---

# Rotational Inertia

Ideal mechanical rotational inertia

**Library:** Powertrain Blockset / Drivetrain / Couplings  
 Vehicle Dynamics Blockset / Powertrain / Drivetrain / Couplings

## Description

The Rotational Inertia block implements an ideal mechanical rotational inertia.

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Variable	Equations	
PwrInfo	PwrTrnsfrd — Power transferred between blocks  <ul style="list-style-type: none"> <li>Positive signals indicate flow into block</li> <li>Negative signals indicate flow out of block</li> </ul>	PwrR	Mechanical power from base shaft	$P_{TR}$	$P_{TR} = T_R\omega$
		PwrC	Mechanical power from follower shaft	$P_{TC}$	$P_{TC} = T_C\omega$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred  <ul style="list-style-type: none"> <li>Positive signals indicate an input</li> <li>Negative signals indicate a loss</li> </ul>	PwrDampLoss	Power loss due to damping	$P_d$	$P_d = -b \omega ^2$
	PwrStored — Stored energy rate of change  <ul style="list-style-type: none"> <li>Positive signals indicate an increase</li> <li>Negative signals indicate a decrease</li> </ul>	PwrStoredShft	Rate change of stored internal torsional energy	$P_s$	$P_s = \omega\dot{\omega}J$

The equations use these variables.

$T_R$	Input torque
$T_C$	Output torque
$\omega$	Driveshaft angular velocity
$J$	Rotational inertia
$b$	Rotational viscous damping
$P_d$	Power loss due to damping
$P_s$	Rate change of stored internal torsional energy

## Ports

### Input

#### **RTrq — Input torque**

scalar

Applied input driveshaft torque,  $T_R$ , in N·m.

#### **Dependencies**

To enable this port, for **Port Configuration**, select Simulink.

#### **CTrq — Output torque**

scalar

Load driveshaft torque,  $T_C$ , in N·m.

#### **Dependencies**

To enable this port, for **Port Configuration**, select Simulink.

#### **R — Angular velocity and torque**

two-way connector port

Angular velocity in rad/s. Torque is in N·m.

#### **Dependencies**

To enable this port, for **Port Configuration**, select Two-way connection.

#### **Inertia — Input**

scalar

Rotational inertia, in kg·m<sup>2</sup>.

#### **Dependencies**

To create the Inertia port, select **External inertia input**.

### Output

#### **Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal		Description	Variable	Units	
Trq	R	Applied input driveshaft torque	$T_R$	N·m	
	C	Output driveshaft torque	$T_C$	N·m	
	Damp	Damping torque	$T_d=b\omega$	N·m	
Spd		Angular driveshaft speed	$\omega$	rad/s	
PwrInfo	PwrTrnsfrd	PwrR	Mechanical power from base shaft	$P_{TR}$	W
		PwrC	Mechanical power from follower shaft	$P_{TC}$	W
	PwrNotTrnsfrd	PwrDampLoss	Power loss due to damping	$P_d$	W
	PwrStored	PwrStoredShft	Rate change of stored internal torsional energy	$P_s$	W

**Dependencies**

To enable this port, select **Output Info bus**.

**Spd — Driveshaft speed**

scalar

Angular driveshaft speed,  $\omega$ , in rad/s.

**Dependencies**

To enable this port, for **Port Configuration**, select Simulink.

**C — Angular velocity and torque**

two-way connector port

Angular velocity in rad/s. Torque is in N·m.

**Dependencies**

To enable this port, for **Port Configuration**, select Two-way connection.

**Parameters**

**Block Options**

**Port Configuration — Specify configuration**

Simulink (default) | Two-way connection

Specify the port configuration.

**Dependencies**

Specifying Simulink creates these ports:

- RTrq
- CTrq
- Spd

Specifying Two-way connection creates these ports:

- R
- C

### Output Info bus – Selection

off (default) | on

Select to create the Info output port.

### External inertia input – Input rotational inertia

off (default) | on

#### Dependencies

To create the Inertia port, select **External inertia input**.

#### Parameters

### Rotational inertia, J – Inertia

.01 (default) | scalar

Rotational inertia, in  $\text{kg}\cdot\text{m}^2$ .

#### Dependencies

To enable this parameter, clear **Input rotational inertia**.

### Torsional damping, b – Damping

.001 (default) | scalar

Torsional damping, in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

### Initial velocity, omega\_o – Angular

0 (default) | scalar

Initial angular velocity, in rad/s.

## Extended Capabilities

### C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

# Split Torsional Compliance

Split torsional coupler

**Library:** Powertrain Blockset / Drivetrain / Couplings  
 Vehicle Dynamics Blockset / Powertrain / Drivetrain / Couplings

## Description

The Split Torsional Compliance block implements parallel spring-damper coupling between shafts. You can specify the type of coupling by selecting one of the **Coupling Configuration** parameters:

- Shaft split — Single input shaft coupled to two output shafts
- Shaft merge — Two input shafts coupled to a single output shaft

In fuel economy and emissions studies, you can use the Split Torsional Compliance block to model mechanical rotational compliance between common driveline elements such as motors, planetary gears, and clutches. For example, use the Shaft split configuration to couple a motor and two planetary gear sets. Use the Shaft merge configuration to couple a dual clutch transmission to an output shaft.

### Shaft Split

For the Shaft split configuration, the block implements this schematic and equations.

$$T_{in} = -(\omega_{in} - \omega_{1out})b_1 - (\omega_{in} - \omega_{2out})b_2 - \theta_1 k_1 - \theta_2 k_2$$

$$T_{1out} = (\omega_{in} - \omega_{1out})b_1 + \theta_1 k_1$$

$$T_{2out} = (\omega_{in} - \omega_{2out})b_2 + \theta_2 k_2$$

$$\dot{\theta}_1 = (\omega_{in} - \omega_{1out})$$

$$\dot{\theta}_2 = (\omega_{in} - \omega_{2out})$$

To account for frequency-dependent damping, both damping terms incorporate a low-pass filter.

The equations use these variables.

$T_{in}$	Resulting applied input reaction torque
$\omega_{in}$	Input shaft rotational velocity
$T_{1out}$	Resulting applied torque to first output shaft
$\omega_{1out}$	First output shaft rotational velocity
$T_{2out}$	Resulting applied torque to second output shaft
$\omega_{2out}$	Second output shaft rotational velocity
$\theta_1, \theta_2$	First, second shaft rotation, respectively
$b_1, b_2$	First, second shaft viscous damping, respectively
$k_1, k_2$	First, second shaft torsional stiffness, respectively

### Shaft Merge

For the Shaft merge configuration, the block implements this schematic and equations.

$$T_{out} = (-\omega_{out} + \omega_{1in})b_1 + (-\omega_{out} + \omega_{2in})b_2 + \theta_1 k_1 + \theta_2 k_2$$

$$T_{1out} = (\omega_{out} - \omega_{1in})b_1 - \theta_1 k_1$$

$$T_{2out} = (\omega_{out} - \omega_{2in})b_2 - \theta_2 k_2$$

$$\dot{\theta}_1 = (\omega_{1in} - \omega_{out})$$

$$\dot{\theta}_2 = (\omega_{2in} - \omega_{out})$$

To account for frequency-dependent damping, both damping terms incorporate a low-pass filter.

The equations use these variables.

$T_{out}$	Resulting applied output torque
$\omega_{out}$	Output shaft rotational velocity
$T_{1in}$	Resulting reaction torque to first input shaft
$\omega_{1in}$	First input shaft rotational velocity
$T_{2in}$	Resulting reaction torque to second input shaft
$\omega_{2in}$	Second input shaft rotational velocity
$\theta_1, \theta_2$	First, second shaft rotation, respectively
$b_1, b_2$	First, second shaft viscous damping, respectively
$k_1, k_2$	First, second shaft torsional stiffness, respectively

**Power Accounting**

For the power accounting, the block implements these equations.

Bus Signal		Description	Variable	Equations
PwrInfo	PwrTrnsfrd — Power transferred between blocks <ul style="list-style-type: none"> <li>• Positive signals indicate flow into block</li> <li>• Negative signals indicate flow out of block</li> </ul>	PwrR	For the Shaft split configuration, mechanical power from input shaft	$P_{TR} = -T_R\omega_R$
		PwrC1	For the Shaft split configuration, mechanical power from first output shaft	$P_{TC1} = -T_{C1}\omega_{C1}$
		PwrC2	For the Shaft split configuration, mechanical power from second output shaft	$P_{TC2} = -T_{C2}\omega_{C2}$
		PwrC	For the Shaft merge configuration, mechanical power from output shaft	$P_{TC} = T_C\omega_C$

Bus Signal		Description	Variable	Equations
	PwrR1	For the Shaft merge configuration, mechanical power from first input shaft	$P_{TR1}$	$P_{TR1} = T_{R1}\omega_{R1}$
	PwrR2	For the Shaft merge configuration, mechanical power from second input shaft	$P_{TR2}$	$P_{TR2} = T_{R2}\omega_{R2}$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred  <ul style="list-style-type: none"> <li>• Positive signals indicate an input</li> <li>• Negative signals indicate a loss</li> </ul>	PwrDampLoss	Mechanical damping loss	$P_d = -\left(b_1 \dot{\theta}_1 ^2 + b_2 \dot{\theta}_2 ^2\right)$
	PwrStored — Stored energy rate of change  <ul style="list-style-type: none"> <li>• Positive signals indicate an increase</li> <li>• Negative signals indicate a decrease</li> </ul>	PwrStoredShft	Rate change in spring energy	$P_s = \left(k_1\theta_1\dot{\theta}_1 + k_2\theta_2\dot{\theta}_2\right)$

The equations use these variables.

$T_R$	Shaft R torque
$T_C$	Shaft C torque
$\omega_R$	Shaft R angular velocity
$\omega_C$	Shaft C angular velocity
$\theta$	Coupled shaft rotation
$k$	Shaft torsional stiffness
$b$	Rotational viscous damping
$P_t$	Total mechanical power
$P_d$	Power loss due to damping
$P_s$	Rate change of stored spring energy

## Ports

### Input

#### **RSpd — Input shaft speed**

scalar

Input shaft rotational velocity,  $\omega_{in}$ , in rad/s.

#### **Dependencies**

To enable this port, set both of these parameters:

- **Port Configuration** to Simulink
- **Coupling Configuration** to Shaft split

#### **C1Spd — First output shaft speed**

scalar

First output shaft rotational velocity,  $\omega_{1out}$ , in rad/s.

#### **Dependencies**

To enable this port, set both of these parameters:

- **Port Configuration** to Simulink
- **Coupling Configuration** to Shaft split

#### **C2Spd — Second output shaft speed**

scalar

Second output shaft rotational velocity,  $\omega_{2out}$ , in rad/s.

#### **Dependencies**

To enable this port, set both of these parameters:

- **Port Configuration** to Simulink
- **Coupling Configuration** to Shaft split

#### **CSpd — Input speed**

scalar

Output shaft rotational velocity,  $\omega_{out}$ , in rad/s.

#### **Dependencies**

To enable this port, set both of these parameters:

- **Port Configuration** to Simulink
- **Coupling Configuration** to Shaft merge

#### **R1Spd — First input shaft speed**

scalar

First input shaft rotational velocity,  $\omega_{1in}$ , in rad/s.

**Dependencies**

To enable this port, set both of these parameters:

- **Port Configuration** to Simulink
- **Coupling Configuration** to Shaft merge

**R2Spd – Second input shaft speed**

scalar

Second input shaft rotational velocity,  $\omega_{2in}$ , in rad/s.

**Dependencies**

To enable this port, set both of these parameters:

- **Port Configuration** to Simulink
- **Coupling Configuration** to Shaft merge

**R – Input shaft angular velocity and torque**

two-way connector port

Input shaft angular velocity,  $\omega_{in}$ , in rad/s and torque,  $T_{in}$ , in N·m.

**Dependencies**

To enable this port, select:

- **Port Configuration**>Two-way connection
- **Coupling Configuration**>Shaft split

**R1 – First input shaft angular velocity and torque**

two-way connector port

First input shaft angular velocity,  $\omega_{1in}$ , in rad/s and torque,  $T_{1in}$ , in N·m.

**Dependencies**

To enable this port, select:

- **Port Configuration**>Two-way connection
- **Coupling Configuration**>Shaft merge

**R2 – Second input shaft angular velocity and torque**

two-way connector port

Second input shaft angular velocity,  $\omega_{2in}$ , in rad/s and torque,  $T_{2in}$ , in N·m.

**Dependencies**

To enable this port, select:

- **Port Configuration**>Two-way connection
- **Coupling Configuration**>Shaft merge

## Output

### Info – Bus signal

bus

If you set **Coupling Configuration** to Shaft split, the Info bus contains these signals.

Signal		Description	Variable	Units	
Trq	R	Input shaft torque	$T_{in}$	N·m	
	C1	First output shaft torque	$T_{1out}$	N·m	
	C2	Second output shaft torque	$T_{2out}$	N·m	
	Damp	C1	First output shaft damping torque	$b_1\omega_{1out}$	N·m
		C2	Second output shaft damping torque	$b_2\omega_{2out}$	N·m
	Spring	C1	First output shaft spring torque	$k_1\theta_1$	N·m
C2		Second output shaft spring torque	$k_2\theta_2$	N·m	
Spd	R	Input shaft angular velocity	$\omega_{in}$	rad/s	
	C1	First output shaft angular velocity	$\omega_{1out}$	rad/s	
	C2	Second output shaft angular velocity	$\omega_{2out}$	rad/s	
	deltadot1	Difference in input and first output shaft angular velocity	$\dot{\theta}_1$	rad/s	
	deltadot2	Difference in input and second output shaft angular velocity	$\dot{\theta}_2$	rad/s	
PwrInfo	PwrTrnsfrd	PwrR	Mechanical power from input shaft	$P_{TR}$	W
		PwrC1	Mechanical power from first output shaft	$P_{TC1}$	W
		PwrC2	Mechanical power from second output shaft	$P_{TC2}$	W
	PwrNotTrnsfrd	PwrDampLoss	Mechanical damping loss	$P_d$	W
	PwrStored	PwrStoredShft	Rate change of stored internal torsional energy	$P_s$	W

If you set **Coupling Configuration** to Shaft merge, the Info bus contains these signals.

Signal		Description	Variable	Units
Trq	C	Output shaft torque	$T_{out}$	N·m
	R1	First input shaft torque	$T_{1in}$	N·m
	R2	Second input shaft torque	$T_{2in}$	N·m

Signal			Description	Variable	Units
	Damp	R1	First input shaft damping torque	$b_1\omega_{1in}$	N·m
		R2	Second in shaft damping torque	$b_2\omega_{2in}$	N·m
	Spring	R1	First input shaft spring torque	$k_1\theta_1$	N·m
		R2	Second in shaft spring torque	$k_2\theta_2$	N·m
Spd	C		Output shaft angular velocity	$\omega_{out}$	rad/s
	R1		First input shaft angular velocity	$\omega_{1in}$	rad/s
	R2		Second input shaft angular velocity	$\omega_{2in}$	rad/s
	deltadot1		Difference in first input and output shaft angular velocity	$\dot{\theta}_1$	rad/s
	deltadot2		Difference in second input and output shaft angular velocity	$\dot{\theta}_2$	rad/s
PwrInfo	PwrTrnsfrd	PwrC	Mechanical power from output shaft	$P_{TC}$	W
		PwrR1	Mechanical power from first input shaft	$P_{TR1}$	W
		PwrR2	Mechanical power from second input shaft	$P_{TR2}$	W
	PwrNotTrnsfrd	PwrDampLoss	Mechanical damping loss	$P_d$	W
	PwrStored	PwrStoredShft	Rate change of stored internal torsional energy	$P_s$	W

### Dependencies

To enable this port, select **Output Info bus**.

### RTrq – Input shaft torque

scalar

Input shaft torque,  $T_{in}$ , in N·m.

### Dependencies

To enable this port, set both of these parameters:

- **Port Configuration** to Simulink
- **Coupling Configuration** to Shaft split

### C1Trq – First output shaft torque

scalar

First output shaft torque,  $T_{1out}$ , in N·m.

### Dependencies

To enable this port, set both of these parameters:

- **Port Configuration** to Simulink
- **Coupling Configuration** to Shaft split

**C2Trq — Second output shaft torque**

scalar

Second output shaft torque,  $T_{2out}$ , in N·m.

**Dependencies**

To enable this port, set both of these parameters:

- **Port Configuration** to Simulink
- **Coupling Configuration** to Shaft split

**CTrq — Output shaft torque**

scalar

Output shaft torque,  $T_{out}$ , in N·m.

**Dependencies**

To enable this port, set both of these parameters:

- **Port Configuration** to Simulink
- **Coupling Configuration** to Shaft merge

**R1Trq — First input shaft torque**

scalar

First input shaft torque,  $T_{1in}$ , in N·m.

**Dependencies**

To enable this port, set both of these parameters:

- **Port Configuration** to Simulink
- **Coupling Configuration** to Shaft merge

**R2Trq — Second input shaft torque**

scalar

Second input shaft torque,  $T_{2in}$ , in N·m.

**Dependencies**

To enable this port, set both of these parameters:

- **Port Configuration** to Simulink
- **Coupling Configuration** to Shaft merge

**C1 — First output shaft angular velocity and torque**

two-way connector port

First output shaft angular velocity,  $\omega_{1out}$ , in rad/s and torque,  $T_{1out}$ , in N·m.

**Dependencies**

To enable this port, select:

- **Port Configuration**>Two-way connection
- **Coupling Configuration**>Shaft split

**C2 — Second output shaft angular velocity and torque**

two-way connector port

Second output shaft angular velocity,  $\omega_{2out}$ , in rad/s and torque,  $T_{2out}$ , in N·m.

**Dependencies**

To enable this port, select:

- **Port Configuration**>Two-way connection
- **Coupling Configuration**>Shaft split

**C — Output shaft angular velocity and torque**

two-way connector port

Output shaft angular velocity,  $\omega_{out}$ , in rad/s and torque,  $T_{out}$ , in N·m.

**Dependencies**

To enable this port, select:

- **Port Configuration**>Two-way connection
- **Coupling Configuration**>Shaft merge

**Parameters****Block Options****Port Configuration — Specify configuration**

Simulink (default) | Two-way connection

Specify the port configuration.

**Coupling Configuration — Specify configuration**

Shaft split (default) | Shaft merge

Specify the coupling type.

**Output Info bus — Selection**

off (default) | on

Select to create the Info output port.

**Coupling 1****Torsional stiffness, k1 — Stiffness**

5e4 (default) | scalar

Rotational inertia,  $k_1$ , in N·m/rad.

**Torsional damping, b1 — Damping**

1e2 (default) | scalar

Torsional damping,  $b_1$ , in N·m· s/rad.

**Damping cutoff frequency, omega1\_c — Frequency**

3000 (default) | scalar

Damping cutoff frequency, in rad/s.

**Coupling 2**

**Torsional stiffness, k2 — Stiffness**

5e4 (default) | scalar

Rotational inertia,  $k_2$ , in N·m/rad.

**Torsional damping, b2 — Damping**

1e2 (default) | scalar

Torsional damping,  $b_2$ , in N·m· s/rad.

**Damping cutoff frequency, omega2\_c — Frequency**

3000 (default) | scalar

Damping cutoff frequency, in rad/s.

# Torsional Compliance

Parallel spring-damper

**Library:** Powertrain Blockset / Drivetrain / Couplings  
Vehicle Dynamics Blockset / Powertrain / Drivetrain / Couplings

## Description

The Torsional Compliance block implements a parallel spring-damper to couple two rotating driveshafts. The block uses the driveshaft angular velocities, torsional stiffness, and torsional damping to determine the torques.

$$T_R = -(\omega_R - \omega_C)b - \theta k$$

$$T_C = (\omega_R - \omega_C)b + \theta k$$

$$\dot{\theta} = (\omega_R - \omega_C)$$

## Power Accounting

For the power accounting, the block implements these equations.

Bus Signal	Description	Variable	Equations	
PwrInfo	PwrTrnsfrd — Power transferred between blocks	PwrR	Mechanical power from driveshaft R	$P_{TR} = T_R \omega_R$
	<ul style="list-style-type: none"> <li>Positive signals indicate flow into block</li> <li>Negative signals indicate flow out of block</li> </ul>	PwrC	Mechanical power from driveshaft C	$P_{TC} = T_C \omega_C$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred	PwrDampLoss	Mechanical damping loss	$P_d = -b \dot{\theta} ^2$
	<ul style="list-style-type: none"> <li>Positive signals indicate an input</li> <li>Negative signals indicate a loss</li> </ul>			

Bus Signal		Description	Variable	Equations	
	PwrStored — Stored energy rate of change <ul style="list-style-type: none"> <li>Positive signals indicate an increase</li> <li>Negative signals indicate a decrease</li> </ul>	PwrStoredShft	Rate change in spring energy	$P_s$	$P_s = -\theta k \dot{\theta}$

The equations use these variables.

$T_R$	Driveshaft R torque
$T_C$	Driveshaft C torque
$\omega_R$	Driveshaft R angular velocity
$\omega_C$	Driveshaft C angular velocity
$\theta$	Coupled driveshaft rotation
$k$	Driveshaft torsional stiffness
$b$	Rotational viscous damping
$P_d$	Power loss due to damping
$P_s$	Rate change of stored spring energy

## Ports

### Input

#### RSpd — Driveshaft R angular velocity

scalar

Input driveshaft angular velocity, in rad/s.

#### Dependencies

To enable this port, for **Port Configuration**, select Simulink.

#### CSpd — Driveshaft C angular velocity

scalar

Output driveshaft angular velocity, in rad/s.

#### Dependencies

To enable this port, for **Port Configuration**, select Simulink.

#### R — Angular velocity and torque

two-way connector port

Angular velocity in rad/s. Torque is in N·m.

#### Dependencies

To enable this port, for **Port Configuration**, select Two-way connection.

## Output

### Info — Bus signal

bus

Bus signal containing these block calculations.

Signal		Description	Variable	Units	
Trq	R	Input driveshaft torque	$T_R$	N·m	
	C	Output driveshaft torque	$T_C$	N·m	
	Damp	Damping torque	$T_s = b\dot{\theta}$	N·m	
	Spring	Spring torque	$T_d = k\theta$	N·m	
Spd	R	Input driveshaft angular velocity	$\omega_R$	rad/s

## Limited Slip Differential

Limited differential as a planetary bevel gear

**Library:** Powertrain Blockset / Drivetrain / Final Drive Unit  
Vehicle Dynamics Blockset / Powertrain / Drivetrain / Final Drive Unit

### Description

The Limited Slip Differential block implements a differential as a planetary bevel gear train. The block matches the driveshaft bevel gear to the crown (ring) bevel gear. You can specify:

- Carrier-to-driveshaft ratio
- Crown wheel location
- Viscous and damping coefficients for the axles and carrier
- Type of slip coupling

Use the block in system-level driveline analysis to account for the power transfer from the transmission to the wheels. The block is suitable for use in hardware-in-the-loop (HIL) and optimization workflows. All the parameters are tunable.

In a limited slip differential, to prevent one of the wheels from slipping, the differential splits the torque applied to the left and right axles. With different torque applied to the axles, the wheels can move at different angular velocities, preventing slip. The block implements three methods for coupling the different torques applied to the axes:

- Pre-loaded ideal clutch
- Slip speed-dependent torque data
- Input torque dependent torque data

The block uses a coordinate system that produces positive tire and vehicle motion for standard engine, transmission, and differential configurations. The arrows indicate positive motion.

### Efficiency

To account for the block efficiency, use the **Efficiency factors** parameter. This table summarizes the block implementation for each setting.

Setting	Implementation
Constant	Constant efficiency that you can set with the <b>Constant efficiency factor, eta</b> parameter.
Driveshaft torque, temperature and speed	<p>Efficiency as a function of base gear input torque, air temperature, and driveshaft speed. Use these parameters to specify the lookup table and breakpoints:</p> <ul style="list-style-type: none"> <li>• <b>Efficiency lookup table, eta_tbl</b></li> <li>• <b>Efficiency torque breakpoints, Trq_bpts</b></li> <li>• <b>Efficiency speed breakpoints, omega_bpts</b></li> <li>• <b>Efficiency temperature breakpoints, Temp_bpts</b></li> </ul> <p>For the air temperature, you can either:</p> <ul style="list-style-type: none"> <li>• Select <b>Input temperature</b> to create an input port.</li> <li>• Set a <b>Ambient temperature, Tamb</b> parameter value.</li> </ul> <p>To select the interpolation method, use the <b>Interpolation method</b> parameter. For more information, see "Interpolation Methods".</p>

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Equations
PwrInfo	PwrTrnsfrd — Power transferred between blocks	PwrDriveshft	Mechanical power from driveshaft $\eta T_d \omega_d$
	<ul style="list-style-type: none"> <li>Positive signals indicate flow into block</li> <li>Negative signals indicate flow out of block</li> </ul>	PwrAxl1	Mechanical power from axle 1 $\eta T_1 \omega_1$
		PwrAxl2	Mechanical power from axle 2 $\eta T_2 \omega_2$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred <ul style="list-style-type: none"> <li>Positive signals indicate an input</li> <li>Negative signals indicate a loss</li> </ul>	PwrMechLoss	Total power loss $\dot{W}_{loss} = -(P_t + P_d + P_c) + P_s$ $P_t = \eta(T_d \omega_d + T_1 \omega_1 + T_2 \omega_2)$
		PwrDampLoss	Power loss due to damping $P_d = -(b_1  \omega_1  + b_2  \omega_2  + b_d  \omega_d )$
		PwrCplngLoss	Power loss due to clutch $P_c = T_c  \bar{\omega} $
PwrStored — Stored energy rate of change <ul style="list-style-type: none"> <li>Positive signals indicate an increase</li> <li>Negative signals indicate a decrease</li> </ul>	PwrStoredShft	Rate change of stored internal energy $P_s = -(\omega_1 \dot{\omega}_1 J_1 + \omega_2 \dot{\omega}_2 J_2 + \omega_d \dot{\omega}_d J_d)$	

### Dynamics

The Limited Slip Differential block implements these differential equations to represent the mechanical dynamic response for the crown gear, left axle, and right axle.

Mechanical Dynamic Response	Differential Equation
Crown Gear	$\dot{\omega}_d J_d = \eta T_d - \omega_d b_d - T_i$
Left Axle	$\dot{\omega}_1 J_1 = \eta T_1 - \omega_1 b_1 - T_{i1}$
Right Axle	$\dot{\omega}_2 J_2 = \eta T_2 - \omega_2 b_2 - T_{i2}$

The block assumes rigid coupling between the crown gear and axles. These constraint equations apply.

$$\eta T_1 = \frac{N}{2} T_i - \frac{1}{2} T_c$$

$$\eta T_2 = \frac{N}{2} T_i + \frac{1}{2} T_c$$

$$\omega_d = \frac{N}{2}(\omega_1 + \omega_2)$$

The equations use these variables.

$N$	Carrier-to-driveshaft gear ratio
$J_d$	Rotational inertia of the crown gear assembly
$b_d$	Crown gear linear viscous damping
$\omega_d$	Driveshaft angular speed
$\varpi$	Slip speed
$J_1$	Axle 1 rotational inertia
$b_1$	Axle 1 linear viscous damping
$\omega_1$	Axle 1 speed
$J_2$	Axle 2 rotational inertia
$b_2$	Axle 2 linear viscous damping
$\omega_2$	Axle 2 angular speed
$\eta$	Efficiency
$T_d$	Driveshaft torque
$T_1$	Axle 1 torque
$T_2$	Axle 2 torque
$T_i$	Axle internal resistance torque
$T_{i1}$	Axle 1 internal resistance torque
$T_{i2}$	Axle 2 internal resistance torque
$\mu$	Coefficient of friction
$R_{eff}$	Effective clutch radius
$R_o$	Annular disk outer radius
$R_i$	Annular disk inner radius
$F_c$	Clutch force
$T_c$	Clutch torque
$\mu$	Coefficient of friction

Table blocks in the Limited Slip Differential have these parameter settings:

- **Interpolation method** – Linear
- **Extrapolation method** – Clip

#### Ideal Clutch Coupling

The ideal clutch coupling model uses the axle slip speed and friction to calculate the clutch torque. The friction coefficient is a function of the slip speed.

$$T_c = F_c N \mu(|\varpi|) R_{eff} \tanh(4|\varpi|)$$

The disc radii determine the effective clutch radius over which the clutch force acts.

$$R_{eff} = \frac{2(R_o^3 - R_i^3)}{3(R_o^2 - R_i^2)}$$

The angular velocities of the axles determine the slip speed.

$$\varpi = \omega_1 - \omega_2$$

### Slip Speed Coupling

To calculate the clutch torque, the slip speed coupling model uses torque data that is a function of slip speed. The angular velocities of the axles determine the slip speed.

$$\varpi = \omega_1 - \omega_2$$

### Input Torque Coupling

To calculate the clutch torque, the input torque coupling model uses torque data that is a function of input torque.

The Open Differential block assumes rigid coupling between the crown gear and axles. These constraint equations apply.

$$\eta T_{i1} = \eta T_{i2} = \frac{N}{2} T_i$$

$$\omega_d = \frac{N}{2} (\omega_1 + \omega_2)$$

## Ports

### Inputs

#### DriveshaftTrq — Torque

scalar

Applied input torque, typically from the engine crankshaft, in N·m.

#### Axl1Trq — Torque

scalar

Axle 1 torque,  $T_1$ , in N·m.

#### Axl2Trq — Torque

scalar

Axle 2 torque,  $T_2$ , in N·m.

#### Temp — Temperature

scalar

Temperature, in K.

### Dependencies

To enable this port:

- Set **Efficiency factors** to Driveshaft torque, speed and temperature.
- Select **Input temperature**.

## Output

### Info – Bus signal

bus

Bus signal containing these block calculations.

scalar

Axle 1 angular speed,  $\omega_1$ , in rad/s.

### Axl2Spd – Angular speed

scalar

Axle 2 angular speed,  $\omega_2$ , in rad/s.

## Parameters

### Block Options

#### Efficiency factors — Specify configuration

Constant (default) | Driveshaft torque, speed and temperature

To account for the block efficiency, use the **Efficiency factors** parameter. This table summarizes the block implementation for each setting.

Setting	Implementation
Constant	Constant efficiency that you can set with the <b>Constant efficiency factor, eta</b> parameter.
Driveshaft torque, temperature and speed	<p>Efficiency as a function of base gear input torque, air temperature, and driveshaft speed. Use these parameters to specify the lookup table and breakpoints:</p> <ul style="list-style-type: none"> <li>• <b>Efficiency lookup table, eta_tbl</b></li> <li>• <b>Efficiency torque breakpoints, Trq_bpts</b></li> <li>• <b>Efficiency speed breakpoints, omega_bpts</b></li> <li>• <b>Efficiency temperature breakpoints, Temp_bpts</b></li> </ul> <p>For the air temperature, you can either:</p> <ul style="list-style-type: none"> <li>• Select <b>Input temperature</b> to create an input port.</li> <li>• Set a <b>Ambient temperature, Tamb</b> parameter value.</li> </ul> <p>To select the interpolation method, use the <b>Interpolation method</b> parameter. For more information, see “Interpolation Methods”.</p>

#### Interpolation method — Method

Flat | Nearest | Linear point-slope | Linear Lagrange | Cubic spline

For more information, see “Interpolation Methods”.

### Dependencies

To enable this parameter, set **Efficiency factors** to Driveshaft torque, speed and temperature.

#### Input temperature — Create input port

off (default) | on

Select to create input port Temp for the temperature.

### Dependencies

To enable this parameter, set **Efficiency factors** to Driveshaft torque, speed and temperature.

### Open Differential

#### Crown wheel (ring gear) located — Specify crown wheel connection

To the left of center-line (default) | To the right of center-line

Specify the crown wheel connection to the driveshaft.

**Carrier to drive shaft ratio, NC/ND – Ratio**

4 (default) | scalar

Carrier-to-driveshaft gear ratio,  $N$ .

**Carrier inertia, Jd – Inertia**

.1 (default) | scalar

Rotational inertia of the crown gear assembly,  $J_d$ , in  $\text{kg}\cdot\text{m}^2$ . You can include the driveshaft inertia.

**Carrier damping, bd – Damping**

1e-3 (default) | scalar

Crown gear linear viscous damping,  $b_d$ , in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

**Axle 1 inertia, Jw1 – Inertia**

.1 (default) | scalar

Axle 1 rotational inertia,  $J_1$ , in  $\text{kg}\cdot\text{m}^2$ .

**Axle 1 damping, bw1 – Damping**

1e-3 (default) | scalar

Axle 1 linear viscous damping,  $b_1$ , in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

**Axle 2 inertia, Jw2 – Inertia**

.1 (default) | scalar

Axle 2 rotational inertia,  $J_2$ , in  $\text{kg}\cdot\text{m}^2$ .

**Axle 2 damping, bw2 – Damping**

1e-3 (default) | scalar

Axle 2 linear viscous damping,  $b_2$ , in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

**Axle 1 initial velocity, omegaw1o – Angular velocity**

0 (default) | scalar

Axle 1 initial velocity,  $\omega_{o1}$ , in  $\text{rad}/\text{s}$ .

**Axle 2 initial velocity, omegaw2o – Angular velocity**

0 (default) | scalar

Axle 2 initial velocity,  $\omega_{o2}$ , in  $\text{rad}/\text{s}$ .

**Constant efficiency factor, eta – Efficiency**

1 (default) | scalar

Constant efficiency,  $\eta$ .

**Dependencies**

To enable this parameter, set **Efficiency factors** to Constant.

**Efficiency lookup table, eta\_tbl — Lookup table**

M-by-N-by-L array

Dimensionless array of values for efficiency as a function of:

- M input torques
- N input speed
- L air temperatures

Each value specifies the efficiency for a specific combination of torque, speed, and temperature. The array size must match the dimensions defined by the torque, speed, and temperature breakpoint vectors.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Driveshaft torque, speed and temperature.

**Efficiency torque breakpoints, Trq\_bpts — Torque breakpoints**

[25, 50, 75, 100, 150, 200, 250] (default) | 1-by-M vector

Vector of input torque, breakpoints for efficiency, in N·m.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Driveshaft torque, speed and temperature.

**Efficiency speed breakpoints, omega\_bpts — Speed breakpoints**

[52.4 78.5 105 131 157 183 209 262 314 419 524] (default) | 1-by-N vector

Vector of speed, breakpoints for efficiency, in rad/s.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Driveshaft torque, speed and temperature.

**Efficiency temperature breakpoints, Temp\_bpts — Temperature breakpoints**

[290 358] (default) | 1-by-L vector

Vector of ambient temperature breakpoints for efficiency, in K.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Driveshaft torque, speed and temperature.

**Ambient temperature, Tamb — Ambient temperature**

297.15 (default) | scalar

Ambient air temperature,  $T_{air}$ , in K.

**Dependencies**

To enable this parameter:

- Set **Efficiency factors** to Driveshaft torque, speed and temperature.
- Clear **Input temperature**.

### Slip Coupling

#### Coupling type – Torque coupling

Pre-loaded ideal clutch (default) | Slip speed dependent torque data | Input torque dependent torque data

Specify the type of torque coupling.

#### Number of disks, Ndisks – Torque coupling

4 (default) | scalar

Number of disks.

#### Dependencies

To enable the ideal clutch parameters, select Pre-loaded ideal clutch for the **Coupling type** parameter.

#### Effective radius, Reff – Radius

.20 (default) | scalar

The effective radius,  $R_{eff}$ , used with the applied clutch friction force to determine the friction force. The effective radius is defined as:

$$R_{eff} = \frac{2(R_o^3 - R_i^3)}{3(R_o^2 - R_i^2)}$$

The equation uses these variables.

$R_o$  Annular disk outer radius

$R_i$  Annular disk inner radius

#### Dependencies

To enable the clutch parameters, select Pre-loaded ideal clutch for the **Coupling type** parameter.

#### Nominal preload force, Fc – Force

500 (default) | scalar

Nominal preload force, in N.

#### Dependencies

To enable the clutch parameters, select Pre-loaded ideal clutch for the **Coupling type** parameter.

#### Friction coefficient vector, muc – Friction

[.16 0.13 0.115 0.11 0.105 0.1025 0.10125] (default) | vector

Friction coefficient vector.

**Dependencies**

To enable the clutch parameters, select Pre-loaded ideal clutch for the **Coupling type** parameter.

**Slip speed vector,  $d\omega$  – Angular velocity**

[0 10 20 40 60 80 100] (default) | vector

Slip speed vector, in rad/s.

**Dependencies**

To enable the clutch parameters, select Pre-loaded ideal clutch for the **Coupling type** parameter.

**Torque - slip speed vector,  $T_{dw}$  – Torque**

[-100, -90, -50, -5, 0, 5, 50, 90, 100] (default) | vector

Torque vector, in N·m.

**Dependencies**

To enable the slip speed parameters, select Slip speed dependent torque data for the **Coupling type** parameter.

**Slip speed vector,  $d\omega_T$  – Angular velocity**

[-200, -175, -100, -50, 0, 50, 100, 175, 200] (default) | vector

Slip speed vector, in rad/s.

**Dependencies**

To enable the slip speed parameters, select Slip speed dependent torque data for the **Coupling type** parameter.

**Torque - input torque vector,  $T_{Tin}$  – Torque**

[-200 -175 -100 -50 0 50 100 175 200] (default) | vector

Torque vector, in N·m.

**Dependencies**

To enable the input torque parameters, select Input torque dependent torque data for the **Coupling type** parameter.

**Input torque vector,  $T_{in}$  – Torque**

[-200 -175 -100 -50 0 50 100 175 200] (default) | vector

Torque vector, in N·m.

**Dependencies**

To enable the input torque parameters, select Input torque dependent torque data for the **Coupling type** parameter.

**Coupling time constant,  $\tau_C$  – Constant**

.01 (default) | scalar

Coupling time constant, in s.

## Open Differential

Differential as a planetary bevel gear

**Library:** Powertrain Blockset / Drivetrain / Final Drive Unit  
Vehicle Dynamics Blockset / Powertrain / Drivetrain / Final Drive Unit

### Description

The Open Differential block implements a differential as a planetary bevel gear train. The block matches the driveshaft bevel gear to the crown (ring) bevel gear. You can specify:

- Carrier-to-driveshaft ratio
- Crown wheel location
- Viscous and damping coefficients for the axles and carrier

Use the Open Differential block to:

- Dynamically couple the post-transmission driveshaft to the wheel axles or universal joints
- Model simplified or older drivetrains when optimal traction control does not require passive or active torque vectoring
- Model mechanical power splitting in generic gearbox and drive line scenarios

The block is suitable for use in hardware-in-the-loop (HIL) and optimization workflows. All the parameters are tunable.

The block uses a coordinate system that produces positive tire and vehicle motion for standard engine, transmission, and differential configurations. The arrows indicate positive motion.

## Efficiency

To account for the block efficiency, use the **Efficiency factors** parameter. This table summarizes the block implementation for each setting.

Setting	Implementation
Constant	Constant efficiency that you can set with the <b>Constant efficiency factor, eta</b> parameter.
Driveshaft torque, temperature and speed	<p>Efficiency as a function of base gear input torque, air temperature, and driveshaft speed. Use these parameters to specify the lookup table and breakpoints:</p> <ul style="list-style-type: none"> <li>• <b>Efficiency lookup table, eta_tbl</b></li> <li>• <b>Efficiency torque breakpoints, Trq_bpts</b></li> <li>• <b>Efficiency speed breakpoints, omega_bpts</b></li> <li>• <b>Efficiency temperature breakpoints, Temp_bpts</b></li> </ul> <p>For the air temperature, you can either:</p> <ul style="list-style-type: none"> <li>• Select <b>Input temperature</b> to create an input port.</li> <li>• Set a <b>Ambient temperature, Tamb</b> parameter value.</li> </ul> <p>To select the interpolation method, use the <b>Interpolation method</b> parameter. For more information, see “Interpolation Methods”.</p>

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Equations
PwrInfo	PwrTrnsfrd — Power transferred between blocks	PwrDriveshft	Mechanical power from driveshaft $\eta T_d \omega_d$
	<ul style="list-style-type: none"> <li>Positive signals indicate flow into block</li> <li>Negative signals indicate flow out of block</li> </ul>	PwrAxl1	Mechanical power from axle 1 $\eta T_1 \omega_1$
		PwrAxl2	Mechanical power from axle 2 $\eta T_2 \omega_2$
PwrNotTrnsfrd — Power crossing the block boundary, but not transferred	<ul style="list-style-type: none"> <li>Positive signals indicate an input</li> <li>Negative signals indicate a loss</li> </ul>	PwrMechLoss	Total power loss $\dot{W}_{loss} = -(P_t + P_d) + P_s$
		PwrDampLoss	Power loss due to damping $P_d = -(b_1 \omega_1  + b_2 \omega_2  + b_d \omega_d )$
PwrStored — Stored energy rate of change	<ul style="list-style-type: none"> <li>Positive signals indicate an increase</li> <li>Negative signals indicate a decrease</li> </ul>	PwrStoredShft	Rate change of stored internal energy $P_s = -(\omega_1 \dot{\omega}_1 J_1 + \omega_2 \dot{\omega}_2 J_2 + \omega_d \dot{\omega}_d J_d)$

### Dynamics

The Open Differential block implements these differential equations to represent the mechanical dynamic response for the crown gear, left axle, and right axle.

Mechanical Dynamic Response	Differential Equation
Crown Gear	$\dot{\omega}_d J_d = \eta T_d - \omega_d b_d - T_i$
Left Axle	$\dot{\omega}_1 J_1 = \eta T_1 - \omega_1 b_1 - T_{i1}$
Right Axle	$\dot{\omega}_2 J_2 = \eta T_2 - \omega_2 b_2 - T_{i2}$

The Open Differential block assumes rigid coupling between the crown gear and axles. These constraint equations apply.

$$\eta T_{i1} = \eta T_{i2} = \frac{N}{2} T_i$$

$$\omega_d = \frac{N}{2} (\omega_1 + \omega_2)$$

The equations use these variables.

$N$	Carrier-to-driveshaft gear ratio
$J_d$	Rotational inertia of the crown gear assembly
$b_d$	Crown gear linear viscous damping
$\omega_d$	Driveshaft angular speed
$\eta$	Differential efficiency
$J_1$	Axle 1 rotational inertia
$b_1$	Axle 1 linear viscous damping
$\omega_1$	Axle 1 speed
$J_2$	Axle 2 rotational inertia
$b_2$	Axle 2 linear viscous damping
$\omega_2$	Axle 2 angular speed
$T_d$	Driveshaft torque
$T_1$	Axle 1 torque
$T_2$	Axle 2 torque
$T_i$	Driveshaft internal resistance torque
$T_{i1}$	Axle 1 internal resistance torque
$T_{i2}$	Axle 2 internal resistance torque

## Ports

### Inputs

#### DriveshaftTrq — Torque

scalar

Applied input torque, typically from the engine crankshaft, in N·m.

#### Ax11Trq — Torque

scalar

Axle 1 torque,  $T_1$ , in N·m.

#### Ax12Trq — Torque

scalar

Axle 2 torque,  $T_2$ , in N·m.

#### Temp — Temperature

scalar

Temperature, in K.

### Dependencies

To enable this port:

- Set **Efficiency factors** to Driveshaft torque, speed and temperature.
- Select **Input temperature**.

**Output**

**Info – Bus signal**

bus

Bus signal containing these block calculations.

Signal		Description	Units	
Driveshft	DriveshftTrq	Driveshaft torque	N·m

#### Interpolation method — Method

Flat | Nearest | Linear point-slope | Linear Lagrange | Cubic spline

For more information, see “Interpolation Methods”.

### Dependencies

To enable this parameter, set **Efficiency factors** to Driveshaft torque, speed and temperature.

#### Input temperature — Create input port

off (default) | on

Select to create input port Temp for the temperature.

### Dependencies

To enable this parameter, set **Efficiency factors** to Driveshaft torque, speed and temperature.

#### Crown wheel (ring gear) located — Specify crown wheel connection

To the left of center-line (default) | To the right of center-line

Specify the crown wheel connection to the driveshaft.

**Carrier to drive shaft ratio, Ndiff – Ratio**

4 (default) | scalar

Carrier-to-driveshaft gear ratio,  $N$ , dimensionless.**Carrier inertia, Jd – Inertia**

.1 (default) | scalar

Rotational inertia of the crown gear assembly,  $J_d$ , in  $\text{kg}\cdot\text{m}^2$ . You can include the driveshaft inertia.**Carrier damping, bd – Damping**

1e-3 (default) | scalar

Crown gear linear viscous damping,  $b_d$ , in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .**Axle 1 inertia, Jw1 – Inertia**

.1 (default) | scalar

Axle 1 rotational inertia,  $J_1$ , in  $\text{kg}\cdot\text{m}^2$ .**Axle 1 damping, bw1 – Damping**

1e-3 (default) | scalar

Axle 1 linear viscous damping,  $b_1$ , in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .**Axle 2 inertia, Jw2 – Inertia**

.1 (default) | scalar

Axle 2 rotational inertia,  $J_2$ , in  $\text{kg}\cdot\text{m}^2$ .**Axle 2 damping, bw2 – Damping**

1e-3 (default) | scalar

Axle 2 linear viscous damping,  $b_2$ , in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .**Axle 1 initial velocity, omegaw1o – Angular velocity**

0 (default) | scalar

Axle 1 initial velocity,  $\omega_{o1}$ , in  $\text{rad}/\text{s}$ .**Axle 2 initial velocity, omegaw2o – Angular velocity**

0 (default) | scalar

Axle 2 initial velocity,  $\omega_{o2}$ , in  $\text{rad}/\text{s}$ .**Efficiency****Constant efficiency factor, eta – Efficiency**

1 (default) | scalar

Constant efficiency,  $\eta$ .**Dependencies**To enable this parameter, set **Efficiency factors** to Constant.

**Efficiency lookup table, eta\_tbl — Lookup table**

M-by-N-by-L array

Dimensionless array of values for efficiency as a function of:

- M input torques
- N input speed
- L air temperatures

Each value specifies the efficiency for a specific combination of torque, speed, and temperature. The array size must match the dimensions defined by the torque, speed, and temperature breakpoint vectors.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Driveshaft torque, speed and temperature.

**Efficiency torque breakpoints, Trq\_bpts — Torque breakpoints**

[25, 50, 75, 100, 150, 200, 250] (default) | 1-by-M vector

Vector of input torque, breakpoints for efficiency, in N·m.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Driveshaft torque, speed and temperature.

**Efficiency speed breakpoints, omega\_bpts — Speed breakpoints**

[52.4 78.5 105 131 157 183 209 262 314 419 524] (default) | 1-by-N vector

Vector of speed, breakpoints for efficiency, in rad/s.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Driveshaft torque, speed and temperature.

**Efficiency temperature breakpoints, Temp\_bpts — Temperature breakpoints**

[290 358] (default) | 1-by-L vector

Vector of ambient temperature breakpoints for efficiency, in K.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Driveshaft torque, speed and temperature.

**Ambient temperature, Tamb — Ambient temperature**

297.15 (default) | scalar

Ambient air temperature,  $T_{air}$ , in K.

**Dependencies**

To enable this parameter:

- Set **Efficiency factors** to Driveshaft torque, speed and temperature.
- Clear **Input temperature**.

# Longitudinal Wheel

Longitudinal wheel with disc, drum, or mapped brake

**Library:** Powertrain Blockset / Drivetrain / Wheels  
 Vehicle Dynamics Blockset / Wheels and Tires

## Description

The Longitudinal Wheel block implements the longitudinal behavior of an ideal wheel. You can specify the longitudinal force and rolling resistance calculation method, and brake type. Use the block in driveline and longitudinal vehicle simulations where low frequency tire-road and braking forces are required to determine vehicle acceleration, braking, and wheel-rolling resistance. For example, you can use the block to determine the torque and power requirements for a specified drive cycle or braking event. The block is not suitable for applications that require combined lateral slip.

There are four types of Longitudinal Wheel blocks. Each block implements a different brake type.

Block Name	Brake Type Setting	Brake Implementation
Longitudinal Wheel - No Brake	None	None
Longitudinal Wheel - Disc Brake	Disc	Brake that converts the brake cylinder pressure into a braking force.
Longitudinal Wheel - Drum Brake	Drum	Simplex drum brake that converts the applied force and brake geometry into a net braking torque.
Longitudinal Wheel - Mapped Brake	Mapped	Lookup table that is a function of the wheel speed and applied brake pressure.

The block models longitudinal force as a function of wheel slip relative to the road surface. To calculate the longitudinal force, specify one of these **Longitudinal Force** parameters.

Setting	Block Implementation
Magic Formula constant value	Magic Formula with constant coefficient for stiffness, shape, peak, and curvature.
Magic Formula pure longitudinal slip	Magic Formula with load-dependent coefficients that implement equations 4.E9 through 4.E18 in <i>Tire and Vehicle Dynamics</i> .
Mapped force	Lookup table that is a function of the normal force and wheel slip ratio.

To calculate the rolling resistance torque, specify one of these **Rolling Resistance** parameters.

Setting	Block Implementation
None	None
Pressure and velocity	Method in <i>Stepwise Coastdown Methodology for Measuring Tire Rolling Resistance</i> . The rolling resistance is a function of tire pressure, normal force, and velocity.
ISO 28580	Method specified in ISO 28580:2018, <i>Passenger car, truck and bus tyre rolling resistance measurement method – Single point test and correlation of measurement results</i> .
Magic Formula	Magic formula equations from 4.E70 in <i>Tire and Vehicle Dynamics</i> . The magic formula is an empirical equation based on fitting coefficients.
Mapped torque	Lookup table that is a function of the normal force and spin axis longitudinal velocity.

To calculate vertical motion, specify one of these **Vertical Motion** parameters.

Setting	Block Implementation
None	Block passes the applied chassis forces directly through to the rolling resistance and longitudinal force calculations.
Mapped stiffness and damping	Vertical motion depends on wheel stiffness and damping. Stiffness is a function of tire sidewall displacement and pressure. Damping is a function of tire sidewall velocity and pressure.

### Rotational Wheel Dynamics

The block calculates the inertial response of the wheel subject to:

- Axle losses
- Brake and drive torque
- Tire rolling resistance
- Ground contact through the tire-road interface

The input torque is the summation of the applied axle torque, braking torque, and moment arising from the combined tire torque.

$$T_i = T_a - T_b + T_d$$

For the moment arising from the combined tire torque, the block implements tractive wheel forces and rolling resistance with first order dynamics. The rolling resistance has a time constant parameterized in terms of a relaxation length.

$$T_d(s) = \frac{1}{\frac{|\omega| R_e}{L_e} s + 1} (F_x R_e + M_y)$$

To calculate the rolling resistance torque, you can specify one of these **Rolling Resistance** parameters.

Setting	Block Implementation
None	Block sets rolling resistance, $M_y$ , to zero.
Pressure and velocity	Block uses the method in SAE <i>Stepwise Coastdown Methodology for Measuring Tire Rolling Resistance</i> . The rolling resistance is a function of tire pressure, normal force, and velocity. Specifically, $M_y = R_e \{ a + b V_x  + cV_x^2 \} \{ F_z \beta p_i a \} \tanh(4V_x)$
ISO 28580	Block uses the method specified in ISO 28580:2018, <i>Passenger car, truck and bus tyre rolling resistance measurement method – Single point test and correlation of measurement results</i> . The method accounts for normal load, parasitic loss, and thermal corrections from test conditions. Specifically, $M_y = R_e \left( \frac{F_z C_r}{1 + K_t(T_{amb} - T_{meas})} - F_{pl} \right) \tanh(\omega)$
Magic Formula	Block calculates the rolling resistance, $M_y$ , using the Magic Formula equations from 4.E70 in <i>Tire and Vehicle Dynamics</i> . The magic formula is an empirical equation based on fitting coefficients.
Mapped torque	For the rolling resistance, $M_y$ , the block uses a lookup table that is a function of the normal force and spin axis longitudinal velocity.

If the brakes are enabled, the block determines the braking locked or unlocked condition based on an idealized dry clutch friction model. Based on the lock-up condition, the block implements these friction and dynamic models.

If	Lock-Up Condition	Friction Model	Dynamic Model
$\omega \neq 0$ or $T_S <  T_i + T_f - \omega b $	Unlocked	$T_f = T_k$ where, $T_k = F_c R_{eff} \mu_k \tanh[4(-\omega_d)]$ $T_s = F_c R_{eff} \mu_s$ $R_{eff} = \frac{2(R_o^3 - R_i^3)}{3(R_o^2 - R_i^2)}$	$\dot{\omega} J = -\omega b + T_i + T_o$
$\omega = 0$ and $T_S \geq  T_i + T_f - \omega b $	Locked	$T_f = T_s$	$\omega = 0$

The equations use these variables.

$\omega$	Wheel angular velocity
$a$	Velocity-independent force component
$b$	Linear velocity force component
$c$	Quadratic velocity force component
$L_e$	Tire relaxation length
$J$	Moment of inertia

$M_y$	Rolling resistance torque
$T_a$	Applied axle torque
$T_b$	Braking torque
$T_d$	Combined tire torque
$T_f$	Frictional torque
$T_i$	Net input torque
$T_k$	Kinetic frictional torque
$T_o$	Net output torque
$T_s$	Static frictional torque
$F_c$	Applied clutch force
$F_x$	Longitudinal force developed by the tire road interface due to slip
$R_{eff}$	Effective clutch radius
$R_o$	Annular disk outer radius
$R_i$	Annular disk inner radius
$R_e$	Effective tire radius while under load and for a given pressure
$V_x$	Longitudinal axle velocity
$F_z$	Vehicle normal force
$C_r$	Rolling resistance constant
$T_{amb}$	Ambient temperature
$T_{meas}$	Measured temperature for rolling resistance constant
$F_{pl}$	Parasitic force loss
$K_t$	Thermal correction factor
$\alpha$	Tire pressure exponent
$\beta$	Normal force exponent
$p_i$	Tire pressure
$\mu_s$	Coefficient of static friction
$\mu_k$	Coefficient of kinetic friction

## **Brakes**

### **Disc**

If you specify the **Brake Type** parameter `Disc`, the block implements a disc brake. This figure shows the side and front views of a disc brake.

A disc brake converts brake cylinder pressure from the brake cylinder into force. The disc brake applies the force at the brake pad mean radius.

The block uses these equations to calculate brake torque for the disc brake.

$$T = \begin{cases} \frac{\mu P \pi B_a^2 R_m N_{pads}}{4} & \text{when } N \neq 0 \\ \frac{\mu_{static} P \pi B_a^2 R_m N_{pads}}{4} & \text{when } N = 0 \end{cases}$$

$$R_m = \frac{R_o + R_i}{2}$$

The equations use these variables.

$T$	Brake torque
$P$	Applied brake pressure
$N$	Wheel speed
$N_{pads}$	Number of brake pads in disc brake assembly
$\mu_{static}$	Disc pad-rotor coefficient of static friction
$\mu$	Disc pad-rotor coefficient of kinetic friction
$B_a$	Brake actuator bore diameter
$R_m$	Mean radius of brake pad force application on brake rotor
$R_o$	Outer radius of brake pad

$R_i$  Inner radius of brake pad

**Drum**

If you specify the **Brake Type** parameter Drum, the block implements a static (steady-state) simplex drum brake. A simplex drum brake consists of a single two-sided hydraulic actuator and two brake shoes. The brake shoes do not share a common hinge pin.

The simplex drum brake model uses the applied force and brake geometry to calculate a net torque for each brake shoe. The drum model assumes that the actuators and shoe geometry are symmetrical for both sides, allowing a single set of geometry and friction parameters to be used for both shoes.

The block implements equations that are derived from these equations in *Fundamentals of Machine Elements*.

$$T_{rshoe} = \left( \frac{\pi\mu cr(\cos\theta_2 - \cos\theta_1)B_a^2}{2\mu(2r(\cos\theta_2 - \cos\theta_1) + a(\cos^2\theta_2 - \cos^2\theta_1)) + ar(2\theta_1 - 2\theta_2 + \sin 2\theta_2 - \sin 2\theta_1)} \right) P$$

$$T_{lshoe} = \left( \frac{\pi\mu cr(\cos\theta_2 - \cos\theta_1)B_a^2}{-2\mu(2r(\cos\theta_2 - \cos\theta_1) + a(\cos^2\theta_2 - \cos^2\theta_1)) + ar(2\theta_1 - 2\theta_2 + \sin 2\theta_2 - \sin 2\theta_1)} \right) P$$

$$T = \begin{cases} T_{rshoe} + T_{lshoe} & \text{when } N \neq 0 \\ (T_{rshoe} + T_{lshoe}) \frac{\mu_{static}}{\mu} & \text{when } N = 0 \end{cases}$$

The equations use these variables.

- $T$  Brake torque
- $P$  Applied brake pressure
- $N$  Wheel speed

$\mu_{static}$	Disc pad-rotor coefficient of static friction
$\mu$	Disc pad-rotor coefficient of kinetic friction
$T_{rshoe}$	Right shoe brake torque
$T_{lshoe}$	Left shoe brake torque
$a$	Distance from drum center to shoe hinge pin center
$c$	Distance from shoe hinge pin center to brake actuator connection on brake shoe
$r$	Drum internal radius
$B_a$	Brake actuator bore diameter
$\theta_1$	Angle from shoe hinge pin center to start of brake pad material on shoe
$\theta_2$	Angle from shoe hinge pin center to end of brake pad material on shoe

### Mapped

If you specify the **Brake Type** parameter Mapped, the block uses a lookup table to determine the brake torque.

$$T = \begin{cases} f_{brake}(P, N) & \text{when } N \neq 0 \\ \left(\frac{\mu_{static}}{\mu}\right)f_{brake}(P, N) & \text{when } N = 0 \end{cases}$$

The equations use these variables.

$T$	Brake torque
$f_{brake}(P, N)$	Brake torque lookup table
$P$	Applied brake pressure
$N$	Wheel speed
$\mu_{static}$	Friction coefficient of drum pad-face interface under static conditions
$\mu$	Friction coefficient of disc pad-rotor interface

The lookup table for the brake torque,  $f_{brake}(P, N)$ , is a function of applied brake pressure and wheel speed, where:

- $T$  is brake torque, in N·m.
- $P$  is applied brake pressure, in bar.
- $N$  is wheel speed, in rpm.

## Longitudinal Force

To model the Longitudinal Wheel block longitudinal forces, you can use the Magic Formula. The model provides a steady-state *tire characteristic function*  $F_x = f(\kappa, F_z)$ , the longitudinal force  $F_x$  on the tire, based on:

- Vertical load  $F_z$
- Wheel slip  $\kappa$

The Magic Formula model uses these variables.

$\Omega$	Wheel angular velocity
$r_w$	Wheel radius
$V_x$	Wheel hub longitudinal velocity
$r_w\Omega$	Tire tread longitudinal velocity
$V_{sx} = r_w\Omega - V_x$	Wheel slip velocity
$\kappa = V_{sx}/ V_x $	Wheel slip
$F_z, F_{z0}$	Vertical load and nominal vertical load on tire
$F_x = f(\kappa, F_z)$	Longitudinal force exerted on the tire at the contact point. Also a characteristic function $f$ of the tire.

### Magic Formula Constant Value

If you set **Longitudinal Force** to **Magic Formula constant value**, the block implements the Magic Formula as a specific form of the tire characteristic function, characterized by four dimensionless coefficients ( $B, C, D, E$ ), or stiffness, shape, peak, and curvature:

$$F_x = f(\kappa, F_z) = F_z D \sin\left(C \tan^{-1}\left[\left\{B\kappa - E\left[B\kappa - \tan^{-1}(B\kappa)\right]\right\}\right]\right)$$

The slope of  $f$  at  $\kappa = 0$  is  $BCD \cdot F_z$ .

The coefficients are based on empirical tire data. These values are typical sets of constant Magic Formula coefficients for common road conditions.

Surface	B	C	D	E
Dry tarmac	10	1.9	1	0.97
Wet tarmac	12	2.3	0.82	1
Snow	5	2	0.3	1
Ice	4	2	0.1	1

### Magic Formula Pure Longitudinal Slip

If you set **Longitudinal Force** to Magic Formula pure longitudinal slip, the block implements a more general Magic Formula using dimensionless coefficients that are functions of the tire load. The block implements the longitudinal force equations in Chapter 4 of *Tire and Vehicle Dynamics*, including 4.E9 through 4.E18:

$$F_{x0} = D_x \sin\left(C_x \tan^{-1}\left[\left\{B_x K_x - E_x [B_x K_x - \tan^{-1}(B_x K_x)]\right\}\right]\right) + S_{Vx}$$

where:

$$K_x = \kappa + S_{Hx}$$

$$C_x = p_{Cx1} \lambda_{Cx}$$

$$D_x = \mu_x F_z \zeta_1$$

$$\mu_x = (p_{Dx1} + p_{Dx2} df_z)(1 + p_{px3} dp_i + p_{px4} dp_i^2)(1 - p_{Dx3} v^2) \lambda_{\mu x}^*$$

$$E_x = (p_{Ex1} + p_{Ex2} df_z + p_{Ex3} df_z^2)[1 - p_{Ex4} \text{sgn}(\kappa_x)] \lambda_{Ex}$$

$$K_{xk} = F_z (p_{Kx1} + p_{Kx2} df_z) \exp(p_{Kx3} df_z)(1 + p_{px1} dp_i + p_{px2} dp_i^2)$$

$$B_x = K_{xk} / (C_x D_x + \epsilon_x)$$

$$S_{Hx} = p_{Hx1} + p_{Hx2} df_z$$

$$S_{Vx} = F_z \cdot (p_{Vx1} + p_{Vx2} df_z) \lambda_{Vx} \lambda'_{\mu x} \zeta_1$$

$S_{Hx}$  and  $S_{Vx}$  represent offsets to the slip and longitudinal force in the force-slip function, or horizontal and vertical offsets if the function is plotted as a curve.  $\mu_x$  is the longitudinal load-dependent friction coefficient.  $\epsilon_x$  is a small number inserted to prevent division by zero as  $F_z$  approaches zero.

### Vertical Dynamics

If you select no vertical degrees-of-freedom by setting **Vertical Motion** to None, the block passes the applied chassis forces directly through to the rolling resistance and longitudinal force calculations.

If you set **Vertical Motion** to Mapped stiffness and damping, the vertical motion depends on wheel stiffness and damping. Stiffness is a function of tire sidewall displacement and pressure. Damping is a function of tire sidewall velocity and pressure.

$$F_{ztire}(z, \dot{z}, P_{tire}) = F_{zk}(z, P_{tire}) + F_{zb}(\dot{z}, P_{tire})$$

The block determines the vertical response using this differential equation.

$$\ddot{z}m = F_{ztire} - F_z - mg$$

When you disable the vertical degree-of-freedom, the input normal force from the vehicle passes directly to the longitudinal and rolling force calculations.

$$\ddot{z} = \dot{z} = m = 0$$

$$F_{ztire} = mg$$

The block uses the wheel-fixed frame to resolve the vertical forces.

The equations use these variables.

$F_{ztire}$	Tire normal force along the wheel-fixed z-axis
$m$	Axle mass
$F_{zk}$	Tire normal force due to wheel stiffness along the wheel-fixed z-axis
$F_{zb}$	Tire normal force due to wheel damping along the wheel-fixed z-axis
$F_z$	Suspension or vehicle normal force along the wheel-fixed z-axis
$P_{Tire}$	Tire pressure
$z, \dot{z}, \ddot{z}$	Tire displacement, velocity, and acceleration, respectively, along the wheel-fixed z-axis

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Equations
PwrInfo	PwrTrnsfrd — Power transferred between blocks	PwrRoad	Tractive power applied from the axle $P_{road} = F_x V_x$
		PwrAxlTrq	External torque applied by the axle to the wheel $P_T = T\omega$

Bus Signal		Description	Equations
	<ul style="list-style-type: none"> <li>Positive signals indicate flow into block</li> <li>Negative signals indicate flow out of block</li> </ul>	PwrFz	Vertical force applied to the wheel by the vehicle or suspension $P_{Fz} = F_z \dot{z}$
PwrNotTrnsfrd — Power crossing the block boundary, but not transferred	<ul style="list-style-type: none"> <li>Positive signals indicate an input</li> <li>Negative signals indicate a loss</li> </ul>	PwrSlip	Tractive power loss $P_K = F_x V_x + (-F_{cp} R_e + M_y) \omega$
		PwrMyRoll	Rolling resistance power $P_{My} = M_y \omega$
		PwrMyBrk	Braking power $P_{brk} = M_{brk} \omega$
		PwrMyb	Rolling viscous damping loss $P_b = -b \omega^2$
		PwrFzDamp	Vertical damping power $P_{Fzb} = F_{zb} \dot{z}$
PwrStored — Stored energy rate of change	<ul style="list-style-type: none"> <li>Positive signals indicate an increase</li> <li>Negative signals indicate a decrease</li> </ul>	PwrStoredzdot	Rate of change of vertical kinetic energy $P_z = m \dot{z} \dot{z}$
		PwrStoredq	Rate of change of rotational kinetic energy $P_\omega = I_{yy} \dot{\omega} \omega$
		PwrStoredFsFzSprng	Rate of change of stored sidewall potential energy $P_{Fzk} = F_{zk} \dot{x}$
		PwrStoredGrvty	Rate of change of gravitational potential energy $P_g = -mg \dot{z}$

The equations use these variables.

$\omega$	Wheel angular velocity
$b$	Linear velocity force component
$F_x$	Longitudinal force developed by the tire road interface due to slip
$F_{cp}$	Tire slip force at contact patch
$F_z$	Vehicle normal force
$F_{zb}$	Tire normal force due to wheel damping
$F_{zk}$	Tire normal force due to wheel stiffness
$I_{yy}$	Wheel rotational inertia
$M_{brk}$	Braking moment
$M_y$	Rolling resistance torque
$R_e$	Effective tire radius while under load and for a given pressure
$T$	Axle torque applied on wheel
$V_x$	Longitudinal axle velocity

$z, \dot{z}, \ddot{z}$	Tire displacement, velocity, and acceleration, respectively
$\omega$	Wheel angular velocity
$\dot{z}$	Vehicle vertical velocity along the vehicle-fixed z-axis

## Ports

### Input

#### **BrkPrs — Brake pressure**

scalar

Brake pressure, in Pa.

#### **Dependencies**

To enable this port, for the **Brake Type** parameter, specify one of these types:

- Disc
- Drum
- Mapped

#### **AxLTrq — Axle torque**

scalar

Axle torque,  $T_a$ , about wheel spin axis, in N·m.

#### **Vx — Velocity**

scalar

Axle longitudinal velocity along vehicle(body)-fixed x-axis, in m/s.

#### **Fz — Normal force**

scalar

Absolute value of suspension or vehicle normal force along body-fixed z-axis, in N.

#### **Gnd — Ground displacement**

scalar

Ground displacement,  $Grndz$ , along negative wheel-fixed z-axis, in m.

### Dependencies

To create Gnd:

- Set **Vertical Motion** to Mapped stiffness and damping.
- On the **Vertical** pane, select **Input ground displacement**.

### lam\_mux — Friction scaling factor

scalar

Longitudinal friction scaling factor, dimensionless.

### Dependencies

To enable this port, select **Input friction scale factor**.

### TirePrs — Tire pressure

scalar

Tire pressure, in Pa.

### Dependencies

To enable this port:

- Set one of these parameters:
  - **Longitudinal Force** to Magic Formula pure longitudinal slip.
  - **Rolling Resistance** to Pressure and velocity or Magic Formula.
  - **Vertical Motion** to Mapped stiffness and damping.

- On the **Wheel Dynamics** pane, select **Input tire pressure**.

**Tamb – Ambient temperature**

scalar

Ambient temperature,  $T_{amb}$ , in K.

**Dependencies**

To enable this port:

- 1 Set **Rolling Resistance** to ISO 28580.
- 2 On the **Rolling Resistance** pane, select to **Input ambient temperature**.

**Output**

**Info – Bus signal**

bus

Bus signal containing these block calculations.

Signal	Description	Units
AxlTrq	Axle torque about body-fixed y-axis	N·m
Omega	Wheel angular velocity about body-fixed y-axis	rad/s
Omegadot	Wheel angular acceleration about body-fixed y-axis	rad/s <sup>2</sup>
Fx	Longitudinal vehicle force along body-fixed x-axis	N
Fz	Vertical vehicle force along body-fixed z-axis	N
Fzb	Tire normal force due to wheel damping along the wheel-fixed z-axis	N
Fzk	Tire normal force due to wheel stiffness along the wheel-fixed z-axis	N
My	Rolling resistance torque about body-fixed y-axis	N·m
Myb	Rolling resistance torque due to damping about body-fixed y-axis	N·m
Kappa	Slip ratio	NA
Vx	Vehicle longitudinal velocity along body-fixed x-axis	m/s
Re	Wheel effective radius along wheel-fixed z-axis	m

Signal		Description	Units	
BrkTrq		Brake torque about body-fixed y-axis	N·m	
BrkPrs		Brake pressure	Pa	
z		Wheel vertical deflection along wheel-fixed z-axis	m	
zdot		Wheel vertical velocity along wheel-fixed z-axis	m/s	
zddot		Wheel vertical acceleration along wheel-fixed z-axis	m/s <sup>2</sup>	
Gndz		Ground displacement along negative of wheel-fixed z-axis (positive input produces wheel lift)	m	
GndFz		Vertical wheel force on ground along negative of wheel-fixed z-axis	N	
TirePrs		Tire pressure	Pa	
Fpatch		Tractive power applied from the axle		
PwrInfo	PwrTrnsfrd	PwrRoad	External torque applied by the axle to the wheel	W
		PwrAxlTrq	Vertical force applied to the wheel by the vehicle or suspension	W
		PwrFz	Tractive power loss	W
	PwrNotTrnsfrd	PwrSlip	Rolling resistance power	W
		PwrMyRoll	Braking power	W
		PwrMyBrk	Rolling viscous damping loss	W
		PwrMyb	Vertical damping power	W
	PwrStored	PwrFzDamp	Rate of change of vertical kinetic energy	W
		PwrStoredzdot	Rate of change of rotational kinetic energy	W
		PwrStoredq	Rate of change of stored sidewall potential energy	W
		PwrStoredFsFzSprng	Rate of change of gravitational potential energy	W
		PwrStoredGrvty	Tractive power applied from the axle	W

**F<sub>x</sub> — Longitudinal axle force**  
scalar

Longitudinal force acting on axle, along body-fixed x-axis, in N. Positive force acts to move the vehicle forward.

**Omega – Wheel angular velocity**

scalar

Wheel angular velocity, about body-fixed y-axis, in rad/s.

**z – Wheel vertical deflection**

scalar

Wheel vertical deflection along wheel-fixed z-axis, in m.

**Dependencies**

To enable this port, set **Vertical Motion** to Mapped stiffness and damping.

**zdot – Wheel vertical velocity**

scalar

Wheel vertical velocity along wheel-fixed z-axis, in m/s.

**Dependencies**

To enable this port, set **Vertical Motion** to Mapped stiffness and damping.

**Parameters**

**Block Options**

**Longitudinal Force – Select type**

Magic Formula constant value (default) | Magic Formula pure longitudinal slip | Mapped force

The block models longitudinal force as a function of wheel slip relative to the road surface. To calculate the longitudinal force, specify one of these **Longitudinal Force** parameters.

Setting	Block Implementation
Magic Formula constant value	Magic Formula with constant coefficient for stiffness, shape, peak, and curvature.
Magic Formula pure longitudinal slip	Magic Formula with load-dependent coefficients that implement equations 4.E9 through 4.E18 in <i>Tire and Vehicle Dynamics</i> .
Mapped force	Lookup table that is a function of the normal force and wheel slip ratio.

**Dependencies**

<b>Selecting</b>	<b>Enables These Parameters</b>

### Rolling Resistance – Select type

None (default) | Pressure and velocity | ISO 28580 | Magic Formula | Mapped torque

To calculate the rolling resistance torque, specify one of these **Rolling Resistance** parameters.

Setting	Block Implementation
None	None
Pressure and velocity	Method in <i>Stepwise Coastdown Methodology for Measuring Tire Rolling Resistance</i> . The rolling resistance is a function of tire pressure, normal force, and velocity.
ISO 28580	Method specified in ISO 28580:2018, <i>Passenger car, truck and bus tyre rolling resistance measurement method – Single point test and correlation of measurement results</i> .
Magic Formula	Magic formula equations from 4.E70 in <i>Tire and Vehicle Dynamics</i> . The magic formula is an empirical equation based on fitting coefficients.
Mapped torque	Lookup table that is a function of the normal force and spin axis longitudinal velocity.

### Dependencies

Selecting	Parameters
Pressure and velocity	<b>Velocity independent force coefficient, aMy</b> <b>Linear velocity force component, bMy</b> <b>Quadratic velocity force component, cMy</b> <b>Tire pressure exponent, alphaMy</b> <b>Normal force exponent, betaMy</b>

Selecting	Parameters
ISO 28580	<b>Parasitic losses force, Fpl</b> <b>Rolling resistance constant, Cr</b> <b>Thermal correction factor, Kt</b> <b>Measured temperature, Tmeas</b> <b>Parasitic losses force, Fpl</b> <b>Ambient temperature, Tamb</b>
Magic Formula	<b>Rolling resistance torque coefficient, QSY</b> <b>Longitudinal force rolling resistance coefficient, QSY2</b> <b>Linear rotational speed rolling resistance coefficient, QSY3</b> <b>Quartic rotational speed rolling resistance coefficient, QSY4</b> <b>Camber squared rolling resistance torque, QSY5</b> <b>Load based camber squared rolling resistance torque, QSY6</b> <b>Normal load rolling resistance coefficient, QSY7</b> <b>Pressure load rolling resistance coefficient, QSY8</b> <b>Rolling resistance scaling factor, lam_My</b>

**Brake Type – Select type**

None | Disc | Drum | Mapped

There are four types of Longitudinal Wheel blocks. Each block implements a different brake type.

Block Name	Brake Type Setting	Brake Implementation
Longitudinal Wheel - No Brake	None	None
Longitudinal Wheel - Disc Brake	Disc	Brake that converts the brake cylinder pressure into a braking force.
Longitudinal Wheel - Drum Brake	Drum	Simplex drum brake that converts the applied force and brake geometry into a net braking torque.

Block Name	Brake Type Setting	Brake Implementation
Longitudinal Wheel - Mapped Brake	Mapped	Lookup table that is a function of the wheel speed and applied brake pressure.

**Vertical Motion – Select type**

None (default) | Mapped stiffness and damping

To calculate vertical motion, specify one of these **Vertical Motion** parameters.

Setting	Block Implementation
None	Block passes the applied chassis forces directly through to the rolling resistance and longitudinal force calculations.
Mapped stiffness and damping	Vertical motion depends on wheel stiffness and damping. Stiffness is a function of tire sidewall displacement and pressure. Damping is a function of tire sidewall velocity and pressure.

Selecting	Enables These Parameters	Creates These Output Ports
Mapped stiffness and damping	<b>Wheel and unsprung mass, m</b> <b>Initial deflection, z<sub>0</sub></b> <b>Initial velocity, z<sub>dot0</sub></b> <b>Gravitational acceleration, g</b> <b>Vertical deflection breakpoints, zFz</b> <b>Pressure breakpoints, pFz</b> <b>Force due to deflection, Fzz</b> <b>Vertical velocity breakpoints, zdotFz</b> <b>Force due to velocity, Fzzdot</b> <b>Ground displacement, Gndz</b> <b>Input ground displacement</b>	z zdot

**Longitudinal scaling factor, lam\_x – Friction scaling factor**

1 (default)

Longitudinal friction scaling factor, dimensionless.

**Dependencies**

To enable this parameter, clear **Input friction scale factor**.

**Input friction scale factor – Selection**

Off (default)

Create input port for longitudinal friction scaling factor.

### Dependencies

Selecting this parameter:

- Creates input port `lam_mux`.
- Disables parameter **Longitudinal scaling factor, lam\_x**.

### Wheel Dynamics

#### **Axle viscous damping coefficient, br – Damping**

0.001 (default) | scalar

Axle viscous damping coefficient, *br*, in N·m·s/rad.

#### **Wheel inertia, Iyy – Inertia**

0.8 (default) | scalar

Wheel inertia, in kg·m<sup>2</sup>.

#### **Wheel initial angular velocity, omegao – Wheel speed**

0 (default) | scalar

Initial angular velocity of wheel, along body-fixed y-axis, in rad/s.

#### **Relaxation length, Lrel – Relaxation length**

0.5 (default) | scalar

Wheel relaxation length, in m.

#### **Loaded radius, Re – Loaded radius**

0.3 (default) | scalar

Loaded wheel radius, *Re*, in m.

**Unloaded radius, UNLOADED\_RADIUS – Unloaded radius**

0.4 (default) | scalar

Unloaded wheel radius, in m.

**Dependencies**To create this parameter, set **Rolling Resistance** to Pressure and velocity or Magic Formula.**Nominal longitudinal speed, LONGVL – Speed**

16 (default) | scalar

Nominal longitudinal speed along body-fixed x-axis, in m/s.

**Dependencies**To enable this parameter, set **Longitudinal Force** to Magic Formula pure longitudinal slip.**Nominal camber angle, gamma – Camber**

0 (default) | scalar

Nominal camber angle, in rad.

**Dependencies**

To enable this parameter, set either:

- **Longitudinal Force** to Magic Formula pure longitudinal slip.
- **Rolling Resistance** to Magic Formula.

**Nominal pressure, NOMPRES – Pressure**

220000 (default) | scalar

Nominal pressure, in Pa.

**Dependencies**

To enable this parameter, set either:

- **Longitudinal Force** to Magic Formula pure longitudinal slip.
- **Rolling Resistance** to Magic Formula.

**Pressure, press – Pressure**

220000 (default) | scalar

Pressure, in Pa.

**Dependencies**

To enable this parameter:

- Set one of these:
  - **Longitudinal Force** to Magic Formula pure longitudinal slip.
  - **Rolling Resistance** to Pressure and velocity or Magic Formula.
  - **Vertical Motion** to Mapped stiffness and damping.
- On the **Wheel Dynamics** pane, clear **Input tire pressure**.

**Longitudinal**

**Magic Formula Constant Value**

**Pure longitudinal peak factor, Dx – Factor**

1 (default) | scalar

Pure longitudinal peak factor, dimensionless.

The coefficients are based on empirical tire data. These values are typical sets of constant Magic Formula coefficients for common road conditions.

Surface	B	C	D	E
Dry tarmac	10	1.9	1	0.97
Wet tarmac	12	2.3	0.82	1
Snow	5	2	0.3	1
Ice	4	2	0.1	1

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula constant value.

**Pure longitudinal shape factor, Cx – Factor**

1.65 (default) | scalar

Pure longitudinal shape factor, dimensionless.

The coefficients are based on empirical tire data. These values are typical sets of constant Magic Formula coefficients for common road conditions.

Surface	B	C	D	E
Dry tarmac	10	1.9	1	0.97
Wet tarmac	12	2.3	0.82	1
Snow	5	2	0.3	1
Ice	4	2	0.1	1

#### Dependencies

To create this parameter, select the **Longitudinal Force** parameter Magic Formula constant value.

#### Pure longitudinal stiffness factor, Bx – Factor

10 (default) | scalar

Pure longitudinal stiffness factor, dimensionless.

The coefficients are based on empirical tire data. These values are typical sets of constant Magic Formula coefficients for common road conditions.

Surface	B	C	D	E
Dry tarmac	10	1.9	1	0.97
Wet tarmac	12	2.3	0.82	1
Snow	5	2	0.3	1
Ice	4	2	0.1	1

#### Dependencies

To create this parameter, select the **Longitudinal Force** parameter Magic Formula constant value.

#### Pure longitudinal curvature factor, Ex – Factor

0.01 (default) | scalar

Pure longitudinal curvature factor, dimensionless.

The coefficients are based on empirical tire data. These values are typical sets of constant Magic Formula coefficients for common road conditions.

Surface	B	C	D	E
Dry tarmac	10	1.9	1	0.97
Wet tarmac	12	2.3	0.82	1
Snow	5	2	0.3	1
Ice	4	2	0.1	1

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula constant value.

**Magic Formula Pure Longitudinal Slip****Cfx shape factor, PCX1 – Factor**

1.6 (default) | scalar

Cfx shape factor, PCX1, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Longitudinal friction at nominal normal load, PDX1 – Factor**

1 (default) | scalar

Longitudinal friction at nominal normal load, PDX1, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Frictional variation with load, PDX2 – Factor**

-0.08 (default) | scalar

Frictional variation with load, PDX2, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Frictional variation with camber, PDX3 – Factor**

0 (default) | scalar

Frictional variation with camber, PDX3, 1/rad<sup>2</sup>.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Longitudinal curvature at nominal normal load, PEX1 – Factor**

0.112 (default) | scalar

Longitudinal curvature at nominal normal load, PEX1, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Variation of curvature factor with load, PEX2 – Factor**

0.313 (default) | scalar

Variation of curvature factor with load, PEX2, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Variation of curvature factor with square of load, PEX3 – Factor**

0 (default) | scalar

Variation of curvature factor with square of load, PEX3, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Longitudinal curvature factor with slip, PEX4 – Factor**

0.0016 (default) | scalar

Longitudinal curvature factor with slip, PEX4, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Longitudinal slip stiffness at nominal normal load, PKX1 – Factor**

21.7 (default) | scalar

Longitudinal slip stiffness at nominal normal load, PKX1, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Variation of slip stiffness with load, PKX2 – Factor**

13.77 (default) | scalar

Variation of slip stiffness with load, PKX2, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Slip stiffness exponent factor, PKX3 – Factor**

-0.412 (default) | scalar

Slip stiffness exponent factor, PKX3, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Horizontal shift in slip ratio at nominal normal load, PHX1 – Factor**

2.1585E-4 (default) | scalar

Horizontal shift in slip ratio at nominal normal load, PHX1, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Variation of horizontal slip ratio with load, PHX2 – Factor**

0.00115 (default) | scalar

Variation of horizontal slip ratio with load, PHX2, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Vertical shift in load at nominal normal load, PVX1 – Factor**

1.5973E-5 (default) | scalar

Vertical shift in load at nominal normal load, PVX1, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Variation of vertical shift with load, PVX2 – Factor**

1.043E-4 (default) | scalar

Variation of vertical shift with load, PVX2, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Linear variation of longitudinal slip stiffness with tire pressure, PPX1 – Factor**

-0.3489 (default) | scalar

Linear variation of longitudinal slip stiffness with tire pressure, PPX1, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Quadratic variation of longitudinal slip stiffness with tire pressure, PPX2 – Factor**

0.382 (default) | scalar

Quadratic variation of longitudinal slip stiffness with tire pressure, PPX2, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Linear variation of peak longitudinal friction with tire pressure, PPX3 – Factor**

-0.09634 (default) | scalar

Linear variation of peak longitudinal friction with tire pressure, PPX3, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Quadratic variation of peak longitudinal friction with tire pressure, PPX4 – Factor**

0.06447 (default) | scalar

Quadratic variation of peak longitudinal friction with tire pressure, PPX4, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Slip speed decay function scaling factor, lam\_muV – Factor**

1 (default) | scalar

Slip speed decay function scaling factor, lam\_muV, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Brake slip stiffness scaling factor, lam\_Kxkappa – Factor**

1 (default) | scalar

Brake slip stiffness scaling factor, lam\_Kxkappa, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Longitudinal shape scaling factor, lam\_Cx – Factor**

1 (default) | scalar

Longitudinal shape scaling factor, lam\_Cx, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Longitudinal curvature scaling factor, lam\_Ex — Factor**

0 (default) | scalar

Longitudinal curvature scaling factor, lam\_Ex, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Longitudinal horizontal shift scaling factor, lam\_Hx — Factor**

1 (default) | scalar

Longitudinal horizontal shift scaling factor, lam\_Hx, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Longitudinal vertical shift scaling factor, lam\_Vx — Factor**

1 (default) | scalar

Longitudinal vertical shift scaling factor, lam\_Vx, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Mapped Force**

**Slip ratio breakpoints, kappaFx — Breakpoints**

vector

Slip ratio breakpoints, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Mapped force.

**Normal force breakpoints, FzFx — Breakpoints**

vector

Normal force breakpoints, N.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Mapped force.

**Longitudinal force map, FxMap — Lookup table**

array

Longitudinal force versus slip ratio and normal force, N.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Mapped force.

**Rolling Resistance****Pressure and Velocity****Velocity independent force coefficient, aMy – Force coefficient**

8e-4 (default) | scalar

Velocity-independent force coefficient,  $a$ , in s/m.**Dependencies**To create this parameter, select the **Rolling Resistance** parameter Pressure and velocity.**Linear velocity force component, bMy – Force component**

.001 (default) | scalar

Linear velocity force component,  $b$ , in s/m.**Dependencies**To create this parameter, select the **Rolling Resistance** parameter Pressure and velocity.**Quadratic velocity force component, cMy – Force component**

1.6e-4 (default) | scalar

Quadratic velocity force component,  $c$ , in s<sup>2</sup>/m<sup>2</sup>.**Dependencies**To create this parameter, select the **Rolling Resistance** parameter Pressure and velocity.**Tire pressure exponent, alphaMy – Pressure exponent**

-0.003 (default) | scalar

Tire pressure exponent,  $\alpha$ , dimensionless.**Dependencies**To create this parameter, select the **Rolling Resistance** parameter Pressure and velocity.**Normal force exponent, betaMy – Force exponent**

0.97 (default) | scalar

Normal force exponent,  $\beta$ , dimensionless.**Dependencies**To create this parameter, select the **Rolling Resistance** parameter Pressure and velocity.**ISO 28580****Parasitic losses force, Fpl – Force loss**

10 (default) | scalar

Parasitic force loss,  $F_{pl}$ , in N.**Dependencies**To create this parameter, select the **Rolling Resistance** parameter ISO 28580.

**Rolling resistance constant, Cr – Constant**

1e-3 (default) | scalar

Rolling resistance constant,  $C_r$ , in N/kN. ISO 28580 specifies the rolling resistance unit as one newton of tractive resistance for every kilonewtons of normal load.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter ISO 28580.

**Thermal correction factor, Kt – Correction factor**

.008 (default) | scalar

Thermal correction factor,  $K_t$ , in 1/degC.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter ISO 28580.

**Measured temperature, Tmeas – Temperature**

298.15 (default) | scalar

Measured temperature,  $T_{meas}$ , in K.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter ISO 28580.

**Ambient temperature, Tamb – Temperature**

298.15 (default) | scalar

Measured temperature,  $T_{amb}$ , in K.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter ISO 28580.

**Input ambient temperature – Selection**

off (default) | on

Select to create input port Tamb.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter ISO 28580.

**Magic Formula****Rolling resistance torque coefficient, QSY1 – Torque coefficient**

0.007 (default) | scalar

Rolling resistance torque coefficient, dimensionless.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Magic Formula.

**Longitudinal force rolling resistance coefficient, QSY2 – Force resistance coefficient**

0 (default) | scalar

Longitudinal force rolling resistance coefficient, dimensionless.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Magic Formula.

**Linear rotational speed rolling resistance coefficient, QSY3 – Linear speed coefficient**

0.0015 (default) | scalar

Linear rotational speed rolling resistance coefficient, dimensionless.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Magic Formula.

**Quartic rotational speed rolling resistance coefficient, QSY4 – Quartic speed coefficient**

8.5e-05 (default) | scalar

Quartic rotational speed rolling resistance coefficient, dimensionless.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Magic Formula.

**Camber squared rolling resistance torque, QSY5 – Camber resistance torque**

0 (default) | scalar

Camber squared rolling resistance torque, in  $1/\text{rad}^2$ .

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Magic Formula.

**Load based camber squared rolling resistance torque, QSY6 – Load resistance torque**

0 (default) | scalar

Load based camber squared rolling resistance torque, in  $1/\text{rad}^2$ .

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Magic Formula.

**Normal load rolling resistance coefficient, QSY7 – Normal resistance coefficient**

0.9 (default) | scalar

Normal load rolling resistance coefficient, dimensionless.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Magic Formula.

**Pressure load rolling resistance coefficient, QSY8 – Pressure resistance coefficient**

-0.4 (default) | scalar

Pressure load rolling resistance coefficient, dimensionless.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Magic Formula.

**Rolling resistance scaling factor, lam\_My – Scale**

1 (default) | scalar

Rolling resistance scaling factor, dimensionless.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Magic Formula.

**Mapped****Spin axis velocity breakpoints, VxMy – Breakpoints**

-20:1:20 (default) | vector

Spin axis velocity breakpoints, in m/s.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Mapped torque.

**Normal force breakpoints, FzMy – Breakpoints**

0:200:1e4 (default) | vector

Normal force breakpoints, in N.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Mapped torque.

**Rolling resistance torque map, MyMap – Lookup table**

array

Rolling resistance torque versus axle speed and normal force, in N·m.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Mapped torque.

**Brake****Static friction coefficient, mu\_static – Static friction**

.3 (default) | scalar

Static friction coefficient, dimensionless.

**Dependencies**

To enable this parameter, for the **Brake Type** parameter, specify one of these types:

- Disc
- Drum
- Mapped

**Kinetic friction coefficient, `mu_kinetic` — Kinetic friction**

.2 (default) | scalar

Kinematic friction coefficient, dimensionless.

**Dependencies**

To enable this parameter, for the **Brake Type** parameter, specify one of these types:

- Disc
- Drum
- Mapped

**Disc**

**Disc brake actuator bore, `disc_abore` — Bore distance**

.05 (default) | scalar

Disc brake actuator bore, in m.

**Dependencies**

To enable the disc brake parameters, select Disc for the **Brake Type** parameter.

**Brake pad mean radius, `Rm` — Radius**

.177 (default) | scalar

Brake pad mean radius, in m.

**Dependencies**

To enable the disc brake parameters, select Disc for the **Brake Type** parameter.

**Number of brake pads, `num_pads` — Count**

2 (default) | scalar

Number of brake pads.

**Dependencies**

To enable the disc brake parameters, select Disc for the **Brake Type** parameter.

**Drum**

**Drum brake actuator bore, `disc_abore` — Bore distance**

0.0508 (default) | scalar

Drum brake actuator bore, in m.

**Dependencies**

To enable the drum brake parameters, select Drum for the **Brake Type** parameter.

**Shoe pin to drum center distance, drum\_a – Distance**

0.123 (default) | scalar

Shoe pin to drum center distance, in m.

**Dependencies**To enable the drum brake parameters, select Drum for the **Brake Type** parameter.**Shoe pin center to force application point distance, drum\_c – Distance**

0.212 (default) | scalar

Shoe pin center to force application point distance, in m.

**Dependencies**To enable the drum brake parameters, select Drum for the **Brake Type** parameter.**Drum internal radius, drum\_r – Radius**

0.15 (default) | scalar

Drum internal radius, in m.

**Dependencies**To enable the drum brake parameters, select Drum for the **Brake Type** parameter.**Shoe pin to pad start angle, drum\_theta1 – Angle**

0 (default) | scalar

Shoe pin to pad start angle, in deg.

**Dependencies**To enable the drum brake parameters, select Drum for the **Brake Type** parameter.**Shoe pin to pad end angle, drum\_theta2 – Angle**

126 (default) | scalar

Shoe pin to pad end angle, in deg.

**Dependencies**To enable the drum brake parameters, select Drum for the **Brake Type** parameter.**Mapped****Brake actuator pressure breakpoints, brake\_p\_bpt – Breakpoints**

vector

Brake actuator pressure breakpoints, in bar.

**Dependencies**To enable the mapped brake parameters, select Mapped for the **Brake Type** parameter.**Wheel speed breakpoints, brake\_n\_bpt – Breakpoints**

vector

Wheel speed breakpoints, in rpm.

### Dependencies

To enable the mapped brake parameters, select Mapped for the **Brake Type** parameter.

### Brake torque map, $f_{brake\_t}$ – Lookup table

array

The lookup table for the brake torque,  $f_{brake}(P, N)$ , is a function of applied brake pressure and wheel speed, where:

- $T$  is brake torque, in N·m.
- $P$  is applied brake pressure, in bar.
- $N$  is wheel speed, in rpm.

### Dependencies

To enable the mapped brake parameters, select Mapped for the **Brake Type** parameter.

### Vertical

#### Nominal normal force, $FNOMIN$ – Force

2000 (default) | scalar

Nominal rated wheel load along wheel-fixed z-axis, in N.

### Dependencies

To enable this parameter, set either:

- **Longitudinal Force** to Magic Formula pure longitudinal slip.
- **Rolling Resistance** to Magic Formula.

#### Nominal rated load scaling factor, $\lambda_{m\_Fz0}$ – Factor

1 (default) | scalar

Nominal rated load scaling factor, dimensionless. Used to scale the normal for specific applications and load conditions.

### Dependencies

To enable this parameter, set **Longitudinal Force** to Magic Formula pure longitudinal slip.

**Wheel and unsprung mass,  $m$  – Mass**

10 (default) | scalar

Wheel and unsprung mass, in kg. Used in the vertical motion calculations.

**Dependencies**

To enable this parameter, set **Vertical Motion** to Mapped stiffness and damping.

**Initial deflection,  $z_0$  – Deflection**

0 (default) | scalar

Initial axle displacement along wheel-fixed z-axis, in m.

**Dependencies**

To enable this parameter, set **Vertical Motion** to Mapped stiffness and damping.

**Initial velocity,  $\dot{z}_0$  – Velocity**

0 (default) | scalar

Initial axle velocity along wheel-fixed z-axis, in m.

**Dependencies**

To enable this parameter, set **Vertical Motion** to Mapped stiffness and damping.

**Gravitational acceleration,  $g$  – Gravity**

9.81 (default) | scalar

Gravitational acceleration, in  $m/s^2$ .

**Dependencies**

To enable this parameter, set **Vertical Motion** to Mapped stiffness and damping.

**Ground displacement,  $Gndz$  – Displacement**

0 (default) | scalar

Ground displacement,  $Gndz$ , along negative wheel-fixed z-axis, in m.

**Dependencies**

To enable this parameter, set **Vertical Motion** to Mapped stiffness and damping.

**Mapped Stiffness and Damping**

**Vertical deflection breakpoints, zFz – Breakpoints**

[0 .01 .1] (default) | vector

Vector of sidewall deflection breakpoints corresponding to the force table, in m.

**Dependencies**

To enable this parameter, set **Vertical Motion** to Mapped stiffness and damping.

**Pressure breakpoints, pFz – Breakpoints**

[10000 1000000] (default) | vector

Vector of pressure data points corresponding to the force table, in Pa.

**Dependencies**

To enable this parameter, set **Vertical Motion** to Mapped stiffness and damping.

**Force due to deflection, Fzz – Force**

[0 1e3 1e4; 0 1e4 1e5] (default) | vector

Force due to sidewall deflection and pressure along wheel-fixed z-axis, in N.

**Dependencies**

To enable this parameter, set **Vertical Motion** to Mapped stiffness and damping.

**Vertical velocity breakpoints, zdotFz – Breakpoints**

[-20 0 20] (default) | scalar

Vector of sidewall velocity breakpoints corresponding to the force due to velocity table, in m.

**Dependencies**

To enable this parameter, set **Vertical Motion** to Mapped stiffness and damping.

**Force due to velocity, Fzzdot – Force**

[500 0 -500;250 0 -250] (default) | array

Force due to sidewall velocity and pressure along wheel-fixed z-axis, in N.

**Dependencies**

To enable this parameter, set **Vertical Motion** to Mapped stiffness and damping.

**Simulation Setup****Minimum normal force, FZMIN – Force**

0 (default) | scalar

Minimum normal force, in N. Used with all vertical force calculations.

**Maximum normal force, FZMAX – Force**

10000 (default) | scalar

Maximum normal force, in N. Used with all vertical force calculations.

**Max allowable slip ratio (absolute), kappamax – Ratio**

1.5 (default) | scalar

Maximum allowable absolute slip ratio, dimensionless.

**Velocity tolerance used to handle low velocity situations, VXL0W – Tolerance**

1 (default) | scalar

Velocity tolerance used to handle low-velocity situations, in m/s.

**Minimum ambient temperature, TMIN – Tmin**

0 (default) | scalar

Minimum ambient temperature,  $T_{MIN}$ , in K.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter ISO 28580.

**Maximum ambient temperature, TMAX – Tmax**

400 (default) | scalar

Maximum ambient temperature,  $T_{MAX}$ , in K.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter ISO 28580.

## Planetary Gear

Ideal planetary gear with sun, ring, and carrier

**Library:** Powertrain Blockset / Drivetrain / Couplings

### Description

The Planetary Gear block implements an ideal planetary gear coupling consisting of a rigidly coupled sun, ring, and carrier gears. The block calculates the dynamic response to the sun, carrier, and ring input torques.

In fuel economy and powertrain studies, you can use the Planetary Gear block as a power-split device by coupling it to common driveline elements such as transmissions, engines, clutches, and differentials.

These equations of motion represent the dynamic response of the planetary gear.

$$\dot{\omega}_s J_s = \dot{\omega}_s b_s + T_s + T_{ps}$$

$$\dot{\omega}_c J_c = \dot{\omega}_c b_c + T_c + T_{pc}$$

$$\dot{\omega}_r J_r = \dot{\omega}_r b_r + T_r + T_{pr}$$

$$\dot{\omega}_p J_p = \dot{\omega}_p b_p + T_{rp} + T_{sp} + T_{cp}$$

To reduce the equations of motion, the block uses these kinematic and geometric constraints.

$$\omega_c r_c = r_s \omega_s + r_p \omega_p$$

$$\omega_r r_r = r_c \omega_c + r_p \omega_p$$

$$r_c = r_s + r_p$$

$$r_r = r_c + r_p$$

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Equations
PwrInfo	PwrTrnsfrd — Power transferred between blocks	PwrSun	Sun gear applied power $\omega_s T_s$
	<ul style="list-style-type: none"> <li>• Positive signals indicate flow into block</li> <li>• Negative signals indicate flow out of block</li> </ul>	PwrCarr	Carrier gear applied power $\omega_c T_c$
		PwrRing	Ring gear applied power $\omega_r T_r$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred	PwrDampLoss	Mechanical damping loss $-(b_s \omega_s^2 + b_c \omega_c^2 + b_r \omega_r^2 + b_p \omega_p^2)$
PwrStored — Stored energy rate of change	PwrStoredPlntry	Rate change in rotational kinetic energy $\dot{\omega}_s \omega_s J_s + \dot{\omega}_c \omega_c J_c + \dot{\omega}_r \omega_r J_r + \dot{\omega}_p \omega_p J_p$	
<ul style="list-style-type: none"> <li>• Positive signals indicate an increase</li> <li>• Negative signals indicate a decrease</li> </ul>			

The equations use these variables.

$\omega_c, \omega_p, \omega_r, \omega_s$	Carrier, planet, ring, and sun gear angular speed
$r_c, r_p, r_r, r_s$	Carrier, planet, ring, and sun gear angular radius
$J_c, J_p, J_r, J_s$	Carrier, planet, ring, and sun gear inertia
$b_c, b_p, b_r, b_s$	Carrier, planet, ring, and sun gear damping
$T_c, T_p, T_r, T_s$	Applied carrier, planet, ring, and sun gear torque

$T_{ps}$	Torque applied from planet gear on sun gear
$T_{pc}$	Torque applied from planet gear on carrier gear
$T_{pr}$	Torque applied from planet gear on ring gear
$T_{rp}$	Torque applied from ring gear on planet gear
$T_{sp}$	Torque applied from sun gear on planet gear
$T_{cp}$	Torque applied from carrier gear on planet gear

**Parameters****Block Options****Port Configuration – Specify configuration**

Simulink (default) | Two-way connection

Specify the port configuration.

**Dependencies**

Specifying Simulink creates these ports:

- SunTrq
- CarrTrq
- RingTrq
- SunSpd
- CarrSpd
- RingSpd

Specifying Two-way connection creates these ports:

- C
- S
- R

**Sun to planet ratio, Nsp – Ratio**

30/23 (default) | scalar

Sun-to-planet gear ratio, dimensionless.

**Sun to ring ratio, Nsr – Ratio**

30/78 (default) | scalar

Sun-to-ring gear ratio, dimensionless.

**Sun inertia, Js – Inertia**

.003 (default) | scalar

Sun gear inertia,  $J_s$ , in kg·m<sup>2</sup>.

**Planet inertia, Jp – Inertia**

.001 (default) | scalar

Planet gear inertia,  $J_p$ , in kg·m<sup>2</sup>.

**Ring inertia, Jr – Inertia**

.01 (default) | scalar

Ring gear inertia,  $J_r$ , in  $\text{kg}\cdot\text{m}^2$ .

**Carrier inertia,  $J_c$  – Inertia**

.002 (default) | scalar

Carrier gear inertia,  $J_c$ , in  $\text{kg}\cdot\text{m}^2$ .

**Sun viscous damping,  $b_s$  – Damping**

.001 (default) | scalar

Sun gear viscous damping,  $b_s$ ,  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

**Ring viscous damping,  $b_r$  – Damping**

.001 (default) | scalar

Ring gear viscous damping,  $b_r$ ,  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

**Planet viscous damping,  $b_p$  – Damping**

.001 (default) | scalar

Planet gear viscous damping,  $b_p$ ,  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

**Carrier viscous damping,  $b_c$  – Damping**

.001 (default) | scalar

Carrier gear viscous damping,  $b_c$ ,  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

**Initial sun velocity,  $ws_o$  – Angular speed**

0 (default) | scalar

Initial sun gear angular speed, in  $\text{rad}/\text{s}$ .

**Initial carrier velocity,  $wc_o$  – Angular speed**

0 (default) | scalar

Initial carrier gear angular speed, in  $\text{rad}/\text{s}$ .

# Gearbox

Ideal rotational gearbox

**Library:** Powertrain Blockset / Drivetrain / Couplings

## Description

The Gearbox block implements an ideal rotational gearbox. The block uses the gear inertias and damping to calculate the velocity response to the base and follower gear pair input torques.

In fuel economy and powertrain efficiency studies, you can use the Gearbox block to model ideal gear coupling and the power transfer between common driveline elements such as transmissions, engines, clutches, and differentials.

The Gearbox block uses these equations to approximate the transmission dynamics.

$$\dot{\omega}_B J_B = \omega_B b_B + \eta N T_F$$

$$\dot{\omega}_F J_F = \omega_F b_F + \eta T_B$$

This constraint equation reduces the system to a one DOF system.

$$\omega_B = N \omega_F$$

To express the ideal torque transfer, the block uses this relationship.

$$\eta N T_B + T_F = 0$$

## Efficiency

To account for the block efficiency, use the **Efficiency factors** parameter. This table summarizes the block implementation for each setting.

Setting	Implementation
Constant	Constant efficiency that you can set with the <b>Constant efficiency factor, eta</b> parameter.

Setting	Implementation
Driveshaft torque, temperature and speed	<p>Efficiency as a function of base gear input torque, air temperature, and driveshaft speed. Use these parameters to specify the lookup table and breakpoints:</p> <ul style="list-style-type: none"> <li>• <b>Efficiency lookup table, eta_tbl</b></li> <li>• <b>Efficiency torque breakpoints, Trq_bpts</b></li> <li>• <b>Efficiency speed breakpoints, omega_bpts</b></li> <li>• <b>Efficiency temperature breakpoints, Temp_bpts</b></li> </ul> <p>For the air temperature, you can either:</p> <ul style="list-style-type: none"> <li>• Select <b>Input temperature</b> to create an input port.</li> <li>• Set a <b>Ambient temperature, Tamb</b> parameter value.</li> </ul> <p>To select the interpolation method, use the <b>Interpolation method</b> parameter. For more information, see “Interpolation Methods”.</p>

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Variable	Equations	
PwrInfo	PwrTrnsfrd — Power transferred between blocks	PwrBase	Mechanical power from base shaft	$P_{Base}$	$P_{Base} = \eta T_B \omega_B$
	<ul style="list-style-type: none"> <li>• Positive signals indicate flow into block</li> <li>• Negative signals indicate flow out of block</li> </ul>	PwrFlwr	Mechanical power from follower shaft	$P_{Flwr}$	$P_{Flwr} = \eta T_F \omega_F$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred	PwrMechLoss	Total power loss	$P_{ng}$	$P_{ng} = - (P_t + P_d) + P_s$
	<ul style="list-style-type: none"> <li>• Positive signals indicate an input</li> <li>• Negative signals indicate a loss</li> </ul>	PwrDampLoss	Power loss due to damping	$P_d$	$P_d = - (b_F  \omega_F ^2 + b_B  \omega_B ^2)$
PwrStored — Stored energy rate of change	PwrStoredShft	Rate change of stored internal kinetic energy	$P_s$	$P_s = (\omega_B \dot{\omega}_B J_B + \omega_F \dot{\omega}_F J_F)$	
<ul style="list-style-type: none"> <li>• Positive signals indicate an increase</li> <li>• Negative signals indicate a decrease</li> </ul>					

The equations use these variables.

$T_B$	Base gear input torque
$T_F$	Follower gear output torque
$\omega_B$	Base gear angular velocity
$\omega_F$	Follower gear angular velocity
$J_B$	Base gear rotational inertia
$J_F$	Follower gear rotational inertia
$b_B$	Base gear rotational viscous damping
$b_F$	Follower gear rotational viscous damping
$N$	Torque transmission gear ratio
$\eta$	Gear efficiency
$P_t$	Total power
$P_d$	Power loss due to damping
$P_s$	Rate change of stored internal kinetic energy

## Ports

### Input

#### **BTrq — Base gear input torque**

scalar

Base gear input torque,  $T_B$ , in N·m.

#### **Dependencies**

To create this port, for **Port Configuration**, select Simulink.

#### **FTrq — Follower gear output torque**

scalar

Follower gear output torque,  $T_F$ , in N·m.

#### **Dependencies**

To create this port, for **Port Configuration**, select Simulink.

#### **B — Base gear angular velocity and torque**

two-way connector port

Base gear angular velocity,  $\omega_B$ , in rad/s. Base gear torque,  $T_B$ , in N·m.

#### **Dependencies**

To create this port, for **Port Configuration**, select Two-way connection.

#### **AirTemp — Ambient air temperature**

scalar

Ambient air temperature,  $T_{air}$ , in K.

**Dependencies**

To enable this port:

- Set **Efficiency factors** to Driveshaft torque, speed and temperature.
- Select **Input ambient temperature**.

**Output****Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal			Description	Variable	Units
Base	BaseTrq		Base gear input torque	$T_B$	N·m
	BaseSpd		Base gear angular velocity	$\omega_B$	rad/s
Flwr	FlwrTrq		Follower gear torque	$T_F$	N·m
	FlwrSpd		Follower gear angular velocity	$\omega_F$	rad/s
PwrInfo	PwrTrnsfrd	PwrBase	Mechanical power from base shaft	$P_{Base}$	W
		PwrFlwr	Mechanical power from follower shaft	$P_{Flwr}$	W
	PwrNotTrnsfrd	PwrMechLoss	Total gear power loss	$P_{ng}$	W
		PwrDampLoss	Power loss due to damping	$P_d$	W
	PwrStored	PwrStoredShft	Rate change of stored internal kinetic energy	$P_s$	W

**BSpd — Input gear angular velocity**

scalar

Base gear angular velocity,  $\omega_B$ , in rad/s.

**Dependencies**

To create this port, for **Port Configuration**, select Simulink.

**FSpd — Output gear angular velocity**

scalar

Follower gear angular velocity,  $\omega_F$ , in rad/s.

**Dependencies**

To create this port, for **Port Configuration**, select Simulink.

**F – Output gear angular velocity and torque**

two-way connector port

Follower gear angular velocity,  $\omega_F$ , in rad/s. Follower gear torque,  $T_F$ , in N·m.

**Dependencies**

To create this port, for **Port Configuration**, select Two-way connection.

**Parameters**

**Block Options**

**Port Configuration – Specify configuration**

Simulink (default) | Two-way connection

Specify the port configuration.

**Dependencies**

Specifying Simulink creates these ports:

- BSpd
- FSpd
- BTrq
- FTrq

Specifying Two-way connection creates these ports:

- B
- F

**Efficiency factors – Specify configuration**

Constant (default) | Driveshaft torque, speed and temperature

To account for the block efficiency, use the **Efficiency factors** parameter. This table summarizes the block implementation for each setting.

Setting	Implementation
Constant	Constant efficiency that you can set with the <b>Constant efficiency factor, eta</b> parameter.

Setting	Implementation
Driveshaft torque, temperature and speed	<p>Efficiency as a function of base gear input torque, air temperature, and driveshaft speed. Use these parameters to specify the lookup table and breakpoints:</p> <ul style="list-style-type: none"> <li>• <b>Efficiency lookup table, eta_tbl</b></li> <li>• <b>Efficiency torque breakpoints, Trq_bpts</b></li> <li>• <b>Efficiency speed breakpoints, omega_bpts</b></li> <li>• <b>Efficiency temperature breakpoints, Temp_bpts</b></li> </ul> <p>For the air temperature, you can either:</p> <ul style="list-style-type: none"> <li>• Select <b>Input temperature</b> to create an input port.</li> <li>• Set a <b>Ambient temperature, Tamb</b> parameter value.</li> </ul> <p>To select the interpolation method, use the <b>Interpolation method</b> parameter. For more information, see “Interpolation Methods”.</p>

#### Interpolation method – Method

Flat | Nearest | Linear point-slope | Linear Lagrange | Cubic spline

For more information, see “Interpolation Methods”.

#### Dependencies

To enable this parameter, set **Efficiency factors** to Driveshaft torque, speed and temperature.

#### Output shaft rotates in same direction as input – Rotation

off (default) | on

Select to specify that the output shaft rotates in the same direction as the input.

#### Input ambient temperature – Create input port

off (default) | on

Select to create input port AirTemp for the ambient air temperature.

#### Dependencies

To enable this parameter, set **Efficiency factors** to Driveshaft torque, speed and temperature.

#### Input to output gear ratio, N – Ratio

2 (default) | scalar

Base-to-follower gear ratio, dimensionless.

#### Input shaft inertia, J1 – Inertia

.01 (default) | scalar

Base shaft inertia, in  $\text{kg}\cdot\text{m}^2$ .

#### Output shaft inertia, J2 – Inertia

.01 (default) | scalar

Follower shaft inertia, in  $\text{kg}\cdot\text{m}^2$ .

**Input shaft damping, b1 – Damping**

.001 (default) | scalar

Base viscous shaft damping, in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

**Output shaft damping, b2 – Damping**

.001 (default) | scalar

Follower viscous shaft damping, in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

**Input shaft initial velocity, w1\_o – Initial velocity**

0 (default) | scalar

Base shaft initial velocity, in  $\text{rad}/\text{s}$ .

**Efficiency****Constant efficiency factor, eta – Efficiency**

1 (default) | scalar

Constant efficiency,  $\eta$ .

**Dependencies**

To enable this parameter, set **Efficiency factors** to Constant.

**Efficiency lookup table, eta\_tbl – Lookup table**

M-by-N-by-L array

Dimensionless array of values for efficiency as a function of:

- M input torques
- N input speed
- L air temperatures

Each value specifies the efficiency for a specific combination of torque, speed, and temperature. The array size must match the dimensions defined by the torque, speed, and temperature breakpoint vectors.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Driveshaft torque, speed and temperature.

**Efficiency torque breakpoints, Trq\_bpts – Torque breakpoints**

[25, 50, 75, 100, 150, 200, 250] (default) | 1-by-M vector

Vector of input torque, breakpoints for efficiency, in  $\text{N}\cdot\text{m}$ .

**Dependencies**

To enable this parameter, set **Efficiency factors** to Driveshaft torque, speed and temperature.

**Efficiency speed breakpoints, omega\_bpts — Speed breakpoints**

[52.4 78.5 105 131 157 183 209 262 314 419 524] (default) | 1-by-N vector

Vector of speed, breakpoints for efficiency, in rad/s.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Driveshaft torque, speed and temperature.

**Efficiency temperature breakpoints, Temp\_bpts — Temperature breakpoints**

[290 358] (default) | 1-by-L vector

Vector of ambient temperature breakpoints for efficiency, in K.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Driveshaft torque, speed and temperature.

**Air temperature, Tair — Ambient air temperature**

297.15 (default) | scalar

Ambient air temperature,  $T_{air}$ , in K.

**Dependencies**

To enable this parameter:

- Set **Efficiency factors** to Driveshaft torque, speed and temperature.
- Clear **Input ambient temperature**.

**Extended Capabilities****C/C++ Code Generation**

**Introduced in R2017a**

# Disc Clutch

Idealized disc clutch coupler

**Library:** Powertrain Blockset / Drivetrain / Couplings

## Description

The Disc Clutch block implements an idealized disc clutch coupler. The block couples the rotary input and output shafts through an idealized friction model. To determine the output torque, the block uses friction parameters, relative slip velocity, and applied input pressure.

In fuel economy and powertrain efficiency studies, you can use the Disc Clutch block to model the mechanical power transfer between common driveline elements such as transmissions, engines, and differentials.

To approximate the torque response, the Disc Clutch block implements friction and dynamic models that depend on the clutch lockup condition. The block determines the locked or unlocked condition based on an idealized dry clutch friction model. This table summarizes the logic the block uses to determine the clutch condition.

Clutch Condition	When
Unlocked	$\omega_i \neq \omega_o$ or $T_{fmax} < \left  \frac{J_o T_i - (J_o b_i - J_i b_o) \omega_{i/o}}{J_o + J_i} \right $
Locked	$\omega_i = \omega_o$ and $T_{fmax} < \left  T_i - \frac{J_i (b_i + b_o) \omega_i}{J_o + J_i} + b_o \omega_i \right $

This table summarizes the friction and dynamic models that the block uses for locked or unlocked clutch conditions.

Clutch Condition	Friction Model	Dynamic Model
Unlocked	$T_{fmax} = T_k$ where, $T_k = N_{disc} P_c A_{eff} R_{eff} \mu_k \tanh[4(\omega_i - \omega_o)]$ $R_{eff} = \frac{2(R_o^3 - R_i^3)}{3(R_o^2 - R_i^2)}$ and $P_c = \max(P_c - P_{eng}, 0)$	$\dot{\omega}_i J_i = T_i - T_f - \omega_i b_i$ $\dot{\omega}_o J_o = T_f + T_o - \omega_o b_o$
Locked	$T_{fmax} = T_s$ where, $T_s = N_{disc} P_c A_{eff} R_{eff} \mu_s$ $R_{eff} = \frac{2(R_o^3 - R_i^3)}{3(R_o^2 - R_i^2)}$	$\dot{\omega}_i (J_o + J_i) = T_o - \omega_i (b_i + b_o) + T_i$ $\omega_i = \omega_o$

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal	Description	Equations
PwrInfo	PwrTrnsfrd — Power transferred between blocks	PwrBase Applied base power $\omega_i T_i$ PwrFlwr Applied follower output power $\omega_o T_o$
	<ul style="list-style-type: none"> <li>Positive signals indicate flow into block</li> <li>Negative signals indicate flow out of block</li> </ul>	
PwrNotTrnsfrd — Power crossing the block boundary, but not transferred	PwrDampLoss Damping power loss	$-b_o \omega_o^2 - b_i \omega_i^2$
	PwrClutchSlipLoss Clutch slip power loss	$-T_k (\omega_i - \omega_o)$
PwrStored — Stored energy rate of change	PwrStoredBase Rate change in base rotational kinetic energy	$\dot{\omega}_i \omega_i J_i$
	PwrStoredFlwr Rate change in follower rotational kinetic energy	$\dot{\omega}_o \omega_o J_o$
<ul style="list-style-type: none"> <li>Positive signals indicate an increase</li> <li>Negative signals indicate a decrease</li> </ul>		

The equations use these variables.

$\omega_i$	Input shaft angular speed
$\omega_o$	Output shaft angular speed

$b_i$	Input shaft viscous damping
$b_o$	Output shaft viscous damping
$J_i$	Input shaft moment of inertia
$J_o$	Output shaft moment of inertia
$T_f$	Frictional torque
$T_i$	Net input torque
$T_k$	Kinetic frictional torque
$T_o$	Net output torque
$T_s$	Static frictional torque
$T_{fmax}$	Maximum frictional torque before slipping
$P_c$	Applied clutch pressure
$P_{eng}$	Engagement pressure
$A_{eff}$	Effective area
$N_{disc}$	Number of frictional discs
$R_{eff}$	Effective clutch radius
$R_o$	Annular disk outer radius
$R_i$	Annular disk inner radius
$R_e$	Effective tire radius while under load and for a given pressure
$\mu_s$	Coefficient of static friction
$\mu_k$	Coefficient of kinetic friction

**Dependencies**

To create this port, for **Port Configuration**, select Simulink.

**FSpd — Angular speed**

scalar

Drive shaft angular speed output,  $\omega_o$ , in rad/s.

**Dependencies**

To create this port, for **Port Configuration**, select Simulink.

**F — Output velocity and torque**

two-way connector port

Output drive shaft angular speed,  $\omega_{oi}$ , in rad/s. Output drive shaft torque,  $T_o$ , in N·m.

**Dependencies**

To create this port, for **Port Configuration**, select Two-way connection.

**Parameters****Block Options****Port Configuration — Specify configuration**

Simulink (default) | Two-way connection

Specify the port configuration.

**Dependencies**

Specifying Simulink creates these ports:

- BSpd
- FSpd
- BTrq
- FTrq

Specifying Two-way connection creates these ports:

- B
- F

**Clutch force equivalent net radius, Reff — Radius**

1 (default) | scalar

Clutch force equivalent net radius, in m.

**Number of disks, Ndisk — Ratio**

1 (default) | scalar

Number of disks, dimensionless.

**Effective applied pressure area, Aeff – Pressure area**

.01 (default) | scalar

Effective applied pressure area, in  $m^2$ .**Engagement pressure threshold, Peng – Pressure threshold**

0 (default) | scalar

Pressure to engage clutch, in Pa.

**Input shaft inertia, Jin – Inertia**

.1 (default) | scalar

Input shaft inertia, in  $kg \cdot m^2$ .**Output shaft inertia, Jout – Inertia**

.1 (default) | scalar

Output shaft inertia, in  $kg \cdot m^2$ .**Kinetic friction coefficient, muk – Coefficient**

.3 (default) | scalar

Kinetic friction coefficient, dimensionless.

**Static friction coefficient, mus – Coefficient**

.5 (default) | scalar

Static friction coefficient, dimensionless.

**Input shaft viscous damping, bin – Damping**

.001 (default) | scalar

Input shaft viscous damping, in  $N \cdot m \cdot s/rad$ .**Output shaft viscous damping, bout – Damping**

.001 (default) | scalar

Output shaft viscous damping, in  $N \cdot m \cdot s/rad$ .**Initial input shaft velocity, win\_o – Initial velocity**

0 (default) | scalar

Input shaft initial velocity, in rad/s.

**Initial output shaft velocity, wout\_o – Initial velocity**

0 (default) | scalar

Input shaft initial velocity, in rad/s.

**Clutch actuation time constant, tauC – Constant**

.01 (default) | scalar

Clutch actuation time constant, in s.

**Clutch initially locked — Select to initially lock clutch**

off (default) | on

Select to lock clutch initially.

## Vehicle Body 1DOF Longitudinal

Two-axle vehicle in forward and reverse motion

**Library:** Powertrain Blockset / Vehicle Dynamics  
Vehicle Dynamics Blockset / Vehicle Body

### Description

The Vehicle Body 1DOF Longitudinal block implements a one degree-of-freedom (1DOF) rigid vehicle body with constant mass undergoing longitudinal (that is, forward and reverse) motion. Use the block:

- In powertrain and fuel economy studies to represent the vehicle inertial and drag loads when weight transfer from vertical and pitch motions are negligible.
- To determine the engine torque and power required for the vehicle to follow a specified drive cycle.

You can select block options to create input ports for external forces, moments, air temperature, and wind speed.

Block Option Setting	External Input Ports	Description
<b>External forces</b>	FExt	External force applied to vehicle CG in the vehicle-fixed frame.
<b>External moments</b>	MExt	External moment about vehicle CG in the vehicle-fixed frame.
<b>Air temperature</b>	AirTemp	Ambient air temperature. Consider this option if you want to vary the temperature during run-time.
<b>Wind X,Y,Z</b>	WindXYZ	Wind speed along earth-fixed X-, Y-, and Z-axes.  If you do not select this option, the block implements input port WindX — Longitudinal wind speed along the earth-fixed X-axis.

### Vehicle Body Model

The vehicle axles are parallel and form a plane. The longitudinal direction lies in this plane and is perpendicular to the axles. If the vehicle is traveling on an inclined slope, the normal direction is not parallel to gravity but is always perpendicular to the axle-longitudinal plane.

The block uses the net effect of all the forces and torques acting on it to determine the vehicle motion. The longitudinal tire forces push the vehicle forward or backward. The weight of the vehicle acts through its center of gravity (CG). The grade angle changes the direction of the resolved gravitational force acting on the vehicle CG. Similarly, the block resolves the resistive aerodynamic drag force on the vehicle CM.

The Vehicle Body 1DOF Longitudinal block implements these equations.

$$F_b = m\ddot{x}$$

$$F_b = F_{xF} + F_{xR} - F_{d,x} + F_{ext,x} - mg\sin\gamma$$

Zero normal acceleration and zero pitch torque determine the normal force on each front and rear axles.

$$F_{zF} = \frac{-M_{ext,y} - M_{d,y} + b(F_{d,z} + F_{ext,z} + mg\cos\gamma) - h(-F_{ext,x} + F_{d,x} + mg\sin\gamma + m\ddot{x})}{N_F(a + b)}$$

$$F_{zR} = \frac{M_{ext,y} + M_{d,y} + a(F_{d,z} + F_{ext,z} + mg\cos\gamma) + h(-F_{ext,x} + F_{d,x} + mg\sin\gamma + m\ddot{x})}{N_R(a + b)}$$

The wheel normal forces satisfy this equation.

$$N_FF_{zF} + N_RF_{zR} - F_{ext,z} = mg\cos\gamma$$

### Wind and Drag Forces

The block subtracts the wind speeds from the vehicle velocity components to obtain a net relative airspeed. To calculate the drag force and moments acting on the vehicle, the block uses the net relative airspeed.

$$F_{d,x} = \frac{1}{2TR} C_d A_f P_{abs} \dot{x}$$

$$F_{d,z} = \frac{1}{2TR} C_l A_f P_{abs} \dot{x}$$

$$M_{d,y} = \frac{1}{2TR} C_{pm} A_f P_{abs} \dot{x} (a + b)$$

By default, to calculate the wind speed along the vehicle-fixed x-axis, the block uses the longitudinal wind speed along the earth-fixed X-axis. If you select **WindX,Y,Z**, the block uses the wind speed along the earth-fixed X-, Y-, Z-axes.

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Equations
PwrInfo	PwrTrnsfrd — Power transferred between blocks  • Positive signals indicate flow into block • Negative signals indicate flow out of block	PwrFxExt	Externally applied force power $P_{FxExt} = F_{xExt} \dot{x}$
		PwrFwFx	Longitudinal force power applied at the front axle $P_{FwFx} = F_{wFx} \dot{x}$
		PwrFwRx	Longitudinal force power applied at the rear axle $P_{FwRx} = F_{wRx} \dot{x}$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred  • Positive signals indicate an input • Negative signals indicate a loss	PwrFxDrag	Drag force power $P_d = - \frac{0.5 C_d A_f P_{abs} (\dot{x}^2 - w_x)^2}{287.058T} \dot{x}$
	PwrStored — Stored energy rate of change  • Positive signals indicate an increase • Negative signals indicate a decrease	wrStoredGrvty	Rate change in gravitational potential energy $P_g = - mg \dot{Z}$
PwrStoredxdot		Rate in change of longitudinal kinetic energy $P_{\dot{x}} = m \ddot{x} \dot{x}$	

The equations use these variables.

$F_{xf}, F_{xr}$  Longitudinal forces on each wheel at the front and rear ground contact points, respectively

$F_{zf}, F_{zr}$	Normal load forces on each wheel at the front and rear ground contact points, respectively
$F_{wF}, F_{wR}$	Longitudinal force on front and rear axles along vehicle-fixed x-axis
$F_{xExt}, F_{wR}$	External force along the vehicle-fixed x-axis
$F_{d,x}, F_{d,z}$	Longitudinal and normal drag force on vehicle CG
$M_{d,y}$	Torque due to drag on vehicle about the vehicle-fixed y-axis
$F_d$	Aerodynamic drag force
$V_x$	Velocity of the vehicle. When $V_x > 0$ , the vehicle moves forward. When $V_x < 0$ , the vehicle moves backward.
$N_f, N_r$	Number of wheels on front and rear axle, respectively
$\gamma$	Angle of road grade
$m$	Vehicle body mass
$a, b$	Distance of front and rear axles, respectively, from the normal projection point of vehicle CG onto the common axle plane
$h$	Height of vehicle CG above the axle plane
$C_d$	Frontal air drag coefficient
$A_f$	Frontal area
$P_{abs}$	Absolute pressure
$\rho$	Mass density of air
$x, \dot{x}, \ddot{x}$	Vehicle longitudinal position, velocity, and acceleration along the vehicle-fixed x-axis
$w_x$	Wind speed along the vehicle-fixed x-axis
$\dot{z}$	Vehicle vertical velocity along the vehicle-fixed z-axis

## Limitations

The Vehicle Body 1DOF Longitudinal block lets you model only longitudinal dynamics, parallel to the ground and oriented along the direction of motion. The vehicle is assumed to be in pitch and normal equilibrium. The block does not model pitch or vertical movement. To model a vehicle with three degrees-of-freedom (DOF), use the Vehicle Body 3DOF Longitudinal.

## Ports

### Input

#### FExt — External force on vehicle CG

array

External forces applied to vehicle CG,  $F_{xext}, F_{yext}, F_{zext}$ , in vehicle-fixed frame, in N. Signal vector dimensions are [1x3] or [3x1].

### Dependencies

To enable this port, select **External forces**.

**MExt — External moment about vehicle CG**

array

External moment about vehicle CG,  $M_x$ ,  $M_y$ ,  $M_z$ , in the vehicle-fixed frame, in N·m. Signal vector dimensions are [1x3] or [3x1].

**Dependencies**

To enable this port, select **External moments**.

**FwF — Total longitudinal force on front axle**

scalar

Longitudinal force on the front axle,  $F_{wf}$ , along vehicle-fixed x-axis, in N.

**FwR — Total longitudinal force on rear axle**

scalar

Longitudinal force on the rear axle,  $F_{wr}$ , along vehicle-fixed x-axis, in N.

**Grade — Road grade angle**

scalar

Road grade angle,  $\gamma$ , in deg.

**WindX — Longitudinal wind speed**

scalar

Longitudinal wind speed,  $W_w$ , along earth-fixed X-axis, in m/s.

**Dependencies**

To enable this port, clear **Wind X,Y,Z components**.

**WindXYZ — Wind speed**

array

Wind speed,  $W_w$ ,  $W_{wy}$ ,  $W_{wz}$  along inertial X-, Y-, and Z-axes, in m/s. Signal vector dimensions are [1x3] or [3x1].

**Dependencies**

To enable this port, select **Wind X,Y,Z components**.

**AirTemp — Ambient air temperature**

scalar

Ambient air temperature,  $T_{air}$ , in K. Considering this option if you want to vary the temperature during run-time.

**Dependencies**

To enable this port, select **Air temperature**.

**Output****Info — Bus signal**

bus

Bus signal containing these block values.

### Longitudinal

#### Number of wheels on front axle, $N_F$ – Front wheel count

2 (default) | scalar

Number of wheels on front axle,  $N_F$ . The value is dimensionless.

#### Number of wheels on rear axle, $N_R$ – Rear wheel count

2 (default) | scalar

Number of wheels on rear axle,  $N_R$ . The value is dimensionless.

#### Mass, $m$ – Vehicle mass

1500 (default) | scalar

Vehicle mass,  $M$ , in kg.

#### Horizontal distance from CG to front axle, $a$ – Front axle distance

1.4 (default) | scalar

Horizontal distance  $a$  from the vehicle CG to the front wheel axle, in m.

#### Horizontal distance from CG to rear axle, $b$ – Rear axle distance

1.8 (default) | scalar

Horizontal distance  $b$  from the vehicle CG to the rear wheel axle, in m.

#### CG height above axles, $h$ – Height

.35 (default) | scalar

Height of vehicle CG above the ground,  $h$ , in m.

#### Drag coefficient, $C_d$ – Drag

.3 (default) | scalar

Air drag coefficient,  $C_d$ . The value is dimensionless.

#### Lift coefficient, $C_l$ – Lift

0 (default) | scalar

Air lift coefficient,  $C_l$ . The value is dimensionless.

#### Pitch drag moment coefficient, $C_{pm}$ – Pitch drag

0 (default) | scalar

Pitch drag moment coefficient,  $C_{pm}$ . The value is dimensionless.

#### Frontal area, $A_f$ – Area

4 (default) | scalar

Effective vehicle cross-sectional area,  $A$ , to calculate the aerodynamic drag force on the vehicle, in  $m^2$ .

#### Initial position, $x_o$ – Position

0 (default) | scalar

Vehicle body longitudinal initial position along the vehicle-fixed x-axis,  $x_0$ , in m.

### **Initial velocity, xdot\_o – Velocity**

0 (default) | scalar

Vehicle body longitudinal initial velocity along the vehicle-fixed x-axis,  $\dot{x}_0$ , in m/s.

### **Environment**

#### **Absolute air pressure, Pabs – Pressure**

101325 (default) | scalar

Environmental air absolute pressure,  $P_{abs}$ , in Pa.

#### **Air temperature, T – Ambient air temperature**

273 (default) | scalar

Ambient air temperature,  $T_{air}$ , in K.

### **Dependencies**

To enable this parameter, clear **Air temperature**.

#### **Gravitational acceleration, g – Gravity**

9.81 (default) | scalar

Gravitational acceleration,  $g$ , in m/s<sup>2</sup>.

# Vehicle Body 3DOF Longitudinal

3DOF rigid vehicle body to calculate longitudinal, vertical, and pitch motion

**Library:** Powertrain Blockset / Vehicle Dynamics  
Vehicle Dynamics Blockset / Vehicle Body

## Description

The Vehicle Body 3DOF Longitudinal block implements a three degrees-of-freedom (3DOF) rigid vehicle body model with configurable axle stiffness to calculate longitudinal, vertical, and pitch motion. The block accounts for body mass, aerodynamic drag, road incline, and weight distribution between the axles due to acceleration and the road profile.

You can specify the type of axle attachment to the vehicle:

- Grade angle — Vertical axle displacement from road surface to axles remains constant. The block uses tabular stiffness and damping parameters to model the suspension forces acting between the vehicle body and axles.
- Axle displacement — Axles have input-provided vertical displacement and velocity with respect to the road grade. The block uses tabular stiffness and damping parameters to model the suspension forces acting between the vehicle body and axle.
- External suspension — Axles have externally applied forces for coupling the vehicle body to custom suspension models.

If the weight transfer from vertical and pitch motions are not negligible, consider using this block to represent vehicle motion in powertrain and fuel economy studies. For example, in studies with heavy braking or acceleration or road profiles that contain larger vertical changes.

The block uses rigid-body vehicle motion, suspension system forces, and wind and drag forces to calculate the normal forces on the front and rear axles. The block resolves the force components and moments on the rigid vehicle body frame:

$$\begin{aligned}
 F_x &= F_{wF} + F_{wR} - F_{d,x} - F_{sx,F} - F_{sx,R} + F_{g,x} \\
 F_z &= F_{d,z} - F_{sz,F} - F_{sz,R} + F_{g,z} \\
 M_y &= aF_{sz,F} - bF_{sz,R} + h(F_{wF} + F_{wR} + F_{sx,F} + F_{sx,R}) - M_{d,y}
 \end{aligned}$$

### Rigid-Body Vehicle Motion

The vehicle axles are parallel and form a plane. The longitudinal direction lies in this plane and is perpendicular to the axles. If the vehicle is traveling on an inclined slope, the normal direction is not parallel to gravity but is always perpendicular to the axle-longitudinal plane.

The block uses the net effect of all the forces and torques acting on it to determine the vehicle motion. The longitudinal tire forces push the vehicle forward or backward. The weight of the vehicle acts through its center of gravity (CG). Depending on the inclined angle, the weight pulls the vehicle to the ground and either forward or backward. Whether the vehicle travels forward or backward, aerodynamic drag slows it down. For simplicity, the drag is assumed to act through the CG.

The Vehicle Body 3DOF Longitudinal implements these equations.

$$\ddot{x} = \frac{F_x}{m} - qz$$

$$\ddot{z} = \frac{F_z}{m} - qx$$

$$\dot{q} = \frac{M_y}{I_{yy}}$$

$$\dot{\theta} = q$$

### Suspension System Forces

If you configure the block with the **Ground interaction type** parameter `Grade angle` or `Axle displacement, velocity`, the block uses nonlinear stiffness and damping parameters to model the suspension system.

The front and rear axle suspension forces are given by:

$$F_{S_F} = N_F[Fk_F + Fb_F]$$

$$F_{S_R} = N_R[Fk_R + Fb_R]$$

The block uses lookup tables to implement the front and rear suspension stiffness. To account for kinematic and material nonlinearities, including collisions with end-stops, the tables are functions of the stroke.

$$Fk_F = f(dZ_F)$$

$$Fk_R = f(dZ_R)$$

The block uses lookup tables to implement the front and rear suspension damping. To account for nonlinearities, compression, and rebound, the tables are functions of the stroke rate.

$$Fb_F = f(d\dot{Z}_F)$$

$$Fb_R = f(d\dot{Z}_R)$$

The stroke is the difference in the vehicle vertical and axle positions. The stroke rate is the difference in the vertical and axle velocities.

$$dZ_F = Z_F - \bar{Z}_F$$

$$dZ_R = Z_R - \bar{Z}_R$$

$$d\dot{Z}_F = \dot{Z}_F - \dot{\bar{Z}}_F$$

$$d\dot{Z}_R = \dot{Z}_R - \dot{\bar{Z}}_R$$

When the **Ground interaction type** parameter is `Grade angle`, the axle vertical positions ( $\bar{Z}_F, \bar{Z}_R$ ) and velocities ( $\dot{\bar{Z}}_F, \dot{\bar{Z}}_R$ ) are set to  $\theta$ .

### Wind and Drag Forces

The block subtracts the wind speeds from the vehicle velocity components to obtain a net relative airspeed. To calculate the drag force and moments acting on the vehicle, the block uses the net relative airspeed:

$$F_{d,x} = \frac{1}{2TR} C_d A_f P_{abs}(\dot{x})$$

$$F_{d,z} = \frac{1}{2TR} C_l A_f P_{abs}(\dot{x})$$

$$M_{d,y} = \frac{1}{2TR} C_{pm} A_f P_{abs}(\dot{x})(a + b)$$

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Equations	
PwrInfo	PwrTrnsfrd — Power transferred between blocks	PwrFxExt	Externally applied longitudinal force power	$P_{FxExt} = F_{xExt}\dot{x}$
		PwrFzExt	Externally applied longitudinal force power	$P_{FzExt} = F_{zExt}\dot{z}$
		PwrMyExt	Externally applied pitch moment power	$P_{MzExt} = M_{zExt}\dot{\theta}$
		PwrFwFx	Longitudinal force applied at the front axle	$P_{FwFx} = F_{wFx}\dot{x}$
		PwrFwRx	Longitudinal force applied at the rear axle	$P_{FwRx} = F_{wRx}\dot{x}$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred	PwrFsF	Internal power transferred between suspension and vehicle body at the front axle	$P_{Fs,F} = -P_{FwFx} + P_{FsbF} + P_{Fsk,F} + F_{xF}\dot{x}_F + F_{zF}\dot{z}_F$
		PwrFsR	Internal power transferred between suspension and vehicle body at the rear axle	$P_{Fs,R} = -P_{FwRx} + P_{Fsb,R} + P_{Fsk,R} + F_{xF}\dot{x}_F + F_{zF}\dot{z}_F$
		PwrFxDrag	Longitudinal drag force power	$P_{d,x} = F_{d,x}\dot{x}$
		PwrFzDrag	Vertical drag force power	$P_{d,z} = F_{d,z}\dot{z}$
		PwrMyDrag	Drag pitch moment power	$P_{d,My} = M_{d,y}\dot{\theta}$
		PwrFsb	Total suspension damping power	$P_{Fsb} = \sum_{i=F,R} F_{sb,i}\dot{z}_i$
		PwrStored — Stored energy rate of change	PwrStoredGrvty	Rate change in gravitational potential energy
	PwrStoredxdot		Rate of change of longitudinal kinetic energy	$P_{\dot{x}} = m\dot{x}\dot{x}$
	PwrStoredzdot		Rate of change of longitudinal kinetic energy	$P_{\dot{z}} = m\dot{z}\dot{z}$

Bus Signal		Description	Equations
	PwrStoredq	Rate of change of rotational pitch kinetic energy	$P_{\dot{\theta}} = I_{yy}\ddot{\theta}$
	PwrStoredFsFzSprng	Stored spring energy from front suspension	$P_{FskF} = F_{sk,F}\dot{z}_F$
	PwrStoredFsRzSprng	Stored spring energy from rear suspension	$P_{FskR} = F_{sk,R}\dot{z}_R$

The equations use these variables.

$F_x$	Longitudinal force on vehicle
$F_z$	Normal force on vehicle
$M_y$	Torque on vehicle about the vehicle-fixed y-axis
$F_{wF}, F_{wR}$	Longitudinal force on front and rear axles along vehicle-fixed x-axis
$F_{d,x}, F_{d,z}$	Longitudinal and normal drag force on vehicle CG
$F_{sx,F}, F_{sx,R}$	Longitudinal suspension force on front and rear axles
$F_{sz,F}, F_{sz,R}$	Normal suspension force on front and rear axles
$F_{g,x}, F_{g,z}$	Longitudinal and normal gravitational force on vehicle along the vehicle-fixed frame
$M_{d,y}$	Torque due to drag on vehicle about the vehicle-fixed y-axis
$a, b$	Distance of front and rear axles, respectively, from the normal projection point of vehicle CG onto the common axle plane
$h$	Height of vehicle CG above the axle plane along vehicle-fixed z-axis
$F_{sF}, F_{sR}$	Front and rear axle suspension force along vehicle-fixed z-axis
$Z_{wF}, Z_{wR}$	Front and rear vehicle normal position along earth-fixed z-axis
$\theta$	Vehicle pitch angle about the vehicle-fixed y-axis
$m$	Vehicle body mass
$N_F, N_R$	Number of front and rear wheels
$I_{yy}$	Vehicle body moment of inertia about the vehicle-fixed y-axis
$x, \dot{x}, \ddot{x}$	Vehicle longitudinal position, velocity, and acceleration along the vehicle-fixed x-axis
$z, \dot{z}, \ddot{z}$	Vehicle normal position, velocity, and acceleration along the vehicle-fixed z-axis
$Fk_F, Fk_R$	Front and rear wheel suspension stiffness force along vehicle-fixed z-axis
$Fb_F, Fb_R$	Front and rear wheel suspension damping force along vehicle-fixed z-axis
$Z_F, Z_R$	Front and rear vehicle vertical position along earth-fixed Z-axis
$\dot{Z}_F, \dot{Z}_R$	Front and rear vehicle vertical velocity along vehicle-fixed z-axis
$\bar{Z}_F, \bar{Z}_R$	Front and rear wheel axle vertical position along vehicle-fixed z-axis
$\dot{\bar{Z}}_F, \dot{\bar{Z}}_R$	Front and rear wheel axle vertical velocity along earth-fixed z-axis

$dZ_F, dZ_R$	Front and rear axle suspension deflection along vehicle-fixed $z$ -axis
$d\dot{Z}_F, d\dot{Z}_R$	Front and rear axle suspension deflection rate along vehicle-fixed $z$ -axis
$C_d$	Frontal air drag coefficient acting along the vehicle-fixed $x$ -axis
$C_l$	Lateral air drag coefficient acting along the vehicle-fixed $z$ -axis
$C_{pm}$	Air drag pitch moment acting about the vehicle-fixed $y$ -axis
$A_f$	Frontal area
$P_{abs}$	Environmental absolute pressure
$R$	Atmospheric specific gas constant
$T$	Environmental air temperature
$w_x$	Wind speed along the vehicle-fixed $x$ -axis

## Ports

### Input

#### **FExt — External force on vehicle CG**

array

External forces applied to vehicle CG,  $F_{x_{ext}}, F_{y_{ext}}, F_{z_{ext}}$ , in vehicle-fixed frame, in N. Signal vector dimensions are [1x3] or [3x1].

#### **Dependencies**

To enable this port, select **External forces**.

#### **MExt — External moment about vehicle CG**

array

External moment about vehicle CG,  $M_x, M_y, M_z$ , in the vehicle-fixed frame, in N·m. Signal vector dimensions are [1x3] or [3x1].

#### **Dependencies**

To enable this port, select **External moments**.

#### **FwF — Total longitudinal force on the front axle**

scalar

Longitudinal force on the front axle,  $F_{wF}$ , along vehicle-fixed  $x$ -axis, in N.

#### **FwR — Total longitudinal force on the rear axle**

scalar

Longitudinal force on the rear axle,  $F_{wR}$ , along vehicle-fixed  $x$ -axis, in N.

#### **Grade — Road grade angle**

scalar

Road grade angle,  $\gamma$ , in deg.

#### **FsF — Suspension force on front axle per wheel**

vector

Suspension force on front axle,  $F_{s_F}$ , along the vehicle-fixed  $z$ -axis, in N.

**Dependencies**

To enable this port, for the **Ground interaction type** parameter, select External suspension.

**FsR — Suspension force on rear axle per wheel**

vector

Suspension force on rear axle,  $F_{s_R}$ , along the vehicle-fixed  $z$ -axis, in N.

**Dependencies**

To enable this port, for the **Ground interaction type** parameter, select External suspension.

**WindXYZ — Wind speed**

array

Wind speed,  $W_x$ ,  $W_y$ ,  $W_z$  along earth-fixed  $X$ -,  $Y$ -, and  $Z$ -axes, in m/s. Signal vector dimensions are  $[1 \times 3]$  or  $[3 \times 1]$ .

**AirTemp — Ambient air temperature**

scalar

Ambient air temperature,  $T_{air}$ , in K. Considering this option if you want to vary the temperature during run-time.

**Dependencies**

To enable this port, select **Air temperature**.

**zF,R — Forward and rear axle positions**

vector

Forward and rear axle positions along the vehicle-fixed  $z$ -axis,  $\bar{z}_F$ ,  $\bar{z}_R$ , in m.

**Dependencies**

To enable this port, for the **Ground interaction type** parameter, select Axle displacement, velocity.

**zdotF,R — Forward and rear axle velocities**

vector

Forward and rear axle velocities along the vehicle-fixed  $z$ -axis,  $\dot{\bar{z}}_F$ ,  $\dot{\bar{z}}_R$ , in m/s.

**Dependencies**

To enable this port, for the **Ground interaction type** parameter, select Axle displacement, velocity.

**Output**

**Info — Bus signal**

bus

Bus signal containing these block values.

**x<sub>dot</sub> – Vehicle longitudinal velocity**

scalar

Vehicle CG velocity along the vehicle-fixed x-axis, in m/s.

**F<sub>zF</sub> – Front axle normal force**

scalar

Normal force on front axle,  $F_{zF}$ , along the vehicle-fixed z-axis, in N.**F<sub>zR</sub> – Rear axle normal force**

scalar

Normal force on rear axle,  $F_{zR}$ , along the vehicle-fixed z-axis, in N.

## Parameters

### Options

**External forces – FExt input port**

off (default) | on

Specify to create input port FExt.

**External moments – MExt input port**

off (default) | on

Specify to create input port MExt.

**Air temperature – AirTemp input port**

off (default) | on

Specify to create input port AirTemp.

### Longitudinal

**Number of wheels on front axle, NF – Front wheel count**

2 (default) | scalar

Number of wheels on front axle,  $N_F$ . The value is dimensionless.**Number of wheels on rear axle, NR – Rear wheel count**

2 (default) | scalar

Number of wheels on rear axle,  $N_R$ . The value is dimensionless.**Mass, m – Vehicle mass**

1200 (default) | scalar

Vehicle mass,  $m$ , in kg.**Horizontal distance from CG to front axle, a – Front axle distance**

1.4 (default) | scalar

Horizontal distance  $a$  from the vehicle CG to the front wheel axle, in m.**Horizontal distance from CG to rear axle, b – Rear axle distance**

1.8 (default) | scalar

Horizontal distance  $b$  from the vehicle CG to the rear wheel axle, in m.**CG height above axles, h – Height**

0.35 (default) | scalar

Height of vehicle CG above the axles,  $h$ , in m.**Drag coefficient, Cd – Drag**

.3 (default) | scalar

Air drag coefficient,  $C_d$ . The value is dimensionless.

**Frontal area,  $A_f$  – Area**

2 (default) | scalar

Effective vehicle cross-sectional area,  $A_f$  to calculate the aerodynamic drag force on the vehicle, in  $m^2$ .

**Initial position,  $x_o$  – Position**

0 (default) | scalar

Vehicle body longitudinal initial position along earth-fixed x-axis,  $x_o$ , in m.

**Initial velocity,  $\dot{x}_o$  – Velocity**

0 (default) | scalar

Vehicle body longitudinal initial velocity along earth-fixed x-axis,  $\dot{x}_o$ , in m/s.

**Vertical****Lift coefficient,  $C_l$  – Lift**

.1 (default) | scalar

Lift coefficient,  $C_l$ . The value is dimensionless.

**Initial vertical position,  $z_o$  – Position**

-.35 (default) | scalar

Initial vertical CG position,  $z_o$ , along the vehicle-fixed z-axis, in m.

**Initial vertical velocity,  $\dot{z}_o$  – Velocity**

0 (default) | scalar

Initial vertical CG velocity,  $\dot{z}_o$ , along the vehicle-fixed z-axis, in m.

**Pitch****Inertia,  $I_{yy}$  – About body y-axis**

3500 (default) | scalar

Vehicle body moment of inertia about body z-axis.

**Pitch drag moment coefficient,  $C_{pm}$  – Drag coefficient**

.1 (default) | scalar

Pitch drag moment coefficient. The value is dimensionless.

**Initial pitch angle,  $\theta_o$  – Pitch**

0 (default) | scalar

Initial pitch angle about body z-axis, in rad.

**Initial angular velocity,  $q_o$  – Pitch velocity**

0 (default) | scalar

Initial vehicle body angular velocity about body z-axis, in rad/s.

**Suspension****Front axle stiffness force data, FskF — Force**

[-50, -1, 0, 2, 3, 52].\*1.5e4 (default) | vector

Front axle stiffness force data,  $Fk_F$ , in N.**Dependencies**

To enable this parameter, for the **Ground interaction type** parameter, select Grade angle or Axle displacement, velocity.

**Front axle displacement data, dzsF — Displacement**

[-5e-3, -1e-4, 0, .2, .2001, .2051] (default) | vector

Front axle displacement data, in m.

**Dependencies**

To enable this parameter, for the **Ground interaction type** parameter, select Grade angle or Axle displacement, velocity.

**Front axle damping force data, FsbF — Damping force**

[-10000 -100 -10 0 10 100 10000] (default) | vector

Front axle damping force, in N.

**Dependencies**

To enable this parameter, for the **Ground interaction type** parameter, select Grade angle or Axle displacement, velocity.

**Front axle velocity data, dzdotsF — Velocity**

[-10 -1 -.1 0 .1 1 10] (default) | vector

Front axle velocity data, in m/s.

**Dependencies**

To enable this parameter, for the **Ground interaction type** parameter, select Grade angle or Axle displacement, velocity.

**Rear axle stiffness force data, FskR — Force**

[-50, -1, 0, 2, 3, 52].\*1e4 (default) | vector

Rear axle stiffness force data, in N.

**Dependencies**

To enable this parameter, for the **Ground interaction type** parameter, select Grade angle or Axle displacement, velocity.

**Rear axle displacement data, dzsR — Displacement**

[-5e-3, -1e-4, 0, .2, .2001, .2051] (default) | vector

Rear axle displacement data, in m.

**Dependencies**

To enable this parameter, for the **Ground interaction type** parameter, select **Grade angle** or **Axle displacement, velocity**.

**Rear axle damping force data, FsbR — Damping force**

[-10000 -100 -10 0 10 100 10000] (default) | vector

Rear axle damping force, in N.

**Dependencies**

To enable this parameter, for the **Ground interaction type** parameter, select **Grade angle** or **Axle displacement, velocity**.

**Rear axle velocity data, dzdotsR — Velocity**

[-10 -1 -.1 0 .1 1 10] (default) | vector

Rear axle velocity data, in m/s.

**Dependencies**

To enable this parameter, for the **Ground interaction type** parameter, select **Grade angle** or **Axle displacement, velocity**.

**Environment****Absolute air pressure, Pabs — Pressure**

101325 (default) | scalar

Environmental air absolute pressure,  $P_{abs}$ , in Pa.

**Air temperature, Tair — Ambient air temperature**

273 (default) | scalar

Ambient air temperature,  $T_{air}$ , in K.

**Dependencies**

To enable this parameter, clear **Air temperature**.

**Gravitational acceleration, g — Gravity**

9.81 (default)

Gravitational acceleration,  $g$ , in  $m/s^2$ .

# Vehicle Body Total Road Load

Vehicle motion using coast-down testing coefficients

**Library:** Powertrain Blockset / Vehicle Dynamics  
Vehicle Dynamics Blockset / Vehicle Body

## Description

The Vehicle Body Total Road Load block implements a one degree-of-freedom (1DOF) rigid vehicle model using coast-down testing coefficients. You can use this block in a vehicle model to represent the load that the driveline and chassis applies to a transmission or engine. It is suitable for system-level performance, component sizing, fuel economy, or drive cycle tracking studies. The block calculates the dynamic powertrain load with minimal parameterization or computational cost.

You can configure the block for kinematic, force, or total power input.

- Kinematic — Block uses the vehicle longitudinal velocity and acceleration to calculate the tractive force and power.
- Force — Block uses the tractive force to calculate the vehicle longitudinal displacement and velocity.
- Power — Block uses the engine or transmission power to calculate the vehicle longitudinal displacement and velocity.

## Dynamics

To calculate the total road load acting on the vehicle, the block implements this equation.

$$F_{road} = a + b\dot{x} + c\dot{x}^2 + mg\sin(\theta)$$

To determine the coefficients  $a$ ,  $b$ , and  $c$ , you can use a test procedure similar to the one described in *Road Load Measurement and Dynamometer Simulation Using Coastdown Techniques*. You can also use Simulink® Design Optimization™ to fit the coefficients to measured data.

To calculate the vehicle motion, the block uses Newton's law for rigid bodies.

$$F_{total} = m\ddot{x} + F_{road}$$

Total power input is a product of the total force and longitudinal velocity. Power due to road and gravitational forces is a product of the road force and longitudinal velocity.

$$P_{total} = F_{total}\dot{x}$$

$$P_{road} = F_{road}\dot{x}$$

## Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Variable	Equations
PwrIn fo	PwrTrnsfrd — Power transferred between blocks  <ul style="list-style-type: none"> <li>Positive signals indicate flow into block</li> <li>Negative signals indicate flow out of block</li> </ul>	PwrFxExt	Externally applied force power  $P_{FxExt}$	$P_{FxExt} = F_{total}\dot{x}$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred  <ul style="list-style-type: none"> <li>Positive signals indicate an input</li> <li>Negative signals indicate a loss</li> </ul>	PwrFxDrag	Drag force power  $P_D$	$P_D = -(a + b\dot{x} + c\dot{x}^2)\dot{x}$
	PwrStored — Stored energy rate of change  <ul style="list-style-type: none"> <li>Positive signals indicate an increase</li> <li>Negative signals indicate a decrease</li> </ul>	wrStoredGrvty	Rate change in gravitational potential energy  $P_g$	$P_g = -mg\dot{Z}$
		PwrStoredxdot	Rate in change of longitudinal kinetic energy  $P_{xdot}$	$P_{\dot{x}} = m\ddot{x}\dot{x}$

The equations use these variables.

- $a$  Steady-state rolling resistance coefficient
- $b$  Viscous driveline and rolling resistance coefficient
- $c$  Aerodynamic drag coefficient
- $g$  Gravitational acceleration
- $x$  Vehicle longitudinal displacement with respect to ground, in the vehicle-fixed frame
- $\dot{x}$  Vehicle longitudinal velocity with respect to ground, in the vehicle-fixed frame
- $\ddot{x}$  Vehicle longitudinal acceleration with respect to ground, vehicle-fixed frame
- $m$  Vehicle body mass
- $\Theta$  Road grade angle
- $F_{total}$  Total force acting on vehicle
- $F_{road}$  Resistive road load due to losses and gravitational load
- $P_{total}$  Total tractive input power
- $P_{road}$  Total power due to losses and gravitational load
- $\dot{Z}$  Vehicle vertical velocity along the vehicle-fixed z-axis

## Ports

### Input

#### **xdot** — Vehicle longitudinal velocity

scalar

Vehicle total longitudinal velocity,  $\dot{x}$ , in m/s.

#### **Dependencies**

To enable this port, for the **Input Mode** parameter, select Kinematic.

#### **xddot** — Vehicle longitudinal acceleration

scalar

Vehicle total longitudinal acceleration,  $\ddot{x}$ , in m/s<sup>2</sup>.

#### **Dependencies**

To enable this port, for the **Input Mode** parameter, select Kinematic.

#### **PwrTot** — Tractive input power

scalar

Tractive input power,  $P_{total}$ , in W.

#### **Dependencies**

To enable this port, for the **Input Mode** parameter, select Power.

#### **ForceTot** — Tractive input force

scalar

Tractive input force,  $F_{total}$ , in N.

#### **Dependencies**

To enable this port, for the **Input Mode** parameter, select Force.

#### **Grade** — Road grade angle

scalar

Road grade angle,  $\theta$ , in deg.

### Output

#### **Info** — Bus signal

bus

Bus signal containing these block calculations.

**xdot – Vehicle longitudinal velocity**

scalar

Vehicle total longitudinal velocity,  $\dot{x}$ , in m/s.**Dependencies**To enable this port, for the **Input Mode** parameter, select Power or Force.**ForceTot – Tractive input force**

scalar

Tractive input force,  $F_{total}$ , in N.**Dependencies**To enable this port, for the **Input Mode** parameter, select Kinematic.

## Parameters

### Input Mode — Specify input mode

Kinematic (default) | Force | Power

Specify the input type.

- **Kinematic** — Block uses the vehicle longitudinal velocity and acceleration to calculate the tractive force and power. Use this configuration for powertrain, driveline, and braking system design, or component sizing.
- **Force** — Block uses the tractive force to calculate the vehicle longitudinal displacement and velocity. Use this configuration for system-level performance, fuel economy, or drive cycle tracking studies.
- **Power** — Block uses the engine or transmission power to calculate the vehicle longitudinal displacement and velocity. Use this configuration for system-level performance, fuel economy, or drive cycle tracking studies.

### Dependencies

This table summarizes the port and input mode configurations.

Input Mode	Creates Ports
Kinematic	xdot xddot
Force	Force
Power	Power

### Mass — Vehicle body mass

1200 (default) | scalar

Vehicle body mass,  $m$ , in kg.

### Rolling resistance coefficient, a — Rolling

196 (default) | scalar

Steady-state rolling resistance coefficient,  $a$ , in N.

### Rolling and driveline resistance coefficient, b — Rolling and driveline

2.232 (default) | scalar

Viscous driveline and rolling resistance coefficient,  $b$ , in N\*s/m.

### Aerodynamic drag coefficient, c — Drag

0.389 (default) | scalar

Aerodynamic drag coefficient,  $c$ , in N\*s<sup>2</sup>/m.

### Gravitational acceleration, g — Gravity

9.81 (default) | scalar

Gravitational acceleration,  $g$ , in m/s<sup>2</sup>.

**Initial position,  $x_o$  – Position** $0$  (default) | scalar

Vehicle longitudinal initial position, in m.

**Initial velocity,  $\dot{x}_o$  – Velocity** $0$  (default) | scalar

Vehicle longitudinal initial velocity with respect to ground, in m/s.

# Energy Storage Blocks

---

## Datasheet Battery

Lithium-ion, lithium-polymer, or lead-acid battery

**Library:** Powertrain Blockset / Energy Storage and Auxiliary Drive / Datasheet Battery

### Description

The Datasheet Battery block implements a lithium-ion, lithium-polymer, or lead-acid battery that you can parameterize using manufacturer data. To create the open-circuit voltage and internal resistance parameters that you need for the block, use the manufacturer discharge characteristics by temperature data. For an example, see “Generate Parameter Data for Datasheet Battery Block”.

To determine the battery output voltage, the block uses lookup tables for the battery open-circuit voltage and the internal resistance. The lookup tables are functions of the state-of charge (SOC) and battery temperature, characterizing the battery performance at various operating points:

$$E_m = f(SOC)$$

$$R_{int} = f(T, SOC)$$

To calculate the voltage, the block implements these equations.

$$V_T = E_m + I_{batt}R_{int}$$

$$I_{batt} = \frac{I_{in}}{N_p}$$

$$V_{out} = \begin{cases} N_s V_T & \text{unfiltered} \\ \frac{V_{out}}{\tau s + 1} & \text{filtered} \end{cases}$$

$$SOC = \frac{1}{Cap_{batt}} \int_0^t I_{batt} dt$$

$$Ld_{AmpHr} = \int_0^t I_{batt} dt$$

Positive current indicates battery discharge. Negative current indicates battery charge.

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Equations
PwrInfo	PwrTrnsfrd — Power transferred between blocks <ul style="list-style-type: none"> <li>Positive signals indicate flow into block</li> <li>Negative signals indicate flow out of block</li> </ul>	PwrLdBatt	Battery network power $V_{batt} = V_{out}$ OR $\frac{V_{out}}{\tau_s + 1}$ $P_{batt} = -V_{batt}I_{batt}$ $P_{LdBatt} = -P_{batt}$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred <ul style="list-style-type: none"> <li>Positive signals indicate an input</li> <li>Negative signals indicate a loss</li> </ul>	PwrLossBatt	Battery network power loss $P_{LossBatt} = -N_p N_s I_{batt}^2 R_{int}$
	PwrStored — Stored energy rate of change <ul style="list-style-type: none"> <li>Positive signals indicate an increase</li> <li>Negative signals indicate a decrease</li> </ul>	PwrStoredBatt	Battery network power stored $P_{StoredBatt} = P_{Batt} + P_{LossBatt}$

The equations use these variables.

<i>SOC</i>	State-of-charge
<i>E<sub>m</sub></i>	Battery open-circuit voltage
<i>I<sub>batt</sub></i>	Per module battery current
<i>P<sub>LdBatt</sub></i>	Battery network power

## Ports

### Inputs

#### CapInit — Battery capacity

scalar

Rated battery capacity at the nominal temperature, *Cap<sub>batt</sub>*, in Ah.

**Dependencies**

To create this port, select External Input for the **Initial battery capacity** parameter.

**BattCurr – Battery load current**

scalar

Combined current flowing from the battery network,  $I_{in}$ , in A.

**BattTemp – Battery temperature**

scalar

Temperature measured at the battery housing,  $T$ , in K.

**Output**

**Info – Bus signal**

bus

Bus signal containing these block calculations.

Signal		Description	Variable	Units	
BattCurr		Combined current flowing from the battery network	$I_{batt}$	A	
BattAmpHr		Battery energy	$Ld_{AmpHr}$	A*h	
BattSoc		State-of-charge capacity	$SOC$	NA	
BattVolt		Combined voltage of the battery network	$V_{out}$	V	
BattPwr		Battery network power	$P_{batt}$	W	
PwrInfo	PwrTrnsfrd	PwrLdBatt	Battery network power	$P_{LdBatt}$	W
	PwrNotTrnsfrd	PwrLossBatt	Battery network power loss	$P_{LossBatt}$	W
	PwrStored	PwrStoredBatt	Battery network power stored	$P_{StoredBatt}$	W

**BattVolt – Battery output voltage**

scalar

Combined voltage of the battery network,  $V_{out}$ , in V.

**Parameters**

**Block Options**

**Initial battery capacity – Input or parameter**

Parameter (default) | External Input

Initial battery capacity,  $Cap_{batt}$ , in Ah.

**Dependencies**

Block Parameter Initial battery capacity Option	Creates
External Input	Input port CapInit
Parameter	Parameter <b>Initial battery capacity, BattCapInit</b>

**Output battery voltage – Unfiltered or Filter**

Unfiltered (default) | Filtered

Select Filtered to apply a first-order filter to the output batter voltage.

**Dependencies**

Setting **Output battery voltage** parameter to Filtered creates these parameters:

- **Output battery voltage time constant, Tc**
- **Output battery voltage initial value, Vinit**

**Rated capacity at nominal temperature, BattChargeMax – Constant**

100 (default) | scalar

Rated battery capacity at the nominal temperature, in Ah.

**Open circuit voltage table data, Em – 1-D lookup table**

1-by-P matrix

Open-circuit voltage data curve,  $E_m$ , as a function of the discharged capacity for P operating points, in V.

**Open circuit voltage breakpoints 1, CapLUTBp – Breakpoints**

1-by-P matrix

Discharge capacity breakpoints for P operating points, dimensionless.

Although this parameter is the same as the **Battery capacity breakpoints 2, CapSOCBp** parameter, the block uses unique parameters for calibration flexibility.

**Internal resistance table data, RInt – 2-D lookup table**

N-by-M matrix

Internal resistance map,  $R_{int}$ , as a function of N temperatures and M SOCs, in ohms.

**Battery temperature breakpoints 1, BattTempBp – Breakpoints**

[243.1 253.1 263.1 273.1 283.1 298.1 313.1] (default) | 1-by-N matrix

Battery temperature breakpoints for N temperatures, in K.

**Battery capacity breakpoints 2, CapSOCBp – Breakpoints**

[0 0.2 0.4 0.6 0.8 1] (default) | 1-by-M matrix

Battery capacity breakpoints for M SOCs, dimensionless.

Although this parameter is the same as the **Open circuit voltage breakpoints 1, CapLUTBp** parameter, the block uses unique parameters for calibration flexibility.

**Number of cells in series,  $N_s$  – Integer**

1 (default) | scalar

Number of cells in series, dimensionless,  $N_s$ .

**Number of cells in parallel,  $N_p$  – Integer**

1 (default) | scalar

Number of cells in parallel, dimensionless,  $N_p$ .

**Initial battery capacity, BattCapInit – Capacity**

100 (default) | scalar

Initial battery capacity,  $Cap_{batt}$ , in Ah.

**Dependencies**

Block Parameter Initial battery capacity Option	Creates
External Input	Input port CapInit
Parameter	Parameter <b>Initial battery capacity, BattCapInit</b>

**Output battery voltage time constant, Tc – Filter time constant**

1/1000 (default) | scalar

Output battery voltage time constant,  $T_c$ , in s. Used in a first-order voltage filter.

**Dependencies**

Setting **Output battery voltage** parameter to Filtered creates these parameters:

- **Output battery voltage time constant, Tc**
- **Output battery voltage initial value, Vinit**

**Output battery voltage initial value – Filter initial voltage**

4.221 (default) | scalar

Output battery voltage initial value,  $V_{init}$ , in V. Used in a first-order voltage filter.

**Dependencies**

Setting **Output battery voltage** parameter to Filtered creates these parameters:

- **Output battery voltage time constant, Tc**
- **Output battery voltage initial value, Vinit**

## Estimation Equivalent Circuit Battery

Resistor-capacitor (RC) circuit battery that creates lookup tables

**Library:** Powertrain Blockset / Energy Storage and Auxiliary Drive / Network Battery

### Description

The Estimation Equivalent Circuit Battery block implements a resistor-capacitor (RC) circuit battery model that you can use to create lookup tables for the Equivalent Circuit Battery block. The lookup tables are functions of the state-of-charge (SOC).

The Estimation Equivalent Circuit Battery block calculates the combined voltage of the network battery using parameter lookup tables. The tables are functions of the SOC. To acquire the SOC, the block integrates the charge and discharge currents.

Specifically, the block implements these parameters as lookup tables that are functions of the SOC:

- Series resistance,  $R_o=f(SOC)$
- Battery open-circuit voltage,  $E_m=f(SOC)$
- Network resistance,  $R_n=f(SOC)$
- Network capacitance,  $C_n=f(SOC)$

To calculate the combined voltage of the battery network, the block uses these equations.

$$V_T = E_m - I_{batt}R_o - \sum_1^n V_n$$

$$V_n = \int_0^t \left[ \frac{I_{batt}}{C_n} - \frac{V_n}{R_n C_n} \right] dt$$

$$SOC = \frac{-1}{C_{batt}} \int_0^t I_{batt} dt$$

$$I_{batt} = I_{in}$$

$$V_{out} = V_T$$

Positive current indicates battery discharge. Negative current indicates battery charge.

The equations use these variables.

$SOC$	State-of-charge
$E_m$	Battery open-circuit voltage

$I_{batt}$	Per module battery current
$I_{in}$	Combined current flowing from the battery network
$R_o$	Series resistance
$n$	Number of RC pairs in series
$V_{out}, V_T$	Combined voltage of the battery network
$V_n$	Voltage for $n$ -th RC pair
$R_n$	Resistance for $n$ -th RC pair
$C_n$	Capacitance for $n$ -th RC pair
$C_{batt}$	Battery capacity

**Ports**

**Inputs**

**BattCurr – Battery network current**

scalar

Combined current flowing from the battery network,  $I_{in}$ , in A.

**Output**

**Info – Bus signal**

bus

Bus signal containing these block calculations.

Signal	Description	Variable	Units
CapVolt	Voltage for $n$ -th RC pair	$V_n$	V

**BattVolt – Battery output voltage**

scalar

Combined voltage of the battery network,  $V_{out}$ , in V.

**BattSoc – Battery SOC**

scalar

Battery state-of-charge,  $SOC$ .

**Parameters**

**Core Battery**

**Number of series RC pairs – RC pairs**

1 (default) | 2 | 3 | 4 | 5

Number of series RC pairs. For lithium, typically 1 or 2.

**Open circuit voltage Em table data, Em – Voltage table**

[3.8 3.8 3.8 3.8 3.8 3.8] (default) | array

Open-circuit voltage table,  $E_m$ , in V. Function of SOC.

**Series resistance table data, R0 – Resistance**  
[0.01 0.01 0.01 0.01 0.01 0.01] (default) | array

Series resistance table,  $R_o$ , in ohms. Function of SOC.

**State of charge breakpoints, SOC\_BP – SOC breakpoints**  
[0 .2 .4 .6 .8 1] (default) | vector

State-of-charge (SOC) breakpoints, dimensionless.

**Battery capacity, BattCap – Capacity**  
27.6250 (default) | scalar

Battery capacity,  $C_{batt}$ , in Ah.

**Initial battery capacity, BattCapInit – Capacity**  
27.6250 (default) | scalar

Initial battery capacity,  $C_{batto}$ , in Ah.

**Initial capacitor voltage, InitialCapVoltage – Voltage**  
0 (default) | vector

Initial capacitor voltage, in V. Dimension of vector must equal the **Number of series RC pairs**.

#### **R and C Table Data**

**Network resistance table data, Rn – Lookup table**  
[0.005 0.005 0.005 0.005 0.005 0.005] (default) | array

Network resistance table data for  $n$ -th RC pair, as a function of SOC, in ohms.

**Network capacitance table data, Cn – Lookup table**  
[10000 10000 10000 10000 10000 10000] (default) | array

Network capacitance table data for  $n$ -th RC pair, as a function of SOC, in F.

#### **Cell Limits**

**Upper Integrator Voltage Limit, Vu – Maximum**  
Inf (default) | scalar

Upper voltage limit, in V.

**Lower Integrator Voltage Limit, Vl – Minimum**  
Inf (default) | scalar

Lower voltage limit, in V.

## Equivalent Circuit Battery

Resistor-capacitor (RC) circuit battery

**Library:** Powertrain Blockset / Energy Storage and Auxiliary Drive / Network Battery

### Description

The Equivalent Circuit Battery block implements a resistor-capacitor (RC) circuit battery that you can parameterize using equivalent circuit modeling (ECM). To simulate the state-of-charge (SOC) and terminal voltage, the block uses load current and internal core temperature.

The Equivalent Circuit Battery block calculates the combined voltage of the network battery using parameter lookup tables. The tables are functions of the SOC and battery temperature. You can use the Estimation Equivalent Circuit Battery block to help create the lookup tables.

Specifically, the Equivalent Circuit Battery block implements these parameters as lookup tables that are functions of the SOC and battery temperature:

- Series resistance,  $R_o=f(SOC,T)$
- Battery open-circuit voltage,  $E_m=f(SOC,T)$
- Battery capacity,  $C_{batt}=f(T)$
- Network resistance,  $R_n=f(SOC,T)$
- Network capacitance,  $C_n=f(SOC,T)$

To calculate the combined voltage of the battery network, the block uses these equations.

$$V_T = E_m - I_{batt}R_0 - \sum_1^n V_n$$

$$V_n = \int_0^t \left[ \frac{I_{batt}}{C_n} - \frac{V_n}{R_n C_n} \right] dt$$

$$SOC = \frac{-1}{C_{batt}} \int_0^t I_{batt} dt$$

$$I_{batt} = \frac{I_{in}}{N_p}$$

$$V_{out} = N_s V_T$$

$$P_{BattLoss} = I_{batt}^2 R_0 + \sum_1^n \frac{V_n^2}{R_n}$$

$$Ld_{AmpHr} = \int_0^t I_{batt} dt$$

Positive current indicates battery discharge. Negative current indicates battery charge.

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Equations
PwrIn fo	PwrTrnsfrd — Power transferred between blocks  • Positive signals indicate flow into block • Negative signals indicate flow out of block	PwrLdBatt	Battery network power  $V_{batt} = V_{out}$ OR $\frac{V_{out}}{\tau_s + 1}$  $P_{batt} = -V_{batt}I_{batt}$ $P_{LdBatt} = -P_{batt}$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred  • Positive signals indicate an input • Negative signals indicate a loss	PwrLossBatt	Battery network power loss  $P_{LossBatt} =$ $- \left( I_{batt}^2 R_0 + \sum_1^n \frac{V_n^2}{R_n} \right)$
	PwrStored — Stored energy rate of change  • Positive signals indicate an increase • Negative signals indicate a decrease	PwrStoredBatt	Battery network power stored  $P_{StoredBatt} = P_{Batt} + P_{LossBatt}$

The equations use these variables.

SOC                      State-of-charge

$E_m$	Battery open-circuit voltage
$I_{batt}$	Per module battery current
$I_{in}$	Combined current flowing from the battery network
$R_o$	Series resistance
$N_p$	Number parallel branches
$N_p$	Number of RC pairs in series
$V_{out}, V_T$	Combined voltage of the battery network
$V_n$	Voltage for $n$ -th RC pair
$R_n$	Resistance for $n$ -th RC pair
$C_n$	Capacitance for $n$ -th RC pair
$C_{batt}$	Battery capacity
$P_{batt}$	Battery power
$P_{LossBatt}$	Negative of battery network power loss
$P_{BattLoss}$	Battery network power loss
$P_{StoredBatt}$	Battery network power stored
$P_{LdBatt}$	Battery network power
$T$	Battery temperature

## Ports

### Inputs

#### CapInit – Battery capacity

scalar

Rated battery capacity at the nominal temperature,  $Cap_{batt}$ , in Ah.

#### Dependencies

To create this port, select External Input for the **Initial battery capacity** parameter.

#### BattCurr – Battery network current

scalar

Combined current flowing from the battery network,  $I_{in}$ , in A.

#### BattTemp – Battery temperature

scalar

Battery temperature,  $T$ , in K.

### Output

#### Info – Bus signal

bus

Bus signal containing these block calculations.

Signal		Description	Variable	Units	
BattCurr		Combined current flowing from the battery network	$I_{batt}$	A	
BattAmpHr		Battery energy	$Ld_{AmpHr}$	A*h	
BattSoc		State-of-charge capacity	$SOC$	NA	
BattVolt		Combined voltage of the battery network	$V_{out}$	V	
BattPwr		Battery power	$P_{batt}$	W	
PwrInfo	PwrTrnsfrd	PwrLdBatt	Battery network power	$P_{LdBatt}$	W
	PwrNotTrnsfrd	PwrLossBatt	Battery network power loss	$P_{LossBatt}$	W
	PwrStored	PwrStoredBatt	Battery network power stored	$P_{StoredBatt}$	W

### BattVolt – Battery output voltage

scalar

Combined voltage of the battery network,  $V_{out}$ , in V.

## Parameters

### Block Options

#### Initial battery capacity – Input or parameter

Parameter (default) | External Input

Initial battery capacity,  $Cap_{batt}$ , in Ah.

### Dependencies

Block Parameter Initial battery capacity Option	Creates
External Input	Input port CapInit
Parameter	Parameter <b>Initial battery capacity, BattCapInit</b>

#### Output battery voltage – Unfiltered or Filter

Unfiltered (default) | Filtered

Select Filtered to apply a first-order filter to the output batter voltage.

### Dependencies

Setting **Output battery voltage** parameter to Filtered creates these parameters:

- **Output battery voltage time constant, Tc**
- **Output battery voltage initial value, Vinit**

**Core Battery**

**Number of series RC pairs – RC pairs**

1 (default) | 2 | 3 | 4 | 5

Number of series RC pairs. For lithium, typically 1 or 2.

**Open circuit voltage Em table data, Em – Voltage table**

[3.5042 3.5136; 3.5573 3.5646; 3.6009 3.6153; 3.6393 3.6565; 3.6742 3.6889; 3.7121 3.7214; 3.7937 3.8078; 3.8753 3.8945; 3.97 3.9859; 4.0764 4.0821; 4.1924 4.193] (default) | array

Open circuit voltage table,  $E_m$ , in V. Function of SOC and battery temperature.

**Series resistance table data, R0 – Resistance**

array

Series resistance table,  $R_o$ , in ohms. Function of SOC and battery temperature.

**State of charge breakpoints, SOC\_BP – SOC breakpoints**

[0 0.1 0.2 0.3 0.4 0.5 0.6 0.7 0.8 0.9 1] (default) | vector

State-of-charge (SOC) breakpoints, dimensionless.

**Temperature breakpoints, Temperature\_BP – Battery**

[293.15 313.15] (default) | vector

Battery temperature breakpoints, K.

**Battery capacity table, BattCap – Capacity**

[28 28] (default) | array

Battery capacity,  $C_{batt}$ , in Ah. Function of battery temperature.

**Initial battery capacity, BattCapInit – Capacity**

28 (default) | scalar

Initial battery capacity,  $Cap_{batt}$ , in Ah.

**Dependencies**

Block Parameter Initial battery capacity Option	Creates
External Input	Input port CapInit
Parameter	Parameter <b>Initial battery capacity, BattCapInit</b>

**Initial capacitor voltage, InitialCapVoltage – Voltage**

0 (default) | array

Initial capacitor voltage, in V. Dimension of vector must equal the **Number of series RC pairs**.

**Output battery voltage time constant, Tc – Filter time constant**

1/1000 (default) | scalar

Output battery voltage time constant,  $T_c$ , in s. Used in a first-order voltage filter.

#### Dependencies

Setting **Output battery voltage** parameter to Filtered creates these parameters:

- **Output battery voltage time constant, Tc**
- **Output battery voltage initial value, Vinit**

#### Output battery voltage initial value, Vinit – Filter initial voltage

4.193 (default) | scalar

Output battery voltage initial value,  $V_{init}$ , in V. Used in a first-order voltage filter.

#### Dependencies

Setting **Output battery voltage** parameter to Filtered creates these parameters:

- **Output battery voltage time constant, Tc**
- **Output battery voltage initial value, Vinit**

#### R and C Table Data

##### Network resistance table data, Rn – Lookup table

[0.010342 0.0012244; 0.0067316 0.0011396; 0.0051156 0.0012661; 0.0043447 0.0012265; 0.0038826 0.0011163; 0.0034226 0.0009968; 0.003346 0.0011458; 0.0033222 0.001345; 0.0033201 0.0013091; 0.0032886 0.0010986; 0.0028114 0.0010309] (default) | array

Network resistance table data for  $n$ -th RC pair, in ohms, as a function of SOC and battery temperature.

##### Network capacitance table data, Cn – Lookup table

[2287.7 11897; 6122 24515; 18460 42098; 20975 44453; 15254 33098; 10440 24492; 13903 32975; 16694 40007; 15784 35937; 12165 26430; 9118 24795] (default) | array

Network capacitance table data for  $n$ -th RC pair, in F, as a function of SOC and battery temperature.

#### Cell Limits

##### Upper integrator voltage limit, Vu – Maximum

-Inf (default) | scalar

Upper voltage limit, in V.

##### Lower integrator voltage limit, Vl – Minimum

-Inf (default) | scalar

Lower voltage limit, in V.

# Reduced Lundell Alternator

Reduced Lundell (claw-pole) alternator with an external voltage regulator

**Library:** Powertrain Blockset / Energy Storage and Auxiliary Drive / Alternator

## Description

The Reduced Lundell Alternator block implements a reduced Lundell (claw-pole) alternator with an external voltage regulator. The back-electromotive force (EMF) voltage is proportional to the input velocity and field current. The motor operates as a source torque to the internal combustion engine.

Use the Reduced Lundell Alternator block:

- To model an automotive electrical system
- In an engine model with a front-end accessory drive (FEAD)

The calculated motor shaft torque is in the opposite direction of the engine speed. You can:

- Tune the external voltage regulator to a desired bandwidth. The stator current and two diode drops reduce the stator voltage.
- Filter the load current to desired bandwidth. The load current has a lower saturation of 0 A.

The Reduced Lundell Alternator block implements equations for the electrical, control, and mechanical systems that use these variables.

## Electrical

To calculate voltages, the block uses these equations.

Calculation	Equations
Alternator output voltage	$v_s = K_v i_f \omega - R_s i_s - 2V_d$
Field winding voltage	$v_f = R_f i_f + L_f \frac{di_f}{dt}$

## Control

The controller assumes no resistance or voltage drop.

Calculation	Equations
Field winding voltage transform	$V_f(s) = R_f I_f(s) + sL_f I_f(s)$
Field winding current transform	$I_f(s) = \frac{V_f(s)}{(R_f + sL_f)}$

Calculation	Equations
Open loop electrical transfer function	$G(s) = \frac{V_s(s)}{V_f(s)} = \frac{K_v \omega}{(R_f + sL_f)}$
Open loop voltage regulator transfer function	$G_C(s) = \frac{V_f(s)}{V_{ref}(s)}$
Closed loop transfer function	$T(s) = \frac{G(s)G_C(s)}{1 + G(s)G_C(s)}$
Closed loop controller design	$T(s) = \frac{1}{\tau s + 1} \rightarrow G(s)G_C(s) = \frac{1}{\tau s}$ $G_C(s) = K_g \left( K_p + \frac{K_i}{s} \right)$ $G(s)G_C(s) = \frac{K_v \omega}{(R_f + sL_f)} K_g \left( K_p + \frac{K_i}{s} \right)$ $K_p = L_f, K_i = R_f, \text{ and } K_g = \frac{2\pi f}{K_v \omega}$

### Mechanical

To calculate torques, the block uses these equations.

Calculation	Equations
Electrical torque	$\tau_{elec} = (K_v i_f \omega) i_{load}$
Frictional torque	$\tau_{friction} = K_b \omega$
Windage torque	$\tau_{windage} = K_w \omega^2$
Torque at start	$\tau_{start} = K_c$ when $\omega = 0$
Motor shaft torque	$\tau_{mech} = \tau_{elec} + \tau_{friction} + \tau_{windage} + \tau_{start}$

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Variable	Equations
PwrIn fo	PwrTrnsfrd — Power transferred between blocks  <ul style="list-style-type: none"> <li>Positive signals indicate flow into block</li> <li>Negative signals indicate flow out of block</li> </ul>	PwrMtr	Mechanical power $P_{mot}$	$P_{mot} = \omega \tau_{mech}$
		PwrBus	Electrical power $P_{bus}$	$P_{bus} = -v_s i_{load}$

Bus Signal		Description	Variable	Equations	
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred <ul style="list-style-type: none"> <li>• Positive signals indicate an input</li> <li>• Negative signals indicate a loss</li> </ul>	PwrLoss	Motor power loss	$P_{loss}$	$P_{loss} = -(P_{mot} + P_{bus} - P_{ind})$
	PwrStored — Stored energy rate of change <ul style="list-style-type: none"> <li>• Positive signals indicate an increase</li> <li>• Negative signals indicate a decrease</li> </ul>	PwrInd	Electrical winding loss	$P_{ind}$	$P_{ind} = L_f i_f \frac{di_f}{dt}$

The equations use these variables.

$v_{ref}$	Alternator output voltage command
$v_f$	Field winding voltage
$i_f$	Field winding current
$i_s$	Stator winding current
$V_d$	Diode voltage drop
$R_f$	Field winding resistance
$R_s$	Stator winding resistance
$L_f$	Field winding inductance
$K_v$	Voltage constant
$F_v$	Voltage regulator bandwidth
$F_c$	Input current filter bandwidth
$V_{fmax}$	Field control voltage upper saturation limit
$V_{fmin}$	Field control voltage lower saturation limit
$K_c$	Coulomb friction coefficient
$K_b$	Viscous friction coefficient
$K_w$	Windage coefficient
$\omega$	Motor shaft angular speed
$i_{load}$	Alternator load current
$v_s$	Alternator output voltage
$\tau_{mech}, T_{mech}$	Motor shaft torque

## Ports

### Inputs

#### RefVolt — Alternator output voltage command

scalar

Alternator output voltage command, in V.

#### AltSpd — Angular speed

scalar

Motor shaft input angular speed, in rad/s.

#### LdCurr — Alternator load current

scalar

Alternator load current, in A.

Do not connect the port to the alternator rated current, which is a constant value. The block uses the alternator load current as the stator winding current,  $i_s$ , to determine the alternator voltage and motor torque. If you connect the port to the rated alternator current, the block does not model the dynamic effect of load current changes on the voltage and motor torque.

### Output

#### Info — Bus signal

bus

Bus signal containing these block calculations.

Signal		Description	Units	
FldVolt		Field winding voltage	A	
FldFlux		Field flux	Wb	
PwrInfo	PwrTrnsfrd	PwrMtr	Mechanical power	W
		PwrBus	Electrical power	W
	PwrNotTrnsfrd	PwrLoss	Motor power loss	W
	PwrStored	PwrInd	Electrical winding loss	W

#### AltVolt — Alternator output voltage

scalar

Alternator output voltage, in V.

#### LdTrq — Motor shaft torque

scalar

Motor shaft torque, in N·m.

## Parameters

### Machine Configuration

#### Voltage constant, $K_v$ — Constant

.1 (default) | scalar

Voltage constant, in V/rad/s.

#### Field winding resistance, $R_f$ — Resistance

0.2 (default) | scalar

Field winding resistance, in ohm.

#### Field winding inductance, $L_f$ — Inductance

0.002 (default) | scalar

Field winding inductance, in H.

#### Stator winding resistance, $R_s$ — Resistance

0.01 (default) | scalar

Stator winding resistance, in ohm.

#### Diode voltage drop, $V_d$ — Voltage

0.7 (default) | scalar

Diode voltage drop, in V.

### Voltage Regulator

#### Regulator bandwidth, $F_v$ — Bandwidth

2000 (default) | scalar

The regulator bandwidth, in Hz.

#### Current filter bandwidth, $F_c$ — Bandwidth

1000 (default) | scalar

The current filter bandwidth, in Hz.

#### Field voltage max, $V_{fmax}$ — Maximum field voltage

100 (default) | scalar

The maximum field voltage, in V.

#### Field voltage min, $V_{fmin}$ — Minimum field voltage

-100 (default) | scalar

The minimum field voltage, in V.

### Mechanical Losses

#### Coulomb friction, $K_c$ — Friction

0 (default) | scalar

Coulomb friction, in N·m.

**Viscous friction, Kb — Friction**

0 (default) | scalar

Viscous friction, in N·m/rad/s.

**Windage, Kw — Windage**

0 (default) | scalar

Windage, in N·m/rad<sup>2</sup>/s<sup>2</sup>.

Starter

**Introduced in R2017a**

# Starter

Starter as a DC motor

**Library:** Powertrain Blockset / Energy Storage and Auxiliary Drive / Starter

## Description

The Starter block implements a starter assembly as a separately excited DC motor, permanent magnet DC motor, or series connection DC motor. The motor operates as a torque source to an internal combustion engine.

Use the Starter block:

- In an engine model with a front-end accessory drive (FEAD)
- To model engine start and stop scenarios

The Starter block supports only an angular speed input to the DC motor. A load torque input requires engine dynamics.

### Separately Excited DC Motor

In a separately excited DC motor, the field winding is connected to a separate source of DC power.

The relationship between the field winding voltage, field resistance, and field inductance is given by:

$$V_f = L_f \frac{di_f}{dt} + R_f i_f$$

The counter-electromotive force is a product of the field resistance, mutual inductance, and motor shaft angular speed:

$$EMF = L_a i_f L_{af} \omega$$

The armature voltage is given by:

$$V_a = L_a \frac{di_a}{dt} + R_a i_a + EMF$$

The starter motor current load is the sum of the field winding current and armature winding current:

$$i_{load} = i_f + i_a$$

The starter motor shaft torque is the product of the armature current, field current, and mutual inductance:

$$T_{mech} = i_a i_f L_{af}$$

### Permanent Magnet DC Motor

In a permanent magnet DC motor, the magnets establish the excitation flux, so there is no field current.

The counter-electromotive force is proportional to the motor shaft angular speed:

$$EMF = K_t \omega$$

The armature voltage is given by:

$$V_a = L_a \frac{di_a}{dt} + R_a i_a + EMF$$

The starter motor current load is equal to the armature winding current:

$$i_{load} = i_a$$

The starter motor shaft torque is proportional to the armature winding current:

$$T_{mech} = K_t i_a$$

### Series Excited DC Motor

A series excited DC motor connects the armature and field windings in series with a common DC power source.

The counter-electromotive force is a product of the field and armature initial series current, field, and armature mutual inductance and motor shaft angular speed:

$$EMF = i_{af} L_{af} \omega$$

The field and armature winding voltage is given by:

$$V_{af} = L_{ser} \frac{di_{af}}{dt} + R_{ser} i_{af} + EMF$$

The starter motor current load is equal to the field and armature series current:

$$i_{load} = i_{af}$$

The starter motor shaft torque is the product of the squared field and armature series current and the field and armature mutual inductance:

$$T_{mech} = i_{af}^2 L_{af}$$

For motor stability, the motor shaft angular speed must be greater than the ratio of the series connected field and armature resistance to the mutual inductance:

$$\omega > - \frac{R_{ser}}{L_{af}}$$

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Variable	Equations
PwrInfo	PwrTrnsfrd — Power transferred between blocks	PwrMtr	Mechanical power	$P_{mot} = -\omega T_{mech}$
	<ul style="list-style-type: none"> <li>Positive signals indicate flow into block</li> <li>Negative signals indicate flow out of block</li> </ul>	PwrBus	Electrical power	Separately excited DC motor
				$P_{bus} = v_a i_a + v_f i_f$ PM excited DC motor $P_{bus} = v_a i_a$ Series excited DC motor $P_{bus} = v_{af} i_{af}$
PwrNotTrnsfrd — Power crossing the block boundary, but not transferred	PwrLoss	Motor losses	$P_{loss} = -(P_{mot} + P_{bus} - P_{ind})$	
PwrStored	— Stored energy rate of change <ul style="list-style-type: none"> <li>Positive signals indicate an increase</li> <li>Negative signals indicate a decrease</li> </ul>	PwrInd	Electrical inductance	Separately excited DC motor
				$P_{ind} = L_f i_f \frac{di_f}{dt} + L_a i_a \frac{di_a}{dt}$ PM excited DC motor $P_{ind} = L_a i_a \frac{di_a}{dt}$
				Series excited DC motor $P_{ind} = L_{ser} i_{af} \frac{di_{af}}{dt}$

The equations use these variables.

- $R_a$  Armature winding resistance
- $L_a$  Armature winding inductance
- $EMF$  Counter-electromotive force
- $R_f$  Field winding resistance
- $L_f$  Field winding inductance
- $L_{af}$  Field and armature mutual inductance

$i_a$	Armature winding current
$i_f$	Field winding current
$K_t$	Motor torque constant
$\omega$	Motor shaft angular speed
$V_a$	Armature winding voltage
$V_f$	Field winding voltage
$V_{af}$	Field and armature winding voltage
$i_{af}$	Field and armature series current
$R_{ser}$	Series connected field and armature resistance
$L_{ser}$	Series connected field and armature inductance
$i_{load}$	Starter motor current load
$T_{mech}$	Starter motor shaft torque

## Ports

### Inputs

#### MtrSpd – Angular speed

scalar

Motor shaft angular speed, in rad/s.

#### StartVOLT – Armature and field voltage

scalar

- Armature winding voltage  $V_a$  and field winding voltage  $V_f$  in V.
- In series excited DC motor, armature and field winding voltage  $V_{af}$ .

### Output

#### Info – Bus signal

bus

Bus signal containing these block calculations.

Signal		Description	Units	
ArmCurr		Armature winding current	A	
FldCurr		Field winding current	A	
PwrInfo	PwrTrnsfrd	PwrMtr	Mechanical power	W
		PwrBus	Electrical power	W
	PwrNotTrnsfrd	PwrLoss	Motor power loss	W
	PwrStored	PwrInd	Electrical inductance	W

#### LdCurr – Starter motor load current

scalar

Starter motor load current, in A.

**MtrTrq – Starter motor shaft torque**  
 scalar

Starter motor shaft torque, in N·m.

## Parameters

### Configuration

#### Motor Type – Select motor type

Separately Excited DC Motor (default) | Permanent Magnet Excited DC Motor | Series Connection DC Motor

Select one of the three motor types.

### Dependencies

The table summarizes the motor parameter dependencies.

Motor Type	Enables Motor Parameter
Separately Excited DC Motor	Armature winding resistance, Ra
	Armature winding inductance, La
	Field winding resistance Rf
	Field winding inductance, Lf
	Mutual inductance, Laf
Permanent Magnet Excited DC Motor	Initial armature and field current, Iaf
	Armature winding resistance, Rapm
	Armature winding inductance, Lapm
	Torque constant, Kt
Series Connection DC Motor	Initial armature current, Ia
	Total resistance, Rser
	Total inductance, Lser
	Initial current, Iafser
	Mutual inductance, Lafser

### Separately Excited DC Motor

**Armature winding resistance, Ra – Resistance**  
 1 (default) | scalar

Armature winding resistance, in ohm.

### Dependencies

To enable this parameter, select Separately Excited DC Motor for the **Motor Type** parameter.

**Armature winding inductance, La – Inductance**  
 .1 (default) | scalar

Armature winding inductance, in H.

**Dependencies**

To enable this parameter, select Separately Excited DC Motor for the **Motor Type** parameter.

**Field winding resistance,  $R_f$  – Resistance**

.3 (default) | scalar

Field winding resistance, in ohm.

**Dependencies**

To enable this parameter, select Separately Excited DC Motor for the **Motor Type** parameter.

**Field winding inductance,  $L_f$  – Inductance**

.2 (default) | scalar

Field winding inductance, in H.

**Dependencies**

To enable this parameter, select Separately Excited DC Motor for the **Motor Type** parameter.

**Mutual inductance,  $L_{af}$  – Inductance**

.3 (default) | scalar

Mutual inductance, in H.

**Dependencies**

To enable this parameter, select Separately Excited DC Motor for the **Motor Type** parameter.

**Initial armature current and field current,  $I_{af}$  – Current**

[0 0] (default) | vector

Initial armature and field current, in A.

**Dependencies**

To enable this parameter, select Separately Excited DC Motor for the **Motor Type** parameter.

**Permanent Magnet Excited DC Motor**

**Armature winding resistance,  $R_{apm}$  – Resistance**

.5 (default) | scalar

Armature winding resistance, in ohm.

**Dependencies**

To enable this parameter, select Permanent Magnet Excited DC Motor for the **Motor Type** parameter.

**Armature winding inductance,  $L_{apm}$  – Inductance**

.1 (default) | scalar

Armature winding inductance, in H.

**Dependencies**

To enable this parameter, select Permanent Magnet Excited DC Motor for the **Motor Type** parameter.

**Torque constant,  $K_t$  — Motor torque constant**

.1 (default) | scalar

Motor torque constant, in N·m/A.

**Dependencies**

To enable this parameter, select Permanent Magnet Excited DC Motor for the **Motor Type** parameter.

**Initial armature current,  $I_a$  — Current**

.1 (default) | scalar

Initial armature current, in A.

**Dependencies**

To enable this parameter, select Permanent Magnet Excited DC Motor for the **Motor Type** parameter.

**Series Connection DC Motor****Total resistance,  $R_{ser}$  — Resistance**

.1 (default) | scalar

Series connected field and armature resistance, in ohm.

**Dependencies**

To enable this parameter, select Series Excited DC Motor for the **Motor Type** parameter.

**Total inductance,  $L_{ser}$  — Inductance**

.1 (default) | scalar

Series connected field and armature inductance, in H.

**Dependencies**

To enable this parameter, select Series Excited DC Motor for the **Motor Type** parameter.

**Initial current,  $I_{afser}$  — Current**

0 (default) | scalar

Initial series current, in A.

**Dependencies**

To enable this parameter, select Series Excited DC Motor for the **Motor Type** parameter.

**Mutual inductance,  $L_{afser}$  — Inductance**

.3 (default) | scalar

Field and armature mutual inductance, in H.

### **Dependencies**

To enable this parameter, select `Series Excited DC Motor` for the **Motor Type** parameter.

## Bidirectional DC-DC

DC-to-DC converter that supports bidirectional boost and buck

**Library:** Powertrain Blockset / Energy Storage and Auxiliary Drive / DC-DC

### Description

The Bidirectional DC-DC block implements a DC-to-DC converter that supports bidirectional boost and buck (lower) operation. Unless the DC-to-DC conversion limits the power, the output voltage tracks the voltage command. You can specify electrical losses or measured efficiency.

Depending on your battery system configuration, the voltage might not be at a potential that is required by electrical system components such as inverters and motors. You can use the block to boost or buck the voltage. Connect the block to the battery and one of these blocks:

- Mapped Motor
- IM Controller
- Interior PM Controller
- Surface Mount PM Controller

To calculate the electrical loss during the DC-to-DC conversion, use **Parameterize losses by**.

Parameter Option	Description
Single efficiency measurement	Electrical loss calculated using a constant value for conversion efficiency.
Tabulated loss data	Electrical loss calculated as a function of load current and voltage. DC-to-DC converter data sheets typically provide loss data in this format. When you use this option, provide data for all the operating quadrants in which the simulation will run. If you provide partial data, the block assumes the same loss pattern for other quadrants. The block does not extrapolate loss that is outside the range voltage and current that you provide. The block allows you to account for fixed losses that are still present for zero voltage or current.

Parameter Option	Description
Tabulated efficiency data	<p>Electrical loss calculated using conversion efficiency that is a function of load current and voltage. When you use this option, provide data for all the operating quadrants in which the simulation will run. If you provide partial data, the block assumes the same efficiency pattern for other quadrants. The block:</p> <ul style="list-style-type: none"> <li>Assumes zero loss when either the voltage or current is zero.</li> <li>Uses linear interpolation to determine the loss. At lower power conditions, for calculation accuracy, provide efficiency at low voltage and low current.</li> </ul>

**Note** The block does not support inversion. The polarity of the input voltage matches the polarity of the output voltage.

### Theory

The Bidirectional DC-DC block uses the commanded voltage and the actual voltage to determine whether to boost or buck (lower) the voltage. You can specify a time constant for the voltage response.

If	Then
$Volt_{cmd} > Src_{Volt}$	Boost
$Volt_{cmd} < Src_{Volt}$	Buck

The Bidirectional DC-DC block uses a time constant-based regulator to provide a fixed output voltage that is independent of load current. Using the output voltage and current, the block determines the losses of the DC-to-DC conversion. The block uses the conversion losses to calculate the input current. The block accounts for:

- Bidirectional current flow
  - Source to load — Battery discharge
  - Load to source — Battery charge
- Rated power limits

The block provides voltage control that is power limited based on these equations. The voltage is fixed. The block does not implement a voltage drop because the load current approximates DC-to-DC conversion with a bandwidth that is greater than the load current draw.

DC-to-DC converter load voltage	$LdVolt_{Cmd} = \min(Volt_{Cmd}, \frac{P_{limit}}{Ld_{Amp}}, 0)$ $LdVolt = LdVolt_{Cmd} \cdot \frac{1}{TS + 1}$
Power loss for single efficiency source to load	$P_{Wr_{Loss}} = \frac{100 - Eff}{Eff} \cdot Ld_{Volt} \cdot Ld_{Amp}$

Power loss for single efficiency load to source	$P_{WrLoss} = \frac{100 - Eff}{Eff} \cdot  Ld_{Volt} \cdot Ld_{Amp} $
Power loss for tabulated efficiency	$Prw_{Loss} = f(Ld_{Volt}, Ld_{Amp})$
Source current draw from DC-to-DC converter	$Src_{Amp} = \frac{Ld_{Pwr} + Prw_{Loss}}{Src_{Volt}}$
Source power from DC-to-DC converter	$Src_{Pwr} = Src_{Amp} \cdot Src_{Volt}$

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Variable	Equations
PwrInfo	PwrTrnsfrd — Power transferred between blocks	PwrBusSrc	Source power to DC-to-DC converter	$P_{src} = Src_{Pwr}$
	<ul style="list-style-type: none"> <li>Positive signals indicate flow into block</li> <li>Negative signals indicate flow out of block</li> </ul>	PwrBusLd	Load power from DC-to-DC converter	$P_{bus} = -Ld_{Volt}$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred	PwrLoss	Converter power loss	$P_{loss} = Pwr_{Loss}$
	<ul style="list-style-type: none"> <li>Positive signals indicate an input</li> <li>Negative signals indicate a loss</li> </ul>			
	PwrStored — Stored energy rate of change		Not used	
	<ul style="list-style-type: none"> <li>Positive signals indicate an increase</li> <li>Negative signals indicate a decrease</li> </ul>			

The equations use these variables.

$Volt_{Cmd}$	DC-to-DC converter commanded output voltage
$Src_{Volt}$	Source input voltage to DC-to-DC converter
$Ld_{Amp}$	Load current of DC-to-DC converter
$Ld_{Volt}$	Load voltage of DC-to-DC converter
$Src_{Amp}$	Source current draw from DC-to-DC converter
$\tau$	Conversion time constant
$V_{init}$	Initial load voltage of the DC-to-DC converter
$P_{limit}$	Output power limit for DC-to-DC converter
$Eff$	Input to output efficiency
$Src_{Pwr}$	Source power to DC-to-DC converter
$Ld_{Pwr}$	Load power from DC-to-DC converter

$Pwr_{Loss}$  Power loss  
 $LdVolt_{Cmd}$  Commanded load voltage of DC-to-DC converter before application of time constant

## Ports

### Inputs

#### **VoltCmd — Commanded voltage**

scalar

DC-to-DC converter commanded output voltage,  $Volt_{Cmd}$ , in V.

#### **SrcVolt — Input voltage**

scalar

Source input voltage to DC-to-DC converter,  $Src_{Volt}$ , in V.

#### **LdCurr — Load current**

scalar

Load current of DC-to-DC converter,  $Ld_{Amp}$ , in A.

### Output

#### **Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal		Description	Variable	Units	
SrcPwr		Source power to DC-to-DC converter	$Src_{Pwr}$	W	
LdPwr		Load power from DC-to-DC converter	$Ld_{Pwr}$	W

#### **LdVolt — Load voltage**

scalar

Load voltage of DC-to-DC converter,  $Ld_{Volt}$ , in V.

**SrcCurr – Source current**

scalar

Source current draw from DC-to-DC converter,  $Src_{Amp}$ , in A.**Parameters****Electrical Control****Converter response time constant – Constant**

1/1000 (default) | scalar

Converter response time,  $\tau$ , in s.**Converter response initial voltage, Vinit – Voltage**

0 (default) | scalar

Initial load voltage of the DC-to-DC converter,  $V_{init}$ , in V.**Converter power limit, Plimit – Power**

100000 (default) | scalar

Initial load voltage of the DC-to-DC converter,  $P_{limit}$ , in W.**Electrical Losses****Parameterize losses by – Loss calculation**

Single efficiency measurement (default) | Tabulated loss data | Tabulated efficiency data

This table summarizes the loss options used to calculate electrical options.

Parameter Option	Description
Single efficiency measurement	Electrical loss calculated using a constant value for conversion efficiency.
Tabulated loss data	Electrical loss calculated as a function of load current and voltage. DC-to-DC converter data sheets typically provide loss data in this format. When you use this option, provide data for all the operating quadrants in which the simulation will run. If you provide partial data, the block assumes the same loss pattern for other quadrants. The block does not extrapolate loss that is outside the range voltage and current that you provide. The block allows you to account for fixed losses that are still present for zero voltage or current.

Parameter Option	Description
Tabulated efficiency data	<p>Electrical loss calculated using conversion efficiency that is a function of load current and voltage. When you use this option, provide data for all the operating quadrants in which the simulation will run. If you provide partial data, the block assumes the same efficiency pattern for other quadrants. The block:</p> <ul style="list-style-type: none"> <li>Assumes zero loss when either the voltage or current is zero.</li> <li>Uses linear interpolation to determine the loss. At lower power conditions, for calculation accuracy, provide efficiency at low voltage and low current.</li> </ul>

**Overall DC to DC converter efficiency, *eff* – Constant**

98 (default) | scalar

Overall conversion efficiency, *Eff*, in %.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Single efficiency measurement.

**Vector of voltages (*v*) for tabulated loss, *v\_loss\_bp* – Breakpoints**

[0 200 400 600 800 1000] (default) | 1-by-M vector

Tabulated loss breakpoints for M load voltages, in V.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.

**Vector of currents (*i*) for tabulated loss, *i\_loss\_bp* – Breakpoints**

[0 25 50 75 100] (default) | 1-by-N vector

Tabulated loss breakpoints for N load currents, in A.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.

**Corresponding losses, *losses\_table* – 2-D lookup table**

N-by-M matrix

Electrical loss map, as a function of N load currents and M load voltages, in W.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.

## Equivalent Consumption Minimization Strategy

Energy management controller for P0-P4 hybrid electric vehicles

**Library:** Powertrain Blockset / Propulsion / Supervisory Controllers

### Description

Use the Equivalent Consumption Minimization Strategy (ECMS) block to control the energy management of hybrid electric vehicles (HEVs). The block optimizes the torque split between the engine and motor to minimize energy consumption while maintaining the battery state of charge (SOC).

The HEV P0, P1, P2, P3, and P4 reference applications use the Equivalent Consumption Minimization Strategy block for hybrid control.

Use the **Motor location** parameter to specify the HEV motor location.

Use the **ECMS method** parameter to implement either an adaptive or non-adaptive ECMS method. The HEV architectures are charge-sustaining, meaning the battery SOC must remain in a specified range because there is no plugin capability to recharge the battery. The battery is an energy buffer, and all energy comes from the fuel if the change in SOC is minimized over a drive cycle. To sustain the charge over a specified drive cycle, the block implements either of these ECMS methods.

ECMS Method	Description
Non-adaptive (default)	<p>The block uses a constant ECMS equivalence factor.</p> <ul style="list-style-type: none"> <li>• Use this method to determine the best fuel economy over a drive cycle. <ul style="list-style-type: none"> <li>• If you change the drive cycle or HEV architecture, retune the <b>ECMS weighting factor</b> to maintain the ending SOC.</li> </ul> </li> <li>• By default, the block uses a single constant.</li> </ul>
Adaptive	<p>The block adjusts an ECMS equivalence factor by using the output of a PI controller.</p> <ul style="list-style-type: none"> <li>• Use this method to maintain the SOC and minimize the delta SOC over many drive cycles. The block: <ul style="list-style-type: none"> <li>• Tunes the PI controller gains.</li> <li>• Sustains the SOC.</li> </ul> </li> <li>• The PI controller minimizes the error between the target SOC and current SOC.</li> </ul>

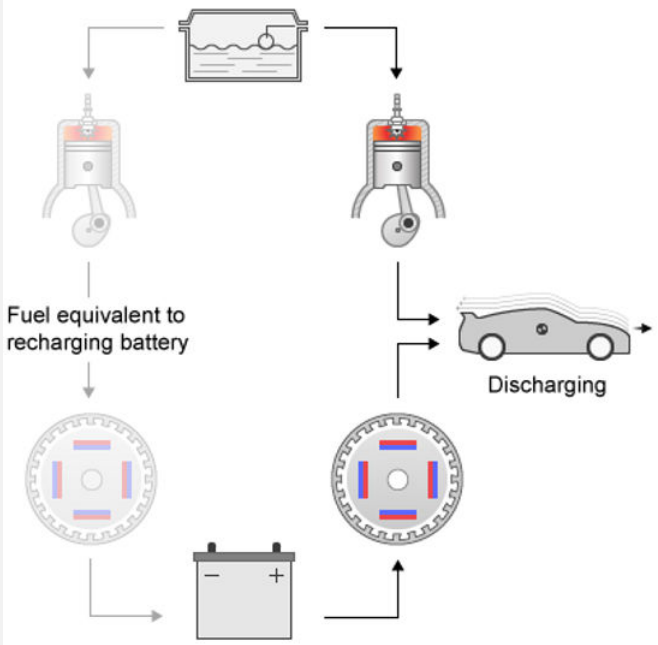

### ECMS Control Algorithm

The block implements a dynamic supervisory controller that determines the engine torque, motor torque, starter, clutch, and brake pressure commands. Specifically, the block:

- Converts the driver accelerator pedal signal to a wheel torque request. To calculate the total powertrain torque at the wheels, the algorithm uses the maximum engine torque and motor torque curves and the transmission and differential gear ratios.
- Converts the driver brake pedal signal to a brake pressure request. The algorithm multiplies the brake pedal signal by a maximum brake pressure.
- Implements a regenerative braking algorithm for the traction motor to recover the maximum amount of kinetic energy from the vehicle.

The block implements an ECMS algorithm<sup>[2]</sup> that optimizes the torque split between the engine and motor to minimize energy consumption while maintaining the battery SOC. Specifically, the ECMS:

- Assigns a cost to electrical energy, so that using stored electrical energy is equal to consuming fuel energy.

Battery Mode	Equivalent Electrical Energy	Description
Discharging	Positive	<p>Battery discharges stored electrical energy when the electric machine is in use.</p> 

Battery Mode	Equivalent Electrical Energy	Description
Charging	Negative	<p>Battery stores electrical energy from either the:</p> <ul style="list-style-type: none"> <li>• Engine and electric machine acting as a generator</li> <li>• Electric machine acting as a generator during regenerative braking</li> </ul>

- Is an instantaneous minimization method that the software solves at every controller time step. To implement the strategy, the ECMS selects the optimal motor and engine torque in the optimization strategy to minimize the equivalent energy consumption.
- Implements either an adaptive or non-adaptive ECMS method.

## Ports

### Input

**WhlTrqCmd – Wheel torque command**  
scalar

Wheel torque command.

Data Types: double

**BattSoc – Battery state of charge**  
scalar

Battery state of charge.

Data Types: double

**BattVolt — Battery voltage**

scalar

Battery voltage.

Data Types: double

**Gear — Transmission gear**

scalar

Transmission gear.

**MtrSpd — Motor speed**

scalar

Motor speed.

Data Types: double

**VehSpd — Vehicle speed**

scalar

Vehicle speed, in m/s.

Data Types: double

**TransTemp — Transmission temperature**

scalar

Transmission temperature, in K.

Data Types: double

**Output**

**Info — Block data**

bus

Block data, returned as a bus signal that contains these block values.

Signal	Description	Units
EngTrqCmd	Engine torque command	N·m
MtrTrqCmd	Motor torque command	N·m
EquivFctr	Equivalence factor	NA
MinHamil	Minimum Hamiltonian	kW

**EngTrqCmd — Engine torque command**

scalar

Engine torque command, in N·m.

Data Types: double

**MtrTrqCmd — Motor torque command**

scalar

Motor torque command, in N·m.

Data Types: double

## Parameters

### Block Options

#### Motor location – Location of motor

P0 (default) | P1 | P2 | P3 | P4

Specify the HEV motor location.

#### ECMS method – ECMS method

Non-adaptive (default) | Adaptive

Use the **ECMS method** parameter to implement either an adaptive or non-adaptive ECMS method. The HEV architectures are charge-sustaining, meaning the battery SOC must remain in a specified range because there is no plugin capability to recharge the battery. The battery is an energy buffer, and all energy comes from the fuel if the change in SOC is minimized over a drive cycle. To sustain the charge over a specified drive cycle, the block implements either of these ECMS methods.

ECMS Method	Description
Non-adaptive (default)	<p>The block uses a constant ECMS equivalence factor.</p> <ul style="list-style-type: none"> <li>Use this method to determine the best fuel economy over a drive cycle.                             <ul style="list-style-type: none"> <li>If you change the drive cycle or HEV architecture, retune the <b>ECMS weighting factor</b> to maintain the ending SOC.</li> </ul> </li> <li>By default, the block uses a single constant.</li> </ul>

ECMS Method	Description
Adaptive	<p>The block adjusts an ECMS equivalence factor by using the output of a PI controller.</p> <ul style="list-style-type: none"> <li>• Use this method to maintain the SOC and minimize the delta SOC over many drive cycles. The block: <ul style="list-style-type: none"> <li>• Tunes the PI controller gains.</li> <li>• Sustains the SOC.</li> </ul> </li> <li>• The PI controller minimizes the error between the target SOC and current SOC.</li> </ul>

**Differential**

**Differential gear ratio, N\_diff – Differential gear ratio**

3.32 (default) | scalar

Differential gear ratio. No dimension.

Data Types: double

**Differential efficiency factor, eta\_diff – Differential efficiency factor**

0.98 (default) | scalar

Differential efficiency factor. No dimension.

Data Types: double

**Loaded wheel radius, Re – Loaded wheel radius**

0.327 (default) | scalar

Loaded wheel radius, in m.

Data Types: double

**Transmission**

**Transmission efficiency factors – Transmission efficiency factors**

Gear, input torque, input speed, and temperature (default) | Gear only

Transmission efficiency factors.

Data Types: double

**Transmission gear number vector, G\_trans – Transmission gear number vector**

[0 1 2 3 4 5 6] (default) | vector

Transmission gear number vector. No dimension.

Data Types: double

**Transmission gear ratio vector, N\_trans – Transmission gear ratio vector**

[1 4.212 2.637 1.8 1.386 1 0.772] (default) | vector

Transmission gear ratio vector. No dimension.

Data Types: double

**Transmission efficiency vector, eta\_trans – Transmission efficiency vector**

[1 1 1 1 1 1 1] (default) | vector

Transmission efficiency vector. No dimension.

**Dependencies**To enable this parameter, set **Transmission efficiency factors** to Gear only.

Data Types: double

**Transmission efficiency torque breakpoints, Trq\_trans\_bpts – Transmission efficiency torque breakpoints**

[25 50 75 100 150 200 250] (default) | vector

Transmission efficiency torque breakpoints, in N·m.

**Dependencies**To enable this parameter, set **Transmission efficiency factors** to Gear, input torque, input speed, and temperature.

Data Types: double

**Transmission efficiency speed breakpoints, omega\_trans\_bpts – Transmission efficiency speed breakpoints**[500.383141080919 749.619781962827 1002.676141478941 1250.957852702297

Commanded torque breakpoints, in N·m.

Data Types: double

**Brake torque map, f\_tbrake — Brake torque map**

array

Brake torque map, in N·m.

Data Types: double

**Minimum engine torque command table, f\_tbrake\_min — Minimum engine torque command table**

vector

Minimum engine torque command table, in N·m.

Data Types: double

**Fuel flow map, f\_fuel — Fuel flow map**

array

Fuel flow map, in kg/s.

Data Types: double

**Minimum engine torque command, HEVEngTrq\_min — Minimum engine torque command**

16.18610438796213 (default) | scalar

Minimum engine torque command, in N·m.

Data Types: double

**Fuel lower heating value, LHV – Fuel lower heating value**

46000000 (default) | scalar

Fuel lower heating value, in J/kg.

Data Types: double

**Engine idle speed, N\_idle – Engine idle speed**

750 (default) | scalar

Engine idle speed, in rpm.

Data Types: double

**Battery****Battery state-of-charge breakpoints, SOC\_bpt – Battery state-of-charge breakpoints**

[0 0.1 0.2 0.3 0.4 0.5 0.6 0.7 0.8 0.9 1] (default) | vector

Battery state-of-charge breakpoints. No dimension.

Data Types: double

**Battery charge limit table, ChrgLmt – Battery charge limit table**

[1 1 1 1 1 1 1 0.9 0.7 0.5 0] (default) | vector

Battery charge limit table. No dimension.

Data Types: double

**Battery discharge limit table, DischrgLmt – Battery discharge limit table**

[0 0.5 0.7 0.9 1 1 1 1 1 1 1] (default) | vector

Battery discharge limit table. No dimension.

Data Types: double

**Maximum battery current, BattCurrMax – Maximum battery current**

150 (default) | scalar

Maximum battery current, in A.

Data Types: double

**DC/DC converter efficiency, eta\_dcdc – DC/DC converter efficiency**

1 (default) | scalar

DC/DC converter efficiency. No dimension.

Data Types: double

**Maximum battery charge power, BattChrgPwrMax – Maximum battery charge power**

-30000 (default) | scalar

Maximum battery charge power, in W.

Data Types: double

**Maximum battery discharge power, BattDischrgPwrMax — Maximum battery discharge power**

46000 (default) | scalar

Maximum battery discharge power, in W.

Data Types: double

**Motor**

**Motor maximum torque table, f\_tmtr\_max — Motor maximum torque table**  
vector

Motor maximum torque table, in N·m.

Data Types: double

**Motor speed breakpoints, f\_mtr\_w\_bpt — Motor speed breakpoints**  
vector

Motor speed breakpoints, in rpm.

Data Types: double

**Motor torque breakpoints, f\_mtr\_t\_bpt — Motor torque breakpoints**  
vector

Motor torque breakpoints, in N·m.

Data Types: double

**Motor efficiency map, f\_mtr\_eta — Motor efficiency map**  
array

Motor efficiency map. No dimension.

Data Types: double

**Number of motor torque calculation points, Ngrid — Number of motor torque calculation points**

200 (default) | scalar

Number of motor torque calculation points. No dimension.

Data Types: double

**P0 belt ratio, N\_P0 — P0 belt ratio**

3 (default) | scalar

P0 belt ratio. No dimension.

**Dependencies**

To enable this parameter, set **Motor location** to P0.

Data Types: double

**Energy Management****ECMS weighting factor, ECMS\_s — ECMS weighting factor**

3.385 (default) | scalar

ECMS weighting factor. No dimension.

Data Types: double

**Penalty factor power, PenaltyFctrPwr — Penalty factor power**

3 (default) | scalar

Penalty factor power. No dimension.

Data Types: double

**Adaptive ECMS proportional gain, ECMS\_Kp — Adaptive ECMS proportional gain**

0 (default) | scalar

Adaptive ECMS proportional gain. No dimension.

**Dependencies**To enable this parameter, set **ECMS method** to Adaptive.

Data Types: double

**Adaptive ECMS integral gain, ECMS\_Ki — Adaptive ECMS integral gain**

0 (default) | scalar

Adaptive ECMS integral gain. No dimension.

**Dependencies**To enable this parameter, set **ECMS method** to Adaptive.

Data Types: double

**Constraint penalty factor, PenaltyFctr — Constraint penalty factor**

10000000 (default) | scalar

Constraint penalty factor. No dimension.

Data Types: double

**Target battery state-of-charge, SOCTrgt — Target battery state-of-charge**

60 (default) | scalar

Target battery state-of-charge. No dimension.

Data Types: double

# Power Accounting Bus Creator

Create power information bus

**Library:** Powertrain Blockset / Utilities / Power Accounting

## Description

Creates a power information bus for reporting system power and energy consumption. You can associate the block to a parent system, select types of power signals to track, and add signal descriptions. If you want to generate a power and energy report, you must use this block to log the power signals in your plant model blocks. The Powertrain Blockset plant blocks use the Power Accounting Bus Creator to log the power signals. The documentation for each block includes information about the logged power bus signals.

The system-level power and energy accounting satisfies the conservation of energy.

$$\sum P_{trans} + \sum P_{nottrans} = \sum P_{store}$$

To add the Power Accounting Bus Creator to your plant block, follow these steps:

- 1 Add the Power Accounting Bus Creator block to your block.
- 2 Select the types of power signals that you want to log. See “Power Signals” on page 3-53.
- 3 Associate the Power Accounting Bus Creator with a parent subsystem. See “Block Association” on page 3-54.
- 4 Connect the power signals to the Power Accounting Bus Creator.
  - Follow the sign convention.
  - To ensure that your plant block conserves energy, include all power associated with the block.
- 5 In the Power Accounting Bus Creator:
  - On the **Transferred** power tab, specify these parameters:
    - **Associated Port**
    - **Description**
  - On the **Not Transferred** power tab, specify the **Description** parameter:
- 6 In the plant block, connect the transferred power signals to the Power Accounting Bus Creator ports that are specified with the **Associated Port** parameter.

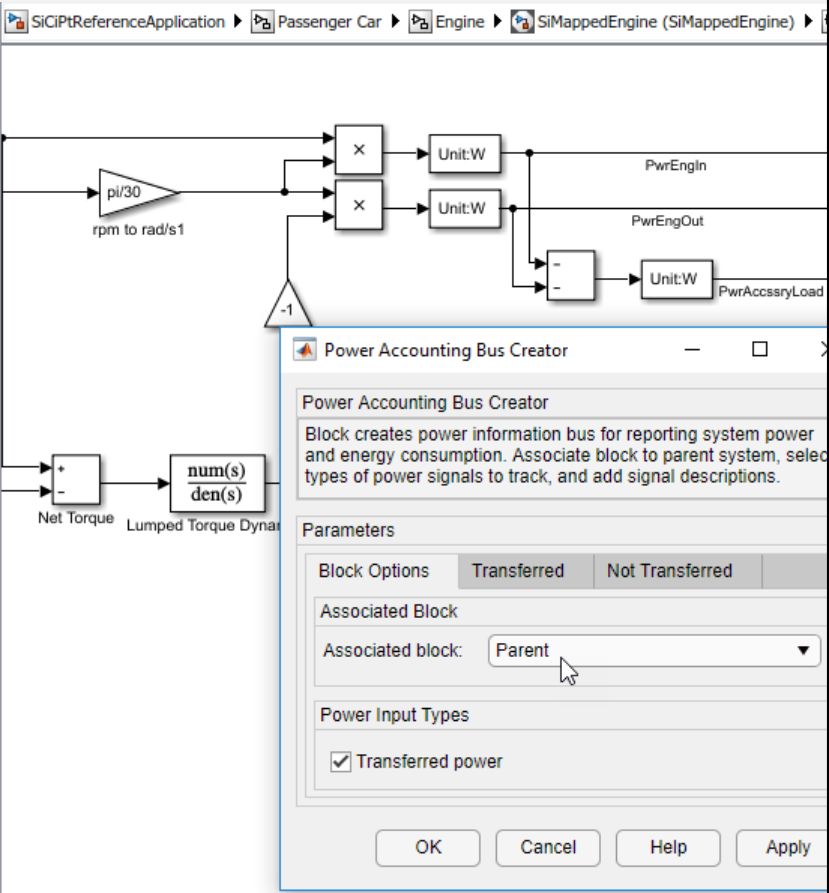

## Power Signals

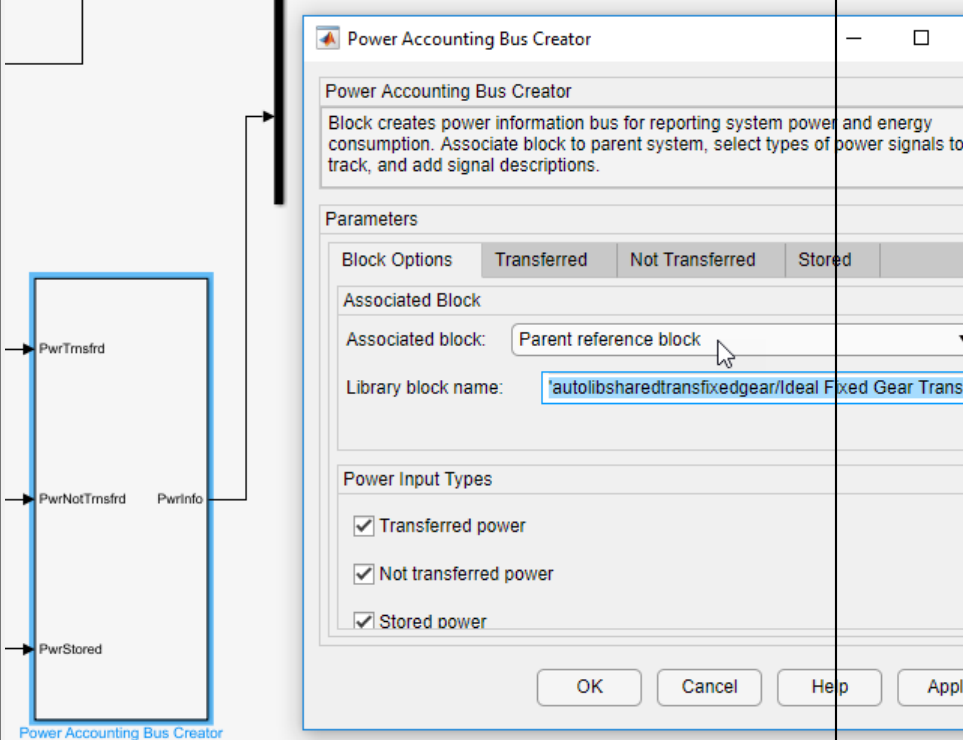

The Power Accounting Bus Creator sorts the signals into three power types.

Power Type		Description	Examples
$P_{trans}$	Transferred	<p>Power transferred between blocks:</p> <ul style="list-style-type: none"> <li>• Positive signals indicate flow into block</li> <li>• Negative signals indicate flow out of block</li> </ul>	<ul style="list-style-type: none"> <li>• Crankshaft power transferred from mapped engine to transmission.</li> <li>• Road load power transferred from wheel to vehicle.</li> <li>• Rate of heat flow transferred from throttle to manifold volume.</li> </ul>
$P_{nottrans}$	Not transferred	<p>Power crossing the block boundary, but not transferred:</p> <ul style="list-style-type: none"> <li>• Positive signals indicate an input</li> <li>• Negative signals indicate a loss</li> </ul>	<ul style="list-style-type: none"> <li>• Rate of heat transfer with the environment. <ul style="list-style-type: none"> <li>• From environment is an input (positive signal)</li> <li>• To environment is a loss (negative signal)</li> </ul> </li> <li>• Flow boundary with the environment. <ul style="list-style-type: none"> <li>• From environment is an input (positive signal)</li> <li>• To environment is a loss (negative signal)</li> </ul> </li> <li>• Mapped engine fuel flow.</li> </ul>
$P_{store}$	Stored	<p>Stored energy rate of change:</p> <ul style="list-style-type: none"> <li>• Positive signals indicate an increase</li> <li>• Negative signals indicate a decrease</li> </ul>	<p>Energy rate of change:</p> <ul style="list-style-type: none"> <li>• Battery storage</li> <li>• Kinetic energy in drivetrain components</li> <li>• Vehicle potential energy</li> <li>• Vehicle velocity</li> </ul>

**Block Association**

When you add the Power Accounting Bus Creator to your plant block, you associate the signals to a parent block. There are two association methods.

Method	Description	Example
Parent	<p>Power Accounting Bus Creator associates the power bus signals with the parent block.</p>	<p>In the conventional vehicle reference application, navigate to the Passenger Car &gt; Engine &gt; SiMappedEngine &gt; Accessory Load Model plant subsystem. Open the Power Accounting Bus Creator.</p> <p>The <b>Associated block</b> parameter is set to Parent, so the Power Accounting Bus Creator associates the power signals with the Accessory Load Model plant subsystem.</p> 

Method	Description	Example
<p>Parent reference block</p>	<p>Power Accounting Bus Creator associates the power bus signals with a reference block.</p> <p>Use the <b>Library block name</b> parameter to specify the block.</p>	<p>In the Ideal Fixed Gear Transmission block, navigate to the Bus Creation subsystem. Open the Power Accounting Bus Creator.</p> <p>The Power Accounting Bus Creator block uses these parameter settings to associate the power signals to the Ideal Fixed Gear Transmission block.</p> <ul style="list-style-type: none"> <li>• <b>Associated block</b> parameter is set to Parent reference block.</li> <li>• <b>Library block name</b> parameter is set to 'autolibsharedtransfixedgear/Ideal Fixed Gear Transmission'.</li> </ul> 

## Ports

### Input

**PwrTrnsfrd – Power transferred between blocks bus**

PwrTrnsfrd – Power transferred between blocks

- Positive signals indicate flow into block
- Negative signals indicate flow out of block

**Dependencies**

To create this input port, select **Transferred power**.

**PwrNotTrnsfrd — Power crossing block boundary, not transferred bus**

PwrNotTrnsfrd — Power crossing the block boundary, but not transferred

- Positive signals indicate an input
- Negative signals indicate a loss

**Dependencies**

To create this input port, select **Not transferred power**.

**PwrStored — Stored energy rate of change bus**

PwrStored — Stored energy rate of change

- Positive signals indicate an increase
- Negative signals indicate a decrease

**Dependencies**

To create this input port, select **Stored power**.

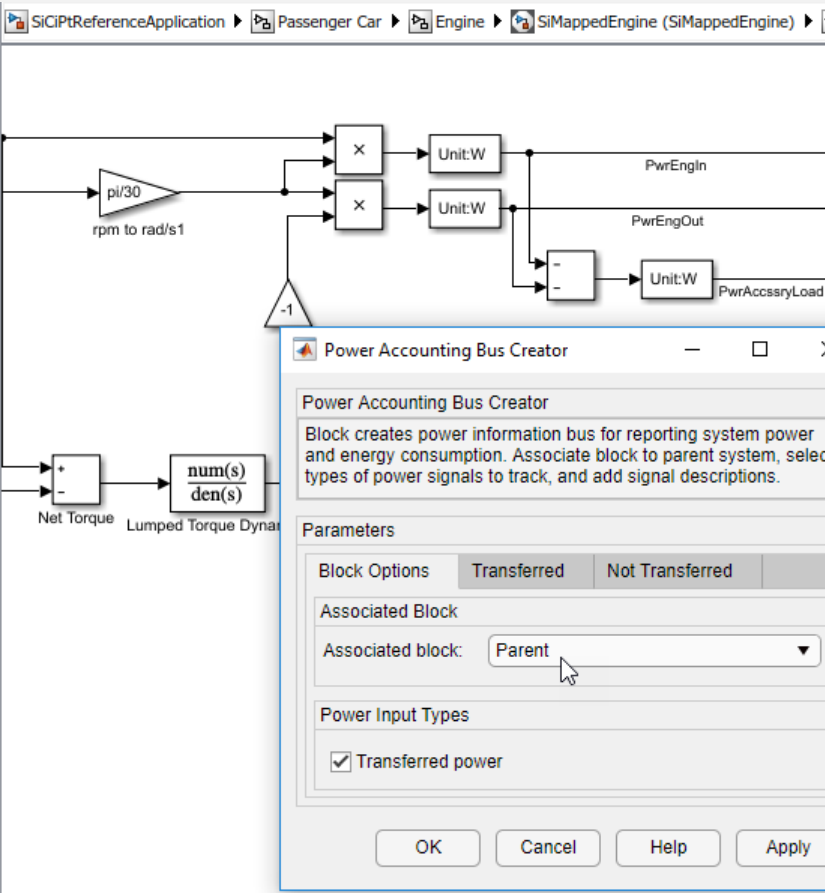

**Output****PwrInfo — Power information bus**

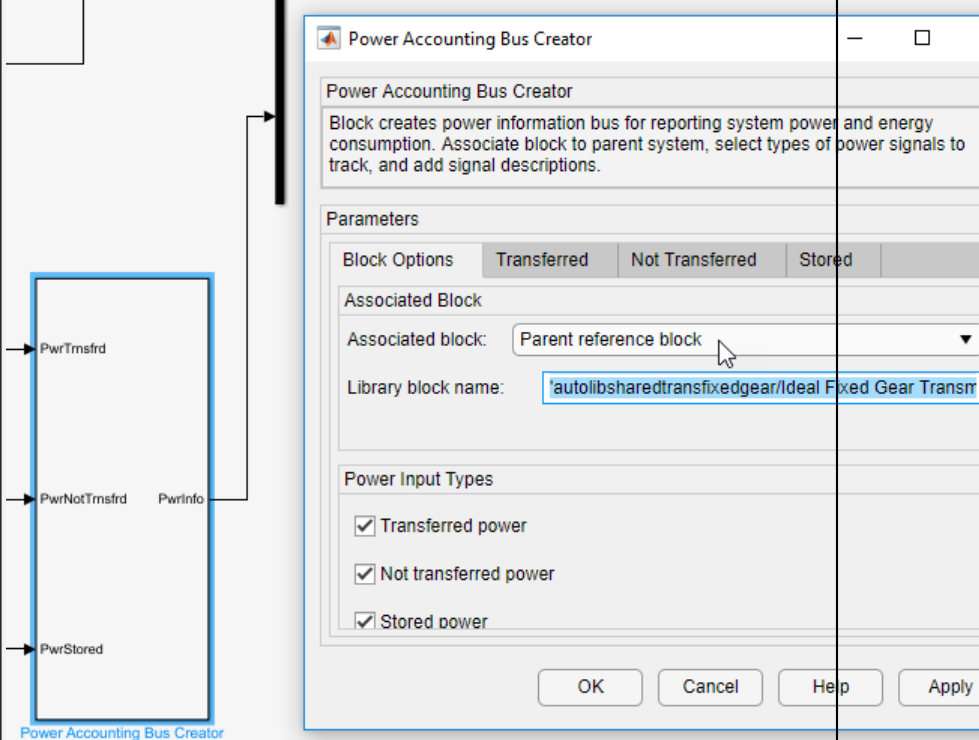

Power information bus

**Parameters****Block Options****Associated block — Associated block**

Parent (default) | Parent reference block

When you add the Power Accounting Bus Creator to your plant block, you associate the signals to a parent block. There are two association methods.

Method	Description	Example
Parent	<p>Power Accounting Bus Creator associates the power bus signals with the parent block.</p>	<p>In the conventional vehicle reference application, navigate to the Passenger Car &gt; Engine &gt; SiMappedEngine &gt; Accessory Load Model plant subsystem. Open the Power Accounting Bus Creator.</p> <p>The <b>Associated block</b> parameter is set to Parent, so the Power Accounting Bus Creator associates the power signals with the Accessory Load Model plant subsystem.</p> 

Method	Description	Example
Parent reference block	<p>Power Accounting Bus Creator associates the power bus signals with a reference block.</p> <p>Use the <b>Library block name</b> parameter to specify the block.</p>	<p>In the Ideal Fixed Gear Transmission block, navigate to the Bus Creation subsystem. Open the Power Accounting Bus Creator.</p> <p>The Power Accounting Bus Creator block uses these parameter settings to associate the power signals to the Ideal Fixed Gear Transmission block.</p> <ul style="list-style-type: none"> <li>• <b>Associated block</b> parameter is set to Parent reference block.</li> <li>• <b>Library block name</b> parameter is set to 'autolibsharedtransfixedgear/Ideal Fixed Gear Transmission'.</li> </ul> 

### Library block name — Block name

Block name

### Dependencies

To create this parameter, set **Associated block** to Parent reference block.

### Power Input Types

#### Transferred power — Power transferred between blocks

on (default) | off

Power transferred between blocks.

**Dependencies**

Selecting this parameter creates the:

- PwrTrnsfrd input port
- **Transferred** parameters

**Not transferred power — Power crossing block boundary**

on (default) | off

Power crossing block boundary, but not transferred.

**Dependencies**

Selecting this parameter creates the:

- PwrNotTrnsfrd input port
- **Not Transferred** parameters

**Stored power — Stored energy rate of change**

on (default) | off

Stored energy rate of change.

**Dependencies**

Selecting this parameter creates the:

- PwrStored input port
- **Stored** parameters

**Transferred**

**Signal name — Name of signal**

char

Signal name.

## Boost Drive Shaft

Boost drive shaft speed

**Library:** Powertrain Blockset / Propulsion / Combustion Engine  
Components / Boost

### Description

The Boost Drive Shaft block uses the compressor, turbine, and external torques to calculate the drive shaft speed. Use the block to model turbochargers and superchargers in an engine model.

You can specify these configurations:

- Turbocharger — Connect the compressor to the turbine
  - Two-way ports for turbine and compressor connections
  - Option to add an externally applied input torque
- Compressor only — Connect the drive shaft to the compressor
  - Two-way port for compressor connection
  - Externally applied input torque
- Turbine only — Connect the drive shaft to the turbine
  - Two-way port for turbine connection
  - Externally applied load torque

For the Turbine only and Turbocharger configurations, the block modifies the turbine torque with a mechanical efficiency.

### Equations

The Boost Drive Shaft block applies Newton's Second Law for Rotation. Positive torques cause the drive shaft to accelerate. Negative torques impose a load and decelerate the drive shaft.

The block also calculates the power loss due to mechanical inefficiency.

Calculation	Equations
Shaft dynamics	$\frac{d\omega}{dt} = \frac{1}{J_{shaft}}(\eta_{mech}\tau_{turb} + \tau_{comp} + \tau_{ext})$ with initial speed $\omega_0$
Speed constraint	$\omega_{min} \leq \omega \leq \omega_{max}$
Power loss	$\dot{W}_{loss} = \omega\tau_{turb}(1 - \eta_{mech})$

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Equations	
PwrInfo	PwrTrnsfrd — Power transferred between blocks	PwrCmprsr	Shaft power from compressor	$\tau_{comp}\omega$
	<ul style="list-style-type: none"> <li>Positive signals indicate flow into block</li> <li>Negative signals indicate flow out of block</li> </ul>	PwrTurb	Shaft power from turbine	$\tau_{turb}\omega$
		PwrExt	Externally applied power	$\tau_{ext}\omega$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred	PwrMechLoss	Mechanical power loss	$-\dot{W}_{turb}$
PwrStored — Stored energy rate of change	PwrStoredDriveshaft	Rate change in rotational kinetic energy	$(\eta_{mech}\tau_{turb} + \tau_{comp} + \tau_{ext})\omega$	
<ul style="list-style-type: none"> <li>Positive signals indicate an increase</li> <li>Negative signals indicate a decrease</li> </ul>				

The equations use these variables.

$\omega$	Shaft speed
$\omega_0$	Initial drive shaft speed
$\omega_{min}$	Minimum drive shaft speed
$\omega_{max}$	Maximum drive shaft speed
$J_{shaft}$	Shaft inertia
$\eta_{max}$	Mechanical efficiency of turbine
$\tau_{comp}$	Compressor torque
$\tau_{turb}$	Turbine torque
$\tau_{ext}$	Externally applied torque.
$\dot{W}_{loss}$	Power loss due to mechanical inefficiency

## Ports

### Input

#### Cmprsr — Compressor torque

two-way connector port

Compressor torque,  $\tau_{comp}$ , in N·m.

#### Dependencies

To create this port, for the **Configuration** parameter, select Turbocharger or Compressor only.

**Turb – Turbine torque**

two-way connector port

Turbine torque,  $\tau_{turb}$ , in N·m.

**Dependencies**

To create this port, for the **Configuration** parameter, select Turbocharger or Turbine only.

**ExtTrq – Externally applied torque**

scalar

Externally applied torque,  $\tau_{ext}$ , in N·m.

**Dependencies**

For turbocharger configurations, to create this port, set **Additional torque input** to External torque input.

**Output**

**Info – Bus signal**

bus

Bus signal containing these block calculations.

Signal		Description	Units	
DriveshftSpd		Shaft speed	rad/s	
MechPwrLoss		Mechanical power loss	W	
ExtTrq		Applied external torque	N·m	
PwrInfo	PwrTrnsfrd	PwrCmps r	Shaft power from compressor	W
		PwrTurb	Shaft power from turbine	W
		PwrExt	Externally applied power	W

	PwrStored	PwrStoredDriveshft	Rate change in rotational kinetic energy	W

**Cmpsr – Compressor speed**

two-way connector port

Compressor speed,  $\omega$ , in rad/s.

**Dependencies**

To create this port, for the **Configuration** parameter, select Turbocharger or Compressor only.

**Turb – Turbine speed**

two-way connector port

Turbine speed,  $\omega$ , in N·m.

**Dependencies**

To create this port, for the **Configuration** parameter, select Turbocharger or Turbine only.

**Parameters****Block Options****Configuration – Specify configuration**

Turbocharger (default) | Turbine only | Compressor only

**Dependencies**

- Selecting Turbocharger or Compressor only creates the Cmprs port.
- Selecting Turbocharger or Turbine only creates the Turb port.

**Additional torque input – Specify external torque input**

External torque input (default) | No external torque

**Dependencies**

- To enable this parameter, select a Turbocharger configuration.
- To create the Trq port, select External torque input.

**Shaft inertia, J\_shaft – Inertia**

1.55e-5 (default) | scalar

Shaft inertia,  $J_{shaft}$ , in  $\text{kg}\cdot\text{m}^2$ .

**Initial shaft speed, w\_0 – Speed**

1000 (default) | scalar

Initial drive shaft speed,  $\omega_0$ , in rad/s.

**Min shaft speed, w\_min – Speed**

100 (default) | scalar

Minimum drive shaft speed,  $\omega_{min}$ , in rad/s.

**Max shaft speed, w\_max – Speed**

20000 (default) | scalar

Maximum drive shaft speed,  $\omega_{max}$ , in rad/s.

**Turbine mechanical efficiency, eta\_mech – Efficiency**

0.95 (default) | scalar

Mechanical efficiency of turbine  $\eta_{max}$ .

**Dependencies**

To enable this parameter, select the Turbocharger or Turbine only configuration.

# CI Controller

Compression-ignition controller that includes air mass flow, torque, and EGR estimation

**Library:** Powertrain Blockset / Propulsion / Combustion Engine Controllers

## Description

The CI Controller block implements a compression-ignition (CI) controller with air mass flow, torque, exhaust gas recirculation (EGR) flow, exhaust back-pressure, and exhaust gas temperature estimation. You can use the CI Controller block in engine control design or performance, fuel economy, and emission tradeoff studies. The core engine block requires the commands that are output from the CI Controller block.

The block uses the commanded torque and measured engine speed to determine these open-loop actuator commands:

- Injector pulse-width
- Fuel injection timing
- Variable geometry turbocharger (VGT) rack position
- EGR valve area percent

The CI Controller block has two subsystems:

- The **Controller** subsystem — Determines the commands based on tables that are functions of commanded torque and measured engine speed.

Based On	Determines Commands for
Commanded torque	Injector pulse-width
Measured engine speed	Fuel injection timing
	VGT rack position
	EGR valve area percent

- The **Estimator** subsystem — Determines estimates based on these engine attributes.

Based On	Estimates
Measured engine speed	Air mass flow
Fuel injection timing	Torque
Cycle average intake manifold pressure and temperature	Exhaust gas temperature
Fuel injector pulse-width	Exhaust gas back-pressure
Absolute ambient pressure	EGR valve gas mass flow
EGR valve area percent	
VGT rack position	
VGT speed	

The figure illustrates the signal flow.

The figure uses these variables.

- $N$  Engine speed
- $MAP$  Cycle average intake manifold absolute pressure
- $MAT$  Cycle average intake manifold gas absolute temperature
- $EGR_{ap}, EGR_{cmd}$  EGR valve area percent and EGR valve area percent command, respectively
- $VGT_{pos}$  VGT rack position

$N_{vgt}$	Corrected turbocharger speed
$RP_{cmd}$	VGT rack position command
$PW_{inj}$	Fuel injector pulse-width
$MAINSOI$	Start of injection timing for main fuel injection pulse

The Model-Based Calibration Toolbox™ was used to develop the tables that are available with the Powertrain Blockset.

## Controller

The controller governs the combustion process by commanding VGT rack position, EGR valve area percent, fuel injection timing, and injector pulse-width. Feedforward lookup tables, which are functions of measured engine speed and commanded torque, determine the control commands.

### Air

The controller commands the EGR valve area percent and VGT rack position. Changing the VGT rack position modifies the turbine flow characteristics. At low-requested torques, the rack position can reduce the exhaust back pressure, resulting in a low turbocharger speed and boost pressure. When the commanded fuel requires additional air mass flow, the rack position is set to close the turbocharger vanes, increasing the turbocharger speed and intake manifold boost pressure.

The variable geometry turbocharger (VGT) rack position lookup table is a function of commanded torque and engine speed

$$RP_{cmd} = f_{RPcmd}(Trq_{cmd}, N)$$

where:

- $RP_{cmd}$  is VGT rack position command, in percent.
- $Trq_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

The commanded exhaust gas recirculation (EGR) valve area percent lookup table is a function of commanded torque and engine speed

$$EGR_{cmd} = f_{EGRcmd}(Trq_{cmd}, N)$$

where:

- $EGR_{cmd}$  is commanded EGR valve area percent, in percent.
- $Trq_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

### Fuel

To initiate combustion, a CI engine injects fuel directly into the combustion chamber. After the injection, the fuel spontaneously ignites, increasing cylinder pressure. The total mass of the injected fuel and main injection timing determines the torque production.

Assuming constant fuel rail pressure, the CI controller commands the injector pulse-width based on the total requested fuel mass:

$$Pw_{inj} = \frac{F_{cmd, tot}}{S_{inj}}$$

The equation uses these variables.

$Pw_{inj}$	Fuel injector pulse-width
$S_{inj}$	Fuel injector slope
$F_{cmd, tot}$	Commanded total fuel mass per injection
$MAINSOI$	Main start-of-injection timing
$N$	Engine speed

The commanded total fuel mass per injection table is a function of the torque command and engine speed

$$F_{cmd, tot} = f_{F_{cmd, tot}}(Trq_{cmd}, N)$$

where:

- $F_{cmd, tot} = F$  is commanded total fuel mass per injection, in mg per cylinder.
- $Trq_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

The main start-of-injection (SOI) timing lookup table is a function of commanded fuel mass and engine speed

$$MAINSOI = f(F_{cmd,tot}, N)$$

where:

- $MAINSOI$  is the main start-of-injection timing, in degrees crank angle after top dead center (degATDC).
- $F_{cmd,tot} = F$  is commanded fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

### Idle Speed

When the commanded torque is below a threshold value, the idle speed controller regulates the engine speed.

If	Idle Speed Controller
$Trq_{cmd,input} < Trq_{idlecmd,enable}$	Enabled
$Trq_{idlecmd,enable} \leq Trq_{cmd,input}$	Not enabled

The idle speed controller uses a discrete PI controller to regulate the target idle speed by commanding a torque.

The PI controller uses this transfer function:

$$C_{idle}(z) = K_{p, idle} + K_{i, idle} \frac{t_s}{z-1}$$

The idle speed commanded torque must be less than the maximum commanded torque:

$$0 \leq Trq_{idlecmd} \leq Trq_{idlecmd,max}$$

Idle speed control is active under these conditions. If the commanded input torque drops below the threshold for enabling the idle speed controller ( $Trq_{cmd,input} < Trq_{idlecmd,enable}$ ), the commanded engine torque is given by:

$$Trq_{cmd} = \max(Trq_{cmd,input}, Trq_{idlecmd}).$$

The equations use these variables.

$Trq_{cmd}$	Commanded engine torque
$Trq_{cmd,input}$	Input commanded engine torque
$Trq_{idlecmd,enable}$	Threshold for enabling idle speed controller
$Trq_{idlecmd}$	Idle speed controller commanded torque
$Trq_{idlecmd,max}$	Maximum commanded torque
$N_{idle}$	Base idle speed
$K_{p,idle}$	Idle speed controller proportional gain
$K_{i,idle}$	Idle speed controller integral gain

### Speed Limiter

To prevent over revving the engine, the block implements an engine speed limit controller that limits the engine speed to the value specified by the **Rev-limiter speed threshold** parameter on the **Controls > Idle Speed** tab.

If the engine speed,  $N$ , exceeds the engine speed limit,  $N_{lim}$ , the block sets the commanded engine torque to 0.

To smoothly transition the torque command to 0 as the engine speed approaches the speed limit, the block implements a lookup table multiplier. The lookup table multiplies the torque command by a value that ranges from 0 (engine speed exceeds limit) to 1 (engine speed does not exceed the limit).

### Estimator

Using the CI Core Engine block, the CI Controller block estimates the air mass flow rate, EGR valve mass flow, exhaust back-pressure, engine torque, AFR, and exhaust temperature from sensor feedback. The **Info** port provides the estimated values, but block does not use them to determine the open-loop engine actuator commands.

### Air Mass Flow

To calculate the air mass flow, the compression-ignition (CI) engine uses the “CI Engine Speed-Density Air Mass Flow Model”. The speed-density model uses the speed-density equation to calculate the engine air mass flow, relating the engine intake port mass flow to the intake manifold pressure, intake manifold temperature, and engine speed.

### EGR Valve Mass Flow

To calculate the estimated exhaust gas recirculation (EGR) valve mass flow, the block calculates the EGR flow that would occur at standard temperature and pressure conditions, and then corrects the

flow to actual temperature and pressure conditions. The block EGR calculation uses estimated exhaust back-pressure, estimated exhaust temperature, standard temperature, and standard pressure.

$$\dot{m}_{egr,est} = \dot{m}_{egr,std} \frac{P_{exh,est}}{P_{std}} \sqrt{\frac{T_{std}}{T_{exh,est}}}$$

- The standard exhaust gas recirculation (EGR) mass flow is a lookup table that is a function of the standard flow pressure ratio and EGR valve flow area

$$\dot{m}_{egr,std} = f\left(\frac{MAP}{P_{exh,est}}, EGRap\right)$$

where:

- $\dot{m}_{egr,std}$  is the standard EGR valve mass flow, in g/s.
- $P_{exh,est}$  is the estimated exhaust back-pressure, in Pa.
- $MAP$  is the cycle average intake manifold absolute pressure, in Pa.
- $EGRap$  is the measured EGR valve area, in percent.

The equations use these variables.

$\dot{m}_{egr,est}$	Estimated EGR valve mass flow
$\dot{m}_{egr,std}$	Standard EGR valve mass flow
$P_{std}$	Standard pressure
$T_{std}$	Standard temperature
$T_{exh,est}$	Estimated exhaust manifold gas temperature
$MAP$	Measured cycle average intake manifold absolute pressure
$P_{exh,est}$	Estimated exhaust back-pressure
$P_{Amb}$	Absolute ambient pressure
$EGRap$	Measured EGR valve area percent

### Exhaust Back-Pressure

To estimate the EGR valve mass flow, the block requires an estimate of the exhaust back-pressure. To estimate the exhaust back-pressure, the block uses the ambient pressure and the turbocharger pressure ratio.

$$P_{exh,est} = P_{Amb} Pr_{turbo}$$

For the turbocharger pressure ration calculation, the block uses two lookup tables. The first lookup table determines the approximate turbocharger pressure ratio as a function of turbocharger mass flow and corrected turbocharger speed. Using a second lookup table, the block corrects the approximate turbocharger pressure ratio for VGT rack position.

$$Pr_{turbo} = f(\dot{m}_{airstd}, N_{vgtcrr})f(VGT_{pos})$$

where:

$$N_{vgtcrr} = \frac{N_{vgt}}{\sqrt{T_{exh,est}}}$$

The equations use these variables.

$\dot{m}_{egr,est}$	Estimated EGR valve mass flow
$\dot{m}_{egr,std}$	Standard EGR valve mass flow
$\dot{m}_{port,est}$	Estimated intake port mass flow rate
$\dot{m}_{airstd}$	Standard air mass flow
$EGR_{ap}$	Measured EGR valve area
$MAP$	Measured cycle average intake manifold absolute pressure
$MAT$	Measured cycle average intake manifold gas absolute temperature
$P_{std}$	Standard pressure
$T_{std}$	Standard temperature
$T_{exh,est}$	Estimated exhaust manifold gas temperature
$Pr_{vgtcrr}$	Turbocharger pressure ratio correction for VGT rack position
$Pr_{turbo}$	Turbocharger pressure ratio
$P_{exh,est}$	Estimated exhaust back-pressure
$P_{Amb}$	Absolute ambient pressure
$N_{vgtcrr}$	Corrected turbocharger speed
$VGT_{pos}$	Measured VGT rack position

The exhaust-back pressure calculation uses these lookup tables:

- The turbocharger pressure ratio, corrected for variable geometry turbocharger (VGT) speed, is a lookup table that is a function of the standard air mass flow and corrected turbocharger speed,  $Pr_{turbo} = f(\dot{m}_{airstd}, N_{vgtcrr})$ , where:
  - $Pr_{turbo}$  is the turbocharger pressure ratio, corrected for VGT speed.
  - $\dot{m}_{airstd}$  is the standard air mass flow, in g/s.
  - $N_{vgtcrr}$  is the corrected turbocharger speed, in rpm/K<sup>(1/2)</sup>.

To calculate the standard air mass flow through the turbocharger, the block uses conservation of mass, the estimated intake port, and EGR mass flows (from the last estimated calculation). The calculation assumes negligible exhaust manifold filling dynamics.

$$\dot{m}_{airstd} = (\dot{m}_{port, est} - \dot{m}_{egr, est}) \frac{P_{std}}{MAP} \sqrt{\frac{MAT}{T_{std}}}$$

- The variable geometry turbocharger pressure ratio correction is a function of the rack position,  $Pr_{vgtcorr} = f(VGT_{pos})$ , where:
  - $Pr_{vgtcorr}$  is the turbocharger pressure ratio correction.
  - $VGT_{pos}$  is the variable geometry turbocharger (VGT) rack position.

### Engine Torque

To calculate the engine torque, you can configure the block to use either of these torque models.

Brake Torque Model	Description
"CI Engine Torque Structure Model"	<p>The CI core engine torque structure model determines the engine torque by reducing the maximum engine torque potential as these engine conditions vary from nominal:</p> <ul style="list-style-type: none"> <li>• Start of injection (SOI) timing</li> <li>• Exhaust back-pressure</li> <li>• Burned fuel mass</li> <li>• Intake manifold gas pressure, temperature, and oxygen percentage</li> <li>• Fuel rail pressure</li> </ul> <p>To account for the effect of post-inject fuel on torque, the model uses a calibrated torque offset table.</p>
"CI Engine Simple Torque Model"	<p>For the simple engine torque calculation, the CI engine uses a torque lookup table map that is a function of engine speed and injected fuel mass.</p>

**Exhaust Temperature**

The exhaust temperature calculation depends on the torque model. For both torque models, the block implements lookup tables.

Torque Model	Description	Equations
Simple Torque Lookup	Exhaust temperature lookup table is a function of the injected fuel mass and engine speed.	$T_{exh} = f_{Texh}(F, N)$
Torque Structure	<p>The nominal exhaust temperature, <math>T_{exh_{nom}}</math>, is a product of these exhaust temperature efficiencies:</p> <ul style="list-style-type: none"> <li>• SOI timing</li> <li>• Intake manifold gas pressure</li> <li>• Intake manifold gas temperature</li> <li>• Intake manifold gas oxygen percentage</li> <li>• Fuel rail pressure</li> <li>• Optimal temperature</li> </ul> <p>The exhaust temperature, <math>T_{exh_{nom}}</math>, is offset by a post temperature effect, <math>\Delta T_{post}</math>, that accounts for post and late injections during the expansion and exhaust strokes.</p>	$T_{exh_{nom}} = SOI_{exhteff} MAP_{exhteff} MAT_{exhteff} O2p_{exhteff} FUI$ $T_{exh} = T_{exh_{nom}} + \Delta T_{post}$ $SOI_{exhteff} = f_{SOI_{exhteff}}(\Delta SOI, N)$ $MAP_{exhteff} = f_{MAP_{exhteff}}(MAP_{ratio}, \lambda)$ $MAT_{exhteff} = f_{MAT_{exhteff}}(\Delta MAT, N)$ $O2p_{exhteff} = f_{O2p_{exhteff}}(\Delta O2p, N)$ $Texh_{opt} = f_{Texh}(F, N)$

The equations use these variables.

$F$	Compression stroke injected fuel mass
$N$	Engine speed
$T_{exh}$	Exhaust manifold gas temperature
$T_{exh_{opt}}$	Optimal exhaust manifold gas temperature
$\Delta T_{post}$	Post injection temperature effect
$T_{exh_{nom}}$	Nominal exhaust temperature
$SOI_{exheff}$	Main SOI exhaust temperature efficiency multiplier
$\Delta SOI$	Main SOI timing relative to optimal timing
$MAP_{exheff}$	Intake manifold gas pressure exhaust temperature efficiency multiplier
$MAP_{ratio}$	Intake manifold gas pressure ratio relative to optimal pressure ratio
$\lambda$	Intake manifold gas lambda
$MAT_{exheff}$	Intake manifold gas temperature exhaust temperature efficiency multiplier
$\Delta MAT$	Intake manifold gas temperature relative to optimal temperature
$O2P_{exheff}$	Intake manifold gas oxygen exhaust temperature efficiency multiplier
$\Delta O2P$	Intake gas oxygen percent relative to optimal
$FUELP_{exheff}$	Fuel rail pressure exhaust temperature efficiency multiplier
$\Delta FUELP$	Fuel rail pressure relative to optimal

#### Air-Fuel Ratio

The measured engine speed and fuel injector pulse-width determine the commanded fuel mass flow rate:

$$\dot{m}_{fuel,cmd} = \frac{NS_{inj}Pw_{inj}N_{cyl}}{Cps\left(\frac{60s}{min}\right)\left(\frac{1000mg}{g}\right)}$$

The commanded total fuel mass flow and estimated port mass flow rates determine the estimated AFR:

$$AFR_{est} = \frac{\dot{m}_{port,est}}{\dot{m}_{fuel,cmd}}$$

The equations use these variables.

$Pw_{inj}$	Fuel injector pulse-width
$AFR_{est}$	Estimated air-fuel ratio
$\dot{m}_{fuel,cmd}$	Commanded fuel mass flow rate
$S_{inj}$	Fuel injector slope
$N$	Engine speed
$N_{cyl}$	Number of engine cylinders
$Cps$	Crankshaft revolutions per power stroke, rev/stroke
$\dot{m}_{port,est}$	Total estimated engine air mass flow at intake ports

scalar

VGT rack position command,  $RP_{cmd}$ .

### EgrVlvAreaPctCmd – Intake cam phaser angle command

scalar

EGR valve area percent command,  $EGR_{cmd}$ .

## Parameters

### Controls

#### Air - EGR

#### EGR valve area percent, $f_{egr}$ cmd – Lookup table

array

The commanded exhaust gas recirculation (EGR) valve area percent lookup table is a function of commanded torque and engine speed

$$EGR_{cmd} = f_{EGRcmd}(Trq_{cmd}, N)$$

where:

- $EGR_{cmd}$  is commanded EGR valve area percent, in percent.
- $Trq_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

**Commanded torque breakpoints,  $f_{egr\_tq\_bpt}$  – Breakpoints**

[10 26.43 42.86 59.29 75.71 92.14 108.6 125 141.4 157.9 174.3 190.7 207.1 223.6 240] (default) | vector

Commanded torque breakpoints, in N·m.

**Speed breakpoints,  $f_{egr\_n\_bpt}$  – Breakpoints**

[1000 1411 1821 2232 2643 3054 3464 3875 4286 4696 5107 5518 5929 6339 6750] (default) | vector

Speed breakpoints, in rpm.

**Air - VGR**

**VGT rack position table,  $f_{rpcmd}$  – Lookup table**

array

The variable geometry turbocharger (VGT) rack position lookup table is a function of commanded torque and engine speed

$$RP_{cmd} = f_{RPcmd}(Trq_{cmd}, N)$$

where:

- $RP_{cmd}$  is VGT rack position command, in percent.
- $Trq_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

### Commanded torque breakpoints, `f_rp_tq_bpt` – Breakpoints

[10 26.43 42.86 59.29 75.71 92.14 108.6 125 141.4 157.9 174.3 190.7 207.1 223.6 240] (default) | vector

Breakpoints, in N·m.

### Speed breakpoints, `f_rp_n_bpt` – Breakpoints

[1000 1411 1821 2232 2643 3054 3464 3875 4286 4696 5107 5518 5929 6339 6750] (default) | vector

Breakpoints, in rpm.

### Fuel

#### Injector slope, `Sinj` – Slope

6.452 (default) | scalar

Fuel injector slope,  $S_{inj}$ , in mg/ms.

#### Stoichiometric air-fuel ratio, `afr_stoich` – Ratio

14.6 (default) | scalar

Stoichiometric air-fuel ratio,  $AFR_{stoich}$ .

#### Fuel lower heating value, `fuel_lhv` – Heat

42e6 (default) | scalar

Fuel lower heating value, in J/kg.

#### Fuel mass per injection table, `f_fcnd_tot` – Lookup table

array

The commanded total fuel mass per injection table is a function of the torque command and engine speed

$$F_{cmd,tot} = f_{Fcmd,tot}(Trq_{cmd}, N)$$

where:

- $F_{cmd,tot} = F$  is commanded total fuel mass per injection, in mg per cylinder.

- $Trq_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

**Fuel main injection timing table,  $f_{main\_soi}$  – Lookup table array**

The main start-of-injection (SOI) timing lookup table is a function of commanded fuel mass and engine speed

$$MAINSOI = f(F_{cmd,tot}, N)$$

where:

- $MAINSOI$  is the main start-of-injection timing, in degrees crank angle after top dead center (degATDC).
- $F_{cmd,tot} = F$  is commanded fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

**Fuel main injection timing fuel breakpoints,  $f_{main\_soi\_f\_bpt}$  – Breakpoints vector**

Fuel main injection timing fuel breakpoints, in mg per injection.

**Fuel main injection timing speed breakpoints,  $f_{main\_soi\_n\_bpt}$  – Breakpoints**  
 [1000, 1410.71428571429, 1821.42857142857, 2232.14285714286, 2642.85714285714, 3053.57142857143, 3464.28571428571, 3875, 4285.71428571429, 4696.42857142857, 5107.14

285714286, 5517.85714285714, 5928.57142857143, 6339.28571428572, 6750] (default) | vector

Fuel main injection timing speed breakpoints, in rpm.

**Commanded torque breakpoints,  $f\_f\_tot\_tq\_bpt$  — Breakpoints**

[0 10 26.43 42.86 59.29 75.71 92.14 108.6 125 141.4 157.9 174.3 190.7 207.1 223.6 240] (default) | vector

Commanded torque breakpoints, in N·m.

**Speed breakpoints,  $f\_f\_tot\_n\_bpt$  — Breakpoints**

[1000 1411 1821 2232 2643 3054 3464 3875 4286 4696 5107 5518 5929 6339 6750] (default) | vector

Speed breakpoints, in rpm.

**Idle Speed**

**Base idle speed,  $N\_idle$  — Speed**

750 (default) | scalar

Base idle speed,  $N_{idle}$ , in rpm.

**Enable torque command limit,  $Trq\_idlecmd\_enable$  — Torque**

1 (default) | scalar

Torque to enable the idle speed controller,  $Trq_{idlecmd,enable}$ , in N·m.

**Maximum torque command,  $Trq\_idlecmd\_max$  — Torque**

50 (default) | scalar

Maximum idle controller commanded torque,  $Trq_{idlecmd,max}$ , in N·m.

**Proportional gain,  $Kp\_idle$  — PI Controller**

0.05 (default) | scalar

Proportional gain for idle speed control,  $K_{p,idle}$ , in N·m/rpm.

**Integral gain,  $Ki\_idle$  — PI Controller**

0.2 (default) | scalar

Integral gain for idle speed control,  $K_{i,idle}$ , in N·m/(rpm·s).

**Rev-limiter speed threshold — Engine speed limit**

scalar

Engine speed limit,  $N_{lim}$ , in rpm.

If the engine speed,  $N$ , exceeds the engine speed limit,  $N_{lim}$ , the block sets the commanded engine torque to 0.

To smoothly transition the torque command to 0 as the engine speed approaches the speed limit, the block implements a lookup table multiplier. The lookup table multiplies the torque command by a value that ranges from 0 (engine speed exceeds limit) to 1 (engine speed does not exceed the limit).

**Estimation****Air****Number of cylinders, NCyl – Engine cylinders**

4 (default) | scalar

Number of engine cylinders,  $N_{cyl}$ .**Crank revolutions per power stroke, Cps – Revolutions per stroke**

2 (default) | scalar

Crankshaft revolutions per power stroke,  $Cps$ , in rev/stroke.**Total displaced volume, Vd – Volume**

0.0015 (default) | scalar

Displaced volume,  $V_d$ , in  $m^3$ .**Ideal gas constant air, Rair – Constant**

287 (default) | scalar

Ideal gas constant,  $R_{air}$ , in  $J/(kg \cdot K)$ .**Air standard pressure, Pstd – Pressure**

101325 (default) | scalar

Standard air pressure,  $P_{std}$ , in Pa.**Air standard temperature, Tstd – Temperature**

293.15 (default) | scalar

Standard air temperature,  $T_{std}$ , in K.**Speed density volumetric efficiency, f\_nv – Lookup table**

array

The volumetric efficiency lookup table is a function of the intake manifold absolute pressure at intake valve closing (IVC) and engine speed

$$\eta_v = f_{\eta_v}(MAP, N)$$

where:

- $\eta_v$  is engine volumetric efficiency, dimensionless.
- $MAP$  is intake manifold absolute pressure, in KPa.
- $N$  is engine speed, in rpm.

### Speed density intake manifold pressure breakpoints, `f_nv_prs_bpt` — Breakpoints

```
[95 100.3 105.7 111 116.4 121.7 127.1 132.4 137.8 143.1 148.4 153.8 159.1
164.5 169.8 175.2 180.5 185.9 191.2 196.6 201.9 207.2 212.6 217.9 223.3 228.6
234 239.3 244.7 250] (default) | vector
```

Intake manifold pressure breakpoints for speed-density volumetric efficiency lookup table, in KPa.

### Speed density engine speed breakpoints, `f_nv_n_bpt` — Breakpoints

```
[750 956.9 1164 1371 1578 1784 1991 2198 2405 2612 2819 3026 3233 3440 3647

(default) | vector
```

Engine speed breakpoints for speed-density volumetric efficiency lookup table, in rpm.

### EGR valve standard flow calibration, `f_egr_stdflow` — Lookup table

array

The standard exhaust gas recirculation (EGR) mass flow is a lookup table that is a function of the standard flow pressure ratio and EGR valve flow area

$$\dot{m}_{egr, std} = f\left(\frac{MAP}{P_{exh, est}}, EGRap\right)$$

where:

- $\dot{m}_{egr, std}$  is the standard EGR valve mass flow, in g/s.
- $P_{exh, est}$  is the estimated exhaust back-pressure, in Pa.
- $MAP$  is the cycle average intake manifold absolute pressure, in Pa.
- $EGRap$  is the measured EGR valve area, in percent.

**EGR valve standard flow pressure ratio breakpoints,  $f\_egr\_stdflow\_pr\_bpt$  – Breakpoints**  
vector

EGR valve standard flow pressure ratio breakpoints, dimensionless.

**EGR valve standard flow area percent breakpoints,  $f\_egr\_stdflow\_egrap\_bpt$  – Breakpoints**  
vector

EGR valve standard flow area percent breakpoints, in percent.

**Turbocharger pressure ratio,  $f\_turbo\_pr$  – Lookup table**  
array

The turbocharger pressure ratio, corrected for variable geometry turbocharger (VGT) speed, is a lookup table that is a function of the standard air mass flow and corrected turbocharger speed,  $Pr_{turbo} = f(\dot{m}_{airstd}, N_{vgtcorr})$ , where:

- $Pr_{turbo}$  is the turbocharger pressure ratio, corrected for VGT speed.
- $\dot{m}_{airstd}$  is the standard air mass flow, in g/s.
- $N_{vgtcorr}$  is the corrected turbocharger speed, in rpm/K<sup>(1/2)</sup>.

**Turbocharger pressure ratio standard flow breakpoints,  $f\_turbo\_pr\_stdflow\_bpt$  – Breakpoints**  
vector

Turbocharger pressure ratio standard flow breakpoints, in g/s.

**Turbocharger pressure ratio corrected speed breakpoints,  
f\_turbo\_pr\_corrspd\_bpt – Breakpoints**

vector

Turbocharger pressure ratio corrected speed breakpoints, in  $\text{rpm}/\text{K}^{(1/2)}$ .

**Turbocharger pressure ratio VGT position correction, f\_turbo\_pr\_vgtposcorr –  
Lookup table**

array

The variable geometry turbocharger pressure ratio correction is a function of the rack position,  $Pr_{vgtcorr} = f(VGT_{pos})$ , where:

- $Pr_{vgtcorr}$  is the turbocharger pressure ratio correction.
- $VGT_{pos}$  is the variable geometry turbocharger (VGT) rack position.

**Turbocharger pressure ratio VGT position correction breakpoints,  
f\_turbo\_pr\_vgtposcorr\_bpt – Breakpoints**

vector

Turbocharger pressure ratio VGT position correction breakpoints, dimensionless.

**Torque - Simple Torque Lookup**

**Torque table, f\_tq\_nf – Lookup table**

array

For the simple torque lookup table model, the CI engine uses a lookup table is a function of engine speed and injected fuel mass,  $T_{brake} = f_{Tnf}(F, N)$ , where:

- $Tq = T_{brake}$  is engine brake torque after accounting for engine mechanical and pumping friction effects, in  $\text{N}\cdot\text{m}$ .
- $F$  is injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, for **Torque model**, select Simple Torque Lookup.

**Torque table fuel mass per injection breakpoints, f\_tq\_nf\_f\_bpt – Breakpoints**

[0 3.5714 7.1429 10.7143 14.2857 17.8571 21.4286 25 28.5714 32.1429 35.7143 39.2857 42.8571 46.4286 50] (default) | vector

Torque table fuel mass per injection breakpoints, in mg per injection.

**Dependencies**

To enable this parameter, for **Torque model**, select Simple Torque Lookup.

**Torque table speed breakpoints, f\_tq\_nf\_n\_bpt – Breakpoints**

[1000 1410.7143 1821.4286 2232.1429 2642.8571 3053.5714 3464.2857 3875 4285.7143 4696.4286 5107.1429 5517.8571 5928.5714 6339.2857 6750] (default) | vector

Engine speed breakpoints, in rpm.

**Dependencies**

To enable this parameter, for **Torque model**, select Simple Torque Lookup.

**Torque - Torque Structure**

**Fuel mass per injection breakpoints, f\_tqs\_f\_bpt – Breakpoints**

vector

Fuel mass per injection breakpoints, in mg per injection.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Engine speed breakpoints, f\_tqs\_n\_bpt – Breakpoints**

[500 750 1000 1250 1500 1750 2000 2250 2500 2750 3000 3250 3500 3750 4000] (default) | vector

Engine speed breakpoints, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Optimal main start of injection timing, $f_{tqs\_mainsoi}$ – Optimal MAINSOI array

The optimal main start of injection (SOI) timing lookup table,  $f_{SOI_c}$ , is a function of the engine speed and injected fuel mass,  $SOI_c = f_{SOI_c}(F, N)$ , where:

- $SOI_c$  is optimal SOI timing, in degATDC.
- $F$  is compression stroke injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Optimal intake manifold gas pressure, $f_{tqs\_map}$ – Optimal intake MAP array

The optimal intake manifold gas pressure lookup table,  $f_{MAP}$ , is a function of the engine speed and injected fuel mass,  $MAP = f_{MAP}(F, N)$ , where:

- $MAP$  is optimal intake manifold gas pressure, in Pa.
- $F$  is compression stroke injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Optimal exhaust manifold gas pressure, f\_tqs\_emap – Optimal exhaust MAP array**

The optimal exhaust manifold gas pressure lookup table,  $f_{EMAP}$ , is a function of the engine speed and injected fuel mass,  $EMAP = f_{EMAP}(F,N)$ , where:

- $EMAP$  is optimal exhaust manifold gas pressure, in Pa.
- $F$  is compression stroke injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Optimal intake manifold gas temperature, f\_tqs\_mat – Optimal intake MAT array**

The optimal intake manifold gas temperature lookup table,  $f_{MAT}$ , is a function of the engine speed and injected fuel mass,  $MAT = f_{MAT}(F,N)$ , where:

- $MAT$  is optimal intake manifold gas temperature, in K.
- $F$  is compression stroke injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Optimal intake gas oxygen percent, $f_{tqs\_o2pct}$ – Optimal intake gas oxygen array

The optimal intake gas oxygen percent lookup table,  $f_{O_2}$ , is a function of the engine speed and injected fuel mass,  $O_2PCT = f_{O_2}(F, N)$ , where:

- $O_2PCT$  is optimal intake gas oxygen, in percent.
- $F$  is compression stroke injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Optimal fuel rail pressure, $f_{tqs\_fuelpress}$ – Optimal fuel rail pressure array

The optimal fuel rail pressure lookup table,  $f_{fuelp}$ , is a function of the engine speed and injected fuel mass,  $FUELP = f_{fuelp}(F, N)$ , where:

- $FUELP$  is optimal fuel rail pressure, in MPa.
- $F$  is compression stroke injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Optimal gross indicated mean effective pressure, f\_tqs\_imepg – Optimal mean effective pressure**

array

The optimal gross indicated mean effective pressure lookup table,  $f_{imepg}$ , is a function of the engine speed and injected fuel mass,  $IMEPG = f_{imepg}(F, N)$ , where:

- $IMEPG$  is optimal gross indicated mean effective pressure, in Pa.
- $F$  is compression stroke injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Optimal friction mean effective pressure, f\_tqs\_fmep – Optimal friction mean effective pressure**

array

The optimal friction mean effective pressure lookup table,  $f_{fmep}$ , is a function of the engine speed and injected fuel mass,  $FMEP = f_{fmep}(F, N)$ , where:

- $FMEP$  is optimal friction mean effective pressure, in Pa.
- $F$  is compression stroke injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

**Optimal pumping mean effective pressure, f\_tqs\_pmp** – Optimal pumping mean effective pressure  
array

The optimal pumping mean effective pressure lookup table,  $f_{pmp}$ , is a function of the engine speed and injected fuel mass,  $PMEP = f_{pmp}(F, N)$ , where:

- $PMEP$  is optimal pumping mean effective pressure, in Pa.
- $F$  is compression stroke injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

**Friction multiplier as a function of temperature, f\_tqs\_fric\_temp\_mod** – Friction multiplier  
array

Friction multiplier as a function of temperature, dimensionless.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

**Friction multiplier temperature breakpoints,  $f\_tqs\_fric\_temp\_bpt$  – Breakpoints vector**

Friction multiplier temperature breakpoints, in K.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Main start of injection timing efficiency multiplier,  $f\_tqs\_mainsoi\_eff$  – MAINSOI efficiency multiplier**

array

The main start of injection (SOI) timing efficiency multiplier lookup table,  $f_{SOI_{eff}}$ , is a function of the engine speed and main SOI timing relative to optimal timing,  $SOI_{eff} = f_{SOI_{eff}}(\Delta SOI, N)$ , where:

- $SOI_{eff}$  is main SOI timing efficiency multiplier, dimensionless.
- $\Delta SOI$  is main SOI timing relative to optimal timing, in degBTDC.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Main start of injection timing relative to optimal timing breakpoints,  $f\_tqs\_mainsoi\_delta\_bpt$  – Breakpoints**

vector

Main start of injection timing relative to optimal timing breakpoints, in degBTDC.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Intake manifold gas pressure efficiency multiplier,  $f\_tqs\_map\_eff$  – Intake pressure efficiency multiplier**

array

The intake manifold gas pressure efficiency multiplier lookup table,  $f_{MAP_{eff}}$ , is a function of the intake manifold gas pressure ratio relative to optimal pressure ratio and lambda,  $MAP_{eff} = f_{MAP_{eff}}(MAP_{ratio}, \lambda)$ , where:

- $MAP_{eff}$  is intake manifold gas pressure efficiency multiplier, dimensionless.
- $MAP_{ratio}$  is intake manifold gas pressure ratio relative to optimal pressure ratio, dimensionless.
- $\lambda$  is intake manifold gas lambda, dimensionless.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Intake manifold gas pressure ratio relative to optimal pressure ratio breakpoints, $f_{tqs\_map\_ratio\_bpt}$ — Breakpoints

[0.8;0.85;0.9;0.95;1;1.05;1.1;1.15;1.2;1.25;1.3;1.35;1.4;1.45;1.5] (default) | vector

Intake manifold gas pressure ratio relative to optimal pressure ratio breakpoints, dimensionless.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Intake manifold gas lambda breakpoints, $f_{tqs\_lambda\_bpt}$ — Breakpoints

[1.5 1.678571428571429 1.857142857142857 2.035714285714286 2.214285714285714

(default) | vector

Intake manifold gas lambda breakpoints, dimensionless.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Intake manifold gas temperature efficiency multiplier, $f_{tqs\_mat\_eff}$ — Intake temperature efficiency multiplier

array

The intake manifold gas temperature efficiency multiplier lookup table,  $f_{MAT_{eff}}$ , is a function of the engine speed and intake manifold gas temperature relative to optimal temperature,  $MAT_{eff} = f_{MAT_{eff}}(\Delta MAT, N)$ , where:

- $MAT_{eff}$  is intake manifold gas temperature efficiency multiplier, dimensionless.
- $\Delta MAT$  is intake manifold gas temperature relative to optimal temperature, in K.

- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

**Intake manifold gas temperature relative to optimal gas temperature breakpoints,  $f_{tqs\_mat\_delta\_bpt}$  – Breakpoints**

`[-55; -50; -45; -40; -35; -30; -25; -20; -15; -10; -5; 0; 5; 10; 15]` (default) | vector

Intake manifold gas temperature relative to optimal gas temperature breakpoints, in K.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

**Intake manifold gas oxygen efficiency multiplier,  $f_{tqs\_o2pct\_eff}$  – Intake oxygen efficiency multiplier**

array

The intake manifold gas oxygen efficiency multiplier lookup table,  $f_{O2P_{eff}}$ , is a function of the engine speed and intake manifold gas oxygen percent relative to optimal,  $O2P_{eff} = f_{O2P_{eff}}(\Delta O2P, N)$ , where:

- $O2P_{eff}$  is intake manifold gas oxygen efficiency multiplier, dimensionless.
- $\Delta O2P$  is intake gas oxygen percent relative to optimal, in percent.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Intake gas oxygen percent relative to optimal breakpoints, f\_tqs\_o2pct\_delta\_bpt – Breakpoints**  
vector

Intake gas oxygen percent relative to optimal breakpoints, in percent.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Fuel rail pressure efficiency multiplier, f\_tqs\_fuelpress\_eff – Efficiency multiplier**  
array

The fuel rail pressure efficiency multiplier lookup table,  $f_{FUELP_{eff}}$ , is a function of the engine speed and fuel rail pressure relative to optimal breakpoints,  $FUELP_{eff} = f_{FUELP_{eff}}(\Delta FUELP, N)$ , where:

- $FUELP_{eff}$  is fuel rail pressure efficiency multiplier, dimensionless.
- $\Delta FUELP$  is fuel rail pressure relative to optimal, in MPa.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Fuel rail pressure relative to optimal breakpoints, f\_tqs\_fuelpress\_delta\_bpt – Breakpoints**  
vector

Fuel rail pressure relative to optimal breakpoints, in MPa.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Fuel mass injection type identifier, f\_tqs\_f\_inj\_type – Type identifier**  
0 (default) | scalar

Fuel mass injection type identifier, dimensionless.

In the CI Core Engine and CI Controller blocks, you can represent multiple injections with the start of injection (SOI) and fuel mass inputs to the model. To specify the type of injection, use the **Fuel mass injection type identifier** parameter.

Type of Injection	Parameter Value
Pilot	0
Main	1
Post	2
Passed	3

The model considers Passed fuel injections and fuel injected later than a threshold to be unburned fuel. Use the **Maximum start of injection angle for burned fuel, f\_tqs\_f\_burned\_soi\_limit** parameter to specify the threshold.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Indicated mean effective pressure post inject correction, f\_tqs\_imep\_post\_corr – Post inject correction**  
array

The indicated mean effective pressure post inject correction lookup table,  $f_{IMEP_{post}}$ , is a function of the engine speed and fuel rail pressure relative to optimal breakpoints,  $\Delta IMEP_{post} = f_{IMEP_{post}}(\Delta SOI_{post}, F_{post})$ , where:

- $\Delta IMEP_{post}$  is indicated mean effective pressure post inject correction, in Pa.
- $\Delta SOI_{post}$  is indicated mean effective pressure post inject start of inject timing centroid, in degATDC.
- $F_{post}$  is indicated mean effective pressure post inject mass sum, in mg per injection.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Indicated mean effective pressure post inject mass sum breakpoints, f\_tqs\_f\_post\_sum\_bpt – Breakpoints**

(default) | vector

Indicated mean effective pressure post inject start of inject timing centroid breakpoints, in degATDC.

#### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

#### Maximum start of injection angle for burned fuel, **f\_tqs\_f\_burned\_soi\_limit** — Maximum SOI angle for burned fuel

500 (default) | scalar

Maximum start of injection angle for burned fuel, in degATDC.

#### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

#### Exhaust

#### Exhaust gas specific heat at constant pressure, **cp\_exh** — Specific heat

1005 (default) | scalar

Exhaust gas-specific heat,  $C_{p_{exh}}$ , in J/(kg·K).

#### Exhaust Temperature - Simple Torque Lookup

#### Exhaust temperature table, **f\_t\_exh** — Lookup table

array

The lookup table for the exhaust temperature is a function of injected fuel mass and engine speed

$$T_{exh} = f_{T_{exh}}(F, N)$$

where:

- $T_{exh}$  is exhaust temperature, in K.
- $F$  is injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Simple Torque Lookup.

### Fuel mass per injection breakpoints, `f_t_exh_f_bpt` — Breakpoints

[0 3.5714 7.1429 10.7143 14.2857 17.8571 21.4286 25 28.5714 32.1429 35.7143 39.2857 42.8571 46.4286 50] (default) | array

Engine load breakpoints used for exhaust temperature lookup table, in mg per injection.

### Dependencies

To enable this parameter, for **Torque model**, select Simple Torque Lookup.

### Speed breakpoints, `f_t_exh_n_bpt` — Breakpoints

[1000 1410.7143 1821.4286 2232.1429 2642.8571 3053.5714 3464.2857 3875 4285.7143 4696.4286 5107.1429 5517.8571 5928.5714 6339.2857 6750] (default) | array

Engine speed breakpoints used for exhaust temperature lookup table, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Simple Torque Lookup.

### Exhaust Temperature - Torque Structure

#### Optimal exhaust manifold gas temperature, `f_tqs_exht` — Optimal exhaust manifold gas temperature

array

The optimal exhaust manifold gas temperature lookup table,  $f_{Texh}$ , is a function of the engine speed engine speed and injected fuel mass,  $Texh_{opt} = f_{Texh}(F, N)$ , where:

- $Texh_{opt}$  is optimal exhaust manifold gas temperature, in K.
- $F$  is compression stroke injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

**Main start of injection timing exhaust temperature efficiency multiplier,  $f_{SOI_{exhteff}}$  – Main SOI timing efficiency multiplier**  
array

The main start of injection (SOI) timing exhaust temperature efficiency multiplier lookup table,  $f_{SOI_{exhteff}}$ , is a function of the engine speed engine speed and injected fuel mass,  $SOI_{exhteff} = f_{SOI_{exhteff}}(\Delta SOI, N)$ , where:

- $SOI_{exhteff}$  is main SOI exhaust temperature efficiency multiplier, dimensionless.
- $\Delta SOI$  is main SOI timing relative to optimal timing, in degBTDC.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

**Intake manifold gas pressure exhaust temperature efficiency multiplier,  $f_{MAP_{exhteff}}$  – Intake manifold efficiency multiplier**  
array

The intake manifold gas pressure exhaust temperature efficiency multiplier lookup table,  $f_{MAP_{exhteff}}$ , is a function of the intake manifold gas pressure ratio relative to optimal pressure ratio and lambda,  $MAP_{exhteff} = f_{MAP_{exhteff}}(MAP_{ratio}, \lambda)$ , where:

- $MAP_{exheff}$  is intake manifold gas pressure exhaust temperature efficiency multiplier, dimensionless.
- $MAP_{ratio}$  is intake manifold gas pressure ratio relative to optimal pressure ratio, dimensionless.
- $\lambda$  is intake manifold gas lambda, dimensionless.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

**Intake manifold gas temperature exhaust temperature efficiency multiplier,  $f_{tqs\_exht\_mat\_eff}$  – Intake manifold efficiency multiplier**  
array

The intake manifold gas temperature exhaust temperature efficiency multiplier lookup table,  $f_{MATexheff}$ , is a function of the engine speed and intake manifold gas temperature relative to optimal temperature,  $MAT_{exheff} = f_{MATexheff}(\Delta MAT, N)$ , where:

- $MAT_{exheff}$  is intake manifold gas temperature exhaust temperature efficiency multiplier, dimensionless.
- $\Delta MAT$  is intake manifold gas temperature relative to optimal temperature, in K.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

**Intake manifold gas oxygen exhaust temperature efficiency multiplier,  $f_{tqs\_exht\_o2pct\_eff}$  – Intake manifold efficiency multiplier**  
array

The intake manifold gas oxygen exhaust temperature efficiency multiplier lookup table,  $f_{O2P_{exheff}}$ , is a function of the engine speed and intake manifold gas oxygen percent relative to optimal,  $O2P_{exheff} = f_{O2P_{exheff}}(\Delta O2P, N)$ , where:

- $O2P_{exheff}$  is intake manifold gas oxygen exhaust temperature efficiency multiplier, dimensionless.
- $\Delta O2P$  is intake gas oxygen percent relative to optimal, in percent.
- $N$  is engine speed, in rpm.

#### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

**Fuel rail pressure exhaust temperature efficiency multiplier, f\_tqs\_exht\_fuelpress\_eff** — Fuel rail pressure exhaust temperature efficiency multiplier array

The fuel rail pressure efficiency exhaust temperature multiplier lookup table,  $f_{FUELP_{exheff}}$ , is a function of the engine speed and fuel rail pressure relative to optimal breakpoints,  $FUELP_{exheff} = f_{FUELP_{exheff}}(\Delta FUELP, N)$ , where:

- $FUELP_{exheff}$  is fuel rail pressure exhaust temperature efficiency multiplier, dimensionless.
- $\Delta FUELP$  is fuel rail pressure relative to optimal, in MPa.
- $N$  is engine speed, in rpm.

#### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

**Post-injection cylinder wall heat loss transfer coefficient,  
f\_tqs\_exht\_post\_inj\_wall\_htc – Post-injection offset**  
0 (default) | scalar

Post-injection cylinder wall heat loss transfer coefficient, in W/K.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

# CI Core Engine

Compression-ignition engine from intake to exhaust port

**Library:** Powertrain Blockset / Propulsion / Combustion Engine  
Components / Core Engine

## Description

The CI Core Engine block implements a compression-ignition (CI) engine from intake to the exhaust port. You can use the block for hardware-in-the-loop (HIL) engine control design or vehicle-level fuel economy and performance simulations.

The CI Core Engine block calculates:

- Brake torque
- Exhaust temperature
- Air-fuel ratio (AFR)
- Fuel rail pressure
- Engine-out (EO) exhaust emissions:
  - Hydrocarbon (HC)
  - Carbon monoxide (CO)
  - Nitric oxide and nitrogen dioxide (NO<sub>x</sub>)
  - Carbon dioxide (CO<sub>2</sub>)
  - Particulate matter (PM)

### Air Mass Flow

To calculate the air mass flow, the compression-ignition (CI) engine uses the “CI Engine Speed-Density Air Mass Flow Model”. The speed-density model uses the speed-density equation to calculate the engine air mass flow, relating the engine intake port mass flow to the intake manifold pressure, intake manifold temperature, and engine speed.

### Brake Torque

To calculate the engine torque, you can configure the block to use either of these torque models.

Brake Torque Model	Description
“CI Engine Torque Structure Model”	<p>The CI core engine torque structure model determines the engine torque by reducing the maximum engine torque potential as these engine conditions vary from nominal:</p> <ul style="list-style-type: none"> <li>• Start of injection (SOI) timing</li> <li>• Exhaust back-pressure</li> <li>• Burned fuel mass</li> <li>• Intake manifold gas pressure, temperature, and oxygen percentage</li> <li>• Fuel rail pressure</li> </ul> <p>To account for the effect of post-inject fuel on torque, the model uses a calibrated torque offset table.</p>
“CI Engine Simple Torque Model”	<p>For the simple engine torque calculation, the CI engine uses a torque lookup table map that is a function of engine speed and injected fuel mass.</p>

### Fuel Flow

In the CI Core Engine and CI Controller blocks, you can represent multiple injections with the start of injection (SOI) and fuel mass inputs to the model. To specify the type of injection, use the **Fuel mass injection type identifier** parameter.

Type of Injection	Parameter Value
Pilot	0
Main	1
Post	2
Passed	3

The model considers Passed fuel injections and fuel injected later than a threshold to be unburned fuel. Use the **Maximum start of injection angle for burned fuel, f\_tqs\_f\_burned\_soi\_limit** parameter to specify the threshold.

To calculate the engine fuel mass flow, the CI Core Engine block uses fuel mass flow delivered by the injectors and the engine airflow.

$$\dot{m}_{fuel} = \frac{N \cdot N_{cyl}}{Cps \left( \frac{60s}{min} \right) \left( \frac{1000mg}{g} \right)} \sum m_{fuel, inj}$$

To calculate the fuel economy for high-fidelity models, the block uses the volumetric fuel flow.

$$Q_{fuel} = \frac{\dot{m}_{fuel}}{\left( \frac{1000kg}{m^3} \right) Sg_{fuel}}$$

The equation uses these variables.

$\dot{m}_{fuel}$  Fuel mass flow, g/s

$m_{fuel,inj}$	Fuel mass per injection
$Cps$	Crankshaft revolutions per power stroke, rev/stroke
$N_{cyl}$	Number of engine cylinders
$N$	Engine speed, rpm
$Q_{fuel}$	Volumetric fuel flow
$Sg_{fuel}$	Specific gravity of fuel

The block uses the internal signal `FlwDir` to track the direction of the flow.

### Air-Fuel Ratio

To calculate the air-fuel (AFR) ratio, the CI Core Engine and SI Core Engine blocks implement this equation.

$$AFR = \frac{\dot{m}_{air}}{\dot{m}_{fuel}}$$

The CI Core Engine uses this equation to calculate the relative AFR.

$$\lambda = \frac{AFR}{AFR_s}$$

To calculate the exhaust gas recirculation (EGR), the blocks implement this equation. The calculation expresses the EGR as a percent of the total intake port flow.

$$EGR_{pct} = 100 \frac{\dot{m}_{intk,b}}{\dot{m}_{intk}} = 100 y_{intk,b}$$

The equations use these variables.

$AFR$	Air-fuel ratio
$AFR_s$	Stoichiometric air-fuel ratio
$\dot{m}_{intk}$	Engine air mass flow
$\dot{m}_{fuel}$	Fuel mass flow
$\lambda$	Relative AFR
$y_{intk,b}$	Intake burned mass fraction
$EGR_{pct}$	EGR percent
$\dot{m}_{intk,b}$	Recirculated burned gas mass flow rate

### Exhaust Temperature

The exhaust temperature calculation depends on the torque model. For both torque models, the block implements lookup tables.

Torque Model	Description	Equations
Simple Torque Lookup	Exhaust temperature lookup table is a function of the injected fuel mass and engine speed.	$T_{exh} = f_{Texh}(F, N)$
Torque Structure	<p>The nominal exhaust temperature, <math>T_{exh_{nom}}</math>, is a product of these exhaust temperature efficiencies:</p> <ul style="list-style-type: none"> <li>• SOI timing</li> <li>• Intake manifold gas pressure</li> <li>• Intake manifold gas temperature</li> <li>• Intake manifold gas oxygen percentage</li> <li>• Fuel rail pressure</li> <li>• Optimal temperature</li> </ul> <p>The exhaust temperature, <math>T_{exh_{nom}}</math>, is offset by a post temperature effect, <math>\Delta T_{post}</math>, that accounts for post and late injections during the expansion and exhaust strokes.</p>	$T_{exh_{nom}} = SOI_{exh_{teff}} MAP_{exh_{teff}} MAT_{exh_{teff}} O2p_{exh_{teff}} FUEL_{exh_{teff}}$ $T_{exh} = T_{exh_{nom}} + \Delta T_{post}$ $SOI_{exh_{teff}} = f_{SOI_{exh_{teff}}}(\Delta SOI, N)$ $MAP_{exh_{teff}} = f_{MAP_{exh_{teff}}}(MAP_{ratio}, \lambda)$ $MAT_{exh_{teff}} = f_{MAT_{exh_{teff}}}(\Delta MAT, N)$ $O2p_{exh_{teff}} = f_{O2p_{exh_{teff}}}(\Delta O2p, N)$ $Texh_{opt} = f_{Texh}(F, N)$

The equations use these variables.

$F$	Compression stroke injected fuel mass
$N$	Engine speed
$T_{exh}$	Exhaust manifold gas temperature
$T_{exh_{opt}}$	Optimal exhaust manifold gas temperature
$\Delta T_{post}$	Post injection temperature effect
$T_{exh_{nom}}$	Nominal exhaust temperature
$SOI_{exh_{teff}}$	Main SOI exhaust temperature efficiency multiplier
$\Delta SOI$	Main SOI timing relative to optimal timing
$MAP_{exh_{teff}}$	Intake manifold gas pressure exhaust temperature efficiency multiplier
$MAP_{ratio}$	Intake manifold gas pressure ratio relative to optimal pressure ratio
$\lambda$	Intake manifold gas lambda
$MAT_{exh_{teff}}$	Intake manifold gas temperature exhaust temperature efficiency multiplier
$\Delta MAT$	Intake manifold gas temperature relative to optimal temperature
$O2P_{exh_{teff}}$	Intake manifold gas oxygen exhaust temperature efficiency multiplier
$\Delta O2P$	Intake gas oxygen percent relative to optimal
$FUEL_{exh_{teff}}$	Fuel rail pressure exhaust temperature efficiency multiplier
$\Delta FUEL_{P}$	Fuel rail pressure relative to optimal

## EO Exhaust Emissions

The block calculates these engine-out (EO) exhaust emissions:

- Hydrocarbon (HC)
- Carbon monoxide (CO)
- Nitric oxide and nitrogen dioxide (NO<sub>x</sub>)
- Carbon dioxide (CO<sub>2</sub>)
- Particulate matter (PM)

The exhaust temperature determines the specific enthalpy.

$$h_{exh} = Cp_{exh}T_{exh}$$

The exhaust mass flow rate is the sum of the intake port air mass flow and the fuel mass flow.

$$\dot{m}_{exh} = \dot{m}_{intake} + \dot{m}_{fuel}$$

To calculate the exhaust emissions, the block multiplies the emission mass fraction by the exhaust mass flow rate. To determine the emission mass fractions, the block uses lookup tables that are functions of the engine torque and speed.

$$y_{exh,i} = f_{i\_frac}(T_{brake}, N)$$

$$\dot{m}_{exh,i} = \dot{m}_{exh}y_{exh,i}$$

The fraction of air and fuel entering the intake port, injected fuel, and stoichiometric AFR determine the air mass fraction that exits the exhaust.

$$y_{exh,air} = \max\left[y_{in,air} - \frac{\dot{m}_{fuel} + y_{in,fuel}\dot{m}_{intake}}{\dot{m}_{fuel} + \dot{m}_{intake}}AFR_s\right]$$

If the engine is operating at the stoichiometric or fuel rich AFR, no air exits the exhaust. Unburned hydrocarbons and burned gas comprise the remainder of the exhaust gas. This equation determines the exhaust burned gas mass fraction.

$$y_{exh,b} = \max[(1 - y_{exh,air} - y_{exh,HC}), 0]$$

The equations use these variables.

$T_{exh}$	Engine exhaust temperature
$h_{exh}$	Exhaust manifold inlet-specific enthalpy
$Cp_{exh}$	Exhaust gas specific heat
$\dot{m}_{intk}$	Intake port air mass flow rate
$\dot{m}_{fuel}$	Fuel mass flow rate
$\dot{m}_{exh}$	Exhaust mass flow rate
$y_{in,fuel}$	Intake fuel mass fraction
$y_{exh,i}$	Exhaust mass fraction for $i = \text{CO}_2, \text{CO}, \text{HC}, \text{NO}_x, \text{air}, \text{burned gas}, \text{and PM}$
$\dot{m}_{exh,i}$	Exhaust mass flow rate for $i = \text{CO}_2, \text{CO}, \text{HC}, \text{NO}_x, \text{air}, \text{burned gas}, \text{and PM}$

- $T_{brake}$  Engine brake torque
- $N$  Engine speed
- $y_{exh,air}$  Exhaust air mass fraction
- $y_{exh,b}$  Exhaust air burned mass fraction

**Power Accounting**

For the power accounting, the block implements equations that depend on **Torque model**.

When you set **Torque model** to Simple Torque Lookup, the block implements these equations.

Bus Signal		Description	Equations
PwrInfo	PwrTrnsfrd — Power transferred between blocks  • Positive signals indicate flow into block • Negative signals indicate flow out of block	PwrIntkHeatFlw	Intake heat flow $\dot{m}_{intk}h_{intk}$
		PwrExhHeatFlw	Exhaust heat flow $-\dot{m}_{exh}h_{exh}$
		PwrCrkshft	Crankshaft power $-T_{brake}\omega$
PwrNotTrnsfrd — Power crossing the block boundary, but not transferred  • Positive signals indicate an input • Negative signals indicate a loss	PwrFuel	Fuel input power $\dot{m}_{fuel}LHV$	
	PwrLoss	All losses $T_{brake}\omega - \dot{m}_{fuel}LHV - \dot{m}_{intk}h_{intk} + \dot{m}_{exh}h_{exh}$	

Bus Signal		Description	Equations
	PwrStored — Stored energy rate of change <ul style="list-style-type: none"> <li>• Positive signals indicate an increase</li> <li>• Negative signals indicate a decrease</li> </ul>	<i>Not used</i>	

When you set **Torque model** to Torque Structure, the block implements these equations.

Bus Signal		Description	Equations

$T_{fric}$	Engine friction torque
$LHV$	Fuel lower heating value

## Ports

### Input

#### FuelMass — Fuel injector pulse-width

vector

Fuel mass per injection,  $m_{fuel,inj}$ , in mg per injection.

#### Soi — Start of fuel injection timing

vector

Fuel injection timing,  $SOI$ , in degrees crank angle after top dead center (degATDC). First vector value,  $Soi(1)$ , is main injection timing.

#### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

#### EngSpd — Engine speed

scalar

Engine speed,  $N$ , in rpm.

**FuelPrs — Fuel rail pressure**

scalar

Fuel rail pressure,  $FUELP$ , in MPa.**Dependencies**To enable this parameter, for **Torque model**, select Torque Structure.**Ect — Engine cooling temperature**

scalar

Engine cooling temperature,  $T_{coolant}$ , in K.**Dependencies**To enable this parameter, for **Torque model**, select Torque Structure.**Intk — Intake port pressure, temperature, enthalpy, mass fractions**

two-way connector port

Bus containing the upstream:

- Prs — Pressure, in Pa
- Temp — Temperature, in K
- Enth — Specific enthalpy, in J/kg
- MassFrac — Intake port mass fractions, dimensionless. Exhaust gas recirculation (EGR) mass flow at the intake port is burned gas.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

**Exh — Exhaust port pressure, temperature, enthalpy, mass fractions**

two-way connector port

Bus containing the exhaust:

- Prs — Pressure, in Pa

- Temp — Temperature, in K
- Enth — Specific enthalpy, in J/kg
- MassFrac — Exhaust port mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

## Output

### Info — Bus signal

bus

Bus signal containing these block calculations.

Signal	Description	Variable	Units
IntkGasMassFlw	Engine intake air mass flow.	$\dot{m}_{air}$	kg/s
IntkAirMassFlw	Engine intake port mass flow.	$\dot{m}_{intk}$	kg/s
NrmlzdAirChrg	Engine load (that is, normalized cylinder air mass) corrected for final steady-state cam phase angles	$L$	N/A
Afr	Air-fuel ratio at engine exhaust port	$AFR$	N/A
FuelMassFlw	Fuel flow into engine	$\dot{m}_{fuel}$	kg/s
FuelVolFlw	Volumetric fuel flow	$Q_{fuel}$	m <sup>3</sup> /s
ExhManGasTemp	Exhaust gas temperature at exhaust manifold inlet	$T_{exh}$	K
EngTrq	Engine brake torque	$T_{brake}$	N·m
EngSpd	Engine speed	$N$	rpm

Signal		Description	Variable	Units	
IntkCamPhase		Intake cam phaser angle	$\varphi_{ICP}$	degrees crank advance	
ExhCamPhase		Exhaust cam phaser angle	$\varphi_{ECP}$	degrees crank retard	
CrkAng		Engine crankshaft absolute angle	$\int_0^{(360)Cps} EngSpd \frac{180}{30} d\theta$  where $Cps$ is crankshaft revolutions per power stroke	degrees crank angle	
EgrPct		EGR percent	$EGR_{pct}$	N/A	
EoAir		EO air mass flow rate	$\dot{m}_{exh}$	kg/s	
EoBrndGas		EO burned gas mass flow rate	$y_{exh,b}$	kg/s	
EoHC		EO hydrocarbon emission mass flow rate	$y_{exh,HC}$	kg/s	
EoCO		EO carbon monoxide emission mass flow rate	$y_{exh,CO}$	kg/s	
EoNOx		EO nitric oxide and nitrogen dioxide emissions mass flow rate	$y_{exh,NOx}$	kg/s	
EoCO2		EO carbon dioxide emission mass flow rate	$y_{exh,CO2}$	kg/s	
EoPm		EO particulate matter emission mass flow rate	$y_{exh,PM}$	kg/s	
PwrIn fo	PwrTrns frd	PwrIntkHeatFlw	Intake heat flow	$\dot{m}_{intk}h_{intk}$	W

## Parameters

### Block Options

#### Torque model — Select torque model

Torque Structure (default) | Simple Torque Lookup

To calculate the engine torque, you can configure the block to use either of these torque models.

Brake Torque Model	Description
“CI Engine Torque Structure Model”	<p>The CI core engine torque structure model determines the engine torque by reducing the maximum engine torque potential as these engine conditions vary from nominal:</p> <ul style="list-style-type: none"> <li>• Start of injection (SOI) timing</li> <li>• Exhaust back-pressure</li> <li>• Burned fuel mass</li> <li>• Intake manifold gas pressure, temperature, and oxygen percentage</li> <li>• Fuel rail pressure</li> </ul> <p>To account for the effect of post-inject fuel on torque, the model uses a calibrated torque offset table.</p>
“CI Engine Simple Torque Model”	<p>For the simple engine torque calculation, the CI engine uses a torque lookup table map that is a function of engine speed and injected fuel mass.</p>

**Air****Number of cylinders, NCyl – Engine cylinders**

4 (default) | scalar

Number of engine cylinders,  $N_{cyl}$ .**Air standard temperature, Pstd – Temperature**

293.15 (default) | scalar

Standard air temperature,  $T_{std}$ , in K.**Crank revolutions per power stroke, Cps – Revolutions per stroke**

2 (default) | scalar

Crankshaft revolutions per power stroke,  $Cps$ , in rev/stroke.**Total displaced volume, Vd – Volume**

0.0015 (default) | scalar

Displaced volume,  $V_d$ , in  $m^3$ .**Ideal gas constant air, Rair – Constant**

287.05 (default) | scalar

Ideal gas constant,  $R_{air}$ , in  $J/(kg \cdot K)$ .**Air standard pressure, Pstd – Pressure**

101325 (default) | scalar

Standard air pressure,  $P_{std}$ , in Pa.**Speed-density volumetric efficiency, f\_nv – Lookup table**

array

The volumetric efficiency lookup table is a function of the intake manifold absolute pressure at intake valve closing (IVC) and engine speed

$$\eta_v = f_{\eta_v}(MAP, N)$$

where:

- $\eta_v$  is engine volumetric efficiency, dimensionless.
- $MAP$  is intake manifold absolute pressure, in KPa.
- $N$  is engine speed, in rpm.

### Speed-density intake manifold pressure breakpoints, $f_{nv\_prs\_bpt}$ – Breakpoints vector

Intake manifold pressure breakpoints for speed-density volumetric efficiency lookup table, in KPa.

### Speed-density engine speed breakpoints, $f_{nv\_n\_bpt}$ – Breakpoints vector

Engine speed breakpoints for speed-density volumetric efficiency lookup table, in rpm.

## Torque

### Torque - Simple Torque Lookup

### Torque table, $f_{tq\_nf}$ – Lookup table array

For the simple torque lookup table model, the CI engine uses a lookup table as a function of engine speed and injected fuel mass,  $T_{brake} = f_{Tnf}(F, N)$ , where:

- $Tq = T_{brake}$  is engine brake torque after accounting for engine mechanical and pumping friction effects, in N·m.
- $F$  is injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, for **Torque model**, select Simple Torque Lookup.

**Torque table fuel mass per injection breakpoints, f\_tq\_nf\_f\_bpt — Breakpoints**

[0 3.5714 7.1429 10.7143 14.2857 17.8571 21.4286 25 28.5714 32.1429 35.7143 39.2857 42.8571 46.4286 50] (default) | vector

Torque table fuel mass per injection breakpoints, in mg per injection.

**Dependencies**

To enable this parameter, for **Torque model**, select Simple Torque Lookup.

**Torque table speed breakpoints, f\_tq\_nf\_n\_bpt — Breakpoints**

[1000 1410.7143 1821.4286 2232.1429 2642.8571 3053.5714 3464.2857 3875 4285.7143 4696.4286 5107.1429 5517.8571 5928.5714 6339.2857 6750] (default) | vector

Engine speed breakpoints, in rpm.

**Dependencies**

To enable this parameter, for **Torque model**, select Simple Torque Lookup.

**Torque - Torque Structure**

**Fuel mass per injection breakpoints, f\_tqs\_f\_bpt — Breakpoints**

vector

Fuel mass per injection breakpoints, in mg per injection.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Engine speed breakpoints, f\_tqs\_n\_bpt — Breakpoints**

[500 750 1000 1250 1500 1750 2000 2250 2500 2750 3000 3250 3500 3750 4000] (default) | vector

Engine speed breakpoints, in rpm.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Optimal main start of injection timing, f\_tqs\_mainsoi — Optimal MAINSOI**

array

The optimal main start of injection (SOI) timing lookup table,  $f_{SOI_c}$ , is a function of the engine speed and injected fuel mass,  $SOI_c = f_{SOI_c}(F, N)$ , where:

- $SOI_c$  is optimal SOI timing, in degATDC.
- $F$  is compression stroke injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Optimal intake manifold gas pressure, $f_{tqs\_map}$ – Optimal intake MAP array

The optimal intake manifold gas pressure lookup table,  $f_{MAP}$ , is a function of the engine speed and injected fuel mass,  $MAP = f_{MAP}(F, N)$ , where:

- $MAP$  is optimal intake manifold gas pressure, in Pa.
- $F$  is compression stroke injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Optimal exhaust manifold gas pressure, $f_{tqs\_emap}$ – Optimal exhaust MAP array

The optimal exhaust manifold gas pressure lookup table,  $f_{EMAP}$ , is a function of the engine speed and injected fuel mass,  $EMAP = f_{EMAP}(F, N)$ , where:

- $EMAP$  is optimal exhaust manifold gas pressure, in Pa.
- $F$  is compression stroke injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Optimal intake manifold gas temperature, $f_{tqs\_mat}$ – Optimal intake MAT array

The optimal intake manifold gas temperature lookup table,  $f_{MAT}$ , is a function of the engine speed and injected fuel mass,  $MAT = f_{MAT}(F, N)$ , where:

- $MAT$  is optimal intake manifold gas temperature, in K.
- $F$  is compression stroke injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Optimal intake gas oxygen percent, $f_{tqs\_o2pct}$ – Optimal intake gas oxygen array

The optimal intake gas oxygen percent lookup table,  $f_{O2}$ , is a function of the engine speed and injected fuel mass,  $O2PCT = f_{O2}(F, N)$ , where:

- $O2PCT$  is optimal intake gas oxygen, in percent.
- $F$  is compression stroke injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Optimal fuel rail pressure, $f_{tqs\_fuelpress}$ – Optimal fuel rail pressure array

The optimal fuel rail pressure lookup table,  $f_{fuelp}$ , is a function of the engine speed and injected fuel mass,  $FUELP = f_{fuelp}(F, N)$ , where:

- $FUELP$  is optimal fuel rail pressure, in MPa.
- $F$  is compression stroke injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Optimal gross indicated mean effective pressure, $f_{tqs\_imepg}$ – Optimal mean effective pressure array

The optimal gross indicated mean effective pressure lookup table,  $f_{imepg}$ , is a function of the engine speed and injected fuel mass,  $IMEPG = f_{imepg}(F, N)$ , where:

- $IMEPG$  is optimal gross indicated mean effective pressure, in Pa.
- $F$  is compression stroke injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Optimal friction mean effective pressure, f\_tqs\_fmep – Optimal friction mean effective pressure**  
array

The optimal friction mean effective pressure lookup table,  $f_{fmep}$ , is a function of the engine speed and injected fuel mass,  $FMEP = f_{fmep}(F,N)$ , where:

- $FMEP$  is optimal friction mean effective pressure, in Pa.
- $F$  is compression stroke injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Optimal pumping mean effective pressure, f\_tqs\_pmep – Optimal pumping mean effective pressure**  
array

The optimal pumping mean effective pressure lookup table,  $f_{pmep}$ , is a function of the engine speed and injected fuel mass,  $PMEP = f_{pmep}(F,N)$ , where:

- $PMEP$  is optimal pumping mean effective pressure, in Pa.

- $F$  is compression stroke injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Friction multiplier as a function of temperature, $f_{tqs\_fric\_temp\_mod}$ — Friction multiplier

array

Friction multiplier as a function of temperature, dimensionless.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Friction multiplier temperature breakpoints, $f_{tqs\_fric\_temp\_bpt}$ — Breakpoints

vector

Friction multiplier temperature breakpoints, in K.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Main start of injection timing efficiency multiplier, $f_{tqs\_mainsoi\_eff}$ — MAINSOI efficiency multiplier

array

The main start of injection (SOI) timing efficiency multiplier lookup table,  $f_{SOI_{eff}}$ , is a function of the engine speed and main SOI timing relative to optimal timing,  $SOI_{eff} = f_{SOI_{eff}}(\Delta SOI, N)$ , where:

- $SOI_{eff}$  is main SOI timing efficiency multiplier, dimensionless.
- $\Delta SOI$  is main SOI timing relative to optimal timing, in degBTDC.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Main start of injection timing relative to optimal timing breakpoints, f\_tqs\_mainsoi\_delta\_bpt – Breakpoints**  
vector

Main start of injection timing relative to optimal timing breakpoints, in degBTDC.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Intake manifold gas pressure efficiency multiplier, f\_tqs\_map\_eff – Intake pressure efficiency multiplier**  
array

The intake manifold gas pressure efficiency multiplier lookup table,  $f_{MAP_{eff}}$ , is a function of the intake manifold gas pressure ratio relative to optimal pressure ratio and lambda,  $MAP_{eff} = f_{MAP_{eff}}(MAP_{ratio}, \lambda)$ , where:

- $MAP_{eff}$  is intake manifold gas pressure efficiency multiplier, dimensionless.
- $MAP_{ratio}$  is intake manifold gas pressure ratio relative to optimal pressure ratio, dimensionless.
- $\lambda$  is intake manifold gas lambda, dimensionless.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Intake manifold gas pressure ratio relative to optimal pressure ratio breakpoints,  $f_{tqs\_map\_ratio\_bpt}$  — Breakpoints**

[0.8;0.85;0.9;0.95;1;1.05;1.1;1.15;1.2;1.25;1.3;1.35;1.4;1.45;1.5] (default) | vector

Intake manifold gas pressure ratio relative to optimal pressure ratio breakpoints, dimensionless.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Intake manifold gas lambda breakpoints,  $f_{tqs\_lambda\_bpt}$  — Breakpoints**

[1.5 1.678571428571429 1.857142857142857 2.035714285714286 2.214285714285714 2.392857142857143 2.571428571428571 2.75 2.928571428571429 3.107142857142857 3.285714285714286 3.464285714285714 3.642857142857143 3.821428571428572 4] (default) | vector

Intake manifold gas lambda breakpoints, dimensionless.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Intake manifold gas temperature efficiency multiplier,  $f_{tqs\_mat\_eff}$  — Intake temperature efficiency multiplier**

array

The intake manifold gas temperature efficiency multiplier lookup table,  $f_{MAT_{eff}}$ , is a function of the engine speed and intake manifold gas temperature relative to optimal temperature,  $MAT_{eff} = f_{MAT_{eff}}(\Delta MAT, N)$ , where:

- $MAT_{eff}$  is intake manifold gas temperature efficiency multiplier, dimensionless.
- $\Delta MAT$  is intake manifold gas temperature relative to optimal temperature, in K.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Intake manifold gas temperature relative to optimal gas temperature breakpoints,  $f_{tqs\_mat\_delta\_bpt}$  — Breakpoints**

[-55; -50; -45; -40; -35; -30; -25; -20; -15; -10; -5; 0; 5; 10; 15] (default) | vector

Intake manifold gas temperature relative to optimal gas temperature breakpoints, in K.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Intake manifold gas oxygen efficiency multiplier, f\_tqs\_o2pct\_eff – Intake oxygen efficiency multiplier**

array

The intake manifold gas oxygen efficiency multiplier lookup table,  $f_{O2P_{eff}}$ , is a function of the engine speed and intake manifold gas oxygen percent relative to optimal,  $O2P_{eff} = f_{O2P_{eff}}(\Delta O2P, N)$ , where:

- $O2P_{eff}$  is intake manifold gas oxygen efficiency multiplier, dimensionless.
- $\Delta O2P$  is intake gas oxygen percent relative to optimal, in percent.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Intake gas oxygen percent relative to optimal breakpoints, f\_tqs\_o2pct\_delta\_bpt – Breakpoints**

vector

Intake gas oxygen percent relative to optimal breakpoints, in percent.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Fuel rail pressure efficiency multiplier, f\_tqs\_fuelpress\_eff – Efficiency multiplier**

array

The fuel rail pressure efficiency multiplier lookup table,  $f_{FUEL P_{eff}}$ , is a function of the engine speed and fuel rail pressure relative to optimal breakpoints,  $FUEL P_{eff} = f_{FUEL P_{eff}}(\Delta FUEL P, N)$ , where:

- $FUEL P_{eff}$  is fuel rail pressure efficiency multiplier, dimensionless.
- $\Delta FUEL P$  is fuel rail pressure relative to optimal, in MPa.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Fuel rail pressure relative to optimal breakpoints, `f_tqs_fuelpress_delta_bpt` – Breakpoints vector

Fuel rail pressure relative to optimal breakpoints, in MPa.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Fuel mass injection type identifier, `f_tqs_f_inj_type` – Type identifier 0 (default) | scalar

Fuel mass injection type identifier, dimensionless.

In the CI Core Engine and CI Controller blocks, you can represent multiple injections with the start of injection (SOI) and fuel mass inputs to the model. To specify the type of injection, use the **Fuel mass injection type identifier** parameter.

Type of Injection	Parameter Value
Pilot	0
Main	1
Post	2
Passed	3

The model considers Passed fuel injections and fuel injected later than a threshold to be unburned fuel. Use the **Maximum start of injection angle for burned fuel, `f_tqs_f_burned_soi_limit`** parameter to specify the threshold.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Indicated mean effective pressure post inject correction, `f_tqs_imep_post_corr` – Post inject correction array

The indicated mean effective pressure post inject correction lookup table,  $f_{IMEP_{post}}$ , is a function of the engine speed and fuel rail pressure relative to optimal breakpoints,  $\Delta IMEP_{post} = f_{IMEP_{post}}(\Delta SOI_{post}, F_{post})$ , where:

- $\Delta IMEP_{post}$  is indicated mean effective pressure post inject correction, in Pa.
- $\Delta SOI_{post}$  is indicated mean effective pressure post inject start of inject timing centroid, in degATDC.
- $F_{post}$  is indicated mean effective pressure post inject mass sum, in mg per injection.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Indicated mean effective pressure post inject mass sum breakpoints, f\_tqs\_f\_post\_sum\_bpt – Breakpoints**

```
[0 3.571428571428572 7.142857142857143 10.71428571428571 14.28571428571429

(default) | vector
```

Indicated mean effective pressure post inject mass sum breakpoints, in mg per injection.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Indicated mean effective pressure post inject start of inject timing centroid breakpoints, f\_tqs\_soi\_post\_cent\_bpt – Breakpoints**

```
[150 160.7142857142857 171.4285714285714 182.1428571428571 192.8571428571429

(default) | vector
```

Indicated mean effective pressure post inject start of inject timing centroid breakpoints, in degATDC.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Maximum start of injection angle for burned fuel, f\_tqs\_f\_burned\_soi\_limit – Maximum SOI angle for burned fuel**

```
500 (default) | scalar
```

Maximum start of injection angle for burned fuel, in degATDC.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Exhaust

#### Exhaust Temperature - Simple Torque Lookup

#### Exhaust temperature table, $f\_t\_exh$ – Lookup table

array

The lookup table for the exhaust temperature is a function of injected fuel mass and engine speed

$$T_{exh} = f_{Texh}(F, N)$$

where:

- $T_{exh}$  is exhaust temperature, in K.
- $F$  is injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Simple Torque Lookup.

#### Fuel mass per injection breakpoints, $f\_t\_exh\_f\_bpt$ – Breakpoints

[0 3.5714 7.1429 10.7143 14.2857 17.8571 21.4286 25 28.5714 32.1429 35.7143 39.2857 42.8571 46.4286 50] (default) | array

Engine load breakpoints used for exhaust temperature lookup table, in mg per injection.

### Dependencies

To enable this parameter, for **Torque model**, select Simple Torque Lookup.

**Speed breakpoints, f\_t\_exh\_n\_bpt – Breakpoints**

[1000 1410.7143 1821.4286 2232.1429 2642.8571 3053.5714 3464.2857 3875 4285.7143 4696.4286 5107.1429 5517.8571 5928.5714 6339.2857 6750] (default) | array

Engine speed breakpoints used for exhaust temperature lookup table, in rpm.

**Dependencies**

To enable this parameter, for **Torque model**, select Simple Torque Lookup.

**Exhaust Temperature - Torque Structure**

**Optimal exhaust manifold gas temperature, f\_tqs\_exht – Optimal exhaust manifold gas temperature**

array

The optimal exhaust manifold gas temperature lookup table,  $f_{Texh}$ , is a function of the engine speed engine speed and injected fuel mass,  $Texh_{opt} = f_{Texh}(F,N)$ , where:

- $Texh_{opt}$  is optimal exhaust manifold gas temperature, in K.
- $F$  is compression stroke injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Main start of injection timing exhaust temperature efficiency multiplier, f\_tqs\_exht\_mainsoi\_eff – Main SOI timing efficiency multiplier**

array

The main start of injection (SOI) timing exhaust temperature efficiency multiplier lookup table,  $f_{SOIexhteff}$ , is a function of the engine speed engine speed and injected fuel mass,  $SOI_{exhteff} = f_{SOIexhteff}(\Delta SOI,N)$ , where:

- $SOI_{exhteff}$  is main SOI exhaust temperature efficiency multiplier, dimensionless.
- $\Delta SOI$  is main SOI timing relative to optimal timing, in degBTDC.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

**Intake manifold gas pressure exhaust temperature efficiency multiplier,  $f_{MAPexheff}$  — Intake manifold efficiency multiplier**  
array

The intake manifold gas pressure exhaust temperature efficiency multiplier lookup table,  $f_{MAPexheff}$ , is a function of the intake manifold gas pressure ratio relative to optimal pressure ratio and lambda,  $MAP_{exheff} = f_{MAPexheff}(MAP_{ratio}, \lambda)$ , where:

- $MAP_{exheff}$  is intake manifold gas pressure exhaust temperature efficiency multiplier, dimensionless.
- $MAP_{ratio}$  is intake manifold gas pressure ratio relative to optimal pressure ratio, dimensionless.
- $\lambda$  is intake manifold gas lambda, dimensionless.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

**Intake manifold gas temperature exhaust temperature efficiency multiplier,  $f_{MATexheff}$  — Intake manifold efficiency multiplier**  
array

The intake manifold gas temperature exhaust temperature efficiency multiplier lookup table,  $f_{MATexheff}$ , is a function of the engine speed and intake manifold gas temperature relative to optimal temperature,  $MAT_{exheff} = f_{MATexheff}(\Delta MAT, N)$ , where:

- $MAT_{exheff}$  is intake manifold gas temperature exhaust temperature efficiency multiplier, dimensionless.
- $\Delta MAT$  is intake manifold gas temperature relative to optimal temperature, in K.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Intake manifold gas oxygen exhaust temperature efficiency multiplier, f\_tqs\_exht\_o2pct\_eff – Intake manifold efficiency multiplier**  
array

The intake manifold gas oxygen exhaust temperature efficiency multiplier lookup table,  $f_{O2Pexheff}$ , is a function of the engine speed and intake manifold gas oxygen percent relative to optimal,  $O2P_{exheff} = f_{O2Pexheff}(\Delta O2P, N)$ , where:

- $O2P_{exheff}$  is intake manifold gas oxygen exhaust temperature efficiency multiplier, dimensionless.
- $\Delta O2P$  is intake gas oxygen percent relative to optimal, in percent.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Fuel rail pressure exhaust temperature efficiency multiplier, f\_tqs\_exht\_fuelpress\_eff – Fuel rail pressure exhaust temperature efficiency multiplier**  
array

The fuel rail pressure efficiency exhaust temperature multiplier lookup table,  $f_{FUELP_{exheff}}$ , is a function of the engine speed and fuel rail pressure relative to optimal breakpoints,  $FUELP_{exheff} = f_{FUELP_{exheff}}(\Delta FUELP, N)$ , where:

- $FUELP_{exheff}$  is fuel rail pressure exhaust temperature efficiency multiplier, dimensionless.
- $\Delta FUELP$  is fuel rail pressure relative to optimal, in MPa.
- $N$  is engine speed, in rpm.

#### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

#### Post-injection cylinder wall heat loss transfer coefficient, $f_{tqs\_exht\_post\_inj\_wall\_htc}$ – Post-injection offset

0 (default) | scalar

Post-injection cylinder wall heat loss transfer coefficient, in W/K.

#### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

#### Emissions

#### CO<sub>2</sub> mass fraction table, $f_{CO_2\_frac}$ – Carbon dioxide (CO<sub>2</sub>) emission lookup table

array

The CI Core Engine CO<sub>2</sub> emission mass fraction lookup table is a function of engine torque and engine speed,  $CO_2 \text{ Mass Fraction} = f(\text{Speed}, \text{Torque})$ , where:

- $CO_2 \text{ Mass Fraction}$  is the CO<sub>2</sub> emission mass fraction, dimensionless.
- $\text{Speed}$  is engine speed, in rpm.
- $\text{Torque}$  is engine torque, in N·m.

**Dependencies**

To enable this parameter, on the **Exhaust** tab, select **CO2**.

**CO mass fraction table, f\_CO\_frac – Carbon monoxide (CO) emission lookup table array**

The CI Core Engine CO emission mass fraction lookup table is a function of engine torque and engine speed,  $CO\ Mass\ Fraction = f(Speed, Torque)$ , where:

- *CO Mass Fraction* is the CO emission mass fraction, dimensionless.
- *Speed* is engine speed, in rpm.
- *Torque* is engine torque, in N·m.

**Dependencies**

To enable this parameter, on the **Exhaust** tab, select **CO**.

**HC mass fraction table, f\_HC\_frac – Hydrocarbon (HC) emission lookup table**

array

The CI Core Engine HC emission mass fraction lookup table is a function of engine torque and engine speed,  $HC\ Mass\ Fraction = f(Speed, Torque)$ , where:

- *HC Mass Fraction* is the HC emission mass fraction, dimensionless.
- *Speed* is engine speed, in rpm.
- *Torque* is engine torque, in N·m.

**Dependencies**

To enable this parameter, on the **Exhaust** tab, select **HC**.

**NOx mass fraction table, f\_NOx\_frac – Nitric oxide and nitrogen dioxide (NOx) emission lookup table**

array

The CI Core Engine NOx emission mass fraction lookup table is a function of engine torque and engine speed,  $NOx\ Mass\ Fraction = f(Speed, Torque)$ , where:

- *NOx Mass Fraction* is the NOx emission mass fraction, dimensionless.
- *Speed* is engine speed, in rpm.
- *Torque* is engine torque, in N·m.

**Dependencies**

To enable this parameter, on the **Exhaust** tab, select **NOx**.

**PM mass fraction table, f\_PM\_frac – Particulate matter (PM) emission lookup table array**

The CI Core Engine PM emission mass fraction lookup table is a function of engine torque and engine speed where:

- *PM* is the PM emission mass fraction, dimensionless.
- *Speed* is engine speed, in rpm.
- *Torque* is engine torque, in N·m.

**Dependencies**

To enable this parameter, on the **Exhaust** tab, select **PM**.

**Engine speed breakpoints, f\_exhfrac\_n\_bpt – Breakpoints**

```

```

Engine torque breakpoints used for the emission mass fractions lookup tables, in N·m.

### Dependencies

To enable this parameter, on the **Exhaust** tab, select **CO<sub>2</sub>**, **CO**, **NO<sub>x</sub>**, **HC**, or **PM**.

**Exhaust gas specific heat at constant pressure, cp\_exh — Specific heat**  
1005 (default) | scalar

Exhaust gas-specific heat,  $C_{p_{exh}}$ , in J/(kg·K).

### Fuel

**Stoichiometric air-fuel ratio, afr\_stoich — Air-fuel ratio**  
14.6 (default) | scalar

Air-fuel ratio, *AFR*.

**Fuel lower heating value, fuel\_lhv — Heating value**  
42e6 (default) | scalar

Fuel lower heating value, *LHV*, in J/kg.

**Fuel specific gravity, fuel\_sg — Specific gravity**  
0.832 (default) | scalar

Specific gravity of fuel,  $Sg_{fuel}$ , dimensionless.

# Compressor

Compressor for boosted engines

**Library:** Powertrain Blockset / Propulsion / Combustion Engine  
Components / Boost

## Description

The Compressor block simulates engine boost by using the drive shaft energy to increase the intake manifold pressure. The block is a component of supercharger and turbocharger models. The block uses two-way ports to connect to the inlet and outlet control volumes and the drive shaft. The control volumes provide the pressure, temperature, and specific enthalpy for the compressor to calculate the mass and energy flow rates. To calculate the torque and flow rates, the drive shaft provides the speed to the compressor. Typically, compressor manufacturers provide the mass flow rate and efficiency tables as a function of corrected speed and pressure ratio. You can specify the lookup tables to calculate the mass flow rate and efficiency. The block does not support reverse mass flow.

If you have Model-Based Calibration Toolbox, click **Calibrate Performance Maps** to virtually calibrate the mass flow rate and turbine efficiency lookup tables using measured data.

The mass flows from the inlet control volume to the outlet control volume.

## Virtual Calibration

If you have Model-Based Calibration Toolbox, click **Calibrate Performance Maps** to virtually calibrate the mass flow rate and turbine efficiency lookup tables using measured data. The dialog box steps through these tasks.

Task	Description

Task	Description
Update block parameters	Update these mass flow rate and efficiency parameters with the calibration. <ul style="list-style-type: none"> <li>• <b>Corrected mass flow rate table, <math>\dot{m}_{corr\_tbl}</math></b></li> <li>• <b>Efficiency table, <math>\eta_{comp\_tbl}</math></b></li> <li>• <b>Corrected speed breakpoints, <math>w\_corr\_bpts1</math></b></li> <li>• <b>Pressure ratio breakpoints, <math>Pr\_bpts2</math></b></li> </ul>

### Thermodynamics

The block uses these equations to model the thermodynamics.

Calculation	Equations
Forward mass flow	$\dot{m}_{comp} > 0$ $p_{01} = p_{inlet}$ $p_{02} = p_{outlet}$ $T_{01} = T_{inlet}$ $h_{01} = h_{inlet}$
First law of thermodynamics	$\dot{W}_{comp} = \dot{m}_{comp}c_p(T_{01} - T_{02})$
Isentropic efficiency	$\eta_{comp} = \frac{h_{02s} - h_{01}}{h_{02} - h_{01}} = \frac{T_{02s} - T_{01}}{T_{02} - T_{01}}$
Isentropic outlet temperature, assuming ideal gas and constant specific heats	$T_{02s} = T_{01} \left( \frac{p_{02}}{p_{01}} \right)^{\frac{\gamma - 1}{\gamma}}$
Specific heat ratio	$\gamma = \frac{c_p}{c_p - R}$
Outlet temperature	$T_{02} = T_{01} + \frac{T_{01}}{\eta_{comb}} \left\{ \left( \frac{p_{02}}{p_{01}} \right)^{\frac{\gamma - 1}{\gamma}} - 1 \right\}$
Heat flows	$q_{inlet} = \dot{m}_{comp}h_{01}$ $q_{outlet} = \dot{m}_{comp}h_{02} = \dot{m}_{comp}c_pT_{02}$
Corrected mass flow rate	$\dot{m}_{corr} = \dot{m}_{comp} \frac{\sqrt{T_{01}/T_{ref}}}{p_{01}/p_{ref}}$
Corrected speed	$\omega_{corr} = \frac{\omega}{\sqrt{T_{01}/T_{ref}}}$
Pressure ratio	$p_r = \frac{p_{01}}{p_{02}}$

The block uses the internal signal `FlwDir` to track the direction of the flow.

The equations use these variables.

$p_{inlet}, p_{01}$	Inlet control volume total pressure
$T_{inlet}, T_{01}$	Inlet control volume total temperature
$h_{inlet}, h_{01}$	Inlet control volume total specific enthalpy
$p_{outlet}, p_{02}$	Outlet control volume total pressure
$T_{outlet}$	Outlet control volume total temperature
$h_{outlet}$	Outlet control volume total specific enthalpy
$\dot{W}_{comp}$	Drive shaft power
$T_{02}$	Outlet total temperature
$h_{02}$	Outlet total specific enthalpy
$\dot{m}_{comp}$	Mass flow rate through compressor
$q_{inlet}$	Inlet heat flow rate
$q_{outlet}$	Outlet heat flow rate
$\eta_{comp}$	Compressor isentropic efficiency
$T_{02s}$	Isentropic outlet total temperature
$h_{02s}$	Isentropic outlet total specific enthalpy
$R$	Ideal gas constant
$c_p$	Specific heat at constant pressure
$\gamma$	Specific heat ratio
$\dot{m}_{corr}$	Corrected mass flow rate
$\omega$	Drive shaft speed
$\omega_{corr}$	Corrected drive shaft speed
$T_{ref}$	Lookup table reference temperature
$P_{ref}$	Lookup table reference pressure
$\tau_{comp}$	Compressor drive shaft torque
$p_r$	Pressure ratio
$\eta_{comb, tbl}$	Compressor efficiency 3-D lookup table
$\dot{m}_{corr, tbl}$	Corrected mass flow rate 3-D lookup table
$\omega_{corr, bpts1}$	Corrected speed breakpoints
$p_r, bpts2$	Pressure ratio breakpoints

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Equations
PwrInfo	PwrTrnsfrd — Power transferred between blocks	PwrDriveshaft	Power transmitted from the shaft
	<ul style="list-style-type: none"> <li>• Positive signals indicate flow into block</li> <li>• Negative signals indicate flow out of block</li> </ul>	PwrHeatFlwin	Heat flow rate at port A
		PwrHeatFlwout	Heat flow rate at port B
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred	PwrLoss	Power loss
	<ul style="list-style-type: none"> <li>• Positive signals indicate an input</li> <li>• Negative signals indicate a loss</li> </ul>		
PwrStored — Stored energy rate of change	<i>Not used</i>		
<ul style="list-style-type: none"> <li>• Positive signals indicate an increase</li> <li>• Negative signals indicate a decrease</li> </ul>			

The equations use these variables.

- $\dot{W}_{turb}$  Drive shaft power
- $q_{outlet}$  Total outlet heat flow rate
- $q_{inlet}$  Total inlet heat flow rate

## Ports

### Input

#### Ds — Drive shaft speed

two-way connector port

ShftSpd — Signal containing the drive shaft angular speed,  $\omega$ , in rad/s.

#### A — Inlet pressure, temperature, enthalpy, mass fractions

two-way connector port

Bus containing the inlet control volume:

- InPrs — Pressure,  $p_{inlet}$ , in Pa
- InTemp — Temperature,  $T_{inlet}$ , in K
- InEnth — Specific enthalpy,  $h_{inlet}$ , in J/kg

#### B — Outlet pressure, temperature, enthalpy, mass fractions

two-way connector port

Bus containing the outlet control volume:

- OutPrs — Pressure,  $p_{outlet}$ , in Pa
- OutTemp — Temperature,  $T_{outlet}$ , in K
- OutEnth — Specific enthalpy,  $h_{outlet}$ , in J/kg

## Output

### Info — Bus signal

bus

Bus signal containing these block calculations.

Signal		Description	Units	
CmprsOutletTemp		Temperature exiting the compressor	K	
DriveshftPwr		Drive shaft power	W	
DriveshftTrq		Drive shaft torque	N·m	
CmprsMassFlw		Mass flow rate through compressor	kg/s	
PrsRatio		Pressure ratio	N/A	
DriveshftCorrSpd		Corrected drive shaft speed	rad/s	
CmprsEff		Compressor isentropic efficiency	N/A	
CorrMassFlw		Corrected mass flow rate	kg/s	
PwrInfo	PwrTrnsfrd	PwrDriveshft	Power transmitted from the shaft	W
		PwrHeatFlwIn	Heat flow rate at port A	W
		PwrHeatFlwOut	Heat flow rate at port B	W
	PwrNotTrnsfrd	PwrLoss	Power loss	W
	PwrStored		<i>Not used</i>	W

### Ds — Drive shaft torque

two-way connector port

Trq — Signal containing the drive shaft torque,  $\tau_{comp}$ , in N·m.

### A — Inlet mass flow rate, heat flow rate, temperature, mass fractions

two-way connector port

Bus containing:

- MassFlwRate — Mass flow rate through inlet,  $\dot{m}_{comp}$ , in kg/s
- HeatFlwRate — Inlet heat flow rate,  $q_{inlet}$ , in J/s
- Temp — Inlet temperature, in K
- MassFrac — Inlet mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

**B — Outlet mass flow rate, heat flow rate, temperature, mass fractions**

two-way connector port

Bus containing:

- MassFlwRate — Outlet mass flow rate,  $\dot{m}_{comp}$ , in kg/s
- HeatFlwRate — Outlet heat flow rate,  $q_{outlet}$ , in J/s
- Temp — Outlet temperature, in K
- MassFrac — Outlet mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

**Parameters****Performance Tables**

**Calibrate Performance Maps — Calibrate tables with measured data selection**

If you have Model-Based Calibration Toolbox, click **Calibrate Performance Maps** to virtually calibrate the mass flow rate and turbine efficiency lookup tables using measured data. The dialog box steps through these tasks.

# Control Volume System

Constant volume open thermodynamic system with heat transfer

**Library:** Powertrain Blockset / Propulsion / Combustion Engine  
Components / Fundamental Flow

## Description

The Control Volume System block models a constant volume open thermodynamic system with heat transfer. The block uses the conservation of mass and energy, assuming an ideal gas, to determine the pressure and temperature. The block implements an automotive-specific Constant Volume Pneumatic Chamber block that includes thermal effects related to the under hood of passenger vehicles. You can specify heat transfer models:

- Constant
- External input
- External wall convection

You can use the Control Volume System block to represent engine components that contain volume, including pipes and manifolds.

## Thermodynamics

The Control Volume System block implements a constant volume chamber containing an ideal gas. To determine the rate changes in temperature and pressure, the block uses the continuity equation and the first law of thermodynamics.

$$\frac{dT_{vol}}{dt} = \frac{RT_{vol}}{c_v V_{ch} P_{vol}} \left( \sum (q_i - T_{vol} c_v \dot{m}_i) - Q_{wall} \right)$$

$$\frac{dP_{vol}}{dt} = \frac{P_{vol}}{T_{vol}} \frac{dT_{vol}}{dt} + \frac{RT_{vol}}{V_{ch}} \sum \dot{m}_i$$

The block uses this equation for the volume-specific enthalpy.

$$h_{vol} = c_p T_{vol}$$

The equations use these variables.

$\dot{m}_i$	Mass flow rate at port
$q_i$	Heat flow rate at port
$V_{ch}$	Chamber volume
$P_{vol}$	Absolute pressure in the chamber
$R$	Ideal gas constant
$c_v$	Specific heat at constant volume

$T_{vol}$	Absolute gas temperature
$Q_{wall}$	Wall heat transfer rate
$h_{vol}$	Volume-specific enthalpy
$c_p$	Specific heat capacity

### Mass Fractions

The Control Volume Source block is part of a flow network. Blocks in the network determine the mass fractions that the block will track during simulation. The block can track these mass fractions:

- O2 — Oxygen
- N2 — Nitrogen
- UnburnedFuel — Unburned fuel
- CO2 — Carbon dioxide
- H2O — Water
- CO — Carbon monoxide
- NO — Nitric oxide
- NO2 — Nitrogen dioxide
- PM — Particulate matter
- Air — Air
- BurnedGas — Burned gas

Using the conservation of mass for each gas constituent, this equation determines the rate change:

$$\frac{dy_{vol,j}}{dt} = \frac{RT_{vol}}{P_{vol}V_{ch}} (\sum \dot{m}_i y_{i,j} + y_{vol,j} \sum \dot{m}_i)$$

The equations use these variables.

$V_{ch}$	Chamber volume
$P_{vol}$	Absolute pressure in the chamber
$R$	Ideal gas constant
$T_{vol}$	Absolute gas temperature
$y_{i,j}$	I-th port mass fraction for $j = O_2, N_2, \text{unburned fuel}, CO_2, H_2O, CO, NO, NO_2, PM, \text{air}, \text{and burned gas}$
$y_{vol,j}$	Control volume mass fraction for $j = O_2, N_2, \text{unburned fuel}, CO_2, H_2O, CO, NO, NO_2, PM, \text{air}, \text{and burned gas}$
$\dot{m}_i$	Mass flow rate for $i = O_2, N_2, \text{unburned fuel}, CO_2, H_2O, CO, NO, NO_2, PM, \text{air}, \text{and burned gas}$

### External Wall Convection Heat Transfer Model

To calculate the heat transfer, you can configure the Control Volume Source block to calculate the heat transfer across the wall of the control volume.

The block implements these equations to calculate the heat transfer,  $Q_1$ , from the internal control volume gas to the internal wall depth,  $D_{int\_cond}$ .

$$Q_1 = Q_{1,conv} = Q_{1,cond}$$

$$Q_{1,conv} = h_{int}(x_{int}) \cdot A_{int\_conv} \cdot (T_{int\_gas} - T_{w\_int})$$

$$Q_{1,cond} = k_{int} \cdot \frac{A_{int\_cond}}{D_{int\_cond}} \cdot (T_{w\_int} - T_{mass})$$

The block implements these equations to calculate the heat transfer,  $Q_2$ , from the external wall depth,  $D_{ext\_cond}$  to the external gas.

$$Q_2 = Q_{2,conv} = h_{ext}(x_{ext}) \cdot A_{ext\_conv} \cdot (T_{w\_ext} - T_{ext\_gas})$$

$$Q_{2,cond} = k_{ext} \cdot \frac{A_{ext\_cond}}{D_{ext\_cond}} \cdot (T_{mass} - T_{w\_ext})$$

This equation expresses the heat stored in the thermal mass.

$$\frac{dT_{mass}}{dt} = \frac{Q_1 - Q_2}{c_{pwall} m_{wall}}$$

The block determines the interior convection heat transfer coefficient using a lookup table that is a function of the average mass flow rate.

$$\dot{m}_{int\_gas} = \frac{1}{2} \sum |\dot{m}_i|$$

The equations use these variables.

$Q_1$	Heat flow from the internal gas to a specified wall depth
$Q_{1,conv}$	Heat flow convection from the internal gas to the internal wall
$Q_{1,cond}$	Conduction heat transfer rate
$Q_2$	Heat transfer rate
$Q_{2,conv}$	Convection heat transfer
$Q_{2,cond}$	Heat flow conduction from the external middle portion of the wall to the external wall
$Q_{mass}$	Heat stored in thermal mass
$h_{int}$	Internal convection heat transfer coefficient
$x_{int}$	Internal mass flow rate breakpoints

$A_{int\_conv}$	Internal flow convection area
$T_{int\_gas}$	Temperature of the gas inside the chamber
$T_{w\_int}$	Temperature of the inside wall of the chamber
$k_{int}$	Internal wall thermal conductivity
$A_{int\_cond}$	Internal conduction area
$D_{int\_cond}$	Internal wall thickness
$h_{ext}$	External convection heat transfer coefficient
$x_{ext}$	External velocity breakpoints
$A_{ext\_conv}$	External convection area
$T_{ext\_gas}$	External gas temperature
$T_{w\_ext}$	Temperature of the external wall of the chamber
$k_{ext}$	External wall thermal conductivity
$A_{ext\_cond}$	External conduction area
$D_{ext\_cond}$	External wall thickness
$T_{mass}$	Temperature of the thermal mass
$c_{p\_wall}$	Wall heat capacity
$m_{wall}$	Thermal mass
$Flw_{spd}$	External flow velocity
$\dot{m}_{int\_gas}$	Average internal mass flow rate

### Power Accounting

For the power accounting, the block implements these equation based on the number of inlet and outlet ports.

Bus Signal		Description	Equations
PwrIn fo	PwrTrnsfrd — Power transferred between blocks  <ul style="list-style-type: none"> <li>Positive signals indicate flow into block</li> <li>Negative signals indicate flow out of block</li> </ul>	PwrHeatFl wi	Port $i$ heat flow  $q_i$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred  <ul style="list-style-type: none"> <li>Positive signals indicate an input</li> <li>Negative signals indicate a loss</li> </ul>	PwrHeatTr nsfr	Heat transfer rate from wall to control volume  $-Q_{wall}$

Bus Signal		Description	Equations	
	<p><b>PwrStored</b> — Stored energy rate of change</p> <ul style="list-style-type: none"> <li>• Positive signals indicate an increase</li> <li>• Negative signals indicate a decrease</li> </ul>	<b>PwrHeatStored</b>	Rate of heat stored in the control volume	$\left( \sum (q_i) - Q_{wall} \right)$

For example, if you configure your block with 3 input ports and 2 outlet ports, the block implements these equations

Bus Signal		Description	Equations	
PwrIn fo	<p><b>PwrTrnsfrd</b> — Power transferred between blocks</p> <ul style="list-style-type: none"> <li>• Positive signals indicate flow into block</li> <li>• Negative signals indicate flow out of block</li> </ul>	<b>PwrHeatFlw1</b>	Inlet port 1 heat flow	$q_1$

## Ports

### Input

#### C — Inlet mass flow rate, heat flow rate, mass fractions

two-way connector port

Bus containing:

- **MassFlw** — Mass flow rate through inlet, in kg/s
- **HeatFlw** — Inlet heat flow rate, in J/s

- **MassFrac** — Inlet mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- **O2MassFrac** — Oxygen
- **N2MassFrac** — Nitrogen
- **UnbrndFuelMassFrac** — Unburned fuel
- **C02MassFrac** — Carbon dioxide
- **H20MassFrac** — Water
- **C0MassFrac** — Carbon monoxide
- **N0MassFrac** — Nitric oxide
- **N02MassFrac** — Nitrogen dioxide
- **N0xMassFrac** — Nitric oxide and nitrogen dioxide
- **PmMassFrac** — Particulate matter
- **AirMassFrac** — Air
- **BrndGasMassFrac** — Burned gas

**Dependencies**

To create input ports, specify the **Number of inlet ports** parameter.

**HeatTrnsfrRate — Heat transfer**

scalar

External heat transfer input to control volume,  $q_{he}$ , in Kg/s.

**Dependencies**

To create this port, select External input for the **Heat transfer model** parameter.

**ExtnlFlwVel — External flow velocity**

scalar

External flow velocity,  $Flw_{spd}$ , in m/s.

**Dependencies**

To create this port, select External wall convection for the **Heat transfer model** parameter.

**ExtnlTemp — Ambient temperature, K**

scalar

**Dependencies**

To create this port, select External wall convection for the **Heat transfer model** parameter.

**Output****Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal		Description	Units	
Vol	Prs	Volume pressure	Pa	
	Temp	Volume temperature	K

	PwrStored	PwrHeatStored	Rate of heat stored in the control volume	W

### C – Outlet pressure, temperature, enthalpy, mass fractions

two-way connector port

Bus containing the outlet control volume:

- Prs — Chamber pressure, in Pa
- Temp — Gas temperature, in K

- Enth — Specific enthalpy, in J/kg
- MassFrac — Mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

### Dependencies

To create outlet ports, specify the **Number of outlet ports** parameter.

## Parameters

### Block Options

#### Number of inlet ports — Number of ports

1 (default) | 0 | 2 | 3 | 4

Number of inlet ports.

### Dependencies

To create inlet ports, specify the number.

#### Number of outlet ports — Number of ports

1 (default) | 0 | 2 | 3 | 4

Number of outlet ports.

### Dependencies

To create outlet ports, specify the number.

#### Heat transfer model — Select model

Constant (default) | External input | External wall convection

### Dependencies

Selecting Constant or External wall convection enables the **Heat Transfer** parameters.

**Image type — Icon color**

Cold (default) | Hot

Select color for block icon:

- Cold for blue
- Hot for red

**General****Chamber volume, Vch — Volume**

0.0029 (default) | scalar

Chamber volume,  $V_{ch}$ , in  $m^3$ .**Initial chamber pressure, Pinit — Pressure**

101325 (default) | scalar

Initial chamber pressure,  $P_{vol}$ , in Pa.**Initial chamber temperature, Tinit — Temperature**

298 (default) | scalar

Initial chamber temperature,  $T_{vol}$ , in K.**Ideal gas constant, R — Ideal gas constant**

287 (default) | scalar

Ideal gas constant,  $R$ , in  $J/(kg \cdot K)$ .**Specific heat capacity, cp — Specific heat**

1005 (default) | scalar

Specific heat capacity,  $c_p$ , in  $J/(kg \cdot K)$ .**Heat Transfer****Heat transfer rate, q\_he — Rate**

0 (default) | scalar

Constant heat transfer rate,  $q_{he}$ , in J/s.**Dependencies**To enable this parameter, select Constant for the **Heat transfer model** parameter.**External convection heat transfer coefficient, ext\_tbl — Manifold external air**

[40 160 740 2000] (default) | vector

External convection heat transfer coefficient,  $h_{ext}$ , in  $W/(m^2K)$ .**Dependencies**To enable this parameter, select External wall convection for the **Heat transfer model** parameter.

**External velocity breakpoints, ext\_bpts – Manifold external air**

linspace(0,180,4) (default) | vector

External velocity breakpoints,  $x_{ext}$ , in m/s.**Dependencies**

To enable this parameter, select External wall convection for the **Heat transfer model** parameter.

**External convection area, Aext\_conv – Manifold external air**

0.125 (default) | scalar

External convection area,  $A_{ext\_conv}$ , in m<sup>2</sup>.**Dependencies**

To enable this parameter, select External wall convection for the **Heat transfer model** parameter.

**Thermal mass, m\_wall – Manifold wall general**

7 (default) | scalar

Thermal mass,  $m_{wall}$ , in kg.**Dependencies**

To enable this parameter, select External wall convection for the **Heat transfer model** parameter.

**Wall heat capacity, cp\_wall – Manifold wall general**

900 (default) | scalar

Wall heat capacity,  $c_{p\_wall}$ , in J/(kg·K).**Dependencies**

To enable this parameter, select External wall convection for the **Heat transfer model** parameter.

**Initial mass temperature, Tmass – Manifold wall general**

293.15 (default) | scalar

Initial mass temperature,  $T_{mass}$ , in K.**Dependencies**

To enable this parameter, select External wall convection for the **Heat transfer model** parameter.

**External wall thickness, Dext\_cond – Manifold wall external**

0.004 (default) | scalar

External wall thickness,  $D_{ext\_cond}$ , in m.**Dependencies**

To enable this parameter, select External wall convection for the **Heat transfer model** parameter.

**External conduction area, Aext\_cond – Manifold wall external**

0.003 (default) | scalar

External conduction area,  $A_{ext\_cond}$ , in  $m^2$ .**Dependencies**To enable this parameter, select External wall convection for the **Heat transfer model** parameter.**External wall thermal conductivity, kint – Manifold wall external**

25 (default) | scalar

External wall thermal conductivity,  $k_{ext}$ , in  $W/(m \cdot K)$ .**Dependencies**To enable this parameter, select External wall convection for the **Heat transfer model** parameter.**Internal wall thickness, Dint\_cond – Manifold wall internal**

0.004 (default) | scalar

Internal wall thickness,  $D_{int\_cond}$ , in m.**Dependencies**To enable this parameter, select External wall convection for the **Heat transfer model** parameter.**Internal conduction area, Aint\_cond – Manifold wall internal**

0.003 (default) | scalar

Internal conduction area,  $A_{int\_cond}$ , in  $m^2$ .**Dependencies**To enable this parameter, select External wall convection for the **Heat transfer model** parameter.**Internal wall thermal conductivity, kint – Manifold wall internal**

25 (default) | scalar

Internal wall thermal conductivity,  $k_{int}$ , in  $W/(m \cdot K)$ .**Dependencies**To enable this parameter, select External wall convection for the **Heat transfer model** parameter.**Internal convection heat transfer coefficient, int\_tbl – Manifold internal air**

[40 160 740 2000] (default) | vector

Internal convection heat transfer coefficient,  $h_{int}$ , in  $W/(m^2K)$ .**Dependencies**To enable this parameter, select External wall convection for the **Heat transfer model** parameter.

### Internal mass flow rate breakpoints, `int_bpts` — Manifold internal air

`linspace(0.0020,0.1100,4)` (default) | vector

Internal velocity breakpoints,  $x_{int}$ , in kg/s.

#### Dependencies

To enable this parameter, select External wall convection for the **Heat transfer model** parameter.

### Internal flow convection area, `Aint_conv` — Manifold internal air

0.125 (default) | scalar

Internal convection area,  $A_{int\_conv}$ , in  $m^2$ .

#### Dependencies

To enable this parameter, select External wall convection for the **Heat transfer model** parameter.

## Introduced in R2017a

# Flow Boundary

Flow boundary for ambient temperature and pressure

**Library:** Powertrain Blockset / Propulsion / Combustion Engine  
Components / Fundamental Flow

## Description

The Flow Boundary block implements a flow boundary that typically represents ambient temperature and pressure. Engine models require flow boundaries at the intake inlet and exhaust outlet. In dynamic engine models, flow-modifying components (for example, flow restriction, turbines, and compressors) connect to control volumes and flow boundaries.

You can specify these block configurations:

- Constant pressure and temperature
- Externally input pressure and temperature

The Flow Boundary block outputs pressure, temperature, and specific enthalpy:

$$h = c_p T$$

The block models the mass fractions as dry air, resulting in these mass fractions:

- $y_{N_2} = 0.767$
- $y_{O_2} = .233$

The equation uses these variables.

$T$	Temperature
$h$	Specific enthalpy
$c_p$	Specific heat at constant pressure
$y_{N_2}$	Nitrogen mass fraction
$y_{O_2}$	Oxygen mass fraction

## Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Equations
PwrInfo	PwrTrnsfrd — Power transferred between blocks <ul style="list-style-type: none"> <li>• Positive signals indicate flow into block</li> <li>• Negative signals indicate flow out of block</li> </ul>	PwrBndrFlw	Heat flow rate to flow restriction $q_{orf}$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred <ul style="list-style-type: none"> <li>• Positive signals indicate an input</li> <li>• Negative signals indicate a loss</li> </ul>	PwrEnv	Heat flow rate to environment $-q_{orf}$

**Introduced in R2017a**

# Flow Restriction

Isentropic ideal gas flow through an orifice

**Library:** Powertrain Blockset / Propulsion / Combustion Engine  
Components / Fundamental Flow

## Description

The Flow Restriction block models isentropic ideal gas flow through an orifice. The block uses the conservation of mass and energy to determine the mass flow rate. The flow velocity is limited by choked flow.

You can specify these orifice area models:

- Constant
- External input
- Throttle body geometry

## Equations

The Flow Restriction block implements these equations.

Calculation	Equations
Standard orifice	$\dot{m}_{orf} = \Gamma \cdot \Psi(P_{ratio})$ $P_{ratio} = \frac{P_{downstr}}{P_{upstr}}$ $\Gamma = \frac{A_{eff} \cdot P_{upstr}}{\sqrt{R \cdot T_{upstr}}}$ $P_{cr} = \left(\frac{2}{\gamma + 1}\right)^{\frac{\gamma}{\gamma - 1}}$ $\Psi = \begin{cases} \sqrt{\gamma \left(\frac{2}{\gamma + 1}\right)^{\frac{\gamma + 1}{\gamma - 1}}} & P_{ratio} < P_{cr} \\ \sqrt{\frac{2\gamma}{\gamma - 1} \left(P_{ratio}^{\frac{2}{\gamma}} - P_{ratio}^{\frac{\gamma + 1}{\gamma}}\right)} & P_{cr} \leq P_{ratio} \leq P_{lim} \\ \frac{P_{ratio} - 1}{P_{lim} - 1} \sqrt{\frac{2\gamma}{\gamma - 1} \left(P_{lim}^{\frac{2}{\gamma}} - P_{lim}^{\frac{\gamma + 1}{\gamma}}\right)} & P_{lim} < P_{ratio} \end{cases}$
Constituent mass flow rates	$\dot{m}_i = \dot{m}_{orf} y_{upstr, i}$
Constant orifice area	$A_{eff} = A_{orf\_cnst} \cdot C_{d_{cnst}}$

Calculation	Equations
External input orifice area	$A_{eff} = A_{orf\_ext} \cdot Cd_{ext}$
Throttle body geometry	$\theta_{thr} = Pct_{thr} \cdot \frac{90}{100}$ $A_{eff\_thr} = \frac{\pi}{4} D_{thr}^2 C_{d\_thr}(\theta_{thr})$
Heat flow rate	$q_{orf} = \dot{m}_{orf} h_{upstr}$

The equations use these variables.

$A_{eff}, A_{eff\_thr}$	Effective orifice cross-sectional area
$A_{orf\_cnst}, A_{orf\_ext}$	Orifice area
$Cd_{cnst}, Cd_{ext}$	Discharge coefficient
$R$	Ideal gas constant
$P_{cr}$	Critical pressure at which choked flow occurs
$\gamma$	Ratio of specific heats
$\Gamma$	Flow function based on pressure ratio
$P_{ratio}$	Pressure ratio
$P_{upstr}$	Upstream orifice pressure
$P_{downstr}$	Downstream orifice pressure
$P_{lim}$	Pressure ratio limit to avoid singularities as the pressure ratio approaches 1
$y_{upstr,i}$	Upstream species mass fraction for $i = O_2, N_2, \text{unburned fuel}, CO_2, H_2O, CO, NO, NO_2, PM, \text{air}, \text{and burned gas}$
$\dot{m}_i$	Mass flow rate for $i = O_2, N_2, \text{unburned fuel}, CO_2, H_2O, CO, NO, NO_2, PM, \text{air}, \text{and burned gas}$
$\theta_{thr}$	Throttle angle
$Pct_{thr}$	Percentage of throttle body that is open
$C_{d\_thr}$	Throttle discharge coefficient
$D_{thr}$	Throttle body diameter at opening
$\dot{m}_{orf}$	Orifice mass flow
$h_{upstr}$	Upstream specific enthalpy
$q_{orf}$	Heat flow rate

The block uses the internal signal `FlwDir` to track the direction of the flow.

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Descripti on	Equations
PwrInfo	PwrTrnsfrd — Power transferred between blocks	PwrHeatFlwIn	Heat flow rate at port A $q_{orf}$
	<ul style="list-style-type: none"> <li>Positive signals indicate flow into block</li> <li>Negative signals indicate flow out of block</li> </ul>	PwrHeatFlwOut	Heat flow rate at port B $-q_{orf}$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred	<i>Not used</i>	
	<ul style="list-style-type: none"> <li>Positive signals indicate an input</li> <li>Negative signals indicate a loss</li> </ul>		
PwrStored	PwrStored — Stored energy rate of change	<i>Not used</i>	
	<ul style="list-style-type: none"> <li>Positive signals indicate an increase</li> <li>Negative signals indicate a decrease</li> </ul>		

## Ports

### Input

#### A — Inlet orifice pressure, temperature, enthalpy, mass fractions

two-way connector port

Bus containing orifice:

- Prs — Pressure, in Pa
- Temp — Temperature, in K
- Enth — Specific enthalpy, in J/kg
- MassFrac — Inlet mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

**B — Outlet orifice pressure, temperature, enthalpy, mass fractions**

two-way connector port

Bus containing orifice:

- Prs — Pressure, in Pa
- Temp — Temperature, in K
- Enth — Specific enthalpy, in J/kg
- MassFrac — Outlet mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

**Area — Orifice area**

scalar

External area input for orifice area,  $A_{orf\_ext}$  in  $m^2$ .**Dependencies**To create this port, select External input for the **Orifice area model** parameter.**ThrPct — Throttle body percent open**

scalar

Percentage of throttle body that is open,  $Pct_{thr}$ .**Dependencies**To create this port, select Throttle body geometry for the **Orifice area model** parameter.**Output****A — Inlet mass flow rate, heat flow rate, temperature**

two-way connector port

Bus containing:

- MassFlw — Mass flow rate through inlet, in kg/s
- HeatFlw — Inlet heat flow rate, in J/s
- Temp — Inlet temperature, in K
- MassFrac — Inlet mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

### **B — Outlet mass flow rate, heat flow rate, temperature** two-way connector port

Bus containing:

- MassFlw — Outlet mass flow rate, in kg/s
- HeatFlw — Outlet heat flow rate, in J/s
- Temp — Outlet temperature, in K
- MassFrac — Outlet mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

## Parameters

### Block Options

#### Orifice area model — Select model

Constant (default) | External input | Throttle body geometry

Orifice area model.

### Dependencies

The orifice area model enables the parameters on the **Area Parameters** tab.

#### Image type — Icon color

Cold (default) | Hot

Block icon color:

- Cold for blue.
- Hot for red.

### General

#### Ratio of specific heats, gamma — Ratio

1.3998 (default) | scalar

Ratio of specific heats,  $\gamma$ .

#### Ideal gas constant, R — Constant

287.05 (default) | scalar

Ideal gas constant,  $R$ , in J/(kg·K).

#### Pressure ratio linearize limit, $P_{lim}$ — Limit

0.95 (default) | scalar

Pressure ratio limit to avoid singularities as the pressure ratio approaches 1,  $P_{lim}$ .

### Area

#### Constant area value, $A_{orf\_cnst}$ — Area

.1 (default) | scalar

Constant area value,  $A_{orf\_cnst}$ , in  $m^2$ .

### Dependencies

To enable this parameter, select Constant for the **Orifice area model** parameter.

#### Discharge coefficient, $Cd\_cnst$ — Coefficient

1 (default) | scalar

Discharge coefficient for constant area,  $Cd_{cnst}$ .

### Dependencies

To enable this parameter, select Constant for the **Orifice area model** parameter.

**Discharge coefficient, Cd\_ext – Coefficient**

1 (default) | scalar

Discharge coefficient for external area input,  $Cd_{ext}$ .**Dependencies**To enable this parameter, select External input for the **Orifice area model** parameter.**Throttle diameter, Dthr – Diameter**

50 (default) | scalar

Throttle body diameter at opening,  $D_{thr}$ , in mm.**Dependencies**To enable this parameter, select Throttle body geometry for the **Orifice area model** parameter.**Discharge coefficient table, ThrCd – Coefficient**

[0.001; 0.735] (default) | vector

Discharge coefficient table,  $Cd_{thr}$ .**Dependencies**To enable this parameter, select Throttle body geometry for the **Orifice area model** parameter.**Angle breakpoints, ThrAngBpts – Angle**

[0; 90] (default) | vector

Angle breakpoints,  $Thr_{ang\_bpts}$ , in deg.**Dependencies**To enable this parameter, select Throttle body geometry for the **Orifice area model** parameter.**References**[1] Heywood, John B. *Internal Combustion Engine Fundamentals*. Control Volume System | Heat Exchanger

**Introduced in R2017a**

# Heat Exchanger

Intercooler or exhaust gas recirculation (EGR) cooler

**Library:** Powertrain Blockset / Propulsion / Combustion Engine  
Components / Fundamental Flow

## Description

The Heat Exchanger block models a heat exchanger, for example, an intercooler or exhaust gas recirculation (EGR) cooler. The inlet (port C) connects to an engine flow component (flow restriction, compressor, turbine, or engine block). The outlet (port B) connects to a volume (control volume or environment). Based on the upstream temperature, heat exchanger effectiveness, and cooling medium temperature, the block determines the heat transfer rate and downstream temperature.

For the heat exchanger effectiveness and cooling medium temperature, you can specify either a constant value or an external input. For example, if you specify a heat exchanger effectiveness that is:

- Equal to 1, the downstream temperature is equal to the cooling medium temperature.
- Equal to 0, there is no heat transfer to the cooling medium. The downstream temperature is equal to the upstream temperature.

The block assumes no pressure drop. To model pressure losses, use a Flow Restriction block.

## Equations

The Heat Exchanger block implements equations that use these variables.

$T_{upstr}$	Upstream temperature
$T_{dnstr}$	Downstream temperature
$T_{cool}$	Cooling medium temperature
$T_{cool, cnst}$	Constant cooling medium temperature
$T_{cool, input}$	External input cooling medium temperature
$\epsilon$	Heat exchanger effectiveness
$\epsilon_{cnst}$	Constant heat exchanger effectiveness
$\epsilon_{input}$	Input heat exchanger effectiveness
$c_p$	Specific heat at constant pressure
$q_{ht}$	Heat exchanger heat transfer rate
$p_{flw, in}$	Pressure at inlet
$p_{vol, out}$	Pressure at outlet
$T_{vol, out}$	Temperature at outlet
$h_{vol, out}$	Specific enthalpy at outlet

$q_{in}$	Heat flow rate at inlet
$q_{out}$	Heat flow rate at outlet
$\dot{m}$	Heat exchanger mass flow rate
$T_{flw,in}$	Temperature at inlet
$T_{in}$	Heat exchanger inlet temperature
$T_{out}$	Heat exchanger outlet temperature
$h_{in}$	Inlet specific enthalpy

**Heat Exchanger Effectiveness**

Heat exchanger effectiveness measures the effectiveness of heat transfer from the incoming hot fluid to the cooling medium:

$$\varepsilon = \frac{T_{upstr} - T_{dnstr}}{T_{upstr} - T_{cool}}$$

In an ideal heat exchanger, the downstream temperature equals the cooling temperature. The effectiveness is equal to 1.

$$T_{dnstr} = T_{cool}$$

$$\varepsilon = 1$$

The Heat Exchanger block uses the effectiveness to determine the downstream temperature and heat transfer rate.

$$T_{dnstr} = T_{upstr} - \varepsilon(T_{upstr} - T_{cool})$$

$$q_{ht} = \dot{m}c_p(T_{upstr} - T_{dnstr})$$

**Fluid Flow**

Since the block assumes no pressure drop,  $P_{flw,in} = P_{vol,out}$ .

The flow component connection to the heat exchanger inlet determines the direction of the mass flow. Based on the mass flow rate direction, these temperature and heat flow equations apply.

Fluid Flow	Mass Flow Rate	Temperatures and Heat Flow
Forward — From engine flow component to outlet volume	$\dot{m} \geq 0$	$T_{upstr} = T_{flw,in}$ $T_{in} = T_{upstr}$ $T_{out} = T_{dnstr}$ $q_{out} = \dot{m}c_pT_{dnstr}$
Reverse — From outlet volume to engine flow component	$\dot{m} < 0$	$T_{upstr} = T_{vol,out}$ $T_{in} = T_{dnstr}$ $T_{out} = T_{vol,out}$ $h_{in} = c_pT_{dnstr}$ $q_{out} = \dot{m}h_{vol,out}$

The block uses the internal signal `FlwDir` to track the direction of the flow.

## Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Equations
PwrIn fo	PwrTrnsfrd — Power transferred between blocks	PwrHeatFlw In	Heat flow rate at port C $q_{in}$
	<ul style="list-style-type: none"> <li>Positive signals indicate flow into block</li> <li>Negative signals indicate flow out of block</li> </ul>	PwrHeatFlw Out	Heat flow rate at port B $-q_{out}$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred	PwrHeatTrn sfr	Heat transfer rate to cooling medium $-q_{ht}$
	PwrStored — Stored energy rate of change		<i>Not used</i>
	<ul style="list-style-type: none"> <li>Positive signals indicate an increase</li> <li>Negative signals indicate a decrease</li> </ul>		

## Ports

### Input

#### C — Inlet mass flow rate, heat flow rate, temperature, mass fractions

two-way connector port

Bus containing the heat exchanger:

- MassFlwRate — Mass flow rate at inlet,  $\dot{m}$ , in kg/s
- HeatFlwRate — Heat flow rate at inlet,  $q_{in}$ , in J/s
- Temp — Temperature at inlet,  $T_{flw,in}$ , in K
- MassFrac — Inlet mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide

- `NOxMassFrac` — Nitric oxide and nitrogen dioxide
- `PmMassFrac` — Particulate matter
- `AirMassFrac` — Air
- `BrndGasMassFrac` — Burned gas

**B — Outlet volume pressure, temperature, enthalpy, mass fractions**

two-way connector port

Bus containing the heat exchanger:

- `Prs` — Pressure at outlet,  $p_{vol, out}$ , in Pa
- `Temp` — Temperature at outlet,  $T_{vol, out}$ , in K
- `Enth` — Specific enthalpy at outlet,  $h_{vol, out}$ , in J/kg
- `MassFrac` — Outlet mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- `O2MassFrac` — Oxygen
- `N2MassFrac` — Nitrogen
- `UnbrndFuelMassFrac` — Unburned fuel
- `CO2MassFrac` — Carbon dioxide
- `H2OMassFrac` — Water
- `COMassFrac` — Carbon monoxide
- `NOMassFrac` — Nitric oxide
- `NO2MassFrac` — Nitrogen dioxide
- `NOxMassFrac` — Nitric oxide and nitrogen dioxide
- `PmMassFrac` — Particulate matter
- `AirMassFrac` — Air
- `BrndGasMassFrac` — Burned gas

**Effct — Heat exchanger effectiveness**

scalar

Heat exchanger effectiveness,  $\epsilon_{input}$ .

**Dependencies**

To create this port, set **Effectiveness model** to External input.

**CoolTemp — Cooling medium temperature**

scalar

Cooling medium temperature,  $T_{cool, input}$ .

**Dependencies**

To create this port, set **Cooling medium temperature input** to External input

## Output

### Info — Heat exchanger data

bus

Bus signal containing these block calculations.

Signal		Description	Units	
InletTemp		Heat exchanger inlet temperature	K	
OutletTemp		Heat exchanger outlet temperature	K	
HeatTrnsfrRate		Heat exchanger heat transfer rate	J/s	
PwrInfo	PwrTrnsfrd	PwrHeatFlwIn	Heat flow rate at port C	W
		PwrHeatFlwOut	Heat flow rate at port B	W
	PwrNotTrnsfrd	PwrHeatTrnsfr	Heat transfer rate to cooling medium	W
	PwrStored		<i>Not used</i>	

### C — Inlet flow pressure, temperature, enthalpy, mass fractions

two-way connector port

Bus containing the heat exchanger:

- Prs — Pressure at inlet,  $p_{flw,in}$ , in Pa
- Temp — Temperature at inlet,  $T_{in}$ , in K
- Enth — Specific enthalpy at inlet,  $h_{in}$ , in J/kg
- MassFrac — Inlet mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

**B – Outlet volume mass flow rate, heat flow rate, temperature, mass fractions**

two-way connector port

Bus containing the heat exchanger:

- `MassFlwRate` — Mass flow rate at outlet,  $\dot{m}$ , in kg/s
- `HeatFlwRate` — Heat flow rate at outlet,  $q_{out}$ , in J/s
- `Temp` — Temperature at outlet,  $T_{out}$ , in K
- `MassFrac` — Outlet mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- `O2MassFrac` — Oxygen
- `N2MassFrac` — Nitrogen
- `UnbrndFuelMassFrac` — Unburned fuel
- `CO2MassFrac` — Carbon dioxide
- `H2OMassFrac` — Water
- `COMassFrac` — Carbon monoxide
- `NOMassFrac` — Nitric oxide
- `NO2MassFrac` — Nitrogen dioxide
- `NOxMassFrac` — Nitric oxide and nitrogen dioxide
- `PmMassFrac` — Particulate matter
- `AirMassFrac` — Air
- `BrndGasMassFrac` — Burned gas

**Parameters****Block Options****Effectiveness model — Model type for heat effectiveness**

Constant (default) | External input

Type of model to calculate the heat exchanger effectiveness.

**Dependencies**

Selecting:

- External input creates the `Effct` port.
- Constant enables the **Heat exchanger effectiveness**, `ep_cnst` parameter.

**Cooling medium temperature input — Specify type**

Constant (default) | External input

Cooling medium temperature input.

**Dependencies**

Selecting:

- External input creates the CoolTemp port.
- Constant enables the **Cooling medium temperature, T\_cool\_cnst** parameter.

### Image type – Icon color

Intercooler (default) | EGR cooler hot to cold | EGR cooler cold to hot

Block icon color:

- Intercooler for blue, to indicate an intercooler
- EGR cooler hot to cold for red to blue, to indicate EGR from hot to cold
- EGR cooler cold to hot for blue to red, to indicate EGR from cold to hot

### Heat exchanger effectiveness, ep\_cnst – Effectiveness

0.7 (default) | scalar

Constant heat exchanger effectiveness,  $\varepsilon_{cnst}$ .

#### Dependencies

To enable this parameter, select Constant for the **Effectiveness model** parameter.

### Cooling medium temperature, T\_cool\_cnst – Temperature

300 (default) | scalar

Constant cooling medium temperature,  $T_{cool, cnst}$ , in K.

#### Dependencies

To enable this parameter, select Constant for the **Cooling medium temperature input** parameter.

### Specific heat at constant pressure, cp – Specific heat

1005 (default) | scalar

Specific heat at constant pressure,  $c_p$ , in J/(kg\*K).

Spark-ignition engine controller that uses the driver torque request

**Library:** Powertrain Blockset / Propulsion / Combustion Engine Controllers

### Description

The SI Controller block implements a spark-ignition (SI) controller that uses the driver torque request to calculate the open-loop air, fuel, and spark actuator commands that are required to meet the driver demand.

You can use the SI Controller block in engine control design or performance, fuel economy, and emission tradeoff studies. The core engine, throttle, and turbocharger wastegate subsystems require the commands that are output from the SI Controller block.

The block uses the commanded torque and engine speed to determine these open-loop actuator commands:

- Throttle position percent
- Wastegate area percent
- Injector pulse-width
- Spark advance
- Intake cam phaser angle
- Exhaust cam phaser angle
- Exhaust gas recirculation (EGR) valve area percent

The SI Controller block has two subsystems:

- The **Controller** subsystem — Determines the commands based on the commanded torque, measured engine speed, and estimated cylinder air mass.
- The **Estimator** subsystem — Determines the estimated air mass flow, torque, and exhaust gas temperature from intake manifold gas pressure, intake manifold gas temperature, engine speed, and cam phaser positions.

The figure illustrates the signal flow.

The figure uses these variables.

$N$	Engine speed
$MAP$	Cycle average intake manifold pressure
$IAT$	Intake air temperature
$T_{in,EGR}$	Temperature at EGR valve inlet
$MAT$	Cycle average intake manifold gas absolute temperature
$\phi_{ICP}, \phi_{ICPCMD}$	Intake cam phaser angle and intake cam phaser angle command, respectively
$\phi_{ECP}, \phi_{EPCCMD}$	Exhaust cam phaser angle and exhaust cam phaser angle command, respectively
$EGRap,$ $EGRap_{cmd}$	EGR valve area percent and EGR valve area percent command, respectively
$\Delta P_{EGR}$	Pressure difference at EGR valve inlet and outlet
$WAP_{cmd}$	Turbocharger wastegate area percent command
$SA$	Spark advance
$Pw_{inj}$	Fuel injector pulse-width
$TPP_{cmd}$	Throttle position percent command

The Model-Based Calibration Toolbox was used to develop the tables that are available with the Powertrain Blockset.

## Controller

### Air

The block determines the commanded engine load (that is, normalized cylinder air mass) from a lookup table that is a function of commanded torque and measured engine speed.

$$L_{cmd} = f_{Lcmd}(T_{cmd}, N)$$

To achieve the commanded load, the controller sets the throttle position percent and turbocharger wastegate area percent using feed forward lookup tables. The lookup tables are functions of the commanded load and measured engine speed.

$$TAP_{cmd} = f_{TAPcmd}(L_{cmd}, N)$$

$$TPP_{cmd} = f_{TPPcmd}(TAP_{cmd})$$

$$WAP_{cmd} = f_{WAPcmd}(L_{cmd}, N)$$

To determine the cam phaser angle commands, the block uses lookup tables that are functions of estimated engine load and measured engine speed.

$$\varphi_{ICPCMD} = f_{ICPCMD}(L_{est}, N)$$

$$\varphi_{ECPCMD} = f_{ECPCMD}(L_{est}, N)$$

The block calculates the desired engine load using this equation.

$$L_{est} = \frac{CpsR_{air}T_{std}\dot{m}_{air,est}}{P_{std}V_dN}$$

The equations use these variables.

$L_{est}$	Estimated engine load
$L_{cmd}$	Commanded engine load
$N$	Engine speed
$T_{cmd}$	Commanded engine torque
$TAP_{cmd}$	Throttle area percent command
$TPP_{cmd}$	Throttle position percent command
$WAP_{cmd}$	Turbocharger wastegate area percent command
$Cps$	Crankshaft revolutions per power stroke
$P_{std}$	Standard pressure
$T_{std}$	Standard temperature
$R_{air}$	Ideal gas constant for air and burned gas mixture
$V_d$	Displaced volume
$\dot{m}_{air,est}$	Estimated engine air mass flow

The controller subsystem uses these lookup tables for the air calculations.

- The throttle area percent command lookup table,  $f_{TAPcmd}$ , is a function of commanded load and engine speed

$$TAP_{cmd} = f_{TAPcmd}(L_{cmd}, N)$$

where:

- $TAP_{cmd}$  is throttle area percentage command, in percent.
- $L_{cmd}=L$  is commanded engine load, dimensionless.
- $N$  is engine speed, in rpm.

- To account for the non-linearity of the throttle position to throttle area, the throttle position percent lookup table linearizes the open-loop air mass flow control.

The throttle position percent command lookup table,  $f_{TPPcmd}$ , is a function of the throttle area percentage command

$$TPP_{cmd} = f_{TPPcmd}(TAP_{cmd})$$

where:

- $TPP_{cmd}$  is throttle position percentage command, in percent.
- $TAP_{cmd}$  is throttle area percentage command, in percent.

- The wastegate area percent command lookup table,  $f_{WAPcmd}$ , is a function of the commanded engine load and engine speed

$$WAP_{cmd} = f_{WAPcmd}(L_{cmd}, N)$$

where:

- $WAP_{cmd}$  is wastegate area percentage command, in percent.
- $L_{cmd}=L$  is commanded engine load, dimensionless.

- $N$  is engine speed, in rpm.

- The commanded engine load lookup table,  $f_{Lcmd}$ , is a function of the commanded torque and engine speed

$$L_{cmd} = f_{Lcmd}(T_{cmd}, N)$$

where:

- $L_{cmd}=L$  is commanded engine load, dimensionless.
- $T_{cmd}$  is commanded torque, in N·m.
- $N$  is engine speed, in rpm.

- The intake cam phaser angle command lookup table,  $f_{ICPCMD}$ , is a function of the engine load and engine speed

$$\varphi_{ICPCMD} = f_{ICPCMD}(L_{est}, N)$$

where:

- $\varphi_{ICPCMD}$  is commanded intake cam phaser angle, in degrees crank advance.
- $L_{est}=L$  is estimated engine load, dimensionless.
- $N$  is engine speed, in rpm.

- The exhaust cam phaser angle command lookup table,  $f_{ECPCMD}$ , is a function of the engine load and engine speed

$$\varphi_{ECPCMD} = f_{ECPCMD}(L_{est}, N)$$

where:

- $\varphi_{ECPCMD}$  is commanded exhaust cam phaser angle, in degrees crank retard.
- $L_{est}=L$  is estimated engine load, dimensionless.
- $N$  is engine speed, in rpm.

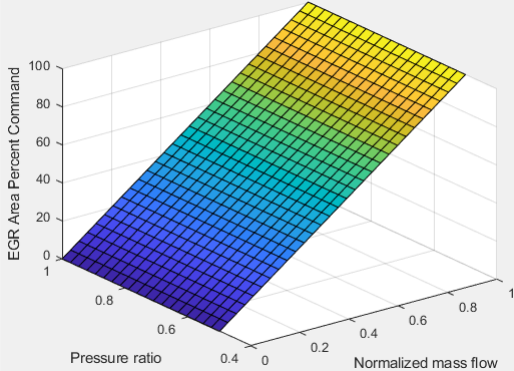

## EGR

EGR is typically expressed as a percent of total intake port flow.

$$EGR_{pct} = 100 \frac{\dot{m}_{EGR}}{\dot{m}_{EGR} + \dot{m}_{air}}$$

To calculate the EGR area percent command, the block uses equations and a lookup table.

Equations	$\dot{m}_{EGRstd, cmd} = \dot{m}_{EGR, cmd} \frac{P_{std}}{P_{in, EGR}} \sqrt{\frac{T_{in, EGR}}{T_{std}}}$ $\dot{m}_{EGRstd, max} = f_{EGRstd, max} \left( \frac{P_{out, EGR}}{P_{in, EGR}} \right)$ $\dot{m}_{EGR, cmd} = EGR_{pct, cmd} \dot{m}_{intk, est}$
-----------	---

Lookup table	<p>The EGR area percent command, <math>EGRap_{cmd}</math>, lookup table is a function of the normalized mass flow and pressure ratio</p> $EGRap_{cmd} = f_{EGRap,cmd} \left( \frac{\dot{m}_{EGRstd,cmd}}{\dot{m}_{EGRstd,max}}, \frac{P_{out,EGR}}{P_{in,EGR}} \right)$ <p>where:</p> <ul style="list-style-type: none"> <li>• <math>EGRap_{cmd}</math> is commanded EGR area percent, dimensionless.</li> <li>• <math>\frac{\dot{m}_{EGRstd,cmd}}{\dot{m}_{EGRstd,max}}</math> is the normalized mass flow, dimensionless.</li> <li>• <math>\frac{P_{out,EGR}}{P_{in,EGR}}</math> is the pressure ratio, dimensionless.</li> </ul> 
--------------	--

The equations and table use these variables.

$EGRap$ , $EGRap_{cmd}$	EGR valve area percent and EGR valve area percent command, respectively
$EGR_{pct,cmd}$	EGR percent command
$\dot{m}_{EGRstd,cmd}$	Commanded standard mass flow
$\dot{m}_{EGRstd,max}$	Maximum standard mass flow
$\dot{m}_{EGR,cmd}$	Commanded mass flow
$\dot{m}_{intk,est}$	Estimated intake port mass flow
$T_{std}, P_{std}$	Standard temperature and pressure
$T_{in,EGR}$	Temperature at EGR valve inlet
$P_{out,EGR}, P_{in,EGR}$	Pressure at EGR valve inlet and outlet, respectively

**Fuel**

The air-fuel ratio (AFR) impacts three-way-catalyst (TWC) conversion efficiency, torque production, and combustion temperature. The engine controller manages AFR by commanding injector pulse-width from a desired relative AFR. The relative AFR,  $\lambda_{cmd}$ , is the ratio between the commanded AFR and the stoichiometric AFR of the fuel.

$$\lambda_{cmd} = \frac{AFR_{cmd}}{AFR_{stoich}}$$

$$AFR_{cmd} = \frac{\dot{m}_{air,est}}{\dot{m}_{fuel,cmd}}$$

The SI Controller block accounts for the extra fuel delivered to the SI engine during startup. If the engine speed is greater than the startup engine cranking speed, the SI Controller block enriches the optimal AFR, lambda, with an exponentially decaying delta lambda. To initialize the delta lambda, the block uses the engine coolant temperature at startup. The delta lambda exponentially decays to zero based on a time constant that is a function of the engine coolant temperature.

You can configure the block for open-loop and closed-loop AFR control.

To	Use	Controls > Fuel > Closed-loop feedback Parameter Setting
<ul style="list-style-type: none"> <li>Assess the dynamic and steady-state accuracy of the controller airflow estimation and fuel delivery.</li> </ul>	(default) Open-loop control	off
<ul style="list-style-type: none"> <li>Hold the average AFR close to stoichiometric AFR to maintain a high TWC conversion efficiency.</li> </ul>	Closed-loop control	on

### Open-Loop Control

To create an input port for the commanded AFR (lambda), on the **Controls > Fuel > Open-loop fuel** pane, select **Input lambda**.

You can manually tune the catalyst for maximum efficiency during open-loop AFR control with or without dither. If you want to implement dither during open-loop control, on the **Fuel** tab, on the **Closed-loop fuel** pane, select **Dither**.

By default, the block is configured to use a lookup table for the commanded AFR.

The commanded lambda,  $\lambda_{cmd}$ , lookup table is a function of estimated engine load and measured engine speed

$$\lambda_{cmd} = f_{\lambda_{cmd}}(L_{est}, N)$$

where:

- $\lambda_{cmd}$  is commanded relative AFR, dimensionless.
- $L_{est}=L$  is estimated engine load, dimensionless.
- $N$  is engine speed, in rpm.

The block calculates the estimated fuel mass flow rate using the commanded lambda,  $\lambda_{cmd}$ , stoichiometric AFR, and estimated air mass flow rate.

$$\dot{m}_{fuel,cmd} = \frac{\dot{m}_{air,est}}{AFR_{cmd}} = \frac{\dot{m}_{air,est}}{\lambda_{cmd}AFR_{stoich}}$$

The block assumes that the battery voltage and fuel pressure are at nominal settings where pulse-width correction is not necessary. The commanded fuel injector pulse-width is proportional to the fuel mass per injection. The fuel mass per injection is calculated from the commanded fuel mass flow rate, engine speed, and the number of cylinders.

$$Pw_{inj} = \begin{cases} \frac{\dot{m}_{fuel,cmd} Cps \left( \frac{60s}{min} \right) \left( \frac{1000mg}{g} \right) \left( \frac{1000g}{kg} \right)}{NS_{inj} N_{cyl}} & \text{when } Trq_{cmd} > 0 \\ 0 & \text{when } Trq_{cmd} \leq 0 \end{cases}$$

### Closed-Loop Control

TWC converters are most efficient when the exhaust AFR is near the stoichiometric AFR, where the air and fuel burn most completely. Around this ideal point, the AFR is within the *catalyst window* in which the catalyst is most efficient at converting carbon monoxide, hydrocarbons, and nitrogen oxides to non-harmful exhaust products. Empirical studies show that oscillating the AFR around stoichiometry at an optimized AFR frequency, amplitude, and bias widens the TWC window, increasing catalyst conversion efficiency in the presence of unavoidable disturbances.

To keep production hardware costs down, AFR control systems include inexpensive switching oxygen sensors positioned in the engine exhaust stream upstream and downstream of the catalyst. The oxygen sensors have a narrow range. Essentially, they switch between too lean (i.e., more air is available than is required to burn the available fuel) and too rich (i.e., more air is available than is required to burn the available fuel).

The block implements a period-based method to control the average AFR at a value within the catalyst window for maximum conversion efficiency. Period-based AFR control is independent of the transport delay across the engine from the fuel injection point to the sensor measurement point. For more information about the method, see *Developing a Period-Based Air-Fuel Ratio Controller Using a Low-Cost Switching Sensor*.

### Spark

Spark advance is the crank angle before top dead center (BTDC) of the power stroke when the spark is delivered. The spark advance has an impact on engine efficiency, torque, exhaust temperature, knock, and emissions.

The spark advance lookup table is a function of estimated load and engine speed.

$$SA = f_{SA}(L_{est}, N)$$

where:

- $SA$  is spark advance, in crank advance degrees.
- $L_{est}=L$  is estimated engine load, dimensionless.
- $N$  is engine speed, in rpm.

The equations use these variables.

$L_{est}$	Estimated engine load, based on normalized cylinder air mass
$N$	Engine speed
$f_{SA}$	Lookup table for spark advance
$SA$	Spark advance

### Idle Speed

When the commanded torque is below a threshold value, the idle speed controller regulates the engine speed.

If	Idle Speed Controller
$Trq_{cmd,input} < Trq_{idlecmd,enable}$	Enabled
$Trq_{idlecmd,enable} \leq Trq_{cmd,input}$	Not enabled

The idle speed controller uses a discrete PI controller to regulate the target idle speed by commanding a torque.

The PI controller uses this transfer function:

$$C_{idle}(z) = K_{p, idle} + K_{i, idle} \frac{t_s}{z-1}$$

The idle speed commanded torque must be less than the maximum commanded torque:

$$0 \leq Trq_{idlecmd} \leq Trq_{idlecmd,max}$$

Idle speed control is active under these conditions. If the commanded input torque drops below the threshold for enabling the idle speed controller ( $Trq_{cmd,input} < Trq_{idlecmd,enable}$ ), the commanded engine torque is given by:

$$Trq_{cmd} = \max(Trq_{cmd,input}, Trq_{idlecmd}).$$

The equations use these variables.

$Trq_{cmd}$	Commanded engine torque
$Trq_{cmd,input}$	Input commanded engine torque
$Trq_{idlecmd,enable}$	Threshold for enabling idle speed controller
$Trq_{idlecmd}$	Idle speed controller commanded torque
$Trq_{idlecmd,max}$	Maximum commanded torque
$N_{idle}$	Base idle speed
$K_{p,idle}$	Idle speed controller proportional gain
$K_{i,idle}$	Idle speed controller integral gain

### Speed Limiter

To prevent over revving the engine, the block implements an engine speed limit controller that limits the engine speed to the value specified by the **Rev-limiter speed threshold** parameter on the **Controls > Idle Speed** tab.

If the engine speed,  $N$ , exceeds the engine speed limit,  $N_{lim}$ , the block sets the commanded engine torque to 0.

To smoothly transition the torque command to 0 as the engine speed approaches the speed limit, the block implements a lookup table multiplier. The lookup table multiplies the torque command by a value that ranges from 0 (engine speed exceeds limit) to 1 (engine speed does not exceed the limit).

### Estimator

The estimator subsystem determines the estimated air mass flow, torque, EGR mass flow, and exhaust temperature based on sensor feedback and calibration parameters.

$\dot{m}_{air,est}$	Estimated engine air mass flow
$Trq_{est}$	Estimated engine torque
$T_{exh,est}$	Estimated engine exhaust temperature
$\dot{m}_{EGR,est}$	Estimated low-pressure EGR mass flow

### Air Mass Flow

To calculate engine air mass flow, configure the SI engine to use either of these air mass flow models.

Air Mass Flow Model	Description
“SI Engine Speed-Density Air Mass Flow Model”	Uses the speed-density equation to calculate the engine air mass flow, relating the engine air mass flow to the intake manifold pressure and engine speed. Consider using this air mass flow model in engines with fixed valvetrain designs.

Air Mass Flow Model	Description
"SI Engine Dual-Independent Cam Phaser Air Mass Flow Model"	<p>To calculate the engine air mass flow, the dual-independent cam phaser model uses:</p> <ul style="list-style-type: none"> <li>• Empirical calibration parameters developed from engine mapping measurements</li> <li>• Desktop calibration parameters derived from engine computer-aided design (CAD) data</li> </ul> <p>In contrast to typical embedded air mass flow calculations based on direct air mass flow measurement with an air mass flow (MAF) sensor, this air mass flow model offers:</p> <ul style="list-style-type: none"> <li>• Elimination of MAF sensors in dual cam-phased valvetrain applications</li> <li>• Reasonable accuracy with changes in altitude</li> <li>• Semiphysical modeling approach</li> <li>• Bounded behavior</li> <li>• Suitable execution time for electronic control unit (ECU) implementation</li> <li>• Systematic development of a relatively small number of calibration parameters</li> </ul>

To determine the estimated air mass flow, the block uses the intake air mass fraction. The EGR mass fraction at the intake port lags the mass fraction near the EGR valve outlet. To model the lag, the block uses a first order system with a time constant.

$$y_{intk,EGR,est} = \frac{\dot{m}_{EGR,est}}{\dot{m}_{intk,est}} \frac{t_s z}{\tau_{EGR} z + t_s - \tau_{EGR}}$$

The remainder of the gas is air.

$$y_{intk,air,est} = 1 - y_{intk,EGR,est}$$

The equations use these variables.

$y_{intk,EGR,est}$	Estimated intake manifold EGR mass fraction
$y_{intk,air,est}$	Estimated intake manifold air mass fraction
$\dot{m}_{EGR,est}$	Estimated low-pressure EGR mass flow
$\dot{m}_{intk,est}$	Estimated intake port mass flow
$\tau_{EGR}$	EGR time constant

### Torque

To calculate the brake torque, configure the SI engine to use either of these torque models.

Brake Torque Model	Description
"SI Engine Torque Structure Model"	<p>For the structured brake torque calculation, the SI engine uses tables for the inner torque, friction torque, optimal spark, spark efficiency, and lambda efficiency.</p> <p>If you select <b>Crank angle pressure and torque</b> on the block <b>Torque</b> tab, you can:</p> <ul style="list-style-type: none"> <li>• Simulate advanced closed-loop engine controls in desktop simulations and on HIL bench, based on cylinder pressure recorded from a model or laboratory test as a function of crank angle.</li> <li>• Simulate driveline vibrations downstream of the engine due to high-frequency crankshaft torsionals.</li> <li>• Simulate engine misfires due to lean operation or spark plug fouling by using the injector pulse width input.</li> <li>• Simulate cylinder deactivation effect (closed intake and exhaust valves, no injected fuel) on individual cylinder pressures, mean-value airflow, mean-value torque, and crank-angle-based torque.</li> <li>• Simulate the fuel-cut effect on individual cylinder pressure, mean-value torque, and crank-angle-based torque.</li> </ul>
"SI Engine Simple Torque Model"	<p>For the simple brake torque calculation, the SI engine block uses a torque lookup table map that is a function of engine speed and load.</p>

**EGR**

The controller estimates low-pressure mass flow, EGR valve inlet pressure, and EGR valve outlet pressure using an algorithm developed by F. Liu and J. Pfeiffer. The estimator requires measured EGR valve differential pressure, EGR valve area percent, intake air temperature, and EGR valve inlet temperature.

To estimate the EGR valve commands, the block uses:

- Equations

$$\dot{m}_{air, std} = \dot{m}_{air, est} \frac{P_{std}}{P_{amb}} \sqrt{\frac{IAT}{T_{std}}}$$

$$P_{in, EGR} = P_{out, EGR} + \Delta P_{EGR}$$

$$\dot{m}_{EGR, est} = \dot{m}_{EGR, std} \frac{P_{in, EGR}}{P_{std}} \sqrt{\frac{T_{std}}{T_{in, EGR}}}$$

- Tables

- The EGR valve standard mass flow lookup table is a function of EGR valve area percent and the pressure ratio

$$\dot{m}_{EGR, std} = f_{EGR, std} \left( EGRap, \frac{P_{out, EGR}}{P_{in, EGR}} \right)$$

where:

- $\dot{m}_{EGR, std}$  is EGR valve standard mass flow, dimensionless.
- $EGRap$  is EGR valve flow area percent, in percent.
- $\frac{P_{out, EGR}}{P_{in, EGR}}$  is the pressure ratio, dimensionless.

- The pressure ratio is a function of the standard mass flow

$$\frac{P_{out, EGR}}{P_{amb}} = f_{intksys, pr}(\dot{m}_{air, std})$$

where:

- $\dot{m}_{air, std}$  is standard mass flow, in g/s.
- $\frac{P_{out, EGR}}{P_{amb}}$  is pressure ratio, dimensionless.

The equations use these variables.

$EGRap$	EGR valve area percent command
$IAT$	Intake air temperature

$\dot{m}_{air, std}, \dot{m}_{EGR, std}$	Standard air and EGR valve mass flow, respectively
$\dot{m}_{air, est}, \dot{m}_{EGR, est}$	Estimated air and EGR valve mass flow, respectively
$T_{std}, P_{std}$	Standard temperature and pressure
$T_{amb}, P_{amb}$	Ambient temperature and pressure
$\Delta P_{EGR}$	Pressure difference at EGR valve inlet and outlet
$T_{in,EGR}, T_{out,EGR}$	Temperature at EGR valve inlet and outlet, respectively
$P_{in,EGR}, P_{out,EGR}$	Pressure at EGR valve inlet and outlet, respectively

### Exhaust Temperature

The exhaust temperature lookup table,  $f_{Texh}$ , is a function of engine load and engine speed

$$T_{exh} = f_{Texh}(L, N)$$

where:

- $T_{exh}$  is engine exhaust temperature, in K.
- $L$  is normalized cylinder air mass or engine load, dimensionless.
- $N$  is engine speed, in rpm.

## Ports

### Input

#### TrqCmd — Commanded engine torque

scalar

Commanded engine torque,  $Trq_{cmd,input}$ , in N·m.

#### EngSpd — Measured engine speed

scalar

Measured engine speed,  $N$ , in rpm.

**AmbPrs — Measured absolute ambient pressure**

scalar

Measured ambient pressure,  $P_{Amb}$ , in Pa.**Map — Measured intake manifold absolute pressure**

scalar

Measured intake manifold absolute pressure  $MAP$ , in Pa.**Mat — Measured intake manifold absolute temperature**

scalar

Measured intake manifold absolute temperature,  $MAT$ , in K.**IntkCamPhase — Intake cam phaser angle**

scalar

Intake cam phaser angle,  $\varphi_{ICP}$ , in degCrkAdv, or degrees crank advance.**ExhCamPhase — Exhaust cam phaser angle**

scalar

Exhaust cam phaser angle,  $\varphi_{ECP}$ , in degCrkRet, or degrees crank retard.**Iat — Intake air temperature**

scalar

Intake air temperature,  $IAT$ , in K.**Ect — Engine cooling temperature**

scalar

Engine cooling temperature,  $T_{coolant}$ , in K.**EgrVlvInTemp — EGR valve inlet temperature**

scalar

EGR valve inlet temperature,  $T_{in,EGR}$ , in K.**EgrVlvAreaPct — EGR valve area percent**

scalar

EGR valve area percent,  $EGRap$ , in %.**EgrVlvDeltaPrs — EGR valve delta pressure**

scalar

EGR valve delta pressure,  $\Delta P_{EGR}$ , in Pa.**O2VltSen — Oxygen sensor voltage**

scalar

Oxygen sensor voltage for closed-loop air-fuel-ratio (lambda) control, in mV.

To configure the block to use closed-loop air-fuel-ratio control, on the **Fuel** tab, on the **Closed-loop fuel** pane, select **Closed-loop feedback**.

**LambdaCmd — Commanded AFR, lambda**

scalar

Commanded air-fuel-ratio (lambda),  $\lambda_{cmd}$ , dimensionless.

**Dependencies**

To create this port, on the **Fuel** tab, on the **Open-loop fuel** pane, select **Input lambda**.

**Output**

**Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal	Description	Variable	Units
TrqCmd	Engine torque	$Trq_{cmd}$	N·m
LdCmd	Commanded load	$L_{cmd}$	N/A
ThrPosCmd	Throttle area percent command	$TAP_{cmd}$	%
WgAreaPctCmd	Wastegate area percent command	$WAP_{cmd}$	%
InjPw	Fuel injector pulse-width	$Pw_{inj}$	ms
SpkAdv	Spark advance	SA	degBTDC
IntkCamPhaseCmd	Intake cam phaser angle command	$\varphi_{ICPCMD}$	degCrkAdv
ExhCamPhaseCmd	Exhaust cam phaser angle command	$\varphi_{ECPCMD}$	degCrkRet
EgrVlvAreaPctCmd	Exhaust cam phaser angle command	$EGRap_{cmd}$	%
FuelMassFlwCmd	EGR valve area percent command	$\dot{m}_{fuel,cmd}$	kg/s
AfrCmd	Commanded air-fuel ratio	$AFR_{cmd}$	N/A
EstEngTrq	Estimated engine torque	$Trq_{est}$	N·m
EstNrmLzdAirCharg	Estimated normalized cylinder air mass	N/A	N/A
EstIntkPortMassFlw	Estimated intake port air mass flow rate	$\dot{m}_{intk,est}$	kg/s
EstIntkAirMassFlw	Estimated air mass flow rate	$\dot{m}_{air,est}$	kg/s
EstEgrMassFlw	Estimated low-pressure EGR mass flow rate	$\dot{m}_{EGR,est}$	kg/s
EstExhManGasTemp	Estimated exhaust manifold gas temperature	$T_{exh,est}$	K
EngRevLimAct	Flag that indicates if rev-limiter control is active	N/A	N/A
ClsdLpFuelMult	Fuel injector pulse-width multiplier for closed-loop AFR control	$Pw_{inj\_mult}$	N/A

**ThrPosPctCmd — Throttle area percent command**

scalar

Throttle area percent command,  $TAP_{cmd}$ .

**WgAreaPctCmd – Wastegate area percent command**

scalar

Wastegate area percent command,  $WAP_{cmd}$ .

**InjPw – Fuel injector pulse-width**

scalar

Fuel injector pulse-width,  $Pw_{inj}$ , in ms.

**SpkAdv – Spark advance**

scalar

Spark advance,  $SA$ , in degrees crank angle before top dead center (degBTDC).

**IntkCamPhaseCmd – Intake cam phaser angle command**

scalar

Intake cam phaser angle command,  $\varphi_{ICPCMD}$ .

**ExhCamPhaseCmd – Exhaust cam phaser angle command**

scalar

Exhaust cam phaser angle command,  $\varphi_{ECPCMD}$ .

**EgrVlvAreaPctCmd – EGR valve area percent command**

scalar

EGR valve area percent command,  $EGRap_{cmd}$ , in %.

## Parameters

### Configuration

**Air mass flow estimation model – Select air mass flow estimation model**

Dual Variable Cam Phasing (default) | Simple Speed-Density

To calculate engine air mass flow, configure the SI engine to use either of these air mass flow models.

Air Mass Flow Model	Description
"SI Engine Speed-Density Air Mass Flow Model"	Uses the speed-density equation to calculate the engine air mass flow, relating the engine air mass flow to the intake manifold pressure and engine speed. Consider using this air mass flow model in engines with fixed valvetrain designs.

Air Mass Flow Model	Description
<p>“SI Engine Dual-Independent Cam Phaser Air Mass Flow Model”</p>	<p>To calculate the engine air mass flow, the dual-independent cam phaser model uses:</p> <ul style="list-style-type: none"> <li>• Empirical calibration parameters developed from engine mapping measurements</li> <li>• Desktop calibration parameters derived from engine computer-aided design (CAD) data</li> </ul> <p>In contrast to typical embedded air mass flow calculations based on direct air mass flow measurement with an air mass flow (MAF) sensor, this air mass flow model offers:</p> <ul style="list-style-type: none"> <li>• Elimination of MAF sensors in dual cam-phased valvetrain applications</li> <li>• Reasonable accuracy with changes in altitude</li> <li>• Semiphysical modeling approach</li> <li>• Bounded behavior</li> <li>• Suitable execution time for electronic control unit (ECU) implementation</li> <li>• Systematic development of a relatively small number of calibration parameters</li> </ul>

**Dependencies**

The table summarizes the parameter dependencies.

Air Mass Flow Estimation Model	Enables Parameters on Estimation > Air Tab
<p>Dual Variable Cam Phasing</p>	<p>Cylinder volume at intake valve close table, <b>f_vivc</b></p> <p>Cylinder volume intake cam phase breakpoints, <b>f_vivc_icp_bpt</b></p> <p>Cylinder trapped mass correction factor, <b>f_tm_corr</b></p> <p>Normalized density breakpoints, <b>f_tm_corr_nd_bpt</b></p> <p>Engine speed breakpoints, <b>f_tm_corr_n_bpt</b></p> <p>Air mass flow, <b>f_mdot_air</b></p> <p>Exhaust cam phase breakpoints, <b>f_mdot_air_ecp_bpt</b></p> <p>Trapped mass flow breakpoints, <b>f_mdot_trpd_bpt</b></p> <p>Air mass flow correction factor, <b>f_mdot_air_corr</b></p> <p>Engine load breakpoints for air mass flow correction, <b>f_mdot_air_corr_ld_bpt</b></p> <p>Engine speed breakpoints for air mass flow correction, <b>f_mdot_air_n_bpt</b></p>

### Torque estimation model – Select torque estimation model

Torque Structure (default) | Simple Torque Lookup

To calculate the brake torque, configure the SI engine to use either of these torque models.

Brake Torque Model	Description
"SI Engine Torque Structure Model"	<p>For the structured brake torque calculation, the SI engine uses tables for the inner torque, friction torque, optimal spark, spark efficiency, and lambda efficiency.</p> <p>If you select <b>Crank angle pressure and torque</b> on the block <b>Torque</b> tab, you can:</p> <ul style="list-style-type: none"> <li>• Simulate advanced closed-loop engine controls in desktop simulations and on HIL bench, based on cylinder pressure recorded from a model or laboratory test as a function of crank angle.</li> <li>• Simulate driveline vibrations downstream of the engine due to high-frequency crankshaft torsionals.</li> <li>• Simulate engine misfires due to lean operation or spark plug fouling by using the injector pulse width input.</li> <li>• Simulate cylinder deactivation effect (closed intake and exhaust valves, no injected fuel) on individual cylinder pressures, mean-value airflow, mean-value torque, and crank-angle-based torque.</li> <li>• Simulate the fuel-cut effect on individual cylinder pressure, mean-value torque, and crank-angle-based torque.</li> </ul>
"SI Engine Simple Torque Model"	<p>For the simple brake torque calculation, the SI engine block uses a torque lookup table map that is a function of engine speed and load.</p>

### Dependencies

## Controls

### Air

#### Engine commanded load table, **f\_lcmd** – Lookup table

array

The commanded engine load lookup table,  $f_{Lcmd}$ , is a function of the commanded torque and engine speed

$$L_{cmd} = f_{Lcmd}(T_{cmd}, N)$$

where:

- $L_{cmd}=L$  is commanded engine load, dimensionless.
- $T_{cmd}$  is commanded torque, in N·m.
- $N$  is engine speed, in rpm.

### Torque command breakpoints, $f_{lcmd\_tq\_bpt}$ – Breakpoints

[15 26.43 37.86 49.29 60.71 72.14 83.57 95 106.4 117.9 129.3 140.7 152.1 163.6 175] (default) | vector

Torque command breakpoints, in N·m.

### Speed breakpoints, $f_{lcmd\_n\_bpt}$ – Breakpoints

[750 1054 1357 1661 1964 2268 2571 2875 3179 3482 3786 4089 4393 4696 5000] (default) | vector

Speed breakpoints, in rpm.

### Throttle area percent, $f_{tap}$ – Lookup table, % array

The throttle area percent command lookup table,  $f_{TAPcmd}$ , is a function of commanded load and engine speed

$$TAP_{cmd} = f_{TAPcmd}(L_{cmd}, N)$$

where:

- $TAP_{cmd}$  is throttle area percentage command, in percent.
- $L_{cmd}=L$  is commanded engine load, dimensionless.
- $N$  is engine speed, in rpm.

**Throttle area percent load breakpoints,  $f_{tap\_ld\_bpt}$  — Breakpoints**

[0.2 0.275 0.35 0.425 0.5 0.575 0.65 0.725 0.8 0.875 0.95 1.025 1.1 1.175 1.25] (default) | vector

Throttle area percent load breakpoints, dimensionless.

**Throttle area percent speed breakpoints,  $f_{tap\_n\_bpt}$  — Breakpoints**

[750 1054 1357 1661 1964 2268 2571 2875 3179 3482 3786 4089 4393 4696 5000] (default) | vector

Throttle area percent speed breakpoints, in rpm.

**Throttle area percent to position percent table,  $f_{tpp}$  — Lookup table**

[0 100] (default) | vector

The throttle position percent command lookup table,  $f_{TPPcmd}$ , is a function of the throttle area percentage command

$$TPP_{cmd} = f_{TPPcmd}(TAP_{cmd})$$

where:

- $TPP_{cmd}$  is throttle position percentage command, in percent.
- $TAP_{cmd}$  is throttle area percentage command, in percent.

**Throttle area percent to position percent area breakpoints,  $f_{tpp\_tap\_bpt}$  — Breakpoints**

[0 100] (default) | vector

Throttle area percent to position percent area breakpoints, dimensionless.

**Wastegate area percent,  $f_{wap}$  — Lookup table, %**

array

The wastegate area percent command lookup table,  $f_{WAPcmd}$ , is a function of the commanded engine load and engine speed

$$WAP_{cmd} = f_{WAPcmd}(L_{cmd}, N)$$

where:

- $WAP_{cmd}$  is wastegate area percentage command, in percent.
- $L_{cmd}=L$  is commanded engine load, dimensionless.
- $N$  is engine speed, in rpm.

#### Load breakpoints, $f_{wap\_ld\_bpt}$ — Breakpoints

[0.2 0.275 0.35 0.425 0.5 0.575 0.65 0.725 0.8 0.875 0.95 1.025 1.1 1.175 1.25] (default) | vector

Load breakpoints, dimensionless.

#### Speed breakpoints, $f_{wap\_n\_bpt}$ — Breakpoints, rpm

[750 1054 1357 1661 1964 2268 2571 2875 3179 3482 3786 4089 4393 4696 5000] (default) | vector

Speed breakpoints, in rpm.

#### Intake cam phaser angle, $f_{icp}$ — Lookup table

array

The intake cam phaser angle command lookup table,  $f_{ICPCMD}$ , is a function of the engine load and engine speed

$$\varphi_{ICPCMD} = f_{ICPCMD}(L_{est}, N)$$

where:

- $\varphi_{ICPCMD}$  is commanded intake cam phaser angle, in degrees crank advance.
- $L_{est}=L$  is estimated engine load, dimensionless.
- $N$  is engine speed, in rpm.

**Exhaust cam phaser angle,  $f_{ecp}$  – Lookup table**  
array

The exhaust cam phaser angle command lookup table,  $f_{ECPCMD}$ , is a function of the engine load and engine speed

$$\varphi_{ECPCMD} = f_{ECPCMD}(L_{est}, N)$$

where:

- $\varphi_{ECPCMD}$  is commanded exhaust cam phaser angle, in degrees crank retard.
- $L_{est}=L$  is estimated engine load, dimensionless.
- $N$  is engine speed, in rpm.

**Load breakpoints,  $f_{cp\_ld\_bpt}$  – Breakpoints**

[0.2 0.275 0.35 0.425 0.5 0.575 0.65 0.725 0.8 0.875 0.95 1.025 1.1 1.175 1.25] (default) | vector

Load breakpoints, dimensionless.

**Speed breakpoints,  $f_{cp\_n\_bpt}$  – Breakpoints**

[750 1054 1357 1661 1964 2268 2571 2875 3179 3482 3786 4089 4393 4696 5000] (default) | vector

Speed breakpoints, in rpm.

**Commanded EGR percent,  $f_{egrpct\_cmd}$  – Lookup table**

array

The EGR percent command,  $EGR_{pct,cmd}$ , lookup table is a function of estimated engine load and engine speed

$$EGR_{pct,cmd} = f_{EGRpct,cmd}(L_{est}, N)$$

where:

- $EGR_{pct,cmd}$  is commanded EGR percent, dimensionless.
- $L_{est}=L$  is estimated engine load, dimensionless.
- $N$  is engine speed, in rpm.

#### Load breakpoints, $f\_egrpct\_ld\_bpt$ – Breakpoints

[0 0.2 0.275 0.35 0.425 0.5 0.575 0.65 0.725 0.8 0.875 0.95 1.025 1.1 1.175 1.25] (default) | vector

Engine load breakpoints,  $L$ , dimensionless.

#### Speed breakpoints, $f\_egrpct\_n\_bpt$ – Breakpoints

[750 1054 1357 1661 1964 2268 2571 2875 3179 3482 3786 4089 4393 4696 5000] (default) | vector

Engine speed breakpoints,  $N$ , in rpm.

#### EGR valve area percent, $f\_egr\_areapct\_cmd$ – Lookup table

array

The EGR area percent command,  $EGRap_{cmd}$ , lookup table is a function of the normalized mass flow and pressure ratio

$$EGRap_{cmd} = f_{EGRap,cmd} \left( \frac{\dot{m}_{EGRstd,cmd}}{\dot{m}_{EGRstd,max}}, \frac{P_{out,EGR}}{P_{in,EGR}} \right)$$

where:

- $EGRap_{cmd}$  is commanded EGR area percent, dimensionless.
- $\frac{\dot{m}_{EGRstd,cmd}}{\dot{m}_{EGRstd,max}}$  is the normalized mass flow, dimensionless.
- $\frac{P_{out,EGR}}{P_{in,EGR}}$  is the pressure ratio, dimensionless.

**Open EGR valve standard flow,  $f_{egr\_max\_stdflow}$  – Breakpoints**

[74.87 74.87 74.74 74.39 73.81 72.98 71.91 70.58 68.97 67.06 64.84 62.25 59.27 55.81 51.79 47.07 36.33 24.22 12.11 0] (default) | vector

Maximum standard EGR valve mass flow breakpoints,  $\dot{m}_{EGRstd,max}$ , in N·m.

**Normalized EGR valve standard flow breakpoints,  $f_{egr\_areapct\_nrmlzdfldw\_bpt}$  – Breakpoints**

[0 0.03448 0.06897 0.1034 0.1379 0.1724 0.2069 0.2414 0.2759 0.3103 0.3448 0.3793 0.4138 0.4483 0.4828 0.5172 0.5517 0.5862 0.6207 0.6552 0.6897 0.7241 0.7586 0.7931 0.8276 0.8621 0.8966 0.931 0.9655 1] (default) | vector

Normalized mass flow breakpoints,  $\frac{\dot{m}_{EGRstd,cmd}}{\dot{m}_{EGRstd,max}}$ , dimensionless.

**EGR valve pressure ratio breakpoints,  $f_{egr\_areapct\_pr\_bpt}$  – Breakpoints**  
vector

Pressure ratio breakpoints,  $\frac{P_{out,EGR}}{P_{in,EGR}}$ , dimensionless.

**Fuel**

**Injector slope,  $S_{inj}$  – Slope**

6.452 (default) | scalar

Fuel injector slope,  $S_{inj}$ , in mg/ms.

**Stoichiometric air-fuel ratio,  $afr\_stoich$  – Ratio**

14.6 (default) | scalar

Stoichiometric air-fuel ratio,  $AFR_{stoich}$ .

**Relative air-fuel ratio lambda,  $f_{lamcmd}$  – Air-fuel-ratio (AFR) lookup table**  
array

The commanded lambda,  $\lambda_{cmd}$ , lookup table is a function of estimated engine load and measured engine speed

$$\lambda_{cmd} = f_{\lambda_{cmd}}(L_{est}, N)$$

where:

- $\lambda_{cmd}$  is commanded relative AFR, dimensionless.
- $L_{est}=L$  is estimated engine load, dimensionless.
- $N$  is engine speed, in rpm.

### Dependencies

To create this parameter, on the **Fuel** tab, on the **Open-loop fuel** pane, clear **Input lambda**.

### Load breakpoints, $f\_lamcmd\_ld\_bpt$ – Breakpoints

[0.2 0.275 0.35 0.425 0.5 0.575 0.65 0.725 0.8 0.875 0.95 1.025 1.1 1.175 1.25] (default) | vector

Load breakpoints, dimensionless.

### Dependencies

To create this parameter, on the **Fuel** tab, on the **Open-loop fuel** pane, clear **Input lambda**.

### Speed breakpoints, $f\_lamcmd\_n\_bpt$ – Breakpoints

[750 1054 1357 1661 1964 2268 2571 2875 3179 3482 3786 4089 4393 4696 5000] (default) | vector

Speed breakpoints, in rpm.

### Dependencies

To create this parameter, on the **Fuel** tab, on the **Open-loop fuel** pane, clear **Input lambda**.

### Engine startup lambda enrichment delta vs coolant temperature, $f\_startup\_lambda\_delta$ – Lookup table

[0.5 0.3 0.2 0] (default) | vector

Engine startup lambda enrichment delta as a function of coolant temperature, dimensionless.

The SI Controller block uses this parameter to account for the extra fuel delivered to the spark-ignition (SI) engine during startup. If the engine speed is greater than the **Engine cranking speed** parameter, the SI Controller block enriches the optimal relative air-fuel ratio (lambda) with an exponentially decaying delta lambda. To initialize the delta lambda, the block uses the **Engine startup lambda enrichment delta vs coolant temperature** parameter to create a lambda enrichment table that is a function of the engine coolant temperature. The delta lambda exponentially

decays to zero based on a time constant specified with the **Engine startup lambda enrichment delta time constant vs coolant temperature** parameter.

#### Dependencies

To create this parameter, on the **Fuel** tab, on the **Open-loop fuel** pane, clear **Input lambda**.

**Engine startup lambda enrichment delta time constant vs coolant temperature, f\_startup\_lambda\_delta\_timecnst – Lambda time constant**

[90 40 12 0] (default) | vector

Engine startup lambda enrichment delta time constant versus coolant temperature, in s.

The SI Controller block uses this parameter to account for the extra fuel delivered to the spark-ignition (SI) engine during startup. If the engine speed is greater than the **Engine cranking speed** parameter, the SI Controller block enriches the optimal relative air-fuel ratio (lambda) with an exponentially decaying delta lambda. To initialize the delta lambda, the block uses the **Engine startup lambda enrichment delta vs coolant temperature** parameter to create a lambda enrichment table that is a function of the engine coolant temperature. The delta lambda exponentially decays to zero based on a time constant specified with the **Engine startup lambda enrichment delta time constant vs coolant temperature** parameter.

#### Dependencies

To create this parameter, on the **Fuel** tab, on the **Open-loop fuel** pane, clear **Input lambda**.

**Engine startup coolant temperature breakpoints, f\_startup\_ect\_bpt – Breakpoints**

[-40 0 20 50] (default) | vector

Engine startup coolant temperature breakpoints, in C.

The SI Controller block uses this parameter to account for the extra fuel delivered to the spark-ignition (SI) engine during startup. If the engine speed is greater than the **Engine cranking speed** parameter, the SI Controller block enriches the optimal relative air-fuel ratio (lambda) with an exponentially decaying delta lambda. To initialize the delta lambda, the block uses the **Engine startup lambda enrichment delta vs coolant temperature** parameter to create a lambda enrichment table that is a function of the engine coolant temperature. The delta lambda exponentially decays to zero based on a time constant specified with the **Engine startup lambda enrichment delta time constant vs coolant temperature** parameter.

#### Dependencies

To create this parameter, on the **Fuel** tab, on the **Open-loop fuel** pane, clear **Input lambda**.

**Closed-loop feedback – Minimize commanded AFR error**

off (default) | on

Select option to minimize the commanded air-fuel-ratio (lambda),  $\lambda_{cmd}$  error.

#### Dependencies

Selecting this parameter enables these parameters:

- **Closed-loop fuel proportional gain, ClsdLpFuelPGain**
- **Closed-loop fuel integral gain, ClsdLpFuelIGain**

- **Closed-loop fuel integrator limit, ClsdLpFuelIntgLmt**
- **Lambda dither amplitude, LambdaDitherAmp**
- **Lambda dither frequency, LambdaDitherFrq**
- **Oxygen sensor stoichiometric reset voltage, O2ResetStoichVoltSen**
- **Oxygen sensor minimum voltage reset, O2ResetMinVoltSen**
- **Oxygen sensor maximum voltage reset, O2ResetMaxVoltSen**
- **Oxygen sensor voltage learn update period, O2LearnUpdatePerSen**
- **Oxygen sensor voltage amplitude minimum, O2AmpMinVoltSen**
- **Oxygen sensor ready voltage, O2ReadyVoltSen**
- **Oxygen sensor not ready voltage, O2NotReadyVoltSen**

#### **Dither — Model catalytic conversion efficiency**

off (default) | on

Configure the block to model dither. For open-loop analysis, select this option to tune for maximum catalytic conversion efficiency.

#### **Dependencies**

By default, selecting **Closed-loop feedback** configures the block to model dither.

To enable this parameter for open-loop air-fuel-ratio (lambda) commands, clear **Closed-loop feedback**.

Selecting this parameter enables these parameters:

- **Lambda dither amplitude, LambdaDitherAmp**
- **Lambda dither frequency, LambdaDitherFrq**

#### **Closed-loop fuel proportional gain, ClsdLpFuelPGain — Proportional gain**

0.005 (default) | scalar

Closed-loop fuel proportional gain, dimensionless.

#### **Dependencies**

To enable this parameter, on the **Fuel** tab, on the **Closed-loop fuel** pane, select **Closed-loop feedback**.

#### **Closed-loop fuel integral gain, ClsdLpFuelIGain — Integral gain**

0.05 (default) | scalar

Closed-loop fuel integral gain, dimensionless.

#### **Dependencies**

To enable this parameter, on the **Fuel** tab, on the **Closed-loop fuel** pane, select **Closed-loop feedback**.

#### **Closed-loop fuel integrator limit, ClsdLpFuelIntgLmt — Integrator limit**

0.2 (default) | scalar

Closed-loop fuel integrator limit, dimensionless.

**Dependencies**

To enable this parameter, on the **Fuel** tab, on the **Closed-loop fuel** pane, select **Closed-loop feedback**.

**Lambda dither amplitude, LambdaDitherAmp — Amplitude**

0.03 (default) | scalar

Lambda dither amplitude, dimensionless.

**Dependencies**

To enable this parameter, on the **Fuel** tab, on the **Closed-loop fuel** pane, select either **Closed-loop feedback** or **Dither**.

**Lambda dither frequency, LambdaDitherFrq — Frequency**

0.75 (default) | scalar

Lambda dither frequency, in Hz.

**Dependencies**

To enable this parameter, on the **Fuel** tab, on the **Closed-loop fuel** pane, select either **Closed-loop feedback** or **Dither**.

**Oxygen sensor stoichiometric reset voltage, O2ResetStoichVoltSen — Closed-loop AFR control**

2500 (default) | scalar

Oxygen sensor stoichiometric reset voltage, O2ResetStoichVoltSen, in mV.

**Dependencies**

To enable this parameter, on the **Fuel** tab, on the **Closed-loop fuel** pane, select **Closed-loop feedback**.

**Oxygen sensor minimum voltage reset, O2ResetMinVoltSen — Closed-loop AFR control**

0 (default) | scalar

Oxygen sensor minimum voltage reset, O2ResetMinVoltSen, in mV.

**Dependencies**

To enable this parameter, on the **Fuel** tab, on the **Closed-loop fuel** pane, select **Closed-loop feedback**.

**Oxygen sensor maximum voltage reset, O2ResetMaxVoltSen — Closed-loop AFR control**

5000 (default) | scalar

Oxygen sensor maximum voltage reset, O2ResetMaxVoltSen, in mV.

**Dependencies**

To enable this parameter, on the **Fuel** tab, on the **Closed-loop fuel** pane, select **Closed-loop feedback**.

**Oxygen sensor voltage learn update period, O2LearnUpdatePerSen — Closed-loop AFR control**

4 (default) | scalar

Oxygen sensor voltage learn update period, O2LearnUpdatePerSen, in mV.

**Dependencies**

To enable this parameter, on the **Fuel** tab, on the **Closed-loop fuel** pane, select **Closed-loop feedback**.

**Oxygen sensor voltage amplitude minimum, O2AmpMinVoltSen — Closed-loop AFR control**

250 (default) | scalar

Oxygen sensor voltage amplitude minimum, O2AmpMinVoltSen, in mV.

**Dependencies**

To enable this parameter, on the **Fuel** tab, on the **Closed-loop fuel** pane, select **Closed-loop feedback**.

**Oxygen sensor ready voltage, O2ReadyVoltSen — Closed-loop AFR control**

1150 (default) | scalar

Oxygen sensor ready voltage, O2ReadyVoltSen, in mV.

**Dependencies**

To enable this parameter, on the **Fuel** tab, on the **Closed-loop fuel** pane, select **Closed-loop feedback**.

**Oxygen sensor not ready voltage, O2NotReadyVoltSen — Closed-loop AFR control**

1950 (default) | scalar

Oxygen sensor not ready voltage, O2NotReadyVoltSen, in mV.

**Dependencies**

To enable this parameter, on the **Fuel** tab, on the **Closed-loop fuel** pane, select **Closed-loop feedback**.

**Spark****Spark advance table, f\_sa — Lookup table**

array

The spark advance lookup table is a function of estimated load and engine speed.

$$SA = f_{SA}(L_{est}, N)$$

where:

- $SA$  is spark advance, in crank advance degrees.
- $L_{est}=L$  is estimated engine load, dimensionless.
- $N$  is engine speed, in rpm.

**Load breakpoints,  $f_{sa\_ld\_bpt}$  – Breakpoints**

[0.2 0.275 0.35 0.425 0.5 0.575 0.65 0.725 0.8 0.875 0.95 1.025 1.1 1.175 1.25] (default) | vector

Load breakpoints, dimensionless.

**Speed breakpoints,  $f_{sa\_n\_bpt}$  – Breakpoints**

[750 1054 1357 1661 1964 2268 2571 2875 3179 3482 3786 4089 4393 4696 5000] (default) | vector

Speed breakpoints, in rpm.

**Idle Speed**

**Target idle speed,  $N_{idle}$  – Speed**

750 (default) | scalar

Target idle speed,  $N_{idle}$ , in rpm.

**Enable torque command limit,  $Trq\_idlecmd\_enable$  – Torque**

1 (default) | scalar

Torque to enable the idle speed controller,  $Trq_{idlecmd,enable}$ , in N·m.

**Maximum torque command,  $Trq\_idlecmd\_max$  – Torque**

50 (default) | scalar

Maximum idle controller commanded torque,  $Trq_{idlecmd,max}$ , in N·m.

**Proportional gain,  $K_p\_idle$  – PI Controller**

0.05 (default) | scalar

Proportional gain for idle speed control,  $K_{p,idle}$ , in N·m/rpm.

**Integral gain,  $K_i\_idle$  – PI Controller**

0.2 (default) | scalar

Integral gain for idle speed control,  $K_{i,idle}$ , in N·m/(rpm·s).

**Rev-limiter speed threshold – Engine speed limit**

scalar

Engine speed limit,  $N_{lim}$ , in rpm.

If the engine speed,  $N$ , exceeds the engine speed limit,  $N_{lim}$ , the block sets the commanded engine torque to 0.

To smoothly transition the torque command to 0 as the engine speed approaches the speed limit, the block implements a lookup table multiplier. The lookup table multiplies the torque command by a value that ranges from 0 (engine speed exceeds limit) to 1 (engine speed does not exceed the limit).

**Engine cranking speed, CrankSpeed — Engine speed**

150 (default) | scalar

Engine cranking speed, in rpm.

**Estimation**

**Air**

**Number of cylinders, NCyl — Engine cylinders**

4 (default) | scalar

Number of engine cylinders,  $N_{cyl}$ .

**Crank revolutions per power stroke, Cps — Revolutions per stroke**

2 (default) | scalar

Crankshaft revolutions per power stroke,  $Cps$ , in rev/stroke.

**Total displaced volume, Vd — Volume**

0.0015 (default) | scalar

Displaced volume,  $V_d$ , in  $m^3$ .

**Ideal gas constant air, Rair — Constant**

287 (default) | scalar

Ideal gas constant,  $R_{air}$ , in  $J/(kg \cdot K)$ .

**Air standard pressure, Pstd — Pressure**

101325 (default) | scalar

Standard air pressure,  $P_{std}$ , in Pa.

**Air standard temperature, Tstd — Temperature**

293.15 (default) | scalar

Standard air temperature,  $T_{std}$ , in K.

**Speed-density volumetric efficiency, f\_nv — Lookup table**

array

The engine volumetric efficiency lookup table,  $f_{\eta_v}$ , is a function of intake manifold absolute pressure and engine speed

$$\eta_v = f_{\eta_v}(MAP, N)$$

where:

- $\eta_v$  is engine volumetric efficiency, dimensionless.
- $MAP$  is intake manifold absolute pressure, in KPa.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, for the **Air mass flow estimation model** parameter, select Simple Speed-Density.

**Speed-density intake manifold pressure breakpoints,  $f_{nv\_prs\_bpt}$  – Breakpoints**  
 [31 40.64 50.29 59.93 69.57 79.21 88.86 98.5 108.1 117.8 127.4 137.1 146.7 156.4 166] (default) | vector

Intake manifold pressure breakpoints for speed-density volumetric efficiency lookup table, in KPa.

**Dependencies**

To enable this parameter, for the **Air mass flow estimation model** parameter, select Simple Speed-Density.

**Speed-density engine speed breakpoints,  $f_{nv\_n\_bpt}$  – Breakpoints**  
 [750 1054 1357 1661 1964 2268 2571 2875 3179 3482 3786 4089 4393 4696 5000] (default) | vector

Engine speed breakpoints for speed-density volumetric efficiency lookup table, in rpm.

**Dependencies**

To enable this parameter, for the **Air mass flow estimation model** parameter, select Simple Speed-Density.

**Cylinder volume at intake valve close table,  $f_{v_{ivc}}$  – 2-D lookup table**  
 array

The cylinder volume at intake valve close table (IVC),  $f_{v_{ivc}}$  is a function of the intake cam phaser angle

$$V_{IVC} = f_{v_{ivc}}(\phi_{ICP})$$

where:

- $V_{IVC}$  is cylinder volume at IVC, in L.
- $\phi_{ICP}$  is intake cam phaser angle, in crank advance degrees.

#### Dependencies

To enable this parameter, for the **Air mass flow estimation model** parameter, select Dual Variable Cam Phasing.

#### Engine speed breakpoints, $f_{tm\_corr\_n\_bpt}$ — Breakpoints

[750 973.7 1197 1421 1645 1868 2092 2316 2539 2763 2987 3211 3434 3658 3882 4105 4329 4553 4776 5000] (default) | vector

Engine speed breakpoints, in rpm.

#### Dependencies

To enable this parameter, for the **Air mass flow estimation model** parameter, select Dual Variable Cam Phasing.

#### Cylinder volume intake cam phase breakpoints, $f_{vivc\_icp\_bpt}$ — Breakpoints

[0 2.632 5.263 7.895 10.53 13.16 15.79 18.42 21.05 23.68 26.32 28.95 31.58 34.21 36.84 39.47 42.11 44.74 47.37 50] (default) | vector

Cylinder volume at intake valve close table breakpoints.

#### Dependencies

To enable this parameter, for the **Air mass flow estimation model** parameter, select Dual Variable Cam Phasing.

#### Cylinder trapped mass correction factor, $f_{tm\_corr}$ — Lookup table

array

The trapped mass correction factor table,  $f_{TMcorr}$ , is a function of the normalized density and engine speed

$$TM_{corr} = f_{TM_{corr}}(\rho_{norm}, N)$$

where:

- $TM_{corr}$ , is trapped mass correction multiplier, dimensionless.
- $\rho_{norm}$  is normalized density, dimensionless.
- $N$  is engine speed, in rpm.

#### Dependencies

To enable this parameter, for the **Air mass flow estimation model** parameter, select Dual Variable Cam Phasing.

#### Normalized density breakpoints, `f_tm_corr_nd_bpt` – Breakpoints

[0.3 0.3895 0.4789 0.5684 0.6579 0.7474 0.8368 0.9263 1.016 1.105 1.195 1.284 1.374 1.463 1.553 1.642 1.732 1.821 1.911 2] (default) | vector

Normalized density breakpoints.

#### Dependencies

To enable this parameter, for the **Air mass flow estimation model** parameter, select Dual Variable Cam Phasing.

#### Intake mass flow, `f_mdot_intk` – Lookup table

array

The phaser intake mass flow model lookup table is a function of exhaust cam phaser angles and trapped air mass flow

$$\dot{m}_{intkideal} = f_{intkideal}(\varphi_{ECP}, TM_{flow})$$

where:

- $\dot{m}_{intkideal}$  is engine intake port mass flow at arbitrary cam phaser angles, in g/s.
- $\varphi_{ECP}$  is exhaust cam phaser angle, in degrees crank retard.
- $TM_{flow}$  is flow rate equivalent to corrected trapped mass at the current engine speed, in g/s.

### Dependencies

To enable this parameter, for the **Air mass flow estimation model** parameter, select Dual Variable Cam Phasing.

### Exhaust cam phase breakpoints, `f_mdott_air_ecp_bpt` — Breakpoints

[0 2.632 5.263 7.895 10.53 13.16 15.79 18.42 21.05 23.68 26.32 28.95 31.58 34.21 36.84 39.47 42.11 44.74 47.37 50] (default) | vector

Exhaust cam phaser breakpoints for air mass flow lookup table.

### Dependencies

To enable this parameter, for the **Air mass flow estimation model** parameter, select Dual Variable Cam Phasing.

### Trapped mass flow breakpoints, `f_mdott_trpd_bpt` — Breakpoints

[0 5.79 11.58 17.37 23.16 28.95 34.74 40.53 46.32 52.11 57.89 63.68 69.47 75.26 81.05 86.84 92.63 98.42 104.2 110] (default) | vector

Trapped mass flow breakpoints for air mass flow lookup table.

### Dependencies

To enable this parameter, for the **Air mass flow estimation model** parameter, select Dual Variable Cam Phasing.

### Air mass flow correction factor, `f_mdott_air_corr` — Lookup table

array

The intake air mass flow correction lookup table,  $f_{aircorr}$ , is a function of ideal load and engine speed

$$\dot{m}_{air} = \dot{m}_{intkideal} f_{aircorr}(L_{ideal}, N)$$

where:

- $L_{ideal}$  is engine load (normalized cylinder air mass) at arbitrary cam phaser angles, uncorrected for final steady-state cam phaser angles, dimensionless.
- $N$  is engine speed, in rpm.
- $\dot{m}_{air}$  is engine intake air mass flow final correction at steady-state cam phaser angles, in g/s.

- $\dot{m}_{intkideal}$  is engine intake port mass flow at arbitrary cam phaser angles, in g/s.

**Dependencies**

To enable this parameter, for the **Air mass flow estimation model** parameter, select Dual Variable Cam Phasing.

**Engine load breakpoints for air mass flow correction, f\_mdott\_air\_corr\_ld\_bpt – Breakpoints**  
vector

Engine load breakpoints for air mass flow final correction.

**Dependencies**

To enable this parameter, for the **Air mass flow estimation model** parameter, select Dual Variable Cam Phasing.

**Engine speed breakpoints for air mass flow correction, f\_mdott\_air\_n\_bpt – Breakpoints**

[750 973.7 1197 1421 1645 1868 2092 2316 2539 2763 2987 3211 3434 3658 3882 4105 4329 4553 4776 5000] (default) | vector

Engine speed breakpoints for air mass flow final correction.

**Dependencies**

To enable this parameter, for the **Air mass flow estimation model** parameter, select Dual Variable Cam Phasing.

**EGR flow time constant, tau\_egr – Constant**

0.2 (default) | scalar

EGR flow time constant,  $\tau_{EGR}$ , in s.

**Intake system pressure ratio table, f\_intksys\_stdflow\_pr – Table**  
array

The pressure ratio is a function of the standard mass flow

$$\frac{P_{out,EGR}}{P_{amb}} = f_{intksys,pr}(\dot{m}_{air,std})$$

where:

- $\dot{m}_{air, std}$  is standard mass flow, in g/s.
- $\frac{P_{out, EGR}}{P_{amb}}$  is pressure ratio, dimensionless.

**Standard mass flow rate breakpoints for intake pressure ratio, f\_intksys\_stdflow\_bpt – Breakpoints**

[0 29.67 59.34 89.01 117.8 144.1 155.7 166 175.2 183.3 190.7 197 202.7 207.7 212.2 216.1 219.4 222.2 224.5 226.4] (default) | vector

Standard mass flow,  $\dot{m}_{air, std}$ , in g/s.

**EGR valve standard mass flow rate, f\_egr\_stdflow – Table**

array

The EGR valve standard mass flow lookup table is a function of EGR valve area percent and the pressure ratio

$$\dot{m}_{EGR, std} = f_{EGR, std} \left( EGRap, \frac{P_{out, EGR}}{P_{in, EGR}} \right)$$

where:

- $\dot{m}_{EGR, std}$  is EGR valve standard mass flow, dimensionless.
- $EGRap$  is EGR valve flow area percent, in percent.
- $\frac{P_{out, EGR}}{P_{in, EGR}}$  is the pressure ratio, dimensionless.

**EGR valve standard flow pressure ratio breakpoints, `f_egr_stdflow_pr_bpt` – Breakpoints**  
vector

EGR valve standard flow pressure ratio,  $\frac{P_{out,EGR}}{P_{in,EGR}}$ , dimensionless.

**EGR valve standard flow area percent breakpoints, `f_egr_stdflow_egrp_bpt` – Breakpoints**

[0;5;10;15;20;25;30;35;40;45;50;55;60;65;70;75;80;85;90;95;100] (default) | vector

EGR valve flow area percent,  $EGRap$ , in percent.

**Torque**

**Torque table, `f_tq_nL` – Lookup table**

[L x N] array

For the simple torque lookup table model, the SI engine uses a lookup table map that is a function of engine speed and load,  $T_{brake} = f_{TnL}(L, N)$ , where:

- $T_{brake}$  is engine brake torque after accounting for spark advance, AFR, and friction effects, in N·m.
- $L$  is engine load, as a normalized cylinder air mass, dimensionless.
- $N$  is engine speed, in rpm.

The simple torque lookup model assumes that the calibration has negative torque values to indicate the non-firing engine load ( $L$ ) versus speed ( $N$ ) condition. The calibrated table ( $L$ -by- $N$ ) contains the non-firing data in the first table row ( $1$ -by- $N$ ). When the fuel delivered to the engine is zero, the model uses the data in the first table row ( $1$ -by- $N$ ) at or above 100 AFR. 100 AFR results from fuel cutoff or very lean operation where combustion cannot occur.

#### Dependencies

To enable this parameter, for the **Torque model** parameter, select Simple Torque Lookup.

#### Torque table load breakpoints, $f_{tq\_nl\_l\_bpt}$ — Breakpoints

[0.2 0.275 0.35 0.425 0.5 0.575 0.65 0.725 0.8 0.875 0.95 1.025 1.1 1.175 1.25] (default) | vector | [1 x  $L$ ] vector

Engine load breakpoints,  $L$ , dimensionless.

#### Dependencies

To enable this parameter, for the **Torque model** parameter, select Simple Torque Lookup.

#### Torque table speed breakpoints, $f_{tq\_nl\_n\_bpt}$ — Breakpoints

[750 1053.57142857143 1357.14285714286 1660.71428571429 1964.28571428571 2267.85714285714 2571.42857142857 2875 3178.57142857143 3482.14285714286 3785.71428571429 4089.28571428571 4392.85714285714 4696.42857142857 5000] (default) | vector | [1 x  $N$ ] vector

Engine speed breakpoints,  $N$ , in rpm.

#### Dependencies

To enable this parameter, for the **Torque model** parameter, select Simple Torque Lookup.

#### Crank angle pressure and torque — Enable Crank angle signals

off (default) | on

If you select **Crank angle pressure and torque** on the block **Torque** tab, you can:

- Simulate advanced closed-loop engine controls in desktop simulations and on HIL bench, based on cylinder pressure recorded from a model or laboratory test as a function of crank angle.
- Simulate driveline vibrations downstream of the engine due to high-frequency crankshaft torsionals.
- Simulate engine misfires due to lean operation or spark plug fouling by using the injector pulse width input.
- Simulate cylinder deactivation effect (closed intake and exhaust valves, no injected fuel) on individual cylinder pressures, mean-value airflow, mean-value torque, and crank-angle-based torque.
- Simulate the fuel-cut effect on individual cylinder pressure, mean-value torque, and crank-angle-based torque.

#### Dependencies

To enable this parameter, set **Torque model** to Torque Structure.

#### Cylinder pressure, $f_{crk\_prs}$ — Cylinder pressure table

$L \times M \times N$  array

Cylinder pressure table  $Prs$ , as a function of speed  $N$ , load  $L$ , and crank angle  $M$ , in Pa.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Torque Structure. Select **Crank angle pressure and torque**.

**Brake torque, f\_crk\_btq – Brake torque table**

$L \times M \times N$  array

Brake torque table  $T_{brake}$ , as a function of speed  $N$ , load  $L$ , and crank angle  $M$ , in N·m.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Torque Structure. Select **Crank angle pressure and torque**.

**Speed breakpoints, f\_crk\_n\_bpt – Speed breakpoints**

[750 5000] (default) |  $1 \times N$  vector

Speed breakpoints,  $N$ , in rpm.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Torque Structure. Select **Crank angle pressure and torque**.

**Load breakpoints, f\_crk\_l\_bpt – Load breakpoints**

[0.2 1.4] (default) |  $1 \times L$  vector

Load breakpoints,  $L$ . No dimension.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Torque Structure. Select **Crank angle pressure and torque**.

**Crank angle breakpoints, f\_crk\_ang\_bpt – Crank angle breakpoints**

[60 660] (default) |  $1 \times M$  vector

Crank angle breakpoints,  $M$ , in deg.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Torque Structure. Select **Crank angle pressure and torque**.

**TDC compression angles by cylinder, f\_crk\_tdc\_ang – TDC compression angles by cylinder**

[0 540 180 360] (default) | vector

Top dead center (TDC) compression angles by cylinder, in deg.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Torque Structure. Select **Crank angle pressure and torque**.

**Inner torque table,  $f_{Tq\_inr}$  – Lookup table**

array

The inner torque lookup table,  $f_{Tq\_inr}$ , is a function of engine speed and engine load,  $T_{q\_inr} = f_{Tq\_inr}(L, N)$ , where:

- $T_{q\_inr}$  is inner torque based on gross indicated mean effective pressure, in N·m.
- $L$  is engine load at arbitrary cam phaser angles, corrected for final steady-state cam phaser angles, dimensionless.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

**Friction torque table,  $f_{Tq\_fric}$  – Lookup table**

array

The friction torque lookup table,  $f_{Tq\_fric}$ , is a function of engine speed and engine load,  $T_{fric} = f_{Tq\_fric}(L, N)$ , where:

- $T_{fric}$  is friction torque offset to inner torque, in N·m.
- $L$  is engine load at arbitrary cam phaser angles, corrected for final steady-state cam phaser angles, dimensionless.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

**Engine temperature modifier on friction torque, f\_fric\_temp\_mod – Lookup table**

[3.96 3.22 2.56 2.26 2.11 2 1.9 1.83 1.76 1.7 1.65 1.6 1.55 1.49 1.44 1.41  
1.38 1.35 1.32 1.3 1.27 1.25 1.24 1.21 1.2 1.18 1.16 1.15 1.13 1.12 1.11 1.1  
1.09 1.08 1.07 1.06 1.05 1.05 1.04 1.03 1.02 1.02 1.01 1.01 1 1 1 0.999 0.997  
0.995 0.993 0.991 0.989 0.987] (default) | vector | vector

Engine temperature modifier on friction torque,  $f_{fric,temp}$ , dimensionless.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

**Engine temperature modifier breakpoints, f\_fric\_temp\_bpt – Breakpoints**

[274 276 278 280 282 284 286 288 290 292 294 296 298 300 302 304 306 308 310  
312 314 316 318 320 322 324 326 328 330 332 334 336 338 340 342 344 346 348  
350 352 354 356 358 360 362 364 366 368 370 372 374 376 378 380] (default) |  
vector | vector

Engine temperature modifier breakpoints, in K.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

**Pumping work table, f\_tq\_pump – Lookup table**

array

The pumping work lookup table,  $f_{T_{pump}}$ , is a function of engine load and engine speed,  $T_{pump} = f_{T_{pump}}(L, N)$ , where:

- $T_{pump}$  is pumping work, in N·m.
- $L$  is engine load, as a normalized cylinder air mass, dimensionless.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

**Optimal spark table, f\_sa\_opt – Lookup table**

array

The optimal spark lookup table,  $f_{SAopt}$ , is a function of engine speed and engine load,  $SA_{opt} = f_{SAopt}(L, N)$ , where:

- $SA_{opt}$  is optimal spark advance timing for maximum inner torque at stoichiometric air-fuel ratio (AFR), in deg.
- $L$  is engine load at arbitrary cam phaser angles, corrected for final steady-state cam phaser angles, dimensionless.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Inner torque load breakpoints, $f_{tq\_inr\_l\_bpt}$ – Breakpoints

[0.2 0.28571 0.37143 0.45714 0.54286 0.62857 0.71429 0.8 0.88571 0.97143 1.0571 1.1429 1.2286 1.3143 1.4] (default) | vector

Inner torque load breakpoints, dimensionless.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Inner torque speed breakpoints, $f_{tq\_inr\_n\_bpt}$ – Breakpoints

[750 1053.5714 1357.1429 1660.7143 1964.2857 2267.8571 2571.4286 2875 3178.5714 3482.1429 3785.7143 4089.2857 4392.8571 4696.4286 5000] (default) | vector

Inner torque speed breakpoints, in rpm.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Spark efficiency table, $f_{m\_sa}$ – Lookup table

array

The spark efficiency lookup table,  $f_{Msa}$ , is a function of the spark retard from optimal

$$M_{sa} = f_{Msa}(\Delta SA)$$

$$\Delta SA = SA_{opt} - SA$$

where:

- $M_{sa}$  is the spark retard efficiency multiplier, dimensionless.
- $\Delta SA$  is the spark retard timing distance from optimal spark advance, in deg.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Spark retard from optimal, `f_del_sa_bpt` – Breakpoints

```
[0 0.75 1.5 2.25 3 3.75 4.5 5.25 6 6.75 7.5 8.25 9 9.75 10.5 11.25 12 12.75
13.5 14.25 15 15.75 16.5 17.25 18 18.75 19.5 20.25 21 21.75 22.5 23.25 24
24.75 25.5 26.25 27 27.75 28.5 29.25 30 30.75 31.5 32.25 33 33.75 34.5 35.25

47.25 48] (default) | vector
```

Spark retard from optimal inner torque timing breakpoints, in deg.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Lambda efficiency, `f_m_lam` – Lookup table

array

The lambda efficiency lookup table,  $f_{M\lambda}$ , is a function of lambda,  $M_\lambda = f_{M\lambda}(\lambda)$ , where:

- $M_\lambda$  is the lambda multiplier on inner torque to account for the air-fuel ratio (AFR) effect, dimensionless.
- $\lambda$  is lambda, AFR normalized to stoichiometric fuel AFR, dimensionless.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Lambda breakpoints, `f_m_lam_bpt` – Breakpoints

[0.65 0.7 0.75 0.8 0.85 0.9 0.95 1 1.05 1.1] (default) | vector

Lambda effect on inner torque lambda breakpoints, dimensionless.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Exhaust

### Exhaust temperature table, `f_t_exh` – Lookup table

array

The exhaust temperature lookup table,  $f_{Texh}$ , is a function of engine load and engine speed

$$T_{exh} = f_{Texh}(L, N)$$

where:

- $T_{exh}$  is engine exhaust temperature, in K.
- $L$  is normalized cylinder air mass or engine load, dimensionless.
- $N$  is engine speed, in rpm.

**Load breakpoints, f\_t\_exh\_l\_bpt — Breakpoints**

[0.2 0.275 0.35 0.425 0.5 0.575 0.65 0.725 0.8 0.875 0.95 1.025 1.1 1.175 1.25] (default) | vector

Engine load breakpoints used for exhaust temperature lookup table.

**Speed breakpoints, f\_t\_exh\_n\_bpt — Breakpoints**

[750 1054 1357 1661 1964 2268 2571 2875 3179 3482 3786 4089 4393 4696 5000] (default) | vector

Engine speed breakpoints used for exhaust temperature lookup table, in rpm.

## SI Core Engine

Spark-ignition engine from intake to exhaust port

**Library:** Powertrain Blockset / Propulsion / Combustion Engine  
Components / Core Engine

### Description

The SI Core Engine block implements a spark-ignition (SI) engine from intake to exhaust port. You can use the block in larger vehicle models, hardware-in-the-loop (HIL) engine control design, or vehicle-level fuel economy and performance simulations.

The SI Core Engine block calculates:

- Brake torque
- Fuel flow
- Port gas mass flow, including exhaust gas recirculation (EGR)
- Air-fuel ratio (AFR)
- Exhaust temperature and exhaust mass flow rate
- Engine-out (EO) exhaust emissions
  - Hydrocarbon (HC)
  - Carbon monoxide (CO)
  - Nitric oxide and nitrogen dioxide (NO<sub>x</sub>)
  - Carbon dioxide (CO<sub>2</sub>)
  - Particulate matter (PM)

### Air Mass Flow

To calculate engine air mass flow, configure the SI engine to use either of these air mass flow models.

Air Mass Flow Model	Description
"SI Engine Speed-Density Air Mass Flow Model"	Uses the speed-density equation to calculate the engine air mass flow, relating the engine air mass flow to the intake manifold pressure and engine speed. Consider using this air mass flow model in engines with fixed valvetrain designs.

Air Mass Flow Model	Description
<p>“SI Engine Dual-Independent Cam Phaser Air Mass Flow Model”</p>	<p>To calculate the engine air mass flow, the dual-independent cam phaser model uses:</p> <ul style="list-style-type: none"> <li>• Empirical calibration parameters developed from engine mapping measurements</li> <li>• Desktop calibration parameters derived from engine computer-aided design (CAD) data</li> </ul> <p>In contrast to typical embedded air mass flow calculations based on direct air mass flow measurement with an air mass flow (MAF) sensor, this air mass flow model offers:</p> <ul style="list-style-type: none"> <li>• Elimination of MAF sensors in dual cam-phased valvetrain applications</li> <li>• Reasonable accuracy with changes in altitude</li> <li>• Semiphysical modeling approach</li> <li>• Bounded behavior</li> <li>• Suitable execution time for electronic control unit (ECU) implementation</li> <li>• Systematic development of a relatively small number of calibration parameters</li> </ul>

### Brake Torque

To calculate the brake torque, configure the SI engine to use either of these torque models.

Brake Torque Model	Description
"SI Engine Torque Structure Model"	<p>For the structured brake torque calculation, the SI engine uses tables for the inner torque, friction torque, optimal spark, spark efficiency, and lambda efficiency.</p> <p>If you select <b>Crank angle pressure and torque</b> on the block <b>Torque</b> tab, you can:</p> <ul style="list-style-type: none"> <li>• Simulate advanced closed-loop engine controls in desktop simulations and on HIL bench, based on cylinder pressure recorded from a model or laboratory test as a function of crank angle.</li> <li>• Simulate driveline vibrations downstream of the engine due to high-frequency crankshaft torsionals.</li> <li>• Simulate engine misfires due to lean operation or spark plug fouling by using the injector pulse width input.</li> <li>• Simulate cylinder deactivation effect (closed intake and exhaust valves, no injected fuel) on individual cylinder pressures, mean-value airflow, mean-value torque, and crank-angle-based torque.</li> <li>• Simulate the fuel-cut effect on individual cylinder pressure, mean-value torque, and crank-angle-based torque.</li> </ul>
"SI Engine Simple Torque Model"	<p>For the simple brake torque calculation, the SI engine block uses a torque lookup table map that is a function of engine speed and load.</p>

### Fuel Flow

To calculate the fuel flow, the SI Core Engine block uses fuel injector characteristics and fuel injector pulse-width.

$$\dot{m}_{fuel} = \frac{NS_{inj}Pw_{inj}N_{cyl}}{Cps\left(\frac{60s}{min}\right)\left(\frac{1000mg}{g}\right)}$$

To calculate the fuel economy for high-fidelity models, the block uses the volumetric fuel flow.

$$Q_{fuel} = \frac{\dot{m}_{fuel}}{\left(\frac{1000kg}{m^3}\right)Sg_{fuel}}$$

The equation uses these variables.

- $\dot{m}_{fuel}$  Fuel mass flow, g/s
- $\omega$  Engine rotational speed, rad/s
- $Cps$  Crankshaft revolutions per power stroke, rev/stroke
- $S_{inj}$  Fuel injector slope, mg/ms
- $Pw_{inj}$  Fuel injector pulse-width, ms

$N_{cyl}$	Number of engine cylinders
$N$	Engine speed, rpm
$Sg_{fuel}$	Specific gravity of fuel
$Q_{fuel}$	Volumetric fuel flow

The block uses the internal signal `FlwDir` to track the direction of the flow.

### Air-Fuel Ratio

To calculate the air-fuel (AFR) ratio, the CI Core Engine and SI Core Engine blocks implement this equation.

$$AFR = \frac{\dot{m}_{air}}{\dot{m}_{fuel}}$$

The CI Core Engine uses this equation to calculate the relative AFR.

$$\lambda = \frac{AFR}{AFR_s}$$

To calculate the exhaust gas recirculation (EGR), the blocks implement this equation. The calculation expresses the EGR as a percent of the total intake port flow.

$$EGR_{pct} = 100 \frac{\dot{m}_{intk,b}}{\dot{m}_{intk}} = 100 y_{intk,b}$$

The equations use these variables.

$AFR$	Air-fuel ratio
$AFR_s$	Stoichiometric air-fuel ratio
$\dot{m}_{intk}$	Engine air mass flow
$\dot{m}_{fuel}$	Fuel mass flow
$\lambda$	Relative AFR
$y_{intk,b}$	Intake burned mass fraction
$EGR_{pct}$	EGR percent
$\dot{m}_{intk,b}$	Recirculated burned gas mass flow rate

### Exhaust

The block calculates the:

- Exhaust gas temperature
- Exhaust gas-specific enthalpy
- Exhaust gas mass flow rate
- Engine-out (EO) exhaust emissions:
  - Hydrocarbon (HC)
  - Carbon monoxide (CO)

- Nitric oxide and nitrogen dioxide (NOx)
- Carbon dioxide (CO<sub>2</sub>)
- Particulate matter (PM)

The exhaust temperature determines the specific enthalpy.

$$h_{exh} = Cp_{exh}T_{exh}$$

The exhaust mass flow rate is the sum of the intake port air mass flow and the fuel mass flow.

$$\dot{m}_{exh} = \dot{m}_{intake} + \dot{m}_{fuel}$$

To calculate the exhaust emissions, the block multiplies the emission mass fraction by the exhaust mass flow rate. To determine the emission mass fractions, the block uses lookup tables that are functions of the engine torque and speed.

$$y_{exh,i} = f_{i\_frac}(T_{brake}, N)$$

$$\dot{m}_{exh,i} = \dot{m}_{exh}y_{exh,i}$$

The fraction of air and fuel entering the intake port, injected fuel, and stoichiometric AFR determine the air mass fraction that exits the exhaust.

$$y_{exh,air} = \max\left[y_{in,air} - \frac{\dot{m}_{fuel} + y_{in,fuel}\dot{m}_{intake}}{\dot{m}_{fuel} + \dot{m}_{intake}}AFR_s\right]$$

If the engine is operating at the stoichiometric or fuel rich AFR, no air exits the exhaust. Unburned hydrocarbons and burned gas comprise the remainder of the exhaust gas. This equation determines the exhaust burned gas mass fraction.

$$y_{exh,b} = \max[(1 - y_{exh,air} - y_{exh,HC}), 0]$$

The equations use these variables.

$T_{exh}$	Engine exhaust temperature
$h_{exh}$	Exhaust manifold inlet-specific enthalpy
$Cp_{exh}$	Exhaust gas specific heat
$\dot{m}_{intk}$	Intake port air mass flow rate
$\dot{m}_{fuel}$	Fuel mass flow rate
$\dot{m}_{exh}$	Exhaust mass flow rate
$y_{in,fuel}$	Intake fuel mass fraction
$y_{exh,i}$	Exhaust mass fraction for $i = \text{CO}_2, \text{CO}, \text{HC}, \text{NOx}, \text{air}, \text{burned gas}, \text{and PM}$
$\dot{m}_{exh,i}$	Exhaust mass flow rate for $i = \text{CO}_2, \text{CO}, \text{HC}, \text{NOx}, \text{air}, \text{burned gas}, \text{and PM}$
$T_{brake}$	Engine brake torque
$N$	Engine speed
$y_{exh,air}$	Exhaust air mass fraction
$y_{exh,b}$	Exhaust air burned mass fraction

## Power Accounting

For the power accounting, the block implements equations that depend on **Torque model**.

When you set **Torque model** to Simple Torque Lookup, the block implements these equations.

Bus Signal		Description	Equations
PwrInfo	PwrTrnsfrd — Power transferred between blocks	PwrIntkHeatFlw Intake heat flow	$\dot{m}_{intk}h_{intk}$
	<ul style="list-style-type: none"> <li>• Positive signals indicate flow into block</li> <li>• Negative signals indicate flow out of block</li> </ul>	PwrExheatFlw Exhaust heat flow	$-\dot{m}_{exh}h_{exh}$
		PwrCrkshft Crankshaft power	$-T_{brake}\omega$
PwrNotTrnsfrd — Power crossing the block boundary, but not transferred	PwrFuel Fuel input power	$\dot{m}_{fuel}LHV$	
	PwrLoss All losses	$T_{brake}\omega - \dot{m}_{fuel}LHV - \dot{m}_{intk}h_{intk} + \dot{m}_{exh}h_{exh}$	
<ul style="list-style-type: none"> <li>• Positive signals indicate an input</li> <li>• Negative signals indicate a loss</li> </ul>			

Bus Signal		Description	Equations
	<p>PwrStored — Stored energy rate of change</p> <ul style="list-style-type: none"> <li>• Positive signals indicate an increase</li> <li>• Negative signals indicate a decrease</li> </ul>	Not used	

When you set **Torque model** to Torque Structure, the block implements these equations.

Bus Signal		Description	Equations
PwrInfo	<p>PwrTrnsfrd — Power transferred between blocks</p> <ul style="list-style-type: none"> <li>• Positive signals indicate flow into block</li> <li>• Negative signals indicate flow out of block</li> </ul>	PwrIntkHeatFlw	Intake heat flow $\dot{m}_{intk}h_{intk}$
		PwrExhHeatFlw	Exhaust heat flow $-\dot{m}_{exh}h_{exh}$
		PwrCrkshft	Crankshaft power $-T_{brake}\omega$
	<p>PwrNotTrnsfrd — Power crossing the block boundary, but not transferred</p> <ul style="list-style-type: none"> <li>• Positive signals indicate an input</li> <li>• Negative signals indicate a loss</li> </ul>	PwrFuel	Fuel input power $\dot{m}_{fuel}LHV$
		PwrFricLoss	Friction loss $-T_{fric}\omega$
		PwrPumpLoss	Pumping loss $-T_{pump}\omega$
		PwrHeatLoss	Heat transfer loss $T_{brake}\omega - \dot{m}_{fuel}LHV - \dot{m}_{intk}h_{intk} + \dot{m}_{exh}h_{exh} + T_{fric}\omega + T_{pump}\omega$

Bus Signal		Description	Equations
	PwrStored — Stored energy rate of change <ul style="list-style-type: none"> <li>• Positive signals indicate an increase</li> <li>• Negative signals indicate a decrease</li> </ul>	<i>Not used</i>	

$h_{exh}$	Exhaust manifold inlet-specific enthalpy
$h_{intk}$	Intake port specific enthalpy
$\dot{m}_{intk}$	Intake port air mass flow rate
$\dot{m}_{fuel}$	Fuel mass flow rate
$\dot{m}_{exh}$	Exhaust mass flow rate
$\omega$	Engine speed
$T_{brake}$	Brake torque
$T_{pump}$	Engine pumping work offset to inner torque
$T_{fric}$	Engine friction torque
$LHV$	Fuel lower heating value

## Ports

### Input

#### InjPw — Fuel injector pulse-width

scalar

Fuel injector pulse-width,  $Pw_{inj}$ , in ms.

#### SpkAdv — Spark advance

scalar

Spark advance,  $SA$ , in degrees crank angle before top dead center (degBTDC).

### Dependencies

To create this port, for the **Torque model** parameter, select Torque Structure.

#### ICP — Intake cam phase angle command

scalar

Intake cam phase angle command,  $\varphi_{ICPCMD}$ , in degCrkAdv, or degrees crank advance.

**Dependencies**

To create this port, for the **Air mass flow model** parameter, select Dual-Independent Variable Cam Phasing.

**ECP — Exhaust cam phase angle command**

scalar

Exhaust cam phase angle command,  $\varphi_{ECPCMD}$ , in degCrkRet, or degrees crank retard.

**Dependencies**

To create this port, for the **Air mass flow model** parameter, select Dual-Independent Variable Cam Phasing.

**AmbPrs — Ambient pressure**

scalar

Ambient pressure,  $P_{Amb}$ , in Pa.

**Dependencies**

To create this port, for the **Air mass flow model** parameter, select Dual-Independent Variable Cam Phasing.

**EngSpd — Engine speed**

scalar

Engine speed,  $N$ , in rpm.

**Ect — Engine cooling temperature**

scalar

Engine cooling temperature,  $T_{coolant}$ , in K.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Intk — Intake port pressure, temperature, enthalpy, mass fractions**

two-way connector port

Bus containing the upstream:

- Prs — Pressure, in Pa
- Temp — Temperature, in K
- Enth — Specific enthalpy, in J/kg
- MassFrac — Intake port mass fractions, dimensionless. EGR mass flow at the intake port is burned gas.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen

- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

### **Exh — Exhaust port pressure, temperature, enthalpy, mass fractions**

two-way connector port

Bus containing the exhaust:

- Prs — Pressure, in Pa
- Temp — Temperature, in K
- Enth — Specific enthalpy, in J/kg
- MassFrac — Exhaust port mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

### **Output**

#### **Info — Bus signal**

bus

Bus signal that contains these block calculations.

Signal	Description	Variable	Units
IntkGasMassFlw	Engine intake air mass flow	$\dot{m}_{air}$	kg/s
IntkAirMassFlw	Engine intake port mass flow	$\dot{m}_{intk}$	kg/s
NrmlzdAirChrg	Engine load (that is, normalized cylinder air mass) corrected for final steady-state cam phase angles	$L$	N/A
Afr	Air-fuel ratio at engine exhaust port	$AFR$	N/A
FuelMassFlw	Fuel flow into engine	$\dot{m}_{fuel}$	kg/s
FuelVolFlw	Volumetric fuel flow	$Q_{fuel}$	m <sup>3</sup> /s
ExhManGasTemp	Exhaust gas temperature at exhaust manifold inlet	$T_{exh}$	K
EngTrq	Engine brake torque	$T_{brake}$	N·m
EngSpd	Engine speed	$N$	rpm
IntkCamPhase	Intake cam phaser angle	$\varphi_{ICP}$ i	degrees crank advance
ExhCamPhase	Exhaust cam phaser angle	$\varphi_{ECP}$	degrees crank retard
CrkAng	Engine crankshaft absolute angle	$\int_0^{(360)Cps} EngSpd \frac{180}{30} d\theta$ <p>where <math>Cps</math> is crankshaft revolutions per power stroke</p>	degrees crank angle
EgrPct	EGR percent	$EGR_{pct}$	N/A
EoAir	EO air mass flow rate	$\dot{m}_{exh}$	kg/s
EoBrndGas	EO burned gas mass flow rate	$y_{exh,b}$	kg/s
EoHC	EO hydrocarbon emission mass flow rate	$y_{exh,HC}$	kg/s
EoCO	EO carbon monoxide emission mass flow rate	$y_{exh,CO}$	kg/s
EoNOx	EO nitric oxide and nitrogen dioxide emissions mass flow rate	$y_{exh,NOx}$	kg/s
EoCO2	EO carbon dioxide emission mass flow rate	$y_{exh,CO2}$	kg/s

Signal		Description	Variable	Units	
EoPm		EO particulate matter emission mass flow rate	$y_{exh,PM}$	kg/s	
CylPrs		Cylinder pressure	N/A	Pa	
EngTrqCrk		Crank-angle based engine torque	N/A	N·m	
PwrInfo	PwrTrnsfrd	PwrIntkHeatFlw	Intake heat flow	$\dot{m}_{intk}h_{intk}$	W
		PwrExhHeatFlw	Exhaust heat flow	$-\dot{m}_{exh}h_{exh}$	W
		PwrCrkshft	Crankshaft power	$-T_{brake}\omega$	W
	PwrNotTrnsfrd	PwrFuel	Fuel input power	$\dot{m}_{fuel}LHV$	W
		PwrLoss	For <b>Torque model</b> set to Simple Torque Lookup: All losses	$T_{brake}\omega - \dot{m}_{fuel}LHV - \dot{m}_{intk}h_{intk} + \dot{m}_{exh}h_{exh}$	W
		PwrFricLoss	For <b>Torque model</b> set to Torque Structure: Friction loss	$-T_{fric}\omega$	W
		PwrPumpLoss	For <b>Torque model</b> set to Torque Structure: Pumping loss	$-T_{pump}\omega$	W
		PwrHeatTrnsfrLoss	For <b>Torque model</b> set to Torque Structure: Heat transfer loss	$T_{brake}\omega - \dot{m}_{fuel}LHV - \dot{m}_{intk}h_{intk} + \dot{m}_{exh}h_{exh} + T_{fric}\omega + T_{pump}\omega$	W
	PwrStored	Not used			

### EngTrq – Engine brake torque

scalar

Engine brake torque,  $T_{brake}$ , in N·m.

### Intk – Intake port mass flow rate, heat flow rate, temperature, mass fraction

two-way connector port

Bus containing:

- MassFlwRate – Intake port mass flow rate, in kg/s
- HeatFlwRate – Intake port heat flow rate, in J/s
- Temp – Intake port temperature, in K
- MassFrac – Intake port mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

**Exh — Exhaust port mass flow rate, heat flow rate, temperature, mass fraction**  
two-way connector port

Bus containing:

- MassFlwRate — Exhaust port mass flow rate, in kg/s
- HeatFlwRate — Exhaust heat flow rate, in J/s
- Temp — Exhaust temperature, in K
- MassFrac — Exhaust port mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

## Parameters

### Block Options

**Air mass flow model — Select air mass flow model**

Dual-Independent Variable Cam Phasing (default) | Simple Speed-Density

To calculate engine air mass flow, configure the SI engine to use either of these air mass flow models.

Air Mass Flow Model	Description
"SI Engine Speed-Density Air Mass Flow Model"	Uses the speed-density equation to calculate the engine air mass flow, relating the engine air mass flow to the intake manifold pressure and engine speed. Consider using this air mass flow model in engines with fixed valvetrain designs.
"SI Engine Dual-Independent Cam Phaser Air Mass Flow Model"	<p>To calculate the engine air mass flow, the dual-independent cam phaser model uses:</p> <ul style="list-style-type: none"> <li>• Empirical calibration parameters developed from engine mapping measurements</li> <li>• Desktop calibration parameters derived from engine computer-aided design (CAD) data</li> </ul> <p>In contrast to typical embedded air mass flow calculations based on direct air mass flow measurement with an air mass flow (MAF) sensor, this air mass flow model offers:</p> <ul style="list-style-type: none"> <li>• Elimination of MAF sensors in dual cam-phased valvetrain applications</li> <li>• Reasonable accuracy with changes in altitude</li> <li>• Semiphysical modeling approach</li> <li>• Bounded behavior</li> <li>• Suitable execution time for electronic control unit (ECU) implementation</li> <li>• Systematic development of a relatively small number of calibration parameters</li> </ul>

### Dependencies

The table summarizes the parameter dependencies.

Air Mass Flow Model	Enables Parameters
Dual-Independent Variable Cam Phasing	<p>Cylinder volume at intake valve close table, <b>f_vivc</b></p> <p>Cylinder volume intake cam phase breakpoints, <b>f_vivc_icp_bpt</b></p> <p>Cylinder trapped mass correction factor, <b>f_tm_corr</b></p> <p>Normalized density breakpoints, <b>f_tm_corr_nd_bpt</b></p> <p>Engine speed breakpoints, <b>f_tm_corr_n_bpt</b></p> <p>Air mass flow, <b>f_mdot_air</b></p> <p>Exhaust cam phase breakpoints, <b>f_mdot_air_ecp_bpt</b></p> <p>Trapped mass flow breakpoints, <b>f_mdot_trpd_bpt</b></p> <p>Air mass flow correction factor, <b>f_mdot_air_corr</b></p> <p>Engine load breakpoints for air mass flow correction, <b>f_mdot_air_corr_ld_bpt</b></p> <p>Engine speed breakpoints for air mass flow correction, <b>f_mdot_air_n_bpt</b></p>

Simple Torque Lookup	<p>Torque table, <b>f_tq_nl</b></p> <p>Torque table load breakpoints, <b>f_tq_nl_l_bpt</b></p> <p>Torque table speed breakpoints, <b>f_tq_nl_n_bpt</b></p>

**Air**

**Number of cylinders, NCyl – Engine cylinders**

4 (default) | scalar

Number of engine cylinders,  $N_{cyl}$ .

**Crank revolutions per power stroke, Cps – Revolutions per stroke**

2 (default) | scalar

Crankshaft revolutions per power stroke,  $Cps$ , in rev/stroke.

**Total displaced volume, Vd – Volume**

0.0015 (default) | scalar

Displaced volume,  $V_d$ , in  $m^3$ .

**Ideal gas constant air, Rair – Constant**

287 (default) | scalar

Ideal gas constant,  $R_{air}$ , in  $J/(kg \cdot K)$ .

**Air standard pressure, Pstd – Pressure**

101325 (default) | scalar

Standard air pressure,  $P_{std}$ , in Pa.

### Air standard temperature, $T_{std}$ – Temperature

293.15 (default) | scalar

Standard air temperature,  $T_{std}$ , in K.

### Speed-density volumetric efficiency, $f_{\eta_v}$ – Lookup table

array

The engine volumetric efficiency lookup table,  $f_{\eta_v}$ , is a function of intake manifold absolute pressure and engine speed

$$\eta_v = f_{\eta_v}(MAP, N)$$

where:

- $\eta_v$  is engine volumetric efficiency, dimensionless.
- $MAP$  is intake manifold absolute pressure, in KPa.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for the **Air mass flow model** parameter, select Simple Speed-Density.

### Speed-density intake manifold pressure breakpoints, $f_{\eta_v\_prs\_bpt}$ – Breakpoints

[31 40.6428571428571 50.2857142857143 59.9285714285714 69.5714285714286  
79.2142857142857 88.8571428571429 98.5 108.142857142857 117.785714285714

(default) | array

Intake manifold pressure breakpoints for speed-density volumetric efficiency lookup table, in KPa.

### Dependencies

To enable this parameter, for the **Air mass flow model** parameter, select Simple Speed-Density.

**Speed-density engine speed breakpoints,  $f_{nv\_n\_bpt}$  — Breakpoints**

[750 1053.57142857143 1357.14285714286 1660.71428571429 1964.28571428571 2267.85714285714 2571.42857142857 2875 3178.57142857143 3482.14285714286 3785.71428571429 4089.28571428571 4392.85714285714 4696.42857142857 5000] (default) | array

Engine speed breakpoints for speed-density volumetric efficiency lookup table, in rpm.

**Dependencies**

To enable this parameter, for the **Air mass flow model** parameter, select Simple Speed-Density.

**Cylinder volume at intake valve close table,  $f_{vivc}$  — 2-D lookup table**

array

The cylinder volume at intake valve close table (IVC),  $f_{vivc}$  is a function of the intake cam phaser angle

$$V_{IVC} = f_{vivc}(\varphi_{ICP})$$

where:

- $V_{IVC}$  is cylinder volume at IVC, in L.
- $\varphi_{ICP}$  is intake cam phaser angle, in crank advance degrees.

**Dependencies**

To enable this parameter, for the **Air mass flow model** parameter, select Dual - Independent Variable Cam Phasing.

**Cylinder volume intake cam phase breakpoints,  $f_{vivc\_icp\_bpt}$  — Breakpoints**

[0 2.6316 5.2632 7.8947 10.5263 13.1579 15.7895 18.4211 21.0526 23.6842 26.3158 28.9474 31.5789 34.2105 36.8421 39.4737 42.1053 44.7368 47.3684 50] (default) | vector

Cylinder volume intake cam phase breakpoints, in L.

### Dependencies

To enable this parameter, for the **Air mass flow model** parameter, select Dual - Independent Variable Cam Phasing.

### Cylinder trapped mass correction factor, $f_{TM_{corr}}$ – Lookup table

array

The trapped mass correction factor table,  $f_{TM_{corr}}$ , is a function of the normalized density and engine speed

$$TM_{corr} = f_{TM_{corr}}(\rho_{norm}, N)$$

where:

- $TM_{corr}$ , is trapped mass correction multiplier, dimensionless.
- $\rho_{norm}$  is normalized density, dimensionless.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for the **Air mass flow model** parameter, select Dual - Independent Variable Cam Phasing.

### Normalized density breakpoints, $f_{tm\_corr\_nd\_bpt}$ – Breakpoints

[0.3 0.38947 0.47895 0.56842 0.65789 0.74737 0.83684 0.92632 1.0158 1.1053 1.1947 1.2842 1.3737 1.4632 1.5526 1.6421 1.7316 1.8211 1.9105 2] (default) | vector

Normalized density breakpoints, dimensionless.

### Dependencies

To enable this parameter, for the **Air mass flow model** parameter, select Dual - Independent Variable Cam Phasing.

**Engine speed breakpoints,  $f_{tm\_corr\_n\_bpt}$  — Breakpoints**

[750 973.6842 1197.3684 1421.0526 1644.7368 1868.4211 2092.1053 2315.7895 2539.4737 2763.1579 2986.8421 3210.5263 3434.2105 3657.8947 3881.5789 4105.2632 4328.9474 4552.6316 4776.3158 5000] (default) | vector

Engine speed breakpoints, in rpm.

**Dependencies**

To enable this parameter, for the **Air mass flow model** parameter, select Dual - Independent Variable Cam Phasing.

**Intake mass flow,  $f_{mdot\_intk}$  — Lookup table**

array

The phaser intake mass flow model lookup table is a function of exhaust cam phaser angles and trapped air mass flow

$$\dot{m}_{intkideal} = f_{intkideal}(\varphi_{ECP}, TM_{flow})$$

where:

- $\dot{m}_{intkideal}$  is engine intake port mass flow at arbitrary cam phaser angles, in g/s.
- $\varphi_{ECP}$  is exhaust cam phaser angle, in degrees crank retard.
- $TM_{flow}$  is flow rate equivalent to corrected trapped mass at the current engine speed, in g/s.

**Dependencies**

To enable this parameter, for the **Air mass flow model** parameter, select Dual - Independent Variable Cam Phasing.

**Exhaust cam phase breakpoints,  $f_{mdot\_air\_ecp\_bpt}$  — Breakpoints**

[0 2.6316 5.2632 7.8947 10.5263 13.1579 15.7895 18.4211 21.0526 23.6842 26.3158 28.9474 31.5789 34.2105 36.8421 39.4737 42.1053 44.7368 47.3684 50] (default) | vector

Exhaust cam phaser breakpoints for air mass flow lookup table, in degrees crank retard.

### Dependencies

To enable this parameter, for the **Air mass flow model** parameter, select Dual - Independent Variable Cam Phasing.

### Trapped mass flow breakpoints, $f\_mdot\_trpd\_bpt$ – Breakpoints

[0 5.7895 11.5789 17.3684 23.1579 28.9474 34.7368 40.5263 46.3158 52.1053 57.8947 63.6842 69.4737 75.2632 81.0526 86.8421 92.6316 98.4211 104.2105 110]  
(default) | vector

Trapped mass flow breakpoints for air mass flow lookup table, in g/s.

### Dependencies

To enable this parameter, for the **Air mass flow model** parameter, select Dual - Independent Variable Cam Phasing.

### Air mass flow correction factor, $f\_mdot\_air\_corr$ – Lookup table

array

The intake air mass flow correction lookup table,  $f_{aircorr}$ , is a function of ideal load and engine speed

$$\dot{m}_{air} = \dot{m}_{intkideal} f_{aircorr}(L_{ideal}, N)$$

where:

- $L_{ideal}$  is engine load (normalized cylinder air mass) at arbitrary cam phaser angles, uncorrected for final steady-state cam phaser angles, dimensionless.
- $N$  is engine speed, in rpm.
- $\dot{m}_{air}$  is engine intake air mass flow final correction at steady-state cam phaser angles, in g/s.
- $\dot{m}_{intkideal}$  is engine intake port mass flow at arbitrary cam phaser angles, in g/s.

### Dependencies

To enable this parameter, for the **Air mass flow model** parameter, select Dual - Independent Variable Cam Phasing.

### Engine load breakpoints for air mass flow correction, $f\_mdot\_air\_corr\_ld\_bpt$ – Breakpoints

vector

Engine load breakpoints for air mass flow final correction, dimensionless.

#### Dependencies

To enable this parameter, for the **Air mass flow model** parameter, select Dual - Independent Variable Cam Phasing.

### Engine speed breakpoints for air mass flow correction, $f\_mdot\_air\_n\_bpt$ – Breakpoints

vector

Engine speed breakpoints for air mass flow final correction, in rpm.

#### Dependencies

To enable this parameter, for the **Air mass flow model** parameter, select Dual - Independent Variable Cam Phasing.

#### Torque

### Torque table, $f\_tq\_nL$ – Lookup table

[L x N] array

For the simple torque lookup table model, the SI engine uses a lookup table map that is a function of engine speed and load,  $T_{brake} = f_{TnL}(L, N)$ , where:

- $T_{brake}$  is engine brake torque after accounting for spark advance, AFR, and friction effects, in N·m.
- $L$  is engine load, as a normalized cylinder air mass, dimensionless.
- $N$  is engine speed, in rpm.

The simple torque lookup model assumes that the calibration has negative torque values to indicate the non-firing engine load (L) versus speed (N) condition. The calibrated table (L-by-N) contains the non-firing data in the first table row (1-by-N). When the fuel delivered to the engine is zero, the model uses the data in the first table row (1-by-N) at or above 100 AFR. 100 AFR results from fuel cutoff or very lean operation where combustion cannot occur.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Simple Torque Lookup.

**Torque table load breakpoints,  $f_{tq\_nl\_l\_bpt}$  — Breakpoints**

[0.2 0.275 0.35 0.425 0.5 0.575 0.65 0.725 0.8 0.875 0.95 1.025 1.1 1.175 1.25] (default) | vector | [1 x L] vector

Engine load breakpoints,  $L$ , dimensionless.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Simple Torque Lookup.

**Torque table speed breakpoints,  $f_{tq\_nl\_n\_bpt}$  — Breakpoints**

[750 1053.57142857143 1357.14285714286 1660.71428571429 1964.28571428571 2267.85714285714 2571.42857142857 2875 3178.57142857143 3482.14285714286 3785.71428571429 4089.28571428571 4392.85714285714 4696.42857142857 5000] (default) | vector | [1 x N] vector

Engine speed breakpoints,  $N$ , in rpm.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Simple Torque Lookup.

**Crank angle pressure and torque — Enable Crank angle signals**

off (default) | on

If you select **Crank angle pressure and torque** on the block **Torque** tab, you can:

- Simulate advanced closed-loop engine controls in desktop simulations and on HIL bench, based on cylinder pressure recorded from a model or laboratory test as a function of crank angle.
- Simulate driveline vibrations downstream of the engine due to high-frequency crankshaft torsionals.
- Simulate engine misfires due to lean operation or spark plug fouling by using the injector pulse width input.
- Simulate cylinder deactivation effect (closed intake and exhaust valves, no injected fuel) on individual cylinder pressures, mean-value airflow, mean-value torque, and crank-angle-based torque.
- Simulate the fuel-cut effect on individual cylinder pressure, mean-value torque, and crank-angle-based torque.

**Dependencies**

To enable this parameter, set **Torque model** to Torque Structure.

**Cylinder pressure,  $f_{crk\_prs}$  — Cylinder pressure table**

$L \times M \times N$  array

Cylinder pressure table  $Prs$ , as a function of speed  $N$ , load  $L$ , and crank angle  $M$ , in Pa.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Torque Structure. Select **Crank angle pressure and torque**.

**Brake torque, f\_crk\_btq — Brake torque table** $L \times M \times N$  array

Brake torque table  $T_{brake}$ , as a function of speed  $N$ , load  $L$ , and crank angle  $M$ , in N·m.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Torque Structure. Select **Crank angle pressure and torque**.

**Speed breakpoints, f\_crk\_n\_bpt — Speed breakpoints**[750 5000] (default) |  $1 \times N$  vector

Speed breakpoints,  $N$ , in rpm.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Torque Structure. Select **Crank angle pressure and torque**.

**Load breakpoints, f\_crk\_l\_bpt — Load breakpoints**[0.2 1.4] (default) |  $1 \times L$  vector

Load breakpoints,  $L$ . No dimension.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Torque Structure. Select **Crank angle pressure and torque**.

**Crank angle breakpoints, f\_crk\_ang\_bpt — Crank angle breakpoints**[60 660] (default) |  $1 \times M$  vector

Crank angle breakpoints,  $M$ , in deg.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Torque Structure. Select **Crank angle pressure and torque**.

**TDC compression angles by cylinder, f\_crk\_tdc\_ang — TDC compression angles by cylinder**

[0 540 180 360] (default) | vector

Top dead center (TDC) compression angles by cylinder, in deg.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Torque Structure. Select **Crank angle pressure and torque**.

**Inner torque table, f\_tq\_inr — Lookup table**

array

The inner torque lookup table,  $f_{Tq_{inr}}$ , is a function of engine speed and engine load,  $T_{q_{inr}} = f_{Tq_{inr}}(L, N)$ , where:

- $T_{q_{inr}}$  is inner torque based on gross indicated mean effective pressure, in N·m.
- $L$  is engine load at arbitrary cam phaser angles, corrected for final steady-state cam phaser angles, dimensionless.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Friction torque table, $f_{Tq\_fric}$ — Lookup table array

The friction torque lookup table,  $f_{Tq_{fric}}$ , is a function of engine speed and engine load,  $T_{q_{fric}} = f_{Tq_{fric}}(L, N)$ , where:

- $T_{q_{fric}}$  is friction torque offset to inner torque, in N·m.
- $L$  is engine load at arbitrary cam phaser angles, corrected for final steady-state cam phaser angles, dimensionless.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Engine temperature modifier on friction torque, $f_{fric\_temp\_mod}$ — Lookup table

```
[3.96 3.22 2.56 2.26 2.11 2 1.9 1.83 1.76 1.7 1.65 1.6 1.55 1.49 1.44 1.41

vector | vector

Engine temperature modifier breakpoints, in K.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

**Pumping work table, f\_tq\_pump — Lookup table**

array

The pumping work lookup table,  $f_{T_{pump}}$ , is a function of engine load and engine speed,  
 $T_{pump} = f_{T_{pump}}(L, N)$ , where:

- $T_{pump}$  is pumping work, in N·m.
- $L$  is engine load, as a normalized cylinder air mass, dimensionless.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

**Optimal spark table, f\_sa\_opt — Lookup table**

array

The optimal spark lookup table,  $f_{SA_{opt}}$ , is a function of engine speed and engine load,  
 $SA_{opt} = f_{SA_{opt}}(L, N)$ , where:

- $SA_{opt}$  is optimal spark advance timing for maximum inner torque at stoichiometric air-fuel ratio (AFR), in deg.

- $L$  is engine load at arbitrary cam phaser angles, corrected for final steady-state cam phaser angles, dimensionless.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Inner torque load breakpoints, $f_{tq\_inr\_l\_bpt}$ – Breakpoints

[0.2 0.28571 0.37143 0.45714 0.54286 0.62857 0.71429 0.8 0.88571 0.97143 1.0571 1.1429 1.2286 1.3143 1.4] (default) | vector

Inner torque load breakpoints, dimensionless.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Inner torque speed breakpoints, $f_{tq\_inr\_n\_bpt}$ – Breakpoints

[750 1053.5714 1357.1429 1660.7143 1964.2857 2267.8571 2571.4286 2875 3178.5714 3482.1429 3785.7143 4089.2857 4392.8571 4696.4286 5000] (default) | vector

Inner torque speed breakpoints, in rpm.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Spark efficiency table, $f_{m\_sa}$ – Lookup table

array

The spark efficiency lookup table,  $f_{Msa}$ , is a function of the spark retard from optimal

$$M_{sa} = f_{Msa}(\Delta SA)$$

$$\Delta SA = SA_{opt} - SA$$

where:

- $M_{sa}$  is the spark retard efficiency multiplier, dimensionless.
- $\Delta SA$  is the spark retard timing distance from optimal spark advance, in deg.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select **Torque Structure**.

**Spark retard from optimal, f\_del\_sa\_bpt — Breakpoints**

```
[0 0.75 1.5 2.25 3 3.75 4.5 5.25 6 6.75 7.5 8.25 9 9.75 10.5 11.25 12 12.75

47.25 48] (default) | vector
```

Spark retard from optimal inner torque timing breakpoints, in deg.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select **Torque Structure**.

**Lambda efficiency, f\_m\_lam — Lookup table**

array

The lambda efficiency lookup table,  $f_{M\lambda}$ , is a function of lambda,  $M_\lambda = f_{M\lambda}(\lambda)$ , where:

- $M_\lambda$  is the lambda multiplier on inner torque to account for the air-fuel ratio (AFR) effect, dimensionless.
- $\lambda$  is lambda, AFR normalized to stoichiometric fuel AFR, dimensionless.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Lambda breakpoints, `f_m_lam_bpt` – Breakpoints

[0.65 0.7 0.75 0.8 0.85 0.9 0.95 1 1.05 1.1] (default) | vector

Lambda effect on inner torque lambda breakpoints, dimensionless.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Exhaust

### Exhaust temperature table, `f_t_exh` – Lookup table

array

The exhaust temperature lookup table,  $f_{Texh}$ , is a function of engine load and engine speed

$$T_{exh} = f_{Texh}(L, N)$$

where:

- $T_{exh}$  is engine exhaust temperature, in K.
- $L$  is normalized cylinder air mass or engine load, dimensionless.
- $N$  is engine speed, in rpm.

**Load breakpoints,  $f\_t\_exh\_l\_bpt$  – Breakpoints**

[0.2 0.275 0.35 0.425 0.5 0.575 0.65 0.725 0.8 0.875 0.95 1.025 1.1 1.175 1.25] (default) | vector

Engine load breakpoints used for exhaust temperature lookup table, dimensionless.

**Speed breakpoints,  $f\_t\_exh\_n\_bpt$  – Breakpoints**

[750 1053.57142857143 1357.14285714286 1660.71428571429 1964.28571428571 2267.85714285714 2571.42857142857 2875 3178.57142857143 3482.14285714286 3785.71428571429 4089.28571428571 4392.85714285714 4696.42857142857 5000] (default) | vector

Engine speed breakpoints used for exhaust temperature lookup table, in rpm.

**Exhaust gas specific heat at constant pressure,  $cp\_exh$  – Specific heat**

1005 (default) | scalar

Exhaust gas-specific heat,  $C_{p_{exh}}$ , in J/(kg·K).

**CO<sub>2</sub> mass fraction table,  $f\_CO2\_frac$  – Carbon dioxide (CO<sub>2</sub>) emission lookup table**  
array

The SI Core Engine CO<sub>2</sub> emission mass fraction lookup table is a function of engine torque and engine speed,  $CO_2\ Mass\ Fraction = f(Speed, Torque)$ , where:

- $CO_2\ Mass\ Fraction$  is the CO<sub>2</sub> emission mass fraction, dimensionless.
- $Speed$  is engine speed, in rpm.
- $Torque$  is engine torque, in N·m.

#### Dependencies

To enable this parameter, on the **Exhaust** tab, select **CO2**.

#### CO mass fraction table, `f_CO_frac` – Carbon monoxide (CO) emission lookup table array

The SI Core Engine CO emission mass fraction lookup table is a function of engine torque and engine speed,  $CO\ Mass\ Fraction = f(Speed, Torque)$ , where:

- *CO Mass Fraction* is the CO emission mass fraction, dimensionless.
- *Speed* is engine speed, in rpm.
- *Torque* is engine torque, in N·m.

### Dependencies

To enable this parameter, on the **Exhaust** tab, select **CO**.

### HC mass fraction table, $f_{HC\_frac}$ – Hydrocarbon (HC) emission lookup table array

The SI Core Engine HC emission mass fraction lookup table is a function of engine torque and engine speed,  $HC\ Mass\ Fraction = f(Speed, Torque)$ , where:

- *HC Mass Fraction* is the HC emission mass fraction, dimensionless.
- *Speed* is engine speed, in rpm.
- *Torque* is engine torque, in N·m.

### Dependencies

To enable this parameter, on the **Exhaust** tab, select **HC**.

### NOx mass fraction table, $f_{NOx\_frac}$ – Nitric oxide and nitrogen dioxide (NOx) emission lookup table array

The SI Core Engine NOx emission mass fraction lookup table is a function of engine torque and engine speed,  $NOx\ Mass\ Fraction = f(Speed, Torque)$ , where:

- *NOx Mass Fraction* is the NOx emission mass fraction, dimensionless.
- *Speed* is engine speed, in rpm.
- *Torque* is engine torque, in N·m.

#### Dependencies

To enable this parameter, on the **Exhaust** tab, select **NOx**.

#### PM mass fraction table, `f_PM_frac` – Particulate matter (PM) emission lookup table array

The SI Core Engine PM emission mass fraction lookup table is a function of engine torque and engine speed where:

- *PM* is the PM emission mass fraction, dimensionless.
- *Speed* is engine speed, in rpm.
- *Torque* is engine torque, in N·m.

#### Dependencies

To enable this parameter, on the **Exhaust** tab, select **PM**.

#### Engine speed breakpoints, `f_exhfrac_n_bpt` – Breakpoints

```
[750 1053.57142857143 1357.14285714286 1660.71428571429 1964.28571428571
2267.85714285714 2571.42857142857 2875 3178.57142857143 3482.14285714286

(default) | vector
```

Engine torque breakpoints used for the emission mass fractions lookup tables, in N·m.

**Dependencies**

To enable this parameter, on the **Exhaust** tab, select **CO<sub>2</sub>**, **CO**, **NO<sub>x</sub>**, **HC**, or **PM**.

**Fuel****Injector slope,  $S_{inj}$  – Slope**

6.45161290322581 (default) | scalar

Fuel injector slope,  $S_{inj}$ , mg/ms.

**Stoichiometric air-fuel ratio,  $afr_{stoich}$  – Air-fuel ratio**

14.6 (default) | scalar

Air-fuel ratio,  $AFR$ .

**Fuel lower heating value,  $fuel\_lhv$  – Heating value**

46e6 (default) | scalar

Fuel lower heating value,  $LHV$ , in J/kg.

**Fuel specific gravity,  $fuel\_sg$  – Specific gravity**

0.745 (default) | scalar

Specific gravity of fuel,  $Sg_{fuel}$ , dimensionless.

# Turbine

Turbine for boosted engines

**Library:** Powertrain Blockset / Propulsion / Combustion Engine  
Components / Boost

## Description

The Turbine block uses the conservation of mass and energy to calculate mass and heat flow rates for turbines with either fixed or variable geometry. You can configure the block with a wastegate valve to bypass the turbine. The block uses two-way ports to connect to the inlet and outlet control volumes and the drive shaft. You can specify the lookup tables to calculate the mass flow rate and turbine efficiency. Typically, turbine manufacturers provide the mass flow rate and efficiency tables as a function of corrected speed and pressure ratio. The block does not support reverse mass flow.

If you have Model-Based Calibration Toolbox, click **Calibrate Performance Maps** to virtually calibrate the mass flow rate and turbine efficiency lookup tables using measured data.

The mass flows from the inlet control volume to outlet control volume.

The Turbine block implements equations to model the performance, wastegate flow, and combined flow.

### **Virtual Calibration**

If you have Model-Based Calibration Toolbox, click **Calibrate Performance Maps** to virtually calibrate the corrected mass flow rate and turbine efficiency lookup tables using measured data. The dialog box steps through these tasks.

Task	Description																																																	
Import turbine data	Import this turbine data from a file. For more information, see “Using Data” (Model-Based Calibration Toolbox).

### Thermodynamics

The block uses these equations to model the thermodynamics.

Calculation	Equations
Forward mass flow	$\dot{m}_{turb} > 0$ $p_{01} = p_{inlet}$ $p_{02} = p_{outlet}$ $T_{01} = T_{inlet}$ $h_{01} = h_{inlet}$
First law of thermodynamics	$\dot{W}_{turb} = \dot{m}_{turb} c_p (T_{01} - T_{02})$
Isentropic efficiency	$\eta_{turb} = \frac{h_{01} - h_{02}}{h_{01} - h_{02s}} = \frac{T_{01} - T_{02}}{T_{01} - T_{02s}}$
Isentropic outlet temperature, assuming ideal gas, and constant specific heats	$T_{02s} = T_{01} \left( \frac{p_{02}}{p_{01}} \right)^{\frac{\gamma-1}{\gamma}}$
Specific heat ratio	$\gamma = \frac{c_p}{c_p - R}$
Outlet temperature	$T_{02} = T_{01} + \eta_{turb} T_{01} \left\{ 1 - \left( \frac{p_{02}}{p_{01}} \right)^{\frac{\gamma-1}{\gamma}} \right\}$
Heat flows	$q_{in,turb} = \dot{m}_{turb} c_p T_{01}$ $q_{out,turb} = \dot{m}_{turb} c_p T_{02}$

Calculation	Equations
Drive shaft torque	$\tau_{turb} = \frac{\dot{W}_{turb}}{\omega}$

The equations use these variables.

$p_{inlet}, p_{01}$	Inlet control volume total pressure
$T_{inlet}, T_{01}$	Inlet control volume total temperature
$h_{inlet}, h_{01}$	Inlet control volume total specific enthalpy
$p_{outlet}, p_{02}$	Outlet control volume total pressure
$T_{outlet}$	Outlet control volume total temperature
$h_{outlet}$	Outlet control volume total specific enthalpy
$\dot{W}_{turb}$	Drive shaft power
$T_{02}$	Temperature exiting the turbine
$h_{02}$	Outlet total specific enthalpy
$\dot{m}_{turb}$	Turbine mass flow rate
$q_{in, turb}$	Turbine inlet heat flow rate
$q_{out, turb}$	Turbine outlet heat flow rate
$\eta_{turb}$	Turbine isentropic efficiency
$T_{02s}$	Isentropic outlet total temperature
$h_{02s}$	Isentropic outlet total specific enthalpy
$R$	Ideal gas constant
$c_p$	Specific heat at constant pressure
$\gamma$	Specific heat ratio
$\tau_{turb}$	Drive shaft torque

### Performance Lookup Tables

The block implements lookup tables based on these equations.

Calculation	Equation	
Corrected mass flow rate	$\dot{m}_{corr} = \dot{m}_{turb} \frac{\sqrt{T_{01}/T_{ref}}}{p_{01}/p_{ref}}$	
Corrected speed	$\omega_{corr} = \frac{\omega}{\sqrt{T_{01}/T_{ref}}}$	
Pressure expansion ratio	$p_r = \frac{p_{01}}{p_{02}}$	
Efficiency lookup table	Fixed geometry (3-D table)	$\eta_{turbfx, tbl} = f(\omega_{corr}, p_r)$
	Variable geometry (3-D table)	$\eta_{turbvr, tbl} = f(\omega_{corr}, p_r, L_{rack})$

Calculation	Equation	
Corrected mass flow lookup table	Fixed geometry (3-D table)	$\dot{m}_{corrfx, tbl} = f(\omega_{corr}, p_r)$
	Variable geometry (3-D table)	$\dot{m}_{corrvr, tbl} = f(\omega_{corr}, p_r, L_{rack})$

The equations use these variables.

$p_{01}$	Inlet control volume total pressure
$p_r$	Pressure expansion ratio
$p_{02}$	Outlet control volume total pressure
$P_{ref}$	Lookup table reference pressure
$T_{01}$	Inlet control volume total temperature
$T_{ref}$	Lookup table reference temperature
$\dot{m}_{turb}$	Turbine mass flow rate
$\omega$	Drive shaft speed
$\omega_{corr}$	Corrected drive shaft speed
$L_{rack}$	Variable geometry turbine rack position
$\eta_{turbfx, tbl}$	Efficiency 3-D lookup table for fixed geometry
$\dot{m}_{corrfx, tbl}$	Corrected mass flow rate 3-D lookup table for fixed geometry
$\eta_{turbvr, tbl}$	Efficiency 3-D lookup table for variable geometry
$\dot{m}_{corrvr, tbl}$	Corrected mass flow rate 3-D lookup table for variable geometry

### Wastegate

To calculate the wastegate heat and mass flow rates, the Turbine block uses a Flow Restriction block. The Flow Restriction block uses the wastegate flow area.

$$A_{wg} = A_{wgpctcmd} \frac{A_{wgopen}}{100}$$

The equation uses these variables.

$A_{wgpctcmd}$	Wastegate valve area percent command
$A_{wg}$	Wastegate valve area
$A_{wgopen}$	Wastegate valve area when fully open

### Combined Flow

To represent flow through the wastegate valve and turbine, the block uses these equations.

Calculation	Equations
Blocks not configured with a wastegate valve	$\dot{m}_{wg} = q_{wg} = 0$
Total mass flow rate	$\dot{m}_{total} = \dot{m}_{turb} + \dot{m}_{wg}$

Calculation	Equations
Total heat flow rate	$q_{inlet} = q_{in, turb} + q_{wg}$
	$q_{outlet} = q_{out, turb} + q_{wg}$
Combined temperature exiting the wastegate valve and turbine	$T_{outflw} = \begin{cases} \frac{q_{outlet}}{\dot{m}_{total}c_p} & \dot{m}_{total} > \dot{m}_{thresh} \\ \frac{T_{02} + T_{outflw, wg}}{2} & else \end{cases}$

The block uses the internal signal FlwDir to track the direction of the flow.

The equations use these variables.

$\dot{m}_{total}$	Total mass flow rate through the wastegate valve and turbine
$\dot{m}_{turb}$	Turbine mass flow rate
$\dot{m}_{wg}$	Mass flow rate through the wastegate valve
$q_{inlet}$	Total inlet heat flow rate
$q_{outlet}$	Total outlet heat flow rate
$q_{in, turb}$	Turbine inlet heat flow rate
$q_{out, turb}$	Turbine outlet heat flow rate
$q_{wg}$	Wastegate valve heat flow rate
$T_{02}$	Temperature exiting the turbine
$T_{outflw}$	Total temperature exiting the block
$T_{outflw, wg}$	Temperature exiting the wastegate valve
$\dot{m}_{thresh}$	Mass flow rate threshold to prevent dividing by zero
$c_p$	Specific heat at constant pressure

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Equations
PwrInfo	PwrTrnsfrd — Power transferred between blocks	PwrDriveshft	Power transmitted from the shaft $-\dot{W}_{turb}$
	<ul style="list-style-type: none"> <li>Positive signals indicate flow into block</li> <li>Negative signals indicate flow out of block</li> </ul>	PwrHeatFlwIn	Heat flow rate at port A $q_{outlet}$
		PwrHeatFlwOut	Heat flow rate at port B $q_{outlet}$

Bus Signal		Description	Equations	
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred <ul style="list-style-type: none"> <li>• Positive signals indicate an input</li> <li>• Negative signals indicate a loss</li> </ul>	PwrLoss	Power loss	$-q_{inlet}$ $-q_{outlet}$ $+ \dot{W}_{turb}$
	PwrStored — Stored energy rate of change <ul style="list-style-type: none"> <li>• Positive signals indicate an increase</li> <li>• Negative signals indicate a decrease</li> </ul>	<i>Not used</i>		

The equations use these variables.

$\dot{W}_{turb}$	Drive shaft power
$q_{outlet}$	Total outlet heat flow rate
$q_{inlet}$	Total inlet heat flow rate

## Ports

### Input

#### Ds — Drive shaft speed

two-way connector port

ShaftSpd — Signal containing the drive shaft angular speed,  $\omega$ , in rad/s.

#### A — Inlet pressure, temperature, enthalpy, mass fractions

two-way connector port

Bus containing the inlet control volume:

- InPrs — Pressure,  $p_{inlet}$ , in Pa
- InTemp — Temperature,  $T_{inlet}$ , in K
- InEnth — Specific enthalpy,  $h_{inlet}$ , in J/kg

#### B — Outlet pressure, temperature, enthalpy, mass fractions

two-way connector port

Bus containing the outlet control volume:

- OutPrs — Pressure,  $p_{outlet}$ , in Pa
- OutTemp — Temperature,  $T_{outlet}$ , in K
- OutEnth — Specific enthalpy,  $h_{outlet}$ , in J/kg

**RackPos — Rack position**

scalar

Variable geometry turbine rack position,  $L_{rack}$ .

**Dependencies**

To create this port, select Variable geometry for the **Turbine type** parameter.

**WgAreaPct — Wastegate area percent**

scalar

Wastegate valve area percent,  $A_{wgpctcmd}$ .

**Dependencies**

To create this port, select **Include wastegate**.

**Output**

**Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal			Description	Units
TurbOutletTemp			Temperature exiting the turbine	K
DriveshftPwr			Drive shaft power	W
DriveshftTrq			Drive shaft torque	N·m
TurbMassFlw			Turbine mass flow rate	kg/s
PrsRatio			Pressure ratio	N/A
DriveshftCorrSpd			Corrected drive shaft speed	rad/s
TurbEff			Turbine isentropic efficiency	N/A
CorrMassFlw			Corrected mass flow rate	kg/s
WgArea			Wastegate valve area	m <sup>2</sup>
WgMassFlw			Mass flow rate through the wastegate valve	kg/s
WgOutletTemp			Temperature exiting the wastegate valve	K
PwrInfo	PwrTrnsfrd	PwrDriveshft	Power transmitted from the shaft	W
		PwrHeatFlwIn	Heat flow rate at port A	W
		PwrHeatFlwOut	Heat flow rate at port B	W
	PwrNotTrnsfrd	PwrLoss	Power loss	W
	PwrStored		<i>Not used</i>	

**Ds — Drive shaft torque**

two-way connector port

Trq — Signal containing the drive shaft torque,  $\tau_{turb}$ , in N·m.

### **A — Inlet mass flow rate, heat flow rate, temperature, mass fractions**

two-way connector port

Bus containing:

- MassFlwRate — Total mass flow rate through wastegate valve and turbine,  $-\dot{m}_{total}$ , in kg/s
- HeatFlwRate — Total inlet heat flow rate,  $-q_{inlet}$ , in J/s
- Temp — Total inlet temperature,  $T_{inlet}$ , in K
- MassFrac — Mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

### **B — Outlet mass flow rate, heat flow rate, temperature, mass fractions**

two-way connector port

Bus containing:

- MassFlwRate — Turbine mass flow rate through wastegate valve and turbine,  $\dot{m}_{turb}$ , in kg/s
- HeatFlwRate — Total outlet heat flow rate,  $q_{outlet}$ , in J/s
- Temp — Total outlet temperature,  $T_{outflw}$ , in K
- MassFrac — Mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide

- N0MassFrac — Nitric oxide
- N02MassFrac — Nitrogen dioxide
- N0xMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

## Parameters

### Block Options

#### Turbine type — Select turbine type

Fixed geometry (default) | Variable geometry

Turbine type.

### Dependencies

The table summarizes the parameter and port dependencies.

Value	Enables Parameters	Creates Ports
Fixed geometry	<p>Corrected mass flow rate table, <b>mdot_corrfx_tbl</b></p> <p>Efficiency table, <b>eta_turbfx_tbl</b></p> <p>Corrected speed breakpoints, <b>w_corrfx_bpts1</b></p> <p>Pressure ratio breakpoints, <b>Pr_fx_bpts2</b></p>	None
Variable geometry	<p>Corrected mass flow rate table, <b>mdot_corrvr_tbl</b></p> <p>Efficiency table, <b>eta_turbvr_tbl</b></p> <p>Corrected speed breakpoints, <b>w_corrvr_bpts2</b></p> <p>Pressure ratio breakpoints, <b>Pr_vr_bpts2</b></p> <p>Rack breakpoints, <b>L_rack_bpts3</b></p>	RP

#### Include wastegate — Select

on (default) | off

### Dependencies

Selecting the **Include wastegate** parameter enables:

- **Wastegate flow area, A\_wgopen**
- **Pressure ratio linearize limit, Plim\_wg**

## Performance Tables

### Calibrate Performance Maps — Calibrate tables with measured data selection

If you have Model-Based Calibration Toolbox, click **Calibrate Performance Maps** to virtually calibrate the corrected mass flow rate and turbine efficiency lookup tables using measured data. The dialog box steps through these tasks.

Task	Description																																																	
Import turbine data	Import this turbine data from a file. For more information, see “Using Data” (Model-Based Calibration Toolbox).

**Corrected mass flow rate table,  $\dot{m}_{corr,fx\_tbl}$  – Lookup table array**

Corrected mass flow rate lookup table for fixed geometry,  $\dot{m}_{corr,fx\_tbl}$ , as a function of corrected driveshaft speed,  $\omega_{corr}$ , and pressure ratio,  $p_r$ , in kg/s.

**Dependencies**

To enable this parameter, select Fixed geometry for the **Turbine type** parameter.

**Efficiency table, eta\_turbfx\_tb — Lookup table**

array

Efficiency lookup table for fixed geometry,  $\eta_{turbfx,tbl}$ , as a function of corrected driveshaft speed,  $\omega_{corr}$ , and pressure ratio,  $p_r$ , dimensionless.

**Dependencies**

To enable this parameter, select Fixed geometry for the **Turbine type** parameter.

**Corrected speed breakpoints, w\_corrfx\_bpts1 — Fixed geometry**

[0 1552 3104 4657 6209 7761 9313 1.087e+04 1.242e+04 1.397e+04] (default) | vector

Corrected drive shaft speed breakpoints for fixed geometry,  $\omega_{corrfx,bpts1}$ , in rad/s.

**Dependencies**

To enable this parameter, select Fixed geometry for the **Turbine type** parameter.

**Pressure ratio breakpoints, Pr\_fx\_bpts2 — Fixed geometry**

[1 1.333 1.667 2 2.333 2.667 3 3.333 3.667 4] (default) | vector

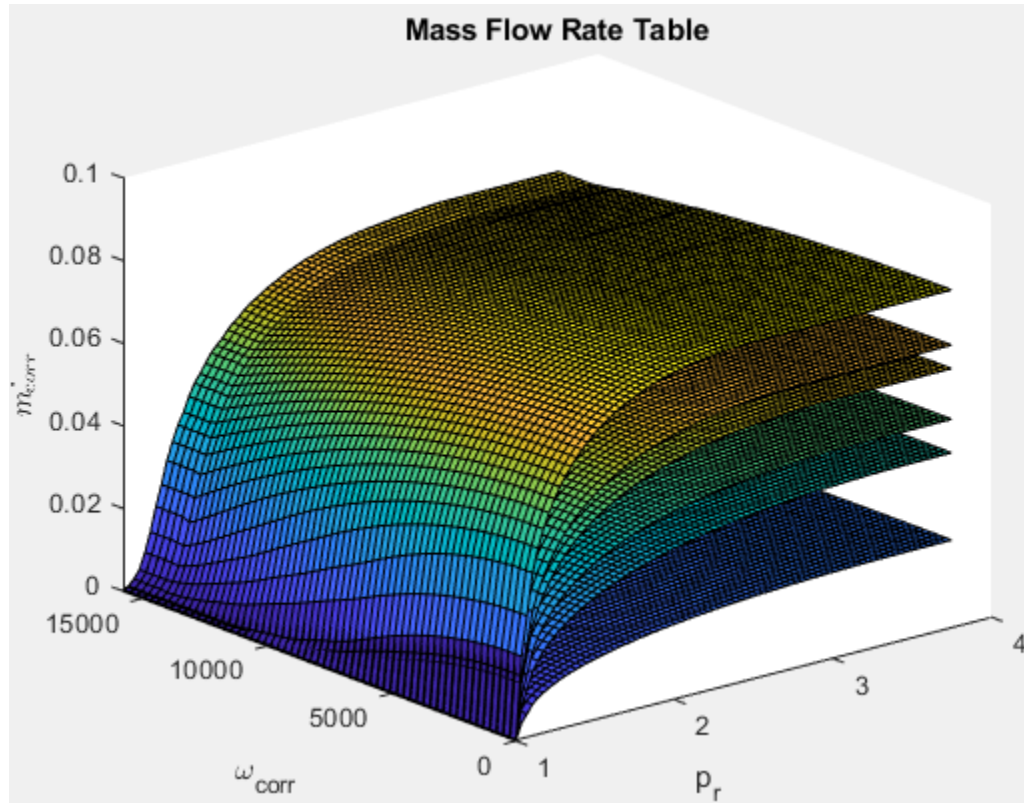

Pressure ratio breakpoints for fixed geometry,  $p_{rfx,bpts2}$ .

**Dependencies**

To enable this parameter, select Fixed geometry for the **Turbine type** parameter.

**Corrected mass flow rate table,  $\dot{m}_{corrvr\_tbl}$  – Lookup table**  
array

Corrected mass flow rate lookup table for variable geometry,  $\dot{m}_{corrvr\_tbl}$ , as a function of corrected driveshaft speed,  $\omega_{corr}$ , and pressure ratio,  $p_r$ , in kg/s.

**Dependencies**

To enable this parameter, select Variable geometry for the **Turbine type** parameter.

**Efficiency table,  $\eta_{turbvr\_tbl}$  – Lookup table**  
array

Efficiency lookup table for variable geometry,  $\eta_{turbvr\_tbl}$ , as a function of corrected driveshaft speed,  $\omega_{corr}$ , and pressure ratio,  $p_r$ , dimensionless.

### Dependencies

To enable this parameter, select **Variable geometry** for the **Turbine type** parameter.

### Corrected speed breakpoints, $w\_corrvr\_bpts2$ – Variable geometry

[0 1752 3504 5257 7009 8761 1.051e+04 1.227e+04 1.402e+04 1.577e+04] (default) | vector

Corrected drive shaft speed breakpoints for variable geometry,  $\omega_{corrvr,bpts1}$ , in rad/s.

### Dependencies

To enable this parameter, select **Variable geometry** for the **Turbine type** parameter.

### Pressure ratio breakpoints, $Pr\_vr\_bpts2$ – Variable geometry

[1 1.306 1.611 1.917 2.222 2.528 2.833 3.139 3.444 3.75] (default) | vector

Pressure ratio breakpoints for variable geometry.

### Dependencies

To enable this parameter, select **Variable geometry** for the **Turbine type** parameter.

### Rack breakpoints, $L\_rack\_bpts3$ – Variable geometry

[0 0.2 0.3 0.5 0.7 1] (default) | vector

Rack position breakpoints for variable geometry,  $L_{rack,bpts3}$ .

**Dependencies**

To enable this parameter, select Variable geometry for the **Turbine type** parameter.

**Reference temperature, T\_ref – Temperature**

293.15 (default) | scalar

Performance map reference temperature,  $T_{ref}$ , in K.

**Reference pressure, P\_ref – Pressure**

101325 (default) | scalar

Performance map reference pressure,  $P_{ref}$ , in Pa.

**Wastegate****Wastegate flow area, A\_wgopen – Area**

0.0003 (default) | scalar

Area of fully opened wastegate valve,  $A_{wgopen}$ , in  $m^2$ .

**Dependencies**

To enable **Wastegate flow area, A\_wgopen**, select the **Include wastegate** parameter.

**Pressure ratio linearize limit, Plim\_wg – Area, m^2**

0.95 (default) | scalar

**Dependencies**

Flow restriction linearization limit,  $p_{lim, wg}$ .

To enable **Pressure ratio linearize limit, Plim\_wg**, select the **Include wastegate** parameter.

**Properties****Ideal gas constant, R – Constant**

287 (default) | scalar

Ideal gas constant  $R$ , in  $J/(kg \cdot K)$ .

**Specific heat at constant pressure, cp – Specific heat**

1005 (default) | scalar

Specific heat at constant pressure,  $c_p$ , in  $J/(kg \cdot K)$ .

## Mapped Core Engine

Steady-state core engine model using lookup tables

**Library:** Powertrain Blockset / Propulsion / Combustion Engine  
Components / Core Engine

### Description

The Mapped Core Engine block implements a steady-state core engine model using power, air mass flow, fuel flow, exhaust temperature, efficiency, and emission performance lookup tables. You can use the block for:

- Hardware-in-the-loop (HIL) engine control design.
- Vehicle-level fuel economy and performance simulations.

The block enables you to specify lookup tables for these engine characteristics. The lookup tables are functions of engine load,  $L$ , and engine speed  $N$ . If you select **Input engine temperature**, the tables are also a function of engine temperature,  $T$ .

- Power
- Air
- Fuel
- Temperature
- Efficiency
- Emissions
  - Hydrocarbon (HC)
  - Carbon monoxide (CO)
  - Nitric oxide and nitrogen dioxide (NO<sub>x</sub>)
  - Carbon dioxide (CO<sub>2</sub>)
  - Particulate matter (PM) emissions

To bound the Mapped Core Engine block output, the block does not extrapolate the lookup table data.

### Ports

#### Input

**<TrqCmd> – Engine load**

TrqCmd (default)

Engine load,  $L$ . Examples of engine load include:

- Commanded torque
- Commanded indicated mean effective pressure (IMEP) in the engine cylinder
- Normalized cylinder air mass
- Injected fuel mass

#### Dependencies

To specify an engine load port name, on the **Configuration** tab, enter a name in the **Load input port name** parameter field.

#### <EngSpd> – Engine speed

EngSpd (default)

Engine speed,  $N$ .

#### Dependencies

To specify an engine load port name, on the **Configuration** tab, enter a name in the **Speed input port name** parameter field.

#### <EngTemp> – Engine temperature

EngTemp (default)

Engine temperature,  $T$ .

#### Dependencies

To create the engine temperature input port name, select **Input engine temperature** parameter field.

To specify an engine load port name, on the **Configuration** tab, enter a name in the **Temperature input port name** parameter field.

#### Output

#### <EngTrq> – Power

EngTrq (default)

Engine power,  $T_{brake}$ .

#### Dependencies

- To create this port, on the **Configuration** tab, select **Power**.
- To specify the port name, on the **Power** tab, enter a name in the **Power output port name** parameter field.

#### <IntkAirMassFlw> – Air mass flow

IntkAirMassFlw (default)

Engine air mass flow,  $\dot{m}_{intk}$ .

#### Dependencies

- To create this port, on the **Configuration** tab, select **Air**.

- To specify the port name, on the **Air** tab, enter a name in the **Air output port name** parameter field.

**<FuelMassFlw> – Fuel flow**

FuelMassFlw (default)

Engine fuel flow,  $\dot{m}_{fuel}$ .**Dependencies**

- To create this port, on the **Configuration** tab, select **Fuel**.
- To specify the port name, on the **Fuel** tab, enter a name in the **Fuel output port name** parameter field.

**<ExhManGasTemp> – Exhaust temperature**

ExhManGasTemp (default)

Engine exhaust temperature,  $T_{exh}$ .**Dependencies**

- To create this port, on the **Configuration** tab, select **Temperature**.
- To specify the port name, on the **Temperature** tab, enter a name in the **Temperature output port name** parameter field.

**<Bsfc> – Efficiency**

Bsfc (default)

Brake-specific fuel consumption (BSFC),  $Eff$ .**Dependencies**

- To create this port, on the **Configuration** tab, select **Efficiency**.
- To specify the port name, on the **Efficiency** tab, enter a name in the **Efficiency output port name** parameter field.

**<EoHC> – Hydrocarbon emissions**

EoHC (default)

Hydrocarbon emissions,  $HC$ .**Dependencies**

- To create this port, on the **Configuration** tab, select **HC**.
- To specify the port name, on the **HC** tab, enter a name in the **HC output port name** parameter field.

**<EoCO> – Carbon monoxide emissions**

EoCO (default)

Carbon monoxide emissions,  $CO$ .**Dependencies**

- To create this port, on the **Configuration** tab, select **CO**.

- To specify the port name, on the **CO** tab, enter a name in the **CO output port name** parameter field.

### <EoNOx> – Nitric oxide and nitrogen dioxide emissions

EoNOx (default)

Nitric oxide and nitrogen dioxide emissions, *NOx*.

#### Dependencies

- To create this port, on the **Configuration** tab, select **NOx**.
- To specify the port name, on the **NOx** tab, enter a name in the **NOx output port name** parameter field.

### <EoCO2> – Carbon dioxide emissions

EoCO2 (default)

Carbon dioxide emissions, *CO2*.

#### Dependencies

- To create this port, on the **Configuration** tab, select **CO2**.
- To specify the port name, on the **CO2** tab, enter a name in the **CO2 output port name** parameter field.

### <EoPm> – Particulate matter emissions

EoPm (default)

Particulate matter emissions, *PM*.

#### Dependencies

- To create this port, on the **Configuration** tab, select **PM**.
- To specify the port name, on the **PM** tab, enter a name in the **PM output port name** parameter field.

## Parameters

### Configuration

#### Engine Type – Type of engine image

Compression-ignition (CI) (default) | Spark-ignition (SI)

Type of mapped internal combustion engine image to use in the block.

#### Load input port name – Name

TrqCmd (default)

Engine load input port name.

#### Breakpoints for load input – Breakpoints

vector

Breakpoints for engine load input.

**Speed input port name – Name**

EngSpd (default)

Speed input port name.

**Breakpoints for speed input – Breakpoints**

vector

Breakpoints for engine speed input.

**Temperature input port name – Name**

EngTemp (default)

Temperature input port name.

**Dependencies**

To enable this parameter, select **Input engine temperature**.

**Breakpoints for temperature input – Breakpoints**

[233.15 273.15 373.15] (default) | vector

Breakpoints for engine temperature input.

**Dependencies**

To enable this parameter, select **Input engine temperature**.

**Output Configuration – Create output ports**

on (default)

Create the output ports.

**Dependencies**

The table summarizes the output ports that are created for each **Output** parameter selection.

Output Selection	Creates Port	Creates Tab
<b>Power</b>	<i>EngTrq</i>	<b>Power</b>
<b>Air</b>	<i>IntkAirMassFlw</i>	<b>Air</b>
<b>Fuel</b>	<i>FuelMassFlw</i>	<b>Fuel</b>
<b>Temperature</b>	<i>ExhManGasTemp</i>	<b>Temperature</b>
<b>Efficiency</b>	<i>Bsfc</i>	<b>Efficiency</b>
<b>HC</b>	<i>EoHC</i>	<b>HC</b>
<b>CO</b>	<i>EoCO</i>	<b>CO</b>
<b>NOx</b>	<i>EoNOx</i>	<b>NOx</b>
<b>CO2</b>	<i>EoCO2</i>	<b>CO2</b>
<b>PM</b>	<i>EoPm</i>	<b>PM</b>

**Power**

**Power output port name – Power**

EngTrq (default)

Power output port name.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **Power**.

**Power table – Power**

array

Power table.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **Power**.

**Air**

**Air output port name – Air**

IntkAirMassFlw (default)

Air mass flow output port name.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **Air**.

**Air table – Air**

array

Air mass flow table.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **Air**.

**Fuel**

**Fuel output port name – Fuel**

FuelMassFlw (default)

Fuel output port name.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **Fuel**.

**Fuel table – Fuel**

array

Fuel table.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **Fuel**.

**Temperature**

**Temperature output port name – Temperature**

ExhManGasTemp (default)

Temperature output port name.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **Temperature**.

**Temperature table – Temperature**

array

Temperature table.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **Temperature**.

**Efficiency**

**Efficiency output port name – Efficiency**

Bsfc (default)

Efficiency output port name.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **Efficiency**.

**Efficiency table – Efficiency**

array

Efficiency table.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **Efficiency**.

**HC**

**HC output port name – Hydrocarbon**

EoHC (default)

Hydrocarbon output port name.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **HC**.

**HC table – Hydrocarbon**

array

Hydrocarbon table.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **HC**.

**CO**

**CO output port name – Carbon dioxide**

EoCO (default)

Carbon monoxide output port name.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **CO**.

**CO table – Carbon dioxide**

array

Carbon dioxide table.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **CO**.

**NOx**

**NOx output port name – Nitric oxide *NO* and nitrogen dioxide *NO<sub>2</sub>***

EoNOx (default)

NOx output port name. NOx is nitric oxide *NO* and nitrogen dioxide *NO<sub>2</sub>*.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **NOx**.

**NOx table – Nitric oxide *NO* and nitrogen dioxide *NO<sub>2</sub>***

array

NOx emissions table. NOx is nitric oxide *NO* and nitrogen dioxide *NO<sub>2</sub>*.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **NOx**.

**CO2**

**CO2 output port name – Carbon dioxide**

EoCO2 (default)

Carbon dioxide output port name.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **CO2**.

**CO2 table – Carbon dioxide**

array

Carbon dioxide table.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **CO2**.

**PM**

**PM output port name – Particulate matter**

EoPm (default)

Particulate matter output port name.

### **Dependencies**

To create this parameter, on the **Configuration** tab, select **PM**.

### **PM table – Particulate matter**

array

Particulate matter table.

### **Dependencies**

To create this parameter, on the **Configuration** tab, select **PM**.

# Mapped CI Engine

Compression-ignition engine model using lookup tables

**Library:** Powertrain Blockset / Propulsion / Combustion Engines  
Vehicle Dynamics Blockset / Powertrain / Propulsion

## Description

The Mapped CI Engine block implements a mapped compression-ignition (CI) engine model using power, air mass flow, fuel flow, exhaust temperature, efficiency, and emission performance lookup tables. You can use the block for:

- Hardware-in-the-loop (HIL) engine control design
- Vehicle-level fuel economy and performance simulations

The lookup tables, developed with the Model-Based Calibration Toolbox, are functions of injected fuel mass,  $F$ , engine torque,  $T$ , engine speed,  $N$ , and engine temperature,  $Temp_{Eng}$ .

Input Command Setting	Input Engine Temperature Parameter Setting	Lookup Tables
Fuel mass	off	$f(F,N)$
	on	$f(F,N,Temp_{Eng})$
Torque	off	$f(T,N)$
	on	$f(T,N,Temp_{Eng})$

The block enables you to specify lookup tables for these engine characteristics:

- Power
- Air
- Fuel
- Temperature
- Efficiency
- Hydrocarbon (HC) emissions
- Carbon monoxide (CO) emissions
- Nitric oxide and nitrogen dioxide (NOx) emissions
- Carbon dioxide (CO<sub>2</sub>) emissions
- Particulate matter (PM) emissions

To bound the Mapped CI Engine block output, the block does not extrapolate the lookup table data.

### Virtual Calibration

If you have Model-Based Calibration Toolbox, click **Calibrate Maps** to virtually calibrate the 2D lookup tables using measured data. The dialog box steps through these tasks.

Task	Description									
Import firing data	<p>Import this loss data from a file. For example, open <code>&lt;matlabroot&gt;/toolbox/autoblks/autodemos/projectsrc/CIDynamometer/CalMappedEng/CiEngineData.xlsx</code>.</p> <p>For more information, see “Using Data” (Model-Based Calibration Toolbox).</p>

All non-firing torque points must be less than zero. Non-firing data is a function of engine speed only.</p>									

Task	Description
Generate response models	For both firing and non-firing data, the Model-Based Calibration Toolbox uses test plans to fit data to Gaussian process models (GPMs).  To assess or adjust the response model fit, select <b>Edit in Application</b> . The Model-Based Calibration Toolbox Model Browser opens. For more information, see "Model Assessment" (Model-Based Calibration Toolbox).
Generate calibration	Model-Based Calibration Toolbox calibrates the firing and non-firing response models and generates calibrated tables.  To assess or adjust the calibration, select <b>Edit in Application</b> . The Model-Based Calibration Toolbox CAGE Browser opens. For more information, see "Calibration Lookup Tables" (Model-Based Calibration Toolbox).
Update block parameters	Update the block lookup table and breakpoint parameters with the calibration.

### Cylinder Air Mass

The block calculates the normalized cylinder air mass using these equations.

$$M_{Nom} = \frac{P_{std} V_d}{N_{cyl} R_{air} T_{std}}$$

$$L = \frac{\left(\frac{60s}{min}\right) Cps \cdot \dot{m}_{air}}{\left(\frac{1000g}{Kg}\right) N_{cyl} \cdot N \cdot M_{Nom}}$$

The equations use these variables.

$L$	Normalized cylinder air mass
$M_{Nom}$	Nominal engine cylinder air mass at standard temperature and pressure, piston at bottom dead center (BDC) maximum volume, in kg
$Cps$	Crankshaft revolutions per power stroke, rev/stroke
$P_{std}$	Standard pressure
$T_{std}$	Standard temperature
$R_{air}$	Ideal gas constant for air and burned gas mixture
$V_d$	Displaced volume
$N_{cyl}$	Number of engine cylinders
$N$	Engine speed
$\dot{m}_{intk}$	Engine air mass flow, in g/s

### Turbocharger Lag

To model turbocharger lag, select **Include turbocharger lag effect**. Turbocharger lag limits the maximum fuel mass per injection. To model the maximum fuel mass per injection, the block uses a first-order system with a time constant. At low torque, the engine does not require boost to provide sufficient air flow. When the requested fuel mass requires boost, the block uses a time constant to determine the maximum fuel mass per injection. The block uses these equations for the specified **Input command** setting.

Calculation	Input command Parameter Setting	
	Fuel mass	Torque
Dynamic torque	$\frac{dF_{max}}{dt} = \frac{1}{\tau_{eng}}(F_{cmd} - F_{max})$	$\frac{dT_{max}}{dt} = \frac{1}{\tau_{eng}}(T_{cmd} - T_{max})$
Fuel mass per injection or torque - with turbocharger lag	$F =$ $\begin{cases} F_{cmd} & \text{when } F_{cmd} < F_{max} \\ F_{max} & \text{when } F_{cmd} \geq F_{max} \end{cases}$	$T_{target} =$ $\begin{cases} T_{cmd} & \text{when } T_{cmd} < T_{max} \\ T_{max} & \text{when } T_{cmd} \geq T_{max} \end{cases}$
Fuel mass per injection or torque- without turbocharger lag	$F = F_{cmd} = F_{max}$	$T_{target} = T_{cmd} = T_{max}$
Boost time constant	$\tau_{bst} =$ $\begin{cases} \tau_{bst, rising} & \text{when } F_{cmd} > F_{max} \\ \tau_{bst, falling} & \text{when } F_{cmd} \leq F_{max} \end{cases}$	$\tau_{bst} =$ $\begin{cases} \tau_{bst, rising} & \text{when } T_{cmd} > T_{max} \\ \tau_{bst, falling} & \text{when } T_{cmd} \leq T_{max} \end{cases}$
Final time constant	$\tau_{eng} = \begin{cases} \tau_{nat} & \text{when } T_{brake} < f_{bst}(N) \\ \tau_{bst} & \text{when } T_{brake} \geq f_{bst}(N) \end{cases}$	

The equations use these variables.

- $T_{brake}$  Brake torque
- $F$  Fuel mass per injection
- $F_{cmd}, F_{max}$  Commanded and maximum fuel mass per injection, respectively
- $T_{target}, T_{cmd}, T_{max}$  Target, commanded, and maximum torque, respectively
- $\tau_{bst}$  Boost time constant
- $\tau_{bst, rising}, \tau_{bst, falling}$  Boost rising and falling time constant, respectively
- $\tau_{eng}$  Final time constant
- $\tau_{nat}$  Time constant below the boost torque speed line
- $f_{bst}(N)$  Boost torque/speed line
- $N$  Engine speed

### Fuel Flow

To calculate the fuel economy for high-fidelity models, the block uses the volumetric fuel flow.

$$Q_{fuel} = \frac{\dot{m}_{fuel}}{\left(\frac{1000kg}{m^3}\right)Sg_{fuel}}$$

The equation uses these variables.

- $\dot{m}_{fuel}$  Fuel mass flow
- $Sg_{fuel}$  Specific gravity of fuel

$Q_{fuel}$  Volumetric fuel flow

## Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Equations
PwrInfo	PwrTrnsfrd — Power transferred between blocks <ul style="list-style-type: none"> <li>Positive signals indicate flow into block</li> <li>Negative signals indicate flow out of block</li> </ul>	PwrCrkshft	Crankshaft power $-\tau_{eng}\omega$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred <ul style="list-style-type: none"> <li>Positive signals indicate an input</li> <li>Negative signals indicate a loss</li> </ul>	PwrFuel	Fuel input power $\dot{m}_{fuel}LHV$
		PwrLoss	Power loss $\tau_{eng}\omega - \dot{m}_{fuel}LHV$
PwrStored — Stored energy rate of change <ul style="list-style-type: none"> <li>Positive signals indicate an increase</li> <li>Negative signals indicate a decrease</li> </ul>		<i>Not used</i>	

The equations use these variables.

$LHV$  Fuel lower heating value  
 $\omega$  Engine speed, rad/s  
 $\dot{m}_{fuel}$  Fuel mass flow  
 $\tau_{eng}$  Fuel mass per injection time constant

## Ports

### Input

#### FuelMassCmd — Injected fuel mass command

scalar

Injected fuel mass command,  $F$ , in mg/inj.

#### Dependencies

To enable this port, for **Input command**, select Fuel mass.

#### TrqCmd — Torque command

scalar

Torque command,  $T$ , in N·m.

#### Dependencies

To enable this port, for **Input command**, select Torque.

**EngSpd – Engine speed**

scalar

Engine speed,  $N$ , in rpm.

**EngTemp – Engine temperature**

scalar

Engine temperature,  $Temp_{Eng}$ , in K.

**Dependencies**

To enable this port, select **Input engine temperature**.

**Output**

**Info – Bus signal**

bus

Bus signal containing these block calculations.

Signal	Description	Units
IntkGasMassFlw	Engine air mass flow output	kg/s
NrmlzdAirChrg	Normalized engine cylinder air mass	N/A
Afr	Air-fuel ratio (AFR)	N/A
FuelMassFlw	Engine fuel flow output	kg/s
FuelVolFlw	Volumetric fuel flow	m <sup>3</sup> /s
ExhManGasTemp	Engine exhaust gas temperature	K
EngTrq	Engine torque output	N·m
EngSpd	Engine speed	rpm
CrkAng	Engine crankshaft absolute angle  $\int_0^{(360)Cps} EngSpd \frac{180}{30} d\theta$ where $Cps$ is crankshaft revolutions per power stroke.	degrees crank angle
Bsfc	Engine brake-specific fuel consumption (BSFC)	g/kWh
EoHC	Engine out hydrocarbon emission mass flow	kg/s
EoCO	Engine out carbon monoxide emission mass flow rate	kg/s
EoNOx	Engine out nitric oxide and nitrogen dioxide emissions mass flow	kg/s
EoCO2	Engine out carbon dioxide emission mass flow	kg/s

Signal			Description	Units
EoPM			Engine out particulate matter emission mass flow	kg/s
PwrInfo	PwrTrnsfrd	PwrCrkshft	Crankshaft power	W
	PwrNotTrnsfrd	PwrFuel	Fuel input power	W
		PwrLoss	Power loss	W
	PwrStored		<i>Not used</i>	

### EngTrq – Power

scalar

Engine power,  $T_{brake}$ , in N·m.

## Parameters

### Block Options

#### Input command – Table functions

Fuel mass (default) | Torque

The lookup tables, developed with the Model-Based Calibration Toolbox, are functions of injected fuel mass,  $F$ , engine torque,  $T$ , engine speed,  $N$ , and engine temperature,  $Temp_{Eng}$ .

Input Command Setting	Input Engine Temperature Parameter Setting	Lookup Tables
Fuel mass	off	$f(F,N)$
	on	$f(F,N,Temp_{Eng})$
Torque	off	$f(T,N)$
	on	$f(T,N,Temp_{Eng})$

### Dependencies

- Selecting Fuel mass enables **Breakpoints for commanded fuel mass input, f\_tbrake\_f\_bpt.**
- Selecting Torque enables **Breakpoints for commanded torque input, f\_tbrake\_t\_bpt.**
- Selecting **Input engine temperature** enables **Breakpoints for temperature input, f\_tbrake\_engtmp\_bpt.**

#### Include turbocharger lag effect – Increase time constant

off (default)

To model turbocharger lag, select **Include turbocharger lag effect**. Turbocharger lag limits the maximum fuel mass per injection. To model the maximum fuel mass per injection, the block uses a first-order system with a time constant. At low torque, the engine does not require boost to provide sufficient air flow. When the requested fuel mass requires boost, the block uses a time constant to determine the maximum fuel mass per injection. The block uses these equations for the specified **Input command** setting.

Calculation	Input command Parameter Setting	
	Fuel mass	Torque
Dynamic torque	$\frac{dF_{max}}{dt} = \frac{1}{\tau_{eng}}(F_{cmd} - F_{max})$	$\frac{dT_{max}}{dt} = \frac{1}{\tau_{eng}}(T_{cmd} - T_{max})$
Fuel mass per injection or torque - with turbocharger lag	$F =$ $\begin{cases} F_{cmd} & \text{when } F_{cmd} < F_{max} \\ F_{max} & \text{when } F_{cmd} \geq F_{max} \end{cases}$	$T_{target} =$ $\begin{cases} T_{cmd} & \text{when } T_{cmd} < T_{max} \\ T_{max} & \text{when } T_{cmd} \geq T_{max} \end{cases}$
Fuel mass per injection or torque- without turbocharger lag	$F = F_{cmd} = F_{max}$	$T_{target} = T_{cmd} = T_{max}$
Boost time constant	$\tau_{bst} =$ $\begin{cases} \tau_{bst, rising} & \text{when } F_{cmd} > F_{max} \\ \tau_{bst, falling} & \text{when } F_{cmd} \leq F_{max} \end{cases}$	$\tau_{bst} =$ $\begin{cases} \tau_{bst, rising} & \text{when } T_{cmd} > T_{max} \\ \tau_{bst, falling} & \text{when } T_{cmd} \leq T_{max} \end{cases}$
Final time constant	$\tau_{eng} = \begin{cases} \tau_{nat} & \text{when } T_{brake} < f_{bst}(N) \\ \tau_{bst} & \text{when } T_{brake} \geq f_{bst}(N) \end{cases}$	

The equations use these variables.

$T_{brake}$	Brake torque
$F$	Fuel mass per injection
$F_{cmd}, F_{max}$	Commanded and maximum fuel mass per injection, respectively
$T_{target}, T_{cmd}, T_{max}$	Target, commanded, and maximum torque, respectively
$\tau_{bst}$	Boost time constant
$\tau_{bst, rising}, \tau_{bst, falling}$	Boost rising and falling time constant, respectively
$\tau_{eng}$	Final time constant
$\tau_{nat}$	Time constant below the boost torque speed line
$f_{bst}(N)$	Boost torque/speed line
$N$	Engine speed

**Dependencies**

Selecting **Include turbocharger lag effect** enables these parameters:

- **Boost torque line, f\_tbrake\_bst**
- **Time constant below boost line, tau\_nat**
- **Rising maximum fuel mass boost time constant, tau\_bst\_rising**
- **Falling maximum fuel mass boost time constant, tau\_bst\_falling**

**Input engine temperature – Create input port**

off (default) | on

Select this to create the EngTemp input port.

The lookup tables, developed with the Model-Based Calibration Toolbox, are functions of injected fuel mass,  $F$ , engine torque,  $T$ , engine speed,  $N$ , and engine temperature,  $Temp_{Eng}$ .

Input Command Setting	Input Engine Temperature Parameter Setting	Lookup Tables
Fuel mass	off	$f(F,N)$
	on	$f(F,N,Temp_{Eng})$
Torque	off	$f(T,N)$
	on	$f(T,N,Temp_{Eng})$

### Configuration

#### Calibrate Maps — Calibrate tables with measured data selection

If you have Model-Based Calibration Toolbox, click **Calibrate Maps** to virtually calibrate the 2D lookup tables using measured data. The dialog box steps through these tasks.

Task	Description								
Import firing data	Import this loss data from a file. For example, open <code>&lt;matlabroot&gt;/toolbox/autoblks/autodemos/projectsrc/CIDynamometer/CalMappedEng/CiEngineData.xlsx</code> .								
	For more information, see “Using Data” (Model-Based Calibration Toolbox).								
	<table border="1"> <thead> <tr> <th>Input command</th> <th>Required Data</th> <th>Optional Data</th> </tr> </thead> <tbody> <tr> <td>Fuel mass</td> <td> <ul style="list-style-type: none"> <li>Engine speed, rpm</li> <li>Commanded fuel mass per injection, mg</li> <li>Engine torque, N·m</li> </ul> </td> <td> <ul style="list-style-type: none"> <li>Air mass flow rate, kg/s</li> <li>Brake specific fuel consumption, g/(kW·h)</li> <li>CO<sub>2</sub> mass flow rate, kg/s</li> </ul> </td> </tr> <tr> <td>Torque</td> <td> <ul style="list-style-type: none"> <li>Engine speed, rpm</li> <li>Engine torque, N·m</li> </ul> </td> <td> <ul style="list-style-type: none"> <li>CO mass flow rate, kg/s</li> <li>Exhaust temperature, K</li> <li>Fuel mass flow rate, kg/s</li> <li>HC mass flow rate, kg/s</li> <li>NO<sub>x</sub> mass flow rate, kg/s</li> <li>Particulate matter mass flow rate, kg/s</li> </ul> </td> </tr> </tbody> </table>	Input command	Required Data	Optional Data	Fuel mass	<ul style="list-style-type: none"> <li>Engine speed, rpm</li> <li>Commanded fuel mass per injection, mg</li> <li>Engine torque, N·m</li> </ul>	<ul style="list-style-type: none"> <li>Air mass flow rate, kg/s</li> <li>Brake specific fuel consumption, g/(kW·h)</li> <li>CO<sub>2</sub> mass flow rate, kg/s</li> </ul>	Torque	<ul style="list-style-type: none"> <li>Engine speed, rpm</li> <li>Engine torque, N·m</li> </ul>
Input command	Required Data	Optional Data							
Fuel mass	<ul style="list-style-type: none"> <li>Engine speed, rpm</li> <li>Commanded fuel mass per injection, mg</li> <li>Engine torque, N·m</li> </ul>	<ul style="list-style-type: none"> <li>Air mass flow rate, kg/s</li> <li>Brake specific fuel consumption, g/(kW·h)</li> <li>CO<sub>2</sub> mass flow rate, kg/s</li> </ul>							
Torque	<ul style="list-style-type: none"> <li>Engine speed, rpm</li> <li>Engine torque, N·m</li> </ul>	<ul style="list-style-type: none"> <li>CO mass flow rate, kg/s</li> <li>Exhaust temperature, K</li> <li>Fuel mass flow rate, kg/s</li> <li>HC mass flow rate, kg/s</li> <li>NO<sub>x</sub> mass flow rate, kg/s</li> <li>Particulate matter mass flow rate, kg/s</li> </ul>							
Collect firing data at steady-state operating conditions when injectors deliver the fuel. Data should cover the engine speed and torque operating range. Model-Based Calibration Toolbox uses the firing data boundary as the maximum torque.									
To filter or edit the data, select <b>Edit in Application</b> . The Model-Based Calibration Toolbox Data Editor opens.									

Task	Description
Import non-firing data	<p>Import this non-firing data from a file. For example, open <code>&lt;matlabroot&gt;/toolbox/autoblks/autodemos/projectsrc/CIDynamometer/CalMappedEng/CiEngineData.xlsx</code>.</p> <ul style="list-style-type: none"> <li>• Engine speed, rpm</li> <li>• Engine torque, N·m</li> </ul> <p>Collect non-firing (motoring) data at steady-state operating conditions when fuel is cut off. All non-firing torque points must be less than zero. Non-firing data is a function of engine speed only.</p>
Generate response models	<p>For both firing and non-firing data, the Model-Based Calibration Toolbox uses test plans to fit data to Gaussian process models (GPMs).</p> <p>To assess or adjust the response model fit, select <b>Edit in Application</b>. The Model-Based Calibration Toolbox Model Browser opens. For more information, see “Model Assessment” (Model-Based Calibration Toolbox).</p>
Generate calibration	<p>Model-Based Calibration Toolbox calibrates the firing and non-firing response models and generates calibrated tables.</p> <p>To assess or adjust the calibration, select <b>Edit in Application</b>. The Model-Based Calibration Toolbox CAGE Browser opens. For more information, see “Calibration Lookup Tables” (Model-Based Calibration Toolbox).</p>
Update block parameters	<p>Update the block lookup table and breakpoint parameters with the calibration.</p>

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**Breakpoints for commanded fuel mass input, f\_tbrake\_f\_bpt — Breakpoints**

1-by-M vector

Breakpoints, in mg/inj.

**Dependencies**

Setting **Input command** to Fuel mass enables this parameter.

**Breakpoints for commanded torque input, f\_tbrake\_t\_bpt — Breakpoints**

1-by-M vector

Breakpoints, in N·m.

**Dependencies**

Setting **Input command** to Torque enables this parameter.

**Breakpoints for engine speed input, f\_tbrake\_n\_bpt — Breakpoints**

1-by-N vector

Breakpoints, in rpm.

**Breakpoints for temperature input, f\_tbrake\_engtmp\_bpt – Breakpoints**  
[233.15 273.15 373.15] (default) | 1-by-L vector

Breakpoints, in K.

**Dependencies**

To enable this parameter, select **Input engine temperature**.

**Number of cylinders, NCyl – Number**  
4 (default) | scalar

Number of cylinders.

**Crank revolutions per power stroke, Cps – Crank revolutions**  
2 (default) | scalar

Crank revolutions per power stroke.

**Total displaced volume, Vd – Volume**  
0.0015 (default) | scalar

Volume displaced by engine, in  $m^3$ .

**Fuel lower heating value, Lhv – Heating value**  
45e6 (default) | scalar

Fuel lower heating value,  $LHV$ , in J/kg.

**Fuel specific gravity, Sg – Specific gravity**  
0.832 (default) | scalar

Specific gravity of fuel,  $Sg_{fuel}$ , dimensionless.

**Ideal gas constant air, Rair – Constant**  
287 (default) | scalar

Ideal gas constant of air and residual gas entering the engine intake port, in J/(kg·K).

**Air standard pressure, Pstd – Pressure**  
101325 (default) | scalar

Standard air pressure, in Pa.

**Air standard temperature, Tstd – Temperature**  
293.15 (default) | scalar

Standard air temperature, in K.

**Boost torque line, f\_tbrake\_bst – Boost lag**  
[90, 95, 95, 95, 96, 100, 104, 104, 104, 100, 95, 85, 75, 67, 60, 55] (default) | 1-by-M vector

Boost torque line,  $f_{bst}(N)$ , in N·m.

**Dependencies**

To enable this parameter, select **Include turbocharger lag effect**.

**Time constant below boost line – Time constant below**

0.1 (default) | scalar

Time constant below boost line,  $\tau_{nat}$ , in s.**Dependencies**To enable this parameter, select **Include turbocharger lag effect**.**Rising maximum fuel mass boost time constant, tau\_bst\_rising – Rising time constant**

1.0 (default) | scalar

Rising maximum fuel mass boost time constant,  $\tau_{bst,rising}$ , in s.**Dependencies**To enable this parameter, select **Include turbocharger lag effect**.**Falling maximum fuel mass boost time constant, tau\_bst\_falling – Falling time constant**

0.7 (default) | scalar

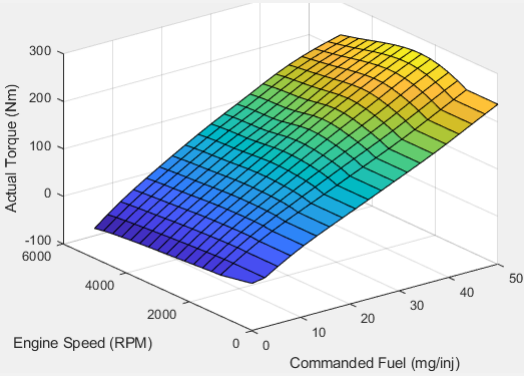

Falling maximum fuel mass boost time constant,  $\tau_{bst,falling}$ , in s.**Dependencies**To enable this parameter, select **Include turbocharger lag effect**.**Turbocharger time constant blend fuel mass fraction, f\_blend\_frac – Time constant**

0.01 (default) | scalar

Turbocharger time constant blend fuel mass fraction, in s.

**Dependencies**To enable this parameter, select **Include turbocharger lag effect**.**Power****Brake torque map, f\_tbrake – 2D lookup table**

M-by-N matrix

Input Command Setting	Description
Fuel mass	<p>The engine brake torque lookup table is a function of commanded fuel mass and engine speed, <math>T_{brake} = f(F, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>T_{brake}</math> is engine torque, in N·m.</li> <li>• <math>F</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul> 
Torque	<p>The engine brake torque lookup table is a function of target torque and engine speed, <math>T_{brake} = f(T_{target}, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>T_{brake}</math> is engine torque, in N·m.</li> <li>• <math>T_{target}</math> is target torque, in N·m.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul>

### Dependencies

To enable this parameter, clear **Input engine temperature**.

### Plot brake torque map – Plot table button

Click to plot table.

### Dependencies

To enable this parameter, clear **Input engine temperature**.

### Brake torque map, f\_tbrake\_3d – 3D lookup table

M-by-N-by-L array

Input Command Setting	Description
Fuel mass	<p>The engine brake torque lookup table is a function of commanded fuel mass and engine speed, <math>T_{brake} = f(F, N, Temp_{Eng})</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>T_{brake}</math> is engine torque, in N·m.</li> <li>• <math>F</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>Temp_{Eng}</math> is engine temperature, in K.</li> </ul>

Input Command Setting	Description
Torque	<p>The engine brake torque lookup table is a function of target torque and engine speed, <math>T_{brake} = f(T_{target}, N, Temp_{Eng})</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>T_{brake}</math> is engine torque, in N·m.</li> <li>• <math>T_{target}</math> is target torque, in N·m.</li> <li>• <math>N</math> is engine speed, in rpm.</li> <li>• <math>Temp_{Eng}</math> is engine temperature, in K.</li> </ul>

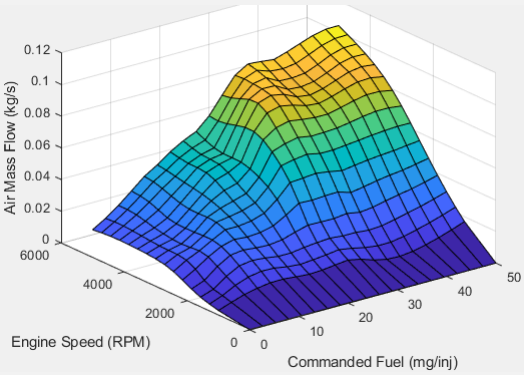

**Dependencies**

To enable this parameter, select **Input engine temperature**.

**Air**

**Air mass flow map, f\_air – 2D lookup table**

M-by-N matrix

Input Command Setting	Description
Fuel mass	<p>The air mass flow lookup table is a function of commanded fuel mass and engine speed, <math>\dot{m}_{intk} = f(F_{max}, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>\dot{m}_{intk}</math> is engine air mass flow, in kg/s.</li> <li>• <math>F_{max}</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul> 
Torque	<p>The air mass flow lookup table is a function of maximum torque and engine speed, <math>\dot{m}_{intk} = f(T_{max}, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>\dot{m}_{intk}</math> is engine air mass flow, in kg/s.</li> <li>• <math>T_{max}</math> is maximum torque, in N·m.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul>

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**Plot air mass map – Plot table**

button

Click to plot table.

#### Dependencies

To enable this parameter, clear **Input engine temperature**.

#### Air mass flow map, **f\_air\_3d** – 3D lookup table

M-by-N-by-L array

Input Command Setting	Description
Fuel mass	<p>The air mass flow lookup table is a function of commanded fuel mass and engine speed, <math>\dot{m}_{intk} = f(F_{max}, N, Temp_{Eng})</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>\dot{m}_{intk}</math> is engine air mass flow, in kg/s.</li> <li>• <math>F_{max}</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>N</math> is engine speed, in rpm.</li> <li>• <math>Temp_{Eng}</math> is engine temperature, in K.</li> </ul>
Torque	<p>The air mass flow lookup table is a function of maximum torque and engine speed, <math>\dot{m}_{intk} = f(T_{max}, N, Temp_{Eng})</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>\dot{m}_{intk}</math> is engine air mass flow, in kg/s.</li> <li>• <math>T_{max}</math> is maximum torque, in N·m.</li> <li>• <math>N</math> is engine speed, in rpm.</li> <li>• <math>Temp_{Eng}</math> is engine temperature, in K.</li> </ul>

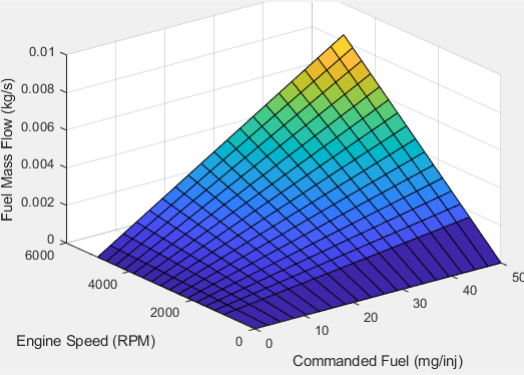

#### Dependencies

To enable this parameter, select **Input engine temperature**.

#### Fuel

#### Fuel flow map, **f\_fuel** – 2D lookup table

M-by-N matrix

Input Command Setting	Description
Fuel mass	<p>The engine fuel flow lookup table is a function of commanded fuel mass and engine speed, <math>MassFlow = f(F, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>MassFlow</math> is engine fuel mass flow, in kg/s.</li> <li>• <math>F</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul> 
Torque	<p>The engine fuel flow lookup table is a function of target torque and engine speed, <math>MassFlow = f(T_{target}, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>MassFlow</math> is engine fuel mass flow, in kg/s.</li> <li>• <math>T_{target}</math> is target torque, in N·m.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul>

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**Plot fuel flow map – Plot table**

button

Click to plot table.

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**Fuel flow map, f\_fuel\_3d – 3D lookup table**

M-by-N-by-L array

Input Command Setting	Description
Fuel mass	<p>The engine fuel flow lookup table is a function of commanded fuel mass, engine speed, and engine temperature, <math>MassFlow = f(F, N, Temp_{Eng})</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>MassFlow</math> is engine fuel mass flow, in kg/s.</li> <li>• <math>F</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>N</math> is engine speed, in rpm.</li> <li>• <math>Temp_{Eng}</math> is engine temperature, in K.</li> </ul>
Torque	<p>The engine fuel flow lookup table is a function of target torque and engine speed, and engine temperature, <math>MassFlow = f(T_{target}, N, Temp_{Eng})</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>MassFlow</math> is engine fuel mass flow, in kg/s.</li> <li>• <math>T_{target}</math> is target torque, in N·m.</li> <li>• <math>N</math> is engine speed, in rpm.</li> <li>• <math>Temp_{Eng}</math> is engine temperature, in K.</li> </ul>

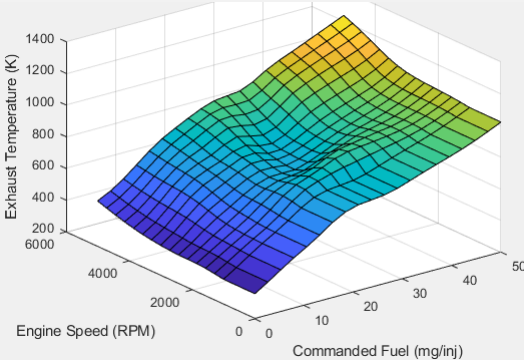

### Dependencies

To enable this parameter, select **Input engine temperature**.

### Temperature

#### Exhaust temperature map, $f_{texh}$ – 2D lookup table

M-by-N matrix

Input Command Setting	Description
Fuel mass	<p>The engine exhaust temperature table is a function of commanded fuel mass and engine speed, <math>T_{exh} = f(F, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>T_{exh}</math> is exhaust temperature, in K.</li> <li>• <math>F</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul> 

Input Command Setting	Description
Torque	<p>The engine exhaust temperature table is a function of target torque and engine speed, <math>T_{exh} = f(T_{target}, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>T_{exh}</math> is exhaust temperature, in K.</li> <li>• <math>T_{target}</math> is target torque, in N·m.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul>

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**Plot exhaust temperature map – Plot table**

button

Click to plot table.

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**Exhaust temperature map, f\_texh\_3d – 3D lookup table**

M-by-N-by-L array

Input Command Setting	Description
Fuel mass	<p>The engine exhaust temperature table is a function of commanded fuel mass and engine speed, <math>T_{exh} = f(F, N, Temp_{Eng})</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>T_{exh}</math> is exhaust temperature, in K.</li> <li>• <math>F</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>N</math> is engine speed, in rpm.</li> <li>• <math>Temp_{Eng}</math> is engine temperature, in K.</li> </ul>
Torque	<p>The engine exhaust temperature table is a function of target torque and engine speed, <math>T_{exh} = f(T_{target}, N, Temp_{Eng})</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>T_{exh}</math> is exhaust temperature, in K.</li> <li>• <math>T_{target}</math> is target torque, in N·m.</li> <li>• <math>N</math> is engine speed, in rpm.</li> <li>• <math>Temp_{Eng}</math> is engine temperature, in K.</li> </ul>

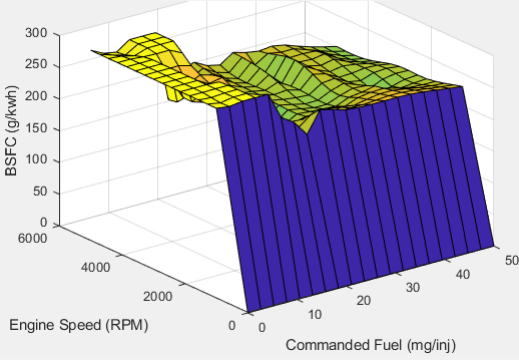

**Dependencies**

To enable this parameter, select **Input engine temperature**.

**Efficiency**

**BSFC map, f\_eff – 2D lookup table**

M-by-N matrix

Input Command Setting	Description
Fuel mass	<p>The brake-specific fuel consumption (BSFC) efficiency is a function of commanded fuel mass and engine speed, <math>BSFC = f(F, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>BSFC</math> is BSFC, in g/kWh.</li> <li>• <math>F</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul> 
Torque	<p>The brake-specific fuel consumption (BSFC) efficiency is a function of target torque and engine speed, <math>BSFC = f(T_{target}, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>BSFC</math> is BSFC, in g/kWh.</li> <li>• <math>T_{target}</math> is target torque, in N·m.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul>

#### Dependencies

To enable this parameter, clear **Input engine temperature**.

#### Plot BSFC map – Plot table button

Click to plot table.

#### Dependencies

To enable this parameter, clear **Input engine temperature**.

#### BSFC map, f\_eff\_3d – 3D lookup table

M-by-N-by-L array

Input Command Setting	Description
Fuel mass	<p>The brake-specific fuel consumption (BSFC) efficiency is a function of commanded fuel mass and engine speed, <math>BSFC = f(F, N, Temp_{Eng})</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>BSFC</math> is BSFC, in g/kWh.</li> <li>• <math>F</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>N</math> is engine speed, in rpm.</li> <li>• <math>Temp_{Eng}</math> is engine temperature, in K.</li> </ul>

Input Command Setting	Description
Torque	<p>The brake-specific fuel consumption (BSFC) efficiency is a function of target torque and engine speed, <math>BSFC = f(T_{target}, N, Temp_{Eng})</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>BSFC</math> is BSFC, in g/kWh.</li> <li>• <math>T_{target}</math> is target torque, in N·m.</li> <li>• <math>N</math> is engine speed, in rpm.</li> <li>• <math>Temp_{Eng}</math> is engine temperature, in K.</li> </ul>

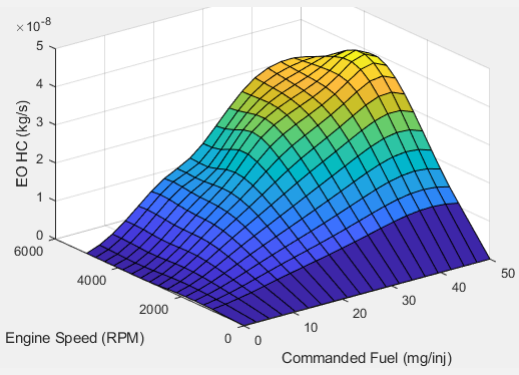

**Dependencies**

To enable this parameter, select **Input engine temperature**.

**HC**

**E0 HC map, f\_hc – 2D lookup table**

M-by-N matrix

Input Command Setting	Description
Fuel mass	<p>The engine-out hydrocarbon emissions are a function of commanded fuel mass and engine speed, <math>EO\ HC = f(F, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>EO\ HC</math> is engine-out hydrocarbon emissions, in kg/s.</li> <li>• <math>F</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul> 
Torque	<p>The engine-out hydrocarbon emissions are a function of target torque and engine speed, <math>EO\ HC = f(T_{target}, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>EO\ HC</math> is engine-out hydrocarbon emissions, in kg/s.</li> <li>• <math>T_{target}</math> is target torque, in N·m.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul>

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**Plot E0 HC map – Plot table**

button

Click to plot table.

#### Dependencies

To enable this parameter, clear **Input engine temperature**.

#### EO HC map, $f_{hc\_3d}$ — 3D lookup table

M-by-N-by-L array

Input Command Setting	Description
Fuel mass	<p>The engine-out hydrocarbon emissions are a function of commanded fuel mass and engine speed, <math>EO HC = f(F, N, Temp_{Eng})</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>EO HC</math> is engine-out hydrocarbon emissions, in kg/s.</li> <li>• <math>F</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>N</math> is engine speed, in rpm.</li> <li>• <math>Temp_{Eng}</math> is engine temperature, in K.</li> </ul>
Torque	<p>The engine-out hydrocarbon emissions are a function of target torque and engine speed, <math>EO HC = f(T_{target}, N, Temp_{Eng})</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>EO HC</math> is engine-out hydrocarbon emissions, in kg/s.</li> <li>• <math>T_{target}</math> is target torque, in N·m.</li> <li>• <math>N</math> is engine speed, in rpm.</li> <li>• <math>Temp_{Eng}</math> is engine temperature, in K.</li> </ul>

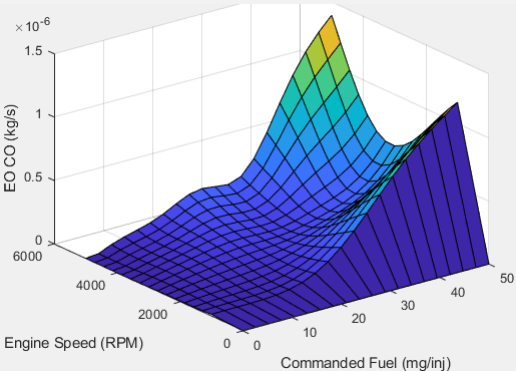

#### Dependencies

To enable this parameter, select **Input engine temperature**.

#### CO

#### EO CO map, $f_{co}$ — 2D lookup table

M-by-N matrix

Input Command Setting	Description
Fuel mass	<p>The engine-out carbon monoxide emissions are a function of commanded fuel mass and engine speed, <math>EO\ CO = f(F, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>EO\ CO</math> is engine-out carbon monoxide emissions, in kg/s.</li> <li>• <math>F</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul> 
Torque	<p>The engine-out carbon monoxide emissions are a function of target torque and engine speed, <math>EO\ CO = f(T_{target}, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>EO\ CO</math> is engine-out carbon monoxide emissions, in kg/s.</li> <li>• <math>T_{target}</math> is target torque, in N·m.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul>

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**Plot EO CO map – Plot table**

button

Click to plot table.

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**EO CO map, f\_co\_3d – 3D lookup table**

M-by-N-by-L array

Input Command Setting	Description
Fuel mass	<p>The engine-out carbon monoxide emissions are a function of commanded fuel mass and engine speed, <math>EO\ CO = f(F, N, Temp_{Eng})</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>EO\ CO</math> is engine-out carbon monoxide emissions, in kg/s.</li> <li>• <math>F</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>N</math> is engine speed, in rpm.</li> <li>• <math>Temp_{Eng}</math> is engine temperature, in K.</li> </ul>
Torque	<p>The engine-out carbon monoxide emissions are a function of target torque and engine speed, <math>EO\ CO = f(T_{target}, N, Temp_{Eng})</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>EO\ CO</math> is engine-out carbon monoxide emissions, in kg/s.</li> <li>• <math>T_{target}</math> is target torque, in N·m.</li> <li>• <math>N</math> is engine speed, in rpm.</li> <li>• <math>Temp_{Eng}</math> is engine temperature, in K.</li> </ul>

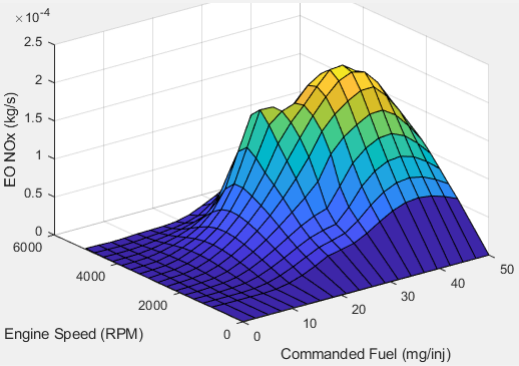

### Dependencies

To enable this parameter, select **Input engine temperature**.

### NOx

#### EO NOx map, $f_{nox}$ — 2D lookup table

M-by-N matrix

Input Command Setting	Description
Fuel mass	<p>The engine-out nitric oxide and nitrogen dioxide emissions are a function of commanded fuel mass and engine speed, <math>EO\ NOx = f(F, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>EO\ NOx</math> is engine-out nitric oxide and nitrogen dioxide emissions, in kg/s.</li> <li>• <math>F</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul> 

Input Command Setting	Description
Torque	<p>The engine-out nitric oxide and nitrogen dioxide emissions are a function of target torque and engine speed, <math>EO\ NO_x = f(T_{target}, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>EO\ NO_x</math> is engine-out nitric oxide and nitrogen dioxide emissions, in kg/s.</li> <li>• <math>T_{target}</math> is target torque, in N·m.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul>

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**Plot EO NOx map – Plot table**

button

Click to plot table.

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**EO NOx map, f\_nox\_3d – 3D lookup table**

M-by-N-by-L array

Input Command Setting	Description
Fuel mass	<p>The engine-out nitric oxide and nitrogen dioxide emissions are a function of commanded fuel mass, engine speed, and engine temperature, <math>EO\ NO_x = f(F, N, Temp_{Eng})</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>EO\ NO_x</math> is engine-out nitric oxide and nitrogen dioxide emissions, in kg/s.</li> <li>• <math>F</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>N</math> is engine speed, in rpm.</li> <li>• <math>Temp_{Eng}</math> is engine temperature, in K.</li> </ul>
Torque	<p>The engine-out nitric oxide and nitrogen dioxide emissions are a function of target torque, engine speed, and engine temperature, <math>EO\ NO_x = f(T_{target}, N, Temp_{Eng})</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>EO\ NO_x</math> is engine-out nitric oxide and nitrogen dioxide emissions, in kg/s.</li> <li>• <math>T_{target}</math> is target torque, in N·m.</li> <li>• <math>N</math> is engine speed, in rpm.</li> <li>• <math>Temp_{Eng}</math> is engine temperature, in K.</li> </ul>

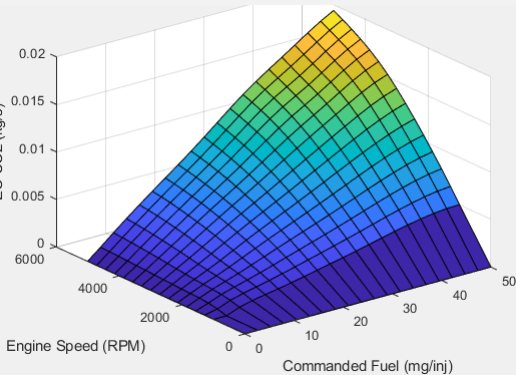

**Dependencies**

To enable this parameter, select **Input engine temperature**.

**CO2****E0 CO2 map, f\_co2 – 2D lookup table**

M-by-N matrix

Input Command Setting	Description
Fuel mass	<p>The engine-out carbon dioxide emissions are a function of commanded fuel mass and engine speed, <math>EO\ CO_2 = f(F, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>EO\ CO_2</math> is engine-out carbon dioxide emissions, in kg/s.</li> <li>• <math>F</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul> 
Torque	<p>The engine-out carbon dioxide emissions are a function of target torque and engine speed, <math>EO\ CO_2 = f(T_{target}, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>EO\ CO_2</math> is engine-out carbon dioxide emissions, in kg/s.</li> <li>• <math>T_{target}</math> is target torque, in N·m.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul>

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**Plot CO2 map – Plot table**

button

Click to plot table.

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**E0 CO2 map, f\_co2\_3d – 3D lookup table**

M-by-N-by-L array

Input Command Setting	Description
Fuel mass	<p>The engine-out carbon dioxide emissions are a function of commanded fuel mass, engine speed, and engine temperature, <math>EO\ CO_2 = f(F, N, Temp_{Eng})</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>EO\ CO_2</math> is engine-out carbon dioxide emissions, in kg/s.</li> <li>• <math>F</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>N</math> is engine speed, in rpm.</li> <li>• <math>Temp_{Eng}</math> is engine temperature, in K.</li> </ul>
Torque	<p>The engine-out carbon dioxide emissions are a function of target torque, engine speed, and engine temperature, <math>EO\ CO_2 = f(T_{target}, N, Temp_{Eng})</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>EO\ CO_2</math> is engine-out carbon dioxide emissions, in kg/s.</li> <li>• <math>T_{target}</math> is target torque, in N·m.</li> <li>• <math>N</math> is engine speed, in rpm.</li> <li>• <math>Temp_{Eng}</math> is engine temperature, in K.</li> </ul>

**Dependencies**

To enable this parameter, select **Input engine temperature**.

**PM**

**E0 PM map, f\_pm – 2D lookup table**

M-by-N matrix

Input Command Setting	Description
Fuel mass	<p>The engine-out PM emissions are a function of commanded fuel mass and engine speed, where:</p> <ul style="list-style-type: none"> <li>• <math>EO\ PM</math> is engine-out PM emissions, in kg/s.</li> <li>• <math>F</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul>
Torque	<p>The engine-out PM emissions are a function of target torque and engine speed, <math>EO\ PM = f(T_{target}, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>EO\ PM</math> is engine-out PM emissions, in kg/s.</li> <li>• <math>T_{target}</math> is target torque, in N·m.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul>

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**Plot E0 PM map – Plot table**

button

Click to plot table.

### Dependencies

To enable this parameter, clear **Input engine temperature**.

### EO PM map, $f_{pm\_3d}$ — 3D lookup table

M-by-N-by-L array

Input Command Setting	Description
Fuel mass	<p>The engine-out PM emissions are a function of commanded fuel mass, engine speed, and engine temperature, where:</p> <ul style="list-style-type: none"> <li>• <math>EO\ PM</math> is engine-out PM emissions, in kg/s.</li> <li>• <math>F</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>N</math> is engine speed, in rpm.</li> <li>• <math>Temp_{Eng}</math> is engine temperature, in K.</li> </ul>
Torque	<p>The engine-out PM emissions are a function of target torque, engine speed, and engine temperature, <math>EO\ PM = f(T_{target}, N, T)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>EO\ PM</math> is engine-out PM emissions, in kg/s.</li> <li>• <math>T_{target}</math> is target torque, in N·m.</li> <li>• <math>N</math> is engine speed, in rpm.</li> <li>• <math>Temp_{Eng}</math> is engine temperature, in K.</li> </ul>

### Dependencies

To enable this parameter, select **Input engine temperature**.

## Mapped SI Engine

Spark-ignition engine model using lookup tables

**Library:** Powertrain Blockset / Propulsion / Combustion Engines  
Vehicle Dynamics Blockset / Powertrain / Propulsion

### Description

The Mapped SI Engine block implements a mapped spark-ignition (SI) engine model using power, air mass flow, fuel flow, exhaust temperature, efficiency, and emission performance lookup tables. You can use the block for:

- Hardware-in-the-loop (HIL) engine control design
- Vehicle-level fuel economy and performance simulations

The block enables you to specify lookup tables for these engine characteristics. The lookup tables, developed with the Model-Based Calibration Toolbox, are functions of commanded torque,  $T_{cmd}$ , brake torque,  $T_{brake}$ , and engine speed,  $N$ . If you select **Input engine temperature**, the tables are also a function of engine temperature,  $Temp_{Eng}$ .

Table	Input Engine Temperature Parameter Setting	
	off	on
Power	$f(T_{cmd}, N)$	$f(T_{cmd}, N, Temp_{Eng})$
Air	$f(T_{brake}, N)$	$f(T_{brake}, N, Temp_{Eng})$
Fuel		
Temperature		
Efficiency		
HC		
CO		
NOx		
CO2		
PM		

To bound the Mapped SI Engine block output, the block does not extrapolate the lookup table data.

### Virtual Calibration

If you have Model-Based Calibration Toolbox, click **Calibrate Maps** to virtually calibrate the 2D lookup tables using measured data. The dialog box steps through these tasks.

Task	Description				
Import firing data	<p>Import this loss data from a file. For example, open <code>&lt;matlabroot&gt;/toolbox/autobks/autodemos/projectsrc/SIDynamometer/CalMappedEng/SiEngineData.xlsx</code>.</p> <p>For more information, see “Using Data” (Model-Based Calibration Toolbox).</p> <table border="1" data-bbox="505 478 1468 905"> <thead> <tr> <th data-bbox="505 478 862 520">Required Data</th> <th data-bbox="862 478 1468 520">Optional Data</th> </tr> </thead> <tbody> <tr> <td data-bbox="505 520 862 905"> <ul style="list-style-type: none"> <li>• Engine speed, rpm</li> <li>• Engine torque, N·m</li> </ul> </td> <td data-bbox="862 520 1468 905"> <ul style="list-style-type: none"> <li>• Air mass flow rate, kg/s</li> <li>• Brake specific fuel consumption, g/(kW·h)</li> <li>• CO<sub>2</sub> mass flow rate, kg/s</li> <li>• CO mass flow rate, kg/s</li> <li>• Exhaust temperature, K</li> <li>• Fuel mass flow rate, kg/s</li> <li>• HC mass flow rate, kg/s</li> <li>• NO<sub>x</sub> mass flow rate, kg/s</li> <li>• Particulate matter mass flow rate, kg/s</li> </ul> </td> </tr> </tbody> </table> <p>Collect firing data at steady-state operating conditions when injectors deliver the fuel. Data should cover the engine speed and torque operating range. Model-Based Calibration Toolbox uses the firing data boundary as the maximum torque.</p> <p>To filter or edit the data, select <b>Edit in Application</b>. The Model-Based Calibration Toolbox Data Editor opens.</p>	Required Data	Optional Data	<ul style="list-style-type: none"> <li>• Engine speed, rpm</li> <li>• Engine torque, N·m</li> </ul>	<ul style="list-style-type: none"> <li>• Air mass flow rate, kg/s</li> <li>• Brake specific fuel consumption, g/(kW·h)</li> <li>• CO<sub>2</sub> mass flow rate, kg/s</li> <li>• CO mass flow rate, kg/s</li> <li>• Exhaust temperature, K</li> <li>• Fuel mass flow rate, kg/s</li> <li>• HC mass flow rate, kg/s</li> <li>• NO<sub>x</sub> mass flow rate, kg/s</li> <li>• Particulate matter mass flow rate, kg/s</li> </ul>

Task	Description
Update block parameters	Update the block lookup table and breakpoint parameters with the calibration.

### Cylinder Air Mass

The block calculates the normalized cylinder air mass using these equations.

$$M_{Nom} = \frac{P_{std} V_d}{N_{cyl} R_{air} T_{std}}$$

$$L = \frac{\left(\frac{60s}{min}\right) Cps \cdot \dot{m}_{air}}{\left(\frac{1000g}{Kg}\right) N_{cyl} \cdot N \cdot M_{Nom}}$$

The equations use these variables.

$L$	Normalized cylinder air mass
$M_{Nom}$	Nominal engine cylinder air mass at standard temperature and pressure, piston at bottom dead center (BDC) maximum volume, in kg
$Cps$	Crankshaft revolutions per power stroke, rev/stroke
$P_{std}$	Standard pressure
$T_{std}$	Standard temperature
$R_{air}$	Ideal gas constant for air and burned gas mixture
$V_d$	Displaced volume
$N_{cyl}$	Number of engine cylinders
$N$	Engine speed
$\dot{m}_{intk}$	Engine air mass flow, in g/s

### Turbocharger Lag

To model turbocharger lag, select **Include turbocharger lag effect**. During throttle control, the time constant models the manifold filling and emptying dynamics. When the torque request requires a turbocharger boost, the block uses a larger time constant to represent the turbocharger lag. The block uses these equations.

Dynamic torque	$\frac{dT_{brake}}{dt} = \frac{1}{\tau_{eng}} (T_{stdy} - T_{brake})$
Boost time constant	$\tau_{bst} = \begin{cases} \tau_{bst, rising} & \text{when } T_{stdy} > T_{brake} \\ \tau_{bst, falling} & \text{when } T_{stdy} \leq T_{brake} \end{cases}$
Final time constant	$\tau_{eng} = \begin{cases} \tau_{thr} & \text{when } T_{brake} < f_{bst}(N) \\ \tau_{bst} & \text{when } T_{brake} \geq f_{bst}(N) \end{cases}$

The equations use these variables.

$T_{brake}$	Brake torque
-------------	--------------

$T_{stdy}$	Steady-state target torque
$\tau_{bst}$	Boost time constant
$\tau_{bst,rising}$	Boost rising and falling time constant, respectively
$\tau_{bst,falling}$	
$\tau_{eng}$	Final time constant
$\tau_{thr}$	Time constant during throttle control
$f_{bst}(N)$	Boost torque speed line
$N$	Engine speed

### Fuel Flow

To calculate the fuel economy for high-fidelity models, the block uses the volumetric fuel flow.

$$Q_{fuel} = \frac{\dot{m}_{fuel}}{\left(\frac{1000kg}{m^3}\right)Sg_{fuel}}$$

The equation uses these variables.

$\dot{m}_{fuel}$	Fuel mass flow
$Sg_{fuel}$	Specific gravity of fuel
$Q_{fuel}$	Volumetric fuel flow

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Equations
PwrInflow	PwrTrnsfrd — Power transferred between blocks <ul style="list-style-type: none"> <li>Positive signals indicate flow into block</li> <li>Negative signals indicate flow out of block</li> </ul>	PwrCrkshft	Crankshaft power $-\tau_{eng}\omega$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred <ul style="list-style-type: none"> <li>Positive signals indicate an input</li> <li>Negative signals indicate a loss</li> </ul>	PwrFuel	Fuel input power $\dot{m}_{fuel}LHV$
		PwrLoss	Power loss $\tau_{eng}\omega - \dot{m}_{fuel}LHV$
PwrStored — Stored energy rate of change <ul style="list-style-type: none"> <li>Positive signals indicate an increase</li> <li>Negative signals indicate a decrease</li> </ul>		Not used	

The equations use these variables.

$LHV$	Fuel lower heating value
-------	--------------------------

$\omega$	Engine speed, rad/s
$\dot{m}_{fuel}$	Fuel mass flow
$\tau_{eng}$	Fuel mass per injection time constant

## Ports

### Input

#### TrqCmd – Commanded torque

scalar

Torque,  $T_{cmd}$ , in N·m.

#### EngSpd – Engine speed

scalar

Engine speed,  $N$ , in rpm.

#### EngTemp – Engine temperature

scalar

Engine temperature,  $Temp_{Eng}$ , in K.

### Dependencies

To enable this port, select **Input engine temperature**.

### Output

#### Info – Bus signal

bus

Bus signal containing these block calculations.

Signal	Description	Units
IntkGassMassFlw	Engine air mass flow output	kg/s
NrmlzdAirChrg	Normalized engine cylinder air mass	N/A
Afr	Air-fuel ratio (AFR)	N/A
FuelMassFlw	Engine fuel flow output	kg/s
FuelVolFlw	Volumetric fuel flow	m <sup>3</sup> /s
ExhManGasTemp	Engine exhaust gas temperature	K
EngTrq	Engine torque output	N·m
EngSpd	Engine speed	rpm

Signal		Description	Units	
CrkAng		Engine crankshaft absolute angle $\int_0^{(360)Cps} EngSpd \frac{180}{30} d\theta$ where <i>Cps</i> is crankshaft revolutions per power stroke.	degrees crank angle	
Bsfc		Engine brake-specific fuel consumption (BSFC)	g/kWh	
EoHC		Engine out hydrocarbon emission mass flow	kg/s	
EoCO		Engine out carbon monoxide emission mass flow rate	kg/s	
EoNOx		Engine out nitric oxide and nitrogen dioxide emissions mass flow	kg/s	
EoCO2		Engine out carbon dioxide emission mass flow	kg/s	
EoPM		Engine out particulate matter emission mass flow	kg/s	
PwrInfo	PwrTrnsfrd	PwrCrkshft	Crankshaft power	W
	PwrNotTrnsfrd	PwrFuel	Fuel input power	W
		PwrLoss	Power loss	W
	PwrStored		<i>Not used</i>	

**EngTrq – Engine brake torque**

scalar

Engine brake torque,  $T_{brake}$ , in N·m.**Parameters****Block Options****Include turbocharger lag effect – Increase time constant**

off (default)

To model turbocharger lag, select **Include turbocharger lag effect**. During throttle control, the time constant models the manifold filling and emptying dynamics. When the torque request requires a turbocharger boost, the block uses a larger time constant to represent the turbocharger lag. The block uses these equations.

Dynamic torque	$\frac{dT_{brake}}{dt} = \frac{1}{\tau_{eng}}(T_{stdy} - T_{brake})$
----------------	--

Boost time constant	$\tau_{bst} = \begin{cases} \tau_{bst, rising} & \text{when } T_{stdy} > T_{brake} \\ \tau_{bst, falling} & \text{when } T_{stdy} \leq T_{brake} \end{cases}$
Final time constant	$\tau_{eng} = \begin{cases} \tau_{thr} & \text{when } T_{brake} < f_{bst}(N) \\ \tau_{bst} & \text{when } T_{brake} \geq f_{bst}(N) \end{cases}$

The equations use these variables.

$T_{brake}$	Brake torque
$T_{stdy}$	Steady-state target torque
$\tau_{bst}$	Boost time constant
$\tau_{bst, rising}$ , $\tau_{bst, falling}$	Boost rising and falling time constant, respectively
$\tau_{eng}$	Final time constant
$\tau_{thr}$	Time constant during throttle control
$f_{bst}(N)$	Boost torque speed line
$N$	Engine speed

**Dependencies**

Selecting **Include turbocharger lag effect** enables these parameters:

- **Boost torque line, f\_tbrake\_bst**
- **Time constant below boost line, tau\_thr**
- **Rising torque boost time constant, tau\_bst\_rising**
- **Falling torque boost time constant, tau\_bst\_falling**

**Input engine temperature – Create input port**

off (default) | on

Select this to create the EngTemp input port.

The block enables you to specify lookup tables for these engine characteristics. The lookup tables, developed with the Model-Based Calibration Toolbox, are functions of commanded torque,  $T_{cmd}$ , brake torque,  $T_{brake}$ , and engine speed,  $N$ . If you select **Input engine temperature**, the tables are also a function of engine temperature,  $Temp_{Eng}$ .

Table	Input Engine Temperature Parameter Setting	
	off	on
Power	$f(T_{cmd}, N)$	$f(T_{cmd}, N, Temp_{Eng})$
Air	$f(T_{brake}, N)$	$f(T_{brake}, N, Temp_{Eng})$
Fuel		
Temperature		
Efficiency		
HC		
CO		

Table	Input Engine Temperature Parameter Setting	
	off	on
NOx		
CO2		
PM		

### Configuration

#### Calibrate Maps – Calibrate tables with measured data selection

If you have Model-Based Calibration Toolbox, click **Calibrate Maps** to virtually calibrate the 2D lookup tables using measured data. The dialog box steps through these tasks.

Task	Description				
Import firing data	<p>Import this loss data from a file. For example, open <code>&lt;matlabroot&gt;/toolbox/autoblks/autodemos/projectsrc/SIDynamometer/CalMappedEng/SiEngineData.xlsx</code>.</p> <p>For more information, see “Using Data” (Model-Based Calibration Toolbox).</p> <table border="1"> <thead> <tr> <th>Required Data</th> <th>Optional Data</th> </tr> </thead> <tbody> <tr> <td> <ul style="list-style-type: none"> <li>Engine speed, rpm</li> <li>Engine torque, N·m</li> </ul> </td> <td> <ul style="list-style-type: none"> <li>Air mass flow rate, kg/s</li> <li>Brake specific fuel consumption, g/(kW·h)</li> <li>CO2 mass flow rate, kg/s</li> <li>CO mass flow rate, kg/s</li> <li>Exhaust temperature, K</li> <li>Fuel mass flow rate, kg/s</li> <li>HC mass flow rate, kg/s</li> <li>NOx mass flow rate, kg/s</li> <li>Particulate matter mass flow rate, kg/s</li> </ul> </td> </tr> </tbody> </table> <p>Collect firing data at steady-state operating conditions when injectors deliver the fuel. Data should cover the engine speed and torque operating range. Model-Based Calibration Toolbox uses the firing data boundary as the maximum torque.</p> <p>To filter or edit the data, select <b>Edit in Application</b>. The Model-Based Calibration Toolbox Data Editor opens.</p>	Required Data	Optional Data	<ul style="list-style-type: none"> <li>Engine speed, rpm</li> <li>Engine torque, N·m</li> </ul>	<ul style="list-style-type: none"> <li>Air mass flow rate, kg/s</li> <li>Brake specific fuel consumption, g/(kW·h)</li> <li>CO2 mass flow rate, kg/s</li> <li>CO mass flow rate, kg/s</li> <li>Exhaust temperature, K</li> <li>Fuel mass flow rate, kg/s</li> <li>HC mass flow rate, kg/s</li> <li>NOx mass flow rate, kg/s</li> <li>Particulate matter mass flow rate, kg/s</li> </ul>
Required Data	Optional Data				
<ul style="list-style-type: none"> <li>Engine speed, rpm</li> <li>Engine torque, N·m</li> </ul>	<ul style="list-style-type: none"> <li>Air mass flow rate, kg/s</li> <li>Brake specific fuel consumption, g/(kW·h)</li> <li>CO2 mass flow rate, kg/s</li> <li>CO mass flow rate, kg/s</li> <li>Exhaust temperature, K</li> <li>Fuel mass flow rate, kg/s</li> <li>HC mass flow rate, kg/s</li> <li>NOx mass flow rate, kg/s</li> <li>Particulate matter mass flow rate, kg/s</li> </ul>				

Task	Description
Import non-firing data	<p>Import this non-firing data from a file. For example, open <code>&lt;matlabroot&gt;/toolbox/autoblks/autodemos/projectsrc/SIDynamometer/CalMappedEng/SiEngineData.xlsx</code>.</p> <ul style="list-style-type: none"> <li>• Engine speed, rpm</li> <li>• Engine torque, N·m</li> </ul> <p>Collect non-firing (motoring) data at steady-state operating conditions when fuel is cut off. All non-firing torque points must be less than zero. Non-firing data is a function of engine speed only.</p>
Generate response models	<p>For both firing and non-firing data, the Model-Based Calibration Toolbox uses test plans to fit data to Gaussian process models (GPMs).</p> <p>To assess or adjust the response model fit, select <b>Edit in Application</b>. The Model-Based Calibration Toolbox Model Browser opens. For more information, see “Model Assessment” (Model-Based Calibration Toolbox).</p>
Generate calibration	<p>Model-Based Calibration Toolbox calibrates the firing and non-firing response models and generates calibrated tables.</p> <p>To assess or adjust the calibration, select <b>Edit in Application</b>. The Model-Based Calibration Toolbox CAGE Browser opens. For more information, see “Calibration Lookup Tables” (Model-Based Calibration Toolbox).</p>
Update block parameters	<p>Update the block lookup table and breakpoint parameters with the calibration.</p>

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**Breakpoints for commanded torque, f\_tbrake\_t\_bpt – Breakpoints**

1-by-M vector

Breakpoints, in N·m.

**Breakpoints for engine speed input, f\_tbrake\_n\_bpt – Breakpoints**

1-by-N vector

Breakpoints, in rpm.

**Breakpoints for temperature input, f\_tbrake\_engtmp\_bpt – Breakpoints**

[233.15 273.15 373.15] (default) | 1-by-L vector

Breakpoints, in K.

**Dependencies**

To enable this parameter, select **Input engine temperature**.

**Number of cylinders, NCyl – Number**

4 (default) | scalar

Number of cylinders.

**Crank revolutions per power stroke, Cps – Crank revolutions**

2 (default) | scalar

Crank revolutions per power stroke.

**Total displaced volume, Vd – Volume**

0.0015 (default) | scalar

Volume displaced by engine, in  $m^3$ .**Fuel lower heating value, Lhv – Heating value**

45e6 (default) | scalar

Fuel lower heating value,  $LHV$ , in J/kg.**Fuel specific gravity, Sg – Specific gravity**

0.745 (default) | scalar

Specific gravity of fuel,  $Sg_{fuel}$ , dimensionless.**Ideal gas constant air, Rair – Constant**

287 (default) | scalar

Ideal gas constant of air and residual gas entering the engine intake port, in J/(kg\*K).

**Air standard pressure, Pstd – Pressure**

101325 (default) | scalar

Standard air pressure, in Pa.

**Air standard temperature, Tstd – Temperature**

293.15 (default) | scalar

Standard air temperature, in K.

**Boost torque line, f\_tbrake\_bst – Boost lag**

1-by-M vector

Boost torque line,  $f_{bst}(N)$ , in N·m.**Dependencies**To enable this parameter, select **Include turbocharger lag effect**.**Time constant below boost line – Time constant below**

0.2 (default) | scalar

Time constant below boost line,  $\tau_{thr}$ , in s.**Dependencies**To enable this parameter, select **Include turbocharger lag effect**.**Rising torque boost time constant, tau\_bst\_rising – Rising time constant**

1.5 (default) | scalar

Rising torque boost time constant,  $\tau_{bst,rising}$ , in s.

**Dependencies**

To enable this parameter, select **Include turbocharger lag effect**.

**Falling torque boost time constant, tau\_bst\_falling** — Falling time constant  
1 (default) | scalar

Falling torque boost time constant,  $\tau_{bst,falling}$ , in s.

**Dependencies**

To enable this parameter, select **Include turbocharger lag effect**.

**Power**

**Brake torque map, f\_tbrake** — 2D lookup table  
M-by-N matrix

The engine torque lookup table is a function of commanded engine torque and engine speed,  $T = f(T_{cmd}, N)$ , where:

- $T$  is engine torque, in N·m.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

**Plot brake torque map** — Plot table  
button

Click to plot table.

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**Brake torque map, f\_tbrake\_3d** — 3D lookup table  
M-by-N-by-L array

The engine torque lookup table is a function of commanded engine torque, engine speed, and engine temperature,  $T = f(T_{cmd}, N, Temp_{Eng})$ , where:

- $T$  is engine torque, in N·m.
- $T_{cmd}$  is commanded engine torque, in N·m.

- $N$  is engine speed, in rpm.
- $Temp_{Eng}$  is engine temperature, in K.

### Dependencies

To enable this parameter, select **Input engine temperature**.

### Air

#### Air mass flow map, $f_{air}$ – 2D lookup table

M-by-N matrix

The engine air mass flow lookup table is a function of commanded engine torque and engine speed,  $\dot{m}_{intk} = f(T_{cmd}, N)$ , where:

- $\dot{m}_{intk}$  is engine air mass flow, in kg/s.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, clear **Input engine temperature**.

#### Plot air mass map – Plot table

button

Click to plot table.

### Dependencies

To enable this parameter, clear **Input engine temperature**.

#### Air mass flow map, $f_{air\_3d}$ – 3D lookup table

M-by-N-by-L array

The engine air mass flow lookup table is a function of commanded engine torque, engine speed, and engine temperature,  $\dot{m}_{intk} = f(T_{cmd}, N, Temp_{Eng})$ , where:

- $\dot{m}_{intk}$  is engine air mass flow, in kg/s.
- $T_{cmd}$  is commanded engine torque, in N·m.

- $N$  is engine speed, in rpm.
- $Temp_{Eng}$  is engine temperature, in K.

**Dependencies**

To enable this parameter, select **Input engine temperature**.

**Fuel**

**Fuel flow map, f\_fuel – 2D lookup table**

M-by-N matrix

The engine fuel mass flow lookup table is a function of commanded engine torque and engine speed,  $MassFlow = f(T_{cmd}, N)$ , where:

- $MassFlow$  is engine fuel mass flow, in kg/s.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**Plot fuel flow map – Plot table**

button

Click to plot table.

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**Fuel flow map, f\_fuel\_3d – 3D lookup table**

M-by-N-by-L array

The engine fuel mass flow lookup table is a function of commanded engine torque, engine speed, and engine temperature,  $MassFlow = f(T_{cmd}, N, Temp_{Eng})$ , where:

- $MassFlow$  is engine fuel mass flow, in kg/s.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

- $Temp_{Eng}$  is engine temperature, in K.

### Dependencies

To enable this parameter, select **Input engine temperature**.

### Temperature

### Exhaust temperature map, $f_{texh}$ – 2D lookup table

M-by-N matrix

The engine exhaust temperature lookup table is a function of commanded engine torque and engine speed,  $T_{exh} = f(T_{cmd}, N)$ , where:

- $T_{exh}$  is exhaust temperature, in K.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, clear **Input engine temperature**.

### Plot exhaust temperature map – Plot table

button

Click to plot table.

### Dependencies

To enable this parameter, clear **Input engine temperature**.

### Exhaust temperature map, $f_{texh\_3d}$ – 3D lookup table

array

The engine exhaust temperature lookup table is a function of commanded engine torque, engine speed, and engine temperature,  $T_{exh} = f(T_{cmd}, N, Temp_{Eng})$ , where:

- $T_{exh}$  is exhaust temperature, in K.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.
- $Temp_{Eng}$  is engine temperature, in K.

**Dependencies**

To enable this parameter, select **Input engine temperature**.

**Efficiency****BSFC map, f\_eff — 2D lookup table**

M-by-N-by-L array

The brake-specific fuel consumption (BSFC) efficiency is a function of commanded engine torque and engine speed,  $BSFC = f(T_{cmd}, N)$ , where:

- $BSFC$  is BSFC, in g/kWh.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**Plot BSFC map — Plot table**

button

Click to plot table.

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**BSFC map, f\_eff\_3d — 3D lookup table**

M-by-N-by-L array

The brake-specific fuel consumption (BSFC) efficiency is a function of commanded engine torque, engine speed, and engine temperature,  $BSFC = f(T_{cmd}, N, Temp_{Eng})$ , where:

- $BSFC$  is BSFC, in g/kWh.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.
- $Temp_{Eng}$  is engine temperature, in K.

**Dependencies**

To enable this parameter, select **Input engine temperature**.

**HC****E0 HC map, f\_hc – 2D lookup table**

M-by-N matrix

The engine-out hydrocarbon emissions are a function of commanded engine torque and engine speed,  $EO\ HC = f(T_{cmd}, N)$ , where:

- $EO\ HC$  is engine-out hydrocarbon emissions, in kg/s.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**Plot E0 HC map – Plot table**

button

Click to plot table.

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**E0 HC map, f\_hc\_3d – 3D lookup table**

M-by-N-by-L array

The engine-out hydrocarbon emissions are a function of commanded engine torque, engine speed, and engine temperature,  $EO\ HC = f(T_{cmd}, N, Temp_{Eng})$ , where:

- $EO\ HC$  is engine-out hydrocarbon emissions, in kg/s.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.
- $Temp_{Eng}$  is engine temperature, in K.

**Dependencies**

To enable this parameter, select **Input engine temperature**.

**CO****E0 CO map, f\_co – 2D lookup table**

M-by-N matrix

The engine-out carbon monoxide emissions are a function of commanded engine torque and engine speed,  $EO\ CO = f(T_{cmd}, N)$ , where:

- $EO\ CO$  is engine-out carbon monoxide emissions, in kg/s.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**Plot E0 CO map – Plot table**

button

Click to plot table.

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**E0 HC map, f\_hc\_3d – 3D lookup table**

M-by-N-by-L array

The engine-out hydrocarbon emissions are a function of commanded engine torque, engine speed, and engine temperature,  $EO\ HC = f(T_{cmd}, N, Temp_{Eng})$ , where:

- $EO\ HC$  is engine-out hydrocarbon emissions, in kg/s.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.
- $Temp_{Eng}$  is engine temperature, in K.

**Dependencies**

To enable this parameter, select **Input engine temperature**.

**NOx****E0 NOx map, f\_nox – 2D lookup table**

M-by-N matrix

The engine-out nitric oxide and nitrogen dioxide emissions are a function of commanded engine torque and engine speed,  $EO\ NOx = f(T_{cmd}, N)$ , where:

- $EO\ NOx$  is engine-out nitric oxide and nitrogen dioxide emissions, in kg/s.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**Plot E0 NOx map – Plot table**

button

Click to plot table.

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**E0 NOx map, f\_nox\_3d – 3D lookup table**

M-by-N-by-L array

The engine-out nitric oxide and nitrogen dioxide emissions are a function of commanded engine torque, engine speed, and engine temperature,  $EO\ NOx = f(T_{cmd}, N, Temp_{Eng})$ , where:

- $EO\ NOx$  is engine-out nitric oxide and nitrogen dioxide emissions, in kg/s.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.
- $Temp_{Eng}$  is engine temperature, in K.

**Dependencies**

To enable this parameter, select **Input engine temperature**.

**CO2****E0 CO2 map, f\_co2 – 2D lookup table**

M-by-N matrix

The engine-out carbon dioxide emissions are a function of commanded engine torque and engine speed,  $EO\ CO2 = f(T_{cmd}, N)$ , where:

- $EO\ CO2$  is engine-out carbon dioxide emissions, in kg/s.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**Plot CO2 map – Plot table**

button

Click to plot table.

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**E0 CO2 map, f\_co2\_3d – 3D lookup table**

M-by-N-by-L array

The engine-out carbon dioxide emissions are a function of commanded engine torque, engine speed, and engine temperature,  $EO\ CO2 = f(T_{cmd}, N, Temp_{Eng})$ , where:

- $EO\ CO2$  is engine-out carbon dioxide emissions, in kg/s.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.
- $Temp_{Eng}$  is engine temperature, in K.

**Dependencies**

To enable this parameter, select **Input engine temperature**.

**PM****E0 PM map,  $f_{pm}$  – 2D lookup table**

M-by-N matrix

The engine-out particulate matter emissions are a function of commanded engine torque and engine speed, where:

- $EO\ PM$  is engine-out PM emissions, in kg/s.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**Plot E0 PM map – Plot table**

button

Click to plot table.

**Dependencies**

To enable this parameter, clear **Input engine temperature**.

**E0 PM map,  $f_{pm\_3d}$  – 3D lookup table**

M-by-N-by-L array

The engine-out particulate matter emissions are a function of commanded engine torque, engine speed, and engine temperature, where:

- $EO\ PM$  is engine-out PM emissions, in kg/s.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.
- $Temp_{Eng}$  is engine temperature, in K.

**Dependencies**

To enable this parameter, select **Input engine temperature**.

---

## Interior PMSM

Three-phase interior permanent magnet synchronous motor with sinusoidal back electromotive force

**Library:** Powertrain Blockset / Propulsion / Electric Motors and Inverters  
Motor Control Blockset / Electrical Systems / Motors

### Description

The Interior PMSM block implements a three-phase interior permanent magnet synchronous motor (PMSM) with sinusoidal back electromotive force. The block uses the three-phase input voltages to regulate the individual phase currents, allowing control of the motor torque or speed.

By default, the block sets the **Simulation type** parameter to **Continuous** to use a continuous sample time during simulation. If you want to generate code for fixed-step double- and single-precision targets, considering setting the parameter to **Discrete**. Then specify a **Sample Time, Ts** parameter.

On the **Parameters** tab, if you select **Back-emf**, the block implements this equation to calculate the permanent flux linkage constant.

$$\lambda_{pm} = \frac{1}{\sqrt{3}} \cdot \frac{K_e}{1000P} \cdot \frac{60}{2\pi}$$

### Motor Construction

This figure shows the motor construction with a single pole pair on the motor.

The motor magnetic field due to the permanent magnets creates a sinusoidal rate of change of flux with motor angle.

For the axes convention, the *a*-phase and permanent magnet fluxes are aligned when motor angle  $\theta_r$  is zero.

### Three-Phase Sinusoidal Model Electrical System

The block implements these equations, expressed in the motor flux reference frame (dq frame). All quantities in the motor reference frame are referred to the stator.

$$\omega_e = P\omega_m$$

$$\frac{d}{dt}i_d = \frac{1}{L_d}v_d - \frac{R}{L_d}i_d + \frac{L_q}{L_d}P\omega_m i_q$$

$$\frac{d}{dt}i_q = \frac{1}{L_q}v_q - \frac{R}{L_q}i_q - \frac{L_d}{L_q}P\omega_m i_d - \frac{\lambda_{pm}P\omega_m}{L_q}$$

$$T_e = 1.5P[\lambda_{pm}i_q + (L_d - L_q)i_d i_q]$$

The  $L_q$  and  $L_d$  inductances represent the relation between the phase inductance and the motor position due to the saliency of the motor.

The equations use these variables.

$L_q, L_d$	q- and d-axis inductances (H)
$R$	Resistance of the stator windings (ohm)
$i_q, i_d$	q- and d-axis currents (A)
$v_q, v_d$	q- and d-axis voltages (V)
$\omega_m$	Angular mechanical velocity of the motor (rad/s)
$\omega_e$	Angular electrical velocity of the motor (rad/s)
$\lambda_{pm}$	Permanent flux linkage constant (Wb)
$K_e$	Back electromotive force (EMF) (Vpk_LL/krpm, where Vpk_LL is the peak voltage line-to-line measurement)
$P$	Number of pole pairs
$T_e$	Electromagnetic torque (Nm)
$\Theta_e$	Electrical angle (rad)

### Mechanical System

The motor angular velocity is given by:

$$\frac{d}{dt}\omega_m = \frac{1}{J}(T_e - T_f - F\omega_m - T_m)$$

$$\frac{d\theta_m}{dt} = \omega_m$$

The equations use these variables.

$J$	Combined inertia of motor and load (kgm <sup>2</sup> )
$F$	Combined viscous friction of motor and load (N·m/(rad/s))
$\theta_m$	Motor mechanical angular position (rad)
$T_m$	Motor shaft torque (Nm)

$T_e$	Electromagnetic torque (Nm)
$T_f$	Motor shaft static friction torque (Nm)
$\omega_m$	Angular mechanical velocity of the motor (rad/s)

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Variable	Equations
PwrInfo	PwrTrnsfrd — Power transferred between blocks	PwrMtr	Mechanical power	$P_{mot} = -\omega_m T_e$
	<ul style="list-style-type: none"> <li>Positive signals indicate flow into block</li> <li>Negative signals indicate flow out of block</li> </ul>	PwrBus	Electrical power	$P_{bus} = v_{an}i_a + v_{bn}i_b + v_{cn}i_c$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred	PwrElecLoss	Resistive power loss	$P_{elec} = -\frac{3}{2}(R_s i_{sd}^2 + R_s i_{sq}^2)$
	<ul style="list-style-type: none"> <li>Positive signals indicate an input</li> <li>Negative signals indicate a loss</li> </ul>	PwrMechLoss	Mechanical power loss	<p>When <b>Port Configuration</b> is set to <b>Torque</b>:</p> $P_{mech} = -(\omega_m^2 F +  \omega_m  T_f)$ <p>When <b>Port Configuration</b> is set to <b>Speed</b>:</p> $P_{mech} = 0$
PwrStored — Stored energy rate of change	PwrMtrStored	Stored motor power	$P_{str}$	$P_{str} = \frac{P_{bus} + P_{mot} + P_{elec} + P_{mech}}$
<ul style="list-style-type: none"> <li>Positive signals indicate an increase</li> <li>Negative signals indicate a decrease</li> </ul>				

The equations use these variables.

$R_s$	Stator resistance (ohm)
$i_a, i_b, i_c$	Stator phase a, b, and c current (A)
$i_{sq}, i_{sd}$	Stator q- and d-axis currents (A)
$v_{an}, v_{bn}, v_{cn}$	Stator phase a, b, and c voltage (V)
$\omega_m$	Angular mechanical velocity of the rotor (rad/s)

$F$	Combined motor and load viscous damping (N·m/(rad/s))
$T_e$	Electromagnetic torque (Nm)
$T_f$	Combined motor and load friction torque (Nm)

### Amplitude invariant dq transformation

The block uses these equations to implement amplitude invariant  $dq$  transformation to ensure that the  $dq$  and three phase amplitudes are equal.

$$\begin{bmatrix} v_{sd} \\ v_{sq} \end{bmatrix} = \frac{2}{3} \begin{bmatrix} \cos(\theta_{da}) & \cos(\theta_{da} - \frac{2\pi}{3}) & \cos(\theta_{da} + \frac{2\pi}{3}) \\ -\sin(\theta_{da}) & -\sin(\theta_{da} - \frac{2\pi}{3}) & -\sin(\theta_{da} + \frac{2\pi}{3}) \end{bmatrix} \begin{bmatrix} v_a \\ v_b \\ v_c \end{bmatrix}$$

$$\begin{bmatrix} i_a \\ i_b \\ i_c \end{bmatrix} = \begin{bmatrix} \cos(\theta_{da}) & -\sin(\theta_{da}) \\ \cos(\theta_{da} - \frac{2\pi}{3}) & -\sin(\theta_{da} - \frac{2\pi}{3}) \\ \cos(\theta_{da} + \frac{2\pi}{3}) & -\sin(\theta_{da} + \frac{2\pi}{3}) \end{bmatrix} \begin{bmatrix} i_{sd} \\ i_{sq} \end{bmatrix}$$

The equations use these variables.

$\theta_{da}$	$dq$ stator electrical angle with respect to the rotor $a$ -axis (rad)
$v_{sq}, v_{sd}$	Stator $q$ - and $d$ -axis voltages (V)
$i_{sq}, i_{sd}$	Stator $q$ - and $d$ -axis currents (A)
$v_a, v_b, v_c$	Stator voltage phases $a, b, c$ (V)
$i_a, i_b, i_c$	Stator currents phases $a, b, c$ (A)

## Ports

### Input

#### LdTrq — Motor shaft torque

scalar

Motor shaft input torque,  $T_m$ , in N·m.

#### Dependencies

To create this port, select Torque for the **Port Configuration** parameter.

#### Spd — Motor shaft speed

scalar

Angular velocity of the motor,  $\omega_m$ , in rad/s.

#### Dependencies

To create this port, select Speed for the **Port Configuration** parameter.

#### PhaseVolt — Stator terminal voltages

1-by-3 array

Stator terminal voltages,  $V_a$ ,  $V_b$ , and  $V_c$ , in V.

**Dependencies**

To create this port, select Speed or Torque for the **Port Configuration** parameter.

**Output**

**Info – Bus signal**

bus

The bus signal contains these block calculations.

Signal	Description	Variable	Units		
IaStator	Stator phase current A	$i_a$	A		
IbStator	Stator phase current B	$i_b$	A		
IcStator	Stator phase current C	$i_c$	A		
IdSync	Direct axis current	$i_d$	A		
IqSync	Quadrature axis current	$i_q$	A		
VdSync	Direct axis voltage	$v_d$	V		
VqSync	Quadrature axis voltage	$v_q$	V		
MtrSpd	Angular mechanical velocity of the motor	$\omega_m$	rad/s		
MtrPos	Motor mechanical angular position	$\theta_m$	rad		
MtrTrq	Electromagnetic torque	$T_e$	N·m		
PwrInfo	PwrTrnsfrd	PwrMtr	Mechanical power	$P_{mot}$	W
		PwrBus	Electrical power	$P_{bus}$	W
	PwrNotTrnsfrd	PwrElecLoss	Resistive power loss	$P_{elec}$	W
		PwrMechLoss	Mechanical power loss	$P_{mech}$	W
	PwrStored	PwrMtrStored	Stored motor power	$P_{str}$	W

**PhaseCurr – Phase a, b, c current**

1-by-3 array

Phase a, b, c current,  $i_a$ ,  $i_b$ , and  $i_c$ , in A.

**MtrTrq – Motor torque**

scalar

Motor torque,  $T_{mtr}$ , in N·m.

**Dependencies**

To create this port, select Speed for the **Mechanical input configuration** parameter.

**MtrSpd – Motor speed**

scalar

Angular speed of the motor,  $\omega_{mtr}$ , in rad/s.

#### Dependencies

To create this port, select Torque for the **Mechanical input configuration** parameter.

## Parameters

#### Block Options

#### Mechanical input configuration – Select port configuration

Torque (default) | Speed

This table summarizes the port configurations.

Port Configuration	Creates Input Port	Creates Output Port
Torque	LdTrq	MtrSpd
Speed	Spd	MtrTrq

#### Simulation type – Select simulation type

Continuous (default) | Discrete

By default, the block uses a continuous sample time during simulation. If you want to generate code for single-precision targets, considering setting the parameter to **Discrete**.

#### Dependencies

Setting **Simulation type** to **Discrete** creates the **Sample Time, Ts** parameter.

#### Sample Time (Ts) – Sample time for discrete integration

scalar

Integration sample time for discrete simulation, in s.

#### Dependencies

Setting **Simulation type** to **Discrete** creates the **Sample Time, Ts** parameter.

#### Parameters

#### Number of pole pairs (P) – Pole pairs

scalar

Motor pole pairs,  $P$ .

#### Stator phase resistance per phase (Rs) – Resistance

scalar

Stator phase resistance per phase,  $R_s$ , in ohm.

#### Stator d-axis and q-axis inductance (Ldq) – Inductance

vector

Stator d-axis and q-axis inductance,  $L_d$ ,  $L_q$ , in H.

**Permanent flux linkage constant (lambda\_pm) – Flux**  
scalar

Permanent flux linkage constant,  $\lambda_{pm}$ , in Wb.

**Back-emf constant (Ke) – Back electromotive force**  
scalar

Back electromotive force, EMF,  $K_e$ , in Vpk\_LL/krpm. Vpk\_LL is the peak voltage line-to-line measurement.

To calculate the permanent flux linkage constant, the block implements this equation.

$$\lambda_{pm} = \frac{1}{\sqrt{3}} \cdot \frac{K_e}{1000P} \cdot \frac{60}{2\pi}$$

**Physical inertia, viscous damping, and static friction (mechanical) – Inertia, damping, friction**

vector

Mechanical properties of the motor:

- Inertia,  $J$ , in  $\text{kgm}^2$
- Viscous damping,  $F$ , in  $\text{N}\cdot\text{m}/(\text{rad}/\text{s})$
- Static friction,  $T_f$ , in  $\text{N}\cdot\text{m}$

**Dependencies**

To enable this parameter, select the Torque configuration parameter.

**Initial Values****Initial d-axis and q-axis current (idq0) – Current**

vector

Initial q- and d-axis currents,  $i_q$ ,  $i_d$ , in A.

**Initial mechanical position (theta\_init) – Angle**

scalar

Initial motor angular position,  $\theta_{m0}$ , in rad.

**Initial mechanical speed (omega\_init) – Speed**

scalar

Initial angular velocity of the motor,  $\omega_{m0}$ , in rad/s.

**Dependencies**

To enable this parameter, select the Torque configuration parameter.

## Interior PM Controller

Torque-based, field-oriented controller for an internal permanent magnet synchronous motor

**Library:** Powertrain Blockset / Propulsion / Electric Motor Controllers

### Description

The Interior PM Controller block implements a torque-based, field-oriented controller for an internal permanent magnet synchronous motor (PMSM) with an optional outer-loop speed controller. The internal torque control implements strategies for achieving maximum torque per ampere (MTPA) and weakening the magnetic flux. You can specify either the speed or torque control type.

The Interior PM Controller implements equations for speed control, torque determination, regulators, transforms, and motors.

The figure illustrates the information flow in the block.

The block implements equations that use these variables.

$\omega$	Rotor speed
$\omega^*$	Rotor speed command
$T^*$	Torque command
$i_d$	d-axis current
$i_d^*$	d-axis current command
$i_q$	q-axis current
$i_q^*$	q-axis current command

$v_d$	d-axis voltage
$v_d^*$	d-axis voltage command
$v_q$	q-axis voltage
$v_q^*$	q-axis voltage command
$v_a, v_b, v_c$	Stator phase a, b, c voltages
$i_a, i_b, i_c$	Stator phase a, b, c currents

### Speed Controller

To implement the speed controller, select the **Control Type** parameter `Speed Control`. If you select the **Control Type** parameter `Torque Control`, the block does not implement the speed controller.

The speed controller determines the torque command by implementing a state filter, and calculating the feedforward and feedback commands. If you do not implement the speed controller, input a torque command to the Interior PM Controller block.

### State Filter

The state filter is a low-pass filter that generates the acceleration command based on the speed command. On the **Speed Controller** tab:

- To make the speed-command lag time negligible, specify a **Bandwidth of the state filter** parameter.
- To calculate a **Speed regulation time constant, Ksf** gain based on the state filter bandwidth, select **Calculate Speed Regulator Gains**.

The discrete form of characteristic equation is given by:

$$z + K_{sf}T_{sm} - 1$$

The filter calculates the gain using this equation.

$$K_{sf} = \frac{1 - \exp(-T_{sm}2\pi EV_{sf})}{T_{sm}}$$

The equations use these variables.

$EV_{sf}$	Bandwidth of the speed command filter
$T_{sm}$	Motion controller sample time
$K_{sf}$	Speed regulator time constant

**State Feedback**

To generate the state feedback torque, the block uses the filtered speed error signal from the state filter. The feedback torque calculation also requires gains for speed regulator.

On the **Speed Controller** tab, select **Calculate Speed Regulator Gains** to calculate:

- **Proportional gain,  $b_a$**
- **Angular gain,  $K_{sa}$**
- **Rotational gain,  $K_{isa}$**

For the gain calculations, the block uses the inertia from the **Physical inertia, viscous damping, static friction** parameter value on the **Motor Parameters** tab.

The gains for the state feedback are calculated using these equations.

Calculation	Equations
Discrete forms of characteristic equation	$z^3 + \frac{(-3J_p + T_s b_a + T_s^2 K_{sa} + T_s^3 K_{isa})}{J_p} z^2 + \frac{(3J_p - 2T_s b_a - T_s^2 K_{sa})}{J_p} z + \frac{-J_p + T_s b_a}{J_p}$ $(z - p_1)(z - p_2)(z - p_3) = z^3 + (p_1 + p_2 + p_3)z^2 + (p_1 p_2 + p_2 p_3 + p_1 p_3)z^2 - p_1 p_2 p_3$
Speed regulator proportional gain	$b_a = \frac{J_p - J_p p_1 p_2 p_3}{T_{sm}}$
Speed regulator integral gain	$K_{sa} = \frac{J_p(p_1 p_2 + p_2 p_3 + p_3 p_1) - 3J_p + 2b_a T_{sm}}{T_{sm}^2}$
Speed regulator double integral gain	$K_{isa} = \frac{-J_p(p_1 + p_2 + p_3) + 3J_p - b_a T_{sm} - K_{sa} T_{sm}^2}{T_{sm}^3}$

The equations use these variables.

$P$	Motor pole pairs
$b_a$	Speed regulator proportional gain
$K_{sa}$	Speed regulator integral gain
$K_{isa}$	Speed regulator double integral gain
$J_p$	Motor inertia
$T_{sm}$	Motion controller sample time

**Command Feedforward**

To generate the state feedforward torque, the block uses the filtered speed and acceleration from the state filter. Also, the feedforward torque calculation uses the inertia, viscous damping, and static friction. To achieve zero tracking error, the torque command is the sum of the feedforward and feedback torque commands.

Selecting **Calculate Speed Regulator Gains** on the **Speed Controller** tab updates the inertia, viscous damping, and static friction with the **Physical inertia, viscous damping, static friction** parameter values on the **Motor Parameters** tab.

The feedforward torque command uses this equation.

$$T_{cmd\_ff} = J_p \dot{\omega}_m + F_v \omega_m + F_s \frac{\omega_m}{|\omega_m|}$$

where:

$J_p$	Motor inertia
$T_{cmd\_ff}$	Torque command feedforward
$F_s$	Static friction torque constant
$F_v$	Viscous friction torque constant
$F_s$	Static friction torque constant
$\omega_m$	Rotor speed

### Torque Determination

The block uses a maximum torque per ampere (MTPA) trajectory to calculate the base speed and the current commands. The available bus voltage determines the base speed. The direct (d) and quadrature (q) permanent magnet (PM) determines the induced voltage.

Calculation	Equations
Electrical base speed transition into field weakening	$\omega_{base} = \frac{v_{max}}{\sqrt{(L_q i_q)^2 + (L_d i_d + \lambda_{pm})^2}}$
d-axis voltage	$v_d = -\omega_e L_q i_{q_{max}}$
q-axis voltage	$v_q = \omega_e (L_d i_{d_{max}} + \lambda_{pm})$
Maximum phase current	$i_{max}^2 = i_{d_{max}}^2 + i_{q_{max}}^2$
Maximum line to neutral voltage	$v_{max} = \frac{v_{bus}}{\sqrt{3}}$
d-axis phase current MTPA table	$I_m = \frac{2T_{max}}{3P\lambda_{pm}}$ $i_{d\_mtpa} = \frac{\lambda_{pm}}{4(L_q - L_d)} - \sqrt{\frac{\lambda_{pm}^2}{16(L_q - L_d)^2} + \frac{I_m^2}{2}}$
q-axis phase current MTPA table	$i_{q\_mtpa} = \sqrt{I_m^2 - (i_{mtpa})^2}$
Torque MTPA breakpoints	$T_{mtpa} = \frac{3}{2}P(\lambda_{pm} i_q + (L_d - L_q) i_d i_q)$

Calculation	Equations
Field weakening, using the speed-based voltage limits	$(L_q i_q)^2 + (L_d i_d + \lambda_{pm})^2 \leq \frac{v_{max}^2}{\omega_e^2}$ $i_q = \sqrt{i_{max}^2 - i_d^2}$ $(L_d^2 - L_q^2) i_d^2 + 2\lambda_{pm} L_d i_d + \lambda_{pm}^2 + L_q^2 i_{max}^2 - \frac{v_{max}^2}{\omega_e^2} = 0$ $i_{dfw} = \frac{-\lambda_{pm} L_d + \sqrt{(\lambda_{pm} L_d)^2 - (L_d^2 - L_q^2) \left( \lambda_{pm}^2 + L_q^2 i_{max}^2 - \frac{v_{max}^2}{\omega_e^2} \right)}}{(L_d^2 - L_q^2)}$ $T_{fw} = \frac{3}{2} P (\lambda_{pm} i_{qfw} + (L_d - L_q) i_{dfw} i_{qfw})$
Current command	<p>If <math> \omega_e  \leq \omega_{base}</math></p> $i_{dref} = i_{dmtpa}(T_{ref})$ $i_{qref} = i_{qmtpa}(T_{ref})$ <p>Else</p> $i_{dfw} = \max(i_{dfw}, -i_{max})$ $i_{qfw} = \sqrt{i_{max}^2 - i_d^2}$ <p>If <math>T_{fw} &lt; T_{ref}</math></p> $i_{dref} = i_{dfw}$ $i_{qref} = i_{qfw}$ <p>Else</p> $i_{dref} = i_{dfw}$ $i_{qref} = \frac{T_{ref}}{\frac{3}{2} P (\lambda_{pm} + (L_d - L_q) i_{dfw})}$ <p>End</p> <p>End</p>

The equations use these variables.

$i_{max}$	Maximum phase current
$i_d$	d-axis current
$i_q$	q-axis current
$i_{d\_max}$	Maximum d-axis phase current
$i_{q\_max}$	Maximum q-axis phase current
$i_{d\_mtpa}$	d-axis phase current MTPA table
$i_{q\_mtpa}$	q-axis phase current MTPA table
$I_m$	Estimated maximum current
$i_{dfw}$	d-axis field weakening current
$i_{qfw}$	q-axis field weakening current

$\omega_e$	Rotor electrical speed
$\lambda_{pm}$	Permanent magnet flux linkage
$v_d$	d-axis voltage
$v_q$	q-axis voltage
$v_{max}$	Maximum line to neutral voltage
$v_{bus}$	DC bus voltage
$L_d$	d-axis winding inductance
$L_q$	q-axis winding inductance
$P$	Motor pole pairs
$T_{fw}$	Field weakening torque
$T_{mtpa}$	Torque MTPA breakpoints

### Current Regulators

The block regulates the current with an anti-windup feature. Classic proportional-integrator (PI) current regulators do not consider the d-axis and q-axis coupling or the back-electromagnetic force (EMF) coupling. As a result, transient performance deteriorates. To account for the coupling, the block implements the complex vector current regulator (CVCR) in the scalar format of the rotor reference frame. The CVCR decouples:

- d-axis and q-axis current cross-coupling
- Back-EMF cross-coupling

The current frequency response is a first-order system, with a bandwidth of  $EV_{current}$ .

The block implements these equations.

Calculation	Equations
Motor voltage, in the rotor reference frame	$L_d \frac{di_d}{dt} = v_d - R_s i_d + p \omega_m L_q i_q$ $L_d \frac{di_q}{dt} = v_q - R_s i_q - p \omega_m L_d i_d - p \omega_m \lambda_{pm}$
Current regulator gains	$\omega_b = 2\pi EV_{current}$ $K_{p\_d} = L_d \omega_b$ $K_{p\_q} = L_q \omega_b$ $K_i = R_s \omega_b$
Transfer functions	$\frac{i_d}{i_{dref}} = \frac{\omega_b}{s + \omega_b}$ $\frac{i_q}{i_{qref}} = \frac{\omega_b}{s + \omega_b}$

The equations use these variables.

$EV_{current}$	Current regulator bandwidth
$i_d$	d-axis current

$i_q$	q-axis current
$K_{p,d}$	Current regulator d-axis gain
$K_{p,q}$	Current regulator q-axis gain
$L_d$	d-axis winding inductance
$L_q$	q-axis winding inductance
$R_s$	Stator phase winding resistance
$\omega_m$	Rotor speed
$v_d$	d-axis voltage
$v_q$	q-axis voltage
$\lambda_{pm}$	Permanent magnet flux linkage
$P$	Motor pole pairs

### Transforms

To calculate the voltages and currents in balanced three-phase ( $a, b$ ) quantities, quadrature two-phase ( $\alpha, \beta$ ) quantities, and rotating ( $d, q$ ) reference frames, the block uses the Clarke and Park Transforms.

In the transform equations.

$$\omega_e = P\omega_m$$

$$\frac{d\theta_e}{dt} = \omega_e$$

Transform	Description	Equations
Clarke	Converts balanced three-phase quantities ( $a, b$ ) into balanced two-phase quadrature quantities ( $\alpha, \beta$ ).	$x_\alpha = \frac{2}{3}x_a - \frac{1}{3}x_b - \frac{1}{3}x_c$ $x_\beta = \frac{\sqrt{3}}{2}x_b - \frac{\sqrt{3}}{2}x_c$
Park	Converts balanced two-phase orthogonal stationary quantities ( $\alpha, \beta$ ) into an orthogonal rotating reference frame ( $d, q$ ).	$x_d = x_\alpha \cos\theta_e + x_\beta \sin\theta_e$ $x_q = -x_\alpha \sin\theta_e + x_\beta \cos\theta_e$
Inverse Clarke	Converts balanced two-phase quadrature quantities ( $\alpha, \beta$ ) into balanced three-phase quantities ( $a, b$ ).	$x_a = x_\alpha$ $x_b = -\frac{1}{2}x_\alpha + \frac{\sqrt{3}}{2}x_\beta$ $x_c = -\frac{1}{2}x_\alpha - \frac{\sqrt{3}}{2}x_\beta$
Inverse Park	Converts an orthogonal rotating reference frame ( $d, q$ ) into balanced two-phase orthogonal stationary quantities ( $\alpha, \beta$ ).	$x_\alpha = x_d \cos\theta_e - x_q \sin\theta_e$ $x_\beta = x_d \sin\theta_e + x_q \cos\theta_e$

The transforms use these variables.

$\omega_m$	Rotor speed
$P$	Motor pole pairs

$\omega_e$	Rotor electrical speed
$\Theta_e$	Rotor electrical angle
x	Phase current or voltage

### Motor

The block uses the phase currents and phase voltages to estimate the DC bus current. Positive current indicates battery discharge. Negative current indicates battery charge. The block uses these equations.

Load power	$Ld_{Pwr} = v_a i_a + v_b i_b + v_c i_c$
Source power	$Src_{Pwr} = Ld_{Pwr} + Pwr_{Loss}$
DC bus current	$i_{bus} = \frac{Src_{Pwr}}{v_{bus}}$
Estimated rotor torque	$MtrTrq_{est} = 1.5P[\lambda i_q + (L_d - L_q)i_d i_q]$
Power loss for single efficiency source to load	$Pwr_{Loss} = \frac{100 - Eff}{Eff} \cdot Ld_{Pwr}$
Power loss for single efficiency load to source	$Pwr_{Loss} = \frac{100 - Eff}{100} \cdot  Ld_{Pwr} $
Power loss for tabulated efficiency	$Pwr_{Loss} = f(\omega_m, MtrTrq_{est})$

The equations use these variables.

$v_a, v_b, v_c$	Stator phase a, b, c voltages
$v_{bus}$	Estimated DC bus voltage
$i_a, i_b, i_c$	Stator phase a, b, c currents
$i_{bus}$	Estimated DC bus current
$Eff$	Overall inverter efficiency
$\omega_m$	Rotor mechanical speed
$L_q$	q-axis winding inductance
$L_d$	d-axis winding inductance
$i_q$	q-axis current
$i_d$	d-axis current
$\lambda$	Permanent magnet flux linkage
$P$	Motor pole pairs

### Electrical Losses

To specify the electrical losses, on the **Electrical Losses** tab, for **Parameterize losses by**, select one of these options.

Setting	Block Implementation
Single efficiency measurement	Electrical loss calculated using a constant value for inverter efficiency.

Setting	Block Implementation
Tabulated loss data	Electrical loss calculated as a function of motor speeds and load torques.
Tabulated efficiency data	<p>Electrical loss calculated using inverter efficiency that is a function of motor speeds and load torques.</p> <ul style="list-style-type: none"> <li>Converts the efficiency values you provide into losses and uses the tabulated losses for simulation.</li> <li>Ignores efficiency values you provide for zero speed or zero torque. Losses are assumed zero when either torque or speed is zero.</li> <li>Uses linear interpolation to determine losses. Provide tabulated data for low speeds and low torques, as required, to get the desired level of accuracy for lower power conditions.</li> <li>Does not extrapolate loss values for speed and torque magnitudes that exceed the range of the table.</li> </ul>

For best practice, use `Tabulated loss data` instead of `Tabulated efficiency data`:

- Efficiency becomes ill defined for zero speed or zero torque.
- You can account for fixed losses that are still present for zero speed or torque.

## Ports

### Input

#### SpdReq — Rotor speed command

scalar

Rotor speed command,  $\omega_m^*$ , in rad/s.

#### Dependencies

To create this port, select `Speed Control` for the **Control Type** parameter.

#### TrqCmd — Torque command

scalar

Torque command,  $T^*$ , in N·m.

#### Dependencies

To create this port, select `Torque Control` for the **Control Type** parameter.

#### BusVolt — DC bus voltage

scalar

DC bus voltage,  $v_{bus}$ , in V.

#### PhaseCurrA — Current

scalar

Stator current phase a,  $i_a$ , in A.

**PhaseCurrB – Current**

scalar

Stator current phase b,  $i_b$ , in A.**SpdFdbk – Rotor speed**

scalar

Rotor speed,  $\omega_m$ , in rad/s.**PosFdbk – Rotor electrical angle**

scalar

Rotor electrical angle,  $\theta_m$ , in rad.**Output****Info – Bus signal**

bus

Bus signal containing these block calculations.

Signal	Description	Units
SrcPwr	Source power	W
LdPwr	Load power	W
PwrLoss	Power loss	W
MtrTrqEst	Estimated motor torque	N·m

**BusCurr – Bus current**

scalar

Estimated DC bus current,  $i_{bus}$ , in A.**PhaseVolt – Stator terminal voltages**

array

Stator terminal voltages,  $V_a$ ,  $V_b$ , and  $V_c$ , in V.**Parameters****Block Options****Control Type – Select control**

Speed Control (default) | Torque Control

If you select Torque Control, the block does not implement the speed controller.

This table summarizes the port configurations.

Port Configuration	Creates Ports
Speed Control	SpdReq

Port Configuration	Creates Ports
Torque Control	TrqCmd

**Motor Parameters**

**Stator resistance,  $R_s$  — Resistance**

0.02 (default) | scalar

Stator phase winding resistance,  $R_s$ , in ohm.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Stator resistance, $R_s$	D and Q axis integral gain, $K_i$	Current Controller

**D-axis inductance,  $L_d$  — Inductance**

1.7e-3 (default) | scalar

D-axis winding inductance,  $L_{d_i}$ , in H.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
D-axis inductance, $L_d$	Torque Breakpoints, $T_{mtpa}$ D-axis table data, $id_{mtpa}$ Q-axis table data, $iq_{mtpa}$ D, q, and max current limits, $idq\_limits$	Id and Iq Calculation

**Q-axis inductance,  $L_q$  — Inductance**

3.2e-3 (default) | scalar

Q-axis winding inductance,  $L_{q_i}$ , in H.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
<b>Q-axis inductance, Lq</b>	Torque Breakpoints, T_mtpa D-axis table data, id_mtpa Q-axis table data, iq_mtpa D, Q, and max current limits, idq_limits	<b>Id and Iq Calculation</b>

### Permanent magnet flux, lambda\_pm – Flux

0.2205 (default) | scalar

Permanent magnet flux,  $\lambda_{pm}$ , in Wb.

#### Dependencies

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
<b>Permanent magnet flux, lambda_pm</b>	Torque Breakpoints, T_mtpa D-axis table data, id_mtpa Q-axis table data, iq_mtpa D, Q, and max current limits, idq_limits	<b>Id and Iq Calculation</b>

### Number of pole pairs, PolePairs – Poles

4 (default) | scalar

Motor pole pairs,  $P$ .

#### Dependencies

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
<b>Number of pole pairs, PolePairs</b>	Torque Breakpoints, T_mtpa D-axis table data, id_mtpa Q-axis table data, iq_mtpa D, Q, and max current limits, idq_limits	<b>Id and Iq Calculation</b>

**Physical inertia, viscous damping, static friction, Mechanical – Inertia, damping, friction**

[0.0027, 4.924e-4, 0] (default) | vector

Mechanical properties of the motor:

- Motor inertia,  $F_v$ , in  $\text{kgm}^2$
- Viscous friction torque constant,  $F_v$ , in  $\text{N}\cdot\text{m}/(\text{rad}/\text{s})$
- Static friction torque constant,  $F_s$ , in  $\text{N}\cdot\text{m}$

**Dependencies**

To enable this parameter, set the **Control Type** parameter to Speed Control.

For the gain calculations, the block uses the inertia from the **Physical inertia, viscous damping, static friction** parameter value that is on the **Motor Parameters** tab.

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
<b>Physical inertia, viscous damping, static friction, Mechanical</b>	<b>Proportional gain, ba</b> <b>Angular gain, Ksa</b> <b>Rotational gain, Kisa</b> <b>Inertia compensation, Jcomp</b> <b>Viscous damping compensation, Fv</b> <b>Static friction, Fs</b>	<b>Speed Controller</b>

**Id and Iq Calculation**

**Maximum torque, T\_max – Torque**

60 (default) | scalar

Maximum torque, in  $\text{N}\cdot\text{m}$ .

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Maximum torque, T_max	Torque Breakpoints, T_mtpa D-axis table data, id_mtpa Q-axis table data, iq_mtpa D, Q, and max current limits, idq_limits	Id and Iq Calculation

### MTPA table breakpoints, bp – Number of breakpoints

10 (default) | scalar

#### Dependencies

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
MTPA table breakpoints, pb	Torque Breakpoints, T_mtpa D-axis table data, id_mtpa Q-axis table data, iq_mtpa D, Q, and max current limits, idq_limits	Id and Iq Calculation

### Calculate MTPA Table Data – Derive parameters

button

Click to derive parameters.

#### Dependencies

On the **Id and Iq Calculation** tab, when you select **Calculate MPTA Table data**, the block calculates derived parameters. The table summarizes the derived parameter dependencies on other block parameters.

Derived Parameter on Id and Iq Calculation tab		Depends On	
		Parameter	Tab
Torque Breakpoints, T_mtpa	$T_{mtpa} = \frac{3}{2}P(\lambda_{pm}i_q + (L_d - L_q)i_d i_q)$	Maximum torque, T_max MTPA table breakpoints, pb	Id and Iq Calculation

Derived Parameter on Id and Iq Calculation tab		Depends On	
		Parameter	Tab
<b>D-axis table data, id_mtpa</b>	$I_m = \frac{2T_{max}}{3P\lambda_{pm}}$	<b>Permanent magnet flux, lambda_pm</b>	<b>Motor Parameters</b>
	$i_{d\_mtpa} = \frac{\lambda_{pm}}{4(L_q - L_d)} - \sqrt{\frac{\lambda_{pm}^2}{16(L_q - L_d)^2} + \frac{I_m^2}{4}}$		
<b>Q-axis table data, iq_mtpa</b>	$i_{q\_mtpa} = \sqrt{I_m^2 - (i_{mtpa})^2}$	<b>Q-axis inductance, Lq</b>	
<b>D, Q, and max current limits, idq_limits</b>		<b>Number of pole pairs, PolePairs</b>	

The equations use these variables.

- $i_{max}$  Maximum phase current
- $i_d$  d-axis current
- $i_q$  q-axis current
- $i_{d\_max}$  Maximum d-axis phase current
- $i_{q\_max}$  Maximum q-axis phase current
- $i_{d\_mtpa}$  d-axis phase current MTPA table
- $i_{q\_mtpa}$  q-axis phase current MTPA table
- $\lambda_{pm}$  Permanent magnet flux linkage
- $L_d$  d-axis winding inductance
- $L_q$  q-axis winding inductance
- $P$  Motor pole pairs
- $T_{mtpa}$  Torque MTPA breakpoints
- $I_m$  Estimated maximum current

**Torque Breakpoints, T\_mtpa – Derived**

**Current Controller**

**Bandwidth of the current regulator, EV\_current – Bandwidth**

200 (default) | scalar

Derived current regulator bandwidth, in Hz.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Bandwidth of the current regulator, EV_current	D-axis proportional gain, Kp_d	Current Controller
	Q-axis proportional gain, Kp_q	
	D and Q axis proportional gain, Ki	

### Sample time for the torque control, Tst – Time

5e-5 (default) | scalar

Derived torque control sample time, in s.

#### Dependencies

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Sample time for the torque control, Tst	Speed regulation time constant, Ksf	Speed Controller

### Calculate Current Regulator Gains – Derive parameters

button

Click to derive parameters.

#### Dependencies

On the **Current Controller** tab, when you select **Calculate Current Regulator Gains**, the block calculates derived parameters. The table summarizes the derived parameter dependencies on other block parameters.

Derived Parameter on Current Controller tab	Dependency	
	Parameter	Tab
D-axis proportional gain, Kp_d	Bandwidth of the current regulator, EV_current	Current Controller
Q-axis proportional gain, Kp_q	Stator resistance, Rs	Motor Parameters
D and Q axis integral gain, Ki		

### D-axis proportional gain, Kp\_d – Derived

2.1363 (default) | scalar

Derived d-axis proportional gain, in V/A.

#### Dependencies

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
D-axis proportional gain, Kp_d	Bandwidth of the current regulator, EV_current	Current Controller

**Q-axis proportional gain, Kp\_q – Derived**

4.0212 (default) | scalar

Derived q-axis proportional gain, in V/A.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Q-axis proportional gain, Kp_q	Bandwidth of the current regulator, EV_current	Current Controller

**D and Q axis integral gain, Ki – Derived**

25.1327 (default) | scalar

Derived d- and q- axis integral gains, in V/A·s.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
D and Q axis integral gain, Ki	Stator resistance, Rs	Motor Parameters

**Speed Controller**

**Bandwidth of the motion controller, EV\_motion – Bandwidth**

[20, 4, 0.8] (default) | vector

Motion controller bandwidth, in Hz. Set the first element of the vector to the desired cutoff frequency. Set the second and third elements of the vector to the higher-order cut off frequencies. You can set the value of the next element to 1/5 the value of the previous element. For example, if the desired cutoff frequency is 20 Hz, specify [20 4 0.8].

**Dependencies**

The parameter is enabled when the **Control Type** parameter is set to Speed Control.

Parameter	Used to Derive	
	Parameter	Tab
Bandwidth of the motion controller, EV_motion	Proportional gain, ba	Speed Controller
	Angular gain, Ksa	
	Rotational gain, Kisa	

### Bandwidth of the state filter, EV\_sf – Bandwidth

200 (default) | scalar

State filter bandwidth, in Hz.

#### Dependencies

The parameter is enabled when the **Control Type** parameter is set to Speed Control.

Parameter	Used to Derive	
	Parameter	Tab
Bandwidth of the state filter, EV_sf	Speed regulation time constant, Ksf	Speed Controller

### Calculate Speed Regulator Gains – Derive parameters

button

Click to derive parameters.

#### Dependencies

On the **Speed Controller** tab, when you select **Calculate Speed Regulator Gains**, the block calculates derived parameters. The table summarizes the derived parameters that depend on other block parameters.

Derived Parameter on Speed Controller tab		Depends On	
		Parameter	Tab
<b>Proportional gain, ba</b>	$b_a = \frac{J_p - J_p p_1 p_2 p_3}{T_{sm}}$	Bandwidth of the motion controller, EV_motion  Bandwidth of the state filter, EV_sf	Speed Controller
<b>Angular gain, Ksa</b>	$K_{sa} = \frac{J_p(p_1 p_2 + p_2 p_3 + p_3 p_1) - 3J_p + 2b_a T_{sm}}{T_{sm}^2}$	Sample time for the torque control, Tst	Current Controller
<b>Rotational gain, Kisa</b>	$K_{isa} = \frac{-J_p(p_1 + p_2 + p_3) + 3J_p - b_a T_{sm} - K_{sa} T_{sm}^2}{T_{sm}^3}$	Physical inertia, viscous damping, static friction, Mechanical	Motor Parameters

Derived Parameter on Speed Controller tab		Depends On	
		Parameter	Tab
<b>Speed regulation time constant, Ksf</b>	$K_{sf} = \frac{1 - \exp(-T_{sm}2\pi EV_{sf})}{T_{sm}}$		
<b>Inertia compensation, Jcomp</b>	$J_{comp} = J_p$	<b>Physical inertia, viscous damping, static friction, Mechanical</b>	<b>Motor Parameters</b>
<b>Viscous damping compensation, Fv</b>	$F_v$		
<b>Static friction, Fs</b>	$F_s$		

The equations use these variables.

- $P$  Motor pole pairs
- $b_a$  Speed regulator proportional gain
- $K_{sa}$  Speed regulator integral gain
- $K_{isa}$  Speed regulator double integral gain
- $K_{sf}$  Speed regulator time constant
- $J_p$  Motor inertia
- $EV_{sf}$  State filter bandwidth
- $EV_{motion}$  Motion controller bandwidth

**Proportional gain, ba – Derived**

3.7477 (default) | scalar

Derived proportional gain, in N·m/(rad/s).

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
<b>Proportional gain, ba</b>	<b>Physical inertia, viscous damping, static friction, Mechanical</b>	<b>Motor Parameters</b>
	<b>Bandwidth of the motion controller, EV_motion</b>	<b>Speed Controller</b>

**Angular gain, Ksa – Derived**

94.0877 (default) | scalar

Derived angular gain, in N·m/rad.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Angular gain, Ksa	Physical inertia, viscous damping, static friction, Mechanical	Motor Parameters
	Bandwidth of the motion controller, EV_motion	Speed Controller

**Rotational gain, Kisa – Derived**

381.7822 (default) | scalar

Derived rotational gain, in N·m/(rad\*s).

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Rotational gain, Kisa	Physical inertia, viscous damping, static friction, Mechanical	Motor Parameters
	Bandwidth of the motion controller, EV_motion	Speed Controller

**Speed regulation time constant, Ksf – Derived**

1217.9727 (default) | scalar

Derived speed regulation time constant, in 1/s.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Speed regulation time constant, Ksf	Sample time for the torque control, Tst	Current Controller
	Bandwidth of the state filter, EV_sf	Speed Controller

**Inertia compensation, Jcomp – Derived**

0.025 (default) | scalar

Derived inertia compensation, in kg·m<sup>2</sup>.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Inertia compensation, Jcomp	Physical inertia, viscous damping, static friction, Mechanical	Motor Parameters

**Viscous damping compensation, Fv – Derived**

0 (default) | scalar

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Viscous damping compensation, Fv	Physical inertia, viscous damping, static friction, Mechanical	Motor Parameters

**Static friction, Fs – Derived**

0 (default) | scalar

Derived static friction, in N·m/(rad/s).

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Static friction, Fs	Physical inertia, viscous damping, static friction, Mechanical	Motor Parameters

**Electrical Losses**

**Parameterize losses by – Select type**

Single efficiency measurement (default) | Tabulated loss data | Tabulated efficiency data

Setting	Block Implementation
Single efficiency measurement	Electrical loss calculated using a constant value for inverter efficiency.
Tabulated loss data	Electrical loss calculated as a function of motor speeds and load torques.

Setting	Block Implementation
Tabulated efficiency data	<p>Electrical loss calculated using inverter efficiency that is a function of motor speeds and load torques.</p> <ul style="list-style-type: none"> <li>Converts the efficiency values you provide into losses and uses the tabulated losses for simulation.</li> <li>Ignores efficiency values you provide for zero speed or zero torque. Losses are assumed zero when either torque or speed is zero.</li> <li>Uses linear interpolation to determine losses. Provide tabulated data for low speeds and low torques, as required, to get the desired level of accuracy for lower power conditions.</li> <li>Does not extrapolate loss values for speed and torque magnitudes that exceed the range of the table.</li> </ul>

For best practice, use `Tabulated loss data` instead of `Tabulated efficiency data`:

- Efficiency becomes ill defined for zero speed or zero torque.
- You can account for fixed losses that are still present for zero speed or torque.

#### Overall inverter efficiency, `eff` – Constant

98 (default) | scalar

Overall inverter efficiency,  $Eff$ , in %.

#### Dependencies

To enable this parameter, for **Parameterize losses by**, select `Tabulated loss data`.

#### Vector of speeds ( $w$ ) for tabulated loss, `w_loss_bp` – Breakpoints

[0 200 400 600 800 1000] (default) | 1-by-M vector

Speed breakpoints for lookup table when calculating losses, in rad/s.

#### Dependencies

To enable this parameter, for **Parameterize losses by**, select `Tabulated loss data`.

#### Vector of torques ( $T$ ) for tabulated loss, `T_loss_bp` – Breakpoints

[0 25 50 75 100] (default) | 1-by-N vector

Torque breakpoints for lookup table when calculating losses, in N·m.

#### Dependencies

To enable this parameter, for **Parameterize losses by**, select `Tabulated loss data`.

#### Corresponding losses, `losses_table` – Table

[100 100 100 100 100;100 150 200 250 300;100 200 300 400 500;100 250 400 550 700;100 300 500 700 900;100 350 600 850 1100] (default) | M-by-N array

Array of values for electrical losses as a function of M speeds and N torques, in W. Each value specifies the losses for a specific combination of speed and torque. The matrix size must match the dimensions defined by the speed and torque vectors.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.

**Vector of speeds (w) for tabulated efficiency, w\_eff\_bp – Breakpoints**

[200 400 600 800 1000] (default) | 1-by-M vector

Speed breakpoints for lookup table when calculating efficiency, in rad/s.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated efficiency data.

**Vector of torques (T) for tabulated efficiency, T\_eff\_bp – Breakpoints**

[25 50 75 100] (default) | 1-by-N vector

Torque breakpoints for lookup table when calculating efficiency, in N·m.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated efficiency data.

**Corresponding efficiency, efficiency\_table – Table**

[96.2 98.1 98.7 99;98.1 99 99.4 99.5;98.7 99.4 99.6 99.7;99 99.5 99.7 99.8;99.2 99.6 99.7 99.8] (default) | M-by-N array

Array of efficiency as a function of M speeds and N torque, in %. Each value specifies the efficiency for a specific combination of speed and torque. The matrix size must match the dimensions defined by the speed and torque vectors.

The block ignores efficiency values for zero speed or zero torque. Losses are zero when either torque or speed is zero. The block uses linear interpolation.

To get the desired level of accuracy for lower power conditions, you can provide tabulated data for low speeds and low torques.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated efficiency data.

## Flux-Based PMSM

Flux-based permanent magnet synchronous motor

**Library:** Powertrain Blockset / Propulsion / Electric Motors and Inverters

### Description

The Flux-Based PMSM block implements a flux-based three-phase permanent magnet synchronous motor (PMSM) with a tabular-based electromotive force. The block uses the three-phase input voltages to regulate the individual phase currents, allowing control of the motor torque or speed.

Flux-based motor models take into account magnetic saturation and iron losses. To calculate the magnetic saturation and iron loss, the Flux-Based PMSM block uses the inverse of the flux linkages. To obtain the block parameters, you can use finite-element analysis (FEA) or measure phase voltages using a dynamometer.

By default, the block sets the **Simulation Type** parameter to **Continuous** to use a continuous sample time during simulation. If you want to generate code for fixed-step double- and single-precision targets, considering setting the parameter to **Discrete**. Then specify a **Sample Time, Ts** parameter.

To enable power loss calculations suitable for code generation targets that limit memory, select **Enable memory optimized 2D LUT**.

### Three-Phase Sinusoidal Model Electrical System

The block implements equations that are expressed in a stationary rotor reference (dq) frame. The  $d$ -axis aligns with the  $a$ -axis. All quantities in the rotor reference frame are referred to the stator.

The block uses these equations.

Calculation	Equation
$q$ - and $d$ -axis voltage	$v_d = \frac{d\psi_d}{dt} + R_s i_d - \omega_e \psi_q$ $v_q = \frac{d\psi_q}{dt} + R_s i_q + \omega_e \psi_d$
$q$ - and $d$ -axis current	$i_d = f(\psi_d, \psi_q)$ $i_q = g(\psi_d, \psi_q)$
Electromechanical torque	$T_e = 1.5P[\psi_d i_q - \psi_q i_d]$

The equations use these variables.

$\omega_m$	Rotor mechanical speed
$\omega_e$	Rotor electrical speed
$\theta_{da}$	dq stator electrical angle with respect to the rotor a-axis
$R_s, R_r$	Resistance of the stator and rotor windings, respectively
$i_q, i_d$	$q$ - and $d$ -axis current, respectively
$v_q, v_d$	$q$ - and $d$ -axis voltage, respectively
$\psi_q, \psi_d$	$q$ - and $d$ -axis magnet flux, respectively
$P$	Number of pole pairs
$T_e$	Electromagnetic torque

### Transforms

To calculate the voltages and currents in balanced three-phase ( $a, b$ ) quantities, quadrature two-phase ( $\alpha, \beta$ ) quantities, and rotating ( $d, q$ ) reference frames, the block uses the Clarke and Park Transforms.

In the transform equations.

$$\omega_e = P\omega_m$$

$$\frac{d\theta_e}{dt} = \omega_e$$

Transform	Description	Equations
Clarke	Converts balanced three-phase quantities ( $a, b$ ) into balanced two-phase quadrature quantities ( $\alpha, \beta$ ).	$x_\alpha = \frac{2}{3}x_a - \frac{1}{3}x_b - \frac{1}{3}x_c$ $x_\beta = \frac{\sqrt{3}}{2}x_b - \frac{\sqrt{3}}{2}x_c$
Park	Converts balanced two-phase orthogonal stationary quantities ( $\alpha, \beta$ ) into an orthogonal rotating reference frame ( $d, q$ ).	$x_d = x_\alpha \cos\theta_e + x_\beta \sin\theta_e$ $x_q = -x_\alpha \sin\theta_e + x_\beta \cos\theta_e$
Inverse Clarke	Converts balanced two-phase quadrature quantities ( $\alpha, \beta$ ) into balanced three-phase quantities ( $a, b$ ).	$x_a = x_\alpha$ $x_b = -\frac{1}{2}x_\alpha + \frac{\sqrt{3}}{2}x_\beta$ $x_c = -\frac{1}{2}x_\alpha - \frac{\sqrt{3}}{2}x_\beta$
Inverse Park	Converts an orthogonal rotating reference frame ( $d, q$ ) into balanced two-phase orthogonal stationary quantities ( $\alpha, \beta$ ).	$x_\alpha = x_d \cos\theta_e - x_q \sin\theta_e$ $x_\beta = x_d \sin\theta_e + x_q \cos\theta_e$

The transforms use these variables.

$\omega_m$	Rotor mechanical speed
$P$	Motor pole pairs
$\omega_e$	Rotor electrical speed
$\theta_e$	Rotor electrical angle
$x$	Phase current or voltage

### Mechanical System

The rotor angular velocity is given by:

$$\frac{d}{dt}\omega_m = \frac{1}{J}(T_e - T_f - F\omega_m - T_m)$$

$$\frac{d\theta_m}{dt} = \omega_m$$

The equations use these variables.

$J$	Combined inertia of rotor and load
$F$	Combined viscous friction of rotor and load
$\theta_m$	Rotor mechanical angular position
$T_m$	Rotor shaft torque
$T_e$	Electromagnetic torque
$T_f$	Combined rotor and load friction torque
$\omega_m$	Rotor mechanical speed

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Variable	Equations	
PwrInfo	PwrTrnsfrd — Power transferred between blocks	PwrMtr	Mechanical power	$P_{mot}$	$P_{mot} = -\omega_m T_e$
	<ul style="list-style-type: none"> <li>Positive signals indicate flow into block</li> <li>Negative signals indicate flow out of block</li> </ul>	PwrBus	Electrical power	$P_{bus}$	$P_{bus} = v_{an}i_a + v_{bn}i_b + v_{cn}i_c$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred	PwrElecLoss	Resistive power loss	$P_{elec}$	$P_{elec} = -\frac{3}{2}(R_s i_{sd}^2 + R_s i_{sq}^2)$
	<ul style="list-style-type: none"> <li>Positive signals indicate an input</li> <li>Negative signals indicate a loss</li> </ul>	PwrMechLoss	Mechanical power loss	$P_{mech}$	<p>When <b>Port Configuration</b> is set to Torque:</p> $P_{mech} = -(\omega_m^2 F +  \omega_m  T_f)$ <p>When <b>Port Configuration</b> is set to Speed:</p> $P_{mech} = 0$
PwrStored — Stored energy rate of change	PwrMtrStored	Stored motor power	$P_{str}$	$P_{str} = P_{bus} + P_{mot} + P_{elec} + P_{mech}$	
<ul style="list-style-type: none"> <li>Positive signals indicate an increase</li> <li>Negative signals indicate a decrease</li> </ul>					

The equations use these variables.

$R_s$	Stator resistance
-------	-------------------

$i_a, i_b, i_c$	Stator phase a, b, and c current
$i_{sq}, i_{sd}$	Stator q- and d-axis currents
$v_{an}, v_{bn}, v_{cn}$	Stator phase a, b, and c voltage
$\omega_m$	Angular mechanical velocity of the rotor
$F$	Combined motor and load viscous damping
$T_e$	Electromagnetic torque
$T_f$	Combined motor and load friction torque

### Lookup Table Memory Optimization

The data for the **Corresponding d-axis current,  $i_d$**  and **Corresponding q-axis current,  $i_q$**  lookup tables are functions of the  $d$ - and  $q$ -axis flux.

To enable current calculations suitable for code generation targets that limit memory, select **Enable memory optimized 2D LUT**. The block uses linear interpolation to optimize the current lookup table values for code generation. This table summarizes the optimization implementation.

Use Case	Implementation
$d$ - and $q$ -axis flux aligns with the lookup table breakpoint values.	Memory-optimized current is current lookup table value at intersection of flux values.
$d$ - and $q$ -axis flux does not align with the lookup table breakpoint values, but is within range.	Memory-optimized current is linear interpolation between corresponding flux values.
$d$ - and $q$ -axis flux does not align with the lookup table breakpoint values, and is out of range.	Cannot compute an memory-optimized current. Block uses extrapolated data.

### Extrapolation

The lookup tables optimized for code generation do not support extrapolation for data that is out of range. However, you can include pre-calculated extrapolation values in the power loss lookup table by selecting **Specify Extrapolation**.

The block uses the endpoint parameters to resize the table data.

## Ports

### Input

#### LdTrq – Rotor shaft torque

scalar

Rotor shaft input torque,  $T_m$ , in N·m.

#### Dependencies

To create this port, select Torque for the **Port Configuration** parameter.

#### Spd – Rotor shaft speed

scalar

Angular velocity of the rotor,  $\omega_m$ , in rad/s.

#### Dependencies

To create this port, select Speed for the **Port Configuration** parameter.

#### PhaseVolt – Stator terminal voltages

1-by-3 array

Stator terminal voltages,  $V_a$ ,  $V_b$ , and  $V_c$ , in V.

#### Dependencies

To create this port, select Speed or Torque for the **Port Configuration** parameter.

## Output

### Info — Bus signal

bus

The bus signal contains these block calculations.

Signal	Description	Variable	Units		
IaStator	Stator phase current A	$i_a$	A		
IbStator	Stator phase current B	$i_b$	A		
IcStator	Stator phase current C	$i_c$	A		
IdSync	Direct axis current	$i_d$	A		
IqSync	Quadrature axis current	$i_q$	A		
VdSync	Direct axis voltage	$v_d$	V		
VqSync	Quadrature axis voltage	$v_q$	V		
MtrSpd	Angular mechanical velocity of the rotor	$\omega_m$	rad/s		
MtrPos	Rotor mechanical angular position	$\theta_m$	rad		
MtrTrq	Electromagnetic torque	$T_e$	N·m		
PwrInfo	PwrTrnsfrd	PwrMtr	Mechanical power	$P_{mot}$	W
		PwrBus	Electrical power	$P_{bus}$	W
	PwrNotTrnsfrd	PwrElecLoss	Resistive power loss	$P_{elec}$	W
		PwrMechLoss	Mechanical power loss	$P_{mech}$	W
	PwrStored	PwrMtrStored	Stored motor power	$P_{str}$	W

### PhaseCurr — Phase a, b, c current

1-by-3 array

Phase a, b, c current,  $i_a$ ,  $i_b$ , and  $i_c$ , in A.

### MtrTrq — Motor torque

scalar

Motor torque,  $T_{mtr}$ , in N·m.

#### Dependencies

To create this port, select Speed for the **Port configuration** parameter.

### MtrSpd — Motor speed

scalar

Angular speed of the motor,  $\omega_{mtr}$ , in rad/s.

#### Dependencies

To create this port, select Torque for the **Port configuration** parameter.

## Parameters

### Block Options

#### Simulation type — Select simulation type

Continuous (default) | Discrete

By default, the block uses a continuous sample time during simulation. If you want to generate code for single-precision targets, considering setting the parameter to Discrete.

#### Dependencies

Setting **Simulation Type** to Discrete creates the **Sample Time, Ts** parameter.

#### Sample time, Ts — Sample time for discrete integration

0.001 (default) | scalar

Integration sample time for discrete simulation, in s.

#### Dependencies

Setting **Simulation Type** to Discrete creates the **Sample Time, Ts** parameter.

#### Port Configuration — Select port configuration

Torque (default) | Speed

This table summarizes the port configurations.

Port Configuration	Creates Input Port	Creates Output Port
Torque	LdTrq	MtrSpd
Speed	Spd	MtrTrq

#### Enable memory optimized 2D LUT — Selection

off (default) | on

Enable generation of optimized lookup tables, suitable code generation targets that limit memory.

#### Vector of d-axis flux, flux\_d — Flux breakpoints

1-by-M vector

$d$ -axis flux,  $\Psi_d$ , breakpoints, in Wb.

#### Resample storage size for flux\_d, n1 — Flux bit size

2 (default) | 4 | 8 | 16 | 32 | 64 | 128 | 256

Flux breakpoint storage size,  $n1$ , dimensionless. The block resamples the **Corresponding d-axis current, id** and **Corresponding q-axis current, iq** data based on the storage size.

#### Dependencies

To create this parameter, select **Enable memory optimized 2D LUT**.

#### Vector of q-axis flux, flux\_q — Flux breakpoints

1-by-N vector

$q$ -axis flux,  $\Psi_q$ , breakpoints, in Wb.

**Resample storage size for flux\_q, n2 — Flux bit size**

2 (default) | 4 | 8 | 16 | 32 | 64 | 128 | 256

Flux breakpoint storage size,  $n2$ , dimensionless. The block resamples the **Corresponding d-axis current,  $i_d$**  and **Corresponding q-axis current,  $i_q$**  data based on the storage size.

**Dependencies**

To create this parameter, select **Enable memory optimized 2D LUT**.

**Corresponding d-axis current,  $i_d$  — 2D lookup table**

M-by-N array

Array of values for  $d$ -axis current,  $i_d$ , as a function of M  $d$ -fluxes,  $\Psi_d$ , and N  $q$ -fluxes,  $\Psi_q$ , in A. Each value specifies the current for a specific combination of  $d$ - and  $q$ -axis flux. The array size must match the dimensions defined by the flux vectors.

If you set **Enable memory optimized 2D LUT**, the block converts the data to single precision.

**Corresponding q-axis current,  $i_q$  — 2D lookup table**

M-by-N array

Array of values for  $q$ -axis current,  $i_q$ , as a function of M  $d$ -fluxes,  $\Psi_d$ , and N  $q$ -fluxes,  $\Psi_q$ , in A. Each value specifies the current for a specific combination of  $d$ - and  $q$ -axis flux. The array size must match the dimensions defined by the flux vectors.

If you set **Enable memory optimized 2D LUT**, the block converts the data to single precision.

**flux\_d max endpoint, u1max — Flux breakpoint**

0.22457 (default) | scalar

Flux breakpoint maximum extrapolation endpoint,  $u1max$ , in Wb.

**Dependencies**

To create this parameter, select **Enable memory optimized 2D LUT** and **Specify Extrapolation**.

**flux\_d min endpoint, u1min — Flux breakpoint**

-0.22607 (default) | scalar

Flux breakpoint minimum extrapolation endpoint,  $u1min$ , in Wb.

**Dependencies**

To create this parameter, select **Enable memory optimized 2D LUT** and **Specify Extrapolation**.

**flux\_q max endpoint, u2max — Flux breakpoint**

0.42959 (default) | scalar

Flux breakpoint maximum extrapolation endpoint,  $u2max$ , in Wb.

**Dependencies**

To create this parameter, select **Enable memory optimized 2D LUT** and **Specify Extrapolation**.

**flux\_q min endpoint, u2min — Flux breakpoint**

-0.4296 (default) | scalar

Flux breakpoint minimum extrapolation endpoint,  $u2min$ , in Wb.

#### Dependencies

To create this parameter, select **Enable memory optimized 2D LUT** and **Specify Extrapolation**.

#### Stator phase resistance, $R_s$ — Resistance

0.02 (default) | scalar

Stator phase resistance,  $R_s$ , in ohm.

#### Number of pole pairs, $P$ — Pole pairs

4 (default) | scalar

Motor pole pairs,  $P$ .

#### Initial flux, fluxdq0 — Flux

[0 0] (default) | vector

Initial  $d$ - and  $q$ -axis flux,  $\Psi_{q0}$  and  $\Psi_{d0}$ , in Wb.

#### Initial mechanical position, theta\_init — Angle

0 (default) | scalar

Initial rotor angular position,  $\theta_{m0}$ , in rad.

#### Initial mechanical speed, omega\_init — Speed

0 (default) | scalar

Initial angular velocity of the rotor,  $\omega_{m0}$ , in rad/s.

#### Dependencies

To enable this parameter, select the Torque configuration parameter.

#### Physical inertia, viscous damping, and static friction, mechanical — Inertia, damping, friction

[0.0027, 4.924e-4, 0] (default) | vector

Mechanical properties of the rotor:

- Inertia,  $J$ , in  $\text{kgm}^2$
- Viscous damping,  $F$ , in  $\text{N}\cdot\text{m}/(\text{rad}/\text{s})$
- Static friction,  $T_f$ , in  $\text{N}\cdot\text{m}$

#### Dependencies

To enable this parameter, select the Torque configuration parameter.

# Flux-Based PM Controller

Controller for a flux-based permanent magnet synchronous motor

**Library:** Powertrain Blockset / Propulsion / Electric Motor Controllers

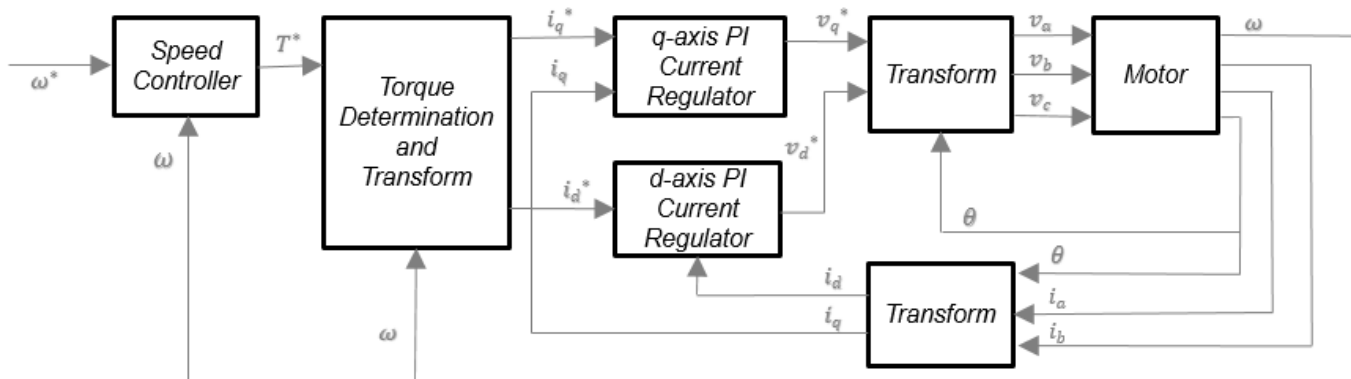

## Description

The Flux Based PM Controller block implements a flux-based, field-oriented controller for an interior permanent magnet synchronous motor (PMSM) with an optional outer-loop speed controller. The internal torque control implements strategies for achieving maximum torque per ampere (MTPA) and weakening the magnetic flux. You can specify either the speed or torque control type.

The Flux Based PM Controller implements equations for speed control, torque determination, regulators, transforms, and motors.

The figure illustrates the information flow in the block.

The block implements equations using these variables.

$\omega$	Rotor speed
$\omega^*$	Rotor speed command
$T^*$	Torque command
$i_d$	$d$ -axis current
$i_d^*$	$d$ -axis current command
$i_q$	$q$ -axis current
$i_q^*$	$q$ -axis current command

$v_d$ ,	$d$ -axis voltage
$v_d^*$	$d$ -axis voltage command
$v_q$	$q$ -axis voltage
$v_q^*$	$q$ -axis voltage command
$v_a, v_b, v_c$	Stator phase a, b, c voltages
$i_a, i_b, i_c$	Stator phase a, b, c currents

### Speed Controller

To implement the speed controller, select the **Control Type** parameter `Speed Control`. If you select the **Control Type** parameter `Torque Control`, the block does not implement the speed controller.

The speed controller determines the torque command by implementing a state filter, and calculating the feedforward and feedback commands. If you do not implement the speed controller, input a torque command to the Flux Based PM Controller block.

#### State Filter

The state filter is a low-pass filter that generates the acceleration command based on the speed command. The discrete form of characteristic equation is given by:

$$z + K_{sf}T_{sm} - 1$$

The filter calculates the gain using this equation.

$$K_{sf} = \frac{1 - \exp(-T_{sm}2\pi EV_{sf})}{T_{sm}}$$

The equations use these variables.

$EV_{sf}$	Bandwidth of the speed command filter
$T_{sm}$	Motion controller sample time
$K_{sf}$	Speed regulator time constant

#### State Feedback

To generate the state feedback torque, the block uses the filtered speed error signal from the state filter. To filter the speed, the block uses a proportional integral (PI) controller.

$$T_{cmd} = Kp_{\omega}(\omega_m^* - \omega_m) + Ki_{\omega} \frac{zT_{sm}}{z-1}(\omega_m^* - \omega_m)$$

The equations use these variables.

$\omega_m$	Rotor speed
$\omega_m^*$	Rotor speed command
$T_{cmd}$	Torque command
$Kp_{\omega}$	Speed regulator proportional gain
$Ki_{\omega}$	Speed regulator integral gain
$T_{sm}$	Speed regulator sample rate

### Command Feedforward

To generate the state feedforward torque, the block uses the filtered speed and acceleration from the state filter. Also, the feedforward torque calculation uses the inertia, viscous damping, and static friction. To achieve zero tracking error, the torque command is the sum of the feedforward and feedback torque commands.

The feedforward torque command uses this equation.

$$T_{cmd\_ff} = J_p \dot{\omega}_m + F_v \omega_m + F_s \frac{\omega_m}{|\omega_m|}$$

where:

$J_p$	Rotor inertia
$T_{cmd\_ff}$	Torque command feedforward
$F_s$	Static friction torque constant
$F_v$	Viscous friction torque constant
$F_s$	Static friction torque constant
$\omega_m$	Rotor speed

### Current Command

The block uses lookup tables to determine the  $d$ -axis and  $q$ -axis current commands. The lookup tables are functions of mechanical speed and torque. To determine the lookup tables, you can use an external finite element analysis (FEA) models or dynamometer test results.

$$i_{dref} = f(|\omega_m|, |T_{ref}|)$$

$$i_{qref} = \text{sign}(T_{ref}) * f(|\omega_m|, |T_{ref}|)$$

The equations use these variables.

$\omega_m$	Rotor speed
$T_{ref}$	Torque command
$i_{dref}, i_{qref}$	$d$ - and $q$ -axis reference current, respectively

### Voltage Command

The block uses these equations to calculate the voltage in the motor reference frame.

$$v_d = \frac{d\psi_d}{dt} + R_s i_d - \omega_e \psi_q$$

$$v_q = \frac{d\psi_q}{dt} + R_s i_q + \omega_e \psi_d$$

$$\frac{d\psi_d}{dt} + R_s i_d = Kp_d(i_d^* - i_d) + Ki_d \frac{zT_{st}}{z-1}(i_d^* - i_d)$$

$$\frac{d\psi_q}{dt} + R_s i_q = Kp_q(i_q^* - i_q) + Ki_q \frac{zT_{st}}{z-1}(i_q^* - i_q)$$

$$v_d = Kp_d(i_d^* - i_d) + Ki_d \frac{zT_{st}}{z-1}(i_d^* - i_d) + \omega_e \psi_q$$

$$v_q = Kp_q(i_q^* - i_q) + Ki_q \frac{zT_{st}}{z-1}(i_q^* - i_q) - \omega_e \psi_d$$

$$\psi_q = f(i_d, i_q)$$

$$\psi_d = f(i_d, i_q)$$

The equations use these variables.

$\omega_m$	Rotor mechanical speed
$\omega_e$	Rotor electrical speed
$R_s, R_r$	Resistance of the stator and rotor windings, respectively
$i_q, i_d$	$q$ - and $d$ -axis current, respectively
$v_q, v_d$	$q$ - and $d$ -axis voltage, respectively
$\Psi_q, \Psi_d$	$q$ - and $d$ -axis magnet flux, respectively
$T_{st}$	Current regulator sample rate
$Ki_d, Ki_q$	$d$ - and $q$ - axis integral gain, respectively
$Kp_d, Kp_q$	$d$ - and $q$ - axis proportional gain, respectively

### Transforms

To calculate the voltages and currents in balanced three-phase ( $a, b$ ) quantities, quadrature two-phase ( $\alpha, \beta$ ) quantities, and rotating ( $d, q$ ) reference frames, the block uses the Clarke and Park Transforms.

In the transform equations.

$$\omega_e = P\omega_m$$

$$\frac{d\theta_e}{dt} = \omega_e$$

Transform	Description	Equations
Clarke	Converts balanced three-phase quantities ( $a, b$ ) into balanced two-phase quadrature quantities ( $\alpha, \beta$ ).	$x_\alpha = \frac{2}{3}x_a - \frac{1}{3}x_b - \frac{1}{3}x_c$ $x_\beta = \frac{\sqrt{3}}{2}x_b - \frac{\sqrt{3}}{2}x_c$
Park	Converts balanced two-phase orthogonal stationary quantities ( $\alpha, \beta$ ) into an orthogonal rotating reference frame ( $d, q$ ).	$x_d = x_\alpha \cos\theta_e + x_\beta \sin\theta_e$ $x_q = -x_\alpha \sin\theta_e + x_\beta \cos\theta_e$
Inverse Clarke	Converts balanced two-phase quadrature quantities ( $\alpha, \beta$ ) into balanced three-phase quantities ( $a, b$ ).	$x_a = x_\alpha$ $x_b = -\frac{1}{2}x_\alpha + \frac{\sqrt{3}}{2}x_\beta$ $x_c = -\frac{1}{2}x_\alpha - \frac{\sqrt{3}}{2}x_\beta$
Inverse Park	Converts an orthogonal rotating reference frame ( $d, q$ ) into balanced two-phase orthogonal stationary quantities ( $\alpha, \beta$ ).	$x_\alpha = x_d \cos\theta_e - x_q \sin\theta_e$ $x_\beta = x_d \sin\theta_e + x_q \cos\theta_e$

The transforms use these variables.

$\omega_m$	Rotor speed
$P$	Rotor pole pairs
$\omega_e$	Rotor electrical speed
$\theta_e$	Rotor electrical angle
$x$	Phase current or voltage

### Motor

The block uses the phase currents and phase voltages to estimate the DC bus current. Positive current indicates battery discharge. Negative current indicates battery charge.

The block uses these equations.

Load power	$Ld_{Pwr} = v_a i_a + v_b i_b + v_c i_c$
Source power	$Src_{Pwr} = Ld_{Pwr} + Pwr_{Loss}$
DC bus current	$i_{bus} = \frac{Src_{Pwr}}{v_{bus}}$
Estimated rotor torque	$T_e = 1.5P[\psi_d i_q - \psi_q i_d]$
Power loss for single efficiency source to load	$Pwr_{Loss} = \frac{100 - Eff}{Eff} \cdot Ld_{Pwr}$
Power loss for single efficiency load to source	$Pwr_{Loss} = \frac{100 - Eff}{100} \cdot  Ld_{Pwr} $
Power loss for tabulated efficiency	$Pwr_{Loss} = f(\omega_m, MtrTrq_{est})$

The equations use these variables.

$v_a, v_b, v_c$	Stator phase a, b, c voltages
$v_{bus}$	Estimated DC bus voltage
$i_a, i_b, i_c$	Stator phase a, b, c currents
$i_{bus}$	Estimated DC bus current
$Eff$	Overall inverter efficiency
$\omega_m$	Rotor mechanical speed
$L_q, L_d$	$q$ - and $d$ -axis winding inductance, respectively
$\Psi_q, \Psi_d$	$q$ - and $d$ -axis magnet flux, respectively
$i_q, i_d$	$q$ - and $d$ -axis current, respectively
$\lambda$	Permanent magnet flux linkage
$P$	Rotor pole pairs

### Electrical Losses

To specify the electrical losses, on the **Electrical Losses** tab, for **Parameterize losses by**, select one of these options.

Setting	Block Implementation
Single efficiency measurement	Electrical loss calculated using a constant value for inverter efficiency.
Tabulated loss data	Electrical loss calculated as a function of motor speeds and load torques.
Tabulated efficiency data	<p>Electrical loss calculated using inverter efficiency that is a function of motor speeds and load torques.</p> <ul style="list-style-type: none"> <li>Converts the efficiency values you provide into losses and uses the tabulated losses for simulation.</li> <li>Ignores efficiency values you provide for zero speed or zero torque. Losses are assumed zero when either torque or speed is zero.</li> <li>Uses linear interpolation to determine losses. Provide tabulated data for low speeds and low torques, as required, to get the desired level of accuracy for lower power conditions.</li> <li>Does not extrapolate loss values for speed and torque magnitudes that exceed the range of the table.</li> </ul>

For best practice, use **Tabulated loss data** instead of **Tabulated efficiency data**:

- Efficiency becomes ill defined for zero speed or zero torque.
- You can account for fixed losses that are still present for zero speed or torque.

### Ports

#### Input

**SpdReq — Rotor speed command**  
scalar

Rotor speed command,  $\omega_m^*$ , in rad/s.

**Dependencies**

To create this port, select Speed Control for the **Control Type** parameter.

**TrqCmd — Torque command**

scalar

Torque command,  $T^*$ , in N·m.

**Dependencies**

To create this port, select Torque Control for the **Control Type** parameter.

**BusVolt — DC bus voltage**

scalar

DC bus voltage,  $v_{bus}$ , in V.

**PhaseCurrA — Current**

scalar

Stator current phase a,  $i_a$ , in A.

**PhaseCurrB — Current**

scalar

Stator current phase b,  $i_b$ , in A.

**SpdFdbk — Rotor speed**

scalar

Rotor speed,  $\omega_m$ , in rad/s.

**PosFdbk — Rotor electrical angle**

scalar

Rotor electrical angle,  $\theta_m$ , in rad.

**Output**

**Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal	Description	Units
SrcPwr	Source power	W
LdPwr	Load power	W
PwrLoss	Power loss	W
MtrTrqEst	Estimated motor torque	N·m

**BusCurr — Bus current**

scalar

Estimated DC bus current,  $i_{bus}$ , in A.

**PhaseVolt – Stator terminal voltages**

array

Stator terminal voltages,  $V_a$ ,  $V_b$ , and  $V_c$ , in V.

**Parameters**

**Block Options**

**Control Type – Select control**

Torque Control (default) | Speed Control

If you select Torque Control, the block does not implement the speed controller.

This table summarizes the port configurations.

Port Configuration	Creates Ports
Speed Control	SpdReq
Torque Control	TrqCmd

**Motor Parameters**

**Number of pole pairs, PolePairs – Poles**

4 (default) | scalar

Motor pole pairs,  $P$ .

**Vector of d-axis current breakpoints, id\_index – Current**

vector

$d$ -axis current,  $i_{d\_index}$ , in A.

**Vector of q-axis current breakpoints, iq\_index – current**

vector

$q$ -axis current,  $i_{q\_index}$ , in A.

**Corresponding d-axis flux, lambda\_d – Flux**

vector

$d$ -axis flux,  $\lambda_d$ , in Wb.

**Corresponding q-axis flux, lambda\_q – Flux**

vector

$q$ -axis flux,  $\lambda_q$ , in Wb.

**Current Controller**

**Sample time for the torque control, Tst – Time**

1e-4 (default) | scalar

Torque control sample time,  $T_{st}$ , in s.

**D-axis proportional gain, Kp\_d – Gain**

2.4056 (default) | scalar

 $d$ -axis proportional gain,  $Kp_d$ , in V/A.**Q-axis proportional gain, Kp\_q – Gain**

2.4056 (default) | scalar

 $q$ -axis proportional gain,  $Kp_q$ , in V/A.**D-axis integral gain, Ki\_d – Gain**

192.45 (default) | scalar

 $d$ -axis integral gain,  $Ki_d$ , in V/A·s.**Q-axis integral gain, Ki\_q – Gain**

192.45 (default) | scalar

 $q$ -axis integral gain,  $Ki_q$ , in V/A·s.**Vector of speed breakpoints, wpb – Breakpoints**

vector

Speed breakpoints,  $\omega_{bp}$ , in rad/s.**Vector of torque breakpoints, tpb – Breakpoints**

vector

Torque breakpoints,  $T_{bp}$ , in N·m.**Corresponding d-axis current reference, id\_ref – Current**

vector

 $d$ -axis reference current,  $i_{dref}$ , in A.**Corresponding q-axis current reference, iq\_ref – Current**

vector

 $q$ -axis reference current,  $i_{qref}$ , in A.**Speed Controller****Speed regulation time constant, Ksf – Time**

.1 (default) | scalar

Speed regulator time constant,  $K_{sf}$ , in 1/s.**Dependencies**To enable this parameter, for the **Control Type** parameter, select Speed Control.**Proportional gain, Kp\_w – Gain**

0.40475 (default) | scalar

Proportional gain,  $Kp_w$ , in N·m/(rad/s).

**Dependencies**

To enable this parameter, for the **Control Type** parameter, select Speed Control.

**Integral gain,  $Ki_w$  – Gain**

10.1615 (default) | scalar

Integral gain,  $Ki_w$  N·m/rad.

**Dependencies**

To enable this parameter, for the **Control Type** parameter, select Speed Control.

**Inertia compensation,  $Jcomp$  – Inertia**

0.0027 (default) | scalar

Inertia compensation, in  $kg \cdot m^2$ .

**Dependencies**

To enable this parameter, for the **Control Type** parameter, select Speed Control.

**Static friction,  $Fs$  – Friction**

0 (default) | scalar

Static friction, in N·m.

**Dependencies**

To enable this parameter, for the **Control Type** parameter, select Speed Control.

**Viscous damping compensation,  $Fv$  – Dampint**

0.0004924 (default) | scalar

Viscous damping compensation, in N·m/(rad/s).

**Dependencies**

To enable this parameter, for the **Control Type** parameter, select Speed Control.

**Electrical Losses**

**Parameterize losses by – Select type**

Single efficiency measurement (default) | Tabulated loss data | Tabulated efficiency data

Setting	Block Implementation
Single efficiency measurement	Electrical loss calculated using a constant value for inverter efficiency.
Tabulated loss data	Electrical loss calculated as a function of motor speeds and load torques.

Setting	Block Implementation
Tabulated efficiency data	<p>Electrical loss calculated using inverter efficiency that is a function of motor speeds and load torques.</p> <ul style="list-style-type: none"> <li>Converts the efficiency values you provide into losses and uses the tabulated losses for simulation.</li> <li>Ignores efficiency values you provide for zero speed or zero torque. Losses are assumed zero when either torque or speed is zero.</li> <li>Uses linear interpolation to determine losses. Provide tabulated data for low speeds and low torques, as required, to get the desired level of accuracy for lower power conditions.</li> <li>Does not extrapolate loss values for speed and torque magnitudes that exceed the range of the table.</li> </ul>

For best practice, use `Tabulated loss data` instead of `Tabulated efficiency data`:

- Efficiency becomes ill defined for zero speed or zero torque.
- You can account for fixed losses that are still present for zero speed or torque.

#### Overall inverter efficiency, `eff` – Constant

98 (default) | scalar

Overall inverter efficiency,  $Eff$ , in %.

#### Dependencies

To enable this parameter, for **Parameterize losses by**, select `Tabulated loss data`.

#### Vector of speeds ( $w$ ) for tabulated loss, `w_loss_bp` – Breakpoints

[0 200 400 600 800 1000] (default) | 1-by-M vector

Speed breakpoints for lookup table when calculating losses, in rad/s.

#### Dependencies

To enable this parameter, for **Parameterize losses by**, select `Tabulated loss data`.

#### Vector of torques ( $T$ ) for tabulated loss, `T_loss_bp` – Breakpoints

[0 25 50 75 100] (default) | 1-by-N vector

Torque breakpoints for lookup table when calculating losses, in N·m.

#### Dependencies

To enable this parameter, for **Parameterize losses by**, select `Tabulated loss data`.

#### Corresponding losses, `losses_table` – Table

[100 100 100 100 100;100 150 200 250 300;100 200 300 400 500;100 250 400 550 700;100 300 500 700 900;100 350 600 850 1100] (default) | M-by-N array

Array of values for electrical losses as a function of  $M$  speeds and  $N$  torques, in  $W$ . Each value specifies the losses for a specific combination of speed and torque. The matrix size must match the dimensions defined by the speed and torque vectors.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.

**Vector of speeds (w) for tabulated efficiency, w\_eff\_bp – Breakpoints**

[200 400 600 800 1000] (default) | 1-by-M vector

Speed breakpoints for lookup table when calculating efficiency, in rad/s.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated efficiency data.

**Vector of torques (T) for tabulated efficiency, T\_eff\_bp – Breakpoints**

[25 50 75 100] (default) | 1-by-N vector

Torque breakpoints for lookup table when calculating efficiency, in N·m.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated efficiency data.

**Corresponding efficiency, efficiency\_table – Table**

[96.2 98.1 98.7 99;98.1 99 99.4 99.5;98.7 99.4 99.6 99.7;99 99.5 99.7 99.8;99.2 99.6 99.7 99.8] (default) | M-by-N array

Array of efficiency as a function of M speeds and N torque, in %. Each value specifies the efficiency for a specific combination of speed and torque. The matrix size must match the dimensions defined by the speed and torque vectors.

The block ignores efficiency values for zero speed or zero torque. Losses are zero when either torque or speed is zero. The block uses linear interpolation.

To get the desired level of accuracy for lower power conditions, you can provide tabulated data for low speeds and low torques.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated efficiency data.

## Induction Motor

Three-phase induction motor

**Library:** Powertrain Blockset / Propulsion / Electric Motors and Inverters  
Motor Control Blockset / Electrical Systems / Motors

### Description

The Induction Motor block implements a three-phase induction motor. The block uses the three-phase input voltages to regulate the individual phase currents, allowing control of the motor torque or speed.

By default, the block sets the **Simulation Type** parameter to **Continuous** to use a continuous sample time during simulation. If you want to generate code for fixed-step double- and single-precision targets, considering setting the parameter to **Discrete**. Then specify a **Sample Time, Ts** parameter.

### Three-Phase Sinusoidal Model Electrical System

The block implements equations that are expressed in a stationary rotor reference (qd) frame. The d-axis aligns with the a-axis. All quantities in the rotor reference frame are referred to the stator.

The block uses these equations to calculate the electrical speed ( $\omega_{em}$ ) and slip speed ( $\omega_{slip}$ ).

$$\omega_{em} = P\omega_m$$

$$\omega_{slip} = \omega_{syn} - \omega_{em}$$

To calculate the dq rotor electrical speed with respect to the rotor A-axis ( $dA$ ), the block uses the difference between the stator a-axis ( $da$ ) speed and slip speed:

$$\omega_{dA} = \omega_{da} - \omega_{em}$$

To simplify the equations for the flux, voltage, and current transformations, the block uses a stationary reference frame:

$$\omega_{da} = 0$$

$$\omega_{dA} = -\omega_{em}$$

Calculation	Equation
Flux	$\frac{d}{dt} \begin{bmatrix} \lambda_{sd} \\ \lambda_{sq} \end{bmatrix} = \begin{bmatrix} v_{sd} \\ v_{sq} \end{bmatrix} - R_s \begin{bmatrix} i_{sd} \\ i_{sq} \end{bmatrix} - \omega_{da} \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} \begin{bmatrix} \lambda_{sd} \\ \lambda_{sq} \end{bmatrix}$ $\frac{d}{dt} \begin{bmatrix} \lambda_{rd} \\ \lambda_{rq} \end{bmatrix} = \begin{bmatrix} v_{rd} \\ v_{rq} \end{bmatrix} - R_r \begin{bmatrix} i_{rd} \\ i_{rq} \end{bmatrix} - \omega_{dA} \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} \begin{bmatrix} \lambda_{rd} \\ \lambda_{rq} \end{bmatrix}$ $\begin{bmatrix} \lambda_{sd} \\ \lambda_{sq} \\ \lambda_{rd} \\ \lambda_{rq} \end{bmatrix} = \begin{bmatrix} L_s & 0 & L_m & 0 \\ 0 & L_s & 0 & L_m \\ L_m & 0 & L_r & 0 \\ 0 & L_m & 0 & L_r \end{bmatrix} \begin{bmatrix} i_{sd} \\ i_{sq} \\ i_{rd} \\ i_{rq} \end{bmatrix}$
Current	$\begin{bmatrix} i_{sd} \\ i_{sq} \\ i_{rd} \\ i_{rq} \end{bmatrix} = \left( \frac{1}{L_m^2 - L_r L_s} \right) \begin{bmatrix} -L_r & 0 & L_m & 0 \\ 0 & -L_r & 0 & L_m \\ L_m & 0 & -L_s & 0 \\ 0 & L_m & 0 & -L_s \end{bmatrix} \begin{bmatrix} \lambda_{sd} \\ \lambda_{sq} \\ \lambda_{rd} \\ \lambda_{rq} \end{bmatrix}$
Inductance	$L_s = L_{ls} + L_m$ $L_r = L_{lr} + L_m$
Electromagnetic torque	$T_e = PL_m(i_{sq}i_{rd} - i_{sd}i_{rq})$
Power invariant dq transformation to ensure that the dq and three phase powers are equal	$\begin{bmatrix} v_{sd} \\ v_{sq} \end{bmatrix} = \sqrt{\frac{2}{3}}$ $\begin{bmatrix} \cos(\theta_{da}) & \cos(\theta_{da} - \frac{2\pi}{3}) & \cos(\theta_{da} + \frac{2\pi}{3}) \\ -\sin(\theta_{da}) & -\sin(\theta_{da} - \frac{2\pi}{3}) & -\sin(\theta_{da} + \frac{2\pi}{3}) \end{bmatrix} \begin{bmatrix} v_a \\ v_b \\ v_c \end{bmatrix}$ $\begin{bmatrix} i_a \\ i_b \\ i_c \end{bmatrix} = \sqrt{\frac{2}{3}} \begin{bmatrix} \cos(\theta_{da}) & -\sin(\theta_{da}) \\ \cos(\theta_{da} - \frac{2\pi}{3}) & -\sin(\theta_{da} - \frac{2\pi}{3}) \\ \cos(\theta_{da} + \frac{2\pi}{3}) & -\sin(\theta_{da} + \frac{2\pi}{3}) \end{bmatrix} \begin{bmatrix} i_{sd} \\ i_{sq} \end{bmatrix}$

The equations use these variables.

$\omega_m$	Angular velocity of the rotor (rad/s)
$\omega_{em}$	Electrical rotor speed (rad/s)
$\omega_{slip}$	Electrical rotor slip speed (rad/s)
$\omega_{syn}$	Synchronous rotor speed (rad/s)
$\omega_{da}$	dq stator electrical speed with respect to the rotor a-axis (rad/s)
$\omega_{dA}$	dq stator electrical speed with respect to the rotor A-axis (rad/s)
$\Theta_{da}$	dq stator electrical angle with respect to the rotor a-axis (rad)
$\Theta_{dA}$	dq stator electrical angle with respect to the rotor A-axis (rad)
$L_q, L_d$	q- and d-axis inductances (H)
$L_s$	Stator inductance (H)
$L_r$	Rotor inductance (H)
$L_m$	Magnetizing inductance (H)
$L_{ls}$	Stator leakage inductance (H)
$L_{lr}$	Rotor leakage inductance (H)
$v_{sq}, v_{sd}$	Stator q- and d-axis voltages (V)
$i_{sq}, i_{sd}$	Stator q- and d-axis currents (A)
$\lambda_{sq}, \lambda_{sd}$	Stator q- and d-axis flux (Wb)
$i_{rq}, i_{rd}$	Rotor q- and d-axis currents (A)
$\lambda_{rq}, \lambda_{rd}$	Rotor q- and d-axis flux (Wb)
$v_a, v_b, v_c$	Stator voltage phases a, b, c (V)
$i_a, i_b, i_c$	Stator currents phases a, b, c (A)
$R_s$	Resistance of the stator windings (Ohm)
$R_r$	Resistance of the rotor windings (Ohm)
$P$	Number of pole pairs
$T_e$	Electromagnetic torque (Nm)

### Mechanical System

The motor angular velocity is given by:

$$\frac{d}{dt}\omega_m = \frac{1}{J}(T_e - T_f - F\omega_m - T_m)$$

$$\frac{d\theta_m}{dt} = \omega_m$$

The equations use these variables.

$J$	Combined inertia of motor and load (kgm <sup>2</sup> )
$F$	Combined viscous friction of motor and load (N·m/(rad/s))
$\theta_m$	Motor mechanical angular position (rad)
$T_m$	Motor shaft torque (Nm)

$T_e$	Electromagnetic torque (Nm)
$T_f$	Motor shaft static friction torque (Nm)
$\omega_m$	Angular mechanical velocity of the motor (rad/s)

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Variable	Equations
PwrInfo	PwrTrnsfrd — Power transferred between blocks	PwrMtr	Mechanical power	$P_{mot} = -\omega_m T_e$
	<ul style="list-style-type: none"> <li>Positive signals indicate flow into block</li> <li>Negative signals indicate flow out of block</li> </ul>	PwrBus	Electrical power	$P_{bus} = v_{an}i_a + v_{bn}i_b + v_{cn}i_c$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred	PwrElecLoss	Resistive power loss	$P_{elec} = -(R_s i_{sd}^2 + R_s i_{sq}^2 + R_r i_{rd}^2 + R_r i_{rq}^2)$
	<ul style="list-style-type: none"> <li>Positive signals indicate an input</li> <li>Negative signals indicate a loss</li> </ul>	PwrMechLoss	Mechanical power loss	<p>When <b>Port Configuration</b> is set to Torque:</p> $P_{mech} = -(\omega_m^2 F +  \omega_m  T_f)$ <p>When <b>Port Configuration</b> is set to Speed:</p> $P_{mech} = 0$
PwrStored — Stored energy rate of change	PwrMtrStored	Stored motor power	$P_{str} = \frac{P_{bus} + P_{mot} + P_{elec} + P_{mech}}{}$	
<ul style="list-style-type: none"> <li>Positive signals indicate an increase</li> <li>Negative signals indicate a decrease</li> </ul>				

The equations use these variables.

$R_s$	Stator resistance (Ohm)
$R_r$	Motor resistance (Ohm)
$i_a, i_b, i_c$	Stator phase a, b, and c current (A)
$i_{sq}, i_{sd}$	Stator q- and d-axis currents (A)
$v_{an}, v_{bn}, v_{cn}$	Stator phase a, b, and c voltage (V)
$\omega_m$	Angular mechanical velocity of the rotor (rad/s)

$F$	Combined motor and load viscous damping (N·m/(rad/s))
$T_e$	Electromagnetic torque (Nm)
$T_f$	Combined motor and load friction torque (Nm)

## Ports

### Input

#### LdTrq — Rotor shaft torque

scalar

Rotor shaft input torque,  $T_m$ , in N·m.

#### Dependencies

To create this port, select Torque for the **Port configuration** parameter.

#### Spd — Rotor shaft speed

scalar

Angular velocity of the rotor,  $\omega_m$ , in rad/s.

#### Dependencies

To create this port, select Speed for the **Port configuration** parameter.

#### PhaseVolt — Stator terminal voltages

1-by-3 array

Stator terminal voltages,  $V_a$ ,  $V_b$ , and  $V_c$ , in V.

### Output

#### Info — Bus signal

bus

The bus signal contains these block calculations.

Signal	Description	Variable	Units
IaStator	Stator phase current A	$i_a$	A
IbStator	Stator phase current B	$i_b$	A
IcStator	Stator phase current C	$i_c$	A
IdSync	Direct axis current	$i_d$	A
IqSync	Quadrature axis current	$i_q$	A
VdSync	Direct axis voltage	$v_d$	V
VqSync	Quadrature axis voltage	$v_q$	V
MtrSpd	Angular mechanical velocity of the rotor	$\omega_m$	rad/s
MtrMechPos	Rotor mechanical angular position	$\theta_m$	rad

Signal			Description	Variable	Units
MtrPos			Rotor electrical angular position	$\theta_e$	rad

**PhaseCurr — Phase a, b, c current**

1-by-3 array

Phase a, b, c current,  $i_a$ ,  $i_b$ , and  $i_c$ , in A.**MtrTrq — Motor torque**

scalar

Motor torque,  $T_{mtr}$ , in N·m.**Dependencies**To create this port, select Speed for the **Port configuration** parameter.**MtrSpd — Motor speed**

scalar

Angular speed of the motor,  $\omega_{mtr}$ , in rad/s.**Dependencies**To create this port, select Torque for the **Port configuration** parameter.**Parameters****Block Options****Simulation type — Select simulation type**

Continuous (default) | Discrete

By default, the block uses a continuous sample time during simulation. If you want to generate code for single-precision targets, considering setting the parameter to Discrete.

**Dependencies**Setting **Simulation Type** to Discrete creates the **Sample Time, Ts** parameter.**Sample time, Ts — Sample time for discrete integration**

0.001 (default) | scalar

Integration sample time for discrete simulation, in s.

**Dependencies**

Setting **Simulation Type** to Discrete creates the **Sample Time, Ts** parameter.

**Port configuration – Select port configuration**

Torque (default) | Speed

This table summarizes the port configurations.

Port Configuration	Creates Input Port	Creates Output Port
Torque	LdTrq	MtrSpd
Speed	Spd	MtrTrq

**Parameters**

**Number of pole pairs, P – Pole pairs**

2 (default) | scalar

Motor pole pairs,  $P$ .

**Stator resistance and leakage inductance, Zs – Resistance and inductance**

[1.77 0.0139] (default) | vector

Stator resistance,  $R_s$ , in ohms and leakage inductance,  $L_{ls}$ , in H.

**Rotor resistance and leakage inductance, Zr – Resistance and inductance**

[1.34 0.0121] (default) | vector

Rotor resistance,  $R_r$ , in ohms and leakage inductance,  $L_{lr}$ , in H.

**Magnetizing inductance, Lm – Inductance**

0.3687 (default) | scalar

Magnetizing inductance,  $L_m$ , in H.

**Physical inertia, viscous damping, static friction, mechanical – Inertia, damping, friction**

[0.001 0 0] (default) | vector

Mechanical properties of the rotor:

- Inertia,  $J$ , in  $\text{kg}\cdot\text{m}^2$
- Viscous damping,  $F$ , in  $\text{N}\cdot\text{m}/(\text{rad}/\text{s})$
- Static friction,  $T_f$ , in  $\text{N}\cdot\text{m}$

**Dependencies**

To enable this parameter, select Torque for the **Port configuration**.

**Initial Values**

**Initial mechanical position, theta\_init – Angular position**

0 (default) | scalar

Initial rotor angular position,  $\theta_{m0}$ , in rad.

**Initial mechanical speed, omega\_init – Angular speed** $\theta$  (default) | scalar

Initial angular velocity of the rotor,  $\omega_{m0}$ , in rad/s.

**Dependencies**

To enable this parameter, select Torque for the **Port configuration**.

**Introduced in R2017a**

## IM Controller

Internal torque-based, field-oriented controller for an induction motor with an optional outer-loop speed controller

**Library:** Powertrain Blockset / Propulsion / Electric Motor Controllers

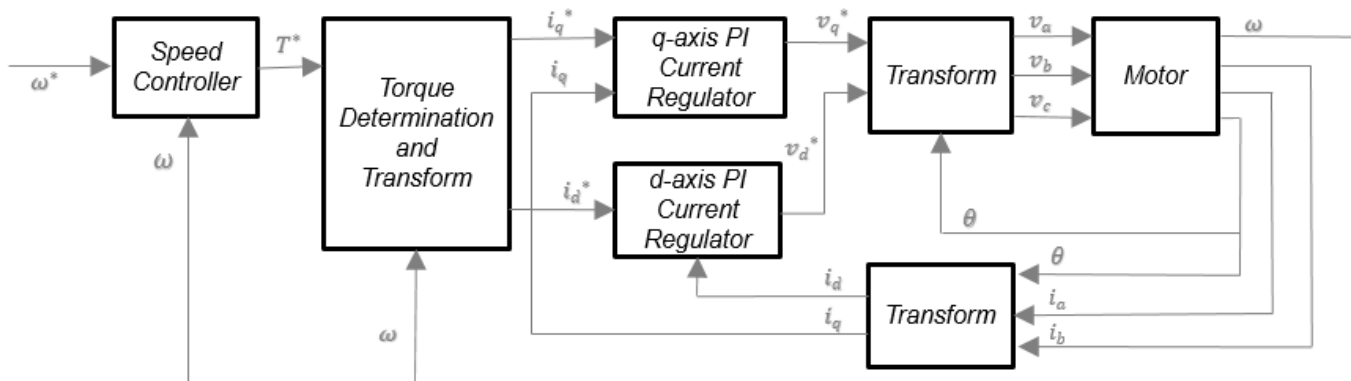

### Description

The IM Controller block implements an internal torque-based, field-oriented controller for an induction motor (IM) with an optional outer-loop speed controller. The torque control implements a strategy to control the motor flux. You can specify either speed or torque control.

The IM Controller implements equations for speed control, torque determination, regulators, transforms, and motors.

The figure illustrates the information flow in the block.

The block implements equations that use these variables.

$\omega$	Rotor speed
$\omega^*$	Rotor speed command
$T^*$	Torque command
$i_d$	d-axis current
$i_d^*$	d-axis current command
$i_q$	q-axis current
$i_q^*$	q-axis current command

$v_d$	d-axis voltage
$v_d^*$	d-axis voltage command
$v_q$	q-axis voltage
$v_q^*$	q-axis voltage command
$v_a, v_b, v_c$	Stator phase a, b, c voltages
$i_a, i_b, i_c$	Stator phase a, b, c currents

### Speed Controller

To implement the speed controller, select the **Control Type** parameter `Speed Control`. If you select the **Control Type** parameter `Torque Control`, the block does not implement the speed controller.

The speed controller determines the torque command by implementing a state filter, and calculating the feedforward and feedback commands. If you do not implement the speed controller, input a torque command to the IM Controller block.

### State Filter

The state filter is a low-pass filter that generates the acceleration command based on the speed command. On the **Speed Controller** tab:

- To make the speed-command lag time negligible, specify a **Bandwidth of the state filter** parameter.
- To calculate a **Speed regulation time constant, Ksf** gain based on the state filter bandwidth, select **Calculate Speed Regulator Gains**.

The discrete form of characteristic equation is given by:

$$z + K_{sf}T_{sm} - 1$$

The filter calculates the gain using this equation.

$$K_{sf} = \frac{1 - \exp(-T_{sm}2\pi EV_{sf})}{T_{sm}}$$

The equation uses these variables.

$EV_{sf}$	Bandwidth of the speed command filter
$T_{sm}$	Motion controller sample time
$K_{sf}$	Speed regulator time constant

**State Feedback**

To generate the state feedback torque, the block uses the filtered speed error signal from the state filter. The feedback torque calculation also requires gains for speed regulator.

On the **Speed Controller** tab, select **Calculate Speed Regulator Gains** to compute:

- **Proportional gain,  $b_a$**
- **Angular gain,  $K_{sa}$**
- **Rotational gain,  $K_{isa}$**

For the gain calculations, the block uses the inertia from the **Physical inertia, viscous damping, static friction** parameter value on the **Motor Parameter** tab.

The gains for the state feedback are calculated using these equations.

Calculation	Equations
Discrete forms of characteristic equation	$z^3 + \frac{(-3J_p + T_s b_a + T_s^2 K_{sa} + T_s^3 K_{isa})}{J_p} z^2 + \frac{(3J_p - 2T_s b_a - T_s^2 K_{sa})}{J_p} z + \frac{-J_p + T_s b_a}{J_p}$ $(z - p_1)(z - p_2)(z - p_3) = z^3 + (p_1 + p_2 + p_3)z^2 + (p_1 p_2 + p_2 p_3 + p_1 p_3)z^2 - p_1 p_2 p_3$
Speed regulator proportional gain	$b_a = \frac{J_p - J_p p_1 p_2 p_3}{T_{sm}}$
Speed regulator integral gain	$K_{sa} = \frac{J_p(p_1 p_2 + p_2 p_3 + p_3 p_1) - 3J_p + 2b_a T_{sm}}{T_{sm}^2}$
Speed regulator double integral gain	$K_{isa} = \frac{-J_p(p_1 + p_2 + p_3) + 3J_p - b_a T_{sm} - K_{sa} T_{sm}^2}{T_{sm}^3}$

The equations use these variables.

$P$	Motor pole pairs
$b_a$	Speed regulator proportional gain
$K_{sa}$	Speed regulator integral gain
$K_{isa}$	Speed regulator double integral gain
$J_p$	Motor inertia
$T_{sm}$	Motion controller sample time

**Command Feedforward**

To generate the state feedforward torque, the block uses the filtered speed and acceleration from the state filter. Also, the feedforward torque calculation uses the inertia, viscous damping, and static friction. To achieve zero tracking error, the torque command is the sum of the feedforward and feedback torque commands.

Selecting **Calculate Speed Regulator Gains** on the **Speed Controller** tab updates the inertia, viscous damping, and static friction with the **Physical inertia, viscous damping, static friction** parameter values on the **Motor Parameter** tab.

The feedforward torque command uses this equation.

$$T_{cmd\_ff} = J_p \dot{\omega}_m + F_v \omega_m + F_s \frac{\omega_m}{|\omega_m|}$$

The equation uses these variables.

$J_p$	Motor inertia
$T_{cmd\_ff}$	Torque command feedforward
$F_s$	Static friction torque constant
$F_v$	Viscous friction torque constant
$F_s$	Static friction torque constant
$\omega_m$	Rotor mechanical speed

### Torque Determination

The block uses a quadrature current to determine the base speed and the current commands. The motor ratings determine the rated electrical speed.

Calculation	Equations
Current commands	$i_{qref} = \frac{T_{cmd}}{i_{sq\_0} \cdot P \cdot \left(\frac{L_m^2}{L_r}\right)}$ <p>If <math> \omega_e  \leq \omega_{rated}</math>  <math display="block">i_{dref} = i_{sd\_0}</math> Else  <math display="block">i_{dref} = \frac{i_{sd\_0}}{ \omega_e }</math> End</p>
Inductance	$L_r = L_{lr} + L_m$ $L_s = L_{ls} + L_m$

The equations use these variables.

$i_{dref}$	d-axis reference current
$i_{qref}$	q-axis reference current
$i_{sd\_0}$	d-axis rated current
$i_{sq\_0}$	q-axis rated current
$\omega_e$	Rotor electrical speed
$\omega_{rated}$	Rated electrical speed
$L_{lr}$	Rotor leaking inductance

$L_r$	Rotor winding inductance
$L_{ls}$	Stator leaking inductance
$L_s$	Stator winding inductance
$L_m$	Motor magnetizing inductance
$P$	Motor pole pairs
$T_{cmd}$	Commanded motor maximum torque

### Current Regulators

The block regulates the current with an anti-windup feature. Classic proportional-integrator (PI) current regulators do not consider the d-axis and q-axis coupling or the back-electromagnetic force (EMF) coupling. As a result, transient performance deteriorates. To account for the coupling, the block implements the complex vector current regulator (CVCR) in the scalar format of the rotor reference frame. The CVCR decouples:

- d-axis and q-axis current cross-coupling
- Back-EMF cross-coupling

The current frequency response is a first-order system, with a bandwidth of  $EV_{current}$ .

The block implements these equations.

Calculation	Equations
Motor voltage, in the stator reference frame	$\sigma = 1 - \frac{L_m^2}{L_s L_r}$ $v_{sd} = R_s i_{sd} + \sigma L_s \frac{di_{sd}}{dt} + \frac{L_m}{L_r} \frac{d\lambda_{rd}}{dt} - P\omega_m \sigma L_s i_{sq}$ $v_{sq} = R_s i_{sq} + \sigma L_s \frac{di_{sq}}{dt} + \omega_d \frac{L_m}{L_r} \frac{d\lambda_{rd}}{dt} + P\omega_m \sigma L_s i_{sd}$
Current regulator gains	$\omega_b = 2\pi EV_{current}$ $K_p = \sigma L_d \omega_b$ $K_i = R_s \omega_b$
Transfer functions	$\frac{i_d}{i_{dref}} = \frac{\omega_b}{s + \omega_b}$ $\frac{i_q}{i_{qref}} = \frac{\omega_b}{s + \omega_b}$

The equations use these variables.

$EV_{current}$	Current regulator bandwidth
$i_d$	d-axis current
$i_q$	q-axis current
$i_{sq}$	Stator q-axis current
$i_{sd}$	Stator d-axis current
$v_{sd}$	Stator d-axis voltage

$v_{sq}$	Stator q-axis voltage
$K_p$	Current regulator d-axis gain
$K_i$	Current regulator integrator gain
$L_s$	Stator winding inductance
$L_m$	Motor magnetizing inductance
$L_r$	Rotor winding inductance
$R_s$	Stator phase winding resistance
$\lambda_{rd}$	Rotor d-axis magnetic flux
$\sigma$	Leakage factor
$p$	Motor pole pairs

### Transforms

To calculate the voltages and currents in balanced three-phase ( $a, b$ ) quantities, quadrature two-phase ( $\alpha, \beta$ ) quantities, and rotating ( $d, q$ ) reference frames, the block uses the Clarke and Park Transforms.

In the transform equations.

$$\omega_e = P\omega_m$$

$$\frac{d\theta_e}{dt} = \omega_e$$

Transform	Description	Equations
Clarke	Converts balanced three-phase quantities ( $a, b$ ) into balanced two-phase quadrature quantities ( $\alpha, \beta$ ).	$x_\alpha = \frac{2}{3}x_a - \frac{1}{3}x_b - \frac{1}{3}x_c$ $x_\beta = \frac{\sqrt{3}}{2}x_b - \frac{\sqrt{3}}{2}x_c$
Park	Converts balanced two-phase orthogonal stationary quantities ( $\alpha, \beta$ ) into an orthogonal rotating reference frame ( $d, q$ ).	$x_d = x_\alpha \cos\theta_e + x_\beta \sin\theta_e$ $x_q = -x_\alpha \sin\theta_e + x_\beta \cos\theta_e$
Inverse Clarke	Converts balanced two-phase quadrature quantities ( $\alpha, \beta$ ) into balanced three-phase quantities ( $a, b$ ).	$x_a = x_\alpha$ $x_b = -\frac{1}{2}x_\alpha + \frac{\sqrt{3}}{2}x_\beta$ $x_c = -\frac{1}{2}x_\alpha - \frac{\sqrt{3}}{2}x_\beta$
Inverse Park	Converts an orthogonal rotating reference frame ( $d, q$ ) into balanced two-phase orthogonal stationary quantities ( $\alpha, \beta$ ).	$x_\alpha = x_d \cos\theta_e - x_q \sin\theta_e$ $x_\beta = x_d \sin\theta_e + x_q \cos\theta_e$

The transforms use these variables.

$\omega_m$	Rotor mechanical speed
$P$	Motor pole pairs
$\omega_e$	Rotor electrical speed

$\theta_e$  Rotor electrical angle  
 x Phase current or voltage

**Motor**

The block uses the phase currents and phase voltages to estimate the DC bus current. Positive current indicates battery discharge. Negative current indicates battery charge. The block uses these equations.

Load power	$Ld_{Pwr} = v_a i_a + v_b i_b + v_c i_c$
Source power	$Src_{Pwr} = Ld_{Pwr} + Pwr_{Loss}$
DC bus current	$i_{bus} = \frac{Src_{Pwr}}{v_{bus}}$
Estimated rotor torque	$MtrTrq_{est} = P \lambda_{rd} i_{sq} \frac{L_m}{L_r}$
Power loss for single efficiency source to load	$Pwr_{Loss} = \frac{100 - Eff}{Eff} \cdot Ld_{Pwr}$
Power loss for single efficiency load to source	$Pwr_{Loss} = \frac{100 - Eff}{100} \cdot  Ld_{Pwr} $
Power loss for tabulated efficiency	$Pwr_{Loss} = f(\omega_m, MtrTrq_{est})$

The equations use these variables.

$v_a, v_b, v_c$  Stator phase a, b, c voltages  
 $v_{bus}$  Estimated DC bus voltage  
 $i_a, i_b, i_c$  Stator phase a, b, c currents  
 $i_{bus}$  Estimated DC bus current  
 $Eff$  Overall inverter efficiency  
 $\omega_m$  Rotor mechanical speed  
 $L_r$  Rotor winding inductance  
 $L_m$  Motor magnetizing inductance  
 $\lambda_{rd}$  Rotor d-axis magnetic flux  
 $i_{sq}$  q-axis current  
 $P$  Motor pole pairs

**Electrical Losses**

To specify the electrical losses, on the **Electrical Losses** tab, for **Parameterize losses by**, select one of these options.

Setting	Block Implementation
Single efficiency measurement	Electrical loss calculated using a constant value for inverter efficiency.
Tabulated loss data	Electrical loss calculated as a function of motor speeds and load torques.

Setting	Block Implementation
Tabulated efficiency data	<p>Electrical loss calculated using inverter efficiency that is a function of motor speeds and load torques.</p> <ul style="list-style-type: none"> <li>• Converts the efficiency values you provide into losses and uses the tabulated losses for simulation.</li> <li>• Ignores efficiency values you provide for zero speed or zero torque. Losses are assumed zero when either torque or speed is zero.</li> <li>• Uses linear interpolation to determine losses. Provide tabulated data for low speeds and low torques, as required, to get the desired level of accuracy for lower power conditions.</li> <li>• Does not extrapolate loss values for speed and torque magnitudes that exceed the range of the table.</li> </ul>

For best practice, use Tabulated loss data instead of Tabulated efficiency data:

- Efficiency becomes ill defined for zero speed or zero torque.
- You can account for fixed losses that are still present for zero speed or torque.

## Ports

### Input

#### SpdReq — Rotor mechanical speed command

scalar

Rotor mechanical speed command,  $\omega_m^*$ , in rad/s.

#### Dependencies

To create this port, select Speed Control for the **Control Type** parameter.

#### TrqCmd — Torque command

scalar

Torque command,  $T^*$ , in N·m.

#### Dependencies

To create this port, select Torque Control for the **Control Type** parameter.

#### BusVolt — DC bus voltage

scalar

DC bus voltage  $v_{bus}$ , in V.

#### PhaseCurrA — Current

scalar

Stator current phase a,  $i_a$ , in A.

#### PhaseCurrB — Current

scalar

Stator current phase b,  $i_b$ , in A.

**SpdFdbk – Rotor mechanical speed**

scalar

Rotor mechanical speed,  $\omega_m$ , in rad/s.

**Output**

**Info – Bus signal**

bus

Bus signal containing these block calculations.

Signal	Description	Units
SrcPwr	Source power	W
LdPwr	Load power	W
PwrLoss	Power loss	W
MtrTrqEst	Estimated motor torque	N·m

**BusCurr – Bus current**

scalar

Estimated DC bus current,  $i_{bus}$ , in A.

**PhaseVolt – Stator terminal voltages**

array

Stator terminal voltages,  $V_a$ ,  $V_b$ , and  $V_c$ , in V.

**Parameters**

**Block Options**

**Control Type – Select control**

Speed Control (default) | Torque Control

If you select Torque Control, the block does not implement the speed controller.

This table summarizes the port configurations.

Port Configuration	Creates Ports
Speed Control	SpdReq
Torque Control	TrqCmd

**Motor**

**Stator resistance, Rs – Resistance**

1.77 (default) | scalar

Stator phase winding resistance,  $R_s$ , in ohm.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Stator resistance, $R_s$	D-axis rated current, $I_{sd\_0}$	Id and Iq Calculation
	Q-axis rated current, $I_{sq\_0}$	
	Torque at rated current, $T_{em}$	
	D and Q axis integral gain, $K_i$	Current Controller

**Stator leakage inductance,  $L_{ls}$  – Inductance**

0.0139 (default) | scalar

Stator leakage inductance,  $L_{ls}$ , in H.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Stator leakage inductance, $L_{ls}$	D-axis rated current, $I_{sd\_0}$	Id and Iq Calculation
	Q-axis rated current, $I_{sq\_0}$	
	Torque at rated current, $T_{em}$	
	D and Q axis proportional gain, $K_p$	Current Controller
	D and Q axis integral gain, $K_i$	

**Rotor resistance,  $R_r$  – Resistance**

1.34 (default) | scalar

Rotor resistance,  $R_r$ , in ohm.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Rotor resistance, $R_r$	D-axis rated current, $I_{sd\_0}$	Id and Iq Calculation
	Q-axis rated current, $I_{sq\_0}$	
	Torque at rated current, $T_{em}$	

**Rotor leakage inductance,  $L_{lr}$  – Inductance**

0.0121 (default) | scalar

Rotor leakage inductance,  $L_{lr}$ , in H.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Rotor leakage inductance, Llr	D-axis rated current, Isd_0	Id and Iq Calculation
	Q-axis rated current, Isq_0	
	Torque at rated current, Tem	
	D and Q axis proportional gain, Kp	Current Controller

**Rotor magnetizing inductance, Lm – Inductance**

0.3687 (default) | scalar

Rotor magnetizing inductance,  $L_m$ , in H.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Rotor leakage inductance, Llr	D-axis rated current, Isd_0	Id and Iq Calculation
	Q-axis rated current, Isq_0	
	Torque at rated current, Tem	
	D and Q axis proportional gain, Kp	Current Controller

**Number of pole pairs, PolePairs – Poles**

2 (default) | scalar

Motor pole pairs,  $P$ .

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Rotor leakage inductance, Llr	Torque at rated current, Tem	Id and Iq Calculation

**Physical inertia, viscous damping, static friction, Mechanical – Mechanical properties of motor**

[0.025, 0, 0] (default) | vector

Mechanical properties of the motor:

- Motor inertia,  $F_v$ , in  $\text{kgm}^2$
- Viscous friction torque constant,  $F_v$ , in  $\text{N}\cdot\text{m}/(\text{rad}/\text{s})$
- Static friction torque constant,  $F_s$ , in  $\text{N}\cdot\text{m}$

#### Dependencies

To enable this parameter, set the **Control Type** parameter to Speed Control.

For the gain calculations, the block uses the inertia from the **Physical inertia, viscous damping, static friction** parameter value that is on the **Motor Parameters** tab.

Parameter	Used to Derive	
	Parameter	Tab
<b>Physical inertia, viscous damping, static friction, Mechanical</b>	<b>Proportional gain, ba</b> <b>Angular gain, Ksa</b> <b>Rotational gain, Kisa</b> <b>Inertia compensation, Jcomp</b> <b>Viscous damping compensation, Fv</b> <b>Static friction, Fs</b>	<b>Speed Controller</b>

#### Id and Iq Calculation

##### Rated synchronous speed, $F_{rate}$ – Motor frequency

60 (default) | scalar

Motor-rated electrical frequency,  $F_{rate}$ , in Hz.

#### Dependencies

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
<b>Rated synchronous speed, <math>F_{rate}</math></b>	<b>D-axis rated current, Isd_0</b> <b>Q-axis rated current, Isq_0</b> <b>Torque at rated current, Tem</b>	<b>Id and Iq Calculation</b>

##### Rated line to line voltage RMS, $V_{rate}$ – Motor voltage

460 (default) | scalar

Motor-rated line-to-line voltage,  $V_{rate}$ , in V.

#### Dependencies

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Rated synchronous speed, $F_{rate}$	D-axis rated current, $I_{sd\_0}$	Id and Iq Calculation
	Q-axis rated current, $I_{sq\_0}$	
	Torque at rated current, $T_{em}$	

**Rated slip,  $S_{rate}$  – Motor slip speed**

0.0172 (default) | scalar

Motor-rated slip speed,  $S_{rate}$ , dimensionless.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Rated slip, $S_{rate}$	D-axis rated current, $I_{sd\_0}$	Id and Iq Calculation
	Q-axis rated current, $I_{sq\_0}$	
	Torque at rated current, $T_{em}$	

**Calculate Rated Stator Flux Current – Derive parameters**

button

Click to derive parameters.

**Dependencies**

On the **Id and Iq Calculation** tab, when you select **Calculate Rated Stator Flux Current**, the block calculates derived parameters. The table summarizes the derived parameters that depend on other block parameters.

Derived Parameter on Id and Iq Calculation tab	Dependency	
	Parameter	Tab
D-axis rated current, $I_{sd\_0}$ Q-axis rated current, $I_{sq\_0}$ Torque at rated current, $T_{em}$	Rated synchronous speed, $F_{rate}$	Id and Iq Calculation
	Rated line to line voltage RMS, $V_{rate}$	
	Rated slip, $S_{rate}$	

Derived Parameter on Id and Iq Calculation tab	Dependency	
	Parameter	Tab
	Stator resistance, Rs Stator leakage inductance, Lls Rotor resistance, Rr Rotor leakage inductance, Llr Rotor magnetizing inductance, Lm	Motor Parameters

### D-axis rated current, Isd\_0 – Derived

3.1004 (default) | scalar

Derived d-axis rated current, in A.

#### Dependencies

On the **Id and Iq Calculation** tab, when you select **Calculate Rated Stator Flux Current**, the block calculates derived parameters. The table summarizes the derived parameters that depend on other block parameters.

Derived Parameter on Id and Iq Calculation tab	Dependency	
	Parameter	Tab
D-axis rated current, Isd_0	Rated synchronous speed, Frate	Id and Iq Calculation
Q-axis rated current, Isq_0	Rated line to line voltage RMS, Vrate	
Torque at rated current, Tem	Rated slip, Srate	
	Stator resistance, Rs Stator leakage inductance, Lls Rotor resistance, Rr Rotor leakage inductance, Llr Rotor magnetizing inductance, Lm	Motor Parameters

### Q-axis rated current, Isq\_0 – Derived

5.7131 (default) | scalar

Derived q-axis rated current, in A.

**Dependencies**

On the **Id and Iq Calculation** tab, when you select **Calculate Rated Stator Flux Current**, the block calculates derived parameters. The table summarizes the derived parameters that depend on other block parameters.

Derived Parameter on Id and Iq Calculation tab	Dependency	
	Parameter	Tab
D-axis rated current, Isd_0	Rated synchronous speed, Frate	Id and Iq Calculation
Q-axis rated current, Isq_0		
Torque at rated current, Tem	Rated line to line voltage RMS, Vrate	Motor Parameters
	Rated slip, Srate	
	Stator resistance, Rs	
	Stator leakage inductance, Lls	
	Rotor resistance, Rr	
	Rotor leakage inductance, Llr	
	Rotor magnetizing inductance, Lm	

**Torque at rated current, Tem – Derived**

12.6467 (default) | scalar

Torque at rated current, in N·m.

**Dependencies**

On the **Id and Iq Calculation** tab, when you select **Calculate Rated Stator Flux Current**, the block calculates derived parameters. The table summarizes the derived parameters that depend on other block parameters.

Derived Parameter on Id and Iq Calculation tab	Dependency	
	Parameter	Tab
D-axis rated current, Isd_0	Rated synchronous speed, Frate	Id and Iq Calculation
Q-axis rated current, Isq_0		
Torque at rated current, Tem	Rated line to line voltage RMS, Vrate	
	Rated slip, Srate	

Derived Parameter on Id and Iq Calculation tab	Dependency	
	Parameter	Tab
	Stator resistance, Rs Stator leakage inductance, Lls Rotor resistance, Rr Rotor leakage inductance, Llr Rotor magnetizing inductance, Lm	Motor Parameters

### Current Controller

#### Bandwidth of the current regulator, EV\_current – Bandwidth

200 (default) | scalar

Current regulator bandwidth, in Hz.

#### Dependencies

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Bandwidth of the current regulator, EV_current	D and Q axis integral gain, Ki D and Q axis proportional gain, Kp	Current Controller

#### Sample time for the torque control, Tst – Time

5e-5 (default) | scalar

Torque control sample time, in s.

#### Dependencies

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Sample time for the torque control, Tst	Speed regulation time constant, Ksf	Speed Controller

#### Calculate Current Regulator Gains – Derive parameters

button

Click to derive parameters.

**Dependencies**

On the **Current Controller** tab, when you select **Calculate Current Regulator Gains**, the block calculates derived parameters. The table summarizes the derived parameters that depend on other block parameters.

Derived Parameter on Current Controller tab	Dependency	
	Parameter	Tab
D and Q axis proportional gain, Kp	Bandwidth of the current regulator, EV_current	Current Controller
	Stator resistance, Rs	Motor Parameters
D and Q axis integral gain, Ki	Stator leakage inductance, Lls	
	Rotor resistance, Rr	
	Rotor leakage inductance, Llr	
	Rotor magnetizing inductance, Lm	

**D and Q axis proportional gain, Kp – Derived**

32.1894 (default) | scalar

Derived proportional gain, in V/A.

**Dependencies**

On the **Current Controller** tab, when you select **Calculate Current Regulator Gains**, the block calculates derived parameters. The table summarizes the derived parameters that depend on other block parameters.

Derived Parameter on Current Controller tab	Dependency	
	Parameter	Tab
D and Q axis proportional gain, Kp	Bandwidth of the current regulator, EV_current	Current Controller
	Stator resistance, Rs	Motor Parameters
D and Q axis integral gain, Ki	Stator leakage inductance, Lls	
	Rotor resistance, Rr	
	Rotor leakage inductance, Llr	
	Rotor magnetizing inductance, Lm	

**D and Q axis integral gain, Ki – Derived**

2224.2476 (default) | scalar

Derived integral gain, in V/A\*s.

### Dependencies

On the **Current Controller** tab, when you select **Calculate Current Regulator Gains**, the block calculates derived parameters. The table summarizes the derived parameters that depend on other block parameters.

Derived Parameter on Current Controller tab	Dependency	
	Parameter	Tab
D and Q axis proportional gain, Kp	Bandwidth of the current regulator, EV_current	Current Controller
	Stator resistance, Rs	Motor Parameters
D and Q axis integral gain, Ki	Stator leakage inductance, Lls	
	Rotor resistance, Rr	
	Rotor leakage inductance, Llr	
	Rotor magnetizing inductance, Lm	

### Speed Controller

#### Bandwidth of the motion controller, EV\_motion – Bandwidth

[20, 4, 0.8] (default) | vector

Motion controller bandwidth, in Hz. Set the first element of the vector to the desired cutoff frequency. Set the second and third elements of the vector to the higher-order cut off frequencies. You can set the value of the next element to 1/5 the value of the previous element. For example, if the desired cutoff frequency is 20 Hz, specify [20 4 0.8].

### Dependencies

The parameter is enabled when the **Control Type** parameter is set to Speed Control.

Parameter	Used to Derive	
	Parameter	Tab
Bandwidth of the motion controller, EV_motion	Proportional gain, ba	Speed Controller
	Angular gain, Ksa	
	Rotational gain, Kisa	

#### Bandwidth of the state filter, EV\_sf – Bandwidth

200 (default) | scalar

State filter bandwidth, in Hz.

### Dependencies

The parameter is enabled when the **Control Type** parameter is set to Speed Control.

Parameter	Used to Derive	
	Parameter	Tab
Bandwidth of the state filter, EV_sf	Speed regulation time constant, Ksf	Speed Controller

**Calculate Speed Regulator Gains – Derive parameters**

button

Click to derive parameters.

**Dependencies**

On the **Speed Controller** tab, when you select **Calculate Speed Regulator Gains**, the block calculates derived parameters. The table summarizes the derived parameters that depend on other block parameters.

Derived Parameter on Speed Controller tab		Depends On	
		Parameter	Tab
<b>Proportional gain, ba</b>	$b_a = \frac{J_p - J_p p_1 p_2 p_3}{T_{sm}}$	Bandwidth of the motion controller, EV_motion  Bandwidth of the state filter, EV_sf	Speed Controller
<b>Angular gain, Ksa</b>	$K_{sa} = \frac{J_p(p_1 p_2 + p_2 p_3 + p_3 p_1) - 3J_p + 2b_a T_{sm}}{T_{sm}^2}$	Sample time for the torque control, Tst	Current Controller
<b>Rotational gain, Kisa</b>	$K_{isa} = \frac{-J_p(p_1 + p_2 + p_3) + 3J_p - b_a T_{sm} - K_{sa} T_{sm}^2}{T_{sm}^3}$	Physical inertia, viscous damping, static friction, Mechanical	Motor Parameters
<b>Speed regulation time constant, Ksf</b>	$K_{sf} = \frac{1 - \exp(-T_{sm} 2\pi EV_{sf})}{T_{sm}}$		
<b>Inertia compensation, Jcomp</b>	$J_{comp} = J_p$	Physical inertia, viscous damping, static friction, Mechanical	Motor Parameters
<b>Viscous damping compensation, Fv</b>	$F_v$		
<b>Static friction, Fs</b>	$F_s$		

The equations use these variables.

$P$	Motor pole pairs
$b_a$	Speed regulator proportional gain
$K_{sa}$	Speed regulator integral gain
$K_{isa}$	Speed regulator double integral gain
$K_{sf}$	Speed regulator time constant
$J_p$	Motor inertia
$EV_{sf}$	State filter bandwidth
$EV_{motion}$	Motion controller bandwidth

**Proportional gain,  $b_a$  – Derived**

3.7477 (default) | scalar

Derived proportional gain, in N·m/(rad/s).

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Proportional gain, $b_a$	Physical inertia, viscous damping, static friction, Mechanical	Motor Parameters
	Bandwidth of the motion controller, $EV_{motion}$	Speed Controller

**Angular gain,  $K_{sa}$  – Derived**

94.0877 (default) | scalar

Derived angular gain, in N·m/rad.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Angular gain, $K_{sa}$	Physical inertia, viscous damping, static friction, Mechanical	Motor Parameters
	Bandwidth of the motion controller, $EV_{motion}$	Speed Controller

**Rotational gain,  $K_{isa}$  – Derived**

381.7822 (default) | scalar

Derived rotational gain, in N·m/(rad\*s).

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Rotational gain, Kisa	Physical inertia, viscous damping, static friction, Mechanical	Motor Parameters
	Bandwidth of the motion controller, EV_motion	Speed Controller

**Speed regulation time constant, Ksf – Derived**

1217.9727 (default) | scalar

Derived speed regulation time constant, in 1/s.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Speed regulation time constant, Ksf	Sample time for the torque control, Tst	Current Controller
	Bandwidth of the state filter, EV_sf	Speed Controller

**Inertia compensation, Jcomp – Derived**

0.025 (default) | scalar

Derived inertia compensation, in kg·m<sup>2</sup>.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Inertia compensation, Jcomp	Physical inertia, viscous damping, static friction, Mechanical	Motor Parameters

**Viscous damping compensation, Fv – Derived**

0 (default) | scalar

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Viscous damping compensation, $F_v$	Physical inertia, viscous damping, static friction, Mechanical	Motor Parameters

### Static friction, $F_s$ – Derived

0 (default) | scalar

Derived static friction, in N·m/(rad/s).

#### Dependencies

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Static friction, $F_s$	Physical inertia, viscous damping, static friction, Mechanical	Motor Parameters

### Electrical Losses

#### Parameterize losses by – Select type

Single efficiency measurement (default) | Tabulated loss data | Tabulated efficiency data

Setting	Block Implementation
Single efficiency measurement	Electrical loss calculated using a constant value for inverter efficiency.
Tabulated loss data	Electrical loss calculated as a function of motor speeds and load torques.
Tabulated efficiency data	<p>Electrical loss calculated using inverter efficiency that is a function of motor speeds and load torques.</p> <ul style="list-style-type: none"> <li>Converts the efficiency values you provide into losses and uses the tabulated losses for simulation.</li> <li>Ignores efficiency values you provide for zero speed or zero torque. Losses are assumed zero when either torque or speed is zero.</li> <li>Uses linear interpolation to determine losses. Provide tabulated data for low speeds and low torques, as required, to get the desired level of accuracy for lower power conditions.</li> <li>Does not extrapolate loss values for speed and torque magnitudes that exceed the range of the table.</li> </ul>

For best practice, use Tabulated loss data instead of Tabulated efficiency data:

- Efficiency becomes ill defined for zero speed or zero torque.

- You can account for fixed losses that are still present for zero speed or torque.

### Overall inverter efficiency, $eff$ – Constant

98 (default) | scalar

Overall inverter efficiency,  $Eff$ , in %.

#### Dependencies

To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.

### Vector of speeds ( $w$ ) for tabulated loss, $w\_loss\_bp$ – Breakpoints

[0 200 400 600 800 1000] (default) | 1-by-M vector

Speed breakpoints for lookup table when calculating losses, in rad/s.

#### Dependencies

To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.

### Vector of torques ( $T$ ) for tabulated loss, $T\_loss\_bp$ – Breakpoints

[0 25 50 75 100] (default) | 1-by-N vector

Torque breakpoints for lookup table when calculating losses, in N·m.

#### Dependencies

To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.

### Corresponding losses, $losses\_table$ – Table

[100 100 100 100 100;100 150 200 250 300;100 200 300 400 500;100 250 400 550 700;100 300 500 700 900;100 350 600 850 1100] (default) | M-by-N array

Array of values for electrical losses as a function of M speeds and N torques, in W. Each value specifies the losses for a specific combination of speed and torque. The matrix size must match the dimensions defined by the speed and torque vectors.

#### Dependencies

To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.

### Vector of speeds ( $w$ ) for tabulated efficiency, $w\_eff\_bp$ – Breakpoints

[200 400 600 800 1000] (default) | 1-by-M vector

Speed breakpoints for lookup table when calculating efficiency, in rad/s.

#### Dependencies

To enable this parameter, for **Parameterize losses by**, select Tabulated efficiency data.

### Vector of torques ( $T$ ) for tabulated efficiency, $T\_eff\_bp$ – Breakpoints

[25 50 75 100] (default) | 1-by-N vector

Torque breakpoints for lookup table when calculating efficiency, in N·m.

#### Dependencies

To enable this parameter, for **Parameterize losses by**, select Tabulated efficiency data.

**Corresponding efficiency, efficiency\_table – Table**

[96.2 98.1 98.7 99;98.1 99 99.4 99.5;98.7 99.4 99.6 99.7;99 99.5 99.7 99.8;99.2 99.6 99.7 99.8] (default) | M-by-N array

Array of efficiency as a function of M speeds and N torque, in %. Each value specifies the efficiency for a specific combination of speed and torque. The matrix size must match the dimensions defined by the speed and torque vectors.

The block ignores efficiency values for zero speed or zero torque. Losses are zero when either torque or speed is zero. The block uses linear interpolation.

To get the desired level of accuracy for lower power conditions, you can provide tabulated data for low speeds and low torques.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated efficiency data.

## Surface Mount PMSM

Three-phase exterior permanent magnet synchronous motor with sinusoidal back electromotive force

**Library:** Powertrain Blockset / Propulsion / Electric Motors and Inverters  
Motor Control Blockset / Electrical Systems / Motors

### Description

The Surface Mount PMSM block implements a three-phase exterior permanent magnet synchronous motor (PMSM) with sinusoidal back electromotive force. The block uses the three-phase input voltages to regulate the individual phase currents, allowing control of the motor torque or speed.

By default, the block sets the **Simulation type** parameter to **Continuous** to use a continuous sample time during simulation. If you want to generate code for fixed-step double- and single-precision targets, considering setting the parameter to **Discrete**. Then specify a **Sample Time, Ts** parameter.

On the **Parameters** tab, if you select **Back-emf** or **Torque constant**, the block implements one of these equations to calculate the permanent flux linkage constant.

Setting	Equation
Back-emf	$\lambda_{pm} = \frac{1}{\sqrt{3}} \cdot \frac{K_e}{1000P} \cdot \frac{60}{2\pi}$
Torque constant	$\lambda_{pm} = \frac{2}{3} \cdot \frac{K_t}{P}$

### Motor Construction

This figure shows the motor construction with a single pole pair on the motor.

The motor magnetic field due to the permanent magnets creates a sinusoidal rate of change of flux with motor angle.

For the axes convention, the  $a$ -phase and permanent magnet fluxes are aligned when motor angle  $\theta_r$  is zero.

### Three-Phase Sinusoidal Model Electrical System

The block implements these equations, expressed in the motor flux reference frame (dq frame). All quantities in the motor reference frame are referred to the stator.

$$\omega_e = P\omega_m$$

$$\frac{d}{dt}i_d = \frac{1}{L_d}v_d - \frac{R}{L_d}i_d + \frac{L_q}{L_d}P\omega_m i_q$$

$$\frac{d}{dt}i_q = \frac{1}{L_q}v_q - \frac{R}{L_q}i_q - \frac{L_d}{L_q}P\omega_m i_d - \frac{\lambda_{pm}P\omega_m}{L_q}$$

$$T_e = 1.5P[\lambda_{pm}i_q + (L_d - L_q)i_d i_q]$$

The  $L_q$  and  $L_d$  inductances represent the relation between the phase inductance and the motor position due to the saliency of the motor magnets. For the surface mount PMSM,  $L_d = L_q$ .

The equations use these variables.

$L_q, L_d$	q- and d-axis inductances (H)
$R$	Resistance of the stator windings (ohm)
$i_q, i_d$	q- and d-axis currents (A)
$v_q, v_d$	q- and d-axis voltages (V)
$\omega_m$	Angular mechanical velocity of the motor (rad/s)
$\omega_e$	Angular electrical velocity of the motor (rad/s)
$\lambda_{pm}$	Permanent magnet flux linkage (Wb)
$K_e$	Back electromotive force (EMF) (Vpk_LL/krpm, where Vpk_LL is the peak voltage line-to-line measurement)
$K_t$	Torque constant (N·m/A)
$P$	Number of pole pairs
$T_e$	Electromagnetic torque (Nm)
$\Theta_e$	Electrical angle (rad)

### Mechanical System

The motor angular velocity is given by:

$$\frac{d}{dt}\omega_m = \frac{1}{J}(T_e - T_f - F\omega_m - T_m)$$

$$\frac{d\theta_m}{dt} = \omega_m$$

The equations use these variables.

$J$	Combined inertia of motor and load (kgm <sup>2</sup> )
$F$	Combined viscous friction of motor and load (N·m/(rad/s))
$\theta_m$	Motor mechanical angular position (rad)
$T_m$	Motor shaft torque (Nm)
$T_e$	Electromagnetic torque (Nm)
$T_f$	Motor shaft static friction torque (Nm)
$\omega_m$	Angular mechanical velocity of the motor (rad/s)

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Variable	Equations	
PwrInfo	PwrTrnsfrd — Power transferred between blocks	PwrMtr	Mechanical power	$P_{mot}$	$P_{mot} = -\omega_m T_e$
	<ul style="list-style-type: none"> <li>Positive signals indicate flow into block</li> <li>Negative signals indicate flow out of block</li> </ul>	PwrBus	Electrical power	$P_{bus}$	$P_{bus} = v_{an}i_a + v_{bn}i_b + v_{cn}i_c$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred	PwrElecLoss	Resistive power loss	$P_{elec}$	$P_{elec} = -\frac{3}{2}(R_s i_{sd}^2 + R_s i_{sq}^2)$
	<ul style="list-style-type: none"> <li>Positive signals indicate an input</li> <li>Negative signals indicate a loss</li> </ul>	PwrMechLoss	Mechanical power loss	$P_{mech}$	<p>When <b>Port Configuration</b> is set to Torque:</p> $P_{mech} = -(\omega_m^2 F +  \omega_m  T_f)$ <p>When <b>Port Configuration</b> is set to Speed:</p> $P_{mech} = 0$
PwrStored — Stored energy rate of change	PwrMtrStored	Stored motor power	$P_{str}$	$P_{str} = P_{bus} + P_{mot} + P_{elec} + P_{mech}$	
<ul style="list-style-type: none"> <li>Positive signals indicate an increase</li> <li>Negative signals indicate a decrease</li> </ul>					

The equations use these variables.

$R_s$	Stator resistance (ohm)
-------	-------------------------

$i_a, i_b, i_c$	Stator phase a, b, and c current (A)
$i_{sq}, i_{sd}$	Stator q- and d-axis currents (A)
$v_{an}, v_{bn}, v_{cn}$	Stator phase a, b, and c voltage (V)
$\omega_m$	Angular mechanical velocity of the motor (rad/s)
$F$	Combined motor and load viscous damping N·m/(rad/s)
$T_e$	Electromagnetic torque (Nm)
$T_f$	Combined motor and load friction torque (Nm)

## Ports

### Input

#### LdTrq — Motor shaft torque

scalar

Motor shaft input torque,  $T_m$ , in N·m.

#### Dependencies

To create this port, select Torque for the **Port Configuration** parameter.

#### Spd — Motor shaft speed

scalar

Angular velocity of the motor,  $\omega_m$ , in rad/s.

#### Dependencies

To create this port, select Speed for the **Port Configuration** parameter.

#### PhaseVolt — Stator terminal voltages

1-by-3 array

Stator terminal voltages,  $V_a$ ,  $V_b$ , and  $V_c$ , in V.

### Output

#### Info — Bus signal

bus

The bus signal contains these block calculations.

Signal	Description	Variable	Units
IaStator	Stator phase current A	$i_a$	A
IbStator	Stator phase current B	$i_b$	A
IcStator	Stator phase current C	$i_c$	A
IdSync	Direct axis current	$i_d$	A
IqSync	Quadrature axis current	$i_q$	A
VdSync	Direct axis voltage	$v_d$	V

Signal			Description	Variable	Units
VqSync			Quadrature axis voltage	$v_q$	V
MtrSpd			Angular mechanical velocity of the motor	$\omega_m$	rad/s
MtrPos			Motor mechanical angular position	$\theta_m$	rad
MtrTrq			Electromagnetic torque	$T_e$	N·m
PwrInfo	PwrTrnsfrd	PwrMtr	Mechanical power	$P_{mot}$	W
		PwrBus	Electrical power	$P_{bus}$	W
	PwrNotTrnsfrd	PwrElecLoss	Resistive power loss	$P_{elec}$	W
		PwrMechLoss	Mechanical power loss	$P_{mech}$	W
	PwrStored	PwrMtrStored	Stored motor power	$P_{str}$	W

**PhaseCurr — Phase a, b, c current**

1-by-3 array

Phase a, b, c current,  $i_a$ ,  $i_b$ , and  $i_c$ , in A.

**MtrTrq — Motor torque**

scalar

Motor torque,  $T_{mtr}$ , in N·m.

**Dependencies**

To create this port, select Speed for the **Mechanical input configuration** parameter.

**MtrSpd — Motor speed**

scalar

Angular speed of the motor,  $\omega_{mtr}$ , in rad/s.

**Dependencies**

To create this port, select Torque for the **Mechanical input configuration** parameter.

**Parameters**

**Block Options**

**Mechanical input configuration — Select port configuration**

Torque (default) | Speed

This table summarizes the port configurations.

Port Configuration	Creates Input Port	Creates Output Port
Torque	LdTrq	MtrSpd

Port Configuration	Creates Input Port	Creates Output Port
Speed	Spd	MtrTrq

### Simulation type – Select simulation type

Continuous (default) | Discrete

By default, the block uses a continuous sample time during simulation. If you want to generate code for single-precision targets, considering setting the parameter to Discrete.

#### Dependencies

Setting **Simulation type** to Discrete creates the **Sample Time, Ts** parameter.

### Sample Time (Ts) – Sample time for discrete integration

scalar

Integration sample time for discrete simulation, in s.

#### Dependencies

Setting **Simulation type** to Discrete creates the **Sample Time, Ts** parameter.

#### Parameters

### Number of pole pairs (P) – Pole pairs

scalar

Motor pole pairs,  $P$ .

### Stator phase resistance per phase (Rs) – Resistance

scalar

Stator phase resistance per phase,  $R_s$ , in ohm.

### Stator d-axis inductance (Ldq\_) – Inductance

scalar

Stator inductance,  $L_{dq}$ , in H.

### Permanent flux linkage constant (lambda\_pm) – Flux

scalar

Permanent flux linkage constant,  $\lambda_{pm}$ , in Wb.

### Back-emf constant (Ke) – Back electromotive force

scalar

Back electromotive force, EMF,  $K_e$ , in peak Vpk\_LL/krpm. Vpk\_LL is the peak voltage line-to-line measurement.

To calculate the permanent flux linkage constant, the block implements this equation.

$$\lambda_{pm} = \frac{1}{\sqrt{3}} \cdot \frac{K_e}{1000P} \cdot \frac{60}{2\pi}$$

**Torque constant (Kt) – Torque constant**  
scalar

Torque constant,  $K_t$ , in N·m/A.

To calculate the permanent flux linkage constant, the block implements this equation.

$$\lambda_{pm} = \frac{2}{3} \cdot \frac{K_t}{P}$$

**Physical inertia, viscous damping, and static friction (mechanical) – Inertia, damping, friction**

vector

Mechanical properties of the motor:

- Inertia,  $J$ , in kgm<sup>2</sup>
- Viscous damping,  $F$ , in N·m/(rad/s)
- Static friction,  $T_f$ , in N·m

**Dependencies**

To enable this parameter, select the Torque configuration parameter.

**Initial Values****Initial d-axis and q-axis current (idq0) – Current**

vector

Initial q- and d-axis currents,  $i_q$ ,  $i_d$ , in A.

**Initial mechanical position (theta\_init) – Angle**

scalar

Initial motor angular position,  $\theta_{m0}$ , in rad.

**Initial mechanical speed (omega\_init) – Speed**

scalar

Initial angular velocity of the motor,  $\omega_{m0}$ , in rad/s.

**Dependencies**

To enable this parameter, select the Torque configuration parameter.

## Surface Mount PM Controller

Torque-based, field-oriented controller for a surface mount permanent magnet synchronous motor

**Library:** Powertrain Blockset / Propulsion / Electric Motors and Inverters  
Motor Control Blockset / Electrical Systems / Motors

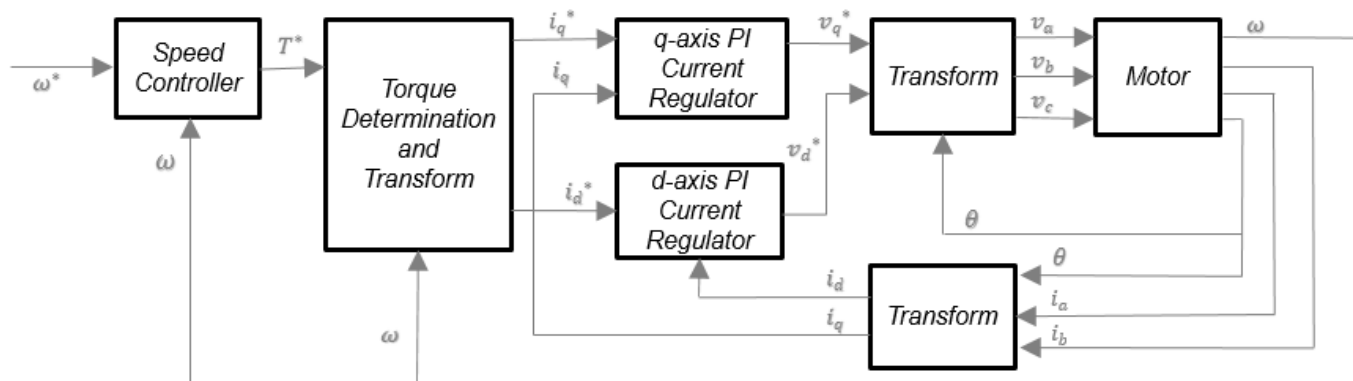

### Description

The Surface Mount PM Controller block implements a torque-based, field-oriented controller for a surface mount permanent magnet synchronous motor (PMSM) with an optional outer-loop speed controller. The torque control utilizes quadrature current and does not weaken the magnetic flux. You can specify either speed or torque control.

The Surface Mount PM Controller implements equations for speed control, torque determination, regulators, transforms, and motors.

The figure illustrates the information flow in the block.

The block implements equations that use these variables.

$\omega$	Rotor speed
$\omega^*$	Rotor speed command
$T^*$	Torque command
$i_d$	d-axis current
$i_d^*$	d-axis current command
$i_q$	q-axis current
$i_q^*$	q-axis current command

$v_d$	d-axis voltage
$v_d^*$	d-axis voltage command
$v_q$	q-axis voltage
$v_q^*$	q-axis voltage command
$v_a, v_b, v_c$	Stator phase a, b, c voltages
$i_a, i_b, i_c$	Stator phase a, b, c currents

### Speed Controller

To implement the speed controller, select the **Control Type** parameter `Speed Control`. If you select the **Control Type** parameter `Torque Control`, the block does not implement the speed controller.

The speed controller determines the torque command by implementing a state filter, and calculating the feedforward and feedback commands. If you do not implement the speed controller, input a torque command to the Surface Mount PM Controller block.

### State Filter

The state filter is a low-pass filter that generates the acceleration command based on the speed command. On the **Speed Controller** tab:

- To make the speed-command lag time negligible, specify a **Bandwidth of the state filter** parameter.
- To calculate a **Speed regulation time constant, Ksf** gain based on the state filter bandwidth, select **Calculate Speed Regulator Gains**.

The discrete form of characteristic equation is given by:

$$z + K_{sf}T_{sm} - 1$$

The filter calculates the gain using this equation.

$$K_{sf} = \frac{1 - \exp(-T_{sm}2\pi EV_{sf})}{T_{sm}}$$

The equations use these variables.

$EV_{sf}$	Bandwidth of the speed command filter
$T_{sm}$	Motion controller sample time
$K_{sf}$	Speed regulator time constant

**State Feedback**

To generate the state feedback torque, the block uses the filtered speed error signal from the state filter. The feedback torque calculation also requires gains for speed regulator.

On the **Speed Controller** tab, select **Calculate Speed Regulator Gains** to calculate:

- **Proportional gain,  $b_a$**
- **Angular gain,  $K_{sa}$**
- **Rotational gain,  $K_{isa}$**

For the gain calculations, the block uses the inertia from the **Physical inertia, viscous damping, static friction** parameter value on the **Motor Parameters** tab.

The gains for the state feedback are calculated using these equations.

Calculation	Equations
Discrete forms of characteristic equation	$z^3 + \frac{(-3J_p + T_s b_a + T_s^2 K_{sa} + T_s^3 K_{isa})}{J_p} z^2 + \frac{(3J_p - 2T_s b_a - T_s^2 K_{sa})}{J_p} z + \frac{-J_p + T_s b_a}{J_p}$ $(z - p_1)(z - p_2)(z - p_3) = z^3 + (p_1 + p_2 + p_3)z^2 + (p_1 p_2 + p_2 p_3 + p_1 p_3)z^2 - p_1 p_2 p_3$
Speed regulator proportional gain	$b_a = \frac{J_p - J_p p_1 p_2 p_3}{T_{sm}}$
Speed regulator integral gain	$K_{sa} = \frac{J_p(p_1 p_2 + p_2 p_3 + p_3 p_1) - 3J_p + 2b_a T_{sm}}{T_{sm}^2}$
Speed regulator double integral gain	$K_{isa} = \frac{-J_p(p_1 + p_2 + p_3) + 3J_p - b_a T_{sm} - K_{sa} T_{sm}^2}{T_{sm}^3}$

The equations use these variables.

$P$	Motor pole pairs
$b_a$	Speed regulator proportional gain
$K_{sa}$	Speed regulator integral gain
$K_{isa}$	Speed regulator double integral gain
$J_p$	Motor inertia
$T_{sm}$	Motion controller sample time

**Command Feedforward**

To generate the state feedforward torque, the block uses the filtered speed and acceleration from the state filter. Also, the feedforward torque calculation uses the inertia, viscous damping, and static friction. To achieve zero tracking error, the torque command is the sum of the feedforward and feedback torque commands.

Selecting **Calculate Speed Regulator Gains** on the **Speed Controller** tab updates the inertia, viscous damping, and static friction with the **Physical inertia, viscous damping, static friction** parameter values on the **Motor Parameters** tab.

The feedforward torque command uses this equation.

$$T_{cmd\_ff} = J_p \dot{\omega}_m + F_v \omega_m + F_s \frac{\omega_m}{|\omega_m|}$$

The equation uses these variables.

$J_p$	Motor inertia
$T_{cmd\_ff}$	Torque command feedforward
$F_s$	Static friction torque constant
$F_v$	Viscous friction torque constant
$F_s$	Static friction torque constant
$\omega_m$	Rotor speed

### Torque Determination

The block uses a quadrature current to determine the base speed and the current commands. The available bus voltage determines the base speed. The direct (d) and quadrature (q) permanent magnet (PM) determines the induced voltage.

Calculation	Equations
Motor maximum torque	$T_{max} = \frac{3}{2}P(\lambda_{pm}i_q + (L_d - L_q)i_d i_q)$
Maximum q-axis phase current	$i_{q\_max} = \frac{T_{cmd}}{\frac{3}{2}P\lambda_{pm}}$
Electrical base speed	$\omega_{base} = \frac{v_{max}}{\sqrt{(L_q i_q)^2 + (\lambda_{pm})^2}}$
d-axis voltage	$v_d = -\omega_e L_q i_{q\_max}$
q-axis voltage	$v_q = \omega_e \lambda_{pm}$
Maximum phase current	$i_{max} =  i_{q\_max} $
Maximum voltage	$v_{max} = \frac{v_{bus}}{\sqrt{3}}$

Calculation	Equations
Current command	$i_{dref} = 0$ $i_{q\_tmp} = \min(i_{q\_max}, \frac{T_{cmd}}{\frac{3}{2}P\lambda_{pm}})$ <p>If <math> \omega_e  \leq \omega_{base}</math>  <math display="block">i_{qref} = i_{q\_tmp}</math></p> <p>Else</p> $i_{qfw} = \text{sqr}t(\min(0, \frac{1}{L_q}((\frac{v_{max}}{\omega_e})^2 - (\lambda_{pm})^2)))$ <p>If <math>i_{q\_tmp} &lt; i_{qfw}</math>  <math display="block">i_{qref} = i_{q\_tmp}</math></p> <p>Else  <math display="block">i_{qref} = i_{qfw}</math></p> <p>End</p> <p>End</p>

The equations use these variables.

$i_{max}$	Maximum phase current
$i_d$	d-axis current
$i_q$	q-axis current
$i_{dref}$	d-axis reference current
$i_{qref}$	q-axis reference current
$i_{q\_max}$	Maximum q-axis phase current
$\omega_e$	Rotor electrical speed
$\lambda_{pm}$	Permanent magnet flux linkage
$v_d$	d-axis voltage
$v_q$	q-axis voltage
$v_{max}$	Maximum line to neutral voltage
$v_{bus}$	DC bus voltage
$L_d$	d-axis winding inductance
$L_q$	q-axis winding inductance
$P$	Motor pole pairs
$T_{max}$	Motor maximum torque
$T_{cmd}$	Commanded motor maximum torque

### Current Regulators

The block regulates the current with an anti-windup feature. Classic proportional-integrator (PI) current regulators do not consider the d-axis and q-axis coupling or the back-electromagnetic force (EMF) coupling. As a result, transient performance deteriorates. To account for the coupling, the block implements the complex vector current regulator (CVCR) in the scalar format of the rotor reference frame. The CVCR decouples:

- d-axis and q-axis current cross-coupling

- back-EMF cross-coupling

The current frequency response is a first-order system, with a bandwidth of  $EV_{current}$ .

The block implements these equations.

Calculation	Equations
Motor voltage, in the rotor reference frame	$L_d \frac{di_d}{dt} = v_d - R_s i_d + p \omega_m L_q i_q$ $L_d \frac{di_q}{dt} = v_q - R_s i_q - p \omega_m L_d i_d - p \omega_m \lambda_{pm}$
Current regulator gains	$\omega_b = 2\pi EV_{current}$ $K_{p\_d} = L_d \omega_b$ $K_{p\_q} = L_q \omega_b$ $K_i = R_s \omega_b$
Transfer functions	$\frac{i_d}{i_{dref}} = \frac{\omega_b}{s + \omega_b}$ $\frac{i_q}{i_{qref}} = \frac{\omega_b}{s + \omega_b}$

The equations use these variables.

$EV_{current}$	Current regulator bandwidth
$i_d$	d-axis current
$i_q$	q-axis current
$K_{p\_d}$	Current regulator d-axis gain
$K_{p\_q}$	Current regulator q-axis gain
$K_i$	Current regulator integrator gain
$L_d$	d-axis winding inductance
$L_q$	q-axis winding inductance
$R_s$	Stator phase winding resistance
$\omega_m$	Rotor speed
$v_d$	d-axis voltage
$v_q$	q-axis voltage
$\lambda_{pm}$	Permanent magnet flux linkage
$P$	Motor pole pairs

## Transforms

To calculate the voltages and currents in balanced three-phase ( $a, b$ ) quantities, quadrature two-phase ( $\alpha, \beta$ ) quantities, and rotating ( $d, q$ ) reference frames, the block uses the Clarke and Park Transforms.

In the transform equations.

$$\omega_e = P\omega_m$$

$$\frac{d\theta_e}{dt} = \omega_e$$

Transform	Description	Equations
Clarke	Converts balanced three-phase quantities ( $a, b$ ) into balanced two-phase quadrature quantities ( $\alpha, \beta$ ).	$x_\alpha = \frac{2}{3}x_a - \frac{1}{3}x_b - \frac{1}{3}x_c$ $x_\beta = \frac{\sqrt{3}}{2}x_b - \frac{\sqrt{3}}{2}x_c$
Park	Converts balanced two-phase orthogonal stationary quantities ( $\alpha, \beta$ ) into an orthogonal rotating reference frame ( $d, q$ ).	$x_d = x_\alpha \cos\theta_e + x_\beta \sin\theta_e$ $x_q = -x_\alpha \sin\theta_e + x_\beta \cos\theta_e$
Inverse Clarke	Converts balanced two-phase quadrature quantities ( $\alpha, \beta$ ) into balanced three-phase quantities ( $a, b$ ).	$x_a = x_\alpha$ $x_b = -\frac{1}{2}x_\alpha + \frac{\sqrt{3}}{2}x_\beta$ $x_c = -\frac{1}{2}x_\alpha - \frac{\sqrt{3}}{2}x_\beta$
Inverse Park	Converts an orthogonal rotating reference frame ( $d, q$ ) into balanced two-phase orthogonal stationary quantities ( $\alpha, \beta$ ).	$x_\alpha = x_d \cos\theta_e - x_q \sin\theta_e$ $x_\beta = x_d \sin\theta_e + x_q \cos\theta_e$

The transforms use these variables.

$\omega_m$	Rotor speed
$P$	Motor pole pairs
$\omega_e$	Rotor electrical speed
$\theta_e$	Rotor electrical angle
$x$	Phase current or voltage

### Motor

The block uses the phase currents and phase voltages to estimate the DC bus current. Positive current indicates battery discharge. Negative current indicates battery charge. The block uses these equations.

Load power	$Ld_{Pwr} = v_a i_a + v_b i_b + v_c i_c$
Source power	$Src_{Pwr} = Ld_{Pwr} + Pwr_{Loss}$
DC bus current	$i_{bus} = \frac{Src_{Pwr}}{v_{bus}}$
Estimated rotor torque	$MtrTrq_{est} = 1.5P[\lambda i_q + (L_d - L_q)i_d i_q]$
Power loss for single efficiency source to load	$Pwr_{Loss} = \frac{100 - Eff}{Eff} \cdot Ld_{Pwr}$
Power loss for single efficiency load to source	$Pwr_{Loss} = \frac{100 - Eff}{100} \cdot  Ld_{Pwr} $

Power loss for tabulated efficiency	$Pwr_{Loss} = f(\omega_m, MtrTrq_{est})$
-------------------------------------	--

The equations use these variables.

$v_a, v_b, v_c$	Stator phase a, b, c voltages
$v_{bus}$	Estimated DC bus voltage
$i_a, i_b, i_c$	Stator phase a, b, c currents
$i_{bus}$	Estimated DC bus current
$Eff$	Overall inverter efficiency
$\omega_m$	Rotor mechanical speed
$L_q$	q-axis winding inductance
$L_d$	d-axis winding inductance
$i_q$	q-axis current
$i_d$	d-axis current
$\lambda$	Permanent magnet flux linkage
$P$	Motor pole pairs

### Electrical Losses

To specify the electrical losses, on the **Electrical Losses** tab, for **Parameterize losses by**, select one of these options.

Setting	Block Implementation
Single efficiency measurement	Electrical loss calculated using a constant value for inverter efficiency.
Tabulated loss data	Electrical loss calculated as a function of motor speeds and load torques.
Tabulated efficiency data	<p>Electrical loss calculated using inverter efficiency that is a function of motor speeds and load torques.</p> <ul style="list-style-type: none"> <li>Converts the efficiency values you provide into losses and uses the tabulated losses for simulation.</li> <li>Ignores efficiency values you provide for zero speed or zero torque. Losses are assumed zero when either torque or speed is zero.</li> <li>Uses linear interpolation to determine losses. Provide tabulated data for low speeds and low torques, as required, to get the desired level of accuracy for lower power conditions.</li> <li>Does not extrapolate loss values for speed and torque magnitudes that exceed the range of the table.</li> </ul>

For best practice, use **Tabulated loss data** instead of **Tabulated efficiency data**:

- Efficiency becomes ill defined for zero speed or zero torque.
- You can account for fixed losses that are still present for zero speed or torque.

## Ports

### Input

#### **SpdReq — Rotor speed command**

scalar

Rotor speed command,  $\omega_m^*$ , in rad/s.

#### **Dependencies**

To create this port, select Speed Control for the **Control Type** parameter.

#### **TrqCmd — Torque command**

scalar

Torque command,  $T^*$ , in N·m.

#### **Dependencies**

To create this port, select Torque Control for the **Control Type** parameter.

#### **BusVolt — DC bus voltage**

scalar

DC bus voltage  $v_{bus}$ , in V.

#### **PhaseCurrA — Current**

scalar

Stator current phase a,  $i_a$ , in A.

#### **PhaseCurrB — Current**

scalar

Stator current phase b,  $i_b$ , in A.

#### **SpdFdbk — Rotor speed**

scalar

Rotor speed,  $\omega_m$ , in rad/s.

#### **PosFdbk — Rotor electrical angle**

scalar

Rotor electrical angle,  $\theta_m$ , in rad.

### Output

#### **Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal	Description	Units
SrcPwr	Source power	W
LdPwr	Load power	W
PwrLoss	Power loss	W
MtrTrqEst	Estimated motor torque	N·m

**BusCurr – Bus current**

scalar

Estimated DC bus current,  $i_{bus}$ , in A.**PhaseVolt – Stator terminal voltages**

array

Stator terminal voltages,  $V_a$ ,  $V_b$ , and  $V_c$ , in V.**Parameters****Configuration****Control Type – Select control**

Speed Control (default) | Torque Control

If you select Torque Control, the block does not implement the speed controller.

This table summarizes the port configurations.

Port Configuration	Creates Ports
Speed Control	SpdReq
Torque Control	TrqCmd

**Motor Parameters****Stator resistance, Rs – Resistance**

0.02 (default) | scalar

Stator phase winding resistance,  $R_s$ , in ohm.**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Stator resistance, Rs	D and Q axis integral gain, Ki	Current Controller

**DQ axis inductance, Ldq – Inductance**

1.7e-3 (default) | scalar

D-axis winding inductance,  $L_{dq}$ , in H.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
DQ axis inductance, <b>Ldq</b>	D-axis proportional gain, <b>Kp_d</b> Q-axis proportional gain, <b>Kp_q</b> D and Q axis integral gain, <b>Ki</b>	Current Controller

**Permanent magnet flux, lambda\_pm – Flux**

0.2205 (default) | scalar

Permanent magnet flux,  $\lambda_{pm}$ , in Wb.

**Number of pole pairs, PolePairs – Poles**

4 (default) | scalar

Motor pole pairs,  $P$ .

**Physical inertia, viscous damping, static friction, Mechanical – Inertia, damping, friction**

[0.0027, 4.924e-4, 0] (default) | vector

Mechanical properties of the motor:

- Motor inertia,  $F_v$ , in  $\text{kgm}^2$
- Viscous friction torque constant,  $F_v$ , in  $\text{N}\cdot\text{m}/(\text{rad}/\text{s})$
- Static friction torque constant,  $F_s$ , in  $\text{N}\cdot\text{m}$

**Dependencies**

To enable this parameter, set the **Control Type** parameter to Speed Control.

For the gain calculations, the block uses the inertia from the **Physical inertia, viscous damping, static friction** parameter value that is on the **Motor Parameters** tab.

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Physical inertia, viscous damping, static friction, Mechanical	Proportional gain, $b_a$ Angular gain, $K_{sa}$ Rotational gain, $K_{isa}$ Inertia compensation, $J_{comp}$ Viscous damping compensation, $F_v$ Static friction, $F_s$	Speed Controller

### Id and Iq Calculation

#### Maximum torque, $T_{max}$ – Torque

60 (default) | scalar

Maximum torque, in N·m.

### Current Controller

#### Bandwidth of the current regulator, $EV_{current}$ – Bandwidth

200 (default) | scalar

Current regulator bandwidth, in Hz.

### Dependencies

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Bandwidth of the current regulator, $EV_{current}$	D-axis proportional gain, $Kp_d$ Q-axis proportional gain, $Kp_q$ D and q axis proportional gain, $Ki$	Current Controller

#### Sample time for the torque control, $Tst$ – Time

5e-5 (default) | scalar

Torque control sample time, in s.

### Dependencies

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Sample time for the torque control, Tst	Speed regulation time constant, Ksf	Speed Controller

**Calculate Current Regulator Gains – Derive parameters**

button

Click to derive parameters.

**Dependencies**

On the **Current Controller** tab, when you select **Calculate Current Regulator Gains**, the block calculates derived parameters. The table summarizes the derived parameters that depend on other block parameters.

Derived Parameter on Current Controller tab	Dependency	
	Parameter	Tab
D-axis proportional gain, Kp_d	Bandwidth of the current regulator, EV_current	Current Controller
Q-axis proportional gain, Kp_q	Stator resistance, Rs	Motor Parameters
D and Q axis integral gain, Ki	DQ-axis inductance, Ldq	

**D-axis proportional gain, Kp\_d – Derived**

0.47149 (default) | scalar

Derived d-axis proportional gain, in V/A.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
D-axis proportional gain, Kp_d	Bandwidth of the current regulator, EV_current	Current Controller
	DQ-axis inductance, Ldq	Motor Parameters

**Q-axis proportional gain, Kp\_q – Derived**

0.52125 (default) | scalar

Derived q-axis proportional gain, in V/A.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Q-axis proportional gain, Kp_q	Bandwidth of the current regulator, EV_current	Current Controller
	DQ-axis inductance, Ldq	Motor Parameters

**D and Q axis integral gain, Ki – Derived**

251.3274 (default) | scalar

Derived axis integral gain, in V/A\*s.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
D and Q axis integral gain, Ki	Bandwidth of the current regulator, EV_current	Current Controller
	Stator resistance, Rs	Motor Parameters
	DQ-axis inductance, Ldq	

**Speed Controller****Bandwidth of the motion controller, EV\_motion – Bandwidth**

[20, 4, 0.8] (default) | vector

Motion controller bandwidth, in Hz. Set the first element of the vector to the desired cutoff frequency. Set the second and third elements of the vector to the higher-order cut off frequencies. You can set the value of the next element to 1/5 the value of the previous element. For example, if the desired cutoff frequency is 20 Hz, specify [20 4 0.8].

**Dependencies**The parameter is enabled when the **Control Type** parameter is set to Speed Control.

Parameter	Used to Derive	
	Parameter	Tab
Bandwidth of the motion controller, EV_motion	Proportional gain, ba	Speed Controller
	Angular gain, Ksa	
	Rotational gain, Kisa	

**Bandwidth of the state filter, EV\_sf – Bandwidth**

200 (default) | scalar

State filter bandwidth, in Hz.

**Dependencies**The parameter is enabled when the **Control Type** parameter is set to Speed Control.

Parameter	Used to Derive	
	Parameter	Tab
Bandwidth of the state filter, EV_sf	Speed regulation time constant, Ksf	Speed Controller

**Calculate Speed Regulator Gains – Derive parameters**

button

Click to derive parameters.

**Dependencies**

On the **Speed Controller** tab, when you select **Calculate Speed Regulator Gains**, the block calculates derived parameters. The table summarizes the derived parameters that depend on other block parameters.

Derived Parameter on Speed Controller tab		Depends On	
		Parameter	Tab
<b>Proportional gain, ba</b>	$b_a = \frac{J_p - J_p p_1 p_2 p_3}{T_{sm}}$	Bandwidth of the motion controller, EV_motion  Bandwidth of the state filter, EV_sf	Speed Controller
<b>Angular gain, Ksa</b>	$K_{sa} = \frac{J_p(p_1 p_2 + p_2 p_3 + p_3 p_1) - 3J_p + 2b_a T_{sm}}{T_{sm}^2}$	Sample time for the torque control, Tst	Current Controller
<b>Rotational gain, Kisa</b>	$K_{isa} = \frac{-J_p(p_1 + p_2 + p_3) + 3J_p - b_a T_{sm} - K_{sa} T_{sm}^2}{T_{sm}^3}$	Physical inertia, viscous damping, static friction, Mechanical	Motor Parameters
<b>Speed regulation time constant, Ksf</b>	$K_{sf} = \frac{1 - \exp(-T_{sm} 2\pi EV_{sf})}{T_{sm}}$		
<b>Inertia compensation, Jcomp</b>	$J_{comp} = J_p$	Physical inertia, viscous damping, static friction, Mechanical	Motor Parameters
<b>Viscous damping compensation, Fv</b>	$F_v$		
<b>Static friction, Fs</b>	$F_s$		

The equations use these variables.

$P$	Motor pole pairs
$b_a$	Speed regulator proportional gain
$K_{sa}$	Speed regulator integral gain
$K_{isa}$	Speed regulator double integral gain
$K_{sf}$	Speed regulator time constant
$J_p$	Motor inertia
$EV_{sf}$	State filter bandwidth
$EV_{motion}$	Motion controller bandwidth

**Proportional gain,  $b_a$  – Derived**

3.7477 (default) | scalar

Derived proportional gain, in N·m/(rad/s).

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Proportional gain, $b_a$	Physical inertia, viscous damping, static friction, Mechanical	Motor Parameters
	Bandwidth of the motion controller, $EV_{motion}$	Speed Controller

**Angular gain,  $K_{sa}$  – Derived**

94.0877 (default) | scalar

Derived angular gain, in N·m/rad.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Angular gain, $K_{sa}$	Physical inertia, viscous damping, static friction, Mechanical	Motor Parameters
	Bandwidth of the motion controller, $EV_{motion}$	Speed Controller

**Rotational gain,  $K_{isa}$  – Derived**

381.7822 (default) | scalar

Derived rotational gain, in N·m/(rad\*s).

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Rotational gain, Kisa	Physical inertia, viscous damping, static friction, Mechanical	Motor Parameters
	Bandwidth of the motion controller, EV_motion	Speed Controller

**Speed regulation time constant, Ksf – Derived**

1217.9727 (default) | scalar

Derived speed regulation time constant, in 1/s.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Speed regulation time constant, Ksf	Sample time for the torque control, Tst	Current Controller
	Bandwidth of the state filter, EV_sf	Speed Controller

**Inertia compensation, Jcomp – Derived**

0.025 (default) | scalar

Derived inertia compensation, in kg·m<sup>2</sup>.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Inertia compensation, Jcomp	Physical inertia, viscous damping, static friction, Mechanical	Motor Parameters

**Viscous damping compensation, Fv – Derived**

0 (default) | scalar

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Viscous damping compensation, $F_v$	Physical inertia, viscous damping, static friction, Mechanical	Motor Parameters

### Static friction, $F_s$ – Derived

0 (default) | scalar

Derived static friction, in N·m/(rad/s).

#### Dependencies

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Static friction, $F_s$	Physical inertia, viscous damping, static friction, Mechanical	Motor Parameters

### Electrical Losses

#### Parameterize losses by – Select type

Single efficiency measurement (default) | Tabulated loss data | Tabulated efficiency data

Setting	Block Implementation
Single efficiency measurement	Electrical loss calculated using a constant value for inverter efficiency.
Tabulated loss data	Electrical loss calculated as a function of motor speeds and load torques.
Tabulated efficiency data	<p>Electrical loss calculated using inverter efficiency that is a function of motor speeds and load torques.</p> <ul style="list-style-type: none"> <li>Converts the efficiency values you provide into losses and uses the tabulated losses for simulation.</li> <li>Ignores efficiency values you provide for zero speed or zero torque. Losses are assumed zero when either torque or speed is zero.</li> <li>Uses linear interpolation to determine losses. Provide tabulated data for low speeds and low torques, as required, to get the desired level of accuracy for lower power conditions.</li> <li>Does not extrapolate loss values for speed and torque magnitudes that exceed the range of the table.</li> </ul>

For best practice, use Tabulated loss data instead of Tabulated efficiency data:

- Efficiency becomes ill defined for zero speed or zero torque.

- You can account for fixed losses that are still present for zero speed or torque.

**Overall inverter efficiency,  $eff$  – Constant**

98 (default) | scalar

Overall inverter efficiency,  $Eff$ , in %.**Dependencies**To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.**Vector of speeds ( $w$ ) for tabulated loss,  $w\_loss\_bp$  – Breakpoints**

[0 200 400 600 800 1000] (default) | 1-by-M vector

Speed breakpoints for lookup table when calculating losses, in rad/s.

**Dependencies**To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.**Vector of torques (T) for tabulated loss,  $T\_loss\_bp$  – Breakpoints**

[0 25 50 75 100] (default) | 1-by-N vector

Torque breakpoints for lookup table when calculating losses, in N·m.

**Dependencies**To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.**Corresponding losses,  $losses\_table$  – Table**

[100 100 100 100 100;100 150 200 250 300;100 200 300 400 500;100 250 400 550 700;100 300 500 700 900;100 350 600 850 1100] (default) | M-by-N array

Array of values for electrical losses as a function of M speeds and N torques, in W. Each value specifies the losses for a specific combination of speed and torque. The matrix size must match the dimensions defined by the speed and torque vectors.

**Dependencies**To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.**Vector of speeds ( $w$ ) for tabulated efficiency,  $w\_eff\_bp$  – Breakpoints**

[200 400 600 800 1000] (default) | 1-by-M vector

Speed breakpoints for lookup table when calculating efficiency, in rad/s.

**Dependencies**To enable this parameter, for **Parameterize losses by**, select Tabulated efficiency data.**Vector of torques (T) for tabulated efficiency,  $T\_eff\_bp$  – Breakpoints**

[25 50 75 100] (default) | 1-by-N vector

Torque breakpoints for lookup table when calculating efficiency, in N·m.

**Dependencies**To enable this parameter, for **Parameterize losses by**, select Tabulated efficiency data.

**Corresponding efficiency, efficiency\_table – Table**

[96.2 98.1 98.7 99;98.1 99 99.4 99.5;98.7 99.4 99.6 99.7;99 99.5 99.7 99.8;99.2 99.6 99.7 99.8] (default) | M-by-N array

Array of efficiency as a function of M speeds and N torque, in %. Each value specifies the efficiency for a specific combination of speed and torque. The matrix size must match the dimensions defined by the speed and torque vectors.

The block ignores efficiency values for zero speed or zero torque. Losses are zero when either torque or speed is zero. The block uses linear interpolation.

To get the desired level of accuracy for lower power conditions, you can provide tabulated data for low speeds and low torques.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated efficiency data.

## Three-Phase Voltage Source Inverter

Three-phase voltage source inverter

**Library:** Powertrain Blockset / Propulsion / Electric Motors and Inverters

### Description

The Three-Phase Voltage Source Inverter block implements a three-phase voltage source inverter that generates neutral voltage commands for a balanced three-phase load. Configure the voltage switching function for continuous vector modulation or inverter switch input signals. You can incorporate the block into a closed-loop model to simulate a power inverter. The block controls the ideal switch states.

To enable power loss calculations suitable for code generation targets that limit memory, select **Enable memory optimized 2D LUT**. Click **Calibrate Maps** to virtually calibrate an inverter power loss lookup table as a function of motor torque and motor speed.

If you select **Input inverter temperature**, click **Calibrate Maps** to virtually calibrate the power loss table as a function of motor torque, motor speed, and inverter temperature. You cannot enable memory optimization for the 3D power loss lookup table.

Use the **Switching voltage function** parameter to set the switching voltage function.

Setting	Implementation	Illustration
<b>Commanded phase voltage</b>	Phase a, b, c line-to-neutral voltage command input. Suitable for continuous sinusoidal or space vector modulation input signals.	

Setting	Implementation	Illustration
<b>Switch inputs</b> (default)	Inverter switch input command. Suitable for hardware-in-the-loop (HIL) simulation.  The inverter switches S1, S3, and S5 using complimented control for S2, S4, and S6.	

### Virtual Calibration

If you have Model-Based Calibration Toolbox, click **Calibrate Maps** to virtually calibrate the lookup tables using measured data. The dialog box steps through these tasks.

Task	Description						
Import Loss Data	Import this loss data from a file. For example, open <code>&lt;matlabroot&gt;/toolbox/autoblks/autoblksshared/mbctemplates/MappedInverterDataset.xlsx</code> .  For more information, see “Using Data” (Model-Based Calibration Toolbox).						
	<table border="1"> <thead> <tr> <th>Input inverter temperature Setting</th> <th>Required Data</th> </tr> </thead> <tbody> <tr> <td>off</td> <td> <ul style="list-style-type: none"> <li>Motor speed, rad/s</li> <li>Motor torque, N·m</li> <li>Power loss, W</li> </ul> </td> </tr> <tr> <td>on</td> <td> <ul style="list-style-type: none"> <li>Motor speed, rad/s</li> <li>Motor torque, N·m</li> <li>Motor temperature, K</li> <li>Power loss, W</li> </ul> </td> </tr> </tbody> </table>	Input inverter temperature Setting	Required Data	off	<ul style="list-style-type: none"> <li>Motor speed, rad/s</li> <li>Motor torque, N·m</li> <li>Power loss, W</li> </ul>	on	<ul style="list-style-type: none"> <li>Motor speed, rad/s</li> <li>Motor torque, N·m</li> <li>Motor temperature, K</li> <li>Power loss, W</li> </ul>

### Switching Function

For the switch voltage, the block implementation depends on the **Switching voltage function** setting.

Setting	Calculation	Equations
Commanded phase voltage	Continuous line-to-neutral voltage commands set to phase a, b, c line-to-neutral voltage command input	$v_{an} = v_{a\_cmd}$ $v_{bn} = v_{b\_cmd}$ $v_{cn} = v_{c\_cmd}$
	Line-to-line voltage	$v_{ab} = v_{an} - v_{bn}$ $v_{bc} = v_{bn} - v_{cn}$ $v_{ca} = v_{cn} - v_{an}$

Setting	Calculation	Equations
Switch inputs	Switching function	$SF_a = \begin{cases} 1 & \text{S1 on and S2 off} \\ -1 & \text{S1 off and S2 on} \end{cases}$ $SF_b = \begin{cases} 1 & \text{S3 on and S4 off} \\ -1 & \text{S3 off and S4 on} \end{cases}$ $SF_c = \begin{cases} 1 & \text{S5 on and S6 off} \\ -1 & \text{S5 off and S6 on} \end{cases}$
	Line-to-center point voltage	$v_{ao} = \frac{v_{bus}}{2} SF_a$ $v_{bo} = \frac{v_{bus}}{2} SF_b$ $v_{co} = \frac{v_{bus}}{2} SF_c$
	Line-to-neutral voltage	$v_{an} = v_{ao} - v_{no}$ $v_{bn} = v_{bo} - v_{no}$ $v_{cn} = v_{co} - v_{no}$ $v_{an} + v_{bn} + v_{cn} = 0$ $v_{no} = \frac{1}{3}(v_{ao} + v_{bo} + v_{co})$ $v_{an} = v_{ao} - \frac{1}{3}(v_{ao} + v_{bo} + v_{co})$ $v_{bn} = v_{bo} - \frac{1}{3}(v_{ao} + v_{bo} + v_{co})$ $v_{cn} = v_{co} - \frac{1}{3}(v_{ao} + v_{bo} + v_{co})$
	Line-to-line voltage	$v_{ab} = v_{an} - v_{bn}$ $v_{bc} = v_{bn} - v_{cn}$ $v_{ca} = v_{cn} - v_{an}$

The equations use these variables.

$SF_a, SF_b, SF_c$	Phase a, b, c line switching functions, respectively
$v_{bus}$	Power source bus voltage
$V_{ao}, V_{bo}, V_{co}$	Phase a, b, c line-to-center voltage, respectively
$V_{an}, V_{bn}, V_{cn}$	Phase a, b, c line-to-neutral voltage, respectively
$V_{ab}, V_{bc}, V_{ca}$	Phase ab, bc, ca line-to-neutral voltage, respectively
$V_{a\_cmd}, V_{b\_cmd}, V_{c\_cmd}$	Phase a, b, c line-to-neutral voltage commands, respectively

### Current and Power Loss

For the line-to-center, line-to-neutral, and line-to-line voltage, the block implements these equations.

Calculation	Equations
Motor and bus power	$P_{mtr} = v_{an}i_a + v_{bn}i_b + v_{cn}i_c$ $P_{bus} = v_{bus}i_{bus}$
Inverter power loss and bus current	$P_{in} = P_{bus} = v_{bus}i_{bus}$ $P_{out} = P_{mtr} = v_{an}i_a + v_{bn}i_b + v_{cn}i_c + P_{LossInv}$ $i_{bus} = \frac{v_{an}i_a + v_{bn}i_b + v_{cn}i_c + P_{LossInv}}{v_{bus}}$

The equations use these variables.

$P_{mtr}$	Power delivered to the motor
$P_{bus}$	Power from input bus
$P_{loss}$	Power loss
$i_{bus}$	Power source bus current
$i_a, i_b, i_c$	Phase a, b, c line current, respectively
$V_{an}, V_{bn}, V_{cn}$	Phase a, b, c line-to-neutral voltage, respectively
$v_{bus}$	Power source bus voltage

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Variable	Equation
PwrIn fo	PwrTrnsfrd — Power transferred between blocks  • Positive signals indicate flow into block  • Negative signals indicate flow out of block	PwrMtr	Power delivered to the motor	$P_{TrnsfrdMtr} = -(v_{an}i_a + v_{bn}i_b + v_{cn}i_c)$
		PwrBus	Power from input bus	$P_{TrnsfrdBus} = P_{bus}$

Bus Signal		Description	Variable	Equation
PwrNotTrnsfrd — Power crossing the block boundary, but not transferred	PwrLoss	Power loss  Negative value indicates power loss	$P_{NotTrnsfrd}$	$P_{NotTrnsfrd} = - (P_{TrnsfrdBus} + P_{TrnsfrdMtr})$
<ul style="list-style-type: none"> <li>• Positive signals indicate an input</li> <li>• Negative signals indicate a loss</li> </ul>				
PwrStored — Stored energy rate of change		<i>Not used</i>		
<ul style="list-style-type: none"> <li>• Positive signals indicate an increase</li> <li>• Negative signals indicate a decrease</li> </ul>				

### Lookup Table Memory Optimization

The inverter power loss table parameter **Corresponding power loss, ploss\_table** data is a function of motor torque and motor speed at different battery voltages. Positive current indicates battery discharge. Negative current indicates battery charge.

To enable power loss calculations suitable for code generation targets that limit memory, select **Enable memory optimized 2D LUT**. The block uses linear interpolation to optimize the inverter power loss lookup table values for code generation. This table summarizes the optimization implementation.

Use Case	Implementation
Motor speed and torque input align with the lookup table breakpoint values.	Memory-optimized power loss is power loss lookup table value at intersection of motor speed and torque.
Motor speed and torque input do not align with the lookup table breakpoint values, but are within range.	Memory-optimized power loss is linear interpolation between corresponding motor speed and torque.
Motor speed and torque input do not align with the lookup table breakpoint values, and are out of range.	Cannot compute a memory-optimized power loss. Block uses extrapolated data.

### Extrapolation

The lookup tables optimized for code generation do not support extrapolation for data that is out of range. However, you can include pre-calculated extrapolation values in the power loss lookup table by selecting **Specify Extrapolation**.

The block uses the endpoint parameters to resize the table data.

## Ports

### Input

#### PhaseVoltCmd — Phase a, b, c line-to-neutral voltage command

1-by-3 array

Phase a, b, c line-to-neutral voltage command,  $V_{a\_cmd}$ ,  $V_{b\_cmd}$ , and  $V_{c\_cmd}$ , in V.

#### Dependencies

To create this port, set **Switching voltage function** to Commanded phase voltage.

#### SwitchCmd — Switch commands

1-by-3 array

Switch commands,  $S_a$ ,  $S_b$ , and  $S_c$ , dimensionless.

#### Dependencies

To create this port, set **Switching voltage function** to Switch inputs.

#### BusVolt — Power source bus voltage

bus

Power source bus voltage,  $V_{bus}$ , in V.

#### PhaseCurr — Phase a, b, c current

1-by-3 array

Phase a, b, c current,  $i_a$ ,  $i_b$ , and  $i_c$ , in A.

**MtrTrq — Motor torque**

scalar

Motor torque,  $T_{mtr}$ , in N·m.**MtrSpd — Motor speed**

scalar

Angular speed of the motor,  $\omega_{mtr}$ , in rad/s.**InvrtrTemp — Inverter operating temperature**

scalar

Inverter operating temperature,  $Temp_{Invtrtr}$ , in K.**Dependencies**To create this port, select **Input inverter temperature**.**Output****Info — Bus signal**

bus

The bus signal contains these block calculations.

Signal			Description	Variable	Units
BusCurr			Power source bus current	$i_{bus}$	A
PwrLossInv			Inverter power loss	$\mathcal{E}_{inv}$	dimensionless
PwrInfo	PwrTrnsfrd	PwrMtr	Power delivered to the motor	$P_{TrnsfrdMtr}$	W
		PwrBus	Power from input bus	$P_{TrnsfrdBus}$	W
	PwrNotTrnsfrd	PwrLoss	Power loss	$P_{NotTrnsfrd}$	W
	PwrStored		Not used		

**PhaseVlt — Phase a, b, c line-to-neutral voltage**

1-by-3 array

Phase a, b, c line-to-neutral voltage,  $V_{an}$ ,  $V_{bn}$ , and  $V_{cn}$ , in V.**BusCurr — Power source bus current**

scalar

Power source bus current,  $i_{bus}$ , in A.**Parameters****Block Options****Input inverter temperature — Create input port**

off (default) | on

Select this parameter to create the `InvrtrTemp` input port.

The block enables you to specify inverter power loss lookup tables that are functions of motor torque,  $T_{mtr}$ , and motor speed,  $\omega_{mtr}$ . If you select **Input inverter temperature**, the tables are also a function of the inverter temperature,  $Temp_{Invtrtr}$ .

Input Inverter Temperature Parameter Setting	Enables Efficiency Table	Function Of
off	Corresponding power loss, <code>ploss_table</code>	$f(T_{mtr}, \omega_{mtr})$
on	Corresponding power loss, <code>ploss_table_3d</code>	$f(T_{mtr}, \omega_{mtr}, Temp_{Invtrtr})$

**Dependencies**

If you select **Input inverter temperature** to specify a 3D power loss lookup table as a function of motor torque, motor speed, and inverter temperature, you cannot select **Enable memory optimized 2D LUT** to enable a memory optimization.

**Enable memory optimized 2D LUT – Selection**

off (default) | on

Enable generation of memory-optimized lookup tables, suitable code generation targets that limit memory.

**Dependencies**

If you select **Enable memory optimized 2D LUT**, you cannot select **Input inverter temperature**.

**Calibrate Maps – Calibrate tables with measured data**

selection

If you have Model-Based Calibration Toolbox, click **Calibrate Maps** to virtually calibrate the lookup tables using measured data. The dialog box steps through these tasks.

**Electrical Model**

**Switching voltage function – Selection**

Commanded phase voltage (default) | Switch inputs

Use the **Switching voltage function** parameter to set the switching voltage function.

Setting	Implementation	Illustration
<b>Commanded phase voltage</b>	Phase a, b, c line-to-neutral voltage command input. Suitable for continuous sinusoidal or space vector modulation input signals.	

Setting	Implementation	Illustration
<b>Switch inputs</b> (default)	Inverter switch input command. Suitable for hardware-in-the-loop (HIL) simulation.  The inverter switches S1, S3, and S5 using complimented control for S2, S4, and S6.	

**Vector of speeds ( $w$ ) for tabulated losses,  $w\_eff\_bp$  – Speed breakpoints**  
 $[-1000 \ -500 \ 0 \ 500 \ 1000]$  (default) | 1-by-M vector

Vector of motor speed,  $\omega_{mtr}$ , breakpoints for power loss, in rad/s. If you set **Enable memory optimized 2D LUT**, the block converts the data to single precision.

**Resample storage size for  $w\_eff\_bp$ ,  $n1$  – Speed bit size**  
 128 (default) | 2 | 4 | 8 | 16 | 32 | 64 | 256

Speed breakpoint storage size,  $n1$ , dimensionless. The block resamples the **Corresponding power loss,  $ploss\_table$**  data based on the storage size.

#### Dependencies

To create this parameter, select **Enable memory optimized 2D LUT**.

**Vector of torques ( $T$ ) for tabulated losses,  $T\_eff\_bp$  – Torque breakpoints**  
 $[-200 \ -100 \ 0 \ 100 \ 200]$  (default) | 1-by-N vector

Vector of motor torque,  $T_{mtr}$ , breakpoints for power loss, in N·m. If you set **Enable memory optimized 2D LUT**, the block converts the data to single precision.

**Resample storage size for  $T\_eff\_bp$ ,  $n2$  – Torque bit size**  
 128 (default) | 2 | 4 | 8 | 16 | 32 | 64 | 256

Torque breakpoint storage size,  $n2$ , dimensionless. The block resamples the **Corresponding power loss,  $ploss\_table$**  data based on the storage size.

#### Dependencies

To create this parameter, select **Enable memory optimized 2D LUT**.

**Vector of temperatures for tabulated losses,  $Temp\_eff\_bp$  – Temperature breakpoints**  
 $[213.15 \ 293.15 \ 373.15]$  (default) | 1-by-L vector

Vector of inverter temperature,  $Temp_{Invtr}$ , breakpoints for power loss, in K.

**Dependencies**

To create this parameter, select **Input inverter temperature**.

**Corresponding power loss, ploss\_table — 2D lookup table**

[1 0.999 0.989 0.997 0.996;0.995 0.994 0.993 0.992 0.991;0.990 0.989 0.988  
0.987 0.986;0.985 0.984 0.983 0.982 0.981;0.980 0.979 0.978 0.977 0.976]  
(default) | M-by-N array

Array of values for power loss as a function of M motor speeds,  $\omega_{mtr}$ , and N motor torques,  $T_{mtr}$ , in W. Each value specifies the power loss for a specific combination of motor speed and motor torque. The array size must match the dimensions defined by the speed and torque vectors.

If you have Model-Based Calibration Toolbox, click **Calibrate Maps** to virtually calibrate the lookup table using measured data.

If you set **Enable memory optimized 2D LUT**, the block converts the data to single precision.

**Dependencies**

To create this parameter, clear **Input inverter temperature**.

**Corresponding power loss, ploss\_table\_3d — 3D lookup table**

M-by-N-by-L array

Array of values for power loss as a function of M motor speeds,  $\omega_{mtr}$ , N motor torques,  $T_{mtr}$ , and L motor temperatures,  $Temp_{Invtr}$ , in W. Each value specifies the power loss for a specific combination of motor speed, motor torque, and temperature. The array size must match the dimensions defined by the speed, torque, and temperature vectors.

If you have Model-Based Calibration Toolbox, click **Calibrate Maps** to virtually calibrate the lookup table using measured data.

**Dependencies**

To create this parameter, select **Input inverter temperature**.

**Specify Extraction****w\_eff\_bp max endpoint, ulmax — Speed breakpoint**

1000 (default) | scalar

Speed breakpoint maximum extrapolation endpoint,  $u1max$ , in rad/s.

**Dependencies**

To create this parameter, select **Enable memory optimized 2D LUT** and **Specify Extrapolation**.

**w\_eff\_bp min endpoint, ulmin — Speed breakpoint**

-1000 (default) | scalar

Speed breakpoint minimum extrapolation endpoint,  $u1min$ , in rad/s.

**Dependencies**

To create this parameter, select **Enable memory optimized 2D LUT** and **Specify Extrapolation**.

**T\_eff\_bp max endpoint, u2max – Torque breakpoint**

200 (default) | scalar

Torque breakpoint maximum extrapolation endpoint,  $u2max$ , in rad/s.**Dependencies**To create this parameter, select **Enable memory optimized 2D LUT** and **Specify Extrapolation**.**T\_eff\_bp min endpoint, u2min – Torque breakpoint**

-200 (default) | scalar

Torque breakpoint minimum extrapolation endpoint,  $u2min$ , in rad/s.**Dependencies**To create this parameter, select **Enable memory optimized 2D LUT** and **Specify Extrapolation**.**References**

## Mapped Motor

Mapped motor and drive electronics operating in torque-control mode

**Library:** Powertrain Blockset / Propulsion / Electric Motors and Inverters  
Vehicle Dynamics Blockset / Powertrain / Propulsion

### Description

The Mapped Motor block implements a mapped motor and drive electronics operating in torque-control mode. The output torque tracks the torque reference demand and includes a motor-response and drive-response time constant. Use the block for fast system-level simulations when you do not know detailed motor parameters, for example, for motor power and torque tradeoff studies. The block assumes that the speed fluctuations due to mechanical load do not affect the motor torque tracking.

You can specify:

- Port configuration — Input torque or speed.
- Electrical torque range — Torque speed envelope or maximum motor power and torque.
- Electrical loss — Single operating point, measured efficiency, or measured loss. If you have Model-Based Calibration Toolbox, you can virtually calibrate the measured loss tables.

### Electrical Torque

To specify the range of torque and speed that the block allows, on the **Electrical Torque** tab, for **Parametrized by**, select one of these options.

Setting	Block Implementation
Tabulated torque-speed envelope	Range specified as a set of speed data points and corresponding maximum torque values.
Maximum torque and power	Range specified with maximum torque and maximum power.

For either method, the block implements an envelope similar to this.

### Electrical Losses

To specify the electrical losses, on the **Electrical Losses** tab, for **Parameterize losses by**, select one of these options.

Setting	Block Implementation
Single efficiency measurement	<p>Sum of these terms, measured at a single measurement point:</p> <ul style="list-style-type: none"> <li>• Fixed losses independent of torque and speed, <math>P_0</math>. Use <math>P_0</math> to account for fixed converter losses.</li> <li>• A torque-dependent electrical loss <math>k\tau^2</math>, where <math>k</math> is a constant and <math>\tau</math> is the torque. Represents ohmic losses in the copper windings.</li> <li>• A speed-dependent electrical loss <math>k_w\omega^2</math>, where <math>k_w</math> is a constant and <math>\omega</math> is the speed. Represents iron losses due to eddy currents.</li> </ul>
Tabulated loss data	<p>Loss lookup table that is a function of motor speeds and load torques.</p> <p>If you have Model-Based Calibration Toolbox, click <b>Calibrate Maps</b> to virtually calibrate the 2D lookup tables using measured data.</p>
Tabulated loss data with temperature	<p>Loss lookup table that is a function of motor speeds, load torques, and operating temperature.</p> <p>If you have Model-Based Calibration Toolbox, click <b>Calibrate Maps</b> to virtually calibrate the 3D lookup tables using measured data.</p>

Setting	Block Implementation
Tabulated efficiency data	2D efficiency lookup table that is a function of motor speeds and load torques: <ul style="list-style-type: none"> <li>• Converts the efficiency values you provide into losses and uses the tabulated losses for simulation.</li> <li>• Ignores efficiency values you provide for zero speed or zero torque. Losses are assumed zero when either torque or speed is zero.</li> <li>• Uses linear interpolation to determine losses. Provide tabulated data for low speeds and low torques, as required, to get the desired level of accuracy for lower power conditions.</li> <li>• Does not extrapolate loss values for speed and torque magnitudes that exceed the range of the table.</li> </ul>
Tabulated efficiency data with temperature	3D efficiency lookup table that is a function of motor speeds, load torques, and operating temperature: <ul style="list-style-type: none"> <li>• Converts the efficiency values you provide into losses and uses the tabulated losses for simulation.</li> <li>• Ignores efficiency values you provide for zero speed or zero torque. Losses are assumed zero when either torque or speed is zero.</li> <li>• Uses linear interpolation to determine losses. Provide tabulated data for low speeds and low torques, as required, to get the desired level of accuracy for lower power conditions.</li> <li>• Does not extrapolate loss values for speed, torque, or temperature magnitudes that exceed the range of the table.</li> </ul>

For best practice, use Tabulated loss data instead of Tabulated efficiency data:

- Efficiency becomes ill defined for zero speed or zero torque.
- You can account for fixed losses that are still present for zero speed or torque.

---

**Note** Due to system losses, the motor can draw a current when the motor torque is zero.

---

### Virtual Calibration

If you have Model-Based Calibration Toolbox, you can virtually calibrate the measured loss lookup tables.

- 1 On the **Electrical Losses** tab, set **Parameterize losses by** to either:
  - Tabulated loss data
  - Tabulated loss data with temperature
- 2 Click **Calibrate Maps**.

The dialog box steps through these tasks.

Task	Description	
Update block parameters	Update these parameters with the calibration.	
	Parameterize losses by	Parameters
	Tabulated loss data	<ul style="list-style-type: none"> <li>• Vector of speeds(<b>w</b>) for tabulated losses, <b>w_eff_bp</b></li> <li>• Vector of torques (<b>T</b>) for tabulated losses, <b>T_eff_bp</b></li> <li>• Corresponding losses, <b>losses_table</b></li> </ul>
Tabulated loss data with temperature	<ul style="list-style-type: none"> <li>• Vector of speeds(<b>w</b>) for tabulated losses, <b>w_eff_bp</b></li> <li>• Vector of torques (<b>T</b>) for tabulated losses, <b>T_eff_bp</b></li> <li>• Vector of temperatures for tabulated losses, <b>Temp_eff_bp</b></li> <li>• Corresponding losses, <b>losses_table_3d</b></li> </ul>	

### Battery Current

The block calculates the battery current using the mechanical power, power loss, and battery voltage. Positive current indicates battery discharge. Negative current indicates battery charge.

$$BattAmp = \frac{MechPwr + PwrLoss}{BattVolt}$$

The equation uses these variables.

- BattVolt* Battery voltage
- MechPwr* Mechanical power
- PwrLoss* Power loss
- BattCurr* Battery current

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Variable	Equations	
PwrIn fo	PwrTrnsfrd	PwrMtr	Mechanical power	$P_{mot}$	$P_{mot} = \omega_m T_e$
	<ul style="list-style-type: none"> <li>• Positive signals indicate power flow into the block.</li> <li>• Negative signals indicate power flow out of the block.</li> </ul>	PwrBus	Electrical power	$P_{bus}$	$P_{bus} = P_{mot} + P_{loss}$
	PwrNotTrnsfrd	PwrLoss	Motor power loss	$P_{loss}$	$P_{stored} = \omega_m \dot{\omega}_m J$
	<ul style="list-style-type: none"> <li>• Negative signals indicate power loss.</li> </ul>				

Bus Signal		Description	Variable	Equations	
	PwrStored <ul style="list-style-type: none"> <li>Positive signals indicate power gain.</li> </ul>	PwrStoredShft	Motor power stored	$P_{str}$	$P_{loss} = -(P_{mot} + P_{loss} - P_{stored})$

The equations use these variables.

$T_e$	Motor output shaft torque
$\omega$	Motor shaft speed
$J$	Motor inertia

## Ports

### Input

#### BattVolt – Battery voltage

scalar

Battery voltage, *BattVolt*, in V.

#### TrqCmd – Commanded motor torque

scalar

Commanded motor torque, *TrqCmd*, in N·m.

#### Dependencies

To create this input port, for the **Port configuration**, select Torque.

#### MtrSpd – Motor output shaft speed

scalar

Motor shaft speed, *MtrSpd*, in rad/s.

#### Dependencies

To create this input port, for the **Port configuration**, select Speed.

### Output

#### Info – Bus signal

bus

The bus signal contains these block calculations.

Signal		Description	Units	
MechPwr		Mechanical power	rad	
PwrLoss		Internal inverter and motor power loss	N·m	
PwrInfo	PwrTrnsfrd	PwrMtr	Mechanical power	W
		PwrBus	Electrical power	W

Signal		Description	Units
	PwrNotTrnsfrd	PwrLoss	Motor power loss
	PwrStored	PwrStored Shft	Motor power stored
			W
			W

**BattCurr – Battery current**

scalar

Battery current draw or demand,  $I_{batt}$ , in A.

**MtrTrq – Motor torque**

scalar

Motor output shaft torque,  $Mtr_{trq}$ , in N·m.

**MtrSpd – Motor shaft speed**

scalar

Motor shaft speed,  $Mtr_{spd}$ , in rad/s.

**Dependencies**

To create this output port, for the **Port configuration**, select Torque.

**Parameters**

**Block Options**

**Port configuration – Select port configuration**

Torque (default) | Speed

This table summarizes the port configurations.

Port Configuration	Creates Ports
Torque	Output MtrSpd
Speed	Input MtrSpd

**Calibrate Maps – Calibrate tables with measured data**

selection

If you have Model-Based Calibration Toolbox, you can virtually calibrate the measured loss lookup tables.

- 1 On the **Electrical Losses** tab, set **Parameterize losses by** to either:
  - Tabulated loss data
  - Tabulated loss data with temperature
- 2 Click **Calibrate Maps**.

The dialog box steps through these tasks.

Task	Description						
Import Loss Data	<p data-bbox="508 300 1469 363">Import this loss data from a file. Task	Description	
Update block parameters	Update these parameters with the calibration.	
	Parameterize losses by	Parameters
	Tabulated loss data	<ul style="list-style-type: none"> <li>• Vector of speeds(<math>w</math>) for tabulated losses, <math>w\_eff\_bp</math></li> <li>• Vector of torques (<math>T</math>) for tabulated losses, <math>T\_eff\_bp</math></li> <li>• Corresponding losses, <math>losses\_table</math></li> </ul>
Tabulated loss data with temperature	<ul style="list-style-type: none"> <li>• Vector of speeds(<math>w</math>) for tabulated losses, <math>w\_eff\_bp</math></li> <li>• Vector of torques (<math>T</math>) for tabulated losses, <math>T\_eff\_bp</math></li> <li>• Vector of temperatures for tabulated losses, <math>Temp\_eff\_bp</math></li> <li>• Corresponding losses, <math>losses\_table\_3d</math></li> </ul>	

**Electrical Torque**

**Parameterized by – Select type**

Tabulated torque-speed envelope (default) | Maximum torque and power

Setting	Block Implementation
Tabulated torque-speed envelope	Range specified as a set of speed data points and corresponding maximum torque values.
Maximum torque and power	Range specified with maximum torque and maximum power.

For either method, the block implements an envelope similar to this.

**Vector of rotational speeds,  $w\_t$  – Rotational speeds**

[0 375 750 800] (default) | vector

Rotational speeds for permissible steady-state operation, in rad/s. To avoid poor performance due to an infinite slope in the torque-speed curve, specify a vector of rotational speeds that does not contain duplicate consecutive values.

**Dependencies**

To create this parameter, for the **Parameterized by** parameter, select Tabulated torque-speed envelope.

**Vector of maximum torque values,  $T_t$  – Torque**

[0.09 0.08 0.07 0] (default) | vector

Maximum torque values for permissible steady state, in N·m.

**Dependencies**

To create this parameter, for the **Parameterized by** parameter, select Tabulated torque-speed envelope.

**Maximum torque,  $\text{torque\_max}$  – Torque**

.1 (default) | scalar

The maximum permissible motor torque, in N·m.

**Dependencies**

To create this parameter, for the **Parameterized by** parameter, select Maximum torque and power.

**Maximum power,  $\text{power\_max}$  – Power**

30 (default) | scalar

The maximum permissible motor power, in W.

**Dependencies**

To create this parameter, for the **Parameterized by** parameter, select Maximum torque and power.

**Torque control time constant,  $T_c$  – Time constant**

0.02 (default) | scalar

Time constant with which the motor driver tracks a torque demand, in s.

**Electrical Losses****Parameterize losses by – Select type**

Single efficiency measurement (default) | Tabulated loss data | Tabulated efficiency data

Setting	Block Implementation
Single efficiency measurement	<p>Sum of these terms, measured at a single measurement point:</p> <ul style="list-style-type: none"> <li>• Fixed losses independent of torque and speed, <math>P_0</math>. Use <math>P_0</math> to account for fixed converter losses.</li> <li>• A torque-dependent electrical loss <math>k\tau^2</math>, where <math>k</math> is a constant and <math>\tau</math> is the torque. Represents ohmic losses in the copper windings.</li> <li>• A speed-dependent electrical loss <math>k_w\omega^2</math>, where <math>k_w</math> is a constant and <math>\omega</math> is the speed. Represents iron losses due to eddy currents.</li> </ul>
Tabulated loss data	<p>Loss lookup table that is a function of motor speeds and load torques.</p> <p>If you have Model-Based Calibration Toolbox, click <b>Calibrate Maps</b> to virtually calibrate the 2D lookup tables using measured data.</p>
Tabulated loss data with temperature	<p>Loss lookup table that is a function of motor speeds, load torques, and operating temperature.</p> <p>If you have Model-Based Calibration Toolbox, click <b>Calibrate Maps</b> to virtually calibrate the 3D lookup tables using measured data.</p>
Tabulated efficiency data	<p>2D efficiency lookup table that is a function of motor speeds and load torques:</p> <ul style="list-style-type: none"> <li>• Converts the efficiency values you provide into losses and uses the tabulated losses for simulation.</li> <li>• Ignores efficiency values you provide for zero speed or zero torque. Losses are assumed zero when either torque or speed is zero.</li> <li>• Uses linear interpolation to determine losses. Provide tabulated data for low speeds and low torques, as required, to get the desired level of accuracy for lower power conditions.</li> <li>• Does not extrapolate loss values for speed and torque magnitudes that exceed the range of the table.</li> </ul>

Setting	Block Implementation
Tabulated efficiency data with temperature	<p>3D efficiency lookup table that is a function of motor speeds, load torques, and operating temperature:</p> <ul style="list-style-type: none"> <li>• Converts the efficiency values you provide into losses and uses the tabulated losses for simulation.</li> <li>• Ignores efficiency values you provide for zero speed or zero torque. Losses are assumed zero when either torque or speed is zero.</li> <li>• Uses linear interpolation to determine losses. Provide tabulated data for low speeds and low torques, as required, to get the desired level of accuracy for lower power conditions.</li> <li>• Does not extrapolate loss values for speed, torque, or temperature magnitudes that exceed the range of the table.</li> </ul>

For best practice, use **Tabulated loss data** instead of **Tabulated efficiency data**:

- Efficiency becomes ill defined for zero speed or zero torque.
- You can account for fixed losses that are still present for zero speed or torque.

---

**Note** Due to system losses, the motor can draw a current when the motor torque is zero.

---

### Motor and drive overall efficiency, **eff** – Efficiency

100 (default) | scalar

The block defines overall efficiency as:

$$\eta = 100 \frac{\tau_0 \omega_0}{\tau_0 \omega_0 + P_0 + k\tau_0^2 + k_w \omega_0^2}$$

The equation uses these variables.

$\tau_0$	Torque at which efficiency is measured
$\omega_0$	Speed at which efficiency is measured
$P_0$	Fixed losses independent of torque or speed
$k\tau_0^2$	Torque-dependent electrical losses
$k_w \omega_0^2$	Speed-dependent iron losses

At initialization, the block solves the efficiency equation for  $k$ . The block neglects losses associated with the rotor damping.

#### Dependencies

To create this parameter, for the **Parameterize losses by** parameter, select **Single efficiency measurement**.

### Speed at which efficiency is measured, **w\_eff** – Speed

375 (default) | scalar

Speed at which efficiency is measured, in rad/s.

**Dependencies**

To create this parameter, for the **Parameterize losses by** parameter, select **Single efficiency measurement**.

**Torque at which efficiency is measured,  $T_{\text{eff}}$  – Torque**

0.08 (default) | scalar

Torque at which efficiency is measured, in N·m.

**Dependencies**

To create this parameter, for the **Parameterize losses by** parameter, select **Single efficiency measurement**.

**Iron losses,  $P_{\text{iron}}$  – Power**

0 (default) | scalar

Iron losses at the speed and torque at which efficiency is defined, in W.

**Dependencies**

To create this parameter, for the **Parameterize losses by** parameter, select **Single efficiency measurement**.

**Fixed losses independent of torque and speed,  $P_{\text{base}}$  – Power**

0 (default) | scalar

Fixed electrical loss associated with the driver when the motor current and torque are zero, in W.

**Dependencies**

To create this parameter, for the **Parameterize losses by** parameter, select **Single efficiency measurement**.

**Vector of speeds ( $w$ ) for tabulated losses,  $w_{\text{eff\_bp}}$  – Breakpoints**

[-8000 -4000 0 4000 8000] (default) | 1-by-M vector

Speed breakpoints for lookup table when calculating losses, in rad/s. Array dimensions are 1 by the number of speed breakpoints, M.

**Dependencies**

To create this parameter, for the **Parameterize losses by** parameter, select one of these:

- Tabulated loss data
- Tabulated loss data with temperature
- Tabulated efficiency data
- Tabulated efficiency data with temperature

**Vector of torques ( $T$ ) for tabulated losses,  $T_{\text{eff\_bp}}$  – Breakpoints**

[0 0.03 0.06 0.09] (default) | 1-by-N vector

Torque breakpoints for lookup table when calculating losses, in N·m. Array dimensions are 1 by the number of torque breakpoints, N.

**Dependencies**

To create this parameter, for the **Parameterize losses by** parameter, select one of these:

- Tabulated loss data
- Tabulated loss data with temperature
- Tabulated efficiency data
- Tabulated efficiency data with temperature

**Vector of temperatures for tabulated losses, Temp\_eff\_bp – Breakpoints**

[233.15 293.15 373.15] (default) | 1-by-L vector

Temperature breakpoints for lookup table when calculating losses, in K. Array dimensions are 1 by the number of temperature breakpoints, L.

**Dependencies**

To create this parameter, for the **Parameterize losses by** parameter, select one of these:

- Tabulated loss data with temperature
- Tabulated efficiency data with temperature

**Corresponding losses, losses\_table – 2D lookup table**

M-by-N matrix

Array of values for electrical losses as a function of speed and torque, in W. Each value specifies the losses for a specific combination of speed and torque. The array dimensions must match the speed, M, and torque, N, breakpoint vector dimensions.

**Dependencies**

To create this parameter, for the **Parameterize losses by** parameter, select Tabulated loss data.

**Corresponding losses, losses\_table\_3d – 3D lookup table**

M-by-N-by-L array

Array of values for electrical losses as a function of speed, torque, and temperature, in W. Each value specifies the losses for a specific combination of speed, torque, and temperature. The array dimensions must match the speed, M, torque, N, and temperature, L, breakpoint vector dimensions.

**Dependencies**

To create this parameter, for the **Parameterize losses by** parameter, select Tabulated loss data with temperature.

**Corresponding efficiency, efficiency\_table – 2D lookup table**

M-by-N matrix

Array of efficiency as a function of speed and torque, in %. Each value specifies the losses for a specific combination of speed and torque. The array dimensions must match the speed, M, and torque, N, breakpoint vector dimensions.

The block ignores efficiency values for zero speed or zero torque. Losses are zero when either torque or speed is zero. The block uses linear interpolation.

To get the desired level of accuracy for lower power conditions, you can provide tabulated data for low speeds and low torques.

**Dependencies**

To create this parameter, for the **Parameterize losses by** parameter, select Tabulated efficiency data.

**Corresponding efficiency, efficiency\_table\_3d – 3D lookup table**

M-by-N-by-L array

Array of efficiency as a function of speed and torque, in %. Each value specifies the losses for a specific combination of speed and torque. The array dimensions must match the speed, M, torque, N, and temperature, L, breakpoint vector dimensions.

The block ignores efficiency values for zero speed or zero torque. Losses are zero when either torque or speed is zero. The block uses linear interpolation.

To get the desired level of accuracy for lower power conditions, you can provide tabulated data for low speeds and low torques.

**Dependencies**

To create this parameter, for the **Parameterize losses by** parameter, select Tabulated efficiency data.

**Mechanical****Rotor inertia, J – Inertia**

5e-6 (default) | scalar

Rotor resistance to change in motor motion, in kg\*m<sup>2</sup>. The value can be zero.

**Dependencies**

To create this parameter, for the **Port configuration** parameter, select Torque.

**Rotor damping, b – Damping**

1e-5 (default) | scalar

Rotor damping, in N·m/(rad/s). The value can be zero.

**Dependencies**

To create this parameter, for the **Port configuration** parameter, select Torque.

**Initial rotor speed, omega\_o – Speed**

0 (default) | scalar

Rotor speed at the start of the simulation, in rad/s.

**Dependencies**

To create this parameter, for the **Port configuration** parameter, select Torque.

## Drive Cycle Source

Standard or specified longitudinal drive cycle

**Library:** Powertrain Blockset / Vehicle Scenario Builder  
Vehicle Dynamics Blockset / Vehicle Scenarios / Drive Cycle and Maneuvers

### Description

The Drive Cycle Source block generates a standard or user-specified longitudinal drive cycle. The block output is the specified vehicle longitudinal speed, which you can use to:

- Predict the engine torque and fuel consumption that a vehicle requires to achieve desired speed and acceleration for a given gear shift reference.
- Produce realistic velocity and shift references for closed loop acceleration and braking commands for vehicle control and plant models.
- Study, tune, and optimize vehicle control, system performance, and system robustness over multiple drive cycles.
- Identify the faults within tolerances specified by standardized tests, including:
  - EPA dynamometer driving schedules<sup>1</sup>
  - Worldwide Harmonised Light Vehicle Test Procedure (WLTP) laboratory tests<sup>2</sup>

For the drive cycles, you can use:

- Drive cycles from predefined sources. By default, the block includes the FTP–75 drive cycle. To install additional drive cycles from a support package, see “Install Drive Cycle Data”. The support package has drive cycles that include the gear shift schedules, for example JC08 and CUEDC.
- Workspace variables that define your own drive cycles.
- .mat, .xls, .xlsx, or .txt files.
- Wide open throttle (WOT) parameters, including initial and nominal reference speed, deceleration start time, and final reference speed.

To achieve the goals listed in the table, use the specified Drive Cycle Source block parameter options.

Goal	Action
Repeat the drive cycle if the simulation run time exceeds the drive cycle length.	Select <b>Repeat cyclically</b> .

Goal	Action
Output the acceleration, as calculated by Savitzky-Golay differentiation.	Select <b>Output acceleration</b> .
Specify a sample period for discrete applications.	Specify a <b>Output sample period (0 for continuous)</b> , <b>dt</b> parameter.
Update the simulation run time so that it equals the length of the drive cycle.	Click <b>Update simulation time</b> . If a model configuration reference exists, the block does not enable this option.
Plot the drive cycle in a MATLAB® figure.	Click <b>Plot drive cycle</b> .
Specify the drive cycle using a workspace variable.	<p>Click <b>Specify variable</b>. The block:</p> <ul style="list-style-type: none"> <li>• Sets the <b>Drive cycle source</b> parameter to <b>Workspace variable</b>.</li> <li>• Enables the <b>From workspace</b> parameter.</li> </ul> <p>Specify the workspace variable so that it contains time, velocity, and, optionally, the gear shift schedule. For examples, see “Create Drive Cycles Using Workspace Variables” on page 6-5.</p>
Specify the drive cycle using a file.	<p>Click <b>Select file</b>. The block:</p> <ul style="list-style-type: none"> <li>• Sets the <b>Drive cycle source</b> parameter to <b>.mat</b>, <b>.xls</b>, <b>.xlsx</b> or <b>.txt</b> file.</li> <li>• Enables the <b>Drive cycle source file</b> parameter.</li> </ul> <p>Specify a file that contains time, velocity, and, optionally, the gear shift schedule.</p>
Output drive cycle gear.	<p>Specify a drive cycle that contains a gear shift schedule. You can use:</p> <ul style="list-style-type: none"> <li>• A support package to install standard drive cycles that include the gear shift schedules, for example <b>JC08</b> and <b>CUEDC</b>.</li> <li>• Workspace variables.</li> <li>• <b>.mat</b>, <b>.xls</b>, <b>.xlsx</b>, or <b>.txt</b> files.</li> </ul> <p>Click <b>Output gear shift data</b>.</p>
Install additional drive cycles from a support package.	Click <b>Install additional drive cycles</b> . The block enables the parameter if you can install additional drive cycles from a support package.
Identify drive cycle faults within tolerances specified by standardized tests.	On the <b>Fault Tracking</b> tab, use the parameters to specify the fault tolerances. If the vehicle speed is not within the allowable speed range, the block sets a fault condition.

### Fault and Failure Tracking

On the **Fault Tracking** tab, use the parameters to specify the fault tolerances. If the vehicle speed or time is not within the allowable range, the block sets a fault condition.

Parameter	Description	Setting	
		EPA Standard <sup>1</sup>	WLTP Tests <sup>2</sup>
<b>Speed tolerance</b>	Speed tolerance above the highest point and below the lowest point of the drive cycle speed trace within the time tolerance.	2.0 mph	2.0 km/h
<b>Time tolerance</b>	Time that the block uses to determine the speed tolerance.	1.0 s	1.0 s
<b>Maximum number of faults</b>	Maximum number of faults during the drive cycle.	<i>Not specified</i>	10
<b>Maximum single fault time</b>	Maximum fault duration.	2.0 s	1.0 s
<b>Maximum total fault time</b>	Maximum accumulated time spent under fault condition.	<i>Not specified</i>	<i>Not specified</i>

These figures illustrate how the block uses the velocity and time tolerances to determine the allowable speed range.

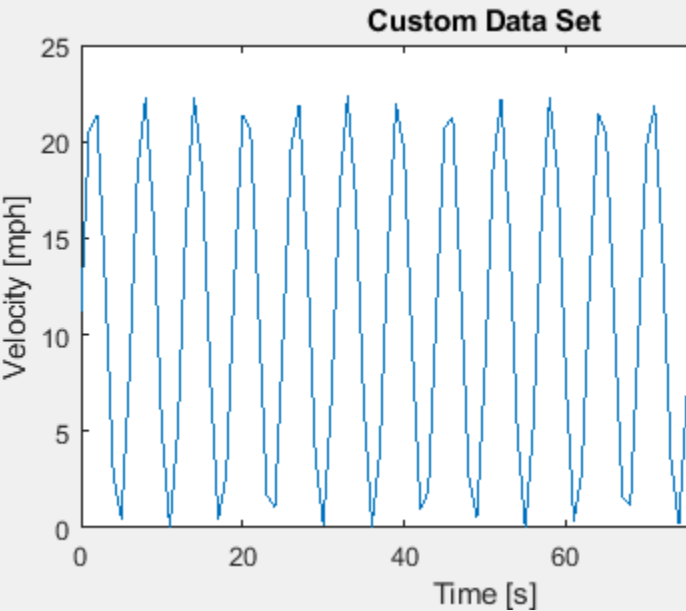

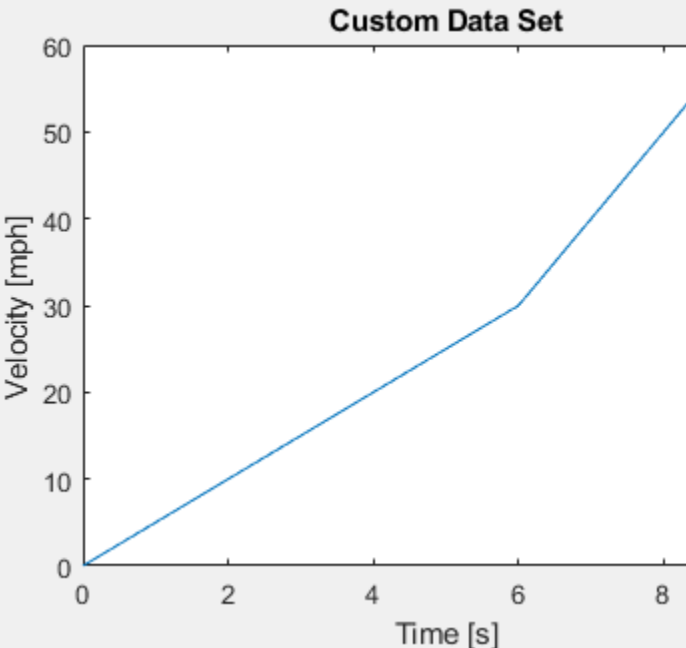

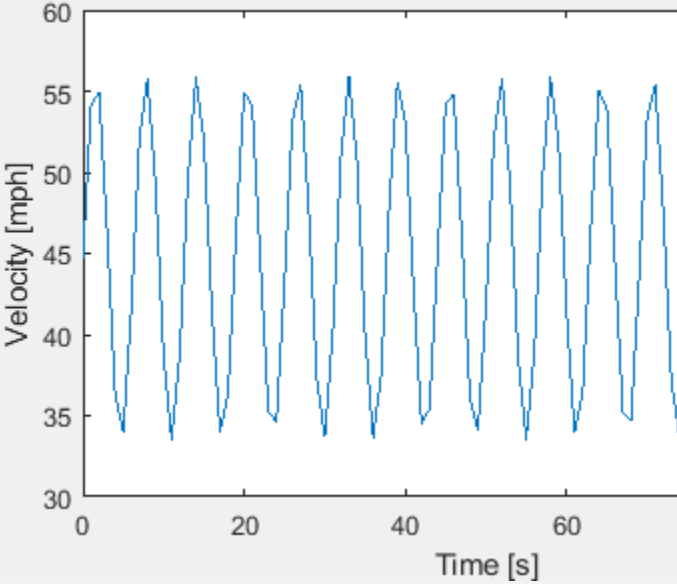

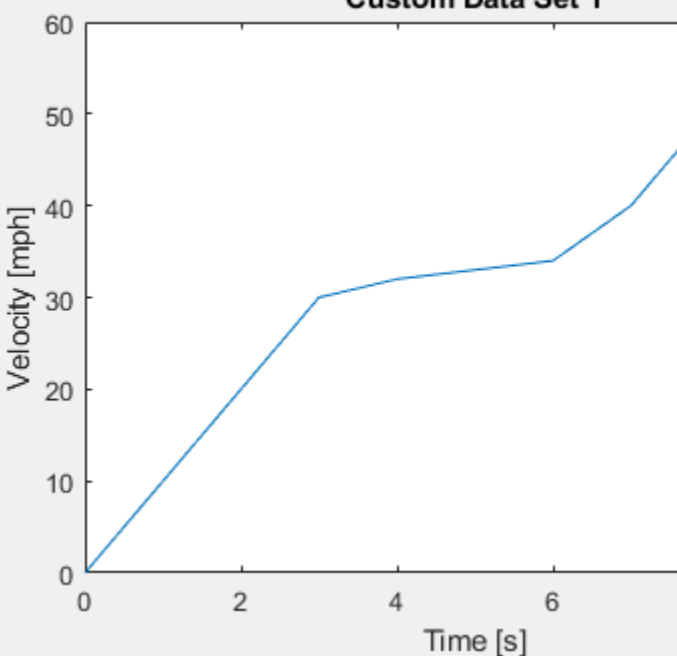

### Create Drive Cycles Using Workspace Variables

If you set **Drive cycle source** to `Workspace variable`, you can specify a workspace variable that defines the drive cycle.

This table provides examples for using workspace variables to create your own drive cycles.

Workspace Variable	Source Velocity Unit	Output Velocity Unit	Drive Cycle Plot
<p>Structure without a gear shift schedule. <b>From workspace</b> set to <code>myCycleS</code>.</p> <pre>t = 0:1:100; xdot = 5.*sin(t)+10; myCycleS.time = t'; myCycleS.signals.values = xdot';</pre>	m/s	mph	
<p>Structure with a gear shift schedule. <b>From workspace</b> set to <code>myCycleS</code>.</p> <pre>gears=[0, 1, 2, 3, 3, 4, 4, 4, 4, 4, 4]; t=0:1:10; xdot=[0,5,10,15,20,25,30,30,30,30,30]; myCycleS.time=t'; myCycleS.signals.values=[xdot',gears'];</pre>	m/s	mph	

Workspace Variable	Source Velocity Unit	Output Velocity Unit	Drive Cycle Plot
<p>2-D array without a gear shift schedule. <b>From workspace</b> set to myCycleA.</p> <pre>t = 0:1:100; xdot = 5.*sin(t)+5; myCycleA = [t',xdot'];</pre>	m/s	mph	
<p>2-D array with a gear shift schedule. <b>From workspace</b> set to myCycleA.</p> <pre>gears=[0, 1, 2, 3, 4, 4, 4, 5, 5, 5, 5]; t=0:1:10; xdot=[0,5,10,15,20,25,30,40,50,60,60]; myCycleA=[t',xdot',gears'];</pre>	mph	mph	

Workspace Variable	Source Velocity Unit	Output Velocity Unit	Drive Cycle Plot
<p>Time series object without a gear shift schedule. <b>From workspace</b> set to myCycleT.</p> <pre>myCycleT = timeseries; t = 0:1:100; xdot = 5.*sin(t)+20; myCycleT.Data = xdot'; myCycleT.Time = t;</pre>	m/s	mph	
<p>Time series object without a gear shift schedule. <b>From workspace</b> set to myCycleT.</p> <pre>myCycleT = timeseries; gears=[0, 1, 2, 3, 4, 4, 4, 5, 5, 5, 5]; t=0:1:10; xdot=[0,10,20,30,32,33,34,40,50,60,60]; myCycleT.Data = [xdot',gears']; myCycleT.Time = t';</pre>	mph	mph	

## Ports

### Input

**VelFdbk** — Vehicle longitudinal speed  
scalar

Longitudinal vehicle speed.

**Dependencies**

To enable this port, on the **Fault Tracking** tab, select **Enable fault tracking**. Set the **Velocity feedback units, inUnit** parameter to the VelFdbk input port signal units.

**Output**

**Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal		Description
Reference Spd		Vehicle reference speed
Reference Accel		Vehicle reference acceleration
Gear		Vehicle gear
Fault	UpprBnd	Upper bound of allowable vehicle speed range.
	LowerBnd	Lower bound of allowable vehicle speed range.
	Fault	Boolean value indicating fault condition: <ul style="list-style-type: none"> <li>• 1 — Fault</li> <li>• 0 — No fault</li> </ul> If the vehicle speed is not within the allowable speed range, the block sets a fault condition.
	FaultCnt	Number of faults.
	CumFaultTime	Cumulative time spent in fault condition.
	SnglFaultTime	Tim spent in a single fault.
	Fail	Boolean value indicating fault failure: <ul style="list-style-type: none"> <li>• 1 — Failure</li> <li>• 0 — No failure</li> </ul> If the fault conditions exceed the maximum number of faults, maximum single fault time, or maximum total fault time, the block sets a fault failure.

**Dependencies**

To enable this port, on the **Fault Tracking** tab, select **Enable fault tracking**.

**RefSpd — Vehicle reference speed**

scalar

Vehicle reference speed, in units that you specify. To specify the units, use the **Output velocity units** parameter.

**RefAcc — Vehicle reference acceleration**

scalar

To calculate the acceleration, the block implements Savitzky-Golay differentiation using a second-order polynomial with a three-sample point filter.

### Dependencies

To create the output acceleration port, select **Output acceleration**. Selecting **Output acceleration** enables the **Output acceleration units** parameter.

### Gear — Vehicle gear

scalar

### Dependencies

To enable this port:

- 1 Specify a drive cycle that contains a gear shift schedule. You can use:
  - A support package to install standard drive cycles that include the gear shift schedules, for example JC08 and CUEDC.
  - Workspace variables.
  - `.mat`, `.xls`, `.xlsx`, or `.txt` files.
- 2 Select **Output gear shift** data.

## Parameters

### Cycle Setup

#### Setup

#### Drive cycle source — Select the drive cycle source

FTP75 (default) | Wide Open Throttle (WOT) | Workspace variable | `.mat`, `.xls`, `.xlsx` or `.txt` file

- **FTP75** — Load the FTP75 drive cycle from a `.mat` file into a 1-D Lookup Table block. The FTP75 represents a city drive cycle that you can use to determine tailpipe emissions and fuel economy of passenger cars. To install additional drive cycles from a support package, see “Install Drive Cycle Data”.
- **Wide Open Throttle (WOT)** — Use WOT parameters to specify a drive cycle for performance testing.
- **Workspace variable** — Specify time, speed, and, optionally, gear data as a structure, 2-D array, or time series object.
- **`.mat`, `.xls`, `.xlsx` or `.txt` file** — Specify a file that contains time, speed and, optionally, gear data in column format.

Once you have installed additional cycles, you can use `set_param` to set the drive cycle. For example, to use drive cycle US06:

```
set_param([gcs '/Drive Cycle Source'],'cycleVar','US06')
```

### Dependencies

The table summarizes the parameter dependencies.

Drive Cycle Source	Enables Parameter
Wide Open Throttle (WOT)	Start time, <code>t_wot1</code>
	Initial reference speed, <code>xdot_woto</code>
	Nominal reference speed, <code>xdot_wot1</code>
	Time to start deceleration, <code>wot2</code>
	Final reference speed, <code>xdot_wot2</code>
	WOT simulation time, <code>t_wotend</code>
	Source velocity units
Workspace variable	From workspace
	Source velocity units
	Output gear shift data, if drive cycle includes gear shift schedule
.mat, .xls, .xlsx or .txt file	Drive cycle source file
	Source velocity units
	Output gear shift data, if drive cycle includes gear shift schedule

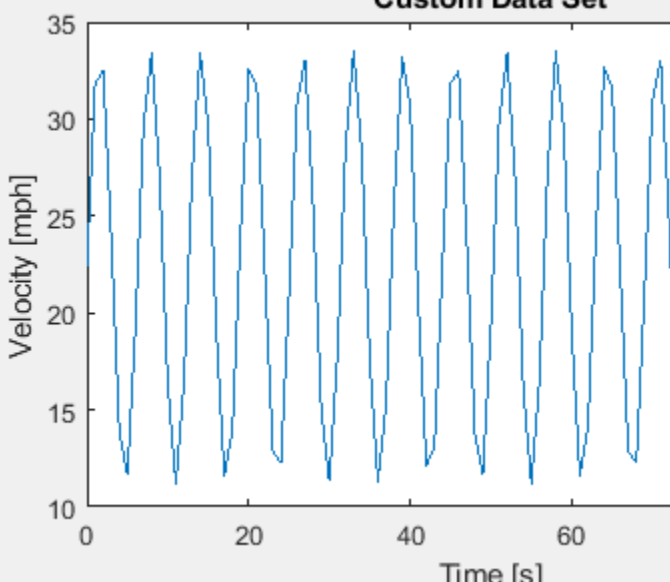

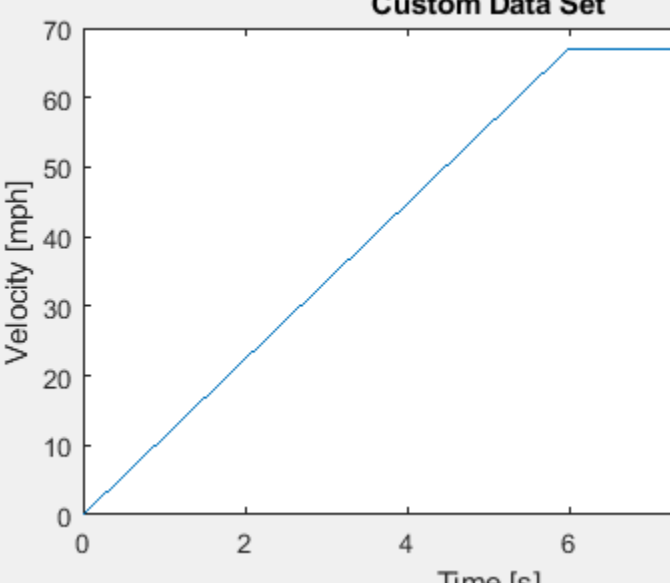

**From workspace – Workspace variable**

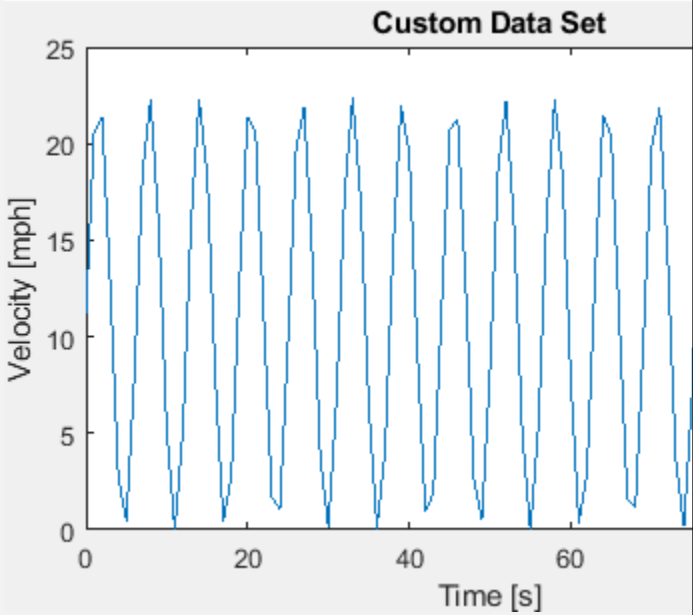

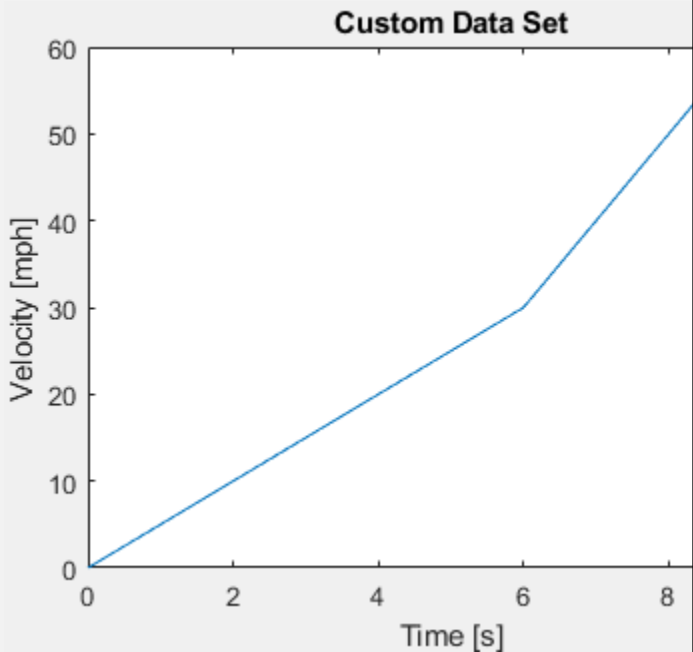

Monotonically increasing time, velocity, and, optionally, gear data, specified by a structure, 2-D array, or time series object. Enter units for velocity in the **Source velocity units** parameter field.

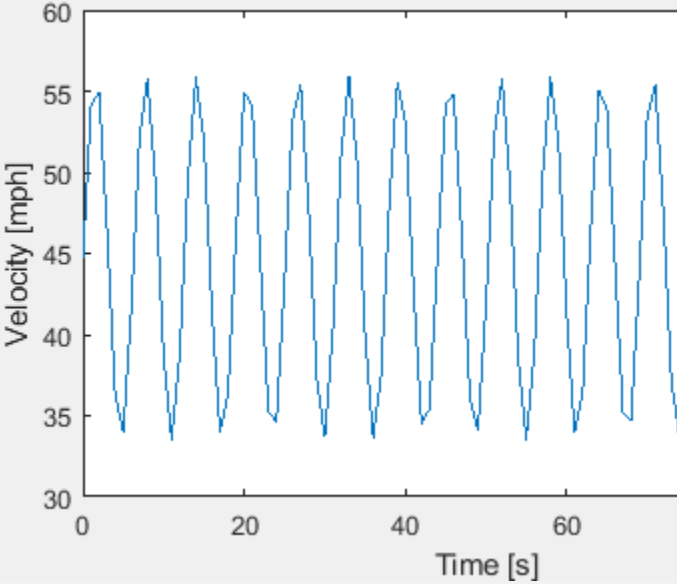

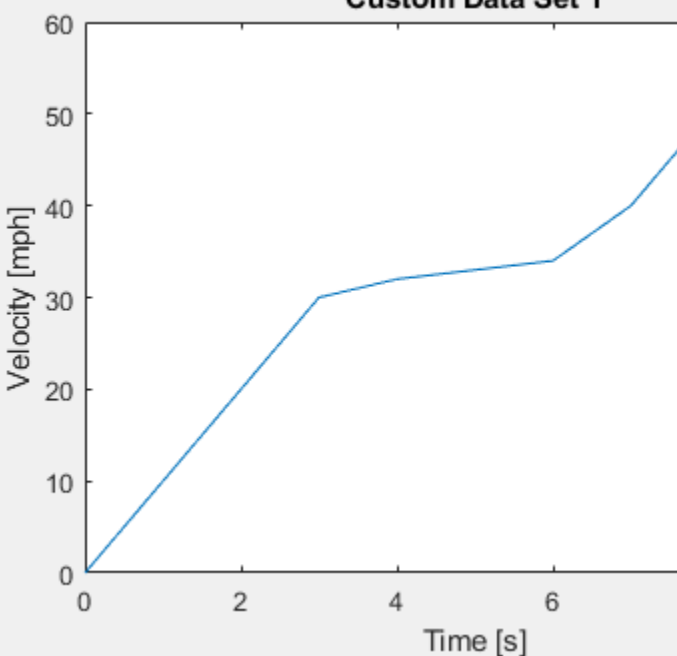

A valid point must exist for each corresponding time value. You cannot specify `inf`, `empty`, or `NaN`.

This table provides examples for using workspace variables to create your own drive cycles.

Workspace Variable	Source Velocity Unit	Output Velocity Unit	Drive Cycle Plot
<p>Structure without a gear shift schedule. <b>From workspace</b> set to myCycleS.</p> <pre>t = 0:1:100; xdot = 5.*sin(t)+10; myCycleS.time = t'; myCycleS.signals.values = xdot';</pre>	m/s	mph	
<p>Structure with a gear shift schedule. <b>From workspace</b> set to myCycleS.</p> <pre>gears=[0, 1, 2, 3, 3, 4, 4, 4, 4, 4, 4]; t=0:1:10; xdot=[0,5,10,15,20,25,30,30,30,30,30]; myCycleS.time=t'; myCycleS.signals.values=[xdot',gears'];</pre>	m/s	mph	

Workspace Variable	Source Velocity Unit	Output Velocity Unit	Drive Cycle Plot
<p>2-D array without a gear shift schedule. <b>From workspace</b> set to myCycleA.</p> <pre>t = 0:1:100; xdot = 5.*sin(t)+5; myCycleA = [t',xdot'];</pre>	m/s	mph	
<p>2-D array with a gear shift schedule. <b>From workspace</b> set to myCycleA.</p> <pre>gears=[0, 1, 2, 3, 4, 4, 4, 5, 5, 5, 5]; t=0:1:10; xdot=[0,5,10,15,20,25,30,40,50,60,60]; myCycleA=[t',xdot',gears'];</pre>	mph	mph	

Workspace Variable	Source Velocity Unit	Output Velocity Unit	Drive Cycle Plot
<p>Time series object without a gear shift schedule. <b>From workspace</b> set to myCycleT.</p> <pre>myCycleT = timeseries; t = 0:1:100; xdot = 5.*sin(t)+20; myCycleT.Data = xdot'; myCycleT.Time = t;</pre>	m/s	mph	
<p>Time series object without a gear shift schedule. <b>From workspace</b> set to myCycleT.</p> <pre>myCycleT = timeseries; gears=[0, 1, 2, 3, 4, 4, 4, 5, 5, 5, 5]; t=0:1:10; xdot=[0,10,20,30,32,33,34,40,50,60,60]; myCycleT.Data = [xdot',gears']; myCycleT.Time = t';</pre>	mph	mph	

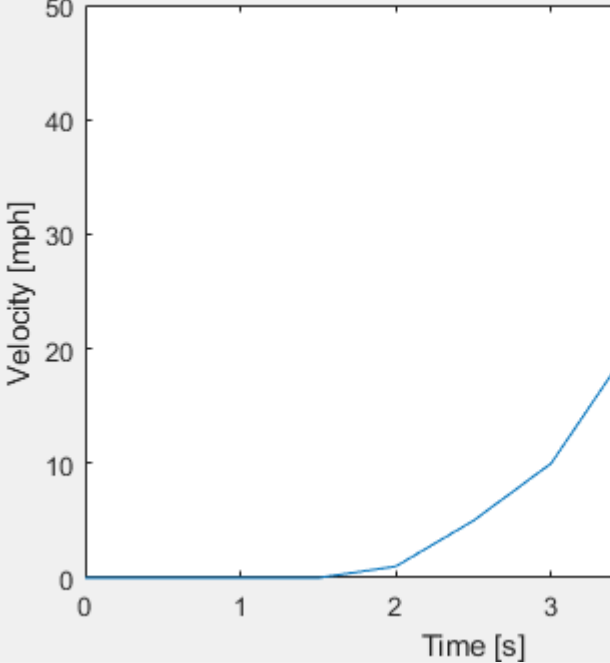

**Dependencies**

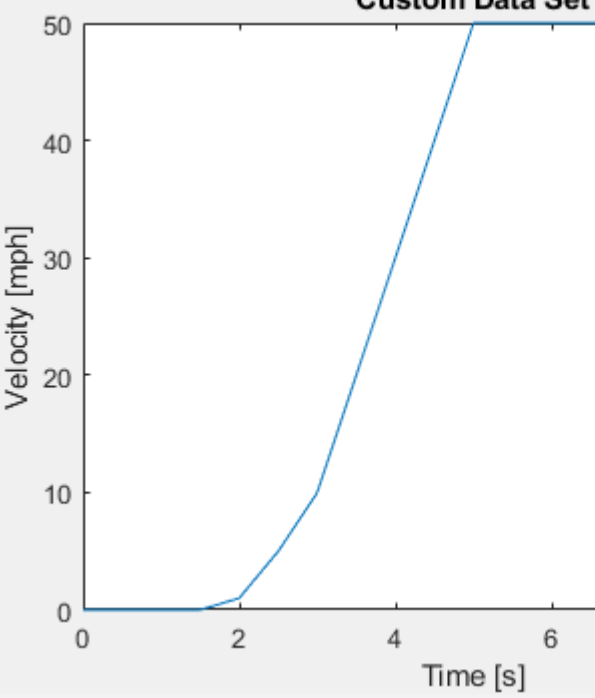

To enable this parameter, select Workspace variable from **Drive cycle source**.

**Drive cycle source file – File name**

.mat, .xls, .xlsx or .txt

File containing monotonically increasing time, velocity, and, optionally, gear in column or comma-separated format. The block ignores units in the file. Enter units for velocity in the **Source velocity units** parameter field.

File	Source Velocity Unit	Output Velocity Unit	Drive Cycle Plot																																				
<p>An .xls or .xlsx file with time in column A and velocity in column B.</p> <table border="1" data-bbox="241 667 467 1024"> <thead> <tr> <th></th> <th>A</th> <th>B</th> </tr> </thead> <tbody> <tr><td>1</td><td>0</td><td>0</td></tr> <tr><td>2</td><td>0.5</td><td>0</td></tr> <tr><td>3</td><td>1</td><td>0</td></tr> <tr><td>4</td><td>1.5</td><td>0</td></tr> <tr><td>5</td><td>2</td><td>1</td></tr> <tr><td>6</td><td>2.5</td><td>5</td></tr> <tr><td>7</td><td>3</td><td>10</td></tr> <tr><td>8</td><td>3.5</td><td>20</td></tr> <tr><td>9</td><td>4</td><td>30</td></tr> <tr><td>10</td><td>4.5</td><td>40</td></tr> <tr><td>11</td><td>5</td><td>50</td></tr> </tbody> </table>		A	B	1	0	0	2	0.5	0	3	1	0	4	1.5	0	5	2	1	6	2.5	5	7	3	10	8	3.5	20	9	4	30	10	4.5	40	11	5	50	mph	mph	<p style="text-align: center;"><b>Custom Data Set</b></p>

If you provide the gear schedule using **P, R, N, D, L, OD**, the block maps the gears to integers.

Gear	Integer
P	80
R	- 1
N	0
L	1
D	2
OD	Next integer after highest specified gear.

For example, the block converts the gear schedule P P N L D 3 4 5 6 5 4 5 6 7 OD 7 to 80 80 0 1 2 3 4 5 6 5 4 5 6 7 8 7.

**Dependencies**

To enable this parameter, select **.mat, .xls, .xlsx or .txt** file from **Drive cycle source**.

**Repeat cyclically – Repeat drive cycle**

off (default) | on

Repeat the drive cycle if the simulation run time exceeds the length of the drive cycle.

### Output acceleration — Output the acceleration

off (default)

To calculate the acceleration, the block implements Savitzky-Golay differentiation using a second-order polynomial with a three-sample point filter.

#### Dependencies

To create the output acceleration port, select **Output acceleration**. Selecting **Output acceleration** enables the **Output acceleration units** parameter.

### Output gear shift data — Output the gear

off (default) | on

#### Dependencies

- Specify a drive cycle that contains a gear shift schedule. You can use:
  - A support package to install standard drive cycles that include the gear shift schedules, for example JC08 and CUEDC.
  - Workspace variables.
  - .mat, .xls, .xlsx, or .txt files.
- Clicking this parameter creates input port **Gear**.

#### WOT

### Start time, t\_wot1 — Drive cycle start time

5 (default) | scalar

Drive cycle start time, in s. For example, this plot shows a drive cycle with a start time of 10 s.

#### Dependencies

To enable this parameter, select the **Drive cycle source** parameter Wide Open Throttle (WOT).

**Initial reference speed,  $\text{xdot\_woto}$  – Speed** $0$  (default) | scalar

Initial reference speed, in units that you specify with the **Source velocity units** parameter. For example, this plot shows a drive cycle with an initial reference speed of 4 m/s.

**Dependencies**

To enable this parameter, select the **Drive cycle source** parameter Wide Open Throttle (WOT).

**Nominal reference speed,  $\text{xdot\_wot1}$  – Speed** $30$  (default) | scalar

Nominal reference speed, in units that you specify with the **Source velocity units** parameter. For example, this plot shows a drive cycle with a nominal reference speed of 30 m/s.

### Dependencies

To enable this parameter, select the **Drive cycle source** parameter Wide Open Throttle (WOT).

### Time to start deceleration, wot2 – Time

20 (default) | scalar

Time to start vehicle deceleration, in s. For example, this plot shows a drive cycle with vehicle deceleration starting at 25 s.

### Dependencies

To enable this parameter, select the **Drive cycle source** parameter Wide Open Throttle (WOT).

### Final reference speed, xdot\_wot2 – Speed

0 (default) | scalar

Final reference speed, in units that you specify with the **Source velocity units** parameter. For example, this plot shows a drive cycle with a final reference speed of 2 m/s.

### Dependencies

To enable this parameter, select the **Drive cycle source** parameter Wide Open Throttle (WOT).

### WOT simulation time, $t_{\text{wotend}}$ — Time

30 (default) | scalar

Drive cycle WOT simulation time, in s. For example, this plot shows a drive cycle with a simulation time of 50 s.

### Dependencies

To enable this parameter, select the **Drive cycle source** parameter Wide Open Throttle (WOT).

## Units and Sample Period

### Source velocity units — Specify velocity units

m/s (default)

Input velocity units.

#### Dependencies

To enable this parameter, select the **Drive cycle source** parameter Wide Open Throttle (WOT), Workspace variable, or .mat, .xls, .xlsx or .txt file.

### Output velocity units — Specify velocity units

m/s (default)

Output velocity units.

### Output acceleration units — Specify acceleration units

m/s<sup>2</sup> (default)

Specify the output acceleration units.

#### Dependencies

To enable this parameter, select **Output acceleration**.

### Output sample period (θ) for continuous — Sample rate

θ (default) | scalar

Sample rate. Set to θ for continuous sample period. For a discrete period, specify a non-zero rate.

## Fault Tracking

### Fault Settings

#### Enable fault tracking — Enable fault tracking

off (default) | on

Select this parameter to enable drive cycle fault tracking. Use the parameters to specify the fault tolerances. If the vehicle speed is not within the allowable speed range, the block sets a fault condition.

#### Dependencies

Selecting this parameter enables these parameters:

- **Speed tolerance, velBnd**
- **Speed tolerance units, velBndUnit**
- **Velocity feedback units, inUnit**
- **Time tolerance, timeBnd**

#### Speed tolerance, velBnd — Drive cycle speed tolerance

2.0 (default) | scalar

The speed tolerance above the highest point and below the lowest point of the drive cycle speed trace within the time tolerance. If the vehicle speed is not within the allowable speed range, the block sets a fault condition. For the tolerances specified by the standardized tests, use these settings:

- EPA dynamometer driving schedules — 2.0
- WLTP tests — 2.0

These figures illustrate how the block uses the velocity and time tolerances to determine the allowable speed range.

**Dependencies**

To enable this parameter, on the **Fault Tracking** tab, select **Enable fault tracking**.

**Speed tolerance units, velBndUnit — Set units**

mph (default)

Speed tolerance units. For the units specified by the standardized tests, use these units:

- EPA dynamometer driving schedules — m/s
- WLTP tests — km/h

**Dependencies**

To enable this parameter, on the **Fault Tracking** tab, select **Enable fault tracking**.

**Velocity feedback units, inUnit — Set velocity feedback units**

m/s (default)

Velocity feedback units. Set the value to the VelFdbk input port signal units.

**Dependencies**

To enable this parameter, on the **Fault Tracking** tab, select **Enable fault tracking**.

**Time tolerance, timeBnd – Time tolerance**

1.0 (default) | scalar

Time that the block uses to determine the speed tolerance. If the vehicle speed is not within the allowable speed range, the block sets a fault condition. For the time tolerances specified by the standardized tests, use these settings:

- EPA dynamometer driving schedules — 1.0
- WLTP tests — 1.0

These figures illustrate how the block uses the velocity and time tolerances to determine the allowable speed range.

**Dependencies**

To enable this parameter, on the **Fault Tracking** tab, select **Enable fault tracking**.

**Failure Settings****Enable failure tracking – Enable failure tracking**

off (default) | on

Select this parameter to enable drive cycle failure tracking.

**Dependencies**

To enable this parameter, select **Enable fault tracking**. Selecting **Enable failure tracking** parameter enables these parameters:

- **Stop simulation when trace fails, stopSim**
- **Maximum number of faults, maxFaultCnt**

- **Maximum single fault time, maxFaultTime**
- **Maximum total fault time, maxTotFaultTime**

**Maximum number of faults, maxFaultCnt — Maximum number of faults**

10 (default) | scalar

Maximum number of faults during the drive cycle. For the number specified by the standardized tests, use these settings:

- EPA dynamometer driving schedules — *Not specified*
- WLTP tests — 10

If the number of faults exceeds the maximum number of faults, the block sets a fault failure.

**Dependencies**

To enable this parameter, on the **Fault Tracking** tab, select **Enable failure tracking**.

**Maximum single fault time, maxFaultTime — Maximum duration of single fault**

2.0 (default) | scalar

Maximum duration of single fault, in s. For the time specified by the standardized tests, use these settings:

- EPA dynamometer driving schedules — 2.0
- WLTP tests — 1.0

If the fault duration exceeds the maximum single fault time, the block sets a fault failure.

**Dependencies**

To enable this parameter, on the **Fault Tracking** tab, select **Enable failure tracking**.

**Maximum total fault time, maxTotFaultTime — Maximum total fault time**

15.0 (default) | scalar

Maximum accumulated time spent under fault condition, in s.

If the accumulated time spent under fault condition exceeds the maximum total fault time, the block sets a fault failure.

**Dependencies**

To enable this parameter, on the **Fault Tracking** tab, select **Enable failure tracking**.

**Simulation Trace**

**Display simulation trace — Display velocity trace**

off (default) | on

Select this parameter to display a velocity trace window. Selecting this parameter can slow the simulation time.

**Dependencies**

Selecting this parameter enables these parameters:

- **Simulation trace update rate, dtTrace**
- **Simulation trace display window, traceWindow**

### **Simulation trace update rate, dtTrace — Trace update rate**

1 (default) | scalar

Simulation trace update rate, in s. Set to 0 for continuous sample period. For a discrete period, specify a non-zero rate.

#### **Dependencies**

To enable this parameter, on the **Fault Tracking** tab, select **Display simulation trace**.

### **Simulation trace display window, traceWindow — Trace window update rate**

10 (default) | scalar

Simulation trace window update rate, in s.

#### **Dependencies**

To enable this parameter, on the **Fault Tracking** tab, select **Display simulation trace**.

# Longitudinal Driver

Longitudinal speed-tracking controller

**Library:** Powertrain Blockset / Vehicle Scenario Builder  
Vehicle Dynamics Blockset / Vehicle Scenarios / Driver

## Description

The Longitudinal Driver block implements a longitudinal speed-tracking controller. Based on reference and feedback velocities, the block generates normalized acceleration and braking commands that can vary from 0 through 1. You can use the block to model the dynamic response of a driver or to generate the commands necessary to track a longitudinal drive cycle.

## Configurations

### External Actions

Use the **External Actions** parameters to create input ports for signals that can disable, hold, or override the closed-loop acceleration or deceleration commands. The block uses this priority order for the input commands: disable (highest), hold, override.

This table summarizes the external action parameters.

Goal	External Action Parameter	Input Ports	Data Type
Override the accelerator command with an input acceleration command.	<b>Accelerator override</b>	EnablAccelOvr	Boolean
		AccelOvrCmd	double
Hold the acceleration command at the current value.	<b>Accelerator hold</b>	AccelHld	Boolean
Disable the acceleration command.	<b>Accelerator disable</b>	AccelZero	Boolean
Override the decelerator command with an input deceleration command.	<b>Decelerator override</b>	EnablDecelOvr	Boolean
		DecelOvrCmd	double
Hold the decelerator command at current value.	<b>Decelerator hold</b>	DecelHld	Boolean
Disable the decelerator command.	<b>Decelerator disable</b>	DecelZero	Boolean

### Controller

Use the **Control type**, **cntrlType** parameter to specify one of these control options.

Setting	Block Implementation
PI	Proportional-integral (PI) control with tracking windup and feed-forward gains.
Scheduled PI	PI control with tracking windup and feed-forward gains that are a function of vehicle velocity.
Predictive	<p>Optimal single-point preview (look ahead) control model developed by C. C. MacAdam<sup>1, 2, 3</sup>. The model represents driver steering control behavior during path-following and obstacle avoidance maneuvers. Drivers preview (look ahead) to follow a predefined path. To implement the MacAdam model, the block:</p> <ul style="list-style-type: none"> <li>• Represents the dynamics as a linear single track (bicycle) vehicle</li> <li>• Minimizes the previewed error signal at a single point <math>T^*</math> seconds ahead in time</li> <li>• Accounts for the driver lag deriving from perceptual and neuromuscular mechanisms</li> </ul>

### Shift

Use the **Shift type**, **shftType** parameter to specify one of these shift options.

Setting	Block Implementation
None	<p>No transmission. Block outputs a constant gear of 1.</p> <p>Use this setting to minimize the number of parameters you need to generate acceleration and braking commands to track forward vehicle motion. This setting does not allow reverse vehicle motion.</p>
Reverse, Neutral, Drive	<p>Block uses a Stateflow<sup>®</sup> chart to model reverse, neutral, and drive gear shift scheduling.</p> <p>Use this setting to generate acceleration and braking commands to track forward and reverse vehicle motion using simple reverse, neutral, and drive gear shift scheduling. Depending on the vehicle state and vehicle velocity feedback, the block uses the initial gear and time required to shift to shift the vehicle up into drive or down into reverse or neutral.</p> <p>For neutral gears, the block uses braking commands to control the vehicle speed. For reverse gears, the block uses an acceleration command to generate torque and a brake command to reduce vehicle speed.</p>

Setting	Block Implementation
Scheduled	<p>Block uses a Stateflow chart to model reverse, neutral, park, and N-speed gear shift scheduling.</p> <p>Use this setting to generate acceleration and braking commands to track forward and reverse vehicle motion using reverse, neutral, park, and N-speed gear shift scheduling. Depending on the vehicle state and vehicle velocity feedback, the block uses these parameters to determine the:</p> <ul style="list-style-type: none"> <li>• Initial gear</li> <li>• Upshift and downshift accelerator pedal positions</li> <li>• Upshift and downshift velocity</li> <li>• Timing for shifting and engaging forward and reverse from neutral</li> </ul> <p>For neutral gears, the block uses braking commands to control the vehicle speed. For reverse gears, the block uses an acceleration command to generate torque and a brake command to reduce vehicle speed.</p>
External	<p>Block uses the input gear, vehicle state, and velocity feedback to generate acceleration and braking commands to track forward and reverse vehicle motion.</p> <p>For neutral gears, the block uses braking commands to control the vehicle speed. For reverse gears, the block uses an acceleration command to generate torque and a brake command to reduce vehicle speed.</p>

**Gear Signal**

Use the **Output gear signal** parameter to create the GearCmd output port. The GearCmd signal contains the integer value of the commanded vehicle gear.

Gear	Integer
Park	80
Reverse	-1
Neutral	0
Drive	1
Gear	Gear number

**Controller: PI Speed-Tracking**

If you set the control type to PI or Scheduled PI, the block implements proportional-integral (PI) control with tracking windup and feed-forward gains. For the Scheduled PI configuration, the block uses feed forward gains that are a function of vehicle velocity.

To calculate the speed control output, the block uses these equations.

Setting	Equation
PI	$y = \frac{K_{ff}}{v_{nom}} v_{ref} + \frac{K_p e_{ref}}{v_{nom}} + \int \left( \frac{K_i e_{ref}}{v_{nom}} + K_{aw} e_{out} \right) dt + K_g \theta$

Setting	Equation
Scheduled PI	$y = \frac{K_{ff}(v)}{v_{nom}}v_{ref} + \frac{K_p(v)e_{ref}}{v_{nom}} + \int \left( \frac{K_i(v)e_{ref}}{v_{nom}} + K_{aw}e_{out} \right) e_{ref} dt + K_g(v)\theta$

where:

$$e_{ref} = v_{ref} - v$$

$$e_{out} = y_{sat} - y$$

$$y_{sat} = \begin{cases} -1 & y < -1 \\ y & -1 \leq y \leq 1 \\ 1 & 1 < y \end{cases}$$

The velocity error low-pass filter uses this transfer function.

$$H(s) = \frac{1}{\tau_{err}s + 1} \quad \text{for } \tau_{err} > 0$$

To calculate the acceleration and braking commands, the block uses these equations.

$$y_{acc} = \begin{cases} 0 & y_{sat} < 0 \\ y_{sat} & 0 \leq y_{sat} \leq 1 \\ 1 & 1 < y_{sat} \end{cases}$$

$$y_{dec} = \begin{cases} 0 & y_{sat} > 0 \\ -y_{sat} & -1 \leq y_{sat} \leq 0 \\ 1 & y_{sat} < -1 \end{cases}$$

The equations use these variables.

$v_{nom}$	Nominal vehicle speed
$K_p$	Proportional gain
$K_i$	Integral gain
$K_{aw}$	Anti-windup gain
$K_{ff}$	Velocity feed-forward gain
$K_g$	Grade angle feed-forward gain
$\theta$	Grade angle
$\tau_{err}$	Error filter time constant
$y$	Nominal control output magnitude
$y_{sat}$	Saturated control output magnitude
$e_{ref}$	Velocity error
$e_{out}$	Difference between saturated and nominal control outputs
$y_{acc}$	Acceleration signal
$y_{dec}$	Braking signal
$v$	Velocity feedback signal

$v_{ref}$  Reference velocity signal

### Controller: Predictive Speed-Tracking

If you set the **Control type**, **cntrlType** parameter to **Predictive**, the block implements an optimal single-point preview (look ahead) control model developed by C. C. MacAdam<sup>1, 2, 3</sup>. The model represents driver steering control behavior during path-following and obstacle avoidance maneuvers. Drivers preview (look ahead) to follow a predefined path. To implement the MacAdam model, the block:

- Represents the dynamics as a linear single track (bicycle) vehicle
- Minimizes the previewed error signal at a single point  $T^*$  seconds ahead in time
- Accounts for the driver lag deriving from perceptual and neuromuscular mechanisms

### Vehicle Dynamics

For longitudinal motion, the block implements these linear dynamics.

$$x_1 = v$$

$$\dot{x}_1 = x_2 = \frac{K_{pt}}{m} - g\sin(\gamma) + F_r x_1$$

In matrix notation:

$$\dot{x} = Fx + g\bar{u}$$

where:

$$x = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix}$$

$$F = \begin{bmatrix} 0 & 1 \\ \frac{F_r}{m} & 0 \end{bmatrix}$$

$$g = \begin{bmatrix} 0 \\ \frac{K_{pt}}{m} \end{bmatrix}$$

$$\bar{u} = u - \frac{m^2}{K_{pt}} g\sin(\gamma)$$

The block uses this equation for the rolling resistance.

$$F_r = - \left[ \tanh(x_1) \left( \frac{a_r}{x_1} + c_r x_1 \right) + b_r \right]$$

The single-point model assumes a minimum previewed error signal at a single point  $T^*$  seconds ahead in time.  $a^*$  is the driver ability to predict the future vehicle response based on the current steering control input.  $b^*$  is the driver ability to predict the future vehicle response based on the current vehicle state. The block uses these equations.

$$a^* = (T^*)m^T \left[ I + \sum_{n=1}^{\infty} \frac{F^n (T^*)^n}{(n+1)!} \right] g e$$

$$b^* = m^T \left[ I + \sum_{n=1}^{\infty} \frac{F^n (T^*)^n}{n!} \right]$$

where:

$$m^T = [1 \ 1]$$

The equations use these variables.

$a, b$	Forward and rearward tire location, respectively
$m$	Vehicle mass
$I$	Vehicle rotational inertia
$a^*, b^*$	Driver prediction scalar and vector gain, respectively
$\mathbf{x}$	Predicted vehicle state vector
$v$	Longitudinal velocity
$F$	System matrix
$K_{pt}$	Tractive force and brake limit
$\gamma$	Grade angle
$\mathbf{g}$	Control coefficient vector
$g$	Gravitational constant
$T^*$	Preview time window
$f(t+T^*)$	Previewed path input $T^*$ seconds ahead
$U$	Forward vehicle velocity
$\mathbf{m}^T$	Constant observer vector; provides vehicle lateral position
$F_r$	Rolling resistance
$a_r$	Static rolling and driveline resistance
$b_r$	Linear rolling and driveline resistance
$c_r$	Aerodynamic rolling and driveline resistance

### Optimization

The single-point model implemented by the block finds the steering command that minimizes a local performance index,  $J$ , over the current preview interval,  $(t, t+T)$ .

$$J = \frac{1}{T} \int_t^{t+T} [f(\eta) - y(\eta)]^2 d\eta$$

To minimize  $J$  with respect to the steering command, this condition must be met.

$$\frac{dJ}{du} = 0$$

You can express the optimal control solution in terms of a current non-optimal and corresponding nonzero preview output error  $T^*$  seconds ahead<sup>1, 2, 3</sup>.

$$u^o(t) = u(t) + \frac{e(t + T^*)}{a^*}$$

The block uses the preview distance and vehicle longitudinal velocity to determine the preview time window.

$$T^* = \frac{L}{U}$$

The equations use these variables.

$T^*$	Preview time window
$f(t+T^*)$	Previewed path input $T^*$ sec ahead
$y(t+T^*)$	Previewed plant output $T^*$ sec ahead
$e(t+T^*)$	Previewed error signal $T^*$ sec ahead
$u(t), u^o(t)$	Steer angle and optimal steer angle, respectively
$L$	Preview distance
$J$	Performance index
$U$	Forward (longitudinal) vehicle velocity

### Driver Lag

The single-point model implemented by the block introduces a driver lag. The driver lag accounts for the delay when the driver is tracking tasks. Specifically, it is the transport delay deriving from perceptual and neuromuscular mechanisms. To calculate the driver transport delay, the block implements this equation.

$$H(s) = e^{-s\tau}$$

The equations use these variables.

$\tau$	Driver transport delay
$y(t+T^*)$	Previewed plant output $T^*$ sec ahead
$e(t+T^*)$	Previewed error signal $T^*$ sec ahead
$u(t), u^o(t)$	Steer angle and optimal steer angle, respectively
$J$	Performance index

### Ports

#### Input

##### VelRef — Reference vehicle velocity

scalar

Reference velocity,  $v_{ref}$ , in m/s.

##### EnbAccelOvr — Enable acceleration command override

scalar

Enable acceleration command override.

**Dependencies**

To enable this port, select **Acceleration override**.

Data Types: Boolean

**AccelOvrCmd — Acceleration override command**

scalar

Acceleration override command, normalized from 0 through 1.

**Dependencies**

To enable this port, select **Acceleration override**.

Data Types: double

**AccelHld — Acceleration hold**

scalar

Boolean signal that holds the acceleration command at the current value.

**Dependencies**

To enable this port, select **Acceleration hold**.

Data Types: Boolean

**AccelZero — Disable acceleration command**

scalar

Disable acceleration command.

**Dependencies**

To enable this port, select **Acceleration disable**.

Data Types: Boolean

**EnbDecelOvr — Enable deceleration command override**

scalar

Enable deceleration command override.

**Dependencies**

To enable this port, select **Deceleration override**.

Data Types: Boolean

**DecelOvrCmd — Deceleration override command**

scalar

Deceleration override command, normalized from 0 through 1.

**Dependencies**

To enable this port, select **Deceleration override**.

Data Types: double

**DecelHld — Deceleration hold**

scalar

Boolean signal that holds the deceleration command at the current value.

**Dependencies**

To enable this port, select **Deceleration hold**.

Data Types: Boolean

**DecelZero — Disable deceleration command**

scalar

Disable deceleration command.

**Dependencies**

To enable this port, select **Deceleration disable**.

Data Types: Boolean

**ExtGear — Gear**

scalar

<b>Gear</b>	<b>Integer</b>
Park	80
Reverse	-1
Neutral	0
Drive	1
Gear	Gear number

**Dependencies**

To enable this port, set **Shift type, shiftType** to External.

**VelFdbk — Longitudinal vehicle velocity**

scalar

Longitudinal vehicle velocity,  $U$ , in the vehicle-fixed frame, in m/s.

**Grade — Road grade angle**

scalar

Road grade angle,  $\theta$  or  $\gamma$ , in deg.

**Output****Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal	Variable	Description
Accel	$y_{acc}$	Commanded vehicle acceleration, normalized from 0 through 1
Decel	$y_{dec}$	Commanded vehicle deceleration, normalized from 0 through 1
Gear		Integer value of commanded gear
Clutch		Clutch command
Err	$e_{ref}$	Difference in reference vehicle speed and vehicle speed
ErrSqrSum	$\int_0^t e_{ref}^2 dt$	Integrated square of error
ErrMax	$\max(e_{ref}(t))$	Maximum error during simulation
ErrMin	$\min(e_{ref}(t))$	Minimum error during simulation
ExtActions	EnblAccelOvr	Override the accelerator command with an input acceleration command
	AccelOvrCmd	Input accelerator override command
	AccelHld	Hold the acceleration command at the current value
	AccelZero	Disable the acceleration command
	EnblDecelOvr	Override the decelerator command with an input deceleration command
	DecelOvrCmd	Input deceleration override command
	DecelHld	Hold the decelerator command at current value
	DecelZero	Disable the decelerator command

**AccelCmd – Commanded vehicle acceleration**

scalar

Commanded vehicle acceleration,  $y_{acc}$ , normalized from 0 through 1.**DecelCmd – Commanded vehicle deceleration**

scalar

Commanded vehicle deceleration,  $y_{dec}$ , normalized from 0 through 1.**GearCmd – Commanded vehicle gear**

scalar

Integer value of commanded vehicle gear.

Gear	Integer
Park	80
Reverse	-1

<b>Gear</b>	<b>Integer</b>
Neutral	0
Drive	1
Gear	Gear number

**Dependencies**

To enable this port, select **Output gear signal**.

**Parameters**

**External Actions**

**Accelerator override – Override acceleration command**

off (default) | on

Select to override the acceleration command with an input acceleration command.

**Dependencies**

Selecting this parameter creates the EnblAccelOvr and AccelOvrCmd input ports.

**Accelerator hold – Hold acceleration command**

off (default) | on

Select to hold the acceleration command.

**Dependencies**

Selecting this parameter creates the AccelHld input port.

**Accelerator disable – Disable acceleration command**

off (default) | on

Select to disable the acceleration command.

**Dependencies**

Selecting this parameter creates the AccelZero input port.

**Decelerator override – Override deceleration command**

off (default) | on

Select to override the deceleration command with an input deceleration command.

**Dependencies**

Selecting this parameter creates the EnblDecelOvr and DecelOvrCmd input ports.

**Decelerator hold – Hold deceleration command**

off (default) | on

Select to hold the deceleration command.

**Dependencies**

Selecting this parameter creates the DecelHld input port.

**Decelerator disable – Disable deceleration command**

off (default) | on

Select to disable the deceleration command.

**Dependencies**

Selecting this parameter creates the DecelZero input port.

**Configuration****Control type, cntrlType – Longitudinal control**

PI (default) | Scheduled PI | Predictive

Type of longitudinal control.

Setting	Block Implementation
PI	Proportional-integral (PI) control with tracking windup and feed-forward gains.
Scheduled PI	PI control with tracking windup and feed-forward gains that are a function of vehicle velocity.
Predictive	<p>Optimal single-point preview (look ahead) control model developed by C. C. MacAdam<sup>1, 2, 3</sup>. The model represents driver steering control behavior during path-following and obstacle avoidance maneuvers. Drivers preview (look ahead) to follow a predefined path. To implement the MacAdam model, the block:</p> <ul style="list-style-type: none"> <li>• Represents the dynamics as a linear single track (bicycle) vehicle</li> <li>• Minimizes the previewed error signal at a single point <math>T^*</math> seconds ahead in time</li> <li>• Accounts for the driver lag deriving from perceptual and neuromuscular mechanisms</li> </ul>

**Shift type, shftType – Shift type**

None (default) | Reverse, Neutral, Drive | Scheduled | External

Shift type.

Setting	Block Implementation
None	<p>No transmission. Block outputs a constant gear of 1.</p> <p>Use this setting to minimize the number of parameters you need to generate acceleration and braking commands to track forward vehicle motion. This setting does not allow reverse vehicle motion.</p>

Setting	Block Implementation
Reverse, Neutral, Drive	<p>Block uses a Stateflow chart to model reverse, neutral, and drive gear shift scheduling.</p> <p>Use this setting to generate acceleration and braking commands to track forward and reverse vehicle motion using simple reverse, neutral, and drive gear shift scheduling. Depending on the vehicle state and vehicle velocity feedback, the block uses the initial gear and time required to shift to shift the vehicle up into drive or down into reverse or neutral.</p> <p>For neutral gears, the block uses braking commands to control the vehicle speed. For reverse gears, the block uses an acceleration command to generate torque and a brake command to reduce vehicle speed.</p>
Scheduled	<p>Block uses a Stateflow chart to model reverse, neutral, park, and N-speed gear shift scheduling.</p> <p>Use this setting to generate acceleration and braking commands to track forward and reverse vehicle motion using reverse, neutral, park, and N-speed gear shift scheduling. Depending on the vehicle state and vehicle velocity feedback, the block uses these parameters to determine the:</p> <ul style="list-style-type: none"> <li>• Initial gear</li> <li>• Upshift and downshift accelerator pedal positions</li> <li>• Upshift and downshift velocity</li> <li>• Timing for shifting and engaging forward and reverse from neutral</li> </ul> <p>For neutral gears, the block uses braking commands to control the vehicle speed. For reverse gears, the block uses an acceleration command to generate torque and a brake command to reduce vehicle speed.</p>
External	<p>Block uses the input gear, vehicle state, and velocity feedback to generate acceleration and braking commands to track forward and reverse vehicle motion.</p> <p>For neutral gears, the block uses braking commands to control the vehicle speed. For reverse gears, the block uses an acceleration command to generate torque and a brake command to reduce vehicle speed.</p>

**Reference and feedback units, velUnits – Velocity units**

m/s (default)

Vehicle velocity reference and feedback units.

**Dependencies**

If you set **Control type, cntrlType** control type to Scheduled or Scheduled PI, the block uses the **Reference and feedback units, velUnits** for the **Nominal speed, vnom** parameter dimension.

If you set **Shift Type, shftType** to Scheduled, the block uses the **Longitudinal velocity units, velUnits** for these parameter dimensions:

- **Upshift velocity data table, upShftTbl**

- **Downshift velocity data table, `dwnShftTbl`**

**Output gear signal – Create GearCmd output port**

off (default) | on

Specify to create output port GearCmd.

**Control**

**Longitudinal**

**Proportional gain,  $K_p$  – Gain**

10 (default) | scalar

Proportional gain,  $K_p$ , dimensionless.

**Dependencies**

To create this parameter, set **Control type** to PI.

**Integral gain,  $K_i$  – Gain**

5 (default) | scalar

Proportional gain,  $K_i$ , dimensionless.

**Dependencies**

To create this parameter, set **Control type** to PI.

**Velocity feed-forward,  $K_{ff}$  – Gain**

.1 (default) | scalar

Velocity feed-forward gain,  $K_{ff}$ , dimensionless.

**Dependencies**

To create this parameter, set **Control type** to PI.

**Grade angle feed-forward,  $K_g$  – Gain**

0 (default) | scalar

Grade angle feed-forward gain,  $K_g$ , in 1/deg.

**Dependencies**

To create this parameter, set **Control type** to PI.

**Velocity gain breakpoints, `VehVelVec` – Breakpoints**

[0 100] (default) | vector

Velocity gain breakpoints, `VehVelVec`, dimensionless.

**Dependencies**

To create this parameter, set **Control type** to Scheduled PI.

**Velocity feed-forward gain values, `KffVec` – Gain**

[.1 .1] (default) | vector

Velocity feed-forward gain values,  $K_{ffVec}$ , as a function of vehicle velocity, dimensionless.

**Dependencies**

To create this parameter, set **Control type** to Scheduled PI.

**Proportional gain values,  $K_pVec$  – Gain**

[10 10] (default) | vector

Proportional gain values,  $K_pVec$ , as a function of vehicle velocity, dimensionless.

**Dependencies**

To create this parameter, set **Control type** to Scheduled PI.

**Integral gain values,  $K_iVec$  – Gain**

[5 5] (default) | vector

Integral gain values,  $K_iVec$ , as a function of vehicle velocity, dimensionless.

**Dependencies**

To create this parameter, set **Control type** to Scheduled PI.

**Grade angle feed-forward values,  $K_gVec$  – Grade gain**

[0 0] (default) | vector

Grade angle feed-forward values,  $K_gVec$ , as a function of vehicle velocity, in 1/deg.

**Dependencies**

To create this parameter, set **Control type** to Scheduled PI.

**Nominal speed,  $v_{nom}$  – Nominal vehicle speed**

5 (default) | scalar

Nominal vehicle speed,  $v_{nom}$ , in units specified by the **Reference and feedback units, velUnits** parameter. The block uses the nominal speed to normalize the controller gains.

**Dependencies**

To create this parameter, set **Control type** to PI or Scheduled PI.

**Anti-windup,  $K_{aw}$  – Gain**

1 (default) | scalar

Anti-windup gain,  $K_{aw}$ , dimensionless.

**Dependencies**

To create this parameter, set **Control type** to PI or Scheduled PI.

**Error filter time constant,  $\tau_{err}$  – Filter**

.01 (default) | scalar

Error filter time constant,  $\tau_{err}$ , in s. To disable the filter, enter 0.

**Dependencies**

To create this parameter, set **Control type** to PI or Scheduled PI.

**Predictive****Vehicle mass,  $m$  – Mass**

1500 (default) | scalar

Vehicle mass,  $m$ , in kg.

**Dependencies**

To create this parameter, set **Longitudinal control type, `ctrlType`** to Predictive.

**Effective vehicle total tractive force,  $K_p$  – Tractive force**

3000 (default) | scalar

Effective vehicle total tractive force,  $K_p$ , in N.

**Dependencies**

To create this parameter, set **Longitudinal control type, `ctrlType`** to Predictive.

**Driver response time,  $\tau$  – Tau**

.1 (default) | scalar

Driver response time,  $\tau$ , in s.

**Dependencies**

To create this parameter, set **Longitudinal control type, `ctrlType`** to Predictive.

**Preview distance,  $L$  – Distance**

2 (default) | scalar

Driver preview distance,  $L$ , in m.

**Dependencies**

To create this parameter, set **Longitudinal control type, `ctrlType`** to Predictive.

**Rolling resistance coefficient,  $a_R$  – Resistance**

200 (default) | scalar

Static rolling and driveline resistance coefficient,  $a_R$ , in N. Block uses the parameter to estimate the constant acceleration or braking effort.

**Dependencies**

To create this parameter, set **Longitudinal control type, `ctrlType`** to Predictive.

**Rolling and driveline resistance coefficient,  $b_R$  – Resistance**

2.5 (default) | scalar

Rolling and driveline resistance coefficient,  $b_R$ , in N·s/m. Block uses the parameter to estimate the linear velocity-dependent acceleration or braking effort.

**Dependencies**

To create this parameter, set **Longitudinal control type, `cntrlType`** to Predictive.

**Aerodynamic drag coefficient, `cR` – Drag**

.5 (default) | scalar

Aerodynamic drag coefficient,  $c_R$ , in  $N \cdot s^2/m^2$ . Block uses the parameter to estimate the quadratic velocity-dependent acceleration or braking effort.

**Dependencies**

To create this parameter, set **Longitudinal control type, `cntrlType`** to Predictive.

**Gravitational constant, `g` – Gravitational constant**

9.81 (default) | scalar

Gravitational constant,  $g$ , in  $m/s^2$ .

**Dependencies**

To create this parameter, set **Longitudinal control type, `cntrlType`** to Predictive.

**Shift****Reverse, Neutral, Drive****Initial gear, `GearInit` – Initial gear**

0 (default) | scalar

Integer value of the initial gear. The block uses the initial gear to generate acceleration and braking commands to track forward and reverse vehicle motion.

Gear	Integer
Park	80
Reverse	-1
Neutral	0
Drive	1
Gear	Gear number

**Dependencies**

To create this parameter, set **Shift type, `shftType`** to Reverse, Neutral, Drive or Scheduled. If you specify Reverse, Neutral, Drive, the **Initial Gear, `GearInit`** parameter value can be only -1, 0, or 1.

**Time required to shift, `tShift` – Time**

.1 (default) | scalar

Time required to shift,  $tShift$ , in s. The block uses the time required to shift to generate acceleration and braking commands to track forward and reverse vehicle motion using reverse, neutral, and drive gear shift scheduling.

**Dependencies**

To create this parameter, set **Shift type, shftType** to Reverse, Neutral, Drive.

**Scheduled****Initial gear, GearInit – Initial gear**

0 (default) | scalar

Integer value of the initial gear. The block uses the initial gear to generate acceleration and braking commands to track forward and reverse vehicle motion.

Gear	Integer
Park	80
Reverse	-1
Neutral	0
Drive	1
Gear	Gear number

**Dependencies**

To create this parameter, set **Shift type, shftType** to Reverse, Neutral, Drive or Scheduled. If you specify Reverse, Neutral, Drive, the **Initial Gear, GearInit** parameter value can be only -1, 0, or 1.

**Up and down shift accelerator pedal positions, pdlVec – Pedal position breakpoints**

[0.1 0.4 0.5 0.9] (default) | [1-by-m] vector

Pedal position breakpoints for lookup tables when calculating upshift and downshift velocities, dimensionless. Vector dimensions are 1 by the number of pedal position breakpoints, m.

**Dependencies**

To create this parameter, set **Shift type, shftType** to Scheduled.

**Upshift velocity data table, upShftTbl – Table**

[m-by-n] array

Upshift velocity data as a function of pedal position and gear, in units specified by the **Reference and feedback units, velUnits** parameter. Upshift velocities indicate the vehicle velocity at which the gear should increase by 1.

The array dimensions are m pedal positions by n gears. The first column of data, when n equals 1, is the upshift velocity for the neutral gear.

**Dependencies**

To create this parameter, set **Shift type, shftType** to Scheduled.

**Downshift velocity data table, dwnShftTbl – Table**

[m-by-n] array

Downshift velocity data as a function of pedal position and gear, in units specified by the **Reference and feedback units, velUnits** parameter. Downshift velocities indicate the vehicle velocity at which the gear should decrease by 1.

The array dimensions are  $m$  pedal positions by  $n$  gears. The first column of data, when  $n$  equals 1, is the downshift velocity for the neutral gear.

#### Dependencies

To create this parameter, set **Shift type, shftType** to Scheduled.

#### Time required to shift, tClutch – Time

.5 (default) | scalar

Time required to shift,  $t_{Clutch}$ , in s.

#### Dependencies

To create this parameter, set **Shift type, shftType** to Scheduled.

#### Time required to engage reverse from neutral, tRev – Time

.5 (default) | scalar

Time required to engage reverse from neutral,  $t_{Rev}$ , in s.

#### Dependencies

To create this parameter, set **Shift type, shftType** to Scheduled.

#### Time required to engage park from neutral, tPark – Time

120 (default) | scalar

Time required to engage park from neutral,  $t_{Park}$ , in s.

#### Dependencies

To create this parameter, set **Shift type, shftType** to Scheduled.

## Automated Manual Transmission

Ideal automated manual transmission

**Library:** Powertrain Blockset / Transmission / Transmission Systems

### Description

The Automated Manual Transmission block implements an ideal automated transmission (AMT). An AMT is a manual transmission with additional actuators and an electronic control unit (ECU) to regulate clutch and gear selection based on commands from a controller. The number of gears is specified via an integer vector with corresponding gear ratios, inertias, viscous damping, and efficiency factors. The clutch and synchronization engagement rates are linear and adjustable.

Use the block for:

- Power and torque capacity sizing
- Determining gear ratio impact on fuel economy and performance

To determine the rotational drive shaft speed and reaction torque, the Automated Manual Transmission block calculates:

- Clutch lock-up and clutch friction
- Locked rotational dynamics
- Unlocked rotational dynamics

To specify the block efficiency calculation, for **Efficiency factors**, select either of these options.

Setting	Block Implementation
Gear only	Efficiency determined from a 1D lookup table that is a function of the gear.
Gear, input torque, input speed, and temperature	Efficiency determined from a 4D lookup table that is a function of: <ul style="list-style-type: none"> <li>• Gear</li> <li>• Input torque</li> <li>• Input speed</li> <li>• Oil temperature</li> </ul>

### Clutch Control

The AMT delivers drive shaft torque continuously by controlling the pressure signals from the clutch. If you select **Control type** parameter *Ideal integrated controller*, the block generates idealized clutch pressure signals. To use your own clutch control signals, select **Control type** parameter *External control*.

### Clutch Lock-Up and Clutch Friction

Based on the clutch lock-up condition, the block implements one of these friction models.

If	Clutch Condition	Friction Model
$\omega_i \neq N\omega_d$ or $T_S <  T_f - Nw_i b_i $	Unlocked	$T_f = T_k$ where, $T_k = F_c R_{eff} \mu_k \tanh\left[4\left(\frac{\omega_i}{N} - \omega_d\right)\right]$ $T_s = F_c R_{eff} \mu_s$ $R_{eff} = \frac{2(R_o^3 - R_i^3)}{3(R_o^2 - R_i^2)}$
$\omega_i = N\omega_t$ and $T_S \geq  T_f - Nb_i \omega_i $	Locked	$T_f = T_s$

The equations use these variables.

$\omega_t$	Output drive shaft speed
$\omega_i$	Input drive shaft speed
$\omega_d$	Drive shaft speed
$b_i$	Viscous damping
$F_c$	Applied clutch force
$N$	Engaged gear
$T_f$	Frictional torque
$T_k$	Kinetic frictional torque
$T_s$	Static frictional torque
$R_{eff}$	Effective clutch radius
$R_o$	Annular disk outer radius
$R_i$	Annular disk inner radius
$\mu_s$	Coefficient of static friction
$\mu_k$	Coefficient of kinetic friction

### Locked Rotational Dynamics

To model the rotational dynamics when the clutch is locked, the block implements these equations.

$$\dot{\omega}_d J_N = \eta_N T_d - \frac{\omega_i}{N} b_N + N T_i$$

$$\omega_i = N \omega_d$$

The block determines the input torque,  $T_i$ , through differentiation.

The equations use these variables.

$\omega_i$	Input drive shaft speed
$\omega_d$	Drive shaft speed
$N$	Engaged gear
$b_N$	Engaged gear viscous damping
$J_N$	Engaged gear inertia
$\eta_N$	Engaged gear efficiency
$T_d$	Drive shaft torque
$T_i$	Applied input torque

### Unlocked Rotational Dynamics

To model the rotational dynamics when the clutch is unlocked, the block implements this equation.

$$\dot{\omega}_d J_N = N T_i - \omega_d b_N + T_d$$

where:

$\omega_d$	Drive shaft speed
$N$	Engaged gear
$b_N$	Engaged gear viscous damping
$J_N$	Engaged gear inertia
$T_d$	Drive shaft torque
$T_i$	Applied input torque

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Variable	Equations	
PwrInfo	PwrTrnsfrd — Power transferred between blocks	PwrEng	Engine power	$P_{eng}$	$\omega_i T_i$
		PwrDiffrntl	Differential power	$P_{diff}$	$\omega_d T_d$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred	PwrEffLoss	Mechanical power loss	$P_{effloss}$	$\omega_d T_d (\eta_N - 1)$
		PwrDampLoss	Mechanical damping loss	$P_{damploss}$	$-b_N \omega_d^2 - b_{in} \omega_i^2$
		PwrClutchLoss	Clutch power loss	$P_{mech}$	When locked: 0 When unlocked: $-T_k(\omega_i - N\omega_d)$

Bus Signal		Description	Variable	Equations
	<b>PwrStored</b> — Stored energy rate of change <ul style="list-style-type: none"> <li>• Positive signals indicate an increase</li> <li>• Negative signals indicate a decrease</li> </ul>	<b>PwrStoredTrans</b>	Rate change in rotational kinetic energy	$P_{str}$ When locked: $\dot{\omega}_i \omega_i (J_{in} + \frac{J_N}{N^2})$ When unlocked: $J_{in} \dot{\omega}_i \omega_i + J_N \dot{\omega}_d \omega_d$

The equations use these variables.

$b_N$	Engaged gear viscous damping
$J_N$	Engaged gear rotational inertia
$J_{in}$	Flywheel rotational inertia
$\eta_N$	Engaged gear efficiency
$N$	Engaged gear ratio
$T_i$	Applied input torque, typically from the engine crankshaft or dual mass flywheel damper
$T_d$	Applied load torque, typically from the differential or drive shaft
$\omega_d$	Initial input drive shaft rotational velocity
$\omega_i, \dot{\omega}_i$	Applied drive shaft angular speed and acceleration

## Ports

### Input

#### **Gear** — Gear number to engage

scalar

Integer value of gear number to engage.

#### **ClutchCmd** — Clutch command

scalar

Clutch pressure command.

### Dependencies

To create this port, select **Control type** parameter External control.

#### **EngTrq** — Applied input torque

scalar

Applied input torque,  $T_i$ , typically from the engine crankshaft or dual mass flywheel damper, in N·m.

#### **DiffTrq** — Applied load torque

scalar

Applied load torque,  $T_d$ , typically from the differential or driveshaft, in N·m.

**Temp – Oil temperature**

scalar

Oil temperature, in K. To determine the efficiency, the block uses a 4D lookup table that is a function of:

- Gear
- Input torque
- Input speed
- Oil temperature

**Dependencies**

To create this port, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

**Output**

**Info – Bus signal**

bus

Bus signal contains these block calculations.

Signal		Description	Variable	Units	
Eng	EngTrq	Input applied torque	$T_i$	N·m	
	EngSpd	Input drive shaft speed	$\omega_i$	rad/s	
Diff	DiffTrq	Output drive shaft torque	$T_t$	N·m	
	DiffSpd	Output drive shaft speed	$\omega_t$	rad/s	
Cltch	CltchForce	Applied clutch force	$F_c$	N	
	CltchLocked	Clutch lock status, Boolean:  • Locked – 0 • Unlocked – 1	N/A	N/A	
Trans	TransSpdRatio	Speed ratio at time $t$	$\phi(t)$	N/A	
	TransEta	Ratio of output power to input power	$\eta$	N/A	
	TransGearCmd	Commanded gear	$N_{cmd}$	N/A	
	TransGear	Engaged gear	$N$	N/A	
PwrInfo	PwrTrnsfrd	PwrEng	Engine power	$P_{eng}$	W
		PwrDiffrentl	Differential power	$P_{diff}$	W
	PwrNotTrnsfrd	PwrEffLoss	Mechanical power loss	$P_{effloss}$	W

Signal		Description	Variable	Units	
		PwrDampLoss	Mechanical damping loss	$P_{damploss}$	W
		PwrClutchLoss	Clutch power loss	$P_{mech}$	W
	PwrStored	PwrStoredTrans	Rate change in rotational kinetic energy	$P_{str}$	W

**EngSpd – Angular speed**

scalar

Applied drive shaft angular speed input,  $\omega_i$ , in rad/s.**DiffSpd – Angular speed**

scalar

Drive shaft angular speed output,  $\omega_d$ , in rad/s.**Parameters****Control type – Specify control type**

Ideal integrated controller (default) | External control

The AMT delivers drive shaft torque continuously by controlling the pressure signals from the clutch. If you select **Control type** parameter `Ideal integrated controller`, the block generates idealized clutch pressure signals. To use your own clutch control signals, select **Control type** parameter `External control`.

**Dependencies**

This table summarizes the port configurations.

Control Mode	Creates Ports
External control	ClutchCmd

**Efficiency factors – Specify efficiency calculation**

Gear only (default) | Gear, input torque, input speed, and temperature

To specify the block efficiency calculation, for **Efficiency factors**, select either of these options.

Setting	Block Implementation
Gear only	Efficiency determined from a 1D lookup table that is a function of the gear.
Gear, input torque, input speed, and temperature	Efficiency determined from a 4D lookup table that is a function of: <ul style="list-style-type: none"> <li>• Gear</li> <li>• Input torque</li> <li>• Input speed</li> <li>• Oil temperature</li> </ul>

**Dependencies**

Setting Parameter To	Enables
Gear only	Efficiency vector, <b>eta</b>
Gear, input torque, input speed, and temperature	Efficiency torque breakpoints, <b>Trq_bpts</b> Efficiency speed breakpoints, <b>omega_bpts</b> Efficiency temperature breakpoints, <b>Temp_bpts</b> Efficiency lookup table, <b>eta_tbl</b>

**Transmission**

**Input shaft inertia, Jin – Inertia**

.01 (default) | scalar

Input shaft inertia, in kg·m<sup>2</sup>.

**Input shaft damping, bin – Damping**

.001 (default) | scalar

Input shaft damping, in N·m·s/rad.

**Initial input velocity, omegain\_o – Angular velocity**

0 (default) | scalar

Angular velocity, in rad/s.

**Gear number vector, G – Specify number of transmission speeds**

[-1, 0, 1, 2, 3, 4, 5] (default) | vector

Vector of integer gear commands used to specify the number of transmission speeds. Neutral gear is 0. For example, you can set these parameter values.

To Specify	Set Gear number, G To
Four transmission speeds, including neutral	[0, 1, 2, 3, 4]
Three transmission speeds, including neutral and reverse	[-1, 0, 1, 2, 3]
Five transmission speeds, including neutral and reverse	[-1, 0, 1, 2, 3, 4, 5]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Transmission inertia vector**, **Transmission damping vector**, and **Efficiency vector** parameters must be equal.

**Efficiency torque breakpoints, Trq\_bpts – Breakpoints**

[25, 50, 75, 100, 150, 200, 250] (default) | vector

Torque breakpoints for efficiency table, in N·m.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

**Efficiency speed breakpoints, omega\_bpts – Breakpoints**

[52.4 78.5 105 131 157 183 209 262 314 419 524] (default) | vector

Speed breakpoints for efficiency table, rad/s.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

**Efficiency temperature breakpoints, Temp\_bpts – Breakpoints**

[313 358] (default) | vector

Temperature breakpoints for efficiency table, in K.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

**Gear ratio vector, N – Ratio of input speed to output speed**

[-4.47, 1, 4.47, 2.47, 1.47, 1, 0.8] (default) | vector

Vector of gear ratios (that is, input speed to output speed) with indices corresponding to the ratios specified in **Gear number, G**. For neutral, set the gear ratio to 1. For example, you can set these parameter values.

To Specify Gear Ratios For	Set Gear number, G To	Set Gear ratio, N To
Four transmission speeds, including neutral	[0, 1, 2, 3, 4]	[1, 4.47, 2.47, 1.47, 1]
Five transmission speeds, including neutral and reverse	[-1, 0, 1, 2, 3, 4, 5]	[-4.47, 1, 4.47, 2.47, 1.47, 1, 0.8]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Transmission inertia vector**, **Transmission damping vector**, and **Efficiency vector** parameters must be equal.

**Transmission inertia vector, Jout – Gear rotational inertia**

[0.128 0.01 0.128 0.1 0.062 0.028 0.01] (default) | vector

Vector of gear rotational inertias, with indices corresponding to the inertias specified in **Gear number, G**, in kg·m<sup>2</sup>. For example, you can set these parameter values.

To Specify Inertia For	Set Gear number, G To	Set Inertia, J To
Four gears, including neutral	[0, 1, 2, 3, 4]	[0.01, 2.28, 2.04, 0.32, 0.028]
Inertia for five gears, including reverse and neutral	[-1, 0, 1, 2, 3, 4, 5]	[2.28, 0.01, 2.28, 2.04, 0.32, 0.028, 0.01]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Transmission inertia vector**, **Transmission damping vector**, and **Efficiency vector** parameters must be equal.

**Transmission damping vector, *bout* – Gear viscous damping coefficient**

[.003 .001 .003 .0025 .002 .001 .001] (default) | vector

Vector of gear viscous damping coefficients, with indices corresponding to the coefficients specified in **Gear number, *G***, in N·m·s/rad. For example, you can set these parameter values.

To Specify Damping For	Set Gear number, <i>G</i> To	Set Damping, <i>b</i> To
Four gears, including neutral	[0, 1, 2, 3, 4]	[0.001, 0.003, 0.0025, 0.002, 0.001]
Five gears, including reverse and neutral	[-1, 0, 1, 2, 3, 4, 5]	[0.003, 0.001, 0.003, 0.0025, 0.002, 0.001, 0.001]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Transmission inertia vector**, **Transmission damping vector**, and **Efficiency vector** parameters must be equal.

**Efficiency vector, *eta* – Gear efficiency**

[0.9, 0.9, 0.9, 0.9, 0.9, 0.95, 0.95] (default) | vector

Vector of gear mechanical efficiency, with indices corresponding to the efficiencies specified in **Gear number, *G***. For example, you can set these parameter values.

To Specify Efficiency For	Set Gear number, <i>G</i> To	Set Efficiency, <i>eta</i> To
Four gears, including neutral	[0, 1, 2, 3, 4]	[0.9, 0.9, 0.9, 0.9, 0.95]
Five gears, including reverse and neutral	[-1, 0, 1, 2, 3, 4, 5]	[0.9, 0.9, 0.9, 0.9, 0.9, 0.95, 0.95]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Transmission inertia vector**, **Transmission damping vector**, and **Efficiency vector** parameters must be equal.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Gear only.

**Efficiency lookup table, *eta\_tbl* – Gear efficiency**

array

Table of gear mechanical efficiency,  $\eta_N$  as a function of gear, input torque, input speed, and temperature.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

**Initial output velocity, *omegaout\_o* – Transmission**

0 (default) | scalar

Transmission initial output rotational velocity,  $\omega_{to}$ , in rad/s. If you select **Clutch initially locked**, the block ignores the **Initial output velocity, *omega\_o*** parameter value.

**Initial gear, *G\_o* – Engaged gear**

0 (default) | scalar

Initial gear to engage,  $G_o$ .

**Clutch and Synchronizer****Clutch pressure time constant, tauc – Time**

.02 (default) | scalar

Pressure input filter time constant,  $\tau_c$ , in s.**Synchronization time, ts – Time**

.25 (default) | scalar

Time required for gear selection and synchronization,  $t_s$ , in s.**Clutch time, tc – Time**

.5 (default) | scalar

Time required to engage and disengage the clutch during shift events,  $t_c$ , in s.**Dependencies**To create this parameter, select **Control type** parameter Ideal integrated controller.**Effective clutch radius, R – Radius**

.2 (default) | scalar

The effective radius,  $R_{eff}$ , used with the applied clutch friction force to determine the friction force, in m. The effective radius is defined as:

$$R_{eff} = \frac{2(R_o^3 - R_i^3)}{3(R_o^2 - R_i^2)}$$

The equation uses these variables.

 $R_o$  Annular disk outer radius $R_i$  Annular disk inner radius**Clutch force gain, K\_c – Force**

5e3 (default) | scalar

Open loop lock-up clutch gain,  $K_c$ , in N.**Clutch static friction coefficient, mus – Coefficient**

0.6 (default) | scalar

Dimensionless clutch disc coefficient of static friction,  $\mu_s$ .**Clutch kinematic friction coefficient, muk – Coefficient**

0.4 (default) | scalar

Dimensionless clutch disc coefficient of kinetic friction,  $\mu_k$ .**Clutch initially locked – Select to initially lock clutch**

off (default) | on

Select to lock clutch initially.

### **Dependencies**

To create this parameter, select **Control type** parameter Ideal integrated controller.

### **Synchronizer initially locked – Select to initially lock synchronizer**

off (default) | on

Select to initially lock synchronizer.

# AMT Controller

Automated manual transmission controller with clutch open, close, and synchronization timing

**Library:** Powertrain Blockset / Transmission / Transmission Controllers

## Description

The AMT Controller block implements an automated manual transmission (AMT) controller. You can specify the clutch open, close, and synchronization timing parameters. The block determines the clutch commands using integrator-based timers and latching logic that is based on the specified timing parameters and gear request.

## Ports

### Inputs

#### **GearReq** — Gear number to engage

scalar

Gear number request,  $G_{req}$ .

### Output

#### **Info** — Bus signal

bus

Bus signal containing these block calculations.

Signal	Description	Variable
GearReq	Gear number request	$G_{req}$
GearEngd	Nominal gear commanded by the controller	$G_o$
Clutch	Clutch pressure command for gears, between 0 and 1	NA

#### **GearEffct** — Effective gear for shifting

scalar

Effective gear for shifting. The block uses this signal for the smooth application of inertial, efficiency, gear ratio, and damping parameters.

#### **Clutch** — Command for clutch pressure

scalar

Clutch pressure command, between 0 and 1.

## Parameters

### **Initial gear, G\_o — Engaged gear**

0 (default) | scalar

Initial gear to engage,  $G_o$ .

### **Clutch actuation time, t\_c — Time**

.1 (default) | scalar

Time required to engage and disengage the clutch during shift events,  $t_c$ , in s.

### **Synchronizer time, t\_s — Time**

.01 (default) | scalar

Time required for gear selection and synchronization,  $t_s$ , in s.

### **Sample period, dt — Time**

-1 (default) | scalar

Sample period,  $dt$ , in s.

### **Clutch initially locked — Select to initially lock clutch**

off (default) | on

Selecting this parameter initially locks the clutch.

### **Synchronizer initially locked — Select to initially lock synchronizer**

off (default) | on

Selecting this parameter initially locks the synchronizer.

# Continuously Variable Transmission

Push belt continuously variable transmission with independent radii control

**Library:** Powertrain Blockset / Transmission / Transmission Systems

## Description

The Continuously Variable Transmission block implements a push belt continuously variable transmission (CVT) with independent radii control. Use the block for control system design, powertrain matching, and fuel economy studies. You can configure the block for internal or external control:

- Internal — Input direction and pulley ratio requests
- External — Input direction and pulley displacement requests

The table summarizes the pulley kinematic, speed reduction, and dynamic calculations made by the Continuously Variable Transmission block.

Calculation	Pulley Kinematics	Reverse and Final Speed Reduction	Dynamics
Final angular speed ratio	✓	✓	✓
Belt torque applied to the secondary and primary pulleys			✓
Torque applied to the secondary and primary pulleys		✓	
Angular velocity of secondary and primary pulleys	✓	✓	✓
Belt and pulley geometry	✓		
Belt linear speed			✓
Wrap angle on secondary and primary pulley	✓		
Primary and secondary pulley radii	✓		

The figure shows the CVT variator with two configurations. In the first configuration, which illustrates speed reduction, the variator is set to decrease the primary pulley radius and increase the secondary pulley radius. In the second configuration, which illustrates overdrive, the variator is set to increase the primary pulley radius and decrease the secondary pulley radius.

### Pulley Kinematics

Using the physical dimensions of the system, the block calculates the primary and secondary variator positions that meet the pulley ratio request.

The figure and equations summarize the geometric dependencies.

$$\begin{aligned}
C_{dist} &= r_{p_{max}} + r_{gap} + r_{sec_{max}} \\
L_0 &= f(r_{p_{max}}, r_{s_{max}}, r_{p_{min}}, r_{s_{min}}, C_{dist}) \\
ratio_{command} &= f(ratio_{request}, ratio_{max}, ratio_{min}) \\
r_{pri} &= f(r_0, ratio_{command}, C_{dist}) \\
r_{sec} &= f(r_0, ratio_{command}, C_{dist}) \\
x_{pri} &= f(r_0, r_{pri}, \theta_{wedge}) \\
x_{sec} &= f(r_0, r_{sec}, \theta_{wedge})
\end{aligned}$$

The equations use these variables.

$ratio_{request}$	Pulley gear ratio request
$ratio_{command}$	Pulley gear ratio command, based on request and physical limitations
$r_{gap}$	Gap distance between variator pulleys
$C_{dist}$	Distance between variator pulley centers
$r_{p_{max}}$	Maximum variator primary pulley radius
$r_{s_{max}}$	Maximum variator secondary pulley radius
$r_{p_{min}}$	Minimum variator primary pulley radius
$r_{s_{min}}$	Minimum variator secondary pulley radius
$r_0$	Initial pulley radii with gear ratio of 1
$L_0$	Initial belt length, resulting from variator specification
$x_{pri}$	Variator primary pulley displacement, resulting from controller request
$x_{sec}$	Variator secondary pulley displacement, resulting from controller request
$r_{pri}$	Variator primary pulley radius, resulting from controller request
$r_{sec}$	Variator secondary pulley radius, resulting from controller request
$\theta_{wedge}$	Variator wedge angle
$\Phi$	Angle of belt to pulley contact point
$L$	Belt length, resulting from variator position

### Reverse and Final Speed Reduction

The CVT input shaft connects to a planetary gear set that drives the primary pulley. The shift direction determines the input gear inertia, efficiency, and gear ratio. The shift direction is the filtered commanded direction:

$$\frac{Dir_{shift}(s)}{Dir} = \frac{1}{\tau_{sS} + 1}$$

For forward motion ( $Dir_{shift} = 1$ ):

$$\begin{aligned}
N_i &= 1 \\
\eta_i &= \eta_{fwd} \\
J_i &= J_{fwd}
\end{aligned}$$

For reverse motion ( $Dir_{shift} = -1$ ):

$$N_i = -N_{rev}$$

$$\eta_i = \eta_{rev}$$

$$J_i = J_{rev}$$

The gear ratio and efficiency determine the input drive shaft speed and torque applied to the primary pulley:

$$T_{app\_pri} = \eta_i N_i T_i$$

The block reduces the secondary pulley speed and applied torque using a fixed gear ratio.

$$T_{app\_sec} = \frac{T_o}{\eta_o N_o}$$

$$\omega_o = \frac{\omega_{sec}}{N_o}$$

The final gear ratio, without slip, is given by:

$$N_{final} = \frac{\omega_i}{\omega_o} = N_i N_o \frac{r_{sec}}{r_{pri}}$$

The equations use these variables.

$N_i$	Input planetary gear ratio
$Dir$	CVT direction command
$Dir_{shift}$	Direction used to determine planetary inertia, efficiency, and ratio
$\tau_s$	Direction shift time constant
$\eta_{fwd}, \eta_{rev}$	Forward and reverse gear efficiency, respectively
$J_{fwd}, J_{rev}$	Forward and reverse gear inertia, respectively
$N_{rev}$	Reverse gear ratio
$T_{app\_pri}, T_{app\_sec}$	Torque applied to primary and secondary pulleys, respectively
$T_i$	Input drive shaft torque
$\omega_i, \omega_o$	Input and output drive shaft speed, respectively
$\omega_{pri}, \omega_{sec}$	Primary and secondary pulley speed, respectively
$N_{final}$	Total no-slip gear ratio

### Dynamics

The maximum torque that the CVT can transmit depends on the friction between the pulleys and belt. According to *Prediction of Friction Drive Limit of Metal V-Belt*, the torque friction is defined as:

$$T_{fric}(r_p, \mu) = \frac{2\mu F_{ax} r_p}{\cos(\theta_{wedge})}$$

Without macro slip, the tangential acceleration of the pulley is assumed to be equal to the belt acceleration. Once the torque reaches the static friction limit, the belt begins to slip, and the pulley and belt acceleration are independent. During slip, the torque transmitted by the belt is a function of the kinetic friction factor. During the transition from slip to non-slip conditions, the belt and tangential pulley velocities are equal.

The block implements these equations for four different slip conditions.

Condition	Equations
Belt slips on both secondary and primary pulleys	$(J_{pri} + J_i)\dot{\omega}_{pri} = T_{app\_pri} - T_{BoP\_pri} - b_{pri}\omega_{pri}$ $J_{sec}\dot{\omega}_{sec} = T_{app\_sec} - T_{BoP\_sec} - b_{sec}\omega_{sec}$ $m_b\dot{v}_b = \frac{T_{BoP\_pri}}{r_{pri}} + \frac{T_{BoP\_sec}}{r_{sec}} - b_b v_b$ $r_{pri}\omega_{pri} \neq v_b$ $r_{sec}\omega_{sec} \neq v_b$
Belt slips on only the primary pulley	$(J_{pri} + J_i)\dot{\omega}_{pri} = T_{app\_pri} - T_{BoP\_pri} - b_{pri}\omega_{pri}$ $\left(m_b + \frac{J_{sec}}{r_{sec}^2}\right)\dot{v}_b = \frac{T_{BoP\_pri}}{r_{pri}} + \frac{T_{BoP\_sec}}{r_{sec}} - \left(b_b + \frac{b_{sec}}{r_{sec}^2}\right)v_b$ $\omega_{sec} = \frac{v_b}{r_{sec}}$ $r_{pri}\omega_{pri} \neq v_b$ $T_{BoP\_pri} = \text{sgn}(r_{pri}\omega_{pri} - v_b)T_{fric}(r_{pri}, \mu_{kin})$ $ T_{BoP\_sec}  < T_{fric}(r_{sec}, \mu_{static})$
Belt slips on only the secondary pulley	$\left(m_b + \frac{J_{pri} + J_i}{r_{pri}^2}\right)\dot{v}_b = \frac{T_{app\_pri}}{r_{pri}} + \frac{T_{BoP\_sec}}{r_{sec}} - \left(b_b + \frac{b_{pri}}{r_{pri}^2}\right)v_b$ $J_{sec}\dot{\omega}_b = T_{app\_sec} + T_{BoP\_sec} - b_{sec}\omega_{sec}$ $\omega_{pri} = \frac{v_b}{r_{pri}}$ $r_{sec}\omega_{sec} \neq v_b$ $T_{BoP\_sec} = \text{sgn}(r_{sec}\omega_{sec} - v_b)T_{fric}(r_{sec}, \mu_{kin})$ $ T_{BoP\_pri}  < T_{fric}(r_{pri}, \mu_{static})$
Belt does not slip	$\left(m_b + \frac{J_{sec}}{r_{sec}^2} + \frac{J_{pri} + J_i}{r_{pri}^2}\right)\dot{v}_b = \frac{T_{app\_pri}}{r_{pri}} + \frac{T_{app\_sec}}{r_{sec}} - \left(b_b + \frac{b_{sec}}{r_{sec}^2} + \frac{b_{pri}}{r_{pri}^2}\right)v_b$ $\omega_{pri} = \frac{v_b}{r_{pri}}$ $\omega_{sec} = \frac{v_b}{r_{sec}}$ $ T_{BoP\_pri}  < T_{fric}(r_{pri}, \mu_{static})$ $ T_{BoP\_sec}  < T_{fric}(r_{sec}, \mu_{static})$

Condition	Equations
Slip direction	$PriSlipDir = \begin{cases} 0 & r_{pri}\omega_{pri} = v_b \\ 1 & r_{pri}\omega_{pri} > v_b \\ -1 & r_{pri}\omega_{pri} < v_b \end{cases}$ $SecSlipDir = \begin{cases} 0 & r_{sec}\omega_{sec} = v_b \\ 1 & r_{sec}\omega_{sec} > v_b \\ -1 & r_{sec}\omega_{sec} < v_b \end{cases}$

The equations use these variables.

$T_{BoP\_pri}, T_{BoP\_sec}$	Belt torque acting on the primary and secondary pulleys, respectively
$T_{app\_pri}, T_{app\_sec}$	Torque applied to primary and secondary pulleys, respectively
$J_{pri}, J_{sec}$	Primary and secondary pulley rotational inertias, respectively
$b_{pri}, b_{sec}$	Primary and secondary pulley rotational viscous damping, respectively
$F_{ax}$	Pulley clamp force
$\mu$	Coefficient of friction
$\mu_{kin}, \mu_{static}$	Coefficient of kinetic and static friction
$v_b, a_b$	Linear speed and acceleration of the belt, respectively
$m_b$	Total belt mass
$r_{pri}, r_{sec}$	Radii of the primary and secondary pulleys, respectively
$\Phi_{wrap}$	Wrap angle of belt to pulley contact point
$\Phi_{wrap\_pri}, \Phi_{wrap\_sec}$	Primary and secondary pulley wrap angles, respectively

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Variable	Equations	
PwrInfo	PwrTrnsfrd — Power transferred between blocks	PwrEng	Engine power	$P_{eng}$	$\omega_i T_i$
	<ul style="list-style-type: none"> <li>Positive signals indicate flow into block</li> <li>Negative signals indicate flow out of block</li> </ul>	PwrDiffrntl	Differential power	$P_{diff}$	$\omega_o T_o$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred <ul style="list-style-type: none"> <li>Positive signals indicate an input</li> <li>Negative signals indicate a loss</li> </ul>	PwrBltLoss	Belt slip power loss	$P_{btlloss}$	$(J_{in} + J_{pri})\dot{\omega}_{pri}\omega_{pri} + J_{sec}\dot{\omega}_{sec}\omega_{sec} + m_b\dot{v}_b v_b + b_{pri}\omega_{pri}^2 + b_{sec}\omega_{sec}^2 + b_b v_b^2 - T_{app\_pri}\omega_{pri} - T_{app\_sec}\omega_{sec}$

Bus Signal		Description	Variable	Equations
	PwrGearInLoss	Input planetary gear mechanical power loss	$P_{grinloss}$	$-\left \omega_i T_i - T_{app\_pri} \omega_{pri}\right $
	PwrGearOutLoss	Output gear reduction mechanical power loss	$P_{groutloss}$	$-\left \omega_o T_o - T_{app\_sec} \omega_{sec}\right $
	PwrDampLoss	Mechanical damping loss	$P_{damploss}$	$-b_{pri} \omega_{pri}^2 - b_{sec} \omega_{sec}^2 - b_b v_b^2$
	PwrStored — Stored energy rate of change <ul style="list-style-type: none"> <li>Positive signals indicate an increase</li> <li>Negative signals indicate a decrease</li> </ul>	PwrStoredTrans	$P_{str}$	$(J_{in} + J_{pri}) \dot{\omega}_{pri} \omega_{pri} + J_{sec} \dot{\omega}_{sec} \omega_{sec} + m_b \dot{v}_b v_b$

The equations use these variables.

$T_{app\_pri}, T_{app\_sec}$	Torque applied to primary and secondary pulleys, respectively
$T_i, T_o$	Input and output drive shaft torque, respectively
$J_{pri}, J_{sec}$	Primary and secondary pulley rotational inertias, respectively
$b_{pri}, b_{sec}$	Primary and secondary pulley rotational viscous damping, respectively
$\omega_{pri}, \omega_{sec}$	Primary and secondary pulley speed, respectively
$\omega_i, \omega_o$	Input and output drive shaft speed, respectively
$v_b, a_b$	Linear speed and acceleration of the belt, respectively
$r_{pri}, r_{sec}$	Radii of the primary and secondary pulleys, respectively

## Ports

### Inputs

#### Dir — Direction request

scalar

Direction request,  $Dir_{req}$ , controlling the direction. The block filters the request to determine the direction, forward or reverse.  $Dir$  equals 1 for forward motion.  $Dir$  equals -1 for reverse.

$$Dir = \begin{cases} 1 & \text{when } Dir_{req} \geq 0 \\ -1 & \text{when } Dir_{req} < 0 \end{cases}$$

#### PLlyRatioReq — Pulley ratio request

scalar

CVT pulley ratio request,  $ratio_{request}$ .

**Dependencies**

To create this port, for the **Control mode** parameter, select `Ideal` integrated controller.

**PriDisp – Primary pulley displacement**

scalar

Variator primary pulley displacement,  $x_{pri}$ , in m.

**Dependencies**

To create this port, for the **Control mode** parameter, select `External` control.

**SecDisp – Secondary pulley displacement**

scalar

Variator secondary pulley displacement,  $x_{sec}$ , in m.

**Dependencies**

To create this port, for the **Control mode** parameter, select `External` control.

**EngTrq – Input drive shaft torque**

scalar

External torque applied to the input drive shaft,  $T_i$ , in N·m.

**DiffTrq – Output drive shaft torque**

scalar

External torque applied to the output drive shaft,  $T_o$ , in N·m.

**Output**

**Info – Bus signal**

bus

Bus signal containing these block calculations.

Signal	Description	Variable	Units
EngTrq	Input shaft torque	$T_i$	N·m
DiffTrq	Output shaft torque	$T_o$	N·m
EngSpd	Input shaft speed	$\omega_i$	rad/s
DiffSpd	Output shaft speed	$\omega_o$	rad/s
PriRadius	Primary pulley radius	$r_{pri}$	m
PriPhi	Primary pulley wrap angle	$\Phi_{pri}$	rad
SecRadius	Secondary pulley radius	$r_{sec}$	m
SecPhi	Secondary pulley wrap angle	$\Phi_{sec}$	rad
BltLngthDelta	Change in belt length	$\Delta L$	m
BltLngth	Belt length	$L$	m
BltLngthInit	Initial belt length	$L_o$	m

Signal		Description	Variable	Units	
BltOnPriTrq		Belt torque acting on the primary pulley	$T_{BoP\_pri}$	N·m	
BltOnSecTrq		Belt torque acting on the secondary pulley	$T_{BoP\_sec}$	N·m	
BltVel		Linear speed of the belt	$v_b$	m/s	
PriAngVel		Primary pulley speed	$\omega_{pri}$	rad/s	
SecAngVel		Secondary pulley speed	$\omega_{sec}$	rad/s	
PriSlipDir		Primary pulley slip direction indicator	$PriSlipDir$	N/A	
SecSlipDir		Secondary pulley slip direction indicator	$SecSlipDir$	N/A	
TransSpdRatio		Total no-slip gear ratio	$N_{final}$	N/A	
PwrInfo	PwrTrnsfrd	PwrEng	Engine power	$P_{eng}$	W

**EngSpd – Input drive shaft speed**

scalar

Input drive shaft angular speed,  $\omega_i$ , in rad/sec.**DiffSpd – Output drive shaft speed**

scalar

Output drive shaft angular speed,  $\omega_o$ , in rad/sec.**Parameters****Control mode – External or internal**

Ideal integrated controller (default) | External control

Specify the control method, either internal or external.

**Dependencies**

This table summarizes the port and input model configurations.

Control Mode	Creates Ports
Ideal integrated controller	PullyRatioReq
External control	PriDisp SecDisp

**Kinematics**

**Maximum variator primary pulley radius,  $rp\_max$  – Radius**

.08 (default) | scalar

Maximum variator primary pulley radius,  $rp_{max}$ , in m.

**Maximum variator secondary pulley radius,  $rs\_max$  – Radius**

.07 (default) | scalar

Maximum variator secondary pulley radius,  $rs_{max}$ , in m.

**Minimum variator primary pulley radius,  $rp\_min$  – Radius**

.03 (default) | scalar

Minimum variator primary pulley radius,  $rp_{min}$ , in m.

**Minimum variator secondary pulley radius,  $rs\_min$  – Radius**

.03 (default) | scalar

Minimum variator secondary pulley radius,  $rs_{min}$ , in m.

**Gap distance between variator pulleys,  $rgap$  – Specify crown wheel connection**

.025 (default) | scalar

The gap between the secondary and primary pulleys,  $r_{gap}$ , in m. The figure shows the pulley geometry.

**Variator wedge angle,  $thetawedge$  – Specify crown wheel connection**

11 (default) | scalar

Variator wedge angle,  $\theta_{wedge}$ , in deg.

### Dynamics

#### Primary pulley inertia, $J_{pri}$ – Inertia

0.1 (default) | scalar

Primary pulley inertia,  $J_{pri}$ , in  $\text{kg}\cdot\text{m}^2$ .

#### Secondary pulley inertia, $J_{sec}$ – Inertia

0.1 (default) | scalar

Secondary pulley inertia,  $J_{sec}$ , in  $\text{kg}\cdot\text{m}^2$ .

#### Primary pulley damping coefficient, $b_{pri}$ – Damping

0.001 (default) | scalar

Primary pulley damping coefficient,  $b_{pri}$ , in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

#### Secondary pulley damping coefficient, $b_{sec}$ – Damping

0.001 (default) | scalar

Secondary pulley damping coefficient,  $b_{sec}$ , in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

#### Belt damping coefficient, $b_b$ – Damping

0.0025 (default) | scalar

Belt damping coefficient,  $b_b$ , in  $\text{kg}/\text{s}$ .

#### Static friction coefficient, $\mu_{static}$ – Friction

0.3 (default) | scalar

Static friction coefficient between the belt and primary pulley,  $\mu_{static}$ , dimensionless.

#### Kinetic friction coefficient, $\mu_{kin}$ – Friction

0.2 (default) | scalar

Kinetic friction coefficient between the belt and primary pulley,  $\mu_{kin}$ , dimensionless.

**Belt mass, m\_b – Mass**

3 (default) | scalar

Belt mass,  $m_b$ , in kg.**Pulley clamp force, F\_ax – Pulley clamp force**

5000 (default) | scalar

Pulley clamp force,  $F_{ax}$ , in N.**Reverse and Output Ratio****Forward inertia, J\_fwd – Inertia**

0.1 (default) | scalar

Forward inertia,  $J_{fwd}$ , in  $\text{kg}\cdot\text{m}^2$ .**Reverse inertia, J\_rev – Inertia**

0.1 (default) | scalar

Reverse inertia,  $J_{rev}$ , in  $\text{kg}\cdot\text{m}^2$ .**Forward efficiency, eta\_fwd – Efficiency**

0.95 (default) | scalar

Forward efficiency,  $\eta_{fwd}$ , dimensionless.**Reverse efficiency, eta\_rev – Efficiency**

0.95 (default) | scalar

Reverse efficiency,  $\eta_{rev}$ , dimensionless.**Reverse gear ratio, N\_rev – Ratio**

2 (default) | scalar

Reverse gear ratio,  $N_{rev}$ , dimensionless.**Shift time constant, tau\_s – Constant**

.01 (default) | scalar

Shift time constant,  $\tau_s$ , in s.**Output gear ratio, N\_o – Ratio**

2 (default) | scalar

Output gear ratio,  $N_o$ , dimensionless.**Output gear efficiency, eta\_o – Efficiency**

0.98 (default) | scalar

Output gear efficiency,  $\eta_o$ , dimensionless.**References**

### Description

The CVT Controller block implements a push belt continuously variable transmission (CVT) controller. The block uses standard pulley and geometric equations to calculate the kinematic setpoints for the CVT variator. You can use the block to control a CVT.

### Pulley Kinematics

Using the physical dimensions of the system, the block calculates the primary and secondary variator positions that meet the pulley ratio request.

The figure and equations summarize the geometric dependencies.

$$\begin{aligned}
C_{dist} &= rp_{max} + r_{gap} + r_{sec\_max} \\
L_0 &= f(rp_{max}, rs_{max}, rp_{min}, rs_{min}, C_{dist}) \\
ratio_{command} &= f(ratio_{request}, ratio_{max}, ratio_{min}) \\
r_{pri} &= f(r_0, ratio_{command}, C_{dist}) \\
r_{sec} &= f(r_0, ratio_{command}, C_{dist}) \\
x_{pri} &= f(r_0, r_{pri}, \theta_{wedge}) \\
x_{sec} &= f(r_0, r_{sec}, \theta_{wedge})
\end{aligned}$$

The equations use these variables.

$ratio_{request}$	Pulley gear ratio request
$ratio_{command}$	Pulley gear ratio command, based on request and physical limitations
$r_{gap}$	Gap distance between variator pulleys
$C_{dist}$	Distance between variator pulley centers
$rp_{max}$	Maximum variator primary pulley radius
$rs_{max}$	Maximum variator secondary pulley radius
$rp_{min}$	Minimum variator primary pulley radius
$rs_{min}$	Minimum variator secondary pulley radius
$r_0$	Initial pulley radii with gear ratio of 1
$L_0$	Initial belt length, resulting from variator specification
$x_{pri}$	Variator primary pulley displacement, resulting from controller request
$x_{sec}$	Variator secondary pulley displacement, resulting from controller request
$r_{pri}$	Variator primary pulley radius, resulting from controller request
$r_{sec}$	Variator secondary pulley radius, resulting from controller request
$\Theta_{wedge}$	Variator wedge angle
$\Phi$	Angle of belt to pulley contact point
$L$	Belt length, resulting from variator position

## Ports

### Inputs

#### DirReq – Direction request

scalar

Direction request,  $Dir_{req}$ , controlling the direction, either forward or reverse.  $Dir$  equals 1 for forward motion.  $Dir$  equals -1 for reverse.

$$Dir = \begin{cases} 1 & \text{when } Dir_{req} \geq 0 \\ -1 & \text{when } Dir_{req} < 0 \end{cases}$$

#### PLlyRatioReq – Pulley ratio request

scalar

CVT pulley ratio request,  $ratio_{request}$ .

**Output**

**Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal		Description	Variable	Units
Radius	PriRadius	Variator primary pulley radius, resulting from controller request	$r_{pri}$	m
	SecRadius	Variator secondary pulley radius, resulting from controller request	$r_{sec}$	m
	InitPllyRadius	Initial pulley radii with gear ratio of 1	$r_o$	m
RatioAdj		Pulley gear ratio command, based on request and physical limitations	$ratio_{command}$	N/A
RatioMax		Maximum pulley ratio	$ratio_{max}$	N/A
RatioMin		Minimum pulley ratio	$ratio_{min}$	N/A
PriDispCmd		Variator primary pulley displacement, resulting from controller request	$x_{pri}$	m
SecDispCmd		Variator secondary pulley displacement, resulting from controller request	$x_{sec}$	m

**Dir — Direction request**

scalar

Direction request,  $Dir_{req}$ , controlling the direction, either forward or reverse.  $Dir$  equals 1 for forward motion.  $Dir$  equals -1 for reverse.

$$Dir = \begin{cases} 1 & \text{when } Dir_{req} \geq 0 \\ -1 & \text{when } Dir_{req} < 0 \end{cases}$$

**PriDispCmd — Primary pulley displacement**

scalar

Variator primary pulley displacement,  $x_{pri}$ , in m.

**SecDispCmd — Secondary pulley displacement**

scalar

Variator secondary pulley displacement,  $x_{sec}$ , in m.

## Parameters

### Kinematics

#### Maximum variator primary pulley radius, $rp\_max$ – Radius

.08 (default) | scalar

Maximum variator primary pulley radius,  $rp_{max}$ , in m.

#### Maximum variator secondary pulley radius, $rs\_max$ – Radius

.07 (default) | scalar

Maximum variator secondary pulley radius,  $rs_{max}$ , in m.

#### Minimum variator primary pulley radius, $rp\_min$ – Radius

.03 (default) | scalar

Minimum variator primary pulley radius,  $rp_{min}$ , in m.

#### Minimum variator secondary pulley radius, $rs\_min$ – Radius

.03 (default) | scalar

Minimum variator secondary pulley radius,  $rs_{min}$ , in m.

#### Gap distance between variator pulleys, $rgap$ – Specify crown wheel connection

.025 (default) | scalar

The gap between the secondary and primary pulleys,  $r_{gap}$ , in m. The figure shows the pulley geometry.

#### Variator wedge angle, $\theta_{wedge}$ – Specify crown wheel connection

11 (default) | scalar

Variator wedge angle,  $\theta_{wedge}$ , in deg.

# Dual Clutch Transmission

Dual clutch transmission that applies torque to the drive shaft

**Library:** Powertrain Blockset / Transmission / Transmission Systems

## Description

The Dual Clutch Transmission block implements a dual clutch transmission (DCT). In a DCT, two clutches apply mechanical torque to the drive shaft. Odd gears engage one clutch, while even gears engage the secondary clutch. The number of gears is specified via an integer vector with corresponding gear ratios, inertias, viscous damping, and efficiency factors. The clutch and synchronization engagement rates are linear and adjustable. You can provide external clutch signals or configure the block to generate idealized internal clutch signals. The block implements the transmission model with minimal parameterization or computational cost.

Use the block to model a simplified automated manual transmission (AMT) for:

- Power and torque capacity sizing
- Determining gear ratio impact on fuel economy and performance

To determine the rotational drive shaft speed and reaction torque, the Dual Clutch Transmission block calculates:

- Clutch lock-up and clutch friction
- Locked rotational dynamics
- Unlocked rotational dynamics

To specify the block efficiency calculation, for **Efficiency factors**, select either of these options.

Setting	Block Implementation
Gear only	Efficiency determined from a 1D lookup table that is a function of the gear.
Gear, input torque, input speed, and temperature	Efficiency determined from a 4D lookup table that is a function of: <ul style="list-style-type: none"> <li>• Gear</li> <li>• Input torque</li> <li>• Input speed</li> <li>• Oil temperature</li> </ul>

## Clutch Control

The DCT delivers drive shaft torque continuously by controlling the pressure signals from both clutches. If you select **Control mode** parameter `Ideal integrated controller`, the block generates idealized clutch pressure signals. The block uses the maximum pressure from each clutch

to approximate the single-clutch commands that result in equivalent drive shaft torque. To use your own clutch control signals, select **Control mode** parameter External control.

**Clutch Lock-Up and Clutch Friction**

Based on the clutch lock-up condition, the block implements one of these friction models.

If	Clutch Condition	Friction Model
$\omega_i \neq N\omega_d$ or $T_S <  T_f - Nw_i b_i $	Unlocked	$T_f = T_k$ where, $T_k = F_c R_{eff} \mu_k \tanh\left[4\left(\frac{w_i}{N} - w_d\right)\right]$ $T_s = F_c R_{eff} \mu_s$ $R_{eff} = \frac{2(R_o^3 - R_i^3)}{3(R_o^2 - R_i^2)}$
$\omega_i = N\omega_t$ and $T_S \geq  T_f - Nb_i \omega_i $	Locked	$T_f = T_s$

The equations use these variables.

- $\omega_t$  Output drive shaft speed
- $\omega_i$  Input drive shaft speed
- $\omega_d$  Drive shaft speed
- $b_i$  Viscous damping
- $F_c$  Applied clutch force
- $N$  Engaged gear
- $T_f$  Frictional torque
- $T_k$  Kinetic frictional torque
- $T_s$  Static frictional torque
- $R_{eff}$  Effective clutch radius
- $R_o$  Annular disk outer radius
- $R_i$  Annular disk inner radius
- $\mu_s$  Coefficient of static friction
- $\mu_k$  Coefficient of kinetic friction

**Locked Rotational Dynamics**

To model the rotational dynamics when the clutch is locked, the block implements these equations.

$$\dot{\omega}_d J_N = \eta_N T_d - \frac{\omega_i}{N} b_N + N T_i$$

$$\omega_i = N \omega_d$$

The block determines the input torque,  $T_i$ , through differentiation.

The equations use these variables.

$\omega_i$	Input drive shaft speed
$\omega_d$	Drive shaft speed
$N$	Engaged gear
$b_N$	Engaged gear viscous damping
$J_N$	Engaged gear inertia
$\eta_N$	Engaged gear efficiency
$T_d$	Drive shaft torque
$T_i$	Applied input torque

### Unlocked Rotational Dynamics

To model the rotational dynamics when the clutch is unlocked, the block implements this equation.

$$\dot{\omega}_d J_N = N T_i - \omega_d b_N + T_d$$

where:

$\omega_d$	Drive shaft speed
$N$	Engaged gear
$b_N$	Engaged gear viscous damping
$J_N$	Engaged gear inertia
$T_d$	Drive shaft torque
$T_i$	Applied input torque

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal		Description	Variable	Equations	
PwrIn fo	PwrTrnsfrd — Power transferred between blocks <ul style="list-style-type: none"> <li>Positive signals indicate flow into block</li> <li>Negative signals indicate flow out of block</li> </ul>	PwrEng	Engine power	$P_{eng}$	$\omega_i T_i$
		PwrDif frntl	Differential power	$P_{diff}$	$\omega_d T_d$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred <ul style="list-style-type: none"> <li>Positive signals indicate an input</li> </ul>	PwrEff Loss	Mechanical power loss	$P_{effloss}$	$\omega_d T_d (\eta_N - 1)$
		PwrDam pLoss	Mechanical damping loss	$P_{damploss}$	$-b_N \omega_d^2 - b_{in} \omega_i^2$

Bus Signal		Description	Variable	Equations	
	<ul style="list-style-type: none"> <li>Negative signals indicate a loss</li> </ul>	PwrClutchLoss	Clutch power loss	$P_{mech}$	When locked: 0  When unlocked: $-T_k(\omega_i - N\omega_d)$
	PwrStored — Stored energy rate of change  <ul style="list-style-type: none"> <li>Positive signals indicate an increase</li> <li>Negative signals indicate a decrease</li> </ul>	PwrStoredTrans	Rate change in rotational kinetic energy	$P_{str}$	When locked: $\dot{\omega}_i\omega_i(J_{in} + \frac{J_N}{N^2})$  When unlocked: $J_{in}\dot{\omega}_i\omega_i + J_N\dot{\omega}_d\omega_d$

The equations use these variables.

$b_N$	Engaged gear viscous damping
$J_N$	Engaged gear rotational inertia
$J_{in}$	Flywheel rotational inertia
$\eta_N$	Engaged gear efficiency
$N$	Engaged gear ratio
$T_i$	Applied input torque, typically from the engine crankshaft or dual mass flywheel damper
$T_d$	Applied load torque, typically from the differential or drive shaft
$\omega_d$	Initial input drive shaft rotational velocity
$\omega_i, \dot{\omega}_i$	Applied drive shaft angular speed and acceleration

## Ports

### Inputs

#### Gear — Gear number to engage

scalar

Integer value of gear number to engage.

#### ClutchACmd — Command for odd-numbered gears

scalar

Clutch pressure command for odd-numbered gears, between 0 and 1.

#### Dependencies

To create this port, select **Control mode** parameter External control.

#### ClutchBCmd — Command for even-numbered gears

scalar

Clutch pressure command for even-numbered gears, between 0 and 1.

**Dependencies**

To create this port, select **Control mode** parameter External control.

**EngTrq – Applied torque**

scalar

Applied input torque,  $T_i$ , typically from the engine crankshaft or dual mass flywheel damper, in N·m.

**DiffTrq – Applied torque**

scalar

Applied load torque,  $T_d$ , typically from the drive shaft, in N·m.

**Temp – Oil temperature**

scalar

Oil temperature, in K. To determine the efficiency, the block uses a 4D lookup table that is a function of:

- Gear
- Input torque
- Input speed
- Oil temperature

**Dependencies**

To create this port, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

**Output****Info – Bus signal**

bus

Bus signal containing these block calculations.

Signal	Description	Variable	Units
Eng	EngTrq	Applied input torque, typically from the engine crankshaft or dual mass flywheel damper	$T_i$ N·m
	EngSpd	Applied drive shaft angular speed input	$\omega_i$ rad/s
Diff	DiffTrq	Applied load torque, typically from the differential	$T_d$ N·m
	DiffSpd	Drive shaft angular speed output	$\omega_d$ rad/s
Cltch	CltchForce	Applied clutch force	$F_c$ N
	CltchLocked	Clutch state	NA NA

Signal		Description	Variable	Units	
Trans	TransSpd Ratio	Input to output speed ratio at time t	$\Phi(t)$	NA	
	TransEta	Ratio of output power to input power	$\eta_N$	NA	
	TransGearCmd	Commanded gear	$N_{cmd}$	NA	
	TransGear	Engaged gear	$N$	NA	
PwrInfo	PwrTrnsfrd	PwrEng	Engine power	$P_{eng}$	W
		PwrDiffrentl	Differential power	$P_{diff}$	W
	PwrNotTrnsfrd	PwrEffLoss	Mechanical power loss	$P_{effloss}$	W
		PwrDampLoss	Mechanical damping loss	$P_{damploss}$	W
		PwrClutchLoss	Clutch power loss	$P_{mech}$	W
	PwrStored	PwrStoredTrans	Rate change in rotational kinetic energy	$P_{str}$	W

**EngSpd – Angular speed**  
scalar

Drive shaft angular speed,  $\omega_d$ , in rad/s.

**DiffSpd – Angular speed**  
scalar

Drive shaft angular speed,  $\omega_d$ , in rad/s.

**Parameters**

**Control mode – Specify control mode**

External control (default) | Ideal integrated controller

The DCT delivers drive shaft torque continuously by controlling the pressure signals from both clutches. If you select **Control mode** parameter **Ideal integrated controller**, the block generates idealized clutch pressure signals. The block uses the maximum pressure from each clutch to approximate the single-clutch commands that result in equivalent drive shaft torque. To use your own clutch control signals, select **Control mode** parameter **External control**.

**Dependencies**

This table summarizes the port configurations.

Control Mode	Creates Ports
External control	ClutchACmd
	ClutchBCmd

### Efficiency factors – Specify efficiency calculation

Gear only (default) | Gear, input torque, input speed, and temperature

To specify the block efficiency calculation, for **Efficiency factors**, select either of these options.

Setting	Block Implementation
Gear only	Efficiency determined from a 1D lookup table that is a function of the gear.
Gear, input torque, input speed, and temperature	Efficiency determined from a 4D lookup table that is a function of: <ul style="list-style-type: none"> <li>• Gear</li> <li>• Input torque</li> <li>• Input speed</li> <li>• Oil temperature</li> </ul>

### Dependencies

Setting Parameter To	Enables
Gear only	<b>Efficiency vector, eta</b>
Gear, input torque, input speed, and temperature	<b>Efficiency torque breakpoints, Trq_bpts</b> <b>Efficiency speed breakpoints, omega_bpts</b> <b>Efficiency temperature breakpoints, Temp_bpts</b> <b>Efficiency lookup table, eta_tbl</b>

### Transmission

#### Input shaft inertia, Jin – Inertia

0.1 (default) | scalar

Input shaft inertia, in kg·m<sup>2</sup>.

#### Input shaft damping, bin – Damping

0.001 (default) | scalar

Input shaft damping, in N·m·s/rad.

#### Initial input velocity, omegain\_o – Angular velocity

0 (default) | scalar

Angular velocity, in rad/s.

#### Efficiency torque breakpoints, Trq\_bpts – Breakpoints

[25 50 75 100 150 200 250] (default) | vector

Torque breakpoints for efficiency table, in N·m.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

**Efficiency speed breakpoints, omega\_bpts — Breakpoints**

[52.4 78.5 105 131 157 183 209 262 314 419 524] (default) | vector

Speed breakpoints for efficiency table, in rad/s.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

**Efficiency temperature breakpoints, Temp\_bpts — Breakpoints**

[313 358] (default) | vector

Temperature breakpoints for efficiency table, in K.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

**Gear number vector, G — Specify number of transmission speeds**

[-1, 0, 1, 2, 3, 4, 5, 6, 7, 8] (default) | vector

Vector of integers used to specify the number of transmission speeds. Neutral gear is 0. For example, you can set these parameter values.

To Specify	Set Gear number, G to
Four transmission speeds, including neutral	[0, 1, 2, 3, 4]
Three transmission speeds, including neutral and reverse	[-1, 0, 1, 2, 3]
Five transmission speeds, including neutral and reverse	[-1, 0, 1, 2, 3, 4, 5]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Transmission inertia vector**, **Damping vector**, and **Efficiency vector** parameters must be equal.

**Gear ratio vector, N — Ratio of input speed to output speed**

[-4.70, 4.70, 4.700, 3.130, 2.100, 1.670, 1.290, 1.000, 0.840, 0.670] (default) | vector

Vector of gear ratios (that is, input speed to output speed) with indices corresponding to the ratios specified in **Gear number, G**. For neutral, set the gear ratio to 1. For example, you can set these parameter values.

To Specify Gear Ratios for	Set Gear number, G to	Set Gear ratio, N to
Four transmission speeds, including neutral	[0, 1, 2, 3, 4]	[1, 4.47, 2.47, 1.47, 1]

To Specify Gear Ratios for	Set Gear number, G to	Set Gear ratio, N to
Five transmission speeds, including neutral and reverse	[-1, 0, 1, 2, 3, 4, 5]	[-4.47, 1, 4.47, 2.47, 1.47, 1, 0.8]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Transmission inertia vector**, **Damping vector**, and **Efficiency vector** parameters must be equal.

#### Transmission inertia vector, Jout – Gear rotational inertia

[0.08 0.08 0.08 0.04 0.02 0.01 0.01 0.01 0.01 0.01] (default) | vector

Vector of gear rotational inertias, with indices corresponding to the inertias specified in **Gear number, G**, in  $\text{kg}\cdot\text{m}^2$ . For example, you can set these parameter values.

To Specify Inertia for	Set Gear number, G to	Set Inertia, J to
Four gears, including neutral	[0, 1, 2, 3, 4]	[0.01, 2.28, 2.04, 0.32, 0.028]
Inertia for five gears, including reverse and neutral	[-1, 0, 1, 2, 3, 4, 5]	[2.28, 0.01, 2.28, 2.04, 0.32, 0.028, 0.01]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Transmission inertia vector**, **Damping vector**, and **Efficiency vector** parameters must be equal.

#### Damping vector, bout – Gear viscous damping coefficient

[.003 .001 .003 .0025 .002 .001 .001 .001 .001 .001] (default) | vector

Vector of gear viscous damping coefficients, with indices corresponding to the coefficients specified in **Gear number, G**, in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ . For example, you can set these parameter values.

To Specify Damping for	Set Gear number, G to	Set Damping, b to
Four gears, including neutral	[0, 1, 2, 3, 4]	[0.001, 0.003, 0.0025, 0.002, 0.001]
Five gears, including reverse and neutral	[-1, 0, 1, 2, 3, 4, 5]	[0.003, 0.001, 0.003, 0.0025, 0.002, 0.001, 0.001]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Transmission inertia vector**, **Damping vector**, and **Efficiency vector** parameters must be equal.

#### Efficiency vector, eta – Gear efficiency

[0.930, 0.930, 0.930, 0.940, 0.947, 0.948, 0.946, 0.943, 0.940, 0.935] (default) | vector

Vector of gear mechanical efficiency, with indices corresponding to the efficiencies specified in **Gear number, G**. For example, you can set these parameter values.

To Specify Efficiency for	Set Gear number, G to	Set Efficiency, eta to
Four gears, including neutral	[0, 1, 2, 3, 4]	[0.9, 0.9, 0.9, 0.9, 0.95]
Five gears, including reverse and neutral	[-1, 0, 1, 2, 3, 4, 5]	[0.9, 0.9, 0.9, 0.9, 0.9, 0.95, 0.95]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Transmission inertia vector**, **Damping vector**, and **Efficiency vector** parameters must be equal.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Gear only.

**Efficiency lookup table, eta\_tbl – Gear efficiency**

array

Table of gear mechanical efficiency,  $\eta_N$  as a function of gear, input torque, input speed, and temperature.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

**Initial output velocity, omegaout\_o – Transmission**

0 (default) | scalar

Transmission initial output rotational velocity,  $\omega_{to}$ , in rad/s. If you select **Clutch initially locked**, the block ignores the **Initial output velocity, omega\_o** parameter value.

**Initial gear, G\_o – Engaged gear**

0 (default) | scalar

Initial gear to engage,  $G_o$ .

**Clutch and Synchronizer****Clutch pressure time constant, tauc – Time**

.02 (default) | scalar

Time required to engage and disengage the clutch during shift events,  $t_c$ , in s.

**Synchronization time, ts – Time**

.2 (default) | scalar

Time required for gear selection and synchronization,  $t_s$ , in s.

**Clutch time, tc – Time**

.5 (default) | scalar

Time required to engage clutch,  $t_c$ , in s.

**Dependencies**

To create this parameter, select **Control mode** parameter Ideal integrated controller.

**Effective clutch radius, R – Radius**

.25 (default) | scalar

The effective radius,  $R_{eff}$ , used with the applied clutch friction force to determine the friction force, in m. The effective radius is defined as:

$$R_{eff} = \frac{2(R_o^3 - R_i^3)}{3(R_o^2 - R_i^2)}$$

The equation uses these variables.

$R_o$  Annular disk outer radius

$R_i$  Annular disk inner radius

**Clutch force gain,  $K_c$  – Force**

5e4 (default) | scalar

Open loop lock-up clutch gain,  $K_c$ , in N.

**Clutch static friction coefficient,  $\mu_s$  – Coefficient**

0.3 (default) | scalar

Dimensionless clutch disc coefficient of static friction,  $\mu_s$ .

**Clutch kinematic friction coefficient,  $\mu_k$  – Coefficient**

0.25 (default) | scalar

Dimensionless clutch disc coefficient of kinetic friction,  $\mu_k$ .

**Clutch initially locked – Select to initially lock clutch**

off (default) | on

Selecting this parameter initially locks the clutch.

**Dependencies**

To create this parameter, select **Control mode** parameter Ideal integrated controller.

**Synchronizer initially locked – Select to initially lock synchronizer**

off (default) | on

Selecting this parameter initially locks the synchronizer.

## DCT Controller

Dual clutch transmission controller

**Library:** Powertrain Blockset / Transmission / Transmission Controllers

### Description

The DCT Controller block implements a dual clutch transmission (DCT) controller. You can specify the clutch open, close, and synchronization timing parameters. The block determines the clutch commands using integrator-based timers and latching logic that is based on the specified timing parameters and gear request.

### Ports

#### Inputs

**GearReq — Gear number to engage**

scalar

Gear number request,  $G_{req}$ .

#### Output

**Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal	Description	Variable
GearReq	Gear number request	$G_{req}$
GearEngd	Nominal gear commanded by the controller	$G_o$
GearEffct	Effective gear	NA
ClutchACmd	Clutch pressure command for odd-numbered gears, between 0 and 1	NA
ClutchBCmd	Clutch pressure command for even-numbered gears, between 0 and 1	NA

**NomGear — Nominal gear for shifting**

scalar

Nominal gear for shifting. The Dual Clutch Transmission block uses this signal for the smooth application of inertial, efficiency, gear ratio, and damping parameters.

**ClutchACmd – Command for odd-numbered gears**

scalar

Clutch pressure command for odd-numbered gears, between 0 and 1.

**ClutchBCmd – Command for even-numbered gears**

scalar

Clutch pressure command for even-numbered gears, between 0 and 1.

**Parameters****Initial gear, G\_o – Engaged gear**

0 (default) | scalar

Initial gear to engage,  $G_o$ .**Clutch actuation time, t\_c – Time**

.1 (default) | scalar

Time required to engage and disengage the clutch during shift events,  $t_c$ , in s.**Synchronizer time, t\_s – Time**

.01 (default) | scalar

Time required for gear selection and synchronization,  $t_s$ , in s.**Sample period, dt – Time**

-1 (default) | scalar

Sample period,  $dt$ , in s.**Clutch initially locked – Select to initially lock clutch**

off (default) | on

Selecting this parameter initially locks the clutch.

**Synchronizer initially locked – Select to initially lock synchronizer**

off (default) | on

Selecting this parameter initially locks the synchronizer.

## Ideal Fixed Gear Transmission

Ideal fixed gear transmission without clutch or synchronization

**Library:** Powertrain Blockset / Transmission / Transmission Systems  
Vehicle Dynamics Blockset / Powertrain / Transmission

### Description

The Ideal Fixed Gear Transmission implements an idealized fixed-gear transmission without a clutch or synchronization. Use the block to model the overall gear ratio and power loss when you do not need a detailed transmission model, for example, in component-sizing, fuel economy, and emission studies. The block implements a transmission model with minimal parameterization or computational cost.

To specify the block efficiency calculation, for **Efficiency factors**, select either of these options.

Setting	Block Implementation
Gear only	Efficiency determined from a 1D lookup table that is a function of the gear.
Gear, input torque, input speed, and temperature	Efficiency determined from a 4D lookup table that is a function of: <ul style="list-style-type: none"> <li>• Gear</li> <li>• Input torque</li> <li>• Input speed</li> <li>• Oil temperature</li> </ul>

The block uses this equation to determine the transmission dynamics:

$$\dot{\omega}_i \frac{J_N}{N^2} = \eta_N \left( \frac{T_o}{N} + T_i \right) - \frac{\omega_i}{N^2} b_N$$

$$\omega_i = N \omega_o$$

The block filters the gear command signal:

$$\frac{G}{G_{cmd}}(s) = \frac{1}{\tau_s s + 1}$$

### Neutral Gear

When **Initial gear number, G\_o** is equal to 0, the initial gear is neutral. The block uses these parameters to decouple the input flywheel from the downstream gearing.

- **Initial input velocity, omega\_o**
- **Initial neutral input velocity, omegainN\_o**

The block uses these equations for the neutral gear speed and flywheel.

$$\dot{\omega}_{neutral} \frac{J_N}{N^2} = \eta_N \frac{T_o}{N} - \frac{\omega_{neutral}}{N^2} b_N$$

$$\omega_{neutral} = N\omega_o$$

$$\dot{\omega}_1 J_F = \eta_{@N=0} T_i - b_{@N=0} \omega_i$$

$$J_F = J_{@N=1} - J_{@N=0}$$

**Power Accounting**

For the power accounting, the block implements these equations.

Bus Signal		Description	Variable	Equations	
PwrIn fo	PwrTrnsfrd — Power transferred between blocks  • Positive signals indicate flow into block • Negative signals indicate flow out of block	PwrEng	Engine power	$P_{eng}$	$\omega_i T_i$
		PwrDiffrntl	Differential power	$P_{diff}$	$\omega_o T_o$
	PwrNotTrnsfrd — Power crossing the block boundary, but not transferred  • Positive signals indicate an input • Negative signals indicate a loss	PwrEffLoss	Mechanical power loss	$P_{effloss}$	$\omega_o T_o (\eta_N - 1)$
		PwrDampLoss	Mechanical damping loss	$P_{damploss}$	For $G=0$ : $-\frac{b_N \omega_i^2}{ N^2 }$ For $G \neq 0$ : $-b_N \omega_i^2 - \frac{b_N \omega_{neutral}^2}{ N^2 }$
PwrStored — Stored energy rate of change  • Positive signals indicate an increase • Negative signals indicate a decrease	PwrStoredTrns	Rate change in rotational kinetic energy	$P_{str}$	For $G=0$ : $\frac{J_N}{N^2} \dot{\omega}_i \omega_i$ For $G \neq 0$ : $J_F \dot{\omega}_i \omega_i + \frac{J_N}{N^2} \dot{\omega}_{neutral} \omega_{neutral}$	

The equations use these variables.

- $b_N$  Engaged gear viscous damping
- $J_N$  Engaged gear rotational inertia
- $J_F$  Flywheel rotational inertia
- $\eta_N$  Engaged gear efficiency
- $G$  Engaged gear number
- $G_{cmd}$  Gear number to engage
- $N$  Engaged gear ratio

$T_i$	Applied input torque, typically from the engine crankshaft or dual mass flywheel damper
$T_o$	Applied load torque, typically from the differential or drive shaft
$\omega_o$	Initial input drive shaft rotational velocity
$\omega_i, \dot{\omega}_i$	Applied drive shaft angular speed and acceleration
$\omega_{No}$	Initial neutral gear input rotational velocity
$\omega_{neutral}$	Neutral gear drive shaft rotational velocity
$\tau_s$	Shift time constant

## Ports

### Inputs

#### **Gear — Gear number to engage**

scalar

Integer value of gear number to engage,  $G_{cmd}$ .

#### **EngTrq — Applied input torque**

scalar

Applied input torque,  $T_i$ , typically from the engine crankshaft or dual mass flywheel damper, in N·m.

#### **DiffTrq — Applied load torque**

scalar

Applied load torque,  $T_o$ , typically from the differential, in N·m.

#### **Temp — Oil temperature**

scalar

Oil temperature, in K. To determine the efficiency, the block uses a 4D lookup table that is a function of:

- Gear
- Input torque
- Input speed
- Oil temperature

### Dependencies

To enable this port, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

### Output

#### **Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal		Description	Variable	Units	
Eng	EngTrq	Applied input torque, typically from the engine crankshaft or dual mass flywheel damper	$T_i$	N·m	
	EngSpd	Applied drive shaft angular speed input	$\omega_i$	rad/s	
Diff	DiffTrq	Applied load torque, typically from the differential	$T_o$	N·m	
	DiffSpd	Drive shaft angular speed output	$\omega_o$	rad/s	
Trans	TransSpdRatio	Input to output speed ratio at time t	$\Phi(t)$	N/A	
	TransEta	Ratio of output power to input power	$\eta_N$	N/A	
	TransGearCmd	Commanded gear	$N_{cmd}$	N/A	
	TransGear	Engaged gear	$N$	N/A	
PwrInfo	PwrTrnsfrd	PwrEng	Engine power	$P_{eng}$	W
		PwrDiffrentl	Differential power	$P_{diff}$	W
	PwrNotTrnsfrd	PwrEffLoss	Mechanical power loss	$P_{effloss}$	W
		PwrDampLoss	Mechanical damping loss	$P_{damploss}$	W
	PwrStored	PwrStoredTrans	Rate change in rotational kinetic energy	$P_{str}$	W

**EngSpd — Angular speed**

scalar

Applied drive shaft angular speed input,  $\omega_i$ , in rad/s.**DiffSpd — Angular speed**

scalar

Drive shaft angular speed output,  $\omega_o$ , in rad/s.

## Parameters

### Efficiency factors – Specify efficiency calculation

Gear only (default) | Gear, input torque, input speed, and temperature

To specify the block efficiency calculation, for **Efficiency factors**, select either of these options.

Setting	Block Implementation
Gear only	Efficiency determined from a 1D lookup table that is a function of the gear.
Gear, input torque, input speed, and temperature	Efficiency determined from a 4D lookup table that is a function of: <ul style="list-style-type: none"> <li>• Gear</li> <li>• Input torque</li> <li>• Input speed</li> <li>• Oil temperature</li> </ul>

### Dependencies

Setting Parameter To	Enables
Gear only	<b>Efficiency vector, eta</b>
Gear, input torque, input speed, and temperature	<b>Efficiency torque breakpoints, Trq_bpts</b> <b>Efficiency speed breakpoints, omega_bpts</b> <b>Efficiency temperature breakpoints, Temp_bpts</b> <b>Efficiency lookup table, eta_tbl</b>

### Gear property interpolation method – Interpolation

Nearest (default) | Linear | Flat | Cubic spline

Method that the block uses to switch the gear ratio during gear shifting.

### Transmission

#### Gear number vector, G – Specify number of transmission speeds

[-1,0,1,2,3,4,5] (default) | vector

Vector of integer gear commands used to specify the number of transmission speeds. Neutral gear is 0. For example, you can set these parameter values.

To Specify	Set Gear number, G To
Four transmission speeds, including neutral	[0, 1, 2, 3, 4]
Three transmission speeds, including neutral and reverse	[-1, 0, 1, 2, 3]
Five transmission speeds, including neutral and reverse	[-1, 0, 1, 2, 3, 4, 5]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Inertia vector**, **Damping vector**, and **Efficiency vector** parameters must be equal.

#### Efficiency torque breakpoints, **Trq\_bpts** – Breakpoints

[25,50,75,100,150,200,250] (default) | vector

Torque breakpoints for efficiency table.

#### Dependencies

To enable this parameter, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

#### Efficiency speed breakpoints, **omega\_bpts** – Breakpoints

[52.4 78.5 105 131 157 183 209 262 314 419 524] (default) | vector

Speed breakpoints for efficiency table.

#### Dependencies

To enable this parameter, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

#### Efficiency temperature breakpoints, **Temp\_bpts** – Breakpoints

[313 358] (default) | vector

Temperature breakpoints for efficiency table.

#### Dependencies

To enable this parameter, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

#### Gear ratio vector, **N** – Ratio of input speed to output speed

[-4.47,4.47,4.47,2.47,1.47,1,0.8] (default) | vector

Vector of gear ratios (that is, input speed to output speed) with indices corresponding to the ratios specified in **Gear number**, **G**. For neutral, set the gear ratio to 1. For example, you can set these parameter values.

To Specify Gear Ratios For	Set Gear number, <b>G</b> To	Set Gear ratio, <b>N</b> To
Four transmission speeds, including neutral	[0, 1, 2, 3, 4]	[1, 4.47, 2.47, 1.47, 1]
Five transmission speeds, including neutral and reverse	[-1, 0, 1, 2, 3, 4, 5]	[-4.47, 1, 4.47, 2.47, 1.47, 1, 0.8]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Inertia vector**, **Damping vector**, and **Efficiency vector** parameters must be equal.

#### Inertia vector, **Jout** – Gear rotational inertia

[0.128 0.01 0.128 0.1 0.062 0.028 0.01] (default) | vector

Vector of gear rotational inertias,  $J_N$ , with indices corresponding to the inertias specified in **Gear number**, **G**, in  $\text{kg}\cdot\text{m}^2$ . For example, you can set these parameter values.

To Specify Inertia For	Set Gear number, G To	Set Inertia, J To
Four gears, including neutral	[0, 1, 2, 3, 4]	[0.01, 2.28, 2.04, 0.32, 0.028]
Inertia for five gears, including reverse and neutral	[-1, 0, 1, 2, 3, 4, 5]	[2.28, 0.01, 2.28, 2.04, 0.32, 0.028, 0.01]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Inertia vector**, **Damping vector**, and **Efficiency vector** parameters must be equal.

**Damping vector, *bout* – Gear viscous damping coefficient**

[.003 .001 .003 .0025 .002 .001 .001] (default) | vector

Vector of gear viscous damping coefficients,  $b_N$ , with indices corresponding to the coefficients specified in **Gear number, G**, in N·m·s/rad. For example, you can set these parameter values.

To Specify Damping For	Set Gear number, G To	Set Damping, b To
Four gears, including neutral	[0, 1, 2, 3, 4]	[0.001, 0.003, 0.0025, 0.002, 0.001]
Five gears, including reverse and neutral	[-1, 0, 1, 2, 3, 4, 5]	[0.003, 0.001, 0.003, 0.0025, 0.002, 0.001, 0.001]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Inertia vector**, **Damping vector**, and **Efficiency vector** parameters must be equal.

**Efficiency vector, *eta* – Gear efficiency**

[0.9, 0.9, 0.9, 0.9, 0.9, 0.95, 0.95] (default) | vector

Vector of gear mechanical efficiency,  $\eta_N$ , with indices corresponding to the efficiencies specified in **Gear number, G**. For example, you can set these parameter values.

To Specify Efficiency For	Set Gear number, G To	Set Efficiency, eta To
Four gears, including neutral	[0, 1, 2, 3, 4]	[0.9, 0.9, 0.9, 0.9, 0.95]
Five gears, including reverse and neutral	[-1, 0, 1, 2, 3, 4, 5]	[0.9, 0.9, 0.9, 0.9, 0.9, 0.95, 0.95]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Inertia vector**, **Damping vector**, and **Efficiency vector** parameters must be equal.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Gear only.

**Efficiency lookup table, *eta\_tbl* – Gear efficiency**

array

Table of gear mechanical efficiency,  $\eta_N$  as a function of gear, input torque, input speed, and temperature.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

**Initial gear number, G\_o – Gear**

0 (default) | scalar

Initial gear number,  $G_o$ , dimensionless.**Initial output velocity, omega\_o – Output speed**

0 (default) | scalar

Transmission initial output rotational velocity,  $\omega_o$ , in rad/s.**Initial neutral input velocity, omegainN\_o – Neutral gear input speed**

0 (default) | scalar

Initial neutral gear input rotational velocity,  $\omega_{No}$ , in rad/s.**Shift time constant, tau\_s – Time**

.01 (default) | scalar

Shift time constant,  $\tau_s$ , in s.**Extended Capabilities****C/C++ Code Generation**

Generate C and C++ code using Simulink® Coder™.

## Torque Converter

Three-part torque converter consisting of an impeller, turbine, and stator

**Library:** Powertrain Blockset / Transmission / Torque Converters

### Description

The Torque Converter block implements a three-part torque converter consisting of an impeller, turbine, and stator with an optional clutch lock-up capability. The block can simulate driving (power flowing from impeller to turbine) and coasting (power from turbine dissipated in torque converter hydraulic fluid).

You can specify torque converter characteristics:

- Speed ratio — Ratio of turbine angular speed to impeller angular speed
- Torque ratio — Ratio of turbine torque to impeller torque
- Capacity factor parameterization — Function of input speed or input torque

Optional clutch lock-up configurations include:

- No lock-up — Model fluid-coupling only
- Lock-up — Model automatic clutch engagement
- External lock-up — Model clutch pressure as input from an external signal

### Dynamics

#### Clutch Lock-Up Condition and Clutch Friction

Based on the clutch lock-up condition, the block implements these friction models.

If	Clutch Condition	Friction Model
$\omega_i \neq \omega_t$ or $T_S < \left  \frac{J_t}{(J_i + J_t)} [T_i + T_f - \omega_i(b_t + b_i)] \right $	Unlocked	$T_f = T_k$ where: $T_k = F_c R_{eff} m_k \tanh[4(\omega_i - \omega_t)]$ $T_s = F_c R_{eff} m_s$ $R_{eff} = \frac{2(R_o^3 - R_i^3)}{3(R_o^2 - R_i^2)}$
$\omega_i = \omega_t$ and $T_S \geq \left  \frac{J_t}{(J_i + J_t)} [T_i + T_f - \omega_t(b_t + b_i) + \omega_t b_t] \right $	Locked	$T_f = T_s$

### Locked Rotational Dynamics

To model the rotational dynamics if the clutch is locked, the block implements equations.

$$\dot{\omega}(J_i + J_t) = T_i - \omega(b_i + b_t) + T_{ext}$$

$$\omega = \omega_i = \omega_t$$

The rotational velocity represents both the impeller and turbine rotational velocities.

### Unlocked Rotational Dynamics

To model the rotational dynamics if the clutch is unlocked, the block implements equations.

$$\dot{\omega}_i J_i = T_i - \omega_i b_i - T_f - T_p$$

$$\dot{\omega}_t J_t = T_{ext} - \omega_t b_t + T_f + T_t$$

$$T_p = \omega_i^2 \psi(\phi)$$

$$T_t = T_p \zeta(\phi)$$

To approximate the torque multiplication lag between the impeller and turbine, you can specify the parameter **Fluid torque response time constant (set to 0 to disable), tauc [s]**.

### Power Accounting

For the power accounting, the block implements these equations.

Bus Signal	Description	Variable	Equations
PwrIn fo	PwrTrnsfrd — Power transferred between blocks  <ul style="list-style-type: none"> <li>Positive signals indicate flow into block</li> <li>Negative signals indicate flow out of block</li> </ul>	PwrImp	Applied impeller power  $P_{imp}$  $\omega_i T_i$
		PwrTur b	Applied turbine output power  $P_{turb}$  $\omega_t T_t$

Bus Signal		Description	Variable	Equations
PwrNotTrnsfrd — Power crossing the block boundary, but not transferred <ul style="list-style-type: none"> <li>• Positive signals indicate an input</li> <li>• Negative signals indicate a loss</li> </ul>	PwrDampLoss	Mechanical damping loss	$P_{damploss}$	$-b_t\omega_t^2 - b_i\omega_i^2$
	PwrFluidCplingLoss	Heat loss to transmission fluid	$P_{flloss}$	$-(T_p\omega_i - T_{hyd}\omega_t)$
	PwrClutchLoss	Clutch slip power loss	$P_{cltloss}$	$-T_k(\omega_i - \omega_t)$
PwrStored — Stored energy rate of change <ul style="list-style-type: none"> <li>• Positive signals indicate an increase</li> <li>• Negative signals indicate a decrease</li> </ul>	PwrStoredImp	Rate change in impeller rotational kinetic energy	$P_{strimp}$	$\dot{\omega}_i\omega_i J_i$
	PwrStoredTurb	Rate change in turbine rotational kinetic energy	$P_{strturb}$	$\dot{\omega}_t\omega_t J_t$

The block implements equations that use these variables.

- $T_f$  Frictional torque
- $T_k$  Kinetic frictional torque
- $T_s$  Static frictional torque
- $T_i$  Applied input torque
- $T_p$  Impeller reaction torque
- $T_{ext}$  Externally applied turbine torque
- $\psi(\phi)$  Torque conversion capacity factor
- $\zeta(\phi)$  Torque ratio
- $\omega_i$  Impeller rotational shaft speed
- $\omega_t$  Turbine rotational shaft speed
- $J_i$  Impeller rotational inertia
- $J_t$  Turbine rotational inertia
- $b_i$  Impeller rotational viscous damping
- $b_t$  Turbine rotational viscous damping
- $R_{eff}$  Effective clutch radius
- $R_o$  Annular disk outer radius
- $R_i$  Annular disk inner radius

## Ports

### Inputs

**ImpTrq — Applied impeller torque**  
 scalar

Applied input torque, typically from the engine crankshaft or dual mass flywheel, in N·m.

### **TurbTrq – Applied turbine torque**

scalar

Applied turbine torque, typically from the transmission, in N·m.

### **Clutch Force – Applied clutch force**

scalar

Applied clutch force, typically from a hydraulic actuator, in N.

### **Dependencies**

To create this port, select External lock-up input for the **Lock-up clutch configuration** parameter.

### **Output**

### **Info – Bus signal**

bus

Bus signal containing these block calculations.

Signal		Description	Units	
Imp	ImpTrq	Applied input torque	N·m	
	ImpSpd	Impeller rotational shaft speed	rad/s	
Turb	TurbTrq	Applied turbine torque	N·m	
	TurbSpd	Turbine rotational shaft speed	rad/s	
Cltch	CltchForce	Applied clutch force	N	
	CltchLocked	Clutch locked or unlocked state	N/A	
TrqConv	TrqConvSpdRatio	Turbine to impeller speed ratio	N/A	
	TrqConvEta	Torque conversion efficiency	N/A	
PwrInfo	PwrTrnsfrd	PwrImp	Applied impeller power	W
		PwrTurb	Applied turbine output power	W
	PwrNotTrnsfrd	PwrDampLoss	Mechanical damping loss	W
		PwrFluidCplingLoss	Heat loss to transmission fluid	W
		PwrCltchLoss	Clutch slip power loss	W
	PwrStored	PwrStoredImp	Rate change in impeller rotational kinetic energy	W
PwrStoredTurb		Rate change in turbine rotational kinetic energy	W	

### **ImpSpd – Impeller speed**

scalar

Impeller rotational shaft speed,  $\omega_i$ , in rad/s.

**TrbSpd — Turbine speed**

scalar

Turbine rotational shaft speed,  $\omega_t$ , in rad/s.

**Parameters**

**Configuration**

**Lock-up clutch configuration — Select lock-up clutch configuration**

Lock-up (default) | No lock-up | External lock-up input

To Model	Select
Fluid-coupling only	No lock-up
Automatic clutch engagement	Lock-up
Clutch pressure as input from an external signal	External lock-up input

**Dependencies**

To enable the **Clutch** parameters, select Lock-up or External lock-up input for the **Lock-up clutch configuration** parameter.

**Torque Converter**

**Impeller shaft inertia, Ji — Inertia**

.1 (default) | scalar

Impeller shaft inertia, in  $\text{kg}\cdot\text{m}^2$ .

**Impeller shaft viscous damping, bi — Viscous damping coefficient**

.001 (default) | scalar

Impeller shaft viscous damping, in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

**Turbine shaft inertia, Jt — Inertia**

.1 (default) | scalar

Turbine shaft inertia, in  $\text{kg}\cdot\text{m}^2$ .

**Turbine shaft viscous damping, bt — Viscous damping coefficient**

.001 (default) | scalar

Turbine shaft viscous damping, in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

**Initial impeller shaft velocity, omegai\_o — Angular velocity**

0 (default) | scalar

Initial impeller shaft velocity, in rad/s.

**Initial turbine shaft velocity, omegat\_o — Angular velocity**

0 (default) | scalar

Initial turbine shaft velocity, in rad/s.

**Speed ratio vector, phi – Ratio**

[ 0 0.50 0.60 0.70 0.80 0.87 0.92 0.94 0.96 0.97] (default) | vector

Vector of turbine speed to impeller speed ratios. Breakpoints for the capacity and torque multiplication vectors.

**Capacity factor parameterization – Select factor ratio type**

Input speed / sqrt(input torque) (default) | Absorbed torque / input speed^2

To Set Factor Ratio to	Select
Impeller angular velocity to square root impeller torque	Input speed / sqrt(input torque)
Impeller absorbed torque to square of impeller angular velocity	Absorbed torque / input speed^2

**Capacity vector, psi – Vector**

[12.2938 12.8588 13.1452 13.6285 14.6163 16.2675 19.3503 22.1046 29.9986 50.00] (default) | vector

Capacity factor parameterization Setting	Capacity Vector Units
Input speed / sqrt(input torque)	(rad/s)/(N·m)^0.5
Absorbed torque / input speed^2	N·m/(rad/s)^2

**Torque ratio vector, zeta – Vector**

[2.2320 1.5462 1.4058 1.2746 1.1528 1.0732 1.0192 0.9983 0.9983 0.9983] (default) | vector

Vector of turbine torque to impeller speed ratios.

**Fluid torque response time constant (set to 0 to disable), tauTC – Time constant**

.02 (default) | scalar

To account for the delay in torque calculations due to changing input torque, specify the fluid torque transfer time constant, in s.

**Interpolation method – Select interpolation method**

Linear (default) | Flat | Nearest

Interpolates the torque ratio and capacity factor functions between the discrete relative velocity values.

**Clutch****Clutch force equivalent net radius, R<sub>eff</sub> – Effective radius**

.3 (default) | scalar

The effective radius,  $R_{eff}$ , used with the applied clutch friction force to determine the friction force, in m. The effective radius is defined as:

$$R_{eff} = \frac{2(R_o^3 - R_i^3)}{3(R_o^2 - R_i^2)}$$

The equation uses these variables.

$R_o$  Annular disk outer radius

$R_i$  Annular disk inner radius

#### **Dependencies**

To enable the **Clutch** parameters, select Lock-up or External lock-up input for the **Lock-up clutch configuration** parameter.

#### **Static friction coefficient, $\mu_s$ – Coefficient**

1.2 (default) | scalar

Dimensionless clutch disc coefficient of static friction.

#### **Dependencies**

To enable the **Clutch** parameters, select Lock-up or External lock-up input for the **Lock-up clutch configuration** parameter.

#### **Kinetic friction coefficient, $\mu_k$ – Coefficient**

1 (default) | scalar

Dimensionless clutch disc coefficient of kinetic friction.

To enable the **Clutch** parameters, select Lock-up or External lock-up input for the **Lock-up clutch configuration** parameter.

#### **Initially lock clutch – Select to initially lock clutch**

off (default) | on

#### **Dependencies**

To enable this parameter, select Lock-up or External lock-up input for the **Lock-up clutch configuration** parameter.

#### **Lock-up speed ratio threshold, $\phi_{ilu}$ – Threshold**

.85 (default) | scalar

Set speed ratio threshold that engages clutch lock-up.

#### **Dependencies**

To enable this parameter, select Lock-up for the **Lock-up clutch configuration** parameter.

#### **Minimum lock-up engagement speed, $\omega_{gl}$ – Angular velocity**

$900 \cdot \pi / 30$  (default) | scalar

Set the minimum impeller speed that engages clutch lock-up, in rad/s.

#### **Dependencies**

To enable this parameter, select Lock-up for the **Lock-up clutch configuration** parameter.

#### **Lock-up disengagement speed, $\omega_{gau}$ – Angular velocity**

$800 \cdot \pi / 30$  (default) | scalar

Set the minimum impeller speed that disengages clutch lock-up, in rad/s.

**Dependencies**

To enable this parameter, select Lock-up for the **Lock-up clutch configuration** parameter.

**Lock-up clutch force gain,  $K_c$  – Gain**

5000 (default) | scalar

Open loop clutch lock-up force gain, in N.

**Dependencies**

To enable this parameter, select Lock-up for the **Lock-up clutch configuration** parameter.

**Lock-up clutch time constant,  $\tau_C$  – Time constant**

.0500 (default) | scalar

Open loop clutch lock-up time constant, in s.

**Dependencies**

To enable this parameter, select Lock-up for the **Lock-up clutch configuration** parameter.

**Extended Capabilities****C/C++ Code Generation**

Generate C and C++ code using Simulink® Coder™.

# Functions

---

## mdf

Access information contained in MDF-file

### Syntax

```
mdfObj = mdf(mdfFileName)
```

### Description

The `mdf` function creates an object for accessing a measurement data format (MDF) file. See “Measurement Data Format (MDF)” on page 8-4.

`mdfObj = mdf(mdfFileName)` identifies a measurement data format (MDF) file and returns an MDF-file object, which you can use to access information and data contained in the file. You can specify a full or partial path to the file.

### Examples

#### Create MDF-File Object for Specified MDF-File

Create an MDF object for a given file, and view the object display.

```
mdfObj = mdf('MDFFile.mf4')
```

MDF with properties:

```

    Attachment: [1x1 struct]
    ChannelNames: {6x1 cell}
    ChannelGroup: [1x6 struct]
```

Options

Conversion: Numeric

## Input Arguments

### mdfFileName — MDF-file name

char vector | string

MDF-file name, specified as a character vector or string, including the necessary full or relative path.

Example: 'MDFFile.mf4'

Data Types: char | string

## Output Arguments

### mdfObj — MDF-file

MDF-file object

MDF-file, returned as an MDF-file object. The object provides access to the MDF-file information contained in the following properties.

Property	Description
Name	Name of the MDF-file, including extension
Path	Full path to the MDF-file, including file name
Author	Author who originated the MDF-file
Department	Department that originated the MDF-file
Project	Project that originated the MDF-file
Subject	Subject matter in the MDF-file
Comment	Open comment field from the MDF-file
Version	MDF standard version of the file
DataSize	Total size of the data in the MDF-file, in bytes
InitialTimestamp	Time when file data acquisition began in UTC or local time
ProgramIdentifier	Originating program of the MDF-file
Creator	Structure containing details about creator of the MDF-file, with these fields: VendorName, ToolName, ToolVersion, UserName, and Comment
Attachment	Structure of information about attachments contained within the MDF-file, with these fields: Name, Path, Comment, Type, MIMEType, Size, EmbeddedSize, and MD5Checksum
ChannelNames	Cell array of the channel names in each channel group
ChannelGroup	Structure of information about channel groups contained within the MDF-file, with these fields: AcquisitionName, Comment, NumSamples, DataSize, Sorted, and Channel

Property	Description
Conversion	<p>Conversion option for data in the MDF-file. Supported values are:</p> <ul style="list-style-type: none"><li>• 'Numeric' (default) — Apply only numeric conversion rules (CC_Type 1-6). Data with non-numeric conversion rules is imported as raw, unconverted values.</li><li>• 'None' — Do not apply any conversion rules. All data is imported as raw data.</li><li>• 'All' — Apply all numeric and text conversion rules (CC_Type 1-10).</li></ul>

## More About

### Measurement Data Format (MDF)

Measurement data format (MDF) files are binary format files for storing measurement data. The format standard is defined by the Association for Standardization of Automation and Measuring Systems (ASAM), which you can read about at ASAM MDF.

Vehicle Network Toolbox™ and Powertrain Blockset provide access to MDF-files through an object you create with the `mdf` function.

## See Also

### Functions

`read` | `saveAttachment`

### Introduced in R2016b

# read

Read channel data from MDF-file

## Syntax

```
data = read(mdfObj)
data = read(mdfObj,chanList)
data = read(mdfObj,chanGroupIndex,chanName)
data = read(mdfObj,chanGroupIndex,chanName,startPosition)
data = read(mdfObj,chanGroupIndex,chanName,startPosition,endPosition)
data = read( __ , 'Conversion', convOpt)
data = read( __ , 'OutputFormat', fmtType)
[data,time] = read( __ , 'OutputFormat', 'Vector')
```

## Description

`data = read(mdfObj)` reads all data for all channels from the MDF-file identified by the MDF-file object `mdfObj`, and assigns the output to `data`. If the file data is one channel group, the output is a timetable; multiple channel groups are returned as a cell array of timetables, where the cell array index corresponds to the channel group number.

`data = read(mdfObj,chanList)` reads all data for all channels specified in the channel list table `chanList`.

`data = read(mdfObj,chanGroupIndex,chanName)` reads all data for the specified channel from the MDF-file identified by the MDF-file object `mdfObj`.

`data = read(mdfObj,chanGroupIndex,chanName,startPosition)` reads data from the position specified by `startPosition`.

`data = read(mdfObj,chanGroupIndex,chanName,startPosition,endPosition)` reads data for the range specified from `startPosition` to `endPosition`.

`data = read( __ , 'Conversion', convOpt)` applies the specified conversion option to the MDF data when reading it in. This option overrides the setting of the `Conversion` property of the `mdf` object.

`data = read( __ , 'OutputFormat', fmtType)` returns data with the specified output format.

`[data,time] = read( __ , 'OutputFormat', 'Vector')` returns two vectors of channel data and corresponding timestamps.

## Examples

### Read All Data from MDF-File

Read all available data from the MDF-file.

```
mdfObj = mdf('MDFFile.mf4');
data = read(mdfObj);
```

### Read Raw Data

Read raw data from a specified channel in the first channel group, without applying any conversion rules.

```
mdfObj = mdf('MDFFile.mf4');
data = read(mdfObj,1,'Unsigend_UInt32_LE_Master_Offset_0','Conversion','None');
data(1:4,:)
```

```
ans =
```

```
4×1 timetable
```

Time	Unsigend_UInt32_LE_Master_Offset_0
0 sec	0
1 sec	1
2 sec	2
3 sec	3

### Read All Data from Specified Channel List

Read all available data from the MDF-file for channels specified as part of a channel list.

```
mdfObj = mdf('MDFFile.mf4');
chanList = channelList(mdfObj) % Channel table
data = read(mdfObj,chanList(1:3,:)); % First 3 channels
```

### Read All Data from Multiple Channels

Read all available data from the MDF-file for specified channels.

```
mdfObj = mdf('MDFFile.mf4');
data = read(mdfObj,1,{'Channel1','Channel2'});
```

### Read Range of Data from Specified Index Values

Read a range of data from the MDF-file using indexing for startPosition and endPosition to specify the data range.

```
mdfObj = mdf('MDFFile.mf4');
data = read(mdfObj,1,{'Channel1','Channel2'},1,10);
```

### Read Range of Data from Specified Time Values

Read a range of data from the MDF-file using time values for `startPosition` and `endPosition` to specify the data range.

```
mdfObj = mdf('MDFFile.mf4');
data = read(mdfObj,1,{'Channel1','Channel2'},seconds(5.5),seconds(7.3));
```

### Read All Data in Vector Format

Read all available data from the MDF-file, returning data and time vectors.

```
mdfObj = mdf('MDFFile.mf4');
[data,time] = read(mdfObj,1,'Channel1','OutputFormat','Vector');
```

### Read All Data in Time Series Format

Read all available data from the MDF-file, returning time series data.

```
mdfObj = mdf('MDFFile.mf4');
data = read(mdfObj,1,'Channel1','OutputFormat','TimeSeries');
```

### Read Data from Channel List Entry

Read data from a channel identified by the `channelList` function.

Get list of channels and display their names and group numbers.

```
mdfObj = mdf('File05.mf4');
chlist = channelList(mdfObj);
chlist(1:2,1:2) % Display 2 channels, 2 columns
```

2×2 table

ChannelName	ChannelGroupNumber
"Float_32_LE_Offset_64"	2
"Float_64_LE_Master_Offset_0"	2

Read data from the first channel in the list.

```
data = read(mdfObj,chlist{1,2},chlist{1,1});
data(1:5,:)
```

5×1 timetable

Time	Float_32_LE_Offset_64
0 sec	5
0.01 sec	5.1
0.02 sec	5.2

0.03 sec            5.3  
0.04 sec            5.4

## Input Arguments

### **mdfObj — MDF-file**

MDF-file object

MDF-file, specified as an MDF-file object.

Example: `mdf('MDFFile.mf4')`

### **chanList — List of channels**

table

List of channels, specified as a table in the format returned by the `channelList` function.

Example: `channelList()`

Data Types: `table`

### **chanGroupIndex — Index of the channel group**

numeric value

Index of channel group, specified as a numeric value that identifies the channel group from which to read.

Example: `1`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64`

### **chanName — Name of channel**

char vector | string

Name of channel, specified as a character vector, string, or array. `chanName` identifies the name of a channel in the channel group. Use a cell array of character vectors or array of string to identify multiple channels.

Example: `'Channel1'`

Data Types: `char` | `string` | `cell`

### **startPosition — First position of channel data**

numeric value | duration

First position of channel data, specified as a numeric value or duration. The `startPosition` option specifies the first position from which to read channel data. Provide a numeric value to specify an index position; use a duration to specify a time position. If only `startPosition` is provided without the `endPosition` option, the data value at that location is returned. When used with `endPosition` to specify a range, the function returns data from the `startPosition` (inclusive) to the `endPosition` (noninclusive).

Example: `1`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `duration`

### **endPosition — Last position of channel data range**

numeric value | duration

Last position of channel data range, specified as a numeric value or duration. The `endPosition` option specifies the last position for reading a range of channel data. Provide both the `startPosition` and `endPosition` to specify retrieval of a range of data. The function returns up to but not including `endPosition` when reading a range. Provide a numeric value to specify an index position; use a duration to specify a time position.

Example: 1000

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `duration`

### **fmtType — Format for output data**

'Timetable' (default) | 'Vector' | 'TimeSeries'

Format for output data, specified as a character vector or string. This option formats the output according to the following table.

OutputFormat	Description
'Timetable'	Return a timetable from one or more channels into one output variable. This is the only format allowed when reading from multiple channels at the same time. (Default.)  Note: The timetable format includes columns for the MDF channels. Because the column titles must be valid MATLAB identifiers, they might not be exactly the same as those values in the MDF object <code>ChannelNames</code> property. The column headers are derived from the property using the function <code>matlab.lang.makeValidName</code> . The original channel names are available in the <code>VariableDescriptions</code> property of the <code>timetable</code> object.
'Vector'	Return a vector of numeric data values, and optionally a vector of time values from one channel. Use one output variable to return only data, or two output variables to return both data and time vectors.
'TimeSeries'	Return a time series of data from one channel.

Example: 'Vector'

Data Types: `char` | `string`

### **convOpt — Conversion option for MDF-file data**

'Numeric' (default) | 'All' | 'None'

Conversion option for MDF-file data, specified as 'Numeric', 'All', or 'None'. The default uses the value specified in the `Conversion` property of the `mdf` object.

- 'Numeric' — Apply only numeric conversion rules (CC\_Type 1-6). Data with non-numeric conversion rules is imported as raw, unconverted values.
- 'None' — Do not apply any conversion rules. All data is imported as raw data.
- 'All' — Apply all numeric and text conversion rules (CC\_Type 1-10).

Example: 'All'

Data Types: `char` | `string`

## Output Arguments

### **data — Channel data**

timetable (default) | double | time series | cell array

Channel data, returned as vector of doubles, a time series, a timetable, or cell array of timetables, according to the 'OutputFormat' option setting and the number of channel groups.

### **time — Channel data times**

double

Channel data times, returned as a vector of double elements. The time vector is returned only when the 'OutputFormat' is set to 'Vector'.

# saveAttachment

Save attachment from MDF-file

## Syntax

```
saveAttachment(mdfObj, AttachmentName)
saveAttachment(mdfObj, AttachmentName, DestFile)
```

## Description

`saveAttachment(mdfObj, AttachmentName)` saves the specified attachment from the MDF-file to the current MATLAB working folder. The attachment is saved with its existing name.

`saveAttachment(mdfObj, AttachmentName, DestFile)` saves the specified attachment from the MDF-file to the given destination. You can specify relative or absolute paths to place the attachment in a specific folder.

## Examples

### Save Attachment with Original Name

Save an MDF-file attachment with its original name in the current folder.

```
mdfObj = mdf('MDFFile.mf4');
saveAttachment(mdfObj, 'AttachmentName.ext')
```

### Save Attachment with New Name

Save an MDF-file attachment with a new name in the current folder.

```
mdfObj = mdf('MDFFile.mf4');
saveAttachment(mdfObj, 'AttachmentName.ext', 'MyFile.ext')
```

### Save Attachment in Parent Folder

Save an MDF-file attachment in a folder specified with a relative path name, in this case in the parent of the current folder.

```
mdfObj = mdf('MDFFile.mf4');
saveAttachment(mdfObj, 'AttachmentName.ext', '..\MyFile.ext')
```

### Save Attachment in Specified Folder

This example saves an MDF-file attachment using an absolute path name.

```
mdfObj = mdf('MDFFile.mf4');  
saveAttachment(mdfObj, 'AttachmentName.ext', 'C:\MyDir\MyFile.ext')
```

## Input Arguments

### **mdfObj** — MDF-file

MDF-file object

MDF-file, specified as an MDF-file object.

Example: `mdf('MDFFile.mf4')`

### **AttachmentName** — MDF-file attachment name

char vector | string

MDF-file attachment name, specified as a character vector or string. The name of the attachment is available in the `Name` field of the MDF-file object `Attachment` property.

Example: `'file1.dbc'`

Data Types: char | string

### **DestFile** — Destination file name for the saved attachment

existing attachment name (default) | char vector | string

Destination file name for the saved attachment, specified as a character vector or string. The specified destination can include an absolute or relative path, otherwise the attachment is saved in the current folder.

Example: `'MyFile.ext'`

Data Types: char | string

### **Introduced in R2016b**

# mdfDatastore

Datastore for collection of MDF-files

## Description

Use the MDF datastore object to access data from a collection of MDF-files.

## Creation

### Syntax

```
mdfds = mdfDatastore(location)
mdfds = mdfDatastore(__, 'Name1', Value1, 'Name2', Value2, ...)
```

### Description

`mdfds = mdfDatastore(location)` creates an `MDFDatastore` based on an MDF-file or a collection of files in the folder specified by `location`. All files in the folder with extensions `.mdf`, `.dat`, or `.mf4` are included.

`mdfds = mdfDatastore(__, 'Name1', Value1, 'Name2', Value2, ...)` specifies function options and properties of `mdfds` using optional name-value pairs.

---

**Note** This function is supported only on 64-bit Windows® operating systems.

---

### Input Arguments

#### location — Location of MDF datastore files

character vector | cell array | `DsFileSet` object

Location of MDF datastore files, specified as a character vector, cell array of character vectors, or `matlab.io.datastore.DsFileSet` object identifying either files or folders. The path can be relative or absolute, and can contain the wildcard character `*`. If `location` specifies a folder, by default the datastore includes all files in that folder with the extensions `.mdf`, `.dat`, or `.mf4`.

Example: `'CANape.MF4'`

Data Types: `char` | `cell` | `DsFileSet`

#### Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name, Value` arguments to set file information or object “Properties” on page 8-14. Allowed options are `IncludeSubfolders`, `FileExtensions`, and the properties `ReadSize`, `SelectedChannelGroupNumber`, and `SelectedChannelNames`.

Example: `'SelectedChannelNames', 'Counter_B4'`

**IncludeSubfolders — Include files in subfolders**`false (default) | true`

Include files in subfolders, specified as a logical. Specify `true` to include files in each folder and recursively in subfolders.

Example: `'IncludeSubfolders', true`

Data Types: `logical`

**FileExtensions — Custom extensions for filenames to include in MDF datastore**`{'.mdf', '.dat', '.mf4'} (default) | char | cell`

Custom extensions for filenames to include in the MDF datastore, specified as a character vector or cell array of character vectors. By default, the supported extensions include `.mdf`, `.dat`, and `.mf4`. If your files have custom or nonstandard extensions, use this Name-Value setting to include files with those extensions.

Example: `'FileExtensions', {' .myformat1', ' .myformat2'}`

Data Types: `char | cell`

## Properties

**ChannelGroups — All channel groups present in first MDF-file**`table`

This property is read-only.

All channel groups present in first MDF-file, returned as a table.

Data Types: `table`

**Channels — All channels present in first MDF-file**`table`

This property is read-only.

All channels present in first MDF-file, returned as a table.

Those channels targeted for reading must have the same name and belong to the same channel group in each file of the MDF datastore.

Data Types: `table`

**Files — Files included in datastore**`char | string | cell`

Files included in the datastore, specified as a character vector, string, or cell array.

Example: `{'file1.mf4', 'file2.mf4'}`

Data Types: `char | string | cell`

**ReadSize — Size of data returned by read**`'file' (default) | numeric | duration`

Size of data returned by the `read` function, specified as `'file'`, a numeric value, or a duration. A character vector value of `'file'` causes the entire file to be read; a numeric double value specifies the number of records to read; and a duration value specifies a time range to read.

If you later change the `ReadSize` property value type, the datastore resets.

Example: 50

Data Types: `double` | `char` | `duration`

### **SelectedChannelGroupNumber — Channel group to read**

numeric scalar

Channel group to read, specified as a numeric scalar value.

Example: 1

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64`

### **SelectedChannelNames — Names of channels to read**

`char` | `string` | `cell`

Names of channels to read, specified as a character vector, string, or cell array.

Those channels targeted for reading must have the same name and belong to the same channel group in each file of the MDF datastore.

Example: `'Counter_B4'`

Data Types: `char` | `string` | `cell`

### **Conversion — Conversion option for MDF-file data**

`'Numeric'` (default) | `'All'` | `'None'`

Conversion option for MDF-file data, specified as `'Numeric'`, `'All'`, or `'None'`.

- `'Numeric'` (default) — Apply only numeric conversion rules (CC\_Type 1-6). Data with non-numeric conversion rules is imported as raw, unconverted values.
- `'None'` — Do not apply any conversion rules. All data is imported as raw data.
- `'All'` — Apply all numeric and text conversion rules (CC\_Type 1-10).

Example: `'All'`

Data Types: `char` | `string`

## **Object Functions**

<code>read</code>	Read data in MDF datastore
<code>readall</code>	Read all data in MDF datastore
<code>preview</code>	Subset of data from MDF datastore
<code>reset</code>	Reset MDF datastore to initial state
<code>hasdata</code>	Determine if data is available to read from MDF datastore
<code>partition</code>	Partition MDF datastore
<code>numpartitions</code>	Number of partitions for MDF datastore
<code>combine (MATLAB)</code>	Combine data from multiple datastores
<code>transform (MATLAB)</code>	Transform datastore
<code>isPartitionable (MATLAB)</code>	Determine whether datastore is partitionable

isShuffleable (MATLAB) Determine whether datastore is shuffleable

## Examples

### Create an MDF Datastore

Create an MDF datastore from the sample file `CANape.MF4`, and read it into a timetable.

```
mdfds = mdfDatastore(fullfile(matlabroot, 'examples', 'vnt', 'data', 'CANape.MF4'));  
while hasdata(mdfds)  
    m = read(mdfds);  
end
```

## See Also

**Introduced in R2017b**

## hasdata (MDFDatastore)

Determine if data is available to read from MDF datastore

### Syntax

```
tf = hasdata(mdfds)
```

### Description

`tf = hasdata(mdfds)` returns logical 1 (true) if there is data available to read from the MDF datastore specified by `mdfds`. Otherwise, it returns logical 0 (false).

### Examples

#### Check MDF Datastore for Readable Data

Use `hasdata` in a loop to control read iterations.

```
mdfds = mdfDatastore(fullfile(matlabroot, 'examples', 'vnt', 'data', 'CANape.MF4'));  
while hasdata(mdfds)  
    m = read(mdfds);  
end
```

### Input Arguments

#### **mdfds** — MDF datastore

MDF datastore object

MDF datastore, specified as an MDF datastore object.

Example: `mdfds = mdfDatastore('CANape.MF4')`

### Output Arguments

#### **tf** — Indicator of data to read

1 | 0

Indicator of data to read, returned as a logical 1 (true) or 0 (false).

### See Also

#### Functions

`mdfDatastore` | `read` | `readall` | `reset`

**Introduced in R2017b**

## numpartitions (MDFDatastore)

Number of partitions for MDF datastore

### Syntax

```
N = numpartitions(mdfds)
N = numpartitions(mdfds,pool)
```

### Description

`N = numpartitions(mdfds)` returns the recommended number of partitions for the MDF datastore `mdfds`. Use the result as an input to the `partition` function.

`N = numpartitions(mdfds,pool)` returns a reasonable number of partitions to parallelize `mdfds` over the parallel pool, `pool`, based on the number of files in the datastore and the number of workers in the pool.

### Examples

#### Find Recommended Number of Partitions for MDF Datastore

Determine the number of partitions you should use for your MDF datastore.

```
mdfds = mdfDatastore(fullfile(matlabroot,'examples','vnt','data','CANape.MF4'));
N = numpartitions(mdfds);
```

### Input Arguments

#### **mdfds** — MDF datastore

MDF datastore object

MDF datastore, specified as an MDF datastore object.

Example: `mdfds = mdfDatastore('CANape.MF4')`

#### **pool** — Parallel pool

parallel pool object

Parallel pool specified as a parallel pool object.

Example: `gcp`

### Output Arguments

#### **N** — Number of partitions

double

Number of partitions, returned as a double. This number is the calculated recommendation for the number of partitions for your MDF datastore. Use this when partitioning your datastore with the `partition` function.

## **See Also**

### **Functions**

mdfDatastore | partition | read | reset

**Introduced in R2017b**

## partition (MDFDatastore)

Partition MDF datastore

### Syntax

```
subds = partition(mdfds,N,index)
subds = partition(mdfds,'Files',index)
subds = partition(mdfds,'Files',filename)
```

### Description

`subds = partition(mdfds,N,index)` partitions the MDF datastore `mdfds` into the number of parts specified by `N`, and returns the partition corresponding to the index `index`.

`subds = partition(mdfds,'Files',index)` partitions the MDF datastore by files and returns the partition corresponding to the file of index `index` in the `Files` property.

`subds = partition(mdfds,'Files',filename)` partitions the datastore by files and returns the partition corresponding to the specified filename.

### Examples

#### Partition an MDF Datastore into Default Parts

Partition an MDF datastore from the sample file `CANape.MF4`, and return the first part.

```
mdfds = mdfDatastore(fullfile(matlabroot,'examples','vnt','data','CANape.MF4'));
N = numpartitions(mdfds);
subds1 = partition(mdfds,N,1);
```

#### Partition an MDF Datastore by Its Files

Partition an MDF datastore according to its files, and return partitions by index and file name.

```
cd c:\temp
mdfds = mdfDatastore({'CANape1.MF4','CANape2.MF4','CANape3.MF4'});
mdfds.Files

ans =
    3×1 cell array
    'c:\temp\CANape1.MF4'
    'c:\temp\CANape2.MF4'
    'c:\temp\CANape3.MF4'
```

```
subds2 = partition(mdfds,'files',2);  
subds3 = partition(mdfds,'files','c:\temp\CANape3.MF4');
```

## Input Arguments

### **mdfds** — MDF datastore

MDF datastore object

MDF datastore, specified as an MDF datastore object.

Example: `mdfds = mdfDatastore('CANape.MF4')`

### **N** — Number of partitions

positive integer

Number of partitions, specified as a double of positive integer value. Use the `numpartitions` function for the recommended number or partitions.

Example: `numpartitions(mdfds)`

Data Types: double

### **index** — Index

positive integer

Index, specified as a double of positive integer value. When using the 'files' partition scheme, this value corresponds to the index of the MDF datastore object `Files` property.

Example: 1

Data Types: double

### **filename** — File name

character vector

File name, specified as a character vector. The argument can specify a relative or absolute path.

Example: `'CANape.MF4'`

Data Types: char

## Output Arguments

### **subds** — MDF datastore partition

MDF datastore object

MDF datastore partition, returned as an MDF datastore object. This output datastore is of the same type as the input datastore `mdfds`.

## See Also

### Functions

`mdfDatastore` | `numpartitions` | `read` | `reset`

**Introduced in R2017b**

## preview (MDFDatastore)

Subset of data from MDF datastore

### Syntax

```
data = preview(mdfds)
```

### Description

`data = preview(mdfds)` returns a subset of data from MDF datastore `mdfds` without changing the current position in the datastore.

### Examples

#### Examine Preview of MDF Datastore

```
mdfds = mdfDatastore(fullfile(matlabroot, 'examples', 'vnt', 'data', 'CANape.MF4'));
data = preview(mdfds)
```

```
data2 =
```

```
10×74 timetable
```

	Time	Counter_B4	Counter_B5	Counter_B6	Counter_B7	PWM
	0.0008254 sec	0	0	1	0	100
	0.010826 sec	0	0	1	0	100
	0.020826 sec	0	0	1	0	100
	0.030826 sec	0	0	1	0	100
	0.040826 sec	0	0	1	0	100
	0.050826 sec	0	0	1	0	100
	0.060826 sec	0	0	1	0	100
	0.070826 sec	0	0	1	0	100

### Input Arguments

#### **mdfds** — MDF datastore

MDF datastore object

MDF datastore, specified as an MDF datastore object.

Example: `mdfds = mdfDatastore('CANape.MF4')`

### Output Arguments

#### **data** — Subset of data

timetable

Subset of data, returned as a timetable of MDF records.

## **See Also**

### **Functions**

hasdata | mdfDatastore | read

**Introduced in R2017b**

## read (MDFDatastore)

Read data in MDF datastore

### Syntax

```
data = read(mdfds)
[data,info] = read(mdfds)
```

### Description

`data = read(mdfds)` returns data from the MDF datastore `mdfds` into the timetable `data`.

The `read` function returns a subset of data from the datastore. The size of the subset is determined by the `ReadSize` property of the datastore object. On the first call, `read` starts reading from the beginning of the datastore, and subsequent calls continue reading from the endpoint of the previous call. Use `reset` to read from the beginning again.

`[data,info] = read(mdfds)` also returns to the output argument `info` information, including metadata, about the extracted data.

### Examples

#### Read Datastore by Files

Read data from an MDF datastore one file at a time.

```
mdfds = mdfDatastore({'CANape1.MF4','CANape2.MF4','CANape3.MF4'});
mdfds.ReadSize = 'file';
data = read(mdfds);
```

Read the second file and view information about the data.

```
[data2,info2] = read(mdfds);
info2

    struct with fields:

        Filename: 'CANape2.MF4'
        FileSize: 57592
        MDFFileProperties: [1x1 struct]
```

### Input Arguments

#### **mdfds** — MDF datastore

MDF datastore object

MDF datastore, specified as an MDF datastore object.

Example: `mdfds = mdfDatastore('CANape.MF4')`

## Output Arguments

### **data** — Output data

timetable

Output data, returned as a timetable of MDF records.

### **info** — Information about data

structure array

Information about data, returned as a structure array with the following fields:

Filename

FileSize

MDFFileProperties

## See Also

### **Functions**

hasdata | mdfDatastore | preview | readall | reset

### **Introduced in R2017b**

## readall (MDFDatastore)

Read all data in MDF datastore

### Syntax

```
data = readall(mdfds)
data = readall(mdfds, "UseParallel", true)
```

### Description

`data = readall(mdfds)` reads all the data in the datastore specified by `mdfds` and returns it to timetable data.

After the `readall` function returns all the data, it resets `mdfds` to point to the beginning of the datastore.

If all the data in the datastore does not fit in memory, then `readall` returns an error.

`data = readall(mdfds, "UseParallel", true)` specifies to use a parallel pool to read all of the data. By default, the "UseParallel" option is `false`. The choice of pool depends on the following conditions:

- If you already have a parallel pool running, that pool is used.
- If your parallel preference settings allow a pool to automatically start, this syntax will start one, using the default cluster.
- If no pool is running and one cannot automatically start, this syntax does not use parallel functionality.

### Examples

#### Read All Data in Datastore

Read all the data from a multiple file MDF datastore into a timetable.

```
mdfds = mdfDatastore({'CANape1.MF4', 'CANape2.MF4', 'CANape3.MF4'});
data = readall(mdfds);
```

#### Read All Data in Datastore

Use a parallel pool to read all the data from the datastore into a timetable.

```
mdfds = mdfDatastore({'CANape1.MF4', 'CANape2.MF4', 'CANape3.MF4'});
data = readall(mdfds, "UseParallel", true);
```

### Input Arguments

#### **mdfds** — MDF datastore

MDF datastore object

MDF datastore, specified as an MDF datastore object.

Example: `mdfds = mdfDatastore('CANape.MF4')`

## Output Arguments

### **data** — Output data

timetable

Output data, returned as a timetable of MDF records.

## See Also

### **Functions**

`hasdata` | `mdfDatastore` | `preview` | `read` | `reset`

**Introduced in R2017b**

## reset (MDFDatastore)

Reset MDF datastore to initial state

### Syntax

```
reset(mdfds)
```

### Description

`reset(mdfds)` resets the MDF datastore specified by `mdfds` to its initial read state, where no data has been read from it. Resetting allows your to reread from the same datastore.

### Examples

#### Reset MDF Datastore

Reset an MDF datastore so that you can read from it again.

```
mdfds = mdfDatastore(fullfile(matlabroot, 'examples', 'vnt', 'data', 'CANape.MF4'));  
data = read(mdfds);  
reset(mdfds);  
data = read(mdfds);
```

### Input Arguments

#### **mdfds** — MDF datastore

MDF datastore object

MDF datastore, specified as an MDF datastore object.

Example: `mdfds = mdfDatastore('CANape.MF4')`

#### Functions

`hasdata` | `mdfDatastore` | `read`

**Introduced in R2017b**

# channelList

Information on available MDF groups and channels

## Syntax

```
chans = channelList(mdfobj)
channelList(mdfObj, chanName)
channelList(mdfObj, chanName, 'ExactMatch', true)
```

## Description

`chans = channelList(mdfobj)` returns a table of information about channels and groups in the specified MDF-file.

`channelList(mdfObj, chanName)` searches the MDF-file to generate a list of channels matching the specified channel name. The search by default is case-insensitive and identifies partial matches. A table is returned containing information about the matched channels and the containing channel groups. If no matches are found, an empty table is returned.

`channelList(mdfObj, chanName, 'ExactMatch', true)` searches the channels for an exact match, including case sensitivity. This is useful if a channel name is a substring of other channel names.

## Examples

### View Available MDF Channels

View all available MDF channels.

```
mdfObj = mdf('File01.mf4');
chans = channelList(mdfObj)
```

chans =

4×9 table

ChannelName	ChannelGroupNumber	ChannelGroupNumSamples
"Float_32_LE_Offset_64"	2	10000
"Float_64_LE_Master_Offset_0"	2	10000
"Sigend_Int16_LE_Offset_32"	1	10000
"Unsigend_UInt32_LE_Master_Offset_0"	1	10000

### View Specific MDF Channels

Filter on channel names.

```
chans = channelList(mdfObj, 'Float')
```

chans =

2×9 table

ChannelName	ChannelGroupNumber	ChannelGroupNumSamples
"Float_32_LE_Offset_64"	2	10000
"Float_64_LE_Master_Offset_0"	2	10000

```
chans = channelList(mdfObj, 'Float', 'ExactMatch', true)
```

```
chans =
```

```
0×9 empty table
```

## Input Arguments

### mdfObj — MDF-file

MDF-file object

MDF-file, specified as an MDF-file object.

Example: `mdf('File01.mf4')`

### chanName — Name of channel

char vector | string

Name of channel, specified as a character vector or string. By default, case-insensitive and partial matches are returned.

Example: `'Channel1'`

Data Types: `char` | `string`

## Output Arguments

### chans — Information on available MDF channels

table

Information on available MDF channels, returned as a table. To access specific elements, you can index into the table.

## See Also

### Functions

`mdf`

**Introduced in R2018b**

# mdfVisualize

View channel data from MDF-file

## Syntax

```
mdfVisualize(mdfFileName)
```

## Description

`mdfVisualize(mdfFileName)` opens an MDF-file in the Simulation Data Inspector for viewing and interacting with channel data. `mdfFileName` is the name of the MDF-file, specified as a full or partial path.

---

**Note** `mdfVisualize` supports only integer and floating point data types in MDF-file channels.

---

## Examples

### View MDF Data

View the data from a specified MDF-file in the Simulation Data Inspector.

```
mdfVisualize('File01.mf4')
```

## Input Arguments

### **mdfFileName** — MDF-file name

char vector | string

MDF-file name, specified as a character vector or string, including the necessary full or relative path.

Example: 'MDFFile.mf4'

Data Types: char | string

## autoblks.pwr.PlantInfo

Analyze powertrain power and energy

### Description

To assess powertrain efficiencies, use the `autoblks.pwr.PlantInfo` object to evaluate and report power and energy for component-level blocks and system-level reference applications.

### Creation

#### Syntax

```
VehPwrAnalysis = autoblks.pwr.PlantInfo(SysName)
```

#### Description

MATLAB creates an `autoblks.pwr.PlantInfo` object for the system that you specify. `VehPwrAnalysis = autoblks.pwr.PlantInfo(SysName)` where `SysName` is the name of the model or subsystem that you want to analyze.

#### Input Arguments

##### **SysName** — Model name

character vector

Model that you want to analyze.

Example: `'SiCiPtReferenceApplication'`

Data Types: `char`

#### Properties

##### **AvgEff** — Average efficiency

double

This property is read-only.

Average efficiency, dimensionless.

##### **Eff** — Time series of efficiency

time series

This property is read-only.

Efficiency,  $\eta$ , dimensionless. To calculate the efficiency, the `Eff` property implements this equation.

$$\eta = \frac{\left| \sum P_{output} - \sum P_{store}(P_{store} > 0) \right|}{\left| \sum P_{input} - \sum P_{store}(P_{store} < 0) \right|}$$

The equation uses these variables.

$P_{store}$	Stored power
$P_{input}, P_{output}$	Input and output power logged by Power Accounting Bus Creator block

### EnergyBalanceAbsTol – Energy balance absolute tolerance

0.0100 (default)

Energy balance absolute tolerance,  $EnergyBal_{AbsTol}$ .

To determine if the system conserves energy, the `isEnergyBalanced` method checks the energy conservation at each time step.

$$E_{Err} = \sum E_{trans} + \sum E_{nottrans} - \sum E_{store}$$

Blocks change the input energy plus released stored energy to output energy plus stored energy. For example, a mapped engine block uses fuel (not transferred energy) to produce torque (transferred energy) and heat loss (not transferred energy). The total modified energy represents the average between the input fuel energy and the energy exiting the system (torque and heat loss). To calculate the total energy modified by the block, the method uses the integral of the average transferred, not transferred, and stored power.

$$E_{total} = \frac{1}{2} \int_0^{t_{end}} \left( \sum |P_{trans}| + \sum |P_{nottrans}| + \sum |P_{store}| \right) dt \Bigg|_{t=t_{end}}$$

If the energy conservation error is within an error tolerance, the method returns true. Specifically, if either condition is met, the method returns true.

Condition		
$\frac{ E_{Err} }{E_{total}} < EnergyBal_{RelTol}$	or	$E_{total} < EnergyBal_{AbsTol}$

The equations use these variables.

$E_{Err}$	Energy conservation error
$E_{total}$	Total energy modified by block
$EnergyBal_{RelTol}, EnergyBal_{AbsTol}$	Energy balance relative and absolute tolerance, respectively
$P_{trans}, E_{trans}$	Transferred power and energy, respectively
$P_{nottrans}, E_{nottrans}$	Not transferred power and energy, respectively

$P_{store}, E_{store}$  Stored power and energy, respectively  
 $P_{input}, P_{output}$  Input and output power logged by Power Accounting Bus Creator block

Data Types: double

### EnergyBalanceRelTol – Energy balance relative tolerance

0.0100 (default)

Energy balance relative tolerance,  $EnergyBal_{RelTol}$ .

To determine if the system conserves energy, the `isEnergyBalanced` method checks the energy conservation at each time step.

$$E_{Err} = \sum E_{trans} + \sum E_{nottrans} - \sum E_{store}$$

Blocks change the input energy plus released stored energy to output energy plus stored energy. For example, a mapped engine block uses fuel (not transferred energy) to produce torque (transferred energy) and heat loss (not transferred energy). The total modified energy represents the average between the input fuel energy and the energy exiting the system (torque and heat loss). To calculate the total energy modified by the block, the method uses the integral of the average transferred, not transferred, and stored power.

$$E_{total} = \frac{1}{2} \left( \int_0^{t_{end}} \left( \sum |P_{trans}| + \sum |P_{nottrans}| + \sum |P_{store}| \right) dt \right) \Bigg|_{t=t_{end}}$$

If the energy conservation error is within an error tolerance, the method returns true. Specifically, if either condition is met, the method returns true.

Condition		
$\frac{ E_{Err} }{E_{total}} < EnergyBal_{RelTol}$	or	$E_{total} < EnergyBal_{AbsTol}$

The equations use these variables.

$E_{Err}$  Energy conservation error  
 $E_{total}$  Total energy modified by block  
 $EnergyBal_{RelTol}, EnergyBal_{AbsTol}$  Energy balance relative and absolute tolerance, respectively  
 $P_{trans}, E_{trans}$  Transferred power and energy, respectively  
 $P_{nottrans}, E_{nottrans}$  Not transferred power and energy, respectively  
 $P_{store}, E_{store}$  Stored power and energy, respectively  
 $P_{input}, P_{output}$  Input and output power logged by Power Accounting Bus Creator block

Data Types: double

**EnrgyUnits — Energy units**

MJ (default) | J

Energy units.

Example: `VehPwrAnalysis.EnrgyUnits = 'MJ';`

Data Types: char

**PwrUnits — Power units**

kW (default) | W

Power units.

Example: `VehPwrAnalysis.PwrUnits = 'kW';`

Data Types: char

**Object Methods**

<code>addLoggedData</code>	Add logged data
<code>dispSignalSummary</code>	Display powertrain subsystem energy analysis
<code>dispSysSummary</code>	Display powertrain system efficiency
<code>findChildSys</code>	Powertrain subsystem energy analysis
<code>histogramEff</code>	Display powertrain subsystem efficiency histogram
<code>isEnrgyBalanced</code>	Logical flag for energy conservation
<code>loggingOff</code>	Turn signal logging off
<code>loggingOn</code>	Turn signal logging on
<code>run</code>	Run powertrain energy and power analysis
<code>sdiSummary</code>	Display Simulation Data Inspector plots of powertrain energy and power
<code>xlsSysSummary</code>	Write powertrain energy analysis to spreadsheet

**Examples****Create PlantInfo Object for Powertrain Energy Analysis**

Analyze the power and energy in the conventional vehicle reference application. To create a `PlantInfo` object, see “step 2” on page 8-35.

- 1 Open the conventional vehicle reference application. By default, the application has a mapped 1.5 L spark-ignition (SI) engine and a dual clutch transmission. Project files open in a writable location.

```
autoblkConVehStart
```

- 2 Set the system name to `SiCiPtReferenceApplication`.

Create the `autoblks.pwr.PlantInfo` object.

Use the `PwrUnits` and `EnrgyUnits` properties to specify the units.

```
SysName = 'SiCiPtReferenceApplication';
VehPwrAnalysis = autoblks.pwr.PlantInfo(SysName);
VehPwrAnalysis.PwrUnits = 'kW';
VehPwrAnalysis.EnrgyUnits = 'MJ';
```

- 3 Use the `run` method to turn on logging, run simulation, and add logged data to the object.

- ```
run(VehPwrAnalysis);
```
- 4 Use the `dispSysSummary` method to display the results.

```
dispSysSummary(VehPwrAnalysis);
```
  - 5 Use the `xlsSysSummary` method to write the results to a spreadsheet.

```
xlsSysSummary(VehPwrAnalysis, 'EnergySummary.xlsx');
```
  - 6 Use the `findChildSys` method to retrieve the `autoblks.pwr.PlantInfo` object for the Engine subsystem.

To display the results, use the `dispSignalSummary` method.

Use the `histogramEff` method to display a histogram of the time spent at each engine plant efficiency.

- ```
EngSysName = 'SiCiPtReferenceApplication/Passenger Car/Engine';  
EngPwrAnalysis = findChildSys(VehPwrAnalysis, EngSysName);  
dispSignalSummary(EngPwrAnalysis);  
histogramEff(EngPwrAnalysis);
```
- 7 Use the `findChildSys` method to retrieve the `autoblks.pwr.PlantInfo` object for the Drivetrain subsystem.

To display the results, use the `dispSignalSummary` method.

- ```
DrvtrnSysName = 'SiCiPtReferenceApplication/Passenger Car/Drivetrain';  
DrvtrnPwrAnalysis = findChildSys(VehPwrAnalysis, DrvtrnSysName);  
dispSignalSummary(DrvtrnPwrAnalysis);
```
- 8 To plot the results, use the `sdiSummary` method.

```
sdiSummary(VehPwrAnalysis, {EngSysName, DrvtrnSysName})
```

# dispSignalSummary

Display powertrain subsystem energy analysis

## Syntax

```
dispSignalSummary(SubSystem)
```

## Description

The `dispSignalSummary(SubSystem)` method displays the subsystem energy for the `autoblks.pwr.PlantInfo` object. Use the `autoblks.pwr.PlantInfo` object to evaluate and report power and energy for component-level blocks and system-level models.

After you use the `findChildSys` method to retrieve the `autoblks.pwr.PlantInfo` object for the subsystem that you want to analyze, use the `dispSignalSummary(SubSystem)` method to display the results.

## Examples

### Use dispSignalSummary Method to Display Subsystem Results

Analyze the power and energy in the conventional vehicle reference application. To use the `dispSignalSummary` method to display the engine and drivetrain subsystem results, see “step 6” on page 8-37 and “step 7” on page 8-38.

- 1 Open the conventional vehicle reference application. By default, the application has a mapped 1.5 L spark-ignition (SI) engine and a dual clutch transmission. Project files open in a writable location.

```
autoblckConVehStart
```

- 2 Set the system name to `SiCiPtReferenceApplication`.

Create the `autoblks.pwr.PlantInfo` object.

Use the `PwrUnits` and `EnrgyUnits` properties to specify the units.

```
SysName = 'SiCiPtReferenceApplication';
VehPwrAnalysis = autoblks.pwr.PlantInfo(SysName);
VehPwrAnalysis.PwrUnits = 'kW';
VehPwrAnalysis.EnrgyUnits = 'MJ';
```

- 3 Use the `run` method to turn on logging, run simulation, and add logged data to the object.

```
run(VehPwrAnalysis);
```

- 4 Use the `dispSysSummary` method to display the results.

```
dispSysSummary(VehPwrAnalysis);
```

- 5 Use the `xlsSysSummary` method to write the results to a spreadsheet.

```
xlsSysSummary(VehPwrAnalysis, 'EnergySummary.xlsx');
```

- 6 Use the `findChildSys` method to retrieve the `autoblks.pwr.PlantInfo` object for the Engine subsystem.

To display the results, use the `dispSignalSummary` method.

Use the `histogramEff` method to display a histogram of the time spent at each engine plant efficiency.

```
EngSysName = 'SiCiPtReferenceApplication/Passenger Car/Engine';  
EngPwrAnalysis = findChildSys(VehPwrAnalysis,EngSysName);  
dispSignalSummary(EngPwrAnalysis);  
histogramEff(EngPwrAnalysis);
```

- 7 Use the `findChildSys` method to retrieve the `autoblks.pwr.PlantInfo` object for the Drivetrain subsystem.

To display the results, use the `dispSignalSummary` method.

```
DrvtrnSysName = 'SiCiPtReferenceApplication/Passenger Car/Drivetrain';  
DrvtrnPwrAnalysis = findChildSys(VehPwrAnalysis,DrvtrnSysName);  
dispSignalSummary(DrvtrnPwrAnalysis);
```

- 8 To plot the results, use the `sdiSummary` method.

```
sdiSummary(VehPwrAnalysis,{EngSysName,DrvtrnSysName})
```

## Input Arguments

### SubSystem — Subsystem name

character vector

Subsystem that you want to analyze.

Example: 'SiCiPtReferenceApplication/Passenger Car/Engine'

Example: 'SiCiPtReferenceApplication/Passenger Car/Drivetrain'

Data Types: char

# dispSysSummary

Display powertrain system efficiency

## Syntax

```
dispSysSummary(PlantInfoObj)
```

## Description

After you use the run method to analyze the powertrain power and energy, use the `dispSysSummary(PlantInfoObj)` method to display the system efficiency for the `autoblks.pwr.PlantInfo` object.

Use instances of the `autoblks.pwr.PlantInfo` object to evaluate and report power and energy for component-level blocks and system-level models.

## Examples

### Use dispSysSummary Method to Display Energy Analysis Results

Analyze the power and energy in the conventional vehicle reference application. To use the `dispSysSummary` method to display the results, see “step 4” on page 8-39.

- 1 Open the conventional vehicle reference application. By default, the application has a mapped 1.5 L spark-ignition (SI) engine and a dual clutch transmission. Project files open in a writable location.

```
autoblkConVehStart
```

- 2 Set the system name to `SiCiPtReferenceApplication`.

Create the `autoblks.pwr.PlantInfo` object.

Use the `PwrUnits` and `EnrgyUnits` properties to specify the units.

```
SysName = 'SiCiPtReferenceApplication';
VehPwrAnalysis = autoblks.pwr.PlantInfo(SysName);
VehPwrAnalysis.PwrUnits = 'kW';
VehPwrAnalysis.EnrgyUnits = 'MJ';
```

- 3 Use the run method to turn on logging, run simulation, and add logged data to the object.

```
run(VehPwrAnalysis);
```

- 4 Use the `dispSysSummary` method to display the results.

```
dispSysSummary(VehPwrAnalysis);
```

- 5 Use the `xlsSysSummary` method to write the results to a spreadsheet.

```
xlsSysSummary(VehPwrAnalysis, 'EnergySummary.xlsx');
```

- 6 Use the `findChildSys` method to retrieve the `autoblks.pwr.PlantInfo` object for the Engine subsystem.

To display the results, use the `dispSignalSummary` method.

Use the `histogramEff` method to display a histogram of the time spent at each engine plant efficiency.

```
EngSysName = 'SiCiPtReferenceApplication/Passenger Car/Engine';  
EngPwrAnalysis = findChildSys(VehPwrAnalysis,EngSysName);  
dispSignalSummary(EngPwrAnalysis);  
histogramEff(EngPwrAnalysis);
```

- 7 Use the `findChildSys` method to retrieve the `autoblks.pwr.PlantInfo` object for the Drivetrain subsystem.

To display the results, use the `dispSignalSummary` method.

```
DrvtrnSysName = 'SiCiPtReferenceApplication/Passenger Car/Drivetrain';  
DrvtrnPwrAnalysis = findChildSys(VehPwrAnalysis,DrvtrnSysName);  
dispSignalSummary(DrvtrnPwrAnalysis);
```

- 8 To plot the results, use the `sdiSummary` method.

```
sdiSummary(VehPwrAnalysis,{EngSysName,DrvtrnSysName})
```

## Input Arguments

### **PlantInfoObj** — Instance of **PlantInfo** object

`autoblks.pwr.PlantInfo` object

`autoblks.pwr.PlantInfo` object for the system that you want to analyze.

# findChildSys

Powertrain subsystem energy analysis

## Syntax

```
findChildSys(PlantInfoObj, SubSystem)
```

## Description

The `findChildSys(PlantInfoObj, SubSystem)` method finds and returns an `autoblks.pwr.PlantInfo` object for the subsystem. Use the `autoblks.pwr.PlantInfo` object to evaluate and report power and energy for component-level blocks and system-level reference applications.

After you use the `run` method to analyze the powertrain power and energy, use the `findChildSys` method to evaluate specific subsystems.

## Examples

### Use findChildSys Method to Analyze Subsystems

Analyze the power and energy in the conventional vehicle reference application. To use the `findChildSys` method to analyze the engine and drivetrain subsystems, see “step 6” on page 8-41 and “step 7” on page 8-42.

- 1 Open the conventional vehicle reference application. By default, the application has a mapped 1.5 L spark-ignition (SI) engine and a dual clutch transmission. Project files open in a writable location.

```
autoblkConVehStart
```

- 2 Set the system name to `SiCiPtReferenceApplication`.

Create the `autoblks.pwr.PlantInfo` object.

Use the `PwrUnits` and `EnrgyUnits` properties to specify the units.

```
SysName = 'SiCiPtReferenceApplication';
VehPwrAnalysis = autoblks.pwr.PlantInfo(SysName);
VehPwrAnalysis.PwrUnits = 'kW';
VehPwrAnalysis.EnrgyUnits = 'MJ';
```

- 3 Use the `run` method to turn on logging, run simulation, and add logged data to the object.

```
run(VehPwrAnalysis);
```

- 4 Use the `dispSysSummary` method to display the results.

```
dispSysSummary(VehPwrAnalysis);
```

- 5 Use the `xlsSysSummary` method to write the results to a spreadsheet.

```
xlsSysSummary(VehPwrAnalysis, 'EnergySummary.xlsx');
```

- 6 Use the `findChildSys` method to retrieve the `autoblks.pwr.PlantInfo` object for the Engine subsystem.

To display the results, use the `dispSignalSummary` method.

Use the `histogramEff` method to display a histogram of the time spent at each engine plant efficiency.

```
EngSysName = 'SiCiPtReferenceApplication/Passenger Car/Engine';
EngPwrAnalysis = findChildSys(VehPwrAnalysis,EngSysName);
dispSignalSummary(EngPwrAnalysis);
histogramEff(EngPwrAnalysis);
```

- 7 Use the `findChildSys` method to retrieve the `autoblks.pwr.PlantInfo` object for the Drivetrain subsystem.

To display the results, use the `dispSignalSummary` method.

```
DrvtrnSysName = 'SiCiPtReferenceApplication/Passenger Car/Drivetrain';
DrvtrnPwrAnalysis = findChildSys(VehPwrAnalysis,DrvtrnSysName);
dispSignalSummary(DrvtrnPwrAnalysis);
```

- 8 To plot the results, use the `sdiSummary` method.

```
sdiSummary(VehPwrAnalysis,{EngSysName,DrvtrnSysName})
```

## Input Arguments

### PlantInfoObj — Instance of PlantInfo object

`autoblks.pwr.PlantInfo` object

`autoblks.pwr.PlantInfo` object for the system that you want to analyze.

### SubSystem — Subsystem name

character vector

Subsystem that you want to analyze.

Example: 'SiCiPtReferenceApplication/Passenger Car/Engine'

Example: 'SiCiPtReferenceApplication/Passenger Car/Drivetrain'

Data Types: char

# histogramEff

Display powertrain subsystem efficiency histogram

## Syntax

```
histogramEff(SubSystem)
```

## Description

The `histogramEff(SubSystem)` method displays a histogram of the powertrain subsystem efficiency for the `autoblks.pwr.PlantInfo` object. Use instances of the `autoblks.pwr.PlantInfo` object to evaluate and report power and energy for component-level blocks and system-level models.

After you use the `findChildSys` method to analyze the powertrain subsystem power and energy, use the `histogramEff` method to display a histogram of the efficiency.

## Examples

### Use histogramEff Method to Display Results

Analyze the power and energy in the conventional vehicle reference application. To use the `histogramEff` method to display a histogram of the time spent at each engine plant efficiency, see “step 6” on page 8-43.

- 1 Open the conventional vehicle reference application. By default, the application has a mapped 1.5 L spark-ignition (SI) engine and a dual clutch transmission. Project files open in a writable location.

```
autoblckConVehStart
```

- 2 Set the system name to `SiCiPtReferenceApplication`.

Create the `autoblks.pwr.PlantInfo` object.

Use the `PwrUnits` and `EnrgyUnits` properties to specify the units.

```
SysName = 'SiCiPtReferenceApplication';
VehPwrAnalysis = autoblks.pwr.PlantInfo(SysName);
VehPwrAnalysis.PwrUnits = 'kW';
VehPwrAnalysis.EnrgyUnits = 'MJ';
```

- 3 Use the `run` method to turn on logging, run simulation, and add logged data to the object.

```
run(VehPwrAnalysis);
```

- 4 Use the `dispSysSummary` method to display the results.

```
dispSysSummary(VehPwrAnalysis);
```

- 5 Use the `xlsSysSummary` method to write the results to a spreadsheet.

```
xlsSysSummary(VehPwrAnalysis, 'EnergySummary.xlsx');
```

- 6 Use the `findChildSys` method to retrieve the `autoblks.pwr.PlantInfo` object for the Engine subsystem.

To display the results, use the `dispSignalSummary` method.

Use the `histogramEff` method to display a histogram of the time spent at each engine plant efficiency.

```
EngSysName = 'SiCiPtReferenceApplication/Passenger Car/Engine';  
EngPwrAnalysis = findChildSys(VehPwrAnalysis,EngSysName);  
dispSignalSummary(EngPwrAnalysis);  
histogramEff(EngPwrAnalysis);
```

- 7 Use the `findChildSys` method to retrieve the `autoblks.pwr.PlantInfo` object for the Drivetrain subsystem.

To display the results, use the `dispSignalSummary` method.

```
DrvtrnSysName = 'SiCiPtReferenceApplication/Passenger Car/Drivetrain';  
DrvtrnPwrAnalysis = findChildSys(VehPwrAnalysis,DrvtrnSysName);  
dispSignalSummary(DrvtrnPwrAnalysis);
```

- 8 To plot the results, use the `sdiSummary` method.

```
sdiSummary(VehPwrAnalysis,{EngSysName,DrvtrnSysName})
```

## Input Arguments

### SubSystem — Subsystem name

character vector

Subsystem that you want to analyze.

Example: 'SiCiPtReferenceApplication/Passenger Car/Engine'

Example: 'SiCiPtReferenceApplication/Passenger Car/Drivetrain'

Data Types: char

## run

Run powertrain energy and power analysis

### Syntax

```
run(PlantInfoObj)
```

### Description

Use the `run(PlantInfoObj)` method to turn signal logging on, run a powertrain energy and power analysis, and add data to the `autoblks.pwr.PlantInfo` object. Use instances of the `autoblks.pwr.PlantInfo` object to evaluate and report power and energy for component-level blocks and system-level models.

### Examples

#### Use run Method for Powertrain Energy Analysis

Analyze the power and energy in the conventional vehicle reference application. To use the `run` method for the analysis, see “step 3” on page 8-45.

- 1 Open the conventional vehicle reference application. By default, the application has a mapped 1.5 L spark-ignition (SI) engine and a dual clutch transmission. Project files open in a writable location.

```
autoblkConVehStart
```

- 2 Set the system name to `SiCiPtReferenceApplication`.

Create the `autoblks.pwr.PlantInfo` object.

Use the `PwrUnits` and `EnrgyUnits` properties to specify the units.

```
SysName = 'SiCiPtReferenceApplication';
VehPwrAnalysis = autoblks.pwr.PlantInfo(SysName);
VehPwrAnalysis.PwrUnits = 'kW';
VehPwrAnalysis.EnrgyUnits = 'MJ';
```

- 3 Use the `run` method to turn on logging, run simulation, and add logged data to the object.

```
run(VehPwrAnalysis);
```

- 4 Use the `dispSysSummary` method to display the results.

```
dispSysSummary(VehPwrAnalysis);
```

- 5 Use the `xlsSysSummary` method to write the results to a spreadsheet.

```
xlsSysSummary(VehPwrAnalysis, 'EnergySummary.xlsx');
```

- 6 Use the `findChildSys` method to retrieve the `autoblks.pwr.PlantInfo` object for the Engine subsystem.

To display the results, use the `dispSignalSummary` method.

Use the `histogramEff` method to display a histogram of the time spent at each engine plant efficiency.

```
EngSysName = 'SiCiPtReferenceApplication/Passenger Car/Engine';  
EngPwrAnalysis = findChildSys(VehPwrAnalysis,EngSysName);  
dispSignalSummary(EngPwrAnalysis);  
histogramEff(EngPwrAnalysis);
```

- 7** Use the `findChildSys` method to retrieve the `autoblks.pwr.PlantInfo` object for the Drivetrain subsystem.

To display the results, use the `dispSignalSummary` method.

```
DrvtrnSysName = 'SiCiPtReferenceApplication/Passenger Car/Drivetrain';  
DrvtrnPwrAnalysis = findChildSys(VehPwrAnalysis,DrvtrnSysName);  
dispSignalSummary(DrvtrnPwrAnalysis);
```

- 8** To plot the results, use the `sdiSummary` method.

```
sdiSummary(VehPwrAnalysis, {EngSysName, DrvtrnSysName})
```

## Input Arguments

### **PlantInfoObj** — Instance of **PlantInfo** object

`autoblks.pwr.PlantInfo` object

`autoblks.pwr.PlantInfo` object for the system that you want to analyze.

## See Also

`autoblks.pwr.PlantInfo`

## Topics

“Analyze Power and Energy”

## Introduced in R2019a

# sdiSummary

Display Simulation Data Inspector plots of powertrain energy and power

## Syntax

```
sdiSummary(PlantInfoObj,blocknames)
```

## Description

The `sdiSummary(PlantInfoObj,blocknames)` method plots the powertrain energy and power analysis results for the `autoblks.pwr.PlantInfo` object.

Use instances of the `autoblks.pwr.PlantInfo` object to evaluate and report power and energy for component-level blocks and system-level models.

## Examples

### Use sdiSummary Method to Plot Results

Analyze the power and energy in the conventional vehicle reference application. To use the `sdiSummary` method to display the Simulation Data Inspector plots of the engine and drivetrain results, see “step 8” on page 8-48.

- 1 Open the conventional vehicle reference application. By default, the application has a mapped 1.5 L spark-ignition (SI) engine and a dual clutch transmission. Project files open in a writable location.

```
autoblckConVehStart
```

- 2 Set the system name to `SiCiPtReferenceApplication`.

Create the `autoblks.pwr.PlantInfo` object.

Use the `PwrUnits` and `EnrgyUnits` properties to specify the units.

```
SysName = 'SiCiPtReferenceApplication';
VehPwrAnalysis = autoblks.pwr.PlantInfo(SysName);
VehPwrAnalysis.PwrUnits = 'kW';
VehPwrAnalysis.EnrgyUnits = 'MJ';
```

- 3 Use the `run` method to turn on logging, run simulation, and add logged data to the object.

```
run(VehPwrAnalysis);
```

- 4 Use the `dispSysSummary` method to display the results.

```
dispSysSummary(VehPwrAnalysis);
```

- 5 Use the `xlsSysSummary` method to write the results to a spreadsheet.

```
xlsSysSummary(VehPwrAnalysis,'EnergySummary.xlsx');
```

- 6 Use the `findChildSys` method to retrieve the `autoblks.pwr.PlantInfo` object for the Engine subsystem.

To display the results, use the `dispSignalSummary` method.

Use the `histogramEff` method to display a histogram of the time spent at each engine plant efficiency.

```
EngSysName = 'SiCiPtReferenceApplication/Passenger Car/Engine';
EngPwrAnalysis = findChildSys(VehPwrAnalysis,EngSysName);
dispSignalSummary(EngPwrAnalysis);
histogramEff(EngPwrAnalysis);
```

- 7 Use the `findChildSys` method to retrieve the `autoblks.pwr.PlantInfo` object for the Drivetrain subsystem.

To display the results, use the `dispSignalSummary` method.

```
DrvtrnSysName = 'SiCiPtReferenceApplication/Passenger Car/Drivetrain';
DrvtrnPwrAnalysis = findChildSys(VehPwrAnalysis,DrvtrnSysName);
dispSignalSummary(DrvtrnPwrAnalysis);
```

- 8 To plot the results, use the `sdiSummary` method.

```
sdiSummary(VehPwrAnalysis,{EngSysName,DrvtrnSysName})
```

## Input Arguments

### **PlantInfoObj** — Instance of **PlantInfo** object

`autoblks.pwr.PlantInfo` object

`autoblks.pwr.PlantInfo` object for the system that you want to analyze.

### **blocknames** — Block or name

character vector | string | 'all'

Block or subsystem names, specified as a character vector or a string, separated by a comma.

Example: 'SiCiPtReferenceApplication/Passenger Car/Engine'

Example: 'SiCiPtReferenceApplication/Passenger Car/Engine', 'SiCiPtReferenceApplication/Passenger Car/Drivetrain'

Data Types: char | string

# xlsSysSummary

Write powertrain energy analysis to spreadsheet

## Syntax

```
xlsSysSummary(PlantInfoObj, filename, sheet)
```

## Description

The `xlsSysSummary(PlantInfoObj, filename, sheet)` method exports the system energy and efficiency for the `autoblks.pwr.PlantInfo` object. Use the `autoblks.pwr.PlantInfo` object to evaluate and report power and energy for component-level blocks and system-level models.

After you use the `run` method to analyze the powertrain power and energy, use the `xlsSysSummary` method to write the results to a spreadsheet.

## Examples

### Use xlsSysSummary Method to Write Results to Spreadsheet

Analyze the power and energy in the conventional vehicle reference application. To use the `xlsSysSummary` method to write the results to a spreadsheet, see “step 5” on page 8-49.

- 1 Open the conventional vehicle reference application. By default, the application has a mapped 1.5 L spark-ignition (SI) engine and a dual clutch transmission. Project files open in a writable location.

```
autoblckConVehStart
```

- 2 Set the system name to `SiCiPtReferenceApplication`.

Create the `autoblks.pwr.PlantInfo` object.

Use the `PwrUnits` and `EnrgyUnits` properties to specify the units.

```
SysName = 'SiCiPtReferenceApplication';
VehPwrAnalysis = autoblks.pwr.PlantInfo(SysName);
VehPwrAnalysis.PwrUnits = 'kW';
VehPwrAnalysis.EnrgyUnits = 'MJ';
```

- 3 Use the `run` method to turn on logging, run simulation, and add logged data to the object.

```
run(VehPwrAnalysis);
```

- 4 Use the `dispSysSummary` method to display the results.

```
dispSysSummary(VehPwrAnalysis);
```

- 5 Use the `xlsSysSummary` method to write the results to a spreadsheet.

```
xlsSysSummary(VehPwrAnalysis, 'EnergySummary.xlsx');
```

- 6 Use the `findChildSys` method to retrieve the `autoblks.pwr.PlantInfo` object for the Engine subsystem.

To display the results, use the `dispSignalSummary` method.

Use the `histogramEff` method to display a histogram of the time spent at each engine plant efficiency.

```
EngSysName = 'SiCiPtReferenceApplication/Passenger Car/Engine';
EngPwrAnalysis = findChildSys(VehPwrAnalysis,EngSysName);
dispSignalSummary(EngPwrAnalysis);
histogramEff(EngPwrAnalysis);
```

- 7 Use the `findChildSys` method to retrieve the `autoblks.pwr.PlantInfo` object for the Drivetrain subsystem.

To display the results, use the `dispSignalSummary` method.

```
DrvtrnSysName = 'SiCiPtReferenceApplication/Passenger Car/Drivetrain';
DrvtrnPwrAnalysis = findChildSys(VehPwrAnalysis,DrvtrnSysName);
dispSignalSummary(DrvtrnPwrAnalysis);
```

- 8 To plot the results, use the `sdiSummary` method.

```
sdiSummary(VehPwrAnalysis,{EngSysName,DrvtrnSysName})
```

## Input Arguments

### PlantInfoObj — Instance of PlantInfo object

`autoblks.pwr.PlantInfo` object

`autoblks.pwr.PlantInfo` object for the system that you want to analyze.

### filename — File name

character vector | string

File name, specified as a character vector or a string.

If `filename` does not exist, `xlsSysSummary` creates a file, determining the format based on the specified extension. To create a file compatible with Excel® 97–2003 software, specify an extension of `.xls`. To create files in Excel 2007 formats, specify an extension of `.xlsx`, `.xlsb`, or `.xlsm`. If you do not specify an extension, `xlsSysSummary` uses the default, `.xls`.

Example: `'myFile.xlsx'` or `"myFile.xlsx"`

Example: `'C:\myFolder\myFile.xlsx'`

Example: `'myFile.csv'`

Data Types: `char` | `string`

### sheet — Worksheet name

character vector | string | positive integer

Worksheet name, specified as one of the following:

- Character vector or string that contains the worksheet name. The name cannot contain a colon (:). To determine the names of the sheets in a spreadsheet file, use `xlsinfo`.
- Positive integer that indicates the worksheet index.

If `sheet` does not exist, `xlswrite` adds a sheet at the end of the worksheet collection. If `sheet` is an index larger than the number of worksheets, `xlswrite` appends empty sheets until the number of worksheets in the workbook equals `sheet`. In either case, `xlswrite` generates a warning indicating that it has added a worksheet.

Data Types: char | string | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

## addLoggedData

Add logged data

### Syntax

```
addLoggedData(PlantInfoObj,logout)
```

### Description

`addLoggedData(PlantInfoObj,logout)` adds logged signal data to the `autoblks.pwr.PlantInfo` object specified by the `Simulink.SimulationData.Dataset` signal data object.

If the data logged for the system does not conserve energy, the method returns a warning.

If the `Simulink.SimulationData.Dataset` object does not include data for the Power Accounting Bus Creator blocks in the system, the method returns an error.

### Input Arguments

#### **PlantInfoObj** — Instance of **PlantInfo** object

`autoblks.pwr.PlantInfo` object

`autoblks.pwr.PlantInfo` object for the system that you want to analyze.

#### **logout** — Dataset object for signals

`Simulink.SimulationData.Dataset` object

`Simulink.SimulationData.Dataset` object for signals that you want to log.

# isEnrgyBalanced

Logical flag for energy conservation

## Syntax

```
flag=isEnrgyBalanced(PlantInfoObj)
```

## Description

`flag=isEnrgyBalanced(PlantInfoObj)` returns logical 1 (true) if the system conserves energy. Otherwise, it returns logical 0 (false).

## Input Arguments

### PlantInfoObj — Instance of PlantInfo object

`autoblks.pwr.PlantInfo` object

`autoblks.pwr.PlantInfo` object for the system that you want to analyze.

## Output Arguments

### flag — Indicator of energy conservation

1 (true) | 0 (false)

Indicator of energy conservation, returned as a logical 1 (true) or 0 (false).

Data Types: `logical`

## Algorithms

To determine if the system conserves energy, the `isEnrgyBalanced` method checks the energy conservation at each time step.

$$E_{Err} = \sum E_{trans} + \sum E_{nottrans} - \sum E_{store}$$

Blocks change the input energy plus released stored energy to output energy plus stored energy. For example, a mapped engine block uses fuel (not transferred energy) to produce torque (transferred energy) and heat loss (not transferred energy). The total modified energy represents the average between the input fuel energy and the energy exiting the system (torque and heat loss). To calculate the total energy modified by the block, the method uses the integral of the average transferred, not transferred, and stored power.

$$E_{total} = \frac{1}{2} \left( \int_0^{t_{end}} \left( \sum |P_{trans}| + \sum |P_{nottrans}| + \sum |P_{store}| \right) dt \right) \Bigg|_{t=t_{end}}$$

If the energy conservation error is within an error tolerance, the method returns true. Specifically, if either condition is met, the method returns true.

| Condition                                          |    |                                  |
|----------------------------------------------------|----|----------------------------------|
| $\frac{ E_{Err} }{E_{total}} < EnergyBal_{RelTol}$ | or | $E_{total} < EnergyBal_{AbsTol}$ |

The equations use these variables.

|                                          |                                                                     |
|------------------------------------------|---------------------------------------------------------------------|
| $E_{Err}$                                | Energy conservation error                                           |
| $E_{total}$                              | Total energy modified by block                                      |
| $EnergyBal_{RelTol}, EnergyBal_{AbsTol}$ | Energy balance relative and absolute tolerance, respectively        |
| $P_{trans}, E_{trans}$                   | Transferred power and energy, respectively                          |
| $P_{nottrans}, E_{nottrans}$             | Not transferred power and energy, respectively                      |
| $P_{store}, E_{store}$                   | Stored power and energy, respectively                               |
| $P_{input}, P_{output}$                  | Input and output power logged by Power Accounting Bus Creator block |

# loggingOff

Turn signal logging off

## Syntax

```
loggingOff(PlantInfoObj)
```

## Description

`loggingOff(PlantInfoObj)` turns signal logging off for all Power Accounting Bus Creator blocks in the `autoblks.pwr.PlantInfo` system object.

## Input Arguments

### **PlantInfoObj** — Instance of **PlantInfo** object

`autoblks.pwr.PlantInfo` object

`autoblks.pwr.PlantInfo` object for the system that you want to analyze.

# Battery.PulseSequence

Define a single pulse sequence

## Description

Use the `Battery.PulseSequence` object to define a single experimental pulse sequence at a specific temperature and pulse current magnitude.

You can place multiple experimental pulse sequences into an array of `Battery.PulseSequence` objects. To do so, create a `Battery.PulseSequence` object for each experimental pulse sequence instance.

To use the `Battery.PulseSequence` object and methods, you need these products:

- Powertrain Blockset
- Curve Fitting Toolbox™
- Optimization Toolbox™
- Parallel Computing Toolbox™
- Simulink Design Optimization

## Creation

### Syntax

```
psObj = Battery.PulseSequence
```

### Description

MATLAB creates a `psObj = Battery.PulseSequence` object that defines a pulse sequence.

## Properties

### Data — Raw data

m-by-5 array

An m-by-5 array of pulse sequence data. Use the `addData` object function to add the data. `addData` computes the charge and state of charge (SOC), using the assumption that the experimental test ranges is 0% to 100% SOC.

| Array Element | Description | Unit |
|---------------|-------------|------|
| Data(m,1)     | Time        | s    |
| Data(m,2)     | Voltage     | V    |
| Data(m,3)     | Current     | A    |
| Data(m,4)     | Charge      | A·s  |

| Array Element | Description           | Unit          |
|---------------|-----------------------|---------------|
| Data(m,5)     | State of charge (SOC) | Dimensionless |

Data Types: double

### modelName — Name of model

character vector

Name of the model to use for simulation

Example: 'BatteryEstim3RC\_PTBS'

Data Types: char

### MetaData — Battery.MetaData object properties

0-by-1 array

Battery.MetaData object properties containing metadata for the data.

Data Types: function\_handle

### Capacity — Pulse sequence capacity

scalar

Capacity observed as the difference between lowest and highest energy, in A·s. Calculated by the `addData` method, but can be overwritten.

Example: 0.0

Data Types: double

### Parameters — Battery.Parameters object properties

0-by-1 array

Battery.Parameters object containing the most recently determined battery equivalent circuit parameters.

Data Types: function\_handle

### ParametersHistory — Battery.ParametersHistory object properties

0-by-1 array

Battery.ParametersHistory object array containing the history of the battery equivalent circuit parameters through different estimation steps. The last element is the most recent parameter set.

Data Types: function\_handle

## Object Functions

|                                  |                                                                 |
|----------------------------------|-----------------------------------------------------------------|
| <code>addData</code>             | Import pulse sequence experimental data                         |
| <code>createPulses</code>        | Identify pulses and create pulse objects from experimental data |
| <code>estimateInitialEmR0</code> | Estimate open circuit voltage and series resistance             |
| <code>estimateInitialEmRx</code> | Estimate open circuit voltage and RC pair resistance            |
| <code>estimateInitialTau</code>  | Estimate RC pair time constant                                  |
| <code>estimateParameters</code>  | Estimate parameters                                             |
| <code>getSocIdxForPulses</code>  | Return state of charge index for pulses                         |
| <code>loadDataFromMatFile</code> | Load pulse data from a MAT-file                                 |

|                         |                                        |
|-------------------------|----------------------------------------|
| plot                    | Plot pulse sequence data               |
| plotIdentifiedPulses    | Plot identified pulses                 |
| plotLatestParameters    | Plot latest pulse sequence parameters  |
| plotSimulationResults   | Plot pulse sequence simulation results |
| populatePulseParameters | Populate pulse parameters              |
| removePulses            | Remove pulses from sequence            |
| repairTimeVector        | Repair time vector                     |

## Examples

### Add File Data to Battery.PulseSequence Object

This example shows how to add data to a `Battery.PulseSequence` object.

Create a pulse sequence object.

```
psObj = Battery.PulseSequence;  
disp(psObj)
```

Load data from a file.

```
FileName = 'Synthetic_LiPo_PulseDischarge.mat';  
[time,voltage,current] = Battery.loadDataFromMatFile(FileName);
```

Add the data to the pulse sequence.

```
addData(psObj,time,voltage,current);
```

## addData

Import pulse sequence experimental data

### Syntax

```
addData(psObj,Time,Voltage,Current)
```

### Description

`addData(psObj,Time,Voltage,Current)` adds the pulse sequence experimental data to the `Battery.PulseSequence` object. The `Time`, `Voltage`, and `Current` input arrays must have equal lengths. `addData` computes the charge and state of charge (SOC), using the assumption that the experimental test range is 0% to 100% SOC.

### Examples

#### Add Data to Battery.PulseSequence Object

This example shows how to add data to a `Battery.PulseSequence` object.

Create a pulse sequence object.

```
psObj = Battery.PulseSequence;  
disp(psObj)
```

Load data from a file.

```
FileName = 'Synthetic_LiPo_PulseDischarge.mat';  
[time,voltage,current] = Battery.loadDataFromMatFile(FileName);
```

Add the data to the pulse sequence.

```
addData(psObj,time,voltage,current);
```

### Input Arguments

#### **psObj** — Instance of `Battery.PulseSequence` class

`Battery.PulseSequence` object

`Battery.PulseSequence` object for the pulse sequence that you want to analyze.

#### **Time** — Time

m-by-1 array

m-by-1 array of time data, in s.

Data Types: `double`

#### **Voltage** — Voltage

m-by-1 array

m-by-1 array of voltage data, in V.

Data Types: double

### **Current — Current**

m-by-1 array

m-by-1 array of current data, in A.

Data Types: double

### **See Also**

Battery.PulseSequence

### **Topics**

“Generate Parameter Data for Datasheet Battery Block”

“Generate Parameter Data for Equivalent Circuit Battery Block”

## loadDataFromMatFile

Load pulse data from a MAT-file

### Syntax

```
[Time,Voltage,Current] = loadDataFromMatFile(FileName)
[Time,Voltage,Current] = loadDataFromMatFile(FileName,Name,Value)
```

### Description

`[Time,Voltage,Current] = loadDataFromMatFile(FileName)` function loads pulse data from a MAT-file.

`[Time,Voltage,Current] = loadDataFromMatFile(FileName,Name,Value)` function loads pulse data from a MAT-file with additional options specified by one or more `Name, Value` pair arguments.

### Examples

#### Load File Data to Battery.PulseSequence Object

This example shows how to add data to a `Battery.PulseSequence` object.

Create a pulse sequence object.

```
psObj = Battery.PulseSequence;
disp(psObj);
```

Load data from a file.

```
FileName = 'Synthetic_LiPo_PulseDischarge.mat';
[time,voltage,current] = Battery.loadDataFromMatFile(FileName);
```

Add the data to the pulse sequence.

```
addData(psObj,time,voltage,current);
```

### Input Arguments

#### FileName — Path or file name

`untitled.mat` (default) | path, or MAT-file name

Path or file name of the MAT-file that contains the pulse sequence data.

Example: `'Synthetic_LiPo_PulseDischarge.mat'`

Data Types: `char`

## Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: `Battery.loadDataFromMatFile(FileName, 'TimeVariable', 'myTimeVariable')`

### TimeVariable — Time variable in MAT-file

`time` (default) | character vector

Use this value to specify the time variable to search for in the MAT-file. If unspecified, the method searches for variables containing 'time'.

Example: `Battery.loadDataFromMatFile(FileName, 'TimeVariable', 'myTimeVariable')`

Data Types: char

### VoltageVariable — Voltage variable in MAT-file

`volt` (default) | character vector

Use this value to specify the voltage variable to search for in the MAT-file. If unspecified, the method searches for variables containing 'voltage'.

Example:

`Battery.loadDataFromMatFile(FileName, 'VoltageVariable', 'myVoltageVariable')`

Data Types: char

### CurrentVariable — Current variable in MAT-file

`current` (default) | character vector

Use this value to specify the current variable to search for in the MAT-file. If unspecified, the method searches for variables containing 'current'.

Example:

`Battery.loadDataFromMatFile(FileName, 'CurrentVariable', 'myCurrentVariable')`

Data Types: char

## Output Arguments

### Time — Time

m-by-1 array

m-by-1 array of time data, in s.

Data Types: double

### Voltage — Voltage

m-by-1 array

m-by-1 array of voltage data, in V.

Data Types: double

### Current — Current

m-by-1 array

m-by-1 array of current data, in A.

Data Types: double

### **See Also**

Battery.PulseSequence

# createPulses

Identify pulses and create pulse objects from experimental data

## Syntax

```
createPulses(psObj)
createPulses(psObj,Name,Value)
```

## Description

`createPulses(psObj)` identifies the location of pulse events. Creates separate pulse objects from the `Battery.PulseSequence` object experimental data.

`createPulses(psObj,Name,Value)` identifies the location of pulse events. Creates separate pulse objects from the `Battery.PulseSequence` object experimental data with additional options specified by one or more `Name,Value` pair arguments.

## Examples

### Create Pulse Objects from Data

This example shows how to create pulse objects from data.

Create a pulse sequence object.

```
psObj = Battery.PulseSequence;
disp(psObj)
```

Load data from a file.

```
FileName = 'Synthetic_LiPo_PulseDischarge.mat';
[time,voltage,current] = Battery.loadDataFromMatFile(FileName);
```

Add the data to the pulse sequence.

```
addData(psObj,time,voltage,current);
```

Create pulse objects from data.

```
createPulses(psObj,...
    'CurrentOnThreshold',0.1,...
    'NumRCBranches',3,...
    'RCBranchesUse2TimeConstants',false,...
    'PreBufferSamples',10,...
    'PostBufferSamples',15);
```

## Input Arguments

**psObj** — Instance of `Battery.PulseSequence` class

`Battery.PulseSequence` object

`Battery.PulseSequence` object for the pulse sequence that you want to analyze.

### Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: `createPulses(psObj, 'CurrentOnThreshold', 0.1)`

### CurrentOnThreshold — Minimum current magnitude

0.025 (default) | scalar

Use this value to specify the minimum current magnitude for identifying the pulse locations, in A. The `createPulses` function considers values below the `CurrentOnThreshold` as relaxation or measurement noise.

Example: `createPulses(psObj, 'CurrentOnThreshold', 0.1)`

Data Types: double

### NumRCBranches — Number of RC branches

3 (default) | scalar

Use this value to specify the number of RC branches. To change the number of branches after an estimation, you must rerun `createPulses` along with any estimation steps. Rerunning ensures that the estimation parameters are the right size.

Example: `createPulses(psObj, 'NumRCBranches', 4)`

Data Types: uint32

### RCBranchesUse2TimeConstants — Use load and relaxation time constants

false

The `createPulses` function does not support using separate time constants for load and relaxation when it estimates each RC branch. If you set the value to true, the `createPulses` function might produce an error.

Example: `createPulses(psObj, 'RCBranchesUse2TimeConstants', false)`

Data Types: logical

### PreBufferSamples — Pulses to retain before pulse estimation

10 (default) | scalar

Use this value to specify the number of pulses to retain before pulse estimation. The buffer allows the estimation to focus on matching the measured data before the pulse begins.

Example: `createPulses(psObj, 'PreBufferSamples', 5)`

Data Types: uint32

### PostBufferSamples — Pulses to retain for next estimation

15 (default) | scalar

Use this value to specify the number of pulses to retain before the next pulse estimation. The buffer allows the estimation to focus on matching the transition when the next pulse begins. Typically, the end transition of one pulse and the starting transition at the next pulse are at the same state of

charge (SOC). Therefore, both transitions help determine the parameter values at that SOC breakpoint.

Example: `createPulses(psObj, 'PostBufferSamples', 14)`

Data Types: `uint32`

### **PulseRequires2Samples — Pulse requires two consecutive samples under current**

`false` (default)

Use this value to specify that there must be two consecutive samples under current to define a pulse. Set to `true` if occasional noise spikes in the current measurement trigger a false pulse detection. By default, the value is `false`, indicating that a single sample above the threshold detects a pulse event.

Example: `createPulses(psObj, 'PulseRequires2Samples', true)`

Data Types: `logical`

## estimateInitialEmR0

Estimate open circuit voltage and series resistance

### Syntax

```
estimateInitialEmR0(psObj)
estimateInitialEmR0(psObj,Name,Value)
```

### Description

`estimateInitialEmR0(psObj)` estimates the open circuit voltage,  $Em$ , and series resistance,  $Ro$ , for the `Battery.PulseSequence` object data. For the estimation, the method uses data points around each pulse transition. The method uses estimated values to determine the minimum and maximum constraint values. The method stores the results in an `Battery.Parameters` object.

`estimateInitialEmR0(psObj,Name,Value)` estimates the open circuit voltage,  $Em$ , and series resistance,  $Ro$ , for the `Battery.PulseSequence` object data with additional options specified by one or more `Name,Value` pair arguments.

### Input Arguments

#### **psObj — Instance of Battery.PulseSequence class**

`Battery.PulseSequence` object

`Battery.PulseSequence` object for the pulse sequence that you want to analyze.

#### **Name-Value Pair Arguments**

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example:

```
estimateInitialEmR0(psObj,'SetEmConstraints',false,'EstimateEm',true,'EstimateR0',true)
```

#### **SetEmConstraints — Use open circuit voltage constraints**

`true` (default)

Use this value to specify if the method constrains the open circuit voltage,  $Eo$ , to within maximum or minimum values. To determine the maximum and minimum voltage, the method uses the voltage at the end of relaxation as a constraint for future estimation steps.

If the pulse is a discharge pulse, the voltage rises during relaxation. The final relaxation voltage is set to the minimum constraint for  $Eo$  at the corresponding state of charge (SOC).

If the pulse is a charge pulse, the voltage falls during relaxation. The final relaxation voltage is set to the maximum constraint at the corresponding SOC.

Example: `estimateInitialEmR0(psObj,'SetEmConstraints',false)`

Data Types: logical

### **EstimateEm — Estimate open circuit voltage**

true (default) | false

Use this value to specify if the method estimates the open circuit voltage,  $E_m$ . Use the default setting, true, unless you have already defined the  $E_m$  values from outside analysis.

Example: `eestimateInitialEmR0(psObj, 'EstimateEm', false)`

Data Types: logical

### **EstimateR0 — Estimate series resistance**

true (default) | false

Use this value to specify if the method estimates the series resistance,  $R_0$ . Use the default setting, true, unless you have already defined the  $R_0$  values from outside analysis.

Example: `estimateInitialEmR0(psObj, 'EstimateR0', false)`

Data Types: logical

## estimateInitialEmRx

Estimate open circuit voltage and RC pair resistance

### Syntax

```
estimateInitialEmRx(psObj)
estimateInitialEmRx(psObj,Name,Value)
```

### Description

`estimateInitialEmRx(psObj)` estimates the open circuit voltage,  $Em$ , and RC pair resistance,  $Ex$ , for the `Battery.PulseSequence` object data. For the estimation, the method solves a linear system of equations throughout the pulse sequence. The method stores the results in a `Battery.Parameters` object.

`estimateInitialEmRx(psObj,Name,Value)` estimates the open circuit voltage,  $Em$ , and RC pair resistance,  $Ex$ , for the `Battery.PulseSequence` object data with additional options specified by one or more `Name,Value` pair arguments.

### Input Arguments

#### **psObj** — Instance of `Battery.PulseSequence` class

`Battery.PulseSequence` object

`Battery.PulseSequence` object for the pulse sequence that you want to analyze.

#### **Name-Value Pair Arguments**

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example:

```
estimateInitialEmRx(psObj,'IgnoreRelaxation',false,'ShowPlots',true,'ShowBeforePlots',true,'PlotDelay',0.5,'EstimateEm',true)
```

#### **EstimateEm** — Estimate voltage

`true` (default) | `false`

Use this value to specify if the method estimates the open circuit voltage,  $Em$ .

Example: `estimateInitialEmRx(psObj,'EstimateEm',false)`

Data Types: `logical`

#### **RetainEm** — Retain voltage estimate

`true` (default) | `false`

Use this value to specify if the method retains the open circuit voltage,  $Em$ , estimate. Set to `true` if you want the method to use an external open circuit voltage to state of charge (SOC) relationship. If `EstimateEm` is `false`, this option does not apply.

Example: `estimateInitialEmRx(psObj, 'RetainEm', false)`

Data Types: `logical`

### **EstimateR0 — Estimate series resistance**

`true` (default) | `false`

Use this value to specify if the method estimates the series resistance,  $R_0$ .

Example: `estimateInitialEmRx(psObj, 'EstimateR0', false)`

Data Types: `logical`

### **RetainR0 — Retain series resistance**

`true` (default) | `false`

Use this value to specify if the method retains the identified series resistance,  $R_0$ , estimate. Set to `true` if you want the method to use an existing series resistance to state of charge (SOC) relationship. If `EstimateEm` is `false`, this option does not apply.

Example: `estimateInitialEmRx(psObj, 'RetainR0', false)`

Data Types: `logical`

### **ShowPlots — Show estimation plots**

`false` (default) | `true`

Use this value to specify if the method shows plots during each estimation step.

Example: `estimateInitialEmRx(psObj, 'ShowPlots', true)`

Data Types: `logical`

### **ShowBeforePlots — Show before estimation plots**

`false` (default) | `true`

Use this value to specify if the method shows before plots during each estimation step. If `ShowPlots` is `false`, this option does not apply.

Example: `estimateInitialEmRx(psObj, 'ShowBeforePlots', true)`

Data Types: `logical`

### **PlotDelay — Plot delay**

`0.0` (default) | `scalar`

Use this value to specify the time delay after showing the plots, in s.

Example: `estimateInitialEmRx(psObj, 'PlotDelay', 0.1)`

Data Types: `double`

### **IgnoreRelaxation — Estimate series resistance**

`false` (default) | `true`

Use this value to specify if the method completely ignores the relaxation and fits only the main pulse.

Example: `estimateInitialEmRx(psObj, 'IgnoreRelaxation', true)`

Data Types: `logical`

# estimateInitialTau

Estimate RC pair time constant

## Syntax

```
estimateInitialTau(psObj)
estimateInitialTau(psObj, Name, Value)
```

## Description

`estimateInitialTau(psObj)` estimates the RC pair time constant, *Tau* for the `Battery.PulseSequence` object data. For the estimation, the method fits the relaxation curve for each pulse. The method stores the results in an `Battery.Parameters` object.

`estimateInitialTau(psObj, Name, Value)` estimates the RC pair time constant, *Tau* for the `Battery.PulseSequence` object data with additional options specified by one or more `Name, Value` pair arguments.

## Input Arguments

### **psObj** — Instance of `Battery.PulseSequence` class

`Battery.PulseSequence` object

`Battery.PulseSequence` object for the pulse sequence that you want to analyze.

### **Name-Value Pair Arguments**

Specify optional comma-separated pairs of `Name, Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example:

```
estimateInitialTau(psObj, 'UpdateEndingEm', false, 'ShowPlots', true, 'ReusePlotFigure', true, 'UseLoadData', false, 'PlotDelay', 0.5)
```

### **ShowPlots** — Show estimation plots

false (default) | true

Use this value to specify if the method shows plots during each estimation step.

Example: `estimateInitialTau(psObj, 'ShowPlots', true)`

Data Types: logical

### **PlotDelay** — Plot delay

0.0 (default) | scalar

Use this value to specify the time delay after showing the plots, in s.

Example: `estimateInitialTau(psObj, 'PlotDelay', 0.5)`

Data Types: double

**ReusePlotFigure — Reuse plots**`true (default) | false`

Use this value to specify if the method reuses the same plot figure. If `false`, the estimation plots are in separate figure windows. If `ShowPlots` is `false`, the option does not apply.

Example: `estimateInitialTau(psObj, 'ReusePlotFigure', true)`

Data Types: `logical`

**UpdateEndingEm — Update voltage estimate**`false (default) | true`

Use this value to specify if the method updates the open circuit voltage estimate at the end of the relaxation, based on the curve fits.

Example: `estimateInitialTau(psObj, 'UpdateEndingEm', true)`

Data Types: `logical`

**UseLoadData — Plot delay**`false (default) | true`

Use this value to specify if the method uses the pulse load data, instead of pulse relaxation data, to estimate the time constant,  $\tau$ . By default, the setting is `false`, and the method uses the pulse relaxation to estimate the time constant.

Example: `estimateInitialTau(psObj, 'UseLoadData', true)`

Data Types: `logical`

# estimateParameters

Estimate parameters

## Syntax

```
estimateParameters(psObj)
estimateParameters(psObj,Name,Value)
```

## Description

`estimateParameters(psObj)` estimates the parameters in the `Battery.Parameters` object. The method stores the results in an `Battery.Parameters` object.

`estimateParameters(psObj,Name,Value)` estimates the parameters in the `Battery.Parameters` object data with additional options specified by one or more `Name,Value` pair arguments.

To use the `Battery.PulseSequence` object and methods, you need these products:

- Powertrain Blockset
- Curve Fitting Toolbox
- Optimization Toolbox
- Parallel Computing Toolbox
- Simulink Design Optimization

## Input Arguments

### **psObj** — Instance of `Battery.PulseSequence` class

`Battery.PulseSequence` object

`Battery.PulseSequence` object for the pulse sequence that you want to analyze.

### **Name-Value Pair Arguments**

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example:

```
estimateParameters(psObj,'CarryParamToNextPulse',true,'ShowPlots',true,'EstimateEm',true,'RetainEm',true,'EstimateR0',true,'RetainR0',true)
```

### **CarryParamsToNextPulse** — Use results for next SOC

`false` (default) | `true`

Use this value to specify if the method uses the identified current pulse final state of charge (SOC) parameter values as the initial estimate for the parameter values at the next SOC.

Example: `estimateParameters(psObj,'CarryParamsToNextPulse',true)`

Data Types: logical

**EstimateEm — Estimate voltage**

true (default) | false

Use this value to specify if the method estimates the open circuit voltage,  $E_m$ .

Example: `estimateParameters(psObj, 'EstimateEm', false)`

Data Types: logical

**RetainEm — Retain voltage estimate**

true (default) | false

Use this value to specify if the method retains the identified open circuit voltage,  $E_m$ , estimate. If `EstimateEm` is false, this option does to apply.

Example: `estimateParameters(psObj, 'RetainEm', false)`

Data Types: logical

**EstimateR0 — Estimate series resistance**

true (default) | false

Use this value to specify if the method estimates the series resistance,  $R_0$ .

Example: `estimateParameters(psObj, 'EstimateR0', false)`

Data Types: logical

**RetainR0 — Retain series resistance**

true (default) | false

Use this value to specify if the method retains the series resistance,  $R_0$ , estimate. If `EstimateR0` is false, this option does to apply.

Example: `estimateParameters(psObj, 'RetainR0', false)`

Data Types: logical

**RelConstrRx — Rx deviation**

inf (default) | scalar

Use this value to specify the RC pair resistance,  $R_x$ , deviation from previous pulse values, in percentage.

Example: `estimateParameters(psObj, 'RelConstrRx', 100)`

Data Types: double

**RelConstrTx — Tx deviation**

inf (default) | scalar

Use this value to specify the time constant deviation from previous pulse values, in percentage.

Example: `estimateParameters(psObj, 'RelConstrTx', 100)`

Data Types: double

**SD00optimizeOptions — Specify optimization options**

'Method' is `lsqnonlin` and 'UseParallel' is true (default)

Use this value to specify the `sdo.OptimizeOptions` object options. For example:

```
SD00optimizeOptions = sdo.OptimizeOptions(...
    'OptimizedModel',psObj.ModelName,...
    'Method','lsqnonlin',...
    'UseParallel','always')
```

### ShowPlots — Show estimation plots

false (default) | true

Use this value to specify if the method shows plots during each estimation step.

Example: `estimateParameters(psObj, 'ShowPlots', true)`

Data Types: logical

### ReusePlotFigure — Reuse plots

true (default) | false

Use this value to specify if the method reuses the same plot figure. If `false`, the estimation plots are in separate figure windows. If `ShowPlots` is `false`, the option does not apply.

Example: `estimateParameters(psObj, 'ReusePlotFigure', true)`

Data Types: logical

### PlotDelay — Plot delay

5.0 (default) | scalar

Use this value to specify the time delay after showing the plots, in s.

Example: `estimateParameters(psObj, 'PlotDelay', 0.1)`

Data Types: double

### PulseNumbers — Pulse numbers

1 (default) | scalar

Use this value to specify the pulse numbers to estimate. The default value, 1, is set to estimate all the pulses.

Data Types: uint32

## getSocIdxForPulses

Return state of charge index for pulses

### Syntax

```
idx=getSocIdxForPulses(psObj,pulseList)
```

### Description

`idx=getSocIdxForPulses(psObj,pulseList)` returns the row vector index of the state of charge (SOC) lookup table breakpoints.

### Input Arguments

**psObj** — Instance of `Battery.PulseSequence` class

`Battery.PulseSequence` object

`Battery.PulseSequence` object for the pulse sequence that you want to analyze.

**pulseList** — Index of pulses

`1:NumPulses` (default)

Index of pulses. For example, `1:10`.

Data Types: `int16`

### Output Arguments

**idx** — Indices into SOC lookup table

`1-by-NumPulses` array

Indices into SOC lookup table.

Data Types: `int16`

# plot

Plot pulse sequence data

## Syntax

```
plot_handle = plot(psObj)
```

## Description

`plot_handle = plot(psObj)` plots the data from a `Battery.PulseSequence` object.

## Input Arguments

**psObj** — Instance of `Battery.PulseSequence` class

`Battery.PulseSequence` object

`Battery.PulseSequence` object for the pulse sequence that you want to analyze.

## Output Arguments

**plot\_handle** — Plot handle

object handle

Handles to plot objects.

Data Types: `function_handle`

## plotIdentifiedPulses

Plot identified pulses

### Syntax

```
plot_handle = plotIdentifiedPulses(psObj)
```

### Description

`plot_handle = plotIdentifiedPulses(psObj)` plots identified pulses from a `Battery.PulseSequence` object.

### Input Arguments

**psObj** — Instance of `Battery.PulseSequence` class

`Battery.PulseSequence` object

`Battery.PulseSequence` object for the pulse sequence that you want to analyze.

### Output Arguments

**plot\_handle** — Plot handle

object handle

Handles to plot objects.

Data Types: `function_handle`

# plotLatestParameters

Plot latest pulse sequence parameters

## Syntax

```
plot_handle = plotLatestParameters(psObj)
```

## Description

`plot_handle = plotLatestParameters(psObj)` plots the latest pulse sequence parameters from a `Battery.PulseSequence` object.

## Input Arguments

**psObj** — Instance of `Battery.PulseSequence` class

`Battery.PulseSequence` object

`Battery.PulseSequence` object for the pulse sequence that you want to analyze.

## Output Arguments

**plot\_handle** — Plot handle

object handle

Handles to plot objects.

Data Types: `function_handle`

# plotSimulationResults

Plot pulse sequence simulation results

## Syntax

```
plot_handle=plotSimulationResults(psObj)  
plot_handle=plotSimulationResults(psObj,param)
```

## Description

`plot_handle=plotSimulationResults(psObj)` plots the simulation results of the pulse sequence based on the current parameter values.

`plot_handle=plotSimulationResults(psObj,param)` plots the simulation results of the pulse sequence based on the parameter values specified by the `Battery.Parameter` object.

## Input Arguments

### **psObj — Instance of Battery.PulseSequence class**

`Battery.PulseSequence` object

`Battery.PulseSequence` object for the pulse sequence that you want to analyze.

### **param — Instance of Battery.Parameter class**

`Battery.Parameter` object

`Battery.Parameter` object for the parameters that you want to analyze.

## Output Arguments

### **plot\_handle — Plot handle**

object handle

Handles to plot objects.

Data Types: `function_handle`

# populatePulseParameters

Populate pulse parameters

## Syntax

```
populatePulseParameters(psObj)
```

## Description

`populatePulseParameters(psObj)` populates parameters in the `Battery.PulseSequence` object based on the series of pulse objects. If the pulse objects are new, updated, or filtered, `populatePulseParameters` updates the identified pulse indices, SOC breakpoints, and parameters objects in `Battery.PulseSequence`.

## Input Arguments

### **psObj** — Instance of `Battery.PulseSequence` class

`Battery.PulseSequence` object

`Battery.PulseSequence` object for the pulse sequence that you want to analyze.

## See Also

`Battery.PulseSequence`

## Topics

“Generate Parameter Data for Datasheet Battery Block”

## removePulses

Remove pulses from sequence

### Syntax

```
removePulses(psObj, idxRemove)
```

### Description

`removePulses(psObj, idxRemove)` removes pulses from sequence specified by the `Battery.PulseSequence` object.

### Input Arguments

**psObj** — Instance of `Battery.PulseSequence` class

`Battery.PulseSequence` object

`Battery.PulseSequence` object for the pulse sequence that you want to analyze.

**idxRemove** — Index of pulse objects to remove

`1:NumPulses` (default)

Index of pulse objects to remove. For example, `1:10`.

Data Types: `int16`

# repairTimeVector

Repair time vector

## Syntax

```
repairTimeVector(psObj)  
repairTimeVector(psObj,MinDeltaT)
```

## Description

`repairTimeVector(psObj)` repairs common problems with the experimental time vector on the `Battery.PulseSequence` object.

`repairTimeVector(psObj,MinDeltaT)` repairs common problems with the experimental time vector on the `Battery.PulseSequence` object using a minimum time difference.

## Input Arguments

### **psObj** — Instance of `Battery.PulseSequence` class

`Battery.PulseSequence` object

`Battery.PulseSequence` object for the pulse sequence that you want to analyze.

### **MinDeltaT** — Minimum time difference

scalar

Index of pulse objects to remove. For example, `1:10`.

Data Types: `double`

## Battery.Pulse

Define a single pulse event

### Description

Use the `Battery.Pulse` object to define a single experimental pulse event. To create a pulse object, use the `Battery.PulseSequence` object function `createPulses`.

To use the `Battery.Pulse` object and methods, you need these products:

- Powertrain Blockset
- Curve Fitting Toolbox
- Optimization Toolbox
- Parallel Computing Toolbox
- Simulink Design Optimization

### Creation

#### Syntax

```
pulseObj = Battery.Pulse(Battery.PulseSequence)
```

#### Description

MATLAB creates a `pulseObj = Battery.Pulse(Battery.PulseSequence)` object that defines a single pulse event.

### Properties

#### Data — Raw data

1-by-5 array

An 1-by-5 array of pulse event data.

| Array Element          | Description           | Unit          |
|------------------------|-----------------------|---------------|
| <code>Data(1,1)</code> | Time                  | s             |
| <code>Data(1,2)</code> | Voltage               | V             |
| <code>Data(1,3)</code> | Current               | A             |
| <code>Data(1,4)</code> | Charge                | A·s           |
| <code>Data(1,5)</code> | State of charge (SOC) | Dimensionless |

Data Types: double

**InitialCapVoltage — Initial capacitor voltage**

array

Initial voltage of each capacitor during a pulse event, in V. Property set by the `Battery.PulseSequence` object function `estimateParameters`, based on the simulated end voltage or a prior pulse.

Data Types: double

**InitialChargeDeficit — Initial charge deficit**

0.0 (default) | scalar

Initial charge deficit at start of pulse event, in A·s. Property set by the `Battery.PulseSequence` object function `createPulses` when the function creates the series of `Battery.Pulse` objects.

Example: 0.0

Data Types: double

**idxLoad — Indices to load data**

[1 0] (default)

Indices to load data where the pulse event load begins and ends. Property set by the `Battery.PulseSequence` object function `createPulses` when the function creates the series of `Battery.Pulse` objects.

Data Types: int16

**idxRelax — Indices to relaxation data**

[1 0] (default)

Indices to relaxation data where the pulse event relaxation begins and ends. Property set by the `Battery.PulseSequence` object function `createPulses` when the function creates the series of `Battery.Pulse` objects.

Data Types: int16

**idxPulseSequence — Index to first pulse event data**

[] (default)

Index to first pulse event data point in the `Battery.PulseSequence` object data. Property set by the `Battery.PulseSequence` object function `createPulses` when the function creates the series of `Battery.Pulse` objects.

Data Types: int16

**IsDischarge — Discharge pulse**

true (default)

Use this value to specify if pulse is a discharge pulse event. Property set by the `Battery.PulseSequence` object function `createPulses` when the function creates the series of `Battery.Pulse` objects.

Data Types: logical

**Parameters — Battery.Parameters object properties**

0-by-1 array

`Battery.Parameters` object containing the most recently determined battery equivalent circuit parameters. Property set by the `Battery.PulseSequence` object function `createPulses` when the function creates the series of `Battery.Pulse` objects.

Data Types: `function_handle`

### **ParametersHistory — Battery.ParametersHistory object properties**

0-by-1 array

`Battery.ParametersHistory` object array containing the history of the battery equivalent circuit parameters through different estimation steps. The last element is the most recent parameter set.

Data Types: `function_handle`

## **Object Functions**

|                                |                                                             |
|--------------------------------|-------------------------------------------------------------|
| <code>plot</code>              | Plot pulse event data                                       |
| <code>getLoadData</code>       | Retrieve experimental data during load phase of pulse       |
| <code>getRelaxationData</code> | Retrieve experimental data during relaxation phase of pulse |
| <code>getTransitionData</code> | Retrieve experimental data during transition phase of pulse |

## **Examples**

### **Create Battery.Pulse Object**

This example shows how to create a `Battery.Pulse` object.

```
pulseObj = Battery.Pulse(psObj);
```

# plot

Plot pulse event data

## Syntax

```
plot_handle=plot(pulseObj)
```

## Description

`plot_handle=plot(pulseObj)` plots the data from a `Battery.Pulse` object.

## Input Arguments

**pulseObj** — Instance of `Battery.Pulse` class

`Battery.Pulse` object

`Battery.Pulse` object for the pulse event that you want to analyze.

## Output Arguments

**plot\_handle** — Plot handle

object handle

Handles to plot objects.

Data Types: `function_handle`

## See Also

`Battery.Pulse`

## Topics

**Introduced in R2016b**

## getLoadData

Retrieve experimental data during load phase of pulse

### Syntax

```
LoadData = plot(pulseObj,Buffer)
```

### Description

`LoadData = plot(pulseObj,Buffer)` retrieves the experimental data from a `Battery.Pulse` object during the load phase of a pulse.

### Input Arguments

**pulseObj — Instance of Battery.Pulse class**

`Battery.Pulse` object

`Battery.Pulse` object for the pulse event that you want to analyze.

**Buffer — Number of samples**

vector

Number of buffer samples before and after the load data, in the form `[BeforeBufferSize,AfterBufferSize]`. Use the buffer to ensure that the estimation has sufficient data before and after a transition.

### Output Arguments

**LoadData — Load data**

array

Load data during pulse event.

Data Types: `double`

### See Also

`Battery.Pulse`

# getRelaxationData

Retrieve experimental data during relaxation phase of pulse

## Syntax

```
RelaxationData = plot(pulseObj,Buffer)
```

## Description

`RelaxationData = plot(pulseObj,Buffer)` retrieves the experimental data from a `Battery.Pulse` object during the relaxation phase of a pulse.

## Input Arguments

### **pulseObj** — Instance of `Battery.Pulse` class

`Battery.Pulse` object

`Battery.Pulse` object for the pulse event that you want to analyze.

### **Buffer** — Number of samples

vector

Number of buffer samples before and after the load data, in the form `[BeforeBufferSize,AfterBufferSize]`. Use the buffer to ensure that the estimation has sufficient data before and after a transition.

## Output Arguments

### **RelaxationData** — Relaxation data

array

Relaxation data during pulse event.

Data Types: `double`

## See Also

`Battery.Pulse`

## Topics

## getTransitionData

Retrieve experimental data during transition phase of pulse

### Syntax

```
[TransitionDataBefore,TransitionDataAfter]=plot(pulseObj,idx)  
[TransitionDataBefore,TransitionDataAfter]=plot(pulseObj,idx,Buffer)
```

### Description

[TransitionDataBefore,TransitionDataAfter]=plot(pulseObj,idx) retrieves the transition data from a `Battery.Pulse` object during the transition phase of a pulse.

[TransitionDataBefore,TransitionDataAfter]=plot(pulseObj,idx,Buffer) retrieves buffered experimental data from a `Battery.Pulse` object during the transition phase of a pulse.

### Input Arguments

#### **pulseObj** — Instance of `Battery.Pulse` class

`Battery.Pulse` object

`Battery.Pulse` object for the pulse event that you want to analyze.

#### **idx** — Transition data index

scalar

Index of transition data.

Data Types: `int16`

#### **Buffer** — Number of samples

vector

Number of buffer samples before and after the load data, in the form `[BeforeBufferSize,AfterBufferSize]`. Use the buffer to ensure that the estimation has sufficient data before and after a transition.

### Output Arguments

#### **TransitionDataBefore** — Data before transition

array

Data before transition during pulse event.

Data Types: `double`

#### **TransitionDataAfter** — Data after transition

array

Data after transition during pulse event.

Data Types: double

## Battery.Parameters

Define battery equivalent circuit parameters

### Description

Use the `Battery.Parameters` object to define the battery equivalent circuit parameters. `Battery.Parameters` objects are contained in the `Battery.PulseSequence` and `Battery.Pulse` objects. The pulse sequence estimation sets some of the `Battery.Parameters` properties. You can override the properties by manually setting the properties. The number of pulses,  $N$ , in the dataset determines the length of each array.

### Creation

#### Syntax

```
paramObj = Battery.Parameters
```

#### Description

MATLAB creates a `paramObj = Battery.Parameters` object that defines the battery equivalent circuit parameters.

### Properties

#### **SOC — State of charge breakpoints**

1-by-11 array (default)

A 1-by- $N$  array of the state of charge (SOC) breakpoints.

Data Types: `double`

#### **Em — Open circuit voltage**

1-by-11 array (default)

A 1-by- $N$  array of the open circuit voltage, in V.

Data Types: `double`

#### **EmMin — Minimum open circuit voltage**

1-by-11 array (default)

A 1-by- $N$  array of the minimum open circuit voltage, in V.

Data Types: `double`

#### **EmMax — Maximum open circuit voltage**

1-by-11 array (default)

A 1-by- $N$  array of the maximum open circuit voltage, in V.

Data Types: double

**R0 — Terminal resistance**

1-by-11 array (default)

A 1-by-N array of the terminal resistance, in Ohms.

Data Types: double

**R0Min — Minimum terminal resistance**

1-by-11 array (default)

A 1-by-N array of the minimum terminal resistance, in Ohms.

Data Types: double

**R0Max — Maximum terminal resistance**

1-by-11 array (default)

A 1-by-N array of the maximum terminal resistance, in Ohms.

Data Types: double

**Rx — RC pair resistance**

3-by-11 array (default)

A 3-by-N array of the RC pair resistance, in Ohms.

Data Types: double

**RxMin — Minimum RC pair resistance**

3-by-11 array (default)

A 3-by-N array of the minimum RC pair resistance, in Ohms.

Data Types: double

**RxMax — Maximum RC pair resistance**

3-by-11 array (default)

A 3-by-N array of the maximum RC pair resistance, in Ohms.

Data Types: double

**Tx — RC pair time constant**

3-by-11 array (default)

A 3-by-N array of the RC pair time constant, in s.

Data Types: double

**TxMin — Minimum RC pair time constant**

3-by-11 array (default)

A 3-by-N array of the minimum RC pair time constant, in s.

Data Types: double

**TxMax — Maximum RC pair time constant**

3-by-11 array (default)

A 3-by-N array of the maximum RC pair time constant, in s.

Data Types: `double`

## Object Functions

`lookupSocFromVoltage` Determine SOC from voltage  
`plot` Plot battery parameter data

## Examples

### Create Battery.Parameters Object

This example shows how to create a `Battery.Parameters` object.

Create a `Battery.Parameters` object.

```
paramObj=Battery.Parameters;
```

## See Also

# lookupSocFromVoltage

Determine SOC from voltage

## Syntax

```
SOC=lookupSocFromVoltage(paramObj,Voltage)
```

## Description

`SOC=lookupSocFromVoltage(paramObj,Voltage)` calculates the state of charge (SOC) from the voltage for a given open-circuit voltage. Use `lookupSocFromVoltage` after you know the open-circuit voltage, *Em*, value.

## Input Arguments

**paramObj** — Instance of `Battery.Parameters` class

`Battery.Parameters` object

`Battery.Parameters` object for the battery that you want to analyze.

**Voltage** — Open circuit voltage

scalar

Open circuit voltage, in V.

Data Types: `char`

## Output Arguments

**SOC** — State of charge

scalar

State of charge.

Data Types: `double`

## See Also

`Battery.Parameters`

## Topics

“Generate Parameter Data for Datasheet Battery Block”

“Generate Parameter Data for Equivalent Circuit Battery Block”

**Introduced in R2016b**

## plot

Plot battery parameter data

### Syntax

```
plot_handle=plot(paramObj)  
plot_handle=plot(paramObj,LegendNames)
```

### Description

`plot_handle=plot(paramObj)` plots the data from a `Battery.Parameters` object.

`plot_handle=plot(paramObj,LegendNames)` plots the data from a `Battery.Parameters` object with the legend names.

### Input Arguments

#### **paramObj** — Instance of `Battery.Pulse` class

`Battery.Parameters` object

`Battery.Parameters` object for the battery that you want to analyze.

#### **LegendNames** — Plot legends

character vector

Name of plot legends.

Data Types: char

### Output Arguments

#### **plot\_handle** — Plot handle

object handle

Handles to plot objects.

Data Types: `function_handle`

### See Also

`Battery.Parameters`

### Topics

# Battery.Metadata

Define battery metadata

## Description

Use the `Battery.Metadata` object to define the battery metadata. A `Battery.PulseSequence` object contains the `Battery.Metadata` object. You must specify the metadata values.

## Creation

### Syntax

```
batmetaObj = Battery.Metadata
```

### Description

MATLAB creates a `batmetaObj = Battery.Metadata` object that defines the battery metadata.

## Properties

### **BatteryId** — Battery identification

character vector

Battery identification name.

Data Types: `double`

### **RatingAh** — Battery rating

character vector

Battery rating.

Data Types: `char`

### **Name** — Dataset name

character vector

Dataset name.

Data Types: `char`

### **Date** — Dataset date

character vector

Dataset date.

Data Types: `char`

### **Source** — Dataset source

character vector

Dataset source.

Data Types: char

**TestType – Experimental data type**

character vector

Test time, for example charge or discharge.

Data Types: char

**TestCurrent – Test current**

scalar

Test current, in A.

Data Types: double

**TestTemperature – Test temperature**

scalar

Test temperature, in C.

Data Types: double

## Examples

**Create Battery.Metadata Object and Set Properties**

This example shows how to create a `Battery.Metadata` object and set properties.

Create a `Battery.Metadata` object.

```
batmetaObj=Battery.Metadata;
```

Set `Battery.Metadata` properties.

```
batmetaObj.BatteryId='myBatteryId';  
batmetaObj.RatingAh='myRatingAh';  
batmetaObj.Name='myName';  
batmetaObj.Date='myDate';  
batmetaObj.Source='mySource';  
batmetaObj.TestType='Charge';  
batmetaObj.TestCurrent=300;  
batmetaObj.TestCurrent=120;
```

Display `Battery.Metadata` properties.

```
disp(batmetaObj)
```
