Selecting this check box disables **Code generation storage class** for the corresponding integrator or filter state.

Programmatic Use

Block Parameter: IntegratorStateMustResolveToSignalObject, FilterStateMustResolveToSignalObject

Type: string, character vector

Values: "off", "on"

Default: "off"

Code generation storage class — Storage class for code generation

Auto (default) | ExportedGlobal | ImportedExtern | ImportedExternPointer

Select state storage class for code generation. If you do not need to interface to external code, select Auto.

For more information, see “C Code Generation Configuration for Model Interface Elements” (Simulink Coder) and “Organize Parameter Data into a Structure by Using Struct Storage Class” (Embedded Coder).

Dependencies

To enable this parameter for the discrete-time integrator or filter state:

- 1 Set **Time domain** to Discrete-time.
- 2 Specify a value for the integrator or filter **State name**.
- 3 Set the model configuration parameter **Signal resolution** to a value other than None.

Programmatic Use

Block Parameter: IntegratorRTWStateStorageClass, FilterRTWStateStorageClass

Type: string, character vector

Values: "Auto", "ExportedGlobal", "ImportedExtern" | "ImportedExternPointer"

Default: "Auto"

Code generation storage type qualifier — Storage type qualifier

empty string (default) | character vector | "const" | "volatile" | ...

Specify a storage type qualifier such as const or volatile.

Note This parameter will be removed in a future release. To apply storage type qualifiers to data, use custom storage classes and memory sections. Unless you use an ERT-based code generation target with Embedded Coder, custom storage classes and memory sections do not affect the generated code.

Dependencies

To enable this parameter, set **Code generation storage class** to any value other than Auto.

Programmatic Use

Block Parameter:

IntegratorRTWStateStorageTypeQualifier, FilterRTWStateStorageTypeQualifier

Type: string, character vector

Values: "", "const", "volatile"

Default: ""

Block Characteristics

Data Types	double fixed point integer single
Direct Feedthrough	no
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

More About

Decomposition of 2-DOF PID Controllers

A 2-DOF PID controller can be interpreted as a PID controller with a prefilter, or a PID controller with a feedforward element.

Prefilter Decomposition

In parallel form, a two-degree-of-freedom PID controller can be equivalently modeled by the following block diagram, where C is a single degree-of-freedom PID controller and F is a prefilter on the reference signal.

Ref is the reference signal, y is the feedback from the measured system output, and u is the controller output. For a continuous-time 2-DOF PID controller in parallel form, the transfer functions for F and C are

$$F_{par}(s) = \frac{(bP + cDN)s^2 + (bPN + I)s + IN}{(P + DN)s^2 + (PN + I)s + IN},$$

$$C_{par}(s) = \frac{(P + DN)s^2 + (PN + I)s + IN}{s(s + N)},$$

where b and c are the setpoint weights.

For a 2-DOF PID controller in ideal form, the transfer functions are

$$F_{id}(s) = \frac{(b + cDN)s^2 + (bN + I)s + IN}{(1 + DN)s^2 + (N + I)s + IN},$$

$$C_{id}(s) = P \frac{(1 + DN)s^2 + (N + I)s + IN}{s(s + N)}.$$

A similar decomposition applies for a discrete-time 2-DOF controller.

Feedforward Decomposition

Alternatively, the parallel two-degree-of-freedom PID controller can be modeled by the following block diagram.

In this realization, Q acts as feed-forward conditioning on the reference signal. For a continuous-time 2-DOF PID controller in parallel form, the transfer function for Q is

$$Q_{par}(s) = \frac{((b-1)P + (c-1)DN)s + (b-1)PN}{s + N}$$

For a 2-DOF PID controller in ideal form, the transfer function is

$$Q_{id}(s) = P \frac{((b-1) + (c-1)DN)s + (b-1)N}{s + N}$$

The transfer functions for C are the same as in the filter decomposition.

A similar decomposition applies for a discrete-time 2-DOF controller.

Compatibility Considerations

ReferenceBlock parameter returns different path

Behavior changed in R2020b

Starting in R2020b, the `get_param` function returns a different value for the `ReferenceBlock` parameter. The `ReferenceBlock` parameter is a property common to all Simulink blocks and gives the path of the library block to which a block links. The PID Controller (2DOF) and Discrete PID Controller (2DOF) blocks now link to 'pid_lib/PID Controller (2DOF)'. Previously, the blocks linked to 'simulink/Continuous/PID Controller (2DOF)'.

This change does not affect any other functionality or workflows. You can still use the previous path with the `set_param` function.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

For continuous-time PID controllers (**Time domain** set to Continuous-time):

- Consider using “Model Discretizer” to map continuous-time blocks to discrete equivalents that support code generation. To access Model Discretizer, in the **Apps** tab, under **Control Systems**, click **Model Discretizer**.
- Not recommended for production code.

For discrete-time PID controllers (**Time domain** set to **Discrete-time**):

- Depends on absolute time when placed inside a triggered subsystem hierarchy.
- Generated code relies on `memcpy` or `memset` functions (`string.h`) under certain conditions.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Fixed-point code generation is supported for discrete-time PID controllers only (**Time domain** set to **Discrete-time**).

Introduced in R2009b

Polynomial

Perform evaluation of polynomial coefficients on input values

Library: Simulink / Math Operations

Description

The Polynomial block evaluates $P(u)$ at each time step for the input u . You define a set of polynomial coefficients in the form that the MATLAB `polyval` command accepts.

Ports

Input

Port_1 — Input signal

real scalar or vector

Value at which to evaluate the polynomial $P(u)$.

Data Types: single | double

Output

Port_1 — Evaluated polynomial value

real scalar or vector

Value of the polynomial $P(u)$ evaluated at the input signal.

Data Types: single | double

Parameters

Polynomial coefficients — Coefficients of polynomial to be evaluated

[+2.081618890e-019, -1.441693666e-014, +4.719686976e-010, -8.536869453e-006, +1.621573104e-001, -8.087801117e+001] (default) | real array

Specify polynomial coefficients in MATLAB `polyval` form. The first coefficient corresponds to x^N and the remaining coefficients correspond to decreasing orders of x . The last coefficient represents the constant for the polynomial.

Programmatic Use

Block Parameter: `coefs`

Type: real array

Default: [+2.081618890e-019, -1.441693666e-014, +4.719686976e-010, -8.536869453e-006, +1.621573104e-001, -8.087801117e+001]

Prelookup

Compute index and fraction for Interpolation Using Prelookup block

Library: Simulink / Lookup Tables
HDL Coder / Lookup Tables

Description

The Prelookup block calculates the index and interval fraction that specify how its input value u relates to the breakpoint dataset. The Prelookup block works best with the Interpolation Using Prelookup block. Feed the resulting index and fraction values into an Interpolation Using Prelookup block to interpolate an n -dimensional table. These two blocks have distributed algorithms. When combined together, they perform the same operation as the integrated algorithm in the n -D Lookup Table block. However, the Prelookup and Interpolation Using Prelookup blocks offer greater flexibility and more efficient simulation and code generation than the n -D Lookup Table block. For more information, see “Efficiency of Performance”.

Supported Block Operations

To use the Prelookup block, you must specify a set of breakpoint values. You choose whether to specify the breakpoint values directly on the dialog box or by feeding the values to a `bp` input port by setting the **Source** parameter to `Dialog` or `Input port`. Typically, this breakpoint data set corresponds to one dimension of the table data in an Interpolation Using Prelookup block. The Prelookup block generates a pair of outputs for each input value u by calculating:

- The index of the breakpoint set element that is less than or equal to u and forms an interval containing u
- The interval fraction in the range $0 \leq f < 1$, representing the normalized position of u on the breakpoint interval between the index and the next index value for in-range input

For example, if the breakpoint data set is `[0 5 10 20 50 100]` and the input value u is 55, the index is 4 and the fractional value is 0.1. Labels for the index and interval fraction appear as **k** and **f** on the Prelookup block icon. The index value is zero based.

The interval fraction can be negative or greater than 1 for out-of-range input. See the **Extrapolation method** block parameter for more information.

Ports

Input

Port_1 — Input signal, u

scalar | vector | matrix

The Prelookup block accepts real-valued signals of any numeric data type that Simulink supports, except Boolean. The Prelookup block supports fixed-point data types for signals and breakpoint data.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point | enumerated | bus

bp — Breakpoint data

1-D vector of real-valued signals

The Prelookup block accepts real-valued signals as breakpoint data of any numeric data type that Simulink supports, except Boolean.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point | enumerated

Output

k — Index of the interval containing the input, u

scalar | vector | matrix

The zero-based index, k , is a real-valued integer that specifies the interval containing the input, u .

Dependencies

To enable this port, set the **Output selection** to Index and fraction or Index only.

Data Types: int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

f — Fraction representing the normalized position of the input, u, within the interval, k

scalar | vector | matrix

Fraction, f , represents the normalized position of the input, u , within the interval k .

Dependencies

To enable this port, set the **Output selection** to Index and fraction.

Data Types: single | double | fixed point

Port_2 — Bus containing index, k, and fraction, f

bus

Outputting the index, k , and fraction f , as a bus object can help simplify the model.

Dependencies

To enable this port, set the **Output selection** to Index and fraction as bus.

Data Types: bus

Parameters

Main

Breakpoints data

Specification — Choose how to enter breakpoint data

Explicit values (default) | Even spacing | Breakpoint object

If you set this parameter to:

- Explicit values, the **Source** and **Value** parameters are visible on the dialog box.
- Even spacing, the **First point**, **Spacing**, and **Number of points** parameters are visible on the dialog box.
- Breakpoint object, the **Name** parameter is visible on the dialog box.

Programmatic Use**Block Parameter:** BreakpointsSpecification**Type:** character vector**Values:** 'Explicit values' | 'Even spacing' | 'Breakpoint object'**Default:** 'Explicit values'**Source — Specify source of breakpoint data**

Dialog (default) | Input port

If you set **Source** to:

- Dialog, specify breakpoint data under **Value**.
- Input port, verify that an upstream signal supplies breakpoint data to the bp input port. Each breakpoint data set must be a strictly monotonically increasing vector that contains two or more elements. For this option, your block inherits breakpoint attributes from the bp input port.

DependenciesTo enable this parameter, set **Specification** to Explicit values.**Programmatic Use****Block Parameter:** BreakpointsDataSource**Type:** character vector**Values:** 'Dialog' | 'Input port'**Default:** 'Dialog'**Value — Breakpoint data values**

[10:10:110] (default) | vector of strictly monotonically increasing values containing two or more elements

Explicitly specify the breakpoint data. Each breakpoint data set must be a strictly monotonically increasing vector that contains two or more elements. For this option, you specify additional breakpoint attributes on the **Data Types** pane.

To open the Lookup Table Editor, click **Edit** (see “Edit Lookup Tables”).

Note When you set **Specification** to Explicit values and **Source** to Input port, verify that an upstream signal supplies breakpoint data to the bp input port. Each breakpoint data set must be a strictly monotonically increasing vector that contains two or more elements. For this option, your block inherits breakpoint attributes (including data type) from the bp input port.

DependenciesTo enable this parameter, set **Specification** to Explicit values and **Source** to Dialog.**Programmatic Use****Block Parameter:** BreakpointsData**Type:** character vector

Values: vector of strictly monotonically increasing values containing two or more elements
Default: '[10:10:110]'

First point — First point in evenly spaced breakpoint data

10 (default) | real-valued scalar

Dependencies

To enable this parameter, set **Specification** to Even spacing.

Programmatic Use

Block Parameter: BreakpointsFirstPoint

Type: character vector

Values: real-valued scalar

Default: '10'

Spacing — Spacing between evenly spaced breakpoints

10 (default) | real-valued, positive scalar

Dependencies

To enable this parameter, set **Specification** to Even spacing.

Programmatic Use

Block Parameter: BreakpointsSpacing

Type: character vector

Values: real-valued, positive scalar

Default: '10'

Number of points — Number of evenly spaced points

11 (default) | real-valued, positive scalar

Dependencies

To enable this parameter, set **Specification** to Even spacing.

Programmatic Use

Block Parameter: BreakpointsNumPoints

Type: character vector

Values: real-valued, positive scalar

Default: '11'

Name — Name of a Simulink.Breakpoint object

no default | Simulink.Breakpoint

Specify the name of a Simulink.Breakpoint object. A breakpoint object references Simulink

breakpoint objects. If a Simulink.Breakpoint object does not exist, click the action button  and select **Create**. The corresponding parameters of the new breakpoint object are automatically populated with the block information.

Dependencies

To enable this parameter, set **Specification** to Breakpoint object.

Programmatic Use

Block Parameter: BreakpointObject

Type: character vector
Values: Simulink.Breakpoint object
Default: ''

Algorithm

Output selection — Specify the signals the block outputs

Index and fraction (default) | Index and fraction as bus | Index only

If you want the block to output the index and interval fraction, you can specify whether the block outputs individual signals or a bus signal that includes both the index and fraction signals.

- `Index only` outputs just the index, without the fraction. Typical applications for this option include:
 - Feeding a Direct Lookup Table (n-D) block, with no interpolation on the interval
 - Feeding selection ports of a subtable selection for an Interpolation Using Prelookup block
 - Performing nonlinear quantizations
- `Index and fraction` outputs the index and fraction as individual signals.
- `Index and fraction as bus` outputs a bus signal that includes the index and fraction signals. Using a bus for these signals:
 - Simplifies the model by tying these two related signals together
 - Creates a testpoint `DpResult` structure for the AUTOSAR 4.0 library
 - For the AUTOSAR 4.0 library, avoids the creation of extra copies during code generation when the Prelookup and Interpolation Using Prelookup blocks are in separate models

Note Selecting `Index and fraction as bus` displays the **Output** parameter in the **Data Types** pane and sets the **Output** parameter to `Inherit: auto`. Change this default value to specify a user-defined bus object. For details about defining the bus object, see the **Output** parameter description.

Programmatic Use

Block Parameter: OutputSelection

Type: character vector

Values: 'Index and fraction' | 'Index and fraction as bus' | 'Index only'

Default: 'Index and fraction'

Index search method — Method for searching breakpoint data

Binary search (default) | Linear search | Evenly spaced points

Each search method has speed advantages in different situations:

- For evenly spaced breakpoint sets (for example, 10, 20, 30, and so on), you achieve optimal speed by selecting `Evenly spaced points` to calculate table indices. This algorithm uses only the first two breakpoints of a set to determine the offset and spacing of the remaining points.
- For unevenly spaced breakpoint sets, follow these guidelines:
 - If input values for `u` do not vary significantly between time steps, selecting `Linear search` with **Begin index search using previous index result** produces the best performance.
 - If input values for `u` jump more than one or two table intervals per time step, selecting `Binary search` produces the best performance.

A suboptimal choice of index search method can lead to slow performance of models that rely heavily on lookup tables.

Note The generated code stores only the first breakpoint, the spacing, and the number of breakpoints when:

- The breakpoint data is not tunable.
 - The index search method is `Evenly spaced points`.
-

Programmatic Use

Block Parameter: `IndexSearchMethod`

Type: character vector

Values: `'Evenly spaced points' | 'Linear search' | 'Binary search'`

Default: `'Binary search'`

Begin index search using previous index result — Start search using the index found at the previous time step

`off (default) | on`

For input values of u that change slowly with respect to the interval size, enabling this option can improve performance. Otherwise, the linear search and binary search methods can take longer, especially for large breakpoint sets.

Programmatic Use

Block Parameter: `BeginIndexSearchUsingPreviousIndexResult`

Type: character vector

Values: `'off' | 'on'`

Default: `'off'`

Extrapolation method — Method for handling out-of-range input values

`Clip (default) | Linear`

Options include:

- `Clip`

Block Input	Block Outputs
Less than the first breakpoint	<ul style="list-style-type: none"> • Index of the first breakpoint (for example, 0) • Interval fraction of 0
Greater than the last breakpoint	<ul style="list-style-type: none"> • Index of the next-to-last breakpoint • Interval fraction of 1

Suppose the range is $[1 \ 2 \ 3]$ and you select this option. If u is 0.5, the index is 0 and the interval fraction is 0. If u is 3.5, the index is 1 and the interval fraction is 1.

- `Linear`

Block Input	Block Outputs
Less than the first breakpoint	<ul style="list-style-type: none"> • Index of the first breakpoint (for example, 0) • Interval fraction that represents the linear distance from u to the first breakpoint
Greater than the last breakpoint	<ul style="list-style-type: none"> • Index of the next-to-last breakpoint • Interval fraction that represents the linear distance from the next-to-last breakpoint to u

Suppose the range is [1 2 3] and you select this option. If u is 0.5, the index is 0 and the interval fraction is -0.5. If u is 3.5, the index is 1 and the interval fraction is 1.5.

Note The Prelookup block supports linear extrapolation only when all of the following conditions are true:

- The input u, breakpoint data, and fraction output use floating-point data types.
- The index uses a built-in integer data type.

Programmatic Use

Block Parameter: ExtrapMethod

Type: character vector

Values: 'Clip' | 'Linear'

Default: 'Clip'

Use last breakpoint for input at or above upper limit — Method of handling inputs at or above upper limit

off (default) | on

Specify how to index input values of u that are greater than or equal to the last breakpoint. The index value is zero based. When input equals the last breakpoint, block outputs differ as follows.

Check Box	Block Outputs
Selected (on)	<ul style="list-style-type: none"> • Index of the last element in the breakpoint data set • Interval fraction of 0
Cleared (off)	<ul style="list-style-type: none"> • Index of the next-to-last breakpoint • Interval fraction of 1

Tip When you select **Use last breakpoint for input at or above upper limit** for a Prelookup block, you must also select **Valid index input may reach last index** for the Interpolation Using Prelookup block to which it connects. This action allows the blocks to use the same indexing convention when accessing the last elements of their breakpoint and table data sets.

Dependencies

This check box is visible only when:

- **Output only the index** is cleared
- **Extrapolation method** is Clip

However, when **Output only the index** is selected and **Extrapolation method** is Clip, the block behaves as if this check box is selected, even though it is invisible.

Programmatic Use

Block Parameter: UseLastBreakpoint

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Diagnostic for out-of-range input – Block action when input is out of range

None (default) | Warning | Error

Options include:

- None — Produce no response.
- Warning — Display a warning and continue the simulation.
- Error — Terminate the simulation and display an error.

Programmatic Use

Block Parameter: DiagnosticForOutOfRangeInput

Type: character vector

Values: 'None' | 'Warning' | 'Error'

Default: 'None'

Code generation

Remove protection against out-of-range input in generated code – Remove code that checks for out-of-range breakpoint inputs

Off (default) | On

Check Box	Result	When to Use
On	Generated code does not include conditional statements to check for out-of-range breakpoint inputs. When the input is out-of-range, it may cause undefined behavior for generated code.	For code efficiency
Off	Generated code includes conditional statements to check for out-of-range breakpoint inputs.	For safety-critical applications

If your input is not out-of-range, you can select the **Remove protection against out-of-range index in generated code** check box for code efficiency. By default, this check box is cleared. For safety-critical applications, do not select this check box. If you want to select the **Remove protection against out-of-range index in generated code** check box, first check that your model inputs are in range. For example:

- 1 Clear the **Remove protection against out-of-range index in generated code** check box.
- 2 Set the **Diagnostic for out-of-range input** parameter to Error.
- 3 Simulate the model in normal mode.
- 4 If there are out-of-range errors, fix them to be in range and run the simulation again.
- 5 When the simulation no longer generates out-of-range input errors, select the **Remove protection against out-of-range index in generated code** check box.

Note When you select the **Remove protection against out-of-range index in generated code** check box and the input is out-of-range, the behavior is undefined for generated code

Depending on your application, you can run the following Model Advisor checks to verify the usage of this check box:

Additionally, to determine if it is safe to select this check box, if you have a Simulink Design Verifier license, consider using the “Detect Block Input Range Violations” (Simulink Design Verifier) check.

- **By Product > Embedded Coder > Identify lookup table blocks that generate expensive out-of-range checking code**
- **By Product > Simulink Check > Modeling Standards > DO-178C/DO-331 Checks > Check usage of lookup table blocks**

For more information about the Model Advisor, see “Run Model Advisor Checks”.

Programmatic Use

Block Parameter: RemoveProtectionInput

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Sample time — Specify sample time as a value other than -1

-1 (default) | scalar | vector

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

Dependencies

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

Programmatic Use

Block Parameter: SampleTime

Type: character vector

Values: scalar or vector

Default: '-1'

Data Types

Breakpoint — Breakpoint data type

Inherit: Same as input (default) | Inherit: Inherit from 'Breakpoint data' | double | single | int8 | uint8 | int16 | uint16 | int32 | uint32 | int64 | uint64 | fixdt(1,16) | fixdt(1,16,0) | fixdt(1,16,2^0,0) | Enum: <class name> | <data type expression>

Specify the breakpoint data type. You can set it to:

- A rule that inherits a data type, for example, `Inherit: Same as input`
- The name of a built-in data type, for example, `single`
- The name of a data type class, for example, an enumerated data type class
- An expression that evaluates to a data type, for example, `fixdt(1,16,0)`

Click the **Show data type assistant** button  to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

Tip

- Specify a breakpoint data type different from the data type of input `u` for these cases:
 - Lower memory requirement for storing breakpoint data that uses a smaller type than the input signal `u`
 - Sharing of prescaled breakpoint data between two Prelookup blocks with different data types for input `u`
 - Sharing of custom storage breakpoint data in the generated code for blocks with different data types for input `u`
- Specify the same slope and bias for a breakpoint data type and its corresponding input data type if either of them has a fixed-point data type.
- Enumerated data:
 - Breakpoints support unordered enumerated data. As a result, linear searches are also unordered, which offers flexibility but can impact performance. The search begins from the first element in the breakpoint.
 - If the **Begin index search using previous index result** check box is selected, you must use ordered monotonically increasing data. This ordering improves performance.
 - For enumerated data, **Extrapolation method** must be `Clip`.
 - Because the fraction is 1 or 0, select **Output selection > Index only**.

If you are using the index only output selection setting with the Interpolation Using Prelookup block, consider using the **Number of sub-table selection dimensions** parameter.

These are limitations for using enumerated data with this block:

- The block does not support out-of-range input for enumerated data. When specifying enumerated data, include the entire enumeration set in the breakpoint data set. For example, use the `enumeration` function.
- When breakpoints data source is set to `Inport port`, the enumeration data type must have 0 as the default value. For example, for this enumeration class, the default value of `GEAR1` must be 0.

```
classdef(Enumeration) Gears < Simulink.IntEnumType
    enumeration
        GEAR1(1),
        GEAR2(2),
        GEAR3(4),
        GEAR4(8),
```

```

        SPORTS(16),
        REVERSE(32),
        NEUTRAL(0)
    end
end

```

Dependencies

To enable this parameter, set the breakpoints data **Source** to Dialog.

Note When you set **Source** to Input port, the block inherits all breakpoint attributes (data type, minimum, and maximum) from the bp input port.

Programmatic Use

Block Parameter: BreakpointDataTypeStr

Type: character vector

Values: 'Inherit: Same as input' | 'Inherit: Inherit from 'Breakpoint data'' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'int64' | 'uint64' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | '<data type expression>'

Default: 'Inherit: Same as input'

Index — Index data type

uint32 (default) | int8 | uint8 | int16 | uint16 | int32 | uint32 | int64 | uint64 | fixdt(1,16) | <data type expression>

Specify a data type that can index all elements in the breakpoint data set. You can:

- Select a built-in integer data type from the list.
- Specify an integer data type using a fixed-point representation.

Click the **Show data type assistant** button  to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

Programmatic Use

Block Parameter: IndexDataTypeStr

Type: character vector

Values:

'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'int64' | 'uint64' | 'fixdt(1,16)' | '<data type expression>'

Default: 'uint32'

Fraction — Fraction data type

Inherit: Inherit via internal rule (default) | double | single | fixdt(1,16,0) | <data type expression>

Specify the data type of the interval fraction. You can:

- Select a built-in data type from the list.
- Specify data type inheritance through an internal rule.

- Specify a fixed-point data type using the [Slope Bias] or binary-point-only scaling representation.
 - If you use the [Slope Bias] representation, the scaling must be trivial — that is, the slope is 1 and the bias is 0.
 - If you use the binary-point-only representation, the fixed power-of-two exponent must be less than or equal to zero.

Click the **Show data type assistant** button  to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

Dependencies

This parameter displays only when you set **Output selection** on the **Main** tab to `Index` and `fraction`.

Programmatic Use

Block Parameter: `FractionDataTypeStr`

Type: character vector

Values: `'Inherit: Inherit via internal rule'` | `'double'` | `'single'` | `'fixdt(1,16,0)'` | `'<data type expression>'`

Default: `'Inherit: Inherit via internal rule'`

Output — Output data type

`Inherit: auto (default)` | `bus: <object name>`

To output a virtual bus, use the `Inherit: auto` setting. The resulting virtual bus contains two elements, the index and the fraction signals.

To output and specify a nonvirtual bus, use the `Bus: <object name>` template. Replace `<object name>` with the name of a bus object that contains the index and fraction signals.

- The bus object must contain two elements. The first element corresponds to the index signal and the second to the fraction signal.
- The index and fraction bus element signals cannot be bus signals.
- The data type and the complexity of the bus elements must meet the same constraints that apply to the index and fraction signals if you set **Output selection** to `Index` and `fraction`.

To create the bus object with the index and fraction bus elements, use MATLAB code similar to this, customizing the bus object name and the names and data types of the bus elements.

```
% Bus object: kfBus
elems(1) = Simulink.BusElement;
elems(1).Name = 'Index';
elems(1).DataType = 'int8';

elems(2) = Simulink.BusElement;
elems(2).Name = 'Fraction';
elems(2).DataType = 'double';

kfBus = Simulink.Bus;
kfBus.Elements = elems;
clear elems;
```

Alternatively, you can use the Bus Editor to create or modify the bus object to use with the Prelookup block.

If you feed the bus output signal from this block to an Interpolation Using Prelookup block, select the **Require index and fraction as bus** check box in that block.

Note Use the Fixed-Point Tool data type override option to override bus objects with new bus objects that replace fixed-point data types with floating-point data types.

Overridden bus objects used with the Prelookup block can cause an error because the block does not accept floating-point data types for the first element in the bus.

If you encounter this issue, use the **Fix** button to redefine the original bus object and protect it from being overridden. For example, suppose you define the first element of the bus object to be an `int32`.

```
myBus.Elements(1).DataType
int32
```

Clicking the **Fix** button redefines the first bus element:

```
myBus.Elements(1).DataType = 'fixdt('int32','DataTypeOverride','0ff')
```

Click the **Show data type assistant** button  to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

Dependencies

This parameter displays only when you set **Output selection** on the **Main** tab to `Index` and `fraction as bus`.

Programmatic Use

Block Parameter: `OutputBusDataTypeStr`

Type: character vector

Values: `'Inherit: auto'` | `'Bus: <object name>'` | `'<data type expression>'`

Default: `'Inherit: auto'`

Breakpoint Minimum — Minimum value breakpoint data can have

`[]` (default) | scalar

Specify the minimum value that the breakpoint data can have. The default value is `[]` (unspecified).

Dependencies

To enable this parameter, set the breakpoints data **Source** to `Dialog` on the **Main** tab.

Programmatic Use

Block Parameter: `BreakpointMin`

Type: character vector

Value: scalar

Default: `'[]'`

Breakpoint Maximum — Maximum value breakpoint data can have

`[]` (default) | scalar

Specify the maximum value that the breakpoint data can have. The default value is [] (unspecified).

Dependencies

To enable this parameter, set the breakpoints data **Source** to Dialog on the **Main** tab.

Programmatic Use

Block Parameter: BreakpointMax

Type: character vector

Value: scalar

Default: '[]'

Lock output data type setting against changes by the fixed-point tools — Prevent fixed-point tools from overriding Output data type

off (default) | on

Select this parameter to prevent the fixed-point tools from overriding the **Output** data type you specify on the block. For more information, see “Use Lock Output Data Type Setting” (Fixed-Point Designer).

Programmatic Use

Block Parameter: LockScale

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Integer rounding mode — Rounding mode for fixed-point operations

Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

Specify the rounding mode for fixed-point operations. For more information, see “Rounding” (Fixed-Point Designer).

Block parameters always round to the nearest representable value. To control the rounding of a block parameter, enter an expression using a MATLAB rounding function into the mask field.

Programmatic Use

Block Parameter: RndMeth

Type: character vector

Values: 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'

Default: 'Floor'

Block Characteristics

Data Types	double enumerated fixed point integer single
Direct Feedthrough	yes
Multidimensional Signals	yes
Variable-Size Signals	no
Zero-Crossing Detection	no

More About

Enumerated Values in Prelookup

Simulate a Prelookup block with enumerated values.

Suppose that you have a Prelookup block with an enumerated class like this defined:

```
classdef(Enumeration) Gears < Simulink.IntEnumType
    enumeration
        GEAR1(1),
        GEAR2(2),
        GEAR3(4),
        GEAR4(8),
        SPORTS(16),
        REVERSE(-1),
        NEUTRAL(0)
    end
end
```

Prelookup block has these settings:

- **Breakpoints data** value is enumeration('Gears').
- **Output selection** is Index only.
- For an unordered search, set **Index search method** to Linear search and clear the **Begin index search using previous index result** check box.
- **Extrapolation method** is Clip.

Interpolation using Prelookup block has these settings:

- **Number of dimensions** to 1.
- **Table data** value is [5 10 20 40 80 -5 0].
- **Interpolation method** is Flat.
- **Number of sub-table selection dimensions** is 1.

Simulation produces a vector [10 -5 80], which correspond to GEAR2, REVERSE, and SPORTS.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

HDL Architecture

This block has a single, default HDL architecture.

HDL Block Properties

ConstrainedOutputPipeline	Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is 0. For more details, see "ConstrainedOutputPipeline" (HDL Coder).
InputPipeline	Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see "InputPipeline" (HDL Coder).
OutputPipeline	Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see "OutputPipeline" (HDL Coder).

Restrictions

Required Block Settings

- **Breakpoint data:** For **Source**, select Dialog.
- **Specification:** You can select either Explicit values or Even spacing.
- **Index search method:** Select Evenly spaced points.
- **Extrapolation method:** Select Clip.
- **Diagnostic for out-of-range input:** Select Error.
- **Use last breakpoint for input at or above upper limit:** Select this check box.
- **Breakpoint:** For **Data Type**, select Inherit: Same as input.
- **Integer rounding mode:** Select Zero, Floor, or Simplest.

Table Data Typing and Sizing

- It is good practice to structure your table such that the spacing between breakpoints is a power of two. If the breakpoint spacing does not meet this condition, HDL Coder issues a warning. When the breakpoint spacing is a power of two, you can replace division operations in the prelookup step with right-shift operations.
- All ports on the block require scalar values.
- The coder permits floating-point data for breakpoints.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Simulink PLC Coder has limited support for lookup table blocks. The coder does not support:

- Number of dimensions greater than 2

- Cubic spline interpolation method
- Begin index search using a previous index mode
- Cubic spline extrapolation method

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Probe

Output signal attributes, including width, dimensionality, sample time, and complex signal flag

Library: Simulink / Signal Attributes
HDL Coder / Signal Attributes

Description

The Probe block outputs selected information about the signal on its input. The block can output the following attributes of the input signal: width, dimensionality, sample time, and a flag indicating whether the input is a complex-valued signal. The block has one input port. The number of output ports depends on the information that you select for probing, that is, signal dimensionality, sample time, and/or complex signal flag. Each probed value is output as a separate signal on a separate output port, with an independent data type control. During simulation, the block icon displays the probed data.

Ports

Input

Port_1 — Input signal

scalar | vector | matrix | N-D array

Input signal to probe, specified as a scalar, vector, matrix, or N-D array. The block accepts real or complex-valued signals of any built-in data type.

You can use an array of buses as an input signal to a Probe block. For details about defining and using an array of buses, see “Group Nonvirtual Buses in Arrays of Buses”.

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | string | Boolean | fixed point | enumerated | bus

Output

Port_1 (W) — Signal width

scalar

Width, or number of elements, in the input signal, specified as a scalar. The width is also displayed on the block icon with the notation *W*:

Dependencies

To enable this port, select **Probe width**.

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Port_2 (Ts) — Sample time

vector

Sample time of the input signal, as a two-element vector that specifies the period and offset of the sample time, respectively. The sample time is also displayed on the block icon with the notation T_s :. See “Specify Sample Time” for more information.

Dependencies

To enable this port, select **Probe sample time**.

Data Types: `single` | `double` | `half` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `fixed point`

Port_3 (C) – Signal complexity

scalar

Indication of input signal complexity:

- When the input signal is complex, the block outputs 1.
- When the input signal is real-valued, the block outputs 0.

The indication of signal complexity is also displayed on the block icon with the notation C :.

Dependencies

To enable this port, select **Detect complex signal**.

Data Types: `single` | `double` | `half` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `fixed point`

Port_4 (D) – Signal dimensions

scalar | vector

Dimensions of the input signal, output as a scalar or vector. The signal dimensions are also displayed on the block icon with the notation D :.

Dependencies

To enable this port, select **Probe signal dimensions**.

Data Types: `single` | `double` | `half` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `fixed point`

Parameters**Main****Probe width – Output width of the input signal**

`on` (default) | `off`

Select to output the width, or number of elements, of the probed signal.

Programmatic Use

Block Parameter: `ProbWidth`

Type: character vector

Values: `'off'` | `'on'`

Default: `'on'`

Probe sample time – Output sample time of input signal

`on` (default) | `off`

Select to output the sample time of the probed signal. The output is a two-element vector that specifies the period and offset of the sample time, respectively. See “Specify Sample Time” for more information.

Programmatic Use

Block Parameter: ProbeSampleTime

Type: character vector

Values: 'off' | 'on'

Default: 'on'

Detect complex signal — Indicate the complexity of input signal

on (default) | off

Select to output 1 if the probed signal is complex; otherwise, 0.

Programmatic Use

Block Parameter: ProbeComplexSignal

Type: character vector

Values: 'off' | 'on'

Default: 'on'

Probe signal dimensions — Output dimensions of input signal

on (default) | off

Select to output the dimensions of the probed signal.

Programmatic Use

Block Parameter: ProbeSignalDimensions

Type: character vector

Values: 'off' | 'on'

Default: 'on'

Signal Attributes

Data type for width — Data type of signal width output

double (default) | single | int8 | uint8 | int16 | uint16 | int32 | uint32 | Same as input

Select the output data type for the signal width.

Programmatic Use

Block Parameter: ProbeWidthDataType

Type: character vector

Values: 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'Same as input'

Default: 'double'

Data type for sample time — Data type of sample time output

double (default) | single | int8 | uint8 | int16 | uint16 | int32 | uint32 | Same as input

Select the output data type for the sample time information.

Programmatic Use

Block Parameter: ProbeSampleTimeDataType

Type: character vector

Values: 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'Same as input'

Default: 'double'

Data type for signal complexity — Data type of complexity output

double (default) | single | int8 | uint8 | int16 | uint16 | int32 | uint32 | boolean | Same as input

Select the output data type for the complexity information.

Programmatic Use

Block Parameter: ProbeComplexityDataType

Type: character vector

Values: 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'Same as input'

Default: 'double'

Data type for signal dimensions — Data type for signal dimension output

double (default) | single | int8 | uint8 | int16 | uint16 | int32 | uint32 | Same as input

Select the output data type for the signal dimension output.

Programmatic Use

Block Parameter: ProbeDimensionsDataType

Type: character vector

Values: 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'Same as input'

Default: 'double'

Block Characteristics

Data Types	Boolean bus double enumerated fixed point half integer single string
Direct Feedthrough	yes

Product

Multiply and divide scalars and nonscalars or multiply and invert matrices

Library: Simulink / Commonly Used Blocks
 Simulink / Math Operations
 HDL Coder / Commonly Used Blocks
 HDL Coder / HDL Floating Point Operations
 HDL Coder / Math Operations

Description

The Product block outputs the result of multiplying two inputs: two scalars, a scalar and a nonscalar, or two nonscalars that have the same dimensions. The default parameter values that specify this behavior are:

- **Multiplication:** Element-wise (.*)
- **Number of inputs:** 2

This table shows the output of the Product block for example inputs using default block parameter values.

Inputs and Behavior	Example
<p>Scalar X Scalar</p> <p>Output the product of the two inputs.</p>	
<p>Scalar X Nonscalar</p> <p>Output a nonscalar having the same dimensions as the input nonscalar. Each element of the output nonscalar is the product of the input scalar and the corresponding element of the input nonscalar.</p>	
<p>Nonscalar X Nonscalar</p> <p>Output a nonscalar having the same dimensions as the inputs. Each element of the output is the product of corresponding elements of the inputs.</p>	

The Divide and Product of Elements blocks are variants of the Product block.

- For information on the Divide block, see Divide.
- For information on the Product of Elements block, see Product of Elements.

The Product block (or the Divide block or Product of Elements block, if appropriately configured) can:

- Numerically multiply and divide any number of scalar, vector, or matrix inputs
- Perform matrix multiplication and division on any number of matrix inputs

The Product block performs scalar or matrix multiplication, depending on the value of the **Multiplication** parameter. The block accepts one or more inputs, depending on the **Number of inputs** parameter. The **Number of inputs** parameter also specifies the operation to perform on each input.

The Product block can input any combination of scalars, vectors, and matrices for which the operation to perform has a mathematically defined result. The block performs the specified operations on the inputs, then outputs the result.

The Product block has two modes: *Element-wise mode*, which processes nonscalar inputs element by element, and *Matrix mode*, which processes nonscalar inputs as matrices.

Element-Wise Mode

When you set **Multiplication** to *Element-wise (.*)*, the Product block is in *Element-wise mode*, in which it operates on the individual numeric elements of any nonscalar inputs. The MATLAB equivalent is the `.*` operator. In element-wise mode, the Product block can perform a variety of multiplication, division, and arithmetic inversion operations.

The value of the **Number of inputs** parameter controls both how many inputs exist and whether each is multiplied or divided to form the output. When the Product block is in element-wise mode and has only one input, it is functionally equivalent to a Product of Elements block. When the block has multiple inputs, any nonscalar inputs must have identical dimensions, and the block outputs a nonscalar with those dimensions. To calculate the output, the block first expands any scalar input to a nonscalar that has the same dimensions as the nonscalar inputs.

This table shows the output of the Product block for example inputs, using the indicated values for the **Number of inputs** parameter.

Parameter Values	Examples
Number of inputs: 2	
Number of inputs: */	

Parameter Values	Examples
Number of inputs: /**/	
Number of inputs:**	
Number of inputs: */*	

Matrix Mode

When the value of the **Multiplication** parameter is `Matrix(*)`, the Product block is in *Matrix mode*, in which it processes nonscalar inputs as matrices. The MATLAB equivalent is the `*` operator. In Matrix mode, the Product block can invert a single square matrix, or multiply and divide any number of matrices that have dimensions for which the result is mathematically defined.

The value of the **Number of inputs** parameter controls both how many inputs exist and whether each input matrix is multiplied or divided to form the output. The syntax of **Number of inputs** is the same as in element-wise mode. The difference between the modes is in the type of multiplication and division that occur.

Expected Differences Between Simulation and Code Generation

For element-wise operations on complex floating-point inputs, simulation and code generation results might differ in near-overflow cases. Although **complex numbers** is selected and **non-finite numbers** is not selected on the **Code Generation > Interface** pane of the Configuration Parameters dialog box, the code generator does not emit special case code for intermediate overflows. This method improves the efficiency of embedded operations for the general case that does not include extreme values. If the inputs could include extreme values, you must manage these cases explicitly.

The generated code might not produce the same pattern of NaN and inf values as simulation when these values are mathematically meaningless. For example, if the simulation output contains a NaN, output from the generated code also contains a NaN, but not necessarily in the same place.

Ports

Input

Port_1 — First input to multiply or divide

scalar | vector | matrix | N-D array

First input to multiply or divide, provided as a scalar, vector, matrix, or N-D array.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

Port_N – Nth input to multiply or divide

scalar | vector | matrix | N-D array

Nth input to multiply or divide, provided as a scalar, vector, matrix, or N-D array.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

X – Input signal to multiply

scalar | vector | matrix | N-D array

Input signal to be multiplied with other inputs.

Dependencies

To enable one or more **X** ports, specify one or more * characters for the **Number of inputs** parameter.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

÷ – Input signal to divide or invert

scalar | vector | matrix | N-D array

Input signal for division or inversion operations.

Dependencies

To enable one or more ÷ ports, specify one or more / characters for the **Number of inputs** parameter.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

Output

Port_1 – Output computed by multiplying, dividing, or inverting inputs

scalar | vector | matrix | N-D array

Output computed by multiplying, dividing, or inverting inputs.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

Parameters

Main

Number of inputs – Control number of inputs and type of operation

2 (default) | scalar | * or / for each input port

Control two properties of the block:

- The number of input ports on the block
- Whether each input is multiplied or divided into the output

When you specify:

- **1 or * or /**

The block has one input port. In element-wise mode, the block processes the input as described for the Product of Elements block. In matrix mode, if the parameter value is 1 or *, the block outputs the input value. If the value is /, the input must be a square matrix (including a scalar as a degenerate case) and the block outputs the matrix inverse. See “Element-Wise Mode” on page 1-1249 and “Matrix Mode” on page 1-1250 for more information.

- **Integer value > 1**

The block has the number of inputs given by the integer value. The inputs are multiplied together in element-wise mode or matrix mode, as specified by the **Multiplication** parameter. See “Element-Wise Mode” on page 1-1249 and “Matrix Mode” on page 1-1250 for more information.

- **Unquoted string of two or more * and / characters**

The block has the number of inputs given by the length of the character vector. Each input that corresponds to a * character is multiplied into the output. Each input that corresponds to a / character is divided into the output. The operations occur in element-wise mode or matrix mode, as specified by the **Multiplication** parameter. See “Element-Wise Mode” on page 1-1249 and “Matrix Mode” on page 1-1250 for more information.

Programmatic Use

Block Parameter: Inputs

Type: character vector

Values: '2' | '**' | '*/' | '*/*' | ...

Default: '2'

Multiplication — Element-wise (.) or Matrix (*) multiplication

Element-wise(.) (default) | Matrix(*)

Specify whether the block performs Element-wise(.) or Matrix(*) multiplication.

Programmatic Use

Block Parameter: Multiplication

Type: character vector

Values: 'Element-wise(.)' | 'Matrix(*)'

Default: 'Element-wise(.)'

Multiply over — All dimensions or specified dimension

All dimensions (default) | Specified dimension

Specify the dimension to multiply over as All dimensions, or Specified dimension. When you select Specified dimension, you can specify the **Dimension** as 1 or 2.

Dependencies

To enable this parameter, set **Number of inputs** to * and **Multiplication** to Element-wise (.*).

Programmatic Use

Block Parameter: CollapseMode

Type: character vector

Values: 'All dimensions' | 'Specified dimension'

Default: 'All dimensions'

Dimension — Dimension to multiply over

1 (default) | 2 | ... | N

Specify the dimension to multiply over as an integer less than or equal to the number of dimensions of the input signal.

Dependencies

To enable this parameter, set:

- **Number of inputs** to *
- **Multiplication** to Element-wise (.*)
- **Multiply over** to Specified dimension

Programmatic Use

Block Parameter: CollapseDim

Type: character vector

Values: '1' | '2' | ...

Default: '1'

Sample time — Specify sample time as a value other than -1

-1 (default) | scalar | vector

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

Dependencies

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

Programmatic Use

Block Parameter: SampleTime

Type: character vector

Values: scalar or vector

Default: '-1'

Signal Attributes

Require all inputs to have the same data type — Require that all inputs have the same data type

off (default) | on

Specify if input signals must all have the same data type. If you enable this parameter, then an error occurs during simulation if the input signal types are different.

Programmatic Use

Block Parameter: InputSameDT

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Output minimum — Minimum output value for range checking

[] (default) | scalar

Lower value of the output range that Simulink checks.

Simulink uses the minimum to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Specify Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Embedded Coder).

Note Output minimum does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use**Block Parameter:** OutMin**Type:** character vector**Values:** ' [] ' | scalar**Default:** ' [] '**Output maximum — Maximum output value for range checking**

[] (default) | scalar

Upper value of the output range that Simulink checks.

Simulink uses the maximum value to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Specify Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Embedded Coder).

Note Output maximum does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use**Block Parameter:** OutMax

Type: character vector

Values: '[]' | scalar

Default: '[]'

Output data type — Specify the output data type

Inherit: Inherit via internal rule (default) | Inherit: Keep MSB | Inherit: Match scaling | Inherit: Inherit via back propagation | Inherit: Same as first input | double | single | half | int8 | uint8 | int16 | uint16 | int32 | uint32 | int64 | uint64 | fixdt(1,16) | fixdt(1,16,0) | fixdt(1,16,2^0,0) | <data type expression>

Choose the data type for the output. The type can be inherited, specified directly, or expressed as a data type object such as Simulink.NumericType. For more information, see “Control Signal Data Types”.

When you select an inherited option, the block behaves as follows:

- **Inherit: Inherit via internal rule** — Simulink chooses a data type to balance numerical accuracy, performance, and generated code size, while taking into account the properties of the embedded target hardware. If you change the embedded target settings, the data type selected by the internal rule might change. For example, if the block multiplies an input of type `int8` by a gain of `int16` and ASIC/FPGA is specified as the targeted hardware type, the output data type is `sfixed24`. If `Unspecified` (assume 32-bit Generic), in other words, a generic 32-bit microprocessor, is specified as the target hardware, the output data type is `int32`. If none of the word lengths provided by the target microprocessor can accommodate the output range, Simulink software displays an error in the Diagnostic Viewer.
- **Inherit: Keep MSB**— Simulink chooses a data type that maintains the full range of the operation, then reduces the precision of the output to a size appropriate for the embedded target hardware.

Tip For more efficient generated code, deselect the **Saturate on integer overflow** parameter.

This rule never produces overflows.

- **Inherit: Match scaling**— Simulink chooses a data type whose scaling matches the scaling of the input types. If the full range of the type does not fit on the embedded target hardware, the range is reduced yielding a type appropriate for the embedded target hardware. This rule can produce overflows. This rule does not support multiplication between complex signals

The **Inherit: Keep MSB** and **Inherit: Match scaling** rules do not support multiplication between complex signals or signals with non-zero bias. The rules support only multiplication and division ('**', '*/', '/*') between two inputs, matrix multiplication of two inputs, and collapsing product of two elements of a vector.

It is not always possible for the software to optimize code efficiency and numerical accuracy at the same time. If the internal rule doesn't meet your specific needs for numerical accuracy or performance, use one of the following options:

- Specify the output data type explicitly.
- Use the simple choice of **Inherit: Same as input**.
- Explicitly specify a default data type such as `fixdt(1,32,16)` and then use the Fixed-Point Tool to propose data types for your model. For more information, see `fxptdlg`.

- To specify your own inheritance rule, use **Inherit: Inherit via back propagation** and then use a Data Type Propagation block. Examples of how to use this block are available in the Signal Attributes library Data Type Propagation Examples block.
- **Inherit: Inherit via back propagation** — Use data type of the driving block.
- **Inherit: Same as first input** — Use data type of first input signal.

Dependencies

When input is a floating-point data type smaller than single precision, the **Inherit: Inherit via internal** rule output data type depends on the setting of the “Inherit floating-point output type smaller than single precision” configuration parameter. Data types are smaller than single precision when the number of bits needed to encode the data type is less than the 32 bits needed to encode the single-precision data type. For example, `half` and `int16` are smaller than single precision.

Programmatic Use

Block Parameter: `OutDataTypeStr`

Type: character vector

Values: `'Inherit: Inherit via internal rule'` | `'Inherit: Keep MSB'` | `'Inherit: Match scaling'` | `'Inherit: Same as first input'` | `'Inherit: Inherit via back propagation'` | `'double'` | `'single'` | `'half'` | `'int8'` | `'uint8'` | `'int16'` | `'uint16'` | `'int32'` | `'uint32'` | `'uint64'` | `'int64'` | `'fixdt(1,16)'` | `'fixdt(1,16,0)'` | `'fixdt(1,16,2^0,0)'` | `'<data type expression>'`

Default: `'Inherit: Inherit via internal rule'`

Lock output data type setting against changes by the fixed-point tools — Prevent fixed-point tools from overriding Output data type

`off` (default) | `on`

Select this parameter to prevent the fixed-point tools from overriding the **Output** data type you specify on the block. For more information, see “Use Lock Output Data Type Setting” (Fixed-Point Designer).

Programmatic Use

Block Parameter: `LockScale`

Type: character vector

Values: `'off'` | `'on'`

Default: `'off'`

Integer rounding mode — Rounding mode for fixed-point operations

`Floor` (default) | `Ceiling` | `Convergent` | `Nearest` | `Round` | `Simplest` | `Zero`

Select the rounding mode for fixed-point operations. You can select:

Ceiling

Rounds positive and negative numbers toward positive infinity. Equivalent to the MATLAB `ceil` function.

Convergent

Rounds number to the nearest representable value. If a tie occurs, rounds to the nearest even integer. Equivalent to the Fixed-Point Designer `convergent` function.

Floor

Rounds positive and negative numbers toward negative infinity. Equivalent to the MATLAB `floor` function.

Nearest

Rounds number to the nearest representable value. If a tie occurs, rounds toward positive infinity. Equivalent to the Fixed-Point Designer `nearest` function.

Round

Rounds number to the nearest representable value. If a tie occurs, rounds positive numbers toward positive infinity and rounds negative numbers toward negative infinity. Equivalent to the Fixed-Point Designer `round` function.

Simplest

Chooses between rounding toward floor and rounding toward zero to generate rounding code that is as efficient as possible.

Zero

Rounds number toward zero. Equivalent to the MATLAB `fix` function.

For more information, see “Rounding” (Fixed-Point Designer).

Block parameters always round to the nearest representable value. To control the rounding of a block parameter, enter an expression using a MATLAB rounding function into the mask field.

Programmatic Use

Block Parameter: `RndMeth`

Type: character vector

Values: 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'

Default: 'Floor'

Saturate on integer overflow – Method of overflow action

`off` (default) | `on`

Specify whether overflows saturate or wrap.

Action	Rationale	Impact on Overflows	Example
Select this check box (on).	Your model has possible overflow, and you want explicit saturation protection in the generated code.	Overflows saturate to either the minimum or maximum value that the data type can represent.	The maximum value that the <code>int8</code> (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box selected, the block output saturates at 127. Similarly, the block output saturates at a minimum output value of -128.

Action	Rationale	Impact on Overflows	Example
Do not select this check box (off).	<p>You want to optimize efficiency of your generated code.</p> <p>You want to avoid overspecifying how a block handles out-of-range signals. For more information, see "Troubleshoot Signal Range Errors".</p>	Overflows wrap to the appropriate value that is representable by the data type.	The maximum value that the <code>int8</code> (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box cleared, the software interprets the overflow-causing value as <code>int8</code> , which can produce an unintended result. For example, a block result of 130 (binary 1000 0010) expressed as <code>int8</code> , is -126.

When you select this check box, saturation applies to every internal operation on the block, not just the output, or result. Usually, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Programmatic Use

Block Parameter: `SaturateOnIntegerOverflow`

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Block Characteristics

Data Types	Boolean double fixed point half integer single
Direct Feedthrough	yes
Multidimensional Signals	yes
Variable-Size Signals	yes
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

HDL Architecture

The default `Linear` implementation generates a chain of N operations (multipliers) for N inputs.

Architecture	Parameters	Description
Lineardefault	None	Generate a product operator * in the generated code.
ShiftAdd	LatencyStrategy	<p>Perform product operations on fixed-point types by using multiple shift and add operations. The block has pipelined implementation that introduces additional latency in the generated code. <code>ShiftAdd</code> architecture maps to efficient circuits in ASIC applications. This architecture is useful in applications on FPGA target boards that do not have DSP units.</p> <p>The MAX latency for different word lengths is calculated by using this formula: $\text{ceil}(\log_2(\min(\text{in1WL}, \text{in2WL})))$. <code>in1WL</code> is the first input word length and <code>in2WL</code> is the second input word length. For example, if both inputs are of word length four the MAX latency is two.</p>

HDL Block Properties

If you use the block in matrix multiplication mode, you can specify the **DotProductStrategy**. This setting determines whether you want to implement the matrix multiplication by using a tree of adders and multipliers, or use the Multiply-Accumulate block implementation. The default is Fully Parallel.

Note The **DotProductStrategy** must be set to Fully Parallel when you use the Native Floating Point mode.

For more information, see “DotProductStrategy” (HDL Coder).

See also “Design Considerations for Matrices and Vectors” (HDL Coder).

General	
ConstrainedOutputPipeline	Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is 0. For more details, see “ConstrainedOutputPipeline” (HDL Coder).
DSPStyle	Synthesis attributes for multiplier mapping. The default is none. See also “DSPStyle” (HDL Coder).

General	
InputPipeline	Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “InputPipeline” (HDL Coder).
OutputPipeline	Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “OutputPipeline” (HDL Coder).
LatencyStrategy	To enable this property, set HDL architecture to <code>ShiftAdd</code> . Specify whether to map the blocks in your design to <code>MAX</code> , <code>CUSTOM</code> , or <code>ZERO</code> latency for fixed-point and floating-point types. The default is <code>MAX</code> . See also “LatencyStrategy” (HDL Coder).
CustomLatency	To enable this property, set HDL architecture to <code>ShiftAdd</code> . When LatencyStrategy is set to <code>CUSTOM</code> , use this property to specify a custom latency value between <code>ZERO</code> and <code>MAX</code> for fixed-point types. See also “LatencyStrategy” (HDL Coder).

Native Floating Point	
HandleDenormals	Specify whether you want HDL Coder to insert additional logic to handle denormal numbers in your design. Denormal numbers are numbers that have magnitudes less than the smallest floating-point number that can be represented without leading zeros in the mantissa. The default is <code>inherit</code> . See also “HandleDenormals” (HDL Coder).
LatencyStrategy	Specify whether to map the blocks in your design to <code>inherit</code> , <code>Max</code> , <code>Min</code> , <code>Zero</code> , or <code>Custom</code> for the floating-point operator. The default is <code>inherit</code> . See also “LatencyStrategy” (HDL Coder).
NFPCustomLatency	To specify a value, set LatencyStrategy to <code>Custom</code> . HDL Coder adds latency equal to the value that you specify for the NFPCustomLatency setting. See also “NFPCustomLatency” (HDL Coder).
MantissaMultiplyStrategy	Specify how to implement the mantissa multiplication operation during code generation. By using different settings, you can control the DSP usage on the target FPGA device. The default is <code>inherit</code> . See also “MantissaMultiplyStrategy” (HDL Coder).

Complex Data Support

The default (linear) implementation supports complex data.

Complex division is not supported. For block implementations of the Product block in divide mode or reciprocal mode, see “HDL Code Generation” on page 1-533 on the Divide block reference page.

Restrictions

- HDL code generation does not support more than two inputs at the ports of the block when you use the block in matrix multiplication mode.
- Product block with `/*` for **Number of inputs** block parameter performs a division where the second input is divided by the first input. This mode has the same restrictions that apply to the Divide block. See “HDL Code Generation” on page 1-533.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Divide | Dot Product | Product of Elements

Introduced before R2006a

Product of Elements

Copy or invert one scalar input, or collapse one nonscalar input

Library: Simulink / Math Operations
 HDL Coder / HDL Floating Point Operations
 HDL Coder / Math Operations

Description

The Product of Elements block inputs one scalar, vector, or matrix. You can use the block to:

- Copy a scalar input unchanged
- Invert a scalar input (divide 1 by it)
- Collapse a vector or matrix to a scalar by multiplying together all elements or taking successive inverses of the elements
- Collapse a matrix to a vector using one of these options:
 - Multiply together the elements of each row or column
 - Take successive inverses of the elements of each row or column

The Product of Elements block is functionally a Product block that has two preset parameter values:

- **Multiplication:** Element-wise (.*)
- **Number of inputs:** *

Setting nondefault values for either of those parameters can change a Product of Elements block to be functionally equivalent to a Product block or a Divide block.

Ports

Input

Port_1 — First input to multiply or divide

scalar | vector | matrix | N-D array

First input to multiply or divide, provided as a scalar, vector, matrix, or N-D array.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

Port_N — Nth input to multiply or divide

scalar | vector | matrix | N-D array

Nth input to multiply or divide, provided as a scalar, vector, matrix, or N-D array.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

X — Input signal to multiply

scalar | vector | matrix | N-D array

Input signal to be multiplied with other inputs.

Dependencies

To enable one or more **X** ports, specify one or more * characters for the **Number of inputs** parameter.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

÷ — Input signal to divide or invert

scalar | vector | matrix | N-D array

Input signal for division or inversion operations.

Dependencies

To enable one or more ÷ ports, specify one or more / characters for the **Number of inputs** parameter.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

Output

Port_1 — Output computed by multiplying, dividing, or inverting inputs

scalar | vector | matrix | N-D array

Output computed by multiplying, dividing, or inverting inputs.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

Parameters

Main

Number of inputs — Control number of inputs and type of operation

* (default) | positive integer scalar | * or / for each input port

Control two properties of the block:

- The number of input ports on the block
- Whether each input is multiplied or divided into the output

When you specify:

- **1 or * or /**

The block has one input port. In element-wise mode, the block processes the input as described for the Product of Elements block. In matrix mode, if the parameter value is 1 or *, the block

outputs the input value. If the value is /, the input must be a square matrix (including a scalar as a degenerate case) and the block outputs the matrix inverse. See “Element-Wise Mode” on page 1-1249 and “Matrix Mode” on page 1-1250 for more information.

- **Integer value > 1**

The block has the number of inputs given by the integer value. The inputs are multiplied together in element-wise mode or matrix mode, as specified by the **Multiplication** parameter. See “Element-Wise Mode” on page 1-1249 and “Matrix Mode” on page 1-1250 for more information.

- **Unquoted string of two or more * and / characters**

The block has the number of inputs given by the length of the character vector. Each input that corresponds to a * character is multiplied into the output. Each input that corresponds to a / character is divided into the output. The operations occur in element-wise mode or matrix mode, as specified by the **Multiplication** parameter. See “Element-Wise Mode” on page 1-1249 and “Matrix Mode” on page 1-1250 for more information.

Programmatic Use

Block Parameter: Inputs

Type: character vector

Values: '2' | '*' | '**' | '*/' | '*/*' | ...

Default: '*'

Multiplication — Element-wise (.*) or Matrix (*) multiplication

Element-wise(.*) (default) | Matrix(*)

Specify whether the block performs Element-wise(.*) or Matrix(*) multiplication.

Programmatic Use

Block Parameter: Multiplication

Type: character vector

Values: 'Element-wise(.*)' | 'Matrix(*)'

Default: 'Element-wise(.*)'

Multiply over — All dimensions or specified dimension

All dimensions (default) | Specified dimension

Specify the dimension to multiply over as All dimensions, or Specified dimension.

When you select All dimensions and select configuration parameter **Use algorithms optimized for row-major array layout**, Simulink enables row-major algorithms for simulation. To generate row-major code, set configuration parameter **Array layout** (Simulink Coder) to Row-major in addition to selecting **Use algorithms optimized for row-major array layout**. The column-major and row-major algorithms differ only in the multiplication order. In some cases, due to different operation order on the same data set, you might experience minor numeric differences in the outputs of column-major and row-major algorithms.

When you select Specified dimension, you can specify the **Dimension** as 1 or 2.

Dependencies

To enable this parameter, set **Number of inputs** to * and **Multiplication** to Element-wise (.*).

Programmatic Use

Block Parameter: CollapseMode

Type: character vector

Values: 'All dimensions' | 'Specified dimension'

Default: 'All dimensions'

Dimension — Dimension to multiply over

1 (default) | 2 | ... | N

Specify the dimension to multiply over as an integer less than or equal to the number of dimensions of the input signal.

Dependencies

To enable this parameter, set:

- **Number of inputs** to *
- **Multiplication** to Element-wise (.*)
- **Multiply over** to Specified dimension

Programmatic Use

Block Parameter: CollapseDim

Type: character vector

Values: '1' | '2' | ...

Default: '1'

Sample time — Specify sample time as a value other than -1

-1 (default) | scalar | vector

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

Dependencies

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

Programmatic Use

Block Parameter: SampleTime

Type: character vector

Values: scalar or vector

Default: '-1'

Signal Attributes

Require all inputs to have the same data type — Require that all inputs have the same data type

off (default) | on

Specify if input signals must all have the same data type. If you enable this parameter, then an error occurs during simulation if the input signal types are different.

Programmatic Use

Block Parameter: InputSameDT

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Output minimum — Minimum output value for range checking

[] (default) | scalar

Lower value of the output range that Simulink checks.

Simulink uses the minimum to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Specify Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Embedded Coder).

Note Output minimum does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use**Block Parameter:** OutMin**Type:** character vector**Values:** '[]' | scalar**Default:** '[]'**Output maximum — Maximum output value for range checking**

[] (default) | scalar

Upper value of the output range that Simulink checks.

Simulink uses the maximum value to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Specify Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Embedded Coder).

Note Output maximum does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use**Block Parameter:** OutMax

Type: character vector

Values: '[]' | scalar

Default: '[]'

Output data type — Specify the output data type

Inherit: Inherit via internal rule (default) | Inherit: Inherit via back propagation | Inherit: Same as first input | double | single | int8 | uint8 | int16 | uint16 | int32 | uint32 | int64 | uint64 | fixdt(1,16) | fixdt(1,16,0) | fixdt(1,16,2^0,0) | <data type expression>

Choose the data type for the output. The type can be inherited, specified directly, or expressed as a data type object such as Simulink.NumericType. For more information, see “Control Signal Data Types”.

When you select an inherited option, the block behaves as follows:

- **Inherit: Inherit via internal rule** — Simulink chooses a data type to balance numerical accuracy, performance, and generated code size, while taking into account the properties of the embedded target hardware. If you change the embedded target settings, the data type selected by the internal rule might change. For example, if the block multiplies an input of type `int8` by a gain of `int16` and ASIC/FPGA is specified as the targeted hardware type, the output data type is `sfix24`. If `Unspecified (assume 32-bit Generic)`, in other words, a generic 32-bit microprocessor, is specified as the target hardware, the output data type is `int32`. If none of the word lengths provided by the target microprocessor can accommodate the output range, Simulink software displays an error in the Diagnostic Viewer.

It is not always possible for the software to optimize code efficiency and numerical accuracy at the same time. If the internal rule doesn't meet your specific needs for numerical accuracy or performance, use one of the following options:

- Specify the output data type explicitly.
- Use the simple choice of **Inherit: Same as input**.
- Explicitly specify a default data type such as `fixdt(1,32,16)` and then use the Fixed-Point Tool to propose data types for your model. For more information, see `fxptdlg`.
- To specify your own inheritance rule, use **Inherit: Inherit via back propagation** and then use a Data Type Propagation block. Examples of how to use this block are available in the Signal Attributes library Data Type Propagation Examples block.
- **Inherit: Inherit via back propagation** — Use data type of the driving block.
- **Inherit: Same as first input** — Use data type of first input signal.

Dependencies

When input is a floating-point data type smaller than single precision, the **Inherit: Inherit via internal rule** output data type depends on the setting of the “Inherit floating-point output type smaller than single precision” configuration parameter. Data types are smaller than single precision when the number of bits needed to encode the data type is less than the 32 bits needed to encode the single-precision data type. For example, `half` and `int16` are smaller than single precision.

Programmatic Use

Block Parameter: `OutDataTypeStr`

Type: character vector

Values: 'Inherit: Inherit via internal rule' | 'Inherit: Same as first input' | 'Inherit: Inherit via back propagation' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'int64' | 'uint64' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | '<data type expression>'
Default: 'Inherit: Inherit via internal rule'

Lock output data type setting against changes by the fixed-point tools – Prevent fixed-point tools from overriding Output data type

off (default) | on

Select this parameter to prevent the fixed-point tools from overriding the **Output** data type you specify on the block. For more information, see “Use Lock Output Data Type Setting” (Fixed-Point Designer).

Programmatic Use

Block Parameter: LockScale

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Integer rounding mode – Rounding mode for fixed-point operations

Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

Select the rounding mode for fixed-point operations. You can select:

Ceiling

Rounds positive and negative numbers toward positive infinity. Equivalent to the MATLAB `ceil` function.

Convergent

Rounds number to the nearest representable value. If a tie occurs, rounds to the nearest even integer. Equivalent to the Fixed-Point Designer `convergent` function.

Floor

Rounds positive and negative numbers toward negative infinity. Equivalent to the MATLAB `floor` function.

Nearest

Rounds number to the nearest representable value. If a tie occurs, rounds toward positive infinity. Equivalent to the Fixed-Point Designer `nearest` function.

Round

Rounds number to the nearest representable value. If a tie occurs, rounds positive numbers toward positive infinity and rounds negative numbers toward negative infinity. Equivalent to the Fixed-Point Designer `round` function.

Simplest

Chooses between rounding toward floor and rounding toward zero to generate rounding code that is as efficient as possible.

Zero

Rounds number toward zero. Equivalent to the MATLAB `fix` function.

For more information, see “Rounding” (Fixed-Point Designer).

Block parameters always round to the nearest representable value. To control the rounding of a block parameter, enter an expression using a MATLAB rounding function into the mask field.

Programmatic Use

Block Parameter: RndMeth

Type: character vector

Values: 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'

Default: 'Floor'

Saturate on integer overflow — Method of overflow action

off (default) | on

Specify whether overflows saturate or wrap.

Action	Rationale	Impact on Overflows	Example
Select this check box (on).	Your model has possible overflow, and you want explicit saturation protection in the generated code.	Overflows saturate to either the minimum or maximum value that the data type can represent.	The maximum value that the <code>int8</code> (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box selected, the block output saturates at 127. Similarly, the block output saturates at a minimum output value of -128.
Do not select this check box (off).	You want to optimize efficiency of your generated code. You want to avoid overspecifying how a block handles out-of-range signals. For more information, see “Troubleshoot Signal Range Errors”.	Overflows wrap to the appropriate value that is representable by the data type.	The maximum value that the <code>int8</code> (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box cleared, the software interprets the overflow-causing value as <code>int8</code> , which can produce an unintended result. For example, a block result of 130 (binary 1000 0010) expressed as <code>int8</code> , is -126.

When you select this check box, saturation applies to every internal operation on the block, not just the output, or result. Usually, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Programmatic Use

Block Parameter: SaturateOnIntegerOverflow

Type: character vector

Values: 'off' | 'on'
 Default: 'off'

Block Characteristics

Data Types	Boolean double fixed point half integer single
Direct Feedthrough	yes
Multidimensional Signals	yes
Variable-Size Signals	yes
Zero-Crossing Detection	no

Algorithms

The Product of Elements block uses these algorithms to perform element-wise operations on inputs of floating-point, built-in integer, and fixed-point types.

Input	Element-Wise Operation	Algorithm
Real scalar, u	Multiplication	$y = u$
	Division	$y = 1/u$
Real vector or matrix with elements $u_1, u_2, u_3, \dots, u_N$	Multiplication	$y = u_1 * u_2 * u_3 * \dots * u_N$
	Division	$y = (((1/u_1)/u_2)/u_3) \dots /u_N$
Complex scalar, u	Multiplication	$y = u$
	Division	$y = 1/u$
Complex vector or matrix with elements $u_1, u_2, u_3, \dots, u_N$	Multiplication	$y = u_1 * u_2 * u_3 * \dots * u_N$
	Division	$y = (((1/u_1)/u_2)/u_3) \dots /u_N$

If the specified dimension for element-wise multiplication or division is a row or column of a matrix, the algorithm applies to that row or column. Consider this model.

The top Product of Elements block collapses the matrix input to a scalar by taking successive inverses of the four elements:

$$\bullet y = (((1/2+i)/3)/4-i)/5$$

The bottom Product of Elements block collapses the matrix input to a vector by taking successive inverses along the second dimension:

- $y(1) = ((1/2+i)/3)$
- $y(2) = ((1/4-i)/5)$

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

HDL Architecture

HDL Coder supports **Tree** and **Cascade** architectures for Product or Product of Elements blocks that have a single vector input with multiple elements.

This block has multi-cycle implementations that introduce additional latency in the generated code. To see the added latency, view the generated model or validation model. See “Generated Model and Validation Model” (HDL Coder).

Architecture	Additional cycles of latency	Description
Linear (default)	0	Generates a linear chain of adders to compute the sum of products.
Tree	0	Generates a tree structure of adders to compute the sum of products.
Cascade	1, when block has a single vector input port.	This implementation optimizes latency * area and is faster than the Tree implementation. It computes partial products and cascades multipliers. See “Cascade Architecture Best Practices” (HDL Coder).

Note The Product of Element block does not support HDL code generation with double data types in the Native Floating Point mode.

HDL Block Properties

If you use the block in matrix multiplication mode, you can specify the **DotProductStrategy**. This setting determines whether you want to implement the matrix multiplication by using a tree of adders and multipliers, or use the Multiply-Accumulate block implementation. The default is Fully Parallel.

Note The **DotProductStrategy** must be set to **Fully Parallel** when you use the **Native Floating Point** mode.

For more information, see “DotProductStrategy” (HDL Coder).

See also “Design Considerations for Matrices and Vectors” (HDL Coder).

General	
ConstrainedOutputPipeline	Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is 0. For more details, see “ConstrainedOutputPipeline” (HDL Coder).
DSPStyle	Synthesis attributes for multiplier mapping. The default is none. See also “DSPStyle” (HDL Coder).
InputPipeline	Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “InputPipeline” (HDL Coder).
OutputPipeline	Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “OutputPipeline” (HDL Coder).
Native Floating Point	
HandleDenormals	Specify whether you want HDL Coder to insert additional logic to handle denormal numbers in your design. Denormal numbers are numbers that have magnitudes less than the smallest floating-point number that can be represented without leading zeros in the mantissa. The default is inherit . See also “HandleDenormals” (HDL Coder).
LatencyStrategy	Specify whether to map the blocks in your design to inherit , Max , Min , Zero , or Custom for the floating-point operator. The default is inherit . See also “LatencyStrategy” (HDL Coder).
NFPCustomLatency	To specify a value, set LatencyStrategy to Custom . HDL Coder adds latency equal to the value that you specify for the NFPCustomLatency setting. See also “NFPCustomLatency” (HDL Coder).
MantissaMultiplyStrategy	Specify how to implement the mantissa multiplication operation during code generation. By using different settings, you can control the DSP usage on the target FPGA device. The default is inherit . See also “MantissaMultiplyStrategy” (HDL Coder).

Complex Data Support

The default (linear) implementation supports complex data.

Complex division is not supported. For block implementations of the Product block in divide mode or reciprocal mode, see “HDL Code Generation” on page 1-533 on the Divide block reference page.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Pulse Generator

Generate square wave pulses at regular intervals

Library: Simulink / Sources

Description

The Pulse Generator block generates square wave pulses at regular intervals. The block waveform parameters, **Amplitude**, **Pulse Width**, **Period**, and **Phase delay**, determine the shape of the output waveform. The following diagram shows how each parameter affects the waveform.

The Pulse Generator block can emit scalar, vector, or matrix signals of any real data type. To emit a scalar signal, use scalars to specify the waveform parameters. To emit a vector or matrix signal, use vectors or matrices, respectively, to specify the waveform parameters. Each element of the waveform parameters affects the corresponding element of the output signal. For example, the first element of a vector amplitude parameter determines the amplitude of the first element of a vector output pulse. All the waveform parameters must have the same dimensions after scalar expansion. The data type of the output is the same as the data type of the **Amplitude** parameter.

The block output can be generated in time-based or sample-based modes, determined by the **Pulse type** parameter.

Time-Based Mode

In time-based mode, Simulink computes the block output only at times when the output actually changes. This approach results in fewer computations for the block output over the simulation time period. Activate this mode by setting the **Pulse type** parameter to Time based.

The block does not support a time-based configuration that results in a constant output signal. Simulink returns an error if the parameters **Pulse Width** and **Period** satisfy either of these conditions:

$$Period * \frac{PulseWidth}{100} = 0$$

$$Period * \frac{PulseWidth}{100} = Period$$

Depending on the pulse waveform characteristics, the intervals between changes in the block output can vary. For this reason, a time-based Pulse Generator block has a variable sample time. The sample time color of such blocks is brown (see “View Sample Time Information” for more information).

Simulink cannot use a fixed-step solver to compute the output of a time-based pulse generator. If you specify a fixed-step solver for models that contain time-based pulse generators, Simulink computes a fixed sample time for the time-based pulse generators. Then the time-based pulse generators simulate as sample based.

If you use a fixed-step solver and the **Pulse type** is **Time based**, choose the step size such that the period, phase delay, and pulse width (in seconds) are integer multiples of the solver step size. For example, suppose that the period is 4 seconds, the pulse width is 75% (that is, 3 s), and the phase delay is 1 s. In this case, the computed sample time is 1 s. Therefore, choose a fixed-step size of 1 or a number that divides 1 exactly (for example, 0.25). To ensure this setting, select **auto** on the **Solver** pane of the Configuration Parameters dialog box.

Sample-Based Mode

In sample-based mode, the block computes its outputs at fixed intervals that you specify. Activate this mode by setting the **Pulse type** parameter to **Sample based**.

An important difference between the time-based and sample-based modes is that in time-based mode, the block output is based on simulation time, and in sample-based mode, the block output depends only on the simulation start, regardless of elapsed simulation time.

This block supports reset semantics in sample-based mode. For example, if a Pulse Generator block is in a resettable subsystem that hits a reset trigger, the block output resets to its initial condition.

Ports

Output

Port_1 — Output signal

scalar | vector | matrix

Generated square wave pulse signal specified by the parameters.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Parameters

Pulse type — Computational technique

Time based (default) | Sample based

Computational technique to generate the type of square wave that this block generates, either time- or sample-based. Some parameters in the dialog box appear depending on whether you select time-based or sample-based.

Programmatic Use**Block Parameter:** PulseType**Type:** character vector**Values:** 'Time based' | 'Sample based'**Default:** 'Time based'**Time (t) — Source of time variable**

Use simulation time (default) | Use external signal

Specifies whether to use simulation time or an external signal as the source of values for the output pulse's time variable. If you specify an external source, the block displays an input port for connecting the source. The output pulse differs as follows:

- **Use simulation time:** The block generates an output pulse where the time variable equals the simulation time.
- **Use external signal:** The block generates an output pulse where the time variable equals the value from the input port, which can differ from the simulation time.

Programmatic Use**Block Parameter:** TimeSource**Type:** character vector**Values:** 'Use simulation time' | 'Use external signal'**Default:** 'Use simulation time'**Amplitude — Signal amplitude**

1 (default) | scalar

Specify the amplitude of the signal.

Programmatic Use**Block Parameter:** Amplitude**Type:** character vector**Value:** scalar**Default:** '1'**Period (secs) — Pulse period**

10 (default) | scalar

Pulse period specified in seconds if the pulse type is time-based. If the pulse type is sample-based, then the period is specified as the number of sample times.

Programmatic Use**Block Parameter:** Period**Type:** character vector**Value:** scalar**Default:** '10'**Pulse width — Duty cycle**

5 (default) | scalar in the range [0,100]

Duty cycle specified as the percentage of the pulse period that the signal is on if time-based or as number of sample times if sample-based.

Programmatic Use**Block Parameter:** PulseWidth

Type: character vector

Value: scalar

Default: '5'

Phase delay (secs) — Delay before pulse

0 (default) | scalar

Delay before the pulse is generated, specified in seconds, if the pulse type is time-based or as number of sample times if the pulse type is sample-based.

Programmatic Use

Block Parameter: PhaseDelay

Type: character vector

Value: scalar

Default: '0'

Sample time — Length of sample time

0 (default) | scalar | vector

Length of the sample time for this block in seconds. This parameter appears only if the block's pulse type is sample-based. See “Specify Sample Time”.

Programmatic Use

Block Parameter: SampleTime

Type: character vector

Value: scalar

Default: '0'

Interpret vector parameters as 1-D — Treat vectors as 1-D

on (default) | off

Select this check box to output a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector.

- When you select this check box, the block outputs a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector. For example, the block outputs a matrix of dimension 1-by-N or N-by-1.
- When you clear this check box, the block does not output a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector.

Programmatic Use

Block Parameter: VectorParams1D

Type: character vector

Values: 'on' | 'off'

Default: 'on'

Block Characteristics

Data Types	Boolean double fixed point integer single
Direct Feedthrough	yes
Multidimensional Signals	no

Variable-Size Signals	no
Zero-Crossing Detection	no

Push Button

Set value of parameter when button is pressed

Library: Simulink / Dashboard

Description

When you press the Push Button block during a simulation, the value of the connected block parameter changes to a specified value. Use the Push Button block with other Dashboard blocks to create an interactive dashboard to control your model.

Double-clicking the Push Button block does not open its dialog box during simulation and when the block is selected. To edit the block's parameters, you can use the **Property Inspector**, or you can right-click the block and select **Block Parameters** from the context menu.

Connect Dashboard Blocks

Dashboard blocks do not use ports to connect to model elements. To connect dashboard blocks to variables and block parameters, use connect mode. Connect mode facilitates the process of connecting dashboard blocks in your model, especially when you want to connect multiple blocks at once. To connect a single dashboard block, you can also use the **Connection** table in the block dialog box.

Tip You can modify dashboard block connections in your model during normal and accelerator mode simulations.

Note Dashboard blocks cannot connect to variables until you update the model diagram. To connect dashboard blocks to variables or modify variable values between opening your model and running a simulation, update the model diagram using **Ctrl+D**.

To enter connect mode, select the block. Then, on the block tab, click **Connect**. In connect mode, when you select one or more blocks, a list of parameters and variables available for connection appears. Select a variable or parameter from the list to connect to the selected dashboard block.

When the value of the selected variable or block parameter is nonscalar, use the text box at the bottom of the **Connection** table to specify the element you want to connect to the dashboard block. To connect to an element of a vector, matrix, or array, specify the element index, for example, 3 or (1, 3). To connect to an element in a bus or structure, specify the element in the context of the bus or structure hierarchy by using dots to indicate different levels in the hierarchy, and omit the top level. For example, specify a.b to connect to scalar element b of the structure or bus a nested inside the selected composite variable or parameter.

To connect another dashboard block, pause on another dashboard block and click the **Connect** button above it. Then, make a selection of signals and blocks in your model and choose a model element to connect.

When you finish connecting the dashboard blocks in your model, on the block tab, click **Done Connecting**.

Tip You can hide the message shown on unconnected blocks using the `set_param` function with the `ShowInitialText` block parameter. The message also disappears when you connect the block.

Parameter Logging

Tunable parameters connected to dashboard blocks are logged to the Simulation Data Inspector, where you can view the parameter values along with logged signal data. You can access logged parameter data in the MATLAB workspace by exporting the parameter data from the Simulation Data Inspector by using the UI or the `Simulink.sdi.exportRun` function. For more information about exporting data using the Simulation Data Inspector UI, see "Export Data from the Simulation Data Inspector". The parameter data is stored in a `Simulink.SimulationData.Parameter` object, accessible as an element in the exported `Simulink.SimulationData.Dataset`.

Limitations

- Except for the Dashboard Scope block and the Display block, dashboard blocks can only connect to real scalar signals.
- The toolstrip does not support blocks that are inside a panel.
- You cannot use the **Connection** table in the block dialog to connect a dashboard block to a block that is commented out. When you connect a dashboard block to a commented block using connect

mode, the dashboard block does not display the connected value until the you uncomment the block.

- Dashboard blocks cannot connect to model elements inside referenced models.
- When you simulate a model hierarchy, dashboard blocks inside referenced models do not update.
- Dashboard blocks do not support rapid accelerator simulation.
- When you connect a dashboard block to a variable or parameter during simulation, the data for that variable or parameter is not logged to the Simulation Data Inspector. To log variable and parameter data to the Simulation Data Inspector, connect the dashboard block to the variable or parameter prior to simulation.
- When you simulate a model in external mode with the **Default parameter behavior** set to **Inlined**, dashboard blocks can appear to change parameter and variable values. However, the change does not propagate to the simulation. For example, Gain blocks display changes made to the **Gain** parameter using the dashboard blocks, but the **Gain** value used in the simulation does not change.

Parameters

Connection — Select a variable or block parameter to connect

variable and parameter connection options

Select the variable or block parameter to control using the **Connection** table. To connect the block to a signal:

- 1 Make a selection in the model that includes one or more blocks.
- 2 Select the variable or parameter you want to connect.

When the value of the selected variable or block parameter is nonscalar, use the text box at the bottom of the **Connection** table to specify the element you want to connect to the dashboard block. To connect to an element of a vector, matrix, or array, specify the element index, for example, 3 or (1, 3). To connect to an element in a bus or structure, specify the element in the context of the bus or structure hierarchy by using dots to indicate different levels in the hierarchy, and omit the top level. For example, specify a.b to connect to scalar element b of the structure or bus a nested inside the selected composite variable or parameter.

- 3 Click **Apply**.

To facilitate understanding and debugging your model, you can connect Dashboard blocks to variables and parameters in your model during simulation.

Note To see workspace variables in the connection table, update the model diagram using **Ctrl+D**.

Programmatic Use

To programmatically connect a dashboard block to a tunable parameter or a variable, use a `Simulink.HMI.ParamSourceInfo` object. The `Simulink.HMI.ParamSourceInfo` object contains four properties. Some of the properties apply to connecting dashboard blocks to parameters, and some apply to connecting dashboard blocks to variables. Not all fields have a value for a connection because a given dashboard block connects to either a parameter or a variable.

Block Parameter: Binding

Type: Simulink.HMI.ParamSourceInfo

Default: []

Button Text — Text displayed on button

Button (default) | character vector

The text displayed on the Push Button block in your model.

Programmatic Use

Block Parameter: ButtonText

Type: string or character array

Default: 'Button'

On Value — Value assigned to parameter when button is pressed

1 (default) | scalar

The value assigned to the connected block parameter when the button is pressed.

Programmatic Use

Block Parameter: OnValue

Type: string or character array

Default: '1'

Label — Block label position

Hide (default) | Bottom | Top

Position of the block label. When the block is connected to an element in the model, the label is the name of the connected element.

Programmatic Use

Block Parameter: LabelPosition

Type: character vector

Values: 'Hide' | 'Bottom' | 'Top'

Default: 'Hide'

Opacity — Block background opacity

1 (default) | scalar

Block background opacity, specified as a scalar value between 0 and 1.

Example: 0.5

Programmatic Use

Block Parameter: Opacity

Type: scalar

Default: 1

ForegroundColor — Block foreground color

[r g b] vector

Block foreground color, including the text. You can select a color from a palette of standard colors or specify a custom color.

Programmatic Use

Specify the ForegroundColor parameter for the block as a 1-by-3 [r g b] vector with values between 0 and 1.

Block Parameter: ForegroundColor

Type: [r g b] vector

Background Color — Block background color

[r g b] vector

Block background color. You can select a color from a palette of standard colors or specify a custom color.

Programmatic Use

Specify the BackgroundColor parameter for the block as a 1-by-3 [r g b] vector with values between 0 and 1.

Block Parameter: BackgroundColor

Type: [r g b] vector

Block Characteristics

Data Types	double half integer single

PWM

Generate ideal pulse width modulated signal corresponding to input duty cycle

Library: Simulink / Discontinuities

Description

Use the PWM block to generate an ideal pulse width modulated signal.

Pulse Width Modulation (PWM) is a technique for encoding an analog signal using square pulses. This encoding is achieved by controlling the fraction of one period of the square wave that is set to high. This fraction is the duty cycle of the signal. The relationship between the modulated signal and the input duty cycle can be simply described as:

$$\bar{y} = Dy_{max} + (1 - D)y_{min}$$

where y_{max} and y_{min} are the upper and lower bounds of the duty cycle, respectively. For the PWM block, the duty cycle is constrained to [0,1]. Thus the idealized PWM signal is proportional to the duty cycle D .

Ports

Input

D – Duty Cycle

scalar

Desired duty cycle of the pulse P , specified as scalar within the range [0,1].

Data Types: double

Output

Port 1 – Output pulse

scalar

PWM signal corresponding to the input duty cycle.

Data Types: double

Parameters

Period (s) – Pulse width

1 (default) | real scalar

Time between rising edges of consecutive pulses of the output signal. A smaller value represents a higher frequency pulse.

Run at fixed time intervals – Choose continuous or discrete-time behavior

continuous (default) | discrete

Select whether the block should operate in continuous or discrete sampling modes.

By default, the block uses continuous sampling mode as it improves simulation performance with variable step solvers.

Select discrete sampling mode if you need to:

- use a fixed-step solver
- generate code
- sample the block output

Sampling rate – Set pulse resolution

0.1 (default) | scalar

Specify the rate at which the block samples input duty cycle signal. This sampling rate becomes the resolution of the output pulse signal.

Dependencies

This parameter requires that **Sampling mode** is set to discrete

Disallow zero duty cycle – Avoid algebraic loops

off | on

Enable this parameter to break algebraic loops containing the PWM block.

Note Enabling this parameter causes a signal value of 0 or below for the Duty Cycle input to throw an error.

Data Types: Boolean

Block Characteristics

Data Types	double
Direct Feedthrough	no
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Algorithms

Continuous Sampling Mode

For a pulse starting at time t_k

$$y(t) = \begin{cases} 1 & t_k < t < t_k + pw \\ 0 & t_{k+1} < t < t_k + pw \end{cases}$$

where pw is the pulse width. For a given period P , pw is proportional to the duty cycle D

$$pw = D(t_k) * P(t_k)$$

Discrete Sampling Mode

In Discrete sampling mode, the input duty cycle signal is sampled at the rate specified by the **Sampling rate** parameter.

For a specified sampling rate t_s , the number of samples needed for a pulse of width pw can be expressed as follows

$$n_{pw} = \left\lceil \frac{D_k \cdot P_k}{T_S} \right\rceil \quad 0 < n_{pw} < n_P$$

$$n_P = \left\lceil \frac{P}{T_S} \right\rceil$$

where n_P is the number of samples needed to simulate a pulse of period P .

Consider a nominal pulse of period P with the sampling rate of the block set to be $t_s = 0.25 P$. The number of samples needed for one period of the pulse, $n_p = 4$. Thus, for the input duty cycle $D = 0.47$, the number of samples n_{pw} is floored to $\left\lfloor \frac{0.47P}{0.25} \right\rfloor = 1$. Therefore, the pulse is high for 1 of the 4 samples in the period.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production-quality code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. The code generated can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code.

In general, consider using the Simulink Model Discretizer to map continuous blocks into discrete equivalents that support production code generation. To start the Model Discretizer, in the Simulink Editor, on the **Apps** tab, under **Apps**, under **Control Systems**, click **Model Discretizer**. One exception is the Second-Order Integrator block because, for this block, the Model Discretizer produces an approximate discretization.

Introduced in R2020b

Quantizer

Discretize input at given interval

Library: Simulink / Discontinuities

Description

The Quantizer block discretizes the input signal using a quantization algorithm. The block uses a round-to-nearest method to map signal values to quantized values at the output that are defined by the **Quantization interval**. A smooth input signal can take on a stair-step shape after quantization.

This equation mathematically describes the round-to-nearest method:

$$y = q * \text{round}(u/q)$$

where y is the quantized output, u is the input, and q is the **Quantization interval**.

Ports

Input

Port_1 — Input signal to quantize

scalar | vector

Input signal to the quantization algorithm.

Data Types: single | double

Output

Port_1 — Quantized output signal

scalar | vector

Output signal composed of discrete values, quantized with a round-to-nearest approach:

$$y = q * \text{round}(u/q)$$

where y is the output, u is the input, and q is the **Quantization interval**.

Data Types: single | double

Parameters

Quantization interval — Interval that defines quantization levels for the output signal

0.5 (default) | scalar | vector

Specify the quantization interval used in the algorithm. Quantization levels for the Quantizer block output are integer multiples of the **Quantization interval**.

Programmatic Use**Block Parameter:** QuantizationInterval**Type:** character vector**Value:** Any real or complex value**Default:** '0.5'**Treat as gain when linearizing — Specify the gain value**

On (default) | boolean

The linearization commands in Simulink software treat this block as a gain in state space. Select this check box to cause the commands to treat the gain as 1. Clear the box to have the commands treat the gain as 0.

Programmatic Use**Block Parameter:** LinearizeAsGain**Type:** character vector**Value:** 'off' | 'on'**Default:** 'on'**Sample time — Specify sample time as a value other than -1**

-1 (default) | scalar | vector

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

Dependencies

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

Programmatic Use**Block Parameter:** SampleTime**Type:** character vector**Values:** scalar or vector**Default:** '-1'**Block Characteristics**

Quarter Gauge

Display input value on quadrant scale

Library: Simulink / Dashboard

Description

The Quarter Gauge block displays the connected signal on a quadrant scale during simulation. You can use the Quarter Gauge block with other Dashboard blocks to build an interactive dashboard of controls and indicators for your model. The Quarter Gauge block provides an indication of the instantaneous value of the connected signal throughout simulation. You can modify the range of the Quarter Gauge block to fit your data. You can also customize the appearance of the Quarter Gauge block to provide more information about your signal. For example, you can color-code in-specification and out-of-specification ranges.

Connect Dashboard Blocks

Dashboard blocks do not use ports to connect to model elements. To connect dashboard blocks to signals in your model, use connect mode. Connect mode facilitates the process of connecting dashboard blocks in your model, especially when you want to connect multiple blocks at once. To connect a single dashboard block, you can also use the **Connection** table in the block dialog box.

Tip You can modify dashboard block connections during normal and accelerator mode simulations.

To enter connect mode, select a dashboard block to connect. Then on the block tab, click **Connect**. In connect mode, when you select one or more signals or blocks, a list of signals that are available for connection appears. Select a signal from the list to connect to the selected dashboard block. To connect another dashboard block, pause on the block you want to connect and click the **Connect** button above it. Then, select one or more signals and blocks in the model and choose a signal to connect.

When you finish connecting the dashboard blocks in your model, on the block tab, click **Done Connecting**.

Tip You can hide the message shown on unconnected blocks using the `set_param` function with the `ShowInitialText` block parameter. The message also disappears when you connect the block.

Limitations

- Except for the Dashboard Scope block and the Display block, dashboard blocks can only connect to real scalar signals.
- The toolstrip does not support blocks that are inside a panel.
- You cannot use the **Connection** table in the block dialog to connect a dashboard block to a block that is commented out. When you connect a dashboard block to a commented block using connect mode, the dashboard block does not display the connected value until the you uncomment the block.
- Dashboard blocks cannot connect to model elements inside referenced models.
- When you simulate a model hierarchy, dashboard blocks inside referenced models do not update.
- Dashboard blocks do not support rapid accelerator simulation.
- You cannot connect a dashboard block to data or activity in Stateflow during simulation.
- Some signals are removed by optimization and are not available during accelerator mode simulations. To view such a signal using a dashboard block, mark the signal for logging.

Parameters

Signal

Connection — Signal to connect and display

signal connection options

Use the connection table to select the signal to connect to the block. To connect the block to a signal:

- 1 Make a selection in the model that includes one or more signals.
- 2 In the table, select the signal you want to connect.
- 3 Click **Apply**.

Tip You can connect dashboard blocks to signals in the model during simulation.

Programmatic Use

Block Parameter: Binding

Type: Simulink.HMI.SignalSpecification

Default: []

Main

Minimum — Minimum tick mark value

0 (default) | scalar

Finite, real, double, scalar value specifying the minimum tick mark value for the scale. The minimum must be less than the value of the **Maximum** parameter.

Programmatic Use

To programmatically set the Minimum parameter, use a 1-by-3 vector containing values for the Minimum, Tick Interval, and Maximum parameters, in that order. To use the auto value for the Tick Interval, leave the Tick Interval position in the vector empty or specify -1.

Block Parameter: Limits

Type: 1x3 vector

Default: [0 -1 100]

Maximum — Maximum tick mark value

100 (default) | scalar

Finite, real, double, scalar value specifying the maximum tick mark value for the scale. The maximum must be greater than the value of the **Minimum** parameter.

Programmatic Use

To programmatically set the Maximum parameter, use a 1-by-3 vector containing values for the Minimum, Tick Interval, and Maximum parameters, in that order. To use the auto value for the Tick Interval, leave the Tick Interval position in the vector empty or specify -1.

Block Parameter: Limits

Type: 1x3 vector

Default: [0 -1 100]

Tick Interval — Interval between major tick marks

auto (default) | scalar

Finite, real, positive, whole, scalar value specifying the interval of major tick marks on the scale. When set to `auto`, the block automatically adjusts the tick interval based on the values of the **Maximum** and **Minimum** parameters.

Programmatic Use

To programmatically set the `Tick Interval` parameter, use a 1-by-3 vector containing values for the `Minimum`, `Tick Interval`, and `Maximum` parameters, in that order. To use the `auto` value for the `Tick Interval`, leave the `Tick Interval` position in the vector empty or specify `-1`.

Block Parameter: Limits

Type: 1x3 vector

Default: [0 -1 100]

Scale Colors — Color indications on gauge scale

colors for scale ranges

Color specifications for value ranges on the scale. Press the **+** button to add a scale color. For each color added, specify the minimum and maximum values of the range in which you want to display that color.

Programmatic Use

To programmatically specify the `Scale Colors` parameter, use an array of structures with the fields:

- `Min` — Minimum value for the color range on the scale
- `Max` — Maximum value for the color range on the scale
- `Color` — 1-by-3 vector of double values between 0 and 1 that specify the color for the range in the form [r g b]

Include a structure in the array for each scale range for which you want to specify a color.

```
range1.Min = 0;  
range1.Max = 10;  
range1.Color = [0 0 1];  
range2.Min = 10;  
range2.Max = 15;  
range2.Color = [0 1 0];  
scaleRanges = [range1 range2];
```

Block Parameter: ScaleColors

Type: structure array

Default: 0x1 struct array

Label — Block label position

Top (default) | Bottom | Hide

Position of the block label. When the block is connected to an element in the model, the label is the name of the connected element.

Programmatic Use

Block Parameter: LabelPosition

Type: character vector

Values: 'Top' | 'Bottom' | 'Hide'

Default: 'Top'

Scale Direction — Gauge scale direction

Clockwise (default) | Counterclockwise

Gauge scale direction.

Programmatic Use**Block Parameter:** ScaleDirection**Type:** character vector**Values:** 'Clockwise' | 'Counterclockwise'**Default:** 'Clockwise'**Format****Opacity — Block background opacity**

1 (default) | scalar

Block background opacity, specified as a scalar value between 0 and 1.

Example: 0.5

Programmatic Use**Block Parameter:** Opacity**Type:** scalar**Default:** 1**Foreground Color — Block foreground color**

[r g b] vector

Block foreground color, excluding the text. The **Foreground Color** applies to the scale and the block name. You can select a color from a palette of standard colors or specify a custom color. To specify the color for the block text, use the **Font Color**.

Programmatic Use

Specify the `ForegroundColor` parameter for the block as a 1-by-3 [r g b] vector with values between 0 and 1.

Block Parameter: ForegroundColor**Type:** [r g b] vector**Background Color — Block background color**

[r g b] vector

Block background color. You can select a color from a palette of standard colors or specify a custom color.

Programmatic Use

Specify the `BackgroundColor` parameter for the block as a 1-by-3 [r g b] vector with values between 0 and 1.

Block Parameter: BackgroundColor**Type:** [r g b] vector**Font Color — Block font color**

[r g b] vector

Block font color. The **Font Color** applies to the tick labels on the scale. You can select a color from a palette of standard colors or specify a custom color.

Programmatic Use

Specify the `FontColor` parameter for the block as a 1-by-3 [r g b] vector with values between 0 and 1.

Block Parameter: `FontColor`

Type: [r g b] vector

Queue, Entity Queue

Enqueue messages and entities

Library: Simulink / Messages & Events
SimEvents

Description

This block stores entities or messages in a queue, based on the order of arrival or priority. Each element at the head of the queue departs when the downstream block is ready to accept it. The Queue block and the Entity Queue block are the same blocks with different default values for the **Overwrite the oldest element if queue is full** check box.

You can specify the capacity of the queue, and the policy when the queue is full. The block supports three different message or queue sorting policies, first-in-first out (FIFO), last-in-first out (LIFO), and priority. The priority queue can be used only when the **Overwrite the oldest element if queue is full** check box is cleared.

Ports

Input

Port_1 — Input entity or message

scalar | vector | matrix

Input entity or message that carries scalar, bus, or vector data to enter the queue.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | enumerated | bus | fixed point

Output

Port_1 — Output entity or message

scalar | vector | matrix

Output port that allows entities or messages at the head of the queue to depart when a downstream block is ready to accept them.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | enumerated | bus | fixed point

Port_d — Number of entities that have departed the block

scalar

Number of entities that have departed the block.

Dependencies

To enable this port, select **Overwrite the oldest element if queue is full** check box, and click the **Statistics** tab and select the box labeled **Number of entities departed, d**.

Data Types: double

Port_n – Number of entities that have not yet departed the block

scalar

Number of entities that have not yet departed the block.

Dependencies

To enable this port, select **Overwrite the oldest element if queue is full** check box, and click the **Statistics** tab and select the box labeled **Number of entities in block, n**.

Data Types: double

Port_w – Average wait time for entities in the block

scalar

Average wait time for entities in the block.

Dependencies

To enable this port, select **Overwrite the oldest element if queue is full** check box, and click the **Statistics** tab and select the box labeled **Average wait, w**.

Data Types: double

Port_l – Average length of the entity queue

scalar

Port_l outputs the average length of the entity queue.

Dependencies

To enable this port, select **Overwrite the oldest element if queue is full** check box, and click the **Statistics** tab and select the box labeled **Average queue length, l**.

Data Types: double

Port_ex – Number of entities extracted

scalar

Number of entities that are pulled out of this block.

Dependencies

To enable this port, select **Overwrite the oldest element if queue is full** check box, and click the **Statistics** tab and select the box labeled **Number of entities extracted, ex**.

Data Types: double

Parameters**Overwrite the oldest element if queue is full – Specify queue overwriting policy**

on (default for Simulink) | off (default for SimEvents)

Select this check box to choose between two queue overwriting policies.

- If you select the check box, an incoming message overwrites the oldest if the queue is full.

This mode represents a simple message buffer that you can use to generate asynchronous communication between Simulink components and production code.

- If you clear the check box, the block does not accept new messages if the queue is full.

In this mode, you can manipulate entity data using event actions and visualize statistics.

To customize actions when entities or messages enter, exit, or are blocked, enter MATLAB code in the **Entry action**, **Exit action**, or **Blocked action** field of the **Event actions** tab. For more information, see “Events and Event Actions” (SimEvents).

For an example, see “Manage Entities Using Event Actions” (SimEvents).

Programmatic Use

Block Parameter: QueueOverwriting

Type: character vector

Values: 'on' | 'off'

Default: 'on' (for Simulink) and 'off' (for SimEvents)

Capacity — Specify the capacity of the queue

25 (default) | scalar

Specify the capacity of the queue.

Programmatic Use

Block Parameter: Capacity

Type: character vector

Values: '25' | scalar

Default: '25'

Queue type — Choose the queue type

FIFO (default) | LIFO | Priority

Choose the queue type.

- FIFO — first-in-first-out
- LIFO — last-in-first-out
- Priority — store elements in order of priority, see “Serve High-Priority Customers by Sorting Entities Based on Priority” (SimEvents). Priority can be selected when you clear the **Overwrite the oldest element if queue is full** check box.

Note Priority queue does not support fixed point data type.

Programmatic Use

Block Parameter: QueueType

Type: character vector

Values: 'FIFO' | 'LIFO' | 'Priority'

Default: 'FIFO'

Multicast tag — Specify the tag when accepting entities broadcast via multicast sources

A (default) | character vector

Specify the tag when accepting entities broadcast via multicast sources. The Entity Multicast block requires SimEvents license.

Dependencies

This parameter is visible when you clear the **Overwrite the oldest element if queue is full** check box, and set **Entity arrival source** to Multicast.

Programmatic Use

Block Parameter: MulticastTag

Type: character vector

Values: 'A' | character vector

Default: 'A'

Priority source — Specify which attribute of the entity determines its priority

PriorityAttribute (default) | character vector

Specify which attribute of the entity determines its priority.

Dependencies

This parameter is visible when you clear the **Overwrite the oldest element if queue is full** check box, and set **Queue type** to Priority.

Programmatic Use

Block Parameter: PrioritySource

Type: character vector

Values: 'PriorityAttribute' | character vector

Default: 'PriorityAttribute'

Sorting direction — Choose the direction of sorting based on priority

Ascending (default) | Descending

Choose the direction of sorting based on priority.

- Ascending — Elements with smaller priority values appear in front of the queue.
- Descending — Elements with greater priority values appear in front of the queue.

Dependencies

This parameter is visible when you clear the **Overwrite the oldest element if queue is full** check box, and set **Queue type** to Priority.

Programmatic Use

Block Parameter: SortingDirection

Type: character vector

Values: 'Ascending' | 'Descending'

Default: 'Ascending'

Entity arrival source — Choose the source of arrival for the entities

Input port (default) | Multicast

Choose the source of arrival for the entities.

- Input port — Input port is source of messages or entities.
- Multicast — Entity Multicast block is source of entities. The Entity Multicast block requires SimEvents license.

Dependencies

This parameter is visible when you clear the **Overwrite the oldest element if queue is full** check box, and set **Queue type** to Priority.

Programmatic Use

Block Parameter: EntityArrivalSource

Type: character vector

Values: 'Input port' | 'Multicast'

Default: 'Input port'

Event action — Specify the behavior of the entity in certain events

Entry (default) | Exit | Blocked

Specify the behavior of the entity in certain events. Define the behavior in the **Event action** parameter. The **Entry** and the **Exit** actions are called just after the entity entry and just before entity exit. The **Blocked** action is called after an entity is blocked. For more information, see “Events and Event Actions” (SimEvents).

Note Event actions do not support fixed point data type.

Dependencies

Event actions are visible when you clear the **Overwrite the oldest element if queue is full** check box.

Programmatic Use

Block Parameter: EntryAction, ExitAction, BlockedAction

Type: character vector

Values: MATLAB code

Default: ''

Number of entities departed, d — Outputs the number of entities that have departed the block

off (default) | on

Number of entities that have departed the block.

Dependencies

Number of entities departed, d is visible when you clear the **Overwrite the oldest element if queue is full** check box.

Programmatic Use

Block Parameter: NumberEntitiesDeparted

Type: character vector

Values: 'on' | 'off'

Default: 'off'

Number of entities in block, n — Outputs the number of entities present in the block, that are yet to depart

off (default) | on

Number of entities present in the block, but which are yet to depart.

Dependencies

Number of entities in block, n is visible when you clear the **Overwrite the oldest element if queue is full** check box.

Programmatic Use

Block Parameter: NumberEntitiesInBlock

Type: character vector

Values: 'on' | 'off'

Default: 'off'

Average wait, w – Outputs the average wait time

off (default) | on

Sum of the wait times for entities departing the block divided by their total number. Wait time is the duration between the Entity Queue block entry and exit of an entity. For more information, see “Interpret SimEvents Models Using Statistical Analysis” (SimEvents).

Dependencies

Average wait, w is visible when you clear the **Overwrite the oldest element if queue is full** check box.

Programmatic Use

Block Parameter: AverageWait

Type: character vector

Values: 'on' | 'off'

Default: 'off'

Average queue length, l – Outputs the average length of the entity queue

off (default) | on

Accumulated time-weighted average queue size. The block computes this value by:

- 1 Multiplying the size of the queue by its duration to calculate time-weighted queue size
- 2 Summing up all time-weighted queue sizes and averaging them over total time

For more information, see “Interpret SimEvents Models Using Statistical Analysis” (SimEvents).

Dependencies

Average queue length, l is visible when you clear the **Overwrite the oldest element if queue is full** check box.

Programmatic Use

Block Parameter: AverageQueueLength

Type: character vector

Values: 'on' | 'off'

Default: 'off'

Number of entities extracted, ex – Number of entities extracted from this block

off (default) | on

Outputs the number of extracted entities which are pulled out from this block by the Entity Find block. The Entity Find block requires a SimEvents license. If the extracted entity is the first entity in the queue, the next entity is set as the pending entity to leave the block. If an entity attribute defines

the priority in a priority queue and it is modified by the Entity Find block, the queue is sorted again. When an entity is extracted, **Number of entities departed, d**, **Number of entities in block, n**, **Average wait, w**, and **Average queue length, l** statistics are updated accordingly. For more information about finding and extracting entities, see “Find and Extract Entities in SimEvents Models” (SimEvents).

Dependencies

Number of entities extracted, ex is visible when you clear the **Overwrite the oldest element if queue is full** check box.

Programmatic Use

Block Parameter: NumEntitiesExtracted

Type: character vector

Values: 'on' | 'off'

Default: 'off'

Block Characteristics

Data Types	Boolean bus double enumerated fixed point integer single string
Direct Feedthrough	no
Multidimensional Signals	yes
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Code generation is not supported for event actions and statistics.

“Overview of Queues and Servers in Discrete-Event Simulation” (SimEvents)

Introduced in R2016a

Radio Button

Select parameter value

Library: Simulink / Dashboard

Description

The Radio Button block lets you change the value of the connected parameter during simulation. You can specify a list of values and labels and then select the value for the parameter from that list. Use the Radio Button block with other Dashboard blocks to build an interactive dashboard of controls and indicators for your model.

Double-clicking the Radio Button block does not open its dialog box during simulation and when the block is selected. To edit the block's parameters, you can use the **Property Inspector**, or you can right-click the block and select **Block Parameters** from the context menu.

Connect Dashboard Blocks

Dashboard blocks do not use ports to connect to model elements. To connect dashboard blocks to variables and block parameters, use connect mode. Connect mode facilitates the process of connecting dashboard blocks in your model, especially when you want to connect multiple blocks at once. To connect a single dashboard block, you can also use the **Connection** table in the block dialog box.

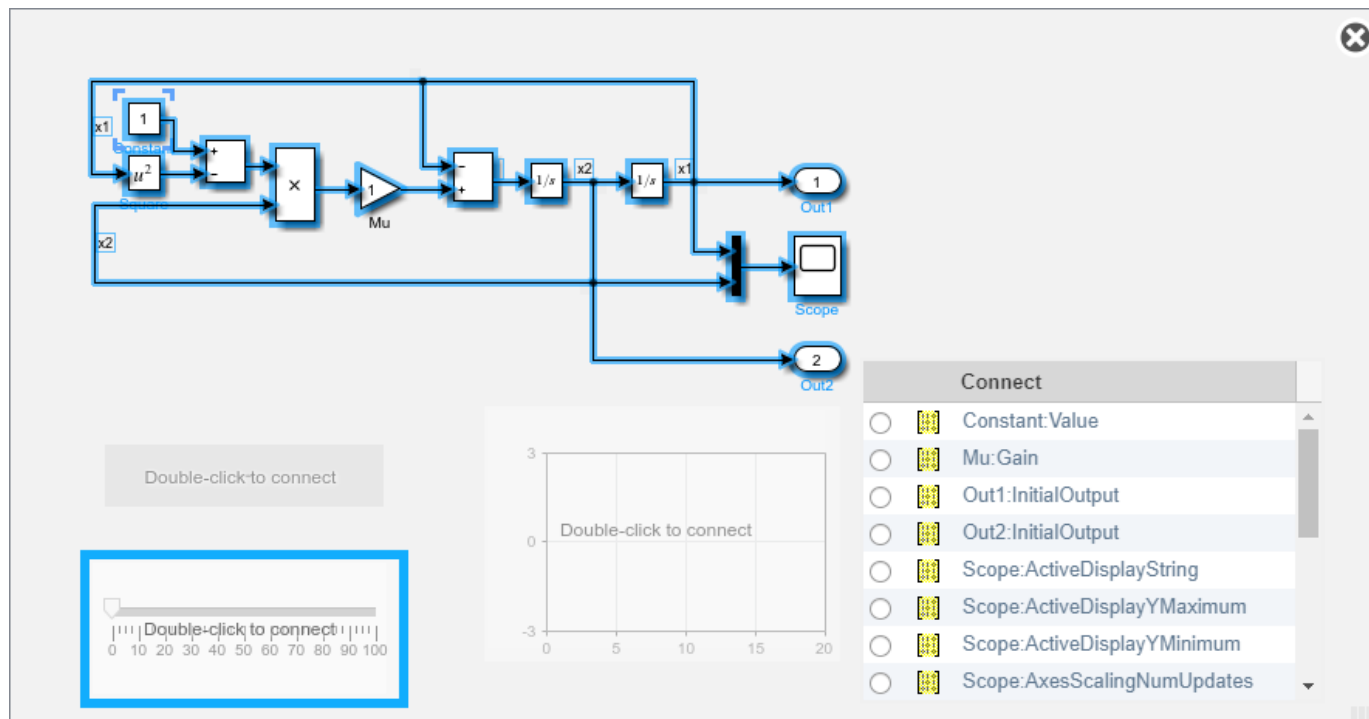

Tip You can modify dashboard block connections in your model during normal and accelerator mode simulations.

Note Dashboard blocks cannot connect to variables until you update the model diagram. To connect dashboard blocks to variables or modify variable values between opening your model and running a simulation, update the model diagram using **Ctrl+D**.

To enter connect mode, select the block. Then, on the block tab, click **Connect**. In connect mode, when you select one or more blocks, a list of parameters and variables available for connection appears. Select a variable or parameter from the list to connect to the selected dashboard block.

When the value of the selected variable or block parameter is nonscalar, use the text box at the bottom of the **Connection** table to specify the element you want to connect to the dashboard block. To connect to an element of a vector, matrix, or array, specify the element index, for example, 3 or (1, 3). To connect to an element in a bus or structure, specify the element in the context of the bus or structure hierarchy by using dots to indicate different levels in the hierarchy, and omit the top level. For example, specify a.b to connect to scalar element b of the structure or bus a nested inside the selected composite variable or parameter.

To connect another dashboard block, pause on another dashboard block and click the **Connect** button above it. Then, make a selection of signals and blocks in your model and choose a model element to connect.

When you finish connecting the dashboard blocks in your model, on the block tab, click **Done Connecting**.

Tip You can hide the message shown on unconnected blocks using the `set_param` function with the `ShowInitialText` block parameter. The message also disappears when you connect the block.

Parameter Logging

Tunable parameters connected to dashboard blocks are logged to the Simulation Data Inspector, where you can view the parameter values along with logged signal data. You can access logged parameter data in the MATLAB workspace by exporting the parameter data from the Simulation Data Inspector by using the UI or the `Simulink.sdi.exportRun` function. For more information about exporting data using the Simulation Data Inspector UI, see “Export Data from the Simulation Data Inspector”. The parameter data is stored in a `Simulink.SimulationData.Parameter` object, accessible as an element in the exported `Simulink.SimulationData.Dataset`.

Limitations

- Except for the Dashboard Scope block and the Display block, dashboard blocks can only connect to real scalar signals.
- The toolstrip does not support blocks that are inside a panel.
- You cannot use the **Connection** table in the block dialog to connect a dashboard block to a block that is commented out. When you connect a dashboard block to a commented block using connect

mode, the dashboard block does not display the connected value until the you uncomment the block.

- Dashboard blocks cannot connect to model elements inside referenced models.
- When you simulate a model hierarchy, dashboard blocks inside referenced models do not update.
- Dashboard blocks do not support rapid accelerator simulation.
- When you connect a dashboard block to a variable or parameter during simulation, the data for that variable or parameter is not logged to the Simulation Data Inspector. To log variable and parameter data to the Simulation Data Inspector, connect the dashboard block to the variable or parameter prior to simulation.
- When you simulate a model in external mode with the **Default parameter behavior** set to **Inlined**, dashboard blocks can appear to change parameter and variable values. However, the change does not propagate to the simulation. For example, Gain blocks display changes made to the **Gain** parameter using the dashboard blocks, but the **Gain** value used in the simulation does not change.

Parameters

Connection — Select a variable or block parameter to connect

variable and parameter connection options

Select the variable or block parameter to control using the **Connection** table. To connect the block to a signal:

- 1 Make a selection in the model that includes one or more blocks.
- 2 Select the variable or parameter you want to connect.

When the value of the selected variable or block parameter is nonscalar, use the text box at the bottom of the **Connection** table to specify the element you want to connect to the dashboard block. To connect to an element of a vector, matrix, or array, specify the element index, for example, 3 or (1, 3). To connect to an element in a bus or structure, specify the element in the context of the bus or structure hierarchy by using dots to indicate different levels in the hierarchy, and omit the top level. For example, specify a.b to connect to scalar element b of the structure or bus a nested inside the selected composite variable or parameter.

- 3 Click **Apply**.

To facilitate understanding and debugging your model, you can connect Dashboard blocks to variables and parameters in your model during simulation.

Note To see workspace variables in the connection table, update the model diagram using **Ctrl+D**.

Programmatic Use

To programmatically connect a dashboard block to a tunable parameter or a variable, use a `Simulink.HMI.ParamSourceInfo` object. The `Simulink.HMI.ParamSourceInfo` object contains four properties. Some of the properties apply to connecting dashboard blocks to parameters, and some apply to connecting dashboard blocks to variables. Not all fields have a value for a connection because a given dashboard block connects to either a parameter or a variable.

Block Parameter: Binding

Type: Simulink.HMI.ParamSourceInfo

Default: []

States — Set of states to select for connected parameter

scalar and character vector

Set of states from which to select a value for the connected parameter. Each **State** consists of a **State Value** and a **State Label**.

- **State Value** — Value assigned to the connected variable or parameter when you select the state with the corresponding **Label**.
- **State Label** — Label for each state. You can use the **Label** to display the value the connected parameter takes when the switch is positioned at the bottom, or you can enter a descriptive text label.

Click the + button to add additional **States**.

The default configuration for the block includes these **States**.

States

State Value	State Label
0	Label1
1	Label2
2	Label3

Programmatic Use

To programmatically configure the **States** for a block, use an array of structures containing the fields **Value** and **Label**. Include a structure in the array for each state you want to configure on the block.

```
state1.Value = 1;
state1.Label = 'State 1';
state2.Value = 2;
state2.Label = 'State 2';
radioStates = [state1 state2];
```

Block Parameter: States

Type: structure

Default: 3x1 structure array

Enumerated Data Type — Specify state values and labels using an enumerated data type

off (default) | on

You can use an enumerated data type that pairs a numeric value with each enumeration to configure the state values and labels for the block. To specify the states for the block using an enumerated data type, first select the **Enumerated Data Type** option. Then, specify the name of the enumerated data type in the text box. The definition for the specified enumerated data type must be saved on the MATLAB path or in the base workspace.

Example: myEnumType

Programmatic Use

To programmatically specify the state labels and values for the block using an enumerated data type, specify 'on' for the `UseEnumeratedDataType` parameter and the name of the enumerated data type for the `EnumeratedDataType` parameter.

Block Parameter: `UseEnumeratedDataType`

Type: string or character array

Values: 'on' | 'off'

Default: 'off'

Block Parameter: `EnumeratedDataType`

Type: string or character array

Default: ''

Group Name — Radio Button group name

`RadioButtonGroup` (default) | character vector

Name for the group of values displayed on the Radio Button block. Unlike the **Block Name** and **Label**, the **Group Name** always shows on the Radio Button block.

Example: `Input Amplitude`

Programmatic Use

Block Parameter: `ButtonGroupName`

Type: string or character array

Default: 'Group'

Label — Block label position

`Top` (default) | `Bottom` | `Hide`

Position of the block label. When the block is connected to an element in the model, the label is the name of the connected element.

Programmatic Use

Block Parameter: `LabelPosition`

Type: character vector

Values: 'Top' | 'Bottom' | 'Hide'

Default: 'Top'

Opacity — Block background opacity

1 (default) | scalar

Block background opacity, specified as a scalar value between 0 and 1.

Example: `0.5`

Programmatic Use

Block Parameter: `Opacity`

Type: scalar

Default: 1

Foreground Color — Block foreground color

[r g b] vector

Block foreground color, including the text. You can select a color from a palette of standard colors or specify a custom color.

Programmatic Use

Specify the `ForegroundColor` parameter for the block as a 1-by-3 [r g b] vector with values between 0 and 1.

Block Parameter: `ForegroundColor`

Type: [r g b] vector

Background Color — Block background color

[r g b] vector

Block background color. You can select a color from a palette of standard colors or specify a custom color.

Programmatic Use

Specify the `BackgroundColor` parameter for the block as a 1-by-3 [r g b] vector with values between 0 and 1.

Block Parameter: `BackgroundColor`

Type: [r g b] vector

Ramp

Generate constantly increasing or decreasing signal

Library: Simulink / Sources

Description

The Ramp block generates a signal that starts at a specified time and value and changes by a specified rate. The block's **Slope**, **Start time**, and **Initial output** parameters determine the characteristics of the output signal. All must have the same dimensions after scalar expansion.

Ports

Output

Port_1 — Output signal

scalar | vector | matrix

Generated output ramp signal characterized by the **Slope**, **Start time**, and **Initial output** parameters.

Data Types: double

Parameters

Slope — Slope of signal

1 (default) | scalar | vector | matrix

Specify the rate of change of the generated signal.

Programmatic Use

Block Parameter: slope

Type: character vector

Values: scalar

Default: '1'

Start time — Time output begins

0 (default) | scalar

Specify the time at which the block begins generating the signal.

Programmatic Use

Block Parameter: start

Type: character vector

Values: scalar

Default: '0'

Initial output — Initial value of output signal

0 (default) | scalar | vector | matrix

Specify the initial value of the output signal.

Programmatic Use**Block Parameter:** InitialOutput**Type:** character vector**Values:** scalar**Default:** '0'**Interpret vector parameters as 1-D — Treat vectors as 1-D**

on (default) | off

Select this check box to output a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector.

- When you select this check box, the block outputs a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector. For example, the block outputs a matrix of dimension 1-by-N or N-by-1.
- When you clear this check box, the block does not output a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector.

Programmatic Use**Block Parameter:** VectorParams1D**Type:** character vector**Values:** 'on' | 'off'**Default:** 'on'**Block Characteristics**

Data Types	double

Pulse Generator | Repeating Sequence

Introduced before R2006a

Random Number

Generate normally distributed random numbers

Library: Simulink / Sources

Description

The Random Number block generates normally distributed random numbers. To generate uniformly distributed random numbers, use the Uniform Random Number block. Both blocks use the Normal (Gaussian) random number generator ('v4': legacy MATLAB 4.0 generator of the `rng` function).

You can generate a repeatable sequence using any Random Number block with the same nonnegative seed and parameters. The seed resets to the specified value each time a simulation starts. By default, the block produces a sequence that has a mean of 0 and a variance of 1. To generate a vector of random numbers with the same mean and variance, specify the **Seed** parameter as a vector.

Avoid integrating a random signal, because solvers must integrate relatively smooth signals. Instead, use the Band-Limited White Noise block.

The numeric parameters of this block must have the same dimensions after scalar expansion. If you select the **Interpret vector parameters as 1-D** check box, and the numeric parameters are row or column vectors after scalar expansion, the block outputs a 1-D signal. If you clear the **Interpret vector parameters as 1-D** check box, the block outputs a signal of the same dimensionality as the parameters.

Ports

Output

Port_1 — Output signal

scalar | vector | matrix

Output signal that is the generated random numbers falling within a normal Gaussian distribution. The output is repeatable for a given seed.

Data Types: `double`

Parameters

Mean — Mean of random numbers

0 (default) | scalar

Specify the mean of the random numbers generated.

Programmatic Use

Block Parameter: Mean

Type: character vector

Values: scalar

Default: '0'

Variance — Variance of random numbers

1 (default) | scalar

Specify the variance of the random numbers.

Programmatic Use

Block Parameter: Variance

Type: character vector

Values: scalar

Default: '1'

Seed — Starting seed

0 (default) | positive integer

Specify the starting seed for the random number generator.

The output of number generated is repeatable for a given seed.

Programmatic Use

Block Parameter: Seed

Type: character vector

Values: scalar

Default: '0'

Sample time — Time between intervals

0.1 (default) | integer

Specify the time interval between samples. The default is 0.1, which matches the default sample time of the Band-Limited White Noise block. See “Specify Sample Time” for more information.

Programmatic Use

Block Parameter: SampleTime

Type: character vector

Values: scalar

Default: '0.1'

Interpret vector parameters as 1-D — Treat vectors as 1-D

on (default) | off

Select this check box to output a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector.

- When you select this check box, the block outputs a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector. For example, the block outputs a matrix of dimension 1-by-N or N-by-1.
- When you clear this check box, the block does not output a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector.

Programmatic Use

Block Parameter: VectorParams1D

Type: character vector

Values: 'on' | 'off'

Default: 'on'

Block Characteristics

Data Types	double
Direct Feedthrough	no
Multidimensional Signals	yes
Variable-Size Signals	no
Zero-Crossing Detection	no

Band-Limited White Noise | Uniform Random Number | rng

Introduced before R2006a

Rate Limiter

Limit rate of change of signal

Library: Simulink / Discontinuities

Description

The Rate Limiter block limits the first derivative of the signal passing through it. The output changes no faster than the specified limit. The derivative is calculated using this equation:

$$rate = \frac{u(i) - y(i - 1)}{t(i) - t(i - 1)}$$

where $u(i)$ and $t(i)$ are the current block input and time, and $y(i-1)$ and $t(i-1)$ are the output and time at the previous step. The output is determined by comparing $rate$ to the **Rising slew rate** and **Falling slew rate** parameters:

- If $rate$ is greater than the **Rising slew rate** parameter (R), the output is calculated as

$$y(i) = \Delta t \cdot R + y(i - 1).$$

- If $rate$ is less than the **Falling slew rate** parameter (F), the output is calculated as

$$y(i) = \Delta t \cdot F + y(i - 1).$$

- If $rate$ is between the bounds of R and F , the change in output is equal to the change in input:

$$y(i) = u(i)$$

When the block is running in continuous mode (for example, **Sample time mode** is inherited and **Sample time** of the driving block is zero), the **Initial condition** is ignored. The block output at $t = 0$ is equal to the initial input:

$$y(0) = u(0)$$

When the block is running in discrete mode (for example, **Sample time mode** is inherited and **Sample time** of the driving block is nonzero), the **Initial condition** is preserved:

$$y(-1) = I_c$$

where I_c is the initial condition. The block output at $t = 0$ is calculated as if $rate$ is outside the bounds of R and F . For $t = 0$, $rate$ is calculated as follows:

$$rate = \frac{u(0) - y(-1)}{sample\ time}$$

Limitations

- You cannot use a Rate Limiter block inside a Triggered Subsystem. Use the Rate Limiter Dynamic block instead.

Ports

Input

Port_1 — Input signal

scalar

The input signal to the rate limiter algorithm.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `fixed point`

Output

Port_1 — Output signal

scalar

Output signal from the rate limiter algorithm.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `fixed point`

Parameters

Rising slew rate — Limit of derivative for increasing input

1 (default) | real number

Specify the limit of the rising rate of the input signal. This parameter is tunable for fixed-point inputs.

Programmatic Use

Block Parameter: `RisingSlewLimit`

Type: character vector

Values: real number

Default: `'1'`

Falling slew rate — Limit of derivative for decreasing input

-1 (default) | real number

Specify the lower limit on the falling rate of the input signal. This parameter is tunable for fixed-point inputs.

Programmatic Use

Block Parameter: `FallingSlewLimit`

Type: character vector

Values: real number

Default: `'-1'`

Sample time mode — Sample time mode

`inherited` (default) | `continuous`

Specify the sample time mode, `continuous` or `inherited` from the driving block.

Programmatic Use

Block Parameter: `SampleTimeMode`

Type: character vector

Values: 'inherited' | 'continuous' |
Default: 'inherited'

Initial condition — Initial output

0 (default) | scalar

Set the initial output of the simulation. Simulink does not allow you to set the initial condition of this block to `inf` or `NaN`.

Programmatic Use

Block Parameter: InitialCondition

Type: character vector

Values: scalar

Default: '0'

Treat as gain when linearizing — Specify the gain value

On (default) | Boolean

Select this check box to cause the commands to treat the gain as 1. The linearization commands in Simulink software treat this block as a gain in state space. Clear the box to have the commands treat the gain as 0.

Programmatic Use

Block Parameter: LinearizeAsGain

Type: character vector

Values: 'off' | 'on'

Default: 'on'

Block Characteristics

Data Types	double fixed point integer single
Direct Feedthrough	yes
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Cannot be used inside a triggered subsystem hierarchy.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Rate Limiter Dynamic | Saturation

Introduced before R2006a

Rate Limiter Dynamic

Limit rate of change of signal

Library: Simulink / Discontinuities

Description

The Rate Limiter Dynamic block limits the rising and falling rates of the signal.

- The external signal `up` sets the upper limit on the rising rate of the signal.
- The external signal `lo` sets the lower limit on the falling rate of the signal.

Follow these guidelines when using the Rate Limiter Dynamic block:

- Ensure that the data types of `up` and `lo` are the same as the data type of the input signal `u`.

When the lower limit uses a signed type and the input signal uses an unsigned type, the output signal keeps increasing regardless of the input and the limits.

- Use a fixed-step solver to simulate models that contain this block.

Because the Rate Limiter Dynamic block supports only discrete sample time.

Ports

Input

u — Input signal

scalar

Input signal to the rate limiter algorithm.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `fixed point`

lo — Limit of derivative for decreasing input

scalar

Dynamic value providing the limit of the falling rate of the input signal. Make the signal data type of `lo` the same data type of the input signal `u`.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `fixed point`

up — Limit of derivative for increasing input

scalar

Dynamic value providing the limit of the rising rate of the input signal. Make the signal data type of `up` the same data type of the input signal `u`.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Output

Y — Output signal

scalar

Output signal from the rate limiter algorithm.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point | enumerated | bus

Block Characteristics

Data Types	double fixed point integer single
Direct Feedthrough	no
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

The code generator does not explicitly group primitive blocks that constitute a nonatomic masked subsystem block in the generated code. This flexibility allows for more efficient code generation. In certain cases, you can achieve grouping by configuring the masked subsystem block to execute as an atomic unit by selecting the **Treat as atomic unit** option.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Rate Limiter

Introduced before R2006a

Rate Transition

Handle transfer of data between blocks operating at different rates

Library: Simulink / Signal Attributes
HDL Coder / Signal Attributes

Description

The Rate Transition block transfers data from the output of a block operating at one rate to the input of a block operating at a different rate. Use the block parameters to trade data integrity and deterministic transfer for faster response or lower memory requirements. To learn about data integrity and deterministic data transfer, see “Data Transfer Problems” (Simulink Coder).

Transition Handling Options

Transition Handling Options	Block Parameter Settings
<ul style="list-style-type: none"> Data integrity Deterministic data transfer Maximum latency 	Select: <ul style="list-style-type: none"> Ensure data integrity during data transfer Ensure deterministic data transfer
<ul style="list-style-type: none"> Data integrity Nondeterministic data transfer Minimum latency Higher memory requirements 	Select: <ul style="list-style-type: none"> Ensure data integrity during data transfer Clear: <ul style="list-style-type: none"> Ensure deterministic data transfer
<ul style="list-style-type: none"> Potential loss of data integrity Nondeterministic data transfer Minimum latency Lower memory requirements 	Clear: <ul style="list-style-type: none"> Ensure data integrity during data transfer Ensure deterministic data transfer

Dependencies

The behavior of the Rate Transition block depends on:

- Sample times of the ports to which the block connects (see “Effects of Synchronous Sample Times” on page 1-1323 and “Effects of Asynchronous Sample Times” on page 1-1324)
- Priorities of the tasks for the source and destination sample times (see “Sample time properties” in the Simulink documentation)
- Whether the model specifies a fixed- or variable-step solver (see “Compare Solvers” in the Simulink documentation)

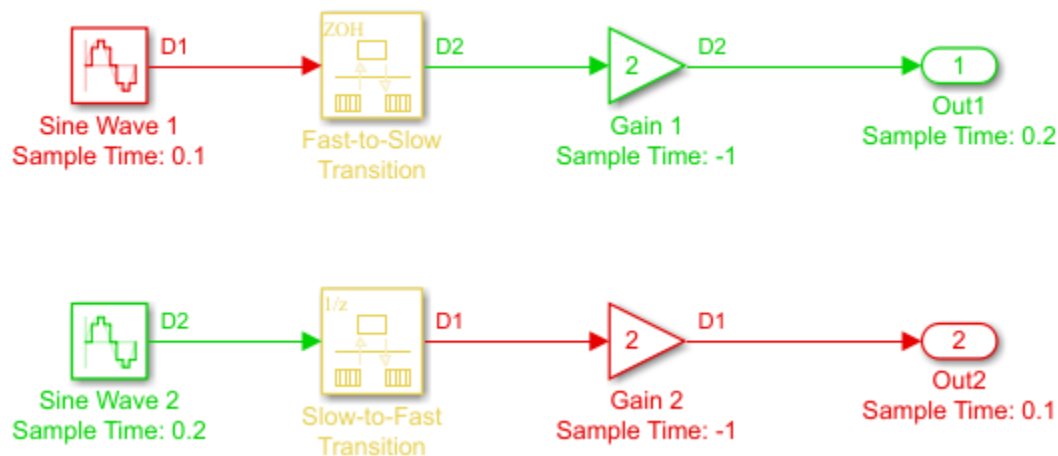

- Setting of model configuration parameters **Device vendor** and **Device type** (see “Effects of Device Configuration” on page 1-1324)

Block Labels

When you update your diagram, a label appears on the Rate Transition block to indicate simulation behavior.

Label	Block Behavior
ZOH	Acts as a zero-order hold
1/z	Acts as a unit delay
Buf	Copies input to output under semaphore control
Db_buf	Copies input to output using double buffers
3buf	Copies input to output using triple buffers
Copy	Unprotected copy of input to output
NoOp	Does nothing
Mixed	Expands to multiple blocks with different behaviors
RT	Indicates data transfer between partitions when using the Schedule Editor. For more information on using the Schedule Editor, see “Using the Schedule Editor”.

The block behavior label shows the method that ensures safe transfer of data between tasks operating at different rates. You can use the sample-time colors feature (see “View Sample Time Information”) to display the relative rates that the block bridges. Consider, for example, the following model:

Sample-time colors and the block behavior label show:

- The Rate Transition block at the top of the diagram acts as a zero-order hold in a fast-to-slow transition.
- The Rate Transition block at the bottom of the diagram acts as a unit delay in a slow-to-fast transition.

For more information, see “Handle Rate Transitions” (Simulink Coder).

Effects of Synchronous Sample Times

The following table summarizes how each label appears when the sample times of the input and output ports ($inTs$ and $outTs$) are periodic, or synchronous.

Block Settings		Block Label		
Rate Transition	Conditions for Rate Transition Block	With Data Integrity and Determinism	With Only Data Integrity	Without Data Integrity or Determinism
inTs = outTs (Equal)	$inTsOffset < outTsOffset$	None (error)	Buf	Copy or NoOp (see note that follows the table)
	$inTsOffset = outTsOffset$	Copy or NoOp (see note that follows the table)	Copy or NoOp (see note that follows the table)	
	$inTsOffset > outTsOffset$	None (error)	Db_buf	
inTs < outTs (Fast to slow)	$inTs = outTs / N$	ZOH	Buf	
	$inTsOffset, outTsOffset = 0$			
	$inTs = outTs / N$	None (error)		
	$inTsOffset \leq outTsOffset$			
	$inTs = outTs / N$	None (error)	Db_buf	
	$inTsOffset > outTsOffset$			
	$inTs \neq outTs / N$	None (error)		
inTs > outTs (Slow to fast)	$inTs = outTs * N$	1/z	Db_buf	
	$inTsOffset, outTsOffset = 0$			
	$inTs = outTs * N$	None (error)		
	$inTsOffset \leq outTsOffset$			
	$inTs = outTs * N$	None (error)		
	$inTsOffset > outTsOffset$			
	$inTs \neq outTs * N$	None (error)		
KEY				
<ul style="list-style-type: none"> • $inTs$, $outTs$: Sample times of input and output ports, respectively • $inTsOffset$, $outTsOffset$: Sample time offsets of input and output ports, respectively • N: Integer value > 1 				

When you select the **Block reduction** parameter on the Configuration Parameters dialog box, Copy reduces to NoOp. No code generation occurs for a Rate Transition block with a NoOp label. To prevent a block from being reduced when block reduction is on, add a test point to the block output (see “Configure Signals as Test Points” in the Simulink documentation).

Effects of Asynchronous Sample Times

The following table summarizes how each label appears when the sample time of the input or output port (inTs or outTs) is not periodic, or asynchronous.

Block Settings	Block Label		
	With Data Integrity and Determinism	With Only Data Integrity	Without Data Integrity or Determinism
inTs = outTs	Copy	Copy	Copy
inTs ≠ outTs	None (error)	Db_buf	
KEY			
<ul style="list-style-type: none"> • inTs, outTs: Sample times of input and output ports, respectively 			

Effects of Device Configuration

If the settings of model configuration parameters **Device vendor** and **Device type** specify hardware that supports atomic data load and store operations, the code generator optimizes the generated rate transition code when the target hardware supports atomic load and store operations for the data type of the signal being transferred. The code generator takes advantage of the hardware data load and store capability by replacing double-buffering code between asynchronous tasks with code that performs a single memory copy.

Ports

Input

Port_1 — Input signal

scalar | vector | matrix | N-D array

Input signal to transition to a new sample rate, specified as a scalar, vector, matrix, or N-D array. To learn about the block parameters that enable you to trade data integrity and deterministic transfer for faster response or lower memory requirements, see “Transition Handling Options” on page 1-1321.

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Output

Port_1 — Output signal

scalar | vector | matrix | N-D array

Output signal is the input signal converted to the sample rate you specify. The default configuration ensures safe and deterministic data transfer. To learn about the block parameters that enable you to trade data integrity and deterministic transfer for faster response or lower memory requirements, see “Transition Handling Options” on page 1-1321.

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Parameters

Ensure data integrity during data transfer — Ensure data integrity

on (default) | off

Selecting this check box results in generated code that ensures data integrity when the block transfers data. If you select this check box and the transfer is nondeterministic (see **Ensure deterministic data transfer**), depending on the priority of input rate and output rate, the generated code uses a proper algorithm using single or multiple buffers to protect data integrity during data transfer.

Otherwise, the Rate Transition block is either reduced or generates code using a copy operation to affect the data transfer. This unprotected mode consumes less memory. But the copy operation is also interruptible, which can lead to loss of data integrity during data transfers. Select this check box if you want the generated code to operate with maximum responsiveness (that is, nondeterministically) and data integrity. For more information, see “Rate Transition Block Options” (Simulink Coder).

Programmatic Use

Block Parameter: Integrity

Type: character vector

Values: 'off' | 'on'

Default: 'on'

Ensure deterministic data transfer (maximum delay) — Ensure deterministic data transfer

on (default) | off

Selecting this check box results in generated code that transfers data at the sample rate of the slower block, that is, deterministically. If you do not select this check box, data transfers occur when new data is available from the source block and the receiving block is ready to receive the data. You avoid transfer delays, thus ensuring that the system operates with maximum responsiveness. However, transfers can occur unpredictably, which is undesirable in some applications. For more information, see “Rate Transition Block Options” (Simulink Coder).

Programmatic Use

Block Parameter: Deterministic

Type: character vector

Values: 'off' | 'on'

Default: 'on'

Initial conditions — Initial conditions

0 (default) | scalar | vector | matrix | N-D array

This parameter applies only to slow-to-fast transitions. It specifies the initial output of the Rate Transition block at the beginning of a transition when there is no output from the slow block connected to the input of the Rate Transition block. Simulink does not allow the initial output of this block to be Inf or NaN. The value you specify must be a scalar, or have the same dimensions as the input signal.

Programmatic Use

Block Parameter: InitialCondition

Type: character vector

Values: finite scalar

Default: '0'

Output port sample time options – Mode for specifying output port sample time`Specify (default) | Inherit | Multiple of input port sample time`

Specifies a mode for setting the output port sample time. The options are:

- **Specify** — Allows you to use the **Output port sample time** parameter to specify the output rate to which the Rate Transition block converts its input rate.
- **Inherit** — Specifies that the Rate Transition block inherits an output rate from the block to which the output port is connected.
- **Multiple of input port sample time** — Allows you to use the **Sample time multiple (>0)** parameter to specify the Rate Transition block output rate as a multiple of its input rate.

If you select **Inherit** and all blocks connected to the output port also inherit sample time, the fastest sample time in the model applies.

Programmatic Use**Block Parameter:** `OutPortSampleTimeOpt`**Type:** character vector**Values:** `'Specify' | 'Inherit' | 'Multiple of input port sample time'`**Default:** `'Specify'`**Output port sample time – Output rate**`-1 (default) | scalar | vector`

Enter a value that specifies the output rate to which the block converts its input rate. The default value (-1) specifies that the Rate Transition block inherits the output rate from the block to which the output port is connected. See “Specify Sample Time” for information on how to specify the output rate.

Dependencies

To enable this parameter, set **Output port sample time options** to **Specify**.

Programmatic Use**Block Parameter:** `OutPortSampleTime`**Type:** character vector**Values:** `scalar | vector`**Default:** `'-1'`**Sample time multiple(>0) – Sample time multiple**`1 (default) | positive scalar`

Enter a positive value that specifies the output rate as a multiple of the input port sample time. The default value (1) specifies that the output rate is the same as the input rate. A value of 0.5 specifies that the output rate is half of the input rate. A value of 2 specifies that the output rate is twice the input rate.

Dependencies

To enable this parameter, set **Output port sample time options** to **Multiple of input port sample time**.

Programmatic Use**Block Parameter:** `OutPortSampleTimeMultiple`**Type:** character vector

Values: scalar

Default: '1'

Block Characteristics

Data Types	Boolean bus double enumerated fixed point half integer single
Direct Feedthrough	yes
Multidimensional Signals	yes
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

- Generated code relies on memcpy or memset functions (string.h) under certain conditions.
- Cannot use inside a triggered subsystem hierarchy.
- Generated code for concurrent programs is platform specific and assumes deployment platform and host platform are the same.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

Best Practices

- When the Rate Transition block is operating at a faster input rate and slower output rate, it is good practice to follow the Rate Transition block with a unit delay. Doing so prevents the code generator from inserting an extra bypass register in the HDL code. See also “Multirate Model Requirements for HDL Code Generation” (HDL Coder).
- To upsample the input signal without incurring a unit delay, in the Block Parameters dialog box of the Rate Transition block:

- Clear the **Ensure data integrity during data transfer** check box.

Clearing this check box makes the **Ensure deterministic data transfer (maximum delay)** check box to disappear.

- Configure the output port sample time of the block to be an integer multiple of the input port sample time. Specify a fractional value of 1/n for **Sample time multiple** where n is an integer. You can choose any value for the block parameter **Output port sample time options** as long as **Sample time multiple** uses a value 1/n.

Note When downsampling the input signal, leave the **Ensure data integrity during data transfer** and **Ensure deterministic data transfer (maximum delay)** check boxes selected. This mode generates an additional bypass register in the HDL code.

See also “Usage of Rate Change and Constant Blocks” (HDL Coder).

Restrictions

- Sample rate cannot be 0 or Inf for block input or output ports.

HDL Architecture

This block has a single, default HDL architecture.

HDL Block Properties

ConstrainedOutputPipeline	Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is 0. For more details, see “ConstrainedOutputPipeline” (HDL Coder).
InputPipeline	Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “InputPipeline” (HDL Coder).
OutputPipeline	Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “OutputPipeline” (HDL Coder).

Complex Data Support

This block supports code generation for complex signals.

Fixed-Point Conversion

Real-Imag to Complex

Convert real and/or imaginary inputs to complex signal

Library: Simulink / Math Operations
HDL Coder / Math Operations

Description

The Real-Imag to Complex block converts real and/or imaginary inputs to a complex-valued output signal.

The inputs can both be arrays (vectors or matrices) of equal dimensions, or one input can be an array and the other a scalar. If the block has an array input, the output is a complex array of the same dimensions. The elements of the real input map to the real parts of the corresponding complex output elements. The imaginary input similarly maps to the imaginary parts of the complex output signals. If one input is a scalar, it maps to the corresponding component (real or imaginary) of all the complex output signals.

Ports

Input

Re — Real part of complex output

scalar | vector | matrix

Real value to be converted to complex-valued output signal, specified as a scalar, vector, or matrix.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point | bus

Im — Imaginary part of complex output

scalar | vector | matrix

Imaginary value to be converted to complex-valued output signal, specified as a scalar, vector, or matrix.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point | bus

Port_1 — Real or imaginary part of complex output

scalar | vector | matrix

Real or imaginary value to convert to complex output signal, specified as a finite scalar, vector, or matrix.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point | bus

Output

Port_1 — Complex signal

scalar | vector | matrix

Complex signal, formed from real and imaginary values.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Parameters

Input — Real, imaginary, or both

Real (default) | Imag | Real and imag

Specify the type of input: a real input, an imaginary input, or both.

Programmatic Use

Block Parameter: Input

Type: character vector

Values: 'Real and imag' | 'Real' | 'Imag'

Default: 'Real and imag'

Imag part — Imaginary part of complex output

0 (default) | finite scalar, vector, or matrix

Specify the imaginary value to use when converting the input to a complex-valued output signal.

Dependencies

To enable this parameter, set **Input** to Real.

Programmatic Use

Block Parameter: ConstantPart

Type: character vector

Values: imaginary value

Default: '0'

Real part — Real part of complex output

0 (default) | finite scalar, vector, or matrix

Specify the constant real value to use when converting the input to a complex-valued output signal.

Dependencies

To enable this parameter, set **Input** to Imag.

Programmatic Use

Block Parameter: ConstantPart

Type: character vector

Values: finite, real-valued scalar, vector, or matrix

Default: '0'

Sample time — Specify sample time as a value other than -1

-1 (default) | scalar | vector

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

Dependencies

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

Programmatic Use

Block Parameter: SampleTime

Type: character vector

Values: scalar or vector

Default: '-1'

Block Characteristics

Data Types	double fixed point integer single
Direct Feedthrough	yes

Record

Log data to the workspace, to a file, or both

Library: Simulink / Sinks

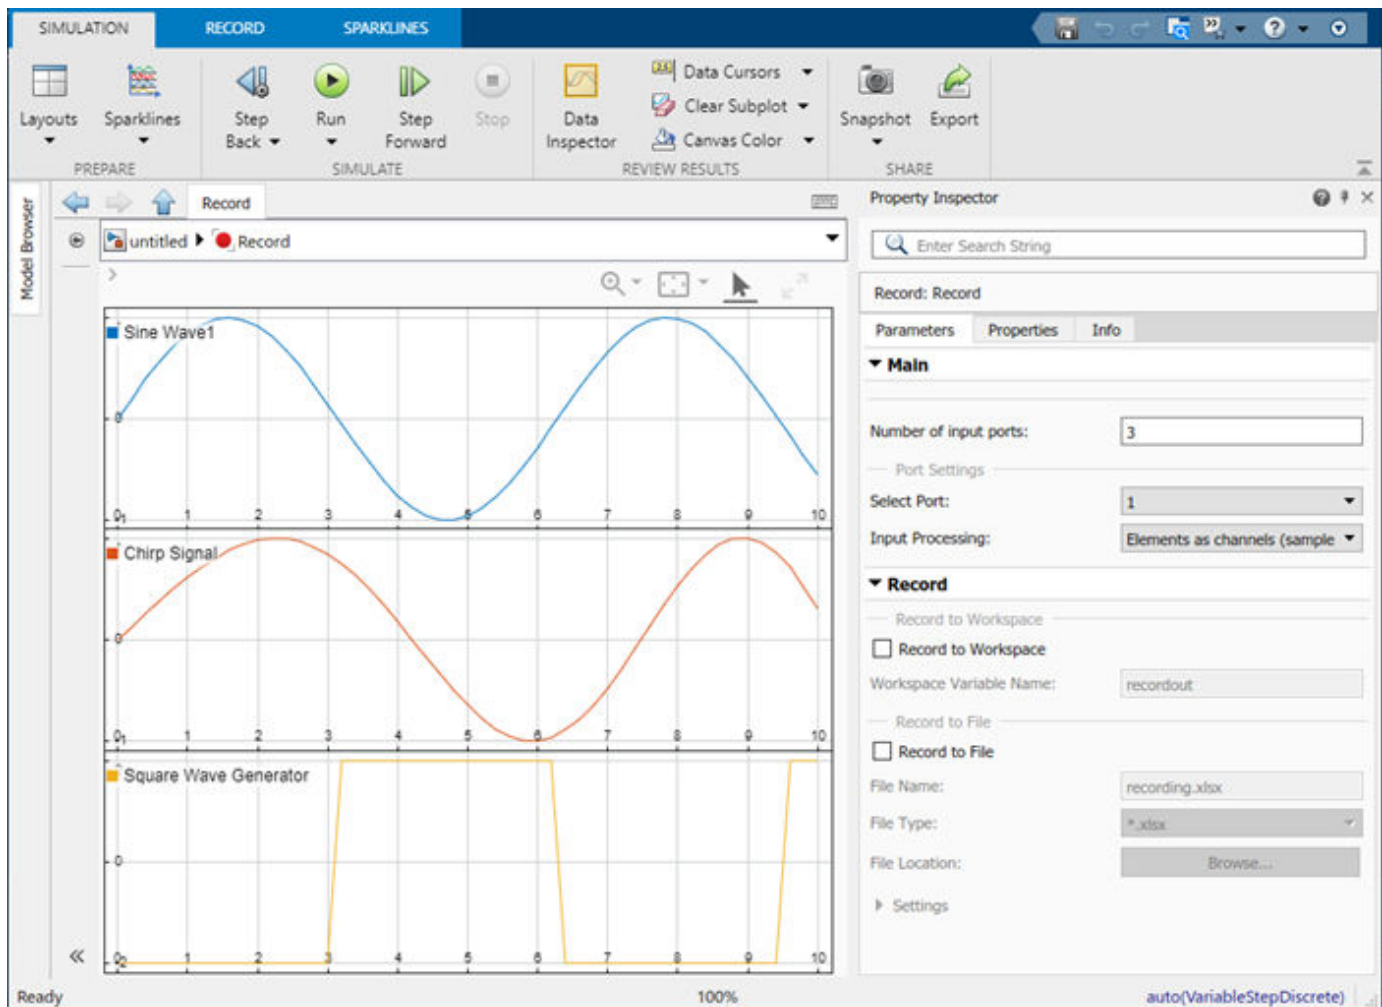

Description

You can use the Record block to record data to the workspace, to a file, or to both the workspace and a file. When you log data to a file, you can choose to log to a MAT file, an MLDATX file, or an Excel file. Signals connected to a Record block always log to the Simulation Data Inspector. If you decide that you need to save data after simulation, you can export data from the Record block to the workspace or to any supported file type.

You can also use the Record block to visualize connected signals. To view data for signals connected to the Record block, double-click the block. You have access to simulation controls, such as the **Run** button, while viewing data in the Record block.

By default, the Record block displays all connected signals as sparklines. A sparkline is added for each connected signal. After sparklines fill the visible space, a scrollbar allows you to continue plotting signals.

Build Visualizations

The Record block supports all visualizations available in the Simulation Data Inspector. When a different visualization makes sense for your data, you can modify the plot layout and plot types using the **Layouts** option and the plot types selector, labeled **Sparklines** by default. Use the **Layouts** list to select a layout of subplots. To change the plot type of a subplot, select the subplot then select the desired plot type from the plot types selector.

For more information, see “Log Data to the Workspace and a File Using the Record Block”. For examples that show how to use each visualization type, see:

- Sparklines — “View Many Signals Together Using Sparklines”
- XY — “Visualize Simulation Data on an XY Plot” and “Analyze Data Using the XY Visualization”
- Map — “View and Replay Map Data”
- Time plot and text editor — “Create Plots Using the Simulation Data Inspector”

Ports

Input

Port_1 — Signal to record

scalar | vector | matrix | N-D array | bus

Signal to record. You can add ports to the Record block by dragging lines to the edge of the block or by using the **Ports** parameter.

The Record block supports logging variable-size signals but does not support visualizing variable-size signals.

Tips

To log frame-based data, specify the **Input Processing** parameter for each port that receives a frame-based signal.

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Parameters

To modify Record block parameters, use the Property Inspector.

Main

Number of input ports — Number of input ports

1 (default) | integer in the range [1, 100]

Number of input ports, specified as an integer between 1 and 100, inclusive.

Programmatic Use

Block Parameter: 'NumPorts'

Type: integer | character vector

Values: integer in the range [1,100]

Default: 1

Port — Port for which to specify input processing mode

1 (default) | integer

Use the **Port** and **Input Processing** parameters together to specify the input processing mode for a port. The input processing mode determines how the Record block interprets matrix data:

- Sample-based — Each element in the matrix is a separate channel.
- Frame-based — Each column in the matrix is a separate channel.

By default, each port processes the input signal as sample-based.

To change the input processing mode for a port:

- 1 Select the port number using the **Port** parameter.
- 2 Select the input processing mode using the **Input Processing** parameter.

Programmatic Use

Programmatically specify the input processing mode for each port by specifying the `FrameSettings` parameter as a row vector with as many elements as block ports. The element index corresponds to the port number on the block. Specify 1 to use frame-based input processing for the port and 0 to use sample-based processing.

Block Parameter: 'FrameSettings'

Type: logical array

Values: 1-by-n row vector, where n is equal to the number of ports

Default: 0

Input Processing — Input processing mode for selected port

Elements as channels (sample-based) (default) | Columns as channels (frame-based)

Use the **Port** and **Input Processing** parameters together to specify the input processing mode for a port. The input processing mode determines how the Record block interprets matrix data:

- Sample-based — Each element in the matrix is a separate channel.
- Frame-based — Each column in the matrix is a separate channel.

By default, each port processes the input signal as sample-based.

To change the input processing mode for a port:

- 1 Select the port number using the **Port** parameter.
- 2 Select the input processing mode using the **Input Processing** parameter.

Programmatic Use

Programmatically specify the input processing mode for each port by specifying the `FrameSettings` parameter as a row vector with as many elements as block ports. The element index corresponds to the port number on the block. Specify 1 to use frame-based input processing for the port and 0 to use sample-based processing.

Block Parameter: 'FrameSettings'

Type: logical array

Values: 1-by-n row vector, where n is equal to the number of ports

Default: 0

Record

Record to Workspace — Workspace logging option

off (default) | on

Workspace logging option. By default, the Record block logs data to the Simulation Data Inspector only. Select **Record to Workspace** to log data for signals connected to the Record block to the MATLAB workspace in a `Simulink.SimulationData.Dataset` object.

Use the **Workspace Variable Name** parameter to specify the name of the `Dataset` object that contains the logged Record block data.

Tips

- When you log data to the workspace, the way you access the data depends on your model configuration. By default, models provide all logged data in a single output variable as a `Simulink.SimulationOutput` object. You can access the Record block data using the `get`

function or a dot with the Record block workspace variable name. When the **Single simulation output** option is disabled, logging data appears in separate variables in the workspace, and you access the Record block data directly.

- You can use a single Record block to log data to the Simulation Data Inspector, to the workspace, and to a file.

Programmatic Use

Block Parameter: 'RecordToWorkspace'

Type: character vector | boolean | numeric

Values: 'on' | 'off' | true or 1 | false or 0

Default: 'off'

Workspace Variable Name — Name for workspace variable that contains logged block data

recordout (default) | character vector | string

Name for the workspace variable that contains the logged block data.

Dependencies

To enable this parameter, select the **Record to Workspace** parameter.

Programmatic Use

Block Parameter: 'VariableName'

Type: character vector | string

Default: 'recordout'

Record to File — Log to file option

off (default) | on

Log to file option. By default, the Record block logs data to the Simulation Data Inspector only. Select **Record to File** to log data for signals connected to the Record block to a file.

Tips

- Use the **File Name** parameter to specify a name for the file.
- Use the **File Type** parameter to specify whether to log data to an MLDATX file, a MAT file, or an Excel file.
- Use the **File Location** parameter to specify the path to the file.

Programmatic Use

Block Parameter: 'RecordToFile'

Type: character vector | boolean | numeric

Values: 'on' | 'off' | true or 1 | false or 0

Default: 'off'

File Name — Name of file with logged data

recording.mldatx (default) | character vector | string

Name of the file that contains the logged data. The name does not need to include the file extension. If you do include the file extension in the name, ensure the name uses a valid extension for the specified **File Type**.

Tips

- If you do not change the name or location of the file you log to from one run to the next, the Record block overwrites prior data in the file.

- When you want to save the file in a location other than your working directory, use the **File Location** parameter to specify the path to the directory where you want to save the file.

Dependencies

To enable this parameter, select the **Record to File** parameter.

Programmatic Use

Use the `FileName` parameter to specify the **File Name**, **File Type**, and **File Location** parameters. Include the extension for the desired file type in the name you pass to `set_param`. When you want to save the file somewhere other than the current working directory, specify the path with the file name and extension.

Block Parameter: 'FileName'

Type: character vector | string

Default: 'recording.mldatx'

File Type — Type of file for logged data

`*.mldatx` (default) | `*.mat` | `*.xlsx`

Use the **File Type** parameter to specify whether you want to log data to an MLDATX file, a MAT file, or an Excel file.

Tips

- When you log data to an Excel file, the data is formatted as described in “Microsoft Excel Import, Export, and Logging Format”.
- When you log data to an Excel file, you can specify whether to share time columns using the **Time** parameter and which signal attributes to log using the **Attributes** parameter.

Dependencies

To enable this parameter, select **Record to File**.

Programmatic Use

Use the `FileName` parameter to specify the **File Name**, **File Type**, and **File Location** parameters. Include the extension for the desired file type in the name you pass to `set_param`. When you want to save the file somewhere other than the current working directory, specify the path with the file name and extension.

Block Parameter: 'FileName'

Type: character vector | string

Default: 'recording.mldatx'

File Location — Path to file with logged data

working directory (default) | character vector | string

Use the **File Location** parameter to specify the location where you want to save the file with the logged data when you want to save the file somewhere other than the working directory. Ensure you have write permissions in the directory you specify.

Dependencies

To enable this parameter, select **Record to File**.

Programmatic Use

Use the `FileName` parameter to specify the **File Name**, **File Type**, and **File Location** parameters. Include the extension for the desired file type in the name you pass to `set_param`. When you want to save the file somewhere other than the current working directory, specify the path with the file name and extension.

Block Parameter: 'FileName'

Type: character vector | string

Default: 'recording.mldatx'

Time — Options for exporting time data to Excel file

Shared Time Columns (default) | Individual Time Columns

Use the **Time** parameter to specify how to log signal time data when you log the Record block data to an Excel file.

- **Shared Time Columns** — When time data is identical for multiple signals, the signals share a single time column in the logging file. The logging file may still include multiple time columns if the Record block logs data for signals with unique time data.
- **Individual Time Columns** — Each logged signal always has its own time column in the logging file.

Dependencies

To enable this parameter, select **Record to File** and specify **File Type** as `*.xlsx`.

Attributes — Signal attributes to export to Excel file

Data Type | Units | Port Index | Block Path | Interpolation

Select one or more signal attribute options to include in the logging file when you log data to an Excel file. Selected signal attributes appear in the signal column above the first data point according to the format described in “Microsoft Excel Import, Export, and Logging Format”.

Dependencies

To enable this parameter, select **Record to File** and specify **File Type** as `*.xlsx`.

Block Characteristics

Data Types	Boolean bus double enumerated fixed point half integer single string
Direct Feedthrough	no
Multidimensional Signals	yes
Variable-Size Signals	no

Introduced in R2021a

Relational Operator

Perform specified relational operation on inputs

Library: Simulink / Commonly Used Blocks
 Simulink / Logic and Bit Operations
 HDL Coder / Commonly Used Blocks
 HDL Coder / HDL Floating Point Operations
 HDL Coder / Logic and Bit Operations

Description

The Relational Operator block performs the specified relational operation on the input. The value you choose for the **Relational operator** parameter determines whether the block accepts one or two input signals.

Two-Input Mode

By default, the Relational Operator block compares two inputs using the **Relational operator** parameter that you specify. The first input corresponds to the top input port and the second input to the bottom input port. (See “Port Location After Rotating or Flipping” for a description of the port order for various block orientations.)

You can specify one of the following operations in two-input mode:

Operation	Description
==	True if the first input is equal to the second input
~=	True if the first input is not equal to the second input
<	True if the first input is less than the second input
<=	True if the first input is less than or equal to the second input
>=	True if the first input is greater than or equal to the second input
>	True if the first input is greater than the second input

You can specify inputs as scalars, arrays, or a combination of a scalar and an array.

For...	The output is...
Scalar inputs	A scalar
Array inputs	An array of the same dimensions, where each element is the result of an element-by-element comparison of the input arrays
Mixed scalar and array inputs	An array, where each element is the result of a comparison between the scalar and the corresponding array element

The input with the smaller positive range is converted to the data type of the other input offline using round-to-nearest and saturation. This conversion occurs before the comparison.

You can specify the output data type using the **Output data type** parameter. The output equals 1 for true and 0 for false.

Tip Select an output data type that represents zero exactly. Data types that satisfy this condition include signed and unsigned integers and any floating-point data type.

One-Input Mode

When you select one of the following operations for **Relational operator**, the block switches to one-input mode.

Operation	Description
isInf	True if the input is Inf
isNaN	True if the input is NaN
isFinite	True if the input is finite

For an input that is not floating point, the block produces the following output.

Data Type	Operation	Block Output
• Fixed point	isInf	False
• Boolean	isNaN	False
• Built-in integer	isFinite	True

Rules for Data Type Propagation

The following rules apply for data type propagation when your block has one or more input ports with unspecified data types.

When the block is in...	And...	The block uses...
Two-input mode	Both input ports have unspecified data types	double as the default data type for both inputs
	One input port has an unspecified data type	The data type from the specified input port as the default data type of the other port
One-input mode	The input port has an unspecified data type	double as the default data type for the input

Ports

Input

Port_1 — First input signal

scalar | vector | matrix

First input signal, specified as a scalar, vector, or matrix.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated

Port_2 — Second input signal

scalar | vector | matrix

Second input signal, specified as a scalar, vector, or matrix.

Dependencies

To enable this port, set the **Relational operator** to ==, ~=, <, <=, >=, or >.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated

Output**Port_1 — Output signal**

scalar | vector | matrix

Output signal, consisting of zeros and ones, with the same dimensions as the input. You control the output data type with the **Output data type** parameter.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated

Parameters**Main****Relational operator — Relational operator**

<= (default) | ~= | == | < | >= | > | isInf | isNaN | isFinite

Specify the operation for comparing two inputs or determining the signal type of one input.

- == — True if the first input is equal to the second input
- ~= — True if the first input is not equal to the second input
- < — True if the first input is less than the second input
- <= — True if the first input is less than or equal to the second input
- >= — True if the first input is greater than or equal to the second input
- > — True if the first input is greater than the second input
- isInf — True if the input is Inf
- isNaN — True if the input is NaN
- isFinite — True if the input is finite

Programmatic Use**Block Parameter:** Operator**Type:** character vector**Values:** '==' | '~=' | '<' | '<=' | '>=' | '>' | 'isInf' | 'isNaN' | 'isFinite'**Default:** '<='**Enable zero-crossing detection — Enable zero-crossing detection**

on (default) | off

Select to enable zero-crossing detection. For more information, see “Zero-Crossing Detection”.

Programmatic Use**Parameter:** ZeroCross**Type:** character vector, string**Values:** 'on' | 'off'**Default:** 'on'**Sample time — Specify sample time as a value other than -1**`-1 (default) | scalar | vector`

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

Dependencies

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

Programmatic Use**Block Parameter:** SampleTime**Type:** character vector**Values:** scalar or vector**Default:** '-1'**Data Type****Require all inputs to have the same data type — Require all inputs to have same data type**`off (default) | on`

To require that all block inputs have the same data type, select this check box. When you clear this check box, the inputs can have different data types.

Dependencies

This check box is not available when you set **Relational operator** to `isInf`, `isNaN`, or `isFinite` because, in those modes, the block only has one input port.

Programmatic Use**Block Parameter:** InputSameDT**Type:** character vector**Values:** 'off' | 'on'**Default:** 'off'**Output data type — Output data type**`boolean (default) | Inherit: Logical (see Configuration Parameters: Optimization) | fixdt(1,16) | <data type expression>`

Specify the output data type. When you select:

- `boolean` — The block output has data type `boolean`.
- `Inherit: Logical (see Configuration Parameters: Optimization)` — The block uses the **Implement logic signals as Boolean data** configuration parameter to specify the output data type (see “Implement logic signals as Boolean data (vs. double)”).

Note This option supports models created before the `boolean` option was available. Use one of the other options, preferably `boolean`, for new models.

- `fixdt(1,16)` — The block output has the specified fixed-point data type `fixdt(1,16)`.

Tip Click the **Show data type assistant** button  to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

- `<data type expression>` — The block output has the data type you specify as a data type expression, for example, `Simulink.NumericType`.

Tip To enter a built-in data type (`double`, `single`, `int8`, `uint8`, `int16`, `uint16`, `int32`, or `uint32`), enclose the expression in single quotes. For example, enter `'double'` instead of `double`.

Programmatic Use

Block Parameter: `OutDataTypeStr`

Type: character vector

Values: `'Inherit: Logical (see Configuration Parameters: Optimization)'` | `'boolean'` | `'fixdt(1,16)'` | `'<data type expression>'`

Default: `'boolean'`

Integer rounding mode — Rounding mode for fixed-point operations

`Simplest (default)` | `Convergent` | `Floor` | `Nearest` | `Round` | `Ceiling` | `Zero`

Specify the rounding mode for fixed-point operations. You can select:

Ceiling

Rounds positive and negative numbers toward positive infinity. Equivalent to the MATLAB `ceil` function.

Convergent

Rounds number to the nearest representable value. If a tie occurs, rounds to the nearest even integer. Equivalent to the Fixed-Point Designer `convergent` function.

Floor

Rounds positive and negative numbers toward negative infinity. Equivalent to the MATLAB `floor` function.

Nearest

Rounds number to the nearest representable value. If a tie occurs, rounds toward positive infinity. Equivalent to the Fixed-Point Designer `nearest` function.

Round

Rounds number to the nearest representable value. If a tie occurs, rounds positive numbers toward positive infinity and rounds negative numbers toward negative infinity. Equivalent to the Fixed-Point Designer `round` function.

Simplest

Chooses between rounding toward floor and rounding toward zero to generate rounding code that is as efficient as possible.

Zero

Rounds number toward zero. Equivalent to the MATLAB `fix` function.

For more information, see “Rounding” (Fixed-Point Designer).

Programmatic Use**Block Parameter:** RndMeth**Type:** character vector**Values:** 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'**Default:** 'Simplest'**Block Characteristics**

Data Types	Boolean double enumerated fixed point half integer single

Variable-Size Signals	yes
Zero-Crossing Detection	yes

Extended Capabilities**C/C++ Code Generation**

Generate C and C++ code using Simulink® Coder™.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

HDL Architecture

This block has a single, default HDL architecture.

HDL Block Properties

General	
ConstrainedOutputPipeline	Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is 0. For more details, see “ConstrainedOutputPipeline” (HDL Coder).
InputPipeline	Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “InputPipeline” (HDL Coder).
OutputPipeline	Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “OutputPipeline” (HDL Coder).

Native Floating Point	
LatencyStrategy	Specify whether to map the blocks in your design to <code>inherit</code> , <code>Max</code> , <code>Min</code> , <code>Zero</code> , or <code>Custom</code> for the floating-point operator. The default is <code>inherit</code> . See also “ <code>LatencyStrategy</code> ” (HDL Coder).
NFPCustomLatency	To specify a value, set LatencyStrategy to <code>Custom</code> . HDL Coder adds latency equal to the value that you specify for the NFPCustomLatency setting. See also “ <code>NFPCustomLatency</code> ” (HDL Coder).

Complex Data Support

The `~=` and `==` operators are supported for code generation.

PLC Code Generation

Relay

Switch output between two constants

Library: Simulink / Discontinuities
HDL Coder / Discontinuities

Description

The output for the Relay block switches between two specified values. When the relay is on, it remains on until the input drops below the value of the **Switch off point** parameter. When the relay is off, it remains off until the input exceeds the value of the **Switch on point** parameter. The block accepts one input and generates one output.

Note When the initial input falls *between* the **Switch off point** and **Switch on point** values, the initial output is the value when the relay is off.

Ports

Input

Port_1 — Input signal

scalar

The input signal that switches the relay on or off.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point`

Output

Port_1 — Output signal

scalar

The output signal switches between two values determined by the parameters **Output when on** and **Output when off**.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point`

Parameters

Switch on point — Input value which switches the relay on

'eps' (default) | scalar

When the input crosses this threshold, the relay switches on. The **Switch on point** value must be greater than or equal to the **Switch off point**. Specifying a **Switch on point** value greater than the

Switch off point models hysteresis, whereas specifying equal values models a switch with a threshold at that value.

The **Switch on point** parameter is converted to the input data type offline using round-to-nearest and saturation methods.

Programmatic Use

Block Parameter: OnSwitchValue

Type: character vector

Values: scalar

Default: 'eps'

Switch off point — Input value which switches the relay off

'eps' (default) | scalar

When the input crosses this threshold the relay switches off. The value of **Switch off point** must be less than or equal to **Switch on point**. The **Switch off point** parameter is converted to the input data type offline using round-to-nearest and saturation.

Programmatic Use

Block Parameter: OffSwitchValue

Type: character vector

Values: scalar

Default: 'eps'

Output when on — Output value when the relay is on

1 (default) | scalar

The output value when the relay is on.

Programmatic Use

Block Parameter: OnOutputValue

Type: character vector

Values: scalar

Default: '1'

Output when off — Output value when the relay is off

0 (default) | scalar

The output value when the relay is off.

Programmatic Use

Block Parameter: OffOutputValue

Type: character vector

Values: scalar

Default: '0'

Input processing — Specify sample- or frame-based processing

Elements as channels (sample based) (default) | Columns as channels (frame based)

Specify whether the block performs sample- or frame-based processing:

- Columns as channels (frame based) — Treat each column of the input as a separate channel (frame-based processing).

Note Frame-based processing requires a DSP System Toolbox license.

For more information, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

- **Elements as channels (sample based)** — Treat each element of the input as a separate channel (sample-based processing).

Use **Input processing** to specify whether the block performs sample- or frame-based processing. The block accepts frame-based signals for the input *u*. All other input signals must be sample-based.

Input Signal <i>u</i>	Input Processing Mode	Block Works?
Sample based	Sample based	Yes
Frame based		No, produces an error
Sample based	Frame based	Yes
Frame based		Yes

For more information about these two processing modes, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

Programmatic Use

Block Parameter: InputProcessing

Type: character vector

Values: 'Columns as channels (frame based)' | 'Elements as channels (sample based)'

Default: 'Elements as channels (sample based)'

Enable zero-crossing detection — Enable zero-crossing detection

on (default) | Boolean

Select to enable zero-crossing detection. For more information, see “Zero-Crossing Detection” in the Simulink documentation.

Programmatic Use

Block Parameter: ZeroCross

Type: character vector, string

Values: 'off' | 'on'

Default: 'on'

Sample time — Specify sample time as a value other than -1

-1 (default) | scalar | vector

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

Dependencies

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

Programmatic Use

Block Parameter: SampleTime

Type: character vector

Values: scalar or vector

Default: '-1'

Output minimum — Minimum output value for range checking

[] (default) | scalar

Lower value of the output range that Simulink checks.

Simulink uses the minimum to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Specify Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Embedded Coder).

Note Output minimum does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use

Block Parameter: OutMin

Type: character vector

Values: ' [] ' | scalar

Default: ' [] '

Output maximum — Maximum output value for range checking

[] (default) | scalar

Upper value of the output range that Simulink checks.

Simulink uses the maximum value to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Specify Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Embedded Coder).

Note Output maximum does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use

Block Parameter: OutMax

Type: character vector

Values: ' [] ' | scalar

Default: ' [] '

Output data type — Data type of output signal

Inherit: All ports same datatype (default) | Inherit: Inherit via back propagation | double | single | int8 | int32 | uint32 | int64 | uint64 | fixdt(1,16,2^0,0) | <data type expression> | ...

Specify the output data type. You can set it to:

- A rule that inherits a data type, for example, Inherit: Inherit via back propagation
- The name of a built-in data type, for example, single
- The name of a data type object, for example, a Simulink.NumericType object
- An expression that evaluates to a data type, for example, fixdt(1,16,0)

Click the **Show data type assistant** button  to display the **Data Type Assistant**, which helps you set the **Output data type** parameter.

See “Control Signal Data Types” in *Simulink User's Guide* for more information.

Programmatic Use

Block Parameter: OutDataTypeStr

Type: character vector

Values: 'Inherit: Same as input', 'Inherit: Inherit via back propagation', 'single', 'int8', 'uint8', int16, 'uint16', 'int32', 'uint32', 'int64', 'uint64', fixdt(1,16,0), fixdt(1,16,2^0,0), fixdt(1,16,2^0,0). '<data type expression>'

Default: 'Inherit: Same as input'

Lock data type settings against changes by the fixed-point tools — Prevent fixed-point tools from overriding data types

off (default) | on

Select this parameter to prevent the fixed-point tools from overriding the data types you specify on this block. For more information, see “Lock the Output Data Type Setting” (Fixed-Point Designer).

Programmatic Use

Block Parameter: LockScale

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Block Characteristics

Data Types	Boolean double fixed point integer single
Direct Feedthrough	yes
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	yes

Introduced before R2006a

Repeating Sequence

Generate arbitrarily shaped periodic signal

Library: Simulink / Sources

Description

The Repeating Sequence block outputs a periodic scalar signal having a waveform that you specify using the **Time values** and **Output values** parameters. The **Time values** parameter specifies a vector of output times. The **Output values** parameter specifies a vector of signal amplitudes at the corresponding output times. Together, the two parameters specify a sampling of the output waveform at points measured from the beginning of the interval over which the waveform repeats (the period of the signal).

By default, both parameters are [0 2]. These default settings specify a sawtooth waveform that repeats every 2 seconds from the start of the simulation and has a maximum amplitude of 2.

Ports

Output

Port_1 — Periodic output signal

scalar

Output signal specified by the **Time values** and **Output values** parameters to create a periodic scalar signal.

Data Types: double

Parameters

Time values — Vector of output times

[0 2] (default) | vector

Vector of strictly monotonically increasing time values. The period of the generated waveform is the difference of the last and first values of this parameter.

Programmatic Use

Block Parameter: rep_seq_t

Type: character vector

Values: vector

Default: [0 2]

Output values — Vector of output values

[0 2] (default) | vector

Vector of output values that specify the output waveform. Each element corresponds to the time value in the **Time values** parameter.

Programmatic Use

Block Parameter: rep_seq_y

Type: character vector

Values: vector

Default: [0 2]

Block Characteristics

Data Types	double
Direct Feedthrough	no
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Algorithms

The block sets the input period as the difference between the first and last value of the **Time values** parameter. The output at any time t is the output at time $t = t - n \cdot \text{period}$, where n is an integer. The sequence repeats at $t = n \cdot \text{period}$. The block uses linear interpolation to compute the value of the waveform between the output times that you specify.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production code.

Consider using Repeating Sequence Stair or Repeating Sequence Interpolated blocks for code generation.

Repeating Sequence Interpolated | Repeating Sequence Stair

Introduced before R2006a

Repeating Sequence Interpolated

Output discrete-time sequence and repeat, interpolating between data points

Library: Simulink / Sources

Description

The Repeating Sequence Interpolated block outputs a periodic discrete-time sequence based on the values in **Vector of time values** and **Vector of output values** parameters. Between data points, the block uses the method you specify for the **Lookup Method** parameter to determine the output.

Ports

Output

Port_1 — Periodic output signal

scalar

Output signal generated based on the values in the **Vector of time values** and **Vector of output values** parameters.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point`

Parameters

Main

Vector of output values — Vector of output values

`[3 1 4 2 1].'` (default) | vector

Vector of output values that specify the output waveform. Each element corresponds to the time value in the **Vector of time values** parameter.

Programmatic Use

Block Parameter: OutValues

Type: character vector

Values: vector

Default: `[3 1 4 2 1].'`

Vector of time values — Vector of time values

`[0 0.1 0.5 0.6 1].'` (default) | vector

Specify the column vector containing time values. The time values must be strictly increasing, and the vector must have the same size as the vector of output values.

Programmatic Use**Block Parameter:** TimeValues**Type:** character vector**Values:** vector**Default:** [0 0.1 0.5 0.6 1].'**Lookup Method — Lookup method for output**

Interpolation-Use End Values (default) | Use Input Nearest | Use Input Below | Use Input Above

Specify the lookup method to determine the output between data points.

Programmatic Use**Block Parameter:** LookUpMeth**Type:** character vector**Values:** 'Interpolation-Use End Values' | 'Use Input Nearest' | Use Input Below | Use Input Above**Default:** 'Interpolation-Use End Values'**Sample time — Time interval between samples**

0.01 (default) | scalar

Specify the time interval between samples. To inherit the sample time, set this parameter to -1. See “Specify Sample Time” for more information.

Programmatic Use**Block Parameter:** tsamp**Type:** character vector**Values:** scalar**Default:** '0.01'**Signal Attributes****Output minimum — Minimum output value for range checking**

[] (default) | scalar

Lower value of the output range that Simulink checks.

Simulink uses the minimum to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Specify Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Embedded Coder).

Note Output minimum does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use**Block Parameter:** OutMin**Type:** character vector**Values:** '[]' | scalar**Default:** '[]'**Output maximum — Maximum output value for range checking**

[] (default) | scalar

Upper value of the output range that Simulink checks.

Simulink uses the maximum value to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Specify Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Embedded Coder).

Note **Output maximum** does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use**Block Parameter:** OutMax**Type:** character vector**Values:** '[]' | scalar**Default:** '[]'**Output data type — Specify the output data type**

double (default) | Inherit: Inherit via back propagation | single | int8 | int32 | uint32 | int64 | uint64 | fixdt(1,16,2^0,0) | <data type expression> | ...

Choose the data type for the output. The type can be inherited, specified directly, or expressed as a data type object such as Simulink.NumericType.

Programmatic Use**Block Parameter:** OutDataTypeStr**Type:** character vector**Values:** , 'Inherit: Inherit via back propagation', 'single', 'int8', 'uint8', int16, 'uint16', 'int32', 'uint32', 'int64', 'uint64', fixdt(1,16,0), fixdt(1,16,2^0,0), fixdt(1,16,2^0,0). '<data type expression>'**Default:** 'Double'**Lock output data type setting against changes by the fixed-point tools — Prevent fixed-point tools from overriding data types**

off (default) | on

Select to lock the output data type setting of this block against changes by the Fixed-Point Tool and the Fixed-Point Advisor. For more information, see “Use Lock Output Data Type Setting” (Fixed-Point Designer).

Programmatic Use

Block Parameter: LockScale

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Block Characteristics

Data Types	Boolean double fixed point integer single
Direct Feedthrough	no
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Cannot be used inside a triggered subsystem hierarchy.

Repeating Sequence | Repeating Sequence Stair

Introduced before R2006a

Repeating Sequence Stair

Output and repeat discrete time sequence

Library: Simulink / Sources

Description

The Repeating Sequence Stair block outputs and repeats a stair sequence that you specify with the **Vector of output values** parameter. For example, you can specify the vector as $[3 \ 1 \ 2 \ 4 \ 1]'$. A value in **Vector of output values** is output at each time interval, and then the sequence repeats.

Ports

Output

Port_1 — Repeating discrete output signal

scalar

Output signal generated based on the values in the **Vector of time values** and **Sample time** parameters.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point` | `enumerated`

Parameters

Main

Vector of output values — Vector of output values

`[3 1 4 2 1].'` (default) | vector

Specify the vector containing values of the repeating stair sequence.

Programmatic Use

Block Parameter: `OutValues`

Type: character vector

Values: vector

Default: `[3 1 4 2 1].'`

Sample time — Time interval between samples

`-1` (default) | scalar

Specify the time interval between samples. To inherit the sample time, set this parameter to `-1`. See “Specify Sample Time” for more information.

Programmatic Use

Block Parameter: `tsamp`

Type: character vector

Values: scalar

Default: `'-1'`

Signal Attributes

Output minimum — Minimum output value for range checking

`[]` (default) | scalar

Lower value of the output range that Simulink checks.

Simulink uses the minimum to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Specify Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Embedded Coder).

Note Output minimum does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use**Block Parameter:** OutMin**Type:** character vector**Values:** '[]' | scalar**Default:** '[]'**Output maximum — Maximum output value for range checking**

[] (default) | scalar

Upper value of the output range that Simulink checks.

Simulink uses the maximum value to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Specify Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Embedded Coder).

Note Output maximum does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use**Block Parameter:** OutMax**Type:** character vector**Values:** '[]' | scalar**Default:** '[]'**Output data type — Specify the output data type**

double (default) | Inherit: Inherit via back propagation | single | int8 | int32 | uint32 | int64 | uint64 | fixdt(1,16,2^0,0) | <data type expression> | ...

Choose the data type for the output. The type can be inherited, specified directly, or expressed as a data type object such as Simulink.NumericType.

Click the **Show data type assistant** button  to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

Programmatic Use**Block Parameter:** OutDataTypeStr**Type:** character vector

Values: 'Inherit: Inherit via back propagation' | 'single' | 'int8' | 'uint8' | int16 | 'uint16' | 'int32' | 'uint32' | 'int64' | 'uint64' | fixdt(1,16,0) | fixdt(1,16,2^0,0) | fixdt(1,16,2^0,0) | '<data type expression>'

Default: 'Double'

Lock output data type setting against changes by the fixed-point tools — Prevent fixed-point tools from overriding data types

off (default) | on

Select to lock the output data type setting of this block against changes by the Fixed-Point Tool and the Fixed-Point Advisor. For more information, see “Use Lock Output Data Type Setting” (Fixed-Point Designer).

Programmatic Use

Block Parameter: LockScale

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Block Characteristics

Data Types	Boolean double enumerated fixed point integer single
Direct Feedthrough	no
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Repeating Sequence | Repeating Sequence Interpolated

Introduced before R2006a

Reset

Add reset port to subsystem

Library: Ports & Subsystems

Description

A Reset block placed at the root level of a Subsystem block adds a control port to the block. When a reset trigger signal occurs on the signal connected to the port, the block states of the subsystem are reset to their initial condition.

Parameters

Reset trigger type — Select the type of trigger event

level (default) | rising | falling | either | level hold

Select the type of trigger signal that resets the subsystem block states.

level

Reset the block states when the trigger signal is nonzero at the current time step or changes from nonzero at the previous time step to zero at the current time step.

rising

Reset the block states when the trigger signal rises from a zero to a positive value or from a negative to a positive value.

falling

Reset the block states when the trigger signal falls from a positive value to zero or from a positive to a negative value.

either

Reset the block states when the trigger signal changes from a zero to a nonzero value or changes sign.

level hold

Reset the block states when the trigger signal is nonzero at the current time step.

Programmatic Use

Block Parameter: ResetTriggerType

Type: character vector

Value: 'level' | 'rising' | 'falling' | 'either' | 'level hold'

Default: 'level'

Propagate sizes of variable-size signals — Select when to propagate a variable-size signal

During execution (default) | Only when enabling

Select when to propagate a variable-size signal.

During execution

Propagate variable-size signals at each time step.

Only when resetting

Propagate variable-size signals when resetting a Subsystem block containing a Reset port block. When you select this option, sample time must be periodic.

Programmatic Use

Block Parameter: PropagateVarSize

Type: character vector

Value: 'During execution' | 'Only when resetting'

Default: 'During execution'

Enable zero-crossing detection – Control zero-crossing detection

on (default) | off

Control zero-crossing detection.

on

Detect zero crossings.

off

Do not detect zero crossings.

Programmatic Use

Block Parameter: ZeroCross

Type: character vector

Value: 'on' | 'off'

Default: 'on'

“Simulink Block Support for Variable-Size Signals”

Introduced in R2015a

Reset Function

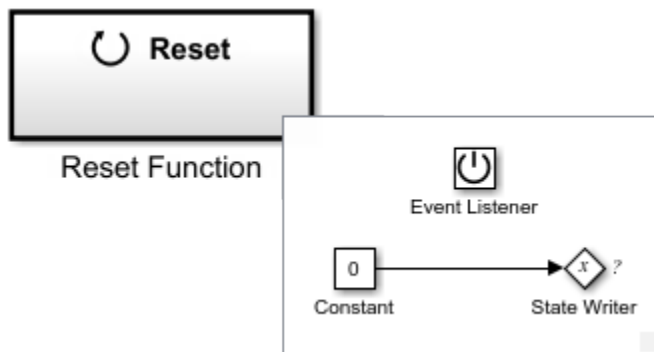

Executes contents on a model reset event

Library: Simulink / User-Defined Functions

Description

The Reset Function block is a pre-configured subsystem block that executes on a model reset event. By default, the Reset Function block includes an Event Listener block with **Event** set to **Reset**, a Constant block with **Constant value** set to 0, and a State Writer block.

Replace the Constant block with source blocks that generate the state value for the State Writer block.

Conditionally executed subsystem blocks with output ports are fully supported within Reset Function blocks.

For a list of unsupported blocks and features, see “Initialize, Reset, and Terminate Function Limitations”.

A model can potentially have multiple Reset Function blocks with each block having a different **Event name**. Each of these reset events appear in the generated code as a different function.

You can select an Initialize Function, Reset Function, or Terminate Function block or a corresponding state owner block to highlight blocks related to it.

Block Characteristics

Data Types	Boolean ^a bus ^a double ^a enumerated ^a fixed point ^a half ^a integer ^a single ^a string ^a
Direct Feedthrough	no
Multidimensional Signals	limited ^a

Variable-Size Signals	no
Zero-Crossing Detection	no

Resettable Delay

Delay input signal by variable sample period and reset with external signal

Library: Simulink / Discrete
HDL Coder / Discrete

Description

The Resettable Delay block is a variant of the Delay block that has the source of the initial condition set to `Input port` and the external reset algorithm set to `Rising`, by default.

Ports

Input

u — Data input signal

scalar | vector

Input data signal delayed according to parameters settings.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | string | Boolean | fixed point | enumerated | bus

d — Delay length

scalar

Delay length specified as inherited from an input port. Enabled when you select the **Delay length: Source** parameter as `Input port`.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Enable — External enable signal

scalar

Enable signal that enables or disables execution of the block. To create this port, select the **Show enable port** parameter.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

External reset — External reset signal

scalar

External signal that resets execution of the block to the initial condition. To create this port, select the **External reset** parameter.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

x0 — Initial condition

scalar | vector

Initial condition specified as inherited from an input port. Enabled when you select the **Initial Condition: Source** parameter as `Input port`.

Data Types: `half` | `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `fixed point`

Output**Port_1 — Output signal**

scalar | vector

Output signal that is the input signal delayed by the length of time specified by the parameter **Delay length**. The initial value of the output signal depends on several conditions. See “Initial Block Output” on page 1-273.

Data Types: `half` | `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters**Main****Delay length — Delay length**`Dialog` (default) | `Input port`

Specify whether to enter the delay length directly on the dialog box (fixed delay) or to inherit the delay from an input port (variable delay).

- If you set **Source** to `Dialog`, enter the delay length in the edit field under **Value**.
- If you set **Source** to `Input port`, verify that an upstream signal supplies a delay length for the `d` input port. You can also specify its maximum value by specifying the parameter **Upper limit**.

Specify the scalar delay length as a real, non-negative integer. An out-of-range or non-integer value in the dialog box (fixed delay) returns an error. An out-of-range value from an input port (variable delay) casts it into the range. A non-integer value from an input port (variable delay) truncates it to the integer.

Programmatic Use**Block Parameter:** `DelayLengthSource`**Type:** character vector**Values:** `'Dialog'` | `'Input port'` |**Default:** `'Dialog'`**Block Parameter:** `DelayLength`**Type:** character vector**Values:** scalar**Default:** `'2'`**Block Parameter:** `DelayLengthUpperLimit`**Type:** character vector**Values:** scalar**Default:** `'100'`

Initial condition — Initial condition

Input port (default) | Dialog

Specify whether to enter the initial condition directly on the dialog box or to inherit the initial condition from an input port.

- If you set **Source** to Dialog, enter the initial condition in the edit field under **Value**.
- If you set **Source** to Input port, verify that an upstream signal supplies an initial condition for the x0 input port.

Simulink converts offline the data type of **Initial condition** to the data type of the input signal u using a round-to-nearest operation and saturation.

Note When **State name must resolve to Simulink signal object** is selected on the **State Attributes** pane, the block copies the initial value of the signal object to the **Initial condition** parameter. However, when the source for **Initial condition** is Input port, the block ignores the initial value of the signal object.

Programmatic Use**Block Parameter:** InitialConditionSource**Type:** character vector**Values:** 'Dialog' | 'Input port' |**Default:** 'Input Port'**Block Parameter:** InitialCondition**Type:** character vector**Values:** scalar**Default:** ''**Input processing — Specify sample- or frame-based processing**

Elements as channels (sample based) (default) | Columns as channels (frame based)

Specify whether the block performs sample- or frame-based processing:

- Columns as channels (frame based) — Treat each column of the input as a separate channel (frame-based processing).

Note Frame-based processing requires a DSP System Toolbox license.

For more information, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

- Elements as channels (sample based) — Treat each element of the input as a separate channel (sample-based processing).

Use **Input processing** to specify whether the block performs sample- or frame-based processing. The block accepts frame-based signals for the input u. All other input signals must be sample-based.

Input Signal u	Input Processing Mode	Block Works?
Sample based	Sample based	Yes
Frame based		No, produces an error
Sample based	Frame based	Yes

Input Signal u	Input Processing Mode	Block Works?
Frame based		Yes

For more information about these two processing modes, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

Programmatic Use

Block Parameter: InputProcessing

Type: character vector

Values: 'Columns as channels (frame based)' | 'Elements as channels (sample based)'

Default: 'Elements as channels (sample based)'

Use circular buffer for state – Circular buffer for storing state

off (default) | on

Select to use a circular buffer for storing the state in simulation and code generation. Otherwise, an array buffer stores the state.

Using a circular buffer can improve execution speed when the delay length is large. For an array buffer, the number of copy operations increases as the delay length goes up. For a circular buffer, the number of copy operations is constant for increasing delay length.

If one of the following conditions is true, an array buffer always stores the state because a circular buffer does not improve execution speed:

- For sample-based signals, the delay length is 1.
- For frame-based signals, the delay length is no larger than the frame size.

Programmatic Use

Block Parameter: UseCircularBuffer

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Prevent direct feedthrough – Prevent direct feedthrough

off (default) | on

Select to increase the delay length from zero to the lower limit for the **Input processing** mode:

- For sample-based signals, increase the minimum delay length to 1.
- For frame-based signals, increase the minimum delay length to the frame length.

Selecting this check box prevents direct feedthrough from the input port, *u*, to the output port. However, this check box cannot prevent direct feedthrough from the initial condition port, *x0*, to the output port.

Dependency

To enable this parameter, set **Delay length: Source** to Input port.

Programmatic Use

Block Parameter: PreventDirectFeedthrough

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Remove delay length check in generated code — Remove delay length out-of-range check

off (default) | on

Select to remove code that checks for out-of-range delay length.

Check Box	Result	When to Use
Selected	Generated code does not include conditional statements to check for out-of-range delay length.	For code efficiency
Cleared	Generated code includes conditional statements to check for out-of-range delay length.	For safety-critical applications

Dependency

To enable this parameter, set **Delay length: Source** to Input port.

Programmatic Use

Block Parameter: RemoveDelayLengthCheckInGeneratedCode

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Diagnostic for delay length — Diagnostic checks for delay length

None (default) | Warning | Error

Specify whether to produce a warning or error when the input *d* is less than the lower limit or greater than the **Delay length: Upper limit**. The lower limit depends on the setting for **Prevent direct feedthrough**.

- If the check box is cleared, the lower limit is zero.
- If the check box is selected, the lower limit is 1 for sample-based signals and frame length for frame-based signals.

Options for the diagnostic include:

- None — Simulink software takes no action.
- Warning — Simulink software displays a warning and continues the simulation.
- Error — Simulink software terminates the simulation and displays an error.

Dependency

To enable this parameter, set **Delay length: Source** to Input port.

Programmatic Use

Block Parameter: DiagnosticForDelayLength

Type: character vector

Values: 'None' | 'Warning' | 'Error'

Default: 'None'

Show enable port — Create enable port

off (default) | on

Select to control execution of this block with an enable port. The block is considered enabled when the input to this port is nonzero, and is disabled when the input is 0. The value of the input is checked at the same time step as the block execution.

Programmatic Use

Block Parameter: ShowEnablePort

Type: character vector

Values: 'off' | 'on'

Default: 'off'

External reset — External state reset

Rising (default) | None | Falling | Either | Level | Level hold

Specify the trigger event to use to reset the states to the initial conditions.

Reset Mode	Behavior
None	No reset.
Rising	Reset on a rising edge.
Falling	Reset on a falling edge.
Either	Reset on either a rising or falling edge.
Level	Reset in either of these cases: <ul style="list-style-type: none"> when the reset signal is nonzero at the current time step when the reset signal value changes from nonzero at the previous time step to zero at the current time step
Level hold	Reset when the reset signal is nonzero at the current time step

The reset signal must be a scalar of type single, double, boolean, or integer. Fixed point data types, except for ufix1, are not supported.

Programmatic Use

Block Parameter: ExternalReset

Type: character vector

Values: 'None' | 'Rising' | 'Falling' | 'Either' | 'Level' | 'Level hold'

Default: 'Rising'

Sample time (-1 for inherited) — Discrete interval between sample time hits

-1 (default) | scalar

Specify the time interval between samples. To inherit the sample time, set this parameter to -1. This block supports discrete sample time, but not continuous sample time.

Programmatic Use

Block Parameter: SampleTime

Type: character vector

Value: real scalar

Default: '-1'

State Attributes

State name — Unique name for block state

' ' (default) | alphanumeric string

Use this parameter to assign a unique name to the block state. The default is ' '. When this field is blank, no name is assigned. When using this parameter, remember these considerations:

- A valid identifier starts with an alphabetic or underscore character, followed by alphanumeric or underscore characters.
- The state name applies only to the selected block.

This parameter enables **State name must resolve to Simulink signal object** when you click **Apply**.

For more information, see “C Code Generation Configuration for Model Interface Elements” (Simulink Coder).

Programmatic Use

Block Parameter: StateName

Type: character vector

Values: unique name

Default: ' '

State name must resolve to Simulink signal object — Require state name resolve to a signal object

off (default) | on

Select this check box to require that the state name resolves to a Simulink signal object.

Dependencies

To enable this parameter, specify a value for **State name**. This parameter appears only if you set the model configuration parameter **Signal resolution** to a value other than None.

Selecting this check box disables **Code generation storage class**.

Programmatic Use

Block Parameter: StateMustResolveToSignalObject

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Signal object class — Custom storage class package name

Simulink.Signal (default) | <StorageClass.PackageName>

Choose a custom storage class package by selecting a signal object class that the target package defines. For example, to apply custom storage classes from the built-in package `mpt`, select `mpt.Signal`. Unless you use an ERT-based code generation target with Embedded Coder, custom storage classes do not affect the generated code.

To use a storage class package other than the Simulink package, you must load the package into the model's Embedded Coder Dictionary. See “Load Storage Class Packages into Embedded Coder Dictionary” (Embedded Coder).

For information about configuring model data by using storage classes, see “C Code Generation Configuration for Model Interface Elements” (Embedded Coder). For information about custom storage classes, see “Organize Data into Structures in Generated Code” (Embedded Coder).

Programmatic Use

Block Parameter: StateSignalObject

Type: character vector

Values: 'Simulink.Signal' | '<StorageClass.PackageName>'

Default: 'Simulink.Signal'

Code generation storage class — State storage class for code generation

Auto (default) | Model default | ExportedGlobal | ImportedExtern | ImportedExternPointer | BitField (Custom) | Model default | ExportToFile (Custom) | ImportFromFile (Custom) | FileScope (Custom) | AutoScope (Custom) | Struct (Custom) | GetSet (Custom) | Reusable (Custom)

Select state storage class for code generation.

- Auto is the appropriate storage class for states that you do not need to interface to external code.
- *StorageClass* applies the storage class or custom storage class that you select from the list. For information about storage classes, see “C Code Generation Configuration for Model Interface Elements” (Simulink Coder). For information about custom storage classes, see “Organize Parameter Data into a Structure by Using Struct Storage Class” (Embedded Coder).

Use **Signal object class** to select custom storage classes from a package other than Simulink.

Dependencies

To enable this parameter, specify a value for **State name**.

Programmatic Use

Block Parameter: StateStorageClass

Type: character vector

Values: 'Auto' | 'Model default' | 'ExportedGlobal' | 'ImportedExtern' | 'ImportedExternPointer' | 'Custom' | ...

Default: 'Auto'

Block Characteristics

Data Types	Boolean bus double enumerated fixed point half integer single string
Direct Feedthrough	yes
Multidimensional Signals	yes
Variable-Size Signals	yes
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Consider using the Model Discretizer to map these continuous blocks into discrete equivalents that support code generation. From a model, in the **Apps** tab, under **Control Systems**, click **Model Discretizer**.

Not recommended for production code.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

For information about HDL code generation, see the “HDL Code Generation” on page 1-283 section on the Delay page.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

“Using Enabled Subsystems”

Introduced in R2012b

Resettable Subsystem

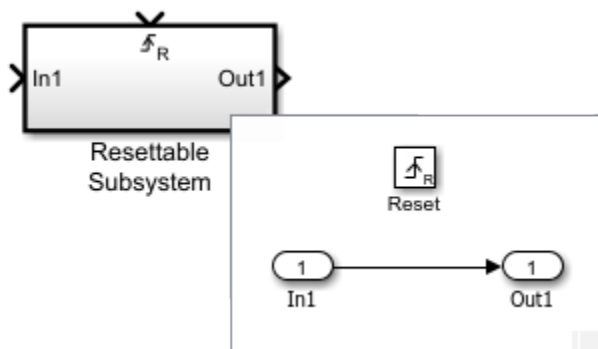

Subsystem whose block states reset with external trigger

Library: Simulink / Ports & Subsystems

Description

The Resettable Subsystem block is a Subsystem block preconfigured as a starting point for creating a subsystem that resets the block states each time the control port receives a trigger signal.

Ports

Input

In — Signal input to a subsystem block

scalar | vector | matrix

Placing an Inport block in a Subsystem block adds an external input port to the block. The port label matches the name of the Inport block.

Use Inport blocks to receive signals from the local environment.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Reset — Control signal input to a subsystem block

scalar | vector | matrix

Placing a Reset block in a Subsystem block adds an external input port to the block and changes the block to a Resettable Subsystem block.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

Output

Out — Signal output from a subsystem

scalar | vector | matrix

Placing an Output block in a Subsystem block adds an output port from the block. The port label on the Subsystem block is the name of the Output block.

Use Output blocks to send signals to the local environment.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed_point | enumerated | bus

Block Characteristics

Data Types	Boolean ^a bus ^a double ^a enumerated ^a fixed_point ^a half ^a integer ^a single ^a string ^a
Direct Feedthrough	no
Multidimensional Signals	limited ^a
Variable-Size Signals	limited ^a
Zero-Crossing Detection	no

“Use Resettable Subsystems”

Introduced in R2015a

Reshape

Change dimensionality of signal

Library: Simulink / Math Operations
HDL Coder / Math Operations

Description

The Reshape block changes the dimensionality of the input signal to a dimensionality that you specify, using the **Output dimensionality** parameter. For example, you can use the block to change an N -element vector to a 1-by- N or N -by-1 matrix signal.

Ports

Input

Port_1 — Input signal

scalar | vector | matrix

Input signal whose dimensions are changed based on the **Output dimensionality** parameter.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Output

Port_1 — Output signal

scalar | vector | matrix

Output signal created with the dimensions specified in the **Output dimensionality** parameter.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Parameters

Output dimensionality — Dimensions of output signal

1-D array (default) | Column vector (2-D) | Row vector (2-D) | Customize | Derive from reference input port

Specify the dimensionality of the output signal.

Output Dimensionality	Description
1-D array	Converts a multidimensional array to a vector (1-D array) array signal. The output vector consists of the first column of the input matrix followed by the second column, and so on. (This option leaves a vector input unchanged.)
Column vector	Converts a vector, matrix, or multidimensional input signal to a column matrix, a M -by-1 matrix, where M is the number of elements in the input signal. For matrices, the conversion is done in column-major order. For multidimensional arrays, the conversion is done along the first dimension.
Row vector	Converts a vector, matrix, or multidimensional input signal to a row matrix, a 1-by- N matrix where N is the number of elements in the input signal. For matrices, the conversion is done in column-major order. For multidimensional arrays, the conversion is done along the first dimension.
Customize	Converts the input signal to an output signal whose dimensions you specify, using the Output dimensions parameter.
Derive from reference input port	Creates a second input port, Ref , on the block. Derives the dimensions of the output signal from the dimensions of the signal input to the Ref input port. Selecting this option disables the Output dimensions parameter. When you select this parameter, the input signals for both inport ports, U and Ref , must have the same sampling mode (sample-based or frame-based).

Programmatic Use**Block Parameter:** OutputDimensionality**Type:** character vector**Value:** '1-D array' | 'Column vector (2-D)' | 'Row vector (2-D)' | 'Customize' | 'Derive from reference input port'**Default:** '1-D array'**Output dimensions — Custom dimensions of output signal**

[1,1] (default) | [integer] | [integer, integer]

Specify the dimensions for the output signal. The value can be a one- or multi-element vector. A value of $[N]$ outputs a vector of size N . A value of $[M N]$ outputs an M -by- N matrix. The number of elements of the input signal must match the number of elements specified by the **Output dimensions** parameter. For multidimensional arrays, the conversion is done along the first dimension.

DependencyTo enable this parameter, set **Output dimensionality** to Customize.**Programmatic Use****Block Parameter:** OutputDimensions**Type:** character vector**Value:** '[integer, integer]' |**Default:** '[1,1]'

Block Characteristics

Data Types	Boolean bus double enumerated fixed point half integer single

Introduced before R2006a

Rocker Switch

Toggle parameter between two values

Library: Simulink / Dashboard

Description

The Rocker Switch block toggles the value of the connected block parameter between two values during simulation. For example, you can connect the Rocker Switch block to a Switch block in your model and change its state during simulation. Use the Rocker Switch block with other Dashboard blocks to create an interactive dashboard for your model.

Double-clicking the Rocker Switch block does not open its dialog box during simulation and when the block is selected. To edit the block's parameters, you can use the **Property Inspector**, or you can right-click the block and select **Block Parameters** from the context menu.

Connect Dashboard Blocks

Dashboard blocks do not use ports to connect to model elements. To connect dashboard blocks to variables and block parameters, use connect mode. Connect mode facilitates the process of connecting dashboard blocks in your model, especially when you want to connect multiple blocks at once. To connect a single dashboard block, you can also use the **Connection** table in the block dialog box.

Tip You can modify dashboard block connections in your model during normal and accelerator mode simulations.

Note Dashboard blocks cannot connect to variables until you update the model diagram. To connect dashboard blocks to variables or modify variable values between opening your model and running a simulation, update the model diagram using **Ctrl+D**.

To enter connect mode, select the block. Then, on the block tab, click **Connect**. In connect mode, when you select one or more blocks, a list of parameters and variables available for connection appears. Select a variable or parameter from the list to connect to the selected dashboard block.

When the value of the selected variable or block parameter is nonscalar, use the text box at the bottom of the **Connection** table to specify the element you want to connect to the dashboard block. To connect to an element of a vector, matrix, or array, specify the element index, for example, 3 or (1, 3). To connect to an element in a bus or structure, specify the element in the context of the bus or structure hierarchy by using dots to indicate different levels in the hierarchy, and omit the top level. For example, specify a.b to connect to scalar element b of the structure or bus a nested inside the selected composite variable or parameter.

To connect another dashboard block, pause on another dashboard block and click the **Connect** button above it. Then, make a selection of signals and blocks in your model and choose a model element to connect.

When you finish connecting the dashboard blocks in your model, on the block tab, click **Done Connecting**.

Tip You can hide the message shown on unconnected blocks using the `set_param` function with the `ShowInitialText` block parameter. The message also disappears when you connect the block.

Parameter Logging

Tunable parameters connected to dashboard blocks are logged to the Simulation Data Inspector, where you can view the parameter values along with logged signal data. You can access logged parameter data in the MATLAB workspace by exporting the parameter data from the Simulation Data Inspector by using the UI or the `Simulink.sdi.exportRun` function. For more information about exporting data using the Simulation Data Inspector UI, see “Export Data from the Simulation Data Inspector”. The parameter data is stored in a `Simulink.SimulationData.Parameter` object, accessible as an element in the exported `Simulink.SimulationData.Dataset`.

Limitations

- Except for the Dashboard Scope block and the Display block, dashboard blocks can only connect to real scalar signals.
- The toolstrip does not support blocks that are inside a panel.
- You cannot use the **Connection** table in the block dialog to connect a dashboard block to a block that is commented out. When you connect a dashboard block to a commented block using connect

mode, the dashboard block does not display the connected value until the you uncomment the block.

- Dashboard blocks cannot connect to model elements inside referenced models.
- When you simulate a model hierarchy, dashboard blocks inside referenced models do not update.
- Dashboard blocks do not support rapid accelerator simulation.
- When you connect a dashboard block to a variable or parameter during simulation, the data for that variable or parameter is not logged to the Simulation Data Inspector. To log variable and parameter data to the Simulation Data Inspector, connect the dashboard block to the variable or parameter prior to simulation.
- When you simulate a model in external mode with the **Default parameter behavior** set to **Inlined**, dashboard blocks can appear to change parameter and variable values. However, the change does not propagate to the simulation. For example, Gain blocks display changes made to the **Gain** parameter using the dashboard blocks, but the **Gain** value used in the simulation does not change.

Parameters

Connection — Select a variable or block parameter to connect

variable and parameter connection options

Select the variable or block parameter to control using the **Connection** table. To connect the block to a signal:

- 1 Make a selection in the model that includes one or more blocks.
- 2 Select the variable or parameter you want to connect.

When the value of the selected variable or block parameter is nonscalar, use the text box at the bottom of the **Connection** table to specify the element you want to connect to the dashboard block. To connect to an element of a vector, matrix, or array, specify the element index, for example, 3 or (1, 3). To connect to an element in a bus or structure, specify the element in the context of the bus or structure hierarchy by using dots to indicate different levels in the hierarchy, and omit the top level. For example, specify a.b to connect to scalar element b of the structure or bus a nested inside the selected composite variable or parameter.

- 3 Click **Apply**.

To facilitate understanding and debugging your model, you can connect Dashboard blocks to variables and parameters in your model during simulation.

Note To see workspace variables in the connection table, update the model diagram using **Ctrl+D**.

Programmatic Use

To programmatically connect a dashboard block to a tunable parameter or a variable, use a `Simulink.HMI.ParamSourceInfo` object. The `Simulink.HMI.ParamSourceInfo` object contains four properties. Some of the properties apply to connecting dashboard blocks to parameters, and some apply to connecting dashboard blocks to variables. Not all fields have a value for a connection because a given dashboard block connects to either a parameter or a variable.

Block Parameter: Binding

Type: Simulink.HMI.ParamSourceInfo

Default: []

States — Pair values and labels

scalar and character vector

Pairs of values to assign to the connected variable or parameter and text to display on the block. Switches have two states — **Top** and **Bottom** — one corresponding to each switch position. Each state contains a **Value** and a **Label**.

- **Value** — Value to assign to the connected variable or parameter when the switch is in the corresponding position.
- **Label** — Text to display on the block for the corresponding position.

This table describes the default configuration for the block.

States

Position	State Value	State Label
Top	0	on
Bottom	1	off

Programmatic Use

To configure the **States** for the block programmatically, specify the value of the **States** parameter as a structure array containing two elements with fields:

- **Value** — Scalar double value for the state.
- **Label** — String or character array to use as the label for the switch position.

```
topState.Value = 0;
topState.Label = 'Off';
bottomState.Value = 1;
bottomState.Label = 'On';
switchStates = [topState bottomState];
```

Block Parameter: States

Type: two element array of structures

Label — Block label position

Top (default) | Bottom | Hide

Position of the block label. When the block is connected to an element in the model, the label is the name of the connected element.

Programmatic Use

Block Parameter: LabelPosition

Type: character vector

Values: 'Top' | 'Bottom' | 'Hide'

Default: 'Top'

Block Characteristics

Data Types	double half integer single
Direct Feedthrough	no
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Introduced in R2015a

Rotary Switch

Switch parameter to set values on dial

Library: Simulink / Dashboard

Description

The Rotary Switch changes the value of the connected block parameter to several specified values during simulation. For example, you can connect the Rotary Switch block to the amplitude or frequency of an input signal in your model and change its characteristics during simulation. Use the Rotary Switch block with other Dashboard blocks to create an interactive dashboard to control your model.

Double-clicking the Rotary Switch block does not open its dialog box during simulation and when the block is selected. To edit the block's parameters, you can use the **Property Inspector**, or you can right-click the block and select **Block Parameters** from the context menu.

Connect Dashboard Blocks

Dashboard blocks do not use ports to connect to model elements. To connect dashboard blocks to variables and block parameters, use connect mode. Connect mode facilitates the process of connecting dashboard blocks in your model, especially when you want to connect multiple blocks at once. To connect a single dashboard block, you can also use the **Connection** table in the block dialog box.

Tip You can modify dashboard block connections in your model during normal and accelerator mode simulations.

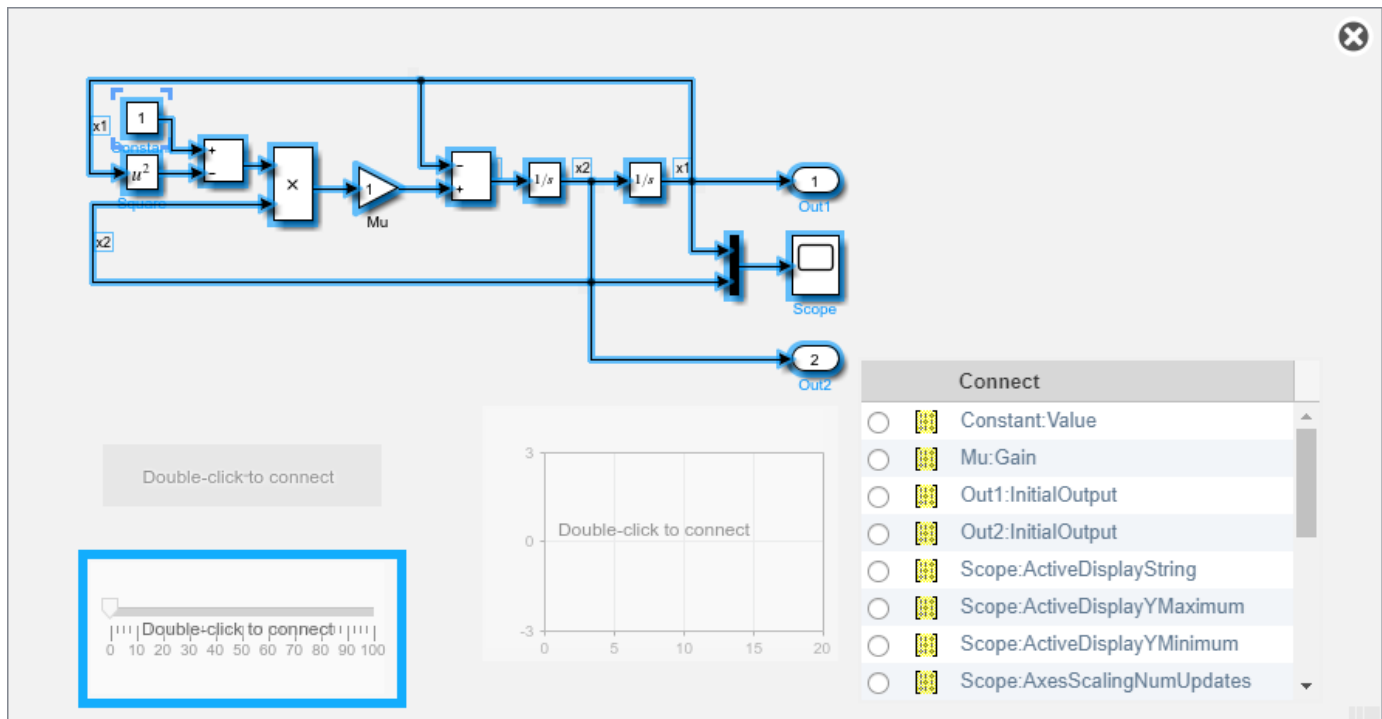

Note Dashboard blocks cannot connect to variables until you update the model diagram. To connect dashboard blocks to variables or modify variable values between opening your model and running a simulation, update the model diagram using **Ctrl+D**.

To enter connect mode, select the block. Then, on the block tab, click **Connect**. In connect mode, when you select one or more blocks, a list of parameters and variables available for connection appears. Select a variable or parameter from the list to connect to the selected dashboard block.

When the value of the selected variable or block parameter is nonscalar, use the text box at the bottom of the **Connection** table to specify the element you want to connect to the dashboard block. To connect to an element of a vector, matrix, or array, specify the element index, for example, 3 or (1, 3). To connect to an element in a bus or structure, specify the element in the context of the bus or structure hierarchy by using dots to indicate different levels in the hierarchy, and omit the top

level. For example, specify `a.b` to connect to scalar element `b` of the structure or bus `a` nested inside the selected composite variable or parameter.

To connect another dashboard block, pause on another dashboard block and click the **Connect** button above it. Then, make a selection of signals and blocks in your model and choose a model element to connect.

When you finish connecting the dashboard blocks in your model, on the block tab, click **Done Connecting**.

Tip You can hide the message shown on unconnected blocks using the `set_param` function with the `ShowInitialText` block parameter. The message also disappears when you connect the block.

Parameter Logging

Tunable parameters connected to dashboard blocks are logged to the Simulation Data Inspector, where you can view the parameter values along with logged signal data. You can access logged parameter data in the MATLAB workspace by exporting the parameter data from the Simulation Data Inspector by using the UI or the `Simulink.sdi.exportRun` function. For more information about exporting data using the Simulation Data Inspector UI, see “Export Data from the Simulation Data Inspector”. The parameter data is stored in a `Simulink.SimulationData.Parameter` object, accessible as an element in the exported `Simulink.SimulationData.Dataset`.

Limitations

- Except for the Dashboard Scope block and the Display block, dashboard blocks can only connect to real scalar signals.

- The toolbar does not support blocks that are inside a panel.
- You cannot use the **Connection** table in the block dialog to connect a dashboard block to a block that is commented out. When you connect a dashboard block to a commented block using connect mode, the dashboard block does not display the connected value until the you uncomment the block.
- Dashboard blocks cannot connect to model elements inside referenced models.
- When you simulate a model hierarchy, dashboard blocks inside referenced models do not update.
- Dashboard blocks do not support rapid accelerator simulation.
- When you connect a dashboard block to a variable or parameter during simulation, the data for that variable or parameter is not logged to the Simulation Data Inspector. To log variable and parameter data to the Simulation Data Inspector, connect the dashboard block to the variable or parameter prior to simulation.
- When you simulate a model in external mode with the **Default parameter behavior** set to **Inlined**, dashboard blocks can appear to change parameter and variable values. However, the change does not propagate to the simulation. For example, Gain blocks display changes made to the **Gain** parameter using the dashboard blocks, but the **Gain** value used in the simulation does not change.

Parameters

Connection — Select a variable or block parameter to connect

variable and parameter connection options

Select the variable or block parameter to control using the **Connection** table. To connect the block to a signal:

- 1 Make a selection in the model that includes one or more blocks.
- 2 Select the variable or parameter you want to connect.

When the value of the selected variable or block parameter is nonscalar, use the text box at the bottom of the **Connection** table to specify the element you want to connect to the dashboard block. To connect to an element of a vector, matrix, or array, specify the element index, for example, 3 or (1, 3). To connect to an element in a bus or structure, specify the element in the context of the bus or structure hierarchy by using dots to indicate different levels in the hierarchy, and omit the top level. For example, specify a.b to connect to scalar element b of the structure or bus a nested inside the selected composite variable or parameter.

- 3 Click **Apply**.

To facilitate understanding and debugging your model, you can connect Dashboard blocks to variables and parameters in your model during simulation.

Note To see workspace variables in the connection table, update the model diagram using **Ctrl+D**.

Programmatic Use

To programmatically connect a dashboard block to a tunable parameter or a variable, use a `Simulink.HMI.ParamSourceInfo` object. The `Simulink.HMI.ParamSourceInfo` object contains four properties. Some of the properties apply to connecting dashboard blocks to parameters, and

some apply to connecting dashboard blocks to variables. Not all fields have a value for a connection because a given dashboard block connects to either a parameter or a variable.

Block Parameter: Binding

Type: Simulink.HMI.ParamSourceInfo

Default: []

States — Position labels and values

scalar and character vector

Pairs of numeric values to assign to the connected variable or parameter with labels for the block. A State consists of a **State Value** and a **State Label**.

- **State Value** — Value assigned to the connected variable or parameter when the Rotary Switch block is positioned at the corresponding **State Label**.
- **State Label** — Label for the switch position. You can use the **State Label** to display the value the connected variable or parameter takes when the Rotary Switch block points to the **State Label**, or you can use a descriptive text label.

Click the + button to add **States**.

The default configuration for the block includes these **States**:

States

State Value	State Label
0	Off
1	Low
2	Medium
3	High

Programmatic Use

To configure the **States** for the block programmatically, specify the value of the **States** parameter as a structure array with fields:

- **Value** — Scalar double value for the state.
- **Label** — String or character array to use as the label for the switch position.

Include a structure element in the array for each state you want to specify for the block.

```
state1.Value = 1;
state1.Label = 'State 1';
state2.Value = 2;
state2.Label = 'State 2';
states = [state1 state2];
```

Block Parameter: States

Type: structure array

Enumerated Data Type — Specify state values and labels using an enumerated data type

off (default) | on

You can use an enumerated data type that pairs a numeric value with each enumeration to configure the state values and labels for the block. To specify the states for the block using an enumerated data

type, first select the **Enumerated Data Type** option. Then, specify the name of the enumerated data type in the text box. The definition for the specified enumerated data type must be saved on the MATLAB path or in the base workspace.

Example: myEnumType

Programmatic Use

To programmatically specify the state labels and values for the block using an enumerated data type, specify 'on' for the UseEnumeratedDataType parameter and the name of the enumerated data type for the EnumeratedDataType parameter.

Block Parameter: UseEnumeratedDataType

Type: string or character array

Values: 'on' | 'off'

Default: 'off'

Block Parameter: EnumeratedDataType

Type: string or character array

Default: ''

Label — Block label position

Top (default) | Bottom | Hide

Position of the block label. When the block is connected to an element in the model, the label is the name of the connected element.

Programmatic Use

Block Parameter: LabelPosition

Type: character vector

Values: 'Top' | 'Bottom' | 'Hide'

Default: 'Top'

Block Characteristics

Data Types	double half integer single
Direct Feedthrough	no
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Rounding Function

Apply rounding function to signal

Library: Simulink / Math Operations

Description

The Rounding Function block rounds each element of the input signal to produce the output signal.

You select the type of rounding from the **Function** parameter list. The name of the selected function appears on the block.

Tip Use the Rounding Function block when you want vector or matrix output.

Ports

Input

Port_1 – Input signal

scalar | vector | matrix

Input signal to which the rounding function is applied.

Data Types: single | double

Output

Port_1 – Output signal

scalar | vector | matrix

Output signal after the rounding function is applied to the input signal. The output signal has the same dimensions and data type as the input. Each element of the output signal is the result of applying the selected rounding function to the corresponding element of the input signal.

Data Types: single | double

Parameters

Function – Rounding function

floor (default) | ceil | round | fix

Choose the rounding function applied to the input signal.

Rounding function	Rounds each element of the input signal
floor	To the nearest integer value towards minus infinity
ceil	To the nearest integer towards positive infinity
round	To the nearest integer
fix	To the nearest integer towards zero

Programmatic Use**Block Parameter:** Operator**Type:** character vector**Values:** 'floor' | 'ceil' | 'round' | 'fix'**Default:** 'floor'**Sample time — Specify sample time as a value other than -1**

-1 (default) | scalar | vector

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

Dependencies

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

Programmatic Use**Block Parameter:** SampleTime**Type:** character vector**Values:** scalar or vector**Default:** '-1'**Block Characteristics**

Data Types	double single
Direct Feedthrough	yes
Multidimensional Signals	no
Variable-Size Signals	yes
Zero-Crossing Detection	no

Extended Capabilities**C/C++ Code Generation**

Generate C and C++ code using Simulink® Coder™.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

HDL Code Generation Requirements

HDL code generation for the block requires that you use single data types as inputs to the block, and enable the native floating point mode. In the Configuration Parameters dialog box, on the **HDL Code Generation > Floating Point** pane, for **Library**, select **Native Floating Point**. To learn more about using the native floating-point mode, see “Getting Started with HDL Coder Native Floating-Point Support” (HDL Coder) and “Generate Target-Independent HDL Code with Native Floating-Point” (HDL Coder).

HDL Architecture

This block has a single, default HDL architecture.

HDL Block Properties

General	
ConstrainedOutputPipeline	Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is 0. For more details, see “ConstrainedOutputPipeline” (HDL Coder).
InputPipeline	Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “InputPipeline” (HDL Coder).
OutputPipeline	Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “OutputPipeline” (HDL Coder).
Native Floating Point	
LatencyStrategy	Specify whether to map the blocks in your design to <code>inherit</code> , <code>Max</code> , <code>Min</code> , <code>Zero</code> , or <code>Custom</code> for the floating-point operator. The default is <code>inherit</code> . See also “LatencyStrategy” (HDL Coder).
NFPCustomLatency	To specify a value, set LatencyStrategy to <code>Custom</code> . HDL Coder adds latency equal to the value that you specify for the NFPCustomLatency setting. See also “NFPCustomLatency” (HDL Coder).

Complex Data Support

This block supports code generation for complex signals.

Saturation

Limit input signal to the upper and lower saturation values

Library: Simulink / Commonly Used Blocks
 Simulink / Discontinuities
 HDL Coder / Discontinuities

Description

The Saturation block produces an output signal that is the value of the input signal bounded to the upper and lower saturation values. The upper and lower limits are specified by the parameters **Upper limit** and **Lower limit**.

Input	Output
$\text{Lower limit} \leq \text{Input value} \leq \text{Upper limit}$	Input value
Input value < Lower limit	Lower limit
Input value > Upper limit	Upper limit

Ports

Input

Port_1 – Input signal

scalar | vector

The input signal to the saturation algorithm.

Data Types: double | single | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Output

Port_1 – Output signal

scalar | vector

Output signal that is the value of the input signal, upper saturation limit, or lower saturation limit.

Data Types: double | single | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Parameters

Main

Upper limit – Upper saturation boundary for the input signal

0.5 (default) | scalar | vector

Specify the upper bound on the input signal. If the input signal is greater than this boundary, then the output signal is set to this saturation value. The **Upper limit** parameter is converted to the output data type using round-to-nearest and saturation. **Upper limit** must be greater than the **Output minimum** parameter and less than the **Output maximum** parameter.

Programmatic Use**Block Parameter:** UpperLimit**Type:** character vector**Value:** real scalar or vector**Default:** '0.5'**Lower limit – Lower saturation boundary for the input signal**

-0.5 (default) | scalar | vector

Specify the lower bound on the input signal. If the input signal is less than this boundary, then the output signal is set to this saturation value. The **Lower limit** parameter is converted to the output data type using round-to-nearest and saturation. **Lower limit** must be greater than the **Output minimum** parameter and less than the **Output maximum** parameter.

Programmatic Use**Block Parameter:** LowerLimit**Type:** character vector**Value:** real scalar or vector**Default:** '-0.5'**Treat as gain when linearizing – Specify the gain value**

On (default) | Boolean

Select this check box to cause the commands to treat the gain as 1. The linearization commands in Simulink software treat this block as a gain in state space. Clear the box to have the commands treat the gain as 0.

Programmatic Use**Block Parameter:** LinearizeAsGain**Type:** character vector**Values:** 'off' | 'on'**Default:** 'on'**Enable zero-crossing detection – Enable zero-crossing detection**

on (default) | Boolean

Select to enable zero-crossing detection. For more information, see “Zero-Crossing Detection” in the Simulink documentation.

Programmatic Use**Block Parameter:** ZeroCross**Type:** character vector, string**Values:** 'off' | 'on'**Default:** 'on'**Sample time – Specify sample time as a value other than -1**

-1 (default) | scalar | vector

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

Dependencies

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

Programmatic Use

Block Parameter: SampleTime

Type: character vector

Values: scalar or vector

Default: '-1'

Signal Attributes

Click the **Show data type assistant** button  to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

Output minimum — Minimum output value for range checking

[] (default) | scalar

Lower value of the output range that Simulink checks.

Simulink uses the minimum to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Specify Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Embedded Coder).

Note Output minimum does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use

Block Parameter: OutMin

Type: character vector

Values: '[]' | scalar

Default: '[]'

Output maximum — Maximum output value for range checking

[] (default) | scalar

Upper value of the output range that Simulink checks.

Simulink uses the maximum value to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.

- Simulation range checking (see “Specify Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Embedded Coder).

Note Output maximum does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use

Block Parameter: OutMax

Type: character vector

Values: '[]' | scalar

Default: '[]'

Output data type — Specify the output data type

Inherit: Same as input (default) | Inherit: Inherit via back propagation | double | single | int8 | int32 | uint32 | int64 | uint64 | fixdt(1,16,2^0,0) | <data type expression> | ...

Choose the data type for the output. The type can be inherited, specified directly, or expressed as a data type object such as Simulink.NumericType.

Programmatic Use

Block Parameter: OutDataTypeStr

Type: character vector

Values: 'Inherit: Same as input', 'Inherit: Inherit via back propagation', 'single', 'int8', 'uint8', int16, 'uint16', 'int32', 'uint32', 'int64', 'uint64', fixdt(1,16,0), fixdt(1,16,2^0,0), fixdt(1,16,2^0,0). '<data type expression>'

Default: 'Inherit: Same as input'

Lock output data type setting against changes by the fixed-point tools — Prevent fixed-point tools from overriding Output data type

off (default) | on

Select this parameter to prevent the fixed-point tools from overriding the **Output** data type you specify on the block. For more information, see “Use Lock Output Data Type Setting” (Fixed-Point Designer).

Programmatic Use

Block Parameter: LockScale

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Integer rounding mode — Specify the rounding mode for fixed-point operations

Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

Choose one of these rounding modes.

Ceiling

Rounds both positive and negative numbers toward positive infinity. Equivalent to the MATLAB `ceil` function.

Convergent

Rounds number to the nearest representable value. If a tie occurs, rounds to the nearest even integer. Equivalent to the Fixed-Point Designer `convergent` function.

Floor

Rounds both positive and negative numbers toward negative infinity. Equivalent to the MATLAB `floor` function.

Nearest

Rounds number to the nearest representable value. If a tie occurs, rounds toward positive infinity. Equivalent to the Fixed-Point Designer `nearest` function.

Round

Rounds number to the nearest representable value. If a tie occurs, rounds positive numbers toward positive infinity and rounds negative numbers toward negative infinity. Equivalent to the Fixed-Point Designer `round` function.

Simplest

Automatically chooses between round toward floor and round toward zero to generate rounding code that is as efficient as possible.

Zero

Rounds number toward zero. Equivalent to the MATLAB `fix` function.

Programmatic Use

Block Parameter: `RndMeth`

Type: character vector

Values: `'Ceiling'` | `'Convergent'` | `'Floor'` | `'Nearest'` | `'Round'` | `'Simplest'` | `'Zero'`

Default: `'Floor'`

Backlash | Saturation Dynamic

Introduced before R2006a

Saturation Dynamic

Limit input signal to dynamic upper and lower saturation values

Library: Simulink / Discontinuities
HDL Coder / Discontinuities

Description

The Saturation Dynamic block produces an output signal that is the value of the input signal bounded to the saturation values from the input ports **up** and **lo**.

Input	Output
$lo \leq \text{Input value} \leq up$	Input value
Input value < lo	Lower limit
Input value > up	Upper limit

Ports

Input

u – Input signal

scalar | vector

The input signal to the saturation algorithm.

Data Types: double | single | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

up – Signal that provides the upper saturation limit

scalar | vector

Dynamic value providing the upper saturation limit. When the input is greater than **up** then the output value is bound to **up**.

Data Types: double | single | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

lo – Signal that provides the lower saturation limit

scalar | vector

Dynamic value providing the lower saturation limit. When the input is less than **lo** then the output value is bound to **lo**.

Data Types: double | single | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Output

y — Output signal

scalar | vector

Output signal that is the value of the input signal, upper saturation limit, or lower saturation limit.

Data Types: double | single | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Parameters

To edit the parameters for the Saturation Dynamic block, double-click the block icon.

Click the **Show data type assistant** button  to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

Output minimum — Minimum output value for range checking

[] (default) | scalar

Lower value of the output range that Simulink checks.

Simulink uses the minimum to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Specify Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Embedded Coder).

Note **Output minimum** does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use

Block Parameter: OutMin

Type: character vector

Values: '[]' | scalar

Default: '[]'

Output maximum — Maximum output value for range checking

[] (default) | scalar

Upper value of the output range that Simulink checks.

Simulink uses the maximum value to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Specify Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Embedded Coder).

Note Output maximum does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use

Block Parameter: OutMax

Type: character vector

Values: '[]' | scalar

Default: '[]'

Output data type — Specify the output data type

Inherit: Same as input (default) | Inherit: Inherit via back propagation | double | single | int8 | int32 | uint32 | int64 | uint64 | fixdt(1,16,2^0,0) | <data type expression> | ...

Choose the data type for the output. The type can be inherited, specified directly, or expressed as a data type object such as Simulink.NumericType.

Programmatic Use

Block Parameter: OutDataTypeStr

Type: character vector

Values: 'Inherit: Same as input', 'Inherit: Inherit via back propagation', 'single', 'int8', 'uint8', 'int16', 'uint16', 'int32', 'uint32', 'int64', 'uint64', 'fixdt(1,16,0)', 'fixdt(1,16,2^0,0)', 'fixdt(1,16,2^0,0)'. '<data type expression>'

Default: 'Inherit: Same as input'

Lock output data type setting against changes by the fixed-point tools — Prevent fixed-point tools from overriding Output data type

off (default) | on

Select this parameter to prevent the fixed-point tools from overriding the **Output** data type you specify on the block. For more information, see “Use Lock Output Data Type Setting” (Fixed-Point Designer).

Programmatic Use

Block Parameter: LockScale

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Integer rounding mode — Specify the rounding mode for fixed-point operations

Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

Choose one of these rounding modes.

Ceiling

Rounds both positive and negative numbers toward positive infinity. Equivalent to the MATLAB `ceil` function.

Convergent

Rounds number to the nearest representable value. If a tie occurs, rounds to the nearest even integer. Equivalent to the Fixed-Point Designer `convergent` function.

Floor

Rounds both positive and negative numbers toward negative infinity. Equivalent to the MATLAB `floor` function.

Nearest

Rounds number to the nearest representable value. If a tie occurs, rounds toward positive infinity. Equivalent to the Fixed-Point Designer `nearest` function.

Round

Rounds number to the nearest representable value. If a tie occurs, rounds positive numbers toward positive infinity and rounds negative numbers toward negative infinity. Equivalent to the Fixed-Point Designer `round` function.

Simplest

Automatically chooses between round toward floor and round toward zero to generate rounding code that is as efficient as possible.

Zero

Rounds number toward zero. Equivalent to the MATLAB `fix` function.

Programmatic Use

Block Parameter: `RndMeth`

Type: character vector

Values: `'Ceiling'` | `'Convergent'` | `'Floor'` | `'Nearest'` | `'Round'` | `'Simplest'` | `'Zero'`

Default: `'Floor'`

See Also

For more information, see “Rounding” (Fixed-Point Designer).

Saturate on integer overflow — Choose the behavior when integer overflow occurs

`off` (default) | `on`

Action	Reasons for Taking This Action	What Happens for Overflows	Example
Select this check box.	Your model has possible overflow, and you want explicit saturation protection in the generated code.	Overflows saturate to either the minimum or maximum value that the data type can represent.	The maximum value that the <code>int8</code> (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box selected, the block output saturates at 127. Similarly, the block output saturates at a minimum output value of -128.
Do not select this check box.	You want to optimize efficiency of your generated code. You want to avoid overspecifying how a block handles out-of-range signals. For more information, see "Troubleshoot Signal Range Errors".	Overflows wrap to the appropriate value that is representable by the data type.	The maximum value that the <code>int8</code> (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box cleared, the software interprets the overflow-causing value as <code>int8</code> , which can produce an unintended result. For example, a block result of 130 (binary 1000 0010) expressed as <code>int8</code> , is -126.

When you select this check box, saturation applies to every internal operation on the block, not just the output or result. Usually, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Programmatic Use

Block Parameter: DoSatur

Type: character vector

Value: 'off' | 'on'

Default: 'off'

Block Characteristics

Data Types	Boolean ^a double fixed point integer single
Direct Feedthrough	no
Multidimensional Signals	no
Variable-Size Signals	no

Zero-Crossing Detection	no
--------------------------------	----

a. This block is not recommended for use with Boolean signals.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

HDL Architecture

This block has a single, default HDL architecture.

HDL Block Properties

ConstrainedOutputPipeline	Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is 0. For more details, see “ConstrainedOutputPipeline” (HDL Coder).
InputPipeline	Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “InputPipeline” (HDL Coder).
OutputPipeline	Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “OutputPipeline” (HDL Coder).

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Introduced before R2006a

Scan String

Scan input string and convert to signals per specified format

Library: Simulink / String

Description

The Scan String block scans an input string and converts it to signals per the format specified by the **Format** parameter. The block converts values to their decimal (base 10) representation and outputs the results as numeric or string signals. Use this block when you want to deconstruct a string, for example a sentence, into its individual components. For example, if the **Format** parameter is set to "%s is %f.", the block outputs two parts, a string signal and a single signal. If the input is the string "Pi is 3.14", the two outputs are "Pi" and "3.14".

Note If you specify a numeric display format that is not large enough to display all the digits of a value, the displayed values may lose precision. The result depends on your computer hardware and operating system.

The Scan String, String to Double, and String to Single blocks are identical blocks. When configured for String to Double, the block converts the input string signal to a double numerical output. When configured for String to Single, the block converts the input string signal to a single numerical output.

For code generation, configure models that contain this block for non-finite number support by selecting the **Configuration Parameters > Code Generation > Interface > Support non-finite numbers** check box.

Ports

Input

Port_1 – Input string

scalar

Input string, specified as a scalar.

Data Types: `string`

Output

d – Output data whose format matches %d format

scalar

Output data whose format matches the specified format, defined as a scalar. Total maximum number of outputs is 128.

If the block cannot match an input string to a format operator specified in **Format**, it returns a warning and outputs an appropriate value (0 or "") for each unmatched format operator.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

f – Output data whose format matches %f format

scalar

Output data whose format matches the %f format, specified as a scalar. Total maximum number of outputs is 128.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Port_N – Output data whose format matches N format

scalar

Output data whose format matches *N* format, specified as a scalar. Total maximum number of outputs is 128.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

Format – Format operator for input

"%d %f" (default) | scalar

Format operator for input, specified as a scalar. If the block cannot match the input string with the specified format, it returns 0. The return of 0 differs from the `sscanf` function return, which is an empty matrix if the function cannot match the input with the specified format.

- For the String to Double block, this parameter has a default value of %lf.
- For the String to Single block, this parameter has a default value of %f.

For more information about acceptable format operators, see the Algorithms section.

Block Characteristics

Data Types	<code>double</code> <code>integer</code> <code>single</code> <code>string</code>
Direct Feedthrough	yes
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Algorithms

The Scan String block uses this format specifier prototype:

`%[width][length]specifier`

Numeric Fields

This table lists available conversion specifiers to convert text to numeric outputs. The block converts values to their decimal (base 10) representation.

Output Port Data Type	Conversion Specifier	Description
Integer, signed	<code>%d</code>	Base 10
Integer, unsigned	<code>%u</code>	Base 10
Floating-point number	<code>%f</code> , <code>%e</code> , or <code>%g</code>	Floating-point values. Input fields can contain NaN (case sensitive). Input fields that represents floating-point numbers can include leading + or - symbols and exponential notation using e or E. The conversion specifiers <code>%f</code> , <code>%e</code> , and <code>%g</code> all treat input fields the same way.

Character Fields

This table lists available conversion specifiers to convert text so that the output is a string.

Character Field Type	Conversion Specifier	Description
String scalar	<code>%s</code>	Read the text until the block encounters whitespace.
	<code>%c</code>	Read any single character, including whitespace. To read multiple characters at a time, specify field width. For example, <code>%10c</code> reads 10 characters at a time.
Pattern-matching	<code>%[. . .]</code>	Read only the characters in the brackets up to the first nonmatching character or whitespace. Example: <code>%[mus]</code> reads 'summer' as 'summ'.
	<code>%[^ . . .]</code>	Read any characters not in the brackets up to the first matching character or whitespace. Example: <code>%[^m]</code> reads 'summer' as 'su'.

Optional Operators

- **Field Width** — To specify the maximum number of digits or text characters to read at a time, insert a number after the percent character. For example, `%10s` reads up to 10 characters at a time, including whitespace. `%4f` reads up to four digits at a time, including the decimal point.
- **Literal Text to Ignore** — This block must match the specified text immediately before or after the conversion specifier.

Example: `Hell%s` reads "Hello!" as "o!".

Length Specifiers

The Scan String block supports the `h` and `l` length subspecifiers. These specifiers can change according to the **Configuration Parameters > Hardware Implementation > Number of bits** settings.

Length	i	u	f e g	s c [...] [^...]
No length specifier	int	unsigned int	single	string
<code>h</code>	short	unsigned short	—	—
<code>l</code>	long	unsigned long	double	—

Notes for Specifiers that Specify Integer Data Types (d, u)

- Target `int`, `long`, and `short` type sizes are controlled by settings in the **Configuration Parameters > Hardware Implementation** pane. For example, if the target `int` is 32 bits and the specifier is `%u`, then the expected input type will be `uint32`. For this example, the Scan String block requires that the output type be exactly `int32`. It cannot be any other data type.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Introduced in R2018a

Scope

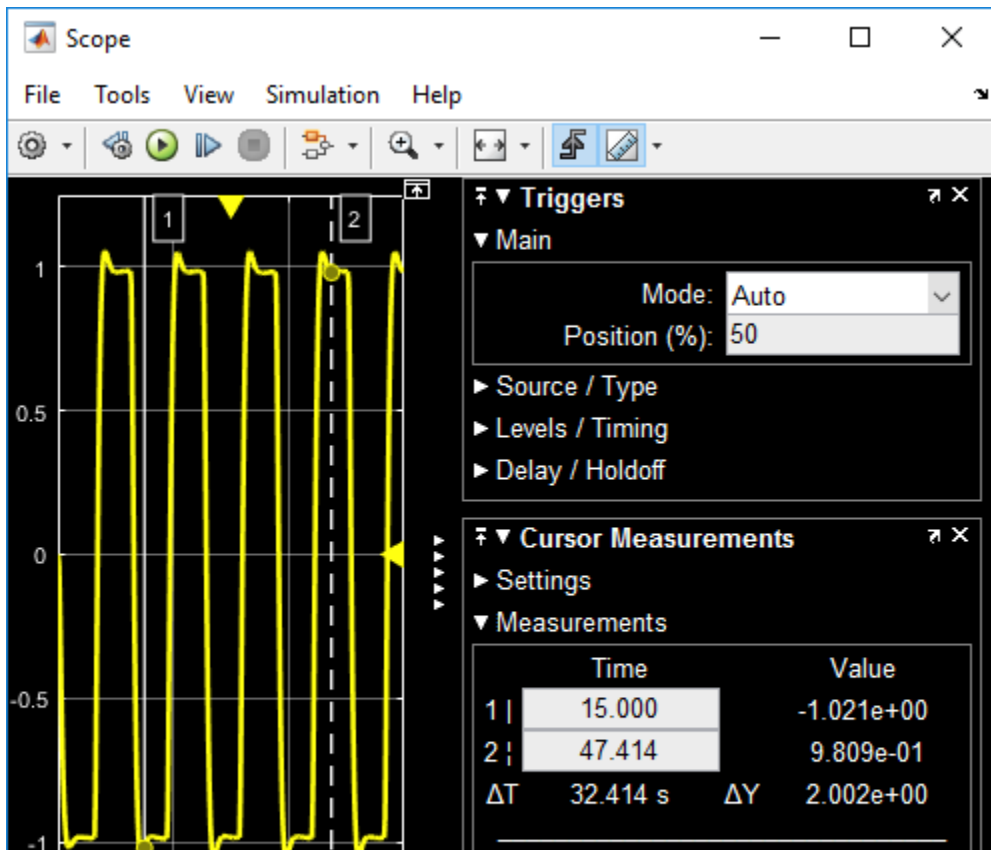

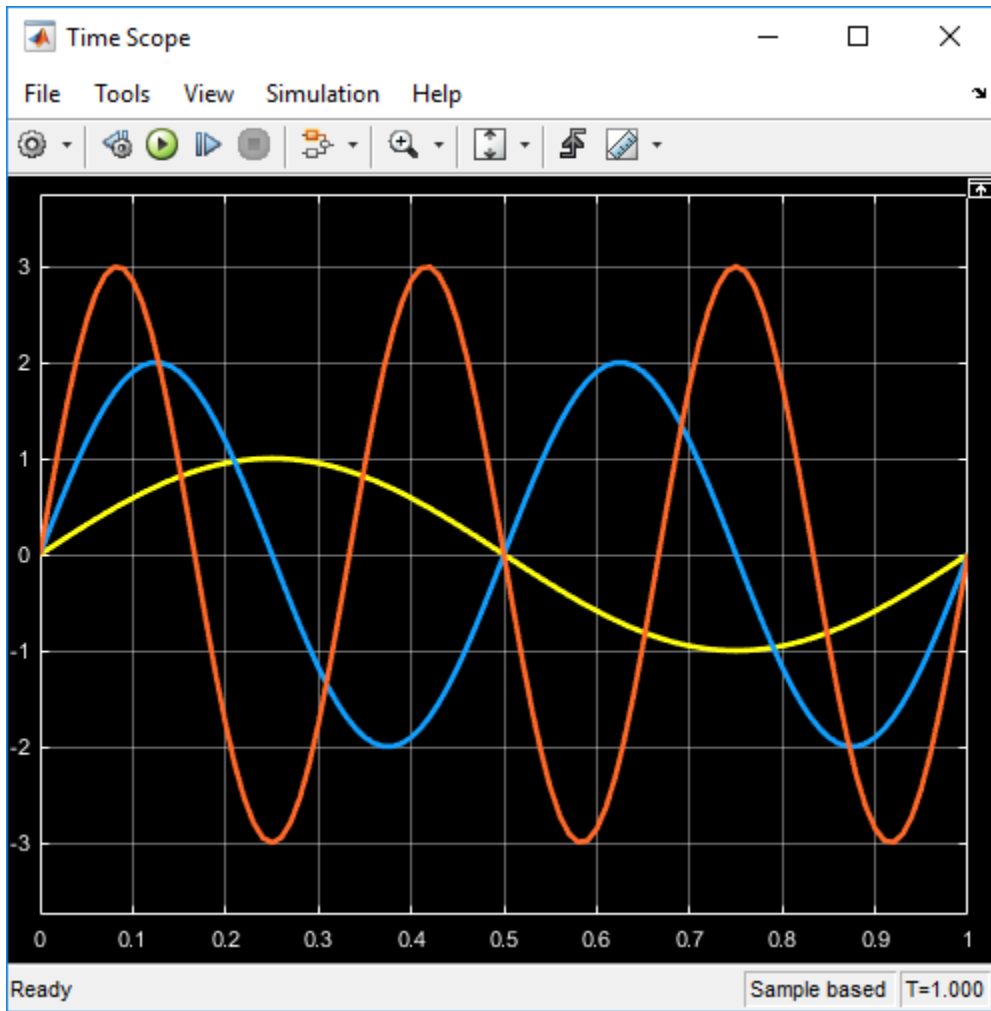

Display signals generated during simulation

Library: Simulink / Commonly Used Blocks
Simulink / Sinks
HDL Coder / Commonly Used Blocks
HDL Coder / Sinks

Description

The Simulink Scope block and DSP System Toolbox Time Scope block display time domain signals.

The two blocks have identical functionality, but different default settings. The Time Scope is optimized for discrete time processing. The Scope is optimized for general time-domain simulation. For a side-by-side comparison, see “Simulink Scope Versus DSP System Toolbox Time Scope”.

Oscilloscope features:

- Triggers — Set triggers to sync repeating signals and pause the display when events occur.
- Cursor Measurements — Measure signal values using vertical and horizontal cursors.
- Signal Statistics — Display the maximum, minimum, peak-to-peak difference, mean, median, and RMS values of a selected signal.
- Peak Finder — Find maxima, showing the x-axis values at which they occur.
- Bilevel Measurements — Measure transitions, overshoots, undershoots, and cycles.

You must have a Simscape or DSP System Toolbox license to use the Peak Finder, Bilevel Measurements, and Signal Statistics.

Scope display features:

- Simulation control — Debug models from a Scope window using **Run**, **Step Forward**, and **Step Backward** toolbar buttons.
- Multiple signals — Plot multiple signals on the same y-axis (display) using multiple input ports.
- Multiple y-axes (displays) — Display multiple y-axes. All the y-axes have a common time range on the x-axis.
- Modify parameters — Modify scope parameter values before and during a simulation.
- Axis autoscaling — Autoscale axes during or at the end of a simulation. Margins are drawn at the top and bottom of the axes.
- Display data after simulation — Scope data is saved during a simulation. If a scope is closed at the start of a simulation, when you open the scope after a simulation, the scope displays simulation results for attached input signals.

Note If you have a high sample rate or long simulation time, you may run into issues with memory or system performance because the scope saves data internally. To limit the amount of data saved for scope visualization, use the Limit data points to last property.

For information on controlling a scope programmatically, see “Control Scope Blocks Programmatically”.

Limitations

- Do not use scope blocks in a Library. If you place a scope block inside a library block with a locked link or in a locked library, Simulink displays an error when trying to open the scope window. To display internal data from a library block, add an output port to the library block, and then connect the port to a Scope block in your model.
- If you step through a model, the scope only updates when the scope block runs. This means that the time shown in the status bar may not match the model time.
- When connected to a constant signal, a scope block may plot a single point.
- The scope shows gaps in the display when the signal value is NaN.

- When you visualize multiple frame-based signals in the scope, some samples of signals with a frame size of 1 might not be displayed. To visualize these signals, move the signals with frame size of 1 to a separate scope.
- Scope displays have limitations in Rapid Accelerator mode. See “Behavior of Scopes and Viewers with Rapid Accelerator Mode”
- When the Scope is in a ForEach subsystem, the scope only displays the last index.

Ports

Input

Port_1 — Signal or signals to visualize

scalar | vector | matrix | array | bus | nonvirtual bus

Connect the signals you want to visualize. You can have up to 96 input ports. Input signals can have these characteristics:

- **Type** — Continuous (sample-based) or discrete (sample-based and frame-based).
- **Data type** — Any data type that Simulink supports. See “Data Types Supported by Simulink”.
- **Dimension** — Scalar, one dimensional (vector), two dimensional (matrix), or multidimensional (array). Display multiple channels within one signal depending on the dimension. See “Signal Dimensions” and “Determine Signal Dimensions”.

Input Limitations

- When the input is a constant signal, the scope plots a single point.
- The scope shows gaps in the display when the signal value is NaN.
- When you visualize multiple frame-based signals in the scope, some samples of signals with a frame size of 1 might not be displayed. To visualize these signals, move the signals with frame size of 1 to a separate scope.

Bus Support

You can connect nonvirtual bus and arrays of bus signals to a scope. To display the bus signals, use normal or accelerator simulation mode. The scope displays each bus element signal in the order the elements appear in the bus, from the top to the bottom. Nested bus elements are flattened.

To log nonvirtual bus signals with a scope, set the **Save format** parameter to Dataset. You can use any **Save format** to log virtual bus signals.

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Properties

Configuration Properties

The Configuration Properties dialog box controls various properties about the scope displays. From the scope menu, select **View > Configuration Properties**.

Main**Open at simulation start — Specify when scope window opens**

off (default for Scope) | on (default for Time Scope)

Select this check box to open the scope window when simulation starts.

Programmatic Use

See `OpenAtSimulationStart`.

Display the full path — Display block path on scope title bar

off (default) | on

Select this check box to display the block path in addition to the block name.

Number of input ports — Number of input ports on scope block

1 (default) | integer

Specify number of input ports on a Scope block, specified as an integer. The maximum number of input ports is 96.

Programmatic Use

See `NumInputPorts`.

Layout — Number and arrangement of displays

1-by-1 display (default) | an arrangement of m-by-n axes

Specify number and arrangement of displays. The maximum layout is 16 rows by 16 columns.

To expand the layout grid beyond 4 by 4, click within the dialog box and drag. Maximum of 16 rows by 16 columns.

If the number of displays is equal to the number of ports, signals from each port appear on separate displays. If the number of displays is less than the number of ports, signals from additional ports appear on the last display. For layouts with multiple columns and rows, ports are mapped down then across.

Programmatic Use

See `LayoutDimensions`.

Sample time — Simulation interval between scope updates

-1 (for inherited) (default) | positive real number

Specify the time interval between updates of the scope display. This property does not apply to floating scopes and scope viewers.

Programmatic Use

See `SampleTime`.

Input processing — Channel or element signal processing

`Elements as channels (sample based)` (default for `Scope`) | `Columns as channels (frame based)` (default for `Time Scope`)

- `Elements as channels (sample based)` - Process each element as a unique sample.
- `Columns as channels (frame based)` - Process signal values in a channel as a group of values from multiple time intervals. Frame-based processing is available only with discrete input signals.

Programmatic Use

See `FrameBasedProcessing`.

Maximize axes — Maximize size of plots

`Off` (default for `Scope`) | `Auto` (default for `Time Scope`) | `On`

- `Auto` - If “`Title`” on page 1-0 and “`Y-label`” on page 1-0 properties are not specified, maximize all plots.
- `On` - Maximize all plots. Values in **Title** and **Y-label** are hidden.
- `Off` - Do not maximize plots.

Programmatic Use

See `MaximizeAxes`.

Time**Time span — Length of x-axis to display**

`Auto` (default) | `User defined` | `One frame period`

- `Auto` — Difference between the simulation start and stop times.

The block calculates the beginning and end times of the time range using the “`Time display offset`” on page 1-0 and “`Time span`” on page 1-0 properties. For example, if you set the **Time display offset** to 10 and the **Time span** to 20, the scope sets the time range from 10 to 30.

- `User defined` — Enter any value less than the total simulation time.
- `One frame period` — Use the frame period of the input signal to the `Time Scope` block. This option is only available when the **Input processing** parameter is set to `Columns as channels (frame based)`.

Programmatic Use

See `TimeSpan`.

Time span overrun action — Display data beyond visible x-axis

Wrap (default) | Scroll

Specify how to display data beyond the visible x-axis range.

You can see the effects of this option only when plotting is slow with large models or small step sizes.

- **Wrap** — Draw a full screen of data from left to right, clear the screen, and then restart drawing the data from the left.
- **Scroll** — Move data to the left as new data is drawn on the right. This mode is graphically intensive and can affect run-time performance.

Programmatic Use

See `TimeSpanOverrunAction`.

Time units — x-axis units

None (default for Scope) | Metric (default for Time Scope) | Seconds

- **Metric** — Display time units based on the length of “Time span” on page 1-0 .
- **Seconds** — Display time in seconds.
- **None** — Do not display time units.

Programmatic Use

See `TimeUnits`.

Time display offset — x-axis offset

0 (default) | scalar | vector

Offset the x-axis by a specified time value, specified as a real number or vector of real numbers.

For input signals with multiple channels, you can enter a scalar or vector:

- **Scalar** — Offset all channels of an input signal by the same time value.
- **Vector** — Independently offset the channels.

Programmatic Use

See `TimeDisplayOffset`.

Time-axis labels — Display of x-axis labels

Bottom Displays Only (default for Scope) | All (default for Time Scope) | None

Specify how x-axis (time) labels display:

- **All** — Display x-axis labels on all y-axes.
- **None** — Do not display labels. Selecting None also clears the **Show time-axis label** check box.
- **Bottom displays only** — Display x-axis label on the bottom y-axis.

Dependencies

To enable this property, set:

- “Show time-axis label” on page 1-0 to on.
- “Maximize axes” on page 1-0 to off.

The “Active display” on page 1-0 property determines which display is affected.

Programmatic Use

See `TimeAxisLabels`.

Show time-axis label — Display or hide x-axis labels

off (default for Scope) | on (default for Time Scope)

Select this check box to show the x-axis label for the active display

Dependencies

To enable this property, set “Time-axis labels” on page 1-0 to **All or Bottom Displays Only**.

The “Active display” on page 1-0 property determines which display is affected.

Programmatic Use

See `ShowTimeAxisLabel`.

Display**Active display — Selected display**

1 (default) | positive integer

Selected display. Use this property to control which display is changed when changing style properties and axes-specific properties.

Specify the desired display using a positive integer that corresponds to the column-wise placement index. For layouts with multiple columns and rows, display numbers are mapped down and then across.

Programmatic Use

See `ActiveDisplay`.

Title — Display name

%<SignalLabel> (default) | string

Title for a display. The default value %<SignalLabel> uses the input signal name for the title.

Dependency

The “Active display” on page 1-0 property determines which display is affected.

Programmatic Use

See `Title`.

Show legend — Display signal legend

off (default) | on

Toggle signal legend. The names listed in the legend are the signal names from the model. For signals with multiple channels, a channel index is appended after the signal name. Continuous signals have straight lines before their names, and discrete signals have step-shaped lines.

From the legend, you can control which signals are visible. This control is equivalent to changing the visibility in the **Style** properties. In the scope legend, click a signal name to hide the signal in the scope. To show the signal, click the signal name again. To show only one signal, right-click the signal name, which hides all other signals. To show all signals, press **Esc**.

Note The legend only shows the first 20 signals. Any additional signals cannot be controlled from the legend.

Dependency

The “Active display” on page 1-0 property determines which display is affected.

Programmatic Use

See ShowLegend.

Show grid — Show internal grid lines

on (default) | off

Select this check box to show grid lines.

Dependency

The “Active display” on page 1-0 property determines which display is affected.

Programmatic Use

See ShowGrid.

Plot signals as magnitude and phase — Split display into magnitude and phase plots

off (default) | on

- On — Display magnitude and phase plots. If the signal is real, plots the absolute value of the signal for the magnitude. The phase is 0 degrees for positive values and 180 degrees for negative values. This feature is useful for complex-valued input signals. If the input is a real-valued signal, selecting this check box returns the absolute value of the signal for the magnitude.
- Off — Display signal plot. If the signal is complex, plots the real and imaginary parts on the same y-axis.

Dependency

The “Active display” on page 1-0 property determines which display is affected.

Programmatic Use

See PlotAsMagnitudePhase.

Y-limits (Minimum) — Minimum y-axis value

-10 (default) | real scalar

Specify the minimum value of the y-axis as a real number.

Tunable: Yes

Dependency

If you select **Plot signals as magnitude and phase**, this property only applies to the magnitude plot. The y-axis limits of the phase plot are always [-180 180].

The “Active display” on page 1-0 property determines which display is affected.

Programmatic Use

See `YLimits`.

Y-limits (Maximum) — Maximum y-axis value

10 (default) | real scalar

Specify the maximum value of the y-axis as a real number.

Tunable: Yes

Dependency

If you select **Plot signals as magnitude and phase**, this property only applies to the magnitude plot. The y-axis limits of the phase plot are always [-180 180].

The “Active display” on page 1-0 property determines which display is affected.

Programmatic Use

See `YLimits`.

Y-label — Y-axis label

none (default for Scope) | Amplitude (default for Time Scope) | string

Specify the text to display on the y-axis. To display signal units, add (`%<SignalUnits>`) to the label. At the beginning of a simulation, Simulink replaces (`%SignalUnits`) with the units associated with the signals.

Example: For a velocity signal with units of m/s, enter `Velocity (%<SignalUnits>)`.

Dependency

If you select **Plot signals as magnitude and phase**, this property does not apply. The y-axes are labeled Magnitude and Phase.

The “Active display” on page 1-0 property determines which display is affected.

Programmatic Use

See `YLabel`.

Logging**Limit data points to last — Limit buffered data values**

off and 5000 (default) | on | positive integer

Limit data saved by the scope internally. By default all data points are saved so that you can view the scope visualization after the simulation finishes. For simulations with **Stop time** set to `inf`, consider selecting **Limit data points to last**.

Note If you do not select **Limit data points to last** and you have a high sample rate or long simulation time, you may run into issues with memory or system performance.

When you select this property, the scope saves the latest n data points, where n the specified number of data points.

- Off — Save and plot all data values.
- On — Save specified number of data values for each signal. If the signal is frame-based, the number of buffered data values is the specified number of data values multiplied by the frame size.

In some cases, selecting this property can have the effect of plotting signals for less than the entire time range of a simulation (for example if your sample time is small). If the scope plots a portion of your signals, consider increasing the number of data points to save.

This property limits the data values plotted in the scope and the data values saved to a MATLAB variable specified in “Variable name” on page 1-0 .

Programmatic Use

See `DataLoggingLimitDataPoints` and `DataLoggingMaxPoints`.

Decimation — Reduce amount of scope data to display and save

off, 2 (default) | on | positive integer

- On — Plot and log (save) scope data every Nth data point, where N is the decimation factor entered in the text box. A value of 1 buffers all data values.
- Off — Save all scope data values.

Dependency

To enable this property, select “Log data to workspace” on page 1-0 .

This property limits the data values plotted in the scope and the data values saved to a MATLAB variable specified in “Variable name” on page 1-0 .

Programmatic Use

See `DataLoggingDecimateData` and `DataLoggingDecimation`.

Log data to workspace — Save data to MATLAB workspace

off (default) | on

Select this check box to enable logging and enable the **Variable name**, **Save format**, and **Decimation** properties. This property does not apply to floating scopes and scope viewers.

For an example of saving signals to the MATLAB Workspace using a Scope block, see “Save Simulation Data Using Scope Block”.

Programmatic Use

See `DataLogging`.

Variable name — Name of saved data variable

`ScopeData` (default) | string

Specify a variable name for saving scope data in the MATLAB workspace. This property does not apply to floating scopes and scope viewers.

Dependency

To enable this property, select “Log data to workspace” on page 1-0 .

Programmatic Use

See `DataLoggingVariableName`.

Save format — MATLAB variable format

Dataset (default) | Structure With Time | Structure | Array

Select variable format for saving data to the MATLAB workspace. This property does not apply to floating scopes and scope viewers.

- **Dataset** — Save data as a dataset object. Use the **Dataset signal format** configuration parameter to select the dataset object. This format does not support variable-size data, MAT-file logging, or external mode archiving. See `Simulink.SimulationData.Dataset`.
- **Structure With Time** — Save data as a structure with associated time information.
- **Structure** — Save data as a structure.
- **Array** — Save data as an array with associated time information. This format does not support variable-size data.

Dependency

To enable this property, select “Log data to workspace” on page 1-0 .

Programmatic Use

See `DataLoggingSaveFormat`.

Axes Scaling Properties

The **Axes Scaling** dialog controls the axes limits of the scope. To open the Axes Scaling properties, in the scope menu, select **Tools > Axes Scaling > Axes Scaling Properties**.

Axes scaling — Y-axis scaling mode

Manual (default) | Auto | After N Updates

- **Manual** — Manually scale the y-axis range with the **Scale Y-axis Limits** toolbar button.
- **Auto** — Scale the y-axis range during and after simulation. Selecting this option displays the **Do not allow Y-axis limits to shrink** check box. If you want the y-axis range to increase and decrease with the maximum value of a signal, set **Axes scaling** to Auto and clear the **Do not allow Y-axis limits to shrink** check box.
- **After N Updates** — Scale y-axis after the number of time steps specified in the **Number of updates** text box (10 by default). Scaling occurs only once during each run.

Programmatic Use

See `AxesScaling`.

Do not allow Y-axis limits to shrink — When y-axis limits can change

on (default) | off

Allow y-axis range limits to increase but not decrease during a simulation.

Dependency

To use this property, set **Axes scaling** to Auto.

Number of updates — Number of updates before scaling

10 (default) | integer

Set this property to delay auto scaling the y-axis.

Dependency

To use this property, set **Axes scaling** to After N Updates.

Programmatic Use

See AxesScalingNumUpdates.

Scale axes limits at stop — When y-axis limits can change

on (default) | off

- On — Scale axes when simulation stops.
- Off — Scale axes continually.

Dependency

To use this property, set **Axes scaling** to Auto.

Y-axis Data range (%) — Percent of y-axis to use for plotting

80 (default) | integer between [1, 100]

Specify the percentage of the y-axis range used for plotting data. If you set this property to 100, the plotted data uses the entire y-axis range.

Y-axis Align — Alignment along y-axis

Center (default) | Top | Bottom

Specify where to align plotted data along the y-axis data range when **Y-axis Data range** is set to less than 100 percent.

- Top — Align signals with the maximum values of the y-axis range.
- Center — Center signals between the minimum and maximum values.
- Bottom — Align signals with the minimum values of the y-axis range.

Autoscale X-axis limits — Scale x-axis range limits

off (default) | on

Scale x-axis range to fit all signal values. If **Axes scaling** is set to Auto, the data currently within the axes is scaled, not the entire signal in the data buffer.

X-axis Data range (%) — Percent of x-axis to use for plotting

100 (default) | integer in the range [1, 100]

Specify the percentage of the x-axis range to plot data on. For example, if you set this property to 100, plotted data uses the entire x-axis range.

X-axis Align — Alignment along x-axis

Center (default) | Top | Bottom

Specify where to align plotted data along the x-axis data range when **X-axis Data range** is set to less than 100 percent.

- **Top** — Align signals with the maximum values of the x-axis range.
- **Center** — Center signals between the minimum and maximum values.
- **Bottom** — Align signals with the minimum values of the x-axis range.

Style Properties

To open the Style dialog box, from the scope menu, select **View > Style**.

Figure color — Background color for window

black (default) | color

Background color for the scope.

Plot type — How to plot signal

Auto (default for Scope) | Line (default for Time Scope) | Stairs | Stem

When you select **Auto**, the plot type is a line graph for continuous signals, a stair-step graph for discrete signals, and a stem graph for Simulink message signals.

Axes colors — Background and axes color for individual displays

black (default) | color

Select the background color for axes (displays) with the first color palette. Select the grid and label color with the second color palette.

Preserve colors for copy to clipboard — Copy scope without changing colors

off (default) | on

Specify whether to use the displayed color of the scope when copying.

When you select **File > Copy to Clipboard**, the software changes the color of the scope to be printer friendly (white background, visible lines). If you want to copy and paste the scope with the colors displayed, select this check box.

Properties for line — Line to change

Channel 1 (default)

Select active line for setting line style properties.

Visible — Line visibility

on (default) | off

Show or hide a signal on the plot.

Dependency

The values of “Active display” on page 1-0 and “Properties for line” on page 1-0 determine which line is affected.

Line – Line style

solid line (default style) | 0.75 (default width) | yellow (default color)

Select line style, width, and color.

Dependency

The values of “Active display” on page 1-0 and “Properties for line” on page 1-0 determine which line is affected.

Marker – Data point marker style

None (default) | marker shape

Select marker shape.

Dependency

The values of “Active display” on page 1-0 and “Properties for line” on page 1-0 determine which line is affected.

Block Characteristics

Data Types	Boolean bus ^a double enumerated fixed point half integer single
Direct Feedthrough	no
Multidimensional Signals	yes
Variable-Size Signals	yes
Zero-Crossing Detection	no

a. Virtual bus not supported. Nonvirtual bus supported only in normal and accelerator mode simulation. Data logging for nonvirtual bus supported only in the dataset format

Extended Capabilities**C/C++ Code Generation**

Generate C and C++ code using Simulink® Coder™.

This block can be used for simulation visibility in systems that generate code, but is not included in the generated code.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

This block can be used for simulation visibility in subsystems that generate HDL code, but is not included in the hardware implementation.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

This block can be used for simulation visibility in systems that generate code, but is not included in the generated code.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

This block accepts fixed-point input, but converts it to `double` for display.

Second-Order Integrator

Second-order integration of input signal

Library: Simulink / Continuous

Description

The Second-Order Integrator block and the Second-Order Integrator Limited block solve the second-order initial value problem:

$$\frac{d^2x}{dt^2} = u,$$

$$\left. \frac{dx}{dt} \right|_{t=0} = dx_0,$$

$$x|_{t=0} = x_0,$$

where u is the input to the system. The block is therefore a dynamic system with two continuous states: x and dx/dt .

Note These two states have a mathematical relationship, namely, that dx/dt is the derivative of x . To satisfy this relationship throughout the simulation, Simulink places various constraints on the block parameters and behavior.

The Second-Order Integrator Limited block is identical to the Second-Order Integrator block with the exception that it defaults to limiting the states based on the specified upper and lower limits. For more information, see “Limiting the States” on page 1-1430.

Simulink software can use several different numerical integration methods to compute the outputs of the block. Each has advantages for specific applications. Use the **Solver** pane of the Configuration Parameters dialog box to select the technique best suited to your application. (For more information, see “Solver Selection Criteria”.) The selected solver computes the states of the Second-Order Integrator block at the current time step using the current input value.

Use the block parameter dialog box to:

- Specify whether the source of each state initial condition is internal or external
- Specify a value for the state initial conditions
- Define upper and lower limits on either or both states
- Specify absolute tolerances for each state
- Specify names for both states
- Choose an external reset condition

- Enable zero-crossing detection
- Reinitialize dx/dt when x reaches saturation
- Specify that Simulink disregard the state limits and external reset for linearization operations

Defining Initial Conditions

You can define the initial conditions of each state individually as a parameter on the block dialog box or input one or both of them from an external signal.

- To define the initial conditions of state x as a block parameter, use the **Initial condition source x** drop-down menu to select `internal` and enter the value in the **Initial condition x** field.
- To provide the initial conditions from an external source for state x , specify the **Initial condition source x** parameter as `external`. An additional input port appears on the block.
- To define the initial conditions of state dx/dt as a block parameter, use the **Initial condition source dx/dt** drop-down menu to select `internal` and enter the value in the **Initial condition dx/dt** field.
- To provide the initial conditions from an external source for state dx/dt , specify **Initial condition source dx/dt** as `external`. An additional input port appears on the block.

If you choose to use an external source for both state initial conditions, your block appears as follows.

Note

- Simulink does not allow initial condition values of `inf` or `NaN`.
- If you limit state x or state dx/dt by specifying saturation limits (see "Limiting the States" on page 1-1430) and one or more initial conditions are outside the corresponding limits, then the respective states are initialized to the closest valid value and a set of consistent initial conditions is calculated.

Limiting the States

When modeling a second-order system, you may need to limit the block states. For example, the motion of a piston within a cylinder is governed by Newton's Second Law and has constraints on the piston position (x). With the Second-Order Integrator block, you can limit the states x and dx/dt independent of each other. You can even change the limits during simulation; however, you cannot change whether or not the states are limited. An important rule to follow is that an upper limit must be strictly greater than its corresponding lower limit.

The block appearance changes when you limit one or both states. With both states limited, the block appears as follows.

For each state, you can use the block parameter dialog box to set appropriate saturation limits.

Limiting x Only

If you use the Second-Order Integrator Limited block, both states are limited by default. But you can also manually limit state x on the Second-Order Integrator block by selecting **Limit x** and entering the limits in the appropriate parameter fields.

The block then determines the values of the states as follows:

- When x is less than or equal to its lower limit, the value of x is held at its lower limit and dx/dt is set to zero.
- When x is in between its lower and upper limits, both states follow the trajectory given by the second-order ODE.
- When x is greater than or equal to its upper limit, the value of x is held at its upper limit and dx/dt is set to zero.

You can choose to reinitialize dx/dt to a new value at the time when x reaches saturation. See “Reinitializing dx/dt When x Reaches Saturation” on page 1-1435.

Limiting dx/dt Only

As with state x , state dx/dt is set as limited by default on the **dx/dt** pane of the Second-Order Integrator Limited block dialog box. You can manually set this parameter, **Limit dx/dt**, on the Second-Order Integrator block. In either case, you must enter the appropriate limits for dx/dt .

Block Parameters: Integrator, Second-Order

Second-Order Integrator

Second-order continuous-time integration of the input signal.

x dx/dt Attributes

Initial condition source dx/dt: internal

Initial condition dx/dt: 0.0

Limit dx/dt

Upper limit dx/dt: inf

Lower limit dx/dt: -inf

Absolute tolerance dx/dt: auto

State name dx/dt:

? OK Cancel Help Apply

If you limit only the state dx/dt , then the block determines the values of dx/dt as follows:

- When dx/dt is less than or equal to its lower limit, the value of dx/dt is held at its lower limit.
- When dx/dt is in between its lower and upper limits, both states follow the trajectory given by the second-order ODE.
- When dx/dt is greater than or equal to its upper limit, the value of dx/dt is held at its upper limit.

When state dx/dt is held at its upper or lower limit, the value of x is governed by the first-order initial value problem:

$$\frac{dx}{dt} = L,$$

$$x(t_L) = x_L,$$

where L is the dx/dt limit (upper or lower), t_L is the time when dx/dt reaches this limit, and x_L is the value of state x at that time.

Limiting Both States

When you limit both states, Simulink maintains mathematical consistency of the states by limiting the allowable values of the upper and lower limits for dx/dt . Such limitations are necessary to satisfy the following constraints:

- When x is at its saturation limits, the value of dx/dt must be zero.
- In order for x to leave the upper limit, the value of dx/dt must be strictly negative.
- In order for x to leave its lower limit, the value of dx/dt must be strictly positive.

For such cases, the upper limit of dx/dt must be strictly positive and the lower limit of dx/dt must be strictly negative.

When both states are limited, the block determines the states as follows:

- Whenever x reaches its limits, the resulting behavior is the same as that described in “Limiting x only”.
- Whenever dx/dt reaches one of its limits, the resulting behavior is the same as that described in “Limiting dx/dt only” — including the computation of x using a first-order ODE when dx/dt is held at one of its limits. In such cases, when x reaches one of its limits, it is held at that limit and dx/dt is set to zero.
- Whenever both reach their respective limits simultaneously, the state x behavior overrides dx/dt behavior to maintain consistency of the states.

When you limit both states, you can choose to reinitialize dx/dt at the time when state x reaches saturation. If the reinitialized value is outside specified limits on dx/dt , then dx/dt is reinitialized to the closest valid value and a consistent set of initial conditions is calculated. See “Reinitializing dx/dt When x Reaches Saturation” on page 1-1435

Resetting the State

The block can reset its states to the specified initial conditions based on an external signal. To cause the block to reset its states, select one of the **External reset** choices on the **Attributes** pane. A trigger port appears on the block below its input port and indicates the trigger type.

- Select **rising** to reset the states when the reset signal rises from zero to a positive value, from a negative to a positive value, or a negative value to zero.
- Select **falling** to reset the states when the reset signal falls from a positive value to zero, from a positive to a negative value, or from zero to negative.
- Select **either** to reset the states when the reset signal changes from zero to a nonzero value or changes sign.

The reset port has direct feedthrough. If the block output feeds back into this port, either directly or through a series of blocks with direct feedthrough, an algebraic loop results (see “Algebraic Loop Concepts”).

Enabling Zero-Crossing Detection

This parameter controls whether zero-crossing detection is enabled for this block. By default, the **Enable zero-crossing detection** parameter is selected on the **Attributes** pane. However, this parameter is only in affect if the **Zero-crossing control**, on the **Solver** pane of the Configuration Parameters dialog box, is set to Use local settings. For more information, see “Zero-Crossing Detection”.

Reinitializing dx/dt When x Reaches Saturation

For certain modeling applications, dx/dt must be reinitialized when state x reaches its limits in order to pull x out of saturation immediately. You can achieve this by selecting **Reinitialize dx/dt when x reaches saturation** on the **Attributes** pane.

If this option is on, then at the instant when x reaches saturation, Simulink checks whether the current value of the dx/dt initial condition (parameter or signal) allows the state x to leave saturation immediately. If so, Simulink reinitializes state dx/dt with the value of the initial condition (parameter or signal) at that instant. If not, Simulink ignores this parameter at the current instant and sets dx/dt to zero to make the block states consistent.

This parameter only applies at the time when x actually reaches saturation limit. It does not apply at any future time when x is being held at saturation.

Refer to the sections on limiting the states for more information. For an example, see “Simulation of a Bouncing Ball” on page 13-6.

Disregarding State Limits and External Reset for Linearization

For cases where you simplify your model by linearizing it, you can have Simulink disregard the limits of the states and the external reset by selecting **Ignore state limits and the reset for linearization**.

Specifying the Absolute Tolerance for the Block Outputs

By default Simulink software uses the absolute tolerance value specified in the Configuration Parameters dialog box (see “Error Tolerances for Variable-Step Solvers”) to compute the output of the integrator blocks. If this value does not provide sufficient error control, specify a more appropriate value for state x in the **Absolute tolerance x** field and for state dx/dt in the **Absolute tolerance dx/dt** field of the parameter dialog box. Simulink uses the values that you specify to compute the state values of the block.

Specifying the Display of the Output Ports

You can control whether to display the x or the dx/dt output port using the ShowOutput parameter. You can display one output port or both; however, you must select at least one.

Specifying the State Names

You can specify the name of x states and dx/dt states using the StateNameX and StateNameDXDT parameters. However, you must specify names for both or neither; you cannot specify names for just x

or just dx/dt . Both state names must have identical type and length. Furthermore, the number of names must evenly divide the number of states.

Selecting All Options

When you select all options, the block icon looks like this.

Ports

Input

u — Input signal u

scalar | vector | matrix

Input signal u to the integrator system, specified as a scalar, vector, or matrix.

Data Types: double

x0 — Initial condition x0

scalar | vector | matrix

External signal specifying the initial condition x_0 to the integrator system. You can specify the initial condition as a scalar, vector, or matrix.

Dependencies

To enable this input port, set the **Initial condition source x** parameter to external.

Data Types: double

dx0 — Initial condition dx0

scalar | vector | matrix

External signal specifying the initial condition dx_0 to the integrator system. You can specify the initial condition dx_0 as a scalar, vector, or matrix.

Dependencies

To enable this input port, set the **Initial condition source dx/dt** parameter to external.

Data Types: double

Output

x — Output signal x

scalar | vector | matrix

x state output signal, provided as a scalar, vector, or matrix.

Data Types: double

dx — Output signal dx

scalar | vector | matrix

dx state output signal, specified as a scalar, vector, or matrix.

Data Types: double

Parameters

x

Initial condition source x — Source of initial condition for state x

internal (default) | external

Specify the source of the initial conditions for state x.

- `internal` — Get the initial conditions of state x from the **Initial condition x** parameter.
- `external` — Get the initial conditions of state x from an external block connected to the X_0 input port.

Limitations

Simulink software does not allow the initial condition of this block to be `inf` or `NaN`.

Dependencies

Selecting `internal` enables the **Initial condition x** parameter and removes the X_0 input port.

Selecting `external` disables the **Initial condition x** parameter and enables the X_0 input port.

Programmatic Use

Block Parameter: `ICSourceX`

Type: character vector, string

Values: `'internal'` | `'external'`

Default: `'internal'`

Initial condition x — Initial condition of state x

0.0 (default) | scalar | vector | matrix

Specify the initial condition of state x.

Limitations

Simulink software does not allow the initial condition of this block to be `inf` or `NaN`.

Dependencies

To enable this parameter, set **Initial condition source x** to `internal`.

Setting **Initial condition source x** to external disables this parameter and enables the X_0 input port.

Programmatic Use**Block Parameter:** ICX**Type:** character vector, string**Values:** scalar | vector | matrix**Default:** '0.0'**Limit x – Limit values of state x**

off | on

Limit state x of the block to a value between the **Lower limit x** and **Upper limit x** parameters. The default value of the Second-Order Integrator block is off. The default value of the Second-Order Integrator Limited is on.

- To limit state x to a value between the **Lower limit x** and **Upper limit x** parameters, select this check box.
- To remove range limitations on state x , clear this check box.

Dependencies

Selecting this check box enables the **Upper limit x** and **Lower limit x** parameters.

Programmatic Use**Block Parameter:** LimitX**Type:** character vector, string**Values:** 'off' | 'on'**Default:** 'off' (Second-Order Integrator) | 'on' (Second-Order Integrator Limited)**Upper limit x – Upper limit of state x**

1 | inf | scalar | vector | matrix

Specify the upper limit of state x . The default value for the Second-Order Integrator block is inf. The default value for the Second-Order Integrator Limited block is 1.

Tips

The upper saturation limit for state x must be strictly greater than the lower saturation limit.

Dependencies

To enable this parameter, select the **Limit x** check box.

Programmatic Use**Block Parameter:** UpperLimitX**Type:** character vector, string**Values:** '1' | 'inf' | scalar | vector | matrix**Default:** '1' (Second-Order Integrator Limited) | 'inf' (Second-Order Integrator)**Lower limit x – Lower limit of state x**

0 (default) | -inf | scalar | vector | matrix

Specify the lower limit of state x . The default value for the Second-Order Integrator block is -inf. The default value for the Second-Order Integrator Limited block is 0.

Tip

The lower saturation limit for state x must be strictly less than the upper saturation limit.

Dependencies

To enable this parameter, select the **Limit x** check box.

Programmatic Use

Block Parameter: LowerLimitX

Type: character vector, string

Values: '0' | '-inf' | scalar | vector | matrix

Default: '0' (Second-Order Integrator Limited) | '-inf' (Second-Order Integrator)

Wrap x — Enable wrapping of x

off (default) | on

Enable wrapping of x between the **Wrapped upper value x** and **Wrapped lower value x** parameters. Enabling wrapping of x eliminates the need for zero-crossing detection, reduces solver resets, improves solver performance and accuracy, and increases simulation time span when modeling rotary and cyclic state trajectories.

If you specify **Wrapped upper value x** as inf and **Wrapped lower value x** as $-\text{inf}$, wrapping will never occur.

Dependencies

Selecting this check box enables **Wrapped upper value x** and **Wrapped lower value x** .

Programmatic Use

Block Parameter: WrapX

Type: character vector, string

Values: 'off' | 'on'

Default: 'off'

Wrapped upper value x — Upper value for wrapping x

π (default) | scalar | vector | matrix

Specify the upper value for wrapping x .

Dependencies

To enable this parameter, select the **Wrap x** check box.

Programmatic Use

Block Parameter: WrappedUpperValueX

Type: character vector, string

Values: scalar | vector | matrix

Default: 'pi'

Wrapped lower value x — Lower value for wrapping x

$-\pi$ (default) | scalar | vector | matrix

Specify the lower value for wrapping x .

Dependencies

To enable this parameter, select the **Wrap x** check box.

Programmatic Use**Block Parameter:** WrappedLowerValueX**Type:** character vector, string**Values:** scalar | vector | matrix**Default:** '-pi'**Absolute tolerance x — Absolute tolerance for computing state x**

auto (default) | -1 | scalar | vector

Specify the absolute tolerance for computing state x .

- You can enter `auto`, `-1`, a positive real scalar or vector.
- If you enter `auto` or `-1`, Simulink uses the absolute tolerance value in the Configuration Parameters dialog box (see “Solver Pane”) to compute state x .
- If you enter a real scalar value, that value overrides the absolute tolerance in the Configuration Parameters dialog box and is used for computing all x states.
- If you enter a real vector, the dimension of that vector must match the dimension of state x . These values override the absolute tolerance in the Configuration Parameters dialog box.

Programmatic Use**Block Parameter:** AbsoluteToleranceX**Type:** character vector, string**Values:** 'auto' | '-1' | any positive real scalar or vector**Default:** 'auto'**State name x — Name for state x**

' ' (default) | character vector | string

Assign a unique name to state x .

Tips

- To assign a name to a single state, enter the name between quotes, for example, `position'`.
- To assign names to multiple x states, enter a comma-delimited list surrounded by braces, for example, `{'a', 'b', 'c'}`. Each name must be unique.
- The state names apply only to the selected block.
- If you specify a state name for x , you must also specify a state name for dx/dt .
- State names for x and dx/dt must have identical types and lengths.
- The number of states must be evenly divided by the number of state names. You can specify fewer names than x states, but you cannot specify more names than x states. For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states. However, you must be consistent and apply the same scheme to the state names for dx/dt .
- To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, string or a cell array.

Programmatic Use**Block Parameter:** StateNameX**Type:** character vector, string**Values:** ' ' | user-defined**Default:** ' '

dx/dt**Initial condition source dx/dt — Source of initial condition for state dx/dt**

internal (default) | external

Specify the source of initial conditions for state dx/dt as internal or external.

Limitations

Simulink software does not allow the initial condition of this block to be inf or NaN.

Dependencies

- Selecting internal enables the **Initial condition dx/dt** parameter and removes the dx_0 input port.
- Selecting external disables the **Initial condition dx/dt** parameter and enables the dx_0 input port.

Programmatic Use

Block Parameter: ICSourceDXDT

Type: character vector

Values: 'internal' | 'external'

Default: 'internal'

Initial condition dx/dt — Initial condition of state dx/dt

0.0 (default) | scalar | vector | matrix

Specify the initial condition of state dx/dt .

Limitations

Simulink software does not allow the initial condition of this block to be inf or NaN.

Dependencies

- Setting **Initial condition source dx/dt** to internal enables this parameter.
- Setting **Initial condition source dx/dt** to external disables this parameter.

Programmatic Use

Block Parameter: ICDXDT

Type: character vector

Values: scalar | vector | matrix

Default: '0.0'

Limit dx/dt — Limit values of state dx/dt

off | on

Limit the dx/dt state of the block to a value between the **Lower limit dx/dt** and **Upper limit dx/dt** parameters. The default value of the Second-Order Integrator block is off. The default value of the Second-Order Integrator Limited is on.

Tip

If you set saturation limits for x , then the interval defined by the **Upper limit dx/dt** and **Lower limit dx/dt** must contain zero.

Dependencies

Selecting this check box enables the **Upper limit dx/dt** and **Lower limit dx/dt** parameters.

Programmatic Use

Parameter: LimitDXDT

Type: character vector

Values: 'off' | 'on'

Default: 'off' (Second-Order Integrator) | 'on' (Second-Order Integrator Limited)

Upper limit dx/dt — Upper limit of state dx/dt

inf (default) | scalar | vector | matrix

Specify the upper limit for state dx/dt .

Dependencies

If you limit x , then this parameter must have a strictly positive value.

To enable this parameter, select the **Limit dx/dt** check box.

Programmatic Use

Block Parameter: UpperLimitDXDT

Type: character vector

Values: scalar | vector | matrix

Default: 'inf'

Lower limit dx/dt — Lower limit of state dx/dt

-inf (default) | scalar | vector | matrix

Specify the lower limit for state dx/dt .

Dependencies

If you limit x , then this parameter must have a strictly negative value.

To enable this parameter, select the **Limit dx/dt** check box.

Programmatic Use

Block Parameter: LowerLimitDXDT

Type: character vector

Values: scalar | vector | matrix

Default: '-inf'

Absolute tolerance dx/dt — Absolute tolerance for computing state dx/dt

auto (default) | -1 | scalar | vector

Specify the absolute tolerance for computing state dx/dt .

- You can enter `auto`, `-1`, a positive real scalar or vector.
- If you enter `auto` or `-1`, then Simulink uses the absolute tolerance value in the Configuration Parameters dialog box (see “Solver Pane”) to compute the dx/dt output of the block.
- If you enter a numeric value, that value overrides the absolute tolerance in the Configuration Parameters dialog box.

Programmatic Use**Block Parameter:** AbsoluteToleranceDXDT**Type:** character vector, string, scalar, or vector**Values:** 'auto' | '-1' | any positive real scalar or vector**Default:** 'auto'**State name dx/dt — Name for state dx/dt**

' ' (default) | character vector | string

Assign a unique name to state dx/dt .**Tips**

- To assign a name to a single state, enter the name between quotes, for example, 'velocity'.
- To assign names to multiple dx/dt states, enter a comma-delimited list surrounded by braces, for example, {'a', 'b', 'c'}. Each name must be unique.
- The state names apply only to the selected block.
- If you specify a state name for dx/dt , you must also specify a state name for x .
- State names for x and dx/dt must have identical types and lengths.
- The number of states must be evenly divided by the number of state names. You can specify fewer names than dx/dt states, but you cannot specify more names than dx/dt states. For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states. However, you must be consistent and apply the same scheme to the state names for x .
- To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, string, or a cell array.

Programmatic Use**Block Parameter:** StateNameDXDT**Type:** character vector, string**Values:** ' ' | user-defined**Default:** ' '**Attributes****External reset — Reset states to their initial conditions**

none (default) | rising | falling | either

Reset the states to their initial conditions when a trigger event occurs in the reset signal.

- **none** — Do not reset the state to initial conditions.
- **rising** — Reset the state when the reset signal rises from a zero to a positive value or from a negative to a positive value.
- **falling** — Reset the state when the reset signal falls from a positive value to zero or from a positive to a negative value.
- **either** — Reset the state when the reset signal changes from zero to a nonzero value or changes sign.

Programmatic Use**Block Parameter:** ExternalReset**Type:** character vector, string

Values: 'none' | 'rising' | 'falling' | 'either'
Default: 'none'

Enable zero-crossing detection — Enable zero-crossing detection

on (default) | off

Select to enable zero-crossing detection. For more information, see “Zero-Crossing Detection”.

Programmatic Use

Parameter: ZeroCross

Type: character vector, string

Values: 'on' | 'off'

Default: 'on'

Reinitialize dx/dt when x reaches saturation — Reset dx/dt when x reaches saturation

off (default) | on

At the instant when state x reaches saturation, reset dx/dt to its current initial conditions.

Tip

The dx/dt initial condition must have a value that enables x to leave saturation immediately. Otherwise, Simulink ignores the initial conditions for dx/dt to preserve mathematical consistency of block states.

Programmatic Use

Block Parameter: ReinitDXDTwhenXreachesSaturation

Type: character vector, string

Values: 'off' | 'on'

Default: 'off'

Ignore state limits and the reset for linearization — Ignore state limits and external reset for linearization

off (default) | on

For linearization purposes, have Simulink ignore the specified state limits and the external reset.

Programmatic Use

Block Parameter: IgnoreStateLimitsAndResetForLinearization

Type: character vector, string

Values: 'off' | 'on'

Default: 'off'

Show output — Output ports to display

both (default) | x | dxdt

Specify the output ports on the block.

- both — Show both x and dx/dt output ports.
- x — Show only the x output port.
- dx/dt — Show only the dx/dt output port.

Programmatic Use

Block Parameter: ShowOutput

Type: character vector, string
Values: 'both' | 'x' | 'dxdt'
Default: 'both'

Block Characteristics

Data Types	double
Direct Feedthrough	yes
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	yes

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production-quality code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. The code generated can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code.

In general, consider using the Simulink Model Discretizer to map continuous blocks into discrete equivalents that support production code generation. To start the Model Discretizer, in the Simulink Editor, on the **Apps** tab, under **Apps**, under **Control Systems**, click **Model Discretizer**. One exception is the Second-Order Integrator block because, for this block, the Model Discretizer produces an approximate discretization.

Second-Order Integrator Limited

Second-order integration of input signal

Library: Simulink / Continuous

Description

The Second-Order Integrator block and the Second-Order Integrator Limited block solve the second-order initial value problem:

$$\begin{aligned}\frac{d^2x}{dt^2} &= u, \\ \frac{dx}{dt} \Big|_{t=0} &= dx_0, \\ x \Big|_{t=0} &= x_0,\end{aligned}$$

where u is the input to the system. The block is therefore a dynamic system with two continuous states: x and dx/dt .

Note These two states have a mathematical relationship, namely, that dx/dt is the derivative of x . To satisfy this relationship throughout the simulation, Simulink places various constraints on the block parameters and behavior.

The Second-Order Integrator Limited block is identical to the Second-Order Integrator block with the exception that it defaults to limiting the states based on the specified upper and lower limits. For more information, see “Limiting the States” on page 1-1447.

Simulink software can use several different numerical integration methods to compute the outputs of the block. Each has advantages for specific applications. Use the **Solver** pane of the Configuration Parameters dialog box to select the technique best suited to your application. (For more information, see “Solver Selection Criteria”.) The selected solver computes the states of the Second-Order Integrator block at the current time step using the current input value.

Use the block parameter dialog box to:

- Specify whether the source of each state initial condition is internal or external
- Specify a value for the state initial conditions
- Define upper and lower limits on either or both states
- Specify absolute tolerances for each state
- Specify names for both states
- Choose an external reset condition

- Enable zero-crossing detection
- Reinitialize dx/dt when x reaches saturation
- Specify that Simulink disregard the state limits and external reset for linearization operations

Defining Initial Conditions

You can define the initial conditions of each state individually as a parameter on the block dialog box or input one or both of them from an external signal.

- To define the initial conditions of state x as a block parameter, use the **Initial condition source x** drop-down menu to select `internal` and enter the value in the **Initial condition x** field.
- To provide the initial conditions from an external source for state x , specify the **Initial condition source x** parameter as `external`. An additional input port appears on the block.
- To define the initial conditions of state dx/dt as a block parameter, use the **Initial condition source dx/dt** drop-down menu to select `internal` and enter the value in the **Initial condition dx/dt** field.
- To provide the initial conditions from an external source for state dx/dt , specify **Initial condition source dx/dt** as `external`. An additional input port appears on the block.

If you choose to use an external source for both state initial conditions, your block appears as follows.

Note

- Simulink does not allow initial condition values of `inf` or `NaN`.
- If you limit state x or state dx/dt by specifying saturation limits (see "Limiting the States" on page 1-1447) and one or more initial conditions are outside the corresponding limits, then the respective states are initialized to the closest valid value and a set of consistent initial conditions is calculated.

Limiting the States

When modeling a second-order system, you may need to limit the block states. For example, the motion of a piston within a cylinder is governed by Newton's Second Law and has constraints on the piston position (x). With the Second-Order Integrator block, you can limit the states x and dx/dt independent of each other. You can even change the limits during simulation; however, you cannot change whether or not the states are limited. An important rule to follow is that an upper limit must be strictly greater than its corresponding lower limit.

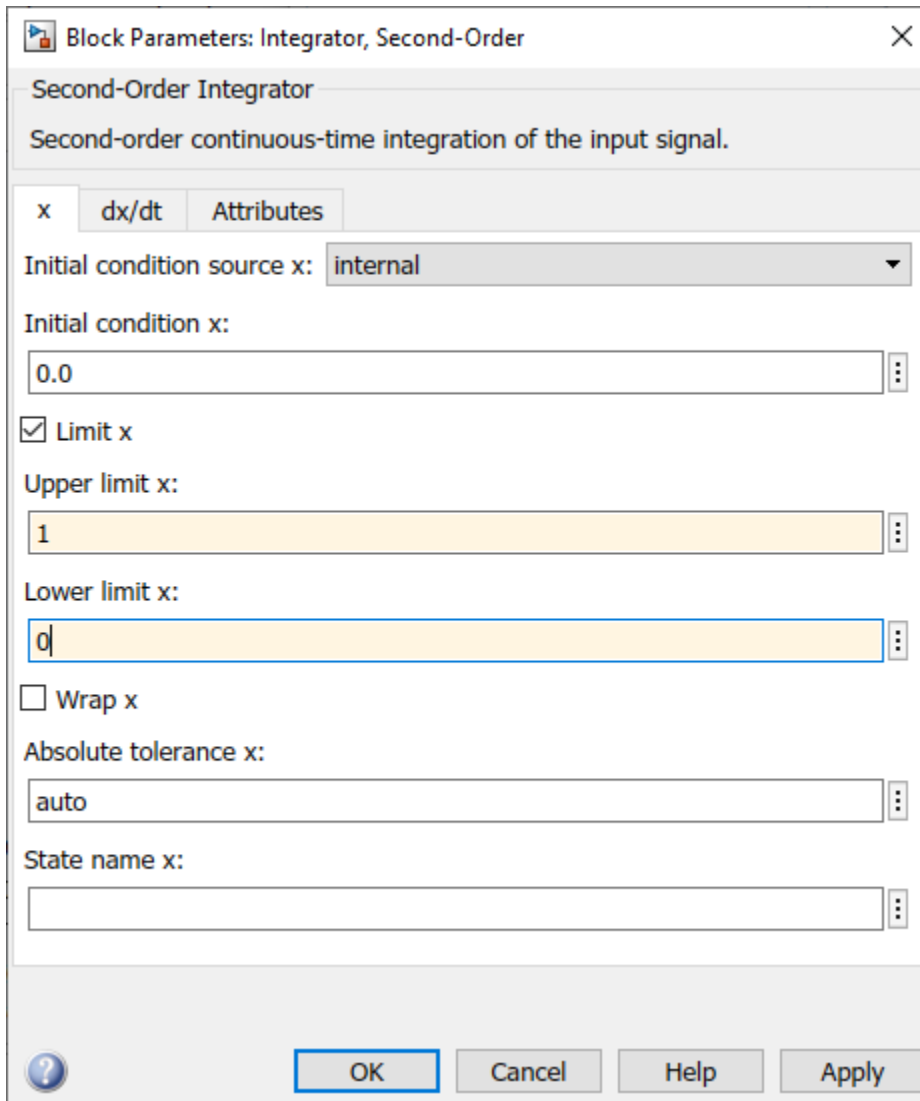

The block appearance changes when you limit one or both states. With both states limited, the block appears as follows.

For each state, you can use the block parameter dialog box to set appropriate saturation limits.

Limiting x Only

If you use the Second-Order Integrator Limited block, both states are limited by default. But you can also manually limit state x on the Second-Order Integrator block by selecting **Limit x** and entering the limits in the appropriate parameter fields.

The block then determines the values of the states as follows:

- When x is less than or equal to its lower limit, the value of x is held at its lower limit and dx/dt is set to zero.
- When x is in between its lower and upper limits, both states follow the trajectory given by the second-order ODE.
- When x is greater than or equal to its upper limit, the value of x is held at its upper limit and dx/dt is set to zero.

You can choose to reinitialize dx/dt to a new value at the time when x reaches saturation. See “Reinitializing dx/dt When x Reaches Saturation” on page 1-1452.

Limiting dx/dt Only

As with state x , state dx/dt is set as limited by default on the **dx/dt** pane of the Second-Order Integrator Limited block dialog box. You can manually set this parameter, **Limit dx/dt**, on the Second-Order Integrator block. In either case, you must enter the appropriate limits for dx/dt .

If you limit only the state dx/dt , then the block determines the values of dx/dt as follows:

- When dx/dt is less than or equal to its lower limit, the value of dx/dt is held at its lower limit.
- When dx/dt is in between its lower and upper limits, both states follow the trajectory given by the second-order ODE.
- When dx/dt is greater than or equal to its upper limit, the value of dx/dt is held at its upper limit.

When state dx/dt is held at its upper or lower limit, the value of x is governed by the first-order initial value problem:

$$\begin{aligned}\frac{dx}{dt} &= L, \\ x(t_L) &= x_L,\end{aligned}$$

where L is the dx/dt limit (upper or lower), t_L is the time when dx/dt reaches this limit, and x_L is the value of state x at that time.

Limiting Both States

When you limit both states, Simulink maintains mathematical consistency of the states by limiting the allowable values of the upper and lower limits for dx/dt . Such limitations are necessary to satisfy the following constraints:

- When x is at its saturation limits, the value of dx/dt must be zero.
- In order for x to leave the upper limit, the value of dx/dt must be strictly negative.
- In order for x to leave its lower limit, the value of dx/dt must be strictly positive.

For such cases, the upper limit of dx/dt must be strictly positive and the lower limit of dx/dt must be strictly negative.

When both states are limited, the block determines the states as follows:

- Whenever x reaches its limits, the resulting behavior is the same as that described in “Limiting x only”.
- Whenever dx/dt reaches one of its limits, the resulting behavior is the same as that described in “Limiting dx/dt only” — including the computation of x using a first-order ODE when dx/dt is held at one of its limits. In such cases, when x reaches one of its limits, it is held at that limit and dx/dt is set to zero.
- Whenever both reach their respective limits simultaneously, the state x behavior overrides dx/dt behavior to maintain consistency of the states.

When you limit both states, you can choose to reinitialize dx/dt at the time when state x reaches saturation. If the reinitialized value is outside specified limits on dx/dt , then dx/dt is reinitialized to the closest valid value and a consistent set of initial conditions is calculated. See “Reinitializing dx/dt When x Reaches Saturation” on page 1-1452

Resetting the State

The block can reset its states to the specified initial conditions based on an external signal. To cause the block to reset its states, select one of the **External reset** choices on the **Attributes** pane. A trigger port appears on the block below its input port and indicates the trigger type.

- Select **rising** to reset the states when the reset signal rises from zero to a positive value, from a negative to a positive value, or a negative value to zero.
- Select **falling** to reset the states when the reset signal falls from a positive value to zero, from a positive to a negative value, or from zero to negative.
- Select **either** to reset the states when the reset signal changes from zero to a nonzero value or changes sign.

The reset port has direct feedthrough. If the block output feeds back into this port, either directly or through a series of blocks with direct feedthrough, an algebraic loop results (see “Algebraic Loop Concepts”).

Enabling Zero-Crossing Detection

This parameter controls whether zero-crossing detection is enabled for this block. By default, the **Enable zero-crossing detection** parameter is selected on the **Attributes** pane. However, this parameter is only in affect if the **Zero-crossing control**, on the **Solver** pane of the Configuration Parameters dialog box, is set to Use local settings. For more information, see “Zero-Crossing Detection”.

Reinitializing dx/dt When x Reaches Saturation

For certain modeling applications, dx/dt must be reinitialized when state x reaches its limits in order to pull x out of saturation immediately. You can achieve this by selecting **Reinitialize dx/dt when x reaches saturation** on the **Attributes** pane.

If this option is on, then at the instant when x reaches saturation, Simulink checks whether the current value of the dx/dt initial condition (parameter or signal) allows the state x to leave saturation immediately. If so, Simulink reinitializes state dx/dt with the value of the initial condition (parameter or signal) at that instant. If not, Simulink ignores this parameter at the current instant and sets dx/dt to zero to make the block states consistent.

This parameter only applies at the time when x actually reaches saturation limit. It does not apply at any future time when x is being held at saturation.

Refer to the sections on limiting the states for more information. For an example, see “Simulation of a Bouncing Ball” on page 13-6.

Disregarding State Limits and External Reset for Linearization

For cases where you simplify your model by linearizing it, you can have Simulink disregard the limits of the states and the external reset by selecting **Ignore state limits and the reset for linearization**.

Specifying the Absolute Tolerance for the Block Outputs

By default Simulink software uses the absolute tolerance value specified in the Configuration Parameters dialog box (see “Error Tolerances for Variable-Step Solvers”) to compute the output of the integrator blocks. If this value does not provide sufficient error control, specify a more appropriate value for state x in the **Absolute tolerance x** field and for state dx/dt in the **Absolute tolerance dx/dt** field of the parameter dialog box. Simulink uses the values that you specify to compute the state values of the block.

Specifying the Display of the Output Ports

You can control whether to display the x or the dx/dt output port using the ShowOutput parameter. You can display one output port or both; however, you must select at least one.

Specifying the State Names

You can specify the name of x states and dx/dt states using the StateNameX and StateNameDXDT parameters. However, you must specify names for both or neither; you cannot specify names for just x

or just dx/dt . Both state names must have identical type and length. Furthermore, the number of names must evenly divide the number of states.

Selecting All Options

When you select all options, the block icon looks like this.

Ports

Input

u — Input signal u

scalar | vector | matrix

Input signal u to the integrator system, specified as a scalar, vector, or matrix.

Data Types: double

x0 — Initial condition x0

scalar | vector | matrix

External signal specifying the initial condition x_0 to the integrator system. You can specify the initial condition as a scalar, vector, or matrix.

Dependencies

To enable this input port, set the **Initial condition source x** parameter to external.

Data Types: double

dx0 — Initial condition dx0

scalar | vector | matrix

External signal specifying the initial condition dx_0 to the integrator system. You can specify the initial condition dx_0 as a scalar, vector, or matrix.

Dependencies

To enable this input port, set the **Initial condition source dx/dt** parameter to external.

Data Types: double

Output

x — Output signal x

scalar | vector | matrix

x state output signal, provided as a scalar, vector, or matrix.

Data Types: double

dx — Output signal dx

scalar | vector | matrix

dx state output signal, specified as a scalar, vector, or matrix.

Data Types: double

Parameters

x

Initial condition source x — Source of initial condition for state x

internal (default) | external

Specify the source of the initial conditions for state x.

- `internal` — Get the initial conditions of state x from the **Initial condition x** parameter.
- `external` — Get the initial conditions of state x from an external block connected to the **X₀** input port.

Limitations

Simulink software does not allow the initial condition of this block to be `inf` or `NaN`.

Dependencies

Selecting `internal` enables the **Initial condition x** parameter and removes the **X₀** input port.

Selecting `external` disables the **Initial condition x** parameter and enables the **X₀** input port.

Programmatic Use

Block Parameter: `ICSourceX`

Type: character vector, string

Values: `'internal'` | `'external'`

Default: `'internal'`

Initial condition x — Initial condition of state x

0.0 (default) | scalar | vector | matrix

Specify the initial condition of state x.

Limitations

Simulink software does not allow the initial condition of this block to be `inf` or `NaN`.

Dependencies

To enable this parameter, set **Initial condition source x** to `internal`.

Setting **Initial condition source x** to external disables this parameter and enables the X_0 input port.

Programmatic Use

Block Parameter: ICX

Type: character vector, string

Values: scalar | vector | matrix

Default: '0.0'

Limit x – Limit values of state x

off | on

Limit state x of the block to a value between the **Lower limit x** and **Upper limit x** parameters. The default value of the Second-Order Integrator block is off. The default value of the Second-Order Integrator Limited is on.

- To limit state x to a value between the **Lower limit x** and **Upper limit x** parameters, select this check box.
- To remove range limitations on state x , clear this check box.

Dependencies

Selecting this check box enables the **Upper limit x** and **Lower limit x** parameters.

Programmatic Use

Block Parameter: LimitX

Type: character vector, string

Values: 'off' | 'on'

Default: 'off' (Second-Order Integrator) | 'on' (Second-Order Integrator Limited)

Upper limit x – Upper limit of state x

1 | inf | scalar | vector | matrix

Specify the upper limit of state x . The default value for the Second-Order Integrator block is inf. The default value for the Second-Order Integrator Limited block is 1.

Tips

The upper saturation limit for state x must be strictly greater than the lower saturation limit.

Dependencies

To enable this parameter, select the **Limit x** check box.

Programmatic Use

Block Parameter: UpperLimitX

Type: character vector, string

Values: '1' | 'inf' | scalar | vector | matrix

Default: '1' (Second-Order Integrator Limited) | 'inf' (Second-Order Integrator)

Lower limit x – Lower limit of state x

0 (default) | -inf | scalar | vector | matrix

Specify the lower limit of state x . The default value for the Second-Order Integrator block is -inf. The default value for the Second-Order Integrator Limited block is 0.

Tip

The lower saturation limit for state x must be strictly less than the upper saturation limit.

Dependencies

To enable this parameter, select the **Limit x** check box.

Programmatic Use

Block Parameter: LowerLimitX

Type: character vector, string

Values: '0' | '-inf' | scalar | vector | matrix

Default: '0' (Second-Order Integrator Limited) | '-inf' (Second-Order Integrator)

Wrap x — Enable wrapping of x

off (default) | on

Enable wrapping of x between the **Wrapped upper value x** and **Wrapped lower value x** parameters. Enabling wrapping of x eliminates the need for zero-crossing detection, reduces solver resets, improves solver performance and accuracy, and increases simulation time span when modeling rotary and cyclic state trajectories.

If you specify **Wrapped upper value x** as `inf` and **Wrapped lower value x** as `-inf`, wrapping will never occur.

Dependencies

Selecting this check box enables **Wrapped upper value x** and **Wrapped lower value x** .

Programmatic Use

Block Parameter: WrapX

Type: character vector, string

Values: 'off' | 'on'

Default: 'off'

Wrapped upper value x — Upper value for wrapping x

π (default) | scalar | vector | matrix

Specify the upper value for wrapping x .

Dependencies

To enable this parameter, select the **Wrap x** check box.

Programmatic Use

Block Parameter: WrappedUpperValueX

Type: character vector, string

Values: scalar | vector | matrix

Default: 'pi'

Wrapped lower value x — Lower value for wrapping x

$-\pi$ (default) | scalar | vector | matrix

Specify the lower value for wrapping x .

Dependencies

To enable this parameter, select the **Wrap x** check box.

Programmatic Use**Block Parameter:** WrappedLowerValueX**Type:** character vector, string**Values:** scalar | vector | matrix**Default:** '-pi'**Absolute tolerance x — Absolute tolerance for computing state x**

auto (default) | -1 | scalar | vector

Specify the absolute tolerance for computing state x .

- You can enter `auto`, `-1`, a positive real scalar or vector.
- If you enter `auto` or `-1`, Simulink uses the absolute tolerance value in the Configuration Parameters dialog box (see “Solver Pane”) to compute state x .
- If you enter a real scalar value, that value overrides the absolute tolerance in the Configuration Parameters dialog box and is used for computing all x states.
- If you enter a real vector, the dimension of that vector must match the dimension of state x . These values override the absolute tolerance in the Configuration Parameters dialog box.

Programmatic Use**Block Parameter:** AbsoluteToleranceX**Type:** character vector, string**Values:** 'auto' | '-1' | any positive real scalar or vector**Default:** 'auto'**State name x — Name for state x**

' ' (default) | character vector | string

Assign a unique name to state x .**Tips**

- To assign a name to a single state, enter the name between quotes, for example, `position'`.
- To assign names to multiple x states, enter a comma-delimited list surrounded by braces, for example, `{'a', 'b', 'c'}`. Each name must be unique.
- The state names apply only to the selected block.
- If you specify a state name for x , you must also specify a state name for dx/dt .
- State names for x and dx/dt must have identical types and lengths.
- The number of states must be evenly divided by the number of state names. You can specify fewer names than x states, but you cannot specify more names than x states. For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states. However, you must be consistent and apply the same scheme to the state names for dx/dt .
- To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, string or a cell array.

Programmatic Use**Block Parameter:** StateNameX**Type:** character vector, string**Values:** ' ' | user-defined**Default:** ' '

dx/dt**Initial condition source dx/dt — Source of initial condition for state dx/dt** `internal` (default) | `external`

Specify the source of initial conditions for state dx/dt as `internal` or `external`.

Limitations

Simulink software does not allow the initial condition of this block to be `inf` or `NaN`.

Dependencies

- Selecting `internal` enables the **Initial condition dx/dt** parameter and removes the **dx₀** input port.
- Selecting `external` disables the **Initial condition dx/dt** parameter and enables the **dx₀** input port.

Programmatic Use**Block Parameter:** `ICSourceDXDT`**Type:** character vector**Values:** `'internal'` | `'external'`**Default:** `'internal'`**Initial condition dx/dt — Initial condition of state dx/dt** `0.0` (default) | `scalar` | `vector` | `matrix`

Specify the initial condition of state dx/dt .

Limitations

Simulink software does not allow the initial condition of this block to be `inf` or `NaN`.

Dependencies

- Setting **Initial condition source dx/dt** to `internal` enables this parameter.
- Setting **Initial condition source dx/dt** to `external` disables this parameter.

Programmatic Use**Block Parameter:** `ICDXDT`**Type:** character vector**Values:** `scalar` | `vector` | `matrix`**Default:** `'0.0'`**Limit dx/dt — Limit values of state dx/dt** `off` | `on`

Limit the dx/dt state of the block to a value between the **Lower limit dx/dt** and **Upper limit dx/dt** parameters. The default value of the Second-Order Integrator block is `off`. The default value of the Second-Order Integrator Limited is `on`.

Tip

If you set saturation limits for x , then the interval defined by the **Upper limit dx/dt** and **Lower limit dx/dt** must contain zero.

Dependencies

Selecting this check box enables the **Upper limit dx/dt** and **Lower limit dx/dt** parameters.

Programmatic Use

Parameter: LimitDXDT

Type: character vector

Values: 'off' | 'on'

Default: 'off' (Second-Order Integrator) | 'on' (Second-Order Integrator Limited)

Upper limit dx/dt — Upper limit of state dx/dt

inf (default) | scalar | vector | matrix

Specify the upper limit for state dx/dt .

Dependencies

If you limit x , then this parameter must have a strictly positive value.

To enable this parameter, select the **Limit dx/dt** check box.

Programmatic Use

Block Parameter: UpperLimitDXDT

Type: character vector

Values: scalar | vector | matrix

Default: 'inf'

Lower limit dx/dt — Lower limit of state dx/dt

-inf (default) | scalar | vector | matrix

Specify the lower limit for state dx/dt .

Dependencies

If you limit x , then this parameter must have a strictly negative value.

To enable this parameter, select the **Limit dx/dt** check box.

Programmatic Use

Block Parameter: LowerLimitDXDT

Type: character vector

Values: scalar | vector | matrix

Default: '-inf'

Absolute tolerance dx/dt — Absolute tolerance for computing state dx/dt

auto (default) | -1 | scalar | vector

Specify the absolute tolerance for computing state dx/dt .

- You can enter `auto`, `-1`, a positive real scalar or vector.
- If you enter `auto` or `-1`, then Simulink uses the absolute tolerance value in the Configuration Parameters dialog box (see “Solver Pane”) to compute the dx/dt output of the block.
- If you enter a numeric value, that value overrides the absolute tolerance in the Configuration Parameters dialog box.

Programmatic Use**Block Parameter:** AbsoluteToleranceDXDT**Type:** character vector, string, scalar, or vector**Values:** 'auto' | '-1' | any positive real scalar or vector**Default:** 'auto'**State name dx/dt — Name for state dx/dt**

' ' (default) | character vector | string

Assign a unique name to state dx/dt .**Tips**

- To assign a name to a single state, enter the name between quotes, for example, 'velocity'.
- To assign names to multiple dx/dt states, enter a comma-delimited list surrounded by braces, for example, {'a', 'b', 'c'}. Each name must be unique.
- The state names apply only to the selected block.
- If you specify a state name for dx/dt , you must also specify a state name for x .
- State names for x and dx/dt must have identical types and lengths.
- The number of states must be evenly divided by the number of state names. You can specify fewer names than dx/dt states, but you cannot specify more names than dx/dt states. For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states. However, you must be consistent and apply the same scheme to the state names for x .
- To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, string, or a cell array.

Programmatic Use**Block Parameter:** StateNameDXDT**Type:** character vector, string**Values:** ' ' | user-defined**Default:** ' '**Attributes****External reset — Reset states to their initial conditions**

none (default) | rising | falling | either

Reset the states to their initial conditions when a trigger event occurs in the reset signal.

- **none** — Do not reset the state to initial conditions.
- **rising** — Reset the state when the reset signal rises from a zero to a positive value or from a negative to a positive value.
- **falling** — Reset the state when the reset signal falls from a positive value to zero or from a positive to a negative value.
- **either** — Reset the state when the reset signal changes from zero to a nonzero value or changes sign.

Programmatic Use**Block Parameter:** ExternalReset**Type:** character vector, string

Values: 'none' | 'rising' | 'falling' | 'either'
Default: 'none'

Enable zero-crossing detection — Enable zero-crossing detection

on (default) | off

Select to enable zero-crossing detection. For more information, see “Zero-Crossing Detection”.

Programmatic Use

Parameter: ZeroCross

Type: character vector, string

Values: 'on' | 'off'

Default: 'on'

Reinitialize dx/dt when x reaches saturation — Reset dx/dt when x reaches saturation

off (default) | on

At the instant when state x reaches saturation, reset dx/dt to its current initial conditions.

Tip

The dx/dt initial condition must have a value that enables x to leave saturation immediately. Otherwise, Simulink ignores the initial conditions for dx/dt to preserve mathematical consistency of block states.

Programmatic Use

Block Parameter: ReinitDXDTwhenXreachesSaturation

Type: character vector, string

Values: 'off' | 'on'

Default: 'off'

Ignore state limits and the reset for linearization — Ignore state limits and external reset for linearization

off (default) | on

For linearization purposes, have Simulink ignore the specified state limits and the external reset.

Programmatic Use

Block Parameter: IgnoreStateLimitsAndResetForLinearization

Type: character vector, string

Values: 'off' | 'on'

Default: 'off'

Show output — Output ports to display

both (default) | x | dxdt

Specify the output ports on the block.

- both — Show both x and dx/dt output ports.
- x — Show only the x output port.
- dx/dt — Show only the dx/dt output port.

Programmatic Use

Block Parameter: ShowOutput

Type: character vector, string
Values: 'both' | 'x' | 'dxdt'
Default: 'both'

Block Characteristics

Data Types	double
Multidimensional Signals	No
Variable-Size Signals	No

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production-quality code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. The code generated can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code.

In general, consider using the Simulink Model Discretizer to map continuous blocks into discrete equivalents that support production code generation. To start the Model Discretizer, in the Simulink Editor, on the **Apps** tab, under **Apps**, under **Control Systems**, click **Model Discretizer**. One exception is the Second-Order Integrator block because, for this block, the Model Discretizer produces an approximate discretization.

Selector

Select input elements from vector, matrix, or multidimensional signal

Library: Simulink / Signal Routing
HDL Coder / Signal Routing

Description

The Selector block generates as output selected or reordered elements of an input vector, matrix, or multidimensional signal.

Based on the value you enter for the **Number of input dimensions** parameter, a table of indexing settings is displayed. Each row of the table corresponds to one of the input dimensions in **Number of input dimensions**. For each dimension, you define the elements of the signal to work with. Specify a vector signal as a 1-D signal and a matrix signal as a 2-D signal. When you configure the Selector block for multidimensional signal operations, the block icon changes.

For example, assume a 6-D signal with a one-based index mode. The table of the Selector block dialog changes to include one row for each dimension. If you define dimensions as shown in the next table, the output is $Y = U(1:\text{end}, 2:6, [1\ 3\ 5], \text{Idx}4:\text{Idx}4+7, \text{Idx}5, \text{Idx}6(1):\text{Idx}6(2))$, where $\text{Idx}4$, $\text{Idx}5$, and $\text{Idx}6$ are the index ports for dimensions 4, 5, and 6.

Row	Index Option	Index	Output Size
1	Select all		
2	Starting index (dialog)	2	5
3	Index vector (dialog)	[1 3 5]	
4	Starting index (port)		8
5	Index vector (port)		
6	Starting and ending indices (port)		

You can use an array of buses as an input signal to a Selector block. For details about defining and using an array of buses, see “Group Nonvirtual Buses in Arrays of Buses”.

Ports

Input

Port_1 — Input signal

scalar | vector | matrix | multidimensional

Input signal and source of elements to output signal.

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

IndxN — Nth index signal

scalar | vector | matrix

External port specifying an index for the selection of the corresponding output element.

Dependencies

To enable an external index port, in the corresponding row of the **Index Option** table, set **Index Option** to Index vector (port), Starting index (port), or Starting and ending indices (port).

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32

Output

Port_1 — Output signal

scalar | vector | matrix | multidimensional

Output signal generated from selected or reordered elements of input signal.

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Parameters

Number of input dimensions — Number of dimensions of the input signal

1 (default) | integer

Specifies the number of dimensions of the input signal.

Programmatic Use

Block Parameter: NumberOfDimensions

Type: character vector

Values: integer

Default: '1'

Index mode — Index mode

One-based (default) | Zero-based

Specifies the indexing mode. If One-based is selected, an index of 1 specifies the first element of the input vector. If Zero-based is selected, an index of 0 specifies the first element of the input vector.

Programmatic Use

Block Parameter: IndexMode

Type: character vector

Values: 'One-based' | 'Zero-based'

Default: 'One-based'

Index Option — Index method for elements

Index vector (dialog) (default) | Select all | Index vector (port) | Starting index (dialog) | Starting index (port) | Starting and ending indices (port)

Defines, by dimension, how the elements of the signal are to be indexed. From the list, select:

- Select all

No further configuration is required. All elements are selected.

- Index vector (dialog)

Enables the **Index** column. Enter the vector of indices of the elements. Do not select this option when the input signal is variable-sized.

- Index vector (port)

No further configuration is required.

- Starting index (dialog)

Enables the **Index** and **Output Size** columns. Enter the starting index of the range of elements to select in the **Index** column and the number of elements to select in the **Output Size** column. Do not select this option when the input signal is variable-sized.

- Starting index (port)

Enables the **Output Size** column. Enter the number of elements to be selected in the **Output Size** column.

- Starting and ending indices (port)

No further configuration is required.

Using this option results in a variable-size output signal. When you update, the output dimension is set to be the same as the input signal dimension. During execution, the output dimension is updated based on the signal feeding the index.

When logging output signal data, signals not selected are padded with NaN values.

The **Index** and **Output Size** columns appear as needed.

Programmatic Use

Block Parameter: IndexOptionArray

Type: character vector

Values: 'Select all' | 'Index vector (dialog)' | 'Index option (port)' | 'Starting index (dialog)' | 'Starting index (port)' | Starting and ending indices (port)

Default: 'Index vector (dialog)'

Index — Index of elements

1 (default) | integer

If the **Index Option** is Index vector (dialog), enter the index of each element you are interested in.

If the **Index Option** is Starting index (dialog), enter the starting index of the range of elements to be selected.

Programmatic Use

Block Parameter: IndexParamArray

Type: character vector

Values: cell array

Default: '{ }'

Output Size — Width of the block output signal

1 (default) | integer

Specifies the width of the block output signal.

Programmatic Use

Block Parameter: OutputSizeArray

Type: character vector

Values: cell array

Default: '{ }'

Input port size — Width of the input signal

3 (default) | integer

Specify the width of the block input signal for 1-D signals. Enter -1 to inherit from the driving block.

Programmatic Use

Block Parameter: InputPortWidth

Type: character vector

Values: integer

Default: '1'

Sample time — Specify sample time as a value other than -1

-1 (default) | scalar | vector

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

Dependencies

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

Programmatic Use

Block Parameter: SampleTime

Type: character vector

Values: scalar or vector

Default: '-1'

Block Characteristics

Data Types	Boolean double enumerated fixed point half integer single
Direct Feedthrough	no
Multidimensional Signals	yes

Variable-Size Signals	yes
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

HDL Architecture

This block has a single, default HDL architecture.

HDL Block Properties

General	
ConstrainedOutputPipeline	Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is 0. For more details, see “ConstrainedOutputPipeline” (HDL Coder).
InputPipeline	Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “InputPipeline” (HDL Coder).
OutputPipeline	Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “OutputPipeline” (HDL Coder).

Native Floating Point	
LatencyStrategy	Specify whether to map the blocks in your design to <code>inherit</code> , <code>Max</code> , <code>Min</code> , or <code>Zero</code> for the floating-point operator. The default is <code>inherit</code> . See also “LatencyStrategy” (HDL Coder).

Complex Data Support

This block supports code generation for complex signals.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Sequence Viewer

Display messages, events, states, transitions, and functions between blocks during simulation

Library: Simulink / Messages & Events
 Simulink Test
 SimEvents
 Stateflow

Description

The Sequence Viewer block displays messages, events, states, transitions, and functions between certain blocks during simulation. The blocks that you can display are called *lifeline blocks* and include:

- Subsystems
- Referenced models
- Blocks that contain messages, such as Stateflow charts
- Blocks that call functions or generate events, such as Function Caller, Function-Call Generator, and MATLAB Function blocks
- Blocks that contain functions, such as Function-Call Subsystem and Simulink Function blocks

To see states, transitions, and events for lifeline blocks in a referenced model, you must have a Sequence Viewer block in the referenced model. Without a Sequence Viewer block in the referenced model, you can see only messages and functions for lifeline blocks in the referenced model.

Parameters

Time Precision for Variable Step — Digits for time increment precision

3 (default) | scalar

Number of digits for time increment precision. When using a variable step solver, change this parameter to adjust the time precision for the sequence viewer. By default the block supports 3 digits of precision.

Suppose the block displays two events that occur at times 0.1215 and 0.1219. Displaying these two events precisely requires 4 digits of precision. If the precision is 3, then the block displays two events at time 0.121.

Programmatic Use

Block Parameter: VariableStepTimePrecision

Type: character vector

Values: '3' | scalar

Default: '3'

History — Maximum number of previous events to display

5000 (default) | scalar

Total number of events before the last event to display.

For example, if **History** is 5 and there are 10 events in your simulation, then the block displays 6 events, including the last event and the five events prior the last event. Earlier events are not displayed. The time ruler is greyed to indicate the time between the beginning of the simulation and the time of the first displayed event.

Each send, receive, drop, or function call event is counted as one event, even if they occur at the same simulation time.

Programmatic Use

Block Parameter: History

Type: character vector

Values: '1000' | scalar

Default: '1000'

Block Characteristics

Data Types	Boolean bus double enumerated fixed point integer single
Direct Feedthrough	no
Multidimensional Signals	yes
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

This block can be used for visualizing message transitions during simulation, but is not included in the generated code.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

This block displays messages during simulation when used in subsystems that generate HDL code, but it is not included in the hardware implementation.

Introduced in R2015b

S-Function

Include S-function in model

Library: Simulink / User-Defined Functions

Description

The S-Function block provides access to S-functions from a block diagram. The S-function named as the **S-function name** parameter can be a Level-2 MATLAB or a Level-1 or Level-2 C MEX S-function (see “MATLAB S-Function Basics” for information on how to create S-functions).

Note Use the Level-2 MATLAB S-Function block to include a Level-2 MATLAB S-function in a block diagram.

The S-Function block displays the name of the specified S-function and the number of input and output ports specified by the S-function. Signals connected to the inputs must have the dimensions specified by the S-function for the inputs.

Parameters

S-function name — Name of the S-function

character array (default)

Use this parameter to specify the name of your S-function.

Programmatic Use

Block Parameter: FunctionName

Type: character vector

Value: name of the S-function

Default: 'system'

S-function parameters — Additional S-function parameters

cell array (default)

Specify the additional S-function parameters.

The function parameters can be specified as MATLAB expressions or as variables separated by commas. For example,

```
A, B, C, D, [eye(2,2);zeros(2,2)]
```

Note that although individual parameters can be enclosed in brackets, the list of parameters must not be enclosed in brackets.

Programmatic Use**Block Parameter:** Parameters**Type:** character vector**Value:** S-function parameters**Default:** ' '**S-function modules — List additional files for code generation**

cell array (default)

This parameter applies only if this block represents a C MEX S-function and you intend to use the Simulink Coder software to generate code from the model containing the block. If you use it, when you are ready to generate code, you must force the coder to rebuild the top model as explained in “Control Regeneration of Top Model Code” (Simulink Coder).

For more information on using this parameter, see “Specify Additional Source Files for an S-Function” (Simulink Coder).

Programmatic Use**Block Parameter:** SFunctionModules**Type:** character vector**Value:** character vector of file names**Default:** ' '**Block Characteristics**

Data Types	Boolean ^a bus ^a double ^a fixed point ^{ba} half ^a integer ^a single ^a string ^a
Direct Feedthrough	limited ^a
Multidimensional Signals	limited ^a
Variable-Size Signals	limited ^a
Zero-Crossing Detection	limited ^a

a. Actual data type or capability support depends on block implementation.

b. See Writing Fixed-Point S-Functions for details on using fixed-point data types in S-functions.

Extended Capabilities**C/C++ Code Generation**

Generate C and C++ code using Simulink® Coder™.

- Actual code generation support depends on block implementation.
- S-functions that call into MATLAB are not supported for code generation.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

- Actual data type support depends on block implementation.
- See “Integrate External Code” (Fixed-Point Designer) for details on using fixed-point data types in S-functions.

S-Function Builder

Integrate C or C++ code to create S-functions

Library: Simulink / User-Defined Functions

Description

The S-function builder integrates new or existing C or C++ code and creates a C MEX S-function from specifications you provide. See “Use a Bus Signal with S-Function Builder to Create an S-Function” for detailed instructions on using the S-Function Builder block to generate an S-function.

Instances of the S-Function Builder block also serve as wrappers for generated S-functions in Simulink models. When simulating a model containing instances of an S-Function Builder block, Simulink software invokes the generated S-function in order to call your C or C++ code in the instance's `mdlStart`, `mdlOutputs`, `mdlDerivatives`, `mdlUpdate` and `mdlTerminate` methods. To learn how Simulink engine interacts with S-functions, see “Simulink Engine Interaction with C S-Functions”.

Note The S-Function Builder block does not support masking. However, you can mask a Subsystem block that contains an S-Function Builder block. For more information, see “Dynamic Masked Subsystem”.

Ports

Input

In — Input to an S-function builder

scalar | vector | matrix

The S-Function Builder can accept and complex, 1-D, or 2-D signals and nonvirtual buses. For each of these cases, the signals must have a data type that Simulink supports.

For more information, see “Data Types Supported by Simulink” in the Simulink documentation.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point` | `enumerated` | `bus`

Output

Out — Output from an S-function builder

scalar | vector | matrix

The S-Function Builder can output complex, 1-D, or 2-D signals and nonvirtual buses. For each of these cases, the signals must have a data type that Simulink supports.

For more information, see “Data Types Supported by Simulink” in the Simulink documentation.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

See “Build S-Functions Automatically Using S-Function Builder” for information on parameters on the S-Function Builder editor.

Block Characteristics

Data Types	<code>Boolean</code> <code>double</code> <code>fixed point</code> <code>integer</code> <code>single</code>
Direct Feedthrough	no
Multidimensional Signals	yes
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

S-functions that call into MATLAB are not supported for code generation.

Shift Arithmetic

Shift bits or binary point of signal

Library: Simulink / Logic and Bit Operations
HDL Coder / Logic and Bit Operations

Description

The Shift Arithmetic block can shift the bits or the binary point of an input signal, or both.

For example, shifting the binary point on an input of data type `sfixed(8)` by two places to the right and left gives these decimal values.

Shift Operation	Binary Value	Decimal Value
No shift (original number)	11001.011	-6.625
Binary point shift right by two places	1100101.1	-26.5
Binary point shift left by two places	110.01011	-1.65625

This block performs arithmetic bit shifts on signed numbers. Therefore, the block recycles the most significant bit for each bit shift. Shifting the bits on an input of data type `sfixed(8)` by two places to the right and left gives these decimal values.

Shift Operation	Binary Value	Decimal Value
No shift (original number)	11001.011	-6.625
Bit shift right by two places	11110.010	-1.75
Bit shift left by two places	00101.100	5.5

Ports

Input

u – Number to be operated on

scalar | vector | array

Number to be operated on, specified as a scalar, vector, or array.

Data Types: `single` | `double` | `half` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `fixed point`

s – Number of bits to shift

scalar

Number of bits to shift, specified as a scalar.

Data Types: `single` | `double` | `half` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `fixed point`

Output**Port_1 — Result of operation**

scalar | vector | array

Result of operation, returned as a scalar, vector, or array.

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Parameters**Bits to shift: Source — Source of bits to shift**

Dialog (default) | Input port

Specify whether to enter the bits to shift on the dialog box or to inherit the values from an input port.

Tunable: No**Programmatic Use****Block Parameter:** BitShiftNumberSource**Type:** character vector, string**Values:** 'Dialog' | 'Input port'**Default:** 'Dialog'**Bits to shift: Number — Bits to shift**

8 (default) | scalar

Specify a scalar, vector, or array of bit shift values. This parameter is available when **Bits to shift: Source** is Dialog.

If the direction is...	Then...
Left or Right	Use positive integers to specify bit shifts.
Bidirectional	Use positive integers for right shifts and negative integers for left shifts.

Tunable: No**Programmatic Use****Block Parameter:** BitShiftNumber**Type:** character vector, string**Values:** scalar**Default:** '9'**Bits to shift: Direction — Direction in which to shift bits**

Left (default) | Right | Bidirectional

Specify the direction in which to shift bits: left, right, or bidirectional.

Tunable: No**Programmatic Use****Block Parameter:** BitShiftDirection**Type:** character vector, string

Values: 'Left' | 'Right' | 'Bidirectional'
Default: 'Bidirectional'

Binary points to shift: Number — Number of places to shift binary point

0 (default) | scalar

Specify an integer number of places to shift the binary point of the input signal. A positive value indicates a right shift, while a negative value indicates a left shift.

Tunable: No

Programmatic Use

Block Parameter: BinPtShiftNumber

Type: character vector, string

Values: 'Dialog' | 'Input port'

Default: 'Dialog'

Diagnostic for out of range shift value — Diagnostic action

None (default) | Warning | Error

Specify whether to produce a warning or error during simulation when the block contains an out-of-range shift value. Options include:

- None — Simulink takes no action.
- Warning — Simulink displays a warning and continues the simulation.
- Error — Simulink terminates the simulation and displays an error.

For more information, see “Simulation and Accelerator Mode Results for Out-of-Range Bit Shift Values” on page 1-1482.

Programmatic Use

Block Parameter: DiagnosticFor00RShift

Type: character vector, string

Values: 'None' | 'Warning' | 'Error'

Default: 'None'

Check for out-of-range 'Bits to shift' in generated code — Check for out-of-range bits to shift in generated code

off (default) | on

Select this check box to include conditional statements in the generated code that protect against out-of-range bit shift values. This check box is available when **Bits to shift: Source** is Input port.

For more information, see “Code Generation for Out-of-Range Bit Shift Values” on page 1-1483.

Programmatic Use

Block Parameter: Check00RBitShift

Type: character vector, string

Values: 'on' | 'off'

Default: 'off'

Block Characteristics

Data Types	double fixed point half integer single
-------------------	--

Direct Feedthrough	yes
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

More About

Block Icon Variables

The Shift Arithmetic block icon shows the block behavior using these variables:

- Q — Stored integer value
- V — Real world value
- E — Exponent
- Qy — Stored integer value of output
- Qu — Stored integer value of input
- Vy — Value of output
- Vu — Value of input
- Ey — Exponent of output
- Eu — Exponent of input

Block Output for Right Bit Shifts

The following model compares the behavior of right bit shifts using the dialog box versus the block input port.

The key block parameter settings of the Constant blocks are:

Block	Parameter	Setting
Constant and Constant1	Constant value	124
	Output data type	int8

Block	Parameter	Setting
Dynamic bit shift	Constant value	2
	Output data type	Inherit: Inherit from 'Constant value'

The key block parameter settings of the Shift Arithmetic blocks are:

Block	Parameter	Setting
Bit shift from dialog	Bits to shift: Source	Dialog
	Bits to shift: Direction	Right
	Bits to shift: Number	2
Bit shift from input	Bits to shift: Source	Input port
	Bits to shift: Direction	Right

The top Shift Arithmetic block takes an input of 124, which corresponds to 01111100 in binary format. Shifting the number of bits two places to the right produces 00011111 in binary format. Therefore, the block outputs 31.

The bottom Shift Arithmetic block performs the same operation as the top block. However, the bottom block receives the bit shift value through an input port instead of the dialog box. By supplying this value as an input signal, you can change the number of bits to shift during simulation.

Block Output for Binary Point Shifts

The following model shows the effect of binary point shifts.

The key block parameter settings of the Constant blocks are:

Block	Parameter	Setting
Constant and Constant1	Constant value	124
	Output data type	int8

The key block parameter settings of the Shift Arithmetic blocks are:

Block	Parameter	Setting
Shift binary point 3 places to the right	Bits to shift: Source	Dialog
	Bits to shift: Direction	Bidirectional

Block	Parameter	Setting
	Bits to shift: Number	0
	Binary points to shift: Number	3
Shift binary point 3 places to the left	Bits to shift: Source	Dialog
	Bits to shift: Direction	Bidirectional
	Bits to shift: Number	0
	Binary points to shift: Number	- 3

The top Shift Arithmetic block takes an input of 124, which corresponds to 01111100 in binary format. Shifting the binary point three places to the right produces 0111110000 in binary format. Therefore, the top block outputs 995.

The bottom Shift Arithmetic block also takes an input of 124. Shifting the binary point three places to the left produces 01111.100 in binary format. Therefore, the bottom block outputs 15.5.

Algorithms

Out-of-Range Bit Shift

Suppose that WL is the input word length. The shaded regions in the following diagram show out-of-range bit shift values for left and right shifts.

Similarly, the shaded regions in the following diagram show out-of-range bit shift values for bidirectional shifts.

The diagnostic for out-of-range bit shifts responds as follows, depending on the mode of operation:

Mode	Diagnostic for out-of-range shift value		
	None	Warning	Error
Simulation modes	Do not report any warning or error.	Report a warning but continue simulation.	Report an error and stop simulation.
Code generation	Has no effect.		

Simulation and Accelerator Mode Results for Out-of-Range Bit Shift Values

Suppose that U is the input, WL is the input word length, and Y is the output. The output for an out-of-range bit shift value for left shifts is as follows:

Similarly, the output for an out-of-range bit shift value for right shifts is as follows:

For bidirectional shifts, the output for an out-of-range bit shift value is as follows:

Code Generation for Out-of-Range Bit Shift Values

For generated code, the method for handling out-of-range bit shifts depends on the setting of **Check for out-of-range 'Bits to shift' in generated code**.

Check Box Setting	Generated Code	Simulation Results Compared to Generated Code
Selected	Includes conditional statements to protect against out-of-range bit shift values.	Simulation and Accelerator mode results match those of code generation.

Check Box Setting	Generated Code	Simulation Results Compared to Generated Code
Cleared	Does not protect against out-of-range bit shift values.	<ul style="list-style-type: none"> For in-range values, simulation and Accelerator mode results match those of code generation. For out-of-range values, the code generation results are compiler specific.

For right shifts on signed negative inputs, most C compilers use an arithmetic shift instead of a logical shift. Generated code for the Shift Arithmetic block depends on this compiler behavior.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

You can generate HDL code when **Bits to shift: Source** is **Dialog** or **Input port**.

HDL Architecture

The generated VHDL code uses the `shift_right` function and `sll` operator.

The generated Verilog code uses the `>>>` and `<<<` shift operators.

HDL Block Properties

ConstrainedOutputPipeline	Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is 0. For more details, see “ConstrainedOutputPipeline” (HDL Coder).
InputPipeline	Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “InputPipeline” (HDL Coder).
OutputPipeline	Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “OutputPipeline” (HDL Coder).

Complex Data Support

This block supports code generation for complex signals.

Restrictions

When **Bits to shift: Source** is **Input port**, binary point shifting is not supported.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Introduced before R2006a

Sign

Indicate sign of input

Library: Simulink / Math Operations
HDL Coder / HDL Floating Point Operations
HDL Coder / Math Operations

Description

Block Behavior for Real Inputs

For real inputs, the Sign block outputs the sign of the input:

Input	Output
Greater than zero	1
Equal to zero	0
Less than zero	-1

For vector and matrix inputs, the block outputs a vector or matrix where each element is the sign of the corresponding input element, as shown in this example:

Block Behavior for Complex Inputs

When the input u is a complex scalar, the block output matches the MATLAB result for:

$$\text{sign}(u) = u ./ \text{abs}(u)$$

When an element of a vector or matrix input is complex, the block uses the same formula that applies to scalar input, as shown in this example:

Ports

Input

Port_1 — Input signal

scalar | vector | matrix

Input signal whose sign will determine the output.

The block supports complex input signals only for floating-point data types, `double` and `single`.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point`

Output

Port_1 — Output signal

scalar | vector | matrix

Output signal that is the sign of the input signal.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point`

Parameters

Enable zero-crossing detection — Enable zero-crossing detection

on (default) | Boolean

Select to enable zero-crossing detection. For more information, see “Zero-Crossing Detection” in the Simulink documentation.

Programmatic Use

Block Parameter: ZeroCross

Type: character vector, string

Values: 'off' | 'on'

Default: 'on'

Sample time — Specify sample time as a value other than -1

-1 (default) | scalar | vector

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

Dependencies

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

Programmatic Use

Block Parameter: SampleTime

Type: character vector

Values: scalar or vector

Default: '-1'

Block Characteristics

Data Types	Boolean double fixed point integer single
Direct Feedthrough	yes
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	yes

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

HDL Architecture

This block has a single, default HDL architecture.

HDL Block Properties

ConstrainedOutputPipeline	Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is 0. For more details, see “ConstrainedOutputPipeline” (HDL Coder).
InputPipeline	Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “InputPipeline” (HDL Coder).
OutputPipeline	Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “OutputPipeline” (HDL Coder).

Signal Builder

Create and generate interchangeable groups of signals whose waveforms are piecewise linear

Library: Simulink / Sources

Description

Note The Signal Builder block is not recommended. Use the Signal Editor block instead.

The Signal Builder block allows you to create interchangeable groups of piecewise linear signal sources and use them in a model. You can quickly switch the signal groups into and out of a model to facilitate testing. In the Signal Builder window, create signals and define the output waveforms. To open the window, double-click the block. See “Signal Groups”.

Note Use the `signalbuilder` function to create and access Signal Builder blocks programmatically.

Ports

Output

Signal 1 – First output signal

scalar | vector | matrix

First output signal from the signal group currently visible in the Signal Builder window.

Data Types: double | bus

Signal n – nth output signal

scalar | vector | matrix

nth output signal from the signal group currently visible in the Signal Builder window. n corresponds to the signal index.

Data Types: double | bus

Block Characteristics

Data Types	double
Direct Feedthrough	no
Multidimensional Signals	no

Variable-Size Signals	no
Zero-Crossing Detection	yes

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production code.

Signal Conversion

Convert signal to new type without altering signal values

Library: Simulink / Signal Attributes
HDL Coder / Signal Attributes

Description

The Signal Conversion block converts a signal from one type to another. To select the type of conversion to perform, use the **Output** parameter or one of these preconfigured Signal Conversion blocks:

- Signal Copy block
- To Virtual Bus block
- To Nonvirtual Bus block

Ports

Input

Port_1 — Input signal to convert

scalar | vector | matrix | N-D array

Input signal to convert, specified as a scalar, vector, matrix, or N-D array.

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | string | Boolean | fixed point | enumerated | bus

Output

Port_1 — Converted signal

scalar | vector | matrix | N-D array

Output signal is the input signal converted to the specified type.

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Parameters

Output — Type of conversion

Signal copy (default) | Virtual bus | Nonvirtual bus

Specify the type of conversion to perform. The type of conversion that you use depends on your modeling goal.

Modeling Goal	Output Option
Reduce generated code for a muxed signal. For an example involving Simulink Coder software, see “Generate Reentrant Code from Subsystems” (Simulink Coder).	Signal copy
Connect a block with a constant sample time to an output port of an enabled subsystem.	Signal copy
Save memory by converting a nonvirtual bus to a virtual bus.	Virtual bus
Pass a virtual bus to a modeling construct that requires a nonvirtual bus, such as a Model block.	Nonvirtual bus

- The Signal copy option is the default. The type of conversion that the Signal Conversion block performs using the Signal copy option depends on the type of input signal.

Type of Input Signal	Conversion That the Signal Copy Option Performs
Muxed (nonbus) signal	Converts the muxed signal, whose elements occupy discontinuous areas of memory, to a vector signal, whose elements occupy contiguous areas of memory. The conversion allocates a contiguous area of memory for the elements of the muxed signal and copies the values from the discontinuous areas (represented by the block input) to the contiguous areas (represented by the block output) at each time step.
Bus	Outputs a contiguous copy of the bus that is the input to the Signal Conversion block.

For an array of buses input signal, use the Signal copy option.

- The Virtual bus option converts a nonvirtual bus to a virtual bus.
- The Nonvirtual bus option converts a virtual bus to a nonvirtual bus.

Programmatic Use

Block Parameter: ConversionOutput

Type: character vector

Values: 'Signal copy' | 'Virtual bus' | 'Nonvirtual bus'

Default: 'Signal copy'

Data type — Nonvirtual bus data type

Inherit: auto (default) | Bus: <object name> | <data type expression>

Specify the output data type of the nonvirtual bus that the Signal Conversion block produces.

This option is available only when you set the **Output** parameter to Nonvirtual bus.

The default option is Inherit: auto, which uses a rule that inherits a data type.

Specify a Simulink.Bus object in the **Data type** parameter for one or both of the following blocks:

- Signal Conversion block
- An upstream Bus Creator block

If you specify a bus object for the Signal Conversion block, but not for its upstream Bus Creator block, then use a bus object that matches the hierarchy of the bus that upstream Bus Creator block outputs.

If you specify a bus object for both the Signal Conversion block and its upstream Bus Creator block, use the same bus object for both blocks.

Click the **Show data type assistant** button  to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

Dependencies

To enable this parameter, set **Output** to Nonvirtual bus.

Programmatic Use

Block Parameter: OutDataTypeStr

Type: character vector

Values: 'Inherit: auto' | 'Bus: <object name>' | '<data type expression>'

Default: 'Inherit: auto'

Exclude this block from 'Block reduction' optimization — Exclude from block reduction optimization

off (default) | on

This option is available only when you set the **Output** parameter to Signal copy. If the elements of the input signal occupy contiguous areas of memory, then as an optimization, Simulink software eliminates the block from the compiled model. If you select the **Exclude this block from 'Block reduction' optimization** check box, the optimization occurs the next time you compile the model. For more information, see “Block reduction”.

Programmatic Use

Block Parameter: OverrideOpt

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Block Characteristics

Data Types	Boolean double enumerated fixed point half integer single string
Direct Feedthrough	yes
Multidimensional Signals	yes
Variable-Size Signals	yes
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

HDL Architecture

This block has a pass-through implementation.

HDL Block Properties

ConstrainedOutputPipeline	Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is 0. For more details, see “ConstrainedOutputPipeline” (HDL Coder).
InputPipeline	Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “InputPipeline” (HDL Coder).
OutputPipeline	Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “OutputPipeline” (HDL Coder).

Complex Data Support

This block supports code generation for complex signals.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Signal Editor

Display, create, edit, and switch interchangeable scenarios

Library: Simulink / Sources

Description

The Signal Editor block displays, creates, and edits interchangeable scenarios. You can also use the block to switch scenarios in and out of models.

The Signal Editor block supports MAT-files that contain one or more scalar `Simulink.SimulationData.Dataset` objects.

You can port Signal Builder block configurations to the Signal Editor block using the `signalBuilderToSignalEditor` function. For more information, see “Replace Signal Builder Block with Signal Editor Block”.

To programmatically get the total number of scenarios and signals in the Signal Editor block, use the `get_param` `NumberOfScenarios` and `NumberOfSignals` properties. These properties contain the values as character vectors. To convert these values to doubles, use the `str2double` function.

To programmatically enable the Signal Editor block to label output signal lines, set the `set_param` `PreserveSignalName` to 'on' (default). For example:

```
set_param(gcf, 'PreserveSignalName', 'on')
```

Limitations

The Signal Editor block does not support:

- Function-calls
- Buses while using rapid accelerator mode
- Ground signals

The Signal Editor block supports dynamic strings. It does not support strings with maximum length. In addition, strings in the Signal Editor block cannot output:

- Non-scalar MATLAB strings.
- String data that contains missing values.
- String data that contains non-ASCII characters.

Ports

Output Arguments

Signal1 — Signals in scenario

multidimensional

One or more signals, which can be:

- A MATLAB `timeseries` object
- A structure of MATLAB `timeseries` objects
- A two-dimensional matrix

The port label depends on the associated variable in the data set MAT-file.

Data Types: `single` | `double` | `half` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `string` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

File name — Data set file

`untitled.mat` (default) | character vector

Data set file, specified as character vector, containing one or more scalar `Simulink.SimulationData.Dataset` objects. Do not use a file name from one locale in a different locale. When using the block on multiple platforms, consider specifying just the MAT-file name and having the MAT-file be on the MATLAB path.

Dependencies

- If `untitled.mat` does not exist in the current folder, these parameters are disabled:
 - **Active scenario**
 - **Signals**
 - **Output a bus signal**
 - **Unit**
 - **Sample time**
 - **Interpolate data**
 - **Enable zero-crossing detection**
 - **Form output after final data value by**
- To create a MAT-file, click . This button starts the Signal Editor user interface, which lets you create and edit scenario MAT-files.

Programmatic Use

Block Parameter: Filename

Type: character vector

Values: character vector

Default: `'untitled.mat'`

Active scenario — Active scenario

Scenario (default) | character vector

Active scenario, specified as a character vector. The specified MAT-file must exist.

Dependencies

- To enable this parameter, ensure that the specified MAT-file exists.
- With fast restart enabled, you can:

- Change the active scenario
- Change the active signal
- Start the Signal Editor user interface and edit data

While you can change the active signal, you cannot edit the signal properties in the block.

Programmatic Use**Block Parameter:** ActiveScenario**Type:** character vector | numeric**Values:** character vector | index value**Default:** 'Scenario'**To create and edit scenarios, launch Signal Editor user interface – Start Signal Editor**

button click

To start Signal Editor user interface, click .

Active signal – Signal to configure

Signal 1 (default) | character vector

Signal to configure, specified as a signal name. This signal is considered the active signal. The MAT-file must exist before you can configure signals.

To enable this parameter, ensure that the specified MAT-file exists.

Tip Do not use the `set_param` function to set the active signal property Name-Value argument ('ActiveSignal') in combination with another Name-Value pair argument for the Signal Editor block.

Programmatic Use**Block Parameter:** ActiveSignal**Type:** character vector | numeric**Values:** character vector | index vector**Default:** 'Signal 1'**Output a bus signal – Configure signal as bus**

off (default) | on

Configure signal as a bus:

 On

Configure signal as a bus.

 Off

Do not configure signal as a bus.

The specified MAT-file must exist.

Tip Select this check box only if the active signal is a MATLAB structure whose fields are the same as an existing bus object, or create a new matching bus object. If you select this check box for an active signal that is not a MATLAB structure, simulation returns an error.

Dependencies

- Selecting **Output a bus signal** check box enables the **Select bus object** parameter.
- To enable this parameter, ensure that the specified MAT-file exists.

Programmatic Use

Block Parameter: IsBus

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Select bus object — Bus object

Bus: BusObject (default) | bus object name

Select or enter the bus object name. To edit the bus object or create a bus object using the Data Type Assistant, click >>. The active signal must be a MATLAB structure whose fields are the same as this bus object. The specified MAT-file must exist.

Dependencies

To enable this parameter, ensure that the specified MAT-file exists.

Programmatic Use

Block Parameter: OutputBusObjectStr

Type: character vector

Values: bus object name

Default: 'Bus: BusObject'

Mode — Bus object mode

Bus Object (default) | bus object data type

Select the bus object name. If you do not have a bus object, create one by clicking **Edit**, which starts the Bus Editor. For more information, see “Create and Specify Simulink.Bus Objects”.

Unit — Physical unit

inherit (default) | supported physical unit

Physical unit of the signal, specified as an allowed unit. To specify a unit, begin typing in the text box. As you type, the parameter displays potential matching units. For more information, see “Unit Specification in Simulink Models”. For a list of supported units, see Allowed Unit Systems.

To constrain the unit system, click the link to the right of the parameter:

- If a Unit System Configuration block exists in the component, its dialog box opens. Use that dialog box to specify allowed and disallowed unit systems for the component.
- If a Unit System Configuration block does not exist in the component, the model Configuration Parameters dialog box displays. Use that dialog box to specify allowed and disallowed unit systems for the model.

The specified MAT-file must exist.

Dependencies

To enable this parameter, ensure that the specified MAT-file exists.

Programmatic Use

Block Parameter: Unit

Type: character vector

Values: 'inherit' | supported physical unit

Default: 'inherit'

Sample time — Time interval between samples

0 (default) | -1 | sample time in seconds

Time interval between samples, specified in seconds. The specified MAT-file must exist.

Dependencies

To enable this parameter, ensure that the specified MAT-file exists.

Programmatic Use

Block Parameter: SampleTime

Type: character vector

Values: -1 | sample time in seconds

Default: '0'

Interpolate data — Linearly interpolate data

off (default) | on

Linearly interpolate data at time hits for which no corresponding workspace data exist. The specified MAT-file must exist.

The Signal Editor block linearly interpolates:

On

Linearly interpolate at time hits for which no corresponding workspace data exist, select this option.

Off

The current output equals the output at the most recent time for which data exists.

The Signal Editor block interpolates by using the two corresponding workspace samples:

- For `double` data, linearly interpolates the value by using the two corresponding samples
- For `Boolean` data, uses `false` for the first half of the time between two time values and `true` for the second half
- For a built-in data type other than `double` or `Boolean`:
 - Upcasts the data to `double`
 - Performs linear interpolation (as described for `double` data)
 - Downcasts the interpolated value to the original data type

You cannot use linear interpolation with enumerated (`enum`) data.

The block uses the value of the last known data point as the value of time hits that occur after the last known data point.

To determine the block output after the last time hit for which data is available, combine the settings of these parameters:

- **Interpolate data**
- **Form output after final data value by**

For details, see the **Form output after final data value by** parameter.

Dependencies

To enable this parameter, ensure that the specified MAT-file exists.

Programmatic Use

Block Parameter: Interpolate

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Enable zero-crossing detection — Detect zero-crossings

off (default) | on

If you select the **Enable zero-crossing detection** parameter, then when the input array contains multiple entries for the same time hit, Simulink detects a zero crossing. For example, suppose that the input array has this data:

```
time:    0 1 2 2 3
signal:  2 3 4 5 6
```

At time 2, there is a zero crossing from input signal discontinuity. For more information, see “Zero-Crossing Detection”.

For bus signals, Simulink detects zero crossings across all leaf bus elements.

The specified MAT-file must exist.

Dependencies

To enable this parameter, ensure that the specified MAT-file exists.

Programmatic Use

Block Parameter: ZeroCross

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Form output after final data value by — Block output after the last time hit for which data is available

Setting to zero (default) | Extrapolation | Holding final value

To determine the block output after the last time hit for which workspace data is available, combine the settings of these parameters:

- **Interpolate data**

- **Form output after final data value by**

This table lists the block output, based on the values of the two options.

Setting for Form Output After Final Data Value By	Setting for Interpolate Data	Block Output After Final Data
Extrapolation	On	Extrapolated from final data value
	Off	Error
Setting to zero	On	Zero
	Off	Zero
Holding final value	On	Final value from workspace
	Off	Final value from workspace

For example, the block uses the last two known data points to extrapolate data points that occur after the last known point if you:

- Select **Interpolate data**.
- Set **Form output after final data value by** to Extrapolation.

The specified MAT-file must exist.

Dependencies

To enable this parameter, ensure that the specified MAT-file exists.

Programmatic Use

Block Parameter: OutputAfterFinalValue

Type: character vector

Values: 'Setting to zero' | 'Extrapolation' | 'Holding final value'

Default: 'Setting to zero'

Block Characteristics

Data Types	Boolean bus double enumerated fixed point half integer single string
Direct Feedthrough	no
Multidimensional Signals	yes
Variable-Size Signals	no
Zero-Crossing Detection	yes

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production code.

Signal Generator

Generate various waveforms

Library: Simulink / Sources

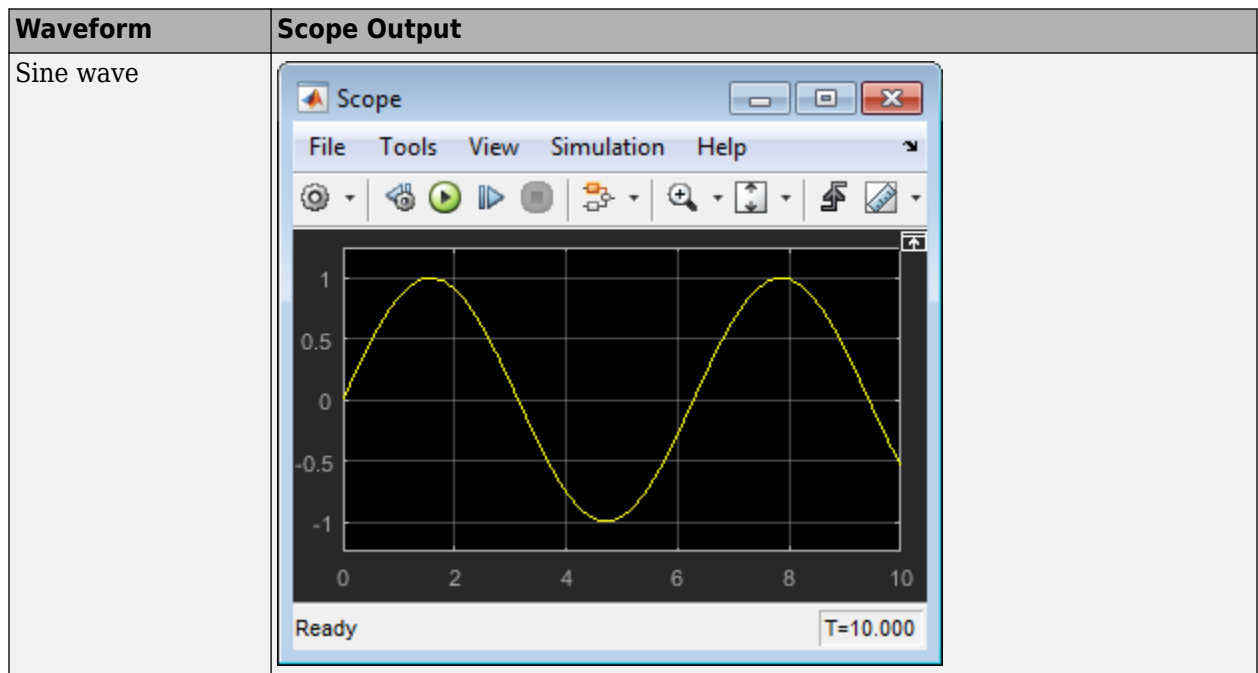

Description

Supported Operations

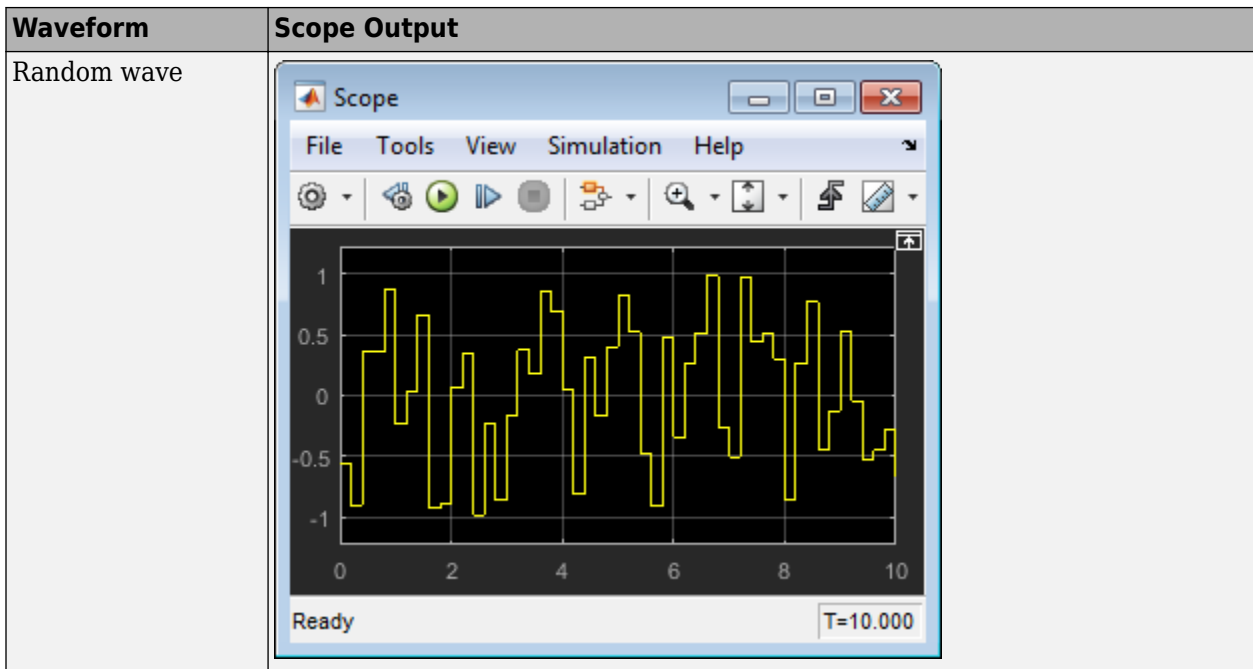

The Signal Generator block can produce one of four different waveforms:

- sine
- square
- sawtooth
- random

You can express signal parameters in hertz or radians per second. Using default parameter values, you get one of the following waveforms:

Waveform	Scope Output
Square wave	 <p>The image shows a 'Scope' window with a menu bar (File, Tools, View, Simulation, Help) and a toolbar. The plot area displays a square wave signal on a grid. The vertical axis (y-axis) ranges from -1 to 1 with major ticks at -1, -0.5, 0, 0.5, and 1. The horizontal axis (x-axis) ranges from 0 to 10 with major ticks at 0, 2, 4, 6, 8, and 10. The signal is a square wave with a period of 4 units, alternating between -1 and 1. The status bar at the bottom indicates 'Ready' and 'T=10.000'.</p>
Sawtooth wave	 <p>The image shows a 'Scope' window with a menu bar (File, Tools, View, Simulation, Help) and a toolbar. The plot area displays a sawtooth wave signal on a grid. The vertical axis (y-axis) ranges from -1 to 1 with major ticks at -1, -0.5, 0, 0.5, and 1. The horizontal axis (x-axis) ranges from 0 to 10 with major ticks at 0, 2, 4, 6, 8, and 10. The signal is a sawtooth wave with a period of 6 units, starting at 1 and decreasing linearly to -1, then jumping back to 1. The status bar at the bottom indicates 'Ready' and 'T=10.000'.</p>

A negative **Amplitude** parameter value causes a 180-degree phase shift. You can generate a phase-shifted wave at other than 180 degrees in many ways. For example, you can connect a Clock block signal to a MATLAB Function block and write the equation for the specific wave.

You can vary the output settings of the Signal Generator block while a simulation is in progress to determine quickly the response of a system to different types of inputs.

The **Amplitude** and **Frequency** parameters determine the amplitude and frequency of the output signal. The parameters must be of the same dimensions after scalar expansion. If you clear the **Interpret vector parameters as 1-D** check box, the block outputs a signal of the same dimensions as the **Amplitude** and **Frequency** parameters (after scalar expansion). If you select the **Interpret vector parameters as 1-D** check box, the block outputs a vector (1-D) signal if the **Amplitude** and **Frequency** parameters are row or column vectors, that is, single-row or column 2-D arrays. Otherwise, the block outputs a signal of the same dimensions as the parameters.

Solver Considerations

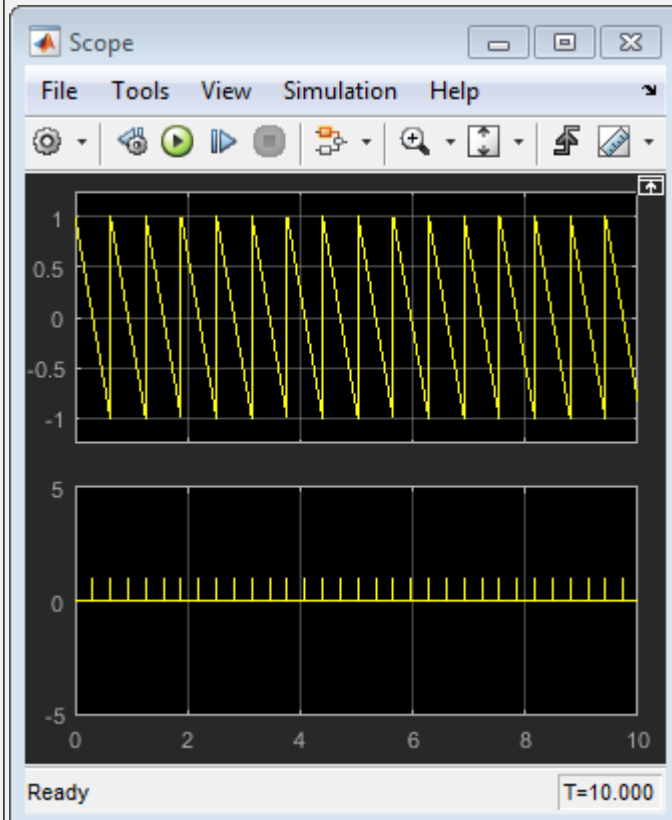

If your model uses a fixed-step solver, Simulink uses the same step size for the entire simulation. In this case, the Signal Generator block output provides a uniformly sampled representation of the ideal waveform.

If your model uses a variable-step solver, Simulink might use different step sizes during the simulation. In this case, the Signal Generator block output does not always provide a uniformly sampled representation of the ideal waveform. To ensure that the block output is a uniformly sampled representation, add a Hit Crossing block directly downstream of the Signal Generator block. These models show the difference in Signal Generator block output with and without the Hit Crossing block.

Model That Uses a Variable-Step Solver

Signal Generator Block Output

Ports

Output

Port_1 — Generated output signal

scalar | vector | matrix

Output signal specified as one of these waveforms.

- sine
- square
- sawtooth
- random

Data Types: double

Parameters

Wave form — Wave form to generate

sine (default) | square | sawtooth | random

Specify the wave form.

Programmatic Use

Block Parameter: WaveForm

Type: character vector

Values: 'sine' | 'square' | 'sawtooth' | 'random'

Default: 'sine'

Time (t) — Source of time variable

Use simulation time (default) | Use external signal

Specify whether to use simulation time or an external signal as the source of values for the waveform time variable. If you specify an external source, the block displays an input port for connecting the source.

Programmatic Use

Block Parameter: TimeSource

Type: character vector

Values: 'Use simulation time' | 'Use external signal'

Default: 'Use simulation time'

Amplitude — Signal amplitude

1 (default) | scalar | vector | matrix

Specify the amplitude of the generated waveform.

Programmatic Use

Block Parameter: Amplitude

Type: character vector

Values: real scalar

Default: '1'

Frequency — Signal frequency

1 (default) | scalar | vector | matrix

Specify the frequency of the generated waveform.

Programmatic Use**Block Parameter:** Frequency**Type:** character vector**Values:** real scalar**Default:** '1'**Units — Signal units**

rad/sec (default) | Hertz

Specify the signal units as Hertz or rad/sec.

Programmatic Use**Block Parameter:** Units**Type:** character vector**Values:** 'rad/sec' | 'Hertz'**Default:** 'rad/sec'**Interpret vector parameters as 1-D — Treat vectors as 1-D**

on (default) | off

Select this check box to output a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector.

- When you select this check box, the block outputs a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector. For example, the block outputs a matrix of dimension 1-by-N or N-by-1.
- When you clear this check box, the block does not output a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector.

Programmatic Use**Block Parameter:** VectorParams1D**Type:** character vector**Values:** 'on' | 'off'**Default:** 'on'**Block Characteristics**

Data Types	double
Direct Feedthrough	yes
Multidimensional Signals	yes
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Cannot be used inside a triggered subsystem hierarchy.

These blocks do not reference absolute time when configured for sample-based operation. In time-based operation, they depend on absolute time.

Signal Specification

Specify desired dimensions, sample time, data type, numeric type, and other attributes of signal

Library: Simulink / Signal Attributes
HDL Coder / Signal Attributes

Description

The Signal Specification block allows you to specify the attributes of the signal connected to its input and output ports. If the specified attributes conflict with the attributes specified by the blocks connected to its ports, Simulink software displays an error when it compiles the model. For example, at the beginning of a simulation, if no conflict exists, Simulink eliminates the Signal Specification block from the compiled model. In other words, the Signal Specification block is a virtual block. It exists only to specify the attributes of a signal and plays no role in the simulation of the model.

You can use the Signal Specification block to ensure that the actual attributes of a signal meet desired attributes. For example, suppose that you and a colleague are working on different parts of the same model. You use Signal Specification blocks to connect your part of the model with your colleague's. If your colleague changes the attributes of a signal without informing you, the attributes entering the corresponding Signal Specification block do not match. When you try to simulate the model, you get an error.

You can also use the Signal Specification block to ensure correct propagation of signal attributes throughout a model. However, if some blocks have unspecified attributes for the signals they accept or output, the model does not have enough information to propagate attributes correctly. In these cases, the Signal Specification block can provide the information Simulink needs. Using the Signal Specification block also helps speed up model compilation when blocks are missing signal attributes.

The Signal Specification block supports signal label propagation.

Ports

Input

Port_1 — Input signal

scalar | vector | matrix | N-D array

Input signal whose attributes to check, specified as a scalar, vector, matrix, or N-D array. The block checks the attributes of the input signal against the desired attributes you specify in the block dialog box. If the attributes do not match, the block generates an error.

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Output

Port_1 — Output signal

scalar | vector | matrix | N-D array

Output signal is the input signal when all attributes of the signal match those specified in the dialog box. If the attributes do not match, the block generates an error.

Data Types: `single` | `double` | `half` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

Minimum — Minimum value for range checking

[] (default) | scalar

Specify the minimum value for the block output as a finite real double scalar value.

Note If you specify a bus object as the data type for this block, do not set the minimum value for bus data on the block. Simulink ignores this setting. Instead, set the minimum values for bus elements of the bus object specified as the data type. For information on the Minimum property of a bus element, see `Simulink.BusElement`.

Simulink uses this value to perform:

- Simulation range checking (see “Specify Signal Ranges”)
- Automatic scaling of fixed-point data types

Programmatic Use

Block Parameter: `OutMin`

Type: character vector

Values: scalar

Default: ' [] '

Maximum — Maximum value for range checking

[] (default) | scalar

Specify the maximum value for the block output as a finite real double scalar value.

Note If you specify a bus object as the data type for this block, do not set the maximum value for bus data on the block. Simulink ignores this setting. Instead, set the maximum values for bus elements of the bus object specified as the data type. For information on the Maximum property of a bus element, see `Simulink.BusElement`.

Simulink uses this value to perform:

- Simulation range checking (see “Specify Signal Ranges”)
- Automatic scaling of fixed-point data types

Programmatic Use

Block Parameter: `OutMax`

Type: character vector

Values: scalar

Default: ' [] '

Data type – Output data type

Inherit: auto (default) | double | single | half | int8 | uint8 | int16 | uint16 | int32 | uint32 | int64 | uint64 | boolean | fixdt(1,16) | fixdt(1,16,0) | fixdt(1,16,2^0,0) | Enum: <class name> | Bus: <object name> | string | <data type expression>

Specify the desired output data type. If the data type of the input signal does not match the value you specify, the block generates an error.

Click the **Show data type assistant** button  to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

Programmatic Use

Block Parameter: OutDataTypeStr

Type: character vector

Value: 'Inherit: auto' | 'double' | 'single' | 'half' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'int64' | 'uint64' | 'boolean' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>' | 'Bus: <object name>' | 'string' | <data type expression>

Default: 'Inherit: auto'

Lock output data type setting against changes by the fixed-point tools – Prevent fixed-point tools from overriding Output data type

off (default) | on

Select this parameter to prevent the fixed-point tools from overriding the **Output** data type you specify on the block. For more information, see “Use Lock Output Data Type Setting” (Fixed-Point Designer).

Programmatic Use

Block Parameter: LockScale

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Require nonvirtual bus – Accept only nonvirtual bus signals

off (default) | on

If you specify a bus object as the data type, use this parameter to specify whether to accept only nonvirtual bus signals.

- off — Specifies that a signal must come from a *virtual* bus.
- on — Specifies that a signal must come from a *nonvirtual* bus.

Dependencies

To enable this parameter, set **Data type** to one of these values:

- Bus: <object name>
- <data type expression> that specifies a bus object

Programmatic Use

Block Parameter: BusOutputAsStruct

Type: character vector

Value: 'off' | 'on'

Default: 'off'

Unit (e.g., m, m/s², N*m) — Physical unit of the input signal to the block

inherit (default) | <Enter unit>

Specify the physical unit of the input signal to the block. To specify a unit, begin typing in the text box. As you type, the parameter displays potential matching units. For a list of supported units, see Allowed Unit Systems.

To constrain the unit system, click the link to the right of the parameter:

- If a Unit System Configuration block exists in the component, its dialog box opens. Use that dialog box to specify allowed and disallowed unit systems for the component.
- If a Unit System Configuration block does not exist in the component, the model Configuration Parameters dialog box displays. Use that dialog box to specify allowed and disallowed unit systems for the model.

Programmatic Use

Block Parameter: Unit

Type: character vector

Values: 'inherit' | '<Enter unit>'

Default: 'inherit'

Dimensions (-1 for inherited) — Dimensions of input and output signals

-1 (default) | n | [m n]

Specify the dimensions of the input and output signals.

- -1 — Specifies that signals inherit dimensions.
- n — Specifies a vector of width n.
- [m n] — Specifies a matrix with m rows and n columns.

Programmatic Use

Block Parameter: Dimensions

Type: character vector

Values: '-1' | n | [m n]

Default: '-1'

Variable-size signal — Allow signal to be variable-size, fixed-size, or both

Inherit (default) | No | Yes

Specify the signal to be of variable-size, fixed size, or both.

- Inherit — Allows variable-size and fixed-size signals.
- No — Does not allow variable-size signals.
- Yes — Allows only variable-size signals.

Dependencies

When the signal is a variable-size signal, the **Dimensions** parameter specifies the maximum dimensions of the signal.

If you specify a bus object, the simulation allows variable-size signals only with a disabled bus object.

Programmatic Use

Block Parameter: VarSizeSig

Type: character vector

Values: 'Inherit' | 'No' | 'Yes'

Default: 'Inherit'

Sample time (-1 for inherited) – Time interval between samples

-1 (default) | scalar | vector

Specify the time interval between samples. To inherit the sample time, set this parameter to -1. See “Specify Sample Time” for more information.

Programmatic Use

Parameter: SampleTime

Type: character vector

Values: Any valid sample time

Default: '-1'

Signal type – Complexity of signal

auto (default) | real | complex

Specify the complexity of the input and output signals.

- auto — Accepts either real or complex as the numeric type.
- real — Specifies the numeric type as a real number.
- complex — Specifies the numeric type as a complex number.

Programmatic Use

Parameter: SignalType

Type: character vector

Values: 'auto' | 'real' | 'complex'

Default: 'auto'

Block Characteristics

Data Types	Boolean bus double enumerated fixed point half integer single string

Simulink Function

Function defined with Simulink blocks

Library: Simulink / User-Defined Functions
SimEvents

Description

The Simulink Function block is a Subsystem block preconfigured as a starting point for graphically defining a function with Simulink blocks. The block provides a text interface to function callers. You can call a Simulink Function block from a Function Caller block, a MATLAB Function block, or a Stateflow Chart.

For a description of the block parameters, see the Subsystem block reference page in the Simulink documentation.

You can visualize Simulink Function calls in the Sequence Viewer. The viewer shows when calls were made with the argument and the return values. See Sequence Viewer block reference.

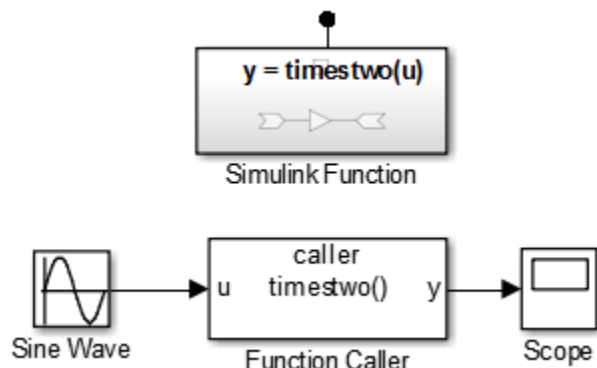

You can select a Simulink Function or Function Caller block to highlight blocks related to it.

Function Interface

The function interface appears on the face of a Simulink Function block. Editing the block text adds and deletes Argument Inport blocks and Argument Outport blocks from the function definition. Editing also sets the **Function name** parameter in the Trigger block within the Simulink Function block.

For example, entering $y = \text{myfunction}(u)$ on the face of a Simulink Function block adds one Argument Inport block (u) and one Argument Outport block (y) within the subsystem.

When calling a function using a Function Caller block, the parameter **Function prototype** in the Function Caller block must match exactly the function interface you specify on the Simulink Function block. This match includes the name of the function and the names of input and output arguments. For example, the Simulink Function block and the Function Caller block both use the argument names u and y .

When calling a function from a Stateflow transition or state label, you can use different argument names. For example, the Simulink Function block uses *x* and *y* arguments while the Stateflow transition uses *x2* and *y2* arguments to call the function.

Function-Call Subsystems Versus Simulink Function Blocks

In general, a Function-Call Subsystem block provides better signal traceability with direct signal connections than a Simulink Function block. While a Simulink Function block eliminates the need for routing input and output signal lines through the model hierarchy.

Attribute	Function-Call Subsystem block	Simulink Function block
Method of executing/invoking function	Triggered using a signal line	Called by reference using the function name
Formal input arguments (Argument Inport blocks) and output arguments (Argument Outport blocks)	No	Yes
Local inputs (Inport block) and outputs (Outport block)	Yes	Yes

Ports

Input

In — Signal input to a subsystem block

scalar | vector | matrix

Placing an Inport block in a subsystem block adds an external input port to the Simulink Function block. The port label matches the name of the Inport block.

Use Inport blocks to get signals from the local environment.

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus | struct

ArgIn — Argument input to a subsystem block

scalar | vector | matrix

An Argument Inport block in a subsystem block provides an input port corresponding to an input argument. A port is not displayed on the subsystem block.

Data Types: `single` | `double` | `half` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point` | `enumerated` | `bus` | `struct`

Output

Out — Signal output from a subsystem

`scalar` | `vector` | `matrix`

Placing an Outport block in a subsystem block adds an output port from the block. The port label on the subsystem block is the name of the Outport block.

Use Outport blocks to send signals to the local environment.

Data Types: `single` | `double` | `half` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point` | `enumerated` | `bus` | `struct`

ArgOut — Argument output from a subsystem block

`scalar` | `vector` | `matrix`

An Argument Outport block in a subsystem block provides an output port corresponding to an out put argument. A port is not displayed on the subsystem block.

Data Types: `single` | `double` | `half` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point` | `enumerated` | `bus` | `struct`

Sine, Cosine

Implement fixed-point sine or cosine wave using lookup table approach that exploits quarter wave symmetry

Library: Simulink / Lookup Tables

Description

The Sine and Cosine block implements a sine and/or cosine wave in fixed point using a lookup table method that exploits quarter wave symmetry. The block can output the following functions of the input signal, depending upon what you select for the **Output formula** parameter:

- $\sin(2\pi u)$
- $\cos(2\pi u)$
- $\exp(j2\pi u)$
- $\sin(2\pi u)$ and $\cos(2\pi u)$

You define the number of lookup table points in the **Number of data points for lookup table** parameter. The block implementation is most efficient when you specify the lookup table data points to be $(2^n)+1$, where n is an integer.

Use the **Output word length** parameter to specify the word length of the fixed-point output data type. The fraction length of the output is the output word length minus 2.

Ports

Input

u — Input signal to implement as fixed-point sine or cosine wave

real-valued signal

Input signal, u , specified as a real-valued scalar, vector, or matrix.

Tip To obtain meaningful block output, the block input values should fall within the range $[0, 1)$. For input values that fall outside this range, the values are cast to an unsigned data type, where overflows wrap. For these out-of-range inputs, the block output might not be meaningful.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point`

Output

`sin(2*pi*u)` — Fixed-point sine wave

real-valued fixed-point signal

Fixed-point sine wave, implemented using a lookup table approach.

Dependencies

This port is enabled when the **Output formula** is set to `sin(2*pi*u)` or `sin(2*pi*u)` and `cos(2*pi*u)`.

Data Types: `fixed point`

`cos(2*pi*u)` — Fixed-point cosine wave

real-valued fixed-point signal

Fixed-point cosine wave, implemented using a lookup table approach.

Dependencies

This port is enabled when the **Output formula** is set to `cos(2*pi*u)` or `sin(2*pi*u)` and `cos(2*pi*u)`.

Data Types: `fixed point`

`exp(j*2*pi*u)` — `exp(j*2*pi*u)`

complex-valued fixed-point signal

`exp(j*2*pi*u)`, implemented using a lookup table approach.

Dependencies

This port is enabled when the **Output formula** is set to `exp(j*2*pi*u)`.

Data Types: `fixed point`

Parameters

Output formula — Select the signal(s) to output

`cos(2*pi*u)` | `sin(2*pi*u)` | `exp(j*2*pi*u)` | `sin(2*pi*u)` and `cos(2*pi*u)`

Programmatic Use

Block Parameter: `Formula`

Values: `'sin(2*pi*u)'` | `'cos(2*pi*u)'` | `'exp(j*2*pi*u)'` | `'sin(2*pi*u) and cos(2*pi*u)'`

Number of data points for lookup table — Specify the number of data points to retrieve from the lookup table

$(2^5)+1$ (default) | integer, greater than or equal to 2

The implementation is most efficient when you specify the lookup table data points to be $(2^n)+1$, where n is an integer. To be compatible with the **Output word length** parameter, the **Number of data points for lookup table** must be less than or equal to $(2^{(\text{Output word length}-2)}+1)$.

Programmatic Use**Block Parameter:** NumDataPoints**Type:** scalar**Value:** integer ≥ 2 **Default:** '(2⁵)+1'**Output word length — Specify the word length for the fixed-point data type of the output signal**

16 (default) | integer from 2 to 53

The fraction length of the output is the output word length minus 2. To be compatible with the **Number of data points for lookup table** parameter, $(2^{(\text{Output word length} - 2) + 1})$ must be greater than or equal to **Number of data points for lookup table**.

Note The block uses double-precision floating-point values to construct lookup tables. Therefore, the maximum amount of precision you can achieve in your output is 53 bits. Setting the word length to values greater than 53 bits does not improve the precision of your output.

Programmatic Use**Block Parameter:** OutputWordLength**Type:** scalar**Value:** integer from 2 to 53**Default:** '16'**Internal rule priority for lookup table — Specify the internal rule for intermediate calculations**

Speed (default) | Precision

Select Speed for faster calculations. If you do, a loss of accuracy might occur, usually up to 2 bits.

Programmatic Use**Block Parameter:** InternalRulePriority**Values:** 'Speed' | 'Precision'**Default:** 'Speed'**Block Characteristics**

Data Types	Boolean double fixed point integer single
Direct Feedthrough	no
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities**C/C++ Code Generation**

Generate C and C++ code using Simulink® Coder™.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

HDL Architecture

The HDL code implements Cosine and Sine blocks by using the quarter-wave lookup table that you specify in the Simulink block parameters.

To avoid generating a division operator (/) in the HDL code, for **Number of data points for lookup table**, enter $(2^n)+1$. n is an integer.

HDL Block Properties

ConstrainedOutputPipeline	Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is 0. For more details, see “ConstrainedOutputPipeline” (HDL Coder).
InputPipeline	Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “InputPipeline” (HDL Coder).
OutputPipeline	Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “OutputPipeline” (HDL Coder).

Limitations

If you use Intel MAX 10 device, to map the lookup table to RAM, add this Tcl command when creating the project in the Quartus tool:

```
set_global_assignment -name INTERNAL_FLASH_UPDATE_MODE "SINGLE IMAGE WITH ERAM"
```

Introduced before R2006a

Sine Wave

Generate sine wave, using simulation time as time source

Library: Simulink / Sources

Description

The Sine Wave block outputs a sinusoidal waveform. The block can operate in time-based or sample-based mode.

Note This block is the same as the Sine Wave Function block that appears in the Math Operations library. If you select Use external signal for the **Time** parameter in the block dialog box, you get the Sine Wave Function block.

Time-Based Mode

The block calculates the output waveform.

$$y = \textit{amplitude} \times \sin(\textit{frequency} \times \textit{time} + \textit{phase}) + \textit{bias} .$$

In time-based mode, the value of the **Sample time** parameter determines whether the block operates in continuous mode or discrete mode.

- 0 (the default) causes the block to operate in continuous mode.
- >0 causes the block to operate in discrete mode.

For more information, see “Specify Sample Time”.

Block Behavior in Continuous Mode

When operating in continuous mode, the Sine Wave block can become inaccurate due to loss of precision as time becomes very large.

Block Behavior in Discrete Mode

A **Sample time** parameter value greater than zero causes the block to behave as if it were driving a Zero-Order Hold block whose sample time is set to that value.

This way, you can build models with sine wave sources that are purely discrete, rather than models that are hybrid continuous/discrete systems. Hybrid systems are inherently more complex and as a result take more time to simulate.

In discrete mode, this block uses a differential incremental algorithm instead of one based on absolute time. As a result, the block can be useful in models intended to run for an indefinite length of time, such as in vibration or fatigue testing.

The differential incremental algorithm computes the sine based on the value computed at the previous sample time. This method uses the following trigonometric identities:

$$\begin{aligned} \sin(t + \Delta t) &= \sin(t)\cos(\Delta t) + \sin(\Delta t)\cos(t) \\ \cos(t + \Delta t) &= \cos(t)\cos(\Delta t) - \sin(t)\sin(\Delta t) \end{aligned}$$

In matrix form, these identities are:

$$\begin{bmatrix} \sin(t + \Delta t) \\ \cos(t + \Delta t) \end{bmatrix} = \begin{bmatrix} \cos(\Delta t) & \sin(\Delta t) \\ -\sin(\Delta t) & \cos(\Delta t) \end{bmatrix} \begin{bmatrix} \sin(t) \\ \cos(t) \end{bmatrix}$$

Because Δt is constant, the following expression is a constant:

$$\begin{bmatrix} \cos(\Delta t) & \sin(\Delta t) \\ -\sin(\Delta t) & \cos(\Delta t) \end{bmatrix}$$

Therefore, the problem becomes one of a matrix multiplication of the value of $\sin(t)$ by a constant matrix to obtain $\sin(t + \Delta t)$.

Discrete mode reduces but does not eliminate the accumulation of round-off errors, for example, ($4 \cdot \text{eps}$). This accumulation can happen because computation of the block output at each time step depends on the value of the output at the previous time step.

Methods to Handle Round-Off Errors in Discrete Mode

To handle round-off errors when the Sine Wave block operates in time-based discrete mode, use one of these methods.

Method	Rationale
Insert a Saturation block directly downstream of the Sine Wave block.	By setting saturation limits on the Sine Wave block output, you can remove overshoot due to accumulation of round-off errors.
Set up the Sine Wave block to use the <code>sin()</code> math library function to calculate block output. <ol style="list-style-type: none"> 1 On the Sine Wave block dialog box, set Time to Use external signal so that an input port appears on the block icon. 2 Connect a clock signal to this input port using a Digital Clock block. 3 Set the sample time of the clock signal to the sample time of the Sine Wave block. 	The <code>sin()</code> math library function computes block output at each time step <i>independently</i> of output values from other time steps, preventing the accumulation of round-off errors.

Sample-Based Mode

Sample-based mode uses this formula to compute the output of the Sine Wave block.

$$y = A\sin(2\pi(k + o)/p) + b$$

- A is the amplitude of the sine wave.
- p is the number of time samples per sine wave period.
- k is a repeating integer value that ranges from 0 to $p-1$.
- o is the offset (phase shift) of the signal.
- b is the signal bias.

In this mode, Simulink sets k equal to θ at the first time step and computes the block output, using the formula. At the next time step, Simulink increments k and recomputes the output of the block. When k reaches p , Simulink resets k to θ before computing the block output. This process continues until the end of the simulation.

The sample-based method of computing block output at a given time step does not depend on the output of the previous time steps. Therefore, this mode avoids the accumulation of round-off errors. Sample-based mode supports reset semantics in subsystems that offer it. For example, if a Sine Wave block is in a resettable subsystem that receives a reset trigger, the repeating integer k resets and the block output resets to its initial condition.

Ports

Output

Port_1 — Sine wave output signal

scalar | vector

Output sine wave signal created based on the block parameter values.

Data Types: double

Parameters

Sine type — Type of sine wave

Time based (default) | Sample based

Specify the type of sine wave that this block generates. Some parameters in the dialog box appear depending on whether you select time-based or sample-based.

Programmatic Use

Block Parameter: SineType

Type: character vector

Values: 'Time based' | 'Sample based'

Default: 'Time based'

Time (t) — Source of time variable

Use simulation time (default) | Use external signal

Specify whether to use simulation time as the source of values for the time variable, or an external source. If you specify an external time source, the block creates an input port for the time source. When you select an external time source, the block is the same as the Sine Wave Function block.

Programmatic Use

Block Parameter: TimeSource

Type: character vector

Values: 'Use simulation time' | 'Use external signal'

Default: 'Use simulation time'

Amplitude — Amplitude of the sine wave

1 (default) | scalar | vector

Specify the amplitude of the output sine wave signal.

Programmatic Use**Block Parameter:** Amplitude**Type:** character vector**Value:** scalar**Default:** '1'**Bias — Constant added to sine wave** θ (default) | scalar | vector

Specify the constant value added to the sine to produce the output.

Programmatic Use**Block Parameter:** Bias**Type:** character vector**Value:** scalar**Default:** '0'**Frequency (rad/sec) — Frequency of sine wave**

1 (default) | scalar | vector

Specify the frequency, in rad/sec.

Dependencies

To enable this parameter, set **Sine type** to Time based.

Programmatic Use**Block Parameter:** Frequency**Type:** character vector**Value:** scalar**Default:** '1'**Phase (rad) — Phase shift of sine wave** θ (default) | scalar | vector

Specify the phase shift of the sine wave.

You cannot configure this parameter to appear in the generated code as a tunable global variable if you set **Time (t)** to Use simulation time. For example, if you set **Default parameter behavior** to Tunable or apply a storage class to a Simulink.Parameter object, the **Phase** parameter does not appear in the generated code as a tunable global variable.

To generate code so that you can tune the phase during execution, set **Time (t)** to Use external signal. You can provide your own time input signal or use a Digital Clock block to generate the time signal. For an example, see “Tune Phase Parameter of Sine Wave Block During Code Execution” (Simulink Coder).

Dependencies

To enable this parameter, set **Sine type** to Time based.

Programmatic Use**Block Parameter:** Phase**Type:** character vector**Value:** scalar**Default:** '0'

Samples per period — Samples per period

0 (default) | integer scalar | integer vector

Specify the number of samples per period.

Dependencies

To enable this parameter, set **Sine type** to Sample based.

Programmatic Use**Block Parameter:** Samples**Type:** character vector**Value:** scalar**Default:** '10'**Number of offset samples — Offset in number of time samples**

0 (default) | integer scalar | integer vector

Specify the offset (discrete phase shift) in number of sample times.

Dependencies

To enable this parameter, set **Sine type** to Sample based.

Programmatic Use**Block Parameter:** Offset**Type:** character vector**Value:** scalar**Default:** '0'**Sample time — Sample period**

0 (default) | scalar | vector

Specify the sample period in seconds. The default is 0. If the sine type is sample-based, the sample time must be greater than 0. See “Specify Sample Time”.

Programmatic Use**Block Parameter:** SampleTime**Type:** character vector**Value:** scalar**Default:** '0'**Interpret vector parameters as 1-D — Output dimensions for one-row or one-column matrices**

off (default) | on

Specify the output dimensions to be a 1-D vector signal when other parameters are one-row and one-column matrices. If you do not select this box, the block outputs a signal of the same dimensionality as the numeric parameters. See “Determine the Output Dimensions of Source Blocks”. This parameter is not available when an external signal specifies time. In this case, if numeric parameters are column or row matrix values, the output is a 1-D vector.

Programmatic Use**Block Parameter:** VectorParams1D**Type:** character vector**Values:** 'off' | 'on'

Default: 'on'

Block Characteristics

Data Types	double
Direct Feedthrough	yes
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Depends on absolute time when placed inside a triggered subsystem hierarchy. These blocks do not reference absolute time when configured for sample-based operation. In time-based operation, they depend on absolute time.

Sine Wave Function

Generate sine wave, using external signal as time source

Library: Simulink / Math Operations

Description

The Sine Wave Function block outputs a sinusoidal waveform. The block can operate in time-based or sample-based mode.

Note This block is the same as the Sine Wave block that appears in the Math Operations library. If you select Use `simulation time` for the **Time** parameter in the block dialog box, you get the Sine Wave Function block.

Time-Based Mode

The block calculates the output waveform.

$$y = \text{amplitude} \times \sin(\text{frequency} \times \text{time} + \text{phase}) + \text{bias}.$$

In time-based mode, the value of the **Sample time** parameter determines whether the block operates in continuous mode or discrete mode.

- 0 (the default) causes the block to operate in continuous mode.
- >0 causes the block to operate in discrete mode.

For more information, see “Specify Sample Time”.

Block Behavior in Continuous Mode

When operating in continuous mode, the Sine Wave block can become inaccurate due to loss of precision as time becomes very large.

Block Behavior in Discrete Mode

A **Sample time** parameter value greater than zero causes the block to behave as if it were driving a Zero-Order Hold block whose sample time is set to that value.

This way, you can build models with sine wave sources that are purely discrete, rather than models that are hybrid continuous/discrete systems. Hybrid systems are inherently more complex and as a result take more time to simulate.

In discrete mode, this block uses a differential incremental algorithm instead of one based on absolute time. As a result, the block can be useful in models intended to run for an indefinite length of time, such as in vibration or fatigue testing.

The differential incremental algorithm computes the sine based on the value computed at the previous sample time. This method uses the following trigonometric identities:

$$\begin{aligned} \sin(t + \Delta t) &= \sin(t)\cos(\Delta t) + \sin(\Delta t)\cos(t) \\ \cos(t + \Delta t) &= \cos(t)\cos(\Delta t) - \sin(t)\sin(\Delta t) \end{aligned}$$

In matrix form, these identities are:

$$\begin{bmatrix} \sin(t + \Delta t) \\ \cos(t + \Delta t) \end{bmatrix} = \begin{bmatrix} \cos(\Delta t) & \sin(\Delta t) \\ -\sin(\Delta t) & \cos(\Delta t) \end{bmatrix} \begin{bmatrix} \sin(t) \\ \cos(t) \end{bmatrix}$$

Because Δt is constant, the following expression is a constant:

$$\begin{bmatrix} \cos(\Delta t) & \sin(\Delta t) \\ -\sin(\Delta t) & \cos(\Delta t) \end{bmatrix}$$

Therefore, the problem becomes one of a matrix multiplication of the value of $\sin(t)$ by a constant matrix to obtain $\sin(t + \Delta t)$.

Discrete mode reduces but does not eliminate the accumulation of round-off errors, for example, $(4 * \text{eps})$. This accumulation can happen because computation of the block output at each time step depends on the value of the output at the previous time step.

Methods to Handle Round-Off Errors in Discrete Mode

To handle round-off errors when the Sine Wave block operates in time-based discrete mode, use one of these methods.

Method	Rationale
Insert a Saturation block directly downstream of the Sine Wave block.	By setting saturation limits on the Sine Wave block output, you can remove overshoot due to accumulation of round-off errors.
Set up the Sine Wave block to use the <code>sin()</code> math library function to calculate block output. 1 On the Sine Wave block dialog box, set Time to Use external signal so that an input port appears on the block icon. 2 Connect a clock signal to this input port using a Digital Clock block. 3 Set the sample time of the clock signal to the sample time of the Sine Wave block.	The <code>sin()</code> math library function computes block output at each time step <i>independently</i> of output values from other time steps, preventing the accumulation of round-off errors.

Sample-Based Mode

Sample-based mode uses this formula to compute the output of the Sine Wave block.

$$y = A\sin(2\pi(k + o)/p) + b$$

- A is the amplitude of the sine wave.
- p is the number of time samples per sine wave period.
- k is a repeating integer value that ranges from 0 to $p-1$.

- o is the offset (phase shift) of the signal.
- b is the signal bias.

In this mode, Simulink sets k equal to θ at the first time step and computes the block output, using the formula. At the next time step, Simulink increments k and recomputes the output of the block. When k reaches p , Simulink resets k to θ before computing the block output. This process continues until the end of the simulation.

The sample-based method of computing block output at a given time step does not depend on the output of the previous time steps. Therefore, this mode avoids the accumulation of round-off errors. Sample-based mode supports reset semantics in subsystems that offer it. For example, if a Sine Wave block is in a resettable subsystem that receives a reset trigger, the repeating integer k resets and the block output resets to its initial condition.

Ports

Input

Port_1 — Time source signal

scalar

Input signal representing the time source in the sine wave calculation.

Data Types: double

Output

Output 1 — Output sine wave signal

scalar

Output signal that is the created sine wave.

Data Types: double

Parameters

Sine type — Type of sine wave

Time based (default) | Sample based

Specify the type of sine wave that this block generates. Some parameters in the dialog box appear depending on whether you select time-based or sample-based.

Programmatic Use

Block Parameter: SineType

Type: character vector

Values: 'Time based' | 'Sample based'

Default: 'Time based'

Time (t) — Source of time variable

Use external signal (default) | Use simulation time

Specify whether to use simulation time as the source of values for the time variable, or an external source. If you specify an external time source, the block creates an input port for the time source.

Programmatic Use**Block Parameter:** TimeSource**Type:** character vector**Values:** 'Use simulation time' | 'Use external signal'**Default:** 'Use external signal'**Amplitude — Amplitude of the sine wave**

1 (default) | scalar

Specify the amplitude of the output sine wave signal.

Programmatic Use**Block Parameter:** Amplitude**Type:** character vector**Value:** scalar**Default:** '1'**Bias — Constant added to sine wave**

0 (default) | scalar

Specify the constant value added to the sine to produce the output.

Programmatic Use**Block Parameter:** Bias**Type:** character vector**Value:** scalar**Default:** '0'**Frequency (rad/sec) — Frequency of sine wave**

1 (default) | scalar

Specify the frequency, in radians per second.

Dependency

To enable this parameter, set **Sine type** to Time based.

Programmatic Use**Block Parameter:** Frequency**Type:** character vector**Value:** scalar**Default:** '1'**Phase (rad) — Phase shift of sine wave**

0 (default) | scalar

Specify the phase shift of the sine wave.

You cannot configure this parameter to appear in the generated code as a tunable global variable if you set **Time (t)** to Use simulation time. For example, if you set **Default parameter behavior** to Tunable or apply a storage class to a Simulink.Parameter object, the **Phase** parameter does not appear in the generated code as a tunable global variable.

To generate code so that you can tune the phase during execution, set **Time (t)** to Use external signal. You can provide your own time input signal or use a Digital Clock block to generate the time signal. For an example, see “Tune Phase Parameter of Sine Wave Block During Code Execution” (Simulink Coder).

Dependencies

To enable this parameter, set **Sine type** to Time based.

Programmatic Use

Block Parameter: Phase

Type: character vector

Value: scalar

Default: '0'

Samples per period — Samples per period

0 (default) | integer

Specify the number of samples per period.

Dependencies

To enable this parameter, set **Sine type** to Sample based.

Programmatic Use

Block Parameter: Samples

Type: character vector

Value: scalar

Default: '10'

Number of offset samples — Offset in number of time samples

0 (default) | integer

Specify the offset (discrete phase shift) in number of sample times.

Dependencies

To enable this parameter, set **Sine type** to Sample based.

Programmatic Use

Block Parameter: Offset

Type: character vector

Value: scalar

Default: '0'

Sample time — Sample period

0 (default) | scalar

Specify the sample period in seconds. The default is 0. If the sine type is sample-based, the sample time must be greater than 0. See “Specify Sample Time”.

Programmatic Use

Block Parameter: SampleTime

Type: character vector

Value: scalar

Default: '0'

Interpret vector parameters as 1-D — Output dimensions for one-row or one-column matrices

off (default) | on

Specify the output dimensions to be a 1-D vector signal when other parameters are one-row and one-column matrices. If you do not select this box, the block outputs a signal of the same dimensionality

as the numeric parameters. See “Determine the Output Dimensions of Source Blocks”. This parameter is not available when an external signal specifies time. In this case, if numeric parameters are column or row matrix values, the output is a 1-D vector.

Programmatic Use**Block Parameter:** VectorParams1D**Type:** character vector**Values:** 'off' | 'on'**Default:** 'on'**Block Characteristics**

Data Types	double
Direct Feedthrough	yes
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities**C/C++ Code Generation**

Generate C and C++ code using Simulink® Coder™.

Depends on absolute time when placed inside a triggered subsystem hierarchy. These blocks do not reference absolute time when configured for sample-based operation. In time-based operation, they depend on absolute time.

Slider

Tune parameter value with sliding scale

Library: Simulink / Dashboard

Description

The Slider block tunes the value of the connected block parameter during simulation. For example, you can connect the Slider block to a Gain block in your model and adjust its value during simulation. You can modify the range of the Slider block's scale to fit your data. Use the Slider block with other Dashboard blocks to create an interactive dashboard to control your model.

Connect Dashboard Blocks

Dashboard blocks do not use ports to connect to model elements. To connect dashboard blocks to variables and block parameters, use connect mode. Connect mode facilitates the process of connecting dashboard blocks in your model, especially when you want to connect multiple blocks at once. To connect a single dashboard block, you can also use the **Connection** table in the block dialog box.

Tip You can modify dashboard block connections in your model during normal and accelerator mode simulations.

Note Dashboard blocks cannot connect to variables until you update the model diagram. To connect dashboard blocks to variables or modify variable values between opening your model and running a simulation, update the model diagram using **Ctrl+D**.

To enter connect mode, select the block. Then, on the block tab, click **Connect**. In connect mode, when you select one or more blocks, a list of parameters and variables available for connection appears. Select a variable or parameter from the list to connect to the selected dashboard block.

When the value of the selected variable or block parameter is nonscalar, use the text box at the bottom of the **Connection** table to specify the element you want to connect to the dashboard block. To connect to an element of a vector, matrix, or array, specify the element index, for example, 3 or (1, 3). To connect to an element in a bus or structure, specify the element in the context of the bus or structure hierarchy by using dots to indicate different levels in the hierarchy, and omit the top level. For example, specify a.b to connect to scalar element b of the structure or bus a nested inside the selected composite variable or parameter.

To connect another dashboard block, pause on another dashboard block and click the **Connect** button above it. Then, make a selection of signals and blocks in your model and choose a model element to connect.

When you finish connecting the dashboard blocks in your model, on the block tab, click **Done Connecting**.

Tip You can hide the message shown on unconnected blocks using the `set_param` function with the `ShowInitialText` block parameter. The message also disappears when you connect the block.

Parameter Logging

Tunable parameters connected to dashboard blocks are logged to the Simulation Data Inspector, where you can view the parameter values along with logged signal data. You can access logged parameter data in the MATLAB workspace by exporting the parameter data from the Simulation Data Inspector by using the UI or the `Simulink.sdi.exportRun` function. For more information about exporting data using the Simulation Data Inspector UI, see “Export Data from the Simulation Data Inspector”. The parameter data is stored in a `Simulink.SimulationData.Parameter` object, accessible as an element in the exported `Simulink.SimulationData.Dataset`.

Limitations

- Except for the Dashboard Scope block and the Display block, dashboard blocks can only connect to real scalar signals.
- The toolstrip does not support blocks that are inside a panel.
- You cannot use the **Connection** table in the block dialog to connect a dashboard block to a block that is commented out. When you connect a dashboard block to a commented block using connect mode, the dashboard block does not display the connected value until the you uncomment the block.
- Dashboard blocks cannot connect to model elements inside referenced models.

- When you simulate a model hierarchy, dashboard blocks inside referenced models do not update.
- Dashboard blocks do not support rapid accelerator simulation.
- When you connect a dashboard block to a variable or parameter during simulation, the data for that variable or parameter is not logged to the Simulation Data Inspector. To log variable and parameter data to the Simulation Data Inspector, connect the dashboard block to the variable or parameter prior to simulation.
- When you simulate a model in external mode with the **Default parameter behavior** set to **Inlined**, dashboard blocks can appear to change parameter and variable values. However, the change does not propagate to the simulation. For example, Gain blocks display changes made to the **Gain** parameter using the dashboard blocks, but the **Gain** value used in the simulation does not change.

Parameters

Connection — Select a variable or block parameter to connect

variable and parameter connection options

Select the variable or block parameter to control using the **Connection** table. To connect the block to a signal:

- 1 Make a selection in the model that includes one or more blocks.
- 2 Select the variable or parameter you want to connect.

When the value of the selected variable or block parameter is nonscalar, use the text box at the bottom of the **Connection** table to specify the element you want to connect to the dashboard block. To connect to an element of a vector, matrix, or array, specify the element index, for example, 3 or (1, 3). To connect to an element in a bus or structure, specify the element in the context of the bus or structure hierarchy by using dots to indicate different levels in the hierarchy, and omit the top level. For example, specify `a.b` to connect to scalar element `b` of the structure or bus `a` nested inside the selected composite variable or parameter.

- 3 Click **Apply**.

To facilitate understanding and debugging your model, you can connect Dashboard blocks to variables and parameters in your model during simulation.

Note To see workspace variables in the connection table, update the model diagram using **Ctrl+D**.

Programmatic Use

To programmatically connect a dashboard block to a tunable parameter or a variable, use a `Simulink.HMI.ParamSourceInfo` object. The `Simulink.HMI.ParamSourceInfo` object contains four properties. Some of the properties apply to connecting dashboard blocks to parameters, and some apply to connecting dashboard blocks to variables. Not all fields have a value for a connection because a given dashboard block connects to either a parameter or a variable.

Block Parameter: Binding

Type: `Simulink.HMI.ParamSourceInfo`

Default: []

Scale Type — Type of scale

Linear (default) | Log

Type of scale displayed on the block. **Linear** specifies a linear scale, and **Log** specifies a logarithmic scale.

Programmatic Use

Block Parameter: ScaleType

Type: string or character vector

Values: 'Linear' | 'Log'

Default: 'Linear'

Minimum — Minimum tick mark value

0 (default) | scalar

Finite, real, double, scalar value specifying the minimum tick mark value for the scale. The minimum must be less than the value of the **Maximum** parameter.

Programmatic Use

To programmatically set the Minimum parameter, use a 1-by-3 vector containing values for the Minimum, Tick Interval, and Maximum parameters, in that order. To use the `auto` value for the Tick Interval, leave the Tick Interval position in the vector empty or specify `-1`.

Block Parameter: Limits

Type: 1×3 vector

Default: [0 -1 100]

Maximum — Maximum tick mark value

100 (default) | scalar

Finite, real, double, scalar value specifying the maximum tick mark value for the scale. The maximum must be greater than the value of the **Minimum** parameter.

Programmatic Use

To programmatically set the Maximum parameter, use a 1-by-3 vector containing values for the Minimum, Tick Interval, and Maximum parameters, in that order. To use the `auto` value for the Tick Interval, leave the Tick Interval position in the vector empty or specify `-1`.

Block Parameter: Limits

Type: 1×3 vector

Default: [0 -1 100]

Tick Interval — Interval between major tick marks

auto (default) | scalar

Finite, real, positive, whole, scalar value specifying the interval of major tick marks on the scale. When set to `auto`, the block automatically adjusts the tick interval based on the values of the **Maximum** and **Minimum** parameters.

Programmatic Use

To programmatically set the Tick Interval parameter, use a 1-by-3 vector containing values for the Minimum, Tick Interval, and Maximum parameters, in that order. To use the `auto` value for the Tick Interval, leave the Tick Interval position in the vector empty or specify `-1`.

Block Parameter: Limits

Type: 1×3 vector

Default: [0 -1 100]

Label — Block label position

Top (default) | Bottom | Hide

Position of the block label. When the block is connected to an element in the model, the label is the name of the connected element.

Programmatic Use**Block Parameter:** LabelPosition**Type:** character vector**Values:** 'Top' | 'Bottom' | 'Hide'**Default:** 'Top'**Block Characteristics**

Data Types	double half integer single
Direct Feedthrough	no
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities**C/C++ Code Generation**

Generate C and C++ code using Simulink® Coder™.

Dashboard blocks are ignored for code generation.

Slider Gain

Vary scalar gain using slider

Library: Simulink / Math Operations

Description

The Slider Gain block performs a scalar gain that you can modify during simulation. Modify the gain using the slider parameter.

Ports

Input

Port_1 – Input signal

scalar | vector | matrix

The Slider Gain block accepts real or complex-valued scalar, vector, or matrix input. The block supports fixed-point data types.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

Output

Port_1 – Input multiplied by gain

scalar | vector | matrix

The Slider Gain block outputs the input multiplied by a constant gain value. When the input to the block is real and gain is complex, the output is complex.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

Parameters

Slider gain – Gain value

0 (default) | real value

Chose the gain value applied to the input.

Programmatic Use

Block Parameter: gain

Type: character vector

Values: real scalar

Default: '1'

Low — Lower limit of slider range

0 (default) | real value

Specify the lower limit of the slider range.

Programmatic Use**Block Parameter:** low**Type:** character vector**Values:** real scalar**Default:** '0'**High — Upper limit of slider range**

2 (default) | real value

Specify the upper limit of the slider range.

Programmatic Use**Block Parameter:** high**Type:** character vector**Values:** real scalar**Default:** '2'**Block Characteristics**

Data Types	Boolean double fixed point integer single
Direct Feedthrough	no
Multidimensional Signals	yes
Variable-Size Signals	yes
Zero-Crossing Detection	no

Extended Capabilities**C/C++ Code Generation**

Generate C and C++ code using Simulink® Coder™.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Gain

Introduced before R2006a

Spectrum Analyzer

Display frequency spectrum

Library: DSP System Toolbox / Sinks
DSP System Toolbox HDL Support / Sinks

Description

The Spectrum Analyzer block, referred to here as the scope, displays the frequency spectra of signals.

You can use the Spectrum Analyzer block in models running in Normal or Accelerator simulation modes. You can also use the Spectrum Analyzer block in models running in Rapid Accelerator or External simulation modes, with some limitations.

You can use the Spectrum Analyzer block inside all subsystems and conditional subsystems. Conditional subsystems include enabled subsystems, triggered subsystems, enabled and triggered subsystems, and function-call subsystems. See “Conditionally Executed Subsystems Overview” for more information.

Measurements

- Cursors (DSP System Toolbox) — Measure signal values using vertical and horizontal cursors.

- Peak Finder (DSP System Toolbox) — Find maxima, showing the x-axis values at which they occur.
- Channel Measurements (DSP System Toolbox) — Measure the occupied bandwidth or adjacent channel power ratio (ACPR).
- Distortion Measurements (DSP System Toolbox) — Measure harmonic distortion and intermodulation distortion.
- CCDF Measurements (DSP System Toolbox) — Measure the complimentary cumulative distribution function. CCDF measurements show the probability of a signal's instantaneous power being a specified level above the signal's average power.
- “Spectral Masks” (DSP System Toolbox) — Visualize spectrum limits and compare spectrum values to specification values.

Programmatic Control

You can configure and display Spectrum Analyzer settings from the command line with the `SpectrumAnalyzerConfiguration` object.

Ports

Input

Port_1 — Signals to visualize

scalar | vector | matrix | array

Connect the signals you want to visualize. You can have up to 96 input ports. Input signals can have these characteristics:

- **Signal Domain** — Frequency or time signals
- **Type** — Discrete (sample-based and frame-based).
- **Data type** — Any data type that Simulink supports. See “Data Types Supported by Simulink”.
- **Dimension** — One dimensional (vector), two dimensional (matrix), or multidimensional (array). Input must have fixed number of channels. See “Signal Dimensions” and “Determine Signal Dimensions”.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Parameters

Spectrum Settings

The **Spectrum Settings** pane appears at the right side of the Spectrum Analyzer window. These settings control how the spectrum is calculated. To show the Spectrum Settings, in the Spectrum

Analyzer menu, select **View > Spectrum Settings** or use the  button in the toolbar.

Main options

Input domain — Domain of the input signal

Time (default) | Frequency

The domain of the input signal you want to visualize. If you visualize time-domain signals, the signal is transformed to the frequency spectrum based on the algorithm specified by the `Method` parameter.

Programmatic Use

See InputDomain.

Type — Type of spectrum to display

Power (default) | Power density | RMS

Power — Spectrum Analyzer shows the power spectrum.

Power density — Spectrum Analyzer shows the power spectral density. The power spectral density is the magnitude of the spectrum normalized to a bandwidth of 1 hertz.

RMS — Spectrum Analyzer shows the root mean squared spectrum.

Tunable: Yes

Programmatic Use

See .

View — Spectrum view

Spectrum (default) | Spectrogram | Spectrum and spectrogram

Spectrum — Spectrum Analyzer shows the spectrum.

Spectrogram — Spectrum Analyzer shows the spectrogram, which displays frequency content over time. The most recent spectrogram update is at the bottom of the display, and time scrolls from the bottom to the top of the display.

Spectrum and spectrogram — Spectrum Analyzer shows both the spectrum and spectrogram.

Tunable: Yes

Programmatic Use

See ViewType.

Sample rate — Sample rate of the input signal in hertz

Inherited (default) | positive scalar

Sample rate of the input signal in hertz, specified as either

- Inherited to use the same sample rate as the input signal.
- Positive scalar. The specified sample rate must be at least twice the input signal sample rate. Otherwise, you might see unexpected behavior in your signal visualization due to aliasing.

Programmatic Use

See SampleRate.

Method — Spectrum estimation method

Filter Bank (default) | Welch

Select Welch or Filter Bank as the spectrum estimation method. For more details about the two spectrum estimation algorithms, see “Algorithms” (DSP System Toolbox).

Tunable: No

Dependency

To use this parameter, set “Input domain” (DSP System Toolbox) to Time.

Programmatic Use

See Method.

Full frequency span — Use entire Nyquist frequency interval

on (default) | off

Select this check box to compute and plot the spectrum over the entire “Nyquist frequency interval” (DSP System Toolbox).

Tunable: Yes

Dependency

To use this parameter, set “Input domain” (DSP System Toolbox) to Time.

Programmatic Use

See FrequencySpan.

Span (Hz) — Frequency span in hertz

10e3 (default) | real positive scalar

Specify the frequency span in hertz. Use this parameter with the CF (Hz) parameter to define the frequency span around a center frequency. This parameter defines the range of values shown on the Frequency axis in the Spectrum Analyzer window.

Tunable: Yes

Dependencies

To use this parameter, you must:

- Set “Input domain” (DSP System Toolbox) to Time.
- Clear the “Full frequency span” (DSP System Toolbox) check box.
- Set the **Span (Hz)/Fstart (Hz)** drop-down to Span (Hz).

Programmatic Use

See FrequencySpan and Span.

CF (Hz) — Center frequency in hertz

0 (default) | scalar

Specify the center frequency, in hertz. Use this parameter with the “Span (Hz)” (DSP System Toolbox) parameter to define the frequency span around a center frequency. This parameter defines the value shown at the middle point of the Frequency axis on the Spectrum Analyzer window.

Tunable: Yes

Dependencies

To use this parameter, you must:

- Set “Input domain” (DSP System Toolbox) to **Time**.
- Clear the “Full frequency span” (DSP System Toolbox) check box.
- Set the **Span (Hz)/Fstart (Hz)** drop-down to “Span (Hz)” (DSP System Toolbox).

Programmatic Use

See `CenterFrequency`.

FStart (Hz) — Start frequency in hertz

-5e3 (default) | scalar

Specify the start frequency in hertz. Use this parameter with the “FStop (Hz)” (DSP System Toolbox) parameter to define the range of frequency-axis values using start frequency and stop frequency. This parameter defines the value shown at the leftmost side of the Frequency axis on the Spectrum Analyzer window.

Tunable: Yes

Dependencies

To use this parameter, you must:

- Set “Input domain” (DSP System Toolbox) to **Time**.
- Clear the “Full frequency span” (DSP System Toolbox) check box.
- Set the **Span (Hz)/FStart (Hz)** drop-down to **FStart (Hz)**.

Programmatic Use

See `StartFrequency`.

FStop (Hz) — Stop frequency in hertz

5e3 (default) | scalar

Specify the stop frequency, in hertz. Use this parameter with the “FStart (Hz)” (DSP System Toolbox) parameter to define the range of Frequency axis values. This parameter defines the value shown at the rightmost side of the Frequency axis on the Spectrum Analyzer window.

Tunable: Yes

Dependencies

To use this parameter, you must:

- Set “Input domain” (DSP System Toolbox) to **Time**.
- Clear the “Full frequency span” (DSP System Toolbox) check box.
- Set the **Span (Hz)/FStart (Hz)** drop-down to “FStart (Hz)” (DSP System Toolbox).

Programmatic Use

See `StopFrequency`.

Frequency (Hz) — Frequency vector

Auto (default) | Input port | monotonically increasing vector

Set the frequency vector which determines the x-axis of the display.

- **Auto** — The frequency vector is calculated from the length of the input. See “Frequency Vector” (DSP System Toolbox).
- **Input port** — When selected, an input port appears on the block for the frequency vector input.
- **Custom vector** — Enter a custom vector as the frequency vector. The length of the custom vector must be equal to the frame size of the input signal.

Tunable: No

Dependency

To use this parameter, set “Input domain” (DSP System Toolbox) to Frequency.

Programmatic Use

See FrequencyVector.

RBW (Hz) — Resolution bandwidth

Auto (default) | Input port | positive scalar

The resolution bandwidth in hertz. This parameter defines the smallest positive frequency that can be resolved. By default, this parameter is set to **Auto**. In this case, the Spectrum Analyzer determines the appropriate value to ensure that there are 1024 RBW intervals over the specified frequency span.

If you set this parameter to a numeric value, the value must allow at least two RBW intervals over the specified frequency span. In other words, the ratio of the overall frequency span to RBW must be greater than two:

$$\frac{span}{RBW} > 2$$

For frequency input only, you can use an input port to set the RBW value.

Tunable: Yes

Dependency

To use this parameter, set either:

- “Input domain” (DSP System Toolbox) to Time and the **RBW (Hz)/Window length/Number of frequency bands** drop-down to RBW (Hz).
- “Input domain” (DSP System Toolbox) to Frequency.

Programmatic Use

See RBW.

Input units — Units of frequency input

Auto (default) | dBm | dBV | dBW | Vrms | Watts

Select the units of the frequency-domain input. This property allows the Spectrum Analyzer to scale frequency data if you choose a different display unit with the “Units” (DSP System Toolbox) property.

Tunable: No

Dependency

This option is only available when “Input domain” (DSP System Toolbox) is set to Frequency.

Programmatic Use

See InputUnits.

Window length — Length of window in samples

1024 (default) | integer greater than 2

The length of the window, in samples. The window length used to control the frequency resolution and compute the spectral estimates. The window length must be an integer greater than 2.

Dependencies

To use this parameter, set:

- “Method” (DSP System Toolbox) to Welch
- Set the **RBW (Hz)/Window length/Number of frequency bands** drop-down to Window Length

Dependency

To use this parameter, set “Input domain” (DSP System Toolbox) to Time.

Programmatic Use

See WindowLength.

Number of frequency bands — FFT length

Auto (default) | positive integer

Specify the fast Fourier transform (FFT) length to control the number of frequency bands. If the value is Auto, the Spectrum Analyzer uses the entire frame size to estimate the spectrum. If you specify the number of frequency bands, you set the input buffer size.

Dependencies

To use this parameter, set:

- “Method” (DSP System Toolbox) to Filter Bank
- Set the **RBW (Hz)/Window length/Number of frequency bands** drop-down to Number of frequency bands

Programmatic Use

See FFTLength

Taps per band — Number of filter taps

12 (default) | positive even integer

Specify the number of filter taps or coefficients for each frequency band. This number must be a positive even integer. This value corresponds to the number of filter coefficients per polyphase branch. The total number of filter coefficients is equal to *Taps Per Band + FFT Length*.

Dependency

To use this parameter, you must set the **RBW (Hz)/Window length/Number of frequency bands** drop-down to “Number of frequency bands” (DSP System Toolbox).

Programmatic Use

See NumTapsPerBand.

NFFT — Number of FFT points

Auto (default) | positive integer

Specify the length of the FFT that Spectrum Analyzer uses to compute spectral estimates. Acceptable options are `Auto` or a positive integer.

The **NFFT** value must be greater than or equal to the value of the **Window length** parameter. By default, when **NFFT** is set to `Auto`, the Spectrum Analyzer sets **NFFT** equal to the value of **Window length**. When in RBW mode, the specified RBW value is used to calculate an FFT length that equals the window length.

When this parameter is set to a positive integer, this parameter is equivalent to the `n` parameter of the `fft` function.

Dependencies

To use this parameter, you must set the **RBW (Hz)/Window length/Number of frequency bands** drop-down to “Window length” (DSP System Toolbox).

Programmatic Use

See `FFTLengh`.

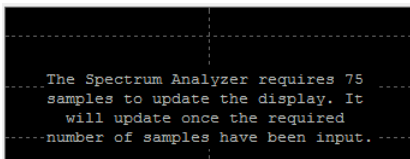

Samples/update — Required number of input samples

positive scalar

This property is read-only.

The number of input samples required to compute one spectral update. You cannot modify this parameter; it is shown in the spectrum analyzer for informational purposes only. This parameter is directly related to **RBW (Hz)/Window length/Number of frequency bands**. For more details, see “Algorithms” (DSP System Toolbox).

If the input does not have enough samples to achieve the resolution bandwidth that you specify, Spectrum Analyzer produces a message on the display.

**Spectrogram Settings****Channel — Spectrogram channel**

channel name

Select the signal channel for which the spectrogram settings apply.

Dependencies

To use this option, set “View” (DSP System Toolbox) to `Spectrogram` or `Spectrum` and `spectrogram`.

Programmatic Use

See SpectrogramChannel.

Time res. (s) – Time resolution in seconds

Auto (default) | positive number

Time resolution is the amount of data, in seconds, used to compute a spectrogram line. The minimum attainable resolution is the amount of time it takes to compute a single spectral estimate. The tooltip displays the minimum attainable resolution given the current settings.

The time resolution value is determined based on frequency resolution method, the RBW setting, and the time resolution setting.

Method	Frequency Resolution Method	Frequency Resolution Setting	Time Resolution Setting	Resulting Time Resolution in Seconds
Welch or Filter Bank	RBW (Hz)	Auto	Auto	1/RBW
Welch or Filter Bank	RBW (Hz)	Auto	Manually entered	Time Resolution
Welch or Filter Bank	RBW (Hz)	Manually entered	Auto	1/RBW
Welch or Filter Bank	RBW (Hz)	Manually entered	Manually entered	Must be equal to or greater than the minimum attainable time resolution, 1/RBW. Several spectral estimates are combined into one spectrogram line to obtain the desired time resolution. Interpolation is used to obtain time resolution values that are not integer multiples of 1/RBW.
Welch	Window length	—	Auto	1/RBW
Welch	Window length	—	Manually entered	Must be equal to or greater than the minimum attainable time resolution. Several spectral estimates are combined into one spectrogram line to obtain the desired time resolution. Interpolation is used to obtain time resolution values that are not integer multiples of 1/RBW.

Method	Frequency Resolution Method	Frequency Resolution Setting	Time Resolution Setting	Resulting Time Resolution in Seconds
Filter Bank	Number of frequency bands	—	Auto	1/RBW
Filter Bank	Number of frequency bands	—	Manually entered	Must be equal to or greater than the minimum attainable time resolution, 1/RBW.

Tunable: Yes

Dependency

To use this option, set “View” (DSP System Toolbox) to Spectrogram or Spectrum and spectrogram.

Programmatic Use

See TimeResolution.

Time span — Time span in seconds

Auto (default) | positive scalar

The time span over which the Spectrum Analyzer displays the spectrogram specified in seconds. The time span is the product of the desired number of spectral lines and the time resolution. The tooltip displays the minimum allowable time span, given the current settings. If the time span is set to Auto, 100 spectral lines are used.

Tunable: Yes

Dependency

To use this option, set “View” (DSP System Toolbox) to Spectrogram or Spectrum and spectrogram.

Programmatic Use

See TimeSpan.

Window Options

Overlap (%) — Segment overlap percentage

0 (default) | scalar between 0 and 100

This parameter defines the amount of overlap between the previous and current buffered data segments. The overlap creates a window segment that is used to compute a spectral estimate. The value must be greater than or equal to zero and less than 100.

Tunable: Yes

Programmatic Use

See OverlapPercent.

Window — Windowing method

Hann (default) | Rectangular | Blackman-Harris | Chebyshev | Flat Top | Hamming | Kaiser | custom window function name

The windowing method to apply to the spectrum. Windowing is used to control the effect of sidelobes in spectral estimation. The window you specify affects the window length required to achieve a resolution bandwidth and the required number of samples per update. For more information about windowing, see “Windows” (Signal Processing Toolbox).

Tunable: Yes

Programmatic Use

See Window.

Attenuation — Sidelobe attenuation

60 (default) | scalar greater than or equal to 45

The sidelobe attenuation in decibels (dB). The value must be greater than or equal to 45.

Dependency

This parameter applies only when you set the **Window** parameter to Chebyshev or Kaiser.

Programmatic Use

See SidelobeAttenuation.

NENBW — Normalized effective noise bandwidth

scalar

This property is read-only.

The normalized effective noise bandwidth of the window. You cannot modify this parameter; it is shown for informational purposes only. This parameter is a measure of the noise performance of the window. The value is the width of a rectangular filter that accumulates the same noise power with the same peak power gain.

The rectangular window has the smallest NENBW, with a value of 1. All other windows have a larger NENBW value. For example, the Hann window has an NENBW value of approximately 1.5.

Trace Options**Units — Spectrum units**

dBm (default) | dBW | Watts | Vrms | dBV | dBFS

The units of the spectrum. The available values depend on the value of the “Type” (DSP System Toolbox) parameter.

Tunable: Yes

Programmatic Use

See SpectrumUnits.

Full scale — Full scale for dBFS units

Auto (default) | positive real scalar

The full scale used for the decibel full scale (dBFS) units. By default, the Spectrum Analyzer uses the entire spectrum scale. Specify a positive real scalar for the dBFS full scale.

Tunable: Yes

Dependencies

To enable this parameter, set:

- “Input domain” (DSP System Toolbox) to Time
- “Units” on page 1-0 to dBFS

Programmatic Use

See FullScale.

Averaging method — Smoothing method

Exponential (default) | Running

Specify the smoothing method as:

- Exponential — Weighted average of samples. Use the Forgetting factor property to specify the weighted forgetting factor.
- Running — Running average of the last n samples. Use the Averages property to specify n .

For more information about the averaging methods, see “Averaging Method” on page 1-1568.

Programmatic Use

See AveragingMethod.

Averages — Number of spectral averages

1 (default) | positive integer

Specify the number of spectral averages as a positive integer. The spectrum analyzer computes the current power spectrum estimate by computing a running average of the last N power spectrum estimates. This parameter defines the number of spectral averages, N .

Dependencies

This parameter applies only when:

- **View** is Spectrum or Spectrum and spectrogram.
- **Averaging method** is Running.

Programmatic Use

See SpectralAverages.

Forgetting factor — Weighting forgetting factor

0.9 (default) | scalar in the range (0,1]

Specify the exponential weighting as a scalar value greater than 0 and less than or equal to 1.

Dependency

This parameter applies only when the **Averaging method** is Exponential.

Programmatic Use

See ForgettingFactor.

Reference load — Reference load

1 (default) | positive real scalar

The reference load in ohms that the Spectrum Analyzer uses as a reference to compute power values.

Programmatic Use

See ReferenceLoad.

Scale — Scale of frequency axis

Linear (default) | Logarithmic

Choose a linear or logarithm scale for the frequency axis. When the frequency span contains negative frequency values, you cannot choose the logarithmic option.

Programmatic Use

See FrequencyScale.

Offset — Constant frequency offset

0 (default) | scalar

The constant frequency offset to apply to the entire spectrum, or a vector of frequencies to apply to each spectrum for multiple inputs. The offset parameter is added to the values on the Frequency axis in the Spectrum Analyzer window. This parameter is not used in any spectral computations. You must take the parameter into consideration when you set the **Span (Hz)** and **CF (Hz)** parameters to ensure that the frequency span is within the “Nyquist frequency interval” (DSP System Toolbox).

Dependency

To use this parameter, set “Input domain” (DSP System Toolbox) to Time.

Programmatic Use

See FrequencyOffset.

Normal trace — Normal trace view

on (default) | off

When this check box is selected, the Spectrum Analyzer calculates and plots the power spectrum or power spectrum density. Spectrum Analyzer performs a smoothing operation by averaging several spectral estimates.

Dependencies

To clear this check box, you must first select either the “Max hold trace” (DSP System Toolbox) or the “Min hold trace” (DSP System Toolbox) parameter. This parameter applies only when “View” (DSP System Toolbox) is Spectrum or Spectrum and spectrogram.

Programmatic Use

See PlotNormalTrace.

Max hold trace — Maximum hold trace view

off (default) | on

Select this check box to enable Spectrum Analyzer to plot the maximum spectral values of all the estimates obtained.

Dependency

This parameter applies only when “View” (DSP System Toolbox) is **Spectrum** or **Spectrum and spectrogram**.

Programmatic Use

See `PlotMaxHoldTrace`.

Min hold trace — Minimum hold trace view

off (default) | on

Select this check box to enable Spectrum Analyzer to plot the minimum spectral values of all the estimates obtained.

Dependency

This parameter applies only when “View” (DSP System Toolbox) is **Spectrum** or **Spectrum and spectrogram**.

Programmatic Use

See `PlotMinHoldTrace`.

Two-sided spectrum — Enable two-sided spectrum view

off (default) | on

Select this check box to enable a two-sided spectrum view. In this view, both negative and positive frequencies are shown. If you clear this check box, Spectrum Analyzer shows a one-sided spectrum with only positive frequencies. Spectrum Analyzer requires that this parameter is selected when the input signal is complex-valued.

Programmatic Use

See `PlotAsTwoSidedSpectrum`.

Configuration Properties

The **Configuration Properties** dialog box controls visual aspects of the Spectrum Analyzer. To open the Configuration Properties, in the Spectrum Analyzer menu, select **View > Configuration**

Properties or select the  button in the toolbar drop-down.

Title — Display title

character vector | string

Specify the display title. Enter `%<SignalLabel>` to use the signal labels in the Simulink model as the axes titles.

Tunable: Yes

Programmatic Use

See Title.

Show Legend — Display signal legend

off (default) | on

Show signal legend. The names listed in the legend are the signal names from the model. For signals with multiple channels, a channel index is appended after the signal name. Continuous signals have straight lines before their names and discrete signals have step-shaped lines.

From the legend, you can control which signals are visible. This control is equivalent to changing the visibility in the **Style** parameters. In the scope legend, click a signal name to hide the signal in the scope. To show the signal, click the signal name again. To show only one signal, right-click the signal name, which hides all other signals. To show all signals, press **ESC**.

Note The legend only shows the first 20 signals. Any additional signals cannot be viewed or controlled from the legend.

Dependency

To enable this parameter, set “View” (DSP System Toolbox) to Spectrum or Spectrum and spectrogram.

Programmatic Use

See ShowLegend.

Show grid — Show internal grid lines

on (default) | off

Show internal grid lines on the Spectrum Analyzer

Programmatic Use

See ShowGrid.

Y-limits (minimum) — Y-axis minimum

-80 (default) | scalar

Specify the minimum value of the y-axis.

Programmatic Use

See YLimits.

Y-limits (maximum) — Y-axis maximum

20 (default) | scalar

Specify the maximum value of the y-axis.

Programmatic Use

See YLimits.

Y-label — Y-axis label

character vector | string

To display signal units, add (%<SignalUnits>) to the label. At the beginning of a simulation, Simulink replaces (%SignalUnits) with the units associated with the signals. For example, if you have a signal for velocity with units of m/s enter

Velocity (%<SignalUnits>)

Programmatic Use

See YLabel.

Color map — Spectrogram colormap

jet(256) (default) | hot(256) | bone(256) | cool(256) | copper(256) | gray(256) | parula(256) | 3-column matrix

Select the colormap for the spectrogram, or enter a three-column matrix expression for the colormap. For more information about colormaps, see colormap.

Tunable: Yes**Dependency**

To use this parameter, set “View” (DSP System Toolbox) to Spectrogram or Spectrum and spectrogram.

Color-limits (minimum) — Spectrogram minimum

-80 (default) | scalar

Specify the signal power for the minimum color value of the spectrogram.

Tunable: Yes**Dependency**

To use this parameter, set “View” (DSP System Toolbox) to Spectrogram or Spectrum and spectrogram.

Programmatic Use

See ColorLimits.

Color-limits (maximum) — Spectrogram maximum

20 (default) | scalar

Specify the signal power for the maximum color value of the spectrogram.

Tunable: Yes**Dependency**

To use this parameter, set “View” (DSP System Toolbox) to Spectrogram or Spectrum and spectrogram.

Programmatic Use

See ColorLimits.

Style

The **Style** dialog box controls how the Spectrum Analyzer appears. To open the Style properties, in the Spectrum Analyzer menu, select **View > Style** or select the  button in the toolbar drop-down.

Figure color – Window background

gray (default) | color picker

Specify the color that you want to apply to the background of the scope figure.

Plot type – Plot type

Line (default) | Stem

Specify whether to display a Line or Stem plot.

Programmatic Use

See PlotType.

Axes colors – Axes background color

black (default) | color picker

Specify the color that you want to apply to the background of the axes.

Properties for line – Channel for visual property settings

channel names

Specify the channel for which you want to modify the visibility, line properties, and marker properties.

Visible – Channel visibility

on (default) | off

Specify whether the selected channel is visible. If you clear this check box, the line disappears. You can also change signal visibility using the scope legend.

Line – Line style

line, 0.5, yellow (default)

Specify the line style, line width, and line color for the selected channel.

Marker – Data point markers

none (default)

Specify marks for the selected channel to show at its data points. This parameter is similar to the 'Marker' property for plots. You can choose any of the marker symbols from the drop-down.

Axes Scaling

The **Axes Scaling** dialog box controls the axes limits of the Spectrum Analyzer. To open the Axes Scaling properties, in the Spectrum Analyzer menu, select **Tools > Axes Scaling > Axes Scaling Properties**.

Axes scaling/Color scaling – Automatic axes scaling

Auto (default) | Manual | After N Updates

Specify when the scope automatically scales the y-axis. If the spectrogram is displayed, specify when the scope automatically scales the color axis. By default, this parameter is set to **Auto**, and the scope does not shrink the y-axis limits when scaling the axes or color. You can select one of the following options:

- **Auto** — The scope scales the axes or color as needed, both during and after simulation. Selecting this option shows the **Do not allow Y-axis limits to shrink** or **Do not allow color limits to shrink**.
- **Manual** — When you select this option, the scope does not automatically scale the axes or color. You can manually scale the axes or color in any of the following ways:
 - Select **Tools > Scaling Properties**.
 - Press one of the **Scale Axis Limits** toolbar buttons.
 - When the scope figure is the active window, press **Ctrl+A**.
- **After N Updates** — Selecting this option causes the scope to scale the axes or color after a specified number of updates. This option is useful, and most efficient, when your frequency signal values quickly reach steady-state after a short period. Selecting this option shows the **Number of updates** edit box where you can modify the number of updates to wait before scaling.

Tunable: Yes

Programmatic Use

See `AxesScaling`.

Do not allow Y-axis/color limits to shrink — Axes scaling limits

on (default) | off

When you select this parameter, the y-axis is allowed to grow during axes scaling operations. If the spectrogram is displayed, selecting this parameter allows the color limits to grow during axis scaling. If you clear this check box, the y-axis or color limits can shrink during axes scaling operations.

Dependency

This parameter appears only when you select **Auto** for the **Axis scaling** or **Color scaling** parameter. When you set the **Axis scaling** or **Color scaling** parameter to **Manual** or **After N Updates**, the y-axis or color limits can shrink.

Number of updates — Number of updates before scaling

10 (default) | positive number

The number of updates after which the axes scale, specified as a positive integer. If the spectrogram is displayed, this parameter specifies the number of updates after which the color axes scales.

Tunable: Yes

Dependency

This parameter appears only when you set “Axes scaling/Color scaling” (DSP System Toolbox) to **After N Updates**.

Scale limits at stop — Scale axes at stop

off (default) | on

Select this check box to scale the axes when the simulation stops. If the spectrogram is displayed, select this check box to scale the color when the simulation stops. The y-axis is always scaled. The x-axis limits are only scaled if you also select the **Scale X-axis limits** check box.

Data range (%) — Percent of axes

100 (default) | number in the range [1,100]

Set the percentage of the axis that the scope uses to display the data when scaling the axes. If the spectrogram is displayed, set the percentage of the power values range within the colormap. Valid values are from 1 through 100. For example, if you set this parameter to 100, the scope scales the axis limits such that your data uses the entire axis range. If you then set this parameter to 30, the scope increases the y-axis or color range such that your data uses only 30% of the axis range.

Tunable: Yes

Align — Alignment along axes

Center (default) | Bottom | Top | Left | Right

Specify where the scope aligns your data along the axis when it scales the axes. If the spectrogram is displayed, specify where the scope aligns your data along the axis when it scales the color. If you are using CCDF Measurements (DSP System Toolbox), the x axis is also configurable.

Tunable: Yes

Block Characteristics

Data Types	Boolean double enumerated fixed point integer single
Direct Feedthrough	no
Multidimensional Signals	yes
Variable-Size Signals	yes
Zero-Crossing Detection	no

Algorithms

Spectrum Estimation — Welch's Method

When you choose the Welch method, the power spectrum estimate is averaged modified periodograms.

Given the signal input, x , the Spectrum Analyzer does the following:

- 1 Multiplies x by the given window and scales the result by the window power. The Spectrum Analyzer uses the RBW or the Window Length setting in the **Spectrum Settings** pane to determine the data window length.
- 2 Computes the FFT of the signal, Y , and takes the square magnitude using $Z = Y \cdot \text{conj}(Y)$.
- 3 Computes the current power spectrum estimate by taking the moving average of the last N number of Z 's, and scales the answer by the sample rate. For details on the moving average methods, see "Averaging Method" on page 1-1568.

Spectrum Analyzer requires that a minimum number of samples to compute a spectral estimate. This number of input samples required to compute one spectral update is shown as **Samples/update** in the **Main options** pane. This value is directly related to resolution bandwidth, RBW , by the following equation, or to the window length, by the equation shown in step 2.

$$N_{samples} = \frac{\left(1 - \frac{O_p}{100}\right) \times NENBW \times F_s}{RBW}$$

The normalized effective noise bandwidth, $NENBW$, is a factor that depends on the windowing method. Spectrum Analyzer shows the value of $NENBW$ in the **Window Options** pane of the **Spectrum Settings** pane. Overlap percentage, O_p , is the value of the **Overlap %** parameter in the **Window Options** pane of the **Spectrum Settings** pane. F_s is the sample rate of the input signal. Spectrum Analyzer shows sample rate in the **Main Options** pane of the **Spectrum Settings** pane.

- 1 When in **RBW (Hz)** mode, the window length required to compute one spectral update, N_{window} , is directly related to the resolution bandwidth and normalized effective noise bandwidth:

$$N_{window} = \frac{NENBW \times F_s}{RBW}$$

When in **Window Length** mode, the window length is used as specified.

- 2 The number of input samples required to compute one spectral update, $N_{samples}$, is directly related to the window length and the amount of overlap by the following equation.

$$N_{samples} = \left(1 - \frac{O_p}{100}\right) N_{window}$$

When you increase the overlap percentage, fewer new input samples are needed to compute a new spectral update. For example, if the window length is 100, then the number of input samples required to compute one spectral update is given as shown in the following table.

O_p	$N_{samples}$
0%	100
50%	50
80%	20

- 3 The normalized effective noise bandwidth, $NENBW$, is a window parameter determined by the window length, N_{window} , and the type of window used. If $w(n)$ denotes the vector of N_{window} window coefficients, then $NENBW$ is given by the following equation.

$$NENBW = N_{window} \times \frac{\sum_{n=1}^{N_{window}} w^2(n)}{\left[\sum_{n=1}^{N_{window}} w(n)\right]^2}$$

- 4 When in **RBW (Hz)** mode, you can set the resolution bandwidth using the value of the **RBW (Hz)** parameter on the **Main options** pane of the **Spectrum Settings** pane. You must specify a value to ensure that there are at least two RBW intervals over the specified frequency span. The ratio of the overall span to RBW must be greater than two:

$$\frac{span}{RBW} > 2$$

By default, the **RBW (Hz)** parameter on the **Main options** pane is set to **Auto**. In this case, the Spectrum Analyzer determines the appropriate value to ensure that there are 1024 RBW intervals over the specified frequency span. When you set **RBW (Hz)** to **Auto**, *RBW* is calculated as:

$$RBW_{auto} = \frac{span}{1024}$$

- 5 When in **Window Length** mode, you specify N_{window} and the resulting *RBW* is:

$$\frac{NENBW \times F_s}{N_{window}}$$

Sometimes, the number of input samples provided are not sufficient to achieve the resolution bandwidth that you specify. When this situation occurs, Spectrum Analyzer displays a message:

Spectrum Analyzer removes this message and displays a spectral estimate when enough data has been input.

Note The number of FFT points (N_{fft}) is independent of the window length (N_{window}). You can set them to different values if N_{fft} is greater than or equal to N_{window} .

Nyquist frequency interval

When the `PlotAsTwoSidedSpectrum` property is set to `true`, the interval is

$$\left[-\frac{SampleRate}{2}, \frac{SampleRate}{2} \right] + FrequencyOffset \text{ hertz.}$$

When the `PlotAsTwoSidedSpectrum` property is set to `false`, the interval is

$$\left[0, \frac{SampleRate}{2} \right] + FrequencyOffset \text{ hertz.}$$

Periodogram and Spectrogram

Spectrum Analyzer calculates and plots the power spectrum, power spectrum density, and RMS computed by the modified Periodogram estimator. For more information about the Periodogram method, see `periodogram`.

Power Spectral Density — The power spectral density (PSD) is given by the following equation.

$$\text{PSD}(f) = \frac{1}{P} \sum_{p=1}^P \frac{\left| \sum_{n=1}^{N_{FFT}} x^p[n] e^{-j2\pi f(n-1)T} \right|^2}{F_s \times \sum_{n=1}^{N_{window}} w^2[n]}$$

In this equation, $x[n]$ is the discrete input signal. On every input signal frame, Spectrum Analyzer generates as many overlapping windows as possible, with each window denoted as $x^{(p)}[n]$, and computes their periodograms. Spectrum Analyzer displays a running average of the P most current periodograms.

Power Spectrum — The power spectrum is the product of the power spectral density and the resolution bandwidth, as given by the following equation.

$$P_{\text{spectrum}}(f) = \text{PSD}(f) \times \text{RBW} = \text{PSD}(f) \times \frac{F_s \times N_{ENBW}}{N_{\text{window}}} = \frac{1}{P} \sum_{p=1}^P \frac{\left| \sum_{n=1}^{N_{FFT}} x^p[n] e^{-j2\pi f(n-1)T} \right|^2}{\left[\sum_{n=1}^{N_{\text{window}}} w[n] \right]^2}$$

Frequency Vector

When set to Auto, the frequency vector for frequency-domain input is calculated by the software.

When the PlotAsTwoSidedSpectrum property is set to true, the frequency vector is:

$$\left[-\frac{\text{SampleRate}}{2}, \frac{\text{SampleRate}}{2} \right]$$

When the PlotAsTwoSidedSpectrum property is set to false, the frequency vector is:

$$\left[0, \frac{\text{SampleRate}}{2} \right]$$

Occupied BW

The *Occupied BW* is calculated as follows.

- 1 Calculate the total power in the measured frequency range.
- 2 Determine the lower frequency value. Starting at the lowest frequency in the range and moving upward, the power distributed in each frequency is summed until this result is

$$\frac{100 - \text{OccupiedBW}\%}{2}$$

of the total power.

- 3 Determine the upper frequency value. Starting at the highest frequency in the range and moving downward, the power distributed in each frequency is summed until the result reaches

$$\frac{100 - \text{OccupiedBW}\%}{2}$$

of the total power.

- 4 The bandwidth between the lower and upper power frequency values is the occupied bandwidth.
- 5 The frequency halfway between the lower and upper frequency values is the center frequency.

Distortion Measurements

The *Distortion Measurements* are computed as follows.

- 1 Spectral content is estimated by finding peaks in the spectrum. When the algorithm detects a peak, it records the width of the peak and clears all monotonically decreasing values. That is, the algorithm treats all these values as if they belong to the peak. Using this method, all spectral content centered at DC (0 Hz) is removed from the spectrum and the amount of bandwidth cleared (W_0) is recorded.
- 2 The fundamental power (P_1) is determined from the remaining maximum value of the displayed spectrum. A local estimate (Fe_1) of the fundamental frequency is made by computing the central moment of the power near the peak. The bandwidth of the fundamental power content (W_1) is recorded. Then, the power from the fundamental is removed as in step 1.
- 3 The power and width of the higher-order harmonics (P_2, W_2, P_3, W_3 , etc.) are determined in succession by examining the frequencies closest to the appropriate multiple of the local estimate (Fe_1). Any spectral content that decreases monotonically about the harmonic frequency is removed from the spectrum first before proceeding to the next harmonic.
- 4 Once the DC, fundamental, and harmonic content is removed from the spectrum, the power of the remaining spectrum is examined for its sum ($P_{remaining}$), peak value ($P_{maxspur}$), and median value ($P_{estnoise}$).
- 5 The sum of all the removed bandwidth is computed as $W_{sum} = W_0 + W_1 + W_2 + \dots + W_n$.

The sum of powers of the second and higher-order harmonics are computed as $P_{harmonic} = P_2 + P_3 + P_4 + \dots + P_n$.

- 6 The sum of the noise power is estimated as:

$$P_{noise} = (P_{remaining} \cdot dF + P_{est.noise} \cdot W_{sum}) / RBW$$

Where dF is the absolute difference between frequency bins, and RBW is the resolution bandwidth of the window.

- 7 The metrics for SNR, THD, SINAD, and SFDR are then computed from the estimates.

$$THD = 10 \cdot \log_{10} \left(\frac{P_{harmonic}}{P_1} \right)$$

$$SINAD = 10 \cdot \log_{10} \left(\frac{P_1}{P_{harmonic} + P_{noise}} \right)$$

$$SNR = 10 \cdot \log_{10} \left(\frac{P_1}{P_{noise}} \right)$$

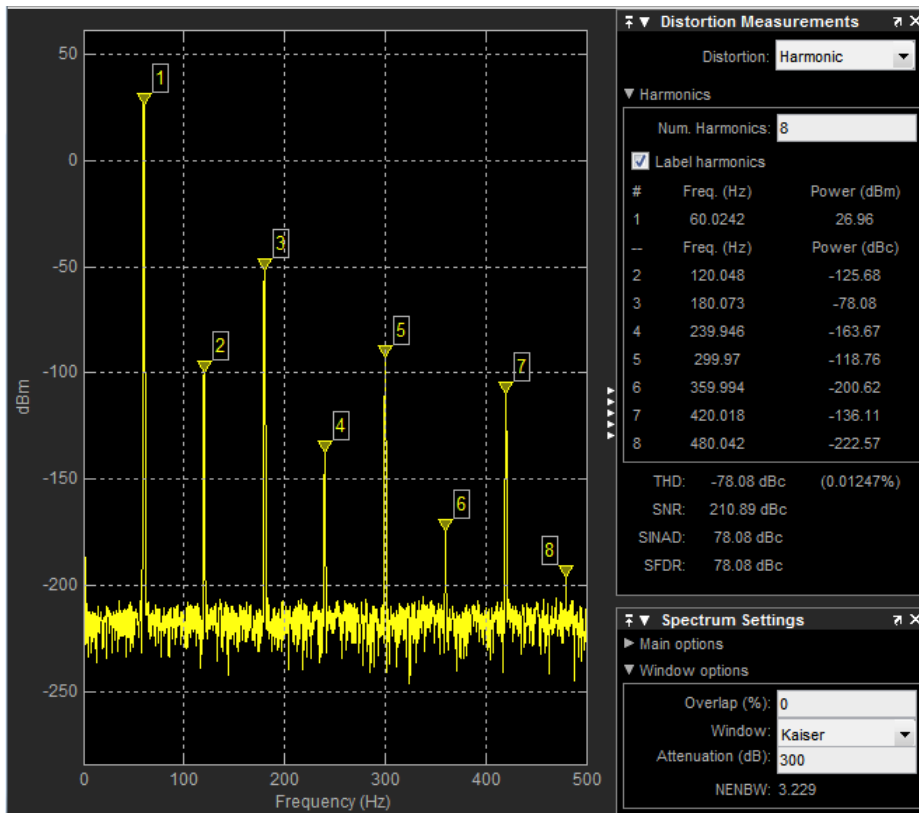

$$SFDR = 10 \cdot \log_{10} \left(\frac{P_1}{\max(P_{maxspur}, \max(P_2, P_3, \dots, P_n))} \right)$$

Harmonic Measurements

- 1 The harmonic distortion measurements use the spectrum trace shown in the display as the input to the measurements. The default Hann window setting of the Spectrum Analyzer may exhibit leakage that can completely mask the noise floor of the measured signal.

The harmonic measurements attempt to correct for leakage by ignoring all frequency content that decreases monotonically away from the maximum of harmonic peaks. If the window leakage covers more than 70% of the frequency bandwidth in your spectrum, you may see a blank reading (-) reported for **SNR** and **SINAD**. If your application can tolerate the increased equivalent noise bandwidth (ENBW), consider using a Kaiser window with a high attenuation (up to 330 dB) to minimize spectral leakage.

- 2 The DC component is ignored.
- 3 After windowing, the width of each harmonic component masks the noise power in the neighborhood of the fundamental frequency and harmonics. To estimate the noise power in each region, Spectrum Analyzer computes the median noise level in the nonharmonic areas of the spectrum. It then extrapolates that value into each region.
- 4 N^{th} order intermodulation products occur at $A*F1 + B*F2$,

where $F1$ and $F2$ are the sinusoid input frequencies and $|A| + |B| = N$. A and B are integer values.

- 5 For intermodulation measurements, the third-order intercept (TOI) point is computed as follows, where P is power in decibels of the measured power referenced to 1 milliwatt (dBm):

- $TOI_{lower} = P_{F1} + (P_{F2} - P_{(2F1-F2)})/2$
- $TOI_{upper} = P_{F2} + (P_{F1} - P_{(2F2-F1)})/2$
- $TOI = (TOI_{lower} + TOI_{upper})/2$

Averaging Method

The moving average is calculated using one of the two methods:

- Running — For each frame of input, average the last N scaled Z vectors, which are computed by the algorithm. The variable N is the value you specify for the number of spectral averages. If the algorithm does not have enough Z vectors, the algorithm uses zeros to fill the empty elements.

- **Exponential** – The moving average algorithm using the exponential weighting method updates the weights and computes the moving average recursively for each Z vector that comes in by using the following recursive equations:

$$w_N = \lambda w_{N-1} + 1$$

$$\bar{z}_N = \left(1 - \frac{1}{w_N}\right)\bar{z}_{N-1} + \left(\frac{1}{w_N}\right)z_N$$

- λ – Forgetting factor.
- w_N – Weighting factor applied to the current Z vector.
- z_N – Current Z vector.
- \bar{z}_{N-1} – Moving average until the previous Z vector.
- $\left(1 - \frac{1}{w_N}\right)\bar{z}_{N-1}$ – Effect of the previous Z vectors on the average.
- \bar{z}_N – Moving average including the current Z vector.

Slider Switch

Toggle parameter between two values

Library: Simulink / Dashboard

Description

The Slider Switch block toggles the value of the connected block parameter between two values during simulation. For example, you can connect the Slider Switch block to a Switch block in your model and change its state during simulation. Use the Slider Switch block with other Dashboard blocks to create an interactive dashboard for your model.

Double-clicking the Slider Switch block does not open its dialog box during simulation and when the block is selected. To edit the block's parameters, you can use the **Property Inspector**, or you can right-click the block and select **Block Parameters** from the context menu.

Connect Dashboard Blocks

Dashboard blocks do not use ports to connect to model elements. To connect dashboard blocks to variables and block parameters, use connect mode. Connect mode facilitates the process of connecting dashboard blocks in your model, especially when you want to connect multiple blocks at once. To connect a single dashboard block, you can also use the **Connection** table in the block dialog box.

Tip You can modify dashboard block connections in your model during normal and accelerator mode simulations.

Note Dashboard blocks cannot connect to variables until you update the model diagram. To connect dashboard blocks to variables or modify variable values between opening your model and running a simulation, update the model diagram using **Ctrl+D**.

To enter connect mode, select the block. Then, on the block tab, click **Connect**. In connect mode, when you select one or more blocks, a list of parameters and variables available for connection appears. Select a variable or parameter from the list to connect to the selected dashboard block.

When the value of the selected variable or block parameter is nonscalar, use the text box at the bottom of the **Connection** table to specify the element you want to connect to the dashboard block. To connect to an element of a vector, matrix, or array, specify the element index, for example, 3 or (1, 3). To connect to an element in a bus or structure, specify the element in the context of the bus or structure hierarchy by using dots to indicate different levels in the hierarchy, and omit the top level. For example, specify a.b to connect to scalar element b of the structure or bus a nested inside the selected composite variable or parameter.

To connect another dashboard block, pause on another dashboard block and click the **Connect** button above it. Then, make a selection of signals and blocks in your model and choose a model element to connect.

When you finish connecting the dashboard blocks in your model, on the block tab, click **Done Connecting**.

Tip You can hide the message shown on unconnected blocks using the `set_param` function with the `ShowInitialText` block parameter. The message also disappears when you connect the block.

Parameter Logging

Tunable parameters connected to dashboard blocks are logged to the Simulation Data Inspector, where you can view the parameter values along with logged signal data. You can access logged parameter data in the MATLAB workspace by exporting the parameter data from the Simulation Data Inspector by using the UI or the `Simulink.sdi.exportRun` function. For more information about exporting data using the Simulation Data Inspector UI, see “Export Data from the Simulation Data Inspector”. The parameter data is stored in a `Simulink.SimulationData.Parameter` object, accessible as an element in the exported `Simulink.SimulationData.Dataset`.

Limitations

- Except for the Dashboard Scope block and the Display block, dashboard blocks can only connect to real scalar signals.
- The toolstrip does not support blocks that are inside a panel.
- You cannot use the **Connection** table in the block dialog to connect a dashboard block to a block that is commented out. When you connect a dashboard block to a commented block using connect

mode, the dashboard block does not display the connected value until the you uncomment the block.

- Dashboard blocks cannot connect to model elements inside referenced models.
- When you simulate a model hierarchy, dashboard blocks inside referenced models do not update.
- Dashboard blocks do not support rapid accelerator simulation.
- When you connect a dashboard block to a variable or parameter during simulation, the data for that variable or parameter is not logged to the Simulation Data Inspector. To log variable and parameter data to the Simulation Data Inspector, connect the dashboard block to the variable or parameter prior to simulation.
- When you simulate a model in external mode with the **Default parameter behavior** set to **Inlined**, dashboard blocks can appear to change parameter and variable values. However, the change does not propagate to the simulation. For example, Gain blocks display changes made to the **Gain** parameter using the dashboard blocks, but the **Gain** value used in the simulation does not change.

Parameters

Connection — Select a variable or block parameter to connect

variable and parameter connection options

Select the variable or block parameter to control using the **Connection** table. To connect the block to a signal:

- 1 Make a selection in the model that includes one or more blocks.
- 2 Select the variable or parameter you want to connect.

When the value of the selected variable or block parameter is nonscalar, use the text box at the bottom of the **Connection** table to specify the element you want to connect to the dashboard block. To connect to an element of a vector, matrix, or array, specify the element index, for example, 3 or (1, 3). To connect to an element in a bus or structure, specify the element in the context of the bus or structure hierarchy by using dots to indicate different levels in the hierarchy, and omit the top level. For example, specify a.b to connect to scalar element b of the structure or bus a nested inside the selected composite variable or parameter.

- 3 Click **Apply**.

To facilitate understanding and debugging your model, you can connect Dashboard blocks to variables and parameters in your model during simulation.

Note To see workspace variables in the connection table, update the model diagram using **Ctrl+D**.

Programmatic Use

To programmatically connect a dashboard block to a tunable parameter or a variable, use a `Simulink.HMI.ParamSourceInfo` object. The `Simulink.HMI.ParamSourceInfo` object contains four properties. Some of the properties apply to connecting dashboard blocks to parameters, and some apply to connecting dashboard blocks to variables. Not all fields have a value for a connection because a given dashboard block connects to either a parameter or a variable.

Block Parameter: Binding

Type: Simulink.HMI.ParamSourceInfo

Default: []

States — Pair values and labels

scalar and character vector

Pairs of values to assign to the connected variable or parameter and text to display on the block. Switches have two states — **Left** and **Right** — one corresponding to each switch position. Each state contains a **Value** and a **Label**.

- **Value** — Value to assign to the connected variable or parameter when the switch is in the corresponding position.
- **Label** — Text to display on the block for the corresponding position.

This table describes the default configuration for the block.

States

Position	State Value	State Label
Left	0	on
Right	1	off

Programmatic Use

To configure the **States** for the block programmatically, specify the value of the **States** parameter as a structure array containing two elements with fields:

- **Value** — Scalar double value for the state.
- **Label** — String or character array to use as the label for the switch position.

```
leftState.Value = 0;
leftState.Label = 'Off';
rightState.Value = 1;
rightState.Label = 'On';
switchStates = [leftState rightState];
```

Block Parameter: States

Type: two element array of structures

Label — Block label position

Top (default) | Bottom | Hide

Position of the block label. When the block is connected to an element in the model, the label is the name of the connected element.

Programmatic Use

Block Parameter: LabelPosition

Type: character vector

Values: 'Top' | 'Bottom' | 'Hide'

Default: 'Top'

Block Characteristics

Data Types	double half integer single
Direct Feedthrough	no

Sqrt

Calculate square root, signed square root, or reciprocal of square root

Library: Simulink / Math Operations
 HDL Coder / HDL Floating Point Operations
 HDL Coder / Math Operations

Description

The Sqrt block calculates the square root, signed square root, or reciprocal of square root on the input signal. Select one of the following functions from the **Function** parameter list.

Function	Description	Mathematical Expression	MATLAB Equivalent
sqrt	Square root of the input	$u^{0.5}$	sqrt
signedSqrt	Square root of the absolute value of the input, multiplied by the sign of the input	$\text{sign}(u) * u ^{0.5}$	—
rSqrt	Reciprocal of the square root of the input	$u^{-0.5}$	—

The block icon changes to match the function.

Ports

Input

Port_1 — Input signal

scalar | vector | matrix

Input signal to the block to calculate the square root, signed square root, or reciprocal of square root. The sqrt function accepts real or complex inputs, except for complex fixed-point signals. signedSqrt and rSqrt do not accept complex inputs. The input signal must be a floating point number.

This table summarizes the support for complex types and negative values for floating point, integer, and fixed-point data types for sqrt, rSqrt, and signedSqrt functions.

Function	Data Type	Complex		Negative Values
		Input	Output	
sqrt	Floating point	Yes	Yes	Yes
	Integer and fixed-point	No	No	No

Function	Data Type	Complex		Negative Values
		Input	Output	
rSqrt	Floating point	No	No	Yes
	Integer and fixed-point	No	No	No
signedSqrt	Floating point	No	Yes	Yes
	Integer and fixed-point	No	No	No

If the input is negative, set the **Output signal** to complex for all functions except signedSqrt.

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Output

Port_1 — Output signal

scalar | vector | matrix

Output signal that is the square root, signed square root, or reciprocal of square root of the input signal. When the input is an integer or fixed-point type, the output must be floating point.

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Parameters

Main

Function — Function the block performs

sqrt (default) | signedSqrt | rSqrt

Specify the mathematical function that the block calculates. The block icon changes to match the function you select.

Function	Block Icon
sqrt	
signedSqrt	
rSqrt	

Dependency

When this parameter is set to signedSqrt, the **Intermediate results data type** parameter is disabled.

Programmatic Use**Block Parameter:** Operator**Type:** character vector**Values:** 'sqrt' | 'signedSqrt' | 'rSqrt'**Default:** 'sqrt'**Output signal type — Output signal type**

auto (default) | real | complex

Specify the output signal type of the block.

Function	Input Signal Type	Output Signal Type		
		Auto	Real	Complex
sqrt	real	real for nonnegative inputs NaN for negative inputs	real for nonnegative inputs NaN for negative inputs	complex
	complex	complex	error	complex
signedSqrt	real	real	real	complex
	complex	error	error	error
rSqrt	real	real	real	error
	complex	error	error	error

Programmatic Use**Block Parameter:** OutputSignalType**Type:** character vector**Values:** 'auto' | 'real' | 'complex'**Default:** 'auto'**Sample time — Specify sample time as a value other than -1**

-1 (default) | scalar | vector

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

Dependencies

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

Programmatic Use**Block Parameter:** SampleTime**Type:** character vector**Values:** scalar or vector**Default:** '-1'**Algorithm****Method — Method to compute reciprocal of square root**

Exact (default) | Newton-Raphson

Specify the method for computing the reciprocal of a square root. This parameter is only valid for the rSqrt function.

Method	Data Types Supported	When to Use This Method
Exact	Floating point	You do not want an approximation. Note The input or output must be floating point.
Newton-Raphson	Floating-point, fixed-point, and built-in integer types	You want a fast, approximate calculation.

The Exact method provides results that are consistent with MATLAB computations.

Note The algorithms for `sqrt` and `signedSqrt` are always of Exact type, no matter what selection appears on the block dialog box.

Programmatic Use

Block Parameter: AlgorithmType

Type: character vector

Values: 'Exact' | 'Newton-Raphson'

Default: 'Exact'

Number of iterations — Number of iterations used for Newton Raphson algorithm

3 (default) | integer

Specify the number of iterations to perform the Newton-Raphson algorithm. This parameter is valid with the `rSqrt` function and the Newton-Raphson value for **Method**.

Note If you enter 0, the block output is the initial guess of the Newton-Raphson algorithm.

Programmatic Use

Block Parameter: Iterations

Type: character vector

Values: integer

Default: '3'

Data Types

Click the **Show data type assistant** button  to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

Intermediate results data type — Data type of intermediate results

Inherit: Inherit via internal rule (default) | Inherit: Inherit from input |
 Inherit: Inherit from output | double | single | int8 | uint8 | int16 | uint16 | int32 |
 uint32 | int64 | uint64 | fixdt(1,16,,0) | fixdt(1,16,2^0,0) | <data type expression>

Specify the data type for intermediate results when you set **Function** to `sqrt` or `rSqrt` on the **Main** pane.

The type can be inherited, specified directly, or expressed as a data type object such as `Simulink.NumericType`.

Note To avoid overflow, the intermediate data type must be larger than or equal to a data type that can contain the square of the output data type.

Follow these guidelines on setting an intermediate data type explicitly for the square root function, `sqrt`:

Input and Output Data Types	Intermediate Data Type
Input or output is double.	Use double.
Input or output is single, and any non-single data type is <i>not</i> double.	Use single or double.
Input and output are fixed point.	Use fixed point.

Follow these guidelines on setting an intermediate data type explicitly for the reciprocal square root function, `rSqrt`:

Input and Output Data Types	Intermediate Data Type
Input is double and output is not single.	Use double.
Input is not single and output is double.	Use double.
Input and output are fixed point.	Use fixed point.

Caution Do not set **Intermediate results data type** to `Inherit:Inherit` from output when:

- You select Newton-Raphson to compute the reciprocal of a square root.
- The input data type is floating point.
- The output data type is fixed point.

Under these conditions, selecting `Inherit:Inherit` from output yields suboptimal performance and produces an error.

To avoid this error, convert the input signal from a floating-point to fixed-point data type. For example, insert a Data Type Conversion block in front of the `Sqrt` block to perform the conversion.

Dependencies

This parameter is disabled when the **Function** parameter is set to `signedSqrt`.

Programmatic Use

Block Parameter: `IntermediateResultsDataTypeStr`

Type: character vector

Values: `'Inherit: Inherit via internal rule' | 'Inherit: Inherit from input' | 'Inherit: Inherit from output' | 'double' | 'single', 'int8', 'uint8', 'int16', 'uint16', 'int32', 'uint32', 'int64', 'uint64', 'fixdt(1,16,0), fixdt(1,16,2^0,0), '<data type expression>'`

Default: `'Inherit: Inherit via internal rule'`

Output — Output data type

Inherit: Same as first input (default) | Inherit: Inherit via internal rule |
 Inherit: Inherit via back propagation | double | single | half | int8 | int32 | uint32 |
 int64 | uint64 | fixdt(1,16,2^0,0) | <data type expression> | ...

Specify the output data type. The type can be inherited, specified directly, or expressed as a data type object such as `Simulink.NumericType`.

Dependencies

When input is a floating-point data type smaller than single precision, the `Inherit: Inherit via internal rule` output data type depends on the setting of the “Inherit floating-point output type smaller than single precision” configuration parameter. Data types are smaller than single precision when the number of bits needed to encode the data type is less than the 32 bits needed to encode the single-precision data type. For example, `half` and `int16` are smaller than single precision.

Programmatic Use

Block Parameter: `OutDataTypeStr`

Type: character vector

Values: 'Inherit: Inherit via internal rule' | 'Inherit: Inherit via back propagation' | 'Inherit: Same as first input' | 'double' | 'single' | 'half' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'int64' | 'uint64' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'fixdt(1,16,2^0,0)' | '<data type expression>'

Default: 'Inherit: Same as first input'

Minimum — Minimum output value for range checking

[] (default) | scalar

Specify the lower value of the output range that Simulink checks as a finite, real, double, scalar value.

Note If you specify a bus object as the data type for this block, do not set the minimum value for bus data on the block. Simulink ignores this setting. Instead, set the minimum values for bus elements of the bus object specified as the data type. For information on the `Minimum` parameter for a bus element, see `Simulink.BusElement`.

Simulink uses the minimum to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Specify Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Embedded Coder).

Note `Output minimum` does not saturate or clip the actual output signal. Use the `Saturation` block instead.

Programmatic Use**Block Parameter:** OutMin**Type:** character vector**Values:** scalar**Default:** '[]'**Maximum — Maximum output value for range checking**

[] (default) | scalar

Specify the upper value of the output range that Simulink checks as a finite, real, double, scalar value.

Note If you specify a bus object as the data type for this block, do not set the maximum value for bus data on the block. Simulink ignores this setting. Instead, set the maximum values for bus elements of the bus object specified as the data type. For information on the Maximum parameter for a bus element, see `Simulink.BusElement`.

Simulink uses the maximum value to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Specify Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Embedded Coder).

Note **Output maximum** does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use**Block Parameter:** OutMax**Type:** character vector**Values:** scalar**Default:** '[]'**Integer rounding mode — Rounding mode for fixed-point operations**

Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

Specify the rounding mode for fixed-point operations. For more information, see “Rounding” (Fixed-Point Designer).

Programmatic Use**Block Parameter:** RndMeth**Type:** character vector**Values:** 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'

Default: 'Floor'

Lock output data type setting against changes by the fixed-point tools – Prevent fixed-point tools from overriding data types

off (default) | on

Select to lock the output data type setting of this block against changes by the Fixed-Point Tool and the Fixed-Point Advisor. For more information, see “Use Lock Output Data Type Setting” (Fixed-Point Designer).

Programmatic Use

Block Parameter: LockScale

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Saturate on integer overflow – Choose the behavior when integer overflow occurs

off (default) | on

Action	Reasons for Taking This Action	What Happens for Overflows	Example
Select this check box.	Your model has possible overflow, and you want explicit saturation protection in the generated code.	Overflows saturate to either the minimum or maximum value that the data type can represent.	The maximum value that the <code>int8</code> (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box selected, the block output saturates at 127. Similarly, the block output saturates at a minimum output value of -128.
Do not select this check box.	You want to optimize efficiency of your generated code. You want to avoid overspecifying how a block handles out-of-range signals. For more information, see “Troubleshoot Signal Range Errors”.	Overflows wrap to the appropriate value that is representable by the data type.	The maximum value that the <code>int8</code> (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box cleared, the software interprets the overflow-causing value as <code>int8</code> , which can produce an unintended result. For example, a block result of 130 (binary 1000 0010) expressed as <code>int8</code> , is -126.

When you select this check box, saturation applies to every internal operation on the block, not just the output or result. Usually, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Programmatic Use**Block Parameter:** DoSatur**Type:** character vector**Value:** 'off' | 'on'**Default:** 'off'**Block Characteristics**

Data Types	double fixed point half integer single
Direct Feedthrough	yes
Multidimensional Signals	yes
Variable-Size Signals	yes
Zero-Crossing Detection	no

Extended Capabilities**C/C++ Code Generation**

Generate C and C++ code using Simulink® Coder™.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

Sqrt Function Modes

For the Sqrt block with **Function** set to `sqrt`, the code generator supports various architectures and data types.

The `sqrtfunction` architecture supports code generation for fixed-point types and floating-point types. When you use floating-point types, set “Floating Point IP Library” (HDL Coder) to **Native Floating Point**. You can specify the **LatencyStrategy** and **CustomLatency** HDL properties to choose from a range of frequency values when targeting your design on the hardware platform.

Use the **UseMultiplier** HDL block property in combination with the **LatencyStrategy** and **CustomLatency** properties to specify whether to compute the square root by using a pipelined shift and add or multiplication algorithm

Native Floating Point Settings for Different Modes

For this architecture, you can specify the **HandleDenormals** and **LatencyStrategy** settings from the **Native Floating Point** tab in the HDL Block Properties dialog box.

Architecture	Fixed-Point	Native Floating-Point	HandleDenormals	LatencyStrategy
<code>sqrtfunction</code>	✓	✓	✓	✓
<code>sqrtnewton</code>	✓	—	—	—

Architecture	Fixed-Point	Native Floating-Point	HandleDenormals	LatencyStrategy
sqrtnewtonsinglerate	✓	—	—	—
recipsqrtnewton	✓	—	—	—
recipsqrtnewtonsinglerate	✓	—	—	—

HDL Architecture

This block has multi-cycle implementations that introduce additional latency in the generated code. To see the added latency, view the generated model or validation model. See “Generated Model and Validation Model” (HDL Coder).

Architecture	Parameter	Additional cycles of latency	Description
SqrtFunction (default)	<ul style="list-style-type: none"> UseMultiplier LatencyStrategy CustomLatency 	Depends on parameter choices, output word length, and input and output fraction lengths.	<p>To specify this architecture, set Function to <code>sqrt</code> or <code>rSqrt</code>.</p> <p>Compute the square root by using a pipelined shift/addition algorithm or multiplication-based algorithm.</p> <p>The <code>SqrtFunction</code> architecture has a maximum latency that is determined by the output word length, and input and output fraction lengths, for fixed-point data. For example, the maximum latency is 11 for output word length of 17.</p> <p>To see the latency calculation, at the MATLAB command prompt, enter:</p> <pre>HDLMathLib</pre> <p>Improve design frequency and reduce resource utilization by setting the UseMultiplier to <code>off</code> and LatencyStrategy to <code>inherit</code>.</p>

Architecture	Parameter	Additional cycles of latency	Description
SqrtNewton	Iterations	Iterations + 3	<p>To specify this architecture, set Function to sqrt.</p> <p>Use the iterative Newton method. Select this option to optimize area.</p> <p>The default value for Iterations is 3.</p> <p>The recommended value for Iterations is from 2 through 10. If Iterations is outside the recommended range, HDL Coder generates a message.</p>
SqrtNewtonSingleRate	Iterations	(Iterations * 4) + 6	<p>To specify this architecture, set Function to sqrt.</p> <p>Use the single rate pipelined Newton method. Select this option to optimize speed, or if you want a single rate implementation.</p> <p>The default value for Iterations is 3.</p> <p>The recommended value for Iterations is from 2 through 10. If Iterations is outside the recommended range, the coder generates a message.</p>
RecipSqrtNewton	Iterations	Iterations + 2	<p>To specify this architecture, set Function to rSqrt.</p> <p>Use the iterative Newton method. Select this option to optimize area.</p>
RecipSqrtNewtonSingleRate	Iterations	(Iterations * 4) + 5	<p>To specify this architecture, set Function to rSqrt.</p> <p>Use the single rate pipelined Newton method. Select this option to optimize speed, or if you want a single rate implementation.</p>

The Newton-Raphson iterative method:

$$x_{i+1} = x_i - \frac{f(x_i)}{f'(x_i)} = x_i(1.5 - 0.5ax_i^2)$$

ReciprocalRsqrtBasedNewton and ReciprocalRsqrtBasedNewtonSingleRate implement the Newton-Raphson method with:

$$f(x) = \frac{1}{x^2} - 1$$

HDL Block Properties

General	
ConstrainedOutputPipeline	Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is 0. For more details, see “ConstrainedOutputPipeline” (HDL Coder).
Iterations	Number of iterations for SqrtNewton or SqrtNewtonSingleRate implementation.
InputPipeline	Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “InputPipeline” (HDL Coder).
OutputPipeline	Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “OutputPipeline” (HDL Coder).
UseMultiplier	Select algorithm for SqrtFunction implementation. By default, this property is set to off, and the block computes square root by using the shift-add algorithm. When the property is set to on, the square root is computed by using multipliers. Increase design frequency and reduce resource utilization by setting the UseMultiplier to off and LatencyStrategy to inherit .
LatencyStrategy	Specify whether to map the blocks in your design to MAX, MIN, CUSTOM, or ZERO latency for fixed-point and floating-point types. The default is MAX. The block settings for floating-point types overrides the model-level settings. For fixed-point types, the block-level setting determines the latency strategy. See also “LatencyStrategy” (HDL Coder) . Increase design frequency and reduce resource utilization by setting the UseMultiplier to off and LatencyStrategy to inherit .
CustomLatency	When LatencyStrategy is set to CUSTOM and if you use fixed-point types, use this property to specify a custom latency value between ZERO and MAX for fixed-point types. For floating-point types, this value becomes the custom latency of the operator. See also “NFPCustomLatency” (HDL Coder).
Native Floating Point	
HandleDenormals	Specify whether you want HDL Coder to insert additional logic to handle denormal numbers in your design. Denormal numbers are numbers that have magnitudes less than the smallest floating-point number that can be represented without leading zeros in the mantissa. The default is inherit. See also “HandleDenormals” (HDL Coder).

Restrictions

- Input must be an unsigned scalar value.
- Output is a fixed-point scalar value.

Squeeze

Remove singleton dimensions from multidimensional signal

Library: Simulink / Math Operations

Description

The Squeeze block removes singleton dimensions from its multidimensional input signal. A singleton dimension is any dimension whose size is one. The Squeeze block operates only on signals whose number of dimensions is greater than two. Scalar, vector, and matrix signals pass through the Squeeze block unchanged.

Ports

Input

Port_1 — Multidimensional input signal

multidimensional signal

Input signal that has any singleton dimensions removed in the output.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Output

Port_1 — Output signal with no singleton dimensions

multidimensional signal

Output signal with no singleton dimensions. For example, a multidimensional array of size 3-by-1-by-2 changes into a 3-by-2 signal. If there are no singleton dimensions in the input, then the input signal is passed through unchanged to the output.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Block Characteristics

Data Types	Boolean double enumerated fixed point half integer single
Direct Feedthrough	no
Multidimensional Signals	yes
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

Reshape

Introduced in R2007b

State Reader

Read a block state

Library: Simulink / Signal Routing

Description

The State Reader block reads the current state of a supported state owner block.

State Reader blocks can read state from these state owner blocks:

- Discrete State-Space
- Discrete-Time Integrator
- Delay
- Unit Delay
- Discrete Transfer Fcn
- Discrete Filter
- Discrete FIR Filter
- Integrator
- Second-Order Integrator
- Output of conditional subsystem blocks such as Enabled Subsystem, Triggered Subsystem, and Function-Call Subsystem
- S-Function with multiple discrete states

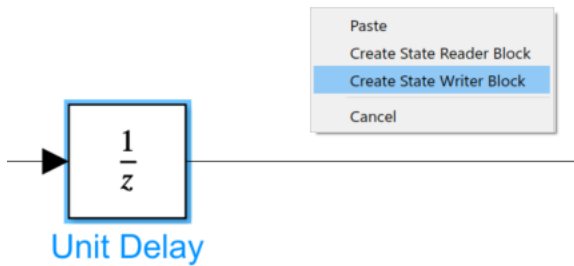

To configure an S-Function block as a state owner block, each data type work vector must be declared as a discrete state vector using `ssSetDWorkUsedAsDState` and named using `ssSetDWorkName` or `ssSetDWorkRTWIdentifier` in `mdlInitializeSizes`.

Tip You can determine whether a block is a supported state owner block by the value of the block's `IsStateOwnerBlock` parameter. The expression

```
get_param(blk, 'IsStateOwnerBlock')
```

where `blk` is a block name or handle, returns 'on' if the block is a supported state owner block and 'off' otherwise.

To add a State Reader or State Writer block to your model, right-click on a state owner block and drag to an empty portion of the Simulink canvas. When you release, a menu will appear. Select **Create State Reader Block** or **Create State Writer Block**.

After you create a State Reader or State Writer block, a x badge appears above the state owner block, and the name of the state owner block appears next to the State Reader or State Writer block.

A State Reader or State Writer block cannot remain in the same system as its state owner block. After you create a State Reader or State Writer block, cut and paste it to move it to the desired location within the model hierarchy.

Alternatively, you can add a State Reader or State Writer block to your model from the Simulink Library Browser, then set the **State owner block** parameter from the block parameters dialog.

Note When you create a library block with a State Reader or State Writer block, you must also include the corresponding state owner block in the library block.

You can select a State Reader or State Writer block or a corresponding state owner block to highlight blocks related to it.

Ports

Output

Out — State value

scalar | vector

State value read from a state owner block.

The dimension of the output is the dimension of the full state vector. Refer to the **Initial conditions** parameter for specific blocks. For example, for a Delay block with a **Delay length** of N, the State Reader block returns a state vector of length [1×N].

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Parameters

State owner block — Show the state owner block

none (default)

Show the state owner block whose state this block is reading. To change the state owner block, select a block from the **State Owner Selector Tree**.

Programmatic Use

Block Parameter: StateOwnerBlock

Type: character vector

Value: '' | '<model path/block name>'

Default: ''

Block Characteristics

Data Types	Boolean bus double enumerated fixed point half integer single
Direct Feedthrough	no
Multidimensional Signals	yes
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

State Writer

Write to a block state

Library: Simulink / Signal Routing

Description

The State Writer block sets the state of a supported state owner block.

State Writer blocks can write state to these state owner blocks:

- Discrete State-Space
- Discrete-Time Integrator
- Delay
- Unit Delay
- Discrete Transfer Fcn
- Discrete Filter
- Discrete FIR Filter
- Integrator
- Second-Order Integrator
- Output of conditional subsystem blocks such as Enabled Subsystem, Triggered Subsystem, and Function-Call Subsystem
- S-Function with multiple discrete states

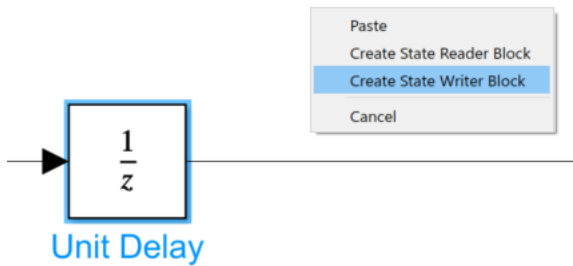

To configure an S-Function block as a state owner block, each data type work vector must be declared as a discrete state vector using `ssSetDWorkUsedAsDState` and named using `ssSetDWorkName` or `ssSetDWorkRTWIdentifier` in `mdlInitializeSizes`.

Tip You can determine whether a block is a supported state owner block by the value of the block's `IsStateOwnerBlock` parameter. The expression

```
get_param(blk, 'IsStateOwnerBlock')
```

where `blk` is a block name or handle, returns 'on' if the block is a supported state owner block and 'off' otherwise.

To add a State Reader or State Writer block to your model, right-click on a state owner block and drag to an empty portion of the Simulink canvas. When you release, a menu will appear. Select **Create State Reader Block** or **Create State Writer Block**.

After you create a State Reader or State Writer block, a  badge appears above the state owner block, and the name of the state owner block appears next to the State Reader or State Writer block.

A State Reader or State Writer block cannot remain in the same system as its state owner block. After you create a State Reader or State Writer block, cut and paste it to move it to the desired location within the model hierarchy.

Alternatively, you can add a State Reader or State Writer block to your model from the Simulink Library Browser, then set the **State owner block** parameter from the block parameters dialog.

Note When you create a library block with a State Reader or State Writer block, you must also include the corresponding state owner block in the library block.

You can select a State Reader or State Writer block or a corresponding state owner block to highlight blocks related to it.

Ports

Input

In — State value

scalar | vector

State value written to a state owner block.

When writing to a state owner block with an input scalar, the scalar value is expanded to match the dimension of the state. All elements of the state are set to the same value.

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Parameters

State owner block — Show the state owner block

none (default)

Show the state owner block whose state this block is writing. To change the state owner block, select a block from the **State Owner Selector Tree**.

Programmatic Use

Block Parameter: StateOwnerBlock

Type: character vector

Value: '' | '<model path/block name>'

Default: ''

Block Characteristics

Data Types	Boolean bus double enumerated fixed point half integer single
Direct Feedthrough	no
Multidimensional Signals	yes
Variable-Size Signals	no
Zero-Crossing Detection	no

State-Space

Implement linear state-space system

Library: Simulink / Continuous

Description

The State-Space block implements a system whose behavior you define as

$$\dot{x} = Ax + Bu$$

$$y = Cx + Du$$

$$x|_{t=t_0} = x_0,$$

where x is the state vector, u is the input vector, y is the output vector, and x_0 is the initial condition of the state vector. The A , B , C , and D matrices can be specified as either sparse matrices or dense matrices. The matrix coefficients must have these characteristics:

- A must be an n -by- n matrix, where n is the number of states.
- B must be an n -by- m matrix, where m is the number of inputs.
- C must be an r -by- n matrix, where r is the number of outputs.
- D must be an r -by- m matrix.

In general, the block has one input port and one output port. The number of rows in C or D matrix is the same as the width of the output port. The number of columns in the B or D matrix are the same as the width of the input port. If you want to model an autonomous linear system with no inputs, set the B and D matrices to empty. In this case, the block acts as a source block with no input port and one output port, and implements the following system:

$$\dot{x} = Ax$$

$$y = Cx$$

$$x|_{t=t_0} = x_0.$$

Simulink software converts a matrix containing zeros to a sparse matrix for efficient multiplication.

Ports

Input

Port_1 — Input signal

scalar | vector

Real-valued input vector of type `double`, where the width equals the number of columns in the **B** and **D** matrices. For more information, see “Description” on page 1-1597.

Data Types: `double`

Output

Port_1 – Output vector

scalar | vector

Real-valued output vector of data type `double`, with width equal to the number of rows in the **C** and **D** matrices. For more information, see “Description” on page 1-1597.

Data Types: `double`

Parameters

A – Matrix coefficient, A

1 (default) | scalar | vector | matrix | sparse matrix

Specify the matrix coefficient **A**, as a real-valued n -by- n matrix, where n is the number of states. For more information on the matrix coefficients, see “Description” on page 1-1597.

Programmatic Use

Block Parameter: A

Type: character vector, string

Values: scalar | vector | matrix | sparse matrix

Default: '1'

B – Matrix coefficient, B

1 (default) | scalar | vector | matrix | sparse matrix

Specify the matrix coefficient **B**, as a real-valued n -by- m matrix, where n is the number of states and m is the number of inputs. For more information on the matrix coefficients, see “Description” on page 1-1597.

Programmatic Use

Block Parameter: B

Type: character vector, string

Values: scalar | vector | matrix | sparse matrix

Default: '1'

C – Matrix coefficient, C

1 (default) | scalar | vector | matrix | sparse matrix

Specify the matrix coefficient **C** as a real-valued r -by- n matrix, where r is the number of outputs and n is the number of states. For more information on the matrix coefficients, see “Description” on page 1-1597.

Programmatic Use

Block Parameter: C

Type: character vector, string

Values: scalar | vector | matrix | sparse matrix

Default: '1'

D — Matrix coefficient, D

1 (default) | scalar | vector | matrix | sparse matrix

Specify the matrix coefficient **D** as a real-valued r -by- m matrix, where r is the number of outputs and m is the number of inputs. For more information on the matrix coefficients, see “Description” on page 1-1597.

Programmatic Use**Block Parameter:** D**Type:** character vector, string**Values:** scalar | vector | matrix | sparse matrix**Default:** '1'**Initial conditions — Initial state vector**

0 (default) | scalar | vector

Specify the initial state vector.

Limitations

The initial conditions of this block cannot be `inf` or `NaN`.

Programmatic Use**Block Parameter:** X0**Type:** character vector, string**Values:** scalar | vector**Default:** '0'**Parameter tunability — Choose tunable representation of block parameters**

Auto (default) | Optimized | Unconstrained

Tunability level of the state-space matrices (A,B,C, and D) for accelerated simulation modes and deployed simulations using the Simulink Compiler™. When set to `Auto`, Simulink chooses the appropriate parameter tunability level.

For sparse matrix coefficients, set the parameter to `Optimized` to allow tunability of non-zero elements while keeping the pattern and number of non-zero elements constant. Set this parameter to `Unconstrained` to allow all elements to be tunable, so long as the number of non-zero elements is kept constant, that is, you can change the pattern of the sparse matrix.

For dense matrix coefficients, select `Optimized` to allow tunability of all matrix elements, provided the number of non-zero elements initially specified in the matrix is kept constant. Set this parameter to `Unconstrained` to allow full tunability of all matrix elements.

Note To tune the **D** matrix of the block when $D = 0$, you must enable the **Allow non-zero values for D matrix initially specified as zero** parameter.

Programmatic Use**Block Parameter:** ParameterTunability**Type:** character vector | string**Values:** 'Auto' | 'Optimized' | 'Unconstrained'**Default:** 'Auto'

Allow non-zero values for D matrix initially specified as zero — Allow tunability of D matrix when D = 0

off (default) | on

Enable this parameter to support tunability of **D** even when $D = 0$.

Note Enabling this parameter enables direct feedthrough for the State-Space block.

Programmatic Use**Block Parameter:** AllowTunableDMatrix**Type:** character vector | string**Values:** 'off' | 'on'**Default:** 'off'**Absolute tolerance — Absolute tolerance for computing block states**

auto (default) | scalar | vector

Absolute tolerance for computing block states, specified as a positive, real-valued, scalar or vector. To inherit the absolute tolerance from the Configuration Parameters, specify `auto` or `-1`.

- If you enter a real scalar, then that value overrides the absolute tolerance in the Configuration Parameters dialog box for computing all block states.
- If you enter a real vector, then the dimension of that vector must match the dimension of the continuous states in the block. These values override the absolute tolerance in the Configuration Parameters dialog box.
- If you enter `auto` or `-1`, then Simulink uses the absolute tolerance value in the Configuration Parameters dialog box (see “Solver Pane”) to compute block states.

Programmatic Use**Block Parameter:** AbsoluteTolerance**Type:** character vector, string**Values:** 'auto' | '-1' | any positive real-valued scalar or vector**Default:** 'auto'**State Name (e.g., 'position') — Assign unique name to each state**

' ' (default) | 'position' | {'a', 'b', 'c'} | a | ...

Assign a unique name to each state. If this field is blank (' '), no name assignment occurs.

- To assign a name to a single state, enter the name between quotes, for example, 'position'.
- To assign names to multiple states, enter a comma-delimited list surrounded by braces, for example, {'a', 'b', 'c'}. Each name must be unique.
- To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, string, cell array, or structure.

Limitations

- The state names apply only to the selected block.
- The number of states must divide evenly among the number of state names.
- You can specify fewer names than states, but you cannot specify more names than states.

For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states.

Programmatic Use

Block Parameter: ContinuousStateAttributes

Type: character vector, string

Values: ' ' | user-defined

Default: ' '

Block Characteristics

Data Types	double
Direct Feedthrough	yes
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production-quality code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. The code generated can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code.

In general, consider using the Simulink Model Discretizer to map continuous blocks into discrete equivalents that support production code generation. To start the Model Discretizer, in the Simulink Editor, on the **Apps** tab, under **Apps**, under **Control Systems**, click **Model Discretizer**. One exception is the Second-Order Integrator block because, for this block, the Model Discretizer produces an approximate discretization.

Discrete State-Space | Transfer Fcn

Topics

“State”

Introduced before R2006a

Step

Generate step function

Library: Simulink / Sources

Description

The Step block provides a step between two definable levels at a specified time. If the simulation time is less than the **Step time** parameter value, the block's output is the **Initial value** parameter value. For simulation time greater than or equal to the **Step time**, the output is the **Final value** parameter value.

The numeric block parameters must be of the same dimensions after scalar expansion. If the **Interpret vector parameters as 1-D** option is off, the block outputs a signal of the same dimensions and dimensionality as the parameters. If the **Interpret vector parameters as 1-D** option is on and the numeric parameters are row or column vectors (that is, single-row or column 2-D arrays), the block outputs a vector (1-D array) signal. Otherwise, the block outputs a signal of the same dimensionality and dimensions as the parameters.

Ports

Output

Port_1 — Output step signal

scalar | vector

Output step function signal defined by the parameters **Step time**, **Initial value**, and **Final value**.

Data Types: double | single

Parameters

Step time — Time when step occurs

1 (default) | scalar

Specify the time, in seconds, when the output jumps from the **Initial value** parameter to the **Final value** parameter.

Programmatic Use

Block Parameter: Time

Type: character vector

Values: '1' | real- or complex-valued scalar, vector, or matrix

Default: '1'

Initial value — Output value before step

0 (default) | scalar

Specify the block output until the simulation time reaches the **Step time** parameter.

Programmatic Use

Block Parameter: Before

Type: character vector

Values: '1' | real- or complex-valued scalar, vector, or matrix

Default: '0'

Final value — Output value after step

1 (default) | scalar

Specify the block output when the simulation time reaches and exceeds the **Step time** parameter.

Programmatic Use

Block Parameter: After

Type: character vector

Values: '1' | real- or complex-valued scalar, vector, or matrix

Default: '1'

Sample time — Sample rate

0 (default) | scalar

Specify the sample rate of step. See “Specify Sample Time” for more information.

Programmatic Use

Block Parameter: SampleTime

Type: character vector

Values: scalar

Default: '0'

Interpret vector parameters as 1-D — Treat vectors as 1-D

on (default) | off

Select this check box to output a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector.

- When you select this check box, the block outputs a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector. For example, the block outputs a matrix of dimension 1-by-N or N-by-1.
- When you clear this check box, the block does not output a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector.

Programmatic Use

Block Parameter: VectorParams1D

Type: character vector

Values: 'on' | 'off'

Default: 'on'

Enable zero-crossing detection — Enable zero-crossing detection

on (default) | Boolean

Select to enable zero-crossing detection. For more information, see “Zero-Crossing Detection” in the Simulink documentation.

Programmatic Use**Block Parameter:** ZeroCross**Type:** character vector, string**Values:** 'off' | 'on'**Default:** 'on'**Output data type — Output data type**

double (default) | Inherit: Inherit via back propagation | single | <data type expression>

Output data type. The type can be inherited, specified directly, or expressed as a data type object such as `Simulink.NumericType`.

When you select `Inherit: Inherit via back propagation`, the block uses the data type of the driving block.

Click the **Show data type assistant** button  to display the **Data Type Assistant**, which helps you set the data type attributes. See “Specify Data Types Using Data Type Assistant” in the *Simulink User's Guide* for more information.

Programmatic Use**Block Parameter:** OutDataTypeStr**Type:** character vector**Values:** 'Inherit: Inherit via internal rule' | 'double' | 'single' | <data type expression>**Default:** 'double'**Data type override — Specify data type override mode for this signal**

Inherit | Off

Select the data type override mode for this signal.

- When you select `Inherit`, Simulink inherits the data type override setting from its context, that is, from the block, `Simulink.Signal` object or Stateflow chart in Simulink that is using the signal.
- When you select `Off`, Simulink ignores the data type override setting of its context.

For more information, see “Specify Data Types Using Data Type Assistant” in the Simulink documentation.

Dependencies

To enable this parameter, click the **Show data type assistant** button, and set the **Mode** to `Built in`.

Tips

The ability to turn off data type override for an individual data type provides greater control over the data types in your model when you apply data type override. For example, you can use this option to ensure that data types meet the requirements of downstream blocks regardless of the data type override setting.

Block Characteristics

Data Types	double
Direct Feedthrough	no
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	yes

Extended Capabilities

Stop Simulation

Stop simulation when input is nonzero

Library: Simulink / Sinks
HDL Coder / Sinks

Description

The Stop Simulation block stops the simulation when the input is nonzero. The simulation completes the current time step before terminating. If the block input is a vector, any nonzero vector element causes the simulation to stop.

When you use the Stop Simulation block in a For Iterator subsystem, the stop action occurs after execution of *all* iterations in the subsystem during a time step. The stop action does not interrupt execution until the start of the next time step.

You cannot use the Stop Simulation block to pause the simulation. To create a block that pauses the simulation, see “Pause Simulation Using Assertion Blocks”.

Ports

Input

Port_1 — Input signal

scalar | vector | matrix

Stop simulation when input signal is nonzero. This port accepts real signals of `double` or `Boolean` data types.

Data Types: `double` | `Boolean`

Block Characteristics

Data Types	Boolean double
Direct Feedthrough	no
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. Generated code can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely varying execution times. While the code is functionally valid and acceptable in resource-rich environments, smaller embedded targets often cannot support such code. Usually, blocks evolve toward being suitable for production code. Thus, blocks suitable for production code remain suitable.

Generated code stops executing when the stop condition is true.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

This block can be used to stop simulation when used with subsystems that generates code, but is not included in the hardware implementation.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

String Compare

Compare two input strings

Library: Simulink / String

Description

String Compare compares two strings. To see if two strings are identical, use this block. You can specify if the match is case sensitive and how much of the string to compare.

Ports

Input

Port_1 — First string to compare

scalar

First string to compare, specified as a scalar.

Data Types: `string`

Port_2 — Second string to compare

scalar

Second string to compare, specified as a scalar.

Data Types: `string`

Output

Port_1 — True or false result

scalar

True or false result, specified as a scalar:

- 1 — Match.
- 0 — No match.

Data Types: `Boolean`

Parameters

Case sensitive — Case sensitivity for string comparison

on (default) | off

Case sensitivity for string comparison:

on

Consider string case when comparing strings.

 off

Do not consider string case when comparing strings.

Compare Option — Amount of characters to compare

Entire string (default) | First N characters

Amount of string to compare:

- Entire string — Compare both entire strings.
- First N characters — Compare the first *N* characters of both strings.

Dependencies

Setting this parameter to First N characters enables the **Number of characters** parameter.

Number of characters — Number of characters to compare

1 (default) | scalar

Number of characters to compare

Dependencies

This parameter is enabled when the **Compare Option** parameter is set to First N characters.

Data Types: double

Block Characteristics

Data Types	Boolean string
Direct Feedthrough	yes
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities**C/C++ Code Generation**

String Concatenate

Concatenate input strings to form one output string

Library: Simulink / String

Description

The String Concatenate block concatenates multiple input strings, in order of their input, to form one output string. Use this block if you want to combine multiple strings into a single string.

Ports

Input

Port_1 — First input string

scalar

First input string, specified as a scalar.

Data Types: `string`

Port_2 — Second input string

scalar

Second input string, specified as a scalar.

Data Types: `string`

Output

Port_1 — Concatenated string

scalar

Concatenated string, specified as a scalar.

Data Types: `string`

Parameters

Number of Inputs — Number of input strings

scalar

Number of input strings to concatenate, specified as a scalar. You can specify from 2 to 512 input ports.

Output data type — Output data type

`string` (default) | <data type expression> | `scalar`

Output data type, specified using the string data type to specify a string with no maximum length.

To specify a string data type with a maximum length, specify `stringtype(N)`. For example, `stringtype(128)` creates a string data type with a maximum length of 128 characters.

Click the **Show data type assistant** button  to display the **Data Type Assistant**, which helps you set the data type attributes. See “Specify Data Types Using Data Type Assistant” in the *Simulink User's Guide* for more information.

Mode — Category of data

`stringtype(128)` (default) | `scalar`

Use the `stringtype` function, for example, `stringtype(128)`.

Dependency

Clicking the **Show data type assistant** button enables this parameter.

Block Characteristics

Data Types	string
Direct Feedthrough	yes
Multidimensional Signals	no

String Constant

Output specified string

Library: Simulink / String

Description

The String Constant block outputs a string specified by the **String** parameter. Use this block when you want a constant whose type is string.

Ports

Output

Port_1 – Output string

scalar

Output string, specified as a scalar.

Data Types: `string`

Parameters

String – Input string

"Hello!" (default) | scalar

Input string, specified as a scalar.

Output data type – Output data type

`string` (default) | `<data type expression>` | scalar

Output data type, specified using the string data type to specify a string with no maximum length.

To specify a string data type with a maximum length, specify `stringtype(N)`. For example, `stringtype(31)` creates a string data type with a maximum length of 31 characters.

Click the **Show data type assistant** button  to display the **Data Type Assistant**, which helps you set the data type attributes. See “Specify Data Types Using Data Type Assistant” in the *Simulink User's Guide* for more information.

String Contains, String Starts With, String Ends With

Determine if string contains, starts with, or ends with pattern

Library: Simulink / String

Description

The String Contains, String Starts With, and String Ends With blocks determine if a string (**str**) contains, starts with, or ends with a pattern (**sub**).

The String Contains, String Starts With, and String Ends With blocks are identical. When **Function** is set to Contains, the block determines if the string contains a specified pattern. When **Function** is set to Starts with, the block determines if the string starts with a specified pattern. When **Function** is set to Ends with, the block determines if the string ends with a specified pattern.

Ports

Input

str — String to search

scalar

String to search for the pattern in, specified as a scalar.

Data Types: `string`

sub — String pattern to search for

scalar

String pattern to search for in string, specified as a scalar.

Data Types: `string`

Output

T/F — String pattern detected

1 | 0

Whether the string pattern was detected, returned as detected (1) or not detected (0).

Data Types: `Boolean`

Parameters

Case sensitive — Case sensitivity

on (default) | off

Case sensitivity for the pattern detection:

on

Consider string case when searching for the pattern.

off

Do not consider string case when searching for the pattern.

Programmatic Use

Block Parameter: CaseSensitive

Type: character vector

Values: 'on' | 'off'

Default: 'on'

Function — Pattern search function

Contains | Starts with | Ends with

Pattern search function, specified as:

- Contains

Search for the pattern anywhere in the string. This is the default for the String Contains block.

- Starts with

Search for the pattern only at the beginning of the string. This is the default for the String Starts With block.

- Ends with

Search for the pattern only at the end of the string. This is the default for the String Ends With block.

Programmatic Use

Block Parameter: Function

Type: character vector

Values: 'Contains' | 'Starts with' | 'Ends with'

Default: 'Contains' for String Contains block, 'Starts with' for String Starts With block, 'Ends with' for String Ends With block

Block Characteristics

Data Types	Boolean string
Direct Feedthrough	yes
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

String Count

Count occurrences of pattern in string

Library: Simulink / String

Description

The String Count block counts the occurrences of the pattern (**sub**) in a string (**str**). If the input at **sub** matches part or all of the input at **str**, the block counts the occurrence as 1.

Ports

Input

str — String to search

scalar

String to search for the pattern in, specified as a scalar.

Data Types: `string`

sub — String pattern to search for

scalar

String pattern to search for in string, specified as a scalar.

Data Types: `string`

Output

n — Number of times pattern was found in string

scalar

Number of times the string pattern was found in the string, `str`, returned as a scalar.

Data Types: `string`

Parameters

Case sensitive — Case sensitivity

on (default) | off

Case sensitivity for the string count:

on

Consider string case when counting found strings.

off

Do not consider string case when counting found strings.

Programmatic Use

Block Parameter: CaseSensitive

Type: character vector

Values: 'on' | 'off'

Default: 'on'

Output data type – Output data type

Inherit: `Inherit via internal rule (default)` | `Inherit via back propagation` | `int8` | `uint8` | `int16` | `uint16` | `int32` | `uint32` | `<data type expression>`

Output data type. The type can be inherited, specified directly, or expressed as a data type object such as `Simulink.NumericType`.

When you select an inherited option, the block exhibits these behaviors:

- `Inherit: Inherit via internal rule` — Simulink chooses a data type to balance numerical accuracy, performance, and generated code size, while taking into account the properties of the embedded target hardware.
- `Inherit: Inherit via back propagation` — Use data type of the driving block.

Click the Show data type assistant button  to display the **Data Type Assistant**, which helps you set the data type attributes. See “Specify Data Types Using Data Type Assistant” in the *Simulink User's Guide* for more information.

Programmatic Use

Block Parameter: OutDataTypeStr

Type: character vector

Values: 'Inherit: Inherit via internal rule' | 'Inherit: Inherit via back propagation' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | '<data type expression>'

Default: 'Inherit: Inherit via internal rule'

Block Characteristics

Data Types	integer string
Direct Feedthrough	yes
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Introduced in R2020a

String Find

Return index of first occurrence of pattern string

Library: Simulink / String

Description

The String Find block returns the index of the first occurrence of the pattern string **sub** in the text string **str**.

Ports

Input

str — String in which to find pattern

scalar

String in which to find pattern (**sub**), specified as a scalar.

Data Types: `string`

sub — Pattern

scalar

Pattern to be found in string (**str**), specified as a scalar.

Data Types: `string`

Output

idx — Position index of found pattern

scalar

Position index of the found pattern, specified as a positive integer scalar.

- If the block does not find the pattern, it returns -1.
- If the **sub** parameter is empty (""), the block returns 1, indicating that it matched the beginning of the searched string.

Data Types: `int32`

Parameters

Output data type — Output data type

Inherit: `Inherit via internal rule (default)` | Inherit: `Inherit via back propagation` | `int8` | `int16` | `int32` | `<data type expression>`

Output data type. The type can be inherited, specified directly, or expressed as a data type object such as `Simulink.NumericType`.

When you select an inherited option, the block exhibits these behaviors:

- **Inherit: Inherit via internal rule** — Simulink chooses a data type to balance numerical accuracy, performance, and generated code size, while taking into account the properties of the embedded target hardware.
- **Inherit: Inherit via back propagation** — Use data type of the driving block.

Click the **Show data type assistant** button  to display the **Data Type Assistant**, which helps you set the data type attributes. See “Specify Data Types Using Data Type Assistant” in the *Simulink User's Guide* for more information.

Programmatic Use

Block Parameter: `OutDataTypeStr`

Type: character vector

Values: `'Inherit: Inherit via internal rule' | 'Inherit: Inherit via back propagation' | 'int8' | 'int16' | 'int32' | '<data type expression>'`

Default: `'Inherit: Inherit via internal rule'`

Block Characteristics

Data Types	<code>integer string</code>
Direct Feedthrough	<code>yes</code>
Multidimensional Signals	<code>no</code>
Variable-Size Signals	<code>no</code>
Zero-Crossing Detection	<code>no</code>

Extended Capabilities

String Length

Output number of characters in input string

Library: Simulink / String

Description

The String Length block outputs the number of characters in the input string. For example, you can use the String Length block to move focus of attention to a particular location in a string.

Ports

Input

Port_1 — Input string

scalar

Input string, specified as a scalar.

Data Types: `string`

Output

Port_1 — Number of characters

scalar

Number of characters in the input string, specified as a scalar.

Data Types: `uint16` | `uint32`

Parameters

Output data type — Output data type

Inherit: `Inherit via internal rule (default)` | `Inherit via back propagation` | `int8` | `uint8` | `int16` | `uint16` | `int32` | `uint32` | `<data type expression>`

Output data type. The type can be inherited, specified directly, or expressed as a data type object such as `Simulink.NumericType`.

When you select an inherited option, the block exhibits these behaviors:

- `Inherit: Inherit via internal rule` — Simulink chooses a data type to balance numerical accuracy, performance, and generated code size, while taking into account the properties of the embedded target hardware.
- `Inherit: Inherit via back propagation` — Use data type of the driving block.

Click the **Show data type assistant** button  to display the **Data Type Assistant**, which helps you set the data type attributes. See “Specify Data Types Using Data Type Assistant” in the *Simulink User's Guide* for more information.

Programmatic Use

Block Parameter: OutDataTypeStr

String to ASCII

Convert string signal to uint8 vector

Library: Simulink / String

Description

The String To ASCII block converts a string signal to a uint8 vector. The block converts each character in the string to its corresponding ASCII value. For example, the block converts the input string "Hello" to [72 101 108 108 111].

Ports

Input

Port_1 — Input string signal

scalar

Input string signal, specified as a scalar.

Data Types: `string`

Output

Port_1 — Converted uint8 vector signal

vector

Converted uint8 vector signal of ASCII characters from input string signal, specified as a vector. The block converts each element in the string into its ASCII character equivalent and outputs the ASCII equivalents as a vector. If there are fewer characters than the maximum length, the block fills the remaining space with zeros at simulation. At code generation, the block fills the remaining space with null characters.

Data Types: `uint8`

Parameters

Output vector size — Size of output vector

31 (default) | scalar

Size of output string vector, specified as a scalar.

Block Characteristics

Data Types	integer string
Direct Feedthrough	yes

Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

String to Double

Convert string signal to double signal

Library: Simulink / String

Description

Scan String scans an input string and converts it to signals per the format specified by the **Format** parameter. The block converts values to their decimal (base 10) representation and outputs the results as numeric or string signals. For example, if the **Format** parameter is set to "%s is %f.", the block outputs two parts, a string signal and a single signal. If the input is the string "Pi is 3.14", the two outputs are "Pi" and "3.14".

The Scan String, String to Double, and String to Single blocks are identical blocks. When configured for String to Double, the block converts the input string signal to a double numerical output. When configured for String to Single, the block converts the input string signal to a single numerical output.

For code generation, configure models that contain this block for non-finite number support by selecting the **Configuration Parameters > Code Generation > Interface > Support non-finite numbers** check box.

Ports

Input

Port_1 — Input string

scalar

Input string, specified as a scalar.

Data Types: `string`

Output

d — Output data whose format matches %d format

scalar

Output data whose format matches specified format, defined as a scalar. Total maximum number of outputs is 128.

If the block cannot match an input string to a format operator specified in **Format**, it returns a warning and outputs an appropriate value (0 or "") for each unmatched format operator.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

f — Output data whose format matches %f format

scalar

Output data whose format matches the %f format, specified as a scalar. Total maximum number of outputs is 128.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Port_N — Output data whose format matches N format

scalar

Output data whose format matches *N* format, specified as a scalar. Total maximum number of outputs is 128.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Parameters

Format — Format operator for input

"%lf" (default) | scalar

Format operator for input, specified as a scalar. If the block cannot match the input string with the specified format, it returns 0. The return of 0 differs from the `sscanf` function return, which is an empty matrix if the function cannot match the input with the specified format.

- For the String to Double block, this parameter has a default value of %lf.
- For the String to Single block, this parameter has a default value of %f.

For more information about acceptable format operators, see the Algorithms section.

Block Characteristics

Data Types	double integer single string
Direct Feedthrough	yes
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Algorithms

The Scan String block uses this format specifier prototype:

%[width][length]specifier

Numeric Fields

This table lists available conversion specifiers to convert text to numeric outputs. The block converts values to their decimal (base 10) representation.

Output Port Data Type	Conversion Specifier	Description
Integer, signed	%d	Base 10
Integer, unsigned	%u	Base 10
Floating-point number	%f, %e, or %g	Floating-point values. Input fields can contain NaN (case sensitive). Input fields that represents floating-point numbers can include leading + or - symbols and exponential notation using e or E. The conversion specifiers %f, %e, and %g all treat input fields the same way.

Character Fields

This table lists available conversion specifiers to convert text so that the output is a character array.

Character Field Type	Conversion Specifier	Description
String scalar	%s	Read the text until the block encounters whitespace.
	%c	Read any single character, including whitespace. To read multiple characters at a time, specify field width. For example, %10c reads 10 characters at a time.
Pattern-matching	%[...]	Read only characters in the brackets up to the first nonmatching character or whitespace. Example: %[mus] reads 'summer' as 'summ'.
	%[^...]	Read any characters not in the brackets up to the first matching character or whitespace. Example: %[^m] reads 'summer' as 'su'.

Optional Operators

- **Field Width** — To specify the maximum number of digits or text characters to read at a time, insert a number after the percent character. For example, %10s reads up to 10 characters at a time, including whitespace. %4f reads up to four digits at a time, including the decimal point.
- **Literal Text to Ignore** — This block must match the specified text immediately before or after the conversion specifier.

Example: Hell%s reads "Hello!" as "o!".

Length Specifiers

The Scan String block supports the h and l length subspecifiers. These specifiers can change according to the **Configuration Parameters > Hardware Implementation > Number of bits** settings.

Length	i	u	f e g	s c
No length specifier	int	unsigned int	single	string
h	short	unsigned short	—	—
l	long	unsigned long	double	—

Notes for Specifiers that Specify Integer Data Types (d, u)

- Target int, long, short type sizes are controlled by settings in the **Configuration Parameters > Hardware Implementation** pane. For example, if the target int is 32 bits and the specifier is %u, then the expected input type will be uint32. For this example, the Scan String block requires that the output type be exactly int32. It cannot be any other data type.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

String to Enum

Input string signal to enumerated signal

Library: Simulink / String

Description

The String To Enum block converts the input string signal to an enumerated signal. To use this block, create an enumeration class in the current folder and use that class name in the **Output data type** parameter.

Ports

Input

Port_1 – Input string signal

scalar

Input string signal, specified as a scalar.

Data Types: string

Output

Output 1 – Enumerated number

scalar

Enumerated number associated with the input string, specified as a scalar.

Data Types: enumerated

Parameters

Output data type – Output data type

SlDemoSign (default) | <data type expression>

Use a data type object, for example, Simulink.IntEnumType.

Click the **Show data type assistant** button  to display the **Data Type Assistant**, which helps you set the data type attributes. See “Specify Data Types Using Data Type Assistant” in the *Simulink User's Guide* for more information.

Mode – Category of data

Enumerated (default) | <data type expression>

Use a data type object, for example, Simulink.IntEnumType.

- Enumerated — Enumerated data class object.
- <data type expression> — Expressions that evaluate to data types. Selecting **Expression** enables a second menu/text box to the right, where you can enter the expression.

Dependency

Clicking the **Show data type assistant** button enables this parameter.

Block Characteristics

Data Types	enumerated string
Direct Feedthrough	yes
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities**C/C++ Code Generation**

Generate C and C++ code using Simulink® Coder™.

String to Single

Convert string signal to single signal

Library: Simulink / String

Description

Scan String scans an input string and converts it to signals per the format specified by the **Format** parameter. The block converts values to their decimal (base 10) representation and outputs the results as numeric or string signals. For example, if the **Format** parameter is set to "%s is %f.", the block outputs two parts, a string signal and a single signal. If the input is the string "Pi is 3.14", the two outputs are "Pi" and "3.14".

The Scan String, String to Double, and String to Single blocks are identical blocks. When configured for String to Double, the block converts the input string signal to a double numerical output. When configured for String to Single, the block converts the input string signal to a single numerical output.

For code generation, configure models that contain this block for non-finite number support by selecting the **Configuration Parameters > Code Generation > Interface > Support non-finite numbers** check box.

Ports

Input

Port_1 – Input string

scalar

Input string, specified as a scalar.

Data Types: `string`

Output

d – Output data whose format matches %d format

scalar

Output data whose format matches specified format, defined as a scalar. Total maximum number of outputs is 128.

If the block cannot match an input string to a format operator specified in **Format**, it returns a warning and outputs an appropriate value (0 or "") for each unmatched format operator.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

f – Output data whose format matches %f format

scalar

Output data whose format matches the %f format, specified as a scalar. Total maximum number of outputs is 128.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Port_N — Output data whose format matches N format

scalar

Output data whose format matches *N* format, specified as a scalar. Total maximum number of outputs is 128.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Parameters

Format — Format operator for input

"%f" (default) | scalar

Format operator for input, specified as a scalar. If the block cannot match the input string with the specified format, it returns 0. The return of 0 differs from the `sscanf` function return, which is an empty matrix if the function cannot match the input with the specified format.

- For the String to Double block, this parameter has a default value of %lf.
- For the String to Single block, this parameter has a default value of %f.

For more information about acceptable format operators, see the Algorithms section.

Block Characteristics

Data Types	double integer single string
Direct Feedthrough	yes
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Algorithms

The Scan String block uses this format specifier prototype:

%[width][length]specifier

Numeric Fields

This table lists available conversion specifiers to convert text to numeric outputs. The block converts values to their decimal (base 10) representation.

Output Port Data Type	Conversion Specifier	Description
Integer, signed	%d	Base 10
Integer, unsigned	%u	Base 10
Floating-point number	%f, %e, or %g	Floating-point values. Input fields can contain NaN (case sensitive). Input fields that represents floating-point numbers can include leading + or - symbols and exponential notation using e or E. The conversion specifiers %f, %e, and %g all treat input fields the same way.

Character Fields

This table lists available conversion specifiers to convert text so that the output is a character array.

Character Field Type	Conversion Specifier	Description
String scalar	%s	Read the text until the block encounters whitespace.
	%c	Read any single character, including whitespace. To read multiple characters at a time, specify field width. For example, %10c reads 10 characters at a time.
Pattern-matching	%[...]	Read only characters in the brackets up to the first nonmatching character or whitespace. Example: %[mus] reads 'summer' as 'summ'.
	%[^...]	Read any characters not in the brackets up to the first matching character or whitespace. Example: %[^m] reads 'summer' as 'su'.

Optional Operators

Introduced in R2018a

Substring

Extract substring from input string signal

Library: Simulink / String

Description

The Substring block extracts a substring from the input string signal. The block extracts the substring starting from the letter corresponding to **idx** and includes a **len** number of characters starting at **idx**. For example, if the input string is "hello 123", input **idx** is 1, and input **len** is 5, the output is "hello". The block extracts a substring starting at 1 and the next 4 characters for a total of 5 characters (hello).

Ports

Input

str — Input string signal

scalar

Input string signal, specified as a string.

Data Types: `string`

idx — Start of string to extract

scalar

Start of string to extract, specified as a positive scalar integer.

Data Types: `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32`

len — Length of string to extract

scalar

Length of string to extract, specified as a scalar. If **len** causes the substring to extend beyond the end of the string, the output signal contains fewer than **len** characters.

Data Types: `uint8` | `uint16` | `uint32`

Output

sub — Extracted string

scalar

Extracted string, specified as a scalar.

Data Types: `string`

Parameters

Inherit maximum length from input — Use same maximum length as input string

on (default) | off

Use same maximum length as the input string source block.

on

Use same maximum length. The substring includes the characters starting from the character at **idx** to the end of the string.

off

Do not use same maximum length.

Dependencies

Selecting this check box enables the **Output data type** parameter.

Output data type — Output data type

string (default) | <data type expression> | scalar

Output data type, specified using the string data type to specify a string with no maximum length.

To specify a string data type with a maximum length, specify `stringtype(N)`. For example, `stringtype(31)` creates a string data type with a maximum length of 31 characters.

Click the **Show data type assistant** button  to display the **Data Type Assistant**, which helps you set the data type attributes. See “Specify Data Types Using Data Type Assistant” in the *Simulink User's Guide* for more information.

Dependencies

To enable this parameter, select **Inherit maximum length from input**.

Output string from 'idx' to end — Extract string from idx to end

off (default) | on

Extract string from `idx` to end of input string.

on

Extract string from `idx` to end of input string.

off

Do not extract string from `idx` to end of input string.

Dependencies

Selecting this parameter removes the third input port.

Block Characteristics

Data Types	integer string
Direct Feedthrough	yes
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Subsystem, Atomic Subsystem, CodeReuse Subsystem

Group blocks to create model hierarchy

Library: Simulink / Ports & Subsystems

Description

A Subsystem block contains a subset of blocks within a model or system. The Subsystem block can represent a virtual subsystem or a nonvirtual subsystem.

- Nonvirtual subsystem - Control when the contents of the subsystem are evaluated as a single unit (atomic execution). Create conditionally executed subsystems that run only when an event occurs on a triggering, function-call, action, or enabling input (see “Conditionally Executed Subsystems and Models”).
- Virtual subsystem - Subsystem is neither conditionally nor atomically executed. Virtual subsystems do not have checksums. To determine if a subsystem is virtual, use the `get_param` function for the Boolean block parameter `IsSubsystemVirtual`.

An atomic subsystem is a Subsystem block with the block parameter **Treat as atomic unit** selected.

A code reuse subsystem is a Subsystem block with the parameter **Treat as atomic unit** selected and the parameter **Function packaging** set to `Reusable function`, specifying the function code generation format for the subsystem.

To create a subsystem, do one of the following:

- Copy a Subsystem block from the Ports & Subsystems library into your model. Then add blocks to the subsystem by opening the Subsystem block and copying blocks into it.
- Select all blocks and lines that make up the subsystem, and then in the **Multiple** tab, click **Create Subsystem**. Simulink replaces the blocks with a Subsystem block, along with the necessary Inport and Outport blocks to reflect signals entering and leaving the subsystem.

The number of input ports drawn on the Subsystem block icon corresponds to the number of Inport blocks in the subsystem. Similarly, the number of output ports drawn on the block corresponds to the number of Outport blocks in the subsystem.

The Subsystem block supports signal label propagation through subsystem Inport and Outport blocks.

Note A referenced subsystem is a subsystem stored in a separate file that is referenced using a Subsystem Reference block. To reuse that subsystem, add multiple Subsystem Reference blocks that reference that same subsystem file. A referenced subsystem behaves identically to a regular subsystem during run-time.

Ports

Input

In — Signal input to a subsystem

scalar | vector | matrix

Placing an Inport block in a subsystem adds an external input port to the Subsystem block. The port label matches the name of the Inport block.

Use Inport blocks to get signals from the local environment.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Output

Out — Signal output from a subsystem

scalar | vector | matrix

Placing an Outport block in a subsystem adds an output port from the Subsystem block. The port label on the Subsystem block is the name of the Outport block.

Use Outport blocks to send signals to the local environment.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Parameters

Parameters on the Code Generation tab require a Simulink Coder or Embedded Coder license.

Main

Show port labels — Display options for port labels

FromPortIcon (default) | FromPortBlockName | SignalName

Select how to display port labels on the Subsystem block icon.

none

Do not display port labels.

FromPortIcon

If the corresponding port icon displays a signal name, display the signal name on the Subsystem block. Otherwise, display the port block name or the port number if the block name is a default name.

FromPortBlockName

Display the name of the corresponding port block on the Subsystem block.

SignalName

If the signal connected to the port is named, display the name of the signal on the Subsystem block. Otherwise, display the name of the corresponding port block.

Programmatic Use**Parameter:** ShowPortLabels**Type:** character vector**Value:** 'FromPortIcon' | 'FromPortBlockName' | 'SignalName'**Default:** 'FromPortIcon'**Read/Write permissions — Levels of access to contents of subsystem**

ReadWrite (default) | ReadOnly | NoReadOrWrite

Control user access to the contents of the subsystem.

ReadWrite

Enable opening and modification of subsystem contents.

ReadOnly

Enable opening but not modification of the subsystem. If the subsystem resides in a block library, you can create and open links to the subsystem and can make and modify local copies of the subsystem but cannot change the permissions or modify the contents of the original library instance.

NoReadOrWrite

Disable opening or modification of subsystem. If the subsystem resides in a library, you can create links to the subsystem in a model but cannot open, modify, change permissions, or create local copies of the subsystem.

Note You do not receive a response if you attempt to view the contents of a subsystem whose **Read/Write permissions** parameter is set to **NoReadOrWrite**. For example, when double-clicking such a subsystem, Simulink does not open the subsystem and does not display any messages.

Programmatic Use**Parameter:** Permissions**Type:** character vector**Value:** 'ReadWrite' | 'ReadOnly' | 'NoReadOrWrite'**Default:** 'ReadWrite'**Name of error callback function — Name of function to be called if error occurs**

' ' (default) | function name

Enter name of a function to be called if an error occurs while Simulink is executing the subsystem.

Simulink passes two arguments to the function: the handle of the subsystem and a character vector that specifies the error type. If no function is specified, Simulink displays a generic error message if executing the subsystem causes an error.

Programmatic Use**Parameter:** ErrorFcn**Type:** character vector**Value:** '' | '<function name>'**Default:** ''**Permit hierarchical resolution — Resolution for workspace variable names**

All (default) | ExplicitOnly | None

Select whether to resolve names of workspace variables referenced by this subsystem.

For more information, see “Symbol Resolution” and “Symbol Resolution Process”.

All

Resolve all names of workspace variables used by this subsystem, including those used to specify block parameter values and Simulink data objects (for example, `Simulink.Signal` objects).

ExplicitOnly

Resolve only names of workspace variables used to specify block parameter values, data store memory (where no block exists), signals, and states marked as “must resolve”.

None

Do not resolve any workspace variable names.

Programmatic Use

Parameter: `PermitHierarchicalResolution`

Type: character vector

Value: 'All' | 'ExplicitOnly' | 'None'

Default: 'All'

Treat as atomic unit — Option to execute subsystem as one unit

off (default) | on

Causes Simulink to treat the subsystem as a unit when determining the execution order of block methods.

off

Treat all blocks in the subsystem as being at the same level in the model hierarchy as the subsystem when determining block method execution order. This can cause execution of methods of blocks in the subsystem to be interleaved with execution of methods of blocks outside the subsystem.

on

Treat the subsystem as a unit when determining the execution order of block methods. For example, when it needs to compute the output of the subsystem, Simulink invokes the output methods of all the blocks in the subsystem before invoking the output methods of other blocks at the same level as the Subsystem block.

Programmatic Use

Parameter: `TreatAsAtomicUnit`

Type: character vector

Value: 'off' | 'on'

Default: 'off'

Minimize algebraic loop occurrences — Option to eliminate artificial algebraic loops

off (default) | on

Try to eliminate any artificial algebraic loops that include the atomic subsystem

off

Do not try to eliminate any artificial algebraic loops that include the atomic subsystem.

on

Try to eliminate any artificial algebraic loops that include the atomic subsystem.

Dependencies

To enable this parameter, select the **Treat as atomic unit** parameter.

Programmatic Use

Parameter: MinAlgLoopOccurrences

Type: character vector

Value: 'off' | 'on'

Default: 'off'

Schedule As — Type of scheduling

Sample Time (default) | Periodic Partition | Aperiodic Partition

Specify how to schedule the subsystem.

Sample time

Specify whether all blocks in this subsystem must run at the same rate or can run at different rates.

Periodic Partition

Schedule the subsystem as a periodic partition. Specify a partition name and a sample time corresponding to the rate at which the partition runs.

Aperiodic Partition

Schedule the subsystem as an aperiodic partition. Specify a partition name.

Dependencies

To enable this parameter, select the **Treat as atomic unit** parameter.

Programmatic Use

Parameter: ScheduleAs

Type: character vector

Value: 'SampleTime' | 'DiscretePartition' | 'UnconstrainedPartition'

Default: 'SampleTime'

Partition Name — Name of partition

character vector

Specify name of the partition for the subsystem.

Dependencies

To enable this parameter, select the **Treat as atomic unit** parameter, and set **Schedule As** to Periodic Partition or Aperiodic Partition.

Programmatic Use

Parameter: PartitionName

Type: character vector

Value: ''

Default: ''

Sample time — Time interval

-1 (default) | [Ts 0]

Specify whether all blocks in this subsystem must run at the same rate or can run at different rates.

- If the blocks in the subsystem can run at different rates, specify the subsystem sample time as inherited (-1).
- If all blocks must run at the same rate, specify the sample time corresponding to this rate as the value of the **Sample time** parameter.
- If any of the blocks in the subsystem specify a different sample time (other than -1 or inf), Simulink displays an error message when you update or simulate the model. For example, suppose all the blocks in the subsystem must run 5 times a second. To ensure this, specify the sample time of the subsystem as 0.2. In this example, if any of the blocks in the subsystem specify a sample time other than 0.2, -1, or inf, Simulink displays an error when you update or simulate the model.

-1

Specify inherited sample time. Use this sample time if the blocks in the subsystem can run at different rates.

[Ts 0]

Specify periodic sample time.

Dependencies

To enable this parameter, select the **Treat as atomic unit** parameter.

Programmatic Use

Parameter: SystemSampleTime

Type: character vector

Value: '-1' | '[Ts 0]'

Default: '-1'

Variant control — Variant control (condition) expression

Variant (default) | logical expression

Specify variant control (condition) expression that executes a variant Simulink Function block when the expression evaluates to true.

For more information, see `Simulink.Variant`.

Variant

Default name for a logical (Boolean) expression.

logical expression

A logical (Boolean) expression or a `Simulink.Variant` object representing a logical expression.

The function is activated when the expression evaluates to true.

If you want to generate code for your model, define the variables in the expression as `Simulink.Parameter` objects.

Dependencies

Enable this parameter by adding a Subsystem block inside a Variant Subsystem block.

Programmatic Use

Block parameter: VariantControl

Type: character vector

Value: 'Variant' | '<logical expression>'

Default: 'Variant'

Treat as grouped when propagating variant conditions — Option to treat subsystem as unit when propagating variant conditions

on (default) | off

Causes Simulink to treat the subsystem as a unit when propagating variant conditions from Variant Source blocks or to Variant Sink blocks.

on

Simulink treats the subsystem as a unit when propagating variant conditions from Variant Source blocks or to Variant Sink blocks. For example, when Simulink computes the variant condition of the subsystem, it propagates that condition to all the blocks in the subsystem.

off

Simulink treats all blocks in the subsystem as being at the same level in the model hierarchy as the subsystem itself when determining their variant condition.

Programmatic Use

Parameter: TreatAsGroupedWhenPropagatingVariantConditions

Type: character vector

Value: 'on' | 'off'

Default: 'on'

Code Generation

Function packaging — Code format

Auto (default) | Inline | Nonreusable function | Reusable function

Select the code format to be generated for an atomic (nonvirtual) subsystem.

Auto

Simulink Coder and Embedded Coder choose the optimal format for you based on the type and number of instances of the subsystem that exist in the model.

Inline

Simulink Coder and Embedded Coder inline the subsystem unconditionally.

Nonreusable function

If **Filename options** is set to Auto, Simulink Coder and Embedded Coder package separate functions in the model file. If **File name options** is set to Use subsystem name, Use function name, or User specified using different file names, Simulink Coder and Embedded Coder package separate functions in separate files.

Subsystems with this setting generate functions that might have arguments depending on the “Function interface” on page 1-0 parameter setting. You can name the generated function and file using parameters “Function name” on page 1-0 and “File name (no extension)” on page 1-0. These functions are not reentrant.

Reusable function

Simulink Coder and Embedded Coder generate a function with arguments that allows reuse of subsystem code when a model includes multiple instances of the subsystem.

This option also generates a function with arguments that allows subsystem code to be reused in the generated code of a model reference hierarchy that includes multiple instances of a subsystem across referenced models. In this case, the subsystem must be in a library.

For more information, see:

- “Control Generation of Functions for Subsystems” (Simulink Coder)
- “Generate Code and Executables for Individual Subsystems” (Simulink Coder)
- “Inline Subsystem Code” (Simulink Coder)
- “Generate Subsystem Code as Separate Function and Files” (Simulink Coder)
- “Generate Reusable Code from Library Subsystems Shared Across Models” (Simulink Coder)

Tips

- When you want multiple instances of a subsystem to be represented as one reusable function, you can designate each one of them as `Auto` or as `Reusable` function. It is best to use one or the other, as using both creates two reusable functions, one for each designation. The outcomes of these choices differ only when reuse is not possible. Selecting `Auto` does not allow control of the function or file name for the subsystem code.
- The `Reusable` function and `Auto` options both try to determine if multiple instances of a subsystem exist and if the code can be reused. The difference between the options' behavior is that when reuse is not possible:
 - `Auto` yields inlined code, or if circumstances prohibit inlining, separate functions for each subsystem instance.
 - `Reusable` function yields a separate function with arguments for each subsystem instance in the model.
- If you select `Reusable` function while your generated code is under source control, set **File name options** to `Use subsystem name`, `Use function name`, or `User specified`. Otherwise, the names of your code files change whenever you modify your model, which prevents source control on your files.

Dependencies

- This parameter requires Simulink Coder for code generation.
- To enable this parameter, select **Treat as atomic unit**.

Programmatic Use

Parameter: RTWSystemCode

Type: character vector

Value: 'Auto' | 'Inline' | 'Nonreusable function' | 'Reusable function'

Default: 'Auto'

Function name options — How to name generated function

Auto (default) | Use subsystem name | User specified

Select how Simulink Coder names the function it generates for the subsystem.

If you have an Embedded Coder license, you can control function names with options on the Configuration Parameter **Code Generation > Identifiers** pane.

Auto

Assign a unique function name using the default naming convention, `model_subsystem()`, where `model` is the name of the model and `subsystem` is the name of the subsystem (or that of an identical one when code is being reused).

If you select `Reusable function` for the **Function packaging** parameter and there are multiple instances of the reusable subsystem in a model reference hierarchy, in order to generate reusable code for the subsystem, **Function name options** must be set to `Auto`.

Use subsystem name

Use the subsystem name as the function name. By default, the function name uses the naming convention `model_subsystem`.

Note When a subsystem is in a library block and the subsystem parameter “Function packaging” on page 1-0 is set to `Reusable function`, if you set the `Use subsystem name` option, the code generator uses the name of the library block for the subsystem function name and file name.

User specified

Enable the **Function name** field. Enter any legal C or C++ function name, which must be unique.

For more information, see “Control Generation of Functions for Subsystems” (Simulink Coder).

Dependencies

- This parameter requires a Simulink Coder license.
- To enable this parameter, set **Function packaging** to `Nonreusable function` or `Reusable function`.

Programmatic Use

Parameter: `RTWFcnNameOpts`

Type: character vector

Value: `'Auto' | 'Use subsystem name' | 'User specified'`

Default: `'Auto'`

Function name — Name of function for subsystem code

`''` (default) | function name

Specify a unique, valid C or C++ function name for subsystem code.

Use this parameter if you want to give the function a specific name instead of allowing the Simulink Coder code generator to assign its own autogenerated name or use the subsystem name. For more information, see “Control Generation of Functions for Subsystems” (Simulink Coder).

Dependencies

- This parameter requires a Simulink Coder license.
- To enable this parameter, set the **Function name options** parameter to `User specified`.

Programmatic Use

Parameter: `RTWFcnName`

Type: character vector

Value: '' | '<function name>'

Default: ''

File name options — How to name generated file

Auto (default) | Use subsystem name | Use function name | User specified

Select how Simulink Coder names the separate file for the function it generates for the subsystem.

Auto

Depending on the configuration of the subsystem and how many instances are in the model, Auto yields different results:

- If the code generator does *not* generate a separate file for the subsystem, the subsystem code is generated within the code module generated from the subsystem parent system. If the subsystem parent is the model itself, the subsystem code is generated within *model.c* or *model.cpp*.
- If you select Reusable function for the **Function packaging** parameter and your generated code is under source control, consider specifying a **File name options** value other than Auto. This prevents the generated file name from changing due to unrelated model modifications, which is problematic for using source control to manage configurations.
- If you select Reusable function for the **Function packaging** parameter and there are multiple instances of the reusable subsystem in a model reference hierarchy, in order to generate reusable code for the subsystem, **File name options** must be set to Auto.

Use subsystem name

The code generator generates a separate file, using the subsystem (or library block) name as the file name.

Note When **File name options** is set to Use subsystem name, the subsystem file name is mangled if the model contains Model blocks, or if a model reference target is being generated for the model. In these situations, the file name for the subsystem consists of the subsystem name prefixed by the model name.

Use function name

The code generator uses the function name specified by **Function name options** as the file name.

User specified

This option enables the **File name (no extension)** text entry field. The code generator uses the name you enter as the file name. Enter any file name, but do not include the .c or .cpp (or any other) extension. This file name need not be unique.

Note While a subsystem source file name need not be unique, you must avoid giving nonunique names that result in cyclic dependencies (for example, *sys_a.h* includes *sys_b.h*, *sys_b.h* includes *sys_c.h*, and *sys_c.h* includes *sys_a.h*).

Dependencies

- This parameter requires a Simulink Coder license.

- To enable this parameter, set **Function packaging** to `Nonreusable function` or `Reusable function`.

Programmatic Use**Parameter:** `RTWFileNameOpts`**Type:** character vector**Value:** `'Auto' | 'Use subsystem name' | 'Use function name' | 'User specified'`**Default:** `'Auto'`**File name (no extension) – Name of generated file**`'' (default) | file name`

The file name that you specify does not have to be unique. However, avoid giving non-unique names that result in cyclic dependencies (for example, `sys_a.h` includes `sys_b.h`, `sys_b.h` includes `sys_c.h`, and `sys_c.h` includes `sys_a.h`).

For more information, see “Control Generation of Functions for Subsystems” (Simulink Coder).

Dependencies

- This parameter requires a Simulink Coder license.
- To enable this parameter, set **File name options** to `User specified`.

Programmatic Use**Parameter:** `RTWFileName`**Type:** character vector**Value:** `'' | '<file name>'`**Default:** `''`**Function interface – Select to use arguments with generate function**`void_void (default) | Allow arguments (Optimized) | Allow arguments (Match graphical interface)`

Select to use arguments with generated function.

void_void

Generate a function without arguments and pass data as global variables. For example:

```
void subsystem_function(void)
```

Allow arguments (Optimized)

Generate a function that uses arguments instead of passing data as global variables. This specification reduces global RAM. It might reduce code size and improve execution speed and enable the code generator to apply additional optimizations. For example:

```
void subsystem_function(real_T rtu_In1, real_T rtu_In2,  
                        real_T *rtu_Out1)
```

In some cases, when generating optimized code, the code generator might not generate a function that has arguments.

Allow arguments (Match graphical interface)

Generate a function interface that uses arguments that match the Subsystem graphical block interface. The generated function interface is predictable and does not change. A predictable interface can be useful for debugging and testing your code and integrating with external

applications. For example, if a model has two Inports and two Outports, then the generated function interface is:

```
void subsystem_function(real_T rtu_In1, real_T rtu_In2,
                      real_T *rty_Out1, real_T *rty_Out2)
```

For more information, see:

- “Reduce Global Variables in Nonreusable Subsystem Functions” (Embedded Coder)
- “Generate Predictable Function Interface to Match Graphical Block Interface” (Embedded Coder)
- “Generate Modular Function Code for Nonvirtual Subsystems” (Embedded Coder)

Dependencies

- This parameter requires Embedded Coder and an ERT-based system target file.
- To enable this parameter, set **Function packaging** to Nonreusable function.

Programmatic Use

Parameter: FunctionInterfaceSpec

Type: character vector

Value: 'void_void' | 'Allow arguments (Optimized)' | 'Allow arguments (Match graphical interface)'

Default: 'void_void'

Function with separate data — Control code generation for subsystem

off (default) | on

Generate subsystem function code in which the internal data for an atomic subsystem is separated from its parent model and is owned by the subsystem.

off

Do not generate subsystem function code in which the internal data for an atomic subsystem is separated from its parent model and is owned by the subsystem.

on

Generate subsystem function code in which the internal data for an atomic subsystem is separated from its parent model and is owned by the subsystem. The subsystem data structure is declared independently from the parent model data structures. A subsystem with separate data has its own block I/O and DWork data structure. As a result, the generated code for the subsystem is easier to trace and test. The data separation also tends to reduce the maximum size of global data structures throughout the model, because they are split into multiple data structures.

For details on how to generate modular function code for an atomic subsystem, see “Generate Modular Function Code for Nonvirtual Subsystems” (Embedded Coder).

For details on how to apply memory sections to atomic subsystems, see “Override Default Memory Placement for Subsystem Functions and Data” (Embedded Coder).

Dependencies

- This parameter requires a license for Embedded Coder and an ERT-based system target file.
- To enable this parameter, set **Function packaging** to Nonreusable function.

Programmatic Use**Parameter:** FunctionWithSeparateData**Type:** character vector**Value:** 'off' | 'on'**Default:** 'off'**Memory section for initialize/terminate functions — Select how to apply memory sections**`Inherit from model (default) | Default | The memory section of interest`

Select how Embedded Coder applies memory sections to the subsystem initialization and termination functions.

`Inherit from model`

Apply the root model memory sections to the subsystem function code

`Default`

Do not apply memory sections to the subsystem system code, overriding any model-level specification

`The memory section of interest`

Apply one of the model memory sections to the subsystem

Tips

- The possible values vary depending on what (if any) package of memory sections you have set for the model configuration. See “Control Data and Function Placement in Memory by Inserting Pragmas” (Embedded Coder) and “Model Configuration Parameters: Code Generation” (Simulink Coder).
- If you have not configured the model with a package, `Inherit from model` is the only value that appears. Otherwise, the list includes `Default` and all memory sections the model package contains.
- These options can be useful for overriding the model memory section settings for the given subsystem. For details on how to apply memory sections to atomic subsystems, see “Override Default Memory Placement for Subsystem Functions and Data” (Embedded Coder).

Dependencies

- This parameter requires a license for Embedded Coder software and an ERT-based system target file.
- To enable this parameter, set **Function packaging** to `Nonreusable function` or `Reusable function`.

Programmatic Use**Parameter:** RTWMemSecFuncInitTerm**Type:** character vector**Value:** 'Inherit from model' | 'Default' | 'The memory section of interest'**Default:** 'Inherit from model'**Memory section for execution functions — Select how to apply memory sections**`Inherit from model (default) | Default | The memory section of interest`

Select how Embedded Coder applies memory sections to the subsystem execution functions.

Inherit from model

Apply the root model memory sections to the subsystem function code

Default

Do not apply memory sections to the subsystem system code, overriding any model-level specification

The memory section of interest

Apply one of the model memory sections to the subsystem

Tips

- The possible values vary depending on what (if any) package of memory sections you have set for the model configuration. See “Control Data and Function Placement in Memory by Inserting Pragmas” (Embedded Coder) and “Model Configuration Parameters: Code Generation” (Simulink Coder).
- If you have not configured the model with a package, `Inherit from model` is the only value that appears. Otherwise, the list includes `Default` and all memory sections the model package contains.
- These options can be useful for overriding the model memory section settings for the given subsystem. For details on how to apply memory sections to atomic subsystems, see “Override Default Memory Placement for Subsystem Functions and Data” (Embedded Coder).

Dependencies

- This parameter requires a license for Embedded Coder software and an ERT-based system target file.
- To enable this parameter, set **Function packaging** to `Nonreusable function` or `Reusable function`.

Programmatic Use

Parameter: `RTWMemSecFuncExecute`

Type: character vector

Value: `'Inherit from model' | 'Default' | 'The memory section of interest'`

Default: `'Inherit from model'`

Memory section for constants — Select how to apply memory sections

`Inherit from model (default) | Default | The memory section of interest`

Select how Embedded Coder applies memory sections to the subsystem constants.

Inherit from model

Apply the root model memory sections to the subsystem data

Default

Not apply memory sections to the subsystem data, overriding any model-level specification

The memory section of interest

Apply one of the model memory sections to the subsystem

Tips

- The memory section that you specify applies to the corresponding global data structures in the generated code. For basic information about the global data structures generated for atomic subsystems, see “Standard Data Structures” (Simulink Coder).

- The possible values vary depending on what (if any) package of memory sections you have set for the model configuration. See “Control Data and Function Placement in Memory by Inserting Pragmas” (Embedded Coder).
- If you have not configured the model with a package, `Inherit from model` is the only value that appears. Otherwise, the list includes `Default` and all memory sections the model package contains.
- These options can be useful for overriding the model memory section settings for the given subsystem. For details on how to apply memory sections to atomic subsystems, see “Override Default Memory Placement for Subsystem Functions and Data” (Embedded Coder).

Dependencies

- This parameter requires a license for Embedded Coder and an ERT-based system target file.
- To enable this parameter, set **Function packaging** to `Nonreusable function` and select the **Function with separate data** parameter.

Programmatic Use

Parameter: `RTWMemSecDataConstants`

Type: character vector

Value: `'Inherit from model' | 'Default' | 'The memory section of interest'`

Default: `'Inherit from model'`

Memory section for internal data — Select how to apply memory sections

`Inherit from model` (default) | `Default` | `The memory section of interest`

Select how Embedded Coder applies memory sections to the subsystem internal data.

`Inherit from model`

Apply the root model memory sections to the subsystem data

`Default`

Not apply memory sections to the subsystem data, overriding any model-level specification

`The memory section of interest`

Apply one of the model memory sections to the subsystem

Tips

- The memory section that you specify applies to the corresponding global data structures in the generated code. For basic information about the global data structures generated for atomic subsystems, see “Standard Data Structures” (Simulink Coder).
- The possible values vary depending on what (if any) package of memory sections you have set for the model configuration. See “Control Data and Function Placement in Memory by Inserting Pragmas” (Embedded Coder).
- If you have not configured the model with a package, `Inherit from model` is the only value that appears. Otherwise, the list includes `Default` and all memory sections the model package contains.
- These options can be useful for overriding the model memory section settings for the given subsystem. For details on how to apply memory sections to atomic subsystems, see “Override Default Memory Placement for Subsystem Functions and Data” (Embedded Coder).

Dependencies

- This parameter requires a license for Embedded Coder and an ERT-based system target file.
- To enable this parameter, set **Function packaging** to `Nonreusable` function and select the **Function with separate data** parameter.

Programmatic Use**Parameter:** RTWMemSecDataInternal**Type:** character vector**Value:** 'Inherit from model' | 'Default' | 'The memory section of interest'**Default:** 'Inherit from model'**Memory section for parameters — Select how to apply memory sections**

Inherit from model (default) | Default | The memory section of interest

Select how Embedded Coder applies memory sections to the subsystem parameters.

Inherit from model

Apply the root model memory sections to the subsystem function code

Default

Not apply memory sections to the subsystem system code, overriding any model-level specification

The memory section of interest

Apply one of the model memory sections to the subsystem

Tips

- The memory section that you specify applies to the corresponding global data structure in the generated code. For basic information about the global data structures generated for atomic subsystems, see “Standard Data Structures” (Simulink Coder).
- The possible values vary depending on what (if any) package of memory sections you have set for the model configuration. See “Control Data and Function Placement in Memory by Inserting Pragmas” (Embedded Coder).
- If you have not configured the model with a package, `Inherit from model` is the only value that appears. Otherwise, the list includes `Default` and all memory sections the model package contains.
- These options can be useful for overriding the model memory section settings for the given subsystem. For details on how to apply memory sections to atomic subsystems, see “Override Default Memory Placement for Subsystem Functions and Data” (Embedded Coder).

Dependencies

- This parameter requires a license for Embedded Coder and an ERT-based system target file.
- To enable this parameter, set **Function packaging** to `Nonreusable` function and select the **Function with separate data** parameter.

Programmatic Use**Parameter:** RTWMemSecDataParameters**Type:** character vector**Value:** 'Inherit from model' | 'Default' | 'The memory section of interest'**Default:** 'Inherit from model'

Subsystem Reference

Subsystem file name — File name for referenced subsystem

string | character vector

Dependencies

To access this parameter, click the **Convert** button.

For more information on how to convert a subsystem to a referenced subsystem, see “Convert an Existing Subsystem to a Referenced Subsystem”.

Block Characteristics

Data Types	Boolean ^a bus ^a double ^a enumerated ^a fixed point ^a half ^a integer ^a single ^a string ^a
Direct Feedthrough	no
Multidimensional Signals	limited ^a
Variable-Size Signals	limited ^a
Zero-Crossing Detection	no

a. Actual data type or capability support depends on block implementation.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Actual data type or capability support depends on block implementation.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

HDL Architecture

Architecture	Description
Module (default)	Generate code for the subsystem and the blocks within the subsystem.
BlackBox	Generate a black box interface. The generated HDL code includes only the input/output port definitions for the subsystem. Therefore, you can use a subsystem in your model to generate an interface to existing, manually written HDL code. The black-box interface generation for subsystems is similar to the Model block interface generation without the clock signals.
No HDL	Remove the subsystem from the generated code. You can use the subsystem in simulation, however, treat it as a “no-op” in the HDL code.

Black Box Interface Customization

For the BlackBox architecture, you can customize port names and set attributes of the external component interface. See “Customize Black Box or HDL Cosimulation Interface” (HDL Coder).

HDL Block Properties

General	
AdaptivePipelining	Automatic pipeline insertion based on the synthesis tool, target frequency, and multiplier word-lengths. The default is <code>inherit</code> . See also “AdaptivePipelining” (HDL Coder).
BalanceDelays	Detects introduction of new delays along one path and inserts matching delays on the other paths. The default is <code>inherit</code> . See also “BalanceDelays” (HDL Coder).
ClockRatePipelining	Insert pipeline registers at a faster clock rate instead of the slower data rate. The default is <code>inherit</code> . See also “ClockRatePipelining” (HDL Coder).
ConstrainedOutputPipeline	Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is <code>0</code> . For more details, see “ConstrainedOutputPipeline” (HDL Coder).
DistributedPipelining	Pipeline register distribution, or register retiming. The default is <code>off</code> . See also “DistributedPipelining” (HDL Coder).
DSPStyle	Synthesis attributes for multiplier mapping. The default is <code>none</code> . See also “DSPStyle” (HDL Coder).
FlattenHierarchy	Remove subsystem hierarchy from generated HDL code. The default is <code>inherit</code> . See also “FlattenHierarchy” (HDL Coder).
InputPipeline	Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is <code>0</code> . For more details, see “InputPipeline” (HDL Coder).
OutputPipeline	Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is <code>0</code> . For more details, see “OutputPipeline” (HDL Coder).
SharingFactor	Number of functionally equivalent resources to map to a single shared resource. The default is <code>0</code> . See also “Resource Sharing” (HDL Coder).
StreamingFactor	Number of parallel data paths, or vectors, that are time multiplexed to transform into serial, scalar data paths. The default is <code>0</code> , which implements fully parallel data paths. See also “Streaming” (HDL Coder).

If this block is not the DUT, the block property settings in the **Target Specification** tab are ignored. In the HDL Workflow Advisor, if you use the **IP Core Generation** workflow, these target specification block property values are saved with the model. If you specify these target specification block property values using `hdlset_param`, when you open HDL Workflow Advisor, the fields are populated with the corresponding values.

Target Specification	
AdditionalTargetInterfaces	<p>Additional target interfaces, specified as a character vector.</p> <p>To save this block property on the model, in the Set Target Interface task of the IP Core Generation workflow, corresponding to the DUT ports that you want to add more interfaces, select Add more.... You can then add more interfaces in the Add New Target Interfaces dialog box. Specify the type of interface, number of additional interfaces, and a unique name for each additional interface.</p> <p>Values: '' (default) cell array of character vectors</p> <p>Example: '{{'AXI4-Stream', 'InterfaceID', 'AXI4-Stream1'}}'</p>
ProcessorFPGASynchronization	<p>Processor/FPGA synchronization mode, specified as a character vector.</p> <p>To save this block property on the model, specify the Processor/FPGA Synchronization in the Set Target Interface task of the IP Core Generation workflow.</p> <p>Values: Free running (default) Coprocessing - blocking</p> <p>Example: 'Free running'</p>
TestPointMapping	<p>To save this block property on the model, specify the mapping of test point ports to target platform interfaces in the Set Target Interface task of the IP Core Generation workflow.</p> <p>Values: '' (default) cell array of character vectors</p> <p>Example: '{{'TestPoint', 'AXI4-Lite', 'x"108"'}}'</p>
TunableParameterMapping	<p>To save this block property on the model, specify the mapping of tunable parameter ports to target platform interfaces in the Set Target Interface task of the IP Core Generation workflow.</p> <p>Values: '' (default) cell array of character vectors</p> <p>Example: '{{'myParam', 'AXI4-Lite', 'x"108"'}}'</p>
AXI4RegisterReadback	<p>To save this block property on the model, specify whether you want to enable readback on AXI4 slave write registers in the Generate RTL Code and IP Core task of the IP Core Generation workflow. To learn more, see "Model Design for AXI4 Slave Interface Generation" (HDL Coder).</p> <p>Values: 'off' (default) 'on'</p>
AXI4SlaveIDWidth	<p>To save this block property on the model, specify the number of AXI Master interfaces that you want to connect the DUT IP core to by using the AXI4 Slave ID Width setting in the Generate RTL Code and IP Core task of the IP Core Generation workflow. To learn more, see "Define Multiple AXI Master Interfaces in Reference Designs to access DUT AXI4 Slave Interface" (HDL Coder).</p> <p>Values: 'off' (default) 'on'</p>

Target Specification	
AXI4SlavePortToPipelineRegisterRatio	<p>To save this block property on the model, specify the number of AXI4 slave ports for which you want a pipeline register to be inserted by using the AXI4 Slave port to pipeline register ratio setting in the Generate RTL Code and IP Core task of the IP Core Generation workflow. To learn more, see “Model Design for AXI4 Slave Interface Generation” (HDL Coder).</p> <p>Values: 'off' (default) 'on'</p>
GenerateDefaultAXI4Slave	<p>To save this block property on the model, specify whether you want to disable generation of default AXI4 slave interfaces in the Generate RTL Code and IP Core task of the IP Core Generation workflow.</p> <p>Values: 'on' (default) 'off'</p>
IPCoreAdditionalFiles	<p>Verilog or VHDL files for black boxes in your design. Specify the full path to each file, and separate file names with a semicolon (;).</p> <p>You can set this property in the HDL Workflow Advisor, in the Additional source files field.</p> <p>Values: '' (default) character vector</p> <p>Example: 'C:\myprojfiles \led_blinking_file1.vhd;C:\myprojfiles \led_blinking_file2.vhd;'</p>
IPCoreName	<p>IP core name, specified as a character vector.</p> <p>You can set this property in the HDL Workflow Advisor, in the IP core name field. If this property is set to the default value, the HDL Workflow Advisor constructs the IP core name based on the name of the DUT.</p> <p>Values: '' (default) character vector</p> <p>Example: 'my_model_name'</p>
IPCoreVersion	<p>IP core version number, specified as a character vector.</p> <p>You can set this property in the HDL Workflow Advisor, in the IP core version field. If this property is set to the default value, the HDL Workflow Advisor sets the IP core version.</p> <p>Values: '' (default) character vector</p> <p>Example: '1.3'</p>

Target Specification	
IPDataCaptureBuffer Size	<p>FPGA Data Capture buffer size, specified as a character vector. Use FPGA Data Capture to observe signals in a design when running on an FPGA.</p> <p>The buffer size uses values that are $128 \cdot 2^n$, where n is an integer. By default, the buffer size is 128 ($n=0$). The maximum value of n is 13, which means that the maximum value for buffer size is 1048576 ($=128 \cdot 2^{13}$).</p> <p>Values: ' ' (default) character vector</p> <p>Example: '1.3'</p>

Restrictions

If your DUT is a masked subsystem, you can generate code only if it is at the top level of the model.

For more information, see:

- “External Component Interfaces” (HDL Coder)
- “Generate Black Box Interface for Subsystem” (HDL Coder)

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Add, Subtract, Sum of Elements, Sum

Add or subtract inputs

Library: Simulink / Math Operations
HDL Coder / HDL Floating Point Operations
HDL Coder / Math Operations

Description

The Sum block performs addition or subtraction on its inputs. The Add, Subtract, Sum of Elements, and Sum blocks are identical blocks. This block can add or subtract scalar, vector, or matrix inputs. It can also collapse the elements of a signal and perform a summation.

You specify the operations of the block with the **List of signs** parameter with plus (+), minus (-), and spacer (|).

- The number of + and - characters equals the number of inputs. For example, +-+ requires three inputs. The block subtracts the second (middle) input from the first (top) input, and then adds the third (bottom) input.
- A spacer character creates extra space between ports on the block icon.
- If performing only addition, you can use a numerical value equal to the number of inputs.
- If only there is only one input port, a single + or - adds or subtracts the elements over all dimensions or in the specified dimension.

The Sum block first converts the input data type to its accumulator data type, then performs the specified operations. The block converts the result to its output data type using the specified rounding and overflow modes.

Calculation of Block Output

Output calculation for the Sum block depends on the number of block inputs and the sign of input ports:

If the Sum block has...	And...	The formula for output calculation is...	Where...
One input port	The input port sign is +	$y = e[0] + e[1] + e[2] \dots + e[m]$	$e[i]$ is the i^{th} element of input u
	The input port sign is -	$y = 0.0 - e[0] - e[1] - e[2] \dots - e[m]$	
Two or more input ports	All input port signs are -	$y = 0.0 - u[0] - u[1] - u[2] \dots - u[n]$	$u[i]$ is the input to the i^{th} input port

If the Sum block has...	And...	The formula for output calculation is...	Where...
	The k^{th} input port is the first port where the sign is +	$y = u[k] - u[0] - u[1] - u[2] - u[k-1] (+/-) u[k+1] \dots (+/-) u[n]$	

Ports

Inputs

The inputs can be of different data types, unless you select the **Require all inputs to have the same data type** parameter.

Port_1 — First input operand signal

scalar | vector | matrix

Input signal to the addition or subtraction operation. If there is only one input signal, then addition or subtraction is performed on the elements over all dimensions or the specified dimension.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

Port_n — nth input operand signal

scalar | vector | matrix

nth input signal to the operations. The number of inputs matches the number of signs in the **List of signs** parameter. The block applies the operations to the inputs in the order listed. You can also use a numerical value equal to the number of input ports as the **List of signs** parameter. The block creates the input ports and applies addition to all inputs. For example, if you assign 5 for the **List of signs** parameter, the block creates 5 input ports and adds them together to produce the output.

All nonscalar inputs must have the same dimensions. Scalar inputs are expanded to have the same dimensions as other inputs.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

Output

Port_1 — Output signal

scalar | vector | matrix

Output signal resulting from addition and/or subtraction operations. The output signal has the same dimension as the input signals.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

Parameters

Main

Icon shape — Block icon shape

rectangular (default) | **round**

Designate the icon shape of the block as rectangular or round.

For a rectangular block, the first input port is the top port. For a round Sum block, the first input port is the port closest to the 12 o'clock position going in a counterclockwise direction around the block. Similarly, other input ports appear in counterclockwise order around the block.

Programmatic Use

Block Parameter: IconShape

Type: character vector

Values: 'rectangular' | 'round'

Default: 'round'

List of signs — Operations performed on inputs

++ (default) | **+** | **-** | **|** | **integer**

Enter addition and subtraction operations performed on the inputs. An input port is created for each operation. A spacer (|) creates extra space between the input ports on the block icon. Addition is the default operation. If you only want to add the inputs, enter the number of input ports. The operations are performed in the order listed.

When you enter only one element, the block enables the **Sum over** parameter. For a single vector input, + or - adds or subtracts the elements over all dimensions or in the specified dimension.

Tips

You can manipulate the positions of the input ports on the block by inserting spacers (|) between the signs in the **List of signs** parameter. For example, “++| - -” creates an extra space between the second and third input ports.

Programmatic Use

Block Parameter: Inputs

Type: character vector

Values: '+' | '-' | '|' | integer

Default: '++'

Sum over — Dimensions for operations on a single vector input

All dimensions (default) | **Specified dimension**

Select the dimension over which the block performs the sum-over operation.

For **All dimensions**, all input elements are summed. When you select configuration parameter **Use algorithms optimized for row-major array layout**, Simulink enables row-major algorithms for simulation. To generate row-major code, set configuration parameter **Array layout** (Simulink Coder) to Row-major in addition to selecting **Use algorithms optimized for row-major array layout**. The column-major and row-major algorithms differ only in the summation order. In some cases, due to different operation order on the same data set, you might experience minor numeric differences in the outputs of column-major and row-major algorithms.

When you select **Specified dimensions**, another parameter **Dimension** appears. Choose the specific dimension for summing the vector input.

Dependency

Enabled when you list only one sign in the **List of signs** parameter.

Programmatic Use

Block Parameter: CollapseMode

Type: character vector

Values: 'All dimensions' | 'Specified dimension'

Default: 'All dimensions'

Dimension — Dimension for summation on vector input

1 (default) | integer

When you choose **Specified dimension** for the **Sum over** parameter, specify the dimension over which to perform the operation.

The block follows the same summation rules as the MATLAB `sum` function.

Suppose that you have a 2-by-3 matrix U .

- Setting **Dimension** to 1 results in the output Y being computed as:

$$Y = \sum_{i=1}^2 U(i, j)$$

- Setting **Dimension** to 2 results in the output Y being computed as:

$$Y = \sum_{j=1}^3 U(i, j)$$

If the specified dimension is greater than the dimension of the input, an error message appears.

Dependency

Enabled when you choose Specified dimension for the **Sum over** parameter.

Programmatic Use

Block Parameter: CollapseDim

Type: character vector

Value: integer

Default: '1'

Sample time — Specify sample time as a value other than -1

-1 (default) | scalar | vector

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

Dependencies

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

Programmatic Use

Block Parameter: SampleTime

Type: character vector

Values: scalar or vector

Default: '- 1'

Signal Attributes

Click the **Show data type assistant** button  to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

Require all inputs to have the same data type – Require that all inputs have the same data type

off (default) | on

Specify if input signals must all have the same data type. If you enable this parameter, then an error occurs during simulation if the input signal types are different.

Programmatic Use

Block Parameter: InputSameDT

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Accumulator data type – Data type of the accumulator

Inherit: Inherit via internal rule (default) | Inherit: Same as first input | double | single | half | int8 | uint8 | int16 | uint16 | int32 | uint32 | int64 | uint64 | fixdt(1,16) | fixdt(1,16,0) | fixdt(1,16,2^0,0) | <data type expression>

Choose the data type of the accumulator. The type can be inherited, specified directly, or expressed as a data type object such as `Simulink.NumericType`. When you choose `Inherit: Inherit via internal rule`, Simulink chooses a data type to balance numerical accuracy, performance, and generated code size, while taking into account the properties of the embedded target hardware.

Programmatic Use

Block Parameter: AccumDataTypeStr

Type: character vector

Values: 'Inherit: Inherit via internal rule' | 'Inherit: Same as first input' | 'double' | 'single' | 'half' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'int64' | 'uint64' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | '<data type expression>'

Default: 'Inherit: Inherit via internal rule'

Output minimum – Minimum output value for range checking

[] (default) | scalar

Lower value of the output range that Simulink checks.

Simulink uses the minimum to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Specify Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.

- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Embedded Coder).

Note Output minimum does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use

Block Parameter: OutMin

Type: character vector

Values: ' [] ' | scalar

Default: ' [] '

Output maximum — Maximum output value for range checking

[] (default) | scalar

Upper value of the output range that Simulink checks.

Simulink uses the maximum value to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Specify Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Embedded Coder).

Note Output maximum does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use

Block Parameter: OutMax

Type: character vector

Values: ' [] ' | scalar

Default: ' [] '

Output data type — Specify the output data type

Inherit: Inherit via internal rule (default) | Inherit: Keep MSB | Inherit: Keep LSB | Inherit: Inherit via back propagation | Inherit: Same as first input | Inherit: Same as accumulator | double | single | half | int8 | uint8 | int16 | uint16 | int32 | uint32 | int64 | uint64 | fixdt(1,16) | fixdt(1,16,0) | fixdt(1,16,2^0,0) | <data type expression>

Choose the data type for the output. The type can be inherited, specified directly, or expressed as a data type object such as `Simulink.NumericType`.

When you select an inherited option, the block behaves as follows:

- **Inherit: Inherit via internal rule**—Simulink chooses a data type to balance numerical accuracy, performance, and generated code size, while taking into account the properties of the embedded target hardware.

Note The accumulator internal rule favors greater numerical accuracy, possibly at the cost of less efficient generated code. To get the same accuracy for the output, set the output data type to **Inherit: Inherit same as accumulator**.

Note When input is a floating-point data type smaller than single precision, the **Inherit: Inherit via internal rule** output data type depends on the setting of the “Inherit floating-point output type smaller than single precision” configuration parameter. Data types are smaller than single precision when the number of bits needed to encode the data type is less than the 32 bits needed to encode the single-precision data type. For example, `half` and `int16` are smaller than single precision.

- **Inherit: Keep MSB**— Simulink chooses a data type that maintains the full range of the operation, then reduces the precision of the output to a size appropriate for the embedded target hardware.

Tip For more efficient generated code, set the **Accumulator data type** to **Inherit: Inherit via internal rule**, and deselect the **Saturate on integer overflow** parameter.

This rule never produces overflows.

- **Inherit: Keep LSB**— Simulink chooses a data type that maintains the precision of the operation, but reduces the range if the full type does not fit on the embedded target hardware.

Tip For more efficient generated code, set the **Accumulator data type** to **Inherit: Inherit via internal rule**, and deselect the **Saturate on integer overflow** parameter.

This rule can produce overflows.

If you change the embedded target settings, the data type selected by these internal rules might change. It is not always possible for the software to optimize code efficiency and numerical accuracy at the same time. If the rules do not meet your specific needs for numerical accuracy or performance, use one of the following options:

- Specify the output data type explicitly.
- Use the simple choice of **Inherit: Same as first input**.
- Explicitly specify a default data type such as `fixdt(1,32,16)` and then use the Fixed-Point Tool to propose data types for your model. For more information, see `fxptdlg`.
- To specify your own inheritance rule, use **Inherit: Inherit via back propagation** and then use a Data Type Propagation block. Examples of how to use this block are available in the Signal Attributes library Data Type Propagation Examples block.
- **Inherit: Inherit via back propagation** — Use data type of the driving block.
- **Inherit: Same as first input** — Use data type of the first input signal.

- **Inherit:** Inherit same as accumulator— Use data type of the accumulator.

Programmatic Use

Block Parameter: OutDataTypeStr

Type: character vector

Values: 'Inherit: Inherit via internal rule'|'Inherit: Keep MSB'|'Inherit: Keep LSB'|'Inherit: Inherit via back propagation'|'Inherit: Same as first input'|'Inherit: Same as accumulator'|'double'|'single'|'half'|'int8'|'uint8'|'int16'|'uint16', 'int32'|'uint32'|'int64'|'uint64'|'fixdt(1,16)'|'fixdt(1,16,0)'|'fixdt(1,16,2^0,0)'|'<data type expression>'

Default: 'Inherit: Inherit via internal rule'

Lock data type settings against changes by the fixed-point tools — Prevent fixed-point tools from overriding data types

off (default) | on

Select to lock data type settings of this block against changes by the Fixed-Point Tool and the Fixed-Point Advisor. For more information, see “Lock the Output Data Type Setting” (Fixed-Point Designer).

Programmatic Use

Block Parameter: LockScale

Values: 'off' | 'on'

Default: 'off'

Integer rounding mode — Rounding mode for fixed-point operations

Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

Specify the rounding mode for fixed-point operations. For more information, see “Rounding” (Fixed-Point Designer).

Block parameters always round to the nearest representable value. To control the rounding of a block parameter, enter an expression using a MATLAB rounding function into the mask field.

Programmatic Use

Block Parameter: RndMeth

Type: character vector

Values: 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'

Default: 'Floor'

Saturate on integer overflow — Method of overflow action

off (default) | on

Specify whether overflows saturate or wrap.

Action	Rationale	Impact on Overflows	Example
Select this check box (on).	Your model has possible overflow, and you want explicit saturation protection in the generated code.	Overflows saturate to either the minimum or maximum value that the data type can represent.	The maximum value that the <code>int8</code> (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box selected, the block output saturates at 127. Similarly, the block output saturates at a minimum output value of -128.
Do not select this check box (off).	You want to optimize efficiency of your generated code. You want to avoid overspecifying how a block handles out-of-range signals. For more information, see "Troubleshoot Signal Range Errors".	Overflows wrap to the appropriate value that is representable by the data type.	The maximum value that the <code>int8</code> (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box cleared, the software interprets the overflow-causing value as <code>int8</code> , which can produce an unintended result. For example, a block result of 130 (binary 1000 0010) expressed as <code>int8</code> , is -126.

When you select this check box, saturation applies to every internal operation on the block, not just the output, or result. Usually, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Programmatic Use

Block Parameter: SaturateOnIntegerOverflow

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Block Characteristics

Data Types	Boolean double fixed point half integer single
Direct Feedthrough	yes
Multidimensional Signals	yes
Variable-Size Signals	yes
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

HDL Architecture of Sum, Add, and Subtract Blocks

The default **Linear** architecture generates a chain of N operations (adders) for N inputs.

HDL Architecture of Sum of Elements Block

For the Sum of Elements block, HDL Coder supports **Tree** and **Cascade** architectures for Sum of Elements blocks that have a single vector input with multiple elements.

This block has multi-cycle implementations that introduce additional latency in the generated code. To see the added latency, view the generated model or validation model. See “Generated Model and Validation Model” (HDL Coder).

Architecture	Additional cycles of latency	Description
Linear	0	Generates a linear chain of adders to compute the sum of products. For multiple inputs that have different bit widths, the Linear architecture optimizes the resource utilization by implementing adders in multiple stages with pipelines in between the stages. The output of each stage is calculated based on the width of the inputs to that stage.
Tree	0	Generates a tree structure of adders to compute the sum of products.
Cascade	1, when block has a single vector input port.	This implementation optimizes latency * area and is faster than the Tree implementation. It computes partial sums and cascades adders. See “Cascade Architecture Best Practices” (HDL Coder).

HDL Block Properties

Note To use the **LatencyStrategy** setting in the **Native Floating Point** tab of the HDL Block Properties dialog box, specify **Linear** or **Tree** as the HDL Architecture.

General	
ConstrainedOutputPipeline	Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is 0. For more details, see “ConstrainedOutputPipeline” (HDL Coder).
InputPipeline	Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “InputPipeline” (HDL Coder).
OutputPipeline	Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “OutputPipeline” (HDL Coder).

Note The Sum of Elements block does not support HDL code generation with double data types in the Native Floating Point mode.

Native Floating Point	
LatencyStrategy	Specify whether to map the blocks in your design to <code>inherit</code> , <code>Max</code> , <code>Min</code> , <code>Zero</code> , or <code>Custom</code> for the floating-point operator. The default is <code>inherit</code> . See also “LatencyStrategy” (HDL Coder).
NFPCustomLatency	To specify a value, set LatencyStrategy to <code>Custom</code> . HDL Coder adds latency equal to the value that you specify for the NFPCustomLatency setting. See also “NFPCustomLatency” (HDL Coder).

Complex Data Support

The default `Linear` implementation supports complex data.

The `Tree` implementation supports complex data with `+` for the **List of signs** block parameter. With native floating point support, the `Tree` implementation supports complex data with both `+` and `-` for **List of signs**.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Topics

“Control Signal Data Types”

Introduced before R2006a

Switch

Combine multiple signals into single signal

Library: Simulink / Commonly Used Blocks
 Simulink / Signal Routing
 HDL Coder / Commonly Used Blocks
 HDL Coder / Signal Routing

Description

The Switch block passes through the first input or the third input signal based on the value of the second input. The first and third inputs are data input. The second input is a control input. Specify the condition under which the block passes the first input by using the **Criteria for passing first input** and **Threshold** parameters.

Bus Support

The Switch block is a bus-capable block. The data inputs can be virtual or nonvirtual bus signals subject to the following restrictions:

- All the buses must be equivalent (same hierarchy with identical names and attributes for all elements).
- All signals in a nonvirtual bus input to a Switch block must have the same sample time. The requirement holds even if the elements of the associated bus object specify inherited sample times.

You can use a Rate Transition block to change the sample time of an individual signal, or of all signals in a bus. See “Modify Sample Times for Nonvirtual Buses” and Bus-Capable Blocks for more information.

You can use an array of buses as an input signal to a Switch block. For details about defining and using an array of buses, see “Group Nonvirtual Buses in Arrays of Buses”. When using an array of buses, set the **Threshold** parameter to a scalar value.

Limitations

- If the data inputs to the Switch block are buses, the element names of both buses must be the same. Using the same element names ensures that the output bus has the same element names no matter which input bus the block selects. To ensure that your model meets this requirement, use a bus object to define the buses and set the **Element name mismatch** diagnostic to error. See “Connectivity Diagnostics Overview” for more information.

Ports

Input

Port_1 — First data input signal

scalar | vector

First of two data inputs. The block propagates either the first or second data input to the output. The block selects which input to pass based on the control input. Specify the condition for the control input to pass the first input using the **Criteria for passing first input** and **Threshold** parameters.

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Port_2 — Control input signal

scalar | vector

Control signal the block uses to determine whether to pass the first or second data input to the output. If the control input meets the condition set in the **Criteria for passing first input** parameter, then the block passes the first data input. Otherwise, the block passes the second data input.

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Port_3 — Second data input signal

scalar | vector

Second of two data inputs. The block propagates either the first or second data input to the output. The block selects which input to pass based on the control input. Specify the condition for the control input to pass the first or second input using the **Criteria for passing first input** and **Threshold** parameters.

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Output

Port_1 — Output signal

scalar | vector

Output signal propagated from either the first or second input signal, based on the control signal value.

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Parameters

Main

Criteria for passing first input — Selection criteria to pass first data input

u2 >= Threshold (default) | u2 > Threshold | u2 ~= 0

Select the condition under which the block passes the first data input. If the control input meets the condition set in the **Criteria for passing first input** parameter, the block passes the first input. Otherwise, the block passes the second data input signal from input `Port_3`.

`u2 >= Threshold`

Checks whether the control input is greater than or equal to the threshold value.

`u2 > Threshold`

Checks whether the control input is greater than the threshold value.

`u2 ~=0`

Checks whether the control input is nonzero.

Note The Switch block does not support `u2 ~=0` mode for enumerated data types.

Tip

When the control input is a Boolean signal, use one of these combinations of condition and threshold value:

- `u2 >= Threshold`, where the threshold value equals 1
- `u2 > Threshold`, where the threshold value equals 0
- `u2 ~=0`

Otherwise, the Switch block ignores threshold values and uses the Boolean value for signal routing. For a value of 1, the block passes the first input, and for a value of 0, the block passes the third input. A warning message that describes this behavior also appears in the MATLAB Command Window.

Programmatic Use

Block Parameter: Criteria

Type: character vector

Value: 'u2 >= Threshold' | 'u2 > Threshold' | 'u2 ~=0'

Default: 'u2 >= Threshold'

Threshold — Threshold used in criteria

0 (default) | scalar

Assign the threshold used in the **Criteria for passing first input** that determines which input the block passes to the output. **Threshold** must be greater than **Output minimum** and less than **Output maximum**.

To specify a nonscalar threshold, use brackets. For example, the following entries are valid:

- [1 4 8 12]
- [MyColors.Red, MyColors.Blue]

Dependencies

Setting **Criteria for passing first input** to `u2 ~=0` disables this parameter.

Programmatic Use

Block Parameter: Threshold

Type: character vector

Value: 'off' | 'on'

Default: 'off'

Enable zero-crossing detection — Enable zero-crossing detection

on (default) | Boolean

Select to enable zero-crossing detection. For more information, see “Zero-Crossing Detection” in the Simulink documentation.

Programmatic Use

Block Parameter: ZeroCross

Type: character vector, string

Values: 'off' | 'on'

Default: 'on'

Signal Attributes

Click the **Show data type assistant** button  to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

Require all data port inputs to have the same data type — Require data ports to have the same data type

off (default) | on

Require all data inputs to have the same data type.

Programmatic Use

Block Parameter: InputSameDT

Type: character vector

Value:

Default: '0'

Output minimum — Minimum output value for range checking

[] (default) | scalar

Lower value of the output range that Simulink checks.

Simulink uses the minimum to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Specify Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Embedded Coder).

Note Output minimum does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use**Block Parameter:** OutMin**Type:** character vector**Values:** '[]' | scalar**Default:** '[]'**Output maximum — Maximum output value for range checking**

[] (default) | scalar

Upper value of the output range that Simulink checks.

Simulink uses the maximum value to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Specify Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Embedded Coder).

Note **Output maximum** does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use**Block Parameter:** OutMax**Type:** character vector**Values:** '[]' | scalar**Default:** '[]'**Output data type — Output data type**

Inherit: Inherit via internal rule (default) | Inherit: Inherit via back propagation | Inherit: Same as first input | double | single | half | int8 | uint8 | int16 | uint16 | int32 | uint32 | int64 | uint64 | fixdt(1,16) | fixdt(1,16,0) | fixdt(1,16,2^0,0) | string | Enum: <class name> | <data type expression>

Specify the output data type.

Inherit: Inherit via internal rule

Uses the following rules to determine the output data type.

Data Type of First Input Port	Output Data Type
Has a larger positive range than the third input port	Inherited from the first input port
Has the same positive range as the third input port	Inherited from the third input port

Data Type of First Input Port	Output Data Type
Has a smaller positive range than the third input port	

Inherit: Inherit via back propagation

Uses data type of the driving block.

Inherit: Inherit same as first input

Uses data type of the first data input port.

double

Specifies output data type is double.

single

Specifies output data type is single.

half

Specifies output data type is half.

int8

Specifies output data type is int8.

uint8

Specifies output data type is uint8.

int16

Specifies output data type is int16.

uint16

Specifies output data type is uint16.

int32

Specifies output data type is int32.

uint32

Specifies output data type is uint32.

int64

Specifies output data type is int64.

uint64

Specifies output data type is uint64.

fixdt(1,16,0)

Specifies output data type is fixed point fixdt(1,16,0).

fixdt(1,16,2^0,0)

Specifies output data type is fixed point fixdt(1,16,2^0,0).

Enum: <class name>

Uses an enumerated data type, for example, Enum: BasicColors.

string

Specifies output data type is string.

<data type expression>

Uses a data type object, for example, Simulink.NumericType.

Tip

When the output is of enumerated type, both data inputs should use the same enumerated type as the output.

Programmatic Use

Block Parameter: OutDataTypeStr

Type: character vector

Values: 'Inherit: Inherit via internal rule' | 'Inherit: Inherit via back propagation' | 'Inherit: Same as first input' | 'double' | 'single' | 'half' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'int64' | 'uint64' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | Enum: <class name> | 'string' | '<data type expression>'

Default: 'Inherit: Inherit via internal rule'

Lock data type settings against changes by the fixed-point tools – Prevent fixed-point tools from overriding data types

off (default) | on

Select this parameter to prevent the fixed-point tools from overriding the data types you specify on this block. For more information, see “Lock the Output Data Type Setting” (Fixed-Point Designer).

Programmatic Use

Block Parameter: LockScale

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Integer rounding mode – Specify the rounding mode for fixed-point operations

Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

Choose one of these rounding modes.

Ceiling

Rounds both positive and negative numbers toward positive infinity. Equivalent to the MATLAB `ceil` function.

Convergent

Rounds number to the nearest representable value. If a tie occurs, rounds to the nearest even integer. Equivalent to the Fixed-Point Designer `convergent` function.

Floor

Rounds both positive and negative numbers toward negative infinity. Equivalent to the MATLAB `floor` function.

Nearest

Rounds number to the nearest representable value. If a tie occurs, rounds toward positive infinity. Equivalent to the Fixed-Point Designer `nearest` function.

Round

Rounds number to the nearest representable value. If a tie occurs, rounds positive numbers toward positive infinity and rounds negative numbers toward negative infinity. Equivalent to the Fixed-Point Designer `round` function.

Simplest

Automatically chooses between round toward floor and round toward zero to generate rounding code that is as efficient as possible.

Zero

Rounds number toward zero. Equivalent to the MATLAB `fix` function.

Programmatic Use

Block Parameter: RndMeth

Type: character vector

Values: 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'

Default: 'Floor'

See Also

For more information, see “Rounding” (Fixed-Point Designer).

Saturate on integer overflow — Method of overflow action

off (default) | on

Specify whether overflows saturate or wrap.

- **off** — Overflows wrap to the appropriate value that the data type can represent.

For example, the number 130 does not fit in a signed 8-bit integer and wraps to -126.

- **on** — Overflows saturate to either the minimum or maximum value that the data type can represent.

For example, an overflow associated with a signed 8-bit integer can saturate to -128 or 127.

Tip

- Consider selecting this check box when your model has a possible overflow and you want explicit saturation protection in the generated code.
- Consider clearing this check box when you want to optimize efficiency of your generated code.

Clearing this check box also helps you to avoid overspecifying how a block handles out-of-range signals. For more information, see “Troubleshoot Signal Range Errors”.

- When you select this check box, saturation applies to every internal operation on the block, not just the output or result.
 - In general, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.
-

Programmatic Use

Block Parameter: SaturateOnIntegerOverflow

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Allow different data input sizes — Allow different data input sizes

off (default) | on

Select this check box to allow input signals with different sizes. The block propagates the input signal size to the output signal. If the two data inputs are variable-size signals, the maximum size of the signals can be equal or different.

Programmatic Use

Block Parameter: AllowDiffInputSizes

Type: character vector

Value: 'on' | 'off'

Default: 'off'

Block Characteristics

Data Types	Boolean bus double enumerated fixed point half integer single string
Direct Feedthrough	yes
Multidimensional Signals	yes
Variable-Size Signals	yes
Zero-Crossing Detection	yes

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Generated code relies on memcpy or memset functions (string.h) under certain conditions.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

HDL Architecture

This block has a single, default HDL architecture.

HDL Block Properties

ConstrainedOutputPipeline	Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is 0. For more details, see “ConstrainedOutputPipeline” (HDL Coder).
InputPipeline	Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “InputPipeline” (HDL Coder).

OutputPipeline	Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “OutputPipeline” (HDL Coder).

Switch Case

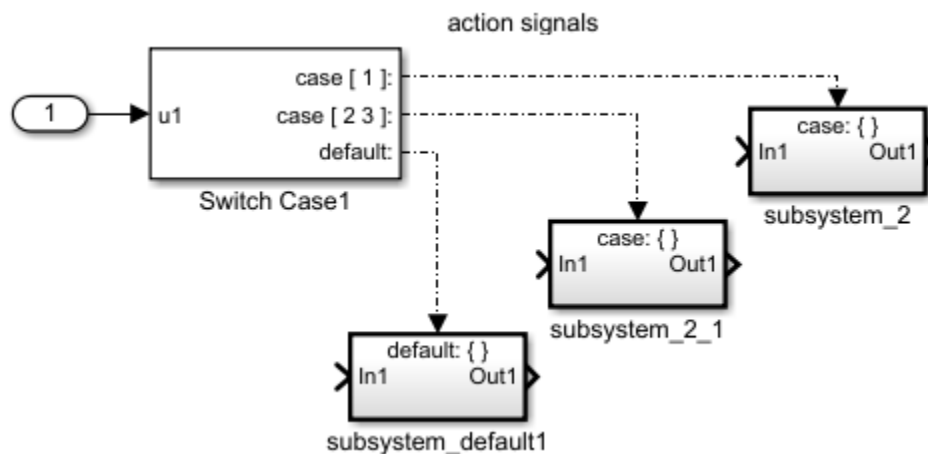

Select subsystem execution using logic similar to a switch statement

Library: Simulink / Ports & Subsystems

Description

The Switch Case block with Switch Case Action Subsystem blocks containing Action Port blocks, implements switch logic to control subsystem execution.

A Switch Case block has a single input. To select a case, define the input value using the **Case conditions** parameter. The cases are evaluated top down starting with the first case.

Each case is associated with an output port that is attached to a Switch Case Action Subsystem block. When a case is selected, the associated output port sends an action signal to execute the subsystem.

A default case is selected after all of the other case conditions evaluate to false. Providing a default case is optional, even if the other case conditions do not exhaust every possible input value.

Cases for the Switch Case block contain an implied break after a Switch Case Action Subsystem block is executed. Therefore, there is no fall through behavior for the Simulink Switch Case block as found in standard C switch statements.

Ports

Input

u1 (logical operator) – Value for case selection

scalar

Input to the port labeled **u1** of a Switch Case block can be:

- A scalar value with a built-in data type that Simulink supports. However, the Switch Case block does not support Boolean or fixed-point data types, and it truncates numeric inputs to 32-bit signed integers.
- A scalar value of any enumerated data type.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `enumerated`

Output

case — Action signal for a Switch Case Action Subsystem block

scalar

Output from the **Case** and **default** ports are action signals connected to Switch Case Action Subsystem blocks.

Parameters

Case conditions — Specify case values

{1} (default) | list of cases

Specify the cases values using MATLAB cell notation.

{1}

Specify the output port labeled `case[1]` outputs an action signal when the input port value is 1.

list of ports with case assignments

Specify multiple cases and ports using MATLAB cell notation. For example, entering `{1, [7,9,4]}` specifies that output port `case[1]` is run when the input value is 1, and output port `case [7 9 4]` is run when the input value is 7, 9, or 4.

You can use colon notation to specify a range of integer case conditions. For example, entering `{[1:5]}` specifies that output port **case[1 2 3 4 5]** is run when the input value is 1, 2, 3, 4, or 5.

Depending on block size, cases from a long list of case conditions are displayed in shortened form on the face of the Switch Case block, using a terminating ellipsis (...).

You can use the `enumeration` function to specify case conditions that include a case for every value in an enumerated type.

Programmatic Use

Block Parameter: `CaseConditions`

Type: character vector

Values: `'{1}'` | `'<list of cases>'`

Default: `'{1}'`

Show default case — Control display of default output port

off (default) | on

Control display of default output port.

off

Hide default output port.

on

Display default output port as the last case on the Switch Case block. This allows you to specify a default case that executes when the input value does not match any of the other case values.

Programmatic Use

Block Parameter: ShowDefaultCase

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Enable zero-crossing detection — Control zero-crossing detection

on (default) | off

Control zero-crossing detection.

on

Detect zero crossings.

off

Do not detect zero crossings.

Programmatic Use

Block Parameter: ZeroCross

Type: character vector

Values: 'on' | 'off'

Default: 'on'

Block Characteristics

Data Types	double enumerated integer single
Direct Feedthrough	yes
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	yes

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Switch Case Action Subsystem

Subsystem whose execution is enabled by a Switch Case block

Library: Simulink / Ports & Subsystems

Description

The Switch Case Action Subsystem block is a Subsystem block preconfigured as a starting point for creating a subsystem whose execution is controlled by a Switch Case block. The input port to a Switch Case block selects a case defined using the **Case conditions** parameter. Depending on input value and case selected, an action signal is sent to execute a Switch Case Action Subsystem block.

All blocks in a Switch Case Action Subsystem block must run at the same rate as the driving Switch Case block. You can achieve this requirement by setting each block sample time parameter to be either inherited (-1) or the same value as the Switch Case block sample time.

Merge signals from Switch Case Subsystem blocks

This example shows how to create a one signal from multiple subsystem output signals. The Switch Case block selects the execution of one If Action Subsystem block from a set of subsystems. Regardless of which subsystem the Switch Case block selects, you can create a one resulting signal with a Merge block. Open model.

Ports

Input

In1 — Signal input to a subsystem block

scalar | vector | matrix

Placing an Inport block in a subsystem block adds an external input port to the block. The port label matches the name of the Inport block.

Use Inport blocks to get signals from the local environment.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Action — Control signal input to a subsystem block

scalar | vector | matrix

Placing an Action Port block in a subsystem block adds an external input port to the block and changes the block to a Switch Case Action Subsystem block.

Dot-dash lines from a Switch Case block to an Switch Case Action Subsystem block represent *action* signals. An action signal is a control signal connected to the action port of an Switch Case Action Subsystem block. A message on the action signal initiates execution of the subsystem.

Data Types: action

Output

Out1 — Signal output from a subsystem

scalar | vector | matrix

Placing an Outport block in a subsystem block adds an output port from the block. The port label on the subsystem block is the name of the Outport block.

Use Outport blocks to send signals to the local environment.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Block Characteristics

Data Types	Boolean ^a bus ^a double ^a enumerated ^a fixed point ^a half ^a integer ^a single ^a string ^a
Direct Feedthrough	no
Multidimensional Signals	limited ^a
Variable-Size Signals	limited ^a
Zero-Crossing Detection	no

a. Actual data type or capability support depends on block implementation.

Tapped Delay

Delay scalar signal multiple sample periods and output all delayed versions

Library: Simulink / Discrete
HDL Coder / Discrete

Description

The Tapped Delay block delays an input by the specified number of sample periods and provides an output signal for each delay. For example, when you specify 4 for **Number of delays** and **Order output starting with** is `Oldest`, the block provides four outputs — the first delayed by four sample periods, the second delayed by three, and so on. Use this block to discretize a signal in time or resample a signal at a different rate.

The block accepts one scalar input and generates an output vector that contains data for each incremental delay. Specify the order of the delayed signals in the output vector with the **Order output vector starting with** parameter:

- `Oldest` orders the output vector starting with the oldest delay version and ending with the newest delay version.
- `Newest` orders the output vector starting with the newest delay version and ending with the oldest delay version.

Specify the output vector for the first sampling period with the **Initial condition** parameter. Careful selection of this parameter can mitigate unwanted output behavior.

Specify the time between samples with the **Sample time** parameter. Specify the number of delays with the **Number of delays** parameter. A value of -1 instructs the block to inherit the number of delays by backpropagation. Each delay is equivalent to the z^{-1} discrete-time operator, which the Unit Delay block represents.

Ports

Input

Port_1 — Input signal

scalar

Input signal to delay.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point`

Output

Port_1 — Delayed versions of input signal

scalar | vector

All versions of the delayed input signal. Use the **Order output vector starting with** parameter to specify the order of delayed signals in the output vector.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

Parameters

Initial condition — Initial output

0.0 (default) | scalar

Specify the initial output of the simulation. The **Initial condition** parameter is converted from a double to the input data type offline using round-to-nearest and saturation.

Limitations

The initial condition of this block cannot be `inf` or `NaN`.

Programmatic Use

Block Parameter: `vinit`

Type: character vector

Values: scalar

Default: `'0.0'`

Sample time — Time between samples

-1 (default) | scalar | vector

Specify the time interval between samples. To inherit the sample time, set this parameter to -1. For more information, see “Specify Sample Time”.

Programmatic Use

Block Parameter: `samptime`

Type: character vector

Values: scalar | vector

Default: `'-1'`

Number of delays — Number of discrete-time operators

4 (default) | positive scalar | -1 (for inherited)

Specify the number of discrete-time operators as a positive scalar, or -1 for inherited.

Programmatic Use

Block Parameter: `NumDelays`

Type: character vector

Values: positive scalar | -1 (inherited)

Default: `'4'`

Order output vector starting with — Order of output

Oldest (default) | Newest

Specify whether to output the oldest delay version first, or the newest delay version first.

Programmatic Use**Block Parameter:** DelayOrder**Type:** character vector**Values:** 'Oldest' | 'Newest'**Default:** 'Oldest'**Include current input in output vector — Include current input in output vector**

off (default) | on

Select this check box to include the current input in the output vector.

Programmatic Use**Block Parameter:** includeCurrent**Type:** character vector**Values:** 'off' | 'on'**Default:** 'off'**Block Characteristics**

Data Types	Boolean double fixed point integer single
Direct Feedthrough	no
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities**C/C++ Code Generation**

Generate C and C++ code using Simulink® Coder™.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

HDL Architecture

This block has a single, default HDL architecture.

HDL Block Properties

ConstrainedOutputPipeline	Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is 0. For more details, see “ConstrainedOutputPipeline” (HDL Coder).
----------------------------------	--

InputPipeline	Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “InputPipeline” (HDL Coder).
OutputPipeline	Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “OutputPipeline” (HDL Coder).
ResetType	Suppress reset logic generation. The default is <code>default</code> , which generates reset logic. See also “ResetType” (HDL Coder).

Complex Data Support

This block supports code generation for complex signals.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Terminate Function

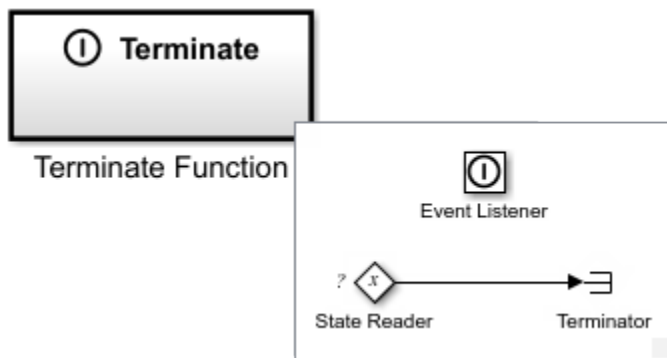

Execute contents on a model terminate event

Library: Simulink / User-Defined Functions

Description

The Terminate Function block is a pre-configured subsystem block that executes on a model terminate event. By default, the Terminate Function block includes an Event Listener block with **Event** set to Terminate, a Terminator block, and a State Reader block.

Replace the Terminator block with blocks to save the state value from the State Reader block.

Conditionally executed subsystem blocks with output ports are fully supported within Terminate Function blocks.

For a list of unsupported blocks and features, see “Initialize, Reset, and Terminate Function Limitations”.

The input and output ports of a component containing Initialize Function and Terminate Function blocks must connect to input and output port blocks.

The code generated from this block is part of the `model_terminate` function that is called once at the end of model execution.

You can select an Initialize Function, Reset Function, or Terminate Function block or a corresponding state owner block to highlight blocks related to it.

Block Characteristics

Data Types	Boolean ^a bus ^a double ^a enumerated ^a fixed point ^a half ^a integer ^a single ^a string ^a
Direct Feedthrough	no

Multidimensional Signals	limited ^a
Variable-Size Signals	no
Zero-Crossing Detection	no

a. Actual data type or capability support depends on block implementation.

Extended Capabilities

Terminator

Terminate unconnected output port

Library: Simulink / Commonly Used Blocks
 Simulink / Sinks
 HDL Coder / Sinks

Description

Use the Terminator block to cap blocks whose output ports do not connect to other blocks. If you run a simulation with blocks having unconnected output ports, Simulink issues warning messages. Using Terminator blocks to cap those blocks helps prevent warning messages.

Ports

Input

Port_1 — Input signal

scalar | vector | matrix | n-D array | bus

Use this port to direct signals from output ports that are otherwise unconnected during a simulation. The port accepts real or complex signals of all data types.

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | string | Boolean | fixed point | enumerated | bus

Block Characteristics

Data Types	Boolean bus double enumerated fixed point half integer single string
Direct Feedthrough	no
Multidimensional Signals	yes
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

This block can be used to terminate simulation when used with subsystems that generate HDL code, but is not included in the hardware implementation

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Timed-Based Linearization

Generate linear models in base workspace at specific times

Library: Simulink / Model-Wide Utilities

Description

This block calls `linmod` or `dlinmod` to create a linear model for the system when the simulation clock reaches the time specified by the **Linearization time** parameter. No trimming is performed. The linear model is stored in the base workspace as a structure, along with information about the operating point at which the snapshot was taken. Multiple snapshots are appended to form an array of structures.

The block sets the following model parameters to the indicated values:

- `BufferReuse` = 'off'
- `RTWInlineParameters` = 'on'
- `BlockReductionOpt` = 'off'

The name of the structure used to save the snapshots is the name of the model appended by `_Timed_Based_Linearization`, for example, `vdp_Timed_Based_Linearization`. The structure has the following fields:

Field	Description
<code>a</code>	The A matrix of the linearization
<code>b</code>	The B matrix of the linearization
<code>c</code>	The C matrix of the linearization
<code>d</code>	The D matrix of the linearization
<code>StateName</code>	Names of the model's states
<code>OutputName</code>	Names of the model's output ports
<code>InputName</code>	Names of the model's input ports
<code>OperPoint</code>	A structure that specifies the operating point of the linearization. The structure specifies the operating point time (<code>OperPoint.t</code>). The states (<code>OperPoint.x</code>) and inputs (<code>OperPoint.u</code>) fields are not used.
<code>Ts</code>	The sample time of the linearization for a discrete linearization

Tip To generate models conditionally, use the Trigger-Based Linearization block.

Parameters

Linearization time — Time at which to generate a linear model

1 (default) | scalar | vector

Time at which you want the block to generate a linear model. Enter a vector of times if you want the block to generate linear models at more than one time step.

Programmatic Use

Block Parameter: LinearizationTime

Type: character vector

Values: scalar | vector

Default: '1'

Sample time (of linearized model) — Sample time

0 (default) | scalar | vector

Specify a sample time for the linear model. To create a continuous-time model using `linmod`, specify a sample time of 0. Otherwise, to create a discrete-time model using `dlinmod`, specify a positive sample time (see “Discrete-Time System Linearization” on page 2-47).

Programmatic Use

Block Parameter: SampleTime

Type: character vector

Values: scalar | vector

Default: '0'

Block Characteristics

Data Types	
Direct Feedthrough	no
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Topics

“Discrete-Time System Linearization” on page 2-47

Introduced in R2010a

To File

Write data to file

Library: Simulink / Sinks
HDL Coder / Sinks

Description

The To File block writes input signal data into a MAT-file. The block writes to the output file incrementally, with minimal memory overhead during simulation. If the output file exists when the simulation starts, the block overwrites the file. The file automatically closes when you pause the simulation or the simulation completes. If simulation terminates abnormally, the To File block saves the data it has logged up until the point of the abnormal termination.

The To File block icon shows the name of the output file.

Control Amount of Data Saved

If you specify data logging intervals with the **Configuration Parameters > Data Import/Export > Logging intervals** parameter, the To File block logs only data inside of the intervals. For example, the block logs no data if the intervals are empty ([]). The block stores the logged data in the file associated with the block instead of in the variable that you specify for the **Single simulation output** parameter.

For variable-step solvers, to control the amount of data available to the To File block, use the **Configuration Parameters > Data Import/Export > Additional parameters > Output options** parameter. For example, to write data at identical time points over multiple simulations, select the **Produce specified output only** option.

Block parameters also control the amount of data saved. See “Decimation” on page 1-0 and “Sample time” on page 1-0 .

Pause Simulation

After pausing a simulation, do not alter any file that a To File block logs into. For example, do not save such a file with the MATLAB `save` command. Altering the file can cause an error when you resume the simulation. If you want to alter the file after pausing, copy the file and work with the copy of the file.

If you pause using the Simulation Stepper, the To File block captures the simulation data up to the point of the pause. When you step back, the To File data file no longer contains any simulation data past the new reduced time of the last output.

Limitations

When a To File block is in a referenced model, that model must be a single-instance model. Only one instance of such a model can exist in a model hierarchy. See “Model Reuse” for more information.

Ports

Input

Port_1 — Input signal

scalar | vector | matrix | N-D array

Signal to store in file. Each sample consists of a timestamp and an associated data value. The data can be in array format or MATLAB `timeseries` format. The To File block accepts real or complex signal data of any data type that Simulink software supports, except fixed-point data with a word length greater than 32 bits.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

File name — Path or file name

`untitled.mat` (default) | MAT-file path or name

Specify the path or file name of the MAT-file in which to store the output. On UNIX systems, the path name can start with a tilde (~) character signifying your home folder. If you specify a file name without path information, Simulink software stores the file in the MATLAB working folder. (To determine the working folder, at the MATLAB command line, enter `pwd`.) If the file exists, Simulink software overwrites it.

Programmatic Use

Block Parameter: `FileName`

Type: character vector

Values: MAT-file path or name

Default: `'untitled.mat'`

Variable name — Matrix name

`ans` (default) | character vector

Specify the name of the matrix contained in the file.

Programmatic Use

Block Parameter: `MatrixName`

Type: character vector

Values: character vector

Default: `'ans'`

Save format — Data format

`Timeseries` (default) | `Array`

Specify the data format that the To File block uses for writing data.

Use the `Array` format only for vector, double, noncomplex signals.

For the `Timeseries` format, the To File block:

- Writes data in a MATLAB `timeseries` object.
- Supports writing multidimensional, real, or complex output values.

- Supports writing output values that have any built-in data type, including Boolean, enumerated (enum), and fixed-point data with a word length of up to 32 bits.
- For virtual and nonvirtual bus input signals, creates a MATLAB structure that matches the bus hierarchy. Each leaf of the structure is a MATLAB timeseries object.

For the Array format, the To File block:

- Writes data into a matrix containing two or more rows. The matrix has the following form:

$$\begin{bmatrix} t_1 & t_2 & \dots & t_{final} \\ u_{11} & u_{12} & \dots & u_{1final} \\ \dots & & & \\ u_{n1} & u_{n2} & \dots & u_{nfinal} \end{bmatrix}$$

Simulink software writes one column to the matrix for each data sample. The first element of the column contains the timestamp. The remainder of the column contains data for the corresponding output values.

- Supports writing data that is one-dimensional, double, and noncomplex.

The From File block can use data written by a To File block in any format (Timeseries or Array) without any modifications to the data or other special provisions.

The From Workspace block can read data that is in the Array format and is the transposition of the data written by the To File block. To provide the required format, use MATLAB commands to load and transpose the data from the MAT-file.

The following table shows how simulation mode support depends on the **Save format** value.

Simulation Mode	Timeseries	Array
Normal	Supported	Supported
Accelerator	Supported	Supported
Rapid Accelerator	Supported	Supported
Software-in-the-loop (SIL)	Not supported	Supported if MAT-file logging is enabled
Processor-in-the-loop (PIL)	Not supported	Supported if MAT-file logging is available and enabled
External	Not supported	Supported if MAT-file logging is enabled
RSim target	Supported	Supported if MAT-file logging is enabled

Programmatic Use

Block Parameter: SaveFormat

Type: character vector

Values: 'Timeseries' | 'Array'

Default: 'Timeseries'

Decimation — Decimation factor that determines when data writes

1 (default) | scalar | vector

Specify the decimation factor, n , that writes data at every n th time that the block executes. The default value has this block writing data at every time step.

Programmatic Use

Block Parameter: Decimation

Type: character vector

Values: scalar | vector

Default: '1'

Sample time — Sample period and offset

-1 (default) | scalar | vector

Specifies the sample period and offset at which to collect data points. This parameter is useful when you are using a variable-step solver where the interval between time steps is not constant. The default value causes the block to inherit the sample time from the driving block. See “Specify Sample Time”.

Programmatic Use

Block Parameter: SampleTime

Type: character vector

Values: scalar | vector

Default: '-1'

Block Characteristics

Data Types	Boolean bus double enumerated fixed point ^a integer single
Direct Feedthrough	no
Multidimensional Signals	yes
Variable-Size Signals	no
Zero-Crossing Detection	no

a. Supports up to 32-bit fixed-point data types.

Tips

- If MATLAB encounters memory issues when you log many signals in a long simulation that has many time steps, consider logging to persistent storage. When you log to persistent storage, the Dataset format logging data is stored in a MAT-file. Compared to logging to persistent storage, connecting a To File block to signals:
 - Is a per-signal approach that can clutter a model with several To File blocks attached to individual signals.
 - Creates a separate MAT-file for each To File block, compared to the one MAT-file that logging to persistent storage uses.

For details, see “Log Data to Persistent Storage”.

- To avoid the overhead of compressing data in real time, the To File block writes an uncompressed Version 7.3 MAT-file. To compress the data within the MAT-file, load and save the file in MATLAB.

The resaved file is smaller than the original MAT-file that the To File block created, because the **Save** command compresses the data in the MAT-file.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. Generated code can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code. Usually, blocks evolve toward being suitable for production code. Thus, blocks suitable for production code remain suitable.

Code generation for RSim target provides identical support as Simulink; all other code generation targets support only double, one-dimensional, real signals in array with time format.

To generate code for a To File block, on the **Code Generation > Interface** pane, select the configuration parameter “MAT-file logging” (Simulink Coder).

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

This block can be used for writing simulation results to a file when used with subsystems that generate HDL code, but is not included in the hardware implementation

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Supports up to 32-bit fixed-point data types.

To Workspace

Write data to workspace

Library: Simulink / Sinks
HDL Coder / Sinks

Description

The To Workspace block writes input signal data to a workspace. During simulation, the block writes data to an internal buffer. When you pause the simulation or the simulation completes, that data is written to the workspace. Data is not available until the simulation pauses or stops.

The To Workspace block typically writes data to the MATLAB base workspace. For a `sim` command in a MATLAB function, the To Workspace block sends data to the workspace of the calling function, not to the MATLAB base workspace. To send the logged data to the base workspace, use an `assignin` command in the function.

```
function myfunc
    a = sim('mTest','SimulationMode','normal');
    b = a.get('simout')
    assignin('base','b',b);
end
```

The To Workspace block icon shows the name of the variable to which the data is written.

Control Amount of Data Saved

If you specify data logging intervals with the **Configuration Parameters > Data Import/Export > Logging intervals** parameter, the To Workspace block does not log data outside of the intervals. For example, the block logs no data if the intervals are empty (`[]`). The block stores the logged data in the variable that you specify for the **Single simulation output** parameter.

For variable-step solvers, to control the amount of data available to the To Workspace block, use the **Configuration Parameters > Data Import/Export > Additional parameters > Output options** parameter. For example, to write data at identical time points over multiple simulations, select the `Produce specified output only` option.

Block parameters also control the amount of data saved. See “Limit data points to last” on page 1-0 , “Decimation” on page 1-0 , and “Sample time” on page 1-0 .

Log to MAT-File

When you enable the **MAT-file logging** parameter in **Configuration Parameters**, the To Workspace block logs its data to a MAT-file. For information about this parameter, see “MAT-file logging” (Simulink Coder).

Ports

Input

Port_1 — Input signal

scalar | vector | matrix | N-D array

Workspace data created from input signal. The To Workspace block can save real or complex inputs of any data type that Simulink supports, including fixed-point and enumerated data types, and bus objects.

By default, the To Workspace block treats input signals as sample-based. To have the To Workspace block treat input signals as frame-based, set:

- 1 **Save format** to either Array or Structure
- 2 **Save 2-D signals as** to 2-D array (concatenate along first dimension)

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Parameters

Variable name — Name of variable for saved data

simout (default) | character vector

Specify the name of the variable for the saved data.

Programmatic Use

Block Parameter: VariableName

Type: character vector

Values: character vector

Default: 'simout'

Limit data points to last — Maximum number of input samples to save

inf (default) | scalar | vector

Specify the maximum number of input samples to save. If the simulation generates more data points than the specified maximum, the simulation saves only the most recently generated samples. The default value causes the block to write all data.

Programmatic Use

Block Parameter: MaxDataPoints

Type: character vector

Values: scalar | vector

Default: 'inf'

Decimation — Decimation factor that determines when data writes

1 (default) | scalar | vector

Specify the decimation factor, n , which writes data at every n th time that the block executes. The default value causes the block to write data at every time step.

Programmatic Use

Block Parameter: Decimation

Type: character vector

Values: scalar | vector

Default: '1'

Save format — Format for saving simulation output

Timeseries (default) | Structure With Time | Structure | Array

Specify the format for saving simulation output to the workspace.

The default `Timeseries` format saves nonbus signals as a MATLAB `timeseries` object and bus signals as a structure of MATLAB `timeseries` objects.

The `Array` format saves the input as an N -dimensional array where N is one more than the number of dimensions of the input signal. For example, if the input signal is a vector, the resulting workspace array is two-dimensional. If the input signal is a matrix, then the array is three-dimensional. How Simulink stores samples in the array depends on whether the input signal is a scalar, vector, or matrix.

- If the input signal is a scalar or a vector, each input sample is output as a row of the array. Suppose that the name of the output array is `simout`. Then, `simout(1, :)` corresponds to the first sample, `simout(2, :)` corresponds to the second sample, and so on.
- If the input signal is a matrix, time corresponds to the third dimension. Suppose again that `simout` is the name of the resulting workspace array. Then, `simout(:, :, 1)` is the input signal value at the first sample point, `simout(:, :, 2)` is the input signal value at the second sample point, and so on.

The `Structure` format consists of a structure with three fields:

- `time` — Empty field for this format.
- `signals` — Structure with three fields: `values`, `dimensions`, and `label`. The `values` field contains the array of signal values. The `dimensions` field specifies the dimensions of the corresponding signals. The `label` field contains the label of the input line.
- `blockName` — Name of the To Workspace block.

The `Structure With Time` format is the same as `Structure`, except that the `time` field contains a vector of simulation time hits.

If you select `Array` or `Structure`, the **Save 2-D signals as** parameter appears.

To read the To Workspace block output directly with a From Workspace block, use either the `Timeseries` or `Structure with Time` format. The From Workspace block can read sample-based data from a To Workspace block that was saved in a previous simulation. For details, see “Comparison of Signal Loading Techniques”.

The following table shows how simulation mode support depends on the **Save format** value.

Simulation Mode	Timeseries	Array, Structure, or Structure With Time
Normal	Supported	Supported
Accelerator	Supported	Supported only in top model, not referenced models

Simulation Mode	Timeseries	Array, Structure, or Structure With Time
Rapid Accelerator	Not supported	Supported only in top model, not referenced models
Software-in-the-loop (SIL)	Not supported	If MAT-file logging is enabled, supported only in top model, not referenced models
Processor-in-the-loop (PIL)	Not supported	If MAT-file logging is available and enabled, supported only in top model, not referenced models
External	Not supported	Supported only in top model, not referenced models
Simulink Coder Targets	Not supported	If MAT-file logging is enabled, supported only in top model, not referenced models

Programmatic Use**Block Parameter:** SaveFormat**Type:** character vector**Values:** 'Timeseries' | 'Structure with Time' | 'Structure' | 'Array'**Default:** 'Timeseries'**Save 2-D signal as — Format for saving 2-D signals**

3-D array (concatenate along third dimension) (default) | 2-D array (concatenate along first dimension)

Specify one of these formats for saving 2-D signals to the workspace:

- 3-D array (concatenate along third dimension) (Default)

This setting is well-suited for sample-based signals. Data is concatenated along the third dimension. For example, 2-by-4 matrix input for 10 samples is stored as a 2-by-4-by-10 array.

- 2-D array (concatenate along first dimension)

This setting is well-suited for frame-based signals. Data is concatenated along the first dimension. For example, 2-by-4 matrix input for 10 samples is stored as a 20-by-4 array.

When the **Save format** is set to Array or Structure, the dimensions of the output depend on the input dimensions and the setting of the **Save 2-D signals as** parameter. The following table summarizes the output dimensions under various conditions. In the table, *K* represents the value of the **Limit data points to last** parameter.

Input Signal Dimensions	Save 2-D Signals As ...	Signal to Workspace Output Dimension
M -by- N matrix	2-D array (concatenate along first dimension)	K -by- N matrix. If you set the Limit data points to last parameter to <code>inf</code> , K represents the total number of samples acquired in each column by the end of simulation. This setting is equivalent to multiplying the input frame size (M) by the total number of M -by- N inputs acquired by the block.
M -by- N matrix	3-D array (concatenate along third dimension)	M -by- N -by- K array. If you set the Limit data points to last parameter to <code>inf</code> , K represents the total number of M -by- N inputs acquired by the end of the simulation.
Length- N unoriented vector	Any setting	K -by- N matrix
N -dimensional array where $N > 2$	Any setting	Array with $N + 1$ dimensions, where the size of the last dimension is equal to K . If you set the Limit data points to last parameter to <code>inf</code> , K represents the total number of M -by- N inputs acquired by the end of simulation

Dependencies

To enable the **Save 2-D signals as** parameter, set the **Save format** to Array or Structure.

Programmatic Use

Block Parameter: Save2DSignal

Type: character vector

Values: '2-D array (concatenate along first dimension)' | '3-D array (concatenate along third dimension)'

Default: '3-D array (concatenate along third dimension)'

Log fixed-point data as a fi object — Log fixed-point data as a fi object or double
off (default) | on

By default, the To Workspace block logs fixed-point data to the MATLAB workspace as a Fixed-Point Designer `fi` object. If you clear this parameter, Simulink software logs fixed-point data to the workspace as `double`.

Programmatic Use

Block Parameter: FixptAsFi

Type: character vector

Values: 'off' | 'on'
Default: 'off'

Sample time — Sample period and offset

-1 (default) | scalar | vector

Specifies the sample period and offset at which to collect data points. This parameter is useful when you are using a variable-step solver where the interval between time steps is not constant. The default value causes the block to inherit the sample time from the driving block. See “Specify Sample Time”.

Programmatic Use

Block Parameter: SampleTime

Type: character vector

Values: scalar | vector

Default: '-1'

Block Characteristics

Data Types	Boolean bus double enumerated fixed point integer single
Direct Feedthrough	no
Multidimensional Signals	yes
Variable-Size Signals	yes
Zero-Crossing Detection	no

Tips

To make post-processing easier, you can convert data saved by this block to **Dataset** format. This conversion is useful when post processing this data with other logged data that can use **Dataset** format (for example, logged states). See “Convert Logged Data to Dataset Format”.

Extended Capabilities

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

This block can be used for simulation visibility in subsystems that generate HDL code, but is not included in the hardware implementation.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Toggle Switch

Toggle parameter between two values

Library: Simulink / Dashboard

Description

The Toggle Switch block toggles the value of the connected block parameter between two values during simulation. For example, you can connect the Toggle Switch block to a Switch block in your model and change its state during simulation. Use the Toggle Switch block with other Dashboard blocks to create an interactive dashboard for your model.

Double-clicking the Toggle Switch block does not open its dialog box during simulation and when the block is selected. To edit the block's parameters, you can use the **Property Inspector**, or you can right-click the block and select **Block Parameters** from the context menu.

Connect Dashboard Blocks

Dashboard blocks do not use ports to connect to model elements. To connect dashboard blocks to variables and block parameters, use connect mode. Connect mode facilitates the process of connecting dashboard blocks in your model, especially when you want to connect multiple blocks at once. To connect a single dashboard block, you can also use the **Connection** table in the block dialog box.

Tip You can modify dashboard block connections in your model during normal and accelerator mode simulations.

Note Dashboard blocks cannot connect to variables until you update the model diagram. To connect dashboard blocks to variables or modify variable values between opening your model and running a simulation, update the model diagram using **Ctrl+D**.

To enter connect mode, select the block. Then, on the block tab, click **Connect**. In connect mode, when you select one or more blocks, a list of parameters and variables available for connection appears. Select a variable or parameter from the list to connect to the selected dashboard block.

When the value of the selected variable or block parameter is nonscalar, use the text box at the bottom of the **Connection** table to specify the element you want to connect to the dashboard block. To connect to an element of a vector, matrix, or array, specify the element index, for example, 3 or (1, 3). To connect to an element in a bus or structure, specify the element in the context of the bus or structure hierarchy by using dots to indicate different levels in the hierarchy, and omit the top level. For example, specify a.b to connect to scalar element b of the structure or bus a nested inside the selected composite variable or parameter.

To connect another dashboard block, pause on another dashboard block and click the **Connect** button above it. Then, make a selection of signals and blocks in your model and choose a model element to connect.

When you finish connecting the dashboard blocks in your model, on the block tab, click **Done Connecting**.

Tip You can hide the message shown on unconnected blocks using the `set_param` function with the `ShowInitialText` block parameter. The message also disappears when you connect the block.

Parameter Logging

Tunable parameters connected to dashboard blocks are logged to the Simulation Data Inspector, where you can view the parameter values along with logged signal data. You can access logged parameter data in the MATLAB workspace by exporting the parameter data from the Simulation Data Inspector by using the UI or the `Simulink.sdi.exportRun` function. For more information about exporting data using the Simulation Data Inspector UI, see “Export Data from the Simulation Data Inspector”. The parameter data is stored in a `Simulink.SimulationData.Parameter` object, accessible as an element in the exported `Simulink.SimulationData.Dataset`.

Limitations

- Except for the Dashboard Scope block and the Display block, dashboard blocks can only connect to real scalar signals.
- The toolstrip does not support blocks that are inside a panel.
- You cannot use the **Connection** table in the block dialog to connect a dashboard block to a block that is commented out. When you connect a dashboard block to a commented block using connect

mode, the dashboard block does not display the connected value until the you uncomment the block.

- Dashboard blocks cannot connect to model elements inside referenced models.
- When you simulate a model hierarchy, dashboard blocks inside referenced models do not update.
- Dashboard blocks do not support rapid accelerator simulation.
- When you connect a dashboard block to a variable or parameter during simulation, the data for that variable or parameter is not logged to the Simulation Data Inspector. To log variable and parameter data to the Simulation Data Inspector, connect the dashboard block to the variable or parameter prior to simulation.
- When you simulate a model in external mode with the **Default parameter behavior** set to **Inlined**, dashboard blocks can appear to change parameter and variable values. However, the change does not propagate to the simulation. For example, Gain blocks display changes made to the **Gain** parameter using the dashboard blocks, but the **Gain** value used in the simulation does not change.

Parameters

Connection — Select a variable or block parameter to connect

variable and parameter connection options

Select the variable or block parameter to control using the **Connection** table. To connect the block to a signal:

- 1 Make a selection in the model that includes one or more blocks.
- 2 Select the variable or parameter you want to connect.

When the value of the selected variable or block parameter is nonscalar, use the text box at the bottom of the **Connection** table to specify the element you want to connect to the dashboard block. To connect to an element of a vector, matrix, or array, specify the element index, for example, 3 or (1, 3). To connect to an element in a bus or structure, specify the element in the context of the bus or structure hierarchy by using dots to indicate different levels in the hierarchy, and omit the top level. For example, specify a.b to connect to scalar element b of the structure or bus a nested inside the selected composite variable or parameter.

- 3 Click **Apply**.

To facilitate understanding and debugging your model, you can connect Dashboard blocks to variables and parameters in your model during simulation.

Note To see workspace variables in the connection table, update the model diagram using **Ctrl+D**.

Programmatic Use

To programmatically connect a dashboard block to a tunable parameter or a variable, use a `Simulink.HMI.ParamSourceInfo` object. The `Simulink.HMI.ParamSourceInfo` object contains four properties. Some of the properties apply to connecting dashboard blocks to parameters, and some apply to connecting dashboard blocks to variables. Not all fields have a value for a connection because a given dashboard block connects to either a parameter or a variable.

Block Parameter: Binding

Type: Simulink.HMI.ParamSourceInfo

Default: []

States — Pair values and labels

scalar and character vector

Pairs of values to assign to the connected variable or parameter and text to display on the block. Switches have two states — **Top** and **Bottom** — one corresponding to each switch position. Each state contains a **Value** and a **Label**.

- **Value** — Value to assign to the connected variable or parameter when the switch is in the corresponding position.
- **Label** — Text to display on the block for the corresponding position.

This table describes the default configuration for the block.

States

Position	State Value	State Label
Top	0	on
Bottom	1	off

Programmatic Use

To configure the **States** for the block programmatically, specify the value of the **States** parameter as a structure array containing two elements with fields:

- **Value** — Scalar double value for the state.
- **Label** — String or character array to use as the label for the switch position.

```
topState.Value = 0;
topState.Label = 'Off';
bottomState.Value = 1;
bottomState.Label = 'On';
switchStates = [topState bottomState];
```

Block Parameter: States

Type: two element array of structures

Label — Block label position

Top (default) | Bottom | Hide

Position of the block label. When the block is connected to an element in the model, the label is the name of the connected element.

Programmatic Use

Block Parameter: LabelPosition

Type: character vector

Values: 'Top' | 'Bottom' | 'Hide'

Default: 'Top'

Block Characteristics

Data Types	double half integer single
Direct Feedthrough	no
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Dashboard blocks are ignored for code generation.

To String

Convert input signal to string signal

Library: Simulink / String

Description

The To String block creates a string signal from an input signal. For example, consider using this signal to convert a logical value 1 or 0 to its string equivalent "false" or "true".

When a MinGW compiler compiles code generated from the block, running the compiled code may produce nonstandard results for floating-point inputs. For example, a numeric input of 501.987 returns the string "5.019870e+002" instead of the expected string "5.019870e+02".

Ports

Input

Port_1 — Input signal

scalar

Input signal, specified as a scalar.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated

Output

Port_1 — Output string

scalar

Output string, specified as a scalar. This block returns the output as a string, surrounded by double quotes.

- If the input is a Boolean, the output is a logical value (1 or 0) and the block returns its textual equivalent (true or false).
- If the input is a numeric data type, such as an integer, single, double, or fixed point, the block returns the number as a string. For example, an input of 1 converts to "1" and an input of 0 converts to "0".

Note The output string might not contain all the digits of the numeric value from the input port.

Data Types: string

Block Characteristics

Data Types	Boolean double enumerated fixed point integer single string
Direct Feedthrough	yes
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

Transfer Fcn

Model linear system by transfer function

Library: Simulink / Continuous

Description

The Transfer Fcn block models a linear system by a transfer function of the Laplace-domain variable s . The block can model single-input single-output (SISO) and single-input multiple-output (SIMO) systems.

Conditions for Using This Block

The Transfer Fcn block assumes the following conditions:

- The transfer function has the form

$$H(s) = \frac{y(s)}{u(s)} = \frac{num(s)}{den(s)} = \frac{num(1)s^{nn-1} + num(2)s^{nn-2} + \dots + num(nn)}{den(1)s^{nd-1} + den(2)s^{nd-2} + \dots + den(nd)},$$

where u and y are the system input and outputs, respectively, nn and nd are the number of numerator and denominator coefficients, respectively. $num(s)$ and $den(s)$ contain the coefficients of the numerator and denominator in descending powers of s .

- The order of the denominator must be greater than or equal to the order of the numerator.
- For a multiple-output system, all transfer functions have the same denominator and all numerators have the same order.

Modeling a Single-Output System

For a single-output system, the input and output of the block are scalar time-domain signals. To model this system:

- 1 Enter a vector for the numerator coefficients of the transfer function in the **Numerator coefficients** field.
- 2 Enter a vector for the denominator coefficients of the transfer function in the **Denominator coefficients** field.

Modeling a Multiple-Output System

For a multiple-output system, the block input is a scalar and the output is a vector, where each element is an output of the system. To model this system:

- 1 Enter a matrix in the **Numerator coefficients** field.

Each *row* of this matrix contains the numerator coefficients of a transfer function that determines one of the block outputs.

- 2 Enter a vector of the denominator coefficients common to all transfer functions of the system in the **Denominator coefficients** field.

Specifying Initial Conditions

A transfer function describes the relationship between input and output in Laplace (frequency) domain. Specifically, it is defined as the Laplace transform of the response (output) of a system with zero initial conditions to an impulse input.

Operations like multiplication and division of transfer functions rely on zero initial state. For example, you can decompose a single complicated transfer function into a series of simpler transfer functions. Apply them sequentially to get a response equivalent to that of the original transfer function. This will not be correct if one of the transfer functions assumes a non-zero initial state. Furthermore, a transfer function has infinitely many time domain realizations, most of whose states do not have any physical meaning.

For these reasons, Simulink presets the initial conditions of the Transfer Fcn block to zero. To specify initial conditions for a given transfer function, convert the transfer function to its controllable, canonical state-space realization using `tf2ss`. Then, use the State-Space block. The `tf2ss` utility provides the A, B, C, and D matrices for the system.

For more information, type `help tf2ss` or see the Control System Toolbox™ documentation.

Transfer Function Display on the Block

The Transfer Fcn block displays the transfer function depending on how you specify the numerator and denominator parameters.

- If you specify each parameter as an expression or a vector, the block shows the transfer function with the specified coefficients and powers of s . If you specify a variable in parentheses, the block evaluates the variable.

For example, if you specify **Numerator coefficients** as `[3, 2, 1]` and **Denominator coefficients** as `(den)`, where `den` is `[7, 5, 3, 1]`, the block looks like this:

$$\frac{3s^2 + 2s + 1}{7s^3 + 5s^2 + 3s + 1}$$

- If you specify each parameter as a variable, the block shows the variable name followed by (s) .

For example, if you specify **Numerator coefficients** as `num` and **Denominator coefficients** as `den`, the block looks like this:

$$\frac{\text{num}(s)}{\text{den}(s)}$$

Ports

Input

Port_1 — Input signal

scalar

Input signal, specified as a scalar with data type double.

Data Types: double

Output

Port_1 — Output signal

scalar | vector

Output signal, provided as a scalar or vector with data type double.

- For a single-output system, the input and output of the block are scalar time-domain signals.
- For a multiple-output system, the input is a scalar, and the output is a vector, where each element is an output of the system.

Data Types: double

Parameters

Numerator coefficients — Vector or matrix of numerator coefficients

[1] (default) | vector | matrix

Define the numerator coefficients of the transfer function.

- For a single-output system, enter a vector for the numerator coefficients of the transfer function.
- For a multiple-output system, enter a matrix. Each row of this matrix contains the numerator coefficients of a transfer function that determines one of the block outputs.

Programmatic Use

Block Parameter: Numerator

Type: character vector, string

Values: vector | matrix

Default: ' [1] '

Denominator coefficients — Row vector of denominator coefficients

[1 1] (default) | vector

Define the row vector of denominator coefficients.

- For a single-output system, enter a vector for the denominator coefficients of the transfer function.
- For a multiple-output system, enter a vector containing the denominator coefficients common to all transfer functions of the system.

Programmatic Use

Block Parameter: Denominator

Type: character vector | string

Values: vector
Default: '[1 1]'

Parameter tunability — Tunable representation of block parameters in code

Auto (default) | Optimized | Unconstrained

Tunability level of the numerator and denominator coefficients for Accelerated simulation modes and deployed simulations using Simulink Compiler. Set this parameter to `Auto` to allow Simulink to choose the appropriate level of parameter tunability.

Set this parameter to `Optimized` to generate a representation of numerator and denominator coefficients in generated code for accelerated and deployed simulations that is optimized for better simulation performance.

Set this parameter to `Unconstrained` to generate a fully tunable (between simulations) representation of the the numerator and denominator coefficients in the generated code for accelerated and deployed simulations. To let Simulink determine the appropriate tunability level, select `Auto`.

Programmatic Use

Block Parameter: `ParameterTunability`

Type: character vector, string

Values: 'Auto' | 'Optimized' | 'Unconstrained'

Default: 'Auto'

Absolute tolerance — Absolute tolerance for computing block states

auto (default) | scalar | vector

Absolute tolerance for computing block states, specified as a positive, real-valued, scalar or vector. To inherit the absolute tolerance from the Configuration Parameters, specify `auto` or `-1`.

- If you enter a real scalar, then that value overrides the absolute tolerance in the Configuration Parameters dialog box for computing all block states.
- If you enter a real vector, then the dimension of that vector must match the dimension of the continuous states in the block. These values override the absolute tolerance in the Configuration Parameters dialog box.
- If you enter `auto` or `-1`, then Simulink uses the absolute tolerance value in the Configuration Parameters dialog box (see “Solver Pane”) to compute block states.

Programmatic Use

Block Parameter: `AbsoluteTolerance`

Type: character vector, string

Values: 'auto' | '-1' | any positive real-valued scalar or vector

Default: 'auto'

State Name (e.g., 'position') — Assign unique name to each state

' ' (default) | 'position' | {'a', 'b', 'c'} | a | ...

Assign a unique name to each state. If this field is blank (' '), no name assignment occurs.

- To assign a name to a single state, enter the name between quotes, for example, 'position'.
- To assign names to multiple states, enter a comma-delimited list surrounded by braces, for example, {'a', 'b', 'c'}. Each name must be unique.

- To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, string, cell array, or structure.

Limitations

- The state names apply only to the selected block.
- The number of states must divide evenly among the number of state names.
- You can specify fewer names than states, but you cannot specify more names than states.

For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states.

Programmatic Use

Block Parameter: ContinuousStateAttributes

Type: character vector, string

Values: ' ' | user-defined

Default: ' '

Block Characteristics

Data Types	double
Direct Feedthrough	yes
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production-quality code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. The code generated can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code.

In general, consider using the Simulink Model Discretizer to map continuous blocks into discrete equivalents that support production code generation. To start the Model Discretizer, in the Simulink Editor, on the **Apps** tab, under **Apps**, under **Control Systems**, click **Model Discretizer**. One exception is the Second-Order Integrator block because, for this block, the Model Discretizer produces an approximate discretization.

Transfer Fcn Direct Form II

Implement Direct Form II realization of transfer function

Library: Simulink / Additional Math & Discrete / Additional Discrete

$$\frac{0.2+0.3z^{-1}+0.2z^{-2}}{1-0.9z^{-1}+0.6z^{-2}}$$

Description

The Transfer Fcn Direct Form II block implements a Direct Form II realization of the transfer function that the **Numerator coefficients** and **Denominator coefficients excluding lead** parameters specify. The block supports only single input-single output (SISO) transfer functions.

The block automatically selects the data types and scalings of the output, the coefficients, and any temporary variables.

Ports

Input

Port_1 — Input signal

scalar | vector

Input signal, specified as a scalar or vector.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Output

Port_1 — Output signal

scalar | vector

Output signal, specified as a scalar or vector.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Parameters

Numerator coefficients — Numerator coefficients

[0.2 0.3 0.2] (default) | vector

Specify the numerator coefficients as a vector.

Programmatic Use

Block Parameter: NumCoefVec

Type: character vector

Values: vector

Default: '[0.2 0.3 0.2]'

Denominator coefficients excluding lead — Denominator coefficient

[-0.9 0.6] (default) | vector

Specify the denominator coefficients, excluding the leading coefficient, which must be 1.0.

Programmatic Use**Block Parameter:** DenCoeffVec**Type:** character vector**Values:** vector**Default:** '[-0.9 0.6]'**Initial condition — Initial condition**

0.0 (default) | scalar

Specify the initial condition as a scalar.

Programmatic Use**Block Parameter:** vinit**Type:** character vector**Values:** scalar**Default:** '0.0'**Integer rounding mode — Rounding mode for fixed-point operations**

Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

Specify the rounding mode for fixed-point operations. For more information, see “Rounding” (Fixed-Point Designer).

Programmatic Use**Block Parameter:** RndMeth**Type:** character vector**Values:** 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'**Default:** 'Floor'**Saturate to max or min when overflows occur — Method of overflow action**

off (default) | on

When you select this check box, overflows saturate to the maximum or minimum value that the data type can represent. Otherwise, overflows wrap.

When you select this check box, saturation applies to every internal operation on the block, not just the output or result. In general, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Programmatic Use**Block Parameter:** DoSatur**Type:** character vector**Values:** 'off' | 'on'**Default:** 'off'**Block Characteristics**

Discrete Transfer Fcn | Transfer Fcn Direct Form II Time Varying

Topics

“Fixed-Point Numbers”

Introduced before R2006a

Transfer Fcn Direct Form II Time Varying

Implement time varying Direct Form II realization of transfer function

Library: Simulink / Additional Math & Discrete / Additional Discrete

Description

The Transfer Fcn Direct Form II Time Varying block implements a Direct Form II realization of the specified transfer function. The block supports only single input-single output (SISO) transfer functions.

The input signal labeled **Den No Lead** contains the denominator coefficients of the transfer function. The full denominator has a leading coefficient of one, but it is excluded from the input signal. For example, to use a denominator of $[1 \ -1.7 \ 0.72]$, specify a signal with the value $[-1.7 \ 0.72]$. The input signal labeled **Num** contains the numerator coefficients. The data types of the numerator and denominator coefficients can be different, but the length of the numerator vector and the full denominator vector must be the same. Pad the numerator vector with zeros, if needed.

The block automatically selects the data types and scalings of the output, the coefficients, and any temporary variables.

Ports

Input

u — Input signal

scalar | vector

Input signal, specified as a scalar or vector.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

Num — Numerator coefficients

scalar | vector

Numerator coefficients of the transfer function, specified as a scalar or vector.

Dependencies

The data types of the numerator and denominator coefficients can be different, but the length of the numerator vector and the full denominator vector must be the same. Pad the numerator vector with zeros, if needed.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

Den No Lead — Denominator coefficients

scalar | vector

Denominator coefficients of the transfer function, specified as a scalar or vector, without the leading coefficient of one. The full denominator has a leading coefficient of one, but it is excluded from the input signal.

Example: For a denominator coefficient of [1 -1.7 0.72], specify a signal with value [-1.7 0.72].

Dependencies

The data types of the numerator and denominator coefficients can be different, but the length of the numerator vector and the full denominator vector must be the same.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

Output

y — Output signal

scalar | vector

Output signal, specified as a scalar or vector.

The block automatically selects the data types and scalings of the output and any temporary variables.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Parameters

Initial condition — Initial condition

0.0 (default) | scalar

Specify the initial condition as a scalar.

Programmatic Use

Block Parameter: vinit

Type: character vector

Values: scalar

Default: '0.0'

Integer rounding mode — Rounding mode for fixed-point operations

Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

Specify the rounding mode for fixed-point operations. For more information, see “Rounding” (Fixed-Point Designer).

Programmatic Use

Block Parameter: RndMeth

Type: character vector

Values: 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'

Default: 'Floor'

Saturate to max or min when overflows occur — Method of overflow action

off (default) | on

When you select this check box, overflows saturate to the maximum or minimum value that the data type can represent. Otherwise, overflows wrap.

When you select this check box, saturation applies to every internal operation on the block, not just the output or result. In general, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Programmatic Use

Block Parameter: DoSatur

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Block Characteristics

Data Types	Boolean ^a double fixed point integer single
Direct Feedthrough	no
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

a. This block is not recommended for use with Boolean signals.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

The code generator does not explicitly group primitive blocks that constitute a nonatomic masked subsystem block in the generated code. This flexibility allows for more efficient code generation. In certain cases, you can achieve grouping by configuring the masked subsystem block to execute as an atomic unit by selecting the **Treat as atomic unit** option.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Topics

“Fixed-Point Numbers”

Introduced before R2006a

Transfer Fcn First Order

Implement discrete-time first order transfer function

Library: Simulink / Discrete

Description

The Transfer Fcn First Order block implements a discrete-time first order transfer function of the input. The transfer function has a unity DC gain.

Ports

Input

Port_1 – Input signal

scalar | vector

Input signal to the first order transfer function algorithm.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

Output

Port_1 – Transfer function output signal

scalar | vector

Output signal that is the discrete-time first order transfer function of the input with a unity DC gain.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

Parameters

Pole (in Z plane) – Pole

0.95 (default) | scalar

Specify the pole.

Programmatic Use

Block Parameter: PoleZ

Type: character vector

Value: real scalar

Default: '0.95'

Initial condition for previous output – Initial condition for previous output

0.0 (default) | scalar

Specify the initial condition for the previous output.

Programmatic Use

Block Parameter: ICPrevOutput

Type: character vector

Value: real scalar

Default: '0.0'

Integer rounding mode — Rounding mode for fixed-point operations

Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

Specify the rounding mode for fixed-point operations. For more information, see “Rounding” (Fixed-Point Designer).

Block parameters always round to the nearest representable value. To control the rounding of a block parameter, enter an expression using a MATLAB rounding function into the mask field.

Programmatic Use

Block Parameter: RndMeth

Type: character vector

Values: 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'

Default: 'Floor'

Saturate to max or min when overflows occur — Method of overflow action

off (default) | on

When you select this check box, overflows saturate to the maximum or minimum value that the data type can represent. Otherwise, overflows wrap.

When you select this check box, saturation applies to every internal operation on the block, not just the output or result. In general, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Transfer Fcn | Transfer Fcn Lead or Lag

Introduced before R2006a

Transfer Fcn Lead or Lag

Implement discrete-time lead or lag compensator

Library: Simulink / Discrete

Description

The Transfer Fcn Lead or Lag block implements a discrete-time lead or lag compensator of the input. The instantaneous gain of the compensator is 1, and the DC gain is equal to $(1-z)/(1-p)$, where z is the zero and p is the pole of the compensator.

The block implements a lead compensator when $0 < z < p < 1$, and implements a lag compensator when $0 < p < z < 1$.

Ports

Input

Port_1 – Input signal

scalar | vector

Input signal that the block applies the discrete-time lead or lag compensation to.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Output

Port_1 – Output signal

scalar | vector

Output signal that is discrete-time lead or lag compensation of the input sign.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Parameters

Pole of compensator (in Z plane) – Pole

0.95 (default) | scalar

Specify the pole of the compensator.

Programmatic Use

Block Parameter: PoleZ

Type: character vector

Value: real scalar

Default: '0.95'

Zero of compensator (in Z plane) — Zero of compensator

0.75 (default) | scalar

Specify the zero of compensator in the Z plane.

Programmatic Use

Block Parameter: ZeroZ

Type: character vector

Value: real scalar

Default: '0.75'

Initial condition for previous input — Initial condition for previous input

0.0 (default) | scalar

Specify the initial condition for the previous input.

Programmatic Use

Block Parameter: ICPrevInput

Type: character vector

Value: real scalar

Default: '0.0'

Initial condition for previous output — Initial condition for previous output

0.0 (default) | scalar

Specify the initial condition for the previous output.

Programmatic Use

Block Parameter: ICPrevOutput

Type: character vector

Value: real scalar

Default: '0.0'

Integer rounding mode — Rounding mode for fixed-point operations

Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

Specify the rounding mode for fixed-point operations. For more information, see “Rounding” (Fixed-Point Designer).

Block parameters always round to the nearest representable value. To control the rounding of a block parameter, enter an expression using a MATLAB rounding function into the mask field.

Programmatic Use

Block Parameter: RndMeth

Type: character vector

Values: 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'

Default: 'Floor'

Saturate to max or min when overflows occur — Method of overflow action

off (default) | on

When you select this check box, overflows saturate to the maximum or minimum value that the data type can represent. Otherwise, overflows wrap.

When you select this check box, saturation applies to every internal operation on the block, not just the output or result. In general, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Programmatic Use

Block Parameter: DoSatur

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Transfer Fcn | Transfer Fcn First Order

Introduced before R2006a

Transfer Fcn Real Zero

Implement discrete-time transfer function that has real zero and no pole

Library: Simulink / Discrete

Description

The Transfer Fcn Real Zero block implements a discrete-time transfer function that has a real zero and effectively no pole.

Ports

Input

Port_1 — Input signal

scalar | vector

Input signal to the discrete-time transfer function algorithm.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Output

Port_1 — Output signal

scalar | vector

Output signal that is the discrete-time transfer function with a real zero and effectively no pole of the input signal.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Parameters

Zero (in Z plane) — Zero

0.75 (default) | scalar

Specify the zero in the Z plane.

Programmatic Use

Block Parameter: ZeroZ

Type: character vector

Value: real scalar

Default: '0.75'

Initial condition for previous input — Initial condition for previous input

0.0 (default) | scalar

Specify the initial condition for the previous input.

Programmatic Use**Block Parameter:** ICPprevInput**Type:** character vector**Value:** real scalar**Default:** '0.0'**Input processing — Specify sample- or frame-based processing**

Elements as channels (sample based) (default) | Columns as channels (frame based)

Specify whether the block performs sample- or frame-based processing:

- Columns as channels (frame based) — Treat each column of the input as a separate channel (frame-based processing).

Note Frame-based processing requires a DSP System Toolbox license.

For more information, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

- Elements as channels (sample based) — Treat each element of the input as a separate channel (sample-based processing).

Use **Input processing** to specify whether the block performs sample- or frame-based processing. The block accepts frame-based signals for the input *u*. All other input signals must be sample-based.

Input Signal <i>u</i>	Input Processing Mode	Block Works?
Sample based	Sample based	Yes
Frame based		No, produces an error
Sample based	Frame based	Yes
Frame based		Yes

For more information about these two processing modes, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

Programmatic Use**Block Parameter:** InputProcessing**Type:** character vector**Values:** 'Columns as channels (frame based)' | 'Elements as channels (sample based)'**Default:** 'Elements as channels (sample based)'**Integer rounding mode — Rounding mode for fixed-point operations**

Transport Delay

Delay input by given amount of time

Library: Simulink / Continuous

Description

The Transport Delay block delays the input by a specified amount of time. You can use this block to simulate a time delay. The input to this block should be a continuous signal.

At the start of simulation, the block outputs the **Initial output** parameter until the simulation time exceeds the **Time delay** parameter. Then, the block begins generating the delayed input. During simulation, the block stores input points and simulation times in a buffer. You specify this size with the **Initial buffer size** parameter.

When you want output at a time that does not correspond to times of the stored input values, the block interpolates linearly between points. When the delay is smaller than the step size, the block extrapolates from the last output point, which can produce inaccurate results. Because the block does not have direct feedthrough, it cannot use the current input to calculate an output value. For example, consider a fixed-step simulation with a step size of 1 and the current time at $t = 5$. If the delay is 0.5, the block must generate a point at $t = 4.5$. Because the most recent stored time value is at $t = 4$, the block performs forward extrapolation.

The Transport Delay block does not interpolate discrete signals. Instead, the block returns the discrete value at the required time.

This block differs from the Unit Delay block, which delays and holds the output on sample hits only.

Tip Avoid using `linmod` to linearize a model that contains a Transport Delay block. For more information, see “Linearizing Models”.

Ports

Input

Port_1 — Input signal

scalar | vector | matrix

Input signal to delay, specified as a scalar, vector, or matrix.

Data Types: `double`

Output

Port_1 — Delayed signal

scalar | vector | matrix

Input signal, delayed by specified amount of time. Output has the same dimensions and data type as the input signal.

Data Types: `double`

Parameters

Time delay — Time delay

1 (default) | `scalar` | `vector` | `matrix`

Specify the amount of simulation time to delay the input signal before propagation to the output as a nonnegative scalar, vector, or matrix.

Programmatic Use:

Block Parameter: `DelayTime`

Type: character vector, string

Values: nonnegative scalar, vector, or matrix

Default: '1'

Initial output — Initial output value

0 (default) | `scalar` | `vector` | `matrix`

Specify the output that the block generates until the simulation time first exceeds the time delay input as a scalar, vector, or matrix.

Limitations

The initial output of this block cannot be `inf` or `NaN`.

A Run-to-run tunable parameter cannot be changed during a simulation run time. However, changing it before a simulation begins does not cause Accelerator or Rapid Accelerator to regenerate code.

Programmatic Use

Block Parameter: `InitialOutput`

Type: character vector, string

Values: `scalar` | `vector` | `matrix`

Default: '0'

Initial buffer size — Initial memory allocation

1024 (default) | `positive integer scalar`

Define the initial memory allocation for the number of input points to store.

- If the number of input points exceeds the initial buffer size, the block allocates additional memory.
- After simulation ends, a message shows the total buffer size needed.

Tips

- Because allocating memory slows down simulation, choose this value carefully if simulation speed is an issue.
- For long time delays, this block can use a large amount of memory, particularly for dimensionalized input.

Programmatic Use**Block Parameter:** BufferSize**Type:** character vector, string**Value:** positive integer scalar**Default:** '1024'**Use fixed buffer size — Use fixed-size buffer**

off (default) | on

Select this check box to use a fixed-size buffer to save input data from previous time steps.

The **Initial buffer size** parameter specifies the size of the buffer. If the buffer is full, new data replaces data already in the buffer. Simulink software uses linear extrapolation to estimate output values that are not in the buffer.

Note If you have a Simulink Coder license, ERT or GRT code generation uses a fixed-size buffer even if you do not select this check box.

Tips

- If the input data is linear, selecting this check box can save memory.
- If the input data is nonlinear, do not select this check box. Doing so can yield inaccurate results.

Programmatic Use**Block Parameter:** FixedBuffer**Type:** character vector, string**Value:** 'off' | 'on'**Default:** 'off'**Direct feedthrough of input during linearization — Enable direct feedthrough**

off (default) | on

Cause the block to output its input during linearization and trim, which sets the block mode to direct feedthrough.

Tips

- Selecting this check box can cause a change in the ordering of states in the model when you use the functions `linmod`, `dlinmod`, or `trim`. To extract this new state ordering:
 - 1 Compile the model using the following command, where `model` is the name of the Simulink model.

```
[sizes, x0, x_str] = model([],[],[],'lincompile');
```
 - 2 Terminate the compilation with the following command.

```
model([],[],[],'term');
```
- The output argument `x_str`, which is a cell array of the states in the Simulink model, contains the new state ordering. When you pass a vector of states as input to the `linmod`, `dlinmod`, or `trim` functions, the state vector must use this new state ordering.

Programmatic Use**Block Parameter:** TransDelayFeedthrough

Type: character vector, string

Value: 'off' | 'on'

Default: 'off'

Pade order (for linearization) – Order of Pade approximation

0 (default) | scalar | vector | matrix

Set the order of the Pade approximation for linearization routines as a scalar, vector, or matrix of nonnegative integers.

- The default value is 0, which results in a unity gain with no dynamic states.
- Setting the order to a positive integer n adds n states to your model, but results in a more accurate linear model of the transport delay.

Programmatic Use

Block Parameter: PadeOrder

Type: character vector, string

Values: scalar | vector | matrix

Default: '0'

Block Characteristics

Data Types	double
Direct Feedthrough	yes
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production-quality code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. The code generated can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code.

In general, consider using the Simulink Model Discretizer to map continuous blocks into discrete equivalents that support production code generation. To start the Model Discretizer, in the Simulink Editor, on the **Apps** tab, under **Apps**, under **Control Systems**, click **Model Discretizer**. One exception is the Second-Order Integrator block because, for this block, the Model Discretizer produces an approximate discretization.

Trigger

Add trigger or function port to subsystem or model

Library: Simulink / Ports & Subsystems
HDL Coder / Ports & Subsystems

Description

The Trigger block adds an external signal to control the execution of a subsystem or a model. To enable this functionality, add this block to a Subsystem block or at the root level of a model that is referenced in a Model block.

Then, configure the Trigger block to execute a subsystem or model:

- Once at each time step, when the value of the control signal changes in a way that you specify.
- Multiple times during a time step, when the control signal is a function-call event from a Stateflow chart, Function-Call Generator block, or S-Function block.

Ports

Output

Port_1 — Value that describes control signal

scalar | vector

Value that identifies a control signal, returned as a scalar or vector. For each element of the input signal, the value at a given time step is:

- 1 for a signal that causes a rising trigger
- -1 for a signal that causes a falling trigger
- 2 for a function-call event
- 0 in all other cases

Dependencies

To enable this port, select **Show output port**.

Data Types: double | int8

Parameters

Main

Trigger type — Select the type control signal

rising (default) | falling | either | function-call

Select the type of control signal that executes a subsystem or model.

rising

Trigger execution of subsystem or model when the control signal rises from a negative or zero value to a positive value. If the initial value is negative, a rising signal to zero triggers execution.

falling

Trigger execution of subsystem or model when the control signal falls from a positive or a zero value to a negative value. If the initial value is positive, a falling signal to zero triggers execution.

either

Trigger execution of subsystem or model when the control signal is either rising or falling.

function-call

Execute subsystem or model when the control signal receives a function-call event from a Stateflow chart, Function-Call Generator block, S-Function block, or Hit Crossing block.

Programmatic Use

Block Parameter: TriggerType

Type: character vector

Values: 'rising' | 'falling' | 'either' | 'function-call'

Default: 'rising'

Treat as Simulink function — Create Simulink Function block

off (default) | on

Select this parameter to create a Simulink Function block by configuring a Subsystem block that is callable with arguments from a function caller. The Trigger block must reside within the subsystem. You can edit the function prototype that displays on the block face to specify input and output arguments for the block.

Clear this parameter to remove the configuration.

Dependency

To display and enable this parameter, select `function-call` from the **Trigger type** list.

Programmatic Use

Block Parameter: IsSimulinkFunction

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Function name — Specify function name for Simulink Function block

f (default) | function name

Specify the function name for a Simulink Function block. Alternatively, you can specify the name by editing the function prototype on the face of the block.

f

Default name for a Simulink Function block.

function name

Function name that displays on the face of a Simulink Function block.

Dependency

To display and enable this parameter, select `function-call` from the **Trigger type** list and select the **Treat as a Simulink Function** check box.

Programmatic Use

Block Parameter: `FunctionName`

Type: character vector

Values: `'f' | '<function name>'`

Default: `'f'`

Enable variant condition – Controls activating the variant control (condition)

`on (default) | off`

Control activating the variant control (condition) defined with the **Variant Control** parameter.

Select this parameter to activate variant control of the subsystem. Selecting this parameter:

- Enables the **Variant control** parameter.
- Displays a variant badge  on the face of the block indicating that variant conditions are enabled.

Clear this parameter to deactivate variant control of the subsystem.

Dependency

To display and enable this parameter, select `function-call` from the **Trigger type** list and select the **Treat as Simulink function** check box.

Programmatic Use

Block Parameter: `Variant`

Type: character vector

Values: `'off' | 'on'`

Default: `'on'`

Variant control – Specify variant control (condition) expression

`(inherit) (default) | <logical expression>`

Specify variant control (condition) expression that executes a variant Simulink Function block when the expression evaluates to `true`.

`(inherit)`

Default value for variant control. Inherits the variant condition from the corresponding Function Caller blocks in the model. When **Variant Control** is set as `(inherit)` the value for **Generate preprocessor conditionals** is inherited automatically from the Function Caller block in the model.

`logical expression`

A logical (Boolean) expression or a `Simulink.Variant` object representing a logical expression.

The function is activated when the expression evaluates to `true`.

If you want to generate code for your model, define the variables in the expression as `Simulink.Parameter` objects.

Dependency

To display and enable this parameter, select function-call from the **Trigger type** list, select the **Treat as a Simulink Function** check box, then select the **Enable variant condition** check box.

Programmatic Use

Block Parameter: VariantControl

Type: character vector

Values: '(inherit)' | <logical expression> | Simulink.Variant object

Default: '(inherit)'

Generate preprocessor conditionals – Control enclosing variant choices

off (default) | on

Control enclosing variant choices within C preprocessor conditional statements.

Select this parameter to enclose variant choices within C preprocessor conditional statements (#if) when generating code for an ERT target.

Dependency

To display and enable this parameter, select the **Enable variant condition** check box.

Programmatic Use

Block Parameter: GeneratePreprocessorConditionals

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Function visibility – Select scope visibility of function

scoped (default) | global

Select scope of Simulink Function block within subsystem or model.

scoped

Limit accessibility of function to:

- Hierarchic level containing the Simulink Function block and levels below.
- One hierarchical level above with qualification.

global

Function accessible from any part of the model hierarchy.

Dependency

To display and enable this parameter, select function-call from the **Trigger type** list, then select the **Treat as a Simulink Function** check box..

Programmatic Use

Block Parameter: FunctionVisibility

Type: character vector

Values: 'scoped' | 'global'

Default: 'scoped'

States when enabling – Select how to set block state values

held (default) | reset | inherit

Select how to set block state values when the subsystem or model is disabled.

held

Leave the block states at their current values.

reset

Reset the block state values.

inherit

Use the **held** or **reset** setting from the parent subsystem initiating the function-call. If the parent of the initiator is the model root, the inherited setting is **held**. If the trigger has multiple initiators, set the parents of all initiators to either **held** or **reset**.

Dependencies

To enable this parameter, select **function-call** from the **Trigger Type** list.

This parameter setting applies only if the model explicitly enables and disables the function-call subsystem. For example:

- The function-call subsystem resides in an enabled subsystem. In this case, the model enables and disables the function-call subsystem along with the parent subsystem.
- The function-call initiator that controls the function-call subsystem resides in an enabled subsystem. In this case, the model enables and disables the function-call subsystem along with the enabled subsystem containing the function-call initiator.
- The function-call initiator is a Stateflow event bound to a particular state. See “Control Function-Call Subsystems by Using bind Actions” (Stateflow).
- The function-call initiator is an S-function that explicitly enables and disables the function-call subsystem. See `ssEnableSystemWithTid` for an example.

Programmatic Use

Block Parameter: `StatesWhenEnabling`

Type: character vector

Values: `'held' | 'reset' | 'inherit'`

Default: `'held'`

Propagate sizes of variable-size signals — Select when to propagate variable-size signals

During execution (default) | Only when enabling

Select when to propagate variable-size signals.

During execution

Propagate variable-size signals at each time step.

Only when enabling

Propagate variable-size signals when executing a Subsystem block or Model block containing an Enable port, Trigger port with **Trigger type** set to **function-call**, or Action Port block. When you select this option, sample time must be periodic.

Dependencies

To display and enable this parameter for a Trigger port block, select **Function-call** from the **Trigger type** list.

Programmatic Use**Block Parameter:** PropagateVarSize**Type:** character vector**Values:** 'During execution' | 'Only when enabling'**Default:** 'During execution'**Show output port — Control display of output port**

off (default) | on

Control display of an output port for a signal that identifies the trigger signal or function-call event signal.

Select this parameter to display the output port and determine which signal caused the trigger signal or function-call event. The width of the output port signal is the width of the control signal. The signal value is:

- 1 for a signal that causes a rising trigger
- -1 for a signal that causes a falling trigger
- 2 for a function-call event
- 0 in all other cases

Clear this parameter to remove the output port.

Programmatic Use**Block Parameter:** ShowOutputPort**Type:** character vector**Values:** 'off' | 'on'**Default:** 'off'**Output data type — Select output port data type**

auto (default) | double | int8

Select the output port data type for the signal that identifies the trigger signal or function-call event signal.

auto

Data type is the same as the port connected to the output.

double

Double value.

int8

Integer value

Dependency

To enable this parameter, select the **Show output port** check box.

The Trigger block ignores the **Data type override** setting for the Fixed-Point Tool.

Programmatic Use**Block Parameter:** OutputDataType**Type:** character vector**Values:** 'auto' | 'double' | 'int8'

Default: 'auto'

Sample time type — Select calling rate

triggered (default) | periodic

Select the calling rate for a subsystem or model.

triggered

Apply to applications that do not have a periodic function-call frequency. A function-call initiator can execute a triggered (aperiodic) function-call subsystem one or more times per time step and can provide a series of aperiodic function-call events.

periodic

A function-call initiator can execute a periodic function-call system only once per time step and must provide a series of periodic function-call events.. A Stateflow chart is an example of a function-call initiator.

Dependency

To enable this parameter, select Function-call from the **Trigger type** list.

Programmatic Use

Block Parameter: SampleTimeType

Type: character vector

Values: 'triggered' | 'periodic'

Default: 'triggered'

Sample time — Specify time interval

-1 (default) | Ts | [Ts, To]

Specify the time interval between function calls to a subsystem or model containing this Trigger port block. If the actual calling rate for the subsystem or model differs from the time interval this parameter specifies, Simulink displays an error.

-1

Inherit time interval from the control signal.

Ts

Scalar where Ts is the time interval.

[Ts, To]

Vector where Ts is the time interval and To is the initial time offset.

Dependencies

To enable this parameter, select function-call from the **Trigger type** list and periodic from the **Sample time type** list.

Programmatic Use

Block Parameter: SampleTime

Type: character vector

Values: '-1' | 'Ts' | '[Ts, To]'

Default: '-1'

Enable zero-crossing detection — Control zero-crossing detection

on (default) | off

Select this parameter to detect zero crossings.

Dependencies

To enable this parameter, select rising, falling, or either from the **Trigger type** list.

Programmatic Use

Block Parameter: ZeroCross

Type: character vector

Values: 'on' | 'off'

Default: 'on'

Initial trigger signal state — Select the initial state of the trigger signal

compatibility (no trigger on first evaluation) (default) | zero | positive | negative

Select the initial state of the trigger control signal.

compatibility (no trigger on first evaluation)

No trigger at the first evaluation of trigger signal. If you choose this option and the Trigger block is in a subsystem where the states are reset, the block does not reset.

zero

Zero. Helps to evaluate a rising or falling trigger signal at the first time step.

positive

Positive value. Helps to evaluate a falling trigger signal at the first time step.

negative

Negative value. Helps to evaluate a rising trigger signal at the first time step.

Dependency

To display and activate this parameter, select rising, falling, or either from the **Trigger type** list.

Programmatic Use

Block Parameter: InitialTriggerSignalState

Type: character vector

Values: 'compatibility (no trigger on first evaluation)' | 'zero' | 'positive' | 'negative'

Default: 'compatibility (no trigger on first evaluation)'

Signal Attributes

Port dimensions — Specify dimensions for the trigger signal

1 (default) | [n] | [m n]

Specify dimensions for the trigger signal attached externally a Model block and passed to the inside of the block.

1

Scalar signal.

[n]

Vector signal of width n.

[m n]

Matrix signal having m rows and n columns.

Dependency

To display and enable this parameter for a Trigger port block at the root-level of a model, select rising, falling, or either from the **Trigger type** list.

Programmatic Use

Block Parameter: PortDimensions

Type: character vector

Values: '1' | '[n]' | '[m n]'

Default: '1'

Trigger signal sample time — Specify time interval

-1 (default) | Ts | [Ts, To]

Specify time interval between block method executions for the block driving the trigger signal.

-1

Inherit time interval.

Ts

Scalar where Ts is the time interval.

[Ts, To]

Vector where Ts is the time interval and To is the initial time offset.

Dependency

To display and enable this parameter for a Trigger port block at the root-level of a model, select rising, falling, or either from the **Trigger type** list.

Programmatic Use

Block Parameter: TriggerSignalSampleTime

Type: character vector

Values: '-1' | 'Ts' | '[Ts, To]'

Default: '-1'

Minimum — Specify minimum output value for the trigger signal

[] (default) | real scalar

Specify minimum value for the trigger signal attached externally to a Model block and passed to the inside of the block.

Simulink uses this value to perform:

- Simulation range checking. See “Specify Signal Ranges”.
- Automatic scaling of fixed-point data types.
- Optimization of generated code. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. See “Optimize using the specified minimum and maximum values” (Embedded Coder).

[]

Unspecified minimum value.

real scalar

Real scalar value.

Dependency

To display and enable this parameter for a Trigger port block at the root-level of a model, select rising, falling, or either from the **Trigger type** list.

Programmatic Use

Block Parameter: OutMin

Type: character vector

Values: '[]' | '<real scalar>'

Default: '[]'

Maximum — Specify maximum output value for the trigger signal

[] (default) | real scalar

Specify maximum value for the trigger signal attached externally to a Model block and passed to the inside of the block.

Simulink uses this value to perform:

- Simulation range checking. See “Specify Signal Ranges”.
- Automatic scaling of fixed-point data types.
- Optimization of generated code. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. See “Optimize using the specified minimum and maximum values” (Embedded Coder).

[]

Unspecified maximum value.

real scalar

Real scalar value.

Dependency

To display and enable this parameter for a Trigger port block at the root-level of a model, select rising, falling, or either from the **Trigger type** list.

Programmatic Use

Block Parameter: OutMax

Type: character vector

Values: '[]' | '<real scalar>'

Default: '[]'

Data type — Select output data type for the trigger signal

double (default) | single | int8 | uint8 | int16 | uint16 | int32 | uint32 | int64 | uint64 | boolean | fixdt(1,16) | fixdt(1,16,0) | fixdt(1,16,2^,0) | <data type expression>

Select data type for the trigger signal attached externally to a Model block and passed to the inside of the block.

double

Double-precision floating point.

`single`

Single-precision floating point.

`int8`

Signed 8-bit integer.

`uint8`

Unsigned 8-bit integer.

`int16`

Signed 16-bit integer.

`uint16`

Unsigned 16-bit integer.

`int32`

Signed 32-bit integer.

`uint32`

Unsigned 32-bit integer.

`int64`

Signed 64-bit integer.

`uint64`

Unsigned 64-bit integer.

`boolean`

Boolean with a value of `true` or `false`.

`fixdt(1,16)`

Signed 16-bit fixed point number with binary point undefined.

`fixdt(1,16,0)`

Signed 16-bit fixed point number with binary point set to zero.

`fixdt(1,16,2^0,0)`

Signed 16-bit fixed point number with slope set to 2^0 and bias set to 0.

`<data type expression>`

Data type object, for example `Simulink.NumericType`. You cannot enter the name of a `Simulink.Bus` object as a data type expression.

Dependency

To display and enable this parameter for a Trigger port block at the root-level of a model, select rising, falling, or either from the **Trigger type** list.

Programmatic Use

Block Parameter: `OutDataTypeStr`

Type: character vector

Values: `'double'` | `'single'` | `'int8'` | `'uint8'` | `'int16'` | `'uint16'` | `'int32'` | `'uint32'` | `'int64'` | `'uint64'` | `'boolean'` | `'fixdt(1,16)'` | `'fixdt(1,16,0)'` | `'fixdt(1,16,2^0,0)'` | `'<data type expression>'`

Default: `'double'`

Mode — Select data type category

Built in (default) | Fixed point | Expression

Select data type category and display drop-down lists to help you define the data type.

Built in

Display drop-down lists for data type and **Data type override**.

Fixed point

Display drop-down lists for **Signedness**, **Scaling**, and **Data type override**.

Expression

Display text box for entering an expression.

Dependency

To enable this parameter, select the Show data type assistant button .

Programmatic Use

No equivalent command-line parameter.

Interpolate data — Control how missing workspace data is estimated

on (default) | off

Control how missing workspace data is estimated when loading data from the MATLAB workspace.

Select this parameter to linearly interpolate output at time steps for which no corresponding workspace data exists.

Clear this parameter to set the output at such time steps equal to the output at the most recent time step for which data exists.

Dependency

To display and enable this parameter for a Trigger port block at the root-level of a model, select rising, falling, or either from the **Trigger type** list.

Programmatic Use

Block Parameter: Interpolate

Type: character vector

Values: 'on' | 'off'

Default: 'on'

Block Characteristics

Data Types	Boolean double enumerated fixed point integer single
Direct Feedthrough	no
Multidimensional Signals	yes
Variable-Size Signals	no
Zero-Crossing Detection	yes

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic. See also “HDL Code Generation” on page 1-1761.

HDL Architecture

This block has a single, default HDL architecture.

Trigger-Based Linearization

Generate linear models in base workspace when triggered

Library: Simulink / Model-Wide Utilities

Description

When triggered, this block calls `linmod` or `dlinmod` to create a linear model for the system at the current operating point. No trimming is performed. The linear model is stored in the base workspace as a structure, along with information about the operating point at which the snapshot was taken. Multiple snapshots are appended to form an array of structures.

The block sets the following model parameters to the indicated values:

- `BufferReuse` = 'off'
- `RTWInlineParameters` = 'on'
- `BlockReductionOpt` = 'off'

The name of the structure used to save the snapshots is the name of the model appended by `_Trigger_Based_Linearization`, for example, `vdp_Trigger_Based_Linearization`. The structure has the following fields:

Field	Description
<code>a</code>	The A matrix of the linearization
<code>b</code>	The B matrix of the linearization
<code>c</code>	The C matrix of the linearization
<code>d</code>	The D matrix of the linearization
<code>StateName</code>	Names of the model's states
<code>OutputName</code>	Names of the model's output ports
<code>InputName</code>	Names of the model's input ports
<code>OperPoint</code>	A structure that specifies the operating point of the linearization. The structure specifies the value of the model's states (<code>OperPoint.x</code>) and inputs (<code>OperPoint.u</code>) at the operating point time (<code>OperPoint.t</code>).
<code>Ts</code>	The sample time of the linearization for a discrete linearization

Tip Use the Timed-Based Linearization block to generate linear models at predetermined times.

Ports

Input

Port_1 — Input signal

scalar

Input trigger signal, specified as a scalar. Specify the type of event that triggers generation of a linear model using the **Trigger type** parameter.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `fixed point`

Parameters

Trigger type — Signal type that triggers generation of a linear model

`rising` | `falling` | `either` | `function-call`

Type of event on the trigger input signal that triggers generation of a linear model. You can select:

- `rising` — Trigger execution of subsystem or model when the trigger signal rises from a negative or zero value to a positive value. If the initial value is negative, a rising signal to zero triggers execution.
- `falling` — Trigger execution of subsystem or model when the trigger signal falls from a positive or a zero value to a negative value. If the initial value is positive, a falling signal to zero triggers execution.
- `either` — Trigger execution of subsystem or model when the trigger signal is either rising or falling.
- `function-call` — Trigger execution of subsystem or model when the trigger signal is a function-call event from a Stateflow chart, Function-Call Generator block, S-Function block, or Hit Crossing block.

Programmatic Use

Block Parameter: `TriggerType`

Type: character vector

Values: `'rising'` | `'falling'` | `'either'` | `'function-call'`

Default: `'rising'`

Sample time (of linearized model) — Sample time

`0` (default) | scalar | vector

Specify a sample time for the linear model. To create a continuous-time model using `linmod`, specify a sample time of `0`. Otherwise, to create a discrete-time model using `dlinmod`, specify a positive sample time (see “Discrete-Time System Linearization” on page 2-47).

Programmatic Use

Block Parameter: `SampleTime`

Type: character vector

Values: scalar | vector

Default: `'0'`

Block Characteristics

Data Types	Boolean double fixed point integer single
Direct Feedthrough	no
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

Triggered Subsystem

Subsystem whose execution is triggered by external input

Library: Simulink / Ports & Subsystems
HDL Coder / Ports & Subsystems

Description

The Triggered Subsystem block is a Subsystem block preconfigured as a starting point for creating a subsystem that executes each time the control signal has a trigger value.

Use Triggered Subsystem blocks to model:

- A task that runs with the detection of a trigger value.
- An interrupt from I/O hardware.
- A processor request to handle an exception or error.

Ports

Input

In — Signal input to a subsystem block

scalar | vector | matrix

Placing an Inport block in a subsystem block adds an external input port to the block. The port label matches the name of the Inport block.

Use Inport blocks to get signals from the local environment.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Trigger — Control signal input to a subsystem block

scalar

Placing a Trigger block in a subsystem block adds an external input port to the block.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `fixed point`

Output

Out — Signal output from a subsystem

`scalar` | `vector` | `matrix`

Placing an Outport block in a subsystem block adds an output port from the block. The port label on the subsystem block is the name of the Outport block.

Use Outport blocks to send signals to the local environment.

Data Types: `half` | `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point` | `enumerated` | `bus`

Block Characteristics

Data Types	<code>Boolean^a</code> <code>bus^a</code> <code>double^a</code> <code>enumerated^a</code> <code>fixed point^a</code> <code>half^a</code> <code>integer^a</code> <code>single^a</code> <code>string^a</code>
Direct Feedthrough	no
Multidimensional Signals	limited ^a
Variable-Size Signals	limited ^a
Zero-Crossing Detection	no

a. Actual data type or capability support depends on block implementation.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Actual code generation support depends on block implementation.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic. For information about best practices, restrictions, and how you can use the trigger signal as a clock with the `TriggerAsClock` property, see “Using Triggered Subsystems for HDL Code Generation” (HDL Coder).

HDL Architecture

Architecture	Description
Module (default)	Generate code for the subsystem and the blocks within the subsystem.

Architecture	Description
BlackBox	<p>Generate a black box interface. The generated HDL code includes only the input/output port definitions for the subsystem. Therefore, you can use a subsystem in your model to generate an interface to existing, manually written HDL code.</p> <p>The black-box interface generation for subsystems is similar to the Model block interface generation without the clock signals.</p>
No HDL	Remove the subsystem from the generated code. You can use the subsystem in simulation, however, treat it as a “no-op” in the HDL code.

Black Box Interface Customization

For the BlackBox architecture, you can customize port names and set attributes of the external component interface. See “Customize Black Box or HDL Cosimulation Interface” (HDL Coder).

HDL Block Properties

General	
AdaptivePipelining	Automatic pipeline insertion based on the synthesis tool, target frequency, and multiplier word-lengths. The default is <code>inherit</code> . See also “AdaptivePipelining” (HDL Coder).
BalanceDelays	Detects introduction of new delays along one path and inserts matching delays on the other paths. The default is <code>inherit</code> . See also “BalanceDelays” (HDL Coder).
ClockRatePipelining	Insert pipeline registers at a faster clock rate instead of the slower data rate. The default is <code>inherit</code> . See also “ClockRatePipelining” (HDL Coder).
ConstrainedOutputPipeline	Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is 0. For more details, see “ConstrainedOutputPipeline” (HDL Coder).
DistributedPipelining	Pipeline register distribution, or register retiming. The default is <code>off</code> . See also “DistributedPipelining” (HDL Coder).
DSPStyle	Synthesis attributes for multiplier mapping. The default is <code>none</code> . See also “DSPStyle” (HDL Coder).
FlattenHierarchy	Remove subsystem hierarchy from generated HDL code. The default is <code>inherit</code> . See also “FlattenHierarchy” (HDL Coder).
InputPipeline	Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “InputPipeline” (HDL Coder).
OutputPipeline	Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “OutputPipeline” (HDL Coder).
SharingFactor	Number of functionally equivalent resources to map to a single shared resource. The default is 0. See also “Resource Sharing” (HDL Coder).

General	
StreamingFactor	Number of parallel data paths, or vectors, that are time multiplexed to transform into serial, scalar data paths. The default is 0, which implements fully parallel data paths. See also "Streaming" (HDL Coder).

Target Specification

This block cannot be the DUT, so the block property settings in the **Target Specification** tab are ignored.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Actual data type support depends on block implementation.

Trigonometric Function

Specified trigonometric function on input

Library: Simulink / Math Operations
HDL Coder / Math Operations

Description

The Trigonometric Function block performs common trigonometric functions and outputs the result in rad or rev.

Supported Functions

You can select one of these functions from the **Function** parameter list.

Function	Description	Mathematical Expression	MATLAB Equivalent
sin	Sine of the input	$\sin(u)$	sin
cos	Cosine of the input	$\cos(u)$	cos
tan	Tangent of the input	$\tan(u)$	tan
asin	Inverse sine of the input	$\text{asin}(u)$	asin
acos	Inverse cosine of the input	$\text{acos}(u)$	acos
atan	Inverse tangent of the input	$\text{atan}(u)$	atan
atan2	Four-quadrant inverse tangent of the input	$\text{atan2}(u)$	atan2
sinh	Hyperbolic sine of the input	$\sinh(u)$	sinh
cosh	Hyperbolic cosine of the input	$\cosh(u)$	cosh
tanh	Hyperbolic tangent of the input	$\tanh(u)$	tanh
asinh	Inverse hyperbolic sine of the input	$\text{asinh}(u)$	asinh
acosh	Inverse hyperbolic cosine of the input	$\text{acosh}(u)$	acosh
atanh	Inverse hyperbolic tangent of the input	$\text{atanh}(u)$	atanh

Function	Description	Mathematical Expression	MATLAB Equivalent
sincos	Sine of the input; cosine of the input	—	—
cos + jsin	Complex exponential of the input	—	—

CORDIC Approximation Method

If you use the CORDIC approximation method (see “More About” on page 1-1774), the block input has further requirements.

When you set **Function** to `sin`, `cos`, `sincos`, or `cos + jsin` and set the **Approximation method** to CORDIC, the block has these limitations:

- When you use signed fixed-point types, the input angle must fall within the range $[-2\pi, 2\pi)$ rad.
- When you use unsigned fixed-point types, the input angle must fall within the range $[0, 2\pi)$ rad.

When you set **Function** to `atan2` and the **Approximation method** to CORDIC, the block has these limitations:

- Inputs must be the same size, or at least one value must be a scalar value.
- Both inputs must have the same data type.
- When you use signed fixed-point types, the word length must be 126 or less.
- When you use unsigned fixed-point types, the word length must be 125 or less.

This table summarizes what happens for an invalid input.

Block Usage	Effect of Invalid Input
Simulation modes	An error appears.
Generated code	Undefined behavior occurs. Avoid relying on undefined behavior for generated code.

Lookup Approximation Method

When you set **Function** to `sin`, `cos`, `sincos`, or `cos + jsin` and set the **Approximation method** to Lookup, the block has these limitations:

- When you use signed fixed-point types, the input angle must fall within the range $[-2\pi, 2\pi]$ rad.
- When you use unsigned fixed-point types, the input angle must fall within the range $[0, 2\pi)$ rad.
- When you set **Function** to `atan2` and the **Approximation method** to Lookup, the block has these limitations:
 - Inputs must be the same size, or at least one value must be a scalar value.
 - Both inputs must have the same data type.
 - The number of data points are limited by:
 - $smallEnoughNumDataPoints = 2^{(inputFractionLen-2)+1}$
 - $bigEnoughFractionLen = \log_2(numberOfDataPoints - 1)+2$

where:

- *smallEnoughNumDataPoints* is the maximum number of data points represented by specified input fraction length, *inputFractionLen*.
- *bigEnoughFractionLen* is the minimum fraction length needed to represent specified number of data points, *numberOfDataPoints*.

Ports

Input

Port_1 – Input signal

scalar | vector | matrix

Input specified as a scalar, vector, or matrix. The block accepts input signals of the following data types:

Functions	Input Data Types
<ul style="list-style-type: none"> • sin • cos • sincos • cos + jsin • atan2 	<ul style="list-style-type: none"> • Floating point • Fixed point (only when Approximation method is CORDIC)
<ul style="list-style-type: none"> • tan • asin • acos • atan • sinh • cosh • tanh • asinh • acosh • atanh 	<ul style="list-style-type: none"> • Floating point

Dependencies

- When you set **Function** to `atan2`, the block shows two input ports. The first input (**Port_1**) is the y-axis or imaginary part of the function argument. The second input (**Port_2**) is the x-axis or real part of the function argument.
- You can use floating-point input signals when you set **Approximation method** to `None`, `CORDIC`, or `Lookup`. However, the block output data type depends on which of these approximation method options you choose.

Input Data Type	Approximation Method	Output Data Type
Floating point	None	Depends on your selection for Output signal type . Options are auto (same data type as input), real, or complex.
Floating point	CORDIC	Same as input. Output signal type is not available when you use the CORDIC approximation method to compute the block output.
Floating point	Lookup	Same as input. Output signal type is not available when you use the Lookup approximation method to compute the block output.

For CORDIC and Lookup approximations:

- Input must be real for the `sin`, `cos`, `sincos`, `cos + jsin`, and `atan2` functions.
- Output is real for the `sin`, `cos`, `sincos`, and `atan2` functions.
- Output is complex for the `cos + jsin` function.

Limitations

Complex input signals are supported for all functions in this block except `atan2`.

You can use fixed-point input signals only when **Approximation method** is set to CORDIC or Lookup. The CORDIC and Lookup approximations are available for the `sin`, `cos`, `sincos`, `cos + jsin`, and `atan2` functions.

CORDIC approximation fixed-point type propagations:

Input Data Type	Function	Output Data Type
Fixed point, signed or unsigned	<code>sin</code> , <code>cos</code> , <code>sincos</code> , and <code>cos + jsin</code>	<code>fixdt(1, WL, WL - 2)</code> where <i>WL</i> is the input word length This fixed-point type provides the best precision for the CORDIC algorithm.
Fixed point, signed	<code>atan2</code>	<code>fixdt(1, WL, WL - 3)</code>
Fixed point, unsigned	<code>atan2</code>	<code>fixdt(1, WL, WL - 2)</code>

Lookup approximation fixed-point type propagations:

Input Data Type	Function	Output Data Type
Fixed point, signed	<code>sin</code> , <code>cos</code> , <code>sincos</code> , <code>cos + jsin</code> , <code>atan2</code>	<code>fixdt(1, WL, FL)</code>
Fixed point, unsigned	<code>sin</code> , <code>cos</code> , <code>sincos</code> , <code>cos + jsin</code> , <code>atan2</code>	<code>fixdt(1, WL - 1, FL)</code>

When you set **Function** to `sin`, `cos`, `sincos`, or `cos + jsin` and set the **Approximation method** to CORDIC, the block has these limitations:

- When you use signed fixed-point types, the input angle must fall within the range $[-2\pi, 2\pi)$ rad.
- When you use unsigned fixed-point types, the input angle must fall within the range $[0, 2\pi)$ rad.

When you set **Function** to `atan2` and the **Approximation method** to `CORDIC`, the block has these limitations:

- Inputs must be the same size, or at least one value must be a scalar value.
- Both inputs must have the same data type.
- When you use signed fixed-point types, the word length must be 126 or less.
- When you use unsigned fixed-point types, the word length must be 125 or less.

When you set **Function** to `sin`, `cos`, `sincos`, or `cos + jsin` and set the **Approximation method** to `Lookup`, the block has these limitations:

- When you use signed fixed-point types, the input angle must fall within the range $[-2\pi, 2\pi]$ rad.
- When you use unsigned fixed-point types, the input angle must fall within the range $[0, 2\pi)$ rad.
- When you set **Function** to `atan2` and the **Approximation method** to `Lookup`, the block has these limitations:

- Inputs must be the same size, or at least one value must be a scalar value.
- Both inputs must have the same data type.
- The number of data points are limited by:
 - $smallEnoughNumDataPoints = 2^{(inputFractionLen-2)+1}$
 - $bigEnoughFractionLen = \log_2(numberOfDataPoints - 1)+2$

where:

- *smallEnoughNumDataPoints* is the maximum number of data points represented by specified input fraction length, *inputFractionLen*.
- *bigEnoughFractionLen* is the minimum fraction length needed to represent specified number of data points, *numberOfDataPoints*.

Data Types: `half` | `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `fixed point`

Port_2 — x-axis or real part of the function argument for `atan2`

`scalar` | `vector` | `matrix`

Input the x-axis or real part of the function argument for `atan2`. When you set **Function** to `atan2`, the block shows two input ports. The first input (**Port_1**) is the y-axis or imaginary part of the function argument. The second input (**Port_2**) is the x-axis or real part of the function argument. (See “Port Location After Rotating or Flipping” for a description of the port order for various block orientations.)

Dependencies

To enable this port, set **Function** to `atan2`.

Limitations

- Fixed-point input signals are supported only when you set **Approximation method** to `CORDIC` or `Lookup`.

- When you set **Function** to atan2 and **Approximation method** to CORDIC:
 - Inputs must be the same size, or at least one value must be a scalar value.
 - Both inputs must have the same data type.
 - When you use signed fixed-point types, the word length must be 126 or less.
 - When you use unsigned fixed-point types, the word length must be 125 or less.
- When you set **Function** to sin, cos, sincos, or cos + jsin and set the **Approximation method** to Lookup, the block has these limitations:
 - When you use signed fixed-point types, the input angle must fall within the range $[-2\pi, 2\pi]$ rad.
 - When you use unsigned fixed-point types, the input angle must fall within the range $[0, 2\pi)$ rad.
- When you set **Function** to atan2 and the **Approximation method** to Lookup, the block has these limitations:
 - Inputs must be the same size, or at least one value must be a scalar value.
 - Both inputs must have the same data type.
 - The number of data points are limited by:
 - $smallEnoughNumDataPoints = 2^{(inputFractionLen - 2)+1}$
 - $bigEnoughFractinoLen = \log_2(numberOfDataPoints - 1)+2$

where:

- *smallEnoughNumDataPoints* is the maximum number of data points represented by specified input fraction length, *inputFractionLen*.
- *bigEnoughFractinoLen* is the minimum fraction length needed to represent specified number of data points, *numberOfDataPoints*.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Output

Port_1 — Specified trigonometric function of input

scalar | vector | matrix

Result of applying the specified trigonometric function to one or more inputs in rad. Each function supports:

- Scalar operations
- Element-wise vector and matrix operations

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

sin — Sine of input signal

scalar | vector | matrix

Sine of the input signal, in rad and rev.

Dependencies

To enable this port, set **Function** to sincos.

Limitations

Fixed-point input signals are supported only when you set **Approximation method** to CORDIC or Lookup.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

cos — Cosine of input signal

scalar | vector | matrix

Cosine of the input signal, in rad and rev.

Dependencies

To enable this port, set **Function** to sincos.

Limitations

Fixed-point input signals are supported only when you set **Approximation method** to CORDIC or Lookup.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Parameters**Function — Trigonometric function**

sin (default) | cos | tan | asin | acos | atan | atan2 | sinh | cosh | tanh | asinh | acosh | atanh | sincos | cos + jsin

Specify the trigonometric function. The name of the function on the block icon changes to match your selection.

Limitations

When you set **Function** to sin, cos, sincos, or cos + jsin and set the **Approximation method** to CORDIC, the block has these limitations:

- When you use signed fixed-point types, the input angle must fall within the range $[-2\pi, 2\pi]$ rad.
- When you use unsigned fixed-point types, the input angle must fall within the range $[0, 2\pi]$ rad.

When you set **Function** to atan2 and the **Approximation method** to CORDIC, the block has these limitations:

- Inputs must be the same size, or at least one value must be a scalar value.
- Both inputs must have the same data type.
- When you use signed fixed-point types, the word length must be 126 or less.
- When you use unsigned fixed-point types, the word length must be 125 or less.

Programmatic Use

Block Parameter: Operator

Type: character vector

Values: 'sin' | 'cos' | 'tan' | 'asin' | 'acos' | 'atan' | 'atan2' | 'sinh' | 'cosh' | 'tanh' | 'asinh' | 'acosh' | 'atanh' | 'sincos' | 'cos + jsin'

Default: 'sin'

Approximation method — CORDIC, Lookup, or none

None (default) | CORDIC | Lookup

Specify the type of approximation for computing output.

Approximation Method	Data Types Supported	When to Use This Method
None (default)	Floating point	You want to use the default Taylor series algorithm.
CORDIC	Floating point and fixed point	You want a fast, approximate iterative calculation.
Lookup	Floating point and fixed point (double and single)	You want a fast, approximate lookup table implementation.

Dependencies

To enable this parameter, set **Function** to `sin`, `cos`, `sincos`, `cos + jsin`, or `atan2`.

To use fixed-point input signals, you must set **Approximation method** to CORDIC or Lookup.

Limitations

When you set **Function** to `sin`, `cos`, `sincos`, or `cos + jsin` and set the **Approximation method** to CORDIC, the block has these limitations:

- When you use signed fixed-point types, the input angle must fall within the range $[-2\pi, 2\pi]$ rad.
- When you use unsigned fixed-point types, the input angle must fall within the range $[0, 2\pi]$ rad.

When you set **Function** to `atan2` and the **Approximation method** to CORDIC, the block has these limitations:

- Inputs must be the same size, or at least one value must be a scalar value.
- Both inputs must have the same data type.
- When you use signed fixed-point types, the word length must be 126 or less.
- When you use unsigned fixed-point types, the word length must be 125 or less.

Programmatic Use

Block Parameter: ApproximationMethod

Type: character vector

Values: 'None' | 'CORDIC' | 'Lookup'

Default: 'None'

Number of iterations — Number of iterations for CORDIC algorithm

11 (default) | positive integer, less than or equal to word length of fixed-point input

Specify the number of iterations to perform the CORDIC algorithm. The default value is 11.

- When the block input uses a floating-point data type, the number of iterations can be a positive integer.
- When the block input is a fixed-point data type, the number of iterations cannot exceed the word length.

For example, if the block input is `fixdt(1,16,15)`, the word length is 16. In this case, the number of iterations cannot exceed 16.

Dependencies

To enable this parameter, you must set the **Function** and **Approximation method** parameters as follows:

- Set **Function** to `sin`, `cos`, `sincos`, `cos + jsin`, or `atan2`.
- Set **Approximation method** to `CORDIC`.

Programmatic Use

Block Parameter: `NumberOfIterations`

Type: character vector

Values: positive integer, less than or equal to word length of fixed-point input

Default: `'11'`

Angle unit — Angle unit

`radian (default) | revolution`

Specify the angle unit for lookup method as `radian` or `revolution`.

Dependencies

To enable this parameter:

- Set **Function** to `sin`, `cos`, `sincos`, `cos + jsin`, or `atan2`.
- Set **Approximation method** to `Lookup`.

Programmatic Use

Block Parameter: `AngleUnit`

Type: character vector

Values: `'radian'` | `'revolution'`

Default: `'radian'`

Number of data points — Number of data points for lookup table

`16 (default) | scalar`

Specify the number of data points for lookup table as a scalar real number.

Dependencies

To enable this parameter:

- Set **Function** to `sin`, `cos`, `sincos`, `cos + jsin`, or `atan2`.
- Set **Approximation method** to `Lookup`.

Programmatic Use

Block Parameter: `NumberOfDataPoints`

Type: character vector

Values: scalar

Default: `'16'`

Output signal type — Complexity of output signal

`auto (default) | real | complex`

Specify the output signal type of the Trigonometric Function block as `auto`, `real`, or `complex`.

Function	Input Signal Type	Output Signal Type		
		Auto	Real	Complex
Any selection for the Function parameter	real	real	real	complex
	complex	complex	error	complex

Dependencies

Setting **Approximation method** to CORDIC disables this parameter.

Note When **Function** is `atan2`, complex input signals are not supported for simulation or code generation.

Programmatic Use

Block Parameter: `OutputSignalType`

Type: character vector

Values: `'auto'` | `'real'` | `'complex'`

Default: `'auto'`

Remove protection against out-of-range input — Remove protection against out-of-range input

`off` (default) | `on`

For `acos` and `asin`, select this check box to remove the protection against out-of-range inputs, which reduces redundancy.

- When you clear this check box, the protection is enabled. The block saturates out-of-range inputs to 1 or -1 before any operation is performed. Generated code contains code to check for out-of-range input.
- When you select this check box, the protection is removed. The block performs all operations on the input value without any changes. Generated code does not contain code to check for the out-of-range input.

Enabling this check box can eliminate redundancy if the input is already in range.

Dependencies

Setting **Function** to `acos` and `asin` enables this parameter.

Programmatic Use

Block Parameter: `RemoveProtectionAgainstOutOfRangeInput`

Type: character vector

Values: `'off'` | `'on'`

Default: `'off'`

Sample time — Specify sample time as a value other than -1

`-1` (default) | `scalar` | `vector`

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

Dependencies

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

Programmatic Use

Block Parameter: SampleTime

Type: character vector

Values: scalar or vector

Default: '-1'

Block Characteristics

Data Types	double fixed point ^a half integer ^a single
Direct Feedthrough	yes
Multidimensional Signals	yes
Variable-Size Signals	yes
Zero-Crossing Detection	no

a. This block supports fixed-point and base integer data types for 'Approximation method' CORDIC.

More About

CORDIC

CORDIC is an acronym for COordinate Rotation DIgital Computer. The Givens rotation-based CORDIC algorithm is one of the most hardware-efficient algorithms available because it requires only iterative shift-add operations (see References). The CORDIC algorithm eliminates the need for explicit multipliers. Using CORDIC, you can calculate various functions such as sine, cosine, arc sine, arc cosine, arc tangent, and vector magnitude. You can also use this algorithm for divide, square root, hyperbolic, and logarithmic functions.

Increasing the number of CORDIC iterations can produce more accurate results, but doing so increases the expense of the computation and adds latency.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not all compilers support the `asinh`, `acosh`, and `atanh` functions. If you use a compiler that does not support those functions, a warning appears and the generated code fails to link.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

HDL Architecture

You can generate HDL code for all functions of the block with floating-point data types and architecture set to `Trigonometric` in native floating-point mode. The native floating-point mode does not support `double` data types for the block.

This block has multi-cycle implementations that introduce additional latency in the generated code. To see the added latency, view the generated model or validation model. See “Generated Model and Validation Model” (HDL Coder).

The Trigonometric Function block supports HDL code generation for these functions in this table with CORDIC approximation method and `Cordic` HDL architecture for fixed-point data types.

- `sin`
- `cos`
- `sincos`
- `cos+jsin`
- `atan2`

The latency calculation depends on the word length and **LatencyStrategy** settings. To learn more, open the `HDLMathLib` library.

`HDLMathLib`

HDL Block Properties

General	
ConstrainedOutputPipeline	Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is 0. For more details, see “ConstrainedOutputPipeline” (HDL Coder).
InputPipeline	Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “InputPipeline” (HDL Coder).

General	
OutputPipeline	Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “OutputPipeline” (HDL Coder).
LatencyStrategy	To enable this property for fixed-point types, set Function as <code>sin</code> , <code>cos</code> , <code>sincos</code> , <code>cos+jsin</code> , or <code>atan2</code> and Approximation method as <code>CORDIC</code> . Specify whether to map the blocks in your design to <code>MAX</code> , <code>CUSTOM</code> , or <code>ZERO</code> latency for fixed-point and floating-point types. The default is <code>MAX</code> . See also “LatencyStrategy” (HDL Coder).
CustomLatency	To enable this property for fixed-point types, set Function as <code>sin</code> , <code>cos</code> , <code>sincos</code> , <code>cos+jsin</code> , or <code>atan2</code> and Approximation method as <code>CORDIC</code> . When LatencyStrategy is set to <code>CUSTOM</code> , use this property to specify a custom latency value between <code>ZERO</code> and <code>MAX</code> for fixed-point types. See also “LatencyStrategy” (HDL Coder).
Native Floating Point	
InputRangeReduction	Use this property for the <code>sin</code> , <code>cos</code> , <code>tan</code> , <code>sincos</code> , and <code>cos+jsin</code> functions. If your input range is unbounded, enable this property for HDL Coder to insert additional logic to reduce the range of inputs to $[-\pi, \pi]$. See also “InputRangeReduction” (HDL Coder).
HandleDenormals	Specify whether you want HDL Coder to insert additional logic to handle denormal numbers in your design. Denormal numbers are numbers that have magnitudes less than the smallest floating-point number that can be represented without leading zeros in the mantissa. The default is <code>inherit</code> . See also “HandleDenormals” (HDL Coder).
LatencyStrategy	Specify whether to map the blocks in your design to <code>inherit</code> , <code>Max</code> , <code>Min</code> , or <code>Zero</code> for the floating-point operator. The default is <code>inherit</code> . See also “LatencyStrategy” (HDL Coder).
MultiplyStrategy	Use this property for the <code>sin</code> , <code>cos</code> , <code>tan</code> , <code>sincos</code> , and <code>cos+jsin</code> functions. The default is <code>inherit</code> . Specify whether you want to use <code>FullMultiplier</code> or <code>PartMultiplierPartAddShift</code> . See also “MantissaMultiplyStrategy” (HDL Coder).

To see the latency calculation for fixed-point types with the block, at the MATLAB command prompt, enter:

```
HDLMathLib
```

Restrictions

- For the `sin` and `cos` functions, only signed fixed-point data types are supported for CORDIC approximations.
- For functions that have the CORDIC mode such as `sin`, `cos`, `sincos`, `atan2`, and `cos+jsin`, fixed-point data types greater than 127 bits are not supported for HDL code generation.
- HDL Coder displays an error when you select these settings for a Trigonometric Function block inside a feedback loop:
 - HDL architecture as `SinCosCordic`

- **UsePipelinedKernel** as On

The error occurs because the block is in a feedback loop and the code generator is unable to insert additional latency. To avoid this error, add a delay of length equal to the **Number of iterations** + 3 adjacent to the block. The code generator then absorbs this delay to meet the additional latency of the Trigonometric Function block.

For example, this Trigonometric Function block has **Number of iterations** set to 30. A Delay of length 33 adjacent to the block meets the additional latency.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

This block supports fixed-point and base integer data types when you set the **Function** to sin, cos, sincos, cos + jsin, or atan2 and set the **Approximation method** to CORDIC.

Unary Minus

Negate input

Library: Simulink / Math Operations
HDL Coder / HDL Floating Point Operations
HDL Coder / Math Operations

Description

The Unary Minus block negates the input.

Ports

Input

Port_1 — Signal to negate

scalar | vector | matrix | N-D array

Input signal, specified as a scalar, vector, matrix, or N-D array.

Data Types: half | single | double | int8 | int16 | int32 | int64 | fixed point

Output

Port_1 — Negation of input signal

scalar | vector | matrix | N-D array

Negation of the input signal. The output has the same data type and dimensions as the input.

Data Types: half | single | double | int8 | int16 | int32 | int64 | fixed point

Parameters

Saturate on integer overflow — Method of overflow action

off (default) | on

Select to have integer overflows saturate. Otherwise, overflows wrap.

When you select this check box, saturation applies to every internal operation on the block, not just the output, or result. In general, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

For signed-integer data types, the unary minus of the most negative value is not representable by the data type. In this case, the **Saturate on integer overflow** check box controls the behavior of the block:

Parameter Setting	Block Behavior	Examples
Saturate on integer overflow = on	Values saturate to the most positive value of the integer data type	<ul style="list-style-type: none"> For 8-bit signed integers, -128 maps to 127. For 16-bit signed integers, -32768 maps to 32767. For 32-bit signed integers, -2147483648 maps to 2147483647.
Saturate on integer overflow = off	Values wrap to the most negative value of the integer data type	<ul style="list-style-type: none"> For 8-bit signed integers, -128 remains -128. For 16-bit signed integers, -32768 remains -32768. For 32-bit signed integers, -2147483648 remains -2147483648.

Programmatic Use**Block Parameter:** SaturateOnIntegerOverflow**Type:** character vector**Values:** 'off' | 'on'**Default:** 'off'**Sample time — Specify sample time as a value other than -1**

Uniform Random Number

Generate uniformly distributed random numbers

Library: Simulink / Sources

Description

The Uniform Random Number block generates uniformly distributed random numbers over an interval that you specify. To generate normally distributed random numbers, use the Random Number block. Both blocks use the Normal (Gaussian) random number generator ('v4': legacy MATLAB 4.0 generator of the `rng` function).

You can generate a repeatable sequence using any Uniform Random Number block with the same nonnegative seed and parameters. The seed resets to the specified value each time a simulation starts.

Avoid integrating a random signal, because solvers must integrate relatively smooth signals. Instead, use the Band-Limited White Noise block.

The numeric parameters of this block must have the same dimensions after scalar expansion. If you select the **Interpret vector parameters as 1-D** check box and the numeric parameters are row or column vectors after scalar expansion, the block outputs a 1-D signal. If you clear the **Interpret vector parameters as 1-D** check box, the block outputs a signal of the same dimensionality as the parameters.

Ports

Output

Port_1 — Random number output signal

scalar | vector

Output signal of generated uniformly distributed random numbers over the interval you specify.

Data Types: double

Parameters

Minimum — Minimum interval

0 (default) | scalar | vector | matrix | N-D array

Specify the minimum of the interval.

Programmatic Use

Block Parameter: Minimum

Type: character vector

Values: scalar
Default: '-1'

Maximum — Maximum interval

0 (default) | scalar | vector | matrix | N-D array

Specify the maximum of the interval.

Programmatic Use

Block Parameter: Maximum

Type: character vector

Values: scalar

Default: '1'

Seed — Random number seed

0 (default) | scalar | vector | matrix | N-D array

Specify the starting seed for the random number generator.

The seed must be 0 or a positive integer. Output is repeatable for a given seed.

Programmatic Use

Block Parameter: See

Type: character vector

Values: scalar

Default: '0'

Sample time — Sample time

0.1 (default) | scalar

Specify the time interval between samples. See “Specify Sample Time” for more information.

Programmatic Use

Block Parameter: SampleTime

Type: character vector

Values: scalar

Default: '0.1'

Interpret vector parameters as 1-D — Treat vectors as 1-D

on (default) | off

Select this check box to output a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector.

- When you select this check box, the block outputs a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector. For example, the block outputs a matrix of dimension 1-by-N or N-by-1.
- When you clear this check box, the block does not output a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector.

Programmatic Use

Block Parameter: VectorParams1D

Type: character vector

Values: 'on' | 'off'

Default: 'on'

Block Characteristics

Data Types	double
Direct Feedthrough	no
Multidimensional Signals	yes
Variable-Size Signals	no
Zero-Crossing Detection	no

Unit System Configuration

Restrict units to specified allowed unit systems

Library: Simulink / Ports & Subsystems

Description

The Unit System Configuration block specifies allowed and disallowed unit systems for the component. It restricts units systems for a subsystem or top model and all its children, unless you override it with another Unit System Configuration block in a child.

This block supports normal, accelerator, and rapid accelerator modes and fast restart.

Parameters

Disallowed unit systems — Disallowed unit systems

SI | English | SI (extended) | CGS

Displays a list of the disallowed unit systems. By default, the **Allow all unit systems** check box is selected, and all unit systems are allowed.

To designate a unit system as disallowed, select it in the **Allowed unit systems** column and click **<< Disallow**.

Dependencies

To enable changes to this parameter, you must first clear the **Allow all unit systems** check box.

Allowed unit systems — Allowed unit systems

SI | English | SI (extended) | CGS

Displays a list of the allowed unit systems. By default, the **Allow all unit systems** check box is selected, and all unit systems are allowed.

To designate a unit system as allowed, use the **Allow >>** and **<< Disallow** buttons to move unit systems between the **Disallowed unit systems** and **Allowed unit systems** columns.

Dependencies

To enable changes to this parameter, you must first clear the **Allow all unit systems** check box.

Programmatic Use

Block Parameter: UnitSystems

Type: cell array of character vectors

Values: cell array of the following character vectors: 'SI' | 'English' | 'SI (extended)' | 'CGS'

Default: {'SI', 'English', 'SI (extended)', 'CGS'}

Allow all unit systems — Allow all unit systems

on (default) | off

When you select this check box, all unit systems are allowed. To restrict the allowed unit systems to only the ones specified in the **Allowed unit systems** column, clear this check box.

Dependencies

Selecting the **Allow all unit systems** check box disables the **Disallowed unit systems** and **Allowed unit systems** parameters.

Programmatic Use

Block Parameter: AllowAllUnitSystems

Type: character vector

Values: 'on' | 'off'

Default: 'on'

Block Characteristics

Data Types	Boolean bus double enumerated fixed point integer single
Direct Feedthrough	no
Multidimensional Signals	yes
Variable-Size Signals	yes
Zero-Crossing Detection	no

Extended Capabilities**C/C++ Code Generation**

Generate C and C++ code using Simulink® Coder™.

Unit Conversion

Convert units

Library: Simulink / Signal Attributes

Description

The Unit Conversion block converts the unit of the input signal to the output signal. The block can perform the conversion if the units are separated by a scaling factor or offset, or are inverse units, for example:

- $y = a*U$
- $y = a*U+b$, where a is the scale and b is the offset
- $y = a/U$

This block supports normal, accelerator, and rapid accelerator modes and fast restart.

Ports

Input

Port_1 – Input signal

scalar | vector | matrix

Input signal for unit conversion, specified as a scalar, vector, or matrix.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Output

Port_1 – Output signal

scalar | vector | matrix

Output signal with converted units, specified as a scalar, vector, or matrix.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Parameters

Output data type – Output data type

Inherit: Inherit via internal rule (default) | Inherit: Inherit via back propagation

Specify the output data type.

- **Inherit: Inherit via internal rule** — Simulink chooses intermediate and output data types to balance numerical accuracy, performance, and generated code size, while accounting for the properties of the embedded target hardware. If you change the embedded target settings, the data type selected by the internal rule might change.
- **Inherit: Inherit via back propagation** — Output data type is inherited via back propagation. Internal rules determine the intermediate data types and Simulink casts the final results to the output data type.

Programmatic Use

Block Parameter: OutDataTypeStr

Type: character vector

Values: 'Inherit via internal rule' | 'Inherit via back propagation'

Default: 'Inherit via internal rule'

Block Characteristics

Data Types	double fixed point integer single
Direct Feedthrough	yes
Multidimensional Signals	yes
Variable-Size Signals	yes
Zero-Crossing Detection	no

Unit Delay

Delay signal one sample period

Library: Simulink / Discrete
HDL Coder / Discrete

Description

The Unit Delay block holds and delays its input by the sample period you specify. When placed in an iterator subsystem, it holds and delays its input by one iteration. This block is equivalent to the z^{-1} discrete-time operator. The block accepts one input and generates one output. Each signal can be scalar or vector. If the input is a vector, the block holds and delays all elements of the vector by the same sample period.

You specify the block output for the first sampling period with the **Initial conditions** parameter. Careful selection of this parameter can minimize unwanted output behavior. You specify the time between samples with the **Sample time** parameter. A setting of -1 means the block inherits the **Sample time**.

Note The Unit Delay block errors out if you use it to create a transition between blocks operating at different sample rates. Use the Rate Transition block instead.

Comparison with Similar Blocks

The Memory, Unit Delay, and Zero-Order Hold blocks provide similar functionality but have different capabilities. Also, the purpose of each block is different.

This table shows recommended usage for each block.

Block	Purpose of the Block	Reference Examples
Unit Delay	Implement a delay using a discrete sample time that you specify. The block accepts and outputs signals with a discrete sample time.	<ul style="list-style-type: none"> “Engine Timing Model with Closed Loop Control” on page 13-143 (Compression subsystem)
Memory on page 1-1058	Implement a delay by one major integration time step. Ideally, the block accepts continuous (or fixed in minor time step) signals and outputs a signal that is fixed in minor time step.	<ul style="list-style-type: none"> “Building a Clutch Lock-Up Model” on page 13-147 (Friction Mode Logic/Lockup FSM subsystem) “Capture the Velocity of a Bouncing Ball with the Memory Block” on page 12-87

Block	Purpose of the Block	Reference Examples
Zero-Order Hold	Convert an input signal with a continuous sample time to an output signal with a discrete sample time.	<ul style="list-style-type: none"> “Developing the Apollo Lunar Module Digital Autopilot” on page 13-206 “Radar Tracking Using MATLAB Function Block” on page 13-230

Each block has the following capabilities.

Capability	Memory	Unit Delay	Zero-Order Hold
Specification of initial condition	Yes	Yes	No, because the block output at time $t = 0$ must match the input value.
Specification of sample time	No, because the block can only inherit sample time from the driving block or the solver used for the entire model.	Yes	Yes
Support for frame-based signals	No	Yes	Yes
Support for state logging	No	Yes	No

String Support

The Unit Delay block can accept and output string data type only if the block is configured for a delay length of 0 or 1 or for direct feedthrough.

Ports

Port_1 – Input signal

scalar | vector

Input signal that the block delays by one sample period.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | string | Boolean | fixed point | enumerated | bus

Output

Port_1 – Output signal

scalar | vector

Output signal that is the input delayed by one sample period.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | string | Boolean | fixed point | enumerated | bus

Parameters

Main

Initial condition — First sample period output

0 (default) | scalar | vector

Specify the output of the simulation for the first sampling period, during which the output of the Unit Delay block is otherwise undefined.

Programmatic Use

Block Parameter: InitialCondition

Type: character vector

Value: scalar | vector

Default: '0'

Input processing — Specify sample- or frame-based processing

Elements as channels (sample based) (default) | Columns as channels (frame based)

Specify whether the block performs sample- or frame-based processing:

- Columns as channels (frame based) — Treat each column of the input as a separate channel (frame-based processing).

Note Frame-based processing requires a DSP System Toolbox license.

For more information, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

- Elements as channels (sample based) — Treat each element of the input as a separate channel (sample-based processing).

Use **Input processing** to specify whether the block performs sample- or frame-based processing. The block accepts frame-based signals for the input *u*. All other input signals must be sample-based.

Input Signal <i>u</i>	Input Processing Mode	Block Works?
Sample based	Sample based	Yes
Frame based		No, produces an error
Sample based	Frame based	Yes
Frame based		Yes

For more information about these two processing modes, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

Programmatic Use

Block Parameter: InputProcessing

Type: character vector

Values: 'Columns as channels (frame based)' | 'Elements as channels (sample based)'

Default: 'Elements as channels (sample based)'

Sample time (-1 for inherited) — Discrete interval between sample time hits

-1 (default) | scalar

Enter the discrete interval between sample time hits or specify -1 to inherit the sample time.

See also “Specify Sample Time”.

Programmatic Use

Block Parameter: SampleTime

Type: character vector

Value: real scalar

Default: '-1'

State Attributes

State name — Unique name for block state

' ' (default) | alphanumeric string

Use this parameter to assign a unique name to the block state. The default is ' '. When this field is blank, no name is assigned. When using this parameter, remember these considerations:

- A valid identifier starts with an alphabetic or underscore character, followed by alphanumeric or underscore characters.
- The state name applies only to the selected block.

This parameter enables **State name must resolve to Simulink signal object** when you click **Apply**.

For more information, see “C Code Generation Configuration for Model Interface Elements” (Simulink Coder).

Programmatic Use

Block Parameter: StateName

Type: character vector

Values: unique name

Default: ''

State name must resolve to Simulink signal object — Require state names resolve to signal object

Off (default) | Boolean

Specify if requiring that state name resolve to Simulink signal objects or not. If selected, the software generates an error at run time if you specify a state name that does not match the name of a Simulink signal object.

Dependency

Enabled when you give the parameter **State name** a value and set the model configuration parameter **Signal resolution** to a value other than None.

Selecting this check box disables **Code generation storage class**.

Programmatic Use

Block Parameter: StateMustResolveToSignalObject

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Signal object class — Custom storage class package name

Simulink.Signal (default)

Choose a custom storage class package by selecting a signal object class that the target package defines. For example, to apply custom storage classes from the built-in package `mpt`, select `mpt.Signal`. Unless you use an ERT-based code generation target with Embedded Coder, custom storage classes do not affect the generated code.

To use a storage class package other than the Simulink package, you must load the package into the model's Embedded Coder Dictionary. See “Load Storage Class Packages into Embedded Coder Dictionary” (Embedded Coder).

For information about configuring model data by using storage classes, see “C Code Generation Configuration for Model Interface Elements” (Embedded Coder). For information about custom storage classes, see “Organize Data into Structures in Generated Code” (Embedded Coder).

Programmatic Use

Block Parameter: `StateSignalObject`

Type: character vector

Values: `'Simulink.Signal'` | `'<StorageClass.PackageName>'`

Default: `'Simulink.Signal'`

Code generation storage class — Storage class for code generation

`Auto` (default) | `Model default` | `ExportedGlobal` | `ImportedExtern` | `ImportedExternPointer` | `Bitfield` (Custom) | `Volatile` (Custom) | `ExportToFile` (Custom) | `ImportFromFile` (Custom) | `FileScope` (Custom) | `Struct` (Custom) | `GetSet` (Custom) | `Reusable` (Custom)

Select state storage class for code generation. If you do not need to interface to external code, select `Auto`.

For more information, see “C Code Generation Configuration for Model Interface Elements” (Simulink Coder) and “Organize Parameter Data into a Structure by Using Struct Storage Class” (Embedded Coder).

Programmatic Use

Block Parameter: `StateStorageClass`

Type: character vector

Values: `'Auto'` | `'Model default'` | `'ExportedGlobal'` | `'ImportedExtern'` | `'ImportedExternPointer'` | `'Custom'`

Default: `'Auto'`

Block Characteristics

Data Types	<code>Boolean</code> <code>bus</code> <code>double</code> <code>enumerated</code> <code>fixed point</code> <code>half</code> <code>integer</code> <code>single</code> <code>string</code>
Direct Feedthrough	yes
Multidimensional Signals	yes
Variable-Size Signals	yes
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Generated code relies on memcpy or memset functions (strong.h) under certain conditions.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

HDL Architecture

This block has a single, default HDL architecture.

HDL Block Properties

InputPipeline	Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “InputPipeline” (HDL Coder).
OutputPipeline	Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “OutputPipeline” (HDL Coder).
ResetType	Suppress reset logic generation. The default is default, which generates reset logic. See also “ResetType” (HDL Coder).

Complex Data Support

This block supports code generation for complex signals.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Delay | Resettable Delay

Introduced before R2006a

Variable Integer Delay

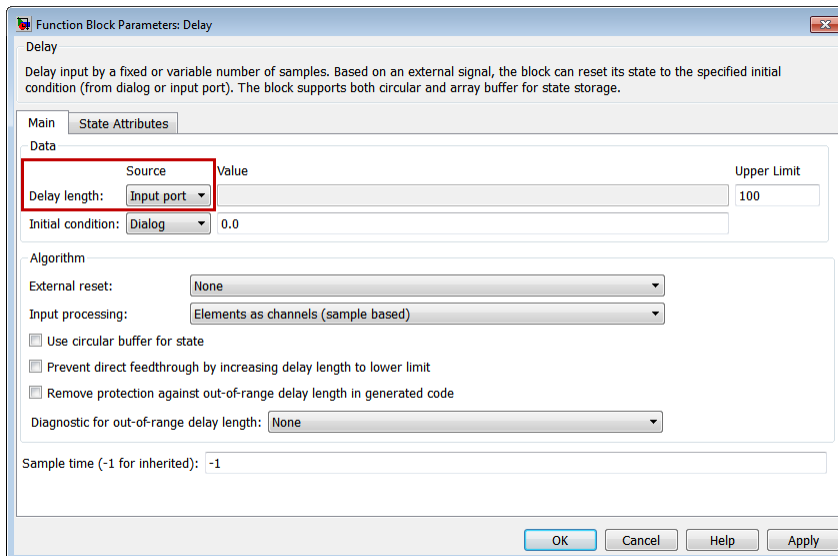

Delay input signal by variable sample period

Library: Simulink / Discrete

Description

The Variable Integer Delay block is a variant of the Delay block that has the source of the delay length set to Input port, by default.

Ports

Input

u — Data input signal

scalar | vector

Input data signal delayed according to parameters settings.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

d — Delay length

scalar

Delay length specified as inherited from an input port. Enabled when you select the **Delay length: Source** parameter as Input port.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Enable — External enable signal

scalar

Enable signal that enables or disables execution of the block. To create this port, select the **Show enable port** parameter.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

External reset — External reset signal

scalar

External signal that resets execution of the block to the initial condition. To create this port, select the **External reset** parameter.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

x0 — Initial condition

scalar | vector

Initial condition specified as inherited from an input port. Enabled when you select the **Initial Condition: Source** parameter as Input port.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Output**Port_1 — Output signal**

scalar | vector

Output signal that is the input signal delayed by the length of time specified by the parameter **Delay length**. The initial value of the output signal depends on several conditions. See “Initial Block Output” on page 1-273.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Parameters**Main****Delay length — Delay length**

Dialog (default) | Input port

Specify whether to enter the delay length directly on the dialog box (fixed delay) or to inherit the delay from an input port (variable delay).

- If you set **Source** to Dialog, enter the delay length in the edit field under **Value**.
- If you set **Source** to Input port, verify that an upstream signal supplies a delay length for the d input port. You can also specify its maximum value by specifying the parameter **Upper limit**.

Specify the scalar delay length as a real, non-negative integer. An out-of-range or non-integer value in the dialog box (fixed delay) returns an error. An out-of-range value from an input port (variable delay)

casts it into the range. A non-integer value from an input port (variable delay) truncates it to the integer.

Programmatic Use

Block Parameter: DelayLengthSource

Type: character vector

Values: 'Dialog' | 'Input port' |

Default: 'Dialog'

Block Parameter: DelayLength

Type: character vector

Values: scalar

Default: '2'

Block Parameter: DelayLengthUpperLimit

Type: character vector

Values: scalar

Default: '100'

Initial condition — Initial condition

Dialog (default) | Input port

Specify whether to enter the initial condition directly on the dialog box or to inherit the initial condition from an input port.

- If you set **Source** to Dialog, enter the initial condition in the edit field under **Value**.
- If you set **Source** to Input port, verify that an upstream signal supplies an initial condition for the x0 input port.

Simulink converts offline the data type of **Initial condition** to the data type of the input signal u using a round-to-nearest operation and saturation.

Note When **State name must resolve to Simulink signal object** is selected on the **State Attributes** pane, the block copies the initial value of the signal object to the **Initial condition** parameter. However, when the source for **Initial condition** is Input port, the block ignores the initial value of the signal object.

Programmatic Use

Block Parameter: InitialConditionSource

Type: character vector

Values: 'Dialog' | 'Input port' |

Default: 'Dialog'

Block Parameter: InitialCondition

Type: character vector

Values: scalar

Default: '0.0'

Input processing — Specify sample- or frame-based processing

Elements as channels (sample based) (default) | Columns as channels (frame based)

Specify whether the block performs sample- or frame-based processing:

- Columns as channels (frame based) — Treat each column of the input as a separate channel (frame-based processing).

Note Frame-based processing requires a DSP System Toolbox license.

For more information, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

- `Elements as channels (sample based)` — Treat each element of the input as a separate channel (sample-based processing).

Use **Input processing** to specify whether the block performs sample- or frame-based processing. The block accepts frame-based signals for the input `u`. All other input signals must be sample-based.

Input Signal <code>u</code>	Input Processing Mode	Block Works?
Sample based	Sample based	Yes
Frame based		No, produces an error
Sample based	Frame based	Yes
Frame based		Yes

For more information about these two processing modes, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

Programmatic Use

Block Parameter: `InputProcessing`

Type: character vector

Values: `'Columns as channels (frame based)'` | `'Elements as channels (sample based)'`

Default: `'Elements as channels (sample based)'`

Use circular buffer for state — Circular buffer for storing state

`off (default)` | `on`

Select to use a circular buffer for storing the state in simulation and code generation. Otherwise, an array buffer stores the state.

Using a circular buffer can improve execution speed when the delay length is large. For an array buffer, the number of copy operations increases as the delay length goes up. For a circular buffer, the number of copy operations is constant for increasing delay length.

If one of the following conditions is true, an array buffer always stores the state because a circular buffer does not improve execution speed:

- For sample-based signals, the delay length is 1.
- For frame-based signals, the delay length is no larger than the frame size.

Programmatic Use

Block Parameter: `UseCircularBuffer`

Type: character vector

Values: `'off'` | `'on'`

Default: `'off'`

Prevent direct feedthrough — Prevent direct feedthrough

`off (default)` | `on`

Select to increase the delay length from zero to the lower limit for the **Input processing** mode:

- For sample-based signals, increase the minimum delay length to 1.
- For frame-based signals, increase the minimum delay length to the frame length.

Selecting this check box prevents direct feedthrough from the input port, u , to the output port. However, this check box cannot prevent direct feedthrough from the initial condition port, x_0 , to the output port.

Dependency

To enable this parameter, set **Delay length: Source** to Input port.

Programmatic Use

Block Parameter: PreventDirectFeedthrough

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Remove delay length check in generated code — Remove delay length out-of-range check

off (default) | on

Select to remove code that checks for out-of-range delay length.

Check Box	Result	When to Use
Selected	Generated code does not include conditional statements to check for out-of-range delay length.	For code efficiency
Cleared	Generated code includes conditional statements to check for out-of-range delay length.	For safety-critical applications

Dependency

To enable this parameter, set **Delay length: Source** to Input port.

Programmatic Use

Block Parameter: RemoveDelayLengthCheckInGeneratedCode

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Diagnostic for delay length — Diagnostic checks for delay length

None (default) | Warning | Error

Specify whether to produce a warning or error when the input d is less than the lower limit or greater than the **Delay length: Upper limit**. The lower limit depends on the setting for **Prevent direct feedthrough**.

- If the check box is cleared, the lower limit is zero.
- If the check box is selected, the lower limit is 1 for sample-based signals and frame length for frame-based signals.

Options for the diagnostic include:

- None — Simulink software takes no action.
- Warning — Simulink software displays a warning and continues the simulation.
- Error — Simulink software terminates the simulation and displays an error.

Dependency

To enable this parameter, set **Delay length: Source** to Input port.

Programmatic Use

Block Parameter: DiagnosticForDelayLength

Type: character vector

Values: 'None' | 'Warning' | 'Error'

Default: 'None'

Show enable port — Create enable port

off (default) | on

Select to control execution of this block with an enable port. The block is considered enabled when the input to this port is nonzero, and is disabled when the input is 0. The value of the input is checked at the same time step as the block execution.

Programmatic Use

Block Parameter: ShowEnablePort

Type: character vector

Values: 'off' | 'on'

Default: 'off'

External reset — External state reset

None (default) | Rising | Falling | Either | Level | Level hold

Specify the trigger event to use to reset the states to the initial conditions.

Reset Mode	Behavior
None	No reset
Rising	Reset on a rising edge
Falling	Reset on a falling edge
Either	Reset on either a rising or falling edge
Level	Reset in either of these cases: <ul style="list-style-type: none"> • When the reset signal is nonzero at the current time step • When the reset signal value changes from nonzero at the previous time step to zero at the current time step
Level hold	Reset when the reset signal is nonzero at the current time step

Programmatic Use

Block Parameter: ExternalReset

Type: character vector

Values: 'None' | 'Rising' | 'Falling' | 'Either' | 'Level' | 'Level hold'

Default: 'None'

Sample time (-1 for inherited) — Discrete interval between sample time hits

-1 (default) | scalar

Specify the time interval between samples. To inherit the sample time, set this parameter to -1. This block supports discrete sample time, but not continuous sample time.

Programmatic Use

Block Parameter: SampleTime

Type: character vector

Value: real scalar

Default: '-1'

State Attributes

State name — Unique name for block state

' ' (default) | alphanumeric string

Use this parameter to assign a unique name to the block state. The default is ' '. When this field is blank, no name is assigned. When using this parameter, remember these considerations:

- A valid identifier starts with an alphabetic or underscore character, followed by alphanumeric or underscore characters.
- The state name applies only to the selected block.

This parameter enables **State name must resolve to Simulink signal object** when you click **Apply**.

For more information, see “C Code Generation Configuration for Model Interface Elements” (Simulink Coder).

Programmatic Use

Block Parameter: StateName

Type: character vector

Values: unique name

Default: ''

State name must resolve to Simulink signal object — Require state name resolve to a signal object

off (default) | on

Select this check box to require that the state name resolves to a Simulink signal object.

Dependencies

To enable this parameter, specify a value for **State name**. This parameter appears only if you set the model configuration parameter **Signal resolution** to a value other than None.

Selecting this check box disables **Code generation storage class**.

Programmatic Use

Block Parameter: StateMustResolveToSignalObject

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Signal object class — Custom storage class package name

Simulink.Signal (default) | <StorageClass.PackageName>

Choose a custom storage class package by selecting a signal object class that the target package defines. For example, to apply custom storage classes from the built-in package `mpt`, select `mpt.Signal`. Unless you use an ERT-based code generation target with Embedded Coder, custom storage classes do not affect the generated code.

To use a storage class package other than the Simulink package, you must load the package into the model's Embedded Coder Dictionary. See “Load Storage Class Packages into Embedded Coder Dictionary” (Embedded Coder).

For information about configuring model data by using storage classes, see “C Code Generation Configuration for Model Interface Elements” (Embedded Coder). For information about custom storage classes, see “Organize Data into Structures in Generated Code” (Embedded Coder).

Programmatic Use

Block Parameter: StateSignalObject

Type: character vector

Values: 'Simulink.Signal' | '<StorageClass.PackageName>'

Default: 'Simulink.Signal'

Code generation storage class — State storage class for code generation

Auto (default) | Model default | ExportedGlobal | ImportedExtern | ImportedExternPointer | BitField (Custom) | Model default | ExportToFile (Custom) | ImportFromFile (Custom) | FileScope (Custom) | AutoScope (Custom) | Struct (Custom) | GetSet (Custom) | Reusable (Custom)

Select state storage class for code generation.

- Auto is the appropriate storage class for states that you do not need to interface to external code.
- *StorageClass* applies the storage class or custom storage class that you select from the list. For information about storage classes, see “C Code Generation Configuration for Model Interface Elements” (Simulink Coder). For information about custom storage classes, see “Organize Parameter Data into a Structure by Using Struct Storage Class” (Embedded Coder).

Use **Signal object class** to select custom storage classes from a package other than Simulink.

Dependencies

To enable this parameter, specify a value for **State name**.

Programmatic Use

Block Parameter: StateStorageClass

Type: character vector

Values: 'Auto' | 'Model default' | 'ExportedGlobal' | 'ImportedExtern' | 'ImportedExternPointer' | 'Custom' | ...

Default: 'Auto'

Block Characteristics

Data Types	Boolean bus double enumerated fixed point half integer single string
Direct Feedthrough	yes
Multidimensional Signals	yes
Variable-Size Signals	yes
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Generated code relies on memcpy or memset functions (string.h) under certain conditions.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

Topics

“Using Enabled Subsystems”

Introduced in R2012b

Variable Pulse Generator

Generate an ideal, time varying pulse signal

Library: Simulink / Discontinuities

Description

Use the Variable Pulse Generator block to create ideal modulated pulse signals.

Generally speaking, the output pulse of the block is described by

$$y(t) = \begin{cases} 1 & t_k < t < t_k + pw \\ 0 & t_{k+1} < t < t_k + pw \end{cases}$$

where pw is the output pulse width.

For an implementation of Pulse Width Modulation, see PWM.

Ports

Input

D — Duty Cycle

scalar

Desired duty cycle of the pulse P , specified as scalar within the range $[0,1]$.

Data Types: double

P — Period

scalar

Time between rising edges of consecutive pulses of the output signal. A smaller value represents a higher frequency pulse.

Data Types: double

Output

Port 1 — Modulated pulse signal

scalar

Modulated output pulse signal corresponding to input duty cycle.

Data Types: double

Parameters

Allow zero pulse width — Allow zero magnitude of output signal

off (default) | on

Enable this parameter to allow the output pulse signal to support pulses of width 0.

Note Enabling this parameter causes the block to have direct feedthrough. This can cause algebraic loops in your model.

Data Types: Boolean

Run at fixed time intervals — Choose continuous or discrete-time behavior

continuous (default) | discrete

Select whether the block should operate in continuous or discrete sampling modes.

By default, the block uses `continuous` sampling mode as it improves simulation performance with variable step solvers.

Select `discrete` sampling mode if you need to:

- use a fixed-step solver
- generate code
- sample the block output

Sampling rate — Set pulse resolution

0.1 (default) | scalar

Specify the rate at which the block samples input duty cycle signal. This sampling rate becomes the resolution of the output pulse signal.

Dependencies

This parameter requires that **Sampling mode** is set to `discrete`

Block Characteristics

Data Types	double
Direct Feedthrough	no
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Algorithms

Continuous Sampling Mode

For a pulse starting at time t_k

$$y(t) = \begin{cases} 1 & t_k < t < t_k + pw \\ 0 & t_{k+1} < t < t_k + pw \end{cases}$$

where pw is the pulse width. For a given period P , pw is proportional to the duty cycle D

$$pw = D(t_k) * P(t_k)$$

Discrete Sampling Mode

In Discrete sampling mode, the input duty cycle signal is sampled at the rate specified by the **Sampling rate** parameter.

For a specified sampling rate t_s , the number of samples needed for a pulse of width pw can be expressed as follows

$$n_{pw} = \left\lceil \frac{D_k \cdot P_k}{T_S} \right\rceil \quad 0 < n_{pw} < n_P$$

$$n_P = \left\lceil \frac{P}{T_S} \right\rceil$$

where n_P is the number of samples needed to simulate a pulse of period P .

Consider a nominal pulse of period P with the sampling rate of the block set to be $t_s = 0.25 P$. The number of samples needed for one period of the pulse, $n_p = 4$. Thus, for the input duty cycle $D = 0.47$, the number of samples n_{pw} is floored to $\left\lfloor \frac{0.47P}{0.25} \right\rfloor = 1$. Therefore, the pulse is high for 1 of the 4 samples in the period.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production-quality code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. The code generated can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code.

In general, consider using the Simulink Model Discretizer to map continuous blocks into discrete equivalents that support production code generation. To start the Model Discretizer, in the Simulink Editor, on the **Apps** tab, under **Apps**, under **Control Systems**, click **Model Discretizer**. One exception is the Second-Order Integrator block because, for this block, the Model Discretizer produces an approximate discretization.

Variable Time Delay

Delay input by variable amount of time

Library: Simulink / Continuous

Description

The Variable Transport Delay and Variable Time Delay blocks appear as two blocks in the Simulink block library. However, they are the same Simulink block with different settings for the **Select delay type** parameter. Use this parameter to specify the mode in which the block operates.

Variable Time Delay

In this mode, the block has a data input, a time delay input, and a data output. (See “Port Location After Rotating or Flipping” for a description of the port order for various block orientations.) The output at the current time step equals the value of its data input at a previous time step. This time step is the current simulation time minus a delay time specified by the time delay input.

$$y(t) = u(t - t_0) = u(t - \tau(t))$$

During the simulation, the block stores time and input value pairs in an internal buffer. At the start of simulation, the block outputs the value of the **Initial output** parameter until the simulation time exceeds the time delay input. Then, at each simulation step, the block outputs the signal at the time that corresponds to the current simulation time minus the delay time.

If you want the output at a time between input storing times and the solver is a continuous solver, the block interpolates linearly between points. If the time delay is smaller than the step size, the block extrapolates an output point from a previous point. For example, consider a fixed-step simulation with a step size of 1 and the current time at $t = 5$. If the delay is 0.5, the block must generate a point at $t = 4.5$, but the most recent stored time value is at $t = 4$. Thus, the block extrapolates the input at 4.5 from the input at 4 and uses the extrapolated value as its output at $t = 5$.

Extrapolating forward from the previous time step can produce a less accurate result than extrapolating back from the current time step. However, the block cannot use the current input to calculate its output value because the input port does not have direct feedthrough.

If the model specifies a discrete solver, the block does not interpolate between time steps. Instead, it returns the nearest stored value that precedes the required value.

Variable Transport Delay

In this mode, the block output at the current time step is equal to the value of its data (top, or left) input at an earlier time step equal to the current time minus a transport delay.

$$y(t) = u(t - t_d(t))$$

Simulink software finds the transport delay, $t_d(t)$, by solving the following equation:

$$\int_{-t_d(t)}^t \frac{1}{t_i(\tau)} d\tau = 1$$

This equation involves an instantaneous time delay, $t_i(t)$, given by the time delay (bottom, or right) input.

Suppose that you want to use this block to model the fluid flow through a pipe where the fluid speed varies with time. In this case, the time delay input to the block is

$$t_i(t) = \frac{L}{v_i(t)}$$

where L is the length of the pipe and $v_i(t)$ is the speed of the fluid.

Ports

Input

Port_1 – Input signal

scalar | vector | matrix

Input signal specified as a scalar, vector, or matrix.

Data Types: double

t_0 – Time delay input

scalar | vector | matrix

Time delay input specified as a scalar, vector, or matrix. When the block is in **Variable time delay** mode, this value specifies the time delay. For more information about that calculation, see “Variable Time Delay” on page 1-1807.

Dependencies

To enable this port, set **Select delay type** to **Variable time delay**.

Data Types: double

t_i – Instantaneous time delay input

scalar | vector | matrix

Instantaneous time delay input specified as a scalar, vector, or matrix. When the block is in **Variable transport delay** mode, this value is used to calculate the transport delay. For more information about that calculation, see “Variable Transport Delay” on page 1-1807.

Dependencies

To enable this port, set **Select delay type** to `Variable transport delay`.

Data Types: `double`

Output**Port_1 – Delayed signal**

`scalar` | `vector` | `matrix`

Output signal specified as a scalar, vector, or matrix.

Data Types: `double`

Parameters**Select delay type – Type of delay**

`Variable time delay` | `Variable transport delay`

Specify the type of delay as `Variable time delay` or `Variable transport delay`.

The default value of this parameter depends on the block implementation: `Variable time delay` for the Variable Time Delay block, and `Variable transport delay` for the Variable Transport Delay block.

Dependencies

- Setting this parameter to `Variable time delay` enables the **Handle zero delay** parameter.
- Setting this parameter to `Variable transport delay` enables the **Absolute tolerance** and **State Name** parameters.

Programmatic Use

Block Parameter: `VariableDelayType`

Type: character vector, string

Values: `'Variable transport delay'` | `'Variable time delay'`

Maximum delay – Maximum value of time delay input

`10` (default) | `scalar` | `vector`

Set the maximum value of the time delay input. This value defines the largest time delay input that this block allows. The block clips any delay that exceeds this value. This value cannot be negative. If the time delay becomes negative, the block clips it to zero and issues a warning message.

Programmatic Use

Block Parameter: `MaximumDelay`

Type: character vector, string

Value: `scalar` | `vector`

Default: `'10'`

Initial output – Initial output

`0` (default) | `scalar` | `vector`

Specify the output that the block generates until the simulation time first exceeds the time delay input.

Dependencies

- The initial output of this block cannot be `inf` or `NaN`.
- A Run-to-run tunable parameter cannot be changed during simulation run time. However, changing it before a simulation begins does not cause Accelerator or Rapid Accelerator to regenerate code.

Programmatic Use**Block Parameter:** `InitialOutput`**Type:** character vector, string**Values:** scalar | vector**Default:** `'0'`**Initial buffer size — Initial memory allocation**

1024 (default) | scalar

Define the initial memory allocation for the number of input points to store. The input points define the history of the input signal up to the current simulation time.

- If the number of input points exceeds the initial buffer size, the block allocates additional memory.
- After simulation ends, a message displays if the buffer is not sufficient and more memory must be allocated.

Tips

- Because allocating memory slows down simulation, choose this value carefully if simulation speed is an issue.
- For long time delays, this block might use a large amount of memory, particularly for dimensionalized input.

Programmatic Use**Block Parameter:** `MaximumPoints`**Type:** character vector, string**Values:** scalar | vector**Default:** `'1024'`**Use fixed buffer size — Use fixed-size buffer**

off (default) | on

Selecting this check box uses a fixed-size buffer to save input data from previous time steps. When you clear this check box, the block does not use a fixed-size buffer.

The **Initial buffer size** parameter specifies the buffer size. If the buffer is full, new data replaces data already in the buffer. Simulink software uses linear extrapolation to estimate output values that are not in the buffer.

Note ERT or GRT code generation uses a fixed-size buffer even if you do not select this check box.

Tips

- If the input data is linear, selecting this check box can save memory.
- If the input data is nonlinear, do not select this check box. Doing so might yield inaccurate results.

Programmatic Use**Block Parameter:** FixedBuffer**Type:** character vector, string**Values:** 'off' | 'on'**Default:** 'off'**Handle zero delay — Use direct feedthrough**

off (default) | on

Selecting this check box converts this block to a direct feedthrough block. When you clear this check box, the block does not use direct feedthrough.

Dependencies

To enable this parameter, set **Select delay type** to Variable time delay.

Programmatic Use**Block Parameter:** ZeroDelay**Type:** character vector, string**Values:** 'off' | 'on'**Default:** 'off'**Direct feedthrough of input during linearization — Use direct feedthrough during linearization**

off (default) | on

When you select this parameter, the block outputs its input during linearization and trim, which sets the block mode to direct feedthrough. To disable direct feedthrough, clear this check box.

Tips

- Selecting this check box can cause a change in the ordering of states in the model when you use the functions `linmod`, `dlinmod`, or `trim`. To extract this new state ordering:
 - 1 Compile the model using the following command, where `model` is the name of the Simulink model.

```
[sizes, x0, x_str] = model([],[],[],'lincompile');
```
 - 2 Terminate the compilation with the following command.

```
model([],[],[],'term');
```
- The output argument `x_str`, which is a cell array of the states in the Simulink model, contains the new state ordering. When you pass a vector of states as input to the `linmod`, `dlinmod`, or `trim` functions, the state vector must use this new state ordering.

Programmatic Use**Block Parameter:** TransDelayFeedthrough**Type:** character vector, string**Values:** 'off' | 'on'**Default:** 'off'**Pade order (for linearization) — Order of Pade approximation**

0 (default) | scalar

Set the order of the Pade approximation for linearization routines.

- The default value is 0, which results in a unity gain with no dynamic states.
- Setting the order to a positive integer n adds n states to your model, but results in a more accurate linear model of the transport delay.

Programmatic Use**Block Parameter:** PadeOrder**Type:** character vector, string**Values:** scalar**Default:** '0'**Absolute tolerance – Absolute tolerance for computing block state**

auto (default) | positive, real, scalar or vector

Specify the absolute tolerance for computing the block state.

Dependencies

To enable this parameter, set **Select delay type** to Variable transport delay.

Programmatic Use**Block Parameter:** AbsoluteTolerance**Type:** character vector, string**Values:** 'auto' | '-1' | any positive real scalar or vector**Default:** 'auto'**State Name (e.g., 'position') – Unique name for each state**

' ' (default) | character vector, string

Assign a unique name to each state. If this field is blank, no name assignment occurs.

Tips

- To assign a name to a single state, enter the name between quotes, for example, 'velocity'.
- To assign names to multiple states, enter a comma-delimited list surrounded by braces, for example, {'a', 'b', 'c'}. Each name must be unique.
- The state names apply only to the selected block.
- The number of states must divide evenly among the number of state names.
- You can specify fewer names than states, but you cannot specify more names than states.

For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states.

- To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, string, cell array, or structure.

Dependencies

To enable this parameter, set **Select delay type** to Variable transport delay.

Programmatic Use**Block Parameter:** ContinuousStateAttributes**Type:** character vector, string**Values:** ' ' | user-defined character vector, user-defined string**Default:** ' '

Block Characteristics

Data Types	double
Direct Feedthrough	yes
Multidimensional Signals	no

Variable Transport Delay

Delay input by variable amount of time

Library: Simulink / Continuous

Description

The Variable Transport Delay and Variable Time Delay blocks appear as two blocks in the Simulink block library. However, they are the same Simulink block with different settings for the **Select delay type** parameter. Use this parameter to specify the mode in which the block operates.

Variable Transport Delay

In this mode, the block output at the current time step is equal to the value of its data (top, or left) input at an earlier time step equal to the current time minus a transport delay.

$$y(t) = u(t - t_d(t))$$

Simulink software finds the transport delay, $t_d(t)$, by solving the following equation:

$$\int_{-t_d(t)}^t \frac{1}{t_i(\tau)} d\tau = 1$$

This equation involves an instantaneous time delay, $t_i(t)$, given by the time delay (bottom, or right) input.

Suppose that you want to use this block to model the fluid flow through a pipe where the fluid speed varies with time. In this case, the time delay input to the block is

$$t_i(t) = \frac{L}{v_i(t)}$$

where L is the length of the pipe and $v_i(t)$ is the speed of the fluid.

Variable Time Delay

In this mode, the block has a data input, a time delay input, and a data output. (See “Port Location After Rotating or Flipping” for a description of the port order for various block orientations.) The output at the current time step equals the value of its data input at a previous time step. This time step is the current simulation time minus a delay time specified by the time delay input.

$$y(t) = u(t - t_0) = u(t - \tau(t))$$

During the simulation, the block stores time and input value pairs in an internal buffer. At the start of simulation, the block outputs the value of the **Initial output** parameter until the simulation time exceeds the time delay input. Then, at each simulation step, the block outputs the signal at the time that corresponds to the current simulation time minus the delay time.

If you want the output at a time between input storing times and the solver is a continuous solver, the block interpolates linearly between points. If the time delay is smaller than the step size, the block extrapolates an output point from a previous point. For example, consider a fixed-step simulation with a step size of 1 and the current time at $t = 5$. If the delay is 0.5, the block must generate a point at $t = 4.5$, but the most recent stored time value is at $t = 4$. Thus, the block extrapolates the input at 4.5 from the input at 4 and uses the extrapolated value as its output at $t = 5$.

Extrapolating forward from the previous time step can produce a less accurate result than extrapolating back from the current time step. However, the block cannot use the current input to calculate its output value because the input port does not have direct feedthrough.

If the model specifies a discrete solver, the block does not interpolate between time steps. Instead, it returns the nearest stored value that precedes the required value.

Ports

Input

Port_1 — Input signal

scalar | vector | matrix

Input signal specified as a scalar, vector, or matrix.

Data Types: double

t_0 — Time delay input

scalar | vector | matrix

Time delay input specified as a scalar, vector, or matrix. When the block is in **Variable time delay** mode, this value specifies the time delay. For more information about that calculation, see “Variable Time Delay” on page 1-1814.

Dependencies

To enable this port, set **Select delay type** to **Variable time delay**.

Data Types: double

t_i — Instantaneous time delay input

scalar | vector | matrix

Instantaneous time delay input specified as a scalar, vector, or matrix. When the block is in **Variable transport delay** mode, this value is used to calculate the transport delay. For more information about that calculation, see “Variable Transport Delay” on page 1-1814.

Dependencies

To enable this port, set **Select delay type** to `Variable transport delay`.

Data Types: `double`

Output**Port_1 – Delayed signal**

`scalar` | `vector` | `matrix`

Output signal specified as a scalar, vector, or matrix.

Data Types: `double`

Parameters**Select delay type – Type of delay**

`Variable time delay` | `Variable transport delay`

Specify the type of delay as `Variable time delay` or `Variable transport delay`.

The default value of this parameter depends on the block implementation: `Variable time delay` for the Variable Time Delay block, and `Variable transport delay` for the Variable Transport Delay block.

Dependencies

- Setting this parameter to `Variable time delay` enables the **Handle zero delay** parameter.
- Setting this parameter to `Variable transport delay` enables the **Absolute tolerance** and **State Name** parameters.

Programmatic Use

Block Parameter: `VariableDelayType`

Type: character vector, string

Values: `'Variable transport delay'` | `'Variable time delay'`

Maximum delay – Maximum value of time delay input

`10` (default) | `scalar` | `vector`

Set the maximum value of the time delay input. This value defines the largest time delay input that this block allows. The block clips any delay that exceeds this value. This value cannot be negative. If the time delay becomes negative, the block clips it to zero and issues a warning message.

Programmatic Use

Block Parameter: `MaximumDelay`

Type: character vector, string

Value: `scalar` | `vector`

Default: `'10'`

Initial output – Initial output

`0` (default) | `scalar` | `vector`

Specify the output that the block generates until the simulation time first exceeds the time delay input.

Dependencies

- The initial output of this block cannot be `inf` or `NaN`.
- A Run-to-run tunable parameter cannot be changed during simulation run time. However, changing it before a simulation begins does not cause Accelerator or Rapid Accelerator to regenerate code.

Programmatic Use**Block Parameter:** `InitialOutput`**Type:** character vector, string**Values:** scalar | vector**Default:** `'0'`**Initial buffer size — Initial memory allocation**

1024 (default) | scalar

Define the initial memory allocation for the number of input points to store. The input points define the history of the input signal up to the current simulation time.

- If the number of input points exceeds the initial buffer size, the block allocates additional memory.
- After simulation ends, a message displays if the buffer is not sufficient and more memory must be allocated.

Tips

- Because allocating memory slows down simulation, choose this value carefully if simulation speed is an issue.
- For long time delays, this block might use a large amount of memory, particularly for dimensionalized input.

Programmatic Use**Block Parameter:** `MaximumPoints`**Type:** character vector, string**Values:** scalar | vector**Default:** `'1024'`**Use fixed buffer size — Use fixed-size buffer**

off (default) | on

Selecting this check box uses a fixed-size buffer to save input data from previous time steps. When you clear this check box, the block does not use a fixed-size buffer.

The **Initial buffer size** parameter specifies the buffer size. If the buffer is full, new data replaces data already in the buffer. Simulink software uses linear extrapolation to estimate output values that are not in the buffer.

Note ERT or GRT code generation uses a fixed-size buffer even if you do not select this check box.

Tips

- If the input data is linear, selecting this check box can save memory.
- If the input data is nonlinear, do not select this check box. Doing so might yield inaccurate results.

Programmatic Use**Block Parameter:** FixedBuffer**Type:** character vector, string**Values:** 'off' | 'on'**Default:** 'off'**Handle zero delay — Use direct feedthrough**

off (default) | on

Selecting this check box converts this block to a direct feedthrough block. When you clear this check box, the block does not use direct feedthrough.

Dependencies

To enable this parameter, set **Select delay type** to Variable time delay.

Programmatic Use**Block Parameter:** ZeroDelay**Type:** character vector, string**Values:** 'off' | 'on'**Default:** 'off'**Direct feedthrough of input during linearization — Use direct feedthrough during linearization**

off (default) | on

When you select this parameter, the block outputs its input during linearization and trim, which sets the block mode to direct feedthrough. To disable direct feedthrough, clear this check box.

Tips

- Selecting this check box can cause a change in the ordering of states in the model when you use the functions `linmod`, `dlinmod`, or `trim`. To extract this new state ordering:

- 1 Compile the model using the following command, where `model` is the name of the Simulink model.

```
[sizes, x0, x_str] = model([],[],[],'lincompile');
```

- 2 Terminate the compilation with the following command.

```
model([],[],[],'term');
```

- The output argument `x_str`, which is a cell array of the states in the Simulink model, contains the new state ordering. When you pass a vector of states as input to the `linmod`, `dlinmod`, or `trim` functions, the state vector must use this new state ordering.

Programmatic Use**Block Parameter:** TransDelayFeedthrough**Type:** character vector, string**Values:** 'off' | 'on'**Default:** 'off'**Pade order (for linearization) — Order of Pade approximation**

0 (default) | scalar

Set the order of the Pade approximation for linearization routines.

- The default value is 0, which results in a unity gain with no dynamic states.
- Setting the order to a positive integer n adds n states to your model, but results in a more accurate linear model of the transport delay.

Programmatic Use**Block Parameter:** PadeOrder**Type:** character vector, string**Values:** scalar**Default:** '0'**Absolute tolerance – Absolute tolerance for computing block state**

auto (default) | positive, real, scalar or vector

Specify the absolute tolerance for computing the block state.

DependenciesTo enable this parameter, set **Select delay type** to Variable transport delay.**Programmatic Use****Block Parameter:** AbsoluteTolerance**Type:** character vector, string**Values:** 'auto' | '-1' | any positive real scalar or vector**Default:** 'auto'**State Name (e.g., 'position') – Unique name for each state**

' ' (default) | character vector, string

Assign a unique name to each state. If this field is blank, no name assignment occurs.

Tips

- To assign a name to a single state, enter the name between quotes, for example, 'velocity'.
- To assign names to multiple states, enter a comma-delimited list surrounded by braces, for example, {'a', 'b', 'c'}. Each name must be unique.
- The state names apply only to the selected block.
- The number of states must divide evenly among the number of state names.
- You can specify fewer names than states, but you cannot specify more names than states.

For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states.

- To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, string, cell array, or structure.

DependenciesTo enable this parameter, set **Select delay type** to Variable transport delay.**Programmatic Use****Block Parameter:** ContinuousStateAttributes**Type:** character vector, string**Values:** ' ' | user-defined character vector, user-defined string**Default:** ' '

Variant Sink

Route amongst multiple outputs using Variants

Library: Simulink / Signal Routing

Description

The Variant Sink block has one input port and one or more output ports. You can define Variant choices as blocks that are connected to the output port so that, at most, one choice is active.

Each output port is associated with a Variant control. The Variant control that evaluates to `true`, determines which output port is active.

During simulation, Simulink connects the active choice directly to the input port of the Variant Sink block and ignores the inactive choices.

Ports

Input

Port_1 – Input signal

scalar | vector | matrix

Input signal, specified as a scalar, vector, or matrix, to be connected to the active output port.

Data Types: `single` | `double` | `half` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point` | `enumerated` | `bus` | `struct`

Output

Port_1 – Output from first Variant

scalar | vector | matrix

Output signal from the first Variant. The Variant control that evaluates to `true`, determines which output port is active.

Data Types: `single` | `double` | `half` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point` | `enumerated` | `bus`

Port_N – Output from Nth Variant

scalar | vector | matrix

Output signal from the Nth Variant. The Variant control that evaluates to `true`, determines which output port is active.

Data Types: `single` | `double` | `half` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

Variant control mode — Name of Variant control mode

`expression` (default) | `label` | `sim codegen switching`

- `expression`— To choose the active Variant based on the evaluation of the Variant conditions, use `expression` mode. The Variant control variables used in the Variant condition must be created in a global workspace or in a data dictionary.
- `label`— To choose the active Variant based on the name of the Variant you specify in the **Label mode active choice** parameter, use `label` mode. In `label` mode, the Variant control is a string and does not need to be created in any workspaces.

When you select `label` mode, the Variant badge indicates the change.

Note When you promote the **Label mode active choice** parameter to a mask, **Variant control mode** is disabled.

- If the block is in `expression` mode while promoting the **Label mode active choice** parameter to a mask, you can change the **Variant control mode** to `label` by changing the promoted **Label mode active choice** parameter from the Mask dialog box.
- If the block is in `label` mode while promoting the **Label mode active choice** parameter to a mask, you cannot change the **Variant control mode** to `expression` mode.

For information about promoting parameters to masks, see “Promote Parameter to Mask”.

- `sim codegen switching`— To automatically switch between the Variants for simulation and code generation workflows, use `sim codegen switching` mode. When you simulate (Normal, Accelerator, Rapid Accelerator) a model, then Simulink automatically chooses the `sim` branch as the active choice. Similarly, when you do a Software-in-the-loop (SIL), Processor-In-Loop (PIL) simulation or generate code or use external mode, Simulink automatically chooses the `codegen` branch.

When you set this parameter to different values, the Variant badge changes as shown in “Variant Badges”.

Dependencies

The **Variant activation time** parameter is available only when you set the **Variant control mode** parameter to `expression` or `sim codegen switching`.

Variant activation time — Determine when Simulink chooses active variant choice

`update diagram` (default) | `update diagram analyze all choices` | `code compile`

This parameter determines if Simulink sets the active choice of a Variant Sink block during `update diagram` or `code compile`. This parameter also determines which variability to include in the

generated code for ERT targets. If you choose to include all the Variant choices, the choices are enclosed within C preprocessor conditional statements (`#if` and `#endif`) in the generated code.

When you set this parameter to different values, the variant badge changes as shown in “Variant Badges”.

You can set the **Variant activation time** parameter as:

- `update diagram`— Simulink sets the active choice during update diagram before the propagation of signal attributes. Inactive choices are removed prior to propagation of signal attributes, so the generated code contains only active choice.
- `update diagram analyze all choices`— Simulink sets the active choice during update diagram after the propagation of signal attributes. Signal attributes are propagated to both active and inactive choices. All choices are analyzed to ensure consistency of all variant branches between the results of simulation and code generation. Inactive choices are removed at the end of update diagram before model start occurs. The generated code contains only active choices. This workflow remains the same for simulation and code generation.
- `code compile`— For simulation, the workflow is same as the `update diagram analyze all choices`. However, the inactive choices are not removed during code generation. The generated code contains active and inactive choices, and the choices are enclosed in C preprocessor conditional statements, `#if` and `#endif`.

This figure shows the Variant activation time for the different values you specify in this parameter.

For more information, see “Represent Variant Source and Sink Blocks in Generated Code” (Embedded Coder).

Dependencies

- When you set the **Variant control mode** to `expression`, this parameter can be set to `update diagram`, `update diagram analyze all choices`, or `code compile`.
- When you set the **Variant control mode** to `sim codegen switching`, this parameter can be set to either `update diagram` or `update diagram analyze all choices`. The `code compile` option becomes unavailable.

Programmatic Use

Block Parameter: `VariantActivationTime`

Type: character vector

Values: `update diagram` | `update diagram analyze all choices` | `code compile`

Default: `update diagram`

Port — Number of connected input port

no default

Number of the input port that is connected to one Variant choice upstream of the Variant Sink block. This value is read-only.

Click  to add a port or  to delete an existing one.

Variant control expression — Variant controls available in the global workspace

'Variant' (default) | boolean condition expression | Simulink.Variant object | Simulink.Parameter object | enum

Displays the Variant controls available in the global workspace. The Variant control can be a Boolean condition expression or a Simulink.Variant object representing a Boolean condition expression. If you want to generate code for your model, you must define the control variables as MATLAB variables.

To enter non-numeric Variant control values, use enumerated data. For information about using enumerated data, see “Use Enumerated Data in Simulink Models”

To enter a Variant name, double-click a **Variant control expression** cell in a new row and type in the Variant control expression. Click **Apply** after you edit a Variant control name. If you add or delete a Variant control without applying the changes, the previous edits on the Variant control name are lost.

Programmatic Use

Block Parameter: VariantControls

Type: cell array of character vectors

Values: Variant control that is associated with the Variant choice

Default: 'Variant'

Condition (read-only) — Condition for Variant controls

no default

Displays the **Condition** for the Variant controls that are Simulink.Variant objects. Create or change a Variant condition in the Simulink.Variant parameter dialog box or in the global workspace.

For more information, see “Create Variant Controls Programmatically” and Simulink.Variant.

Label mode active choice — Name of Variant to use if Label control mode is selected

Choice_1 (default) | name of variant control

When you select the **Variant control mode** as Label, the **Label mode active choice** option is available. You can select an active Variant choice from **Label mode active choice** options. You can also right-click the badge on the Variant Sink block and select **Label Mode Active Choice**.

The **Label mode active choice** drop-down list displays all Variant controls that are currently defined in the global workspace or a data dictionary. Use valid MATLAB identifiers to specify Variant controls. For more information, see Simulink.Variant.

Note **Label mode active choice** option is not available in Expression mode.

Dependencies

To enable this parameter, select Label mode.

Programmatic Use

Block Parameter: LabelModeActivechoice

Type: character vector

Values: Specified by the Variant control expression

Default: Choice_1

Allow zero active variant controls – Simulate model without active Variant choice

off (default) | on

To simulate a model (containing a Variant block) without an active Variant choice, select the **Allow zero active variant controls** option. When this option is selected and there is no active Variant choice, Simulink disables all the blocks connected to the input and output stream of Variant Sink block. The removed blocks are ignored from update diagram or simulation.

If you do not select this option, Simulink generates an error when there is no active Variant choice.

When you select this option, the Variant badge indicates the change.

Dependencies

Expression option from **Variant control mode** is selected.

Programmatic Use

Block Parameter: AllowZeroVariantControls

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Show variant condition on block – Annotate block ports

off (default) | on

When you select this option, Simulink annotates each Variant control (condition expression) on the Variant Sink block ports.

Programmatic Use

Block Parameter: ShowConditionOnBlock

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Block Characteristics

Variant Source

Route among multiple inputs using Variants

Library: Simulink / Signal Routing

Description

The Variant Source block has one or more input ports and one output port. You can define Variant choices as blocks that are connected to the input port so that, at most, one choice is active.

Each input port is associated with a Variant control. The Variant control that evaluates to `true`, determines which input port is active.

When the **Variant activation time** option in the block dialog box is set to `update diagram`, then during simulation Simulink connects the active choice directly to the output port of the Variant Source block and ignores the inactive choices.

Ports

Input

Port_1 — Input port associated with first Variant control

scalar | vector | matrix

Input port associated with the first Variant control. The Variant control that evaluates to `true`, determines which input port is active.

Data Types: `single` | `double` | `half` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point` | `enumerated` | `bus`

Port_N — Input port associated with Nth Variant control

scalar | vector | matrix

Input port associated with the Nth Variant control. The Variant control that evaluates to `true`, determines which input port is active.

Data Types: `single` | `double` | `half` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point` | `enumerated` | `bus`

Output

Port_1 — Output of active Variant

scalar | vector | matrix

Output signal from the active Variant.

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Parameters

Variant control mode — Name of Variant control mode

expression (default) | label | sim codegen switching

- **expression**— To choose the active Variant based on the evaluation of the Variant conditions, use **expression** mode. The Variant control variables used in the Variant condition must be created in a global workspace or in a data dictionary.
- **label**— To choose the active Variant based on the name of the Variant you specify in the **Label mode active choice** parameter, use **label** mode. In **label** mode, the Variant control is a string and does not need to be created in any workspaces.

When you select **label** mode, the Variant badge indicates the change.

Note When you promote the **Label mode active choice** parameter to a mask, **Variant control mode** is disabled.

- If the block is in **expression** mode while promoting the **Label mode active choice** parameter to a mask, you can change the **Variant control mode** to **label** by changing the promoted **Label mode active choice** parameter from the Mask dialog box.
- If the block is in **label** mode while promoting the **Label mode active choice** parameter to a mask, you cannot change the **Variant control mode** to **expression** mode.

For information about promoting parameters to masks, see “Promote Parameter to Mask”.

- **sim codegen switching**— To automatically switch between the Variants for simulation and code generation workflows, use **sim codegen switching** mode. When you simulate (Normal, Accelerator, Rapid Accelerator) a model, then Simulink automatically chooses the **sim** branch as the active choice. Similarly, when you do a Software-in-the-loop (SIL), Processor-In-Loop (PIL) simulation or generate code or use external mode, Simulink automatically chooses the **codegen** branch.

When you set this parameter to different values, the Variant badge changes as shown in “Variant Badges”.

Dependencies

The **Variant activation time** parameter is available only when you set the **Variant control mode** parameter to **expression** or **sim codegen switching**.

Variant activation time — Determine when Simulink chooses active variant choice

update diagram (default) | update diagram analyze all choices | code compile

This parameter determines if Simulink sets the active choice of a Variant Source block during update diagram or code compile. This parameter also determines which variability to include in the

generated code for ERT targets. If you choose to include all the Variant choices, the choices are enclosed within C preprocessor conditional statements (`#if` and `#endif`) in the generated code.

When you set this parameter to different values, the variant badge changes as shown in “Variant Badges”.

You can set the **Variant activation time** parameter as:

- `update diagram`— Simulink sets the active choice during update diagram before the propagation of signal attributes. Inactive choices are removed prior to propagation of signal attributes, so the generated code contains only active choice.
- `update diagram analyze all choices`— Simulink sets the active choice during update diagram after the propagation of signal attributes. Signal attributes are propagated to both active and inactive choices. All choices are analyzed to ensure consistency of all variant branches between the results of simulation and code generation. Inactive choices are removed at the end of update diagram before model start occurs. The generated code contains only active choices. This workflow remains the same for simulation and code generation.
- `code compile`— For simulation, the workflow is same as the `update diagram analyze all choices`. However, the inactive choices are not removed during code generation. The generated code contains active and inactive choices, and the choices are enclosed in C preprocessor conditional statements, `#if` and `#endif`.

This figure shows the Variant activation time for the different values you specify in this parameter.

For more information, see “Represent Variant Source and Sink Blocks in Generated Code” (Embedded Coder).

Dependencies

- When you set the **Variant control mode** to `expression`, this parameter can be set to `update diagram`, `update diagram analyze all choices`, or `code compile`.
- When you set the **Variant control mode** to `sim codegen switching`, this parameter can be set to either `update diagram` or `update diagram analyze all choices`. The `code compile` option becomes unavailable.

Programmatic Use

Block Parameter: `VariantActivationTime`

Type: character vector

Values: `update diagram` | `update diagram analyze all choices` | `code compile`

Default: `update diagram`

Port — Number of connected input port

no default

Number of the input port that is connected to one Variant choice upstream of the Variant Source block. This value is read-only.

Click  to add a port or  to delete an existing one.

Variant control expression — Variant controls available in the global workspace

'Variant' (default) | boolean condition expression | Simulink.Variant object | Simulink.Parameter object | enum

Displays the Variant controls available in the global workspace. The Variant control can be a Boolean condition expression or a Simulink.Variant object representing a Boolean condition expression. If you want to generate code for your model, you must define the control variables as Simulink.Parameter objects.

To enter non-numeric Variant control values, use enumerated data. For information about using enumerated data, see “Use Enumerated Data in Simulink Models”

To edit a Variant name, double-click a **Variant control expression** cell and type in the Variant control expression. Click **Apply** after you edit a Variant control name. If you add or delete a Variant control without applying the changes, the previous edits on the Variant control name are lost.

The **Variant control** that evaluates to true determines which input port must be active.

Programmatic Use

Block Parameter: VariantControls

Type: cell array of character vectors

Value: Variant control that is associated with the Variant choice

Default: 'Variant'

Condition (read-only) — Condition for Variant controls

no default

Displays the **Condition** for the Variant controls that are Simulink.Variant objects. Create or change a Variant condition in the Simulink.Variant parameter dialog box or in the global workspace.

For more information, see “Create Variant Controls Programmatically” and Simulink.Variant.

Label mode active choice — Name of Variant to use if Label control mode is selected

Choice_1 (default) | name of Variant control

When you select the **Variant control mode** as Label, the **Label mode active choice** option is available. You can select an active Variant choice from **Label mode active choice** options. You can also right-click the badge on the Variant Source block and select **Label Mode Active Choice**.

The **Label mode active choice** drop-down list displays all Variant controls that are currently defined in the global workspace or a data dictionary. Use valid MATLAB identifiers to specify Variant controls. For more information, see Simulink.Variant.

Note **Label mode active choice** option is not available in Expression mode.

Dependencies

To enable this parameter, select Label mode.

Programmatic Use

Block Parameter: LabelModeActivechoice

Type: character vector

Value: Specified by the Variant control expression.

Default: Choice_1

Allow zero active variant controls – Simulate model without active Variant choice

off (default) | on

To simulate a model (containing a Variant block) without an active Variant choice, select the **Allow zero active variant controls** option. When this option is selected and there is no active Variant choice, Simulink disables all the blocks connected to the input and output stream of Variant Source block. The removed blocks are ignored from update diagram or simulation.

If you do not select this option, Simulink generates an error when there is no active Variant choice.

When you select this option, the Variant badge indicates the change.

Dependencies

Expression option from **Variant control mode** is selected.

Programmatic Use

Block Parameter: AllowZeroVariantControls

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Show variant condition on block – Annotate block ports

off (default) | on

When you select this option, Simulink annotates each Variant control (condition expression) on the Variant Source block ports.

Programmatic Use

Block Parameter: ShowConditionOnBlock

Type: character vector

Value: 'off' | 'on'

Default: 'off'

Block Characteristics

Data Types	Boolean bus double enumerated fixed point half integer single string
Direct Feedthrough	no
Multidimensional Signals	no
Variable-Size Signals	no

Zero-Crossing Detection	no

Variant Subsystem, Variant Model

Template subsystem containing Subsystem blocks or Model blocks as Variant choices

Library: Simulink / Ports & Subsystems
HDL Coder / Ports & Subsystems

Description

The Variant Subsystem block can have at most one active choice for simulation. The Variant Subsystem block is a template preconfigured to contain two Subsystem blocks to use as Variant Subsystem choices.

A Variant Subsystem block can contain a mixture of Subsystem and Model blocks as Variant systems. This can also include Inport, Outport, and Connection Port blocks. There are no drawn connections inside the Variant Subsystem blocks.

A Variant Subsystem block with Model blocks as choices, is called Variant Model block.

Each Variant system is associated with a Variant control that is created in the global workspace. The Variant control determines which Variant system is active. The Variant control can be a condition expression, a `Simulink.Variant` object specifying a condition expression, or a default Variant. The Variant control that evaluates to `true` determines the active Variant.

When you select the **Specify output when source is unconnected** option in the Outport block that is in a Variant Subsystem block, you can specify a non-ground value as its output.

Note You must specify the correct data type in the **Signal Attributes** section of the Outport block dialog box.

Ports

During simulation, Simulink disables the inactive ports in a Variant Subsystem block.

Input

In_1 — Input port corresponding to root-level Inport blocks contained in Variant Subsystem
same data types accepted by Inport blocks

Each Subsystem or Model block contained within a Variant Subsystem represents one Variant system. If the inport names on a Variant system are a subset of the inport names used by the Variant Subsystem container block, then Variant system blocks can have different numbers of inports than the Variant Subsystem block has.

Output

Out_1 — Output port corresponding to root-level Output blocks contained in Variant Subsystem

same data types accepted by Output blocks

Each Subsystem or Model block contained within a Variant Subsystem represents one Variant system. If the output port names on a Variant system are a subset of the output port names used by the Variant Subsystem block, then Variant system blocks can have different numbers of outputs than the Variant Subsystem block has.

Parameters

Variant control mode — Name of Variant control mode

expression (default) | label | sim codegen switching

- **expression**— To choose the active Variant based on the evaluation of the Variant conditions, use **expression mode**. The Variant control variables used in the Variant condition must be created in a global workspace or in a data dictionary.
- **label**— To choose the active Variant based on the name of the Variant you specify in the **Label mode active choice** parameter, use **label mode**. In **label mode**, the Variant control is a string and does not need to be created in any workspaces.

When you select **label mode**, the Variant badge indicates the change.

Note When you promote the **Label mode active choice** parameter to a mask, **Variant control mode** is disabled.

- If the block is in **expression mode** while promoting the **Label mode active choice** parameter to a mask, you can change the **Variant control mode** to **label** by changing the promoted **Label mode active choice** parameter from the Mask dialog box.
- If the block is in **label mode** while promoting the **Label mode active choice** parameter to a mask, you cannot change the **Variant control mode** to **expression mode**.

For information about promoting parameters to masks, see “Promote Parameter to Mask”.

- **sim codegen switching**— To automatically switch between the Variants for simulation and code generation workflows, use **sim codegen switching mode**. When you simulate (Normal, Accelerator, Rapid Accelerator) a model, then Simulink automatically chooses the **sim** branch as the active choice. Similarly, when you do a Software-in-the-loop (SIL), Processor-In-Loop (PIL) simulation or generate code or use external mode, Simulink automatically chooses the **codegen** branch.

When you set this parameter to different values, the Variant badge changes as shown in “Variant Badges”.

Dependencies

The **Variant activation time** parameter is available only when you set the **Variant control mode** parameter to **expression** or **sim codegen switching**.

Variant activation time — Determine when Simulink chooses active variant choice

update diagram (default) | update diagram analyze all choices | code compile

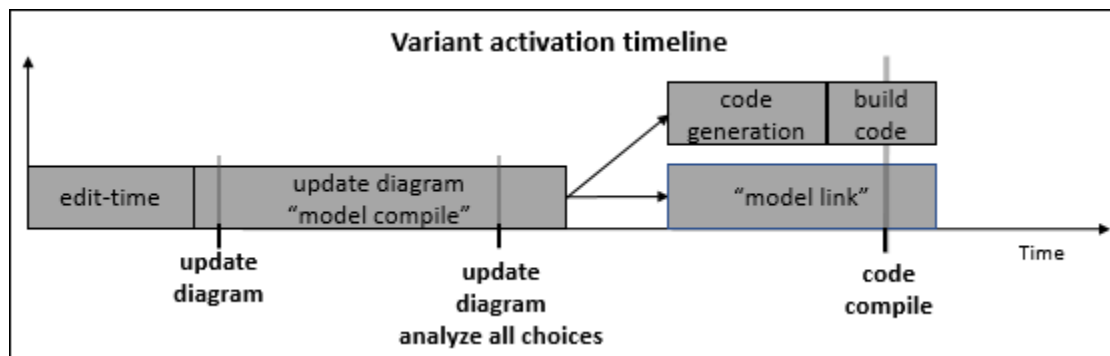

This parameter determines if Simulink sets the active choice of a Variant Subsystem block during update diagram or code compile. This parameter also determines which variability to include in the generated code for ERT targets. If you choose to include all the Variant choices, the choices are enclosed within C preprocessor conditional statements (`#if` and `#endif`) in the generated code.

When you set this parameter to different values, the variant badge changes as shown in “Variant Badges”.

You can set the **Variant activation time** parameter as:

- **update diagram**— Simulink sets the active choice during update diagram before the propagation of signal attributes. Inactive choices are removed prior to propagation of signal attributes, so the generated code contains only active choice.
- **update diagram analyze all choices**— Simulink sets the active choice during update diagram after the propagation of signal attributes. Signal attributes are propagated to both active and inactive choices. All choices are analyzed to ensure consistency of all variant branches between the results of simulation and code generation. Inactive choices are removed at the end of update diagram before model start occurs. The generated code contains only active choices. This workflow remains the same for simulation and code generation.
- **code compile**— For simulation, the workflow is same as the **update diagram analyze all choices**. However, the inactive choices are not removed during code generation. The generated code contains active and inactive choices, and the choices are enclosed in C preprocessor conditional statements, `#if` and `#endif`.

This figure shows the Variant activation time for the different values you specify in this parameter.

For more information, see “Represent Variant Source and Sink Blocks in Generated Code” (Embedded Coder).

Dependencies

- When you set the **Variant control mode** to `expression`, this parameter can be set to `update diagram`, `update diagram analyze all choices`, or `code compile`.
- When you set the **Variant control mode** to `sim codegen switching`, this parameter can be set to either `update diagram` or `update diagram analyze all choices`. The `code compile` option becomes unavailable.

Programmatic Use

Block Parameter: `VariantActivationTime`

Type: character vector

Values: `update diagram|update diagram analyze all choices|code compile`

Default: update diagram

Variant choices (table of variant systems) — Table of variant choices, variant controls, and conditions

empty table (default)

The table has a row for each Variant system contained in the Variant Subsystem. If there are no Variant systems, the table is empty.

You can use buttons to the left of the **Variant choices** table to modify the elements in the table.

To...	Click...
Create and add a new subsystem choice: Place a new Subsystem Variant choice in the table and create a Subsystem block in the Variant Subsystem block diagram.	
Create and add a new model variant choice: Place a new Model Variant choice in the table and create a Model block in the Variant Subsystem block.	
Create/Edit selected variant object: Create a Simulink.Variant object in the global workspace and open the Simulink.Variant object parameter dialog box to specify the Variant Condition .	
Open selected variant choice block: Open the Subsystem block diagram for the selected row in the Variant choices table.	
Refresh dialog information from Variant Subsystem contents: Update the Variant choices table according to the Variant system and values of the Variant control in the global workspace.	

Name (read-only) — Variant system name

' ' (default) | name of Subsystem or Model block contained in the Variant Subsystem

This read-only field is based on the Variant system name. To add a Subsystem Variant choice, click

. To add a Model Variant choice, click .

Variant control expression — Variant control in global workspace

Choice_<index> (default) | boolean condition expression | a Simulink.Variant object representing a boolean condition expression | a Simulink.Parameter object (required for code generation) | enum

To enter a Variant name, double-click a **Variant control** cell in a new row and type in the Variant control expression.

To enter non-numeric Variant control values, use enumerated data. For information about using enumerated data, see “Use Enumerated Data in Simulink Models”

Programmatic Use

Structure field: Represented by the read-only variant.Name field in the Variant parameter structure

Type: character vector

Value: Variant control that is associated with the Variant choice

Default: 'variant'

Condition (read-only) — Condition for Variant controls

' ' (default)

This read-only field is based on the condition for the associated Variant control in the global workspace. Create or change a Variant condition in the Simulink.Variant parameter dialog box or in the global workspace.

Label mode active choice — Name of Active choice if Label mode is selected

Choice_1 (default) | on

When you select the **Variant control mode** to Label, the **Label mode active choice** option is available. You can select an active Variant choice from **Label mode active choice** options. You can also right-click the badge on the Variant Subsystem block and select **Label Mode Active Choice**.

For **Label mode active choice** option, the Variant control need not be a Boolean condition expression or a Simulink.Variant object. Variant controls that start with a % symbol are ignored.

Note **Label mode active choice** option is not available in Expression mode.

Dependencies

To enable this parameter, select Label option from **Variant control mode** parameter.

Programmatic Use

Parameter: LabelModeActivechoice

Type: character vector

Value: if no Label mode active choice is specified, the value is empty. If Label mode active choice is specified, the value is the name of the Label mode active choice.

Default: ''

Allow zero active variant controls — Simulate model without using active Variant

off (default) | on

To simulate a model (containing a Variant system) without an active Variant choice, select the **Allow zero active variant controls** option. When you select this option and if there is no active Variant choice, Simulink disables all the blocks connected to the input and output stream of Variant Subsystem block. The disabled blocks are ignored from update diagram or simulation.

If you do not select this option, Simulink generates an error when there is no active Variant choice.

Dependencies

- The (default) option of Variant is not selected
- Expression option from **Variant control mode** is selected.

Programmatic Use

Parameter: AllowZeroVariantControls

Type: character vector

Value: 'off' | 'on'

Default: 'off'

Propagate conditions outside of variant subsystem — Propagate Variant conditions outside of Variant Subsystem block

off (default) | on

When you select this option, Simulink propagates the Variant conditions of the underlying blocks to the blocks outside the Variant Subsystem block. The components outside of the Subsystem connected

to the active choice becomes active and the components connected to the inactive choice becomes inactive during simulation.

Selecting this option ensures that the components outside of the Variant Subsystem are aware of the active and inactive state of blocks within the Variant Subsystem block. For more information, see “Adaptive Interface for Variant Subsystems”.

When you select this option, the Variant badge indicates the change.

Programmatic Use

Parameter: PropagateVariantConditions

Type: character vector

Value: 'off' | 'on'

Default: 'off'

Block Characteristics

Data Types	Boolean ^a bus ^a double ^a enumerated ^a fixed point ^a half ^a integer ^a single ^a string ^a

a. Actual data type or capability support depends on block implementation.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Actual data type or capability support depends on block implementation.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic. Actual data type or capability support depends on block implementation.

HDL Architecture

Architecture	Description
Module (default)	Generate code for the subsystem and the blocks within the subsystem. HDL Coder generates code for only the active variant.

Architecture	Description
BlackBox	<p>Generate a black-box interface. That is, the generated HDL code includes only the input/output port definitions for the subsystem. In this way, you can use a subsystem in your model to generate an interface to existing manually written HDL code.</p> <p>The black-box interface generated for subsystems is similar to the interface generated for Model blocks, but without generation of clock signals.</p>
No HDL	Remove the subsystem from the generated code. You can use the subsystem in simulation but treat it as a “no-op” in the HDL code.

Black Box Interface Customization

For the BlackBox architecture, you can customize port names and set attributes of the external component interface. See “Customize Black Box or HDL Cosimulation Interface” (HDL Coder).

HDL Block Properties

General	
AdaptivePipelining	Automatic pipeline insertion based on the synthesis tool, target frequency, and multiplier word-lengths. The default is <code>inherit</code> . See also “AdaptivePipelining” (HDL Coder).
BalanceDelays	Detects introduction of new delays along one path and inserts matching delays on the other paths. The default is <code>inherit</code> . See also “BalanceDelays” (HDL Coder).
ClockRatePipelining	Insert pipeline registers at a faster clock rate instead of the slower data rate. The default is <code>inherit</code> . See also “ClockRatePipelining” (HDL Coder).
ConstrainedOutputPipeline	Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is <code>0</code> . For more details, see “ConstrainedOutputPipeline” (HDL Coder).
DistributedPipelining	Pipeline register distribution, or register retiming. The default is <code>off</code> . See also “DistributedPipelining” (HDL Coder).
DSPStyle	Synthesis attributes for multiplier mapping. The default is <code>none</code> . See also “DSPStyle” (HDL Coder).
FlattenHierarchy	Remove subsystem hierarchy from generated HDL code. The default is <code>inherit</code> . See also “FlattenHierarchy” (HDL Coder).
InputPipeline	Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is <code>0</code> . For more details, see “InputPipeline” (HDL Coder).
OutputPipeline	Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is <code>0</code> . For more details, see “OutputPipeline” (HDL Coder).
SharingFactor	Number of functionally equivalent resources to map to a single shared resource. The default is <code>0</code> . See also “Resource Sharing” (HDL Coder).

General	
StreamingFactor	Number of parallel data paths, or vectors, that are time multiplexed to transform into serial, scalar data paths. The default is 0, which implements fully parallel data paths. See also "Streaming" (HDL Coder).

Target Specification

This block cannot be the DUT, so the block property settings in the **Target Specification** tab are ignored.

Restrictions

- The DUT cannot be a Variant Subsystem.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Actual data type or capability support depends on block implementation.

Vector Concatenate, Matrix Concatenate

Concatenate input signals of same data type to create contiguous output signal

Library: Simulink / Commonly Used Blocks
 Simulink / Math Operations
 Simulink / Signal Routing
 HDL Coder / Math Operations
 HDL Coder / Signal Routing

Description

The Vector Concatenate and Matrix Concatenate blocks concatenate the input signals to create a nonvirtual output signal whose elements reside in contiguous locations in memory.

In the Simulink library, these blocks are different configurations of the same block. They differ based on the setting of their **Mode** parameter, which determines whether the block operates in vector or multidimensional array concatenation mode. The input signal requirements and output signal depend on the mode of concatenation.

Block	Mode Setting	Input Signal Requirements	Output Signal
Vector Concatenate	Vector	<ul style="list-style-type: none"> Vectors Row vectors (1-by-M matrices) Column vectors (M-by-1 matrices) Combination of vectors and either row or column vectors 	<p>When all inputs are vectors, the output is a vector.</p> <p>If any of the inputs are row or column vectors, the output is a row or column vector, respectively.</p> <hr/> <p>Tip To create a vector of function calls, use a Mux block.</p>

Block	Mode Setting	Input Signal Requirements	Output Signal
Matrix Concatenate	Multidimensional array	Signals of any dimensionality (scalars, vectors, and matrices)	<p>The output is always an array.</p> <p>Trailing dimensions are assumed to be 1 for lower dimensionality inputs. For example, if the output is 4-D and the input is [2×3] (2-D), this block treats the input as [2×3×1×1].</p> <p>Concatenation is on the dimension that you specify with the Concatenate dimension parameter.</p>

The signals in the output signal appear in the same order as the input signals for the block. For a description of the port order for various block orientations, see “Port Location After Rotating or Flipping”.

You can use multiple Vector Concatenate or Matrix Concatenate blocks to create the output signal in stages, but the result is flat, as if you used a single block to concatenate the signals.

You must use a Vector Concatenate or Matrix Concatenate block to define an array of buses. For more information, see “Group Nonvirtual Buses in Arrays of Buses”.

Ports

Input

Port_1 — First input to concatenate

scalar | vector | matrix | *N*-D array

First input to concatenate, specified as a scalar, vector, matrix, or *N*-D array.

- Inputs must be of the same data type.
- Matrix and *N*-D array inputs are supported only when you set **Mode** to Multidimensional array.

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Port_N — *N*th input to concatenate

scalar | vector | matrix | *N*-D array

*N*th input to concatenate, specified as a scalar, vector, matrix, or *N*-D array.

- Inputs must be of the same data type.
- Matrix and *N*-D array inputs are supported only when you set **Mode** to Multidimensional array.

Dependencies

To enable this port, set **Number of inputs** to an integer greater than or equal to 2.

Data Types: `single` | `double` | `half` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point` | `enumerated` | `bus`

Output

Port_1 — Concatenation of input signals

`scalar` | `vector` | `matrix` | `N-D array`

Concatenation of input signals along specified dimension. Outputs have the same data type as the input.

Data Types: `single` | `double` | `half` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point` | `enumerated` | `bus`

Parameters

Number of inputs — Number of input ports

2 (default) | positive integer

Specify the number of inputs for the block as a real-valued, positive integer, less than or equal to 65536.

Programmatic Use

Block Parameter: NumInputs

Type: character vector

Values: positive integer

Default: '2'

Mode — Type of concatenation

`Vector` | `Multidimensional array`

Select the type of concatenation that this block performs. The default **Mode** of the Vector Concatenate block is `Vector`. The default **Mode** of the Matrix Concatenate block is `Multidimensional array`.

- When you select `Vector`, the block performs vector concatenation.
- When you select `Multidimensional array`, the block performs matrix concatenation.

Mode Setting	Input Signals	Output
<code>Vector</code>	<ul style="list-style-type: none"> • Vectors • Row vectors (1-by-M matrices) • Column vectors (M-by-1 matrices) • Combination of vectors and either row or column vectors 	<p>When all inputs are vectors, the output is a vector.</p> <p>If any of the inputs are row or column vectors, the output is a row or column vector, respectively.</p>

Mode Setting	Input Signals	Output
Multidimensional array	Signals of any dimensionality (scalars, vectors, and matrices)	<p>The output is always an array.</p> <p>Trailing dimensions are assumed to be 1 for lower dimensionality inputs. For example, if the output is 4-D and the input is [2x3] (2-D), this block treats the input as [2x3x1x1].</p> <p>Concatenation is on the dimension that you specify with the Concatenate dimension parameter.</p>

Programmatic Use

Block Parameter: Mode

Type: character vector

Values: 'Vector' | 'Multidimensional array'

Default: 'Vector'

Concatenate dimension — Output dimension along which to concatenate input arrays

1 (default) | scalar integer

Specify the output dimension along which to concatenate the input arrays.

- To concatenate input arrays vertically, enter 1.
- To concatenate input arrays horizontally, enter 2.
- To perform multidimensional concatenation on the inputs, specify an integer greater than 2.

If this parameter is set to 1 and the block inputs are 2-D matrices, the block performs vertical matrix concatenation and stacks the input matrices on top of each other to create the output matrix. For example, see the `ex_concatenate_vertical` model.

If you set this parameter to 2 and the block inputs are 2-D matrices, the block performs horizontal matrix concatenation and places the input matrices side by side to create the output matrix. For example, see the `ex_concatenate_horizontal` model.

The input matrices must have compatible sizes for concatenation. Vertical concatenation requires the input matrices to have the same number of columns. Horizontal concatenation requires input matrices to have the same number of rows.

If you set this parameter to 3 and the block inputs are 2-D matrices, the block performs multidimensional matrix concatenation. For example, see the `ex_concatenate_multidims` model

Dependencies

To enable this parameter, set **Mode** to Multidimensional array.

Programmatic Use

Block Parameter: ConcatenatedDimension

Type: character vector

Values: scalar integer

Default: '1'

Block Characteristics

Data Types	Boolean double enumerated fixed point half integer single
Direct Feedthrough	yes
Multidimensional Signals	no
Variable-Size Signals	yes
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

HDL Architecture

This block has a single, default HDL architecture.

HDL Block Properties

ConstrainedOutputPipeline	Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is 0. For more details, see “ConstrainedOutputPipeline” (HDL Coder).
InputPipeline	Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “InputPipeline” (HDL Coder).
OutputPipeline	Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “OutputPipeline” (HDL Coder).

Complex Data Support

This block supports code generation for complex signals.

Restrictions

HDL code generation does not support matrices at the input or output ports of the block.

PLC Code Generation

Vertical Gauge

Display signal value on vertical, customizable gauge during simulation

Library: Simulink / Dashboard / Customizable Blocks

Description

The Vertical Gauge block displays the value of the connected signal on a linear gauge that you can customize to look like a gauge in a real system.

The Vertical Gauge block displays instantaneous value of the connected signal throughout simulation. You can modify the range and tick values on the Vertical Gauge block to fit your data. Use the Vertical Gauge block with other dashboard blocks to build an interactive dashboard of controls and indicators for your model.

Customize the Vertical Gauge Block

When you add a Vertical Gauge block to your model, the block is preconfigured with a default design. You can use the block with the default design, or you can customize the appearance of the block using design mode. You can enter design mode one of three ways after selecting the block:

- On the **Gauge** tab, under **Design**, click **Edit**.
- In the **Property Inspector**, on the **Design** tab, click **Edit**.
- Pause on the ellipsis that appears above the block and click the **Edit Custom Block** button.

In design mode, you have access to block parameters and settings that allow you to design the appearance of the block. You can use the toolbar above the block to change the background image or needle image and to set the opacity and color for the scale, tick labels, and value bar. To design the appearance of the scale, select the aspect of the scale you want to edit in the middle section of the toolbar. Use the controls on the right of the toolbar to set the color and opacity. You can also click and drag to reposition the needle or the scale.

For fine control of the block design, use the **Design** tab in the **Property Inspector**. You can use the **Property Inspector** to enter exact values for design settings. The **Design** tab also includes design parameters that are not available through the toolbar or interactive editing, such as the ability to add a foreground image to the block.

When you finish editing the gauge, click **Exit** in the upper-right of the canvas to exit design mode.

Connect Dashboard Blocks

Dashboard blocks do not use ports to connect to model elements. To connect dashboard blocks to signals in your model, use connect mode. Connect mode facilitates the process of connecting dashboard blocks in your model, especially when you want to connect multiple blocks at once. To connect a single dashboard block, you can also use the **Connection** table in the block dialog box.

Tip You can modify dashboard block connections during normal and accelerator mode simulations.

To enter connect mode, select a dashboard block to connect. Then on the block tab, click **Connect**. In connect mode, when you select one or more signals or blocks, a list of signals that are available for connection appears. Select a signal from the list to connect to the selected dashboard block. To connect another dashboard block, pause on the block you want to connect and click the **Connect** button above it. Then, select one or more signals and blocks in the model and choose a signal to connect.

When you finish connecting the dashboard blocks in your model, on the block tab, click **Done Connecting**.

Tip You can hide the message shown on unconnected blocks using the `set_param` function with the `ShowInitialText` block parameter. The message also disappears when you connect the block.

Limitations

- Except for the Dashboard Scope block and the Display block, dashboard blocks can only connect to real scalar signals.
- The toolstrip does not support blocks that are inside a panel.
- You cannot use the **Connection** table in the block dialog to connect a dashboard block to a block that is commented out. When you connect a dashboard block to a commented block using connect mode, the dashboard block does not display the connected value until the you uncomment the block.
- Dashboard blocks cannot connect to model elements inside referenced models.
- When you simulate a model hierarchy, dashboard blocks inside referenced models do not update.
- Dashboard blocks do not support rapid accelerator simulation.
- You cannot connect a dashboard block to data or activity in Stateflow during simulation.
- Some signals are removed by optimization and are not available during accelerator mode simulations. To view such a signal using a dashboard block, mark the signal for logging.

Parameters

Connection — Signal to connect and display

signal connection options

Use the connection table to select the signal to connect to the block. To connect the block to a signal:

- 1 Make a selection in the model that includes one or more signals.
- 2 In the table, select the signal you want to connect.
- 3 Click **Apply**.

Tip You can connect dashboard blocks to signals in the model during simulation.

Programmatic Use

Block Parameter: Binding

Type: Simulink.HMI.SignalSpecification

Default: []

Minimum — Minimum tick mark value

0 (default) | scalar

Finite, real, double, scalar value specifying the minimum tick mark value for the scale. The minimum must be less than the value of the **Maximum** parameter.

Programmatic Use

To programmatically set the Minimum parameter, use a 1-by-3 vector containing values for the Minimum, Tick Interval, and Maximum parameters, in that order. To use the **auto** value for the Tick Interval, leave the Tick Interval position in the vector empty or specify -1.

Block Parameter: Limits

Type: 1x3 vector

Default: [0 -1 100]

Maximum — Maximum tick mark value

100 (default) | scalar

Finite, real, double, scalar value specifying the maximum tick mark value for the scale. The maximum must be greater than the value of the **Minimum** parameter.

Programmatic Use

To programmatically set the Maximum parameter, use a 1-by-3 vector containing values for the Minimum, Tick Interval, and Maximum parameters, in that order. To use the **auto** value for the Tick Interval, leave the Tick Interval position in the vector empty or specify -1.

Block Parameter: Limits

Type: 1x3 vector

Default: [0 -1 100]

Tick Interval — Interval between major tick marks

auto (default) | scalar

Finite, real, positive, whole, scalar value specifying the interval of major tick marks on the scale. When set to `auto`, the block automatically adjusts the tick interval based on the values of the **Maximum** and **Minimum** parameters.

Programmatic Use

To programmatically set the `Tick Interval` parameter, use a 1-by-3 vector containing values for the `Minimum`, `Tick Interval`, and `Maximum` parameters, in that order. To use the `auto` value for the `Tick Interval`, leave the `Tick Interval` position in the vector empty or specify `-1`.

Block Parameter: Limits

Type: 1x3 vector

Default: [0 -1 100]

Scale Colors — Color indications on gauge scale

colors for scale ranges

Color specifications for value ranges on the scale. Press the **+** button to add a scale color. For each color added, specify the minimum and maximum values of the range in which you want to display that color.

Programmatic Use

To programmatically specify the `Scale Colors` parameter, use an array of structures with the fields:

- `Min` — Minimum value for the color range on the scale
- `Max` — Maximum value for the color range on the scale
- `Color` — 1-by-3 vector of double values between 0 and 1 that specify the color for the range in the form [r g b]

Include a structure in the array for each scale range for which you want to specify a color.

```
range1.Min = 0;
range1.Max = 10;
range1.Color = [0 0 1];
range2.Min = 10;
range2.Max = 15;
range2.Color = [0 1 0];
scaleRanges = [range1 range2];
```

Block Parameter: ScaleColors

Type: structure array

Default: 0x1 struct array

Lock Aspect Ratio — Whether to maintain block aspect ratio

on (default) | off

Whether to maintain the block aspect ratio when resizing the block and when you specify a new background image.

Label — Block label position

Top (default) | Bottom | Hide

Position of the block label. When the block is connected to an element in the model, the label is the name of the connected element.

Programmatic Use**Block Parameter:** LabelPosition**Type:** character vector**Values:** 'Top' | 'Bottom' | 'Hide'**Default:** 'Top'**Opacity — Block background opacity**

1 (default) | scalar

Block background opacity, specified as a scalar value between 0 and 1. Specify the background opacity using the **Design** tab in the Property Inspector.

- 1 On the **Design** tab, click **Edit Design**.
- 2 Select the **Background** component.
- 3 In the **Background Color** section, specify the desired opacity.

Example: 0.5

Programmatic Use**Block Parameter:** Opacity**Type:** scalar**Default:** 1**Foreground Color — Block foreground color**

[r g b] vector

Block foreground color, excluding the text. The **Foreground Color** applies to the scale and the block name. To specify the color for the block text, use the **Font Color**.

Specify the **Foreground Color** for the block using the **Design** tab in the Property Inspector.

- 1 On the **Design** tab, click **Edit Design**.
- 2 Select the **Scale** component.
- 3 In the **Ticks** section, open the **Color** menu. You can choose from the palette of standard colors or specify a custom color.

Programmatic Use

Specify the `ForegroundColor` parameter for the block as a 1-by-3 [r g b] vector with values between 0 and 1.

Block Parameter: ForegroundColor**Type:** [r g b] vector**Background Color — Block background color**

[r g b] vector

Block background color. You can choose to select a solid background color instead of providing a background image. To design a block that uses a solid background, use the **Design** tab in the Property Inspector.

- 1 On the **Design** tab, click **Edit Design**.
- 2 Select the **Background** component.
- 3 Select **Use background color**.

- 4 Choose a background color from the palette of standard colors or specify a custom color.
- 5 Adjust the **Offset from scale** option until the solid background is the desired size.

Changing the background color using the toolbar removes the background image and enables the **Use background color** option.

Programmatic Use

Specify the `BackgroundColor` parameter for the block as a 1-by-3 [r g b] vector with values between 0 and 1.

Block Parameter: `BackgroundColor`

Type: [r g b] vector

Font Color — Block font color

[r g b] vector

Block font color. The **Font Color** applies to the scale labels. To specify the color of the scale, use the **Foreground Color**.

Specify the **Font Color** for the block using the **Design** tab in the Property Inspector.

- 1 On the **Design** tab, click **Edit Design**.
- 2 Select the **Scale** component.
- 3 In the **Labels** section, open the **Color** menu. You can choose from the palette of standard colors or specify a custom color.

Block Characteristics

Data Types	Boolean double enumerated fixed point half integer single
Direct Feedthrough	no
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Dashboard blocks are ignored for code generation.

“Tune and Visualize Your Model with Dashboard Blocks”

“Simulation Pacing”

Introduced in R2020a

Vertical Slider

Tune parameter using vertical slider with customizable appearance

Library: Simulink / Dashboard / Customizable Blocks

Description

Use the Vertical Slider block to tune the value of a variable or block parameter during simulation. You can customize the appearance of the Vertical Slider block to look like a control in a real system. You can adjust the scale range and tick values to fit the desired range for the value you want to tune. Use the Vertical Slider block with other dashboard blocks to create an interactive dashboard to control your model.

Customize the Vertical Slider Block

When you add a Vertical Slider block to your model, the block is preconfigured with a default design. You can use the block with the default design, or you can customize the appearance of the block using design mode. You can enter design mode one of three ways after selecting the block:

- On the **Slider** tab, under **Design**, click **Edit**.
- In the **Property Inspector**, on the **Design** tab, click **Edit Design**.
- Pause on the ellipsis that appears above the block and click the **Edit Custom Block** button.

In design mode, you have access to block parameters and settings that allow you to design the appearance of the block. You can use the toolbar above the block to change the background image or needle image and to set the opacity and color for the scale, tick labels, and value bar. To design the appearance of the scale, select the aspect of the scale you want to edit in the middle section of the toolbar. Use the controls on the right of the toolbar to set the color and opacity. You can also click and drag to reposition the needle or the scale.

For fine control of the block design, use the **Design** tab in the **Property Inspector**. You can use the **Property Inspector** to enter exact values for design settings. The **Design** tab also includes design parameters that are not available through the toolbar or interactive editing, such as the ability to add a foreground image to the block.

When you finish editing the design, click **Exit** in the upper-right of the canvas to exit design mode.

Connect Dashboard Blocks

Dashboard blocks do not use ports to connect to model elements. To connect dashboard blocks to variables and block parameters, use connect mode. Connect mode facilitates the process of connecting dashboard blocks in your model, especially when you want to connect multiple blocks at once. To connect a single dashboard block, you can also use the **Connection** table in the block dialog box.

Tip You can modify dashboard block connections in your model during normal and accelerator mode simulations.

Note Dashboard blocks cannot connect to variables until you update the model diagram. To connect dashboard blocks to variables or modify variable values between opening your model and running a simulation, update the model diagram using **Ctrl+D**.

To enter connect mode, select the block. Then, on the block tab, click **Connect**. In connect mode, when you select one or more blocks, a list of parameters and variables available for connection appears. Select a variable or parameter from the list to connect to the selected dashboard block.

When the value of the selected variable or block parameter is nonscalar, use the text box at the bottom of the **Connection** table to specify the element you want to connect to the dashboard block. To connect to an element of a vector, matrix, or array, specify the element index, for example, 3 or (1,3). To connect to an element in a bus or structure, specify the element in the context of the bus or structure hierarchy by using dots to indicate different levels in the hierarchy, and omit the top level. For example, specify a.b to connect to scalar element b of the structure or bus a nested inside the selected composite variable or parameter.

To connect another dashboard block, pause on another dashboard block and click the **Connect** button above it. Then, make a selection of signals and blocks in your model and choose a model element to connect.

The screenshot shows a Simulink dashboard with a control system model on the left, a scope plot in the center, and a 'Connect' table on the right. The model includes blocks for gain (Mu), multiplication (x), addition (+), subtraction (-), and integration (1/s). Signals x1 and x2 are labeled. The scope plot shows a signal over time from 0 to 20. The 'Connect' table lists various elements to connect to, including constants, parameters, and scope properties.

Connect	
<input type="radio"/>	Constant: Value
<input type="radio"/>	Mu: Gain
<input type="radio"/>	Out1: InitialOutput
<input type="radio"/>	Out2: InitialOutput
<input type="radio"/>	Scope: ActiveDisplayString
<input type="radio"/>	Scope: ActiveDisplayYMaximum
<input type="radio"/>	Scope: ActiveDisplayYMinimum
<input type="radio"/>	Scope: AxesScalingNumUpdates

When you finish connecting the dashboard blocks in your model, on the block tab, click **Done Connecting**.

Tip You can hide the message shown on unconnected blocks using the `set_param` function with the `ShowInitialText` block parameter. The message also disappears when you connect the block.

Parameter Logging

Tunable parameters connected to dashboard blocks are logged to the Simulation Data Inspector, where you can view the parameter values along with logged signal data. You can access logged parameter data in the MATLAB workspace by exporting the parameter data from the Simulation Data Inspector by using the UI or the `Simulink.sdi.exportRun` function. For more information about exporting data using the Simulation Data Inspector UI, see "Export Data from the Simulation Data Inspector". The parameter data is stored in a `Simulink.SimulationData.Parameter` object, accessible as an element in the exported `Simulink.SimulationData.Dataset`.

Limitations

- Except for the Dashboard Scope block and the Display block, dashboard blocks can only connect to real scalar signals.
- The toolstrip does not support blocks that are inside a panel.
- You cannot use the **Connection** table in the block dialog to connect a dashboard block to a block that is commented out. When you connect a dashboard block to a commented block using connect mode, the dashboard block does not display the connected value until the you uncomment the block.
- Dashboard blocks cannot connect to model elements inside referenced models.
- When you simulate a model hierarchy, dashboard blocks inside referenced models do not update.
- Dashboard blocks do not support rapid accelerator simulation.
- When you connect a dashboard block to a variable or parameter during simulation, the data for that variable or parameter is not logged to the Simulation Data Inspector. To log variable and parameter data to the Simulation Data Inspector, connect the dashboard block to the variable or parameter prior to simulation.
- When you simulate a model in external mode with the **Default parameter behavior** set to **Inlined**, dashboard blocks can appear to change parameter and variable values. However, the change does not propagate to the simulation. For example, Gain blocks display changes made to the **Gain** parameter using the dashboard blocks, but the **Gain** value used in the simulation does not change.

Parameters

Connection — Select a variable or block parameter to connect

variable and parameter connection options

Select the variable or block parameter to control using the **Connection** table. To connect the block to a signal:

- 1 Make a selection in the model that includes one or more blocks.
- 2 Select the variable or parameter you want to connect.

When the value of the selected variable or block parameter is nonscalar, use the text box at the bottom of the **Connection** table to specify the element you want to connect to the dashboard block. To connect to an element of a vector, matrix, or array, specify the element index, for example, 3 or (1,3). To connect to an element in a bus or structure, specify the element in the context of the bus or structure hierarchy by using dots to indicate different levels in the hierarchy, and omit the top level. For example, specify a.b to connect to scalar element b of the structure or bus a nested inside the selected composite variable or parameter.

- 3 Click **Apply**.

To facilitate understanding and debugging your model, you can connect Dashboard blocks to variables and parameters in your model during simulation.

Note To see workspace variables in the connection table, update the model diagram using **Ctrl+D**.

Programmatic Use

To programmatically connect a dashboard block to a tunable parameter or a variable, use a `Simulink.HMI.ParamSourceInfo` object. The `Simulink.HMI.ParamSourceInfo` object contains four properties. Some of the properties apply to connecting dashboard blocks to parameters, and some apply to connecting dashboard blocks to variables. Not all fields have a value for a connection because a given dashboard block connects to either a parameter or a variable.

Block Parameter: Binding

Type: `Simulink.HMI.ParamSourceInfo`

Default: []

Minimum — Minimum tick mark value

0 (default) | scalar

Finite, real, double, scalar value specifying the minimum tick mark value for the scale. The minimum must be less than the value of the **Maximum** parameter.

Programmatic Use

To programmatically set the Minimum parameter, use a 1-by-3 vector containing values for the Minimum, Tick Interval, and Maximum parameters, in that order. To use the `auto` value for the Tick Interval, leave the Tick Interval position in the vector empty or specify -1.

Block Parameter: Limits

Type: 1x3 vector

Default: [0 -1 100]

Maximum — Maximum tick mark value

100 (default) | scalar

Finite, real, double, scalar value specifying the maximum tick mark value for the scale. The maximum must be greater than the value of the **Minimum** parameter.

Programmatic Use

To programmatically set the Maximum parameter, use a 1-by-3 vector containing values for the Minimum, Tick Interval, and Maximum parameters, in that order. To use the `auto` value for the Tick Interval, leave the Tick Interval position in the vector empty or specify -1.

Block Parameter: Limits

Type: 1x3 vector

Default: [0 -1 100]

Tick Interval — Interval between major tick marks

auto (default) | scalar

Finite, real, positive, whole, scalar value specifying the interval of major tick marks on the scale. When set to `auto`, the block automatically adjusts the tick interval based on the values of the **Maximum** and **Minimum** parameters.

Programmatic Use

To programmatically set the Tick Interval parameter, use a 1-by-3 vector containing values for the Minimum, Tick Interval, and Maximum parameters, in that order. To use the `auto` value for the Tick Interval, leave the Tick Interval position in the vector empty or specify -1.

Block Parameter: Limits

Type: 1x3 vector

Default: [0 -1 100]

Label — Block label position

Top (default) | Bottom | Hide

Position of the block label. When the block is connected to an element in the model, the label is the name of the connected element.

Programmatic Use

Block Parameter: LabelPosition

Type: character vector

Values: 'Top' | 'Bottom' | 'Hide'

Default: 'Top'

Foreground Color — Block foreground color

[r g b] vector

Block foreground color, excluding the text. The **Foreground Color** applies to the scale and the block name. To specify the color for the block text, use the **Font Color**.

Specify the **Foreground Color** for the block using the **Design** tab in the Property Inspector.

- 1 On the **Design** tab, click **Edit Design**.
- 2 Select the **Scale** component.
- 3 In the **Ticks** section, open the **Color** menu. You can choose from the palette of standard colors or specify a custom color.

Programmatic Use

Specify the `ForegroundColor` parameter for the block as a 1-by-3 [r g b] vector with values between 0 and 1.

Block Parameter: ForegroundColor

Type: [r g b] vector

Background Color — Block background color

[r g b] vector

Block background color. You can choose to select a solid background color instead of providing a background image. To design a block that uses a solid background, use the **Design** tab in the Property Inspector.

- 1 On the **Design** tab, click **Edit Design**.
- 2 Select the **Background** component.
- 3 Select **Use background color**.
- 4 Choose a background color from the palette of standard colors or specify a custom color.
- 5 Adjust the **Offset from scale** option until the solid background is the desired size.

Changing the background color using the toolbar removes the background image and enables the **Use background color** option.

Programmatic Use

Specify the `BackgroundColor` parameter for the block as a 1-by-3 [r g b] vector with values between 0 and 1.

Block Parameter: BackgroundColor

Type: [r g b] vector

Font Color — Block font color

[r g b] vector

Block font color. The **Font Color** applies to the scale labels. To specify the color of the scale, use the **Foreground Color**.

Specify the **Font Color** for the block using the **Design** tab in the Property Inspector.

- 1 On the **Design** tab, click **Edit Design**.
- 2 Select the **Scale** component.
- 3 In the **Labels** section, open the **Color** menu. You can choose from the palette of standard colors or specify a custom color.

Weighted Sample Time

Support calculations involving sample time

Library: Simulink / Signal Attributes

Description

The Weighted Sample Time block outputs the weighted sample time or weighted sample rate. Because the Weighted Sample Time block is an implementation of the Weighted Sample Time Math, you can also add, subtract, multiply, or divide the input signal, u , by a weighted sample time, T_s . If the input signal is continuous, T_s is the sample time of the Simulink model. Otherwise, T_s is the sample time of the discrete input signal. If the input signal is constant, Simulink assigns a finite sample time to the block based on its connectivity and context.

You specify the math operation with the **Operation** parameter. The block can output just a weighted sample time (**Ts Only**) or a weighted sample rate (**1/Ts Only**).

Enter the weighting factor in the **Weight value** parameter. If the weight, w , is 1, that value does not appear in the equation on the block icon.

Tip You can use the Weighted Sample Time and Weighted Sample Time Math blocks to extract the sample time from a Simulink signal. To do so, set the **Operation** parameter to **Ts** and the **Weight value** to 1.0. In this configuration, the block outputs the sample time of the input signal.

The block computes its output using the precedence rules for MATLAB operators. See “Operator Precedence” for information. For example, if the **Operation** parameter specifies $+$, the block calculates output using this equation:

$$u + (T_s * w)$$

However, if the **Operation** parameter specifies $/$, the block calculates output using this equation:

$$(u / T_s) / w$$

Ports

Input

Port_1 — Input signal

scalar | vector | matrix

Specify the input signal, u , as a scalar, vector, or matrix. Depending on the value of the **Operation** parameter, the block can add, subtract, multiply, or divide the input signal by weighted sample time or just output the weighted sample time or weighted sample rate.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

Output

Port_1 – Output signal

scalar | vector | matrix

Output the weighted sample time or sample rate of the input signal, or output the input signal adjusted by the weighted sample time, T_s . If the input signal is continuous, T_s is the sample time of the Simulink model. Otherwise, T_s is the sample time of the discrete input signal. When the input signal is constant, Simulink assigns a finite sample time to the block based on its connectivity and context.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

Parameters

Main

Operation – Math operation

T_s Only (default) | + | - | * | / | 1/ T_s Only

Specify the operation to use for adjusting the input signal. You can select: +, -, *, /, T_s Only, or 1/ T_s Only.

Programmatic Use

Block Parameter: TsamMathOp

Type: character vector

Values: '+' | '-' | '*' | '/' | 'Ts Only' | '1/Ts Only'

Default: 'Ts Only'

Weight value – Weight of sample time

1.0 (default) | real-valued scalar

Enter the weight of the sample time as a real-valued scalar.

Programmatic Use

Block Parameter: weightValue

Type: character vector

Values: real-valued scalar

Default: '1.0'

Implement using – Method for adjusting sample time

Online Calculations (default) | Offline Scaling Adjustment

Select one of two modes: online calculations or offline scaling adjustment.

Result of ($T_s * w$)	Output Data Type of Two Modes	Block Execution
A power of 2, or an integer value	The same, when Output data type is Inherit: Inherit via internal rule	Equally efficient in both modes
Not power of 2 and not an integer value	Different	More efficient for the offline scaling mode

Note When the **Implement using** parameter is not visible, operations default to online calculations.

Dependencies

To enable this parameter, set **Operation** to * or /.

Programmatic Use

Block Parameter: TsampMathImp

Type: character vector

Values: 'Online Calculations' | 'Offline Scaling Adjustment'

Default: 'Online Calculations'

Signal Attributes

Output data type — Data type of output signal

Inherit: Inherit via internal rule (default) | Inherit: Inherit via back propagation | <data type expression>

Specify the data type for the output.

Programmatic Use

Block Parameter: OutDataTypeStr

Type: character vector

Values: 'Inherit: Inherit via internal rule' | 'Inherit: Inherit via back propagation' | '<data type expression>'

Default: 'Inherit: Inherit via internal rule'

Integer rounding mode — Rounding mode for fixed-point operations

Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

Specify the rounding mode for fixed-point operations. For more information, see “Rounding” (Fixed-Point Designer).

Block parameters always round to the nearest representable value. To control the rounding of a block parameter, enter an expression using a MATLAB rounding function into the mask field.

Dependencies

To enable this parameter, set **Operation** to +, -, *, or /. If you set the **Operation** parameter to * or /, you must also set **Implement using** to Online Calculations.

Programmatic Use

Block Parameter: RndMeth

Type: character vector

Values: 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'

Default: 'Floor'

Saturate on integer overflow — Method of overflow action

off (default) | on

Specify whether overflows saturate or wrap.

Action	Rationale	Impact on Overflows	Example
Select this check box (on).	Your model has possible overflow, and you want explicit saturation protection in the generated code.	Overflows saturate to either the minimum or maximum value that the data type can represent.	The maximum value that the <code>int8</code> (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box selected, the block output saturates at 127. Similarly, the block output saturates at a minimum output value of -128.
Do not select this check box (off).	You want to optimize efficiency of your generated code. You want to avoid overspecifying how a block handles out-of-range signals. For more information, see "Troubleshoot Signal Range Errors".	Overflows wrap to the appropriate value that is representable by the data type.	The maximum value that the <code>int8</code> (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box cleared, the software interprets the overflow-causing value as <code>int8</code> , which can produce an unintended result. For example, a block result of 130 (binary 1000 0010) expressed as <code>int8</code> , is -126.

When you select this check box, saturation applies to every internal operation on the block, not just the output, or result. Usually, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Dependencies

To enable this parameter, set **Operation** to +, -, *, or /. If you set the **Operation** parameter to * or /, you must also set **Implement using** to Online Calculations.

Programmatic Use

Block Parameter: SaturateOnIntegerOverflow

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Block Characteristics

Data Types	Boolean double fixed point integer single
Direct Feedthrough	yes

Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Introduced before R2006a

Waveform Generator

Output waveforms using signal notations

Library: Simulink / Sources

Description

The Waveform Generator block outputs waveforms based on signal notations that you enter in the **Waveform Definition** table.

This block supports these syntaxes for the signal notations:

- Function syntax — Specify all arguments in the specific order for the signal syntax (see “Algorithms” on page 1-1873).
- Name-value syntax — Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, . . . , NameN, ValueN`. For more information, see “Algorithms” on page 1-1873.

This block supports normal, accelerator, and rapid accelerator modes and fast restart.

Supported Operators

Operation	Operator
Absolute value	<code>abs ()</code>
Addition	<code>+</code>
Division	<code>/</code>
Multiplication	<code>*</code>
Parentheses	<code>()</code>
Subtraction	<code>-</code>
Unary minus	<code>-</code>

The Waveform block observes the following rules of operator precedence:

- 1 ()
- 2 + - (unary)
- 3 * /
- 4 + -

Supported Operations

The Waveform Generator block outputs one signal at a time. You can change this output signal. Express frequency and phase offset parameters in radians. You can also:

- Nest signal notations, for example:

```
sin('Amplitude',sin('Amplitude',1,'Frequency',1,'Phase',0),'Frequency',1,'Phase',1)
```

- Reference real scalar variables in the base or model workspace, for example:

```
sin('Amplitude',x,'Frequency',y,'Phase',z)
```

x , y , and z exist in the base workspace.

For more information on waveforms, see the Algorithms section.

To quickly determine the response of a system to different types of inputs, you can vary the output signal of the Waveform Generator block while a simulation is in progress.

Limitations

- You cannot tune the parameters of a waveform, such as frequency or amplitude, during execution of the code that you generate by using Simulink Coder. Instead, you can generate code that enables you to switch between waveform variants that you specify. For more information, see “Switch Between Output Waveforms During Code Execution for Waveform Generator Block” (Simulink Coder).

Ports

Output

Port_1 — Generated output signal

scalar | vector

Output signal specified by an entry in the **Waveform Definition** table.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point` | `bus`

Parameters

Main

Output Signal — Waveform for output signal

1 (default) | integer

Select waveform definition to specify the output signal. The number corresponds to the line item in the **Waveform Definition** table. You can change this parameter while a simulation is running.

Programmatic Use

Block Parameter: SelectedSignal

Type: character vector

Values: scalar

Default: '1'

Waveform Definition — Waveform signal notations

`constant` | `gaussian(mean,variance,seed)` | `pulse(amplitude,trigger_time,duration)` | `sawtooth(amplitude,frequence,phase_offset)` | `sin(amplitude,frequence,phase_offset)` | `square(amplitude,frequence,phase_offset)` | `step(step_time,initial_value,final_value)`

Enter signal notations in the **Waveform Definition** table, one waveform definition per line. For syntax details, see Algorithms.

Signal Attributes

Click the **Show data type assistant** button  to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

Output minimum — Minimum output value for range checking

[] (default) | scalar

Lower value of the output range that Simulink checks.

Simulink uses the minimum to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Specify Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Embedded Coder).

Note Output minimum does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use**Block Parameter:** OutMin**Type:** character vector**Values:** '[]' | scalar**Default:** '[]'**Output maximum — Maximum output value for range checking**

[] (default) | scalar

Upper value of the output range that Simulink checks.

Simulink uses the maximum value to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Specify Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Embedded Coder).

Note Output maximum does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use**Block Parameter:** OutMax**Type:** character vector**Values:** '[]' | scalar**Default:** '[]'**Output data type — Specify the output data type**

double (default) | Inherit: Inherit via back propagation | single | int8 | int32 | uint32 | int64 | uint64 | fixdt(1,16,2^0,0) | <data type expression> | ...

Choose the data type for the output. The type can be inherited, specified directly, or expressed as a data type object such as Simulink.NumericType.

Programmatic Use**Block Parameter:** OutDataTypeStr**Type:** character vector**Values:** , 'Inherit: Inherit via back propagation', 'single', 'int8', 'uint8', int16, 'uint16', 'int32', 'uint32', 'int64', 'uint64', fixdt(1,16,0), fixdt(1,16,2^0,0), fixdt(1,16,2^0,0). '<data type expression>'**Default:** 'Double'

Lock output data type setting against changes by the fixed-point tools — Prevent fixed-point tools from overriding data types

off (default) | on

Select to lock the output data type setting of this block against changes by the Fixed-Point Tool and the Fixed-Point Advisor. For more information, see “Use Lock Output Data Type Setting” (Fixed-Point Designer).

Programmatic Use

Block Parameter: LockScale

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Lock data type settings against changes by the fixed-point tools — Prevent fixed-point tools from overriding data types

off (default) | on

Select to lock data type settings of this block against changes by the Fixed-Point Tool and the Fixed-Point Advisor. For more information, see “Lock the Output Data Type Setting” (Fixed-Point Designer).

Programmatic Use

Block Parameter: LockScale

Values: 'off' | 'on'

Default: 'off'

Integer rounding mode — Specify the rounding mode for fixed-point operations

Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

Choose one of these rounding modes.

Ceiling

Rounds both positive and negative numbers toward positive infinity. Equivalent to the MATLAB `ceil` function.

Convergent

Rounds number to the nearest representable value. If a tie occurs, rounds to the nearest even integer. Equivalent to the Fixed-Point Designer `convergent` function.

Floor

Rounds both positive and negative numbers toward negative infinity. Equivalent to the MATLAB `floor` function.

Nearest

Rounds number to the nearest representable value. If a tie occurs, rounds toward positive infinity. Equivalent to the Fixed-Point Designer `nearest` function.

Round

Rounds number to the nearest representable value. If a tie occurs, rounds positive numbers toward positive infinity and rounds negative numbers toward negative infinity. Equivalent to the Fixed-Point Designer `round` function.

Simplest

Automatically chooses between round toward floor and round toward zero to generate rounding code that is as efficient as possible.

Zero

Rounds number toward zero. Equivalent to the MATLAB `fix` function.

Programmatic Use

Block Parameter: `RndMeth`

Type: character vector

Values: 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'

Default: 'Floor'

See Also

For more information, see “Rounding” (Fixed-Point Designer).

Saturate on integer overflow – Method of overflow action

`off` (default) | `on`

Specify whether overflows saturate or wrap.

Action	Rationale	Impact on Overflows	Example
Select this check box (on).	Your model has possible overflow, and you want explicit saturation protection in the generated code.	Overflows saturate to either the minimum or maximum value that the data type can represent.	The maximum value that the <code>int8</code> (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box selected, the block output saturates at 127. Similarly, the block output saturates at a minimum output value of -128.
Do not select this check box (off).	You want to optimize efficiency of your generated code. You want to avoid overspecifying how a block handles out-of-range signals. For more information, see “Troubleshoot Signal Range Errors”.	Overflows wrap to the appropriate value that is representable by the data type.	The maximum value that the <code>int8</code> (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box cleared, the software interprets the overflow-causing value as <code>int8</code> , which can produce an unintended result. For example, a block result of 130 (binary 1000 0010) expressed as <code>int8</code> , is -126.

When you select this check box, saturation applies to every internal operation on the block, not just the output, or result. Usually, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Programmatic Use**Block Parameter:** SaturateOnIntegerOverflow**Type:** character vector**Values:** 'off' | 'on'**Default:** 'off'**Sample time — Time interval between samples**

0.1 (default) | scalar

Specify the time interval between samples. To inherit the sample time, set this parameter to -1. See “Specify Sample Time” for more information.

Programmatic Use**Block Parameter:** SampleTime**Type:** character vector**Values:** scalar**Default:** '0.1'**Block Characteristics**

Data Types	Boolean double fixed point integer single
Direct Feedthrough	no
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Algorithms

Enter signal notations in the **Waveform Definition** table, one waveform definition per line. To add a waveform definition, click **Add**. The new waveform appears as an empty character vector. The block interprets empty character vectors or white space character vectors as ground.

To remove a waveform definition, click **Remove**. You can select multiple waveforms using **Ctrl+click** or **Shift+click**.

Constant

Constant values can be:

- Numbers
- Workspace variables
 - Scalar, real variables only
- Built-in MATLAB constant, pi

Examples

- 1
- 1.1

- x
- pi

Gaussian Noise

Syntax

```
gaussian(mean,variance,seed)
```

```
gaussian('Mean',mean,'Variance',variance,'Seed',seed)
```

Input Arguments

- mean — Mean value of the random variable output.
 - Default: 0
- variance — Standard deviation squared of the random variable output.
 - Default: 1
 - Value: Positive constant or positive real scalar variable
- seed — Initial seed value for the random number generator.
 - Default: 0
 - Value: Constant or real scalar variable

Example

```
gaussian('Mean',0,'Variance',10,'Seed',1)
```

Pulse

Syntax

```
pulse(amplitude,trigger_time,duration)
```

```
pulse('Amplitude',amplitude,'TriggerTime',trigger_time,'Duration',duration)
```

Input Arguments

- `amplitude` — Value of signal when pulse is high.
 - Default: 1
- `trigger_time` — Elapsed simulation time when signal changes to amplitude, in seconds.
 - Default: 1
 - Value: Constant or real scalar variable
- `duration` — How long the signal remains at the given amplitude before returning to ground, in seconds.
 - Default: 1
 - Value: Positive constant or positive real scalar variable

Example

```
pulse('Amplitude',1,'TriggerTime',1,'Duration',1)
```

**Sawtooth****Syntax**

```
sawtooth(amplitude,frequency,phase_offset)
```

```
sawtooth('Amplitude',amplitude,'Frequency',frequency,'Phase',phase_offset)
```

Input Arguments

- `amplitude` — Sawtooth peak value.
 - Default: 1
- `frequency` — Waveform frequency, in rad/s.
 - Default: 1
- `phase_offset` — Horizontal signal shift, based on elapsed simulation time, in seconds.

- Default: 0

Example

```
sawtooth('Amplitude',1,'Frequency',1,'Phase',0)
```

**Sine Wave****Syntax**

```
sin(amplitude,frequency,phase_offset)
```

```
sin('Amplitude',amplitude,'Frequency',frequency,'Phase',phase_offset)
```

Input Arguments

- `amplitude` — Amplitude of sine wave.
 - Default: 1
- `frequency` — Waveform frequency, in rad/s.
 - Default: 1
- `phase_offset` — Phase offset, in rads.
 - Default: 0

Examples

```
sin('Amplitude',1,'Frequency',1,'Phase',0)
```

To get the cosine waveform:

```
sin('Amplitude',1,'Frequency',1,'Phase',pi/2)
```

Square

Syntax

```
square(amplitude,frequency,phase_delay,duty_cycle)
```

```
square('Amplitude',amplitude,'Frequency',frequency,'Phase',phase_delay,...  
'DutyCycle',duty_cycle)
```

Input Arguments

- `amplitude` — Amplitude of signal.
 - Default: 1
- `frequency` — Waveform frequency in rad/s.

- Default: 1
- `phase_delay` — Horizontal signal shift based on elapsed simulation time, in seconds.
 - Default: 0
- `duty_cycle` — Percentage of high signal per period (0-100%). The block clips the minimum signal to 0% and the maximum signal to 100%.
 - Default: 50

Example

```
square('Amplitude',1,'Frequency',1,'Phase',0,'DutyCycle',50)
```

**Step****Syntax**

```
step(step_time,initial_value,final_value)
```

```
step('StepTime',step_time,'InitialValue',initial_value,'FinalValue',final_value)
```

Input Arguments

- `step_time` — Elapsed simulation time when signal changes from `initial_value` to `final_value`, in seconds.
 - Default: 1
 - Value: Constant or positive real scalar variable.
- `initial_value` — Value of signal when elapsed simulation time is less than `step_time`, in seconds.
 - Default: 0
- `final_value` — Value of signal when elapsed simulation time is greater than or equal to `step_time`, in seconds.
 - Default: 1

Example

```
step('StepTime',1,'InitialValue',0,'FinalValue',1)
```

Weighted Sample Time Math

Support calculations involving sample time

Library: Simulink / Math Operations

Description

The Weighted Sample Time Math block adds, subtracts, multiplies, or divides its input signal, u , by a weighted sample time, T_s . If the input signal is continuous, T_s is the sample time of the Simulink model. Otherwise, T_s is the sample time of the discrete input signal. If the input signal is constant, Simulink assigns a finite sample time to the block based on its connectivity and context.

You specify the math operation with the **Operation** parameter. The block can output just a weighted sample time (T_s Only) or a weighted sample rate ($1/T_s$ Only).

Enter the weighting factor in the **Weight value** parameter. If the weight, w , is 1, that value does not appear in the equation on the block icon.

Tip You can use the Weighted Sample Time and Weighted Sample Time Math blocks to extract the sample time from a Simulink signal. To do so, set the **Operation** parameter to T_s and the **Weight value** to 1.0. In this configuration, the block outputs the sample time of the input signal.

The block computes its output using the precedence rules for MATLAB operators. See “Operator Precedence” for information. For example, if the **Operation** parameter specifies $+$, the block calculates output using this equation:

$$u + (T_s * w)$$

However, if the **Operation** parameter specifies $/$, the block calculates output using this equation:

$$(u / T_s) / w$$

Ports

Input

Port_1 – Input signal

scalar | vector | matrix

Specify the input signal, u , as a scalar, vector, or matrix. Depending on the value of the **Operation** parameter, the block can add, subtract, multiply, or divide the input signal by weighted sample time or just output the weighted sample time or weighted sample rate.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

Output

Port_1 — Output signal

scalar | vector | matrix

Output the weighted sample time or sample rate of the input signal, or output the input signal adjusted by the weighted sample time, T_s . If the input signal is continuous, T_s is the sample time of the Simulink model. Otherwise, T_s is the sample time of the discrete input signal. When the input signal is constant, Simulink assigns a finite sample time to the block based on its connectivity and context.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

Parameters

Main

Operation — Math operation

+ (default) | - | * | / | Ts Only | 1/Ts Only

Specify the operation to use for adjusting the input signal. You can select: +, -, *, /, Ts Only, or 1/Ts Only.

Programmatic Use

Block Parameter: TsamMathOp

Type: character vector

Values: '+' | '-' | '*' | '/' | 'Ts Only' | '1/Ts Only'

Default: '+'

Weight value — Weight of sample time

1.0 (default) | real-valued scalar

Enter the weight of the sample time as a real-valued scalar.

Programmatic Use

Block Parameter: weightValue

Type: character vector

Values: real-valued scalar

Default: '1.0'

Implement using — Method for adjusting sample time

Online Calculations (default) | Offline Scaling Adjustment

Select one of two modes: online calculations or offline scaling adjustment.

Result of ($T_s * w$)	Output Data Type of Two Modes	Block Execution
A power of 2, or an integer value	The same, when Output data type is Inherit: Inherit via internal rule	Equally efficient in both modes
Not power of 2 and not an integer value	Different	More efficient for the offline scaling mode

Note When the **Implement using** parameter is not visible, operations default to online calculations.

Dependencies

To enable this parameter, set **Operation** to * or /.

Programmatic Use

Block Parameter: TsampMathImp

Type: character vector

Values: 'Online Calculations' | 'Offline Scaling Adjustment'

Default: 'Online Calculations'

Signal Attributes

Output data type — Data type of output signal

Inherit: Inherit via internal rule (default) | Inherit: Inherit via back propagation | <data type expression>

Specify the data type for the output.

Programmatic Use

Block Parameter: OutDataTypeStr

Type: character vector

Values: 'Inherit: Inherit via internal rule' | 'Inherit: Inherit via back propagation' | '<data type expression>'

Default: 'Inherit: Inherit via internal rule'

Integer rounding mode — Rounding mode for fixed-point operations

Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

Specify the rounding mode for fixed-point operations. For more information, see “Rounding” (Fixed-Point Designer).

Block parameters always round to the nearest representable value. To control the rounding of a block parameter, enter an expression using a MATLAB rounding function into the mask field.

Dependencies

To enable this parameter, set **Operation** to +, -, *, or /. If you set the **Operation** parameter to * or /, you must also set **Implement using** to Online Calculations.

Programmatic Use

Block Parameter: RndMeth

Type: character vector

Values: 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'

Default: 'Floor'

Saturate on integer overflow — Method of overflow action

off (default) | on

Specify whether overflows saturate or wrap.

Action	Rationale	Impact on Overflows	Example
Select this check box (on).	Your model has possible overflow, and you want explicit saturation protection in the generated code.	Overflows saturate to either the minimum or maximum value that the data type can represent.	The maximum value that the <code>int8</code> (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box selected, the block output saturates at 127. Similarly, the block output saturates at a minimum output value of -128.
Do not select this check box (off).	You want to optimize efficiency of your generated code. You want to avoid overspecifying how a block handles out-of-range signals. For more information, see "Troubleshoot Signal Range Errors".	Overflows wrap to the appropriate value that is representable by the data type.	The maximum value that the <code>int8</code> (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box cleared, the software interprets the overflow-causing value as <code>int8</code> , which can produce an unintended result. For example, a block result of 130 (binary 1000 0010) expressed as <code>int8</code> , is -126.

When you select this check box, saturation applies to every internal operation on the block, not just the output, or result. Usually, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Dependencies

To enable this parameter, set **Operation** to +, -, *, or /. If you set the **Operation** parameter to * or /, you must also set **Implement using** to Online Calculations.

Programmatic Use

Block Parameter: SaturateOnIntegerOverflow

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Block Characteristics

Data Types	Boolean double fixed point integer single
Direct Feedthrough	yes

Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

While Iterator

Repeat execution of a subsystem while a logical expression is true

Library: Ports & Subsystems

Description

The While Iterator block, when placed in a Subsystem block, repeatedly executes the contents of the subsystem during the current time step while the value of the input condition is true or 1. Use this block to implement the block diagram equivalent of a `while` loop in a programming language.

The While Iterator Subsystem block is preconfigured with a While Iterator block. Placing a While Iterator block in a Subsystem block makes it an atomic subsystem.

Ports

Input

cond — Logical condition signal

scalar

Signal with the result from evaluating a logical condition. Because the subsystem is not externally triggered during a time step, evaluating a condition as true (1) or false (0) must reside within the subsystem.

The data type and values of the signal can be:

- Logical (Boolean) — true (1) or false (0) .
- Numerical — true (any positive or negative number) or false (0).

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

IC — Initial logical condition

scalar

Signal with the initial logical condition. At the beginning of each time step:

- If IC is false (0), the subsystem does not execute during the time step.
- If IC is true (value not equal to 0), the subsystem starts executing and continues to repeat execution as long as the `cond` signal is true.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point`

Output Arguments

Iteration number — Signal with the number of iterations

scalar

Signal with the number of While Iterator Subsystem block executions during each time step.

Data Types: `double` | `int8` | `int16` | `int32`

Parameters

Maximum number of iterations — Specify maximum number of iterations

-1 (default) | integer

Specify maximum number of iterations allowed during a time step.

-1

Any number of iterations as long as the `cond` signal is true (value not equal to 0) . If you specify -1 and the `cond` signal never becomes false (0), the simulation runs in an infinite loop. In this case, the only way to stop the simulation is to terminate MATLAB.

integer

Maximum number of iterations during a time step.

Programmatic Use

Block Parameter: `MaxIters`

Type: character vector

Values: `'5'` | `'-1'` | `'<integer>'`

Default: `'5'`

While loop type — Select type of block

`while` (default) | `do-while`

Select type of block.

`while`

The While Iterator block has two inputs, a `cond` (logical condition) input and an IC (initial logical condition) input. The source of the IC signal must be external to the While Iterator Subsystem block.

At the beginning of each time step:

- If the IC input is true (value not equal to 0), the blocks in the subsystem repeat execution while the `cond` input is true. This process continues during a time step as long as the `cond` input is true and the number of iterations is less than or equal to the **Maximum number of iterations**.
- If the IC input is false, the While Iterator block does not execute the contents of the subsystem.

`do-while`

The While Iterator block has one input, the `cond` (while condition) input.

At each time step, the blocks in the subsystem repeat execution while the `cond` input is true (value not equal to 0). This process continues as long as the `cond` input is true and the number of iterations is less than or equal to the **Maximum number of iterations**.

Programmatic Use

Block Parameter: WhileBlockType

Type: character vector

Values: 'while' | 'do-while'

Default: 'while'

States when starting — Select block states between time steps

held (default) | reset

Select how to handle block states between time steps.

held

Hold block states between time steps. Block state values persist across time steps.

reset

Reset block states to their initial values at the beginning of each time step and before the first iteration loop.

Programmatic Use

Block Parameter: ResetStates

Type: character vector

Values: 'held' | 'reset'

Default: 'held'

Show iteration number port — Control display of output port

clear | select

Control display of output port for signal with number of block executions. The value of the signal from this port starts at 1 and is incremented by 1 for each succeeding iteration.

off

Remove output port.

on

Display output port for signal with iteration number.

Dependencies

Selecting this parameter enables the **Output data type** parameter.

Programmatic Use

Block Parameter: ShowIterationPort

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Output data type — Select output data type for current iteration number

int32 (default) | uint32 | int16 | uint16 | int8 | uint8 | double

Select output data type for iteration number signal. The value of this signal is the number of iterations during a time step and the total number of iterations at the end of a time step.

int32

Signed 32-bit integer.

uint32

Unsigned 32-bit integer.

int16

Signed 16-bit integer.

uint16

unsigned 16-bit integer.

int8

Signed 8-bit integer.

uint8

Unsigned 8-bit integer.

double

Double-precision floating point.

Dependencies

Select the **Show iteration number port** check box to enable this parameter.

Programmatic Use

Block Parameter: OutputDataType

Type: character vector

Value: 'int32' | 'uint32' | 'int16' | 'uint16' | 'int8' | 'uint8' | 'double'

Default: 'int32'

Iterator Subsystem Execution

Introduced before R2006a

While Iterator Subsystem

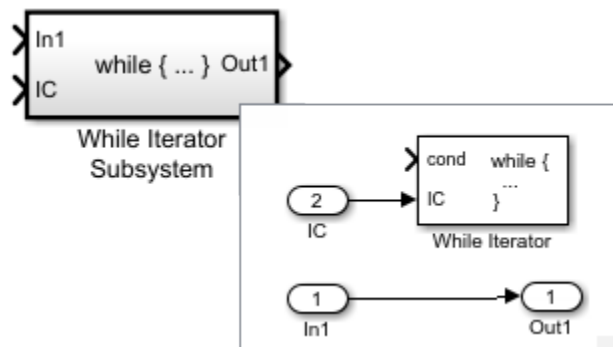

Subsystem that repeats execution during a simulation time step

Library: Simulink / Ports & Subsystems

Description

The While Iterator Subsystem block is a Subsystem block preconfigured as a starting point for creating a subsystem that repeats execution during a simulation time step while a logical condition is true. Open model.

Use While Iterator Subsystem blocks to model:

- Block diagram equivalent of a program `while` or `do-while` loop.
- An iterative algorithm that converges on a more accurate solution after multiple iterations.

When using simplified initialization mode, if you place a block that needs elapsed time (such as a Discrete-Time Integrator block) in a While Iterator Subsystem block, Simulink displays an error.

If the output signal from a While Iterator Subsystem block is a function-call signal, Simulink displays an error when you simulate the model or update the diagram.

Ports

Input

In1 — Signal input to a subsystem block

scalar | vector | matrix

Placing an Inport block in a subsystem block adds an external input port to the block. The port label matches the name of the Inport block.

Use Inport blocks to get signals from the local environment.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

IC (initial logical condition) – Control initial execution of a subsystem block
 scalar

Placing a While Iterator block connected to an Input block in a Subsystem block adds this external input port to the block.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

Output

Out – Signal output from a subsystem
 scalar | vector | matrix

Placing an Outport block in a subsystem block adds an output port from the block. The port label on the subsystem block is the name of the Outport block.

Use Outport blocks to send signals to the local environment.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Block Characteristics

Data Types	Boolean ^a bus ^a double ^a enumerated ^a fixed point ^a half ^a integer ^a single ^a string ^a
Direct Feedthrough	no
Multidimensional Signals	limited ^a
Variable-Size Signals	limited ^a
Zero-Crossing Detection	no

Width

Output width of input vector

Library: Simulink / Signal Attributes

Description

The Width block generates as output the width of its input vector.

You can use an array of buses as an input signal to a Width block. For details about defining and using an array of buses, see “Group Nonvirtual Buses in Arrays of Buses”.

Ports

Input

Port_1 — Input signal

scalar | vector | matrix | N-D array

Input signal specified as a scalar, vector, matrix, or N-D array.

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | string | Boolean | fixed point | enumerated | bus

Output

Port_1 — Width of input signal

scalar

Output is the width of the input signal, specified as a scalar.

Data Types: single | double | half | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

Parameters

Output data type mode — Output data type mode

Choose intrinsic data type (default) | Inherit via back propagation | All ports same datatype

Specify the output data type to be the same as the input, or inherit the data type by back propagation. You can also choose to specify a built-in data type from the drop-down list in the **Output data type** parameter.

Programmatic Use

Block Parameter: OutputDataTypeScalingMode

Type: character vector

Values: 'Choose intrinsic data type' | 'Inherit via back propagation' | 'All ports same datatype'

Default: 'Choose intrinsic data type'

Output data type — Output data type

double (default) | single | int8 | uint8 | int16 | uint16 | int32 | uint32

This parameter is visible when you select Choose intrinsic data type for **Output data type mode**. Select a built-in data type from the drop-down list.

Programmatic Use

Block Parameter: DataType

Type: character vector

Values: 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32'

Default: 'double'

Block Characteristics

Data Types	Boolean bus double enumerated fixed point half integer single string
Direct Feedthrough	yes
Multidimensional Signals	yes
Variable-Size Signals	yes
Zero-Crossing Detection	no

Extended Capabilities

Wrap To Zero

Set output to zero if input is above threshold

Library: Simulink / Discontinuities
HDL Coder / Discontinuities

Description

The Wrap To Zero block sets the output to zero when the input is above the **Threshold** value. When the input is less than or equal to the **Threshold**, then the output is equal to the input.

Ports

Input

Port_1 — Input signal

scalar | vector

Input signal, specified as a scalar or vector. Signal values equal to or greater than the value of **Threshold** are set to zero.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

Output

Port_1 — Output signal

scalar | vector

Output signal set to the input signal value or zero. The data type of the output is the same data type as the input.

Tip If the input data type cannot represent zero, parameter overflow occurs. To detect this overflow, go to the **Diagnostics > Data Validity** pane of the Configuration Parameters dialog box and set **Parameters > Detect overflow** to warning or error.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point

Parameters

To edit the parameters for the Wrap to Zero block, double-click the block icon.

Threshold — Threshold for outputting zero

255 (default) | scalar

Threshold value for setting the output value to zero.

Programmatic Use**Block Parameter:** Threshold**Type:** character vector**Values:** scalar**Default:** '255'**Block Characteristics**

Data Types	Boolean double fixed point integer single
Direct Feedthrough	no
Multidimensional Signals	yes
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities**C/C++ Code Generation**

Generate C and C++ code using Simulink® Coder™.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

HDL Architecture

This block has a single, default HDL architecture.

HDL Block Properties

ConstrainedOutputPipeline	Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is 0. For more details, see "ConstrainedOutputPipeline" (HDL Coder).
InputPipeline	Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see "InputPipeline" (HDL Coder).
OutputPipeline	Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see "OutputPipeline" (HDL Coder).

Restrictions

The input signal and **Threshold** parameter must have equal size. For example, if the input is a two-dimensional vector, **Threshold** must also be a two-dimensional vector.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Introduced before R2006a

XY Graph

Display X-Y plot of signals using MATLAB figure window

Library: Simulink / Sinks
HDL Coder / Sinks

Description

The XY Graph block displays an X-Y plot of its inputs in a MATLAB figure window.

The block has two scalar inputs. The block plots data from the first input (the x direction) against data from the second input (the y direction). (See “Port Location After Rotating or Flipping” for a description of the port order for various block orientations.) This block is useful for examining limit cycles and other two-state data. Data outside the specified range does not appear.

A figure window appears for each XY Graph block in the model at the start of simulation.

Note The XY Graph block does not support stepping back in a simulation.

Ports

Input

Port_1 — X-axis values

scalar

Plot input as x values on an X-Y plot. See “Port Location After Rotating or Flipping” for a description of the port order for various block orientations.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point`

Port_2 — Y-axis values

scalar

Plot input as y values on an X-Y plot. See “Port Location After Rotating or Flipping” for a description of the port order for various block orientations.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `Boolean` | `fixed point`

Parameters

X-min — Minimum x

-1 (default) | real number

Specify the minimum x -axis value. Data below the minimum x is ignored.

Programmatic Use

Block Parameter: `xmin`

Type: character vector

Values: real number

Default: `'-1'`

X-max — Maximum x

1 (default) | real number

Specify the maximum x -axis value. Data above the maximum x is ignored.

Programmatic Use

Block Parameter: `xmax`

Type: character vector

Values: real number

Default: `'1'`

Y-min — Minimum y

-1 (default) | real number

Specify the minimum y -axis value. Data below the minimum y is ignored.

Programmatic Use

Block Parameter: `ymin`

Type: character vector

Values: real number

Default: ' -1 '

Y-max — Maximum y

1 (default) | real number

Specify the maximum y-axis value. Data above the maximum y is ignored.

Programmatic Use

Block Parameter: ymax

Type: character vector

Values: real number

Default: ' 1 '

Sample time — Sample time

-1 (default) | positive number

Specify the time interval between samples. To inherit the sample time, set this parameter to -1. For more information, see “Specify Sample Time”.

Programmatic Use

Block Parameter: st

Type: character vector

Values: ' -1 ' (for inherited) | positive number

Default: ' -1 '

Block Characteristics

Data Types	Boolean double enumerated fixed point integer single
Direct Feedthrough	no
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

This block can be used for simulation visibility in systems that generate code, but is not included in the generated code.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

This block can be used for simulation visibility in subsystems that generate HDL code, but is not included in the hardware implementation.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

This block can be used for simulation visibility in systems that generate PLC code, but is not included in the generated code.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

This block accepts fixed-point input, but converts it to double for display.

Introduced before R2006a

Zero-Order Hold

Implement zero-order hold sample period

Library: Simulink / Discrete
HDL Coder / Discrete

Description

The Zero-Order Hold block holds its input for the sample period you specify. If the input is a vector, the block holds all elements of the vector for the same sample period.

You specify the time between samples with the **Sample time** parameter. A setting of -1 means the block inherits the **Sample time**.

Tip Do not use the Zero-Order Hold block to create a fast-to-slow transition between blocks operating at different sample rates. Instead, use the Rate Transition block.

Bus Support

The Zero-Order Hold block is a bus-capable block. The input can be a virtual or nonvirtual bus signal. No block-specific restrictions exist. All signals in a nonvirtual bus input to a Zero-Order Hold block must have the same sample time, even if the elements of the associated bus object specify inherited sample times. You can use a Rate Transition block to change the sample time of an individual signal, or of all signals in a bus. See “Modify Sample Times for Nonvirtual Buses” and “Bus-Capable Blocks” for more information.

You can use an array of buses as an input signal to a Zero-Order Hold block. For details about defining and using an array of buses, see “Group Nonvirtual Buses in Arrays of Buses”.

Comparison with Similar Blocks

The Memory, Unit Delay, and Zero-Order Hold blocks provide similar functionality but have different capabilities. Also, the purpose of each block is different.

This table shows recommended usage for each block.

Block	Purpose of the Block	Reference Examples
Unit Delay	Implement a delay using a discrete sample time that you specify. The block accepts and outputs signals with a discrete sample time.	<ul style="list-style-type: none"> “Engine Timing Model with Closed Loop Control” on page 13-143 (Compression subsystem)

Block	Purpose of the Block	Reference Examples
Memory on page 1-1058	Implement a delay by one major integration time step. Ideally, the block accepts continuous (or fixed in minor time step) signals and outputs a signal that is fixed in minor time step.	<ul style="list-style-type: none"> • “Building a Clutch Lock-Up Model” on page 13-147 (Friction Mode Logic/Lockup FSM subsystem) • “Capture the Velocity of a Bouncing Ball with the Memory Block” on page 12-87
Zero-Order Hold	Convert an input signal with a continuous sample time to an output signal with a discrete sample time.	<ul style="list-style-type: none"> • “Developing the Apollo Lunar Module Digital Autopilot” on page 13-206 • “Radar Tracking Using MATLAB Function Block” on page 13-230

Each block has the following capabilities.

Capability	Memory	Unit Delay	Zero-Order Hold
Specification of initial condition	Yes	Yes	No, because the block output at time $t = 0$ must match the input value.
Specification of sample time	No, because the block can only inherit sample time from the driving block or the solver used for the entire model.	Yes	Yes
Support for frame-based signals	No	Yes	Yes
Support for state logging	No	Yes	No

Ports

Input

Port_1 – Input signal

scalar | vector

Input signal that the block holds by one sample period.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Output

Port_1 – Output signal

scalar | vector

Output signal that is the input held by one sample period.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | Boolean | fixed point | enumerated | bus

Parameters

Sample time (-1 for inherited) — Discrete interval between sample time hits

-1 (default) | scalar

Specify the time interval between samples. To inherit the sample time, set this parameter to -1. See “Specify Sample Time” in the online documentation for more information.

Do not specify a continuous sample time, either 0 or [0, 0]. This block supports only discrete sample times. When this parameter is -1, the inherited sample time must be discrete and not continuous.

Block Characteristics

Data Types	Boolean bus double enumerated fixed point integer single
Direct Feedthrough	yes
Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Generated code relies on memcpy or memset functions (strong.h) under certain conditions.

HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

HDL Architecture

This block has a single, default HDL architecture.

HDL Block Properties

ConstrainedOutputPipeline	Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is 0. For more details, see “ConstrainedOutputPipeline” (HDL Coder).
InputPipeline	Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “InputPipeline” (HDL Coder).

OutputPipeline	Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “OutputPipeline” (HDL Coder).
-----------------------	--

Complex Data Support

This block supports code generation for complex signals.

Introduced before R2006a

Zero-Pole

Model system by zero-pole-gain transfer function

Library: Simulink / Continuous

Description

The Zero-Pole block models a system that you define with the zeros, poles, and gain of a Laplace-domain transfer function. This block can model single-input single-output (SISO) and single-input multiple-output (SIMO) systems.

Conditions for Using This Block

The Zero-Pole block assumes the following conditions:

- The transfer function has the form

$$H(s) = K \frac{Z(s)}{P(s)} = K \frac{(s - Z(1))(s - Z(2)) \dots (s - Z(m))}{(s - P(1))(s - P(2)) \dots (s - P(n))},$$

where Z represents the zeros, P the poles, and K the gain of the transfer function.

- The number of poles must be greater than or equal to the number of zeros.
- If the poles and zeros are complex, they must be complex-conjugate pairs.
- For a multiple-output system, all transfer functions must have the same poles. The zeros can differ in value, but the number of zeros for each transfer function must be the same.

Note You cannot use a Zero-Pole block to model a multiple-output system when the transfer functions have a differing number of zeros or a single zero each. Use multiple Zero-Pole blocks to model such systems.

Modeling a Single-Output System

For a single-output system, the input and the output of the block are scalar time-domain signals. To model this system:

- 1 Enter a vector for the zeros of the transfer function in the **Zeros** field.
- 2 Enter a vector for the poles of the transfer function in the **Poles** field.
- 3 Enter a 1-by-1 vector for the gain of the transfer function in the **Gain** field.

Modeling a Multiple-Output System

For a multiple-output system, the block input is a scalar and the output is a vector, where each element is an output of the system. To model this system:

- 1 Enter a matrix of zeros in the **Zeros** field.

Each *column* of this matrix contains the zeros of a transfer function that relates the system input to one of the outputs.

- 2 Enter a vector for the poles common to all transfer functions of the system in the **Poles** field.
- 3 Enter a vector of gains in the **Gain** field.

Each element is the gain of the corresponding transfer function in **Zeros**.

Each element of the output vector corresponds to a column in **Zeros**.

Transfer Function Display on the Block

The Zero-Pole block displays the transfer function depending on how you specify the zero, pole, and gain parameters.

- If you specify each parameter as an expression or a vector, the block shows the transfer function with the specified zeros, poles, and gain. If you specify a variable in parentheses, the block evaluates the variable.

For example, if you specify **Zeros** as [3,2,1], **Poles** as (poles), where poles is [7,5,3,1], and **Gain** as gain, the block looks like this.

$$\frac{\text{gain}(s-3)(s-2)(s-1)}{(s-7)(s-5)(s-3)(s-1)}$$

- If you specify each parameter as a variable, the block shows the variable name followed by (s) if appropriate.

For example, if you specify **Zeros** as zeros, **Poles** as poles, and **Gain** as gain, the block looks like this.

$$\frac{\text{gain}^*\text{zeros}(s)}{\text{poles}(s)}$$

Ports

Input

Port_1 – Input signal

scalar

Input signal, specified as a scalar with data type double.

Data Types: double

Output

Port_1 – Output signal

scalar | vector

System modeled by a zero-pole gain transfer function, provided as a scalar or vector signal with data type double.

- When modeling a single-output system, the block outputs a scalar time-domain signal. For more information, see “Modeling a Single-Output System” on page 1-1905.

- When modeling a multiple-output system, the block outputs a vector, where each element is an output of the system. For more information, see “Modeling a Multiple-Output System” on page 1-1905.

Data Types: double

Parameters

Zeros — Matrix of zeros

[1] (default) | vector | matrix

Define the matrix of zeros.

- For a single-output system, enter a vector for the zeros of the transfer function.
- For a multiple-output system, enter a matrix. Each *column* of this matrix contains the zeros of a transfer function that relates the system input to one of the outputs.

Programmatic Use

Block Parameter: Zeros

Type: character vector, string

Value: vector | matrix

Default: ' [1] '

Poles — Vector of poles

[0 -1] (default) | vector

Define the vector of poles.

- For a single-output system, enter a vector for the poles of the transfer function.
- For a multiple-output system, enter a vector for the poles common to all transfer functions of the system.

Programmatic Use

Block Parameter: Poles

Type: character vector, string

Value: vector

Default: ' [0 -1] '

Gain — Vector of gains

[1] (default) | vector

Define the vector of gains.

- For a single-output system, enter a 1-by-1 vector for the gain of the transfer function.
- For a multiple-output system, enter a vector of gains. Each element is the gain of the corresponding transfer function in **Zeros**.

Programmatic Use

Block Parameter: Gain

Type: character vector, string

Value: vector

Default: ' [1] '

Absolute tolerance — Absolute tolerance for computing block states

auto (default) | scalar | vector

Absolute tolerance for computing block states, specified as a positive, real-valued, scalar or vector. To inherit the absolute tolerance from the Configuration Parameters, specify `auto` or `-1`.

- If you enter a real scalar, then that value overrides the absolute tolerance in the Configuration Parameters dialog box for computing all block states.
- If you enter a real vector, then the dimension of that vector must match the dimension of the continuous states in the block. These values override the absolute tolerance in the Configuration Parameters dialog box.
- If you enter `auto` or `-1`, then Simulink uses the absolute tolerance value in the Configuration Parameters dialog box (see “Solver Pane”) to compute block states.

Programmatic Use**Block Parameter:** AbsoluteTolerance**Type:** character vector, string**Values:** 'auto' | '-1' | any positive real-valued scalar or vector**Default:** 'auto'**State Name (e.g., 'position') — Assign unique name to each state**

' ' (default) | 'position' | {'a', 'b', 'c'} | a | ...

Assign a unique name to each state. If this field is blank (' '), no name assignment occurs.

- To assign a name to a single state, enter the name between quotes, for example, 'position'.
- To assign names to multiple states, enter a comma-delimited list surrounded by braces, for example, {'a', 'b', 'c'}. Each name must be unique.
- To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, string, cell array, or structure.

Limitations

- The state names apply only to the selected block.
- The number of states must divide evenly among the number of state names.
- You can specify fewer names than states, but you cannot specify more names than states.

For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states.

Programmatic Use**Block Parameter:** ContinuousStateAttributes**Type:** character vector, string**Values:** ' ' | user-defined**Default:** ' '**Block Characteristics**

Data Types	double
Direct Feedthrough	yes

Multidimensional Signals	no
Variable-Size Signals	no
Zero-Crossing Detection	no

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production-quality code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. The code generated can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code.

In general, consider using the Simulink Model Discretizer to map continuous blocks into discrete equivalents that support production code generation. To start the Model Discretizer, in the Simulink Editor, on the **Apps** tab, under **Apps**, under **Control Systems**, click **Model Discretizer**. One exception is the Second-Order Integrator block because, for this block, the Model Discretizer produces an approximate discretization.

Functions

add_block

Add block to model

Syntax

```
h = add_block(source,dest)
h = add_block(source,dest,'MakeNameUnique','on')
h = add_block(____,'CopyOption','nolink')
h = add_block(sourceIn,destIn,'CopyOption','duplicate')
h = (____,Name,Value)
```

Description

`h = add_block(source,dest)` adds a copy of the block `source` from a library or model to the specified destination model and block name. This syntax creates the block at the same location as it appears in the model or the library model.

If you are copying between models or from a library, load the destination model first.

`h = add_block(source,dest,'MakeNameUnique','on')` ensures that the destination block name is unique in the model. This syntax adds a number to the destination block name if a block with that name exists, incrementing to ensure a unique name.

`h = add_block(____,'CopyOption','nolink')` copies the block or subsystem `source` from a library without creating a link to the library block.

`h = add_block(sourceIn,destIn,'CopyOption','duplicate')` duplicates an inport block in a subsystem, giving the destination block the same port number as the source block. Duplicate an inport to branch a signal from an input port without creating a port or adding lines. For more information, see “Creating Duplicate Inport Blocks” on page 1-769.

`h = (____,Name,Value)` uses optional `Name,Value` arguments.

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

With the `add_block` function, you can use block parameter and value pairs. For a list of all the block parameters, see “Common Block Properties” on page 6-12 and “Block-Specific Parameters” on page 6-27.

Examples

Add Block to Model from a Library

Add the block from the Simulink library to the model `f14`.

Load or open the destination model.

```
open_system('f14');
```

Add the Scope block from the Simulink Sinks library to f14, naming the new block MyScope.

```
add_block('simulink/Sinks/Scope','f14/MyScope');
```

Add a Block from Another Model

Add a copy of a block from the model f14 to vdp.

Load or open the destination model.

```
open_system('vdp');
```

Add the Actuator Model block from f14 to vdp.

```
add_block('f14/Actuator Model','vdp/Actuator Model');
```

Add a Block Using a Unique Name

Add the block from the Simulink library to the model vdp. Because there is already a block named Scope in vdp, use the MakeNameUnique option to ensure that the new block name is unique.

Load or open the destination model.

```
open_system('vdp');
```

Add the Scope block from the Simulink Sinks library to vdp, ensuring that the name is unique.

```
add_block('simulink/Sinks/Scope','vdp/Scope','MakeNameUnique','on')
```

Duplicate an Inport Block in a Subsystem

Add an inport block in the f14/Controller subsystem that uses the same port number as another inport in that subsystem.

Duplicate the Stick Input (in) block in the Controller subsystem, naming the copy Stick Input (in)2. The resulting block uses the same port number as Stick Input (in) but does not add an inport on the parent subsystem. The signal that enters that port branches to both inports.

```
add_block('f14/Controller/Stick Input (in)',...
'f14/Controller/Stick Input (in)2','CopyOption','duplicate')
```

Add a Block and Set Parameters

Add a block from a library to a model and set parameters using a Name, Value pair.

Load or open the destination model.

```
open_system('vdp');
```

Add a Gain block from the library to vdp, and set the Gain value to 5.

```
add_block('simulink/Math Operations/Gain','vdp/Five','Gain','5')
```

Input Arguments

source — Block to copy to model

block path | library block path

Block to copy to model, specified as:

- The full block path if you are copying the block from another model, for example, 'vdp/Mu'. This usage copies the block and its settings.
- The library block path if you want to add a block from a library, for example, 'simulink/Math Operations/Gain'.

To get the library block path, you can hover over the block in the Library Browser. Alternatively, you can open the library model, select the block, and enter `gcb` at the command line. To open the library model, in the Library Browser, right-click the library name in the library list and select **Open *Library_name* library**.

You can also use the syntax '`built-in/blocktype`' as the source block path, where *blocktype* is the programmatic block name—the value of the `BlockType` parameter (see “Common Block Properties” on page 6-12). However, blocks added using '`built-in/blocktype`' sometimes have different default parameter values from library blocks.

For subsystems and masked blocks, use the library block path. Using the `BlockType` value (`SubSystem`) creates an empty subsystem.

Example: 'vdp/Mu', 'simulink/Sinks/Scope'

dest — Name and location of new block

block path

Name and location of the new block in the model, specified as the block path.

Example: 'f14/Controller/MyNewBlock'

sourceIn — Inport block whose port number to copy

block path

Inport block whose port number to copy, specified as the block path.

Example: 'f14/Controller/Stick Input (in)', 'myModel/mySubsystem/In1'

destIn — Inport block to create

block path

Inport block with duplicate port number to create, specified as the block path. Create the destination block in the same system as the source block.

Example: 'myModel/mySubsystem/DupPortIn'

Output Arguments

h — New block

handle

New block, returned as a handle.

Introduced before R2006a

add_exec_event_listener

Register listener for block method execution event

Syntax

```
h = add_exec_event_listener(blk,event,listener);
```

Description

`h = add_exec_event_listener(blk,event,listener)` registers a listener for a block method execution event where the listener is a MATLAB program that performs some task, such as logging runtime data for a block, when the event occurs (see “Listen for Method Execution Events”). Simulink software invokes the registered listener whenever the specified event occurs during simulation of the model. You cannot register a listener for virtual blocks.

Note Simulink software can register a listener only while a simulation is running. Invoking this function when no simulation is running results in an error message. To ensure that a listener catches all relevant events triggered by a model's simulation, you should register the listener in the model's `StartFcn` callback function (see “Callbacks for Customized Model Behavior”).

Input Arguments

`blk`

Specifies the block whose method execution event the listener is intended to handle. May be one of the following:

- Full pathname of a block
- A block handle
- A block runtime object (see “Access Block Data During Simulation”).

`event`

Specifies the type of event for which the listener listens. It may be any of the following:

Event	Occurs...
'PreDerivatives'	Before a block's Derivatives method executes
'PostDerivatives'	After a block's Derivatives method executes
'PreOutputs'	Before a block's Outputs method executes.
'PostOutputs'	After a block's Outputs method executes
'PreUpdate'	Before a block's Update method executes
'PostUpdate'	After a block's Update method executes

`listener`

Specifies the listener to be registered. It may be either a character vector specifying a MATLAB expression, e.g., `'disp(''here'')` or a handle to a MATLAB function that accepts two

arguments. The first argument is the block runtime object of the block that triggered the event. The second argument is an instance of `EventData` class that specifies the runtime object and the name of the event that just occurred.

Output Arguments

`add_exec_event_listener` returns a handle to the listener that it registered. To stop listening for an event, use the MATLAB `clear` command to clear the listener handle from the workspace in which the listener was registered.

Introduced before R2006a

add_line

Add line to Simulink model

Syntax

```
h = add_line(sys,out,in)
h = add_line(sys,out,in,'autorouting',autoOption)
h = add_line(sys,points)
```

Description

`h = add_line(sys,out,in)` adds a line in the model or subsystem `sys` that connects one block's output port `out` to another block's input port `in`. This syntax draws the most direct route from port to port, for example, diagonal lines or lines that go through other blocks.

You can connect ports when:

- The input port does not already have a connection.
- The blocks are compatible for connecting.

`h = add_line(sys,out,in,'autorouting',autoOption)` connects blocks, specifying whether to route the lines around other blocks.

`h = add_line(sys,points)` adds a line drawn by (x,y) coordinate `points` relative to the upper-left corner of the Simulink Editor canvas before any canvas resizing. If either end of the line is within five pixels of a corresponding port, the function connects the line to it. The line can have multiple segments.

Examples

Connect Blocks Using Port Numbers

Use the block port numbers to add a line to connect blocks.

Create a model and open it.

```
open_system(new_system('connect_model'));
```

Add and position a Constant block and a Gain block.

```
add_block('simulink/Commonly Used Blocks/Constant','connect_model/Constant');
set_param('connect_model/Constant','position',[140,80,180,120]);
add_block('simulink/Commonly Used Blocks/Gain','connect_model/Gain');
set_param('connect_model/Gain','position',[220,80,260,120]);
```

Connect the blocks. Each block has one port, so specify port 1.

```
add_line('connect_model','Constant/1','Gain/1');
```

Connect Blocks Using Port Handles

Get the port handles and connect the ports using `add_line`.

Open the model `vdp`.

```
open_system('vdp');
```

Delete the line that connects the Mu gain block to the Sum block.

```
delete_line('vdp','Mu/1','Sum/2');
```

Get the port handles from the Mu block and the Sum block.

```
h = get_param('vdp/Mu','PortHandles');
h1 = get_param('vdp/Sum','PortHandles');
```

Look at the `h1` structure. Notice the two handles for the `Inport` property.

```
h1
```

```
h1 =
```

```
struct with fields:
    Inport: [47.0002 54.0002]
    Output: 39.0002
    Enable: []
    Trigger: []
    State: []
    LConn: []
    RConn: []
    Ifaction: []
    Reset: []
```

Index into the `Outputport` and `Inport` properties on the port handles to get the handles you want and connect them. Connect to the second inport.

```
add_line('vdp',h.Outputport(1),h1.Inport(2));
```

Add a Branched Line

You can branch a line by adding a connection programmatically. You can use the `points` syntax to draw the segment, or you can draw the line by specifying the ports to connect. When using the port, use automatic line routing to improve the look of the branched line.

Add a scope to the `vdp` model above the outputport.

```
vdp
add_block('simulink/Commonly Used Blocks/Scope','vdp/Scope1');
set_param('vdp/Scope1','position',[470,70,500,110]);
```

Connect the Integrator block `x1` to `Scope1`. This code branches the existing line from the `x1` output and connects it to the scope. With autorouting on, the resulting line is segmented.

```
add_line('vdp', 'x1/1', 'Scope1/1', 'autorouting', 'on')
```

Connect Blocks Using Points

You can use points on the canvas as the start and end of each segment. Get the port locations using `get_param` with the 'PortConnectivity' option.

Open the model `vdp` and delete the line that connects the Mu and Sum blocks.

```
vdp
delete_line('vdp', 'Mu/1', 'Sum/2')
```

Get the port locations for Mu. Mu has two ports. The first is the input port, and the second is the output port.

```
mu = get_param('vdp/Mu', 'PortConnectivity');
mu.Position
```

```
ans =
    190    150
```

```
ans =
    225    150
```

Get the port locations for Sum, which has three ports. The second position is the lower input port.

```
s = get_param('vdp/Sum', 'PortConnectivity');
s.Position
```

```
ans =
    250    135
```

```
ans =
    250    150
```

```
ans =
    285    145
```

Connect the ports using the output and input points.

```
add_line('vdp', [225 150; 250 150])
```

Connect Blocks Using Autorouting Options

This example shows the effect of adding lines with and without autorouting options.

Create a model route. Display default block names.

```
open_system(new_system('route'));
set_param('route','HideAutomaticNames','off')
```

Add blocks as shown. Add an inport and outport to each subsystem.

Add lines to connect the outputs from Subsystem to the inputs of Subsystem1.

```
add_line('route',{'Subsystem/1','Subsystem/2'},...
        {'Subsystem1/1','Subsystem1/2'})
```

Because you did not use the autorouting options, the function draws straight lines, which pass through the Gain block.

Delete the lines. Add lines again, this time using the autorouting option set to 'on'.

```
add_line('route',{'Subsystem/1','Subsystem/2'},...
        {'Subsystem1/1','Subsystem1/2'},'autorouting','on')
```

The lines route around the Gain block.

Delete the lines. Add lines again, using the smart autorouting option. When you use an array to connect two sets of inports and outports, 'smart' autorouting routes them together if doing so makes better use of the space.

```
add_line('route',{'Subsystem/1','Subsystem/2'},...
        {'Subsystem1/1','Subsystem1/2'},'autorouting','smart')
```

Input Arguments

sys – Model or subsystem to add line to

character vector

Model or subsystem to add the line to, specified as character vector.

Example: 'vdp', 'f14/Controller'

out – Block output port to connect line from

block/port name or number character vector | port handle | array of port designators

Block output port to connect line from, specified as:

- The block name, a slash, and the port name or number. Most block ports are numbered from top to bottom or from left to right. For a state port, use the port name State instead of a port number.
- The port handle that you want to connect from.
- An array of either of these port designators.

Use 'PortHandles' with `get_param` to get the handles.

Example: 'Mu/1', 'Subsystem/2', `h.Outputport(1) {'Subsystem/1', 'Subsystem/2'}`

in – Block input port to connect line to

block/port name or number character vector | port handle | array of port designators

Block input port to connect line to, specified as:

- The block name, a slash, and the port name or number. The port name on:
 - An enabled subsystem is Enable.
 - A triggered subsystem is Trigger.
 - If Action and Switch Case Action subsystems is Action.
- The port handle that you want to add the line to.
- An array of either of these port designators.

Use the 'PortHandles' option with `get_param` to get handles.

Example: 'Mu/1', 'Subsystem/2', `h.Inport(1), {'Subsystem/1', 'Subsystem/2'}`

autoOption – Type of automatic line routing

'off' (default) | 'on' | 'smart'

Type of automatic line routing around other blocks, specified as:

- 'off' for no automatic line routing
- 'on' for automatic line routing
- 'smart' for automatic line routing that takes the best advantage of the blank spaces on the canvas and avoids overlapping other lines and labels

points — Points of the line to draw

matrix

Points of the line to draw, specified as at least a 2-by-2 matrix. Add a row for every segment you want to draw. Specify points as (x,y) coordinates from the upper-left corner of the Editor before any canvas resizing.

Example: [100 300; 200 300; 200 300; 200 500]

Output Arguments**h — Line**

handle

Line created by add_line, returned as a handle.

add_param

Add parameter to Simulink system

Syntax

```
add_param(sys,param1,val1,...,paramN,valN)
```

Description

`add_param(sys,param1,val1,...,paramN,valN)` adds the specified parameters to the specified system and initializes the parameters to the specified values. The parameters are saved in the corresponding SLX or MDL file. You can use the `set_param` and `get_param` functions on the parameters.

Examples

Add Parameters and Values to System

Add the parameters `DemoName` and `EquationOrder` to the `vdp` model with the values `'VanDerPolEquation'` and `'2'`, respectively.

```
add_param('vdp','DemoName','VanDerPolEquation','EquationOrder','2')
```

Use the `get_param` function to query the values of the new parameters.

```
get_param('vdp','DemoName')
```

```
ans =
```

```
    'VanDerPolEquation'
```

Input Arguments

sys — System name or handle

character vector | string scalar | numeric scalar

System name or handle, specified as a character vector, string scalar, or numeric scalar. The system must be an SLX or MDL file.

Data Types: double | char | string

paramN — Name of parameter

character vector | string scalar

Name of parameter, specified as a character vector or string scalar.

Parameter names are case insensitive. For example, `'ParameterName'` is equivalent to `'parametername'`.

You cannot add a parameter that has the same name as an existing parameter of the system.

Dependencies

To use this parameter, specify a corresponding `val1` argument.

Data Types: `char` | `string`

valN — Initial value of parameter

`character vector` | `string scalar`

Initial value of parameter, specified as a character vector or string scalar.

Values are case sensitive.

Dependencies

To use this parameter, specify a corresponding `param1` argument.

Data Types: `char` | `string`

See Also

`delete_param` | `get_param` | `set_param`

Introduced before R2006a

addFile

(Not recommended) Add file to project

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
addFile(proj, fileorfolder)
```

Description

`addFile(proj, fileorfolder)` adds a file to the project `proj`.

Examples

Add Files to a Project

Open the airframe project and create a project object.

```
sldemo_slproject_airframe  
proj = simulinkproject;
```

Remove a file.

```
removeFile(proj, 'models/AnalogControl.slx')
```

Add the file back to the project.

```
addFile(proj, 'models/AnalogControl.slx');
```

Create and save a new model.

```
new_system('mymodel');  
save_system('mymodel');
```

Add the new file to the project and return a project file object.

```
newPrjFile = addFile(proj, 'mymodel.slx');
```

Use the project file object to manipulate the file, for example, adding a label.

```
addLabel(newPrjFile, 'Classification', 'Design')
```

Input Arguments

proj — **Project**
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

fileorfolder — Path of file or folder

character vector | cell array of character vectors | string array

Path of the file or folder to add relative to the project root folder, specified as a character vector, string, or array. Files must include the file extension. The file or folder must be within the root folder.

Example: 'models/myModelName.slx'

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

Functions

`addFolderIncludingChildFiles` | `removeFile` | `simulinkproject`

Introduced in R2013a

addFolderIncludingChildFiles

(Not recommended) Add folder and child files to project

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
addFolderIncludingChildFiles(proj, folder)
```

Description

`addFolderIncludingChildFiles(proj, folder)` adds a folder and all child files to the project `proj`.

Examples

Add Folders to a Project

Open the airframe project and create a project object.

```
sldemo_slproject_airframe  
proj = simulinkproject;
```

Create a new folder in the project folder.

```
new_folder_path = fullfile(proj.RootFolder, 'new_folder')  
mkdir(new_folder_path);
```

Create a new folder in the previous folder.

```
new_sub_folder_path = fullfile(new_folder_path, 'new_sub_folder')  
mkdir(new_sub_folder_path);
```

Create a new file in the folder.

```
filepath = fullfile(new_sub_folder_path, 'new_model_in_subfolder.slx')  
new_system('new_model_in_subfolder');  
save_system('new_model_in_subfolder', filepath)
```

Add this new folder and child files to the project.

```
projectFile = addFolderIncludingChildFiles(proj, new_folder_path)
```

Input Arguments

proj — **Project**
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

folder — Path of folder

character vector | string

Path of the folder to add relative to the project root folder, specified as a character vector or string. The folder must be within the root folder.

Example: 'models'

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

`upgradeadvisor`

Introduced before R2006a

attachConfigSet

Associate configuration set or configuration reference with model

Syntax

```
attachConfigSet(model, configObj)  
attachConfigSet(model, configObj, allowRename)
```

Description

`attachConfigSet(model, configObj)` associates the configuration set or configuration reference `configObj` with `model`.

`attachConfigSet(model, configObj, allowRename)` associates the configuration set to the model and determines how Simulink handles a name conflict between `configObj` and any configuration objects that are already attached to the model.

If `allowRename` is `false` and the configuration object specified by `configObj` has the same name as a configuration object already attached to `model`, Simulink generates an error. If `allowRename` is `true` and a name conflict occurs, Simulink provides a unique name for `configObj` before associating it with the model.

Examples

Create and Attach a Configuration Set

Create a configuration set and attach it to a model.

Open the model `sldemo_fuelsys`.

```
sldemo_fuelsys
```

Create a configuration set named `Config1` and attach it to the model.

```
configObj = Simulink.ConfigSet;  
set_param(configObj, 'Name', 'Config1')  
attachConfigSet('sldemo_fuelsys', configObj)
```

To use the configuration set for the model, activate it.

Attach and Rename a Configuration Set

Attach a configuration set to a model that already has a configuration set with the same name.

Open the model `sldemo_fuelsys`. The model uses a configuration set with the default name `Configuration`.

```
sldemo_fuelsys
```

Create another configuration set and name it Configuration.

```
configObj = Simulink.ConfigSet;  
set_param(configObj, 'Name', 'Configuration')
```

Attach the configuration to the model. Specify allowRename as true.

```
attachConfigSet('sldemo_fuelsys', configObj, true)
```

Because the model already has a configuration set named Configuration, Simulink changes the name of configObj to Configuration1 before attaching it to the model.

To use the configuration for the model, activate Configuration1.

Input Arguments

model — Model to attach configuration set to

character vector | string scalar

Model to which you want to attach a configuration set, specified as a character vector or string scalar. The model must be open.

Example: 'my_model'

configObj — Configuration object

ConfigSet object | ConfigSetRef object

Configuration object that you want to attach to the model, specified as a ConfigSet object or a Simulink.ConfigSetRef object.

Example: myConfigObj

allowRename — Rename configuration object if there is a naming conflict

false (default) | true

Specification that determines if Simulink renames the configuration object in the case of a name conflict, specified as a Boolean. If allowRename is false and a name conflict occurs, Simulink generates an error. You cannot attach a configuration object to a model if the configuration object is already attached to another model.

Example: true

See Also

attachConfigSetCopy | detachConfigSet | getConfigSet | getConfigSets | setActiveConfigSet

Topics

“Manage Configuration Sets for a Model”

“Share a Configuration with Multiple Models”

Introduced before R2006a

attachConfigSetCopy

Copy configuration set or configuration reference and associate it with model

Syntax

```
configObjCopy = attachConfigSet(model, configObj)
attachConfigSetCopy(model, configObj, allowRename)
```

Description

`configObjCopy = attachConfigSet(model, configObj)` creates a copy of the configuration set or configuration reference `configObj` and associates it with `model`. The function returns the copy of the configuration as a `Simulink.ConfigSet` object or a `Simulink.ConfigSetRef` object.

`attachConfigSetCopy(model, configObj, allowRename)` associates the configuration copy with the model and determines how Simulink handles a name conflict between the configuration and any configuration objects that are already attached to the model.

If `allowRename` is `false` and the configuration object specified by `configObj` has the same name as a configuration object already attached to `model`, Simulink generates an error. If `allowRename` is `true` and a name conflict occurs, Simulink provides a unique name for the copy of `configObj` before associating it with the model.

Examples

Copy Configuration From One Model to Another Model

This example shows to create a copy of the active configuration for the model `sldemo_bounce` and attach the copy to the model `sldemo_boiler`.

Open the model `sldemo_bounce` and get the active configuration object.

```
sldemo_bounce
slbounceConfigObj = getActiveConfigSet('sldemo_bounce');
```

Each model has a configuration with the default name `Configuration`. To avoid a naming conflict when you attach the configuration copy to `sldemo_boiler`, name the configuration `slbounceConfig`.

```
set_param(slbounceConfigObj, 'Name', 'slbounceConfig');
```

Open the model `sldemo_boiler`. Copy the configuration object `slbounceConfigObj` and attach it to `sldemo_boiler`.

```
sldemo_boiler
attachConfigSetCopy('sldemo_boiler', slbounceConfigObj);
```

To use the configuration in `sldemo_boiler`, activate it.

Copy and Rename Configuration Set

This example shows to create a copy of the active configuration for the model `sldemo_bounce` and attach the copy to the model `sldemo_boiler`. Use the `allowRename` argument to avoid naming conflicts.

Open the model `sldemo_bounce` and get the active configuration object.

```
sldemo_bounce
slbounceConfigObj = getActiveConfigSet('sldemo_bounce');
```

Open the model `sldemo_boiler`. Copy the configuration object `slbounceConfigObj` and attach it to `sldemo_boiler`. Specify `allowRename` as `true`.

```
sldemo_boiler
attachConfigSetCopy('sldemo_boiler',slbounceConfigObj,true);
```

Because the model already has a configuration set named `Configuration`, Simulink® changes the name of `slbounceConfigObj` to `Configuration1` before attaching it to `sldemo_boiler`.

To use the configuration in `sldemo_bounce`, activate `Configuration1`.

Input Arguments

model — Model to attach configuration set to

character vector | string scalar

Model to which you want to attach a configuration set, specified as a character vector or string scalar. The model must be open.

Example: `'my_model'`

configObj — Configuration object

`ConfigSet` object | `ConfigSetRef` object

Configuration object that you want to copy, specified as a `Simulink.ConfigSet` object or a `Simulink.ConfigSetRef` object.

Example: `myConfigObj`

allowRename — Rename configuration object copy if there is a naming conflict

`false` (default) | `true`

Specification that determines if Simulink renames the configuration object copy in the case of a name conflict, specified as a Boolean. If `allowRename` is `false` and a name conflict occurs, Simulink generates an error.

Example: `true`

addLabel

(Not recommended) Attach label to project file

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
addLabel(file, categoryName, labelName)
addLabel(file, categoryName, labelName, labelData)
```

Description

`addLabel(file, categoryName, labelName)` attaches the specified label `labelName` in the category `categoryName` to the file.

`addLabel(file, categoryName, labelName, labelData)` attaches the label with data `labelData`.

Examples

Attach a Label to a Project File

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Get a particular file by name.

```
myfile = findFile(proj, 'models/AnalogControl.slx')
```

```
myfile =
```

```
    ProjectFile with properties:
```

```
        Path: 'C:\Work\temp\slexamples\airframe\models\AnalogControl.slx'
```

```
        Labels: [1x1 slproject.Label]
```

```
        Revision: '2'
```

```
        SourceControlStatus: Unmodified
```

Get the `Labels` property of the file.

```
myfile.Labels
```

```
ans =
```

```
    Label with properties:
```

```
        File: 'C:\Work\temp\slexamples\airframe\models\AnalogControl.slx'
```

```

        Data: []
        DataType: 'none'
        Name: 'Design'
    CategoryName: 'Classification'

```

Attach the label 'Artifact' to the file.

```
addLabel(myfile, 'Classification', 'Artifact')
```

ans =

Label with properties:

```

        File: 'C:\Work\temp\slexamples\airframe\models\AnalogControl.slx'
        Data: []
        DataType: 'none'
        Name: 'Artifact'
    CategoryName: 'Classification'

```

Index into the Labels property to get the label attached to this file.

```
reviewLabel = myfile.Labels(1)
```

reviewLabel =

Label with properties:

```

        File: 'C:\Work\temp\slexamples\airframe\models\AnalogControl.slx'
        Data: []
        DataType: 'none'
        Name: 'Artifact'
    CategoryName: 'Classification'

```

Detach the new label from the file.

```
removeLabel(myfile, reviewLabel)
```

Attach a Label to a Subset of Files

Attach the 'Classification' category label 'Utility' to all files in the project that have the .m file extension.

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Get the list of files.

```
files = proj.Files;
```

Loop through each file. If a file has the extension .m, attach the label 'Utility'.

```

for fileIndex = 1:numel(files)
    file = files(fileIndex);
    [~, ~, fileExtension] = fileparts(file.Path);
    if strcmp(fileExtension, '.m')

```

```

        addLabel(file, 'Classification', 'Utility');
    end
end

```

In the Project **Files** view, the **Classification** column displays the label `Utility` for each `.m` file in the `utilities` folder.

Attach a Label and Label Data to a File

Open the `airframe` project and create a project object.

```

sldemo_slproject_airframe;
proj = simulinkproject;

```

Create a new category 'Review'.

```

createCategory(proj, 'Review', 'char');

```

For the new category, create a label 'To Review'.

```

reviewCategory = findCategory(proj, 'Review');
createLabel(reviewCategory, 'To Review');

```

Get a particular file by name.

```

myfile = findFile(proj, 'models/AnalogControl.slx')

```

```

myfile =

```

```

    ProjectFile with properties:
        Path: 'C:\Work\temp\slexamples\airframe\models\AnalogControl.slx'
        Labels: [1x1 slproject.Label]
        Revision: '2'
        SourceControlStatus: Unmodified

```

Attach the label 'To Review' and a character vector of label data to the file.

```

addLabel(myfile, 'Review', 'To Review', 'Whole team design review')

```

Index into the `Labels` property to get the second label attached to this particular file, and see the label data.

```

myfile.Labels(2)

```

```

ans =

```

```

    Label with properties:
        File: 'C:\Work\temp\slexamples\airframe\models\AnalogControl.slx'
        Data: 'Whole team design review'
        DataType: 'char'
        Name: 'To Review'
        CategoryName: 'Review'

```

In the Project **Files** view, for the `AnalogControl.slx` file, the **Review** column displays the `To Review` label with label data.

Alternatively, you can set or change label data using the data property.

```
mylabel = myfile.Labels(2);  
mylabel.Data = 'Final review';
```

Input Arguments

file — File to attach label to

file object

File to attach the label to, specified as a file object. You can get the file object by examining the project's Files property (`proj.Files`), or use `findFile` to find a file by name. The file must be in the project.

categoryName — Name of category for label

character vector

Name of the category for the label, specified as a character vector.

labelName — Name of label

character vector | label definition object

Name of the label to attach, specified as a character vector or a label definition object returned by the `file.Label` property or `findLabel`. You can specify a new label name that does not already exist in the project.

labelData — Data to attach to label

character vector | numeric

Data to attach to the label, specified as a character vector or numeric. Data type depends on the label definition. Get a label to examine its `DataType` property using `file.Label` or `findLabel`.

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

`createLabel` | `findFile` | `findLabel` | `removeLabel` | `simulinkproject`

Introduced in R2013a

batchsim

Offload simulations to run on a compute cluster

Syntax

```
simJob = batchsim(in)
simJob = batchsim(myCluster,in)
simJob = batchsim(...,Name,Value)
```

Description

`simJob = batchsim(in)` runs a batch job on a single worker to simulate a model using the inputs specified in the `SimulationInput` object, `in`.

`simJob = batchsim(myCluster,in)` runs a batch job on the cluster identified by the cluster object `myCluster`. If a cluster profile is not specified, `batchsim` uses a default cluster profile as set up in the parallel preferences. For more information, see “Discover Clusters and Use Cluster Profiles” (Parallel Computing Toolbox).

`simJob = batchsim(...,Name,Value)` runs a batch job that simulates a model using the inputs specified in the `SimulationInput` object and the options specified as `Name, Value` pair.

`batchsim` offloads simulations to a compute cluster, enabling you to carry out other tasks while the batch job is processing, or close the client MATLAB and access the batch job later. Use the 'Pool' argument to run simulations in parallel.

The `batchsim` command uses the Parallel Computing Toolbox™ and MATLAB Parallel Server™ licenses to run the simulations on compute cluster. `batchsim` runs the simulations in serial if a parallel pool cannot be created. If Parallel Computing Toolbox license is not available, `batchsim` errors out.

Examples

Run Parallel Simulations with batchsim

This example shows how to run parallel simulations in batch. `batchsim` offloads simulations to a compute cluster, enabling you to carry out other tasks while the batch job is processing, or close the client MATLAB and access the batch job later.

This example uses the `ex_sldemo_househeat` model and runs simulations in batch to observe the model behavior for different temperature set points.

Open the model.

```
openExample('simulink/OpenTheModelExample');
open_system('ex_sldemo_househeat');
load_system('ex_sldemo_househeat')
```

Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

Using the `setPointValues`, initialize an array of `Simulink.SimulationInput` objects.

```
in(1:spv_Length) = Simulink.SimulationInput('ex_sl-demo_househeat');
for i = 1:1:spv_Length
    in(i) = in(i).setBlockParameter('ex_sl-demo_househeat/Set Point',...
        'Value',num2str(setPointValues(i)));
end
```

Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, let's assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job ID to access the job object later from any machine. `NumWorkers` tells you how many workers are running the simulations. `NumWorkers` is always the number of workers specified in the `'Pool'` argument and an additional head worker.

```
simJob = batchsim(in, 'Pool', 3)

      ID: 1
      Type: pool
      NumWorkers: 4
      Username: #####
      State: running
      SubmitDateTime: ##-###-#### ##:##:##
      StartDateTime:
      Running Duration: 0 days 0h 0m 0s
```

Access the results of the batch job using the `fetchOutputs` method. `fetchOutputs` returns an array of `Simulink.SimulationOutput` objects.

```
out = fetchOutputs(simJob)
```

```
1x11 Simulink.SimulationOutput array
```

Input Arguments

in — `Simulink.SimulationInput` object used to simulate the model
object, array

Specified as a `Simulink.SimulationInput` object or an array of `Simulink.SimulationInput` objects that is used to specify changes to the model for simulation.

Example: `in = Simulink.SimulationInput('vdp')`

myCluster — `parallel.Cluster` object
object

Cluster object that is used to specify the cluster in which the batch job runs.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: 'Pool', 5

AdditionalPaths — Files to attach to parallel pool

character vector | cell array

Specified as a character vector, a cell array or an array of character vector to define paths to be added to the MATLAB search path of the workers before the simulations execute. The default search path might not be the same on the workers as it is on the client; the path difference could be the result of different current working folders (pwd), platforms, or network file system access. The 'AdditionalPaths' property can assure that workers are looking in the correct locations for necessary code files, data files, model files, etc.

AttachedFiles — Files to attach to parallel pool

cell array

Specified as a cell array of additional files to attach to the parallel pool.

AutoAddClientPath — Whether user-added entries on client path are added to each worker path

true (default) | false

Specified as true or false to control whether user-added entries on the client path are added to each worker path.

AutoAttachFiles — Whether code files should be automatically attached to the job

true (default) | false

Specified as true or false to control whether code files are automatically attached to the job.

CaptureDiary — Whether diary is collected

true (default) | false

Specified as true or false to indicate collection of the diary.

CleanupFcn — Function handle to run once per worker after running simulations

function handle

Specify a function handle to 'CleanupFcn' to run once per worker after the simulations are completed.

EnvironmentVariables — Names of environment variables copied from client session to workers

character vector | cell array

Specifies the names of environment variables copied from the client session to the workers. The names specified here are appended to the 'EnvironmentVariables' property specified in the applicable parallel profile to form the complete list of environment variables. Any variables listed which are not set are not copied to the workers. These environment variables will be set on the workers for the duration of the batch job.

ManageDependencies — Manage model dependencies

'on' (default) | 'off'

When `ManageDependencies` is set to 'on', model dependencies are automatically sent to the parallel workers if necessary. If `ManageDependencies` is set to 'off', explicitly attach model dependencies to the parallel pool.

Pool — Size of the number of workers for a parallel pool

integer

An integer specifying the number of workers to make into a parallel pool for the job *in addition* to the worker running the batch job itself. The simulations use this pool for execution. Because the pool requires N workers in addition to the worker running the batch, there must be at least N+1 workers available on the cluster.

Profile — Cluster profile name

profile name

The name of a cluster profile used to identify the cluster. If this option is omitted, the default profile is used to identify the cluster and is applied to the job and task properties.

SetupFcn — Function handle to run once per worker

function handle

Specify a function handle to 'SetupFcn' to run once per worker before the start of the simulations.

Note When `buildRapidAcceleratorTarget` is used in the `SetupFcn` and the model has external inputs specified, either set 'LoadExternalInput' to 'off' or ensure that the specified external input is available on the workers to prevent compilation error.

ShowProgress — Show the progress of the simulations in diary

'on' | 'off'

Set to 'on', to copy the progress of the simulations in the command window to diary of `Simulink.Simulation.Job` object. The progress is hidden when set to 'off'.

StopOnError — Stop simulations on errors

'off' (default) | 'on'

Setting 'StopOnError' to 'on' stops the execution of simulations if an error is encountered.

TransferBaseWorkspaceVariables — Transfer variables to the parallel workers

'off' (default) | 'on'

When `TransferBaseWorkspaceVariables` is set to true, variables used in the model and defined in the base workspace are transferred to the parallel workers.

Note Use of `TransferBaseWorkspaceVariables` requires model compilation.

UseFastRestart — Use fast restart

'off' (default) | 'on'

When `UseFastRestart` is set to true, simulations run on the workers using fast restart.

Note When using `batchsim`, use the `UseFastRestart` option and not the `FastRestart` option. See “Get Started with Fast Restart” for more information.

Output Arguments

simJob — `Simulink.Simulation.Job` job object
object

An object containing metadata of submitted batch job. Poll job object using its ID to check the status of simulations or to access outputs on completion of the job.

Extended Capabilities

Automatic Parallel Support

Accelerate code by automatically running computation in parallel using Parallel Computing Toolbox™.

Using `batchsim` with Parallel Computing Toolbox installed, MATLAB automatically opens a worker and runs the job in the background on another session on your local machine. Specifying a pool size runs the simulations on the number of workers specified. Control parallel behavior with the parallel preferences, including scaling up to a cluster.

For details, see “Run Multiple Simulations”.

bdclose

Close any or all Simulink system windows unconditionally

Syntax

```
bdclose
bdclose(sys)
bdclose('all')
```

Description

`bdclose` closes the current system window unconditionally and without confirmation. Any changes made to the system since it was last saved are lost. To find out the current system, use `gcs`. If a model was only loaded, `bdclose` clears the model from memory.

`bdclose(sys)` closes the specified system window, discarding all changes.

`bdclose('all')` closes all open system windows, discarding all changes.

Examples

Close a System Without Saving

Open the `vdp` system. Then close it without saving any changes.

```
open_system(vdp)
bdclose('vdp')
```

Input Arguments

sys — System to close

character vector | string scalar | cell array

System to close, specified as a character vector, string scalar, or cell array. To specify multiple systems to close, specify a cell array of system names.

Example: `bdclose("vdp")`

Example: `bdclose({'vdp', 'f14'})`

Data Types: `char` | `string` | `cell`

Compatibility Considerations

Closing a window for a model hierarchy closes referenced models

Behavior changed in R2019b

Starting in R2019b, when you close a window for a model hierarchy by closing the top model, all referenced models that are not open in another window are also closed, which clears them from

memory. To keep referenced models loaded in memory, use the `close_system` function and set the `'closeReferencedModels'` argument to `false`.

Introduced before R2006a

bdIsDirty

Determine whether model, subsystem, or library has unsaved changes

Syntax

```
tf = bdIsDirty(bd)
```

Description

`tf = bdIsDirty(bd)` returns whether the specified model, subsystem, or library has unsaved changes. Unsaved changes can include changes to the block diagram, configuration parameters, or properties.

Examples

Check Models for Unsaved Changes

Check if models contain unsaved changes using `bdIsDirty`.

Check if a single model is dirty.

```
vdp
bdIsDirty('vdp')
```

```
ans =
```

```
logical
```

```
0
```

Check if multiple models are dirty.

```
vdp
sf_car
bdIsDirty({'sf_car','vdp'})
```

```
ans =
```

```
1×2 logical array
```

```
0 0
```

Input Arguments

bd — Name or handle of loaded model, subsystem, or library

numeric array | string array | character vector | cell array of character vectors

Name or handle of loaded model, subsystem, or library, specified as a numeric array, string array, character vector, or cell array of character vectors.

You cannot check whether blocks, such as Subsystem blocks, have unsaved changes. You can check whether referenced subsystems have unsaved changes. For more information, see “Subsystem Reference”.

Data Types: `double` | `char` | `string` | `cell`

Output Arguments

tf — True or false result

1 | 0 | logical array

True or false result, returned as a 1 or 0 of data type `logical`.

- 1 (`true`) — File has been modified in memory since it was loaded or last saved.
- 0 (`false`) — File has no unsaved changes.

When multiple files are specified, the function returns a logical array with one entry for each file.

`bdIsLoaded`

Topics

“Manage Shadowed and Dirty Models and Other Project Files”

Introduced in R2017a

bdIsLibrary

Determine whether block diagram is a library

Syntax

```
tf = bdIsLibrary(bd)
```

Description

`tf = bdIsLibrary(bd)` returns whether the specified block diagram is a library.

Examples

Check Whether Block Diagrams Are Libraries

Load the `sf_car`, `hydlib`, and `vdp` block diagrams. Get the handle for `hydlib`.

```
load_system({'sf_car', 'hydlib', 'vdp'})
h = get_param('hydlib', 'Handle');
```

Check whether `sf_car` is a library. The returned value `0` indicates that it is not.

```
bdIsLibrary('sf_car')
```

```
ans =
     0
```

Check whether `hydlib` and `vdp` are libraries. The returned value shows that `hydlib` is a library and `vdp` is not.

```
bdIsLibrary({'hydlib', 'vdp'})
```

```
ans =
     1     0
```

Using the handle to `hydlib`, check whether `hdlib` is a library. The value returned shows that it is.

```
bdIsLibrary(h)
```

```
ans =
     1
```

Input Arguments

bd — Name or handle of loaded block diagram

numeric array | string array | character vector | cell array of character vectors

Name or handle of loaded block diagram, specified as a numeric array, string array, character vector, or cell array of character vectors.

Data Types: double | char | string | cell

Output Arguments

tf — True or false result

1 | 0 | logical array

True or false result, returned as a 1 or 0 of data type `logical`.

- 1 (`true`) — File is a library.
- 0 (`false`) — File is not a library.

When multiple files are specified, the function returns a logical array with one entry for each file.

See Also

`bdIsLoaded` | `bdroot` | `find_system`

Introduced in R2015a

bdIsLoaded

Determine whether model, subsystem, or library is loaded

Syntax

```
tf = bdIsLoaded(bd)
```

Description

`tf = bdIsLoaded(bd)` returns whether the specified model, subsystem, or library is loaded.

Examples

Check Whether Model Is Loaded

Check whether the `sf_car` model is loaded.

```
bdIsLoaded('sf_car')
```

```
ans =  
    logical  
    0
```

The function returns a logical scalar, `0`, which indicates that the file is not loaded.

To load the `sf_car` model, use the `load_system` function.

```
load_system('sf_car')
```

Check Whether Multiple Models Are Loaded

Determine whether the `sf_car` and `vdp` models are loaded.

```
bdIsLoaded({'sf_car', 'vdp'})
```

```
ans =  
    1×2 logical array  
    1    0
```

The function returns a 1-by-2 logical array, which indicates that the first model in the cell array (`sf_car`) is loaded and the second model in the cell array (`vdp`) is not loaded.

To load the `vdp` model, use the `load_system` function.

```
load_system('vdp')
```

Input Arguments

bd — Name of model, subsystem, or library

string array | character vector | cell array of character vectors

Name of model, subsystem, or library, specified as a string array, character vector, or cell array of character vectors.

Blocks, such as Subsystem blocks, cannot be loaded independently. Referenced subsystems can be loaded independently. For more information, see “Subsystem Reference”.

Data Types: `char` | `string` | `cell`

Output Arguments

tf — True or false result

1 | 0 | logical array

True or false result, returned as a 1 or 0 of data type `logical`.

- 1 (`true`) — File is loaded.
- 0 (`false`) — File is not loaded.

When multiple files are specified, the function returns a logical array with one entry for each file.

`bdIsDirty` | `bdIsLibrary` | `find_system`

Introduced in R2008a

bdroot

Top-level model of current system

Syntax

```
model = bdroot
model = bdroot(elements)
```

Description

`model = bdroot` returns the top-level model of the current system. The current system is the currently active Simulink Editor window or the system in which a block is selected.

`model = bdroot(elements)` returns the top-level model of the specified model elements. Before using `bdroot`, make sure the top-level model of each element in `elements` is loaded.

Examples

Get Top-Level Model of Current System

Open the system Controller in the model f14.

```
load_system('f14')
open_system('f14/Controller')
```

Get the top-level model of the current system.

```
bdroot
ans =
    'f14'
```

Get Top-Level Model of a System

Open the system Controller in the model f14.

```
load_system('f14')
open_system('f14/Controller')
```

Get the top-level model of the current system.

```
bdroot(gcs)
```

```
ans =  
    'f14'
```

Input Arguments

elements — Model elements whose top-level models to return

model name | block path name | handle | cell array of character vectors | string array | numeric array

Model elements whose top-level model to return, specified as the model name, block or system path name, handle, cell array of character vectors or string array of system names, or numeric array of handles.

Tip Use `bdroot` with `gcs`, `gcb`, and `gcbh` to get the top-level model of the current system or block.

Output Arguments

model — Top-level model

character vector | cell array | string array

Top-level model, returned as a character vector of the model name. If the input was an array, `model` is returned as an array of the same type as the input.

See Also

`gcb` | `gcbh` | `gcs`

Introduced before R2006a

dlinmod

Extract discrete-time linear state-space model around operating point

Syntax

```
argout = dlinmod('sys', Ts)
```

```
argout = dlinmod('sys', Ts, x, u)
```

```
argout = dlinmod('sys', Ts, x, u, para, 'v5')
```

```
argout = dlinmod('sys', Ts, x, u, para, xpert, upert, 'v5')
```

Arguments

<i>sys</i>	Name of the Simulink system from which the linear model is extracted.
<i>x</i> , <i>u</i>	State (<i>x</i>) and the input (<i>u</i>) vectors. If specified, they set the operating point at which the linear model is extracted. When a model has model references using the Model block, you must use the Simulink structure format to specify <i>x</i> . To extract the <i>x</i> structure from the model, use the following command: <pre>x = Simulink.BlockDiagram.getInitialState('sys');</pre> <p>You can then change the operating point values within this structure by editing <code>x.signals.values</code>.</p> <p>If the state contains different data types (for example, 'double' and 'uint8'), then you cannot use a vector to specify this state. You must use a structure instead. In addition, you can only specify the state as a vector if the state data type is 'double'.</p>
<i>Ts</i>	Sample time of the discrete-time linearized model
'v5'	An optional argument that invokes the perturbation algorithm created prior to MATLAB 5.3. Invoking this optional argument is equivalent to calling <code>linmodv5</code> .
<i>para</i>	A three-element vector of optional arguments: <ul style="list-style-type: none"> • <code>para(1)</code> — Perturbation value of delta, the value used to perform the perturbation of the states and the inputs of the model. This is valid for linearizations using the 'v5' flag. The default value is 1e-05. • <code>para(2)</code> — Linearization time. For blocks that are functions of time, you can set this parameter with a nonnegative value that gives the time (<i>t</i>) at which Simulink evaluates the blocks when linearizing a model. The default value is 0. • <code>para(3)</code> — Set <code>para(3)=1</code> to remove extra states associated with blocks that have no path from input to output. The default value is 0.

xpert, upert

The perturbation values used to perform the perturbation of all the states and inputs of the model. The default values are

```
xpert = para(1) + 1e-3*para(1)*abs(x)
upert = para(1) + 1e-3*para(1)*abs(u)
```

When a model has model references using the Model block, you must use the Simulink structure format to specify *xpert*. To extract the *xpert* structure, use the following command:

```
xpert = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the perturbation values within this structure by editing `xpert.signals.values`.

The perturbation input arguments are only available when invoking the perturbation algorithm created prior to MATLAB 5.3, either by calling `linmodv5` or specifying the 'v5' input argument to `linmod`.

argout

`linmod`, `dlinmod`, and `linmod2` return state-space representations if you specify the output (left-hand) side of the equation as follows:

- `[A,B,C,D] = linmod('sys', x, u)` obtains the linearized model of *sys* around an operating point with the specified state variables *x* and the input *u*. If you omit *x* and *u*, the default values are zero.

`linmod` and `dlinmod` both also return a transfer function and MATLAB data structure representations of the linearized system, depending on how you specify the output (left-hand) side of the equation. Using `linmod` as an example:

- `[num, den] = linmod('sys', x, u)` returns the linearized model in transfer function form.
- `sys_struc = linmod('sys', x, u)` returns a structure that contains the linearized model, including state names, input and output names, and information about the operating point.

Description

`dlinmod` compute a linear state-space model for a discrete-time system by linearizing each block in a model individually.

`linmod` obtains linear models from systems of ordinary differential equations described as Simulink models. Inputs and outputs are denoted in Simulink block diagrams using Inport and Outport blocks.

The default algorithm uses preprogrammed analytic block Jacobians for most blocks which should result in more accurate linearization than numerical perturbation of block inputs and states. A list of blocks that have preprogrammed analytic Jacobians is available in the Simulink Control Design documentation along with a discussion of the block-by-block analytic algorithm for linearization.

The default algorithm also allows for special treatment of problematic blocks such as the Transport Delay and the Quantizer. See the mask dialog of these blocks for more information and options.

Discrete-Time System Linearization

The function `dlinmod` can linearize discrete, multirate, and hybrid continuous and discrete systems at any given sampling time. Use the same calling syntax for `dlinmod` as for `linmod`, but insert the sample time at which to perform the linearization as the second argument. For example,

```
[Ad,Bd,Cd,Dd] = dlinmod('sys', Ts, x, u);
```

produces a discrete state-space model at the sampling time T_s and the operating point given by the state vector x and input vector u . To obtain a continuous model approximation of a discrete system, set T_s to \emptyset .

For systems composed of linear, multirate, discrete, and continuous blocks, `dlinmod` produces linear models having identical frequency and time responses (for constant inputs) at the converted sampling time T_s , provided that

- T_s is an integer multiple of all the sampling times in the system.
- The system is stable.

For systems that do not meet the first condition, in general the linearization is a time-varying system, which cannot be represented with the $[A,B,C,D]$ state-space model that `dlinmod` returns.

Computing the eigenvalues of the linearized matrix A_d provides an indication of the stability of the system. The system is stable if $T_s > \emptyset$ and the eigenvalues are within the unit circle, as determined by this statement:

```
all(abs(eig(Ad))) < 1
```

Likewise, the system is stable if $T_s = \emptyset$ and the eigenvalues are in the left half plane, as determined by this statement:

```
all(real(eig(Ad))) < 0
```

When the system is unstable and the sample time is not an integer multiple of the other sampling times, `dlinmod` produces A_d and B_d matrices, which can be complex. The eigenvalues of the A_d matrix in this case still, however, provide a good indication of stability.

You can use `dlinmod` to convert the sample times of a system to other values or to convert a linear discrete system to a continuous system or vice versa.

You can find the frequency response of a continuous or discrete system by using the `bode` command.

Notes

By default, the system time is set to zero. For systems that are dependent on time, you can set the variable `para` to a two-element vector, where the second element is used to set the value of t at which to obtain the linear model.

The ordering of the states from the nonlinear model to the linear model is maintained. For Simulink systems, a character vector variable that contains the block name associated with each state can be obtained using

```
[sizes,x0,xstring] = sys
```

where `xstring` is a vector of strings whose *i*th row is the block name associated with the *i*th state. Inputs and outputs are numbered sequentially on the diagram.

For single-input multi-output systems, you can convert to transfer function form using the routine `ss2tf` or to zero-pole form using `ss2zp`. You can also convert the linearized models to LTI objects using `ss`. This function produces an LTI object in state-space form that can be further converted to transfer function or zero-pole-gain form using `tf` or `zpk`.

The default algorithms in `linmod` and `dlinmod` handle Transport Delay blocks by replacing the linearization of the blocks with a Pade approximation. For the 'v5' algorithm, linearization of a model that contains Derivative or Transport Delay blocks can be troublesome. For more information, see "Linearizing Models".

See Also

`linmod` | `linmod2` | `linmodv5`

Introduced in R2007a

close_system

Close Simulink system window or block dialog box

Syntax

```
close_system
close_system(blockOrSys)
close_system(sys,saveflag)
close_system(sys,newsys)
close_system(sys, ___,Name,Value)
```

Description

`close_system` closes the current system or subsystem. If the current system is the top-level model and has been modified, `close_system` returns an error.

Use the `gcs` function to determine the current system.

Note You cannot use `close_system` in a block or menu callback to close the root-level model. Attempting to close the root-level model in a block or menu callback causes an error and discontinues the callback execution.

`close_system(blockOrSys)` closes the specified model or subsystem, or the block dialog box of the specified block. If the model was only loaded, that is, with `load_system`, this syntax clears the model from memory.

`close_system(sys,saveflag)` lets you specify whether to save the model with its current name or to close it without saving.

`close_system(sys,newsys)` saves the model to a file with the specified name before closing.

`close_system(sys, ___,Name,Value)` specifies additional options using one or more `Name,Value` pair arguments.

Examples

Close the Current System

Open the model `vdp` and then close it.

```
vdp
close_system
```

Close a Block Dialog Box

Open the model `vdp`.

vdp

In the model, double-click the Mu block to open its block dialog box.

Close the block dialog box

```
close_system('vdp/Mu');
```

Close a Model and Save with New Name

Open a model, modify it, save the model with a new name and close it.

Open the model vdp and add a block to it.

```
vdp  
block = add_block('vdp/Mu', 'vdp/Mu', 'MakeNameUnique', 'on');
```

Close the model, saving it with a new name.

```
close_system('vdp', 'myvdp');
```

Close a Model Using Name, Value Options

This command tries to save the vdp system to a file with the name 'max', but returns an error because 'max' is the name of an existing MATLAB function.

```
close_system('vdp', 'max', 'ErrorIfShadowed', true)
```

Close a Top Model and Keep Referenced Models Loaded

Open a model hierarchy, load the referenced model, then close the top model, leaving the referenced model loaded.

Open the sldemo_mdref_basic model and load its referenced model, sldemo_mdref_counter.

```
open_system('sldemo_mdref_basic')  
load_system('sldemo_mdref_counter')
```

Check what models are loaded in memory.

```
loadedModels = Simulink.allBlockDiagrams('model');  
modelName = get_param(loadedModels, 'Name')
```

```
modelName =
```

```
2x1 cell array
```

```
 {'sldemo_mdref_counter'}  
 {'sldemo_mdref_basic' }
```

Close sldemo_mdref_basic while keeping the referenced model loaded.

```
close_system('sldemo_mdref_basic', 0, 'closeReferencedModels', false)
```

Check what models are loaded in memory.

```
loadedModels = Simulink.allBlockDiagrams('model');
modelName = get_param(loadedModels, 'Name')

modelName =

    'sldemo_mdhref_counter'
```

Closing the top model clears it from memory. By default, because they share a window, using `close_system` on the top model would also close the referenced model and clear it from memory. Setting `'closeReferencedModels'` to `false` keeps the referenced model, `sldemo_mdhref_counter`, loaded.

Input Arguments

blockOrSys — Block, model, or subsystem to close

character vector | cell array of character vectors | string array | handle | array of handles

Name of model, subsystem, or the block whose dialog box you want to close, specified as a character vector, cell array of character vectors, string array, handle, or array of handles. Do not use a file extension.

Example: "vdp/Mu" 'vdp'

sys — Name of model to close

character vector | cell array of character vectors | string array | handle | array of handles

Name of model to close, specified as a character vector, cell array of character vectors, string array, handle, or array of handles. Do not use a file extension.

saveFlag — Option to save file with current name

0 (default) | 1 | numeric array

Option to save model using the current file name, specified as 0 to close without saving or 1 to save and then close. If `sys` is an array, you can supply a single character to apply to all of the models in the array. Or you can provide a numeric array with values that correspond with each model in the `sys` array.

For information on rules for naming models, see “Model Names”.

newsys — File to save to

character vector | cell array of character vectors | string array

File to save to, specified as a character vector, cell array of character vectors, or string array. You can specify a model name in the current folder or the full path name, with or without an extension.

When you specify a name without an extension, `close_system` saves to the file format specified in your Simulink preferences. Possible model extensions are `.slx` and `.mdl`.

For information on rules for naming models, see “Model Names”.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, . . . , NameN, ValueN`.

Example:

```
close_system('myModel', 'newModel', 'closeReferencedModels', false, 'ErrorIfShadowed', true, 'OverwriteIfChangedOnDisk', true, 'SaveModelWorkspace', true)
```

`closeReferencedModels` — Option to close all referenced models

`true` (default) | `false` | `'on'` | `'off'`

Option to close all referenced models when you close the window for the top model, specified as the comma-separated pair consisting of `'closeReferencedModels'` and `true`, `false`, `'on'`, or `'off'`. Referenced models that are open in another window are unaffected by this setting. To keep referenced models loaded, set this argument to `false`.

`ErrorIfShadowed` — Option to return an error if the new name is already used

`false` (default) | `true` | `'on'` | `'off'`

Option to return an error if the new name is already used on the MATLAB path or in the workspace, specified as the comma-separated pair consisting of `'ErrorIfShadowed'` and `true`, `false`, `'on'`, or `'off'`. To receive this error, you must use the `newsys` argument to save the model with a new name. To learn about shadowed files, see “Shadowed Files”.

`OverwriteIfChangedOnDisk` — Option to overwrite the file on disk

`false` (default) | `true` | `'on'` | `'off'`

Option to overwrite the file on disk when you save the model, even if it has been modified since the system was loaded, specified as the comma-separated pair consisting of `'OverwriteIfChangedOnDisk'` and `true`, `false`, `'on'`, or `'off'`. By default, if the file changed on disk since the model was loaded, `close_system` displays an error to prevent the changes on disk from being overwritten.

You can control whether saving the model displays an error if the file has changed on disk by using a Simulink preference. In the **Model File** pane of the Simulink Preferences dialog box, under **Change Notification**, select **Saving the model**. This preference is on by default.

`SaveModelWorkspace` — Option to save the model workspace

`false` (default) | `true` | `'on'` | `'off'`

Option to save the model workspace when you save the model, specified as the comma-separated pair consisting of `'SaveModelWorkspace'` and `true`, `false`, `'on'`, or `'off'`. The model workspace `DataSource` must be a MAT-file. If the data source is not a MAT-file, saving the model does not save the workspace. See “Specify Source for Data in Model Workspace”.

Compatibility Considerations

Closing a window for a model hierarchy closes referenced models

Behavior changed in R2019b

Starting in R2019b, when you close a window for a model hierarchy by closing the top model, all referenced models that are not open in another window are also closed, which clears them from

memory. To keep referenced models loaded in memory, set the 'closeReferencedModels' argument to false.

bdclose | gcs | load_system | new_system | open_system | save_system

Introduced before R2006a

closeDialog

Close configuration parameters dialog

Syntax

```
closeDialog(configObj)
```

Arguments

configObj

A configuration set (`Simulink.ConfigSet`) or configuration reference (`Simulink.ConfigSetRef`)

Description

`closeDialog` closes an open configuration parameters dialog box. If *configObj* is a configuration set, the function closes the dialog box that displays the configuration set. If *configObj* is a configuration reference, the function closes the dialog box that displays the referenced configuration set, or generates an error if the reference does not specify a valid configuration set. If the dialog box is already closed, the function does nothing.

Examples

The following example closes a configuration parameters dialog box that shows the current parameters for the current model. The parameter values derive from the active configuration set or configuration reference (configuration object). The code is the same in either case; the only difference is which type of configuration object is currently active.

```
myConfigObj = getActiveConfigSet(gcs);  
closeDialog(myConfigObj);
```

“Share a Configuration with Multiple Models”

Introduced in R2006b

close

(Not recommended) Close project

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead of `simulinkproject`. For more information, see “Compatibility Considerations”.

Syntax

```
close(proj)
```

Description

`close(proj)` closes the project `proj`.

Examples

Open and Close a Project

Open a specified project and get a project object to manipulate the project at the command line. For example,

```
proj = simulinkproject('C:/projects/project1/myproject.prj')
```

Close the project.

```
close(proj)
```

Input Arguments

proj – Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

See Also

Functions

simulinkproject

Introduced in R2013a

closeReport

Package: Simulink

Close MATLAB function report

Syntax

```
closeReport(config)
```

Description

`closeReport(config)` closes the MATLAB function report for a MATLAB Function block.

Examples

Open and Close MATLAB Function Report

Access the `MATLABFunctionConfiguration` object for the MATLAB Function block in the model `call_stats_block1` described in “Create Custom Functionality Using MATLAB Function Block”.

```
config = get_param('call_stats_block1/MATLAB Function', ...  
    'MATLABFunctionConfiguration');
```

Open the MATLAB function report.

```
openReport(config)
```

Close the MATLAB function report.

```
closeReport(config)
```

Input Arguments

config — MATLAB Function block property configuration

`MATLABFunctionConfiguration` object

MATLAB Function block property configuration, specified as a `MATLABFunctionConfiguration` object.

Data Types: `MATLABFunctionConfiguration`

Introduced in R2021a

coder.allowpcode

Package: coder

Control code generation from protected MATLAB files

Syntax

```
coder.allowpcode('plain')
```

Description

`coder.allowpcode('plain')` allows you to generate protected MATLAB code (P-code) that you can then compile into optimized MEX functions or embeddable C/C++ code. This function does not obfuscate the generated MEX functions or embeddable C/C++ code.

With this capability, you can distribute algorithms as protected P-files that provide code generation optimizations.

Call this function in the top-level function before control-flow statements, such as `if`, `while`, `switch`, and function calls.

MATLAB functions can call P-code. When the `.m` and `.p` versions of a file exist in the same folder, the P-file takes precedence.

`coder.allowpcode` is ignored outside of code generation.

Examples

Generate optimized embeddable code from protected MATLAB code:

- 1 Write an function `p_abs` that returns the absolute value of its input:

```
function out = p_abs(in)    %#codegen
% The directive %#codegen indicates that the function
% is intended for code generation
coder.allowpcode('plain');
out = abs(in);
```

- 2 Generate protected P-code. At the MATLAB prompt, enter:

```
pcode p_abs
```

The P-file, `p_abs.p`, appears in the current folder.

- 3 Generate a MEX function for `p_abs.p`, using the `-args` option to specify the size, class, and complexity of the input parameter (requires a MATLAB Coder license). At the MATLAB prompt, enter:

```
codegen p_abs -args { int32(0) }
```

`codegen` generates a MEX function in the current folder.

- 4 Generate embeddable C code for `p_abs.p` (requires a MATLAB Coder license). At the MATLAB prompt, enter:

```
codegen p_abs -config:lib -args { int32(0) };
```

codegen generates C library code in the codegen\lib\p_abs folder.

codegen | pcode

Introduced in R2011a

coder.ceval

Call external C/C++ function

Syntax

```
coder.ceval(cfun_name)
coder.ceval(cfun_name,cfun_arguments)

coder.ceval('-global',cfun_name)
coder.ceval('-global',cfun_name,cfun_arguments)

coder.ceval('-gpudevicefcn',devicefun_name,devicefun_arguments)

coder.ceval('-layout:rowMajor',cfun_name,cfun_arguments)
coder.ceval('-layout:columnMajor',cfun_name,cfun_arguments)
coder.ceval('-layout:any',cfun_name,cfun_arguments)

cfun_return = coder.ceval( ___ )
```

Description

`coder.ceval(cfun_name)` executes the external C/C++ function specified by `cfun_name`. Define `cfun_name` in an external C/C++ source file or library. Provide the external source, library, and header files to the code generator.

`coder.ceval(cfun_name,cfun_arguments)` executes `cfun_name` with arguments `cfun_arguments`. `cfun_arguments` is a comma-separated list of input arguments in the order that `cfun_name` requires.

By default, `coder.ceval` passes arguments by value to the C/C++ function whenever C/C++ supports passing arguments by value. To make `coder.ceval` pass arguments by reference, use the constructs `coder.ref`, `coder.rref`, and `coder.wref`. If C/C++ does not support passing arguments by value, for example, if the argument is an array, `coder.ceval` passes arguments by reference. If you do not use `coder.ref`, `coder.rref` or `coder.wref`, a copy of the argument can appear in the generated code to enforce MATLAB semantics for arrays.

`coder.ceval('-global',cfun_name)` executes `cfun_name` and indicates that `cfun_name` uses one or more MATLAB global variables. The code generator can then produce code that is consistent with this global variable usage.

`coder.ceval('-global',cfun_name,cfun_arguments)` executes `cfun_name` with arguments `cfun_arguments` and indicates that `cfun_name` uses one or more MATLAB global variables.

`coder.ceval('-gpudevicefcn',devicefun_name,devicefun_arguments)` allows you to call CUDA® GPU `__device__` functions from within kernels. `'-gpudevicefcn'` indicates to `coder.ceval` that the target function is on the GPU device. `devicefun_name` is the name of the `__device__` function and `devicefun_arguments` is a comma-separated list of input arguments in the order that `devicefun_name` requires. This option requires the GPU Coder™ product.

`coder.ceval('-layout:rowMajor',cfun_name,cfun_arguments)` executes `cfun_name` with arguments `cfun_arguments` and passes data stored in row-major layout. When called from a

function that uses column-major layout, the code generator converts inputs to row-major layout and converts outputs back to column-major layout. For a shorter syntax, use `coder.ceval(' -row', ...)`.

`coder.ceval(' -layout:columnMajor', cfun_name, cfun_arguments)` executes `cfun_name` with arguments `cfun_arguments` and passes data stored in column-major layout. When called from a function that uses row-major layout, the code generator converts inputs to column-major layout and converts outputs back to row-major layout. For a shorter syntax, use `coder.ceval(' -col', ...)`.

`coder.ceval(' -layout:any', cfun_name, cfun_arguments)` executes `cfun_name` with arguments `cfun_arguments` and passes data with its current array layout, even when array layouts do not match. The code generator does not convert the array layout of the input or output data.

`cfun_return = coder.ceval(___)` executes `cfun_name` and returns a single scalar value, `cfun_return`, corresponding to the value that the C/C++ function returns in the `return` statement. To be consistent with C/C++, `coder.ceval` can return only a scalar value. It cannot return an array. Use this option with any of the input argument combinations in the previous syntaxes.

Examples

Call External C Function

Call a C function `foo(u)` from a MATLAB function from which you intend to generate C code.

Create a C header file `foo.h` for a function `foo` that takes two input parameters of type `double` and returns a value of type `double`.

```
double foo(double in1, double in2);
```

Write the C function `foo.c`.

```
#include <stdio.h>
#include <stdlib.h>
#include "foo.h"

double foo(double in1, double in2)
{
    return in1 + in2;
}
```

Write a function `callfoo` that calls `foo` by using `coder.ceval`. Provide the source and header files to the code generator in the function.

```
function y = callfoo %#codegen
y = 0.0;
if coder.target('MATLAB')
    % Executing in MATLAB, call MATLAB equivalent of
    % C function foo
    y = 10 + 20;
else
    % Executing in generated code, call C function foo
    coder.updateBuildInfo('addSourceFiles','foo.c');
    coder.cinclude('foo.h');
    y = coder.ceval('foo', 10, 20);
```

```
end
end
```

Generate C library code for function `callfoo`. The `codegen` function generates C code in the `\codegen\lib\callfoo` subfolder.

```
codegen -config:lib callfoo -report
```

Call a C Library Function

Call a C library function from MATLAB code.

Write a MATLAB function `myabsval`.

```
function y = myabsval(u)
%#codegen
y = abs(u);
```

Generate a C static library for `myabsval`, using the `-args` option to specify the size, type, and complexity of the input parameter.

```
codegen -config:lib myabsval -args {0.0}
```

The `codegen` function creates the library file `myabsval.lib` and header file `myabsval.h` in the folder `\codegen\lib\myabsval`. (The library file extension can change depending on your platform.) It generates the functions `myabsval_initialize` and `myabsval_terminate` in the same folder.

Write a MATLAB function to call the generated C library function using `coder.ceval`.

```
function y = callmyabsval(y)
%#codegen
% Check the target. Do not use coder.ceval if callmyabsval is
% executing in MATLAB
if coder.target('MATLAB')
    % Executing in MATLAB, call function myabsval
    y = myabsval(y);
else
    % add the required include statements to generated function code
    coder.updateBuildInfo('addIncludePaths', '${START_DIR}\codegen\lib\myabsval');
    coder.cinclude('myabsval_initialize.h');
    coder.cinclude('myabsval.h');
    coder.cinclude('myabsval_terminate.h');

    % Executing in the generated code.
    % Call the initialize function before calling the
    % C function for the first time
    coder.ceval('myabsval_initialize');

    % Call the generated C library function myabsval
    y = coder.ceval('myabsval',y);

    % Call the terminate function after
    % calling the C function for the last time
    coder.ceval('myabsval_terminate');
end
```

Generate the MEX function `callmyabsval_mex`. Provide the generated library file at the command line.

```
codegen -config:mex callmyabsval codegen\lib\myabsval\myabsval.lib -args {-2.75}
```

Rather than providing the library at the command line, you can use `coder.updateBuildInfo` to specify the library within the function. Use this option to preconfigure the build. Add this line to the `else` block:

```
coder.updateBuildInfo('addLinkObjects','myabsval.lib','$(START_DIR)\codegen\lib\myabsval',100, true);
```

Run the MEX function `callmyabsval_mex` which calls the library function `myabsval`.

```
callmyabsval_mex(-2.75)
```

```
ans =
```

```
2.7500
```

Call the MATLAB function `callmyabsval`.

```
callmyabsval(-2.75)
```

```
ans =
```

```
2.7500
```

The `callmyabsval` function exhibits the desired behavior for execution in MATLAB and in code generation.

Call C Function That Uses Global Variable

Use the `'-global'` flag when you call a C function that modifies a global variable.

Write a MATLAB function `useGlobal` that calls a C function `addGlobal`. Use the `'-global'` flag to indicate to the code generator that the C function uses a global variable.

```
function y = useGlobal()
global g;
t = g;
% compare execution with/without '-global' flag
coder.ceval('-global','addGlobal');
y = t;
end
```

Create a C header file `addGlobal.h` for the function `addGlobal`.

```
void addGlobal(void);
```

Write the C function `addGlobal` in the file `addGlobal.c`. This function includes the header file `useGlobal_data.h` that the code generator creates when you generate code for the function `useGlobal`. This header file contains the global variable declaration for `g`.

```
#include "addGlobal.h"
#include "useGlobal_data.h"
void addGlobal(void) {
```

```
    g++;
}
```

Generate the MEX function for `useGlobal`. To define the input to the code generator, declare the global variable in the workspace.

```
global g;
g = 1;
codegen useGlobal -report addGlobal.h addGlobal.c
y = useGlobal_mex();
```

With the `'-global'` flag, the MEX function produces the result `y = 1`. The `'-global'` flag indicates to the code generator that the C function possibly modifies the global variable. For `useGlobal`, the code generator produces this code:

```
real_T useGlobal(const emlrtStack *sp)
{
    real_T y;
    (void)sp;
    y = g;
    addGlobal();
    return y;
}
```

Without the `'-global'` flag, the MEX function produces `y = 2`. Because there is no indication that the C function modifies `g`, the code generator assumes that `y` and `g` are identical. This C code is generated:

```
real_T useGlobal(const emlrtStack *sp)
{
    (void)sp;
    addGlobal();
    return g;
}
```

Call C Function That Uses Different Array Layout

Suppose that you have a C function `testRM` that is designed to use row-major layout. You want to integrate this function into a MATLAB function `bar` that operates on arrays. The function `bar` is designed to use column-major layout, employing the `coder.columnMajor` directive.

```
function out = bar(in)
%#codegen
coder.columnMajor;
coder.ceval('-layout:rowMajor','testRM', ...
    coder.rref(in),coder.wref(out));
end
```

In the generated code, the code generator inserts a layout conversion from column-major layout to row-major layout on the variable `in` before passing it to `testRM`. On the output variable `out`, the code generator inserts a layout conversion back to column-major.

In general, if you do not specify the `layout` option for `coder.ceval`, the external function arguments are assumed to use column-major.

Call C Function That Takes Complex Number Inputs

Suppose you have a MATLAB function that calls custom C code that takes complex number inputs. You must define your C code input parameters so that the complex number inputs from your MATLAB function can map to your C code.

In generated code, complex numbers are defined as a `struct` that has two fields, `re` and `im`, which are the real and imaginary part of a complex number respectively. This `struct` is defined in the header file `rtwtypes.h`, which you can find in the `codegen\lib\functionName` folder of your current path. The `struct` is defined as follows:

```
typedef struct {
    real32_T re; /*Real Component*/
    real32_T im; /*Imaginary Component*/
} creal32_T;
```

For more information, see “Mapping MATLAB Types to Types in Generated Code” (MATLAB Coder).

The C code that you want to integrate must include the `rtwtypes.h` header file. An example C code `foo.c` is shown below:

```
#include "foo.h"
#include<stdio.h>
#include<stdlib.h>
#include "rtwtypes.h"

double foo(creal32_T x) {
    double z = 0.0;
    z = x.re*x.re + x.im*x.im;
    return (z);
}
```

The `struct` is named `creal32_T`. A header file `foo.h` must also be defined as:

```
#include "rtwtypes.h"
double foo(creal32_T x);
```

The MATLAB code executes `foo.c` by using the `coder.ceval` function that has a complex numbers input:

```
function y = complexCeval %#codegen
y = 0.0;
coder.updateBuildInfo('addSourceFiles','foo.c');
coder.cinclude('foo.h');
y = coder.ceval('foo', 10+20i);
end
```

The `coder.ceval` command takes the complex number input. The code generator maps the complex number to the `struct creal32_T` variable `x` and its fields `re` and `im`.

Generate code for the function `complexCeval` by running this command:

```
codegen -config:lib -report complexCeval
```

Input Arguments

cfun_name — C/C++ function name

character vector | string scalar

Name of external C/C++ function to call.

Example: `coder.ceval('foo')`

Data Types: `char` | `string`

cfun_arguments — C/C++ function arguments

scalar variable | array | element of an array | structure | structure field | object property

Comma-separated list of input arguments in the order that `cfun_name` requires.

Example: `coder.ceval('foo', 10, 20);`

Example: `coder.ceval('myFunction', coder.ref(x));`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `struct`

Complex Number Support: Yes

Limitations

- You cannot use `coder.ceval` on functions that you declare extrinsic with `coder.extrinsic`.
- When the LCC compiler creates a library, it adds a leading underscore to the library function names. If the compiler for the library was LCC and your code generation compiler is not LCC, you must add the leading underscore to the function name, for example, `coder.ceval('_mylibfun')`. If the compiler for a library was not LCC, you cannot use LCC to generate code from MATLAB code that calls functions from that library. Those library function names do not have the leading underscore that the LCC compiler requires.
- If a property has a get method, a set method, or validators, or is a System object property with certain attributes, then you cannot pass the property by reference to an external function. See “Passing By Reference Not Supported for Some Properties”.

Tips

- For code generation, before calling `coder.ceval`, you must specify the type, size, and complexity data type of return values and output arguments.
- To apply `coder.ceval` to a function that accepts or returns variables that do not exist in MATLAB code, such as pointers, FILE types for file I/O, and C/C++ macros, use the `coder.opaque` function.
- Use `coder.ceval` only in MATLAB for code generation. `coder.ceval` generates an error in uncompiled MATLAB code. To determine if a MATLAB function is executing in MATLAB, use `coder.target`. If the function is executing in MATLAB, call the MATLAB version of the C/C++ function.

Introduced in R2011a

coder.cinclude

Include header file in generated code

Syntax

```
coder.cinclude(headerfile)
coder.cinclude(headerfile, 'InAllSourceFiles', allfiles)
```

Description

`coder.cinclude(headerfile)` includes a header file in generated C/C++ source code.

MATLAB Coder generates the include statement in the C/C++ source files that are generated from the MATLAB code that contains the `coder.cinclude` call.

In a Simulink model, when a `coder.cinclude` call appears in a MATLAB Function block, the code generator puts the include statement in the model header file.

Note Place a `coder.cinclude` call as close as possible to the `coder.ceval` call that requires the header file.

`coder.cinclude(headerfile, 'InAllSourceFiles', allfiles)` uses the `allfiles` option to determine whether to include the header file in almost all C/C++ source files.

If `allfiles` is true, MATLAB Coder generates the include statement in almost all C/C++ source files, except for some utility files. This behavior is the `coder.cinclude` behavior from R2016a and earlier releases. The presence of the include statement in these additional files can increase compile time and make the generated code less readable. Use this option only if your code depends on the legacy behavior. If `allfiles` is false, the behavior is the same as the behavior of `coder.cinclude(headerfile)`.

In a MATLAB Function block, `coder.cinclude(headerfile, 'InAllSourceFiles', allfiles)` is the same as `coder.cinclude(headerfile)`.

Examples

Include Header File in C/C++ Code Generated by Using the MATLAB Coder codegen Command

Generate code from a MATLAB function that calls an external C function. Use `coder.cinclude` to include the required header file in the generated C code.

In a writable folder, create a subfolder `mycfiles`.

Write a C function `myMult2.c` that doubles its input. Save it in `mycfiles`.

```
#include "myMult2.h"
double myMult2(double u)
```

```
{
    return 2 * u;
}
```

Write the header file `myMult2.h`. Save it in `mycfiles`.

```
#if !defined(MYMULT2)
#define MYMULT2
extern double myMult2(double);
#endif
```

Write a MATLAB function, `myfunc`, that includes `myMult2.h` and calls `myMult2` for code generation only.

```
function y = myfunc
%#codegen
y = 21;
if ~coder.target('MATLAB')
    % Running in generated code
    coder.cinclude('myMult2.h');
    y = coder.ceval('myMult2', y);
else
    % Running in MATLAB
    y = y * 2;
end
end
```

Create a code configuration object for a static library. Specify the locations of `myMult2.h` and `myMult2.c`.

```
cfg = coder.config('lib');
cfg.CustomInclude = fullfile(pwd, 'mycfiles');
cfg.CustomSource = fullfile(pwd, 'mycfiles', 'myMult2.c');
```

Generate the code.

```
codegen -config cfg myfunc -report
```

The file `myfunc.c` contains this statement:

```
#include "myMult2.h"
```

The include statement does not appear in any other file.

Include Header File in C/C++ Code Generated from a MATLAB Function Block in a Simulink Model

Generate code from a MATLAB Function block that calls an external C function. Use `coder.cinclude` to include the required header file in the generated C code.

In a writable folder, create a subfolder `mycfiles`.

Write a C function `myMult2.c` that doubles its input. Save it in `mycfiles`.

```
#include "myMult2.h"
double myMult2(double u)
```

```
{
    return 2 * u;
}
```

Write the header file `myMult2.h`. Save it in `mycfiles`.

```
#if !defined(MYMULT2)
#define MYMULT2
extern double myMult2(double);
#endif
```

Create a Simulink model that contains a MATLAB Function block connected to an Output block.

In the MATLAB Function block, add the function `myfunc` that includes `myMult2.h` and calls `myMult2`.

```
function y = myfunc
%#codegen
y = 21;
coder.cinclude('myMult2.h');
y = coder.ceval('myMult2', y);
% Specify the locations of myMult2.h and myMult2.c
coder.extrinsic('pwd', 'fullfile');
customDir = coder.const(fullfile(pwd, 'mycfiles'));
coder.updateBuildInfo('addIncludePaths', customDir);
coder.updateBuildInfo('addSourcePaths', customDir);
coder.updateBuildInfo('addSourceFiles', 'myMult2.c');
end
```

Open the Configuration Parameters dialog box.

On the **Solver** pane, select a fixed-step solver.

Save the model as `mymodel`.

Build the model.

The file `mymodel.h` contains this statement:

```
#include "myMult2.h"
```

To read more about integrating custom code in a MATLAB Function block, see “Integrate C Code Using the MATLAB Function Block”.

Input Arguments

headerfile — Name of header file

character vector | string scalar

Name of a header file specified as a character vector or string scalar. `headerfile` must be a compile-time constant.

Enclose a system header file name in angle brackets `< >`. The generated `#include` statement for a system header file has the format `#include <sysheader>`. A system header file must be in a standard location or on the include path. Specify the include path by using code generation custom code parameters.

Example: `coder.cinclude('<sysheader.h>')`

For a header file that is not a system header file, omit the angle brackets. The generated `#include` statement for a header file that is not a system header file has the format `#include "myHeader"`. The header file must be in the current folder or on the include path. Specify the include path by using code generation custom code parameters.

Example: `coder.cinclude('myheader.h')`

Data Types: `char`

allfiles — All source files option

`true | false`

Option to include header file in all generated C/C++ source files. If `allfiles` is `true`, MATLAB Coder generates the include statement in almost all of the C/C++ source files, except for some utility files. If `allfiles` is `false`, the behavior is the same as the behavior of `coder.cinclude(headerfile)`.

In a MATLAB Function block, the code generator ignores the all source files option.

Data Types: `logical`

Limitations

- Do not call `coder.cinclude` inside run-time conditional constructs such as `if` statements, `switch` statements, `while`-loops, and `for`-loops. You can call `coder.cinclude` inside compile-time conditional statements, such as `coder.target`. For example:

```
...
if ~coder.target('MATLAB')
    coder.cinclude('foo.h');
    coder.ceval('foo');
end
...
```

Tips

- Before a `coder.ceval` call, call `coder.cinclude` to include the header file required by the external function that `coder.ceval` calls.
- Extraneous include statements in generated C/C++ code can increase compile time and reduce code readability. To avoid extraneous include statements in code generated by MATLAB Coder, follow these best practices:
 - Place a `coder.cinclude` call as close as possible to the `coder.ceval` call that requires the header file.
 - Do not set `allfiles` to `true`.

For the MATLAB Function block, the code generator generates the include statement in the model header file.

- In R2016a and earlier releases, for any `coder.cinclude` call, MATLAB Coder included the header file in almost all generated C/C++ source files, except for some utility files. If you have code that depends on this legacy behavior, you can preserve the legacy behavior by using this syntax:

```
coder.cinclude(headerfile,'InAllSourceFiles',true)
```

“Model Configuration Parameters: Code Generation Custom Code” (Simulink Coder)

Introduced in R2013a

coder.columnMajor

Specify column-major array layout for a function or class

Syntax

```
coder.columnMajor
```

Description

`coder.columnMajor` specifies column-major array layout for the data used by the current function in generated code. When placed in a class constructor, `coder.columnMajor` specifies column-major layout for data used by the class.

Note By default, code generation uses column-major array layout.

Examples

Specify Column-Major Array Layout for a Function

Specify column-major array layout for a function by inserting `coder.columnMajor` into the function body.

Suppose that `myFunction` is the top-level function of your code. Your application requires you to perform matrix addition with column-major array layout and matrix multiplication with row-major layout.

```
function S = myFunction(A,B)
%#codegen
% check to make sure inputs are valid
if size(A,1) ~= size(B,1) || size(A,2) ~= size(B,2)
    disp('Matrices must be same size.')
    return;
end
% make both matrices symmetric
B = B*B';
A = A*A';
% add matrices
S = addMatrix(A,B);
end
```

Write a function for matrix addition called `addMatrix`. Specify column-major for `addMatrix` by using `coder.columnMajor`.

```
function S = addMatrix(A,B)
%#codegen
S = zeros(size(A));
coder.columnMajor; % specify column-major array layout
S = A + B;
end
```

Generate code for `myFunction`. Use the `codegen` command.

```
codegen myFunction -args {ones(10,20),ones(10,20)} -config:lib -launchreport -rowmajor
```

Because of the `codegen -rowmajor` option, the matrix multiplication in `myFunction` uses row-major layout. However, the generated code for `addMatrix` uses column-major array layout due to the `coder.columnMajor` call.

Tips

- The code generator uses column-major array layout by default.
- The specification of array layout inside a function supersedes the array layout specified with the `codegen` command. For example, if the function `foo` contains `coder.columnMajor`, and you generate code by using:

```
codegen foo -rowmajor
```

then the generated code still uses column-major layout.
- Other functions called from within a column-major function inherit the column-major specification. However, if one of the called functions has its own distinct `coder.rowMajor` call, the code generator changes the array layout accordingly. If a row-major function and a column-major function call the same function, which does not have its own array layout specification, the code generator produces a row-major version and column-major version of the function.
- `coder.columnMajor` is ignored outside of code generation and simulation.

coder.const

Fold expressions into constants in generated code

Syntax

```
out = coder.const(expression)
[out1,...,outN] = coder.const(handle,arg1,...,argN)
```

Description

`out = coder.const(expression)` evaluates `expression` and replaces `out` with the result of the evaluation in generated code.

`[out1,...,outN] = coder.const(handle,arg1,...,argN)` evaluates the multi-output function having handle `handle`. It then replaces `out1,...,outN` with the results of the evaluation in the generated code.

Examples

Specify Constants in Generated Code

This example shows how to specify constants in generated code using `coder.const`.

Write a function `AddShift` that takes an input `Shift` and adds it to the elements of a vector. The vector consists of the square of the first 10 natural numbers. `AddShift` generates this vector.

```
function y = AddShift(Shift) %#codegen
y = (1:10).^2+Shift;
```

Generate code for `AddShift` using the `codegen` command. Open the Code Generation Report.

```
codegen -config:lib -launchreport AddShift -args 0
```

The code generator produces code for creating the vector. It adds `Shift` to each element of the vector during vector creation. The definition of `AddShift` in generated code looks as follows:

```
void AddShift(double Shift, double y[10])
{
    int k;
    for (k = 0; k < 10; k++) {
        y[k] = (double)((1 + k) * (1 + k)) + Shift;
    }
}
```

Replace the expression `(1:10).^2` with `coder.const((1:10).^2)`, and then generate code for `AddShift` again using the `codegen` command. Open the Code Generation Report.

```
codegen -config:lib -launchreport AddShift -args 0
```

The code generator creates the vector containing the squares of the first 10 natural numbers. In the generated code, it adds `Shift` to each element of this vector. The definition of `AddShift` in generated code looks as follows:

```
void AddShift(double Shift, double y[10])
{
    int i;
    static const signed char iv[10] = { 1, 4, 9, 16, 25, 36,
                                        49, 64, 81, 100 };

    for (i = 0; i < 10; i++) {
        y[i] = (double)iv[i] + Shift;
    }
}
```

Create Lookup Table in Generated Code

This example shows how to fold a user-written function into a constant in generated code.

Write a function `getsine` that takes an input `index` and returns the element referred to by `index` from a lookup table of sines. The function `getsine` creates the lookup table using another function `gettable`.

```
function y = getsine(index) %#codegen
    assert(isa(index, 'int32'));
    persistent tbl;
    if isempty(tbl)
        tbl = gettable(1024);
    end
    y = tbl(index);

function y = gettable(n)
    y = zeros(1,n);
    for i = 1:n
        y(i) = sin((i-1)/(2*pi*n));
    end
```

Generate code for `getsine` using an argument of type `int32`. Open the Code Generation Report.

```
codegen -config:lib -launchreport getsine -args int32(0)
```

The generated code contains instructions for creating the lookup table.

Replace the statement:

```
tbl = gettable(1024);
```

with:

```
tbl = coder.const(gettable(1024));
```

Generate code for `getsine` using an argument of type `int32`. Open the Code Generation Report.

The generated code contains the lookup table itself. `coder.const` forces the expression `gettable(1024)` to be evaluated during code generation. The generated code does not contain instructions for the evaluation. The generated code contains the result of the evaluation itself.

Specify Constants in Generated Code Using Multi-Output Function

This example shows how to specify constants in generated code using a multi-output function in a `coder.const` statement.

Write a function `MultiplyConst` that takes an input `factor` and multiplies every element of two vectors `vec1` and `vec2` with `factor`. The function generates `vec1` and `vec2` using another function `EvalConsts`.

```
function [y1,y2] = MultiplyConst(factor) %#codegen
    [vec1,vec2]=EvalConsts(pi.*(1./2.^(1:10)),2);
    y1=vec1.*factor;
    y2=vec2.*factor;

function [f1,f2]=EvalConsts(z,n)
    f1=z.^(2*n)/factorial(2*n);
    f2=z.^(2*n+1)/factorial(2*n+1);
```

Generate code for `MultiplyConst` using the `codegen` command. Open the Code Generation Report.

```
codegen -config:lib -launchreport MultiplyConst -args 0
```

The code generator produces code for creating the vectors.

Replace the statement

```
[vec1,vec2]=EvalConsts(pi.*(1./2.^(1:10)),2);
```

with

```
[vec1,vec2]=coder.const(@EvalConsts,pi.*(1./2.^(1:10)),2);
```

Generate code for `MultiplyConst` using the `codegen` command. Open the Code Generation Report.

```
codegen -config:lib -launchreport MultiplyConst -args 0
```

The code generator does not generate code for creating the vectors. Instead, it calculates the vectors and specifies the calculated vectors in generated code.

Read Constants by Processing XML File

This example shows how to call an extrinsic function using `coder.const`.

Write an XML file `MyParams.xml` containing the following statements:

```
<params>
  <param name="hello" value="17"/>
  <param name="world" value="42"/>
</params>
```

Save `MyParams.xml` in the current folder.

Write a MATLAB function `xml2struct` that reads an XML file. The function identifies the XML tag `param` inside another tag `params`.

After identifying `param`, the function assigns the value of its attribute `name` to the field name of a structure `s`. The function also assigns the value of attribute `value` to the value of the field.

```
function s = xml2struct(file)

s = struct();
doc = xmlread(file);
els = doc.getElementsByTagName('params');
for i = 0:els.getLength-1
    it = els.item(i);
    ps = it.getElementsByTagName('param');
    for j = 0:ps.getLength-1
        param = ps.item(j);
        paramName = char(param.getAttribute('name'));
        paramValue = char(param.getAttribute('value'));
        paramValue = evalin('base', paramValue);
        s.(paramName) = paramValue;
    end
end
```

Save `xml2struct` in the current folder.

Write a MATLAB function `MyFunc` that reads the XML file `MyParams.xml` into a structure `s` using the function `xml2struct`. Declare `xml2struct` as extrinsic using `coder.extrinsic` and call it in a `coder.const` statement.

```
function y = MyFunc(u) %#codegen
    assert(isa(u, 'double'));
    coder.extrinsic('xml2struct');
    s = coder.const(xml2struct('MyParams.xml'));
    y = s.hello + s.world + u;
```

Generate code for `MyFunc` using the `codegen` command. Open the Code Generation Report.

```
codegen -config:dll -launchreport MyFunc -args 0
```

The code generator executes the call to `xml2struct` during code generation. It replaces the structure fields `s.hello` and `s.world` with the values 17 and 42 in generated code.

Input Arguments

expression — MATLAB expression or user-written function

expression with constants | single-output function with constant arguments

MATLAB expression or user-defined single-output function.

The expression must have compile-time constants only. The function must take constant arguments only. For instance, the following code leads to a code generation error, because `x` is not a compile-time constant.

```
function y=func(x)
    y=coder.const(log10(x));
```

To fix the error, assign `x` to a constant in the MATLAB code. Alternatively, during code generation, you can use `coder.Constant` to define input type as follows:

```
codegen -config:lib func -args coder.Constant(10)
```

Example: `2*pi, factorial(10)`

handle — Function handle

function handle

Handle to built-in or user-written function.

Example: `@log, @sin`

Data Types: `function_handle`

arg1, ..., argN — Arguments to the function with handle handle

function arguments that are constants

Arguments to the function with handle `handle`.

The arguments must be compile-time constants. For instance, the following code leads to a code generation error, because `x` and `y` are not compile-time constants.

```
function y=func(x,y)
    y=coder.const(@choosek,x,y);
```

To fix the error, assign `x` and `y` to constants in the MATLAB code. Alternatively, during code generation, you can use `coder.Constant` to define input type as follows:

```
codegen -config:lib func -args {coder.Constant(10),coder.Constant(2)}
```

Output Arguments

out — Value of expression

value of the evaluated expression

Value of expression. In the generated code, MATLAB Coder replaces occurrences of `out` with the value of expression.

out1, ..., outN — Outputs of the function with handle handle

values of the outputs of the function with handle `handle`

Outputs of the function with handle `handle`. MATLAB Coder evaluates the function and replaces occurrences of `out1, ..., outN` with constants in the generated code.

Tips

- When possible, the code generator constant-folds expressions automatically. Typically, automatic constant-folding occurs for expressions with scalars only. Use `coder.const` when the code generator does not constant-fold expressions on its own.
- When constant-folding computationally intensive function calls, to reduce code generation time, make the function call extrinsic. The extrinsic function call causes evaluation of the function call by MATLAB instead of by the code generator. For example:

```
function j = fcn(z)
zTable = coder.const(0:0.01:100);
jTable = coder.const(feval('besselj',3,zTable));
j = interp1(zTable,jTable,z);
end
```

See “Use coder.const with Extrinsic Function Calls” (MATLAB Coder).

- If `coder.const` is unable to constant-fold a function call, try to force constant-folding by making the function call extrinsic. The extrinsic function call causes evaluation of the function call by MATLAB instead of by the code generator. For example:

```
function yi = fcn(xi)
y = coder.const(feval('rand',1,100));
yi = interp1(y,xi);
end
```

See “Use coder.const with Extrinsic Function Calls” (MATLAB Coder).

Introduced in R2013b

coder.cstructname

Package: coder

Name C structure type in generated code

Syntax

```
coder.cstructname(var,structName)
coder.cstructname(var,structName,'extern','HeaderFile',headerfile)
coder.cstructname(var,structName,'extern','HeaderFile',
headerfile,'Alignment',alignment)

outtype = coder.cstructname(intype,structName)
outtype = coder.cstructname(intype,structName,'extern','HeaderFile',
headerfile)
outtype = coder.cstructname(intype,structName,'extern','HeaderFile',
headerfile,'Alignment',alignment)
```

Description

`coder.cstructname` names the generated or externally defined C structure type to use for MATLAB variables that are represented as structures in generated code.

`coder.cstructname(var,structName)` names the C structure type generated for the MATLAB variable `var`. The input `var` can be a structure or a cell array. Use this syntax in a function from which you generate code. Place `coder.cstructname` after the definition of `var` and before the first use of `var`. If `var` is an entry-point (top-level) function input argument, place `coder.cstructname` at the beginning of the function, before any control flow statements.

`coder.cstructname(var,structName,'extern','HeaderFile',headerfile)` specifies that the C structure type to use for `var` has the name `structName` and is defined in the external file, `headerfileName`.

It is possible to use the 'extern' option without specifying the header file. However, it is a best practice to specify the header file so that the code generator produces the `#include` statement in the correct location.

`coder.cstructname(var,structName,'extern','HeaderFile',headerfile,'Alignment',alignment)` also specifies the run-time memory alignment for the externally defined structure type `structName`. If you have Embedded Coder and use custom Code Replacement Libraries (CRLs), specify the alignment so that the code generator can match CRL functions that require alignment for structures. See “Data Alignment for Code Replacement” (Embedded Coder).

`outtype = coder.cstructname(intype,structName)` returns a structure or cell array type object `outtype` that specifies the name of the C structure type to generate. `coder.cstructname` creates `outtype` with the properties of the input type `intype`. Then, it sets the `TypeName` property to `structName`. Use this syntax to create a type object that you use with the `codegen -args` option. You cannot use this syntax in a function from which you generate code.

You cannot use this syntax in a MATLAB Function block.

`outtype = coder.cstructname(intype, structName, 'extern', 'HeaderFile', headerfile)` returns a type object `outtype` that specifies the name and location of an externally defined C structure type. The code generator uses the externally defined structure type for variables with type `outtype`.

You cannot use this syntax in a MATLAB Function block.

`outtype = coder.cstructname(intype, structName, 'extern', 'HeaderFile', headerfile, 'Alignment', alignment)` creates a type object `outtype` that also specifies the C structure type alignment.

You cannot use this syntax in a MATLAB Function block.

Examples

Name the C Structure Type for a Variable in a Function

In a MATLAB function, `myfun`, assign the name `MyStruct` to the generated C structure type for the variable `v`.

```
function y = myfun()
%#codegen
v = struct('a',1,'b',2);
coder.cstructname(v, 'myStruct');
y = v;
end
```

Generate standalone C code. For example, generate a static library.

```
codegen -config:lib myfun -report
```

To see the generated structure type, open `codegen/lib/myfun/myfun_types.h` or view `myfun_types.h` in the code generation report. The generated C structure type is:

```
typedef struct {
    double a;
    double b;
} myStruct;
```

Name the C Structure Type Generated for a Substructure

In a MATLAB function, `myfun1`, assign the name `MyStruct` to the generated C structure type for the structure `v`. Assign the name `mysubStruct` to the structure type generated for the substructure `v.b`.

```
function y = myfun()
%#codegen
v = struct('a',1,'b',struct('f',3));
coder.cstructname(v, 'myStruct');
coder.cstructname(v.b, 'mysubStruct');
y = v;
end
```

The generated C structure type `mysubStruct` is:

```
typedef struct {  
    double f;  
} mysubStruct;
```

The generated C structure type `myStruct` is:

```
typedef struct {  
    double a;  
    mysubStruct b;  
} myStruct;
```

Name the Structure Type Generated for a Cell Array

In a MATLAB function, `myfun2`, assign the name `myStruct` to the generated C structure type for the cell array `c`.

```
function z = myfun2()  
c = {1 2 3};  
coder.cstructname(c, 'myStruct')  
z = c;
```

The generated C structure type for `c` is:

```
typedef struct {  
    double f1;  
    double f2;  
    double f3;  
} myStruct;
```

Name an Externally Defined C Structure Type

Specify that a structure passed to a C function has a structure type defined in a C header file.

Create a C header file `mycadd.h` for the function `mycadd` that takes a parameter of type `mycstruct`. Define the type `mycstruct` in the header file.

```
#ifndef MYCADD_H  
#define MYCADD_H  
  
typedef struct {  
    double f1;  
    double f2;  
} mycstruct;  
  
double mycadd(mycstruct *s);  
#endif
```

Write the C function `mycadd.c`.

```
#include <stdio.h>  
#include <stdlib.h>
```

```
#include "mycadd.h"

double mycadd(mycstruct *s)
{
    return s->f1 + s->f2;
}
```

Write a MATLAB function `mymAdd` that passes a structure by reference to `mycadd`. Use `coder.cstructname` to specify that in the generated code, the structure has the C type `mycstruct`, which is defined in `mycadd.h`.

```
function y = mymAdd
%#codegen
s = struct('f1', 1, 'f2', 2);
coder.cstructname(s, 'mycstruct', 'extern', 'HeaderFile', 'mycadd.h');
y = 0;
y = coder.ceval('mycadd', coder.ref(s));
```

Generate a C static library for function `mymAdd`.

```
codegen -config:lib mymAdd mycadd.c
```

The generated header file `mymadd_types.h` does not contain a definition of the structure `mycstruct` because `mycstruct` is an external type.

Create a Structure Type Object That Names the Generated C Structure Type

Suppose that the entry-point function `myFunction` takes a structure argument. To specify the type of the input argument at the command line:

- 1 Define an example structure `S`.
- 2 Create a type `T` from `S` by using `coder.typeof`.
- 3 Use `coder.cstructname` to create a type `T1` that:
 - Has the properties of `T`.
 - Names the generated C structure type `myStruct`.
- 4 Pass the type to `codegen` by using the `-args` option.

For example:

```
S = struct('a',double(0),'b',single(0));
T = coder.typeof(S);
T1 = coder.cstructname(T,'myStruct');
codegen -config:lib myFunction -args T1
```

Alternatively, you can create the structure type directly from the example structure.

```
S = struct('a',double(0),'b',single(0));
T1 = coder.cstructname(S,'myStruct');
codegen -config:lib myFunction -args T1
```

Input Arguments

var — MATLAB structure or cell array variable

structure | cell array

MATLAB structure or cell array variable that is represented as a structure in the generated code.

structName — Name of C structure type

character vector | string scalar

Name of generated or externally defined C structure type, specified as a character vector or string scalar.

headerfile — Header file that contains the C structure type definition

character vector | string scalar

Header file that contains the C structure type definition, specified as a character vector or string scalar.

To specify the path to the file:

- Use the `codegen -I` option or the **Additional include directories** parameter on the MATLAB Coder app settings **Custom Code** tab.
- For a MATLAB Function block, on the **Simulation Target** and the **Code Generation > Custom Code** panes, under **Additional build information**, set the **Include directories** parameter.

Alternatively, use `coder.updateBuildInfo` with the `'addIncludePaths'` option.

Example: `'mystruct.h'`

alignment — Run-time memory alignment for structure

-1 (default) | power of 2 not greater than 128

Run-time memory alignment for generated or externally defined structure.

intype — Type object or variable for creation of new type object

`coder.StructType` | `coder.CellType` | structure | cell array

Structure type object, cell array type object, structure variable, or cell array variable from which to create a type object.

Limitations

- You cannot apply `coder.cstructname` directly to a global variable. To name the structure type to use with a global variable, use `coder.cstructname` to create a type object that names the structure type. Then, when you run `codegen`, specify that the global variable has that type. See “Name the C Structure Type to Use With a Global Structure Variable” (MATLAB Coder).
- For cell array inputs, the field names of externally defined structures must be `f1`, `f2`, and so on.
- You cannot apply `coder.cstructname` directly to a class property.

Tips

- For information about how the code generator determines the C/C++ types of structure fields, see “Mapping MATLAB Types to Types in Generated Code” (MATLAB Coder).
- Using `coder.cstructname` on a structure array sets the name of the structure type of the base element, not the name of the array. Therefore, you cannot apply `coder.cstructname` to a structure array element, and then apply it to the array with a different C structure type name. For example, the following code is not allowed. The second `coder.cstructname` attempts to set the name of the base type to `myStructArrayName`, which conflicts with the previously specified name, `myStructName`.

```
% Define scalar structure with field a
myStruct = struct('a', 0);
coder.cstructname(myStruct, 'myStructName');
% Define array of structure with field a
myStructArray = repmat(myStruct,4,6);
coder.cstructname(myStructArray, 'myStructArrayName');
```

- Applying `coder.cstructname` to an element of a structure array produces the same result as applying `coder.cstructname` to the entire structure array. If you apply `coder.cstructname` to an element of a structure array, you must refer to the element by using a single subscript. For example, you can use `var(1)`, but not `var(1,1)`. Applying `coder.cstructname` to `var(:)` produces the same result as applying `coder.cstructname` to `var` or `var(n)`.
- Heterogeneous cell arrays are represented as structures in the generated code. Here are considerations for using `coder.cstructname` with cell arrays:
 - In a function from which you generate code, using `coder.cstructname` with a cell array variable makes the cell array heterogeneous. Therefore, if a cell array is an entry-point function input and its type is permanently homogeneous, then you cannot use `coder.cstructname` with the cell array.
 - Using `coder.cstructname` with a homogeneous `coder.CellType` object `intype` makes the returned object heterogeneous. Therefore, you cannot use `coder.cstructname` with a permanently homogeneous `coder.CellType` object. For information about when a cell array is permanently homogeneous, see “Specify Cell Array Inputs at the Command Line” (MATLAB Coder).
 - When used with a `coder.CellType` object, `coder.cstructname` creates a `coder.CellType` object that is permanently heterogeneous.
- When you use a structure named by `coder.cstructname` in a project with row-major and column-major array layouts, the code generator renames the structure in certain cases, appending `row_` or `col_` to the beginning of the structure name. This renaming provides unique type definitions for the types that are used in both array layouts.
- These tips apply only to MATLAB Function blocks:
 - MATLAB Function block input and output structures are associated with bus signals. The generated name for the structure type comes from the bus signal name. Do not use `coder.cstructname` to name the structure type for input or output signals. See “Create Structures in MATLAB Function Blocks”.
 - The code generator produces structure type names according to identifier naming rules, even if you name the structure type with `coder.cstructname`. If you have Embedded Coder, you can customize the naming rules. See “Construction of Generated Identifiers” (Embedded Coder).

coder.extrinsic

Declare a function as extrinsic and execute it in MATLAB

Syntax

```
coder.extrinsic(function)
coder.extrinsic(function1, ... ,functionN)

coder.extrinsic('-sync:on', function1, ... ,functionN)
coder.extrinsic('-sync:off', function1, ... ,functionN)
```

Description

`coder.extrinsic(function)` declares `function` as an extrinsic function. The code generator does not produce code for the body of the extrinsic function and instead uses the MATLAB engine to execute the call. This functionality is available only when the MATLAB engine is available during execution. Examples of situations during which the MATLAB engine is available include execution of MEX functions, Simulink simulations, or function calls at the time of code generation (also known as compile time).

During standalone code generation, the code generator attempts to determine whether an extrinsic function affects the output of the function in which it is called — for example by returning `mxArrays` to an output variable. Provided that there is no change to the output, the code generator proceeds with code generation, but excludes the extrinsic function from the generated code. Otherwise, the code generator produces a compilation error.

You cannot use `coder.ceval` on functions that you declare as extrinsic by using `coder.extrinsic`.

`coder.extrinsic` is ignored outside of code generation.

Note The code generator automatically treats many common MATLAB visualization functions, such as `plot`, `disp`, and `figure`, as extrinsic. You do not have to explicitly declare them as extrinsic functions by using `coder.extrinsic`.

`coder.extrinsic(function1, ... ,functionN)` declares `function1` through `functionN` as extrinsic functions.

`coder.extrinsic('-sync:on', function1, ... ,functionN)` enables synchronization of global data between MATLAB execution and generated code execution or Simulink simulation before and after calls to the extrinsic functions `function1` through `functionN`. If only a few extrinsic calls use or modify global data, turn off synchronization before and after all extrinsic function calls by setting the global synchronization mode to `At MEX-function entry and exit`. Use the `'-sync:on'` option to turn on synchronization for only the extrinsic calls that do modify global data.

See “Generate Code for Global Data” (MATLAB Coder).

`coder.extrinsic('-sync:off', function1, ... ,functionN)` disables synchronization of global data between MATLAB execution and generated code execution before and after calls to the

extrinsic functions `function1` through `functionN`. If most extrinsic calls use or modify global data, but a few do not, use the `'-sync:off'` option to turn off synchronization for the extrinsic calls that do not modify global data.

See “Generate Code for Global Data” (MATLAB Coder).

Examples

Declare a MATLAB Visualization Function as Extrinsic

The MATLAB function `patch` is not supported for code generation. This example shows how you can still use the functionality of `patch` in your generated MEX function by declaring `patch` as extrinsic your MATLAB function.

This MATLAB code declares `patch` as extrinsic in the local function `create_plot`. By declaring `patch` as extrinsic, you instruct the code generator not to produce code for `patch`. Instead, the code generator dispatches `patch` to MATLAB for execution.

The code generator automatically treats many common MATLAB visualization functions, such as the function `axis` as extrinsic.

```
function c = pythagoras(a,b,color) %#codegen
% Calculate the hypotenuse of a right triangle
% and display the triangle as a patch object.
c = sqrt(a^2 + b^2);
create_plot(a, b, color);
end

function create_plot(a, b, color)
%Declare patch as extrinsic
coder.extrinsic('patch');
x = [0;a;a];
y = [0;0;b];
patch(x,y,color);
axis('equal');
end
```

Generate a MEX function for `pythagoras`. Also, generate the code generation report.

```
codegen -report pythagoras -args {1, 1, [.3 .3 .3]}
```

In the report, view the MATLAB code for `create_plot`.

```
7 function create_plot(a, b, color)
8 coder.extrinsic('patch');
9 x = [0;a;a];
10 y = [0;0;b];
11 patch(x,y,color);
12 axis('equal');
13 end
```

The report highlights the `patch` and `axis` functions to indicate that they are treated as extrinsic functions.

Run the MEX function.

```
pythagoras_mex(3, 4, [1.0 0.0 0.0]);
```

MATLAB displays the plot of the right triangle as a red patch object.

Note Instead of generating a MEX file by using the `codegen` command, you could also place the function `pythagoras` inside a MATLAB Function block in a Simulink model. When you simulate the model, the MATLAB Function block has similar behavior as `pythagoras_mex`.

Declare MATLAB Graph Functions as Extrinsic

The MATLAB functions for graph and network algorithms are not supported for code generation. This example shows how you can still use these functions in your generated MEX code by declaring them as extrinsic.

Define a MATLAB function `foo` that accepts source and target node indices for a directed graph as inputs and determines if the graph is acyclic. The function `foo` also plots the directed graph.

The function `foo` calls these functions that are not supported for code generation:

- `plot`: The code generator automatically treats this function as extrinsic.
- `digraph` and `isdag`: These two functions are explicitly declared to be extrinsic by using the `coder.extrinsic` construct.

```
function isDAG = foo(source,target)
coder.extrinsic('digraph','isdag');
assert(numel(source) == numel(target))
G = digraph(source,target);
plot(G)
isDAG = isdag(G);
end
```

Generate MEX code for foo. Specify the inputs to be unbounded vectors of type double.

```
codegen foo -args {coder.typeof(0,Inf),coder.typeof(0,Inf)}
```

Call the generated MEX function foo_mex with suitable inputs:

```
foo_mex([1 2 4 4],[2 3 3 1])
```

```
ans =
```

```
logical
```

```
1
```

MATLAB also displays the graph:

Input Arguments

function — MATLAB function name
character vector

Name of the MATLAB function that is declared as extrinsic.

Example: `coder.extrinsic('patch')`

Data Types: `char`

Limitations

- Extrinsic function calls have some overhead that can affect performance. Input data that is passed in an extrinsic function call must be provided to MATLAB, which requires making a copy of the data. If the function has any output data, this data must be transferred back into the MEX function environment, which also requires a copy.
- The code generator does not support the use of `coder.extrinsic` to call functions that are located in a private folder.
- The code generator does not support the use of `coder.extrinsic` to call local functions.

Tips

- The code generator automatically treats many common MATLAB visualization functions, such as `plot`, `disp`, and `figure`, as extrinsic. You do not have to explicitly declare them as extrinsic functions by using `coder.extrinsic`.
- Use the `coder.screener` function to detect which functions you must declare as extrinsic. This function runs the Code Generation Readiness Tool that screens the MATLAB code for features and functions that are not supported for code generation.

Introduced in R2011a

coder.ignoreConst

Prevent use of constant value of expression for function specializations

Syntax

```
coder.ignoreConst(expression)
```

Description

`coder.ignoreConst(expression)` prevents the code generator from using the constant value of expression to create function specializations on page 2-96. `coder.ignoreConst(expression)` returns the value of expression.

Examples

Prevent Function Specializations Based on Constant Input Values

Use `coder.ignoreConst` to prevent function specializations for a function that is called with constant values.

Write the function `call_myfcn`, which calls `myfcn`.

```
function [x, y] = call_myfcn(n)
    %#codegen
    x = myfcn(n, 'mode1');
    y = myfcn(n, 'mode2');
end

function y = myfcn(n,mode)
    coder.inline('never');
    if strcmp(mode, 'mode1')
        y = n;
    else
        y = -n;
    end
end
```

Generate standalone C code. For example, generate a static library. Enable the code generation report.

```
codegen -config:lib call_myfcn -args {1} -report
```

In the code generation report, you see two function specializations for `call_myfcn`.

The code generator creates `call_myfcn>myfcn>1` for `mode` with a value of `'mode1'`. It creates `call_myfcn>myfcn>2` for `mode` with a value of `'mode2'`.

In the generated C code, you see the specializations `my_fcn` and `b_my_fcn`.

```
static double b_myfcn(double n)
{
    return -n;
}

static double myfcn(double n)
{
    return n;
}
```

To prevent the function specializations, instruct the code generator to ignore that values of the `mode` argument are constant.

```
function [x, y] = call_myfcn(n)
%#codegen
x = myfcn(n, coder.ignoreConst('mode1'));
y = myfcn(n, coder.ignoreConst('mode2'));
end

function y = myfcn(n,mode)
coder.inline('never');
if strcmp(mode,'mode1')
    y = n;
else
    y = -n;
end
end
```

Generate the C code.

```
codegen -config:lib call_myfcn -args {1} -report
```

In the code generation report, you do not see multiple function specializations.

In the generated C code, you see one function for `my_fcn`.

Input Arguments

expression — Expression whose value is to be treated as a nonconstant

MATLAB expression

Expression whose value is to be treated as a nonconstant, specified as a MATLAB expression.

More About

Function Specialization

Version of a function in which an input type, size, complexity, or value is customized for a particular invocation of the function.

Function specialization produces efficient C code at the expense of code duplication. The code generation report shows all MATLAB function specializations that the code generator creates. However, the specializations might not appear in the generated C/C++ code due to later transformations or optimizations.

Tips

- For some recursive function calls, you can use `coder.ignoreConst` to force run-time recursion. See “Force Code Generator to Use Run-Time Recursion”.
- `coder.ignoreConst(expression)` prevents the code generator from using the constant value of `expression` to create function specializations. It does not prevent other uses of the constant value during code generation.

coder.ignoreSize

Package: coder

Prevent code generator from creating function specializations for constant-size expressions

Syntax

```
coder.ignoreSize(expression)
```

Description

`coder.ignoreSize(expression)` declares that the code generator must not use the constant size of an expression to create function specializations.

Examples

Duplicate Functions Generated for Multiple Input Sizes

If your MATLAB code calls a function multiple times and passes inputs of different sizes, the code generator can create function specializations for each size. To avoid this issue, use `coder.ignoreSize` on the function input. For example, this code uses `coder.ignoreSize` to avoid creating multiple copies of the function `indexOf`:

```
function [out1, out2] = test1(in)
    a = 1:10;
    b = 2:40;
    % Without coder.ignoreSize duplicate functions are generated
    out1 = indexOf(coder.ignoreSize(a), in);
    out2 = indexOf(coder.ignoreSize(b), in);
end

function index = indexOf(array, value)
    coder.inline('never');
    for i = 1:numel(array)
        if array(i) == value
            index = i;
            return
        end
    end
    index = -1;
    return
end
```

To generate code, enter:

```
codegen test1 -config:lib -report -args {1}
```

Input Arguments

expression — Expression whose size is to be treated as nonconstant
MATLAB expression

Example: `foo(coder.ignoreSize(1:10))`

More About

Function Specialization

Version of a function in which an input type, size, complexity, or value is customized for a particular invocation of the function.

Function specialization produces efficient C code at the expense of code duplication. The code generation report shows all MATLAB function specializations that the code generator creates. However, the specializations might not appear in the generated C/C++ code due to later transformations or optimizations.

Tips

- If you assign an expression to a variable and declare the variable as variable-size by using `coder.varsize`, this declaration has the same effect as using `coder.ignoreSize` on the expression.

`coder.ignoreConst`

Topics

“Avoid Duplicate Functions in Generated Code”

Introduced in R2019b

coder.inline

Control inlining of a specific function in generated code

Syntax

```
coder.inline('always')
coder.inline('never')
coder.inline('default')
```

Description

`coder.inline('always')` forces inlining on page 2-100 of the current function in the generated code. Place the `coder.inline` directive inside the function that you want to inline. The code generator does not inline entry-point functions and recursive functions. Also, the code generator does not inline functions into `parfor` loops, or inline functions called from `parfor` loops.

`coder.inline('never')` prevents inlining of the current function in the generated code. Prevent inlining when you want to simplify the mapping between the MATLAB source code and the generated code.

Note If you use the `codegen` or the `fiaccl` command, you can disable inlining for all functions by using the `-O disable:inline` option.

If you generate C/C++ code by using the `codegen` command or the MATLAB Coder app, you might have different speed and readability requirements for the code generated for functions that you write and the code generated for MathWorks® functions. Certain additional global settings enable you to separately control the inlining behavior for these two parts of the generated code base and at the boundary between them. See .

`coder.inline('default')` instructs the code generator to use internal heuristics to determine whether to inline the current function. Usually, the heuristics produce highly optimized code. Use `coder.inline` explicitly in your MATLAB functions only when you need to fine-tune these optimizations.

Examples

Prevent Function Inlining

In this example, function `foo` is not inlined in the generated code:

```
function y = foo(x)
    coder.inline('never');
    y = x;
end
```

Use `coder.inline` in Control Flow Statements

You can use `coder.inline` in control flow code. If the software detects contradictory `coder.inline` directives, the generated code uses the default inlining heuristic and issues a warning.

Suppose that you want to generate code for a division function that runs on a system with limited memory. To optimize memory use in the generated code, the `inline_division` function manually controls inlining based on whether it performs scalar division or vector division:

```
function y = inline_division(dividend, divisor)

% For scalar division, inlining produces smaller code
% than the function call itself.
if isscalar(dividend) && isscalar(divisor)
    coder.inline('always');
else
% Vector division produces a for-loop.
% Prohibit inlining to reduce code size.
    coder.inline('never');
end

if any(divisor == 0)
    error('Cannot divide by 0');
end

y = dividend / divisor;
```

More About

Inlining

Technique that replaces a function call with the contents (body) of that function. Inlining eliminates the overhead of a function call, but can produce larger C/C++ code. Inlining can create opportunities for further optimization of the generated C/C++ code.

Introduced in R2011a

coder.isColumnMajor

Determine whether the current function or variable uses column-major layout

Syntax

```
coder.isColumnMajor
coder.isColumnMajor(arg)
```

Description

`coder.isColumnMajor` resolves as true in the generated code if the current function uses column-major array layout. Use the function as the expression in control flow (`if`, `else`, `switch`) statements.

`coder.isColumnMajor(arg)` resolves as true if the current variable uses column-major array layout.

Examples

Query Array Layout of a Function

To query the array layout of a function at compile time, use `coder.isColumnMajor` or `coder.isRowMajor`. This query can be useful for specializing your generated code when it involves row-major and column-major functions. For example, consider this function:

```
function S = addMatrixRouted(A,B)
    if coder.isRowMajor
        %execute this code if row major
        S = addMatrix_OptimizedForRowMajor(A,B);
    elseif coder.isColumnMajor
        %execute this code if column major
        S = addMatrix_OptimizedForColumnMajor(A,B);
    end
```

The function `addMatrixRouted` behaves differently depending on whether it uses row-major layout or column-major layout. The layout that the function uses, for example, can depend on whether it is called from a function that contains `coder.rowMajor` or `coder.columnMajor`. When `addMatrixRouted` uses row-major layout, it calls the `addMatrix_OptimizedForRowMajor` function, which has efficient memory access for row-major data. When the function uses column-major layout, it calls a version of the `addMatrix` function optimized for column-major data.

By using the query functions, the generated code for `addMatrixRouted` provides efficient memory access for either choice of array layout.

Query Array Layout of a Variable

Consider the function `bar`:

```
function bar
    coder.columnMajor;
```

```
x = magic(3);  
if coder.isColumnMajor(x)  
    fprintf('This will always be displayed in generated code.\n');  
else  
    fprintf('This will never be displayed in generated code.\n');  
end  
end
```

Generate code:

```
codegen bar
```

To run the MEX function, enter:

```
bar_mex
```

Input Arguments

arg — Variable name

array variable

Variable to query for array layout.

Example: `coder.isColumnMajor(x)`;

Limitations

- You cannot query the array layout of a structure field or property.

Tips

- The code generator uses column-major layout by default.
- Outside of code generation and simulation, `coder.isColumnMajor` is always true.
- If `coder.isColumnMajor` always resolves to true for your code, other branches in the `if` statement are ignored by the code generator. Otherwise, one instance of the current function is created for each array layout.

Introduced in R2018a

coder.isRowMajor

Determine whether the current function or variable uses row-major layout

Syntax

```
coder.isRowMajor
coder.isRowMajor(arg)
```

Description

`coder.isRowMajor` resolves as true in the generated code if the current function uses row-major array layout. Use the function as the expression in control flow (`if`, `else`, `switch`) statements.

`coder.isRowMajor(arg)` resolves as true if the current variable uses row-major array layout.

Examples

Query Array Layout of a Function

To query the array layout of a function at compile time, use `coder.isRowMajor` or `coder.isColumnMajor`. This query can be useful for specializing your generated code when it involves row-major and column-major functions. For example, consider this function:

```
function S = addMatrixRouted(A,B)
    if coder.isRowMajor
        %execute this code if row major
        S = addMatrix_OptimizedForRowMajor(A,B);
    elseif coder.isColumnMajor
        %execute this code if column major
        S = addMatrix_OptimizedForColumnMajor(A,B);
    end
```

The function `addMatrixRouted` behaves differently depending on whether it uses row-major layout or column-major layout. The layout that the function uses, for example, can depend on whether it is called from a function that contains `coder.rowMajor` or `coder.columnMajor`. When `addMatrixRouted` uses row-major layout, it calls the `addMatrix_OptimizedForRowMajor` function, which has efficient memory access for row-major data. When the function uses column-major layout, it calls a version of the `addMatrix` function optimized for column-major data.

By using the query functions, the generated code for `addMatrixRouted` provides efficient memory access for either choice of array layout.

Query Array Layout of a Variable

Consider the function `foo`:

```
function foo
    coder.rowMajor;
```

```
x = magic(3);  
if coder.isRowMajor(x)  
    fprintf('This will always be displayed in generated code.\n');  
else  
    fprintf('This will never be displayed in generated code.\n');  
end  
end
```

Generate code:

```
codegen foo
```

To run the MEX function, enter:

```
foo_mex
```

Input Arguments

arg — Variable name

array variable

Variable to query for array layout.

Example: `coder.isRowMajor(x)`;

Limitations

- You cannot query the array layout of a structure field or property.

Tips

- Outside of code generation and simulation, `coder.isRowMajor` is always false.
- If `coder.isRowMajor` always resolves to true for your code, other branches in the `if` statement are ignored by the code generator. Otherwise, one instance of the current function is created for each array layout.

Introduced in R2018a

coder.load

Load compile-time constants from MAT-file or ASCII file into caller workspace

Syntax

```
S = coder.load(filename)
S = coder.load(filename,var1,...,varN)
S = coder.load(filename,'-regex',expr1,...,exprN)
S = coder.load(filename,'-ascii')
S = coder.load(filename,'-mat')
S = coder.load(filename,'-mat',var1,...,varN)
S = coder.load(filename,'-mat','-regex', expr1,...,exprN)
```

Description

`S = coder.load(filename)` loads compile-time constants from `filename`.

- If `filename` is a MAT-file, then `coder.load` loads variables from the MAT-file into a structure array.
- If `filename` is an ASCII file, then `coder.load` loads data into a double-precision array.

`coder.load` loads data at code generation time, also referred to as *compile time*. If you change the content of `filename` after you generate code, the change is not reflected in the behavior of the generated code.

`S = coder.load(filename,var1,...,varN)` loads only the specified variables from the MAT-file `filename`.

`S = coder.load(filename,'-regex',expr1,...,exprN)` loads only the variables that match the specified regular expressions.

`S = coder.load(filename,'-ascii')` treats `filename` as an ASCII file, regardless of the file extension.

`S = coder.load(filename,'-mat')` treats `filename` as a MAT-file, regardless of the file extension.

`S = coder.load(filename,'-mat',var1,...,varN)` treats `filename` as a MAT-file and loads only the specified variables from the file.

`S = coder.load(filename,'-mat','-regex', expr1,...,exprN)` treats `filename` as a MAT-file and loads only the variables that match the specified regular expressions.

Examples

Load compile-time constants from MAT-file

Generate code for a function `edgeDetect1` which given a normalized image, returns an image where the edges are detected with respect to the threshold value. `edgeDetect1` uses `coder.load` to load the edge detection kernel from a MAT-file at compile time.

Save the Sobel edge-detection kernel in a MAT-file.

```
k = [1 2 1; 0 0 0; -1 -2 -1];
```

```
save sobel.mat k
```

Write the function `edgeDetect1`.

```
function edgeImage = edgeDetect1(originalImage, threshold) %#codegen
assert(all(size(originalImage) <= [1024 1024]));
assert(isa(originalImage, 'double'));
assert(isa(threshold, 'double'));

S = coder.load('sobel.mat', 'k');
H = conv2(double(originalImage), S.k, 'same');
V = conv2(double(originalImage), S.k', 'same');
E = sqrt(H.*H + V.*V);
edgeImage = uint8((E > threshold) * 255);
```

Create a code generation configuration object for a static library.

```
cfg = coder.config('lib');
```

Generate a static library for `edgeDetect1`.

```
codegen -report -config cfg edgeDetect1
```

`codegen` generates C code in the `codegen\lib\edgeDetect1` folder.

Load compile-time constants from ASCII file

Generate code for a function `edgeDetect2` which given a normalized image, returns an image where the edges are detected with respect to the threshold value. `edgeDetect2` uses `coder.load` to load the edge detection kernel from an ASCII file at compile time.

Save the Sobel edge-detection kernel in an ASCII file.

```
k = [1 2 1; 0 0 0; -1 -2 -1];
```

```
save sobel.dat k -ascii
```

Write the function `edgeDetect2`.

```
function edgeImage = edgeDetect2(originalImage, threshold) %#codegen
assert(all(size(originalImage) <= [1024 1024]));
assert(isa(originalImage, 'double'));
assert(isa(threshold, 'double'));

k = coder.load('sobel.dat');
H = conv2(double(originalImage), k, 'same');
V = conv2(double(originalImage), k', 'same');
```

```
E = sqrt(H.*H + V.*V);
edgeImage = uint8((E > threshold) * 255);
```

Create a code generation configuration object for a static library.

```
cfg = coder.config('lib');
```

Generate a static library for `edgeDetect2`.

```
codegen -report -config cfg edgeDetect2
```

`codegen` generates C code in the `codegen\lib\edgeDetect2` folder.

Input Arguments

filename — Name of file

character vector | string scalar

Name of file. `filename` must be a compile-time constant.

`filename` can include a file extension and a full or partial path. If `filename` has no extension, `load` looks for a file named `filename.mat`. If `filename` has an extension other than `.mat`, `load` treats the file as ASCII data.

ASCII files must contain a rectangular table of numbers, with an equal number of elements in each row. The file delimiter (the character between elements in each row) can be a blank, comma, semicolon, or tab character. The file can contain MATLAB comments (lines that begin with a percent sign, %).

Example: `'myFile.mat'`

var1, ..., varN — Names of variables to load

character vector | string scalar

Names of variables, specified as one or more character vectors or string scalars. Each variable name must be a compile-time constant. Use the `*` wildcard to match patterns.

Example: `coder.load('myFile.mat', 'A*')` loads all variables in the file whose names start with `A`.

expr1, ..., exprN — Regular expressions indicating which variables to load

character vector | string scalar

Regular expressions indicating which variables to load specified as one or more character vectors or string scalars. Each regular expression must be a compile-time constant.

Example: `coder.load('myFile.mat', '-regexp', '^A')` loads only variables whose names begin with `A`.

Output Arguments

S — Loaded variables or data

structure array | m-by-n array

If `filename` is a MAT-file, `S` is a structure array.

If `filename` is an ASCII file, `S` is an `m`-by-`n` array of type `double`. `m` is the number of lines in the file and `n` is the number of values on a line.

Limitations

- Arguments to `coder.load` must be compile-time constants.
- The output `S` must be the name of a structure or array without any subscripting. For example, `S(i) = coder.load('myFile.mat')` is not allowed.
- You cannot use `save` to save workspace data to a file inside a function intended for code generation. The code generator does not support the `save` function. Furthermore, you cannot use `coder.extrinsic` with `save`. Prior to generating code, you can use `save` to save workspace data to a file.

Tips

- `coder.load` loads data at compile time, not at run time. If you are generating MEX code or code for Simulink simulation, you can use the MATLAB function `load` to load run-time values.
- If the MAT-file contains unsupported constructs, use `coder.load(filename, var1, ..., varN)` to load only the supported constructs.
- If you generate code in a MATLAB Coder project, the code generator practices incremental code generation for the `coder.load` function. When the MAT-file or ASCII file used by `coder.load` changes, the software rebuilds the code.

`matfile` | `regexp` | `save`

Topics

“Regular Expressions”

Introduced in R2013a

coder.nullcopy

Package: coder

Declare uninitialized variables in code generation

Syntax

```
X = coder.nullcopy(A)
```

Description

`X = coder.nullcopy(A)` copies type, size, and complexity of `A` to `X`, but does not copy element values. The function preallocates memory for `X` without incurring the overhead of initializing memory. In code generation, the `coder.nullcopy` function declares uninitialized variables. In MATLAB, `coder.nullcopy` returns the input such that `X` is equal to `A`.

If `X` is a structure or a class containing variable-sized arrays, then you must assign the size of each array. `coder.nullcopy` does not copy sizes of arrays or nested arrays from its argument to its result.

Note Before you use `X` in a function or a program, ensure that the data in `X` is completely initialized. Declaring a variable through `coder.nullcopy` without assigning all the elements of the variable results in nondeterministic program behavior. For more information, see “How to Eliminate Redundant Copies by Defining Uninitialized Variables”.

Examples

Declare Variables for Optimized Initialization

Declare variable `X` as a 1-by-5 vector of real doubles without performing an unnecessary initialization:

```
function X = foo %#codegen

N = 5;
X = coder.nullcopy(zeros(1,N));
for i = 1:N
    if mod(i,2) == 0
        X(i) = i;
    else
        X(i) = 0;
    end
end
```

Using `coder.nullcopy` with `zeros` lets you specify the size of vector `X` without initializing each element to zero.

Input Arguments

A — Variable to copy

scalar | vector | matrix | class | multidimensional array

Variable to copy, specified as a scalar, vector, matrix, or multidimensional array.

Example: `coder.nullcopy(A)`;

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `string` | `class`

Complex Number Support: Yes

Limitations

- You cannot use `coder.nullcopy` on sparse matrices.
- You cannot use `coder.nullcopy` with classes that support overloaded parentheses or require indexing methods to access their data, such as `table`.

Topics

“Eliminate Redundant Copies of Variables in Generated Code”

Introduced in R2011a

coder.opaque

Declare variable in generated code

Syntax

```
y = coder.opaque(type)
y = coder.opaque(type,value)
y = coder.opaque( ____, 'Size',Size)
y = coder.opaque( ____, 'HeaderFile',HeaderFile)
```

Description

`y = coder.opaque(type)` declares a variable `y` with the specified type and no initial value in the generated code.

- `y` can be a variable or a structure field.
- MATLAB code cannot set or access `y`, but external C functions can accept `y` as an argument.
- `y` can be an:
 - Argument to `coder.rref`, `coder.wref`, or `coder.ref`
 - Input or output argument to `coder.ceval`
 - Input or output argument to a user-written MATLAB function
 - Input to a subset of MATLAB toolbox functions supported for code generation
- Assignment from `y` declares another variable with the same type in the generated code. For example:

```
y = coder.opaque('int');
z = y;
```

declares a variable `z` of type `int` in the generated code.

- You can assign `y` from another variable declared using either `coder.opaque` or assignment from a variable declared using `coder.opaque`. The variables must have identical types.
- You can compare `y` to another variable declared using either `coder.opaque` or assignment from a variable declared using `coder.opaque`. The variables must have identical types.

`y = coder.opaque(type,value)` specifies the type and initial value of `y`.

`y = coder.opaque(____, 'Size',Size)` specifies the size, in bytes, of `y`. You can specify the size with any of the previous syntaxes.

`y = coder.opaque(____, 'HeaderFile',HeaderFile)` specifies the header file that contains the type definition. The code generator produces the `#include` statement for the header file where the statement is required in the generated code. You can specify the header file with any of the previous syntaxes.

Examples

Declare Variable Specifying Initial Value

Generate code for a function `valtest` which returns 1 if the call to `myfun` is successful. This function uses `coder.opaque` to declare a variable `x1` with type `int` and initial value 0. The assignment `x2 = x1` declares `x2` to be a variable with the type and initial value of `x1`.

Write a function `valtest`.

```
function y = valtest
%codegen
%declare x1 to be an integer with initial value '0'
x1 = coder.opaque('int','0');
%Declare x2 to have same type and initial value as x1
x2 = x1;
x2 = coder.ceval('myfun');
%test the result of call to 'myfun' by comparing to value of x1
if x2 == x1
    y = 0;
else
    y = 1;
end
end
```

Declare Variable Specifying Initial Value and Header File

Generate code for a MATLAB function `filetest` which returns its own source code using `fopen/fread/fclose`. This function uses `coder.opaque` to declare the variable that stores the file pointer used by `fopen/fread/fclose`. The call to `coder.opaque` declares the variable `f` with type `FILE *`, initial value `NULL`, and header file `<stdio.h>`.

Write a MATLAB function `filetest`.

```
function buffer = filetest
%#codegen

% Declare 'f' as an opaque type 'FILE *' with initial value 'NULL'
%Specify the header file that contains the type definition of 'FILE *';

f = coder.opaque('FILE *', 'NULL', 'HeaderFile', '<stdio.h>');
% Open file in binary mode
f = coder.ceval('fopen', cstring('filetest.m'), cstring('rb'));

% Read from file until end of file is reached and put
% contents into buffer
n = int32(1);
i = int32(1);
buffer = char(zeros(1,8192));
while n > 0
    % By default, MATLAB converts constant values
    % to doubles in generated code
    % so explicit type conversion to int32 is inserted.
    n = coder.ceval('fread', coder.ref(buffer(i)), int32(1), ...
        int32(numel(buffer)), f);
    i = i + n;
end
coder.ceval('fclose', f);

buffer = strip_cr(buffer);

% Put a C termination character '\0' at the end of MATLAB character vector
```

```

function y = cstring(x)
    y = [x char(0)];

% Remove all character 13 (CR) but keep character 10 (LF)
function buffer = strip_cr(buffer)
    j = 1;
    for i = 1:numel(buffer)
        if buffer(i) ~= char(13)
            buffer(j) = buffer(i);
            j = j + 1;
        end
    end
    buffer(i) = 0;

```

Compare Variables Declared Using coder.opaque

Compare variables declared using `coder.opaque` to test for successfully opening a file.

Use `coder.opaque` to declare a variable `null` with type `FILE *` and initial value `NULL`.

```
null = coder.opaque('FILE *', 'NULL', 'HeaderFile', '<stdio.h>');
```

Use assignment to declare another variable `ftmp` with the same type and value as `null`.

```
ftmp = null;
ftmp = coder.ceval('fopen', ['testfile.txt', char(0)], ['r', char(0)]);
```

Compare the variables.

```
if ftmp == null
    %error condition
end
```

Cast to and from Types of Variables Declared Using coder.opaque

This example shows how to cast to and from types of variables that are declared using `coder.opaque`. The function `castopaque` calls the C run-time function `strncmp` to compare at most `n` characters of the strings `s1` and `s2`. `n` is the number of characters in the shorter of the strings. To generate the correct C type for the `strncmp` input `nsizet`, the function casts `n` to the C type `size_t` and assigns the result to `nsizet`. The function uses `coder.opaque` to declare `nsizet`. Before using the output `retval` from `strncmp`, the function casts `retval` to the MATLAB type `int32` and stores the results in `y`.

Write this MATLAB function:

```

function y = castopaque(s1,s2)

% <0 - the first character that does not match has a lower value in s1 than in s2
%  0 - the contents of both strings are equal
% >0 - the first character that does not match has a greater value in s1 than in s2
%
%#codegen

coder.cinclude('<string.h>');
n = min(numel(s1), numel(s2));

% Convert the number of characters to compare to a size_t
nsizet = cast(n,'like',coder.opaque('size_t','0'));

```

```
% The return value is an int
retval = coder.opaque('int');
retval = coder.ceval('strcmp', cstr(s1), cstr(s2), nsizet);

% Convert the opaque return value to a MATLAB value
y = cast(retval, 'int32');

%-----
function sc = cstr(s)
% NULL terminate a MATLAB character vector for C
sc = [s, char(0)];
```

Generate the MEX function.

```
codegen castopaque -args {blanks(3), blanks(3)} -report
```

Call the MEX function with inputs 'abc' and 'abc'.

```
castopaque_mex('abc', 'abc')
```

```
ans =
```

```
0
```

The output is 0 because the strings are equal.

Call the MEX function with inputs 'abc' and 'abd'.

```
castopaque_mex('abc', 'abd')
```

```
ans =
```

```
-1
```

The output is -1 because the third character d in the second string is greater than the third character c in the first string.

Call the MEX function with inputs 'abd' and 'abc'.

```
castopaque_mex('abd', 'abc')
```

```
ans =
```

```
1
```

The output is 1 because the third character d in the first string is greater than the third character c in the second string.

In the MATLAB workspace, you can see that the type of y is int32.

Declare Variable Specifying Initial Value and Size

Declare y to be a 4-byte integer with initial value 0.

```
y = coder.opaque('int', '0', 'Size', 4);
```

Input Arguments

type — Type of variable

character vector | string scalar

Type of variable in generated code. `type` must be a compile-time constant. The type must be a:

- Built-in C data type or a type defined in a header file
- C type that supports copy by assignment
- Legal prefix in a C declaration

Example: 'FILE *'

value — Initial value of variable

character vector | string scalar

Initial value of variable in generated code. `value` must be a compile-time constant. Specify a C expression not dependent on MATLAB variables or functions.

If you do not provide the initial value in `value`, initialize the value of the variable before using it. To initialize a variable declared using `coder.opaque`:

- Assign a value from another variable with the same type declared using either `coder.opaque` or assignment from a variable declared using `coder.opaque`.
- Assign a value from an external C function.
- Pass the address of the variable to an external function using `coder.wref`.

Specify a `value` that has the type that `type` specifies. Otherwise, the generated code can produce unexpected results.

Example: 'NULL'

Size — Size of variable

integer

Number of bytes for the variable in the generated code, specified as an integer. If you do not specify the size, the size of the variable is 8 bytes.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64`

HeaderFile — Name of header file

character vector | string scalar

Name of header file that contains the definition of `type`. `HeaderFile` must be a compile-time constant.

For a system header file, use angle brackets.

Example: '<stdio.h>' generates `#include <stdio.h>`

For an application header file, use double quotes.

Example: '"foo.h"' generates `#include "foo.h"`

If you omit the angle brackets or double quotes, the code generator produces double quotes.

Example: 'foo.h' generates #include "foo.h"

Specify the include path in the build configuration parameters.

Example: `cfg.CustomInclude = 'c:\myincludes'`

Tips

- Specify a `value` that has the type that `type` specifies. Otherwise, the generated code can produce unexpected results. For example, the following `coder.opaque` declaration can produce unexpected results.

```
y = coder.opaque('int', '0.2')
```

- `coder.opaque` declares the type of a variable. It does not instantiate the variable. You can instantiate a variable by using it later in the MATLAB code. In the following example, assignment of `fp1` from `coder.ceval` instantiates `fp1`.

```
% Declare fp1 of type FILE *
fp1 = coder.opaque('FILE *');
%Create the variable fp1
fp1 = coder.ceval('fopen', ['testfile.txt', char(0)], ['r', char(0)]);
```

- In the MATLAB environment, `coder.opaque` returns the value specified in `value`. If `value` is not provided, it returns an empty character vector.
- You can compare variables declared using either `coder.opaque` or assignment from a variable declared using `coder.opaque`. The variables must have identical types. The following example demonstrates how to compare these variables. “Compare Variables Declared Using `coder.opaque`” on page 2-113
- To avoid multiple inclusions of the same header file in generated code, enclose the header file in the conditional preprocessor statements `#ifndef` and `#endif`. For example:

```
#ifndef MyHeader_h
#define MyHeader_h
<body of header file>
#endif
```

- You can use the MATLAB `cast` function to cast a variable to or from a variable that is declared using `coder.opaque`. Use `cast` with `coder.opaque` only for numeric types.

To cast a variable declared by `coder.opaque` to a MATLAB type, you can use the `B = cast(A, type)` syntax. For example:

```
x = coder.opaque('size_t', '0');
x1 = cast(x, 'int32');
```

You can also use the `B = cast(A, 'like', p)` syntax. For example:

```
x = coder.opaque('size_t', '0');
x1 = cast(x, 'like', int32(0));
```

To cast a MATLAB variable to the type of a variable declared by `coder.opaque`, you must use the `B = cast(A, 'like', p)` syntax. For example:

```
x = int32(12);
x1 = coder.opaque('size_t', '0');
x2 = cast(x, 'like', x1);
```

Use `cast` with `coder.opaque` to generate the correct data types for:

- Inputs to C/C++ functions that you call using `coder.ceval`.
- Variables that you assign to outputs from C/C++ functions that you call using `coder.ceval`.

Without this casting, it is possible to receive compiler warnings during code generation.

Topics

“Integrate C Code Using the MATLAB Function Block”

Introduced in R2011a

coder.ref

Indicate data to pass by reference

Syntax

```
coder.ref(arg)
```

Description

`coder.ref(arg)` indicates that `arg` is an expression or variable to pass by reference to an external C/C++ function. Use `coder.ref` inside a `coder.ceval` call only. The C/C++ function can read from or write to the variable passed by reference. Use a separate `coder.ref` construct for each argument that you pass by reference to the function.

See also `coder.rref` and `coder.wref`.

Examples

Pass Scalar Variable by Reference

Consider the C function `addone` that returns the value of an input plus one:

```
double addone(double* p) {  
    return *p + 1;  
}
```

The C function defines the input variable `p` as a pointer to a double.

Pass the input by reference to `addone`:

```
...  
y = 0;  
u = 42;  
y = coder.ceval('addone', coder.ref(u));  
...
```

Pass Multiple Arguments by Reference

```
...  
u = 1;  
v = 2;  
y = coder.ceval('my_fcn', coder.ref(u), coder.ref(v));  
...
```

Pass Class Property by Reference

```
...  
x = myClass;  
x.prop = 1;  
coder.ceval('foo', coder.ref(x.prop));  
...
```

Pass a Structure by Reference

To indicate that the structure type is defined in a C header file, use `coder.cstructname`.

Suppose that you have the C function `incr_struct`. This function reads from and writes to the input argument.

```
#include "MyStruct.h"

void incr_struct(struct MyStruct *my_struct)
{
    my_struct->f1 = my_struct->f1 + 1;
    my_struct->f2 = my_struct->f2 + 1;
}
```

The C header file, `MyStruct.h`, defines a structure type named `MyStruct`:

```
#ifndef MYSTRUCT
#define MYSTRUCT

typedef struct MyStruct
{
    double f1;
    double f2;
} MyStruct;

void incr_struct(struct MyStruct *my_struct);

#endif
```

In your MATLAB function, pass a structure by reference to `incr_struct`. To indicate that the structure type for `s` has the name `MyStruct` that is defined in the C header file `MyStruct.h`, use `coder.cstructname`.

```
function y = foo
%#codegen
y = 0;
coder.updateBuildInfo('addSourceFiles','incr_struct.c');

s = struct('f1',1,'f2',2);
coder.cstructname(s,'MyStruct','extern','HeaderFile','MyStruct.h');
coder.ceval('incr_struct', coder.ref(s));
```

To generate standalone library code, enter:

```
codegen -config:lib foo -report
```

Pass Structure Field by Reference

```
...
s = struct('s1', struct('a', [0 1]));
coder.ceval('foo', coder.ref(s.s1.a));
...
```

You can also pass an element of an array of structures:

```
...
c = repmat(struct('u',magic(2)),1,10);
```

```
b = repmat(struct('c',c),3,6);
a = struct('b',b);
coder.ceval('foo', coder.ref(a.b(3,4).c(2).u));
...
```

Input Arguments

arg — Argument to pass by reference

scalar variable | array | element of an array | structure | structure field | object property

Argument to pass by reference to an external C/C++ function. The argument cannot be a class, a System object, a cell array, or an index into a cell array.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `struct`

Complex Number Support: Yes

Limitations

- You cannot pass these data types by reference:
 - Class or System object
 - Cell array or index into a cell array
- If a property has a get method, a set method, or validators, or is a System object property with certain attributes, then you cannot pass the property by reference to an external function. See “Passing By Reference Not Supported for Some Properties”.

Tips

- If `arg` is an array, then `coder.ref(arg)` provides the address of the first element of the array. The `coder.ref(arg)` function does not contain information about the size of the array. If the C function must know the number of elements of your data, pass that information as a separate argument. For example:

```
coder.ceval('myFun', coder.ref(arg), int32(numel(arg)));
```
- When you pass a structure by reference to an external C/C++ function, use `coder.cstructname` to provide the name of a C structure type that is defined in a C header file.
- In MATLAB, `coder.ref` results in an error. To parameterize your MATLAB code so that it can run in MATLAB and in generated code, use `coder.target`.
- You can use `coder.opaque` to declare variables that you pass to and from an external C/C++ function.

Topics

“Integrate C Code Using the MATLAB Function Block”

Introduced in R2011a

coder.rowMajor

Specify row-major array layout for a function or class

Syntax

```
coder.rowMajor
```

Description

`coder.rowMajor` specifies row-major array layout for the data used by the current function in generated code. When placed in a class constructor, `coder.rowMajor` specifies row-major layout for data used by the class.

Note By default, code generation uses column-major array layout.

Examples

Specify Row-Major Array Layout for a Function

Specify row-major array layout for a function by inserting `coder.rowMajor` into the function body.

Suppose that `myFunction` is the top-level function of your code. Your application requires you to perform matrix addition with row-major array layout and matrix multiplication with column-major layout.

```
function S = myFunction(A,B)
%#codegen
% check to make sure inputs are valid
if size(A,1) ~= size(B,1) || size(A,2) ~= size(B,2)
    disp('Matrices must be same size.');
```

`return;`

```
end
% make both matrices symmetric
B = B*B';
A = A*A';
% add matrices
S = addMatrix(A,B);
end
```

Write a function for matrix addition called `addMatrix`. Specify row-major layout for `addMatrix` by using `coder.rowMajor`.

```
function S = addMatrix(A,B)
%#codegen
S = zeros(size(A));
coder.rowMajor; % specify row-major array layout
S = A + B;
end
```

Generate code for `myFunction`. Use the `codegen` command.

```
codegen myFunction -args {ones(10,20),ones(10,20)} -config:lib -launchreport
```

The code generator produces code for `addMatrix` that uses row-major array layout. However, the matrix multiplication from the top-level function uses the default layout, column-major.

Tips

- To specify row-major array layout for all the functions in your generated code, use the `codegen -rowmajor` option.
- Other functions called from within a row-major function inherit the row-major specification. However, if one of the called functions has its own distinct `coder.columnMajor` call, the code generator changes the array layout accordingly. If a row-major function and a column-major function call the same function, which does not have its own array layout specification, the code generator produces a row-major version and column-major version of the function.
- `coder.rowMajor` is ignored outside of code generation and simulation.

coder.rref

Indicate read-only data to pass by reference

Syntax

```
coder.rref(arg)
```

Description

`coder.rref(arg)` indicates that `arg` is a read-only expression or variable to pass by reference to an external C/C++ function. Use `coder.rref` only inside a `coder.ceval` call.

The `coder.rref` function can enable the code generator to optimize the generated code. Because the external function is assumed to not write to `coder.rref(arg)`, the code generator can perform optimizations such as expression folding on assignments to `arg` that occur before and after the `coder.ceval` call. Expression folding is the combining of multiple operations into one statement to avoid the use of temporary variables and improve code performance.

Note The code generator assumes that the memory that you pass with `coder.rref(arg)` is read-only. To avoid unpredictable results, the C/C++ function must not write to this variable.

See also `coder.ref` and `coder.wref`.

Examples

Pass Scalar Variable as a Read-Only Reference

Consider the C function `addone` that returns the value of a constant input plus one:

```
double addone(const double* p) {
    return *p + 1;
}
```

The C function defines the input variable `p` as a pointer to a constant double.

Pass the input by reference to `addone`:

```
...
y = 0;
u = 42;
y = coder.ceval('addone', coder.rref(u));
...
```

Pass Multiple Arguments as a Read-Only Reference

```
...
u = 1;
v = 2;
y = coder.ceval('my_fcn', coder.rref(u), coder.rref(v));
...
```

Pass Class Property as a Read-Only Reference

```

...
x = myClass;
x.prop = 1;
y = coder.ceval('foo', coder.rref(x.prop));
...

```

Pass Structure as a Read-Only Reference

To indicate that the structure type is defined in a C header file, use `coder.cstructname`.

Suppose that you have the C function `use_struct`. This function reads from the input argument but does not write to it.

```

#include "MyStruct.h"

double use_struct(const struct MyStruct *my_struct)
{
    return my_struct->f1 + my_struct->f2;
}

```

The C header file, `MyStruct.h`, defines a structure type named `MyStruct`:

```

#ifndef MYSTRUCT
#define MYSTRUCT

typedef struct MyStruct
{
    double f1;
    double f2;
} MyStruct;

double use_struct(const struct MyStruct *my_struct);

#endif

```

In your MATLAB function, pass a structure as a read-only reference to `use_struct`. To indicate that the structure type for `s` has the name `MyStruct` that is defined in the C header file `MyStruct.h`, use `coder.cstructname`.

```

function y = foo
%#codegen
y = 0;
coder.updateBuildInfo('addSourceFiles','use_struct.c');

s = struct('f1',1,'f2',2);
coder.cstructname(s,'MyStruct','extern','HeaderFile','MyStruct.h');
y = coder.ceval('use_struct', coder.rref(s));

```

To generate standalone library code, enter:

```
codegen -config:lib foo -report
```

Pass Structure Field as a Read-Only Reference

```

...
s = struct('s1', struct('a', [0 1]));

```

```
y = coder.ceval('foo', coder.rref(s.s1.a));
...
```

You can also pass an element of an array of structures:

```
...
c = repmat(struct('u',magic(2)),1,10);
b = repmat(struct('c',c),3,6);
a = struct('b',b);
coder.ceval('foo', coder.rref(a.b(3,4).c(2).u));
...
```

Input Arguments

arg — Argument to pass by reference

scalar variable | array | element of an array | structure | structure field | object property

Argument to pass by reference to an external C/C++ function. The argument cannot be a class, a System object, a cell array, or an index into a cell array.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical | char | struct

Complex Number Support: Yes

Limitations

- You cannot pass these data types by reference:
 - Class or System object
 - Cell array or index into a cell array
- If a property has a get method, a set method, or validators, or is a System object property with certain attributes, then you cannot pass the property by reference to an external function. See “Passing By Reference Not Supported for Some Properties”.

Tips

- If `arg` is an array, then `coder.rref(arg)` provides the address of the first element of the array. The `coder.rref(arg)` function does not contain information about the size of the array. If the C function must know the number of elements of your data, pass that information as a separate argument. For example:

```
coder.ceval('myFun',coder.rref(arg),int32(numel(arg)));
```
- When you pass a structure by reference to an external C/C++ function, use `coder.cstructname` to provide the name of a C structure type that is defined in a C header file.
- In MATLAB, `coder.rref` results in an error. To parametrize your MATLAB code so that it can run in MATLAB and in generated code, use `coder.target`.
- You can use `coder.opaque` to declare variables that you pass to and from an external C/C++ function.

“Integrate C Code Using the MATLAB Function Block”

Introduced in R2011a

coder.screener

Package: coder

Determine if function is suitable for code generation

Syntax

```
coder.screener(fcn)
coder.screener(fcn, '-gpu')
coder.screener(fcn_1, ..., fcn_n)
```

Description

`coder.screener(fcn)` analyzes the entry-point MATLAB function `fcn` to identify unsupported functions and language features as code generation compliance issues. The code generation compliance issues are displayed in the readiness report.

If `fcn` calls other functions directly or indirectly that are not MathWorks functions (MATLAB built-in functions and toolbox functions), `coder.screener` analyzes these functions. It does not analyze the MathWorks functions.

It is possible that `coder.screener` does not detect all code generation issues. Under certain circumstances, it is possible that `coder.screener` reports false errors.

To avoid undetected code generation issues and false errors, before generating code, verify that your MATLAB code is suitable for code generation by performing these additional checks:

- Before using `coder.screener`, fix issues that the Code Analyzer identifies.
- After using `coder.screener`, and before generating C/C++ code, verify that your MATLAB code is suitable for code generation by generating and verifying a MEX function.

The `coder.screener` function does not report functions that the code generator treats as extrinsic. Examples of such functions are `plot`, `disp`, and `figure`. See “Use MATLAB Engine to Execute a Function Call in Generated Code”.

`coder.screener(fcn, '-gpu')` analyzes the entry-point MATLAB function `fcn` to identify unsupported functions and language features for GPU code generation. This option requires a GPU Coder license.

`coder.screener(fcn_1, ..., fcn_n)` analyzes multiple entry-point MATLAB functions.

Examples

Identify Unsupported Functions

The `coder.screener` function identifies calls to functions that are not supported for code generation. It checks the entry-point function, `foo1`, and the function, `foo2`, that `foo1` calls.

Write the function `foo2` and save it in the file `foo2.m`.

```
function tf = foo2(source,target)
G = digraph(source,target);
tf = isdag(G);
end
```

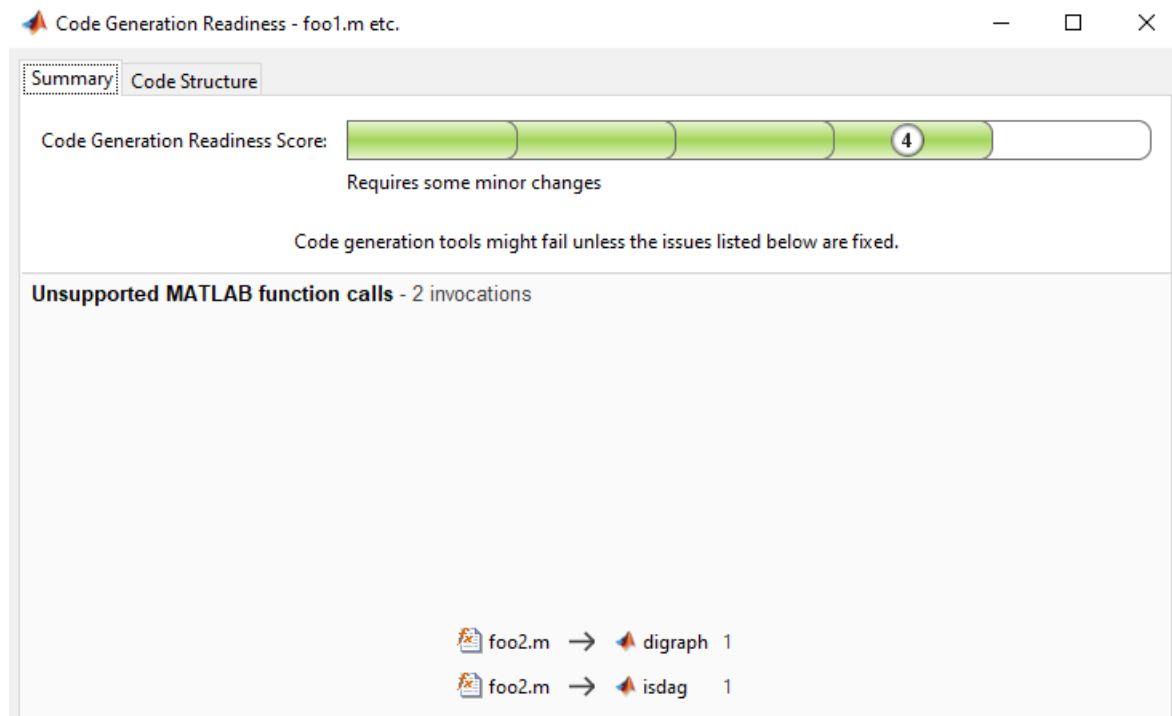

Write the function `foo1` that calls `foo2`. Save `foo1` in the file `foo1.m`.

```
function tf = foo1(source,target)
assert(numel(source)==numel(target))
tf = foo2(source,target);
end
```

Analyze `foo1`.

```
coder.screener('foo1')
```

The Code Generation Readiness report displays a summary of the unsupported MATLAB function calls. The report **Summary** tab indicates that `foo2.m` contains one call to the `digraph` function and one call to the `isdag` function, which are not supported for code generation.

In the report, click the **Code Structure** tab and select the **Show MATLAB functions** check box.

This tab displays a pie chart showing the relative size of each file and how suitable each file is for code generation. The report displays:

- Green: Function (`foo1.m`) suitable for code generation.
- Yellow: Function (`foo2.m`) requires significant changes.

The report also displays a **Call Tree** with **Code Generation Readiness Score**. The score is based on a scale of 1-5. 1 indicates that significant changes are required. 5 indicates that the code generation readiness tool does not detect issues. In this example, the report assigns `foo1.m` a code generation readiness score of 4 and `foo2.m` a score of 3.

The function `foo2` calls two unsupported MATLAB functions. To generate a MEX function, modify the code to make the calls to `digraph` and `isdag` extrinsic by using the `coder.extrinsic` directive, and then rerun the code generation readiness tool.

```
function tf = foo2(source,target)
coder.extrinsic('digraph','isdag');
G = digraph(source,target);
tf = isdag(G);
end
```

Rerun `coder.screener` on the entry-point function `foo1`.

```
coder.screener('foo1')
```

The report no longer flags that code generation does not support the `digraph` and `dag` functions. When you generate a MEX function for `foo1`, the code generator dispatches these two functions to MATLAB for execution.

Identify Unsupported Data Types

The `coder.screener` function identifies MATLAB data types that code generation does not support.

Write the function `myfun1` that contains a MATLAB calendar duration array data type.

```
function out = myfun1(A)
out = calyears(A);
end
```

Analyze `myfun1`.

```
coder.screener('myfun1');
```

The code generation readiness report indicates that the `calyears` data type is not supported for code generation.

The report assigns `myfun1` a code generation readiness score of 3. Before generating code, fix the reported issues.

Input Arguments

fcn — Name of entry-point function

character vector | string scalar

Name of entry-point MATLAB function for analysis. Specify as a character vector or a string scalar.

Example: `coder.screener('myfun');`

Data Types: char | string

fcn_1, ..., fcn_n — List of entry-point function names

character vector | string scalar

Comma-separated list of entry-point MATLAB function names for analysis. Specify as character vectors or string scalars.

Example: `coder.screener('myfun1','myfun2');`

Data Types: char | string

“Code Generation Readiness Tool”

Introduced in R2012b

coder.target

Determine if code generation target is specified target

Syntax

```
tf = coder.target(target)
```

Description

`tf = coder.target(target)` returns true (1) if the code generation target is `target`. Otherwise, it returns false (0).

If you generate code for MATLAB classes, MATLAB computes class initial values at class loading time before code generation. If you use `coder.target` in MATLAB class property initialization, `coder.target('MATLAB')` returns true.

Examples

Use coder.target to Parametrize a MATLAB Function

Parametrize a MATLAB function so that it works in MATLAB or in generated code. When the function runs in MATLAB, it calls the MATLAB function `myabsval`. The generated code, however, calls a C library function `myabsval`.

Write a MATLAB function `myabsval`.

```
function y = myabsval(u)
%#codegen
y = abs(u);
```

Generate a C static library for `myabsval`, using the `-args` option to specify the size, type, and complexity of the input parameter.

```
codegen -config:lib myabsval -args {0.0}
```

The `codegen` function creates the library file `myabsval.lib` and header file `myabsval.h` in the folder `\codegen\lib\myabsval`. (The library file extension can change depending on your platform.) It generates the functions `myabsval_initialize` and `myabsval_terminate` in the same folder.

Write a MATLAB function to call the generated C library function using `coder.ceval`.

```
function y = callmyabsval(y)
%#codegen
% Check the target. Do not use coder.ceval if callmyabsval is
% executing in MATLAB
if coder.target('MATLAB')
    % Executing in MATLAB, call function myabsval
    y = myabsval(y);
else
```

```

% add the required include statements to generated function code
coder.updateBuildInfo('addIncludePaths', '${START_DIR}\codegen\lib\myabsval');
coder.cinclude('myabsval_initialize.h');
coder.cinclude('myabsval.h');
coder.cinclude('myabsval_terminate.h');

% Executing in the generated code.
% Call the initialize function before calling the
% C function for the first time
coder.ceval('myabsval_initialize');

% Call the generated C library function myabsval
y = coder.ceval('myabsval',y);

% Call the terminate function after
% calling the C function for the last time
coder.ceval('myabsval_terminate');
end

```

Generate the MEX function `callmyabsval_mex`. Provide the generated library file at the command line.

```
codegen -config:mex callmyabsval codegen\lib\myabsval\myabsval.lib -args {-2.75}
```

Rather than providing the library at the command line, you can use `coder.updateBuildInfo` to specify the library within the function. Use this option to preconfigure the build. Add this line to the `else` block:

```
coder.updateBuildInfo('addLinkObjects', 'myabsval.lib', '${START_DIR}\codegen\lib\myabsval', 100, true);
```

Run the MEX function `callmyabsval_mex` which calls the library function `myabsval`.

```
callmyabsval_mex(-2.75)
```

```
ans =
```

```
2.7500
```

Call the MATLAB function `callmyabsval`.

```
callmyabsval(-2.75)
```

```
ans =
```

```
2.7500
```

The `callmyabsval` function exhibits the desired behavior for execution in MATLAB and in code generation.

Input Arguments

target — code generation target

```
'MATLAB' | 'MEX' | 'Sfun' | 'Rtw' | 'HDL' | 'Custom'
```

Code generation target, specified as a character vector or a string scalar. Specify one of these targets.

'MATLAB'	Running in MATLAB (not generating code)
'MEX'	Generating a MEX function
'Sfun'	Simulating a Simulink model. Also used for running in Accelerator mode.
'Rtw'	Generating a LIB, DLL, or EXE target. Also used for running in Simulink Coder and Rapid Accelerator mode.
'HDL'	Generating an HDL target
'Custom'	Generating a custom target

Example: `tf = coder.target('MATLAB')`

Example: `tf = coder.target("MATLAB")`

coder.unroll

Unroll for-loop by making a copy of the loop body for each loop iteration

Syntax

```
coder.unroll()  
coder.unroll(flag)
```

Description

`coder.unroll()` unrolls a for-loop. The `coder.unroll` call must be on a line by itself immediately preceding the for-loop that it unrolls.

Instead of producing a for-loop in the generated code, loop unrolling produces a copy of the for-loop body for each loop iteration. In each iteration, the loop index becomes constant. To unroll a loop, the code generator must be able to determine the bounds of the for-loop.

For small, tight loops, unrolling can improve performance. However, for large loops, unrolling can increase code generation time significantly and generate inefficient code.

`coder.unroll` is ignored outside of code generation.

`coder.unroll(flag)` unrolls a for-loop if `flag` is `true`. `flag` is evaluated at code generation time. The `coder.unroll` call must be on a line by itself immediately preceding the for-loop that it unrolls.

Examples

Unroll a for-loop

To produce copies of a for-loop body in the generated code, use `coder.unroll`.

In one file, write the entry-point function `call_getrand` and a local function `getrand`. `getrand` unrolls a for-loop that assigns random numbers to an n-by-1 array. `call_getrand` calls `getrand` with the value 3.

```
function z = call_getrand  
%#codegen  
z = getrand(3);  
end  
  
function y = getrand(n)  
coder.inline('never');  
y = zeros(n, 1);  
coder.unroll();  
for i = 1:n  
    y(i) = rand();  
end  
end
```

Generate a static library.

```
codegen -config:lib call_getrand -report
```

In the generated code, the code generator produces a copy of the for-loop body for each of the three loop iterations.

```
static void getrand(double y[3])
{
    y[0] = b_rand();
    y[1] = b_rand();
    y[2] = b_rand();
}
```

Control for-loop Unrolling with Flag

Control loop unrolling by using `coder.unroll` with the `flag` argument.

In one file, write the entry-point function `call_getrand_unrollflag` and a local function `getrand_unrollflag`. When the number of loop iterations is less than 10, `getrand_unrollflag` unrolls the for-loop. `call_getrand` calls `getrand` with the value 50.

```
function z = call_getrand_unrollflag
    %#codegen
    z = getrand_unrollflag(50);
end
```

```
function y = getrand_unrollflag(n)
    coder.inline('never');
    unrollflag = n < 10;
    y = zeros(n, 1);
    coder.unroll(unrollflag)
    for i = 1:n
        y(i) = rand();
    end
end
```

Generate a static library.

```
codegen -config:lib call_getrand_unrollflag -report
```

```
static void getrand_unrollflag(double y[50])
{
    int i;
    for (i = 0; i < 50; i++) {
        y[i] = b_rand();
    }
}
```

The number of iterations is not less than 10. Therefore, the code generator does not unroll the for-loop. It produces a for-loop in the generated code.

Use Legacy Syntax to Unroll for-Loop

- ```
function z = call_getrand
 %#codegen
 z = getrand(3);
end

function y = getrand(n)
 coder.inline('never');
 y = zeros(n, 1);
 for i = coder.unroll(1:n)
 y(i) = rand();
 end
end
```

## Use Legacy Syntax to Control for-Loop Unrolling

- ```
function z = call_getrand_unrollflag
    %#codegen
    z = getrand_unrollflag(50);
end

function y = getrand_unrollflag(n)
    coder.inline('never');
    unrollflag = n < 10;
    y = zeros(n, 1);
    for i = coder.unroll(1:n, unrollflag)
        y(i) = rand();
    end
end
```

Input Arguments

flag — Indicates whether to unroll the for-loop

true (default) | false

When `flag` is `true`, the code generator unrolls the `for`-loop. When `flag` is `false`, the code generator produces a `for`-loop in the generated code. `flag` is evaluated at code generation time.

Tips

- Sometimes, the code generator unrolls a `for`-loop even though you do not use `coder.unroll`. For example, if a `for`-loop indexes into a heterogeneous cell array or into `varargin` or `varargout`, the code generator unrolls the loop. By unrolling the loop, the code generator can determine the value of the index for each loop iteration. The code generator uses heuristics to determine when to unroll a `for`-loop. If the heuristics fail to identify that unrolling is warranted, or if the number of loop iterations exceeds a limit, code generation fails. In these cases, you can force loop unrolling by using `coder.unroll`. See “Nonconstant Index into `varargin` or `varargout` in a `for`-Loop”.

coder.updateBuildInfo

Update build information object RTW.BuildInfo

Syntax

```
coder.updateBuildInfo('addCompileFlags',options)
coder.updateBuildInfo('addLinkFlags',options)
coder.updateBuildInfo('addDefines',options)
coder.updateBuildInfo( __ ,group)
```

```
coder.updateBuildInfo('addLinkObjects',filename,path)
coder.updateBuildInfo('addLinkObjects',filename,path,priority,precompiled)
coder.updateBuildInfo('addLinkObjects',filename,path,priority,precompiled,
linkonly)
coder.updateBuildInfo( __ ,group)
```

```
coder.updateBuildInfo('addNonBuildFiles',filename)
coder.updateBuildInfo('addSourceFiles',filename)
coder.updateBuildInfo('addIncludeFiles',filename)
coder.updateBuildInfo( __ ,path)
coder.updateBuildInfo( __ ,path,group)
```

```
coder.updateBuildInfo('addSourcePaths',path)
coder.updateBuildInfo('addIncludePaths',path)
coder.updateBuildInfo( __ ,group)
```

Description

`coder.updateBuildInfo('addCompileFlags',options)` adds compiler options to the build information object.

`coder.updateBuildInfo('addLinkFlags',options)` adds link options to the build information object.

`coder.updateBuildInfo('addDefines',options)` adds preprocessor macro definitions to the build information object.

`coder.updateBuildInfo(__ ,group)` assigns a group name to options for later reference.

`coder.updateBuildInfo('addLinkObjects',filename,path)` adds a link object from a file to the build information object.

`coder.updateBuildInfo('addLinkObjects',filename,path,priority,precompiled)` specifies if the link object is precompiled.

`coder.updateBuildInfo('addLinkObjects',filename,path,priority,precompiled,linkonly)` specifies if the object is to be built before being linked or used for linking alone. If the object is to be built, it specifies if the object is precompiled.

`coder.updateBuildInfo(__ ,group)` assigns a group name to the link object for later reference.

`coder.updateBuildInfo('addNonBuildFiles', filename)` adds a nonbuild-related file to the build information object.

`coder.updateBuildInfo('addSourceFiles', filename)` adds a source file to the build information object.

`coder.updateBuildInfo('addIncludeFiles', filename)` adds an include file to the build information object.

`coder.updateBuildInfo(____, path)` adds the file from specified path.

`coder.updateBuildInfo(____, path, group)` assigns a group name to the file for later reference.

`coder.updateBuildInfo('addSourcePaths', path)` adds a source file path to the build information object.

`coder.updateBuildInfo('addIncludePaths', path)` adds an include file path to the build information object.

`coder.updateBuildInfo(____, group)` assigns a group name to the path for later reference.

Examples

Add Multiple Compiler Options

Add the compiler options `-Zi` and `-Wall` during code generation for function, `func`.

Anywhere in the MATLAB code for `func`, add the following line:

```
coder.updateBuildInfo('addCompileFlags', '-Zi -Wall');
```

Generate code for `func` using the `codegen` command. Open the Code Generation Report.

```
codegen -config:lib -launchreport func
```

Add Source File Name

Add a source file to the project build information while generating code for a function, `calc_factorial`.

- 1 Write a header file `fact.h` that declares a C function `factorial`.

```
double factorial(double x);
```

`fact.h` will be included as a header file in generated code. This inclusion ensures that the function is declared before it is called.

Save the file in the current folder.

- 2 Write a C file `fact.c` that contains the definition of `factorial`. `factorial` calculates the factorial of its input.

```
#include "fact.h"
```

```

double factorial(double x)
{
    int i;
    double fact = 1.0;
    if (x == 0 || x == 1) {
        return 1.0;
    } else {
        for (i = 1; i <= x; i++) {
            fact *= (double)i;
        }
        return fact;
    }
}

```

`fact.c` is used as a source file during code generation.

Save the file in the current folder.

- 3 Write a MATLAB function `calc_factorial` that uses `coder.ceval` to call the external C function `factorial`.

Use `coder.updateBuildInfo` with option `'addSourceFiles'` to add the source file `fact.c` to the build information. Use `coder.cinclude` to include the header file `fact.h` in the generated code.

```

function y = calc_factorial(x) %#codegen

    coder.cinclude('fact.h');
    coder.updateBuildInfo('addSourceFiles', 'fact.c');

    y = 0;
    y = coder.ceval('factorial', x);

```

- 4 Generate code for `calc_factorial` using the `codegen` command.

```

codegen -config:dll -launchreport calc_factorial -args 0

```

Add Link Object

Add a link object `LinkObj.lib` to the build information while generating code for a function `func`. For this example, you must have a link object `LinkObj.lib` saved in a local folder, for example, `c:\Link_Objects`.

Anywhere in the MATLAB code for `func`, add the following lines:

```

libPriority = '';
libPreCompiled = true;
libLinkOnly = true;
libName = 'LinkObj.lib';
libPath = 'c:\Link_Objects';
coder.updateBuildInfo('addLinkObjects', libName, libPath, ...
    libPriority, libPreCompiled, libLinkOnly);

```

Generate a MEX function for `func` using the `codegen` command. Open the Code Generation Report.

```
codegen -launchreport func
```

Add Include Paths

Add an include path to the build information while generating code for a function, `adder`. Include a header file, `adder.h`, existing on the path.

When header files do not reside in the current folder, to include them, use this method:

- 1 Write a header file `mysum.h` that contains the declaration for a C function `mysum`.

```
double mysum(double, double);
```

Save it in a local folder, for example `c:\coder\myheaders`.

- 2 Write a C file `mysum.c` that contains the definition of the function `mysum`.

```
#include "mysum.h"

double mysum(double x, double y)
{
    return(x+y);
}
```

Save it in the current folder.

- 3 Write a MATLAB function `adder` that adds the path `c:\coder\myheaders` to the build information.

Use `coder.cinclude` to include the header file `mysum.h` in the generated code.

```
function y = adder(x1, x2) %#codegen
    coder.updateBuildInfo('addIncludePaths','c:\coder\myheaders');
    coder.updateBuildInfo('addSourceFiles','mysum.c');
    %Include the source file containing C function definition
    coder.cinclude('mysum.h');
    y = 0;
    if coder.target('MATLAB')
        % This line ensures that the function works in MATLAB
        y = x1 + x2;
    else
        y = coder.ceval('mysum', x1, x2);
    end
end
```

- 4 Generate code for `adder` using the `codegen` command.

```
codegen -config:lib -launchreport adder -args {0,0}
```

Input Arguments

options — Build options

character vector | string scalar

Build options, specified as a character vector or string scalar. The value must be a compile-time constant.

Depending on the leading argument, `options` specifies the relevant build options to be added to the project's build information.

Leading Argument	Values in options
'addCompileFlags'	Compiler options
'addLinkFlags'	Link options
'addDefines'	Preprocessor macro definitions

The function adds the options to the end of an option vector.

Example: `coder.updateBuildInfo('addCompileFlags', '-Zi -Wall')`

group – Group name

character vector | string scalar

Name of user-defined group, specified as a character vector or string scalar. The value must be a compile-time constant.

The group option assigns a group name to the parameters in the second argument.

Leading Argument	Second Argument	Parameters Named by group
'addCompileFlags'	options	Compiler options
'addLinkFlags'	options	Link options
'addLinkObjects'	filename	Name of file containing linkable objects
'addNonBuildFiles'	filename	Name of nonbuild-related file
'addSourceFiles'	filename	Name of source file
'addSourcePaths'	path	Name of source file path

You can use `group` to:

- Document the use of specific parameters.
- Retrieve or apply multiple parameters together as one group.

filename – File name

character vector | string scalar

File name, specified as a character vector or string scalar. The value must be a compile-time constant.

Depending on the leading argument, `filename` specifies the relevant file to be added to the project's build information.

Leading Argument	File Specified by filename
'addLinkObjects'	File containing linkable objects
'addNonBuildFiles'	Nonbuild-related file
'addSourceFiles'	Source file

The function adds the file name to the end of a file name vector.

Example: `coder.updateBuildInfo('addSourceFiles', 'fact.c')`

path — Path name

character vector | string scalar

Relative path name, specified as a character vector or string scalar. The value must be a compile-time constant.

Depending on the leading argument, `path` specifies the relevant path name to be added to the project's build information. The function adds the path to the end of a path name vector.

Leading Argument	Path Specified by path
'addLinkObjects'	Path to linkable objects
'addNonBuildFiles'	Path to nonbuild-related files
'addSourceFiles', 'addSourcePaths'	Path to source files

The relative path starts from the *current working folder* in which you generate code. In the relative path name, reference the current working folder by using the `START_DIR` macro. For example, suppose that your source file `fact.c` is contained in `C:\myCode\mySrcDir`, and you generate code from `C:\myCode`. Write the path as in this example:

```
Example: coder.updateBuildInfo('addSourceFiles','fact.c','$(START_DIR)\mySrcDir')
```

priority — Relative priority of link object

''

Priority of link objects.

This feature applies only when several link objects are added. Currently, only a single link object file can be added for every `coder.updateBuildInfo` statement. Therefore, this feature is not available for use.

To use the succeeding arguments, include '' as a placeholder argument.

precompiled — Variable indicating if link objects are precompiled

logical value

Variable indicating if the link objects are precompiled, specified as a logical value. The value must be a compile-time constant.

If the link object has been prebuilt for faster compiling and linking and exists in a specified location, specify `true`. Otherwise, the MATLAB Coder build process creates the link object in the build folder.

If `linkonly` is set to `true`, this argument is ignored.

Data Types: `logical`

linkonly — Variable indicating if objects must be used for linking only

logical value

Variable indicating if objects must be used for linking only, specified as a logical value. The value must be a compile-time constant.

If you want that the MATLAB Coder build process must not build or generate rules in the makefile for building the specified link object, specify `true`. Instead, when linking the final executable, the

process should just include the object. Otherwise, rules for building the link object are added to the makefile.

You can use this argument to incorporate link objects for which source files are not available.

If `linkonly` is set to `true`, the value of `precompiled` is ignored.

Data Types: `logical`

coder.versize

Package: coder

Declare variable-size data

Syntax

```
coder.versize(varName1,...,varNameN)
coder.versize(varName1,...,varNameN,ubounds)
coder.versize(varName1,...,varNameN,ubounds,dims)
```

Description

`coder.versize(varName1,...,varNameN)` declares that the variables named `varName1,...,varNameN` have a variable size. The declaration instructs the code generator to allow the variables to change size during execution of the generated code. With this syntax, you do not specify the upper bounds of the dimensions of the variables or which dimensions can change size. The code generator computes the upper bounds. All dimensions, except singleton dimensions on page 2-151, are allowed to change size.

Use `coder.versize` according to these restrictions and guidelines:

- Use `coder.versize` inside a MATLAB function intended for code generation.
- The `coder.versize` declaration must precede the first use of a variable. For example:

```
...
x = 1;
coder.versize('x');
disp(size(x));
...
```

- Use `coder.versize` to declare that an output argument has a variable size or to address size mismatch errors. Otherwise, to define variable-size data, use the methods described in “Define Variable-Size Data for Code Generation”.

Note For MATLAB Function blocks, to declare variable-size input or output signals, use the Ports and Data Manager. See “Declare Variable-Size Inputs and Outputs”. If you provide upper bounds in a `coder.versize` declaration, the upper bounds must match the upper bounds in the Ports and Data Manager.

For more restrictions and guidelines, see “Limitations” on page 2-149 and “Tips” on page 2-151.

`coder.versize(varName1,...,varNameN,ubounds)` also specifies an upper bound for each dimension of the variables. All variables must have the same number of dimensions. All dimensions, except singleton dimensions on page 2-151, are allowed to change size.

`coder.versize(varName1,...,varNameN,ubounds,dims)` also specifies an upper bound for each dimension of the variables and whether each dimension has a fixed size or a variable size. If a dimension has a fixed size, then the corresponding `ubound` element specifies the fixed size of the dimension. All variables have the same fixed-size dimensions and the same variable-size dimensions.

Examples

Address Size Mismatch Error by Using `coder.varsize`

After a variable is used (read), changing the size of the variable can cause a size mismatch error. Use `coder.varsize` to specify that the size of the variable can change.

Code generation for the following function produces a size mismatch error because `x = 1:10` changes the size of the second dimension of `x` after the line `y = size(x)` that uses `x`.

```
function [x,y] = usevarsize(n)
%#codegen
x = 1;
y = size(x);
if n > 10
    x = 1:10;
end
```

To declare that `x` can change size, use `coder.varsize`.

```
function [x,y] = usevarsize(n)
%#codegen
x = 1;
coder.varsize('x');
y = size(x);
if n > 10
    x = 1:10;
end
```

If you remove the line `y = size(x)`, you no longer need the `coder.varsize` declaration because `x` is not used before its size changes.

Declare Variable-Size Array with Upper Bounds

Specify that `A` is a row vector whose second dimension has a variable size with an upper bound of 20.

```
function fcn()
...
coder.varsize('A',[1 20]);
...
end
```

When you do not provide `dims`, all dimensions, except singleton dimensions, have a variable size.

Declare Variable-Size Array with a Mix of Fixed and Variable Dimensions

Specify that `A` is an array whose first dimension has a fixed size of three and whose second dimension has a variable size with an upper bound of 20.

```
function fcn()
...
coder.varsize('A',[3 20], [0 1] );
```

```
...  
end
```

Declare Variable-Size Structure Fields

In this function, the statement `coder. varsize('data.values')` declares that the field values inside each element of `data` has a variable size.

```
function y = varsize_field()  
%#codegen  
  
d = struct('values', zeros(1,0), 'color', 0);  
data = repmat(d, [3 3]);  
coder. varsize('data.values');  
  
for i = 1:numel(data)  
    data(i).color = rand-0.5;  
    data(i).values = 1:i;  
end  
  
y = 0;  
for i = 1:numel(data)  
    if data(i).color > 0  
        y = y + sum(data(i).values);  
    end  
end
```

Declare Variable-Size Cell Array

Specify that cell array `C` has a fixed-size first dimension and variable-size second dimension with an upper bound of three. The `coder. varsize` declaration must precede the first use of `C`.

```
...  
C = {1 [1 2]};  
coder. varsize('C', [1 3], [0 1]);  
y = C{1};  
...  
end
```

Without the `coder. varsize` declaration, `C` is a heterogeneous cell array whose elements have the same class and different sizes. With the `coder. varsize` declaration, `C` is a homogeneous cell array whose elements have the same class and maximum size. The first dimension of each element is fixed at 1. The second dimension of each element has a variable size with an upper bound of 3.

Declare That a Cell Array Has Variable-Size Elements

Specify that the elements of cell array `C` are vectors with a fixed-size first dimension and variable-size second dimension with an upper bound of 5.

```
...  
C = {1 2 3};  
coder. varsize('C{:}', [1 5], [0 1]);
```

```
C = {1, 1:5, 2:3};
...
```

Input Arguments

varName1, ..., varNameN — Names of variables to declare as having a variable size
character vectors | string scalars

Names of variables to declare as having a variable size, specified as one or more character vectors or string scalars.

Example: `coder.varsize('x','y')`

ubounds — Upper bounds for array dimensions
[] (default) | vector of integer constants

Upper bounds for array dimensions, specified as a vector of integer constants.

When you do not specify `ubounds`, the code generator computes the upper bound for each variable. If the `ubounds` element corresponds to a fixed-size dimension, the value is the fixed size of the dimension.

Example: `coder.varsize('x','y',[1 2])`

dims — Indication of whether each dimension has a fixed size or a variable size
logical vector

Indication of whether each dimension has a fixed size or a variable size, specified as a logical vector. Dimensions that correspond to 0 or `false` in `dims` have a fixed size. Dimensions that correspond to 1 or `true` have a variable size.

When you do not specify `dims`, the dimensions have a variable size, except for the singleton dimensions.

Example: `coder.varsize('x','y',[1 2], [0 1])`

Limitations

- The `coder.varsize` declaration instructs the code generator to allow the size of a variable to change. It does not change the size of the variable. Consider this code:

```
...
x = 7;
coder.varsize('x', [1,5]);
disp(size(x));
...
```

After the `coder.varsize` declaration, `x` is still a 1-by-1 array. You cannot assign a value to an element beyond the current size of `x`. For example, this code produces a run-time error because the index 3 exceeds the dimensions of `x`.

```
...
x = 7;
coder.varsize('x', [1,5]);
x(3) = 1;
...
```

- `coder.versize` is not supported for a function input argument. Instead:
 - If the function is an entry-point function, specify that an input argument has a variable size by using `coder.typeof` at the command line. Alternatively, specify that an entry-point function input argument has a variable size by using the **Define Input Types** step of the app.
 - If the function is not an entry-point function, use `coder.versize` in the calling function with the variable that is the input to the called function.
- For sparse matrices, `coder.versize` drops upper bounds for variable-size dimensions.
- Limitations for using `coder.versize` with cell arrays:
 - A cell array can have a variable size only if it is homogeneous. When you use `coder.versize` with a heterogeneous cell array, the code generator tries to make the cell array homogeneous. The code generator tries to find a class and maximum size that apply to all elements of the cell array. For example, consider the cell array `c = {1, [2 3]}`. Both elements can be represented by a double type whose first dimension has a fixed size of 1 and whose second dimension has a variable size with an upper bound of 2. If the code generator cannot find a common class and a maximum size, code generation fails. For example, consider the cell array `c = {'a', [2 3]}`. The code generator cannot find a class that can represent both elements because the first element is `char` and the second element is `double`.
 - If you use the `cell` function to define a fixed-size cell array, you cannot use `coder.versize` to specify that the cell array has a variable size. For example, this code causes a code generation error because `x = cell(1,3)` makes `x` a fixed-size,1-by-3 cell array.

```
...
x = cell(1,3);
coder.versize('x',[1 5])
...
```

You can use `coder.versize` with a cell array that you define by using curly braces. For example:

```
...
x = {1 2 3};
coder.versize('x',[1 5])
...
```

- To create a variable-size cell array by using the `cell` function, use this code pattern:

```
function mycell(n)
%#codegen
x = cell(1,n);
for i = 1:n
    x{i} = i;
end
end
```

See “Definition of Variable-Size Cell Array by Using `cell`”.

To specify upper bounds for the cell array, use `coder.versize`.

```
function mycell(n)
%#codegen
x = cell(1,n);
for i = 1:n
    x{i} = i;
coder.versize('x',[1,20]);
end
end
```

```
end
end
```

More About

Singleton Dimension

Dimension for which `size(A,dim) = 1`.

Tips

- In a code generation report or a MATLAB Function report, a colon (:) indicates that a dimension has a variable size. For example, a size of `1x:2` indicates that the first dimension has a fixed size of one and the second dimension has a variable size with an upper bound of two.
- If you use `coder.versize` to specify that the upper bound of a dimension is 1, by default, the dimension has a fixed size of 1. To specify that the dimension can be 0 (empty array) or 1, set the corresponding element of the `dims` argument to `true`. For example, this code specifies that the first dimension of `x` has a fixed size of 1 and the other dimensions have a variable size of 5.

```
coder.versize('x',[1,5,5])
```

In contrast, this code specifies that the first dimension of `x` has an upper bound of 1 and has a variable size (can be 0 or 1).

```
coder.versize('x',[1,5,5],[1,1,1])
```

Note For a MATLAB Function block, you cannot specify that an input or output signal with size 1 has a variable size.

- If you use input variables or the result of a computation using input variables to specify the size of an array, it is declared as variable-size in the generated code. Do not re-use `coder.versize` on the array, unless you also want to specify an upper bound for its size.
- If you do not specify upper bounds with a `coder.versize` declaration and the code generator is unable to determine the upper bounds, the generated code uses dynamic memory allocation. Dynamic memory allocation can reduce the speed of generated code. To avoid dynamic memory allocation, specify the upper bounds by providing the `ubounds` argument.

Introduced in R2011a

coder.wref

Indicate write-only data to pass by reference

Syntax

```
coder.wref(arg)
```

Description

`coder.wref(arg)` indicates that `arg` is a write-only expression or variable to pass by reference to an external C/C++ function. Use `coder.wref` only inside a `coder.ceval` call. This function enables the code generator to optimize the generated code by ignoring prior assignments to `arg` in your MATLAB code, because the external function is assumed to not read from the data. Write to all the elements of `arg` in your external code to fully initialize the memory.

Note The C/C++ function must fully initialize the memory referenced by `coder.wref(arg)`. Initialize the memory by assigning values to every element of `arg` in your C/C++ code. If the generated code tries to read from uninitialized memory, it can cause undefined run-time behavior.

See also `coder.ref` and `coder.rref`.

Examples

Pass Array by Reference as Write-Only

Suppose that you have a C function `init_array`.

```
void init_array(double* array, int numel) {
    for(int i = 0; i < numel; i++) {
        array[i] = 42;
    }
}
```

The C function defines the input variable `array` as a pointer to a double.

Call the C function `init_array` to initialize all elements of `y` to 42:

```
...
Y = zeros(5, 10);
coder.ceval('init_array', coder.wref(Y), int32(numel(Y)));
...
```

Pass Multiple Arguments as a Write-Only Reference

```
...
U = zeros(5, 10);
V = zeros(5, 10);
coder.ceval('my_fcn', coder.wref(U), int32(numel(U)), coder.wref(V), int32(numel(V)));
...
```

Pass Class Property as a Write-Only Reference

```
...
x = myClass;
x.prop = 1;
coder.ceval('foo', coder.wref(x.prop));
...
```

Pass Structure as a Write-Only Reference

To indicate that the structure type is defined in a C header file, use `coder.cstructname`.

Suppose that you have the C function `init_struct`. This function writes to the input argument but does not read from it.

```
#include "MyStruct.h"

void init_struct(struct MyStruct *my_struct)
{
    my_struct->f1 = 1;
    my_struct->f2 = 2;
}
```

The C header file, `MyStruct.h`, defines a structure type named `MyStruct`:

```
#ifndef MYSTRUCT
#define MYSTRUCT

typedef struct MyStruct
{
    double f1;
    double f2;
} MyStruct;

void init_struct(struct MyStruct *my_struct);

#endif
```

In your MATLAB function, pass a structure as a write-only reference to `init_struct`. Use `coder.cstructname` to indicate that the structure type for `s` has the name `MyStruct` that is defined in the C header file `MyStruct.h`.

```
function y = foo
%#codegen
y = 0;
coder.updateBuildInfo('addSourceFiles','init_struct.c');

s = struct('f1',1,'f2',2);
coder.cstructname(s,'MyStruct','extern','HeaderFile','MyStruct.h');
coder.ceval('init_struct', coder.wref(s));
```

To generate standalone library code, enter:

```
codegen -config:lib foo -report
```

Pass Structure Field as a Write-Only Reference

```
...
s = struct('s1', struct('a', [0 1]));
```

```
coder.ceval('foo', coder.wref(s.s1.a));
...
```

You can also pass an element of an array of structures:

```
...
c = repmat(struct('u',magic(2)),1,10);
b = repmat(struct('c',c),3,6);
a = struct('b',b);
coder.ceval('foo', coder.wref(a.b(3,4).c(2).u));
...
```

Input Arguments

arg — Argument to pass by reference

scalar variable | array | element of an array | structure | structure field | object property

Argument to pass by reference to an external C/C++ function. The argument cannot be a class, a System object, a cell array, or an index into a cell array.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical | char | struct
Complex Number Support: Yes

Limitations

- You cannot pass these data types by reference:
 - Class or System object
 - Cell array or index into a cell array
- If a property has a get method, a set method, or validators, or is a System object property with certain attributes, then you cannot pass the property by reference to an external function. See “Passing By Reference Not Supported for Some Properties”.

Tips

- If `arg` is an array, then `coder.wref(arg)` provides the address of the first element of the array. The `coder.wref(arg)` function does not contain information about the size of the array. If the C function must know the number of elements of your data, pass that information as a separate argument. For example:

```
coder.ceval('myFun', coder.wref(arg), int32(numel(arg)));
```

- When you pass a structure by reference to an external C/C++ function, use `coder.cstructname` to provide the name of a C structure type that is defined in a C header file.
- In MATLAB, `coder.wref` results in an error. To parametrize your MATLAB code so that it can run in MATLAB and in generated code, use `coder.target`.
- You can use `coder.opaque` to declare variables that you pass to and from an external C/C++ function.

configset.reference.getOverriddenParameters

Parameters that are overridden in a configuration reference

Syntax

```
parameters = getOverriddenParameters(model)
```

Description

`parameters = getOverriddenParameters(model)` returns the parameters that are overridden in the configuration reference that is active for the model.

Examples

Override Parameters in a Configuration Reference

Programmatically override a parameter in a configuration reference and set a value that is different from the referenced configuration set.

Open the model `slexConfigSetRefExample`, which uses a configuration reference as the active configuration.

```
model = 'slexConfigSetRefExample';
open(model)
```

Check if the model has any overridden parameters.

```
configset.reference.hasOverriddenParameters(model)
```

```
ans = logical
      0
```

The model does not have any overridden parameters. For this example, override the parameter `ModelReferenceNumInstancesAllowed`. This parameter controls the number of times that the model can be referenced directly or indirectly by another model. In the referenced configuration set, the value is `Multi`. For the model `slexConfigSetRefExample`, override the parameter and set the value to `Single` so that it can be referenced only once by another model.

```
configset.reference.overrideParameter(model, "ModelReferenceNumInstancesAllowed", "Single");
```

Verify that the parameter `ModelReferenceNumInstancesAllowed` is overridden and check its value for the model.

```
configset.reference.isParameterOverridden(model, "ModelReferenceNumInstancesAllowed")
```

```
ans = logical
      1
```

```
get_param(model, "ModelReferenceNumInstancesAllowed")
```

```
ans =
'Single'
```

Restore the parameter to the value in the referenced configuration set. Restoring the parameter makes it read-only again.

```
configset.reference.restoreOverriddenParameter(model, "ModelReferenceNumInstancesAllowed");
```

If multiple parameters are overridden for the model, you can interact with all of them at once. For example, override the parameters `StartTime`, `StopTime`, and `SolverType`. Then, use the function `configset.reference.getOverriddenParameters` to see a list of the overridden parameters.

```
configset.reference.overrideParameter(model, "StartTime");
configset.reference.overrideParameter(model, "StopTime");
configset.reference.overrideParameter(model, "Solver");
configset.reference.getOverriddenParameters(model)
```

```
ans = 3x1 string
    "StartTime"
    "StopTime"
    "Solver"
```

Now, restore all of the overridden parameters for the model. The parameters reset to the values in the referenced configuration set and become read-only again.

```
configset.reference.restoreAllOverriddenParameters(model)
```

Input Arguments

model — Model that uses configuration reference

character vector | string scalar

Model that uses configuration reference, specified as a character vector or string scalar.

Example: 'vdp'

Output Arguments

parameters — Overridden parameters

string array

Overridden parameters, returned as a string array.

“Change Parameter Value in a Configuration Reference”

Introduced in R2021a

configset.reference.hasOverriddenParameters

Determine if model configuration reference has overridden parameters

Syntax

```
tf = configset.reference.hasOverriddenParameters(model)
```

Description

`tf = configset.reference.hasOverriddenParameters(model)` determines if the `model` uses a configuration reference that contains overridden parameters. An overridden parameter can have a value that is different from the value in the referenced configuration set.

Examples

Override Parameters in a Configuration Reference

Programmatically override a parameter in a configuration reference and set a value that is different from the referenced configuration set.

Open the model `slexConfigSetRefExample`, which uses a configuration reference as the active configuration.

```
model = 'slexConfigSetRefExample';
open(model)
```

Check if the model has any overridden parameters.

```
configset.reference.hasOverriddenParameters(model)
```

```
ans = logical
      0
```

The model does not have any overridden parameters. For this example, override the parameter `ModelReferenceNumInstancesAllowed`. This parameter controls the number of times that the model can be referenced directly or indirectly by another model. In the referenced configuration set, the value is `Multi`. For the model `slexConfigSetRefExample`, override the parameter and set the value to `Single` so that it can be referenced only once by another model.

```
configset.reference.overrideParameter(model, "ModelReferenceNumInstancesAllowed", "Single");
```

Verify that the parameter `ModelReferenceNumInstancesAllowed` is overridden and check its value for the model.

```
configset.reference.isParameterOverridden(model, "ModelReferenceNumInstancesAllowed")
```

```
ans = logical
      1
```

```
get_param(model, "ModelReferenceNumInstancesAllowed")
```

```
ans =  
'Single'
```

Restore the parameter to the value in the referenced configuration set. Restoring the parameter makes it read-only again.

```
configset.reference.restoreOverriddenParameter(model, "ModelReferenceNumInstancesAllowed");
```

If multiple parameters are overridden for the model, you can interact with all of them at once. For example, override the parameters `StartTime`, `StopTime`, and `SolverType`. Then, use the function `configset.reference.getOverriddenParameters` to see a list of the overridden parameters.

```
configset.reference.overrideParameter(model, "StartTime");  
configset.reference.overrideParameter(model, "StopTime");  
configset.reference.overrideParameter(model, "Solver");  
configset.reference.getOverriddenParameters(model)
```

```
ans = 3x1 string  
    "StartTime"  
    "StopTime"  
    "Solver"
```

Now, restore all of the overridden parameters for the model. The parameters reset to the values in the referenced configuration set and become read-only again.

```
configset.reference.restoreAllOverriddenParameters(model)
```

Input Arguments

model — Model that uses configuration reference

character vector | string scalar

Model that uses configuration reference, specified as a character vector or string scalar.

Example: `'vdp'`

Output Arguments

tf — True or false result

1 | 0 | logical array

True or false result, returned as a 1 or 0 of data type logical.

Introduced in R2021a

configset.reference.isParameterOverridden

Determine if parameter is overridden in configuration reference of model

Syntax

```
tf = configset.reference.isParameterOverridden(model, parameter)
```

Description

`tf = configset.reference.isParameterOverridden(model, parameter)` determines if the specified model uses a configuration reference in which the parameter that you specify is overridden. An overridden parameter can have a value that is different from the value in the referenced configuration set.

Examples

Override Parameters in a Configuration Reference

Programmatically override a parameter in a configuration reference and set a value that is different from the referenced configuration set.

Open the model `slexConfigSetRefExample`, which uses a configuration reference as the active configuration.

```
model = 'slexConfigSetRefExample';
open(model)
```

Check if the model has any overridden parameters.

```
configset.reference.hasOverriddenParameters(model)
```

```
ans = logical
      0
```

The model does not have any overridden parameters. For this example, override the parameter `ModelReferenceNumInstancesAllowed`. This parameter controls the number of times that the model can be referenced directly or indirectly by another model. In the referenced configuration set, the value is `Multi`. For the model `slexConfigSetRefExample`, override the parameter and set the value to `Single` so that it can be referenced only once by another model.

```
configset.reference.overrideParameter(model, "ModelReferenceNumInstancesAllowed", "Single");
```

Verify that the parameter `ModelReferenceNumInstancesAllowed` is overridden and check its value for the model.

```
configset.reference.isParameterOverridden(model, "ModelReferenceNumInstancesAllowed")
```

```
ans = logical
      1
```

```
get_param(model, "ModelReferenceNumInstancesAllowed")
```

```
ans =  
'Single'
```

Restore the parameter to the value in the referenced configuration set. Restoring the parameter makes it read-only again.

```
configset.reference.restoreOverriddenParameter(model, "ModelReferenceNumInstancesAllowed");
```

If multiple parameters are overridden for the model, you can interact with all of them at once. For example, override the parameters `StartTime`, `StopTime`, and `SolverType`. Then, use the function `configset.reference.getOverriddenParameters` to see a list of the overridden parameters.

```
configset.reference.overrideParameter(model, "StartTime");  
configset.reference.overrideParameter(model, "StopTime");  
configset.reference.overrideParameter(model, "Solver");  
configset.reference.getOverriddenParameters(model)
```

```
ans = 3x1 string  
    "StartTime"  
    "StopTime"  
    "Solver"
```

Now, restore all of the overridden parameters for the model. The parameters reset to the values in the referenced configuration set and become read-only again.

```
configset.reference.restoreAllOverriddenParameters(model)
```

Input Arguments

model — Model that uses configuration reference

character vector | string scalar

Model that uses configuration reference, specified as a character vector or string scalar.

Example: 'vdp'

parameter — Parameter to check

character vector | string scalar

Parameter to check, specified as a character vector or string scalar.

Example: 'ModelReferenceNumInstancesAllowed'

Output Arguments

tf — True or false result

1 | 0 | logical array

True or false result, returned as a 1 or 0 of data type `logical`.

Topics

“Change Parameter Value in a Configuration Reference”

Introduced in R2021a

configset.reference.overrideParameter

Change value of parameter in configuration reference

Syntax

```
configset.reference.overrideParameter(model, parameter)
configset.reference.overrideParameter(model, parameter, value)
```

Description

`configset.reference.overrideParameter(model, parameter)` overrides the parameter `parameter` in the active configuration reference that `model` uses. By default, a configuration reference uses the parameter values from the configuration set that it references and does not enable editing. Overriding a parameter enables editing in the configuration reference so that you can change the value for the parameter in the reference without changing the referenced configuration set. Changing the value in the referenced configuration set does not affect the value of the overridden parameter. Some parameters cannot be overridden.

`configset.reference.overrideParameter(model, parameter, value)` overrides the parameter and sets the value in the configuration reference to `value`.

Examples

Override Parameters in a Configuration Reference

Programmatically override a parameter in a configuration reference and set a value that is different from the referenced configuration set.

Open the model `slexConfigSetRefExample`, which uses a configuration reference as the active configuration.

```
model = 'slexConfigSetRefExample';
open(model)
```

Check if the model has any overridden parameters.

```
configset.reference.hasOverriddenParameters(model)
```

```
ans = logical
      0
```

The model does not have any overridden parameters. For this example, override the parameter `ModelReferenceNumInstancesAllowed`. This parameter controls the number of times that the model can be referenced directly or indirectly by another model. In the referenced configuration set, the value is `Multi`. For the model `slexConfigSetRefExample`, override the parameter and set the value to `Single` so that it can be referenced only once by another model.

```
configset.reference.overrideParameter(model, "ModelReferenceNumInstancesAllowed", "Single");
```

Verify that the parameter `ModelReferenceNumInstancesAllowed` is overridden and check its value for the model.

```
configset.reference.isParameterOverridden(model, "ModelReferenceNumInstancesAllowed")
```

```
ans = logical
      1
```

```
get_param(model, "ModelReferenceNumInstancesAllowed")
```

```
ans =
'Single'
```

Restore the parameter to the value in the referenced configuration set. Restoring the parameter makes it read-only again.

```
configset.reference.restoreOverriddenParameter(model, "ModelReferenceNumInstancesAllowed");
```

If multiple parameters are overridden for the model, you can interact with all of them at once. For example, override the parameters `StartTime`, `StopTime`, and `SolverType`. Then, use the function `configset.reference.getOverriddenParameters` to see a list of the overridden parameters.

```
configset.reference.overrideParameter(model, "StartTime");
configset.reference.overrideParameter(model, "StopTime");
configset.reference.overrideParameter(model, "Solver");
configset.reference.getOverriddenParameters(model)
```

```
ans = 3x1 string
      "StartTime"
      "StopTime"
      "Solver"
```

Now, restore all of the overridden parameters for the model. The parameters reset to the values in the referenced configuration set and become read-only again.

```
configset.reference.restoreAllOverriddenParameters(model)
```

Input Arguments

model — Model that uses configuration reference

character vector | string scalar

Model that uses the configuration reference, specified as a character vector or string scalar.

Example: `'vdp'`

parameter — Parameter to override

character vector | string scalar

Parameter to override, specified as a character vector or string scalar.

Example: `'ModelReferenceNumInstancesAllowed'`

value — Value to set

character vector | string scalar

Value to set for the overridden parameter, specified as a character vector or string scalar.

Example: 'Multi'

Topics

“Change Parameter Value in a Configuration Reference”

Introduced in R2021a

configset.reference.restoreAllOverriddenParameters

Restore all overridden parameters in configuration reference of model

Syntax

```
configset.reference.restoreAllOverriddenParameters(model)
```

Description

`configset.reference.restoreAllOverriddenParameters(model)` restores all parameters that are overridden in the configuration reference that is active in the model. The overridden parameters reset to the values in the referenced configuration and become read-only again.

Examples

Override Parameters in a Configuration Reference

Programmatically override a parameter in a configuration reference and set a value that is different from the referenced configuration set.

Open the model `slexConfigSetRefExample`, which uses a configuration reference as the active configuration.

```
model = 'slexConfigSetRefExample';
open(model)
```

Check if the model has any overridden parameters.

```
configset.reference.hasOverriddenParameters(model)
```

```
ans = logical
      0
```

The model does not have any overridden parameters. For this example, override the parameter `ModelReferenceNumInstancesAllowed`. This parameter controls the number of times that the model can be referenced directly or indirectly by another model. In the referenced configuration set, the value is `Multi`. For the model `slexConfigSetRefExample`, override the parameter and set the value to `Single` so that it can be referenced only once by another model.

```
configset.reference.overrideParameter(model, "ModelReferenceNumInstancesAllowed", "Single");
```

Verify that the parameter `ModelReferenceNumInstancesAllowed` is overridden and check its value for the model.

```
configset.reference.isParameterOverridden(model, "ModelReferenceNumInstancesAllowed")
```

```
ans = logical  
     1
```

```
get_param(model, "ModelReferenceNumInstancesAllowed")
```

```
ans =  
'Single'
```

Restore the parameter to the value in the referenced configuration set. Restoring the parameter makes it read-only again.

```
configset.reference.restoreOverriddenParameter(model, "ModelReferenceNumInstancesAllowed");
```

If multiple parameters are overridden for the model, you can interact with all of them at once. For example, override the parameters `StartTime`, `StopTime`, and `SolverType`. Then, use the function `configset.reference.getOverriddenParameters` to see a list of the overridden parameters.

```
configset.reference.overrideParameter(model, "StartTime");  
configset.reference.overrideParameter(model, "StopTime");  
configset.reference.overrideParameter(model, "Solver");  
configset.reference.getOverriddenParameters(model)
```

```
ans = 3x1 string  
     "StartTime"  
     "StopTime"  
     "Solver"
```

Now, restore all of the overridden parameters for the model. The parameters reset to the values in the referenced configuration set and become read-only again.

```
configset.reference.restoreAllOverriddenParameters(model)
```

Input Arguments

model — Model that uses configuration reference

character vector | string scalar

Model that uses configuration reference, specified as a character vector or string scalar.

Example: 'vdp'

Topics

“Change Parameter Value in a Configuration Reference”

Introduced in R2021a

configset.reference.restoreOverriddenParameter

Restore overridden parameter in configuration reference of model

Syntax

```
configset.reference.restoreOverriddenParameter(model, parameter)
```

Description

`configset.reference.restoreOverriddenParameter(model, parameter)` restores the overridden parameter that you specify in the configuration reference that is active in the model. The overridden parameter resets to the value in the referenced configuration and becomes read-only again.

Examples

Override Parameters in a Configuration Reference

Programmatically override a parameter in a configuration reference and set a value that is different from the referenced configuration set.

Open the model `slexConfigSetRefExample`, which uses a configuration reference as the active configuration.

```
model = 'slexConfigSetRefExample';
open(model)
```

Check if the model has any overridden parameters.

```
configset.reference.hasOverriddenParameters(model)
```

```
ans = logical
      0
```

The model does not have any overridden parameters. For this example, override the parameter `ModelReferenceNumInstancesAllowed`. This parameter controls the number of times that the model can be referenced directly or indirectly by another model. In the referenced configuration set, the value is `Multi`. For the model `slexConfigSetRefExample`, override the parameter and set the value to `Single` so that it can be referenced only once by another model.

```
configset.reference.overrideParameter(model, "ModelReferenceNumInstancesAllowed", "Single");
```

Verify that the parameter `ModelReferenceNumInstancesAllowed` is overridden and check its value for the model.

```
configset.reference.isParameterOverridden(model, "ModelReferenceNumInstancesAllowed")
```

```
ans = logical
      1
```

```
get_param(model, "ModelReferenceNumInstancesAllowed")
```

```
ans =  
'Single'
```

Restore the parameter to the value in the referenced configuration set. Restoring the parameter makes it read-only again.

```
configset.reference.restoreOverriddenParameter(model, "ModelReferenceNumInstancesAllowed");
```

If multiple parameters are overridden for the model, you can interact with all of them at once. For example, override the parameters `StartTime`, `StopTime`, and `SolverType`. Then, use the function `configset.reference.getOverriddenParameters` to see a list of the overridden parameters.

```
configset.reference.overrideParameter(model, "StartTime");  
configset.reference.overrideParameter(model, "StopTime");  
configset.reference.overrideParameter(model, "Solver");  
configset.reference.getOverriddenParameters(model)
```

```
ans = 3x1 string  
    "StartTime"  
    "StopTime"  
    "Solver"
```

Now, restore all of the overridden parameters for the model. The parameters reset to the values in the referenced configuration set and become read-only again.

```
configset.reference.restoreAllOverriddenParameters(model)
```

Input Arguments

model — Model that uses configuration reference

character vector | string scalar

Model that uses configuration reference, specified as a character vector or string scalar.

Example: `'vdp'`

parameter — Parameter to restore

character vector | string scalar

Parameter to restore, specified as a character vector or string scalar.

Example: `'ModelReferenceNumInstancesAllowed'`

createCustomDBFromExcel

Create custom units database file from Microsoft Excel spreadsheet

Syntax

```
createCustomDBFromExcel(units_db.xlsx)
```

Description

`createCustomDBFromExcel(units_db.xlsx)` creates a custom units database file from an Excel spreadsheet that contains custom units. On all supported platforms, the `createCustomDBFromExcel` function supports: `.xls` and `.xlsx` files.

To see the supported spreadsheet format, see “Custom Units Spreadsheet Format”.

Examples

Create Custom Units Database File from Excel Spreadsheet

Create a custom units database file from custom Excel spreadsheet file, `unitsDB.xlsx`.

Create a Excel spreadsheet containing these columns and data in any order:

- **name**, containing `ounce_force`
- **symbol**, containing `ozf`
- **asciiSymbol**, containing `ozf`
- **displayName**, containing $\{\rm\}oz_{\{force\}}$
- **definitionExpression**, containing `oz*gn`
- **conversionFactor**, containing `1`
- **conversionOffset**, containing `0`
- **physicalQuantity**, containing `force`

Enter your custom unit specifications.

Save the database file, for example `unitsDB.xlsx`.

Create the database.

```
createCustomDBFromExcel('unitsDB.xlsx')
```

The function creates `unitsDB.slunitdb.mldatx` in the current folder.

Add the current folder to the MATLAB path.

```
addpath C:\work\custom_units
```

Load the new units database into memory.

rehashUnitDBs

Input Arguments

units_db.xlsx — Custom unit database

Excel units database file name

Custom unit database, specified as the file name of an Excel units database file. Create this file as an Excel spreadsheet with columns that contain custom unit information.

The function creates a unit database file, *units_db.slunitdb.mldatx*, in the current folder, where *units_db* is the name of the Excel file. If the unit entry is empty for the **symbol**, **asciiSymbol**, or **displayName** columns, the function uses the unit name for the missing **symbol**, **asciiSymbol**, or **displayName** entries.

To see the supported spreadsheet format, see “Custom Units Spreadsheet Format”.

Example: `custom_units.xlsx`

Data Types: `char` | `string`

See Also

createInputDataset

Generate dataset object for root-level Inport or bus element ports in model

Syntax

```
[inports_dataset] = createInputDataset(model)
[inports_dataset] = createInputDataset(model,
'DatasetSignalFormat',signalFormat)
```

Description

[inports_dataset] = createInputDataset(model) generates a Simulink.SimulationData.Dataset object from the root-level Inport blocks or bus element ports in a model. Signals in the generated dataset have the properties of the root inports and the corresponding ground values at model start and stop times. You can create timetable or timeseries objects for the time and values for signals for which you want to load data for simulation. The other signals use ground values.

[inports_dataset] = createInputDataset(model, 'DatasetSignalFormat',signalFormat) generates a Simulink.SimulationData.Dataset object whose signal dataset signal elements are either timeseries or timetable.

Examples

Generate and Populate Dataset for Root-Level Inport Blocks

This example shows how to create a dataset with elements for the four root-level Inport blocks in a model. Use that dataset as a basis for creating a dataset to load signal data into the model.

The In1 block outputs a double, In2 and In3 each output a nonvirtual bus, and In4 outputs an int16.

```
mdl = 'ex_dataset_for_inports';
open_system(mdl)
```

Create a Dataset object for the root-level Inport blocks.

```
ds = createInputDataset mdl
```

```
ds =
```

```
Simulink.SimulationData.Dataset '' with 4 elements
```

		Name	BlockPath
1	[1x1 timeseries]	In1	''
2	[1x1 struct]	In2	''
3	[1x1 struct]	In3	''
4	[1x1 timeseries]	In4	''

- Use braces { } to access, modify, or add elements using index.

Replace the placeholder value for the first signal in the Dataset with actual signal values that you want to load into the model.

```
ds{1} = ds{1}.delsample('Index',[1,2]);
ds{1} = ds{1}.addsample('time',[1 3 3 10]','data',[1 1 5 5]');
```

Examine the In2 signal.

```
ds{2}
```

```
ans =
```

```
struct with fields:
    a: [1x1 timeseries]
    b: [1x1 timeseries]
```

For In2 , create data for bus elements a and b.

```
ds{2}.a = ds{2}.a.delsample('Index',[1,2]);
ds{2}.a = addsample(ds{2}.a,'time',[1:10]','data',[1:10]');
ds{2}.b = timeseries((1:10)',0.1:.1:1,'Name','sig2_b');
```

For In3, specify data for element a of the bus, and use ground values for element b.

```
ds{3}.a = timeseries((1:10)',0.1:.1:1,'Name','sig3_a');
```

Plot ds.

```
plot(ds)
```

Set the **Input** configuration parameter to ds. Alternatively, you can use the Root Inport Mapper tool to set the **Input** parameter.

```
set_param mdl, 'LoadExternalInput', 'on');
set_param mdl, 'ExternalInput', 'ds');
```

Run the simulation. The Inport blocks use the signal data specified in ds or ground values for elements that do not have specified signal data.

```
sim mdl)
```

Input Arguments

model — Model for which to generate dataset for root-level Inport blocks or bus element ports

character vector | model handle

Model for which to generate a dataset with an element for each root-level Inport block, specified as a character vector or model handle.

'DatasetSignalFormat' — Signal format for dataset signal elements

'timeseries' (default) | 'timedata'

Signal format for dataset signal elements, specified as 'timedata' or 'timeseries'.

Data Types: char | string

Output Arguments

inports_dataset — Dataset with an element for each root-level Inport block

a Simulink.SimulationData.Dataset object

Dataset with an element for each root-level Inport block, returned as a Simulink.SimulationData.Dataset object.

See Also

Simulink.SimulationData.Dataset | timeseries | timetable

Topics

“Create a Dataset Object for Inport Blocks”

Introduced in R2017a

getHardwareImplementation

Class: `coder.BuildConfig`

Package: `coder`

Get handle of copy of hardware implementation object

Syntax

```
hw = bldcfg.getHardwareImplementation()
```

Description

`hw = bldcfg.getHardwareImplementation()` returns the handle of a copy of the hardware implementation object.

Input Arguments

bldcfg

`coder.BuildConfig` object.

Output Arguments

hw

Handle of copy of hardware implementation object.

See Also

getStdLibInfo

Class: coder.BuildConfig

Package: coder

Get standard library information

Syntax

```
[linkLibPath,linkLibExt,execLibExt,libPrefix]= bldcfg.getStdLibInfo()
```

Description

[linkLibPath,linkLibExt,execLibExt,libPrefix]= bldcfg.getStdLibInfo() returns character vectors representing the:

- Standard MATLAB architecture-specific library path
- Platform-specific library file extension for use at link time
- Platform-specific library file extension for use at run time
- Standard architecture-specific library name prefix

Input Arguments

bldcfg

coder.BuildConfig object.

Output Arguments

linkLibPath

Standard MATLAB architecture-specific library path specified as a character vector. The character vector can be empty.

linkLibExt

Platform-specific library file extension for use at link time, specified as a character vector. The value is one of '.lib', '.dylib', '.so', ''.

execLibExt

Platform-specific library file extension for use at run time, specified as a character vector. The value is one of '.dll', '.dylib', '.so', ''.

linkPrefix

Standard architecture-specific library name prefix, specified as a character vector. The character vector can be empty.

getTargetLang

Class: coder.BuildConfig

Package: coder

Get target code generation language

Syntax

```
lang = bldcfg.getTargetLang()
```

Description

`lang = bldcfg.getTargetLang()` returns a character vector containing the target code generation language.

Input Arguments

bldcfg

coder.BuildConfig object.

Output Arguments

lang

A character vector containing the target code generation language. The value is 'C' or 'C++'.

getToolchainInfo

Class: `coder.BuildConfig`

Package: `coder`

Returns handle of copy of toolchain information object

Syntax

```
tc = bldcfg.getToolchainInfo()
```

Description

`tc = bldcfg.getToolchainInfo()` returns a handle of a copy of the toolchain information object.

Input Arguments

bldcfg

`coder.BuildConfig` object.

Output Arguments

tc

Handle of copy of toolchain information object.

See Also

isCodeGenTarget

Class: `coder.BuildConfig`

Package: `coder`

Determine if build configuration represents specified target

Syntax

```
tf = bldcfg.isCodeGenTarget(target)
```

Description

`tf = bldcfg.isCodeGenTarget(target)` returns true (1) if the code generation target of the current build configuration represents the code generation target specified by `target`. Otherwise, it returns false (0).

Input Arguments

bldcfg

`coder.BuildConfig` object.

target

Code generation target specified as a character vector or cell array of character vectors.

Specify	For code generation target
'rtw'	C/C++ dynamic Library, C/C++ static library, or C/C++ executable
'sfun'	S-function (Simulation)
'mex'	MEX-function

Specify `target` as a cell array of character vectors to test if the code generation target of the build configuration represents one of the targets specified in the cell array.

For example:

```
...
mytarget = {'sfun','mex'};
tf = bldcfg.isCodeGenTarget(mytarget);
...
```

tests whether the build context represents an S-function target or a MEX-function target.

Output Arguments

tf

The value is true (1) if the code generation target of the build configuration represents the code generation target specified by `target`. Otherwise, the value is false (0).

See Also

`coder.target`

isMatlabHostTarget

Class: coder.BuildConfig

Package: coder

Determine if hardware implementation object target is MATLAB host computer

Syntax

```
tf = bldcfg.isMatlabHostTarget()
```

Description

`tf = bldcfg.isMatlabHostTarget()` returns true (1) if the current hardware implementation object targets the MATLAB host computer. Otherwise, it returns false (0).

Input Arguments

bldcfg

coder.BuildConfig object.

Output Arguments

tf

Value is true (1) if the current hardware implementation object targets the MATLAB host computer. Otherwise, the value is false (0).

See Also

coder.ExternalDependency.getDescriptiveName

Class: coder.ExternalDependency

Package: coder

Return descriptive name for external dependency

Syntax

```
extname = coder.ExternalDependency.getDescriptiveName(bldcfg)
```

Description

`extname = coder.ExternalDependency.getDescriptiveName(bldcfg)` returns the name that you want to associate with an “external dependency” on page 2-186. The code generator uses the external dependency name for error messages.

Input Arguments

bldcfg

`coder.BuildConfig` object. Use `coder.BuildConfig` methods to get information about the “build context” on page 2-186

You can use this information when you want to return different names based on the build context.

Output Arguments

extname

External dependency name returned as a character vector.

Examples

Return external dependency name

Define a method that always returns the same name.

```
function myextname = getDescriptiveName(~)
    myextname = 'MyLibrary'
end
```

Return external library name based on the code generation target

Define a method that uses the build context to determine the name.

```
function myextname = getDescriptiveName(context)
    if context.isMatlabHostTarget()
```

```
        myextname = 'MyLibrary_MatlabHost';  
    else  
        myextname = 'MyLibrary_Local';  
    end  
end
```

More About

external dependency

External code interface represented by a class derived from a `coder.ExternalDependency` class. The external code can be a library, object files, or C/C++ source.

build context

Information used by the build process including:

- Target language
- Code generation target
- Target hardware
- Build toolchain

See Also

`coder.BuildConfig` | `coder.ExternalDependency` | `coder.ceval` | `coder.updateBuildInfo`

Topics

“Develop Interface for External C/C++ Code” (MATLAB Coder)

“Build Process Customization” (MATLAB Coder)

“Integrate External/Custom Code” (MATLAB Coder)

coder.ExternalDependency.isSupportedContext

Class: coder.ExternalDependency

Package: coder

Determine if build context supports external dependency

Syntax

```
tf = coder.ExternalDependency.isSupportedContext(blcfg)
```

Description

`tf = coder.ExternalDependency.isSupportedContext(blcfg)` returns true (1) if you can use the “external dependency” on page 2-188 in the current “build context” on page 2-188 . You must provide this method in the class definition for a class that derives from `coder.ExternalDependency`.

If you cannot use the “external dependency” on page 2-188 in the current “build context” on page 2-188, display an error message and stop code generation. The error message must describe why you cannot use the external dependency in this build context. If the method returns false (0), the code generator uses a default error message. The default error message uses the name returned by the `getDescriptiveName` method of the `coder.ExternalDependency` class.

Use `coder.BuildConfig` methods to determine if you can use the external dependency in the current build context.

Input Arguments

blcfg

`coder.BuildConfig` object. Use `coder.BuildConfig` methods to get information about the “build context” on page 2-188.

Output Arguments

tf

Value is true (1) if the build context supports the external dependency.

Examples

Report error when build context does not support external library

This method returns true(1) if the code generation target is a MATLAB host target. Otherwise, the method reports an error and stops code generation.

Write `isSupportedContext` method.

```
function tf = isSupportedContext(ctx)
    if ctx.isMatlabHostTarget()
        tf = true;
    else
        error('adder library not available for this target');
    end
end
```

More About

external dependency

External code interface represented by a class derived from `coder.ExternalDependency` class. The external code can be a library, object file, or C/C++ source.

build context

Information used by the build process including:

- Target language
- Code generation target
- Target hardware
- Build toolchain

coder.ExternalDependency.updateBuildInfo

Class: coder.ExternalDependency

Package: coder

Update build information

Syntax

```
coder.ExternalDependency.updateBuildInfo(buildInfo, bldcfg)
```

Description

`coder.ExternalDependency.updateBuildInfo(buildInfo, bldcfg)` updates the build information object whose handle is `buildInfo`. After code generation, the build information object has standard information. Use this method to provide additional information required to link to external code. Use `coder.BuildConfig` methods to get information about the “build context” on page 2-189.

You must implement this method in a subclass of `coder.ExternalDependency`. For an example, see `coder.ExternalDependency`.

Input Arguments

buildInfo

Handle of build information object.

bldcfg

`coder.BuildConfig` object. Use `coder.BuildConfig` methods to get information about the “build context” on page 2-189.

Limitations

- The build information method `AddIncludeFiles` has no effect in a `coder.ExternalDependency.updateBuildInfo` method.

More About

build context

Information used by the build process including:

- Target language
- Code generation target
- Target hardware
- Build toolchain

convertToSLDataset

Convert contents of MAT-file to `Simulink.SimulationData.Dataset` object

Syntax

```
success=convertToSLDataset(source,destination)
success=convertToSLDataset(source,destination,datasetname)
```

Description

`success=convertToSLDataset(source,destination)` converts the contents of a MAT-file (`source`) to a destination MAT-file (`destination`).

`success=convertToSLDataset(source,destination,datasetname)` names the dataset `datasetname`.

When converting structure signal data, the function names the signal using the value contained in the `label` field of the structure signal field, such as: `mySignal.signal(1).label`.

This function ignores time expressions in `source`.

Examples

Save Signals to Dataset in file2.mat

Save signals from `file1.mat` to a dataset named `file1` in `file2.mat`.

```
success=convertToSLDataset('file1.mat','file2.mat')
```

Save Signals to Dataset Named myDataset in file2.mat

Save signals from `file1.mat` to a dataset named `myDataset` in `file2.mat`.

```
success=convertToSLDataset('file1.mat','file2.mat','myDataset')
```

Input Arguments

source — MAT-file

character vector

MAT-file that contains Simulink inputs.

destination — MAT-file

character vector

MAT-file to contain `Simulink.SimulationData.Dataset` converted from contents of `source`.

datasetname — Data set name

character vector

Data set name for new `Simulink.SimulationData.Dataset` object.

Output Arguments**success — Outcome of conversion**

binary

Outcome of conversion, specified as binary:

- 1

Conversion is successful.

- 0

Conversion is not successful.

See Also**Introduced in R2016a**

copy

Copy configuration set or reference

Syntax

```
copyCs = copy(cs)
```

Description

`copyCs = copy(cs)` returns a copy of a configuration set or configuration reference.

Examples

Attach New Configuration Set to a Model

Create a copy of a configuration set and attach it to a model.

Get the active configuration set for your model.

```
activeConfig = getActiveConfigSet ('vdp');
```

Copy the active configuration set.

```
develConfig = copy(activeConfig);
```

Give the copied configuration set a name.

```
develConfig.Name = 'develConfig';
```

Attach the new configuration set to the model.

```
attachConfigSet('vdp',develConfig);
```

Input Arguments

cs — Configuration set

`ConfigSet` object | `ConfigSetRef` object

Configuration set object to copy, specified as a `ConfigSet` object or a `Simulink.ConfigSetRef` object.

Output Arguments

copyCs — Copy of configuration set

`ConfigSet` object

A copy of the configuration set, returned as a `ConfigSet` object or a `ConfigSetRef` object.

See Also

Topics

“Manage Configuration Sets for a Model”

Introduced before R2006a

createCategory

(Not recommended) Create category of project labels

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
createCategory(proj, categoryName)
createCategory(proj, categoryName, dataType)
createCategory(proj, categoryName, dataType, single-valued)
```

Description

`createCategory(proj, categoryName)` creates a new category of labels `categoryName` in the project `proj`.

`createCategory(proj, categoryName, dataType)` specifies the class of data to store in labels of the new category.

`createCategory(proj, categoryName, dataType, single-valued)` specifies a single-valued category, where you can attach only one label from the category to a file. If you do not specify `single-valued`, then you can attach multiple labels from the category to a file.

Examples

Create a New Category of Labels for File Ownership

Create a new category of labels for file ownership, and attach a new label and label data to a file.

Open the `airframe` project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Create a new category of labels, called `Engineers`, to denote file ownership in a project. These labels have the `char` datatype for attaching character vector data.

```
createCategory(proj, 'Engineers', 'char');
```

Use `findCategory` to get the new category.

```
engineersCategory = findCategory(proj, 'Engineers');
```

Create labels in the new category.

```
createLabel(engineersCategory, 'Tom');
createLabel(engineersCategory, 'Dick');
createLabel(engineersCategory, 'Harry');
```

Attach one of the new labels to a file in the project.

```
myfile = findFile(proj, 'models/AnalogControl.slx')
addLabel(myfile, 'Engineers', 'Tom');
```

Get the label and add data.

```
label = findLabel(file, 'Engineers', 'Tom');
label.Data = 'Maintenance responsibility';
disp(label)
```

Label with properties:

```
File: [1x80 char]
Data: 'Maintenance responsibility'
DataType: 'char'
Name: 'Tom'
CategoryName: 'Engineers'
```

Create a New Category of Labels with Datatype Double

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Create a new category of labels.

```
createCategory(proj, 'Coverage', 'double')
```

category =

Category with properties:

```
Name: 'Coverage'
DataType: 'double'
LabelDefinitions: []
```

Find out what you can do with the new category.

```
category = findCategory(proj, 'Coverage');
methods(category)
```

Methods for class slproject.Category:

```
findLabel removeLabel createLabel
```

Create a Single-Valued Category

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Create a category of labels for file ownership, and specify single-valued to restrict only one label in the category per file.

```
createCategory(proj, 'Engineers', 'char', 'single-valued');
```

Input Arguments

proj — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

categoryName — Name of category

character vector

Name of the category of labels to create, specified as a character vector.

dataType — Class of data to store in labels

character vector

The class of data to store in labels in the new category, specified as a character vector.

single-valued — Single-valued category

character vector

Single-valued category, specified as a character vector. Single-valued means you can attach only one label from the category to a file. If you do not specify `single-valued`, then you can attach multiple labels from the category to a file.

Tips

After you create a new category, you can create labels in the new category. See `createLabel`.

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

See Also

Functions

`createLabel` | `simulinkproject`

Introduced in R2013a

createLabel

(Not recommended) Define project label

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
createLabel(category,newLabelName)
```

Description

`createLabel(category,newLabelName)` creates a new label, `newLabelName`, in a category. Use this syntax if you previously got a `category` by accessing a `Categories` property, e.g., using a command like `proj.Categories(1)`.

Use `addLabel` instead to create and attach a new label in an existing category using a single step.

Use `createCategory` first if you want to make a new category of labels.

Examples

Create a New Label

Open the airframe project and create a project object.

```
sldemo_slproject_airframe  
proj = simulinkproject;
```

Examine the first existing category.

```
cat = proj.Categories(1)
```

```
cat =
```

```
Category with properties:
```

```
    Name: 'Classification'  
    DataType: 'none'  
    LabelDefinitions: [1x8 slproject.LabelDefinition]
```

Define a new label in the category.

```
createLabel(cat, 'Future');
```

Create a New Category of Labels for File Ownership

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Create creates a new category of labels called Engineers which can be used to denote file ownership in a project. These labels have the char datatype for attaching character vector data.

```
createCategory(proj, 'Engineers', 'char');
```

Use findCategory to get the new category.

```
engineersCategory = findCategory(proj, 'Engineers');
```

Create labels in the new category.

```
createLabel(engineersCategory, 'Tom');
createLabel(engineersCategory, 'Dick');
createLabel(engineersCategory, 'Harry');
```

Attach one of the new labels to a file in the project.

```
myfile = findFile(proj, 'models/AnalogControl.slx')
addLabel(myfile, 'Engineers', 'Tom');
```

Get the label and add data.

```
label = findLabel(myfile, 'Engineers', 'Tom');
label.Data = 'Maintenance responsibility';
disp(label)
```

Label with properties:

```
File: [1x80 char]
Data: 'Maintenance responsibility'
DataType: 'char'
Name: 'Tom'
CategoryName: 'Engineers'
```

Input Arguments

category — Category

category object

Category for the new label, specified as a category object. Get the category by accessing a Categories property, e.g. with a command like `proj.Categories(1)`, or use `findCategory`. To create a new category, use `createCategory`.

newLabelName — The name of the new label to define

character vector

The name of the new label to define, specified as a character vector.

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

See Also

Functions

`addLabel` | `createCategory`

Introduced in R2013a

addStartupFile

(Not recommended) Add startup file to project

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
addStartupFile(proj, file)
```

Description

`addStartupFile(proj, file)` adds a startup file to the project `proj`. Startup files automatically run (.m and .p files), load (.mat files), or open (Simulink models) when you open the project.

Examples

Add a Startup File

Open the airframe project and create a project object.

```
sldemo_slproject_airframe  
proj = simulinkproject;
```

Create a new file.

```
filepath = fullfile(proj.RootFolder, 'new_model.slx')  
    new_system('new_model');  
    save_system('new_model', filepath)
```

Add the new model to the project.

```
projectFile = addFile(proj, filepath)
```

Automatically open the model when the project opens, by making it a startup file.

```
addStartupFile(proj, filepath);
```

Input Arguments

proj — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

file — Path of file

character vector

Path of the file to add relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: 'models/myModelName.slx'

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

See Also

`simulinkproject`

Introduced in R2017b

addShutdownFile

(Not recommended) Add shutdown file to project

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see .

Syntax

```
addShutdownFile(proj, file)
```

Description

`addShutdownFile(proj, file)` adds a shutdown file to the project `proj`. When you close the project, it runs the shutdown file automatically. Use the shutdown list to specify executable MATLAB code to run as the project shuts down.

Examples

Add a Shutdown File

Open the airframe project and create a project object.

```
sldemo_slproject_airframe  
proj = simulinkproject;
```

Specify executable MATLAB code to run as the project shuts down.

```
filepath = fullfile('utilities', 'rebuild_s_functions.m');
```

Automatically run the file when the project closes, by making it a shutdown file.

```
addShutdownFile(project, filepath);
```

Input Arguments

proj — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

file — Path of file

character vector

Path of the MATLAB file to add relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: `'utilities/myscript.m'`

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

`simulinkproject`

Introduced in R2017b

removeStartupFile

(Not recommended) Remove startup file from project startup list

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
removeStartupFile(proj, file)
```

Description

`removeStartupFile(proj, file)` removes the startup file from the startup list in the project `proj`.

Examples

Remove a Startup File

Open the airframe project and create a project object.

```
sldemo_slproject_airframe  
proj = simulinkproject;
```

Create a new file.

```
filepath = fullfile(proj.RootFolder, 'new_model.slx')  
    new_system('new_model');  
    save_system('new_model', filepath)
```

Add the new model to the project.

```
projectFile = addFile(proj, filepath)
```

Automatically open the model when the project opens, by making it a startup file.

```
addStartupFile(proj, filepath);
```

Remove the startup file.

```
removeStartupFile(proj, filepath);
```

Input Arguments

proj — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

file — Path of file

character vector

Path of the file to add relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: 'models/myModelName.slx'

Compatibility Considerations**Simulink project API is not recommended**

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. removeShutdownFile

(Not recommended) Remove shutdown file from project shutdown list

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
removeShutdownFile(proj, file)
```

Description

`removeShutdownFile(proj, file)` removes the shutdown file from the shutdown list in the project `proj`.

Examples

Remove a Shutdown File

Open the airframe project and create a project object.

```
sldemo_slproject_airframe  
proj = simulinkproject;
```

Specify executable MATLAB code to run as the project shuts down.

```
filepath = fullfile('utilities', 'rebuild_s_functions.m');
```

Automatically run the file when the project closes, by making it a shutdown file.

```
addShutdownFile(project, filepath);
```

Remove the shutdown file.

```
removeShutdownFile(project, filepath);
```

Input Arguments

proj – Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

file – Path of file

character vector

Path of the MATLAB file to add relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: 'utilities/myscript.m'

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

`simulinkproject`

Introduced in R2017b

delete_block

Delete blocks from Simulink system

Syntax

```
delete_block(blockArg)
```

Description

`delete_block(blockArg)` deletes the specified blocks from a system. Open the system before you delete blocks.

Examples

Delete Block Using Full Path Name

Delete the block Mu from the vdp system.

```
open_system('vdp')  
delete_block('vdp/Mu')
```

Delete Block Using Block Handle

Delete the block Out2 from the vdp system using the block handle.

Open the vdp system.

```
open_system('vdp')
```

Interactively select the block Out1. Get the block's handle and assign it to the variable `Out1_handle`. Delete the block using the handle.

```
Out1_handle = get_param(gcf, 'Handle');  
delete_block(Out1_handle)
```

Delete Blocks Using Vector of Handles

Delete three blocks from the vdp system.

Open the vdp system. Add three blocks and assign their handles to variables.

```
open_system('vdp')  
Constant_handle = add_block('built-in/Constant', 'vdp/MyConstant');  
Gain_handle = add_block('built-in/Gain', 'vdp/MyGain');  
Outputport_handle = add_block('built-in/Outputport', 'vdp/MyOutputport');
```

Delete the blocks you added using a vector of handles.

```
delete_block([Constant_handle Gain_handle Outport_handle])
```

Input Arguments

blockArg — Blocks to delete

full path name | handle | vector of handles | 1-D cell array of handles or block path names

Blocks to delete, specified as the full block path name, a handle, a vector of handles, or a 1-D cell array of handles or block path names.

Example: 'vdp/Mu'

Example: [handle1 handle2]

Example: {'vdp/Mu' 'vdp/Out1' 'vdp/Out2'}

See Also

`add_block`

Introduced before R2006a

delete_line

Delete line from Simulink model

Syntax

```
delete_line(sys,out,in)
delete_line(sys,point)
delete_line(lineHandle)
```

Description

`delete_line(sys,out,in)` deletes the line from the model or subsystem `sys` that connects the output port `out` to the input port `in`.

`delete_line(sys,point)` deletes the line that includes the point `point`.

`delete_line(lineHandle)` deletes the line using the line handle.

Examples

Remove Line Using Block Port Names

For the model `vdp`, remove the line connecting the Product block with the Gain block.

```
load_system('vdp');
delete_line('vdp','Product/1','Mu/1');
```

Remove Line Using Line Handle

For the model `vdp`, remove a line using the line handle. You can get the line handle using different techniques.

```
load_system('vdp');
h = get_param('vdp/Mu','LineHandles');
delete_line(h.Outputport(1));
```

Get a line handle when you create the line. Delete the line using that handle.

```
a = add_line('vdp','Mu/1','Sum/2');
delete_line(a)
```

Delete a Line Using a Point

You can use a point on the line to delete the whole line.

Find the port coordinates for the block `Mu` in the model `vdp`.

```
open_system('vdp');
mu = get_param('vdp/Mu', 'PortConnectivity');
mu.Position
```

```
ans = 1×2
    190    150
```

```
ans = 1×2
    225    150
```

The line that connects the Mu block to the Sum block starts at the output port, which is at (225,150). You can use any point to the right of that point along the same x-axis to delete the line.

```
delete_line('vdp',[230,150]);
```

Delete Segments of Branched Lines

Use `delete_line` with branched lines to remove the segment for any connection.

Open the model vdp.

```
open_system('vdp');
```

Delete the line from x1 to the Out1 block. This command deletes only the segment of the line that connects the branch to the specified block.

```
delete_line('vdp','x1/1','Out1/1')
```

Delete the line segment from x2 to the Mux.

```
delete_line('vdp','x2/1','Mux/2')
```

Delete the line segment from x2 to the Product block.

```
delete_line('vdp', 'x2/1', 'Product/2')
```

Input Arguments

sys — Model or subsystem to delete line from

character vector

Model or subsystem to delete the line from, specified as a character vector.

Example: 'vdp', 'f14/Controller'

out — Block output port to delete line from

block/port name or number character vector | port handle

Block output port to delete line from, specified as either:

- The block name, a slash, and the port name or number. Most block ports are numbered from top to bottom or from left to right. For a state port, use the port name State instead of a port number.
- The port handle that you want to delete the line from.

Use 'PortHandles' with get_param to get the handles.

Example: 'Mu/1', 'Subsystem/2'

in — Block input port to delete line from

block/port name or number character vector | port handle

Block input port to delete line from, specified as either:

- The block name, a slash, and the port name or number. The port name on:
 - An enabled subsystem is Enable.
 - A triggered subsystem is Trigger.
 - If Action and Switch Case Action subsystems is Action.
- The port handle that you want to delete the line from.

Use 'PortHandles' with `get_param` to get handles.

Example: 'Mu/1', 'Subsystem/2'

point — Point on the line you want to delete

1-by-2 matrix

Point that falls on the line you want to delete, specified as a 1-by-2 matrix.

Example: [150 200]

lineHandle — Handle of the line you want to delete

handle

Handle of the line you want to delete. You can get the line handle by using `get_param` with the 'LineHandles' option or by assigning the line to a handle when you create it programmatically.

See Also

`add_line` | `get_param`

Introduced before R2006a

delete_param

Delete system parameter added via `add_param` command

Syntax

```
delete_param('sys', 'parameter1', 'parameter2', ...)
```

Description

This command deletes parameters that were added to the system using the `add_param` command. The command displays an error message if a specified parameter was not added with the `add_param` command.

Examples

The following example

```
add_param('vdp', 'DemoName', 'VanDerPolEquation', 'EquationOrder', '2')
delete_param('vdp', 'DemoName')
```

adds the parameters `DemoName` and `EquationOrder` to the `vdp` system, then deletes `DemoName` from the system.

See Also

`add_param`

Introduced before R2006a

dependencies.fileDependencyAnalysis

Find model file dependencies

Syntax

```
files = dependencies.fileDependencyAnalysis('modelname')
[files,missing] = dependencies.fileDependencyAnalysis('modelname')
[files,missing,depfile] = dependencies.fileDependencyAnalysis('modelname')
[files,missing,depfile,manifestfile] = dependencies.fileDependencyAnalysis('modelname','manifestfile')
```

Description

`files = dependencies.fileDependencyAnalysis('modelname')` returns the full paths of all existing files referenced by the model `modelname`.

`[files,missing] = dependencies.fileDependencyAnalysis('modelname')` also returns `missing`, any referenced files that cannot be found.

`[files,missing,depfile] = dependencies.fileDependencyAnalysis('modelname')` also returns `depfile`, the full path of the user dependencies (.smd) file, if it exists, that stores the names of any files the user manually added or excluded.

`[files,missing,depfile,manifestfile] = dependencies.fileDependencyAnalysis('modelname','manifestfile')` also creates a manifest file specified in `manifestfile`.

Examples

Find Model File Dependencies

Programmatically find all the file dependencies of the model `sldemo_mdref_depgraph`.

```
files = dependencies.fileDependencyAnalysis('sldemo_mdref_depgraph')
```

```
files = 7x1 cell
    {'C:\TEMP\Bdoc21a_1606923_3504\ib7FC80E\10\tp39136306\simulink-ex05898741\sldemo_mdref_F2C...'
    {'C:\TEMP\Bdoc21a_1606923_3504\ib7FC80E\10\tp39136306\simulink-ex05898741\sldemo_mdref_depgraph...'
    {'C:\TEMP\Bdoc21a_1606923_3504\ib7FC80E\10\tp39136306\simulink-ex05898741\sldemo_mdref_heat...'
    {'C:\TEMP\Bdoc21a_1606923_3504\ib7FC80E\10\tp39136306\simulink-ex05898741\sldemo_mdref_heate...'
    {'C:\TEMP\Bdoc21a_1606923_3504\ib7FC80E\10\tp39136306\simulink-ex05898741\sldemo_mdref_hous...'
    {'C:\TEMP\Bdoc21a_1606923_3504\ib7FC80E\10\tp39136306\simulink-ex05898741\sldemo_mdref_outd...'
    {'C:\TEMP\Bdoc21a_1606923_3504\ib7FC80E\10\tp39136306\simulink-ex05898741\sldemo_mdref_therm...
```

Input Arguments

modelname — Model, library, or subsystem name or path

character vector | string

Full name or path of a model, library, or subsystem to analyze, specified as a character vector or string.

Data Types: `char` | `string`

manifestfile — Manifest file name or path

character vector | string

(Optional) Full name or path of the manifest file to create, specified as a character vector or string. The function adds the suffix `.smf` to the user-specified name.

Data Types: `char` | `string`

Output Arguments

files — Full paths of referenced files

character vector | cell array of character vectors

Full paths of all existing files referenced by the model or library `modelName`, returned as a character vector or a cell array of character vectors.

missing — Full paths of missing files

character vector | cell array of character vectors

Full paths of files referenced by the model or library `modelName` that cannot be found, returned as a character vector or a cell array of character vectors.

depfile — Full path of user dependencies file

character vector

Full path of user dependencies (`.smd`) file, if it exists, that stores the names of any files the user manually added or excluded, returned as a character vector.

manifestfile — Full path of created manifest file

character vector

Full path of new manifest (`.smf`) file, returned as a character vector.

Tips

- Interactively generate a dependency graph and a report summarizing the list of required files and products. For more details, see “Analyze Model Dependencies”.
- If your model is in a project, use `listRequiredFiles` instead.
- To programmatically check which add-ons are required, use `dependencies.toolboxDependencyAnalysis` instead.

Compatibility Considerations

Output arguments `manifestfile` and `depfile` will be removed

Not recommended starting in R2020b

Output arguments `manifestfile` and `depfile` will be removed in a future release.

Starting in R2020b, you can only generate the manifest file programmatically. You can open manifest files created prior to R2020b using the Dependency Analyzer. To interactively generate a dependency graph and report, perform a dependency analysis. For more details, see “Analyze Model Dependencies”.

Starting in R2020b, you can no longer generate a user dependencies file (.smd file). The function only returns a .smd file if it already exists. To manually add or exclude dependencies, create a project from your model. For more details, see “Create a Project from a Model” and “Add Files to the Project”.

See Also

`dependencies.toolbox.DependencyAnalysis | listRequiredFiles`

Topics

“What Is Dependency Analysis?”

Introduced in R2012a

dependencies.toolboxDependencyAnalysis

Find add-on dependencies

Syntax

```
names = dependencies.toolboxDependencyAnalysis(files)
[names, folders] = dependencies.toolboxDependencyAnalysis(files)
```

Description

`names = dependencies.toolboxDependencyAnalysis(files)` returns `names`, a cell array of the add-on names required by the files in `files`.

`[names, folders] = dependencies.toolboxDependencyAnalysis(files)` also returns `folders`, a cell array of the add-on folders.

Examples

Find Required Add-Ons

Find all the required add-ons for the model `vdp`.

```
files={'vdp'};
names = dependencies.toolboxDependencyAnalysis(files)

names =

    1x1 cell array

    {'Simulink'}
```

Tip You can interactively run a dependency analysis. You can find the required add-ons for the entire project, for selected files, or for a model. You can see which products a new team member requires to use the design, or find which file is introducing a product dependency. See “Find Required Products and Add-Ons”.

To programmatically check which files are required, see `dependencies.fileDependencyAnalysis`.

To view long product names, examine the `names` cell array as follows:

```
names{:}

ans =

    'Simulink'
```

Find Names and Folders of Required Add-Ons

Find the names and folders of the required add-ons for the model vdp.

```
files={'vdp'};
[names, folders] = dependencies.toolboxDependencyAnalysis(files)

names =

    1×1 cell array

    {'Simulink'}

folders =

    1×1 cell array

    {'simulink'}
```

Input Arguments

files — Files names or paths

" " (default) | cell array of strings

Names of files on the MATLAB path or full paths to files, specified as a cell array of strings.

Output Arguments

names — Add-on names

cell array of character vectors

Add-on names required by the files in `files`, returned as a cell array of character vectors.

folders — Add-on folders

cell array of character vectors

(Optional) Required add-on folders, returned as a cell array of character vectors.

Topics

“Dependency Analysis”

“What Is Dependency Analysis?”

Introduced in R2012a

depview

Analyze and visualize model referencing dependencies with or without library dependencies

Syntax

```
depview(sys)
depview(sys,Name,Value)
```

Description

depview opens the Dependency Analyzer. While `view_mdhrefs` also opens the Dependency Analyzer, `depview` provides programmatic options that allow you to open a specific configuration of the dependency graph.

`depview(sys)` opens the Dependency Analyzer and displays a graph of dependencies for the model or library specified by `sys`.

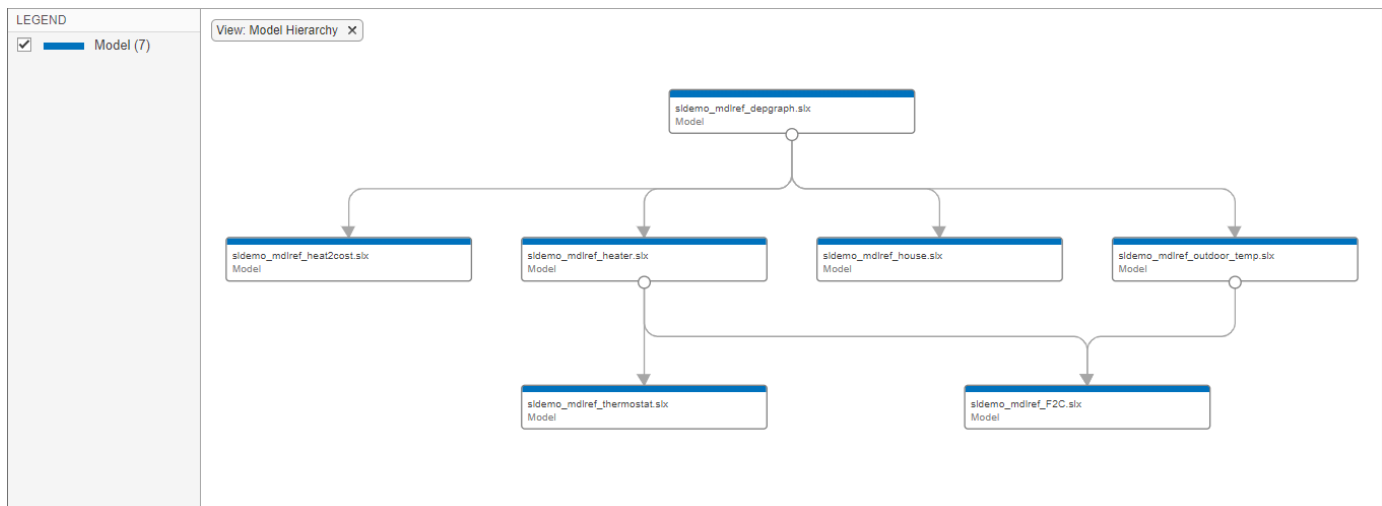

`depview(sys,Name,Value)` opens the Dependency Analyzer and displays a graph of dependencies as specified by one or more `Name,Value` pair arguments.

Examples

Open Dependency Analyzer with Default Settings

Open the Dependency Analyzer for the `sldemo_mdhref_depgraph` model.

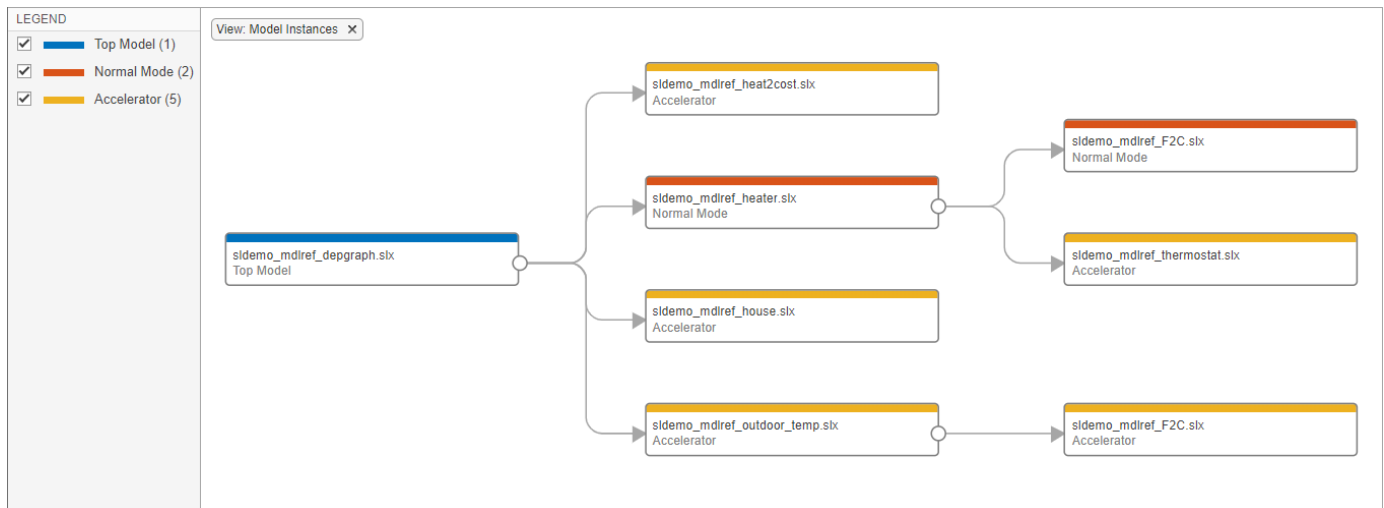

```
depview('sldemo_mdhref_depgraph');
```

Open Dependency Analyzer with Custom Settings

Open the Dependency Analyzer for the `sldemo_mdref_depgraph` model in **Model Instances** view with a **Horizontal** layout.

```
depview('sldemo_mdref_depgraph', 'ModelReferenceInstance', true, 'ShowHorizontal', true);
```

In **Model Instances** view, node appearance corresponds to simulation mode.

Input Arguments

sys — Name or path of model or library

' ' (default) | character vector

Name or path of model or library, specified as a character vector.

Data Types: char

Name-Value Pair Arguments

Specify optional comma-separated pairs of **Name**, **Value** arguments. **Name** is the argument name and **Value** is the corresponding value. **Name** must appear inside quotes. You can specify two name and value pair arguments in any order as `Name1, Value1, Name2, Value2`.

Example:

```
depview('sldemo_mdref_depgraph', 'ModelReferenceInstance', true, 'ShowHorizontal', true)
```

FileDependenciesExcludingLibraries — Graph with only models

false (default) | true

To open the dependency graph with only models, set this parameter to `true`. In this view, node appearance corresponds to file type.

Dependencies

You can only set one of `'FileDependenciesExcludingLibraries'`, `'FileDependenciesIncludingLibraries'`, and `'ModelReferenceInstance'` to `true`.

FileDependenciesIncludingLibraries — Graph with models and user-defined libraries`true (default) | false`

To open the dependency graph with models and user-defined libraries, use the default setting. In this view, node appearance corresponds to file type.

Dependencies

You can only set one of 'FileDependenciesExcludingLibraries', 'FileDependenciesIncludingLibraries', and 'ModelReferenceInstance' to true.

ModelReferenceInstance — Graph with only models that shows each model instance separately`false (default) | true`

To open the dependency graph with each instance of a model as a separate node in the graph, set this parameter to true. In this view, node appearance corresponds to simulation mode.

Dependencies

You can only set one of 'FileDependenciesExcludingLibraries', 'FileDependenciesIncludingLibraries', and 'ModelReferenceInstance' to true.

ShowHorizontal — Horizontal dependency display`false (default) | true`

To open the dependency graph with referenced models and libraries to the right of their parents, set this parameter to true. By default, the Dependency Analyzer shows referenced models and libraries below their parents.

See Also**Blocks**`Model`**Functions**`find_mdhrefs`**Topics**`"Model Reference Basics"``"Analyze Model Dependencies"`**Introduced in R2006b**

detachConfigSet

Dissociate configuration set or configuration reference from model

Syntax

```
configObj = detachConfigSet(model, configObjName)
```

Description

`configObj = detachConfigSet(model, configObjName)` dissociates the configuration set or configuration reference with the name `configObjName` from the model. The function returns the detached configuration as a `Simulink.ConfigSet` object or a `Simulink.ConfigSetRef` object. You cannot detach the active configuration from a model. When you want to detach the active configuration, first activate a different configuration for the model.

Examples

Detach Configuration Set From Model

Create, attach, and activate a configuration set for a model. Then, detach the default configuration set from the model.

Open the model `sldemo_fuelsys`. Create a configuration set named `'MyConfig'` and attach it to the model.

```
sldemo_fuelsys
configObj = Simulink.ConfigSet;
set_param(configObj, 'Name', 'MyConfig')
attachConfigSet('sldemo_fuelsys', configObj)
```

The active configuration for `sldemo_fuelsys` is the default configuration set, `Configuration`. To detach `Configuration`, activate another configuration for the model. For this example, set `MyConfig` as the active configuration set for `sldemo_fuelsys`.

```
setActiveConfigSet('sldemo_fuelsys', 'MyConfig')
```

Detach the default configuration set `Configuration` from the model.

```
detachConfigSet('sldemo_fuelsys', 'Configuration');
```

Input Arguments

model — Model from which to detach configuration set

character vector | string scalar

Model from which to disassociate a configuration set, specified as a character vector or string scalar. The model must be open.

Example: `'my_model'`

configObjName — Configuration object name

character vector | string scalar

Name of the configuration object to detach from the model, specified as a character vector or string scalar.

Example: 'Configuration'

See Also

attachConfigSet | attachConfigSetCopy | setActiveConfigSet

Topics

“Manage Configuration Sets for a Model”

Introduced in R2006a

disableimplicitsignalresolution

Convert model to use only explicit signal resolution

Syntax

```
retVal = disableimplicitsignalresolution('model')
retVal = disableimplicitsignalresolution('model', displayOnly)
```

Description

`retVal = disableimplicitsignalresolution('model')` inputs a model, reports all signals and states that implicitly resolve to signal objects, and converts the model to resolve only signals and states that explicitly require it. The report and any changes are limited to the model itself; they do not include blocks that are library links.

Before executing this function, ensure that all relevant Simulink data objects are defined in the base workspace or a data dictionary to which the model is linked. The function ignores any data objects that are defined elsewhere.

The function scans *model*, returns a structure of handles to signals and states that resolve implicitly to signal objects, and performs the following operations on *model*:

- Search the model for all output ports and block states that resolve to Simulink signal objects.
- Modify these ports and blocks to enforce signal object resolution in the future.
- Set the model's `SignalResolutionControl` parameter to 'UseLocalSettings' (GUI: **Explicit Only**).

If `SignalResolutionControl` is already set to 'UseLocalSettings' or to 'None', the function takes no action and returns a warning.

- If any Stateflow output data resolves to a Simulink signal object:
 - Turn off hierarchical scoping of signal objects from within the Stateflow chart.
 - Explicitly label the output signal of the Stateflow chart.
 - Enforce signal object resolution for this signal in the future.

Any changes made by `disableimplicitsignalresolution` permanently change the model. Be sure to back up the model before calling the function with `displayOnly` defaulted to or specified as `false`.

`retVal = disableimplicitsignalresolution('model', displayOnly)` is equivalent to `disableimplicitsignalresolution(model)` if `displayOnly` is `false`.

If `displayOnly` is `true`, the function returns a structure of handles to signals and states that resolve implicitly to signal objects, but leaves the model unchanged.

Input Arguments

displayOnly

Boolean specifying whether to change the model (`false`) or just generate a report (`true`)

Default: `false`

model

Model name or handle

Output Arguments

retVal

A MATLAB structure containing:

Signals

Handles to ports with signal names that resolve to signal objects

States

Handles to blocks with states that resolve to signal objects

See Also

`Simulink.Signal`

docblock

Get or set editor invoked by Simulink DocBlock

Syntax

```
docblock(setEditorType,command)
```

```
editCommand = docblock(getEditorType)
```

Description

`docblock(setEditorType,command)` uses the specified command to set the editor opened by double-clicking a DocBlock block.

By default, a DocBlock block opens Microsoft Word to edit HTML or RTF files. If Word is not available on your system, the block opens these file types using the text editor specified on the **Editor/Debugger Preferences** pane of the MATLAB Preferences dialog box. For text files, the default editor is the text editor specified in the MATLAB preferences.

`editCommand = docblock(getEditorType)` returns the current command to open the specified editor from a DocBlock block.

Input Arguments

setEditorType — File type whose editor command to set

'setEditorHTML' | 'setEditorDOC' | 'setEditorTXT'

File type whose editor command you want to set, specified as 'setEditorHTML', 'setEditorDOC', or 'setEditorTXT'.

command — Command to open file in editor

character vector | ''

Command to open the specified file type in an editor from the MATLAB command prompt, specified as a character vector. Use '' to reset to the default editor for that file type.

In the command, use the "%<FileName>" token to represent the full pathname to the document.

getEditorType — File type of the editor command to return

'getEditorHTML' | 'getEditorDOC' | 'getEditorTXT'

File type of the editor command to return, specified as 'getEditorHTML', 'getEditorDOC', or 'getEditorTXT'.

Output Arguments

editCommand — Command to open the editor

character vector

Command to open the editor, returned as a character vector.

Examples

Set DocBlock Text Editor

Specify Notepad as the DocBlock editor for text files.

```
docblock('setEditorTXT', 'system('notepad "%<FileName>"');')
```

Set and Get Current HTML Editor

You can use the docblock command to get the current editor.

Set your HTML editor for the DocBlock block to Mozilla Composer. The ampersand executes the command in the background.

```
docblock('setEditorHTML', ...
    'system('/usr/local/bin/mozilla -edit "%<FileName>" &');')
```

Get the current HTML editor.

```
htmlEd = docblock('getEditorHTML')
htmlEd =
    'system('/usr/local/bin/mozilla -edit "%<FileName>" &');
```

Reset Text Editor to Default

Specify Notepad as the DocBlock editor for text files.

```
docblock('setEditorTXT', 'system('notepad "%<FileName>"');')
```

Get the current text editor.

```
txtEd = docblock('getEditorTXT')
txtEd =
    'system('notepad "%<FileName>"');
```

Reset the editor to the default editor.

```
docblock('setEditorTXT', '')
```

edittime.getDisplayIssues

Check whether model design warnings and errors is on

Syntax

```
val= edittime.getDisplayIssue
```

Description

Use the `val= edittime.getDisplayIssue` function to check whether model design errors and warnings is on.

Examples

Enable model design errors and warnings via the command-line

By default, model design errors and warnings are visible while you edit a model. You can turn them off by entering this command at the MATLAB command line.

```
edittime.setDisplayIssues('off')
```

You can turn them on by entering this command at the MATLAB command line.

```
edittime.setDisplayIssues('on')
```

You can check whether they are on by entering this command at the MATLAB command line.

```
val=edittime.getDisplayIssues
```

Output Arguments

val — Returns on or off

char

If edit-time checking is on, this function returns on. If edit-time checking is off, this function returns off.

See Also

`edittime.setDisplayIssues` | **Simulink Editor**

Introduced in R2019a

edittime.setDisplayIssues

Detect model design errors and warnings

Syntax

```
edittime.setDisplayIssues(value)
```

Description

`edittime.setDisplayIssues(value)` function sets whether to display model design errors and warnings while you design your model. This function is equivalent to selecting **Diagnostics > Edit-Time Errors & Warnings**. This setting persists for all models.

Examples

Enable model design errors and warnings through the command-line

By default, model design errors and warnings are visible while you edit a model. You can turn them off. At the MATLAB command line, enter:

```
edittime.setDisplayIssues('off')
```

To turn on errors and warnings, at the MATLAB command line, enter:

```
edittime.setDisplayIssues('on')
```

Input Arguments

value — Enable model design warning and error detection

character vector

To enable warnings and errors while you edit your model, set value to `on`. To disable warnings and errors while you edit, set value to `off`.

Data Types: `char`

See Also

`edittime.getDisplayIssues` | **Simulink Editor**

Introduced in R2019a

export

(Not recommended) Export project to zip

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
export(proj,zipFileName)
export(proj,zipFileName,definitionType)
```

Description

`export(proj,zipFileName)` exports the project `proj` to a zip file specified by `zipFileName`. The zip archive preserves the project files, structure, labels, and shortcuts, and does not include any source control information. You can use the zip archive to send the project to customers, suppliers, or colleagues who do not have access to your source control repository. Recipients can create a new project from the zip archive by clicking **New** in the Project Tool, and then in the start page, clicking **Archive**.

`export(proj,zipFileName,definitionType)` exports the project using the specified `definitionType` for the project definition files, single or multiple. If you do not specify `definitionType`, the project's current setting is used. Use the `definitionType` export option if you want to change project definition file management from the type selected when the project was created. You can control project definition file management in the preferences.

Examples

Export a Project to a Zip File

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Export the project to a zip file.

```
export(proj,'airframeproj.zip')
```

Input Arguments

proj — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

zipFileName — Zip file name or path

character vector

Zip file name or path, specified as a character vector ending in the file extension `.zip`. If `zipFileName` is a filename, Simulink exports the file to the current folder. You can also specify a fully qualified path name.

Example: `'project.zip'`

Data Types: `char`

definitionType — Definition file type`slproject.DefinitionFiles.SingleFile` | `slproject.DefinitionFiles.MultiFile`

Definition file type, specified as `slproject.DefinitionFiles.SingleFile`, `slproject.DefinitionFiles.MultiFile`, or `slproject.DefinitionFiles.FixedPathMultiFile`. Use the `definitionType` export option if you want to change project definition file management from the type selected when the project was created. `MultiFile` is better for avoiding merging issues on shared projects. `SingleFile` is faster but is likely to cause merge issues when two users submit changes in the same project to a source control tool. If you need to work with long file paths, use `FixedPathMultiFile`.

Example: `export(proj, 'proj.zip', slproject.DefinitionFiles.SingleFile)`

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

"Archive Projects"

Introduced in R2013a

findCategory

(Not recommended) Get project category of labels

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
category = findCategory(proj,categoryName)
```

Description

`category = findCategory(proj,categoryName)` returns the project category specified by `categoryName`. You need to get a category before you can use `createLabel` or `removeLabel`.

Examples

Get a Category of Project Labels

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Use `findCategory` to get a category of labels by name.

```
category = findCategory(proj,'Classification')
category =
```

```
Category with properties:
```

```
        Name: 'Classification'
        DataType: 'none'
LabelDefinitions: [1x8 slproject.LabelDefinition]
```

Alternatively, you can examine categories by index. Get the first category.

```
proj.Categories(1)
```

```
ans =
```

```
Category with properties:
```

```
        Name: 'Classification'
        DataType: 'none'
LabelDefinitions: [1x8 slproject.LabelDefinition]
```

Find out what you can do with the category.

```
methods(category)
```

Methods for class `slproject.Category`:

`createLabel` `findLabel` `removeLabel`

Input Arguments

proj — Project

project

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

categoryName — Name of category

character vector

Name of the category to get, specified as a character vector.

Output Arguments

category — Category of labels

category object

Category of labels, returned as a category object that you can query or modify. If the specified category is not found, the function returns an empty array.

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

`createLabel` | `removeLabel` | `simulinkproject`

Introduced in R2013a

findFile

(Not recommended) Get project file by name

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
file = findFile(proj,fileorfolder)
```

Description

`file = findFile(proj,fileorfolder)` returns a specific project file by name. You need to get a file before you can query labels, or use `addLabel` or `removeLabel`.

Examples

Find a File By Name

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;  
proj = simulinkproject;
```

Use `findFile` to get a file by name. You need to know the path if it is inside subfolders under the project root.

```
myfile = findFile(proj,'models/AnalogControl.slx')
```

```
myfile =
```

```
    ProjectFile with properties:
```

```
        Path: [1x86 char]  
        Labels: [1x1 slproject.Label]  
        Revision: '2'  
    SourceControlStatus: Unmodified
```

Alternatively, you can examine files by index. Get the first file.

```
file = proj.Files(1);
```

Find out what you can do with the file.

```
methods(file)
```

Methods for class `slproject.ProjectFile`:

`addLabel` `removeLabel` `findLabel`

Input Arguments

proj – Project

project

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

fileorfolder – Path of file or folder

character vector | cell array of character vectors | string array

Path of the file or folder to find relative to the project root folder, specified as a character vector, string, or array. Files must include any subfolders under the project root and the file extension. The file or folder must be within the root folder.

Example: `'models/myModelName.slx'`

Output Arguments

file – Project file

file object

Project file, returned as a file object that you can query or modify.

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

Functions

`addLabel` | `findCategory` | `findLabel` | `removeLabel` | `simulinkproject`

Introduced in R2013a

findLabel

(Not recommended) Get project file label

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
label = findLabel(file,categoryName,labelName)
label = findLabel(file,labelDefinition)
label = findLabel(category,labelName)
```

Description

`label = findLabel(file,categoryName,labelName)` returns the label and its attached data for the label `labelName` in the category `categoryName` that is attached to the specified `file` or files. Use this syntax when you know the label name and category.

`label = findLabel(file,labelDefinition)` returns the file label and its attached data for the label name and category specified by `labelDefinition`. Use this syntax if you previously got a `labelDefinition` by accessing a `Labels` property, e.g., using a command like `myfile.Labels(1)`.

`label = findLabel(category,labelName)` returns the label definition of the label in this category specified by `labelName`. Returns an empty array if the label is not found.

Examples

Find Files with the Label Utility

Find all project files with a particular label.

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Get the list of project files.

```
files = proj.Files;
```

Loop through each file. If the file has the extension `.m`, attach the label `Utility`.

```
for fileIndex = 1:numel(files)
    file = files(fileIndex);
    [~,~,fileExtension] = fileparts(file.Path);
    if strcmp(fileExtension,'.m')
        addLabel(file,'Classification','Utility');
```

```

end
end

```

Find all the files with the label Utility and add them to a list returned in `utility_files_to_review`.

```

utility_files_to_review = {};
for jj=1:numel(files)
    this_file = files(jj);

    label = findLabel(this_file, 'Classification', 'Utility');

    if ( ~isempty(label))
        % This is a file labeled 'Utility'. Add to the
        % list of utility files.
        utility_files_to_review = [utility_files_to_review; this_file];
    end
end

```

Find a Label by Name or Definition

Open the airframe project and create a project object.

```

sldemo_slproject_airframe;
proj = simulinkproject;

```

Get a particular file by name.

```

myfile = findFile(proj, 'models/AnalogControl.slx');

```

Get a label by name.

```

label = findLabel(myfile, 'Classification', 'Design');

```

Alternatively, examine the `Labels` property of the file to get an array of Label objects, one for each label attached to the file.

```

labels = myfile.Labels

```

Index into the `Labels` property to get the label attached to the particular file.

```

labeldefinition = myfile.Labels(1)

```

After you get the label definition from the `Labels` property, you can use it with `findLabel`.

```

label = findLabel(myfile, labeldefinition);

```

Find Labels by Name or Definition

Open the airframe project and create a project object.

```

sldemo_slproject_airframe;
proj = simulinkproject;

```

Get a category.

```
category = proj.Categories(1)
category =
    Category with properties:
        Name: 'Classification'
        DataType: 'none'
        LabelDefinitions: [1x8 slproject.LabelDefinition]
```

Get a label definition.

```
ld = findLabel(category, 'Design')
ld =
    LabelDefinition with properties:
        Name: 'Design'
        CategoryName: 'Classification'
```

Input Arguments

file — File to search labels of

file object

File to search the labels of, specified as a file object or an array of file objects. You can get the file object by examining the project's Files property (`proj.Files`), or use `findFile` to get a file by name. The file must be in the project.

categoryName — Name of category

character vector

Name of the parent category for the label, specified as a character vector.

labelName — Name of label

character vector

Name of the label to get, specified as a character vector.

labelDefinition — Name of label

label definition object

Name of the label to get, specified as a label definition object returned by the `file.Label` property.

category — Category of labels

category object

Category of labels, specified as a category object. Get a category object from the `proj.Categories` property or by using `findCategory`.

Output Arguments

label — Label

label object

Label, returned as a label object.

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

Functions

`addLabel` | `createLabel` | `findFile` | `simulinkproject`

Introduced in R2013a

find_mdhrefs

Find referenced models and Model blocks in model hierarchy

Note Variants option will be removed. Use `MatchFilter` instead. For more information, see “Compatibility Considerations”.

Syntax

```
[models,blocks] = find_mdhrefs(system)
[models,blocks] = find_mdhrefs(system,Name,Value)
```

Description

`[models,blocks] = find_mdhrefs(system)` finds all referenced models and Model blocks in the model hierarchy below the specified system. The `find_mdhrefs` function temporarily loads the models.

`[models,blocks] = find_mdhrefs(system,Name,Value)` provides additional search options using one or more name-value pairs. For example, to keep the models loaded instead of temporarily loading them, set `KeepModelsLoaded` to `true`.

Examples

Find Referenced Models in Model Hierarchy

Find referenced models and Model blocks for all models referenced by the specified model.

```
load_system('sldemo_mdhref_basic');
[myModels,myModelBlks] = find_mdhrefs('sldemo_mdhref_basic')
```

```
myModels = 2x1 cell
    {'sldemo_mdhref_counter'}
    {'sldemo_mdhref_basic' }
```

```
myModelBlks = 3x1 cell
    {'sldemo_mdhref_basic/CounterA'}
    {'sldemo_mdhref_basic/CounterB'}
    {'sldemo_mdhref_basic/CounterC'}
```

Find and Load All Models in Model Hierarchy

By default, the `find_mdhrefs` function loads and then closes the models that were not already loaded. To identify what models are loaded, use the `find_system` function.

```
find_mdrefs('sldemo_mdhref_depgraph');
find_system('type','block_diagram')
```

```
ans =
```

```
0x1 empty cell array
```

To find and load all models in the model hierarchy, set `KeepModelsLoaded` to `true`.

```
find_mdrefs('sldemo_mdhref_depgraph','KeepModelsLoaded',true);
find_system('type','block_diagram')
```

```
ans = 7x1 cell
```

```
{'sldemo_mdhref_thermostat' }
{'sldemo_mdhref_heater'     }
{'sldemo_mdhref_F2C'        }
{'sldemo_mdhref_outdoor_temp'}
{'sldemo_mdhref_house'      }
{'sldemo_mdhref_heat2cost'   }
{'sldemo_mdhref_depgraph'   }
```

The top model and all referenced models remain loaded. If you open `sldemo_mdhref_depgraph`, you can navigate the model hierarchy without waiting for the referenced models to load as you open them.

Input Arguments

system — System name, block path, or handle

character vector | string scalar | numeric scalar

System name, block path, or handle, specified as a character vector, string scalar, or numeric scalar.

The system must be an SLX file, MDL file, Model block, or Subsystem block.

If you specify a file name, do not include the file extension.

Data Types: `double` | `char` | `string`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `refModels =`

```
find_mdrefs(topmodel,'KeepModelsLoaded',true,'ReturnTopModelAsLastElement',false)
```

AllLevels — Levels to search

`true` or `1` (default) | `false` or `0`

Levels to search, specified as the comma-separated pair consisting of `'AllLevels'` and a numeric or logical `1` (`true`) or `0` (`false`).

- `true` — Search all Model blocks in the model hierarchy of the specified system.

- `false` — Search only the top-level system.

Data Types: `logical`

KeepModelsLoaded — Option to keep models loaded

`false` or `0` (default) | `true` or `1`

Option to keep models loaded, specified as the comma-separated pair consisting of 'KeepModelsLoaded' and a numeric or logical `1` (`true`) or `0` (`false`).

By default the function loads and then closes the models that were not already loaded. To keep the models loaded, set this argument to `true`. Keeping the models loaded can be useful if you plan on interacting with the models after finding them.

Data Types: `logical`

IncludeProtectedModels — Option to include protected models

`false` or `0` (default) | `true` or `1`

Option to include protected models in the search results, specified as the comma-separated pair consisting of 'IncludeProtectedModels' and a numeric or logical `1` (`true`) or `0` (`false`).

This setting only affects the returned list of referenced models; It does not affect the returned list of Model blocks.

Data Types: `logical`

Variants — Option to include variant models

'ActivePlusCodeVariants' (default) | 'ActiveVariants' | 'AllVariants'

Option to include variant models in the search results, specified as the comma-separated pair consisting of 'Variants' and 'ActivePlusCodeVariants', 'ActiveVariants', or 'AllVariants'.

- 'ActivePlusCodeVariants' — Include all variant models in the Variant Subsystem that are active in simulation and is part of the generated code.
- 'ActiveVariants' — Include the active variant models in the Variant Subsystem block.
- 'AllVariants' — Include all variant models in the Variant Subsystem block.

Note This search constraint applies only to Variant Subsystem blocks that have the **Variant control mode** set to `expression` or `label`. Use the `find_mdrefs` function with the `MatchFilter` option to operate on all types of variant blocks.

Data Types: `char` | `string`

CaseSensitive — Option to match case when searching

`true` (default) | `false`

Option to match case when searching, specified as `true` for case-sensitive search or `false` for case-insensitive search.

Data Types: `logical`

FollowLinks — Option for search to follow library links

false (default) | true

Option for the search to follow library links, specified as true or false. If true, search follows links into library blocks.

Data Types: logical

IncludeCommented — Option for search to include commented blocks

true (default) | false

Option for the search to include commented blocks, specified as true or false.

Data Types: logical

LookUnderMasks — Options to search masked blocks

'all' (default) | 'none' | 'functional' | 'graphical'

Options to search masked blocks, specified as:

- 'all' — Search in all masked blocks.
- 'none' — Prevent searching in masked systems.
- 'functional' — Include masked subsystems that do not have dialogs.
- 'graphical' — Include masked subsystems that do not have workspaces or dialogs.

Data Types: char | string

MatchFilter — Function handle to match elements

function handle

Function handle to match elements in a search, such as blocks, system, lines, ports, and annotations. Use MatchFilter to determine whether elements should be included or skipped in a search.

The named function must be defined within a MATLAB program file. The function takes the handle of the element as input and returns two outputs.

```
function [match, prune] = func(element)
```

- The input element is the handle of the block being processed.
- The first output, match, is a logical value. If false, search skips the element.
- The second output, prune, is an optional logical value that only applies when element is a subsystem. The default value is false. If this value is set to true, the entire subsystem is omitted from the search.

Example: Use MatchFilter to find all model blocks in a model for which the InitFcn is defined using the filter function, initFcnMdlBlocks:

```
function match = initFcnMdlBlocks(handle)
    match = ~isempty(get_param(handle, 'InitFcn'));
end

addpath(fullfile(matlabroot, 'examples', 'simulink_variants', 'main'));
model = 'slexVariantMdlRefCondProp';
load_system(model);
[models, blocks] = find_mdrefs(model, 'MatchFilter', @initFcnMdlBlocks)
```

Variants: Simulink provides `Simulink.match.activeVariants` and `Simulink.match.codeCompileVariants` match filter functions, which you can use to find active variants or code compile variant blocks. To do so, compile the model and apply the appropriate `MatchFilter` options:

- `Simulink.match.activeVariants` - Matches blocks that are active in simulation after model compilation
- `Simulink.match.codeCompileVariants` - Matches blocks that are part of generated code after model compilation

For example, use `Simulink.match.activeVariants` option to find active variants in a model:

```
addpath(fullfile(matlabroot,'examples','simulink_variants','main'));
model='slexVariantMdlRefCondProp';
load_system(model);
set_param(model, 'SimulationCommand', 'update');
[models,blocks] = find_mdhrefs(model, 'MatchFilter', @Simulink.match.activeVariants);
```

For example, use `Simulink.match.codeCompileVariants` option to find variant choices that are part of the generated C code:

```
addpath(fullfile(matlabroot,'examples','simulink_variants','main'));
load_system('slexVariantMdlRefCondProp');
assignin('base','VSS_MODE',2);
slexVariantMdlRefCondProp([], [], [], 'compileForRTW');
[models,blocks]=find_mdhrefs('slexVariantMdlRefCondProp', 'MatchFilter', @Simulink.match.codeCompileVariants);
slexVariantMdlRefCondProp([], [], [], 'term');
```

IncludeCommented — Option to include commented blocks

false or 0 (default) | true or 1

Option to include commented blocks in the search results, specified as the comma-separated pair consisting of 'IncludeCommented' and a numeric or logical 1 (true) or 0 (false).

Data Types: logical

ReturnTopModelAsLastElement — Option to include specified system

true or 1 (default) | false or 0

Option to include the specified system in the search results, , specified as the comma-separated pair consisting of 'ReturnTopModelAsLastElement' and a numeric or logical 1 (true) or 0 (false).

By default, the last element in the returned list of referenced models is the name of the model, library, or subsystem file that you specified with the `system` argument. If you specify a block, the last element is the name of the file that contains it.

Data Types: logical

Output Arguments

models — Names of models

cell array of character vectors

Names of models, returned as a cell array of character vectors.

By default, the last element is the name of the model, library, or subsystem file that you specified with the `system` argument. If you specify a block, the last element is the model, library, or subsystem file that contains it.

blocks — Names of Model blocks

cell array of character vectors

Names of Model blocks, returned as a cell array of character vectors.

Compatibility Considerations**Specifying a logical value as the second argument of find_mdhrefs is discouraged***Not recommended starting in R2020b*

The `find_mdhrefs` function provides two ways to specify whether to search all levels of the model hierarchy. Both techniques give the same results, but only the name-value pair technique allows you to specify additional options.

Instead of specifying whether to search all levels of the model hierarchy with a logical as the second argument, use the `AllLevels` name-value pair.

Variants will be removed*Warns starting in R2021a*

The `Variants` option will be removed from `find_mdhrefs` in a future release. Scripts that use the `Variants` option continue to work with a warning.

To find Model blocks that are active during simulation or code generation, compile the model and use the `find_mdhrefs` function with the `MatchFilter` option.

Default behavior of find_mdhrefs with Variants and MatchFilter options in a model with variant blocks*Behavior changed in R2021a*

- **Variants:** Using the `find_mdhrefs` function *without* the `Variants` option includes only the Model blocks that are active during simulation or code generation in the search by default.

Consider a model with a Variant Model block that has two variant choices, `Mdl_Linear_Controller` and `Mdl_NonLinear_Controller`.

This command returns only the active Model blocks in the model.

```
[myModels,myModelBlks] = find_mdhrefs...
('sldemo_variant_subsystems_modelblocks')
```

```
myModels =
```

```
2x1 cell array
```

```
    {'mdlref_nonlinear_controller'          }
    {'sldemo_variant_subsystems_modelblocks'}
```

```
myModelBlks =
```

```
1x1 cell array
```

```
    {'sldemo_variant_subsystems_modelblocks/Controller/Mdl_NonLinear_Controller'}
```

- **MatchFilter:** Using the `find_mdhrefs` function with the `MatchFilter` option applies the filters on the active and inactive variant choices by default.

Consider a model with a Variant Model block that has two variant choices, `Mdl_Linear_Controller` and `Mdl_NonLinear_Controller`. The filter function `initFcnMdlBlocks` finds all the Model blocks for which the `InitFcn` callback is set.

```
function match = initFcnMdlBlocks(handle)
match = ~isempty(get_param(handle, 'InitFcn'));
end
```

This command returns both the active and inactive Model blocks in the model.

```
[myModels,myModelBlks] = find_mdhrefs('sldemo_variant_subsystems_modelblocks',...
'MatchFilter', @initFcnMdlBlocks)
```

myModels =

3×1 cell array

```
{'mdlref_linear_controller'      }
{'mdlref_nonlinear_controller'  }
{'sldemo_variant_subsystems_modelblocks'}
```

myModelBlks =

2×1 cell array

```
{'sldemo_variant_subsystems_modelblocks/Controller/Mdl_Linear_Controller'  }
{'sldemo_variant_subsystems_modelblocks/Controller/Mdl_NonLinear_Controller'}
```

- `find_mdhrefs` does not support the use of `MatchFilter` along with the `Variants` option.

This command produces an error:

```
find_mdhrefs(bdroot,'MatchFilter',@Simulink.match.activeVariants,...
'Variants','ActiveVariants');
```

Model

Functions

`find_system`

Topics

“Model Reference Basics”

“Inspect Model Hierarchies”

Introduced before R2006a

find_system

Find systems, blocks, lines, ports, and annotations

Note Variants option will be removed. Use `MatchFilter` instead. For more information, see “Compatibility Considerations”.

Syntax

```
Objects = find_system
Objects = find_system(System)
Objects = find_system(Name,Value)
Objects = find_system(System,Name,Value)
```

Description

`Objects = find_system` returns loaded systems and their blocks, including subsystems.

`Objects = find_system(System)` returns the specified system and its blocks.

`Objects = find_system(Name,Value)` returns loaded systems and the objects in those systems that meet the criteria specified by one or more `Name, Value` pair arguments. You can use this syntax to specify search constraints and to search for specific parameter values. Specify the search constraints before the parameter and value pairs.

`Objects = find_system(System,Name,Value)` returns the objects in the specified system that meet the specified criteria.

Examples

Find Loaded Systems and Their Blocks

Return the names of all loaded systems and their blocks.

```
load_system('vdp')
find_system

ans = 15x1 cell
    {'vdp' }
    {'vdp/Constant' }
    {'vdp/More Info' }
    {'vdp/More Info/Model Info'}
    {'vdp/Mu' }
    {'vdp/Mux' }
    {'vdp/Product' }
    {'vdp/Scope' }
    {'vdp/Square' }
    {'vdp/Sum' }
    {'vdp/Sum1' }
    {'vdp/x1' }
```

```
{'vdp/x2'          }  
{'vdp/Out1'       }  
{'vdp/Out2'       }
```

Returns loaded systems and libraries, including vdp.

Find Specific System and Its Blocks

Return vdp system and its blocks.

```
load_system({'vdp', 'ex_sl-demo_clutch'})  
find_system('vdp')
```

```
ans = 15x1 cell  
    {'vdp'          }  
    {'vdp/Constant' }  
    {'vdp/More Info' }  
    {'vdp/More Info/Model Info'}  
    {'vdp/Mu'       }  
    {'vdp/Mux'       }  
    {'vdp/Product'   }  
    {'vdp/Scope'     }  
    {'vdp/Square'     }  
    {'vdp/Sum'        }  
    {'vdp/Sum1'       }  
    {'vdp/x1'         }  
    {'vdp/x2'         }  
    {'vdp/Out1'       }  
    {'vdp/Out2'       }
```

Return Names of Loaded Models, Subsystems, and Libraries

Return the names of the loaded models, subsystems, and libraries. A subsystem name is returned only if the subsystem can be loaded independently.

```
load_system('vdp');  
find_system('type', 'block_diagram')
```

```
ans = 1x1 cell array  
    {'vdp'}
```

Search Children of Subsystem

Return the names of all Goto blocks that are children of the Unlocked subsystem in the ex_sl-demo_clutch system.

```
load_system('ex_sl-demo_clutch');  
find_system('ex_sl-demo_clutch/Unlocked', 'SearchDepth', 1, 'BlockType', 'Goto')
```

```
ans = 2x1 cell
    {'ex_sl-demo_clutch/Unlocked/Goto' }
    {'ex_sl-demo_clutch/Unlocked/Goto1' }
```

Copyright 2020 The MathWorks, Inc.

Search Using Multiple Criteria

Search in the vdp system and return the names of all Gain blocks whose **Gain** value is set to 1.

```
load_system('vdp');
find_system('vdp','BlockType','Gain','Gain','1')
```

```
ans = 1x1 cell array
    {'vdp/Mu' }
```

Return Lines and Annotations as Handles

Get the handles of all lines and annotations in the vdp system. With 'FindAll', the function returns handles regardless of how you specify the system to search.

```
load_system('vdp');
L = find_system('vdp','FindAll','on','type','line')
```

```
L = 19x1

    34.0084
    33.0084
    32.0084

    30.0084
    29.0084
    28.0084
    27.0084
    26.0084
    25.0084
    :
```

```
A = find_system('vdp','FindAll','on','type','annotation')
```

```
A = 2x1

    36.0084
    35.0084
```

Search for Specific Block Parameter Value

Find any block dialog box parameters with a value of 0 in the vdp and ex_slldemo_clutch systems.

```
load_system({'vdp','f14'})
find_system({'vdp','f14'},'BlockDialogParams','0')

ans =

    32x1 cell array

    {'vdp/More Info' }
    {'vdp/More Info/Model Info' }
    {'vdp/Scope' }
    {'vdp/x2' }
    {'vdp/Out1' }
    {'vdp/Out1' }
    {'vdp/Out2' }
    {'vdp/Out2' }
    {'f14/Aircraft←Dynamics←Model' }
    {'f14/Aircraft←Dynamics←Model/Vertical Velocity←w (ft//sec)'}
    {'f14/Aircraft←Dynamics←Model/Vertical Velocity←w (ft//sec)'}
    {'f14/Aircraft←Dynamics←Model/Pitch Rate←q (rad//sec)'}
    {'f14/Aircraft←Dynamics←Model/Pitch Rate←q (rad//sec)'}
    .
    .
    .
```

Search Using Regular Expressions

Find all blocks in the top level of the currently loaded systems with a block dialog parameter value that starts with 3.

```
load_system({'ex_slldemo_clutch','vdp'});
find_system('SearchDepth','1','regexp','on','BlockDialogParams','^3')

ans = 4x1 cell
    {'vdp/Scope' }
    {'vdp/Scope' }
    {'vdp/Square' }
    {'ex_slldemo_clutch/w' }
```

Regular Expression Search for Partial Match

When you search using regular expressions, you can specify a part of the character vector you want to match to return all objects that contain that character vector. Find all the inport and outport blocks in the ex_slldemo_clutch model.

```
load_system('ex_slldemo_clutch');
find_system('ex_slldemo_clutch','regexp','on','blocktype','port')

ans = 39x1 cell
    {'ex_slldemo_clutch/Friction...' }
```

```

{'ex_slldemo_clutch/Friction...' }
{'ex_slldemo_clutch/Friction...' }
{'ex_slldemo_clutch/Friction Mode Logic/Tin' }
{'ex_slldemo_clutch/Friction Mode Logic/Tfmaxs' }
{'ex_slldemo_clutch/Friction Mode Logic/Break Apart...' }
{'ex_slldemo_clutch/Friction Mode Logic/Break Apart...' }
{'ex_slldemo_clutch/Friction Mode Logic/Break Apart...' }
{'ex_slldemo_clutch/Friction Mode Logic/Lockup...' }
{'ex_slldemo_clutch/Friction Mode Logic/Lockup...' }
{'ex_slldemo_clutch/Friction Mode Logic/Lockup...' }
{'ex_slldemo_clutch/Friction Mode Logic/Lockup...' }

:

```

Update Library Links in a Subsystem

In this example, `myModel` contains a single subsystem, which is a library link. After the model was last opened, a Gain block was added to the corresponding subsystem in the library.

Open the model. Use `find_system` with `'FollowLinks'` set to `'off'`. The command does not follow the library links into the subsystem and returns only the subsystem at the top level.

```

open_system('myModel')
find_system(bdroot,'LookUnderMasks','on','FollowLinks','off')

```

ans =

```

' myModel '
' myModel/Subsystem '

```

Use `find_system` with `'FollowLinks'` set to `'on'`. `find_system` updates the library links and returns the block in the subsystem.

```

find_system(bdroot,'LookUnderMasks','on','FollowLinks','on')

```

```

Updating Link: myModel/Subsystem/Gain
Updating Link: myModel/Subsystem/Gain

```

```
ans =
    'myModel'
    'myModel/Subsystem'
    'myModel/Subsystem/Gain'
```

Return Values as Handles

Provide the system to `find_system` as a handle. Search for block dialog box parameters with a value of 0. If you make multiple calls to `get_param` for the same block, then using the block handle is more efficient than specifying the full block path as a character vector.

```
load_system('vdp');
sys = get_param('vdp','Handle');
find_system(sys,'BlockDialogParams','0')
```

```
ans = 8x1

    3.0087
    4.0087
    8.0087
   13.0087
   14.0087
   14.0087
   15.0087
   15.0087
```

Input Arguments

System — System to search

path name | cell array of path names | handle | vector of handles

System to search, specified as the full system path name, a cell array of system path names, a handle, or a vector of handles.

Example: 'MyModel/Subsystem1'

Example: {'vdp','ex_sl-demo-clutch'}

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1`, `Value1`, ..., `NameN`, `ValueN`.

When you use the `find_system` function, `Name`, `Value` pair arguments can include search constraints and parameter name and value pairs. You can specify search constraints in any order, but they must precede the parameter name and value pairs.

See “Block-Specific Parameters” on page 6-27 for the list of block parameters.

Example: 'SearchDepth','0','LookUnderMasks','none','BlockType','Goto' searches in loaded systems, excluding masked subsystems, for Goto blocks.

BlockDialogParams — Option to search block dialog box parameters for the specified value
 character vector | string scalar

Option to search block dialog box parameters for the specified value, specified as the comma-separated pair consisting of 'BlockDialogParams' and a character vector or string scalar. This pair must follow the other search constraint pairs.

CaseSensitive — Option to consider case when matching
 'on' (default) | 'off'

Option to consider case when matching, specified as the comma-separated pair consisting of 'CaseSensitive' and 'on' for case-sensitive searching or 'off'.

FindAll — Option to include lines, ports, and annotations within systems
 'off' (default) | 'on'

Option to include lines, ports, and annotations in systems in the search, specified as the comma-separated pair consisting of 'FindAll' and 'on' or 'off'. When this option is set to 'on', find_system returns a vector of handles regardless of how you specify the System argument.

FirstResultOnly — Option to return only the first result
 'off' (default) | 'on'

Option to return only the first result and then stop the search, specified as the comma-separated pair consisting of 'FirstResultOnly' and 'on' or 'off'.

LookInsideSubsystemReference — Option to look inside a referenced subsystem
 'on' (default) | 'off'

Option to look inside a referenced subsystem in a model and list child blocks specified as the comma-separated pair consisting of 'LookInsideSubsystemReference' and 'on' or 'off'.

FollowLinks — Option to follow links into library blocks
 'off' (default) | 'on'

Option to follow links into library blocks, specified as the comma-separated pair consisting of 'FollowLinks' and 'on' or 'off'. If you do not specify a system to search, find_system includes loaded libraries in the results, whether you set 'FollowLinks' to 'on' or 'off'. You can use 'FollowLinks' with 'LookUnderMasks' to update library links in subsystems. See "Update Library Links in a Subsystem" on page 2-253.

IncludeCommented — Option to include commented blocks
 'off' (default) | 'on'

Option to include commented blocks in the search, specified as the comma-separated pair consisting of 'IncludeCommented' and 'on' or 'off'.

LoadFullyIfNeeded — Option to load any partially loaded models
 'on' (default) | 'off'

Option to load any partially loaded models, specified as the comma-separated pair of 'LoadFullyIfNeeded' and 'on' to load models or 'off' to disable loading. Use this option, for example, to prevent load warnings.

LookUnderMasks — Options for searching under masks

'graphical' (default) | 'none' | 'functional' | 'all' | 'on' | 'off'

Options for searching under masks, specified as the comma-separated pair consisting of 'LookUnderMasks' and one of these options:

- 'graphical' — Search includes masked subsystems that have no workspaces and no dialogs.
- 'none' — Search skips masked subsystems.
- 'functional' — Search includes masked subsystems that do not have dialogs.
- 'all' — Search includes all masked subsystems.
- 'on' — Search includes all masked subsystems.
- 'off' — Search skips masked subsystem.

RegExp — Option to treat search expressions as regular expressions

'off' (default) | 'on'

Option to treat search expressions as regular expressions specified as the comma-separated pair consisting of 'RegExp' and 'on' to treat search expressions as regular expressions or 'off'. To learn more about MATLAB regular expressions, see “Regular Expressions”.

SearchDepth — Option to restrict the search depth

positive integer character vector or string scalar

Option to restrict the search depth to the specified level, specified as the comma-separated pair consisting of 'SearchDepth' and a positive integer character vector or string scalar. For example, specify '0' to search loaded systems only, '1' for blocks and subsystems of the top-level system, '2' for the top-level system and its children, etc. The default is to search all levels.

Variants — Options for searching variants

'ActiveVariants' (default) | 'AllVariants' | 'ActivePlusCodeVariants'

Options for searching variants, specified as the comma-separated pair consisting of 'Variants' and one of these options:

- 'ActiveVariants' — Search only the active variant choice in the Variant Subsystem.
- 'AllVariants' — Search all variant choices in the Variant Subsystem.
- 'ActivePlusCodeVariants' — Search all variant choices in the Variant Subsystem that are active in simulation and is part of the generated code.

Note This search constraint applies only to Variant Subsystem blocks that have the **Variant control mode** set to `expression` or `label`. Use the `find_system` function with the `MatchFilter` option to operate on all types of variant blocks.

MatchFilter — Function handle to match elements

function handle

Function handle to match elements in a search, such as blocks, system, lines, ports, and annotations. Use `MatchFilter` to determine whether elements should be included or skipped in a search.

The named function must be defined within a MATLAB program file. The function takes the handle of the element as input and returns two outputs.

```
function [match, prune] = func(element)
```

- The input `element` is the handle of the block being processed.
- The first output, `match`, is a logical value. If `false`, search skips the element.
- The second output, `prune`, is an optional logical value that only applies when `element` is a subsystem. The default value is `false`. If this value is set to `true`, the entire subsystem is omitted from the search.

Example: Use `MatchFilter` to find all non Inport and Outport blocks in a model using your own defined filter function, `nonInOutBlocks`:

```
function match = nonInOutBlocks(handle)
match = true;
if strcmp(get_param(handle, 'Type'), 'block')
    blockType = get_param(handle, 'BlockType');
    if strcmp(blockType, 'Inport') || ...
        strcmp(blockType, 'Outport')
        match = false;
    end
end
end

load_system('vdp');
blks = find_system('vdp', 'MatchFilter', @nonInOutBlocks)
```

Variants: Simulink provides `Simulink.match.activeVariants` and `Simulink.match.codeCompileVariants` match filter functions for variant blocks, which you can use to find active variants or code compile variant blocks. To do so, compile the model and apply the appropriate `MatchFilter` options:

- `Simulink.match.activeVariants` - Matches blocks that are active in simulation after model compilation
- `Simulink.match.codeCompileVariants` - Matches blocks that are part of generated code after model compilation

Example: Use `Simulink.match.activeVariants` option to find active variants in a model:

```
addpath(fullfile(matlabroot, 'examples', 'simulink_variants', 'main'));
model='sldemo_variant_subsystems';
load_system(model);
assignin('base', 'VSS_MODE', 2);
set_param(model, 'SimulationCommand', 'update');
activeBlks = find_system(model, 'MatchFilter', @Simulink.match.activeVariants);
```

Example: Use `Simulink.match.codeCompileVariants` option to find variant choices that are part of the generated C code:

```
addpath(fullfile(matlabroot, 'examples', 'simulink_variants', 'main'));
load_system('sldemo_variant_subsystems');
assignin('base', 'VSS_MODE', 2);
sldemo_variant_subsystems([], [], [], 'compileForRTW');
activeBlks= find_system('sldemo_variant_subsystems', 'MatchFilter', @Simulink.match.codeCompileV
sldemo_variant_subsystems([], [], [], 'term');
```

Output Arguments

Objects — Matching objects

cell array of path names | vector of handles

Matching objects found, returned as:

- A cell array of path names if you specified `System` as a path name or cell array of path names, or if you did not specify a system
- A vector of handles if you specified `System` as a handle or vector of handles

Compatibility Considerations

Variants will be removed

Warns starting in R2021a

The `Variants` option will be removed from `find_system` in a future release. Scripts that use the `Variants` option continue to work with a warning.

To find variant blocks in a model that are active during simulation or code generation, compile the model and use the `find_system` function with the `MatchFilter` option.

Default behavior of `find_system` with `Variants` and `MatchFilter` options in a model with variant blocks

Behavior changed in R2021a

- **Variants:** Using the `find_system` function *without* the `Variants` option includes only the active variant choice in the search by default.

Consider a model with a Variant Subsystem that has two variant choices, `Linear Controller` and `Non-Linear Controller`.

This command returns only the active `Add` blocks in the model.

```
add_blocks=find_system('sldemo_variant_subsystems/Controller',...
    'BlockType','Sum')
```

```
add_blocks =
```

```
    1×1 cell array
```

```
    {'sldemo_variant_subsystems/Controller/Nonlinear Controller/Add'}
```

- **MatchFilter:** Using the `find_system` function with the `MatchFilter` option applies the filters on the active and inactive variant choices by default.

Consider a model with a Variant Subsystem that has two variant choices, `Linear Controller` and `Non-Linear Controller`. The filter function `findAddBlocks` finds all the `Add` blocks in the model.

```
function match = findAddBlocks(handle)
match = strcmp(get_param(handle, 'Type'), 'block') &&...
    strcmp(get_param(handle, 'BlockType'), 'Sum');
end
```

This command returns both the active and inactive `Add` blocks in the model.

```
add_blocks=find_system('sldemo_variant_subsystems','MatchFilter',...
@findAddBlocks)
```

```
add_blocks =
```

```
2x1 cell array
```

```
 {'sldemo_variant_subsystems/Controller/Linear Controller/Add' }
 {'sldemo_variant_subsystems/Controller/Nonlinear Controller/Add'}
```

- find_system does not support the use of MatchFilter along with the Variants option.

This command produces an error:

```
find_system(bdroot,'MatchFilter',@Simulink.match.activeVariants,...
'Variants','ActiveVariants');
```

“Block-Specific Parameters” on page 6-27

Introduced before R2006a

fixdt

Package: Simulink

Create `Simulink.NumericType` object describing a fixed-point or floating-point data type

Syntax

```
a = fixdt(Signed,WordLength)
a = fixdt(Signed,WordLength,FractionLength)
a = fixdt(Signed,WordLength,TotalSlope,Bias)
a = fixdt(Signed,WordLength,SlopeAdjustmentFactor,FixedExponent,Bias)
a = fixdt(DataTypeNameString)
a = fixdt(___, 'DataTypeOverride', 'Off')
[a,IsScaledDouble] = fixdt(___)
```

Description

`a = fixdt(Signed,WordLength)` returns a `Simulink.NumericType` object that describes a fixed-point data type with the specified signedness and wordlength, and unspecified scaling.

`a = fixdt(Signed,WordLength,FractionLength)` returns a `Simulink.NumericType` object that describes a fixed-point data type with binary point scaling.

`a = fixdt(Signed,WordLength,TotalSlope,Bias)` returns a `Simulink.NumericType` object that describes a fixed-point data type with slope and bias scaling.

`a = fixdt(Signed,WordLength,SlopeAdjustmentFactor,FixedExponent,Bias)` returns a `Simulink.NumericType` object that describes a fixed-point data type with slope and bias scaling.

`a = fixdt(DataTypeNameString)` returns a `Simulink.NumericType` object that describes an integer, fixed-point, or floating-point data type specified by the name of a data type.

`a = fixdt(___, 'DataTypeOverride', 'Off')` returns a `Simulink.NumericType` object with its `DataTypeOverride` parameter set to `Off`. The default value for this property is `Inherit`. You can specify the `DataTypeOverride` parameter after any combination of other input parameters.

`[a,IsScaledDouble] = fixdt(___)` returns a `Simulink.NumericType` object that describes a fixed-point or floating-point data type and a flag that indicates whether the specified data type is of a scaled double data type.

Examples

Create a `Simulink.NumericType` Object with Unspecified Scaling

Create a signed `Simulink.NumericType` object with a word length of 16 bits and unspecified scaling.

```
a = fixdt(1,16)
```

```
a =
NumericType with properties:

    DataTypeMode: 'Fixed-point: unspecified scaling'
    Signedness: 'Signed'
    WordLength: 16
    IsAlias: 0
    DataScope: 'Auto'
    HeaderFile: ''
    Description: ''
```

Create a Simulink.NumericType Object with Binary Point Scaling

Create a `Simulink.NumericType` object that describes a signed fixed-point data types with a word length of 16 bits and fraction length of 2 bits.

```
a = fixdt(1,16,2)

a =
NumericType with properties:

    DataTypeMode: 'Fixed-point: binary point scaling'
    Signedness: 'Signed'
    WordLength: 16
    FractionLength: 2
    IsAlias: 0
    DataScope: 'Auto'
    HeaderFile: ''
    Description: ''
```

Create a Simulink.NumericType Object with Slope and Bias Scaling

The real-world value of a slope bias scaled number is represented by:

$$\text{real world value} = (\text{slope} \times \text{integer}) + \text{bias}$$

Create a `Simulink.NumericType` object that describes a signed fixed-point data type with a word length of 16 bits, slope of 2^{-2} , and bias of 4.

```
a = fixdt(1,16,2^-2,4)

a =
NumericType with properties:

    DataTypeMode: 'Fixed-point: slope and bias scaling'
    Signedness: 'Signed'
    WordLength: 16
    Slope: 0.2500
    Bias: 4
    IsAlias: 0
    DataScope: 'Auto'
```

```
HeaderFile: ''  
Description: ''
```

Alternatively, the slope can be represented by:

$$\text{slope} = \text{slopeadjustmentfactor} \times 2^{\text{fixedexponent}}$$

```
a = fixdt(1,16,1,-2,4)
```

```
a =
```

```
NumericType with properties:
```

```
DataTypeMode: 'Fixed-point: slope and bias scaling'  
Signedness: 'Signed'  
WordLength: 16  
Slope: 0.2500  
Bias: 4  
IsAlias: 0  
DataScope: 'Auto'  
HeaderFile: ''  
Description: ''
```

The `DataTypeMode` property of the `Simulink.NumericType` object, `a`, is slope and bias scaling.

Create a `Simulink.NumericType` Object Using a Data Type Name

Use a data type name to create a `Simulink.NumericType` object that describes an 8-bit, unsigned, fixed-point data type and return a flag that indicates whether the object is of a scaled double data type.

```
[a,IsScaledDouble] = fixdt('ufix8')
```

```
a =
```

```
NumericType with properties:
```

```
DataTypeMode: 'Fixed-point: binary point scaling'  
Signedness: 'Unsigned'  
WordLength: 8  
FractionLength: 0  
IsAlias: 0  
DataScope: 'Auto'  
HeaderFile: ''  
Description: ''
```

```
IsScaledDouble = logical  
0
```

The `IsScaledDouble` output returns `0`, which indicates that the data type of `a` is not a scaled double data type.

Create a Simulink.NumericType Object with DataTypeOverride Set to Off

Create a Simulink.NumericType object with its DataTypeOverride property set to Off.

```
a = fixdt(0,8,2,'DataTypeOverride','Off')

a =
  NumericType with properties:

    DataTypeMode: 'Fixed-point: binary point scaling'
    Signedness: 'Unsigned'
    WordLength: 8
    FractionLength: 2
    DataTypeOverride: 'Off'
    IsAlias: 0
    DataScope: 'Auto'
    HeaderFile: ''
    Description: ''
```

Input Arguments

Signed — Signedness

true or 1 | false or 0

Signedness of the Simulink.NumericType object, specified as a numeric or logical 1 (true) or 0 (false). A value of 1, or true, indicates a signed data type. A value of 0, or false, indicates an unsigned data type.

Data Types: logical

WordLength — Word length

positive scalar

Word length, in bits, of the Simulink.NumericType object, specified as a positive scalar.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

FractionLength — Fraction length

0 (default) | scalar

Fraction length, in bits, of the Simulink.NumericType object, specified as a scalar.

FractionLength can be greater than WordLength. For more information, see “Binary Point Interpretation” (Fixed-Point Designer).

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

TotalSlope — Slope of the scaling

1 (default) | scalar

Slope of the scaling, specified as a scalar.

The following equation represents the real-world value of a slope bias scaled number:

$$realworldvalue = (slope \times integer) + bias$$

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

Bias — Bias of the scaling

0 (default) | scalar

Bias of the scaling, specified as a scalar.

The following equation represents the real-world value of a slope bias scaled number:

$$realworldvalue = (slope \times integer) + bias$$

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

SlopeAdjustmentFactor — Slope adjustment factor of slope and bias scaled number

1 (default) | positive scalar

Slope adjustment factor of a slope bias scaled number, specified as a positive scalar.

The slope adjustment factor must be greater than or equal to 1 and less than 2. If you input a `SlopeAdjustmentFactor` outside this range, `fixdt` automatically applies a scaling normalization to the values of `SlopeAdjustmentFactor` and `FixedExponent` so that the revised slope adjustment factor is greater than or equal to 1 and less than 2, and maintains the value of the slope.

The following equation demonstrates the relationship between the slope, fixed exponent, and slope adjustment factor:

$$slope = slopeadjustmentfactor \times 2^{fixedexponent}$$

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

FixedExponent — Fixed exponent of slope and bias scaled number

0 (default) | scalar

Fixed exponent of a slope bias scaled number, specified as a scalar.

The following equation demonstrates the relationship between the slope, fixed exponent, and slope adjustment factor:

$$slope = slopeadjustmentfactor \times 2^{fixedexponent}$$

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

DataTypeNameString — Data type name

character vector

Data type name, specified as a character vector.

The data type name can be either the name of a built-in Simulink data type or the name of a fixed-point data type that conforms to the naming convention for fixed-point names established by the

Fixed-Point Designer product. For more information, see “Fixed-Point Data Type and Scaling Notation” (Fixed-Point Designer).

Data Types: char

Output Arguments

a — Data type

Simulink.NumericType object

Data type, returned as a Simulink.NumericType object.

IsScaledDouble — Scaled double flag

logical

Scaled double flag, returned as a logical that indicates whether the specified data type name is the name of a scaled double data type.

fixpt_evenspace_cleanup

Modify breakpoints of lookup table to have even spacing

Syntax

```
xdata_modified = fixpt_evenspace_cleanup(xdata,xdt,xscale)
```

Description

xdata_modified = `fixpt_evenspace_cleanup(xdata,xdt,xscale)` modifies breakpoints of a lookup table to have even spacing after quantization. By adjusting breakpoints to have even spacing after quantization, Simulink Coder generated code can exclude breakpoints from memory.

xdata is the breakpoint vector of a lookup table to make evenly spaced, such as `0:0.005:1`. *xdt* is the data type of the breakpoints, such as `sfixed(16)`. *xscale* is the scaling of the breakpoints, such as 2^{-12} . Using these three inputs, `fixpt_evenspace_cleanup` returns the modified breakpoints in *xdata_modified*.

This function works only with nontunable data and considers data to have even spacing relative to the scaling slope. For example, the breakpoint vector `[0 2 5]`, which has spacing value 2 and 3, appears to have uneven spacing. However, the difference between the maximum spacing 3 and the minimum spacing 2 equals 1. If the scaling slope is 1 or greater, a spacing variation of 1 represents a 1-bit change or less. In this case, the `fixpt_evenspace_cleanup` function considers a spacing variation of 1 bit or less to be even.

Modifications to breakpoints can change the numerical behavior of a lookup table. To check for changes, test the model using simulation, rapid prototyping, or other appropriate methods.

Examples

Modify breakpoints of a lookup table to have even spacing after quantization:

```
xdata = 0:0.005:1;  
xdt = sfixed(16);  
xscale = 2^-12;  
xdata_modified = fixpt_evenspace_cleanup(xdata,xdt,xscale)
```

Introduced before R2006a

fixpt_interp1

Implement 1-D lookup table

Syntax

```
y = fixpt_interp1(xdata,ydata,x,xdt,xscale,ydt,yscale,rndmeth)
```

Description

y = fixpt_interp1(*xdata*,*ydata*,*x*,*xdt*,*xscale*,*ydt*,*yscale*,*rndmeth*) implements a one-dimensional lookup table to find output *y* for input *x*. If *x* falls between two *xdata* values (breakpoints), *y* is the result of interpolating between the corresponding *ydata* values. If *x* is greater than the maximum value in *xdata*, *y* is the maximum *ydata* value. If *x* is less than the minimum value in *xdata*, *y* is the minimum *ydata* value.

If the input data type *xdt* or the output data type *ydt* is floating point, fixpt_interp1 performs the interpolation using floating-point calculations. Otherwise, fixpt_interp1 uses integer-only calculations. These calculations handle the input scaling *xscale* and the output scaling *yscale* and obey the rounding method *rndmeth*.

Input Arguments

xdata

Vector of breakpoints for the lookup table, such as `linspace(0,8,33)`.

ydata

Vector of table data that correspond to the breakpoints for the lookup table, such as `sin(xdata)`.

x

Vector of input values for the lookup table to process, such as `linspace(-1,9,201)`.

xdt

Data type of input *x*, such as `sfixed(8)`.

xscale

Scaling for input *x*, such as 2^{-3} .

ydt

Data type of output *y*, such as `sfixed(16)`.

yscale

Scaling for output *y*, such as 2^{-14} .

rndmeth

Rounding mode supported by fixed-point Simulink blocks:

'Ceiling'	Round to the nearest representable number in the direction of positive infinity.
'Floor' (default)	Round to the nearest representable number in the direction of negative infinity.
'Nearest'	Round to the nearest representable number.
'Toward Zero'	Round to the nearest representable number in the direction of zero.

Examples

Interpolate outputs for x using a 1-D lookup table that approximates the sine function:

```
xdata = linspace(0,8,33).';  
ydata = sin(xdata);  
% Define input x as a vector of 201 evenly  
% spaced points between -1 and 9 (includes  
% values both lower and higher than the range  
% of breakpoints in xdata)  
x = linspace(-1,9,201).';  
% Interpolate output values for x  
y = fixpt_interp1(xdata,ydata,x,sfix(8),2^-3,sfix(16),...  
  2^-14,'Floor')
```

fixpt_look1_func_approx

Optimize fixed-point approximation of nonlinear function by interpolating lookup table data points

Syntax

```
[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,nptsmax)
[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,[])
[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,[],nptsmax)
[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...
xmin,xmax,xdt,xscale,ydtydt,yscale,rndmeth,errmax,nptsmax,spacing)
```

Description

[*xdata*,*ydata*,*errworst*] = `fixpt_look1_func_approx`('func',...
xmin,*xmax*,*xdt*,*xscale*,*ydt*,*yscale*,*rndmeth*,*errmax*,*nptsmax*) returns the optimal breakpoints of a lookup table, an ideal function applied to the breakpoints, and the worst-case approximation error. The lookup table satisfies the maximum acceptable error and maximum number of points that you specify.

[*xdata*,*ydata*,*errworst*] = `fixpt_look1_func_approx`('func',...
xmin,*xmax*,*xdt*,*xscale*,*ydt*,*yscale*,*rndmeth*,*errmax*,[]) returns the optimal breakpoints of a lookup table, an ideal function applied to the breakpoints, and the worst-case approximation error. The lookup table satisfies the maximum acceptable error that you specify.

[*xdata*,*ydata*,*errworst*] = `fixpt_look1_func_approx`('func',...
xmin,*xmax*,*xdt*,*xscale*,*ydt*,*yscale*,*rndmeth*,[],*nptsmax*) returns the optimal breakpoints of a lookup table, an ideal function applied to the breakpoints, and the worst-case approximation error. The lookup table satisfies the maximum number of points that you specify.

[*xdata*,*ydata*,*errworst*] = `fixpt_look1_func_approx`('func',...
xmin,*xmax*,*xdt*,*xscale*,*ydt*,*yscale*,*rndmeth*,*errmax*,*nptsmax*,*spacing*) returns the optimal breakpoints of a lookup table, an ideal function applied to the breakpoints, and the worst-case approximation error. The lookup table satisfies the maximum acceptable error, maximum number of points, and breakpoint spacing that you specify.

In each case, `fixpt_look1_func_approx` interpolates between lookup table data points to optimize the fixed-point approximation. The inputs *xmin* and *xmax* specify the range over which to approximate the breakpoints. The inputs *xdt*, *xscale*, *ydt*, *yscale*, and *rndmeth* follow conventions used by fixed-point Simulink blocks.

The inputs *errmax*, *nptsmax*, and *spacing* are optional. Of these inputs, you must specify at least *errmax* or *nptsmax*. If you omit one of those two inputs, you must use brackets, [], in place of the omitted input. `fixpt_look1_func_approx` ignores that requirement for the lookup table.

If you do not specify spacing, and more than one spacing satisfies *errmax* and *nptsmax*, `fixpt_look1_func_approx` chooses in this order: power-of-2 spacing, even spacing, uneven

spacing. This behavior applies when you specify both *errmax* and *nptsmax*, but not when you specify just one of the two.

Input Arguments

func

Function of x for which to approximate breakpoints. Enclose this expression in single quotes, for example, `'sin(2*pi*x)'`.

xmin

Minimum value of x .

xmax

Maximum value of x .

xdt

Data type of x .

xscale

Scaling for the x values.

ydt

Data type of y .

yscale

Scaling for the y values.

rndmeth

Rounding mode supported by fixed-point Simulink blocks:

'Ceiling'	Round to the nearest representable number in the direction of positive infinity.
'Floor' (default)	Round to the nearest representable number in the direction of negative infinity.
'Nearest'	Round to the nearest representable number.
'Toward Zero'	Round to the nearest representable number in the direction of zero.

errmax

Maximum acceptable error between the ideal function and the approximation given by the lookup table.

nptsmax

Maximum number of points for the lookup table.

spacing

Spacing of breakpoints for the lookup table:

'even'	Even spacing
'pow2'	Even, power-of-2 spacing
'unrestricted' (default)	Uneven spacing

If you specify...	The breakpoints of the lookup table...
<i>errmax</i> and <i>nptsmax</i>	Meet both criteria, if possible. The <i>errmax</i> requirement has higher priority than <i>nptsmax</i> . If the breakpoints cannot meet both criteria with the specified spacing, <i>nptsmax</i> does not apply.
<i>errmax</i> only	Meet the error criteria, and <code>fixpt_look1_func_approx</code> returns the fewest number of points.
<i>nptsmax</i> only	Meet the points criteria, and <code>fixpt_look1_func_approx</code> returns the smallest worst-case error.

Output Arguments

xdata

Vector of breakpoints for the lookup table.

ydata

Vector of values from applying the ideal function to the breakpoints.

errworst

Worst-case error, which is the maximum absolute error between the ideal function and the approximation given by the lookup table.

Examples

Approximate a fixed-point sine function using a lookup table:

```
func = 'sin(2*pi*x)';
% Define the range over which to optimize breakpoints
xmin = 0;
xmax = 0.25;
% Define the data type and scaling for the inputs
xdt = ufix(16);
xscale = 2^-16;
% Define the data type and scaling for the outputs
ydt = sfix(16);
yscale = 2^-14;
% Specify the rounding method
rndmeth = 'Floor';
```

```
% Define the maximum acceptable error
errmax = 2^-10;
% Choose even, power-of-2 spacing for breakpoints
spacing = 'pow2';
% Create the lookup table
[xdata,ydata,errworst] = fixpt_look1_func_approx(func,...
    xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,[],spacing);
```

Topics

“Producing Lookup Table Data” (Fixed-Point Designer)

“Use Lookup Table Approximation Functions” (Fixed-Point Designer)

Introduced before R2006a

fixpt_look1_func_plot

Plot fixed-point approximation function for lookup table

Syntax

```
fixpt_look1_func_plot(xdata,ydata,'func',...
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth)
errworst = fixpt_look1_func_plot(xdata,ydata,'func',...
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth)
```

Description

`fixpt_look1_func_plot(xdata,ydata,'func',...
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth)` plots a lookup table approximation function and the error from the ideal function.

`errworst = fixpt_look1_func_plot(xdata,ydata,'func',...
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth)` plots a lookup table approximation function and the error from the ideal function. The output `errworst` is the maximum absolute error.

You can use `fixpt_look1_func_approx` to generate `xdata` and `ydata`, the breakpoints and table data for the lookup table, respectively. `fixpt_look1_func_approx` applies the ideal function to the breakpoints in `xdata` to produce `ydata`. While this method is the easiest way to generate `ydata`, you can choose other values for `ydata` as input for `fixpt_look1_func_plot`. Choosing different values for `ydata` can, in some cases, produce a lookup table with a smaller maximum absolute error.

Input Arguments

xdata

Vector of breakpoints for the lookup table.

ydata

Vector of values from applying the ideal function to the breakpoints.

func

Function of `x` for which to approximate breakpoints. Enclose this expression in single quotes, for example, `'sin(2*pi*x)'`.

xmin

Minimum value of `x`.

xmax

Maximum value of `x`.

xdt

Data type of x.

xscale

Scaling for the x values.

ydt

Data type of y.

yscale

Scaling for the y values.

rndmeth

Rounding mode supported by fixed-point Simulink blocks:

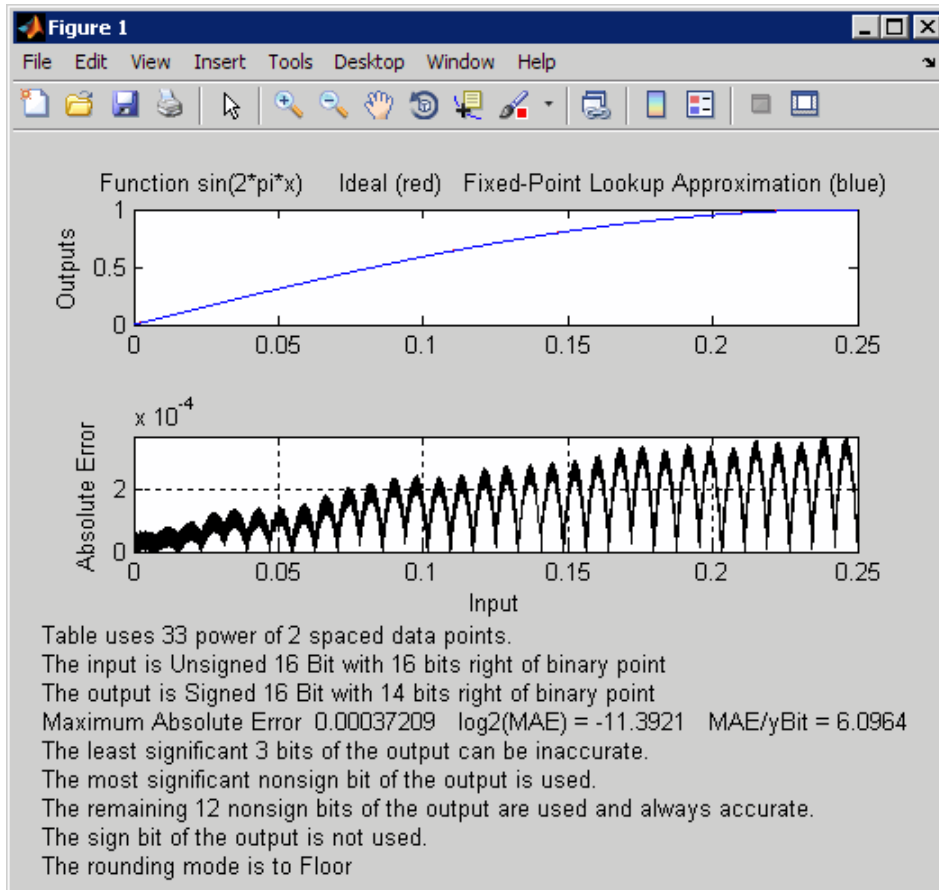

'Ceiling'	Round to the nearest representable number in the direction of positive infinity.
'Floor' (default)	Round to the nearest representable number in the direction of negative infinity.
'Nearest'	Round to the nearest representable number.
'Toward Zero'	Round to the nearest representable number in the direction of zero.

Examples

Plot a fixed-point approximation of the sine function using data points generated by `fixpt_look1_func_approx`:

```
func = 'sin(2*pi*x)';
% Define the range over which to optimize breakpoints
xmin = 0;
xmax = 0.25;
% Define the data type and scaling for the inputs
xdt = ufix(16);
xscale = 2^-16;
% Define the data type and scaling for the outputs
ydt = sfix(16);
yscale = 2^-14;
% Specify the rounding method
rndmeth = 'Floor';
% Define the maximum acceptable error
errmax = 2^-10;
% Choose even, power-of-2 spacing for breakpoints
spacing = 'pow2';
% Generate data points for the lookup table
[xdata,ydata,errworst]=fixpt_look1_func_approx(func,...
    xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,[],spacing);
% Plot the sine function (ideal and fixed-point) & errors
fixpt_look1_func_plot(xdata,ydata,func,xmin,xmax,...
    xdt,xscale,ydt,yscale,rndmeth);
```

`fixpt_look1_func_plot` plots the fixed-point sine function, using generated data points, and plots the error between the ideal function and the fixed-point function. The maximum absolute error and the number of points required appear on the plot. The error drops to zero at a breakpoint, but increases between breakpoints due to curvature differences between the ideal function and the line drawn between breakpoints.

The lookup table requires 33 points to achieve a maximum absolute error of $2^{-11.3922}$.

Topics

“Producing Lookup Table Data” (Fixed-Point Designer)

“Use Lookup Table Approximation Functions” (Fixed-Point Designer)

Introduced before R2006a

fixpt_set_all

Set property for each fixed-point block in subsystem

Syntax

```
fixpt_set_all(SystemName, fixptPropertyName, fixptPropertyValue)
```

Description

`fixpt_set_all(SystemName, fixptPropertyName, fixptPropertyValue)` sets the property `fixptPropertyName` of every applicable block in the model or subsystem `SystemName` to the value `fixptPropertyValue`

Examples

Set each fixed-point block in a model `Filter_1` to round towards the floor and saturate upon overflow:

```
% Round towards the floor  
fixpt_set_all('Filter_1', 'RndMeth', 'Floor')
```

```
% Saturate upon overflow  
fixpt_set_all('Filter_1', 'DoSatur', 'on')
```

Introduced before R2006a

fixptbestexp

Exponent that gives best precision for fixed-point representation of value

Syntax

```
out = fixptbestexp(RealWorldValue, TotalBits, IsSigned)
out = fixptbestexp(RealWorldValue, FixPtDataType)
```

Description

`out = fixptbestexp(RealWorldValue, TotalBits, IsSigned)` returns the exponent that gives the best precision for the fixed-point representation of *RealWorldValue*. *TotalBits* specifies the number of bits for the fixed-point number. *IsSigned* specifies whether the fixed-point number is signed: 1 indicates the number is signed and 0 indicates the number is not signed.

`out = fixptbestexp(RealWorldValue, FixPtDataType)` returns the exponent that gives the best precision based on the data type *FixPtDataType*.

Examples

Get the exponent that gives the best precision for the real-world value 4/3 using a signed, 16-bit number:

```
out = fixptbestexp(4/3,16,1)
```

```
out =
    -14
```

Alternatively, specify the fixed-point data type:

```
out = fixptbestexp(4/3,sfix(16))
```

```
out =
    -14
```

This shows that the maximum precision representation of 4/3 is obtained by placing 14 bits to the right of the binary point:

```
01.01010101010101
```

You can specify the precision of this representation in fixed-point blocks by setting the scaling to 2^{-14} or `2^fixptbestexp(4/3,16,1)`.

See Also

fixptbestprec

Introduced before R2006a

fixptbestprec

Determine maximum precision available for fixed-point representation of value

Syntax

```
out = fixptbestprec(RealWorldValue,TotalBits,IsSigned)
out = fixptbestprec(RealWorldValue,FixPtDataType)
```

Description

`out = fixptbestprec(RealWorldValue,TotalBits,IsSigned)` determines the maximum precision for the fixed-point representation of the real-world value specified by `RealWorldValue`. You specify the number of bits for the fixed-point number with `TotalBits`, and you specify whether the fixed-point number is signed with `IsSigned`. If `IsSigned` is 1, the number is signed. If `IsSigned` is 0, the number is not signed. The maximum precision is returned to `out`.

`out = fixptbestprec(RealWorldValue,FixPtDataType)` determines the maximum precision based on the data type specified by `FixPtDataType`.

Examples

Example 1

The following command returns the maximum precision available for the real-world value 4/3 using a signed, 8-bit number:

```
out = fixptbestprec(4/3,8,1)

out =
    0.015625
```

Alternatively, you can specify the fixed-point data type:

```
out = fixptbestprec(4/3,sfix(8))

out =
    0.015625
```

This value means that the maximum precision available for 4/3 is obtained by placing six bits to the right of the binary point since 2^{-6} equals 0.015625:

```
01.010101
```

Example 2

You can use the maximum precision as the scaling in fixed-point blocks. This enables you to use `fixptbestprec` to perform a type of autoscaling if you would like to designate a known range of your simulation. For example, if your known range is -13 to 22, and you are using a safety margin of 30%:

```
knownMax = 22;
knownMin = -13;
```

```
localSafetyMargin = 30;  
slope = max( fixptbestprec( (1+localSafetyMargin/100)* ...  
    [knownMax,knownMin], sfix(16) ) );
```

The variable `slope` can then be used in the expression that you specify for the **Output data type** parameter in a block mask. Be sure to select the **Lock output data type setting against changes by the fixed-point tools** check box in the same block to prevent the Fixed-Point Tool from overriding the scaling. If you know the range, you can use this technique in place of relying on a model simulation to provide the range to the autoscaling tool, as described in `autofixexp`.

`fixptbestexp`

Introduced before R2006a

float

Create `Simulink.NumericType` object describing floating-point data type

Syntax

```
a = float('half')
a = float('single')
a = float('double')
```

Description

`a = float('half')` returns a `Simulink.NumericType` object that describes the data type of an IEEE half (16 total bits, 5 exponent bits).

`a = float('single')` returns a `Simulink.NumericType` object that describes the data type of an IEEE single (32 total bits, 8 exponent bits).

`a = float('double')` returns a `Simulink.NumericType` object that describes the data type of an IEEE double (64 total bits, 11 exponent bits).

Note `float` is a legacy function. In new code, use `fixdt` instead. In existing code, replace `float('half')` with `fixdt('half')`, `float('single')` with `fixdt('single')`, and `float('double')` with `fixdt('double')`.

Examples

Define an IEEE single data type.

```
>> a = float('single')
```

```
a =
```

```
    NumericType with properties:
```

```
    DataTypeMode: 'Single'
        IsAlias: 0
        DataScope: 'Auto'
        HeaderFile: ''
        Description: ''
```

Introduced before R2006a

fmudialog.createBusType

Create all FMU bus objects required for structured input or output ports in workspace

Syntax

```
fmudialog.createBusType(currentBlock)
```

Description

`fmudialog.createBusType(currentBlock)` creates all the FMU bus objects required for structured input or output ports in the workspace.

Examples

Create FMU Bus Object in Current Workspace

Create FMU bus object in current workspace.

```
fmudialog.createBusType(gcf)
```

Input Arguments

currentBlock — Current block

current block

Current block for which to create all required FMU bus objects.

Data Types: char | string

See Also

FMU

Topics

“Import FMUs”

“Implement an FMU Block”

Introduced in R2020b

frameedit

Edit print frames for Simulink and Stateflow block diagrams

Syntax

```
frameedit  
frameedit filename
```

Description

`frameedit` starts the PrintFrame Editor, a graphical user interface you use to create borders for Simulink and Stateflow block diagrams. With no argument, `frameedit` opens the **PrintFrame Editor** window with a new file.

`frameedit filename` opens the **PrintFrame Editor** window with the specified filename, where filename is a figure file (`.fig`) previously created and saved using `frameedit`.

Tips

This illustrates the main features of the PrintFrame Editor.

Closing the PrintFrame Editor

To close the **PrintFrame Editor** window, click the close box in the upper right corner, or select **Close** from the **File** menu.

Printing Simulink Block Diagrams with Print Frames

Select **Print** from the Simulink **File** menu. Check the **Frame** box and supply the filename for the print frame you want to use. Click **OK** in the **Print** dialog box.

Getting Help for the PrintFrame Editor

For further instructions on using the PrintFrame Editor, select **PrintFrame Editor Help** from the **Help** menu in the PrintFrame Editor.

Introduced in R2008b

gcb

Get path name of current block

Syntax

```
b1 = gcb  
b1 = gcb(sys)
```

Description

`b1 = gcb` returns the full block path name of the current block in the current system. The current block is:

- The most recently clicked block
- The S-Function block currently executing its corresponding MATLAB function
- The block whose callback routine is being executed
- The block whose mask is being evaluated as part of the `MaskInitialization` parameter evaluation
- The last block loaded after opening a model

`b1 = gcb(sys)` returns the full block path name of the current block in the specified system. Load the system first.

Examples

Get Path Name of Most Recently Selected Block

Open a model.

```
vdp
```

In the model, select a block. For example, select the Gain block. Then, enter `gcb` at the command prompt.

```
gcb
```

```
ans =
```

```
vdp/Mu
```

Get Parameters of Current Block

Open a model.

```
vdp
```

Select the Gain block.

Use the value of `gcb` with `get_param` to get the value of the Gain parameter.

```
x = get_param(gcb, 'Gain')
```

```
x =
```

```
1
```

Get Current Block in Specified System

Load the model.

```
load_system('sldemo_fuelsys');
```

Get the current block in the `fuel_rate_control` subsystem.

```
bl = gcb('sldemo_fuelsys/fuel_rate_control')
```

```
bl =
```

```
sldemo_fuelsys/fuel_rate_control/validate_sample_time
```

Input Arguments

sys — System that contains the block

character vector

System that contains the block, specified as a character vector.

Example: `'vdp'` `'sldemo_fuelsys/fuel_rate_control'`

See Also

`gcbh` | `gcbp` | `gcs` | `get_param`

Topics

“Mask Callback Code”

Introduced before R2006a

gcbh

Get handle of current block

Syntax

```
handle = gcbh
```

Description

handle = gcbh returns the handle of the current block in the current system.

Examples

Get Handle of Current Block

Get the handle of the most recently selected block.

```
handle = gcbh
```

```
handle =
```

```
    281.0001
```

See Also

gcb | gcbp | gcs | getSimulinkBlockHandle

Introduced before R2006a

gcbp

Get `Simulink.BlockPath` object for current block

Syntax

```
path = gcbp
```

Description

`path = gcbp` returns the `Simulink.BlockPath` object of the current block in the current system. The current block is:

- The most recently clicked block
- The last block loaded after opening a model

The returned `Simulink.BlockPath` object is context sensitive to model hierarchy.

Examples

Create `Simulink.BlockPath` Object for Selected Block

Open `sldemo_mdref_basic`.

```
sldemo_mdref_basic
```

Click a block in the model hierarchy. For example, click the block labeled `ScopeA` in the `CounterA` instance of `sldemo_mdref_counter`. Then, use `gcbp` in the Command Window.

```
path = gcbp
```

```
path =
```

```
Simulink.BlockPath  
Package: Simulink
```

```
Block Path:  
  sldemo_mdref_basic/CounterA  
  sldemo_mdref_counter/ScopeA
```

Use the `getBlock` method to access block path strings from this object.

```
Methods
```

Objects

`Simulink.BlockPath`

Functions

`gcb` | `gcbh` | `gcs` | `get_param` | `open` (`BlockPath`)

Introduced in R2019a

gcs

Get path name of current system

Syntax

gcs

Description

gcs returns the path name of the current system. The current system is one of these:

- During editing, the system or subsystem most recently clicked or that contains the block most recently clicked
- During simulation of a system that contains an S-Function block, the system or subsystem containing the S-Function block currently being evaluated
- During callbacks, the system containing any block whose callback routine is being executed
- During evaluation of `MaskInitialization`, the system containing the block whose mask is being evaluated
- The system most recently loaded into memory with `load_system`; only the first use of `load_system` makes the model the current system

The current system is the current model or a subsystem of the current model. Use `bdroot` to get the current model.

If you close the model that contains the current system, another open or loaded system becomes the current one. Use `gcs` to find out the new current system.

To explicitly set the current system, you can either:

- Use `set_param` with the `'CurrentSystem'` parameter on the root Simulink model, for example:

```
set_param(0, 'CurrentSystem', 'mymodel')
```
- Open the model by using `open_system` or the model name at the MATLAB command prompt.

Examples

Get Current System That Contains a Block

Return the path of the system that contains the most recently selected block.

Open the model `sldemo_fuelsys`. Open the subsystem `To Controller`.

```
sldemo_fuelsys
open_system('sldemo_fuelsys/To Controller')
```

Click the Rate Transition block. Get the current system.

```
gcs
```

```
ans =  
    'sldemo_fuelsys/To Controller'
```

Get Current System After Loading a Model

Open the model f14 and get the current system.

```
f14  
gcs  
ans =  
    'f14'
```

Load the model vdp using `load_system`. Then get the current system.

```
load_system('vdp');  
gcs  
ans =  
    'vdp'
```

To remove vdp from memory, close it. In this example, the current system becomes the open model, f14.

```
close_system('vdp');  
gcs  
ans =  
    'f14'
```

`bdroot` | `gcb` | `gcbp`

Introduced before R2006a

get_param

Get parameter names and values

Syntax

```
ParamValue = get_param(Object,Parameter)
```

Description

`ParamValue = get_param(Object,Parameter)` returns the name or value of the specified parameter for the specified model or block object. Open or load the Simulink model first.

Tip If you make multiple calls to `get_param` for the same block, then specifying the block using a numeric handle is more efficient than using the full block path. Use `getSimulinkBlockHandle` to get a block handle.

For parameter names, see:

- “Block-Specific Parameters” on page 6-27
- “Common Block Properties” on page 6-12

Examples

Get a Block Parameter Value and a Model Parameter Value

Load the vdp model.

```
load_system('vdp');
```

Get the value for the Expression block parameter.

```
BlockParameterValue = get_param('vdp/Mu','Multiplication')
```

```
BlockParameterValue =  
    'Element-wise(K.*u)'
```

Get the value for the SolverType model parameter.

```
SolverType = get_param('vdp','SolverType')
```

```
SolverType =  
    Variable-step
```

Get Root Parameter Names and Values

Get a list of global parameter names by finding the difference between the Simulink root parameter names and the model parameter names.

```
RootParameterNames = fieldnames(get_param(0, 'ObjectParameters'));
load_system('vdp')
ModelParameterNames = fieldnames(get_param('vdp', 'ObjectParameters'));
GlobalParameterNames = setdiff(RootParameterNames, ModelParameterNames)
```

```
GlobalParameterNames =
    'AutoSaveOptions'
    'CacheFolder'
    'CallbackTracing'
    'CharacterEncoding'
    .
    .
    'CurrentSystem'
```

Get the value of a global parameter.

```
GlobalParameterValue = get_param(0, 'CurrentSystem')

GlobalParameterValue =
    vdp
```

Get Model Parameter Names and Values

Get a list of model parameters for the vdp model .

```
load_system('vdp')
ModelParameterNames = get_param('vdp', 'ObjectParameters')

ModelParameterNames =
    Name: [1x1 struct]
    Tag: [1x1 struct]
    Description: [1x1 struct]
    Type: [1x1 struct]
    Parent: [1x1 struct]
    Handle: [1x1 struct]
    .
    .
    Version: [1x1 struct]
```

Get the current value of the ModelVersion model parameter for the vdp model.

```
ModelParameterValue = get_param('vdp', 'ModelVersion')

ModelParameterValue =
    1.6
```

Get All Blocks and a Parameter Value

Get a list of block paths and names for the vdp model.

```
load_system('vdp')
BlockPaths = find_system('vdp', 'Type', 'Block')
```

```
BlockPaths =
    14x1 cell array

    {'vdp/Constant'          }
    {'vdp/More Info'        }
    {'vdp/More Info/Model Info'}
    {'vdp/Mu'                }
    {'vdp/Mux'               }
    {'vdp/Product'          }
    {'vdp/Scope'            }
    {'vdp/Square'           }
    {'vdp/Sum'               }
    {'vdp/Sum1'              }
    {'vdp/x1'                }
    {'vdp/x2'                }
    {'vdp/Out1'              }
    {'vdp/Out2'              }
```

Get a list of block dialog parameters for the Mu block.

```
BlockDialogParameters = get_param('vdp/Mu', 'DialogParameters')
```

```
BlockDialogParameters =
    struct with fields:

        Gain: [1x1 struct]
        Multiplication: [1x1 struct]
        ParamMin: [1x1 struct]
        ParamMax: [1x1 struct]
        ParamDataTypeStr: [1x1 struct]
        OutMin: [1x1 struct]
        OutMax: [1x1 struct]
        OutDataTypeStr: [1x1 struct]
        LockScale: [1x1 struct]
        RndMeth: [1x1 struct]
        SaturateOnIntegerOverflow: [1x1 struct]
        SampleTime: [1x1 struct]
```

Get the value for the Multiplication block parameter.

```
BlockParameterValue = get_param('vdp/Mu', 'Multiplication')
```

```
BlockParameterValue =
    'Element-wise(K.*u)'
```

Get a Block Parameter Value Using a Block Handle

If you make multiple calls to `get_param` for the same block, then using the block handle is more efficient than specifying the full block path as a character vector, e.g., `'vdp/Mu'`.

You can use the block handle in subsequent calls to `get_param` or `set_param`. If you examine the handle, you can see that it contains a double. Do not try to use the number of a handle alone (e.g., `5.007`) because you usually need to specify many more digits than MATLAB displays. Instead, assign the handle to a variable and use that variable name to specify a block.

Use `getSimulinkBlockHandle` to load the vdp model if necessary (by specifying `true`), and get a handle to the Mu block.

```
mublockhandle = getSimulinkBlockHandle('vdp/Mu',true);
```

Use the block handle with `get_param` and get the value for the `Expr` block parameter.

```
BlockParameterValue = get_param(mublockhandle,'Multiplication')
```

```
BlockParameterValue =  
    'Element-wise(K.*u)'
```

Display Block Types for all Blocks in a Model

Get a list of block paths and names for the vdp model.

```
load_system('vdp')  
BlockPaths = find_system('vdp','Type','Block')
```

```
BlockPaths =
```

```
14x1 cell array
```

```
{'vdp/Constant'      }  
{'vdp/More Info'    }  
{'vdp/More Info/Model Info'}  
{'vdp/Mu'           }  
{'vdp/Mux'          }  
{'vdp/Product'      }  
{'vdp/Scope'        }  
{'vdp/Square'       }  
{'vdp/Sum'          }  
{'vdp/Sum1'         }  
{'vdp/x1'           }  
{'vdp/x2'           }  
{'vdp/Out1'         }  
{'vdp/Out2'         }
```

Get the value for the `BlockType` parameter for each of the blocks in the vdp model.

```
BlockTypes = get_param(BlockPaths,'BlockType')
```

```
BlockTypes =
```

```
14x1 cell array
```

```
{'Constant'  }  
{'SubSystem' }  
{'SubSystem' }  
{'Gain'      }  
{'Mux'       }  
{'Product'   }  
{'Scope'     }  
{'Math'      }  
{'Sum'       }  
{'Sum'       }  
{'Integrator'}
```

```
{'Integrator'}
{'Outport'   }
{'Outport'   }
```

Input Arguments

Object — Name or handle of a model or block, or root

handle | character vector | cell array of character vectors | string array | 0

Handle or name of a model or block, or root, specified as a numeric handle or a character vector, a cell array of character vectors for multiple blocks, or 0 for root. A numeric handle must be a scalar. You can also get parameters of lines and ports, but you must use numeric handles to specify them.

Tip If you make multiple calls to `get_param` for the same block, then specifying a block using a numeric handle is more efficient than using the full block path. Use `getSimulinkBlockHandle` to get a block handle. Do not try to use the number of a handle alone (e.g., `5.007`) because you usually need to specify many more digits than MATLAB displays. Assign the handle to a variable and use that variable name to specify a block.

Specify 0 to get root parameter names, including global parameters and model parameters for the current Simulink session.

- Global parameters include Editor preferences and Simulink Coder parameters.
- Model parameters include configuration parameters, Simulink Coder parameters, and Simulink Code Inspector parameters.

Example: `'vdp/Mu'`

Parameter — Parameter of model or block, or root

character vector | string scalar

Parameter of model or block, or root, specified as a character vector or 0 for root. The table shows special cases.

Specified Parameter	Result
'ObjectParameters'	Returns a structure array with the parameter names of the specified object (model, block, or root) as separate fields in the structure.
'DialogParameters'	Returns a structure array with the block dialog box parameter names as separate fields in the structure. If the block has a mask, the function instead returns the mask parameters.

Specified Parameter	Result
Parameter name, e.g., 'BlockType'. Specify any model or block parameter, or block dialog box parameter.	Returns the value of the specified model or block parameter. If you specified multiple blocks as a cell array, returns a cell array with the values of the specified parameter common to all blocks. All of the specified blocks in the cell array must contain the parameter, otherwise the function returns an error.

Example: 'ObjectParameters'

Data Types: char

Output Arguments

ParamValue — The name or value of the specified parameter for the specified model or block, or root

any data type, depending on the parameter

The name or value of the specified parameter for the specified model or block, or root. If you specify multiple objects, the output is a cell array of objects. The table shows special cases.

Specified Parameter	ParamValue Returned
'ObjectParameters'	A structure array with the parameter names of the specified object (model, block, or root) as separate fields in the structure.
'DialogParameters'	A structure array with the block dialog box parameter names as separate fields in the structure. If the block has a mask, the function instead returns the mask parameters.
Parameter name, e.g., 'BlockType'	The value of the specified model or block parameter. If multiple blocks are specified as a cell array, returns a cell array with the values of the specified parameter common to all blocks.

If you get the root parameters by specifying `get_param(0, 'ObjectParameters')`, then the output `ParamValue` is a structure array with the root parameter names as separate fields in the structure. Each parameter field is a structure containing these fields:

- **Type** — Parameter type values are: 'boolean', 'string', 'int', 'real', 'point', 'rectangle', 'matrix', 'enum', 'ports', or 'list'
- **Enum** — Cell array of enumeration character vector values that applies only to 'enum' parameter types
- **Attributes** — Cell array of character vectors defining the attributes of the parameter. Values are: 'read-write', 'read-only', 'read-only-if-compiled', 'write-only', 'dont-eval', 'always-save', 'never-save', 'nondirty', or 'simulation'

Introduced before R2006a

getActiveConfigSet

Get active configuration set or configuration reference of model

Syntax

```
getActiveConfigSet(model)
```

Description

`getActiveConfigSet(model)` returns the active configuration object of the model as a `ConfigSet` object or a `Simulink.ConfigSetRef` object.

Examples

Get Active Configuration Set

Get the active configuration set for a model that is open.

Open the model `vdp` and get the active configuration set.

```
vdp  
vdpConfig = getActiveConfigSet('vdp');
```

Input Arguments

model — Name of model

character vector | string scalar

Name of model, specified as a character vector or string scalar. The model must be open.

Example: `'vdp'`

See Also

Introduced before R2006a

getCallbackAnnotation

Get annotation executing callback

Syntax

```
ann = getCallbackAnnotation
```

Description

`ann = getCallbackAnnotation` gets the annotation from which a callback was invoked. Invoke a callback from an annotation click function. After you get the annotation, you can, for example, get text or parameters from the annotation to use someplace else in your model.

For information on click functions, see “Make Annotations Interactive”.

Examples

Click Annotation to Change Parameter Value

Invoke a callback by way of an annotation click function. This example shows how to change a parameter value on a block to the value shown on an annotation.

Open `vdp`. Add and position two annotations. Each annotation displays a different value.

```
open_system('vdp');
an1 = Simulink.Annotation('vdp/1');
an1.position = [100,300];
an2 = Simulink.Annotation('vdp/3');
an2.position = [150,300];
```

Assign a click function to each annotation. The click function uses `getAnnotationCallback` to get the annotation instance. Get the text from each annotation and use it to set the parameter on the Gain block (Mu).

```
an1.ClickFcn = 'ann = getCallbackAnnotation; v = ann.Text; set_param(''vdp/Mu'', ''Gain'',v)';
an2.ClickFcn = 'ann = getCallbackAnnotation; v = ann.Text; set_param(''vdp/Mu'', ''Gain'',v)';
```

Click each annotation. When you click, the gain value on the Mu block changes to the number shown on the annotation.

Output Arguments

ann — Annotation

`Simulink.Annotation` instance

Annotation, returned as a `Simulink.Annotation` instance.

See Also

Simulink.Annotation

Topics

“Describe Models Using Notes and Annotations”

Introduced before R2006a

getConfigSet

Get configuration set or configuration reference from model

Syntax

```
myConfigObj = getConfigSet(model, configObjName)
```

Description

`myConfigObj = getConfigSet(model, configObjName)` returns the configuration set or configuration reference that is attached to `model` and is named `configObjName`.

Examples

Get a Configuration Set

Get a configuration set for a model that is open.

Open the model `vdp` and get the configuration set `Configuration`.

```
vdp  
vdpConfig = getConfigSet('vdp','Configuration');
```

Input Arguments

model — Name of model

character vector | string scalar

Name of model, specified as a character vector or string scalar. The model must be open.

Example: `'vdp'`

configObjName — Configuration object

character vector | string scalar

Name of the configuration object, specified as a character vector or string scalar.

Example: `'Configuration'`

Output Arguments

myConfigObj — Configuration object

`ConfigSet` object | `ConfigSetRef` object

The configuration object, returned as a `ConfigSet` object or a `Simulink.ConfigSetRef` object. If no such object exists, the function returns an empty object.

See Also

`attachConfigSet` | `attachConfigSetCopy` | `detachConfigSet` | `setActiveConfigSet`

Topics

“Manage Configuration Sets for a Model”

Introduced before R2006a

getConfigSets

Get names of all of model's configuration sets or configuration references

Syntax

```
myConfigObjNames = getConfigSets(model)
```

Description

`myConfigObjNames = getConfigSets(model)` returns the names of the configuration objects that are attached to the model. You can use the returned name of a configuration set from `myConfigObjNames` to activate it for the model.

Examples

Get Names of Configurations for a Model

Get the names of the configuration sets and configuration references that are attached to a model.

Open the model `sldemo_fuelsys_dd_controller` and get the configuration object names.

```
sldemo_fuelsys_dd_controller
configObjNames = getConfigSets('sldemo_fuelsys_dd_controller')

configObjNames =

    1×1 cell array

    {'ModelReferencing'}
```

The model has one configuration set with the name `ModelReferencing`.

Input Arguments

model — Name of model

character vector | string scalar

Name of model, specified as a character vector or string scalar. The model must be open.

Example: `'vdp'`

Output Arguments

myConfigObjNames — Names of configuration objects

cell array of character vectors

Names of the configuration objects that are attached to the model, returned as a cell array of character vectors. The configuration objects include configuration sets and configuration references.

See Also

`ConfigSet` | `Simulink.ConfigSetRef` | `detachConfigSet` | `setActiveConfigSet`

Topics

“Manage Configuration Sets for a Model”

Introduced before R2006a

getfullname

Get path that identifies block or line

Syntax

```
path = getfullname(handle)
```

Description

`path = getfullname(handle)` returns the full path that identifies the block or line specified by `handle`. If you specify multiple block or line handles, the function returns a cell array of paths.

Examples

Get Path That Identifies Block

Open the vdp model.

```
vdp
```

Interactively, select the block named Mu.

Get the path that identifies the currently selected block.

```
blkpath = getfullname(gcf)
```

```
blkpath =  
    'vdp/Mu'
```

Get Path That Identifies Line

Open the vdp model.

```
vdp
```

Interactively, select the output line from the block named Mu.

Get the handle associated with the currently selected line.

```
line = find_system(gcf, 'SearchDepth', 1, 'FindAll', 'on', ...  
    'Type', 'line', 'Selected', 'on');
```

Get the path that identifies the currently selected line.

```
linepath = getfullname(line)
```

```
linepath =  
    'vdp/Mu/1'
```

The path describes the source port of the line.

Input Arguments

handle — Block or line

handle | cell array of handles

Block or line, specified as a handle or cell array of handles.

Example: `getfullname(gcb)`

Example: `getfullname({handle1,handle2})`

Data Types: double | cell

See Also

`find_system` | `gcb`

Introduced in R2007a

getGlobalArg

Package: Simulink.CustomCode

Get an object definition of a global variable in a C Caller block

Syntax

```
GlobalArg = PortSpecObj.getGlobalArg(globalVariableName)
```

Description

GlobalArg = PortSpecObj.getGlobalArg(globalVariableName), where PortSpecObj is an object of class FunctionPortSpecification or Simulink.CodeImporter.SimulinkPortSpecification, creates a FunctionArgument on page 8-32 object. To use global variables in a model that uses C Caller blocks, turn on the **Enable custom code globals as function interface** setting from **Configuration Parameters > Simulation Target**.

Examples

Create Handle to Global Variable in C Caller Block

Access the properties of a global variable used in a C Caller block.

Create a FunctionPortSpecification object.

```
myFunctionPortSpecObject = get_param(gcb, 'FunctionPortSpecification')
```

Query and create a FunctionArgument object for the global argument.

```
myGlobalVariable = myFunctionPortSpecObject.getGlobalArg('myGlobalVariableName')
```

```
myGlobalVariable =
```

```
FunctionArgument with properties:
```

```
    Name: 'myGlobalVarPort'
PortNumber: 1
    Size: '1'
    Type: 'double'
    Label: 'myGlobalVarPort'
    Scope: 'Input'
```

Input Arguments

globalVariableName — Name of global variable

character vector | string scalar

Name of global variable, specified as a character vector.

Data Types: char

Output Arguments

GlobalArg — Global argument object

FunctionArgument object

Global argument object associated with the C Caller block, returned as a FunctionArgument object.

See Also

C Caller | FunctionPortSpecification |

Simulink.CodeImporter.SimulinkPortSpecification

Topics

“Integrate C Code Using C Caller Blocks”

Introduced in R2020b

getInputString

Create comma-separated list of variables to map

Syntax

```
externalInputString = getInputString(inputmap, 'base')
```

```
externalInputString = getInputString(inputmap, filename)
```

```
externalInputString = getInputString(inputmap)
```

Description

`externalInputString = getInputString(inputmap, 'base')` creates an input character vector using the supplied mapping `inputmap` and the variables loaded in the base workspace ('base').

This function generates a comma-separated list of variables (input character vector) to be mapped. You can then use this list:

- As input to the `sim` command. Load the variables in the base workspace first.
- As input for the **Configuration Parameters > Data Import/Export > Input** parameter. Copy the contents of the input character vector into the text field.

This function is most useful if you have created a custom mapping.

`externalInputString = getInputString(inputmap, filename)` creates an input character vector using the supplied mapping `inputmap` and the variables defined in `filename`.

`externalInputString = getInputString(inputmap)` creates an input character vector using the signals from the most recently created mapping.

Examples

Create an input character vector from the base workspace

Create an input character vector from the base workspace and simulate a model.

Open the model

```
slexAutotransRootInportsExample;
```

Create signal variables in the base workspace

```
Throttle = timeseries(ones(10,1)*10);
Brake     = timeseries(zeros(10,1));
```

Create a mapping (`inputMap`) for the model.

```
inputMap = getRootInportMap('model', ...
    'slexAutotransRootInportsExample', ...
```

```
'signalName', {'Throttle', 'Brake'}, ...  
'blockName', {'Throttle', 'Brake'});
```

Call `getInputString` with `inputMap` and `'base'` as inputs.

```
externalInputString = getInputString(inputMap, 'base')  
  
externalInputString =  
  
Throttle, Brake
```

Simulate the model with the input character vector.

```
sim('slexAutotransRootInportsExample', 'ExternalInput', ...  
externalInputString);
```

Create an external input character vector from variables in a MAT-file

Create an external input character vector from variables in a MAT-file named `input.mat`.

In a writable folder, create a MAT-file with input variables.

```
Throttle = timeseries(ones(10,1)*10);  
Brake = timeseries(zeros(10,1));  
save('input.mat', 'Throttle', 'Brake');
```

Open the model.

```
slexAutotransRootInportsExample;
```

Create map object.

```
inputMap = getRootInportMap('model', ...  
'slexAutotransRootInportsExample', ...  
'signalName', {'Throttle', 'Brake'}, ...  
'blockName', {'Throttle', 'Brake'});
```

Get the resulting input character vector.

```
externalInputString = getInputString(inputMap, 'input.mat')  
  
externalInputString =  
  
Throttle, Brake
```

Load variables from the base workspace for the simulation.

```
load('input.mat');
```

Simulate the model.

```
sim('slexAutotransRootInportsExample', 'ExternalInput', ...  
externalInputString);
```

Create an external input character vector from only an input map

Create an input character vector from only an input map vector and simulate the model.

Open the model.

```
slexAutotransRootInportsExample;
```

Create signal variables in the base workspace

```
Throttle = timeseries(ones(10,1)*10);
Brake     = timeseries(zeros(10,1));
```

Create a mapping vector for the model.

```
inputMap = getSIRootInportMap('model', 'slexAutotransRootInportsExample', ...
'MappingMode', 'BlockName', ...
'signalName', {'Throttle', 'Brake'}, ...
'signalValue', {Throttle, Brake});
```

Get the resulting input character vector.

```
externalInputString = getInputString(inputMap)
```

Simulate the model with the input character vector.

```
sim('slexAutotransRootInportsExample', 'ExternalInput', ...
externalInputString);
```

Alternatively, if you want to input the list of variables through the Configuration Parameters dialog, copy the contents of `externalInputString` (Throttle, Brake) into the **Data Import/Export > Input** parameter. Apply the changes, and then simulate the model.

Input Arguments

inputmap — Map object

character vector

Map object, as returned from the `getRootInportMap` or `getSIRootInportMap` functions.

filename — Input variables

MAT-file name as character vector

Input variables, contained in a MAT-file. The file contains variables to map.

Example: 'data.mat'

Data Types: char

Output Arguments

externalInputString — External input

comma-separated character vector

External input, returned as a comma-separated character vector. The character vector contains root inport information that you can specify to the `sim` command or the **Configuration Parameters > Data Import/Export > Input** parameter.

Topics

“Map Root Inport Signal Data”

Introduced in R2013a

getReport

Package: Simulink

Generate MATLAB function report

Syntax

```
report = getReport(config)
```

Description

`report = getReport(config)` returns the `MATLABFunctionReport` object for a MATLAB Function block. Use the `MATLABFunctionReport` object to access information about the functions and variables used by the MATLAB Function block.

Examples

Create Custom Report for MATLAB Function Block

Access the `MATLABFunctionConfiguration` object for the MATLAB Function block in the model `call_stats_block1` described in “Create Custom Functionality Using MATLAB Function Block”.

```
config = get_param('call_stats_block1/MATLAB Function', ...
    'MATLABFunctionConfiguration');
```

Create the `MATLABFunctionReport` object for the MATLAB Function block.

```
report = getReport(config);
```

Access the `coder.Function` objects in the report.

```
functions = report.Functions;
```

Create a custom report that lists the functions and variables in the MATLAB Function block.

```
for i = 1:numel(functions)
    fprintf('Function %s uses these variables:\n', functions(i).Name)
    variables = functions(i).Variables;
    for j = 1:numel(variables)
        fprintf('%d. %s -- %s\n', j, variables(j).Name, variables(j).Scope)
    end
    fprintf('\n')
end
```

```
Function stats uses these variables:
```

```
1. mean -- Output
2. stdev -- Output
3. vals -- Input
4. len -- Local
```

```
Function avg uses these variables:
```

1. mean -- Output
2. array -- Input
3. size -- Input

Input Arguments

config — MATLAB Function block property configuration

MATLABFunctionConfiguration object

MATLAB Function block property configuration, specified as a MATLABFunctionConfiguration object.

Tips

The first time that you create a MATLABFunctionReport object or open the MATLAB function report, Simulink automatically updates your model. If you make subsequent changes to the MATLAB code in the block, you must update your model before you generate a new MATLABFunctionReport object. Otherwise, the object does not reflect your changes. From the **Modeling** tab, select **Update Model**, or press **Ctrl+D**. For more information, see “Update Diagram and Run Simulation”.

“MATLAB Function Reports”

“Create Custom Functionality Using MATLAB Function Block”

Introduced in R2021a

getRootInportMap

Create custom object to map signals to root-level inports

Syntax

```
map = getRootInportMap('Empty');  
map = getRootInportMap(model,mdl,Name,Value);  
map = getRootInportMap(inputmap,map,Name,Value);
```

Description

`map = getRootInportMap('Empty');` creates an empty map object, *map*. Use this map object to set up an empty custom mapping object. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards.

`map = getRootInportMap(model,mdl,Name,Value);` creates a map object for *model*, *mdl*, with block names and signal names specified. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

`map = getRootInportMap(inputmap,map,Name,Value);` overrides the mapping object with the specified property. You can override only the properties *model*, *blockName*, and *signalName*. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

Use the `getRootInportMap` function when creating a custom mapping mode to map data to root-level inports. See the example file `BlockNameIgnorePrefixMap.m`, located in `matlabroot/help/toolbox/simulink/examples`, for an example of a custom mapping algorithm.

Input Arguments

Empty

Create an empty map object.

Default: none

Name-Value Pair Arguments

Specify optional comma-separated pairs of *Name*, *Value* arguments. *Name* is the argument name and *Value* is the corresponding value. *Name* must appear inside quotes. You can specify several name and value pair arguments in any order as *Name1*, *Value1*, ..., *NameN*, *ValueN*.

model

Name of model to associate with the root inport map.

Default: None

blockName

Block names of root-level input ports. The tool assigns data to ports according to the name of the root-inport block. If the tool finds a data element whose name matches the name of a root-inport block, it maps the data to the corresponding port.

The value for this argument can be:
Block name of root-level input ports.
Cell array containing multiple block names of root-level input ports.

Default: None

signalName

Signal names to be mapped. The tool assigns data to ports according to the name of the signal on the port. If the tool finds a data element whose name matches the name of a signal at a port, it maps the data to the corresponding port.

The value for this argument can be:
Signal name to be mapped.
Cell array containing multiple signal names of signals to be mapped.

Default: None

inputmap

Name of mapping object to override.

Default: None

Output Arguments

map

Custom object that you can use to map data to root-level input port. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

Examples

Empty Mapping Object

Create an empty custom mapping object.

```
map = getRootInportMap('Empty')
```

```
map =
```

```
1x0 InputMap array with properties:
```

```
Type
```

```
DataSourceName
Destination
```

Simple Mapping Object

Create a simple mapping object using a MATLAB time series object.

Create a time series object, `signalIn1`.

```
signalIn1 = timeseries((1:10)')
```

Common Properties:

```
Name: 'unnamed'
Time: [10x1 double]
TimeInfo: [1x1 tsdata.timemetadata]
Data: [10x1 double]
DataInfo: [1x1 tsdata.datametadata]
```

Create a mapping object for the time series object for the model, `ex_minportsOnlyModel`.

```
modelFile = fullfile(matlabroot,'help','toolbox','simulink',...
'examples','ex_minportsOnlyModel');
load_system(modelFile);
map = getRootInportMap('model','ex_minportsOnlyModel',...
'blockName','In1','signalname','signalIn1')
```

```
map =
```

```
InputMap with properties:
```

```
Type: 'Inport'
DataSourceName: 'signalIn1'
Destination: [1x1 Simulink.iospecification.Destination]
```

Mapping Object with Vectors

Create a mapping object using vectors of block names and signal names for the model `ex_minportsOnlyModel`.

Create a mapping object of vectors.

```
modelFile = fullfile(matlabroot,'help','toolbox','simulink',...
'examples','ex_minportsOnlyModel');
load_system(modelFile);
map = getRootInportMap('model','ex_minportsOnlyModel',...
'blockName',{'In1' 'In2'}, ...
'signalname',{'signalIn1' 'signalIn2'})
```

```
map =
```

```
1x2 InputMap array with properties:
```

```
Type
```

```
DataSourceName
Destination
```

Overriding Maps

Create a mapping object that contains the signal *var2*, then override *var2* with *var1*.

Create a mapping object of vectors.

```
% Load the model and define variables
modelFile = fullfile(matlabroot,'help','toolbox','simulink',...
'examples','ex_minportsOnlyModel');
load_system(modelFile);
modelValue = 'ex_minportsOnlyModel';
blockNameValue = 'In1';
signalNameValue = 'var2';
portType = 'Inport';

% Define var1 and override var2 with var1
signalNameToOverload = 'var1';
mapToOverload = getRootInportMap('model',modelValue,...
'blockName',blockNameValue,...
'signalName',signalNameToOverload)

mapToOverload =

    InputMap with properties:

        Type: 'Inport'
    DataSourceName: 'var1'
        Destination: [1x1 Simulink.iospecification.Destination]
```

Tips

- Load the model before running this function.
- If your custom mapping mode similar to an existing Simulink mapping mode, consider using the `getSlRootInportMap` function instead.

Topics

“Create Custom Mapping File Function”

Introduced in R2012b

getSimulinkBlockHandle

Get block handle from block path

Syntax

```
handle = getSimulinkBlockHandle(path)
handle = getSimulinkBlockHandle(path,true)
```

Description

`handle = getSimulinkBlockHandle(path)` returns the numeric handle of the block specified by `path`, if it exists in a loaded model or library. Returns -1 if the block is not found. Library links are resolved where necessary.

Use the numeric handle returned by `getSimulinkBlockHandle` to manipulate the block in subsequent calls to `get_param` or `set_param`. This approach is more efficient than making multiple calls to these functions using the full block path. Do not try to use the number of a handle alone (e.g., 5.007) because you usually need to specify many more digits than MATLAB displays. Assign the handle to a variable and use that variable name to specify a block. The handle applies only to the current MATLAB session.

Use `getSimulinkBlockHandle` to check whether a block path is valid. This approach is more efficient than calling `get_param` inside a `try` statement.

`handle = getSimulinkBlockHandle(path,true)` attempts to load the model or library containing the specified block path, and then checks if the block exists. No error is returned if the model or library is not found. Any models or libraries loaded this way remain in memory even if the function does not find a block with the specified path.

Examples

Get the Handle of a Block

Get the handle of the Pilot block.

```
load_system('f14')
handle = getSimulinkBlockHandle('f14/Pilot')

handle =

    562.0004
```

You can use the handle in subsequent calls to `get_param` or `set_param`.

Load the Model and Get the Block Handle

Load the model `f14` if necessary (by specifying `true`), and get the handle of the Pilot block.

```
handle = getSimulinkBlockHandle('f14/Pilot',true)
handle =
    562.0004
```

You can use the handle in subsequent calls to `get_param` or `set_param`.

Check If a Model Contains a Specific Block

Check whether the model `f14` is loaded and contains a block named `Pilot`. Valid handles are always greater than zero. If the function does not find the block, it returns `-1`.

```
valid_block_path = getSimulinkBlockHandle('f14/Pilot') > 0
valid_block_path =
    0
```

The model contains the block but the model is not loaded, so this command returns `0` because it cannot find the block.

Using `getSimulinkBlockHandle` to check whether a block path is valid is more efficient than calling `get_param` inside a `try` statement.

Input Arguments

path — Block path name

character vector | cell array of character vectors

Block path name, specified as a character vector or a cell array of character vectors.

Example: `'f14/Pilot'`

Data Types: `char`

Output Arguments

handle — Numeric handle of a block

double | array of doubles

Numeric handle of a block, returned as a double or an array of doubles. Valid handles are always greater than zero. If the function does not find the block, it returns `-1`. If the `path` input is a cell array of character vectors, then the output is a numeric array of handles.

Data Types: `double`

See Also

`get_param` | `set_param`

Introduced in R2015a

getSlRootInportMap

Create custom object to map signals to root-level inports using Simulink mapping mode

Syntax

```
inputMap = getSlRootInportMap('model',modelname,'MappingMode',
mappingmode,'SignalName',signalname,'SignalValue',signalvalue)
[inputMap, hasASignal] = getSlRootInportMap('model',modelname,'MappingMode',
mappingmode,'SignalName',signalname,'SignalValue',signalvalue)
```

```
inputMap = getSlRootInportMap('model',
modelname,'MappingMode','Custom','CustomFunction',
customfunction,'SignalName',signalname,'SignalValue',signalvalue)
[inputMap,hasASignal] = getSlRootInportMap('model',
modelname,'MappingMode','Custom','CustomFunction',
customfunction,'SignalName',signalname,'SignalValue',signalvalue)
```

Description

`inputMap = getSlRootInportMap('model',modelname,'MappingMode', mappingmode,'SignalName',signalname,'SignalValue',signalvalue)` creates a root inport map using one of the Simulink mapping modes. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

`[inputMap, hasASignal] = getSlRootInportMap('model',modelname,'MappingMode', mappingmode,'SignalName',signalname,'SignalValue',signalvalue)` returns a vector of logical values specifying whether or not the root inport map has a signal associated with it. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

`inputMap = getSlRootInportMap('model', modelname,'MappingMode','Custom','CustomFunction', customfunction,'SignalName',signalname,'SignalValue',signalvalue)` creates a root inport map using a custom mapping mode specified in `customfunction`. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

`[inputMap,hasASignal] = getSlRootInportMap('model', modelname,'MappingMode','Custom','CustomFunction', customfunction,'SignalName',signalname,'SignalValue',signalvalue)` returns a vector of logical values specifying whether or not the root inport map has a signal associated with it. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

To map signals to root-level inports using custom mapping modes, you can use `getSlRootInport` with the Root Inport Mapper dialog box custom mapping capability.

Examples

Create inport map using Simulink mapping mode

Create a vector of inport maps using a built-in mapping mode.

```
Throttle = timeseries(ones(10,1)*10);
Brake    = timeseries(zeros(10,1));
inputMap = getSIRootInportMap('model','slexAutotransRootInportsExample',...
    'MappingMode','BlockName', ...
    'SignalName',{'Throttle' 'Brake'},...
    'SignalValue',{Throttle Brake});
```

Create inport map using custom function

Create a vector of inport maps using a custom function

```
port1    = timeseries(ones(10,1)*10);
port2    = timeseries(zeros(10,1));
inputMap = getSIRootInportMap('model','slexAutotransRootInportsExample',...
    'MappingMode','Custom', ...
    'CustomFunction','slexCustomMappingMyCustomMap',...
    'SignalName',{'port1' 'port2'},...
    'SignalValue',{port1 port2});
```

Input Arguments

modelName — Model name

character vector

Specify the model to associate with the root inport map.

Data Types: char

mappingmode — Simulink mapping mode

character vector

Specify the mapping mode to use with model name and data source. Possible values are:

'Index'	Assign sequential index numbers, starting at 1, to the data in the MAT-file, and map this data to the corresponding inport.
'BlockName'	Assign data to ports according to the name of the root-inport block. If the block name of a data element matches the name of a root-inport block, map the data to the corresponding port.
'SignalName'	Assign data to ports according to the name of the signal on the port. If the signal name of a data element matches the name of a signal at a port, map the data to the corresponding port.
'BlockPath'	Assign data to ports according to the block path of the root-inport block. If the block path of a data element matches the block path of a root-inport block, map the data to the corresponding port.
'Custom'	Apply mappings according to the definitions in a custom file.

Data Types: char

customfunction — Custom function file name

character vector

Specify name of file that implements a custom method to map signals to root-level ports. This function must be on the MATLAB path.

Data Types: char

signalname — signal name

scalar | cell array of character vectors

Specify the signal name(s) of the signal to associate with the root inport map.

Data Types: char | cell

signalvalue — signal value

scalar | cell arrays

Specify the values of the signals to map to the root inport map. For the list of supported data types for the values, see “Choose a Base Workspace and MAT-File Format”.

Output Arguments

inputMap — input map

scalar | vector

Mapping object that defines the mapping of input signals to root-level ports. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

hasASignal — signal presence indicator

scalar | vector

A vector of logical values with the same length as `inputMap`. If the value is true the `inputMap` has a signal associated with it. If the value is false the `inputMap` does not have a signal associated with it and will use a ground value as an input.

Data Types: logical

Tips

- Load the model before running this function.
- If your custom mapping mode is not similar to an existing Simulink mapping mode, consider using the `getRootInportMap` function instead.

“Map Root Inport Signal Data”

Introduced in R2013b

hdllib

Display blocks that are compatible with HDL code generation

Syntax

```
hdllib
hdllib('off')
hdllib('html')
hdllib('librarymodel')
```

Description

`hdllib` displays the blocks that are supported for HDL code generation, and for which you have a license, in the Library Browser. To build models that are compatible with the HDL Coder software, use blocks from this Library Browser view.

If you close and reopen the Library Browser in the same MATLAB session, the Library Browser continues to show only the blocks supported for HDL code generation. To show all blocks, regardless of HDL code generation compatibility, at the command prompt, enter `hdllib('off')`.

`hdllib('off')` displays all the blocks for which you have a license in the Library Browser, regardless of HDL code generation compatibility.

`hdllib('html')` creates a library of blocks that are compatible with HDL code generation. It generates two additional HTML reports: a categorized list of blocks (`hdlblklist.html`) and a table of blocks and their HDL code generation parameters (`hdlsupported.html`).

To run `hdllib('html')`, you must have an HDL Coder license.

`hdllib('librarymodel')` displays blocks that are compatible with HDL code generation in the Library Browser. To build models that are compatible with the HDL Coder software, use blocks from this library.

The default library name is `hdlsupported`. After you generate the library, you can save it to a folder of your choice.

To keep the library current, you must regenerate it each time that you install a new software release.

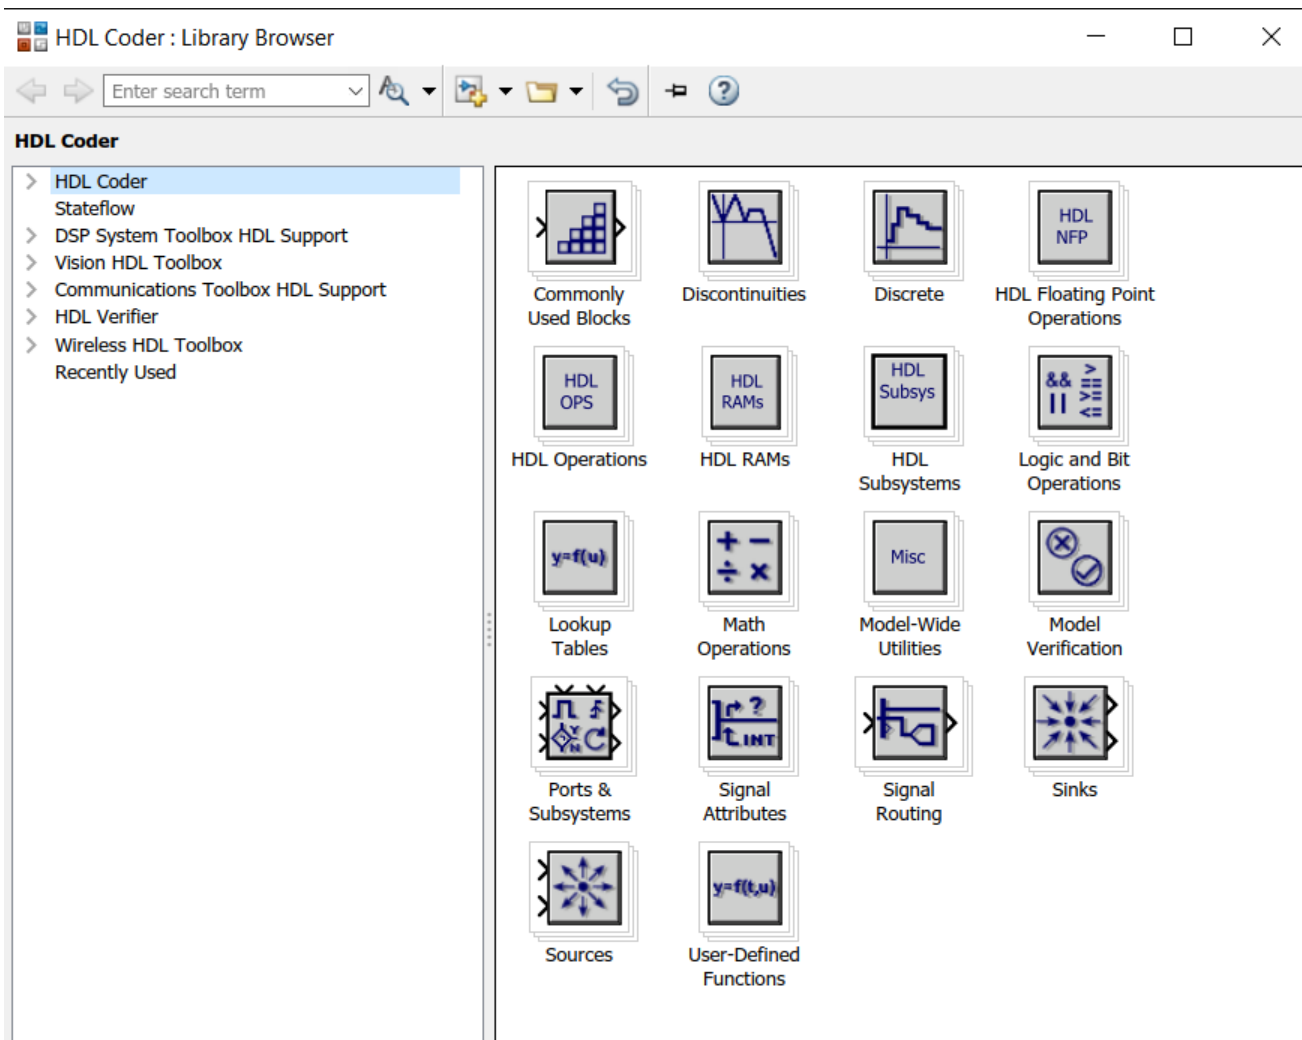

To run `hdllib('librarymodel')`, you must have an HDL Coder license.

Examples

Display Supported Blocks in the Library Browser

To display blocks that are compatible with HDL code generation in the Library Browser:

```
hdllib
### Generating view of HDL Coder compatible blocks in Library Browser.
### To restore the Library Browser to the default Simulink view, enter "hdllib off".
```

Display All Blocks in the Library Browser

To restore the Library Browser to the default view, in the Library Browser, click the  button. Alternatively, at the command line, enter:

```
hdlLib('off')
```

```
### Restoring Library Browser to default view; removing the HDL Coder compatibility filter.
```

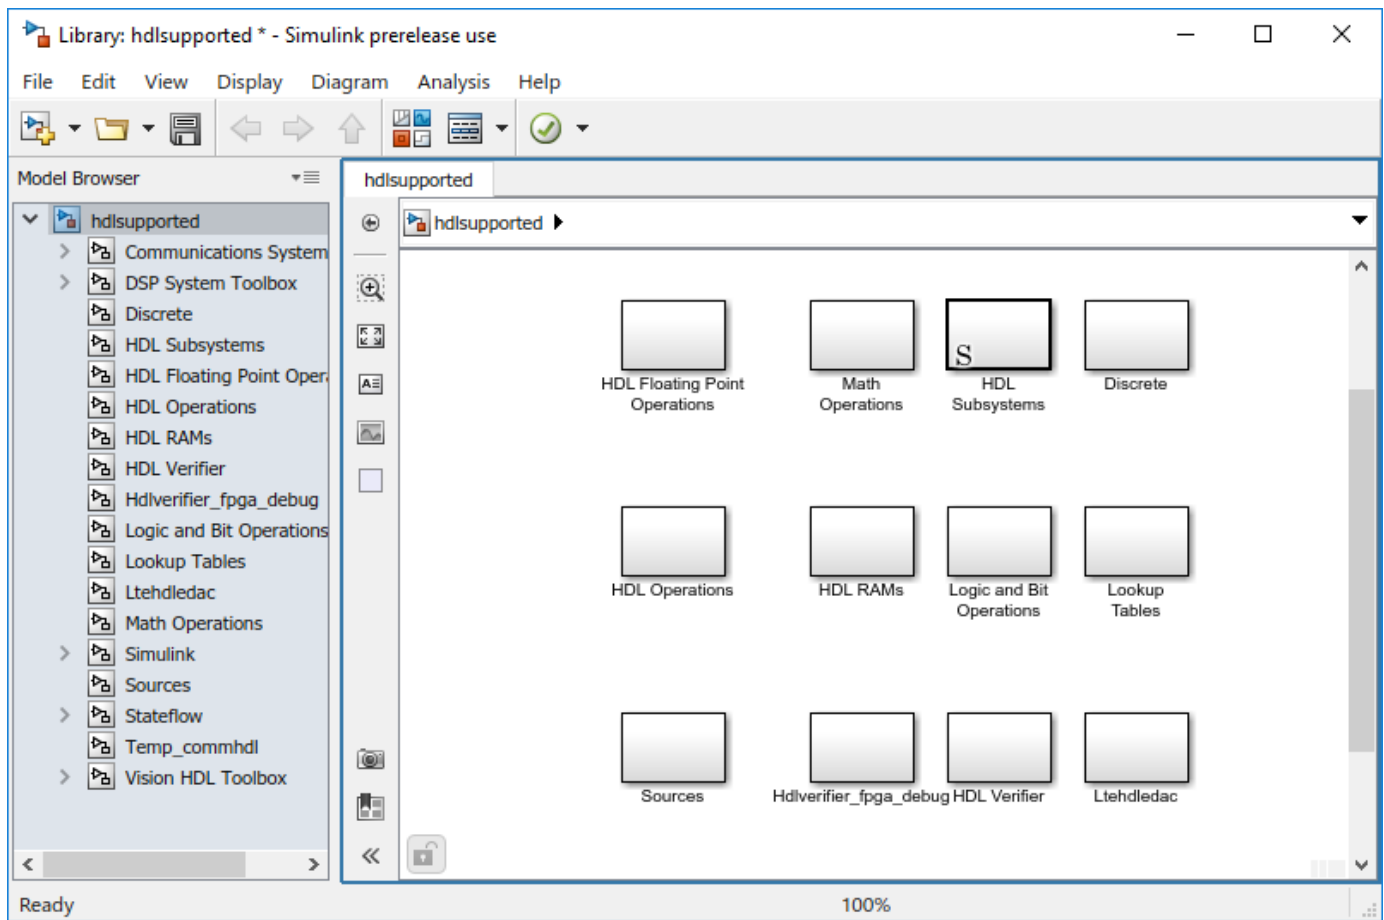

Create a Supported Blocks Library and HTML Reports

To create a library and HTML reports showing the blocks that are compatible with HDL code generation:

```
hdllib('html')
```

```
### HDL supported block list hdlblklist.html
### HDL implementation list hdlsupported.html
```

The `hdlsupported` library opens. To view the reports, click the `hdlblklist.html` and `hdlsupported.html` links.

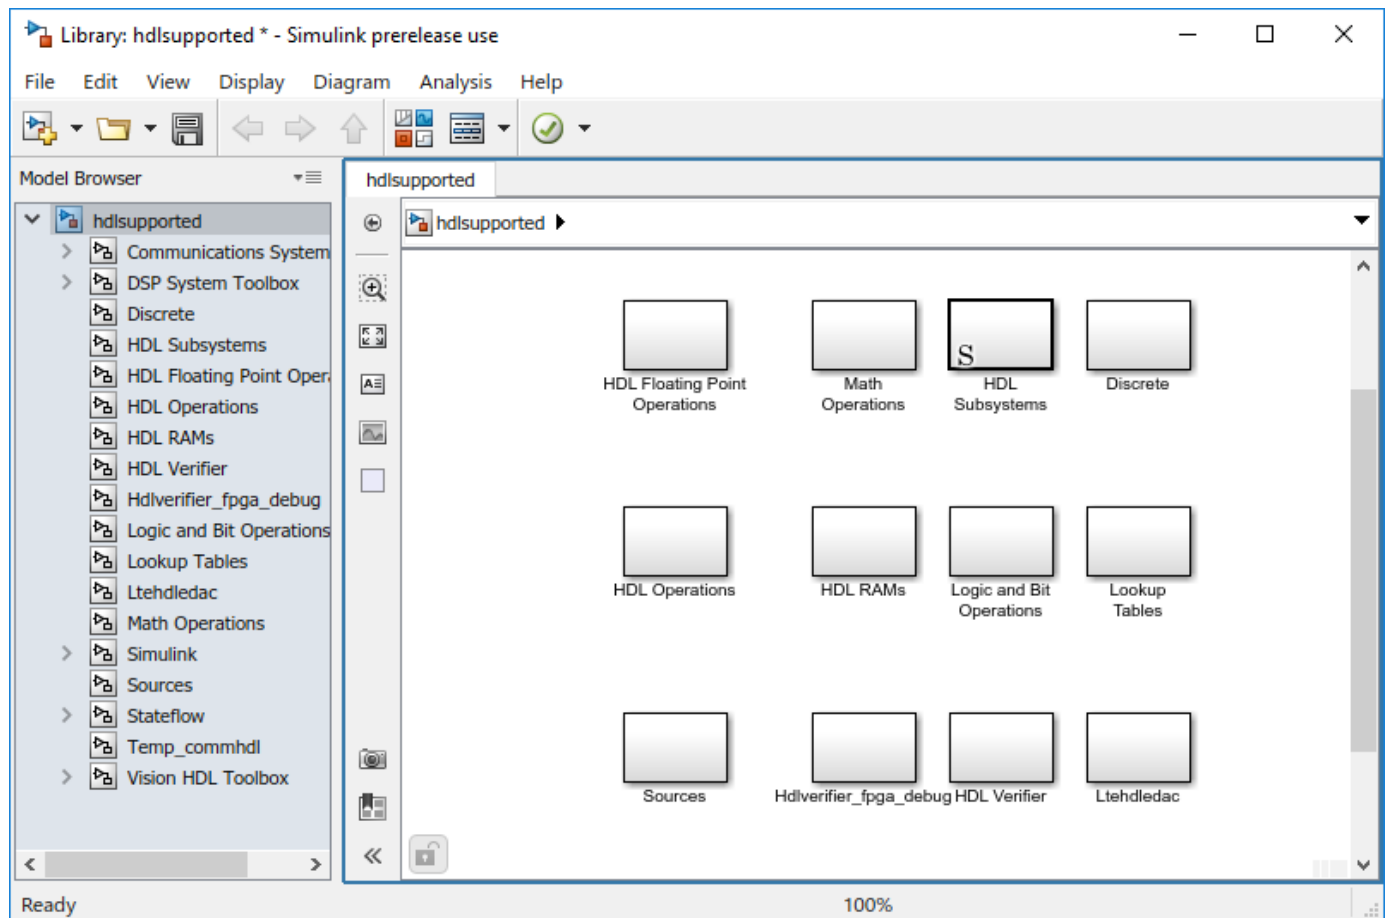

Create a Supported Blocks Library

To create a library that contains blocks that are compatible with HDL code generation:

```
hdlLib('librarymodel')
```

The hdl_supported block library opens.

Introduced in R2006b

hilite_system

Highlight block, signal line, port, or annotation

Syntax

```
hilite_system(obj)
hilite_system(obj,style)
```

Description

`hilite_system(obj)` highlights a block, line, port, or annotation in an open model using the default highlight style. Use `hilite_system` with a port to highlight the signal line attached to the port. Each use of `hilite_system` adds to the highlighting. Highlighting is not saved with the model.

`hilite_system(obj,style)` uses the specified highlighting style.

Examples

Highlight Block Using Default Highlight Style

Open the model `slexAircraftExample`.

```
openExample('slexAircraftExample')
```

Highlight the Controller block. When you use the default highlight style, the block appears highlighted with a red outline and yellow fill.

```
hilite_system('slexAircraftExample/Controller')
```

Highlight a Block Using a Highlight Style

Open the model `vdp`.

```
vdp
```

Highlight the Mu block using the style 'fade'.

```
hilite_system('vdp/Mu','fade')
```

Use Block Highlighting to Trace Generated Code

If you have a Simulink Coder license, you can trace generated code to the corresponding source block in a model.

Open the model `f14`.

```
f14
```

In the model configuration parameters, in the **Solver** pane, set **Type** to Fixed-step.

Generate code for the model. In the **Apps** tab, under **Code Generation**, click **Embedded Coder**. The **C Code** tab appears. Click **Build**.

In an editor or in the code generation report, open a generated source or header file. As you review lines of code, note traceability tags that correspond to code of interest.

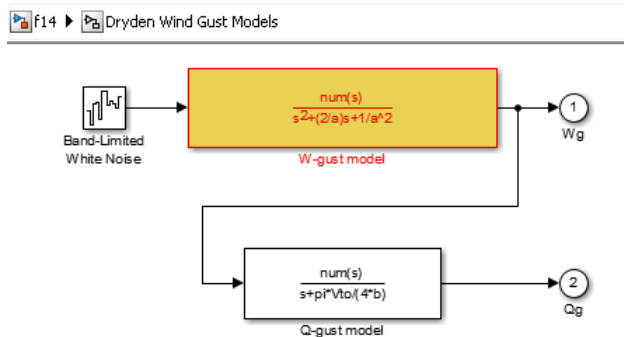

Highlight a block using a traceability tag.

```
hilite_system('<Root>/Stick Input')
```

Highlight a block in a subsystem.

```
hilite_system('<S3>/W-gust model')
```

Customize a Highlighting Style

You can customize a highlighting style by setting the 'HiliteAncestorsData' parameter on the root-level model using set_param in this form:

```
set_param(0, 'HiliteAncestorsData', hiliteData)
```

Specify `hiliteData` as a structure array that has these fields:

- 'HiliteType' — Highlighting style to customize, such as 'user1', 'debug', or 'error'.
- 'ForegroundColor' — Color for block fill.
- 'BackgroundColor' — Color for block outline.

The supported values for 'ForegroundColor' and 'BackgroundColor' are:

- 'black'
- 'white'
- 'gray'
- 'red'
- 'orange'
- 'yellow'
- 'green'
- 'darkGreen'
- 'blue'
- 'lightBlue'
- 'cyan'
- 'magenta'

Define a highlight style for 'user1', and customize the style for 'debug'.

```
set_param(0, 'HiliteAncestorsData', ...
    struct('HiliteType', 'user1', ...
        'ForegroundColor', 'darkGreen', ...
        'BackgroundColor', 'lightBlue'));
set_param(0, 'HiliteAncestorsData', ...
    struct('HiliteType', 'debug', ...
        'ForegroundColor', 'red', ...
        'BackgroundColor', 'black'));
```

Use the defined style to highlight a block.

```
f14
hilite_system('f14/Controller/Alpha-sensor Low-pass Filter', 'user1')
```

Input Arguments

obj — Block, port, line, or annotation to highlight

block path name | Simulink.BlockPath object | numeric handle | Simulink identifier | traceability tag

Block, port, line, or annotation to highlight, specified as:

- The full block path name
- A Simulink.BlockPath object

- A numeric handle for lines, ports, or annotations
- Simulink identifier
- A traceability tag from the comments of Simulink Coder generated code.

Using a traceability tag requires a Simulink Coder license.

The format for a traceability tag is `<system>/block`, where `system` is either:

- Root
- A unique system number assigned by Simulink during code generation

Example: `'vdp/Mu'`, `'sldemo_fuelsys/fuel_rate_control/airflow_calc'`, `'vdp:3'`, `'<Root>/Mu'`

style — Highlighting style

`'default'` (default) | character vector

Highlighting style, specified as one of these values. You can customize the appearance of any of the styles. See “Customize a Highlighting Style” on page 2-330.

- `'default'` — Default color scheme: red outline, yellow fill.
- `'none'` — Clears the highlight.

To clear all highlighting, in the Simulink Editor, in the **Signal** tab, click **Remove Trace**.

- `'debug'` — Uses default color scheme.
- `'different'` — Applies red outline, white fill.
- `'error'` — Uses default color scheme.
- `'fade'` — Applies gray outline, white fill.
- `'find'` — Applies dark blue outline, blue fill.
- `'lineTrace'` — Applies red outline, blue fill.
- `'unique'` — Dark blue outline, white fill.
- `'user1'`, `'user2'`, `'user3'`, `'user4'`, `'user5'` — Applies custom highlight: black outline, white fill by default (i.e., no highlight).

In addition, you can use these color schemes. The first word is the outline and the second is the fill color.

- `'orangeWhite'`
- `'blackWhite'`
- `'redWhite'`
- `'blueWhite'`
- `'greenWhite'`

`find_system` | `rtwtrace`

Introduced before R2006a

isLoaded

(Not recommended) Determine if project is loaded

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
loaded = isLoaded(proj)
```

Description

`loaded = isLoaded(proj)` returns whether the project referenced by the project object `proj` is loaded.

Examples

Find Out if Project Is Loaded

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;  
proj = simulinkproject;
```

Find out if the project is still loaded.

```
loaded = isLoaded(proj)  
loaded =
```

```
1
```

Input Arguments

proj — Project

project

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Project at the command line.

Output Arguments

loaded — Loaded status

```
1 | 0
```

Project loaded status, returned as true (1) if the project is loaded.

Data Types: `logical`

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

Functions

`reload` | `simulinkproject`

Introduced in R2013a

isSimulinkStarted

Check whether Simulink is started

Syntax

```
tf = isSimulinkStarted
```

Description

`tf = isSimulinkStarted` returns whether Simulink is started.

Examples

Check Whether Simulink Is Started

```
isSimulinkStarted
```

```
ans =  
  
    logical  
  
     0
```

The returned value 0 indicates that Simulink is not started.

Start Simulink.

```
simulink
```

Confirm that Simulink is started.

```
isSimulinkStarted
```

```
ans =  
  
    logical  
  
     1
```

The returned value 1 indicates that Simulink is started.

Output Arguments

tf — True or false result

1 | 0

True or false result, returned as a 1 or 0 of data type `logical`.

- 1 (`true`) — Simulink is started.
- 0 (`false`) — Simulink is not started.

When multiple files are specified, the function returns a logical array with one entry for each file.

legacy_code

Use Legacy Code Tool

Syntax

```
legacy_code('help')
specs = legacy_code('initialize')
legacy_code('sfcn_cmex_generate', specs)
legacy_code('compile', specs, compilerOptions)
legacy_code('generate_for_sim', specs, modelName)
legacy_code('slblock_generate', specs, modelName)
legacy_code('sfcn_tlc_generate', specs)
legacy_code('sfcn_makecfg_generate', specs)
legacy_code('rtwmakecfg_generate', specs)
legacy_code('backward_compatibility')
```

Description

The `legacy_code` function creates a MATLAB structure for registering the specification for existing C or C++ code and the S-function being generated. In addition, the function can generate, compile and link, and create a masked block for the specified S-function. Other options include generating

- A TLC file for simulation in Accelerator mode or code generation
- An `rtwmakecfg.m` file that you can customize to specify dependent source and header files that reside in a different directory than that of the generated S-function

`legacy_code('help')` displays instructions for using Legacy Code Tool.

`specs = legacy_code('initialize')` initializes the Legacy Code Tool data structure, `specs`, which registers characteristics of existing C or C++ code and properties of the S-function that the Legacy Code Tool generates.

`legacy_code('sfcn_cmex_generate', specs)` generates an S-function source file as specified by the Legacy Code Tool data structure, `specs`.

`legacy_code('compile', specs, compilerOptions)` compiles and links the S-function generated by the Legacy Code Tool based on the data structure, `specs`, and compiler options that you might specify. The compiler options must be supported by the `mex` function.

`legacy_code('generate_for_sim', specs, modelName)` generates, compiles, and links the S-function in a single step. If the `Options.useTlcWithAccel` field of the Legacy Code Tool data structure is set to logical 1 (`true`), the function also generates a TLC file for accelerated simulations.

`legacy_code('slblock_generate', specs, modelName)` generates a masked S-Function block for the S-function generated by the Legacy Code Tool based on the data structure, `specs`. The block appears in the Simulink model specified by `modelName`. If you omit `modelName`, the block appears in an empty model editor window.

`legacy_code('sfcn_tlc_generate', specs)` generates a TLC file for the S-function generated by the Legacy Code Tool based on the data structure, `specs`. This option is relevant if you want to:

- Force Accelerator mode in Simulink software to use the TLC inlining code of the generated S-function. See the description of the `ssSetOptions SimStruct` function and `SS_OPTION_USE_TLC_WITH_ACCELERATOR` S-function option for more information.
- Use Simulink Coder software to generate code from your Simulink model. For more information, see “Import Calls to External Code into Generated Code with Legacy Code Tool” (Simulink Coder).

`legacy_code('sfcn_makecfg_generate', specs)` generates an `sFunction_makecfg.m` file for the S-function generated by the Legacy Code Tool based on the data structure, `specs`. This option is relevant only if you use Simulink Coder software to generate code from your Simulink model. For more information, see “Use makecfg to Customize Generated Makefiles for S-Functions” (Simulink Coder) and “Import Calls to External Code into Generated Code with Legacy Code Tool” (Simulink Coder).

`legacy_code('rtwmakecfg_generate', specs)` generates an `rtwmakecfg.m` file for the S-function generated by the Legacy Code Tool based on the data structure, `specs`. This option is relevant only if you use Simulink Coder software to generate code from your Simulink model. For more information, see “Use rtwmakecfg.m API to Customize Generated Makefiles” (Simulink Coder) and “Import Calls to External Code into Generated Code with Legacy Code Tool” (Simulink Coder).

`legacy_code('backward_compatibility')` automatically updates syntax for using Legacy Code Tool to the supported syntax described in this reference page and in “Integrate C Functions Using Legacy Code Tool”.

Input Arguments

specs

A structure with the following fields:

Name the S-function

`SFunctionName` (Required) — A character vector specifying a name for the S-function to be generated by the Legacy Code Tool.

Define Legacy Code Tool Function Specifications

- `InitializeConditionsFcnSpec` — A nonempty character vector specifying a function that the S-function calls to initialize and reset states. You must declare this function by using tokens that Simulink software can interpret as explained in “Declaring Legacy Code Tool Function Specifications”.
- `OutputFcnSpec` — A nonempty character vector specifying the function that the S-function calls at each time step. You must declare this function by using tokens that Simulink software can interpret as explained in “Declaring Legacy Code Tool Function Specifications”.
- `StartFcnSpec` — A character vector specifying the function that the S-function calls when it begins execution. This function can access S-function parameter arguments and work data. You must declare this function by using tokens that Simulink software can interpret as explained in “Declaring Legacy Code Tool Function Specifications”.
- `TerminateFcnSpec` — A character vector specifying the function that the S-function calls when it terminates execution. This function can access S-function parameter arguments and work data. You must declare this function by using tokens that Simulink software can interpret as explained in “Declaring Legacy Code Tool Function Specifications”.

Define Compilation Resources

- **HeaderFiles** — A cell array of character vectors specifying the file names of header files required for compilation.
- **SourceFiles** — A cell array of character vectors specifying source files required for compilation. You can specify the source files using absolute or relative path names.
- **HostLibFiles** — A cell array of character vectors specifying library files required for host compilation. You can specify the library files using absolute or relative path names.
- **TargetLibFiles** — A cell array of character vectors specifying library files required for target (that is, standalone) compilation. You can specify the library files using absolute or relative path names.
- **IncPaths** — A cell array of character vectors specifying directories containing header files. You can specify the directories using absolute or relative path names.
- **SrcPaths** — A cell array of character vectors specifying directories containing source files. You can specify the directories using absolute or relative path names.
- **LibPaths** — A cell array of character vectors specifying directories containing host and target library files. You can specify the directories using absolute or relative path names.

Specify a Sample Time

SampleTime — One of the following:

- **'inherited'** (default) — Sample time is inherited from the source block.
- **'parameterized'** — Sample time is represented as a tunable parameter. Generated code can access the parameter by calling MEX API functions, such as `mxGetPr` or `mxGetData`.
- **Fixed** — Sample time that you explicitly specify. For information on how to specify sample time, see “Specify Sample Time”.

If you specify this field, you must specify it last.

Define S-Function Options

Options — A structure that controls S-function options. The structure's fields include:

- **canBeCalledConditionally** — A logical value specifying the setting of the S-function `SS_OPTION_CAN_BE_CALLED_CONDITIONALLY` option. By default, the value is `true` (1).
- **convertNDArrayToRowMajor** — A logical value specifying the automatic conversion of a matrix between a column-major format and a row-major format. The column-major format is used by MATLAB, Simulink, and the generated code. The row-major format is used by C. By default, the value is `false` (0). If you currently specify the previous version of the option, `convert2DMatrixToRowMajor`, the function automatically specifies the new `convertNDArrayToRowMajor` option.

Note This option does not support a 2-D matrix of complex data.

- **isMacro** — A logical value specifying whether the legacy code is a C macro. By default, the value is `false` (0).
- **isVolatile** — A logical value specifying the setting of the S-function `SS_OPTION_NONVOLATILE` option. By default, the value is `true` (1).
- **language** — A character vector specifying either `'C'` or `'C++'` as the target language of the S-function that Legacy Code Tool will produce. By default, the value is `'C'`.

Note The Legacy Code Tool can interface with C++ functions, but not C++ objects. For a work around, see “Legacy Code Tool Limitations” in the Simulink documentation.

- `outputsConditionallyWritten`— A logical value specifying whether the legacy code conditionally writes the output ports. If `true`, the generated S-function specifies that the memory associated with each output port cannot be overwritten and is global (`SS_NOT_REUSABLE_AND_GLOBAL`). If `false`, the memory associated with each output port is reusable and is local (`SS_REUSABLE_AND_LOCAL`). By default, the value is `false` (0). For more information, see `ssSetOutputPortOptimOpts`.
- `singleCPPMexFile` — A logical value that, if `true`, specifies that generated code:
 - Requires you to generate and manage an inlined S-function as only one file (`.cpp`) instead of two (`.c` and `.tlc`).
 - Maintains model code style (level of parentheses usage and preservation of operand order in expressions and condition expressions in if statements) as specified by model configuration parameters.

By default, the value is `false`.

Limitations You cannot set the `singleCPPMexFile` field to `true` if

- `Options.language='C++'`
 - You use one of the following Simulink objects with the `IsAlias` property set to `true`:
 - `Simulink.Bus`
 - `Simulink.AliasType`
 - `Simulink.NumericType`
 - The Legacy Code Tool function specification includes a `void*` or `void**` to represent scalar work data for a state argument
 - `HeaderFiles` field of the Legacy Code Tool structure specifies multiple header files
-
- `supportsMultipleExecInstances`— A logical value specifying whether to include a call to the `ssSupportsMultipleExecInstances` function. By default, the value is `false` (0).
 - `supportCodeReuseAcrossModels`— A logical value specifying whether the generated S-function can be reused across the model reference hierarchy. If `true`, the generated S-function includes the `ssSetSupportedForCodeReuseAcrossModels` function call. The code generator produces the code for the S-functions in the `slprj\vert_sharedutils` folder.
 - `supportCoverage`— A logical value specifying whether the generated S-function must be compatible with Model Coverage. By default, the value is `false` (0).
 - `supportCoverageAndDesignVerifier`— A logical value specifying whether the generated S-function must be compatible with Model Coverage and Simulink Design Verifier. By default, the value is `false` (0).
 - `useTlcWithAcceler` — A logical value specifying the setting of the S-function `SS_OPTION_USE_TLC_WITH_ACCELERATOR` option. By default, the value is `true` (1).

modelName

The name of a Simulink model into which Legacy Code Tool is to insert the masked S-function block generated when you specify `legacy_code` with the action character vector `'slblock_generate'`. If you omit this argument, the block appears in an empty model editor window.

libinfo

Get information about library blocks referenced by model

Syntax

```
libdata = libinfo('system')  
libdata = libinfo('system', constraint1, value1, ...)
```

Description

`libdata = libinfo('system')` returns information about library blocks referenced by `system` and all the systems underneath it.

`libdata = libinfo('system', constraint1, value1, ...)` restricts the search as indicated by the search constraint(s) `c1, v1, ...`

Input Arguments

system

The system to search recursively for library blocks.

constraint1, value1, ...

One or more pairs, each consisting of a search constraint followed by a constraint value. You can specify any of the search constraints that you can use with `find_system`.

Output Arguments

libdata

An array of structures that describes each library block referenced by `system`. Each structure has the following fields:

Block	Path of the link to the library block
Library	Name of the library containing the referenced block
ReferenceBlock	Path of the library block
LinkStatus	Value of the LinkStatus parameter for the link to the library block

getPosition

Package: LibraryBrowser

Get position of Simulink Library Browser

Syntax

```
position = getPosition(lb)
```

Description

`position = getPosition(lb)` returns the position of the Simulink Library Browser.

Examples

Get Position of Library Browser

```
lb = LibraryBrowser.LibraryBrowser2;  
getPosition(lb)
```

```
ans =
```

```
    50    279    600    600
```

Input Arguments

lb — Simulink Library Browser

LibraryBrowser.LibraryBrowser2 object

Simulink Library Browser, specified as a LibraryBrowser.LibraryBrowser2 object.

Output Arguments

position — Position of Library Browser

numeric array

Position of Library Browser, returned as a numeric array of integers, in pixels: upper-left x-coordinate, upper-left y-coordinate, width, and height.

refresh

Package: LibraryBrowser

Refresh Simulink Library Browser

Syntax

```
refresh(lb)
```

Description

`refresh(lb)` updates the Simulink Library Browser with changes that affect it. Examples include adding a library to the Library Browser, removing a library from the Library Browser, and making changes to your custom libraries, `slblocks` function, or `sl_customization.m` file.

Examples

Refresh Library Browser

Refresh the Library Browser when you have made any changes that affect libraries on your MATLAB path that are registered in the Library Browser.

```
lb = LibraryBrowser.LibraryBrowser2;  
refresh(lb)
```

Input Arguments

lb — Simulink Library Browser

LibraryBrowser.LibraryBrowser2 object

Simulink Library Browser, specified as a LibraryBrowser.LibraryBrowser2 object.

setPosition

Package: LibraryBrowser

Set position of Simulink Library Browser

Syntax

```
setPosition(lb,position)
```

Description

`setPosition(lb,position)` sets the position of the Simulink Library Browser.

Examples

Set Position of Library Browser

```
lb = LibraryBrowser.LibraryBrowser2;  
setPosition(lb,[70 250 500 500])
```

Input Arguments

lb — Simulink Library Browser

`LibraryBrowser.LibraryBrowser2` object

Simulink Library Browser, specified as a `LibraryBrowser.LibraryBrowser2` object.

position — New position of Library Browser

numeric array

New position of Library Browser, specified as a numeric array of integers, in pixels: upper-left x-coordinate, upper-left y-coordinate, width, and height.

Data Types: `double`

linmod

Extract continuous-time linear state-space model around operating point

Syntax

```
argout = linmod('sys');
argout = linmod('sys', x, u);
argout = linmod('sys', x, u, para);
argout = linmod('sys', x, u, 'v5');
argout = linmod('sys', x, u, para, 'v5');
argout = linmod('sys', x, u, para, xpert, upert, 'v5');
```

Arguments

<code>sys</code>	Name of the Simulink system from which the linear model is extracted.
<code>x</code> and <code>u</code>	State (<code>x</code>) and the input (<code>u</code>) vectors. If specified, they set the operating point at which the linear model is extracted. When a model has model references using the Model block, you must use the Simulink structure format to specify <code>x</code> . To extract the <code>x</code> structure from the model, use the following command: <pre>x = Simulink.BlockDiagram.getInitialState('sys');</pre> <p>You can then change the operating point values within this structure by editing <code>x.signals.values</code>.</p> <p>If the state contains different data types (for example, 'double' and 'uint8'), then you cannot use a vector to specify this state. You must use a structure instead. In addition, you can only specify the state as a vector if the state data type is 'double'.</p>
<code>Ts</code>	Sample time of the discrete-time linearized model
'v5'	An optional argument that invokes the perturbation algorithm created prior to MATLAB 5.3. Invoking this optional argument is equivalent to calling <code>linmodv5</code> .
<code>para</code>	A three-element vector of optional arguments: <ul style="list-style-type: none"> <code>para(1)</code> — Perturbation value of delta, the value used to perform the perturbation of the states and the inputs of the model. This is valid for linearizations using the 'v5' flag. The default value is 1e-05. <code>para(2)</code> — Linearization time. For blocks that are functions of time, you can set this parameter with a nonnegative value that gives the time (<code>t</code>) at which Simulink evaluates the blocks when linearizing a model. The default value is 0. <code>para(3)</code> — Set <code>para(3)=1</code> to remove extra states associated with blocks that have no path from input to output. The default value is 0.

`xpert` and `upert` The perturbation values used to perform the perturbation of all the states and inputs of the model. The default values are

```
xpert = para(1) + 1e-3*para(1)*abs(x)
upert = para(1) + 1e-3*para(1)*abs(u)
```

When a model has model references using the Model block, you must use the Simulink structure format to specify `xpert`. To extract the `xpert` structure, use the following command:

```
xpert = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the perturbation values within this structure by editing `xpert.signals.values`.

The perturbation input arguments are only available when invoking the perturbation algorithm created prior to MATLAB 5.3, either by calling `linmodv5` or specifying the 'v5' input argument to `linmod`.

`argout`

`linmod`, `dlinmod`, and `linmod2` return state-space representations if you specify the output (left-hand) side of the equation as follows:

- `[A,B,C,D] = linmod('sys', x, u)` obtains the linearized model of `sys` around an operating point with the specified state variables `x` and the input `u`. If you omit `x` and `u`, the default values are zero.

`linmod` and `dlinmod` both also return a transfer function and MATLAB data structure representations of the linearized system, depending on how you specify the output (left-hand) side of the equation. Using `linmod` as an example:

- `[num, den] = linmod('sys', x, u)` returns the linearized model in transfer function form.
- `sys_struct = linmod('sys', x, u)` returns a structure that contains the linearized model, including state names, input and output names, and information about the operating point.

Description

`linmod` compute a linear state-space model by linearizing each block in a model individually.

`linmod` obtains linear models from systems of ordinary differential equations described as Simulink models. Inputs and outputs are denoted in Simulink block diagrams using Inport and Outport blocks.

The default algorithm uses preprogrammed analytic block Jacobians for most blocks which should result in more accurate linearization than numerical perturbation of block inputs and states. A list of blocks that have preprogrammed analytic Jacobians is available in the Simulink Control Design documentation along with a discussion of the block-by-block analytic algorithm for linearization.

The default algorithm also allows for special treatment of problematic blocks such as the Transport Delay and the Quantizer. See the mask dialog of these blocks for more information and options.

Notes

By default, the system time is set to zero. For systems that are dependent on time, you can set the variable `para` to a two-element vector, where the second element is used to set the value of `t` at which to obtain the linear model.

The ordering of the states from the nonlinear model to the linear model is maintained. For Simulink systems, a character vector variable that contains the block name associated with each state can be obtained using

```
[sizes,x0,xstring] = sys
```

where `xstring` is a vector of strings whose *i*th row is the block name associated with the *i*th state. Inputs and outputs are numbered sequentially on the diagram.

For single-input multi-output systems, you can convert to transfer function form using the routine `ss2tf` or to zero-pole form using `ss2zp`. You can also convert the linearized models to LTI objects using `ss`. This function produces an LTI object in state-space form that can be further converted to transfer function or zero-pole-gain form using `tf` or `zpk`.

The default algorithms in `linmod` handle Transport Delay blocks by replacing the linearization of the blocks with a Pade approximation. For the 'v5' algorithm, linearization of a model that contains Derivative or Transport Delay blocks can be troublesome. For more information, see "Linearizing Models".

`dlinmod` | `linmod2` | `linmodv5`

Introduced in R2007a

linmod2

Extract continuous-time linear state-space model around operating point

Syntax

```
argout = linmod2('sys', x, u);  
argout = linmod2('sys', x, u, para);
```

Arguments

sys

Name of the Simulink system from which the linear model is extracted.

x, u

State (*x*) and the input (*u*) vectors. If specified, they set the operating point at which the linear model is extracted. When a model has model references using the Model block, you must use the Simulink structure format to specify *x*. To extract the *x* structure from the model, use the following command:

```
x = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the operating point values within this structure by editing `x.signals.values`.

If the state contains different data types (for example, 'double' and 'uint8'), then you cannot use a vector to specify this state. You must use a structure instead. In addition, you can only specify the state as a vector if the state data type is 'double'.

para

A three-element vector of optional arguments:

- `para(1)` — Perturbation value of delta, the value used to perform the perturbation of the states and the inputs of the model. This is valid for linearizations using the 'v5' flag. The default value is 1e-05.
- `para(2)` — Linearization time. For blocks that are functions of time, you can set this parameter with a nonnegative value that gives the time (*t*) at which Simulink evaluates the blocks when linearizing a model. The default value is 0.
- `para(3)` — Set `para(3)=1` to remove extra states associated with blocks that have no path from input to output. The default value is 0.

argout

`linmod`, `dlinmod`, and `linmod2` return state-space representations if you specify the output (left-hand) side of the equation as follows:

- `[A,B,C,D] = linmod('sys', x, u)` obtains the linearized model of `sys` around an operating point with the specified state variables `x` and the input `u`. If you omit `x` and `u`, the default values are zero.

`linmod` and `dlinmod` both also return a transfer function and MATLAB data structure representations of the linearized system, depending on how you specify the output (left-hand) side of the equation. Using `linmod` as an example:

- `[num, den] = linmod('sys', x, u)` returns the linearized model in transfer function form.
- `sys_struct = linmod('sys', x, u)` returns a structure that contains the linearized model, including state names, input and output names, and information about the operating point.

Description

`linmod2` computes a linear state-space model by perturbing the model inputs and model states, and uses an advanced algorithm to reduce truncation error.

`linmod2` obtains linear models from systems of ordinary differential equations described as Simulink models. Inputs and outputs are denoted in Simulink block diagrams using Inport and Outport blocks.

Notes

By default, the system time is set to zero. For systems that are dependent on time, you can set the variable `para` to a two-element vector, where the second element is used to set the value of `t` at which to obtain the linear model.

The ordering of the states from the nonlinear model to the linear model is maintained. For Simulink systems, a character vector variable that contains the block name associated with each state can be obtained using

```
[sizes,x0,xstring] = sys
```

where `xstring` is a vector of strings whose *i*th row is the block name associated with the *i*th state. Inputs and outputs are numbered sequentially on the diagram.

For single-input multi-output systems, you can convert to transfer function form using the routine `ss2tf` or to zero-pole form using `ss2zp`. You can also convert the linearized models to LTI objects using `ss`. This function produces an LTI object in state-space form that can be further converted to transfer function or zero-pole-gain form using `tf` or `zpk`.

The default algorithms in `linmod` and `dlinmod` handle Transport Delay blocks by replacing the linearization of the blocks with a Pade approximation. For more information, see “Linearizing Models”.

`dlinmod` | `linmod` | `linmodv5`

Introduced in R2007a

linmodv5

Extract continuous-time linear state-space model around operating point

Syntax

```
argout = linmodv5('sys');
argout = linmodv5('sys',x,u);
argout = linmodv5('sys', x, u, para);
argout = linmodv5('sys', x, u, para, xpert, upert);
```

Arguments

sys

Name of the Simulink system from which the linear model is extracted.

x, u

State (x) and the input (u) vectors. If specified, they set the operating point at which the linear model is extracted. When a model has model references using the Model block, you must use the Simulink structure format to specify x . To extract the x structure from the model, use the following command:

```
x = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the operating point values within this structure by editing `x.signals.values`.

If the state contains different data types (for example, 'double' and 'uint8'), then you cannot use a vector to specify this state. You must use a structure instead. In addition, you can only specify the state as a vector if the state data type is 'double'.

para

A three-element vector of optional arguments:

- `para(1)` — Perturbation value of delta, the value used to perform the perturbation of the states and the inputs of the model. This is valid for linearizations using the 'v5' flag. The default value is 1e-05.
- `para(2)` — Linearization time. For blocks that are functions of time, you can set this parameter with a nonnegative value that gives the time (t) at which Simulink evaluates the blocks when linearizing a model. The default value is 0.
- `para(3)` — Set `para(3)=1` to remove extra states associated with blocks that have no path from input to output. The default value is 0.

xpert, upert

The perturbation values used to perform the perturbation of all the states and inputs of the model. The default values are

```
xpert = para(1) + 1e-3*para(1)*abs(x)
upert = para(1) + 1e-3*para(1)*abs(u)
```

When a model has model references using the Model block, you must use the Simulink structure format to specify *xpert*. To extract the *xpert* structure, use the following command:

```
xpert = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the perturbation values within this structure by editing `xpert.signals.values`.

The perturbation input arguments are only available when invoking the perturbation algorithm created prior to MATLAB 5.3, either by calling `linmodv5` or specifying the 'v5' input argument to `linmod`.

argout

`linmod`, `dlinmod`, and `linmod2` return state-space representations if you specify the output (left-hand) side of the equation as follows:

- `[A,B,C,D] = linmod('sys', x, u)` obtains the linearized model of *sys* around an operating point with the specified state variables *x* and the input *u*. If you omit *x* and *u*, the default values are zero.

`linmod` and `dlinmod` both also return a transfer function and MATLAB data structure representations of the linearized system, depending on how you specify the output (left-hand) side of the equation. Using `linmod` as an example:

- `[num, den] = linmod('sys', x, u)` returns the linearized model in transfer function form.
- `sys_struct = linmod('sys', x, u)` returns a structure that contains the linearized model, including state names, input and output names, and information about the operating point.

Description

`linmodv5` computes a linear state space model using the full model perturbation algorithm created prior to MATLAB 5.3.

`linmodv5` obtains linear models from systems of ordinary differential equations described as Simulink models. Inputs and outputs are denoted in Simulink block diagrams using Inport and Outport blocks.

Notes

By default, the system time is set to zero. For systems that are dependent on time, you can set the variable *para* to a two-element vector, where the second element is used to set the value of *t* at which to obtain the linear model.

The ordering of the states from the nonlinear model to the linear model is maintained. For Simulink systems, a character vector variable that contains the block name associated with each state can be obtained using

```
[sizes,x0,xstring] = sys
```

where `xstring` is a vector of strings whose *i*th row is the block name associated with the *i*th state. Inputs and outputs are numbered sequentially on the diagram.

For single-input multi-output systems, you can convert to transfer function form using the routine `ss2tf` or to zero-pole form using `ss2zp`. You can also convert the linearized models to LTI objects using `ss`. This function produces an LTI object in state-space form that can be further converted to transfer function or zero-pole-gain form using `tf` or `zpk`.

The default algorithms in `linmod` and `dlinmod` handle Transport Delay blocks by replacing the linearization of the blocks with a Pade approximation. For the 'v5' algorithm, linearization of a model that contains Derivative or Transport Delay blocks can be troublesome. For more information, see "Linearizing Models".

`dlinmod` | `linmod` | `linmod2`

Introduced in R2011b

load_system

Load Simulink model into memory

Syntax

```
handle = load_system(sys)
```

Description

`handle = load_system(sys)` loads the model `sys` into memory without opening the model in the Simulink Editor. After you load a model into memory, you can work with it using Simulink API commands. Save changes to the model using `save_system`.

Examples

Load Model into Memory

Load the model `vdp` into memory and return the model handle.

```
h = load_system("vdp")
```

```
h =
```

```
172.0004
```

Input Arguments

sys — System to search

character vector | string scalar

System to search, specified as the full system path name, a cell array of system path names, a handle, or a vector of handles.

Example: "vdp"

Example: 'MyModel/Subsystem1'

Example: {'vdp', 'fuelssystem'}

Output Arguments

handle — Handle of loaded model

handle

Handle of loaded model.

See Also

`close_system` | `open_system` | `save_system`

Introduced before R2006a

loadIntoMemory

Load logged data into memory

Syntax

```
logs = loadIntoMemory(logs)
```

Description

`logs = loadIntoMemory(logs)` loads the data in `logs` into memory. Data is logged to a repository and brought into memory on an as-needed basis. When you want to work with all elements of a large set of logged data, use `loadIntoMemory` to bring all of the elements into memory at once. Loading all the data at once, rather than element by element, is much faster.

Examples

Load Logged Data into Memory

This example shows how to load a set of logged data into memory all at once, rather than element by element.

```
% Simulate model to generate logged data
sim('sldemo_fuelsys')
```

The simulation logs all of the instrumented signals in the model to the `Simulink.SimulationData.Dataset` object `sldemo_fuelsys_output`. At the end of simulation, the signal data remains in the repository until used in the MATLAB workspace. When you work with small sets of data or only postprocess a subset, leaving signals in the repository improves performance. But when you have a large set of data and need to postprocess all of the signals, you should bring them all into memory at once.

```
% Load all logged signals into memory
loadIntoMemory(sldemo_fuelsys_output);
```

All of the data in `sldemo_fuelsys_output` is now available for efficient postprocessing.

Input Arguments

logs — Data to load into memory

'Simulink.SimulationData.Dataset' | 'Simulink.SimulationOutput'

Data to load into memory. The `loadIntoMemory` function can load `Simulink.SimulationData.Dataset` and `Simulink.SimulationOutput` data.

Example: `logout`

Output Arguments

Logs — Data

'Simulink.SimulationData.Dataset' | 'Simulink.SimulationOutput'

Data loaded into memory.

See Also

Simulink.SimulationData.Dataset | Simulink.SimulationOutput

Introduced in R2017b

model

Execute particular phase of simulation of model

Syntax

```
[sys,x0,str,ts] = model([],[],[],'sizes');  
[sys,x0,str,ts] = model([],[],[],'compile');  
outputs = model(t,x,u,'outputs');  
derivs = model(t,x,u,'derivs');  
dstates = model(t,x,u,'update');  
model([],[],[],'term');
```

Description

The `model` command executes a specific phase of the simulation of a Simulink model whose name is `model`. The command's last argument (`flag`) specifies the phase of the simulation to be executed. See “Simulation Phases in Dynamic Systems” for a description of the steps that Simulink software uses to simulate a model.

This command ignores the effects of state transitions and conditional execution. Therefore, it is not suitable for models which have such logic. Use this command for models which can be represented as simple dynamic systems. Such systems should meet these requirements.

- All states in the model must be built-in non-bus data types. For a discussion on built-in data types, see “About Data Types in Simulink”.
- If you are using vector format to specify the state, this command can access only non-complex states of `double` data type.
- There is minimal amount of state logic (Stateflow, conditionally executed subsystems etc.)
- The models are not mixed-domain models. That is, most blocks in the model are built-in Simulink blocks and do not include user-written S-functions or blocks from other Sim* products.

For models which do not comply with these requirements, using this command can cause Simulink to produce results which can only be interpreted by further analyzing and simplifying the model.

Note The state variable `x` can be represented in structure as well as vector formats. The variable follows the limitations of the format in which it is specified.

This command is also not intended to be used to run a model step-by-step, for example, to debug a model. Use the Simulink debugger if you need to examine intermediate results to debug a model.

Arguments

<code>sys</code>	<p>Vector of model size data:</p> <ul style="list-style-type: none"> • <code>sys(1)</code> = number of continuous states • <code>sys(2)</code> = number of discrete states • <code>sys(3)</code> = number of outputs • <code>sys(4)</code> = number of inputs • <code>sys(5)</code> = reserved • <code>sys(6)</code> = direct-feedthrough flag (1 = yes, 0 = no) • <code>sys(7)</code> = number of Continuous, Discrete, Fixed in minor step, and Controllable sample times (= number of rows in <code>ts</code>)
<code>x0</code>	Vector containing the initial conditions of the system's states
<code>str</code>	Vector of names of the blocks associated with the model's states. The state names and initial conditions appear in the same order in <code>str</code> and <code>x0</code> , respectively.
<code>ts</code>	<p>An m-by-2 matrix containing the sample time (period, offset) information of the Continuous, Discrete, Fixed in minor step, and Controllable sample times in the model.</p> <p>For more information on the sample times in Simulink, see “Types of Sample Time”.</p>
<code>outputs</code>	Outputs of the model at time step <code>t</code> .
<code>derivs</code>	Derivatives of the continuous states of the model at time <code>t</code> .
<code>dstates</code>	<p>States of the model at time <code>t</code> returned as either a structure or an array. Simulink returns a structure when the model has states and <code>x</code> is either empty (<code>[]</code>) or in structure format. Otherwise, Simulink returns an array.</p> <ul style="list-style-type: none"> • If the return type is a vector or array, Simulink returns real double discrete states only. • If the return type is a structure, Simulink returns a structure that contains both continuous and discrete states of built-in types only. Non-built-in types are omitted.
<code>t</code>	Time step, specified as real double in scalar format.
<code>x</code>	State vector, specified as real double in structure or vector format.
<code>u</code>	Inputs, specified as real double in vector format.

flag	<p>Specification of the simulation phase to be executed:</p> <ul style="list-style-type: none"> • 'sizes' executes the size computation phase of the simulation. This phase determines the sizes of the model's inputs, outputs, state vector, etc. • 'compile' executes the compilation phase of the simulation. The compilation phase propagates signal and sample time attributes. • 'update' computes the next values of the model's discrete states. • 'outputs' computes the outputs of the model's blocks at time <i>t</i>. • 'derivs' computes the derivatives of the model's continuous states at time step <i>t</i>. • 'term' causes Simulink software to terminate simulation of the model. <hr/> <p>Note The <code>output</code>, <code>update</code>, and <code>derivs</code> flags are valid only for single-tasking models. For more information on single-tasking and multi-tasking, see “Tasking Modes” (Simulink Coder).</p>
------	---

Examples

The following command executes the compilation phase of the `vdp` model that comes with Simulink software.

```
vdp([], [], [], 'compile')
```

The following command terminates the simulation initiated in the previous example.

```
vdp([], [], [], 'term')
```

Note Simulink does not let you close a model while it is compiling or simulating. For all phases except the 'sizes' phase, before closing the model, you must invoke the model command with the 'term' argument.

`sim`

Introduced in R2007a

modeladvisor

Open Model Advisor

Syntax

```
modeladvisor(model)
modeladvisor(model, 'configuration', configfile)
```

Description

`modeladvisor(model)` opens the Model Advisor for the model or subsystem specified by `model`. If the specified model or subsystem is not open, this command opens it.

If you have a Simulink Check™ license, you can specify a name-value pair with `modeladvisor(model, 'configuration', configfile)` that opens the Model Advisor with a custom configuration. The configuration defines the organization of folders and checks in the Model Advisor. For more information, see “Create and Deploy a Model Advisor Custom Configuration” (Simulink Check).

Examples

Open Model Advisor for model

Open the Model Advisor for vdp example model:

```
modeladvisor('vdp')
```

Open Model Advisor for subsystem

Open the Model Advisor for the Aircraft Dynamics Model subsystem of the f14 example model:

```
modeladvisor('f14/Aircraft Dynamics Model')
```

Open Model Advisor for currently selected model

Open the Model Advisor on the currently selected model:

```
modeladvisor(bdroot)
```

Open Model Advisor for currently selected subsystem

Open the Model Advisor on the currently selected subsystem:

modeladvisor(gcs)

Input Arguments

model — Model or subsystem name

character vector

Model or subsystem name or handle, specified as a character vector.

Data Types: char

configfile — Custom configuration

character vector

File that contains a Model Advisor custom configuration of folders and checks (available with a Simulink Check license).

Data Types: char

“Run Model Advisor Checks”

Introduced before R2006a

new_system

Create Simulink model or library in memory

Syntax

```
h = new_system

h = new_system(name)
h = new_system(name, 'FromTemplate', template)
h = new_system(name, 'FromFile', file)
h = new_system( ___, 'ErrorIfShadowed' )

h = new_system(name, 'Model' )
h = new_system(name, 'Model', subsystem)
h = new_system(name, 'Subsystem' )
h = new_system(name, 'Library' )
h = new_system( ___, 'ErrorIfShadowed' )
```

Description

`h = new_system` creates a model named `untitled` (and then `untitled1`, `untitled2`, and so on) based on your default model template and returns the new model's numeric handle. Select your default model template on the Simulink start page or by using the `Simulink.defaultModelTemplate` function.

The `new_system` function does not open the new model. This function creates the model in memory. To save the model, use `save_system`, or open the model with `open_system` and then save it using the Simulink Editor.

`h = new_system(name)` creates a model based on your default model template and gives the new model the specified name. This function returns the new model's numeric handle. Select your default model template on the Simulink start page or by using the `Simulink.defaultModelTemplate` function.

If `name` is empty, the function creates a model named `untitled`, `untitled1`, `untitled2`, and so on.

The `new_system` function does not open the new model. This function creates the model in memory. To save the model, use `save_system`, or open the model with `open_system` and then save it using the Simulink Editor.

`h = new_system(name, 'FromTemplate', template)` creates the model based on the specified template.

`h = new_system(name, 'FromFile', file)` creates the model based on the specified model or template.

`h = new_system(___, 'ErrorIfShadowed')` creates the model or returns an error if another model, MATLAB file, or variable with the same name is on the MATLAB path or in the workspace. It uses any of the input arguments in the previous syntaxes.

`h = new_system(name, 'Model')` creates an empty model based on the Simulink default model and returns the new model's numeric handle. The Simulink default model is also known as the root block diagram and has the numeric handle 0. If `name` is empty, the function creates a model or library named `untitled`, `untitled1`, `untitled2`, and so on.

The `new_system` function does not open the new model. This function creates the model in memory. To save the model, use `save_system`, or open the model with `open_system` and then save it using the Simulink Editor.

`h = new_system(name, 'Model', subsystem)` creates a model based on the subsystem `subsystem` in a currently loaded model.

`h = new_system(name, 'Subsystem')` creates an empty subsystem file that has the specified name.

`h = new_system(name, 'Library')` creates an empty library that has the specified name and returns a numeric handle.

`h = new_system(____, 'ErrorIfShadowed')` returns an error if another model, MATLAB file, or variable with the same name is on the MATLAB path or in the workspace. This syntax uses any of the input arguments in the previous syntaxes.

Examples

Create a Model Based on Default Template

Create a model in memory called `untitled`.

```
h = new_system;
```

You can use `get_param` to get the name.

```
get_param(h, 'Name')
open_system(h)
open_system('untitled')
open_system(get_param(h, 'Name'))
```

```
ans =
```

```
untitled
```

Use the name, the handle, or `get_param` command as input to `open_system`. You can use any of these commands:

Create a Model Based on Named Template

Before you use this syntax, create a template. In the Simulink Editor, create the model you want to use as the template, then in the **Simulation** tab, select **Save > Template**. For this example, name the template `mytemplate`.

By default, the template is on the MATLAB path, so if you change location, add the folder to the MATLAB path.

Create a model named `templateModel` based on the template `mytemplate`.

```
h = new_system('templateModel','FromTemplate','mytemplate');
```

Invoking `template` \\myuserdir\Documents\MATLAB\mytemplate.sltx

Create a Model Based on Another Model

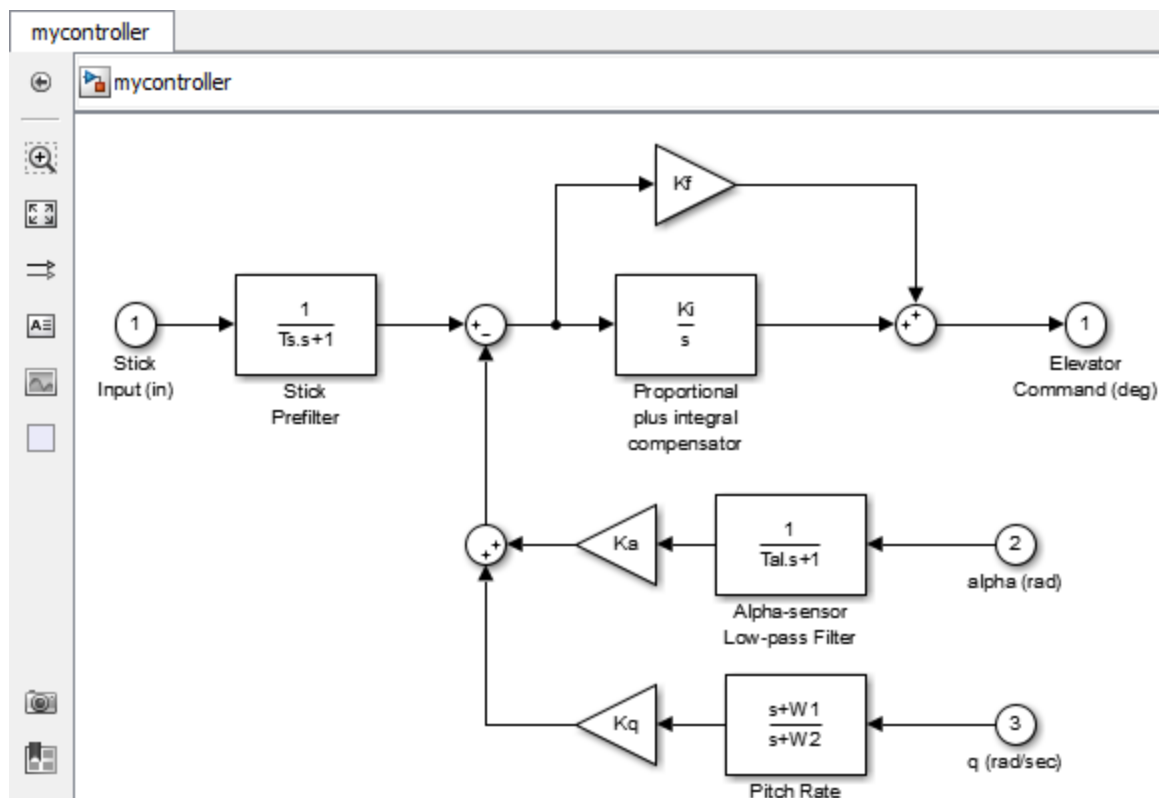

Create a model named `mynewmodel` based on `myoldmodel`, which is in the current folder.

```
h = new_system('mynewmodel','FromFile','myoldmodel.slx');
```

Create Model from Subsystem

Load the model `f14`. Create a model based on the Controller subsystem.

```
load_system('f14');
new_system('mycontroller','Model','f14/Controller');
open_system('mycontroller');
```

Create a Library

Create a library in memory and then open it.

```
new_system('mylib','Library')
open_system('mylib')
```

Create a Subsystem File

Create a subsystem file in memory and then open it.

```
new_system('mysubsystem','Subsystem')
open_system('mysubsystem')
```

Ensure Model Name Is Unique

Create a variable with the name myvar.

```
myvar = 17
```

Try to create a model that uses the same name as the variable. When you use the 'ErrorIfShadowed' option, the new_system function returns an error.

```
new_system('myvar2','Model','ErrorIfShadowed')
```

The model 'myvar2' cannot be created because this name is shadowing another name on the MATLAB path or in the workspace. Choose another name, or do not use the option 'ErrorIfShadowed'

Input Arguments

name — Name of new model or library

character vector

Name of new model or library, specified as a character vector that:

- Has 63 or fewer characters
- Is not a MATLAB keyword
- Is not 'simulink'
- Is unique among model names, variables, and MATLAB files on the MATLAB path and in the workspace

Example: 'mymodel', 'mylibrary'

subsys — Subsystem to base new model on

subsystem block path name

Subsystem to base the new model on, specified as the subsystem block path name in a currently open model.

Example: 'f14/Controller'

template — Name of template to base new model on

character vector

Name of the template to base the new model on, specified as a character vector of the name of a template on the MATLAB path. Create a template in the Simulink Editor. In the **Simulation** tab, select **Save > Template**.

Example: 'mytemplate', 'mytemplate.slx'

file — Path name of model or template to base new model on

character vector

Path name of the model or template to base the new model on, specified as a character vector. You can use an `.mdl`, `.slx`, or `.sltx` file. Include the extension and use a full or relative path.

Example: 'Models/mymodel.slx', 'mytemplate.slx', 'model.mdl'

Introduced before R2006a

num2fixpt

Convert number to nearest value representable by specified fixed-point data type

Syntax

```
outValue = num2fixpt(OrigValue, FixPtDataType, FixPtScaling,
                    RndMeth, DoSatur)
```

Description

`num2fixpt(OrigValue, FixPtDataType, FixPtScaling, RndMeth, DoSatur)` returns the result of converting `OrigValue` to the nearest value representable by the fixed-point data type `FixPtDataType`. Both `OrigValue` and `outValue` are of data type `double`. As illustrated in the example that follows, you can use `num2fixpt` to investigate quantization error that might result from converting a number to a fixed-point data type. The arguments of `num2fixpt` include:

<code>OrigValue</code>	Value to be converted to a fixed-point representation. Must be specified using a <code>double</code> data type.
<code>FixPtDataType</code>	The fixed-point data type used to convert <code>OrigValue</code> .
<code>FixPtScaling</code>	Scaling of the output in either <code>Slope</code> or <code>[Slope Bias]</code> format. If <code>FixPtDataType</code> does not specify a generalized fixed-point data type using the <code>sfix</code> or <code>ufix</code> command, <code>FixPtScaling</code> is ignored.
<code>RndMeth</code>	Rounding technique used if the fixed-point data type lacks the precision to represent <code>OrigValue</code> . If <code>FixPtDataType</code> specifies a floating-point data type using the <code>float</code> command, <code>RndMeth</code> is ignored. Valid values are <code>Zero</code> , <code>Nearest</code> , <code>Ceiling</code> , or <code>Floor</code> (the default).
<code>DoSatur</code>	Indicates whether the output should be saturated to the minimum or maximum representable value upon underflow or overflow. If <code>FixPtDataType</code> specifies a floating-point data type using the <code>float</code> command, <code>DoSatur</code> is ignored. Valid values are <code>on</code> or <code>off</code> (the default).

Examples

Suppose you wish to investigate the quantization effect associated with representing the real-world value 9.875 as a signed, 8-bit fixed-point number. The command

```
num2fixpt(9.875, sfix(8), 2^-1)
```

```
ans =
```

```
9.500000000000000
```

reveals that a slope of 2^{-1} results in a quantization error of 0.375. The command

```
num2fixpt(9.875, sfix(8), 2^-2)
```

```
ans =
```

```
9.750000000000000
```

demonstrates that a slope of 2^{-2} reduces the quantization error to 0.125. But a slope of 2^{-3} , as used in the command

```
num2fixpt(9.875, sfix(8), 2^-3)
```

```
ans =
```

```
9.87500000000000
```

eliminates the quantization error entirely.

Introduced before R2006a

open_system

Open model, library, subsystem, or block dialog box

Syntax

```
open_system(obj)

open_system(sys, 'loadonly')

open_system(sbsys, 'window')
open_system(sbsys, 'tab')

open_system(blk, 'mask')
open_system(blk, 'force')
open_system(blk, 'parameter')
open_system(blk, 'OpenFcn')
```

Description

`open_system(obj)` opens the specified model, library, subsystem, or block. This is equivalent to double-clicking the model or library in the Current Folder Browser, or the subsystem or block in the Simulink Editor.

A model or library opens in a new window. For a subsystem or block within a model, the behavior depends on the type of block and its properties.

- Any `OpenFcn` callback parameter is evaluated.
- If there is no `OpenFcn` callback, and a mask is defined, the mask parameter dialog box opens.
- Without an `OpenFcn` callback or a mask parameter, Simulink opens the object.
 - A referenced model opens in a new window.
 - A subsystem opens in a new tab in the same window.
 - For blocks, the parameters dialog box for the block opens.

To open a specific subsystem or block, you must load the model or library containing it. Otherwise Simulink returns an error.

You can override the default behavior by supplying a second input argument.

`open_system(sys, 'loadonly')` loads the specified model or library without opening the Simulink Editor. This is equivalent to using `load_system`.

`open_system(sbsys, 'window')` opens the subsystem `sbsys` in a new Simulink Editor window. Before opening a specific subsystem or block, load the model or library containing it. Otherwise Simulink returns an error.

`open_system(sbsys, 'tab')` opens the subsystem in a new Simulink Editor tab in the same window. Before opening a specific subsystem or block, load the model or library containing it. Otherwise Simulink returns an error.

`open_system(blk, 'mask')` opens the mask dialog box of the block or subsystem specified by `blk`. Load the model or library containing `blk` before opening it.

`open_system(blk, 'force')` looks under the mask of a masked block or subsystem. It opens the dialog box of the block under the mask or opens a masked subsystems in a new Simulink Editor tab. This is equivalent to the **Look Under Mask** menu item. Before opening a specific subsystem or block, load the model or library containing it. Otherwise Simulink returns an error.

`open_system(blk, 'parameter')` opens the block parameter dialog box.

`open_system(blk, 'OpenFcn')` runs the block callback `OpenFcn`.

Examples

Open a Model

Open the f14 model.

```
open_system('f14')
```

Load a Model Without Opening it

Load the f14 model.

```
open_system('f14', 'loadonly')
```

Open a Subsystem

Open the Controller subsystem of the f14 model.

```
load_system('f14')  
open_system('f14/Controller')
```

Open a Subsystem in New Tab in Existing Window

Open the f14 model and open the Controller subsystem in a new tab.

```
f14  
open_system('f14/Controller', 'tab')
```

Open a Subsystem in a Separate Window

Open a subsystem in its own Simulink Editor window.

```
open_system('f14')  
open_system('f14/Controller', 'window')
```

Open a Referenced Model

Open the model `sldemo_mdhref_counter`, which is referenced by the CounterA Model block in `sldemo_mdhref_basic`.

```
open_system('sldemo_mdhref_basic')
open_system('sldemo_mdhref_basic/CounterA')
```

The referenced model opens in its own Simulink Editor window as a top model. To open the referenced model in the context of a model hierarchy, use the `open` function with a `Simulink.BlockPath` object.

Open Block Dialog Box

Open the block parameters dialog box for the first Gain block in the Controller subsystem.

```
load_system('f14')
open_system('f14/Controller/Gain')
```

Run Block Open Callback Function

Define an `OpenFcn` callback for a block and execute the block callback.

```
f14
set_param('f14/Pilot','OpenFcn','disp(''Hello World!'')')
open_system('f14/Pilot','OpenFcn')
```

The words `Hello World` appear on the MATLAB Command Prompt.

Open Masked Subsystem

Open the contents of the masked subsystem `Vehicle` in the model `sf_car`.

```
open_system('sf_car')
open_system('sf_car/Vehicle','force')
```

Open Multiple Systems with One Command

Create a cell array of two model names, `f14` and `vdp`. Open both models using `open_system` with the cell array name.

```
models = {'f14','vdp'}
open_system(models)
```

Input Arguments

obj — Model, referenced model, library, subsystem, or block path

character vector

Model, referenced model, library, subsystem, or block path, specified as a character vector. If the model is not on the MATLAB path, specify the full path to the model file. Specify the block or subsystem using its full name, e.g., `f14/Controller/Gain`, on an opened or loaded model. On UNIX systems, the fully qualified path name of a model can start with a tilde (~), signifying your home directory.

Data Types: char

sys — Model or library path

character vector

The full name or path of a model or library, specified as a character vector.

Data Types: char

sbsys — Subsystem path

character vector

The full name or path of a subsystem in an open or loaded model, specified as a character vector.

Data Types: char

blk — Block or subsystem path

character vector

The full name or path of a block or subsystem in an open or loaded model, specified as a character vector.

Data Types: char

Tips

To open a referenced model in the context of a model hierarchy, use the `open` function with a `Simulink.BlockPath` object.

See Also

`close_system` | `load_system` | `new_system` | `open (BlockPath)` | `save_system`

Introduced before R2006a

openDialog

Open configuration parameters dialog

Syntax

```
openDialog(configObj)
```

Arguments

configObj

A configuration set (`Simulink.ConfigSet`) or configuration reference (`Simulink.ConfigSetRef`)

Description

`openDialog` opens a configuration parameters dialog box. If *configObj* is a configuration set, the dialog box displays the configuration set. If *configObj* is a configuration reference, the dialog box displays the referenced configuration set, or generates an error if the reference does not specify a valid configuration set. If the dialog box is already open, its window becomes selected.

Examples

The following example opens a configuration parameters dialog box that shows the current parameters for the current model. The parameter values derive from the active configuration set or configuration reference (configuration object). The code is the same in either case; the only difference is which type of configuration object is currently active.

```
myConfigObj = getActiveConfigSet(gcs);  
openDialog(myConfigObj);
```

“Share a Configuration with Multiple Models”

Introduced in R2006b

openReport

Package: Simulink

Open MATLAB function report

Syntax

```
openReport(config)
```

Description

`openReport(config)` opens the MATLAB function report for a MATLAB Function block.

Examples

Open and Close MATLAB Function Report

Access the `MATLABFunctionConfiguration` object for the MATLAB Function block in the model `call_stats_block1` described in “Create Custom Functionality Using MATLAB Function Block”.

```
config = get_param('call_stats_block1/MATLAB Function', ...  
    'MATLABFunctionConfiguration');
```

Open the MATLAB function report.

```
openReport(config)
```

Close the MATLAB function report.

```
closeReport(config)
```

Input Arguments

config — MATLAB Function block property configuration

`MATLABFunctionConfiguration` object

MATLAB Function block property configuration, specified as a `MATLABFunctionConfiguration` object.

Data Types: `MATLABFunctionConfiguration`

Tips

The first time that you open the MATLAB function report, Simulink automatically updates your model. If you make subsequent changes to the MATLAB code in the block, you must update your model before you reopen the report. Otherwise, the report does not reflect your changes. From the **Modeling** tab, select **Update Model**, or press **Ctrl-D**. For more information, see “Update Diagram and Run Simulation”.

Introduced in R2021a

parsim

Simulate dynamic system multiple times in parallel or serial

Syntax

```
simOut = parsim(in)
simOut = parsim(in, 'ShowSimulationManager', 'on')
simOut = parsim(in, Name, Value)
```

Description

`simOut = parsim(in)` simulates a model using the inputs specified in the `SimulationInput` object, `in`. The `parsim` command uses an array of `SimulationInput` objects to run multiple simulations.

`simOut = parsim(in, 'ShowSimulationManager', 'on')` simulates a model in parallel using the inputs specified in the `SimulationInput` object and opens the Simulation Manager UI. For more information, see `Simulation Manager`.

`simOut = parsim(in, Name, Value)` simulates a model in parallel using the inputs specified in the `SimulationInput` object and the options specified as the `Name, Value` pair.

The `parsim` command uses the Parallel Computing Toolbox license to run the simulations in parallel. `parsim` runs the simulations in serial if a parallel pool cannot be created or if Parallel Computing Toolbox is not used.

Examples

Using `parsim` with Rapid Accelerator

Simulate the model, `vdp`, in rapid accelerator mode.

Load the model.

```
model = 'vdp';
load_system(model)
```

This step builds the Rapid Accelerator target

```
Simulink.BlockDiagram.buildRapidAcceleratorTarget(model);
```

Create a `SimulationInput` object and use `setModelParameter` method to set `RapidAcceleratorUpToDateCheck` to 'off'.

```
in = Simulink.SimulationInput(model);
in = in.setModelParameter('SimulationMode', 'rapid-accelerator');
in = in.setModelParameter('RapidAcceleratorUpToDateCheck', 'off');
```

Simulate the model.

```
out = parsim(in)
```

Simulate Model in Parallel with parsim

Simulate the model, CSTR, in parallel by sweeping over a variable. An array of `SimulationInput` objects is used to perform the sweep.

Specify sweep values.

```
FeedTempSweep = 250:10:300;
```

Create an array of `SimulationInput` objects.

```
for i = length(FeedTempSweep):-1:1
in(i) = Simulink.SimulationInput('CSTR');
in(i) = in(i).setVariable('FeedTemp0',FeedTempSweep(i));
end
```

Simulate the model in parallel.

```
out = parsim(in, 'ShowProgress', 'on')
```

```
[11-Dec-2020 09:14:55] Checking for availability of parallel pool...

[11-Dec-2020 09:17:02] Cleaning up parallel workers...
```

```
out =
```

```
1x6 Simulink.SimulationOutput array
```

Input Arguments

in — `Simulink.SimulationInput` object used to simulate the model
object, array

A `Simulink.SimulationInput` object or an array of `Simulink.SimulationInput` objects that is used to specify changes to the model for a simulation.

Example: `in = Simulink.SimulationInput('vdp')`

Name-Value Pair Arguments

Note All parameters passed to `parsim` command are unrelated to the parameters that are used with the `sim` command. To pass to the `parsim` command, use the list of following input arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` and `Value` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: 'ShowProgress', 'on'

AttachedFiles — Files to attach to parallel pool

cell array

Specified as a cell array of additional files to attach to the parallel pool.

ShowProgress — Show the progress of the simulations

'on'(default) | 'off'

Set to 'on', to see the progress of the simulations in the command window. The progress is hidden when set to 'off'.

Note When the progress is shown, a message 'Cleaning up parallel workers..' may be displayed before the completion of the last few simulations. This message does not depend on the completion of the simulations. Simulations complete when the outputs are fetched from the future. For more information, see `Simulink.Simulation.Future`.

RunInBackground — Run simulations in background

'off' (default) | 'on'

Set to 'on' to run simulations asynchronously, keeping the MATLAB command prompt available for use.

SetupFcn — Function handle to run once per worker

function handle

Specify a function handle to 'SetupFcn' to run once per worker before the start of the simulations.

Example: 'SetupFcn', @()currentProject('Modelex/Model_example.prj')

Note When `buildRapidAcceleratorTarget` is used in the `SetupFcn` and the model has external inputs specified, either set 'LoadExternalInput' to 'off' or ensure that the specified external input is available on the workers to prevent compilation error.

CleanupFcn — Function handle to run once per worker after running simulations

function handle

Specify a function handle to 'CleanupFcn' to run once per worker after the simulations are completed.

ManageDependencies — Manage model dependencies

'on' (default) | 'off'

When `ManageDependencies` is set to on, model dependencies are automatically sent to the parallel workers if required. If `ManageDependencies` is set to off, explicitly attach model dependencies to the parallel pool.

UseFastRestart — Use fast restart

'off' (default) | 'on'

When `UseFastRestart` is set to on, simulations run on the workers using fast restart.

When performing a parameter sweep varying properties of a Simscape component (e.g. mass and inertia of a Solid block in Simscape Multibody), specify the Simscape block parameter as run-time configurable. For more information, see “About Simscape Run-Time Parameters” (Simscape).

Note When using `parsim`, use the `UseFastRestart` option and not the `FastRestart` option. See “Get Started with Fast Restart” for more information.

TransferBaseWorkspaceVariables — Transfer variables to the parallel workers

'off' (default) | 'on'

When `TransferBaseWorkspaceVariables` is set to on, variables used in the model and everything defined in the base workspace are transferred to the parallel workers.

ShowSimulationManager — Starts the Simulation Manager app

'off' (default) | 'on'

When '`ShowSimulationManager`' is set to 'on', you can use the Simulation Manager App to monitor simulations.

StopOnError — Stop simulations on errors

'off' (default) | 'on'

Setting '`StopOnError`' to 'on' stops the execution of simulations if an error is encountered.

Output Arguments

simOut — Simulation object containing logged simulation results

object

Array of `Simulink.SimulationOutput` objects that contains all of the logged simulation results. The size of the array is equal to the size of the array of `Simulink.SimulationInput` objects.

All simulation outputs (logged time, states, and signals) are returned in a single `Simulink.SimulationOutput` object. You define the model time, states, and output that is logged using the **Data Import/Export** pane of the Model Configuration Parameters dialog box. You can log signals using blocks such as the To Workspace and Scope blocks. The **Signal & Scope Manager** can directly log signals.

Extended Capabilities

Automatic Parallel Support

Accelerate code by automatically running computation in parallel using Parallel Computing Toolbox™.

If you have Parallel Computing Toolbox installed, then when you use `parsim`, MATLAB automatically opens a parallel pool of workers on your local machine. MATLAB runs the simulations across the available workers. Control parallel behavior with the parallel preferences, including scaling up to a cluster.

For details, see “Run Multiple Simulations”.

performanceadvisor

Open Performance Advisor

Syntax

```
performanceadvisor(model)
```

Description

`performanceadvisor(model)` opens the Performance Advisor on the model or subsystem specified by `model`. If the specified model or subsystem is not open, this command opens it.

Input Arguments

model

A character vector specifying the name or handle to the model or subsystem.

Examples

Open Performance Advisor

Open Performance Advisor on the `vdp` example model.

```
performanceadvisor('vdp')
```

Performance Advisor opens the `vdp` model and opens Performance Advisor on the model.

Alternatives

In the Simulink Editor, in the **Debug** tab, click **Performance Advisor**.

Introduced in R2013a

polyspacePackNGo

Generate and package options files to run Polyspace analysis on code generated from Simulink model

Syntax

```
archivePath = polyspacePackNGo mdlName)
archivePath = polyspacePackNGo mdlName, psOpt)
archivePath = polyspacePackNGo mdlName, psOpt, asModelRef)
```

Description

`archivePath = polyspacePackNGo mdlName)` examines the Simulink model `mdlName`, extracts Polyspace® options files from it, and packages the options files in the zip file located at `archivePath`. Before using `polyspacePackNGo`, generate code from your Simulink model. Then archive the generated code, for instance, by using `packNGo`. Generate the Polyspace options files from the Simulink model and include them in the code archive by using `polyspacePackNGo`. In a different development environment, when running a Polyspace analysis of the generated code, use the options files included in the code archive to preserve model-specific information, such as design range specifications. You must have Embedded Coder to use `slbuild`.

`archivePath = polyspacePackNGo mdlName, psOpt)` generates and packages the Polyspace options files that are generated according to the specification in `psOpt`. The object `psOpt` must be a Polyspace options object that is generated by using `pslinkoptions`. Using `psOpt`, modify the options for the Polyspace analysis.

`archivePath = polyspacePackNGo mdlName, psOpt, asModelRef)` generates and packages the Polyspace options files by using `asModelRef` to specify whether to generate option files for model reference code or standalone code.

Examples

Generate and Package Polyspace Options Files

To generate and package Polyspace options files for a Simulink model, use `polyspacePackNGo`.

Open the Simulink model `rtwdemo_counter` and specify a folder for storing the generated code.

```
% Open the model
mdlName = 'rtwdemo_counter';
open_system mdlName);
% Specify a folder for generated code
codegenFolder = 'rtwdemo_counter_ert_rtw';
```

To enable packing the generated code in an archive, set the option `PackageGeneratedCodeAndArtifacts` to `true`. Specify the name of the generated code archive as `genCodeArchive.zip`.

```

configSet = getActiveConfigSet mdlName);
set_param(configSet, 'PackageGeneratedCodeAndArtifacts', true);
set_param(configSet, 'PackageName', 'genCodeArchive.zip');

```

To make the model compatible with Polyspace, set `SystemTargetFile` to `ert.tlc`.

```

set_param(configSet, 'SystemTargetFile', 'ert.tlc');

```

After configuring the model, generate code.

```

if exist(fullfile(pwd,codegenFolder), 'dir') == 0
    slbuild mdlName)
end

```

Because `PackageGeneratedCodeAndArtifacts` is set to `true`, the generated code is packed into the archive `genCodeArchive.zip`.

Generate and package Polyspace options files.

```

zipFile = polyspacePackNGo mdlName);

```

In the code archive `genCodeArchive.zip`, the Polyspace options files are packaged in the `polyspace` folder.

Package Polyspace Options Files That Have Specific Polyspace Analysis Options

To specify the Polyspace analysis options when packaging and generating options files, use `pslinktoptions`.

Open the Simulink model `rtwdemo_counter` and configure the model for generating a code archive that is compatible with Polyspace.

```

% Open the model
mdlName = 'rtwdemo_counter';
open_system mdlName);
% Specify a folder for generated code
codegenFolder = 'rtwdemo_counter_ert_rtw';
configSet = getActiveConfigSet mdlName);
% Enable packing the generated code into an archive
set_param(configSet, 'PackageGeneratedCodeAndArtifacts', true);
% Specify a name for the code archive
set_param(configSet, 'PackageName', 'genCodeArchive.zip');
% Configure the model to be Polyspace Compatible
set_param(configSet, 'SystemTargetFile', 'ert.tlc');

```

After configuring the model, generate code.

```

if exist(fullfile(pwd,codegenFolder), 'dir') == 0
    slbuild mdlName)
end

```

Because `PackageGeneratedCodeAndArtifacts` is set to `true`, the generated code is packed into the archive `genCodeArchive.zip`.

To specify the model configuration for the Polyspace analysis, use a `pslinktoptions` object. Create this object by using the function `pslinktoptions`.

```
psOpt = pslinkoptions mdlName);
```

The object `psOpt` is a structure where the fields are model configurations that you can specify.

Specify the model configuration by using `psOpt` object. For instance, set `InputRangeMode` to full range. For a full options list, see the input argument `psOpt`.

```
psOpt.InputRangeMode = 'FullRange';
```

Generate and package Polyspace options files. Use the `psOpt` object as the second argument in `polyspacePackNGo`.

```
zipFile = polyspacePackNGo mdlName, psOpt);
```

In the code archive `genCodeArchive.zip`, the Polyspace options files are packaged in the `polyspace` folder. The file `optionsFile.txt` contains the specified Polyspace analysis options.

Package Polyspace Options Files for Code Generated as a Model Reference

To accelerate model simulations, invoke referenced Simulink models as simulation targets. To generate model reference simulation targets from a Simulink model, generate code from the model by using `slbuild` with the build process specified as `ModelReferenceCoderTargetOnly`. Then, package the generated code by using `packNGo`. To generate and package Polyspace options files for analyzing such code, use the function `polyspacePackNGo` with the optional argument `asModelRef` set to `true`.

Open the Simulink model `rtwdemo_counter` and configure the model for generating a code archive that is compatible with Polyspace.

```
% Load model
mdlName = 'rtwdemo_counter';
load_system mdlName);
configSet = getActiveConfigSet mdlName);
% Enable packing the generated code into an archive
set_param(configSet, 'PackageGeneratedCodeAndArtifacts', true);
set_param(configSet, 'PackageName', '');
% Configure the model to be Polyspace Compatible
set_param(configSet, 'SystemTargetFile', 'ert.tlc');
```

After configuring the model, generate a model reference simulation target from it by using the function `slbuild`. Specify the option `ModelReferenceCoderTargetOnly`. See `slbuild`.

```
slbuild mdlName, 'ModelReferenceCoderTargetOnly');
```

The code that is generated is stored in the folder `slprj`.

To package the code that is generated as a model reference, use the function `packNGo`. Locate the file `buildinfo.mat` in `<working folder>/slprj/ert/rtwdemo_counter` and use the full path to it as the input to `packNGo`. This command generates an archive containing the generated code and the object `buildinfo.mat`. See `packNGo`.

```
% Locate buildinfo and generate code archive
buildinfo = fullfile(pwd, 'slprj', 'ert', mdlName, 'buildinfo.mat');
packNGo(buildinfo)
```

Generate and package Polyspace options files. Omit the optional second argument. Set the third argument `asModelRef` to `true`.

```
zipFile = polyspacePackNGo mdlName, [], true);
```

In the code archive `rtwdemo_counter.zip`, the Polyspace options files are packaged in the `polyspace` folder.

Input Arguments

mdlName — Name of Simulink model for which to generate Polyspace options files

model name

A character array containing the name of the model for which you want to generate and package the Polyspace options files.

Example: `polyspacePackNGo('rtwdemo_roll')`

Data Types: `char`

psOpt — Polyspace options object

options associated with `model` (default) | object created by using `pslinkoptions`

Specifies the model configuration for the Polyspace analysis by using a `pslinkoptions` object. You can modify certain analysis options by modifying `psOpt`, which is a structure where individual fields represent analysis options. For a full list of options that you can modify, see the table **Polyspace Analysis Options Supported by `polyspacePackNGo`**.

Polyspace Analysis Options Supported by polyspacePacknGo

Property	Value	Description
EnableAdditionalFileList: Enable an additional file list to be analyzed, specified as true or false. Use with the AdditionalFileList option.	true	Polyspace verifies additional files specified in the AdditionalFileList option.
	false (default)	Polyspace does not verify additional files.
AdditionalFileList: List of additional files to be analyzed specified as a cell array of files. To add these files to the analysis, use the EnableAdditionalFileList option.	cell array	Polyspace considers the listed files for verification.
InputRangeMode: Specifies the range of the input variables.	'DesignMinMax' (default)	Polyspace uses the input range defined in the workspace or a block.
	'Fullrange'	Polyspace uses full range inputs.
ParamRangeMode: Specifies the range of the constant parameters.	'DesignMinmax'	Polyspace uses the constant parameter range defined in the workspace or in a block.
	'None' (default)	Polyspace uses the value of parameters specified in the code.
OutputRangeMode: Specifies the output assertions.	'DesignMinMax'	Polyspace applies assertions to outputs by using a range defined in a block or the workspace.
	'None' (default)	Polyspace does not apply assertions to the output variables.
ModelRefVerifDepth: Specify the depth for analyzing the models that are referenced by the current model.	'Current model Only' (default)	Polyspace analyzes only the top model without analyzing the referenced models. Use this option when you refer to models that do not need to be analyzed, such as library models.

Property	Value	Description
	'1' '2' '3'	Polyspace analyzes referenced models up to the specified depth in the reference hierarchy. To analyze the models that are referenced by the top model, specify the property <code>ModelRefVerifDepth</code> as '1'. To analyze models that are referenced by the first level of references, specify this property as '2'.
	'All'	Polyspace verifies all referenced models.
<code>ModelRefByModelRefVerif</code> : Specify whether you want to analyze all referenced models together or individually.	true	Polyspace analyzes the top model and the referenced models together. Use this option to check for integration or scaling issues.
	false (default)	Polyspace analyzes the top model and the referenced models individually.
<code>AutoStubLUT</code> : Specifies how lookup tables are used.	true (default)	Polyspace stubs the lookup tables and verifies the model without analyzing the lookup table code.
	false	Polyspace includes the lookup table code in the analysis.
<code>CheckConfigBeforeAnalysis</code> : Specifies the level of configuration checking done before the Polyspace analysis starts.	'Off'	Polyspace checks only for errors. The analysis stops if errors are found.
	'OnWarn' (default)	Polyspace stops the analysis when errors are found and displays a message when warnings are found.
	'OnHalt'	Polyspace stops the analysis when either errors or warnings are found.

Example: `polyspacePackNGo('rtwdemo_roll', psOpt)`, where `ps_opt` is an options object created by calling `pslinkoptions`

asModelRef – Indicator for model reference analysis

false (default) | true

Indicator for model reference analysis, specified as true or false.

- If `asModelRef` is false (default), the function generates options files so that Polyspace analyzes the generated code as standalone code.

- If `asModelRef` is `true`, the function generates options files so that Polyspace analyzes the generated code as model reference code.

Note If you set `asModelRef` to `true`, use `slbuild` to generate code.

Example: `polyspacePackNGo('rtwdemo_roll', psOpt,true)`

Data Types: `logical`

Output Arguments

archivePath — The full path to the archive containing the generated options files

path to archive

A character array containing the path to the generated archive. The options files are located in the `polyspace` folder in the archive. The `polyspace` folder contains these options files:

- `optionsFile.txt`: a text file containing the Polyspace options required to run a Polyspace analysis on the generated code without losing model-specific information, such as design range specification.
- `model_drs.xml`: A file containing the design range specification of the model.
- `linkdata.xml`: A file that links the generated code to the components of the model.

To run a Polyspace analysis on the generated code in an environment that is different than the environment where the code was generated from the Simulink model, use these files.

Data Types: `char`

See Also

`pslinkoptions` | `slbuild`

Topics

“Run Polyspace Analysis on Generated Code by Using Packaged Options Files”

Introduced in R2020b

pslinkoptions

Create an options object to customize configuration of a Simulink model, generated code or a S-Function block. Use the object to specify configuration options for these Simulink objects in a Polyspace run from the MATLAB command line

Syntax

```
opts = pslinkoptions(codegen)
opts = pslinkoptions(model)
opts = pslinkoptions(sfunc)
```

Description

`opts = pslinkoptions(codegen)` returns an options object with the configuration options for code generated by `codegen`.

`opts = pslinkoptions(model)` returns an options object with the configuration options for the Simulink model.

`opts = pslinkoptions(sfunc)` returns an options object with the configuration options for the S-Function.

Note Before you run Polyspace from MATLAB, you must link your Polyspace and MATLAB installations. See “Integrate Polyspace with MATLAB and Simulink” (Polyspace Code Prover).

Examples

Use a Simulink model to create and edit an options objects

Load `closed_loop_control` and create a Polyspace® options object from the model:

```
load_system('closed_loop_control');
model_opt = pslinkoptions('closed_loop_control')
```

```
model_opt =
```

```

        ResultDir: 'results_ $ModelName$'
VerificationSettings: 'PrjConfig'
  OpenProjectManager: 0
AddSuffixToResultDir: 0
EnableAdditionalFileList: 0
  AdditionalFileList: {}
  VerificationMode: 'CodeProver'
  EnablePrjConfigFile: 0
        PrjConfigFile: ''
AddToSimulinkProject: 0
  InputRangeMode: 'DesignMinMax'
  ParamRangeMode: 'None'
  OutputRangeMode: 'None'
```

```

        ModelRefVerifDepth: 'Current model only'
    ModelRefByModelRefVerif: 0
        AutoStubLUT: 1
    CxxVerificationSettings: 'PrjConfig'
    CheckConfigBeforeAnalysis: 'OnWarn'
    VerifAllSFcnInstances: 0

```

The model is already configured for Embedded Coder®, so only the Embedded Coder configuration options appear. Change the results folder name option and set `OpenProjectManager` to true.

```

model_opt.ResultDir = 'results_v1_$ModelName$';
model_opt.OpenProjectManager = true

```

```

model_opt =

        ResultDir: 'results_v1_$ModelName$'
    VerificationSettings: 'PrjConfig'
        OpenProjectManager: 1
    AddSuffixToResultDir: 0
    EnableAdditionalFileList: 0
        AdditionalFileList: {}
        VerificationMode: 'CodeProver'
    EnablePrjConfigFile: 0
        PrjConfigFile: ''
    AddToSimulinkProject: 0
        InputRangeMode: 'DesignMinMax'
        ParamRangeMode: 'None'
        OutputRangeMode: 'None'
    ModelRefVerifDepth: 'Current model only'
    ModelRefByModelRefVerif: 0
        AutoStubLUT: 1
    CxxVerificationSettings: 'PrjConfig'
    CheckConfigBeforeAnalysis: 'OnWarn'
    VerifAllSFcnInstances: 0

```

Create and edit an options object for Embedded Coder at the command line

Create a Polyspace® options object called `new_opt` with Embedded Coder parameters:

```

new_opt = pslinkoptions('ec')

new_opt =

        ResultDir: 'results_$ModelName$'
    VerificationSettings: 'PrjConfig'
        OpenProjectManager: 0
    AddSuffixToResultDir: 0
    EnableAdditionalFileList: 0
        AdditionalFileList: {}
        VerificationMode: 'CodeProver'
    EnablePrjConfigFile: 0
        PrjConfigFile: ''
    AddToSimulinkProject: 0
        InputRangeMode: 'DesignMinMax'
        ParamRangeMode: 'None'
        OutputRangeMode: 'None'

```

```
        ModelRefVerifDepth: 'Current model only'  
ModelRefByModelRefVerif: 0  
        AutoStubLUT: 1  
    CxxVerificationSettings: 'PrjConfig'  
CheckConfigBeforeAnalysis: 'OnWarn'
```

To follow the progress in the Polyspace interface, set the `OpenProjectManager` option to true. Change the configuration to check for both checks and MISRA C® 2012 coding rule violations:

```
new_opt.OpenProjectManager = true;  
new_opt.VerificationSettings = 'PrjConfigAndMisraC2012'
```

```
new_opt =  
  
        ResultDir: 'results_$ModelName$'  
VerificationSettings: 'PrjConfigAndMisraC2012'  
    OpenProjectManager: 1  
AddSuffixToResultDir: 0  
EnableAdditionalFileList: 0  
    AdditionalFileList: {}  
    VerificationMode: 'CodeProver'  
EnablePrjConfigFile: 0  
    PrjConfigFile: ''  
AddToSimulinkProject: 0  
    InputRangeMode: 'DesignMinMax'  
    ParamRangeMode: 'None'  
    OutputRangeMode: 'None'  
    ModelRefVerifDepth: 'Current model only'  
ModelRefByModelRefVerif: 0  
    AutoStubLUT: 1  
    CxxVerificationSettings: 'PrjConfig'  
CheckConfigBeforeAnalysis: 'OnWarn'
```

Create and edit an options object for TargetLink at the command line

Create a Polyspace® options object called `new_opt` with TargetLink® parameters:

```
new_opt = pslinkoptions('tl')  
  
new_opt =  
  
        ResultDir: 'results_$ModelName$'  
VerificationSettings: 'PrjConfig'  
    OpenProjectManager: 0  
AddSuffixToResultDir: 0  
EnableAdditionalFileList: 0  
    AdditionalFileList: {}  
    VerificationMode: 'CodeProver'  
EnablePrjConfigFile: 0  
    PrjConfigFile: ''  
AddToSimulinkProject: 0  
    InputRangeMode: 'DesignMinMax'  
    ParamRangeMode: 'None'  
    OutputRangeMode: 'None'  
    AutoStubLUT: 1
```

Set the `OpenProjectManager` option to true to follow the progress in the Polyspace interface. Also change the configuration to check for both run-time errors and MISRA C® coding rule violations:

```
new_opt.OpenProjectManager = true;
new_opt.VerificationSettings = 'PrjConfigAndMisra'
```

```
new_opt =
```

```

        ResultDir: 'results_$ModelName$'
VerificationSettings: 'PrjConfigAndMisra'
  OpenProjectManager: 1
AddSuffixToResultDir: 0
EnableAdditionalFileList: 0
  AdditionalFileList: {}
  VerificationMode: 'CodeProver'
  EnablePrjConfigFile: 0
    PrjConfigFile: ''
AddToSimulinkProject: 0
  InputRangeMode: 'DesignMinMax'
  ParamRangeMode: 'None'
  OutputRangeMode: 'None'
    AutoStubLUT: 1
```

Input Arguments

codegen — Code generator

```
'ec' | 'tl'
```

Code generator, specified as either 'ec' for Embedded Coder or 'tl' for TargetLink®. Each argument creates a Polyspace options object with properties specific to that code generator.

For a description of all configuration options and their values, see `pslinkoptions`.

```
Example: ec_opt = pslinkoptions('ec')
```

```
Example: tl_opt = pslinkoptions('tl')
```

Data Types: char

model — Simulink model name

```
model name
```

Simulink model, specified by the model name. Creates a Polyspace options object with the configuration options of that model. If you have not set any options, the object has the default configuration options. If you have set a code generator, the object has the default options for that code generator.

For a description of all configuration options and their values, see `pslinkoptions`.

```
Example: model_opt = pslinkoptions('my_model')
```

Data Types: char

sfunc — path to S-Function

```
character vector
```

Path to S-Function, specified as a character vector. Creates a Polyspace options object with the configuration options for the S-function. If you have not set any options, the object has the default configuration options.

For a description of all configuration options and their values, see `pslinkoptions`.

Example: `sfunc_opt = pslinkoptions('path/to/sfunction')`

Data Types: `char`

Output Arguments

opts — Polyspace configuration options

options object

Polyspace configuration options, returned as an options object. The object is used with `pslinkrun` to run Polyspace from the MATLAB command line.

For the list of object properties, see `pslinkoptions`.

Example: `opts= pslinkoptions('ec')`
`opts.VerificationSettings = 'Misra'`

rehashUnitDBs

Refresh unit database files on MATLAB path

Syntax

rehashUnitDBs

Description

rehashUnitDBs refreshes unit database files on the MATLAB path. To load a custom unit database, use this function in conjunction with the createCustomDBFromExcel function.

The rehashUnitDBs function:

- Clears all previously loaded custom units in memory.
- Resets the set of supported units to the built-in set of units.
- Looks for database files with the extension `.slunitdb.mldtax` on the MATLAB path and loads those databases.
- Issues warnings if units with the same names are loaded. If units have several definitions with the same name in different databases, by default the function tries to use the definition in a built-in units databases. If the unit is not defined in a built-in database, the function uses the definition in the database highest on the MATLAB path.

To see the supported spreadsheet format, see “Custom Units Spreadsheet Format”.

Examples

Create Custom Units Database File from Excel Spreadsheet

Create a custom units database file from custom Excel spreadsheet file, `unitsDB.xlsx`.

Create a Excel spreadsheet containing these columns and data in any order:

- **name**, containing `ounce_force`
- **symbol**, containing `oz f`
- **asciiSymbol**, containing `oz f`
- **displayName**, containing `{\rm{}}oz_{force}}`
- **definitionExpression**, containing `oz*gn`
- **conversionFactor**, containing `1`
- **conversionOffset**, containing `0`
- **physicalQuantity**, containing `force`

Enter your custom unit specifications.

Save the database file, for example `unitsDB.xlsx`.

Create the database.

```
createCustomDBFromExcel('unitsDB.xlsx')
```

The function creates `unitsDB.slunitdb.mldatx` in the current folder.

Add the current folder to the MATLAB path.

```
addpath C:\work\custom_units
```

Load the new units database into memory.

```
rehashUnitDBs
```

reload

(Not recommended) Reload project

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
reload(proj)
```

Description

`reload(proj)` reloads the project. Use `reload` when you want to run the project startup shortcuts.

Examples

Reload Project

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;  
proj = simulinkproject;
```

When you want to run the startup shortcuts again, reload the project.

```
reload(proj)
```

Input Arguments

proj — Project

project object

Project, specified as a project object already created with `simulinkproject` to manipulate a project at the command line.

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

removeCategory

(Not recommended) Remove project category of labels

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
removeCategory(proj, categoryName)
```

Description

`removeCategory(proj, categoryName)` removes a category of labels, `categoryName`, from the project specified by `proj`.

Examples

Remove Category

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;  
proj = simulinkproject;
```

Create a new category of labels.

```
createCategory(proj, 'Engineers', 'char');
```

Remove the new category of labels.

```
removeCategory(proj, 'Engineers');
```

A message appears warning you that you cannot undo the operation. Click **Continue**. You can configure warnings in the Preferences in the Project Tool.

Input Arguments

proj — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

categoryName — Name of category

character vector

Name of the category to remove, which exists in the project, specified as a character vector.

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

removeFile

(Not recommended) Remove file from project

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
removeFile(proj, file)
```

Description

`removeFile(proj, file)` removes a file from the project `proj`.

Examples

Remove File from Project

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;  
proj = simulinkproject;
```

Remove a file.

```
removeFile(proj, 'models/AnalogControl.slx')
```

Add the file back to the project.

```
addFile(proj, 'models/AnalogControl.slx')
```

Input Arguments

proj — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

file — Path of file

character vector | file object

Path of the file to remove relative to the project root folder, including the file extension, specified as a character vector or a file object returned by `findFile`. The file must be in the project.

Example: `'models/myModelName.slx'`

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

Introduced in R2013a

removeLabel

(Not recommended) Remove label from project

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
removeLabel(category, labelName)
removeLabel(file, categoryName, labelName)
removeLabel(file, labelDefinition)
```

Description

`removeLabel(category, labelName)` removes the label from the specified category of labels in the currently loaded project.

`removeLabel(file, categoryName, labelName)` removes the specified label in the category `categoryName` from the file. Use this syntax to specify category and label by name.

`removeLabel(file, labelDefinition)` removes the specified label `labelDefinition` from the file. Before you can remove the label, you need to get the label from the `file.Label` property or by using `findLabel`.

Examples

Remove a Label

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Examine the first existing category.

```
cat = proj.Categories(1)
```

```
cat =
```

```
    Category with properties:
```

```
        Name: 'Classification'
        DataType: 'none'
    LabelDefinitions: [1x8 slproject.LabelDefinition]
```

Define a new label in the category.

```
createLabel(cat, 'Future');
```

Remove the new label.

```
removeLabel(cat, 'Future');
```

Input Arguments

category — Category of labels

category object

Category of labels, specified as a category object. Get a category object from the `proj.Categories` property or by using `findCategory`.

labelName — Name of label

character vector

Name of the label to remove, specified as a character vector.

file — File to detach label from

file object

File to detach the label from, specified as a file object. You can get the file object by examining the project's `Files` property (`proj.Files`), or use `findFile` to find a file by name. The file must be within the root folder.

categoryName — Name of category that contains label

character vector

Name of the category that contains the label to remove, specified as a character vector.

labelDefinition — Label to detach

label definition object

Name of the label to detach, specified as a label definition object returned by the `file.Label` property or `findLabel`.

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

Introduced in R2013a

replace_block

Replace blocks in Simulink model

Syntax

```
replBlks = replace_block(sys,current,new)
replBlks = replace_block(sys,Name,Value,new)
replBlks = replace_block( ____, 'noprompt')
```

Description

`replBlks = replace_block(sys,current,new)` replaces the blocks `current` in the model `sys` with blocks of type `new`. You can use a block from a Simulink library or from another model as the replacement block.

Load the model `sys` before using this function. The function prompts you to select the blocks you want to replace from a list of blocks that match the `current` argument.

Tip Save the model before using this command.

`replBlks = replace_block(sys,Name,Value,new)` replaces the blocks that match the block parameters specified by the `Name,Value` pair arguments. You can also use `find_system` `Name,Value` pairs to qualify the search for blocks to replace.

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

With the `replace_block` function, you can use block parameter and value pairs. For a list of all the block parameters, see “Common Block Properties” on page 6-12 and “Block-Specific Parameters” on page 6-27.

To specify additional information about the search for blocks to replace, you use `find_system` `Name,Value` pairs before the block parameters. For example, you can use `'CaseSensitive','off'` to make the search for blocks case insensitive or `'FollowLinks','on'` to follow links into library links. See `find_system` for that list of `Name,Value` pairs.

`replBlks = replace_block(____, 'noprompt')` replaces the blocks without prompting you to select them from a dialog box.

Examples

Replace Blocks in a Model

Replace blocks in the 'vdp' model.

Load the model 'vdp'.

```
load_system('vdp');
```

Replace Gain blocks with Integrator blocks.

```
RepNames = replace_block('vdp','Gain','Integrator');
```

A dialog box prompts you to select the blocks you want to replace.

With vdp/Mu selected in the dialog box, click **OK**.

Replace Scope blocks with To Workspace blocks.

```
RepNames = replace_block('vdp','Scope','simulink/Sinks/To Workspace');
```

A dialog box prompts you to select the blocks you want to replace.

With vdp/Scope selected in the dialog box, click **OK**.

Replace Blocks in a Subsystem Using Parameter Values

Replace blocks in the Unlocked subsystem of the sldemo_clutch model. Replace blocks whose Gain parameter is set to bv.

Load the model sldemo_clutch.

```
openExample('sldemo_clutch');
```

In the 'Unlocked' subsystem, replace blocks whose Gain value is bv with Integrator blocks.

```
replace_block('sldemo_clutch/Unlocked','Gain','bv','Integrator');
```

A dialog box prompts you to select the blocks to replace.

With sldemo_clutch/Unlocked/VehicleDamping selected in the dialog box, click **OK**.

Replace Blocks Without Dialog Box

Load the model f14.

```
load_system('f14')
```

Replace Gain blocks with Integrator blocks. The command returns the blocks it found to replace and replaces the blocks.

```
repl = replace_block('f14','Gain','Integrator','noprompt')
```

```
repl = 13x1 cell
    {'f14/Aircraft...'}
    {'f14/Aircraft...'}
    {'f14/Aircraft...'}
    {'f14/Aircraft...'}
    {'f14/Controller/Gain'}
    {'f14/Controller/Gain2'}
    {'f14/Controller/Gain3'}
```

```

{'f14/Gain'           }
{'f14/Gain1'         }
{'f14/Gain2'         }
{'f14/Gain5'         }
{'f14/Nz pilot...'  }
{'f14/Nz pilot...'  }

```

Use find_system Pairs with replace_block

Select a block that is a library link. Follow the library links and replace Gain blocks with Integrator blocks within them.

```
replace_block(gcb, 'FollowLinks', 'on', 'BlockType', 'Gain', 'Integrator', 'noprompt')
```

Input Arguments

sys — Model or subsystem whose blocks to replace

character vector

Name of model whose blocks to replace, specified as a character vector. If you specify a model, the command replaces all blocks that match in the model. If you specify a subsystem, the command replaces blocks in that subsystem and below.

Example: 'vdp', 'sldemo_fuelsys/fuel_rate_control'

current — Type of block to replace

BlockType value | MaskType value

Type of block to replace, specified as a BlockType or MaskType value. To find out the block type, select the block and, at the command prompt, enter:

```
get_param(gcb, 'BlockType')
```

For masked blocks, to find out the mask type, select the block and enter:

```
get_param(gcb, 'MaskType')
```

new — Block to replace current blocks

BlockType value | MaskType value | library path | block path name from a model

Block to replace the current block, specified in one of these forms:

- BlockType value of the replacement block. Specifying this value uses a library block as the replacement block.
- MaskType value of the replacement block. Specifying this value uses a library block as the replacement block.
- Library path of the replacement block, for example, 'simulink/Sinks/To Workspace'. Hover over the block in the library to see the library path.
- Block path name of a block from a different model, for example, 'vdp/Mu'. Use this value to reuse an instance of a block from another model in your model.

Output Arguments

replBlks — Blocks returned by the current argument

cell array of character vectors

Blocks returned by the current argument, returned as a cell array of character vectors. The function returns the values regardless of whether you complete the replacement.

Introduced before R2006a

save_system

Save Simulink model

Syntax

```
filename = save_system
filename = save_system(sys)
filename = save_system(sys,newsys)
filename = save_system(sys,newsys,Name,Value)
```

Description

`filename = save_system` saves the current top-level model. If the model was not previously saved, `save_system` creates a file in the current folder.

To save a subsystem, instead use `Simulink.SubSystem.copyContentsToBlockDiagram` to copy the subsystem contents to a new model. You can then save that model using `save_system`. See `Simulink.SubSystem.copyContentsToBlockDiagram`.

`filename = save_system(sys)` saves the model `sys`. The model must be open or loaded.

`filename = save_system(sys,newsys)` saves the model to a new file `newsys`. If you do not specify an extension, then `save_system` uses the file format specified in your Simulink preferences.

`filename = save_system(sys,newsys,Name,Value)` saves the system with additional options specified by one or more `Name,Value` pair arguments. To use `Name,Value` pairs without saving to a new file, use `[]` for `newsys`.

Examples

Save Named Model

Create a model.

```
new_system('newmodel')
```

Save the model.

```
save_system('newmodel')
```

Save Model with Another Name

Open the model `vdp`. Save it to a model named `myvdp` in the current folder. Without a file extension, the function saves the model using the format specified in your Simulink preferences.

```
open_system('vdp')
save_system('vdp','myvdp')
```

After you save the model by another name, the model is no longer open under its original name. Open vdp again and save it as an .mdl file in the current folder.

```
open_system('vdp')
save_system('vdp','mynewvdp.mdl')
```

Return Error If Name Exists

Save a model with a new name and return an error if something with this name exists on the MATLAB path. In this case, `save_system` displays an error because `max` is the name of a MATLAB function. The model is not saved.

```
open_system('vdp')
save_system('vdp','max','ErrorIfShadowed',true)
```

```
Error using save_system (line 38)
The model 'vdp' cannot be saved with the new name 'max', because this name is
shadowing another name on the MATLAB path or in the workspace. Choose another
name, or do not use the option 'ErrorIfShadowed'
```

Save Model with Options

Suppose that you have a model named `mymodel`. Open the model and save it to a model named `newmodel`. Also save the model workspace, break links to user-defined library blocks, and overwrite if the file has changed on disk,

```
open_system('mymodel')
save_system('mymodel','mynewmodel','SaveModelWorkspace',
true,'BreakUserLinks',true,'OverwriteIfChangedOnDisk',true)
```

Save Model to Same Name and Use Options

Save the model `mymodel`, breaking links to user-defined library blocks in the model.

```
save_system('mymodel',[],'BreakUserLinks',true)
```

Input Arguments

sys — Name of model to save

character vector | cell array of character vectors | string array | handle | array of handles

Name of model to save, specified as a character, cell array of character vectors, string array, handle, or array of handles. Do not use a file extension.

newsys — File to save to

character vector | cell array of character vectors | string array | []

File to save to, specified as a character vector, cell array of character vectors, string array, or, to use `Name, Value` pairs without changing the file name, []. You can specify a model name in the current folder or the full path name, with or without an extension.

With no an extension, `save_system` saves to the file format specified in your Simulink preferences. Possible model extensions are `.slx` and `.mdl`. With the 'ExportToXML' option, use the extension `.xml`.

For information on rules for naming models, see “Model Names”.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, . . . , NameN, ValueN`.

Example:

```
save_system('mymodel', 'newmodel', 'SaveModelWorkspace', true, 'BreakUserLinks', true, 'OverwriteIfChangedOnDisk', true)
```

AllowPrompt — Allow dialog box prompts

`false` (default) | `true` | 'on' | 'off'

Option to allow dialog box prompts, specified as `true`, `false`, 'on', or 'off'. By default, warnings and error messages appear at the command line.

BreakAllLinks — Replace links to library blocks

`false` (default) | `true` | 'on' | 'off'

Option to, in the saved file, replace links to library blocks with copies of the library blocks, specified as `true`, `false`, 'on', or 'off'. This option affects user-defined blocks and Simulink library blocks.

Caution The 'BreakAllLinks' option can result in compatibility issues when upgrading to newer versions of Simulink. For example:

- Any masks on top of library links to Simulink S-functions do not upgrade to the new version of the S-function.
- Any library links to masked subsystems in a Simulink library do not upgrade to the new subsystem behavior.
- Any broken links prevent the library forwarding mechanism from upgrading the link.

If you saved a model with broken links to built-in libraries, use the Upgrade Advisor to scan the model for out-of-date blocks. Then upgrade the Simulink blocks to their current versions.

BreakUserLinks — Replace links to user-defined blocks

`false` (default) | `true` | 'on' | 'off'

Option to, in the saved file, replace links to user-defined library blocks with copies of the library blocks, specified as `true`, `false`, 'on', or 'off'.

BreakToolboxLinks — Replace links to built-in library block

`false` (default) | `true` | 'on' | 'off'

Option to, in the saved file, replace links to built-in library blocks with copies of the library blocks, specified as `true`, `false`, 'on', or 'off'. This option affects Simulink library blocks and blocks from libraries supplied with MathWorks toolboxes or blocksets.

ErrorIfShadowed — Return an error if name exists

false (default) | true | 'on' | 'off'

Option to return an error if the new name exists on the MATLAB path or workspace, specified as true, false, 'on', or 'off'.

ExportToXML — Export model to XML format

false (default) | true | 'on' | 'off'

Option to export the model to a file in a simple XML format, specified as true, false, 'on', or 'off'. Specify the full name of the file, including the .xml extension. The block diagram in memory does not change and no callbacks execute. Use this option without any other Name, Value pair arguments. This option warns and will be removed in a future release.

Example: `save_system('mymodel','exportfile.xml','ExportToXML',true)`

ExportToVersion — MATLAB release name to export to

character vector | string scalar

MATLAB release name to export to, specified in either of these forms (not case sensitive). You can export to seven years of previous releases.

- Release name, for example, 'R2013B', 'R2016B'
- Release name, followed by an underscore and then the extension, for example, 'R2016A_SLX', 'R2014A_MDL'. If you do not specify an extension, you export to the file format specified in your Simulink preferences.

`save_system` exports the system such that the specified Simulink version can load it. If the system contains functionality not supported by the specified Simulink version, the command removes the functionality in the exported file. It also replaces unsupported blocks with empty masked subsystem blocks colored yellow. As a result, the exported system might generate different results.

Alternatively, use `Simulink.exportToVersion` or, interactively, the Export to Previous Version dialog box.

To export a project to previous releases, see “Export a Project to a Previous Version” on page 2-701.

OverwriteIfChangedOnDisk — Overwrite file

false (default) | true | 'on' | 'off'

Option to overwrite the file on disk even if it has been modified since the system was loaded, specified as true, false, 'on', or 'off'. By default, if the file changed on disk since the model was loaded, `save_system` displays an error to prevent the changes on disk from being overwritten.

You can control whether `save_system` displays an error if the file has changed on disk using a Simulink preference. In the **Model File** pane of the Simulink Preferences dialog box, under **Change Notification**, select **Saving the model**. This preference is on by default.

SaveDirtyReferencedModels — Save referenced models with unsaved changes

false (default) | true | 'on' | 'off'

Option to save referenced models that have unsaved changes while saving changes to their parent model, specified as true, false, 'on', or 'off'. This option applies to models that are directly referenced by each model that is saved. If the parent model of a dirty referenced model is not saved, the dirty referenced model is not saved.

Suppose you have a model hierarchy in which model A references model B, and model B references model C. If models B and C both have unsaved changes, they are both saved. If model C has unsaved changes but model B does not have unsaved changes, neither model is saved.

By default, attempting to save a model that contains unsaved referenced models return an error.

SaveModelWorkspace — Save model workspace

false (default) | true | 'on' | 'off'

Option to save the contents of the model workspace, specified as true, false, 'on', or 'off'. The model workspace DataSource must be a MAT-file. If the data source is not a MAT-file, save_system does not save the workspace. See “Specify Source for Data in Model Workspace”.

Output Arguments

filename — Name of saved file

character vector | cell array of character vectors

Full name of saved file, returned as a character vector or a cell array of character vectors.

“Save the Model”

Introduced before R2006a

Schedule Editor

View and edit the schedule of model components (partitions)

Description

The Schedule Editor is a scheduling tool that represents the components in the model known as partitions, the data connections between them, and the order of those partitions.

Partitions are the components of the model that execute independently as tasks. The data connections between the partitions show the flow of the data between those partitions. The scheduling of these partitions is based on the rates and the events in the model. This schedule is shown in the **Order** table in the Schedule Editor.

Using the Schedule Editor, you can:

- Create partitions and specify their order.
- Edit and analyze the schedule of the executable partitions without disturbing the structure of the model.
- Visualize how Simulink executes partitions.

Changes made in the Schedule Editor affect both, simulation and code generation.

Using the Schedule Editor

The Schedule Editor consists of two parts representing two different views of partitions in the model:

- A graph that shows the partitions and the data connections between them.

- A table that shows the order in which the partitions execute.

ORDER		
Order	Name	Trigger
1	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: black; margin-right: 5px;"></div> Cont <i>implicit</i> </div> <div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: red; margin-right: 5px;"></div> D1 <i>implicit</i> </div>	0 0.001
2	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> D2 <i>implicit</i> </div>	0.005
3	▶ ThrottleControl.APPSnsrRun	
4	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> ThrottleControl.ActuatorRun5ms </div>	0.005
5	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> ThrottleControl.TPSSecondaryRun5ms </div>	0.005
6	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> ThrottleControl.MonitorRun5ms </div>	0.005
7	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> ThrottleControl.ControllerRun5ms </div>	0.005
8	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: blue; margin-right: 5px;"></div> D3 <i>implicit</i> </div>	0.01
9	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: blue; margin-right: 5px;"></div> ThrottleControl.TPSPPrimaryRun10ms </div>	0.01

Changing one of the views impacts the other.

To use the Schedule Editor, select **Schedule Editor** in the **Design** section of the **Modeling** tab. If the model is already partitioned, you can open the Schedule Editor by clicking the  badge, which appears above the blocks. To see the default partitions present in the model in the Schedule Editor, update the diagram by clicking the  icon on the toolbar or by selecting **Ctrl+D**. As you create partitions in the model and update the diagram, partitions appear in the Schedule Editor.

To check how the partitions map to the model, right-click the partitions and select **Show Source**. The Simulink model window appears with every block corresponding to the partition highlighted.

Order

The **Order** shows the order in which the partitions execute. To change the order, you can drag and drop the partitions. You can also use the **Up** and **Down** arrows on the toolbar. Partitions are sorted based on their rates. You can only reorder the partitions with the same rate. Clicking a partition in the **Order**, highlights the corresponding partition in the graph. On changing the order, the connections that are affected by this specified change get highlighted.

3	▶ ThrottleControl.APPSnsrRun	
4	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> ThrottleControl.ActuatorRun5ms </div>	0.005
5	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> ThrottleControl.TPSSecondaryRun5ms </div>	0.005
6	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> ThrottleControl.MonitorRun5ms </div>	0.005
7	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> ThrottleControl.ControllerRun5ms </div>	0.005
8	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: blue; margin-right: 5px;"></div> D3 <i>implicit</i> </div>	0.01
9	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: blue; margin-right: 5px;"></div> ThrottleControl.TPSPPrimaryRun10ms </div>	0.01

Connections

Connections between the partitions show data dependencies. You can right-click the connections between the partitions to change the constraints on data connections. The different types of connections illustrate how the partitions behave with each other.

The types of connections are:

- **Dependency** — Indicates that the source always runs before the destination. The dependency connection is a solid line.

- **Delay** — Indicates that the destination runs before the source. When the destination runs before the source, a scheduling delay is introduced. The delay connection is a dashed line.

You can put these types of constraints on connections:

- **Allow Delay** — Inserts a delay when required. When you specify this constraint for a connection, Simulink inserts a delay for that connection only when necessary. The unlock icon on the connections signifies an allowed delay. When you select this constraint on a connection, Simulink prefers these connections to be turned into a delay if necessary over other connections.

This constraint is displayed as one of these options.

- **Prevent Delay** — Prevents delay from being inserted in the connection. When you specify this constraint for a connection, Simulink ensures that the connection is a dependency. The lock icon on the connection indicates that the connection is locked as a dependency and is not changed to a delay.

Events

The **Events** panel allows you to manage events in the Schedule Editor. The events in the Schedule Editor can bind with aperiodic partitions to schedule their execution. You can create events in the Schedule Editor and use these events to send from Stateflow to schedule execution of an aperiodic partition. To send the events from the Stateflow chart, use the `send(eventName)` command.

In the **Events** panel, you can see the listeners and the broadcasters of the event. The icon denotes the listeners, and the icon denotes the broadcasters. When you bind the aperiodic partition with an event, the aperiodic partition executes when that event is sent. The broadcaster of the event shows you the path of the Stateflow chart that sends the event.

Click the icon to create an event in the Schedule Editor, and select a listener partition from the drop down. You can also bind an event by dragging and dropping the event over a valid aperiodic partition.

When an event is bound to a partition, the event name appears on the left side of the partition and in the **Trigger** column of the **Order** table.

The screenshot displays the Schedule Editor interface. The main workspace shows a block diagram with several blocks representing partitions and their triggers. The blocks are:

- Cont**: A block with a red background, containing a table with values 0, 0.001, and D1.
- ThrottleControl.TPSSecondaryRun5ms**: A green block with a sample time of 0.005.
- ThrottleControl.TPSPPrimaryRun10ms**: A blue block with a sample time of 0.01.
- ThrottleControl.APPSnsrRun**: A green block with a sample time of 0.005.
- ThrottleControl.MonitorRun5ms**: A green block with a sample time of 0.005.
- ThrottleControl.ControllerRun5ms**: A green block with a sample time of 0.005.
- ThrottleControl.ActuatorRun5ms**: A green block with a sample time of 0.005.
- D3**: A blue block with a sample time of 0.01.
- D2**: A green block with a sample time of 0.005.

The **ORDER** table on the right side of the interface lists the partitions and their triggers:

Order Name	Trigger
1	Cont
2	D3
3	ThrottleControl.APPSnsrRun
4	ThrottleControl.ActuatorRun5ms
5	ThrottleControl.TPSSecondaryRun5ms
6	ThrottleControl.MonitorRun5ms
7	ThrottleControl.ControllerRun5ms
8	D2
9	ThrottleControl.TPSPPrimaryRun10ms

The **MANAGE PARTITIONS** table at the bottom shows the following data:

Block Name	Partition Name	Sample time
Convert Pedal to ADC Range		
Convert TPS to ADC Range		
ThrottleControl	ThrottleControl <...>	

Open the Schedule Editor

- Simulink: In the **Modeling** tab, expand the **Design** section and select **Schedule Editor** from **System Design**.
- Simulink model: Click the badge on the partitioned blocks.

Examples

- “Schedule an Export-Function Model Using the Schedule Editor”
- “Schedule a Rate-Based Model Using the Schedule Editor”
- “Events in Schedule Editor”

Parameters

Manage Partitions

Partition Name — Name of the partitions

character vector

Name of the partitions created. Double-click the name to edit and use the enter key to save the partition name.

Sample Time — Sample time for partitions to execute

discrete value | variable

Sample time at which the partitions execute. The sample time is a discrete value or a defined variable that contains a discrete value.

Property Inspector**Hit times — Times for aperiodic partitions to execute**

vector

Times at which the aperiodic partitions execute, specified as a vector of discrete values.

Connections — Data connections between partitions

Auto (default) | Delay | Dependency | Prevent Delays | Allow Delays

Dependency between the partitions is shown as a solid line. A delay between the partitions is shown as a dashed line. The arrow tail and head denote the source and destination, respectively.

Specify constraints on the connections by right-clicking the lines and selecting the constraint type.

More About**Order**

By default, the **Order** table is expanded. **Order** shows the order of partition execution. Edit the order by dragging the partitions or using the **Up** and **Down** arrows on the toolstrip.

Manage Partitions

By default, the **Manage Partitions** panel is collapsed. Expand the panel to create partitions, edit names and/or sample times of the existing partitions, and remove existing partitions. Changes made in the **Manage Partitions** panel take effect after updating the diagram.

Property Inspector

The **Property Inspector** shows information about the selected partition. It shows the rate at which the partition executes and the connections on that partition. Enter the **Hit times** when you select an aperiodic partition in the **Property Inspector**.

Arrange

The **Arrange** button organizes the partition graph.

Layout

By default, the **Order** panel and the **Property Inspector** panel are expanded. From the **Layout** drop-down, select the preferred panels to be expanded as per preference. Clearing the panels collapses them.

Introduced in R2019a

set_param

Set system and block parameter values

Syntax

```
set_param(Object,ParameterName,Value,...ParameterNameN,ValueN)
```

Description

`set_param(Object,ParameterName,Value,...ParameterNameN,ValueN)` sets the parameter to the specified value on the specified model or block object.

When you set multiple parameters on the same model or block, use a single `set_param` command with multiple pairs of `ParameterName, Value` arguments, rather than multiple `set_param` commands. This technique is efficient because using a single call requires evaluating parameters only once. If any parameter names or values are invalid, then the function doesn't set any parameters.

Tips:

- If you make multiple calls to `set_param` for the same block, then specifying the block using a numeric handle is more efficient than using the full block path. Use `getSimulinkBlockHandle` to get a block handle.
- If you use `matlab -nodisplay` to start a session, you cannot use `set_param` to run your simulation. The `-nodisplay` mode does not support simulation using `set_param`. Use the `sim` command instead.
- After you set parameters in the MATLAB workspace, to see the changes in a model, update the diagram.

```
set_param(model,'SimulationCommand','Update')
```

For parameter names, see:

- “Block-Specific Parameters” on page 6-27
- “Common Block Properties” on page 6-12

Examples

Set Model Configuration Parameters for a Model

Open `vdp` and set the `Solver` and `StopTime` parameters.

```
vdp  
set_param('vdp','Solver','ode15s','StopTime','3000')
```

Set Model Configuration Parameters for Current Model

Open a model and set the Solver and StopTime parameters. Use bdroot to get the current top-level model.

```
vdp
set_param(bdroot, 'Solver', 'ode15s', 'StopTime', '3000')
```

Set a Gain Block Parameter Value

Open vdp and set a Gain parameter value in the Mu block.

```
vdp
set_param('vdp/Mu', 'Gain', '10')
```

Set Position of Block

Open vdp and set the position of the Mu block.

```
vdp
set_param('vdp/Mu', 'Position', [50 100 110 120])
```

Set Position of Block Using a Handle

Set the position of the Mu block in the vdp model.

Use `getSimulinkBlockHandle` to load the vdp model if necessary (by specifying `true`), and get a handle to the Mu block. If you make multiple calls to `set_param` for the same block, then using the block handle is more efficient than specifying the full block path as a character vector.

```
mublockhandle = getSimulinkBlockHandle('vdp/Mu', true);
```

You can use the block handle in subsequent calls to `get_param` or `set_param`. If you examine the handle, you can see that it contains a double. Do not try to use the number of a handle alone (e.g., `5.007`) because you usually need to specify many more digits than MATLAB displays. Instead, assign the handle to a variable and use that variable name to specify a block.

Use the block handle with `set_param` to set the position.

```
set_param(mublockhandle, 'Position', [50 100 110 120])
```

Put Block Name on Top of Block

Set the position of the Mu block name on top in the vdp model.

Open the vdp model. Type `vdp` at the command line.

Select the Mu block.

Set the name of the block on top.

```
set_param(gcb, 'NameLocation', 'top')
```

Input Arguments

Object — Name or handle of a model or block

character vector | string scalar | handle

Handle or name of a model or block, specified as a numeric handle or a character vector. A numeric handle must be a scalar. You can also set parameters of lines and ports, but you must use numeric handles to specify them.

Tip If you make multiple calls to `set_param` for the same block, then specifying a block using a numeric handle is more efficient than using the full block path with `set_param`. Use `getSimulinkBlockHandle` to get a block handle. Do not try to use the number of a handle alone (e.g., 5.007) because you usually need to specify many more digits than MATLAB displays. Assign the handle to a variable and use that variable name to specify a block.

Example: 'vdp/Mu'

ParameterName — Model or block parameter name

character vector | string scalar

Model or block parameter name, specified as a character vector or a string scalar. Some parameter names are case sensitive.

Example: 'Solver'

Example: 'SimulationCommand'

Example: 'Position'

Example: 'NameLocation'

Value — Value of the specified parameter

any data type, depending on the parameter

Model or block parameter value, specified in the format determined by the parameter type. Some parameter values are case sensitive. Values are often character vectors, but they can also be numeric, arrays, and other types. Many block parameter values are specified as character vectors, but two exceptions are these parameters: `Position`, specified as a vector, and `UserData`, which can be any data type.

Example: 'right' 'left' 'top' 'bottom'

setActiveConfigSet

Specify active configuration set or configuration reference for model

Syntax

```
setActiveConfigSet(model, configObjName)
```

Description

`setActiveConfigSet(model, configObjName)` activates the configuration set or configuration reference that is attached to `model` and is named `configObjName`. Before you activate a configuration, attach the configuration to the model by using `attachConfigSet`.

Examples

Activate Configuration Set

Create a configuration set, attach it to a model, and activate it.

Open the model `sldemo_fuelsys`.

```
sldemo_fuelsys
```

Create a configuration set named `Config1` and attach it to the model.

```
configObj = Simulink.ConfigSet;  
set_param(configObj, 'Name', 'Config1')  
attachConfigSet('sldemo_fuelsys', configObj)
```

Activate the `Config1` configuration set.

```
setActiveConfigSet('sldemo_fuelsys', 'Config1')
```

Input Arguments

model — Model for which to activate configuration

character vector | string scalar

Name of model for which you want to activate a configuration set, specified as a character vector or string scalar. The model must be open.

Example: `'my_model'`

configObjName — Name of configuration object

character vector | string scalar

Name of the configuration object that you want to activate, specified as a character vector or string scalar.

Example: `'Configuration'`

Introduced before R2006a

sfix

Create `Simulink.NumericType` object describing signed fixed-point data type

Syntax

```
a = sfix(WordLength)
```

Description

`sfix(WordLength)` returns a `Simulink.NumericType` object that describes a signed fixed-point number with the specified word length and unspecified scaling.

Note `sfix` is a legacy function. In new code, use `fixdt` instead. In existing code, replace `sfix(WordLength)` with `fixdt(1,WordLength)`.

Examples

Define a 16-bit signed fixed-point data type.

```
a = sfix(16)
```

```
a =
```

```
    NumericType with properties:
```

```
    DataTypeMode: 'Fixed-point: unspecified scaling'  
    Signedness: 'Signed'  
    WordLength: 16  
    IsAlias: 0  
    DataScope: 'Auto'  
    HeaderFile: ''  
    Description: ''
```

See Also

`Simulink.NumericType` | `fixdt` | `float` | `sfrac` | `sint` | `ufix` | `ufrac` | `uint`

Introduced before R2006a

sfrac

Create `Simulink.NumericType` object describing signed fractional data type

Syntax

```
a = sfrac(WordLength)
a = sfrac(WordLength, GuardBits)
```

Description

`sfrac(WordLength)` returns a `Simulink.NumericType` object that describes the data type of a signed fractional data type with a word size given by `WordLength`.

`sfrac(WordLength, GuardBits)` returns a `Simulink.NumericType` object that describes the data type of a signed fractional number. The total word size is given by `WordLength` with `GuardBits` bits located to the left of the binary point.

The most significant (leftmost) bit is the sign bit. The default binary point for this data type is assumed to lie immediately to the right of the sign bit. If guard bits are specified, they lie to the left of the binary point and to right of the sign bit. For example, the structure for an 8-bit signed fractional data type with 4 guard bits is:

Note `sfrac` is a legacy function. In new code, use `fixdt` instead. In existing code, replace `sfrac(WordLength,GuardBits)` with `fixdt(1,WordLength,(WordLength-1-GuardBits))` and `sfrac(WordLength)` with `fixdt(1,WordLength,(WordLength-1))`.

Examples

Define an 8-bit signed fractional data type with 4 guard bits. Note that the range of this data type is $-2^4 = -16$ to $(1 - 2^{(1-8)}) \cdot 2^4 = 15.875$.

```
a = sfrac(8,4)
```

```
a =
```

```
NumericType with properties:
```

```
    DataTypeMode: 'Fixed-point: binary point scaling'
    Signedness: 'Signed'
    WordLength: 8
    FractionLength: 3
```

```
    IsAlias: 0  
    DataScope: 'Auto'  
    HeaderFile: ''  
    Description: ''
```

Introduced before R2006a

showblockdatatypetable

Display HTML page of Simulink block data type support

Syntax

showblockdatatypetable

Description

showblockdatatypetable displays an HTML page of the Simulink block data type support. This table lists the data types that Simulink blocks support.

Examples

Display Support of Simulink Block Data Types

Display an HTML page of the Simulink block data type support.

showblockdatatypetable

Tips

To open the Block Support Table using a block, double-click the Block Support Table block in the block library or add it to a model and then double-click it.

Introduced before R2006a

showunitslist

Show built-in units, physical quantities, and unit systems supported by Simulink

Syntax

```
showunitslist
```

Description

`showunitslist` opens a web browser that contains the list of built-in units, physical quantities, and unit systems supported by Simulink.

Examples

Show Built-in Units, Physical Quantities, and Unit Systems

Show built-in units, physical quantities, and unit systems supported by Simulink.

```
showunitslist
```

This function opens a web browser displaying the allowed units.

signalbuilder

(Not recommended) Create and access Signal Builder blocks

Note The Signal Builder block is not recommended. Use the Signal Editor block instead.

Syntax

```
[time,data] = signalbuilder(block)
[time,data,signames] = signalbuilder(block)
[time,data,signames,groupnames] = signalbuilder(block)

block = signalbuilder(path,'create',time,data)
block = signalbuilder(path,'create',time,data,signames,groupnames)
block = signalbuilder(path,'create',time,data,signames,groupnames,vis)
block = signalbuilder(path,'create',time,data,signames,groupnames,vis,pos)
block = signalbuilder(path,'create',time,data,signames,groupnames,vis,pos,{
openui openmodel})

block = signalbuilder(block,'appendgroup',time,data,signames,groupnames)
signalbuilder(block,'appendgroup',ds)
signalbuilder(block,'appendgroup',[ds1 ...dsN])
signalbuilder(block,'appendsignal',time,data,signames)

signalbuilder(block,'showsignal',signal,group)
signalbuilder(block,'hidesignal',signal,group)

[time,data] = signalbuilder(block,'get',signal,group)
ds = signalbuilder(block,'get',group)
[ds, ...dsN] = signalbuilder(block,'get',group)
signalbuilder(block,'set',signal,group,time,data)
signalbuilder(block,'set',group,ds)
signalbuilder(block,'set',group,[ds1 ...dsN])

index = signalbuilder(block,'activegroup')
[index, activeGroupLabel] = signalbuilder(block,'activegroup')
signalbuilder(block,'activegroup',index)

signalbuilder(block,'annotategroup')

signalbuilder(block,'print',config,printArgs)
figh = signalbuilder(block,'print',config,'figure')
```

Description

`[time,data] = signalbuilder(block)` returns the time and data of the Signal Builder block, block.

`[time,data,signames] = signalbuilder(block)` returns signal names, signames, and time and data.

`[time,data,signames,groupnames] = signalbuilder(block)` returns the signal names, signames, and group names, groupnames, and time and data.

`block = signalbuilder(path,'create',time,data)` creates a new Signal Builder block at path with specified time and data. Signal and group names are default.

`block = signalbuilder(path,'create',time,data,signames,groupnames)` creates a new Signal Builder block at path with specified time and data, signal names, and group names.

`block = signalbuilder(path,'create',time,data,signames,groupnames,vis)` creates a new Signal Builder block and sets the visible signals in each group based on the values of the matrix vis.

`block = signalbuilder(path,'create',time,data,signames,groupnames,vis,pos)` creates a new Signal Builder block and sets the block position to pos.

If you create signals that are smaller than the display range or do not start from 0, the Signal Builder block extrapolates the undefined signal data. It does so by holding the final value.

`block = signalbuilder(path,'create',time,data,signames,groupnames,vis,pos,{openui openmodel})` creates a new Signal Builder block and opens or invisibly loads the model and Signal Builder block window.

`block = signalbuilder(block,'appendgroup',time,data,signames,groupnames)` appends new groups (groupnames) containing signames to the Signal Builder block, block. The time and data arguments must have the same number of signals as the existing block.

`signalbuilder(block,'appendgroup',ds)` appends one dataset.

`signalbuilder(block,'appendgroup',[ds1 ...dsN])` appends *N* datasets.

`signalbuilder(block,'appendsignal',time,data,signames)` appends new signals to all signal groups in the Signal Builder block, block. You can append either the same signals to all groups, or append different signals to different groups. Regardless of which signals you append, append the same number of signals to all the groups. Append signals to all the groups in the block; you cannot append signals to a subset of the groups. Correspondingly, provide time and data arguments for either one group (append the same information to all groups) or different time and data arguments for different groups.

`signalbuilder(block,'showsignal',signal,group)` makes signals that are hidden from the Signal Builder block visible. By default, signals in the current active group are visible when created.

`signalbuilder(block,'hidesignal',signal, group)` makes signals, signal, hidden from the Signal Builder block. By default, all signals are visible when created.

`[time,data] = signalbuilder(block,'get',signal,group)` gets the time and data values for the specified signal(s) and group(s).

`ds = signalbuilder(block,'get',group)` gets one or more datasets for one requested Signal Builder group. *r* gets *N* datasets for *N* requested Signal Builder groups.

`[ds, ...dsN] = signalbuilder(block,'get',group)` gets *N* datasets for *N* requested Signal Builder groups.

`signalbuilder(block, 'set', signal, group, time, data)` sets the time and data values for the specified signal and group. Use empty values of `time` and `data` to remove groups and signals. To remove a signal group, you must also remove all the signals in that group in the same command.

`signalbuilder(block, 'set', group, ds)` sets one dataset for the requested Signal Builder group. Specifying an empty dataset deletes the groups specified in `group`.

`signalbuilder(block, 'set', group, [ds1 ... dsN])` sets N datasets for N requested groups.

`index = signalbuilder(block, 'activegroup')` gets the index of the active group.

`[index, activeGroupLabel] = signalbuilder(block, 'activegroup')` gets the label value of the active group.

`signalbuilder(block, 'activegroup', index)` sets the active group to indexed active group.

`signalbuilder(block, 'annotategroup')` controls the display of the current group name on the mask of the Signal Builder block. 'annotategroup' takes one of these values:

- 'on' — Shows the current group name
- 'off' — Hides the current group name

`signalbuilder(block, 'print', config, printArgs)` prints the currently active signal group or the signal group that `config` specifies. Use the `config` to customize the printed appearance of a signal group.

`figh = signalbuilder(block, 'print', config, 'figure')` prints the currently active signal group or the signal group that `config` specifies to a new hidden figure handle, `figh`.

Examples

Create Signal Builder Block

Create a Signal Builder block in a new model editor window.

```
block = signalbuilder([], 'create', [0 5], {[2 2];[0 2]});
```

Get Signal Builder data from this block.

```
[time, data, signames, groupnames] = signalbuilder(block)
```

```
time =
```

```
2×1 cell array
```

```
{1×2 double}  
{1×2 double}
```

```
data =
```

```
2×1 cell array
```

```
{1×2 double}  
{1×2 double}
```

```
signames =  
    1x2 cell array  
    {'Signal 1'}    {'Signal 2'}  
groupnames =  
    1x1 cell array  
    {'Group 1'}
```

The Signal Builder block contains two signals in one group. Alter the second signal in the group.

```
signalbuilder(block, 'set', 2, 1, [0 5], [2 0]);
```

To make this same change using the signal name and group name:

```
signalbuilder(block, 'set', 'Signal 2', 'Group 1', [0 5], [2 0])
```

Create Signal Builder Block and Delete Group

Create a Signal Builder block with two signal groups and delete one of the groups.

```
block = signalbuilder([], 'create', [0 2], {[0 1],[1 0]});
```

The Signal Builder block has two groups, each of which contains a signal.

To delete the second group, also delete its signal.

```
signalbuilder(block, 'set', 1, 2, [], [])
```

Create Signal Builder Block with Two Groups

Create a Signal Builder block with two groups, each of which contains three signals.

```
block = signalbuilder([], 'create', [0 1], ...  
    {[0 0],[1 1];[1 0],[0 1];[1 1],[0 0]});
```

Create Signal Builder Block and Append Signal Groups

Create a Signal Builder block in a new model editor window.

```
block = signalbuilder([], 'create', {[0 10],[0 20]},{[6 -6],...  
    [2 5]});
```

The Signal Builder block has two groups. Each group contains one signal.

Append a new signal group to the existing block.

```
block = signalbuilder(block, 'appendgroup', [0 30],[10 -10]);
```

Append a new signal, sig3, to all groups.

```
signalbuilder(block, 'appendsignal', [0 30], [0 10], 'sig3');
```

Create Signal Builder Block and Delete Signal Group

Create a Signal Builder block in a new model editor window.

```
time = [0 1];
data = {[0 0], [1 1]; [1 0], [0 1]; [1 1], [0 0]};
block = signalbuilder([], 'create', time, data);
```

The Signal Builder block has two groups. Each group contains three signals.

Delete the second group. To delete a signal group, also delete all the signals in the group.

```
signalbuilder(block, 'set', [1,2,3], 'Group 2', []);
```

Create Signal Builder Block and Hide Signal

Create a Signal Builder block in a new model editor window and hide signal.

```
block = signalbuilder([], 'create', [0 5], {[2 2]; [0 2]});
```

The Signal Builder block has one group that contains two signals.

Hide the signal, Signal 1.

```
signalbuilder(block, 'hidesignal', 'Signal 1', 'Group 1')
```

Signal 1 is no longer visible in the Signal Builder block.

Make Signal 1 visible again.

```
signalbuilder(block, 'showsignal', 'Signal 1', 'Group 1')
```

Create Two Signal Builder Blocks

Create two Signal Builder blocks in new model editor windows.

```
block = signalbuilder([], 'create', [0 5], {[2 2]; [0 2]});
block1 = signalbuilder('untitled/Signal Builder1', 'create', [1 2], {[1 2]; [0 10]});
```

Get a dataset for group 1 of block.

```
ds=signalbuilder(block, 'get', 1);
```

Get a dataset for group 1 of block1.

```
ds1=signalbuilder(block1, 'get', 1);
```

Set the dataset for group 1 of block to ds1.

```
signalbuilder(block, 'set', 1, ds1);
```

Append the original dataset for group 1 of block (ds) to block.

```
signalbuilder(block, 'appendgroup', ds);
```

To create a third group in `block`, append `ds1` to the end of the groups in `block`.

```
signalbuilder(block, 'appendgroup', ds1);
```

Input Arguments

block — Signal Builder block path or handle

[] (default) | block handle | block name

Signal Builder block handle or name. If you specify [] for this argument, the block has the path 'untitled/Signal Builder'.

Example: 'untitled/Signal Builder'

Example: `block_handle = gcbh`

Data Types: `char` | `string`

time — Time

row vector | column cell vector | row cell vector | cell matrix

Specify `time` format depending on the block configuration.

If `data` is a cell array and `time` is a vector, the `time` values are duplicated for each element of `data`. Each vector within `time` and `data` must be the same length and have at least two elements. If `time` is a cell array, all elements in a column must have the same initial and final value.

Configuration	Time Format
1 signal, 1 group	Row vector of break points.
>1 signal, 1 group	Column cell vector where each element corresponds to a separate signal and contains a row vector of points.
1 signal, >1 group	Row cell vector where each element corresponds to a separate group and contains a row vector of points.
>1 signal, >1 group	Cell matrix where each element (i, j) corresponds to signal i and group j.

Dependencies

If `signalbuilder` is called for an existing block, the `time` argument must have the same number of signals as the existing block.

Data Types: `double`

data — Data

row vector | column cell vector | row cell vector | cell matrix

Specify `data` format depending on the block configuration.

If `data` is a cell array and `time` is a vector, the `time` values are duplicated for each element of `data`. Each vector within `time` and `data` must be the same length and have at least two elements. If `time` is a cell array, all elements in a column must have the same initial and final value.

Configuration	Time/Data Format
1 signal, 1 group	Row vector of break points.
>1 signal, 1 group	Column cell vector where each element corresponds to a separate signal and contains a row vector of points.
1 signal, >1 group	Row cell vector where each element corresponds to a separate group and contains a row vector of points.
>1 signal, >1 group	Cell matrix where each element (i, j) corresponds to signal i and group j.

Data Types: double

config – Configuration structure name

structure name

Configuration structure containing instructions to display signal group information on the block mask. Set up the structure with one or more of these fields before you print.

Field	Description	Example Value
groupIndex	Scalar specifying index of signal group to print	2
timeRange	Two-element vector specifying the time range to print (must not exceed the block's time range)	[3 6]
visibleSignals	Vector specifying index of signals to print	[1 2]
yLimits	Cell array specifying limits for each signal's y-axis	{[-1 1], [0 1]}
extent	Two-element vector of the form: [width, height] specifying the dimensions (in pixels) of the area in which to print the signals	[500 300]
showTitle	Logical value specifying whether to print a title: true (1) prints the title	false

For example, to print just group 2 using a configuration structure, `configstruct`, set up the structure as follows. You do not need to specify any other fields.

```
configstruct.groupIndex=1
```

Example: `configstruct`

Data Types: char | string

'create' – Create directive

'create'

Create new Signal Builder block.

Data Types: char | string

signames – Signal names

Signal 1 (default) | ' ' | {} | character vector | cell array of character vectors

Signal names, specified as ' ', {}, a character vector, or cell array of character vectors.

If you specify a value of ' ' or {}, the function uses existing signal names for the new groups.

Data Types: char | string

groupnames — Signal group names

Group 1 (default) | character vector | cell array of character vectors

Group names, specified as a character vector or cell array of character vectors.

Data Types: char | string

path — Block path

[] (default) | full block path

Block path, specified as full block path. To create a Signal Builder block in a new model, untitled, with the name Signal Builder, specify [].

Data Types: char | string

vis — Signal visibility

matrix

Signal visibility, specified as a matrix. The Signal Builder block displays signals in each group based on the values of the matrix vis. This matrix must be the same size as the cell array, data. You cannot create Signal Builder blocks in which all signals are invisible. For example, if you set the vis parameter for all signals to 0, the first signal is still visible.

Data Types: double

pos — Block position in model

[0 0] (default) | [x y right bottom]

Block position in model, specified as [x y right bottom].

Data Types: double

openui — Open Signal Builder block dialog box

0 (default) | 1

Open Signal Builder block dialog upon creation by signalbuilder function, specified as 0 or 1.

Data Types: double

openmodel — Open model

1 (default) | 0

Open model upon creation by signalbuilder function, specified as one of:

- 0 — Load the model but do not open it.
- 1 — Open the model.

Data Types: double

'appendsignal' — Append signals

'appendsignal' (default)

Append new signals to all signal groups in the Signal Builder block. You can append either the same signals to all groups, or append different signals to different groups. Regardless of which signals you append, append the same number of signals to all the groups. Append signals to all the groups in the block. You cannot append signals to a subset of the groups.

Data Types: `char` | `string`

'appendgroup' — Append new signal group

`'appendgroup'`

Append new signal groups whose number of time and signal elements are the same as existing signal groups in the Signal Builder block.

For the `showsignal` and `hidesignal` methods, if you do not specify a value for the `group` argument, `signalbuilder` applies the operation to all the signals and groups.

Data Types: `char`

'set' — Set values

`'set'`

Set values based on input arguments.

- `time` and `data` — Return time and data values.
- `ds` — Return `Simulink.SimulationData.Dataset` object(s).

Data Types: `char`

'get' — Get values

`'get'`

Get values based on output arguments.

- `[time, data]` — Return time and data values.
- `[ds, ...dsN]` — Return `Simulink.SimulationData.Dataset` object(s).

Data Types: `char` | `string`

'showsignal' — Make signal visible

`'showsignal'`

Make one or more signals visible in a signal group. If no group is specified, all the signals and groups are visible.

Data Types: `char` | `string`

'hidesignal' — Hide signal

`'hidesignal'`

Hide one or more signals in a signal group. If no group is specified, all the signals and groups are hidden.

Data Types: `char`

ds — Dataset

`timeseries` data elements | 1-D scalar data value at each time | nonempty data and/or time | empty values

Dataset of timeseries elements, specified as a `Simulink.SimulationData.Dataset` object.

Data Types: `double`

ds1 ... dsN — Multiple datasets

vectors of timeseries data elements | vectors of 1-D scalar data value at each time | nonempty data and/or time

One or more datasets of timeseries elements, specified as `Simulink.SimulationData.Dataset` objects.

Example: `[ds1 ds2 ds3]`

Data Types: `double`

signal — Signal

signal name | scalar index | array of signal indices

Signal, specified as a signal name, scalar index, or array of signal indices.

Data Types: `char` | `double` | `string`

group — Signal group

group name | scalar index | array of group indices

Signal group, specified as a group name, scalar index, or array of group indices.

Data Types: `char` | `double` | `string`

index — Group index

active group index

Active signal group index.

Data Types: `double`

'activegroup' — Get active group

`'activegroup'`

Get currently active signal group.

Data Types: `char` | `string`

'annotategroup' — Display active signal group name

`'on'` (default) | `'off'`

Display active signal group name on Signal Builder block mask:

- `'on'` — Display active signal group names on block mask.
- `'off'` — Do not display active signal group names on block mask.

Data Types: `char` | `string`

'print' — Print signal group

`'print'`

Print signal group.

Data Types: `char` | `string`

printArgs — Configure print options

[] | print function arguments

Configure print options (see print).

To print the entire contents of the Signal Builder block, specify [].

Data Types: char | string

'figure' — Figure

'figure'

Create a figure containing contents of Signal Builder block.

Data Types: char | double | string

Output Arguments**time — Time**

row vector | column cell vector | row cell vector | cell matrix

Time for the Signal Builder block, returned as row vector, column cell vector, row cell vector, or cell matrix. For the Signal Builder block, time is the x-coordinate.

time returns in different formats depending on the block configuration.

Configuration	Time Format
1 signal, 1 group	Row vector of break points.
>1 signal, 1 group	Column cell vector where each element corresponds to a separate signal and contains a row vector of points.
1 signal, >1 group	Row cell vector where each element corresponds to a separate group and contains a row vector of points.
>1 signal, >1 group	Cell matrix where each element (i, j) corresponds to signal i and group j.

data — Data

row vector | column cell vector | row cell vector | cell matrix

Data of the Signal Builder block, returned as a one-dimensional array. For the Signal Builder block, time is the y-coordinate.

data takes different formats depending on the block configuration.

Configuration	Data Format
1 signal, 1 group	Row vector of break points.
>1 signal, 1 group	Column cell vector where each element corresponds to a separate signal and contains a row vector of points.
1 signal, >1 group	Row cell vector where each element corresponds to a separate group and contains a row vector of points.
>1 signal, >1 group	Cell matrix where each element (i, j) corresponds to signal i and group j.

Datasets must have the same number of elements as the signals in a signal group. Dataset format limitations for the `set`, `append`, and `appendgroup` functions include:

- Elements must be MATLAB timeseries data.
Timeseries data and/or time cannot be empty.
- Timeseries data must be of type double.
- Timeseries data must be 1-D (scalar value at each time).

signames — Signal names

character vector | cell array of character vectors

Signal names, returned as a character vector or cell array of character vectors.

block — Signal Builder block path or handle

block handle

Signal Builder block path or handle, returned by block creation or append commands.

ds — Dataset

timeseries data elements | 1-D scalar data value at each time | nonempty data and/or time

Dataset of timeseries elements, returned as a `Simulink.SimulationData.Dataset` object.

ds, ...dsN — Multiple datasets

vectors of timeseries data elements | vectors of 1-D scalar data value at each time | nonempty data and/or time

One or more datasets of timeseries elements, returned as `Simulink.SimulationData.Dataset` objects.

index — Group index

active group index

Active signal group index.

activeGroupLabel — Active group label

index

Active group label, returned as an index.

figh — Figure handle

handle

Figure handle, returned when contents of Signal Builder block are printed to the hidden figure.

More About

Interpolating Missing Data Values

When specifying a periodic signal such as a Sine Wave, the `signalbuilder` function uses linear Lagrangian interpolation to compute data values for time steps that occur between time steps for which the `signalbuilder` function supplies data. When specifying periodic signals, specify them as a time vector that is defined as multiples of sample time, for example:

```
t = 0.2*[0:49]';
```

Signal Builder | Signal Editor | Simulink.SimulationData.Dataset

Topics

“Load Data with Interchangeable Scenarios”

“Signal Groups”

Introduced in R2007a

signalEditor

Start Signal Editor

Syntax

```
signalEditor
signalEditor(Name,Value)
```

Description

`signalEditor` starts Signal Editor without an associated model.

`signalEditor(Name,Value)` starts signal Editor using additional options specified by one or more name-value pair arguments.

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify the name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

- `Model` - Model name, specified as a character array, for which Signal Editor is to start. You can specify one model per call to the `signalEditor` function.

Note Load the model before starting Signal Editor for it.

- `DataSource` - Data set name, specified as a character array, to be edited. You can specify one data set file per call to the `signalEditor` function.

Note You can start multiple sessions of Signal Editor for the same model. However, you can associate a data set file with only one Signal Editor at a time. A data set file cannot have multiple Signal Editor sessions associated with it.

To add a scenario to the Signal Editor interface, select **Scenario** from the **Insert** section of the Signal Editor toolstrip.

Examples

Start Signal Editor for a Model

Start the Signal Editor for the model, `slexAutotransRootInportsExample`.

Load the `slexAutotransRootInportsExample` model, then start Signal Editor for it.

```
open_system('slexAutotransRootInportsExample')
signalEditor('Model','slexAutotransRootInportsExample');
```

Start Signal Editor to Edit a Data Set File

Start Signal Editor to edit myFile.mat.

```
signalEditor('DataSource', 'myFile.mat');
```

Start Signal Editor and Data Set File for a Model

Load the slexAutotransRootInportsExample model, then start Signal Editor for the model, and edit myFile.mat.

```
open_system('slexAutotransRootInportsExample')  
signalEditor('Model', 'slexAutotransRootInportsExample', 'DataSource', 'myFile.mat');
```

“Create and Edit Signal Data”

Introduced in R2017b

sim

Simulate a Simulink model

Syntax

```
simOut = sim(model)
simOut = sim(model,Name,Value)
simOut = sim(simIn)
simOut = sim(model,ParameterStruct)
simOut = sim(model,ConfigSet)
```

Description

A Simulink model represents a dynamic system. Simulating a model lets you understand the behavior of the system as a function of simulated time. The `sim` command uses the specified model and applies the arguments to the model. At the end of the simulation, the `sim` command reverts any arguments that it applied.

`simOut = sim(model)` simulates the specified model using existing model configuration parameters, and returns the result as a `Simulink.SimulationOutput` object (single-output format).

To return simulation results using the backward-compatible format (time vector), see “Backward-Compatible Syntax” on page 2-456.

`simOut = sim(model,Name,Value)` simulates the specified model using parameter name-value pairs.

`simOut = sim(simIn)` simulates the model using the inputs specified in the `Simulink.SimulationInput` object `simIn`. The `sim` command can be used with an array of `SimulationInput` objects to run multiple simulations in a series. If `simIn` is an array of `Simulink.SimulationInput` objects, output is returned as an array of `Simulink.SimulationOutput` objects.

`simOut = sim(model,ParameterStruct)` simulates the specified model using the parameter values specified in the structure `ParameterStruct`.

`simOut = sim(model,ConfigSet)` simulates the specified model using the configuration settings specified in the model configuration set `ConfigSet`.

Examples

Set Block Parameters using an Array of Simulink.SimulationInput Objects

This example modifies the block parameters of a model through the `SimulationInput` object.

Open the model.

```
openExample('simulink/OpenTheModelExample');
open_system('ex_sldemo_househeat');
load_system('ex_sldemo_househeat')
```

Create a `SimulationInput` object for this model.

```
mdl = 'sldemo_househeat';
in = Simulink.SimulationInput(mdl);
```

Modify block parameter.

```
in = in.setBlockParameter('sldemo_househeat/Set Point','Value','300');
```

Simulate the model.

```
out = sim(in)
```

Simulate Model with Default Parameter Settings

Simulate the model, `vdp` as it is in the present state, whether it is not loaded or is loaded and has some unsaved changes.

On the Data Import/Export pane of the Configuration Parameters dialog box, **Single simulation output** is selected by default, so `sim` returns the simulation results using the single-output format (simulation object). This selection overrides the Dataset format used for signal logging.

```
simOut = sim('vdp')
```

Simulate Model with `sim` Command-Line Options in Structure

Simulate the model, `vdp`, and save the states in `xoutNew` and the output in `youtNew`.

Specify parameters using a name-value pairs structure `paramNameValStruct` for the `sim` command:

```
paramNameValStruct.SaveState      = 'on';
paramNameValStruct.StateSaveName = 'xoutNew';
paramNameValStruct.SaveOutput     = 'on';
paramNameValStruct.OutputSaveName = 'youtNew';
simOut = sim('vdp',paramNameValStruct)
```

```
simOut =
  Simulink.SimulationOutput:

      xoutNew: [64x2 double]
      youtNew: [64x2 double]

  SimulationMetadata: [1x1 Simulink.SimulationMetadata]
  ErrorMessage: [0x0 char]
```

Simulate Model with `sim` Command-Line Options in Configuration Set

Simulate the model, `vdp`, for an absolute tolerance of $1e-5$ and save the states in `xoutNew` and the output in `youtNew`.

Specify parameters as name-value pairs in configuration set `mdl_cs` for the `sim` command:

```
mdl = 'vdp';
load_system(mdl)
cs = getActiveConfigSet(mdl);
mdl_cs = cs.copy;
```

```

set_param mdl_cs, 'AbsTol', '1e-5', ...
    'SaveState', 'on', 'StateSaveName', 'xoutNew', ...
    'SaveOutput', 'on', 'OutputSaveName', 'youtNew')
simOut = sim mdl, mdl_cs

simOut =
    Simulink.SimulationOutput:

        xoutNew: [65x2 double]
        youtNew: [65x2 double]

    SimulationMetadata: [1x1 Simulink.SimulationMetadata]
    ErrorMessage: [0x0 char]

```

Input Arguments

model — Model to simulate

character vector

Model to simulate, specified as a character vector.

Example: `simOut = sim('vdp')`

ParameterStruct — Structure containing parameter settings

structure

Structure containing parameter settings for the simulation specified as a structure. The fields in the structure are the names of the configuration parameters, and the corresponding values are the parameter values.

ConfigSet — Set of configuration parameters

`Simulink.Configset` object

Set of configuration parameters for a model, specified as a `Simulink.Configset` object. For more information, see `Simulink.ConfigSet`.

simIn — `Simulink.SimulationInput` object for a model

`Simulink.SimulationInput` object

Simulation input object for a model, specified as a `Simulink.SimulationInput` object created by specifying the model name. For more information, see `Simulink.SimulationInput`.

Use the `SimulationInput` object to specify Block Parameters, Model Parameters, Variables and External Inputs for simulation.

Example: `simIn = Simulink.SimulationInput('vdp')`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: `'Solver', 'ode15s', 'Timeout', '30'` specifies that the model is simulated using the `ode15s` solver with a timeout that occurs when `SimulationTime` reaches 30.

You can pass any model parameter and its value to the `sim` command.

In addition, the `sim` command accepts the following parameters that are not available on the `Configset` and `set_param`

CaptureErrors — Option to save errors to SimulationMetadata object

off (default) | on

Option to save errors to SimulationMetadata object, specified as 'off' or 'on'. By default, if an error occurs during simulation, the `sim` command stops and reports the error in the MATLAB Command Window. If you specify 'CaptureErrors', 'on', the `sim` command saves any errors to the `ErrorDiagnostic` structure within the SimulationMetadata object. The error message is saved in the `ErrorMessage` property of the SimulationOutput object.

When running multiple simulations in a loop, this option ensures that one simulation error will not stop a script or function from continuing.

If you specify an array of input objects, the `sim` commands runs with `CaptureErrors` enabled. If an error occurs, the error messages are included in the `Simulink.SimulationMetadata` object for the simulation, as well as simulation data up to the point of the failure.

This option is not available for simulation in SIL and PIL modes.

Example: 'CaptureErrors', 'on'

Debug — Debug mode option

off (default) | on | cmds | cell array

Debug mode option for simulation, specified as 'off' or 'on'. Setting the value of 'Debug' argument to 'on' starts the simulation in debug mode (see “Debugger Graphical User Interface” for more information). The value of this option can be a cell array of commands to be sent to the debugger after it starts.

Example: 'Debug', 'on'

RapidAcceleratorUpToDateCheck — Perform up-to-date check before simulation

on (default) | off

This option is available in Rapid Accelerator mode only. Pre-simulation up-to-date-check, specified as 'on' or 'off'. If you set this value to 'off', Simulink does not perform an up-to-date check. It skips the start/stop callbacks in blocks. If you call the `sim` command from `parfor`, set this value to 'off'.

When you set this option to 'off', changes that you make to block parameter values in the model (for example, by using block dialog boxes, by using the `set_param` function, or by changing the values of MATLAB variables) do not affect the simulation. Use `RapidAcceleratorParameterSets` to pass new parameter values directly to the simulation.

Example: 'RapidAcceleratorUpToDateCheck', 'off'

TimeOut — Maximum simulation run time

positive scalar

Maximum simulation run time, specified as a positive scalar. Specify the time, in seconds, to allow the simulation to run. If you run your model for a period longer than the value of `TimeOut`, the software issues a warning and stops the simulation. `TimeOut` refers to the time spent for a simulation.

Example: 'TimeOut', 60

Trace — Enables simulation tracing facilities`minstep | siminfo`

Simulation tracing facilities, specified as:

- 'minstep' specifies that simulation stops when the solution changes so abruptly that the variable-step solvers cannot take a step and satisfy the error tolerances.
- 'siminfo' provides a short summary of the simulation parameters in effect at the start of simulation.

Example: `'Trace','minstep','Trace','siminfo'`

Output Arguments**simOut — Simulation object containing logged simulation results**`Simulink.SimulationOutput` object

Simulation object containing logged simulation results, returned as a `Simulink.SimulationOutput` object that contains all of the logged simulation results.

All simulation outputs (logged time, states, and signals) are returned in a single `Simulink.SimulationOutput` object. You select the data to be logged, such as the model time, states, and output that is logged using the **Data Import/Export** pane of the **Model Configuration Parameters** dialog box. You can log signals using blocks such as the To Workspace and Scope blocks. For more information on signal logging, see “Signal Logging”.

More About**Backward-Compatible Syntax**

Starting in R2009b, the `sim` command was enhanced to provide greater compatibility with parallel computing. The improved single-output format saves all simulation results to a single object, simplifying the management of output variables.

For compatibility with R2009a or earlier releases, use this syntax:

```
[T,X,Y] = sim('model',Timespan, Options, UT)
[T,X,Y1,...,Yn] = sim('model',Timespan, Options, UT)
```

If you specify only the `model` argument, Simulink automatically saves the time, state, and output to the specified output arguments.

If you do not specify any output arguments, Simulink determines what data to log based on the settings for the **Configuration Parameters > Data Import/Export** pane. Simulink stores the simulation output either in the current workspace or in the variable `ans`, based on the setting for **Save simulation output as a single object** parameter.

Backward-Compatible Syntax Input and Output Arguments

Argument	Description
<code>T</code>	The time vector returned.

Argument	Description
X	The state returned in matrix or structure format. The state matrix contains continuous states followed by discrete states.
Y	The output returned in matrix or structure format. For block diagram models, this variable contains all root-level blocks.
Y_1, \dots, Y_n	The outputs, which can only be specified for diagram models. Here, n must be the number of root-level blocks. Each output will be returned in the Y_1, \dots, Y_n variables.
'model'	The name of the model to simulate.
<i>Timespan</i>	The timespan can be T_{Final} , $[T_{Start} \ T_{Final}]$, or $[T_{Start} \ OutputTimes \ T_{Final}]$. Output times are time points returned in T , but in general, T includes additional time points.
<i>Options</i>	Optional simulation parameters created in a structure by the <code>simset</code> command using name-value pairs.
UT	Optional external inputs. For supported expressions, see “Load Data to Root-Level Input Ports”.

Simulink requires only the `model` argument. Simulink takes all defaults from the block diagram, including unspecified options. If you specify any optional arguments, your specified settings override the settings in the block diagram.

Specifying an input argument of `sim` as the empty matrix, `[]`, causes Simulink to use the default for that argument.

Tips

- Parameters specified using the `sim` command override the values defined in the **Model Configuration Parameters** dialog box. The software restores the original configuration values at the end of simulation.
- In the case of a model with a model reference block, the parameter specifications are applied to the top model.
- When simulating a model with infinite stop time, to stop the simulation, you must press **Ctrl+C**. **Ctrl+C** breaks the simulation, and the simulation results are not saved in the MATLAB workspace.
- To specify the time span for a simulation, you must specify the `StartTime` and `StopTime` parameters.
- To log the model time, states, or outputs, use the **Data Import/Export** pane of the Model Configuration Parameters dialog box.
- To log signals, either use a To Workspace block such as the To Workspace block or the Scope block, or use Signal Logging. For more information, see “Export Signal Data Using Signal Logging”.
- To get a list of simulation parameters for the model `vdp`, in the MATLAB Command Window, enter:

```
configSet = getActiveConfigSet('vdp')
configSetNames = get_param(configSet, 'ObjectParameters')
```

This command lists several object parameters, including simulation parameters such as 'StopTime', 'SaveTime', 'SaveState', 'SaveOutput', and 'SignalLogging'.

Introduced before R2006a

simplot

Redirects to the Simulation Data Inspector

Note simplot will be removed in a future release. Use the Simulation Data Inspector instead.

Syntax

```
simplot
```

Description

simplot redirects to the Simulation Data Inspector and returns empty handles. This function is no longer supported and has been replaced by the Simulation Data Inspector. Use the **Simulation Data Inspector** button in the Simulink Editor to capture simulation output in the Simulation Data Inspector. Programmatically, use the function `Simulink.sdi.view` instead.

See Also

`Simulink.sdi.view`

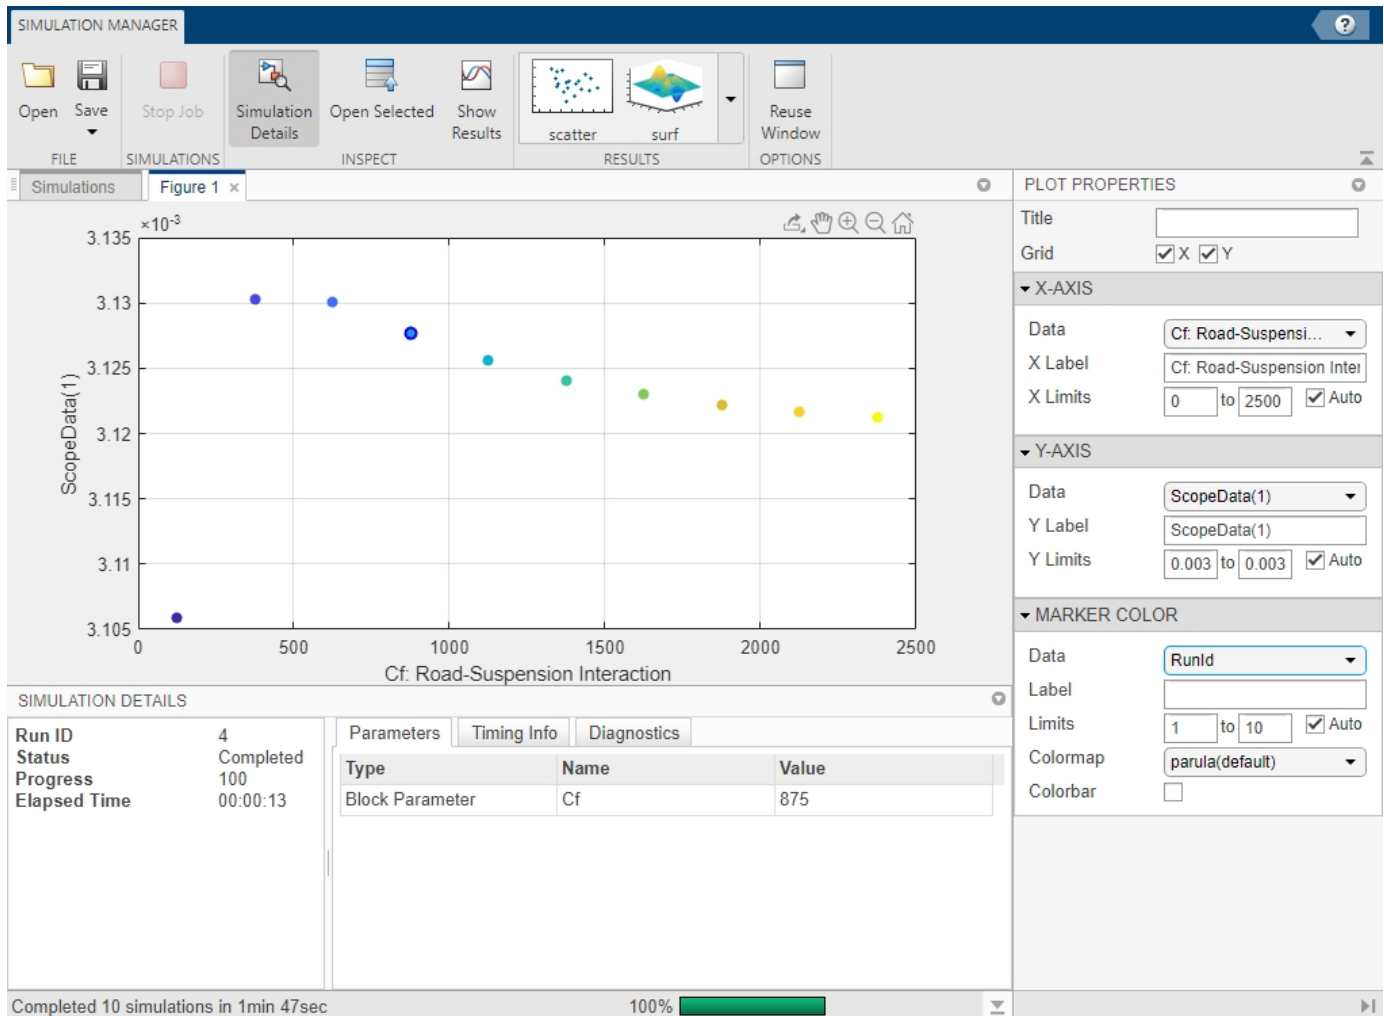

Simulation Manager

Monitor multiple simulations and visualize the simulation data

Description

Simulation Manager allows you to monitor the status of multiple simulations. Using this tool, you can:

- View the progress of the simulations in a high-level grid view or a detailed list view.
- Find the simulations that error out and view diagnostics for each simulation.
- Visualize simulation data to analyze the trends across the simulations.
- Select a simulation run and open the model in Simulink, with all of the simulation settings applied to the model.
- View simulation results in the Simulation Data Inspector.
- Abort simulations.

Open the Simulation Manager

- `parsim` and `sim` commands — Set the argument `ShowSimulationManager` to `on` with Parallel Computing Toolbox. The `parsim` and `sim` commands use a `Simulink.SimulationInput` object to run simulations. For more information, see `Simulink.SimulationInput`.

```
out = parsim(in, 'ShowSimulationManager', 'on')
```

```
out = sim(in, 'ShowSimulationManager', 'on')
```

- To open a saved Simulation Manager session, navigate to the folder where the file is saved and double click the `.mlatx` Simulation Manager file.

```
open filename.mlatx
```

- To open a Simulation Manager with the `Simulink.SimulationInput` object, `in`, and a `Simulink.SimulationOutput` object, `out`, of a completed run, use the `openSimulationManager` command.

```
openSimulationManager(in, out)
```

Examples

Open Simulation Manager

Open the model `sldemo_suspn_3dof` and create a set of sweep values.

```
mdl = 'sldemo_suspn_3dof';
open_system(mdl);
Cf_sweep = Cf*(0.05:0.1:0.95);
numSims = length(Cf_sweep);
```

To modify the block parameter **Road-Suspension Interaction** with the sweep values, create an array of `Simulink.SimulationInput` objects.

```
in(1:numSims) = Simulink.SimulationInput(mdl);
for i = 1:numSims
    in(i) = setBlockParameter(in(i), [mdl '/Road-Suspension Interaction'], 'Cf', num2str(Cf_sweep(i)));
end
```

Run multiple simulations and open the Simulation Manager.

```
out = parsim(in, 'ShowSimulationManager', 'on')
```

In the absence of Parallel Computing Toolbox, the simulations run in serial.

Using Simulation Manager

Once you run the `parsim` command, the Simulation Manager UI opens up as follows:

Plot results

In the **Figure 1** tab, you can view the default scatter plot where the parameter `Cf` is plotted against itself. Use the **Plot Properties** to edit the plot. Add grid lines for X and Y by checking the corresponding boxes. You can also change the data that is displayed on X- and Y- axes and the Marker Color. Change the data on y-axis by selecting `ScopeData(1)` from the **Data** drop-down. Set the Marker Color Data field to `RunID`.

To add another figure to the Simulation Manager, click **surf** or **scatter** plot and add plots as desired. In this example, click **surf** plot, located in the **Results** section of the toolbar. Drag the **Figure 2** tab to view the two plots together.

Plots in the Simulation Manager support numeric arrays and datasets.

Adding multiple plots to the Simulation Manager enables you to observe the simulation data in different ways. Using the results, you can analyze and study the design space of the parameters and their behavior.

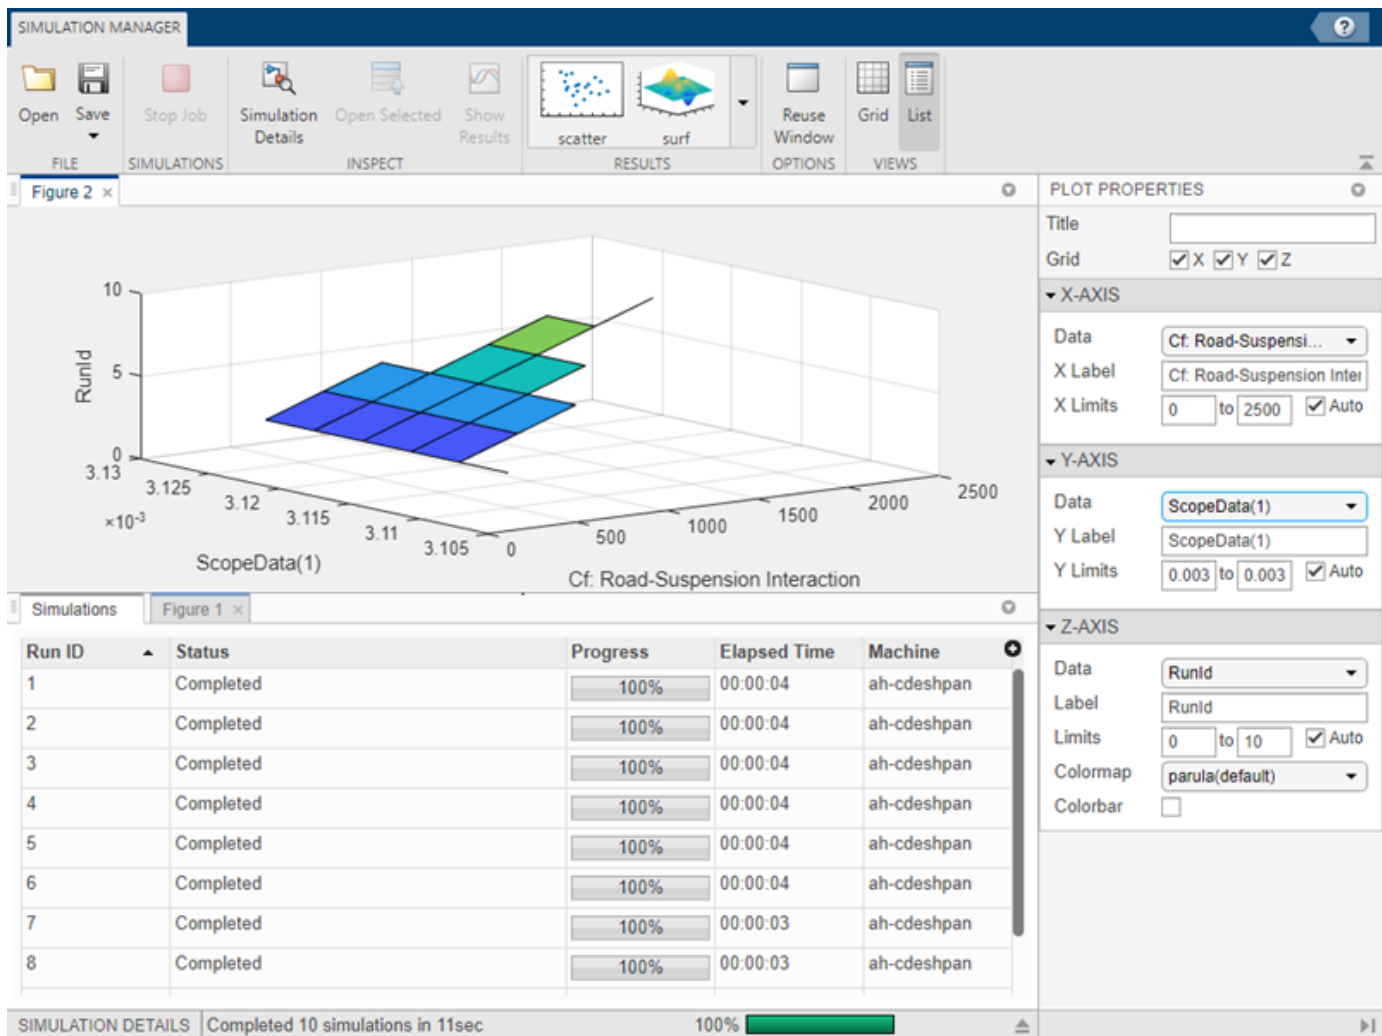

You can modify the configuration of the plot layouts by clicking the down arrow on the right corner of the plot.

- **Tile All** — Choose a layout for multiple plots.
- **Tab Position** — Select where to display the figure tab.

View the Status

To view the status of the simulations in list and grid views, click the **Simulations** tab next to **Figure 1**. Toggle between the **List** and **Grid** in the **Views** section of the toolbar. The list view shows a tabular view of the simulations with certain details, such as status, parameters and timing information. For large number of simulations, choose grid view for a compact view of the status of the simulations.

The status bar at the bottom of the window shows the progress of the simulations.

You can view all the multiple simulations in a detailed list view. This view gives you an option to add or delete columns. Use the  button to choose which columns to display. You can also sort the columns based on your preference.

Click a specific run to view more details about it.. The simulation details appear at the bottom of the window.

To show or hide the details of the selected simulation, toggle the **Simulation Details** button, .

Open Selected button, , allows you to open the model with the specifications of the selected run.

You can view the results of one or more runs in the Simulation Data Inspector by clicking the **Show Results** button, . Clicking **Show Results** creates a Simulation Data Inspector run from the `Simulink.SimulationOutput` object and is displayed in Simulation Data Inspector.

To abort the job while the simulations are running, you can use the **Stop Job** button, .

Save the Session

To save the Simulation Manager session, click the **Save** button on the toolbar. The saved session contains all the simulation data and the plot configurations and layout. To reopen the saved Simulation Manager session, navigate to the folder where the file is saved and double-click the `.mlatx` Simulation Manager file.

The **Reuse Window**, , button enables you to reuse the plot layout and configurations for new multiple simulations run with a different set of data. If the button is toggled off, a new window opens with each set of simulations. If the button is toggled on, the new simulations reuse the existing window preserving all plot configurations and layouts.

To reopen a saved file, use the **Open** button, navigate to the file location and double click the file.

simulink

Open Simulink Start Page

Syntax

```
simulink
```

Description

`simulink` opens the Simulink Start Page. From the Start Page, choose a model or project template, or browse the examples. See “Build and Edit a Model Interactively”.

The behavior of the `simulink` function changed in R2016a. Formerly it opened the Simulink Library Browser and loaded the Simulink block library.

- To open the Library Browser, use `sLibraryBrowser`.
- To only load the Simulink block library, use this command:

```
load_system simulink
```

- To start Simulink without opening the Library Browser or Start Page, use `start_simulink`, which is faster.

See Also

`sLibraryBrowser` | `start_simulink`

“Modeling”

Introduced before R2006a

simulinkproject

(Not recommended) Open project and get project object

Note simulinkproject is not recommended. Use currentProject or openProject instead. For more information, see “Compatibility Considerations”.

Syntax

```
simulinkproject
simulinkproject(projectPath)

proj = simulinkproject
proj = simulinkproject(projectPath)
```

Description

simulinkproject opens the project or brings focus to the tool if it is already open. After you open the tool, you can create projects or access recent projects using the **Project** tab.

simulinkproject(projectPath) opens the project specified by any file or folder under the project root in projectPath and gives focus to the project.

proj = simulinkproject returns a project object proj you can use to manipulate the project at the command line. You need to get a project object before you can use any of the other project functions.

proj = simulinkproject(projectPath) opens the project specified by projectPath and returns a project object.

Examples

Open Project Tool

Open the Project Tool.

```
simulinkproject
```

Open a Project

Specify either the .prj file path or the folder that contains your .SimulinkProject folder and .prj file. The project opens and brings focus to the project.

```
simulinkproject('C:/projects/project1/')
```

Open a Project and Get a Project Object

Open a specified project and get a project object to manipulate the project at the command line. To avoid your startup script opening windows that take focus away from the MATLAB Desktop, use `start_simulink` instead of the `simulink` function, and use `simulinkproject` with an output argument instead of `uiopen`. If you use `uiopen(myproject.prj)` this calls `simulinkproject` with no output argument and gives focus to the project.

```
start_simulink
proj = simulinkproject('C:/projects/project1/myproject.prj')
```

Get Airframe Example Project

Open the Airframe project and create a project object to manipulate and explore the project at the command line.

```
sldemo_slproject_airframe
proj = simulinkproject

proj =

    ProjectManager with properties:

        Name: 'Simulink Project Airframe Example'
    Information: [1x1 slproject.Information]
    Dependencies: [1x1 slproject.Dependencies]
    Categories: [1x1 slproject.Category]
    Files: [1x31 slproject.ProjectFile]
    Shortcuts: [1x7 slproject.Shortcut]
    ProjectPath: [1x7 slproject.PathFolder]
    ProjectReferences: [1x0 slproject.ProjectReference]
    StartupFiles: [1x0 slproject.StartupFile]
    ShutdownFiles: [1x0 slproject.ShutdownFile]
    RootFolder: 'C:\slexamples\airframell'
```

Find Project Commands

Find out what you can do with your project.

```
methods(proj)
```

Methods for class `slproject.ProjectManager`:

```
addFile
addFolderIncludingChildFiles
addPath
addReference
addShortcut
addShutdownFile
addStartupFile
close
createCategory
export
```

```
findCategory
findFile
isLoading
listModifiedFiles
listRequiredFiles
refreshSourceControl
reload
removeCategory
removeFile
removePath
removeReference
removeShortcut
removeShutdownFile
RemoveStartupFile
```

Examine Project Properties Programmatically

After you get a project object using the `simulinkproject` function, you can examine project properties.

Examine the project files.

```
files = proj.Files
```

```
files =
```

```
    1x31 ProjectFile array with properties:
```

```
    Path
    Labels
    Revision
    SourceControlStatus
```

Use indexing to access files in this list. The following command gets file number 14. Each file has properties describing its path, attached labels, and source control information.

```
proj.Files(15)
```

```
ans =
```

```
    ProjectFile with properties:
```

```
    Path: 'C:\slexamples\airframe24\models\DigitalControl.slx'
    Labels: [1x1 slproject.Label]
    Revision: '2'
    SourceControlStatus: Unmodified
```

Examine the labels of the file.

```
proj.Files(15).Labels
```

```
ans =
```

```
    Label with properties:
```

```
File: 'C:\slexamples\airframe24\models\DigitalControl.slx'
DataType: 'none'
```

```

        Data: []
        Name: 'Design'
    CategoryName: 'Classification'

```

Get a particular file by name.

```
myfile = findFile(proj, 'models/AnalogControl.slx')
```

```
myfile =
```

```

    ProjectFile with properties:
    Path: 'C:\slexamples\airframe24\models\AnalogControl.slx'
        Labels: [1x1 slproject.Label]
        Revision: '2'
    SourceControlStatus: Unmodified

```

Find out what you can do with the file.

```
methods(myfile)
```

```
Methods for class slproject.ProjectFile:
```

```
addLabel    findLabel    removeLabel
```

Update the file dependencies.

```
update(proj.Dependencies)
```

The project runs a dependency analysis to update the known dependencies between project files.

For more information on working with project files, including modified files and dependencies, see “Automate Project Tasks Using Scripts”.

Input Arguments

projectPath — Full path to project file or folder

character vector

Full path to project .prj file, or the path to the project root folder, or any subfolder or file under your project root, specified as a character vector.

Example: 'C:/projects/project1/myProject.prj'

Example: 'C:/projects/project1/'

Output Arguments

proj — Project

project object

Project, returned as a project object. Use the project object to manipulate the currently open project at the command line.

Properties of proj output argument.

Project Property	Description
Categories	Categories of project labels
Dependencies	Dependencies between project files in a MATLAB digraph object
Files	Paths and names of project files
Information	Information about the project such as the description, source control integration, repository location, and whether it is a top-level project
Name	Project name
ProjectPath	Folders that the project puts on the MATLAB path
ProjectReferences	Folders that contain referenced projects. Contains read-only project objects for referenced projects.
RootFolder	Full path to project root folder
Shortcuts	An array of the shortcuts in this project
ShutdownFiles	An array of the shutdown files in this project
StartupFiles	An array of the startup files in this project

Tips

Alternatively, you can use `slproject.loadProject` to load a project, and `slproject.getCurrentProjects` to get a project object. Use `simulinkproject` to open projects and explore projects interactively. Use `slproject.getCurrentProjects` and `slproject.loadProject` for project automation scripts.

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

Simulink.allBlockDiagrams

Find loaded Simulink models and libraries

Syntax

```
bd = Simulink.allBlockDiagrams()  
bd = Simulink.allBlockDiagrams(type)
```

Description

`bd = Simulink.allBlockDiagrams()` returns all loaded block diagrams, including models and libraries.

`bd = Simulink.allBlockDiagrams(type)` returns either models or libraries.

Examples

Find Loaded Models

Find all loaded models in the current Simulink session, excluding libraries. The example shows a result from a typical session.

```
Simulink.allBlockDiagrams('model')
```

```
ans =  
  
    237.0001  
     56.0001  
     2.0001
```

Get Names of Loaded Block Diagrams

Find all loaded models in the current Simulink session and return results as names. Use `Simulink.allBlockDiagrams` with `get_param` to get the names. The example shows a result from a typical session and includes loaded libraries and models.

```
get_param(Simulink.allBlockDiagrams(), 'Name')
```

```
ans =  
  
    5×1 cell array  
  
    {'simulink_extras'}  
    {'simulink'      }  
    {'sldemo_fuelsys' }
```

```
{'f14'      }  
{'vdp'     }
```

Get Loaded Block Diagrams Based on Parameter

Find all loaded models in the current Simulink session whose 'Dirty' parameter is 'on'.

```
bds = Simulink.allBlockDiagrams();  
dirtyBds = bds(strcmp(get_param(bds,'Dirty'),'on'));
```

Input Arguments

type — Type of block diagram whose blocks to return

'model' | 'library'

Type of block diagram whose blocks to return, specified as 'model' or 'library'.

Output Arguments

bd — Loaded block diagrams

array of handles

Loaded block diagrams, returned as an array of handles.

See Also

Introduced in R2018a

delete

Package: Simulink

Delete annotation

Syntax

```
delete(a)
```

Description

`delete(a)` deletes the specified annotation.

Examples

Delete Annotation

Programmatically delete an annotation.

Open the vdp model.

```
vdp
```

To get the handles for the annotations in the model, use the `find_system` function.

```
h = find_system(gcs, 'FindAll', 'on', 'Type', 'annotation');
```

To identify the annotations, query the text inside the annotations.

```
get_param(h, 'PlainText')  
  
ans = 2x1 cell  
    {'Copyright 2004-2020 The MathWorks, Inc.'}  
    {'van der Pol Equation'}
```

To delete the title of the model ('van der Pol Equation'), get the `Simulink.Annotation` object that corresponds to the second handle.

```
a = get_param(h(2), 'Object');
```

Delete the annotation from the model.

```
delete(a)
```

Input Arguments

a — Annotation

`Simulink.Annotation` object

Annotation, specified as a `Simulink.Annotation` object.

See Also

`Simulink.Annotation` | `setImage` | `view`

Topics

“Describe Models Using Notes and Annotations”

“Create and Edit Annotations Programmatically”

Introduced before R2006a

setImage

Package: Simulink

Specify image to display as annotation

Syntax

```
setImage(a, img)
```

Description

`setImage(a, img)` changes the annotation to display only the specified image.

Examples

Add Image to Model

Add an image to your model, such as a logo, by creating an image-only annotation.

Open a new model and create an annotation in it.

```
open_system(new_system)
a = Simulink.Annotation(gcs, 'This is an annotation.');
```

Change the annotation to display only the specified image.

```
img = fullfile(matlabroot, 'toolbox', 'matlab', 'imagesci', 'peppers.png');
setImage(a, img)
```

Input Arguments

a — Annotation

Simulink.Annotation object

Annotation, specified as a Simulink.Annotation object.

img — Image filename

character vector | string scalar

Image filename, specified as a character vector or string scalar. The filename must contain the file extension and can include a partial path, complete path, relative path, or no path.

Data Types: char | string

See Also

Simulink.Annotation | delete | view

Topics

“Describe Models Using Notes and Annotations”

“Create and Edit Annotations Programmatically”

Introduced before R2006a

view

Package: Simulink

Find annotation

Syntax

```
view(a)
```

Description

`view(a)` displays and briefly highlights the specified annotation.

Examples

Create Annotation Programmatically

Programmatically create, modify, and view an annotation.

Open a new model.

```
open_system(new_system)
```

Create an annotation with default properties using the `Simulink.Annotation` function.

```
a = Simulink.Annotation(gcs, 'This is an annotation.');
```

After creating the annotation, use dot notation to set property values. For example, apply an 18-point font and light blue background to the annotation.

```
a.FontSize = 18;  
a.BackgroundColor = 'lightBlue';
```

To view and briefly highlight the new annotation, use the `view` function.

```
view(a)
```

Input Arguments

a — Annotation

`Simulink.Annotation` object

Annotation, specified as a `Simulink.Annotation` object.

See Also

`Simulink.Annotation` | `delete` | `setImage`

Simulink.architecture.add

Add tasks or triggers to selected architecture of model

Syntax

```
Simulink.architecture.add(Type, Object)
```

Description

`Simulink.architecture.add(Type, Object)` adds the new task or trigger `Object` of the specified `Type` to a model.

Examples

Add periodic trigger

Add a task, `MyTask1`, to the software node `MulticoreProcessor` of the selected architecture of the `slexMulticoreExample` model.

```
slexMulticoreExample;  
Simulink.architecture.add('Task', 'slexMulticoreExample/MulticoreProcessor/Core2/MyTask1');
```

Input Arguments

Type — Object type

'PeriodicTrigger' | 'AperiodicTrigger' | 'Task'

Object type that identifies the kind of trigger or task to add, , specified as a 'PeriodicTrigger', 'AperiodicTrigger', or 'Task'.

- 'PeriodicTrigger'

Adds a periodic trigger to the architecture. Set the properties of the trigger with the `Simulink.architecture.set_param` function.

- 'AperiodicTrigger'

Adds an aperiodic trigger to the architecture. Set the properties of the trigger with the `Simulink.architecture.set_param` function.

- 'Task'

Adds a task to the architecture. Set the properties of the task with the `Simulink.architecture.set_param` function.

Object — Trigger or task object identifier

character vector

Trigger or task object identifier to add to architecture, specified as a character vector.

Example: 'slexMulticoreExample/MulticoreProcessor/Core2/MyTask1'

Data Types: char

Simulink.architecture.config

Create or convert configuration for concurrent execution

Syntax

```
Simulink.architecture.config(model, 'Convert')  
Simulink.architecture.config(model, 'Add')  
Simulink.architecture.config(model, 'OpenDialog')
```

Description

`Simulink.architecture.config(model, 'Convert')` converts the active configuration set in the specified model to one for concurrent execution.

`Simulink.architecture.config(model, 'Add')` adds and activates a new configuration set for concurrent execution.

`Simulink.architecture.config(model, 'OpenDialog')` opens the Concurrent Execution dialog box for a model configuration.

Examples

Convert existing configuration set

Convert existing configuration set for concurrent execution in the model `vdp`.

```
vdp;  
Simulink.architecture.config('vdp', 'Convert');
```

Add new configuration set

Add a new configuration set (copied from the existing configuration set) for concurrent execution in the model `vdp`.

```
vdp;  
Simulink.architecture.config('vdp', 'Add');
```

Open Concurrent Execution dialog box

Open the Concurrent Execution dialog box in the model `slexMulticoreExample`.

```
slexMulticoreExample;  
Simulink.architecture.config('slexMulticoreExample','OpenDialog');
```

Input Arguments

model — Model name

character vector

Model name whose configuration set you want to convert or add to, specified as a character vector.

Example:

Data Types: char

Introduced in R2014a

signalBuilderToSignalEditor

Import signal data and properties from Signal Builder block to Signal Editor block

Syntax

```
signal_editor = signalBuilderToSignalEditor(signal_builder,Name,Value)
[signal_editor,sorted_group_index,sorted_group_names] =
signalBuilderToSignalEditor(signal_builder,Name,Value)
```

Description

`signal_editor = signalBuilderToSignalEditor(signal_builder,Name,Value)` imports signal data and properties from Signal Builder block to the Signal Editor block. This function adds a Signal Editor block to the current model using the signal data and properties from the Signal Builder block.

During the port, the `signalBuilderToSignalEditor` function:

- Unicode group names are prefixed with `Test_Case_`.
- Group names are converted to valid MATLAB variable names with leading and trailing white spaces removed.
- Group names are converted with trailing underscores removed.
- Remaining numbers maintained in the scenario name.
- Orders signal groups alphabetically.
- Creates unique group names from existing names following MATLAB conventions.

The `signalBuilderToSignalEditor` function does not support

- Models that contain test case parameters. You can successfully port data from the Signal Builder block, but you cannot initialize parameters with the Signal Editor block in test harnesses generated by Simulink Design Verifier.
- Models that contain Signal Builder signal generators created from the **Create and Connect Generator** context menu.

`[signal_editor,sorted_group_index,sorted_group_names] = signalBuilderToSignalEditor(signal_builder,Name,Value)` outputs vectors containing the signal groups and group names.

Examples

Replace Signal Builder Block with Signal Editor Block

This example shows how to replace an existing Signal Builder block with a Signal Editor block. To store signals from Signal Builder, the example uses `RoadProfiles.mat`.

```
model = 'ex_replace_signalbuilder';
open_system(model);
```

```

sbBlockH = [model '/Road Profiles'];
seBlockH = signalBuilderToSignalEditor(sbBlockH,...
'Replace',true,'FileName','RoadProfiles.mat');

```

Copyright 2018 The MathWorks, Inc.

Input Arguments

signal_builder — Signal Builder block to replace

current model (default) | scalar

Signal Builder block to replace, specified as a scalar.

Data Types: char | string

Name-Value Pair Arguments

Specify optional comma-separated pairs of **Name**, **Value** arguments. **Name** is the argument name and **Value** is the corresponding value. **Name** must appear inside quotes. You can specify several name and value pair arguments in any order as **Name1**, **Value1**, ..., **NameN**, **ValueN**.

Example: 'FileName','RoadProfiles.mat'

FileName — MAT-file that stores signals

'dataset.mat' (default) | scalar

MAT-file that stores signals and properties, specified as a scalar. Do not use a file name from one locale in a different locale. When using the block on multiple platforms, consider specifying just the MAT-file name and having the MAT-file be on the MATLAB path.

Data Types: char | string

Replace — Replace Signal Builder block with Signal Editor block

false (default) | true

Replace Signal Builder block with Signal Editor block, specified as true or false.

Data Types: logical

Output Arguments

signal_editor — Signal Editor block handle

scalar

Signal Editor block handle, specified as a scalar.

sorted_group_index — List of Signal Builder group indices

vector

List of Signal Builder group indices, specified as a vector and ordered as they will appear in the Signal Editor.

sorted_group_names — List of Signal Builder group names

cell array

Signal Editor group names, specified as a cell array of vectors, in alphabetical order.

The names are unique valid MATLAB variable names generated from the Signal Builder group names.

.

See Also

Signal Editor | Signal Builder | `signalEditor` | `signalbuilder`

Introduced in R2018a

Simulink.architecture.delete

Delete triggers and tasks from selected architecture of model

Syntax

```
Simulink.architecture.delete(Object)
```

Description

`Simulink.architecture.delete(Object)` deletes the specified object trigger or task.

Examples

Delete task Plant

Delete the task Task3 from the Core2 periodic trigger of the MulticoreProcessor software node of the selected architecture of the `slexMulticoreExample` model.

```
slexMulticoreExample
Simulink.architecture.delete('slexMulticoreExample/MulticoreProcessor/Core2/Task3')
```

Input Arguments

Object — Object to delete, specified as a character vector

character vector

Object to be deleted. Possible objects are:

- Periodic trigger

Note You cannot delete the last periodic trigger. The software node must contain at least one periodic trigger.

- Aperiodic trigger
- Task

Example: `[bdroot '/MulticoreProcessor/Core2/Task3']`

Data Types: char

Introduced in R2014a

Simulink.architecture.find_system

Find objects under architecture object

Syntax

```
object = Simulink.architecture.find_system(RootObject)
```

```
object = Simulink.architecture.find_system(RootObject, ParamName, ParamValue)
```

Description

`object = Simulink.architecture.find_system(RootObject)` looks for all objects under `RootObject`.

`object = Simulink.architecture.find_system(RootObject, ParamName, ParamValue)` returns the object in `RootObject` whose parameter `ParamName` has the value `ParamValue`. Parameter name and value character vectors are case-sensitive.

Examples

Look for all objects

To find all the objects in `slexMulticoreExample`:

```
slexMulticoreExample
t = Simulink.architecture.find_system('slexMulticoreExample')

t =

    'slexMulticoreExample'
    'slexMulticoreExample/MulticoreProcessor'
    'slexMulticoreExample/MulticoreProcessor/Core1'
    'slexMulticoreExample/MulticoreProcessor/Core1/Task1'
    'slexMulticoreExample/MulticoreProcessor/Core1/Task2'
    'slexMulticoreExample/MulticoreProcessor/Core2'
    'slexMulticoreExample/MulticoreProcessor/Core2/Task3'
    'slexMulticoreExample/MulticoreProcessor/Core2/Task4'
```

Look for all tasks

To find all the tasks in `slexMulticoreExample`:

```
slexMulticoreExample
t = Simulink.architecture.find_system('slexMulticoreExample', 'Type', 'Task')

t =

    'slexMulticoreExample/MulticoreProcessor/Core1/Task1'
    'slexMulticoreExample/MulticoreProcessor/Core1/Task2'
```

```
'slexMulticoreExample/MulticoreProcessor/Core2/Task3'  
'slexMulticoreExample/MulticoreProcessor/Core2/Task4'
```

Input Arguments

RootObject — Object to search

character vector

Object to search for parameter value, specified as a character vector giving the object full path name. Possible objects are:

- Model
- Software node
- Hardware node
- Periodic trigger
- Aperiodic trigger
- Task

Example: 'slexMulticoreExample'

ParamName — Name of parameter to find

character vector | scalar | vector

Name of the parameter to find. Possible values are:

- 'Name'
- 'Type'
- 'ClockFrequency'
- 'Color'
- 'Period'
- 'EventHandlerType'
- 'SignalNumber'
- 'EventName'

Example: 'EventName'

ParamValue — Parameter value to find

character vector | scalar | vector

Parameter value to find, specified as a character vector, a scalar, or a vector.

Example: 'ERTDefaultEvent'

Introduced in R2014a

Simulink.architecture.get_param

Get configuration parameters of architecture objects

Syntax

```
ParamValue = Simulink.architecture.get_param(Object,ParamName)
```

Description

`ParamValue = Simulink.architecture.get_param(Object,ParamName)` returns the value of the specified parameter for the object, `Object`. `ParamName` is case-sensitive.

Examples

Get period

Get the period of task `Task3` of trigger `Core2` of software node `MulticoreProcessor` of the selected architecture for the model `slexMulticoreExample`.

```
slexMulticoreExample;  
p = Simulink.architecture.get_param('slexMulticoreExample/MulticoreProcessor/Core2/Task3','Period')  
  
p =  
  
0.2
```

Input Arguments

Object — Object whose parameter value to return

character vector

Object whose parameter value to return, specified as a character vector giving the object full path name. Possible objects are:

- Software node
- Hardware node
- Periodic trigger
- Aperiodic trigger
- Task

ParamName — Parameter whose value to return

character vector

Name of a parameter for which `Simulink.architecture.get_param` returns a value.

The following are the possible `ParamName` values:

For a model:

- 'ArchitectureName'
- 'Type'

For a software node:

- 'Name'
- 'Type'

For a hardware node

- 'Name'
- 'ClockFrequency'
- 'Color'
- 'Type'

For a periodic trigger:

- 'Name'
- 'Period'
- 'Color'
- 'Type'

For an aperiodic trigger:

- 'Name'
- 'Color'
- 'EventHandlerType'
- 'SignalNumber'
- 'EventName'
- 'Type'

For a task:

- 'Name'
- 'Period'
- 'Color'
- 'Type'

Simulink.architecture.importAndSelect

Import and select target architecture for concurrent execution environment for model

Syntax

```
Simulink.architecture.importAndSelect(model,Architecture)
```

```
Simulink.architecture.importAndSelect(model,  
CustomArchitectureDescriptionFile)
```

Description

`Simulink.architecture.importAndSelect(model,Architecture)` imports and selects the built-in target architecture for the concurrent execution environment for the model.

Importing and selecting target architectures requires that the associated support packages or hardware is installed on your computer.

`Simulink.architecture.importAndSelect(model,CustomArchitectureDescriptionFile)` imports and selects the architecture from an XML-based architecture description file.

Importing and selecting target architectures requires that the associated support packages or hardware is installed on your computer.

Examples

Import and select a different architecture

Import and select the sample architecture to the model `slexMulticoreExample`.

```
slexMulticoreExample  
Simulink.architecture.importAndSelect('slexMulticoreExample','Sample Architecture')
```

Import and select a custom architecture

Import and select the custom architecture defined in the XML file `custom_arch.xml`. This example requires you to create a `custom_arch.xml` file first.

```
slexMulticoreExample  
Simulink.architecture.importAndSelect('slexMulticoreExample','custom_arch.xml')
```

Input Arguments

model — Model

character vector

Model to import architecture to, specified as a character vector.

Data Types: char

Architecture — Target architecture name

character vector

Target architecture name to import into the concurrent execution environment for the model. Possible target names are:

Property	Description
'Multicore'	Single CPU with multiple cores
'Sample Architecture'	Example architecture consisting of single CPU with multiple cores and two FPGAs. You can use this architecture to model for concurrent execution.
'Simulink Real-Time'	Simulink Real-Time™ target
'Xilinx Zynq ZC702 evaluation kit'	Xilinx® Zynq® ZC702 evaluation kit target
'Xilinx Zynq ZC706 evaluation kit'	Xilinx Zynq ZC706 evaluation kit target
'Xilinx Zynq Zedboard'	Xilinx Zynq ZedBoard™ target

Data Types: char

CustomArchitectureDescriptionFile — Custom target architecture file

XML file

Custom target architecture file name, in XML format, that describes a custom target for the concurrent execution environment for the model, specified as a character vector giving the XML file name.

Example: `custom_arch.xml`

Introduced in R2014a

Simulink.architecture.profile

Generate profile report for model configured for concurrent execution

Syntax

```
Simulink.architecture.profile(model)  
Simulink.architecture.profile(model,numSamples)
```

Description

`Simulink.architecture.profile(model)` generates a profile report for a model configured for concurrent execution. Subsequent calls to the command for the same model name overwrite the existing profile report.

`Simulink.architecture.profile(model,numSamples)` specifies the number of samples to generate a profile report.

Examples

Generate profile report

Generate profile report for the model `slexMulticoreExample`.

```
slexMulticoreExample;  
Simulink.architecture.profile('slexMulticoreExample');
```

The command creates the file `slexMulticoreExample_ProfileReport.html` in the current folder and opens it.

Generate profile report for 120 time steps

Generate profile report for the model `slexMulticoreExample` with data for 120 time steps.

```
slexMulticoreExample;  
Simulink.architecture.profile('slexMulticoreExample',120);
```

The command creates the file `slexMulticoreExample_ProfileReport.html` in the current folder.

Input Arguments

model — Model to profile

character vector

Model to profile, specified as a character vector. Specify a model that is configured for concurrent execution.

Data Types: char

numSamples — Number of time steps

100 (default) | real, positive integer

Number of time steps, specified as a real, positive integer. This value determines the number of steps to collect data for in the profiled model.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

Simulink.architecture.register

Add custom target architecture to concurrent execution target architecture selector

Syntax

```
Simulink.architecture.register(CustomArchFile)
```

Description

`Simulink.architecture.register(CustomArchFile)` adds an XML-format custom target architecture file `CustomArchFile` to the concurrent execution target architecture selector. To access this selector, click the **Select** button on the Concurrent Execution pane of the Concurrent Execution dialog box.

Examples

Add custom target architecture

Add custom target architecture defined in the XML file `custom_arch.xml` to the concurrent execution target architecture selector. This example requires you to create a `custom_arch.xml` first.

```
slexMulticoreExample  
Simulink.architecture.register('custom_arch.xml')
```

Input Arguments

CustomArchFile — Custom target architecture file

XML file

Custom target architecture file that describes a custom target for concurrent execution, specified as an XML file.

Introduced in R2014a

Simulink.architecture.set_param

Set architecture object properties

Syntax

```
Simulink.architecture.set_param(Object, ParamName, ParamValue)
```

Description

`Simulink.architecture.set_param(Object, ParamName, ParamValue)` sets the specified parameter of `Object` to the specified value. Parameter name and value character vectors are case sensitive.

Examples

Set software node name

Set the software node name from `MulticoreProcessor` to `MyCPUNewName`.

```
slexMulticoreExample
Simulink.architecture.set_param([bdroot '/MulticoreProcessor'], 'Name', 'MyCPUNewName');
```

Change Periodic

Set `Core2` trigger period to `.01`.

```
slexMulticoreExample
Simulink.architecture.set_param([bdroot '/MyCPUNewName/Core2'], 'Period', '.01')
```

Input Arguments

Object — Object whose parameter value to set

character vector

Object whose parameter value to set, specified as a character vector giving the object full path name. Possible objects are:

- Software node
- Hardware node
- Periodic trigger
- Aperiodic trigger
- Task

ParamName — Name of the parameter to set

character vector

Name of parameter whose value to set.

These are the possible parameters whose values you can set for each of the object types:

For software node:

- 'Name' — Name of the software node.

For hardware node:

- 'Name' — Name of the hardware node.
- 'ClockFrequency' — Frequency of the hardware node clock.
- 'Color' — Color of the trigger icon, specified as an RGB triplet (vector).

For a periodic trigger:

- 'Name' — Name of the trigger.
- 'Period' — Period of the trigger.
- 'Color' — Color of the trigger icon, specified as an RGB triplet (vector).

For an aperiodic trigger:

- 'Name' — Name of the trigger.
- 'Color' — Color of the trigger icon, specified as an RGB triplet (vector).
- 'EventHandlerType' — Trigger source for the interrupt-driven task. Possible values:
 - 'Event (Windows)'
 - 'Posix Signal (Linux/VxWorks 6.x)'
- 'SignalNumber' — Signal number for the trigger. You can set this value only if EventHandlerType is set to Event (Windows).
- 'EventName' — Event name for the trigger. You can set this value only if EventHandlerType is set to Posix Signal (Linux/VxWorks 6.x).

For task:

- 'Name' — Name of the task.
- 'Period' — Period of the task.
- 'Color' — Color of the task icon, specified as an RGB triplet (vector).

Data Types: char

ParamValue — Value to set the parameter to

character vector | vector

Value to set the parameter to, specified as a character vector, scalar, or vector. The possible values depend on the parameter.

Example: 'MyCPUNewName'

Simulink.Block.getSampleTimes

Return sample time information for a block

Syntax

```
ts = Simulink.Block.getSampleTimes(block)
```

Input Arguments

block

Full name or handle of a Simulink block

Output Arguments

ts

The command returns *ts* which is a 1xn array of Simulink.SampleTime objects associated with the model passed to Simulink.Block.getSampleTimes. Here n is the number of sample times associated with the block. The format of the returns is:

```
1xn Simulink.SampleTime
Package: Simulink
value: [1x2 double]
Description: [char string]
ColorRGBValue: [1x3 double]
Annotation: [char string]
OwnerBlock: [char string]
ComponentSampleTimes: [1x2 struct]
Methods
```

- *value* — A two-element array of doubles that contains the sample time period and offset
- *Description* — A character vector or string that describes the sample time type
- *ColorRGBValue* — A 1x3 array of doubles that contains the red, green and blue (RGB) values of the sample time color
- *Annotation* — A character vector or string that represents the annotation of a specific sample time (e.g., 'D1')
- *OwnerBlock* — For asynchronous and variable sample times, a character vector or string containing the full path to the block that controls the sample time. For all other types of sample times, an empty character vector or string.
- *ComponentSampleTimes* — A structure array of elements of the same type as Simulink.BlockDiagram.getSampleTimes if the sample time is an async union or if the sample time is hybrid and the component sample times are available.

Description

`ts = Simulink.Block.getSampleTimes(block)` performs an update diagram and then returns the sample times of the block connected to the input argument *mdl/signal*. This method performs an update diagram to ensure that the sample time information returned is up-to-date. If the model is already in the compiled state via a call to the model API, then an update diagram is not necessary.

Using this method allows you to access all information in the Sample Time Legend programmatically.

See Also

`Simulink.BlockDiagram.getSampleTimes`

Introduced in R2009a

Simulink.BlockDiagram.addBusToVector

Convert virtual bus signals into vector signals by adding Bus to Vector blocks

Syntax

```
[destBlocks, busToVectorBlocks, ignoredBlocks] =  
Simulink.BlockDiagram.addBusToVector(model)  
[destBlocks, busToVectorBlocks, ignoredBlocks] =  
Simulink.BlockDiagram.addBusToVector(model, includeLibs)  
[destBlocks, busToVectorBlocks, ignoredBlocks] =  
Simulink.BlockDiagram.addBusToVector(model, includeLibs, reportOnly)  
[destBlocks, busToVectorBlocks, ignoredBlocks] =  
Simulink.BlockDiagram.addBusToVector(model, includeLibs, reportOnly, strictOnly)
```

Description

[destBlocks, busToVectorBlocks, ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model) searches a model, excluding any library blocks, for bus signals used implicitly as vectors, and returns the results of the search.

[destBlocks, busToVectorBlocks, ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model, includeLibs) searches a model, and if includeLibs is true, includes in the search library blocks for bus signals used implicitly as vectors.

[destBlocks, busToVectorBlocks, ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model, includeLibs, reportOnly) searches a model, and if reportOnly is set to false, then the function inserts a Bus to Vector block into each bus that is used as a vector in any block that it searches. The insertion replaces the implicit use of a bus as a vector with an explicit conversion of the bus to a vector. The source and destination blocks of the signal do not change.

If Simulink.BlockDiagram.addBusToVector adds Bus to Vector blocks to the model or any library, the function changes the saved copy of the diagram.

If Simulink.BlockDiagram.addBusToVector changes a library block, the change affects every instance of that block in every model that uses the library.

[destBlocks, busToVectorBlocks, ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model, includeLibs, reportOnly, strictOnly) searches a model, and if strictOnly is true, the function checks for input bus signals used implicitly as vectors that are fed into one of these blocks. These blocks cannot take virtual bus signals, but they can accept nonvirtual bus signals:

- Delay
- Selector
- Assignment
- Vector Concatenate
- Reshape

- Permute Dimensions

Examples

Identify Bus-To-Vector Conversions

Model `ex_bus_to_vector` simulates correctly, but the input to the Gain block is a bus, while the output is a vector. The Gain block implicitly converts the bus to a vector.

Open the model.

```
open_system(fullfile(matlabroot, 'examples', 'simulink', 'main', ...
    'ex_bus_to_vector'))
```

Identify buses treated as vectors.

```
[blocks] = Simulink.BlockDiagram.addBusToVector(...
    'ex_bus_to_vector')
```

```
### Processing block diagram 'ex_bus_to_vector'
### Number of blocks left that are connected to a bus being used as a vector: 2
### Done processing block diagram 'ex_bus_to_vector'
```

```
blocks =
```

```
1x2 struct array with fields:
```

```
BlockPath
InputPort
LibPath
```

To understand the relationship between `Simulink.BlockDiagram.addBusToVector` and the **Bus signal treated as vector** configuration parameter, see “Manage Bus-to-Vector Conversions” on page 12-7.

Add Bus to Vector Blocks

Model `ex_bus_to_vector` simulates correctly, but the input to the Gain block is a bus, while the output is a vector. The Gain block implicitly converts the bus to a vector.

Open the model.

```
open_system(fullfile(matlabroot, 'examples', 'simulink', 'main', ...
    'ex_bus_to_vector'))
```

Insert Bus to Vector blocks.

When you use function `Simulink.BlockDiagram.addBusToVector` with `reportOnly` set to `false`, the function saves the model. To create a writable copy of model `ex_bus_to_vector`, this example uses the `save_system` function.

```
save_system('ex_bus_to_vector','ex_bus_to_vector_blocks');
[blocks,busToVectors] = Simulink.BlockDiagram.addBusToVector(...
'ex_bus_to_vector_blocks',true,false);
```

The Gain block no longer implicitly converts the bus to a vector. The inserted Bus to Vector block performs the conversion explicitly. The Bus to Vector block is virtual and does not affect simulation results, code generation, or performance.

To understand the relationship between `Simulink.BlockDiagram.addBusToVector` and the **Bus signal treated as vector** configuration parameter, see “Manage Bus-to-Vector Conversions” on page 12-7.

Input Arguments

model — Model name or handle

character vector | string scalar | numeric scalar

Model name or handle, specified as a character vector, string scalar, or numeric scalar.

Data Types: `double` | `char` | `string`

includeLibs — Search library blocks

`false` (default) | `true`

Search library blocks, specified as `false` or `true`.

- `false` — Search only the blocks in the model.
- `true` — Search library blocks for bus signals used implicitly as vectors.

Specify as the second argument.

Data Types: `logical`

reportOnly — Report results without changing model

`true` (default) | `false`

Choice to report results without changing the model, specified as `false` or `true`.

- `false` — Update the model by inserting Bus to Vector blocks for bus signals that are implicitly used as vectors.
- `true` — Report search results, but do not change the model.

Specify as the third argument. Also specify the `model` and `includeLibs` arguments.

Data Types: `logical`

strictOnly — Check input bus signals used implicitly as vectors that feed blocks that can accept nonvirtual, but not virtual, bus signals

`false` (default) | `true`

Check input bus signals used implicitly as vectors that feed blocks that can accept nonvirtual, but not virtual, bus signals, specified as `false` or `true`. If `strictOnly` is `true`, the function checks for input bus signals used implicitly as vectors that are fed into one of these blocks. These blocks cannot take virtual bus signals, but they can accept nonvirtual bus signals.

- Delay
- Selector
- Assignment
- Vector Concatenate
- Reshape
- Permute Dimensions

Specify as the fourth argument. You must also specify the `model`, `includeLibs`, and `reportOnly` arguments.

Data Types: `logical`

Output Arguments

destBlocks — Blocks connected to buses but that treat buses as vectors

array of structures

Blocks connected to buses that treat buses as vectors, returned as an array of structures. Each structure in the array contains these fields:

- `BlockPath` — Character vector specifying the path to the block to which the bus connects.
- `InputPort` — Integer specifying the input port to which the bus connects.
- `LibPath` — If the block is a library block instance, and if `includeLibs` is `true`, the field value is the path to the source library block. Otherwise, `LibPath` is empty (`[]`).

busToVectorBlocks — Bus to Vector blocks added by function

cell array

Bus to Vector blocks added by function, specified as a cell array. If `reportOnly` is set to `false`, the cell array contains the paths to each Bus to Vector block that the function added to replace buses used as vectors. Otherwise, `busToVectorBlocks` is empty (`[]`).

ignoredBlocks — Cases where function cannot insert Bus to Vector block

array of structures

Cases where function cannot insert Bus to Vector block, specified as an array of structures. Each structure in the array contains these fields:

- `BlockPath` — Character vector specifying the path to the block to which the bus connects.
- `InputPort` — Integer specifying the input port to which the bus connects.

These cases occur when a Bus to Vector cannot be inserted because the input virtual bus signal consists of elements with mixed attributes.

Tips

- Before you execute this function:
 - 1 Ensure that the model compiles without error.
 - 2 Save the model.
- Back up the model and any libraries before calling the function with `reportOnly` set to `false`.
- To preview the effects of the change on blocks in all models, call `Simulink.BlockDiagram.addBusToVector` with `includeLibs` set to `true` and `reportOnly` set to `true`. Then, examine the information returned in the `destBlocks` output argument.

Bus to Vector

Introduced in R2007a

Simulink.BlockDiagram.arrangeSystem

Improve layout of block diagram

Syntax

```
Simulink.BlockDiagram.arrangeSystem(bd)
```

Description

`Simulink.BlockDiagram.arrangeSystem(bd)` improves the layout of a block diagram by realigning, resizing, and moving blocks and straightening signal lines.

Examples

Arrange Programmatically Populated Model

You can use `Simulink.BlockDiagram.arrangeSystem` with any open model, and it is particularly useful with models you populate programmatically.

Blocks in the model `ex_arrange_system` are poorly arranged.

```
open_system('ex_arrange_system')
```

Blocks in its subsystem are also poorly arranged.

```
open_system('ex_arrange_system/Subsystem')
```

Programmatically arrange blocks in the top layer of the specified system.

```
Simulink.BlockDiagram.arrangeSystem('ex_arrange_system')
```

```
Simulink.BlockDiagram.arrangeSystem('ex_arrange_system/Subsystem')
```

Input Arguments

bd — Block diagram of system

character vector | string scalar | numeric scalar

Block diagram of system, specified as a character vector, string scalar, or numeric scalar.

Specify one of the following options:

- System name (must not include a path or extension)
- System handle
- Subsystem block path

Data Types: double | char | string

Simulink.BlockDiagram.buildRapidAcceleratorTarget

Build Rapid Accelerator target for model and return run-time parameter set

Syntax

```
rtp = Simulink.BlockDiagram.buildRapidAcceleratorTarget mdl)
```

Description

`rtp = Simulink.BlockDiagram.buildRapidAcceleratorTarget(mdl)` builds a Rapid Accelerator target for model, `mdl`, and returns run-time parameter set, `rtp`.

Input Arguments

mdl

Name or handle of a Simulink model

Output Arguments

rtp

Run-time parameter set that contains two elements:

Element	Description																				
<code>modelChecksum</code>	1x4 vector that encodes the structure of the model.																				
<code>parameters</code>	A structure of the tunable parameters in the model. This structure contains the following fields.																				
	<table border="1"> <thead> <tr> <th>Field</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td><code>dataTypeName</code></td> <td>The data type name, for example, <code>double</code>.</td> </tr> <tr> <td><code>dataTypeId</code></td> <td>Internal data type identifier for use by Simulink Coder.</td> </tr> <tr> <td><code>complex</code></td> <td>Complex type or real type specification. Value is 0 if real, 1 if complex.</td> </tr> <tr> <td><code>dtTransIdx</code></td> <td>Internal data type identifier for use by Simulink Coder.</td> </tr> <tr> <td><code>values</code></td> <td>All values associated with this entry in the <code>parameters</code> substructure.</td> </tr> <tr> <td><code>map</code></td> <td>Mapping structure information that correlates the values to the model tunable parameters. This structure contains the following fields.</td> </tr> <tr> <td></td> <td> <table border="1"> <thead> <tr> <th>Field</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td><code>Identifier</code></td> <td>Tunable parameter name.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Field	Description	<code>dataTypeName</code>	The data type name, for example, <code>double</code> .	<code>dataTypeId</code>	Internal data type identifier for use by Simulink Coder.	<code>complex</code>	Complex type or real type specification. Value is 0 if real, 1 if complex.	<code>dtTransIdx</code>	Internal data type identifier for use by Simulink Coder.	<code>values</code>	All values associated with this entry in the <code>parameters</code> substructure.	<code>map</code>	Mapping structure information that correlates the values to the model tunable parameters. This structure contains the following fields.		<table border="1"> <thead> <tr> <th>Field</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td><code>Identifier</code></td> <td>Tunable parameter name.</td> </tr> </tbody> </table>	Field	Description	<code>Identifier</code>	Tunable parameter name.
Field	Description																				
<code>dataTypeName</code>	The data type name, for example, <code>double</code> .																				
<code>dataTypeId</code>	Internal data type identifier for use by Simulink Coder.																				
<code>complex</code>	Complex type or real type specification. Value is 0 if real, 1 if complex.																				
<code>dtTransIdx</code>	Internal data type identifier for use by Simulink Coder.																				
<code>values</code>	All values associated with this entry in the <code>parameters</code> substructure.																				
<code>map</code>	Mapping structure information that correlates the values to the model tunable parameters. This structure contains the following fields.																				
	<table border="1"> <thead> <tr> <th>Field</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td><code>Identifier</code></td> <td>Tunable parameter name.</td> </tr> </tbody> </table>	Field	Description	<code>Identifier</code>	Tunable parameter name.																
Field	Description																				
<code>Identifier</code>	Tunable parameter name.																				

Element	Description		
		ValueIndices	Start and end indices into the values field, [startIdx, endIdx].
		Dimensions	Dimension of this tunable parameter (matrices are generally stored in column-major format).

Examples

Build Rapid Accelerator Target for Model

In the MATLAB Command Window, type:

```

rtp = Simulink.BlockDiagram.buildRapidAcceleratorTarget('f14')
### Building the rapid accelerator target for model: f14
### Successfully built the rapid accelerator target for model: f14

rtp =
    modelChecksum: [2.6812e+09 2.7198e+09 589261472 4.0180e+09]
    parameters: [1x1 struct]

Introduced in R2012b

Simulink.BlockDiagram.copyContentsToSubsystem

Copy graphical contents from system to empty subsystem

Syntax

```
Simulink.BlockDiagram.copyContentsToSubsystem(sys,subsys)
```

Description

`Simulink.BlockDiagram.copyContentsToSubsystem(sys,subsys)` copies the blocks, lines, and annotations of the specified system to the specified subsystem. It does not affect nongraphical information such as configuration sets.

Use this function to convert a referenced model derived from an atomic subsystem into an atomic subsystem that is equivalent to the original subsystem.

To use this function:

- The specified system must be loaded in memory.
- The specified subsystem must be loaded in memory.
- The specified system must not contain the specified subsystem.
- The specified subsystem must not contain any blocks or lines. Other types of information can exist in the subsystem and are unaffected by the function. To delete the graphical content of the destination subsystem, use `Simulink.SubSystem.deleteContents`.

Examples

Copy Block Diagram of Model to Subsystem

Copy the contents of a referenced model to an empty subsystem.

Open the `sldemo_mdref_basic` model.

```
open_system('sldemo_mdref_basic')
```

Add an empty subsystem to the model.

```
add_block('built-in/Subsystem','sldemo_mdref_basic/Subsystem')
```

Copy the graphical contents from the `sldemo_mdref_counter` referenced model to the empty subsystem.

```
Simulink.BlockDiagram.copyContentsToSubsystem...  
( 'sldemo_mdref_counter', 'sldemo_mdref_basic/Subsystem' )
```

Input Arguments

sys — System name or handle

numeric scalar | character vector | string scalar

System name or handle, specified as a numeric scalar, character vector, or string scalar.

The system name must not include a path or extension.

Example: 'model1'

Data Types: double | char | string

subsys — Subsystem block path or handle

numeric scalar | character vector | string scalar

Subsystem block path or handle, specified as a numeric scalar, character vector, or string scalar.

Example: 'model2/Subsystem'

Data Types: double | char | string

“Nonvirtual Blocks” on page 11-8

“Create Subsystems”

Introduced in R2007a

Simulink.BlockDiagram.createSubsystem

Create subsystem containing specified set of blocks

Syntax

```
Simulink.BlockDiagram.createSubsystem(blocks)
Simulink.BlockDiagram.createSubsystem()
Simulink.BlockDiagram.createSubsystem( ____,Name,Value)
```

Description

`Simulink.BlockDiagram.createSubsystem(blocks)` creates a subsystem and moves the specified blocks into it. All of the specified blocks must originally reside in the same block diagram.

If any of the blocks have unconnected ports, the function creates and connects Inport and Outport blocks to them inside the subsystem.

If any of the blocks are input or output port blocks, the function creates Inport and Outport blocks in the parent system to connect to the corresponding ports on the new Subsystem block.

`Simulink.BlockDiagram.createSubsystem()` replaces the currently selected blocks with a new subsystem that contains those blocks.

`Simulink.BlockDiagram.createSubsystem(____,Name,Value)` specifies options using one or more name-value pair arguments in addition to the input arguments in previous syntaxes. For example, 'Name', 'MySubsystem' names the new subsystem 'MySubsystem'.

Examples

Create Subsystem from Model

Open or load the example model.

```
CreateSubsystemModel
```

Get the block handles for all blocks at the top level of the model by using the `Simulink.findBlocks` function.

```
bh = Simulink.findBlocks('CreateSubsystemModel');
```

Replace the contents of the model with a subsystem that contains the model contents.

```
Simulink.BlockDiagram.createSubsystem(bh);
```

Create Named Subsystem from Model

Open or load the example model.

CreateSubsystemModel

Get the block handles for all blocks at the top level of the model by using the `Simulink.findBlocks` function.

```
bh = Simulink.findBlocks('CreateSubsystemModel');
```

Replace the contents of the model with a subsystem named `ss1` that contains the model contents.

```
Simulink.BlockDiagram.createSubsystem(bh, 'Name', 'ss1');
```

Input Arguments

blocks — Block handles

numeric array

Block handles, specified as a numeric array. To get block handles, use the `Simulink.findBlocks` or `gcbh` functions.

Data Types: `double`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: `Simulink.BlockDiagram.createSubsystem(blocks, 'Name', 'MySubsystemName')`

Name — Name of new subsystem

character vector | string scalar

Name of the new subsystem, specified as the comma-separated pair consisting of `'Name'` and a character vector or string scalar.

Data Types: `char` | `string`

MakeNameUnique — Option to make subsystem name unique

`'on'` (default) | `'off'`

Option to make the subsystem name unique, specified as the comma-separated pair consisting of `'MakeNameUnique'` and `'on'` or `'off'`.

If the value that you specify for `Name` is already used in the diagram:

- `'on'` — Uses the next available increment of the name. For example, if `Name` is set to `'Controller'` and the diagram already contains a block named `'Controller'`, the function names the new subsystem `'Controller1'`.
- `'off'` — Returns an error.

Dependencies

To use this parameter, specify a value for the `Name` argument.

Data Types: `char` | `string`

Introduced in R2009a

Simulink.BlockDiagram.deleteContents

Delete graphical contents of system

Syntax

```
Simulink.BlockDiagram.deleteContents(sys)
```

Description

`Simulink.BlockDiagram.deleteContents(sys)` deletes the blocks, lines, and annotations in the specified system, which must be loaded in memory.

Examples

Delete Graphical Content from Model

Open the f14 model.

```
open_system('f14')
```

Delete the graphical content of the model, including all subsystems.

```
Simulink.BlockDiagram.deleteContents('f14')
```

Input Arguments

sys — System name or handle

character vector | string scalar | numeric scalar

System name or handle, specified as a character vector, string scalar, or numeric scalar.

A system name must not include a path or extension.

Example: 'mymodel'

Data Types: double | char | string

Tips

To delete the contents of a Subsystem block, use the `Simulink.SubSystem.deleteContents` function.

“Create Subsystems”

Introduced in R2007a

Simulink.BlockDiagram.getAlgebraicLoops

Show algebraic loops in a model

Syntax

```
Simulink.BlockDiagram.getAlgebraicLoops(model)
[loops,h] = Simulink.BlockDiagram.getAlgebraicLoops(model)
```

Description

`Simulink.BlockDiagram.getAlgebraicLoops(model)` returns a list of algebraic loops in a model as a vector of `AlgebraicLoops` objects.

The Algebraic Loops viewer provides a tabular list of all algebraic loops in the model. Use the Algebraic Loops viewer to control the display of algebraic loops in your model.

```
[loops,h] = Simulink.BlockDiagram.getAlgebraicLoops(model)
```

Examples

Highlight all algebraic loops in model

Open the `ex_sl-demo_hydcyl` model.

In the **Diagnostics** pane of Model Configuration Parameters, set **Algebraic loop** to none or warning. Setting this parameter to error prevents the model from compiling.

Compile the model without any errors. The model must compile before you can highlight any algebraic loops.

At the MATLAB command prompt, enter:

```
mdl = 'ex_sl-demo_hydcyl';
load_system(mdl);
Simulink.BlockDiagram.getAlgebraicLoops(bdroot)
```

AlgebraicLoop with properties:

```

        Model: [1x1 Simulink.BlockDiagram]
           Id: [0 1]
VariableBlockHandles: [198.0001 145.0001]
      BlockHandles: [9x1 double]
      IsArtificial: 0
```

The resulting output shows that the model has one algebraic loop, which contains three blocks.

Running the `getAlgebraicLoops` function also opens the Algebraic Loop viewer. Use the Algebraic loop viewer to highlight specific algebraic loops in your model or all the loops.

The selected loops are highlighted in the corresponding model, in.

Input Arguments

model – Model to highlight

string scalar | character vector

Name of the model being tested, specified as a string scalar or character vector. You can also pass the most recently opened model using `bdroot`.

Note The model must be loaded into memory using either `open_system` or `load_system`.

Data Types: char | string

Output Arguments

Loops – Algebraic loops

vector of AlgebraicLoop objects

Every algebraic loop in the model returned as an `AlgebraicLoop` object that contains the following information:

- `Model`— `Simulink.BlockDiagram` object representing the model
- `Id`— Index of the algebraic loop in the model
- `VariableBlockHandles`: Handles to blocks that have been assigned algebraic variables
- `BlockHandles`—Handles to all the blocks contained in the algebraic loop
- `IsArtificial`— Boolean value indicating whether the loop is an artificial algebraic loop.

h — Handle to control UI

`matlab.ui.Figure` handle

The control UI is a MATLAB figure window. Use the UI's handle `h` to control it programmatically. For more information, see [Figure Properties](#).

Simulink.BlockDiagram.expandSubsystem

Replace subsystem with subsystem contents

Syntax

```
Simulink.BlockDiagram.expandSubsystem(subsys)
Simulink.BlockDiagram.expandSubsystem(subsys, 'CreateArea', specifier)
```

Description

`Simulink.BlockDiagram.expandSubsystem(subsys)` replaces the specified subsystem with its contents in the block diagram that contains it. The file that contains the subsystem must be open or loaded.

You can expand virtual subsystems that are not masked, linked, or commented. For details, see “What Subsystems Can You Expand?”.

`Simulink.BlockDiagram.expandSubsystem(subsys, 'CreateArea', specifier)` provides the option of not creating an area around the expanded subsystem contents.

Examples

Expand Subsystem

Replace a subsystem with its contents.

Open the example model, which contains a subsystem that separates functionally related blocks.

```
open_system('SubsystemExpansionModel')
```

Expand the subsystem.

```
Simulink.BlockDiagram.expandSubsystem('SubsystemExpansionModel/Subsystem')
```

An area that contains the subsystem contents replaces the Subsystem block.

Expand Subsystem Without Creating Area

Replace a subsystem with its contents without creating an area that surround the contents.

Open the example model, which contains a subsystem that separates functionally related blocks.

```
open_system('SubsystemExpansionModel')
```

Expand the subsystem.

```
Simulink.BlockDiagram.expandSubsystem(...
    'SubsystemExpansionModel/Subsystem', 'CreateArea', 'Off')
```

The subsystem contents replace the Subsystem block.

Input Arguments

subsys — Subsystem block path or handle

character vector | string scalar | numeric scalar

Subsystem block path or handle, specified as a character vector, string scalar, or numeric scalar.

Data Types: double | char | string

specifier — Option to create area around contents

'on' (default) | 'off'

Option to create area around contents, specified as 'on' to create the area or 'off' to not create the area.

Data Types: char | string

Introduced in R2014a

Simulink.BlockDiagram.getChecksum

Return checksum of model

Syntax

```
[checksum,details] = Simulink.BlockDiagram.getChecksum('model')
```

Description

[*checksum,details*] = Simulink.BlockDiagram.getChecksum('model') returns the checksum of the specified model. Simulink software computes the checksum based on attributes of the model and the blocks the model contains.

One use of this command is to determine why the Accelerator mode in Simulink software regenerates code. For an example, see `slAccelDemoWhyRebuild`.

Note Simulink.BlockDiagram.getChecksum compiles the specified model, if the model is not already in a compiled state.

This command accepts the argument *model*, which is the full name or handle of the model for which you are returning checksum data.

This command returns the following output:

- *checksum* — Array of four 32-bit integers that represents the model's 128-bit checksum.
- *details* — Structure of the form

```
ContentsChecksum: [1x1 struct]
InterfaceChecksum: [1x1 struct]
ContentsChecksumItems: [nx1 struct]
InterfaceChecksumItems: [mx1 struct]
```

- **ContentsChecksum** — Structure of the following form that represents a checksum that provides information about all blocks in the model.

```
Value: [4x1 uint32]
MarkedUnique: [bool]
```

- **Value** — Array of four 32-bit integers that represents the model's 128-bit checksum.
- **MarkedUnique** — True if any blocks in the model have a property that prevents code reuse.
- **InterfaceChecksum** — Structure of the following form that represents a checksum that provides information about the model.

```
Value: [4x1 uint32]
MarkedUnique: [bool]
```

- **Value** — Array of four 32-bit integers that represents the model's 128-bit checksum.
- **MarkedUnique** — Always true. Present for consistency with **ContentsChecksum** structure.

- `ContentsChecksumItems` and `InterfaceChecksumItems` — Structure arrays of the following form that contain information that Simulink software uses to compute the checksum for `ContentsChecksum` and `InterfaceChecksum`, respectively:

Handle: [char array]
 Identifier: [char array]
 Value: [type]

- `Handle` — Object for which Simulink software added an item to the checksum. For a block, the handle is a full block path. For a block port, the handle is the full block path and a character vector that identifies the port.
- `Identifier` — Descriptor of the item Simulink software added to the checksum. If the item is a documented parameter, the identifier is the parameter name.
- `Value` — Value of the item Simulink software added to the checksum. If the item is a parameter, `Value` is the value returned by

`get_param(handle, identifier)`

`Simulink.BlockDiagram.getChecksum` returns a checksum that depends on why and how you compiled the model. This function also compiles the model if it is not in a compiled state. The model compiles for:

- Simulation— if the simulation mode is Accelerator or you have not installed Simulink Coder
- Code generation— in all other cases

To compile the model before calling `Simulink.BlockDiagram.getChecksum`, use this command:

```
modelName([], [], [], 'compile')
```

Note The checksum that `Simulink.BlockDiagram.getChecksum` returns can vary from the checksum returned if you first compile the model at the command line (using the `model` command) before running `Simulink.BlockDiagram.getChecksum`.

Tip

The structural checksum reflects changes to the model that can affect the simulation results, including:

- Changing the solver type, for example from `Variable-step` to `Fixed-step`
- Adding or deleting blocks or connections between blocks
- Changing the values of nontunable block parameters, for example, the **Seed** parameter of the Random Number block
- Changing the number of inputs or outputs of blocks, even if the connectivity is vectorized
- Changing the number of states or the initial states in the model
- Selecting a different function in the Trigonometric Function block
- Changing signs used in a Sum block
- Adding a Target Language Compiler (TLC) file to inline an S-function

Examples of model changes that do not affect the structural checksum include:

- Changing the position of a block
- Changing the position of a line
- Resizing a block
- Adding, removing, or changing a model annotation

See Also

`Simulink.SubSystem.getChecksum` | `Simulink.getFileChecksum`

Introduced in R2006b

Simulink.BlockDiagram.getInitialState

Return initial state data of block diagram

Syntax

```
x0 = Simulink.BlockDiagram.getInitialState('model')
```

Description

`x0 = Simulink.BlockDiagram.getInitialState('model')` returns the initial state data of the block diagram specified by the input argument *model*. You can use this initial state data as the initial state for simulating a model or to provide an initial state condition to the linearization commands. To specify the initial state for a simulation, use the `LoadInitialState` model argument or the **Data Import/Export > Initial state** configuration parameter.

To specify the format for the initial state data, use the `SaveFormat` model argument. The default format is 'Dataset'. Other formats 'Array', 'Structure', and 'StructureWithTime'. Alternatively, you can set the initial state format using the **Data Import/Export > Format** configuration parameter.

- If format is 'Dataset', then the `Simulink.BlockDiagram.getInitialState` function returns a `Simulink.SimulationData.Dataset` object.
- For other format settings, the function returns a structure of the form:

```
time: 0
signals: [1xn struct]
```

where *n* is the number of states contained in the model, including any models referenced by Model blocks. The `signals` field is a structure of the form:

```
values: [1xm double]
dimensions: [1x1 double]
label: [char array]
blockName: [char array]
inReferencedModel: [bool]
sampleTime: [1x2 double]
```

- `values` — Numeric array of length *m*, where *m* is the number of states in the signal
- `dimensions` — Length of the `values` vector
- `label` — Indication of whether the state is continuous (CSTATE) or discrete. If the state is discrete:

The name of the discrete state is shown for S-function blocks.

The name of the discrete state is shown for those built-in blocks that assign their own names to discrete states.

DSTATE is used in all other cases.

- `blockName` — Full path to block associated with this state

- `inReferencedModel` — Indication of whether the state originates in a model referenced by a Model block (1) or in the top model (0)
- `sampleTime` — Array containing the sample time and offset of the block that owns the state

Using this function to return the initial state data simplifies specifying initial state values for models with multiple states. Each state is associated with the full path to its parent block.

“Format”

Introduced in R2006b

Simulink.BlockDiagram.getSampleTimes

Return all sample times associated with model

Syntax

```
ts = Simulink.BlockDiagram.getSampleTimes('model')
```

Description

`ts = Simulink.BlockDiagram.getSampleTimes('model')` performs an update diagram and then returns the sample times associated with the block diagram *model*. The update diagram ensures that the sample time information returned is up to date. If the model is already in the compiled state via a call to the model API, then an update diagram is not necessary.

Using this method allows you to access all information in the Sample Time Legend programmatically.

Input Arguments

model

Name or handle of a Simulink model

Output Arguments

ts

The command returns a 1xn array of `Simulink.SampleTime` objects associated with the model passed to `Simulink.BlockDiagram.getSampleTimes`. Here *n* is the number of sample times associated with the block diagram. The format of the returns is as follows:

```
1xn Simulink.SampleTime
Package: Simulink
value: [1x2 double]
Description: [char string]
ColorRGBValue: [1x3 double]
Annotation: [char string]
OwnerBlock: [char string]
ComponentSampleTimes: [1x2 struct]
Methods
```

- *value* — A two-element array of doubles that contains the sample time period and offset.
- *Description* — A character vector or string that describes the sample time type.
- *ColorRGBValue* — A 1x3 array of doubles that contains the red, green, and blue (RGB) values of the sample time color.
- *Annotation* — A character vector or string that represents the annotation of a specific sample time (e.g., 'D1').
- *OwnerBlock* — For asynchronous and variable sample times, a character vector or string containing the full path to the block that controls the sample time. For all other types of sample times, an empty character vector or string.

- `ComponentSampleTimes` — A structure array of elements of the same type as `Simulink.BlockDiagram.getSampleTimes` if the sample time is an async union or if the sample time is hybrid and the component sample times are available.

See Also

`Simulink.Block.getSampleTimes`

Introduced in R2009a

Simulink.BlockDiagram.propagateConfigSet

Propagate top model configuration reference to referenced models

Syntax

```
[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model)
[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model, 'include', refModels)
[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model, 'exclude', refModels)
handle = Simulink.BlockDiagram.propagateConfigSet(model, 'gui')
```

Description

`[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model)` propagates the configuration reference for `model` to all referenced models. Execute the function from a writable folder.

`[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model, 'include', refModels)` propagates the configuration reference for `model` to the models in the `refModels` list. Execute the function from a writable folder.

`[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model, 'exclude', refModels)` propagates the configuration reference for `model` to all referenced models in the hierarchy except for the models in the `refModels` list. Execute the function from a writable folder.

`handle = Simulink.BlockDiagram.propagateConfigSet(model, 'gui')` opens the **Configuration Reference Propagation to Referenced Models** dialog box.

Examples

Propagate a Configuration Reference to All Referenced Models

```
[isPropagated, convertedModels] = ...
Simulink.BlockDiagram.propagateConfigSet('sldemo_mdref_depgraph')
```

Propagate a Configuration Reference to Listed Referenced Models

```
[isPropagated, convertedModels] = ...
Simulink.BlockDiagram.propagateConfigSet(...
'sldemo_mdref_depgraph', 'include', ...
{'sldemo_mdref_heater', 'sldemo_mdref_house'})
```

Propagate a Configuration Reference to Referenced Models with Exclusions

```
[isPropagated,convertedModels] = ...  
Simulink.BlockDiagram.propagateConfigSet(...  
'sldemo_mdhref_depgraph','exclude',...  
{'sldemo_mdhref_heater','sldemo_mdhref_house'})
```

Open the Configuration Reference Propagation to Referenced Models Dialog Box for a Model

```
Simulink.BlockDiagram.propagateConfigSet(...  
'sldemo_mdhref_depgraph','gui')
```

Input Arguments

model — Top model

character vector | string scalar

Top model with configuration reference to propagate, specified as a character vector or string scalar.

Example: 'mdl'

refModels — Referenced models

cell array of character vectors | string array

List of referenced models to be included or excluded in propagation, specified as a cell array of character vectors or string array.

Example: {'mdl1','mdl2','mdl3'}

Output Arguments

isPropagated — Success of propagation

false (default) | true

Indication of whether configuration reference propagation is successful, specified as a Boolean.

convertedModels — Converted models

cell array of character vectors

List of converted model names, specified as a cell array of character vectors.

handle — Handle to dialog box

handle

Handle to the **Configuration Reference Propagation to Referenced Models** dialog box. Returned when you specify the 'gui' argument to the function.

See Also

Simulink.BlockDiagram.restoreConfigSet

Topics

"Share a Configuration Across Referenced Models"

“Share a Configuration with Multiple Models”

Introduced in R2012b

Simulink.BlockDiagram.restoreConfigSet

Restore model configuration for converted models

Syntax

```
[isRestored, restoredModels] = Simulink.BlockDiagram.restoreConfigSet(model)
```

Description

```
[isRestored, restoredModels] = Simulink.BlockDiagram.restoreConfigSet(model)
```

restores the model configuration for all converted models after propagating a configuration reference from a top model to the referenced models. Execute the function from a writable folder.

Examples

Restore the Model Configuration for Converted Models

```
[isRestored, restoredModels] = ...  
Simulink.BlockDiagram.restoreConfigSet('sldemo_mdIref_depgraph');
```

Input Arguments

model — Top model

character vector | string scalar

Name of top model, specified as a character vector or string scalar.

Example: 'mdl'

Output Arguments

isRestored — Success of restoration

false (default) | true

Indication of whether configuration reference propagation is successful, specified as a Boolean.

restoredModels — Restored models

cell array of character vectors

List of restored model names, specified as a cell array of character vectors.

“Share a Configuration Across Referenced Models”

“Share a Configuration with Multiple Models”

Introduced in R2012b

Simulink.BlockDiagram.loadActiveConfigSet

Package: Simulink.BlockDiagram

Load, associate, and activate configuration set with model

Syntax

```
Simulink.BlockDiagram.loadActiveConfigSet(model, file)
```

Description

`Simulink.BlockDiagram.loadActiveConfigSet(model, file)` loads a configuration set, attaches it to a model, and makes it the active configuration set for the model.

Examples

Load and Activate a Configuration Set

Load a saved configuration set to a model and activate it.

Open the model `sldemo_fuelsys` and save the active configuration set to a file.

```
sldemo_fuelsys  
Simulink.BlockDiagram.saveActiveConfigSet('sldemo_fuelsys', 'fuelsys_config_set.m')
```

Open the `vdp` model. Load the saved configuration set to `vdp` and activate it.

```
vdp  
Simulink.BlockDiagram.loadActiveConfigSet('vdp', 'fuelsys_config_set.m')
```

Input Arguments

model — Target model

character vector | string scalar

Name or handle of the target model for which you want to use the configuration set, specified as a character vector or string scalar.

Example: `'my_model'`

file — Name of file

character vector | string scalar

Name of the file that contains the configuration set, specified as a character vector or string scalar.

Example: `'configset.m'`

Tips

- If you load a configuration set with the same name as the active configuration set, Simulink overwrites the active configuration set.

- If you load a configuration set with the same name as an inactive configuration set associated with the model, Simulink detaches the inactive configuration from the model.
- If you load a configuration set object that contains an invalid custom target, Simulink sets the “System target file” (Simulink Coder) parameter to `ert.tlc`.

See Also

`Simulink.BlockDiagram.saveActiveConfigSet` | `Simulink.ConfigSet` | `attachConfigSet`
| `setActiveConfigSet`

Topics

“Load a Saved Configuration Set”

Introduced in R2010b

Simulink.BlockDiagram.saveActiveConfigSet

Package: Simulink.BlockDiagram

Save active configuration set of model

Syntax

```
Simulink.BlockDiagram.saveActiveConfigSet(model, file)
```

Description

`Simulink.BlockDiagram.saveActiveConfigSet(model, file)` saves the active configuration set of a model to an `.m` file or MAT-file.

Examples

Save a Configuration Set

Save the configuration set from the `sldemo_fuelsys` model as a `ConfigSet` object in the file `my_config_set.mat`.

Open the model.

```
sldemo_fuelsys
```

Save the active configuration set.

```
Simulink.BlockDiagram.saveActiveConfigSet('sldemo_fuelsys', 'my_config_set.mat')
```

Input Arguments

model — Model using configuration set

character vector | string scalar

Name or handle of the model that uses the configuration set that you want to save, specified as a character vector or string scalar.

Example: `'my_model'`

file — Name of file

character vector | string scalar

Name of the file to save the configuration set, specified as a character vector or string scalar. If you specify an `.m` extension, the file contains a function that creates a configuration set object. If you specify a `.mat` extension, the file contains a configuration set object. If you do not provide a file extension, the active configuration set is saved to a file with a `.m` extension. Do not specify `filename` to be the same as a model name; otherwise, the software cannot determine which file contains the configuration set object when loading the file.

Note If you specify a `.mat` extension when you save the active configuration set, all of the parameters are preserved. If you specify a `.m` extension, the `.m` file does not include hidden or disabled parameters.

Example: `'configset.m'`

Topics

“Save a Configuration Set”

Introduced in R2010b

Simulink.BlockDiagram.routeLine

Route existing lines of model

Syntax

```
Simulink.BlockDiagram.routeLine(lines)
Simulink.BlockDiagram.routeLine('DeferredLines')
```

Description

`Simulink.BlockDiagram.routeLine(lines)` takes an array of existing line handles as input and routes the corresponding lines. Routing existing lines improves line route quality and avoids overlaps with other lines and obstacles in the model.

To find the line handles in the model you want to route, use the `find_system` or `get_param` function.

`Simulink.BlockDiagram.routeLine('DeferredLines')` performs all line updates that the `LineUpdate` model parameter defers while a script runs. For this command to route lines, all of these conditions must apply:

- The `LineUpdate` model parameter is set to 'deferred'.
- The script that contains this command affects line routing before using this command.
- If the script saves models, the script affects line routing after using the `save_system` function and before using this command.

Examples

Route Existing Lines of Model

Route existing lines of a model that overlap with other lines and blocks in the model.

Open the model `ex_route_lines`.

```
open_system('ex_route_lines');
```

The two lines in the top-level system overlap with each other and with a block. To route these lines, create an array of line handles by using `find_system`. Then, call `Simulink.BlockDiagram.routeLine` with this array as input.

```
lineHandles = find_system(gcs,'FindAll','On','SearchDepth',1,'Type','Line');
Simulink.BlockDiagram.routeLine(lineHandles);
```

The updated model has no overlaps.

Route Lines Affected by Script

When the `LineUpdate` model parameter is set to `'deferred'`, scripts postpone line routing until they pause, complete, or run the `Simulink.BlockDiagram.routeLine('DeferredLines')` command.

Model `ex_route_deferred_lines` contains virtual subsystems with numerous signal lines connecting them.

To see how the `Simulink.BlockDiagram.routeline('DeferredLines')` command works with the `LineUpdate` model parameter, set this parameter to `'deferred'`.

```
set_param(0,'LineUpdate','deferred');
```

Capture Image Before Routing Deferred Lines

Run a MATLAB® script that loads the model, moves blocks within the model, and saves an image of the model.

```
load_system('ex_route_deferred_lines');
set_param([gcs '/Subsystem2'],'Position',[765 -370 855 -330]);
set_param([gcs '/Subsystem3'],'Position',[300 215 390 335]);
set_param([gcs '/Subsystem4'],'Position',[270 -135 360 -95]);
print('-s','deferred_lines_unrouted','-dpng');
```

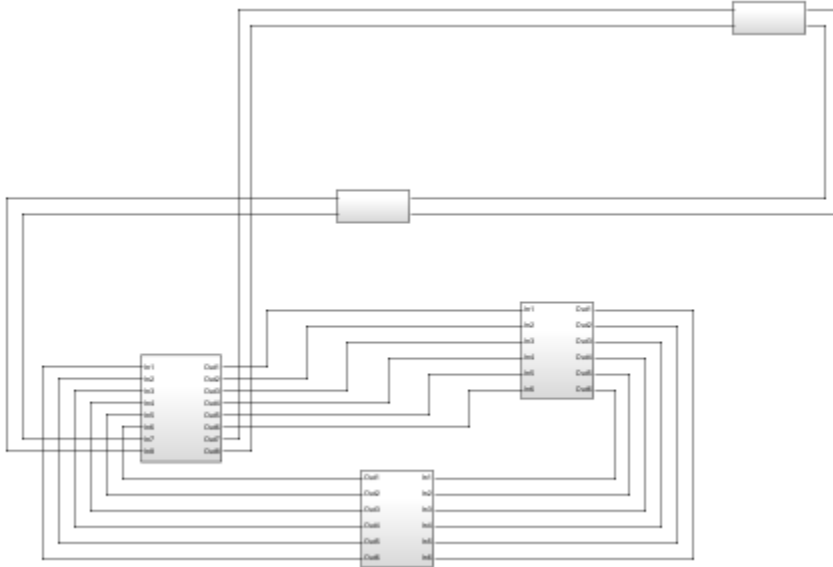

Because the script saves an image of the model before the deferred lines are routed, lines overlap other lines and obstacles in the model.

Capture Image After Routing Deferred Lines

Run a MATLAB script that loads the original model, moves blocks within the model, updates affected line routing, and saves an image of the model.

```
load_system('ex_route_deferred_lines');
set_param([gcs '/Subsystem2'],'Position',[765 -370 855 -330]);
set_param([gcs '/Subsystem3'],'Position',[300 215 390 335]);
set_param([gcs '/Subsystem4'],'Position',[270 -135 360 -95]);
Simulink.BlockDiagram.routeLine('DeferredLines');
print('-s','deferred_lines_routed','-dpng');
```

Adding command `Simulink.BlockDiagram.routeLine('DeferredLines')` before the print function improves line routing in the saved image.

Input Arguments

Lines — Handles of lines to route

numeric array

Handles of lines to route, specified as a numeric array. To find the line handles in your model, use the `find_system` or `get_param` function.

Data Types: double

Limitations

- Line routing can require additional empty space on the Simulink canvas. If the canvas does not have the required empty space, using `Simulink.BlockDiagram.routeLine` might not improve line route quality.
- For large models with many lines to route, `Simulink.BlockDiagram.routeLine` can take several minutes to execute.

Topics

“Programmatic Modeling Basics”

“Format a Model”

Introduced in R2019a

convertToCell

Package: Simulink

Convert block path to cell array of character vectors

Syntax

```
cellarray = convertToCell(bp)
```

Description

`cellarray = convertToCell(bp)` converts a block path to a cell array of character vectors.

Examples

Create Cell Array that Represents Block Path

Open the example model, which references multiple models.

```
sldemo_mdhref_depgraph
```

Create a `Simulink.BlockPath` object.

```
bp = Simulink.BlockPath({'sldemo_mdhref_depgraph/thermostat', ...  
'sldemo_mdhref_heater/Fahrenheit to Celsius', ...  
'sldemo_mdhref_F2C/Gain1'});
```

Create a cell array that represents the elements of the block path.

```
cellarray = convertToCell(bp)
```

```
cellarray =
```

```
3x1 cell array
```

```
    {'sldemo_mdhref_depgraph/thermostat'      }  
    {'sldemo_mdhref_heater/Fahrenheit to Celsius'}  
    {'sldemo_mdhref_F2C/Gain1'                }
```

Input Arguments

bp — Fully specified block path

`Simulink.BlockPath` object

Fully specified block path, specified as a `Simulink.BlockPath` object. This block path uniquely identifies a block within a model hierarchy, even when the model hierarchy references the same model multiple times.

Output Arguments

cellarray — Block path elements

cell array of character vectors

Block path elements, returned as a cell array of character vectors.

Objects

Simulink.BlockPath

Functions

getBlock | getLength | open | validate

Introduced in R2010b

getBlock

Package: Simulink

Get single block path in model reference hierarchy

Syntax

```
block = getBlock(bp,index)
```

Description

`block = getBlock(bp,index)` returns the block path of the block at the level of the model reference hierarchy specified by the `index` argument.

Examples

Get Block Path for Specified Model Hierarchy Level

Open the example model, which references multiple models.

```
sldemo_mdhref_depgraph
```

Create a `Simulink.BlockPath` object.

```
bp = Simulink.BlockPath({'sldemo_mdhref_depgraph/thermostat', ...  
'sldemo_mdhref_heater/Fahrenheit to Celsius', ...  
'sldemo_mdhref_F2C/Gain1'});
```

Get the block for the second level in the model reference hierarchy.

```
blockpath = getBlock(bp,2)
```

```
blockpath =
```

```
    'sldemo_mdhref_heater/Fahrenheit to Celsius'
```

Get the block for the third level in the model reference hierarchy.

```
blockpath = getBlock(bp,3)
```

```
blockpath =
```

```
    'sldemo_mdhref_F2C/Gain1'
```

Input Arguments

bp — Fully specified block path

`Simulink.BlockPath` object

Fully specified block path, specified as a `Simulink.BlockPath` object. This block path uniquely identifies a block within a model hierarchy, even when the model hierarchy references the same model multiple times.

index — Index of block

integer

Index of the block for which you want to get the block path, specified as an integer. The index reflects the level in the model reference hierarchy. For example:

- An index of 1 represents a block in the top model.
- An index of 2 represents a block in the model that is referenced by the Model block of index 1.
- An index of n represents a block in the model that is referenced by the Model block of index n - 1.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64`

Output Arguments**block — Block path of block**

character vector

Block path of the block at the level of the model reference hierarchy specified by the `index` argument, returned as a character vector.

See Also**Objects**

`Simulink.BlockPath`

Functions

`convertToCell` | `getLength` | `open` | `validate`

Introduced in R2010b

getLength

Package: Simulink

Get number of hierarchy levels in block path

Syntax

```
length = getLength(bp)
```

Description

`length = getLength(bp)` returns a numeric value that corresponds to the number of levels in the model reference hierarchy for the block path.

Examples

Get Number of Hierarchy Levels in Block Path

Create a `Simulink.BlockPath` object that represents a referenced model within a model hierarchy.

```
load_system('sldemo_mdref_depgraph')  
bp = Simulink.BlockPath({'sldemo_mdref_depgraph/thermostat', ...  
    'sldemo_mdref_heater/Fahrenheit to Celsius'});
```

Get the number of hierarchy levels in the block path for the `Simulink.BlockPath` object.

```
length = getLength(bp)
```

```
length =
```

```
    2
```

Input Arguments

bp — Fully specified block path

`Simulink.BlockPath` object

Fully specified block path, specified as a `Simulink.BlockPath` object. This block path uniquely identifies a block within a model hierarchy, even when the model hierarchy references the same model multiple times.

Output Arguments

length — Length of block path

integer

Length of the block path, returned as an integer. The length is the number of levels in the model reference hierarchy.

Objects

Simulink.BlockPath

Functions

convertToCell | getBlock | open | validate

Introduced in R2010b

open

Package: Simulink

Open specified model, library, subsystem, or block

Syntax

```
open(bp)  
open(bp, Name, Value)
```

Description

`open(bp)` opens the specified model, library, subsystem, or block. This is equivalent to double-clicking the model or library in the Current Folder browser or the subsystem or block in the Simulink Editor.

`open(bp, Name, Value)` opens the specified model, library, subsystem, or block with additional options.

Examples

Open Referenced Model in Context of Model Hierarchy

Create a `Simulink.BlockPath` object that represents a referenced model within a model hierarchy.

```
load_system('sldemo_mdref_depgraph')  
bp = Simulink.BlockPath({'sldemo_mdref_depgraph/thermostat', ...  
    'sldemo_mdref_heater/Fahrenheit to Celsius'});
```

Open the referenced model specified by `bp` in the context of the model hierarchy.

```
open(bp)
```

Open Referenced Model in New Window

Open the `sldemo_mdref_depgraph` model.

```
sldemo_mdref_depgraph
```

Create a `Simulink.BlockPath` object that represents a referenced model within a model hierarchy.

```
bp = Simulink.BlockPath({'sldemo_mdref_depgraph/thermostat', ...  
    'sldemo_mdref_heater/Fahrenheit to Celsius'})
```

Open the referenced model specified by `bp` in a new window.

```
open(bp, 'OpenType', 'new-window')
```

Input Arguments

bp — Fully specified block path

Simulink.BlockPath object

Fully specified block path, specified as a Simulink.BlockPath object. This block path uniquely identifies a block within a model hierarchy, even when the model hierarchy references the same model multiple times.

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: `open(bp, 'OpenType', 'new-window')`

OpenType — Option to open object in new tab or window

'current-tab' (default) | 'new-tab' | 'new-window'

Option to open object in a new tab or window, specified as the comma-separated pair consisting of 'OpenType' and 'current-tab', 'new-tab', or 'new-window'. This option determines whether the subsystem or model specified by a Simulink.BlockPath object opens in the current window and tab, a new tab, or a new window, respectively.

Data Types: char | string

Force — Option to open object under block mask

'off' (default) | 'on'

Option to open the object under the block mask, specified as the comma-separated pair consisting of 'Force' and 'off' or 'on'. When this argument is set to 'off', the function opens the block mask. When this argument is set to 'on', the function opens the dialog box of the block under the mask or opens the masked system in a new tab, which is equivalent to the **Look Under Mask** menu item. It forces the Simulink.BlockPath object to open, regardless of the block mask.

Data Types: char | string

See Also

Objects

Simulink.BlockPath

Functions

open_system | validate

Introduced in R2019a

validate

Package: Simulink

Determine whether block path represents valid block hierarchy

Syntax

```
validate(bp)
```

Description

`validate(bp)` determines whether the block path represents a valid block hierarchy. If the block path is invalid, the function returns an error. The function checks that:

- All elements in the block path represent valid blocks
- Each element except the last is a valid Model block and references the model of the following element

Examples

Validate Block Path

Create a `Simulink.BlockPath` object that incorrectly represents a referenced model within a model hierarchy.

```
load_system('sldemo_mdref_depgraph')
bp = Simulink.BlockPath({'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/F2C'});
```

Check whether the block path is valid.

```
validate(bp);
```

The function returns an error because the block path is invalid. It does not specify the name of a block in the `sldemo_mdref_heater` model.

Create a `Simulink.BlockPath` object that correctly represents the referenced model within a model hierarchy.

```
bp = Simulink.BlockPath({'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/Fahrenheit to Celsius'});
```

Check whether the block path is valid.

```
validate(bp);
```

The block path is valid, so the function does not return an error.

Input Arguments

bp — Fully specified block path

`Simulink.BlockPath` object

Fully specified block path, specified as a `Simulink.BlockPath` object. This block path uniquely identifies a block within a model hierarchy, even when the model hierarchy references the same model multiple times.

Objects

`Simulink.BlockPath`

Functions

`convertToCell` | `getBlock` | `getLength` | `open`

Introduced in R2010b

Simulink.Bus.cellToObject

Convert cell array containing bus information to Simulink.Bus objects

Syntax

```
Simulink.Bus.cellToObject(busCell)
Simulink.Bus.cellToObject(busCell,scope)
```

Description

`Simulink.Bus.cellToObject(busCell)` creates a set of `Simulink.Bus` objects in the MATLAB base workspace from a cell array of bus information.

`Simulink.Bus.cellToObject(busCell,scope)` creates a set of `Simulink.Bus` objects in the data dictionary specified by `scope` from a cell array of bus information.

Examples

Create Simulink.Bus Object from Cell Array of Bus Information

This example shows how to create and use a cell array to generate `Simulink.Bus` objects in the base workspace.

To define the elements that the Bus object contains, create an array of `Simulink.BusElement` objects or a cell array of the property values for the `BusElement` objects.

When you define the elements in an array of `BusElement` objects, you must specify the values that differ from the default.

```
elementsArray(1) = Simulink.BusElement;

elementsArray(2) = Simulink.BusElement;
elementsArray(2).Name = 'b';
elementsArray(2).Min = -3;
elementsArray(2).Max = 3;
elementsArray(2).Unit = 'm';
elementsArray(2).Description = 'b is distance from the origin.';
```

When you define the elements in a cell array of property values, you must specify the element name, dimensions, data type, complexity, and sampling mode. You can also specify the dimensions mode, minimum, maximum, units, and description.

```
elementsCellArray = {{ 'a',1,'double',-1,'real','Sample'}; ...
                    { 'b',1,'double','real','Sample',...
                      'Fixed',-3,3,'m','b is distance from the origin'}};
```

In this example, `elementsArray` and `elementsCellArray` create the same `BusElement` objects in the Bus objects.

Create a cell array with two subordinate cell arrays that define Bus objects. For each Bus object, specify the bus name, header file, description, data scope, alignment, and elements. For the first Bus

object, specify the elements using `elementsArray`. For the second Bus object, specify the elements using `elementsCellArray`.

```
busCells = { ...
    { ...
        'myBusObjArray', ...
        'MyHeader.h', ...
        'My description', ...
        'Exported', ...
        '-1', ...
        elementsArray,...
    }, ...
    { ...
        'myBusObjCellArray', ...
        'MyHeader.h', ...
        'My description', ...
        'Exported', ...
        '-1', ...
        elementsCellArray,...
    }, ...
};
```

Generate the Bus objects in the base workspace from the cell array of cell arrays.

```
Simulink.Bus.cellToObject(busCells)
```

Compare the generated Bus objects in the **Bus Editor**.

```
buseditor
```

The Bus objects are identical other than their names.

Input Arguments

busCell — Simulink.Bus object information

cell array of cell arrays

Bus object information, specified as a cell array of cell arrays. Each subordinate cell array must contain this Bus object information:

- 1 Bus name
- 2 Header file
- 3 Description
- 4 Data scope
- 5 Alignment
- 6 Elements

The `elements` field is a cell array that contains this information for each of the `Simulink.BusElement` objects that the Bus object references:

The `elements` field must contain arrays or cell arrays with this information for each of the `Simulink.BusElement` objects that the Bus object references:

- 1 Element name
- 2 Dimensions
- 3 Data type
- 4 Sample time (optional) — If you specify a sample time, specify an inherited sample time (-1). A noninherited sample time causes an error during model compilation. For more information, see “Simulink.BusElement objects no longer support the SampleTime property” on page 2-558.
- 5 Complexity
- 6 Sampling mode

The elements field arrays or cell arrays can also contain this information:

- 1 Dimensions mode
- 2 Minimum
- 3 Maximum
- 4 Units
- 5 Description

Example: `Simulink.Bus.cellToObject(busCell);`

scope — Data dictionary to contain Simulink.Bus objects

`Simulink.data.Dictionary` object

Data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this argument, represent the dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

If `scope` is empty, the function uses the MATLAB base workspace as the source of the `Bus` objects.

Example: `Simulink.Bus.cellToObject(busCell,dataDictionaryObject);`

Tips

The inverse function is `Simulink.Bus.objectToCell`.

Compatibility Considerations

Simulink.BusElement objects no longer support the SampleTime property

Errors starting in R2020b

The `SampleTime` property of `Simulink.BusElement` objects is no longer supported.

`BusElement` objects that specify a sample time cause an error during compile. To remove the sample time specification from a `BusElement` object, set its `SampleTime` to -1.

`Simulink.Bus.cellToObject` continues to accept cell arrays that specify sample time for bus elements. `Simulink.Bus.objectToCell`, `Simulink.Bus.save`, and `Simulink.Bus.createObject` continue to return cell arrays or arrays that include the sample time when it is noninherited. When the sample time is inherited (-1), they omit it. Similarly, the **Bus Editor** and **Model Explorer** omit the sample time when it is inherited.

To specify the sample time for an element of a bus, use the `SampleTime` block parameter of corresponding blocks. For example, you can use `In Bus Element`, `Out Bus Element`, and `Signal Specification` blocks to specify sample time.

Simulink.BusElement objects will no longer support the SamplingMode property

Not recommended starting in R2016b

In R2016b, the `SamplingMode` property of `Simulink.BusElement` objects was removed. Scripts that use the `SamplingMode` property of `Simulink.BusElement` objects continue to work. `Simulink.Bus.cellToObject` continues to require the `SamplingMode` field and `Simulink.Bus.objectToCell` continues to include the sampling mode in the output cell arrays.

In a future release, support for the `SamplingMode` property will be removed.

To specify whether a signal is sample-based or frame-based, define the sampling mode of input signals at the block level instead of at the signal level.

Simulink.Bus.createMATLABStruct

Create MATLAB structures that use the same hierarchy and attributes as buses

Syntax

```
structs = Simulink.Bus.createMATLABStruct(buses)
structs = Simulink.Bus.createMATLABStruct(buses,values)
structs = Simulink.Bus.createMATLABStruct(buses,values,dims)
structs = Simulink.Bus.createMATLABStruct(buses,values,dims,scope)
```

Description

`structs = Simulink.Bus.createMATLABStruct(buses)` creates one or more MATLAB structures that have the same hierarchy and attributes as the specified buses. The resulting structures use the ground values of the buses. Use this syntax to create initialization structures for multiple bus ports.

`structs = Simulink.Bus.createMATLABStruct(buses,values)` creates one or more structures that use the specified values.

`structs = Simulink.Bus.createMATLABStruct(buses,values,dims)` creates one or more structures that have the specified dimensions. To create a structure for an array of buses, include the `dims` argument.

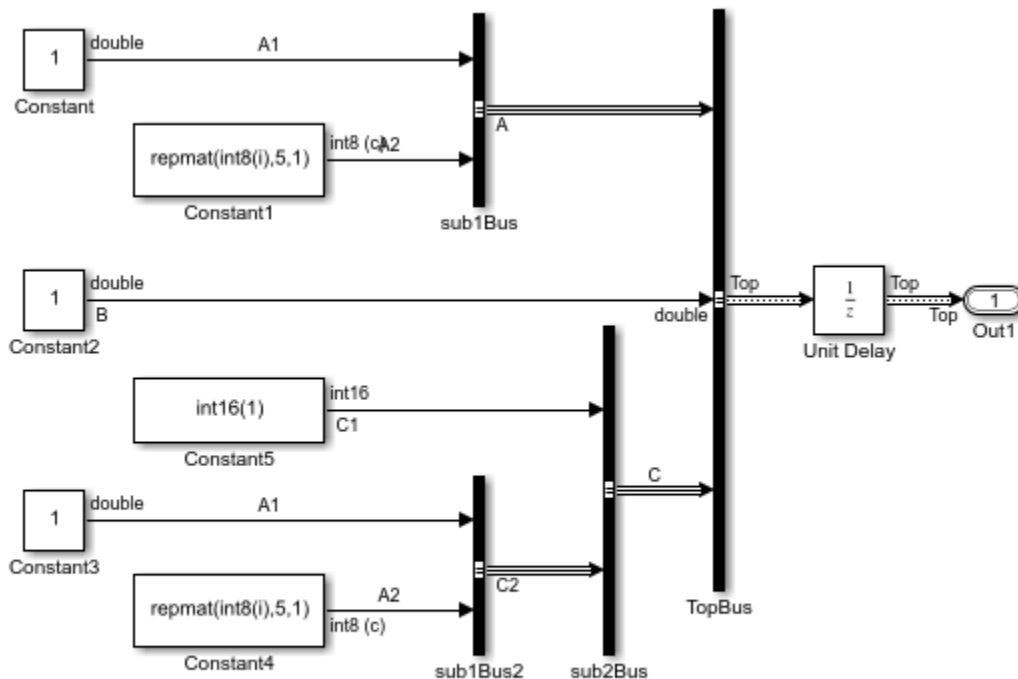

`structs = Simulink.Bus.createMATLABStruct(buses,values,dims,scope)` creates one or more structures in the data dictionary specified by `scope`.

Examples

Create MATLAB Structure from Bus Object

Open and simulate model `ex_bus_initial_conditions`.

```
open_system('ex_bus_initial_conditions')
sim('ex_bus_initial_conditions');
```

Copyright 2004-2018 The MathWorks, Inc.

Create a MATLAB structure using bus object Top, which model `ex_bus_initial_conditions` loads.

```
mStruct = Simulink.Bus.createMATLABStruct('Top');
```

Set a value for the field of the mStruct structure that corresponds to bus element A1 of bus A.

```
mStruct.A.A1 = 3;
mStruct.A
```

```
ans =
```

```
struct with fields:
```

```
A1: 3
A2: [5x1 int8]
```

Simulink sets the other fields in the structure to the ground values of the corresponding bus elements.

You can use mStruct as the initial condition structure for the Unit Delay block.

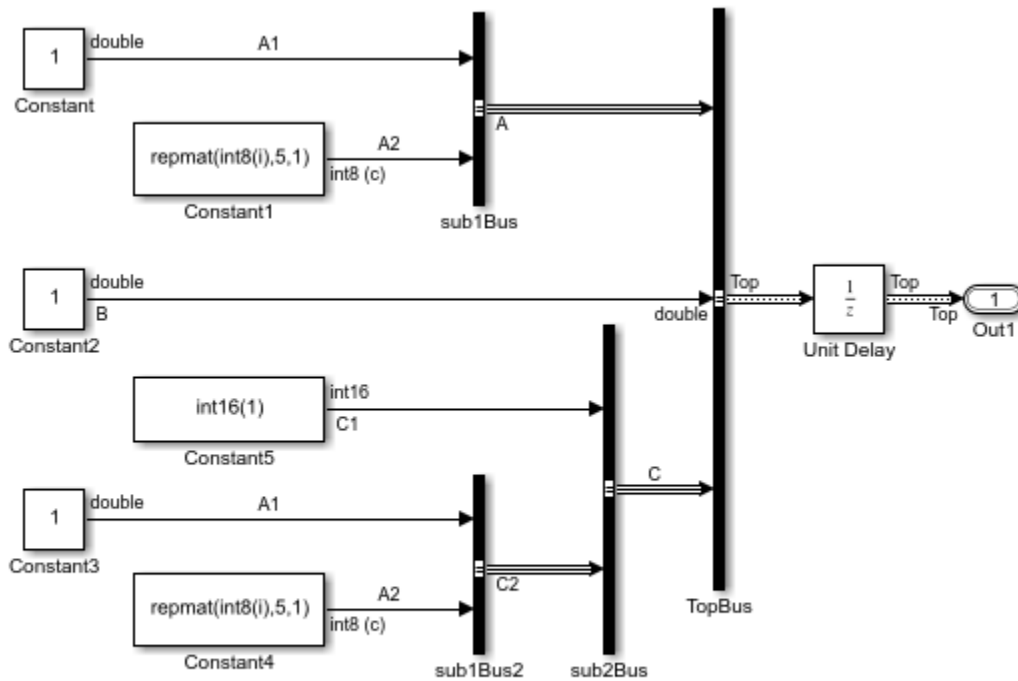

Initialize Signal Elements that Use a Data Type Other than Double

Create a MATLAB structure for a bus whose signal elements use a data type other than `double`. Use a partial structure to specify initialization values for a subset of the elements. When you create the

partial structure, match the data types of the fields with the data types of the corresponding elements.

Open and simulate model `ex_bus_initial_conditions`.

```
open_system('ex_bus_initial_conditions')
sim('ex_bus_initial_conditions');
```

Copyright 2004-2018 The MathWorks, Inc.

The C1 signal element that the block labeled Constant5 produces uses the data type `int16`.

Find the port handle for the Bus Creator block port that produces the Top bus signal.

```
ph = get_param('ex_bus_initial_conditions/TopBus', 'PortHandles');
```

Create a partial structure that specifies values for a subset of the elements in the bus signal created by the TopBus block. To set the value of the `C.C1` field, use a typed expression. Match the data type in the expression with the data type of the signal element in the model (`int16`).

```
PartialstructForK = struct('B',3,'C',struct('C1',int16(5)));
```

Create a full structure by using the port handle (`ph`) for the TopBus block. Override the ground values for the `C.C1` and `B` elements.

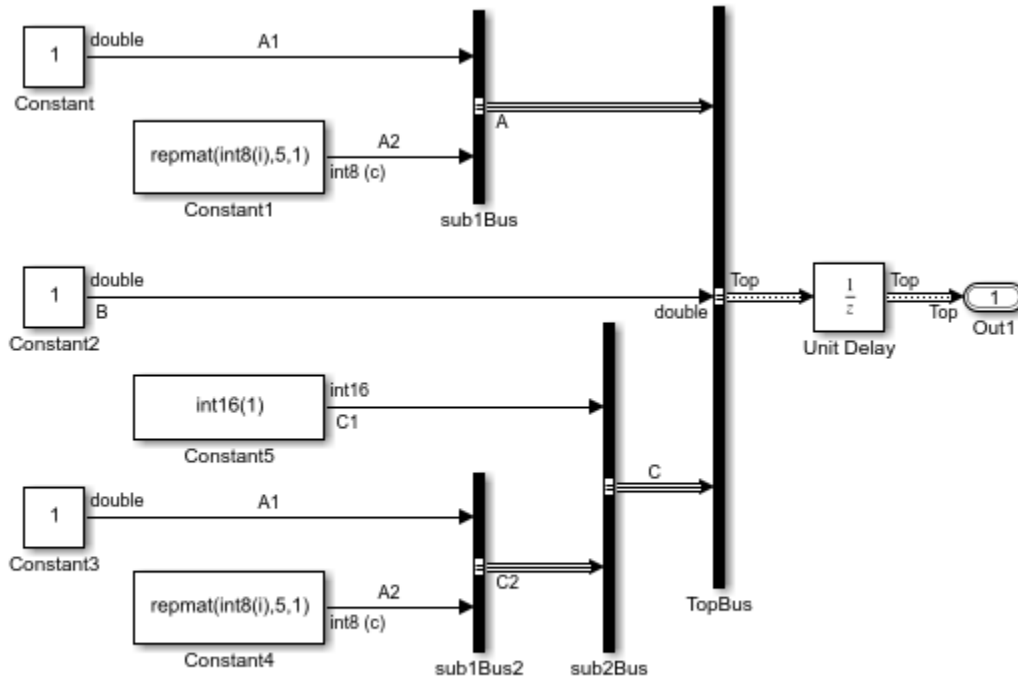

```
outPort = ph.Outport;
mStruct = Simulink.Bus.createMATLABStruct(outPort,PartialstructForK);
```

The field `C.C1` in the output structure continues to use the data type `int16`.

Create MATLAB Structure with Specified Dimensions

Open and simulate model `ex_bus_initial_conditions`.

```
open_system('ex_bus_initial_conditions')
sim('ex_bus_initial_conditions');
```

Copyright 2004-2018 The MathWorks, Inc.

Create a partial structure for a subset of bus elements in the bus created by the TopBus block.

```
PartialStructFork = struct('A',struct('A1',4),'B',3)
```

```
PartialStructFork =
  struct with fields:
    A: [1x1 struct]
    B: 3
```

Create a MATLAB structure using bus object Top, a partial structure, and dimensions for the resulting structure.

```
structFromBus = Simulink.Bus.createMATLABStruct...
  ('Top',PartialStructFork,[2 3])
```

```
structFromBus =
```

2x3 struct array with fields:

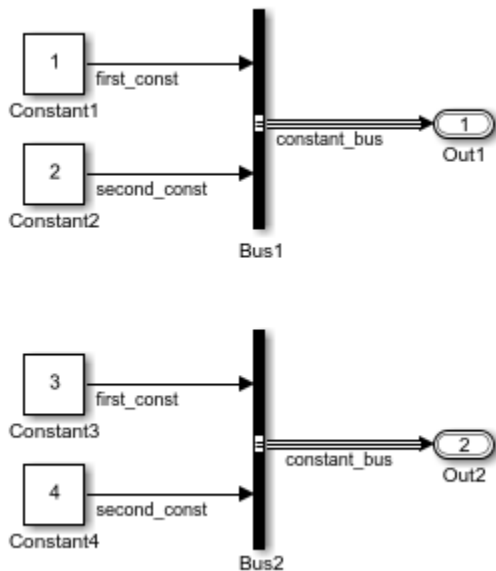

```
A
B
C
```

Create Cell Array of MATLAB Structures

To create initialization structures for multiple bus ports, specify port handles as arguments for `Simulink.Bus.createMATLABStruct`. The resulting cell array of structures uses ground values.

Open and simulate model `ex_two_outports_create_struct`.

```
open_system('ex_two_outports_create_struct')
sim('ex_two_outports_create_struct');
```

Find the port handles for the Bus Creator blocks `Bus1` and `Bus2`.

```
ph_1 = get_param...
    ('ex_two_outports_create_struct/Bus Creator', 'PortHandles');
ph_2 = get_param...
    ('ex_two_outports_create_struct/Bus Creator1', 'PortHandles');
```

Create a MATLAB® structure using an array of port handles.

```
mStruct = Simulink.Bus.createMATLABStruct([ph_1.Outport ph_2.Outport])
```

```
mStruct =
    2x1 cell array
    {1x1 struct}
```

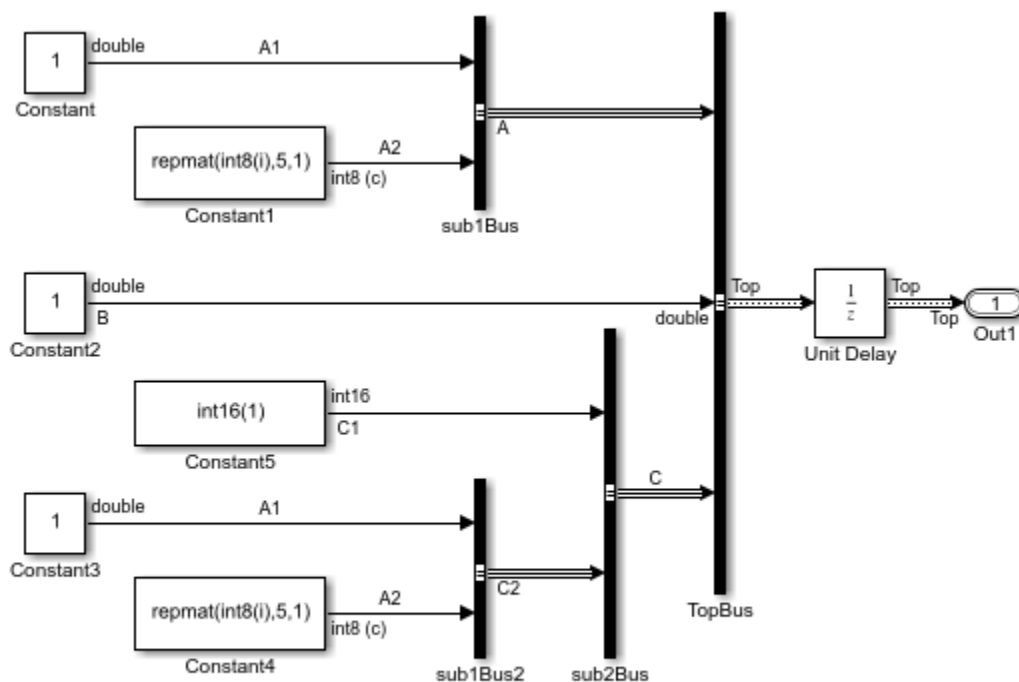

```
{1x1 struct}
```

Create MATLAB Structure from Bus Port and Partial Structure

Create a MATLAB structure based on a port that connects to a bus signal. Use a partial structure to specify values for a subset of the bus elements in the bus that connects to the port.

Open and simulate model `ex_bus_initial_conditions`.

```
open_system('ex_bus_initial_conditions')
sim('ex_bus_initial_conditions');
```

Copyright 2004-2018 The MathWorks, Inc.

Find the port handle for the Bus Creator block port that produces the Top bus signal. The Output handle is the handle that you need.

```
ph = get_param('ex_bus_initial_conditions/TopBus', 'PortHandles')
```

```
ph =
```

```
struct with fields:
```

```
Inport: [35.0144 29.0144 39.0144]
Output: 42.0144
Enable: []
Trigger: []
```

```

State: []
LConn: []
RConn: []
Ifaction: []
Reset: []

```

Create a partial structure for the bus signal created by the TopBus block. You can use a partial structure to specify values for a subset of bus elements.

```
PartialstructFork = struct('A',struct('A1',4),'B',3)
```

```

PartialstructFork =
  struct with fields:
    A: [1x1 struct]
    B: 3

```

Bus elements represented by structure fields `Top.B` and `Top.A` are at the same level in the bus hierarchy. You can use this partial structure to override the ground values for the B and A bus signal elements.

When you create a structure from a bus object or from a bus port, you can use a partial structure as an optional argument.

Create a MATLAB structure by using the port handle (ph) for the TopBus block. Override the ground values for the A.A1 and B bus elements.

```

outPort = ph.Outputport;
mStruct = Simulink.Bus.createMATLABStruct(outPort,PartialstructFork)

```

```

mStruct =
  struct with fields:
    A: [1x1 struct]
    B: 3
    C: [1x1 struct]

```

Input Arguments

buses — Source of bus information

Simulink.Bus object name | port handle | cell array of Simulink.Bus object names | array of port handles

Source of the bus information, specified as a Bus object name, port handle, cell array of Bus object names, or array of port handles.

- If you use a Bus object name, then the Bus object must be in the MATLAB base workspace or the data dictionary used by the model. The data type for a Bus object name is `char` or `string`.
- If you use a port handle, then the model must compile successfully before you use this function. The data type for a port handle is `double`.

- For an array of buses, you cannot use a port handle.
- If you use the `dims` argument, then for the `buses` argument, use a `Bus` object or cell array of `Bus` objects.

Specifying a cell array of `Bus` object names or an array of port handles creates multiple structures with one `Simulink.Bus.createMATLABStruct` call and provides better performance than using separate `Simulink.Bus.createMATLABStruct` calls to create the structures.

Example: `struct = Simulink.Bus.createMATLABStruct('BusObject')`

Example: `structs = Simulink.Bus.createMATLABStruct({'BusObject', 'BusObject1'})`

Example: `struct = Simulink.Bus.createMATLABStruct(portHandle)`

Example: `structs = Simulink.Bus.createMATLABStruct([portHandle, portHandle1])`

Data Types: `double` | `char` | `string` | `struct` | `cell`

values — Values for subset of elements in resulting structure

`[]` | partial structure | cell array

Values for a subset of elements in the resulting structure, specified as an empty matrix (`[]`), partial structure, or cell array. The cell array must contain a partial structure or empty matrix for each specified source of bus information.

For information on creating partial structures, see “Create Partial Structures for Initialization”.

To use ground values, use an empty matrix.

Example: `struct = Simulink.Bus.createMATLABStruct('BusObject', PartialStruct)`

Data Types: `struct` | `cell`

dims — Dimensions of resulting structure

scalar | vector | cell array

Dimensions of the resulting structure, specified as a vector.

Each dimension element must be an integer that is greater than or equal to 1. If you specify a partial structure for the `values` argument, each dimension element must be greater than or equal to its corresponding dimension element in the partial structure.

Example: `struct = Simulink.Bus.createMATLABStruct('BusObject', PartialStruct, [2 3])`

Example: `structs = Simulink.Bus.createMATLABStruct({'Bus', 'Bus1', 'Bus2'}, {[[], [], []], {1, 2, 3}})`

Data Types: `double` | `cell`

scope — Data dictionary to contain MATLAB structure

`Simulink.data.Dictionary` object

Data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this argument, represent the dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

If `scope` is empty, the function uses the MATLAB base workspace as the source of the `Bus` objects.

```
Example: structs = Simulink.Bus.createMATLABStruct({'Bus', 'Bus1', 'Bus2'},{[],  
[], []}, {1,1,1}, dataDictionaryObject)
```

Output Arguments

structs — Structures with same signal hierarchy and attributes as buses

MATLAB structure | cell array of MATLAB structures

Structures with the same signal hierarchy and attributes as buses, returned as a MATLAB structure or a cell array of MATLAB structures.

The structure dimensions depend on the input arguments you specify:

- If you specify only the `buses` argument, then the dimension is 1.
- If you also specify the `values` argument, then the dimensions match the dimensions of `values`.
- If you specify the `dims` argument, then the dimensions match the dimensions of `dims`.

Tips

- If you use the `Simulink.Bus.createMATLABStruct` function repeatedly for the same model (for example, in a loop in a script), you can improve performance by avoiding multiple model compilations. For improved speed, put the model in compile before using the function multiple times. For example, to put the `vdp` model in compile, use this command:

```
vdp([], [], [], 'compile')
```

After you create the MATLAB structure, terminate the compile by using this command:

```
vdp([], [], [], 'term')
```

- You can use the **Bus Editor** to invoke the `Simulink.Bus.createMATLABStruct` function by using one of these approaches:
 - Select the **File > Create a MATLAB structure** menu item.
 - Select the Bus object for which you want to create a full MATLAB structure. Then, in the toolbar, click the **Create a MATLAB structure** button .

You can then edit the MATLAB structure in the MATLAB Editor and evaluate the code to create or update the values in this structure.

- You can use the `Simulink.Bus.createMATLABStruct` function to specify the initial value of the output of a referenced model. For details, see the “Referenced Model: Setting Initial Value for Bus Output” section of the Detailed Workflow for Managing Data with Model Reference example.

Introduced in R2010a

Simulink.Bus.createObject

Create Simulink.Bus objects from blocks or MATLAB structures

Syntax

```
busInfo = Simulink.Bus.createObject(model,blocks)
busInfo = Simulink.Bus.createObject(struct)
busInfo = Simulink.Bus.createObject( ____,file)
busInfo = Simulink.Bus.createObject( ____,file,format)
busInfo = Simulink.Bus.createObject( ____,file,format,scope)
```

Description

`busInfo = Simulink.Bus.createObject(model,blocks)` creates Simulink.Bus objects for the specified blocks and returns information about the created Bus objects. These Bus objects are created in the base workspace or, if available, the data dictionary used by the model.

`busInfo = Simulink.Bus.createObject(struct)` creates Bus objects from a structure that can contain MATLAB timeseries, MATLAB timetable, and `matlab.io.datastore.SimulationDatastore` objects or a numeric structure. These Bus objects are created in the base workspace or, if available, the data dictionary used by the model.

`busInfo = Simulink.Bus.createObject(____,file)` saves Bus objects in a function that defines object properties in a cell array of cell arrays, then creates the Bus objects by calling `Simulink.Bus.cellToObject`.

`busInfo = Simulink.Bus.createObject(____,file,format)` saves Bus objects in a function with the specified format. The function can define object properties using cell arrays or arrays.

`busInfo = Simulink.Bus.createObject(____,file,format,scope)` creates the Bus objects in the data dictionary specified by `scope`.

Examples

Create Simulink.Bus Object from Bus Creator Block

Open the example model.

```
open_system('BusObjectCreationModel')
```

Create a Bus object that corresponds with the bus created by the Bus Creator block.

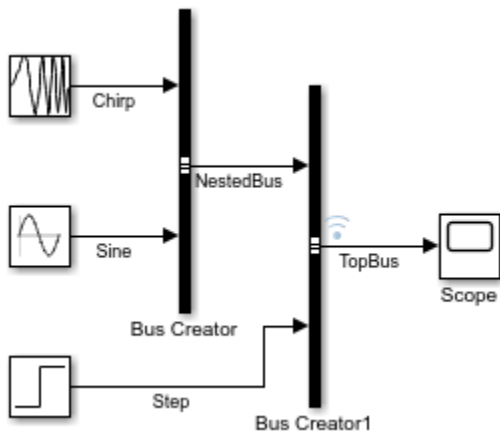

```
busInfo = Simulink.Bus.createObject('BusObjectCreationModel',...
    'BusObjectCreationModel/Bus Creator');
```

Create and Save Simulink.Bus Objects in a Function

Create Bus objects from two Bus Creator blocks and save the Bus object definition in a function.

Open the example model.

```
open_system('BusObjectCreationModel');
```

Assign the block handle for the Bus Creator block to a variable with the getSimulinkBlockHandle function.

```
bc = getSimulinkBlockHandle('BusObjectCreationModel/Bus Creator');
```

Alternatively, you can select a Bus Creator block in the model then use the gcbh function to get its block handle.

Assign the block handle for the Bus Creator1 block to a variable.

```
bc1 = getSimulinkBlockHandle('BusObjectCreationModel/Bus Creator1');
```

To create a Bus object, specify the block handle variables in a vector. To save the Bus object definition, also specify a file name.

```
busInfo = Simulink.Bus.createObject('BusObjectCreationModel',...
    [bc bc1], 'BusObjectFunction');
```

Since these Bus Creator blocks create a bus hierarchy, specifying only the Bus Creator1 block creates both Bus objects in the Workspace and in the function.

Compare the BusObjectFunction against the function created by this command.

```
topBusInfo = Simulink.Bus.createObject('BusObjectCreationModel',...
    bc1, 'BusObjectFunctionFromHierarchy');
```

For a function that is formatted to be easier to read, specify the function format as object.

```
topBusInfo1 = Simulink.Bus.createObject('BusObjectCreationModel',...
    bc1, 'BusObjectFunctionFormatted','object');
```

Input Arguments

model — Model name or handle

character vector

Model name or handle, specified as a character vector.

blocks — Blocks associated with buses

character vector | cell array of block path names | vector of block handles

Blocks associated with buses, specified as a character vector, cell array of block path names, or vector of block handles. For one block, specify the full path name of the block. For multiple blocks, specify either a cell array of block path names or a vector of block handles.

This function can create Bus objects from these blocks:

- Bus Creator blocks
- Subsystem Inport blocks
- Subsystem Outport blocks

If you specify a block associated with a bus hierarchy, the function also creates Bus objects for all nested buses in the hierarchy.

struct — Structure of objects or numeric structure

structure of MATLAB timeseries, MATLAB timetable, and matlab.io.datastore.SimulationDatastore objects | numeric structure

Structure of objects or numeric structure, specified as a structure that can contain MATLAB timeseries, MATLAB timetable, and matlab.io.datastore.SimulationDatastore objects or a numeric structure.

file — Name of function being generated

character vector

Name of function being generated, specified as a character vector. The file name must be unique.

format — Format of function being generated

'cell' (default) | 'object'

Format of function being generated, specified as either 'cell' or 'object'. The 'cell' format is more compact, but the 'object' format is easier to read.

The 'cell' format saves the Bus object definitions in a cell array of cell arrays and creates the Bus objects by calling `Simulink.Bus.cellToObject`. Each subordinate cell array represents a Bus object and contains these properties:

- 1 Bus name
- 2 Header file
- 3 Description
- 4 Data scope
- 5 Alignment
- 6 Elements

The elements field is a cell array that contains this information for each of the `Simulink.BusElement` objects that the Bus object references:

- 1 Element name
- 2 Dimensions
- 3 Data type
- 4 Sample time — The cell array contains this field when the sample time is not inherited. A noninherited sample time causes an error during model compilation. For more information, see “Simulink.BusElement objects no longer support the SampleTime property” on page 2-574.
- 5 Complexity
- 6 Dimensions mode
- 7 Minimum
- 8 Maximum
- 9 Units
- 10 Description

The 'object' format saves the Bus object definitions as arrays. The function uses array indexing to access elements of the array and dot notation to assign property values. For more information, see “Array Indexing” and “Access to Property Values”.

scope — Data dictionary to contain Simulink.Bus objects

`Simulink.data.Dictionary` object

Data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this argument, represent the dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

If scope is empty, the function uses the MATLAB base workspace as the source of the Bus objects.

Output Arguments

busInfo — Bus information for specified blocks

structure array

Bus information for the specified blocks, returned as a structure array. Each element of the structure array corresponds to one block and contains these fields:

- `block` — Handle of the block
- `busName` — Name of the Bus object associated with the block

Tips

If you specify a model name, the model must compile successfully before you use the `Simulink.Bus.createObject` command.

Compatibility Considerations

Simulink.BusElement objects no longer support the `SampleTime` property

Errors starting in R2020b

The `SampleTime` property of `Simulink.BusElement` objects is no longer supported.

`BusElement` objects that specify a sample time cause an error during compile. To remove the sample time specification from a `BusElement` object, set its `SampleTime` to `-1`.

`Simulink.Bus.cellToObject` continues to accept cell arrays that specify sample time for bus elements. `Simulink.Bus.objectToCell`, `Simulink.Bus.save`, and `Simulink.Bus.createObject` continue to return cell arrays or arrays that include the sample time when it is noninherited. When the sample time is inherited (`-1`), they omit it. Similarly, the **Bus Editor** and **Model Explorer** omit the sample time when it is inherited.

To specify the sample time for an element of a bus, use the `SampleTime` block parameter of corresponding blocks. For example, you can use `In Bus Element`, `Out Bus Element`, and `Signal Specification` blocks to specify sample time.

“Specify Bus Properties with `Simulink.Bus` Object Data Types”

“Create Bus Objects Programmatically”

Introduced before R2006a

Simulink.Bus.objectToCell

Use Simulink.Bus objects to create cell array containing bus information

Syntax

```
cells = Simulink.Bus.objectToCell(busNames)
cells = Simulink.Bus.objectToCell(busNames,scope)
```

Description

`cells = Simulink.Bus.objectToCell(busNames)` creates a cell array of bus information from a set of Simulink.Bus objects in the MATLAB base workspace. The cell array contains subordinate cell arrays that define each Bus object. The order of elements in the output cell array corresponds to the order of names in the input cell array.

`cells = Simulink.Bus.objectToCell(busNames,scope)` creates a cell array of bus information from a set of Bus objects in the data dictionary specified by `scope`. The cell array contains subordinate cell arrays that define each Bus object. The order of elements in the output cell array corresponds to the order of names in the input cell array.

Examples

Create Cell Array Containing Bus Object Information

Use the Simulink.Bus.objectToCell function to create a cell array of information about Simulink.Bus objects in the base workspace.

Open a model that has two Bus objects defined, CONTROL and MAIN.

```
open_system('ex_bus_object_tutorial_using_objects')
```

Create a cell array of information about the CONTROL Bus object.

```

cells = Simulink.Bus.objectToCell({'CONTROL'});
cells{1}

ans=1x7 cell array
  Columns 1 through 6
    {'CONTROL'}    {0x0 char}    {0x0 char}    {'Auto'}    {'-1'}    {'0'}

  Column 7
    {2x1 cell}

```

Input Arguments

busNames — Names of Simulink.Bus objects

cell array of Bus object names

Bus objects for which to create cell arrays of Bus object information, specified as a cell array. Specify the Bus object names as character vectors. If `busNames` is empty, the function converts all Bus objects in the base workspace or data dictionary.

Example: `cells = Simulink.Bus.objectToCell({'busObject'})`

scope — Data dictionary that contains Simulink.Bus objects

`Simulink.data.Dictionary` object

Data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this argument, represent the dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

If `scope` is empty, the function uses the MATLAB base workspace as the source of the Bus objects.

Example: `cells = Simulink.Bus.objectToCell({'busObject'},dataDictionaryObject)`

Output Arguments

cells — Bus object information

cell array of cell arrays

Bus object information, specified as a cell array of cell arrays. Each subordinate cell array contains these Bus object properties:

- 1 Bus name
- 2 Header file
- 3 Description
- 4 Data scope
- 5 Alignment
- 6 Elements

The `elements` field is a cell array that contains this information for each of the `Simulink.BusElement` objects that the Bus object references:

- 1** Bus element name
- 2** Dimensions
- 3** Data type
- 4** Sample time — The cell array contains this field when the sample time is not inherited. A noninherited sample time causes an error during model compilation. For more information, see “Simulink.BusElement objects no longer support the SampleTime property” on page 2-578.
- 5** Complexity
- 6** Sampling mode
- 7** Dimensions mode
- 8** Minimum
- 9** Maximum
- 10** Units
- 11** Description

Tips

The inverse function is `Simulink.Bus.cellToObject`.

Compatibility Considerations

Simulink.BusElement objects no longer support the SampleTime property

Errors starting in R2020b

The `SampleTime` property of `Simulink.BusElement` objects is no longer supported.

`BusElement` objects that specify a sample time cause an error during compile. To remove the sample time specification from a `BusElement` object, set its `SampleTime` to `-1`.

`Simulink.Bus.cellToObject` continues to accept cell arrays that specify sample time for bus elements. `Simulink.Bus.objectToCell`, `Simulink.Bus.save`, and `Simulink.Bus.createObject` continue to return cell arrays or arrays that include the sample time when it is noninherited. When the sample time is inherited (`-1`), they omit it. Similarly, the **Bus Editor** and **Model Explorer** omit the sample time when it is inherited.

To specify the sample time for an element of a bus, use the `SampleTime` block parameter of corresponding blocks. For example, you can use `In Bus Element`, `Out Bus Element`, and `Signal Specification` blocks to specify sample time.

Simulink.BusElement objects will no longer support the SamplingMode property

Not recommended starting in R2016b

In R2016b, the `SamplingMode` property of `Simulink.BusElement` objects was removed. Scripts that use the `SamplingMode` property of `Simulink.BusElement` objects continue to work. `Simulink.Bus.cellToObject` continues to require the `SamplingMode` field and `Simulink.Bus.objectToCell` continues to include the sampling mode in the output cell arrays.

In a future release, support for the `SamplingMode` property will be removed.

To specify whether a signal is sample-based or frame-based, define the sampling mode of input signals at the block level instead of at the signal level.

Functions

Simulink.Bus.cellToObject

Topics

“Specify Bus Properties with Simulink.Bus Object Data Types”

“Create Bus Objects Programmatically”

Introduced in R2007a

Simulink.Bus.save

Save Simulink.Bus objects in function

Syntax

```
Simulink.Bus.save(fileName)
Simulink.Bus.save(fileName,format)
Simulink.Bus.save(fileName,format,busNames)
Simulink.Bus.save(fileName,format,busNames,scope)
```

Description

`Simulink.Bus.save(fileName)` saves all `Simulink.Bus` objects from the MATLAB base workspace in a function. The generated function defines object properties in a cell array of cell arrays, then creates the Bus objects by calling `Simulink.Bus.cellToObject`.

`Simulink.Bus.save(fileName,format)` saves the Bus objects in a function with the specified format. The function can define object properties using cell arrays or arrays.

`Simulink.Bus.save(fileName,format,busNames)` saves only the specified Bus objects in a function.

`Simulink.Bus.save(fileName,format,busNames,scope)` saves the Bus objects from the data dictionary specified by `scope` in a function.

Examples

Save a Simulink.Bus Object

Use the `Simulink.Bus.save` function to save a Bus object.

Create a cell array of Bus object information.

```
busCell = { ...
    { ...
        'myBusObj', ...
        'MyHeader.h', ...
        'My description', ...
        'Exported', ...
        '-1', ...
        {{ 'a',1,'double','real','Sample' }; ...
        { 'b',1,'double','real','Sample', ...
        'Fixed',-3,3,'m','b is distance from the origin' }}, ...
    } ...
    { ...
        'myBusObj1', ...
        'MyHeader1.h', ...
        'My description', ...
        'Exported', ...
        '-1', ...
```

```

        {'c',1,'double','real','Sample'}; ...
        {'d',1,'double','real','Sample'}}, ...
    } ...
};

```

Generate Bus objects in the base workspace from the cell array.

```
Simulink.Bus.cellToObject(busCell);
```

Save the Bus objects in a function, using the default format.

```
Simulink.Bus.save('BusObjectFunctionCellFormat');
```

For a function that is formatted to be easier to read, specify the function format as 'object'.

```
Simulink.Bus.save('BusObjectFunctionObjectFormat','object');
```

To save only one of the Bus objects in a function, specify the Bus object name.

```
Simulink.Bus.save('BusObjectFunctionSubset','cell',{'myBusObj'});
```

Input Arguments

fileName — Name of function to generate

character vector

Name of function to generate, specified as a character vector. The file name must be unique.

Example: `Simulink.Bus.save('BusObjectFunction');`

format — Format of function to generate

'cell' (default) | 'object'

Format of function to generate, specified as either 'cell' or 'object'. The 'cell' format is more compact, but the 'object' format is easier to read.

The 'cell' format saves the Bus object definitions in a cell array of cell arrays and creates the Bus objects by calling `Simulink.Bus.cellToObject`. Each subordinate cell array represents a Bus object and contains these properties:

- 1 Bus name
- 2 Header file
- 3 Description
- 4 Data scope
- 5 Alignment
- 6 Elements

The `elements` field is a cell array that contains this information for each of the `Simulink.BusElement` objects that the Bus object references:

- 1 Element name
- 2 Dimensions
- 3 Data type

- 4 Sample time — The cell array contains this field when the sample time is not inherited. A noninherited sample time causes an error during model compilation. For more information, see “Simulink.BusElement objects no longer support the SampleTime property” on page 2-582.
- 5 Complexity
- 6 Dimensions mode
- 7 Minimum
- 8 Maximum
- 9 Units
- 10 Description

The 'object' format saves the Bus object definitions as arrays. The function uses array indexing to access elements of the array and dot notation to assign property values. For more information, see “Array Indexing” and “Access to Property Values”.

Example: `Simulink.Bus.save('BusObjectFunction','object');`

busNames — Bus objects to save

empty cell array | cell array of bus objects

Bus objects to save, specified as an empty cell array ({}) or a cell array of Bus object names.

When you specify a cell array of Bus object names, only the specified Bus objects are saved.

When you specify an empty cell array, all Bus objects are saved. Use an empty cell array to save all Bus objects in the data dictionary specified by scope.

Example: `Simulink.Bus.save('BusObjectFunction','cell',{'myBusObj'});`

scope — Data dictionary that contains Bus objects

`Simulink.data.Dictionary` object

Data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this argument, represent the dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

If scope is empty, the function uses the MATLAB base workspace as the source of the Bus objects.

Example: `Simulink.Bus.save('BusObjectFunction','cell',{},dataDictionaryObject);`

Compatibility Considerations

Simulink.BusElement objects no longer support the SampleTime property

Errors starting in R2020b

The `SampleTime` property of `Simulink.BusElement` objects is no longer supported.

`BusElement` objects that specify a sample time cause an error during compile. To remove the sample time specification from a `BusElement` object, set its `SampleTime` to `-1`.

`Simulink.Bus.cellToObject` continues to accept cell arrays that specify sample time for bus elements. `Simulink.Bus.objectToCell`, `Simulink.Bus.save`, and `Simulink.Bus.createObject` continue to return cell arrays or arrays that include the sample time when it is noninherited. When the sample time is inherited (`-1`), they omit it. Similarly, the **Bus Editor** and **Model Explorer** omit the sample time when it is inherited.

To specify the sample time for an element of a bus, use the `SampleTime` block parameter of corresponding blocks. For example, you can use `In Bus Element`, `Out Bus Element`, and `Signal Specification` blocks to specify sample time.

Simulink.clearIntEnumType

Delete enumeration classes defined by `Simulink.defineIntEnumType`

Syntax

```
Simulink.clearIntEnumType(typeName)  
Simulink.clearIntEnumType()
```

Description

`Simulink.clearIntEnumType(typeName)` deletes a specific enumeration class that is defined by `Simulink.defineIntEnumType`. The function generates a warning if the class name is invalid or if a class cannot be deleted because instances of the class exist.

`Simulink.clearIntEnumType()` deletes all enumeration classes that are defined by `Simulink.defineIntEnumType`. The function generates a warning if a class cannot be deleted because instances of the class exist.

Examples

Delete a Specific Dynamic Enumerated Data Type

Define an enumeration type and confirm that it has been created.

```
Simulink.defineIntEnumType('myEnumType', {'e1', 'e2'}, [1 2]);  
myResult = Simulink.findIntEnumType('myEnumType')
```

Delete the enumeration type that you created and confirm that it is no longer there.

```
Simulink.clearIntEnumType('myEnumType');  
myResult = Simulink.findIntEnumType('myEnumType')
```

Delete All Dynamic Enumerated Data Types

Define two enumeration types and confirm that they have been created.

```
Simulink.defineIntEnumType('myEnumType1', {'e1', 'e2'}, [1 2]);  
Simulink.defineIntEnumType('myEnumType2', {'e3', 'e4'}, [3 4]);  
myResult = Simulink.findIntEnumType()
```

Delete all enumeration types and confirm that no enumeration types exist.

```
Simulink.clearIntEnumType();  
myResult = Simulink.findIntEnumType()
```

Input Arguments

typeName — Name of enumeration class

character vector or string

Name of a specific enumeration class that is defined by `Simulink.defineIntEnumType`, specified as a character vector or string.

Example: 'myEnumType'

Data Types: char | string

[enumeration](#) | [Simulink.defineIntEnumType](#) | [Simulink.findIntEnumType](#)

Introduced in R2018b

addSymbol

Package: Simulink.CFunctionBlock

Add a symbol object definition to a C Function block

Syntax

```
mySymbol = addSymbol(mySymbolSpec)
mySymbol = addSymbol(mySymbolSpec, name)
```

Description

`mySymbol = addSymbol(mySymbolSpec)` creates a `Symbol` object, `mySymbol`, and adds the symbol to the `SymbolSpec` object, `mySymbolSpec`.

`mySymbol = addSymbol(mySymbolSpec, name)` creates a `Symbol` object, `mySymbol`, with the `Name` property specified by `name` and adds the symbol to the `SymbolSpec` object `mySymbolSpec`.

Examples

Specify and Edit Symbol Attributes Used in a C Function Block

Access and edit the properties of a symbol used in a C Function block.

Obtain the `SymbolSpec` object of the C Function block in your model using `get_param`. For example, select the C Function block in the model canvas and enter the following at the command line.

```
mySymbolSpec = get_param(gcb, 'SymbolSpec');
```

Use the `addSymbol` function to specify a new parameter symbol, `myParam`, in your C Function block code.

```
myParam = addSymbol(mySymbolSpec, 'myParam')
```

The `Symbol` object, `myParam`, uses default properties. Specify the scope of the symbol using the `Scope` property.

```
myParam.Scope = 'Parameter';
```

You can use the `getSymbol` function to access symbols specified for the block. For example, access the parameter symbol you added.

```
myParam = getSymbol(mySymbolSpec, 'myParam');
```

Edit the label of the parameter in the Block Parameters dialog using the `Label` property.

```
myParam.Label = 'Amplitude';
```

To delete a symbol from the `SymbolSpec` object, use the `deleteSymbol` function.

```
deleteSymbol(mySymbolSpec, 'myParam');
```

Input Arguments

mySymbolSpec — Symbol specifications of C Function block

SymbolSpec object

Symbol specifications of C Function block, specified as a SymbolSpec object.

name — Name of symbol

character vector

Name of the symbol, specified as a character vector.

Data Types: character

Output Arguments

mySymbol — Symbol

Symbol object

Symbol added to the C Function block, returned as a Symbol object. The Symbol object has default properties, except when you specify a name for the symbol in the input arguments. You can edit the properties of the Symbol object after creation.

Introduced in R2020a

getSymbol

Package: Simulink.CFunctionBlock

Get a symbol object definition of a C Function block

Syntax

```
mySymbol = getSymbol(mySymbolSpec, name)
```

Description

`mySymbol = getSymbol(mySymbolSpec, name)` returns the `Symbol` object with the `Name` property specified by `name` associated with the `SymbolSpec` object.

Examples

Specify and Edit Symbol Attributes Used in a C Function Block

Access and edit the properties of a symbol used in a C Function block.

Obtain the `SymbolSpec` object of the C Function block in your model using `get_param`. For example, select the C Function block in the model canvas and enter the following at the command line.

```
mySymbolSpec = get_param(gcf, 'SymbolSpec');
```

Use the `addSymbol` function to specify a new parameter symbol, `myParam`, in your C Function block code.

```
myParam = addSymbol(mySymbolSpec, 'myParam')
```

The `Symbol` object, `myParam`, uses default properties. Specify the scope of the symbol using the `Scope` property.

```
myParam.Scope = 'Parameter';
```

You can use the `getSymbol` function to access symbols specified for the block. For example, access the parameter symbol you added.

```
myParam = getSymbol(mySymbolSpec, 'myParam');
```

Edit the label of the parameter in the Block Parameters dialog using the `Label` property.

```
myParam.Label = 'Amplitude';
```

To delete a symbol from the `SymbolSpec` object, use the `deleteSymbol` function.

```
deleteSymbol(mySymbolSpec, 'myParam');
```

Input Arguments

mySymbolSpec — Symbol specifications of C Function block

SymbolSpec object

Symbol specifications of C Function block, specified as a SymbolSpec object.

name — Name of symbol

character vector

Name of the symbol, specified as a character vector.

Data Types: character

Output Arguments

mySymbol — Symbol

Symbol object

Symbol associated with the C Function block, returned as a Symbol object.

deleteSymbol(mySymbolSpec, name)
```

Description

`deleteSymbol(mySymbolSpec, name)` deletes the `Symbol` object with the `Name` property specified by `name` from the `SymbolSpec` object.

Examples

Specify and Edit Symbol Attributes Used in a C Function Block

Access and edit the properties of a symbol used in a C Function block.

Obtain the `SymbolSpec` object of the C Function block in your model using `get_param`. For example, select the C Function block in the model canvas and enter the following at the command line.

```
mySymbolSpec = get_param(gcf, 'SymbolSpec');
```

Use the `addSymbol` function to specify a new parameter symbol, `myParam`, in your C Function block code.

```
myParam = addSymbol(mySymbolSpec, 'myParam')
```

The `Symbol` object, `myParam`, uses default properties. Specify the scope of the symbol using the `Scope` property.

```
myParam.Scope = 'Parameter';
```

You can use the `getSymbol` function to access symbols specified for the block. For example, access the parameter symbol you added.

```
myParam = getSymbol(mySymbolSpec, 'myParam');
```

Edit the label of the parameter in the Block Parameters dialog using the `Label` property.

```
myParam.Label = 'Amplitude';
```

To delete a symbol from the `SymbolSpec` object, use the `deleteSymbol` function.

```
deleteSymbol(mySymbolSpec, 'myParam');
```

Input Arguments

mySymbolSpec — Symbol specifications of C Function block

SymbolSpec object

Symbol specifications of C Function block, specified as a SymbolSpec object.

name — Name of symbol

character vector

Name of the symbol to delete, specified as a character vector.

Data Types: character

Simulink.createFromTemplate

Create model or project from template

Syntax

```
Simulink.createFromTemplate(templatename)
h = Simulink.createFromTemplate(templatename)
h = Simulink.createFromTemplate(templatename,Name,Value)
```

Description

`Simulink.createFromTemplate(templatename)` creates a model or a project from the template file specified by `templatename`.

`h = Simulink.createFromTemplate(templatename)` creates a model or a project from the template file and returns `h`, either a numeric model handle or a `simulinkproject` object.

`h = Simulink.createFromTemplate(templatename,Name,Value)` specifies additional options as one or more `Name, Value` pair arguments.

Examples

Create a Model From a Template

```
Simulink.createFromTemplate('simple_simulation.sltx')
```

Create a Project From a Template and Get the Handle

Create a project from a template, specify the name and root folder, and return the handle to the new project (a `simulinkproject` object) for manipulating it programmatically.

```
proj = Simulink.createFromTemplate('code_generation_example.sltx','Name','myProject','Folder','C
```

Input Arguments

templatename — Template file name

character vector

Template file name, specified as a character vector. If the template is not on the MATLAB path, specify the fully-qualified path to the template file and `*.sltx` extension.

Example:

Data Types: `char`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, . . . , NameN, ValueN`.

Example:

Folder — Project root folder

character vector

Project root folder, if creating a new project, specified as a character vector.

Data Types: `char`

Name — New model or project name

character vector

New model or project name, specified as a character vector.

Data Types: `char`

Output Arguments

h — Handle

numeric handle | `simulinkproject`

Handle to the new model project, returned either as a numeric model handle or a `simulinkproject` object.

Simulink.data.assigninGlobal

Modify variable values in context of Simulink model

Syntax

```
Simulink.data.assigninGlobal(modelName,varName,varValue)
```

Description

`Simulink.data.assigninGlobal(modelName,varName,varValue)` assigns the value `varValue` to the variable or data dictionary entry `varName` in the context of the Simulink model `modelName`. `assigninGlobal` creates the variable or data dictionary entry if it does not already exist. The function operates in the Design Data section of the data dictionary that is linked to the target model or in the MATLAB base workspace if the target model is not linked to any data dictionary.

If the target model is linked to a data dictionary that references other dictionaries, `assigninGlobal` searches for `varName` in the entire dictionary hierarchy. If `assigninGlobal` does not find a matching entry, the function creates an entry in the dictionary that is linked to the target model.

Examples

Modify Variable in Model With or Without Data Dictionary

Create a variable `myNewVariable` with value 237 in the context of the Simulink model `vdp.slx`, which is not linked to any data dictionary. `myNewVariable` appears as a variable in the MATLAB base workspace.

```
Simulink.data.assigninGlobal('vdp','myNewVariable',237)
```

Create a variable `myNewEntry` with value `true` in the context of the Simulink model `sldemo_fuelsys_dd_controller.slx`, which is linked to the data dictionary `sldemo_fuelsys_dd_controller.sldd`. The entry `myNewEntry` appears in the Design Data section of the dictionary.

```
Simulink.data.assigninGlobal('sldemo_fuelsys_dd_controller',...  
'myNewEntry',true)
```

Confirm the addition of `myNewEntry` to the data dictionary `sldemo_fuelsys_dd_controller.sldd` by viewing the dictionary in Model Explorer.

```
myDictionaryObj = Simulink.data.dictionary.open(...  
'sldemo_fuelsys_dd_controller.sldd');  
show(myDictionaryObj)
```

Input Arguments

modelName — Name of target Simulink model

character vector

Name of target Simulink model, specified as a character vector.

Example: 'myTestModel'

Data Types: char

varName — Name of target variable or data dictionary entry

character vector

Name of target variable or data dictionary entry, specified as a character vector.

Example: 'myTargetVariable'

Data Types: char

varValue — Value to assign to variable or data dictionary entry

MATLAB expression

Value to assign to variable or data dictionary entry, specified as a MATLAB expression that returns any valid data type or data dictionary content.

Example: 27.5

Example: myBaseWorkspaceVariable

Example: Simulink.Parameter

Tips

- `assignInGlobal` helps you transition Simulink models to using data dictionaries. You can use the function to assign values to model variables before and after linking a model to a data dictionary.

“Considerations before Migrating to Data Dictionary”

Introduced in R2015a

addDataSource

Package: Simulink.data

Add reference data dictionary to parent data dictionary

Syntax

```
addDataSource(dictionaryObj, refDictionaryFile)
```

Description

`addDataSource(dictionaryObj, refDictionaryFile)` adds a data dictionary, `refDictionaryFile`, as a reference dictionary to a parent dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object.

The parent dictionary contains all the entries that are defined in the referenced dictionary until the referenced dictionary is removed from the parent dictionary. The `DataSource` property of an entry indicates the dictionary that defines the entry.

Examples

Add a Reference Data Dictionary to a Parent Data Dictionary

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Add the data dictionary `mySubDictionary_ex_API.sldd` as a reference dictionary to `myDictionary_ex_API.sldd`.

```
addDataSource(myDictionaryObj, 'mySubDictionary_ex_API.sldd');
```

Confirm the addition by viewing the `DataSources` property of variable `myDictionaryObj`. The property returns the name of the newly referenced dictionary.

```
myDictionaryObj.DataSources
```

```
ans =
```

```
    'myRefDictionary_ex_API.sldd'  
    'mySubDictionary_ex_API.sldd'
```

Input Arguments

dictionaryObj — Parent data dictionary

`Simulink.data.Dictionary` object

Parent data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for

example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

refDictionaryFile – File name of data dictionary to reference

character vector

File name of data dictionary to reference, specified as a character vector that includes the `.sldd` extension. The data dictionary file must be on your MATLAB path.

Example: `'mySubDictionary_ex_API.sldd'`

Data Types: `char`

Alternatives

You can use the Model Explorer window to manage reference dictionaries. See “Partition Dictionary Data Using Referenced Dictionaries” for more information.

See Also

`Simulink.data.Dictionary` | `removeDataSource`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

Simulink.data.dictionary.cleanupWorkerCache

Restore defaults after parallel simulation with data dictionary

Syntax

```
Simulink.data.dictionary.cleanupWorkerCache
```

Description

`Simulink.data.dictionary.cleanupWorkerCache` restores default settings after you have finished parallel simulation of a model that is linked to a data dictionary. Use this function in a `spmd` block, after you finish parallel simulation using `parfor` blocks, to restore default settings that were altered by the `Simulink.data.dictionary.setupWorkerCache` function.

During parallel simulation of a model that is linked to a data dictionary, you can allow each worker to access and modify the data in the dictionary independently of other workers. The function `Simulink.data.dictionary.setupWorkerCache` grants each worker a unique dictionary cache to allow independent access to the data, and the function `Simulink.data.dictionary.cleanupWorkerCache` restores cache settings to their default values.

You must have a Parallel Computing Toolbox license to perform parallel simulation using a `parfor` block.

Examples

Sweep Variant Control Using Parallel Simulation

To use parallel simulation to sweep a variant control (a `Simulink.Parameter` object whose value influences the variant condition of a `Simulink.Variant` object) that you store in a data dictionary, use this code as a template. Change the names and values of the model, data dictionary, and variant control to match your application.

To sweep block parameter values or the values of workspace variables that you use to set block parameters, use `Simulink.SimulationInput` objects instead of the programmatic interface to the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

You must have a Parallel Computing Toolbox license to perform parallel simulation.

```
% For convenience, define names of model and data dictionary
model = 'mySweepMdl';
dd = 'mySweepDD.sldd';

% Define the sweeping values for the variant control
CtrlValues = [1 2 3 4];

% Grant each worker in the parallel pool an independent data dictionary
% so they can use the data without interference
spmd
    Simulink.data.dictionary.setupWorkerCache
```

```

end

% Determine the number of times to simulate
numberOfSims = length(CtrlValues);

% Prepare a nondistributed array to contain simulation output
simOut = cell(1,numberOfSims);

parfor index = 1:numberOfSims
    % Create objects to interact with dictionary data
    % You must create these objects for every iteration of the parfor-loop
    dictObj = Simulink.data.dictionary.open(dd);
    sectObj = getSection(dictObj, 'Design Data');
    entryObj = getEntry(sectObj, 'MODE');
    % Suppose MODE is a Simulink.Parameter object stored in the data dictionary

    % Modify the value of MODE
    temp = getValue(entryObj);
    temp.Value = CtrlValues(index);
    setValue(entryObj,temp);

    % Simulate and store simulation output in the nondistributed array
    simOut{index} = sim(model);

    % Each worker must discard all changes to the data dictionary and
    % close the dictionary when finished with an iteration of the parfor-loop
    discardChanges(dictObj);
    close(dictObj);
end

% Restore default settings that were changed by the function
% Simulink.data.dictionary.setupWorkerCache
% Prior to calling cleanupWorkerCache, close the model

spmd
    bdclose(model)
    Simulink.data.dictionary.cleanupWorkerCache
end

```

Note If data dictionaries are open, you cannot use the command `Simulink.data.dictionary.cleanupWorkerCache`. To identify open data dictionaries, use `Simulink.data.dictionary.getOpenDictionaryPaths`.

Introduced in R2015a

close

Package: Simulink.data

Close connection between data dictionary and Simulink.data.Dictionary object

Syntax

```
close(dictionaryObj)
```

Description

`close(dictionaryObj)` closes the connection between the Simulink.data.Dictionary object `dictionaryObj` and the data dictionary it represents. `dictionaryObj` remains as a Simulink.data.Dictionary object but no longer represents any data dictionary.

Examples

Close Connection Between Data Dictionary Object and Data Dictionary

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a Simulink.data.Dictionary object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Remove connection between `myDictionaryObj` and `myDictionary_ex_API.sldd`.

```
close(myDictionaryObj);
```

Input Arguments

dictionaryObj — Target Simulink.data.Dictionary object

handle to Simulink.data.Dictionary object

Target Simulink.data.Dictionary object, specified as a handle to the object.

Tips

- Use the `close` function in a custom MATLAB function to disassociate a Simulink.data.Dictionary object from a data dictionary. Custom MATLAB functions can create and store variables and objects in function workspaces but cannot delete those variables and objects.
- The `close` function does not affect the content or the state of the represented data dictionary. The function does not discard unsaved changes to the represented dictionary or entries. You can save or discard them later.

Simulink.data.Dictionary

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

Simulink.data.dictionary.closeAll

Close all connections to all open data dictionaries

Syntax

```
Simulink.data.dictionary.closeAll
Simulink.data.dictionary.closeAll(dictFileName)
Simulink.data.dictionary.closeAll( ____,unsavedAction)
```

Description

`Simulink.data.dictionary.closeAll` attempts to close all connections to all data dictionaries that are open. For example, if you create objects, such as `Simulink.data.Dictionary`, that refer to a dictionary, that dictionary is open.

Some commands and functions, such as `Simulink.data.dictionary.cleanupWorkerCache`, cannot operate when dictionaries are open. It is a best practice to close each connection individually by using functions and methods such as the `close` method of a `Simulink.data.Dictionary` object. To find dictionaries that are open, use `Simulink.data.dictionary.getOpenDictionaryPaths`. However, you can use this function to close all connections to all dictionaries.

You can also use this function to close dictionaries in a shutdown script that is part of a project.

`Simulink.data.dictionary.closeAll(dictFileName)` closes all connections to the dictionary named `dictFileName`. If you open multiple dictionaries that use this file name (for example, if the dictionaries have different file paths), the function closes all connections to all of the dictionaries.

You cannot specify `dictFileName` as a full file path such as `'C:\temp\myDict.sldd'`.

`Simulink.data.dictionary.closeAll(____,unsavedAction)` closes all connections to the target dictionaries by discarding or saving unsaved changes. You can choose whether to save or discard all changes to all of the target dictionaries.

Examples

Close All Connections to All Open Dictionaries

Discard any unsaved changes. All of the entries in the dictionaries revert to the last saved state.

```
Simulink.data.dictionary.closeAll('-discard')
```

Close All Connections to Single Data Dictionary

Open multiple connections to a data dictionary, make a change, and close all of the connections by discarding the unsaved change.

At the command prompt, open a data dictionary by creating a `Simulink.data.Dictionary` object that refers to the dictionary.

```
dictObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd.slidd');
```

Display the dictionary in the Model Explorer

```
show(dictObj)
```

You now have two connections to this dictionary: The `Simulink.data.Dictionary` object and the Model Explorer.

Make a change to the dictionary by adding an entry.

```
dDataSectObj = getSection(dictObj, 'Design Data');
addEntry(dDataSectObj, 'myEntry', 5.2);
```

The `Simulink.data.dictionary.Section` object `dDataSectObj` is a third connection to the dictionary.

Close the connections to the dictionary. Discard the unsaved change.

```
Simulink.data.dictionary.closeAll('sldemo_fuelsys_dd.slidd', '-discard')
```

The dictionary no longer appears as a node in the **Model Hierarchy** pane of the Model Explorer. The `Simulink.data.Dictionary` object `dictObj` is disconnected from the dictionary. You cannot interact with the dictionary by using the `Simulink.data.dictionary.Section` object `dDataSectObj`.

Clear the objects that referred to the dictionary.

```
clear dictObj dDataSectObj
```

Input Arguments

dictFileName — File name of target data dictionary or dictionaries

character vector

File name of target data dictionary or dictionaries, specified as a character vector. Use the file extension `slidd`.

Example: `'myDict.slidd'`

Data Types: `char`

unsavedAction — Action for unsaved changes

'-discard' | '-save'

Action for unsaved changes, specified as `'-discard'` (to discard changes) or `'-save'` (to save changes).

Tips

A data dictionary is open if any of these conditions are true:

- The dictionary appears as a node in the **Model Hierarchy** pane of the Model Explorer. To close this connection to the dictionary, right-click the node in Model Explorer and select **Close**. Alternatively, use the `hide` method of a `Simulink.data.Dictionary` object.
- You created an object of any of these classes that refer to the dictionary:
 - `Simulink.data.Dictionary`
 - `Simulink.data.dictionary.Section`
 - `Simulink.data.dictionary.Entry`

To close these connections to the dictionary, use the `close` method of the `Simulink.data.Dictionary` object or clear the object. Clear the `Simulink.data.dictionary.Section` and `Simulink.data.dictionary.Entry` objects.

- A model that is linked to the dictionary is open. To close this connection to the dictionary, close the model.

`Simulink.data.dictionary.getOpenDictionaryPaths` |
`Simulink.data.dictionary.setupWorkerCache`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2016a

Simulink.data.dictionary.create

Create new data dictionary and create Simulink.data.Dictionary object

Syntax

```
dictionaryObj = Simulink.data.dictionary.create(dictionaryFile)
```

Description

`dictionaryObj = Simulink.data.dictionary.create(dictionaryFile)` creates a data dictionary file in your current working folder or in a file path you can specify in `dictionaryFile`. The function returns a `Simulink.data.Dictionary` object representing the new data dictionary.

Examples

Create New Data Dictionary and Data Dictionary Object

Create a data dictionary `myNewDictionary.sldd` in your current working folder and a `Simulink.data.Dictionary` object representing the new data dictionary. Assign the object to the variable `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.create('myNewDictionary.sldd')
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```

        DataSourcees: {0x1 cell}
    HasAccessToBaseWorkspace: 0
EnableAccessToBaseWorkspace: 0
        HasUnsavedChanges: 0
        NumberOfEntries: 0
```

Input Arguments

dictionaryFile — Name of new data dictionary

character vector

Name of new data dictionary, specified as a character vector containing the file name and, optionally, path of the dictionary to create. If you do not specify a path, `Simulink.data.dictionary.create` creates the new data dictionary file in your working MATLAB folder.

`Simulink.data.dictionary.create` also supports file paths specified relative to your working folder.

Example: `'myDictionary.sldd'`

Example: `'C:\Users\jsmith\myDictionary.sldd'`

Example: `'..\myOtherDictionary.sldd'`

Data Types: char

Output Arguments

dictionaryObj — Newly created data dictionary

`Simulink.data.Dictionary` object

Newly created data dictionary, returned as a `Simulink.data.Dictionary` object.

Alternatives

You can use the Simulink Editor to create a data dictionary and link it to a model. See “Migrate Single Model to Use Dictionary” for more information.

See Also

`Simulink.data.Dictionary` | `Simulink.data.dictionary.open`

Topics

“Store Data in Dictionary Programmatically”

discardChanges

Package: Simulink.data

Discard changes to data dictionary

Syntax

```
discardChanges(dictionaryObj)
```

Description

`discardChanges(dictionaryObj)` discards all changes made to the specified data dictionary since the last time changes to the dictionary were saved using the `saveChanges` function. `discardChanges` also discards changes made to referenced data dictionaries. The changes to the target dictionary and its referenced dictionaries are permanently lost.

Examples

Discard Changes to Data Dictionary

Create a `Simulink.data.Dictionary` object representing the data dictionary `myDictionary_ex_API.sldd` and assign the object to variable `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
    DataSources: {'myRefDictionary_ex_API.sldd'}
    HasUnsavedChanges: 0
    NumberOfEntries: 4
```

Make a change to `myDictionary_ex_API.sldd` by adding an entry named `myNewEntry` with value 237. View the `HasUnsavedChanges` property of `myDictionaryObj` to confirm a change was made.

```
addEntry(dDataSectObj, 'myNewEntry', 237);
```

```
myDictionaryObj
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
    DataSources: {'myRefDictionary_ex_API.sldd'}
    HasUnsavedChanges: 1
    NumberOfEntries: 5
```

Discard all changes to `myDictionary_ex_API.sldd`. The `HasUnsavedChanges` property of `myDictionaryObj` indicates changes were discarded.

```
discardChanges(myDictionaryObj)
```

```
myDictionaryObj
```

```
myDictionaryObj =  
    Dictionary with properties:  
        DataSourcees: {'myRefDictionary_ex_API.sldd'}  
        HasUnsavedChanges: 0  
        NumberOfEntries: 4
```

Input Arguments

dictionaryObj — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Alternatives

You can use the Model Explorer window to discard changes to data dictionaries. See “View and Revert Changes to Dictionary Entries” for more information.

See Also

`Simulink.data.Dictionary` | `saveChanges`

Topics

“Store Data in Dictionary Programmatically”

“What Is a Data Dictionary?”

Introduced in R2015a

deleteEntry

Package: Simulink.data.dictionary

Delete data dictionary entry

Syntax

```
deleteEntry(entryObj)
```

Description

`deleteEntry(entryObj)` deletes the data dictionary entry represented by `entryObj`, a `Simulink.data.dictionary.Entry` object. The represented entry no longer exists in the data dictionary that defined it.

The function sets the `Status` properties of any `Simulink.data.dictionary.Entry` objects representing the deleted entry to `'Deleted'`. You can access only the `Status` properties of the objects.

Examples

Delete Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');  
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Delete the entry `fuelFlow` from the data dictionary `myDictionary_ex_API.sldd`. `myDictionary_ex_API.sldd` no longer contains the `fuelFlow` entry.

```
deleteEntry(fuelFlowObj)
```

Input Arguments

entryObj — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

Alternatives

You can use the Model Explorer window to view the contents of a data dictionary and delete entries.

See Also

`Simulink.data.dictionary.Entry | addEntry`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

discardChanges

Package: Simulink.data.dictionary

Discard changes to data dictionary entry

Syntax

```
discardChanges(entryObj)
```

Description

`discardChanges(entryObj)` discards all changes made to the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object, since the last time the containing data dictionary was saved using the `saveChanges` function. The changes to the entry are permanently lost.

Examples

Discard Changes to Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Change the entry `fuelFlow` by assigning it the new value 493. Confirm a change was made by viewing the `Status` property of `fuelFlowObj`.

```
setValue(fuelFlowObj, 493);
fuelFlowObj
```

```
fuelFlowObj =
```

```
Entry with properties:
```

```
    Name: 'fuelFlow'
    Value: 493
    DataSource: 'myDictionary_ex_API.sldd'
    LastModified: '2014-Sep-05 13:14:30.661978'
    LastModifiedBy: 'jsmith'
    Status: 'Modified'
```

Discard all changes to the entry `fuelFlow`. The `Status` property of `fuelFlowObj` shows that changes were discarded.

```
discardChanges(fuelFlowObj)
fuelFlowObj
```

```
fuelFlowObj =
```

```
Entry with properties:
```

```
Name: 'fuelFlow'  
Value: 237  
DataSource: 'myDictionary_ex_API.slidd'  
LastModified: '2014-Sep-05 13:12:06.099278'  
LastModifiedBy: 'jsmith'  
Status: 'Unchanged'
```

Input Arguments

entryObj — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

Tips

- You can use the `discardChanges` function or the `saveChanges` function with an entire data dictionary, discarding or saving changes to all entries in the dictionary at once. However, only the `discardChanges` function can additionally operate on individual entries. You cannot use the `saveChanges` function to save changes to individual entries.

Alternatives

You can use Model Explorer and the Comparison Tool to discard changes to data dictionary entries. See “View and Revert Changes to Dictionary Entries” for more information.

See Also

`Simulink.data.dictionary.Entry` | `saveChanges`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

find

Package: Simulink.data.dictionary

Search in array of data dictionary entries

Syntax

```
foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN)
foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN,options)
```

Description

`foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN)` searches the array of data dictionary entries `targetEntries` using search criteria `PName1,PValue1,...,PNameN,PValueN`, and returns an array of entries matching the criteria. This syntax matches the search criteria with the properties of the target entries, which are `Simulink.data.dictionary.Entry` objects, but not with the properties of their values. See `Simulink.data.dictionary.Entry` for a list of data dictionary entry properties.

`foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN,options)` searches for data dictionary entries using additional search options. For example, you can match the search criteria with the values of the target entries.

Examples

Search Data Dictionary Entry Values for Specific Class

Search in an array of data dictionary entries `myEntryObjs` for entries whose values are objects of the class `Simulink.Parameter`.

```
foundEntries = find(myEntryObjs,'-value','-class','Simulink.Parameter')
```

Search Data Dictionary Entries for Modifying User

Search in an array of data dictionary entries `myEntryObjs` for entries that were last modified by the user `jsmith`.

```
foundEntries = find(myEntryObjs,'LastModifiedBy','jsmith')
```

Search Data Dictionary Entries Using Multiple Criteria

Search in an array of data dictionary entries `myEntryObjs` for entries that were last modified by the user `jsmith` or whose names begin with `fuel`.

```
foundEntries = find(myEntryObjs, 'LastModifiedBy', 'jsmith', '-or', ...
'-regexp', 'Name', 'fuel*')
```

Search Data Dictionary Entries Using Regular Expressions

Search in an array of data dictionary entries `myEntryObjs` for entries whose names begin with `Press`.

```
foundEntries = find(myEntryObjs, '-regexp', 'Name', 'Press*')
```

Search Data Dictionary Entries for Specific Value

Search in an array of data dictionary entries `myEntryObjs` for entries whose values are 273. If you find more than one entry, store the entries in an array called `foundEntries`.

```
foundEntries = [];
for i = 1:length(myEntryObjs)
    if getValue(myEntryObjs(i)) == 237
        foundEntries = [foundEntries myEntryObjs(i)];
    end
end
```

Search Data Dictionary Entry Values for Specific Property

Search in an array of data dictionary entries `myEntryObjs` for entries whose values have a property `DataType`.

```
foundEntries = find(myEntryObjs, '-value', '-property', 'DataType')
```

Input Arguments

targetEntries — Data dictionary entries to search

array of `Simulink.data.dictionary.Entry` objects

Data dictionary entries to search, specified as an array `Simulink.data.dictionary.Entry` objects. Before you use this function, represent the target entries with `Simulink.data.dictionary.Entry` objects by using, for example, the `getEntry` function.

Example: `[myEntryObj1, myEntryObj2, myEntryObj3]`

PName1, PValue1, ..., PNameN, PValueN — Search criteria

name-value pairs representing properties

Search criteria, specified as one or more name-value pairs representing names and values of properties of the target data dictionary entries. For a list of the properties of a data dictionary entry, see `Simulink.data.dictionary.Entry`. If you specify more than one name-value pair, the returned entries meet all of the criteria.

If you include the `'-value'` option to search in the values of the target entries, the search criteria apply to the values of the entries rather than to the entries themselves.

Example: 'LastModifiedBy','jsmith'

Example: 'DataSource','myRefDictionary_ex_API.sldd'

options – Additional search options

supported option codes

Additional search options, specified as one or more of the following supported option codes.

'-value'	This option causes <code>find</code> to search only in the values of the target data dictionary entries. Specify this option before any other search criteria or <code>options</code> arguments.
'-and', '-or', '-xor', or '-not' logical operators	These options modify or combine multiple search criteria or other option codes.
'-property',propertyName	This name-value pair causes <code>find</code> to search for entries or values that have the property <code>propertyName</code> regardless of the value of the property. Specify <code>propertyName</code> as a character vector.
'-class',className	This name-value pair causes <code>find</code> to search for entries or values that are objects of the class <code>className</code> . Specify <code>className</code> as a character vector.
'-isa',className	This name-value pair causes <code>find</code> to search for entries or values that are objects of the class or of any subclass derived from the class <code>className</code> . Specify <code>className</code> as a character vector.
'-regex'	This option allows you to use regular expressions in your search criteria. This option affects only search criteria that follow '-regex'.

Example: '-value'

Example: '-value','-property','CoderInfo'

Example: '-value','-class','Simulink.Parameter'

Output Arguments

foundEntries – Data dictionary entries matching search criteria

array of `Simulink.data.dictionary.Entry` objects

Data dictionary entries matching the specified search criteria, returned as an array of `Simulink.data.dictionary.Entry` objects.

`Simulink.data.dictionary.Entry` | `find`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

getValue

Package: Simulink.data.dictionary

Return value of data dictionary entry

Syntax

```
entryValue = getValue(entryObj)
```

Description

`entryValue = getValue(entryObj)` returns the value of the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

Examples

Return Value of Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');  
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Return the value of the entry `fuelFlow` and assign the value to variable `fuelFlowValue`.

```
fuelFlowValue = getValue(fuelFlowObj)
```

```
fuelFlowValue =
```

```
    237
```

Input Arguments

entryObj — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

See Also

`Simulink.data.dictionary.Entry` | `setValue`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

setValue

Package: Simulink.data.dictionary

Set value of data dictionary entry

Syntax

```
setValue(entryObj, newValue)
```

Description

`setValue(entryObj, newValue)` assigns the value `newValue` to the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

Examples

Set Value of Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');  
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Set the value of the entry `fuelFlow` to 493. Then, view the `Value` property of `fuelFlowObj` to observe the change.

```
setValue(fuelFlowObj, 493)  
fuelFlowObj
```

```
fuelFlowObj =
```

```
Entry with properties:
```

```
    Name: 'fuelFlow'  
    Value: 493  
    DataSource: 'myDictionary_ex_API.sldd'  
    LastModified: '2014-Sep-05 13:37:22.161124'  
    LastModifiedBy: 'jsmith'  
    Status: 'Modified'
```

Input Arguments

entryObj — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

newValue — Value to assign to data dictionary entry

MATLAB expression

Value to assign to data dictionary entry, specified as a MATLAB expression. The expression must return a value that is supported by the data dictionary section that contains the entry.

Example: 27.5

Example: myBaseWorkspaceVariable

Example: Simulink.Parameter

Alternatives

You can use the Model Explorer window to view and change the values of data dictionary entries.

See Also

`Simulink.data.dictionary.Entry` | `getValue`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

showChanges

Package: Simulink.data.dictionary

Display changes made to data dictionary entry

Syntax

```
showChanges(entryObj)
```

Description

`showChanges(entryObj)` opens the Comparison Tool to show changes made to the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object. The Comparison Tool displays the properties of `entryObj` as they were when the data dictionary was last saved and as they were when the `showChanges` function was called.

Examples

View Unsaved Changes to Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');  
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Make a change to the entry `fuelFlow` by assigning it the new value 494.

```
setValue(fuelFlowObj, 494);
```

Observe the unsaved change to the entry `fuelFlow`. The Comparison Tool opens and compares side by side the current state of the entry with its most recently saved state.

```
showChanges(fuelFlowObj)
```

Input Arguments

entryObj — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

Alternatives

You can use Model Explorer and the Comparison Tool to view changes to data dictionary entries. See “View and Revert Changes to Dictionary Entries” for more information.

“Store Data in Dictionary Programmatically”

Introduced in R2015a

appendEnumeral

Package: Simulink.data.dictionary

Add enumeration member to enumerated data type definition in data dictionary

Syntax

```
appendEnumeral(typeObj,memberName,memberValue,memberDesc)
```

Description

`appendEnumeral(typeObj,memberName,memberValue,memberDesc)` adds an enumeration member to the enumerated type definition stored by `typeObj`, a `Simulink.data.dictionary.EnumTypeDefinition` object.

Examples

Programmatically Create Enumerated Type Definition in Data Dictionary

Create an object that can store the definition of an enumerated type. By default, the new type defines a single enumeration member `enum1` with underlying integer value 0.

```
myColors = Simulink.data.dictionary.EnumTypeDefinition
```

```
myColors =
```

```
    Simulink.data.dictionary.EnumTypeDefinition  
    enum1
```

Add some enumeration members to the definition of the type.

```
appendEnumeral(myColors,'Orange',1,'')
```

```
appendEnumeral(myColors,'Black',2,'')
```

```
appendEnumeral(myColors,'Cyan',3,'')
```

```
myColors
```

```
myColors =
```

```
    Simulink.data.dictionary.EnumTypeDefinition  
    enum1  
    Orange  
    Black  
    Cyan
```

Remove the default enumeration member `enum1`. Since `enum1` is the first enumeration member in the list, identify it with index 1.

```
removeEnumeral(myColors,1)
```

```
myColors
```

```
myColors =
```

```

Simulink.data.dictionary.EnumTypeDefinition
    Orange
    Black
    Cyan

```

Customize the enumerated type by configuring the properties of the object representing it.

```

myColors.Description = 'These are my favorite colors.';
myColors.DefaultValue = 'Cyan';
myColors.HeaderFile = 'colorsType.h';

```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the object that defines the enumerated type `myColors` to the dictionary.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', {'myColors'});
```

Input Arguments

typeObj — Target enumerated type definition

`Simulink.data.dictionary.EnumTypeDefinition` object

Target enumerated type definition, specified as a `Simulink.data.dictionary.EnumTypeDefinition` object.

memberName — Name of new enumeration member

character vector

Name of the new enumeration member, specified as a character vector.

Example: 'myNewEnumMember'

Data Types: char

memberValue — Integer value underlying new enumeration member

integer

Integer value underlying the new enumeration member, specified as an integer.

The definition of the enumeration class determines the integer data type used in generated code to store the underlying values of enumeration members.

Example: 3

Data Types: single | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | double

memberDesc — Description of new enumeration member

character vector

Description of the new enumeration member, specified as a character vector.

If you do not want to supply a description for the enumeration member, use an empty character vector.

Example: 'Enumeration member number 1.'

Example: ''

Data Types: char

Alternatives

You can use Model Explorer to add enumeration members to the enumerated data type represented by a `Simulink.data.dictionary.EnumTypeDefinition` object.

`Simulink.data.dictionary.EnumTypeDefinition` | `removeEnumeral`

Topics

“Store Data in Dictionary Programmatically”

“Use Enumerated Data in Simulink Models”

Introduced in R2015a

removeEnumeral

Package: Simulink.data.dictionary

Remove enumeration member from enumerated data type definition in data dictionary

Syntax

```
removeEnumeral(typeObj,memberNum)
```

Description

`removeEnumeral(typeObj,memberNum)` removes an enumeration member from the enumerated type definition stored by `typeObj`, a `Simulink.data.dictionary.EnumTypeDefinition` object.

Examples

Programmatically Create Enumerated Type Definition in Data Dictionary

Create an object that can store the definition of an enumerated type. By default, the new type defines a single enumeration member `enum1` with underlying integer value 0.

```
myColors = Simulink.data.dictionary.EnumTypeDefinition
myColors =
    Simulink.data.dictionary.EnumTypeDefinition
    enum1
```

Add some enumeration members to the definition of the type.

```
appendEnumeral(myColors,'Orange',1,'')
appendEnumeral(myColors,'Black',2,'')
appendEnumeral(myColors,'Cyan',3,'')
myColors
myColors =
    Simulink.data.dictionary.EnumTypeDefinition
    enum1
    Orange
    Black
    Cyan
```

Remove the default enumeration member `enum1`. Since `enum1` is the first enumeration member in the list, identify it with index 1.

```
removeEnumeral(myColors,1)
myColors
myColors =
```

```

Simulink.data.dictionary.EnumTypeDefinition
    Orange
    Black
    Cyan

```

Customize the enumerated type by configuring the properties of the object representing it.

```

myColors.Description = 'These are my favorite colors.';
myColors.DefaultValue = 'Cyan';
myColors.HeaderFile = 'colorsType.h';

```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the object that defines the enumerated type `myColors` to the dictionary.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', {'myColors'});
```

Input Arguments

typeObj — Target enumerated type definition

`Simulink.data.dictionary.EnumTypeDefinition` object

Target enumerated type definition, specified as a `Simulink.data.dictionary.EnumTypeDefinition` object.

memberNum — Index of target enumeration member

integer

Index of target enumeration member, specified as an integer.

The first enumeration member in an enumerated type definition has index 1. For example, suppose an enumerated type `BasicColors` has this definition:

```

myColors =
    Simulink.data.dictionary.EnumTypeDefinition
        Orange
        Black
        Cyan

```

To remove the enumeration member `Black`, specify `memberNum` as 2. To remove the enumeration member `Cyan`, specify 3.

Do not specify `memberNum` using the integer value underlying an enumeration member. The integer value underlying the member is not equivalent to the index of the member.

Example: 3

```
Data Types: single | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | double
```

Alternatives

You can use Model Explorer to remove enumeration members from the enumerated data type represented by a `Simulink.data.dictionary.EnumTypeDefinition` object.

filepath

Package: Simulink.data

Full path and file name of data dictionary

Syntax

```
dictionaryFilePath = filepath(dictionaryObj)
```

Description

`dictionaryFilePath = filepath(dictionaryObj)` returns the full path and file name of the data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object.

Examples

Return Path of Data Dictionary File

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Return the full path of `myDictionary_ex_API.sldd` and assign it to variable `myDictionaryFilePath`.

```
myDictionaryFilePath = filepath(myDictionaryObj)
```

```
myDictionaryFilePath =
```

```
C:\Users\jsmith\myDictionary_ex_API.sldd
```

Input Arguments

dictionaryObj — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

See Also

`Simulink.data.Dictionary`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

Simulink.data.dictionary.getOpenDictionaryPaths

Return file names and paths of open data dictionaries

Syntax

```
openDDs = Simulink.data.dictionary.getOpenDictionaryPaths  
openDDs = Simulink.data.dictionary.getOpenDictionaryPaths(dictFileName)
```

Description

`openDDs = Simulink.data.dictionary.getOpenDictionaryPaths` returns the file names and paths of all data dictionaries that are open. For example, a data dictionary is open if you create objects, such as `Simulink.data.Dictionary`, that refer to the dictionary. If you open two or more dictionaries that have the same file name but different file paths, this function returns multiple file paths.

Before executing commands and functions that cannot operate when dictionaries are open, use this function to identify open dictionaries so that you can close them. For example, when you run parallel simulations as described in “Sweep Variant Control Using Parallel Simulation”, this function helps you identify open dictionaries before executing the command `Simulink.data.dictionary.cleanupWorkerCache`.

`openDDs = Simulink.data.dictionary.getOpenDictionaryPaths(dictFileName)` returns the file paths of data dictionaries that have the file name `dictFileName`. If you open two or more dictionaries that have the same file name but different file paths, you can use this syntax to return all of the file paths.

Examples

Identify and Close All Open Data Dictionaries

Open, identify, and close a data dictionary. After you close the connections to the dictionary, you can use commands and functions, such as `Simulink.data.dictionary.cleanupWorkerCache`, that cannot operate when dictionaries are open.

At the command prompt, open a data dictionary by creating a `Simulink.data.Dictionary` object that refers to the dictionary.

```
dictObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd.sldd');
```

Display the dictionary in the Model Explorer

```
show(dictObj)
```

Identify all of the dictionaries that are open.

```
openDDs = Simulink.data.dictionary.getOpenDictionaryPaths;
```

The file path of the dictionary that you opened, `sldemo_fuelsys_dd.sldd`, appears in the cell array of character vectors `openDDs`.

Close the connection from the Model Explorer to the dictionary.

```
hide(dictObj)
```

The dictionary no longer appears as a node in the **Model Hierarchy** pane of the Model Explorer.

Close the connection from the `Simulink.data.Dictionary` object to the dictionary.

```
close(dictObj)
clear dictObj
```

Input Arguments

dictFileName — File name of target data dictionary or dictionaries

character vector

File name of target data dictionary or dictionaries, specified as a character vector. Use the file extension `sldd`.

Example: `'myDict.sldd'`

Data Types: `char`

Output Arguments

openDDs — File names and paths of open data dictionaries

cell array of character vectors

File names and paths of open data dictionaries, returned as a cell array of character vectors.

Tips

A data dictionary is open if any of these conditions are true:

- The dictionary appears as a node in the **Model Hierarchy** pane of the Model Explorer. To close this connection to the dictionary, right-click the node in Model Explorer and select **Close**. Alternatively, use the `hide` method of a `Simulink.data.Dictionary` object.
- You created an object of any of these classes that refer to the dictionary:
 - `Simulink.data.Dictionary`
 - `Simulink.data.dictionary.Section`
 - `Simulink.data.dictionary.Entry`

To close these connections to the dictionary, use the `close` method of the `Simulink.data.Dictionary` object or clear the object. Clear the `Simulink.data.dictionary.Section` and `Simulink.data.dictionary.Entry` objects.

- A model that is linked to the dictionary is open. To close this connection to the dictionary, close the model.

`Simulink.data.Dictionary` | `Simulink.data.dictionary.cleanupWorkerCache` | `Simulink.data.dictionary.closeAll` | `Simulink.data.dictionary.setupWorkerCache`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2016a

getSection

Package: Simulink.data

Return Simulink.data.dictionary.Section object to represent data dictionary section

Syntax

```
sectionObj = getSection(dictionaryObj,sectionName)
```

Description

sectionObj = getSection(dictionaryObj,sectionName) returns a Simulink.data.dictionary.Section object representing one section, sectionName, of a data dictionary dictionaryObj, a Simulink.data.Dictionary object.

When you access the **Embedded Coder** section of a data dictionary, getSection returns a coder.Dictionary object representing the Embedded Coder Dictionary in the data dictionary.

Examples

Create New Data Dictionary Section Object

Open the data dictionary myDictionary_ex_API.sldd and represent it with a Simulink.data.Dictionary object named myDictionaryObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
dDataSectObj = getSection(myDictionaryObj, 'Design Data')
```

```
dDataSectObj =
```

```
    Section with properties:
```

```
        Name: 'Design Data'
```

Input Arguments

dictionaryObj — Data dictionary containing target section

Simulink.data.Dictionary object

Data dictionary containing target section, specified as a Simulink.data.Dictionary object. Before you use this function, represent the dictionary with a Simulink.data.Dictionary object by using, for example, the Simulink.data.dictionary.create or Simulink.data.dictionary.open function.

sectionName — Name of target data dictionary section

character vector

Name of target data dictionary section, specified as a character vector.

Example: 'Design Data'

Example: 'Configurations'

Example: 'EmbeddedCoder'

Data Types: char

See Also

`Simulink.data.Dictionary` | `Simulink.data.dictionary.Section`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

hide

Package: Simulink.data

Remove data dictionary from Model Explorer

Syntax

```
hide(dictionaryObj)
```

Description

`hide(dictionaryObj)` removes the data dictionary `dictionaryObj` from the **Model Hierarchy** pane of Model Explorer. The target dictionary no longer appears as a node in the model hierarchy tree. Use this function when you are finished working with a data dictionary and want to reduce clutter in the Model Explorer.

Examples

Hide Data Dictionary from Model Explorer

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Open Model Explorer and display the new data dictionary as the selected tree node in the **Model Hierarchy** pane.

```
show(myDictionaryObj)
```

With Model Explorer open, at the MATLAB command prompt, call the `hide` function to observe the removal of `myDictionary_ex_API.sldd` from the model hierarchy tree.

```
hide(myDictionaryObj)
```

Input Arguments

dictionaryObj — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Tips

- To add a data dictionary as a node in the model hierarchy tree in Model Explorer, use the `show` function or use the interface to open and view the dictionary in Model Explorer.

- The `hide` function does not affect the content of the target dictionary.

Alternatives

You can remove a data dictionary from the **Model Hierarchy** pane of Model Explorer by right-clicking the dictionary tree node and selecting **Close**.

`Simulink.data.Dictionary | show`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

importEnumTypes

Package: Simulink.data

Import enumerated type definitions to data dictionary

Syntax

```
importedTypes = importEnumTypes(dictionaryObj,targetTypes)
[importedTypes,importFailures] = importEnumTypes(dictionaryObj,targetTypes)
```

Description

`importedTypes = importEnumTypes(dictionaryObj,targetTypes)` imports to the data dictionary `dictionaryObj` the definitions of one or more enumerated types `targetTypes`. `importEnumTypes` does not import MATLAB variables created using enumerated types but instead, in support of those variables, imports the definitions of the types. The target data dictionary stores the definition of a successfully imported type as an entry. This syntax returns a list of the names of successfully imported types. `importEnumTypes` saves changes made to the target dictionary, so before you use `importEnumTypes`, confirm that unsaved changes are acceptable.

`[importedTypes,importFailures] = importEnumTypes(dictionaryObj,targetTypes)` additionally returns a list of any target types that were not successfully imported. You can inspect the list to determine the reason for each failure.

Examples

Import Enumerated Data to Data Dictionary

Create a data dictionary `myNewDictionary.sldd` in your current working folder and a `Simulink.data.Dictionary` object representing the new data dictionary. Assign the object to the variable `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.create('myNewDictionary.sldd');
```

Run the script in the MATLAB file `myDataEnum_ex_API.m`. The file defines an enumerated type named `InstrumentTypes` using the `Simulink.defineIntEnumType` function and creates three variables based on the new type. Then, import the new variables from the base workspace to `myDictionary_ex_API.sldd`.

```
myDataEnum_ex_API
importFromBaseWorkspace(myDictionaryObj,'varList',...
{'firstEnumVariable','secondEnumVariable','thirdEnumVariable'});
```

Clear the imported variables from the base workspace. Before you can import an enumerated data type definition to the target data dictionary, you must clear the base workspace of any variables created using the target type.

```
clear firstEnumVariable
clear secondEnumVariable
clear thirdEnumVariable
```

Import the data type definition to `myDictionary_ex_API.slidd`.

```
importEnumTypes(myDictionaryObj, {'InstrumentTypes'})

ans =

    className: 'InstrumentTypes'
    renamedFiles: {}
```

Input Arguments

dictionaryObj — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

targetTypes — Enumerated type definitions to import

cell array of character vectors | string array

Enumerated type definitions to import, specified as a cell array of character vectors or a string array. If any target types are defined using `classdef` blocks in MATLAB files or P-files, the files must be available on your MATLAB path so that `importEnumTypes` can disable them.

Example: {'myEnumType' }

Example: {'myFirstEnumType', 'mySecondEnumType', 'myThirdEnumType' }

Data Types: `cell`

Output Arguments

importedTypes — Target types successfully imported

array of structures

Target enumerated type definitions successfully imported, returned as an array of structures. Each structure in the array represents one imported type. The `className` field of each structure identifies a type by name and the `renamedFiles` field identifies any renamed MATLAB files or P-files.

importFailures — Target types not imported

array of structures

Enumerated type definitions targeted but not imported, returned as an array of structures. Each structure in the array represents one type not imported. The `className` field of each structure identifies a type by name and the `reason` field explains the failure.

Tips

- Before you can import an enumerated data type definition to a data dictionary, you must clear the base workspace of any variables created using the target type.
- You can define an enumerated type using a `classdef` block in a MATLAB file or a P-file. `importEnumTypes` imports type definitions directly from these files if you specify the names of

the types to import using the input argument `targetTypes` and if the files defining the types are on your MATLAB path.

- To avoid conflicting definitions for imported types, `importEnumTypes` renders MATLAB files or P-files ineffective by appending `.save` to their names. The `.save` extensions cause variables to rely on the definitions in the target data dictionary and not on the definitions in the files. You can remove the `.save` extensions to restore the files to their original state.
- You can use `importEnumTypes` to import enumerated types defined using the `Simulink.defineIntEnumType` function. Because such types are not defined using MATLAB files or P-files, `importEnumTypes` does not rename any files.
- Use the function `Simulink.findVars` to generate a list of the enumerated types that are used by a model. Then, use the list with `importEnumTypes` to import the definitions of the types to a data dictionary. See “Enumerations in Data Dictionary” for more information.

“Enumerations in Data Dictionary”

“Store Data in Dictionary Programmatically”

Introduced in R2015a

importFromBaseWorkspace

Package: Simulink.data

Import base workspace variables to data dictionary

Syntax

```
importedVars = importFromBaseWorkspace(dictionaryObj)
importedVars = importFromBaseWorkspace(dictionaryObj,Name,Value)
[importedVars,existingVars] = importFromBaseWorkspace(____)
```

Description

`importedVars = importFromBaseWorkspace(dictionaryObj)` imports all variables from the MATLAB base workspace to the data dictionary `dictionaryObj` without overwriting existing entries in the dictionary. If any base workspace variables are already in the dictionary, the function present a warning and a list.

This syntax returns a list of names of the successfully imported variables. A variable is considered successfully imported only if `importFromBaseWorkspace` assigns the value of the variable to the corresponding entry in the target data dictionary.

`importedVars = importFromBaseWorkspace(dictionaryObj,Name,Value)` imports base workspace variables to a data dictionary, with additional options specified by one or more `Name,Value` pair arguments.

`[importedVars,existingVars] = importFromBaseWorkspace(____)` additionally returns a list of variables that were not overwritten. Use this syntax if `existingVarsAction` is set to 'none', the default value, which prevents existing dictionary entries from being overwritten.

Examples

Import All Base Workspace Variables to Data Dictionary

In the MATLAB base workspace, create variables to import.

```
a = 'Char Variable';
myVariable = true;
fuelFlow = 324;
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import all base workspace variables to the data dictionary and return a list of successfully imported variables. If any base workspace variables are already in `myDictionary_ex_API.sldd`, `importFromBaseWorkspace` presents a warning and a list of the affected variables.

```
importFromBaseWorkspace(myDictionaryObj);
```

Warning: The following variables were not imported because they already exist in the dictionary:
fuelFlow

Specify Variables to Import to Data Dictionary from Base Workspace

In the MATLAB base workspace, create variables to import.

```
b = 'Char Variable';
mySecondVariable = true;
airFlow = 324;
```

Open the data dictionary myDictionary_ex_API.sldd and represent it with a Simulink.data.Dictionary object named myDictionaryObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import only the new base workspace variables to the data dictionary.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', ...
{'b', 'mySecondVariable', 'airFlow'});
```

Import Variables from Base Workspace and Overwrite Conflicts

In the MATLAB base workspace, create a variable to import.

```
fuelFlow = 324;
```

Open the data dictionary myDictionary_ex_API.sldd and represent it with a Simulink.data.Dictionary object named myDictionaryObj. myDictionary_ex_API.sldd already contains an entry called fuelFlow.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the variable fuelFlow and overwrite the corresponding entry in myDictionary_ex_API.sldd.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', {'fuelFlow'}, ...
'existingVarsAction', 'overwrite');
```

importFromBaseWorkspace assigns the value of the base workspace variable fuelFlow to the value of the corresponding entry in myDictionary_ex_API.sldd.

Return Variables Not Imported to Data Dictionary from Base Workspace

Return a list of variables that are not imported from the MATLAB base workspace because they are already in the target data dictionary.

In the MATLAB base workspace, create variables to import.

```
fuelFlow = 324;
myNewVariable = 'This is a character vector.'
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`. `myDictionary_ex_API.sldd` already contains an entry called `fuelFlow`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the variables `fuelFlow` and `myNewVariable` to the data dictionary. Specify names for the output arguments of `importFromBaseWorkspace` to return the names of successfully and unsuccessfully imported variables.

```
[importedVars,existingVars] = importFromBaseWorkspace(myDictionaryObj,...
'varList',{'fuelFlow','myNewVariable'})
```

```
importedVars =
```

```
    'myNewVariable'
```

```
existingVars =
```

```
    'fuelFlow'
```

`importFromBaseWorkspace` does not import the variable `fuelFlow` because it is already in the target data dictionary.

Input Arguments

dictionaryObj — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'varList',{'fuelFlow'}, 'existingVarsAction','overwrite'` imports the variable `fuelFlow` and overwrites the corresponding entry in the data dictionary.

clearWorkspaceVars — Flag to clear base workspace of imported variables

`false` (default) | `true`

Flag to clear the base workspace of any successfully imported variables, specified as the comma-separated pair consisting of `'clearWorkspaceVars'` and `true` or `false`.

Example: `'clearWorkspaceVars',true`

Data Types: `logical`

existingVarsAction — Action to take for existing dictionary variables

`'none'` (default) | `'error'` | `'overwrite'`

Action to take for existing dictionary variables, specified as the comma-separated pair consisting of 'existingVarsAction' and 'none', 'error', or 'overwrite'.

If you specify 'none', `importFromBaseWorkspace` attempts to import target variables but does not import or make any changes to variables that are already in the data dictionary.

If you specify 'error', `importFromBaseWorkspace` returns an error, without importing any variables, if any target variables are already in the data dictionary.

If you specify 'overwrite', `importFromBaseWorkspace` imports all target variables and overwrites any variables that are already in the data dictionary.

Example: 'existingVarsAction','error'

Data Types: char

varList — Variables to import

cell array of character vectors | string array

Names of specific base workspace variables to import, specified as the comma-separated pair consisting of 'varList' and a cell array of character vectors or a string array. If you want to import only one variable, specify the name inside a cell array. If you do not specify 'varList', `importFromBaseWorkspace` imports all variables from the MATLAB base workspace.

Example: 'varList',{'a','myVariable','fuelFlow'}

Example: 'varList',{'fuelFlow'}

Data Types: cell

Output Arguments

importedVars — Successfully imported variables

cell array of character vectors

Names of successfully imported variables, returned as a cell array of character vectors. A variable is considered successfully imported only if `importFromBaseWorkspace` assigns the value of the variable to the corresponding entry in the target data dictionary.

existingVars — Variables that were not imported

cell array of character vectors

Names of target variables that were not imported due to their existence in the target data dictionary, returned as a cell array of character vectors. `existingVars` has content only if 'existingVarsAction' is set to 'none' which is also the default. In that case `importFromBaseWorkspace` imports only variables that are not already in the target data dictionary.

Tips

- `importFromBaseWorkspace` can import MATLAB variables created from enumerated data types but cannot import the definitions of the enumerated types. Use the `importEnumTypes` function to import enumerated data type definitions to a data dictionary. If you import variables of enumerated data types to a data dictionary but do not import the enumerated type definitions, the dictionary is less portable and might not function properly if used by someone else.

- If the value of a variable is a `timeseries` object (which a data dictionary cannot store) or a structure with fields identical to a `timeseries` object, `importFromBaseWorkspace` cannot import the variable.

Alternatives

- When you use the Simulink Editor to link a model to a data dictionary, you can choose to import model variables from the base workspace. See “Migrate Single Model to Use Dictionary” for more information.
- You can also use the Model Explorer window to drag-and-drop variables from the base workspace into a data dictionary.

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

listEntry

Package: Simulink.data

List data dictionary entries

Syntax

```
listEntry(dictionaryObj)
listEntry(dictionaryObj,Name,Value)
```

Description

`listEntry(dictionaryObj)` displays in the MATLAB Command Window a table of information about all the entries in the data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object. The displayed information includes the name of each entry, the name of the section containing each entry, the status of each entry, the date and time each entry was last modified, the last user name to modify each entry, and the class of the value each entry contains. By default, the function sorts the list of entries alphabetically by entry name.

`listEntry(dictionaryObj,Name,Value)` displays the entries in a data dictionary with additional options specified by one or more `Name,Value` pair arguments.

To return the value of a data dictionary entry at the command prompt, use the `getValue` method of a `Simulink.data.dictionary.Entry` object. See “Store Data in Dictionary Programmatically”.

Examples

List All Entries in Data Dictionary

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List all the entries in the data dictionary.

```
listEntry(myDictionaryObj)
```

Sort List of Data Dictionary Entries in Descending Order

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List all the entries in the data dictionary and sort the list in descending order by entry name.

```
listEntry(myDictionaryObj, 'Ascending', false)
```

Filter List of Data Dictionary Entries by Name

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List only the entries in the data dictionary whose names begin with `max`.

```
listEntry(myDictionaryObj, 'Name', 'max*')
```

Sort List of Data Dictionary Entries by Time of Modification

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List all the entries in the dictionary and sort the list by the date and time each entry was last modified.

```
listEntry(myDictionaryObj, 'SortBy', 'LastModified')
```

Input Arguments

dictionaryObj — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: `'SortBy', 'LastModified'` sorts the entries in the data dictionary by the date and time each entry was last modified.

Ascending — Sort order of list

`true` (default) | `false`

Sort order of the list of data dictionary entries, specified as the comma-separated pair consisting of `'Ascending'` and `true` or `false`. If you specify `false`, `listEntry` sorts the list in descending order.

Example: `'Ascending', false`

Data Types: `logical`

Class — Criteria to filter list by class

character vector

Criteria to filter the list of data dictionary entries by class, specified as the comma-separated pair consisting of 'Class' and a character vector identifying a valid class. The function lists only entries whose values are of the specified class.

Example: 'Class', 'Simulink.Parameter'

Data Types: char

LastModifiedBy – Criteria to filter list by user name of last modifier

character vector

Criteria to filter the list of data dictionary entries by the user name of the last user to modify each entry, specified as the comma-separated pair consisting of 'LastModifiedBy' and a character vector identifying the specified user name. The function lists only entries that were last modified by the specified user name.

Example: 'LastModifiedBy', 'jsmith'

Data Types: char

Limit – Maximum number of entries to list

integer

Maximum number of entries to list, specified as the comma-separated pair consisting of 'Limit' and an integer. The function lists up to the specified number of entries starting from the top of the sorted and filtered list.

Example: 'Limit', 9

Data Types: double

Name – Criteria to filter list by entry name

character vector

Criteria to filter the list of data dictionary entries by entry name, specified as the comma-separated pair consisting of 'Name' and a character vector defining the filter criteria. You can use an asterisk character, *, as a wildcard to represent any number of characters. The function lists only entries whose names match the filter criteria.

Example: 'Name', 'fuelFlow'

Example: 'Name', 'fuel*'

Data Types: char

Section – Criteria to filter list by data dictionary section

character vector

Criteria to filter the list of data dictionary entries by section, specified as the comma-separated pair consisting of 'Section' and a character vector identifying the target section. The function lists only entries that are contained in the target section.

Example: 'Section', 'Design Data'

SortBy – Flag to sort list by specific property

'Name' (default) | 'Section' | 'LastModified' | 'LastModifiedBy'

Flag to sort the list of data dictionary entries by a specific property, specified as the comma-separated pair consisting of 'SortBy' and a character vector identifying a property in the list of entries. Valid properties include 'Name', 'Section', 'LastModified', and 'LastModifiedBy'.

Example: 'SortBy','LastModifiedBy'

Topics

“Store Data in Dictionary Programmatically”

“What Is a Data Dictionary?”

Introduced in R2015a

Simulink.data.dictionary.open

Open data dictionary for editing

Syntax

```
dictionaryObj = Simulink.data.dictionary.open(dictionaryFile)
```

Description

`dictionaryObj = Simulink.data.dictionary.open(dictionaryFile)` opens the specified data dictionary and returns a `Simulink.data.Dictionary` object representing an existing data dictionary identified by its file name and, optionally, file path with `dictionaryFile`.

Make sure any dictionaries referenced by the target dictionary are on the MATLAB path.

Examples

Open Existing Data Dictionary

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')
```

```
myDictionaryObj =
```

Dictionary with properties:

```
    DataSourcees: {'myRefDictionary_ex_API.sldd'}
    HasUnsavedChanges: 0
    NumberOfEntries: 4
```

Input Arguments

dictionaryFile — Target data dictionary

character vector

Target data dictionary, specified as a character vector containing the file name and, optionally, path of the dictionary. If you do not specify a path, `Simulink.data.dictionary.open` searches the MATLAB path for the specified file. `Simulink.data.dictionary.open` also supports paths specified relative to the MATLAB working folder.

Example: `'myDictionary_ex_API.sldd'`

Example: `'C:\Users\jsmith\myDictionary_ex_API.sldd'`

Example: `'..\myOtherDictionary.sldd'`

Data Types: char

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

removeDataSource

Package: Simulink.data

Remove reference data dictionary from parent data dictionary

Syntax

```
removeDataSource(dictionaryObj, refDictionaryFile)
```

Description

`removeDataSource(dictionaryObj, refDictionaryFile)` removes a referenced data dictionary, `refDictionaryFile`, from a parent dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object.

The parent dictionary no longer contains the entries that are defined in the referenced dictionary.

Examples

Remove Referenced Data Dictionary from Parent Data Dictionary

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`. The `DataSources` property of `myDictionaryObj` indicates `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
    DataSources: {'myRefDictionary_ex_API.sldd'}
    HasUnsavedChanges: 0
    NumberOfEntries: 4
```

Remove `myRefDictionary_ex_API.sldd` from `myDictionary_ex_API.sldd`.

```
removeDataSource(myDictionaryObj, 'myRefDictionary_ex_API.sldd');
```

View the properties of the `Simulink.data.Dictionary` object `myDictionaryObj`, which represents the parent data dictionary. The `DataSources` property confirms the removal of `myRefDictionary_ex_API.sldd`.

```
myDictionaryObj
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
    DataSources: {0x1 cell}
```

```
HasUnsavedChanges: 1  
NumberOfEntries: 3
```

Input Arguments

dictionaryObj — Parent data dictionary

`Simulink.data.Dictionary` object

Parent data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

refDictionaryFile — File name of referenced data dictionary

character vector

File name of referenced data dictionary, specified as a character vector that includes the `.sldd` extension. The data dictionary file must be on your MATLAB path.

Example: `'myRefDictionary_ex_API.sldd'`

Data Types: `char`

Alternatives

You can use Model Explorer to manage reference dictionaries. See “Partition Dictionary Data Using Referenced Dictionaries” for more information.

See Also

`Simulink.data.Dictionary` | `addDataSource`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

saveChanges

Package: Simulink.data

Save changes to data dictionary

Syntax

```
saveChanges(dictionaryObj)
```

Description

`saveChanges(dictionaryObj)` saves all changes made to a data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object. `saveChanges` also saves changes made to referenced data dictionaries. The previous states of the target dictionary and its referenced dictionaries are permanently lost.

Examples

Save Changes to Data Dictionary

Create a new data dictionary `myNewDictionary.sldd` and represent the Design Data section with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.create('myNewDictionary.sldd')  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

```
myDictionaryObj =
```

```
data dictionary with properties:
```

```
    DataSources: {0x1 cell}  
    HasUnsavedChanges: 0  
    NumberOfEntries: 0
```

Change `myNewDictionary.sldd` by adding an entry named `myNewEntry` with value 237. View the `HasUnsavedChanges` property of `myDictionaryObj` to confirm a change was made.

```
addEntry(dDataSectObj, 'myNewEntry', 237);  
myDictionaryObj
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
    DataSources: {0x1 cell}  
    HasUnsavedChanges: 1  
    NumberOfEntries: 1
```

Save all changes to `myNewDictionary.sldd`. The `HasUnsavedChanges` property of `myDictionaryObj` indicates changes were saved.

```
saveChanges(myDictionaryObj)
myDictionaryObj

myDictionaryObj =

    Dictionary with properties:
        DataSources: {0x1 cell}
        HasUnsavedChanges: 0
        NumberOfEntries: 1
```

Input Arguments

dictionaryObj — Target data dictionary

Simulink.data.Dictionary object

Target data dictionary, specified as a Simulink.data.Dictionary object. Before you use this function, represent the target dictionary with a Simulink.data.Dictionary object by using, for example, the Simulink.data.dictionary.create or Simulink.data.dictionary.open function.

Alternatives

You can use Model Explorer to save changes to a data dictionary by right-clicking on the dictionary tree node in the **Model Hierarchy** pane and selecting **Save Changes**.

See Also

Simulink.data.Dictionary | discardChanges

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

addEntry

Package: Simulink.data.dictionary

Add new entry to data dictionary section

Syntax

```
addEntry(sectionObj,entryName,entryValue)
entryObj = addEntry(sectionObj,entryName,entryValue)
```

Description

addEntry(sectionObj,entryName,entryValue) adds an entry, with name entryName and value entryValue, to the data dictionary section sectionObj, a Simulink.data.dictionary.Section object.

entryObj = addEntry(sectionObj,entryName,entryValue) returns a Simulink.data.dictionary.Entry object representing the newly added data dictionary entry.

Examples

Add Entry to Design Data Section of Data Dictionary

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Add an entry to the Design Data section of myDictionary_ex_API.sldd an entry myNewEntry with value 237.

```
addEntry(dDataSectObj,'myNewEntry',237)
```

Add New Simulink.Parameter Object to Data Dictionary

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Add an entry to the Design Data section of myDictionary_ex_API.sldd. Name the new entry myNewParam and assign a Simulink.Parameter object to the value.

```
addEntry(dDataSectObj,'myNewParam',Simulink.Parameter)
```

The expression `Simulink.Parameter` constructs a new `Simulink.Parameter` object, and the `addEntry` function assigns the object to the value of the new data dictionary entry `myNewParam`.

Input Arguments

sectionObj — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

entryName — Name of new data dictionary entry

character vector

Name of new data dictionary entry, specified as a character vector.

Example: `'myNewEntry'`

Data Types: `char`

entryValue — Value of new data dictionary entry

MATLAB expression

Value of new data dictionary entry, specified as a MATLAB expression that returns any valid data dictionary content.

Example: `27.5`

Example: `myBaseWorkspaceVariable`

Example: `Simulink.Parameter`

Tips

- `addEntry` returns an error if the entry name you specify with `entryName` is already the name of an entry in the target data dictionary section or in the same section of any referenced dictionaries.

Alternatives

You can use Model Explorer to add entries to a data dictionary in the same way you can use it to add variables to a model workspace or the base workspace.

See Also

`Simulink.data.dictionary.Entry` | `Simulink.data.dictionary.Section` | `assignin`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

assignin

Package: Simulink.data.dictionary

Assign value to data dictionary entry

Syntax

```
assignin(sectionObj,entryName,entryValue)
```

Description

`assignin(sectionObj,entryName,entryValue)` assigns the value `entryValue` to the data dictionary entry `entryName` in the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object. If an entry with the specified name is not in the target section, `assignin` creates the entry with the specified name and value.

If an entry with the name specified by input argument `entryName` is not defined in the target data dictionary section but is defined in a referenced dictionary, `assignin` does not create a new entry in the target section but operates on the entry in the referenced dictionary.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

Examples

Assign Value to Data Dictionary Entry

Assign a value to a data dictionary entry by operating on a `Simulink.data.dictionary.Section` object.

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Assign the value 237 to an entry `myAssignedEntry` in the data dictionary `myDictionary_ex_API.sldd`. If an entry named `myAssignedEntry` is not in `myDictionary_ex_API.sldd`, create it.

```
assignin(dDataSectObj,'myAssignedEntry',237)
```

Input Arguments

sectionObj — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

entryName — Name of target data dictionary entry

character vector

Name of target data dictionary entry, specified as a character vector. If a matching entry does not already exist, the function creates a new entry using the specified name.

Example: 'myEntry'

Data Types: char

entryValue — Value to assign to data dictionary entry

MATLAB expression

Value to assign to data dictionary entry, specified as a MATLAB expression that returns any valid data dictionary content.

Example: 27.5

Example: myBaseWorkspaceVariable

Example: Simulink.Parameter

Alternatives

You can use the Model Explorer window to view and change the values of data dictionary entries.

See Also

`Simulink.data.dictionary.Section | setValue`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

deleteEntry

Package: Simulink.data.dictionary

Delete data dictionary entry

Syntax

```
deleteEntry(sectionObj,entryName)
deleteEntry(sectionObj,entryName,'DataSource',dictionaryName)
```

Description

`deleteEntry(sectionObj,entryName)` deletes a data dictionary entry `entryName` from the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object. If there are multiple entries with the specified name in a hierarchy of reference dictionaries, the function deletes all the entries. If you represent a data dictionary entry with one or more `Simulink.data.dictionary.Entry` objects and later delete the entry using the `deleteEntry` function, the objects remain with their `Status` property set to 'Deleted'.

`deleteEntry(sectionObj,entryName,'DataSource',dictionaryName)` deletes an entry that is defined in the data dictionary `DictionaryName`. Use this syntax to uniquely identify an entry that is defined more than once in a hierarchy of referenced data dictionaries.

Examples

Delete Entry from Data Dictionary Section

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`. The Design Data section of `myDictionary_ex_API.sldd` already contains an entry named `fuelFlow`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Delete the entry `fuelFlow` from the data dictionary `myDictionary_ex_API.sldd`. `myDictionary_ex_API.sldd` no longer contains the `fuelFlow` entry.

```
deleteEntry(dDataSectObj,'fuelFlow')
```

Delete Entry from Reference Data Dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Delete the entry `myRefEntry` from the data dictionary `myRefDictionary_ex_API.sldd`. `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`, and `myRefDictionary_ex_API.sldd` defines an entry `myRefEntry`.

```
deleteEntry(dDataSectObj, 'myRefEntry', 'DataSource', ...  
'myRefDictionary_ex_API.sldd')
```

Input Arguments

sectionObj — Target data dictionary section

Simulink.data.dictionary.Section object

Target data dictionary section, specified as a Simulink.data.dictionary.Section object. Before you use this function, represent the target section with a Simulink.data.dictionary.Section object by using, for example, the getSection function.

entryName — Name of target data dictionary entry

character vector

Name of target data dictionary entry, specified as a character vector.

Example: 'myEntry'

Data Types: char

dictionaryName — Name of data dictionary that defines target entry

character vector

File name of data dictionary that defines the target entry, specified as a character vector including the .sldd extension.

Example: 'mySubDictionary_ex_API.sldd'

Data Types: char

Alternatives

You can use the Model Explorer window to delete entries from a data dictionary in the same way you can delete variables from a model workspace or the base workspace.

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

evalin

Package: Simulink.data.dictionary

Evaluate MATLAB expression in data dictionary section

Syntax

```
returnValue = evalin(sectionObj,expression)
```

Description

`returnValue = evalin(sectionObj,expression)` evaluates a MATLAB expression in the data dictionary section `sectionObj` and returns the values returned by `expression`.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

Examples

List All Entries in Data Dictionary Section

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Execute the `whos` command in the Design Data section of `myDictionary_ex_API.sldd`.

```
evalin(dDataSectObj,'whos')
```

Name	Size	Bytes	Class	Attributes
fuelFlow	1x1	8	double	
myRefEntry	1x1	1	logical	
parameterGain37	1x1	112	Simulink.Parameter	

Input Arguments

sectionObj — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

expression — MATLAB expression to evaluate

character vector

MATLAB expression to evaluate, specified as a character vector.

Example: 'a = 5.3'

Example: 'whos'

Example: 'CurrentSpeed.Value = 290.73'

Data Types: char

Tips

- `evalin` allows you to treat a data dictionary section as a MATLAB workspace. You can think of entries contained in the section as workspace variables you can manipulate with MATLAB expressions.

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

exist

Package: Simulink.data.dictionary

Check existence of data dictionary entry

Syntax

```
doesExist = exist(sectionObj,entryName)
```

Description

`doesExist = exist(sectionObj,entryName)` determines if the data dictionary section `sectionObj` contains an entry by the name of `entryName` and returns an indication.

Examples

Determine if Data Dictionary Entry Exists

Determine if an entry exists in a data dictionary by searching for the name of the entry

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Determine if an entry `fuelFlow` exists in the Design Data section of `myDictionary_ex_API.sldd`.

```
exist(dDataSectObj,'fuelFlow')
```

```
ans =
```

```
    1
```

Determine if an entry `myEntry` exists in the Design Data section of `myDictionary_ex_API.sldd`.

```
exist(dDataSectObj,'myEntry')
```

```
ans =
```

```
    0
```

Input Arguments

sectionObj — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

entryName — Name of target entry

character vector

Name of target entry, specified as a character vector.

Example: 'myEntry'

Data Types: char

Output Arguments**doesExist — Indication of entry existence**

0 | 1

Indication of entry existence, returned as 0 if false and 1 if true.

Tips

- `exist` also determines if a matching entry exists in the same section of any referenced data dictionaries. For example, if `sectionObj` represents the Design Data section of a data dictionary `myDictionary_ex_API.sldd`, `exist` searches the Design Data section of `myDictionary_ex_API.sldd` and the Design Data sections of any dictionaries referenced by `myDictionary_ex_API.sldd`.

Alternatives

You can use Model Explorer to search a data dictionary for an entry.

See Also`Simulink.data.dictionary.Section` | `Simulink.data.existsInGlobal` | `find`**Topics**

"Store Data in Dictionary Programmatically"

Introduced in R2015a

exportToFile

Package: Simulink.data.dictionary

Export data dictionary entries from section to MAT-file or MATLAB file

Syntax

```
exportToFile(sectionObj, fileName)
```

Description

`exportToFile(sectionObj, fileName)` exports to a MAT or MATLAB file all the values of the entries contained in the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object. `exportToFile` exports the values of all entries, including those defined in referenced dictionaries.

Examples

Export Data Dictionary Entries to MAT or MATLAB Files

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`. Represent the Configurations section of `myDictionary_ex_API.sldd` with an object named `configSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
configSectObj = getSection(myDictionaryObj, 'Configurations');
```

Export the entries from the Design Data section of `myDictionary_ex_API.sldd` to a MATLAB file in your current working folder.

```
exportToFile(dDataSectObj, 'myDictionaryDesignData.m')
```

Export the entries from the Configurations section of `myDictionary_ex_API.sldd` to a MAT-file in your current working folder.

```
exportToFile(configSectObj, 'myDictionaryConfigurations.mat')
```

```
Exported 1 entries from scope 'Configurations'
to MAT-file myDictionaryConfigurations.mat.
```

Input Arguments

sectionObj — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

fileName — Name of MAT or MATLAB file

character vector

Name of target MAT or MATLAB file, specified as a character vector. `exportToFile` supplies a file extension `.mat` if you do not specify an extension.

Example: `'myNewFile.mat'`

Example: `'myNewFile.m'`

Data Types: `char`

Limitation

The `exportToFile` method does not export enumerated data types (which are stored as `Simulink.data.dictionary.EnumTypeDefinition` objects). To transfer or copy an enumerated type from one dictionary to another, use the `getEntry` and `addEntry` methods of `Simulink.data.dictionary.Section` objects.

Alternatives

You can use Model Explorer to export data dictionary entries to a file. See “Export Design Data from Dictionary” for more information.

“Store Data in Dictionary Programmatically”

Introduced in R2015a

find

Package: Simulink.data.dictionary

Search in data dictionary section

Syntax

```
foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN)
foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN,options)
```

Description

`foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN)` searches the data dictionary section `sectionObj` using search criteria `PName1,PValue1,...,PNameN,PValueN`, and returns an array of matching entries that were found in the target section. This syntax matches the search criteria with the properties of the entries in the target section but not with the properties of their values. See `Simulink.data.dictionary.Entry` for a list of data dictionary entry properties.

`foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN,options)` searches for data dictionary entries using additional search options. For example, you can match the search criteria with the values of the entries in the target section.

Examples

Return Array of All Entries in Data Dictionary Section

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Return all of the entries stored in the Design Data section of the data dictionary `myDictionary_ex_API.sldd`.

```
allEntries = find(dDataSectObj)
```

Search Data Dictionary Section for Specific Class

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries whose values are objects of the `Simulink.Parameter` class.

```
foundEntries = find(dDataSectObj, '-value', '-class', 'Simulink.Parameter')
```

Search Data Dictionary Section for Modifying User

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries that were last modified by the user `jsmith`.

```
foundEntries = find(dDataSectObj, 'LastModifiedBy', 'jsmith')
```

Search Data Dictionary Section Using Multiple Criteria

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries that were last modified by the user `jsmith` or whose names begin with `fuel`.

```
foundEntries = find(dDataSectObj, 'LastModifiedBy', 'jsmith', '-or', ...  
    '-regexp', 'Name', 'fuel*')
```

Search Data Dictionary Section Using Regular Expressions

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries whose names begin with `fuel`.

```
foundEntries = find(dDataSectObj, '-regexp', 'Name', 'fuel*')
```

Search Data Dictionary Section for Specific Value

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Return all of the entries stored in the Design Data section of the data dictionary `myDictionary_ex_API.sldd`.

```
allEntries = find(dDataSectObj);
```

Find the entries with value 237. If you find more than one entry, store the entries in an array called `foundEntries`.

```
foundEntries = [];
for i = 1:length(allEntries)
    if getValue(allEntries(i)) == 237
        foundEntries = [foundEntries allEntries(i)];
    end
end
```

Search Data Dictionary Section for Specific Property

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries whose values have a property `DataType`.

```
foundEntries = find(dDataSectObj, '-value', '-property', 'DataType')
```

Input Arguments

`sectionObj` — Data dictionary section to search

`Simulink.data.dictionary.Section` object

Data dictionary section to search, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

`PName1, PValue1, . . . , PNameN, PValueN` — Search criteria

name-value pairs representing properties

Search criteria, specified as one or more name-value pairs representing names and values of properties of the entries in the target data dictionary section. For a list of the properties of a data dictionary entry, see `Simulink.data.dictionary.Entry`. If you specify more than one name-value pair, the returned entries meet all of the criteria.

If you include the `'-value'` option to search in the values of the entries, the search criteria apply to the values of the entries rather than to the entries themselves.

Example: `'LastModifiedBy', 'jsmith'`

Example: `'DataSource', 'myRefDictionary_ex_API.sldd'`

`options` — Additional search options

supported option codes

Additional search options, specified as one or more of the following supported option codes.

'-value'	This option causes <code>find</code> to search only in the values of the entries in the target data dictionary section. Specify this option before any other search criteria or options arguments.
'-and', '-or', '-xor', '-not' logical operators	These options modify or combine multiple search criteria or other option codes.
'-property', <code>propertyName</code>	This name-value pair causes <code>find</code> to search for entries or values that have the property <code>propertyName</code> regardless of the value of the property. Specify <code>propertyName</code> as a character vector.
'-class', <code>className</code>	This name-value pair causes <code>find</code> to search for entries or values that are objects of the class <code>className</code> . Specify <code>className</code> as a character vector.
'-isa', <code>className</code>	This name-value pair causes <code>find</code> to search for entries or values that are objects of the class or of any subclass derived from the class <code>className</code> . Specify <code>className</code> as a character vector.
'-regexp'	This option allows you to use regular expressions in your search criteria. This option affects only search criteria that follow '-regexp'.

Example: '-value'

Example: '-value', '-property', 'CoderInfo'

Example: '-value', '-class', 'Simulink.Parameter'

Output Arguments

foundEntries — Data dictionary entries matching search criteria

array of `Simulink.data.dictionary.Entry` objects

Data dictionary entries matching the specified search criteria, returned as an array of `Simulink.data.dictionary.Entry` objects.

Alternatives

You can use Model Explorer to search a data dictionary for entries using arbitrary criteria.

`Simulink.data.dictionary.Entry` | `Simulink.data.dictionary.Section` | `exist` | `find`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

getEntry

Package: Simulink.data.dictionary

Create Simulink.data.dictionary.Entry object to represent data dictionary entry

Syntax

```
entryObj = getEntry(sectionObj,entryName)
entryObj = getEntry(sectionObj,entryName,'DataSource',dictionaryName)
```

Description

entryObj = getEntry(sectionObj,entryName) returns an array of Simulink.data.dictionary.Entry objects representing data dictionary entries entryName found in the data dictionary section sectionObj, a Simulinkdata.dictionary.Section object. getEntry returns multiple objects if multiple entries have the specified name in a reference hierarchy of data dictionaries.

entryObj = getEntry(sectionObj,entryName,'DataSource',dictionaryName) returns an object representing a data dictionary entry that is defined in the data dictionary dictionaryName. Use this syntax to uniquely identify an entry that is defined more than once in a hierarchy of referenced data dictionaries.

Examples

Set Value of Data Dictionary Entry

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Represent the data dictionary entry fuelFlow with a Simulink.data.dictionary.Entry object named fuelFlowObj. fuelFlow is defined in the data dictionary myDictionary_ex_API.sldd.

```
fuelFlowObj = getEntry(dDataSectObj,'fuelFlow');
```

Set the value of the entry fuelFlow to 493.

```
setValue(fuelFlowObj,493)
```

Set Value of Entry in Reference Dictionary

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Represent the data dictionary entry `myRefEntry` with a `Simulink.data.dictionary.Entry` object named `refEntryObj`. `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`, and `myRefDictionary_ex_API.sldd` defines an entry `myRefEntry`.

```
refEntryObj = getEntry(dDataSectObj, 'myRefEntry', 'DataSource', ...  
'myRefDictionary_ex_API.sldd');
```

Set the value of the entry `myRefEntry` to 493.

```
setValue(refEntryObj, 493)
```

Input Arguments

sectionObj — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

entryName — Name of target data dictionary entry

character vector

Name of target data dictionary entry, specified as a character vector.

Example: 'myEntry'

Data Types: char

dictionaryName — Name of data dictionary containing target entry

character vector

File name of data dictionary containing the target entry, specified as a character vector including the `.sldd` extension.
