Simulink Coverage Product Description

Simulink Coverage Product Description

Measure test coverage in models and generated code

Simulink[®] Coverage[™] performs model and code coverage analysis that measures testing completeness in models and generated code. It applies industry-standard metrics such as decision, condition, modified condition/decision coverage (MCDC), and relational boundary coverage to assess the effectiveness of simulation testing in models, software-in-the-loop (SIL), and processor-in-the-loop (PIL). You can use missing coverage data to find gaps in testing, missing requirements, or unintended functionality.

Simulink Coverage produces interactive reports showing how much of your model, C/C++ Sfunctions, MATLAB[®] functions, and code generated by Embedded Coder[®] has been exercised. You can highlight coverage results in blocks and subsystems to visualize gaps in testing. To assess testing completeness, you can accumulate coverage data from multiple test runs, as well as view coverage achieved through unit and system tests. Coverage outcomes can be traced to requirements and tests. You can apply filters to exclude blocks from coverage and justify missing coverage in reports.

Support for industry standards is available through DO Qualification Kit and IEC Certification Kit.

Structural Coverage Metrics

When Simulink Coverage measures coverage for a model, it uses the same principles used in code coverage. In code coverage, you test that all the code is executed to ensure that there is no unexpected behavior in your program. Simulink Coverage applies the same measurement to your Simulink model to ensure that all the blocks and logical branches are executed.

Structural coverage metrics analyze the structural elements of your model, such as blocks and Stateflow[®] charts, and report how much of the model and, if applicable, logical branches execute. The four structural coverage metrics for model coverage are block execution coverage, decision coverage, condition coverage, and modified condition decision coverage (MCDC). These metrics analyze the structural elements of your model, such as blocks and Stateflow charts, and report how much of the logic and/or branches of your model are executed.

For more information about these and other coverage metrics, see "Types of Model Coverage".

Block Execution Coverage

Block execution coverage tells you whether each block executes during simulation. The code coverage metric that block execution coverage is most similar to is statement coverage.

Most blocks receive execution coverage, although there are some types of blocks which do not receive coverage at all. For more information, see "Model Objects That Do Not Receive Coverage".

Decision Coverage

Decision coverage analyzes decision points in your code or model. In code coverage, a decision is a Boolean expression composed of one or more conditions and zero or more Boolean operators. In model coverage, a decision is a place in your model where the value of one or more input signals decide the output signal of a block.

In code coverage, the decision A && B has 100% decision coverage if the decision is true for at least one time step, and false for at least one time step, regardless of the outcomes of the individual conditions inside the decision. Similarly, in model coverage, a Switch block has 100% decision coverage if the true case is executed for at least one time step, and the false case is executed for at least one time step.

Condition Decision Coverage

Condition Decision coverage analyzes both decision points and the conditions that make up the decisions. In code coverage, a condition is a Boolean expression that contains no Boolean operators. In other words, it is a Boolean expression that cannot be broken down into simpler Boolean expressions. An example of a condition is an expression like A, where the outcome is true or false.

In model coverage, condition coverage analyzes blocks that output the logical combination of their input. An example of a condition in a model is the Logical Operator block. A Logical Operator block with the operator set to And would output true if all of its input signals are true. This is what is meant by the logical combination of its inputs.

The expression A has 100% coverage if the condition is true for at least one time step, and false for at least one time step. Similarly, the Logical Operator block has 100% condition coverage if each of its input signals is true for at least one time step, and false for at least one time step. In this example model, the signals A and B are Boolean values in the model which represent the same conditions as the code example.

Modified Condition Decision Coverage (MCDC)

MCDC is condition decision coverage, except each condition must independently affect the decision outcome.

In code coverage, MCDC analyzes code to ensure that every entry and exit point of a program is invoked at least once, and every condition and decision has taken every possible outcome at least once. In MCDC, each condition must independently affect the decision outcome.

Using the same example with the decision A && B, to achieve 100% MCDC coverage, the conditions must show TT, TF, and FT. You need these three outcomes in order to show that each condition independently affects the outcome of the block. The FF outcome is not needed because this does not change the decision outcome from the TF and FT cases.

In model coverage, MCDC looks for decision reversals that occur because one condition outcome changes from true to false or from false to true. An example of a block that receives MCDC coverage is the Logical Operator block.

An And block would have 100% MCDC coverage if each input condition outcome changes, independently affecting the outcome of the decision. For example, an And block with two input conditions must show three outcomes. The true case where both input conditions are true, and two false cases, where condition 1 is false while condition 2 is true, and vice-versa.

- "Model Objects That Receive Coverage"

Use Simulink Coverage to Analyze Your Model

Tip If you have a Simulink Test license, you can collect and aggregate coverage directly in the Test Manager. See "Analyze Model Coverage by Using the Simulink Test Manager" on page 2-22 for more information.

Use Simulink Coverage to gain insight into which parts of your model are exercised during simulation to uncover bugs in your model or gaps in your testing. Your workflow usually looks like:

Enable Coverage and Select Metrics

First, you need to enable coverage and select the coverage metrics that best apply to your model. For more information about selecting metrics, see "Enable Coverage and Select Metrics" on page 2-8. For detailed information about specific blocks, see "Model Objects That Receive Coverage".

Analyze Coverage and View Results

When you simulate your model with coverage enabled, Simulink Coverage reports on, and highlights, the model elements that are exercised during simulation. Use the model coloring in Simulink and the **Coverage Details** pane to browse the coverage results. You can also use the Coverage Results Explorer to look at individual tests and aggregated coverage and see which tests exercise which model elements. Coverage aggregation, which is also called cumulative coverage, allows you to run multiple tests, each of which might target a specific part of your model, and then combine the coverage from all of your simulations into a single report.

Address Missing Coverage

After you view your model coverage results, you might find that your model does not have 100% coverage. You can increase your model coverage by:

- **Editing the model** Your model might contain unintended functionality that is not part of your required design. Remove the unintended functionality.
- Editing the requirements You might have an incorrect requirement or a missing requirement. You can use Simulink Requirements[™] to author and edit requirements in Simulink. If you add a requirement, you must add a test case for that requirement. For more information, see "Test Model Against Requirements and Report Results".
- Editing the tests Your existing tests might not fully exercise the intended simulation inputs. You can use Simulink Coverage to create additional tests to model these inputs. For more information, see "Automating Model Coverage Tasks" and "Generate Test Cases" (Simulink Design Verifier). If you have a Simulink Design Verifier[™] license, you may be able to automatically

generate additional tests to exercise untested parts of your design. For more information, see "Incrementally Increase Test Coverage Using Test Case Generation"

• **Filtering missing coverage results** — Parts of your model might not be exercised during simulation according to your design, such as subsystems that only activate during failures. To achieve full coverage in such cases, you can filter out results for model elements you do not intend to exercise. For more information, see "Create, Edit, and View Coverage Filter Rules".

Create and Archive Reports

After collecting coverage and addressing unsatisfied outcomes, you can create HTML reports for archiving results. In the Coverage Results Explorer, you can create a report from the aggregated coverage results or from any individual test case.

When you create a standalone coverage report, by default, the coverage tables list the satisfied and unsatisfied outcomes for only the model elements that have incomplete coverage. This is different than the report displayed in the **Coverage Details** pane, which always shows the coverage tables. You can change the report settings in the Configuration Parameters window or in the Coverage Results Explorer. See "Access, Manage, and Aggregate Coverage Results" for more information.

Enable Coverage and Select Metrics

Before you analyze coverage results for your model, you need to enable coverage and decide which coverage metrics you want to see.

Open the Model

Open the slvnvdemo_powerwindow model. The slvnvdemo_powerwindow model contains a power window controller and a low-order plant model. The controller is implemented with a Stateflow® chart.

Choose Your Coverage Metrics

On the **Apps** tab, select **Coverage Analyzer**. Then, on the **Coverage** tab, click **Settings** to open the Configuration Parameters window. In the left pane, click **Coverage**. Select **Enable coverage analysis**. By default, the scope of the coverage analysis is set to **Entire system**. If you want to collect coverage data for a specific referenced model or subsystem, select the appropriate coverage scope and click **Select Models** or **Select Subsystem**. For this example, select **Entire system**.

The **Structural coverage level** parameter has four settings:

• Block Execution

Whether each block is executed during simulation.

• Decision

Analyzes decision points in your model. A decision is a place in your model where one or more input signals decide the output signal of a block. Selecting Decision coverage also collects Block Execution coverage.

• Condition Decision

Analyzes blocks that output the logical combination of their input. A condition is a Boolean expression that contains no Boolean operators. Selecting Condition Decision coverage also collects Block Execution coverage.

Modified Condition Decision Coverage (MCDC)

MCDC is condition decision coverage, except each condition must independently affect the decision outcome. Selecting Modified Condition Decision Coverage (MCDC) also collects Condition Decision and Block Execution coverage.

For this example, set **Structural coverage level** to Modified Condition Decision Coverage (MCDC).

For a full list of coverage metrics, including advanced metrics, see "Types of Model Coverage".

Command-Line Information

You can also perform the steps in this example programmatically. Use sim with a Simulink.SimulationInput object to set the coverage model parameters for a simulation.

```
openExample('slcoverage/GetStartedWithSimulinkCoverageExample')
modelName = 'slvnvdemo_powerwindow';
```

```
open_system(modelName)
simIn = Simulink.SimulationInput(modelName);
simIn = setModelParameter(simIn,'CovEnable','on');
simIn = setModelParameter(simIn,'CovScope','EntireSystem');
simIn = setModelParameter(simIn,'CovMetricStructuralLevel','MCDC');
simIn = setModelParameter(simIn,'CovSaveSingleToWorkspaceVar','on');
simIn = setModelParameter(simIn,'CovSaveName','covData');
```

Analyze Coverage and View Results

After you have enabled coverage and selected the metrics you want, you must simulate the model to collect the coverage results.

First, simulate the model by clicking the **Analyze Coverage** button. When the simulation completes, Simulink Coverage highlights the model objects based on their coverage completeness.

The **Coverage Details** pane opens automatically and displays the coverage report. The report automatically opens in the **Details** section which lists the coverage results for the model objects. You can scroll up to view the summary section and model information, or scroll down to browse the individual blocks.

The window_system subsystem is colored green because every block inside the subsystem received 100% coverage. The other subsystems are colored red because one or more blocks inside did not receive full coverage.

Point to a subsystem to display a short summary of coverage for each relevant metric. For example, point to the power_window_control_system subsystem block.

Decision 100%	Condition 79%
(2/2)	(62/78)
MCDC 32%	Execution 100%
(7/22)	(39/39)

If you left click on a block, the **Coverage Details** pane displays the section of the report for that block. For example, click the power_window_control_system subsystem.

You can enter a subsystem to view the granular coverage results for the contents of that subsystem. Double-click the power_window_control_system subsystem to view the coverage results for the blocks it contains. Double-click on validate_passenger and then on check_up.

Click on the And block allow_action to display the relevant section of the report.

Because the And block outputs the logical combination of the two input signals, if both input signals are true, the output signal is true. You can see from the condition table that input signal 1 was False at every time step, while input signal 2 was True for 878 time steps, and False for 884 time steps.

Logic block "allow_action"

Justify or Exclude

Parent:	<pre>slvnvdemo_powerwindow/power_window_control_system/validate_passenger/check_up</pre>
Uncovered Links:	**

Metric	Coverage
Cyclomatic Complexity	0
Condition	75% (3/4) condition outcomes
MCDC	0% (0/2) conditions reversed the outcome
Execution	100% (1/1) objective outcomes

Conditions analyzed

Description	True	False
input port 1	0	1762
input port 2	878	884

Because there are four condition outcomes and one of them did not occur, the allow_action block received 75% condition coverage.

Below the **Conditions analyzed** table is the **MC/DC analysis** table.

MC/DC analysis (combinations in parentheses did not occur) Includes 2 blocks

Decision/Condition	True Out	False Out
C1 && ~C2		
C1 (allow_action In1)	(T F)	FF
C2 (overrule In1)	(T F)	(T T)

The MCDC analysis table lists decision reversals that occur because one condition outcome changes from true to false or from false to true. This table reports that the only the FF case occurred during the simulation for first condition, and neither MCDC objective occurred for the second condition, resulting in 0% MCDC reported.

Command-Line Information

To perform the same steps from the command line, enter:

```
simOut = sim(simIn);
covData = simOut.covData;
cvmodelview(covData);
```

Address Missing Coverage

After you view your model coverage results, you might find that your model does not have 100% coverage. You can address missing coverage in your model.

Add a Test Case to Improve Coverage

In the slvnvdemo_powerwindow model, the And block power_window_control_system/ validate_passenger/check_up/allow_action has 75% condition coverage. The true case of the first condition did not occur because, in the Signal Editor block Input at the model root level, the **Active scenario** parameter is set to Driver. Change **Active scenario** to Passenger. Simulate the model again by clicking **Analyze Coverage**.

The And block allow_action now receives 100% condition coverage. The first condition was true for 595 time steps, and false for 2797 time steps. Additionally, the **T1** and **T2** links in the condition and MCDC tables link to the tests that were used to test each objective. For example, the true case of the first condition was satisfied by test run 2, **T2**. Click the link to scroll to the **Aggregated Tests** section of the report.

Review Coverage Data in the Coverage Results Explorer

You can also review coverage data by using the Coverage Results Explorer. On the **Coverage** tab, click **Results Explorer**. The run data is in the left pane, under **Current Cumulative Data**. Click **Run 1** and **Run 2** to compare the coverage results.

The aggregated results show higher coverage percentages than either of the two individual test cases because the test cases satisfy different objectives in some blocks.

Filter Coverage Outcomes

If you analyze the coverage report and find that you are missing coverage that is not possible to fix by changing the model or a test case, you can filter the missing outcomes so that they are not reported as missing coverage. Some possible reasons you might want to filter coverage outcomes include:

- A block is tested by a different test suite, and is not applicable to the current coverage analysis.
- A block is intended to catch edge cases that you think should never occur anyway. This type of model design is sometimes called defensive coding.

There are two types of coverage filters:

- An exclusion filter rule can be applied to a model element, and causes that element to be ignored by coverage analysis. The excluded model elements appear dimmed in the highlighted model, like other elements that are not applicable to the metrics you selected.
- A justification filter rule can be applied to a coverage outcome that is not satisfied. This filter rule allows Simulink Coverage to analyze the rest of the model element but does not report the justified outcome as missing coverage. This filter rule allows you to improve your coverage for a model object without excluding it entirely.

Suppose that the And block condition 1 MCDC outcome has been tested by a different test suite and is not applicable for this case. You can justify the outcome so that it is not reported as missing coverage.

Click the And block allow_action to scroll to the relevant section in the coverage report. The MCDC condition C1 (allow_action In1) is incomplete because the TF case did not occur. To

justify the C1 (allow_action In1) MCDC outcome, click the Add justification rule icon 🚟.

The Coverage Results Explorer opens the **Filter Editor** pane with a new untitled filter file. The filter file contains a justification rule for the specified outcome. You can add multiple filter rules to the same filter file.

In the **Coverage Details** pane, the justified outcome is highlighted in cyan and links to the justification rationale. Clicking **J1** brings you to the section of the report titled **Objects Filtered from Coverage Analysis**. This section of the report only appears if there are filters applied to the coverage data.

Command-Line Information

To programmatically add a test and aggregate coverage, enter:

```
blockPath = [modelName,'/Input'];
set_param(blockPath,'ActiveScenario','Passenger')
simOut2 = sim(simIn);
covDataRun2 = simOut2.covData;
cvmodelview(covDataRun2);
aggregatedCovData = covData + covDataRun2;
```

To programmatically filter coverage outcomes, enter:

```
filt = slcoverage.Filter;
setFilterName(filt,'slvnvdemo_powerwindow_filter');
blockPath = [modelName,'/power_window_control_system/validate_passenger/check_up/allow_action'];
sel = slcoverage.MetricSelector(slcoverage.MetricSelectorType.MCDCOutcome,blockPath,1,1);
rule = slcoverage.FilterRule(sel,'Tested in a different test suite');
addRule(filt,rule);
```

```
save(filt,'slvnvdemo_powerwindow_filter')
aggregatedCovData.filter = 'slvnvdemo_powerwindow_filter';
```

Create and Archive Reports

After collecting coverage and addressing unsatisfied outcomes, you can archive the results by creating HTML reports. In the Coverage Results Explorer, you can create a report from the aggregated coverage results, or from any individual test case.

When you create a standalone coverage report, by default, the coverage tables that list satisfied and unsatisfied outcomes only appear for model objects that have incomplete coverage. This is different than the report displayed in the **Coverage Details** pane, which always shows the coverage tables. You can change this and other settings in the Configuration Parameters window or in the Coverage Results Explorer. See "Access, Manage, and Aggregate Coverage Results" for more information.

To create a report for the aggregated results, in the Coverage Results Explorer click **Current Cumulative Data** and, at the bottom of the window, click **Generate Report**.

To create a report for an individual run, click on the run name and click Generate Report.

Command-Line Information

To generate an aggregated results report programmatically, enter:

cvhtml('aggregated_coverage_report',aggregatedCovData)

Analyze Model Coverage by Using the Simulink Test Manager

If you have a Simulink Test[™] license, you can collect coverage directly from the Test Manager. For more information about Simulink Test, see "Get Started with Simulink Test" (Simulink Test).

When you analyze coverage for a model, Simulink Coverage reports on and highlights the model objects in your design that were exercised during simulation. Use the Test Manager to explore tests and aggregated coverage to see which tests exercise certain model objects. You can run multiple tests in a test suite, analyze coverage for each test, then view the aggregated results for the result set in the Test Manager. Use the coverage reports and model highlighting to learn which parts of your model activated during the specified test cases.

Open the Model

Open the slvnvdemo_powerwindow model. The slvnvdemo_powerwindow model contains a power window controller and a low-order plant model. The controller is implemented with a Stateflow® chart.

Choose Your Coverage Metrics

On the Apps tab, click Simulink Test to open the Tests tab. Click Simulink Test Manager.

This example includes a test file. In the Test Manager, click **Open**. In the Open File window, select powerwindow_tests.mldatx.

In the **Test Browser** pane, click powerwindow_tests. Then expand the coverage options by clicking **Coverage Settings**.

📣 Test Manager		- 🗆 ×

COVERAGE METRICS Decision Condition Condition Condition Condition Signal Range Signal Size Signal Size Signal Size Signal Bauration on integer overflow Relational Boundary	?
		?

To enable coverage for the model, under **Coverage to Collect**, select **Record coverage for system under test**. Under **Coverage Metrics**, you can select the metrics you want to report. For information about the coverage metrics, see "Structural Coverage Metrics" on page 2-2.

For this example, select **Decision**, **Condition**, and **MCDC**.

Run A Test and Collect Coverage

There are two tests in the powerwindow_tests test file. **Test Case 1** has the Signal Editor scenario set to Driver, and is the default setting in the model. **Test Case 2** has the Signal Editor scenario set to Passenger.

In the Test Manager, you can run individual tests or entire test suites by selecting them in the **Test Browser** and clicking **Run**. Select **Test Case 1** and click **Run**.

When the test finishes, the **Results and Artifacts** tab opens. Click the results for the test to see a summary of the coverage results.

Start Time	05/13/2021 15:54:32	NAME				
End Time	05/13/2021 15:54:41	There are no coverage filter files applied.				^

Test Case 1 is the case where the Signal Editor scenario is set to Driver. You can click the name of the model in the **Analyzed Model** column of the **Coverage Results** table to display the coverage results in the model with model highlighting enabled. The **Coverage Details** pane also opens in the Simulink window.

The window_system subsystem is green because every block inside the subsystem received 100% coverage. The other subsystems are red because one or more blocks inside did not receive full coverage.

You can point to a subsystem to see a short summary of coverage for each relevant metric. For example, point to the power_window_control_system subsystem block.

 Decision 100%
 Condition 79%

 (2/2)
 (62/78)

 MCDC 32%
 Execution 100%

 (7/22)
 (39/39)

If you left click on a block, the **Coverage Details** pane displays the section of the report for that block. For example, click on the power_window_control_system subsystem.

You can enter a subsystem to view the granular coverage results for the contents of that subsystem. Double-click the power_window_control_system subsystem and view the coverage results for the blocks it contains. Double-click on validate_passenger, then check_up.

Click the And block allow_action to display the relevant section of the report.

Click the And block to see the condition and MCDC results. Because the And block outputs the logical combination of the two input signals, if both input signals are true, the output signal is true. You can see from the condition table that input signal 1 was false at every time step, while input signal 2 was true for 878 time steps and false for 884 time steps. Because there are four condition outcomes and one of them did not occur, the allow_action block received 75% condition coverage.

The MCDC analysis table lists decision reversals that occur because one condition outcome changes from true to false or from false to true. This table reports that only the FF case occurred for the first condition, and neither MCDC objective occurred for the second condition, which results in 0% MCDC reported.

Run Multiple Tests and View Aggregated Coverage

In the slvnvdemo_powerwindow model, the And block power_window_control_system/ validate_passenger/check_up/allow_action has 75% condition coverage because the Signal Editor block Input at the model root level has the Active scenario set to Driver. This missing coverage can be resolved by including Test Case 2 in the coverage analysis.

In the Test Manager, open the **Test Browser** tab. Click **Powerwindow Test Suite**, then click **Run** to run all the tests in the test suite. When the tests finish, the Test Manager opens the **Results and Artifacts** pane. Expand results for the new test. You can view the coverage results for each individual test by expanding each test case.

Select **Powerwindow Test Suite**, then click the model name, slvnvdemo_powerwindow, to open the model with coverage highlighting. Navigate to power_window_control_system/validate_passenger/check_up and click the And block. In the coverage report, the condition coverage is now 100%. Additionally, the **T1** and **T2** link in the condition and MCDC tables link to the

test that satisfies each objective. For example, the true case of the first condition was satisfied by test case 2, **T2**. Click the link to scroll to the **Aggregated Tests** section of the report.

In the Test Manager, in the **Aggregated Coverage Results** table, the overall coverage results improved. When you click on the test suite or the test file name, you see the aggregated coverage results for all tests inside.

The aggregated results show higher coverage percentages than either of the two individual test cases because the test cases satisfy different objectives in some blocks.

Filter Coverage Outcomes

If you analyze the coverage report and find that you are missing coverage that is not possible to fix by changing the model or a test case, you can filter the missing outcomes so that they are not reported as missing coverage. Although you cannot filter coverage directly from the Test Manager, you can measure the effect that the coverage filters have on the model. Some possible reasons you might want to filter coverage outcomes include:

- A block is tested by a different test suite, and is not applicable to the current coverage analysis.
- A block is intended to catch edge cases that you think should never occur anyway. This type of model design is sometimes called defensive coding.

There are two types of coverage filters:

• An exclusion filter rule can be applied to a model element, and causes that element to be ignored by coverage analysis. The excluded model elements appear dimmed in the highlighted model, like other elements that are not applicable to the metrics you selected.

• A justification filter rule can be applied to a coverage outcome that is not satisfied. This filter rule allows Simulink Coverage to analyze the rest of the model element but does not report the justified outcome as missing coverage. This filter rule allows you to improve your coverage for a model object without excluding it entirely.

Suppose that the And block condition 1 MCDC outcome has been tested by a different test suite and is not applicable for this case. You can justify the outcome so that it is not reported as missing coverage.

In the model, navigate to the subsystem power_window_control_system/ validate_passenger/check_up and click the And block allow_action to scroll to the relevant section in the coverage report. The MCDC condition C1 (allow_action In1) is incomplete because the TF case did not occur. To justify the C1 (allow_action In1) MCDC outcome, click

the Add justification rule icon $\stackrel{\hbox{\scriptsize \hbox{le}}}{=}$.

The Coverage Results Explorer opens the **Filter Editor** pane with a new untitled filter file. The filter file contains a justification rule for the specified outcome. You can add multiple filter rules to the same filter file.

In the **Coverage Details** pane, the justified outcome is highlighted in cyan and links to the justification rationale. Clicking **J1** brings you to the section of the report titled **Objects Filtered from Coverage Analysis**. This section of the report only appears if there are filters applied to the coverage data.

Go back to the Test Manager. Click the result set. In the **Aggregated Coverage Results** section, the coverage filter has been applied automatically, and the MCDC coverage result is now 50%.

Note You must click on a the top-level results to see the applied coverage filters. The filter is not included in test suite or test case results.

To apply another coverage filter file, click the results set, expand the **Coverage Filters** section, and then click **Add**.

Create and Archive Reports

To create a coverage report, click the arrow in the **Report** column. Alternatively, you can click **Export** under the **Aggregated Coverage Results** table. Then use cvhtml to create a coverage report. For example, export the results with the variable name coverageData and then enter:

cvhtml('testManager_covData', coverageData)

Basic Operation of the Model Coverage Tool

This example shows how to use the Configuration Parameters dialog to enable coverage for a Simulink® model and adjust the type of information that is reported.

Open Example Model

The sldemo_clutch example model that ships with Simulink provides a good introduction to model coverage. This model contains several blocks that have intrinsic decisions, places where control flow can take more than one path.

Copyright 1990-2017 The MathWorks, Inc.

Open Coverage Settings Dialog

You can find coverage settings under the **Coverage** pane of the Configuration Parameters dialog. To navigate to this pane, from the **Modeling** tab, select **Model Settings**.

Configuration Parameters: untitled	I/Configuration (Active)		-		×
Q Search					
Solver Data Import/Export Math and Data Types Diagnostics Hardware Implementation Model Referencing Simulation Target Code Generation Coverage HDL Code Generation	 Enable coverage analys Entire System Referenced Models Subsystem Include in analysis MATLAB files C/C++ S-functions Coverage metrics 	is Select Models Select Subsystem

	Results Save last run in works Autosave data file name: Output directory:	pace variable \$ModelName\$_cvdata slcov_output/\$ModelName\$			
		OK Cancel	Help	Ap	ply

Enable Multiple Coverage Metrics

To enable the coverage tool, select **Enable coverage analysis**. This setting enables the other options in the Coverage pane.

The Coverage metrics group controls the type of coverage information that is collected during simulation.

The **Structural coverage level** drop-down menu allows you to select which structural coverage metrics will be analyzed during simulation. These are ordered from the least rigorous (*Block Execution*) to the most rigorous (*Modified Condition Decision (MCDC*)).

For this example, select the *Modified Condition Decision (MCDC)* structural coverage level. The resulting report also includes decision and condition coverage results.

Configuration Parameters: untitle	d/Configuration (Active)		_		×

	Results			-
	OK Cancel	Help	Ap	ply

Click OK to apply your selected settings and close the Coverage Settings dialog box.

Run Simulation and Explore Results

Once you enable coverage collection for your model, coverage information is automatically recorded when you simulate the model. At the end of the simulation, the Coverage Results Explorer is opened, showing results for the latest coverage analysis.

Click the **Run (Coverage)** button to simulate the model and collect coverage.

Building a Clutch Lock-Up Model This example shows how to use Simulink(R) to model and simulate a rotating clutch system. Although modeling a clutch system is difficult because of topological changes in the system dynamics during lockup, this example shows how Simulinks enabled subsystems feature easily handles such problems. We illustrate how to employ important Simulink modeling concepts in the creation of the clutch simulation. Designers can apply these concepts to many models with strong discontinuities and constraints that may change dynamically. In the example, we use enabled subsystem**2.37** to build the clutch model. Two enabled subsystems model the clutch dynamics in either the locked or unlocked position. After running the simulation, a GUI opens. Checking any of the boxes on the GUI produces a plot of any of the selected variables (versus time).

How to Address Coverage Testing Gaps

In this section...

"Recording and Evaluating Coverage" on page 2-38

"Addressing Coverage Testing Gaps" on page 2-39

"Reporting and Archiving Results" on page 2-39

After you generate a model coverage report, you can use Simulink Coverage to help you address coverage testing gaps for your model.

Recording and Evaluating Coverage

After you enable coverage recording and simulate your model, you then evaluate the coverage data to find gaps in your testing. Coverage reports and model highlighting help you to understand which parts of your design are sufficiently exercised by your test cases.

For more information, see:

- "Specify Coverage Options"
- "View Coverage Results in Simulink Canvas"
- "Types of Coverage Reports"
- "Overview of Model Coverage Highlighting"

Addressing Coverage Testing Gaps

If your coverage tests do not sufficiently exercise your model, there are a few steps you can take to increase your coverage:

- **Edit the model** Your model might contain unintended functionality that is not part of your required design. Remove the unintended functionality.
- Edit the requirements Your requirements might not sufficiently detail the testing required to exercise all parts of your design. You can use Simulink Requirements to author and edit requirements from within the Simulink environment. For more information, see "Test Model Against Requirements and Report Results".
- **Create additional tests** Your existing tests might not fully exercise the intended simulation inputs according to your requirements. You can use Simulink Coverage to create additional tests to model these inputs. For more information, see "Automating Model Coverage Tasks" and "Generate Test Cases" (Simulink Design Verifier).
- **Extend existing tests** Your existing tests might not fully exercise all parts of your design. If you have a Simulink Design Verifier license, you may be able to automatically generate additional tests to exercise untested parts of your design. For more information, see "Incrementally Increase Test Coverage Using Test Case Generation".
- **Justify the results** Parts of your model might not be exercised during simulation according to your design, such as subsystems that only enable during failures. To achieve full coverage in such cases, you can justify the missing coverage. For more information, see "Create, Edit, and View Coverage Filter Rules".

Reporting and Archiving Results

If your coverage tests sufficiently exercise your model, you can archive the reported results. For more information, see:

- "Top-Level Model Coverage Report"
- "Access, Manage, and Aggregate Coverage Results"
- "Code Coverage Report"
- "Export Model Coverage Web View"

You can use Simulink Coverage to increase confidence in your design and testing through end-to-end systematic verification.

System Requirements

End-to-end systematic verification begins with system requirements. The system requirements detail the model design and the testing and verification specifications.

If you have a Simulink Requirements license, you can author and manage system requirements, link Simulink blocks to requirements, and link test cases to the requirements that they verify from within the Simulink environment. For more information, see "Test Model Against Requirements and Report Results".

Simulation Data

To record coverage, you first specify input signals for your model. For more information, see "Create and Run Test Cases" and "Perform Functional Testing and Analyze Test Coverage".

If you have a Simulink Design Verifier license, you can also specify expected output signals for the specified input signals. For more information, see "Perform Functional Testing and Analyze Test Coverage" (Simulink Design Verifier). You can also automatically generate test case for a system. For more information, see "Workflow for Test Case Generation" (Simulink Design Verifier).

Simulation

After you "Specify Coverage Options" for your model, you then simulate the model and record model coverage. For more information on the types of model coverage, see "Types of Model Coverage". You can record several runs of coverage data and accumulate the results. For more information, see "Access, Manage, and Aggregate Coverage Results" and "Cumulative Coverage Data".

If you have an Embedded Coder license, you can also record code coverage for models in software-inthe-loop (SIL) mode and processor-in-the-loop (PIL) mode. The code coverage reports tell you which parts of your generated code are exercised by your tests, and also which elements of your model are associated with which parts of your generated code. For more information on enabling SIL or PIL code coverage for a model, see "Specify Code Coverage Options".

If you have a Simulink Design Verifier license, you can model and verify design requirements using property proving. For more information, see "Requirements-Based Verification" (Simulink Design Verifier).

Coverage Reports and Model Highlighting

After you record coverage for a simulation, you then review the coverage reports and model highlighting to identify gaps in your testing, with the goal of gaining confidence that your tests and verification are complete and adequate. For more information on coverage reports and model highlighting, see:

- "View Coverage Results in Simulink Canvas"
- "Top-Level Model Coverage Report"
- "Code Coverage Report"
- "Access, Manage, and Aggregate Coverage Results"

If you have an Embedded Coder license and you record code coverage for models in software-in-theloop (SIL) mode and processor-in-the-loop (PIL) mode, code coverage reports tell you which parts of your generated code are exercised by your tests, and also which elements of your model are associated with which parts of your model. For more information on enabling SIL or PIL code coverage for a model, see "Code Coverage for Models in Software-in-the-Loop (SIL) Mode and Processor-in-the-Loop (PIL) Mode".

Resolve Missing Coverage

If you find that parts of your design are not fully tested, you can take steps to resolve the missing coverage and gain confidence that your tests and verification are complete and adequate. For more information, see "How to Address Coverage Testing Gaps" on page 2-38.

Archive and Report

When you are confident in the testing and verification of your design, you can archive and report the results of the coverage recording. For more information, see:

- "Top-Level Model Coverage Report"
- "Code Coverage Report"
- "Access, Manage, and Aggregate Coverage Results"
- "Export Model Coverage Web View"
