<b>Database Toolbox interface for MongoDB supports new MongoDB versions</b> .....	<b>6-2</b>
<b>Graph database supports directed graph output</b> .....	<b>6-2</b>
<b>Database Toolbox Interface for Apache Cassandra Database SSL-enabled connection</b> .....	<b>6-2</b>

<b>Export data from MATLAB into wide column database</b> .....	<b>6-2</b>
<b>Database Explorer app streamlined connection workflow</b> .....	<b>6-2</b>
<b>Configure JDBC data source programmatically</b> .....	<b>6-3</b>
<b>Specify driver-specific connection options</b> .....	<b>6-3</b>
<b>Create and execute SQL prepared statements</b> .....	<b>6-3</b>

## R2019a

<b>Configure JDBC data sources using configureJDBCDataSource function</b> .....	<b>7-2</b>
<b>Initialize parallel pool with database connection using createConnectionForPool function</b> .....	<b>7-2</b>
<b>Customize import options for text data types and missing data</b> .....	<b>7-2</b>
<b>Customize import options using the Database Explorer app</b> .....	<b>7-2</b>
<b>Update node labels, node properties, and relationship properties in Neo4j database</b> .....	<b>7-2</b>
<b>Database Toolbox Interface for Neo4j Bolt Protocol enables interaction with Neo4j database using Bolt protocol</b> .....	<b>7-3</b>
<b>Functionality being removed or changed</b> .....	<b>7-3</b>
tableprivileges function has been removed .....	<b>7-3</b>
columnprivileges function has been removed .....	<b>7-3</b>
get function has been removed .....	<b>7-3</b>
runsqlscript function will be removed .....	<b>7-3</b>
setdbprefs function is not recommended .....	<b>7-4</b>

## R2018b

<b>Database Toolbox Interface for Apache Cassandra Database: Explore keyspaces and tables of a Cassandra database and import data as MATLAB types</b> .....	<b>8-2</b>
<b>Customize Import Options: Define and customize an import strategy for relational database data and minimize post-processing steps on imported data</b> .....	<b>8-2</b>
<b>View row count of SQL query results in Database Explorer app</b> .....	<b>8-2</b>

<b>Execute Non-SELECT SQL Statements</b> .....	<b>8-2</b>
<b>Functionality being removed or changed</b> .....	<b>8-2</b>
cursor object is not recommended .....	<b>8-2</b>
close function is not recommended .....	<b>8-3</b>
attr function is not recommended .....	<b>8-3</b>
cols function is not recommended .....	<b>8-4</b>
columnnames function is not recommended .....	<b>8-4</b>
get function is not recommended .....	<b>8-5</b>
isopen function is not recommended .....	<b>8-5</b>
set function is not recommended .....	<b>8-5</b>
querytimeout function is not recommended .....	<b>8-6</b>
rows function is not recommended .....	<b>8-6</b>
width function is not recommended .....	<b>8-7</b>
exec function is not recommended .....	<b>8-7</b>
fetch function with the cursor object is not recommended .....	<b>8-8</b>
fetch function returns results as a table .....	<b>8-8</b>
fetch function ignores 'DataReturnFormat', 'NullNumberRead', and 'NullStringRead' database preferences .....	<b>8-9</b>
fetchmulti function is not recommended .....	<b>8-9</b>
'DataReturnFormat' database preference values will be removed .....	<b>8-9</b>
insert function will be removed .....	<b>8-9</b>
dmd function will be removed .....	<b>8-10</b>
get function will be removed .....	<b>8-10</b>
tables function will be removed .....	<b>8-10</b>
columns function will be removed .....	<b>8-11</b>
tableprivileges function will be removed .....	<b>8-11</b>
columnprivileges function will be removed .....	<b>8-11</b>
explore function has been removed .....	<b>8-12</b>

## R2018a

<b>Neo4j Graph Database Upgrade: Write a directed graph to a Neo4j database, and create, update, and delete nodes and relationships</b> .....	<b>9-2</b>
<b>SQL-Speaking Functions: Read and write data and perform joins on database tables directly from MATLAB without writing SQL queries</b> .....	<b>9-2</b>
<b>Functionality being removed or changed</b> .....	<b>9-2</b>

## R2017b

<b>Database Explorer App: Visually explore relational databases without knowing SQL</b> .....	<b>10-2</b>
---	-------------

<b>Database Toolbox Interface for MongoDB: Easily interact with MongoDB</b> .....	<b>10-2</b>
<b>splitsqlquery Function: Split a SQL query into multiple SQL page queries to access large amounts of data</b> .....	<b>10-2</b>
<b>Functionality being removed or changed</b> .....	<b>10-2</b>

## R2017a

<b>One-step data import</b> .....	<b>11-2</b>
<b>Expanded data type support</b> .....	<b>11-2</b>
<b>Connection object and database connection changes</b> .....	<b>11-2</b>
<b>Functionality being removed or changed</b> .....	<b>11-3</b>

## R2016b

<b>Graph Database Interface: Retrieve graph data from Neo4j</b> .....	<b>12-2</b>
<b>DatabaseDatastore functionality and object properties changes</b> .....	<b>12-2</b>
<b>Functionality being removed or changed</b> .....	<b>12-2</b>

## R2016a

<b>MATLAB Interface to SQLite: Create, read, and write data from SQLite database files without external drivers and administration</b> .....	<b>13-2</b>
<b>fetch Function Speed Improvement: Import data faster using the JDBC driver</b> .....	<b>13-2</b>
<b>Support for 32-bit Windows removed</b> .....	<b>13-2</b>
<b>Functionality being removed or changed</b> .....	<b>13-2</b>

## R2015b

<b>ODBC Interface Functions: Export and retrieve database information using native ODBC connections</b> .....	<b>14-2</b>

**Version: 10.3**

**New Features**

**Bug Fixes**

**Version History**

## MATLAB interface to SQLite functions for data interaction and database management

The MATLAB® interface to SQLite has functions for importing data, exporting data, and database management. For details, see “MATLAB Interface to SQLite”. For added functionality, see this table.

Function	Purpose
isopen	Determine if SQLite connection is open.
sqlread	Import data into MATLAB from an SQLite database table.
sqlwrite	Insert MATLAB data into an SQLite database table.
commit	Make changes to an SQLite database file permanent.
execute	Execute an SQL statement using an SQLite database connection.
rollback	Undo changes made to an SQLite database file.

## Database Toolbox supports MATLAB Online for SQLite databases

Database Toolbox supports MATLAB Online™ when you connect to an SQLite database. For details about interacting with SQLite databases, see “MATLAB Interface to SQLite”.

## Functionality being removed or changed

### exec function will be removed

*Still runs*

The `exec` function will be removed in a future release. Use the `execute` function to manage the SQLite database.

### insert function will be removed

*Still runs*

The `insert` function will be removed in a future release. Use the `sqlwrite` function to import data. Some differences between the workflows might require updates to your code.

### Update Code

Use the `sqlwrite` function with the `sqlite` object to export data from a SQLite database.

In prior releases, you exported data using the `insert` function. For example:

```
tablename = 'inventoryTable';
colnames = {'productNumber', 'Quantity', 'Price', 'inventoryDate'};
insert(conn, tablename, colnames, ...
    {20, 150, 50.00, '11/3/2015 2:24:33 AM'})
```

Now you can export data using the `sqlwrite` function.

```
tablename = "productTable";
data = table(30, 500000, 1000, 25, "Rubik's Cube", ...
```

---

```
    'VariableNames',["productNumber" "stockNumber" ...  
    "supplierNumber" "unitCost" "productDescription"]);  
sqlwrite(conn,tablename,data)
```

### **fetch function returns table**

#### *Behavior change*

In prior releases, the `fetch` function, which imports data from an SQLite database, returned the `results` output argument as a cell array. In R2022a, the `fetch` function returns the `results` output argument as a table. Use the `table2cell` function to convert the data type back to a cell array, or adjust your code to accept the new data type.

### **runsqlscript function will be removed**

#### *Warns*

The `runsqlscript` function will be removed in a future release. Use the `executeSQLScript` function instead. Some differences between the output arguments might require updates to your code.

#### **Update Code**

In prior releases, the output argument of the `runsqlscript` function was a cursor array. For example:

```
datasource = 'MS SQL Server Auth';  
conn = database(datasource, '', '');  
scriptfile = 'compare_sales.sql';  
results = runsqlscript(conn,scriptfile)
```

```
results =
```

```
    1x2 cursor array with properties:
```

```
    Data  
    RowLimit  
    SQLQuery  
    Message  
    Type  
    Statement  
    Position
```

Now the `executeSQLScript` function returns a structure array.

```
datasource = 'MS SQL Server Auth';  
conn = database(datasource, '', '');  
scriptfile = 'compare_sales.sql';  
results = executeSQLScript(conn,scriptfile)
```

```
results = 1x2 struct array with fields:
```

```
    SQLQuery  
    Data  
    Message
```

You can also change the data return format of the results in the structure array by using the `DataReturnFormat` name-value argument.

**insert function will be removed***Warns*

The `insert` function that uses the `connection` object will be removed in a future release. Use the `sqlwrite` function instead. Some differences between these functions require updates to your code.

**Update Code**

In prior releases, you specified a cell array when exporting data from the MATLAB workspace into a database. For example:

```
colnames = {'Month', 'salesTotal', 'Revenue'};
data = {'March', 50, 2000};
tablename = 'yearlySales';
insert(conn, tablename, colnames, data)
```

Now the `sqlwrite` function requires you to specify the data to export as a table.

```
tablename = "yearlySales";
data = table("March", 50, 2000, ...
    'VariableNames', ["Month" "salesTotal" "Revenue"]);
sqlwrite(conn, tablename, data)
```

**Database Toolbox Interface for Apache Cassandra Database will be removed***Warns*

The Database Toolbox Interface for Apache Cassandra® Database will be removed in a future release. Use the Apache Cassandra Database C++ interface instead.

These functions will be removed and replaced by the functions of the Apache™ Cassandra® Database C++ interface.

<b>Database Toolbox Interface for Apache Cassandra Database Function</b>	<b>Apache Cassandra Database C++ Interface Replacement Function</b>
<code>cassandra</code>	<code>apacheCassandra</code>
<code>close</code>	<code>close</code>
<code>isopen</code>	<code>isopen</code>
<code>columninfo</code>	<code>columninfo</code>
<code>partitionRead</code>	<code>partitionRead</code>
<code>tablenames</code>	<code>tablenames</code>
<code>upsert</code>	<code>upsert</code>
<code>executecql</code>	<code>executecql</code>

**Database Toolbox interface for MongoDB will be removed***Warns*

The Database Toolbox interface for MongoDB® will be removed in a future release. Use the MongoDB C++ interface instead.

These functions will be removed and replaced by the functions of the MongoDB C++ interface.

Database Toolbox Interface for MongoDB Function	MongoDB C++ Interface Replacement Function

close	close
count	count
distinct	No replacement
find	find
createCollection	createCollection
dropCollection	dropCollection
insert	insert
remove	remove
update	update

**attr function has been removed**

*Errors*

The attr function has been removed. Use the fetch function to import data. Some differences between the workflows might require updates to your code.

**Update Code**

Use the fetch function with the connection object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the cursor object, import data, and find the attributes of the database columns. For example:

```
curs = exec(conn,sqlquery);
curs = fetch(curs);
results = curs.Data;
attributes = attr(curs);
close(curs)
```

Now you can import data in one step using the fetch function.

```
results = fetch(conn,sqlquery);
```

If you return imported data as a table, access details about the variables in the table by using a function such as summary.

**cols function has been removed**

*Errors*

The cols function has been removed. Use the fetch function to import data. Some differences between the workflows might require updates to your code.

**Update Code**

Use the fetch function with the connection object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the cursor object, import data, and find the number of database columns in the imported data. For example:

```
curs = exec(conn,sqlquery);  
curs = fetch(curs);  
results = curs.Data;  
numcols = cols(curs);  
close(curs)
```

Now you can import data in one step using the `fetch` function.

```
results = fetch(conn,sqlquery);  
sz = size(results);
```

If you return imported data as a table, access details about the variables in the table by using functions such as `summary` or `size`. Alternatively, view the dimensions of the returned data in the Workspace browser.

### **columnnames function has been removed**

#### *Errors*

The `columnnames` function has been removed. Use the `fetch` function to import data. Some differences between the workflows might require updates to your code.

#### **Update Code**

Use the `fetch` function with the `connection` object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the `cursor` object, import data, and find the names of the database columns. For example:

```
curs = exec(conn,sqlquery);  
curs = fetch(curs);  
results = curs.Data;  
columnlist = columnnames(curs);  
close(curs)
```

Now you can import data in one step using the `fetch` function, and then access properties of the output table.

```
results = fetch(conn,sqlquery);  
results.Properties.VariableNames
```

If you return imported data as a table, access details about the variables in the table by using the table properties or a function such as `summary`.

### **fetchmulti function has been removed**

#### *Errors*

The `fetchmulti` function has been removed. There is no replacement for the `fetchmulti` function.

### **querytimeout function has been removed**

#### *Errors*

The `querytimeout` function has been removed. Use the `fetch` function to import data. Some differences between the workflows might require updates to your code.

#### **Update Code**

Use the `fetch` function with the `connection` object to import data from a database in one step.

---

In prior releases, you wrote multiple lines of code to create the `cursor` object, import data, and determine the current database timeout value. For example:

```
curs = exec(conn,sqlquery);
curs = fetch(curs);
results = curs.Data;
timeout = querytimeout(curs);
close(curs)
```

Now you can import data in one step using the `fetch` function.

```
results = fetch(conn,sqlquery);
```

There is no replacement functionality for the `querytimeout` function.

### **rows function has been removed**

#### *Errors*

The `rows` function has been removed. Use the `fetch` function to import data. Some differences between the workflows might require updates to your code.

#### **Update Code**

Use the `fetch` function with the `connection` object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the `cursor` object, import data, and find the number of rows in the imported data. For example:

```
curs = exec(conn,sqlquery);
curs = fetch(curs);
results = curs.Data;
numrows = rows(curs);
close(curs)
```

Now you can import data in one step using the `fetch` function.

```
results = fetch(conn,sqlquery);
sz = size(results);
```

If you return imported data as a table, access details about the variables in the table by using functions such as `summary` or `size`. Alternatively, view the dimensions of the returned data in the Workspace browser.

### **set function has been removed**

#### *Errors*

The `set` function with the `cursor` object has been removed. Use the `fetch` function to import data. Some differences between the workflows might require updates to your code.

#### **Update Code**

Use the `fetch` function with the `connection` object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the `cursor` object, set object properties, and import data. For example:

```
curs = exec(conn,sqlquery);
set(curs, 'RowLimit',5)
```

```
 curs = fetch(curs);  
 s = get(curs);  
 results = curs.Data;  
 close(curs)
```

Now you can import data in one step using the `fetch` function.

```
results = fetch(conn,sqlquery);
```

### **width function has been removed**

#### *Errors*

The `width` function has been removed. Use the `fetch` function to import data. Some differences between the workflows might require updates to your code.

#### **Update Code**

Use the `fetch` function with the `connection` object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the `cursor` object, import data, and determine the field size of a specified column number. For example:

```
 curs = exec(conn,sqlquery);  
 curs = fetch(curs);  
 results = curs.Data;  
 colsize = width(curs,1);  
 close(curs)
```

Now you can import data in one step using the `fetch` function.

```
results = fetch(conn,sqlquery);
```

There is no replacement functionality for the `width` function.

## MongoDB C++ interface

With the MongoDB C++ interface, you can import data stored in a collection of documents in MongoDB for analysis in MATLAB. After connecting to MongoDB, you can also explore and manage collections, and export data from MATLAB into MongoDB. For details, see [MongoDB C++ Interface](#).

Database Toolbox includes the MongoDB C++ interface and does not require the installation of an add-on.

## Functionality being removed or changed

### Database Toolbox Interface for Apache Cassandra Database will be removed

*Still runs*

The Database Toolbox Interface for Apache Cassandra Database will be removed in a future release. Use the Apache Cassandra Database C++ interface instead.

These functions will be removed and replaced by the functions of the Apache Cassandra Database C++ interface.

**Bug Fixes**

**Version History**

## ODBC connection for Linux and DSN-less connection

The `odbc` function creates an ODBC database connection on the Windows® and Linux® platforms. The `odbc` function creates an ODBC database connection by using a defined data source or a connection string. When you specify a connection string, you create a DSN-less database connection. (DSN is a data source name.)

## Apache Cassandra Database C++ Interface

With the Apache Cassandra database C++ interface, you can explore the Cassandra database. You can access the database keyspaces, tables, and columns, and then execute queries using the Cassandra Query Language (CQL). Also, you can import data from partitions of a Cassandra database table into MATLAB. The data import converts CQL data types into MATLAB types. For details, see Apache Cassandra Database C++ Interface.

Database Toolbox includes the Apache Cassandra database C++ interface and does not require the installation of an add-on.

## Functionality being removed or changed

### **attr** function will be removed

*Warns*

The `attr` function will be removed in a future release. Use the `fetch` function to import data. Some differences between the workflows might require updates to your code.

#### **Update Code**

Use the `fetch` function with the `connection` object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the `cursor` object, import data, and find the attributes of the database columns. For example:

```
curs = exec(conn,sqlquery);  
curs = fetch(curs);  
results = curs.Data;  
attributes = attr(curs);  
close(curs)
```

Now you can import data in one step using the `fetch` function.

```
results = fetch(conn,sqlquery);
```

If you return imported data as a table, access details about the variables in the table by using a function such as `summary`.

### **cols** function will be removed

*Warns*

The `cols` function will be removed in a future release. Use the `fetch` function to import data. Some differences between the workflows might require updates to your code.

#### **Update Code**

Use the `fetch` function with the `connection` object to import data from a database in one step.

---

In prior releases, you wrote multiple lines of code to create the `cursor` object, import data, and find the number of database columns in the imported data. For example:

```
curs = exec(conn,sqlquery);
curs = fetch(curs);
results = curs.Data;
numcols = cols(curs);
close(curs)
```

Now you can import data in one step using the `fetch` function.

```
results = fetch(conn,sqlquery);
sz = size(results);
```

If you return imported data as a table, access details about the variables in the table by using functions such as `summary` or `size`. Or, view the dimensions of the returned data in the Workspace browser.

### **columnnames function will be removed**

*Warns*

The `columnnames` function will be removed in a future release. Use the `fetch` function to import data. Some differences between the workflows might require updates to your code.

#### **Update Code**

Use the `fetch` function with the `connection` object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the `cursor` object, import data, and find the names of the database columns. For example:

```
curs = exec(conn,sqlquery);
curs = fetch(curs);
results = curs.Data;
columnlist = columnnames(curs);
close(curs)
```

Now you can import data in one step using the `fetch` function, and then access properties of the output table.

```
results = fetch(conn,sqlquery);
results.Properties.VariableNames
```

If you return imported data as a table, access details about the variables in the table by using the table properties or a function such as `summary`.

### **get function will be removed**

*Warns*

The `get` function with the `cursor` object will be removed in a future release. Use the `fetch` function to import data. Some differences between the workflows might require updates to your code.

#### **Update Code**

Use the `fetch` function with the `connection` object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the `cursor` object, retrieve object properties, and import data. For example:

```
curs = exec(conn,sqlquery);
curs = fetch(curs);
s = get(curs);
results = curs.Data;
close(curs)
```

Now you can import data in one step using the `fetch` function.

```
results = fetch(conn,sqlquery);
```

### **set function will be removed**

#### *Warns*

The `set` function with the `cursor` object will be removed in a future release. Use the `fetch` function to import data. Some differences between the workflows might require updates to your code.

#### **Update Code**

Use the `fetch` function with the `connection` object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the `cursor` object, set object properties, and import data. For example:

```
curs = exec(conn,sqlquery);
set(curs,'RowLimit',5)
curs = fetch(curs);
s = get(curs);
results = curs.Data;
close(curs)
```

Now you can import data in one step using the `fetch` function.

```
results = fetch(conn,sqlquery);
```

### **querytimeout function will be removed**

#### *Warns*

The `querytimeout` function will be removed in a future release. Use the `fetch` function to import data. Some differences between the workflows might require updates to your code.

#### **Update Code**

Use the `fetch` function with the `connection` object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the `cursor` object, import data, and determine the current database timeout value. For example:

```
curs = exec(conn,sqlquery);
curs = fetch(curs);
results = curs.Data;
timeout = querytimeout(curs);
close(curs)
```

Now you can import data in one step using the `fetch` function.

```
results = fetch(conn,sqlquery);
```

There is no replacement functionality for the `querytimeout` function.

---

### **rows function will be removed**

*Warns*

The `rows` function will be removed in a future release. Use the `fetch` function to import data. Some differences between the workflows might require updates to your code.

#### **Update Code**

Use the `fetch` function with the `connection` object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the `cursor` object, import data, and find the number of rows in the imported data. For example:

```
curs = exec(conn,sqlquery);
curs = fetch(curs);
results = curs.Data;
numrows = rows(curs);
close(curs)
```

Now you can import data in one step using the `fetch` function.

```
results = fetch(conn,sqlquery);
sz = size(results);
```

If you return imported data as a table, access details about the variables in the table by using functions such as `summary` or `size`. Or, view the dimensions of the returned data in the Workspace browser.

### **width function will be removed**

*Warns*

The `width` function will be removed in a future release. Use the `fetch` function to import data. Some differences between the workflows might require updates to your code.

#### **Update Code**

Use the `fetch` function with the `connection` object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the `cursor` object, import data, and determine the field size of a specified column number. For example:

```
curs = exec(conn,sqlquery);
curs = fetch(curs);
results = curs.Data;
colsize = width(curs,1);
close(curs)
```

Now you can import data in one step using the `fetch` function.

```
results = fetch(conn,sqlquery);
```

There is no replacement functionality for the `width` function.

### **fetchmulti function will be removed**

*Warns*

The `fetchmulti` function will be removed in a future release. There is no replacement for the `fetchmulti` function.

# R2020b

---

**Version: 10.0**

**New Features**

**Bug Fixes**

**Version History**

## MySQL native interface

The MySQL® native interface provides another way to connect to a MySQL database. Use this interface as an alternative to an ODBC or JDBC database connection.

Install the MySQL Connector/C++ driver, create a data source by using the `databaseConnectionOptions` function, and then connect to the MySQL database by using the `mysql` function. For details about this native interface, see [MySQL Native Interface](#).

## PostgreSQL native interface

The PostgreSQL native interface provides another way to connect to a PostgreSQL database. Use this interface as an alternative to an ODBC or JDBC database connection.

Create a data source by using the `databaseConnectionOptions` function, and then connect to the PostgreSQL database by using the `postgresql` function. For details about this native interface, see [PostgreSQL Native Interface](#).

## Preserve non-ASCII characters in column names of imported data

When you import data from a database table, you can preserve the names of the columns in the table. If a column name contains non-ASCII characters, you can preserve these characters in the imported data. Otherwise, by default, the column name is converted to ASCII characters only. For details, see the `VariableNamingRule` property of the `SQLImportOptions` object.

## Set JDBC connection options with updated workflow

You can configure and save a JDBC data source by setting JDBC connection options using the `SQLConnectionOptions` object and its functions. This table describes the functions for creating and working with the `SQLConnectionOptions` object.

Function	Description
<code>databaseConnectionOptions</code>	Create <code>SQLConnectionOptions</code> object containing connection options
<code>setoptions</code>	Set JDBC connection options
<code>rmoptions</code>	Remove JDBC connection options
<code>testConnection</code>	Test JDBC database connection
<code>saveAsDataSource</code>	Save JDBC data source
<code>reset</code>	Reset JDBC connection options to their defaults

To manage data sources, you can view saved data sources using the `listDataSources` function. Then, you can delete a data source using the `deleteDataSource` function.

## Version History

### **getdatasources function will be removed**

*Still runs*

---

The `getdatasources` function will be removed in a future release. Use the `listDataSources` function instead.

### **configureJDBCDataSource function will be removed**

*Still runs*

The `configureJDBCDataSource` function will be removed in a future release. Use the `databaseConnectionOptions` function instead. Some differences between the workflows might require updates to your code.

#### **Update Code**

Use the `databaseConnectionOptions` function to create an `SQLConnectionOptions` object.

In prior releases, you configured a JDBC data source using the `configureJDBCDataSource` function and the `JDBCConnectionOptions` object. For example:

```
opts = configureJDBCDataSource('Vendor', 'Microsoft SQL Server');
opts = setConnectionOptions(opts, ...
    'DataSourceName', 'SQLServerDataSource', ...
    'Server', 'dbtb04', 'PortNumber', 54317, ...
    'JDBCDriverLocation', 'C:\Drivers\sqljdbc4.jar', ...
    'AuthType', 'Windows');
username = "";
password = "";
status = testConnection(opts, username, password);
saveAsJDBCDataSource(opts)
```

Now you can set JDBC connection options using the `databaseConnectionOptions` function, and save the data source using the `SQLConnectionOptions` object instead.

```
vendor = "Microsoft SQL Server";
opts = databaseConnectionOptions("jdbc", vendor);
opts = setoptions(opts, ...
    'DataSourceName', "SQLServerDataSource", ...
    'JDBCDriverLocation', "C:\Drivers\sqljdbc4.jar", ...
    'DatabaseName', "toystore_doc", 'Server', "dbtb04", ...
    'PortNumber', 54317, 'AuthenticationType', "Windows");
username = "";
password = "";
status = testConnection(opts, username, password);
saveAsDataSource(opts)
```

Also, you can open the JDBC Data Source Configuration dialog box by using the **Database Explorer** app.

### **JDBCConnectionOptions object will be removed**

*Still runs*

The `JDBCConnectionOptions` object will be removed in a future release. Use the `SQLConnectionOptions` object instead. Some differences between the workflows might require updates to your code.

#### **Update Code**

Use the `SQLConnectionOptions` object to set JDBC connection options.

In prior releases, you configured a JDBC data source using the `JDBCConnectionOptions` object. For example:

```
opts = configureJDBCDataSource('Vendor','Microsoft SQL Server');
opts = setConnectionOptions(opts, ...
    'DataSourceName','SQLServerDataSource', ...
    'Server','dbtb04','PortNumber',54317, ...
    'JDBCDriverLocation','C:\Drivers\sqljdbc4.jar', ...
    'AuthType','Windows');
username = "";
password = "";
status = testConnection(opts,username,password);
saveAsJDBCDataSource(opts)
```

Now you can set JDBC connection options and save the data source using the `SQLConnectionOptions` object instead.

```
vendor = "Microsoft SQL Server";
opts = databaseConnectionOptions("jdbc",vendor);
opts = setoptions(opts, ...
    'DataSourceName',"SQLServerDataSource", ...
    'JDBCDriverLocation',"C:\Drivers\sqljdbc4.jar", ...
    'DatabaseName',"toystore_doc",'Server',"dbtb04", ...
    'PortNumber',54317,'AuthenticationType',"Windows");
username = "";
password = "";
status = testConnection(opts,username,password);
saveAsDataSource(opts)
```

### **addConnectionOptions function will be removed**

*Still runs*

The `addConnectionOptions` function will be removed in a future release. Use the `setoptions` function instead. Some differences between the workflows might require updates to your code.

### **Update Code**

Use the `setoptions` function with the `SQLConnectionOptions` object to set JDBC driver-specific connection options.

In prior releases, you configured a JDBC data source using the `JDBCConnectionOptions` object, and added options using the `addConnectionOptions` function. For example:

```
opts = configureJDBCDataSource('Vendor','Microsoft SQL Server');
opts = setConnectionOptions(opts, ...
    'DataSourceName','SQLServerDataSource', ...
    'Server','dbtb04','PortNumber',54317, ...
    'JDBCDriverLocation','C:\Drivers\sqljdbc4.jar', ...
    'AuthType','Windows');
opts = addConnectionOptions(opts,'loginTimeout',20);
username = "";
password = "";
status = testConnection(opts,username,password);
saveAsJDBCDataSource(opts)
```

Now you can set JDBC driver-specific connection options using the `setoptions` function with the `SQLConnectionOptions` object instead.

```

vendor = "Microsoft SQL Server";
opts = databaseConnectionOptions("jdbc",vendor);
opts = setoptions(opts, ...
    'DataSourceName','SQLServerDataSource', ...
    'JDBCdriverLocation','C:\Drivers\sqljdbc4.jar', ...
    'DatabaseName',"toystore_doc",'Server',"dbtb04", ...
    'PortNumber',54317,'AuthenticationType',"Windows", ...
    'loginTimeout',20);
username = "";
password = "";
status = testConnection(opts,username,password);
saveAsDataSource(opts)

```

### **deleteJDBCDataSource function will be removed**

*Still runs*

The deleteJDBCDataSource function will be removed in a future release. Use the deleteDataSource function instead.

### **rmConnectionOptions function will be removed**

*Still runs*

The rmConnectionOptions function will be removed in a future release. Use the rmoptions function instead. Some differences between the workflows might require updates to your code.

### **Update Code**

Use the rmoptions function with the SQLConnectionOptions object to remove JDBC connection options.

In prior releases, you configured a JDBC data source using the JDBCConnectionOptions object, and removed options using the rmConnectionOptions function. For example:

```

opts = configureJDBCDataSource('Vendor','Microsoft SQL Server');
opts = setConnectionOptions(opts, ...
    'DataSourceName','SQLServerDataSource', ...
    'Server','dbtb04','PortNumber',54317, ...
    'JDBCdriverLocation','C:\Drivers\sqljdbc4.jar', ...
    'AuthType','Windows');
opts = addConnectionOptions(opts,'loginTimeout',20);
username = "";
password = "";
status = testConnection(opts,username,password);
opts = rmConnectionOptions(opts,'loginTimeout');
status = testConnection(opts,username,password);
saveAsJDBCDataSource(opts)

```

Now you can set JDBC driver-specific connection options with the SQLConnectionOptions object instead, and then remove options using the rmoptions function.

```

vendor = "Microsoft SQL Server";
opts = databaseConnectionOptions("jdbc",vendor);
opts = setoptions(opts, ...
    'DataSourceName','SQLServerDataSource', ...
    'JDBCdriverLocation','C:\Drivers\sqljdbc4.jar', ...
    'DatabaseName',"toystore_doc",'Server',"dbtb04", ...
    'PortNumber',54317,'AuthenticationType',"Windows", ...
    'loginTimeout',20);

```

```
username = "";  
password = "";  
status = testConnection(opts,username,password);  
opts = rmoptions(opts,'loginTimeout');  
status = testConnection(opts,username,password);  
saveAsDataSource(opts)
```

### **saveAsJDBCDataSource function will be removed**

*Still runs*

The `saveAsJDBCDataSource` function will be removed in a future release. Use the `saveAsDataSource` function instead. Some differences between the workflows might require updates to your code.

#### **Update Code**

Use the `saveAsDataSource` function with the `SQLConnectionOptions` object to save the JDBC data source.

In prior releases, you configured and saved a JDBC data source using the `JDBCConnectionOptions` object and the `saveAsJDBCDataSource` function. For example:

```
opts = configureJDBCDataSource('Vendor','Microsoft SQL Server');  
opts = setConnectionOptions(opts, ...  
    'DataSourceName','SQLServerDataSource', ...  
    'Server','dbtb04','PortNumber',54317, ...  
    'JDBCDriverLocation','C:\Drivers\sqljdbc4.jar', ...  
    'AuthType','Windows');  
username = "";  
password = "";  
status = testConnection(opts,username,password);  
saveAsJDBCDataSource(opts)
```

Now you can set JDBC connection options and save the data source using the `SQLConnectionOptions` object and the `saveAsDataSource` function instead.

```
vendor = "Microsoft SQL Server";  
opts = databaseConnectionOptions("jdbc",vendor);  
opts = setoptions(opts, ...  
    'DataSourceName',"SQLServerDataSource", ...  
    'JDBCDriverLocation',"C:\Drivers\sqljdbc4.jar", ...  
    'DatabaseName',"toystore_doc",'Server',"dbtb04", ...  
    'PortNumber',54317,'AuthenticationType',"Windows");  
username = "";  
password = "";  
status = testConnection(opts,username,password);  
saveAsDataSource(opts)
```

### **setConnectionOptions function will be removed**

*Still runs*

The `setConnectionOptions` function will be removed in a future release. Use the `setoptions` function instead. Some differences between the workflows might require updates to your code.

#### **Update Code**

Use the `setoptions` function with the `SQLConnectionOptions` object to set the JDBC connection options.

---

In prior releases, you configured a JDBC data source using the `setConnectionOptions` function and the `JDBCConnectionOptions` object. For example:

```
opts = configureJDBCDataSource('Vendor', 'Microsoft SQL Server');
opts = setConnectionOptions(opts, ...
    'DataSourceName', 'SQLServerDataSource', ...
    'Server', 'dbtb04', 'PortNumber', 54317, ...
    'JDBCDriverLocation', 'C:\Drivers\sqljdbc4.jar', ...
    'AuthType', 'Windows');
username = "";
password = "";
status = testConnection(opts, username, password);
saveAsJDBCDataSource(opts)
```

Now you can set JDBC connection options using the `setoptions` function, and save the data source using the `SQLConnectionOptions` object instead.

```
vendor = "Microsoft SQL Server";
opts = databaseConnectionOptions("jdbc", vendor);
opts = setoptions(opts, ...
    'DataSourceName', "SQLServerDataSource", ...
    'JDBCDriverLocation', "C:\Drivers\sqljdbc4.jar", ...
    'DatabaseName', "toystore_doc", 'Server', "dbtb04", ...
    'PortNumber', 54317, 'AuthenticationType', "Windows");
username = "";
password = "";
status = testConnection(opts, username, password);
saveAsDataSource(opts)
```

### **testConnection function will be removed**

*Still runs*

The `testConnection` function will be removed in a future release. Use the `testConnection` function of the `SQLConnectionOptions` object instead. Some differences between the workflows might require updates to your code.

### **Update Code**

Use the `testConnection` function with the `SQLConnectionOptions` object to test the specified JDBC connection options.

In prior releases, you configured a JDBC data source using the `JDBCConnectionOptions` object. For example:

```
opts = configureJDBCDataSource('Vendor', 'Microsoft SQL Server');
opts = setConnectionOptions(opts, ...
    'DataSourceName', 'SQLServerDataSource', ...
    'Server', 'dbtb04', 'PortNumber', 54317, ...
    'JDBCDriverLocation', 'C:\Drivers\sqljdbc4.jar', ...
    'AuthType', 'Windows');
username = "";
password = "";
status = testConnection(opts, username, password);
saveAsJDBCDataSource(opts)
```

Now you can set JDBC connection options and save the data source using the `SQLConnectionOptions` object instead.

```
vendor = "Microsoft SQL Server";
opts = databaseConnectionOptions("jdbc",vendor);
opts = setoptions(opts, ...
    'DataSourceName','SQLServerDataSource', ...
    'JDBCdriverLocation','C:\Drivers\sqljdbc4.jar', ...
    'DatabaseName','toystore_doc','Server','dbtb04', ...
    'PortNumber',54317,'AuthenticationType','Windows');
username = "";
password = "";
status = testConnection(opts,username,password);
saveAsDataSource(opts)
```

## Functionality being removed or changed

### **database.ODBCConnection syntax has been removed**

#### *Errors*

The `database.ODBCConnection` syntax has been removed. Use the syntaxes of the database function instead.

# R2020a

---

**Version: 9.2.1**

**Bug Fixes**

**Version History**

## Functionality being removed or changed

### tables function has been removed

#### *Errors*

The `tables` function has been removed. Use the `sqlfind` function or access the properties of the `connection` object instead.

Some differences between these functions require updates to your code.

#### **Update Code**

In prior releases, you retrieved information about database tables by using the `tables` function. For example:

```
conn = database(datasource,username,password);  
t = tables(conn,catalog,schema);
```

Now the `sqlfind` function returns information about the table types in a database.

```
conn = database(datasource,username,password);  
data = sqlfind(conn,pattern);
```

Also, you can access the database properties and catalog and schema information by using the `connection` object. For example:

```
conn = database(datasource,username,password);  
catalogs = conn.Catalogs;  
schemas = conn.Schemas;
```

### columns function has been removed

#### *Errors*

The `columns` function has been removed. Use the `sqlfind` function or access the properties of the `connection` object instead.

Some differences between these functions require updates to your code.

#### **Update Code**

In prior releases, you retrieved information about database columns by using the `columns` function. For example:

```
conn = database(datasource,username,password);  
columnlist = columns(conn,catalog);
```

Now the `sqlfind` function returns information about the table types in the database (including information about database columns).

```
conn = database(datasource,username,password);  
data = sqlfind(conn,pattern);
```

Also, you can access the database properties and catalog and schema information by using the `connection` object. For example:

---

```
conn = database(datasource,username,password);  
catalogs = conn.Catalogs;  
schemas = conn.Schemas;
```

# R2019b

---

**Version: 9.2**

**New Features**

**Bug Fixes**

## Database Toolbox interface for MongoDB SSL-enabled connection

The Database Toolbox interface for MongoDB now supports the creation of an SSL-enabled MongoDB connection. For details about creating an SSL-enabled connection, see the `mongo` function.

## Database Toolbox interface for MongoDB supports new MongoDB versions

The Database Toolbox interface for MongoDB now supports these versions of MongoDB:

- MongoDB 2.6
- MongoDB 3.0
- MongoDB 3.2
- MongoDB 3.4
- MongoDB 3.6
- MongoDB 4.0

To install the Database Toolbox interface for MongoDB, see Database Toolbox Interface for MongoDB Installation.

## Graph database supports directed graph output

The MATLAB interface to Neo4j<sup>®</sup> now supports searching a Neo4j database and returning graph or relationship information as a directed graph. You can specify the data return format of the output arguments in the `searchGraph` and `searchRelation` functions by using the `'DataReturnFormat'` name-value pair argument.

## Database Toolbox Interface for Apache Cassandra Database SSL-enabled connection

The Database Toolbox Interface for Apache Cassandra Database now supports the creation of an SSL-enabled connection to a Cassandra database. For details about creating an SSL-enabled connection, see the `cassandra` function.

## Export data from MATLAB into wide column database

The Database Toolbox Interface for Apache Cassandra Database now supports exporting data from MATLAB into a Cassandra database, which is a wide column database. You can insert and update data in a Cassandra database by using the `upsert` function.

## Database Explorer app streamlined connection workflow

The **Database Explorer** app has a streamlined workflow for creating and closing database connections and creating SQL queries. In the new **Connections** section of the **Database Explorer** tab, you can create a database connection to a configured data source by selecting it from the **Connect** list. Then, you can create an SQL query using the database connection by selecting it from the **New Query** list. Close the database connection by selecting it from the **Close Connection** list.

## Configure JDBC data source programmatically

You can configure a JDBC data source at the command line. The `JDBCConnectionOptions` object contains all properties for a configured JDBC data source. These functions enable you to configure a JDBC data source, set various JDBC connection options, test the connection, and save the data source, and delete the data source:

- `configureJDBCDataSource`
- `setConnectionOptions`
- `testConnection`
- `saveAsJDBCDataSource`
- `deleteJDBCDataSource`

## Specify driver-specific connection options

When you configure a JDBC data source, you can now specify JDBC driver-specific connection options by using the JDBC Data Source Configuration dialog box or the command line. For details about the dialog box, see the `configureJDBCDataSource` function. For details about specifying options at the command line, see the `addConnectionOptions` function. Or, for details about removing options, see the `rmConnectionOptions` function.

## Create and execute SQL prepared statements

You can create an SQL prepared statement using the `databasePreparedStatement` function, which creates an `SQLPreparedStatement` object. With this object, you can bind values to parameters in the SQL prepared statement by using the `bindParamValues` function. Then, you can execute the SQL prepared statement with one or more parameter values by using the `fetch` or `execute` function. For details, see [SQL Prepared Statements](#).

Use an SQL prepared statement for improved performance and security.

# R2019a

---

**Version: 9.1**

**New Features**

**Bug Fixes**

**Version History**

## Configure JDBC data sources using `configureJDBCDataSource` function

You can create and edit JDBC data sources using the `configureJDBCDataSource` function. After you specify the location of the JDBC driver file in the JDBC Data Source Configuration dialog box, the software adds the JDBC driver file to the Java® class path automatically. For examples, see [Configuring Driver and Data Source](#). Then, you can use a JDBC data source in the `database` function to connect to a database.

## Initialize parallel pool with database connection using `createConnectionForPool` function

Use the `createConnectionForPool` function to initialize a parallel pool with a database connection in one step. With Parallel Computing Toolbox™, you can use a JDBC or ODBC data source to work with databases in parallel.

## Customize import options for text data types and missing data

You can customize import options for text data types and missing data using the `setoptions` function.

After customizing any import options, you can preview the data using the `preview` function before you import the data.

## Customize import options using the Database Explorer app

You can customize general, text, datetime, and categorical import options using the **Database Explorer** app. For details, see [Customize Import Options Using Database Explorer App](#).

## Update node labels, node properties, and relationship properties in Neo4j database

You can use these functions to add or delete node labels and properties, and add or delete relationship properties, in a Neo4j database:

- `addNodeLabel`
- `removeNodeLabel`
- `removeNodeProperty`
- `removeRelationProperty`
- `setNodeProperty`
- `setRelationProperty`

These functions enable you to make simple updates without modifying the entire node or relationship.

To improve performance, all functions that update the graph database include a new syntax without output arguments. For details, see [Graph Database](#).

---

## Database Toolbox Interface for Neo4j Bolt Protocol enables interaction with Neo4j database using Bolt protocol

The Database Toolbox Interface for Neo4j Bolt Protocol enables you to interact with a Neo4j database using the Bolt protocol instead of the REST API. In general, you can experience improved performance because the Bolt protocol sends data of a smaller size. To use this interface, you must first install the Database Toolbox Interface for Neo4j Bolt Protocol. For details, see Database Toolbox Interface for Neo4j Bolt Protocol Installation. For details about the workflow, see Graph Database Workflow for Neo4j Database Interfaces.

### Functionality being removed or changed

#### **tableprivileges function has been removed**

*Errors*

The `tableprivileges` function with the `dmd` object has been removed with no replacement.

#### **columnprivileges function has been removed**

*Errors*

The `columnprivileges` function with the `dmd` object has been removed with no replacement.

#### **get function has been removed**

*Errors*

The `get` function with the `dmd` object has been removed with no replacement.

#### **runsqlscript function will be removed**

*Still runs*

The `runsqlscript` function will be removed in a future release. Use the `executeSQLScript` function instead. Some differences between the output arguments might require updates to your code.

#### **Update Code**

In prior releases, the output argument of the `runsqlscript` function was a cursor array. For example:

```
datasource = 'MS SQL Server Auth';  
conn = database(datasource, '', '');  
scriptfile = 'compare_sales.sql';  
results = runsqlscript(conn, scriptfile)
```

```
results =
```

```
    1×2 cursor array with properties:
```

```
    Data  
    RowLimit  
    SQLQuery  
    Message  
    Type  
    Statement
```

Position

Now the `executeSQLScript` function returns a structure array.

```
datasource = 'MS SQL Server Auth';  
conn = database(datasource, '', '');  
scriptfile = 'compare_sales.sql';  
results = executeSQLScript(conn, scriptfile)
```

```
results = 1x2 struct array with fields:  
    SQLQuery  
    Data  
    Message
```

You can also change the data return format of the results in the structure array by using the `'DataReturnFormat'` name-value pair argument.

### **setdbprefs function is not recommended**

*Still runs*

The `setdbprefs` function is not recommended. Use the following replacement functionality to specify the data return format, error handling, and missing data. Some differences between the workflows might require updates to your code.

- Data return format — For the `'DataReturnFormat'` database preference, these values are not recommended:
  - `'numeric'`
  - `'cellarray'`
  - `'structure'`
- Error handling — The `'ErrorHandling'` database preference is not recommended.
- Missing data — The `'NullNumberWrite'`, `'NullStringWrite'`, and `'NullNumberRead'` database preferences for handling NULL data values are not recommended.

There are no plans to remove the `setdbprefs` function at this time.

### **Update Code**

To set the data return format in prior releases, you specified returning imported data as a numeric matrix by setting the `'DataReturnFormat'` database preference to the value `'numeric'`. For example:

```
setdbprefs('DataReturnFormat', 'numeric')  
results = fetch(conn, sqlquery);
```

Now you can set the same value by using the `'DataReturnFormat'` name-value pair argument of the `fetch` function.

```
results = fetch(conn, sqlquery, 'DataReturnFormat', 'numeric');
```

Or, you can customize import options.

```
opts = databaseImportOptions(conn, tablename);  
varnames = "quantity";  
opts = setoptions(opts, varnames, 'Type', 'int64');
```

---

To specify error handling in prior releases, you set the 'ErrorHandling' database preference to the value 'report' or 'store' by using the setdbprefs function. For example:

```
setdbprefs('ErrorHandling','store')
```

Now you specify error handling by using the 'ErrorHandling' name-value pair argument of the database function or the 'ErrorHandling' name-value pair argument of the executeSQLScript function.

```
conn = database(datasource,username,password,'ErrorHandling','store');
```

To specify the handling of missing data in prior releases, you set the 'NullNumberWrite' database preference to a specific value, for example. This table shows database preference settings that are not recommended and the functionality you can use instead.

<b>Discouraged Functionality</b>	<b>Recommended Replacement</b>
setdbprefs('NullNumberWrite','NaN')	data input argument of sqlwrite
setdbprefs('NullStringWrite','null')	data input argument of sqlwrite
setdbprefs('NullNumberRead','0')	SQLImportOptions object

# R2018b

---

**Version: 9.0**

**New Features**

**Bug Fixes**

**Version History**

## Database Toolbox Interface for Apache Cassandra Database: Explore keyspaces and tables of a Cassandra database and import data as MATLAB types

With the Database Toolbox Interface for Apache Cassandra Database, you can explore the Cassandra database, which is a wide-column store. You can access the database keyspaces, tables, and columns, and execute queries using the Cassandra Query Language (CQL). Also, you can import data from partitions of a Cassandra database table into MATLAB. The data import converts CQL data types into MATLAB types. For details, see [Columnar Database](#).

## Customize Import Options: Define and customize an import strategy for relational database data and minimize post-processing steps on imported data

With a relational database connection, you can create the `SQLImportOptions` object using the `databaseImportOptions` function. Use this object to customize options for importing data from a database into MATLAB. You can also retrieve the current import options using the `getoptions` function. Then, you can customize import options using the `setoptions` function. To set the import options back to their default values, use the `reset` function. For a workflow example, see [Customize Options for Importing Data from Database into MATLAB](#).

## View row count of SQL query results in Database Explorer app

The **Show Row Count** check box in the **Preview** section of the **Database Explorer** app enables you to view the total row count of the SQL query results. You can select and clear this check box when previewing data. For details, see [Data Preview Using Database Explorer App](#).

## Execute Non-SELECT SQL Statements

The `execute` function executes SQL queries that contain non-SELECT SQL statements. Use the `execute` function for these SQL statements instead of the `exec` function.

## Functionality being removed or changed

### cursor object is not recommended

*Still runs*

The `cursor` object is not recommended. Use the `fetch` function instead. Some differences between the workflows might require updates to your code.

There are no plans to remove the `cursor` object at this time.

Scrollable cursors have no replacement functionality.

### Update Code

Use the `fetch` function with the `connection` object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the `cursor` object and import data. For example:

---

```
curs = exec(conn,sqlquery);
curs = fetch(curs);
results = curs.Data;
close(curs)
```

Now you can import data in one step using the `fetch` function.

```
results = fetch(conn,sqlquery);
```

### **close function is not recommended**

*Still runs*

The `close` function with the `cursor` object is not recommended. Use the `fetch` function to import data. Some differences between the workflows might require updates to your code.

There are no plans to remove the `close` function at this time.

### **Update Code**

Use the `fetch` function with the `connection` object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the `cursor` object, import data, and close the `cursor` object. For example:

```
curs = exec(conn,sqlquery);
curs = fetch(curs);
results = curs.Data;
attributes = attr(curs);
close(curs)
```

Now you can import data in one step using the `fetch` function.

```
results = fetch(conn,sqlquery);
```

### **attr function is not recommended**

*Still runs*

The `attr` function is not recommended. Use the `fetch` function to import data. Some differences between the workflows might require updates to your code.

There are no plans to remove the `attr` function at this time.

### **Update Code**

Use the `fetch` function with the `connection` object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the `cursor` object, import data, and find the attributes of the database columns. For example:

```
curs = exec(conn,sqlquery);
curs = fetch(curs);
results = curs.Data;
attributes = attr(curs);
close(curs)
```

Now you can import data in one step using the `fetch` function.

```
results = fetch(conn,sqlquery);
```

If you return imported data as a table, access details about the variables in the table by using a function such as `summary`.

### **cols function is not recommended**

*Still runs*

The `cols` function is not recommended. Use the `fetch` function to import data. Some differences between the workflows might require updates to your code.

There are no plans to remove the `cols` function at this time.

#### **Update Code**

Use the `fetch` function with the `connection` object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the `cursor` object, import data, and find the number of database columns in the imported data. For example:

```
curs = exec(conn,sqlquery);
curs = fetch(curs);
results = curs.Data;
numcols = cols(curs);
close(curs)
```

Now you can import data in one step using the `fetch` function.

```
results = fetch(conn,sqlquery);
sz = size(results);
```

If you return imported data as a table, access details about the variables in the table by using functions such as `summary` or `size`. Or, view the dimensions of the returned data in the Workspace browser.

### **columnnames function is not recommended**

*Still runs*

The `columnnames` function is not recommended. Use the `fetch` function to import data. Some differences between the workflows might require updates to your code.

There are no plans to remove the `columnnames` function at this time.

#### **Update Code**

Use the `fetch` function with the `connection` object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the `cursor` object, import data, and find the names of the database columns. For example:

```
curs = exec(conn,sqlquery);
curs = fetch(curs);
results = curs.Data;
columnlist = columnnames(curs);
close(curs)
```

Now you can import data in one step using the `fetch` function, and then access properties of the output table.

---

```
results = fetch(conn,sqlquery);
results.Properties.VariableNames
```

If you return imported data as a table, access details about the variables in the table by using the table properties or a function such as `summary`.

### **get function is not recommended**

*Still runs*

The `get` function with the `cursor` object is not recommended. Use the `fetch` function to import data. Some differences between the workflows might require updates to your code.

There are no plans to remove the `get` function at this time.

### **Update Code**

Use the `fetch` function with the `connection` object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the `cursor` object, retrieve object properties, and import data. For example:

```
curs = exec(conn,sqlquery);
curs = fetch(curs);
s = get(curs);
results = curs.Data;
close(curs)
```

Now you can import data in one step using the `fetch` function.

```
results = fetch(conn,sqlquery);
```

### **isopen function is not recommended**

*Still runs*

The `isopen` function with the `cursor` object is not recommended. Use the `fetch` function to import data. Some differences between the workflows might require updates to your code.

There are no plans to remove the `isopen` function at this time.

### **Update Code**

Use the `fetch` function with the `connection` object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the `cursor` object, determine if the database cursor is open, and import data. For example:

```
curs = exec(conn,sqlquery);
i = isopen(curs);
curs = fetch(curs);
results = curs.Data;
close(curs)
```

Now you can import data in one step using the `fetch` function.

```
results = fetch(conn,sqlquery);
```

### **set function is not recommended**

*Still runs*

The `set` function with the `cursor` object is not recommended. Use the `fetch` function to import data. Some differences between the workflows might require updates to your code.

There are no plans to remove the `set` function at this time.

#### **Update Code**

Use the `fetch` function with the `connection` object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the `cursor` object, set object properties, and import data. For example:

```
curs = exec(conn,sqlquery);
set(curs,'RowLimit',5)
curs = fetch(curs);
s = get(curs);
results = curs.Data;
close(curs)
```

Now you can import data in one step using the `fetch` function.

```
results = fetch(conn,sqlquery);
```

#### **querytimeout function is not recommended**

*Still runs*

The `querytimeout` function is not recommended. Use the `fetch` function to import data. Some differences between the workflows might require updates to your code.

There are no plans to remove the `querytimeout` function at this time.

#### **Update Code**

Use the `fetch` function with the `connection` object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the `cursor` object, import data, and determine the current database timeout value. For example:

```
curs = exec(conn,sqlquery);
curs = fetch(curs);
results = curs.Data;
timeout = querytimeout(curs);
close(curs)
```

Now you can import data in one step using the `fetch` function.

```
results = fetch(conn,sqlquery);
```

There is no replacement functionality for the `querytimeout` function.

#### **rows function is not recommended**

*Still runs*

The `rows` function is not recommended. Use the `fetch` function to import data. Some differences between the workflows might require updates to your code.

There are no plans to remove the `rows` function at this time.

---

### Update Code

Use the `fetch` function with the `connection` object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the `cursor` object, import data, and find the number of rows in the imported data. For example:

```
curs = exec(conn,sqlquery);
curs = fetch(curs);
results = curs.Data;
numrows = rows(curs);
close(curs)
```

Now you can import data in one step using the `fetch` function.

```
results = fetch(conn,sqlquery);
sz = size(results);
```

If you return imported data as a table, access details about the variables in the table by using functions such as `summary` or `size`. Or, view the dimensions of the returned data in the Workspace browser.

### **width function is not recommended**

*Still runs*

The `width` function is not recommended. Use the `fetch` function to import data. Some differences between the workflows might require updates to your code.

There are no plans to remove the `width` function at this time.

### Update Code

Use the `fetch` function with the `connection` object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the `cursor` object, import data, and determine the field size of a specified column number. For example:

```
curs = exec(conn,sqlquery);
curs = fetch(curs);
results = curs.Data;
colsize = width(curs,1);
close(curs)
```

Now you can import data in one step using the `fetch` function.

```
results = fetch(conn,sqlquery);
```

There is no replacement functionality for the `width` function.

### **exec function is not recommended**

*Still runs*

The `exec` function with the `connection` object is not recommended. For SQL statements that return data, use the `fetch` function with the `connection` object or the `select` function instead. For other SQL statements, use the `execute` function instead. Some differences between the workflows might require updates to your code.

There are no plans to remove the `exec` function at this time.

**Update Code**

Use the `fetch` function with the `connection` object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the `cursor` object and import data. For example:

```
curs = exec(conn,sqlquery);  
curs = fetch(curs);  
results = curs.Data;  
close(curs)
```

Now you can import data in one step using the `fetch` function.

```
results = fetch(conn,sqlquery);
```

You can also import data in one step using the `select` function.

```
data = select(conn,selectquery);
```

The scrollable cursor functionality has no replacement.

**fetch function with the cursor object is not recommended**

*Still runs*

The `fetch` function with the `cursor` object is not recommended. Use the `fetch` function with the `connection` object or the `select` function instead. Some differences between the workflows might require updates to your code.

There are no plans to remove the `fetch` function at this time.

**Update Code**

Use the `fetch` function with the `connection` object to import data from a database in one step.

In prior releases, you wrote multiple lines of code to create the `cursor` object and import data. For example:

```
curs = exec(conn,sqlquery);  
curs = fetch(curs);  
results = curs.Data;  
close(curs)
```

Now you can import data in one step using the `fetch` function.

```
results = fetch(conn,sqlquery);
```

You can also import data in one step using the `select` function.

```
data = select(conn,selectquery);
```

The scrollable cursor functionality has no replacement.

**fetch function returns results as a table**

*Behavior change*

The `fetch` function returns results as a table by default instead of a cell array. When the `fetch` function finds no data to import, the function returns an empty table instead of a cell array containing the 'No Data' character vector.

---

## **fetch function ignores 'DataReturnFormat', 'NullNumberRead', and 'NullStringRead' database preferences**

*Behavior change*

The `fetch` function ignores these database preferences:

- 'DataReturnFormat'
- 'NullNumberRead'
- 'NullStringRead'

You can set the data type of the imported data using the 'DataReturnFormat' name-value pair argument of the `fetch` function. For more customization of data types and fill values for missing data in the imported data, use the `SQLImportOptions` object.

## **fetchmulti function is not recommended**

*Still runs*

The `fetchmulti` function is not recommended. There is no replacement for the `fetchmulti` function.

## **'DataReturnFormat' database preference values will be removed**

*Still runs*

These values for the 'DataReturnFormat' database preference of the `setdbprefs` function will be removed in a future release:

- 'numeric'
- 'cellarray'
- 'structure'
- 'dataset'

Use the 'DataReturnFormat' name-value pair argument of the `fetch` function instead. Some differences between these syntaxes require updates to your code.

### **Update Code**

In prior releases, you specified returning imported data as a structure by setting the 'DataReturnFormat' database preference to the value 'structure'.

```
setdbprefs('DataReturnFormat','structure')
results = fetch(conn,sqlquery);
```

Now set the same value by using the 'DataReturnFormat' name-value pair argument of the `fetch` function.

```
results = fetch(conn,sqlquery,'DataReturnFormat','structure');
```

## **insert function will be removed**

*Still runs*

The `insert` function that uses the `connection` object will be removed in a future release. Use the `sqlwrite` function instead.

Some differences between these functions require updates to your code.

### Update Code

In prior releases, you specified a cell array when exporting data from the MATLAB workspace into a database. For example:

```
colnames = {'Month', 'salesTotal', 'Revenue'};  
data = {'March', 50, 2000};  
tablename = 'yearlySales';  
insert(conn, tablename, colnames, data)
```

Now the `sqlwrite` function requires you to specify the data to export as a table.

```
colnames = {'Month', 'salesTotal', 'Revenue'};  
d = {'March', 50, 2000};  
data = cell2table(d, 'VariableNames', colnames);  
tablename = 'yearlySales';  
sqlwrite(conn, tablename, data)
```

### dmd function will be removed

*Warns*

The `dmd` function will be removed in a future release. Use the `sqlfind` function or access the properties of the connection object instead.

Some differences between these functions require updates to your code.

### Update Code

In prior releases, you retrieved information about a database connection by using the `dmd` function. For example:

```
conn = database(datasource, username, password);  
dbmeta = dmd(conn);
```

Now the `sqlfind` function returns information about the table types in the database.

```
conn = database(datasource, username, password);  
data = sqlfind(conn, pattern);
```

Also, you can access the database properties and catalog and schema information by using the connection object. For example:

```
conn = database(datasource, username, password);  
catalogs = conn.Catalogs;  
schemas = conn.Schemas;
```

### get function will be removed

*Warns*

The `get` function with the `dmd` object will be removed in a future release. There is no replacement for the `get` function.

### tables function will be removed

*Warns*

The `tables` function will be removed in a future release. Use the `sqlfind` function or access the properties of the connection object instead.

---

Some differences between these functions require updates to your code.

#### **Update Code**

In prior releases, you retrieved information about database tables by using the `tables` function. For example:

```
conn = database(datasource,username,password);  
t = tables(conn,catalog,schema);
```

Now the `sqlfind` function returns information about the table types in a database.

```
conn = database(datasource,username,password);  
data = sqlfind(conn,pattern);
```

Also, you can access the database properties and catalog and schema information by using the `connection` object. For example:

```
conn = database(datasource,username,password);  
catalogs = conn.Catalogs;  
schemas = conn.Schemas;
```

#### **columns function will be removed**

*Warns*

The `columns` function will be removed in a future release. Use the `sqlfind` function or access the properties of the `connection` object instead.

Some differences between these functions require updates to your code.

#### **Update Code**

In prior releases, you retrieved information about database columns by using the `columns` function. For example:

```
conn = database(datasource,username,password);  
columnlist = columns(conn,catalog);
```

Now the `sqlfind` function returns information about the table types in the database (including information about database columns).

```
conn = database(datasource,username,password);  
data = sqlfind(conn,pattern);
```

Also, you can access the database properties and catalog and schema information by using the `connection` object. For example:

```
conn = database(datasource,username,password);  
catalogs = conn.Catalogs;  
schemas = conn.Schemas;
```

#### **tableprivileges function will be removed**

*Warns*

The `tableprivileges` function will be removed in a future release. There is no replacement for the `tableprivileges` function.

#### **columnprivileges function will be removed**

*Warns*

The `columnprivileges` function will be removed in a future release. There is no replacement for the `columnprivileges` function.

**dexplore function has been removed**

*Errors*

The `dexplore` function has been removed. Enter `databaseExplorer` at the command line to open the **Database Explorer** app instead.

# R2018a

---

**Version: 8.1**

**New Features**

**Bug Fixes**

**Version History**

## Neo4j Graph Database Upgrade: Write a directed graph to a Neo4j database, and create, update, and delete nodes and relationships

Using the MATLAB Interface to Neo4j, you can connect to a Neo4j graph database and import graph data into MATLAB. With this upgrade, you can export data in a directed graph from MATLAB into a Neo4j database. Also, you can create, update, and delete nodes and relationships in the Neo4j database. For details about using the MATLAB interface to Neo4j, see Graph Database. For a basic workflow, see Working with MATLAB Interface to Neo4j.

## SQL-Speaking Functions: Read and write data and perform joins on database tables directly from MATLAB without writing SQL queries

If you are not familiar with writing SQL queries, you can use these command line functions to import data from and insert data into a database:

- `sqlread`
- `sqlinnerjoin`
- `sqlouterjoin`
- `sqlwrite`

The `sqlwrite` function replaces the `datainsert`, `fastinsert`, and `insert` functions, which insert data into a database. For details, see Inserting Data Using Command Line. For examples that show how to migrate to the `sqlwrite` function, see Append Data to Existing Database Table Using Insert Functionality and Insert Data into New Database Table Using Insert Functionality.

Also, you can find information (including table types) about a database by using the `sqlfind` function.

## Functionality being removed or changed

Functionality	What Happens When You Use It?	Use This Instead	Compatibility Considerations
<code>datainsert</code>	Still runs	<code>sqlwrite</code>	Replace all instances of the <code>datainsert</code> function with the <code>sqlwrite</code> function.
<code>fastinsert</code>	Still runs	<code>sqlwrite</code>	Replace all instances of the <code>fastinsert</code> function with the <code>sqlwrite</code> function.
<code>dmd</code>	Still runs	<code>sqlfind</code> and connection object properties	Replace all instances of the <code>dmd</code> function with the <code>sqlfind</code> function or access the properties of the connection object.

Functionality	What Happens When You Use It?	Use This Instead	Compatibility Considerations
tables	Still runs	sqlfind and connection object properties	Replace all instances of the tables function with the sqlfind function or access the properties of the connection object.
columns	Still runs	sqlfind and connection object properties	Replace all instances of the columns function with the sqlfind function or access the properties of the connection object.
tableprivileges	Still runs	sqlfind and connection object properties	Replace all instances of the tableprivileges function with the sqlfind function or access the properties of the connection object.
columnprivileges	Still runs	sqlfind and connection object properties	Replace all instances of the columnprivileges function with the sqlfind function or access the properties of the connection object.
setdbprefs('NullNumberWrite','NaN')	Still runs	sqlwrite	Replace all instances of setdbprefs('NullNumberWrite','NaN') with the sqlwrite function. Specify NULL values using the data input argument of the sqlwrite function.
setdbprefs('NullStringWrite','null')	Still runs	sqlwrite	Replace all instances of setdbprefs('NullStringWrite','null') with the sqlwrite function. Specify NULL values using the data input argument of the sqlwrite function.
setdbprefs('NullNumberRead','0')	Still runs	Default value NaN for numeric NULL values	Replace all instances of setdbprefs('NullNumberRead','0') with NaN values for numeric NULL values.
setdbprefs('ErrorHandling','store')	Still runs	setdbprefs('ErrorHandling','report')	Replace all instances of setdbprefs('ErrorHandling','store') with setdbprefs('ErrorHandling','report').

Functionality	What Happens When You Use It?	Use This Instead	Compatibility Considerations
setdbprefs('DataReturnFormat','numeric')	Still runs	setdbprefs('DataReturnFormat','table')	Replace all instances of setdbprefs('DataReturnFormat','numeric') with setdbprefs('DataReturnFormat','table').
setdbprefs('DataReturnFormat','cellarray')	Still runs	setdbprefs('DataReturnFormat','table')	Replace all instances of setdbprefs('DataReturnFormat','cellarray') with setdbprefs('DataReturnFormat','table').
setdbprefs('DataReturnFormat','structure')	Still runs	setdbprefs('DataReturnFormat','table')	Replace all instances of setdbprefs('DataReturnFormat','structure') with setdbprefs('DataReturnFormat','table').
database.ODBCConnection syntax in the database function	Warns	database syntax	Replace all instances of the database.ODBCConnection syntax with the database syntax in the database function.
dexplore	Warns	databaseExplorer	To open the <b>Database Explorer</b> app, use the databaseExplorer function.
catalogs	Errors	Catalogs property of the connection object	Replace all instances of the catalogs function with access of the Catalogs property.
exportedkeys	Errors	Nothing	No replacement
get	Errors	connection object properties	Access any connection object property.
importedkeys	Errors	Nothing	No replacement
indexinfo	Errors	Nothing	No replacement
isreadonly	Errors	ReadOnly property of the connection object	Replace all instances of the isreadonly function with access of the ReadOnly property.

Functionality	What Happens When You Use It?	Use This Instead	Compatibility Considerations
logintimeout	Errors	Name-value pair argument 'LoginTimeout' in the database function	Remove all instances of the logintimeout function and specify the timeout value by using the 'LoginTimeout' name-value pair argument.
ping	Errors	connection object properties	Access these connection object properties: <ul style="list-style-type: none"> <li>• MaxDatabaseConnections</li> <li>• DatabaseProductName</li> <li>• DatabaseProductVersion</li> <li>• DriverName</li> <li>• DriverVersion</li> </ul>
primarykeys	Errors	Nothing	No replacement
procedures	Errors	Nothing	No replacement
procedurecolumns	Errors	Nothing	No replacement
schemas	Errors	Schemas property of the connection object	Replace all instances of the schemas function with access of the Schemas property.
set	Errors	connection object properties	You can set only the AutoCommit and ReadOnly properties.
sql2native	Errors	Nothing	No replacement
supports	Errors	Nothing	No replacement
setdbprefs('DataReturnFormat','dataset')	Errors	setdbprefs('DataReturnFormat','table')	Replace all instances of setdbprefs('DataReturnFormat','dataset') with setdbprefs('DataReturnFormat','table').
setdbprefs('FetchBatchSize','1000')	Errors	Nothing	The software sets the default value.
setdbprefs('FetchInBatches','yes')	Errors	Nothing	The software performs batching by default.

# R2017b

---

**Version: 8.0**

**New Features**

**Bug Fixes**

**Version History**

## Database Explorer App: Visually explore relational databases without knowing SQL

The **Database Explorer** app has been replaced. You can configure ODBC and JDBC data sources, explore data in a relational database, create SQL queries interactively, and import data into the MATLAB workspace.

### Version History

- To open the new Database Explorer app, use the `databaseExplorer` function instead of the `dexplore` function.
- For JDBC data sources only, set up new JDBC data sources to connect to a database using the JDBC driver. For details, see [Configuring Driver and Data Source](#).
- The syntax `setdbprefs('JDBCDataSourceFile')` has been removed.
- The new Database Explorer app has new workflows for connecting to databases and creating SQL queries. For details, see [Create SQL Queries Using Database Explorer App](#).

## Database Toolbox Interface for MongoDB: Easily interact with MongoDB

With the Database Toolbox interface for MongoDB, you can import data stored in a collection of documents in MongoDB for analysis in MATLAB. After connecting to MongoDB, you can also explore and manage collections, and export data from MATLAB into MongoDB.

For details about installing the Database Toolbox interface for MongoDB, see [Database Toolbox Interface for MongoDB Installation](#). For details about the interface, see [Document Database](#).

## splitsqlquery Function: Split a SQL query into multiple SQL page queries to access large amounts of data

Using the `splitsqlquery` function, you can split a SQL query into multiple SQL page queries and then access large data in chunks. You can access large data using Database Toolbox functions or using a parallel pool (requires Parallel Computing Toolbox).

### Functionality being removed or changed

Functionality	What Happens When You Use It?	Use This Instead	Compatibility Considerations
<code>catalogs</code>	Warns	<code>Catalogs</code> property of the connection object	Replace all instances of the <code>catalogs</code> function with access of the <code>Catalogs</code> property.

Functionality	What Happens When You Use It?	Use This Instead	Compatibility Considerations
database.ODBCConnection syntax in the database function	Warns	database syntax	Replace all instances of the database.ODBCConnection syntax with the database syntax in the database function.
dexplore	Warns	databaseExplorer	To open the <b>Database Explorer</b> app, use the databaseExplorer function.
exportedkeys	Warns	Nothing	No replacement
get	Warns	connection object properties	Access any connection object property.
importedkeys	Warns	Nothing	No replacement
indexinfo	Warns	Nothing	No replacement
isreadonly	Warns	ReadOnly property of the connection object	Replace all instances of the isreadonly function with access of the ReadOnly property.
logintimeout	Warns	Name-value pair argument 'LoginTimeout' in the database function	Remove all instances of the logintimeout function and specify the timeout value using the name-value pair argument 'LoginTimeout'.
ping	Warns	connection object properties	Access these connection object properties: <ul style="list-style-type: none"> <li>• MaxDatabaseConnections</li> <li>• DatabaseProductName</li> <li>• DatabaseProductVersion</li> <li>• DriverName</li> <li>• DriverVersion</li> </ul>
primarykeys	Warns	Nothing	No replacement
procedure	Warns	Nothing	No replacement
procedurecolumns	Warns	Nothing	No replacement
schemas	Warns	Schemas property of the connection object	Replace all instances of the schemas function with access of the Schemas property.

Functionality	What Happens When You Use It?	Use This Instead	Compatibility Considerations
set	Warns	connection object properties	You can set only the AutoCommit and ReadOnly properties.

rsmd object as input argument in get	Errors	Nothing	No replacement
setdbprefs('ErrorHandling','empty')	Errors	Nothing	Replace all instances of setdbprefs('ErrorHandling','empty') with setdbprefs('ErrorHandling','report').
setdbprefs('JDBCDataSourceFile')	Errors	Nothing	Configure JDBC data sources by using the Database Explorer app. For details, see Configuring Driver and Data Source.

## Version History

In the **Database Toolbox Preferences** pane:

- The **Cursor Fetch** pane has been removed. The **Fetch In Batches** and **Batch Size** preferences have been removed. Use the setdbprefs function at the command line instead.

- 
- The dataset option in the **Data Return Format** list will be removed. Use `table` instead.
  - The empty option in the **Error Handling** list will be removed. Use `report` instead.

# R2017a

---

**Version: 7.1**

**New Features**

**Bug Fixes**

**Version History**

## One-step data import

You can import data from a database in one step using the `select` function. This function enables maximum memory savings by importing numeric values using data types as defined in the database. For different ways to import data, see [Data Import Using Database Explorer App or Command Line](#).

## Expanded data type support

You can import data with a larger variety of data types into MATLAB. For the full list, see [Data Type Support](#).

## Connection object and database connection changes

The connection object has additional properties grouped into these categories:

- Database Properties
- Catalog and Schema Information
- Database and Driver Information

Additional properties include:

- `ReadOnly`
- `MaxDatabaseConnections`
- `DefaultCatalog`
- `Catalogs`
- `Schemas`
- `DatabaseProductName`
- `DatabaseProductVersion`
- `DriverName`
- `DriverVersion`

For ODBC drivers, the native ODBC interface is now the default database connection type.

## Version History

These connection object properties have changed:

- `Handle` and `Constructor` is removed.
- `DataSource` replaces `Instance`.
- `LoginTimeout` replaces `TimeOut`.

For details about object properties, see the `connection` object.

## Functionality being removed or changed

Functionality	What Happens When You Use It?	Use This Instead	Compatibility Considerations
catalogs	Still runs	Catalogs property of the connection object	Replace all instances of the catalogs function with access of the Catalogs property.
get	Still runs	connection object properties	Access any connection object property.
isreadonly	Still runs	ReadOnly property of the connection object	Replace all instances of the isreadonly function with access of the ReadOnly property.
logintimeout	Still runs	Name-value pair argument 'LoginTimeout' in the database function	Remove all instances of the logintimeout function and specify the timeout value using the name-value pair argument 'LoginTimeout'.
ping	Still runs	connection object properties	Access these connection object properties: <ul style="list-style-type: none"> <li>• MaxDatabaseConnections</li> <li>• DatabaseProductName</li> <li>• DatabaseProductVersion</li> <li>• DriverName</li> <li>• DriverVersion</li> </ul>
schemas	Still runs	Schemas property of the connection object	Replace all instances of the schemas function with access of the Schemas property.
set	Still runs	connection object properties	You can set only the AutoCommit and ReadOnly properties.

setdbprefs('UseRegis tryForSources','')	Errors	Nothing	No replacement

---

## Version History

The JDBC/ODBC bridge has been removed for the command line. For ODBC drivers, the syntaxes of the `database` function and other command-line functions use the native ODBC interface by default. The Database Explorer app still uses the JDBC/ODBC bridge for ODBC database connection.

Visual Query Builder has been removed. Use the Database Explorer app instead. When using the **Database Explorer** app with JDBC drivers for the first time, you must configure data sources.

# R2016b

---

**Version: 7.0**

**New Features**

**Bug Fixes**

**Version History**

## Graph Database Interface: Retrieve graph data from Neo4j

To import graph data in a Neo4j database into MATLAB, use the MATLAB interface to Neo4j. To perform graph network analysis with graph data in MATLAB using the `digraph` object, create a Neo4j database connection. Or, you can explore the graph using MATLAB functionality. If you are familiar with the Cypher<sup>®</sup> query language, you can execute Cypher queries. For details about using the MATLAB interface to Neo4j, see Graph Database.

## DatabaseDatastore functionality and object properties changes

To analyze data using common MATLAB functions, such as `mean` and `histogram`, you can create a tall array using the `DatabaseDatastore` object. For details about using tall arrays with Database Toolbox, see Analyze Large Data in Database Using Tall Arrays.

To create a `DatabaseDatastore` object, use `databaseDatastore` instead of `datastore`.

The `DatabaseDatastore` object has two additional object properties. The `VariableNames` property provides the variable names of the retrieved data table. The `ReadSize` property specifies the number of rows to read from the retrieved data table.

The `read`, `readall`, and `preview` functions return data as a table.

## Version History

- The `DatabaseDatastore` object properties have changed:
  - The `Cursor` property has been removed.
  - Two properties are added: `VariableNames` and `ReadSize`.

For details about the object properties, see `DatabaseDatastore`.

- This syntax for the `read` function has been removed.

```
data = read(dbds, rowcount)
```

To specify the number of rows to retrieve, set the `ReadSize` property of the `DatabaseDatastore` object instead.

- The data retrieval functionality has changed:
  - The functions retrieve data as a table by default. Setting the database preference `DataReturnFormat` to `'table'` is not required.
  - `read` and `preview` throw an error when there is no more data in the `DatabaseDatastore` object for reading.
  - If `read` finds no more data to read, `hasdata` returns logical 0.

**Version History**

## MATLAB Interface to SQLite: Create, read, and write data from SQLite database files without external drivers and administration

To import and update data without an existing database or database administration, use the MATLAB Interface to SQLite. For details, see *Working with the MATLAB Interface to SQLite*. For the supported functions, see this table.

Function	Purpose
sqlite	Create SQLite connection.
exec	Perform database operation in the SQLite database file.
fetch	Run SQL query and import data from the SQLite database file.
insert	Export data into the SQLite database file.
close	Close SQLite connection.

### fetch Function Speed Improvement: Import data faster using the JDBC driver

When you connect to a database using the JDBC driver, importing data is faster using the `fetch` function.

### Support for 32-bit Windows removed

The Database Toolbox no longer supports connection to a database using a 32-bit driver.

### Version History

Use a 64-bit database. Or, install a 64-bit driver that works with the 32-bit database. For details, consult with your database administrator.

For Microsoft® Access™, see <https://www.mathworks.com/matlabcentral/answers/235949-how-to-connect-to-32-bit-microsoft-access-database-from-64-bit-matlab>.

### Functionality being removed or changed

**Version: 6.0**

**New Features**

**Bug Fixes**

**Version History**

## ODBC Interface Functions: Export and retrieve database information using native ODBC connections

More Database Toolbox functions support the native ODBC interface for exporting data and retrieving database information and metadata. For a list of supported functions, see [Connecting to a Database Using the Native ODBC Interface](#).

## Read and Write Performance Improvements: Import and export data more quickly

Data import and export functions can retrieve and write data faster. Particularly, `datainsert` and `update` call the `TRANSACTION` command of SQL to insert or update records faster for these databases: Microsoft SQL Server®, MySQL, Oracle®, and PostgreSQL.

## Data Export Functions: Insert or replace data using table, structure, and dataset arrays

The `datainsert` and `update` functions can export data in tabular, dataset, and structure arrays to databases.

## Functionality being removed or changed

Functionality	What Happens When You Use It?	Use This Instead	Compatibility Considerations
<code>driver</code>	Warns	Nothing	No replacement
<code>drivermanager</code>	Warns	Nothing	No replacement
<code>isconnection</code>	Warns	<code>isopen</code>	Replace all instances of <code>isconnection</code> with <code>isopen</code> .

# R2015a

---

**Version: 5.2.1**

**Bug Fixes**

# R2014b

---

**Version: 5.2**

**New Features**

## DatabaseDatastore for applying mapreduce to data contained in relational databases

Create a DatabaseDatastore to work with large amounts of data in relational databases. Write custom functions to implement mapreduce to process large amounts of data. To create a DatabaseDatastore, you must create a DatabaseDatastore object. This object is a type of datastore.

Function	Purpose
datastore	Create a DatabaseDatastore.
hasdata	Determine if a DatabaseDatastore contains more data in the cursor object.
preview	Display the first eight records in a DatabaseDatastore.
read	Read data in a DatabaseDatastore.
readall	Read every record in a DatabaseDatastore.
reset	Reset the cursor position in a DatabaseDatastore.

## Scrollable cursors for accessing data using relative and absolute position inputs

Fetch data sequentially or scroll up or down in the data without executing the query again. Scrolling within the data offers advantages when you are working with a large data set. An advantage of scrollable cursors is reading data in the middle of a large data set using the cursor position offset.

Create a scrollable cursor using `exec`. Retrieve data from a scrollable cursor using `fetch`. Use relative and absolute position inputs in `fetch` to retrieve data starting from a specific location in the data set.

# R2014a

---

**Bug Fixes**

## **Fast access to ODBC connections via a native ODBC driver**

Support for native ODBC database connection for Windows platforms. The native ODBC interface is available only for the command line. To use this interface, see [Using the Native ODBC Database Connection](#). The native ODBC interface supports the following functions:

- `database`
- `fetch`
- `exec`
- `insert`
- `fastinsert`
- `close`

### **table data type support**

You can return a `table` data type rather than a cell array. Use the `setdbprefs` command to set the database preference for the `DataReturnFormat` property to `'table'`.

# R2013a

---

**Version: 4.1**

**New Features**

**Bug Fixes**

## **fetch function accepts user-defined batch sizes**

setdbprefs is updated with new properties (FetchInBatches and FetchBatchSize) that support fetch when requesting large data.

# R2012b

---

**Version: 4.0**

**New Features**

**Bug Fixes**

**Version History**

## Database Explorer app for interactively exchanging data with databases

`dexplore` starts Database Explorer, which is the Database Toolbox GUI for connecting to a database and importing data to the MATLAB workspace. Alternatively, you can start Database Explorer by selecting **Database Explorer** from the **Database Connectivity and Reporting** section of the **Apps** tab in the MATLAB Toolstrip.

### Functionality Being Removed or Changed

Functionality	What Happens When You Use It?	Use This Instead	Compatibility Considerations
querybuilder	Warns	dexplore	Continue to use querybuilder for exporting data.

# R2012a

---

**Version: 3.11**

**New Features**

**Bug Fixes**

## **Execute .SQL Files**

The new `runsqlscript` function lets you execute SQL commands from a `.SQL` file on a connected database, and store the results in a `cursor` array. You can input the results from executing `runsqlscript` to functions that accept `cursor` array inputs.

## **Improvements to the Database Constructor**

When using a JDBC driver, you can input individual connection properties to the database constructor, `database`.

# R2011b

---

**Version: 3.10**

**New Features**

**Bug Fixes**

**Version History**

## **Preferences Now Persistent Across MATLAB Sessions**

The preferences you set using the Preference dialog box or the `setdbprefs` function now persist across MATLAB sessions.

## **Version History**

In releases before R2011b, if you changed your preferences during a MATLAB session, these preferences would not remain in the next MATLAB session.

## **Change in Behavior for the update Function**

`update` lets you update images, Booleans, doubles, and strings in a manner consistent with `fastinsert`.

## **Warning and Error ID Changes**

Many warning and error IDs have changed from their previous versions. These warnings or errors typically appear during a function call.

## **Version History**

If using warning or error IDs, you might need to change the strings you use. For example, if you turned off a warning for a certain ID, the warning might now appear under a different ID. If you use a `try/catch` statement in your code, replace the old identifier with the new identifier. There is no definitive list of the differences, or of the IDs that changed.

# R2011a

---

**Version: 3.9**

**New Features**

**Bug Fixes**

## **New `datainsert` Function Exports MATLAB Cell Array Data into a Database Table**

The new `datainsert` function inserts data from the MATLAB workspace into a database table, much like the `fastinsert` function. The new `datainsert` function is faster.

# R2010b

---

**Version: 3.8**

**New Features**

**Bug Fixes**

## **Now Possible to Import Data into MATLAB Dataset Object**

If you have Statistics Toolbox™ installed, you can now return a `dataset` object rather than a cell array. Use the `setdbprefs` command to set the database preference for the `DataReturnFormat` property to `'dataset'`.

# R2010a

---

**Version: 3.7**

**New Features**

**Bug Fixes**

## **New Connection Object Methods**

Several new connection object methods provide database-specific information. The new methods are:

- `database.catalogs`
- `database.columns`
- `database.schemas`
- `database.tables`

See the individual reference pages for more information on how to use these methods.

## **Enhanced Error Messages**

New enhanced error messages provide more information about the error. For example, the 2009b error message `Drivers not Found/Loaded` is now `Drivers not Found/Loaded. Please verify that login information and database url are valid in 2010b`. This error will appear when the driver input is valid but the database URL is invalid.

## **Improved Write Performance**

New bulk insert code templates provide significant performance upgrades.

**Bug Fixes**

## setdbprefs Accepts Structure Input

The `setdbprefs` function now accepts a structure as input. For example, you can run the following commands to assign values to `s`:

```
s.DataReturnFormat = 'numeric';  
s.ErrorHandling = 'report';
```

You can also do this for other `setdbprefs` properties whose values you want to change. Then set the preferences using the values in `s` by running the command:

```
setdbprefs(s)
```

For more information, see the `setdbprefs` reference page.

## Visual Query Builder Generated M-File Includes Placeholder for Password and Assigns Preferences to Structure

When you run a query in the Visual Query Builder and select **File > Generate M-File**, the resulting M-file now includes a placeholder string `password` in the `database` statement. If a password is required for the connection, such as for connections established via JDBC drivers, substitute the password for the `password` string. If no password is required, the M-file will run as is. For more information, see [About Generated Files](#).

The generated M-file assigns values for the preferences to the structure `s`. For more information, see the `setdbprefs` reference page.

## Preference Added for Temporary Registry Output; Ensures Full Output for getdatasources

When you use `getdatasources` to view the data sources for your system, ensure that you view all data sources by specifying a temporary, writable, output directory using the new preference, `TempDirForRegistryOutput`. This is useful when you add data sources and do not have write access for the MATLAB current directory, where the toolbox temporarily writes ODBC registry settings. Without write access, `getdatasources` does not always return data sources you added. In that event, run `setdbprefs` to specify a value for the `TempDirForRegistryOutput` preference, where the value is the full path name to a directory for which you have write access.

# R2006b

---

**Version: 3.2**

**New Features**

**Bug Fixes**

**Version History**

## Enhanced fetch Combines exec with Existing fetch

The new function, `database.fetch`, executes the specified SQL query and imports results into the MATLAB workspace, given the connection handle `conn`. It is provided for convenience, to combine capabilities of the existing `exec` and `cursor.fetch` functions. In statements and code, do not specify `database.fetch` or `cursor.fetch` but rather, just specify `fetch` with the appropriate objects provided as arguments; the toolbox runs `database.fetch` or `cursor.fetch` as appropriate based on the arguments.

Unlike `cursor.fetch`, `database.fetch` does not return a cursor object on which you can run subsequent Database Toolbox functions, but rather returns all data to a MATLAB variable. For more information about `database.fetch` and how it differs from `cursor.fetch`, see the `fetch` reference page, as well as the `database.fetch` and `cursor.fetch` reference pages.

## Import Data from Multiple Resultsets

The new function, `fetchmulti`, imports data into the MATLAB workspace from multiple resultsets, which you retrieve via an `exec` call to a stored procedure that contains two or more `select` statements.

## Run Stored Procedures to Return Output Parameters

The new function, `runstoredprocedure`, executes a stored procedure using input parameters specified in a cell array to return output parameters. This allows you to retrieve the value of a variable into a MATLAB variable. `runstoredprocedure` overcomes a limitation of `exec`; when you run a stored procedures via `exec`, you can only retrieve resultsets.

## Specify Catalog and Schema Using Visual Query Builder

You can now specify the catalog and schema for a data source using the Visual Query Builder. The `default` is `none`, meaning you do not need to select values for them.

## Preferences Option to Find Additional Data Sources

The new `setdbprefs` option, `UseRegistryForSources`, instructs the Visual Query Builder to search the Microsoft Windows registry to find any ODBC data sources not uncovered using the system `ODBC.INI`.

## MATLAB Change to Assignment of Nonscalar Structure Array Fields Might Impact Database Toolbox Users

In Version 7.3 (R2006b) of the MATLAB software, a change was made to how a nonscalar structure array field is assigned to a single MATLAB variable. For more information, see `Assigning Nonscalar Structure Array Fields to a Single Variable` in the MATLAB Release Notes.

## Version History

As a result of this change in the MATLAB software, you may need to modify your Database Toolbox M-files.

# R2006a

---

**Version: 3.1.1**

**Bug Fixes**

# R14SP3

---

**Version: 3.1**

**New Features**

**Bug Fixes**

## fastinsert Function Added

There is a new function, `fastinsert`, that you can use instead of the `insert` function to export data about three times more quickly than `insert`. It also allows exporting for all object types, so that any data you can retrieve from a database you now can export to the database, including binary objects.

While there are no known problems with `fastinsert`, if you receive unexpected results, return to using `insert` and report the problem with `fastinsert` via Technical Support.

Note that the Visual Query Builder insert feature uses the `insert` function instead of `fastinsert`.

## JDBC Drivers Now Supported for Visual Query Builder on Microsoft Windows Systems

You now can use the Visual Query Builder (VQB) with JDBC drivers on Windows platforms. Previously, only ODBC drivers were supported.

The `confds` function now displays an enhanced dialog box you use to define JDBC data sources. With it, you save and load data source information via MATLAB MAT-files.

For details, see [Setting Up JDBC Data Sources](#).

## Define Data Sources from Within the Visual Query Builder

The Visual Query Builder now includes two new items under the **Query** menu:

- **Define ODBC Data Source**—Directly access your Windows ODBC Data Source Administrator dialog box where you define ODBC data sources.
- **Define JDBC Data Source**—Access the Define JDBC Data Source dialog box for defining JDBC data sources to use with the VQB. The function equivalent is `confds`. When you define a JDBC data source, the information is saved in a MAT-file so you can use it again in a later session. Later, open the MAT-file using the Define JDBC Data Source dialog box, or using `setdbprefs('JDBCDataSourceFile','fullpathtomatfile')`.

For details, see [Configuring Your Environment](#).

## setdbprefs Function Enhanced

New arguments are supported for defining the JDBC data source MAT-file. For details, see the `setdbprefs` reference page.

## Dynamically Add JDBC Drivers File

You can dynamically add a JDBC drivers file to the MATLAB Java classpath using the MATLAB `javaaddpath` function. You can use this method instead of adding a pointer to the JDBC drivers file in your `classpath.txt` file. The advantage of using `javaaddpath` is that you do not have to restart the MATLAB software session after running the `javaaddpath` statement. The disadvantage is that this only applies to the current session and so you need to run the `javaaddpath` statement in each new session. For details, see [Setting Up JDBC Data Sources](#).

---

## **64-Bit FLOAT for Microsoft SQL Server Software Is Fully Supported**

You now can retrieve 64-bit FLOAT data using Microsoft SQL Server software.

## **Generate M-File from VQB**

After running a query using the Visual Query Builder, you can generate an M-file consisting of Database Toolbox functions that perform the query. This is useful if you know how to run queries with the VQB and want to determine the equivalent functions, particularly the SQL statements in `exec` and `insert`.

## **update Function Enhanced to Export Multiple Records**

The `update` function has been enhanced so that you can export multiple records based on different `where` clauses. The number of `where` clauses must equal the number of records in the array of data you are exporting. For details, see the reference page for `update`.

## **logintimeout Function Now Supported on Linux Platforms**

The `logintimeout` function is now supported on Linux platforms.

# R14SP2

---

**Version: 3.0.2**

**Bug Fixes**
