Apps

Satellite Link Budget Analyzer

Analyze link budgets for satellite communications

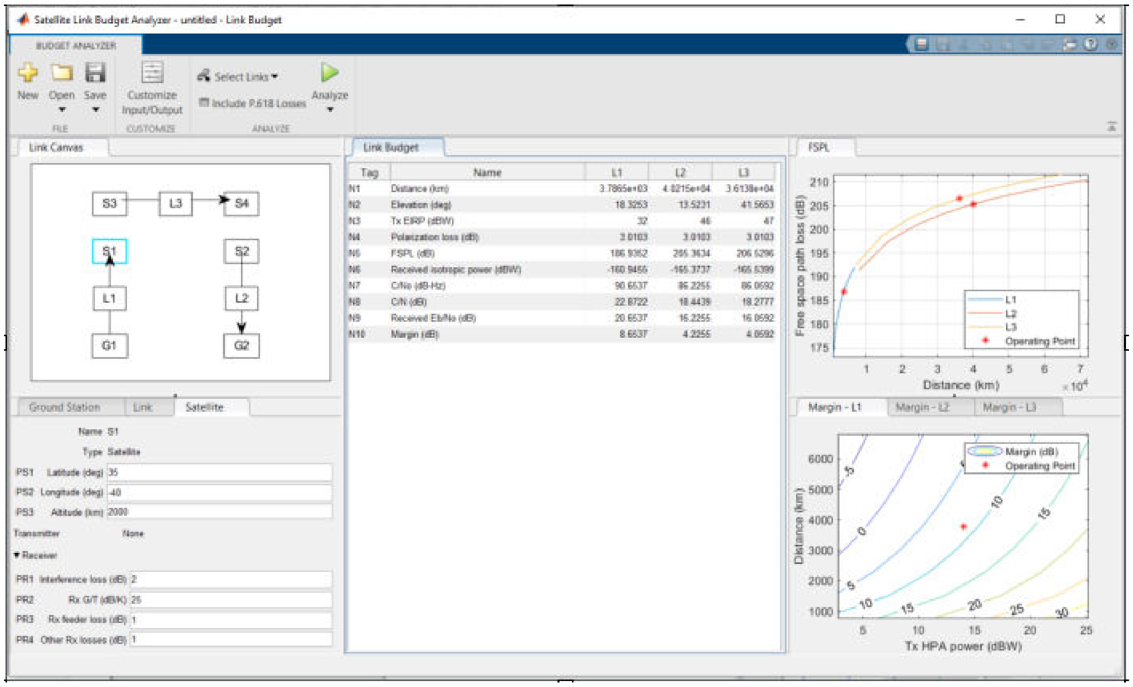
Description

The **Satellite Link Budget Analyzer** app enables you to analyze link budgets for satellite communications.

Using the app, you can:

- Analyze link budgets by specifying inputs properties related to
  - Location, transmitter, and receiver characteristics for satellites and ground stations
  - Atmospheric conditions for links
- Design a satellite communications link to meet a minimum link margin requirement
- Have insight into intermediate link budget computations
- Calculate, compare, and visualize results across a sweep of multiple parametrized design constraints

For more information, see “Get Started with Satellite Link Budget Analyzer App”.



Link Budget

Tag	Name	L1	L2	L3
N1	Distance (km)	3.7865e+03	4.0215e+04	3.6138e+04

Open the Satellite Link Budget Analyzer App

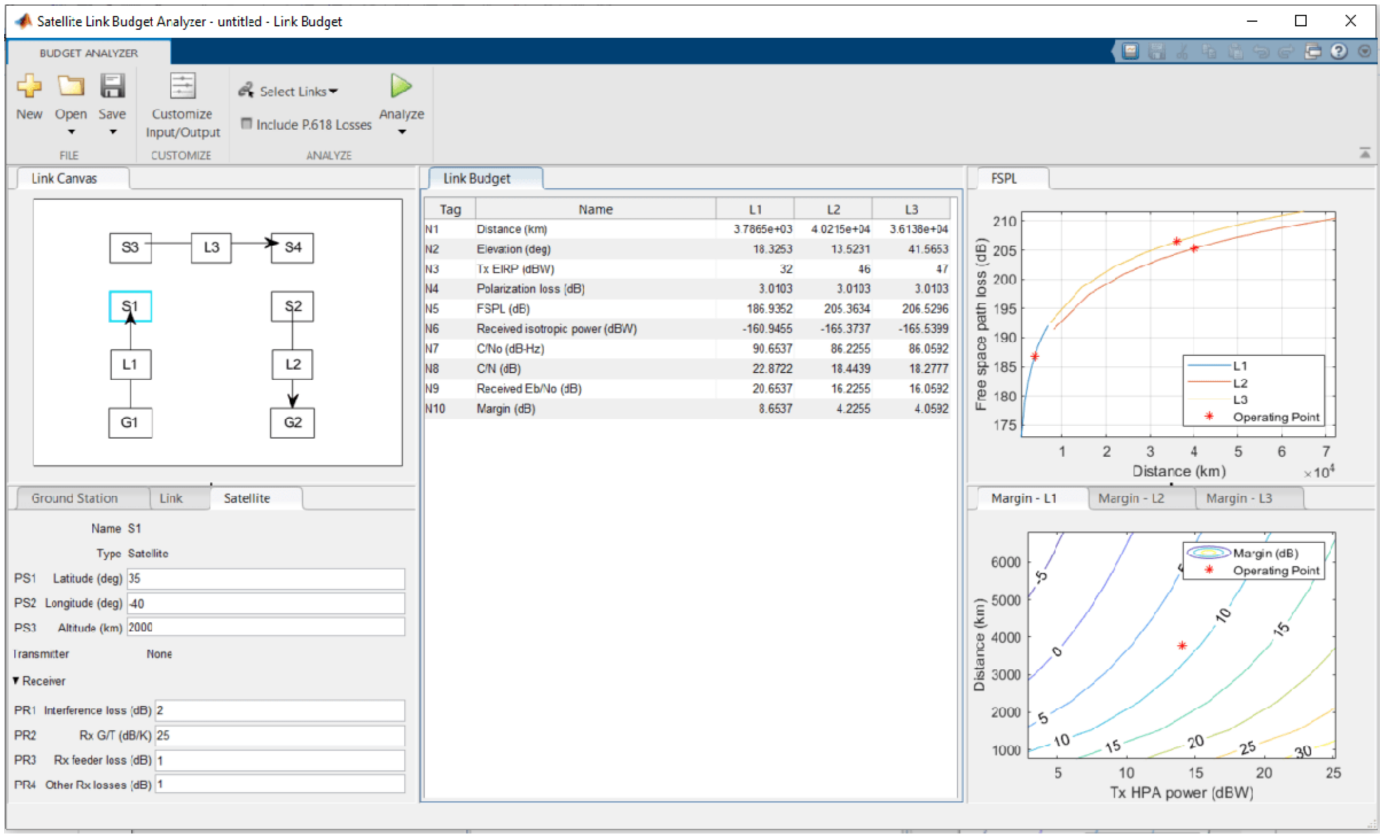
MATLAB® Toolstrip: On the **Apps** tab, under **Signal Processing and Communications**, click the app icon. Satellite Link Budget Anal...

MATLAB Command Prompt: Enter `satelliteLinkBudgetAnalyzer`.

Examples

Show Default Satellite Link Budget App Configuration

This example shows the default configuration that appears when you open the **Satellite Link Budget Analyzer** app. The figure shows the displayed results and plots, which analyze the default satellite communications link.



Link Budget

Tag	Name	L1	L2	L3
N1	Distance (km)	3.7865e+03	4.0215e+04	3.6138e+04
N2	Elevation (deg)	18.3253	13.5231	41.5653
N3	Tx EIRP (dBW)	32	46	47
N4	Polarization loss (dB)	3.0103	3.0103	3.0103
N5	FSPL (dB)	186.9352	205.3634	206.5296
N6	Received isotropic power (dBW)	-160.9455	-165.3737	-165.5399
N7	C/No (dB-Hz)	90.6537	86.2255	86.0592
N8	C/N (dB)	22.8722	18.4439	18.2777
N9	Received Eb/No (dB)	20.6537	16.2255	16.0592
N10	Margin (dB)	8.6537	4.2255	4.0592

Ground Station | Link | Satellite

	Name	S1
	Type	Satellite
PS1	Latitude (deg)	35
PS2	Longitude (deg)	-40
PS3	Altitude (km)	2000
Transmitter		None
▾ Receiver		
PR1	Interference loss (dB)	2
PR2	Rx G/T (dB/K)	25
PR3	Rx feeder loss (dB)	1
PR4	Other Rx losses (dB)	1

The upper-left pane of the app shows the **Link Canvas** tab, which displays this default configuration:

- Link L1 is an uplink connecting ground station G1 to satellite S1
- Link L3 is a crosslink connecting satellite S3 to satellite S4
- Link L2 is a downlink connecting satellite S2 to ground station G2

The lower-left pane of the app shows the **Ground Station**, **Link**, and **Satellite** tabs. In these tabs, you can adjust property settings for each entity in the configured links. To view or adjust the properties settings of an entity, bring that entity into focus by selecting it in the **Link Canvas** tab.

The center pane of the app shows the computed link budget results in the **Link Budget** tab.

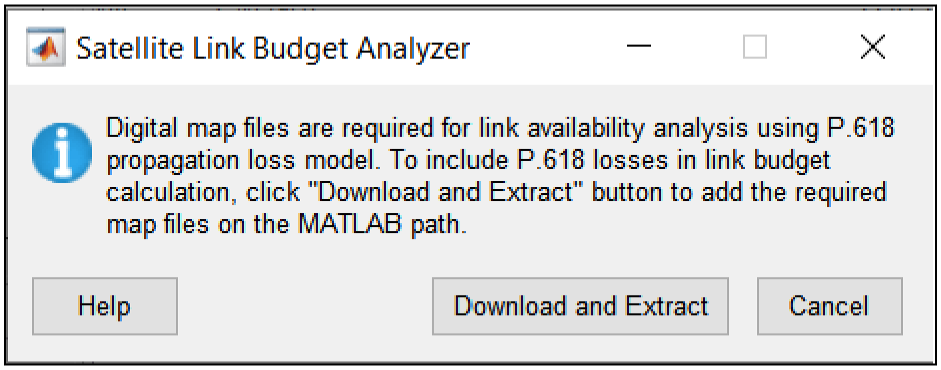
The right pane of the app window shows these plots:

- Free-space path loss for links L1, L2, and L3 in the upper-right area (`FSPL` tab).
- Link margins for links L1, L2, and L3 in separate tabbed plots in the lower-right area (`Margin-L1`, `Margin-L2`, and `Margin-L3` tabs, respectively).

Configuration Including P.618 Link Availability Analysis

The app supports analyzing the satellite communications link availability through the propagation loss model defined in Recommendation ITU-R P.618-13. For details on the P.618 propagation loss model, see Earth-Space Propagation Losses.

To include ITU-R P.618 propagation losses for availability analysis, select the **Include P.618 Losses** checkbox on the **Budget Analyzer** tab. If the MAT-files with digital maps are not available on the path, the following dialog box appears. Click the **Download and Extract** button to add the required map files on the MATLAB path.



Satellite Link Budget Analyzer

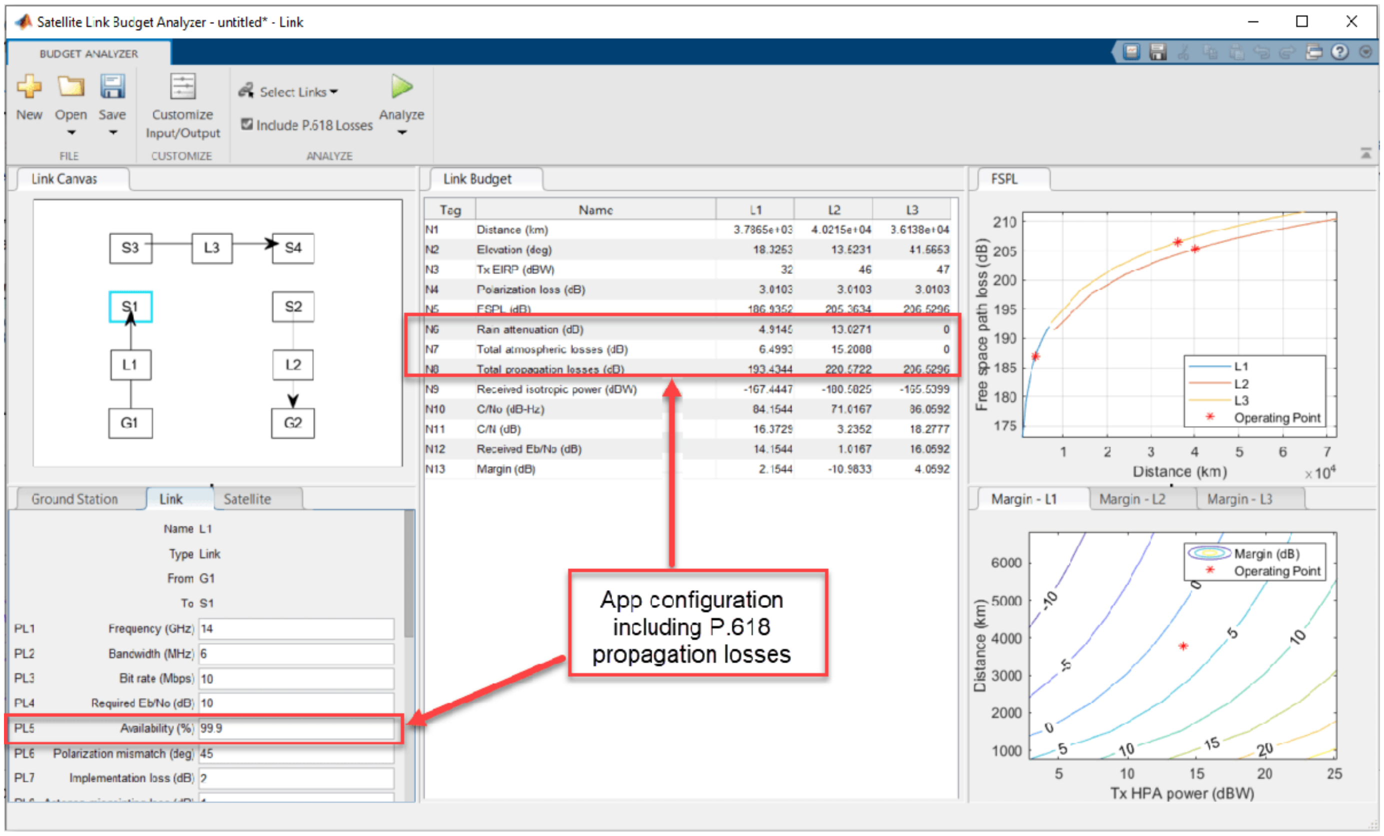
Digital map files are required for link availability analysis using P.618 propagation loss model. To include P.618 losses in link budget calculation, click "Download and Extract" button to add the required map files on the MATLAB path.

Alternatively, you can download and unpack the MAT-files by entering this code at the MATLAB command prompt.

```
maps = exist('maps.mat','file');
p836 = exist('p836.mat','file');
p837 = exist('p837.mat','file');
p840 = exist('p840.mat','file');
matFiles = [maps p836 p837 p840];
if ~all(matFiles)
    if ~exist('ITURDigitalMaps.tar.gz','file')
        url = 'https://www.mathworks.com/supportfiles/spc/P618/ITURDigitalMaps.tar.gz';
        websave('ITURDigitalMaps.tar.gz',url);
        untar('ITURDigitalMaps.tar.gz');
    else
        untar('ITURDigitalMaps.tar.gz');
    end
    addpath(cd);
end
```

If you have an already customized link budget inputs/outputs, including availability will restore the link budget to its default inputs/outputs. A different dialog box opens up in this case where you can choose to either cancel or consent to the inclusion of ITU-R P.618 propagation losses for availability analysis.

This figure shows the updates to the configuration in the **Link Budget** (tags N6, N7, and N8) and **Link** (tag PL5) tabs, after the MAT-files are added on the MATLAB path.



Name	L1
Type	Link
From	G1
To	S1

PL1	Frequency (GHz)	14
PL2	Bandwidth (MHz)	6
PL3	Bit rate (Mbps)	10
PL4	Required Eb/No (dB)	10
PL5	Availability (%)	99.9
PL6	Polarization mismatch (deg)	45
PL7	Implementation loss (dB)	2

Tag	Name	L1	L2	L3
N1	Distance (km)	3.7865e+03	4.0215e+04	3.6138e+04
N2	Elevation (deg)	18.3253	13.6231	41.5653
N3	Tx EIRP (dBW)	32	46	47
N4	Polarization loss (dB)	3.0103	3.0103	3.0103
N5	FSPL (dB)	186.9352	205.3634	206.5296
N6	Rain attenuation (dB)	4.9145	13.0271	0
N7	Total atmospheric losses (dB)	6.4993	15.2088	0
N8	Total propagation losses (dB)	193.4344	220.5722	206.5296
N9	Received isotropic power (dBW)	-167.4447	-180.5825	-165.5399
N10	C/No (dB-Hz)	84.1544	71.0167	86.0592
N11	C/N (dB)	16.3729	3.2352	18.2777
N12	Received Eb/No (dB)	14.1544	1.0167	16.0592
N13	Margin (dB)	2.1544	-10.9833	4.0592

In this app, `Total atmospheric losses` (tag N7) calculation with P.618 propagation model assumes the antenna type as parabolic.

Customize Inputs and Outputs

Customize the **Properties** and **Results** tabs in the **Satellite Link Budget Analyzer** app using the **Customize Input/Output** tab.

Open the **Satellite Link Budget Analyzer** app. These figures show the default configuration on the **Budget Analyzer** and **Customize Input/Output** tabs.

On the **Customize Input/Output** tab:

- Use the options in the **Add New Property** section to add new properties.

- Use the options in the **Add New Result** section to add new results.
- Use the buttons in the **Close** section to accept or cancel the changes.

To delete a property or result, select it and click **Delete** in the respective section.

Add Customized Properties and Results

Add customized properties and results by following these steps.

1. Add a new link property, `FEC code rate`. In the **Add New Property** section of the **Customize Input/Output tab**, select `Link` from the **Type** list. In the **Unit** box, type `-`. In the **Default value** box, type `0.5`. Click **Add Property**. The **Link Properties** section of the **Properties** tab now includes `FEC code rate` (tag `PLC1`).
2. Add another link property, `Coding gain`. Select `Link` from the **Type** list. In the **Unit** box, type `dB`. In the **Default value** box, type `4.2`. Click **Add Property**. The **Link Properties** section of the **Properties** tab now includes `Coding gain` (tag `PLC2`).
3. Add a new result, `Required Eb/No with FEC`. In the **Add New Result** section of the **Customize Input/Output tab**, type `PL4 - PLC2` (`Required Eb/No` - `Coding gain`) in the **Formula** box. In the **Unit** box, type `dB`. Click **Add Result**. The **Results** tab now includes `Required Eb/No with FEC` (tag `NC1`).
4. The formula for `Margin` (tag `N13`) on the **Results** tab is changed to use `NC1` instead of `PL4`.
5. In the **Close** section of the app toolstrip, accept all the changes.

This figure shows these updates in the **Properties** and **Results** tabs.

Delete Existing Results

Delete existing link analysis results by following these steps.

1. In the **Results** tab, select `Rain attenuation` (tag `N6`) and click **Delete** in this tab. Repeat this process for `Total atmospheric losses` (tag `N7`) and `Total propagation losses` (tag `N8`).
2. The formula for `Received isotropic power` (tag `N9`) on the **Results** tab is changed to use `N5` instead of `N8`.
3. In the **Close** section of the app toolstrip, accept all the changes.

This figure shows these updates in the **Results** tab.

Use the **Ground Station**, **Link**, and **Satellite** tabs to adjust property settings for the link budget entities shown in the **Link Canvas** tab.

`Ground Station` — Ground station location, transmitter, and receiver settings

tab

Select the **Ground Station** tab to set the location, transmitter, and receiver settings for the ground station highlighted in the **Link Canvas** tab. For information about customizing satellite, ground station, transmitter, receiver, and link properties, and the link budget result computations, see `CUSTOMIZE INPUT/OUTPUT`.

`Satellite` — Satellite location, transmitter, and receiver settings

tab

Select the **Satellite** tab to set the location, transmitter, and receiver settings for the satellite highlighted in the **Link Canvas** tab. For information about customizing satellite, ground station, transmitter, receiver, and link properties, and the link budget result computations, see `CUSTOMIZE INPUT/OUTPUT`.

`Link` — Link characteristics

tab

Select the **Link** tab to set link characteristics for the link highlighted in the **Link Canvas** tab. For information about customizing satellite, ground station, transmitter, receiver, and link properties, and the link budget result computations, see `CUSTOMIZE INPUT/OUTPUT`.

`Customize Input/Output` — Customize input properties and computations used for output

tab

To view or customize input properties and computations used for output, on the **BUDGET ANALYZER** tab, click **Customize Input/Output** to switch to the **CUSTOMIZE INPUT/OUTPUT** tab. In the **CUSTOMIZE INPUT/OUTPUT** tab, you can

- Change settings of the satellite, ground station, transmitter, receiver, and link properties from the factory default inputs
- Add and delete satellite, ground station, transmitter, receiver, and link input properties
- Add, delete, and modify formulas used to compute link budget output results

`CUSTOMIZE INPUT/OUTPUT` — Customize link budget computations
tab

This figure show the **CUSTOMIZE INPUT/OUTPUT** tab with the factory default configuration.

N10	Margin	dB	N9 - PL4 - PL6

In the **CUSTOMIZE INPUT/OUTPUT** tab, you can

- Use the **Properties** tab to change settings of the satellite, ground station, transmitter, receiver, and link properties from the factory default inputs. You can also add and delete satellite, ground station, transmitter, receiver, and link input properties. On the **Properties** tab you can use the **Restore to factory** button to load the factory default property configuration in the current app session.
- Use the **Results** tab to add, delete, and modify formulas used to compute link budget output results. On the **Results** tab you can use the **Restore to factory** button to load the factory default results configuration in the current app session.

Programmatic Use

`satelliteLinkBudgetAnalyzer` opens the **Satellite Link Budget Analyzer** app.

Functions

bocmod

Binary offset carrier modulation

Syntax

```
y = bocmod(x,m,n)
y = bocmod(x,m,n,halfcyclesps)
y = bocmod(x,m,n,halfcyclesps,phasing)
```

Description

`y = bocmod(x,m,n)` performs binary offset carrier (BOC) modulation on the input bits `x` by using a square wave and returns the modulated symbols `y`. `m` is the square wave frequency indicator. `n` is the input bit rate indicator.

By default, the phasing of the square wave is set to the phase of the sine curve.

`y = bocmod(x,m,n,halfcyclesps)` specifies the number of samples per half cycle of the square wave.

`y = bocmod(x,m,n,halfcyclesps,phasing)` specifies the phase of the square wave.

Examples

Apply BOC Modulation Using Default Phasing

Generate a random stream of input data bits to modulate.

```
numBits = 5;
bits = randi([0,1],numBits,1);
```

Set the values of `m` and `n` for the subcarrier square wave.

```
m = 2; % Square wave frequency is m*1.023e6 Hz
n = 2; % Square wave input bit rate is n*1.023e6 Hz
```

Modulate the input bits with the square wave using the BOC modulation technique.

```
sym = bocmod(bits,m,n) % Default phasing is of a sine curve
```

```
sym = 20×1

    -1
     1
     1
     1
    1
    ⋮
```

Apply BOC Modulation Using Cosine Curve Phasing

Generate a random stream of input data bits to modulate.

```
numBits = 10;
bits = randi([0,1],numBits,1);
```

Set the values of `m` and `n` for the subcarrier square wave. Also specify the number of samples per square wave half cycle, `spshc`.

```
m = 5;
n = 2;
spshc = 4;
```

Modulate the input bits with the square wave using the BOC modulation technique.

```
sym = bocmod(bits,m,n,spshc,"cos");
```

Input Arguments

x — Input bits

column vector of binary values

Input bits, specified as a column vector of binary values.

The function maps an input bit value of `0` to `+1` and an input bit value of `1` to `-1`. It then multiplies the mapped symbols with a square wave by using the BOC modulation technique.

Data Types: `double` | `int8` | `logical`

m — Square wave frequency indicator

positive scalar

Square wave frequency indicator, specified as a positive scalar.

The frequency of square wave is `m*1.023e6` Hz.

Note The value of `2*m/n` must always be an integer. This value represents the number of square wave half cycles per input bit, `x`.

Data Types: `double`

n — Input bit rate indicator

positive scalar

Input bit rate indicator, specified as a positive scalar.

The input bit rate is `n*1.023e6` Hz.

Data Types: `double`

`halfcyclesps` — Number of samples per half cycle of the square wave
2 (default) | integer greater than or equal to 2

Number of samples per half cycle of the square wave, specified as an integer greater than or equal to 2.

Data Types: `double` | `uint8`

`phasing` — Phase of square wave
`"sin"` (default) | `"cos"`

Phase of the square wave, specified as `"sin"` or `"cos"`.

- `"sin"` — Set the phase of the square wave to the phase of a sine curve.
- `"cos"` — Set the phase of the square wave to the phase of a cosine curve.

Data Types: `char` | `string`

Output Arguments

y — BOC modulated symbols
column vector

BOC modulated symbols, returned as a column vector. The length of the vector is equal to `length(x)*halfcyclesps*2*m/n`. If you do not specify `halfcyclesps`, the value of `y` is 2 by default.

The data type of the returned modulated symbols is same as that of the input bits, `x`.

ccsdsRSEncode

Encode CCSDS-compliant RS codes

Syntax

```
code = ccsdsRSEncode(msg,k)
code = ccsdsRSEncode(msg,k,i)
code = ccsdsRSEncode(msg,k,i,s)
```

Description

`code = ccsdsRSEncode(msg,k)` encodes the message in `msg` by using a (255, `k`) Reed-Solomon (RS) encoder, as defined in Consultative Committee for Space Data Systems (CCSDS) 131.0-B-3 Section 4 [1]. `k` is the message length. `code` is in dual basis form, as the function assumes that the input to the CCSDS RS encoder is in dual basis form. For more details on dual basis representation, see CCSDS 131.0-B-3 Section 4.4.2 [1].

For a description of CCSDS RS code construction, see “CCSDS RS Code Construction” on page 2-8.

`code = ccsdsRSEncode(msg,k,i)` specifies the interleaving depth, `i`. `msg` consists of `i` RS message symbols of length `k`.

`code = ccsdsRSEncode(msg,k,i,s)` encodes the shortened input message of length `s` with interleaving depth `i`.

Examples

Encode Message Using Full-Length CCSDS RS Encoder

Encode a message using a Consultative Committee for Space Data Systems (CCSDS) Reed-Solomon (RS) encoder.

Specify the message length, `k`, and the interleaving depth, `i`.

```
k = 239;
i = 3;
```

Generate a column vector of random message symbols. The length of the message is product of message length, `k`, and interleaving depth, `i`.

```
msg = randi([0 255],k*i,1);
size(msg)
```

```
ans = 1×2

   717     1
```

Encode the message by using CCSDS RS encoder.

```
code = ccsdsRSEncode(msg,k,i);
```

Verify that the length of the encoded codeword is 255 times the value of the interleaving depth.

```
size(code)
```

```
ans = 1×2

   765     1
```

Encode Shortened Message Using CCSDS RS Encoder

Encode a message using a Consultative Committee for Space Data Systems (CCSDS) Reed-Solomon (RS) encoder with message shortening.

Specify the message length, `k`, interleaving depth, `i`, and the shortened message length, `s`.

```
k = 223;
i = 2;
s = 146;
```

Generate a column vector of random message bits. The length for the shortened message bits is eight times the product of shortened message length, `s`, and the interleaving depth, `i`.

```
msg = logical(randi([0 1],s*i*8,1));
```

Encode the shortened message by using a CCSDS RS encoder.

```
code = ccsdsRSEncode(msg,k,i,s);
```

Verify that the length of the encoded codeword is equal to (8*`i`*(255 – `k` + `s`).

```
size(code)
```

```
ans = 1×2

        2848            1
```

Input Arguments

`msg` — Input message
column vector of logical bits | column vector of integers in the range [0, 255]

Input message, specified as a column vector of logical bits or a column vector of integers in the range [0, 255]. The size of the column vector depends on the data type of the input message.

Input Message Type	Size of `msg`	
	Data Type of `msg` Is logical	Data Type of `msg` Is uint8 or double
Full-length input message	8*`k`	`k`

Input Message Type	**Size of msg**	
	Data Type of msg Is logical	**Data Type of msg Is uint8 or double**
Interleaved input message	8*k*i	k*i
Shortened input message	8*s*i	s*i

Data Types: double | uint8 | logical

k — Message length
223 | 239

Message length, specified as 223 or 239.

Data Types: double

i — Interleaving depth
1 (default) | 2 | 3 | 4 | 5 | 8

Interleaving depth, specified as 1, 2, 3, 4, 5, or 8. The default value, 1, corresponds to no interleaving.

msg consists of i RS message symbols of length k.

Data Types: double

s — Shortened message length
k (default) | integer in the range [1, k]

Shortened message length, specified as an integer in the range [1, k].

Data Types: double

Output Arguments

code — CCSDS RS encoded message
column vector

CCSDS RS encoded message, returned as a column vector. The data type of code is same as that of the input message, msg. The size of the column vector depends on the data type of the input message.

Input Message Type	**Size of code**	
	Data Type of msg Is logical	**Data Type of msg Is uint8 or double**
Full length input message	8*255	255
Interleaved input message	8*255*i	255*i
Shortened input message	8*i*(255 – k + s)	i*(255 – k + s)

More About

CCSDS RS Code Construction

CCSDS RS codes are powerful burst error-correcting codes used as forward error-correcting (FEC) codes.

The CCSDS RS encoder accepts full-length or shortened messages.

Construction of Full-Length Message CCSDS RS Codes

For full-length input messages the input column vector length is a product of the interleaving depth (*i*) and the message length (*k*).

Encoding in CCSDS RS codes is done row-wise. The encoding results in an *i*-by-*n* vector that includes parity bits added to the end of each row. *n* is the codeword length, which is fixed to 255 symbols according to CCSDS 131.0-B-3 Section 4 [1].

Construction of Shortened Message CCSDS RS Codes

For shortened input messages, the input column vector length is a product of the interleaving depth (*i*) and the shortened message length (*s*). The shortened message vector prepends padding the beginning of the message vector with zeros. The resulting vector is an *i*-by-*k* vector.

Encoding in CCSDS RS codes is done row-wise. The encoding results in an *i*-by-*n* vector that includes parity bits added to the end of each row.

Functions
`ccsdsRSDecode`

Objects
`ccsdsTMWaveformGenerator` | `comm.RSEncoder`

Introduced in R2021a

ccsdsRSDecode

Decode CCSDS-complaint RS codes

Syntax

```
[decoded,cnumerr,ccode] = ccsdsRSDecode(code,k)
[decoded,cnumerr,ccode] = ccsdsRSDecode(code,k,i)
[decoded,cnumerr,ccode] = ccsdsRSDecode(code,k,i,s)
```

Description

`[decoded,cnumerr,ccode] = ccsdsRSDecode(code,k)` decode the received signal in `code` by using a (255, `k`) Reed-Solomon (RS) decoder with the generator polynomial, as defined in the Consultative Committee for Space Data Systems (CCSDS) 131.0-B-3 Section 4 [1]. `k` is the number of symbols in the decoded message. The function returns the decoded message `code`, `decoded`, the number of corrected errors, `cnumerr`, and the corrected version of `code`, `ccode`.

For a description of CCSDS RS code decoding, see “CCSDS RS Code Decoding” on page 2-12.

`[decoded,cnumerr,ccode] = ccsdsRSDecode(code,k,i)` specifies the interleaving depth, `i`. `code` consists of `i` RS codewords of length 255 bytes.

`[decoded,cnumerr,ccode] = ccsdsRSDecode(code,k,i,s)` specifies the shortened message length, `s`.

Examples

Encode and Decode Full-length CCSDS RS Encoded Message

Generate a full-length encoded Reed-Solomon (RS) codeword, introduce random errors, and decode the result using a Consultative Committee for Space Data Systems (CCSDS) RS decoder.

Generate a random message of length `k`.

```
k = 223;
msg = randi([0 255],k,1);
```

Encode the message by using a CCSDS RS encoder.

```
code = ccsdsRSEncode(msg,k);
```

Generate 15 random error symbols and 15 unique random locations to insert these errors.

```
err = randi([1 255],15,1);
errLoc = randperm(255,15);
errVec = zeros(255,1);
errVec(errLoc) = err;
```

Introduce error symbols in the encoded message.

```
rxBytes = bitxor(code,errVec);
```

Decode the encoded symbols introduced with errors by using CCSDS RS decoder.

```
[decoded,v,ccode] = ccsdsRSDecode(rxBytes, k);
```

Display the number of corrected errors.

```
disp(v)
```

```
    15
```

Decode CCSDS RS Codeword with Burst Errors

Generate an full-length encoded Reed-Solomon (RS) codeword, introduce burst of erros, and decode the result using a Consultative Committee for Space Data Systems (CCSDS) RS decoder.

Specify the message length `k` and interleaving depth, `i`.

```
k = 239;
i = 5;
```

Generate a column vector of random message bits. Encode the shortened message by using a CCSDS RS encoder.

```
msg = randi([0 255],k*i,1);
code = ccsdsRSEncode(msg,k,i);
```

Generate 30 random error symbols.

```
err = randi([1 255],30,1);
errVec = zeros(255*i,1);
```

Introduce burst errors from location 52 to 81.

```
errVec(52:81) = err;
rxBytes = bitxor(code,errVec);
```

Decode the encoded symbols introduced with burst errors by using a CCSDS RS decoder.

```
[decoded,v,ccode] = ccsdsRSDecode(rxBytes,k,i);
```

Display the number of corrected errors.

```
disp(v)
```

```
    30
```

Input Arguments

code — Encoded message
column vector of integers in the range [0, 255]

Encoded message, specified as a column vector of integers in the range [0, 255].

The elements and the size of the column vector depends on the data type of the input message.

- For a logical data type, each element in the vector is either 0 or 1.
- For a uint8 or double data type, each element is an integer symbol in GF(2^m), in the range [0, 255]. *m* is the number of bits in each symbol.

Input Message Type	**Size of code**	
	Data Type of code Is logical	**Data Type of code Is uint8 or double**
Full length input message	8*255	255
Interleaved input message	8*255*`i`	255*`i`
Shortened input message	8*`i`*(255 – `k` + `s`)	`i`*(255 – `k` + `s`)

Data Types: `double` | `uint8` | `logical`

k — Number of symbols in decoded message
223 | 239

Number of symbols in the decoded message, specified as `223` or `239`.

Data Types: `double`

`i` — Interleaving depth
1 (default) | 2 | 3 | 4 | 5 | 8

Interleaving depth, specified as `1`, `2`, `3`, `4`, `5`, or `8`. The default value, `1`, corresponds to no interleaving.

`code` consists of `i` RS codewords of length 255 bytes.

Data Types: `double`

s — Shortened message length
`k` (default) | integer in the range [1, `k`]

Shortened message length, specified as an integer in the range [1, `k`].

Data Types: `double`

Output Arguments

decoded — Decoded message
column vector

Decoded message, returned as a column vector. Each element represents decoding the corresponding element in input `code`. The data type of `decoded` is the same as that of `code`.

The size of the column vector depends on the data type of `code`.

Input Message Type	**Size of decoded**	
	Data Type of code Is logical	**Data Type of code Is uint8 or double**
Full length input message	`8*k`	`k`
Interleaved input message	`8*k*i`	`k*i`
Shortened input message	`8*s*i`	`s*i`

When the value of output `cnumerr` is –`1`, `decoded` is equal to the first `k` elements of `code`.

`cnumerr` — Number of corrected errors
integer in the range [`-1`, (*n* – `k`) / 2]

Number of corrected errors, returned as an integer in the range [`-1`, (*n* – `k`) / 2], where *n* is the codeword length. The value of *n* is set to `255` according to CCSDS 131.0-B-3 Section 4 [1].

A value of –`1` in `cnumerr` indicates the failure of the decoder to correct the errors.

`ccode` — Corrected version of code
column vector

Corrected version of code, returned as a column vector. The length of `ccode` is same as the length of `code`. The data type of `ccode` is the same as that of `code`.

When the value of output `cnumerr` is –`1`, `ccode` is equal to `code`.

More About

CCSDS RS Code Decoding

CCSDS RS codes are powerful burst error-correcting codes. These are most commonly used as forward error-correcting (FEC) codes, as they detects and correct errors on the symbol level.

Decoding Full-Length Message CCSDS RS Codes

Like encoding, decoding of CCSDS RS codes is also done row-wise. The input vector length is a product of interleaving depth (*i*) and codeword length (*n*). *n* is fixed to 255 symbols according to CCSDS 131.0-B-3 Section 4 [1]. The input vector is composed of message and parity symbols.

Decoding Shortened Message CCSDS RS Codes

Like encoding, the decoding of CCSDS RS codes is also done row-wise. The input vector length is a product of the interleaving depth (*i*) and the value calculated by *n-k+s*. The input vector is composed of shortened message and parity symbols.

dvbs2BitRecover

Recover bits for DVB-S2 PL frames

Syntax

```
[BITS,NUMFRAMESLOST] = dvbs2BitRecover(RXFRAME,NVAR)
[BITS,NUMFRAMESLOST,PKTCRCSTATUS] = dvbs2BitRecover(RXFRAME,NVAR)
[BITS,NUMFRAMESLOST] = dvbs2BitRecover(RXFRAME,NVAR,EARLYTERM)
```

Description

`[BITS,NUMFRAMESLOST] = dvbs2BitRecover(RXFRAME,NVAR)` recovers user packets (UPs) or a continuous data stream, `BITS`, and the number of lost baseband frames, `NUMFRAMESLOST`. Input `RXFRAME` is the received complex in-phase quadrature (IQ) symbols in the form of physical layer (PL) frames of a Digital Video Broadcasting Satellite Second Generation (DVB-S2) transmission. Input `NVAR` is the noise variance estimate, used to calculate soft bits.

`[BITS,NUMFRAMESLOST,PKTCRCSTATUS] = dvbs2BitRecover(RXFRAME,NVAR)` also returns the UP cyclic redundancy check (CRC) status.

`[BITS,NUMFRAMESLOST] = dvbs2BitRecover(RXFRAME,NVAR,EARLYTERM)` uses low-density parity-check (LDPC) decoding termination criterion, `EARLYTERM`, to recover data bits, `BITS`.

Examples

Recover Data Bits from Transport Stream DVB-S2 Transmission

Recover user packets (UPs) for multiple physical layer (PL) frames in a single transport stream Digital Video Broadcasting Satellite Second Generation (DVB-S2) transmission.

This example uses MAT-files with LDPC parity matrices. If the MAT-files are not available on the path, download and unzip the MAT-files by entering this code at the MATLAB command prompt.

```
if ~exist('dvbs2xLDPCParityMatrices.mat','file')
    if ~exist('s2xLDPCParityMatrices.zip','file')
        url = 'https://ssd.mathworks.com/supportfiles/spc/satcom/DVB/s2xLDPCParityMatrices.zip';
        websave('s2xLDPCParityMatrices.zip',url);
        unzip('s2xLDPCParityMatrices.zip');
    end
addpath('s2xLDPCParityMatrices');
end
```

Specify the number of PL frames per stream. Create a DVB-S2 System object.

```
nFrames = 2;
s2WaveGen = dvbs2WaveformGenerator;
```

Create the bit vector of information bits, `data`, of concatenated TS UPs.

```
syncBits = [0 1 0 0 0 1 1 1]';    % Sync byte for TS packet is 47 Hex
pktLen = 1496;                    % UP length without sync bits is 1496
```

```
numPkts = s2WaveGen.MinNumPackets*nFrames;
txRawPkts = randi([0 1],pktLen,numPkts);
txPkts = [repmat(syncBits,1,numPkts); txRawPkts];
data = txPkts(:);
```

Generate the DVB-S2 time-domain waveform using the input information bits. Flush the transmit filter to handle the filter delay and recover the complete last frame.

```
txWaveform = [s2WaveGen(data); flushFilter(s2WaveGen)];
```

Add additive white Gaussian noise (AWGN) to the generated waveform.

```
sps = s2WaveGen.SamplesPerSymbol;
EsNodB = 1;
snrdB = EsNodB - 10*log10(sps);
rxIn = awgn(txWaveform,snrdB,'measured');
```

Create a raised cosine receiver filter.

```
rxFilter = comm.RaisedCosineReceiveFilter( ...
      'RolloffFactor',s2WaveGen.RolloffFactor, ...
       'InputSamplesPerSymbol',sps,...
       'DecimationFactor',sps);
s = coeffs(rxFilter);
rxFilter.Gain = sum(s.Numerator);
```

Apply matched filtering and remove the filter delay.

```
filtOut = rxFilter(rxIn);
rxFrame = filtOut(rxFilter.FilterSpanInSymbols+1:end);
```

Recover UPs. Display the number of frames lost and the UP cyclic redundancy check (CRC) status.

```
[bits,FramesLost,pktCRCStat] = dvbs2BitRecover(rxFrame,10^(-EsNodB/10));
disp(FramesLost)
```

```
     0
```

```
disp(pktCRCStat)
```

```
    {20×1 logical}
```

Recover Data Bits from Generic Stream DVB-S2 Transmission with Early Termination Enabled

Recover user bits in a multi-input generic stream (GS) Digital Video Broadcasting Satellite Second Generation (DVB-S2) transmission with variable modulation and coding scheme.

This example uses MAT-files with LDPC parity matrices. If the MAT-files are not available on the path, download and unzip the MAT-files by entering this code at the MATLAB command prompt.

```
if ~exist('dvbs2xLDPCParityMatrices.mat','file')
    if ~exist('s2xLDPCParityMatrices.zip','file')
        url = 'https://ssd.mathworks.com/supportfiles/spc/satcom/DVB/s2xLDPCParityMatrices.zip';
        websave('s2xLDPCParityMatrices.zip',url);
        unzip('s2xLDPCParityMatrices.zip');
    end
addpath('s2xLDPCParityMatrices');
end
```

Specify the number of physical layer (PL) frames per stream.

```
nFrames = 1;
```

Create a DVB-S2 System object with variable coding and modulation configuration for a multi-input GS. Specify the modulation scheme and forward error correction (FEC) rate (MODCOD) and the data field length (DFL).

```
s2WaveGen = dvbs2WaveformGenerator;
s2WaveGen.StreamFormat = "GS";
s2WaveGen.NumInputStreams = 3;
s2WaveGen.MODCOD = [10 15 6];    % QPSK 8/9, 8PSK 5/6, and QPSK 2/3
s2WaveGen.DFL = [44500 51387 42960];
```

Create a bit vector of input information bits for each input stream.

```
data =  cell(s2WaveGen.NumInputStreams,1);
for i = 1:s2WaveGen.NumInputStreams
   data{i} = randi([0 1],s2WaveGen.DFL(i)*nFrames,1);
end
```

Generate the DVB-S2 time-domain waveform with the input information bits. Flush the transmit filter to handle the filter delay and recover the complete frame.

```
txWaveform = [s2WaveGen(data); flushFilter(s2WaveGen)];
```

Add additive white Gaussian noise (AWGN) to the generated waveform. Specify the samples per symbol for the baseband filter.

```
sps = s2WaveGen.SamplesPerSymbol;
EsNodB = 10;
snrdB = EsNodB - 10*log10(sps);
rxIn = awgn(txWaveform,snrdB,'measured');
```

Create a raised cosine receiver filter.

```
rxFilter = comm.RaisedCosineReceiveFilter( ...
      'RolloffFactor',s2WaveGen.RolloffFactor, ...
       'InputSamplesPerSymbol',sps,...
       'DecimationFactor',sps);
s = coeffs(rxFilter);
rxFilter.Gain = sum(s.Numerator);
```

Apply matched filtering and remove the filter delay.

```
filtOut = rxFilter(rxIn);
rxFrame = filtOut(rxFilter.FilterSpanInSymbols+1:end);
```

Recover user bits. Enable early termination of the low-density parity-codes (LDPC) decoder.

```
[bits,FramesLost] = dvbs2BitRecover(rxFrame,10^(-EsNodB/10),1);
```

Display the number of frames lost and the number of bit errors in each stream.

```
fprintf('Number of frames lost = %d\n',FramesLost)
```

```
Number of frames lost = 0
```

```
for i = 1:s2WaveGen.NumInputStreams
        fprintf('Number of bit errors in stream %d = %d\n',i, ...
            sum(data{i}~=bits{i}))
end
```

```
Number of bit errors in stream 1 = 0
Number of bit errors in stream 2 = 0
Number of bit errors in stream 3 = 0
```

Recover Data Bits from Transport Stream DVB-S2 Transmission with ISSYI Enabled

Recover user packets (UPs) in a multi-input transport stream (TS) Digital Video Broadcasting Satellite Second Generation (DVB-S2) transmission with constant coding and modulation.

This example uses MAT-files with LDPC parity matrices. If the MAT-files are not available on the path, download and unzip the MAT-files by entering this code at the MATLAB command prompt.

```
if ~exist('dvbs2xLDPCParityMatrices.mat','file')
    if ~exist('s2xLDPCParityMatrices.zip','file')
        url = 'https://ssd.mathworks.com/supportfiles/spc/satcom/DVB/s2xLDPCParityMatrices.zip';
        websave('s2xLDPCParityMatrices.zip',url);
        unzip('s2xLDPCParityMatrices.zip');
    end
addpath('s2xLDPCParityMatrices');
end
```

Specify the number of physical layer (PL) frames per stream.

```
numFrames = 1;
```

Create a DVB-S2 System object with constant coding and modulation configuration for a multi-input TS. Specify a short forward error correction (FEC) frame format and enable the input stream synchronization (ISSY).

```
s2WaveGen = dvbs2WaveformGenerator;
s2WaveGen.NumInputStreams = 3;
s2WaveGen.FECFrame = "short";
s2WaveGen.MODCOD = 10;       % QPSK 8/9
s2WaveGen.DFL    = 13920;
s2WaveGen.ISSYI = true;
```

Create a bit vector of information bits of concatenated TS UPs.

```
syncBits = [0 1 0 0 0 1 1 1]';      % Sync byte for TS packet is 47 Hex
pktLen = 1496;                      % UP length without sync bits is 1496
data =  cell(1,s2WaveGen.NumInputStreams);
for i = 1:s2WaveGen.NumInputStreams
   numPkts = s2WaveGen.MinNumPackets(i)*numFrames;
   txRawPkts = randi([0 1],pktLen,numPkts);
   ISSY = randi([0 1],16,numPkts);   % ISCRFormat is 'short' by default
                                     % 'short' implies the default length of ISSY as 2 bytes
   txPkts = [repmat(syncBits,1,numPkts); txRawPkts; ISSY]; % ISSY is appended at the end of UP
   data{i} = txPkts(:);
end
```

Generate the DVB-S2 time-domain waveform using the input information bits. Flush the transmit filter to handle the filter delay and recover the complete frame.

```
txWaveform = [s2WaveGen(data); flushFilter(s2WaveGen)];
```

Add additive white Gaussian noise (AWGN) to the generated waveform. Specify the samples per symbol for the baseband filter.

```
sps = s2WaveGen.SamplesPerSymbol;
EsNodB = 12;
snrdB = EsNodB - 10*log10(sps);
rxIn = awgn (txWaveform,snrdB,'measured');
```

Create a raised cosine receiver filter.

```
rxFilter = comm.RaisedCosineReceiveFilter( ...
      'RolloffFactor',s2WaveGen.RolloffFactor, ...
       'InputSamplesPerSymbol',sps,...
       'DecimationFactor', sps);
s = coeffs(rxFilter);
rxFilter.Gain = sum(s.Numerator);
```

Apply matched filtering and remove filter delay.

```
filtOut = rxFilter(rxIn);
rxFrame = filtOut(rxFilter.FilterSpanInSymbols+1:end);
```

Recover UPs. Display the number of frames lost and the number of bit errors in each stream.

```
[bits,FramesLost,pktCRCStat] = dvbs2BitRecover(rxFrame,10^(-EsNodB/10));
fprintf('Number of frames lost = %d\n',FramesLost)
```

```
Number of frames lost = 0
```

```
for i = 1:s2WaveGen.NumInputStreams
    fprintf('Number of bit errors in stream %d = %d\n',i, ...
    numel(pktCRCStat{i})-sum(pktCRCStat{i}))
end
```

```
Number of bit errors in stream 1 = 0
Number of bit errors in stream 2 = 0
Number of bit errors in stream 3 = 0
```

Input Arguments

RXFRAME — Received IQ symbols from PL frames of DVB-S2 transmission
column vector

Received IQ symbols from PL frames of a DVB-S2 single-input or multi-input transmission, specified as a column vector. RXFRAME can contain one or multiple PL frames.

The length of RXFRAME depends on the value of the properties FECFrame, MODCOD, and HasPilots of the dvbs2WaveformGenerator System object™.

Data Types: double
Complex Number Support: Yes

NVAR — Noise variance estimate
nonnegative scalar

Noise variance estimate that the function adds to the input IQ symbols, specified as a nonnegative scalar. NVAR is used as a scaling factor to calculate the soft bits from the IQ symbols.

When you specify NVAR as 0, the function uses a value of 1e-5, which corresponds to a signal-to-noise ratio (SNR) of 50 dB.

Data Types: double

EARLYTERM — Flag for early termination of LDPC decoder
0 or false (default) | 1 or true

Flag for early termination of the LDPC decoder when all parity-checks are satisfied, specified as a set logical 1 (true) or 0 (false). When set to 1 (true), the LDPC decoder is terminated when all parity checks are satisfied.

When you set this value to 0 (false), the maximum decoding iteration limit is 50.

Data Types: logical

Output Arguments

BITS — Recovered data bits
cell array of column vectors

Recovered data bits, returned as a cell array of column vectors. Each element of the cell array is of data type int8. This output can be either UPs or generic data stream, depending of the StreamFormat property of the dvbs2WaveformGenerator System object.

For a multi-input stream transmission, each element of the cell array corresponds to an individual input stream.

Data Types: cell

NUMFRAMESLOST — Number of lost baseband frames
nonnegative integer

Number of lost baseband frames, returned as a nonnegative integer. If the baseband header CRC fails, the frame is considered lost.

Data Types: double

PKTCRCSTATUS — UP CRC status
cell array of column vectors

UP CRC status, returned as a cell array of column vectors. Each element of the cell array is of data type logical. For a multi-input stream transmission, each element of the cell array corresponds to an individual input stream.

Dependencies

PKTCRCSTATUS applies for only the input streams where the value of the UPL property of dvbs2WaveformGenerator System object is nonzero.

Data Types: cell

p618PropagationLosses

Calculate Earth-space propagation losses, cross-polarization discrimination, and sky noise temperature

Syntax

```
[pl,xpd,tsky] = p618PropagationLosses(p618cfg)
[pl,xpd,tsky] = p618PropagationLosses(p618cfg,Name,Value)
```

Description

`[pl,xpd,tsky] = p618PropagationLosses(p618cfg)` returns Earth-space propagation losses `pl`, cross-polarization discrimination `xpd`, and sky noise temperature `tsky`, as defined in the ITU-R P.618 recommendation [1]. `p618cfg` specifies the P.618 configuration parameters.

This function requires MAT-files with digital maps from International Telecommunication Union (ITU) documents. If they are not available on the path, download and uncompress the data files from https://www.mathworks.com/supportfiles/spc/P618/ITURDigitalMaps.tar.gz to a location on the MATLAB path.

`[pl,xpd,tsky] = p618PropagationLosses(p618cfg,Name,Value)` specifies additional options using one or more name-value pair arguments.

Examples

Calculate Propagation Losses, Cross-Polarization Discrimination, and Sky Noise Temperature

This example requires MAT-files with digital maps from ITU documents. If they are not available on the path, execute the following commands to download and unzip the MAT-files.

```
maps = exist('maps.mat','file');
p836 = exist('p836.mat','file');
p837 = exist('p837.mat','file');
p840 = exist('p840.mat','file');
matFiles = [maps p836 p837 p840];
if ~all(matFiles)
    if ~exist('ITURDigitalMaps.tar.gz','file')
        url = 'https://www.mathworks.com/supportfiles/spc/P618/ITURDigitalMaps.tar.gz';
        websave('ITURDigitalMaps.tar.gz',url);
        untar('ITURDigitalMaps.tar.gz');
    else
        untar('ITURDigitalMaps.tar.gz');
    end
    addpath(cd);
end
```

Create a default P.618 configuration object.

```
cfg = p618Config;
```

Specify the time percentage of excess for the rain attenuation per annum as 0.01 and the time percentage of excess for the total attenuation per annum as 0.001.

```
cfg.RainAnnualExceedance = 0.01;
cfg.TotalAnnualExceedance = 0.001;
```

Calculate the propagation losses, cross-polarization discrimination, and sky noise temperature.

```
[pl,xpd,tsky] = p618PropagationLosses(cfg)
```

```
pl = struct with fields:
    Ag: 0.2269
    Ac: 0.4552
    Ar: 6.7981
    As: 0.2633
    At: 15.6091

xpd = 32.8876

tsky = 267.4689
```

Calculate Earth-space Propagation Losses Using Name-Value Pair Arguments

This example requires MAT-files with digital maps from ITU documents. If they are not available on the path, execute the following commands to download and untar the MAT-files.

```
maps = exist('maps.mat','file');
p836 = exist('p836.mat','file');
p837 = exist('p837.mat','file');
p840 = exist('p840.mat','file');
matFiles = [maps p836 p837 p840];
if ~all(matFiles)
    if ~exist('ITURDigitalMaps.tar.gz','file')
        url = 'https://www.mathworks.com/supportfiles/spc/P618/ITURDigitalMaps.tar.gz';
        websave('ITURDigitalMaps.tar.gz',url);
        untar('ITURDigitalMaps.tar.gz');
    else
        untar('ITURDigitalMaps.tar.gz');
    end
    addpath(cd);
end
```

Create a P.618 configuration object with a signal frequency of 20 GHz.

```
cfg = p618Config('Frequency',20e9);
```

Specify the surface water vapor density as $2.8\frac{g}{m^3}$, the total columnar content of the cloud liquid water as 1.4 $\frac{\text{kg}}{m^2}$, and the median value of the wet surface refractivity as 1.2. Set the earth station height as 0.5 km. Calculate the Earth-space propagation losses.

```
pl =  p618PropagationLosses(cfg,'StationHeight',0.5,...
                                'WaterVaporDensity',2.8,...
                                'TotalColumnarContent',1.4,...
                                'WetSurfaceRefractivity',1.2)
```

```
pl = struct with fields:
    Ag: 0.8649
    Ac: 1.0987
    Ar: 0.8907
    As: 0.1372
    At: 2.8590
```

Calculate Propagation Losses in Light Rainfall

This example requires MAT-files with digital maps from ITU documents. If they are not available on the path, execute the following commands to download and unzip the MAT-files.

```
maps = exist('maps.mat','file');
p836 = exist('p836.mat','file');
p837 = exist('p837.mat','file');
p840 = exist('p840.mat','file');
matFiles = [maps p836 p837 p840];
if ~all(matFiles)
    if ~exist('ITURDigitalMaps.tar.gz','file')
        url = 'https://www.mathworks.com/supportfiles/spc/P618/ITURDigitalMaps.tar.gz';
        websave('ITURDigitalMaps.tar.gz',url);
        untar('ITURDigitalMaps.tar.gz');
    else
        untar('ITURDigitalMaps.tar.gz');
    end
    addpath(cd);
end
```

Create a P.618 configuration object that occupies a signal frequency of 20 GHz.

```
cfg = p618Config('Frequency',20e9);
```

Calculate the propagation losses in a light rainfall of 1 mm/hr with an earth station height of 0.75 km.

```
pl =  p618PropagationLosses(cfg,'RainRate',1,'StationHeight',0.75)
```

```
pl = struct with fields:
    Ag: 0.7996
    Ac: 0.8793
    Ar: 0.0177
    As: 0.3187
    At: 1.7514
```

Input Arguments

`p618cfg` — P.618 configuration
p618Config object

P.618 configuration required for the calculation of the propagation losses, cross-polarization discrimination, and sky noise temperature, specified as a `p618Config` object.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1,...,NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose `Name` *in quotes.*

Example: `'StationHeight'`,`1.5` specifies the earth station height as 1.5 km.

`StationHeight` — Height of earth station

nonnegative scalar

Height of the earth station above the mean sea level in km, specified as the comma-separated pair consisting of '`StationHeight`' and a nonnegative scalar. The maximum supported value is 100. If the local data is not available as an input, the function uses the digital maps provided in ITU-R P.1511 section 1, Annex 1 [3] to obtain the station height value.

Data Types: `double` | `single`

`Temperature` — Temperature of earth surface

nonnegative scalar

Temperature of the earth surface in kelvin, specified as the comma-separated pair consisting of '`Temperature`' and a nonnegative scalar. If the local data is not available as an input, the function uses the map of the mean annual surface temperature provided in ITU-R P.1510 section 1, Annex 1 [4] to obtain the temperature value.

Data Types: `double` | `single`

`Pressure` — Dry air pressure at earth surface

nonnegative scalar

Dry air pressure at the earth surface in hPa, specified as the comma-separated pair consisting of '`Pressure`' and a nonnegative scalar. If the local data is not available as an input, the function uses the mean annual global reference atmosphere provided in ITU-R P.835 section 1.1, Annex 1 [5] to obtain the air pressure value.

Data Types: `double` | `single`

`WaterVaporDensity` — Surface water vapor density

nonnegative scalar

Surface water vapor density in g/m^3, specified as the comma-separated pair consisting of '`WaterVaporDensity`' and a nonnegative scalar. If the local data is not available as an input, the function uses the digital maps provided in ITU-R P.836 section 1, Annex 1 [6] to estimate the value of the water vapor density.

Data Types: `double` | `single`

`IntegratedWaterVaporContent` — Integrated water vapor content

positive scalar

Integrated water vapor content exceeded for the percentage of GasAnnualExceedance in an average year, specified as the comma-separated pair consisting of '`IntegratedWaterVaporContent`' and a positive scalar. Units are in kg/m^2 or mm. If the local data is not available as an input, the function uses the digital maps provided in ITU-R P.836 section 1, Annex 2 [6] to obtain the value of the integrated water vapor content.

Data Types: `double` | `single`

`TotalColumnarContent` — Total columnar content of cloud liquid water
nonnegative scalar

Total columnar content of the cloud liquid water exceeded for the percentage of CloudAnnualExceedance in an average year, specified as the comma-separated pair consisting of '`TotalColumnarContent`' and a nonnegative scalar. Units are in kg/m^2 or mm. If the local data is not available as an input, the function uses the digital maps provided in ITU-R P.840 section 3.1, Annex 1 [7] to obtain the value of the total columnar content.

Data Types: `double` | `single`

`RainRate` — Point rainfall rate
nonnegative scalar

Point rainfall rate at the location for 0.01% of an average year, specified as the comma-separated pair consisting of '`RainRate`' and a nonnegative scalar. Units are in mm/hr. If the local data is not available as an input, the function uses the digital maps provided in ITU-R P.837, Annex 1 [8] to obtain the value of the point rainfall rate.

Data Types: `double` | `single`

`WetSurfaceRefractivity` — Median value of wet term of surface refractivity
nonnegative scalar

Median value of the wet term of the surface refractivity, specified as the comma-separated pair consisting of '`WetSurfaceRefractivity`' and a nonnegative scalar. If the local data is not available as an input, the function uses the digital maps provided in ITU-R P.453 section 2.2, Annex 1 [9] to obtain the value of the wet surface refractivity.

Data Types: `double` | `single`

`MeanRadiatingTemperature` — Atmospheric mean radiating temperature
nonnegative scalar

Atmospheric mean radiating temperature in kelvin, specified as the comma-separated pair consisting of '`MeanRadiatingTemperature`' and a nonnegative scalar. If the local data is not available as an input, the function uses an atmospheric mean radiating temperature of 275 K in the computation.

Data Types: `double` | `single`

Output Arguments

`pl` — Earth-space propagation losses information
structure

Earth-space propagation losses information, returned as a structure containing these fields.

Fields	Description
At	Total atmospheric attenuation (in dB)

Fields	Description
Ag	Gaseous attenuation (in dB)
Ac	Cloud and fog attenuation (in dB)
Ar	Rain attenuation (in dB)
As	Attenuation due to tropospheric scintillation (in dB)

xpd — Cross-polarization discrimination
scalar

Cross-polarization discrimination in (dB) not exceeded for the percentage of the RainAnnualExceedance, returned as a scalar.

`tsky` — Sky noise temperature
nonnegative scalar

Sky noise temperature (in kelvin) at the ground station antenna, returned as a nonnegative scalar.

Functions
`p618SiteDiversityOutage`

Introduced in R2021a

p618SiteDiversityOutage

Calculate outage probability due to rain attenuation with site diversity

Syntax

```
Outage = p618SiteDiversityOutage(cfgsd)
Outage = p618SiteDiversityOutage(cfgsd,Name,Value)
```

Description

`Outage = p618SiteDiversityOutage(cfgsd)` returns the outage probability due to rain attenuation with site diversity. The function calculates this value as per the ITU-R P.618 recommendation [1].

This function requires MAT-files with digital maps from International Telecommunication Union (ITU) documents. If they are not available on the path, download and uncompress the data files from https://www.mathworks.com/supportfiles/spc/P618/ITURDigitalMaps.tar.gz to a location on the MATLAB path.

`Outage = p618SiteDiversityOutage(cfgsd,Name,Value)` specifies additional options using one or more name-value pair arguments.

Examples

Calculate Outage Probability due to Rain Attenuation with Site Diversity

This example requires MAT-files with digital maps from ITU documents. If they are not available on the path, execute the following commands to download and untar the MAT-files.

```
maps = exist('maps.mat','file');
p836 = exist('p836.mat','file');
p837 = exist('p837.mat','file');
p840 = exist('p840.mat','file');
matFiles = [maps p836 p837 p840];
if ~all(matFiles)
    if ~exist('ITURDigitalMaps.tar.gz','file')
        url = 'https://www.mathworks.com/supportfiles/spc/P618/ITURDigitalMaps.tar.gz';
        websave('ITURDigitalMaps.tar.gz',url);
        untar('ITURDigitalMaps.tar.gz');
    else
        untar('ITURDigitalMaps.tar.gz');
    end
    addpath(cd);
end
```

Create a P.618 site diversity configuration object with a signal frequency of 25 GHz.

```
cfgsd = p618SiteDiversityConfig;
cfgsd.Frequency = 25e9;
```

Specify the polarization tilt angles for two sites as [-90 90] degrees, separation between the two sites as 50 km, and attenuation threshold on the two links as [9 9] dB.

```
cfgsd.PolarizationTiltAngle = [-90 90];
cfgsd.SiteDistance = 50;
cfgsd.AttenuationThreshold = [9 9];
```

Calculate the outage probability due to rain attenuation with site diversity.

```
outage = p618SiteDiversityOutage(cfgsd)
```

```
outage = 0.0338
```

Calculate Outage Probability with Site Diversity Using Name-Value Pair Arguments

This example requires MAT-files with digital maps from ITU documents. If they are not available on the path, execute these commands to download and untar the MAT-files.

```
maps = exist('maps.mat','file');
p836 = exist('p836.mat','file');
p837 = exist('p837.mat','file');
p840 = exist('p840.mat','file');
matFiles = [maps p836 p837 p840];
if ~all(matFiles)
    if ~exist('ITURDigitalMaps.tar.gz','file')
        url = 'https://www.mathworks.com/supportfiles/spc/P618/ITURDigitalMaps.tar.gz';
        websave('ITURDigitalMaps.tar.gz',url);
        untar('ITURDigitalMaps.tar.gz');
    else
        untar('ITURDigitalMaps.tar.gz');
    end
    addpath(cd);
end
```

Create a default P.618 site diversity configuration object. Change the signal frequency to 25 GHz.

```
cfgsd = p618SiteDiversityConfig;
cfgsd.Frequency = 25e9;
```

Specify the separation between two sites as 50 km and the attenuation threshold on the two links as [9 9] dB.

```
cfgsd.SiteDistance = 50;
cfgsd.AttenuationThreshold = [9 9];
```

Calculate the outage probability for the specified site diversity configuration.

```
outage = p618SiteDiversityOutage(cfgsd,'RainAnnualExceedances',[0.01 0.05 0.2],...
                                'RainProbability1',0.3,...
                                'RainProbability2',0.5)
```

```
outage = 0.0339
```

Input Arguments

`cfgsd` — P.618 site diversity configuration
p618SiteDiversityConfig object

P.618 site diversity configuration required for the calculation of the outage probability due to rain attenuation, specified as a `p618SiteDiversityConfig` object.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1,...,NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose `Name` *in quotes.*

Example: `'RainAnnualExceedances',[0.01 0.02 0.03 0.05]` specifies the average annual time percentage of excess for the rain attenuation.

`RainAnnualExceedances` — Average annual time percentage of excess for rain attenuation
nonnegative vector

Average annual time percentage of excess for the rain attenuation, specified as the comma-separated pair consisting of `'RainAnnualExceedances'` and a nonnegative vector. The values in this vector must be less than the probability of rain at the two sites.

If the local data is not available as an input, the function uses `[0.01 0.02 0.03 0.05 0.1 0.2 0.3 0.5 1 2 3 5]` as the default vector.

Data Types: `double` | `single`

`RainAttenuations1` — Rain attenuations at site 1
nonnegative vector

Rain attenuations (in dB) at site 1, specified as the comma-separated pair consisting of `'RainAttenuations1'` and a nonnegative vector. This value specifies the rain attenuation exceeded for the percentages given in the `RainAnnualExceedances` name-value pair argument. The dimension of this value must match that of the `RainAnnualExceedances`.

If the local data is not available as an input, the function uses the method as defined in section 2.2.1.1 of the ITU-R P.618 [1] recommendation to calculate the rain attenuations for site 1.

Note If you do not specify `RainAttenuations1`, then `RainAnnualExceedances` must be in the range from 0.01% to 5%.

Data Types: `double` | `single`

`RainAttenuations2` — Rain attenuations at site 2
nonnegative vector

Rain attenuations (in dB) at site 2, specified as the comma-separated pair consisting of `'RainAttenuations2'` and a nonnegative vector. This value specifies the rain attenuation exceeded for the percentages given in the `RainAnnualExceedances` name-value pair argument. The dimension of this value must match that of the `RainAnnualExceedances`.

If the local data is not available as an input, the function uses the method as defined in section 2.2.1.1 of the ITU-R P.618 recommendation to calculate the rain attenuations for site 2.

Note If you do not specify `RainAttenuations2`, then `RainAnnualExceedances` must be in the range from 0.01% to 5%.

Data Types: `double` | `single`

`RainProbability1` — Probability of rain for site 1
nonnegative scalar

Probability of (in %) rain for site 1, specified as the comma-separated pair consisting of `'RainProbability1'` and a nonnegative scalar.

If the local measured rainfall rate data is not available as an input, the function uses the digital maps as defined in ITU-R P.837 Annex 1 [2] to calculate the rain probability for the sites.

Data Types: `double` | `single`

`RainProbability2` — Probability of rain for site 2
nonnegative scalar

Probability of (in %) rain for site 2, specified as the comma-separated pair consisting of `'RainProbability2'` and a nonnegative scalar.

If the local measured rainfall rate data is not available as an input, the function uses the digital maps as defined in ITU-R P.837 Annex 1 [2] to calculate the rain probability for the sites.

Data Types: `double` | `single`

Output Arguments

`Outage` — Outage probability due to rain attenuation with site diversity
nonnegative scalar

Outage probability due to rain attenuation with site diversity, returned as a nonnegative scalar. This argument predicts the joint probability ($P_r(A_1 \geq a_1, A_2 \geq a_2)$), where the attenuation on the path of the site 1 must exceed a_1 and the attenuation on the path of the site 2 must exceed a_2.

Objects
`p618Config` | `p618SiteDiversityConfig`

Functions
`p618PropagationLosses`

Introduced in R2021a

ccsdsTCWaveform

Generate CCSDS TC waveform

Syntax

```
waveform = ccsdsTCWaveform(bits,cfgFormat)
[waveform,encodedBits] = ccsdsTCWaveform(bits,cfgFormat)
```

Description

`waveform = ccsdsTCWaveform(bits,cfgFormat)` generates a Consultative Committee for Space Data Systems (CCSDS) Telecommand (TC) time-domain waveform, `waveform`, for the corresponding input bits, `bits`, and the given format configuration, `cfgFormat`.

`[waveform,encodedBits] = ccsdsTCWaveform(bits,cfgFormat)` also returns the bits obtained after TC synchronization and channel coding sublayer operations.

Examples

Create CCSDS TC Waveform for Multiple CLTUs

Create a Consultative Committee for Space Data Systems (CCSDS) Telecommand (TC) time-domain waveform for multiple communications link transmission units (CLTUs).

Create a default CCSDS TC configuration object.

```
cfg = ccsdsTCConfig;
disp(cfg)
```

```
  ccsdsTCConfig with properties:

             DataFormat: "CLTU"
          ChannelCoding: "BCH"
          HasRandomizer: 1
             Modulation: "PCM/PSK/PM"
              PCMFormat: "NRZ-L"
        ModulationIndex: 0.4000
    SubcarrierFrequency: 16000
             SymbolRate: 4000
       SamplesPerSymbol: 10

   Read-only properties:
     SubcarrierWaveform: "sine"
```

Specify the number of CLTUs and the transfer frame length.

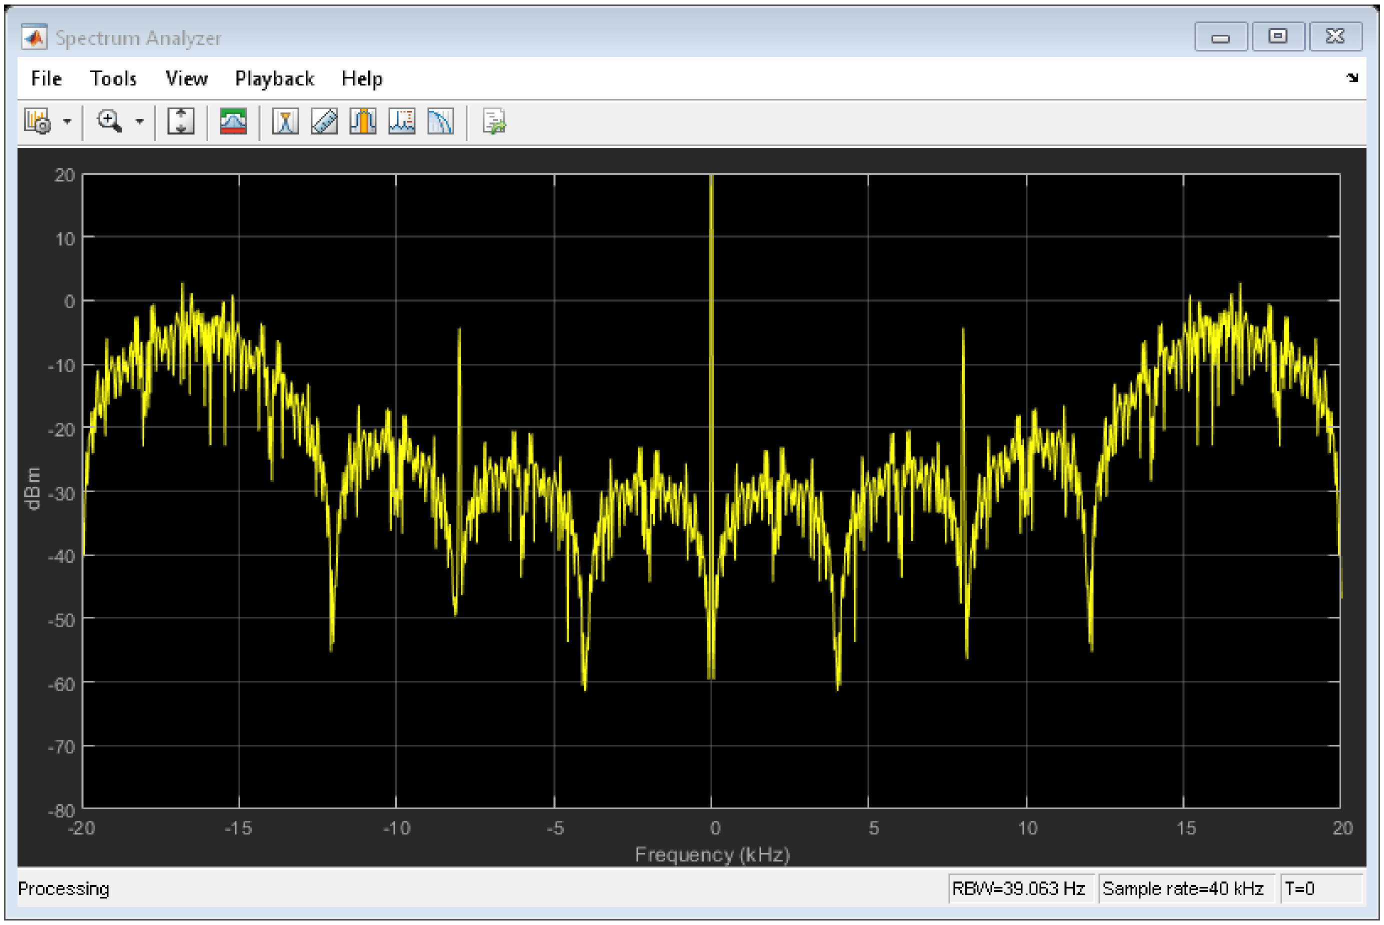
```
numCLTUs = 10;
transferFramesLength = 8; % Number of octets in each transfer frame
```

Generate the CCSDS TC time-domain waveform for the transfer frames.

```
c = cell(1,numCLTUs); % Cell array to store the generated waveform for all CLTUs
for k=1:numCLTUs
    bits = randi([0 1],8*transferFramesLength,1); % Bits in the TC transfer frame
    waveform = ccsdsTCWaveform(bits,cfg);
    c{1,k} = waveform; % Waveform for each CLTU
end
```

Create a `dsp.SpectrumAnalyzer` System object to display the frequency spectrum of the generated CCSDS TC time-domain waveform from the last CLTU.

```
scope = dsp.SpectrumAnalyzer;
scope.SampleRate = cfg.SamplesPerSymbol*cfg.SymbolRate;
scope(waveform)  % Last CLTU spectrum display
```



Create CCSDS TC Waveform for Acquisition Sequence

Create a Consultative Committee for Space Data Systems (CCSDS) Telecommand (TC) time-domain waveform for a acquisition sequence with 20 octets.

Create a CCSDS TC configuration object, and then specify the object properties. Display the object properties.

```
cfg = ccsdsTCConfig;
cfg.DataFormat = "acquisition sequence";
cfg.Modulation = "PCM/PM/biphase-L";
cfg.ModulationIndex = 1.2;
disp(cfg)
```

```
  ccsdsTCConfig with properties:

           DataFormat: "acquisition sequence"
           Modulation: "PCM/PM/biphase-L"
      ModulationIndex: 1.2000
     SamplesPerSymbol: 10
```

Generate the CCSDS TC waveform.

```
bits = repmat([0;1],8*10,1); % Alternating 1s and 0s with 0s as a starting sequence bit
waveform = ccsdsTCWaveform(bits,cfg);
```

Input Arguments

bits — Information bits
binary-valued column vector

Information bits, specified as a binary-valued column vector.

- When you set the DataFormat property of the `ccsdsTCConfig` object to `"CLTU"`, the length of this vector must be an integer multiple of 8.
- When you set the `DataFormat` property of the `ccsdsTCConfig` object to `"acquisition sequence"` or `"idle sequence"`, this vector must be a sequence of alternating 1s and 0s, starting with either 1 or 0.

Data Types: `double` | `int8` | `logical`

cfgFormat — Format configuration object
`ccsdsTCConfig` object

Format configuration object, specified as `ccsdsTCConfig` object. The properties of this object define the parameters required for CCSDS TC waveform generation.

Output Arguments

waveform — Generated time-domain CCSDS TC waveform
column vector

Generated time-domain CCSDS TC waveform, returned as a column vector. The `waveform` output is generated in the form of complex in-phase quadrature (IQ) samples.

Data Types: `double`

encodedBits — Output bits obtained after TC synchronization and channel coding sublayer operations
column vector

Output bits obtained after TC synchronization and channel coding sublayer operations, returned as a column vector.

Data Types: `double`

Functions
`ccsdsTCIdealReceiver`

Objects
`ccsdsTCConfig` | `ccsdsTMWaveformGenerator`

Introduced in R2021a

ccsdsTCIdealReceiver

Ideal receiver for CCSDS TC waveform

Syntax

```
bits = ccsdsTCIdealReceiver(waveform,cfg)
bits = ccsdsTCIdealReceiver(waveform,cfg,Name,Value)
```

Description

`bits = ccsdsTCIdealReceiver(waveform,cfg)` recovers transfer frames from a Consultative Committee for Space Data Systems (CCSDS) Telecommand (TC) `waveform`, generated using the `ccsdsTCWaveform` function. Output `bits` is the recovered bits for the given format configuration `cfg`.

`bits = ccsdsTCIdealReceiver(waveform,cfg,Name,Value)` specifies options using one or more name-value pairs. For example, `'NoiseVariance',1e-11` specifies the noise variance of additive white Gaussian noise (AWGN) on the received waveform as 1e-11.

Examples

Recover Transfer Frame from CCSDS TC Waveform

Recover the transfer frame from the Consultative Committee for Space Data Systems (CCSDS) Telecommand (TC) waveform.

Create a CCSDS TC object and specify the object properties.

```
cfg = ccsdsTCConfig;
cfg.HasRandomizer = 1;
cfg.SamplesPerSymbol = 12;
disp(cfg)
```

```
  ccsdsTCConfig with properties:

              DataFormat: "CLTU"
           ChannelCoding: "BCH"
           HasRandomizer: 1
              Modulation: "PCM/PSK/PM"
               PCMFormat: "NRZ-L"
         ModulationIndex: 0.4000
     SubcarrierFrequency: 16000
              SymbolRate: 4000
        SamplesPerSymbol: 12

   Read-only properties:
     SubcarrierWaveform: "sine"
```

Specify the transfer frame length and generate the CCSDS TC waveform for the transfer frame.

```
transferFrameLength = 12; % Number of octets in each transfer frame
data = randi([0 1],8*transferFrameLength,1); % bits in the transfer frame
waveform = ccsdsTCWaveform(data,cfg);
```

Recover the transfer frame from the CCSDS TC waveform

```
decodedBits = ccsdsTCIdealReceiver(waveform,cfg,'DecodingMode',"error detecting");
```

Check if the transfer frame is recovered successfully.

```
rxBits = decodedBits{1};
bits = rxBits((1:8*transferFrameLength)');
isequal(bits,data)
```

```
ans = logical
   1
```

Input Arguments

`waveform` — Received time-domain signal
column vector

Received time-domain signal, consisting of complex in-phase quadrature (IQ) samples, specified as a column vector. The `waveform` input is a CCSDS TC waveform.

A CCSDS TC waveform can contain one or more communications link transmission units (CLTUs). Each CLTU can contain one or more transfer frames.

Data Types: `single` | `double`
Complex Number Support: Yes

`cfg` — Format configuration object
`ccsdsTCConfig` object

Format configuration object, specified as `ccsdsTCConfig` object. The properties of this object determine the parameters required for CCSDS TC waveform generation and reception.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1,...,NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose `Name` *in quotes.*

Example: `ccsdsTCIdealReceiver(waveform,cfg,'NoiseVariance',1e-11)` specifies the noise variance of AWGN on the received waveform as 1e-11.

`NoiseVariance` — Noise variance of AWGN
`1e-10` (default) | positive scalar

Noise variance of AWGN that is added to the input IQ symbols of the waveform, specified as a positive scalar.

Dependencies

To enable this name-value pair, set the `ChannelCoding` property of the `cfg` input to `"LDPC"`.

Data Types: `double`

`DecodingMode` — Decoding mode
`"error correcting"` (default) | `"error detecting"`

Decoding mode to decode the Bose Chaudhuri Hocquenghem (BCH) encoded codewords, specified as `"error correcting"` or `"error detecting"`.

`'DecodingMode'` defines the allowed number of errors in the start sequence of the CLTU. In error detecting mode, the allowed number of errors in the start sequence is zero. In error correcting mode, the allowed number of errors in the start sequence is one.

Dependencies

To enable this name-value pair, set the `ChannelCoding` property of the `cfg` input to `"BCH"`.

Data Types: `char` | `string`

`DetectionThreshold` — Threshold to detect start sequence
`0.7` (default) | scalar in the range [0.5, 1]

Threshold to detect the start sequence, by calculating the normalized correlation metric with the known start sequence, specified as a scalar in the range [0.5, 1]. When the computed normalized correlation metric is greater than or equal to `'DetectionThreshold'`, the start sequence of the CLTU is detected.

Dependencies

To enable this name-value pair, set the `ChannelCoding` property of the `cfg` input to `"LDPC"`.

Data Types: `double`

Output Arguments

`bits` — Recovered transfer frames
cell array of column vectors

Recovered transfer frames, returned as a cell array of column vectors. Each element of the cell array is of data type `int8`.

Bits in the cell array of one or more column vectors, corresponds to the number of CLTUs present in the `waveform` input. Recovered transfer frames of CLTUs can contain fill bits. The fill bits removal procedure is not performed in the TC synchronization and channel coding sublayer.

Data Types: `int8` | `cell`

info

Characteristic information about object

Syntax

```
s = info(obj)
```

Description

`s = info(obj)` returns a structure containing the characteristic information of the specified input object `obj`.

Examples

Get DVB-S2 Waveform Generator Information and Check Transmit Filter Delay

Get information from a `dvbs2WaveformGenerator` System object by using the `info` function. Then retrieve the filter residual samples by using the `flushFilter` object function.

This example uses MAT-files with LDPC parity matrices. If the MAT-files are not available on the path, download and unzip the MAT-files by entering this code at the MATLAB command prompt.

```
if ~exist('dvbs2xLDPCParityMatrices.mat','file')
    if ~exist('s2xLDPCParityMatrices.zip', 'file')
        url = 'https://ssd.mathworks.com/supportfiles/spc/satcom/DVB/s2xLDPCParityMatrices.zip';
        websave('s2xLDPCParityMatrices.zip',url);
        unzip('s2xLDPCParityMatrices.zip');
    end
addpath('s2xLDPCParityMatrices');
end
```

Specify the number of physical layer (PL) frames per stream.

```
numFrames = 1;
```

Create a Digital Video Broadcasting standard (DVB-S2) System object, and then specify its properties.

```
s2WaveGen = dvbs2WaveformGenerator;
s2WaveGen.NumInputStreams = 2;
s2WaveGen.MODCOD = [21 16];
s2WaveGen.DFL    = 47008;
s2WaveGen.ISSYI = true;
s2WaveGen.SamplesPerSymbol = 2;
disp(s2WaveGen)
```

```
  dvbs2WaveformGenerator with properties:

           StreamFormat: "TS"
        NumInputStreams: 2
               FECFrame: "normal"
                 MODCOD: [21 16]
```

```
                  DFL: 47008
        ScalingMethod: "outer radius as 1"
            HasPilots: 0
        RolloffFactor: 0.3500
  FilterSpanInSymbols: 10
     SamplesPerSymbol: 2
                ISSYI: true
            ISCRFormat: "short"

  Show all properties
```

Get the characteristic information about the DVB-S2 waveform generator.

```
info(s2WaveGen)
```

```
ans = struct with fields:
      ModulationScheme: {'16APSK'  '8PSK'}
    LDPCCodeIdentifier: {'5/6'  '8/9'}
```

Create the bit vector of input information bits, `data`, of concatenated TS user packets.

```
syncBits = [0 1 0 0 0 1 1 1]';       % Sync byte for TS packet is 47 Hex
pktLen = 1496;                       % UP length without sync bits is 1496
data =  cell(1,s2WaveGen.NumInputStreams);
for i = 1:s2WaveGen.NumInputStreams
    numPkts = s2WaveGen.MinNumPackets(i)*numFrames;
    txRawPkts = randi([0 1],pktLen,numPkts);
    ISSY = randi([0 1],16,numPkts);   % ISCRFormat is 'short' by default
                                      % 'short' implies the default length of ISSY as 2 bytes
    txPkts = [repmat(syncBits,1,numPkts);txRawPkts;ISSY];    % ISSY is appended at the end of UP
    data{i} = txPkts(:);
end
```

Generate a DVB-S2 time-domain waveform using the information bits.

```
txWaveform = [s2WaveGen(data)];
```

Check the filter residual data samples that remain in the filter delay.

```
flushFilter(s2WaveGen)
```

```
ans = 20×1 complex

   0.0153 + 0.4565i
   0.2483 + 0.5535i

      ⋮
```

Get DVB-S2X Waveform Generator Information and Check Transmit Filter Delay

Get information from a `dvbs2xWaveformGenerator` System object by using the `info` function. Then retrieve the filter residual samples by using the `flushFilter` object function.

This example uses MAT-files with LDPC parity matrices. If the MAT-files are not available on the path, download and unzip the MAT-files by entering this code at the MATLAB command prompt.

```
if ~exist('dvbs2xLDPCParityMatrices.mat','file')
    if ~exist('s2xLDPCParityMatrices.zip','file')
        url = 'https://ssd.mathworks.com/supportfiles/spc/satcom/DVB/s2xLDPCParityMatrices.zip';
        websave('s2xLDPCParityMatrices.zip',url);
        unzip('s2xLDPCParityMatrices.zip');
    end
addpath('s2xLDPCParityMatrices');
end
```

Specify the number of physical layer (PL) frames per stream.

```
numFrames = 2;
```

Create a Digital Video Broadcasting Satellite Second Generation extended (DVB-S2X) System object and specify its properties. Use time slicing technique and variable coding and modulation configuration mode.

```
s2xWaveGen = dvbs2xWaveformGenerator();
s2xWaveGen.HasTimeSlicing = true;
s2xWaveGen.NumInputStreams = 2;
s2xWaveGen.PLSDecimalCode = [135 145];   % QPSK 9/20 and 8PSK 25/36
s2xWaveGen.DFL = [18048 44656];
s2xWaveGen.PLScramblingIndex = [0 1];
disp(s2xWaveGen)
```

```
  dvbs2xWaveformGenerator with properties:

           StreamFormat: "TS"
         HasTimeSlicing: true
        NumInputStreams: 2
         PLSDecimalCode: [135 145]
                    DFL: [18048 44656]
      PLScramblingIndex: [0 1]
          RolloffFactor: 0.3500
    FilterSpanInSymbols: 10
       SamplesPerSymbol: 4
                  ISSYI: false

  Show all properties
```

Get the characteristic information about the DVB-S2X waveform generator.

```
info(s2xWaveGen)
```

```
ans = struct with fields:
              FECFrame: {'normal'  'normal'}
      ModulationScheme: {'QPSK'  '8PSK'}
    LDPCCodeIdentifier: {'9/20'  '25/36'}
```

Create the bit vector of input information bits, `data`, of concatenated TS user packets for each input stream.

```
syncBits = [0 1 0 0 0 1 1 1]';       % Sync byte for TS packet is 47 Hex
pktLen = 1496;                       % UP length without sync bits is 1496
data =  cell(1, s2xWaveGen.NumInputStreams);

```

Get CCSDS TM Waveform Generator Information and Check Transmit Filter Delay

Get information from a `ccsdsTMWaveformGenerator` System object by using the `info` function. Then retrieve the filter residual samples by using the `flushFilter` object function.

Create a Consultative Committee for Space Data Systems (CCSDS) Telemetry (TM) System object. Set the waveform type as `synchronization and channel coding` with low-density parity-check (LDPC) channel coding. Display the properties.

```
tmWaveGen = ccsdsTMWaveformGenerator;
tmWaveGen.WaveformSource = "synchronization and channel coding";
tmWaveGen.ChannelCoding = "LDPC";
tmWaveGen.NumBitsInInformationBlock = 1024;
tmWaveGen.Modulation = "QPSK";
tmWaveGen.CodeRate = "1/2";
disp(tmWaveGen)
```

```
  ccsdsTMWaveformGenerator with properties:

               WaveformSource: "synchronization and channel coding"
                HasRandomizer: true
                       HasASM: true
                    PCMFormat: "NRZ-L"

   Channel coding
                ChannelCoding: "LDPC"
    NumBitsInInformationBlock: 1024
                     CodeRate: "1/2"
                 IsLDPCOnSMTF: false

   Digital modulation and filter
```

```
                Modulation: "QPSK"
        PulseShapingFilter: "root raised cosine"
             RolloffFactor: 0.3500
       FilterSpanInSymbols: 10
          SamplesPerSymbol: 10

  Use get to show all properties
```

Specify the number of transfer frames.

```
numTF = 20;
```

Get the characteristic information about the CCSDS TM waveform generator.

```
info(tmWaveGen)
```

```
ans = struct with fields:
         ActualCodeRate: 0.5000
       NumBitsPerSymbol: 2
    SubcarrierFrequency: []
```

Generate the input bits for the CCSDS TM waveform generator, and then generate the waveform.

```
bits = randi([0 1], tmWaveGen.NumInputBits*numTF,1);
waveform = tmWaveGen(bits);
```

Check the filter residual data samples that remain in the filter delay.

```
flushFilter(tmWaveGen)
```

```
ans = 100×1 complex

  -0.0772 - 0.0867i
  -0.0751 - 0.0859i

```

Get ETSI Rician Channel Information

Get information from a `etsiRicianChannel` System object by using the `info` object function.

Create a European Telecommunication Standards Institute (ETSI) Rician channel System object, and then specify its properties.

```
chan = etsiRicianChannel;
chan.SampleRate = 2e5;
chan.KFactor = 10;
chan.MaximumDopplerShift = 20;
chan.NumSinusoids = 58;
disp(chan)
```

```
  etsiRicianChannel with properties:

             SampleRate: 200000
                KFactor: 10
    MaximumDopplerShift: 20

  Use get to show all properties
```

Pass data through the channel.

```
txWaveform = randi([0 1],500,1);
rxWaveform = chan(txWaveform);
```

Get the characteristic information about the ETSI Rician channel.

```
info(chan)
```

```
ans = struct with fields:
           ChannelFilterDelay: 0
    ChannelFilterCoefficients: 1
          NumSamplesProcessed: 500
```

Get P.681-11 LMS Channel Information

Get channel information from a `p681LMSChannel` System object by using the `info` object function.

Create an ITU-R P.681-11 LMS channel System object and specify its properties.

```
chan = p681LMSChannel;
chan.SampleRate = 10e3;             % Hz
chan.MobileSpeed = 2;               % m/s
chan.Environment = "RuralWooded";
disp(chan)
```

```
  p681LMSChannel with properties:

             SampleRate: 10000
           InitialState: "Good"
       CarrierFrequency: 2.2000e+09
         ElevationAngle: 45
            MobileSpeed: 2
    AzimuthOrientation: 0
            Environment: "RuralWooded"
       ChannelFiltering: true

  Use get to show all properties
```

QPSK-modulate a random input signal, and then pass it through the channel.

```
numSamples = 2e4;
txWaveform = pskmod(randi([0 3],numSamples,1),4);
[rxWaveform,pathGains,sampleTimes,stateSeries] = chan(txWaveform);
```

Get the characteristic information about the P.681-11 LMS channel.

```
info(chan)
```

```
ans = struct with fields:
                   PathDelays: 0
           ChannelFilterDelay: 0
    ChannelFilterCoefficients: 1
          NumSamplesProcessed: 20000
```

Transmit another QPSK-modulated random input signal through the channel

```
numSamples2 = 3e4;
txWaveform2 = pskmod(randi([0 3],numSamples2,1),4);
[rxWaveform2,pathGains2,sampleTimes2,stateSeries2] = chan(txWaveform2);
```

Observe the change in number of samples processed.

```
info(chan)
```

```
ans = struct with fields:
                   PathDelays: 0
           ChannelFilterDelay: 0
    ChannelFilterCoefficients: 1
          NumSamplesProcessed: 50000
```

Get P-Code State Information

Get information from a `gpsPCode` System object™ by using the `info` object function. Observe how the precision of initial time impacts the generation of the P-code.

Create a P-code generator System object™, and then specify its properties.

```
format long
pgen = gpsPCode
```

```
pgen = 
  gpsPCode with properties:

                 PRNID: 1
      OutputCodeLength: 10230
    InitialStateFormat: "seconds"
           InitialTime: 0
```

```
pgen.InitialStateFormat = "chips";
pgen.InitialNumChipsElapsed = 8388600;
```

Get the characteristic information about the P-code generator.

```
pgen.info
```

```
ans = struct with fields:
    TotalNumChipsElapsed: 8388600
```

```
     TotalSecondsElapsed: 0.820000000000000
```

Advance the time by a quarter of a P-code chip time (that is, 0.25/10.23e6).

```
pgen1 = gpsPCode;
pgen1.InitialTime = pgen.info.TotalSecondsElapsed + 0.25/10.23e6
```

```
pgen1 = 
  gpsPCode with properties:

                PRNID: 1
     OutputCodeLength: 10230
   InitialStateFormat: "seconds"
          InitialTime: 0.820000024437928
```

```
pgen1.info
```

```
ans = struct with fields:
    TotalNumChipsElapsed: 8388600
     TotalSecondsElapsed: 0.820000000000000
```

The `info` function output shows no increment in the `TotalNumChipsElapsed` in this case, because `TotalNumChipsElapsed` is calculated internally using the function `round`.

Advance the time by half of a P-code chip time now (that is, 0.5/10.23e6).

```
pgen2 = gpsPCode;
pgen2.InitialTime = pgen.info.TotalSecondsElapsed + 0.5/10.23e6
```

```
pgen2 = 
  gpsPCode with properties:

                PRNID: 1
     OutputCodeLength: 10230
   InitialStateFormat: "seconds"
          InitialTime: 0.820000048875855
```

```
pgen2.info
```

```
ans = struct with fields:
    TotalNumChipsElapsed: 8388601
     TotalSecondsElapsed: 0.820000097751711
```

The `info` function output now shows the `TotalNumChipsElapsed` is incremented by one, due to the internal usage of `round()` function.

Compare the output of each System object call.

```
code = pgen();
code1 = pgen1();
code2 = pgen2();
isequal(code, code1) % code and code1 are equal
```

```
ans = logical
   1

isequal(code1,code2) % code1 and code2 are unequal

ans = logical
   0
```

Input Arguments

obj — Input object
dvbs2WaveformGenerator | dvbs2xWaveformGenerator | dvbrcs2WaveformGenerator | ccsdsTMWaveformGenerator | etsiRicianChannel | p681LMSChannel | gpsPCode

Input object to get information from, specified as a `dvbs2WaveformGenerator`, `dvbs2xWaveformGenerator`, `dvbrcs2WaveformGenerator`, `ccsdsTMWaveformGenerator`, `etsiRicianChannel`, `p681LMSChannel`, or `gpsPCode` System object.

Output Arguments

s — Characteristic information of specified object
structure

Characteristic information of the specified object, returned as a structure. The fields of the structure depend on the `obj` input.

- If `obj` is a `dvbs2WaveformGenerator` System object, the output structure has these fields, consisting of physical layer information about the Digital Video Broadcasting Satellite Second Generation (DVB-S2) waveform generator.

Field	Value	Description
`ModulationScheme`	String scalar (default) or cell array of character vectors	Modulation scheme, returned as a string scalar for single-input stream and a cell array of character vectors of length equal to the `NumInputStreams` property of the `dvbs2WaveformGenerator` object for multi-input streams.

Field	Value	Description
`LDPCCodeIdentifier`	String scalar (default) or cell array of character vectors	LDPC code identifier used in forward error correction (FEC), returned as a string scalar for single-input stream and a cell array of character vectors of length equal to `NumInputStreams` property of the `dvbs2WaveformGenerator` object for multi-input streams.

- If `obj` is a `dvbs2xWaveformGenerator` System object, the output structure has these fields, consisting of physical layer information about the Digital Video Broadcasting Satellite Second Generation extended (DVB-S2X) waveform generator.

Field	Value	Description
`FECFrame`	String scalar (default) or cell array of character vectors	FEC frame format, returned as a string scalar for single-input stream and a cell array of character vectors of length equal to `NumInputStreams` property of `dvbs2xWaveformGenerator` object for multi-input streams.
`ModulationScheme`	String scalar (default) or cell array of character vectors	Modulation scheme, returned as a string scalar for single-input stream and a cell array of character vectors of length equal to `NumInputStreams` property of `dvbs2xWaveformGenerator` object for multi-input streams.
`LDPCCodeIdentifier`	String scalar (default) or cell array of character vectors	LDPC code identifier used in forward error correction (FEC), returned as a string scalar for single-input stream and a cell array of character vectors of length equal to `NumInputStreams` property of `dvbs2xWaveformGenerator` object for multi-input streams.

- If `obj` is a `dvbrcs2WaveformGenerator` System object, the output structure has these fields, consisting of physical layer information about the Digital Video Broadcasting Second Generation Return Channel over Satellite (DVB-RCS2) waveform generator.

Field	Value	Description
`BurstLength`	positive integer	Length of the burst, in symbols, prior to the pulse shaping, returned as a positive integer.
`PayloadLengthInBytes`	integer in the range [3, 65,535]	Input data length, in bytes, to the forward error correction (FEC) encoder, returned as a integer in the range [3, 65,535].
`MappingScheme`	`"pi/2-BPSK"`, `"QPSK"`, `"8PSK"`, or `"16QAM"`	Symbol mapping and modulation scheme to generate the DVB-RCS2 waveform, returned as `"pi/2-BPSK"`, `"QPSK"`, `"8PSK"`, or `"16QAM"`.
`CodeRate`	`"1/3"`, `"1/2"`, `"2/3"`, `"3/4"`, `"4/5"`, `"5/6"`, `"6/7"`, or `"7/8"`	Code rate of the channel encoder, returned as `"1/3"`, `"1/2"`, `"2/3"`, `"3/4"`, `"4/5"`, `"5/6"`, `"6/7"`, or `"7/8"`.
`PreambleLength`	integer in the range [0, 255]	Number of preamble symbols that are prefixed to the burst symbols prior to the modulation, returned as a integer in the range [0, 255]. When you set the `TransmissionFormat` property to `"TC-LM"`, the unit of preamble length is symbols. When you set the `TransmissionFormat` property to `"SS-TC-LM"`, the unit of preamble length is chips.

Field	Value	Description
`PostambleLength`	integer in the range [0, 255]	Number of postamble symbols that are suffixed to the burst symbols, prior to the modulation, returned as a integer in the range [0, 255]. When you set the `TransmissionFormat` property to `"TC-LM"`, the unit of preamble length is symbols. When you set the `TransmissionFormat` property to `"SS-TC-LM"`, the unit of preamble length is chips.
`PilotPeriod`	integer in the range [0, 4095]	Pilot symbol periodicity, including the burst symbols, returned as a integer in the range [0, 4095]. This period represents the length of the sequence from the first symbol of a pilot block to the first symbol of the next pilot block in symbols or chips.
`PilotBlockLength`	integer in the range [1, 255]	Length of the pilot block, in symbols, returned as a integer in the range [1, 255].
`PermutationParameters`	five-element vector	DVB-RCS2 turbo encoder permutation control parameters that are used to generate turbo encoder interleaver indices, returned as a five-element vector in order: P, Q_0, Q_1, Q_2, and Q_3.
`UniqueWord`	character array or string scalar	Hexadecimal string consisting of combined symbols of the preamble, one pilot block, and the postamble sequence, returned as a character array or string scalar.

- If `obj` is a `ccsdsTMWaveformGenerator` System object, the output structure has these fields, consisting of physical layer information about the Consultative Committee for Space Data Systems (CCSDS) Telemetry (TM) waveform generator.

Field	Value	Description
`ActualCodeRate`	positive scalar in range [0 1]	Numeric value of the code rate of the channel coding scheme, returned as a positive scalar in the range [0, 1]. This value is used to generate the CCSDS TM waveform.
`NumBitsPerSymbol`	positive integer	Number of bits per modulated symbol, returned as a positive integer.
`SubcarrierFrequency`	positive scalar	Subcarrier frequency, returned as a positive scalar. This field is applicable only when the `Modulation` property of `ccsdsTMWaveformGenerator` object is set to `"PCM/PSK/PM"`. For other cases, this value is returned as null.

- If `obj` is an `etsiRicianChannel` System object, the output structure has these fields, consisting of information about the fading channel.

Field	Value	Description
`ChannelFilterDelay`	`0`	Channel filter delay in samples returned as `0` always (due to flat-fading nature of the channel).
`ChannelFilterCoefficients`	`1`	Channel filter coefficient used to convert path gains to channel filter tap gains, returned as `1` always (as `etsiRicianChannel` describes a single path channel).
`NumSamplesProcessed`	positive integer	Number of samples processed by the channel object since the last reset, returned as a positive integer.

- If `obj` is a `p681LMSChannel` System object, the output structure has these fields, consisting of information about the ITU-R P.681-11 land-mobile satellite (LMS) fading channel.

Field	Value	Description
`PathDelays`	`0`	Delay of discrete channel path in seconds returned as `0` always (due to flat-fading nature of the channel).

Field	Value	Description
`ChannelFilterDelay`	`0`	Channel filter delay in samples returned as `0` always (due to flat-fading nature of the channel).
`ChannelFilterCoefficients`	`1`	Channel filter coefficient used to convert path gains to channel filter tap gains, returned as `1` always (as `p681LMSChannel` describes a single path channel).
`NumSamplesProcessed`	nonnegative integer	Number of samples processed by the channel object since the last reset, returned as a nonnegative integer.

- If `obj` is a `gpsPCode` System object, the output structure has these fields, consisting of state information about the GPS P-code generator.

Field	Value	Description
`TotalNumChipsElapsed`	positive integer	Total number of P-code chips that elapsed from the beginning of the week, returned as a positive integer. The beginning of a week is marked at midnight Saturday night - Sunday morning.
`TotalSecondsElapsed`	real-valued scalar	Total seconds elapsed from the beginning of the week, returned as a real-valued scalar.

Introduced in R2021a

flushFilter

Flush transmit filter

Syntax

```
out = flushFilter(obj)
```

Description

`out = flushFilter(obj)` passes zeros through the transmit filter in the input waveform generator to flush the residual data samples that remain in the filter state. The function returns the residual data samples.

You must call the input waveform generator System object (not only create the object) prior to using the `flushFilter` object function. The number of zeros passed through the transmit filter depends on the filter delay. This object function is required for the receiver simulations to recover all of the bits in the last physical layer frame.

Examples

Get DVB-S2 Waveform Generator Information and Check Transmit Filter Delay

Get information from a `dvbs2WaveformGenerator` System object by using the `info` function. Then retrieve the filter residual samples by using the `flushFilter` object function.

This example uses MAT-files with LDPC parity matrices. If the MAT-files are not available on the path, download and unzip the MAT-files by entering this code at the MATLAB command prompt.

```
if ~exist('dvbs2xLDPCParityMatrices.mat','file')
    if ~exist('s2xLDPCParityMatrices.zip', 'file')
        url = 'https://ssd.mathworks.com/supportfiles/spc/satcom/DVB/s2xLDPCParityMatrices.zip';
        websave('s2xLDPCParityMatrices.zip',url);
        unzip('s2xLDPCParityMatrices.zip');
    end
addpath('s2xLDPCParityMatrices');
end
```

Specify the number of physical layer (PL) frames per stream.

```
numFrames = 1;
```

Create a Digital Video Broadcasting standard (DVB-S2) System object, and then specify its properties.

```
s2WaveGen = dvbs2WaveformGenerator;
s2WaveGen.NumInputStreams = 2;
s2WaveGen.MODCOD = [21 16];
s2WaveGen.DFL   = 47008;
s2WaveGen.ISSYI = true;
s2WaveGen.SamplesPerSymbol = 2;
disp(s2WaveGen)
```

```
  dvbs2WaveformGenerator with properties:

           StreamFormat: "TS"
        NumInputStreams: 2
               FECFrame: "normal"
                 MODCOD: [21 16]
                    DFL: 47008
          ScalingMethod: "outer radius as 1"
              HasPilots: 0
          RolloffFactor: 0.3500
    FilterSpanInSymbols: 10
       SamplesPerSymbol: 2
                  ISSYI: true
             ISCRFormat: "short"

  Show all properties
```

Get the characteristic information about the DVB-S2 waveform generator.

```
info(s2WaveGen)
```

```
ans = struct with fields:
      ModulationScheme: {'16APSK'  '8PSK'}
    LDPCCodeIdentifier: {'5/6'  '8/9'}
```

Create the bit vector of input information bits, `data`, of concatenated TS user packets.

```
syncBits = [0 1 0 0 0 1 1 1]';       % Sync byte for TS packet is 47 Hex
pktLen = 1496;                       % UP length without sync bits is 1496
data =  cell(1,s2WaveGen.NumInputStreams);
for i = 1:s2WaveGen.NumInputStreams
    numPkts = s2WaveGen.MinNumPackets(i)*numFrames;
    txRawPkts = randi([0 1],pktLen,numPkts);
    ISSY = randi([0 1],16,numPkts);   % ISCRFormat is 'short' by default
                                      % 'short' implies the default length of ISSY as 2 bytes
    txPkts = [repmat(syncBits,1,numPkts);txRawPkts;ISSY];    % ISSY is appended at the end of UP
    data{i} = txPkts(:);
end
```

Generate a DVB-S2 time-domain waveform using the information bits.

```
txWaveform = [s2WaveGen(data)];
```

Check the filter residual data samples that remain in the filter delay.

```
flushFilter(s2WaveGen)
```

```
ans = 20×1 complex

   0.0153 + 0.4565i
   0.2483 + 0.5535i
   0.3527 + 0.3972i
   0.3541 - 0.0855i
   0.3505 - 0.4071i
   0.4182 - 0.1962i
   0.5068 + 0.0636i
   0.4856 - 0.1532i
   0.3523 - 0.4153i
   0.1597 - 0.2263i
       ⋮
```

Recover Data Bits from Transport Stream DVB-S2 Transmission

Recover user packets (UPs) for multiple physical layer (PL) frames in a single transport stream Digital Video Broadcasting Satellite Second Generation (DVB-S2) transmission.

This example uses MAT-files with LDPC parity matrices. If the MAT-files are not available on the path, download and unzip the MAT-files by entering this code at the MATLAB command prompt.

```
if ~exist('dvbs2xLDPCParityMatrices.mat','file')
    if ~exist('s2xLDPCParityMatrices.zip','file')
        url = 'https://ssd.mathworks.com/supportfiles/spc/satcom/DVB/s2xLDPCParityMatrices.zip';
        websave('s2xLDPCParityMatrices.zip',url);
        unzip('s2xLDPCParityMatrices.zip');
    end
addpath('s2xLDPCParityMatrices');
end
```

Specify the number of PL frames per stream. Create a DVB-S2 System object.

```
nFrames = 2;
s2WaveGen = dvbs2WaveformGenerator;
```

Create the bit vector of information bits, `data`, of concatenated TS UPs.

```
syncBits = [0 1 0 0 0 1 1 1]';    % Sync byte for TS packet is 47 Hex
pktLen = 1496;                    % UP length without sync bits is 1496
numPkts = s2WaveGen.MinNumPackets*nFrames;
txRawPkts = randi([0 1],pktLen,numPkts);
txPkts = [repmat(syncBits,1,numPkts); txRawPkts];
data = txPkts(:);
```

Generate the DVB-S2 time-domain waveform using the input information bits. Flush the transmit filter to handle the filter delay and recover the complete last frame.

```
txWaveform = [s2WaveGen(data); flushFilter(s2WaveGen)];
```

Add additive white Gaussian noise (AWGN) to the generated waveform.

```
sps = s2WaveGen.SamplesPerSymbol;
EsNodB = 1;
snrdB = EsNodB - 10*log10(sps);
rxIn = awgn(txWaveform,snrdB,'measured');
```

Create a raised cosine receiver filter.

```
rxFilter = comm.RaisedCosineReceiveFilter( ...
      'RolloffFactor',s2WaveGen.RolloffFactor, ...
       'InputSamplesPerSymbol',sps,...
       'DecimationFactor',sps);
s = coeffs(rxFilter);
rxFilter.Gain = sum(s.Numerator);
```

Apply matched filtering and remove the filter delay.

```
filtOut = rxFilter(rxIn);
rxFrame = filtOut(rxFilter.FilterSpanInSymbols+1:end);
```

Recover UPs. Display the number of frames lost and the UP cyclic redundancy check (CRC) status.

```
[bits,FramesLost,pktCRCStat] = dvbs2BitRecover(rxFrame,10^(-EsNodB/10));
disp(FramesLost)

     0

disp(pktCRCStat)

    {20×1 logical}
```

Get DVB-S2X Waveform Generator Information and Check Transmit Filter Delay

Get information from a `dvbs2xWaveformGenerator` System object by using the `info` function. Then retrieve the filter residual samples by using the `flushFilter` object function.

This example uses MAT-files with LDPC parity matrices. If the MAT-files are not available on the path, download and unzip the MAT-files by entering this code at the MATLAB command prompt.

```
if ~exist('dvbs2xLDPCParityMatrices.mat','file')
    if ~exist('s2xLDPCParityMatrices.zip','file')
        url = 'https://ssd.mathworks.com/supportfiles/spc/satcom/DVB/s2xLDPCParityMatrices.zip';
        websave('s2xLDPCParityMatrices.zip',url);
        unzip('s2xLDPCParityMatrices.zip');
    end
addpath('s2xLDPCParityMatrices');
end
```

Specify the number of physical layer (PL) frames per stream.

```
numFrames = 2;
```

Create a Digital Video Broadcasting Satellite Second Generation extended (DVB-S2X) System object and specify its properties. Use time slicing technique and variable coding and modulation configuration mode.

```
s2xWaveGen = dvbs2xWaveformGenerator();
s2xWaveGen.HasTimeSlicing = true;
s2xWaveGen.NumInputStreams = 2;
s2xWaveGen.PLSDecimalCode = [135 145];   % QPSK 9/20 and 8PSK 25/36
s2xWaveGen.DFL = [18048 44656];
s2xWaveGen.PLScramblingIndex = [0 1];
disp(s2xWaveGen)

  dvbs2xWaveformGenerator with properties:

           StreamFormat: "TS"
         HasTimeSlicing: true
        NumInputStreams: 2
         PLSDecimalCode: [135 145]
                    DFL: [18048 44656]
```

```
      PLScramblingIndex: [0 1]
          RolloffFactor: 0.3500
    FilterSpanInSymbols: 10
       SamplesPerSymbol: 4
                  ISSYI: false

  Show all properties
```

Get the characteristic information about the DVB-S2X waveform generator.

```
info(s2xWaveGen)
```

```
ans = struct with fields:
              FECFrame: {'normal'  'normal'}
      ModulationScheme: {'QPSK'  '8PSK'}
    LDPCCodeIdentifier: {'9/20'  '25/36'}
```

Create the bit vector of input information bits, `data`, of concatenated TS user packets for each input stream.

```
syncBits = [0 1 0 0 0 1 1 1]';       % Sync byte for TS packet is 47 Hex
pktLen = 1496;                       % UP length without sync bits is 1496
data =  cell(1, s2xWaveGen.NumInputStreams);
for i = 1:s2xWaveGen.NumInputStreams
    numPkts = s2xWaveGen.MinNumPackets(i)*numFrames;
    txRawPkts = randi([0 1], pktLen, numPkts);
    txPkts = [repmat(syncBits, 1, numPkts); txRawPkts];
    data{i} = txPkts(:);
end
```

Generate a DVB-S2X time-domain waveform using the information bits.

```
txWaveform = s2xWaveGen(data);
```

Check the filter residual data samples that remain in the filter delay.

```
flushFilter(s2xWaveGen)
```

```
ans = 40×1 complex

  -0.2412 - 0.0143i

Get CCSDS TM Waveform Generator Information and Check Transmit Filter Delay

Get information from a `ccsdsTMWaveformGenerator` System object by using the `info` function. Then retrieve the filter residual samples by using the `flushFilter` object function.

Create a Consultative Committee for Space Data Systems (CCSDS) Telemetry (TM) System object. Set the waveform type as `synchronization and channel coding` with low-density parity-check (LDPC) channel coding. Display the properties.

```
tmWaveGen = ccsdsTMWaveformGenerator;
tmWaveGen.WaveformSource = "synchronization and channel coding";
tmWaveGen.ChannelCoding = "LDPC";
tmWaveGen.NumBitsInInformationBlock = 1024;
tmWaveGen.Modulation = "QPSK";
tmWaveGen.CodeRate = "1/2";
disp(tmWaveGen)
```

```
  ccsdsTMWaveformGenerator with properties:

             WaveformSource: "synchronization and channel coding"
              HasRandomizer: true
                     HasASM: true
                  PCMFormat: "NRZ-L"

   Channel coding
              ChannelCoding: "LDPC"
    NumBitsInInformationBlock: 1024
                   CodeRate: "1/2"
               IsLDPCOnSMTF: false

   Digital modulation and filter
                 Modulation: "QPSK"
         PulseShapingFilter: "root raised cosine"
              RolloffFactor: 0.3500
         FilterSpanInSymbols: 10
            SamplesPerSymbol: 10

  Use get to show all properties
```

Specify the number of transfer frames.

```
numTF = 20;
```

Get the characteristic information about the CCSDS TM waveform generator.

```
info(tmWaveGen)
```

```
ans = struct with fields:
         ActualCodeRate: 0.5000
        NumBitsPerSymbol: 2
    SubcarrierFrequency: []
```

Generate the input bits for the CCSDS TM waveform generator, and then generate the waveform.

```
bits = randi([0 1], tmWaveGen.NumInputBits*numTF,1);
waveform = tmWaveGen(bits);
```

Check the filter residual data samples that remain in the filter delay.

```
flushFilter(tmWaveGen)

ans = 100×1 complex

Input Arguments

obj — Waveform generator
dvbs2WaveformGenerator | dvbs2xWaveformGenerator | ccsdsTMWaveformGenerator

Waveform generator object, specified as a `dvbs2WaveformGenerator`, `dvbs2xWaveformGenerator`, or `ccsdsTMWaveformGenerator` System object.

To enable the `flushFilter` object function when you specify `obj` as a `ccsdsTMWaveformGenerator` System object, you must set these dependencies in the `ccsdsTMWaveformGenerator` object.

- Set the `WaveformSource` property to `"synchronization and channel coding"`.
- Set the `ChannelCoding` property to one of these values.
  - `"none"`
  - `"RS"`
  - `"turbo"`
  - `"LDPC"` — In this case, you must also set the `IsLDPCOnSMTF` property to `0` (`false`)
  - `"convolutional"` — In this case, you must also set the `ConvolutionalCodeRate` property to either `"1/2"` or `"2/3"`
  - `"concatenated"` — In this case, you must also set the `ConvolutionalCodeRate` property to either `"1/2"` or `"2/3"`
- Set the `Modulation` property to either `"BPSK"` or `"QPSK"`.

Output Arguments

out — Residual data samples that remain in filter state
column vector

Residual data samples that remain in the filter state, returned as a column vector. The length of the column vector is equal to the product of the `SamplesPerSymbol` and `FilterSpanInSymbols` properties of the input object, `obj`.

When you specify `obj` as `dvbs2WaveformGenerator` or `dvbs2xWaveformGenerator` System object and the `NumInputStream` property as a value greater than 1, the data fields generated from different input streams are merged in a round-robin technique into a single stream. The residual samples of the frame after the merging process are flushed out.

Data Types: `double`

Introduced in R2021a

satellite

Add satellites to satellite scenario

Syntax

```
satellite(scenario,file)
satellite(scenario,semimajoraxis,eccentricity,inclination,RAAN,
argofperiapsis,trueanomaly)
satellite(scenario,positiontable)
satellite(scenario,positiontable)
satellite(scenario,positiontable,velocitytable)
satellite(scenario,positiontimeseries)
satellite(scenario,positiontimeseries,velocitytimeseries)
satellite( ___ ,Name,Value)
sat = satellite( ___ )
```

Description

`sat = satellite(scenario,file)` adds a `Satellite` object from `file` to the satellite scenario specified by `scenario`. The yaw (*z*) axes of the satellites point toward nadir and the roll (*x*) axes of the satellites align with their respective inertial velocity vectors.

`satellite(scenario,semimajoraxis,eccentricity,inclination,RAAN, argofperiapsis,trueanomaly)` adds a `Satellite` object from Keplerian elements defined in the Geocentric Celestial Reference Frame (GCRF) to the satellite scenario.

`satellite(scenario,positiontable)` adds a `Satellite` object from position data specified in `positiontable` (`timetable` object) to the scenario. This function creates a `Satellite` with `OrbitPropagator="ephemeris"`.

`satellite(scenario,positiontable)` adds a `Satellite` object from position data specified in `positiontable` to the `scenario`.

`satellite(scenario,positiontable,velocitytable)` adds a `Satellite` object from position data specified in `positiontable` (`timetable` object) and velocity data specified in `velocitytable` (`timetable` object) to the scenario. This function creates a `Satellite` with `OrbitPropagator="ephemeris"`.

`satellite(scenario,positiontimeseries)` adds a `Satellite` object from position data specified in `positiontimeseries` to the `scenario`. This function creates a `Satellite` with `OrbitPropagator="ephemeris"`.

`satellite(scenario,positiontimeseries,velocitytimeseries)` adds a `Satellite` object to the `scenario` from position (in meters) data specified in `positiontimeseries` (`timeseries` object) and velocity (in meters/second) data specified in `velocitytimeseries` (`timeseries` object). This function creates a `Satellite` with `OrbitPropagator="ephemeris"`.

`satellite( ___ ,Name,Value)` specifies options using one or more name-value arguments in addition to any input argument combination from previous syntaxes.

`sat = satellite( ___ )` returns a vector of handles to the added satellites. Specify any input argument combination from previous syntaxes.

Note When the `AutoSimulate` property of the `satelliteScenario` is `false`, you can modify the `satellite` only when the `SimulationStatus` is `NotStarted`. You can use the `restart` function to reset `SimulationStatus` to `NotStarted`, but doing so erases the simulation data.

Examples

Add Four Satellites from Position Timetable and Visualize Their Trajectories

Add four satellites to the satellite scenario from a position timetable to a satellite scenario and visualize their trajectories.

Create a default satellite scenario object.

```
sc = satelliteScenario;
```

Load a satellite ephemeris timetable, assuming the data is in the GCRF coordinate frame.

```
load("timetableSatelliteTrajectory.mat","positionTT");
```

Add the satellites to the scenario.

```
sat = satellite(sc,positionTT);
```

Visualize the trajectories of the satellites.

```
play(sc);
```

Visualize Satellite Trajectories

Create a satellite scenario object.

```
sc = satelliteScenario;
```

Load the satellite ephemeris timetable in the Earth Centered Earth Fixed (ECEF) coordinate frame.

```
load("timetableSatelliteTrajectory.mat","positionTT","velocityTT");
```

Add four satellites to the scenario.

```
sat = satellite(sc,positionTT,velocityTT,"CoordinateFrame","ecef");
```

Visualize the trajectories of the satellites.

```
play(sc);
```

Add Ground stations to Scenario and Visualize Access Intervals

Create satellite scenario and add ground stations from latitudes and longitudes.

```
startTime = datetime(2020, 5, 1, 11, 36, 0);
stopTime = startTime + days(1);
sampleTime = 60;
sc = satelliteScenario(startTime, stopTime, sampleTime);
lat = [10];
lon = [-30];
gs = groundStation(sc, lat, lon);
```

Add satellites using Keplerian elements.

```
semiMajorAxis = 10000000;
eccentricity = 0;
inclination = 10;
rightAscensionOfAscendingNode = 0;
argumentOfPeriapsis = 0;
trueAnomaly = 0;
sat = satellite(sc, semiMajorAxis, eccentricity, inclination, ...
        rightAscensionOfAscendingNode, argumentOfPeriapsis, trueAnomaly);
```

Add access analysis to the scenario and obtain the table of intervals of access between the satellite and the ground station.

```
ac = access(sat, gs);
intvls = accessIntervals(ac)
```

```
intvls=8×8 table

Add Satellites to Scenario Using Keplerian Elements

Create a satellite scenario with a start time of 02-June-2020 8:23:00 AM UTC, and the stop time set to one day later. Set the simulation sample time to 60 seconds.

```
startTime = datetime(2020,6,02,8,23,0);
stopTime = startTime + days(1);
sampleTime = 60;
sc = satelliteScenario(startTime,stopTime,sampleTime);
```

Add two satellites to the scenario using their Keplerian elements.

```
semiMajorAxis = [10000000; 15000000];
eccentricity = [0.01; 0.02];
inclination = [0; 10];
rightAscensionOfAscendingNode = [0; 15];
```

```
argumentOfPeriapsis = [0; 30];
trueAnomaly = [0; 20];

sat = satellite(sc, semiMajorAxis, eccentricity, inclination, ...
    rightAscensionOfAscendingNode, argumentOfPeriapsis, trueAnomaly)
```

```
sat =
  1×2 Satellite array with properties:

    Name
    ID
    ConicalSensors
    Gimbals
    Transmitters
    Receivers
    Accesses
    GroundTrack
    Orbit
    OrbitPropagator
    MarkerColor
    MarkerSize
    ShowLabel
    LabelFontSize
    LabelFontColor
```

View the satellites in orbit and the ground tracks over one hour.

```
show(sat)
groundTrack(sat,'LeadTime',3600)
```

```
ans=1×2 object
  1×2 GroundTrack array with properties:

    LeadTime
    TrailTime
    LineWidth
    TrailLineColor
    LeadLineColor
    VisibilityMode
```

```
play(sc)
```

Satellite 1
Satellite 2
Source: Esri, DigitalGlobe, GeoEye, Earthstar Geographics, CNES/Airbus DS, USDA, USGS, AeroGRID, IGN, and the GIS User Community

Visualize GPS Constellation

Set up the satellite scenario.

```
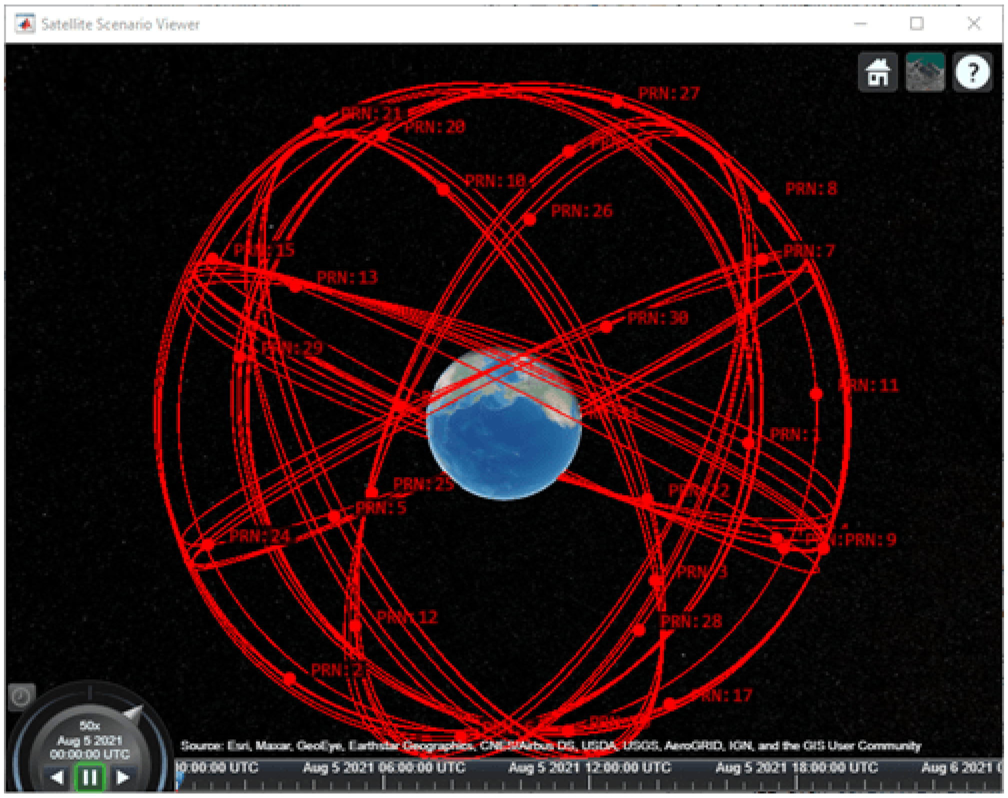
startTime = datetime(2021,8,5);
stopTime = startTime + days(1);
sampleTime = 60;                                          % seconds
sc = satelliteScenario(startTime,stopTime,sampleTime);
```

Add satellites to the scenario from a SEM almanac file.

```
sat = satellite(sc,"gpsAlmanac.txt","OrbitPropagator","gps");
```

Visualize the GPS constellation.

```
v = satelliteScenarioViewer(sc);
```



Input Arguments

`scenario` — Satellite scenario
`satelliteScenario` object

Satellite scenario, specified as a `satelliteScenario` object.

`file` — Type of file
character vector | string scalar

Type of the file, specified as a character vector or a string scalar. The file can be a TLE file or a SEM almanac file and must exist in the current folder, in a folder on the MATLAB path, or it must include a full or relative path to a file.

For more information on TLE files, see "Two Line Element (TLE) Files".

Data Types: `char` | `string`

`semimajoraxis`, `eccentricity`, `inclination`, `RAAN`, `argofperiapsis`, `trueanomaly` — Keplerian elements defined in GCRF
comma-separated list of vectors

Keplerian elements defined in the GCRF, specified as a comma-separated list of vectors. The Keplerian elements are:

- `semimajoraxis` – This vector defines the semimajor axis of the orbit of the satellite. Each value is equal to half of the longest diameter of the orbit.

- eccentricity – This vector defines the shape of the orbit of the satellite.
- inclination – This vector defines the angle between the orbital plane and the *xy*-plane of the GCRF for each satellite in the range [0,180].
- RAAN (right ascension of ascending node) – This element defines the angle between the *xy*-plane of the GCRF and the direction of the ascending node, as seen from the Earth's center of mass for each satellite in the range [0,360). The ascending node is the location where the orbit crosses the *xy*-plane of the GCRF and goes above the plane.
- argofperiapsis (argument of periapsis) – This vector defines the angle between the direction of the ascending node and the periapsis, as seen from the Earth's center of mass in the range [0,360). Periapsis is the location on the orbit that is closest to the Earth's center of mass for each satellite.
- trueanomaly – This vector defines the angle between the direction of the periapsis and the current location of the satellite, as seen from the Earth's center of mass for each satellite in the range [0,360).

Note All angles defined outside the specified range is automatically converted to the corresponding value within the acceptable range.

For more information on Keplerian elements, see “Orbital Elements”.

positiontable — Position data
timetable | table

Position data in meters, specified as a timetable created using the timetable function or table function. The positiontable has exactly one monotonically increasing column of *rowTimes* (datetime or duration) and either:

- One or more columns of variables, where each column contains data for an individual satellite over time.
- One column of 2-D data, where the length of one dimension must equal 3 and the remaining dimension defines the number of satellites in the ephemeris.
- One column of 3-D data, where the length of one dimension must equal 3, one dimension is a singleton, and the remaining dimension defines the number of satellites in the ephemeris.

If *rowTimes* values are of type duration, time values are measured relative to the current scenario StartTime property. The timetable VariableNames property are used by default if no names are provided as an input. Satellite states are assumed to be in the GCRF unless a CoordinateFrame name-value argument is provided. States are held constant in GCRF for scenario timesteps outside of the time range of positiontable.

Data Types: table | timetable

velocitytable — Velocity data
timetable | table

Velocity data in meters/second, specified as a timetable created using the timetable function or the table function. The velocitytable has exactly one monotonically increasing column of *rowTimes* (datetime or duration), and either:

- One or more columns of variables, where each column contains data for an individual satellite over time.

- One column of 2-D data, where the length of one dimension must equal 3 and the remaining dimension defines the number of satellites in the ephemeris.
- One column of 3-D data, where the length of one dimension must equal 3, one dimension is a singleton, and the remaining dimension defines the number of satellites in the ephemeris.

If *rowTimes* values are of type `duration`, time values are measured relative to the current scenario `StartTime` property. The timetable `VariableNames` are used by default if no names are provided as an input. Satellite states are assumed to be in the GCRF unless a `CoordinateFrame` name-value argument is provided. States are held constant in GCRF for scenario timesteps outside of the time range of `velocitytable`.

Data Types: `table` | `timetable`

positiontimeseries — Position data
`timeseries` object | `tscollection` object

Position data in meters, specified as a `timeseries` object or a `tscollection` object.

- If the `Data` property of the `timeseries` or `tscollection` object has two dimensions, one dimension must equal 3, and the other dimension must align with the orientation of the time vector.
- If the `Data` property of the `timeseries` or `tscollection` has three dimensions, one dimension must equal 3, either the first or the last dimension must align with the orientation of the time vector, and the remaining dimension defines the number of satellites in the ephemeris.

  When `timeseries.TimeInfo.StartDate` is empty, time values are measured relative to the current scenario `StartTime` property. The timeseries `Name` property (if defined) is used by default if no names are provided as inputs. Satellite states are assumed to be in the GCRF unless a `CoordinateFrame` name-value pair is provided. States are held constant in GCRF for scenario timesteps outside of the time range of `positiontimeseries`.

Data Types: `timeseries` | `tscollection`

velocitytimeseries — Velocity data
`timeseries` object | `tscollection` object

Velocity data in meters/second, specified as a `timeseries` object or a `tscollection` object.

- If the `Data` property of the `timeseries` or `tscollection` object has two dimensions, one dimension must equal 3, and the other dimension must align with the orientation of the time vector.
- If the `Data` property of the `timeseries` or `tscollection` has three dimensions, one dimension must equal 3, either the first or the last dimension must align with the orientation of the time vector, and the remaining dimension defines the number of satellites in the ephemeris.

  When `timeseries.TimeInfo.StartDate` is empty, time values are measured relative to the current scenario `StartTime` property. The timeseries `Name` property (if defined) is used by default if no names are provided as inputs. Satellite states are assumed to be in the GCRF unless a `CoordinateFrame` name-value pair is provided. States are held constant in GCRF for scenario timesteps outside of the time range of `velocitytimeseries`.

Data Types: `timeseries` | `tscollection`

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1,...,NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Example: `'Name'='MySatellite'` sets the satellite name to `'MySatellite'`.

`CoordinateFrame` — Satellite state coordinate frame

`"inertial"` (default) | `"ecef"` | `"geographic"`

Satellite state coordinate frame, specified as the comma-separated pair consisting of `'CoordinateFrame'` and one of these values:

- `"inertial"` — For `timeseries` or `timetable` data, specifying this value accepts the position and velocity in the GCRF frame.
- `"ecef"` — For `timeseries` or `timetable` data, specifying this value accepts the position and velocity in the ECEF frame.
- `"geographic"` — For `timeseries` or `timetable` data, specifying this value accepts the position [*lat*, *lon*, *altitude*], where *lat* and *lon* are latitude and longitude in degrees, and *altitude* is the height above the World Geodetic System 84 (WGS 84) ellipsoid in meters.

  Velocity is in the local NED frame.

Dependencies

To enable this name value argument, ephemeris data inputs (`timetable` or `timeseries`).

Data Types: `string` | `char`

`GPSweekepoch` — GPS week number

datetime scalar

GPS week number, specified as a `datetime` scalar. The GPS week number specifies the reference date that the function uses when counting weeks defined in the SEM almanac file. If you do not specify `GPSweekepoch`, the function uses the datetime scalar that coincides with the latest GPS week number rollover date before the start time.

This argument applies only if you use a SEM almanac file. If you specify `GPSweekepoch` and you are not using a SEM almanac file, the function ignores the argument value.

Data Types: `string` | `char`

`Viewer` — Satellite scenario viewer

vector of `satelliteScenarioViewer` objects (default) | scalar `satelliteScenarioViewer` object | array of `satelliteScenarioViewer` objects

Satellite scenario viewer, specified as a scalar, vector, or array of `satelliteScenarioViewer` objects. If the `AutoSimulate` property of the scenario is `false`, adding a satellite to the scenario disables any previously available timeline and playback widgets.

`Name` — satellite name

`"satellite` *`idx`*`"` (default) | string scalar | string vector | character vector | cell array of character vectors

You can set this property only when calling the `satellite` function. After you call `satellite`, this property is read-only.

satellite name, specified as a comma-separated pair consisting of `'Name'` and a string scalar, string vector, character vector or a cell array of character vectors.

- If only one satellite is added, specify `Name` as a string scalar or a character vector.
- If multiple satellites are added, specify `Name` as a string scalar, character vector, string vector or a cell array of character vectors. All satellites added as a string scalar or a character vector are assigned the same specified name. The number of elements in the string vector or cell array of character vector must equal the number of satellites being added. Each satellite is assigned the corresponding name from the vector or cell array.

In the default value, *idx* is the ID of the satellites added by the satellite object function.

Data Types: `char` | `string`

`OrbitPropagator` — Name of orbit propagator
`"sgp4"` | `"sdp4"` | `"two-body-keplerian"` | `"ephemeris"` | `"gps"`

This property is read-only.

Set `OrbitPropagator` on `satellite` object creation.

Name of the orbit propagator used for propagating the satellite position and velocity, specified as `"sgp4"`, `"sdp4"`, `"two-body-keplerian"`, `"ephemeris"`, or `"gps"`. The value depends on how you specify the satellite.

- Timetable, table, `timeseries`, or `tscollection` — `OrbitPropagator` is `"ephemeris"`.
- SEM almanac file — `OrbitPropagator` can be any value except `"ephemeris"`. The initialization is performed using the `"gps"` orbit propagator.
- TLE file — `OrbitPropagator` can be `"two-body-keplerian"`, `"sgp4"`, or `"sdp4"`. If the orbital period is less than 225 minutes, the initialization is performed using `"sgp4"`. Otherwise, the initialization is performed using `"sdp4"`.
- `Keplerian` elements — `OrbitPropagator` can be `"two-body-keplerian"`, `"sgp4"`, or `"sdp4"`.

If the satellite is initialized using a timetable, table, `timeseries` object, or `tscollection` object, the default propagator is `"ephemeris"`. If the initialization is performed using a SEM almanac file, the default propagator is `"gps"`. Otherwise, if the orbital period is less than 225 minutes, the default propagator is `"sgp4"`, else `"sdp4"`.

`OrbitPropagator` is not available for ephemeris data inputs (`timetable` or `timeseries`). In these cases, `satellite` automatically selects `"ephemeris"` orbit propagator.

Output Arguments

sat — Satellite in the scenario
`Satellite` object

Satellite in the scenario, returned as a `Satellite` object belonging to the satellite scenario specified by `scenario`.

You can modify the `Satellite` object by changing its property values.

Introduced in R2021a

conicalSensor

Package: `matlabshared.satellitescenario`

Add conical sensor to satellite scenario

Syntax

```
conicalSensor(parent)
conicalSensor(parent,Name,Value)
sensor = conicalSensor( ___ )
```

Description

`conicalSensor(parent)` adds `ConicalSensor` object to each parent in the vector `parent` using default parameters. `parent` can be a `satellite`, `groundStation`, or a `gimbal`.

`conicalSensor(parent,Name,Value)` adds conical sensors to the parents in `parent` using additional parameters specified by optional name-value arguments. For example, `'MaxViewAngle',90` specifies a field of view angle of 90 degrees.

`sensor = conicalSensor( ___ )` returns added conical sensors as a row vector `sensor`. Specify any input argument combination from previous syntaxes.

Examples

Calculate Maximum Revisit Time of Satellite

Create a satellite scenario with a start time of 15-June-2021 8:55:00 AM UTC and a stop time of five days later. Set the simulation sample time to `60` seconds.

```
startTime = datetime(2021,6,21,8,55,0);
stopTime = startTime + days(5);
sampleTime = 60;                                     % seconds
sc = satelliteScenario(startTime,stopTime,sampleTime)
```

```
sc = 
  satelliteScenario with properties:

         StartTime: 21-Jun-2021 08:55:00
          StopTime: 26-Jun-2021 08:55:00
        SampleTime: 60
           Viewers: [0×0 matlabshared.satellitescenario.Viewer]
        Satellites: [1×0 matlabshared.satellitescenario.Satellite]
    GroundStations: [1×0 matlabshared.satellitescenario.GroundStation]
          AutoShow: 1
```

Add a satellite to the scenario using Keplerian orbital elements.

```
semiMajorAxis = 7878137;                                                                    % me
eccentricity = 0;
```

```
inclination = 50;                                                                          % deg
rightAscensionOfAscendingNode = 0;                                                         % deg
argumentOfPeriapsis = 0;                                                                   % deg
trueAnomaly = 50;                                                                          % deg
sat = satellite(sc,semiMajorAxis,eccentricity,inclination,rightAscensionOfAscendingNode, ...
    argumentOfPeriapsis,trueAnomaly)
```

```
sat = 
  Satellite with properties:

               Name:  Satellite 1
                 ID:  1
     ConicalSensors:  [1x0 matlabshared.satellitescenario.ConicalSensor]
            Gimbals:  [1x0 matlabshared.satellitescenario.Gimbal]
       Transmitters:  [1x0 satcom.satellitescenario.Transmitter]
          Receivers:  [1x0 satcom.satellitescenario.Receiver]
           Accesses:  [1x0 matlabshared.satellitescenario.Access]
        GroundTrack:  [1x1 matlabshared.satellitescenario.GroundTrack]
              Orbit:  [1x1 matlabshared.satellitescenario.Orbit]
    OrbitPropagator:  sgp4
        MarkerColor:  [1 0 0]
         MarkerSize:  10
          ShowLabel:  true
     LabelFontColor:  [1 0 0]
      LabelFontSize:  15
```

Add a ground station which represents the location to be photographed, to the scenario.

```
gs = groundStation(sc,"Name","Location To Photograph", ...
    "Latitude",42.3001,"Longitude",-71.3504)                % degrees
```

```
gs = 
  GroundStation with properties:

                 Name:  Location To Photograph
                   ID:  2
             Latitude:  42.3 degrees
            Longitude:  -71.35 degrees
             Altitude:  0 meters
    MinElevationAngle:  0 degrees
       ConicalSensors:  [1x0 matlabshared.satellitescenario.ConicalSensor]
              Gimbals:  [1x0 matlabshared.satellitescenario.Gimbal]
         Transmitters:  [1x0 satcom.satellitescenario.Transmitter]
            Receivers:  [1x0 satcom.satellitescenario.Receiver]
             Accesses:  [1x0 matlabshared.satellitescenario.Access]
          MarkerColor:  [0 1 1]
           MarkerSize:  10
            ShowLabel:  true
       LabelFontColor:  [0 1 1]
        LabelFontSize:  15
```

Add a gimbal to the satellite. You can steer this gimbal independently of the satellite.

```
g = gimbal(sat)
```

```
g = 
  Gimbal with properties:
```

```
                Name:  Gimbal 3
                  ID:  3
    MountingLocation:  [0; 0; 0] meters
      MountingAngles:  [0; 0; 0] degrees
      ConicalSensors:  [1x0 matlabshared.satellitescenario.ConicalSensor]
        Transmitters:  [1x0 satcom.satellitescenario.Transmitter]
           Receivers:  [1x0 satcom.satellitescenario.Receiver]
```

Track the location to be photographed using the gimbal.

```
pointAt(g,gs);
```

Add a conical sensor to the gimbal. This sensor represents the camera. Set the field of view to 60 degrees.

```
camSensor = conicalSensor(g,"MaxViewAngle",60)
```

```
camSensor = 
  ConicalSensor with properties:

                Name:  Conical sensor 4
                  ID:  4
    MountingLocation:  [0; 0; 0] meters
      MountingAngles:  [0; 0; 0] degrees
        MaxViewAngle:  60 degrees
            Accesses:  [1x0 matlabshared.satellitescenario.Access]
         FieldOfView:  [0x0 matlabshared.satellitescenario.FieldOfView]
```

Add access analysis between the camera and the location to be photographed. The access is added to the conical sensor.

```
ac = access(camSensor,gs)
```

```
ac = 
  Access with properties:

    Sequence:  [4 2]
    LineWidth:  1
    LineColor:  [0.5 0 1]
```

Visualize the field of view of the camera by using the Satellite Scenario Viewer.

```
v = satelliteScenarioViewer(sc);
fieldOfView(camSensor);
```

Jun 26 2021 00:00:00

Input Arguments

parent — Element of scenario to which conicalSensor is added
scalar | vector

Element of scenario to which the conicalSensor is added, specified as a scalar or vector of satellites, ground stations or gimbals. The number of conicalSensors specified is determined by the size of the inputs.

- If `parent` is a scalar, all conicalSensors are added to the parent.
- If `parent` is a vector and the number of conicalSensors specified is one, that conicalSensor is added to each parent.
- If `parent` is a vector and the number of conicalSensors specified is more than one, the number of conicalSensors must equal the number of `parents` and each `parent` gets one conicalSensor.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1,...,NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose `Name` *in quotes.*

Example: `'MountingAngle',[20; 35; 10]` sets the yaw, pitch, and roll angles of the conical sensor to 20, 35, and 10 degrees, respectively.

Name — conicalSensor name
`"conicalSensor` *`idx`*`"` (default) | string scalar | string vector | character vector | cell array of character vectors

You can set this property only when calling the `satellite` function. After you call `satellite`, this property is read-only.

conicalSensor name, specified as a comma-separated pair consisting of `'Name'` and a string scalar, string vector, character vector or a cell array of character vectors.

- If only one conicalSensor is added, specify `Name` as a string scalar or a character vector.
- If multiple conicalSensors are added, specify `Name` as a string scalar, character vector, string vector or a cell array of character vectors. All conicalSensors added as a string scalar or a character vector are assigned the same specified name. The number of elements in the string vector or cell array of character vector must equal the number of conicalSensors being added. Each conicalSensor is assigned the corresponding name from the vector or cell array.

In the default value, *idx* is the ID of the conicalSensors added by the conicalSensor object function.

Data Types: `char` | `string`

`MountingLocation` — Mounting location with respect to parent
`[0; 0; 0]` (default) | three-element vector | matrix

Mounting location with respect to the parent object in meters, specified as a three-element vector or a matrix. The position vector is specified in the body frame of the input `parent`.

- One conicalSensor — `MountingLocation` is a three-element vector.
- Multiple conicalSensors — `MountingLocation` can be a three-element vector or a matrix. When specified as a vector, the same `MountingLocation`s are assigned to all specified conicalSensors. When specified as a matrix, `MountingLocation` must contain three rows and the same number of columns as the conicalSensors. The columns correspond to the mounting location of each specified conicalSensor and the rows correspond to the mounting location coordinates in the parent body frame.

When the `AutoSimulate` property of the satellite scenario is `false`, you can modify the `MountingLocation` property only when the `SimulationStatus` is `NotStarted`. You can use the `restart` function to reset `SimulationStatus` to `NotStarted`, but doing so erases the simulation data.

Data Types: `double`

`MountingAngles` — Mounting orientation with respect to parent object
`[0; 0; 0]` (default) | three-element row vector of positive numbers | matrix

Mounting orientation with respect to parent object in degrees, specified as a three-element row vector of positive numbers. The elements of the vector correspond to yaw, pitch, and roll in that order. Yaw, pitch, and roll are positive rotations about the parent's *z* - axis, intermediate *y* - axis and intermediate *x* - axis of the parent.

- One conicalSensor — `MountingAngles` is a three-element vector.
- Multiple conicalSensors — `MountingAngles` can be a three-element vector or a matrix. When specified as a vector, the same `MountingAngless` are assigned to all specified conicalSensors. When specified as a matrix, `MountingAngles` must contain three rows and the same number of columns as the conicalSensors. The columns correspond to the mounting angles of each specified conicalSensor and the rows correspond to the yaw, pitch, and roll angles parent body frame.

When the `AutoSimulate` property of the satellite scenario is `false`, you can modify the `MountingAngles` property only when the `SimulationStatus` is `NotStarted`. You can use the `restart` function to reset `SimulationStatus` to `NotStarted`, but doing so erases the simulation data.

Example: `[0; 30; 60]`

Data Types: `double`

`MaxViewAngle` — Field of view angle
`30` (default) | scalar in the range [0, 180] | vector

Field of view angle in degrees, specified as a scalar in the range [0, 180] or a vector.

- One conicalSensor — `MaxViewAngle` must be a scalar.
- Multiple conicalSensor — `MaxViewAngle` can be a scalar or a vector. When scalar, the same `MaxViewAngle` is assigned to all specified conicalSensors. When vector, the length of `MaxViewAngle` must equal the number of conicalSensors to be specified. Each element of `MaxViewAngle` is assigned to the specified corresponding conicalSensor.

When `AutoSimulate` of the satellite scenario is `false`, you can modify `MaxViewAngle` while the `SimulationStatus` is `NotStarted` or `InProgress`.

Data Types: `double`

Output Arguments

`sensor` — Conical sensor
`row vector` object

Conical sensors attached to `parent`, returned as a row vector.

satelliteScenarioViewer

Package: `matlabshared.satellitescenario`

Create viewer for satellite scenario

Syntax

```
satelliteScenarioViewer(scenario)
satelliteScenarioViewer(scenario,Name,Value)
v = satelliteScenarioViewer(scenario)
```

Description

`satelliteScenarioViewer(scenario)` creates a 3-D or 2-D satellite scenario viewer for the specified satellite scenario. Satellite Scenario Viewer is a 3-D map display and requires hardware graphics support for WebGL™.

`satelliteScenarioViewer(scenario,Name,Value)` creates a new viewer using one or more name-value arguments. For example, `'Basemap'`, `'topographic'` uses topographic imagery provided by Esri®.

`v = satelliteScenarioViewer(scenario)` returns the handle to the satellite scenario viewer.

Examples

Create and Visualize Satellite Scenario

Create a satellite scenario object.

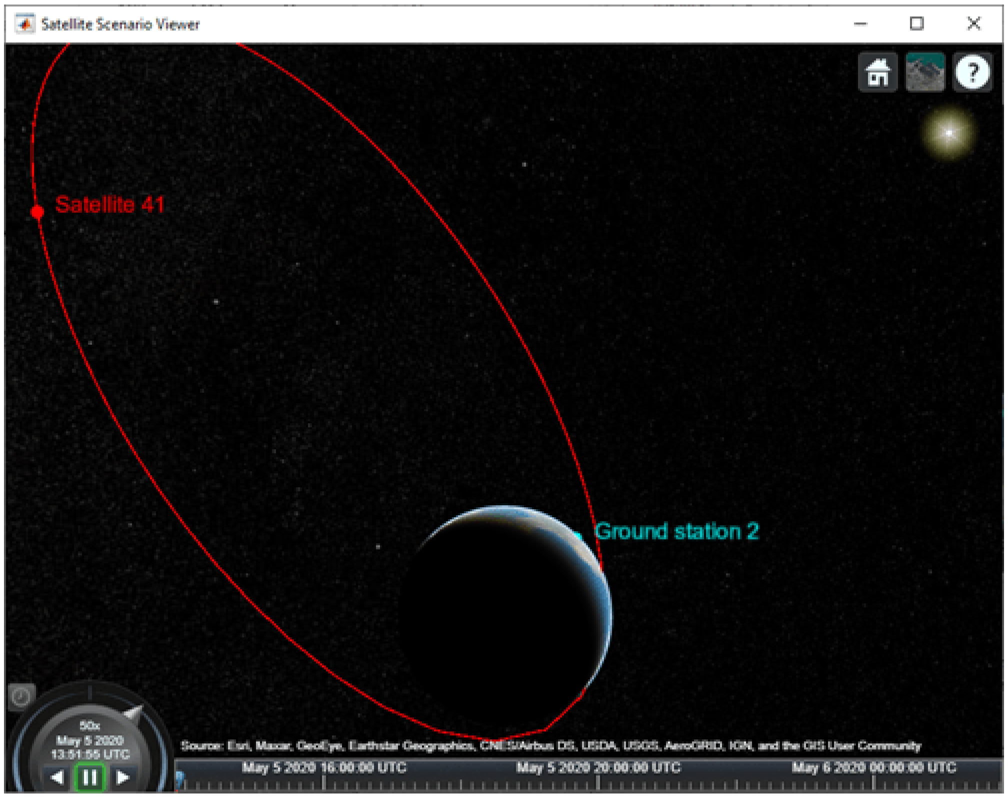
```
sc = satelliteScenario;
```

Add a satellite and ground station to the scenario. Additionally, add an access between the satellite and the ground station.

```
sat = satellite(sc,"eccentricOrbitSatellite.tle");
gs = groundStation(sc);
access(sat,gs);
```

Visualize the scenario at the start time defined in the TLE file by using the Satellite Scenario Viewer.

```
satelliteScenarioViewer(sc);
```



Source: Esri, Maxar, GeoEye, Earthstar Geographics, CNES/Airbus DS, USDA, USGS, AeroGRID, IGN, and the GIS User Community

Input Arguments

`scenario` — Satellite scenario
`satelliteScenario` object

Satellite scenario, specified as a `satelliteScenario` object.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1,...,NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose `Name` *in quotes.*

Example: `'Basemap','topographic'` uses topographic imagery provided by Esri.

`Name` — Name of viewer window
`'Satellite Scenario Viewer'` (default) | string scalar | character vector

Name of the viewer window, specified as a comma-separated pair consisting of `'Name'` and either a string scalar or a character vector.

Data Types: `char` | `string`

`Position` — Viewer window position
center of the screen (default) | row vector of four elements

Size and location of the satellite scenario window in pixels, specified as a row vector of four elements. The elements of the vector are `[left bottom width height]`. In the default case, width and height are 800 and 600 pixels, respectively.

Basemap — Map on which scenario is visualized
`'satellite'` (default) | `'topographic'` | `'streets'` | `'streets-light'` | `'streets-dark'` | `'darkwater'` | `'grayland'` | `'bluegreen'` | `'colorterrain'` | `'grayterrain'` | `'landcover'`

Map on which scenario is visualized, specified as a comma-separated pair consisting of `'Basemap'` and one of the values specified in this table:

Earthstar Geographi CNES/Airbus DS	`'satellite'` Full global basemap composed of high-resolution satellite imagery. Hosted by Esri.	 Cape Town Oranjezicht Sybrand Park Esri South Africa, HERE, Garmin, NGA, USGS	`'streets'` General-purpose road map that emphasizes accurate, legible styling of roads and transit networks. Hosted by Esri.
 Cape Town Oranjezicht Sybrand Park Esri South Africa, HERE, Garr USGS, NGA	`'topographic'` General-purpose map with styling to depict topographic features. Hosted by Esri.		`'streets-dark'` Map designed to provide geographic context while highlighting user data on a dark background. Hosted by Esri.

	`'landcover'` Map that combines satellite-derived land cover data, shaded relief, and ocean-bottom relief. The light, natural palette is suitable for thematic and reference maps. Created using Natural Earth.		`'streets-light'` Map designed to provide geographic context while highlighting user data on a light background. Hosted by Esri.
	`'colorterrain'` Shaded relief map blended with a land cover palette. Humid lowlands are green and arid lowlands are brown. Created using Natural Earth.		`'grayterrain'` Terrain map in shades of gray. Shaded relief emphasizes both high mountains and micro-terrain found in lowlands. Created using Natural Earth.
	`'bluegreen'` Two-tone, land-ocean map with light green land areas and light blue water areas. Created using Natural Earth.		`'grayland'` Two-tone, land-ocean map with gray land areas and white water areas. Created using Natural Earth.

	`'darkwater'` Two-tone, land-ocean map with light gray land areas and dark gray water areas. This basemap is installed with MATLAB. Created using Natural Earth.		

All basemaps except `'darkwater'` require Internet access. The `'darkwater'` basemap is included with MATLAB and Satellite Communications Toolbox.

If you do not have consistent access to the Internet, you can download the basemaps created using Natural Earth onto your local system by using the Add-On Explorer. The basemaps hosted by Esri are not available for download.

Alignment of boundaries and region labels are a presentation of the feature provided by the data vendors and do not imply endorsement by The MathWorks®.

Data Types: `char` | `string`

`PlaybackSpeedMultiplier` — Speed of animation

`50` (default) | positive scalar

Speed of the animation for the input `scenario` used by the `play` function, specified as a comma-separated pair consisting of `'PlaybackSpeedMultiplier'` and a positive scalar.

`CameraReferenceFrame` — Reference frame of camera

`'ECEF'` (default) | `'Inertial'`

Reference frame of the camera, specified as a comma-separated pair consisting of `'CameraReferenceFrame'` and one of these values:

- `'ECEF'` — Earth-Centered Earth-Fixed camera.
- `'Inertial'` — Inertially fixed camera.

When you specify `'Inertial'`, the globe rotates with respect to the camera. When you specify `'ECEF'`, the camera rotates with the globe.

Dependencies

To enable this name-value argument, set to `Dimension` to `'3-D'`.

`CurrentTime` — Current simulation time

`StartTime` of `satelliteScenario` (default) | `datetime` array

Current simulation time of the viewer, specified as a `datetime` array. This value changes over time when the animation is playing.

Dependencies

To enable this name-value argument, set `AutoSimulate` to `true`.

Data Types: `datetime`

`Dimension` — Dimension of viewer
`'3-D'` (default) | `'2-D'`

Dimension of the viewer, specified as a comma-separated pair consisting of `'Dimension'` and either `'3-D'` or `'2-D'`.

`ShowDetails` — Flag to show graphical details
`true` or `1` (default) | `false` or `0`

Flag to show the graphical details for Satellite Scenario Viewer, specified as one of these numeric or logical values.

- `1` (`true`) — Show all graphical details of satellites and ground stations except those explicitly hidden.
- `0` (`false`) — Hide all graphical details of satellites and the ground stations, including orbits, fields of view, labels, and the ground track. Even when `ShowDetails` is `false`, clicking or pausing on satellites and ground stations reveals hidden graphical details or labels, respectively.

Data Types: `logical`

Output Arguments

`v` — Satellite scenario viewer
`satelliteScenarioViewer` object

Satellite scenario viewer, returned as a `satelliteScenarioViewer` object.

To specify, query, or visualize satellite scenario viewer details, use these functions:

`campos`	Set or query camera position.
`camheight`	Set or query camera height.
`camheading`	Set or query camera heading angle.
`camroll`	Set or query camera roll angle.
`campitch`	Set or query camera pitch angle.
`camtarget`	Target an object with the camera.
`hideAll`	Hide all visualizations and animations in the Satellite Viewer.
`showAll`	Show all visualizations and animations in the Satellite Viewer.

Note When `AutoSimulate` property of the satellite scenario is `true`, the timeline and the playback widgets are available. You can use the `play` function to access the widgets during simulation.

Tips

- To pan the viewer window without rotation, use **Shift + left click + drag**.

play

Package: `matlabshared.satellitescenario`

Play satellite scenario simulation results on viewer

Syntax

```
play(scenario)
play(viewer)
play(scenario,Name,Value)
```

Description

`play(scenario)` plays simulation results of the satellite scenario, `scenario`. When `AutoSimulate` of the satellite scenario is `true`, the simulation is automatically performed from `StartTime` to `StopTime` using a step size specified by the `SampleTime`, and the results are played on the viewer. Otherwise, the results calculated up to the `SimulationTime` are played on the viewer. Calling the `play` function enables the widgets on the viewers.

`play(viewer)` plays the satellite scenario simulation results on the Satellite Scenario Viewer specified by `v`.

`play(scenario,Name,Value)` specifies additional options using one or more name-value arguments. For example, you can set the speed of animation to 40 times the real time speed, using `'PlaybackSpeedMultiplier',40`.

Examples

Add Satellites to Scenario Using Keplerian Elements

Create a satellite scenario with a start time of 02-June-2020 8:23:00 AM UTC, and the stop time set to one day later. Set the simulation sample time to 60 seconds.

```
startTime = datetime(2020,6,02,8,23,0);
stopTime = startTime + days(1);
sampleTime = 60;
sc = satelliteScenario(startTime,stopTime,sampleTime);
```

Add two satellites to the scenario using their Keplerian elements.

```
semiMajorAxis = [10000000; 15000000];
eccentricity = [0.01; 0.02];
inclination = [0; 10];
rightAscensionOfAscendingNode = [0; 15];
argumentOfPeriapsis = [0; 30];
trueAnomaly = [0; 20];

sat = satellite(sc, semiMajorAxis, eccentricity, inclination, ...
    rightAscensionOfAscendingNode, argumentOfPeriapsis, trueAnomaly)
```

```
sat = 
  1×2 Satellite array with properties:

    Name
    ID
    ConicalSensors
    Gimbals
    Transmitters
    Receivers
    Accesses
    GroundTrack
    Orbit
    OrbitPropagator
    MarkerColor
    MarkerSize
    ShowLabel
    LabelFontSize
    LabelFontColor
```

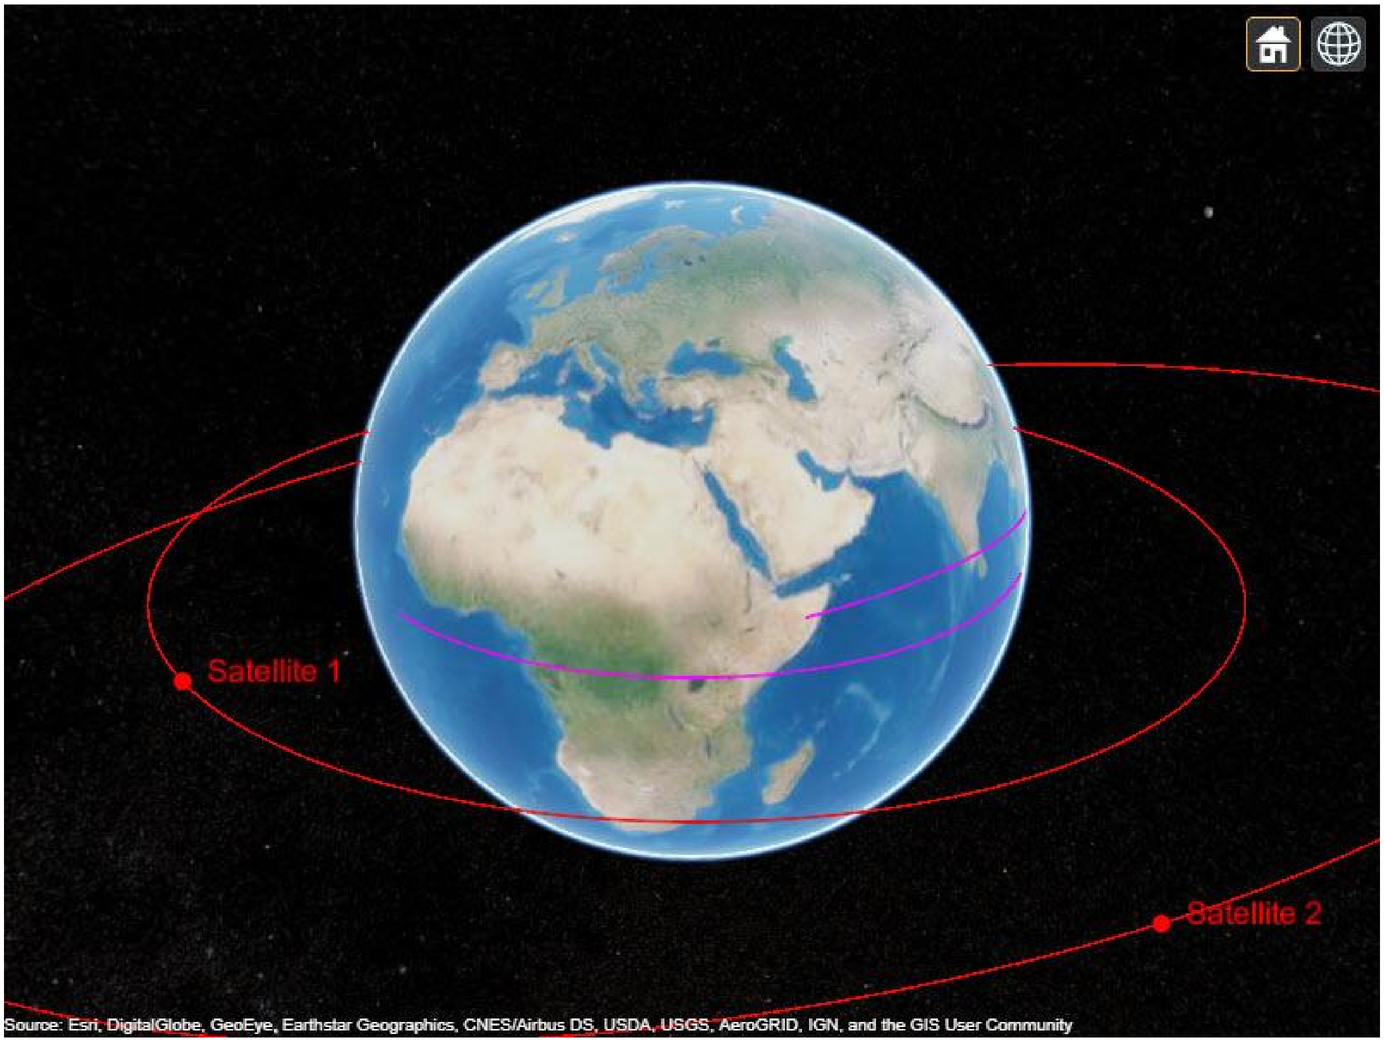
View the satellites in orbit and the ground tracks over one hour.

```
show(sat)
groundTrack(sat,'LeadTime',3600)
```

```
ans=1×2 object
  1×2 GroundTrack array with properties:

    LeadTime
    TrailTime
    LineWidth
    TrailLineColor
    LeadLineColor
    VisibilityMode
```

```
play(sc)
```



Satellite 1
Satellite 2
Source: Esri, DigitalGlobe, GeoEye, Earthstar Geographics, CNES/Airbus DS, USDA, USGS, AeroGRID, IGN, and the GIS User Community

Input Arguments

`scenario` — Satellite scenario
`satelliteScenario` object

Satellite scenario, specified as a `satelliteScenario` object.

`viewer` — Viewer
scalar `satelliteScenarioViewer` object | array of `satelliteScenarioViewer` objects

Viewer playing the simulation results, specified as a scalar `satelliteScenarioViewer` object, or an array of `satelliteScenarioViewer` objects.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1,...,NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose `Name` *in quotes.*

Example: `'PlaybackSpeedMultiplier',30` plays the animation 30 times faster than real time.

`Viewer` — Satellite scenario viewer
all viewers associated with `satelliteScenarioViewer` (default) | scalar `satelliteScenarioViewer` object | array of `satelliteScenarioViewer` objects

Satellite scenario viewer, specified as a scalar, or an array of `satelliteScenarioViewer` objects.

`PlaybackSpeedMultiplier` — Speed of animation
`50` (default) | positive scalar

Speed of animation relative to real time, specified as a positive scalar.

pointAt

Package: `matlabshared.satellitescenario`

Specify the target at which the satellite is pointed

Syntax

```
pointAt(sat,coordinates)
pointAt(sat,target)
pointAt(sat,'nadir')
pointAt(sat,attitudetable)
pointAt(sat,attitudetable,Name=Value)
pointAt(sat,attitudetimeseries)
pointAt(sat,attitudetimeseries,Name=Value)
```

```
pointAt(gimbal,'none')
pointAt(gimbal,coordinates)
pointAt(gimbal,target)
pointAt(gimbal,'nadir')
pointAt(gimbal,steeringtable)
pointAt(gimbal,steeringtimeseries)
```

Description

Satellite Object

`pointAt(sat,coordinates)` steers the satellites in the vector `sat` towards the geographical coordinates [latitude; longitude; altitude] specified by `coordinates`.

`pointAt(sat,target)` steers the satellites specified by `sat` towards the specified `target`. The input `target` can be another satellite or ground station.

`pointAt(sat,'nadir')` steers the satellites specified by the row vector `sat` towards the nadir direction.

`pointAt(sat,attitudetable)` sets the attitude of the satellite `sat` such that it follows the attitudes provided in `attitudetable`, which is a MATLAB `timetable` object.

`pointAt(sat,attitudetable,Name=Value)` specifies options using one or more name-value arguments in addition to the input arguments in the previous `attitudetable` syntax. For example, to interpret the provided attitude values as the rotation from the Geocentric Celestial Reference Frame (GCRF) to the body frame, set `CoordinateFrame` to `inertial`.

`pointAt(sat,attitudetimeseries)` sets the attitudes of the satellite `sat` such that it follows the attitude provided in `attitudetimeseries`, which is a MATLAB `timeseries` object.

`pointAt(sat,attitudetimeseries,Name=Value)` specifies options using one or more name-value arguments in addition to the input arguments in the previous `attitudetimeseries` syntax. For example, to interpret the provided attitude values as the rotation from the GCRF to the body frame, set `CoordinateFrame` to `inertial`.

Gimbal Object

`pointAt(gimbal,'none')` sets the gimbal angles (gimbal azimuth and gimbal elevation) of the gimbals in the vector `gimbal` to zero. This is the default pointing.

`pointAt(gimbal,coordinates)` steers the gimbals in the vector `gimbal` towards the geographical coordinates [latitude; longitude; altitude] specified by `coordinates`.

`pointAt(gimbal,target)` steers the gimbals in the vector `gimbal` towards the specified `target`.

`pointAt(gimbal,'nadir')` steers the gimbals specified by the row vector `gimbal` towards the nadir direction of their parents, namely, the parent's latitude, longitude, and 0 m altitude.

`pointAt(gimbal,steeringtable)` sets the orientation of the gimbals to align with the azimuth and elevation angles provided in `steeringtable`, which is a MATLAB `timetable` object.

`pointAt(gimbal,steeringtimeseries)` sets the orientation of the gimbals to align with the azimuth and elevation angles provided in `steeringtimeseries`, which is MATLAB `timeseries` object.

Examples

Steer Ground Station Gimbal to Point At Satellite

Create a satellite scenario object.

```
startTime = datetime(2021,6,10);                     % 10 June 2021, 12:00 AM UTC
stopTime = datetime(2021,6,11);                      % 11 June 2021, 12:00 AM UTC
sampleTime = 60;                                     % seconds
sc = satelliteScenario(startTime,stopTime,sampleTime);
```

Add a satellite to the scenario.

```
semiMajorAxis = 10000000;                            % meters
eccentricity = 0;
inclination = 10;                                    % degrees
rightAscensionOfAscendingNode = 0;                   % degrees
argumentOfPeriapsis = 0;                             % degrees
trueAnomaly = 0;                                     % degrees
sat = satellite(sc,semiMajorAxis,eccentricity, ...
    inclination,rightAscensionOfAscendingNode, ...
    argumentOfPeriapsis,trueAnomaly);
```

Add a ground station to the scenario.

```
latitude = 42.3501;                             % degrees
longitude = -71.3504;                           % degrees
gs = groundStation(sc, latitude, longitude);
```

Add a gimbal to the ground station.

```
g = gimbal(gs,"MountingLocation",[0; 0; -1],"MountingAngles",[0; 180; 0]);
```

Add a conical sensor to the gimbal.

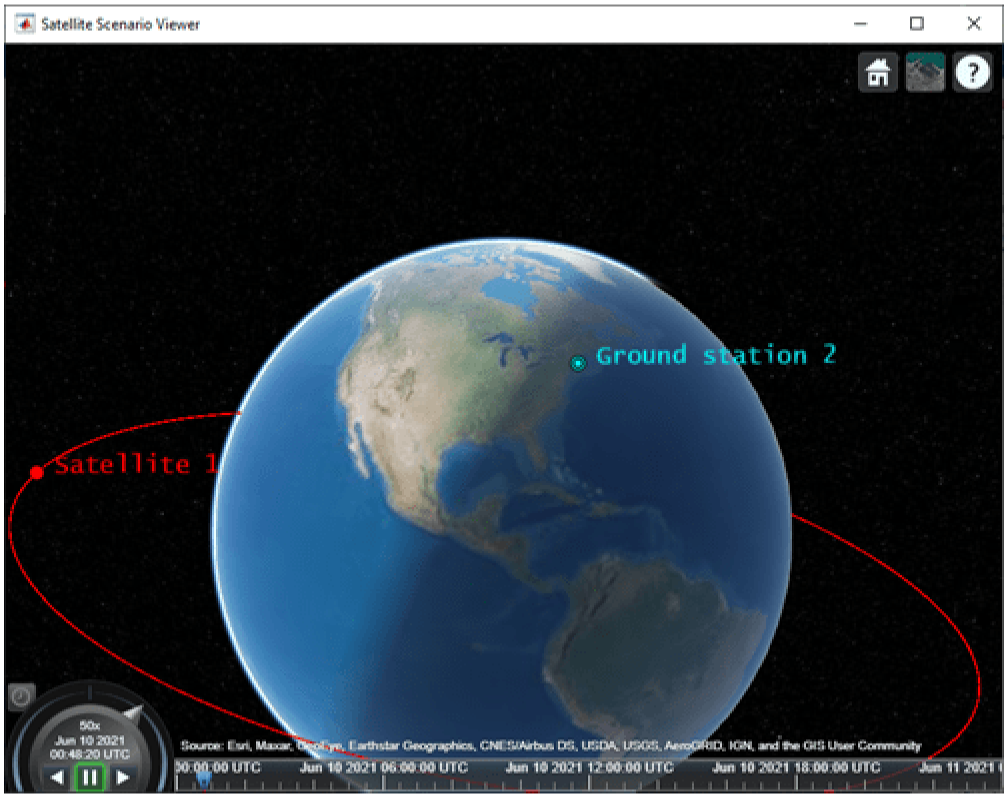
```
c = conicalSensor(g,"MountingLocation",[0; 0; 0.5]);
```

Point the gimbal at the satellite.

```
pointAt(g,sat);
```

Visualize the scenario using the Satellite Scenario Viewer.

```
v = satelliteScenarioViewer(sc);
```



Play the scenario.

```
play(sc);
```

Set the ground station as the camera target.

```
camtarget(v,gs);
```

Input Arguments

`sat` — Satellite

scalar | vector

Satellite object, specified as either a scalar or a vector.

`gimbal` — Gimbal

scalar | vector

Gimbal object, specified as either a scalar or a vector.

`coordinates` — Geographical coordinates of the satellite or gimbal target

three-element vector | 2-D array

Geographical coordinates of the satellite or gimbal target, specified as a three-element vector or a 2-D array.

- Three-element vector — The elements correspond to the latitude, longitude, and altitude, in that order, and all satellites or gimbals are steered to point at this location.
- 2-D array — The number of rows must equal 3 and the number of columns must equal the number of satellites in `satellite` or the number of gimbals in `gimbal`. The rows correspond to the latitude, longitude, and altitude, in that order, and each column represents the pointing coordinates of the corresponding satellite in the vector `satellite` or gimbal in the vector `gimbal`. The latitudes and longitudes are specified in degrees and the altitudes are specified in meters, representing the height above the surface of the Earth.

`target` — Target

scalar | vector

Target at which input `satellite` or `gimbal` is pointed, specified as a scalar or a vector. The input `target` can be another satellite or a ground station.

- `target` is scalar — All satellites or gimbals point to the specified `target`.
- `target` is vector — The length of `target` must equal the number of satellites in `sat` or the number of gimbals in `gimbal`. Each element in `target` represents the pointing target of a satellite in `sat` or a gimbal in `gimbal`.

`attitudetable` — MATLAB `timetable`

`timetable` object

MATLAB `timetable` with exactly one monotonically increasing column of `rowTimes` (datetime or duration).

- If `sat` contains a single satellite, the table must contain one data column of scalar-first quaternions [1-by-4], or ZYX Euler angles [1-by-3].
- If `sat` is an array of satellites, each data row must contain either:
  - Multiple columns, where each column contains data for an individual satellite over time.
  - One column of 2-D data, where the length of one dimension must equal 3 or 4, depending on whether Euler angles or quaternions are used, and the remaining dimension must have length equal to the number of satellites in `sat`.
  - One column of 3-D data, where the length of one dimension must equal 3 or 4, depending on whether Euler angles or quaternions are used, one dimension is a singleton, and the remaining dimension must have length equal to the number of satellites in `sat`.

Euler angles represent passive, intrinsic rotations in degrees, using the ZYX rotation order. If the provided `rowTimes` are of type `duration`, time values are measured relative to the current scenario `StartTime` property.

The function assumes that satellite attitudes represent the transformation from the GCRF to the body frame, unless a `CoordinateFrame` name-value argument is provided. For scenario timesteps outside of the time range of `attitudetable`, the function uses `nadir` by default unless a name-value argument `ExtrapolationMethod` is provided.

`attitudetimeseries` — MATLAB `timeseries`

`timeseries` object

MATLAB `timeseries` timeseries containing scalar-first quaternions or ZYX Euler angles.

- If the `Data` property of `timeseries` has two dimensions, the length of one dimension must equal 3 or 4, depending on whether Euler angles or quaternions are used, and the other dimension must align with the orientation of the time vector.
- If `sat` is an array of satellites, the `Data` property of `timeseries` must have three dimensions where the length of one dimension must equal 3 or 4, depending on whether Euler angles or quaternions are used, either the first or the last dimension must align with the orientation of the time vector, and the remaining dimension must align with the number of satellites in `sat`.

Euler angles represent passive, intrinsic rotations in degrees, using the ZYX rotation order. When `timeseries.TimeInfo.StartDate` is empty, time values are measured relative to the current scenario `StartTime` property.

The function assumes that satellite attitudes represent the transformation from the Geocentric Celestial Reference Frame (GCRF) to the body frame, unless a `CoordinateFrame` name-value argument is provided. For scenario timesteps outside of the time range of `attitudetable`, the function uses `nadir` by default unless a name-value argument `ExtrapolationMethod` is provided.

`steeringtable` — MATLAB `timetable`
`timetable` object

MATLAB `timetable` with exactly one monotonically increasing column of `rowTimes` (datetime or duration).

- If `gimbal` contains a single gimbal, the table must contain one data column of azimuth and elevation angles in degrees [1-by-2].
- If `gimbal` is an array of gimbals, each data row must contain either:
  - Multiple columns, where each column contains data for an individual gimbal over time.
  - One column of 2-D data, where the length of one dimension must equal 2 and the remaining dimension must have length equal to the number of gimbals in `gimbal`.
  - One column of 3-D data, where the length of one dimension must equal 2, one dimension is a singleton, and the remaining dimension must have length equal to the number of gimbals in `gimbal`.

Specify the azimuth and elevation angles in degrees. If the provided `rowTimes` are of type `duration`, time values are measured relative to the current scenario `StartTime` property.

`steeringtimeseries` — MATLAB `timeseries`
`timeseries` object

MATLAB `timeseries` timeseries containing azimuth and elevation in degrees [1-by-2].

- If the `Data` property of `timeseries` has two dimensions, the length of one dimension must equal 2 and the other dimension must align with the orientation of the time vector.
- If `gimbal` is an array of gimbals, the `Data` property of `timeseries` must have three dimensions where:
  - The length of one dimension must equal 2.
  - Either the first or the last dimension must align with the orientation of the time vector.
  - The remaining dimension must align with the number of gimbals in `gimbal`.

When `timeseries.TimeInfo.StartDate` is empty, time values are measured relative to the current scenario `StartTime` property.

Name-Value argument Arguments

Specify optional pairs of arguments as `Name1=Value1,...,NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose `Name` *in quotes.*

Example: `pointAt(sat,attTT,CoordinateFrame="inertial")` interprets the provided attitude values as the rotation from the Geocentric Celestial Reference Frame (GCRF) to the body frame.

`CoordinateFrame` — Coordinate frame of custom attitude inputs
`inertial` (default) | `ecef` | `ned`

Coordinate frame of custom attitude inputs, specified as one of these options.

- `inertial` — Interprets the provided attitude values as the rotation from the GCRF to the body frame.
- `ecef` — Interprets the provided attitude values as the rotation from the Earth-Centered-Earth-Fixed (ECEF) frame to the body frame.
- `ned` — Interprets the provided attitude values as the rotation from the North-East-Down (NED) frame to the body frame.

Data Types: `char` | `string`

`ExtrapolationMethod` — Default behavior for attitude
`nadir` (default) | `fixed`

Default behavior for attitude, specified as:

- `nadir` — Sets the attitude of the satellite `sat` such that the yaw axis points in the nadir direction.
- `fixed` — Keeps the attitude constant with respect to the GCRF at the closest time value for which data is provided in the custom attitude data.

The scenario uses this setting for scenario time steps that lie outside the provided custom attitude time range. If you do not provide `ExtrapolationMethod`, the function returns a warning when the scenario time is out of range of the custom attitude time range.

Data Types: `char` | `string`

`Format` — Format of attitude data provided
`quaternion` (default) | `euler`

Format of attitude data provided, specified as one of these options.

- `quaternion` — Interprets the provided attitude values as scalar-first quaternions. Quaternions represent passive rotations from `CoordinateFrame` to the body frame.
- `euler` — Interprets the provided attitude values as Euler angles, in degrees. Euler angles represent passive, intrinsic rotations from `CoordinateFrame` to the body frame using the ZYX rotation order and are provided in that order.

Data Types: `char` | `string`

Note When `AutoSimulate` property of the satellite scenario is `false`, the `pointAt` function can be called as long as the `SimulationStatus` is `NotStarted` or `InProgress`.

camroll

Package: `matlabshared.satellitescenario`

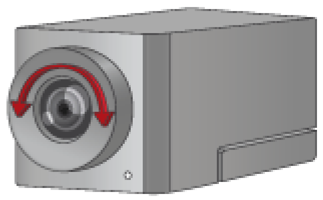
Set or get roll angle of camera for satellite scenario viewer

Syntax

```
camroll(viewer,roll)
outRoll = camroll(viewer,___)
```

Description

`camroll(viewer,roll)` sets the roll angle of the camera for the satellite scenario viewer. Setting the roll angle rotates the camera around its *x*-axis.



`outRoll = camroll(viewer,___)` returns the roll angle of the camera. If the second input is `roll`, then the function sets the output equal to the input roll.

Examples

Set Camera Roll Angle of Satellite Scenario Viewer

Create a satellite scenario object.

```
sc = satelliteScenario;
```

Launch the Satellite Scenario Viewer.

```
v = satelliteScenarioViewer(sc);
```

Aug 23 2021 18:55:22.750
Aug 23 2021 18:55:23.00

Input Arguments

`viewer` — Satellite scenario viewer
`satelliteScenarioViewer` object

Satellite scenario viewer, specified as a `satelliteScenarioViewer` object. `viewer` must be specified as a scalar `satelliteScenarioViewer` object.[1]

`roll` — Roll angle of camera
scalar in the range [–360, 360]

Roll angle of the camera, specified as a scalar in the range [–360, 360] degrees.

Tips

- When the pitch angle is near –90 (the default value) or 90 degrees, the camera loses one rotational degree of freedom. As a result, when you change the roll angle, the heading angle might change instead. This phenomenon is called gimbal lock. To avoid the effects of gimbal lock, call the `camheading` function instead of the `camroll` function.

campitch

Package: `matlabshared.satellitescenario`

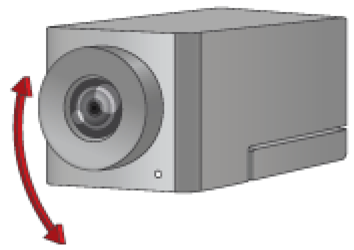
Set or get pitch angle of camera for satellite scenario viewer

Syntax

```
campitch(viewer,pitch)
outPitch = campitch(viewer,___)
```

Description

`campitch(viewer,pitch)` sets the pitch angle of the camera for the specified satellite scenario viewer. Setting the pitch angle tilts the camera up or down as shown in this figure..



`outPitch = campitch(viewer,___)` returns the pitch angle of the camera. If the second input is `pitch`, then the function sets the output equal to the input pitch.

Examples

Set Camera Pitch Angle of Satellite Scenario Viewer

Create a satellite scenario object.

```
sc = satelliteScenario;
```

Launch the Satellite Scenario Viewer.

```
v = satelliteScenarioViewer(sc);
```

Aug 23 2021 18:47:30.000
Aug 23 2021 18:47:30.25

Input Arguments

`viewer` — Satellite scenario viewer
`satelliteScenarioViewer` object

Satellite scenario viewer, specified as a `satelliteScenarioViewer` object. `viewer` must be specified as a scalar `satelliteScenarioViewer` object.[2]

`pitch` — Pitch angle of camera
scalar the in the range [–90, 90]

Pitch angle of the camera, specified as a scalar the in the range [–90, 90] degrees. By default, the pitch angle is –90 degrees, which means that camera points directly toward the surface of the globe.

Tips

- When the pitch angle is near –90 (the default value) or 90 degrees, the camera loses one rotational degree of freedom. As a result, when you change the roll angle, the heading angle might change instead. This phenomenon is called gimbal lock. To avoid the effects of gimbal lock, call the `camheading` function instead of the `camroll` function.

campos

Package: `matlabshared.satellitescenario`

Set or get position of camera for satellite scenario viewer

Syntax

```
campos(viewer,lat,lon)
campos(viewer,lat,lon,height)
campos(viewer)
[latOut,lonOut,heightOut] = campos( ___ )
```

Description

`campos(viewer,lat,lon)` sets the latitude and longitude of the camera for the specified satellite scenario viewer.

`campos(viewer,lat,lon,height)` sets the latitude, longitude, and ellipsoidal height of the camera. If you want to set only the height of the camera, use the `camheight` function instead.

`campos(viewer)` displays the latitude, longitude, and ellipsoidal height of the camera as a three-element vector.

`[latOut,lonOut,heightOut] = campos( ___ )` sets the position and then returns the latitude, longitude, and height of the camera. Specify any input argument combinations from previous syntaxes.

Examples

Reposition Camera of Satellite Scenario Viewer

Create a satellite scenario object.

```
sc = satelliteScenario;
```

Launch the Satellite Scenario Viewer.

```
v = satelliteScenarioViewer(sc);
```

Aug 23 2021 17:02:21.500
Aug 23 2021 17:02:21.750

Input Arguments

`viewer` — Satellite scenario viewer
`satelliteScenarioViewer` object

Satellite scenario viewer, specified as a `satelliteScenarioViewer` object. `viewer` must be specified as a scalar `satelliteScenarioViewer` object.[3]

`lat` — Geodetic latitude of camera
`0` (default) | scalar in the range [-90, 90].

Geodetic latitude of the camera, specified as a scalar in the range [–90, 90] degrees.

`lon` — Geodetic longitude of camera
`0` (default) | scalar in the range [-360, 360].

Geodetic longitude of the camera, specified as a scalar in the range [–360, 360].

`height` — Ellipsoidal height of camera
`15000000` (default) | numeric scalar

Ellipsoidal height of the camera, specified as a numeric scalar in meters. Satellite scenario viewer objects use the WGS84 reference ellipsoid.

3 Alignment of boundaries and region labels are a presentation of the feature provided by the data vendors and do not imply endorsement by MathWorks.

If you specify the height so that the camera is level with or below the surface of the Earth, then the campos function sets the height to a value one meter above the surface.

Output Arguments

`latOut` — Geodetic latitude of camera
numeric scalar

Geodetic latitude of the camera, returned as a numeric scalar in degrees.

`lonOut` — Geodetic longitude of camera
numeric scalar

Geodetic longitude of the camera, returned as a numeric scalar in degrees.

`heightOut` — Ellipsoidal height of camera
numeric scalar

Ellipsoidal height of the camera, returned as a numeric scalar in meters. Satellite scenario viewer objects use the WGS84 reference ellipsoid. For more information about ellipsoidal height, see “Geodetic Coordinates”.

camheading

Package: `matlabshared.satellitescenario`

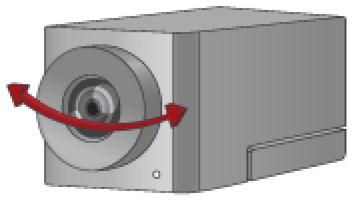
Set or get heading angle of camera for satellite scenario satellite scenario viewer

Syntax

```
camheading(viewer,heading)
outHeading = camheading(viewer,___)
```

Description

`camheading(viewer,heading)` sets the heading angle of the camera for the specified satellite scenario viewer. Setting the heading angle shifts the camera left or right about its *z* - axis.



`outHeading = camheading(viewer,___)` returns the heading angle of the camera. If the second input is `heading`, then the function sets the output equal to the input pitch.

Examples

Set Camera Heading Angle of Satellite Scenario Viewer

Create a satellite scenario object.

```
sc = satelliteScenario;
```

Add a ground station to the scenario.

```
latitude = 42.3001;                         % degrees
longitude = -71.3504;                       % degrees
groundStation(sc, latitude+0.05, longitude);
```

Launch the Satellite Scenario Viewer.

```
v = satelliteScenarioViewer(sc);
```

Aug 23 2021 20:42:17.000

Input Arguments

`viewer` — Satellite scenario viewer
`satelliteScenarioViewer` object

Satellite scenario viewer, specified as a `satelliteScenarioViewer` object. `viewer` must be specified as a scalar `satelliteScenarioViewer` object.[4]

`heading` — Heading angle of camera
`360` (default) | scalar in the range [–360, 360]

Heading angle of the camera, specified as a scalar value in the range [–360, 360] degrees.

Tips

- When the pitch angle is near –90 (the default value) or 90 degrees, the camera loses one rotational degree of freedom. As a result, when you change the roll angle, the heading angle might change instead. This phenomenon is called gimbal lock. To avoid the effects of gimbal lock, call the `camheading` function instead of the `camroll` function.

Aug 23 2021 17:16:12.500
Aug 23 2021 17:16:12.750

Retrieve the height of the camera in the Satellite Scenario Viewer.

```
height = camheight(v)
```

```
height = 15000000
```

Input Arguments

`viewer` — Satellite scenario viewer

`satelliteScenarioViewer` object

Satellite scenario viewer, specified as a `satelliteScenarioViewer` object. `viewer` must be specified as a scalar `satelliteScenarioViewer` object.[5]

`height` — Ellipsoidal height of camera

`15000000` (default) | numeric scalar

Ellipsoidal height of the camera, specified as a numeric scalar in meters. Satellite scenario viewer objects use the WGS84 reference ellipsoid. For more information about ellipsoidal height, see “Geodetic Coordinates”.

If you specify the height so that the camera is level with or below the surface of the Earth, then the `camheight` function sets the height to a value one meter above the surface.

5 Alignment of boundaries and region labels are a presentation of the feature provided by the data vendors and do not imply endorsement by MathWorks.

“Satellite Scenario Basics”

Introduced in R2021a

camtarget

Package: `matlabshared.satellitescenario`

Set camera target for satellite scenario viewer

Syntax

`camtarget(viewer,target)`

Description

`camtarget(viewer,target)` focuses the camera on the input satellite or ground station. The camera follows the object and can be unlocked by calling `camtarget` on another satellite or ground station or by double-clicking anywhere in the map.

Examples

Set Camera Target to Satellite

Create a satellite scenario object.

```
sc = satelliteScenario;
```

Add a satellite to the scenario;

```
semiMajorAxis = 10000000;                           % meters
eccentricity = 0;
inclination = 0;                                    % degrees
rightAscensionOfAscendingNode = 0;                  % degrees
argumentOfPeriapsis = 0;                            % degrees
trueAnomaly = 0;                                    % degrees
sat = satellite(sc,semiMajorAxis,eccentricity, ...
      inclination,rightAscensionOfAscendingNode, ...
      argumentOfPeriapsis,trueAnomaly);
```

Launch the Satellite Scenario Viewer.

```
v = satelliteScenarioViewer(sc);
```

Input Arguments

`viewer` — Satellite scenario viewer
`satelliteScenarioViewer` object

Satellite scenario viewer, specified as a `satelliteScenarioViewer` object. `viewer` must be specified as a scalar `satelliteScenarioViewer` object.[6]

`target` — Target of camera
`Satellite` object | `GroundStation` object

Target of the camera, specified as a scalar `Satellite` or `GroundStation` object.

hideAll

Package: `matlabshared.satellitescenario`

Hide all graphics in satellite scenario viewer

Syntax

```
hideAll(viewer)
```

Description

`hideAll(viewer)` hides all graphics in the specified satellite scenario viewer.

Examples

Hide All Graphics from Satellite Scenario Viewer

Create a satellite scenario object.

```
sc = satelliteScenario;
```

Add satellites to the scenario.

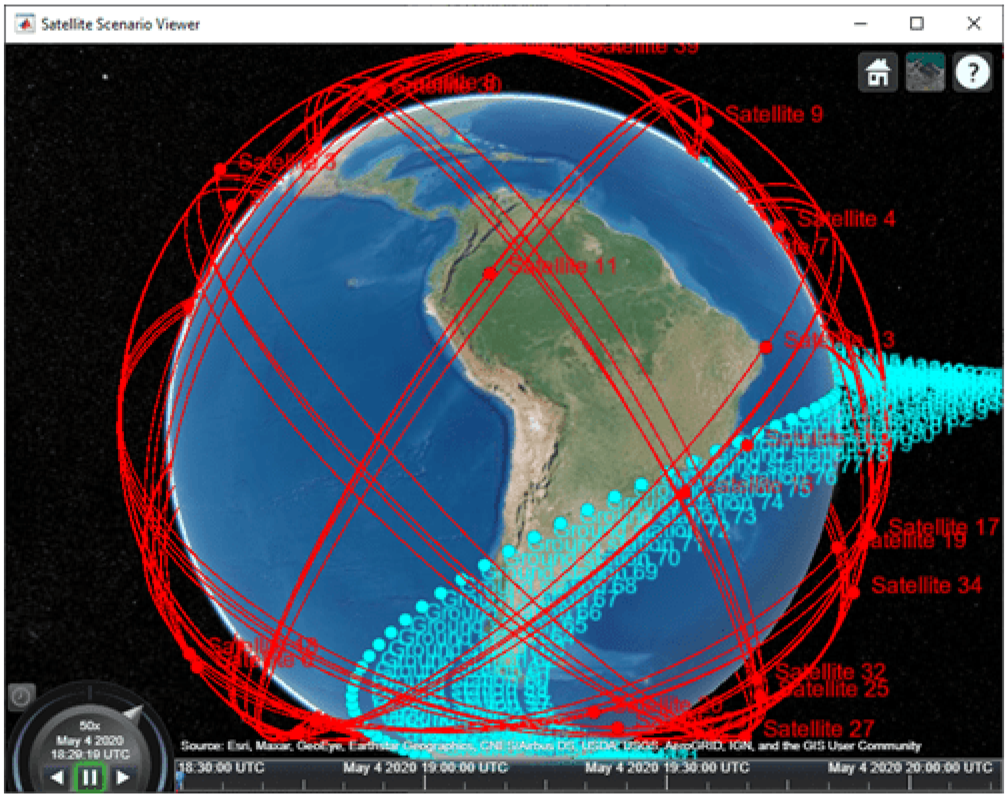
```
tleFile = "leoSatelliteConstellation.tle";
sats = satellite(sc,tleFile);
```

Add a hundred ground stations to the scenario.

```
latitudes = linspace(-90,90,100);            % degrees
longitudes = linspace(-180,180,100);         % degrees
gss = groundStation(sc,latitudes,longitudes);
```

Visualize the scenario using the Satellite Scenario Viewer.

```
v = satelliteScenarioViewer(sc);
```



Hide all the graphics from the viewer.

```
hideAll(v);
```

Introduced in R2021a

showAll

Package: `matlabshared.satellitescenario`

Show all graphics in viewer

Syntax

```
showAll(viewer)
```

Description

`showAll(viewer)` shows all graphics in the specified satellite scenario viewer.

Examples

Show All Hidden Satellite Scenario Objects

Create a satellite scenario object.

```
sc = satelliteScenario;
```

Set the "AutoShow" property of the scenario to false.

```
sc.AutoShow = false;
```

Launch the Satellite Scenario Viewer.

```
v = satelliteScenarioViewer(sc);
```

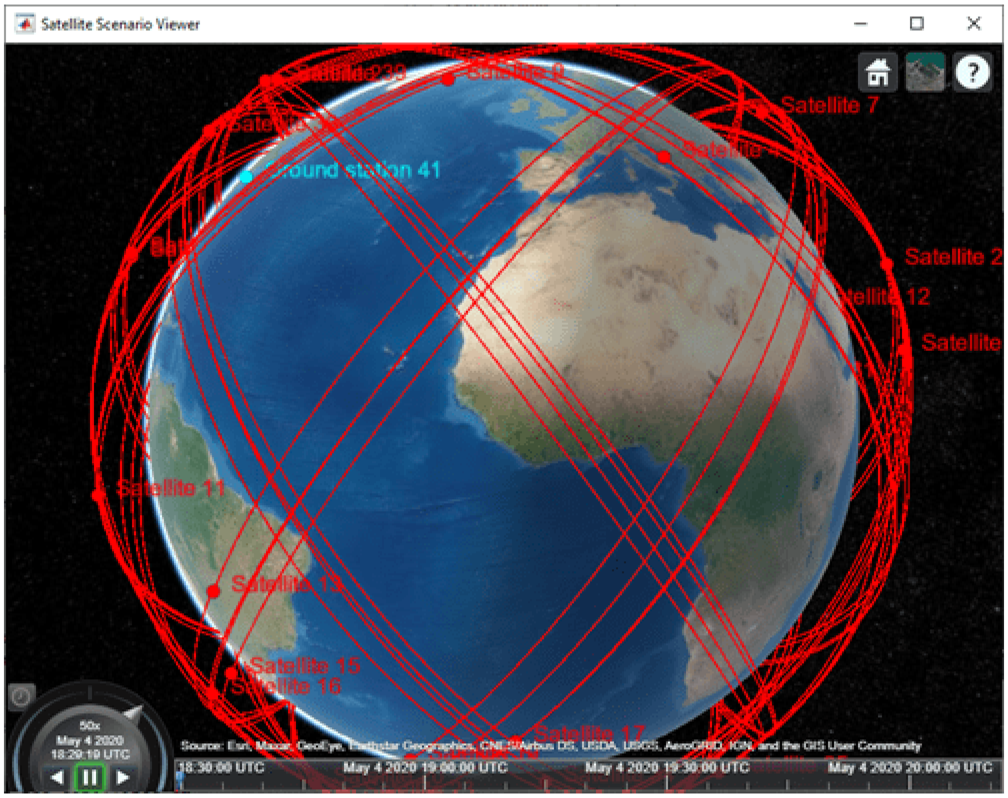
```
tleFile = "leoSatelliteConstellation.tle";
sat = satellite(sc,tleFile);
```

Add a ground station to the scenario.

```
gs = groundStation(sc);
```

Visualize the satellite scenario objects using the Satellite Scenario Viewer.

```
showAll(v);
```



Input Arguments

`viewer` — Satellite scenario viewer
`satelliteScenarioViewer` object

Satellite scenario viewer, specified as a `satelliteScenarioViewer` object. `viewer` must be specified as a scalar `satelliteScenarioViewer` object.[8]

Introduced in R2021a

accessPercentage

Package: `matlabshared.satellitescenario`

Percentage of time when access exists between first and last node defining the access analysis

Syntax

```
acpercent = accessPercentage(ac)
```

Description

`acpercent = accessPercentage(ac)` returns the percentages of time from start time to stop time of the satellite scenario when access exists between the first and last node of each access object in the input vector.

Examples

Calculate Access Percentages Between Ground Station and Satellites

Create a satellite scenario object.

```
startTime = datetime(2020,5,1,11,36,0);
stopTime = startTime + days(1);
sampleTime = 60;
sc = satelliteScenario(startTime,stopTime,sampleTime);
```

Add a ground station to the scenario.

```
gs = groundStation(sc);
```

Add satellites to the scenario.

```
semiMajorAxis = [10000000 10000000];                 % meters
eccentricity = [0 0];
inclination = [0 30];                                % degrees
rightAscensionOfAscendingNode = [0 0];               % degrees
argumentOfPeriapsis = [0 0];                         % degrees
trueAnomaly = [0 10];                                % degrees
sat = satellite(sc,semiMajorAxis,eccentricity, ...
      inclination,rightAscensionOfAscendingNode, ...
      argumentOfPeriapsis,trueAnomaly);
```

Add access analysis between the ground station and each satellite.

```
access(gs,sat(1));
access(gs,sat(2));
```

Obtain the access percentage between the ground station and each satellite.

```
ac = gs.Accesses;
acPercent = accessPercentage(ac)
acPercent = 2×1

   15.0000
   14.9306
```

Input Arguments

ac — Access analysis
row vector of `Access` objects

Access analysis, specified as a row vector of a `Access` objects.

Outputs Arguments

`acpercent` — Access percentage
row vector of nonnegative numbers

Access percentage, returned as a row vector of nonnegative numbers.

Note When `AutoSimulate` of the satellite scenario is `true`, the percentage corresponds to the duration between `StartTime` and `StopTime`. When it is `false`, the percentage corresponds to the duration between `StartTime` and `SimulationTime`.

linkPercentage

Package: `satcom.satellitescenario`

Percentage of time when link between first and last node in link analysis is closed

Syntax

```
lp = linkPercentage(lnk)
```

Description

`lp = linkPercentage(lnk)` returns the percentages of time from start time to stop time of the satellite scenario when link between the first and last node is closed.

Examples

Calculate Uplink Percentage Between Ground Station and Satellite

Create a satellite scenario object.

```
startTime = datetime(2020,11,13,7,25,0);
stopTime = startTime + days(1);
sampleTime = 60;                                       % seconds
sc = satelliteScenario(startTime,stopTime,sampleTime);
```

Add a satellite to the scenario.

```
semiMajorAxis = 10000000;                               % meters
eccentricity = 0;
inclination = 10;                                       % degrees
rightAscensionOfAscendingNode = 0;                      % degrees
argumentOfPeriapsis = 0;                                % degrees
trueAnomaly = 210;                                      % degrees
sat = satellite(sc,semiMajorAxis,eccentricity, ...
    inclination,rightAscensionOfAscendingNode, ...
    argumentOfPeriapsis,trueAnomaly);
```

Add a receiver to the satellite.

```
rx = receiver(sat);
```

Add a ground station to the scenario.

```
latitude = 0;                             % degrees
longitude = 30;                           % degrees
gs = groundStation(sc,latitude,longitude);
```

Add a transmitter to the ground station.

```
tx = transmitter(gs,"MountingAngles",[0; 180; 0]);
```

Create an uplink.

```
lnk = link(tx,rx);
```

Calculate the link percentage of the uplink.

```
linkpercent = linkPercentage(lnk)
```

```
linkpercent = 0
```

Input Arguments

`lnk` — Link analysis
`Link` object vector | `Link` object scalar

Link analysis object, specified as a `Link` object vector or scalar.

Outputs Arguments

`lp` — Link percentage
vector of positive numbers | scalar

Link percentage, returned as a vector of positive numbers or scalar.

Note When `AutoSimulate` of the satellite scenario is `true`, the percentage corresponds to the duration between `StartTime` and `StopTime`. When it is `false`, the percentage corresponds to the duration between `StartTime` and `SimulationTime`.

linkStatus

Package: `satcom.satellitescenario`

Status of link closure between first and last node

Syntax

```
s = linkStatus(lnk)
s = linkStatus(lnk,timeIn)
[s,timeOut] = linkStatus( ___ )
```

Description

`s = linkStatus(lnk)` returns a matrix of logicals representing the link closure status history `s` of each link in the vector `link`. The rows of the matrix correspond to the link objects in `link` and the columns correspond to the time sample.

`s = linkStatus(lnk,timeIn)` returns a column vector of status `s` of each link in the vector `link` at the specified datetime `timeIn`. Each element of `s` corresponds to a link in `link`. If no time zone is specified in `timeIn`, the time zone is assumed to be UTC.

`[s,timeOut] = linkStatus( ___ )` returns the link closure status and the corresponding times in Universal Time Coordinated (UTC).

Examples

Obtain Closed Downlink Status History

Create a satellite scenario object.

```
startTime = datetime(2020,10,13,5,30,0);
stopTime = datetime(2020,10,13,5,45,0);
sampleTime = 60;                                       % seconds
sc = satelliteScenario(startTime,stopTime,sampleTime);
```

Add a satellite to the scenario.

```
semiMajorAxis = 10000000;                               % meters
eccentricity = 0;
inclination = 0;                                        % degrees
rightAscensionOfAscendingNode = 0;                      % degrees
argumentOfPeriapsis = 0;                                % degrees
trueAnomaly = 210;                                      % degrees
sat = satellite(sc,semiMajorAxis,eccentricity, ...
    inclination,rightAscensionOfAscendingNode, ...
    argumentOfPeriapsis,trueAnomaly);
```

Add a transmitter to the satellite.

```
tx = transmitter(sat);
```

Add a ground station to the scenario.

```
latitude = 0;                                   % degrees
longitude = 30;                                 % degrees
gs = groundStation(sc,latitude,longitude);
```

Add a receiver to the ground station.

```
rx = receiver(gs,"MountingAngles",[0; 180; 0]);
```

Create a downlink.

```
lnk = link(tx,rx);
```

Obtain the link status history of the closed downlink.

```
s = linkStatus(lnk)
```

```
s = 1x16 logical array

   0   0   0   0   0   0   0   0   0   0   0   0   0   0   0   0
```

Input Arguments

`lnk` — Link analysis

`Link` object vector | `Link` object scalar

Link analysis object, specified as a `Link` object vector or scalar.

`timeIn` — Time at which output is calculated

`datetime` scalar

Time at which the output is calculated, specified as a `datetime` scalar. If no time zone is specified in `timeIn`, the time zone is assumed to be Universal Time Coordinated (UTC).

Outputs Arguments

`s` — Link closure status

matrix of logical values

Link closure status, returned as a matrix of logical values representing the link closure status history `s` of each link in the vector `link`. The rows of the matrix correspond to the link objects in `link` and the columns correspond to the time sample. The status at a given instant is `1` (`true`) if the link between first and last node is closed. The link between the first and last node is closed when the link between each individual pair of intermediate adjacent nodes in the Sequence property of the link is closed.

- For a given pair, the link is considered to be closed when both nodes belong to the same satellite or ground station.
- Otherwise, the link between the pair is closed if the directionality is from a transmitter to a receiver and the energy per bit to noise power spectral density ratio (Eb/No) at the receiver is greater than its `RequiredEbNo`.

- Additionally, if a given node is attached to a ground station directly or via a gimbal, the elevation angle of the adjacent node with respect to the ground station must be greater than or equal to its MinElevationAngle.

`timeOut` — Time samples of output link status
scalar | vector

Time samples of output link status, returned as a scalar or a vector. If time history of link status is returned, `timeOut` is a row vector.

Note When `AutoSimulate` of the satellite scenario is `true`, the link status history from `StartTime` to `StopTime` is returned. When it is `false`, the link status history from `StartTime` to `SimulationTime` is returned.

Introduced in R2021a

linkIntervals

Package: `satcom.satellitescenario`

Intervals during which link is closed

Syntax

```
int = linkIntervals(lnk)
```

Description

`int = linkIntervals(lnk)` returns a table of intervals during which the link between the first node and last node in each link object input vector is closed.

Examples

Obtain Downlink Closed Intervals Between Satellite and Ground Station

Create a satellite scenario object.

```
startTime = datetime(2020,10,13,7,25,0);
stopTime = startTime + days(1);
sampleTime = 60;                                      % seconds
sc = satelliteScenario(startTime,stopTime,sampleTime);
```

Add a satellite to the scenario.

```
semiMajorAxis = 10000000;                              % meters
eccentricity = 0;
inclination = 10;                                      % degrees
rightAscensionOfAscendingNode = 0;                     % degrees
argumentOfPeriapsis = 0;                               % degrees
trueAnomaly = 210;                                     % degrees
sat = satellite(sc,semiMajorAxis,eccentricity, ...
    inclination,rightAscensionOfAscendingNode, ...
    argumentOfPeriapsis,trueAnomaly);
```

Add a transmitter to the satellite.

```
tx = transmitter(sat);
```

Add a ground station to the scenario.

```
latitude = 0;                             % degrees
longitude = 30;                           % degrees
gs = groundStation(sc,latitude,longitude);
```

Add a receiver to the ground station.

```
rx = receiver(gs,"MountingAngles",[0; 180; 0]);
```

Create a downlink.

```
lnk = link(tx,rx);
```

Obtain the intervals table of the closed downlink.

```
intervals = linkIntervals(lnk)
```

```
intervals =

  0x8 empty table
```

Input Arguments

`lnk` — Link analysis
`Link` object vector | `Link` object scalar

Link analysis object, specified as a `Link` object vector or scalar.

Outputs Arguments

`int` — Intervals during which link is closed
table

Intervals during which the link is closed, returned as a table.

Each row of the table denotes a specific interval, and the columns of the table are named `Source`, `Target`, `IntervalNumber`, `StartTime`, `EndTime`, `Duration` (in seconds), `StartOrbit`, and `EndOrbit`. `Source` and `Target` are the names of the first and last node, respectively, that define the link analysis.

- If `Source` is directly or indirectly attached to a satellite, then `StartOrbit` and `EndOrbit` correspond to the satellite associated with `Source`.
- If `Target` is directly or indirectly attached to a satellite, then `StartOrbit` and `EndOrbit` correspond to the satellite associated with the `Target`. Otherwise, `StartOrbit` and `EndOrbit` are `NaN` because they are associated with ground stations.

Note When `AutoSimulate` of the satellite scenario is `true`, the intervals between `StartTime` and `StopTime` are returned. When it is `false`, the intervals between `StartTime` and `SimulationTime` are returned.

Introduced in R2021a

aer

Package: `matlabshared.satellitescenario`

Calculate azimuth angle, elevation angle, and range of another satellite or ground station in NED frame

Syntax

```
az = aer(asset,target)
[az,el] = aer(asset,target)
[az,el,range] = aer(asset,target)
[az,el,range,timeOut] = aer(asset,target)
[ ___ ] = aer(asset,target,timeIn)
[ ___ ] = aer( ___ ,coordinateFrame='ned')
```

Description

`az = aer(asset,target)` returns a 2-D array of the history of azimuth angles `az`, between `asset` and `target` belonging to a given `satelliteScenario` object.

`[az,el] = aer(asset,target)` returns the history of elevation angles, `el`, between satellite or ground station `asset` and another satellite or ground station `target`.

`[az,el,range] = aer(asset,target)` returns row vectors of the history of the `range` of `Satellite` or `GroundStation` in `target` with respect to those in `asset`.

`[az,el,range,timeOut] = aer(asset,target)` returns the corresponding time in `timeOut`.

`[ ___ ] = aer(asset,target,timeIn)` returns the outputs at the specified datetime `timeIn`. `az`, `el`, and `range` are structured the same way as described in syntaxes with an exception that the size of the second dimension is fixed at 1, representing the values at the specified time `timeIn`.

`[ ___ ] = aer( ___ ,coordinateFrame='ned')` returns the `az`, `el`, `range`, and `timeOut` based on the specified output arguments and the coordinate frame defined by the name-value argument.

Examples

Determine AER of Ground Station

Create a satellite scenario object.

```
startTime = datetime(2021,4,25);                      % April 25, 2021, 12:00 AM UTC
stopTime = datetime(2021,4,26);                       % April 26, 2021, 12:00 AM UTC
sampleTime = 60;                                      % seconds
sc = satelliteScenario(startTime,stopTime,sampleTime);
```

Add a satellite to the scenario.

```
tleFile = "eccentricOrbitSatellite.tle";
sat = satellite(sc,tleFile);
```

Add a ground station to the scenario using default properties.

```
gs = groundStation(sc);
```

Determine the azimuth angle, elevation angle, and range of the ground station with respect to the satellite at April 25, 2021, 1:26 AM UTC.

```
time = datetime(2021,4,25,1,26,0);
[azimuth,elevation,range] = aer(sat,gs,time)
```

```
azimuth = 15.2962

elevation = -70.3858

range = 1.3442e+07
```

Input Arguments

`asset` — First scenario component
scalar | vector

First scenario component, specified as a `Satellite`, `GroundStation`, `ConicalSensor`, `Gimbal`, `Transmitter`, or a `Receiver` object.

`target` — Second scenario component
scalar | vector

Second scenario component, specified as a `Satellite`, `GroundStation`, `ConicalSensor`, `Gimbal`, `Transmitter`, or a `Receiver` object.

`timeIn` — Time at which output is calculated
datetime

Time at which output is calculated, specified as a datetime. If no time zone is specified in `timeIn`, the time zone is assumed to be UTC.

`coordinateFrame` — Coordinate frame
`'ned'` (default) | `'body'`

Coordinate frame, specified as either `'ned'` or `'body'`.

- When `coordinateFrame` is `'ned'` — The azimuth angle is defined in the North-East-Down (NED) frame of (and centered at) `asset` such that 0 degrees is North, 90 degrees is East, 180 degrees is South, and 270 degrees is West. The elevation angle is defined in the NED frame of (and centered at) `asset` such that 0 degrees implies `target` is on the North East (NE) plane, 90 degrees implies `target` is directly above `asset`, and -90 degrees implies `target` is directly below `asset`.
- When `coordinateFrame` is `'body'` — The azimuth angle is the angle between the projection of the relative position vector of `target` on the *x*-*y* plane of the body frame of `asset`, and the *x*-axis of `asset`. The angle is positive for positive (clockwise) rotation about the *z*-axis of `asset`. The elevation angle is the angle between the relative position vector of `target` on the *x*-*y* plane of the body frame of `asset`. The angle is positive when the *z* component of the relative position of `target` defined in the body frame of `asset` is negative.

Output Arguments

az — Azimuth angles
vector | 2-D array | scalar

Azimuth angles of the target in the local azimuth, elevation, and range (AER) system in degrees, returned as a vector, 2-D array, or scalar in the range [0,360). Azimuths are measured clockwise from North. If the `timeIn` argument is not specified, the vector elements correspond to the time samples specified by the `SampleTime` property from the satellite scenario `StartTime` to `StopTime`.

- If both `asset` and `target` are scalars, `az` is a row vector where each element represents the azimuth angle of `target` with respect to `asset` in the NED frame of `asset` at a specified time sample.
- If `asset` is a scalar and `target` is a vector, `az` is a 2-D array, where each row represents the azimuth angle of each element in `target` with respect to `asset` in the NED frame of `asset` and the columns represent the time samples.
- If `asset` is a vector and `target` is a scalar, `az` is a 2-D array, where each row represents the azimuth angle of `target` with respect to each element in `asset` in the NED frame of the element in `asset` and the columns represent the time samples.
- If both `asset` and `target` are vectors, the length of `asset` must equal the length of `target`. The `az` is a 2-D array, where each row index corresponds to the index in `asset` and `target`, and represents the azimuth angle of the element at the index in `target` with respect to the element at the index in `asset` in the NED frame of that element in `asset`. The columns represent the time samples.

If the `timeIn` argument is not specified and when the `AutoSimulate` property of the satellite scenario is `true`, aer function returns the `az` history from `StartTime` to `StopTime`. Otherwise, it returns the `az` history from `StartTime` to `SimulationTime`.

el — Elevation angles
vector | 2-D array | scalar

Elevation angles of target in the local AER system in degrees, returned as a vector, 2-D array, or scalar in the range [0 180]. Elevations are measured with respect to a plane that is perpendicular to the normal of the surface of the earth. If `asset` is on the surface of the Earth, then the plane is tangential to the Earth. If the `timeIn` argument is not specified, the vector elements correspond to the time samples specified by the `SampleTime` property from the satellite scenario `StartTime` to `StopTime`.

If the `timeIn` argument is not specified and when the `AutoSimulate` property of the satellite scenario is `true`, aer function returns the `el` history from `StartTime` to `StopTime`. Otherwise, it returns the `el` history from `StartTime` to `SimulationTime`.

range — Distances from local origin
vector | 2-D array | scalar

Distances from the local origin in meters, returned as a vector, 2-D array, or a scalar. The `range` array is structured the same way as the `az` and `el`, described in the above syntaxes.

If the `timeIn` argument is not specified and when the `AutoSimulate` property of the satellite scenario is `true`, aer function returns the `range` history from `StartTime` to `StopTime`. Otherwise, it returns the `range` history from `StartTime` to `SimulationTime`.

`timeOut` — Time samples between start and stop time of scenario

row vector | scalar

Time samples corresponding to `az`, `el`, and `range` in UTC, returned as a row vector, or a scalar.

If the `timeIn` argument is not specified and when the `AutoSimulate` property of the satellite scenario is `true`, aer function returns the time sample history from `StartTime` to `StopTime`. Otherwise, it returns the time sample history from `StartTime` to `SimulationTime`.

accessIntervals

Package: `satelliteScenario`

Intervals during which access status is true

Syntax

```
int = accessIntervals(ac)
```

Description

`int = accessIntervals(ac)` returns a table of intervals during which the access status corresponding to each access object in the input vector is true.

Examples

Add Ground stations to Scenario and Visualize Access Intervals

Create satellite scenario and add ground stations from latitudes and longitudes.

```
startTime = datetime(2020, 5, 1, 11, 36, 0);
stopTime = startTime + days(1);
sampleTime = 60;
sc = satelliteScenario(startTime, stopTime, sampleTime);
lat = [10];
lon = [-30];
gs = groundStation(sc, lat, lon);
```

Add satellites using Keplerian elements.

```
semiMajorAxis = 10000000;
eccentricity = 0;
inclination = 10;
rightAscensionOfAscendingNode = 0;
argumentOfPeriapsis = 0;
trueAnomaly = 0;
sat = satellite(sc, semiMajorAxis, eccentricity, inclination, ...
        rightAscensionOfAscendingNode, argumentOfPeriapsis, trueAnomaly);
```

Add access analysis to the scenario and obtain the table of intervals of access between the satellite and the ground station.

```
ac = access(sat, gs);
intvls = accessIntervals(ac)
```

```
intvls=8×8 table
       Source             Target          IntervalNumber         StartTime               EndTi

Input Arguments

ac — Access analysis
row vector of `Access` objects

Access analysis, specified as a row vector of a `Access` objects.

Outputs Arguments

`int` — Intervals during which access is true
table

Intervals during which access is true, returned as a table.

Each row of the table denotes a specific interval, and the columns of the table are named `Source`, `Target`, `IntervalNumber`, `StartTime`, `EndTime`, `Duration` (in seconds), `StartOrbit`, and `EndOrbit`. `Source` and `Target` are the names of the first and last node, respectively, defining the access analysis.

- If `Source` is a satellite or an object that is directly or indirectly attached to a satellite, then `StartOrbit` and `EndOrbit` correspond to the satellite associated with Source.
- If `Target` is a satellite or an object that is directly or indirectly attached to a satellite, then `StartOrbit` and `EndOrbit` correspond to the satellite associated with `Target`. Otherwise, `StartOrbit` and `EndOrbit` are `NaN` because they are associated with ground stations.

Note When `AutoSimulate` of the satellite scenario is `true`, the intervals between `StartTime` and `StopTime` are returned. When it is `false`, the intervals between `StartTime` and `SimulationTime` are returned.

orbitalElements

Package: `matlabshared.satellitescenario`

Orbital elements of satellites in scenario

Syntax

```
elements = orbitalElements(sat)
```

Description

`elements = orbitalElements(sat)` returns the orbital elements of the specified satellite `sat`.

Examples

Retrieve Orbital Elements of Satellite

Create a satellite scenario object.

```
sc = satelliteScenario;
```

Add a satellite to the scenario.

```
tleFile = "eccentricOrbitSatellite.tle";
sat1 = satellite(sc,tleFile);
```

Retrieve the orbital elements of `sat1`.

```
elements1 = orbitalElements(sat1)
```

```
elements1 = struct with fields:
                       MeanMotion: 1.4544e-04
                     Eccentricity: 0.7415
                      Inclination: 60.0000
    RightAscensionOfAscendingNode: 30.0000
                ArgumentOfPeriapsis: 280
                      MeanAnomaly: 289.4697
                           Period: 43200
                            Epoch: 05-May-2020 13:51:55
                            BStar: 0
```

Add a satellite from Keplerian elements to the scenario.

```
semiMajorAxis = 6878137;                                % meters
eccentricity = 0;
inclination = 20;                                       % degrees
rightAscensionOfAscendingNode = 0;                      % degrees
argumentOfPeriapsis = 0;                                % degrees
trueAnomaly = 0;                                        % degrees
sat2 = satellite(sc,semiMajorAxis,eccentricity, ...
       inclination,rightAscensionOfAscendingNode, ...
       argumentOfPeriapsis,trueAnomaly, ...
       "OrbitPropagator","two-body-keplerian", ...
       "Name","Sat2");
```

Retrieve the orbital elements of `sat2`.

```
elements2 = orbitalElements(sat2)
```

```
elements2 = struct with fields:
                    SemiMajorAxis: 6878137
                     Eccentricity: 0
                      Inclination: 20
    RightAscensionOfAscendingNode: 0
              ArgumentOfPeriapsis: 0
                      TrueAnomaly: 0
                           Period: 5.6770e+03
```

Input Arguments

`sat` — Satellite

row vector of `Satellite` objects

Satellite, specified as a row vector of `Satellite` objects.

Output Arguments

`elements` — Orbital elements

structure

Orbital elements of the input `sat`, returned as a structure. The fields of the structure depend on the orbit propagator you specify using the OrbitPropagator property of the `satelliteScenario` object.

For more information on orbital elements, see “Orbital Elements”.

Two-Body Keplerian

The `two-body-keplerian` orbit propagator returns these fields.

- `SemiMajorAxis`, in meters
- `Eccentricity`
- `Inclination`, in degrees
- `RightAscensionOfAscendingNode`, in degrees
- `ArgumentOfPeriapsis`, in degrees
- `TrueAnomaly`, in degrees
- `Period`, in seconds

SGP4 and SDP4

The `sgp4` and `sdp4` orbit propagators returns these fields.

- `MeanMotion`, in degrees/second

- `Eccentricity`
- `Inclination`, in degrees
- `RightAscensionOfAscendingNode`, in degrees
- `ArgumentOfPeriapsis`, in degrees
- `MeanAnomaly`, in degrees
- `Epoch`
- `BStar`, in 1/EarthRadius
- `Period`, in seconds

The orbital elements represent the mean values at `Epoch`.

Ephemeris

The `ephemeris` propagator returns these fields.

- `EphemerisStartTime`
- `EphemerisStopTime`
- `PositionTimeTable`
- `VelocityTimeTable`

GPS

The `gps` propagator returns these fields.

- `PRN`
- `SatelliteHealth`
- `GPSWeekNumber`
- `GPSTimeOfApplicability`, in seconds
- `SemiMajorAxis`, in meters
- `Eccentricity`
- `Inclination`, in degrees
- `GeographicLongitudeOfOrbitalPlane`, in degrees
- `RateOfRightAscension`, in degrees/second
- `ArgumentOfPerigee`, in degrees
- `MeanAnomaly`, in degrees
- `Period`, in seconds

The orbital elements are derived from the SEM almanac file and defined in the Earth-Centered-Earth-Fixed (ECEF) frame.

accessStatus

Package: `matlabshared.satellitescenario`

Status of access between first and last node defining access analysis

Syntax

```
s = accessStatus(ac)
s = accessStatus(ac,timeIn)
[s,timeOut] = accessStatus( ___ )
```

Description

`s = accessStatus(ac)` returns a matrix `s` of the access status history between the first and last node corresponding to each `Access` object in the input vector `ac`.

`s = accessStatus(ac,timeIn)` returns the status of each access analysis object at the specified datetime in `timeIn`. Each element of `s` corresponds to an access object in `ac`.

`[s,timeOut] = accessStatus( ___ )` returns the status of each access analysis object and the corresponding datetime in Universal Time Coordinated (UTC).

Examples

Obtain Access Status between Satellite and Ground Station

Create a satellite scenario object.

```
startTime = datetime(2021,4,30);                      % 30 April 2021, 12:00 AM UTC
stopTime = datetime(2021,5,1);                        % 1 May 2021, 12:00 AM UTC
sampleTime = 60;                                      % seconds
sc = satelliteScenario(startTime,stopTime,sampleTime);
```

Add a satellite to the scenario.

```
semiMajorAxis = 10000000;                             % meters
eccentricity = 0;
inclination = 10;                                     % degrees
rightAscensionOfAscendingNode = 0;                    % degrees
argumentOfPeriapsis = 0;                              % degrees
trueAnomaly = 0;                                      % degrees
sat = satellite(sc,semiMajorAxis,eccentricity, ...
    inclination,rightAscensionOfAscendingNode, ...
    argumentOfPeriapsis,trueAnomaly);
```

Add a ground station to the scenario.

```
gs = groundStation(sc);
```

Add access analysis between the satellite and the ground station.

```
ac = access(sat,gs);
```

Obtain the access status at 30 April 2021, 5:34 PM UTC.

```
time = datetime(2021,4,30,17,34,0);
s = accessStatus(ac,time)
```

```
s = logical
   0
```

Input Arguments

ac — Access analysis
row vector of `Access` objects

Access analysis, specified as a row vector of `Access` objects.

`timeIn` — Time at which output is calculated
`datetime` scalar

Time at which the output is calculated, specified as a `datetime` scalar. If no time zone is specified in `timeIn`, the time zone is assumed to be Universal Time Coordinated (UTC).

Outputs Arguments

s — Access analysis status
column vector | matrix

Access analysis status, returned as a column vector or a matrix. If `timeIn` is specified, `s` is a column vector. Otherwise, the output is a matrix. The rows of the matrix correspond to the access object in `ac`, and the columns correspond to the time sample. The status at a given instant is `1` (`true`) if access exists between each pair of adjacent nodes defined by `Sequence`. For example, in a given pair, say defined by node1 and node2, node1 has access to node2 and vice versa:

- If a node is a satellite, then the satellite has access to the adjacent node if both nodes are in line of sight of each other.
- If a node is a ground station, then the ground station has access to the adjacent node if the elevation angle of the node with respect to the ground station is greater than or equal to the `MinElevationAngle` property of `GroundStation`.
- If a node is a conical sensor, then the conical sensor has access to the adjacent node if the latter is in the field of view of the former. If the conical sensor is attached to a ground station directly or via a gimbal, then the elevation angle of the adjacent node with respect to the ground station must be greater than or equal to the `MinElevationAngle` property of `GroundStation`.

`timeOut` — Time samples of output access status
scalar | vector

Time samples of the output access status, returned as a scalar or vector. If the time history of the access status is returned, `timeOut` is a row vector.

Note When `AutoSimulate` of the satellite scenario is `true`, the access status history from `StartTime` to `StopTime` is returned. When it is `false`, the access status history from `StartTime` to `SimulationTime` is returned.

states

Package: `matlabshared.satellitescenario`

Obtain position and velocity of satellite

Syntax

```
pos = states(sat)
[pos,velocity] = states(sat)
[ ___ ] = states(sat,timeIn)
[ ___ ] = states( ___ ,'CoordinateFrame',C)
[pos,velocity,timeOut] = states( ___ )
```

Description

`pos = states(sat)` returns a 3-by-*n*-by-*m* array of the position history `pos` of each satellite in the vector `sat`, where *n* is the number of time samples and *m* is the number of satellites. The rows represent the *x*, *y*, *z* coordinates of the satellite in the Geocentric Celestial Reference Frame (GCRF).

`[pos,velocity] = states(sat)` returns a 3-by-*n*-by-*m* array of the inertial velocity `velocity` of each satellite in the vector `sat` in GCRF.

`[ ___ ] = states(sat,timeIn)` returns one or both of the outputs as 3-by-1-by-*m* arrays in addition to position at the specified datetime `timeIn`. If no time zone is specified in `timeIn`, the time zone is assumed to be Universal Time Coordinated (UTC).

`[ ___ ] = states( ___ ,'CoordinateFrame',C)` returns the outputs in the coordinates specified by `C`.

`[pos,velocity,timeOut] = states( ___ )` returns the position and velocity history of the satellites and the corresponding datetime in UTC.

Examples

Obtain States of Satellite in ECEF Frame

Create a satellite scenario object.

```
startTime = datetime(2021,5,25);                    % May 25, 2021, 12:00 AM UTC
stopTime = datetime(2021,5,26);                     % May 26, 2021, 12:00 AM UTC
sampleTime = 60;                                    % In seconds
sc = satelliteScenario(startTime,stopTime,sampleTime);
```

Add a satellite to the scenario.

```
tleFile = "eccentricOrbitSatellite.tle";
sat = satellite(sc,tleFile);
```

Obtain the position and velocity of the satellite in the Earth-centered Earth-fixed (ECEF) frame corresponding to May 25, 2021, 10:30 PM UTC.

```
time = datetime(2021,5,25,22,30,0);
[position,velocity] = states(sat,time,"CoordinateFrame","ecef")

position = 3×1
10^7 ×

   -0.9431
   -3.0675
    2.7404

velocity = 3×1
10^3 ×

   -1.2166
    0.4198
   -1.6730
```

Input Arguments

sat — Satellite
row vector of `Satellite` objects

Satellite, specified as a row vector of `Satellite` objects.

`timeIn` — Time at which output is calculated
`datetime` scalar

Time at which the output is calculated, specified as a `datetime` scalar. If no time zone is specified in `timeIn`, the time zone is assumed to be Universal Time Coordinated (UTC).

`C` — Coordinate frame
`'ecef'` | `'inertial'` | `'geographical'`

Coordinate frame in which the outputs are returned, specified as `'ecef'`, `'inertial'`, or `'geographical'`.

- The `'ecef'` option returns the position and velocity coordinates in the Earth Centered Earth Fixed (ECEF) frame. For more information on ECEF frames, see "Earth-Centered Earth-Fixed Coordinates".
- The `'inertial'` option returns the position and velocity coordinates in the GCRF frame.
- The `'geographic'` option returns the position as [*lat*; *lon*; *altitude*], where *lat* and *lon* are latitude and longitude in degrees and altitude is the height above the surface of the Earth in meters. The velocity returned is in the North-East-Down (NED) frame.

Output Arguments

pos — Position history
3-by-*n*-by-*m* array

Position history of the satellites in meters, returned as a 3-by-*n*-by-*m* array in the GCRF frame.

If the `AutoSimulate` property of the satellite scenario is `true`, the position history from `StartTime` to `StopTime` is returned. Otherwise, the position history from `StartTime` to `SimulationTime` is returned.

`velocity` — Velocity history
3-by-*n*-by-*m* array

Velocity history of the satellites in meters/second, returned as a 3-by-*n*-by-*m* array in the GCRF frame.

`timeOut` — Time samples of position and velocity
scalar | vector

Time samples of the position and velocity of the satellites, returned as a scalar or vector. If time histories of the position and velocity of the satellite are returned, `timeOut` is a row vector.

Introduced in R2021a

gimbalAngles

Steering angles of gimbal

Syntax

```
az = gimbalAngles(gimbal)
[az,el] = gimbalAngles(gimbal)
[ ___ ] = gimbalAngles(gimbal,timeIn)
[az,el,timeOut] = gimbalAngles(gimbal)
```

Description

`az = gimbalAngles(gimbal)` returns an array of gimbal azimuth `az` histories of the gimbals defined in the vector `gimbal`.

`[az,el] = gimbalAngles(gimbal)` returns an array of gimbal azimuth `az`and gimbal elevation `el` in the vector `gimbal`.

`[ ___ ] = gimbalAngles(gimbal,timeIn)` returns column vectors of gimbal azimuth and gimbal elevation of gimbals defined in the vector `gimbal` at the specified time `timeIn`, depending on the specified output arguments.

`[az,el,timeOut] = gimbalAngles(gimbal)` returns gimbal azimuth, gimbal elevation, and corresponding time in UTC.

Examples

Retrieve Gimbal Angles at Specific Time

Create a satellite scenario object.

```
startTime = datetime(2020,10,10);                    % 10 October 2020, 12:00 AM UTC
stopTime = datetime(2020,10,11);                     % 11 October 2020, 12:00 AM UTC
sampleTime = 60;                                     % seconds
sc = satelliteScenario(startTime,stopTime,sampleTime);
```

Add a satellite to the scenario.

```
semiMajorAxis = 10000000;                            % meters
eccentricity = 0;
inclination = 10;                                    % degrees
rightAscensionOfAscendingNode = 0;                   % degrees
argumentOfPeriapsis = 0;                             % degrees
trueAnomaly = 0;                                     % degrees
sat = satellite(sc,semiMajorAxis,eccentricity, ...
    inclination,rightAscensionOfAscendingNode, ...
    argumentOfPeriapsis,trueAnomaly);
```

Add a gimbal to the satellite.

```
g = gimbal(sat);
```

Point the gimbal at 0 degree latitude and longitude.

```
pointAt(g,[0; 0; 0]);
```

Get the gimbal azimuth and gimbal elevation corresponding to October 10, 2020, 20:54 PM UTC.

```
time = datetime(2020,10,10,20,54,0);
[az,el] = gimbalAngles(g,time)
```

```
az = -5.4268
```

```
el = 19.0368
```

Input Arguments

gimbal — Gimbal
scalar | vector

Gimbal object whose steering angle is being calculated, specified as either a scalar or a vector.

timeIn — Time at which output is calculated
datetime scalar

Time at which the output is calculated, specified as a `datetime` scalar. If no time zone is specified in `timeIn`, the time zone is assumed to be Universal Time Coordinated (UTC).

Output Arguments

az — Gimbal azimuth
array

Gimbal azimuth histories of gimbals in degrees, returned as an array in the range [-180,180]. Each row corresponds to a gimbal in `gimbal`, and each column corresponds to a time sample. This represents the angle of rotation of the gimbal about its *y*-axis.

If `AutoSimulate` of the satellite scenario is `true`, `az` returns the gimbal azimuth history from `StartTime` to `StopTime`. Otherwise the gimbal azimuth history is returned from `StartTime` to `SimulationStatus`.

el — Gimbal elevation
array

Gimbal elevation histories of gimbals in degree, returned as an array in the range [0,180]. This represents the angle of rotation of the gimbal about its *y*-axis. Each row corresponds to a gimbal in `gimbal`, and each column corresponds to a time sample. This represents the angle of rotation of the gimbal about its x-axis.

If `AutoSimulate` of the satellite scenario is `true`, `el` returns the gimbal elevation history from `StartTime` to `StopTime`. Otherwise the gimbal elevation history is returned from `StartTime` to `SimulationStatus`.

timeOut — Time samples between start and stop time of scenario
scalar | vector

Time samples between start and stop time of the scenario, returned as a scalar or vector. If `az` and `el` histories are returned, `timeOut` is a row vector.

show

Package: `matlabshared.satellitescenario`

Show object in satellite scenario viewer

Syntax

```
show(item)
show(item,v)
```

Description

`show(item)` shows the item on all open Satellite Scenario Viewers.

`show(item,v)` shows the graphic on the Satellite Scenario Viewer specified by `v`.

Examples

Add Satellites to Scenario Using Keplerian Elements

Create a satellite scenario with a start time of 02-June-2020 8:23:00 AM UTC, and the stop time set to one day later. Set the simulation sample time to 60 seconds.

```
startTime = datetime(2020,6,02,8,23,0);
stopTime = startTime + days(1);
sampleTime = 60;
sc = satelliteScenario(startTime,stopTime,sampleTime);
```

Add two satellites to the scenario using their Keplerian elements.

```
semiMajorAxis = [10000000; 15000000];
eccentricity = [0.01; 0.02];
inclination = [0; 10];
rightAscensionOfAscendingNode = [0; 15];
argumentOfPeriapsis = [0; 30];
trueAnomaly = [0; 20];

sat = satellite(sc, semiMajorAxis, eccentricity, inclination, ...
    rightAscensionOfAscendingNode, argumentOfPeriapsis, trueAnomaly)
```

```
sat = 
  1×2 Satellite array with properties:

    Name
    ID
    ConicalSensors
    Gimbals
    Transmitters
    Receivers
    Accesses
    GroundTrack
    Orbit
    OrbitPropagator
    MarkerColor
    MarkerSize
    ShowLabel
    LabelFontSize
    LabelFontColor
```

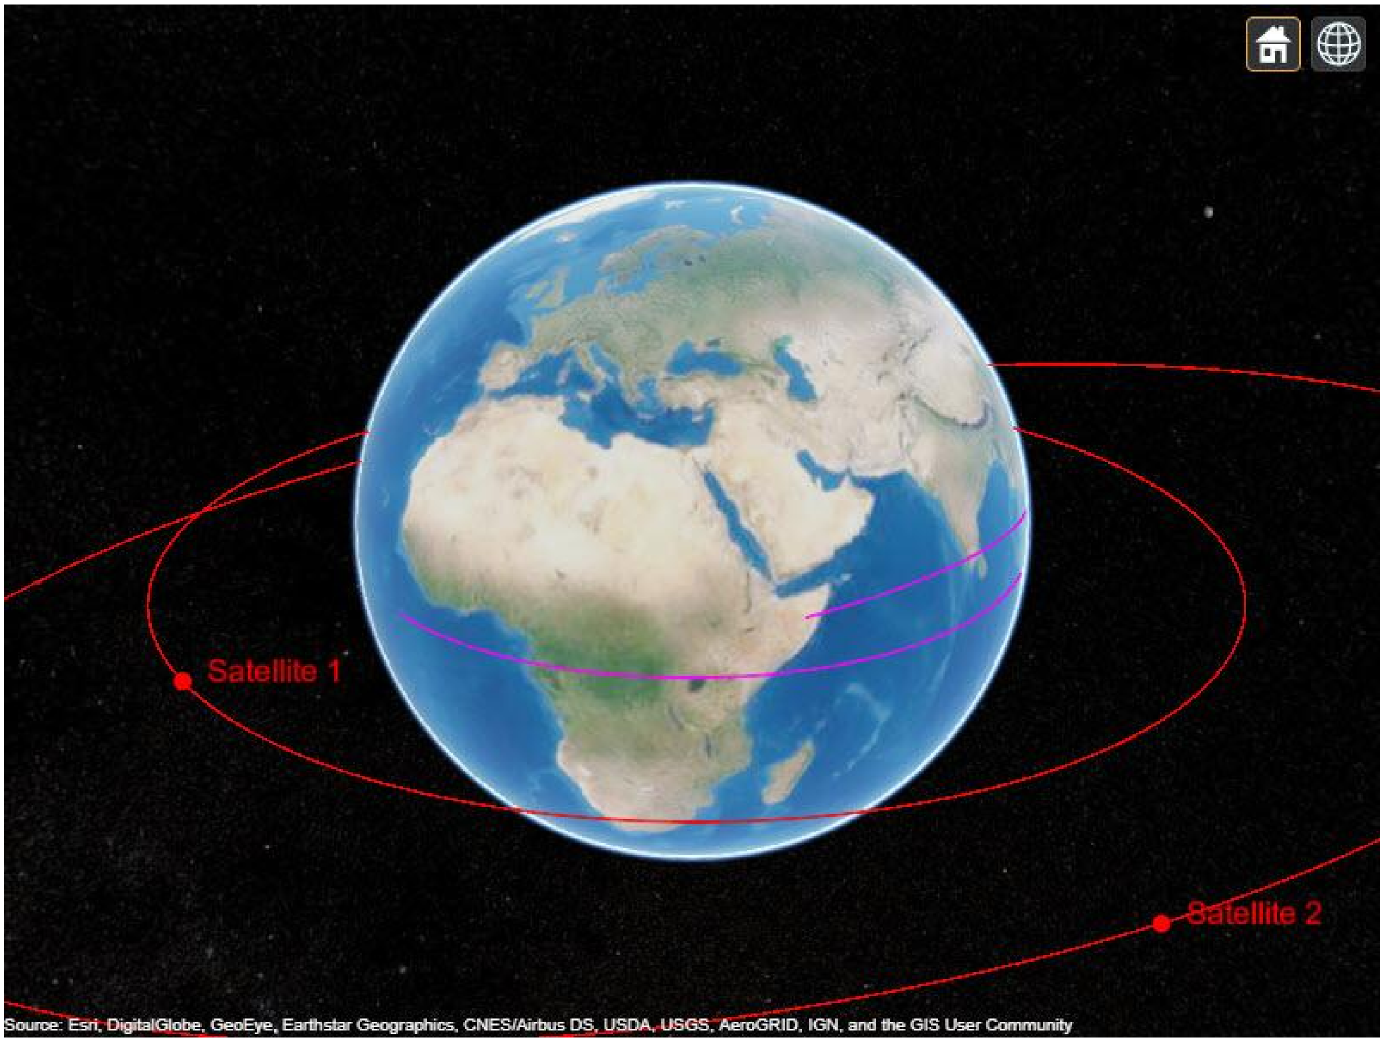
View the satellites in orbit and the ground tracks over one hour.

```
show(sat)
groundTrack(sat,'LeadTime',3600)
```

```
ans=1×2 object
  1×2 GroundTrack array with properties:

    LeadTime
    TrailTime
    LineWidth
    TrailLineColor
    LeadLineColor
    VisibilityMode
```

```
play(sc)
```



Satellite 1
Satellite 2
Source: Esri, DigitalGlobe, GeoEye, Earthstar Geographics, CNES/Airbus DS, USDA, USGS, AeroGRID, IGN, and the GIS User Community

Input Arguments

`item` — Item

`Satellite` object | `GroundStation` object | `ConicalSensor` object | `GroundTrack` object | `FieldofView` object | `Access` object | `Link` object

`Satellite`, `GroundStation`, `ConicalSensors`, `GroundTrack`, `FieldOfView`, `Access` or `Link` object. These objects must belong to the same `satelliteScenario` object.

Note If `item` is a satellite or a ground station, then the associated transmitters, receivers and gimbals are also displayed on the viewer.

`v` — Satellite scenario viewer

row vector of all `satelliteScenarioViewer` objects (default) | scalar `satelliteScenarioViewer` object | array of `satelliteScenarioViewer` objects

Satellite scenario viewer, specified as a scalar, vector, or array of `satelliteScenarioViewer` objects.

hide

Package: `matlabshared.satellitescenario`

Hides satellite scenario entity from viewer

Syntax

```
hide(item)
hide(item,v)
```

Description

`hide(item)` hides `item` from all open satellite scenario viewers.

`hide(item,v)` hides the specified satellite scenario entity on the satellite scenario viewer specified by `v`.

Examples

Hide Satellite from Satellite Scenario Viewer

Create a satellite scenario object.

```
sc = satelliteScenario;
```

Add a satellite to the scenario.

```
semiMajorAxis = 10000000;                          % meters
eccentricity = 0;
inclination = 0;                                   % degrees
rightAscensionOfAscendingNode = 0;                 % degrees
argumentOfPeriapsis = 0;                           % degrees
trueAnomaly = 0;                                   % degrees
sat = satellite(sc,semiMajorAxis,eccentricity, ...
      inclination,rightAscensionOfAscendingNode, ...
      argumentOfPeriapsis,trueAnomaly);
```

Visualize the satellite using the Satellite Scenario Viewer.

```
viewer = satelliteScenarioViewer(sc);
```

Input Arguments

`item` — Item
`Satellite` object | `GroundStation` object | `ConicalSensor` object | `GroundTrack` object | `FieldofView` object | `Access` object | `Link` object

`Satellite`, `GroundStation`, `ConicalSensors`, `GroundTrack`, `FieldOfView`, `Access` or `Link` object. These objects must belong to the same `satelliteScenario` object.

`v` — Satellite scenario viewer
row vector of all `satelliteScenarioViewer` objects (default) | scalar `satelliteScenarioViewer` object | array of `satelliteScenarioViewer` objects

ebno

Package: `satcom.satellitescenario`

Eb/No at final node of link

Syntax

```
e = ebno(lnk)
e = ebno(lnk,timeIn)
[e,timeOut] = ebno( ___ )
```

Description

`e = ebno(lnk)` returns a matrix `e` of the history of received energy per bit to noise power spectral density (Eb/No) values in dB at the final node in each possible multihop link in the vector `lnk`. The rows of the matrix correspond to the link object in `lnk` and the columns correspond to the time sample.

`e = ebno(lnk,timeIn)` returns a column vector of Eb/No `e` in dB at the final node in each link defined in the vector `lnk` at the specified datetime `timein`. Each element of `e` corresponds to a link in `lnk`. If no timezone is specified in `timeIn`, the time zone is assumed to be UTC.

`[e,timeOut] = ebno( ___ )` returns the received Eb/No values and the corresponding times in Universal Time Incorporated (UTC).

Examples

Retrieve Time Samples and EbNo of Reciever

Create a satellite scenario object.

```
startTime = datetime(2020,12,13,10,42,0);
stopTime = startTime + days(1);
sampleTime = 2000;                                       % seconds
sc = satelliteScenario(startTime,stopTime,sampleTime);
```

Add a satellite to the scenario.

```
semiMajorAxis = 10000000;                               % meters
eccentricity = 0;
inclination = 0;                                        % degrees
rightAscensionOfAscendingNode = 0;                      % degrees
argumentOfPeriapsis = 0;                                % degrees
trueAnomaly = 210;                                      % degrees
sat = satellite(sc,semiMajorAxis,eccentricity, ...
    inclination,rightAscensionOfAscendingNode, ...
    argumentOfPeriapsis,trueAnomaly);
```

Add a transmitter to the satellite.

```
tx = transmitter(sat);
```

Add a ground station to the scenario.

```
latitude = 0;                                % degrees
longitude = 30;                              % degrees
gs = groundStation(sc,latitude,longitude);
```

Add a receiver to the ground station.

```
rx = receiver(gs,"MountingAngles",[0; 180; 0]);
```

Add link analysis to the transmitter.

```
lnk = link(tx,rx);
```

Get the Eb/No history at the receiver and their time samples.

```
[e, t] = ebno(lnk)
```

```
e = 1×45
10^3 ×

```

Input Arguments

`lnk` — Link analysis
`Link` object vector | `Link` object scalar

Link analysis object, specified as a `Link` object vector or scalar.

`timeIn` — Time at which output is calculated
`datetime` scalar

Time at which the output is calculated, specified as a `datetime` scalar. If no time zone is specified in `timeIn`, the time zone is assumed to be Universal Time Coordinated (UTC).

Output Arguments

`e` — Eb/No
scalar | vector | matrix

Eb/No, returned as a scalar, vector, or a matrix. If `timeIn` is not specified, `e` is a row vector or a matrix.

`timeOut` — Time samples of output Eb/No
scalar | vector

Time samples of the output Eb/No, returned as a scalar or vector. If time history of Eb/No is returned, `timeOut` is a row vector.

Note When `AutoSimulate` of the satellite scenario is `true`, the Eb/No history from `StartTime` to `StopTime` is returned. When it is `false`, the Eb/No history from `StartTime` to `SimulationTime` is returned.

access

Package: `matlabshared.satellitescenario`

Add access analysis objects to satellite scenario

Syntax

```
access(asset1,asset2,...)
ac = access( ___ ,'Viewer',Viewer)
ac = access( ___ )
```

Description

`access(asset1,asset2,...)` adds `Access` analysis objects defined by nodes `asset1`, `asset2`, and so on.

`ac = access( ___ ,'Viewer',Viewer)` sets the viewer in addition to any input argument combination from previous syntaxes. For example, `'Viewer',v1` picks the viewer `v1`.

`ac = access( ___ )` returns added access analysis objects in the row vector `ac`.

Examples

Add Ground stations to Scenario and Visualize Access Intervals

Create satellite scenario and add ground stations from latitudes and longitudes.

```
startTime = datetime(2020, 5, 1, 11, 36, 0);
stopTime = startTime + days(1);
sampleTime = 60;
sc = satelliteScenario(startTime, stopTime, sampleTime);
lat = [10];
lon = [-30];
gs = groundStation(sc, lat, lon);
```

Add satellites using Keplerian elements.

```
semiMajorAxis = 10000000;
eccentricity = 0;
inclination = 10;
rightAscensionOfAscendingNode = 0;
argumentOfPeriapsis = 0;
trueAnomaly = 0;
sat = satellite(sc, semiMajorAxis, eccentricity, inclination, ...
        rightAscensionOfAscendingNode, argumentOfPeriapsis, trueAnomaly);
```

Add access analysis to the scenario and obtain the table of intervals of access between the satellite and the ground station.

```
ac = access(sat, gs);
intvls = accessIntervals(ac)
```

```
intvls=8×8 table

May 2 2020 00:00:00 UTC
May 2 2020 06:00:00 UTC
May 2 202

Input Arguments

`asset1,asset2,...` — Satellite, ground station, or conical sensor
scalar | vector

`Satellite`, `GroundStation`, or `ConicalSensors` object, specified as a scalar or vector. These objects must belong to the same `satelliteScenario` object. The function adds the access analysis object to the `Accesses` property of the corresponding asset in `asset1`.

- If the asset in a given node is a scalar, every analysis object uses the same asset for that node position.
- If the asset in a given node is a vector, its length must equal the number of access analysis objects. Each access analysis object uses the corresponding element of the asset vector for that node location.

`Viewer` — Satellite scenario viewer
vector of `satelliteScenarioViewer` objects (default) | scalar `satelliteScenarioViewer` object | array of `satelliteScenarioViewer` objects

Satellite scenario viewer, specified as a scalar, vector, or array of `satelliteScenarioViewer` objects. If the `AutoSimulate` property of the scenario is `false`, adding a satellite to the scenario disables any previously available timeline and playback widgets.

Output Arguments

ac — Access analysis
scalar | vector

Access analysis between input objects, returned as either a scalar or vector.

Note When the `AutoSimulate` property is set to `false`, `SimulationStatus` must be `NotStarted` to call `access` function. Otherwise, use the `restart` function to reset the `SimulationStatus` to `NotStarted`. Note that `restart` also erases the simulation data.

groundStation

Package: `matlabshared.satellitescenario`

Add ground station to satellite scenario

Syntax

```
groundStation(scenario)
groundStation(scenario,lat,lon)
groundStation( ___ ,Name,Value)
gs = groundStation( ___ )
```

Description

`groundStation(scenario)` adds a default `GroundStation` object to the specified satellite scenario.

`groundStation(scenario,lat,lon)` sets the Latitude and Longitude properties of the ground station to `lat` and `lon`, respectively. `lat` and `lon` must be of the same length. This length specifies the number of ground stations that the function adds to the input scenario. Together, `lat` and `lon` indicate the locations of the ground stations.

`groundStation( ___ ,Name,Value)` sets options using one or more name-value arguments in addition to any input argument combination from previous syntaxes. For example, `'MinElevationAngle',10` specifies a minimum elevation angle of 10 degrees.

`gs = groundStation( ___ )` returns a vector of handles to the added ground stations. Specify any input argument combination from previous syntaxes.

Examples

Add Ground stations to Scenario and Visualize Access Intervals

Create satellite scenario and add ground stations from latitudes and longitudes.

```
startTime = datetime(2020, 5, 1, 11, 36, 0);
stopTime = startTime + days(1);
sampleTime = 60;
sc = satelliteScenario(startTime, stopTime, sampleTime);
lat = [10];
lon = [-30];
gs = groundStation(sc, lat, lon);
```

Add satellites using Keplerian elements.

```
semiMajorAxis = 10000000;
eccentricity = 0;
inclination = 10;
rightAscensionOfAscendingNode = 0;
argumentOfPeriapsis = 0;
```

```
trueAnomaly = 0;
sat = satellite(sc, semiMajorAxis, eccentricity, inclination, ...
        rightAscensionOfAscendingNode, argumentOfPeriapsis, trueAnomaly);
```

Add access analysis to the scenario and obtain the table of intervals of access between the satellite and the ground station.

```
ac = access(sat, gs);
intvls = accessIntervals(ac)
```

```
intvls=8×8 table

May 2 2020 00:00:00 UTC
May 2 2020 06:00:00 UTC
May 2 202

Input Arguments

`scenario` — Satellite scenario
`satelliteScenario` object

Satellite scenario, specified as a `satelliteScenario` object.

`lat`, `lon` — Latitude and longitude
real-valued scalar | real-valued vector

Latitude and longitude of the ground station, specified as a real-valued scalar or real-valued vector.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1,...,NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose `Name` *in quotes.*

Example: `'MinElevationAngle',10` specifies a minimum elevation angle of 10 degrees.

`Viewer` — Satellite scenario viewer
vector of `satelliteScenarioViewer` objects (default) | scalar `satelliteScenarioViewer` object | array of `satelliteScenarioViewer` objects

Satellite scenario viewer, specified as a scalar, vector, or array of `satelliteScenarioViewer` objects. If the `AutoSimulate` property of the scenario is `false`, adding a satellite to the scenario disables any previously available timeline and playback widgets.

`Name` — groundStation name
`"groundStation` *`idx`*`"` (default) | string scalar | string vector | character vector | cell array of character vectors

You can set this property only when calling the `satellite` function. After you call `satellite`, this property is read-only.

groundStation name, specified as a comma-separated pair consisting of `'Name'` and a string scalar, string vector, character vector or a cell array of character vectors.

- If only one groundStation is added, specify `Name` as a string scalar or a character vector.
- If multiple groundStations are added, specify `Name` as a string scalar, character vector, string vector or a cell array of character vectors. All groundStations added as a string scalar or a character vector are assigned the same specified name. The number of elements in the string vector or cell array of character vector must equal the number of groundStations being added. Each groundStation is assigned the corresponding name from the vector or cell array.

In the default value, *idx* is the ID of the groundStations added by the groundStation object function.

Data Types: `char` | `string`

`Latitude` — Geodetic latitude of ground stations
`42.3001` (default) | scalar | row vector

You can set this property only when calling groundStation. After you call groundStation, this property is read-only.

Geodetic latitude of ground stations, specified as a scalar. Values must be in the range [-90, 90].

- If you add only one ground station, specify Latitude as a scalar double.
- If you add multiple ground stations, specify Latitude as a vector double whose length is equal to the number of ground stations being added.

When latitude and longitude are specified as `lat, lon` inputs to groundStation, Latitude specified as a name-value argument takes precedence.

Data Types: `double`

`Longitude` — Geodetic longitude of ground stations
`-71.3504` (default) | scalar | row vector

You can set this property only when calling groundStation. After you call groundStation, this property is read-only.

Geodetic longitude of ground stations, specified as a scalar or a vector. Values must be in the range [-180, 180].

- If you add only one ground station, specify longitude as a scalar.
- If you add multiple ground stations, specify longitude as a vector whose length is equal to the number of ground stations being added.

When longitude and longitude are specified as `lat, lon` inputs to groundStation, longitude specified as a name-value argument takes precedence.

Data Types: `double`

`Altitude` — Altitude of ground station
`0` m (default) | scalar | vector

You can set this property only when calling groundStation. After you call groundStation, this property is read-only.

Altitude of ground stations, specified as a scalar or a vector.

- If you specify `Altitude` as a scalar, the value is assigned to each ground station in the groundStation.
- If you specify `Altitude` as a vector, the vector length must be equal to the number of ground stations in the groundStation.

When latitude and longitude are specified as `lat, lon` inputs to groundStation, Latitude specified as a name-value argument takes precedence.

Data Types: `double`

`MinElevationAngle` — Minimum elevation angle
`0` (default) | scalar | vector

Minimum elevation angle of a satellite for the satellite to be visible from the ground station, specified as a scalar or row vector. Values must be in the range [–90, 90]. For access and link closure to be possible, the elevation angle must be at least equal to the value specified in `MinElevationAngle`.

- If you specify `MinElevationAngle` as a scalar, the value is assigned to each ground station in the groundStation.
- If you specify `MinElevationAngle` as a vector, the vector length must be equal to the number of ground stations in the groundStation.

When `AutoSimulate` of the satellite scenario is `false`, `MinElevationAngle` can be modified while the `SimulationStatus` is `NotStarted` or `InProgress`.

Data Types: `double`

Output Arguments

gs — Ground station in scenario
`GroundStation` object

Ground station in the scenario, returned as a `GroundStation` object belonging to the satellite scenario specified by the input `scenario`.

You can modify the `GroundStation` object by changing its property values. The name-value arguments used when calling this function correspond to property names.

Introduced in R2021a

transmitter

Package: `matlabshared.satellitescenario`

Add transmitter to satellite scenario

Syntax

```
transmitter(parent)
transmitter(parent,Name,Value)
tx = transmitter( ___ )
```

Description

`transmitter(parent)` adds a `Transmitter` object to the `parent` which can be a `Satellites`, `GroundStations`, or `Gimbals`.

`transmitter(parent,Name,Value)` adds transmitters to parents in `parent` using additional parameters specified by optional name-value arguments. For example, `'MountingAngle',[20; 35; 10]` sets the yaw, pitch, and roll angles of the transmitter to 20, 35, and 10 degrees, respectively.

`tx = transmitter( ___ )` returns added transmitters as a row vector `tx`. Specify any input argument combination from previous syntaxes.

Note When `AutoSimulate` of the satellite scenario is `false`, you can call `transmitter` only when `SimulationStatus` is `NotStarted`. Otherwise, you must call the `restart` function to erase the simulation data and reset the `SimulationStatus` to `NotStarted`.

Examples

Determine Times of Availability for Satellite Link Between Two Ground Stations

Create a satellite scenario object.

```
startTime = datetime(2020,11,25,0,0,0);
stopTime = startTime + days(1);
sampleTime = 60;                                     % seconds
sc = satelliteScenario(startTime,stopTime,sampleTime)
```

```
sc =
  satelliteScenario with properties:

         StartTime: 25-Nov-2020
          StopTime: 26-Nov-2020
        SampleTime: 60
           Viewers: [0×0 matlabshared.satellitescenario.Viewer]
        Satellites: [1×0 matlabshared.satellitescenario.Satellite]
    GroundStations: [1×0 matlabshared.satellitescenario.GroundStation]
```

```
        AutoShow: 1
```

Add a satellite to the scenario.

```
semiMajorAxis = 10000000;                                                   % mete
eccentricity = 0;
inclination = 60;                                                           % degr
rightAscensionOfAscendingNode = 0;                                          % degr
argumentOfPeriapsis = 0;                                                    % degr
trueAnomaly = 0;                                                            % degr
sat = satellite(sc,semiMajorAxis,eccentricity,inclination,rightAscensionOfAscendingNode,...
        argumentOfPeriapsis,trueAnomaly,"Name","Satellite");
```

Add a transmitter to the satellite.

```
frequency = 27e9;                                                             % H
power = 20;                                                                   % d
bitRate = 20;                                                                 % M
systemLoss = 3;                                                               % d
txSat = transmitter(sat,"Name","Satellite Transmitter","Frequency",frequency,"power",power,...
        "BitRate",bitRate,"SystemLoss",systemLoss)
```

```
txSat = 
  Transmitter with properties:

               Name:  Satellite Transmitter
                 ID:  2
   MountingLocation:  [0; 0; 0] meters
     MountingAngles:  [0; 0; 0] degrees
            Antenna:  [1x1 satcom.satellitescenario.GaussianAntenna]
         SystemLoss:  3 decibels
          Frequency:  2.7e+10 Hertz
            BitRate:  20 Mbps
              Power:  20 decibel-watts
              Links:  [1x0 satcom.satellitescenario.Link]
```

Add a receiver to the satellite.

```
gainToNoiseTemperatureRatio = 5;
systemLoss = 3;
rxSat = receiver(sat,"Name","Satellite Receiver","GainToNoiseTemperatureRatio",gainToNoiseTempera
        "SystemLoss",systemLoss)
```

```
rxSat = 
  Receiver with properties:

                           Name:  Satellite Receiver
                             ID:  3
               MountingLocation:  [0; 0; 0] meters
                 MountingAngles:  [0; 0; 0] degrees
                        Antenna:  [1x1 satcom.satellitescenario.GaussianAntenna]
                     SystemLoss:  3 decibels
    GainToNoiseTemperatureRatio:  5 decibels/Kelvin
                  RequiredEbNo:  10 decibels
```

Specify the antenna specifications of the repeater.

```
dishDiameter = 0.5;                                                                        % mete
apertureEfficiency = 0.5;
gaussianAntenna(txSat,"DishDiameter",dishDiameter,"ApertureEfficiency",apertureEfficiency);
gaussianAntenna(rxSat,"DishDiameter",dishDiameter,"ApertureEfficiency",apertureEfficiency);
```

Add two ground stations to the scenario.

```
gs1 = groundStation(sc,"Name","Ground Station 1");
latitude = 52.2294963;                                               % degrees
longitude = 0.1487094;                                               % degrees
gs2 = groundStation(sc,latitude,longitude,"Name","Ground Station 2");
```

Add gimbals to the ground stations. These gimbals enable you to steer the ground station antennas to track the satellite.

```
mountingLocation = [0; 0; -5];                                                              % met
mountingAngles = [0; 180; 0];                                                               % deg
gimbalGs1 = gimbal(gs1,"MountingLocation",mountingLocation,"MountingAngles",mountingAngles);
gimbalGs2 = gimbal(gs2,"MountingLocation",mountingLocation,"MountingAngles",mountingAngles);
```

Track the satellite using the gimbals.

```
pointAt(gimbalGs1,sat);
pointAt(gimbalGs2,sat);
```

Add a transmitter to gimbal `gimbalGs1`.

```
frequency = 30e9;                                                                             % H
power = 40;                                                                                   % d
bitRate = 20;                                                                                 % M
txGs1 = transmitter(gimbalGs1,"Name","Ground Stationn 1 Transmitter","Frequency",frequency,...
        "Power",power,"BitRate",bitRate);
```

Add a receiver to gimbal `gimbalGs2`.

```
requiredEbNo = 14;                                                                          % dB
rxGs2 = receiver(gimbalGs2,"Name","Ground Station 2 Receiver","RequiredEbNo",requiredEbNo);
```

Define the antenna specifications of the ground stations.

```
dishDiameter = 5;                                   % meters
gaussianAntenna(txGs1,"DishDiameter",dishDiameter);
gaussianAntenna(rxGs2,"DishDiameter",dishDiameter);
```

Add link analysis to transmitter `txGs1`.

```
lnk = link(txGs1,rxSat,txSat,rxGs2)
```

```
lnk = 
  Link with properties:

    Sequence:  [8 3 2 9]
    LineWidth:  1
    LineColor:  [0 1 0]
```

Determine the times when ground station `gs1` can send data to ground station `gs2` via the satellite.

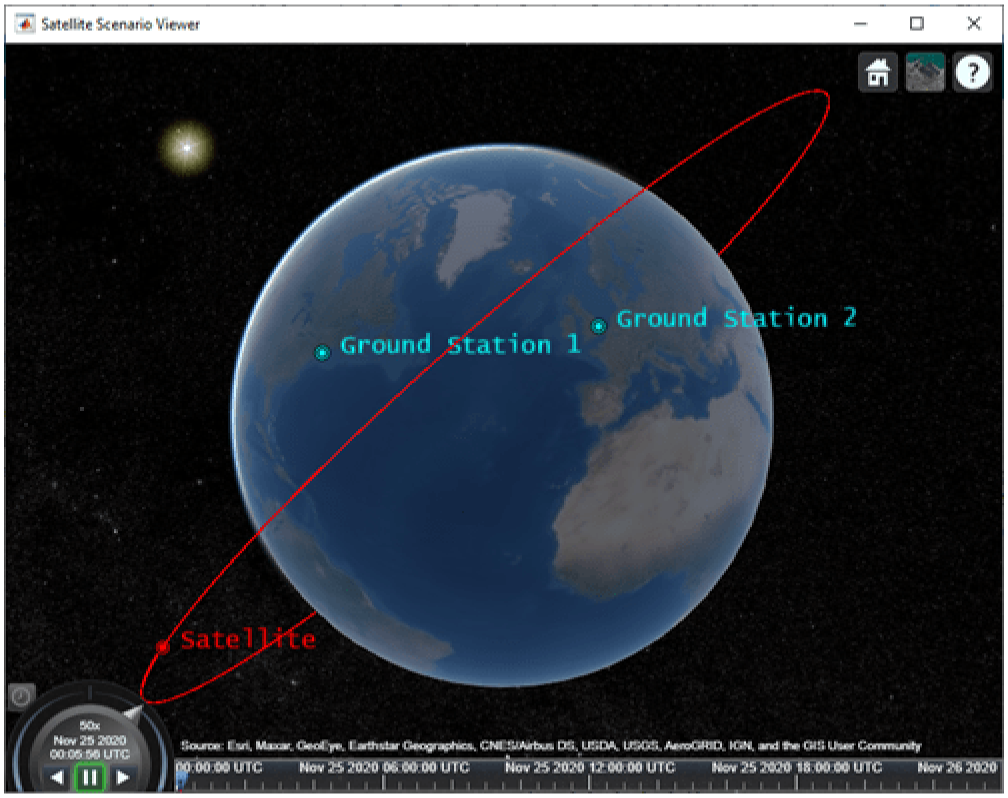
```
linkIntervals(lnk)
```

```
ans =

  0×8 empty table
```

Visualize the link using the Satellite Scenario Viewer.

```
play(sc);
```



Input Arguments

`parent` — Element of scenario to which transmitter is added

scalar | vector

Element of scenario to which the transmitter is added, specified as a scalar or vector of satellites, ground stations or gimbals. The number of transmitters specified is determined by the size of the inputs.

- If `parent` is a scalar, all transmitters are added to the parent.
- If `parent` is a vector and the number of transmitters specified is one, that transmitter is added to each parent.
- If `parent` is a vector and the number of transmitters specified is more than one, the number of transmitters must equal the number of `parents` and each `parent` gets one transmitter.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1,...,NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose `Name` *in quotes.*

Example: `'MountingAngle',[20; 35; 10]` sets the yaw, pitch, and roll angles of the transmitter to 20, 35, and 10 degrees, respectively.

`Name` — transmitter name
`"transmitter idx"` (default) | string scalar | string vector | character vector | cell array of character vectors

You can set this property only when calling the `satellite` function. After you call `satellite`, this property is read-only.

transmitter name, specified as a comma-separated pair consisting of `'Name'` and a string scalar, string vector, character vector or a cell array of character vectors.

- If only one transmitter is added, specify `Name` as a string scalar or a character vector.
- If multiple transmitters are added, specify `Name` as a string scalar, character vector, string vector or a cell array of character vectors. All transmitters added as a string scalar or a character vector are assigned the same specified name. The number of elements in the string vector or cell array of character vector must equal the number of transmitters being added. Each transmitter is assigned the corresponding name from the vector or cell array.

In the default value, *idx* is the ID of the transmitters added by the transmitter object function.

Data Types: `char` | `string`

`MountingLocation` — Mounting location with respect to parent
`[0; 0; 0]` (default) | three-element vector | matrix

Mounting location with respect to the parent object in meters, specified as a three-element vector or a matrix. The position vector is specified in the body frame of the input `parent`.

- One transmitter — `MountingLocation` is a three-element vector.
- Multiple transmitters — `MountingLocation` can be a three-element vector or a matrix. When specified as a vector, the same `MountingLocation`s are assigned to all specified transmitters. When specified as a matrix, `MountingLocation` must contain three rows and the same number of columns as the transmitters. The columns correspond to the mounting location of each specified transmitter and the rows correspond to the mounting location coordinates in the parent body frame.

When the `AutoSimulate` property of the satellite scenario is `false`, you can modify the `MountingLocation` property only when the `SimulationStatus` is `NotStarted`. You can use the `restart` function to reset `SimulationStatus` to `NotStarted`, but doing so erases the simulation data.

Data Types: `double`

`MountingAngles` — Mounting orientation with respect to parent object
`[0; 0; 0]` (default) | three-element row vector of positive numbers | matrix

Mounting orientation with respect to parent object in degrees, specified as a three-element row vector of positive numbers. The elements of the vector correspond to yaw, pitch, and roll in that order. Yaw, pitch, and roll are positive rotations about the parent's *z* - axis, intermediate *y* - axis and intermediate *x* - axis of the parent.

- One transmitter — `MountingAngles` is a three-element vector.
- Multiple transmitters — `MountingAngles` can be a three-element vector or a matrix. When specified as a vector, the same `MountingAngless` are assigned to all specified transmitters. When specified as a matrix, `MountingAngles` must contain three rows and the same number of columns as the transmitters. The columns correspond to the mounting angles of each specified transmitter and the rows correspond to the yaw, pitch, and roll angles parent body frame.

When the `AutoSimulate` property of the satellite scenario is `false`, you can modify the `MountingAngles` property only when the `SimulationStatus` is `NotStarted`. You can use the `restart` function to reset `SimulationStatus` to `NotStarted`, but doing so erases the simulation data.

Example: `[0; 30; 60]`

Data Types: `double`

Antenna — Antenna object associated with transmitter
scalar | vector

`Antenna` object associated with the transmitter, specified as either a scalar or a vector. This object can be the default `gaussianAntenna` object, or one from the Antenna Toolbox or Phased Array System Toolbox. The default Gaussian antenna has a dish diameter of 1 m and an aperture efficiency of 0.65.

Antenna can be specified in transmitter as a name-value pair consisting of `'Antenna'` and a scalar, antenna or phased array objects.

- If only one transmitter is added, `Antenna` must be a scalar.
- If multiple transmitters are added, `Antenna` as a vector. The same antenna is assigned to all transmitters.

`SystemLoss` — System loss in transmitter
5 (default) | scalar | vector

System loss in dB, specified as a scalar or a vector.

System loss can be specified in transmitter as a name-value pair consisting of `'SystemLoss'` and a scalar, or vector.

- If only one transmitter is added, specify `SystemLoss` as a scalar.
- If multiple transmitters are added, specify `SystemLoss` as a scalar or a vector. When `SystemLoss` is a scalar, the same `SystemLoss` is assigned to all transmitters. When `SystemLoss` is a vector, its length must equal the number of transmitter and each element of `SystemLoss` is assigned to the corresponding transmitter specified.

When `AutoSimulate` property of the satellite scenario is `false`, you can modify the `SystemLoss` value while the `SimulationStatus` is `NotStarted` or `InProgress`.

`Frequency` — Transmitter frequency
`14e9` (default) | scalar | vector

Transmitter frequency in Hz, specified as a name-value pair consisting of 'Frequency' and a scalar double or a vector double.

- If one transmitter is added, the `Frequency` must be a scalar.
- If multiple transmitters are added, the frequency value can be a scalar or a vector. All transmitters added as a scalar are assigned the same specified `Frequency`. The length of the vector must equal the number of transmitters added and each element of `Frequency` is assigned to the corresponding transmitter specified.

When `AutoSimulate` of the satellite scenario is false, you can modify the `Frequency` value while the `SimulationStatus` is `NotStarted` or `InProgress`.

`BitRate` — Bit rate of transmitter
`10` (default) | scalar | vector

Bit rate of the transmitter in Mbps, specified as a name-value pair consisting of 'BitRate' and a scalar double or a vector double.

- If one transmitter is added, the bit rate value must be a scalar.
- If multiple transmitters are added, the bit rate value can be a scalar or a vector. All transmitters added as a scalar are assigned the same specified `BitRate`. The length of the vector must equal the number of transmitters added and each element of `BitRate` is assigned to the corresponding transmitter specified.

When `AutoSimulate` of the satellite scenario is `false`, you can modify the `BitRate` value while the `SimulationStatus` is `NotStarted` or `InProgress`.

`Power` — Power of high power amplifier
`12` (default) | scalar | vector

Power of the high power amplifier in dbW, specified as a name-value pair consisting of 'Power' and a scalar double or a vector double.

- If one transmitter is added, the power value must be a scalar.
- If multiple transmitters are added, the power value can be a scalar or a vector. All transmitters added as a scalar are assigned the same specified `Power`. The length of the vector must equal the number of transmitters added and each element of `Power` is assigned to the corresponding transmitter specified.

When `AutoSimulate` of the satellite scenario is false, you can modify the `Power` value while the `SimulationStatus` is `NotStarted` or `InProgress`.

Output Arguments

`tx` — Transmitter
row vector

Transmitters attached to `parent`, returned as a row vector.

Introduced in R2021a

receiver

Package: `matlabshared.satellitescenario`

Add receiver to satellite scenario

Syntax

```
receiver(parent)
receiver(parent,Name,Value)
rx = receiver( ___ )
```

Description

`receiver(parent)` adds a `Receiver` object to the `parent` using default parameters. `parent` can be a `Satellites`, `GroundStations`, or `Gimbals`.

`receiver(parent,Name,Value)` adds receivers to parents in `parent` using additional parameters specified by optional name-value arguments. For example, `'MountingAngle',[20; 35; 10]` sets the yaw, pitch, and roll angles of the transmitter to 20, 35, and 10 degrees, respectively.

`rx = receiver( ___ )` returns added receivers as a row vector `rx`. Specify any input argument combination from previous syntaxes.

Examples

Determine Times of Availability for Satellite Link Between Two Ground Stations

Create a satellite scenario object.

```
startTime = datetime(2020,11,25,0,0,0);
stopTime = startTime + days(1);
sampleTime = 60;                                     % seconds
sc = satelliteScenario(startTime,stopTime,sampleTime)
```

```
sc = 
  satelliteScenario with properties:

         StartTime: 25-Nov-2020
          StopTime: 26-Nov-2020
        SampleTime: 60
           Viewers: [0×0 matlabshared.satellitescenario.Viewer]
        Satellites: [1×0 matlabshared.satellitescenario.Satellite]
    GroundStations: [1×0 matlabshared.satellitescenario.GroundStation]
          AutoShow: 1
```

Add a satellite to the scenario.

```
semiMajorAxis = 10000000;                                                                % mete
eccentricity = 0;
inclination = 60;                                                                        % degr
```

```
rightAscensionOfAscendingNode = 0;                                                 % degr
argumentOfPeriapsis = 0;                                                           % degr
trueAnomaly = 0;                                                                   % degr
sat = satellite(sc,semiMajorAxis,eccentricity,inclination,rightAscensionOfAscendingNode,...
        argumentOfPeriapsis,trueAnomaly,"Name","Satellite");
```

Add a transmitter to the satellite.

```
frequency = 27e9;                                                                    % H
power = 20;                                                                          % d
bitRate = 20;                                                                        % M
systemLoss = 3;                                                                      % d
txSat = transmitter(sat,"Name","Satellite Transmitter","Frequency",frequency,"power",power,...
        "BitRate",bitRate,"SystemLoss",systemLoss)
```

```
txSat = 
  Transmitter with properties:

               Name:  Satellite Transmitter
                 ID:  2
   MountingLocation:  [0; 0; 0] meters
     MountingAngles:  [0; 0; 0] degrees
            Antenna:  [1x1 satcom.satellitescenario.GaussianAntenna]
         SystemLoss:  3 decibels
          Frequency:  2.7e+10 Hertz
            BitRate:  20 Mbps
              Power:  20 decibel-watts
              Links:  [1x0 satcom.satellitescenario.Link]
```

Add a receiver to the satellite.

```
gainToNoiseTemperatureRatio = 5;
systemLoss = 3;
rxSat = receiver(sat,"Name","Satellite Receiver","GainToNoiseTemperatureRatio",gainToNoiseTempera
        "SystemLoss",systemLoss)
```

```
rxSat = 
  Receiver with properties:

                          Name:  Satellite Receiver
                            ID:  3
              MountingLocation:  [0; 0; 0] meters
                MountingAngles:  [0; 0; 0] degrees
                       Antenna:  [1x1 satcom.satellitescenario.GaussianAntenna]
                    SystemLoss:  3 decibels
   GainToNoiseTemperatureRatio:  5 decibels/Kelvin
                 RequiredEbNo:  10 decibels
```

Specify the antenna specifications of the repeater.

```
dishDiameter = 0.5;                                                                % mete
apertureEfficiency = 0.5;
gaussianAntenna(txSat,"DishDiameter",dishDiameter,"ApertureEfficiency",apertureEfficiency);
gaussianAntenna(rxSat,"DishDiameter",dishDiameter,"ApertureEfficiency",apertureEfficiency);
```

Add two ground stations to the scenario.

```
gs1 = groundStation(sc,"Name","Ground Station 1");
latitude = 52.2294963;                                              % degrees
longitude = 0.1487094;                                              % degrees
gs2 = groundStation(sc,latitude,longitude,"Name","Ground Station 2");
```

Add gimbals to the ground stations. These gimbals enable you to steer the ground station antennas to track the satellite.

```
mountingLocation = [0; 0; -5];                                                        % me
mountingAngles = [0; 180; 0];                                                         % deg
gimbalGs1 = gimbal(gs1,"MountingLocation",mountingLocation,"MountingAngles",mountingAngles);
gimbalGs2 = gimbal(gs2,"MountingLocation",mountingLocation,"MountingAngles",mountingAngles);
```

Track the satellite using the gimbals.

```
pointAt(gimbalGs1,sat);
pointAt(gimbalGs2,sat);
```

Add a transmitter to gimbal `gimbalGs1`.

```
frequency = 30e9;                                                                       % H
power = 40;                                                                             % d
bitRate = 20;                                                                           % M
txGs1 = transmitter(gimbalGs1,"Name","Ground Stationn 1 Transmitter","Frequency",frequency,...
        "Power",power,"BitRate",bitRate);
```

Add a receiver to gimbal `gimbalGs2`.

```
requiredEbNo = 14;                                                                    % dB
rxGs2 = receiver(gimbalGs2,"Name","Ground Station 2 Receiver","RequiredEbNo",requiredEbNo);
```

Define the antenna specifications of the ground stations.

```
dishDiameter = 5;                                 % meters
gaussianAntenna(txGs1,"DishDiameter",dishDiameter);
gaussianAntenna(rxGs2,"DishDiameter",dishDiameter);
```

Add link analysis to transmitter `txGs1`.

```
lnk = link(txGs1,rxSat,txSat,rxGs2)
```

```
lnk = 
  Link with properties:

    Sequence:  [8 3 2 9]
    LineWidth:  1
    LineColor:  [0 1 0]
```

Determine the times when ground station `gs1` can send data to ground station `gs2` via the satellite.

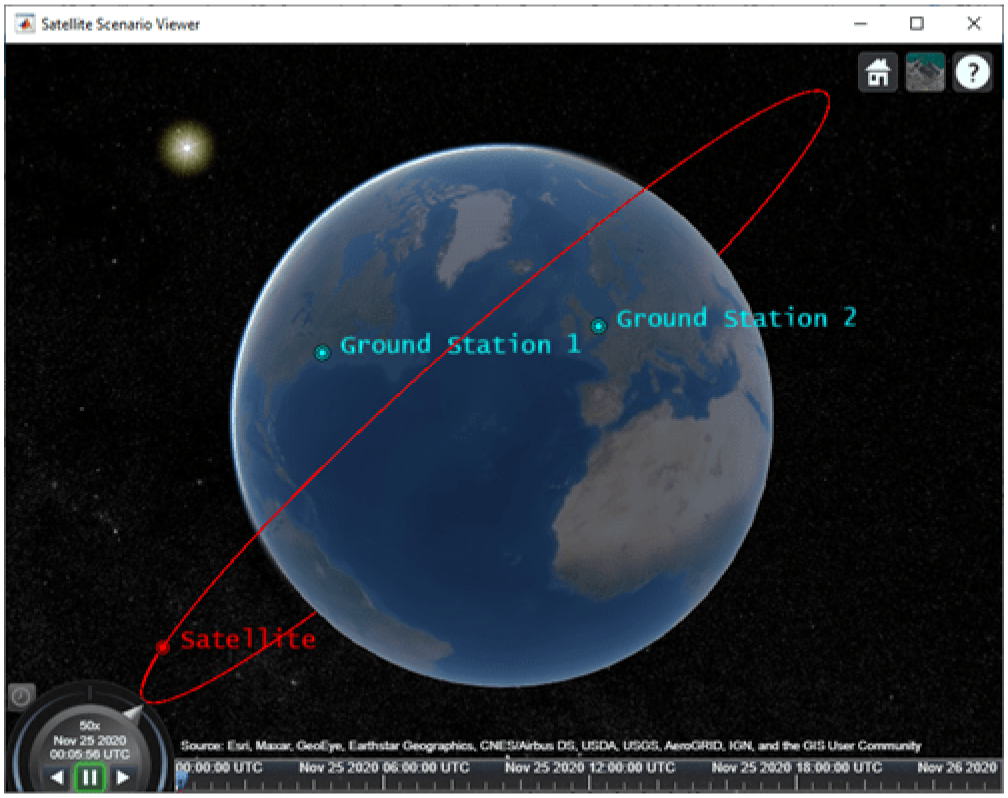
```
linkIntervals(lnk)
```

```
ans =

  0×8 empty table
```

Visualize the link using the Satellite Scenario Viewer.

```
play(sc);
```



Input Arguments

`parent` — Element of scenario to which receiver is added
scalar | vector

Element of scenario to which the receiver is added, specified as a scalar or vector of satellites, ground stations or gimbals. The number of receivers specified is determined by the size of the inputs.

- If `parent` is a scalar, all receivers are added to the parent.
- If `parent` is a vector and the number of receivers specified is one, that receiver is added to each parent.
- If `parent` is a vector and the number of receivers specified is more than one, the number of receivers must equal the number of `parent`s and each `parent` gets one receiver.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1,...,NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose `Name` *in quotes.*

Example: `'MountingAngle',[20; 35; 10]` sets the yaw, pitch, and roll angles of the receiver to 20, 35, and 10 degrees, respectively.

Name — receiver name
"receiver *idx*" (default) | string scalar | string vector | character vector | cell array of character vectors

You can set this property only when calling the `satellite` function. After you call `satellite`, this property is read-only.

receiver name, specified as a comma-separated pair consisting of `'Name'` and a string scalar, string vector, character vector or a cell array of character vectors.

- If only one receiver is added, specify `Name` as a string scalar or a character vector.
- If multiple receivers are added, specify `Name` as a string scalar, character vector, string vector or a cell array of character vectors. All receivers added as a string scalar or a character vector are assigned the same specified name. The number of elements in the string vector or cell array of character vector must equal the number of receivers being added. Each receiver is assigned the corresponding name from the vector or cell array.

In the default value, *idx* is the ID of the receivers added by the receiver object function.

Data Types: `char` | `string`

`MountingLocation` — Mounting location with respect to parent
`[0; 0; 0]` (default) | three-element vector | matrix

Mounting location with respect to the parent object in meters, specified as a three-element vector or a matrix. The position vector is specified in the body frame of the input `parent`.

- One receiver — `MountingLocation` is a three-element vector.
- Multiple receivers — `MountingLocation` can be a three-element vector or a matrix. When specified as a vector, the same `MountingLocations` are assigned to all specified receivers. When specified as a matrix, `MountingLocation` must contain three rows and the same number of columns as the receivers. The columns correspond to the mounting location of each specified receiver and the rows correspond to the mounting location coordinates in the parent body frame.

When the `AutoSimulate` property of the satellite scenario is `false`, you can modify the `MountingLocation` property only when the `SimulationStatus` is `NotStarted`. You can use the `restart` function to reset `SimulationStatus` to `NotStarted`, but doing so erases the simulation data.

Data Types: `double`

`MountingAngles` — Mounting orientation with respect to parent object
`[0; 0; 0]` (default) | three-element row vector of positive numbers | matrix

Mounting orientation with respect to parent object in degrees, specified as a three-element row vector of positive numbers. The elements of the vector correspond to yaw, pitch, and roll in that order. Yaw, pitch, and roll are positive rotations about the parent's *z* - axis, intermediate *y* - axis and intermediate *x* - axis of the parent.

- One receiver — `MountingAngles` is a three-element vector.
- Multiple receivers — `MountingAngles` can be a three-element vector or a matrix. When specified as a vector, the same `MountingAngless` are assigned to all specified receivers. When specified as a matrix, `MountingAngles` must contain three rows and the same number of columns as the receivers. The columns correspond to the mounting angles of each specified receiver and the rows correspond to the yaw, pitch, and roll angles parent body frame.

When the AutoSimulate property of the satellite scenario is false, you can modify the MountingAngles property only when the SimulationStatus is NotStarted. You can use the restart function to reset SimulationStatus to NotStarted, but doing so erases the simulation data.

Example: [0; 30; 60]

Data Types: double

Antenna — Antenna object associated with receiver
scalar | vector

Antenna object associated with the receiver, specified as either a scalar or a vector. This object can be the default gaussianAntenna object, or one from the Antenna Toolbox or Phased Array System Toolbox. The default Gaussian antenna has a dish diameter of 1 m and an aperture efficiency of 0.65.

Antenna can be specified in receiver as a name-value pair consisting of 'Antenna' and a scalar, antenna or phased array objects.

- If only one receiver is added, Antenna must be a scalar.
- If multiple receivers are added, Antenna as a vector. The same antenna is assigned to all receivers.

SystemLoss — System loss in receiver
5 (default) | scalar | vector

System loss in dB, specified as a scalar or a vector.

System loss can be specified in receiver as a name-value pair consisting of 'SystemLoss' and a scalar, or vector.

- If only one receiver is added, specify SystemLoss as a scalar.
- If multiple receivers are added, specify SystemLoss as a scalar or a vector. When SystemLoss is a scalar, the same SystemLoss is assigned to all receivers. When SystemLoss is a vector, its length must equal the number of receiver and each element of SystemLoss is assigned to the corresponding receiver specified.

When AutoSimulate property of the satellite scenario is false, you can modify the SystemLoss value while the SimulationStatus is NotStarted or InProgress.

GainToNoiseTemperatureRatio — Gain to noise temperature ratio
3 (default) | scalar | vector

Gain to noise temperature ratio of the antenna in dB/K, specified as the name-value pair consisting of 'GainToNoiseTemperatureRatio' and a scalar or a vector.

- If only one receiver is added, specify GainToNoiseTemperatureRatio as a scalar.
- If multiple receivers are added, specify GainToNoiseTemperatureRatio as a scalar, or a vector. When GainToNoiseTemperatureRatio is a scalar, the same GainToNoiseTemperatureRatio is assigned to all receivers. When GainToNoiseTemperatureRatio is a vector, its length must equal the number of receivers and each element of GainToNoiseTemperatureRatio is assigned to the corresponding receiver specified.

When `AutoSimulate` property of the satellite scenario is `false`, you can modify the `GainToNoiseTemperatureRatio` value while the `SimulationStatus` is `NotStarted` or `InProgress`.

`RequiredEbNo` — Minimum Eb/No necessary for link closure
`10` (default) | scalar | vector

Minimum energy per bit to noise power spectral density ratio (Eb/No) necessary for link closure in dB, specified as the name-value pair consisting of `'RequiredEbNo'` and a scalar or a vector.

- If only one receiver is added, specify `RequiredEbNo` as a scalar.
- If multiple receivers are added, specify `RequiredEbNo` as a scalar or a vector. When `RequiredEbNo` is a scalar, the same `RequiredEbNo` is assigned to all receivers. When `RequiredEbNo` is a vector, its length must equal the number of receivers and each element of `RequiredEbNo` is assigned to the corresponding receiver specified.

When `AutoSimulate` property of the satellite scenario is `false`, the `RequiredEbNo` property can be modified while the `SimulationStatus` is `NotStarted` or `InProgress`.

Output Arguments

`rx` — Receiver
row vector

Receivers attached to `parent`, returned as a row vector.

Introduced in R2021a

gimbal

Add gimbal to satellite or ground station

Syntax

```
gimbal(parent)
gimbal(parent,Name,Value)
gimbal( ___ )
```

Description

`gimbal(parent)` adds a default `Gimbal` object to each parent in the `parent` vector, which can be a satellite, or a ground station. A gimbal can be added to satellites and ground stations, and dynamically change orientation independent of the parent. Transmitters, receivers, and conical sensors can be mounted on the gimbals.

`gimbal(parent,Name,Value)` adds gimbals to parents in `parent` using additional parameters specified by optional name-value pairs.

`gim = gimbal( ___ )` returns the added gimbals in the row vector `gim`.

Examples

Calculate Maximum Revisit Time of Satellite

Create a satellite scenario with a start time of 15-June-2021 8:55:00 AM UTC and a stop time of five days later. Set the simulation sample time to `60` seconds.

```
startTime = datetime(2021,6,21,8,55,0);
stopTime = startTime + days(5);
sampleTime = 60;                                     % seconds
sc = satelliteScenario(startTime,stopTime,sampleTime)
```

```
sc = 
  satelliteScenario with properties:

         StartTime: 21-Jun-2021 08:55:00
          StopTime: 26-Jun-2021 08:55:00
        SampleTime: 60
           Viewers: [0×0 matlabshared.satellitescenario.Viewer]
        Satellites: [1×0 matlabshared.satellitescenario.Satellite]
    GroundStations: [1×0 matlabshared.satellitescenario.GroundStation]
          AutoShow: 1
```

Add a satellite to the scenario using Keplerian orbital elements.

```
semiMajorAxis = 7878137;                                                        % me
eccentricity = 0;
inclination = 50;                                                               % de
rightAscensionOfAscendingNode = 0;                                              % de
```

```
argumentOfPeriapsis = 0;                                                                      % deg
trueAnomaly = 50;                                                                             % deg
sat = satellite(sc,semiMajorAxis,eccentricity,inclination,rightAscensionOfAscendingNode, ...
    argumentOfPeriapsis,trueAnomaly)

sat = 
  Satellite with properties:

               Name:  Satellite 1
                 ID:  1
     ConicalSensors:  [1x0 matlabshared.satellitescenario.ConicalSensor]
            Gimbals:  [1x0 matlabshared.satellitescenario.Gimbal]
       Transmitters:  [1x0 satcom.satellitescenario.Transmitter]
          Receivers:  [1x0 satcom.satellitescenario.Receiver]
           Accesses:  [1x0 matlabshared.satellitescenario.Access]
        GroundTrack:  [1x1 matlabshared.satellitescenario.GroundTrack]
              Orbit:  [1x1 matlabshared.satellitescenario.Orbit]
    OrbitPropagator:  sgp4
        MarkerColor:  [1 0 0]
         MarkerSize:  10
          ShowLabel:  true
     LabelFontColor:  [1 0 0]
      LabelFontSize:  15
```

Add a ground station which represents the location to be photographed, to the scenario.

```
gs = groundStation(sc,"Name","Location To Photograph", ...
    "Latitude",42.3001,"Longitude",-71.3504)              % degrees

gs = 
  GroundStation with properties:

               Name:  Location To Photograph
                 ID:  2
           Latitude:  42.3 degrees
          Longitude:  -71.35 degrees
           Altitude:  0 meters
    MinElevationAngle:  0 degrees
     ConicalSensors:  [1x0 matlabshared.satellitescenario.ConicalSensor]
            Gimbals:  [1x0 matlabshared.satellitescenario.Gimbal]
       Transmitters:  [1x0 satcom.satellitescenario.Transmitter]
          Receivers:  [1x0 satcom.satellitescenario.Receiver]
           Accesses:  [1x0 matlabshared.satellitescenario.Access]
        MarkerColor:  [0 1 1]
         MarkerSize:  10
          ShowLabel:  true
     LabelFontColor:  [0 1 1]
      LabelFontSize:  15
```

Add a gimbal to the satellite. You can steer this gimbal independently of the satellite.

```
g = gimbal(sat)

g = 
  Gimbal with properties:

                Name:  Gimbal 3
```

```
                 ID:  3
   MountingLocation:  [0; 0; 0] meters
     MountingAngles:  [0; 0; 0] degrees
     ConicalSensors:  [1x0 matlabshared.satellitescenario.ConicalSensor]
       Transmitters:  [1x0 satcom.satellitescenario.Transmitter]
          Receivers:  [1x0 satcom.satellitescenario.Receiver]
```

Track the location to be photographed using the gimbal.

```
pointAt(g,gs);
```

Add a conical sensor to the gimbal. This sensor represents the camera. Set the field of view to 60 degrees.

```
camSensor = conicalSensor(g,"MaxViewAngle",60)
```

```
camSensor = 
  ConicalSensor with properties:

               Name:  Conical sensor 4
                 ID:  4
   MountingLocation:  [0; 0; 0] meters
     MountingAngles:  [0; 0; 0] degrees
       MaxViewAngle:  60 degrees
           Accesses:  [1x0 matlabshared.satellitescenario.Access]
        FieldOfView:  [0x0 matlabshared.satellitescenario.FieldOfView]
```

Add access analysis between the camera and the location to be photographed. The access is added to the conical sensor.

```
ac = access(camSensor,gs)
```

```
ac = 
  Access with properties:

    Sequence:  [4 2]
    LineWidth:  1
    LineColor:  [0.5 0 1]
```

Visualize the field of view of the camera by using the Satellite Scenario Viewer.

```
v = satelliteScenarioViewer(sc);
fieldOfView(camSensor);
```

Input Arguments

parent — Element of scenario to which gimbal is added
scalar | vector

Element of scenario to which the gimbal is added, specified as a scalar or vector of satellites, or ground stations. The number of gimbals specified is determined by the size of the inputs.

- If `parent` is a scalar, all gimbals are added to the parent.
- If `parent` is a vector and the number of gimbals specified is one, that gimbal is added to each parent.
- If `parent` is a vector and the number of gimbals specified is more than one, the number of gimbals must equal the number of `parents` and each `parent` gets one gimbal.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1,...,NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose `Name` *in quotes.*

Example: `'MountingAngle',[20; 35; 10]` sets the yaw, pitch, and roll angles of gimbal to 20, 35, and 10 degrees, respectively.

Name — gimbal name

`"gimbal *idx*"` (default) | string scalar | string vector | character vector | cell array of character vectors

You can set this property only when calling the `satellite` function. After you call `satellite`, this property is read-only.

gimbal name, specified as a comma-separated pair consisting of `'Name'` and a string scalar, string vector, character vector or a cell array of character vectors.

- If only one gimbal is added, specify `Name` as a string scalar or a character vector.
- If multiple gimbals are added, specify `Name` as a string scalar, character vector, string vector or a cell array of character vectors. All gimbals added as a string scalar or a character vector are assigned the same specified name. The number of elements in the string vector or cell array of character vector must equal the number of gimbals being added. Each gimbal is assigned the corresponding name from the vector or cell array.

In the default value, *idx* is the ID of the gimbals added by the gimbal object function.

Data Types: `char` | `string`

`MountingLocation` — Mounting location with respect to parent

`[0; 0; 0]` (default) | three-element vector | matrix

Mounting location with respect to the parent object in meters, specified as a three-element vector or a matrix. The position vector is specified in the body frame of the input `parent`.

- One gimbal — `MountingLocation` is a three-element vector.
- Multiple gimbals — `MountingLocation` can be a three-element vector or a matrix. When specified as a vector, the same `MountingLocation`s are assigned to all specified gimbals. When specified as a matrix, `MountingLocation` must contain three rows and the same number of columns as the gimbals. The columns correspond to the mounting location of each specified gimbal and the rows correspond to the mounting location coordinates in the parent body frame.

When the `AutoSimulate` property of the satellite scenario is `false`, you can modify the `MountingLocation` property only when the `SimulationStatus` is `NotStarted`. You can use the `restart` function to reset `SimulationStatus` to `NotStarted`, but doing so erases the simulation data.

Data Types: `double`

`MountingAngles` — Mounting orientation with respect to parent object

`[0; 0; 0]` (default) | three-element row vector of positive numbers | matrix

Mounting orientation with respect to parent object in degrees, specified as a three-element row vector of positive numbers. The elements of the vector correspond to yaw, pitch, and roll in that order. Yaw, pitch, and roll are positive rotations about the parent's *z* - axis, intermediate *y* - axis and intermediate *x* - axis of the parent.

- One gimbal — `MountingAngles` is a three-element vector.
- Multiple gimbals — `MountingAngles` can be a three-element vector or a matrix. When specified as a vector, the same `MountingAngless` are assigned to all specified gimbals. When specified as a matrix, `MountingAngles` must contain three rows and the same number of columns as the gimbals. The columns correspond to the mounting angles of each specified gimbal and the rows correspond to the yaw, pitch, and roll angles parent body frame.

When the `AutoSimulate` property of the satellite scenario is `false`, you can modify the `MountingAngles` property only when the `SimulationStatus` is `NotStarted`. You can use the `restart` function to reset `SimulationStatus` to `NotStarted`, but doing so erases the simulation data.

Example: `[0; 30; 60]`

Data Types: `double`

Note The size of specified name-value pairs determines the number of receivers specified. Refer to these properties to understand how they must be defined when specifying multiple receivers.

Output Arguments

`gim` — Gimbal
scalar | vector

Gimbal object attached to `parent`, returned as either a scalar or a vector.

Introduced in R2021a

fieldOfView

Package: `matlabshared.satellitescenario`

Visualize field of view of conical sensor

Syntax

```
fieldOfView(sensor)
fieldOfView(sensor,Name,Value)
fov = fieldOfView( ___ )
```

Description

`fieldOfView(sensor)` adds a `FieldOfView` object to the specified conical sensor, and draws contours on the Earth. Each contour represents the field of view of a conical sensor in `sensor` based on the current state of the scenario.

Locations inside the contour are inside the field of view. The field of view contours are drawn on all open satellite scenario viewers. The contours are the lines of intersection of the surface of the earth and the field of view cone. The half angle of the field of view cone equals the `MaxViewAngle` property of the conical sensor, and the axis of the cone is the *z*-axis (or boresight) of the conical sensor. The vertex of the cone is located at the position of the conical sensor. The cone becomes wider along the positive body *z*-axis of the conical sensor.

`fieldOfView(sensor,Name,Value)` specifies options by using one or more name-value arguments.

`fov = fieldOfView( ___ )` returns a vector of handles to the added field of view graphic objects. Specify any input combination from previous syntaxes.

Examples

Calculate Maximum Revisit Time of Satellite

Create a satellite scenario with a start time of 15-June-2021 8:55:00 AM UTC and a stop time of five days later. Set the simulation sample time to `60` seconds.

```
startTime = datetime(2021,6,21,8,55,0);
stopTime = startTime + days(5);
sampleTime = 60;                                     % seconds
sc = satelliteScenario(startTime,stopTime,sampleTime)
```

```
sc =
  satelliteScenario with properties:

         StartTime: 21-Jun-2021 08:55:00
          StopTime: 26-Jun-2021 08:55:00
        SampleTime: 60
           Viewers: [0×0 matlabshared.satellitescenario.Viewer]
        Satellites: [1×0 matlabshared.satellitescenario.Satellite]
```

```
    GroundStations: [1×0 matlabshared.satellitescenario.GroundStation]
          AutoShow: 1
```

Add a satellite to the scenario using Keplerian orbital elements.

```
semiMajorAxis = 7878137;                                                 % me
eccentricity = 0;
inclination = 50;                                                        % de
rightAscensionOfAscendingNode = 0;                                       % de
argumentOfPeriapsis = 0;                                                 % de
trueAnomaly = 50;                                                        % de
sat = satellite(sc,semiMajorAxis,eccentricity,inclination,rightAscensionOfAscendingNode, ...
    argumentOfPeriapsis,trueAnomaly)
```

```
sat = 
  Satellite with properties:

               Name:  Satellite 1
                 ID:  1
     ConicalSensors:  [1x0 matlabshared.satellitescenario.ConicalSensor]
            Gimbals:  [1x0 matlabshared.satellitescenario.Gimbal]
       Transmitters:  [1x0 satcom.satellitescenario.Transmitter]

           Accesses:  [1x0 matlabshared.satellitescenario.Access]
        GroundTrack:  [1x1 matlabshared.satellitescenario.GroundTrack]
              Orbit:  [1x1 matlabshared.satellitescenario.Orbit]
    OrbitPropagator:  sgp4
        MarkerColor:  [1 0 0]
         MarkerSize:  10
          ShowLabel:  true
     LabelFontColor:  [1 0 0]
      LabelFontSize:  15
```

Add a ground station which represents the location to be photographed, to the scenario.

```
gs = groundStation(sc,"Name","Location To Photograph", ...
    "Latitude",42.3001,"Longitude",-71.3504)                % degrees
```

```
gs = 
  GroundStation with properties:

                 Name:  Location To Photograph
                   ID:  2
             Latitude:  42.3 degrees
            Longitude:  -71.35 degrees
             Altitude:  0 meters
    MinElevationAngle:  0 degrees
       ConicalSensors:  [1x0 matlabshared.satellitescenario.ConicalSensor]
              Gimbals:  [1x0 matlabshared.satellitescenario.Gimbal]
         Transmitters:  [1x0 satcom.satellitescenario.Transmitter]
            Receivers:  [1x0 satcom.satellitescenario.Receiver]
             Accesses:  [1x0 matlabshared.satellitescenario.Access]
          MarkerColor:  [0 1 1]
           MarkerSize:  10
            ShowLabel:  true
       LabelFontColor:  [0 1 1]
```

```
        LabelFontSize:  15
```

Add a gimbal to the satellite. You can steer this gimbal independently of the satellite.

```
g = gimbal(sat)
```

```
g = 
  Gimbal with properties:

                 Name:  Gimbal 3
                   ID:  3
     MountingLocation:  [0; 0; 0] meters
       MountingAngles:  [0; 0; 0] degrees
       ConicalSensors:  [1x0 matlabshared.satellitescenario.ConicalSensor]
         Transmitters:  [1x0 satcom.satellitescenario.Transmitter]
            Receivers:  [1x0 satcom.satellitescenario.Receiver]
```

Track the location to be photographed using the gimbal.

```
pointAt(g,gs);
```

Add a conical sensor to the gimbal. This sensor represents the camera. Set the field of view to 60 degrees.

```
camSensor = conicalSensor(g,"MaxViewAngle",60)
```

```
camSensor = 
  ConicalSensor with properties:

                 Name:  Conical sensor 4
                   ID:  4
     MountingLocation:  [0; 0; 0] meters
       MountingAngles:  [0; 0; 0] degrees
         MaxViewAngle:  60 degrees
             Accesses:  [1x0 matlabshared.satellitescenario.Access]
          FieldOfView:  [0x0 matlabshared.satellitescenario.FieldOfView]
```

Add access analysis between the camera and the location to be photographed. The access is added to the conical sensor.

```
ac = access(camSensor,gs)
```

```
ac = 
  Access with properties:

    Sequence:  [4 2]
    LineWidth:  1
    LineColor:  [0.5 0 1]
```

Visualize the field of view of the camera by using the Satellite Scenario Viewer.

```
v = satelliteScenarioViewer(sc);
fieldOfView(camSensor);
```

Input Arguments

sensor — Conical sensor
ConicalSensor object

Conical sensor, specified as a ConicalSensor object.

Name-Value Pair Arguments

Specify optional pairs of arguments as Name1=Value1,...,NameN=ValueN, where Name is the argument name and Value is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name *in quotes.*

Example: 'LineWidth',2.5 sets the line width of the field of view to 2.5 pixels.

`Viewer` — Satellite scenario viewer
vector of `satelliteScenarioViewer` objects (default) | scalar `satelliteScenarioViewer` object | array of `satelliteScenarioViewer` objects

Satellite scenario viewer, specified as a scalar, vector, or array of `satelliteScenarioViewer` objects. If the `AutoSimulate` property of the scenario is `false`, adding a satellite to the scenario disables any previously available timeline and playback widgets.

`NumContourPoints` — Number of contour points
`40` (default) | integer greater than or equal to 4

Number of contour points used to draw the contour of the field of view, specified as an integer greater than or equal to 4.

Data Types: `double`

`LineWidth` — Visual width of field of view contour
`1` (default) | scalar in the range (0 10]

Visual width of the field of view contour in pixels, specified as a scalar in the range (0 10].

The line width cannot be thinner than the width of a pixel. If you set the line width to a value that is less than the width of a pixel on your system, the line displays as one pixel wide.

`LineColor` — Color of field of view contour
`[0 1 0]` (default) | RGB triplet | `RGB triplet` | `string scalar of color name` | `character vector of color name`

Color of field of view contour, specified as an RGB triplet, hexadecimal color code, a color name, or a short name.

For a custom color, specify an RGB triplet or a hexadecimal color code.

- An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range `[0,1]`; for example, `[0.4 0.6 0.7]`.
- A hexadecimal color code is a character vector or a string scalar that starts with a hash symbol (`#`) followed by three or six hexadecimal digits, which can range from `0` to `F`. The values are not case sensitive. Thus, the color codes `'#FF8800'`, `'#ff8800'`, `'#F80'`, and `'#f80'` are equivalent.

Alternatively, you can specify some common colors by name. This table lists the named color options, the equivalent RGB triplets, and hexadecimal color codes.

Color Name	Short Name	RGB Triplet	Hexadecimal Color Code	Appearance
`'red'`	`'r'`	`[1 0 0]`	`'#FF0000'`	🟥
`'green'`	`'g'`	`[0 1 0]`	`'#00FF00'`	🟩
`'blue'`	`'b'`	`[0 0 1]`	`'#0000FF'`	🟦
`'cyan'`	`'c'`	`[0 1 1]`	`'#00FFFF'`	🟦
`'magenta'`	`'m'`	`[1 0 1]`	`'#FF00FF'`	🟪
`'yellow'`	`'y'`	`[1 1 0]`	`'#FFFF00'`	🟨

Color Name	Short Name	RGB Triplet	Hexadecimal Color Code	Appearance
`'black'`	`'k'`	`[0 0 0]`	`'#000000'`	⬛
`'white'`	`'w'`	`[1 1 1]`	`'#FFFFFF'`	⬜
`'none'`	Not applicable	Not applicable	Not applicable	No color

Here are the RGB triplets and hexadecimal color codes for the default colors MATLAB uses in many types of plots.

RGB Triplet	Hexadecimal Color Code	Appearance
`[0 0.4470 0.7410]`	`'#0072BD'`	🟦
`[0.8500 0.3250 0.0980]`	`'#D95319'`	🟧
`[0.9290 0.6940 0.1250]`	`'#EDB120'`	🟨
`[0.4940 0.1840 0.5560]`	`'#7E2F8E'`	🟪
`[0.4660 0.6740 0.1880]`	`'#77AC30'`	🟩
`[0.3010 0.7450 0.9330]`	`'#4DBEEE'`	🟦
`[0.6350 0.0780 0.1840]`	`'#A2142F'`	🟥

Example: `'blue'`

Example: `[0 0 1]`

Example: `'#0000FF'`

Output Arguments

`fov` — Field of view of conical sensor
row vector of `FieldOfView` objects

Field of view of conical sensor, returned as a row vector of `FieldOfView` objects.

Note When the `AutoSimulate` property is set to `false`, the `SimulationStatus` must equal `NotStarted` to call the `fieldOfView` function. Otherwise, use the `restart` function to reset the `SimulationStatus` to `NotStarted`, which erases the simulation data.

link

Package: `satcom.satellitescenario`

Add link analysis objects to transmitter

Syntax

```
link(asset1,asset2,...,assetN)
lnk = link(___,NAME,VALUE)
lnk = link(___)
```

Description

`link(asset1,asset2,...,assetN)` adds `Link` analysis objects defined by nodes `asset1`, `asset2`, and so on.

`lnk = link(___,NAME,VALUE)` adds link analysis objects using additional parameters specified as name-value pairs.

`lnk = link(___)` adds link analysis objects and returns the vector link

Examples

Determine Times of Availability for Satellite Link Between Two Ground Stations

Create a satellite scenario object.

```
startTime = datetime(2020,11,25,0,0,0);
stopTime = startTime + days(1);
sampleTime = 60;                                     % seconds
sc = satelliteScenario(startTime,stopTime,sampleTime)
```

```
sc = 
  satelliteScenario with properties:

         StartTime: 25-Nov-2020
          StopTime: 26-Nov-2020
        SampleTime: 60
           Viewers: [0×0 matlabshared.satellitescenario.Viewer]
        Satellites: [1×0 matlabshared.satellitescenario.Satellite]
    GroundStations: [1×0 matlabshared.satellitescenario.GroundStation]
          AutoShow: 1
```

Add a satellite to the scenario.

```
semiMajorAxis = 10000000;                                                   % mete
eccentricity = 0;
inclination = 60;                                                           % deg
rightAscensionOfAscendingNode = 0;                                          % deg
argumentOfPeriapsis = 0;                                                    % deg
```

```
trueAnomaly = 0;                                                                         % degr
sat = satellite(sc,semiMajorAxis,eccentricity,inclination,rightAscensionOfAscendingNode,...
        argumentOfPeriapsis,trueAnomaly,"Name","Satellite");
```

Add a transmitter to the satellite.

```
frequency = 27e9;                                                                           % H
power = 20;                                                                                 % d
bitRate = 20;                                                                               % M
systemLoss = 3;                                                                             % d
txSat = transmitter(sat,"Name","Satellite Transmitter","Frequency",frequency,"power",power,...
        "BitRate",bitRate,"SystemLoss",systemLoss)
```

```
txSat = 
  Transmitter with properties:

                Name:  Satellite Transmitter
                  ID:  2
    MountingLocation:  [0; 0; 0] meters
      MountingAngles:  [0; 0; 0] degrees
             Antenna:  [1x1 satcom.satellitescenario.GaussianAntenna]
          SystemLoss:  3 decibels
           Frequency:  2.7e+10 Hertz
             BitRate:  20 Mbps
               Power:  20 decibel-watts
               Links:  [1x0 satcom.satellitescenario.Link]
```

Add a receiver to the satellite.

```
gainToNoiseTemperatureRatio = 5;
systemLoss = 3;
rxSat = receiver(sat,"Name","Satellite Receiver","GainToNoiseTemperatureRatio",gainToNoiseTempera
        "SystemLoss",systemLoss)
```

```
rxSat = 
  Receiver with properties:

                           Name:  Satellite Receiver
                             ID:  3
               MountingLocation:  [0; 0; 0] meters
                 MountingAngles:  [0; 0; 0] degrees
                        Antenna:  [1x1 satcom.satellitescenario.GaussianAntenna]
                     SystemLoss:  3 decibels
    GainToNoiseTemperatureRatio:  5 decibels/Kelvin
                    RequiredEbNo:  10 decibels
```

Specify the antenna specifications of the repeater.

```
dishDiameter = 0.5;                                                                      % mete
apertureEfficiency = 0.5;
gaussianAntenna(txSat,"DishDiameter",dishDiameter,"ApertureEfficiency",apertureEfficiency);
gaussianAntenna(rxSat,"DishDiameter",dishDiameter,"ApertureEfficiency",apertureEfficiency);
```

Add two ground stations to the scenario.

```
gs1 = groundStation(sc,"Name","Ground Station 1");
latitude = 52.2294963;                                                   % degrees
```

```
longitude = 0.1487094;                                          % degrees
gs2 = groundStation(sc,latitude,longitude,"Name","Ground Station 2");
```

Add gimbals to the ground stations. These gimbals enable you to steer the ground station antennas to track the satellite.

```
mountingLocation = [0; 0; -5];                                                     % me
mountingAngles = [0; 180; 0];                                                      % deg
gimbalGs1 = gimbal(gs1,"MountingLocation",mountingLocation,"MountingAngles",mountingAngles);
gimbalGs2 = gimbal(gs2,"MountingLocation",mountingLocation,"MountingAngles",mountingAngles);
```

Track the satellite using the gimbals.

```
pointAt(gimbalGs1,sat);
pointAt(gimbalGs2,sat);
```

Add a transmitter to gimbal `gimbalGs1`.

```
frequency = 30e9;                                                                    % H
power = 40;                                                                          % d
bitRate = 20;                                                                        % M
txGs1 = transmitter(gimbalGs1,"Name","Ground Stationn 1 Transmitter","Frequency",frequency,...
        "Power",power,"BitRate",bitRate);
```

Add a receiver to gimbal `gimbalGs2`.

```
requiredEbNo = 14;                                                                 % dB
rxGs2 = receiver(gimbalGs2,"Name","Ground Station 2 Receiver","RequiredEbNo",requiredEbNo);
```

Define the antenna specifications of the ground stations.

```
dishDiameter = 5;                                  % meters
gaussianAntenna(txGs1,"DishDiameter",dishDiameter);
gaussianAntenna(rxGs2,"DishDiameter",dishDiameter);
```

Add link analysis to transmitter `txGs1`.

```
lnk = link(txGs1,rxSat,txSat,rxGs2)
```

```
lnk = 
  Link with properties:

    Sequence:  [8 3 2 9]
    LineWidth:  1
    LineColor:  [0 1 0]
```

Determine the times when ground station `gs1` can send data to ground station `gs2` via the satellite.

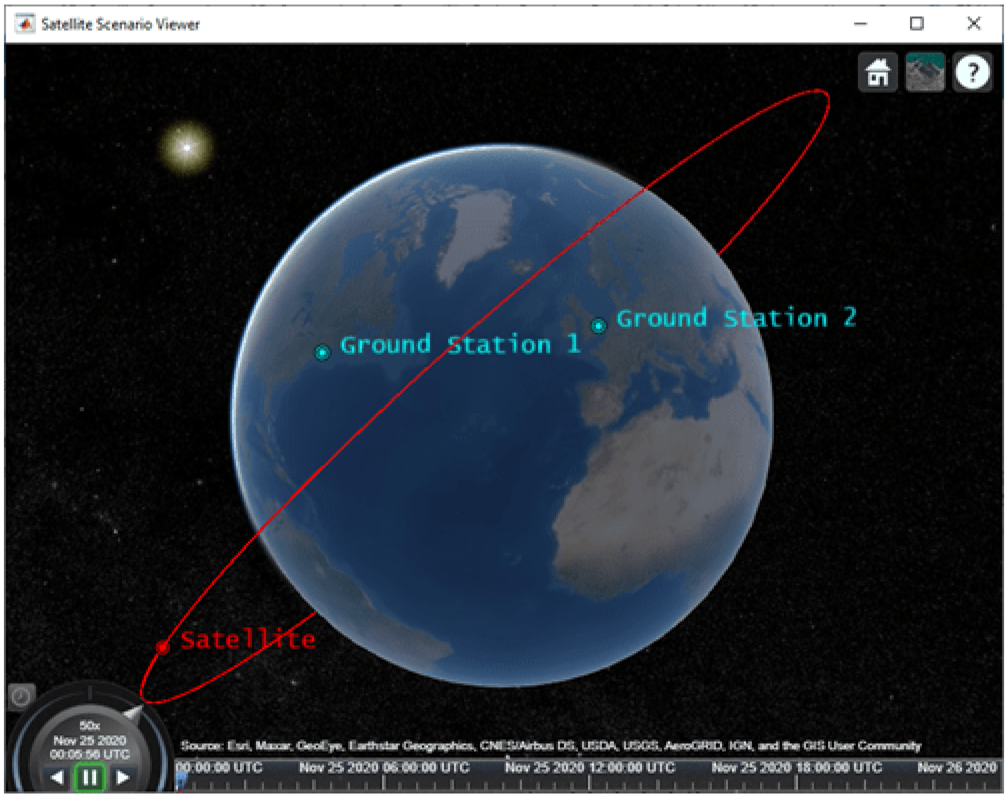
```
linkIntervals(lnk)
```

```
ans =

  0×8 empty table
```

Visualize the link using the Satellite Scenario Viewer.

```
play(sc);
```



Input Arguments

`asset1,asset2,...,assetN` — Adds link analysis objects

scalar | vector

Adds link analysis objects defined by nodes `asset1`, specified as a scalar or vector of transmitters, `asset2`, and so on, specified as a scalar or a vector of transmitters or receivers.

- If the asset in a given node is scalar, every link analysis object uses the same asset for that node position.
- If the asset in a given node is vector, the asset length must equal the number of link analysis objects.

Each link analysis object uses the corresponding element of the asset vector for that node location. The IDs of ASSET1, ASSET2, ASSET3, and so on, specify the Sequence of the link. These objects must belong to the same `satelliteScenario` object. Each link analysis object is added to the Link property of the corresponding transmitter in ASSET1.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1,...,NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose `Name` *in quotes.*

Example: `'LineWidth',2.5` sets the line width of the field of view to 2.5 pixels.

`Viewer` — Satellite scenario viewer
vector of `satelliteScenarioViewer` objects (default) | scalar `satelliteScenarioViewer` object | array of `satelliteScenarioViewer` objects

Satellite scenario viewer, specified as a scalar, vector, or array of `satelliteScenarioViewer` objects. If the `AutoSimulate` property of the scenario is `false`, adding a satellite to the scenario disables any previously available timeline and playback widgets.

Output Arguments

`lnk` — Link analysis
scalar | row vector

Link analysis object between input objects, returned as either a scalar or a row vector.

Note When `AutoSimulate` of the satellite scenario is `false`, you can call `link` only when the `SimulationStatus` is `NotStarted`. Otherwise, you must call the `restart` function to erase the simulation data and reset the `SimulationStatus` to `NotStarted`.

Introduced in R2021a

gaussianAntenna

Package: `satcom.satellitescenario`

Add Gaussian antennas

Syntax

```
gaussianAntenna(trx)
gaussianAntenna(trx,Name,Value)
ant = gaussianAntenna( ___ )
```

Description

`gaussianAntenna(trx)` adds Gaussian antenna to each transmitter or receiver in the vector `trx` using default parameters. The existing antennas in the transmitters or receivers are overwritten.

`gaussianAntenna(trx,Name,Value)` adds a Gaussian antenna to each transmitter or receiver in the vector `trx` using additional parameters specified by optional name-value pairs.

`ant = gaussianAntenna( ___ )` adds a Gaussian antenna to the transmitters or receivers and returns them in the vector `ant`.

Examples

Determine Times of Availability for Satellite Link Between Two Ground Stations

Create a satellite scenario object.

```
startTime = datetime(2020,11,25,0,0,0);
stopTime = startTime + days(1);
sampleTime = 60;                                     % seconds
sc = satelliteScenario(startTime,stopTime,sampleTime)
```

```
sc = 
  satelliteScenario with properties:

         StartTime: 25-Nov-2020
          StopTime: 26-Nov-2020
        SampleTime: 60
           Viewers: [0×0 matlabshared.satellitescenario.Viewer]
        Satellites: [1×0 matlabshared.satellitescenario.Satellite]
    GroundStations: [1×0 matlabshared.satellitescenario.GroundStation]
          AutoShow: 1
```

Add a satellite to the scenario.

```
semiMajorAxis = 10000000;                                                   % mete
eccentricity = 0;
inclination = 60;                                                           % degr
rightAscensionOfAscendingNode = 0;                                          % degr
```

```
argumentOfPeriapsis = 0;                                                                 % degr
trueAnomaly = 0;                                                                         % degr
sat = satellite(sc,semiMajorAxis,eccentricity,inclination,rightAscensionOfAscendingNode,...
        argumentOfPeriapsis,trueAnomaly,"Name","Satellite");
```

Add a transmitter to the satellite.

```
frequency = 27e9;                                                                           % H
power = 20;                                                                                 % d
bitRate = 20;                                                                               % M
systemLoss = 3;                                                                             % d
txSat = transmitter(sat,"Name","Satellite Transmitter","Frequency",frequency,"power",power,...
        "BitRate",bitRate,"SystemLoss",systemLoss)
```

```
txSat = 
  Transmitter with properties:

                Name:  Satellite Transmitter
                  ID:  2
    MountingLocation:  [0; 0; 0] meters
      MountingAngles:  [0; 0; 0] degrees
             Antenna:  [1x1 satcom.satellitescenario.GaussianAntenna]
          SystemLoss:  3 decibels
           Frequency:  2.7e+10 Hertz
             BitRate:  20 Mbps
               Power:  20 decibel-watts
               Links:  [1x0 satcom.satellitescenario.Link]
```

Add a receiver to the satellite.

```
gainToNoiseTemperatureRatio = 5;
systemLoss = 3;
rxSat = receiver(sat,"Name","Satellite Receiver","GainToNoiseTemperatureRatio",gainToNoiseTempera
        "SystemLoss",systemLoss)
```

```
rxSat = 
  Receiver with properties:

                           Name:  Satellite Receiver
                             ID:  3
               MountingLocation:  [0; 0; 0] meters
                 MountingAngles:  [0; 0; 0] degrees
                        Antenna:  [1x1 satcom.satellitescenario.GaussianAntenna]
                     SystemLoss:  3 decibels
    GainToNoiseTemperatureRatio:  5 decibels/Kelvin
                  RequiredEbNo:  10 decibels
```

Specify the antenna specifications of the repeater.

```
dishDiameter = 0.5;                                                                      % mete
apertureEfficiency = 0.5;
gaussianAntenna(txSat,"DishDiameter",dishDiameter,"ApertureEfficiency",apertureEfficiency);
gaussianAntenna(rxSat,"DishDiameter",dishDiameter,"ApertureEfficiency",apertureEfficiency);
```

Add two ground stations to the scenario.

```
gs1 = groundStation(sc,"Name","Ground Station 1");
latitude = 52.2294963;                                                 % degrees
```

```
longitude = 0.1487094;                                               % degrees
gs2 = groundStation(sc,latitude,longitude,"Name","Ground Station 2");
```

Add gimbals to the ground stations. These gimbals enable you to steer the ground station antennas to track the satellite.

```
mountingLocation = [0; 0; -5];                                                              % me
mountingAngles = [0; 180; 0];                                                               % deg
gimbalGs1 = gimbal(gs1,"MountingLocation",mountingLocation,"MountingAngles",mountingAngles);
gimbalGs2 = gimbal(gs2,"MountingLocation",mountingLocation,"MountingAngles",mountingAngles);
```

Track the satellite using the gimbals.

```
pointAt(gimbalGs1,sat);
pointAt(gimbalGs2,sat);
```

Add a transmitter to gimbal `gimbalGs1`.

```
frequency = 30e9;                                                                             % H
power = 40;                                                                                   % d
bitRate = 20;                                                                                 % M
txGs1 = transmitter(gimbalGs1,"Name","Ground Stationn 1 Transmitter","Frequency",frequency,...
        "Power",power,"BitRate",bitRate);
```

Add a receiver to gimbal `gimbalGs2`.

```
requiredEbNo = 14;                                                                          % dB
rxGs2 = receiver(gimbalGs2,"Name","Ground Station 2 Receiver","RequiredEbNo",requiredEbNo);
```

Define the antenna specifications of the ground stations.

```
dishDiameter = 5;                                  % meters
gaussianAntenna(txGs1,"DishDiameter",dishDiameter);
gaussianAntenna(rxGs2,"DishDiameter",dishDiameter);
```

Add link analysis to transmitter `txGs1`.

```
lnk = link(txGs1,rxSat,txSat,rxGs2)
```

```
lnk = 
  Link with properties:

    Sequence:  [8 3 2 9]
    LineWidth:  1
    LineColor:  [0 1 0]
```

Determine the times when ground station `gs1` can send data to ground station `gs2` via the satellite.

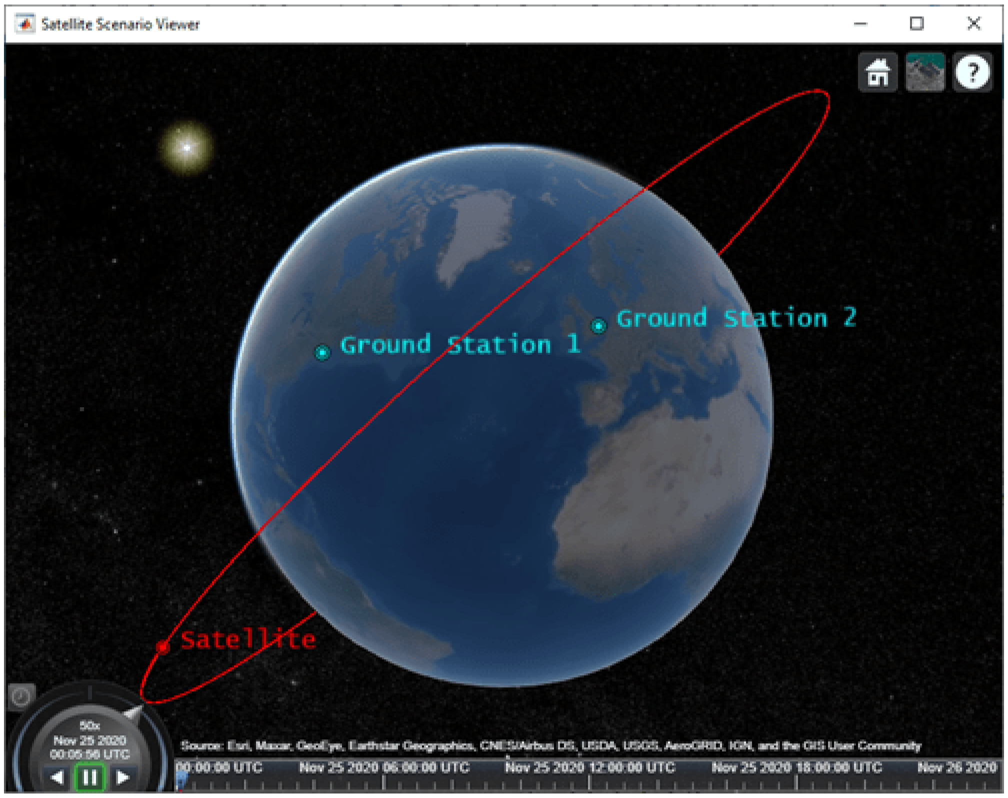
```
linkIntervals(lnk)
```

```
ans =

  0×8 empty table
```

Visualize the link using the Satellite Scenario Viewer.

```
play(sc);
```



Input Arguments

`trx` — Transmitter or receiver

scalar | vector

Transmitter or receiver object to which the Gaussian antenna is added, specified as either a scalar or a vector.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1,...,NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose `Name` *in quotes.*

Example: `'DishDiameter',1.7` sets the dish diameter of the antenna to 1.7 meters upon creation.

`DishDiameter` — Diameter of the antenna dish

1 (default) | scalar | vector

This property is read-only.

You can set this property only when calling `gaussianAntenna`. After you call gaussianAntenna, this property is read-only.

Diameter of the Gaussian antenna dish in meters, specified as a scalar or a vector.

- If `DishDiameter` is scalar, the same value is assigned to all transmitters or receivers in `trx`.
- If `DishDiameter` is vector, the length of the vector must equal that of `trx`, and each transmitter or receiver in `trx` is assigned the corresponding element in `DishDiameter` vector.

`ApertureEfficiency` — Aperture efficiency of Gaussian antenna
`0.65` (default) | scalar in the range (0,1] | vector

This property is read-only.

You can set this property only when calling gaussianAntenna. After you call gaussianAntenna, this property is read-only.

Aperture efficiency of the Gaussian antenna, specified as a scalar in the range (0,1].

- If `ApertureEfficiency` is scalar, the same value is assigned to all transmitters or receivers in `trx`.
- If `ApertureEfficiency` is vector, the length of the vector must equal that of `trx`, and each transmitter or receiver in `trx` is assigned the corresponding element in `ApertureEfficiency` vector.

Output Arguments

`ant` — Gaussian antenna
scalar | vector

Gaussian antenna object added to the specified transmitter or receiver, returned as either a scalar or a vector.

Note When `AutoSimulate` of the satellite scenario is `false`, you can call `gaussianAntenna` only when `SimulationStatus` is `NotStarted`. Otherwise, you must call the `restart` function to erase the simulation data and reset the `SimulationStatus` to `NotStarted`.

Introduced in R2021a

groundTrack

Package: `matlabshared.satellitescenario`

Add ground track object to satellite in scenario

Syntax

```
groundTrack(sat)
groundTrack( ___ ,Name,Value)
```

Description

`groundTrack(sat)` adds ground track visualization for each satellite in `sat` based on their current positions. The ground track begins at the scenario StartTime, and ends at the StopTime. The spacing between samples that make up the ground track visualization is determined by the scenario `SampleTime`. If no viewer is open, a new viewer is launched, and the ground track is displayed. If a viewer is already open, the ground track is added to that viewer. By default, ground tracks will be displayed in 2-D.

`groundTrack( ___ ,Name,Value)` adds a `groundTrack` object by using one or more name-value pairs. Enclose each property name in quotes.

Examples

Add Ground Track to Satellite in Geosynchronous Orbit

Create a satellite scenario object.

```
startTime = datetime(2020,5,10);
stopTime = startTime + days(5);
sampleTime = 60;                                       % seconds
sc = satelliteScenario(startTime,stopTime,sampleTime);
```

Calculate the semimajor axis of the geosynchronous satellite.

```
earthAngularVelocity = 0.0000729211585530;                                                       % rad/s
orbitalPeriod = 2*pi/earthAngularVelocity;                                                       % seconds
earthStandardGravitationalParameter = 398600.4418e9;                                             % m^3/s^2
semiMajorAxis = (earthStandardGravitationalParameter*((orbitalPeriod/(2*pi))^2))^(1/3);
```

Define the remaining orbital elements of the geosynchronous satellite.

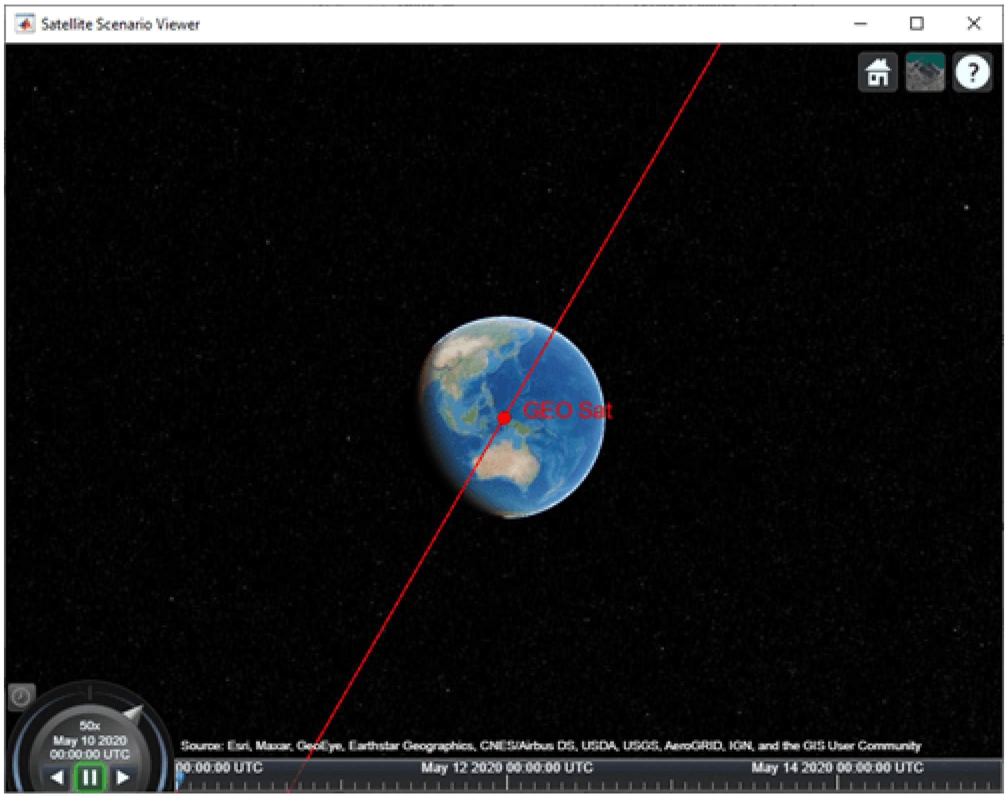
```
eccentricity = 0;
inclination = 60;                 % degrees
rightAscensionOfAscendingNode = 0; % degrees
argumentOfPeriapsis = 0;          % degrees
trueAnomaly = 0;                  % degrees
```

Add the geosynchronous satellite to the scenario.

```
sat = satellite(sc,semiMajorAxis,eccentricity,inclination,rightAscensionOfAscendingNode,...
        argumentOfPeriapsis,trueAnomaly,"OrbitPropagator","two-body-keplerian","Name","GEO Sat")
```

Visualize the scenario using the Satellite Scenario Viewer.

```
v = satelliteScenarioViewer(sc);
```



Satellite Scenario Viewer

00:00:00 UTC
May 12 2020 00:00:00 UTC
May 14 2020 00:00:00 UTC

Add a ground track of the satellite to the visualization and adjust how much of the future and history of the ground track to display.

```
leadTime = 2*24*3600;                                       % seconds
trailTime = leadTime;
gt = groundTrack(sat,"LeadTime",leadTime,"TrailTime",trailTime)
```

```
gt =
  GroundTrack with properties:

          LeadTime: 172800
         TrailTime: 172800
         LineWidth: 1
     LeadLineColor: [1 0 1]
    TrailLineColor: [1 0.5000 0]
    VisibilityMode: 'inherit'
```

Visualize the satellite movement and its trace on the ground. The satellite covers the area around Japan during one half of the day and Australia during the other half.

```
play(sc);
```

May 12 2020 00:00:00 UTC
May 14 2020 00:00:00 UTC

Input Arguments

sat — Satellite
row vector of `Satellite` objects

Satellite, specified as a row vector of `Satellite` objects.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'LeadTime',3600` sets the lead time of the ground track to 3600 seconds upon creation.

Viewer — Satellite scenario viewer
vector of `satelliteScenarioViewer` objects (default) | scalar `satelliteScenarioViewer` object | array of `satelliteScenarioViewer` objects

Satellite scenario viewer, specified as a scalar, vector, or array of `satelliteScenarioViewer` objects. If the `AutoSimulate` property of the scenario is `false`, adding a satellite to the scenario disables any previously available timeline and playback widgets.

LeadTime — Period of future ground track to be visualized
`StartTime` to `StopTime` (default) | real positive scalar

Period of future ground track to be visualized in `Viewer`, specified as a comma-separated pair consisting of `'LeadTime'` and a real positive scalar in seconds.

`TrailTime` — Period of ground track history to be visualized
`StartTime` to `StopTime` (default) | real positive scalar

Period of ground track history to be visualized in `Viewer`, specified as a comma-separated pair consisting of `'TrailTime'` and a real positive scalar in seconds.

`LineWidth` — Visual width of ground track
`1` (default) | scalar

Visual width of ground track in pixels, specified as a comma-separated pair consisting of `'LineWidth'` and a scalar in the range (0,10).

The line width cannot be thinner than the width of a pixel. If you set the line width to a value that is less than the width of a pixel on your system, the line displays as one pixel wide.

`LeadTime` — Period of ground track to be visualized
`StartTime` to `StopTime` (default) | positive scalar

Period of the ground track to be visualized in the satellite scenario viewer, specified as a comma-separated pair consisting of `'LeadTime'` and a real positive scalar in seconds.

`TrailTime` — Period of ground track history to be visualized
`StartTime` to `StopTime` (default) | positive scalar

Period of the ground track history to be visualized in `Viewer`, specified as a comma-separated pair consisting of `'TrailTime'` and a real positive scalar in seconds.

`LineWidth` — Visual width of ground track
`1` (default) | scalar in the range (0 10]

Visual width of the ground track in pixels, specified as a comma-separated pair consisting of `'LineWidth'` and a scalar in the range (0 10].

The line width cannot be thinner than the width of a pixel. If you set the line width to a value that is less than the width of a pixel on your system, the line displays as one pixel wide.

`LeadLineColor` — Color of future ground track line
`[1 0 1]` (default) | RGB triplet | `RGB triplet` | `string scalar of color name` | `character vector of color name`

Color of the future ground track line, specified as a comma-separated pair consisting of `'LeadLineColor'` and an RGB triplet, a hexadecimal color code, a color name, or a short name.

For a custom color, specify an RGB triplet or a hexadecimal color code.

- An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range `[0,1]`; for example, `[0.4 0.6 0.7]`.
- A hexadecimal color code is a character vector or a string scalar that starts with a hash symbol (`#`) followed by three or six hexadecimal digits, which can range from `0` to `F`. The values are not case sensitive. Thus, the color codes `'#FF8800'`, `'#ff8800'`, `'#F80'`, and `'#f80'` are equivalent.

Alternatively, you can specify some common colors by name. This table lists the named color options, the equivalent RGB triplets, and hexadecimal color codes.

Color Name	Short Name	RGB Triplet	Hexadecimal Color Code	Appearance
`'red'`	`'r'`	`[1 0 0]`	`'#FF0000'`	🟥
`'green'`	`'g'`	`[0 1 0]`	`'#00FF00'`	🟩
`'blue'`	`'b'`	`[0 0 1]`	`'#0000FF'`	🟦

`[0.6350 0.0780 0.1840]`	`'#A2142F'`	🟥

Example: `'blue'`

Example: `[0 0 1]`

Example: `'#0000FF'`

`TrailLineColor` — Color of ground track line history

`[1 0.5 0]` (default) | RGB triplet | `RGB triplet` | `string scalar of color name` | `character vector of color name`

Color of the ground track line history, specified as a comma-separated pair consisting of `'TrailLineColor'` and an RGB triplet, a hexadecimal color code, a color name, or a short name.

For a custom color, specify an RGB triplet or a hexadecimal color code.

- An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range `[0,1]`; for example, `[0.4 0.6 0.7]`.

- A hexadecimal color code is a character vector or a string scalar that starts with a hash symbol (#) followed by three or six hexadecimal digits, which can range from `0` to `F`. The values are not case sensitive. Thus, the color codes `'#FF8800'`, `'#ff8800'`, `'#F80'`, and `'#f80'` are equivalent.

Alternatively, you can specify some common colors by name. This table lists the named color options, the equivalent RGB triplets, and hexadecimal color codes.

Color Name	Short Name	RGB Triplet	Hexadecimal Color Code	Appearance

gnssCACode

Generate C/A-code for GPS, NavIC, and QZSS satellites

Syntax

```
code = gnssCACode(prnid,gnsstype)
```

Description

`code = gnssCACode(prnid,gnsstype)` generates coarse acquisition codes (C/A-codes) for the specified pseudo-random noise (PRN) index, `prnid`, of the satellite constellation specified by `gnsstype`.

Examples

Generate C/A-code for Multiple GPS Satellites

Specify the unique pseudo-random noise (PRN) index for for three GPS satellites.

```
prnid = [43 87 10]; % 3 satellites
gnsstype = "GPS";   % Global navigation satellite constellation type
```

Generate the C/A-code for these three GPS satellites.

```
code = gnssCACode(prnid,gnsstype);
size(code)
```

```
ans = 1×2

        1023           3
```

Generate C/A-code for NavIC Satellites over Multiple Epochs

Specify the unique PRN index for two NavIC S-band satellites.

```
prnid = [2 13];
gnsstype = "NavIC S-SPS"; % S-band
```

Generate the C/A-code for these two NavIC S-band satellites.

```
code = gnssCACode(prnid,gnsstype);
```

Calculate the output for 10 C/A-code epochs.

```
numCAEpochs = 10;
fullCode = repmat(code,numCAEpochs,1);
size(fullCode)
```

```
ans = 1×2

       10230           2
```

Input Arguments

prnid — Satellite PRN index
integer | vector of integers

Satellite PRN index for which the function generates a C/A-code, specified as a scalar indicating a PRN index for a single satellite or a vector indicating PRN indices for multiple satellites. Valid values of PRN indices depend on the `gnsstype` input.

`gnsstype` Value	PRN Index Valid Value
`"GPS"`	integer in the range [1, 210]
`"QZSS"`	integer in the range [183, 202]
`"NavIC L5-SPS"` or `"NavIC S-SPS"`	integer in the range [1, 14]

Data Types: `double` | `uint8`

gnsstype — Type of global navigation satellite constellation
`"GPS"` | `"QZSS"` | `"NavIC L5-SPS"` | `"NavIC S-SPS"`

Type of global navigation satellite constellation, specified as one of these values.

- `"GPS"`
- `"QZSS"`
- `"NavIC L5-SPS"`
- `"NavIC S-SPS"`

Data Types: `char` | `string`

Output Arguments

code — Generated C/A-code
column vector | matrix

Generated C/A-code, returned as one of these options.

- Column vector of length 1023 — When you specify `prnid` as a scalar.
- Matrix — When you specify `prnid` as a vector. The number of rows of this matrix is equal to 1023, and the number of columns correspond to the length of the `prnid` vector. Each column of this matrix represents the generated C/A-code corresponding to the element in the `prnid` vector.

For detailed information on the relationship between PRN index values and the generated C/A-codes, refer to IS-GPS-200L Table 3-Ia, 3-Ib, and 6-I [1], ISRO-IRNSS-ICD-SPS-1.1 Table 7 [2], and IS-QZSS-PNT-004 Table 3.2.2-2 [3].

dvbrcs2TurboEncode

Encode DVB-RCS2-compliant turbo codes

Syntax

```
code = dvbrcs2TurboEncode(msg,r,permparams)
```

Description

`code = dvbrcs2TurboEncode(msg,r,permparams)` encodes the message `msg` by using a Digital Video Broadcasting Second Generation Return Channel over Satellite (DVB-RCS2) standard-compliant duo-binary turbo encoder, as defined in ETSI EN 301 545-2 V1.2.1 Section 7.3.5.1 [1]. `r` is the code rate, and `permparams` specifies the permutation control parameters that the function uses to interleave the input message. Output `code` contains the DVB-RCS2-encoded message.

Examples

Encode Message Using DVB-RCS2 Turbo Encoder

Encode a message using a Digital Video Broadcasting Second Generation Return Channel over Satellite (DVB-RCS2) duo-binary turbo encoder, with constant code rate and frame length.

Specify the frame length, code rate, and permutation control parameters.

```
frameLen = 40*8;           % Payload length in bits
r = "3/4";
permParams = [17 9 5 14 1];
```

Generate a column vector of random binary data.

```
msg = randi([0 1],frameLen,1);
```

Encode the message by using DVB-RCS2 turbo encoder.

```
code = dvbrcs2TurboEncode(msg,r,permParams);
```

Encode Message Using DVB-RCS2 Turbo Encoder with Variable Code Rates and Frame Lengths

Encode a message using a Digital Video Broadcasting Second Generation Return Channel over Satellite (DVB-RCS2) duo-binary turbo encoder, with variable code rates and frame lengths.

Specify the frame lengths, code rates, and permutation control parameters.

```
frameLen = [10*8 100*8 49*8];     % Payload length in bits
r = {'1/3','1/2','2/3'};
permParams = [31 1 3 4 2];
```

Generate the column vectors of binary data and encode the message using DVB-RCS2 turbo encoder.

```
% Initialize output as a 3-by-1 cell array
code = cell(length(r),1);
for frmIdx = 1:length(frameLen)
    msg = randi([0 1],frameLen(frmIdx),1);
    code{frmIdx} = dvbrcs2TurboEncode(msg,r{frmIdx},permParams);
end
```

Input Arguments

`msg` — Input message
binary-valued column vector

Input message, specified as a binary-valued column vector. The length of this column vector must be in the range [1, 65,535] bytes.

Data Types: `double` | `int8` | `logical`

`r` — Code rate
`"1/3"` | `"1/2"` | `"2/3"` | `"3/4"` | `"4/5"` | `"5/6"` | `"6/7"` | `"7/8"`

Code rate, specified as one of these values.

- `"1/3"`
- `"1/2"`
- `"2/3"`
- `"3/4"`
- `"4/5"`
- `"5/6"`
- `"6/7"`
- `"7/8"`

Data Types: `char` | `string`

`permparams` — Permutation control parameters
vector

Permutation control parameters that the function uses to interleave the input message, specified as a vector of these five elements in order: P, Q_0, Q_1, Q_2, and Q_3. P must be in the range [9, 255], and Q_0, Q_1, Q_2, and Q_3 must be in the range [0, 15].

To generate unique interleaver indices, the value of P must be coprime to half of the length of the input `msg`.

Data Types: `double` | `uint8`

Output Arguments

`code` — DVB-RCS2-encoded message
binary-valued column vector

DVB-RCS2-encoded message, returned as a binary-valued column vector. The data type of the `code` is same as that of the input `msg`.

Data Types: `double` | `int8` | `logical`

Functions
`dvbrcs2TurboDecode`

Objects
`dvbrcs2WaveformGenerator` | `comm.TurboEncoder`

Introduced in R2021b

dvbrcs2TurboDecode

Decode DVB-RCS2-compliant turbo codes

Syntax

```
decoded = dvbrcs2TurboDecode(code,r,permparams)
decoded = dvbrcs2TurboDecode(code,r,permparams,numiter)
```

Description

`decoded = dvbrcs2TurboDecode(code,r,permparams)` decodes the soft bits in `code` by using a Digital Video Broadcasting Second Generation Return Channel over Satellite (DVB-RCS2) standard-compliant duo-binary turbo decoder, as defined in ETSI EN 301 545-2 V1.2.1 Section 7.3.5.1 [1]. `r` is the code rate, and `permparams` are the permutation control parameters that the function uses to interleave the input soft bits data.

`decoded = dvbrcs2TurboDecode(code,r,permparams,numiter)` specifies the number of decoding iterations.

Examples

Transmit and Decode DVB-RCS2 Encoded Data

Transmit a Digital Video Broadcasting Second Generation Return Channel over Satellite (DVB-RCS2) encoded signal through an additive white Gaussian noise (AWGN) channel, and then decode it using a DVB-RCS2 duo-binary turbo decoder.

Specify the frame length, code rate, and permutation control parameters.

```
frameLen = 100*8;         % Payload length in bits
r = "2/3";
permParams = [37 0 2 0 2];
```

Generate a column vector of random binary data, and then encode the message by using a DVB-RCS2 turbo encoder.

```
msg = randi([0 1],frameLen,1);
code = dvbrcs2TurboEncode(msg,r,permParams);
```

Modulate the encoded message, and then pass it through an AWGN channel.

```
modCode = qammod(code,16,'gray', ...
             'InputType','bit', ...
             'UnitAveragePower',true);  % 16QAM Modulation
snrdB = 10;                             % SNR
receivedCode = awgn(modCode,snrdB);
```

Demodulated the received signal.

```
noiseVar = 10.^(-snrdB/10);                   % Noise variance
demodLLR = qamdemod(receivedCode,16,'gray', ...
              'OutputType','llr', ...
              'UnitAveragePower',true, ...
              'NoiseVariance',noiseVar);     % 16QAM Demodulation
```

Decode the demodulated soft bits by using a DVB-RCS2 turbo decoder.

```
decoded = dvbrcs2TurboDecode(-1*demodLLR,r, ...
                             permParams);
```

Display the erroneous bits.

```
fprintf('Number of bit errors = %f\n',sum(msg~=decoded))
```

```
Number of bit errors = 0.000000
```

Calculate BER for DVB-RCS2 Encode-Decode Chain

Calculate bit error rate (BER) for a Digital Video Broadcasting Second Generation Return Channel over Satellite (DVB-RCS2) encode-decode chain.

Specify the frame length, code rate, and permutation control parameters.

```
frameLen = 25*8;            % Payload length in bits
r = "3/4";
permParams = [19 13 2 9 15];
```

Define the simulation parameters.

```
snrdB = 6;                  % SNR
nVar = 10.^(-snrdB/10);     % Noise variance
errorRate = comm.ErrorRate; % Calculates BER
```

Run the encode-decode chain simulation for 10 frames and calculate the BER.

```
for frmIdx = 1:10
    msg = randi([0 1],frameLen,1);
    code = dvbrcs2TurboEncode(msg,r,permParams);
    modCode = qammod(code,4,[0 2 3 1], ...
                 'InputType','bit', ...
                 'UnitAveragePower',true);        % QPSK Modulation
    receivedOut = awgn(modCode, snrdB);
    demodOut = qamdemod(receivedOut,4,[0 2 3 1], ...
                 'OutputType','llr', ...
                 'UnitAveragePower',true, ...
                 'NoiseVariance',nVar);           % QPSK Demodulation
    decoded = dvbrcs2TurboDecode(-1*demodOut,r, ...
                            permParams);
    errorStats = errorRate(int8(msg),decoded);
end
```

Display the bit error rate.

```
fprintf('Error rate = %f\n',errorStats(1));
```

```
Error rate = 0.003500
```

```
fprintf('Number of errors detected = %f\n',errorStats(2));
```

```
Number of errors detected = 7.000000
```

```
fprintf('Total bits compared = %f\n',errorStats(3));
```

```
Total bits compared = 2000.000000
```

Input Arguments

code — Encoded soft bits
column vector

Encoded soft bits, specified as a column vector.

Data Types: `double`

r — Code rate
`"1/3"` | `"1/2"` | `"2/3"` | `"3/4"` | `"4/5"` | `"5/6"` | `"6/7"` | `"7/8"`

Code rate, specified as one of these values.

- `"1/3"`
- `"1/2"`
- `"2/3"`
- `"3/4"`
- `"4/5"`
- `"5/6"`
- `"6/7"`
- `"7/8"`

Data Types: `char` | `string`

`permparams` — Permutation control parameters
vector

Permutation control parameters that the function uses to interleave the input soft bits data, specified as a vector of these five elements in order: P, Q_0, Q_1, Q_2, and Q_3. P must be in the range [9, 255], and Q_0, Q_1, Q_2, and Q_3 must be in the range [0, 15].

To generate unique interleaver indices, the value of P must be co-prime to `floor`((*inputmsglen* x `r`)/2). *inputmsglen* is the length of the input message, before encoding.

Data Types: `double` | `uint8`

`numiter` — Number of decoding iterations
8 (default) | positive integer

Number of decoding iterations, specified as a positive integer.

Data Types: `double` | `uint8`

Output Arguments

decoded — Decoded message
binary-valued column vector

Decoded message, returned as a binary-valued column vector.

Data Types: `int8`

pattern

Package: `satcom.satellitescenario`

Plot 3-D radiation pattern of antenna

Syntax

```
pat = pattern(tx)
pat = pattern(rx,freq)
pat = pattern( ___ ,Name,Value)
```

Description

`pat = pattern(tx)` plots the 3-D radiation pattern of the antenna for each transmitter in vector `tx`. The signal gain value (in dBi) in a particular direction determines the color of the pattern. The function scales the pattern on the plot according to the `Size` name-value argument. The function plots the pattern for the transmitter frequency as specified by the `Frequency` property of `tx`.

`pat = pattern(rx,freq)` plots the 3-D radiation pattern of the antenna for each receiver in vector, `rx` with frequency `freq`.

`pat = pattern( ___ ,Name,Value)` specifies options using one or more name-value arguments in addition to any of the input argument combinations in previous syntaxes. For example, `'ColorMap','jet'` specifies the jet colormap for coloring the pattern plot.

Examples

Visualize Radiation Pattern of Transmitter Antenna on Satellite

Set up the satellite scenario.

```
startTime = datetime(2021,2,12,13,30,0);
stopTime = startTime + hours(5);
sampleTime = 60;                                     %seconds
sc = satelliteScenario(startTime,stopTime,sampleTime);
```

Create a satellite, ground station, transmitter, and receiver.

```
sat = satellite(sc,1e7,0,0,0,0,0);
gs = groundStation(sc,"Latitude",30,"Longitude",74);
tx = transmitter(sat,"Frequency",3e9);
rx = receiver(gs);
```

Visualize the scenario in the satellite scenario viewer.

Input Arguments

`tx` — Transmitter

scalar | vector

Transmitter object, specified as either a scalar or vector.

`rx` — Receiver

scalar | vector

Receiver object, specified as either a scalar or vector.

`freq` — Frequency to calculate radiation pattern

scalar | vector

Frequency to calculate radiation pattern, specified as a scalar or a vector.

- If `freq` is scalar, its value is applied to the pattern of all receivers in `rx`.
- If `freq` is vector, its length must equal to that of `rx`.

Each element in `freq` corresponds to the pattern of the antenna of the receiver in `rx`.

Data Types: `double`

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1,...,NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose `Name` *in quotes.*

Example: `'Size',1000` sets the size of the radiation pattern plot to 1,000 meters.

`Size` — Size of radiation pattern plot

`1000000` (default) | numeric scalar

Size of the radiation pattern plot, specified as a numeric scalar in meters. This value represents the distance between the antenna position and the point on the plot with the highest gain.

Data Types: `double`

`Colormap` — Colormap for coloring pattern plot

`'jet'` (default) | predefined colormap name | *M*-by-3 matrix

Colormap for coloring the pattern plot, specified as a predefined colormap name or an *M*-by-3 matrix of red, green, blue (RGB) triplets that define *M* individual colors. For more information on the colormap names, see “map”.

Data Types: `double` | `char` | `string`

`Transparency` — Transparency of the pattern plot

`0.4` (default) | scalar in the range [0, 1]

Transparency of the pattern plot, specified as a scalar in the range [0, 1]. A value of `0` means the plot is completely transparent, and a value of `1` means the plot is opaque.

Data Types: `double`

`Resolution` — Resolution of 3-D pattern

`'high'` (default) | `'medium'` | `'low'`

Resolution of the 3-D pattern, specified as `'low'`, `'medium'`, or `'high'`. Use this argument to control the visual quality of the pattern and time the function takes to plot the pattern. `'low'` corresponds to the fastest and least-detailed pattern.

Data Types: `char` | `string`

`Viewer` — Satellite Scenario Viewer to visualize satellite

row vector (default) | scalar | matrix

Satellite Scenario Viewer to visualize the satellite, specified as a scalar, row vector, or matrix of `satelliteScenarioViewer` objects that are associated with the satellite scenario.

Output Arguments

`pat` — Radiation pattern visualization for transmitter or receiver

scalar | vector

Radiation pattern visualization for transmitter or receiver object, returned as either a scalar or vector.

dvbrcs2BitRecover

Recover bits for DVB-RCS2 waveform

Syntax

```
[bits,framePDUErr] = dvbrcs2BitRecover(rxdata,cfgrx,nvar)
```

Description

`[bits,framePDUErr] = dvbrcs2BitRecover(rxdata,cfgrx,nvar)` recovers frame protocol data unit (PDU), `bits`, and the frame PDU cyclic redundancy check (CRC) status, `framePDUErr`. Input `rxdata` is the received complex in-phase quadrature (IQ) symbols in the form of bursts of a Digital Video Broadcasting Second Generation Return Channel over Satellite (DVB-RCS2) transmission. `cfgrx` is the recovery configuration object, `dvbrcs2RecoveryConfig`. `nvar` is the noise variance estimate that the function uses to calculate soft bits.

The function supports demodulation and decoding of the turbo codes with linear modulation (TC-LM), and spread spectrum and turbo codes with linear modulation (SS-TC-LM) transmission formats, with all three PDU types (logon, control, and traffic), for reference and custom waveforms.

Examples

Recover PDU from DVB-RCS2 Reference Waveform

Recover the frame PDU for a DVB-RCS2 reference waveform.

Set the properties of a DVB-RCS2 waveform generator System object™.

```
wg = dvbrcs2WaveformGenerator;
wg.TransmissionFormat = "SS-TC-LM";
wg.WaveformID = 7;
wg.SamplesPerSymbol = 2;
```

Generate a frame PDU.

```
framePDU = randi([0 1],wg.FramePDULength,1);
```

Generate the DVB-RCS2-based burst symbols.

```
txWaveform = wg(framePDU);
```

Add additive white Gaussian noise (AWGN) to the generated waveform.

```
sps = wg.SamplesPerSymbol;
EsNodB = 1;
snrdB = EsNodB - 10*log10(sps);
rxIn = awgn(txWaveform,snrdB,"measured");
```

Create and then configure the DVB-RCS2 recovery configuration object.

```
cfg = dvbrcs2RecoveryConfig;
cfg.TransmissionFormat = wg.TransmissionFormat;
cfg.WaveformID = wg.WaveformID;
```

Create a raised cosine receiver filter.

```
rxFilter = comm.RaisedCosineReceiveFilter( ...
                 'RolloffFactor',0.2, ...
                 'InputSamplesPerSymbol',sps, ...
                 'DecimationFactor',sps);
span = rxFilter.FilterSpanInSymbols;
```

Apply matched filtering and remove the filter delay.

```
filtOut = rxFilter([rxIn; ...
               complex(zeros(span/2*sps,1))]);
rxSymb = filtOut(span+1:end);
```

Recover user packets. Display the frame PDU cyclic redundancy check (CRC) status and the numbers of bit errors.

```
[rxOut,pduErr] = dvbrcs2BitRecover(rxSymb,cfg,10^(-EsNodB/10));
fprintf("Erroneous frame PDU = %d\n", pduErr)
```

```
Erroneous frame PDU = 0
```

```
fprintf("Number of bit errors = %d\n", sum(framePDU~=rxOut))
```

```
Number of bit errors = 0
```

Recover PDU from DVB-RCS2 Custom Waveform

Recover the frame PDU for a DVB-RCS2 custom waveform.

Set the properties of the DVB-RCS2 waveform generator System object™.

```
wg = dvbrcs2WaveformGenerator;
wg.IsCustomWaveform = true;
wg.PayloadLengthInBytes = 115;
wg.MappingScheme = "8PSK";
wg.CodeRate = "2/3";
wg.PermutationParameters = [29 6 5 0 0];
wg.UniqueWord = "3ACF08B13076";
```

Get the characteristic information about the DVB-RCS2 waveform generator.

```
info(wg)
```

```
ans = struct with fields:
              BurstLength: 476
     PayloadLengthInBytes: 115
            MappingScheme: "8PSK"
                 CodeRate: "2/3"
           PreambleLength: 8
          PostambleLength: 8
              PilotPeriod: 0
```

```
        PilotBlockLength: 1
    PermutationParameters: [29 6 5 0 0]
              UniqueWord: "3ACF08B13076"
                PilotSum: 0
```

Generate a frame PDU.

```
framePDU = randi([0 1],wg.FramePDULength,1);
```

Generate the DVB-RCS2-based burst symbols.

```
txWaveform = wg(framePDU);
```

Add additive white Gaussian noise (AWGN) to the generated waveform.

```
sps = wg.SamplesPerSymbol;
EsNodB = 9;
snrdB = EsNodB - 10*log10(sps);
rxIn = awgn(txWaveform,snrdB,'measured');
```

Configure the DVB-RCS2 recovery configuration object.

```
cfg = dvbrcs2RecoveryConfig;
cfg.IsCustomWaveform = true;
cfg.MappingScheme = wg.MappingScheme;
cfg.CodeRate = wg.CodeRate;
cfg.PermutationParameters = wg.PermutationParameters;
```

Get burst parameters from waveform generator info method.

```
burstParams = info(wg);
cfg.BurstLength = burstParams.BurstLength;
```

Create a raised cosine receiver filter.

```
rxFilter = comm.RaisedCosineReceiveFilter( ...
    'RolloffFactor',0.2, ...
    'InputSamplesPerSymbol',sps,...
    'DecimationFactor',sps);
span = rxFilter.FilterSpanInSymbols;
```

Apply matched filtering and remove the filter delay.

```
filtOut = rxFilter([rxIn; ...
    complex(zeros(span/2*sps,1))]);
rxSymb = filtOut(span+1:end);
```

Recover user packets. Display the frame PDU cyclic redundancy check (CRC) status and the numbers of bit errors.

```
[rxOut,pduErr] = dvbrcs2BitRecover(rxSymb,cfg,10^(-EsNodB/10));
fprintf('Erroneous frame PDU = %d\n', pduErr)
```

```
Erroneous frame PDU = 0
```

```
fprintf('Number of bit errors = %d\n', sum(framePDU~=rxOut))
```

```
Number of bit errors = 0
```

Recover PDU from Burst Configuration Parameters

Recover the frame PDU for a DVB-RCS2 waveform with specified burst configuration parameters.

Set the burst configuration paramters.

```
Rsym = 1e6;                     % Symbol rate (1 Msps)
tSlot = 2.11e-3;                % Burst time slot duration (2.11 ms)
preBurstGuardOffset = 20e-6;    % 20 microsecond
waveId = 39;                    % Waveform ID
```

Set the properties of the DVB-RCS2 waveform generator System object™.

```
wg = dvbrcs2WaveformGenerator;
wg.WaveformID = waveId;          % QPSK 6/7
```

Compute the burst parameters in terms of symbols.

```
wg.PreBurstGuardLength = ceil(preBurstGuardOffset*Rsym);
params = info(wg);
burstPayLoadDuration = params.BurstLength/Rsym;
burstPostGuard = ceil((tSlot-preBurstGuardOffset-burstPayLoadDuration)*Rsym);
wg.PostBurstGuardLength = burstPostGuard;
```

Generate the frame PDU.

```
framePDU = randi([0 1],wg.FramePDULength,1);
```

Generate the DVB-RCS2-based burst symbols

```
txWaveform = wg(framePDU);
```

Add additive white Gaussian noise (AWGN) to the generated waveform.

```
sps = wg.SamplesPerSymbol;
EsNodB = 7;
snrdB = EsNodB - 10*log10(sps);
rxIn = awgn(txWaveform,snrdB,'measured');
```

Configure the DVB-RCS2 recovery configuration object.

```
cfg = dvbrcs2RecoveryConfig;
cfg.WaveformID = wg.WaveformID;
```

Initialize a raised cosine receiver filter.

```
rxFilter = comm.RaisedCosineReceiveFilter( ...
    'RolloffFactor', 0.20, ...
    'InputSamplesPerSymbol', sps, 'DecimationFactor', sps);
span = rxFilter.FilterSpanInSymbols;
```

Apply matched filtering and remove the filter delay

```
rxBurst = rxIn(wg.PreBurstGuardLength*sps+1:end-wg.PostBurstGuardLength*sps);
filtOut = rxFilter([rxBurst; ...
    complex(zeros(span/2*sps,1))]);
rxSymb = filtOut(span+1:end);
```

Recover user packets. Display the frame PDU cyclic redundancy check (CRC) status and the numbers of bit errors.

```
[rxOut, pduErr] = dvbrcs2BitRecover(rxSymb, cfg, 10^(-EsNodB/10));
fprintf('Erroneous frame PDU = %d\n', pduErr)
```

```
Erroneous frame PDU = 0
```

```
fprintf('Number of bit errors = %d\n', sum(rxOut~=framePDU))
```

```
Number of bit errors = 0
```

Input Arguments

`rxdata` — Received complex IQ symbols
column vector

Received complex IQ symbols, specified as a column vector. `rxdata` must contain only one burst.

The type of waveform determines the length of `rxdata`.

- Reference waveform — For set values of the TransmissionFormat and WaveformID properties of the `dvbrcs2WaveformGenerator` System object, the length of input `rxdata` must be equal to the burst length parameter specified in ETSI EN 301 545-2 V1.2.1 (2014-11) Table A-1 and A-2 [1].
- Custom waveform — The length must be equal to the value of BurstLength property of the `dvbrcs2RecoveryConfig` object.

Data Types: `double`
Complex Number Support: Yes

`cfgrx` — DVB-RCS2 recovery configuration object
`dvbrcs2RecoveryConfig` object

DVB-RCS2 recovery configuration object, specified as a `dvbrcs2RecoveryConfig` object. The properties of this object specify the transmission parameters of the received waveform and the decoding parameters for the recovery of the data.

`nvar` — Noise variance estimate
nonnegative scalar

Noise variance estimate, specified as a nonnegative scalar. The function uses `nvar` as a scaling factor to calculate the soft bits from the IQ symbols.

When you specify `nvar` as `0`, the function uses a value of 1e-5, which corresponds to a signal-to-noise ratio (SNR) of 50 dB.

Data Types: `double`

Output Arguments

`bits` — Recovered frame PDU data bits
column vector

Recovered frame PDU data bits, returned as a column vector.

Data Types: `int8`

`framePDUErr` — Frame PDU CRC status
`true` or `1` | `false` or `0`

Frame PDU CRC status, returned as a numeric or logical `1` (`true`) or `0` (`false`). A value of `false` indicates the frame is erroneous.

Data Types: `logical`

Introduced in R2021b

advance

Move simulation forward by one sample time

Syntax

```
isrunning = advance(sc)
```

Description

`isrunning = advance(sc)` moves the simulation forward by the amount of time specified by the `SampleTime` property of the scenario `sc`.

Examples

Manual Simulation of Satellite Scenario

Create a satellite scenario object and set the `AutoSimulate` property to `false` to enable manual simulation of the satellite scenario.

```
startTime = datetime(2022,1,12);
stopTime = startTime + days(0.5);
sampleTime = 60;                             % Seconds
sc = satelliteScenario('AutoSimulate',false);
```

Add a GPS satellite constellation to the scenario.

```
sat = satellite(sc,"gpsAlmanac.txt");
```

Simulate the scenario using the `advance` function.

```
while advance(sc)
end
```

Obtain the satellite position histories.

```
p = states(sat);
```

`AutoSimulate` is `false`, so restart the scenario before adding a ground station.

```
restart(sc);
```

Add a ground station to the scenario.

```
gs = groundStation(sc);
```

Add access analysis between each satellite and ground station.

```
ac = access(sat,gs);
```

Simulate the scenario and determine the access intervals.

```
while advance(sc)
end
intvls1 = accessIntervals(ac)
```

```

Input Arguments

sc — Satellite scenario
`satelliteScenario` object

Satellite scenario, specified as a `satelliteScenario` object. The argument applies only if the `AutoSimulate` property of the `sc` object is `false`.

Output Arguments

isrunning — Running status of satellite scenario simulation
`true` or 1 | `false` or 0

Running status of the satellite scenario simulation, returned as a logical 1 (`true`) or 0 (`false`). The `isrunning` value is `true` until the scenario reaches the specified `StopTime` value.

Objects
`satelliteScenario`

Functions
`satelliteScenarioViewer` | `play` | `satellite` | `groundStation` | `restart`

Introduced in R2022a

restart

Restart simulation from beginning

Syntax

```
restart(sc)
```

Description

`restart(sc)` resets the satellite scenario `sc` to the initial start time.

Examples

Manual Simulation of Satellite Scenario

Create a satellite scenario object and set the `AutoSimulate` property to `false` to enable manual simulation of the satellite scenario.

```
startTime = datetime(2022,1,12);
stopTime = startTime + days(0.5);
sampleTime = 60;                             % Seconds
sc = satelliteScenario('AutoSimulate',false);
```

Add a GPS satellite constellation to the scenario.

```
sat = satellite(sc,"gpsAlmanac.txt");
```

Simulate the scenario using the `advance` function.

```
while advance(sc)
end
```

Obtain the satellite position histories.

```
p = states(sat);
```

`AutoSimulate` is `false`, so restart the scenario before adding a ground station.

```
restart(sc);
```

Add a ground station to the scenario.

```
gs = groundStation(sc);
```

Add access analysis between each satellite and ground station.

```
ac = access(sat,gs);
```

Simulate the scenario and determine the access intervals.

```
while advance(sc)
end
intvls1 = accessIntervals(ac)
```

```

Input Arguments

sc — Satellite scenario
satelliteScenario object

Satellite scenario, specified as a `satelliteScenario` object. The argument applies only if the `AutoSimulate` property of the `sc` object is `false`.

The timeline and playback widgets on the open satellite scenario viewers that were previously made available after calling the `play` function become unavailable for interaction.

Objects

ccsdsTCConfig

CCSDS TC configuration parameters

Description

The `ccsdsTCConfig` object creates a configuration object for Consultative Committee for Space Data Systems (CCSDS) Telecommand (TC) using default and specified values. `ccsdsTCConfig` object is configurable by using applicable “Properties” on page 3-2.

Creation

Syntax

```
cfg = ccsdsTCConfig
cfg = ccsdsTCConfig(Name,Value)
```

Description

`cfg = ccsdsTCConfig` creates a CCSDS TC configuration object using default properties.

`cfg = ccsdsTCConfig(Name,Value)` sets “Properties” on page 3-2 using one or more name-value pairs. Enclose each property name in quotes. For example, `ccsdsTCConfig('DataFormat','CLTU','Modulation','BPSK')` configures the CSSDS TC configuration object with a communications link transmission unit data format and binary phase shift keying (BPSK) modulation scheme.

Properties

`DataFormat` — Data formats used by PLOPs
`"CLTU"` (default) | `"acquisition sequence"` | `"idle sequence"`

Data formats used by physical layer operation procedures (PLOPs), specified as one of these options.

- `"CLTU"` — Communications link transmission unit (CLTU)
- `"acquisition sequence"`
- `"idle sequence"`

Data Types: `char` | `string`

`ChannelCoding` — Forward error correction coding
`"BCH"` (default) | `"LDPC"`

Forward error correction coding, specified as one of these options.

- `"BCH"` — Bose Chaudhuri Hocquenghem (BCH)
- `"LDPC"` — Low-density parity–check (LDPC)

Dependencies

To enable this property, set the `DataFormat` property to `"CLTU"`.

Data Types: `char` | `string`

`LDPCCodewordLength` — LDPC codeword length

`128` (default) | `512`

LDPC codeword length, specified as `128` or `512`.

Dependencies

To enable this property, set the `ChannelCoding` property to `"LDPC"`.

Data Types: `double`

`HasRandomizer` — Flag to indicate randomization

`1` or `true` (default) | `0` or `false`

Flag to indicate randomization on the bits in CLTU and on the fill data added prior to randomization, specified as a logical value of `1` (`true`) or `0` (`false`). To indicate the presence of a randomizer in the waveform, set this value to `1` (`true`).

Dependencies

To enable this property, set the `ChannelCoding` property to `"BCH"`.

Data Types: `logical`

`HasTailSequence` — Flag to indicate tail sequence in CLTU

`1` or `true` (default) | `0` or `false`

Flag to indicate the tail sequence in CLTU, specified as a logical value of `1` (`true`) or `0` (`false`). To indicate the presence of the tail sequence to delimit the end of a CLTU, set this value to `1` (`true`).

Dependencies

To enable this property, set the `ChannelCoding` property to `"LDPC"` and the `LDPCCodewordLength` property to `128`.

Data Types: `logical`

`Modulation` — Modulation scheme

`"PCM/PSK/PM"` (default) | `"PCM/PM/biphase-L"` | `"BPSK"`

Modulation scheme used to generate the CCSDS TC waveform, in the form of baseband in-phase quadrature (IQ) samples, specified as one of these options.

- `"PCM/PSK/PM"` — The line coded signal as per the pulse code modulation (PCM) format is phase shift keying (PSK) modulated on a sine wave subcarrier and then phase modulated (PM) on a residual carrier.
- `"PCM/PM/biphase-L"` — The biphase-L (Manchester) encoded data is phase modulated on a residual carrier.
- `"BPSK"` — Suppressed carrier modulation by using non-return-to-zero (NRZ) data on the carrier.

For more details on these modulation schemes, see [3].

Data Types: `char` | `string`

`PCMFormat` — PCM format

`"NRZ-L"` (default) | `"NRZ-M"`

Pulse code modulation (PCM) format, specified as one of these options. This property specifies the PCM coding in the CCSDS TC waveform.

- `"NRZ-L"` — NRZ-level
- `"NRZ-M"` — NRZ-mark

Dependencies

To enable this property, set the `Modulation` property to `"PCM/PSK/PM"`.

Data Types: `char` | `string`

`ModulationIndex` — Modulation index in residual carrier phase modulation

`0.4` (default) | scalar in the range [0.2, 2]

Modulation index in the residual carrier phase modulation, specified as a scalar in the range [0.2, 2]. Units are in radians.

Dependencies

To enable this property, set the `Modulation` property to `"PCM/PSK/PM"` or `"PCM/PM/biphase-L"`.

Data Types: `double`

`SubcarrierFrequency` — Sine wave subcarrier frequency

`16000` (default) | `8000`

Sine wave subcarrier frequency in Hertz, specified as `16000` or `8000`. The subcarrier waveform is used to PSK-modulate the NRZ data on the residual RF carrier.

Dependencies

To enable this property, set the `Modulation` property to `"PCM/PSK/PM"`.

Data Types: `double`

`SymbolRate` — Symbol rate

`4000` (default) | `2000` | `1000` | `500` | `250` | `125` | `62.5` | `31.25` | `15.625` | `7.8125`

Symbol rate in coded symbols per second, specified as one of these options.

- `4000`
- `2000`
- `1000`
- `500`
- `250`
- `125`
- `62.5`
- `31.25`

- `15.625`
- `7.8125`

Note If you set `SymbolRate` to `4000` coded symbols per second, you must set the `SubcarrierFrequency` property to `16000`.

Dependencies

To enable this property, set the `Modulation` property to `"PCM/PSK/PM"`.

Data Types: `double`

`SamplesPerSymbol` — Number of samples per symbol
`10` (default) | positive integer

Number of samples per symbol, specified as a positive integer.

Dependencies

To enable this property, set the `Modulation` property to `"PCM/PSK/PM"` or `"PCM/PM/biphase-L"`.

Data Types: `double`

`SubcarrierWaveform` — Waveform used to PSK-modulate NRZ data
`"sine"`

This property is read-only.

Waveform used to PSK-modulate the NRZ data, returned as `"sine"`. CCSDS TC supports only sine-wave subcarriers.

Dependencies

To enable this property, set the `Modulation` property to `"PCM/PSK/PM"`.

Data Types: `char` | `string`

Object Functions

Specific to This Object

ccsdsTCWaveform	Generate CCSDS TC waveform

Examples

Create CCSDS TC Object

Create a Consultative Committee for Space Data Systems (CCSDS) Telecommand (TC) configuration object. Specify the properties of the object.

```
cfg = ccsdsTCConfig;
cfg.ChannelCoding = "LDPC";
cfg.HasTailSequence = false;
cfg.PCMFormat = "NRZ-M";
```

Display the properties of the CCSDS TC object.

```
disp(cfg)
```

```
  ccsdsTCConfig with properties:

              DataFormat: "CLTU"
           ChannelCoding: "LDPC"
      LDPCCodewordLength: 128
         HasTailSequence: 0
              Modulation: "PCM/PSK/PM"
               PCMFormat: "NRZ-M"
         ModulationIndex: 0.4000
     SubcarrierFrequency: 16000
              SymbolRate: 4000
        SamplesPerSymbol: 10

   Read-only properties:
      SubcarrierWaveform: "sine"
```

Create CCSDS TC Waveform for Multiple CLTUs

Create a Consultative Committee for Space Data Systems (CCSDS) Telecommand (TC) time-domain waveform for multiple communications link transmission units (CLTUs).

Create a default CCSDS TC configuration object.

```
cfg = ccsdsTCConfig;
disp(cfg)
```

```
  ccsdsTCConfig with properties:

              DataFormat: "CLTU"
           ChannelCoding: "BCH"
           HasRandomizer: 1
              Modulation: "PCM/PSK/PM"
               PCMFormat: "NRZ-L"
         ModulationIndex: 0.4000
     SubcarrierFrequency: 16000
              SymbolRate: 4000
        SamplesPerSymbol: 10

   Read-only properties:
      SubcarrierWaveform: "sine"
```

Specify the number of CLTUs and the transfer frame length.

```
numCLTUs = 10;
transferFramesLength = 8; % Number of octets in each transfer frame
```

Generate the CCSDS TC time-domain waveform for the transfer frames.

```
c = cell(1,numCLTUs); % Cell array to store the generated waveform for all CLTUs
for k=1:numCLTUs
    bits = randi([0 1],8*transferFramesLength,1); % Bits in the TC transfer frame
    waveform = ccsdsTCWaveform(bits,cfg);
    c{1,k} = waveform; % Waveform for each CLTU
end
```

Create a `dsp.SpectrumAnalyzer` System object to display the frequency spectrum of the generated CCSDS TC time-domain waveform from the last CLTU.

```
scope = dsp.SpectrumAnalyzer;
scope.SampleRate = cfg.SamplesPerSymbol*cfg.SymbolRate;
scope(waveform)  % Last CLTU spectrum display
```

Extended Capabilities

C/C++ Code Generation
Generate C and C++ code using MATLAB® Coder™.

Usage notes and limitations:

Properties `LDPCCodewordLength` and `ChannelCoding` must be provided as compile-time constant inputs in code generation. Use `coder.Constant` (MATLAB Coder) object to convert the input variable to a constant during code generation.

p618SiteDiversityConfig

Create P.618 site diversity configuration object

Description

The `p618SiteDiversityConfig` object sets P.618 site diversity configuration parameters required for the calculation of outage probability due to rain attenuation, as defined in the ITU-R P.618 recommendation [1].

Creation

Syntax

```
cfgSD = p618SiteDiversityConfig
cfgSD = p618SiteDiversityConfig(Name,Value)
```

Description

`cfgSD = p618SiteDiversityConfig` creates a P.618 site diversity configuration object with default property values.

`cfgSD = p618SiteDiversityConfig(Name,Value)` specifies “Properties” on page 3-9 using one or more name-value pair arguments. Enclose each property name in quotes. For example, p618SiteDiversityConfig(`'Frequency',14.25e9,'ElevationAngle',[52.4099 52.4852]`) configures a P.618 site diversity configuration object with a 14.25 GHz signal frequency and an elevation angle for two sites as [52.4099 52.4852].

Properties

`Frequency` — Signal frequency
`14.25e9` (default) | scalar in the range [1e9, 55e9]

Signal frequency in Hz, specified as a scalar in the range [1e9, 55e9].

Data Types: `double` | `single`

`ElevationAngle` — Elevation angle of two sites
`[52.4099 52.4852]` (default) | two-element vector of values in the range [0, 90]

Elevation angle of the two sites in degrees, specified as a two-element vector of values in the range [0, 90].

Data Types: `double` | `single`

`Latitude` — Latitude of two sites
`[25.768 25.463]` (default) | two-element vector of values in the range [-90, 90]

Latitude of the two sites in degrees, specified as a two-element vector of values in the range [-90, 90]. A positive value corresponds to a North latitude, and a negative value corresponds to a South latitude.

Data Types: `double` | `single`

`Longitude` — Longitude of two sites
`[-80.205 -80.486]` (default) | two-element vector of values in the range [-180, 180]

Longitude of the two sites in degrees, specified as a two-element vector of values in the range [-180, 180]. A positive value corresponds to East longitude, and a negative value corresponds to West longitude.

Data Types: `double` | `single`

`PolarizationTiltAngle` — Polarization tilt angle for two sites
`[0 0]` (default) | two-element vector of values in the range [-90, 90]

Polarization tilt angle for the two sites in degrees, specified as a two-element vector of values in the range [-90, 90].

Data Types: `double` | `single`

`SiteDistance` — Separation between two sites
`44.0256` (default) | positive scalar

Separation between the two sites in km, specified as a positive scalar.

Data Types: `double` | `single`

`AttenuationThreshold` — Attenuation threshold on two links
`[9 3]` (default) | two-element vector

Attenuation threshold on the two links in dB, specified as a two-element vector. The attenuation threshold on an earth space link is the maximum allowed attenuation on the path. Any attenuation value above this property value is considered an outage in the link.

Data Types: `double` | `single`

Object Functions

Specific to This Object

p618SiteDiversityOutage	Calculate outage probability due to rain attenuation with site diversity

Examples

Create P.618 Site Diversity Configuration Object

Create a default P.618 site diversity configuration object.

```
cfg = p618SiteDiversityConfig;
```

Specify the polarization tilt angles for two sites as [-90 90] degrees, separation between the two sites as 50 km, and attenuation threshold on the two links as [9 9] dB.

```
cfg.PolarizationTiltAngle = [-90 90];
cfg.SiteDistance = 50;
cfg.AttenuationThreshold = [9 9];
```

Set the direction of each earth station.

```
cfg.Latitude = [30 60];    % North direction
cfg.Longitude = [120 150]; % East direction
```

Display the properties of the configuration object.

```
disp(cfg);
```

```
  p618SiteDiversityConfig with properties:

                Frequency: 1.4500e+10
           ElevationAngle: [52.4099 52.4852]
                 Latitude: [30 60]
                Longitude: [120 150]
    PolarizationTiltAngle: [-90 90]
             SiteDistance: 50
     AttenuationThreshold: [9 9]
```

Calculate Outage Probability due to Rain Attenuation with Site Diversity

This example requires MAT-files with digital maps from ITU documents. If they are not available on the path, execute the following commands to download and untar the MAT-files.

```
maps = exist('maps.mat','file');
p836 = exist('p836.mat','file');
p837 = exist('p837.mat','file');
p840 = exist('p840.mat','file');
matFiles = [maps p836 p837 p840];

        untar('ITURDigitalMaps.tar.gz');
    end
    addpath(cd);
end
```

Create a P.618 site diversity configuration object with a signal frequency of 25 GHz.

```
cfgsd = p618SiteDiversityConfig;
cfgsd.Frequency = 25e9;
```

Specify the polarization tilt angles for two sites as [-90 90] degrees, separation between the two sites as 50 km, and attenuation threshold on the two links as [9 9] dB.

```
cfgsd.PolarizationTiltAngle = [-90 90];
cfgsd.SiteDistance = 50;
cfgsd.AttenuationThreshold = [9 9];
```

Calculate the outage probability due to rain attenuation with site diversity.

```
outage = p618SiteDiversityOutage(cfgsd)
```

```
outage = 0.0338
```

p618Config

Create P.618 configuration object

Description

The `p618Config` object sets the P.618 configuration parameters required for the calculation of the Earth-space propagation losses, cross-polarization discrimination, and sky noise temperature, as defined in the ITU-R P.618 recommendation [1].

Creation

Syntax

```
cfgP618 = p618Config
cfgP618 = p618Config(Name,Value)
```

Description

`cfgP618 = p618Config` creates a P.618 configuration object with default property values.

`cfgP618 = p618Config(Name,Value)` specifies “Properties” on page 3-13 using one or more name-value pair arguments. Enclose each property name in quotes. For example, p618Config(`'GasAnnualExceedance',10,'AntennaEfficiency',0.65`) configures a P.618 configuration object with 10% average annual time percentage of excess for gaseous attenuation and 0.65 antenna efficiency.

Properties

`Frequency` — Signal frequency
`14.25e9` (default) | scalar in the range [1e9, 55e9]

Signal frequency in Hz, specified as a scalar in the range [1e9, 55e9].

Data Types: `double` | `single`

`ElevationAngle` — Elevation angle
`31.0769` (default) | scalar in the range [5, 90]

Elevation angle in degrees, specified as a scalar in the range [5, 90].

Data Types: `double` | `single`

`Latitude` — Earth station latitude
`51.5000` (default) | scalar in the range [-90, 90]

Earth station latitude in degrees, specified as a scalar in the range [-90, 90]. A positive value corresponds to a North latitude, and a negative value corresponds to a South latitude.

Data Types: `double` | `single`

`Longitude` — Earth station longitude
`-0.1400` (default) | scalar in the range [-180, 180]

Earth station longitude in degrees, specified as a scalar in the range [-180, 180]. A positive value corresponds to East longitude, and a negative value corresponds to West longitude.

Data Types: `double` | `single`

`GasAnnualExceedance` — Average annual time percentage of excess for gaseous attenuation
`1` (default) | scalar in the range [0.1, 99]

Average annual time percentage of excess for the gaseous attenuation, specified as a scalar in the range [0.1, 99]. This property calculates the gaseous attenuation, which satisfies the exceedance condition, in terms of the percentage of an average year.

Note The fraction of time during which a preselected threshold is exceeded in an average year is referred to as the annual time percentage of excess.

Data Types: `double` | `single`

`CloudAnnualExceedance` — Average annual time percentage of excess for cloud attenuation
`1` (default) | scalar in the range [0.1, 99]

Average annual time percentage of excess for the cloud attenuation, specified as a scalar in the range [0.1, 99]. This property calculates the cloud attenuation, which satisfies the exceedance condition, in terms of the percentage of an average year.

Data Types: `double` | `single`

`RainAnnualExceedance` — Average annual time percentage of excess for rain attenuation
`1` (default) | scalar in the range [0.001, 5]

Average annual time percentage of excess for the rain attenuation, specified as a scalar in the range [0.001, 5]. This property calculates the rain attenuation, which satisfies the exceedance condition, in terms of the percentage of an average year.

Data Types: `double` | `single`

`ScintillationAnnualExceedance` — Average annual time percentage of excess for tropospheric scintillation
`1` (default) | scalar in the range [0.01, 50]

Average annual time percentage of excess for the tropospheric scintillation, specified as a scalar in the range [0.01, 50]. This property calculates the tropospheric scintillation, which satisfies the exceedance condition, in terms of the percentage of an average year.

Data Types: `double` | `single`

`TotalAnnualExceedance` — Average annual time percentage of excess for total attenuation
`1` (default) | scalar in the range [0.001, 50]

Average annual time percentage of excess for the total attenuation, specified as a scalar in the range [0.001, 50]. This property calculates the total attenuation, which satisfies the exceedance condition, in terms of the percentage of an average year.

Data Types: `double` | `single`

`PolarizationTiltAngle` — Polarization tilt angle
`0` (default) | scalar in the range [-90, 90]

Polarization tilt angle in degrees, specified as a scalar in the range [-90, 90].

Data Types: `double` | `single`

`AntennaDiameter` — Physical diameter of earth station antenna
`1` (default) | positive scalar

Physical diameter of the earth station antenna in meters, specified as a positive scalar.

Data Types: `double` | `single`

`AntennaEfficiency` — Antenna efficiency of earth station antenna
`0.5` (default) | positive scalar

Antenna efficiency of the earth station antenna, specified as a positive scalar.

Data Types: `double` | `single`

Object Functions

Specific to This Object

p618PropagationLosses	Calculate Earth-space propagation losses, cross-polarization discrimination, and sky noise temperature

Examples

Create P.618 Configuration Object

Create a default P.618 configuration object.

```
cfg = p618Config;
```

Specify the signal frequency as 25 GHz, elevation angle as 45 degrees, and antenna efficiency as 0.65. Set the time percentage of excess for the total attenuation per annum as 0.001.

```
cfg.Frequency = 25e9;
cfg.ElevationAngle = 45;
cfg.AntennaEfficiency = 0.65;
cfg.TotalAnnualExceedance = 0.001;
```

Set the earth station direction.

```
cfg.Latitude = 30;   % North direction
cfg.Longitude = 120; % East direction
```

Display the properties of the configuration object.

```
disp(cfg)

  p618Config with properties:

                      Frequency: 2.5000e+10
                 ElevationAngle: 45
                       Latitude: 30
                      Longitude: 120
           GasAnnualExceedance: 1
         CloudAnnualExceedance: 1
          RainAnnualExceedance: 1
 ScintillationAnnualExceedance: 1
         TotalAnnualExceedance: 1.0000e-03
         PolarizationTiltAngle: 0
               AntennaDiameter: 1
             AntennaEfficiency: 0.6500
```

Calculate Propagation Losses, Cross-Polarization Discrimination, and Sky Noise Temperature

This example requires MAT-files with digital maps from ITU documents. If they are not available on the path, execute the following commands to download and unzip the MAT-files.

```
maps = exist('maps.mat','file');
p836 = exist('p836.mat','file');
p837 = exist('p837.mat','file');
p840 = exist('p840.mat','file');
matFiles = [maps p836 p837 p840];
if ~all(matFiles)
    if ~exist('ITURDigitalMaps.tar.gz','file')
        url = 'https://www.mathworks.com/supportfiles/spc/P618/ITURDigitalMaps.tar.gz';
        websave('ITURDigitalMaps.tar.gz',url);
        untar('ITURDigitalMaps.tar.gz');
    else
        untar('ITURDigitalMaps.tar.gz');
    end
    addpath(cd);
end
```

Create a default P.618 configuration object.

```
cfg = p618Config;
```

Specify the time percentage of excess for the rain attenuation per annum as 0.01 and the time percentage of excess for the total attenuation per annum as 0.001.

```
cfg.RainAnnualExceedance = 0.01;
cfg.TotalAnnualExceedance = 0.001;
```

Calculate the propagation losses, cross-polarization discrimination, and sky noise temperature.

```
[pl,xpd,tsky] = p618PropagationLosses(cfg)
```

```
pl = struct with fields:
    Ag: 0.2269
    Ac: 0.4552
    Ar: 6.7981
    As: 0.2633
    At: 15.6091

xpd = 32.8876

tsky = 267.4689
```

Calculate Propagation Losses in Light Rainfall

This example requires MAT-files with digital maps from ITU documents. If they are not available on the path, execute the following commands to download and unzip the MAT-files.

```
maps = exist('maps.mat','file');
p836 = exist('p836.mat','file');
p837 = exist('p837.mat','file');
p840 = exist('p840.mat','file');
matFiles = [maps p836 p837 p840];
if ~all(matFiles)
    if ~exist('ITURDigitalMaps.tar.gz','file')
        url = 'https://www.mathworks.com/supportfiles/spc/P618/ITURDigitalMaps.tar.gz';
        websave('ITURDigitalMaps.tar.gz',url);
        untar('ITURDigitalMaps.tar.gz');
    else
        untar('ITURDigitalMaps.tar.gz');
    end
    addpath(cd);
end
```

Create a P.618 configuration object that occupies a signal frequency of 20 GHz.

```
cfg = p618Config('Frequency',20e9);
```

Calculate the propagation losses in a light rainfall of 1 mm/hr with an earth station height of 0.75 km.

```
pl =  p618PropagationLosses(cfg,'RainRate',1,'StationHeight',0.75)
```

```
pl = struct with fields:
    Ag: 0.7996
    Ac: 0.8793
    Ar: 0.0177
    As: 0.3187
    At: 1.7514
```

Introduced in R2021a

satelliteScenario

Satellite scenario

Description

The `satelliteScenario` object represents a 3D arena consisting of satellites, ground stations, and the interactions between them. Use this object to model satellite constellations, model ground station networks, perform access analyses between the satellites and the ground stations, and visualize the results.

Creation

Syntax

```
sc = satelliteScenario
sc = satelliteScenario(startTime,stopTime,sampleTime)
sc = satelliteScenario( ___ ,'AutoSimulate'=false)
```

Description

`sc = satelliteScenario` creates a default satellite scenario object.

`sc = satelliteScenario(startTime,stopTime,sampleTime)` sets the `StartTime`, `StopTime`, and `SampleTime` properties to the values of `startTime`, `stopTime`, and `sampleTime`, respectively.

`sc = satelliteScenario( ___ ,'AutoSimulate'=false)` sets the `AutoSimulate` property to a specified value.

Properties

`StartTime` — Start time of satellite scenario simulation in UTC
`datetime` scalar

Start time of the satellite scenario simulation in UTC, specified as a `datetime` scalar. The default `StartTime` is the current UTC time if no satellites are present in the scenario. Otherwise, it is the earliest value from the current UTC time, the epoch defined in the TLE files, reference time deduced in SEM files, or initial time in the timetable and timeseries. If the `StartTime`, `StopTime`, or `SampleTime` properties are explicitly specified, the `StartTime` property no longer updates with further additions of satellites.

When the `AutoSimulate` property is `false`, you can modify the `StartTime` property only when the `SimulationStatus` is `NotStarted`. You can use the `restart` function to reset `SimulationStatus` to `NotStarted`, but doing so erases the simulation data.

Data Types: `datetime`

StopTime — Stop time of satellite scenario simulation in UTC
datetime scalar

Stop time of the satellite scenario simulation in UTC, specified as a datetime scalar. The default StopTime is StartTime + longest orbital period among the satellites in the scenario. If no satellites are added to the scenario, the default StopTime is the same as the default StartTime. If the StartTime, StopTime, or SampleTime properties are explicitly specified, the StopTime property no longer updates with further additions of satellites.

When the AutoSimulate property is false, you can modify the StopTime property only when the SimulationStatus is NotStarted. You can use the restart function to reset SimulationStatus to NotStarted, but doing so erases the simulation data.

Data Types: datetime

SampleTime — Sample time of satellite scenario simulation
scalar

Sample time of the satellite scenario simulation, specified as a real-valued scalar. The default sample time is set such that there are 100 samples between StartTime and StopTime. If the default StartTime and StopTime are the same, which is the case when no satellites are added to the scenario, the default SampleTime is 60 seconds. If the StartTime, StopTime, or SampleTime properties are explicitly specified, the SampleTime property no longer updates with further additions of satellites.

When the AutoSimulate property is false, you can modify the SampleTime property only when the SimulationStatus is NotStarted. You can use the restart function to reset SimulationStatus to NotStarted, but doing so erases the simulation data.

Data Types: double

SimulationTime — Simulation time of satellite scenario in UTC
current UTC time (default) | datetime scalar

This property is read-only.

Current simulation time of the satellite scenario simulation in UTC, specified as a datetime scalar. Call the restart function to reset the time to StartTime.

Dependencies

To enable this property, set AutoSimulate to false.

Data Types: datetime

SimulationStatus — Simulation status
'NotStarted' | 'InProgress' | 'Completed'

This property is read-only.

Simulation status of the satellite scenario, specified as one of the following:

- 'NotStarted' — No call to the advance function has been made
- 'InProgress' — Simulation is running
- 'Completed' — Simulation is finished

The simulation starts when the first call to the `advance` function is made. The simulation continues until one of the following occurs:

- The simulation reaches the `StopTime`.
- A new asset is added to the satellite scenario.
- Certain properties of the asset (satellites, ground stations, gimbals, conical sensors, and so on) have been modified, such as `MountingLocation` or `MountingAngles`. Refer to the properties to determine if modifying them can stop the simulation.

Call the `restart` function to restart the simulation, erase the simulation data, and set `SimulationStatus` to `NotStarted`.

Dependencies

To enable this property, set `AutoSimulate` to `false`.

`AutoSimulate` — Option to simulate satellite scenario automatically
`true` or `1` | `false` or `0`

Option to simulate the satellite scenario automatically, specified as one of these numeric or logical values.

- `1` (`true`) — Simulate the satellite scenario automatically on any call to an analysis function, such as `states` or `accessIntervals`.
- `0` (`false`)— Simulate the satellite scenario only by calling the `advance` function.

Changing the `AutoSimulate` value erases the previous simulation data.

Data Types: `double`

`Satellites` — Satellites in the scenario
row vector of `Satellite` objects

This property is read-only.

Satellites in the scenario, returned as a vector of `Satellite` objects. To add a `Satellite` object to the satellite scenario, use the `satellite` object function.

`GroundStations` — Ground stations in scenario
row vector of `GroundStation` objects

Ground stations in the scenario, returned as a row vector of `GroundStation` objects. To create a `GroundStation` object and add it to the satellite scenario, see the `groundStation` object function.

`Autoshow` — Option to automatically show graphics
`true` or `1` (default) | `false` or `0`

Option to automatically show graphics, specified as a logical `1` (`true`) or `0` (`false`). This property determines if entities added to the scenario are automatically shown in an open `satelliteScenarioViewer` window.

Object Functions

groundStation	Add ground station to satellite scenario
satellite	Add satellites to satellite scenario

satelliteScenarioViewer	Create viewer for satellite scenario
advance	Move simulation forward by one sample time
restart	Restart simulation from beginning
play	Play satellite scenario simulation results on viewer

Examples

Create Satellite Scenario with Custom Start and Stop Times

Specify the start time in the current time zone as yesterday. The simulation lasts for half a day.

```
startTime = datetime("yesterday","TimeZone","local");
stopTime = startTime + days(0.5);
```

Specify the sample time as 60 seconds. Create a satellite scenario object, specifying the start time, stop time, and sample time.

```
sampleTime = 60;
sc = satelliteScenario(startTime,stopTime,sampleTime)
```

```
sc = 
  satelliteScenario with properties:

         StartTime: 25-Feb-2022 05:00:00
          StopTime: 25-Feb-2022 17:00:00
        SampleTime: 60
      AutoSimulate: 1
        Satellites: [1x0 matlabshared.satellitescenario.Satellite]
    GroundStations: [1x0 matlabshared.satellitescenario.GroundStation]
           Viewers: [0x0 matlabshared.satellitescenario.Viewer]
          AutoShow: 1
```

Add Satellites to Scenario Using Keplerian Elements

Create a satellite scenario with a start time of 02-June-2020 8:23:00 AM UTC, and the stop time set to one day later. Set the simulation sample time to 60 seconds.

```
startTime = datetime(2020,6,02,8,23,0);
stopTime = startTime + days(1);
sampleTime = 60;
sc = satelliteScenario(startTime,stopTime,sampleTime);
```

Add two satellites to the scenario using their Keplerian elements.

```
semiMajorAxis = [10000000; 15000000];
eccentricity = [0.01; 0.02];
inclination = [0; 10];
rightAscensionOfAscendingNode = [0; 15];
argumentOfPeriapsis = [0; 30];
trueAnomaly = [0; 20];

sat = satellite(sc, semiMajorAxis, eccentricity, inclination, ...
    rightAscensionOfAscendingNode, argumentOfPeriapsis, trueAnomaly)
```

```
sat = 
  1×2 Satellite array with properties:

    Name
    ID
    ConicalSensors
    Gimbals
    Transmitters
    Receivers
    Accesses
    GroundTrack
    Orbit
    OrbitPropagator
    MarkerColor
    MarkerSize
    ShowLabel
    LabelFontSize
    LabelFontColor
```

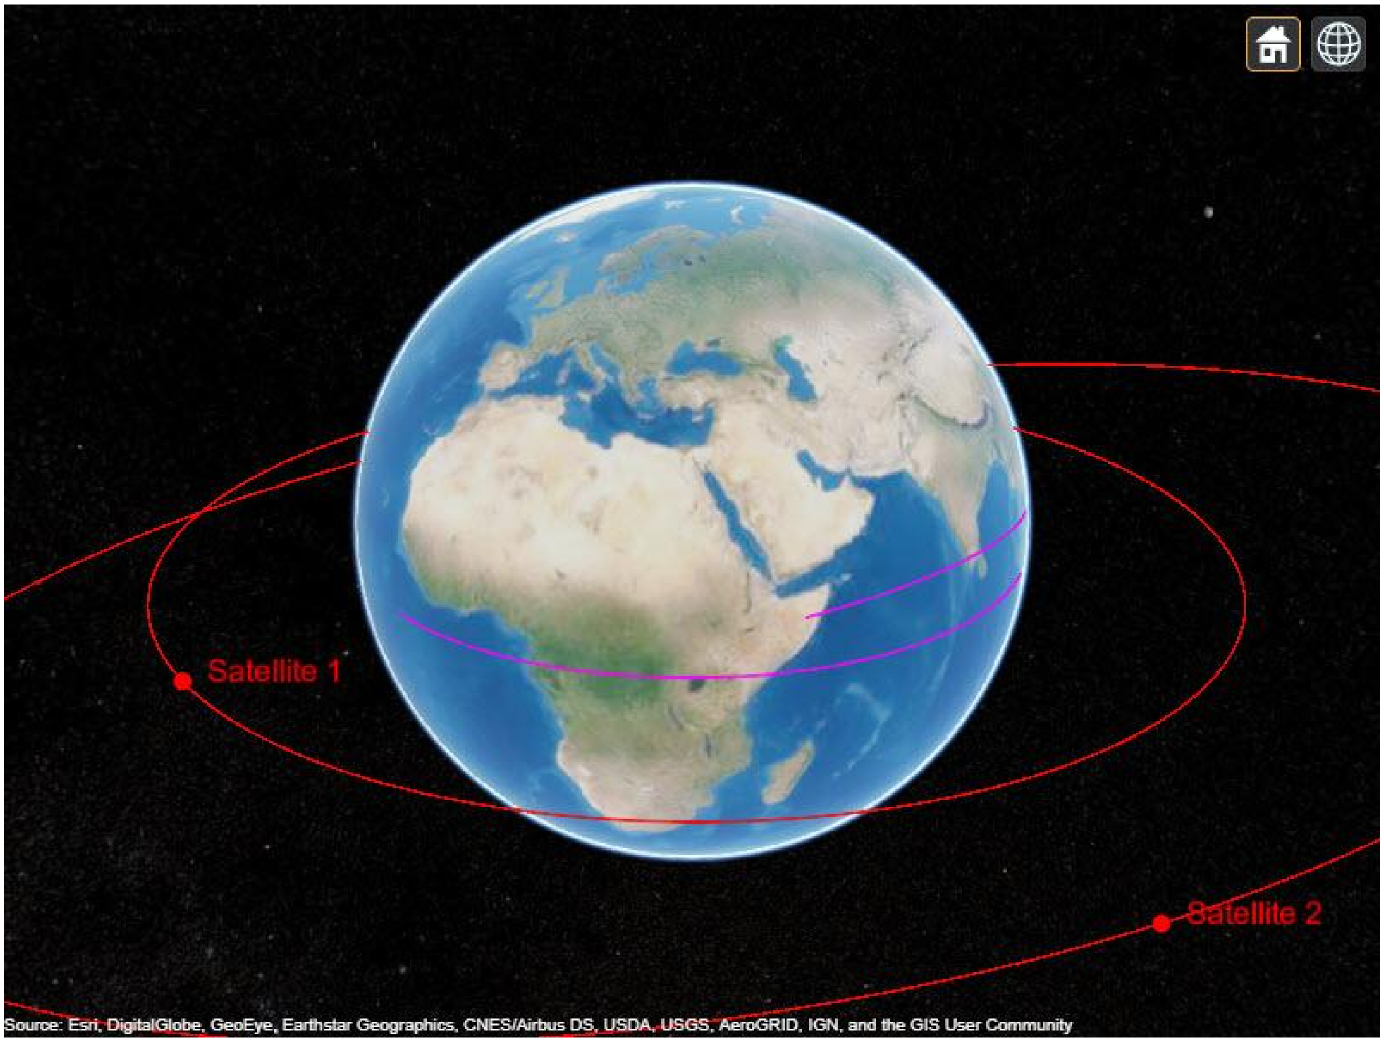
View the satellites in orbit and the ground tracks over one hour.

```
show(sat)
groundTrack(sat,'LeadTime',3600)
```

```
ans=1×2 object
  1×2 GroundTrack array with properties:

    LeadTime
    TrailTime
    LineWidth
    TrailLineColor
    LeadLineColor
    VisibilityMode
```

```
play(sc)
```



Satellite 1
Satellite 2
Source: Esri, DigitalGlobe, GeoEye, Earthstar Geographics, CNES/Airbus DS, USDA, USGS, AeroGRID, IGN, and the GIS User Community

Manual Simulation of Satellite Scenario

Create a satellite scenario object and set the `AutoSimulate` property to `false` to enable manual simulation of the satellite scenario.

```
startTime = datetime(2022,1,12);
stopTime = startTime + days(0.5);
sampleTime = 60;                            % Seconds
sc = satelliteScenario('AutoSimulate',false);
```

Add a GPS satellite constellation to the scenario.

```
sat = satellite(sc,"gpsAlmanac.txt");
```

Simulate the scenario using the `advance` function.

```
while advance(sc)
end
```

Obtain the satellite position histories.

```
p = states(sat);
```

`AutoSimulate` is `false`, so restart the scenario before adding a ground station.

```
restart(sc);
```

Add a ground station to the scenario.

```
gs = groundStation(sc);
```

Add access analysis between each satellite and ground station.

```
ac = access(sat,gs);
```

Simulate the scenario and determine the access intervals.

```
while advance(sc)
end
intvls1 = accessIntervals(ac)
```

```
intvls1=35×8 table

skyplot

Plot satellite azimuth and elevation data

Syntax

```
skyplot(azdata,eldata)
skyplot(azdata,eldata,labeldata)
skyplot(status)
skyplot( ___ ,Name,Value)

skyplot(parent, ___ )
h = skyplot( ___ )
```

Description

`skyplot(azdata,eldata)` creates a sky plot using the azimuth and elevation data specified as vectors in degrees. Azimuth angles are measured in degrees, clockwise-positive from the North direction. Elevation angles are measured from the horizon line with 90 degrees being directly up. For details about the sky plot figure elements, see “Main Sky Plot Elements” on page 3-34.

`skyplot(azdata,eldata,labeldata)` specifies data labels as a string array with elements corresponding to each data point in the `azdata` and `eldata` inputs.

`skyplot(status)` specifies the azimuth and elevation data in a structure with fields `SatelliteAzimuth` and `SatelliteElevation`.

`skyplot( ___ ,Name,Value)` specifies options using one or more name-value arguments in addition to the input arguments in previous syntaxes. The name-value arguments are properties of the `SkyPlotChart` object. For a list of properties, see SkyPlotChart Properties.

`skyplot(parent, ___ )` creates the sky plot in the figure, panel, or tab specified by `parent`.

`h = skyplot( ___ )` returns the sky plot as a `SkyPlotChart` object, `h`. Use `h` to modify the properties of the chart after creating it. For a list of properties, see SkyPlotChart Properties.

Examples

View Satellite Positions from GNSS Sensor

Create a GNSS sensor model as a `gnssSensor` (Navigation Toolbox) System Object™.

```
gnss = gnssSensor;
```

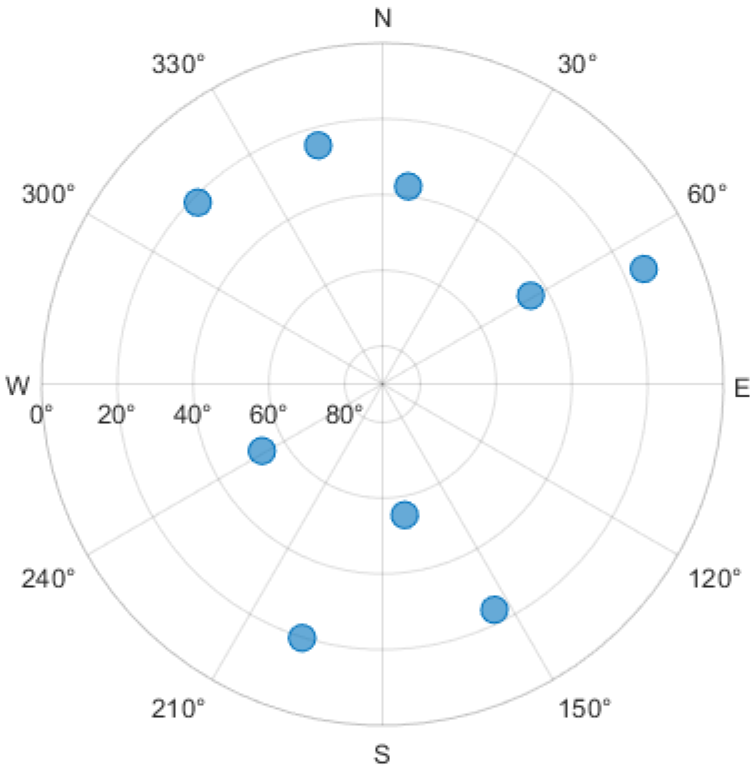
Specify the position and velocity of the sensor. Simulate the sensor readings and get status from visible satellites. Store the azimuth and elevation angles as vectors.

```
pos = [0 0 0];
vel = [0 0 0];
[~, ~, status] = gnss(pos, vel);
```

```
satAz = status.SatelliteAzimuth;
satEl = status.SatelliteElevation;
```

Plot the satellite postions.

```
skyplot(satAz,satEl)
```

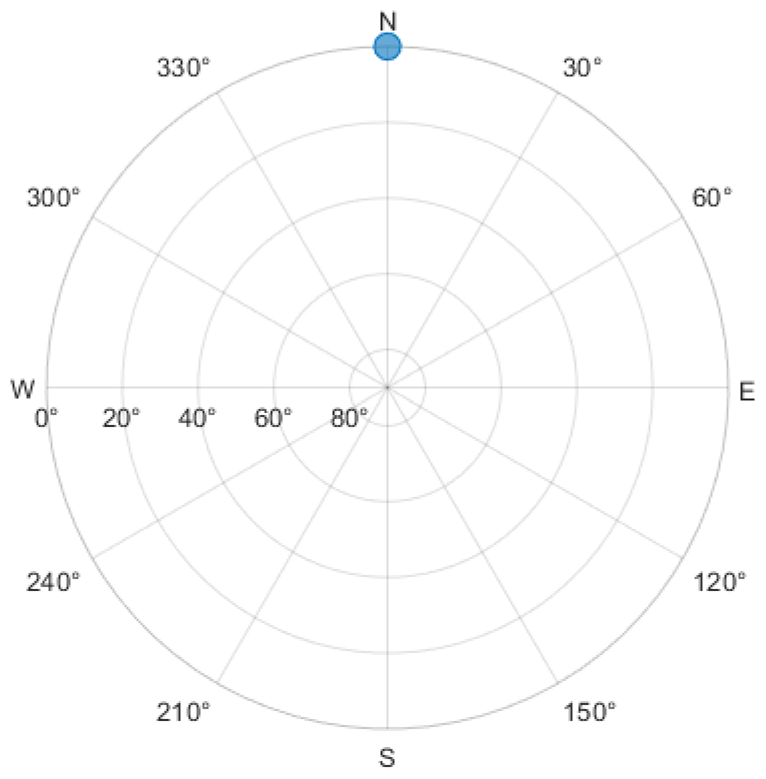


Plot Series of Satellite Positions Over Time

Animate the trajectory of satellite positions over time from a GNSS sensor.

Initialize the sky plot figure. Specify the relevant time-stepping information.

```
skyplotHandle = skyplot(0,0);
```



```
numHours = 12;
dt = 100;
numSeconds = numHours * 60 * 60;
numSimSteps = numSeconds/dt;
```

Create a GNSS sensor model as a `gnssSensor` (Navigation Toolbox) System Object™.

```
gnss = gnssSensor('SampleRate', 1/dt);
```

Iterate through the time steps and do the following:

- Simulate the sensor readings. Specify the zero postion and velocity for the stationary sensor.
- Store the azimuth and elevation angles as vectors.
- Set the `AzimuthData` and `ElevationData` properties of the `SkyPlotChart` handle directly.

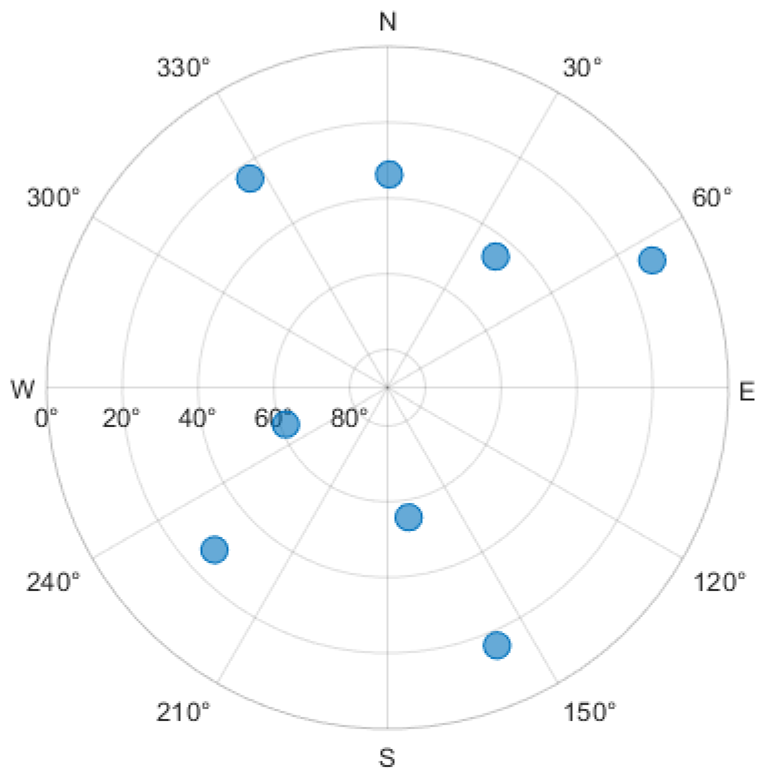
```
for i = 1:numSimSteps

    [~, ~, status] = gnss([0 0 0],[0 0 0]);

    satAz = status.SatelliteAzimuth;
    satEl = status.SatelliteElevation;

    set(skyplotHandle,'AzimuthData',satAz,'ElevationData',satEl);

    drawnow
end
```



View Satellite Positions For Different Groups

Load the azimuth and elevation data from a logfile generated by an Adafruit® GPS satellite sensor. The data provided in this example contains the azimuth and elevation of each satellite and the pseudorandom noise (PRN) codes. Store these values as vectors.

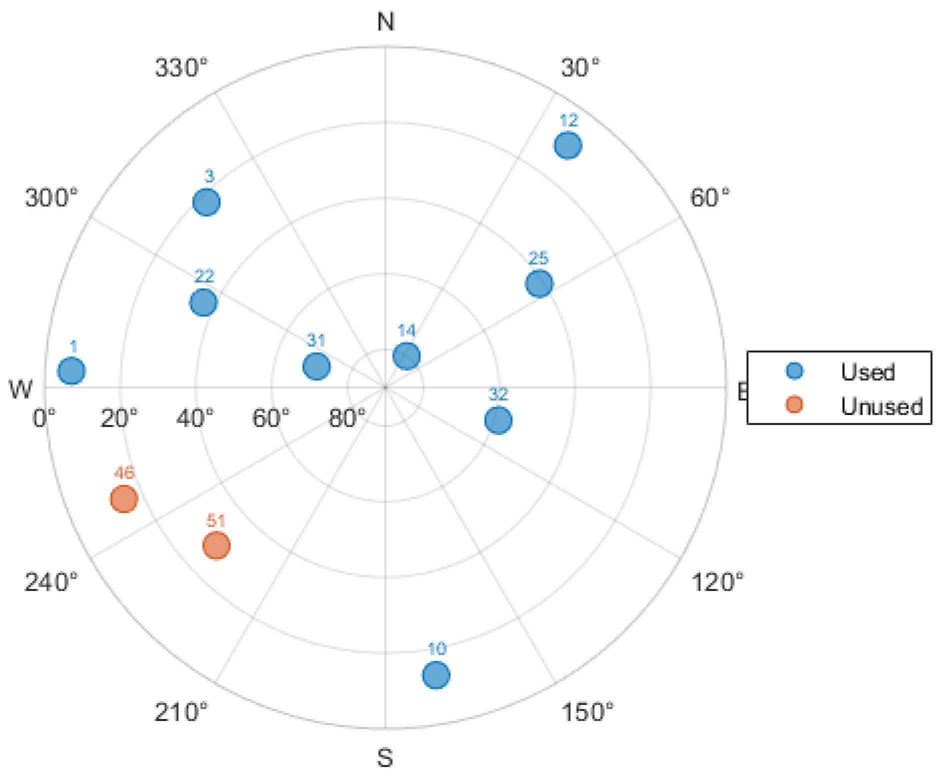
```
load('gpsHWInfo','hwInfo')
satAz = hwInfo.SatelliteAzimuths;
satEl = hwInfo.SatelliteElevations;
prn = hwInfo.SatellitePRNs;
```

Separate the satellites based on the PRN codes. To correlate each position with a group, create a `categorical` array. For this set of satellites, only the ones with PRNs less than 32 are used in the positioning solution.

```
isUnused = (prn > 32);
group = categorical(isUnused,[false true],["Used in Positioning Solution" "Unused"]);
```

Visualize the satellites and specify the categorical groups in the `GroupData` name-value argument. Specify the PRN as the label for each point. Show the legend.

```
skyplot(satAz,satEl,prn,GroupData=group)
legend('Used','Unused')
```



Input Arguments

`azdata` — Azimuth angles for visible satellite positions
n-element vector of angles

Azimuth angles for visible satellite positions, specified as an *n*-element vector of angles. *n* is the number of visible satellite positions in the plot. Azimuth angles are measured in degrees, clockwise-positive from the North direction.

Example: `[25 45 182 356]`

Data Types: `double`

`eldata` — Elevation angles for visible satellite positions
n-element vector of angles

Elevation angles for visible satellite positions, specified as an *n*-element vector of angles. *n* is the number of visible satellite positions in the plot. Elevation angles are measured from the horizon line with 90 degrees being directly up.

Example: `[45 90 27 74]`

Data Types: `double`

`labeldata` — Labels for visible satellite positions
n-element string array

Labels for visible satellite positions, specified as an *n*-element string array. *n* is the number of visible satellite positions in the plot.

Example: `["G1" "G11" "G7" "G3"]`

Data Types: `string`

`status` — Satellite status
structure array

Satellite status, specified as a structure array with fields `SatelliteAzimuth` and `SatelliteElevation`. Typically, this status structure comes from a `gnssSensor` object, which simulates satellite positions and velocities.

Example: `gnss = gnssSensor; [~,~,status] = gnss(position,velocity)`

Data Types: `struct`

`parent` — Parent container
`Figure` object | `Panel` object | `Tab` object | `TiledChartLayout` object | `GridLayout` object

Parent container, specified as a `Figure`, `Panel`, `Tab`, `TiledChartLayout`, or `GridLayout` object.

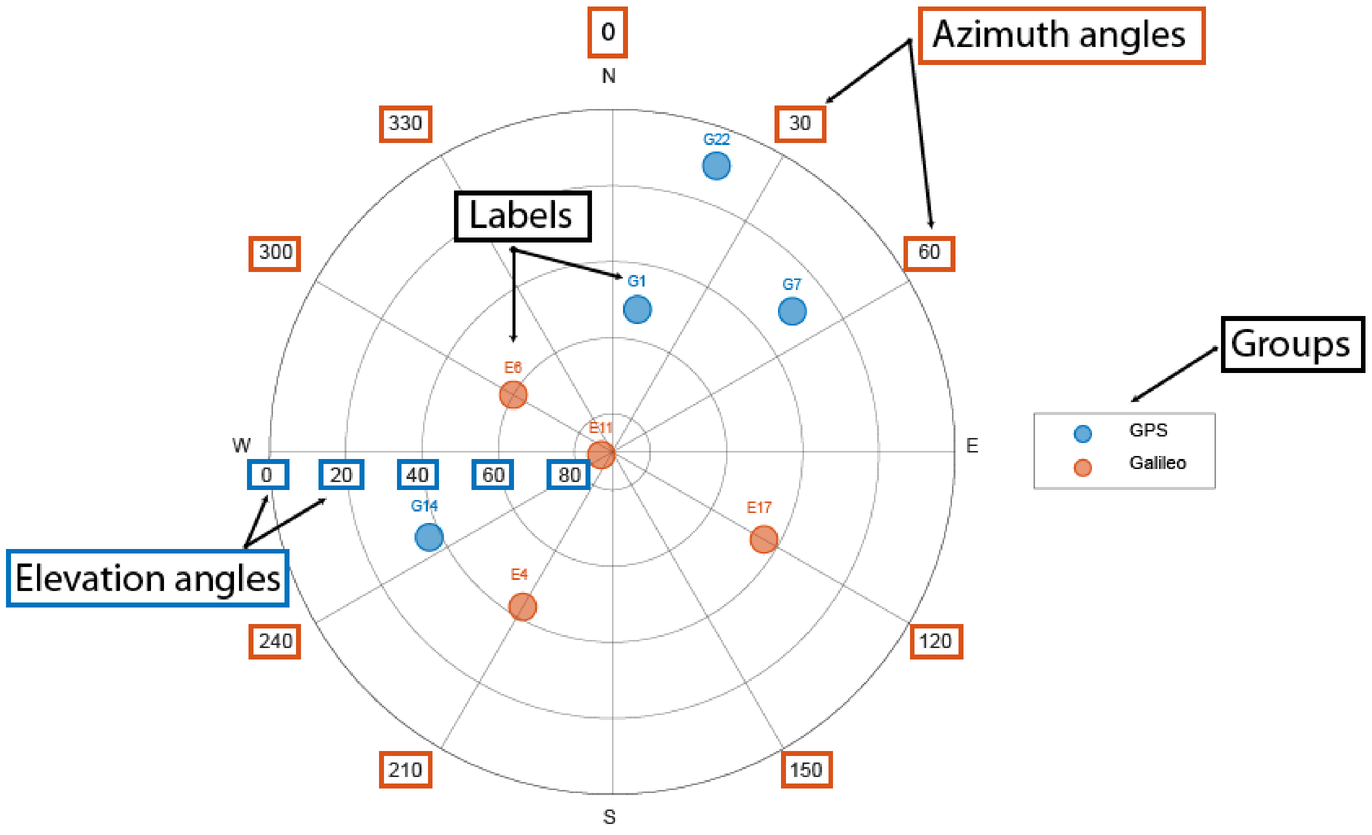
Output Arguments

`h` — Sky plot chart
`SkyplotChart` object

Sky plot chart, returned as a `SkyplotChart` object, which is a standalone visualization on page 3-34. Use `h` to set properties on the sky plot chart. For more information, see SkyPlotChart Properties (Navigation Toolbox).

More About

Main Sky Plot Elements



The main elements of the figure are:

- Azimuth axes — Specified by the `azdata` input argument, azimuth angle positions are measured clockwise-positive from the North direction.
- Elevation axes —Specified by the `eldata` input argument, elevation angle positions are measured from the horizon line with 90 degrees being directly up.
- Labels — Specified by the `labeldata` input argument as a string array with an element for each point in the `azdata` and `eldata` vectors.
- Groups — Specified by the GroupData property, a `categorical` array defines the group for each satellite position.

Standalone Visualization

A standalone visualization is a chart designed for a special purpose that works independently from other charts. Unlike other charts such as `plot` and `surf`, a standalone visualization has a preconfigured axes object built into it, and some customizations are not available. A standalone visualization also has these characteristics:

- It cannot be combined with other graphics elements, such as lines, patches, or surfaces. Thus, the `hold` command is not supported.

- The `gca` function can return the chart object as the current axes.
- You can pass the chart object to many MATLAB functions that accept an axes object as an input argument. For example, you can pass the chart object to the `title` function.

SkyPlotChart Properties

Sky plot chart appearance and behavior

Description

The `SkyPlotChart` properties control the appearance of a sky plot chart generated using the `skyplot` function. To modify the chart appearance, use dot notation on the `SkyPlotChart` object:

```
h = skyplot;
h.AzimuthData = [45 120 295];
h.ElevationData = [10 45 60];
h.Labels = ["G1" "G4" "G11"];
```

Properties

Sky Plot Properties

`AzimuthData` — Azimuth angles for visible satellite positions
n-element vector of angles

Azimuth angles for visible satellite positions, specified as an *n*-element vector of angles. *n* is the number of visible satellite positions in the plot. Angles are measured in degrees, clockwise-positive from the North direction.

Example: `[25 45 182 356]`

Data Types: `double`

`ElevationData` — Elevation angles for visible satellite positions
n-element vector of angles

Elevation angles for visible satellite positions, specified as an *n*-element vector of angles. *n* is the number of visible satellite positions in the plot. Angles are measured from the horizon line with 90 degrees being directly up.

Example: `[45 90 27 74]`

Data Types: `double`

`LabelData` — Labels for visible satellite positions
n-element string array

Labels for visible satellite positions, specified as an *n*-element string array. *n* is the number of visible satellite positions in the plot.

Example: `["G1" "G11" "G7" "G3"]`

Data Types: `string`

`GroupData` — Group for each satellite position
`categorical` array

Group for each satellite position, specified as a `categorical` array. Each group has a different color label defined by the ColorOrder property.

Example: `[GPS GPS Galileo Galileo]`

Data Types: `double`

`ColorOrder` — Color order

seven predefined colors (default) | three-column matrix of RGB triplets

Color order, specified as a three-column matrix of RGB triplets. This property defines the palette of colors MATLAB uses to create plot objects such as `Line`, `Scatter`, and `Bar` objects. Each row of the array is an RGB triplet. An RGB triplet is a three-element vector whose elements specify the intensities of the red, green, and blue components of a color. The intensities must be in the range [0, 1]. This table lists the default colors.

Colors	`ColorOrder` Matrix

	`[ 0 0.4470 0.7410`
	`0.8500 0.3250 0.0980`
	`0.9290 0.6940 0.1250`
	`0.4940 0.1840 0.5560`
	`0.4660 0.6740 0.1880`
	`0.3010 0.7450 0.9330`
	`0.6350 0.0780 0.1840]`

MATLAB assigns colors to objects according to their order of creation. For example, when plotting lines, the first line uses the first color, the second line uses the second color, and so on. If there are more lines than colors, then the cycle repeats.

You can also set the color order using the `colororder` function.

Label Properties

`LabelFontSize` — Font size of labels

scalar numeric value

Font size of labels, specified as a scalar numeric value. The default font depends on the specific operating system and locale.

Example: `h = skyplot(__,'LabelFontSize',12)`

Example: `h.LabelFontSize = 12`

`LabelFontSizeMode` — Selection mode for font size of labels

`'auto'` (default) | `'manual'`

Selection mode for the font size of labels, specified as one of these values:

- `'auto'` — Font size specified by MATLAB. If you resize the axes to be smaller than the default size, the font size can scale down to improve readability and layout.
- `'manual'` — Font size specified manually. MATLAB does not scale the font size as the axes size changes. To specify the font size, set the `LabelFontSize` property.

Chart Properties

`HandleVisibility` — Visibility of object handle
`'on'` (default) | `'off'` | `'callback'`

Visibility of the `SkyPlotChart` object handle in the `Children` property of the parent, specified as one of these values:

- `'on'` — Object handle is always visible.
- `'off'` — Object handle is invisible at all times. This option is useful for preventing unintended changes to the UI by another function. To temporarily hide the handle during the execution of that function, set the `HandleVisibility` to `'off'`.
- `'callback'` — Object handle is visible from within callbacks or functions invoked by callbacks, but not from within functions invoked from the command line. This option blocks access to the object at the command line, but allows callback functions to access it.

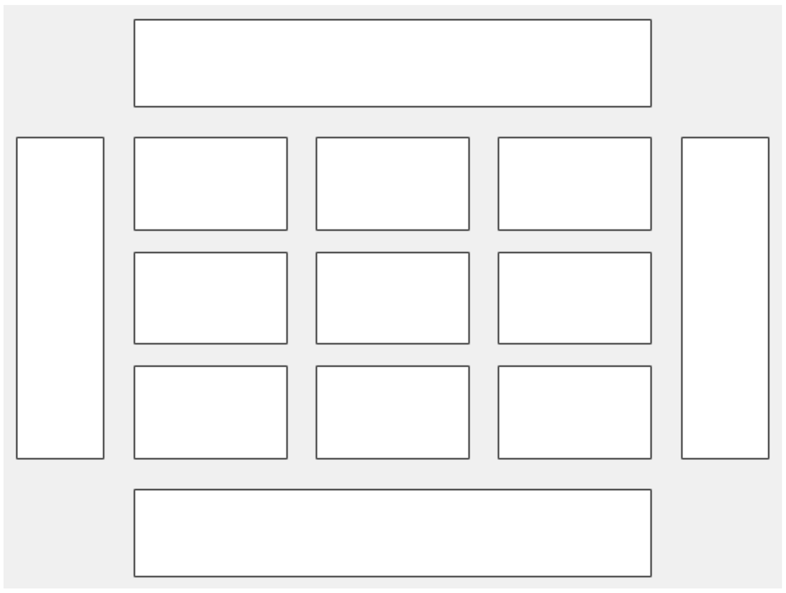
If the object is not listed in the `Children` property of the parent, then functions that obtain object handles by searching the object hierarchy or querying handle properties cannot return it. This includes `get`, `findobj`, `gca`, `gcf`, `gco`, `newplot`, `cla`, `clf`, and `close`.

Hidden object handles are still valid. Set the root `ShowHiddenHandles` property to `'on'` to list all object handles, regardless of their `HandleVisibility` property setting.

`Layout` — Layout options
empty `LayoutOptions` array (default) | `TiledChartLayoutOptions` object | `GridLayoutOptions` object

Layout options, specified as a `TiledChartLayoutOptions` or `GridLayoutOptions` object. This property is useful when the chart is either in a tiled chart layout or a grid layout.

To position the chart within the grid of a tiled chart layout, set the `Tile` and `TileSpan` properties on the `TiledChartLayoutOptions` object. For example, consider a 3-by-3 tiled chart layout. The layout has a grid of tiles in the center, and four tiles along the outer edges. In practice, the grid is invisible and the outer tiles do not take up space until you populate them with axes or charts.



This code places the chart `c` in the third tile of the grid..

```
c.Layout.Tile = 3;
```

To make the chart span multiple tiles, specify the `TileSpan` property as a two-element vector. For example, this chart spans `2` rows and `3` columns of tiles.

```
c.Layout.TileSpan = [2 3];
```

To place the chart in one of the surrounding tiles, specify the `Tile` property as `'north'`, `'south'`, `'east'`, or `'west'`. For example, setting the value to `'east'` places the chart in the tile to the right of the grid.

```
c.Layout.Tile = 'east';
```

To place the chart into a layout within an app, specify this property as a `GridLayoutOptions` object. For more information about working with grid layouts in apps, see `uigridlayout`.

If the chart is not a child of either a tiled chart layout or a grid layout (for example, if it is a child of a figure or panel) then this property is empty and has no effect.

Parent — Parent container
`Figure` object | `Panel` object | `Tab` object | `TiledChartLayout` object | `GridLayout` object

Parent container, specified as a `Figure`, `Panel`, `Tab`, `TiledChartLayout`, or `GridLayout` object.

Marker Properties

`MarkerEdgeAlpha` — Marker edge transparency
`1` (default) | scalar in range `[0,1]` | `'flat'`

Marker edge transparency, specified as a scalar in the range `[0,1]` or `'flat'`. A value of 1 is opaque and 0 is completely transparent. Values between 0 and 1 are semitransparent.

To set the edge transparency to a different value for each point in the plot, set the `AlphaData` property to a vector the same size as the `XData` property, and set the `MarkerEdgeAlpha` property to `'flat'`.

`MarkerEdgeColor` — Marker outline color
`'flat'` (default) | `'auto'` | RGB triplet | hexadecimal color code | `'r'` | `'g'` | `'b'` | ...

Marker outline color, specified as `'auto'`, an RGB triplet, a hexadecimal color code, a color name, or a short name. The value of `'auto'` uses the same color as the `Color` property.

For a custom color, specify an RGB triplet or a hexadecimal color code.

- An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range `[0,1]`. For example, `[0.4 0.6 0.7]`.
- A hexadecimal color code is a character vector or a string scalar that starts with a hash symbol (#) followed by three or six hexadecimal digits, which can range from `0` to `F`. The values are not case sensitive. Thus, the color codes `'#FF8800'`, `'#ff8800'`, `'#F80'`, and `'#f80'` are equivalent.

Alternatively, you can specify some common colors by name. This table lists the named color options, the equivalent RGB triplets, and the hexadecimal color codes.

Color Name	Short Name	RGB Triplet	Hexadecimal Color Code	Appearance
`'red'`	`'r'`	`[1 0 0]`	`'#FF0000'`	🟥
`'green'`	`'g'`	`[0 1 0]`	`'#00FF00'`	🟩
`'blue'`	`'b'`	`[0 0 1]`	`'#0000FF'`	🟦
`'cyan'`	`'c'`	`[0 1 1]`	`'#00FFFF'`	🟦
`'magenta'`	`'m'`	`[1 0 1]`	`'#FF00FF'`	🟪
`'yellow'`	`'y'`	`[1 1 0]`	`'#FFFF00'`	🟨
`'black'`	`'k'`	`[0 0 0]`	`'#000000'`	⬛
`'white'`	`'w'`	`[1 1 1]`	`'#FFFFFF'`	⬜
`'none'`	Not applicable	Not applicable	Not applicable	No color

This table shows the RGB triplets and hexadecimal color codes for the default colors MATLAB uses in many types of plots.

RGB Triplet	Hexadecimal Color Code	Appearance
`[0 0.4470 0.7410]`	`'#0072BD'`	🟦
`[0.8500 0.3250 0.0980]`	`'#D95319'`	🟧
`[0.9290 0.6940 0.1250]`	`'#EDB120'`	🟨
`[0.4940 0.1840 0.5560]`	`'#7E2F8E'`	🟪
`[0.4660 0.6740 0.1880]`	`'#77AC30'`	🟩
`[0.3010 0.7450 0.9330]`	`'#4DBEEE'`	🟦
`[0.6350 0.0780 0.1840]`	`'#A2142F'`	🟥

`MarkerFaceAlpha` — Marker face transparency

`0.6` (default) | scalar in range `[0,1]` | `'flat'`

Marker face transparency, specified as a scalar in the range `[0,1]` or `'flat'`. A value of 1 is opaque and 0 is completely transparent. Values between 0 and 1 are partially transparent.

To set the marker face transparency to a different value for each point, set the `AlphaData` property to a vector the same size as the `XData` property, and set the `MarkerFaceAlpha` property to `'flat'`.

`MarkerFaceColor` — Marker fill color

`'flat'` (default) | `'auto'` | `'none'` | RGB triplet | hexadecimal color code | `'r'` | `'g'` | `'b'` | ...

Marker fill color, specified as `'flat'`, `'auto'`, an RGB triplet, a hexadecimal color code, a color name, or a short name. The `'flat'` option uses the `CData` values. The `'auto'` option uses the same color as the `Color` property for the axes.

For a custom color, specify an RGB triplet or a hexadecimal color code.

- An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range `[0,1]`; for example, `[0.4 0.6 0.7]`.

- A hexadecimal color code is a character vector or a string scalar that starts with a hash symbol (#) followed by three or six hexadecimal digits, which can range from `0` to `F`. The values are not case sensitive. Thus, the color codes `'#FF8800'`, `'#ff8800'`, `'#F80'`, and `'#f80'` are equivalent.

Alternatively, you can specify some common colors by name. This table lists the named color options, the equivalent RGB triplets, and hexadecimal color codes.

Color Name	Short Name	RGB Triplet	Hexadecimal Color Code	Appearance
`'red'`	`'r'`	`[1 0 0]`	`'#FF0000'`	🟥
`'green'`	`'g'`	`[0 1 0]`	`'#00FF00'`	🟩
`'blue'`	`'b'`	`[0 0 1]`	`'#0000FF'`	🟦
`'cyan'`	`'c'`	`[0 1 1]`	`'#00FFFF'`	🟦
`'magenta'`	`'m'`	`[1 0 1]`	`'#FF00FF'`	🟪
`'yellow'`	`'y'`	`[1 1 0]`	`'#FFFF00'`	🟨
`'black'`	`'k'`	`[0 0 0]`	`'#000000'`	⬛
`'white'`	`'w'`	`[1 1 1]`	`'#FFFFFF'`	⬜
`'none'`	Not applicable	Not applicable	Not applicable	No color

Here are the RGB triplets and hexadecimal color codes for the default colors MATLAB uses in many types of plots.

RGB Triplet	Hexadecimal Color Code	Appearance
`[0 0.4470 0.7410]`	`'#0072BD'`	🟦
`[0.8500 0.3250 0.0980]`	`'#D95319'`	🟧
`[0.9290 0.6940 0.1250]`	`'#EDB120'`	🟨
`[0.4940 0.1840 0.5560]`	`'#7E2F8E'`	🟪
`[0.4660 0.6740 0.1880]`	`'#77AC30'`	🟩
`[0.3010 0.7450 0.9330]`	`'#4DBEEE'`	🟦
`[0.6350 0.0780 0.1840]`	`'#A2142F'`	🟥

Example: `[0.3 0.2 0.1]`

Example: `'green'`

Example: `'#D2F9A7'`

`MarkerSizeData` — Marker size

`100` (default) | positive scalar | vector of positive values

Marker size, specified as a positive scalar or vector of positive values in points, where one point = 1/72 of an inch. If specified as a vector, the vector must be of the same length as `AzimuthData`.

Position

`PositionConstraint` — Position to hold constant

`'outerposition'` | `'innerposition'`

Position property to hold constant when adding, removing, or changing decorations, specified as one of the following values:

- `'outerposition'` — The `OuterPosition` property remains constant when you add, remove, or change decorations such as a title or an axis label. If any positional adjustments are needed, MATLAB adjusts the `InnerPosition` property.
- `'innerposition'` — The `InnerPosition` property remains constant when you add, remove, or change decorations such as a title or an axis label. If any positional adjustments are needed, MATLAB adjusts the `OuterPosition` property.

Note Setting this property has no effect when the parent container is a `TiledChartLayout`.

`OuterPosition` — Outer size and location

`[0 0 1 1]` (default) | four-element vector

Outer size and location of the skyplot within the parent container (typically a figure, panel, or tab), specified as a four-element vector of the form `[left bottom width height]`. The outer position includes the colorbar, title, and axis labels.

- The `left` and `bottom` elements define the distance from the lower-left corner of the container to the lower-left corner of the skyplot.
- The `width` and `height` elements are the skyplot dimensions, which include the skyplot cells, plus a margin for the surrounding text and colorbar.

The default value of `[0 0 1 1]` covers the whole interior of the container. The units are normalized relative to the size of the container. To change the units, set the `Units` property.

Note Setting this property has no effect when the parent container is a `TiledChartLayout`.

`InnerPosition` — Inner size and location

`[0.1300 0.1100 0.7750 0.8114]` (default) | four-element vector

Inner size and location of the skyplot within the parent container (typically a figure, panel, or tab), specified as a four-element vector of the form `[left bottom width height]`. The inner position does not include the colorbar, title, or axis labels.

- The `left` and `bottom` elements define the distance from the lower-left corner of the container to the lower-left corner of the skyplot.
- The `width` and `height` elements are the skyplot dimensions, which include only the skyplot cells.

Note Setting this property has no effect when the parent container is a `TiledChartLayout`.

`Position` — Inner size and location

four-element vector

Inner size and location of the skyplot within the parent container (typically a figure, panel, or tab), specified as a four-element vector of the form `[left bottom width height]`. This property is equivalent to the `InnerPosition` property.

Note Setting this property has no effect when the parent container is a `TiledChartLayout`.

`Units` — Position units
`'normalized'` (default) | `'inches'` | `'centimeters'` | `'points'` | `'pixels'` | `'characters'`

Position units, specified as one of these values.

Units	Description
`'normalized'` (default)	Normalized with respect to the container, which is typically the figure or a panel. The lower left corner of the container maps to `(0,0)`, and the upper right corner maps to `(1,1)`.
`'inches'`	Inches.
`'centimeters'`	Centimeters.
`'characters'`	Based on the default `uicontrol` font of the graphics root object: • Character width = width of letter `x`. • Character height = distance between the baselines of two lines of text.
`'points'`	Typography points. One point equals 1/72 inch.
`'pixels'`	Pixels. Starting in R2015b, distances in pixels are independent of your system resolution on Windows® and Macintosh systems: • On Windows systems, a pixel is 1/96th of an inch. • On Macintosh systems, a pixel is 1/72nd of an inch. On Linux® systems, the size of a pixel is determined by your system resolution.

When specifying the units as a name-value argument during object creation, you must set the `Units` property before specifying the properties that you want to use these units, such as `OuterPosition`.

`Visible` — State of visibility
`'on'` (default) | on/off logical value

State of visibility, specified as `'on'` or `'off'`, or as numeric or logical `1` (`true`) or `0` (`false`). A value of `'on'` is equivalent to `true`, and `'off'` is equivalent to `false`. Thus, you can use the value of this property as a logical value. The value is stored as an on/off logical value of type `matlab.lang.OnOffSwitchState`.

- `'on'` — Display the skyplot.
- `'off'` — Hide the skyplot without deleting it. You can still access the properties of an invisible `SkyPlotChart` object.

Introduced in R2021a

Satellite

Satellite object belonging to satellite scenario

Description

Satellite defines a satellite object belonging to a satellite scenario.

Creation

You can create Satellite objects using the `satellite` function of `satelliteScenario`.

Properties

`Name` — Satellite name
`"Satellite *idx*"` (default) | string scalar | string vector | character vector | cell array of character vectors

You can set this property only when calling the `satellite` function. After you call `satellite`, this property is read-only.

Satellite name, specified as a comma-separated pair consisting of `'Name'` and a string scalar, string vector, character vector or a cell array of character vectors.

- If only one Satellite is added, specify `Name` as a string scalar or a character vector.
- If multiple Satellites are added, specify `Name` as a string scalar, character vector, string vector or a cell array of character vectors. All Satellites added as a string scalar or a character vector are assigned the same specified name. The number of elements in the string vector or cell array of character vector must equal the number of Satellites being added. Each Satellite is assigned the corresponding name from the vector or cell array.

In the default value, *idx* is the ID of the Satellites added by the Satellite object function.

Data Types: `char` | `string`

`ID` — Satellite ID assigned by simulator
real positive scalar

This property is set internally by the simulator and is read-only.

Satellite ID assigned by the simulator, specified as a positive scalar.

`ConicalSensors` — Conical sensors
row vector of conical sensors

You can set this property only when calling `conicalSensor`. After you call `conicalSensor`, this property is read-only.

Conical sensors attached to the Satellite, specified as a row vector of conical sensors.

`Gimbals` — Gimbals
row vector of `Gimbal` objects

You can set this property only when calling `gimbal`. After you call `gimbal`, this property is read-only.

Gimbals attached to the Satellite, specified as the comma-separated pair consisting of `'Gimbals'` and a row vector of `Gimbal` objects.

`Transmitters` — Transmitters attached to Satellite
row vector of `Transmitter` objects

You can set this property only when calling `transmitter`. After you call `transmitter`, this property is read-only.

Transmitters attached to the Satellite, specified as a row vector of `Transmitter` objects.

`Receivers` — Receivers attached to the satellite
row vector of `Receiver` objects

You can set this property only when calling `receiver`. After you call `receiver`, this property is read-only.

Receivers attached to the satellite, specified as a row vector of `Receiver` objects.

`Accesses` — Access analysis objects
row vector of `Access` objects

You can set this property only when calling Satellite. After you call Satellite, this property is read-only.

Access analysis objects, specified as a row vector of `Access` objects.

`GroundTrack` — Ground track of the Satellite
row vector of `GroundTrack` objects

You can set this property only when calling `groundTrack`. After you call `groundTrack`, this property is read-only.

Ground track of the Satellite, specified as a row vector of `GroundTrack` objects.

`Orbit` — Orbit graphic
`Orbit` object

Orbit object parameters for a satellite, specified as an `orbit` object. Only these object properties are relevant for this function.

`LineColor` — Color of orbit
`[1,0,0]` (default) | RGB triplet | hexadecimal color code | `'r'` | `'g'` | `'b'`

Color of the orbit, specified as an RGB triplet, hexadecimal color code, a color name, or a short name.

For a custom color, specify an RGB triplet or a hexadecimal color code.

- An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range `[0,1]`; for example, `[0.4 0.6 0.7]`.

- A hexadecimal color code is a character vector or a string scalar that starts with a hash symbol (#) followed by three or six hexadecimal digits, which can range from `0` to `F`. The values are not case sensitive. Thus, the color codes `'#FF8800'`, `'#ff8800'`, `'#F80'`, and `'#f80'` are equivalent.

Alternatively, you can specify some common colors by name. This table lists the named color options, the equivalent RGB triplets, and hexadecimal color codes.

Color Name	Short Name	RGB Triplet	Hexadecimal Color Code	Appearance
`'red'`	`'r'`	`[1 0 0]`	`'#FF0000'`	🟥
`'green'`	`'g'`	`[0 1 0]`	`'#00FF00'`	🟩
`'blue'`	`'b'`	`[0 0 1]`	`'#0000FF'`	🟦
`'cyan'`	`'c'`	`[0 1 1]`	`'#00FFFF'`	🟦
`'magenta'`	`'m'`	`[1 0 1]`	`'#FF00FF'`	🟪
`'yellow'`	`'y'`	`[1 1 0]`	`'#FFFF00'`	🟨
`'black'`	`'k'`	`[0 0 0]`	`'#000000'`	⬛
`'white'`	`'w'`	`[1 1 1]`	`'#FFFFFF'`	⬜
`'none'`	Not applicable	Not applicable	Not applicable	No color

Here are the RGB triplets and hexadecimal color codes for the default colors MATLAB uses in many types of plots.

RGB Triplet	Hexadecimal Color Code	Appearance
`[0 0.4470 0.7410]`	`'#0072BD'`	🟦
`[0.8500 0.3250 0.0980]`	`'#D95319'`	🟧
`[0.9290 0.6940 0.1250]`	`'#EDB120'`	🟨
`[0.4940 0.1840 0.5560]`	`'#7E2F8E'`	🟪
`[0.4660 0.6740 0.1880]`	`'#77AC30'`	🟩
`[0.3010 0.7450 0.9330]`	`'#4DBEEE'`	🟦
`[0.6350 0.0780 0.1840]`	`'#A2142F'`	🟥

Example: `'blue'`

Example: `[0 0 1]`

Example: `'#0000FF'`

`LineWidth` — Visual width of orbit
1 (default) | scalar in the range (0, 10)

Visual width of orbit in pixels, specified as a scalar in the range (0, 10).

The line width cannot be thinner than the width of a pixel. If you set the line width to a value that is less than the width of a pixel on your system, the line displays as one pixel wide.

`VisibilityMode` — Visibility mode of orbit graphic
`'inherit'` (default) | `'manual'`

Visibility mode of orbit graphic, specified as one of these values:

- `'inherit'` — Visibility of the graphic matches that of the parent
- `'manual'` — Visibility of the graphic is not inherited and is independent of that of the parent

Data Types: `char` | `string`

`OrbitPropagator` — Name of orbit propagator
`"sgp4"` | `"sdp4"` | `"two-body-keplerian"` | `"ephemeris"` | `"gps"`

This property is read-only.

Set `OrbitPropagator` on `satellite` object creation.

Name of the orbit propagator used for propagating the satellite position and velocity, specified as `"sgp4"`, `"sdp4"`, `"two-body-keplerian"`, `"ephemeris"`, or `"gps"`. The value depends on how you specify the satellite.

- Timetable, table, `timeseries`, or `tscollection` — `OrbitPropagator` is `"ephemeris"`.
- SEM almanac file — `OrbitPropagator` can be any value except `"ephemeris"`. The initialization is performed using the `"gps"` orbit propagator.
- TLE file — `OrbitPropagator` can be `"two-body-keplerian"`, `"sgp4"`, or `"sdp4"`. If the orbital period is less than 225 minutes, the initialization is performed using `"sgp4"`. Otherwise, the initialization is performed using `"sdp4"`.
- `Keplerian` elements — `OrbitPropagator` can be `"two-body-keplerian"`, `"sgp4"`, or `"sdp4"`.

If the satellite is initialized using a timetable, table, `timeseries` object, or `tscollection` object, the default propagator is `"ephemeris"`. If the initialization is performed using a SEM almanac file, the default propagator is `"gps"`. Otherwise, if the orbital period is less than 225 minutes, the default propagator is `"sgp4"`, else `"sdp4"`.

`OrbitPropagator` is not available for ephemeris data inputs (`timetable` or `timeseries`). In these cases, `satellite` automatically selects `"ephemeris"` orbit propagator.

`MarkerColor` — Color of marker
`[1 0 0]` (default) | `RGB triplet` | `string scalar of color name` | `character vector of color name`

Color of the marker, specified as a comma-separated pair consisting of `'MarkerColor'` and either an RGB triplet or a string or character vector of a color name.

For a custom color, specify an RGB triplet or a hexadecimal color code.

- An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range `[0,1]`; for example, `[0.4 0.6 0.7]`.
- A hexadecimal color code is a character vector or a string scalar that starts with a hash symbol (`#`) followed by three or six hexadecimal digits, which can range from `0` to `F`. The values are not case sensitive. Thus, the color codes `'#FF8800'`, `'#ff8800'`, `'#F80'`, and `'#f80'` are equivalent.

Alternatively, you can specify some common colors by name. This table lists the named color options, the equivalent RGB triplets, and hexadecimal color codes.

Color Name	Short Name	RGB Triplet	Hexadecimal Color Code	Appearance
`'red'`	`'r'`	`[1 0 0]`	`'#FF0000'`	🟥
`'green'`	`'g'`	`[0 1 0]`	`'#00FF00'`	🟩
`'blue'`	`'b'`	`[0 0 1]`	`'#0000FF'`	🟦
`'cyan'`	`'c'`	`[0 1 1]`	`'#00FFFF'`	🟦
`'magenta'`	`'m'`	`[1 0 1]`	`'#FF00FF'`	🟪

`'black'`	`'k'`	`[0 0 0]`	`'#000000'`	⬛
`'white'`	`'w'`	`[1 1 1]`	`'#FFFFFF'`	⬜
`'none'`	Not applicable	Not applicable	Not applicable	No color

Here are the RGB triplets and hexadecimal color codes for the default colors MATLAB uses in many types of plots.

RGB Triplet	Hexadecimal Color Code	Appearance
`[0 0.4470 0.7410]`	`'#0072BD'`	🟦
`[0.8500 0.3250 0.0980]`	`'#D95319'`	🟧
`[0.9290 0.6940 0.1250]`	`'#EDB120'`	🟨
`[0.4940 0.1840 0.5560]`	`'#7E2F8E'`	🟪
`[0.4660 0.6740 0.1880]`	`'#77AC30'`	🟩
`[0.3010 0.7450 0.9330]`	`'#4DBEEE'`	🟦
`[0.6350 0.0780 0.1840]`	`'#A2142F'`	🟥

`MarkerSize` — Size of marker

`10` (default) | positive scalar less than 30

Size of the marker, specified as a comma-separated pair consisting of `'MarkerSize'` and a real positive scalar less than 30. The unit is in pixels.

`ShowLabel` — State of Satellite label visibility

`true` or `1` (default) | `false` or `0`

State of Satellite label visibility, specified as a comma-separated pair consisting of `'ShowLabel'` and numerical or logical value of `1` (`true`) or `0` (`false`).

Data Types: `logical`

`LabelFontColor` — Font color of Satellite label

`[1,0,0]` (default) | `RGB triplet` | `string scalar of color name` | `character vector of color name`

Font color of the Satellitelabel, specified as a comma-separated pair consisting of `'LabelFontColor'` and either an RGB triplet or a string or character vector of a color name.

For a custom color, specify an RGB triplet or a hexadecimal color code.

- An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range `[0,1]`; for example, `[0.4 0.6 0.7]`.
- A hexadecimal color code is a character vector or a string scalar that starts with a hash symbol (`#`) followed by three or six hexadecimal digits, which can range from `0` to `F`. The values are not case sensitive. Thus, the color codes `'#FF8800'`, `'#ff8800'`, `'#F80'`, and `'#f80'` are equivalent.

Alternatively, you can specify some common colors by name. This table lists the named color options, the equivalent RGB triplets, and hexadecimal color codes.

Color Name	Short Name	RGB Triplet	Hexadecimal Color Code	Appearance
`'red'`	`'r'`	`[1 0 0]`	`'#FF0000'`	🟥
`'green'`	`'g'`	`[0 1 0]`	`'#00FF00'`	🟩
`'blue'`	`'b'`	`[0 0 1]`	`'#0000FF'`	🟦
`'cyan'`	`'c'`	`[0 1 1]`	`'#00FFFF'`	🟦
`'magenta'`	`'m'`	`[1 0 1]`	`'#FF00FF'`	🟪

`[0.6350 0.0780 0.1840]`	`'#A2142F'`	🟥

`LabelFontSize` — Font size of Satellite label
15 (default) | positive scalar less than 30

Font size of the Satellite label, specified as a comma-separated pair consisting of `'LabelFontSize'` and a positive scalar less than `30`.

Object Functions

access	Add access analysis objects to satellite scenario
aer	Calculate azimuth angle, elevation angle, and range of another satellite or ground station in NED frame

conicalSensor	Add conical sensor to satellite scenario
gimbal	Add gimbal to satellite or ground station
groundTrack	Add ground track object to satellite in scenario
orbitalElements	Orbital elements of satellites in scenario
pointAt	Specify the target at which the satellite is pointed
receiver	Add receiver to satellite scenario
transmitter	Add transmitter to satellite scenario
states	Obtain position and velocity of satellite
show	Show object in satellite scenario viewer
hide	Hides satellite scenario entity from viewer

Examples

Visualize Line of Sight Between Two Satellites

Create a satellite scenario object.

```
startTime = datetime(2020,5,5,0,0,0);
stopTime = startTime + days(1);
sampleTime = 60;                                      %seconds
sc = satelliteScenario(startTime,stopTime,sampleTime);
```

Add a satellite from a TLE file to the scenario.

```
tleFile = "eccentricOrbitSatellite.tle";
sat1 = satellite(sc,tleFile,"Name","Sat1")
```

```
sat1 = 
  Satellite with properties:

               Name:  Sat1
                 ID:  1
     ConicalSensors:  [1x0 matlabshared.satellitescenario.ConicalSensor]
            Gimbals:  [1x0 matlabshared.satellitescenario.Gimbal]
       Transmitters:  [1x0 satcom.satellitescenario.Transmitter]
          Receivers:  [1x0 satcom.satellitescenario.Receiver]
           Accesses:  [1x0 matlabshared.satellitescenario.Access]
        GroundTrack:  [1x1 matlabshared.satellitescenario.GroundTrack]
              Orbit:  [1x1 matlabshared.satellitescenario.Orbit]
    OrbitPropagator:  sdp4
        MarkerColor:  [1 0 0]
         MarkerSize:  10
          ShowLabel:  true
     LabelFontColor:  [1 0 0]
      LabelFontSize:  15
```

Add a satellite from Keplerian elements to the scenario and specify its orbit propagator to be "two-body-keplerian".

```
semiMajorAxis = 6878137;                                                  %m
eccentricity = 0;
inclination = 20;                                                         %deg
rightAscensionOfAscendingNode = 0;                                        %deg
argumentOfPeriapsis = 0;                                                  %deg
```

```
trueAnomaly = 0;                                                                                         %deg
sat2 = satellite(sc,semiMajorAxis,eccentricity,inclination,rightAscensionOfAscendingNode,...
    argumentOfPeriapsis,trueAnomaly,"OrbitPropagator","two-body-keplerian","Name","Sat2")

sat2 = 
  Satellite with properties:

                 Name:  Sat2
                   ID:  2
       ConicalSensors:  [1x0 matlabshared.satellitescenario.ConicalSensor]
              Gimbals:  [1x0 matlabshared.satellitescenario.Gimbal]
         Transmitters:  [1x0 satcom.satellitescenario.Transmitter]
            Receivers:  [1x0 satcom.satellitescenario.Receiver]
             Accesses:  [1x0 matlabshared.satellitescenario.Access]
          GroundTrack:  [1x1 matlabshared.satellitescenario.GroundTrack]
                Orbit:  [1x1 matlabshared.satellitescenario.Orbit]
      OrbitPropagator:  two-body-keplerian
          MarkerColor:  [1 0 0]
           MarkerSize:  10
            ShowLabel:  true
       LabelFontColor:  [1 0 0]
        LabelFontSize:  15
```

Add access analysis between the two satellites.

```
ac = access(sat1,sat2);
```

Determine the times when there is line of sight between the two satellites.

```
accessIntervals(ac)

Visualize GPS Constellation

Set up the satellite scenario.

```
startTime = datetime(2021,8,5);
stopTime = startTime + days(1);
sampleTime = 60;                                      % seconds
sc = satelliteScenario(startTime,stopTime,sampleTime);
```

Add satellites to the scenario from a SEM almanac file.

```
sat = satellite(sc,"gpsAlmanac.txt","OrbitPropagator","gps");
```

Visualize the GPS constellation.

```
v = satelliteScenarioViewer(sc);
```

Introduced in R2021a

GroundStation

Ground station object belonging to satellite scenario

Description

The `GroundStation` object defines a ground station object belonging to a satellite scenario.

Creation

You can create `GroundStation` object using the `groundStation` object function of the `satelliteScenario` object.

Properties

`Name` — GroundStation name
`"GroundStation *idx*"` (default) | string scalar | string vector | character vector | cell array of character vectors

You can set this property only when calling the `satellite` function. After you call `satellite`, this property is read-only.

GroundStation name, specified as a comma-separated pair consisting of `'Name'` and a string scalar, string vector, character vector or a cell array of character vectors.

- If only one GroundStation is added, specify `Name` as a string scalar or a character vector.
- If multiple GroundStations are added, specify `Name` as a string scalar, character vector, string vector or a cell array of character vectors. All GroundStations added as a string scalar or a character vector are assigned the same specified name. The number of elements in the string vector or cell array of character vector must equal the number of GroundStations being added. Each GroundStation is assigned the corresponding name from the vector or cell array.

In the default value, *idx* is the ID of the GroundStations added by the GroundStation object function.

Data Types: `char` | `string`

`ID` — GroundStation ID assigned by simulator
real positive scalar

This property is set internally by the simulator and is read-only.

GroundStation ID assigned by the simulator, specified as a positive scalar.

`Latitude` — Geodetic latitude of ground stations
`42.3001` (default) | scalar | row vector

You can set this property only when calling GroundStation. After you call GroundStation, this property is read-only.

Geodetic latitude of ground stations, specified as a scalar. Values must be in the range [-90, 90].

- If you add only one ground station, specify Latitude as a scalar double.
- If you add multiple ground stations, specify Latitude as a vector double whose length is equal to the number of ground stations being added.

When latitude and longitude are specified as `lat, lon` inputs to GroundStation, Latitude specified as a name-value argument takes precedence.

Data Types: `double`

`Longitude` — Geodetic longitude of ground stations
`-71.3504` (default) | scalar | row vector

You can set this property only when calling GroundStation. After you call GroundStation, this property is read-only.

Geodetic longitude of ground stations, specified as a scalar or a vector. Values must be in the range [-180, 180].

- If you add only one ground station, specify longitude as a scalar.
- If you add multiple ground stations, specify longitude as a vector whose length is equal to the number of ground stations being added.

When longitude and longitude are specified as `lat, lon` inputs to GroundStation, longitude specified as a name-value argument takes precedence.

Data Types: `double`

`Altitude` — Altitude of ground station
`0` m (default) | scalar | vector

You can set this property only when calling GroundStation. After you call GroundStation, this property is read-only.

Altitude of ground stations, specified as a scalar or a vector.

- If you specify `Altitude` as a scalar, the value is assigned to each ground station in the GroundStation.
- If you specify `Altitude` as a vector, the vector length must be equal to the number of ground stations in the GroundStation.

When latitude and longitude are specified as `lat, lon` inputs to GroundStation, Latitude specified as a name-value argument takes precedence.

Data Types: `double`

`MinElevationAngle` — Minimum elevation angle
`0` (default) | scalar | vector

Minimum elevation angle of a satellite for the satellite to be visible from the ground station, specified as a scalar or row vector. Values must be in the range [–90, 90]. For access and link closure to be possible, the elevation angle must be at least equal to the value specified in `MinElevationAngle`.

- If you specify `MinElevationAngle` as a scalar, the value is assigned to each ground station in the GroundStation.

- If you specify `MinElevationAngle` as a vector, the vector length must be equal to the number of ground stations in the GroundStation.

When `AutoSimulate` of the satellite scenario is `false`, `MinElevationAngle` can be modified while the `SimulationStatus` is `NotStarted` or `InProgress`.

Data Types: `double`

`Accesses` — Access analysis objects
row vector of `Access` objects

You can set this property only when calling GroundStation. After you call GroundStation, this property is read-only.

Access analysis objects, specified as a row vector of `Access` objects.

`ConicalSensors` — Conical sensors
row vector of conical sensors

You can set this property only when calling `conicalSensor`. After you call `conicalSensor`, this property is read-only.

Conical sensors attached to the GroundStation, specified as a row vector of conical sensors.

`Gimbals` — Gimbals
row vector of `Gimbal` objects

You can set this property only when calling `gimbal`. After you call `gimbal`, this property is read-only.

Gimbals attached to the GroundStation, specified as the comma-separated pair consisting of `'Gimbals'` and a row vector of `Gimbal` objects.

`Transmitters` — Transmitters attached to GroundStation
row vector of `Transmitter` objects

You can set this property only when calling `transmitter`. After you call `transmitter`, this property is read-only.

Transmitters attached to the GroundStation, specified as a row vector of `Transmitter` objects.

`Receivers` — Receivers attached to the satellite
row vector of `Receiver` objects

You can set this property only when calling `receiver`. After you call `receiver`, this property is read-only.

Receivers attached to the satellite, specified as a row vector of `Receiver` objects.

`MarkerColor` — Color of marker
`[1 0 0]` (default) | `RGB triplet` | `string scalar of color name` | `character vector of color name`

Color of the marker, specified as a comma-separated pair consisting of `'MarkerColor'` and either an RGB triplet or a string or character vector of a color name.

For a custom color, specify an RGB triplet or a hexadecimal color code.

- An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range `[0,1]`; for example, `[0.4 0.6 0.7]`.
- A hexadecimal color code is a character vector or a string scalar that starts with a hash symbol (`#`) followed by three or six hexadecimal digits, which can range from `0` to `F`. The values are not case sensitive. Thus, the color codes `'#FF8800'`, `'#ff8800'`, `'#F80'`, and `'#f80'` are equivalent.

Alternatively, you can specify some common colors by name. This table lists the named color options, the equivalent RGB triplets, and hexadecimal color codes.

Color Name	Short Name	RGB Triplet	Hexadecimal Color Code	Appearance
`'red'`	`'r'`	`[1 0 0]`	`'#FF0000'`	🟥
`'green'`	`'g'`	`[0 1 0]`	`'#00FF00'`	🟩
`'blue'`	`'b'`	`[0 0 1]`	`'#0000FF'`	🟦
`'cyan'`	`'c'`	`[0 1 1]`	`'#00FFFF'`	🟦
`'magenta'`	`'m'`	`[1 0 1]`	`'#FF00FF'`	🟪
`'yellow'`	`'y'`	`[1 1 0]`	`'#FFFF00'`	🟨
`'black'`	`'k'`	`[0 0 0]`	`'#000000'`	⬛
`'white'`	`'w'`	`[1 1 1]`	`'#FFFFFF'`	⬜
`'none'`	Not applicable	Not applicable	Not applicable	No color

Here are the RGB triplets and hexadecimal color codes for the default colors MATLAB uses in many types of plots.

RGB Triplet	Hexadecimal Color Code	Appearance
`[0 0.4470 0.7410]`	`'#0072BD'`	🟦
`[0.8500 0.3250 0.0980]`	`'#D95319'`	🟧
`[0.9290 0.6940 0.1250]`	`'#EDB120'`	🟨
`[0.4940 0.1840 0.5560]`	`'#7E2F8E'`	🟪
`[0.4660 0.6740 0.1880]`	`'#77AC30'`	🟩
`[0.3010 0.7450 0.9330]`	`'#4DBEEE'`	🟦
`[0.6350 0.0780 0.1840]`	`'#A2142F'`	🟥

`MarkerSize` — Size of marker

`10` (default) | positive scalar less than 30

Size of the marker, specified as a comma-separated pair consisting of `'MarkerSize'` and a real positive scalar less than 30. The unit is in pixels.

`ShowLabel` — State of GroundStation label visibility

`true` or `1` (default) | `false` or `0`

State of GroundStation label visibility, specified as a comma-separated pair consisting of `'ShowLabel'` and numerical or logical value of `1` (`true`) or `0` (`false`).

Data Types: `logical`

`LabelFontSize` — Font size of GroundStation label
15 (default) | positive scalar less than 30

Font size of the GroundStation label, specified as a comma-separated pair consisting of `'LabelFontSize'` and a positive scalar less than `30`.

`LabelFontColor` — Font color of GroundStation label
`[1,0,0]` (default) | `RGB triplet` | `string scalar of color name` | `character vector of color name`

Font color of the GroundStationlabel, specified as a comma-separated pair consisting of `'LabelFontColor'` and either an RGB triplet or a string or character vector of a color name.

For a custom color, specify an RGB triplet or a hexadecimal color code.

- An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range `[0,1]`; for example, `[0.4 0.6 0.7]`.
- A hexadecimal color code is a character vector or a string scalar that starts with a hash symbol (`#`) followed by three or six hexadecimal digits, which can range from `0` to `F`. The values are not case sensitive. Thus, the color codes `'#FF8800'`, `'#ff8800'`, `'#F80'`, and `'#f80'` are equivalent.

Alternatively, you can specify some common colors by name. This table lists the named color options, the equivalent RGB triplets, and hexadecimal color codes.

Color Name	Short Name	RGB Triplet	Hexadecimal Color Code	Appearance
`'red'`	`'r'`	`[1 0 0]`	`'#FF0000'`	🟥
`'green'`	`'g'`	`[0 1 0]`	`'#00FF00'`	🟩
`'blue'`	`'b'`	`[0 0 1]`	`'#0000FF'`	🟦
`'cyan'`	`'c'`	`[0 1 1]`	`'#00FFFF'`	🟦

Object Functions

access	Add access analysis objects to satellite scenario
conicalSensor	Add conical sensor to satellite scenario
transmitter	Add transmitter to satellite scenario
receiver	Add receiver to satellite scenario
gimbal	Add gimbal to satellite or ground station
show	Show object in satellite scenario viewer
aer	Calculate azimuth angle, elevation angle, and range of another satellite or ground station in NED frame
hide	Hides satellite scenario entity from viewer

Examples

Add Ground stations to Scenario and Visualize Access Intervals

Create satellite scenario and add ground stations from latitudes and longitudes.

```
startTime = datetime(2020, 5, 1, 11, 36, 0);
stopTime = startTime + days(1);
sampleTime = 60;
sc = satelliteScenario(startTime, stopTime, sampleTime);
lat = [10];
lon = [-30];
gs = groundStation(sc, lat, lon);
```

Add satellites using Keplerian elements.

```
semiMajorAxis = 10000000;
eccentricity = 0;
inclination = 10;
rightAscensionOfAscendingNode = 0;
argumentOfPeriapsis = 0;
trueAnomaly = 0;
sat = satellite(sc, semiMajorAxis, eccentricity, inclination, ...
        rightAscensionOfAscendingNode, argumentOfPeriapsis, trueAnomaly);
```

Add access analysis to the scenario and obtain the table of intervals of access between the satellite and the ground station.

```
ac = access(sat, gs);
intvls = accessIntervals(ac)
```

```
intvls=8×8 table

Access

Access analysis object belonging to scenario

Description

The Access object defines an access analysis object belonging to a `Satellite`, `GroundStation` or `ConicalSensor`.

Creation

You can create an `Access` object using the `access` object function of `GroundStation` or `Satellite`.

Properties

`Sequence` — IDs of satellites, ground stations, or conical sensors
vector of positive numbers

IDs of the satellites, ground stations, and conical sensors defining access analysis, specified as a vector of positive numbers.

`LineWidth` — Visual width of access analysis object
`1` (default) | scalar

Visual width of access analysis object in pixels, specified as a scalar in the range (0, 10].

The line width cannot be thinner than the width of a pixel. If you set the line width to a value that is less than the width of a pixel on your system, the line displays as one pixel wide.

`LineColor` — Color of analysis line
`[0.5 0 1]` (default) | RGB triplet | hexadecimal color code | color name | short name

Color of access analysis line, specified as an RGB triplet, hexadecimal color code, a color name, or a short name.

For a custom color, specify an RGB triplet or a hexadecimal color code.

- An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range `[0,1]`; for example, `[0.4 0.6 0.7]`.
- A hexadecimal color code is a character vector or a string scalar that starts with a hash symbol (#) followed by three or six hexadecimal digits, which can range from `0` to `F`. The values are not case sensitive. Thus, the color codes `'#FF8800'`, `'#ff8800'`, `'#F80'`, and `'#f80'` are equivalent.

Alternatively, you can specify some common colors by name. This table lists the named color options, the equivalent RGB triplets, and hexadecimal color codes.

Color Name	Short Name	RGB Triplet	Hexadecimal Color Code	Appearance
`'red'`	`'r'`	`[1 0 0]`	`'#FF0000'`	🟥

Object Functions

show	Show object in satellite scenario viewer
accessStatus	Status of access between first and last node defining access analysis
accessIntervals	Intervals during which access status is true
accessPercentage	Percentage of time when access exists between first and last node defining the access analysis
hide	Hides satellite scenario entity from viewer

Examples

Add Ground stations to Scenario and Visualize Access Intervals

Create satellite scenario and add ground stations from latitudes and longitudes.

```
startTime = datetime(2020, 5, 1, 11, 36, 0);
stopTime = startTime + days(1);
sampleTime = 60;
sc = satelliteScenario(startTime, stopTime, sampleTime);
lat = [10];
lon = [-30];
gs = groundStation(sc, lat, lon);
```

Add satellites using Keplerian elements.

```
semiMajorAxis = 10000000;
eccentricity = 0;
inclination = 10;
rightAscensionOfAscendingNode = 0;
argumentOfPeriapsis = 0;
trueAnomaly = 0;
sat = satellite(sc, semiMajorAxis, eccentricity, inclination, ...
        rightAscensionOfAscendingNode, argumentOfPeriapsis, trueAnomaly);
```

Add access analysis to the scenario and obtain the table of intervals of access between the satellite and the ground station.

```
ac = access(sat, gs);
intvls = accessIntervals(ac)
```

```

Introduced in R2021a

ConicalSensor

Conical sensor object belonging to satellite scenario

Description

`ConicalSensor` defines a conical sensor object belonging to a satellite scenario.

Creation

You can create the `ConicalSensor` object using the `conicalSensor` object function of the `Satellite` or `GroundStation` objects.

Properties

`Name` — ConicalSensor name
`"ConicalSensor *idx*"` (default) | string scalar | string vector | character vector | cell array of character vectors

You can set this property only when calling the `satellite` function. After you call `satellite`, this property is read-only.

ConicalSensor name, specified as a comma-separated pair consisting of `'Name'` and a string scalar, string vector, character vector or a cell array of character vectors.

- If only one ConicalSensor is added, specify `Name` as a string scalar or a character vector.
- If multiple ConicalSensors are added, specify `Name` as a string scalar, character vector, string vector or a cell array of character vectors. All ConicalSensors added as a string scalar or a character vector are assigned the same specified name. The number of elements in the string vector or cell array of character vector must equal the number of ConicalSensors being added. Each ConicalSensor is assigned the corresponding name from the vector or cell array.

In the default value, *idx* is the ID of the ConicalSensors added by the ConicalSensor object function.

Data Types: `char` | `string`

`ID` — ConicalSensor ID assigned by simulator
real positive scalar

This property is set internally by the simulator and is read-only.

ConicalSensor ID assigned by the simulator, specified as a positive scalar.

`MountingLocation` — Mounting location with respect to parent
`[0; 0; 0]` (default) | three-element vector | matrix

Mounting location with respect to the parent object in meters, specified as a three-element vector or a matrix. The position vector is specified in the body frame of the input `parent`.

- One ConicalSensor — `MountingLocation` is a three-element vector.
- Multiple ConicalSensors — `MountingLocation` can be a three-element vector or a matrix. When specified as a vector, the same `MountingLocations` are assigned to all specified ConicalSensors. When specified as a matrix, `MountingLocation` must contain three rows and the same number of columns as the ConicalSensors. The columns correspond to the mounting location of each specified ConicalSensor and the rows correspond to the mounting location coordinates in the parent body frame.

When the `AutoSimulate` property of the satellite scenario is `false`, you can modify the `MountingLocation` property only when the `SimulationStatus` is `NotStarted`. You can use the `restart` function to reset `SimulationStatus` to `NotStarted`, but doing so erases the simulation data.

Data Types: `double`

`MountingAngles` — Mounting orientation with respect to parent object
`[0; 0; 0]` (default) | three-element row vector of positive numbers | matrix

Mounting orientation with respect to parent object in degrees, specified as a three-element row vector of positive numbers. The elements of the vector correspond to yaw, pitch, and roll in that order. Yaw, pitch, and roll are positive rotations about the parent's *z* - axis, intermediate *y* - axis and intermediate *x* - axis of the parent.

- One ConicalSensor — `MountingAngles` is a three-element vector.
- Multiple ConicalSensors — `MountingAngles` can be a three-element vector or a matrix. When specified as a vector, the same `MountingAngless` are assigned to all specified ConicalSensors. When specified as a matrix, `MountingAngles` must contain three rows and the same number of columns as the ConicalSensors. The columns correspond to the mounting angles of each specified ConicalSensor and the rows correspond to the yaw, pitch, and roll angles parent body frame.

When the `AutoSimulate` property of the satellite scenario is `false`, you can modify the `MountingAngles` property only when the `SimulationStatus` is `NotStarted`. You can use the `restart` function to reset `SimulationStatus` to `NotStarted`, but doing so erases the simulation data.

Example: `[0; 30; 60]`

Data Types: `double`

`MaxViewAngle` — Field of view angle
`30` (default) | scalar in the range [0, 180] | vector

Field of view angle in degrees, specified as a scalar in the range [0, 180] or a vector.

- One ConicalSensor — `MaxViewAngle` must be a scalar.
- Multiple ConicalSensor — `MaxViewAngle` can be a scalar or a vector. When scalar, the same `MaxViewAngle` is assigned to all specified ConicalSensors. When vector, the length of `MaxViewAngle` must equal the number of ConicalSensors to be specified. Each element of `MaxViewAngle` is assigned to the specified corresponding ConicalSensor.

When `AutoSimulate` of the satellite scenario is `false`, you can modify `MaxViewAngle` while the `SimulationStatus` is `NotStarted` or `InProgress`.

Data Types: `double`

`Accesses` — Access analysis objects
row vector of `Access` objects

You can set this property only when calling ConicalSensor. After you call ConicalSensor, this property is read-only.

Access analysis objects, specified as a row vector of `Access` objects.

`FieldOfView` — Field of view objects
row vector of `FieldOfView` objects

You can set this property only when calling ConicalSensor. After you call ConicalSensor, this property is read-only.

Field of view objects, specified as a scalar of `FieldOfView` objects.

Note The properties Name, MountingLocation, MountingAngles, and MaxViewAngle can be specified as name-value arguments in `conicalSensor`. The size of specified name-value pairs determines the number of conical sensors specified. Refer to these properties to understand how they must be defined when specifying multiple conical sensors.

Object Functions

aer	Calculate azimuth angle, elevation angle, and range of another satellite or ground station in NED frame
access	Add access analysis objects to satellite scenario
fieldOfView	Visualize field of view of conical sensor

Examples

Calculate Maximum Revisit Time of Satellite

Create a satellite scenario with a start time of 15-June-2021 8:55:00 AM UTC and a stop time of five days later. Set the simulation sample time to `60` seconds.

```
startTime = datetime(2021,6,21,8,55,0);
stopTime = startTime + days(5);
sampleTime = 60;                                     % seconds
sc = satelliteScenario(startTime,stopTime,sampleTime)
```

```
sc = 
  satelliteScenario with properties:

         StartTime: 21-Jun-2021 08:55:00
          StopTime: 26-Jun-2021 08:55:00
        SampleTime: 60
           Viewers: [0×0 matlabshared.satellitescenario.Viewer]
        Satellites: [1×0 matlabshared.satellitescenario.Satellite]
    GroundStations: [1×0 matlabshared.satellitescenario.GroundStation]
          AutoShow: 1
```

Add a satellite to the scenario using Keplerian orbital elements.

```
semiMajorAxis = 7878137;                                                                            % me
eccentricity = 0;
inclination = 50;                                                                                   % deg
rightAscensionOfAscendingNode = 0;                                                                  % deg
argumentOfPeriapsis = 0;                                                                            % deg
trueAnomaly = 50;                                                                                   % deg
sat = satellite(sc,semiMajorAxis,eccentricity,inclination,rightAscensionOfAscendingNode, ...
    argumentOfPeriapsis,trueAnomaly)
```

```
sat = 
  Satellite with properties:

               Name:  Satellite 1
                 ID:  1
      ConicalSensors:  [1x0 matlabshared.satellitescenario.ConicalSensor]
             Gimbals:  [1x0 matlabshared.satellitescenario.Gimbal]
        Transmitters:  [1x0 satcom.satellitescenario.Transmitter]
           Receivers:  [1x0 satcom.satellitescenario.Receiver]
            Accesses:  [1x0 matlabshared.satellitescenario.Access]
         GroundTrack:  [1x1 matlabshared.satellitescenario.GroundTrack]
               Orbit:  [1x1 matlabshared.satellitescenario.Orbit]
     OrbitPropagator:  sgp4
         MarkerColor:  [1 0 0]
          MarkerSize:  10
           ShowLabel:  true
      LabelFontColor:  [1 0 0]
       LabelFontSize:  15
```

Add a ground station which represents the location to be photographed, to the scenario.

```
gs = groundStation(sc,"Name","Location To Photograph", ...
    "Latitude",42.3001,"Longitude",-71.3504)                % degrees
```

```
gs = 
  GroundStation with properties:

                 Name:  Location To Photograph
                   ID:  2
             Latitude:  42.3 degrees
            Longitude:  -71.35 degrees
             Altitude:  0 meters
    MinElevationAngle:  0 degrees
       ConicalSensors:  [1x0 matlabshared.satellitescenario.ConicalSensor]
              Gimbals:  [1x0 matlabshared.satellitescenario.Gimbal]
         Transmitters:  [1x0 satcom.satellitescenario.Transmitter]
            Receivers:  [1x0 satcom.satellitescenario.Receiver]
             Accesses:  [1x0 matlabshared.satellitescenario.Access]
          MarkerColor:  [0 1 1]
           MarkerSize:  10
            ShowLabel:  true
       LabelFontColor:  [0 1 1]
        LabelFontSize:  15
```

Add a gimbal to the satellite. You can steer this gimbal independently of the satellite.

```
g = gimbal(sat)
```

```
g = 
  Gimbal with properties:

                Name:  Gimbal 3
                  ID:  3
    MountingLocation:  [0; 0; 0] meters
      MountingAngles:  [0; 0; 0] degrees
      ConicalSensors:  [1x0 matlabshared.satellitescenario.ConicalSensor]
        Transmitters:  [1x0 satcom.satellitescenario.Transmitter]
           Receivers:  [1x0 satcom.satellitescenario.Receiver]
```

Track the location to be photographed using the gimbal.

```
pointAt(g,gs);
```

Add a conical sensor to the gimbal. This sensor represents the camera. Set the field of view to 60 degrees.

```
camSensor = conicalSensor(g,"MaxViewAngle",60)
```

```
camSensor = 
  ConicalSensor with properties:

                Name:  Conical sensor 4
                  ID:  4
    MountingLocation:  [0; 0; 0] meters
      MountingAngles:  [0; 0; 0] degrees
        MaxViewAngle:  60 degrees
            Accesses:  [1x0 matlabshared.satellitescenario.Access]
         FieldOfView:  [0x0 matlabshared.satellitescenario.FieldOfView]
```

Add access analysis between the camera and the location to be photographed. The access is added to the conical sensor.

```
ac = access(camSensor,gs)
```

```
ac = 
  Access with properties:

    Sequence:  [4 2]
    LineWidth:  1
    LineColor:  [0.5 0 1]
```

Visualize the field of view of the camera by using the Satellite Scenario Viewer.

```
v = satelliteScenarioViewer(sc);
fieldOfView(camSensor);
```

Introduced in R2021a

Transmitter

Transmitter object belonging to satellite scenario

Description

Transmitter defines a transmitter object belonging to a satellite scenario.

Creation

You can create Transmitter objects using the `transmitter` method of `satellite`, `groundStation`, or `gimbal`.

Properties

`Name` — Transmitter name
`"Transmitter idx"` (default) | string scalar | string vector | character vector | cell array of character vectors

You can set this property only when calling the `satellite` function. After you call `satellite`, this property is read-only.

Transmitter name, specified as a comma-separated pair consisting of `'Name'` and a string scalar, string vector, character vector or a cell array of character vectors.

- If only one Transmitter is added, specify `Name` as a string scalar or a character vector.
- If multiple Transmitters are added, specify `Name` as a string scalar, character vector, string vector or a cell array of character vectors. All Transmitters added as a string scalar or a character vector are assigned the same specified name. The number of elements in the string vector or cell array of character vector must equal the number of Transmitters being added. Each Transmitter is assigned the corresponding name from the vector or cell array.

In the default value, *idx* is the ID of the Transmitters added by the Transmitter object function.

Data Types: `char` | `string`

`ID` — Transmitter ID assigned by simulator
real positive scalar

This property is set internally by the simulator and is read-only.

Transmitter ID assigned by the simulator, specified as a positive scalar.

`MountingLocation` — Mounting location with respect to parent
`[0; 0; 0]` (default) | three-element vector | matrix

Mounting location with respect to the parent object in meters, specified as a three-element vector or a matrix. The position vector is specified in the body frame of the input `parent`.

- One Transmitter — `MountingLocation` is a three-element vector.
- Multiple Transmitters — `MountingLocation` can be a three-element vector or a matrix. When specified as a vector, the same `MountingLocations` are assigned to all specified Transmitters. When specified as a matrix, `MountingLocation` must contain three rows and the same number of columns as the Transmitters. The columns correspond to the mounting location of each specified Transmitter and the rows correspond to the mounting location coordinates in the parent body frame.

When the `AutoSimulate` property of the satellite scenario is `false`, you can modify the `MountingLocation` property only when the `SimulationStatus` is `NotStarted`. You can use the `restart` function to reset `SimulationStatus` to `NotStarted`, but doing so erases the simulation data.

Data Types: `double`

`MountingAngles` — Mounting orientation with respect to parent object
`[0; 0; 0]` (default) | three-element row vector of positive numbers | matrix

Mounting orientation with respect to parent object in degrees, specified as a three-element row vector of positive numbers. The elements of the vector correspond to yaw, pitch, and roll in that order. Yaw, pitch, and roll are positive rotations about the parent's *z* - axis, intermediate *y* - axis and intermediate *x* - axis of the parent.

- One Transmitter — `MountingAngles` is a three-element vector.
- Multiple Transmitters — `MountingAngles` can be a three-element vector or a matrix. When specified as a vector, the same `MountingAngless` are assigned to all specified Transmitters. When specified as a matrix, `MountingAngles` must contain three rows and the same number of columns as the Transmitters. The columns correspond to the mounting angles of each specified Transmitter and the rows correspond to the yaw, pitch, and roll angles parent body frame.

When the `AutoSimulate` property of the satellite scenario is `false`, you can modify the `MountingAngles` property only when the `SimulationStatus` is `NotStarted`. You can use the `restart` function to reset `SimulationStatus` to `NotStarted`, but doing so erases the simulation data.

Example: `[0; 30; 60]`

Data Types: `double`

Antenna — Antenna object associated with Transmitter
scalar | vector

`Antenna` object associated with the Transmitter, specified as either a scalar or a vector. This object can be the default `gaussianAntenna` object, or one from the Antenna Toolbox or Phased Array System Toolbox. The default Gaussian antenna has a dish diameter of 1 m and an aperture efficiency of 0.65.

Antenna can be specified in Transmitter as a name-value pair consisting of `'Antenna'` and a scalar, antenna or phased array objects.

- If only one Transmitter is added, `Antenna` must be a scalar.
- If multiple Transmitters are added, `Antenna` as a vector. The same antenna is assigned to all Transmitters.

SystemLoss — System loss in Transmitter
5 (default) | scalar | vector

System loss in dB, specified as a scalar or a vector.

System loss can be specified in Transmitter as a name-value pair consisting of 'SystemLoss' and a scalar, or vector.

- If only one Transmitter is added, specify SystemLoss as a scalar.
- If multiple Transmitters are added, specify SystemLoss as a scalar or a vector. When SystemLoss is a scalar, the same SystemLoss is assigned to all Transmitters. When SystemLoss is a vector, its length must equal the number of Transmitter and each element of SystemLoss is assigned to the corresponding Transmitter specified.

When AutoSimulate property of the satellite scenario is false, you can modify the SystemLoss value while the SimulationStatus is NotStarted or InProgress.

Frequency — Transmitter frequency
14e9 (default) | scalar | vector

Transmitter frequency in Hz, specified as a name-value pair consisting of 'Frequency' and a scalar double or a vector double.

- If one Transmitter is added, the Frequency must be a scalar.
- If multiple Transmitters are added, the frequency value can be a scalar or a vector. All Transmitters added as a scalar are assigned the same specified Frequency. The length of the vector must equal the number of Transmitters added and each element of Frequency is assigned to the corresponding Transmitter specified.

When AutoSimulate of the satellite scenario is false, you can modify the Frequency value while the SimulationStatus is NotStarted or InProgress.

BitRate — Bit rate of transmitter
10 (default) | scalar | vector

Bit rate of the transmitter in Mbps, specified as a name-value pair consisting of 'BitRate' and a scalar double or a vector double.

- If one Transmitter is added, the bit rate value must be a scalar.
- If multiple Transmitters are added, the bit rate value can be a scalar or a vector. All Transmitters added as a scalar are assigned the same specified BitRate. The length of the vector must equal the number of Transmitters added and each element of BitRate is assigned to the corresponding Transmitter specified.

When AutoSimulate of the satellite scenario is false, you can modify the BitRate value while the SimulationStatus is NotStarted or InProgress.

Power — Power of high power amplifier
12 (default) | scalar | vector

Power of the high power amplifier in dbW, specified as a name-value pair consisting of 'Power' and a scalar double or a vector double.

- If one Transmitter is added, the power value must be a scalar.

- If multiple Transmitters are added, the power value can be a scalar or a vector. All Transmitters added as a scalar are assigned the same specified `Power`. The length of the vector must equal the number of Transmitters added and each element of `Power` is assigned to the corresponding Transmitter specified.

When `AutoSimulate` of the satellite scenario is false, you can modify the `Power` value while the `SimulationStatus` is `NotStarted` or `InProgress`.

`Links` — Link analysis objects
row vector of `Link` objects

This property is read-only.

Link analysis objects, specified as a row vector `Link` objects.

Object Functions

aer	Calculate azimuth angle, elevation angle, and range of another satellite or ground station in NED frame
gaussianAntenna	Add Gaussian antennas
link	Add link analysis objects to transmitter
pattern	Plot 3-D radiation pattern of antenna
pointAt	Specify the target at which the satellite is pointed

Examples

Determine Times of Availability for Satellite Link Between Two Ground Stations

Create a satellite scenario object.

```
startTime = datetime(2020,11,25,0,0,0);
stopTime = startTime + days(1);
sampleTime = 60;                                     % seconds
sc = satelliteScenario(startTime,stopTime,sampleTime)
```

```
sc = 
  satelliteScenario with properties:

         StartTime: 25-Nov-2020
          StopTime: 26-Nov-2020
        SampleTime: 60
           Viewers: [0×0 matlabshared.satellitescenario.Viewer]
        Satellites: [1×0 matlabshared.satellitescenario.Satellite]
    GroundStations: [1×0 matlabshared.satellitescenario.GroundStation]
          AutoShow: 1
```

Add a satellite to the scenario.

```
semiMajorAxis = 10000000;                                                 % mete
eccentricity = 0;
inclination = 60;                                                         % degr
rightAscensionOfAscendingNode = 0;                                        % degr
argumentOfPeriapsis = 0;                                                  % degr
trueAnomaly = 0;                                                          % degr
```

```
sat = satellite(sc,semiMajorAxis,eccentricity,inclination,rightAscensionOfAscendingNode,...
        argumentOfPeriapsis,trueAnomaly,"Name","Satellite");
```

Add a transmitter to the satellite.

```
frequency = 27e9;                                                                                 % H
power = 20;                                                                                       % d
bitRate = 20;                                                                                     % M
systemLoss = 3;                                                                                   % d
txSat = transmitter(sat,"Name","Satellite Transmitter","Frequency",frequency,"power",power,...
        "BitRate",bitRate,"SystemLoss",systemLoss)
```

```
txSat = 
  Transmitter with properties:

                Name:  Satellite Transmitter
                  ID:  2
    MountingLocation:  [0; 0; 0] meters
      MountingAngles:  [0; 0; 0] degrees
             Antenna:  [1x1 satcom.satellitescenario.GaussianAntenna]
          SystemLoss:  3 decibels
           Frequency:  2.7e+10 Hertz
             BitRate:  20 Mbps
               Power:  20 decibel-watts
               Links:  [1x0 satcom.satellitescenario.Link]
```

Add a receiver to the satellite.

```
gainToNoiseTemperatureRatio = 5;
systemLoss = 3;
rxSat = receiver(sat,"Name","Satellite Receiver","GainToNoiseTemperatureRatio",gainToNoiseTempera
        "SystemLoss",systemLoss)
```

```
rxSat = 
  Receiver with properties:

                           Name:  Satellite Receiver
                             ID:  3
               MountingLocation:  [0; 0; 0] meters
                 MountingAngles:  [0; 0; 0] degrees
                        Antenna:  [1x1 satcom.satellitescenario.GaussianAntenna]
                     SystemLoss:  3 decibels
    GainToNoiseTemperatureRatio:  5 decibels/Kelvin
                  RequiredEbNo:  10 decibels
```

Specify the antenna specifications of the repeater.

```
dishDiameter = 0.5;                                                                            % mete
apertureEfficiency = 0.5;
gaussianAntenna(txSat,"DishDiameter",dishDiameter,"ApertureEfficiency",apertureEfficiency);
gaussianAntenna(rxSat,"DishDiameter",dishDiameter,"ApertureEfficiency",apertureEfficiency);
```

Add two ground stations to the scenario.

```
gs1 = groundStation(sc,"Name","Ground Station 1");
latitude = 52.2294963;                                                      % degrees
```

```
longitude = 0.1487094;                                              % degrees
gs2 = groundStation(sc,latitude,longitude,"Name","Ground Station 2");
```

Add gimbals to the ground stations. These gimbals enable you to steer the ground station antennas to track the satellite.

```
mountingLocation = [0; 0; -5];                                                         % me
mountingAngles = [0; 180; 0];                                                          % deg
gimbalGs1 = gimbal(gs1,"MountingLocation",mountingLocation,"MountingAngles",mountingAngles);
gimbalGs2 = gimbal(gs2,"MountingLocation",mountingLocation,"MountingAngles",mountingAngles);
```

Track the satellite using the gimbals.

```
pointAt(gimbalGs1,sat);
pointAt(gimbalGs2,sat);
```

Add a transmitter to gimbal `gimbalGs1`.

```
frequency = 30e9;                                                                        % H
power = 40;                                                                              % d
bitRate = 20;                                                                            % M
txGs1 = transmitter(gimbalGs1,"Name","Ground Stationn 1 Transmitter","Frequency",frequency,...
        "Power",power,"BitRate",bitRate);
```

Add a receiver to gimbal `gimbalGs2`.

```
requiredEbNo = 14;                                                                     % dB
rxGs2 = receiver(gimbalGs2,"Name","Ground Station 2 Receiver","RequiredEbNo",requiredEbNo);
```

Define the antenna specifications of the ground stations.

```
dishDiameter = 5;                                   % meters
gaussianAntenna(txGs1,"DishDiameter",dishDiameter);
gaussianAntenna(rxGs2,"DishDiameter",dishDiameter);
```

Add link analysis to transmitter `txGs1`.

```
lnk = link(txGs1,rxSat,txSat,rxGs2)
```

```
lnk = 
  Link with properties:

    Sequence:  [8 3 2 9]
    LineWidth:  1
    LineColor:  [0 1 0]
```

Determine the times when ground station `gs1` can send data to ground station `gs2` via the satellite.

```
linkIntervals(lnk)
```

```
ans =

  0×8 empty table
```

Visualize the link using the Satellite Scenario Viewer.

```
play(sc);
```

Introduced in R2021a

Receiver

Receiver object belonging to satellite scenario

Description

The `Receiver` object defines a receiver object function belonging to the satellite scenario.

Creation

You can create `Receiver` object using the `receiver` object function of the `Satellite`, `GroundStation`, or `Gimbal` object.

Properties

`Name` — Receiver name
`"Receiver idx"` (default) | string scalar | string vector | character vector | cell array of character vectors

You can set this property only when calling the `satellite` function. After you call `satellite`, this property is read-only.

Receiver name, specified as a comma-separated pair consisting of `'Name'` and a string scalar, string vector, character vector or a cell array of character vectors.

- If only one Receiver is added, specify `Name` as a string scalar or a character vector.
- If multiple Receivers are added, specify `Name` as a string scalar, character vector, string vector or a cell array of character vectors. All Receivers added as a string scalar or a character vector are assigned the same specified name. The number of elements in the string vector or cell array of character vector must equal the number of Receivers being added. Each Receiver is assigned the corresponding name from the vector or cell array.

In the default value, *idx* is the ID of the Receivers added by the Receiver object function.

Data Types: `char` | `string`

`ID` — Receiver ID assigned by simulator
real positive scalar

This property is set internally by the simulator and is read-only.

Receiver ID assigned by the simulator, specified as a positive scalar.

`MountingLocation` — Mounting location with respect to parent
`[0; 0; 0]` (default) | three-element vector | matrix

Mounting location with respect to the parent object in meters, specified as a three-element vector or a matrix. The position vector is specified in the body frame of the input `parent`.

- One Receiver — `MountingLocation` is a three-element vector.
- Multiple Receivers — `MountingLocation` can be a three-element vector or a matrix. When specified as a vector, the same `MountingLocation`s are assigned to all specified Receivers. When specified as a matrix, `MountingLocation` must contain three rows and the same number of columns as the Receivers. The columns correspond to the mounting location of each specified Receiver and the rows correspond to the mounting location coordinates in the parent body frame.

When the `AutoSimulate` property of the satellite scenario is `false`, you can modify the `MountingLocation` property only when the `SimulationStatus` is `NotStarted`. You can use the `restart` function to reset `SimulationStatus` to `NotStarted`, but doing so erases the simulation data.

Data Types: `double`

`MountingAngles` — Mounting orientation with respect to parent object
`[0; 0; 0]` (default) | three-element row vector of positive numbers | matrix

Mounting orientation with respect to parent object in degrees, specified as a three-element row vector of positive numbers. The elements of the vector correspond to yaw, pitch, and roll in that order. Yaw, pitch, and roll are positive rotations about the parent's *z* - axis, intermediate *y* - axis and intermediate *x* - axis of the parent.

- One Receiver — `MountingAngles` is a three-element vector.
- Multiple Receivers — `MountingAngles` can be a three-element vector or a matrix. When specified as a vector, the same `MountingAngless` are assigned to all specified Receivers. When specified as a matrix, `MountingAngles` must contain three rows and the same number of columns as the Receivers. The columns correspond to the mounting angles of each specified Receiver and the rows correspond to the yaw, pitch, and roll angles parent body frame.

When the `AutoSimulate` property of the satellite scenario is `false`, you can modify the `MountingAngles` property only when the `SimulationStatus` is `NotStarted`. You can use the `restart` function to reset `SimulationStatus` to `NotStarted`, but doing so erases the simulation data.

Example: `[0; 30; 60]`

Data Types: `double`

`Antenna` — Antenna object associated with Receiver
scalar | vector

`Antenna` object associated with the Receiver, specified as either a scalar or a vector. This object can be the default `gaussianAntenna` object, or one from the Antenna Toolbox or Phased Array System Toolbox. The default Gaussian antenna has a dish diameter of 1 m and an aperture efficiency of 0.65.

Antenna can be specified in Receiver as a name-value pair consisting of `'Antenna'` and a scalar, antenna or phased array objects.

- If only one Receiver is added, `Antenna` must be a scalar.
- If multiple Receivers are added, `Antenna` as a vector. The same antenna is assigned to all Receivers.

`SystemLoss` — System loss in Receiver
5 (default) | scalar | vector

System loss in dB, specified as a scalar or a vector.

System loss can be specified in Receiver as a name-value pair consisting of `'SystemLoss'` and a scalar, or vector.

- If only one Receiver is added, specify `SystemLoss` as a scalar.
- If multiple Receivers are added, specify `SystemLoss` as a scalar or a vector. When `SystemLoss` is a scalar, the same `SystemLoss` is assigned to all Receivers. When `SystemLoss` is a vector, its length must equal the number of Receiver and each element of `SystemLoss` is assigned to the corresponding Receiver specified.

When `AutoSimulate` property of the satellite scenario is `false`, you can modify the `SystemLoss` value while the `SimulationStatus` is `NotStarted` or `InProgress`.

`GainToNoiseTemperatureRatio` — Gain to noise temperature ratio

`3` (default) | scalar | vector

Gain to noise temperature ratio of the antenna in dB/K, specified as the name-value pair consisting of `'GainToNoiseTemperatureRatio'` and a scalar or a vector.

- If only one Receiver is added, specify `GainToNoiseTemperatureRatio` as a scalar.
- If multiple Receivers are added, specify `GainToNoiseTemperatureRatio` as a scalar, or a vector. When `GainToNoiseTemperatureRatio` is a scalar, the same `GainToNoiseTemperatureRatio` is assigned to all Receivers. When `GainToNoiseTemperatureRatio` is a vector, its length must equal the number of Receivers and each element of `GainToNoiseTemperatureRatio` is assigned to the corresponding Receiver specified.

When `AutoSimulate` property of the satellite scenario is `false`, you can modify the `GainToNoiseTemperatureRatio` value while the `SimulationStatus` is `NotStarted` or `InProgress`.

`RequiredEbNo` — Minimum Eb/No necessary for link closure

`10` (default) | scalar | vector

Minimum energy per bit to noise power spectral density ratio (Eb/No) necessary for link closure in dB, specified as the name-value pair consisting of `'RequiredEbNo'` and a scalar or a vector.

- If only one Receiver is added, specify `RequiredEbNo` as a scalar.
- If multiple Receivers are added, specify `RequiredEbNo` as a scalar or a vector. When `RequiredEbNo` is a scalar, the same `RequiredEbNo` is assigned to all Receivers. When `RequiredEbNo` is a vector, its length must equal the number of Receivers and each element of `RequiredEbNo` is assigned to the corresponding Receiver specified.

When `AutoSimulate` property of the satellite scenario is `false`, the `RequiredEbNo` property can be modified while the `SimulationStatus` is `NotStarted` or `InProgress`.

Note The above properties except `ID` can be specified as name-value arguments in `receiver`. The size of specified name-value pairs determines the number of receivers specified. Refer to these properties to understand how they must be defined when specifying multiple receivers.

Object Functions

aer	Calculate azimuth angle, elevation angle, and range of another satellite or ground station in NED frame
gaussianAntenna	Add Gaussian antennas
pattern	Plot 3-D radiation pattern of antenna
pointAt	Specify the target at which the satellite is pointed

Examples

Determine Times of Availability for Satellite Link Between Two Ground Stations

Create a satellite scenario object.

```
startTime = datetime(2020,11,25,0,0,0);
stopTime = startTime + days(1);
sampleTime = 60;                                     % seconds
sc = satelliteScenario(startTime,stopTime,sampleTime)
```

```
sc = 
  satelliteScenario with properties:

         StartTime: 25-Nov-2020
          StopTime: 26-Nov-2020
        SampleTime: 60
           Viewers: [0×0 matlabshared.satellitescenario.Viewer]
        Satellites: [1×0 matlabshared.satellitescenario.Satellite]
    GroundStations: [1×0 matlabshared.satellitescenario.GroundStation]
          AutoShow: 1
```

Add a satellite to the scenario.

```
semiMajorAxis = 10000000;                                                  % mete
eccentricity = 0;
inclination = 60;                                                          % degr
rightAscensionOfAscendingNode = 0;                                         % degr
argumentOfPeriapsis = 0;                                                   % degr
trueAnomaly = 0;                                                           % degr
sat = satellite(sc,semiMajorAxis,eccentricity,inclination,rightAscensionOfAscendingNode,...
        argumentOfPeriapsis,trueAnomaly,"Name","Satellite");
```

Add a transmitter to the satellite.

```
frequency = 27e9;                                                             % H
power = 20;                                                                   % d
bitRate = 20;                                                                 % M
systemLoss = 3;                                                               % d
txSat = transmitter(sat,"Name","Satellite Transmitter","Frequency",frequency,"power",power,...
        "BitRate",bitRate,"SystemLoss",systemLoss)
```

```
txSat = 
  Transmitter with properties:

                Name:  Satellite Transmitter
                  ID:  2
    MountingLocation:  [0; 0; 0] meters
```

```
      MountingAngles:  [0; 0; 0] degrees
             Antenna:  [1x1 satcom.satellitescenario.GaussianAntenna]
          SystemLoss:  3 decibels
           Frequency:  2.7e+10 Hertz
             BitRate:  20 Mbps
               Power:  20 decibel-watts
               Links:  [1x0 satcom.satellitescenario.Link]
```

Add a receiver to the satellite.

```
gainToNoiseTemperatureRatio = 5;
systemLoss = 3;
rxSat = receiver(sat,"Name","Satellite Receiver","GainToNoiseTemperatureRatio",gainToNoiseTempera
        "SystemLoss",systemLoss)
```

```
rxSat = 
  Receiver with properties:

                           Name:  Satellite Receiver
                             ID:  3
               MountingLocation:  [0; 0; 0] meters
                 MountingAngles:  [0; 0; 0] degrees
                        Antenna:  [1x1 satcom.satellitescenario.GaussianAntenna]
                     SystemLoss:  3 decibels
    GainToNoiseTemperatureRatio:  5 decibels/Kelvin
                   RequiredEbNo:  10 decibels
```

Specify the antenna specifications of the repeater.

```
dishDiameter = 0.5;                                                                     % mete
apertureEfficiency = 0.5;
gaussianAntenna(txSat,"DishDiameter",dishDiameter,"ApertureEfficiency",apertureEfficiency);
gaussianAntenna(rxSat,"DishDiameter",dishDiameter,"ApertureEfficiency",apertureEfficiency);
```

Add two ground stations to the scenario.

```
gs1 = groundStation(sc,"Name","Ground Station 1");
latitude = 52.2294963;                                            % degrees
longitude = 0.1487094;                                            % degrees
gs2 = groundStation(sc,latitude,longitude,"Name","Ground Station 2");
```

Add gimbals to the ground stations. These gimbals enable you to steer the ground station antennas to track the satellite.

```
mountingLocation = [0; 0; -5];                                                           % me
mountingAngles = [0; 180; 0];                                                            % deg
gimbalGs1 = gimbal(gs1,"MountingLocation",mountingLocation,"MountingAngles",mountingAngles);
gimbalGs2 = gimbal(gs2,"MountingLocation",mountingLocation,"MountingAngles",mountingAngles);
```

Track the satellite using the gimbals.

```
pointAt(gimbalGs1,sat);
pointAt(gimbalGs2,sat);
```

Add a transmitter to gimbal `gimbalGs1`.

```
frequency = 30e9;                                                                          % H
power = 40;                                                                                % d
```

```
bitRate = 20;                                                                          % M
txGs1 = transmitter(gimbalGs1,"Name","Ground Stationn 1 Transmitter","Frequency",frequency,...
        "Power",power,"BitRate",bitRate);
```

Add a receiver to gimbal `gimbalGs2`.

```
requiredEbNo = 14;                                                                    % dB
rxGs2 = receiver(gimbalGs2,"Name","Ground Station 2 Receiver","RequiredEbNo",requiredEbNo);
```

Define the antenna specifications of the ground stations.

```
dishDiameter = 5;                                        % meters
gaussianAntenna(txGs1,"DishDiameter",dishDiameter);
gaussianAntenna(rxGs2,"DishDiameter",dishDiameter);
```

Add link analysis to transmitter `txGs1`.

```
lnk = link(txGs1,rxSat,txSat,rxGs2)
```

```
lnk = 
  Link with properties:

    Sequence:  [8 3 2 9]
    LineWidth:  1
    LineColor:  [0 1 0]
```

Determine the times when ground station `gs1` can send data to ground station `gs2` via the satellite.

```
linkIntervals(lnk)
```

```
ans =

  0×8 empty table
```

Visualize the link using the Satellite Scenario Viewer.

```
play(sc);
```

Introduced in R2021a

Gimbal

Gimbal object belonging to satellite scenario

Description

The `Gimbal` defines a gimbal object belonging to a satellite scenario.

Creation

You can create a `Gimbal` object using the `gimbal` object function of the `Satellite` or `GroundStation`.

Properties

`Name` — Gimbal name
`"Gimbal *idx*"` (default) | string scalar | string vector | character vector | cell array of character vectors

You can set this property only when calling the `satellite` function. After you call `satellite`, this property is read-only.

Gimbal name, specified as a comma-separated pair consisting of `'Name'` and a string scalar, string vector, character vector or a cell array of character vectors.

- If only one Gimbal is added, specify `Name` as a string scalar or a character vector.
- If multiple Gimbals are added, specify `Name` as a string scalar, character vector, string vector or a cell array of character vectors. All Gimbals added as a string scalar or a character vector are assigned the same specified name. The number of elements in the string vector or cell array of character vector must equal the number of Gimbals being added. Each Gimbal is assigned the corresponding name from the vector or cell array.

In the default value, *idx* is the ID of the Gimbals added by the Gimbal object function.

Data Types: `char` | `string`

`ID` — Gimbal ID assigned by simulator
real positive scalar

This property is set internally by the simulator and is read-only.

Gimbal ID assigned by the simulator, specified as a positive scalar.

`MountingLocation` — Mounting location with respect to parent
`[0; 0; 0]` (default) | three-element vector | matrix

Mounting location with respect to the parent object in meters, specified as a three-element vector or a matrix. The position vector is specified in the body frame of the input `parent`.

- One Gimbal — `MountingLocation` is a three-element vector.
- Multiple Gimbals — `MountingLocation` can be a three-element vector or a matrix. When specified as a vector, the same `MountingLocations` are assigned to all specified Gimbals. When specified as a matrix, `MountingLocation` must contain three rows and the same number of columns as the Gimbals. The columns correspond to the mounting location of each specified Gimbal and the rows correspond to the mounting location coordinates in the parent body frame.

When the `AutoSimulate` property of the satellite scenario is `false`, you can modify the `MountingLocation` property only when the `SimulationStatus` is `NotStarted`. You can use the `restart` function to reset `SimulationStatus` to `NotStarted`, but doing so erases the simulation data.

Data Types: `double`

`MountingAngles` — Mounting orientation with respect to parent object
`[0; 0; 0]` (default) | three-element row vector of positive numbers | matrix

Mounting orientation with respect to parent object in degrees, specified as a three-element row vector of positive numbers. The elements of the vector correspond to yaw, pitch, and roll in that order. Yaw, pitch, and roll are positive rotations about the parent's z - axis, intermediate y - axis and intermediate x - axis of the parent.

- One Gimbal — `MountingAngles` is a three-element vector.
- Multiple Gimbals — `MountingAngles` can be a three-element vector or a matrix. When specified as a vector, the same `MountingAngless` are assigned to all specified Gimbals. When specified as a matrix, `MountingAngles` must contain three rows and the same number of columns as the Gimbals. The columns correspond to the mounting angles of each specified Gimbal and the rows correspond to the yaw, pitch, and roll angles parent body frame.

When the `AutoSimulate` property of the satellite scenario is `false`, you can modify the `MountingAngles` property only when the `SimulationStatus` is `NotStarted`. You can use the `restart` function to reset `SimulationStatus` to `NotStarted`, but doing so erases the simulation data.

Example: `[0; 30; 60]`

Data Types: `double`

`ConicalSensors` — Conical sensors
row vector of conical sensors

You can set this property only when calling `conicalSensor`. After you call `conicalSensor`, this property is read-only.

Conical sensors attached to the Gimbal, specified as a row vector of conical sensors.

`Transmitters` — Transmitters attached to Gimbal
row vector of `Transmitter` objects

You can set this property only when calling `transmitter`. After you call `transmitter`, this property is read-only.

Transmitters attached to the Gimbal, specified as a row vector of `Transmitter` objects.

`Receivers` — Receivers attached to the satellite
row vector of `Receiver` objects

You can set this property only when calling `receiver`. After you call `receiver`, this property is read-only.

Receivers attached to the satellite, specified as a row vector of `Receiver` objects.

Object Functions

aer	Calculate azimuth angle, elevation angle, and range of another satellite or ground station in NED frame
conicalSensor	Add conical sensor to satellite scenario
gimbalAngles	Steering angles of gimbal
pointAt	Specify the target at which the satellite is pointed
receiver	Add receiver to satellite scenario
transmitter	Add transmitter to satellite scenario

Examples

Calculate Maximum Revisit Time of Satellite

Create a satellite scenario with a start time of 15-June-2021 8:55:00 AM UTC and a stop time of five days later. Set the simulation sample time to `60` seconds.

```
startTime = datetime(2021,6,21,8,55,0);
stopTime = startTime + days(5);
sampleTime = 60;                                      % seconds
sc = satelliteScenario(startTime,stopTime,sampleTime)
```

```
sc = 
  satelliteScenario with properties:

         StartTime: 21-Jun-2021 08:55:00
          StopTime: 26-Jun-2021 08:55:00
        SampleTime: 60
           Viewers: [0×0 matlabshared.satellitescenario.Viewer]
        Satellites: [1×0 matlabshared.satellitescenario.Satellite]
    GroundStations: [1×0 matlabshared.satellitescenario.GroundStation]
          AutoShow: 1
```

Add a satellite to the scenario using Keplerian orbital elements.

```
semiMajorAxis = 7878137;                                                    % me
eccentricity = 0;
inclination = 50;                                                           % deg
rightAscensionOfAscendingNode = 0;                                          % deg
argumentOfPeriapsis = 0;                                                    % deg
trueAnomaly = 50;                                                           % deg
sat = satellite(sc,semiMajorAxis,eccentricity,inclination,rightAscensionOfAscendingNode, ...
    argumentOfPeriapsis,trueAnomaly)
```

```
sat = 
  Satellite with properties:

               Name:  Satellite 1
                 ID:  1
     ConicalSensors:  [1x0 matlabshared.satellitescenario.ConicalSensor]
```

```
            Gimbals:  [1x0 matlabshared.satellitescenario.Gimbal]
       Transmitters:  [1x0 satcom.satellitescenario.Transmitter]
          Receivers:  [1x0 satcom.satellitescenario.Receiver]
           Accesses:  [1x0 matlabshared.satellitescenario.Access]
        GroundTrack:  [1x1 matlabshared.satellitescenario.GroundTrack]
              Orbit:  [1x1 matlabshared.satellitescenario.Orbit]
    OrbitPropagator:  sgp4
        MarkerColor:  [1 0 0]
         MarkerSize:  10
          ShowLabel:  true
     LabelFontColor:  [1 0 0]
      LabelFontSize:  15
```

Add a ground station which represents the location to be photographed, to the scenario.

```
gs = groundStation(sc,"Name","Location To Photograph", ...
    "Latitude",42.3001,"Longitude",-71.3504)              % degrees
```

```
gs = 
  GroundStation with properties:

                  Name:  Location To Photograph
                    ID:  2
              Latitude:  42.3 degrees
             Longitude:  -71.35 degrees
              Altitude:  0 meters
     MinElevationAngle:  0 degrees
        ConicalSensors:  [1x0 matlabshared.satellitescenario.ConicalSensor]
               Gimbals:  [1x0 matlabshared.satellitescenario.Gimbal]
          Transmitters:  [1x0 satcom.satellitescenario.Transmitter]
             Receivers:  [1x0 satcom.satellitescenario.Receiver]
              Accesses:  [1x0 matlabshared.satellitescenario.Access]
           MarkerColor:  [0 1 1]
            MarkerSize:  10
             ShowLabel:  true
        LabelFontColor:  [0 1 1]
         LabelFontSize:  15
```

Add a gimbal to the satellite. You can steer this gimbal independently of the satellite.

```
g = gimbal(sat)
```

```
g = 
  Gimbal with properties:

                Name:  Gimbal 3
                  ID:  3
    MountingLocation:  [0; 0; 0] meters
      MountingAngles:  [0; 0; 0] degrees
      ConicalSensors:  [1x0 matlabshared.satellitescenario.ConicalSensor]
        Transmitters:  [1x0 satcom.satellitescenario.Transmitter]
           Receivers:  [1x0 satcom.satellitescenario.Receiver]
```

Track the location to be photographed using the gimbal.

```
pointAt(g,gs);
```

Add a conical sensor to the gimbal. This sensor represents the camera. Set the field of view to 60 degrees.

```
camSensor = conicalSensor(g,"MaxViewAngle",60)
```

```
camSensor = 
  ConicalSensor with properties:

                 Name:  Conical sensor 4
                   ID:  4
     MountingLocation:  [0; 0; 0] meters
       MountingAngles:  [0; 0; 0] degrees
         MaxViewAngle:  60 degrees
             Accesses:  [1x0 matlabshared.satellitescenario.Access]
          FieldOfView:  [0x0 matlabshared.satellitescenario.FieldOfView]
```

Add access analysis between the camera and the location to be photographed. The access is added to the conical sensor.

```
ac = access(camSensor,gs)
```

```
ac = 
  Access with properties:

    Sequence:  [4 2]
    LineWidth:  1
    LineColor:  [0.5 0 1]
```

Visualize the field of view of the camera by using the Satellite Scenario Viewer.

```
v = satelliteScenarioViewer(sc);
fieldOfView(camSensor);
```

Introduced in R2021a

FieldOfView

Field of view object belonging to satellite scenario

Description

The FieldOfView object defines a field of view object belonging to a satellite scenario.

Creation

You can create a `FieldOfView` object using the `fieldOfView` object function of the `ConicalSensor` object.

Properties

`LineWidth` — Visual width of field of view contour
`1` (default) | scalar in the range (0 10]

Visual width of the field of view contour in pixels, specified as a scalar in the range (0 10].

The line width cannot be thinner than the width of a pixel. If you set the line width to a value that is less than the width of a pixel on your system, the line displays as one pixel wide.

`LineColor` — Color of field of view contour
`[0 1 0]` (default) | RGB triplet | `RGB triplet` | `string scalar of color name` | `character vector of color name`

Color of field of view contour, specified as an RGB triplet, hexadecimal color code, a color name, or a short name.

For a custom color, specify an RGB triplet or a hexadecimal color code.

- An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range `[0,1]`; for example, `[0.4 0.6 0.7]`.
- A hexadecimal color code is a character vector or a string scalar that starts with a hash symbol (`#`) followed by three or six hexadecimal digits, which can range from `0` to `F`. The values are not case sensitive. Thus, the color codes `'#FF8800'`, `'#ff8800'`, `'#F80'`, and `'#f80'` are equivalent.

Alternatively, you can specify some common colors by name. This table lists the named color options, the equivalent RGB triplets, and hexadecimal color codes.

Color Name	Short Name	RGB Triplet	Hexadecimal Color Code	Appearance
`'red'`	`'r'`	`[1 0 0]`	`'#FF0000'`	🟥
`'green'`	`'g'`	`[0 1 0]`	`'#00FF00'`	🟩
`'blue'`	`'b'`	`[0 0 1]`	`'#0000FF'`	🟦

Color Name	Short Name	RGB Triplet	Hexadecimal Color Code	Appearance
`'cyan'`	`'c'`	`[0 1 1]`	`'#00FFFF'`	🟦
`'magenta'`	`'m'`	`[1 0 1]`	`'#FF00FF'`	🟪
`'yellow'`	`'y'`	`[1 1 0]`	`'#FFFF00'`	🟨
`'black'`	`'k'`	`[0 0 0]`	`'#000000'`	⬛
`'white'`	`'w'`	`[1 1 1]`	`'#FFFFFF'`	⬜
`'none'`	Not applicable	Not applicable	Not applicable	No color

Here are the RGB triplets and hexadecimal color codes for the default colors MATLAB uses in many types of plots.

RGB Triplet	Hexadecimal Color Code	Appearance
`[0 0.4470 0.7410]`	`'#0072BD'`	🟦
`[0.8500 0.3250 0.0980]`	`'#D95319'`	🟧
`[0.9290 0.6940 0.1250]`	`'#EDB120'`	🟨
`[0.4940 0.1840 0.5560]`	`'#7E2F8E'`	🟪
`[0.4660 0.6740 0.1880]`	`'#77AC30'`	🟩
`[0.3010 0.7450 0.9330]`	`'#4DBEEE'`	🟦
`[0.6350 0.0780 0.1840]`	`'#A2142F'`	🟥

Example: `'blue'`

Example: `[0 0 1]`

Example: `'#0000FF'`

`VisibilityMode` — Visibility mode of field of view contour
`'inherit'` (default) | `'manual'`

Visibility mode of the field of view contour, specified as one of these values:

- `'inherit'` — Visibility of the graphic matches that of the parent
- `'manual'` — Visibility of the graphic is not inherited and is independent of that of the parent

Object Functions

show	Show object in satellite scenario viewer
hide	Hides satellite scenario entity from viewer

Examples

Calculate Maximum Revisit Time of Satellite

Create a satellite scenario with a start time of 15-June-2021 8:55:00 AM UTC and a stop time of five days later. Set the simulation sample time to `60` seconds.

```
startTime = datetime(2021,6,21,8,55,0);
stopTime = startTime + days(5);
sampleTime = 60;                                      % seconds
sc = satelliteScenario(startTime,stopTime,sampleTime)
```

```
sc = 
  satelliteScenario with properties:

         StartTime: 21-Jun-2021 08:55:00
          StopTime: 26-Jun-2021 08:55:00
        SampleTime: 60
           Viewers: [0×0 matlabshared.satellitescenario.Viewer]
        Satellites: [1×0 matlabshared.satellitescenario.Satellite]
    GroundStations: [1×0 matlabshared.satellitescenario.GroundStation]
          AutoShow: 1
```

Add a satellite to the scenario using Keplerian orbital elements.

```
semiMajorAxis = 7878137;                                                                    % me
eccentricity = 0;
inclination = 50;                                                                           % deg
rightAscensionOfAscendingNode = 0;                                                          % deg
argumentOfPeriapsis = 0;                                                                    % deg
trueAnomaly = 50;                                                                           % deg
sat = satellite(sc,semiMajorAxis,eccentricity,inclination,rightAscensionOfAscendingNode, ...
    argumentOfPeriapsis,trueAnomaly)
```

```
sat = 
  Satellite with properties:

               Name:  Satellite 1
                 ID:  1
     ConicalSensors:  [1x0 matlabshared.satellitescenario.ConicalSensor]
            Gimbals:  [1x0 matlabshared.satellitescenario.Gimbal]
       Transmitters:  [1x0 satcom.satellitescenario.Transmitter]
          Receivers:  [1x0 satcom.satellitescenario.Receiver]
           Accesses:  [1x0 matlabshared.satellitescenario.Access]
        GroundTrack:  [1x1 matlabshared.satellitescenario.GroundTrack]
              Orbit:  [1x1 matlabshared.satellitescenario.Orbit]
    OrbitPropagator:  sgp4
        MarkerColor:  [1 0 0]
         MarkerSize:  10
          ShowLabel:  true
     LabelFontColor:  [1 0 0]
      LabelFontSize:  15
```

Add a ground station which represents the location to be photographed, to the scenario.

```
gs = groundStation(sc,"Name","Location To Photograph", ...
    "Latitude",42.3001,"Longitude",-71.3504)               % degrees
```

```
gs = 
  GroundStation with properties:

                 Name:  Location To Photograph
                   ID:  2
             Latitude:  42.3 degrees
```

```
            Longitude:  -71.35 degrees
             Altitude:  0 meters
     MinElevationAngle:  0 degrees
        ConicalSensors:  [1x0 matlabshared.satellitescenario.ConicalSensor]
               Gimbals:  [1x0 matlabshared.satellitescenario.Gimbal]
          Transmitters:  [1x0 satcom.satellitescenario.Transmitter]
             Receivers:  [1x0 satcom.satellitescenario.Receiver]
              Accesses:  [1x0 matlabshared.satellitescenario.Access]
           MarkerColor:  [0 1 1]
            MarkerSize:  10
             ShowLabel:  true
        LabelFontColor:  [0 1 1]
         LabelFontSize:  15
```

Add a gimbal to the satellite. You can steer this gimbal independently of the satellite.

```
g = gimbal(sat)
```

```
g = 
  Gimbal with properties:

                 Name:  Gimbal 3
                   ID:  3
     MountingLocation:  [0; 0; 0] meters
       MountingAngles:  [0; 0; 0] degrees
       ConicalSensors:  [1x0 matlabshared.satellitescenario.ConicalSensor]
         Transmitters:  [1x0 satcom.satellitescenario.Transmitter]
            Receivers:  [1x0 satcom.satellitescenario.Receiver]
```

Track the location to be photographed using the gimbal.

```
pointAt(g,gs);
```

Add a conical sensor to the gimbal. This sensor represents the camera. Set the field of view to 60 degrees.

```
camSensor = conicalSensor(g,"MaxViewAngle",60)
```

```
camSensor = 
  ConicalSensor with properties:

                 Name:  Conical sensor 4
                   ID:  4
     MountingLocation:  [0; 0; 0] meters
       MountingAngles:  [0; 0; 0] degrees
         MaxViewAngle:  60 degrees
             Accesses:  [1x0 matlabshared.satellitescenario.Access]
          FieldOfView:  [0x0 matlabshared.satellitescenario.FieldOfView]
```

Add access analysis between the camera and the location to be photographed. The access is added to the conical sensor.

```
ac = access(camSensor,gs)
```

```
ac = 
  Access with properties:
    Sequence:  [4 2]
    LineWidth:  1
    LineColor:  [0.5 0 1]
```

Visualize the field of view of the camera by using the Satellite Scenario Viewer.

```
v = satelliteScenarioViewer(sc);
fieldOfView(camSensor);
```

Link

Link analysis object belonging to Transmitter

Description

The `Link` object defines a link analysis object belonging to `Transmitter`.

Creation

You can create a `Link` object using the `link` object function of the `Transmitter` or `Receiver` objects.

Properties

Sequence — Transmitter or receiver ID
vector of positive numbers

You can set this property only when calling Link. After you call Link, this property is read-only.

Transmitter or receiver ID, specified as a vector of positive numbers.

`LineWidth` — Visual width of link line
`1` (default) | scalar in the range (0 10]

Visual width of link line in pixels, specified as a scalar in the range (0 10].

The line width cannot be thinner than the width of a pixel. If you set the line width to a value that is less than the width of a pixel on your system, the line displays as one pixel wide.

`LineColor` — Color of link line
`[0 1 0]` (default) | `RGB triplet` | `string scalar of color name` | `character vector of color name`

Color of the link line, specified as an RGB triplet, a hexadecimal color code, a color name, or a short name.

For a custom color, specify an RGB triplet or a hexadecimal color code.

- An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range `[0,1]`; for example, `[0.4 0.6 0.7]`.
- A hexadecimal color code is a character vector or a string scalar that starts with a hash symbol (`#`) followed by three or six hexadecimal digits, which can range from `0` to `F`. The values are not case sensitive. Thus, the color codes `'#FF8800'`, `'#ff8800'`, `'#F80'`, and `'#f80'` are equivalent.

Alternatively, you can specify some common colors by name. This table lists the named color options, the equivalent RGB triplets, and hexadecimal color codes.

Color Name	Short Name	RGB Triplet	Hexadecimal Color Code	Appearance
`'red'`	`'r'`	`[1 0 0]`	`'#FF0000'`	🟥
`'green'`	`'g'`	`[0 1 0]`	`'#00FF00'`	🟩
`'blue'`	`'b'`	`[0 0 1]`	`'#0000FF'`	🟦
`'cyan'`	`'c'`	`[0 1 1]`	`'#00FFFF'`	🟦
`'magenta'`	`'m'`	`[1 0 1]`	`'#FF00FF'`	🟪
`'yellow'`	`'y'`	`[1 1 0]`	`'#FFFF00'`	🟨
`'black'`	`'k'`	`[0 0 0]`	`'#000000'`	⬛
`'white'`	`'w'`	`[1 1 1]`	`'#FFFFFF'`	⬜
`'none'`	Not applicable	Not applicable	Not applicable	No color

Here are the RGB triplets and hexadecimal color codes for the default colors MATLAB uses in many types of plots.

RGB Triplet	Hexadecimal Color Code	Appearance
`[0 0.4470 0.7410]`	`'#0072BD'`	🟦
`[0.8500 0.3250 0.0980]`	`'#D95319'`	🟧
`[0.9290 0.6940 0.1250]`	`'#EDB120'`	🟨
`[0.4940 0.1840 0.5560]`	`'#7E2F8E'`	🟪
`[0.4660 0.6740 0.1880]`	`'#77AC30'`	🟩
`[0.3010 0.7450 0.9330]`	`'#4DBEEE'`	🟦
`[0.6350 0.0780 0.1840]`	`'#A2142F'`	🟥

Example: `'blue'`

Example: `[0 0 1]`

Example: `'#0000FF'`

Object Functions

show	Show object in satellite scenario viewer
ebno	Eb/No at final node of link
linkPercentage	Percentage of time when link between first and last node in link analysis is closed
linkStatus	Status of link closure between first and last node
linkIntervals	Intervals during which link is closed
hide	Hides satellite scenario entity from viewer

Examples

Determine Times of Availability for Satellite Link Between Two Ground Stations

Create a satellite scenario object.

```
startTime = datetime(2020,11,25,0,0,0);
stopTime = startTime + days(1);
sampleTime = 60;                                     % seconds
sc = satelliteScenario(startTime,stopTime,sampleTime)

sc = 
  satelliteScenario with properties:

         StartTime: 25-Nov-2020
          StopTime: 26-Nov-2020
        SampleTime: 60
           Viewers: [0×0 matlabshared.satellitescenario.Viewer]
        Satellites: [1×0 matlabshared.satellitescenario.Satellite]
    GroundStations: [1×0 matlabshared.satellitescenario.GroundStation]
          AutoShow: 1
```

Add a satellite to the scenario.

```
semiMajorAxis = 10000000;                                                   % mete
eccentricity = 0;
inclination = 60;                                                           % degr
rightAscensionOfAscendingNode = 0;                                          % degr
argumentOfPeriapsis = 0;                                                    % degr
trueAnomaly = 0;                                                            % degr
sat = satellite(sc,semiMajorAxis,eccentricity,inclination,rightAscensionOfAscendingNode,...
        argumentOfPeriapsis,trueAnomaly,"Name","Satellite");
```

Add a transmitter to the satellite.

```
frequency = 27e9;                                                              % H
power = 20;                                                                    % d
bitRate = 20;                                                                  % M
systemLoss = 3;                                                                % d
txSat = transmitter(sat,"Name","Satellite Transmitter","Frequency",frequency,"power",power,...
        "BitRate",bitRate,"SystemLoss",systemLoss)

txSat = 
  Transmitter with properties:

                Name:  Satellite Transmitter
                  ID:  2
    MountingLocation:  [0; 0; 0] meters
      MountingAngles:  [0; 0; 0] degrees
             Antenna:  [1x1 satcom.satellitescenario.GaussianAntenna]
          SystemLoss:  3 decibels
           Frequency:  2.7e+10 Hertz
             BitRate:  20 Mbps
               Power:  20 decibel-watts
               Links:  [1x0 satcom.satellitescenario.Link]
```

Add a receiver to the satellite.

```
gainToNoiseTemperatureRatio = 5;
systemLoss = 3;
rxSat = receiver(sat,"Name","Satellite Receiver","GainToNoiseTemperatureRatio",gainToNoiseTempera
        "SystemLoss",systemLoss)
```

```
rxSat = 
  Receiver with properties:

                         Name:  Satellite Receiver
                           ID:  3
             MountingLocation:  [0; 0; 0] meters
               MountingAngles:  [0; 0; 0] degrees
                      Antenna:  [1x1 satcom.satellitescenario.GaussianAntenna]
                   SystemLoss:  3 decibels
    GainToNoiseTemperatureRatio:  5 decibels/Kelvin
                  RequiredEbNo:  10 decibels
```

Specify the antenna specifications of the repeater.

```
dishDiameter = 0.5;                                                     % mete
apertureEfficiency = 0.5;
gaussianAntenna(txSat,"DishDiameter",dishDiameter,"ApertureEfficiency",apertureEfficiency);
gaussianAntenna(rxSat,"DishDiameter",dishDiameter,"ApertureEfficiency",apertureEfficiency);
```

Add two ground stations to the scenario.

```
gs1 = groundStation(sc,"Name","Ground Station 1");
latitude = 52.2294963;                                      % degrees
longitude = 0.1487094;                                      % degrees
gs2 = groundStation(sc,latitude,longitude,"Name","Ground Station 2");
```

Add gimbals to the ground stations. These gimbals enable you to steer the ground station antennas to track the satellite.

```
mountingLocation = [0; 0; -5];                                           % me
mountingAngles = [0; 180; 0];                                            % deg
gimbalGs1 = gimbal(gs1,"MountingLocation",mountingLocation,"MountingAngles",mountingAngles);
gimbalGs2 = gimbal(gs2,"MountingLocation",mountingLocation,"MountingAngles",mountingAngles);
```

Track the satellite using the gimbals.

```
pointAt(gimbalGs1,sat);
pointAt(gimbalGs2,sat);
```

Add a transmitter to gimbal `gimbalGs1`.

```
frequency = 30e9;                                                          % H
power = 40;                                                                % d
bitRate = 20;                                                              % M
txGs1 = transmitter(gimbalGs1,"Name","Ground Stationn 1 Transmitter","Frequency",frequency,...
        "Power",power,"BitRate",bitRate);
```

Add a receiver to gimbal `gimbalGs2`.

```
requiredEbNo = 14;                                                       % dB
rxGs2 = receiver(gimbalGs2,"Name","Ground Station 2 Receiver","RequiredEbNo",requiredEbNo);
```

Define the antenna specifications of the ground stations.

```
dishDiameter = 5;                                  % meters
gaussianAntenna(txGs1,"DishDiameter",dishDiameter);
gaussianAntenna(rxGs2,"DishDiameter",dishDiameter);
```

Add link analysis to transmitter `txGs1`.

```
lnk = link(txGs1,rxSat,txSat,rxGs2)
```

```
lnk = 
  Link with properties:

    Sequence:  [8 3 2 9]
    LineWidth:  1
    LineColor:  [0 1 0]
```

Determine the times when ground station `gs1` can send data to ground station `gs2` via the satellite.

```
linkIntervals(lnk)
```

```
ans =

  0×8 empty table
```

Visualize the link using the Satellite Scenario Viewer.

```
play(sc);
```

GroundTrack

Ground track object belonging to satellite in scenario

Description

The `GroundTrack` object defines a ground track object belonging to a satellite in a scenario.

Creation

You can create a `GroundTrack` object using the `groundTrack` object function of the `Satellite` object.

Properties

`LeadTime` — Period of ground track to be visualized
`StartTime` to `StopTime` (default) | positive scalar

Period of the ground track to be visualized in the satellite scenario viewer, specified as a comma-separated pair consisting of `'LeadTime'` and a real positive scalar in seconds.

`TrailTime` — Period of ground track history to be visualized
`StartTime` to `StopTime` (default) | positive scalar

Period of the ground track history to be visualized in `Viewer`, specified as a comma-separated pair consisting of `'TrailTime'` and a real positive scalar in seconds.

`LineWidth` — Visual width of ground track
`1` (default) | scalar in the range (0 10]

Visual width of the ground track in pixels, specified as a comma-separated pair consisting of `'LineWidth'` and a scalar in the range (0 10].

The line width cannot be thinner than the width of a pixel. If you set the line width to a value that is less than the width of a pixel on your system, the line displays as one pixel wide.

`LeadLineColor` — Color of future ground track line
`[1 0 1]` (default) | RGB triplet | `RGB triplet` | `string scalar of color name` | `character vector of color name`

Color of the future ground track line, specified as a comma-separated pair consisting of `'LeadLineColor'` and an RGB triplet, a hexadecimal color code, a color name, or a short name.

For a custom color, specify an RGB triplet or a hexadecimal color code.

- An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range `[0,1]`; for example, `[0.4 0.6 0.7]`.

- A hexadecimal color code is a character vector or a string scalar that starts with a hash symbol (#) followed by three or six hexadecimal digits, which can range from `0` to `F`. The values are not case sensitive. Thus, the color codes `'#FF8800'`, `'#ff8800'`, `'#F80'`, and `'#f80'` are equivalent.

Alternatively, you can specify some common colors by name. This table lists the named color options, the equivalent RGB triplets, and hexadecimal color codes.

Color Name	Short Name	RGB Triplet	Hexadecimal Color Code	Appearance
`'red'`	`'r'`	`[1 0 0]`	`'#FF0000'`	🟥
`'green'`	`'g'`	`[0 1 0]`	`'#00FF00'`	🟩
`'blue'`	`'b'`	`[0 0 1]`	`'#0000FF'`	🟦
`'cyan'`	`'c'`	`[0 1 1]`	`'#00FFFF'`	🟦
`'magenta'`	`'m'`	`[1 0 1]`	`'#FF00FF'`	🟪
`'yellow'`	`'y'`	`[1 1 0]`	`'#FFFF00'`	🟨
`'black'`	`'k'`	`[0 0 0]`	`'#000000'`	⬛
`'white'`	`'w'`	`[1 1 1]`	`'#FFFFFF'`	⬜
`'none'`	Not applicable	Not applicable	Not applicable	No color

Here are the RGB triplets and hexadecimal color codes for the default colors MATLAB uses in many types of plots.

RGB Triplet	Hexadecimal Color Code	Appearance
`[0 0.4470 0.7410]`	`'#0072BD'`	🟦

`[0.9290 0.6940 0.1250]`	`'#EDB120'`	🟨
`[0.4940 0.1840 0.5560]`	`'#7E2F8E'`	🟪
`[0.4660 0.6740 0.1880]`	`'#77AC30'`	🟩
`[0.3010 0.7450 0.9330]`	`'#4DBEEE'`	🟦
`[0.6350 0.0780 0.1840]`	`'#A2142F'`	🟥

Example: `'blue'`

Example: `[0 0 1]`

Example: `'#0000FF'`

`VisibilityMode` — Visibility mode of ground track

`'inherit'` (default) | `'manual'`

Visibility mode of the ground track, specified as either one of these values:

- `'inherit'` — Visibility of the graphic matches that of the parent

- `'manual'` — Visibility of the graphic is not inherited and is independent of that of the parent

hide	

Examples

Add Ground Track to Satellite in Geosynchronous Orbit

Create a satellite scenario object.

```
startTime = datetime(2020,5,10);
stopTime = startTime + days(5);
sampleTime = 60;                                      % seconds
sc = satelliteScenario(startTime,stopTime,sampleTime);
```

Calculate the semimajor axis of the geosynchronous satellite.

```
earthAngularVelocity = 0.0000729211585530;                                      % rad/s
orbitalPeriod = 2*pi/earthAngularVelocity;                                      % seconds
earthStandardGravitationalParameter = 398600.4418e9;                            % m^3/s^2
semiMajorAxis = (earthStandardGravitationalParameter*((orbitalPeriod/(2*pi))^2))^(1/3);
```

Define the remaining orbital elements of the geosynchronous satellite.

```
eccentricity = 0;
inclination = 60;                    % degrees
rightAscensionOfAscendingNode = 0; % degrees
argumentOfPeriapsis = 0;             % degrees
trueAnomaly = 0;                     % degrees
```

Add the geosynchronous satellite to the scenario.

```
sat = satellite(sc,semiMajorAxis,eccentricity,inclination,rightAscensionOfAscendingNode,...
        argumentOfPeriapsis,trueAnomaly,"OrbitPropagator","two-body-keplerian","Name","GEO Sat")
```

Visualize the scenario using the Satellite Scenario Viewer.

```
v = satelliteScenarioViewer(sc);
```

Pattern

Radiation pattern visualization

Description

The `Pattern` object defines a radiation pattern visualization for a transmitter or receiver.

Creation

You can create `Pattern` objects by using the `pattern` object function of the `Transmitter` or `Receiver` object.

Properties

`Size` — Size of radiation pattern plot
`1000000` (default) | numeric scalar

Size of the radiation pattern plot, specified as a numeric scalar in meters. This value represents the distance between the antenna position and the point on the plot with the highest gain.

Data Types: `double`

`Colormap` — Colormap for coloring pattern plot
`'jet'` (default) | predefined colormap name | *M*-by-3 matrix

Colormap for coloring the pattern plot, specified as a predefined colormap name or an *M*-by-3 matrix of red, green, blue (RGB) triplets that define *M* individual colors. For more information on the colormap names, see “map”.

Data Types: `double` | `string` | `char`

`Transparency` — Transparency of pattern plot
`0.4` (default) | scalar in the range [0, 1]

Transparency of the pattern plot, specified as a scalar in the range [0, 1]. A value of `0` means the plot is completely transparent, and a value of `1` means the plot is opaque.

Data Types: `double`

`VisibilityMode` — Visibility of graphic relative to its parent
`'inherit'` (default) | `'manual'`

Visibility of the graphic relative to its parent, specified as `'inherit'` or `'manual'`. This visibility mode determines the visibility of this graphic in the `satelliteScenarioViewer` object relative to its parent graphic. The parent graphic of the `Pattern` object is its corresponding satellite.

- `'inherit'`— Inherit visibility from the parent graphic. The visibility of the graphic matches the parent visibility.
- `'manual'`— Do not inherit visibility from the parent. The visibility of the graphic is independent of the parent visibility.

Data Types: `char` | `string`

Object Functions

show	Show object in satellite scenario viewer
hide	Hides satellite scenario entity from viewer

Examples

Visualize Radiation Pattern of Transmitter Antenna on Satellite

Set up the satellite scenario.

```
startTime = datetime(2021,2,12,13,30,0);
stopTime = startTime + hours(5);
sampleTime = 60;                                     %seconds
sc = satelliteScenario(startTime,stopTime,sampleTime);
```

Create a satellite, ground station, transmitter, and receiver.

```
sat = satellite(sc,1e7,0,0,0,0,0);
gs = groundStation(sc,"Latitude",30,"Longitude",74);
tx = transmitter(sat,"Frequency",3e9);
rx = receiver(gs);
```

Visualize the scenario in the satellite scenario viewer.

```
viewer = satelliteScenarioViewer(sc);
```

dvbrcs2RecoveryConfig

Receiver configuration parameters for DVB-RCS2

Description

The `dvbrcs2RecoveryConfig` object creates a Digital Video Broadcasting Second Generation Return Channel over Satellite (DVB-RCS2) recovery configuration object. Recover the frame protocol data unit (PDU) from the received DVB-RCS2 waveform by using object properties.

Creation

Syntax

```
cfgrcs2 = dvbrcs2RecoveryConfig
cfgrcs2 = dvbrcs2RecoveryConfig(Name,Value)
```

Description

`cfgrcs2 = dvbrcs2RecoveryConfig` creates a default DVB-RCS2 recovery configuration object.

`cfgrcs2 = dvbrcs2RecoveryConfig(Name,Value)` sets “Properties” on page 3-119 using one or more name-value pairs. Enclose each property name in quotes. For example, `dvbrcs2RecoveryConfig('IsCustomWaveform',true)` recovers a custom DVB-RCS2 waveform with the specified property values.

Properties

`TransmissionFormat` — Transmission format
`"TC-LM"` (default) | `"SS-TC-LM"`

Transmission format, specified as one of these values.

- `"TC-LM"` — Turbo codes with linear modulation (TC-LM)
- `"SS-TC-LM"` — Spread spectrum turbo codes with linear modulation (SS-TC-LM)

Data Types: `char` | `string`

`ContentType` — Frame PDU burst content type
`"traffic"` (default) | `"logon"` | `"control"`

Frame protocol data unit (PDU) burst content type, specified as `"traffic"`, `"logon"`, or `"control"`.

Data Types: `char` | `string`

`IsCustomWaveform` — Custom waveform indicator
`0` or `false` (default) | `1` or `true`

Custom waveform indicator, specified as one of these values.

- `0` (`false`) — Use this option to demodulate the complex in-phase quadrature (IQ) samples from a standard-defined reference waveform.
- `1` (`true`) — Use this option to demodulate the complex IQ samples from a custom waveform.

Data Types: `logical`

`WaveformID` — Reference waveform ID
`1` (default) | positive integer

Reference waveform ID, specified as one of these options.

- Integer in the range [1, 22] or [32, 49] — Use this option when you set the `TransmissionFormat` property to `"TC-LM"`.
- Integer in the range [1, 19] — Use this option when you set the `TransmissionFormat` property to `"SS-TC-LM"`.

Based on the values set for `TransmissionFormat` and `WaveformID` properties, this object considers the receiver parameters according to ETSI EN 301 545-2 Annex A Table A-1 and A-2 [1].

Dependencies

To enable this property, set the `IsCustomWaveform` property to `false`.

Data Types: `double` | `unit8`

`SpreadingFactor` — Spreading factor
`2` (default) | integer in the range [2, 16]

Spreading factor, specified as an integer in the range [2, 16].

Dependencies

To enable this property, set the `TransmissionFormat` property to `"SS-TC-LM"` and the `IsCustomWaveform` property to `true`.

Data Types: `double`

`BurstLength` — Burst length
`256` (default) | integer in the range [7, 25,233,405]

Burst length, specified as an integer in the range [7, 25,233,405]. This length includes the preamble, postamble, and pilot sum, in addition to the payload symbols.

When you set the `TransmissionFormat` property to `"TC-LM"`, the unit of burst length is symbols. When you set the `TransmissionFormat` property to `"SS-TC-LM"`, the unit of burst length is chips.

Dependencies

To enable this property, set the `IsCustomWaveform` property to `true`.

Data Types: `double`

`MappingScheme` — Mapping scheme
`"pi/2-BPSK"` (default) | `"QPSK"` | `"8PSK"` | `"16QAM"`

Mapping scheme, specified as one of these values.

- `"pi/2-BPSK"`
- `"QPSK"`
- `"8PSK"`
- `"16QAM"`

Dependencies

To enable this property, set the `TransmissionFormat` property to `"TC-LM"` and the `IsCustomWaveform` property to `true`.

Note When you set the `TransmissionFormat` property to `"SS-TC-LM"`, the only valid value of `MappingScheme` is `"pi/2-BPSK"`.

Data Types: `char` | `string`

`CodeRate` — Code rate
`"1/3"` (default) | `"1/2"` | `"2/3"` | `"3/4"` | `"4/5"` | `"5/6"` | `"6/7"` | `"7/8"`

Code rate, specified as one of these values.

- `"2/3"`, `"3/4"`, `"4/5"`, `"5/6"`, `"6/7"`, or `"7/8"` — Use one of these values when you set the `MappingScheme` property to `"8PSK"`.
- `"3/4"`, `"4/5"`, `"5/6"`, `"6/7"`, or `"7/8"` — Use one of these values when you set the `MappingScheme` property to `"16QAM"`.

All code rates are applicable if `MappingScheme` property is set to `"pi/2-BPSK"` or `"QPSK"`.

Dependencies

To enable this property, set the `IsCustomWaveform` property to `true`.

Data Types: `char` | `string`

`PermutationParameters` — Permutation control parameters
`[9 0 0 0 0]` (default) | vector

Permutation control parameters that the dvbrcs2RecoveryConfig uses to generate turbo encoder interleaver indices, specified as a five-element vector in order: P, Q_0, Q_1, Q_2, and Q_3. P must be in the range [9, 255], and Q_0, Q_1, Q_2, and Q_3 must be in the range [0, 15].

To generate unique interleaver indices, the value of P must be co-prime to `PayloadLengthInBytes`*4.

Dependencies

To enable this property, set the `IsCustomWaveform` property to `true`.

Data Types: `double`

`PreambleLength` — Preamble length
`8` (default) | integer in the range [0, 255]

Preamble length, specified as an integer in the range [0, 255].

When you set the `TransmissionFormat` property to `"TC-LM"`, the unit of preamble length is symbols. When you set the `TransmissionFormat` property to `"SS-TC-LM"`, the unit of preamble length is chips.

A preamble of this specified length is prefixed to the payload symbols.

Dependencies

To enable this property, set the `IsCustomWaveform` property to `true`.

Data Types: `double`

`PostambleLength` — Postamble length

`8` (default) | integer in the range [0, 255]

Postamble length, specified as an integer in the range [0, 255].

When you set the `TransmissionFormat` property to `"TC-LM"`, the unit of postamble length is symbols. When you set the `TransmissionFormat` property to `"SS-TC-LM"`, the unit of postamble length is chips.

A postamble of this specified length is suffixed to the payload symbols in the burst sequence.

Dependencies

To enable this property, set the `IsCustomWaveform` property to `true`.

Data Types: `double`

`PilotPeriod` — Pilot period

`0` (default) | integer in the range [0, 4095]

Pilot period, specified as an integer in the range [0, 4095]. A value of `0` indicates no pilots are inserted.

When you set the `TransmissionFormat` property to `"TC-LM"`, the unit of pilot period is symbols. When you set the `TransmissionFormat` property to `"SS-TC-LM"`, the unit of pilot period is chips.

The pilot period represents the length of the sequence from first symbol of a pilot block to the first symbol of the next pilot block in symbols or chips.

Dependencies

To enable this property, set the `IsCustomWaveform` property to `true`.

Data Types: `double`

`PilotBlockLength` — Pilot block length

`1` (default) | integer in the range [1, 255]

Pilot block length, specified as an integer in the range [1, 255].

After every `PilotPeriod` symbols or chips, a pilot block of this specified length is detected, which must be removed to recover the payload symbols.

Dependencies

To enable this property, set the `IsCustomWaveform` property to `true` and `PilotPeriod` property to a positive integer.

Data Types: `double`

`PilotSum` — Total pilot symbols or chips in received waveform
`0` (default) | nonnegative integer

Total pilot symbols or chips in the received waveform, specified as one of these options.

- Integer in the range [0, 255] — Use this option when you set the `TransmissionFormat` property to `"TC-LM"`.
- Integer in the range [0, 65,535] — Use this option when you set the `TransmissionFormat` property to `"SS-TC-LM"`.

When you set the `TransmissionFormat` property to `"TC-LM"`, the unit of pilot sum is symbols. When you set the `TransmissionFormat` property to `"SS-TC-LM"`, the unit of pilot sum is chips.

Dependencies

To enable this property, set the `IsCustomWaveform` property to `true` and `PilotPeriod` property to a positive integer.

Data Types: `double`

`ScramblingPolynomial` — Scrambling polynomial
16-bit zero vector (default) | 16-bit vector of binary values | numeric vector

Scrambling polynomial, specified as one of these options.

- 16-bit vector of binary values from the most significant bit (MSB), z^{16}, to least significant bit (LSB), z^1. Each element of this vector corresponds to the coefficient of z and its exponent, specified from MSB to LSB. For details on the binary representation, see ETSI EN 301 545-2 Section 7.3.7.1.5.
- Numeric vector containing the exponents of z for nonzero terms of the polynomial in descending order.

The scrambling polynomial determines the shift register feedback connection to generate the spreading sequence.

The coefficient of z^0 is always 1.

The default value of this scrambling polynomial indicates the default scrambling sequence provided in the standard. When you set the `TransmissionFormat` property to `"SS-TC-LM"` and the `IsCustomWaveform` property to `false`, the default scrambling sequence is used to descramble the received reference waveform.

Dependencies

To enable this property, set the `TransmissionFormat` property to `"SS-TC-LM"` and the `IsCustomWaveform` property to `true`.

Data Types: `double` | `logical`

`ScramblingInitialConditions` — Scrambling initial conditions
`[1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1]` (default) | `1` | 16-bit vector of binary values

Scrambling initial conditions of the shift register, specified as one of these options.

- `1` — Use this option to set the initial condition of each cell of the shift register to this value.
- 16-bit vector of binary values from the MSB (z^{16}) to LSB (z^{1}) — Use this option to set the initial condition of each cell of the shift register to the corresponding element in this vector.

Dependencies

To enable this property, set the `TransmissionFormat` property to `"SS-TC-LM"` and the `ScramblingPolynomial` property to a value other than the default value.

Data Types: `double` | `logical`

`NumDecodingIterations` — Number of decoding iterations
`8` (default) | positive integer

Number of decoding iterations of the DVB-RCS2 turbo decoder, specified as a positive integer.

Data Types: `double`

`PayloadLengthInBytes` — Payload length in bytes
`10` (default) | positive integer

This property is read-only.

Payload length in bytes, retuned as a positive integer. This length represents the DVB-RCS2 turbo decoder output length.

Use this property output to choose a valid value for the first element of `PermutationParameters` property (that is, *P*).

`PayloadLengthInBytes`*4 and *P* must be co-primes.

Data Types: `double`

Object Functions

Specific to This Object

dvbrcs2BitRecover	Recover bits for DVB-RCS2 waveform

Examples

Create DVB-RCS2 Receiver Object

Create a DVB-RCS2 recovery configuration object.

Create and then set the properties of the object.

```
cfgrcs2 = dvbrcs2RecoveryConfig;
cfgrcs2.TransmissionFormat = "SS-TC-LM";
cfgrcs2.ContentType = "control";
cfgrcs2.WaveformID = 20;
cfgrcs2.NumDecodingIterations = 6;
```

Display the properties of the DVB-RCS2 object.

```
disp(cfgrcs2)

  dvbrcs2RecoveryConfig with properties:

       TransmissionFormat: "SS-TC-LM"
              ContentType: "control"
         IsCustomWaveform: 0
               WaveformID: 20

   Coding and Modulation:
    NumDecodingIterations: 6
```

Recover PDU from DVB-RCS2 Reference Waveform

Recover the frame PDU for a DVB-RCS2 reference waveform.

Set the properties of a DVB-RCS2 waveform generator System object™.

```
wg = dvbrcs2WaveformGenerator;
wg.TransmissionFormat = "SS-TC-LM";
wg.WaveformID = 7;
wg.SamplesPerSymbol = 2;
```

Generate a frame PDU.

```
framePDU = randi([0 1],wg.FramePDULength,1);
```

Generate the DVB-RCS2-based burst symbols.

```
txWaveform = wg(framePDU);
```

Add additive white Gaussian noise (AWGN) to the generated waveform.

```
sps = wg.SamplesPerSymbol;
EsNodB = 1;
snrdB = EsNodB - 10*log10(sps);
rxIn = awgn(txWaveform,snrdB,"measured");
```

Create and then configure the DVB-RCS2 recovery configuration object.

```
cfg = dvbrcs2RecoveryConfig;
cfg.TransmissionFormat = wg.TransmissionFormat;
cfg.WaveformID = wg.WaveformID;
```

Create a raised cosine receiver filter.

```
rxFilter = comm.RaisedCosineReceiveFilter( ...
                 'RolloffFactor',0.2, ...
                 'InputSamplesPerSymbol',sps, ...
                 'DecimationFactor',sps);
span = rxFilter.FilterSpanInSymbols;
```

Apply matched filtering and remove the filter delay.

```
filtOut = rxFilter([rxIn; ...
               complex(zeros(span/2*sps,1))]);
rxSymb = filtOut(span+1:end);
```

Recover user packets. Display the frame PDU cyclic redundancy check (CRC) status and the numbers of bit errors.

```
[rxOut,pduErr] = dvbrcs2BitRecover(rxSymb,cfg,10^(-EsNodB/10));
fprintf("Erroneous frame PDU = %d\n", pduErr)
```

```
Erroneous frame PDU = 0
```

```
fprintf("Number of bit errors = %d\n", sum(framePDU~=rxOut))
```

```
Number of bit errors = 0
```

`dvbrcs2WaveformGenerator`

Introduced in R2021b

System Objects

ccsdsTMWaveformGenerator

Generate CCSDS TM waveform

Description

The `ccsdsTMWaveformGenerator` System object generates a Consultative Committee for Space Data Systems (CCSDS) Telemetry (TM) time-domain waveform. The object implements the waveform generation aspects of CCSDS standard blue books:

- CCSDS 131.0-B-3 — TM synchronization and channel coding [1]
- CCSDS 401.0-B-30 — Radio frequency and modulation systems [2]
- CCSDS 131.2-B-1 — Flexible advanced coding and modulation scheme for high rate TM applications [3]

Note The object supports waveform generation specified by the CCSDS TM synchronization and channel coding standard [1] and CCSDS flexible advanced coding and modulation scheme for high rate TM standard [3]. To obtain the waveform for either of the desired standard, set the `WaveformSource` property.

To generate a CCSDS TM waveform:

1. Create the `ccsdsTMWaveformGenerator` object and set its properties.
2. Call the object with arguments, as if it were a function.

To learn more about how System objects work, see What Are System Objects?

Creation

Syntax

```
tmWaveGen = ccsdsTMWaveformGenerator
tmWaveGen = ccsdsTMWaveformGenerator(Name,Value)
```

Description

`tmWaveGen = ccsdsTMWaveformGenerator` creates a default CCSDS TM waveform generator System object.

`tmWaveGen = ccsdsTMWaveformGenerator(Name,Value)` sets “Properties” on page 4-3 using one or more name-value pairs. For example, `ccsdsTMWaveformGenerator("WaveformSource","flexible advanced coding and modulation","ACMFormat",20)` specifies the CSSDS TM waveform source as flexible advanced coding and modulation standard with ACM format as 20 for the generated waveform.

Properties

Unless otherwise indicated, properties are *nontunable*, which means you cannot change their values after calling the object. Objects lock when you call them, and the `release` function unlocks them.

If a property is *tunable*, you can change its value at any time.

For more information on changing property values, see System Design in MATLAB Using System Objects.

General

`WaveformSource` — CCSDS TM waveform source
`"synchronization and channel coding"` (default) | `"flexible advanced coding and modulation"`

CCSDS TM waveform source, specified as one of these values.

- `"synchronization and channel coding"` — Use this option to set the waveform to CCSDS TM synchronization and channel coding, as specified in CCSDS 131.0-B-3 [1].
- `"flexible advanced coding and modulation"` — Use this option to set the waveform to CCSDS flexible advanced coding and modulation for high rate TM applications, as specified in CCSDS 131.2-B-1 [3].

Data Types: `char` | `string`

`ACMFormat` — ACM format
`1` (default) | integer in the range [1, 27]

Adaptive coding and modulation (ACM) format, specified as an integer in the range [1, 27], as specified in CCSDS 131.2-B-1 Section 5.2.4 Table 5-2 [3].

Tunable: Yes

Dependencies

To enable this property, set the `WaveformSource` property to `"flexible advanced coding and modulation"`.

Data Types: `double` | `uint8`

`NumBytesInTransferFrame` — Number of bytes in one transfer frame
`223` (default) | integer in the range [1, 2048]

Number of bytes in one transfer frame, specified as an integer in the range [1, 2048].

Dependencies

To enable this property, one of these conditions should be satisfied:

- Set `WaveformSource` property to `"synchronization and channel coding"` and the `ChannelCoding` property to `"none"`, `"convolutional"`, or `"LDPC"` on stream of sync marked transfer frame (SMTF).
- Set `WaveformSource` property to `"flexible advanced coding and modulation"`. In this case, the minimum number of `NumBytesInTransferFrame` is 223.

For other values of `ChannelCoding`, this `NumBytesInTransferFrame` property is calculated internally based on other properties.

Data Types: `double` | `uint16`

`HasRandomizer` — Option for randomizing data
`1` or `true` (default) | `0` or `false`

Option for randomizing the data, specified as a numeric or `logical` value of `1` (`true`) or `0` (`false`). Set this value to `1` (`true`) to randomize the data present in the channel access data unit (CADU).

Dependencies

To enable this property, set the `WaveformSource` property to `"synchronization and channel coding"`.

When you set the `ChannelCoding` property to `"LDPC"` and `IsLDPCOnSMTF` property to `1` (`true`), this property is not applicable, and is set to `1` (`true`).

Data Types: `double` | `logical`

`HasASM` — Option for inserting ASM
`1` or `true` (default) | `0` or `false`

Option for inserting attached sync marker (ASM), specified as a numeric or `logical` value of `1` (`true`) or `0` (`false`). Set this value to `1` (`true`) to indicate the data in CADU is attached with ASM.

Dependencies

To enable this property, set the `WaveformSource` property to `"synchronization and channel coding"`.

When you set the `ChannelCoding` property to `"LDPC"` and `IsLDPCOnSMTF` property to `1` (`true`), this property is not applicable, and is set to `1` (`true`).

Data Types: `double` | `logical`

`PCMFormat` — PCM format
`"NRZ-L"` (default) | `"NRZ-M"`

Pulse code modulation (PCM) format to select the PCM coding in the CCSDS TM waveform, specified as one of these values.

- `"NRZ-L"` — NRZ-level
- `"NRZ-M"` — NRZ-mark

Dependencies

To enable this property, set the `WaveformSource` property to `"synchronization and channel coding"` and the `Modulation` property to `"BPSK"`, `"QPSK"`, `"8PSK"`, `"OPSK"`, or `"PCM/PSK/PM"`.

Data Types: `char` | `string`

Channel Coding

`ChannelCoding` — Forward error correction coding scheme
`"RS"` (default) | `"none"` | `"convolutional"` | `"concatenated"` | `"turbo"` | `"LDPC"`

Forward error correction coding scheme, specified as one of these values.

- `"none"`
- `"RS"`
- `"convolutional"`
- `"concatenated"`
- `"turbo"`
- `"LDPC"`

Dependencies

To enable this property, set the `WaveformSource` property to `"synchronization and channel coding"`.

Data Types: `char` | `string`

`NumBitsInInformationBlock` — Number of bits in turbo or LDPC message
`7136` (default) | `1784` | `3568` | `8920` | `1024` | `4096` | `16384`

Number of bits in the turbo or lower density parity check (LDPC) message, specified as one of these values.

- `1784`, `3568`, `7136`, or `8920` — Use one of these values when you set the `ChannelCoding` property to `"turbo"`.
- `1024`, `4096`, `16384`, or `7136` — Use one of these values when you set the `ChannelCoding` property to `"LDPC"`.

Dependencies

To enable this property, set the `WaveformSource` property to `"synchronization and channel coding"` and the `ChannelCoding` property to either `"turbo"` or `"LDPC"`.

Data Types: `double` | `uint8`

`ConvolutionalCodeRate` — Code rate of convolutional code
`"1/2"` (default) | `"2/3"` | `"3/4"` | `"5/6"` | `"7/8"`

Code rate of convolutional code, specified as a one of these values.

- `"1/2"`
- `"2/3"`
- `"3/4"`
- `"5/6"`
- `"7/8"`

Dependencies

To enable this property, set the `WaveformSource` property to `"synchronization and channel coding"` and the `ChannelCoding` property to either `"convolutional"` or `"concatenated"`.

When you set the `ChannelCoding` property to `"concatenated"`, the numeric value of the code rate also depends on the constituent Reed-Solomon (RS) code. You can obtain the actual numeric value for any code from the output field `ActualCodeRate` of the `info` object function.

Data Types: `char` | `string`

`CodeRate` — Code rate of turbo or LDPC code
`"1/2"` (for turbo code) (default) | `"7/8"` (for LDPC code) (default) | `"2/3"` | `"1/3"` | `"1/4"` | `"1/6"` | `"4/5"`

Code rate of turbo or LDPC code, specified as one of these values.

- `"1/2"`, `"1/3"`, `"1/4"`, or `"1/6"` — Use one of these values when you set the `ChannelCoding` property to `"turbo"`.
- `"1/2"`, `"2/3"`, `"4/5"`, or `"7/8"` — Use one of these values when you set the `ChannelCoding` property to `"LDPC"`.

Note When you set the `ChannelCoding` property to `"LDPC"` and the `NumBitsInInformationBlock` property to `7136`, the `CodeRate` must be `"7/8"`.

For an LDPC code, setting `CodeRate` to `7/8` implies an actual code rate numeric value of 223/255. You can obtain the actual numeric value for any code from the output field `ActualCodeRate` of the `info` object function.

Dependencies

To enable this property, set the `WaveformSource` property to `"synchronization and channel coding"` and the `ChannelCoding` property to either `"turbo"` or `"LDPC"`.

Data Types: `char` | `string`

`RSMessageLength` — Number of bytes in one RS message block
`223` (default) | `239`

Number of bytes in one RS message block, specified as `223` or `239`.

Dependencies

To enable this property, set the `WaveformSource` property to `"synchronization and channel coding"` and the `ChannelCoding` property to `"RS"` or `"concatenated"`.

Data Types: `double` | `uint8`

`RSInterleavingDepth` — Interleaving depth of RS code
`1` (default) | `2` | `3` | `4` | `5` | `8`

Interleaving depth of the RS code, specified as `1`, `2`, `3`, `4`, `5`, or `8`. The interleaving depth is the number of RS codewords in one code block.

Dependencies

To enable this property, set the `WaveformSource` property to `"synchronization and channel coding"` and the `ChannelCoding` property to `"RS"` or `"concatenated"`.

Data Types: `double` | `uint8`

`IsRSMessageShortened` — Option to shorten RS code
`0` or `false` (default) | `1` or `true`

Option to shorten the RS code, specified as a numeric or `logical` value of `0` (`false`) or `1` (`true`). Set this value to `1` (`true`) to shorten the RS code.

Dependencies

To enable this property, set the `WaveformSource` property to `"synchronization and channel coding"` and the `ChannelCoding` property to `"RS"` or `"concatenated"`.

Data Types: `double` | `logical`

`RSShortenedMessageLength` — Number of bytes in RS shortened message block
`223` (default) | integer in the range [1, `RSMessageLength`]

Number of bytes in the RS shortened message block, specified as an integer in the range [1, `RSMessageLength`].

Dependencies

To enable this property, set the `WaveformSource` property to `"synchronization and channel coding"`, the `ChannelCoding` property to `"RS"` or `"concatenated"`, and the `IsRSMessageShortened` property to `1` (`true`).

Data Types: `double` | `uint8`

`IsLDPCOnSMTF` — Option for using LDPC on stream of SMTF
`0` or `false` (default) | `1` or `true`

Option for using LDPC on the stream of a sync marked transfer frame (SMTF), specified as a numeric or `logical` value of `0` (`false`) or `1` (`true`). Set this value to `1` (`true`) to indicate LDPC on the stream of SMTF as specified in CCSDS 131.0-B-3 Section 8 of the TM synchronization and channel coding standard [1]. To indicate LDPC on the transfer frame, set this value to `0` (`false`).

Dependencies

To enable this property, set the `WaveformSource` property to `"synchronization and channel coding"` and the `ChannelCoding` property to `"LDPC"`.

Data Types: `double` | `logical`

`LDPCCodeBlockSize` — Number of LDPC codewords in LDPC code block of stream of SMTF
`1` (default) | integer in the range [1, 8]

Number of LDPC codewords in the LDPC code block of the stream of SMTF, specified as an integer in the range [1, 8].

Dependencies

To enable this property, set the `WaveformSource` property to `"synchronization and channel coding"`, the `ChannelCoding` property to `"LDPC"`, and the `IsLDPCOnSMTF` property to `true`.

Data Types: `double` | `uint8`

Digital Modulation and Filter

`Modulation` — Modulation scheme
`"QPSK"` (default) | `"BPSK"` | `"8PSK"` | `"OQPSK"` | `"GMSK"` | `"PCM/PSK/PM"` | `"PCM/PM/biphase-L"` | `"4D-8PSK-TCM"`

Modulation scheme used in CCSDS TC waveform, specified as one of these values.

- "QPSK"
- "BPSK"
- "8PSK"
- "OQPSK"
- "GMSK"
- "PCM/PSK/PM"
- "PCM/PM/biphase-L"
- "4D-8PSK-TCM"

Dependencies

To enable this property, set the `WaveformSource` property to `"synchronization and channel coding"`.

Data Types: `char` | `string`

`PulseShapingFilter` — Pulse shaping filter
`"root raised cosine"` (default) | `"none"`

Pulse shaping filter, specified as `"root raised cosine"` or `"none"`.

Dependencies

To enable this property, one of these conditions must be satisfied:

- Set `WaveformSource` property to `"synchronization and channel coding"` and the `Modulation` property to `"BPSK"`, `"QPSK"`, `"8PSK"`, or `"4D-8PSK-TCM"`.
- Set `WaveformSource` property to`"flexible advanced coding and modulation"`.

Data Types: `char` | `string`

`RolloffFactor` — Roll-off factor of SRRC baseband filter
`0.35` (default) | scalar in the range [0, 1]

Roll-off factor of the square root raised cosine (SRRC) baseband filter, specified as a scalar in the range [0, 1].

Note This property is not applicable when you set the `PulseShapingFilter` property to `"none"` for either value of the `WaveformSource` property.

Dependencies

To enable this property, one of these conditions must be satisfied:

- Set `WaveformSource` property to `"synchronization and channel coding"` and the `Modulation` property to either `"BPSK"`, `"QPSK"`, `"8PSK"`, `"OQPSK"`, or `"4D-8PSK-TCM"`.
- Set `WaveformSource` property to `"flexible advanced coding and modulation"`.

Data Types: `double`

`FilterSpanInSymbols` — Filter span in number of symbols
`10` (default) | positive integer

Filter span in number of symbols, specified as a positive integer.

The `ccsdsTMWaveformGenerator` System object truncates the infinite impulse response of the ideal root raised cosine filter to this value.

Note This property is not applicable when you set the `PulseShapingFilter` property to `"none"` for either value of the `WaveformSource` property.

Dependencies

To enable this property, one of these conditions must be satisfied:

- Set `WaveformSource` property to `"synchronization and channel coding"` and the `Modulation` property to either `"BPSK"`, `"QPSK"`, `"8PSK"`, `"OQPSK"`, or `"4D-8PSK-TCM"`.
- Set `WaveformSource` property to `"flexible advanced coding and modulation"`.

Data Types: `double` | `uint32`

`BandwidthTimeProduct` — Bandwidth time product for GMSK modulator
`0.25` (default) | `0.5`

Bandwidth time product for the Gaussian minimum shift keying (GMSK) modulator, specified as `0.25` or `0.5`.

Dependencies

To enable this property, set `WaveformSource` property to `"synchronization and channel coding"` and the `Modulation` property to `"GMSK"`.

Data Types: `double`

`ModulationEfficiency` — Modulation efficiency of 4D-8PSK-TCM
`2` (default) | `2.25` | `2.5` | `2.75`

Modulation efficiency of 4D-8PSK trellis coded modulator (TCM), specified as `2`, `2.25`, `2.5`, or `2.75`. This property indicates the number of bits for each complex baseband symbol.

Dependencies

To enable this property, set `WaveformSource` property to `"synchronization and channel coding"` and the `Modulation` property to `"4D-8PSK-TCM"`.

Data Types: `double`

`SubcarrierWaveform` — Type of waveform to PSK-modulate NRZ data
`"sine"` (default) | `"square"`

Type of waveform to PSK-modulate the non-return-to-zero (NRZ) data, specified as `"sine"` or `"square"`.

Dependencies

To enable this property, set `WaveformSource` property to `"synchronization and channel coding"` and the `Modulation` property to `"PCM/PSK/PM"`.

Data Types: `char` | `string`

`ModulationIndex` — Modulation index in residual carrier phase modulation
`0.4` (default) | scalar in the range [0.2, 2]

Modulation index in the residual carrier phase modulation, specified as a scalar in the range [0.2, 2]. Units are in radians.

Dependencies

To enable this property, set `WaveformSource` property to `"synchronization and channel coding"` and the `Modulation` property to `"PCM/PSK/PM"` or `"PCM/PM/biphase-L"`.

Data Types: `double`

`SymbolRate` — Coded symbol rate
`2000` (default) | positive scalar

Coded symbol rate in Hz, specified as a positive scalar.

Dependencies

To enable this property, set `WaveformSource` property to `"synchronization and channel coding"` and the `Modulation` property to `"PCM/PSK/PM"`.

Data Types: `double`

`SubcarrierToSymbolRateRatio` — Ratio of subcarrier frequency to symbol rate
`4` (default) | integer in the range [1, 50]

Ratio of the subcarrier frequency to the symbol rate, specified as an integer in the range [1, 50].

Dependencies

To enable this property, set `WaveformSource` property to `"synchronization and channel coding"` and the `Modulation` property to `"PCM/PSK/PM"`.

Data Types: `double` | `uint8`

`SamplesPerSymbol` — Number of samples per symbol
`10` (default) | positive integer

Number of samples per symbol, specified as a positive integer.

This property is applicable for either input value of the `WaveformSource` property.

Dependencies

To enable this property, one of these conditions must be satisfied:

- Set the `Modulation` property to `"OQPSK"`, `"PCM/PSK/PM"`, or `"GMSK"`.
- Set the `PulseShapingFilter` to `"root raised cosine"`.

Data Types: `double` | `uint8`

`HasPilots` — Option for inserting pilot symbols
`0` or `false` (default) | `1` or `true`

Option for inserting pilot symbols within data, specified as a numeric or `logical` value of `0` (`false`) or `1` (`true`). Set this value to `1` (`true`) to indicate pilots are inserted, as described in CCSDS flexible advanced coding and modulation scheme for high rate TM standard [3].

Dependencies

To enable this property, set the `WaveformSource` property to `"flexible advanced coding and modulation"`.

Data Types: `double` | `logical`

`ScramblingCodeNumber` — Scrambling code number
`0` (default) | integer in the range [0, (2^{18} – 2)]

Scrambling code number for flexible advanced coding and modulation for high rate TM applications standard [3], specified as an integer in the range [0, (2^{18} – 2)].

`ScramblingCodeNumber` is used to randomize the complex baseband symbols.

Dependencies

To enable this property, set the `WaveformSource` property to `"flexible advanced coding and modulation"`.

Data Types: `double` | `uint32`

Read-Only

`NumInputBits` — Minimum number of bits required to generate waveform
integer

This property is read-only.

Minimum number of input bits to generate a waveform, returned as an integer.

The number of input bits must be an integer multiple of `NumInputBits`.

Data Types: `double`

`MinNumTransferFrames` — Minimum number of transfer frames for nonempty output
integer

This property is read-only.

Minimum number of transfer frames for a nonempty System object output, returned as an integer.

When you set the `WaveformSource` property to `"flexible advanced coding and modulation"`, or to `"synchronization and channel coding"` with the `IsLDPCOnSMTF` property set to `1` (`true`), System object output is empty until it has sufficient input to process through channel coding and modulation.

Data Types: `double`

Usage

Syntax

```
txWaveform = tmWaveGen(bits)
[txWaveform,encodedBits] = tmWaveGen(bits)
```

Description

`txWaveform = tmWaveGen(bits)` generates a CCSDS TM time-domain waveform for the corresponding input bits.

`[txWaveform,encodedBits] = tmWaveGen(bits)` also returns the bits obtained after TM synchronization and channel coding sublayer operations.

Input Arguments

`bits` — Information bits
binary-valued column vector

Information bits, in the form of transfer frames, specified as a binary-valued column vector. The length of this vector must be an integer multiple of the number of bits in one transfer frame. The `NumInputBits` property indicates the number of bits in one transfer frame.

Data Types: `double` | `int8` | `logical`

Output Arguments

`txWaveform` — Generated CCSDS TM time-domain waveform
column vector

Generated CCSDS TM time-domain waveform, returned as a column vector. This output is generated in the form of complex in-phase quadrature (IQ) samples.

Data Types: `double`

`encodedBits` — Output bits obtained after TM synchronization and channel coding sublayer operations
binary-valued column vector

Output bits obtained after TM synchronization and channel coding sublayer operations, returned as a binary-valued column vector.

Data Types: `double` | `int8` | `logical`

Object Functions

To use an object function, specify the System object as the first input argument. For example, to release system resources of a System object named `obj`, use this syntax:

```
release(obj)
```

Specific to `ccsdsTMWaveformGenerator`

info	Characteristic information about object
flushFilter	Flush transmit filter

Common to All System Objects

step	Run System object algorithm
release	Release resources and allow changes to System object property values and input characteristics
clone	Create duplicate System object

isLocked	Determine if System object is in use
reset	Reset internal states of System object

Examples

Generate CCSDS TM Waveform for Synchronization and Channel Coding Scheme

Generate a Consultative Committee for Space Data Systems (CCSDS) Telemetry (TM) waveform for the synchronization and channel coding standard, for multiple transfer frames. Visualize the waveform by using a spectrum plot.

Create a CCSDS TM System object. Set the waveform type as `synchronization and channel coding` with GMSK-modulated concatenated codes.

```
tmWaveGen = ccsdsTMWaveformGenerator;
tmWaveGen.WaveformSource = "synchronization and channel coding";
tmWaveGen.ChannelCoding = "concatenated";
tmWaveGen.Modulation = "GMSK";
tmWaveGen.RSMessageLength = 239;
tmWaveGen.RSInterleavingDepth = 2;
tmWaveGen.BandwidthTimeProduct = 0.5;
disp(tmWaveGen)
```

```
  ccsdsTMWaveformGenerator with properties:

           WaveformSource: "synchronization and channel coding"
            HasRandomizer: true
                   HasASM: true

   Channel coding
            ChannelCoding: "concatenated"
    ConvolutionalCodeRate: "1/2"
          RSMessageLength: 239
      RSInterleavingDepth: 2
     IsRSMessageShortened: false

   Digital modulation and filter
               Modulation: "GMSK"
     BandwidthTimeProduct: 0.5000
         SamplesPerSymbol: 10

  Use get to show all properties
```

Specify the number of transfer frames.

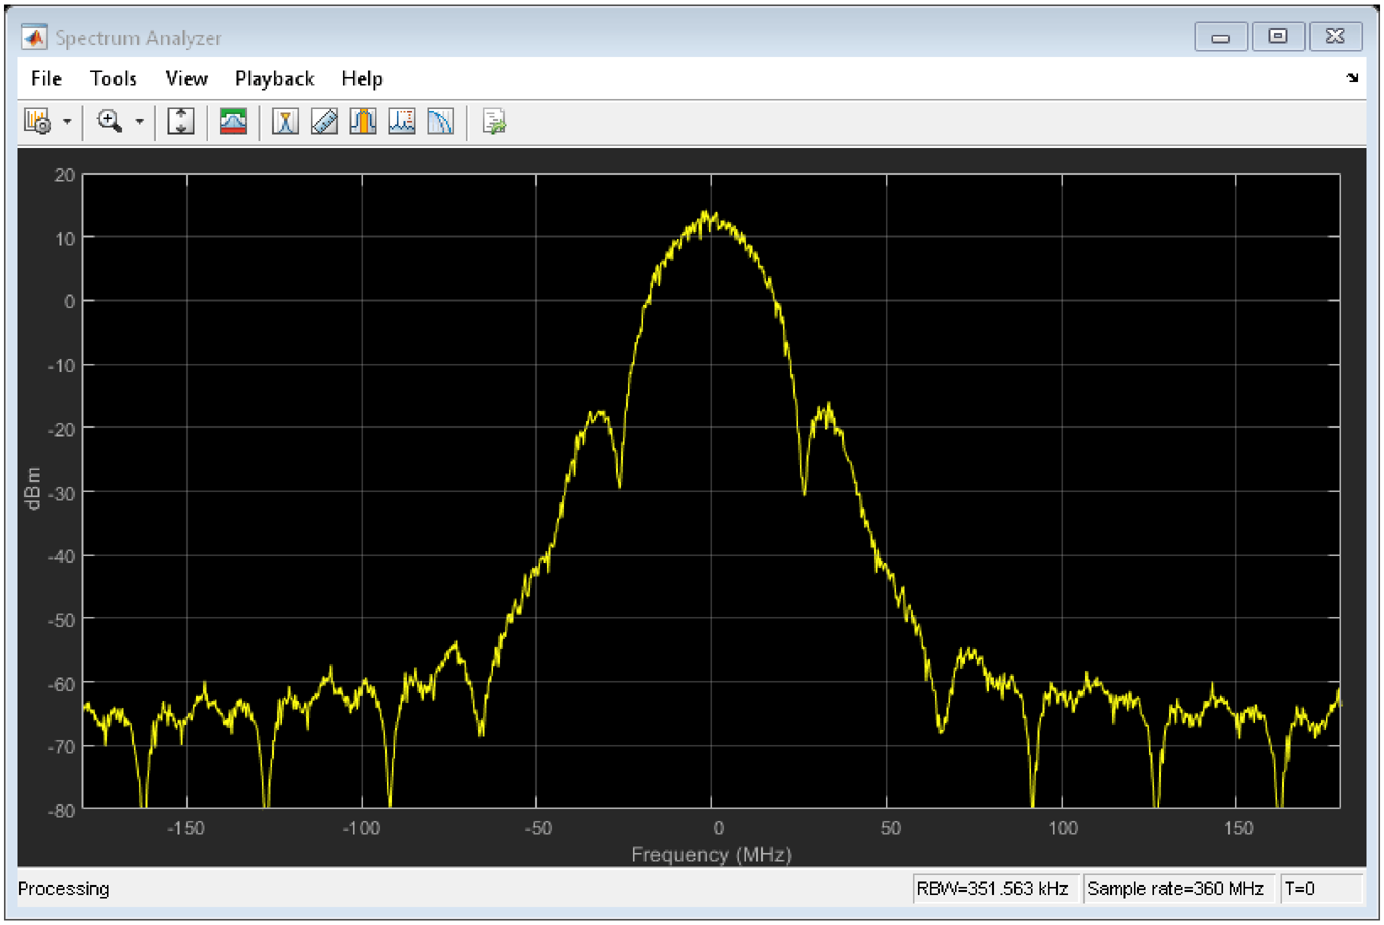
```
numTF = 15;
waveform = [];  % Initialize waveform as null
```

Generate the CCSDS TM waveform for the synchronization and channel coding standard by using multiple System object calls.

```
rng default    % For reproducible results
for iTF = 1:numTF
     bits = randi([0 1],tmWaveGen.NumInputBits,1);
     waveform = [waveform; tmWaveGen(bits)];
end
```

Create a `dsp.SpectrumAnalyzer` System object to display the frequency spectrum of the generated CCSDS TM time-domain waveform.

```
BW = 36e6;      % Typical satellite channel bandwidth
Fsamp = tmWaveGen.SamplesPerSymbol*BW;
scope = dsp.SpectrumAnalyzer('SampleRate',Fsamp,...
                             'AveragingMethod','Exponential');
scope(waveform)
```



Generate CCSDS TM Waveform for Flexible Advanced Coding and Modulation Scheme

Generate a Consultative Committee for Space Data Systems (CCSDS) Telemetry (TM) waveform for the flexible advanced coding and modulation scheme for high rate TM applications standard, for one physical layer (PL) frame. Visualize the waveform by using a scatter plot.

Create a CCSDS TM System object, and then specify its properties.

```
tmWaveGen = ccsdsTMWaveformGenerator;
tmWaveGen.WaveformSource = "flexible advanced coding and modulation";
tmWaveGen.ACMFormat = 17;   % 16APSK
tmWaveGen.PulseShapingFilter = "none";
disp(tmWaveGen)
```

```
  ccsdsTMWaveformGenerator with properties:

             WaveformSource: "flexible advanced coding and modulation"
                  ACMFormat: 17
    NumBytesInTransferFrame: 223

   Channel coding
    No properties.

   Digital modulation and filter
         PulseShapingFilter: "none"
                  HasPilots: false
       ScramblingCodeNumber: 0

  Use get to show all properties
```

Calculate the number of transfer frames in one PL frame.

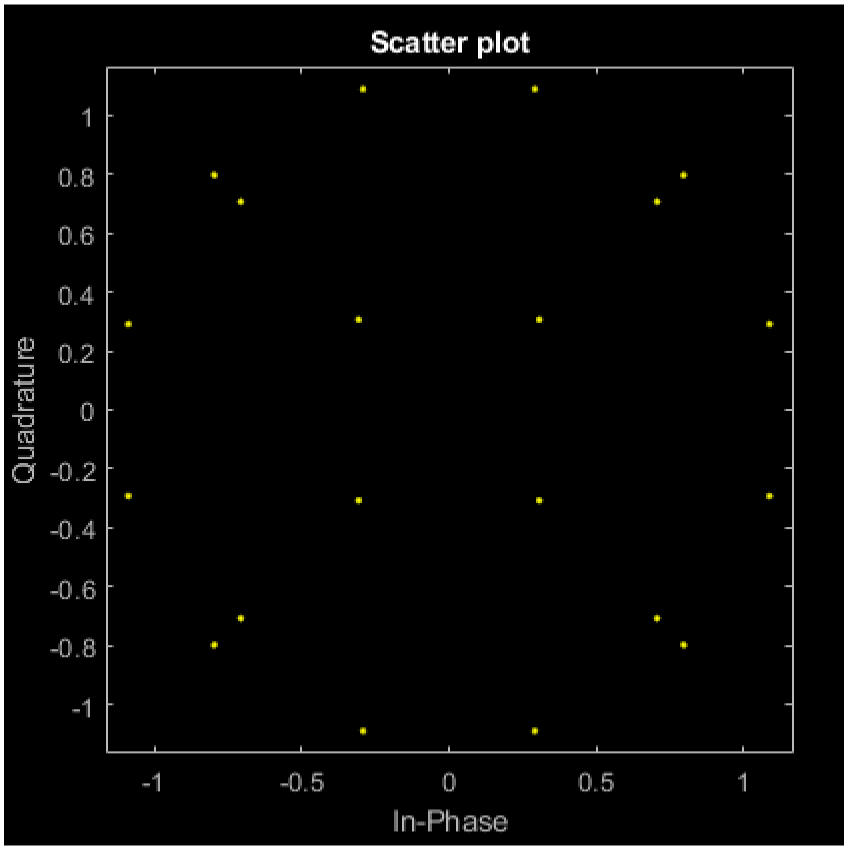
```
NumTFInOnePL = tmWaveGen.MinNumTransferFrames*16; % One PL frame consists of 16 codewords, as spe
waveform = [];  % Initialize waveform as null
```

Generate the CCSDS TM waveform for the flexible advanced coding and modulation scheme for high rate TM applications standard.

```
rng default    % For reproducible results
for iTF = 1:NumTFInOnePL
   bits = randi([0 1],tmWaveGen.NumInputBits,1);
   waveform = [waveform; tmWaveGen(bits)];
end
```

Display the scatter plot of the constellation for the generated waveform.

```
scatterplot(waveform);
legend off;
```



Get CCSDS TM Waveform Generator Information and Check Transmit Filter Delay

Get information from a `ccsdsTMWaveformGenerator` System object by using the `info` function. Then retrieve the filter residual samples by using the `flushFilter` object function.

Create a Consultative Committee for Space Data Systems (CCSDS) Telemetry (TM) System object. Set the waveform type as `synchronization and channel coding` with low-density parity-check (LDPC) channel coding. Display the properties.

```
tmWaveGen = ccsdsTMWaveformGenerator;
tmWaveGen.WaveformSource = "synchronization and channel coding";
tmWaveGen.ChannelCoding = "LDPC";
tmWaveGen.NumBitsInInformationBlock = 1024;
tmWaveGen.Modulation = "QPSK";
tmWaveGen.CodeRate = "1/2";
disp(tmWaveGen)
```

```
  ccsdsTMWaveformGenerator with properties:

             WaveformSource: "synchronization and channel coding"
              HasRandomizer: true
                     HasASM: true
                  PCMFormat: "NRZ-L"

   Channel coding
```

```
               ChannelCoding: "LDPC"
    NumBitsInInformationBlock: 1024
                    CodeRate: "1/2"
                IsLDPCOnSMTF: false

   Digital modulation and filter
                  Modulation: "QPSK"
          PulseShapingFilter: "root raised cosine"
               RolloffFactor: 0.3500
         FilterSpanInSymbols: 10
            SamplesPerSymbol: 10

  Use get to show all properties
```

Specify the number of transfer frames.

```
numTF = 20;
```

Get the characteristic information about the CCSDS TM waveform generator.

```
info(tmWaveGen)
```

```
ans = struct with fields:
         ActualCodeRate: 0.5000
       NumBitsPerSymbol: 2
    SubcarrierFrequency: []
```

Generate the input bits for the CCSDS TM waveform generator, and then generate the waveform.

```
bits = randi([0 1], tmWaveGen.NumInputBits*numTF,1);
waveform = tmWaveGen(bits);
```

Check the filter residual data samples that remain in the filter delay.

```
flushFilter(tmWaveGen)
```

```
ans = 100×1 complex

  -0.0772 - 0.0867i
  -0.0751 - 0.0859i
  -0.0673 - 0.0788i
  -0.0549 - 0.0654i
  -0.0388 - 0.0469i
  -0.0200 - 0.0250i
   0.0002 - 0.0012i
   0.0208 + 0.0227i
   0.0405 + 0.0453i
   0.0587 + 0.0653i
      ⋮
```

dvbrcs2WaveformGenerator

Generate DVB-RCS2 waveform

Description

The `dvbrcs2WaveformGenerator` System object generates a Digital Video Broadcasting Second Generation Return Channel over Satellite (DVB-RCS2) time-domain reference or a custom waveform. The object implements the waveform generation aspects of ETSI EN 301 545-2 V1.2.1 (2014-11) [1].

To generate a DVB-RCS2 waveform:

1. Create the `dvbrcs2WaveformGenerator` object and set its properties.
2. Call the object with arguments, as if it were a function.

To learn more about how System objects work, see What Are System Objects?

Creation

Syntax

```
rcs2WaveGen = dvbrcs2WaveformGenerator
rcs2WaveGen = dvbrcs2WaveformGenerator(Name,Value)
```

Description

`rcs2WaveGen = dvbrcs2WaveformGenerator` creates a default DVB-RCS2 waveform generator System object.

`rcs2WaveGen = dvbrcs2WaveformGenerator(Name,Value)` sets properties on page 4-19 using one or more name-value arguments. For example, `'TransmissionFormat',"SS-TC-LM"` specifies to generate a reference DVB-RCS2 waveform of spread spectrum turbo codes with linear modulation (SS-TC-LM) format.

Properties

Unless otherwise indicated, properties are *nontunable*, which means you cannot change their values after calling the object. Objects lock when you call them, and the `release` function unlocks them.

If a property is *tunable*, you can change its value at any time.

For more information on changing property values, see System Design in MATLAB Using System Objects.

`TransmissionFormat` — Transmission format
`"TC-LM"` (default) | `"SS-TC-LM"`

Transmission format, specified as one of these values.

- `"TC-LM"` — Turbo codes with linear modulation (TC-LM)
- `"SS-TC-LM"` — Spread spectrum turbo codes with linear modulation (SS-TC-LM)

Tunable: Yes

Data Types: `char` | `string`

`ContentType` — Frame PDU burst content type
`"traffic"` (default) | `"logon"` | `"control"`

Frame protocol data unit (PDU) burst content type, specified as `"traffic"`, `"logon"`, or `"control"`.

Data Types: `char` | `string`

`IsCustomWaveform` — Custom waveform indicator
`false` or `0` (default) | `true` or `1`

Custom waveform indicator, specified as one of these numeric or logical values.

- `0` (`false`) — Generate a standard-defined reference waveform. For details, refer to ETSI EN 301 545-2 V1.2.1 (2014-11) Annex A Tables A-1 and A-2 [1].
- `1` (`true`) — Generate a custom waveform.

Tunable: Yes

Data Types: `logical`

`WaveformID` — Reference waveform ID
`1` (default) | positive integer

Reference waveform ID, specified as one of these options.

- Integer in the range [1, 22] or [32, 49] — Use this option when you set the `TransmissionFormat` property to `"TC-LM"`.
- Integer in the range [1, 19] — Use this option when you set the `TransmissionFormat` property to `"SS-TC-LM"`.

Based on the `TransmissionFormat` and `WaveformID` properties, the System object considers the transmission parameters according to ETSI EN 301 545-2 Annex A Table A-1 and A-2 [1].

Tunable: Yes

Dependencies

To enable this property, set the `IsCustomWaveform` property to `false`.

Data Types: `double` | `unit8`

`PreBurstGuardLength` — Preburst guard length
`0` (default) | nonnegative integer

Preburst guard length, specified as a nonnegative integer. This length represents the number of zero-valued symbols in the guard time that are prefixed to the burst symbols, prior to the preamble.

A value of `0` indicates no guard symbols are prefixed.

Tunable: Yes

Data Types: `double`

`PostBurstGuardLength` — Postburst guard length
`0` (default) | nonnegative integer

Postburst guard length, specified as a nonnegative integer. This length represents the number of zero-valued symbols in the guard time that are suffixed to the burst symbols, after the postamble.

In absence of the postamble, these symbols are suffixed directly after the payload symbols.

Tunable: Yes

Data Types: `double`

`FilterSpanInSymbols` — Filter span in symbols
`10` (default) | positive integer

Filter span in symbols, specified as a positive integer.

The ideal impulse response of the raised cosine filter is truncated to a length that spans the number of symbols specified in this property.

Data Types: `double`

`SamplesPerSymbol` — Number of samples per symbol
`4` (default) | positive integer

Number of samples per symbol, specified as a positive integer.

Data Types: `double`

`PayloadLengthInBytes` — Payload length
`10` (default) | positive integer

Payload length in bytes, specified as one of these options.

- Integer in the range [3, 65,535] — Use this option when you set the `ContentType`property to `"control"` or `"logon"`.
- Integer in the range [5, 65,535] — Use this option when you set the `ContentType` property to `"traffic"`.

This length represents the size of the input data to the turbo encoder of this System object. Input data includes the frame PDU and the cyclic redundancy check (CRC) bits.

Tunable: Yes

Dependencies

To enable this property, set the `IsCustomWaveform` property to `true`.

Data Types: `double`

`MappingScheme` — Mapping scheme
`"pi/2-BPSK"` (default) | `"QPSK"` | `"8PSK"` | `"16QAM"`

Mapping scheme, specified as one of these values.

- `"pi/2-BPSK"`
- `"QPSK"`
- `"8PSK"`
- `"16QAM"`

Dependencies

To enable this property, set the `TransmissionFormat` property to `"TC-LM"` and the `IsCustomWaveform` property to `true`.

Note When you set the `TransmissionFormat` property to `"SS-TC-LM"`, the only valid value of `MappingScheme` is `"pi/2-BPSK"`.

Data Types: `char` | `string`

`CodeRate` — Code rate
`"1/3"` (default) | `"1/2"` | `"2/3"` | `"3/4"` | `"4/5"` | `"5/6"` | `"6/7"` | `"7/8"`

Code rate, specified as one of these values.

- `"2/3"`, `"3/4"`, `"4/5"`, `"5/6"`, `"6/7"`, or `"7/8"` — Use one of these values when you set the `MappingScheme` property to `"8PSK"`.
- `"3/4"`, `"4/5"`, `"5/6"`, `"6/7"`, or `"7/8"` — Use one of these values when you set the `MappingScheme` property to `"16QAM"`.

All code rates are applicable if `MappingScheme` property is set to `"pi/2-BPSK"` or `"QPSK"`.

This code rate is passed as an input to the turbo encoder function, that is, `dvbrcs2TurboEncode`, of this System object.

Tunable: Yes

Dependencies

To enable this property, set the `IsCustomWaveform` property to `true`.

Data Types: `char` | `string`

`PreambleLength` — Preamble length
8 (default) | integer in the range [0, 255]

Preamble length, specified as an integer in the range [0, 255].

When you set the `TransmissionFormat` property to `"TC-LM"`, the unit of preamble length is symbols. When you set the `TransmissionFormat` property to `"SS-TC-LM"`, the unit of preamble length is chips.

A preamble of this specified length is prefixed to the burst sequence, prior to the modulation.

Tunable: Yes

Dependencies

To enable this property, set the `IsCustomWaveform` property to `true`.

Data Types: `double`

`PostambleLength` — Postamble length
`8` (default) | integer in the range [0, 255]

Postamble length, specified as an integer in the range [0, 255].

When you set the `TransmissionFormat` property to `"TC-LM"`, the unit of postamble length is symbols. When you set the `TransmissionFormat` property to `"SS-TC-LM"`, the unit of postamble length is chips.

A postamble of this specified length is suffixed to the burst sequence, prior to the modulation.

Tunable: Yes

Dependencies

To enable this property, set the `IsCustomWaveform` property to `true`.

Data Types: `double`

`PilotPeriod` — Pilot period
`0` (default) | integer in the range [0, 4095]

Pilot period, specified as an integer in the range [0, 4095]. A value of `0` indicates no pilots are inserted.

When you set the `TransmissionFormat` property to `"TC-LM"`, the unit of pilot period is symbols. When you set the `TransmissionFormat` property to `"SS-TC-LM"`, the unit of pilot period is chips.

The pilot period represents the length of the sequence from first symbol of a pilot block to the first symbol of the next pilot block in symbols or chips.

Tunable: Yes

Dependencies

To enable this property, set the `IsCustomWaveform` property to `true`.

Data Types: `double`

`PilotBlockLength` — Pilot block length
`1` (default) | integer in the range [1, 255]

Pilot block length, specified as an integer in the range [1, 255].

After every `PilotPeriod` symbols or chips, a pilot block of this specified length is added in the burst sequence.

Tunable: Yes

Dependencies

To enable this property, set the `IsCustomWaveform` property to `true` and `PilotPeriod` property to a positive integer.

Data Types: `double`

`PermutationParameters` — Permutation control parameters
`[9 0 0 0 0]` (default) | vector

Permutation control parameters that the dvbrcs2WaveformGenerator uses to generate turbo encoder interleaver indices, specified as a five-element vector in order: P, Q_0, Q_1, Q_2, and Q_3. P must be in the range [9, 255], and Q_0, Q_1, Q_2, and Q_3 must be in the range [0, 15].

To generate unique interleaver indices, the value of P must be co-prime to `PayloadLengthInBytes`*4.

Tunable: Yes

Dependencies

To enable this property, set the `IsCustomWaveform` property to `true`.

Data Types: `double`

`UniqueWord` — Unique word
`"FFFF"` (default) | character array | string scalar

Unique word, specified as a character array or string scalar.

A unique word is a string of hexadecimal values that include the combination of the preamble, one pilot block, and the postamble sequence. Pilots are included only when you set the `PilotPeriod` property as nonzero.

To know the minimum required length of the unique word, use this formula.

`ceil`((`PreambleLength` + `PostambleLength` + `PilotBlockLength`)*bps/4); where bps is the bits per seconds, determined by the `MappingScheme` specified.

For example, if `PreambleLength = 9`, `PostambleLength = 8`, `PilotBlockLength = 1`, and `MappingScheme = "QPSK"` (bps = 2) then the minimum required length of the unique word by using this formula:

`ceil`((9 + 8 + 1)*2/4) = 9 (hexadecimal values)

Tunable: Yes

Dependencies

To enable this property, set the `IsCustomWaveform` property to `true`.

Data Types: `char` | `string`

`SpreadingFactor` — Spreading factor
2 (default) | integer in the range [2, 16]

Spreading factor, specified as an integer in the range [2, 16].

Tunable: Yes

Dependencies

To enable this property, set the `TransmissionFormat` property to `"SS-TC-LM"` and the `IsCustomWaveform` property to `true`.

Data Types: `double`

`ScramblingPolynomial` — Scrambling polynomial
16-bit zero vector (default) | 16-bit vector of binary values | numeric vector

Scrambling polynomial, specified as one of these options.

- 16-bit vector of binary values from the most significant bit (MSB), z^{16}, to least significant bit (LSB), z^1. Each element of this vector corresponds to the coefficient of z and its exponent, specified from MSB to LSB. For details on the binary representation, see ETSI EN 301 545-2 Section 7.3.7.1.5.
- Numeric vector containing the exponents of z for nonzero terms of the polynomial in descending order.

The scrambling polynomial determines the shift register feedback connection to generate the spreading sequence.

The coefficient of z^0 is always 1.

The default value of this scrambling polynomial indicates the default scrambling sequence provided in the standard. When you set the `TransmissionFormat` property to `"SS-TC-LM"` and the `IsCustomWaveform` property to `false`, all of the reference waveforms use this default scrambling sequence.

Tunable: Yes

Dependencies

To enable this property, set the `TransmissionFormat` property to `"SS-TC-LM"` and the `IsCustomWaveform` property to `true`.

Data Types: `double` | `logical`

`ScramblingInitialConditions` — Scrambling initial conditions
`[1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1]` (default) | `1` | 16-bit vector of binary values

Scrambling initial conditions of the shift register, specified as one of these options.

- `1` — Use this option to set the initial condition of each cell of the shift register to this value.
- 16-bit vector of binary values from the MSB (z^{16}) to LSB (z^1) — Use this option to set the initial condition of each cell of the shift register to the corresponding element in this vector.

For this System object to generate a nonzero sequence, you must specify at least one nonzero element in this vector.

Tunable: Yes

Dependencies

To enable this property, set the `TransmissionFormat` property to `"SS-TC-LM"` and the `ScramblingPolynomial` property to a value other than the default value.

Data Types: `double` | `logical`

`FramePDULength` — Frame PDU length
`48` (default) | positive integer

This property is read-only.

Frame PDU length, returned as a positive integer.

The frame PDU length indicates the length in bits of the input data to this System object. This length is calculated by subtracting the length of the CRC sequence from the payload length in bits.

Data Types: `double`

Usage

Syntax

`burst = rcs2WaveGen(pdu)`

Description

`burst = rcs2WaveGen(pdu)` generates a DVB-RCS2-based burst symbols for the corresponding input binary sequence.

Input Arguments

pdu — Frame PDU
binary-valued column vector

Frame PDU, specified as a binary-valued column vector.

Data Types: `double` | `logical`

Output Arguments

`burst` — DVB-RCS2-based burst samples
column vector

DVB-RCS2-based burst samples, returned as a column vector.

The System object outputs these burst symbols (including the guard symbols) post modulation and pulse shaping.

Data Types: `double`

Object Functions

To use an object function, specify the System object as the first input argument. For example, to release system resources of a System object named `obj`, use this syntax:

```
release(obj)
```

Specific to `dvbrcs2WaveformGenerator`

info	Characteristic information about object

Common to All System Objects

step	Run System object algorithm

release	Release resources and allow changes to System object property values and input characteristics
clone	Create duplicate System object
isLocked	Determine if System object is in use
reset	Reset internal states of System object

Examples

Generate Reference DVB-RCS2 Waveform

Generate a reference DVB-RCS2 time-domain waveform with SS-TC-LM format.

Create and then set the properties of a DVB-RCS2 waveform generator System object™.

```
wg = dvbrcs2WaveformGenerator;
wg.TransmissionFormat = "SS-TC-LM";
wg.ContentType = "logon";
wg.WaveformID = 10;
wg.SamplesPerSymbol = 6;
```

Display the properties of the waveform generator.

```
disp(wg)
```

```
  dvbrcs2WaveformGenerator with properties:

      TransmissionFormat: "SS-TC-LM"
             ContentType: "logon"
        IsCustomWaveform: false
              WaveformID: 10
     PreBurstGuardLength: 0
    PostBurstGuardLength: 0
     FilterSpanInSymbols: 10
        SamplesPerSymbol: 6

  Use get to show all properties
```

Generate a frame PDU.

```
framePDU = randi([0 1],wg.FramePDULength,1);
```

Generate the DVB-RCS2-based burst samples.

```
txWaveform = wg(framePDU);
```

Generate Custom DVB-RCS2 Waveform

Generate a custom DVB-RCS2 time-domain waveform having TC-LM format.

Create and then set the properties of the DVB-RCS2 waveform generator System object™.

```
wg = dvbrcs2WaveformGenerator;
wg.IsCustomWaveform = true;
wg.ContentType = "control";
wg.MappingScheme = "QPSK";
wg.CodeRate = "2/3";
wg.PreambleLength = 10;
wg.PostambleLength = 8;
wg.PermutationParameters = [13 4 2 1 2];
wg.UniqueWord = "FFFFFFFFF";
```

Display the properties of the waveform generator.

```
disp(wg)
```

```
  dvbrcs2WaveformGenerator with properties:

      TransmissionFormat: "TC-LM"
             ContentType: "control"
        IsCustomWaveform: true
     PreBurstGuardLength: 0
    PostBurstGuardLength: 0
     FilterSpanInSymbols: 10
        SamplesPerSymbol: 4
    PayloadLengthInBytes: 10

  Use get to show all properties
```

Generate a frame PDU.

```
framePDU = randi([0 1],wg.FramePDULength,1);
```

Generate the DVB-RCS2-based burst samples.

```
txWaveform = wg(framePDU);
```

Generate Multiple Content Type DVB-RCS2 Bursts

Generate multiple `ContentType` DVB-RCS2 bursts.

Set the `ContentType` of the DVB-RCS2 waveform generator System Object™ as `logon`.

```
wg = dvbrcs2WaveformGenerator;
wg.ContentType = "logon";
```

Generate a frame PDU.

```
framePDU1 = randi([0 1],wg.FramePDULength,1);
```

Generate the DVB-RCS2 logon burst samples.

```
txWaveform1 = wg(framePDU1);
```

Now, generate the DVB-RCS2 traffic burst samples.

```
% ContentType property is tunable
wg.ContentType = "traffic";
framePDU2 = randi([0 1],wg.FramePDULength,1);
txWaveform2 = wg(framePDU2);
```

dvbs2WaveformGenerator

Generate DVB-S2 waveform

Description

The `dvbs2WaveformGenerator` System object generates a Digital Video Broadcasting Satellite Second Generation (DVB-S2) time-domain waveform consisting of a single or multiple physical layer frames. The object implements the waveform generation aspects of ETSI EN 302 307-1 V1.4.1 (2014-11) [1].

To generate a DVB-S2 waveform:

1. Create the `dvbs2WaveformGenerator` object and set its properties.
2. Call the object with arguments, as if it were a function.

To learn more about how System objects work, see What Are System Objects?

Creation

Syntax

```
s2waveGen = dvbs2WaveformGenerator
s2waveGen = dvbs2WaveformGenerator(Name,Value)
```

Description

`s2waveGen = dvbs2WaveformGenerator` creates a default DVB-S2 waveform generator System object.

`s2waveGen = dvbs2WaveformGenerator(Name,Value)` sets properties using one or more name-value pairs. Enclose each property name in quotes. For example, `dvbs2WaveformGenerator('NumInputStreams',4,'UPL',100)` specifies four input streams, each with a user packet length of 100 bits.

Properties

Unless otherwise indicated, properties are *nontunable*, which means you cannot change their values after calling the object. Objects lock when you call them, and the `release` function unlocks them.

If a property is *tunable*, you can change its value at any time.

For more information on changing property values, see System Design in MATLAB Using System Objects.

`StreamFormat` — Input stream format
`"TS"` (default) | `"GS"`

Input stream format, specified as one of these values.

- `"TS"` — For transport stream format
- `"GS"` — For generic stream format

Data Types: `char` | `string`

`NumInputStreams` — Number of input streams
`1` (default) | integer in the range [1, 256]

Number of input streams, specified as an integer in the range [1, 256].

Data Types: `double`

`UPL` — User packet length
`0` (default) | nonnegative integer | vector of nonnegative integers

User packet (UP) length in bits, specified as one of these options.

- Nonnegative integer — Use this option with single-input and multi-input streams. If you set the `NumInputStreams` property to a value greater than 1, the UP in each stream must be equal to the integer value of the `UPL` property.
- Vector of nonnegative integers — Use this option with multi-input streams only. If you set the `NumInputStreams` property to a value greater than 1, the UP in each stream must be the size of the corresponding element in this vector. The length of this vector must be equal to `NumInputStreams`.

Note When you specify `UPL` as a multi-input stream, all UPs must be either packetized or in a continuous stream. Mixing stream types is not supported.

The maximum value of `UPL` as an integer scalar or an integer element in the row vector must be less than or equal to the corresponding `DFL` property value.

For a generic continuous stream, set `UPL` to `0`.

Dependencies

To enable this property, set the `StreamFormat` property to `"GS"`. If you set the `StreamFormat` property to `"TS"`, the UPL is fixed to 1504 bits.

Data Types: `double`

`FECFrame` — FEC frame format
`"normal"` (default) | `"short"`

Forward error correction (FEC) frame format, specified as one of these two options.

- `"normal"` — Sets the low density parity-check (LDPC) codeword length to 64,800 bits
- `"short"` — Sets the LDPC codeword length to 16,200 bits

Tunable: Yes

Data Types: `char` | `string`

`MODCOD` — Modulation scheme and FEC rate
`1` (default) | integer in the range [1, 28] | vector of integers in the range [1, 28]

Modulation scheme and FEC rate for input transmission, specified as one of these options, as defined in ETSI EN 302 307-1 Section 5.5.2.2 Table 12 [1].

- Integer in the range [1, 28] — Use this option with single-input and multi-input streams. If you set the `NumInputStreams` property to a value greater than 1, each stream has the same modulation scheme and coding rate.
- Vector of integers in the range [1, 28] — Use this option with multi-input streams only. If you set the `NumInputStreams` property to a value greater than 1, each input stream has a modulation scheme and coding rate equal to the corresponding element in this vector. The length of this vector must be equal to `NumInputStreams`.

Note `MODCOD` values `11`, `17`, `23`, and `28` are not valid when you set the `FECFrame` property to `"short"` (as specified in ETSI EN 302 307-1 Section 5.3 Table 5b [1]).

Tunable: Yes

Data Types: `double`

`DFL` — Data field length

`15,928` (default) | integer in the range [1, (K_{BCH}−80)] | vector of integers in the range [1, (K_{BCH}−80)]

Data field (DF) length in bits, specified as one of these options. K_{BCH} is the uncoded BCH block length, as specified in ETSI EN 302 307-1 Section 5.3 Table 5a and 5b [1].

- Integer in the range [1, (K_{BCH}−80)] — Use this option with single-input and multi-input streams. If you set the `NumInputStreams` property to a value greater than 1, the length of the DF in baseband frame of each stream is the same value.
- Vector of integers in the range [1, (K_{BCH}−80)] — Use this option with multi-input streams only. If you set the `NumInputStreams` property to a value greater than 1, the length of the data field in the baseband frame of each stream must be the size of the corresponding element in this vector. The length of this vector must be equal to `NumInputStreams`.

Tunable: Yes

Data Types: `double`

`ScalingMethod` — Constellation amplitude scaling method

`"outer radius as 1"` (default) | `"unit average power"`

Constellation amplitude scaling method, specified as `"outer radius as 1"` or `"unit average power"`.

Dependencies

To enable this property, set the `MODCOD` property to a value in the range [18, 28], which indicates only 16APSK and 32APSK modulation schemes.

Data Types: `char` | `string`

`HasPilots` — Pilot block indication

`0` or `false` (default) | `1` or `true` | vector of `logical` values

Pilot block indication, specified as a logical value of `0` (`false`), `1` (`true`), or a vector of `logical` values. Set this value to `1` (`true`) to indicate pilots are inserted in the physical layer frame.

If you set the NumInputStreams property to a value greater than 1, you can configure pilots for each stream by specifying this property as a vector. The length of this vector must be equal to NumInputStreams.

Tunable: Yes

Data Types: logical

RolloffFactor — Transmit filter roll-off factor
0.35 (default) | 0.25 | 0.2

Transmit filter roll-off factor for baseband pulse shaping, specified as 0.35, 0.25, or 0.2.

Data Types: double

FilterSpanInSymbols — Filter span in symbols
10 (default) | positive integer

Filter span in symbols, specified as a positive integer.

The ideal impulse response of the raised cosine filter is truncated to a length that spans the number of symbols specified in this property.

Data Types: double

SamplesPerSymbol — Number of samples per symbol
4 (default) | positive integer

Number of samples per symbol, specified as a positive integer.

Data Types: double

ISSYI — Input stream synchronization indicator
0 or false (default) | 1 or true

Input stream synchronization (ISSY) indicator, specified as a logical value of 0 (false) or 1 (true). To indicate that input stream synchronization is used, set this value to 1 (true).

Dependencies

To enable this property, set the NumInputStreams property to a value greater than 1 and set the UPL property to a nonzero value.

Data Types: logical

ISCRFormat — Input stream clock reference format
"short" (default) | "long"

Input stream clock reference format, specified as one of these options.

- "short" — Indicates the length of ISSY as 2 bytes
- "long" — Indicates the length of ISSY as 3 bytes

When you set the StreamFormat property to "GS", NumInputStreams property to a value greater than 1, UPL property to a nonzero value, and ISSYI to 1 (true), only the "short" option of this ISCRFormat property is applicable.

Dependencies

To enable this property, set the `StreamFormat` property to `"TS"`, the `NumInputStreams` property to a value greater than 1, and the `ISSYI` property to `1` (`true`).

Data Types: `char` | `string`

`MinNumPackets` — Minimum number of packets required to create DF

integer in the range [1, 58,112] | row vector of integers

This property is read-only.

Minimum number of packets required to create a DF, returned as one of these options.

- Integer in the range [1, 58,112] — This option applies with single-input streams only.
- Row vector of integers in the range [1, 58,112] — This option applies with multi-input streams only. If you set the `NumInputStreams` property to a value greater than 1, the minimum number of packets required for each stream is equal to the corresponding element in this vector. The length of this vector must be equal to `NumInputStreams`.

The value of `MinNumPackets` is computed based of values of `DFL` and `UPL` properties.

Dependencies

To enable this property, set the `UPL` property to a nonzero value.

Data Types: `double`

Usage

Syntax

`txWaveform = s2waveGen(data)`

Description

`txWaveform = s2waveGen(data)` generates a DVB-S2 time-domain waveform from the input information bits.

Input Arguments

`data` — Input information bits

[ ] | binary-valued column vector | cell array of binary-valued column vectors

Input information bits, specified as one of these options. Each element of the column vector or cell array can be of data type `double`, `int8`, or `logical`.

- Binary-valued column vector — Use this option with single-input streams.

  To generate a dummy physical layer (PL) frame, specify `data` as an empty column vector.
- Cell array of binary-valued column vectors — Use this option with multi-input streams. Each element of the array represents the corresponding input stream. The length of the cell array must be equal to the value of the `NumInputStreams` property.

To generate a dummy frame for a particular input stream, specify the corresponding element of the `data` cell array as an empty column vector.

Input `data`, either as a single-input or multi-input stream, must be input in one of these forms.

- Packetized stream — The number of packets in each stream must be an integer multiple of the `MinNumPackets` property.

  For a packetized stream, an 8-bit sync field must be included at the beginning of each packet. The combined length of a packet and its sync bits must be equal to the corresponding value of the `UPL` property.
- Continuous stream — The number of bits for each stream must be an integer multiple of the `DFL` property.

Note When you set the `StreamFormat` property to `"TS"`, the sync byte is fixed as 47 hex.

Data Types: `double` | `int8` | `logical` | `cell`

Output Arguments

`txWaveform` — Generated time-domain DVB-S2 waveform
column vector

Generated time-domain DVB-S2 waveform, returned as a column vector. The waveform is generated in the form of complex in-phase quadrature (IQ) samples and can consist of a single physical layer frame or multiple physical layer frames.

When you set the `NumInputStreams` property to a value greater than 1, the data fields generated from different input streams are merged using the round-robin technique.

Data Types: `double`

Object Functions

To use an object function, specify the System object as the first input argument. For example, to release system resources of a System object named `obj`, use this syntax:

```
release(obj)
```

Specific to `dvbs2WaveformGenerator`

info	Characteristic information about object
flushFilter	Flush transmit filter

Common to All System Objects

step	Run System object algorithm
release	Release resources and allow changes to System object property values and input characteristics
clone	Create duplicate System object
isLocked	Determine if System object is in use
reset	Reset internal states of System object

Examples

Generate DVB-S2 Waveform for Single-Input Stream

Generate a Digital Video Broadcasting Satellite Second Generation (DVB-S2) time-domain waveform for a single-input transport stream (TS) with a single physical layer (PL) frame per stream. Visualize the waveform using constellation plots and signal spectrum.

This example uses MAT-files with LDPC parity matrices. If the MAT-files are not available on the path, download and unzip the MAT-files by entering this code at the MATLAB command prompt.

```
if ~exist('dvbs2xLDPCParityMatrices.mat','file')
    if ~exist('s2xLDPCParityMatrices.zip','file')
        url = 'https://ssd.mathworks.com/supportfiles/spc/satcom/DVB/s2xLDPCParityMatrices.zip';
        websave('s2xLDPCParityMatrices.zip',url);
        unzip('s2xLDPCParityMatrices.zip');
    end
addpath('s2xLDPCParityMatrices');
end
```

Specify the number of PL frames per stream.

```
numFrames = 1;
```

Create a DVB-S2 System object. Specify the modulation scheme and FEC rate (MODCOD) and data field length (DFL).

```
 s2WaveGen = dvbs2WaveformGenerator;
 s2WaveGen.MODCOD = 21;              % 16APSK 5/6
 s2WaveGen.DFL = 39690;
 s2WaveGen.HasPilots = true;         % Pilot insertion indication
 disp(s2WaveGen)

  dvbs2WaveformGenerator with properties:

           StreamFormat: "TS"
        NumInputStreams: 1
               FECFrame: "normal"
                 MODCOD: 21
                    DFL: 39690
          ScalingMethod: "outer radius as 1"
              HasPilots: 1
          RolloffFactor: 0.3500
    FilterSpanInSymbols: 10
       SamplesPerSymbol: 4

  Show all properties
```

Create a bit vector of information bits, `data`, of concatenated TS user packets.

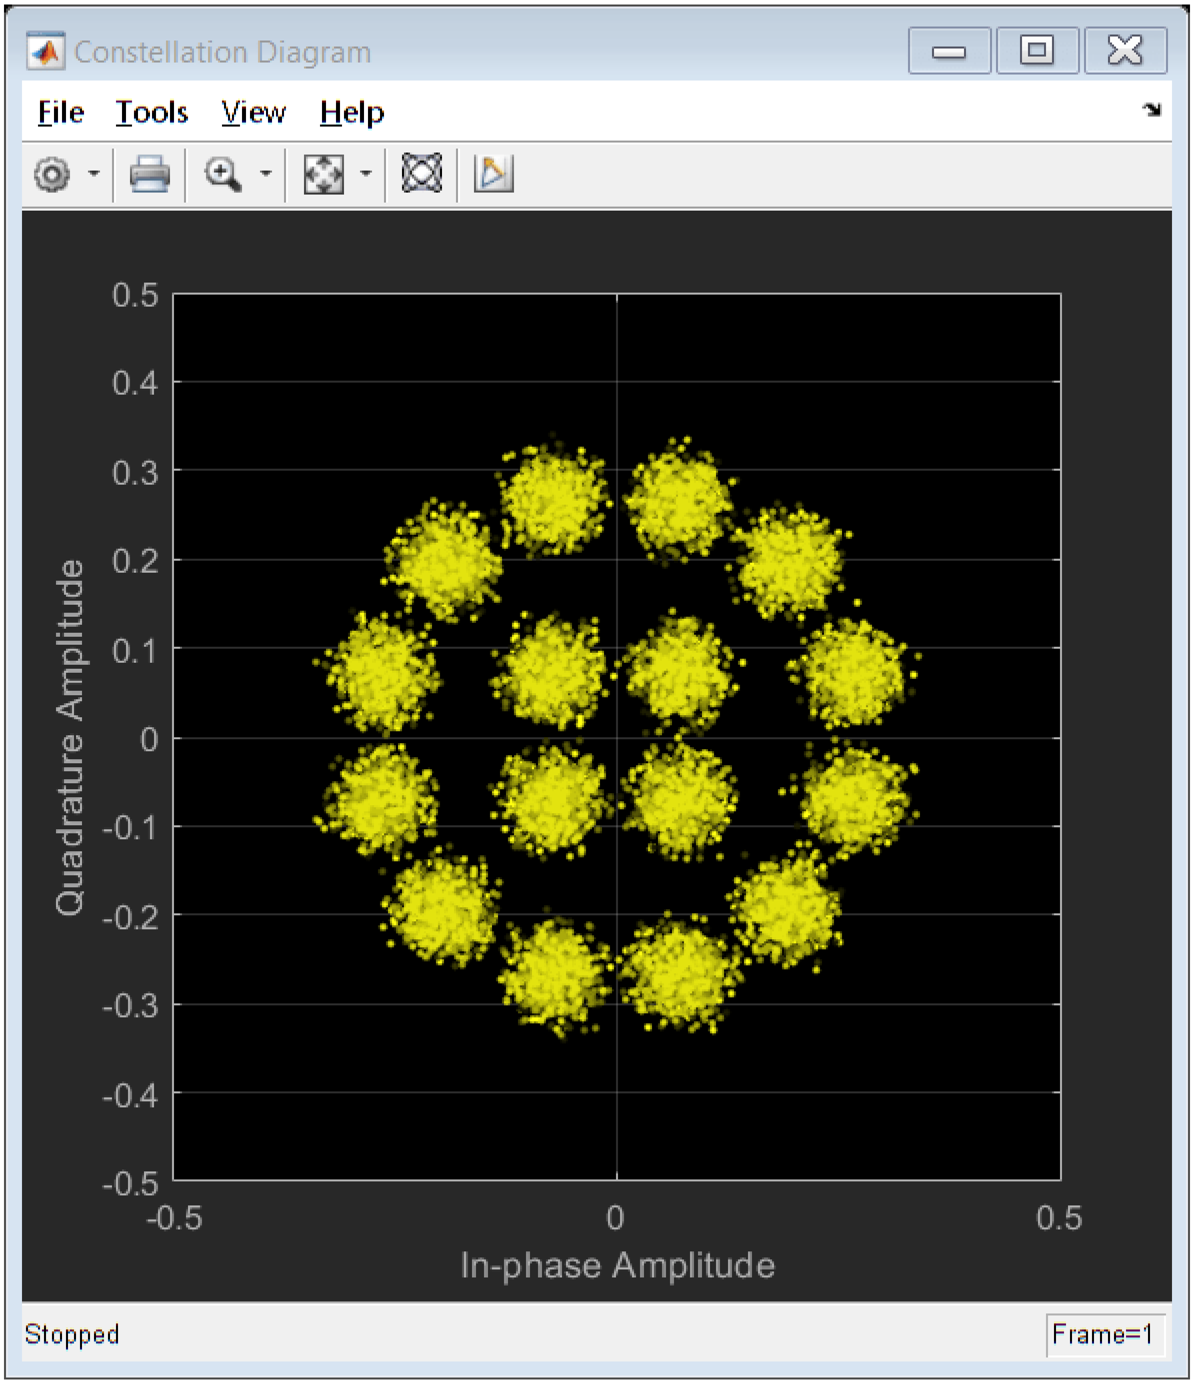
```
syncBits = [0 1 0 0 0 1 1 1]';    % Sync byte for TS packet is 47 Hex
pktLen = 1496;                    % UP length without sync bits is 1496
numPkts = s2WaveGen.MinNumPackets*numFrames;
txRawPkts = randi([0 1],pktLen,numPkts);
txPkts = [repmat(syncBits,1,numPkts); txRawPkts];
data = txPkts(:);
```

Generate a DVB-S2 time-domain waveform using the information bits, `data`.

```
txWaveform = s2WaveGen(data);
```

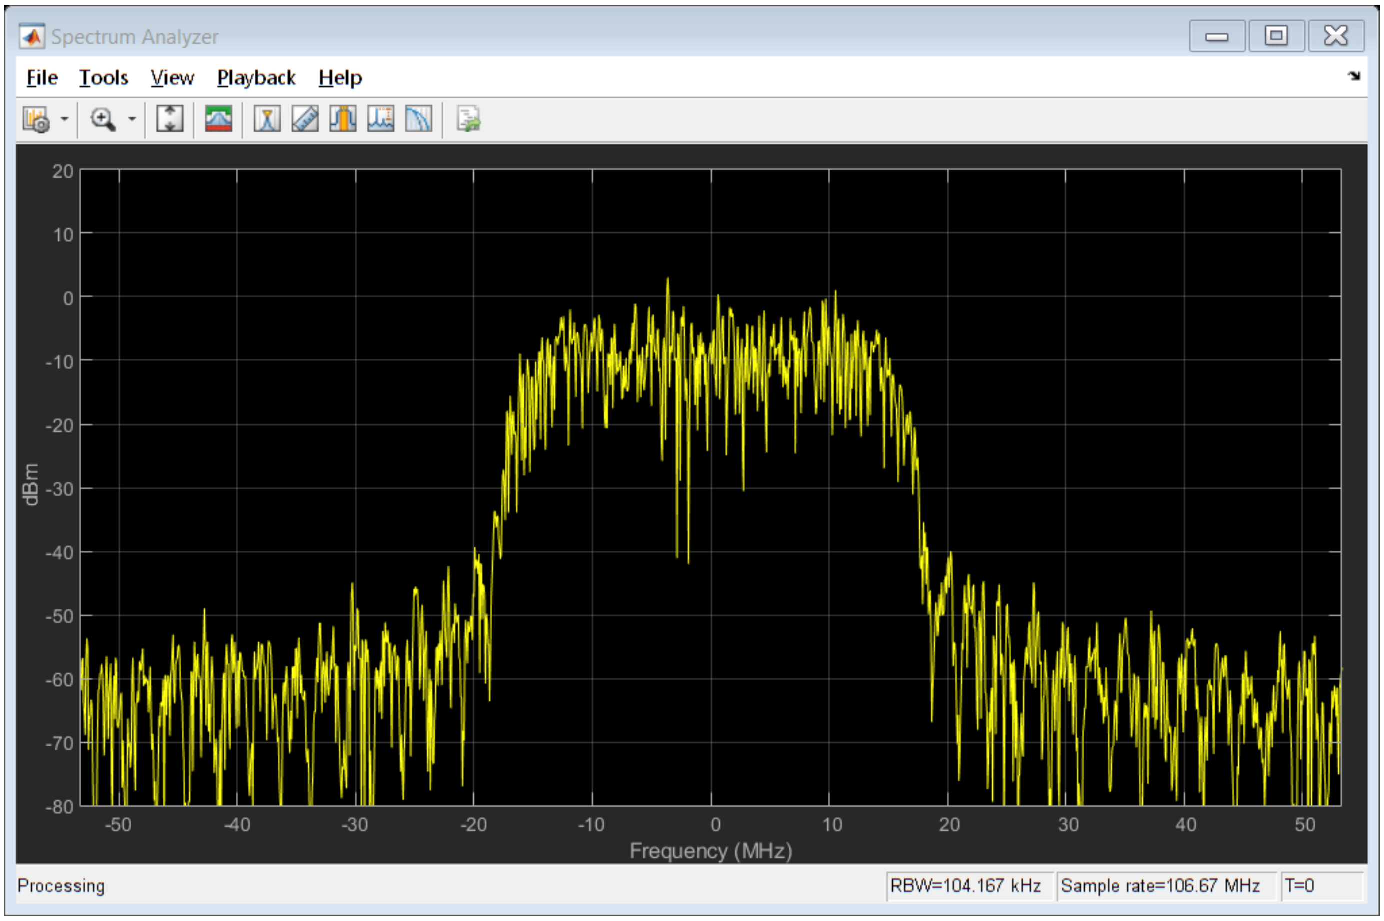
Visualize the constellation plot for the generated DVB-S2 time-domain waveform by creating a comm.ConstellationDiagram System object.

```
sps = s2WaveGen.SamplesPerSymbol;
constel = comm.ConstellationDiagram('ColorFading',true, ...
    'ShowTrajectory',0, ...
    'SamplesPerSymbol',sps, ...
    'ShowReferenceConstellation',false, ...
    'XLimits',[-0.5 0.5], 'YLimits',[-0.5 0.5]);
plHeaderLen = 90*sps;           % PL header length
constel(txWaveform(plHeaderLen+1:end));
release(constel);
```



Display the frequency spectrum of the generated DVB-S2 time-domain waveform by creating a `dsp.SpectrumAnalyzer` System object.

```
BW = 36e6;                 % Typical satellite channel bandwidth
Fsym = BW/(1+s2WaveGen.RolloffFactor);
Fsamp = Fsym*sps;
scope = dsp.SpectrumAnalyzer('SampleRate',Fsamp);
scope(txWaveform)
```



Generate DVB-S2 Waveform for Multi-Input Stream

Generate a Digital Video Broadcasting Satellite Second Generation (DVB-S2) time-domain waveform for a multi-input generic stream (GS) with multiple physical layer (PL) frames per stream.

This example requires MAT-files with LDPC parity matrices. If they are not available on the path, execute the following commands to download and unzip the MAT-files.

```
if ~exist('dvbs2xLDPCParityMatrices.mat','file')
    if ~exist('s2xLDPCParityMatrices.zip', 'file')
        url = 'https://ssd.mathworks.com/supportfiles/spc/satcom/DVB/s2xLDPCParityMatrices.zip';
        websave('s2xLDPCParityMatrices.zip',url);
        unzip('s2xLDPCParityMatrices.zip');
    end
addpath('s2xLDPCParityMatrices');
end
```

Specify the number of PL frames per stream.

```
numFrames = 3;
```

Create a DVB-S2 System object with variable coding and modulation configuration for a multi-input GS. Specify the modulation scheme and FEC rate (MODCOD) and data field length (DFL).

```
s2WaveGen = dvbs2WaveformGenerator;
s2WaveGen.StreamFormat = "GS";
s2WaveGen.NumInputStreams = 2;
s2WaveGen.MODCOD = [6 24];          % QPSK 2/3 and 32APSK 3/4
s2WaveGen.DFL = [42960 48328];
s2WaveGen.HasPilots = true;
s2WaveGen.SamplesPerSymbol = 10;
disp(s2WaveGen)
```

```
  dvbs2WaveformGenerator with properties:

           StreamFormat: "GS"
        NumInputStreams: 2
                    UPL: 0
               FECFrame: "normal"
                 MODCOD: [6 24]
                    DFL: [42960 48328]
          ScalingMethod: "outer radius as 1"
              HasPilots: 1
          RolloffFactor: 0.3500
      FilterSpanInSymbols: 10
       SamplesPerSymbol: 10
```

Create a bit vector of input information bits for each GS user packet.

```
data = cell(s2WaveGen.NumInputStreams,1);
   for i = 1:s2WaveGen.NumInputStreams
           data{i} = randi([0 1],s2WaveGen.DFL(i)*numFrames,1,'int8');
   end
```

Generate the DVB-S2 time-domain waveform with the input information bits.

```
txWaveform = s2WaveGen(data);
```

Generate DVB-S2 Dummy PL Frame

Generate a DVB-S2 dummy PL frame for a single-input transport stream.

This example uses MAT-files with LDPC parity matrices. If the MAT-files are not available on the path, download and unzip the MAT-files by entering this code at the MATLAB command prompt.

```
if ~exist('dvbs2xLDPCParityMatrices.mat','file')
    if ~exist('s2xLDPCParityMatrices.zip','file')
        url = 'https://ssd.mathworks.com/supportfiles/spc/satcom/DVB/s2xLDPCParityMatrices.zip';
        websave('s2xLDPCParityMatrices.zip',url);
        unzip('s2xLDPCParityMatrices.zip');
    end
addpath('s2xLDPCParityMatrices');
end
```

Create a default DVB-S2 System object.

```
s2WaveGen = dvbs2WaveformGenerator;
```

Generate a PL dummy frame.

```
data = zeros(0,1);
```

Generate a DVB-S2 waveform.

```
txWaveform = s2WaveGen(data);
```

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using MATLAB® Coder™.

Usage notes and limitations:

- For all properties that support string and cell array input, code generation is only supported with cell array input.
- See "System Objects in MATLAB Code Generation" (MATLAB Coder).

Introduced in R2021a

dvbs2xWaveformGenerator

Generate DVB-S2X waveform

Description

The `dvbs2xWaveformGenerator` System object generates a Digital Video Broadcasting Satellite Second Generation extended (DVB-S2X) time-domain waveform consisting of a single or multiple physical layer (PL) frames. The object implements the waveform generation aspects of ETSI EN 302 307-2 V1.1.1 (2015-11) [2].

To generate a DVB-S2X waveform:

1. Create the `dvbs2xWaveformGenerator` object and set its properties.
2. Call the object with arguments, as if it were a function.

To learn more about how System objects work, see What Are System Objects?

Creation

Syntax

```
s2xWaveGen = dvbs2xWaveformGenerator
s2xWaveGen = dvbs2xWaveformGenerator(Name,Value)
```

Description

`s2xWaveGen = dvbs2xWaveformGenerator` creates a default DVB-S2X waveform generator System object.

`s2xWaveGen = dvbs2xWaveformGenerator(Name,Value)` sets properties using one or more name-value pairs. Enclose each property name in quotes. For example, `dvbs2xWaveformGenerator('NumInputStreams',4,'UPL',100)` specifies four input streams, each with a user packet length of 100 bits.

Properties

Unless otherwise indicated, properties are *nontunable*, which means you cannot change their values after calling the object. Objects lock when you call them, and the `release` function unlocks them.

If a property is *tunable*, you can change its value at any time.

For more information on changing property values, see System Design in MATLAB Using System Objects.

`StreamFormat` — Input stream format
`"TS"` (default) | `"GS"`

Input stream format, specified as one of these values.

- `"TS"` — For transport stream format
- `"GS"` — For generic stream format

Data Types: `char` | `string`

`HasTimeSlicing` — Time slicing indicator
`0` or `false` (default) | `1` or `true`

Time slicing indicator, specified as a logical value of `0` (`false`) or `1` (`true`). To indicate that time slicing transmission format is used, set this value to `1` (`true`).

If you set this property to `1` (`true`), you can set the `NumInputStreams` property to a maximum value of `8`.

Data Types: `logical`

`NumInputStreams` — Number of input streams
`1` (default) | integer in the range [1, 256]

Number of input streams, specified as an integer in the range [1, 256].

When you set the `HasTImeSlicing` property to `true`, `NumInputStreams` property can be specified to a maximum value of `8`.

Data Types: `double`

`UPL` — User packet length
`0` (default) | nonnegative integer | vector of nonnegative integers

User packet (UP) length in bits, specified as one of these options.

- Nonnegative integer — Use this option with single-input and multi-input streams. If you set the `NumInputStreams` property to a value greater than 1, the UP in each stream must be equal to the integer value of the `UPL` property.
- Vector of nonnegative integers — Use this option with multi-input streams only. If you set the `NumInputStreams` property to a value greater than 1, the UP in each stream must be the size of the corresponding element in this vector. The length of this vector must be equal to `NumInputStreams`.

Note When you specify `UPL` as a multi-input stream, all UPs must be either packetized or in a continuous stream. Mixing stream types is not supported.

The maximum value of `UPL` as an integer scalar or an integer element in the row vector must be less than or equal to the corresponding `DFL` property value.

For a generic continuous stream, set `UPL` to `0`.

Dependencies

To enable this property, set the `StreamFormat` property to `"GS"`. If you set the `StreamFormat` property to `"TS"`, the UPL is fixed to 1504 bits.

Data Types: `double`

`PLSDecimalCode` — PL signalling code information
`132` (default) | integer in the range [4, 249] | vector of integers in the range [4, 249]

PL signalling code information, in decimal format, specified as one of these options (as described in ETSI EN 302 307-1 Section 5.5.2.2 [1] and ETSI EN 302 307-2 Section 5.5.2.2 Table 17a [2]).

- Integer in the range [4, 249] — Use this option with single-input and multi-input streams. If you set the `NumInputStreams` property to a value greater than 1, each stream has the same modulation scheme and coding rate.
- Vector of integers in the range [4, 249] — Use this option with multi-input streams only. If you set the `NumInputStreams` property to a value greater than 1, each stream has a modulation scheme and coding rate equal to the corresponding element in this vector. The length of this vector must be equal to `NumInputStreams`.

All odd integer values are considered to include pilots in PL frames.

Note Few `PLSDecimalCode` values are invalid in this specified value range. Invalid values include {46, 47, 70, 71, 94, 95, 114, 128, 130, 176, 177, 188, 189, 192, 193, 196, and 197}.

To calculate the `PLSDecimalCode` property value for a DVB-S2X system configuration, use this formula.

`MODCOD`*4 + (0 - for normal `FECFrame`/1 - for short `FECFrame`)*2 + (0 - if `HasPilots` property value is `false`/1 - if `HasPilots` property value is `true`)

For example, if `MODCOD` = 18 (16APSK 2/3) with short FEC frame and pilots disabled, the value of `PLSDecimalCode` calculated by using this formula is:

`PLSDecimalCode` = 18*4 + 1*2 + 0 = 74

Note For very low signal to noise ratio (VL-SNR) frames, you must set the `PLSDecimalCode` property to either `129` or `131`, which indicates the VL-SNR set 1 or 2, respectively.

VL-SNR frames must not be combined with regular frames.

Tunable: Yes

Data Types: `double`

`CanonicalMODCODName` — Canonical modulation scheme and code rate name
`"QPSK 2/9"` (default) | character vector | string scalar | cell array | string array

Canonical modulation scheme and code rate name for VL-SNR frame transmission, specified as one of these options (as described in ETSI EN 302 307-2 Section 5.5.2.2 Table 18a [2]).

- Character vector or string scalar — Use this option with single-input and multi-input streams. If you set the `NumInputStreams` property to a value greater than 1, each stream has the same modulation scheme and coding rate.
- Cell array or string array — Use this option with multi-input streams only. If you set the `NumInputStreams` property to a value greater than 1, each input stream has a modulation scheme and coding rate equal to the corresponding value in this array. The length of this array must be equal to `NumInputStreams`.

Valid `CanonicalMODCODName` values include these options.

- `"QPSK 2/9"`, `"BPSK 1/5"`, `"BPSK 11/45"`, `"BPSK-S 1/5"`, `"BPSK-S 11/45"`, and `"BPSK 1/3"` — Applicable for VL-SNR set 1
- `"BPSK 1/5"`, `"BPSK 4/15"`, and `"BPSK 1/3"` — Applicable for VL-SNR set 2

Tunable: Yes

Dependencies

To enable this property, set the `PLSDecimalCode` property to either `129` (for VL-SNR set 1) or `131` (for VL-SNR set 2). This property applies for only VL-SNR frame transmissions.

Data Types: `char` | `string`

`DFL` — Data field length

`18,448` (default) | integer in the range [1, (K_{BCH}−80)] | vector of integers in the range [1, (K_{BCH}−80)]

Data field (DF) length in bits, specified as one of these options. K_{BCH} is the uncoded BCH block length, as specified in ETSI EN 302 307-1 Section 5.3 Table 5a and 5b [1].

- Integer in the range [1, (K_{BCH}−80)] — Use this option with single-input and multi-input streams. If you set the `NumInputStreams` property to a value greater than 1, the length of the DF in baseband frame of each stream is the same value.
- Vector of integers in the range [1, (K_{BCH}−80)] — Use this option with multi-input streams only. If you set the `NumInputStreams` property to a value greater than 1, the length of the data field in the baseband frame of each stream must be the size of the corresponding element in this vector. The length of this vector must be equal to `NumInputStreams`.

Tunable: Yes

Data Types: `double`

`ScalingMethod` — Constellation amplitude scaling method

`"outer radius as 1"` (default) | `"unit average power"`

Constellation amplitude scaling method, specified as `"outer radius as 1"` or `"unit average power"`.

Dependencies

To enable this property, set the `PLSDecimalCode` property to a value corresponding to APSK modulation, with the following as exception: {164, 165, 158, 159, 206, 207, 212, and 213}. The other exceptions are QPSK and 8 PSK values: {4 to 69, inclusive; 129; 131; 132 to 137, inclusive; 142 to 147, inclusive; 216 to 235, inclusive}.

Data Types: `char` | `string`

`PLScramblingIndex` — PL scrambling sequence index

integer in the range [0, 7] | vector of integers in the range [0, 7]

PL scrambling sequence index, specified as one of these options (as described in ETSI EN 302 307-2 Section 5.5.4 Table 19e [2]).

- Integer in the range [0, 7] — Use this option with single-input and multi-input streams.

  If you set the `NumInputStreams` property to a value greater than 1, each stream has the same value of PL scrambling index.

- Vector of integers in the range [0, 7] — Use this option when you set the `HasTimeSlicing` property to `true` for multi-input streams.

  If you set the `NumInputStreams` property to a value greater than 1, the PL scrambling index value of each stream must be equal to the corresponding element in this vector. The length of this vector must be equal to `NumInputStreams`.

To generate the PL scrambling sequence, the actual index used is `PLScramblingIndex`*10949.

Data Types: `double`

`RolloffFactor` — Transmit filter roll-off factor
`0.35` (default) | `0.05` | `0.1` | `0.15` | `0.2` | `0.25`

Transmit filter roll-off factor for baseband pulse shaping, specified as `0.35`, `0.05`, `0.1`, `0.15`, `0.2`, or `0.25`.

Data Types: `double`

`FilterSpanInSymbols` — Filter span in symbols
`10` (default) | positive integer

Filter span in symbols, specified as a positive integer.

The ideal impulse response of the raised cosine filter is truncated to a length that spans the number of symbols specified in this property.

Data Types: `double`

`SamplesPerSymbol` — Number of samples per symbol
`4` (default) | positive integer

Number of samples per symbol, specified as a positive integer.

Data Types: `double`

`ISSYI` — Input stream synchronization indicator
`0` or `false` (default) | `1` or `true`

Input stream synchronization (ISSY) indicator, specified as a logical value of `0` (`false`) or `1` (`true`). To indicate that input stream synchronization is used, set this value to `1` (`true`).

Dependencies

To enable this property, set the `NumInputStreams` property to a value greater than 1 and set the `UPL` property to a nonzero value.

Data Types: `logical`

`ISCRFormat` — Input stream clock reference format
`"short"` (default) | `"long"`

Input stream clock reference format, specified as one of these options.

- `"short"` — Indicates the length of ISSY as 2 bytes
- `"long"` — Indicates the length of ISSY as 3 bytes

When you set the `StreamFormat` property to `"GS"`, `NumInputStreams` property to a value greater than 1, `UPL` property to a nonzero value, and `ISSYI` to `1` (`true`), only the `"short"` option of this `ISCRFormat` property is applicable.

Dependencies

To enable this property, set the `StreamFormat` property to `"TS"`, the `NumInputStreams` property to a value greater than 1, and the `ISSYI` property to `1` (`true`).

Data Types: `char` | `string`

`MinNumPackets` — Minimum number of packets required to create DF
integer in the range [1, 58,112] | row vector of integers

This property is read-only.

Minimum number of packets required to create a DF, returned as one of these options.

- Integer in the range [1, 58,112] — This option applies with single-input streams only.
- Row vector of integers in the range [1, 58,112] — This option applies with multi-input streams only. If you set the `NumInputStreams` property to a value greater than 1, the minimum number of packets required for each stream is equal to the corresponding element in this vector. The length of this vector must be equal to `NumInputStreams`.

The value of `MinNumPackets` is computed based of values of `DFL` and `UPL` properties.

Dependencies

To enable this property, set the `UPL` property to a nonzero value.

Data Types: `double`

Usage

Syntax

`txWaveform = s2xWaveGen(data)`

Description

`txWaveform = s2xWaveGen(data)` generates a DVB-S2X time-domain waveform from the input information bits.

Input Arguments

`data` — Input information bits
[ ] | binary-valued column vector | cell array of binary-valued column vectors

Input information bits, specified as one of these options. Each element of the column vector or cell array can be of the data type `double`, `int8`, or `logical`.

- Binary-valued column vector – Use this option with single-input stream.

  To generate a dummy physical layer (PL) frame, specify `data` as an empty column vector.

- Cell array of binary-valued column vectors – Use this option with multi-input streams. Each element of the array represents the corresponding input stream. The length of the cell array must be equal to the value of the `NumInputStreams` property.

  To generate a dummy frame for a particular input stream, specify the corresponding element of the `data` cell array as an empty column vector.

`data`, either single stream or multi-stream, can be input in one of these forms.

- Packetized stream – The number of packets in each stream must be an integer multiple of the `MinNumPackets` property.

  For a packetized stream, an 8-bit sync field must be included at the beginning of each packet. The combined length of a packet and its sync bits must be equal to the corresponding value of the `UPL` property.
- Continuous Stream – The number of bits for each stream must be an integer multiple of the `DFL` property.

Note When you set the `StreamFormat` property to `"TS"`, the sync byte is fixed as 47 hex.

Data Types: `double` | `int8` | `logical` | `cell`

Output Arguments

`txWaveform` — Generated time-domain DVB-S2X waveform
column vector

Generated time-domain DVB-S2X waveform, returned as a column vector. The waveform is generated in the form of complex in-phase quadrature (IQ) samples and can consist of a single physical layer frame or multiple physical layer frames.

When you set the `NumInputStreams` property to a value greater than 1, the data fields generated from different input streams are merged using the round-robin technique.

Data Types: `double`

Object Functions

To use an object function, specify the System object as the first input argument. For example, to release system resources of a System object named `obj`, use this syntax:

```
release(obj)
```

Specific to `dvbs2xWaveformGenerator`

info	Characteristic information about object
flushFilter	Flush transmit filter

Common to All System Objects

step	Run System object algorithm
release	Release resources and allow changes to System object property values and input characteristics

clone	Create duplicate System object
isLocked	Determine if System object is in use
reset	Reset internal states of System object

Examples

Generate DVB-S2X Waveform for Single-Input Stream

Generate a Digital Video Broadcasting Satellite Second Generation extended (DVB-S2X) time-domain waveform for a single-input transport stream (TS) with a single physical layer (PL) frame per stream.

This example uses MAT-files with LDPC parity matrices. If the MAT-files are not available on the path, download and unzip the MAT-files by entering this code at the MATLAB command prompt.

```
if ~exist('dvbs2xLDPCParityMatrices.mat','file')
    if ~exist('s2xLDPCParityMatrices.zip','file')
        url = 'https://ssd.mathworks.com/supportfiles/spc/satcom/DVB/s2xLDPCParityMatrices.zip';
        websave('s2xLDPCParityMatrices.zip',url);
        unzip('s2xLDPCParityMatrices.zip');
    end
addpath('s2xLDPCParityMatrices');
end
```

Specify the number of PL frames per stream.

```
numFrames = 1;
```

Create a DVB-S2X System object with pilot-aided PL.

```
s2xWaveGen = dvbs2xWaveformGenerator;
s2xWaveGen.PLSDecimalCode = 133;      % QPSK 13/45
                                      % All odd PLSDecimalCode values are pilot aided
disp(s2xWaveGen)
```

```
  dvbs2xWaveformGenerator with properties:

           StreamFormat: "TS"
         HasTimeSlicing: false
        NumInputStreams: 1
         PLSDecimalCode: 133
                    DFL: 18448
      PLScramblingIndex: 0
          RolloffFactor: 0.3500
    FilterSpanInSymbols: 10
       SamplesPerSymbol: 4

  Show all properties
```

Create the bit vector of information bits, `data`, of concatenated TS user packets.

```
syncBits = [0 1 0 0 0 1 1 1]';    % Sync byte for TS packet is 47 Hex
pktLen = 1496;                    % UP length without sync bits is 1496
numPkts = s2xWaveGen.MinNumPackets*numFrames;
txRawPkts = randi([0 1],pktLen,numPkts);
txPkts = [repmat(syncBits,1,numPkts); txRawPkts];
data = txPkts(:);
```

Generate a DVB-S2X time-domain waveform using the information bits, `data`.

```
txWaveform = s2xWaveGen(data);
```

Generate DVB-S2X Waveform Consisting of VL-SNR Frame

Generate a Digital Video Broadcasting Satellite Second Generation extended (DVB-S2X) time-domain waveform for a single-input generic stream (GS) with multiple physical layer (PL) frames per stream.

The DVB-S2X waveform generated in this example consists of a very low signal to noise ratio (VL-SNR) frame of set 2.

This example uses MAT-files with LDPC parity matrices. If the MAT-files are not available on the path, download and unzip the MAT-files by entering this code at the MATLAB command prompt.

```
if ~exist('dvbs2xLDPCParityMatrices.mat','file')
    if ~exist('s2xLDPCParityMatrices.zip','file')
        url = 'https://ssd.mathworks.com/supportfiles/spc/satcom/DVB/s2xLDPCParityMatrices.zip';
        websave('s2xLDPCParityMatrices.zip',url);
        unzip('s2xLDPCParityMatrices.zip');
    end
addpath('s2xLDPCParityMatrices');
end
```

Specify the number of PL frames per stream.

```
numFrames = 2;
```

Create a DVB-S2X System object and specify its properties.

```
s2xWaveGen = dvbs2xWaveformGenerator;
s2xWaveGen.StreamFormat = "GS";
s2xWaveGen.PLSDecimalCode = 131;    % VL-SNR set 2
s2xWaveGen.CanonicalMODCODName = "BPSK 1/3";
s2xWaveGen.DFL = 5080;
s2xWaveGen.SamplesPerSymbol = 6;
disp(s2xWaveGen)
```

```
  dvbs2xWaveformGenerator with properties:

           StreamFormat: "GS"
         HasTimeSlicing: false
        NumInputStreams: 1
                    UPL: 0
         PLSDecimalCode: 131
    CanonicalMODCODName: "BPSK 1/3"
                    DFL: 5080
      PLScramblingIndex: 0
          RolloffFactor: 0.3500
    FilterSpanInSymbols: 10
       SamplesPerSymbol: 6
```

Create a bit vector of information bits for each stream.

```
data = randi([0 1],s2xWaveGen.DFL*numFrames,1,'int8');
```

Generate a DVB-S2X time-domain waveform using the information bits.

```
txWaveform = s2xWaveGen(data);
```

Get DVB-S2X Waveform Generator Information and Check Transmit Filter Delay

Get information from a `dvbs2xWaveformGenerator` System object by using the `info` function. Then retrieve the filter residual samples by using the `flushFilter` object function.

This example uses MAT-files with LDPC parity matrices. If the MAT-files are not available on the path, download and unzip the MAT-files by entering this code at the MATLAB command prompt.

```
if ~exist('dvbs2xLDPCParityMatrices.mat','file')
    if ~exist('s2xLDPCParityMatrices.zip','file')
        url = 'https://ssd.mathworks.com/supportfiles/spc/satcom/DVB/s2xLDPCParityMatrices.zip';
        websave('s2xLDPCParityMatrices.zip',url);
        unzip('s2xLDPCParityMatrices.zip');
    end
addpath('s2xLDPCParityMatrices');
end
```

Specify the number of physical layer (PL) frames per stream.

```
numFrames = 2;
```

Create a Digital Video Broadcasting Satellite Second Generation extended (DVB-S2X) System object and specify its properties. Use time slicing technique and variable coding and modulation configuration mode.

```
s2xWaveGen = dvbs2xWaveformGenerator();
s2xWaveGen.HasTimeSlicing = true;
s2xWaveGen.NumInputStreams = 2;
s2xWaveGen.PLSDecimalCode = [135 145];   % QPSK 9/20 and 8PSK 25/36
s2xWaveGen.DFL = [18048 44656];
s2xWaveGen.PLScramblingIndex = [0 1];
disp(s2xWaveGen)
```

```
  dvbs2xWaveformGenerator with properties:

           StreamFormat: "TS"
         HasTimeSlicing: true
        NumInputStreams: 2
         PLSDecimalCode: [135 145]
                    DFL: [18048 44656]
      PLScramblingIndex: [0 1]
          RolloffFactor: 0.3500
    FilterSpanInSymbols: 10
       SamplesPerSymbol: 4
                  ISSYI: false

  Show all properties
```

Get the characteristic information about the DVB-S2X waveform generator.

```
info(s2xWaveGen)
```

```
ans = struct with fields:
              FECFrame: {'normal'  'normal'}
      ModulationScheme: {'QPSK'  '8PSK'}
    LDPCCodeIdentifier: {'9/20'  '25/36'}
```

Create the bit vector of input information bits, `data`, of concatenated TS user packets for each input stream.

```
syncBits = [0 1 0 0 0 1 1 1]';       % Sync byte for TS packet is 47 Hex
pktLen = 1496;                       % UP length without sync bits is 1496
data =  cell(1, s2xWaveGen.NumInputStreams);
for i = 1:s2xWaveGen.NumInputStreams
    numPkts = s2xWaveGen.MinNumPackets(i)*numFrames;
    txRawPkts = randi([0 1], pktLen, numPkts);
    txPkts = [repmat(syncBits, 1, numPkts); txRawPkts];
    data{i} = txPkts(:);
end
```

Generate a DVB-S2X time-domain waveform using the information bits.

```
txWaveform = s2xWaveGen(data);
```

Check the filter residual data samples that remain in the filter delay.

```
flushFilter(s2xWaveGen)
```

```
ans = 40×1 complex

  -0.2412 - 0.0143i
  -0.2619 - 0.0861i
  -0.2726 - 0.1337i
  -0.2511 - 0.1597i
  -0.1851 - 0.1680i
  -0.0780 - 0.1602i
   0.0448 - 0.1288i
   0.1598 - 0.0751i
   0.2482 - 0.0049i
   0.3026 + 0.0702i
      ⋮
```

Generate DVB-S2X Dummy VL-SNR Frame

Generate a DVB-S2X dummy VL-SNR frame for a single-input transport stream.

This example uses MAT-files with LDPC parity matrices. If the MAT-files are not available on the path, download and unzip the MAT-files by entering this code at the MATLAB command prompt.

```
if ~exist('dvbs2xLDPCParityMatrices.mat','file')
    if ~exist('s2xLDPCParityMatrices.zip','file')
        url = 'https://ssd.mathworks.com/supportfiles/spc/satcom/DVB/s2xLDPCParityMatrices.zip';
        websave('s2xLDPCParityMatrices.zip',url);
        unzip('s2xLDPCParityMatrices.zip');
    end
```

```
addpath('s2xLDPCParityMatrices');
end
```

Create a default DVB-S2X System object.

```
s2xWaveGen = dvbs2xWaveformGenerator;
```

Specify the PLS decimal code value to indicate VL-SNR frame, and set the DFL value.

```
s2xWaveGen.PLSDecimalCode = 129;  % VL-SNR set 1
s2xWaveGen.DFL = 14128;
```

Generate a PL dummy frame.

```
data = zeros(0,1);
```

Generate a DVB-S2X waveform.

```
txWaveform = s2xWaveGen(data);
```

etsiRicianChannel

Filter input signal through multipath ETSI frequency-flat Rician fading channel

Description

The `etsiRicianChannel` System object filters an input signal through a multipath European Telecommunication Standards Institute (ETSI) frequency-flat Rician fading channel. For more information on the `etsiRicianChannel` fading model, see "Channel Model Block Diagram" on page 4-60.

To filter an input signal using a multipath ETSI Rician fading channel:

1. Create the `etsiRicianChannel` object and set its properties.
2. Call the object with arguments, as if it were a function.

To learn more about how System objects work, see What Are System Objects?

Creation

Syntax

```
chan = etsiRicianChannel
chan = etsiRicianChannel(Name,Value)
```

Description

`chan = etsiRicianChannel` creates a multipath ETSI frequency-flat Rician fading channel System object. This object filters a real or complex input signal through the multipath channel to obtain the channel-impaired signal.

`chan = etsiRicianChannel(Name,Value)` sets properties on page 4-54 using one or more name-value pairs. Enclose each property name in quotes. For example, `etsiRicianChannel("SampleRate",2)` sets the input signal sample rate to 2.

Properties

Unless otherwise indicated, properties are *nontunable*, which means you cannot change their values after calling the object. Objects lock when you call them, and the `release` function unlocks them.

If a property is *tunable*, you can change its value at any time.

For more information on changing property values, see System Design in MATLAB Using System Objects.

`SampleRate` — Input signal sample rate
1 (default) | positive scalar

Input signal sample rate in Hz, specified as a positive scalar.

Data Types: `double`

`KFactor` — Rician *K*-factor
`3` (default) | nonnegative nonzero scalar

Rician *K*-factor in dB, specified as a nonnegative nonzero scalar.

`KFactor` is the ratio of direct signal power to the total multipath power. For details, see “Channel Model Block Diagram” on page 4-60.

Data Types: `double`

`MaximumDopplerShift` — Maximum Doppler shift for channel path
`0.001` (default) | nonnegative scalar

Maximum Doppler shift for the channel path, specified as a nonnegative scalar. Units are in hertz.

When you set this property to `0`, the channel remains static for the entire input. You can use the `reset` object function to generate a new channel realization. The `MaximumDopplerShift` property value must be smaller than `SampleRate`/10.

Data Types: `double`

`NumSinusoids` — Number of sinusoids used
`48` (default) | positive integer

Number of sinusoids used to model the fading process, specified as a positive integer.

Data Types: `double`

`RandomStream` — Source of random number stream
`"Global stream"` (default) | `"mt19937ar with seed"`

Source of random number stream, specified as one of these options.

- `"Global stream"` — The current global random number stream is used for normally distributed random number generation. In this case, the `reset` object function resets the channel filters only.
- `"mt19937ar with seed"` — The mt19937ar algorithm is used for normally distributed random number generation. In this case, the `reset` object function resets the channel filters and reinitializes the random number stream to the value of the `seed` property.

Data Types: `char` | `string`

`Seed` — Initial seed of mt19937ar random number stream
`73` (default) | nonnegative integer

Initial seed of the mt19937ar random number stream generator algorithm, specified as a nonnegative integer.

Dependencies

To enable this property, set the `RandomStream` property to `"mt19937ar with seed"`.

Data Types: `double`

`Visualization` — Channel visualization
`"Off"` (default) | `"Impulse response"` | `"Frequency response"` | `"Impulse and frequency responses"` | `"Doppler spectrum"`

Channel visualization, specified as `"Off"`, `"Impulse response"`, `"Frequency response"`, `"Impulse and frequency responses"`, or `"Doppler spectrum"`.

When you set this property to `"Doppler spectrum"`, the values plotted are in dB.

Data Types: `char` | `string`

Usage

Syntax

```
y = chan(x)
[y,pathgains] = chan(x)
```

Description

`y = chan(x)` filters input signal `x` through a multipath ETSI frequency-flat Rician fading channel and returns the output signal in `y`.

`[y,pathgains] = chan(x)` returns the channel path gains of the underlying multipath ETSI frequency-flat Rician fading process in `pathgains`.

Input Arguments

x — Input signal
N_S-by-1 vector

Input signal, specified as an N_S-by-1 vector, where N_S is the number of samples.

Data Types: `double`
Complex Number Support: Yes

Output Arguments

y — Output signal
N_S-by-1 vector

Output signal, returned as an N_S-by-1 vector of complex values with the same data precision as the input signal x on page 4-0 . N_S is the number of samples.

Data Types: `double`
Complex Number Support: Yes

`pathgains` — Path gains
N_S-by-1 vector

Path gains, returned as an N_S-by-1 vector of complex values with the same data precision as the input signal x on page 4-0 . N_S is the number of samples.

Data Types: `double`
Complex Number Support: Yes

Object Functions

To use an object function, specify the System object as the first input argument. For example, to release system resources of a System object named `obj`, use this syntax:

```
release(obj)
```

Specific to `etsiRicianChannel`

info	Characteristic information about object

Common to All System Objects

step	Run System object algorithm
release	Release resources and allow changes to System object property values and input characteristics
clone	Create duplicate System object
isLocked	Determine if System object is in use
reset	Reset internal states of System object

Examples

Transmit Input Signal Through ETSI Rician Channel

Transmit an input signal through a European Telecommunication Standards Institute (ETSI) Rician channel model.

Define the channel configuration using an `etsiRicianChannel` System object and specify its properties.

```
chan = etsiRicianChannel;
chan.SampleRate = 2.9e6;
chan.KFactor = 4;
chan.MaximumDopplerShift = 30;
chan.NumSinusoids = 45;
disp(chan)
```

```
  etsiRicianChannel with properties:

             SampleRate: 2900000
                KFactor: 4
    MaximumDopplerShift: 30

  Use get to show all properties
```

Generate a QPSK-modulated input signal to pass through the channel.

```
txWaveform = pskmod(randi([0 3],chan.SampleRate,1),4);
```

Filter the signal through the Rician channel.

```
rxWaveform = chan(txWaveform);
```

Verify ETSI Rician Channel Outputs Using Two Random Number Generation Methods

Produce the same multipath European Telecommunication Standards Institute (ETSI) Rician fading channel response by using two different methods for random number generation. The multipath ETSI Rician fading channel System object includes two methods for random number generation. You can use the current global stream or the mt19937ar algorithm with a specified seed. By interacting with the global stream, the System object can produce the same outputs from the two methods.

Create `etsiRicianChannel` System object, and then specify its properties. Set the random number generation method as the mt19937ar algorithm.

```
chan = etsiRicianChannel;
chan.SampleRate = 150000;
chan.KFactor = 2;
chan.MaximumDopplerShift = 10;
chan.RandomStream = "mt19937ar with seed";
chan.Seed = 80;
```

Modulate randomly generated data.

```
txWaveform = pskmod(randi([0 3],512,1),4);
```

Filter the modulated data by using the multipath Rician fading channel System object.

```
[ChanOut1,PathGains1] = chan(txWaveform);
```

Set the System object to use the global stream for random number generation.

```
release(chan);
chan.RandomStream = "Global stream";
```

Set the global stream to have the same seed that was specified when creating the multipath Rician fading channel System object.

```
rng(80)
```

Filter the modulated data by using the multipath Rician fading channel System object again.

```
[ChanOut2,PathGains2] = chan(txWaveform);
```

Verify that the channel and path gain outputs are the same for each of the two random number generation methods.

```
isequal(ChanOut1,ChanOut2)
```

```
ans = logical
   1
```

```
isequal(PathGains1,PathGains2)
```

```
ans = logical
   1
```

Plot Doppler Spectrum for ETSI Rician Fading Channel

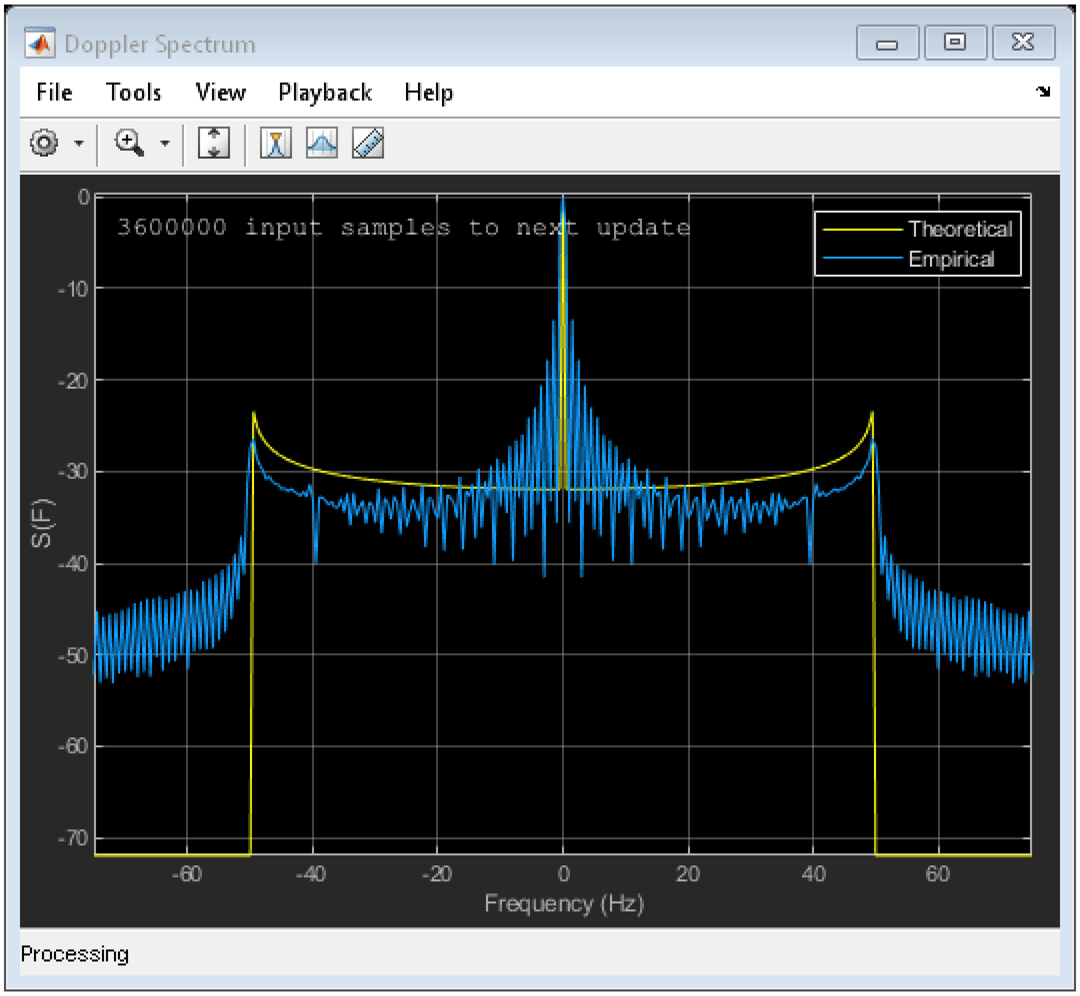
Create a multipath European Telecommunication Standards Institute (ETSI) Rician fading channel and display its Doppler spectrum.

Create `etsiRicianChannel` System object, and then specify its properties.

```
chan = etsiRicianChannel;
chan.SampleRate = 3.6e6;
chan.KFactor = 10;
chan.MaximumDopplerShift = 50;
chan.Visualization = "Doppler Spectrum";  % Jake's Doppler spectrum
```

Generate random binary data for `n` consecutive frames and pass the data through the multipath Rician fading channel.

```
n = 50;
for i = 1:n
  x = randi([0 1],3.6e6,1);
  y = chan(x);  % Spectrum visualization is updated only when the buffer is filled
                % Required samples to fill the buffer is mentioned in the scope
end
```



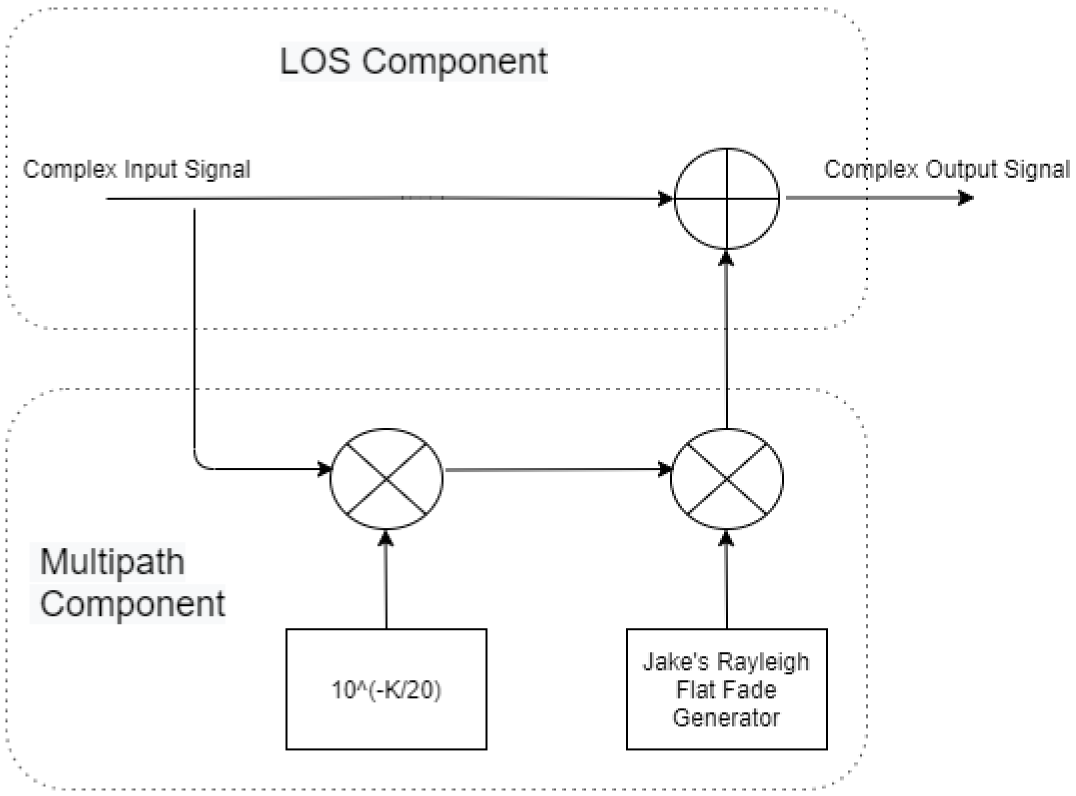
More About

Channel Model Block Diagram

The channel model block diagram provides an overview of the `etsiRicianChannel` System object, as specified in ETSI TS 101 376-5-5 V1.3.1 (2005-02) [1].

- The complex input signal is multiplied by a fixed gain and then by a complex Rayleigh fading gain. These actions form the multipath portion of the signal path. *K* is the Rician fade factor in dB.
- The multipath portion is then added to the direct signal component to form the Rician fading signal. This action forms the line-of-sight (LOS) component of the signal path.

  The coherent summation of many multipath components yield a classical Doppler spectrum for Rayleigh fading process, which when added to the direct path signal, forms the Rician fading signal.
- Noise samples can be subsequently added to the sum of the LOS component and multipath components.



The Rician spectrum for linear Rician factor K_f is given by the following equation:

$$S(f) = \frac{1}{Kf * \pi * fd\sqrt{1 - \left(\frac{f}{fd}\right)^2}} + \delta(f)$$

where:

- K_f is the Rician K-factor, “KFactor” on page 4-0 .

- f_d is the maximum Doppler shift for all multipath signals.
- f is in the range $-f_d < f < +f_d$.
- $\delta(f)$ is the contribution due to the LOS component.

Note The power of the complex output faded signal is $(1+1/K_f)$.

gpsPCode

Generate P-code for GPS satellites

Description

The `gpsPCode` System object generates a precision code (P-code) for a Global Positioning System (GPS) satellite, as defined in IS-GPS-200L Section 3.3.2.2 [1].

To generate a P-code for a GPS satellite:

1. Create the `gpsPCode` object and set its properties.
2. Call the object with arguments, as if it were a function.

To learn more about how System objects work, see What Are System Objects?

Creation

Syntax

```
pgenerator = gpsPCode
pgenerator = gpsPCode(Name,Value)
```

Description

`pgenerator = gpsPCode` creates a default P-code generator System object.

`pgenerator = gpsPCode(Name,Value)` sets “Properties” on page 4-62 using one or more name-value pairs. For example, `'PRNID',10` specifies a pseudo-random noise (PRN) ID of 10.

Properties

Unless otherwise indicated, properties are *nontunable*, which means you cannot change their values after calling the object. Objects lock when you call them, and the `release` function unlocks them.

If a property is *tunable*, you can change its value at any time.

For more information on changing property values, see System Design in MATLAB Using System Objects.

`PRNID` — GPS satellite PRN index
1 (default) | integer in the range [1, 210] | vector of integer elements in the range [1, 210]

GPS satellite PRN index, specified as one of these options.

- Integer in the range [1, 210] — Use this option to input a PRN index for a single satellite.
- Vector of integer elements in the range [1, 210] — Use this option to input PRN indices for multiple satellites.

For details on PRN ID values, see IS-GPS-200L Tables 3-Ia, 3-Ib, and 6-I [1].

Data Types: `double` | `uint8`

`OutputCodeLength` — Output code length
`10230` (default) | positive integer

Output code length, specified as a positive integer. This length specifies the number of rows in the output P-code.

The default value of `10230` corresponds to 1 millisecond of P-code, as the P-code chips are at 10.23 MHz.

Tunable: Yes

Data Types: `double` | `uint64`

`InitialStateFormat` — Format of the initial state
`"seconds"` (default) | `"datetime"` | `"chips"`

Format of the initial state, specified as `"seconds"`, `"datetime"`, or `"chips"`.

Data Types: `char` | `string`

`InitialTime` — Initial time within one week
`0` (default) | integer in the range [0, 604,800] | `datetime` object

Initial time within one week, specified as one of these options.

- Integer in the range [0, 604,800] — Use this option when you set the `InitialStateFormat` property to `"seconds"`. In this case, initial time specifies the seconds that have elapsed from the beginning of the week.
- `datetime` object — Use this option when you set the `InitialStateFormat` property to `"datetime"`. In this case, initial time specifies the time elapsed from the beginning of the week to the time specified by `datetime` object.

Note The P-code is one week long.

The default value of `0` assumes that you set the `InitialStateFormat` property to `"seconds"`.

Dependencies

To enable this property, set the `InitialStateFormat` property to `"seconds"` or `"datetime"`.

Data Types: `double`

`InitialNumChipsElapsed` — Initial number of elapsed P-code chips
`0` (default) | integer in the range [0, 604,800x10.23e6]

Initial number of elapsed P-code chips, from the beginning of the week, specified as an integer in the range [0, 604,800x10.23e6].

The maximum input value, 604,800x10.23e6, is the total number of chips elapsed in one week (7×24×60×60×10.23e6).

Note `10.23e6` is the number of chips elapsed in one second.

Dependencies

To enable this property, set the `InitialStateFormat` property to `"chips"`.

Data Types: `double` | `uint64`

Usage

Syntax

`code = pgenerator()`

Description

`code = pgenerator()`

Output Arguments

code — Generated binary-valued P-code
vector | matrix

Generated binary-valued P-code, specified as one of these options.

- Vector — The System object returns this option when you specify the PRNID property as a scalar.
- Matrix — The System object returns this option when you specify the PRNID property as a vector. Each column of this matrix represents the generated P-code corresponding to the element in the `PRNID` vector.

The number of rows is equal to the value of the OutputCodeLength property. The number of columns is equal to the length of the `PRNID` property. Each element of the vector or matrix is of data type `int8`.

Data Types: `int8`

Object Functions

To use an object function, specify the System object as the first input argument. For example, to release system resources of a System object named `obj`, use this syntax:

```
release(obj)
```

Specific to `gpsPCode`

info	Characteristic information about object

Common to All System Objects

step	Run System object algorithm
release	Release resources and allow changes to System object property values and input characteristics
clone	Create duplicate System object

isLocked	Determine if System object is in use
reset	Reset internal states of System object

Examples

Generate P-code When Initial Format Is Seconds

Create a precision code generator (P-code) System object™, and then set its properties.

```
pgen = gpsPCode;
pgen.PRNID = [10 50];         % 2 satellites
pgen.OutputCodeLength = 1024;
pgen.InitialTime = 1800;      % Seconds (default)
disp(pgen)
```

```
  gpsPCode with properties:

                PRNID: [10 50]
     OutputCodeLength: 1024
   InitialStateFormat: "seconds"
          InitialTime: 1800
```

Generate the P-code.

```
code = pgen();
```

Generate P-code When Initial Format Is Chips

Create the P-code System object™ and set its properties.

```
pgen = gpsPCode;
pgen.PRNID = 45;
pgen.OutputCodeLength = 102400;
```

Set the initial state format as chips. Generate the P-code for the last 5,000 chips in one week.

```
pgen.InitialStateFormat = "chips";
% 604,800 is the total seconds in one week
% 10.23e6 is the number of P-code chips that elapsed in one second
pgen.InitialNumChipsElapsed = 604800*10.23e6 - 5000;
code = pgen();
```

Generate P-code When Initial Format Is `datetime` Object

Create a P-code System object™ and specify the PRN index and the output code length.

Set the format of the initial state as a `datetime` object. Generate the P-code for the current time.

```
pgen = gpsPCode;
pgen.PRNID = 25;
pgen.OutputCodeLength = 20460;
pgen.InitialStateFormat = "datetime";
pgen.InitialTime = datetime("now");
code = pgen();
```

Display the properties of the P-code generator.

```
disp(pgen)
```

```
  gpsPCode with properties:

                PRNID: 25
     OutputCodeLength: 20460
   InitialStateFormat: "datetime"
          InitialTime: 26-Feb-2022 14:54:27
```

Get P-Code State Information

Get information from a `gpsPCode` System object™ by using the `info` object function. Observe how the precision of initial time impacts the generation of the P-code.

Create a P-code generator System object™, and then specify its properties.

```
format long
pgen = gpsPCode
```

```
pgen =
  gpsPCode with properties:

                PRNID: 1
     OutputCodeLength: 10230
   InitialStateFormat: "seconds"
          InitialTime: 0
```

```
pgen.InitialStateFormat = "chips";
pgen.InitialNumChipsElapsed = 8388600;
```

Get the characteristic information about the P-code generator.

```
pgen.info
```

```
ans = struct with fields:
    TotalNumChipsElapsed: 8388600
     TotalSecondsElapsed: 0.820000000000000
```

Advance the time by a quarter of a P-code chip time (that is, 0.25/10.23e6).

```
pgen1 = gpsPCode;
pgen1.InitialTime = pgen.info.TotalSecondsElapsed + 0.25/10.23e6
```

```
pgen1 =
  gpsPCode with properties:

                PRNID: 1
     OutputCodeLength: 10230
```

```
    InitialStateFormat: "seconds"
           InitialTime: 0.820000024437928
```

```
pgen1.info
```

```
ans = struct with fields:
    TotalNumChipsElapsed: 8388600
     TotalSecondsElapsed: 0.820000000000000
```

The info function output shows no increment in the TotalNumChipsElapsed in this case, because TotalNumChipsElapsed is calculated internally using the function round.

Advance the time by half of a P-code chip time now (that is, 0.5/10.23e6).

```
pgen2 = gpsPCode;
pgen2.InitialTime = pgen.info.TotalSecondsElapsed + 0.5/10.23e6
```

```
pgen2 =
  gpsPCode with properties:

                 PRNID: 1
      OutputCodeLength: 10230
    InitialStateFormat: "seconds"
           InitialTime: 0.820000048875855
```

```
pgen2.info
```

```
ans = struct with fields:
    TotalNumChipsElapsed: 8388601
     TotalSecondsElapsed: 0.820000097751711
```

The info function output now shows the TotalNumChipsElapsed is incremented by one, due to the internal usage of round() function.

Compare the output of each System object call.

```
code = pgen();
code1 = pgen1();
code2 = pgen2();
isequal(code, code1) % code and code1 are equal
```

```
ans = logical
   1
```

```
isequal(code1,code2) % code1 and code2 are unequal
```

```
ans = logical
   0
```

p681LMSChannel

Filter input signal through ITU-R P.681-11 LMS frequency-flat fading channel

Description

The `p681LMSChannel` System object filters a real or complex input signal through a frequency-flat fading land mobile-satellite (LMS) communication channel, as defined in the ITU-R Recommendation P.681-11 Section 6.2 [1].

To filter an input signal through a P.681-11 LMS time-varying channel:

1. Create the `p681LMSChannel` object and set its properties.
2. Call the object with arguments, as if it were a function.

To learn more about how System objects work, see What Are System Objects?

Creation

Syntax

```
chan = p681LMSChannel
chan = p681LMSChannel(Name=Value)
```

Description

`chan = p681LMSChannel` creates an ITU-R P.681-11 LMS frequency-flat fading channel System object.

The default System object has the environment set to an urban scenario, with carrier frequency of 2.2 GHz and an elevation angle of 45 degrees. This object models a single geostationary satellite.

`chan = p681LMSChannel(Name=Value)` sets properties on page 4-69 using one or more name-value arguments. For example, `SampleRate=20e3` sets the input signal sample rate to `20e3`.

Properties

Unless otherwise indicated, properties are *nontunable*, which means you cannot change their values after calling the object. Objects lock when you call them, and the `release` function unlocks them.

If a property is *tunable*, you can change its value at any time.

For more information on changing property values, see System Design in MATLAB Using System Objects.

`SampleRate` — Input signal sample rate
`7.68e6` (default) | positive scalar

Input signal sample rate in hertz, specified as a positive scalar.

Data Types: `double`

`InitialState` — Initial state of channel
`"Good"` (default) | `"Bad"`

Initial state of the channel, specified as `"Good"` or `"Bad"`.

Data Types: `char` | `string`

`CarrierFrequency` — Carrier frequency
`2.2e9` (default) | nonnegative scalar

Carrier frequency in hertz, specified as a nonnegative scalar.

Data Types: `double`

`ElevationAngle` — Path elevation angle to geostationary satellite
`45` (default) | scalar

Path elevation angle to a geostationary satellite in degrees, specified as a scalar. The nominal value is in the range [0, 90].

Data Types: `double`

`MobileSpeed` — Speed of mobile terminal
`0.8333` (default) | nonnegative scalar

Speed of mobile terminal in m/s, specified as a nonnegative scalar. The default value of `0.8333` m/s translates to 3 km/h.

This property affects the Doppler spread applied to the multipath component and also the Doppler shift applied to the direct path component.

Setting this property to `0`, results in a static channel. In this case, the Doppler spread is not applicable for the multipath component and the Doppler shift is also not applied in direct path component of the channel.

Data Types: `double`

`AzimuthOrientation` — Azimuth orientation
`0` (default) | scalar

Azimuth orientation in degrees, specified as a scalar. This value specifies the direction of movement of the ground or mobile terminal. The nominal value is in the range [0, 360].

When you set this property to odd multiples of 90, the Doppler shift caused by the mobile movement in the direct path component is nonexistent.

Data Types: `double`

`Environment` — Type of propagation environment
`"Urban"` (default) | `"Suburban"` | `"RuralWooded"` | `"Village"` | `"Residential"` | `"Highway"` | `"Rural"` | `"Train"` | `"Custom"`

Type of propagation environment, specified as one of these values.

- `"Urban"`

- `"Suburban"`
- `"RuralWooded"`
- `"Village"`
- `"Residential"`
- `"Highway"` — Applicable only when you set the value of CarrierFrequency property in the range [10, 20] GHz
- `"Rural"` — Applicable only when you set the value of CarrierFrequency property in the range [10, 20] GHz
- `"Train"` — Applicable only when you set the value of CarrierFrequency property in the range [10, 20] GHz
- `"Custom"`

When you set this property to `"Custom"`, configure the propagation environment using these properties.

- StateDistribution
- MinStateDuration
- DirectPathDistribution
- MultipathPowerCoefficients
- StandardDeviationCoefficients
- DirectPathCorrelationDistance
- TransitionLengthCoefficients
- StateProbabilityRange

Data Types: `char` | `string`

`StateDistribution` — Parameters of state duration distribution
`[3.0639 2.9108; 1.6980 1.2602]` (default) | 2-by-2 matrix

Parameters of state duration distribution in dB, specified as a 2-by-2 matrix. For example, if you specify the input as [*muG*, *muB*; *sigmaG*, *sigmaB*], then:

- *muG* and *sigmaG* represent the mean and standard deviation of good state duration, respectively.
- *muB* and *sigmaB* represent the mean and standard deviation of bad state duration, respectively.

Dependencies

To enable this property, set the Environment property to `"Custom"`.

Data Types: `double`

`MinStateDuration` — Minimum duration of each state
`[10 6]` (default) | two-element row vector

Minimum duration of each state in meters, specified as a two-element row vector. The first element corresponds to good state and the second element corresponds to bad state.

Dependencies

To enable this property, set the Environment property to `"Custom"`.

Data Types: `double`

`DirectPathDistribution` — Parameters of direct path amplitude distribution
`[-1.8225 -15.4844; 1.1317 3.3245]` (default) | 2-by-2 matrix

Parameters of direct path amplitude distribution in dB, specified as a 2-by-2 matrix. For example, if you specify the input as [*muMaG*, *muMaB*; *sigmaMaG*, *sigmaMaB*], then:

- *muMaG* and *sigmaMaG* represent the mean of the direct path amplitude (*Ma*) and the standard deviation of *Ma* in good state, respectively.
- *muMaB* and *sigmaMaB* represent the mean and standard deviation of *Ma* in bad state, respectively.

Dependencies

To enable this property, set the Environment property to `"Custom"`.

Data Types: `double`

`MultipathPowerCoefficients` — Coefficients to compute multipath power
`[-0.0481 0.9434; -14.7450 -1.7555]` (default) | 2-by-2 matrix

Coefficients to compute the multipath power, specified as a 2-by-2 matrix. For example, if you specify the input as [*h1G*, *h1B*; *h2G*, *h2B*], then:

- *h1G* and *h2G* represent the coefficients in good state.
- *h1B* and *h2B* represent the coefficients in bad state.

Dependencies

To enable this property, set the Environment property to `"Custom"`.

Data Types: `double`

`StandardDeviationCoefficients` — Coefficients to compute standard deviation of direct path amplitude
`[-0.4643 -0.0798; 0.3334 2.8101]` (default) | 2-by-2 matrix

Coefficients to compute standard deviation of direct path amplitude in all states, specified as a 2-by-2 matrix. For example, if you specify the input as [*g1G*, *g1B*; *g2G*, *g2B*], then:

- *g1G* and *g2G* represent the coefficients in good state.
- *g1B* and *g2B* represent the coefficients in bad state.

Dependencies

To enable this property, set the Environment property to `"Custom"`.

Data Types: `double`

`DirectPathCorrelationDistance` — Direct path amplitude correlation distance
`[1.7910 1.7910]` (default) | two-element row vector

Direct path amplitude correlation distance (*Lcorr*) in meters, specified as a two-element row vector. The first element corresponds to good state and the second element corresponds to bad state.

Dependencies

To enable this property, set the Environment property to `"Custom"`.

Data Types: `double`

`TransitionLengthCoefficients` — Coefficients to compute transition length
`[0.0744; 2.1423]` (default) | two-element column vector

Coefficients to compute the transition length (*f1;f2*), specified as a two-element column vector.

Dependencies

To enable this property, set the Environment property to `"Custom"`.

Data Types: `double`

`StateProbabilityRange` — Minimum and maximum probability of each state
`[0.05 0.1; 0.95 0.9]` (default) | 2-by-2 matrix

Minimum and maximum probability of each state, specified as a 2-by-2 matrix. For example, if you specify the input as [*pminG*, *pminB*; *pmaxG*, *pmaxB*], then:

- *pminG* and *pmaxG* represent the minimum and maximum values of state probability in good state.
- *pminB* and *pmaxB* represent the minimum and maximum values of state probability in bad state.

The minimum probability must be less than the maximum probability in a state. The value of each element must be in range [0, 1].

Dependencies

To enable this property, set the Environment property to `"Custom"`.

Data Types: `double`

`ChannelFiltering` — Channel filtering
`true` or `1` (default) | `false` or `0`

Channel filtering, specified as one of these logical values.

- `1` (`true`) — The object accepts an input signal and produces a filtered output signal, in addition to the channel path gains, sample times, and state series.
- `0` (`false`) — The object does not accept an input signal, produces no filtered output signal, and outputs only channel path gains, sample times, and state series. You must specify the duration of the fading process by using the NumSamples property, and the sampling rate by using the SampleRate property.

Data Types: `logical`

`NumSamples` — Number of time samples
`7680` (default) | nonnegative integer

Number of time samples used to set the duration of the fading process realization, specified as a nonnegative integer.

Tunable: Yes

Dependencies

To enable this property, set ChannelFiltering property to `false`.

Data Types: `double`

`OutputDataType` — Data type of step method outputs
`"double"` (default) | `"single"`

Data type of step method outputs, specified as one of these values.

- `"double"`
- `"single"`

Dependencies

To enable this property, set ChannelFiltering property to `false`.

Data Types: `char` | `string`

`FadingTechnique` — Channel model fading technique
`"Filtered Gaussian noise"` (default) | `"Sum of sinusoids"`

Channel model fading technique, specified as `"Filtered Gaussian noise"` or `"Sum of sinusoids"`.

Data Types: `char` | `string`

`NumSinusoids` — Number of sinusoids used
`48` (default) | positive integer

Number of sinusoids used to generate the Doppler fading samples, specified as a positive integer.

Dependencies

To enable this property, set the FadingTechnique property to `"Sum of sinusoids"`.

Data Types: `double` | `uint16`

`RandomStream` — Source of random number stream
`"Global stream"` (default) | `"mt19937ar with seed"`

Source of the random number stream, specified as `"Global stream"` or `"mt19937ar with seed"`.

- When you specify `"Global stream"`, the object uses the current global random number stream for normally distributed random number generation. In this case, the `reset` object function resets only the filters.
- When you specify `"mt19937ar with seed"`, the object uses the mt19937ar algorithm for normally distributed random number generation. In this case, the `reset` object function resets the filters and reinitializes the random number stream to the value of the Seed property.

Data Types: `char` | `string`

`Seed` — Initial seed
`73` (default) | nonnegative integer

Initial seed of the mt19937ar random number stream generator algorithm, specified as a nonnegative integer. When you call the `reset` object function, it reinitializes the mt19937ar random number stream to the Seed value.

Dependencies

To enable this property, set the RandomStream property to `"mt19937ar with seed"`.

Data Types: `double` | `uint32`

`Visualization` — Channel visualization
`"Off"` (default) | `"Impulse response"` | `"Frequency response"` | `"Impulse and frequency responses"` | `"Doppler spectrum"`

Channel visualization, specified as one of these options.

- `"Off"`
- `"Impulse response"`
- `"Frequency response"`
- `"Impulse and frequency responses"`
- `"Doppler spectrum"`

When you set this property to enable the visualization, selected channel characteristics are animated in separate figures, with each System object call.

For more information, see the “Channel Visualization” on page 4-82 section.

Data Types: `char` | `string`

Usage

Syntax

```
[pathgains,sampletimes,stateseries] = chan()
[y,pathgains,sampletimes,stateseries] = chan(x)
```

Description

`[pathgains,sampletimes,stateseries] = chan()` produces path gains, `pathgains`, sample times, `sampletimes`, and state series, `stateseries` for an ITU-R P.681-11 LMS flat fading channel.

In this case, the System object acts as a source of path gains, sample times, and state series.

Specify the duration of the fading process by using the NumSamples property. Specify the datatype of outputs using the OutputDataType property.

Note This syntax is applicable when you set the ChannelFiltering property to `false`.

`[y,pathgains,sampletimes,stateseries] = chan(x)` filters the input signal, `x`, through an ITU-R P.681-11 LMS flat fading channel, and returns the output channel-impaired signal in `y`, in addition to the outputs in the previous syntax.

Note This syntax is applicable when you set the ChannelFiltering property to `true`.

Input Arguments

x — Input signal

N_S-by-1 vector

Input signal, specified as an N_S-by-1 vector, where N_S is the number of input samples.

Data Types: `single` | `double`
Complex Number Support: Yes

Output Arguments

y — Output signal

N_S-by-1 vector

Output signal, returned as an N_S-by-1 vector of complex values with the same data precision and length as the input signal `x`. N_S is the number of input samples.

Data Types: `single` | `double`
Complex Number Support: Yes

`pathgains` — Channel path gains of fading process

N_S-by-1 vector

Channel path gains of fading process, returned as an N_S-by-1 vector of complex values.

- When you set the ChannelFiltering property to `true`, `pathgains` is of the same data precision as the input signal `x`, and N_S is the number of input samples.
- When you set the ChannelFiltering property to `false`, `pathgains` is of the same data precision as the OutputDataType property and N_S is equal to the NumSamples property.

Data Types: `single` | `double`
Complex Number Support: Yes

`sampletimes` — Sample times of channel snapshots

N_S-by-1 vector

Sample times of channel snapshots, returned as an N_S-by-1 vector.

- When you set the ChannelFiltering property to `true`, `sampletimes` is of the same data precision as the input signal `x`, and N_S is the number of input samples.
- When you set the ChannelFiltering property to `false`, `sampletimes` is of the same data precision as the OutputDataType property and N_S is equal to the NumSamples property.

Data Types: `single` | `double`

`stateseries` — State series of channel

N_S-by-1 vector

State series of the channel, returned as an N_S-by-1 vector. Each value of this vector describes the state in which channel is present for that channel snapshot. A value of `0` represents bad state. A value of `1` represents good state. A value between 0 and 1 represents a state transition.

- When you set the ChannelFiltering property to `true`, `stateseries` is of the same data precision as the input signal `x`, and N_S is the number of input samples.
- When you set the ChannelFiltering property to `false`, `stateseries` is of the same data precision as the OutputDataType property and N_S is equal to the NumSamples property.

Data Types: `single` | `double`

Object Functions

To use an object function, specify the System object as the first input argument. For example, to release system resources of a System object named `obj`, use this syntax:

```
release(obj)
```

Specific to p681LMSChannel

info	Characteristic information about object

Common to All System Objects

step	Run System object algorithm
release	Release resources and allow changes to System object property values and input characteristics
clone	Create duplicate System object
isLocked	Determine if System object is in use
reset	Reset internal states of System object

Examples

Transmit Signal Through P.681-11 LMS Channel

Create and Configure the Channel

Create an ITU-R P.681-11 LMS channel and configure it for a suburban scenario with a carrier frequency of 20 GHz and an elevation angle of 50 degrees. Set the sample rate to 6000 kHz.

Specify the mobile terminal speed to 50 m/s, with an azimuth orientation of 20 degrees.

```
chan = p681LMSChannel;
chan.SampleRate = 6e6;          % Hz
chan.CarrierFrequency = 20e9;   % Hz
chan.ElevationAngle = 50;       % degrees
chan.Environment = "Suburban";
chan.MobileSpeed = 50;          % m/s
chan.AzimuthOrientation = 20;   % degrees
```

Display the channel characteristics.

```
disp(chan)
```

```
  p681LMSChannel with properties:

             SampleRate: 6000000
           InitialState: "Good"
```

```
       CarrierFrequency: 2.0000e+10
         ElevationAngle: 50
            MobileSpeed: 50
     AzimuthOrientation: 20
            Environment: "Suburban"
       ChannelFiltering: true

   Use get to show all properties
```

Transmit Input Signal Through Channel

Set the random number generation seed as default.

```
rng("default")
```

Generate a random QPSK-modulated input signal.

```
numSamples = 6e6;
txWaveform = pskmod(randi([0 3],numSamples,1),4); % Modulation order = 4
```

Filter the signal through the channel.

```
[rxWaveform,pathGains,sampleTimes,stateSeries] = chan(txWaveform);
```

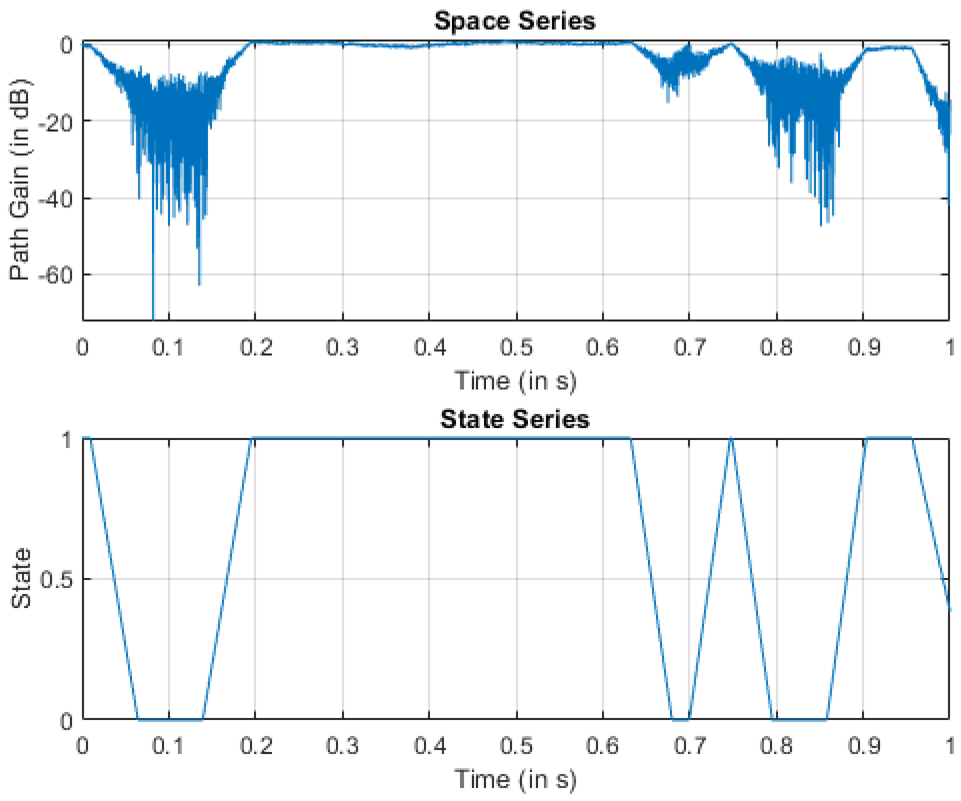
Visualize Space Series and State Series

Plot the space series as a function of time.

```
figure                                     % Create figure window
subplot(2,1,1)
plot(sampleTimes,20*log10(abs(pathGains)))
title('Space Series')
xlabel('Time (in s)')
ylabel('Path Gain (in dB)')
grid on
```

Plot the state series as a function of time.

```
subplot(2,1,2)
plot(sampleTimes,stateSeries)
title('State Series')
xlabel('Time (in s)')
ylabel('State')
grid on
```



Plot Doppler Spectrum for P.681-11 LMS Channel

Define the channel configuration using a `p681LMSChannel` System object and specify its properties.

Set the visualization as Doppler spectrum and disable the channel filtering.

```
chan = p681LMSChannel;
chan.SampleRate = 450000;             % Hz
chan.CarrierFrequency = 11e9;         % Hz
chan.ElevationAngle = 50;             % degrees
chan.MobileSpeed = 20;                % m/s
chan.Visualization = "Doppler spectrum";
chan.ChannelFiltering = false;
chan.NumSamples = 4e7;
```

Display the channel characteristics.

```
disp(chan)
```

```
  p681LMSChannel with properties:

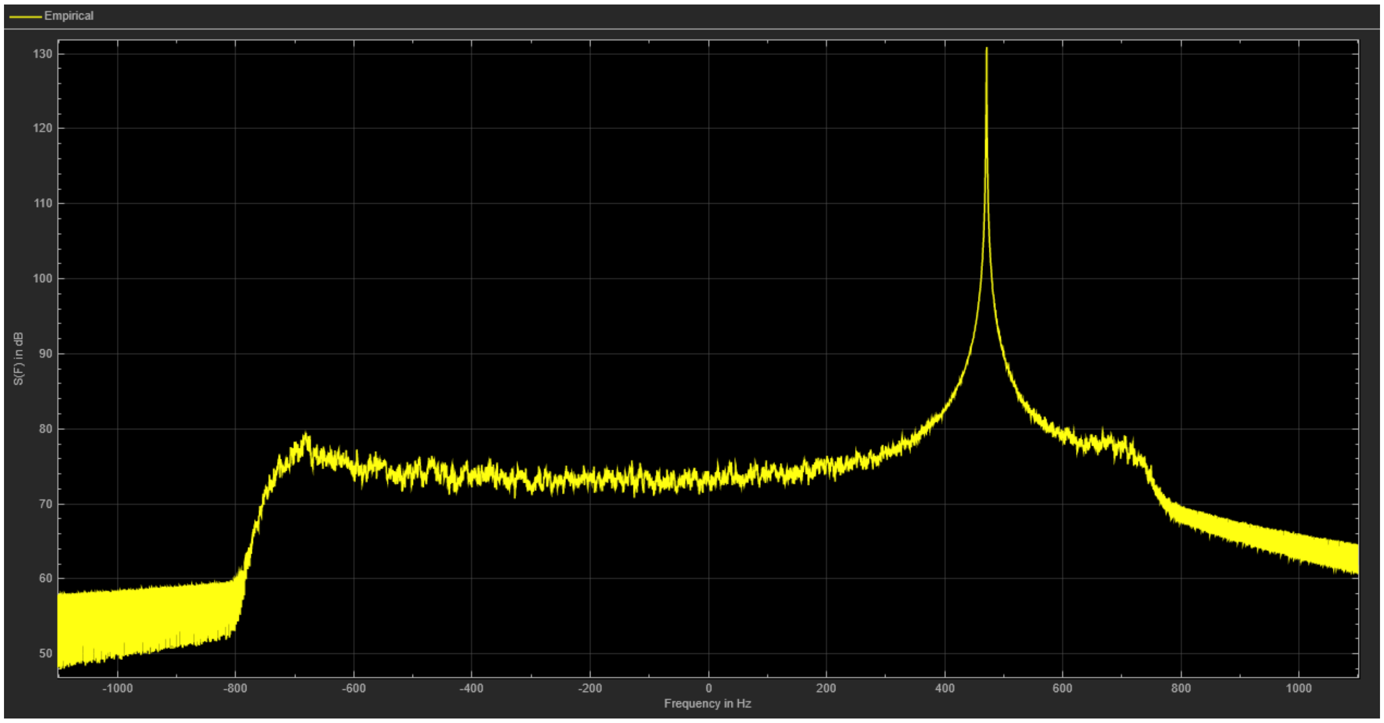
             SampleRate: 450000
           InitialState: "Good"
       CarrierFrequency: 1.1000e+10
         ElevationAngle: 50
            MobileSpeed: 20
```

```
    AzimuthOrientation: 0
           Environment: "Urban"
      ChannelFiltering: false
            NumSamples: 40000000
        OutputDataType: "double"

  Use get to show all properties
```

Get the path gains, sample times, and state series of the channel. Also, observe the Doppler spectrum.

```
[pathGains,sampleTimes,stateSeries] = chan();
```



Get P.681-11 LMS Channel Information

Get channel information from a `p681LMSChannel` System object by using the `info` object function.

Create an ITU-R P.681-11 LMS channel System object and specify its properties.

```
chan = p681LMSChannel;
chan.SampleRate = 10e3;             % Hz
chan.MobileSpeed = 2;               % m/s
chan.Environment = "RuralWooded";
disp(chan)
```

```
  p681LMSChannel with properties:

            SampleRate: 10000
          InitialState: "Good"
```

```
      CarrierFrequency: 2.2000e+09
        ElevationAngle: 45
           MobileSpeed: 2
    AzimuthOrientation: 0
           Environment: "RuralWooded"
      ChannelFiltering: true

  Use get to show all properties
```

QPSK-modulate a random input signal, and then pass it through the channel.

```
numSamples = 2e4;
txWaveform = pskmod(randi([0 3],numSamples,1),4);
[rxWaveform,pathGains,sampleTimes,stateSeries] = chan(txWaveform);
```

Get the characteristic information about the P.681-11 LMS channel.

```
info(chan)
```

```
ans = struct with fields:
                   PathDelays: 0
           ChannelFilterDelay: 0
    ChannelFilterCoefficients: 1
          NumSamplesProcessed: 20000
```

Transmit another QPSK-modulated random input signal through the channel

```
numSamples2 = 3e4;
txWaveform2 = pskmod(randi([0 3],numSamples2,1),4);
[rxWaveform2,pathGains2,sampleTimes2,stateSeries2] = chan(txWaveform2);
```

Observe the change in number of samples processed.

```
info(chan)
```

```
ans = struct with fields:
                   PathDelays: 0
           ChannelFilterDelay: 0
    ChannelFilterCoefficients: 1
          NumSamplesProcessed: 50000
```

Algorithms

Doppler Phenomena

To calculate the Doppler spread and Doppler shift due to the movement of the mobile on Earth, refer to these formulas.

- The maximum Doppler spread due to mobile movement is given by the following formula:

  $F_{mob\_max\_spread} = (v_{mob}*f_c) / c$

  where:

  - v_{mob} is the speed of the mobile terminal on Earth in m/s, specified as the MobileSpeed property.
  - f_c is the carrier frequency in Hz, specified by the CarrierFrequency property.
  - c is the speed of light in free space in m/s, specified as `physconst('lightspeed')`.
- The Doppler shift due to mobile movement is given by the following formula:

  $fd_{mob} = F_{mob\_max\_spread}$ * `cosd`(θ) * `cosd`(φ)

  where:

  - $F_{mob\_max\_spread}$ is the maximum Doppler spread due to mobile movement.
  - θ is the path elevation angle to the satellite in degrees, specified by the ElevationAngle property.
  - φ is the azimuth orientation in degrees, specified by the AzimuthOrientation property.

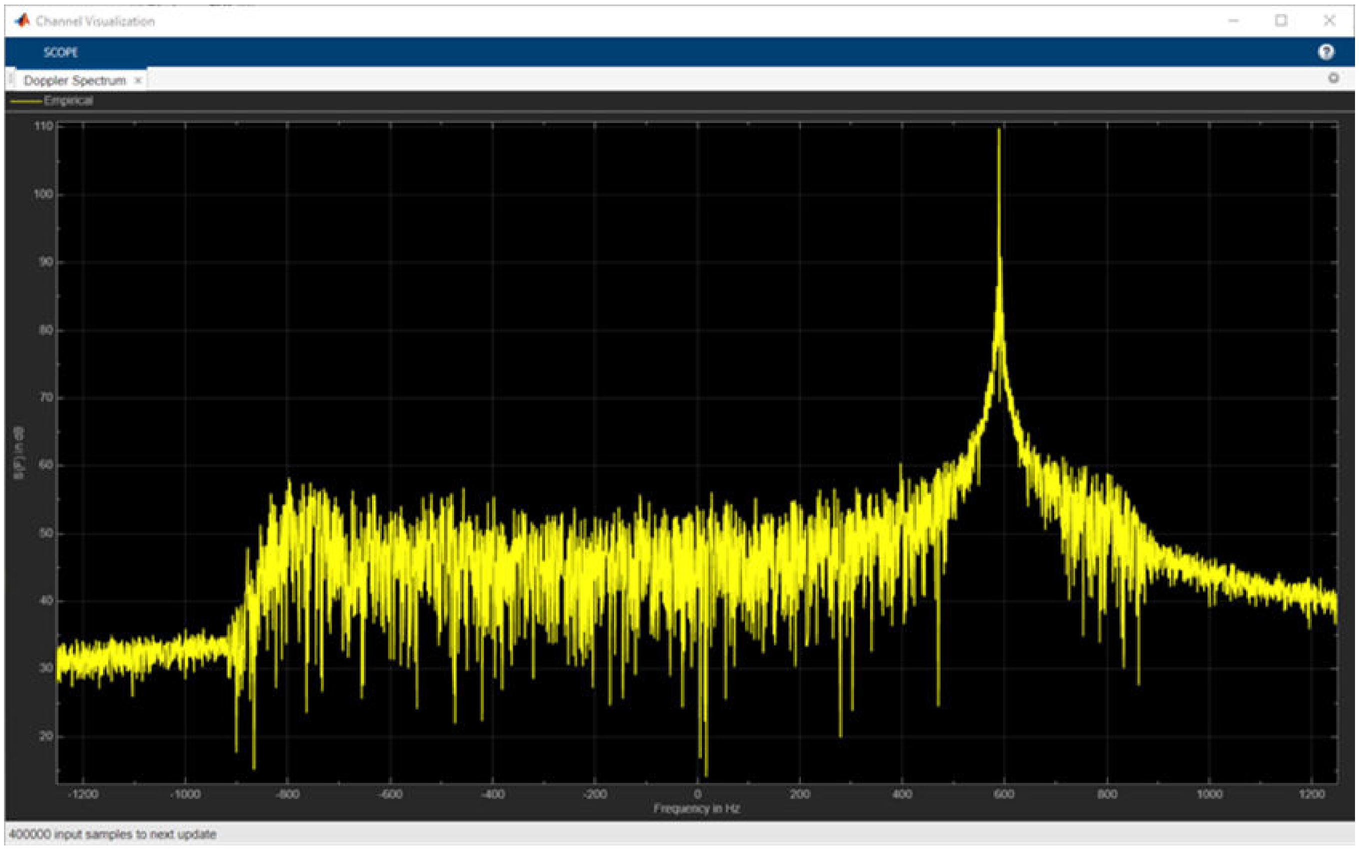
The maximum Doppler shift caused by the movement of the mobile must be less than one-tenth of Sample Rate property.

Channel Visualization

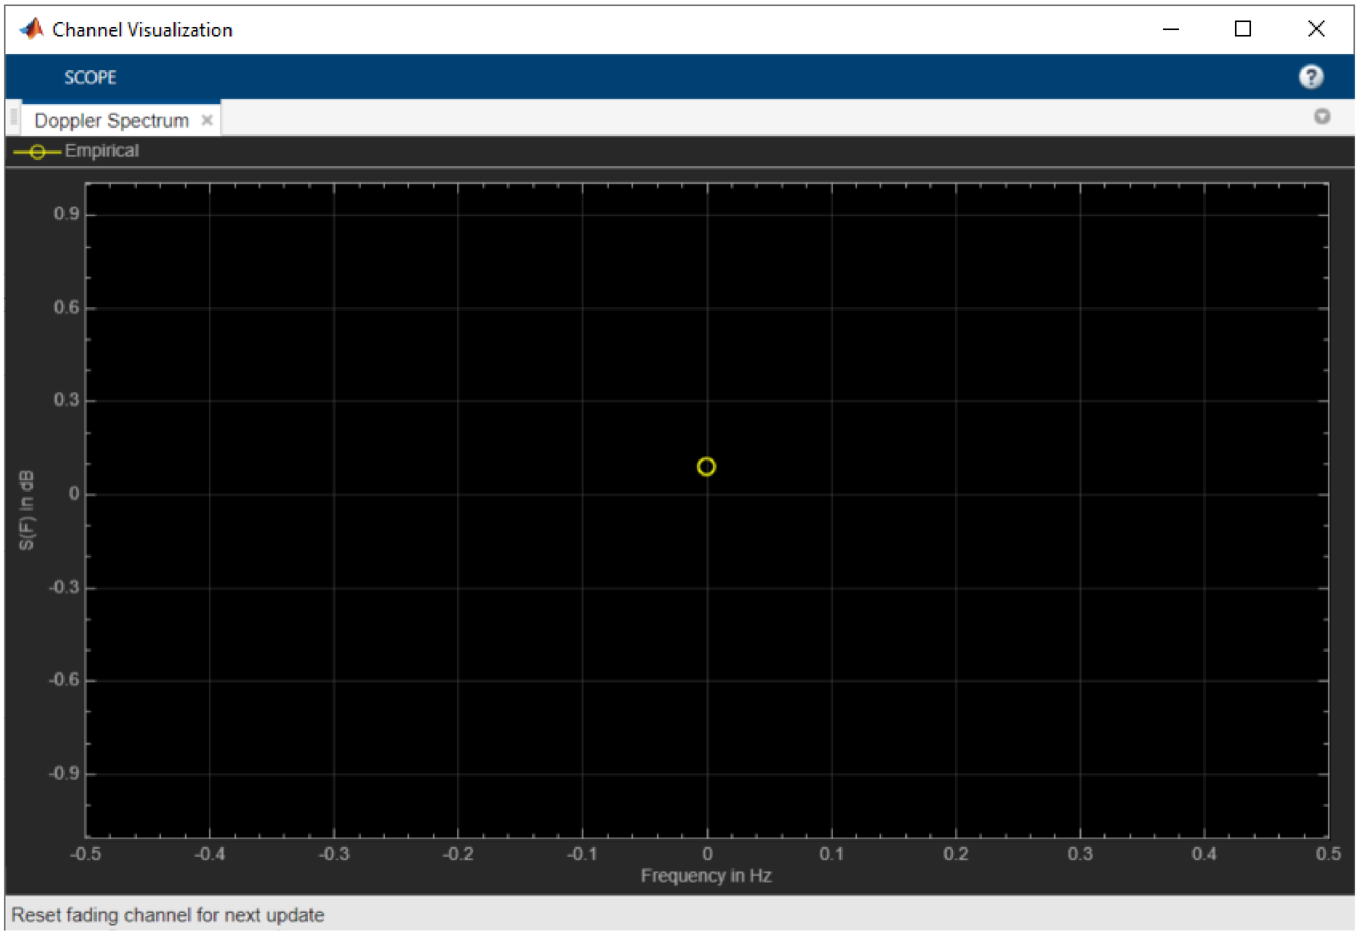
The `p681LMSChannel` System object enables visualization of the channel impulse response, frequency response, and Doppler spectrum.

- The Doppler spectrum plot displays the empirically determined spectrum from the path gains of the channel. The Doppler spectrum values are in dB.

  When there is no mobile movement, the channel is static channel. The empirical data is displayed as a line for the case of nonstatic channels and as a point for static channels. Before the empirical plot is updated, the internal buffer must be completely filled with the required number of channel samples. The empirical plot is the running mean of the spectrum that is calculated from each full buffer. For nonstatic channels, the number of input samples that is needed before the next update is displayed in the status bar located at the bottom of plot. The number of samples that is needed is a function of the sample rate and the maximum Doppler shift depending on mobile movement. For static channels, the text `"Reset fading channel for next update"` is displayed.



Nonstatic Channel



Reset fading channel for next update

Static Channel

- For channel impulse and frequency visualizations, see the “Channel Visualization” section of the `comm.RayleighChannel` System object.
