Data Types: char | string

Replace — Replace Signal Builder block with Signal Editor block

false (default) | true

Replace Signal Builder block with Signal Editor block, specified as true or false.

Data Types: logical

Output Arguments

signal_editor — Signal Editor block handle

scalar

Signal Editor block handle, specified as a scalar.

sorted_group_index — List of Signal Builder group indices

vector

List of Signal Builder group indices, specified as a vector and ordered as they will appear in the Signal Editor.

sorted_group_names — List of Signal Builder group names

cell array

Signal Editor group names, specified as a cell array of vectors, in alphabetical order.

The names are unique valid MATLAB variable names generated from the Signal Builder group names.

.

Limitations

The Signal Editor block can output a bus for each signal, but cannot output all signals in a single bus. If the Signal Builder block from which you are importing signal data has a bus as output, consider:

- Creating or using an existing `Simulink.Bus` bus object to contain the Signal Builder bus signals. The `Simulink.Bus` object contains the `Simulink.BusElement` that define each element in the `Simulink.Bus` object.
- In the Signal Editor user interface, creating a bus element and dragging and dropping the signals imported from the Signal Builder block into that bus element.
- After running the `signalBuilderToSignalEditor` function, select the **Output a bus signal** check box in the Signal Editor block and enter the Signal Builder bus object name in **Select bus object** text box.

Simulink.architecture.delete

Delete triggers and tasks from selected architecture of model

Syntax

```
Simulink.architecture.delete(Object)
```

Description

`Simulink.architecture.delete(Object)` deletes the specified object trigger or task.

Examples

Delete task Plant

Delete the task Task3 from the Core2 periodic trigger of the MulticoreProcessor software node of the selected architecture of the `slexMulticoreExample` model.

```
slexMulticoreExample  
Simulink.architecture.delete('slexMulticoreExample/MulticoreProcessor/Core2/Task3')
```

Input Arguments

Object — Object to delete, specified as a character vector

character vector

Object to be deleted. Possible objects are:

- Periodic trigger

Note You cannot delete the last periodic trigger. The software node must contain at least one periodic trigger.

- Aperiodic trigger
- Task

Example: `[bdroot '/MulticoreProcessor/Core2/Task3']`

Data Types: char

`Simulink.architecture.find_system` | `Simulink.architecture.importAndSelect` |
`Simulink.architecture.profile` | `Simulink.architecture.register`

Introduced in R2014a

Simulink.architecture.find_system

Find objects under architecture object

Syntax

```
object = Simulink.architecture.find_system(RootObject)
```

```
object = Simulink.architecture.find_system(RootObject, ParamName, ParamValue)
```

Description

`object = Simulink.architecture.find_system(RootObject)` looks for all objects under `RootObject`.

`object = Simulink.architecture.find_system(RootObject, ParamName, ParamValue)` returns the object in `RootObject` whose parameter `ParamName` has the value `ParamValue`. Parameter name and value character vectors are case-sensitive.

Examples

Look for all objects

To find all the objects in `slexMulticoreExample`:

```
slexMulticoreExample
t = Simulink.architecture.find_system('slexMulticoreExample')

t =

    'slexMulticoreExample'
    'slexMulticoreExample/MulticoreProcessor'
    'slexMulticoreExample/MulticoreProcessor/Core1'
    'slexMulticoreExample/MulticoreProcessor/Core1/Task1'
    'slexMulticoreExample/MulticoreProcessor/Core1/Task2'
    'slexMulticoreExample/MulticoreProcessor/Core2'
    'slexMulticoreExample/MulticoreProcessor/Core2/Task3'
    'slexMulticoreExample/MulticoreProcessor/Core2/Task4'
```

Look for all tasks

To find all the tasks in `slexMulticoreExample`:

```
slexMulticoreExample
t = Simulink.architecture.find_system('slexMulticoreExample', 'Type', 'Task')

t =

    'slexMulticoreExample/MulticoreProcessor/Core1/Task1'
    'slexMulticoreExample/MulticoreProcessor/Core1/Task2'
```

```
'slexMulticoreExample/MulticoreProcessor/Core2/Task3'  
'slexMulticoreExample/MulticoreProcessor/Core2/Task4'
```

Input Arguments

RootObject — Object to search

character vector

Object to search for parameter value, specified as a character vector giving the object full path name. Possible objects are:

- Model
- Software node
- Hardware node
- Periodic trigger
- Aperiodic trigger
- Task

Example: 'slexMulticoreExample'

ParamName — Name of parameter to find

character vector | scalar | vector

Name of the parameter to find. Possible values are:

- 'Name'
- 'Type'
- 'ClockFrequency'
- 'Color'
- 'Period'
- 'EventHandlerType'
- 'SignalNumber'
- 'EventName'

Example: 'EventName'

ParamValue — Parameter value to find

character vector | scalar | vector

Parameter value to find, specified as a character vector, a scalar, or a vector.

Example: 'ERTDefaultEvent'

Simulink.architecture.get_param

Get configuration parameters of architecture objects

Syntax

```
ParamValue = Simulink.architecture.get_param(Object,ParamName)
```

Description

`ParamValue = Simulink.architecture.get_param(Object,ParamName)` returns the value of the specified parameter for the object, `Object`. `ParamName` is case-sensitive.

Examples

Get period

Get the period of task `Task3` of trigger `Core2` of software node `MulticoreProcessor` of the selected architecture for the model `slexMulticoreExample`.

```
slexMulticoreExample;  
p = Simulink.architecture.get_param('slexMulticoreExample/MulticoreProcessor/Core2/Task3','Period')  
  
p =  
  
0.2
```

Input Arguments

Object — Object whose parameter value to return

character vector

Object whose parameter value to return, specified as a character vector giving the object full path name. Possible objects are:

- Software node
- Hardware node
- Periodic trigger
- Aperiodic trigger
- Task

ParamName — Parameter whose value to return

character vector

Name of a parameter for which `Simulink.architecture.get_param` returns a value.

The following are the possible `ParamName` values:

For a model:

- 'ArchitectureName'
- 'Type'

For a software node:

- 'Name'
- 'Type'

For a hardware node

- 'Name'
- 'ClockFrequency'
- 'Color'
- 'Type'

For a periodic trigger:

- 'Name'
- 'Period'
- 'Color'
- 'Type'

For an aperiodic trigger:

- 'Name'
- 'Color'
- 'EventHandlerType'
- 'SignalNumber'
- 'EventName'
- 'Type'

For a task:

- 'Name'
- 'Period'
- 'Color'
- 'Type'

Simulink.architecture.importAndSelect

Import and select target architecture for concurrent execution environment for model

Syntax

```
Simulink.architecture.importAndSelect(model,Architecture)
```

```
Simulink.architecture.importAndSelect(model,  
CustomArchitectureDescriptionFile)
```

Description

`Simulink.architecture.importAndSelect(model,Architecture)` imports and selects the built-in target architecture for the concurrent execution environment for the model.

Importing and selecting target architectures requires that the associated support packages or hardware is installed on your computer.

`Simulink.architecture.importAndSelect(model,CustomArchitectureDescriptionFile)` imports and selects the architecture from an XML-based architecture description file.

Importing and selecting target architectures requires that the associated support packages or hardware is installed on your computer.

Examples

Import and select a different architecture

Import and select the sample architecture to the model `slexMulticoreExample`.

```
slexMulticoreExample  
Simulink.architecture.importAndSelect('slexMulticoreExample','Sample Architecture')
```

Import and select a custom architecture

Import and select the custom architecture defined in the XML file `custom_arch.xml`. This example requires you to create a `custom_arch.xml` file first.

```
slexMulticoreExample  
Simulink.architecture.importAndSelect('slexMulticoreExample','custom_arch.xml')
```

Input Arguments

model — Model

character vector

Model to import architecture to, specified as a character vector.

Data Types: char

Architecture — Target architecture name

character vector

Target architecture name to import into the concurrent execution environment for the model. Possible target names are:

Property	Description
'Multicore'	Single CPU with multiple cores
'Sample Architecture'	Example architecture consisting of single CPU with multiple cores and two FPGAs. You can use this architecture to model for concurrent execution.
'Simulink Real-Time'	Simulink Real-Time™ target
'Xilinx Zynq ZC702 evaluation kit'	Xilinx® Zynq® ZC702 evaluation kit target
'Xilinx Zynq ZC706 evaluation kit'	Xilinx Zynq ZC706 evaluation kit target
'Xilinx Zynq Zedboard'	Xilinx Zynq ZedBoard™ target

Data Types: char

CustomArchitectureDescriptionFile — Custom target architecture file

XML file

Custom target architecture file name, in XML format, that describes a custom target for the concurrent execution environment for the model, specified as a character vector giving the XML file name.

Example: `custom_arch.xml`

Introduced in R2014a

Simulink.architecture.profile

Generate profile report for model configured for concurrent execution

Syntax

```
Simulink.architecture.profile(model)
Simulink.architecture.profile(model,numSamples)
```

Description

`Simulink.architecture.profile(model)` generates a profile report for a model configured for concurrent execution. Subsequent calls to the command for the same model name overwrite the existing profile report.

`Simulink.architecture.profile(model,numSamples)` specifies the number of samples to generate a profile report.

Examples

Generate profile report

Generate profile report for the model `slexMulticoreExample`.

```
slexMulticoreExample;
Simulink.architecture.profile('slexMulticoreExample');
```

The command creates the file `slexMulticoreExample_ProfileReport.html` in the current folder and opens it.

Generate profile report for 120 time steps

Generate profile report for the model `slexMulticoreExample` with data for 120 time steps.

```
slexMulticoreExample;
Simulink.architecture.profile('slexMulticoreExample',120);
```

The command creates the file `slexMulticoreExample_ProfileReport.html` in the current folder.

Input Arguments

model — Model to profile

character vector

Model to profile, specified as a character vector. Specify a model that is configured for concurrent execution.

Data Types: char

numSamples — Number of time steps

100 (default) | real, positive integer

Number of time steps, specified as a real, positive integer. This value determines the number of steps to collect data for in the profiled model.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

Simulink.architecture.register

Add custom target architecture to concurrent execution target architecture selector

Syntax

```
Simulink.architecture.register(CustomArchFile)
```

Description

`Simulink.architecture.register(CustomArchFile)` adds an XML-format custom target architecture file `CustomArchFile` to the concurrent execution target architecture selector. To access this selector, click the **Select** button on the Concurrent Execution pane of the Concurrent Execution dialog box.

Examples

Add custom target architecture

Add custom target architecture defined in the XML file `custom_arch.xml` to the concurrent execution target architecture selector. This example requires you to create a `custom_arch.xml` first.

```
slexMulticoreExample  
Simulink.architecture.register('custom_arch.xml')
```

Input Arguments

CustomArchFile — Custom target architecture file

XML file

Custom target architecture file that describes a custom target for concurrent execution, specified as an XML file.

Simulink.architecture.set_param

Set architecture object properties

Syntax

```
Simulink.architecture.set_param(Object, ParamName, ParamValue)
```

Description

`Simulink.architecture.set_param(Object, ParamName, ParamValue)` sets the specified parameter of `Object` to the specified value. Parameter name and value character vectors are case sensitive.

Examples

Set software node name

Set the software node name from `MulticoreProcessor` to `MyCPUNewName`.

```
slexMulticoreExample
Simulink.architecture.set_param([bdroot '/MulticoreProcessor'], 'Name', 'MyCPUNewName');
```

Change Periodic

Set `Core2` trigger period to `.01`.

```
slexMulticoreExample
Simulink.architecture.set_param([bdroot '/MyCPUNewName/Core2'], 'Period', '.01')
```

Input Arguments

Object — Object whose parameter value to set

character vector

Object whose parameter value to set, specified as a character vector giving the object full path name. Possible objects are:

- Software node
- Hardware node
- Periodic trigger
- Aperiodic trigger
- Task

ParamName — Name of the parameter to set

character vector

Name of parameter whose value to set.

These are the possible parameters whose values you can set for each of the object types:

For software node:

- 'Name' — Name of the software node.

For hardware node:

- 'Name' — Name of the hardware node.
- 'ClockFrequency' — Frequency of the hardware node clock.
- 'Color' — Color of the trigger icon, specified as an RGB triplet (vector).

For a periodic trigger:

- 'Name' — Name of the trigger.
- 'Period' — Period of the trigger.
- 'Color' — Color of the trigger icon, specified as an RGB triplet (vector).

For an aperiodic trigger:

- 'Name' — Name of the trigger.
- 'Color' — Color of the trigger icon, specified as an RGB triplet (vector).
- 'EventHandlerType' — Trigger source for the interrupt-driven task. Possible values:
 - 'Event (Windows)'
 - 'Posix Signal (Linux/VxWorks 6.x)'
- 'SignalNumber' — Signal number for the trigger. You can set this value only if EventHandlerType is set to Event (Windows).
- 'EventName' — Event name for the trigger. You can set this value only if EventHandlerType is set to Posix Signal (Linux/VxWorks 6.x).

For task:

- 'Name' — Name of the task.
- 'Period' — Period of the task.
- 'Color' — Color of the task icon, specified as an RGB triplet (vector).

Data Types: char

ParamValue — Value to set the parameter to

character vector | vector

Value to set the parameter to, specified as a character vector, scalar, or vector. The possible values depend on the parameter.

Example: 'MyCPUNewName'

Simulink.Block.getSampleTimes

Return sample time information for a block

Syntax

```
ts = Simulink.Block.getSampleTimes(block)
```

Input Arguments

block

Full name or handle of a Simulink block

Output Arguments

ts

The command returns *ts* which is a 1xn array of Simulink.SampleTime objects associated with the model passed to Simulink.Block.getSampleTimes. Here n is the number of sample times associated with the block. The format of the returns is:

```
1xn Simulink.SampleTime
Package: Simulink
value: [1x2 double]
Description: [char string]
ColorRGBValue: [1x3 double]
Annotation: [char string]
OwnerBlock: [char string]
ComponentSampleTimes: [1x2 struct]
Methods
```

- *value* — A two-element array of doubles that contains the sample time period and offset
- *Description* — A character vector or string that describes the sample time type
- *ColorRGBValue* — A 1x3 array of doubles that contains the red, green and blue (RGB) values of the sample time color
- *Annotation* — A character vector or string that represents the annotation of a specific sample time (e.g., 'D1')
- *OwnerBlock* — For asynchronous and variable sample times, a character vector or string containing the full path to the block that controls the sample time. For all other types of sample times, an empty character vector or string.
- *ComponentSampleTimes* — A structure array of elements of the same type as Simulink.BlockDiagram.getSampleTimes if the sample time is an async union or if the sample time is hybrid and the component sample times are available.

Description

`ts = Simulink.Block.getSampleTimes(block)` performs an update diagram and then returns the sample times of the block connected to the input argument *mdl/signal*. This method performs an update diagram to ensure that the sample time information returned is up-to-date. If the model is already in the compiled state via a call to the model API, then an update diagram is not necessary.

Using this method allows you to access all information in the Sample Time Legend programmatically.

See Also

`Simulink.BlockDiagram.getSampleTimes`

Introduced in R2009a

Simulink.BlockDiagram.addBusToVector

Convert virtual bus signals into vector signals by adding Bus to Vector blocks

Syntax

```
[destBlocks, busToVectorBlocks, ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model)
[destBlocks, busToVectorBlocks, ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model, includeLibs)
[destBlocks, busToVectorBlocks, ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model, includeLibs, reportOnly)
[destBlocks, busToVectorBlocks, ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model, includeLibs, reportOnly, strictOnly)
```

Description

[destBlocks, busToVectorBlocks, ignoredBlocks] = Simulink.BlockDiagram.addBusToVector(model) searches a model, excluding any library blocks, for bus signals used implicitly as vectors, and returns the results of the search.

[destBlocks, busToVectorBlocks, ignoredBlocks] = Simulink.BlockDiagram.addBusToVector(model, includeLibs) searches a model, and if includeLibs is true, includes in the search library blocks for bus signals used implicitly as vectors.

[destBlocks, busToVectorBlocks, ignoredBlocks] = Simulink.BlockDiagram.addBusToVector(model, includeLibs, reportOnly) searches a model, and if reportOnly is set to false, then the function inserts a Bus to Vector block into each bus that is used as a vector in any block that it searches. The insertion replaces the implicit use of a bus as a vector with an explicit conversion of the bus to a vector. The source and destination blocks of the signal do not change.

If Simulink.BlockDiagram.addBusToVector adds Bus to Vector blocks to the model or any library, the function changes the saved copy of the diagram.

If Simulink.BlockDiagram.addBusToVector changes a library block, the change affects every instance of that block in every model that uses the library.

[destBlocks, busToVectorBlocks, ignoredBlocks] = Simulink.BlockDiagram.addBusToVector(model, includeLibs, reportOnly, strictOnly) searches a model, and if strictOnly is true, the function checks for input bus signals used implicitly as vectors that are fed into one of these blocks. These blocks cannot take virtual bus signals, but they can accept nonvirtual bus signals:

- Delay
- Selector
- Assignment
- Vector Concatenate
- Reshape

- Permute Dimensions

Examples

Identify Bus-To-Vector Conversions

Model `ex_bus_to_vector` simulates correctly, but the input to the Gain block is a bus, while the output is a vector. The Gain block implicitly converts the bus to a vector.

Open the model.

```
open_system(fullfile(matlabroot, 'examples', 'simulink', 'main', ...
    'ex_bus_to_vector'))
```

Identify buses treated as vectors.

```
[blocks] = Simulink.BlockDiagram.addBusToVector(...
    'ex_bus_to_vector')
```

```
### Processing block diagram 'ex_bus_to_vector'
### Number of blocks left that are connected to a bus being used as a vector: 2
### Done processing block diagram 'ex_bus_to_vector'
```

```
blocks =
```

```
1x2 struct array with fields:
```

```
BlockPath
InputPort
LibPath
```

To understand the relationship between `Simulink.BlockDiagram.addBusToVector` and the **Bus signal treated as vector** configuration parameter, see “Manage Bus-to-Vector Conversions” on page 12-6.

Add Bus to Vector Blocks

Model `ex_bus_to_vector` simulates correctly, but the input to the Gain block is a bus, while the output is a vector. The Gain block implicitly converts the bus to a vector.

Open the model.

```
open_system(fullfile(matlabroot, 'examples', 'simulink', 'main', ...
    'ex_bus_to_vector'))
```

Insert Bus to Vector blocks.

When you use function `Simulink.BlockDiagram.addBusToVector` with `reportOnly` set to `false`, the function saves the model. To create a writable copy of model `ex_bus_to_vector`, this example uses the `save_system` function.

```
save_system('ex_bus_to_vector','ex_bus_to_vector_blocks');
[blocks,busToVectors] = Simulink.BlockDiagram.addBusToVector(...
'ex_bus_to_vector_blocks',true,false);
```

The Gain block no longer implicitly converts the bus to a vector. The inserted Bus to Vector block performs the conversion explicitly. The Bus to Vector block is virtual and does not affect simulation results, code generation, or performance.

To understand the relationship between `Simulink.BlockDiagram.addBusToVector` and the **Bus signal treated as vector** configuration parameter, see “Manage Bus-to-Vector Conversions” on page 12-6.

Input Arguments

model — Model name or handle

character vector | string scalar | numeric scalar

Model name or handle, specified as a character vector, string scalar, or numeric scalar.

Data Types: double | char | string

includeLibs — Search library blocks

false (default) | true

Search library blocks, specified as `false` or `true`.

- `false` — Search only the blocks in the model.
- `true` — Search library blocks for bus signals used implicitly as vectors.

Specify as the second argument.

Data Types: `logical`

reportOnly — Report results without changing model

`true` (default) | `false`

Choice to report results without changing the model, specified as `false` or `true`.

- `false` — Update the model by inserting Bus to Vector blocks for bus signals that are implicitly used as vectors.
- `true` — Report search results, but do not change the model.

Specify as the third argument. Also specify the `model` and `includeLibs` arguments.

Data Types: `logical`

strictOnly — Check input bus signals used implicitly as vectors that feed blocks that can accept nonvirtual, but not virtual, bus signals

`false` (default) | `true`

Check input bus signals used implicitly as vectors that feed blocks that can accept nonvirtual, but not virtual, bus signals, specified as `false` or `true`. If `strictOnly` is `true`, the function checks for input bus signals used implicitly as vectors that are fed into one of these blocks. These blocks cannot take virtual bus signals, but they can accept nonvirtual bus signals.

- Delay
- Selector
- Assignment
- Vector Concatenate
- Reshape
- Permute Dimensions

Specify as the fourth argument. You must also specify the `model`, `includeLibs`, and `reportOnly` arguments.

Data Types: `logical`

Output Arguments

destBlocks — Blocks connected to buses but that treat buses as vectors

array of structures

Blocks connected to buses that treat buses as vectors, returned as an array of structures. Each structure in the array contains these fields:

- `BlockPath` — Character vector specifying the path to the block to which the bus connects.
- `InputPort` — Integer specifying the input port to which the bus connects.
- `LibPath` — If the block is a library block instance, and if `includeLibs` is `true`, the field value is the path to the source library block. Otherwise, `LibPath` is empty (`[]`).

busToVectorBlocks — Bus to Vector blocks added by function

cell array

Bus to Vector blocks added by function, specified as a cell array. If `reportOnly` is set to `false`, the cell array contains the paths to each Bus to Vector block that the function added to replace buses used as vectors. Otherwise, `busToVectorBlocks` is empty (`[]`).

ignoredBlocks — Cases where function cannot insert Bus to Vector block

array of structures

Cases where function cannot insert Bus to Vector block, specified as an array of structures. Each structure in the array contains these fields:

- `BlockPath` — Character vector specifying the path to the block to which the bus connects.
- `InputPort` — Integer specifying the input port to which the bus connects.

These cases occur when a Bus to Vector cannot be inserted because the input virtual bus signal consists of elements with mixed attributes.

Tips

- Before you execute this function:
 - 1 Ensure that the model compiles without error.
 - 2 Save the model.
- Back up the model and any libraries before calling the function with `reportOnly` set to `false`.
- To preview the effects of the change on blocks in all models, call `Simulink.BlockDiagram.addBusToVector` with `includeLibs` set to `true` and `reportOnly` set to `true`. Then, examine the information returned in the `destBlocks` output argument.

Bus to Vector

Introduced in R2007a

Simulink.BlockDiagram.arrangeSystem

Improve layout of block diagram

Syntax

```
Simulink.BlockDiagram.arrangeSystem(bd)  
Simulink.BlockDiagram.arrangeSystem(bd,FullLayout=tf)
```

Description

`Simulink.BlockDiagram.arrangeSystem(bd)` improves the layout of the specified block diagram by realigning, resizing, and moving blocks and straightening signal lines.

`Simulink.BlockDiagram.arrangeSystem(bd,FullLayout=tf)` specifies whether to apply the automated layout even when the automated layout might not improve upon the original layout.

Examples

Arrange Programmatically Populated Model

You can use `Simulink.BlockDiagram.arrangeSystem` with any open model, and it is particularly useful with models you populate programmatically.

Blocks in the model `ex_arrange_system` are poorly arranged.

```
open_system('ex_arrange_system')
```

Blocks in its subsystem are also poorly arranged.

```
open_system('ex_arrange_system/Subsystem')
```

Programmatically arrange blocks in the top layer of the specified system.

```
Simulink.BlockDiagram.arrangeSystem('ex_arrange_system')
```

```
Simulink.BlockDiagram.arrangeSystem('ex_arrange_system/Subsystem')
```

Force Automated Layout

By default, `Simulink.BlockDiagram.arrangeSystem` applies an automated layout only when the automated layout is expected to improve upon the original layout. You can force this function to apply the layout even when the automated layout might not improve upon the original layout.

Blocks in the model `ForceArrangeSystem` are arranged well.

```
open_system('ex_arrange_system2')
```

The automated layout might not improve upon the original layout because the blocks are already arranged well.

Suppose you want to apply the automated layout regardless of whether the automated layout is an improvement. To force the automated layout, set `FullLayout` to `true`.

```
Simulink.BlockDiagram.arrangeSystem('ex_arrange_system2',FullLayout='true')
```

Input Arguments

bd — Block diagram of system

character vector | string scalar | numeric scalar

Block diagram of system, specified as a character vector, string scalar, or numeric scalar.

Specify one of the following options:

- System name (must not include a path or extension)
- System handle
- Subsystem block path

Data Types: double | char | string

tf — Option to force automated layout

'false' (default) | 'true'

Option to force automated layout, specified as 'true' or 'false'.

- 'true' — Applies the automated layout even when the automated layout might not improve upon the original layout
- 'false' — Applies the automated layout only when the automated layout is expected to improve upon the original layout.

Simulink.BlockDiagram.buildRapidAcceleratorTarget

Build Rapid Accelerator target for model and return run-time parameter set

Syntax

```
rtp = Simulink.BlockDiagram.buildRapidAcceleratorTarget mdl)
```

Description

`rtp = Simulink.BlockDiagram.buildRapidAcceleratorTarget mdl)` builds a Rapid Accelerator target for model, `mdl`, and returns run-time parameter set, `rtp`.

Input Arguments

mdl

Name or handle of a Simulink model

Output Arguments

rtp

Run-time parameter set that contains two elements:

Element	Description																				
<code>modelChecksum</code>	1x4 vector that encodes the structure of the model.																				
<code>parameters</code>	A structure of the tunable parameters in the model. This structure contains the following fields.																				
	<table border="1"> <thead> <tr> <th>Field</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td><code>dataTypeName</code></td> <td>The data type name, for example, <code>double</code>.</td> </tr> <tr> <td><code>dataTypeId</code></td> <td>Internal data type identifier for use by Simulink Coder.</td> </tr> <tr> <td><code>complex</code></td> <td>Complex type or real type specification. Value is 0 if real, 1 if complex.</td> </tr> <tr> <td><code>dtTransIdx</code></td> <td>Internal data type identifier for use by Simulink Coder.</td> </tr> <tr> <td><code>values</code></td> <td>All values associated with this entry in the <code>parameters</code> substructure.</td> </tr> <tr> <td><code>map</code></td> <td>Mapping structure information that correlates the values to the model tunable parameters. This structure contains the following fields.</td> </tr> <tr> <td></td> <td> <table border="1"> <thead> <tr> <th>Field</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td><code>Identifier</code></td> <td>Tunable parameter name.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Field	Description	<code>dataTypeName</code>	The data type name, for example, <code>double</code> .	<code>dataTypeId</code>	Internal data type identifier for use by Simulink Coder.	<code>complex</code>	Complex type or real type specification. Value is 0 if real, 1 if complex.	<code>dtTransIdx</code>	Internal data type identifier for use by Simulink Coder.	<code>values</code>	All values associated with this entry in the <code>parameters</code> substructure.	<code>map</code>	Mapping structure information that correlates the values to the model tunable parameters. This structure contains the following fields.		<table border="1"> <thead> <tr> <th>Field</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td><code>Identifier</code></td> <td>Tunable parameter name.</td> </tr> </tbody> </table>	Field	Description	<code>Identifier</code>	Tunable parameter name.
Field	Description																				
<code>dataTypeName</code>	The data type name, for example, <code>double</code> .																				
<code>dataTypeId</code>	Internal data type identifier for use by Simulink Coder.																				
<code>complex</code>	Complex type or real type specification. Value is 0 if real, 1 if complex.																				
<code>dtTransIdx</code>	Internal data type identifier for use by Simulink Coder.																				
<code>values</code>	All values associated with this entry in the <code>parameters</code> substructure.																				
<code>map</code>	Mapping structure information that correlates the values to the model tunable parameters. This structure contains the following fields.																				
	<table border="1"> <thead> <tr> <th>Field</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td><code>Identifier</code></td> <td>Tunable parameter name.</td> </tr> </tbody> </table>	Field	Description	<code>Identifier</code>	Tunable parameter name.																
Field	Description																				
<code>Identifier</code>	Tunable parameter name.																				

Element	Description		
		ValueIndices	Start and end indices into the values field, [startIdx, endIdx].
		Dimensions	Dimension of this tunable parameter (matrices are generally stored in column-major format).

Examples

Build Rapid Accelerator Target for Model

In the MATLAB Command Window, type:

```

rtp = Simulink.BlockDiagram.buildRapidAcceleratorTarget('f14')
### Building the rapid accelerator target for model: f14
### Successfully built the rapid accelerator target for model: f14

rtp =
    modelChecksum: [2.6812e+09 2.7198e+09 589261472 4.0180e+09]
    parameters: [1x1 struct]

```

Introduced in R2012b

Simulink.BlockDiagram.copyContentsToSubsystem

Copy graphical contents from system to empty subsystem

Syntax

```
Simulink.BlockDiagram.copyContentsToSubsystem(sys, subsystem)
```

Description

`Simulink.BlockDiagram.copyContentsToSubsystem(sys, subsystem)` copies the blocks, lines, and annotations of the specified system to the specified subsystem. It does not affect nongraphical information such as configuration sets.

Use this function to convert a referenced model derived from an atomic subsystem into an atomic subsystem that is equivalent to the original subsystem.

To use this function:

- The specified system must be loaded in memory.
- The specified subsystem must be loaded in memory.
- The specified system must not contain the specified subsystem.
- The specified subsystem must not contain any blocks or lines. Other types of information can exist in the subsystem and are unaffected by the function. To delete the graphical content of the destination subsystem, use `Simulink.SubSystem.deleteContents`.

Examples

Copy Block Diagram of Model to Subsystem

Copy the contents of a referenced model to an empty subsystem.

Open the `sldemo_mdref_basic` model.

```
openExample('sldemo_mdref_basic')
```

Add an empty subsystem to the model.

```
add_block('built-in/Subsystem', 'sldemo_mdref_basic/Subsystem')
```

Load the `sldemo_mdref_counter` referenced model that contains the contents to copy.

```
load_system('sldemo_mdref_counter')
```

Copy the graphical contents from the `sldemo_mdref_counter` referenced model to the empty subsystem.

```
Simulink.BlockDiagram.copyContentsToSubsystem...  
( 'sldemo_mdref_counter', 'sldemo_mdref_basic/Subsystem' )
```

Input Arguments

sys — System name or handle

numeric scalar | character vector | string scalar

System name or handle, specified as a numeric scalar, character vector, or string scalar.

The system name must not include a path or extension.

Example: 'model1'

Data Types: double | char | string

subsys — Subsystem block path or handle

numeric scalar | character vector | string scalar

Subsystem block path or handle, specified as a numeric scalar, character vector, or string scalar.

Example: 'model2/Subsystem'

Data Types: double | char | string

“Create Subsystems”

Introduced in R2007a

Simulink.BlockDiagram.createSubsystem

Create subsystem containing specified set of blocks

Syntax

```
Simulink.BlockDiagram.createSubsystem(blocks)
Simulink.BlockDiagram.createSubsystem()
Simulink.BlockDiagram.createSubsystem( ____,Name,Value)
```

Description

`Simulink.BlockDiagram.createSubsystem(blocks)` creates a subsystem and moves the specified blocks into it. All of the specified blocks must originally reside in the same block diagram.

If any of the blocks have unconnected ports, the function creates and connects Inport and Outport blocks to them inside the subsystem.

If any of the blocks are input or output port blocks, the function creates Inport and Outport blocks in the parent system to connect to the corresponding ports on the new Subsystem block.

`Simulink.BlockDiagram.createSubsystem()` replaces the currently selected blocks with a new subsystem that contains those blocks.

`Simulink.BlockDiagram.createSubsystem(____,Name,Value)` specifies options using one or more name-value pair arguments in addition to the input arguments in previous syntaxes. For example, 'Name', 'MySubsystem' names the new subsystem 'MySubsystem'.

Examples

Create Subsystem from Model

Open or load the example model.

```
CreateSubsystemModel
```

Get the block handles for all blocks at the top level of the model by using the `Simulink.findBlocks` function.

```
bh = Simulink.findBlocks('CreateSubsystemModel');
```

Replace the contents of the model with a subsystem that contains the model contents.

```
Simulink.BlockDiagram.createSubsystem(bh);
```

Create Named Subsystem from Model

Open or load the example model.

```
CreateSubsystemModel
```

Get the block handles for all blocks at the top level of the model by using the `Simulink.findBlocks` function.

```
bh = Simulink.findBlocks('CreateSubsystemModel');
```

Replace the contents of the model with a subsystem named `ss1` that contains the model contents.

```
Simulink.BlockDiagram.createSubsystem(bh, 'Name', 'ss1');
```

Input Arguments

blocks — Block handles

numeric array

Block handles, specified as a numeric array. To get block handles, use the `Simulink.findBlocks` or `gcbh` functions.

Data Types: `double`

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: `Simulink.BlockDiagram.createSubsystem(blocks, 'Name', 'MySubsystemName')`

Name — Name of new subsystem

character vector | string scalar

Name of the new subsystem, specified as the comma-separated pair consisting of `'Name'` and a character vector or string scalar.

Data Types: `char` | `string`

MakeNameUnique — Option to make subsystem name unique

`'on'` (default) | `'off'`

Option to make the subsystem name unique, specified as the comma-separated pair consisting of `'MakeNameUnique'` and `'on'` or `'off'`.

If the value that you specify for `Name` is already used in the diagram:

- `'on'` — Uses the next available increment of the name. For example, if `Name` is set to `'Controller'` and the diagram already contains a block named `'Controller'`, the function names the new subsystem `'Controller1'`.
- `'off'` — Returns an error.

Dependencies

To use this parameter, specify a value for the `Name` argument.

Data Types: char | string

Introduced in R2009a

Simulink.BlockDiagram.deleteContents

Delete graphical contents of system

Syntax

```
Simulink.BlockDiagram.deleteContents(sys)
```

Description

`Simulink.BlockDiagram.deleteContents(sys)` deletes the blocks, lines, and annotations in the specified system, which must be loaded in memory.

Examples

Delete Graphical Content from Model

Open the f14 model.

```
open_system('f14')
```

Delete the graphical content of the model, including all subsystems.

```
Simulink.BlockDiagram.deleteContents('f14')
```

Input Arguments

sys — System name or handle

character vector | string scalar | numeric scalar

System name or handle, specified as a character vector, string scalar, or numeric scalar.

A system name must not include a path or extension.

Example: 'mymodel'

Data Types: double | char | string

Tips

To delete the contents of a Subsystem block, use the `Simulink.SubSystem.deleteContents` function.

“Create Subsystems”

Introduced in R2007a

Simulink.BlockDiagram.getAlgebraicLoops

Show algebraic loops in a model

Syntax

```
Simulink.BlockDiagram.getAlgebraicLoops(model)
[loops,h] = Simulink.BlockDiagram.getAlgebraicLoops(model)
```

Description

`Simulink.BlockDiagram.getAlgebraicLoops(model)` returns a list of algebraic loops in a model as a vector of `AlgebraicLoops` objects.

The Algebraic Loops viewer provides a tabular list of all algebraic loops in the model. Use the Algebraic Loops viewer to control the display of algebraic loops in your model.

```
[loops,h] = Simulink.BlockDiagram.getAlgebraicLoops(model)
```

Examples

Highlight all algebraic loops in model

Open the `ex_sl-demo_hydcyl` model.

In the **Diagnostics** pane of Model Configuration Parameters, set **Algebraic loop** to none or warning. Setting this parameter to error prevents the model from compiling.

Compile the model without any errors. The model must compile before you can highlight any algebraic loops.

At the MATLAB command prompt, enter:

```
mdl = 'ex_sl-demo_hydcyl';
load_system(mdl);
Simulink.BlockDiagram.getAlgebraicLoops(bdroot)
```

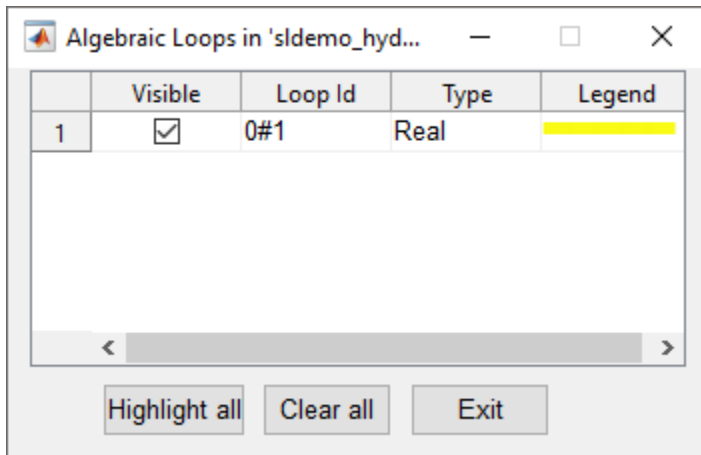

AlgebraicLoop with properties:

```

        Model: [1x1 Simulink.BlockDiagram]
           Id: [0 1]
VariableBlockHandles: [198.0001 145.0001]
      BlockHandles: [9x1 double]
      IsArtificial: 0
```

The resulting output shows that the model has one algebraic loop, which contains three blocks.

Running the `getAlgebraicLoops` function also opens the Algebraic Loop viewer. Use the Algebraic loop viewer to highlight specific algebraic loops in your model or all the loops.

The selected loops are highlighted in the corresponding model, in.

Input Arguments

model – Model to highlight

string scalar | character vector

Name of the model being tested, specified as a string scalar or character vector. You can also pass the most recently opened model using `bdroot`.

Note The model must be loaded into memory using either `open_system` or `load_system`.

Data Types: char | string

Output Arguments

Loops – Algebraic loops

vector of AlgebraicLoop objects

Every algebraic loop in the model returned as an `AlgebraicLoop` object that contains the following information:

- `Model`— `Simulink.BlockDiagram` object representing the model
- `Id`— Index of the algebraic loop in the model
- `VariableBlockHandles`: Handles to blocks that have been assigned algebraic variables
- `BlockHandles`—Handles to all the blocks contained in the algebraic loop
- `IsArtificial`— Boolean value indicating whether the loop is an artificial algebraic loop.

h — Handle to control UI

`matlab.ui.Figure` handle

The control UI is a MATLAB figure window. Use the UI handle `h` to control it programmatically. For more information, see [Figure Properties](#).

Simulink.BlockDiagram.expandSubsystem

Replace subsystem with subsystem contents

Syntax

```
Simulink.BlockDiagram.expandSubsystem(subsys)
Simulink.BlockDiagram.expandSubsystem(subsys, 'CreateArea', specifier)
```

Description

`Simulink.BlockDiagram.expandSubsystem(subsys)` replaces the specified subsystem with its contents in the block diagram that contains it. The file that contains the subsystem must be open or loaded.

You can expand virtual subsystems that are not masked, linked, or commented. For details, see “What Subsystems Can You Expand?”.

`Simulink.BlockDiagram.expandSubsystem(subsys, 'CreateArea', specifier)` provides the option of not creating an area around the expanded subsystem contents.

Examples

Expand Subsystem

Replace a subsystem with its contents.

Open the example model, which contains a subsystem that separates functionally related blocks.

```
open_system('SubsystemExpansionModel')
```

Expand the subsystem.

```
Simulink.BlockDiagram.expandSubsystem('SubsystemExpansionModel/Subsystem')
```

An area that contains the subsystem contents replaces the Subsystem block.

Expand Subsystem Without Creating Area

Replace a subsystem with its contents without creating an area that surround the contents.

Open the example model, which contains a subsystem that separates functionally related blocks.

```
open_system('SubsystemExpansionModel')
```

Expand the subsystem.

```
Simulink.BlockDiagram.expandSubsystem(...  
    'SubsystemExpansionModel/Subsystem', 'CreateArea', 'Off')
```

The subsystem contents replace the Subsystem block.

Input Arguments

subsys — Subsystem block path or handle

character vector | string scalar | numeric scalar

Subsystem block path or handle, specified as a character vector, string scalar, or numeric scalar.

Data Types: double | char | string

specifier — Option to create area around contents

'on' (default) | 'off'

Option to create area around contents, specified as 'on' to create the area or 'off' to not create the area.

Data Types: char | string

Introduced in R2014a

Simulink.BlockDiagram.getChecksum

Return checksum of model

Syntax

```
[checksum,details] = Simulink.BlockDiagram.getChecksum('model')
```

Description

[*checksum,details*] = Simulink.BlockDiagram.getChecksum('model') returns the checksum of the specified model. Simulink software computes the checksum based on attributes of the model and the blocks the model contains.

One use of this command is to determine why the Accelerator mode in Simulink software regenerates code. For an example, see “Determine Why Simulink Accelerator Is Regenerating Code” on page 13-595.

Note Simulink.BlockDiagram.getChecksum compiles the specified model, if the model is not already in a compiled state.

This command accepts the argument *model*, which is the full name or handle of the model for which you are returning checksum data.

This command returns the following output:

- *checksum* — Array of four 32-bit integers that represents the model's 128-bit checksum.
- *details* — Structure of the form

```
ContentsChecksum: [1x1 struct]
InterfaceChecksum: [1x1 struct]
ContentsChecksumItems: [nx1 struct]
InterfaceChecksumItems: [mx1 struct]
```

- **ContentsChecksum** — Structure of the following form that represents a checksum that provides information about all blocks in the model.

```
Value: [4x1 uint32]
MarkedUnique: [bool]
```

- **Value** — Array of four 32-bit integers that represents the model's 128-bit checksum.
- **MarkedUnique** — True if any blocks in the model have a property that prevents code reuse.
- **InterfaceChecksum** — Structure of the following form that represents a checksum that provides information about the model.

```
Value: [4x1 uint32]
MarkedUnique: [bool]
```

- **Value** — Array of four 32-bit integers that represents the model's 128-bit checksum.
- **MarkedUnique** — Always true. Present for consistency with **ContentsChecksum** structure.

- `ContentsChecksumItems` and `InterfaceChecksumItems` — Structure arrays of the following form that contain information that Simulink software uses to compute the checksum for `ContentsChecksum` and `InterfaceChecksum`, respectively:

Handle: [char array]
 Identifier: [char array]
 Value: [type]

- `Handle` — Object for which Simulink software added an item to the checksum. For a block, the handle is a full block path. For a block port, the handle is the full block path and a character vector that identifies the port.
- `Identifier` — Descriptor of the item Simulink software added to the checksum. If the item is a documented parameter, the identifier is the parameter name.
- `Value` — Value of the item Simulink software added to the checksum. If the item is a parameter, `Value` is the value returned by

`get_param(handle, identifier)`

`Simulink.BlockDiagram.getChecksum` returns a checksum that depends on why and how you compiled the model. This function also compiles the model if it is not in a compiled state. The model compiles for:

- Simulation— if the simulation mode is Accelerator or you have not installed Simulink Coder
- Code generation— in all other cases

To compile the model before calling `Simulink.BlockDiagram.getChecksum`, use this command:

```
modelName([], [], [], 'compile')
```

Note The checksum that `Simulink.BlockDiagram.getChecksum` returns can vary from the checksum returned if you first compile the model at the command line (using the `model` command) before running `Simulink.BlockDiagram.getChecksum`.

Tip

The structural checksum reflects changes to the model that can affect the simulation results, including:

- Changing the solver type, for example from `Variable-step` to `Fixed-step`
- Adding or deleting blocks or connections between blocks
- Changing the values of nontunable block parameters, for example, the **Seed** parameter of the Random Number block
- Changing the number of inputs or outputs of blocks, even if the connectivity is vectorized
- Changing the number of states or the initial states in the model
- Selecting a different function in the Trigonometric Function block
- Changing signs used in a Sum block
- Adding a Target Language Compiler (TLC) file to inline an S-function

Examples of model changes that do not affect the structural checksum include:

- Changing the position of a block
- Changing the position of a line
- Resizing a block
- Adding, removing, or changing a model annotation

See Also

`Simulink.SubSystem.getChecksum` | `Simulink.getFileChecksum`

Introduced in R2006b

Simulink.BlockDiagram.getInitialState

Return initial state data of block diagram

Syntax

```
x0 = Simulink.BlockDiagram.getInitialState('model')
```

Description

`x0 = Simulink.BlockDiagram.getInitialState('model')` returns the initial state data of the block diagram specified by the input argument *model*. You can use this initial state data as the initial state for simulating a model or to provide an initial state condition to the linearization commands. To specify the initial state for a simulation, use the `LoadInitialState` model argument or the **Data Import/Export > Initial state** configuration parameter.

To specify the format for the initial state data, use the `SaveFormat` model argument. The default format is 'Dataset'. Other formats 'Array', 'Structure', and 'StructureWithTime'. Alternatively, you can set the initial state format using the **Data Import/Export > Format** configuration parameter.

- If format is 'Dataset', then the `Simulink.BlockDiagram.getInitialState` function returns a `Simulink.SimulationData.Dataset` object.
- For other format settings, the function returns a structure of the form:

```
time: 0
signals: [1xn struct]
```

where *n* is the number of states contained in the model, including any models referenced by Model blocks. The `signals` field is a structure of the form:

```
values: [1xm double]
dimensions: [1x1 double]
label: [char array]
blockName: [char array]
inReferencedModel: [bool]
sampleTime: [1x2 double]
```

- `values` — Numeric array of length *m*, where *m* is the number of states in the signal
- `dimensions` — Length of the `values` vector
- `label` — Indication of whether the state is continuous (CSTATE) or discrete. If the state is discrete:

The name of the discrete state is shown for S-function blocks.

The name of the discrete state is shown for those built-in blocks that assign their own names to discrete states.

DSTATE is used in all other cases.

- `blockName` — Full path to block associated with this state

- `inReferencedModel` — Indication of whether the state originates in a model referenced by a Model block (1) or in the top model (0)
- `sampleTime` — Array containing the sample time and offset of the block that owns the state

Using this function to return the initial state data simplifies specifying initial state values for models with multiple states. Each state is associated with the full path to its parent block.

Introduced in R2006b

Simulink.BlockDiagram.getSampleTimes

Return all sample times associated with model

Syntax

```
ts = Simulink.BlockDiagram.getSampleTimes('model')
```

Description

`ts = Simulink.BlockDiagram.getSampleTimes('model')` performs an update diagram and then returns the sample times associated with the block diagram *model*. The update diagram ensures that the sample time information returned is up to date. If the model is already in the compiled state via a call to the model API, then an update diagram is not necessary.

Using this method allows you to access all information in the Sample Time Legend programmatically.

Input Arguments

model

Name or handle of a Simulink model

Output Arguments

ts

The command returns a $1 \times n$ array of `Simulink.SampleTime` objects associated with the model passed to `Simulink.BlockDiagram.getSampleTimes`. Here n is the number of sample times associated with the block diagram. The format of the returns is as follows:

```
1xn Simulink.SampleTime
Package: Simulink
value: [1x2 double]
Description: [char string]
ColorRGBValue: [1x3 double]
Annotation: [char string]
OwnerBlock: [char string]
ComponentSampleTimes: [1x2 struct]
Methods
```

- **value** — A two-element array of doubles that contains the sample time period and offset.
- **Description** — A character vector or string that describes the sample time type.
- **ColorRGBValue** — A 1×3 array of doubles that contains the red, green, and blue (RGB) values of the sample time color.
- **Annotation** — A character vector or string that represents the annotation of a specific sample time (e.g., 'D1').
- **OwnerBlock** — For asynchronous and variable sample times, a character vector or string containing the full path to the block that controls the sample time. For all other types of sample times, an empty character vector or string.

- `ComponentSampleTimes` — A structure array of elements of the same type as `Simulink.BlockDiagram.getSampleTimes` if the sample time is an async union or if the sample time is hybrid and the component sample times are available.

`Simulink.Block.getSampleTimes`

Introduced in R2009a

Simulink.BlockDiagram.propagateConfigSet

Propagate top model configuration reference to referenced models

Syntax

```
[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model)
[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model, 'include', refModels)
[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model, 'exclude', refModels)
handle = Simulink.BlockDiagram.propagateConfigSet(model, 'gui')
```

Description

`[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model)` propagates the configuration reference for `model` to all referenced models. Execute the function from a writable folder.

`[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model, 'include', refModels)` propagates the configuration reference for `model` to the models in the `refModels` list. Execute the function from a writable folder.

`[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model, 'exclude', refModels)` propagates the configuration reference for `model` to all referenced models in the hierarchy except for the models in the `refModels` list. Execute the function from a writable folder.

`handle = Simulink.BlockDiagram.propagateConfigSet(model, 'gui')` opens the **Configuration Reference Propagation to Referenced Models** dialog box.

Examples

Propagate a Configuration Reference to All Referenced Models

```
openExample('simulink/VisualizeModelReferenceHierarchiesExample')
[isPropagated, convertedModels] = ...
Simulink.BlockDiagram.propagateConfigSet('sldemo_mdref_depgraph')
```

Propagate a Configuration Reference to Listed Referenced Models

```
openExample('simulink/VisualizeModelReferenceHierarchiesExample')
[isPropagated, convertedModels] = ...
Simulink.BlockDiagram.propagateConfigSet(...
'sldemo_mdref_depgraph', 'include', ...
{'sldemo_mdref_heater', 'sldemo_mdref_house'})
```

Propagate a Configuration Reference to Referenced Models with Exclusions

```
openExample('simulink/VisualizeModelReferenceHierarchiesExample')
[isPropagated,convertedModels] = ...
Simulink.BlockDiagram.propagateConfigSet(...
'sldemo_mdhref_depgraph','exclude',...
{'sldemo_mdhref_heater','sldemo_mdhref_house'})
```

Open the Configuration Reference Propagation to Referenced Models Dialog Box for a Model

```
openExample('simulink/VisualizeModelReferenceHierarchiesExample')
Simulink.BlockDiagram.propagateConfigSet(...
'sldemo_mdhref_depgraph','gui')
```

Input Arguments

model — Top model

character vector | string scalar

Top model with configuration reference to propagate, specified as a character vector or string scalar.

Example: 'mdl'

refModels — Referenced models

cell array of character vectors | string array

List of referenced models to be included or excluded in propagation, specified as a cell array of character vectors or string array.

Example: {'mdl1','mdl2','mdl3'}

Output Arguments

isPropagated — Success of propagation

false (default) | true

Indication of whether configuration reference propagation is successful, specified as a Boolean.

convertedModels — Converted models

cell array of character vectors

List of converted model names, specified as a cell array of character vectors.

handle — Handle to dialog box

handle

Handle to the **Configuration Reference Propagation to Referenced Models** dialog box. Returned when you specify the 'gui' argument to the function.

“Share a Configuration with Multiple Models”

Introduced in R2012b

Simulink.BlockDiagram.restoreConfigSet

Restore model configuration for converted models

Syntax

```
[isRestored, restoredModels] = Simulink.BlockDiagram.restoreConfigSet(model)
```

Description

```
[isRestored, restoredModels] = Simulink.BlockDiagram.restoreConfigSet(model)
```

restores the model configuration for all converted models after propagating a configuration reference from a top model to the referenced models. Execute the function from a writable folder.

Examples

Restore the Model Configuration for Converted Models

```
openExample('simulink/VisualizeModelReferenceHierarchiesExample')  
[isRestored, restoredModels] = ...  
Simulink.BlockDiagram.restoreConfigSet('sldemo_mdref_depgraph');
```

Input Arguments

model — Top model

character vector | string scalar

Name of top model, specified as a character vector or string scalar.

Example: 'mdl'

Output Arguments

isRestored — Success of restoration

false (default) | true

Indication of whether configuration reference propagation is successful, specified as a Boolean.

restoredModels — Restored models

cell array of character vectors

List of restored model names, specified as a cell array of character vectors.

Simulink.BlockDiagram.loadActiveConfigSet

Package: Simulink.BlockDiagram

Load, associate, and activate configuration set with model

Syntax

```
Simulink.BlockDiagram.loadActiveConfigSet(model, file)
```

Description

`Simulink.BlockDiagram.loadActiveConfigSet(model, file)` loads a configuration set, attaches it to a model, and makes it the active configuration set for the model.

Examples

Load and Activate a Configuration Set

Load a saved configuration set to a model and activate it.

Open the “Modeling a Fault-Tolerant Fuel Control System” on page 13-119 example model `sldemo_fuelsys`. Save the active configuration set to a file.

```
openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')
sldemo_fuelsys
Simulink.BlockDiagram.saveActiveConfigSet('sldemo_fuelsys', 'fuelsys_config_set.m')
```

Open the `vdp` model. Load the saved configuration set to `vdp` and activate it.

```
vdp
Simulink.BlockDiagram.loadActiveConfigSet('vdp', 'fuelsys_config_set.m')
```

Input Arguments

model — Target model

character vector | string scalar

Name or handle of the target model for which you want to use the configuration set, specified as a character vector or string scalar.

Example: `'my_model'`

file — Name of file

character vector | string scalar

Name of the file that contains the configuration set, specified as a character vector or string scalar.

Example: `'configset.m'`

Tips

- If you load a configuration set with the same name as the active configuration set, Simulink overwrites the active configuration set.
- If you load a configuration set with the same name as an inactive configuration set associated with the model, Simulink detaches the inactive configuration from the model.
- If you load a configuration set object that contains an invalid custom target, Simulink sets the “System target file” (Simulink Coder) parameter to `ert.tlc`.

Topics

“Load a Saved Configuration Set”

Introduced in R2010b

Simulink.BlockDiagram.saveActiveConfigSet

Package: Simulink.BlockDiagram

Save active configuration set of model

Syntax

```
Simulink.BlockDiagram.saveActiveConfigSet(model, file)
```

Description

`Simulink.BlockDiagram.saveActiveConfigSet(model, file)` saves the active configuration set of a model to an `.m` file or MAT-file.

Examples

Save a Configuration Set

Save the configuration set from the `sldemo_fuelsys` model as a `ConfigSet` object in the file `my_config_set.mat`.

Open the “Modeling a Fault-Tolerant Fuel Control System” on page 13-119 example model `sldemo_fuelsys`.

```
openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')  
sldemo_fuelsys
```

Save the active configuration set.

```
Simulink.BlockDiagram.saveActiveConfigSet('sldemo_fuelsys','my_config_set.mat')
```

Input Arguments

model — Model using configuration set

character vector | string scalar

Name or handle of the model that uses the configuration set that you want to save, specified as a character vector or string scalar.

Example: `'my_model'`

file — Name of file

character vector | string scalar

Name of the file to save the configuration set, specified as a character vector or string scalar. If you specify an `.m` extension, the file contains a function that creates a configuration set object. If you specify a `.mat` extension, the file contains a configuration set object. If you do not provide a file extension, the active configuration set is saved to a file with a `.m` extension. Do not specify `filename` to be the same as a model name; otherwise, the software cannot determine which file contains the configuration set object when loading the file.

Note If you specify a `.mat` extension when you save the active configuration set, all of the parameters are preserved. If you specify a `.m` extension, the `.m` file does not include hidden or disabled parameters.

Example: `'configset.m'`

“Save a Configuration Set”

Introduced in R2010b

Simulink.BlockDiagram.routeLine

Route existing lines of model

Syntax

```
Simulink.BlockDiagram.routeLine(lines)  
Simulink.BlockDiagram.routeLine('DeferredLines')
```

Description

`Simulink.BlockDiagram.routeLine(lines)` takes an array of existing line handles as input and routes the corresponding lines. Routing existing lines improves line route quality and avoids overlaps with other lines and obstacles in the model.

To find the line handles in the model you want to route, use the `find_system` or `get_param` function.

`Simulink.BlockDiagram.routeLine('DeferredLines')` performs all line updates that the `LineUpdate` model parameter defers while a script runs. For this command to route lines, all of these conditions must apply:

- The `LineUpdate` model parameter is set to 'deferred'.
- The script that contains this command affects line routing before using this command.
- If the script saves models, the script affects line routing after using the `save_system` function and before using this command.

Examples

Route Existing Lines of Model

Route existing lines of a model that overlap with other lines and blocks in the model.

Open the model `ex_route_lines`.

```
open_system('ex_route_lines');
```

The two lines in the top-level system overlap with each other and with a block. To route these lines, create an array of line handles by using `find_system`. Then, call `Simulink.BlockDiagram.routeLine` with this array as input.

```
lineHandles = find_system(gcs,'FindAll','On','SearchDepth',1,'Type','Line');
Simulink.BlockDiagram.routeLine(lineHandles);
```

The updated model has no overlaps.

Route Lines Affected by Script

When the `LineUpdate` model parameter is set to `'deferred'`, scripts postpone line routing until they pause, complete, or run the `Simulink.BlockDiagram.routeLine('DeferredLines')` command.

Model `ex_route_deferred_lines` contains virtual subsystems with numerous signal lines connecting them.

To see how the `Simulink.BlockDiagram.routeline('DeferredLines')` command works with the `LineUpdate` model parameter, set this parameter to `'deferred'`.

```
set_param(0,'LineUpdate','deferred');
```

Capture Image Before Routing Deferred Lines

Run a MATLAB® script that loads the model, moves blocks within the model, and saves an image of the model.

```
load_system('ex_route_deferred_lines');
set_param([gcs '/Subsystem2'],'Position',[765 -370 855 -330]);
set_param([gcs '/Subsystem3'],'Position',[300 215 390 335]);
set_param([gcs '/Subsystem4'],'Position',[270 -135 360 -95]);
print('-s','deferred_lines_unrouted','-dpng');
```

Because the script saves an image of the model before the deferred lines are routed, lines overlap other lines and obstacles in the model.

Capture Image After Routing Deferred Lines

Run a MATLAB script that loads the original model, moves blocks within the model, updates affected line routing, and saves an image of the model.

```
load_system('ex_route_deferred_lines');
set_param([gcs '/Subsystem2'],'Position',[765 -370 855 -330]);
set_param([gcs '/Subsystem3'],'Position',[300 215 390 335]);
set_param([gcs '/Subsystem4'],'Position',[270 -135 360 -95]);
Simulink.BlockDiagram.routeLine('DeferredLines');
print('-s','deferred_lines_routed','-dpng');
```

Adding command `Simulink.BlockDiagram.routeLine('DeferredLines')` before the print function improves line routing in the saved image.

Input Arguments

Lines — Handles of lines to route

numeric array

Handles of lines to route, specified as a numeric array. To find the line handles in your model, use the `find_system` or `get_param` function.

Data Types: double

Limitations

- Line routing can require additional empty space on the Simulink canvas. If the canvas does not have the required empty space, using `Simulink.BlockDiagram.routeLine` might not improve line route quality.
- For large models with many lines to route, `Simulink.BlockDiagram.routeLine` can take several minutes to execute.

“Programmatic Modeling Basics”

“Format a Model”

Introduced in R2019a

Simulink.Bus.cellToObject

Convert cell array containing bus information to Simulink.Bus objects

Syntax

```
Simulink.Bus.cellToObject(busCell)
Simulink.Bus.cellToObject(busCell,scope)
```

Description

`Simulink.Bus.cellToObject(busCell)` creates a set of `Simulink.Bus` objects in the MATLAB base workspace from a cell array of bus information.

`Simulink.Bus.cellToObject(busCell,scope)` creates a set of `Simulink.Bus` objects in the data dictionary specified by `scope` from a cell array of bus information.

Examples

Create Simulink.Bus Object from Cell Array of Bus Information

This example shows how to create and use a cell array to generate `Simulink.Bus` objects in the base workspace.

To define the elements that the Bus object contains, create an array of `Simulink.BusElement` objects or a cell array of the property values for the `BusElement` objects.

When you define the elements in an array of `BusElement` objects, you must specify the values that differ from the default.

```
elementsArray(1) = Simulink.BusElement;

elementsArray(2) = Simulink.BusElement;
elementsArray(2).Name = 'b';
elementsArray(2).Min = -3;
elementsArray(2).Max = 3;
elementsArray(2).Unit = 'm';
elementsArray(2).Description = 'b is distance from the origin.';
```

When you define the elements in a cell array of property values, you must specify the element name, dimensions, data type, complexity, and sampling mode. You can also specify the dimensions mode, minimum, maximum, units, and description.

```
elementsCellArray = {{ 'a', 1, 'double', -1, 'real', 'Sample' }; ...
                    { 'b', 1, 'double', 'real', 'Sample', ...
                      'Fixed', -3, 3, 'm', 'b is distance from the origin' }};
```

In this example, `elementsArray` and `elementsCellArray` create the same `BusElement` objects in the Bus objects.

Create a cell array with two subordinate cell arrays that define Bus objects. For each Bus object, specify the bus name, header file, description, data scope, alignment, preserve element dimensions,

and elements. For the first Bus object, specify the elements using `elementsArray`. For the second Bus object, specify the elements using `elementsCellArray`.

```
busCells = { ...
    { ...
        'myBusObjArray', ...
        'MyHeader.h', ...
        'My description', ...
        'Exported', ...
        '-1', ...
        '0', ...
        elementsArray,...
    }, ...
    { ...
        'myBusObjCellArray', ...
        'MyHeader.h', ...
        'My description', ...
        'Exported', ...
        '-1', ...
        '0', ...
        elementsCellArray,...
    }, ...
};
```

Generate the Bus objects in the base workspace from the cell array of cell arrays.

```
Simulink.Bus.cellToObject(busCells)
```

Compare the generated Bus objects in the **Bus Editor**.

```
buseditor
```

The Bus objects are identical other than their names.

Input Arguments

busCell — Simulink.Bus object information

cell array of cell arrays

Bus object information, specified as a cell array of cell arrays. Each subordinate cell array must contain this Bus object information:

- 1 Bus name
- 2 Header file
- 3 Description
- 4 Data scope
- 5 Alignment
- 6 Preserve Element Dimensions
- 7 Elements

The `elements` field is a cell array that contains this information for each of the `Simulink.BusElement` objects that the Bus object references:

The `elements` field must contain arrays or cell arrays with this information for each of the `Simulink.BusElement` objects that the `Bus` object references:

- 1 Element name
- 2 Dimensions
- 3 Data type
- 4 Sample time (optional) — If you specify a sample time, specify an inherited sample time (-1). A noninherited sample time causes an error during model compilation. For more information, see “`Simulink.BusElement` objects no longer support the `SampleTime` property” on page 2-496.
- 5 Complexity
- 6 Sampling mode

The `elements` field arrays or cell arrays can also contain this information:

- 1 Dimensions mode
- 2 Minimum
- 3 Maximum
- 4 Units
- 5 Description

Example: `Simulink.Bus.cellToObject(busCell);`

scope — Data dictionary to contain Simulink.Bus objects

`Simulink.data.Dictionary` object

Data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this argument, represent the dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

If `scope` is empty, the function uses the MATLAB base workspace as the source of the `Bus` objects.

Example: `Simulink.Bus.cellToObject(busCell,dataDictionaryObject);`

Tips

The inverse function is `Simulink.Bus.objectToCell`.

Compatibility Considerations

Simulink.BusElement objects no longer support the SampleTime property

Errors starting in R2020b

The `SampleTime` property of `Simulink.BusElement` objects is no longer supported.

`BusElement` objects that specify a sample time cause an error during compile. To remove the sample time specification from a `BusElement` object, set its `SampleTime` to -1.

`Simulink.Bus.cellToObject` continues to accept cell arrays that specify sample time for bus elements. `Simulink.Bus.objectToCell`, `Simulink.Bus.save`, and `Simulink.Bus.createObject` continue to return cell arrays or arrays that include the sample time

when it is noninherited. When the sample time is inherited (-1), they omit it. Similarly, the **Bus Editor** and **Model Explorer** omit the sample time when it is inherited.

To specify the sample time for an element of a bus, use the `SampleTime` block parameter of corresponding blocks. For example, you can use `In Bus Element`, `Out Bus Element`, and `Signal Specification` blocks to specify sample time.

Simulink.BusElement objects will no longer support the SamplingMode property

Not recommended starting in R2016b

In R2016b, the `SamplingMode` property of `Simulink.BusElement` objects was removed. Scripts that use the `SamplingMode` property of `Simulink.BusElement` objects continue to work. `Simulink.Bus.cellToObject` continues to require the `SamplingMode` field and `Simulink.Bus.objectToCell` continues to include the sampling mode in the output cell arrays.

In a future release, support for the `SamplingMode` property will be removed.

To specify whether a signal is sample-based or frame-based, define the sampling mode of input signals at the block level instead of at the signal level.

Simulink.Bus.createMATLABStruct

Create MATLAB structures that use the same hierarchy and attributes as buses

Syntax

```
structs = Simulink.Bus.createMATLABStruct(buses)
structs = Simulink.Bus.createMATLABStruct(buses,values)
structs = Simulink.Bus.createMATLABStruct(buses,values,dims)
structs = Simulink.Bus.createMATLABStruct(buses,values,dims,scope)
```

Description

`structs = Simulink.Bus.createMATLABStruct(buses)` creates one or more MATLAB structures that have the same hierarchy and attributes as the specified buses. The resulting structures use the ground values of the buses. Use this syntax to create initialization structures for multiple bus ports.

`structs = Simulink.Bus.createMATLABStruct(buses,values)` creates one or more structures that use the specified values.

`structs = Simulink.Bus.createMATLABStruct(buses,values,dims)` creates one or more structures that have the specified dimensions. To create a structure for an array of buses, include the `dims` argument.

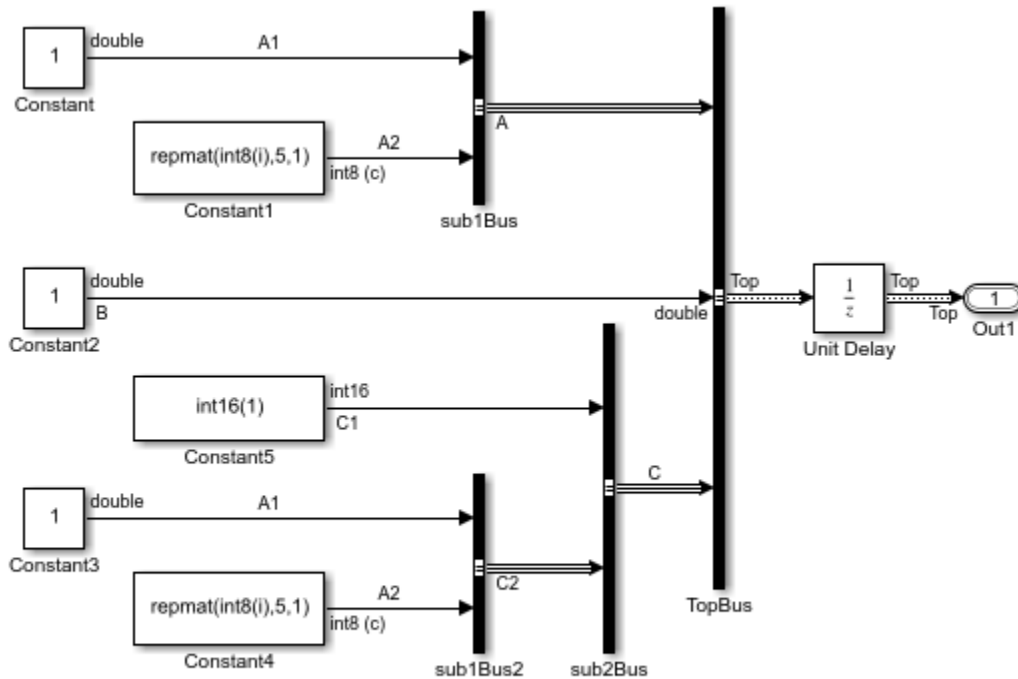

`structs = Simulink.Bus.createMATLABStruct(buses,values,dims,scope)` creates one or more structures in the data dictionary specified by `scope`.

Examples

Create MATLAB Structure from Bus Object

Open and simulate model `ex_bus_initial_conditions`.

```
open_system('ex_bus_initial_conditions')
sim('ex_bus_initial_conditions');
```

Copyright 2004-2018 The MathWorks, Inc.

Create a MATLAB structure using bus object Top, which model `ex_bus_initial_conditions` loads.

```
mStruct = Simulink.Bus.createMATLABStruct('Top');
```

Set a value for the field of the mStruct structure that corresponds to bus element A1 of bus A.

```
mStruct.A.A1 = 3;
mStruct.A
```

```
ans =
```

```
struct with fields:
```

```
A1: 3
A2: [5x1 int8]
```

Simulink sets the other fields in the structure to the ground values of the corresponding bus elements.

You can use mStruct as the initial condition structure for the Unit Delay block.

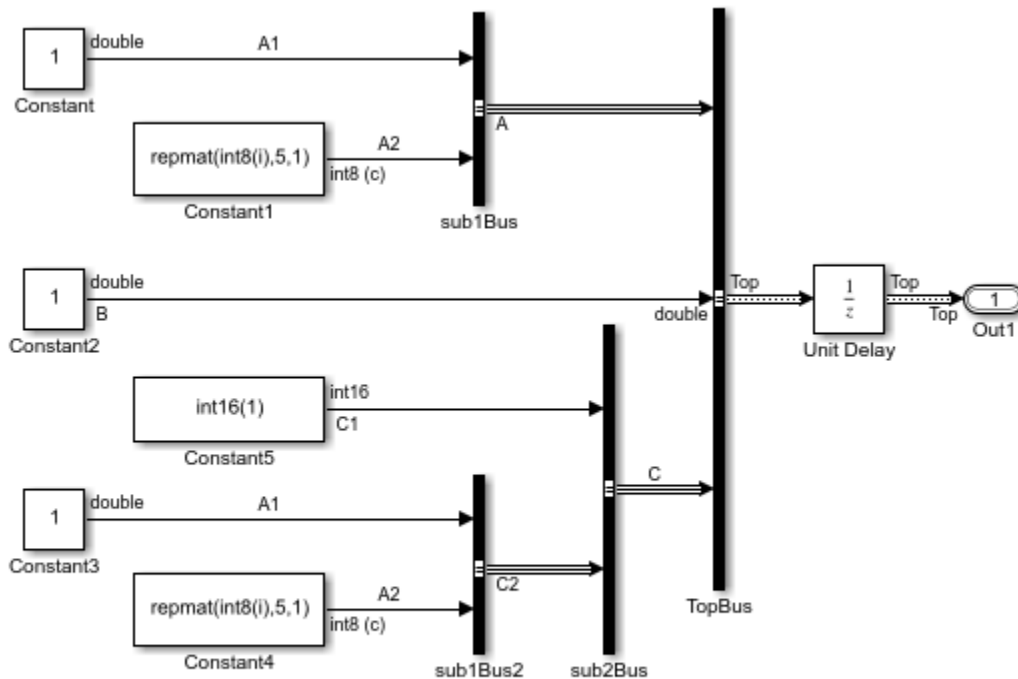

Initialize Signal Elements that Use a Data Type Other than Double

Create a MATLAB structure for a bus whose signal elements use a data type other than `double`. Use a partial structure to specify initialization values for a subset of the elements. When you create the

partial structure, match the data types of the fields with the data types of the corresponding elements.

Open and simulate model `ex_bus_initial_conditions`.

```
open_system('ex_bus_initial_conditions')
sim('ex_bus_initial_conditions');
```

Copyright 2004-2018 The MathWorks, Inc.

The C1 signal element that the block labeled Constant5 produces uses the data type `int16`.

Find the port handle for the Bus Creator block port that produces the Top bus signal.

```
ph = get_param('ex_bus_initial_conditions/TopBus', 'PortHandles');
```

Create a partial structure that specifies values for a subset of the elements in the bus signal created by the TopBus block. To set the value of the `C.C1` field, use a typed expression. Match the data type in the expression with the data type of the signal element in the model (`int16`).

```
PartialstructForK = struct('B',3,'C',struct('C1',int16(5)));
```

Create a full structure by using the port handle (`ph`) for the TopBus block. Override the ground values for the `C.C1` and `B` elements.

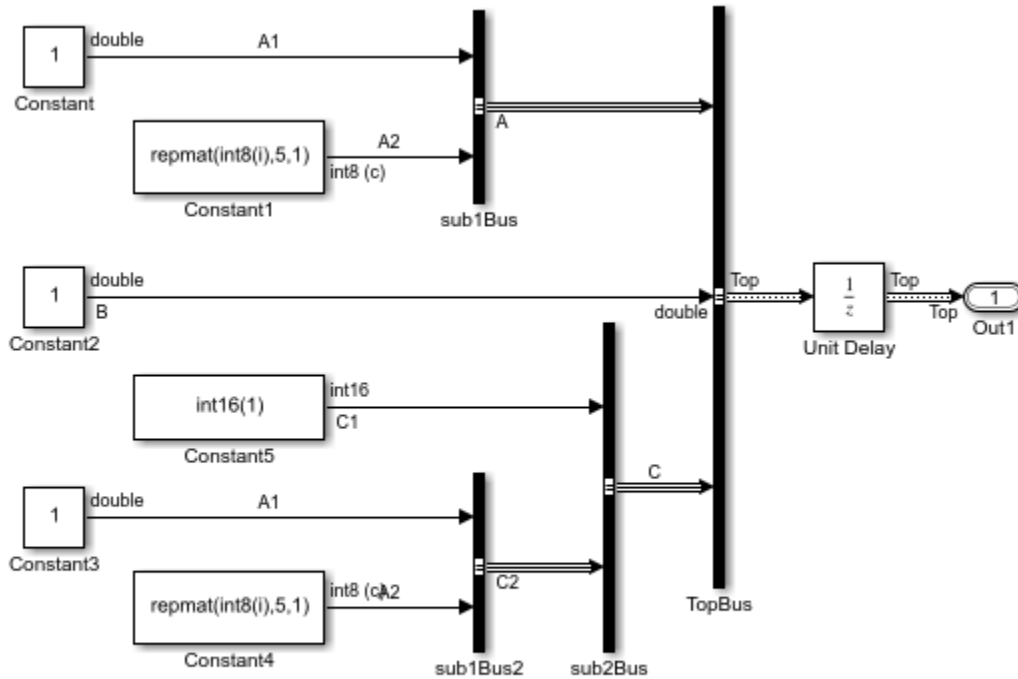

```
outPort = ph.Outport;
mStruct = Simulink.Bus.createMATLABStruct(outPort,PartialstructForK);
```

The field `C.C1` in the output structure continues to use the data type `int16`.

Create MATLAB Structure with Specified Dimensions

Open and simulate model `ex_bus_initial_conditions`.

```
open_system('ex_bus_initial_conditions')
sim('ex_bus_initial_conditions');
```

Copyright 2004-2018 The MathWorks, Inc.

Create a partial structure for a subset of bus elements in the bus created by the TopBus block.

```
PartialStructForK = struct('A',struct('A1',4),'B',3)
```

```
PartialStructForK =
```

```
struct with fields:
```

```
A: [1x1 struct]
B: 3
```

Create a MATLAB structure using bus object Top, a partial structure, and dimensions for the resulting structure.

```
structFromBus = Simulink.Bus.createMATLABStruct...
('Top',PartialStructForK,[2 3])
```

```
structFromBus =
```

2x3 struct array with fields:

```
A
B
C
```

Create Cell Array of MATLAB Structures

To create initialization structures for multiple bus ports, specify port handles as arguments for `Simulink.Bus.createMATLABStruct`. The resulting cell array of structures uses ground values.

Open and simulate model `ex_two_outports_create_struct`.

```
open_system('ex_two_outports_create_struct')
sim('ex_two_outports_create_struct');
```

Find the port handles for the Bus Creator blocks Bus1 and Bus2.

```
ph_1 = get_param...
    ('ex_two_outports_create_struct/Bus Creator', 'PortHandles');
ph_2 = get_param...
    ('ex_two_outports_create_struct/Bus Creator1', 'PortHandles');
```

Create a MATLAB® structure using an array of port handles.

```
mStruct = Simulink.Bus.createMATLABStruct([ph_1.Outport ph_2.Outport])
```

```
mStruct =
    2x1 cell array
    {1x1 struct}
```

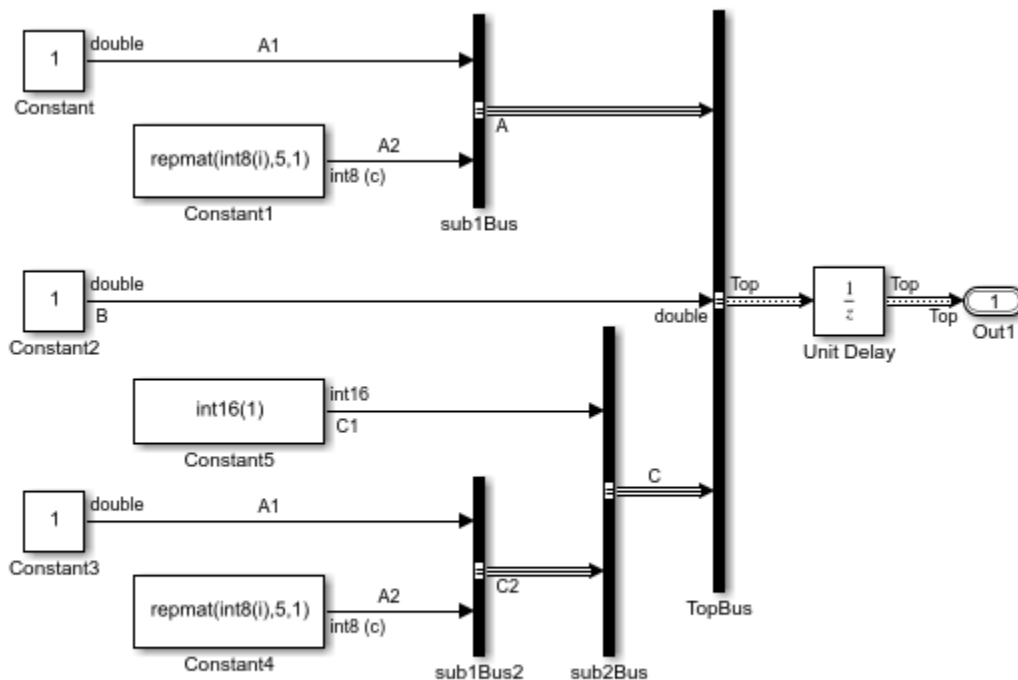

```
{1x1 struct}
```

Create MATLAB Structure from Bus Port and Partial Structure

Create a MATLAB structure based on a port that connects to a bus signal. Use a partial structure to specify values for a subset of the bus elements in the bus that connects to the port.

Open and simulate model `ex_bus_initial_conditions`.

```
open_system('ex_bus_initial_conditions')
sim('ex_bus_initial_conditions');
```

Copyright 2004-2018 The MathWorks, Inc.

Find the port handle for the Bus Creator block port that produces the Top bus signal. The Output handle is the handle that you need.

```
ph = get_param('ex_bus_initial_conditions/TopBus', 'PortHandles')
```

```
ph =
```

```
struct with fields:
```

```
  Inport: [430.0037 432.0037 438.0035]
  Output: 445.0032
  Enable: []
  Trigger: []
```

```
State: []
LConn: []
RConn: []
Ifaction: []
Reset: []
Event: []
```

Create a partial structure for the bus signal created by the TopBus block. You can use a partial structure to specify values for a subset of bus elements.

```
PartialstructForK = struct('A',struct('A1',4), 'B',3)
```

```
PartialstructForK =
  struct with fields:
    A: [1x1 struct]
    B: 3
```

Bus elements represented by structure fields `Top.B` and `Top.A` are at the same level in the bus hierarchy. You can use this partial structure to override the ground values for the B and A bus signal elements.

When you create a structure from a bus object or from a bus port, you can use a partial structure as an optional argument.

Create a MATLAB structure by using the port handle (ph) for the TopBus block. Override the ground values for the A.A1 and B bus elements.

```
outPort = ph.Outputport;
mStruct = Simulink.Bus.createMATLABStruct(outPort,PartialstructForK)
```

```
mStruct =
  struct with fields:
    A: [1x1 struct]
    B: 3
    C: [1x1 struct]
```

Input Arguments

buses — Source of bus information

Simulink.Bus object name | port handle | cell array of Simulink.Bus object names | array of port handles

Source of the bus information, specified as a Bus object name, port handle, cell array of Bus object names, or array of port handles.

- If you use a Bus object name, then the Bus object must be in the MATLAB base workspace or the data dictionary used by the model. The data type for a Bus object name is `char` or `string`.

- If you use a port handle, then the model must compile successfully before you use this function. The data type for a port handle is `double`.
- For an array of buses, you cannot use a port handle.
- If you use the `dims` argument, then for the `buses` argument, use a `Bus` object or cell array of `Bus` objects.

Specifying a cell array of `Bus` object names or an array of port handles creates multiple structures with one `Simulink.Bus.createMATLABStruct` call and provides better performance than using separate `Simulink.Bus.createMATLABStruct` calls to create the structures.

Example: `struct = Simulink.Bus.createMATLABStruct('BusObject')`

Example: `structs = Simulink.Bus.createMATLABStruct({'BusObject','BusObject1'})`

Example: `struct = Simulink.Bus.createMATLABStruct(portHandle)`

Example: `structs = Simulink.Bus.createMATLABStruct([portHandle,portHandle1])`

Data Types: `double` | `char` | `string` | `struct` | `cell`

values — Values for subset of elements in resulting structure

`[]` | partial structure | cell array

Values for a subset of elements in the resulting structure, specified as an empty matrix (`[]`), partial structure, or cell array. The cell array must contain a partial structure or empty matrix for each specified source of bus information.

For information on creating partial structures, see “Create Partial Structures for Initialization”.

To use ground values, use an empty matrix.

Example: `struct = Simulink.Bus.createMATLABStruct('BusObject',PartialStruct)`

Data Types: `struct` | `cell`

dims — Dimensions of resulting structure

scalar | vector | cell array

Dimensions of the resulting structure, specified as a vector.

Each dimension element must be an integer that is greater than or equal to 1. If you specify a partial structure for the `values` argument, each dimension element must be greater than or equal to its corresponding dimension element in the partial structure.

Example: `struct = Simulink.Bus.createMATLABStruct('BusObject',PartialStruct,[2 3])`

Example: `structs = Simulink.Bus.createMATLABStruct({'Bus','Bus1','Bus2'},{[], [], []}, {1,2,3})`

Data Types: `double` | `cell`

scope — Data dictionary to contain MATLAB structure

`Simulink.data.Dictionary` object

Data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this argument, represent the dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

If `scope` is empty, the function uses the MATLAB base workspace as the source of the Bus objects.

Example: `structs = Simulink.Bus.createMATLABStruct({'Bus', 'Bus1', 'Bus2'}, {[], [], []}, {1,1,1}, dataDictionaryObject)`

Output Arguments

structs — Structures with same signal hierarchy and attributes as buses

MATLAB structure | cell array of MATLAB structures

Structures with the same signal hierarchy and attributes as buses, returned as a MATLAB structure or a cell array of MATLAB structures.

The structure dimensions depend on the input arguments you specify:

- If you specify only the `buses` argument, then the dimension is 1.
- If you also specify the `values` argument, then the dimensions match the dimensions of `values`.
- If you specify the `dims` argument, then the dimensions match the dimensions of `dims`.

Tips

- If you use the `Simulink.Bus.createMATLABStruct` function repeatedly for the same model (for example, in a loop in a script), you can improve performance by avoiding multiple model compilations. For improved speed, put the model in compile before using the function multiple times. For example, to put the `vdp` model in compile, use this command:

```
vdp([], [], [], 'compile')
```

After you create the MATLAB structure, terminate the compile by using this command:

```
vdp([], [], [], 'term')
```

- You can use the **Bus Editor** to invoke the `Simulink.Bus.createMATLABStruct` function. In the Bus Editor, select the Bus object for which you want to create a MATLAB structure. Then, in the toolstrip, click **MATLAB Structure**.

You can edit the MATLAB structure in the MATLAB Editor and evaluate the code to create or update the values in this structure.

- You can use the `Simulink.Bus.createMATLABStruct` function to specify the initial value of the output of a referenced model. For details, see the “Referenced Model: Setting Initial Value for Bus Output” section of the “Detailed Workflow for Managing Data with Model Reference” on page 13-417 example.

“Types of Composite Signals”

“Specify Initial Conditions for Bus Elements”

Introduced in R2010a

Simulink.Bus.createObject

Create `Simulink.Bus` objects from blocks or MATLAB structures

Syntax

```
busInfo = Simulink.Bus.createObject(model,blocks)
busInfo = Simulink.Bus.createObject(struct)
busInfo = Simulink.Bus.createObject( ____,file)
busInfo = Simulink.Bus.createObject( ____,file,format)
busInfo = Simulink.Bus.createObject(struct,file,format,scope)
```

Description

`busInfo = Simulink.Bus.createObject(model,blocks)` creates `Simulink.Bus` objects for the specified blocks and returns information about the created Bus objects.

If you specify a block that corresponds to a bus hierarchy, this function creates Bus objects for each bus in the hierarchy.

If the model uses a data dictionary, the Bus objects are created in the data dictionary. Otherwise, they are created in the base workspace.

`busInfo = Simulink.Bus.createObject(struct)` creates Bus objects from a structure that can contain MATLAB timeseries, MATLAB timetable, and `matlab.io.datastore.SimulationDatastore` objects or a numeric structure.

If you specify a structure with hierarchy, this function creates Bus objects for each structure in the hierarchy.

The Bus objects are created in the base workspace.

`busInfo = Simulink.Bus.createObject(____,file)` saves Bus objects in a function that defines object properties in a cell array of cell arrays, then creates the Bus objects by calling `Simulink.Bus.cellToObject`.

Specify any of the input argument combinations in the previous syntaxes followed by the `file` argument.

`busInfo = Simulink.Bus.createObject(____,file,format)` saves Bus objects in a function with the specified format. The function can define object properties using cell arrays or arrays.

`busInfo = Simulink.Bus.createObject(struct,file,format,scope)` creates the Bus objects in the data dictionary specified by `scope`.

Examples

Create Simulink.Bus Object from Bus Creator Block

Open the example model.

```
open_system('BusObjectCreationModel')
```

Create a Bus object that corresponds with the bus created by the Bus Creator block.

```
busInfo = Simulink.Bus.createObject('BusObjectCreationModel',...
    'BusObjectCreationModel/Bus Creator');
```

Create and Save Simulink.Bus Objects in a Function

Create Bus objects from two Bus Creator blocks and save the Bus object definition in a function.

Open the example model.

```
open_system('BusObjectCreationModel');
```

Assign the block handle for the Bus Creator block to a variable with the `getSimulinkBlockHandle` function.

```
bc = getSimulinkBlockHandle('BusObjectCreationModel/Bus Creator');
```

Alternatively, you can select a Bus Creator block in the model then use the `gcbh` function to get its block handle.

Assign the block handle for the Bus Creator1 block to a variable.

```
bc1 = getSimulinkBlockHandle('BusObjectCreationModel/Bus Creator1');
```

To create a Bus object, specify the block handle variables in a vector. To save the Bus object definition, also specify a file name.

```
busInfo = Simulink.Bus.createObject('BusObjectCreationModel',...
    [bc bc1], 'BusObjectFunction');
```

Since these Bus Creator blocks create a bus hierarchy, specifying only the Bus Creator1 block creates both Bus objects in the Workspace and in the function.

Compare the BusObjectFunction against the function created by this command.

```
topBusInfo = Simulink.Bus.createObject('BusObjectCreationModel',...
    bc1, 'BusObjectFunctionFromHierarchy');
```

For a function that is formatted to be easier to read, specify the function format as `object`.

```
topBusInfo1 = Simulink.Bus.createObject('BusObjectCreationModel',...
    bc1, 'BusObjectFunctionFormatted', 'object');
```

Create Simulink.Bus Objects from MATLAB Structures

When you create a nonvirtual bus with a Constant block, you must specify a MATLAB structure for **Constant value** and a Simulink.Bus object as the **Output data type**.

For this example, create a structure that contains other structures.

```
bus_struct.A.A1 = 0;
bus_struct.A.A2 = [0 + 0i;0 + 0i;0 + 0i;0 + 0i;0 + 0i];
bus_struct.B = 5;
bus_struct.C.C1 = 0;
bus_struct.C.C2.A1 = 0;
bus_struct.C.C2.A2 = [0 + 0i;0 + 0i;0 + 0i;0 + 0i;0 + 0i];
```

Create the Bus objects that correspond with the structure.

```
busInfo = Simulink.Bus.createObject(bus_struct);
```

The function creates four Bus objects. The Bus object named `s1Bus1` corresponds to the top-level structure and uses a default Bus object name. The Bus objects named `A`, `C`, and `C2` correspond to the nested structures.

To view the Bus objects, open the Bus Editor.

```
buseditor
```

Input Arguments

model — Model name or handle

character vector

Model name or handle, specified as a character vector.

The model you specify must compile successfully.

blocks — Blocks associated with buses

character vector | cell array of block path names | vector of block handles

Blocks associated with buses, specified as a character vector, cell array of block path names, or vector of block handles. For one block, specify the full path name of the block. For multiple blocks, specify either a cell array of block path names or a vector of block handles.

This function can create Bus objects from these blocks:

- Bus Creator blocks
- Subsystem Inport blocks
- Subsystem Outport blocks

If you specify a block associated with a bus hierarchy, the function also creates Bus objects for all nested buses in the hierarchy.

struct — Structure of objects or numeric structure

structure of MATLAB timeseries, MATLAB timetable, and matlab.io.datastore.SimulationDatastore objects | numeric structure

Structure of objects or numeric structure, specified as a structure that can contain MATLAB timeseries, MATLAB timetable, and matlab.io.datastore.SimulationDatastore objects or a numeric structure.

file — Name of function being generated

character vector

Name of function being generated, specified as a character vector. The file name must be unique.

format — Format of function being generated

'cell' (default) | 'object'

Format of function being generated, specified as either 'cell' or 'object'. The 'cell' format is more compact, but the 'object' format is easier to read.

The 'cell' format saves the Bus object definitions in a cell array of cell arrays and creates the Bus objects by calling `Simulink.Bus.cellToObject`. Each subordinate cell array represents a Bus object and contains these properties:

- 1 Bus name
- 2 Header file
- 3 Description
- 4 Data scope
- 5 Alignment
- 6 Preserve Element Dimensions
- 7 Elements

The `elements` field is a cell array that contains this information for each of the `Simulink.BusElement` objects that the Bus object references:

- 1** Element name
- 2** Dimensions
- 3** Data type
- 4** Sample time — The cell array contains this field when the sample time is not inherited. A noninherited sample time causes an error during model compilation. For more information, see “Simulink.BusElement objects no longer support the SampleTime property” on page 2-512.
- 5** Complexity
- 6** Dimensions mode
- 7** Minimum
- 8** Maximum
- 9** Units
- 10** Description

The 'object' format saves the Bus object definitions as arrays. The function uses array indexing to access elements of the array and dot notation to assign property values.

scope — Data dictionary to contain Simulink.Bus objects

`Simulink.data.Dictionary` object

Data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this argument, represent the dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

If `scope` is empty, the function uses the MATLAB base workspace as the source of the Bus objects.

Output Arguments

busInfo — Bus object information

structure array

Bus object information, returned as a structure array.

When you specify `blocks`, each element of the `busInfo` structure array corresponds to one block and contains these fields:

- `block` — Handle of the block
- `busName` — Name of the Bus object associated with the block

When you specify a `struct`, the `busInfo` structure contains these fields:

- `block` — Empty matrix (`[]`)
- `busName` — Name of the Bus object that corresponds to the structure

Compatibility Considerations

Simulink.BusElement objects no longer support the SampleTime property

Errors starting in R2020b

The `SampleTime` property of `Simulink.BusElement` objects is no longer supported.

BusElement objects that specify a sample time cause an error during compile. To remove the sample time specification from a BusElement object, set its SampleTime to -1.

Simulink.Bus.cellToObject continues to accept cell arrays that specify sample time for bus elements. Simulink.Bus.objectToCell, Simulink.Bus.save, and Simulink.Bus.createObject continue to return cell arrays or arrays that include the sample time when it is noninherited. When the sample time is inherited (-1), they omit it. Similarly, the **Bus Editor** and **Model Explorer** omit the sample time when it is inherited.

To specify the sample time for an element of a bus, use the SampleTime block parameter of corresponding blocks. For example, you can use In Bus Element, Out Bus Element, and Signal Specification blocks to specify sample time.

Simulink.Bus.objectToCell

Use Simulink.Bus objects to create cell array containing bus information

Syntax

```
cells = Simulink.Bus.objectToCell(busNames)
cells = Simulink.Bus.objectToCell(busNames,scope)
```

Description

`cells = Simulink.Bus.objectToCell(busNames)` creates a cell array of bus information from a set of Simulink.Bus objects in the MATLAB base workspace. The cell array contains subordinate cell arrays that define each Bus object. The order of elements in the output cell array corresponds to the order of names in the input cell array.

`cells = Simulink.Bus.objectToCell(busNames,scope)` creates a cell array of bus information from a set of Bus objects in the data dictionary specified by `scope`. The cell array contains subordinate cell arrays that define each Bus object. The order of elements in the output cell array corresponds to the order of names in the input cell array.

Examples

Create Cell Array Containing Bus Object Information

Use the Simulink.Bus.objectToCell function to create a cell array of information about Simulink.Bus objects in the base workspace.

Open a model that has two Bus objects defined, CONTROL and MAIN.

```
open_system('ex_bus_object_tutorial_using_objects')
```

Create a cell array of information about the CONTROL Bus object.

```

cells = Simulink.Bus.objectToCell({'CONTROL'});
cells{1}

ans=1x7 cell array
  Columns 1 through 6

    {'CONTROL'}    {0x0 char}    {0x0 char}    {'Auto'}    {'-1'}    {'0'}

  Column 7

    {2x1 cell}

```

Input Arguments

busNames — Names of Simulink.Bus objects

cell array of Bus object names

Bus objects for which to create cell arrays of Bus object information, specified as a cell array. Specify the Bus object names as character vectors. If `busNames` is empty, the function converts all Bus objects in the base workspace or data dictionary.

Example: `cells = Simulink.Bus.objectToCell({'busObject'})`

scope — Data dictionary that contains Simulink.Bus objects

`Simulink.data.Dictionary` object

Data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this argument, represent the dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

If `scope` is empty, the function uses the MATLAB base workspace as the source of the Bus objects.

Example: `cells = Simulink.Bus.objectToCell({'busObject'},dataDictionaryObject)`

Output Arguments

cells — Bus object information

cell array of cell arrays

Bus object information, specified as a cell array of cell arrays. Each subordinate cell array contains these Bus object properties:

- 1 Bus name
- 2 Header file
- 3 Description
- 4 Data scope
- 5 Alignment
- 6 Preserve Element Dimensions
- 7 Elements

The `elements` field is a cell array that contains this information for each of the `Simulink.BusElement` objects that the Bus object references:

- 1** Bus element name
- 2** Dimensions
- 3** Data type
- 4** Sample time — The cell array contains this field when the sample time is not inherited. A noninherited sample time causes an error during model compilation. For more information, see “Simulink.BusElement objects no longer support the SampleTime property” on page 2-516.
- 5** Complexity
- 6** Sampling mode
- 7** Dimensions mode
- 8** Minimum
- 9** Maximum
- 10** Units
- 11** Description

Tips

The inverse function is `Simulink.Bus.cellToObject`.

Compatibility Considerations

Simulink.BusElement objects no longer support the SampleTime property

Errors starting in R2020b

The `SampleTime` property of `Simulink.BusElement` objects is no longer supported.

`BusElement` objects that specify a sample time cause an error during compile. To remove the sample time specification from a `BusElement` object, set its `SampleTime` to `-1`.

`Simulink.Bus.cellToObject` continues to accept cell arrays that specify sample time for bus elements. `Simulink.Bus.objectToCell`, `Simulink.Bus.save`, and `Simulink.Bus.createObject` continue to return cell arrays or arrays that include the sample time when it is noninherited. When the sample time is inherited (`-1`), they omit it. Similarly, the **Bus Editor** and **Model Explorer** omit the sample time when it is inherited.

To specify the sample time for an element of a bus, use the `SampleTime` block parameter of corresponding blocks. For example, you can use `In Bus Element`, `Out Bus Element`, and `Signal Specification` blocks to specify sample time.

Simulink.BusElement objects will no longer support the SamplingMode property

Not recommended starting in R2016b

In R2016b, the `SamplingMode` property of `Simulink.BusElement` objects was removed. Scripts that use the `SamplingMode` property of `Simulink.BusElement` objects continue to work. `Simulink.Bus.cellToObject` continues to require the `SamplingMode` field and `Simulink.Bus.objectToCell` continues to include the sampling mode in the output cell arrays.

In a future release, support for the `SamplingMode` property will be removed.

To specify whether a signal is sample-based or frame-based, define the sampling mode of input signals at the block level instead of at the signal level.

Introduced in R2007a

Simulink.Bus.save

Save Simulink.Bus objects in function

Syntax

```
Simulink.Bus.save(fileName)
Simulink.Bus.save(fileName,format)
Simulink.Bus.save(fileName,format,busNames)
Simulink.Bus.save(fileName,format,busNames,scope)
```

Description

`Simulink.Bus.save(fileName)` saves all `Simulink.Bus` objects from the MATLAB base workspace in a function. The generated function defines object properties in a cell array of cell arrays, then creates the Bus objects by calling `Simulink.Bus.cellToObject`.

`Simulink.Bus.save(fileName,format)` saves the Bus objects in a function with the specified format. The function can define object properties using cell arrays or arrays.

`Simulink.Bus.save(fileName,format,busNames)` saves only the specified Bus objects in a function.

`Simulink.Bus.save(fileName,format,busNames,scope)` saves the Bus objects from the data dictionary specified by `scope` in a function.

Examples

Save a Simulink.Bus Object

Use the `Simulink.Bus.save` function to save a Bus object.

Create a cell array of Bus object information.

```
busCell = { ...
    { ...
        'myBusObj', ...
        'MyHeader.h', ...
        'My description', ...
        'Exported', ...
        '-1', ...
        '0', ...
        {'a',1,'double','real','Sample'}; ...
        {'b',1,'double','real','Sample', ...
        'Fixed',-3,3,'m','b is distance from the origin'}}, ...
    } ...
    { ...
        'myBusObj1', ...
        'MyHeader1.h', ...
        'My description', ...
        'Exported', ...
```

```

        '-1', ...
        '0', ...
        {'c',1,'double','real','Sample'}; ...
        {'d',1,'double','real','Sample'}}, ...
    } ...
};

```

Generate Bus objects in the base workspace from the cell array.

```
Simulink.Bus.cellToObject(busCell);
```

Save the Bus objects in a function, using the default format.

```
Simulink.Bus.save('BusObjectFunctionCellFormat');
```

For a function that is formatted to be easier to read, specify the function format as 'object'.

```
Simulink.Bus.save('BusObjectFunctionObjectFormat','object');
```

To save only one of the Bus objects in a function, specify the Bus object name.

```
Simulink.Bus.save('BusObjectFunctionSubset','cell',{'myBusObj'});
```

Input Arguments

fileName — Name of function to generate

character vector

Name of function to generate, specified as a character vector. The file name must be unique.

Example: `Simulink.Bus.save('BusObjectFunction');`

format — Format of function to generate

'cell' (default) | 'object'

Format of function to generate, specified as either 'cell' or 'object'. The 'cell' format is more compact, but the 'object' format is easier to read.

The 'cell' format saves the Bus object definitions in a cell array of cell arrays and creates the Bus objects by calling `Simulink.Bus.cellToObject`. Each subordinate cell array represents a Bus object and contains these properties:

- 1 Bus name
- 2 Header file
- 3 Description
- 4 Data scope
- 5 Alignment
- 6 Preserve Element Dimensions
- 7 Elements

The elements field is a cell array that contains this information for each of the `Simulink.BusElement` objects that the Bus object references:

- 1 Element name
- 2 Dimensions
- 3 Data type
- 4 Sample time — The cell array contains this field when the sample time is not inherited. A noninherited sample time causes an error during model compilation. For more information, see “Simulink.BusElement objects no longer support the SampleTime property” on page 2-520.
- 5 Complexity
- 6 Dimensions mode
- 7 Minimum
- 8 Maximum
- 9 Units
- 10 Description

The 'object' format saves the Bus object definitions as arrays. The function uses array indexing to access elements of the array and dot notation to assign property values.

Example: `Simulink.Bus.save('BusObjectFunction','object');`

busNames — Bus objects to save

empty cell array | cell array of bus objects

Bus objects to save, specified as an empty cell array ({}) or a cell array of Bus object names.

When you specify a cell array of Bus object names, only the specified Bus objects are saved.

When you specify an empty cell array, all Bus objects are saved. Use an empty cell array to save all Bus objects in the data dictionary specified by scope.

Example: `Simulink.Bus.save('BusObjectFunction','cell',{'myBusObj'});`

scope — Data dictionary that contains Bus objects

`Simulink.data.Dictionary` object

Data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this argument, represent the dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

If scope is empty, the function uses the MATLAB base workspace as the source of the Bus objects.

Example: `Simulink.Bus.save('BusObjectFunction','cell',{},dataDictionaryObject);`

Compatibility Considerations

Simulink.BusElement objects no longer support the SampleTime property

Errors starting in R2020b

The `SampleTime` property of `Simulink.BusElement` objects is no longer supported.

`BusElement` objects that specify a sample time cause an error during compile. To remove the sample time specification from a `BusElement` object, set its `SampleTime` to `-1`.

`Simulink.Bus.cellToObject` continues to accept cell arrays that specify sample time for bus elements. `Simulink.Bus.objectToCell`, `Simulink.Bus.save`, and

`Simulink.Bus.createObject` continue to return cell arrays or arrays that include the sample time when it is noninherited. When the sample time is inherited (-1), they omit it. Similarly, the **Bus Editor** and **Model Explorer** omit the sample time when it is inherited.

To specify the sample time for an element of a bus, use the `SampleTime` block parameter of corresponding blocks. For example, you can use `In Bus Element`, `Out Bus Element`, and `Signal Specification` blocks to specify sample time.

Simulink.clearIntEnumType

Delete enumeration classes defined by `Simulink.defineIntEnumType`

Syntax

```
Simulink.clearIntEnumType(typeName)  
Simulink.clearIntEnumType()
```

Description

`Simulink.clearIntEnumType(typeName)` deletes a specific enumeration class that is defined by `Simulink.defineIntEnumType`. The function generates a warning if the class name is invalid or if a class cannot be deleted because instances of the class exist.

`Simulink.clearIntEnumType()` deletes all enumeration classes that are defined by `Simulink.defineIntEnumType`. The function generates a warning if a class cannot be deleted because instances of the class exist.

Examples

Delete a Specific Dynamic Enumerated Data Type

Define an enumeration type and confirm that it has been created.

```
Simulink.defineIntEnumType('myEnumType', {'e1', 'e2'}, [1 2]);  
myResult = Simulink.findIntEnumType('myEnumType')
```

Delete the enumeration type that you created and confirm that it is no longer there.

```
Simulink.clearIntEnumType('myEnumType');  
myResult = Simulink.findIntEnumType('myEnumType')
```

Delete All Dynamic Enumerated Data Types

Define two enumeration types and confirm that they have been created.

```
Simulink.defineIntEnumType('myEnumType1', {'e1', 'e2'}, [1 2]);  
Simulink.defineIntEnumType('myEnumType2', {'e3', 'e4'}, [3 4]);  
myResult = Simulink.findIntEnumType()
```

Delete all enumeration types and confirm that no enumeration types exist.

```
Simulink.clearIntEnumType();  
myResult = Simulink.findIntEnumType()
```

Input Arguments

typeName — Name of enumeration class

character vector or string

Name of a specific enumeration class that is defined by `Simulink.defineIntEnumType`, specified as a character vector or string.

Example: 'myEnumType'

Data Types: char | string

[enumeration](#) | [Simulink.defineIntEnumType](#) | [Simulink.findIntEnumType](#)

Introduced in R2018b

Simulink.createFromTemplate

Create model or project from template

Syntax

```
Simulink.createFromTemplate(templatename)
h = Simulink.createFromTemplate(templatename)
h = Simulink.createFromTemplate(templatename,Name,Value)
```

Description

`Simulink.createFromTemplate(templatename)` creates a model or a project from the template file specified by `templatename`. The new project is created in the default project folder.

`h = Simulink.createFromTemplate(templatename)` creates a model or a project from the template file and returns `h`, either a numeric model handle or a `simulinkproject` object.

`h = Simulink.createFromTemplate(templatename,Name,Value)` specifies additional options as one or more `Name, Value` pair arguments.

Examples

Create a Model From a Template

```
Simulink.createFromTemplate('simple_simulation.sltx')
```

Create a Project From a Template and Get the Handle

Create a project from a template, specify the name and root folder, and return the handle to the new project (a `simulinkproject` object) for manipulating it programmatically.

```
proj = Simulink.createFromTemplate('code_generation_example.sltx','Name','myProject','Folder','C
```

Input Arguments

templatename — Template file name

character vector

Template file name, specified as a character vector. If the template is not on the MATLAB path, specify the fully-qualified path to the template file and `*.sltx` extension.

Example:

Data Types: `char`

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, . . . , NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose `Name` in quotes.

Example:

Folder — Project root folder

character vector

Project root folder, if creating a new project, specified as a character vector.

Data Types: `char`

Name — New model or project name

character vector

New model or project name, specified as a character vector.

Data Types: `char`

Output Arguments

h — Handle

numeric handle | `simulinkproject`

Handle to the new model project, returned either as a numeric model handle or a `simulinkproject` object.

Introduced in R2016a

Simulink.data.assigninGlobal

Modify variable values in context of Simulink model

Syntax

```
Simulink.data.assigninGlobal(modelName,varName,varValue)
```

Description

`Simulink.data.assigninGlobal(modelName,varName,varValue)` assigns the value `varValue` to the variable or data dictionary entry `varName` in the context of the Simulink model `modelName`. `assigninGlobal` creates the variable or data dictionary entry if it does not already exist. The function operates in the Design Data section of the data dictionary that is linked to the target model or in the MATLAB base workspace if the target model is not linked to any data dictionary.

If the target model is linked to a data dictionary that references other dictionaries, `assigninGlobal` searches for `varName` in the entire dictionary hierarchy. If `assigninGlobal` does not find a matching entry, the function creates an entry in the dictionary that is linked to the target model.

Examples

Modify Variable in Model With or Without Data Dictionary

Create a variable `myNewVariable` with value 237 in the context of the Simulink model `vdp.slx`, which is not linked to any data dictionary. `myNewVariable` appears as a variable in the MATLAB base workspace.

```
Simulink.data.assigninGlobal('vdp','myNewVariable',237)
```

Create a variable `myNewEntry` with value `true` in the context of the model `sldemo_fuelsys_dd_controller.slx`, which is linked to the data dictionary `sldemo_fuelsys_dd_controller.sldd`. The entry `myNewEntry` appears in the Design Data section of the dictionary.

```
openExample('simulink_automotive/UseDDForFuelContSysExample')
sldemo_fuelsys_dd_controller
Simulink.data.assigninGlobal('sldemo_fuelsys_dd_controller',...
'myNewEntry',true)
```

Confirm the addition of `myNewEntry` to the data dictionary `sldemo_fuelsys_dd_controller.sldd` by viewing the dictionary in Model Explorer.

```
myDictionaryObj = Simulink.data.dictionary.open(...
'sldemo_fuelsys_dd_controller.slidd');
show(myDictionaryObj)
```

Input Arguments

modelName — Name of target Simulink model

character vector

Name of target Simulink model, specified as a character vector.

Example: 'myTestModel'

Data Types: char

varName — Name of target variable or data dictionary entry

character vector

Name of target variable or data dictionary entry, specified as a character vector.

Example: 'myTargetVariable'

Data Types: char

varValue — Value to assign to variable or data dictionary entry

MATLAB expression

Value to assign to variable or data dictionary entry, specified as a MATLAB expression that returns any valid data type or data dictionary content.

Example: 27.5

Example: myBaseWorkspaceVariable

Example: Simulink.Parameter

Tips

- `assigninGlobal` helps you transition Simulink models to using data dictionaries. You can use the function to assign values to model variables before and after linking a model to a data dictionary.

Simulink.data.dictionary.cleanupWorkerCache

Restore defaults after parallel simulation with data dictionary

Syntax

```
Simulink.data.dictionary.cleanupWorkerCache
```

Description

`Simulink.data.dictionary.cleanupWorkerCache` restores default settings after you have finished parallel simulation of a model that is linked to a data dictionary. Use this function in a `spmd` block, after you finish parallel simulation using `parfor` blocks, to restore default settings that were altered by the `Simulink.data.dictionary.setupWorkerCache` function.

During parallel simulation of a model that is linked to a data dictionary, you can allow each worker to access and modify the data in the dictionary independently of other workers. The function `Simulink.data.dictionary.setupWorkerCache` grants each worker a unique dictionary cache to allow independent access to the data, and the function `Simulink.data.dictionary.cleanupWorkerCache` restores cache settings to their default values.

You must have a Parallel Computing Toolbox license to perform parallel simulation using a `parfor` block.

Examples

Sweep Variant Control Using Parallel Simulation

To use parallel simulation to sweep a variant control (a `Simulink.Parameter` object whose value influences the variant condition of a `Simulink.Variant` object) that you store in a data dictionary, use this code as a template. Change the names and values of the model, data dictionary, and variant control to match your application.

To sweep block parameter values or the values of workspace variables that you use to set block parameters, use `Simulink.SimulationInput` objects instead of the programmatic interface to the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

You must have a Parallel Computing Toolbox license to perform parallel simulation.

```
% For convenience, define names of model and data dictionary
model = 'mySweepMdl';
dd = 'mySweepDD.slidd';

% Define the sweeping values for the variant control
CtrlValues = [1 2 3 4];

% Grant each worker in the parallel pool an independent data dictionary
% so they can use the data without interference
spmd
    Simulink.data.dictionary.setupWorkerCache
```

```

end

% Determine the number of times to simulate
numberOfSims = length(CtrlValues);

% Prepare a nondistributed array to contain simulation output
simOut = cell(1,numberOfSims);

parfor index = 1:numberOfSims
    % Create objects to interact with dictionary data
    % You must create these objects for every iteration of the parfor-loop
    dictObj = Simulink.data.dictionary.open(dd);
    sectObj = getSection(dictObj, 'Design Data');
    entryObj = getEntry(sectObj, 'MODE');
    % Suppose MODE is a Simulink.Parameter object stored in the data dictionary

    % Modify the value of MODE
    temp = getValue(entryObj);
    temp.Value = CtrlValues(index);
    setValue(entryObj,temp);

    % Simulate and store simulation output in the nondistributed array
    simOut{index} = sim(model);

    % Each worker must discard all changes to the data dictionary and
    % close the dictionary when finished with an iteration of the parfor-loop
    discardChanges(dictObj);
    close(dictObj);
end

% Restore default settings that were changed by the function
% Simulink.data.dictionary.setupWorkerCache
% Prior to calling cleanupWorkerCache, close the model

spmd
    bdclose(model)
    Simulink.data.dictionary.cleanupWorkerCache
end

```

Note If data dictionaries are open, you cannot use the command `Simulink.data.dictionary.cleanupWorkerCache`. To identify open data dictionaries, use `Simulink.data.dictionary.getOpenDictionaryPaths`.

`Simulink.data.dictionary.getOpenDictionaryPaths` |
`Simulink.data.dictionary.closeAll`

Topics

“Store Data in Dictionary Programmatically”
 “What Is a Data Dictionary?”
 “Run Code on Parallel Pools” (Parallel Computing Toolbox)

Introduced in R2015a

Simulink.data.dictionary.closeAll

Close all connections to all open data dictionaries

Syntax

```
Simulink.data.dictionary.closeAll
Simulink.data.dictionary.closeAll(dictFileName)
Simulink.data.dictionary.closeAll( ____,unsavedAction)
```

Description

`Simulink.data.dictionary.closeAll` attempts to close all connections to all data dictionaries that are open. For example, if you create objects, such as `Simulink.data.Dictionary`, that refer to a dictionary, that dictionary is open.

Some commands and functions, such as `Simulink.data.dictionary.cleanupWorkerCache`, cannot operate when dictionaries are open. It is a best practice to close each connection individually by using functions and methods such as the `close` method of a `Simulink.data.Dictionary` object. To find dictionaries that are open, use `Simulink.data.dictionary.getOpenDictionaryPaths`. However, you can use this function to close all connections to all dictionaries.

You can also use this function to close dictionaries in a shutdown script that is part of a project.

`Simulink.data.dictionary.closeAll(dictFileName)` closes all connections to the dictionary named `dictFileName`. If you open multiple dictionaries that use this file name (for example, if the dictionaries have different file paths), the function closes all connections to all of the dictionaries.

You cannot specify `dictFileName` as a full file path such as `'C:\temp\myDict.sldd'`.

`Simulink.data.dictionary.closeAll(____,unsavedAction)` closes all connections to the target dictionaries by discarding or saving unsaved changes. You can choose whether to save or discard all changes to all of the target dictionaries.

Examples

Close All Connections to All Open Dictionaries

Discard any unsaved changes. All of the entries in the dictionaries revert to the last saved state.

```
Simulink.data.dictionary.closeAll('-discard')
```

Close All Connections to Single Data Dictionary

Open multiple connections to a data dictionary, make a change, and close all of the connections by discarding the unsaved change.

At the command prompt, open a data dictionary by creating a `Simulink.data.Dictionary` object that refers to the dictionary.

For example, open the “Using a Data Dictionary to Manage the Data for a Fuel Control System” on page 13-134 example data dictionary.

```
openExample('simulink_automotive/UseDDForFuelContSysExample')
dictObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd.sldd');
```

Display the dictionary in the Model Explorer

```
show(dictObj)
```

You now have two connections to this dictionary: The `Simulink.data.Dictionary` object and the Model Explorer.

Make a change to the dictionary by adding an entry.

```
dDataSectObj = getSection(dictObj, 'Design Data');
addEntry(dDataSectObj, 'myEntry', 5.2);
```

The `Simulink.data.dictionary.Section` object `dDataSectObj` is a third connection to the dictionary.

Close the connections to the dictionary. Discard the unsaved change.

```
Simulink.data.dictionary.closeAll('sldemo_fuelsys_dd.sldd', '-discard')
```

The dictionary no longer appears as a node in the **Model Hierarchy** pane of the Model Explorer. The `Simulink.data.Dictionary` object `dictObj` is disconnected from the dictionary. You cannot interact with the dictionary by using the `Simulink.data.dictionary.Section` object `dDataSectObj`.

Clear the objects that referred to the dictionary.

```
clear dictObj dDataSectObj
```

Input Arguments

dictFileName — File name of target data dictionary or dictionaries

character vector

File name of target data dictionary or dictionaries, specified as a character vector. Use the file extension `sldd`.

Example: 'myDict.sldd'

Data Types: char

unsavedAction — Action for unsaved changes

'-discard' | '-save'

Action for unsaved changes, specified as '-discard' (to discard changes) or '-save' (to save changes).

Tips

A data dictionary is open if any of these conditions are true:

- The dictionary appears as a node in the **Model Hierarchy** pane of the Model Explorer. To close this connection to the dictionary, right-click the node in Model Explorer and select **Close**. Alternatively, use the `hide` method of a `Simulink.data.Dictionary` object.
- You created an object of any of these classes that refer to the dictionary:
 - `Simulink.data.Dictionary`
 - `Simulink.data.dictionary.Section`
 - `Simulink.data.dictionary.Entry`

To close these connections to the dictionary, use the `close` method of the `Simulink.data.Dictionary` object or clear the object. Clear the `Simulink.data.dictionary.Section` and `Simulink.data.dictionary.Entry` objects.

- A model that is linked to the dictionary is open. To close this connection to the dictionary, close the model.

“Using a Data Dictionary to Manage the Data for a Fuel Control System” on page 13-134

Introduced in R2016a

Simulink.data.dictionary.create

Create new data dictionary and create Simulink.data.Dictionary object

Syntax

```
dictionaryObj = Simulink.data.dictionary.create(dictionaryFile)
```

Description

`dictionaryObj = Simulink.data.dictionary.create(dictionaryFile)` creates a data dictionary file in your current working folder or in a file path you can specify in `dictionaryFile`. The function returns a `Simulink.data.Dictionary` object representing the new data dictionary.

Examples

Create New Data Dictionary and Data Dictionary Object

Create a data dictionary `myNewDictionary.sldd` in your current working folder and a `Simulink.data.Dictionary` object representing the new data dictionary. Assign the object to the variable `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.create('myNewDictionary.sldd')
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```

        DataSourcees: {0x1 cell}
    HasAccessToBaseWorkspace: 0
EnableAccessToBaseWorkspace: 0
        HasUnsavedChanges: 0
        NumberOfEntries: 0
```

Input Arguments

dictionaryFile — Name of new data dictionary

character vector

Name of new data dictionary, specified as a character vector containing the file name and, optionally, path of the dictionary to create. If you do not specify a path, `Simulink.data.dictionary.create` creates the new data dictionary file in your working MATLAB folder.

`Simulink.data.dictionary.create` also supports file paths specified relative to your working folder.

Example: 'myDictionary.sldd'

Example: 'C:\Users\jsmith\myDictionary.sldd'

Example: '..\myOtherDictionary.sldd'

Data Types: char

Output Arguments

dictionaryObj — Newly created data dictionary

`Simulink.data.Dictionary` object

Newly created data dictionary, returned as a `Simulink.data.Dictionary` object.

Alternatives

You can use the Simulink Editor to create a data dictionary and link it to a model. See “Migrate Single Model to Use Dictionary” for more information.

Simulink.data.dictionary.getOpenDictionaryPaths

Return file names and paths of open data dictionaries

Syntax

```
openDDs = Simulink.data.dictionary.getOpenDictionaryPaths
openDDs = Simulink.data.dictionary.getOpenDictionaryPaths(dictFileName)
```

Description

`openDDs = Simulink.data.dictionary.getOpenDictionaryPaths` returns the file names and paths of all data dictionaries that are open. For example, a data dictionary is open if you create objects, such as `Simulink.data.Dictionary`, that refer to the dictionary. If you open two or more dictionaries that have the same file name but different file paths, this function returns multiple file paths.

Before executing commands and functions that cannot operate when dictionaries are open, use this function to identify open dictionaries so that you can close them. For example, when you run parallel simulations as described in “Sweep Variant Control Using Parallel Simulation”, this function helps you identify open dictionaries before executing the command `Simulink.data.dictionary.cleanupWorkerCache`.

`openDDs = Simulink.data.dictionary.getOpenDictionaryPaths(dictFileName)` returns the file paths of data dictionaries that have the file name `dictFileName`. If you open two or more dictionaries that have the same file name but different file paths, you can use this syntax to return all of the file paths.

Examples

Identify and Close All Open Data Dictionaries

Open, identify, and close a data dictionary. After you close the connections to the dictionary, you can use commands and functions, such as `Simulink.data.dictionary.cleanupWorkerCache`, that cannot operate when dictionaries are open.

At the command prompt, open a data dictionary by creating a `Simulink.data.Dictionary` object that refers to the dictionary.

For example, open the “Using a Data Dictionary to Manage the Data for a Fuel Control System” on page 13-134 example data dictionary.

```
openExample('simulink_automotive/UseDDForFuelContSysExample'
dictObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd.sldd');
```

Display the dictionary in the Model Explorer

```
show(dictObj)
```

Identify all of the dictionaries that are open.

```
openDDs = Simulink.data.dictionary.getOpenDictionaryPaths;
```

The file path of the dictionary that you opened, `sldemo_fuelsys_dd.sldd`, appears in the cell array of character vectors `openDDs`.

Close the connection from the Model Explorer to the dictionary.

```
hide(dictObj)
```

The dictionary no longer appears as a node in the **Model Hierarchy** pane of the Model Explorer.

Close the connection from the `Simulink.data.Dictionary` object to the dictionary.

```
close(dictObj)  
clear dictObj
```

Input Arguments

dictFileName — File name of target data dictionary or dictionaries

character vector

File name of target data dictionary or dictionaries, specified as a character vector. Use the file extension `sldd`.

Example: `'myDict.sldd'`

Data Types: `char`

Output Arguments

openDDs — File names and paths of open data dictionaries

cell array of character vectors

File names and paths of open data dictionaries, returned as a cell array of character vectors.

Tips

A data dictionary is open if any of these conditions are true:

- The dictionary appears as a node in the **Model Hierarchy** pane of the Model Explorer. To close this connection to the dictionary, right-click the node in Model Explorer and select **Close**. Alternatively, use the `hide` method of a `Simulink.data.Dictionary` object.
- You created an object of any of these classes that refer to the dictionary:
 - `Simulink.data.Dictionary`
 - `Simulink.data.dictionary.Section`
 - `Simulink.data.dictionary.Entry`

To close these connections to the dictionary, use the `close` method of the `Simulink.data.Dictionary` object or clear the object. Clear the `Simulink.data.dictionary.Section` and `Simulink.data.dictionary.Entry` objects.

- A model that is linked to the dictionary is open. To close this connection to the dictionary, close the model.

Simulink.data.dictionary.open

Open data dictionary for editing

Syntax

```
dictionaryObj = Simulink.data.dictionary.open(dictionaryFile)
```

Description

`dictionaryObj = Simulink.data.dictionary.open(dictionaryFile)` opens the specified data dictionary and returns a `Simulink.data.Dictionary` object representing an existing data dictionary identified by its file name and, optionally, file path with `dictionaryFile`.

Make sure any dictionaries referenced by the target dictionary are on the MATLAB path.

Examples

Open Existing Data Dictionary

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
    DataSources: {'myRefDictionary_ex_API.sldd'}  
    HasUnsavedChanges: 0  
    NumberOfEntries: 4
```

Input Arguments

dictionaryFile — Target data dictionary

character vector

Target data dictionary, specified as a character vector containing the file name and, optionally, path of the dictionary. If you do not specify a path, `Simulink.data.dictionary.open` searches the MATLAB path for the specified file. `Simulink.data.dictionary.open` also supports paths specified relative to the MATLAB working folder.

Example: `'myDictionary_ex_API.sldd'`

Example: `'C:\Users\jsmith\myDictionary_ex_API.sldd'`

Example: `'..\myOtherDictionary.sldd'`

Data Types: char

Simulink.data.dictionary.setupWorkerCache

Enable parallel simulation with data dictionary

Syntax

```
Simulink.data.dictionary.setupWorkerCache
```

Description

`Simulink.data.dictionary.setupWorkerCache` prepares the workers in a parallel pool for simulating a model that is linked to a data dictionary. Use this function in a `spmd` block, prior to starting a `parfor` block, to provide the workers in a parallel pool a way to safely interact with a single data dictionary.

During parallel simulation of a model that is linked to a data dictionary, you can allow each worker to access and modify the data in the dictionary independently of other workers.

`Simulink.data.dictionary.setupWorkerCache` temporarily provides each worker in the pool with its own data dictionary cache, allowing the workers to use the data in the dictionary without permanently changing it.

You must have a Parallel Computing Toolbox license to perform parallel simulation using a `parfor` block.

Examples

Sweep Variant Control Using Parallel Simulation

To use parallel simulation to sweep a variant control (a `Simulink.Parameter` object whose value influences the variant condition of a `Simulink.Variant` object) that you store in a data dictionary, use this code as a template. Change the names and values of the model, data dictionary, and variant control to match your application.

To sweep block parameter values or the values of workspace variables that you use to set block parameters, use `Simulink.SimulationInput` objects instead of the programmatic interface to the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

You must have a Parallel Computing Toolbox license to perform parallel simulation.

```
% For convenience, define names of model and data dictionary
model = 'mySweepMdl';
dd = 'mySweepDD.slidd';

% Define the sweeping values for the variant control
CtrlValues = [1 2 3 4];

% Grant each worker in the parallel pool an independent data dictionary
% so they can use the data without interference
spmd
    Simulink.data.dictionary.setupWorkerCache
end
```

```

% Determine the number of times to simulate
numberOfSims = length(CtrlValues);

% Prepare a nondistributed array to contain simulation output
simOut = cell(1,numberOfSims);

parfor index = 1:numberOfSims
    % Create objects to interact with dictionary data
    % You must create these objects for every iteration of the parfor-loop
    dictObj = Simulink.data.dictionary.open(dd);
    sectObj = getSection(dictObj,'Design Data');
    entryObj = getEntry(sectObj,'MODE');
    % Suppose MODE is a Simulink.Parameter object stored in the data dictionary

    % Modify the value of MODE
    temp = getValue(entryObj);
    temp.Value = CtrlValues(index);
    setValue(entryObj,temp);

    % Simulate and store simulation output in the nondistributed array
    simOut{index} = sim(model);

    % Each worker must discard all changes to the data dictionary and
    % close the dictionary when finished with an iteration of the parfor-loop
    discardChanges(dictObj);
    close(dictObj);
end

% Restore default settings that were changed by the function
% Simulink.data.dictionary.setupWorkerCache
% Prior to calling cleanupWorkerCache, close the model

spmd
    bdclose(model)
    Simulink.data.dictionary.cleanupWorkerCache
end

```

Note If data dictionaries are open, you cannot use the command `Simulink.data.dictionary.cleanupWorkerCache`. To identify open data dictionaries, use `Simulink.data.dictionary.getOpenDictionaryPaths`.

Simulink.data.evalinGlobal

Evaluate MATLAB expression in context of Simulink model

Syntax

```
returnValue = Simulink.data.evalinGlobal(modelName,expression)
```

Description

`returnValue = Simulink.data.evalinGlobal(modelName,expression)` evaluates the MATLAB expression `expression` in the context of the Simulink model `modelName` and returns the values returned by `expression`. `evalinGlobal` evaluates `expression` in the Design Data section of the data dictionary that is linked to the target model or in the MATLAB base workspace if the target model is not linked to any data dictionary.

Examples

Evaluate MATLAB Expression in Model With or Without Data Dictionary

Evaluate the MATLAB expression `myNewVariable = 237;` in the context of the model `vdp`, which is not linked to any data dictionary. `myNewVariable` appears as a variable in the MATLAB base workspace.

```
Simulink.data.evalinGlobal('vdp','myNewVariable = 237;')
```

Evaluate the MATLAB expression `myNewEntry = true;` in the context of the model `sldemo_fuelsys_dd_controller`, which is linked to the data dictionary `sldemo_fuelsys_dd_controller.sldd`. `myNewEntry` appears as an entry in the Design Data section of the dictionary.

```
openExample('simulink_automotive/UseDDForFuelContSysExample')
sldemo_fuelsys_dd_controller
Simulink.data.evalinGlobal('sldemo_fuelsys_dd_controller',...
'myNewEntry = true;')
```

Confirm the creation of the entry `myNewEntry` in the data dictionary `sldemo_fuelsys_dd_controller.sldd` by viewing the dictionary in Model Explorer.

```
openExample('simulink_automotive/UseDDForFuelContSysExample')
sldemo_fuelsys_dd_controller
myDictionaryObj = Simulink.data.dictionary.open(...
'sldemo_fuelsys_dd_controller.sldd');
show(myDictionaryObj)
```

Input Arguments

modelName — Name of target Simulink model

character vector

Name of target Simulink model, specified as a character vector.

Example: 'myTestModel'

Data Types: char

expression — MATLAB expression to evaluate

character vector

MATLAB expression to evaluate, specified as a character vector.

Example: 'a = 5.3'

Example: 'whos'

Example: 'CurrentSpeed.Value = 290.73'

Data Types: char

Output Arguments

returnValue — Value returned by specified expression

valid entry or variable value

Value returned by the specified MATLAB expression.

Tips

- `evalInGlobal` helps you transition Simulink models to the use of data dictionaries. You can use the function to manipulate model variables before and after linking a model to a data dictionary.

See Also

`evalin` | `Simulink.data.assignInGlobal` | `Simulink.data.existsInGlobal`

Topics

“Store Data in Dictionary Programmatically”

“Using a Data Dictionary to Manage the Data for a Fuel Control System” on page 13-134

Introduced in R2015a

Simulink.data.existsInGlobal

Check existence of variable in context of Simulink model

Syntax

```
varExists = Simulink.data.existsInGlobal(modelName,varName)
```

Description

`varExists = Simulink.data.existsInGlobal(modelName,varName)` returns an indication of the existence of a variable or data dictionary entry `varName` in the context of the Simulink model `modelName`. `Simulink.data.existsInGlobal` searches the Design Data section of the data dictionary that is linked to the target model or the MATLAB base workspace if the target model is not linked to any data dictionary.

Examples

Determine Existence of Variable in Model With or Without Data Dictionary

Determine the existence of a variable `PressVect` in the context of the Simulink model `vdp.slx`, which is not linked to any data dictionary.

```
Simulink.data.existsInGlobal('vdp','PressVect')
```

```
ans =
```

```
0
```

Because `vdp.slx` is not linked to any data dictionary, `existsInGlobal` searches only in the MATLAB base workspace for `PressVect`.

Determine the existence of a variable `PressVect` in the context of the Simulink model `sldemo_fuelsys_dd_controller.slx`, which is linked to the data dictionary `sldemo_fuelsys_dd_controller.sldd`.

Open the “Using a Data Dictionary to Manage the Data for a Fuel Control System” on page 13-134 example model `sldemo_fuelsys_dd_controller`.

```
openExample('simulink_automotive/UseDDForFuelContSysExample')
sldemo_fuelsys_dd_controller
Simulink.data.existsInGlobal('sldemo_fuelsys_dd_controller','PressVect')
```

```
ans =
```

```
1
```

Because `sldemo_fuelsys_dd_controller` is linked to the data dictionary `sldemo_fuelsys_dd_controller.slidd`, `existsInGlobal` searches for `PressVect` only in the Design Data section of the dictionary.

Input Arguments

modelName — Name of target Simulink model

character vector

Name of target Simulink model, specified as a character vector.

Example: `'myTestModel'`

Data Types: `char`

varName — Name of target variable or data dictionary entry

character vector

Name of target variable or data dictionary entry, specified as a character vector.

Example: `'myTargetVariable'`

Data Types: `char`

Output Arguments

varExists — Indication of existence of target variable or data dictionary entry

1 | 0

Indication of existence of target variable or data dictionary entry, returned as 1 to indicate existence or 0 to indicate absence.

Tips

- `existsInGlobal` helps you transition Simulink models to the use of data dictionaries. You can use the function to find model variables before and after linking a model to a data dictionary.

Alternatives

You can use Model Explorer to search a data dictionary or any workspace for entries or variables.

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

Simulink.data.getEnumTypeInfo

Get information about enumerated data type

Syntax

```
information = Simulink.data.getEnumTypeInfo(enumTypeName,infoRequest)
```

Description

`information = Simulink.data.getEnumTypeInfo(enumTypeName,infoRequest)` returns information about an enumerated data type `enumTypeName`.

Use this function only to return information about an enumerated data type. To customize an enumerated data type, for example, by specifying a default enumeration member or by controlling the scope of the type definition in generated code, see “Customize Simulink Enumeration”.

Examples

Return Default Value of Enumerated Data Type

Get the default enumeration member of an enumerated data type `LEDcolor`. Suppose `LEDcolor` defines two enumeration members, `GREEN` and `RED`, and uses `GREEN` as the default member.

```
Simulink.data.getEnumTypeInfo('LEDcolor','DefaultValue')
```

```
ans =  
    GREEN
```

Get Scope of Enumerated Data Type Definition in Generated Code

For an enumerated data type `LEDcolor`, find out if generated code exports or imports the definition of the type to or from a header file.

```
Simulink.data.getEnumTypeInfo('LEDcolor','DataScope')  
Simulink.data.getEnumTypeInfo('LEDcolor','HeaderFile')
```

```
ans =  
Auto  
  
ans =  
    ''
```

Because `DataScope` is 'Auto' and `HeaderFile` is empty, generated code defines the enumerated data type `LEDcolor` in the header file `model_types.h` where `model` is the name of the model used to generate code.

Input Arguments

enumTypeName — Name of target enumerated data type

character vector

Name of the target enumerated data type, specified as a character vector.

Example: 'myFirstEnumType'

Data Types: char

infoRequest — Information to return

valid character vector

Information to return, specified as one of the character vector options in the table.

Specified value	Information returned	Example return value
'DefaultValue'	The default enumeration member, returned as an instance of the enumerated data type.	enumMember1
'Description'	The custom description of this data type, returned as a character vector. Returns an empty character vector if a description was not specified for the type.	'My first enum type.'
'HeaderFile'	The name of the custom header file that defines the data type in generated code, returned as a character vector. Returns an empty character vector if a header file was not specified for the type.	'myEnumType.h'
'DataScope'	Indication whether generated code imports or exports the definition of the data type. A return value of 'Auto' indicates generated code defines the type in the header file <code>model_types.h</code> or imports the definition from the header file identified by <code>HeaderFile</code> . A return value of 'Exported' or 'Imported' indicates generated code exports or imports the definition to or from the header file identified by <code>HeaderFile</code> .	'Exported'
'StorageType'	The integer data type used by generated code to store the numeric values of the enumeration members, returned as a character vector. Returns 'int' if you did not specify a storage type for the enumerated type, in which case generated code uses the native integer type of the hardware target.	'int32'

Specified value	Information returned	Example return value
'AddClassNameToEnumNames'	Indication whether generated code prefixes the names of enumeration members with the name of the data type. Returned as true or false.	true

“Simulink Enumerations”

Introduced in R2014b

Simulink.data.isSupportedEnumClass

Determine whether an enumeration class is valid for Simulink

Syntax

```
valid = Simulink.data.isSupportedEnumClass(enumClass)
```

Description

`valid = Simulink.data.isSupportedEnumClass(enumClass)` returns true if `enumClass` is a valid enumeration class for Simulink.

Examples

Determine if Enumeration Class is Valid

Define an enumeration class of basic colors, then confirm that it is valid.

```
Simulink.defineIntEnumType('BasicColors', ...
    {'Red', 'Yellow', 'Blue'}, ...
    [0;1;2]);
Simulink.data.isSupportedEnumClass('BasicColors')
```

```
ans =
    logical
     1
```

Perform the same validity check by using the `meta.class` object as the input.

```
Simulink.data.isSupportedEnumClass(?BasicColors)
```

```
ans =
    logical
     1
```

Check if `Simulink.NumericType` is a valid enumeration class by using the `meta.class` object as the input.

```
Simulink.data.isSupportedEnumClass(?Simulink.NumericType)
```

```
ans =
    logical
```

0

Input Arguments

enumClass — Enumeration class

character vector | `meta.class`

Enumeration class, specified as a character vector or as `meta.class` object.

Example: `'myEnumClass'` or `?myEnumClass`

Output Arguments

valid — Whether enumeration class is valid

logical

If the input value refers to a valid enumeration class for Simulink, `valid` is `true`, otherwise `valid` is `false`.

Topics

“Simulink Enumerations”

Introduced in R2014b

Simulink.data.isSupportedEnumObject

Determine whether an enumeration object is valid for Simulink

Syntax

```
valid = Simulink.data.isSupportedEnumObject(enumObject)
```

Description

`valid = Simulink.data.isSupportedEnumObject(enumObject)` returns true if `enumObject` is a valid enumeration object for Simulink.

Examples

Determine if Enumeration Object is Valid

Define an enumeration class of basic colors.

```
Simulink.defineIntEnumType('BasicColors', ...  
    {'Red', 'Yellow', 'Blue'}, ...  
    [0;1;2]);
```

Confirm that an instance of the enumeration class is valid.

```
Simulink.data.isSupportedEnumObject(BasicColors.Yellow)
```

```
ans =  
  
    logical  
  
     1
```

Call the function with input that is not an enumeration object.

```
Simulink.data.isSupportedEnumObject(5)
```

```
ans =  
  
    logical  
  
     0
```

Input Arguments

enumObject — Enumeration object

enumeration object

Instance of a defined enumeration, specified as an enumeration object.

Example: `myEnumObject`

Output Arguments

valid — Whether enumeration class is valid

logical

If the input value refers to a valid enumeration object for Simulink, `valid` is `true`, otherwise `valid` is `false`.

Topics

“Simulink Enumerations”

Introduced in R2014b

Simulink.defineIntEnumType

Define enumerated data type

Syntax

```
Simulink.defineIntEnumType(ClassName, CellofEnums,IntValues)
Simulink.defineIntEnumType( __ , 'Description',ClassDesc)
Simulink.defineIntEnumType( __ , 'DefaultValue',DefValue)
Simulink.defineIntEnumType( __ , 'DataScope',ScopeSelection)
Simulink.defineIntEnumType( __ , 'HeaderFile',FileName)
Simulink.defineIntEnumType( __ , 'AddClassNameToEnumNames',Flag)
Simulink.defineIntEnumType( __ , 'StorageType',DataType)
```

Description

`Simulink.defineIntEnumType(ClassName, CellofEnums,IntValues)` defines an enumeration named `ClassName` with enumeration values specified with `CellofEnums` and underlying numeric values specified by `IntValues`.

`Simulink.defineIntEnumType(__ , 'Description',ClassDesc)` defines the enumeration with a description.

`Simulink.defineIntEnumType(__ , 'DefaultValue',DefValue)` defines a default value for the enumeration, which is one of the character vectors you specify for `CellofEnums`.

`Simulink.defineIntEnumType(__ , 'DataScope',ScopeSelection)` specifies whether the data type definition should be imported from, or exported to, a header file during code generation.

`Simulink.defineIntEnumType(__ , 'HeaderFile',FileName)` specifies the name of a header file containing the enumeration class definition for use in code generated from a model.

`Simulink.defineIntEnumType(__ , 'AddClassNameToEnumNames',Flag)` specifies whether the code generator applies the class name as a prefix to the enumeration values that you specify for `CellofEnums`. For `Flag`, specify `true` or `false`. For example, if you specify `true`, the code generator would use `BasicColors.Red` instead of `Red` to represent an enumerated value.

`Simulink.defineIntEnumType(__ , 'StorageType',DataType)` specifies the data type used to store the enumerations' underlying integer values in code generated from a model.

Examples

Import Enumeration Class Definition Into Workspace

Assume an external data dictionary includes the following enumeration:

```
BasicColors.Red(0), BasicColors.Yellow(1), BasicColors.Blue(2)
```

Import the enumeration class definition into the MATLAB workspace while specifying `int16` as the underlying integer data type for generated code:

```
Simulink.defineIntEnumType('BasicColors', ...  
    {'Red', 'Yellow', 'Blue'}, ...  
    [0;1;2], ...  
    'Description', 'Basic colors', ...  
    'DefaultValue', 'Blue', ...  
    'HeaderFile', 'mybasiccolors.h', ...  
    'DataScope', 'Exported', ...  
    'AddClassNameToEnumNames', true, ...  
    'StorageType', 'int16');
```

Input Arguments

ClassName — Name of enumerated data type

character vector | string

The name of the enumerated data type, specified as a character vector or string.

Example: 'BasicColors'

CellOfEnums — Enumerations for data type

cell array of character vectors

Enumerations for the data type, specified as a cell array of character vectors.

Example: {'Red', 'Yellow', 'Blue'}

IntValues — Numeric enumeration values

array of numeric values

Numeric enumeration values, specified as an array.

Example: [0;1;2]

ClassDesc — Description of enumeration data type

character vector

Description of the enumeration data type, specified as a character vector.

Example: 'Basic colors'

DefValue — Default enumeration value

character vector

The default enumeration value, specified as a character vector. The value is one of the character vectors specified for `CellOfEnums`.

Example: 'Blue'

FileName — Header file

character vector

That header file that is to contain the data type definition, specified as a character vector. By default, the generated `#include` directive uses the preprocessor delimiter `"` instead of `<` and `>`. To generate the directive `#include <mytypes.h>`, specify `FileName` as `'<myTypes.h>'`.

Example: 'mybasiccolors.h'

ScopeSelection — Action for data type definition

'Auto' (default) | 'Exported' | 'Imported'

Action to take for the data type definition during code generation , specified as one of these values:

- 'Auto' — If no value is specified for `HeaderFile`, export the type definition to `model_types.h` where `model` is the model name. If a value is specified for `HeaderFile`, import the data type definition from the specified header file.
- 'Exported' — Export the data type definition to a header file. If no value is specified for `HeaderFile`, the header file name defaults to `type.h`, where `type` is the data type name.
- 'Imported' — Import the data type definition from a header file. If no value is specified for `HeaderFile`, the header file name defaults to `type.h`, where `type` is the data type name.

Flag — Whether class name is a prefix to enumeration

false or 0 (default) | true or 1

Whether the code generator applies the class name as a prefix to the enumerations, specified as a numeric or logical 1 (true) or 0 (false).

Example: `true`

DataType — Data type used to store enumeration values

'int8' | 'int16' | 'int32' | 'uint8' | 'uint16'

Data type used to store the enumerations' underlying integer values in generated code, specified as a character vector.

Example: `'int16'`

Simulink.defaultModelTemplate

Set or get default model template

Syntax

```
Simulink.defaultModelTemplate(templatename)  
templatepath = Simulink.defaultModelTemplate
```

Description

`Simulink.defaultModelTemplate(templatename)` sets the template file specified by `templatename` as the default model template to use for new models. This setting is persistent between Simulink sessions.

`templatepath = Simulink.defaultModelTemplate` gets the full path to the current default model template.

Examples

Set the default model template

```
Simulink.defaultModelTemplate('simple_simulation.sltx')
```

Get the default model template

```
mydefaulttemplate = Simulink.defaultModelTemplate
```

Clear and restore the default model template

Use `set_param` to set a root block diagram parameter. This clears the default template so that new models will inherit this property of the root block diagram, and warns.

```
set_param(0, 'StopTime', '99');
```

Restore the default template.

```
Simulink.defaultModelTemplate('$restore');
```

Input Arguments

templatename — Template file name

character vector

Template file name, specified as a character vector. If the template is not on the MATLAB path, specify the fully-qualified path to the template file and `*.sltx` extension.

Example: \\Home\username\Documents\MATLAB\template.sltx

Data Types: char

Output Arguments

templatepath — Template path

character vector

Template path, specified as a character vector, showing the full path to the current default model template.

Topics

“Build and Edit a Model Interactively”

“Create Template from Model”

“Using Templates to Create Standard Project Settings”

Introduced in R2016b

Simulink.exportToTemplate

Create template from model or project

Syntax

```
templatefile = Simulink.exportToTemplate(obj,templatename)
templatefile = Simulink.exportToTemplate(obj,templatename,Name,Value)
```

Description

`templatefile = Simulink.exportToTemplate(obj,templatename)` creates a template file (*templatename*.sltx) from a model or project specified by `obj`.

If you have project templates created in R2014a or earlier (.zip files), use `Simulink.exportToTemplate` to upgrade them to .sltx files, then you can use them in the start page.

`templatefile = Simulink.exportToTemplate(obj,templatename,Name,Value)` specifies additional template options as one or more Name, Value pair arguments.

Examples

Create a Template From a Model

Open the vdp model and create a template from it.

```
vdp
myvdptemplate = Simulink.exportToTemplate(bdroot,'vdptemplate')
```

Create a Template From a Model and Specify Description

Open the vdp model and create a template from it, specifying a description.

```
vdp
myvdptemplate = Simulink.exportToTemplate(bdroot,'vdptemplate','Description','Use this template')
```

Input Arguments

obj — Model, library, or project

character vector | numeric handle | `slproject.ProjectManager`

Model, library, or project, specified by name or numeric handle, or a `slproject.ProjectManager` object returned by the `currentProject` function.

Data Types: `double` | `char`

templatename — Template file name

character vector

Template file name, specified as a character vector that can optionally include the fully-qualified path to a template file and *.sltx extension.

Data Types: char

Name-Value Pair Arguments

Specify optional pairs of arguments as Name1=Value1, . . . , NameN=ValueN, where Name is the argument name and Value is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: Title, 'My Project Template'

Group — Group of template

character vector

Group of template, specified as a character vector. On the Start Page, templates are shown under group headings.

Example: 'My Templates'

Data Types: char

Author — Author of template

character vector

Author of template, specified as a character vector.

Data Types: char

Description — Description of template

character vector

Description of template, specified as a character vector.

Data Types: char

ThumbnailFile — Thumbnail image file name

character vector

Thumbnail image file name, specified as a character vector.

Data Types: char

Title — Title of model or project template

character vector

Title of template, specified as a character vector. On the Start Page, the templates titles are shown on the tiles. The title can be different from the file name, and you can use any characters in the title. The default value is the name of the model or project.

Example: 'My Project Template'

Data Types: char

Output Arguments

templatefile — Template file

character vector

Template file, returned as *templatename.sltx* file.

Simulink.exportToVersion

Export model, library, or project for use in previous version of Simulink

Syntax

```
exported_file = Simulink.exportToVersion(modelname,target_filename,version)
exported_file = Simulink.exportToVersion(modelname,target_filename,version,
Name,Value)
exported_project = Simulink.exportToVersion(proj,zipfilename,version)
exported_project = Simulink.exportToVersion(proj,zipfilename,version,
exportReferencedProjects)
```

Description

`exported_file = Simulink.exportToVersion(modelname,target_filename,version)` exports the model or library `modelname` to a file named `target_filename` in a format that the specified previous Simulink version can load.

If the system contains functionality not supported by the specified Simulink software version, the command removes the functionality and replaces any unsupported blocks with empty masked subsystem blocks colored yellow. As a result, the converted system may generate different results.

The `save_system ExportToVersion` option is a legacy option for this functionality that is also supported.

`exported_file = Simulink.exportToVersion(modelname,target_filename,version, Name,Value)` specifies additional options as one or more name-value pair arguments.

`exported_project = Simulink.exportToVersion(proj,zipfilename,version)` exports the project `proj` to a ZIP file `zipfilename` in a format that the specified previous Simulink version can load.

`exported_project = Simulink.exportToVersion(proj,zipfilename,version, exportReferencedProjects)` exports the top-level project `proj` and all referenced projects to a ZIP file `zipfilename` in a format that the specified previous Simulink version can load.

Examples

Export a Model to a Previous Version

Get the current top-level system and export it.

```
Simulink.exportToVersion(bdroot,'mymodel.slx','R2014b');
```

Export a Model to a Previous Version and Break Links

Get the current top-level system and export it, replacing links to library blocks with copies of the library blocks in the saved file.

```
Simulink.exportToVersion(bdroot, 'mymodel.slx', 'R2014b', 'BreakUserLinks', true);
```

Export a Project to a Previous Version

Get the current top-level project and export it.

```
sldemo_slproject_airframe_references;  
proj = currentProject;  
Simulink.exportToVersion(proj, 'myzipfilename', 'R2019a');
```

Export the current top-level project and all referenced projects.

```
Simulink.exportToVersion(proj, 'myzipfilename', 'R2019a', true);
```

Input Arguments

modelName — Model to export

character vector | string scalar

Model to export, specified as a character vector or string scalar, without any file extension. The model must be loaded and unmodified. The target file must not be the same as the model file.

Data Types: char | string

target_filename — Exported file name

character vector | string scalar

Exported file name, specified as a character vector or string scalar. The target file must not be the same as the model file.

Example: 'mymodel.slx'

Data Types: char | string

proj — Project to export

matlab.project.Project object

Project to export, specified as a matlab.project.Project object. Use currentProject to create a project object from the currently loaded project.

zipfilename — Exported ZIP file name

character vector | string scalar

ZIP file name containing the exported project, specified as a character vector or string scalar.

Example: 'myzipfile.zip'

Data Types: char | string

version — MATLAB release name

'R2013B' | 'R2014A_MDL' | 'R2016B_SLX' | ...

MATLAB release name, specified as a character vector or string scalar, which specifies a previous Simulink version. Simulink.exportToVersion exports the system to a format that the specified previous Simulink version can load. You cannot export to your current version. These version names are not case sensitive.

You can specify model file format as SLX or MDL using the suffix `_MDL` or `_SLX`. If you do not specify a format, you export your default model file format. You cannot specify the model files format when exporting a project.

If you use the Export to Previous Version dialog box instead of `Simulink.exportToVersion`, then the **Save as type** list supports 7 years of previous releases.

Example: 'R2015B'

Data Types: `char` | `string`

exportReferencedProjects — Export referenced projects to a previous Simulink version

`false` (default) | `true` | ...

(Optional) Export referenced projects to a previous release, specified as `true` or `false`.

If `true`, `Simulink.exportToVersion` exports the top-level and all referenced projects to a previous release, and includes the references in the ZIP file. Extracting the ZIP file creates a copy of the referenced projects and links them to the top-level project.

If `false`, `Simulink.exportToVersion` only exports the top-level project to a previous release. `Simulink.exportToVersion` preserves the existing absolute and relative link to the references. For a working project on extraction, the references must be at the same absolute and relative paths.

The argument is ignored if the project does not have references.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example:

AllowPrompt — Allow prompt or message dialog box

`false` (default) | `true` | `'on'` | `'off'`

Allow prompt or message dialog box, specified by a logical value that indicates whether to display any output prompt or message in a dialog box or only messages at the command line. For example, prompts to make files writable, or messages about exported versions. If you want to allow prompts, then set to `true`. or `on`.

BreakUserLinks — Break user-defined links

`false` (default) | `true` | `'on'` | `'off'`

Break user-defined links, specified by a logical value that indicates whether the function replaces links to user-defined library blocks with copies of the library blocks in the saved file.

BreakToolboxLinks — Break all toolbox links

`false` (default) | `true` | `'on'` | `'off'`

Break all toolbox links, specified by a logical value that indicates whether the function replaces links to built-in MathWorks library blocks with copies of the library blocks in the saved file. The `'BreakToolboxLinks'` option affects Simulink library blocks and blocks from any other libraries supplied with MathWorks toolboxes or blocksets.

Note The 'BreakToolboxLinks' option can result in compatibility issues when upgrading to newer versions of Simulink software. For example:

- Any masks on top of library links to Simulink S-functions will not upgrade to the new version of the S-function.
- Any library links to masked subsystems in a Simulink library will not upgrade to the new subsystem behavior.
- Any broken links prevent the automatic library forwarding mechanism from upgrading the link. See “Maintain Compatibility of Library Blocks Using Forwarding Tables”.

If you have saved a model with broken links to built-in libraries, use the Upgrade Advisor to scan the model for out-of-date blocks and upgrade the Simulink blocks to their current versions.

Output Arguments

exported_file — Exported file

character vector

Path of the exported file, returned in the format that the specified previous Simulink version can load.

exported_project — Exported project in a ZIP file

character vector

Path of the ZIP file containing the exported project, returned in the format that the specified previous Simulink version can load.

Limitations

`Simulink.exportToVersion` does not support exporting external test harnesses to previous releases.

- For models with external test harnesses, `Simulink.exportToVersion` automatically converts them to internal test harnesses.
- For projects containing models with external test harnesses, `Simulink.exportToVersion` exports the projects and reports the test harnesses as missing files.

Simulink.history.clear

Clear the Simulink start page and editor history

Syntax

```
Simulink.history.clear
```

Description

`Simulink.history.clear` clears the list of favorites and the list of recent models and projects in the Simulink start page and editor.

Examples

Clear All Simulink History

To clear all Simulink history, in the Command Window, type:

```
Simulink.history.clear()
```

Simulink.fileGenControl

Specify root folders for files generated by diagram updates and model builds

Syntax

```
cfg = Simulink.fileGenControl('getConfig')  
Simulink.fileGenControl(Action,Name,Value)
```

Description

`cfg = Simulink.fileGenControl('getConfig')` returns a handle to an instance of the `Simulink.FileGenConfig` object, which contains the current values of these file generation control parameters:

- `CacheFolder` - Specifies the root folder for model build artifacts that are used for simulation, including Simulink® cache files.
- `CodeGenFolder` - Specifies the root folder for code generation files.
- `CodeGenFolderStructure` - Controls the folder structure within the code generation folder.

To get or set the parameter values, use the `Simulink.FileGenConfig` object.

These Simulink preferences determine the initial parameter values for the MATLAB session:

- Simulation cache folder - `CacheFolder`
- Code generation folder - `CodeGenFolder`
- Code generation folder structure - `CodeGenFolderStructure`

`Simulink.fileGenControl(Action,Name,Value)` performs an action that uses the file generation control parameters of the current MATLAB session. Specify additional options with one or more `name,value` pair arguments.

Examples

Get File Generation Control Parameter Values

To obtain the file generation control parameter values for the current MATLAB session, use `getConfig`.

```
cfg = Simulink.fileGenControl('getConfig');  
  
myCacheFolder = cfg.CacheFolder;  
myCodeGenFolder = cfg.CodeGenFolder;  
myCodeGenFolderStructure = cfg.CodeGenFolderStructure;
```

Set File Generation Control Parameters by Using Simulink.FileGenConfig Object

To set the file generation control parameter values for the current MATLAB session, use the `setConfig` action. First, set values in an instance of the `Simulink.FileGenConfig` object. Then,

pass the object instance. This example assumes that your system has `aNonDefaultCacheFolder` and `aNonDefaultCodeGenFolder` folders.

```
% Get the current configuration
cfg = Simulink.fileGenControl('getConfig');

% Change the parameters to non-default locations
% for the cache and code generation folders
cfg.CacheFolder = fullfile('C:', 'aNonDefaultCacheFolder');
cfg.CodeGenFolder = fullfile('C:', 'aNonDefaultCodeGenFolder');
cfg.CodeGenFolderStructure = 'TargetEnvironmentSubfolder';

Simulink.fileGenControl('setConfig', 'config', cfg);
```

Set File Generation Control Parameters Directly

You can set file generation control parameter values for the current MATLAB session without creating an instance of the `Simulink.FileGenConfig` object. This example assumes that your system has `aNonDefaultCacheFolder` and `aNonDefaultCodeGenFolder` folders.

```
myCacheFolder = fullfile('C:', 'aNonDefaultCacheFolder');
myCodeGenFolder = fullfile('C:', 'aNonDefaultCodeGenFolder');

Simulink.fileGenControl('set', 'CacheFolder', myCacheFolder, ...
    'CodeGenFolder', myCodeGenFolder, ...
    'CodeGenFolderStructure', ...
    Simulink.filegen.CodeGenFolderStructure.TargetEnvironmentSubfolder);
```

If you do not want to generate code for different target environments in separate folders, for `'CodeGenFolderStructure'`, specify the value `Simulink.filegen.CodeGenFolderStructure.ModelSpecific`.

Reset File Generation Control Parameters

You can reset the file generation control parameters to values from Simulink preferences.

```
Simulink.fileGenControl('reset');
```

Create Simulation Cache and Code Generation Folders

To create file generation folders, use the `set` action with the `'createDir'` option. You can keep previous file generation folders on the MATLAB path through the `'keepPreviousPath'` option.

```
%
myCacheFolder = fullfile('C:', 'aNonDefaultCacheFolder');
myCodeGenFolder = fullfile('C:', 'aNonDefaultCodeGenFolder');

Simulink.fileGenControl('set', ...
    'CacheFolder', myCacheFolder, ...
    'CodeGenFolder', myCodeGenFolder, ...
    'createDir', true, ...
    'keepPreviousPath', true);
```

```
'keepPreviousPath',true, ...
'createDir',true);
```

Input Arguments

Action — Specify action

'reset' | 'set' | 'setConfig'

Specify an action that uses the file generation control parameters of the current MATLAB session:

- 'reset' - Reset file generation control parameters to values from Simulink preferences.
- 'set' - Set file generation control parameters for the current MATLAB session by directly passing values.
- 'setConfig' - Set file generation control parameters for the current MATLAB session by using an instance of a `Simulink.FileGenConfig` object.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: `Simulink.fileGenControl(Action, Name, Value);`

config — Specify instance of Simulink.FileGenConfig

object handle

Specify the `Simulink.FileGenConfig` object instance containing file generation control parameters that you want to set.

Option for `setConfig`.

Example: `Simulink.fileGenControl('setConfig', 'config', cfg);`

CacheFolder — Specify simulation cache folder

character vector

Specify a simulation cache folder path value for the `CacheFolder` parameter.

Option for `set`.

Example: `Simulink.fileGenControl('set', 'CacheFolder', myCacheFolder);`

CodeGenFolder — Specify code generation folder

character vector

Specify a code generation folder path value for the `CodeGenFolder` parameter. You can specify an absolute path or a path relative to build folders. For example:

- 'C:\Work\mymodelsimcache' and '/mywork/mymodelgencode' specify absolute paths.
- 'mymodelsimcache' is a path relative to the current working folder (pwd). The software converts a relative path to a fully qualified path at the time the `CacheFolder` or `CodeGenFolder`

parameter is set. For example, if `pwd` is `'/mywork'`, the result is `'/mywork/mymodelsimcache'`.

- `'../test/mymodelgencode'` is a path relative to `pwd`. If `pwd` is `'/mywork'`, the result is `'/test/mymodelgencode'`.

Option for `set`.

Example: `Simulink.fileGenControl('set', 'CodeGenFolder', myCodeGenFolder);`

CodeGenFolderStructure — Specify generated code folder structure

`Simulink.filegen.CodeGenFolderStructure.ModelSpecific` (default) |
`Simulink.filegen.CodeGenFolderStructure.TargetEnvironmentSubfolder`

Specify the layout of subfolders within the generated code folder:

- `Simulink.filegen.CodeGenFolderStructure.ModelSpecific` (default) - Place generated code in subfolders within a model-specific folder.
- `Simulink.filegen.CodeGenFolderStructure.TargetEnvironmentSubfolder` - If models are configured for different target environments, place generated code for each model in a separate subfolder. The name of the subfolder corresponds to the target environment.

Option for `set`.

Example: `Simulink.fileGenControl('set', 'CacheFolder', myCacheFolder, ...
'CodeGenFolder', myCodeGenFolder, ... 'CodeGenFolderStructure', ...
Simulink.filegen.CodeGenFolderStructure.TargetEnvironmentSubfolder);`

keepPreviousPath — Keep previous folder paths on MATLAB path

`false` (default) | `true`

Specify whether to keep the previous values of `CacheFolder` and `CodeGenFolder` on the MATLAB path:

- `true` - Keep previous folder path values on MATLAB path.
- `false` (default) - Remove previous folder path values from MATLAB path.

Option for `reset`, `set`, or `setConfig`.

Example: `Simulink.fileGenControl('reset', 'keepPreviousPath', true);`

createDir — Create folders for file generation

`false` (default) | `true`

Specify whether to create folders for file generation if the folders do not exist:

- `true` - Create folders for file generation.
- `false` (default) - Do not create folders for file generation.

Option for `set` or `setConfig`.

Example: `Simulink.fileGenControl('set', 'CacheFolder', myCacheFolder,
'CodeGenFolder', myCodeGenFolder, 'keepPreviousPath', true,
'createDir', true);`

Avoid Naming Conflicts

Using `Simulink.fileGenControl` to set `CacheFolder` and `CodeGenFolder` adds the specified folders to your MATLAB search path. This function has the same potential for introducing a naming conflict as using `addpath` to add folders to the search path. For example, a naming conflict occurs if the folder that you specify for `CacheFolder` or `CodeGenFolder` contains a model file with the same name as an open model. For more information, see “What Is the MATLAB Search Path?” and “Files and Folders that MATLAB Accesses”.

To use a nondefault location for the simulation cache folder or code generation folder:

- 1 Delete any potentially conflicting artifacts that exist in:
 - The current working folder, `pwd`.
 - The nondefault simulation cache and code generation folders that you intend to use.
- 2 Specify the nondefault locations for the simulation cache and code generation folders by using `Simulink.fileGenControl` or Simulink preferences.

Output Arguments

cfg — Current values of file generation control parameters

object handle

Instance of a `Simulink.FileGenConfig` object, which contains the current values of file generation control parameters.

Simulink.findBlocks

Find blocks in Simulink models

Syntax

```
bl = Simulink.findBlocks(sys)
bl = Simulink.findBlocks(sys,options)
bl = Simulink.findBlocks(sys,Param1,Value1,...,ParamN,ValueN)
bl = Simulink.findBlocks(sys,Param1,Value1,...,ParamN,ValueN,options)
```

Description

`bl = Simulink.findBlocks(sys)` returns handles to all blocks in the model or subsystem `sys`.

`bl = Simulink.findBlocks(sys,options)` finds blocks that match the criteria specified by a `Simulink.FindOptions` object.

`bl = Simulink.findBlocks(sys,Param1,Value1,...,ParamN,ValueN)` finds blocks whose block parameters have the specified values.

`bl = Simulink.findBlocks(sys,Param1,Value1,...,ParamN,ValueN,options)` finds blocks whose parameters have the specified values and that match the criteria specified by a `FindOptions` object.

Examples

Find Blocks in a Model

Return handles for all blocks in the model `vdp`.

```
load_system('vdp');
bl = Simulink.findBlocks('vdp')
```

```
bl =
```

```
1.0e+03 *
    9.4450
    9.4460
    9.4470
    9.4480
    9.4490
    9.4500
    9.4510
    9.4520
    9.4530
    9.4540
    9.4550
    9.4560
    9.4570
    9.4580
```

Return block names.

```
bl = getfullname(Simulink.findBlocks('vdp'))
```

```
bl =
```

```
14x1 cell array
```

```
{'vdp/Constant'      }  
{'vdp/More Info'    }  
{'vdp/More Info/Model Info'}  
{'vdp/Mu'           }  
{'vdp/Mux'          }  
{'vdp/Product'      }  
{'vdp/Scope'        }  
{'vdp/Square'       }  
{'vdp/Sum'          }  
{'vdp/Sum1'         }  
{'vdp/x1'           }  
{'vdp/x2'           }  
{'vdp/Out1'         }  
{'vdp/Out2'         }
```

Return block handles for the block whose name is Mu.

```
Simulink.findBlocks('vdp', 'Name', 'Mu')
```

```
ans =
```

```
9.4480e+03
```

Input Arguments

sys — Model or subsystem to find blocks in

character vector | string array

Model or subsystem to find blocks in, specified as a character vector or string array.

Example: 'vdp' "f14/Aircraft Dynamics Model"

options — Search constraints

Simulink.FindOptions object

Search constraints, specified as a Simulink.FindOptions object.

Output Arguments

bl — Search results

array of handles

Search results, returned as an array of handles.

Introduced in R2018a

Simulink.findBlocksOfType

Find specified type of block in Simulink models

Syntax

```
bl = Simulink.findBlocksOfType(sys,type)
bl = Simulink.findBlocksOfType(sys,type,options)
bl = Simulink.findBlocksOfType(sys,type,Param1,Value1,...,ParamN,ValueN)
bl = Simulink.findBlocksofType(sys,type,Param1,Value1,...,ParamN,ValueN,
options)
```

Description

`bl = Simulink.findBlocksOfType(sys,type)` returns handles to all blocks of the specified type in the model or subsystem `sys`.

`bl = Simulink.findBlocksOfType(sys,type,options)` matches the criteria specified by a `FindOptions` object.

`bl = Simulink.findBlocksOfType(sys,type,Param1,Value1,...,ParamN,ValueN)` finds blocks whose parameters have the specified values.

`bl = Simulink.findBlocksofType(sys,type,Param1,Value1,...,ParamN,ValueN,options)` finds blocks whose parameters have the specified values and that match the criteria specified by a `FindOptions` object.

Examples

Find Blocks of a Type in Model

Find all blocks of type Gain in the model `vdp`.

```
load_system('vdp');
Simulink.findBlocksOfType('vdp','Gain')
```

```
ans =
    7.0001
```

To return block names instead of handles, use `getfullname`.

```
getfullname(Simulink.findBlocksOfType('vdp','Gain'))
```

```
ans =
    'vdp/Mu'
```

Find Blocks of a Type Using Search Options

Load the model `sldemo_clutch`. Then, create a `FindOptions` object and use it to constrain the search of `GoTo` blocks in the model to the `Unlocked` system.

```
openExample('sldemo_clutch');
f = Simulink.FindOptions('SearchDepth',1);
bl = Simulink.findBlocksOfType('sldemo_clutch/Unlocked','Goto',f)

bl =

    166.0001
    167.0001
```

Input Arguments

sys — Model or subsystem to find blocks in

character vector | string array

Model or subsystem to find blocks in, specified as a character vector or string array.

Example: `'vdp' "f14/Aircraft Dynamics Model"`

type — Block type

character vector | string scalar

Block type, specified as a character vector or string scalar. Use `get_param` with the `'BlockType'` parameter to get the block type.

options — Search constraints

`simulink.FindOptions` object

Search constraints, specified as a `Simulink.FindOptions` object.

Example: `Simulink.FindOptions('SearchDepth',1)`

Output Arguments

bl — Search results

array of handles

Search results, returned as an array of handles.

"Block-Specific Parameters" on page 6-26

Introduced in R2018a

Simulink.findIntEnumType

Find enumeration classes defined by `Simulink.defineIntEnumType`

Syntax

```
result = Simulink.findIntEnumType(typeName)
result = Simulink.findIntEnumType()
```

Description

`result = Simulink.findIntEnumType(typeName)` returns the `meta.class` object for class `type` that is defined by `Simulink.defineIntEnumType`. Use the returned `meta.class` object to query attributes of the enumeration class. If the class does not exist, the function returns an empty `meta.class` object.

`result = Simulink.findIntEnumType()` returns `meta.class` objects for all enumeration classes that are defined by `Simulink.defineIntEnumType`. Use the returned `meta.class` objects to query attributes of the enumeration classes.

Examples

Find a Specific Dynamic Enumerated Data Type

Define an enumeration type.

```
Simulink.defineIntEnumType('myEnumType', {'e1', 'e2'}, [1 2]);
```

Check for the enumeration type that you have created.

```
myResult = Simulink.findIntEnumType('myEnumType')
```

```
myResult =
```

```
class with properties:
```

```

        Name: 'myEnumType'
      Description: ''
DetailedDescription: ''
        Hidden: 0
        Sealed: 0
        Abstract: 0
      Enumeration: 1
ConstructOnLoad: 0
HandleCompatible: 0
InferiorClasses: {[1x1 meta.class]}
ContainingPackage: [0x0 meta.package]
RestrictsSubclassing: 0
      PropertyList: [0x1 meta.property]
      MethodList: [150x1 meta.method]
      EventList: [0x1 meta.event]
```

```
EnumerationMemberList: [2×1 meta.EnumeratedValue]  
SuperclassList: [1×1 meta.class]
```

Find All Dynamic Enumerated Data Types

Define two enumeration types.

```
Simulink.defineIntEnumType('myEnumType1', {'e1', 'e2'}, [1 2]);  
Simulink.defineIntEnumType('myEnumType2', {'e3', 'e4'}, [3 4]);
```

Check for the enumeration types that you have created.

```
myResult = Simulink.findIntEnumType()
```

Input Arguments

typeName — Name of enumeration class

character vector or string

Name of a specific enumeration class that is defined by `Simulink.defineIntEnumType`, specified as a character vector or string.

Example: 'myEnumType'

Data Types: char | string

Output Arguments

result — Search results

array of `meta.class` objects

Search result, returned as an array of `meta.class` objects. If there are no enumeration classes, the array is empty.

See Also

[enumeration](#) | [Simulink.clearIntEnumType](#) | [Simulink.defineIntEnumType](#)

Introduced in R2018b

Simulink.findTemplates

Find model or project templates with specified properties

Syntax

```
filename = Simulink.findTemplates(templatename)
filename = Simulink.findTemplates(templatename,Name,Value)
[filename,info] = Simulink.findTemplates(templatename)
```

Description

`filename = Simulink.findTemplates(templatename)` returns the names and `TemplateInfo` objects for all matching templates that include `templatename`.

`filename = Simulink.findTemplates(templatename,Name,Value)` also specifies additional template properties as one or more `Name, Value` pair arguments.

`[filename,info] = Simulink.findTemplates(templatename)` returns the names and `TemplateInfo` objects for all matching templates.

Examples

Find a Particular Template

Get the full path to the default model template.

```
filename = Simulink.findTemplates('factory_default_model');
```

Find All Templates With Specified Folders or Authors

Get all templates inside folders called `work`.

```
filename = Simulink.findTemplates('work/')
```

Get all templates for which the `Author` property includes the character vector `Smith`.

```
filename = Simulink.findTemplates('*', 'Author', 'Smith')
```

Find All DSP Templates and Get TemplateInfo Objects

Get the paths to all DSP model templates, and `sltemplate.TemplateInfo` objects for each of them.

```
[filename,info] = Simulink.findTemplates('dsp*', 'Type', 'Model');
```

Input Arguments

templatename — Template name

character vector

Template name, specified as a character vector containing a portion of a file name, which can contain the wildcard asterisk character “*”.

Example:

Data Types: char

Name-Value Pair Arguments

Specify optional pairs of arguments as Name1=Value1, . . . , NameN=ValueN, where Name is the argument name and Value is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

You can specify regular expressions for any of the Value character vectors, e.g., including the wildcard asterisk character “*”.

Example: 'Author', '*son'

Type — Model, library, or project

'Model' | 'Library' | 'Project'

Model, library, or project template type, specified as a character vector for model, library, or project.

Example: 'Simscape'

Data Types: char

Title — Title of template

character vector

Title of template, specified as a character vector.

Example: 'Simscape'

Data Types: char

Group — Group of template

character vector

Group of template, specified as a character vector. On the Start Page, templates are shown under group headings.

Example: 'Simscape'

Data Types: char

Author — Author of template

character vector

Author of template, specified as a character vector.

Data Types: char

Description — Description of template

character vector

Description of template, specified as a character vector.

Data Types: char

Output Arguments**filename — Template name**

character vector | cell array of character vectors

Template names of matching templates, returned as character vectors.

info — Template information

template info objects | array of template info objects

Template information of matching templates, returned as `sltemplate.TemplateInfo` objects.

Simulink.findVars

Analyze relationship between variables and blocks in models

Syntax

```
[variables] = Simulink.findVars(context)
[variables] = Simulink.findVars(context,variablefilter)
[variables] = Simulink.findVars( ____,Name,Value)
```

Description

`[variables] = Simulink.findVars(context)` finds and returns variables that are used in the blocks and models specified by `context`, including subsystems and referenced models. The function returns an empty vector if `context` does not use any variables.

`[variables] = Simulink.findVars(context,variablefilter)` finds only the variables or enumerated types that are specified by `variablefilter`. For example, use this syntax to determine where a variable is used in a model.

`[variables] = Simulink.findVars(____,Name,Value)` finds variables with additional options specified by one or more `Name,Value` pair arguments. For example, you can search for unused variables. You can also search for enumerated data types that are used in `context`, in addition to variables.

Examples

Variables in Use in a Model

Find variables used by `MyModel`.

```
variables = Simulink.findVars('MyModel');
```

Specific Variable in Use in a Model

Find all uses of the base workspace variable `k` by `MyModel`. Use the cached results to avoid compiling `MyModel`.

```
variables = Simulink.findVars('MyModel','Name','k',...
'SearchMethod','cached','SourceType','base workspace');
```

Regular Expression Matching

Find all uses of a variable whose name matches the regular expression `^trans`.

```
variables = Simulink.findVars('MyModel','Regex','on',...  
'Name','^trans');
```

Variables Common to Two Models

Given two models, find the variables used by the first model, the second, and both

```
model1Vars = Simulink.findVars('model1');  
model2Vars = Simulink.findVars('model2');  
commonVars = intersect(model1Vars,model2Vars);
```

Variables Not Used in a Model

Find the variables that are defined in the model workspace of MyModel but that are not used by the model.

```
unusedVars = Simulink.findVars('MyModel','FindUsedVars','off',...  
'SourceType','model workspace');
```

Specific Variable Not Used in a Model

Determine if the base workspace variable k is not used by MyModel.

```
varObj = Simulink.VariableUsage('k','base workspace');  
unusedVar = Simulink.findVars('MyModel',varObj,...  
'FindUsedVars','off');
```

Variables Used by a Block

Find the variables that are used by the block Gain1 in MyModel.

```
variables = Simulink.findVars('MyModel',...  
'Users','MyModel/Gain1');
```

Variables Used in a Model Reference Hierarchy

Find the variables that are used in a model reference hierarchy. Begin the search with the model MyNestedModel, and search the entire hierarchy below MyNestedModel.

```
variables = Simulink.findVars('MyNestedModel','SearchReferencedModels','on');
```

Variables and Enumerated Types Used in a Model

Find variables and enumerated types that are used in MyModel.

```
varsAndEnumTypes = Simulink.findVars('MyModel','IncludeEnumTypes','on');
```

Input Arguments

context — Models and blocks to search

character vector | string | cell array of character vectors | string array

Models and blocks to search, specified as a character vector, string, cell array of character vectors, or a string array. You can specify `context` in one of the following ways:

- The name of a model. For example, ('vdp') specifies the model `vdp.slx`.
- The name or path of a block or masked block. For example, ('vdp/Gain1') specifies a block named `Gain1` at the root level of the model `vdp.slx`.
- A cell array of model or block names.

Data Types: `char` | `cell`

variablefilter — Specific variables to find

array of `Simulink.VariableUsage` objects

Specific variables to find, specified as an array of `Simulink.VariableUsage` objects. Each `Simulink.VariableUsage` object identifies a variable to find.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose `Name` in quotes.

Example: 'FindUsedVars','off'

FindUsedVars — Find variables that are used or not used

'on' (default) | 'off'

Flag to find variables that are explicitly used or not used, specified as the comma-separated pair consisting of 'FindUsedVars' and 'on' or 'off'. If you specify `FindUsedVars` as 'off', the function finds variables that are not used in context but that are defined in the workspace specified by `SourceType`.

Example: 'FindUsedVars','off'

IncludeEnumTypes — Find enumerated types that are used

'off' (default) | 'on'

Flag to find enumerated data types that are used, specified as the comma-separated pair consisting of 'IncludeEnumTypes' and 'on' or 'off'. The function finds enumerated types that are used explicitly in context as well as types that define variables that are used in context.

The function does not report details about which blocks or objects are using the enumerated types.

If you specify `SourceType` as 'base workspace', 'model workspace', or 'mask workspace', the function does not report enumerated types because those sources cannot define enumerated types.

You cannot find unused enumerated types by specifying `FindUsedVars` as `'off'`.

Example: `'IncludeEnumTypes', 'on'`

RegExp — Enable regular expression matching

`'off'` (default) | `'on'`

Flag to enable regular expression matching for input arguments, specified as the comma-separated pair consisting of `'RegExp'` and `'on'`. You can match only input arguments that have character vector values.

Example: `'RegExp', 'on'`

SearchMethod — Compile status

`'compiled'` (default) | `'cached'`

Compile status, specified as the comma-separated pair consisting of `'SearchMethod'` and one of these values:

- `'compiled'` — Return up-to-date results by compiling every model in the search context before search.
- `'cached'` — Return quicker results by using results cached during the previous compile.

Example: `'SearchMethod', 'compiled'`

SearchReferencedModels — Enable search in referenced models

`'off'` (default) | `'on'`

Flag to enable search in referenced models, specified as the comma-separated pair consisting of `'SearchReferencedModels'` and `'on'`.

If a referenced model uses a global variable, such as a variable stored in a data dictionary, the function returns this global variable when called on the parent model. If `SearchReferencedModels` is set to `'on'`, the `Simulink.VariableUsage` object returned by the function specifies a block in the referenced model as the variable user. Otherwise, the object specifies the Model block as the user.

Example: `'SearchReferencedModels', 'on'`

Name — Name of a variable or enumerated type to search for

character vector | string

Name of a variable or enumerated data type to search for, specified as the comma-separated pair consisting of `'Name'` and a character vector or string.

Example: `'Name', 'trans'`

Data Types: char

SourceType — Workspace or source defining the variables or enumerated types

character vector | string

Workspace or source defining the variables, specified as the comma-separated pair of `'SourceType'` and one of these options:

- `'base workspace'`
- `'model workspace'`

- 'mask workspace'
- 'data dictionary'

The function filters results for variables that are defined in the specified source.

Example: 'SourceType', 'base workspace'

If you search for enumerated data types by specifying 'IncludeEnumTypes' as 'on', 'SourceType' represents the way an enumerated type is defined. You can specify one of these options:

- 'MATLAB file'
- 'dynamic class'
- 'data dictionary'

The function filters results for enumerated types that are defined in the specified source.

Example: 'SourceType', 'MATLAB file'

If you do not specify SourceType, the function does not filter results by source.

Users — Name of block to search for variables

character vector | string

Name of specific block to search for variables, specified as the comma-separated pair consisting of 'Users' and a character vector or string.

To search a set of specific blocks, enable regular expression matching by specifying RegExp as 'on' and use regular expressions in the character vector. For example, you can specify 'Users', 'MyModel/Gain*' to search all blocks in MyModel whose names begin with Gain.

Example: 'Users', 'MyModel/Gain1'

Example: 'Users', 'MyModel/mySubsystem/Gain2'

Example: 'Users', 'MyModel/Gain*'

Limitations

Simulink.findVars does not work with these constructs:

- MATLAB code in scripts and initialization and callback functions
- Libraries and blocks in libraries
- Variables in MATLAB Function blocks, except for input arguments

However, Simulink.findVars can find enumerated types anywhere they are used in MATLAB Function blocks.

- Calls directly to MATLAB from the Stateflow action language
- S-functions that use data type variables registered using ssRegisterDataType

To make the variables searchable, use ssRegisterTypeFromNamedObject instead.

- Variables referenced by machine-parented data in Stateflow.
- Variables inside a string.

- Field in a struct.
- Top models configured for parallel model reference builds. In this case, `Simulink.findVars` does not work when called with either of these name-value arguments:
 - 'SearchMethod' specified as 'cached'.
 - 'SearchReferencedModels' specified as 'on'.

`Simulink.findVars` discovers variable usage in inactive subsystem variants only if you set the **Variant activation time** parameter to `code compile` in the Variant Subsystem block dialog box. If you do not select this check box, the function does not discover variable usage in inactive variants.

“Manage Design Data”

Introduced in R2010a

Simulink.fmuexport.ExportSimulinkProjectToFMU

Export project as Functional Mockup Unit (FMU)

Syntax

```
Simulink.fmuexport.ExportSimulinkProjectToFMU(project,model,Name,Value)
```

Description

`Simulink.fmuexport.ExportSimulinkProjectToFMU(project,model,Name,Value)` exports a project as a Functional Mockup Unit (FMU) and sets the `model` as the main interface model.

Examples

Export Model and Set FMU Icon

If the Simulink model `EngineGasDynamics.slx` exists in the `project root/models/` folder, use the following command to export the FMU from project root:

```
project = slproject.getCurrentProject; ...
Simulink.fmuexport.ExportSimulinkProjectToFMU(project,'models/EngineGasDynamics.slx','-fmuname',fullfile(project.RootFolder,'EngineGasDynamics.fmu'))
```

Input Arguments

project — Project to export

scalar (default)

Project to export, specified as a string.

Data Types: `string`

model — Model that defines main interface

scalar (default)

Model that defines the main interface, specified as a string.

Data Types: `string`

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose `Name` in quotes.

Example:

-fmuname — The location and name of the generated FMU relative to the current working folder

`string`

If not specified, FMU is saved to current directory folder with the same name as the main model.

Data Types: `string`

-description — The description of the generated FMU

`string` (default)

The information is saved in `modelDescription.xml` inside FMU.

Data Types: `string`

-author — The author of the generated FMU

`string` (default)

The information is saved in `modelDescription.xml` inside FMU.

Data Types: `string`

-copyright — The copyright of the generated FMU

`string` (default)

The information is saved in `modelDescription.xml` inside FMU.

Data Types: `string`

-license — The license of the generated FMU

`string` (default)

The information is saved in `modelDescription.xml` inside FMU.

Data Types: `string`

-fmuiicon — An icon file for the generated FMU

`string` (default)

The icon file must be in PNG format. If not specified, generated FMU has no icon file.

Data Types: `string`

`slproject.create`

Topics

“Export a Model as a Tool-Coupling FMU”

Introduced in R2018b

Simulink.getFileChecksum

Checksum of file

Syntax

```
checksum = Simulink.getFileChecksum(filename)
```

Description

`checksum = Simulink.getFileChecksum(filename)` returns the checksum of the specified file, using the MD5 checksum algorithm. Use the checksum to see if the file has changed compared to a previous checksum. You can use checksums as part of an audit trail.

Use `Simulink.getFileChecksum` to get a checksum for any file. If the file contents do not change from one checksum to the next, the checksum from `Simulink.getFileChecksum` stays the same. Otherwise, the checksum is different with each change to the file contents.

For functional information on a model, use `Simulink.BlockDiagram.getChecksum` instead. `Simulink.BlockDiagram.getChecksum` looks at the functional aspect of the model. If the functional aspect doesn't change, then `Simulink.BlockDiagram.getChecksum` returns the same checksum.

For example, if you moved a block, the file contents are different (measured by `Simulink.getFileChecksum`) but the function of the model is unchanged (measured by `Simulink.BlockDiagram.getChecksum`).

Examples

Get Checksum of a File

Use `fullfile` to specify a full path to a file and get the checksum.

```
filechecksum = Simulink.getFileChecksum(fullfile(matlabroot, 'toolbox', ...  
'matlab', 'demos', 'gatlin.mat'));
```

Input Arguments

filename — File name to get checksum for

file of any type

File name to get checksum for, with file extension and optional full path. Use `fullfile` to specify a full path to a file, or use the form 'C:\Work\filename.mat'.

Example: 'lengthoffline.m'

Data Types: char

Output Arguments

checksum — **Checksum value**

character vector

Checksum value in a 32-character vector.

See Also

`Simulink.BlockDiagram.getChecksum` | `Simulink.SubSystem.getChecksum`

Introduced in R2014b

Simulink.getOutputInheritsInitialValue

Determine if conditional subsystem Output block inherits initial output value

Syntax

```
tf = Simulink.getOutputInheritsInitialValue(outblock)
```

Description

`tf = Simulink.getOutputInheritsInitialValue(outblock)` evaluates whether `outblock` is a conditional subsystem Output block that inherits its initial output value from an input signal connected to the conditional subsystem. If so, it returns `true`. If not, it returns `false`. The return value is `true` under the same circumstances as the  badge is displayed next to the Output block on the Simulink canvas, as described in “Conditional Subsystem Initial Output Values”.

For the return value to be accurate, update or run the model before calling this function.

The value returned by this function is meaningful only if the model is using simplified initialization mode. See “Simplified Initialization Mode”. If the model is using classic initialization mode, the return value is always `false`.

Examples

Determine If Output Block Inherits Initial Output Value

The model `my_model` contains the enabled subsystem `EnabledSub1`, which contains Output blocks `Out1` and `Out2`.

```
set_param('my_model/EnabledSub1/Out1','InitialOutput','0'); % Explicit initial output value
set_param('my_model','SimulationCommand','Update'); % Update model
inherits = Simulink.getOutputInheritsinitialValue('my_model/EnabledSub1/Out1')
```

```
inherits =
```

```
logical
```

```
0
```

```
set_param('my_model/EnabledSub1/Out2','InitialOutput','[]'); % Inherit initial output value
set_param('my_model','SimulationCommand','Update'); % Update model
inherits = Simulink.getOutputInheritsinitialValue('my_model/EnabledSub1/Out2')
```

```
inherits =
```

```
logical
```

```
1
```

```
inherits = Simulink.getOutputInheritsinitialValue({'my_model/EnabledSub1/Out1','my_model/EnabledSub1/Out2'})
```

```
inherits =  
  
    2×1 logical array  
  
    0  
    1
```

Input Arguments

outblock — Identifier of conditional subsystem Output block

character vector | string scalar | numeric handle

Identifier of conditional subsystem Output block, specified as a character vector, string scalar, or numeric handle. Multiple block identifiers may be specified as a vector or a 1-dimensional cell array.

Example: 'my_model/EnabledSub1/Out1'

Data Types: character vector | string scalar | handle | vector | cell array

Output Arguments

tf — Whether block inherits its initial output value

logical

Whether block inherits its initial output value, returned as a logical `true` or `false`. If the input value refers to an Outputport block connected to a conditional subsystem and the block inherits its initial output value from that subsystem's input signal, `tf` is `true`. Otherwise, `tf` is `false`. If the input value is a vector or a cell array, `tf` is a logical column vector.

For the return value to be accurate, update or run the model before calling this function.

Data Types: logical | logical vector

“Conditional Subsystem Initial Output Values” | Outputport

Introduced in R2021a

Simulink.getSuppressedDiagnostics

Return `Simulink.SuppressedDiagnostic` objects associated with a block, subsystem, or model

Syntax

```
suppressed_diagnostics = Simulink.getSuppressedDiagnostics(source)
```

Description

`suppressed_diagnostics = Simulink.getSuppressedDiagnostics(source)` returns an array of `Simulink.SuppressedDiagnostic` objects that are associated with the specified source.

Examples

Get All Simulink.SuppressedDiagnostic Objects on a Specific Block

Using the model from “Suppress Diagnostic Messages Programmatically”, get all suppressed diagnostics associated with a specified block.

Use the `Simulink.suppressDiagnostic` function to suppress the parameter precision loss warning thrown by the Constant block, one.

```
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one', ...
    'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

Get the `Simulink.SuppressedDiagnostic` objects associated with the block.

```
suppressed_diagnostic = Simulink.getSuppressedDiagnostics('Suppressor_CLI_Demo/one')
```

```
suppressed_diagnostic =
```

```
SuppressedDiagnostic with properties:
```

```
    Source: 'Suppressor_CLI_Demo/one'
      Id: 'SimulinkFixedPoint:util:fxpParameterPrecis...'
LastModifiedBy: ''
    Comments: ''
    LastModified: '2016-Jul-04 14:12:24'
```

Input Arguments

source — System, block, or model object throwing warning

model | subsystem | block path | block handle

The source of the diagnostic, specified as a model, subsystem, block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the `gcb` function.

To get the block handle, use the `getSimulinkBlockHandle` function.

Data Types: char | cell

Output Arguments

suppressed_diagnostics — Suppressed diagnostics

array

Suppressed diagnostics, returned as an array of `Simulink.SuppressedDiagnostic` objects.

See Also

`Simulink.getSuppressedDiagnostics` | `Simulink.suppressDiagnostic` |
`Simulink.restoreDiagnostic` | `restore` | `Simulink.SuppressedDiagnostic`

Introduced in R2016b

Simulink.ID.getHandle

Get handle of block, annotation, or Stateflow object

Note Simulink.ID.getHandle is not recommended. Use getSimulinkBlockHandle instead.

Syntax

```
hdl = Simulink.ID.getHandle(simulinkID)
```

Description

`hdl = Simulink.ID.getHandle(simulinkID)` returns the handle of the block, annotation, or Stateflow object that has the Simulink Identifier `simulinkID`.

Examples

Get Handle of Model Block

Open the model `vdp`.

```
vdp
```

Get the SID of the Sum block.

```
Simulink.ID.getSID('vdp/Sum')
```

```
ans =
```

```
'vdp:8'
```

Get the handle of the Sum block using the SID.

```
hdl = Simulink.ID.getHandle('vdp:8')
```

Input Arguments

simulinkID — Simulink Identifier

character vector | string scalar

Simulink Identifier of a block, annotation, or Stateflow object, specified as a character vector or string scalar.

Example: `'vdp:4'`

Output Arguments

hdl — handle

double | object handle

Handle of a block, annotation, or Stateflow object, returned as a double or a Stateflow object handle.

See Also

[getSimulinkBlockHandle](#) | [hilite_system](#) | [Simulink.ID.getSID](#) | [Simulink.ID.hilite](#)

Topics

“Simulink Identifiers”

Introduced in R2009b

Simulink.ID.getSID

Get Simulink Identifier of block, annotation, or Stateflow object

Note Simulink.ID.getSID is not recommended. Use `find_system` instead.

Syntax

```
simulinkID = Simulink.ID.getSID(obj)
```

Description

`simulinkID = Simulink.ID.getSID(obj)` returns the Simulink Identifier (SID) of the block, annotation, or Stateflow object `obj`.

A Simulink Identifier (SID) is a unique and unmodifiable identifier. Use the SID to identify an object throughout its lifetime, even if the name of the object changes.

Examples

Get SID of Model Block

Open the model `vdp`.

```
vdp
```

Get the SID of the Mu block.

```
simulinkID = Simulink.ID.getSID('vdp/Mu')
```

Get SID of Annotation

Open the model `vdp`.

```
vdp
```

Select the annotation at the top of the diagram. To get the annotation object, use the function `getCurrentAnnotation`.

```
ann = getCurrentAnnotation
```

Get the SID of the annotation.

```
simulinkID = Simulink.ID.getSID(ann)
```

Get SID of Model Block Using Handle

Open the model vdp.

```
vdp
```

Get the handle of the Product block.

```
hdl = getSimulinkBlockHandle('vdp/Product')
```

Get the SID of the Product block using the handle as the input argument.

```
simulinkID = Simulink.ID.getSID(hdl)
```

Input Arguments

obj — Name or handle of block, annotation, or Stateflow object

character vector | string scalar | handle

Name or handle of a block, annotation, or Stateflow object, specified as a handle, character vector, or string scalar.

Example: 'vdp/Mu'

Output Arguments

simulinkID — Simulink Identifier

string scalar

Simulink Identifier (SID), returned as a string scalar.

Topics

“Simulink Identifiers”

Introduced in R2009b

Simulink.ID.hilite

Highlight block, annotation, or Stateflow object

Note Simulink.ID.hilite is not recommended. Use `hilite_system` instead.

Syntax

```
Simulink.ID.hilite(simulinkID)
Simulink.ID.hilite(simulinkID,style)
```

Description

`Simulink.ID.hilite(simulinkID)` highlights the block, annotation, or Stateflow object that has the Simulink Identifier `simulinkID`.

`Simulink.ID.hilite(simulinkID,style)` uses the specified highlighting style.

Examples

Highlight Block

Open the model `vdp`.

```
vdp
```

Get the Simulink Identifier of the Mu block.

```
muSID = Simulink.ID.getSID('vdp/Mu')
```

Highlight the Mu block.

```
Simulink.ID.hilite(muSID)
```

Highlight Block Using a Highlight Style

Open the model `vdp`.

```
vdp
```

Get the Simulink Identifier of the Mu block.

```
muSID = Simulink.ID.getSID('vdp/Mu')
```

Highlight the Mu block using the style `'fade'`.

```
Simulink.ID.hilite(muSID, 'fade')
```

Input Arguments

simulinkID — Simulink Identifier

character vector | string scalar

Simulink Identifier of a block, annotation, or Stateflow object, specified as a character vector or string scalar.

Example: 'vdp:4'

style — Highlighting style

'find' (default) | character vector | string scalar

Highlighting style, specified as one of these values. You can customize the appearance of any of the styles. See “Customize a Highlighting Style” on page 2-300.

- 'default' — Default color scheme: red outline, yellow fill.
- 'none' — Clears the highlight.

To clear all highlighting, on the **Debug** tab, in the **Trace Signal** button group, click the **Remove trace** button.

- 'debug' — Uses default color scheme.
- 'different' — Applies red outline, white fill.
- 'error' — Uses default color scheme.
- 'fade' — Applies gray outline, white fill.
- 'find' — Applies dark blue outline, blue fill.
- 'lineTrace' — Applies red outline, blue fill.
- 'unique' — Dark blue outline, white fill.
- 'user1', 'user2', 'user3', 'user4', 'user5' — Applies custom highlight: black outline, white fill by default (that is, no highlight).

In addition, you can use these color schemes. The first word is the outline and the second is the fill color.

- 'orangeWhite'
- 'blackWhite'
- 'redWhite'
- 'blueWhite'
- 'greenWhite'

“Simulink Identifiers”

Introduced in R2009b

Simulink.importExternalCTypes

Generate Simulink representations of custom data types defined by C or C++ code

Syntax

```
importInfo = Simulink.importExternalCTypes(headerFiles)
importInfo = Simulink.importExternalCTypes(modelName)
importInfo = Simulink.importExternalCTypes( ___,Name,Value)
```

Description

`importInfo = Simulink.importExternalCTypes(headerFiles)` parses the C or C++ header files (.h or .hpp) identified by `headerFiles` for `typedef`, `struct`, and `enum` type definitions, and generates Simulink representations of the types. The output, `importInfo`, identifies the successfully and unsuccessfully imported types.

You can use the Simulink representations to:

- Reuse your existing algorithmic C code and, through simulation, test its interaction with your Simulink control algorithm. For an example that shows how to use the Legacy Code Tool, see “Integrate C Function Whose Arguments Are Pointers to Structures”.
- Generate code (Simulink Coder) that reuses the types and data that your existing code defines. You can then integrate and compile the generated and existing code into a single application. For an example, see “Exchange Structured and Enumerated Data Between Generated and External Code” (Embedded Coder).
- Create and organize data (signals, parameters, and states) in a model by using standard data types that your organization defines in C code.
 - To create structures of signals in Simulink, use nonvirtual buses. See “Group Signal Lines into Virtual Buses”.
 - To create structures of parameters, use MATLAB structures and `Simulink.Parameter` objects. See “Organize Related Block Parameter Definitions in Structures”.
 - To create enumerated data, see “Use Enumerated Data in Simulink Models”.
 - To match a primitive `typedef` statement, use a `Simulink.AliasType` object to set parameter and signal data types in a model.

By default, the function:

- Imports an enumerated type by generating a script file that derives an enumeration class from `Simulink.IntEnumType`, as described in “Define Simulink Enumerations”. If necessary, you can then edit the class definition to customize it (for example, by implementing the `addClassNameToEnumNames` method).
- Imports a structure type by generating a `Simulink.Bus` object in the base workspace.
- Imports a primitive `typedef` statement by generating a `Simulink.AliasType` object in the base workspace.

- Interprets generic C data types, such as `int` or `short`, according to the word lengths of your host computer. For example, for most modern machines, `int` has a 32-bit word length, so the function represents an `int` structure field as a bus element that uses the Simulink data type `int32`.

To override this default behavior, identify your target hardware board by using the `HardwareImplementation` pair argument.

For additional information about default behavior, see “Tips” on page 2-616.

`importInfo = Simulink.importExternalTypes(modelName)` generates Simulink representations of custom C data types by analyzing a model that you identify with `modelName`. When you use the **Simulation Target** configuration parameters in a model to identify header files for inclusion during simulation, use this syntax to import types for the purpose of simulating the model on your host computer. The function interprets generic C data types according to the word lengths of your host computer.

When you use this syntax, do not use pair arguments, such as `HardwareImplementation`, that can conflict with the configuration parameters of the target model. When you use such pair arguments with this syntax, the function generates a warning.

`importInfo = Simulink.importExternalTypes(____, Name, Value)` specifies additional options using one or more name-value pair arguments. You can use this syntax to:

- Specify the names of types to import by using the `Names` pair argument.
- Control the way that Simulink stores the imported types, for example, by generating the types in a Simulink data dictionary. Use the `MATFile` and `DataDictionary` pair arguments.
- Control the way that the function interprets generic C data types. Use the `HardwareImplementation` pair argument.
- Maintain synchrony between the C-code definitions and the Simulink representations by attempting to import the updated C-code definitions again. You can choose whether to overwrite the existing Simulink representations. Use the `Overwrite` and `Verbose` pair arguments.

Examples

Import Simple Structure and Enumerated Types

This example shows how to generate Simulink representations of a C structure type (`struct`) and an enumerated (`enum`) data type from a header file.

- 1 In your current folder, create the file `ex_cc_simpleTypes.h`.

```
typedef enum {
    PWR_LOSS = 0,           /* Default value */
    OVERSPD,
    PRESS_LOW,
} fault_T;

typedef struct {
    double coeff;
    double init;
} params_T;
```

- 2 Generate Simulink representations of the types by calling `Simulink.importExternalTypes`.

```
Simulink.importExternalCTypes('ex_cc_simpleTypes.h');
```

The function creates a `Simulink.Bus` object, `params_T`, in the base workspace.

- 3 To inspect the properties of the object, open the Bus Editor.

```
buseditor
```

Each bus element uses a name and a data type (`double`) that match the corresponding structure field in `ex_cc_simpleTypes.h`.

- 4 In your current folder, inspect the generated file, `fault_T.m`, which defines the enumerated type `fault_T` as an enumeration class.

You can use the bus object and the enumeration class to set signal and parameter data types in Simulink models.

Import Structure Type Whose Fields Use Custom Data Types

This example shows how to generate a Simulink representation of a structure type whose fields use custom data types (`typedef`).

Create the file `ex_integer_aliases.h` in your current folder.

```
typedef int sint_32;
typedef unsigned short uint_16;
```

Create the file `ex_cc_struct_alias.h` in your current folder.

```
#include "ex_integer_aliases.h"
typedef struct {
    sint_32 accum;
    uint_16 index;
} my_ints_T;
```

Import the structure type into Simulink as a `Simulink.Bus` object in the base workspace. Import the `typedef` statements as `Simulink.AliasType` objects.

```
Simulink.importExternalCTypes('ex_cc_struct_alias.h');
```

Inspect the data types of the bus elements in the bus object. For example, inspect the `DataType` property of the first bus element, which corresponds to the structure field `accum`.

```
my_ints_T.Elements(1)
```

```
ans =
```

```
BusElement with properties:
```

```
    Name: 'accum'
Complexity: 'real'
Dimensions: 1
  DataType: 'sint_32'
```

```

        Min: []
        Max: []
DimensionsMode: 'Fixed'
    SampleTime: -1
        Unit: ''
Description: ''

```

The `Simulink.importExternalCTypes` function uses the generated `Simulink.AliasType` objects to set the data types of the bus elements.

Inspect the `Simulink.AliasType` objects in the base workspace. For example, the object named `sint_32` corresponds to one of the `typedef` statements in `ex_integer_aliases.h`.

```
sint_32
```

```
sint_32 =
```

```
AliasType with properties:
```

```

Description: ''
DataScope: 'Imported'
HeaderFile: 'ex_integer_aliases.h'
BaseType: 'int32'

```

For most host computers (which the function targets by default), the word length of `int` is 32 bits and the word length of `unsigned short` is 16 bits. The function maps `int` and `unsigned short` to the Simulink types `int32` and `uint16`.

If you have Embedded Coder, the code that you generate from the model can use `sint_32` and `uint_16` instead of the standard data type names, `int32_T` and `uint16_T`.

Store Imported Types in Data Dictionary

This example shows how to store the imported data types in a Simulink data dictionary. A data dictionary stores data specifications (such as for signals and block parameter values), data types, and other design data for one or more Simulink models.

In your current folder, create the file `ex_cc_simpleTypes.h`.

```

typedef enum {
    PWR_LOSS = 0,          /* Default value */
    OVERSPD,
    PRESS_LOW,
} fault_T;

typedef struct {
    double coeff;
    double init;
} params_T;

```

Create a subfolder called `myDictionaries`.

```
mkdir('myDictionaries')
```

Generate Simulink representations of the types by calling `Simulink.importExternalCTypes`. Permanently store the type definitions by creating a new data dictionary, `ex_cc_myTypes.sldd`, in the new subfolder.

```
Simulink.importExternalCTypes('ex_cc_simpleTypes.h',...
    'DataDictionary','ex_cc_myTypes.sldd',...
    'OutputDir','myDictionaries');
```

To inspect the contents of the dictionary, set your current folder to `myDictionaries` and double-click the dictionary file.

To use the Simulink representations in the dictionary, you must link a model or models to the dictionary. See “Migrate Models to Use Simulink Data Dictionary”.

Import Only Specified Types

This example shows how to generate Simulink representations only for enumerated and structure data types that you identify by name.

In your current folder, create the file `ex_cc_manySimpleTypes.h`. The file defines three structure types: `params_T`, `signals_T`, and `states_T`.

```
typedef struct {
    double coeff;
    double init;
} params_T;

typedef struct {
    double flow_rate;
    double steam_press;
} signals_T;

typedef struct {
    double accum;
    double error;
} states_T;
```

Generate Simulink representations only for `params_T` and `signals_T`.

```
Simulink.importExternalCTypes('ex_cc_manySimpleTypes.h',...
    'Names',{'params_T','signals_T'});
```

The `Simulink.Bus` objects, `params_T` and `signals_T`, appear in the base workspace.

Import Types for 16-Bit Hardware

By default, `Simulink.importExternalCTypes` represents an enumerated data type by creating an enumeration class that derives from the built-in class `Simulink.IntEnumType`. When you simulate or generate code from a model that uses the generated class, configuration parameters that you select for the model (for example, on the **Hardware Implementation** pane) determine the specific integer length that `Simulink.IntEnumType` and the enumeration class employ.

By default, the function interprets generic, primitive C data types, such as `short` and `int`, according to the word lengths of your host computer. For example, to represent an `int` structure field, the function typically applies the 32-bit data type `int32` to the corresponding bus element. When you want to simulate and generate code for hardware other than your host computer, use the `HardwareImplementation` pair argument to identify the target hardware and, by extension, the word lengths of the hardware.

This example shows how to import data types from code that you intend to use on 16-bit hardware. For this board, `int` has a 16-bit length, and each item of enumerated data (`enum`) consumes 16 bits.

In your current folder, create the file `ex_cc_intTypes.h`.

```
typedef enum {
    PWR_LOSS = 0,          /* Default value */
    OVERSPD,
    PRESS_LOW,
} fault_T;

typedef struct {
    int coeff;
    int init;
} params_T;
```

The code defines an enumerated data type and a structure type whose fields use the generic C data type `int`.

To generate an accurate Simulink representation of the structure type, first open an existing model or create a new model. For this example, create a new model named `ex_hdwImpl_16bit`.

In the new model, set **Configuration Parameters > Hardware Implementation > Device vendor** to `Atmel`. Set **Device type** to `AVR`.

Alternatively, at the command prompt, use these commands to create and configure the model:

```
new_system('ex_hdwImpl_16bit','Model');
set_param('ex_hdwImpl_16bit','ProdHWDeviceType','Atmel->AVR')
```

Generate Simulink representations of the types. To specify the word lengths of the target 16-bit hardware, extract the model configuration parameters (which include the **Hardware Implementation** settings) as a `Simulink.ConfigSet` object.

```
configSet = getActiveConfigSet('ex_hdwImpl_16bit');
Simulink.importExternalCTypes('ex_cc_intTypes.h','HardwareImplementation',configSet);
```

The `Simulink.Bus` object `params_T` appears in the base workspace. The bus elements, such as `coeff`, use the Simulink data type `int16`.

```
params_T.Elements(1)
```

```
ans =
```

```
    BusElement with properties:
```

```
        Name: 'coeff'
    Complexity: 'real'
```

```

Dimensions: 1
  DataType: 'int16'
    Min: []
    Max: []
DimensionsMode: 'Fixed'
  Unit: ''
Description: ''

```

In your current folder, the file `fault_T.m` defines the enumeration class `fault_T`. The class derives from `Simulink.IntEnumType`, so you must use model configuration parameters to identify the target hardware and, by extension, the correct native integer length.

Import Structure Type Whose Fields Use 16-Bit Fixed-Point Data Types

Create the file `ex_cc_fixpt_struct.h` in your current folder.

```

typedef struct {
    int coeff; /* Word length 16,
               binary fraction length 7 */

    int init; /* Word length 16,
               binary fraction length 3 */
} params_T;

```

The file defines a structure type whose fields use fixed-point data types. For example, the structure stores the field `coeff` in a signed, 16-bit integer data type. A binary fraction length of 7 relates the stored integer value to the real-world value.

Suppose that this code operates on 16-bit hardware (such that the generic C data type `int` has a 16-bit word length). To generate a Simulink representation of the type, first create a `coder.HardwareImplementation` object that identifies the hardware.

```

hdw = coder.HardwareImplementation;
hdw.ProdHWDeviceType = 'Atmel->AVR';

```

Generate a Simulink representation of the structure type.

```

Simulink.importExternalCTypes('ex_cc_fixpt_struct.h',...
    'HardwareImplementation',hdw);

```

The `Simulink.Bus` object, `params_T`, appears in the base workspace. Each bus element, such as `coeff`, uses the data type `int16`.

```

params_T.Elements(1)

ans =

  BusElement with properties:

    Name: 'coeff'
  Complexity: 'real'

```

```

Dimensions: 1
  DataType: 'int16'
    Min: []
    Max: []
DimensionsMode: 'Fixed'
  Unit: ''
Description: ''

```

`Simulink.importExternalCTypes` cannot infer the fixed-point scaling (binary fraction length) from the C code. You must manually specify the data types of the bus elements. To specify the data types at the command prompt, use the `fixdt` function.

```

params_T.Elements(1).DataType = 'fixdt(1,16,7)';
params_T.Elements(2).DataType = 'fixdt(1,16,3)';

```

To specify the data types interactively (by using the Data Type Assistant), use the Bus Editor.

```
buseditor
```

Manually Synchronize Simulink Representations with C-Code Definitions

This example shows how to maintain the Simulink representations of C data types whose definitions you modify during the life of a modeling project.

Import Custom C Types

Create the file `ex_cc_myTypes_rec.h` in your current folder. The file defines a custom structure type.

```

typedef struct {
    double flow;
    double pres;
    double tqe;
} sigStructType;

```

Generate a `Simulink.Bus` object that represents the type.

```
Simulink.importExternalCTypes('ex_cc_myTypes_rec.h');
```

Modify Type Definition in C Code

In `ex_cc_myTypes_rec.h`, add a field named `spd` to `sigStructType`.

In the same file, create a new structure type, `stateStructType`.

```

typedef struct {
    double flow;
    double pres;
    double tqe;
    double spd;
} sigStructType;

typedef struct {

```

```

    double err;
    double read;
    double write;
} sigStructType;

```

Attempt to Import Types Again

Attempt to generate bus objects that represent the types.

```
importInfo = Simulink.importExternalCTypes('ex_cc_myTypes_rec.h');
```

The function generates warnings at the command prompt. Instead of relying on the warnings, you can inspect the output, `importInfo`, to determine whether the function failed to import any types.

```
importInfo.failedToImport.Bus
```

```
ans =
```

```

1x1 cell array

{'sigStructType'}

```

The function did not import `sigStructType`. The corresponding bus object in the base workspace still has only three bus elements. To determine the reason that the function did not import `sigStructType`, inspect the report field of `importInfo`.

Import `sigStructType` again. This time, overwrite the existing bus object.

```
importInfo = Simulink.importExternalCTypes('ex_cc_myTypes_rec.h', ...
    'Names', importInfo.failedToImport.Bus, 'Overwrite', 'on');
```

When you overwrite existing Simulink representations, any customizations that you made to the Simulink representations (such as the application of fixed-point data types to bus elements) are overwritten.

Input Arguments

headerFiles — Names and paths of header files to parse

character vector | cell array of character vectors | string scalar | string array

Names and paths of header files to parse, specified as a character vector, cell array of character vectors, string, or string array. Include the `.h` or `.hpp` file extension.

If you use a hierarchy of included (`#include`) header files to define your types, when you specify `HeaderFiles`, you need to identify only the entry-point files. The function parses the included files as well as the identified entry-point files. If the included files are not in the same folder as the corresponding entry-point file, use the `IncludeDirs` pair argument to identify the additional folders.

Example: `'myHeader.h'`

Example: `{'thisHeader.hpp', 'thatHeader.hpp'}`

Data Types: `char` | `cell` | `string`

modelName — Name of loaded Simulink model for which to import types

character vector | string scalar

Name of a loaded Simulink model for which to import types, specified as a character vector or string scalar. A model is loaded if, for example, you open the model or use the `load_system` function. When you use this argument, the function:

- Searches the model configuration parameters for custom header files and parses those header files for data types to import. Only the configuration parameters on the **Simulation Target** pane affect this search.

For example, if in the model you set **Configuration Parameters > Simulation Target > Include headers** to `#include "myTypes.h"`, the function parses `myTypes.h` for types to import.

- Interprets generic C data types such as `int` or `short` according to the word lengths of your host computer. Do not use the `HardwareImplementation` pair argument to override this interpretation.

Example: `'myModel'`

Data Types: `char` | `string`

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example:

```
Simulink.importExternalCTypes('myHdr.h','DataDictionary','myDictionary.sldd')
```

MATFile — Name and path of MAT-file to create for storing generated objects

'' (empty) (default) | character vector | string scalar

Name and, optionally, path of the MAT-file to create for storing generated `Simulink.Bus` and `Simulink.AliasType` objects, specified as a character vector or string. If you do not use `MATFile`, by default, the function generates the objects in the base workspace.

The function does not generate enumeration definitions in MAT-files.

If you import some `struct` types and primitive `typedef` statements by using `MATFile` and later import some of the same types again by using `MATFile`, the function entirely replaces the old MAT-file with a new one. The function discards any changes that you made to the contents of the old MAT-file.

You cannot use the `MATFile` and `DataDictionary` pair arguments simultaneously.

Example: `'myMat.mat'`

Example: `'myMat'`

Example: `fullfile('subfolder','myMat')`

Data Types: `char` | `string`

DataDictionary — Name and path of Simulink data dictionary to use or create for storing types

'' (default) | character vector | string scalar

Name and, optionally, path of the Simulink data dictionary to use or create for storing generated enumerations and objects, specified as a character vector or string. When you use this pair argument, the function imports enumerated types as `Simulink.data.dictionary.EnumTypeDefinition` objects, and stores those objects (as well as `Simulink.Bus` objects and `Simulink.AliasType` objects) in the target dictionary.

For information about data dictionaries, see “What Is a Data Dictionary?”.

You can optionally specify a `.sldd` extension.

You cannot use the `DataDictionary` and `MATFile` pair arguments simultaneously.

Example: `'myDict.slidd'`

Example: `'myDict'`

Example: `fullfile('subfolder','myDict.slidd')`

Data Types: `char` | `string`

Names — Names of types to import

`''` (default) | character vector | cell array of character vectors | string scalar | string array

Names of types to import, specified as a character vector, cell array of character vectors, string, or string array. By default, if you do not use `Names`, the function attempts to import all of the custom types that the identified header files define.

To match multiple type names with a single character vector, use an asterisk (*).

Example: `'myEnumType'`

Example: `{'myEnumType','myStructType'}`

Example: `'my*Type'`

Data Types: `char` | `cell` | `string`

Defines — Compiler options to define macros that influence type definitions

`''` (default) | character vector | string scalar

Compiler options to define macros that influence C type definitions, specified as a character vector, or string scalar. For example, a macro influences a type definition if you enclose the definition in an `#ifdef` block that checks whether the macro is defined.

Use `Defines` to specify macro definitions that you otherwise define through compiler options such as `-D`.

Example: `'SIGSTRUCT=1'`

Example: `'SIGSTRUCT=1 ENUM=1'`

Data Types: `char` | `string`

UnDefines — Compiler options to delete macros that influence type definitions

`''` (default) | character vector | string scalar

Compiler options to delete macros that influence C type definitions, specified as a character vector or string scalar. For example, a macro influences a type definition if you enclose the definition in an `#ifdef` block that checks whether the macro is defined.

Use `UnDefines` to specify macro deletions that you otherwise define through compiler options such as `-U`.

Example: `'SIGSTRUCT'`

Example: `'SIGSTRUCT ENUM'`

Data Types: `char` | `string`

IncludeDirs — Folders that contain subordinate, included header files

`''` (default) | character vector | cell array of character vectors | string scalar | string array

Folders that contain subordinate, included (`#include`) header files, specified as a character vector, cell array of character vectors, string, or string array. Use this pair argument to enable the function to locate and parse additional header files on which the primary header files (which you specify with the `headerFiles` argument) depend.

If you use the `modelName` syntax instead of the `headerFiles` syntax, in the target model, you can use the **Simulation Target** configuration parameters to specify include paths. In that case, you do not need to use the `IncludeDirs` pair argument.

Example: `'myHeaders'`

Example: `fullfile('myProject','myHeaders')`

Example:

```
{fullfile('myProject','myHeaders'),fullfile('myProject','myOtherHeaders')}
```

Data Types: `char` | `cell` | `string`

OutputDir — Folder for storing generated files

`''` (default) | character vector | string scalar

Folder for storing generated files, specified as a character vector or string. The function places generated files, such as `classdef` script files and data dictionary files, in this folder.

The folder that you specify must exist before you use the function.

Example: `'myDictionaries'`

Example: `fullfile('myProject','myDictionaries')`

Data Types: `char` | `string`

Language — Language to parse header files

`'Auto'` (default) | `'C'` | `'C++'`

Parse and import compatible data types from C and C++ header files. If specify header files that contain C++ features, specify the `Language` to `'C++'` to import compatible C data types.

When data types are imported from a header file with `hpp` extension, if the `Language` setting is not specified or set to `'Auto'`, `'C++'` is selected to parse your header files. C++ classes and C++ struct types are ignored. Empty structs are not imported.

If you import header files from a loaded model and the `Language` is not specified or set to `'Auto'`, the `Language` setting is inherited from the model's custom settings. If the imported model already has a `Language` setting in **Configuration Parameters > Simulation Target**, this setting is overshadowed by imported model's setting.

HardwareImplementation — Word lengths for interpreting generic, primitive C data types

'' (default) | Simulink.ConfigSet object | coder.HardwareImplementation object

Word lengths for interpreting generic, primitive C data types, specified as a Simulink.ConfigSet or coder.HardwareImplementation object.

- To use a Simulink.ConfigSet object, you can extract a configuration set from a model by using functions such as getConfigSet and getActiveConfigSet. This technique enables you to use the Configuration Parameters dialog box to identify your target hardware (through the **Hardware Implementation** configuration parameters).
- To use a coder.HardwareImplementation object (which you create and configure programmatically), specify properties of the object, such as ProdHWDeviceType, to identify your target hardware. The object then sets other properties, such as ProdBitPerInt, that reflect the native integer size of the hardware.

The function inspects the object to determine which Simulink integer data types to employ when interpreting generic C data types such as int. For example, if you create a coder.HardwareImplementation object to identify 16-bit hardware and then use the function to import a structure type whose fields use the C data type int, the function generates a bus object whose bus elements use the Simulink data type int16. The function uses the production hardware settings, not the test hardware settings.

For more information about hardware implementation settings for Simulink models, see “Configure Run-Time Environment Options” (Simulink Coder).

Overwrite — Specification to overwrite existing Simulink representations

'off' (default) | 'on'

Specification to overwrite existing Simulink representations, specified as 'on' or 'off'. If an imported type already has a representation in Simulink:

- If you specify 'off' or if you do not specify Overwrite, the function does not import the type. In the output argument, importInfo, the failedToImport field identifies the type.
- If you specify 'on', the function overwrites the existing Simulink representation.

If you use the function to import some types into the base workspace or a data dictionary and later customize the generated Simulink representations, when you use the function again and set Overwrite to 'on', the function does not preserve your customizations. These customizations can include:

- In an enumeration class definition, implementing extra methods or modifying the generated methods such as getDataScope (see “Customize Simulink Enumeration”).
- Modifying the properties of a generated Simulink.Bus or Simulink.AliasType object (for example, manually setting the data types of bus elements to a fixed-point data type).

Verbose — Specification to generate messages for successful import operations

'off' (default) | 'on'

Specification to generate messages for successful import operations, specified as 'on' or 'off'.

- If you specify 'off' or if you do not specify Verbose, the function imports types silently. Messages do not appear in the Command Window unless the function cannot import a type.

- If you specify 'on', the function generates a message in the Command Window for each operation during the import process.

Output Arguments

importInfo – Information about types that were imported and not imported

structure

Information about types that were imported and not imported, returned as a structure with these fields.

report – Descriptions of types that were imported and not imported

character vector

Descriptions of types that were imported and not imported, returned as a character vector. Inspect the value of this field to determine the reason that the function could not import a type.

failedToImport – Types that were not imported

structure

Types that were not imported, returned as a structure with these fields.

Field Name	Field Value	Purpose
Bus	Cell array of character vectors	Names of structure (<code>struct</code>) types that were not imported.
Enum	Cell array of character vectors	Names of enumerated types (<code>enum</code>) that were not imported.
AliasType	Cell array of character vectors	Names of primitive <code>typedef</code> statements that were not imported.

importedTypes – Types that were successfully imported

structure

Types that were successfully imported, returned as a structure with these fields.

Field Name	Field Value	Purpose
Bus	Cell array of character vectors	Names of structure (<code>struct</code>) types that were imported. The generated <code>Simulink.Bus</code> objects use these names.
Enum	Cell array of character vectors	Names of enumerated types (<code>enum</code>) that were imported. The generated enumeration classes or <code>Simulink.data.dictionary.EnumTypeDefinition</code> objects use these names.

Field Name	Field Value	Purpose
AliasType	Cell array of character vectors	Names of primitive typedef statements that were imported. The generated Simulink.AliasType objects use these names.

Limitations

- The function does not support:
 - C data types that do not correspond to a type that Simulink supports. For example, Simulink does not recognize an equivalent for `long double`. For information about data types that Simulink supports, see “Data Types Supported by Simulink”.
 - Pointer types, such as a structure that defines a field whose value is a pointer or a typedef statement whose base type is a pointer type.
 - Structures that define a field whose value has more than one dimension.

If a field value is a 1-D array, the function creates a bus element that represents a vector, not a matrix.
 - Unions.
- If a structure field represents fixed-point data, or if a typedef statement maps to a fixed-point base type, the function sets the data type of the corresponding bus element or Simulink.AliasType object to the relevant Simulink integer type (such as `int16`). The importer cannot determine the fixed-point scaling by parsing the C code. After using the function, you must manually specify the data type of the bus element or the base type of the Simulink.AliasType object by using the `fixdt` function.

Tips

- If a MATLAB Function block or Stateflow chart in your model uses an imported enumeration or structure type, configure the model configuration parameters to include (`#include`) the type definition from your external header file. See “Control Imported Bus and Enumeration Type Definitions” (for a MATLAB Function block) and “Access Custom Code Variables and Functions in Stateflow Charts” (Stateflow) and “Integrate Custom Structures in Stateflow Charts” (Stateflow) (for a chart).
- By default:
 - For an imported enumeration, because the Simulink enumeration class derives from `Simulink.IntEnumType`, when you simulate or generate code from a model, the enumeration uses the integer size that is native to your target hardware. You specify the characteristics of your target hardware by using model configuration parameters such as **Production device vendor and type** and **Native word size in production hardware**.
 - For an imported structure type:
 - The function imports a structure field as numerically complex only if the field uses one of the corresponding Simulink Coder structure types as the data type. For example, if a structure field in your external code uses the data type `cint8_T`, the function imports the field as a bus element (`Simulink.BusElement` object) whose data type is `int8` and whose `Complexity` property is set to `'complex'`.

- For nested structures, the function generates a bus object for each unique structure type.
- For an imported structure or enumeration type, if your external code uses a `typedef` statement to name the type, the name of the generated bus object or Simulink enumeration class matches the `typedef` name. If your code does not use a `typedef` statement to name the type, the name of the object or class is the tag name of the type, unless that name conflicts with a type name that is defined in a `typedef` statement elsewhere in your header files, in which case the type is not imported into Simulink. If you do not specify a tag name or apply a `typedef` name, Simulink generates an arbitrary name for the object or class.

Note To import types that are not named in a `typedef` statement, the model configuration parameter **Import custom code** must be selected.

- The function configures the generated Simulink representations as imported for the purposes of simulation and code generation. For example, for bus objects, the function sets the `DataScope` property to 'Imported' and the `HeaderFile` property to the name of your external header file. To simulate or generate code from a model that uses one of these Simulink representations, you must make your header file available to the model.
- When you specify files for `Simulink.importExternalCTypes` to use or generate, for example, by using the `DataDictionary` pair argument:
 - If the existing files to use are in your current folder or on the MATLAB path, you do not need to specify a file path. You can specify the file name by itself.
 - To control the folder location of generated files, you can specify paths as well as file names. You can also use the `OutputDir` pair argument.

Introduced in R2017a

Simulink.ModelDataLogs.convertToDataset

Convert logging data from Simulink.ModelDataLogs format to Simulink.SimulationData.Dataset format

Syntax

```
convertedDataset =  
sourceModelDataLogsObject.convertToDataset(convertedDatasetName)
```

Description

Note The ModelDataLogs class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the ModelDataLogs format. Signal logging uses the Dataset format. In R2016a or later, when you open a model from an earlier release that had used ModelDataLogs format, the model simulated in use Dataset format.

You can convert signal logging data from ModelDataLogs to Dataset format. Converting to Dataset format makes it easier to post-process with other logged data (for example, logged states), which can also use Dataset format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the ModelDataLogs API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy ModelDataLogs API”.

```
convertedDataset =  
sourceModelDataLogsObject.convertToDataset(convertedDatasetName)
```

converts the *sourceModelDataLogsObject* to a Simulink.SimulationData.Dataset object. The name of the converted object is based on *convertedDatasetName*.

The resulting Simulink.SimulationData.Dataset object is a flat list. This list has one element for each Simulink.Timeseries or Simulink.TsArray object in the Simulink.ModelDataLogs object.

Limitations

Source of Simulink.ModelDataLogs Logged Data	Conversion Limitation
Referenced model	<p>Loads all ancestors of the referenced model not previously loaded. If any ancestor model does not appear on the MATLAB path, the conversion fails.</p> <p>If the model has changed, or the model ancestors have changed, after Simulink logged the data, the conversion can fail. For example, adding, deleting, or renaming a block after logging can cause conversion failure.</p>

Source of Simulink.ModelDataLogs Logged Data	Conversion Limitation
Variant model or subsystem	The current active variant must be the same one that was active when Simulink logged the data. Otherwise, the conversion fails.
Frame signal	The conversion fails.
Mux block	The conversion produces a different Simulink.SimulationData.Dataset object as the dataset than Simulink creates when you simulate the model using the Dataset format for the logged data.
Stateflow chart	Not supported.

Input Arguments

sourceModelDataLogsObject

A Simulink.ModelDataLogs object that you want to convert to a Simulink.SimulationData.Dataset object.

convertedDatasetName

Name of the dataset that the conversion process creates.

Output Arguments

convertedDataset

The Simulink.SimulationDataset object that the Simulink.ModelDataLogs.convertToDataset function creates.

For details about the converted dataset, see Simulink.SimulationData.Dataset.

Example

In releases before R2016a, you could log signals using ModelDataLogs format. If you have a MAT-file with signal logging data that uses the ModelDataLogs format, here is how you can convert that data to Dataset format. This example assumes that the model that generated the logging data had the **Configuration Parameters > Data Import/Export > Signal logging** name set to logout.

- 1 Load the MAT-file.
- 2 Convert logout to a dataset called myModel_dataset. (The elements information will be different for your data.)

```
dataset = logout.convertToDataset('myModel_Dataset')
```

```
dataset =  
    Simulink.SimulationData.Dataset  
    Package: Simulink.SimulationData
```

```
Characteristics:
```

```
Name: 'myModel_Dataset'  
Total Elements: 2
```

```
Elements:
```

```
1: 'x1'
```

```
2: 'x2'
```

```
-Use get or getElement to access elements by index or name.  
-Use addElement or setElement to add or modify elements.
```

```
Methods, Superclasses

Simulink.io.getFileTypeDiagnostics

Return structure with NamespaceErrors field for Simulink.io.FileType objects

Syntax

```
diagnosticStruct = Simulink.io.getFileTypeDiagnostics()
```

Description

`diagnosticStruct = Simulink.io.getFileTypeDiagnostics()` returns a structure with field `NamespaceErrors` `diagnosticStruct` for `Simulink.io.FileType` objects.

Examples

Get Diagnostics for Simulink.io.FileType Objects

Get diagnostics for `Simulink.io.FileType` objects and return in `diagnosticStruct`.

```
diagnosticStruct = Simulink.io.getFileTypeDiagnostics()
```

```
diagnosticStruct =
    struct with fields:
        NamespaceErrors: {}
```

In this example, there are no diagnostics.

Output Arguments

diagnosticStruct — Structure of NamespaceErrors field for Simulink.io.FileType objects

structure with cell array

Structure of diagnostics for `Simulink.io.FileType` objects, returned as a structure with a cell array of `NamespaceErrors` fields. The first column in the cell array is the name of the name space plugin. In this example output, the name of the name space plugin is `not.here`.

```
diagnosticStruct =
    struct with fields:
        NamespaceErrors: { 'not.here' 'Unknown package name ' ' '.' }
```

[Simulink.io.FileType](#) | [Simulink.io.PluggableNamespace](#)

Introduced in R2021a

Simulink.MDLInfo.getDescription

Extract SLX, SLXP, or MDL file description without loading file

Syntax

```
d = Simulink.MDLInfo.getDescription(file)
```

Description

`d = Simulink.MDLInfo.getDescription(file)` returns the description of the specified SLX, SLXP, or MDL file without loading the file.

Examples

Get Model Description

Get the description of the vdp model without loading it or creating a `Simulink.MDLInfo` object for it.

```
d = Simulink.MDLInfo.getDescription('vdp')  
  
d =  
  
    'The van der Pol Equation  
  
    This is a simulation of a nonlinear second order system.'
```

Input Arguments

file — Name of SLX, SLXP, or MDL file

character vector | string scalar

Name of the SLX, SLXP, or MDL file, specified as a character vector or string scalar.

The file name can include a partial path, complete path, relative path, or no path. When you do not provide a path, the file extension is optional.

To avoid unexpected results caused by shadowed files that share a name, specify a fully qualified file name.

```
Example: Simulink.MDLInfo('vdp')
```

```
Example: Simulink.MDLInfo('mymodel.slx')
```

```
Example: Simulink.MDLInfo('mydir/mymodel.slx')
```

```
Example: Simulink.MDLInfo('C:/mydir/mymodel.slx')
```

Data Types: char | string

See Also

`Simulink.MDLInfo` | `Simulink.MDLInfo.getMetadata`

Introduced in R2009b

Simulink.MDLInfo.getMetadata

Extract SLX, SLXP, or MDL file metadata without loading file

Syntax

```
m = Simulink.MDLInfo.getMetadata(file)
```

Description

`m = Simulink.MDLInfo.getMetadata(file)` returns the metadata structure associated with the specified SLX, SLXP, or MDL file without loading the file.

The metadata structure contains the names and attributes of arbitrary data associated with the file. The structure fields can be character vectors, numeric matrices of type `double`, or more structures.

Examples

Add and Check File Metadata

Create a structure that contains metadata information.

```
m.TestStatus = 'untested';
m.ExpectedCompletionDate = '01/01/2011';
```

Create a model, update the 'Metadata' parameter, and save the metadata in the model.

```
new_system('MDLInfoMetadataModel')
set_param('MDLInfoMetadataModel','Metadata',m)
save_system('MDLInfoMetadataModel')
```

Check the model for metadata without loading the model or creating a `Simulink.MDLInfo` object.

```
Simulink.MDLInfo.getMetadata('MDLInfoMetadataModel')
```

```
ans =
```

```
struct with fields:
```

```
    TestStatus: 'untested'
ExpectedCompletionDate: '01/01/2011'
```

Input Arguments

file — Name of SLX, SLXP, or MDL file

character vector | string scalar

Name of the SLX, SLXP, or MDL file, specified as a character vector or string scalar.

The file name can include a partial path, complete path, relative path, or no path. When you do not provide a path, the file extension is optional.

To avoid unexpected results caused by shadowed files that share a name, specify a fully qualified file name.

Example: `Simulink.MDLInfo('vdp')`

Example: `Simulink.MDLInfo('mymodel.slx')`

Example: `Simulink.MDLInfo('mydir/mymodel.slx')`

Example: `Simulink.MDLInfo('C:/mydir/mymodel.slx')`

Data Types: `char` | `string`

Tips

To add metadata to an SLX or MDL file, create a metadata structure that contains the information you require and use the `set_param` function to attach it to the file. To extract the information without loading the file, use `metadata` instead of adding custom data by using the `add_param` function.

Introduced in R2009b

Simulink.LibraryDictionary.clear

Package: Simulink.LibraryDictionary

Clear library dictionary dependency analysis

Syntax

```
Simulink.LibraryDictionary.clear
```

Description

`Simulink.LibraryDictionary.clear` clears any previous library dependency analysis that has been performed on a library hierarchy with attached data dictionaries. When you first attach a dictionary to a library and save that library, Simulink opens and performs this analysis on each library in the current folder as well as in the folder of that library (if different than the current folder). Simulink stores the analysis in the user preference folder. Subsequent changes to a library in the hierarchy results in analysis of only relevant library changes.

Run this function only if you intend to reanalyze the entire library hierarchy.

Examples

Clear Library Dependency Analysis for Library Dictionaries

To perform a full reanalysis of dependencies for a library hierarchy with attached data dictionaries, clear any previously stored dependency analysis.

```
Simulink.LibraryDictionary.clear
```

See Also

`Simulink.LibraryDictionary.refresh` |
`Simulink.LibraryDictionary.resetLibraryLinks`

Topics

“Link Data Dictionary to Custom Libraries”
“Create Custom Library”
“Design and Create a Custom Block”

Introduced in R2021a

Simulink.LibraryDictionary.refresh

Package: Simulink.LibraryDictionary

Update library dictionary dependencies

Syntax

```
Simulink.LibraryDictionary.refresh  
Simulink.LibraryDictionary.refresh(libraryDir)  
Simulink.LibraryDictionary.refresh(model)
```

Description

`Simulink.LibraryDictionary.refresh` performs a library dependency analysis on a library hierarchy with attached data dictionaries from the current folder. When you first attach a dictionary to a library and save that library, Simulink opens and performs this analysis on each library in the specified folder as well as in the folder of that library (if different than the current folder). Simulink stores the analysis in the user preference folder. Subsequent changes to a library in the hierarchy result in analysis of only relevant library changes.

Because performing this library dependency analysis can be an expensive operation, call the `Simulink.LibraryDictionary.refresh` function only when you have made changes to your library hierarchy and want to ensure that your library dictionary dependencies are current.

`Simulink.LibraryDictionary.refresh(libraryDir)` performs a library dependency analysis on a library hierarchy with attached data dictionaries from the specified library folder.

`Simulink.LibraryDictionary.refresh(model)` performs a library dependency analysis on a library hierarchy with attached data dictionaries for the specified model.

Examples

Refresh Library Dependency Analysis from the Current Folder

Perform a library dependency analysis on a library hierarchy with attached data dictionaries from the current folder.

```
Simulink.LibraryDictionary.refresh
```

Refresh Library Dependency Analysis from a Specified Folder

Perform a library dependency analysis on a library hierarchy with attached data dictionaries from a specified library folder.

```
Simulink.LibraryDictionary.refresh('C:/Work/myLibraryDir/')
```

Refresh Library Dependency Analysis for a Specified Model

Perform a library dependency analysis on a library hierarchy with attached data dictionaries for a specified model.

```
Simulink.LibraryDictionary.refresh('myModel')
```

Input Arguments

libraryDir — Library folder

character vector

Library folder to use for dependency analysis, specified as a character vector.

Example: 'myLibraryDir'

Data Types: char

model — Model

character vector

Model to use for dependency analysis, specified as a character vector.

Example: 'myModel'

Data Types: char

Simulink.LibraryDictionary.resetLibraryLinks

Package: Simulink.LibraryDictionary

Clear cached information on library dictionary links

Syntax

```
Simulink.LibraryDictionary.resetLibraryLinks
```

Description

`Simulink.LibraryDictionary.resetLibraryLinks` clears previously cached information on library dictionary links. Use this function when you are unable to link your library to a library dictionary due to cache corruption. After calling this function, the ability to link your library to a library dictionary is restored, but information on previously linked library dictionaries is lost.

Examples

Clear Cached Link Information for Library Dictionaries

To restore the ability to link your library to a library dictionary, remove corrupt cache information.

```
Simulink.LibraryDictionary.resetLibraryLinks
```

Simulink.ModelAdvisor.getModelAdvisor

Get Model Advisor object for system or subsystem

Syntax

```
ma = Simulink.ModelAdvisor.getModelAdvisor(system,new)
```

Description

Use the `ma = Simulink.ModelAdvisor.getModelAdvisor(system,new)` method to return an instance of a `Simulink.ModelAdvisor` class for the model or subsystem that you specify by using the `system` input argument.

Input Arguments

system — Model or subsystem name

character vector

Name of model or subsystem for which you obtain the corresponding `Simulink.ModelAdvisor` object.

Example: 'sldemo_fuelsys_dd_controller'

Example: 'sldemo_fuelsys_dd_controller/airflow_calc'

Data Types: char

new — New Model Advisor object

character vector

This argument is optional except when changing the Model Advisor working scope from one system to another without closing the previous session. Alternatively, you can close the previous session before invoking the `getModelAdvisor` method.

Data Types: char

Output Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for a model or subsystem that you specify by using a `system` input argument.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

Simulink.ModelAdvisor.openConfigUI

Starts Model Advisor Configuration Editor

Syntax

```
Simulink.ModelAdvisor.openConfigUI(ma)
```

Description

Use the `Simulink.ModelAdvisor.openConfigUI(ma)` method to open the Model Advisor Configuration Editor. Use the Model Advisor Configuration Editor to create custom Model Advisor configurations.

The Model Advisor Configuration Editor is available with Simulink Check. For more information, see “Use the Model Advisor Configuration Editor to Customize the Model Advisor” (Simulink Check).

Before starting the Model Advisor Configuration Editor, make sure that the current folder is writable. If the folder is not writable, you see an error message when you start the Model Advisor Configuration Editor.

The Model Advisor Configuration Editor uses the `s\prj` folder in the “Code generation folder” to store reports and other information. If the `s\prj` folder does not exist in the code generation folder, the Model Advisor Configuration Editor creates it. For more information, see “Manage Simulation Targets for Referenced Models”.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to open the Model Advisor Configuration Editor.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

Simulink.ModelAdvisor.reportExists

Determine whether Model Advisor report exists for model or subsystem

Syntax

```
exists = Simulink.ModelAdvisor.reportExists(system)
```

Description

Use the `exists = Simulink.ModelAdvisor.reportExists(system)` method to determine whether a Model Advisor report exists in the `slprj/modeladvisor` subfolder of the MATLAB working folder.

Input Arguments

system — Model or subsystem

character vector

Model or subsystem for which you want to determine whether a Model Advisor report exists.

Output Arguments

exists — Boolean value indicating whether Model Advisor report exists

Boolean

Boolean value that indicates whether Model Advisor report exists. A value of 1 indicates that the report exists. A value of 0 indicates that the report does not exist.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

Simulink.ModelReference.refresh

Update Model blocks to reflect changes to referenced models

Syntax

```
Simulink.ModelReference.refresh(modelBlock)
```

Description

`Simulink.ModelReference.refresh(modelBlock)` updates the specified Model block to reflect changes to the referenced model.

Examples

Refresh Model Blocks Programmatically

Programmatically refresh a Model block in a parent model that has the **Port and parameter mismatch** configuration parameter set to error.

Load the example model, which contains two Model blocks that are out of date with the model they reference. The number of input and output ports in the referenced model has increased from one to two.

```
load_system('RefreshModelBlockModel');
```

```
Warning: Ports and parameters of Model block 'RefreshModelBlockModel/Model1' do not reflect changes to referenced model.
```

```
Warning: Number of input ports must match between Model block 'RefreshModelBlockModel/Model1' (1) and referenced model (2).
```

```
Warning: Ports and parameters of Model block 'RefreshModelBlockModel/Model' do not reflect changes to referenced model.
```

```
Warning: Number of input ports must match between Model block 'RefreshModelBlockModel/Model' (1) and referenced model (2).
```

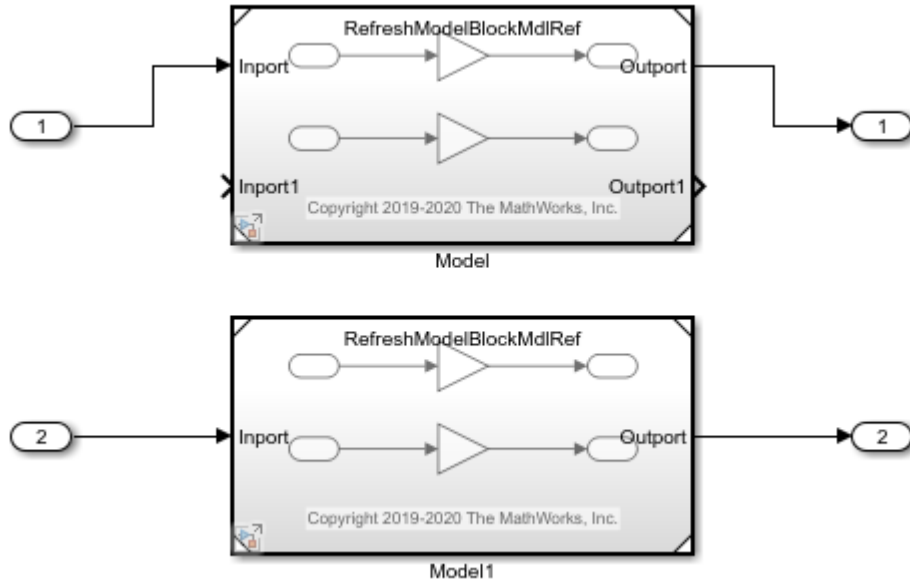

Refresh one of the Model blocks.

```
Simulink.ModelReference.refresh('RefreshModelBlockModel/Model');
```

The number of ports on the refreshed Model block now matches the number of ports for the referenced model.

To see that the refreshed Model block displays all ports in the referenced model, while the other Model block does not, open the parent model.

```
open_system('RefreshModelBlockModel');
```

Input Arguments

modelBlock – Model block to refresh

character vector | handle

Model block to refresh, specified as a character vector or a handle.

Example: 'RefreshModelBlockModel/Model'

Data Types: char | string | double

See Also

Model block version mismatch | **Port and parameter mismatch**

“Model Reference Basics”

“Model Reference Interface and Boundary”

Introduced in R2020a

Simulink.ProtectedModel.createHarness

Create harness model that provides isolated environment for testing protected model

Syntax

```
h = Simulink.ProtectedModel.createHarness(pname)
h = Simulink.ProtectedModel.createHarness(pname,hname)
```

Description

`h = Simulink.ProtectedModel.createHarness(pname)` creates and opens a harness model for the specified protected model. The harness model provides an isolated environment for testing the protected model. The name of the harness model is the name of the protected model followed by `_harness`.

`h = Simulink.ProtectedModel.createHarness(pname,hname)` specifies the name or path of the harness model.

Examples

Create Harness Model for Protected Model

To test a protected model in an isolated environment, use the provided harness model or create a harness model for the protected model.

Suppose you receive a protected model named `sldemo_mdhref_counter.slxp` and do not receive a harness model for it. Using the same platform that was used to create the protected model, create a harness model for the protected model.

```
h = Simulink.ProtectedModel.createHarness('sldemo_mdhref_counter.slxp');
```

The harness model is set up for simulation of the protected model.

Input Arguments

pname — Name of protected model

character vector | string scalar

Name of protected model, specified as a character vector or string scalar.

You can specify the name with or without the `.slxp` extension, however, you cannot specify a full path or partial path. The file must be on the MATLAB path.

Example: `Simulink.ProtectedModel.createHarness('model.slxp')`

Data Types: `char` | `string`

hname — Name of harness model

character vector | string scalar

Name of harness model being created, specified as a character vector or string scalar.

You can specify the name with or without the `.slx` extension.

To save the model in a specific location, specify the full path or a partial path for the harness model, including the name and extension. Otherwise, the harness model is saved in the working directory.

Example: `Simulink.ProtectedModel.createHarness('model.slxp','harness.slx')`

Data Types: `char` | `string`

Output Arguments

h — Harness model

handle

Harness model, returned as a handle.

Data Types: `double`

Alternative Functionality

If you have a Simulink Coder or HDL Coder license, create a harness model as part of the model protection process by using one of these options:

- In the Create Protected Model dialog box, set **Contents** to Protected model (`.slxp`) and dependencies in a project, or select **Create harness model for protected model**.
- Using the `Simulink.ModelReference.protect`, set 'Project' or 'Harness' to true.

When you create the harness model as part of the model protection process, you have more information to provide the harness model. Without this information, you might not be able to create a harness model for the protected model.

`Simulink.ModelReference.protect`

Topics

“Protect Models to Conceal Contents” (Simulink Coder)

“Reference Protected Models from Third Parties”

Introduced in R2020b

Simulink.ProtectedModel.getPublisher

Return information about publisher that signed the protected model

Syntax

```
[publisher,tf] = Simulink.ProtectedModel.getPublisher(protectedModel)
```

Description

`[publisher,tf] = Simulink.ProtectedModel.getPublisher(protectedModel)` returns the name of the publisher that signed `protectedModel` and whether the certificate is verified by a trusted certificate authority. To verify the certificate, the corresponding certificate file must be in your computer's trusted certificate authority store.

Examples

Get Name of Publisher that Signed Protected Model

Get publisher information for the protected model `signed_model_name`.

```
Simulink.ProtectedModel.getPublisher('signed_model_name.slxp')
```

The function returns the name of the publisher that signed the protected model.

Get Publisher and Verification Status of Protected Model

Verify the publisher and status of the protected model `signed_model_name`.

```
[publisher, verified] = Simulink.ProtectedModel.getPublisher('signed_model_name.slxp');
```

The variable `publisher` represents the name of the publisher that signed the model. `verified` has a value of 1 if the signature is verified by a trusted certificate authority.

Input Arguments

protectedModel — Name of signed protected model

character vector | string scalar

Name of the signed protected model, specified as a character vector or a string scalar.

Example: `'my_model.slxp'`

Output Arguments

publisher — Name of publisher

character vector | string scalar

Name of publisher that signed the protected model, returned as a character vector or string scalar. If the signature is not verified by a trusted certificate authority, `publisher` returns empty.

tf — True or false result

1 | 0

True or false result, returned as a 1 or 0. `tf` returns 1 if the signature on the protected model is verified by a trusted certificate authority.

See Also**Topics**

“Reference Protected Models from Third Parties”

“Sign a Protected Model” (Simulink Coder)

Introduced in R2020a

Simulink.ProtectedModel.suppressSignatureVerification

Suppress digital signature verification of protected models

Syntax

```
Simulink.ProtectedModel.suppressSignatureVerification(protectedModel)
Simulink.ProtectedModel.suppressSignatureVerification(protectedModel,
suppressionSetting)
```

Description

`Simulink.ProtectedModel.suppressSignatureVerification(protectedModel)` suppresses the error that indicates whether the signature on the model `protectedModel` is unverified. Note that this does not suppress the error if the protected model was changed after it was signed. In this case, you cannot use the protected model.

`Simulink.ProtectedModel.suppressSignatureVerification(protectedModel, suppressionSetting)` disables or enables suppression for the model that you specify. To re-enable signature verification, specify `false` for the `suppressionSetting`. To enable signature verification for all protected models, specify `'All'` for the `model` argument. You cannot suppress verification for all models at once.

Examples

Suppress Signature Verification for Model

Suppress the verification of the digital signature for a protected model

Disable signature verification for a protected model named `myProtectedModel`.

```
Simulink.ProtectedModel.suppressSignatureVerification('myProtectedModel.slxp');
```

Enable Signature Verification for All Protected Models

Enable the verification of digital signatures on all protected models that you open.

```
Simulink.ProtectedModel.suppressSignatureVerification('All', false);
```

If you previously suppressed signature verification for individual protected models, verification is re-enabled for those models.

Input Arguments

protectedModel — Protected model
character vector | string scalar | `'All'`

Protected model for which you want to suppress digital signature verification, specified as a character vector or string scalar. To re-enable signature verification for all protected models, specify 'All' for this argument and `false` for the second argument. You cannot suppress signature verification for all protected models at once.

Example: `'myProtectedModel.slxp'`

Example: `'All'`

suppressionSetting — Whether to suppress signature verification

`true` or `1` (default) | `false` or `0`

Whether to suppress digital signature verification for the specified model, specified as a numeric or logical `1` (`true`) or `0` (`false`).

Topics

"Reference Protected Models from Third Parties"

Introduced in R2020b

Simulink.ProtectedModel.verifySignature

Verify digital signature on protected model

Syntax

```
Simulink.ProtectedModel.verifySignature(protectedModel)
```

Description

`Simulink.ProtectedModel.verifySignature(protectedModel)` verifies the digital signature on the protected model. If the signature is not valid, the function returns an error that indicates why the signature is invalid. A signature is invalid in the following cases:

- The protected model was changed after it was signed.
- The protected model was not signed.
- The protected model was signed with an expired certificate.
- The protected model was self-signed with a certificate issued by the publisher.
- The protected model was signed with a missing or invalid certificate.
- The certificate in your system certificate authority store is missing or invalid.
- The model was signed with an invalid key.

Examples

Verify Digital Signature of Protected Model

Verify the digital signature for the protected model `signed_model_name`.

```
Simulink.ProtectedModel.verifySignature('signed_model_name.slxp')
```

The function returns an error if the signature on the protected model cannot be verified.

Input Arguments

protectedModel — Name of signed protected model

character vector | string scalar

Name of the signed protected model, specified as a character vector or a string scalar.

Example: `'my_model.slxp'`

Introduced in R2020a

Simulink.restoreDiagnostic

Restore diagnostic warnings to a specific block, subsystem, or model

Syntax

```
Simulink.restoreDiagnostic(source)
Simulink.restoreDiagnostic(source, message_id)
Simulink.restoreDiagnostic(diagnostic)
Simulink.restoreDiagnostic(system, 'FindAll', 'on')
```

Description

`Simulink.restoreDiagnostic(source)` restores all suppressed diagnostics associated with the blocks specified by `source`.

`Simulink.restoreDiagnostic(source, message_id)` restores all instances of `message_id` on the blocks specified by `source`.

`Simulink.restoreDiagnostic(diagnostic)` restores the suppressed diagnostics associated with MSLDiagnostic object `diagnostic`.

`Simulink.restoreDiagnostic(system, 'FindAll', 'on')` restores all suppressed diagnostics associated with the system specified by `system`.

Examples

Restore All Diagnostics for a Specified Block

Using the model from “Suppress Diagnostic Messages Programmatically”, restore all suppressed diagnostics on a specified block.

Create a cell array of message identifiers. Use the `Simulink.suppressDiagnostic` function to suppress these multiple diagnostics from the Constant block, `one`.

```
diags = {'SimulinkFixedPoint:util:fxpParameterPrecisionLoss', ...
        'SimulinkFixedPoint:util:fxpParameterUnderflow'};
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one', diags);
```

Remove all suppressions and restore diagnostics to the block.

```
Simulink.restoreDiagnostic('Suppressor_CLI_Demo/one');
```

Restore a Diagnostic for a Specified Block

Using the model from “Suppress Diagnostic Messages Programmatically”, restore a suppressed diagnostic on a specified block.

Use the `Simulink.suppressDiagnostic` function to suppress the parameter precision loss warning thrown by the Constant block, one.

```
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one',...
    'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

Remove the suppression and restore diagnostics to the block.

```
Simulink.restoreDiagnostic('Suppressor_CLI_Demo/one',...
    'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

Restore All Diagnostics for a Specified System

Using the model from “Suppress Diagnostic Messages Programmatically”, restore all suppressed diagnostics on the specified subsystem.

To restore all diagnostics from a system, use `'FindAll'`, `'on'` to search within the system hierarchy. Specify the system or system handle within which to search.

```
Simulink.restoreDiagnostic('Suppressor_CLI_Demo/Convert',...
    'FindAll', 'On');
```

Restore All Diagnostics for a Specified Model

Using the model from “Suppress Diagnostic Messages Programmatically”, restore all suppressed diagnostics on the model.

To restore all diagnostics from a model, specify the model name or model handle.

```
Simulink.restoreDiagnostic('Suppressor_CLI_Demo', 'FindAll', 'on');
```

Input Arguments

source — Block or model object throwing diagnostic

block path | block handle

The source of the diagnostic, specified as a block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the `gcb` function.

To get the block handle, use the `getSimulinkBlockHandle` function.

Data Types: `char` | `cell`

message_id — message identifier of diagnostic

message identifier | cell array of message identifiers

Message identifier of the diagnostic, specified as a character vector or a cell array of character vectors. You can find the message identifier of warnings and errors thrown during simulation by accessing the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object associated with a simulation. You can also use the `lastwarn` function.

Data Types: char | cell

system — Name of subsystem or model

character vector

The subsystem name, subsystem handle, model name, or model handle specified as a character vector.

Data Types: char

diagnostic — Diagnostic object

MSLDiagnostic object

Diagnostic specified as an MSLDiagnostic object. Access the MSLDiagnostic object through the ExecutionInfo property of the Simulink.SimulationMetadata object.

Data Types: struct

“Suppress Diagnostic Messages Programmatically”

Introduced in R2016b

Simulink.saveVars

(Not recommended) Save workspace variables and their values in MATLAB code format

Note Simulink.saveVars is not recommended. Use matlab.io.saveVariablesToScript instead.

Syntax

```
Simulink.saveVars(filename)
Simulink.saveVars(filename, var1,...,varN)
Simulink.saveVars(filename, '-regex',RegExps)
Simulink.saveVars(filename, __, UpdateOption)
Simulink.saveVars(filename, __, Configuration)
Simulink.saveVars(filename, __, MatlabVer)
[r1, r2] = Simulink.saveVars(filename, __)
```

Description

Simulink.saveVars(filename) saves all variables in the current workspace for which MATLAB code can be generated to a MATLAB file named filename.m. If MATLAB code cannot be generated for a variable, the variable is saved into a companion MAT-file named filename.mat, and a warning is generated. If either file already exists, it is overwritten. The file name cannot match the name of any variable in the current workspace, and can optionally include the suffix .m. Using Simulink.saveVars has no effect on the contents of any workspace.

Executing the MATLAB file restores the variables saved in the file to the current workspace. If a companion MAT-file exists, code in the MATLAB file loads the MAT-file, restoring its variables also. When both a MATLAB file and a MAT-file exist, do not load the MATLAB file unless the MAT file is available, or an error will occur. Do not load a MAT-file directly, or incomplete data restoration will result. No warning occurs if loading a file overwrites any existing variables.

You can edit a MATLAB file that Simulink.saveVars creates. You can insert comments between or within the MATLAB code sections for saved variables. However, if you later use Simulink.saveVars to update or append to the file, only comments between MATLAB code sections will be preserved. Internal comments should therefore be used only in files that you do not expect to change any further.

You must not edit the header section in the MATLAB file, which comprises the first five comment lines. Simulink does not check that a manually edited MATLAB file is syntactically correct. Do not edit any MATLAB code in the file. You cannot edit a MAT-file and should never attempt to do so.

Simulink.saveVars(filename, var1,...,varN) saves only the variables specified by var1,...,varN. You can use the wildcard character * to save all variables that match a pattern. The * matches one or more characters, including non-alphanumeric characters.

Simulink.saveVars(filename, '-regex',RegExps) saves only variables whose names match one of the regular expressions in the comma-separated list of expressions RegExps. See “Regular Expressions” for more information. A call to the function can specify both VarNames and '-regexps', RegExps, in that order and comma-separated.

`Simulink.saveVars(filename, ___, UpdateOption)` saves the variables as directed by `UpdateOption`.

`Simulink.saveVars(filename, ___, Configuration)` saves the variables according to the specified configuration options.

`Simulink.saveVars(filename, ___, MatlabVer)` saves any MAT-file that it creates in the format required by the MATLAB version specified by `MatlabVer`.

`[r1, r2] = Simulink.saveVars(filename, ___)` returns the variables saved in `r1` and `r2`.

Examples

Explore Options for Saving Workspace Variables

Define some base workspace variables, then save them to a MATLAB file using a variety of input arguments.

Define some base workspace variables then save them to a new MATLAB file `myVars.m`.

```
a = 1;
b = 2.5;
c = 'A string';
d = {a,b,c};
Simulink.saveVars('myVars');
```

Define additional base workspace variables, then append them to the existing file `myVars.m` without changing the values previously saved in the file.

```
K = Simulink.Parameter;
myType = fixdt(1,16,3);
Simulink.saveVars('myVars', '-append', 'K', 'myType');
```

Update the variables `V1` and `V2` with their values in a MATLAB file, or for any whose value cannot be converted to MATLAB code, in a MAT-file. The file must already exist. Any array with more than 10 elements will be saved to a MAT-file that can be loaded on any version of MATLAB. The return argument `r1` lists the names of any variables saved to a MATLAB file; `r2` lists any saved to a MAT-file.

```
[r1, r2] = Simulink.saveVars('MyFile', 'V1', 'V2', '-update',
'-maxnumel', 10, '-v4');
```

Specify a 2-D slice for the output of the `my3Dtable` 3-D array. Specify that the 2-D slice expands along the first and third dimensions. Review the generated MATLAB code.

```
my3Dtable = zeros(3, 4, 2, 'single');
Simulink.saveVars('mfile.m', 'my3Dtable', '-2dslice', 1, 3);
```

```
my3Dtable = zeros(3, 4, 2, 'single');
my3Dtable(:,1,:) = single( ...
    [1 13;
     5 17;
     9 21]);
my3Dtable(:,2,:) = single( ...
    [2 14;
     6 18];
```

```

    10 22]);
my3DTable(:,3,:) = single( ...
    [3 15;
     7 19;
    11 23]);
my3DTable(:,4,:) = single( ...
    [4 16;
     8 20;
    12 24]);

```

Input Arguments

filename — Name of file to create or update

character vector | string scalar

Name of file that the function creates or updates, specified as a character vector or string scalar. The file name cannot match the name of any variable in the current workspace. The file name can have the suffix `.m`, but the function ignores it.

var1, ..., varN — Variables to save

character vector | string scalar

A variable or sequence of comma-separated variables, specified as a character vector or string scalar. The function saves only the specified variables to the output file. You can use the wildcard character `*` to save all variables that match a pattern. The `*` matches one or more characters, including non-alphanumeric characters.

Example: `Simulink.saveVars('myFile','A*')` saves all variables in the workspace whose names start with `A` with their values.

RegExps — Regular expression

character vector | string

A regular expression or sequence of comma-separated regular expressions, specified as a character vector or string. The function saves to the output file only those variables whose names match one of the expressions. See “Regular Expressions” for more information. A call to the function can specify both `VarNames` and `'-regexp', RegExps`, in that order and comma-separated.

Example: `Simulink.saveVars('myFile','-regexp','v*')`

UpdateOption — Function action

'-create' (default) | 'update' | '-append'

Keyword that controls the action of the function, specified as one of these values:

- `'-create'` — Create a new MATLAB file (and MAT-file if needed).
- `'-update'` — Update the existing MATLAB file (and MAT-file if needed) specified by `filename` by changing only the specified variables that already exist in the file or files. The order of the variables in the file or files is preserved.
- `'-append'` — Update the existing MATLAB file (and MAT-file if needed) specified by `filename` by:
 - Updating the specified variables that already exist in the file or files, preserving the existing order.

- Appending the specified variables that do not exist in the file or files.

Configuration — Configuration options

'-maxnumel' | '-maxlevels' | '-textwidth' | '-2dslice'

Configuration options for the function, specified as any or all of these values, in any order, separated by commas if more than one appears:

- '-maxnumel' MaxNum — Limits the number of elements saved for an array to MaxNum, which must be an integer between 0 and 10000. If an array is larger than that, the whole array appears in the MAT-file rather than the MATLAB script file, generating a warning. Default: 1000
- '-maxlevels' MaxLevels — Limits the number of levels saved for a structure or cell array to MaxLevels, which must be an integer between 0 and 200. If a structure or cell array is deeper than that, the whole entity appears in the MAT-file rather than the MATLAB script file, generating a warning. Default: 20
- '-textwidth' TextWidth — Sets the text wrap width in the MATLAB script file to TextWidth, which must be an integer between 32 and 256. Default: 76
- '-2dslice' — Sets two dimensions for 2-D slices that represent n-D (where n is greater than 2) arrays of char, logic, or numeric data. Using the '-2dslice' option produces more readable generated code that is consistent with how MATLAB displays n-D array data.

Simulink.saveVars uses the first two dimensions of the n-D array to specify the size of the 2-D slice, unless you supply two positive integer arguments after the -2dslice option. If you specify two integer arguments:

- The two integers must be positive.
- The two integers must be less than or equal to the number of dimensions of the n-D array.
- The second integer must be greater than the first.

Note You can use the MATLAB Preferences to change the defaults for the -maxnumel, -maxlevels, '-2dslice', and -textwidth configuration options. In the **Workspace** pane, use the options in the **Saving variables as MATLAB script files** group.

MatlabVer — MATLAB version

'-v7.3' | '-v7.0' | '-v6' | '-v4'

MATLAB version whose syntax will be used by any MAT-file saved by the function, specified by values including:

- '-v7.3' — 7.3 or later
- '-v7.0' — 7.0 or later
- '-v6' — Version 6 or later
- '-v4' — Any MATLAB version

Output Arguments

r1 — Variables saved to a MATLAB file

cell array of character vectors

Variables that were saved to a MATLAB file, specified as a cell array of character vectors.

r2 — Variables saved to a MAT- file

cell array of character vectors

Variables that were saved to a MAT-file, specified as a cell array of character vectors.

Limitations

The `Simulink.saveVars` function:

- Does not preserve shared references.
- Ignores dynamic properties of objects.
- Saves the following to the MAT-file although they could appear in the MATLAB file:
 - `Simulink.ConfigSet` objects with custom target components. (Use the `Simulink.ConfigSet` method `saveAs` instead.)
 - `Simulink.Timeseries` and `Simulink.ModelDataLogs` objects.

If you save many variables, the generated MATLAB file can contain many lines of code and take a long time to execute. To avoid the long execution time, consider these alternatives:

- Permanently store variables in a data dictionary instead of using `Simulink.saveVars`. A data dictionary also provides more tools for managing variables. See “Determine Where to Store Variables and Objects for Simulink Models”.
- Save variables in a MAT-file by using the `save` function.

Tips

- If you do not need to save variables in an easily-understood form, see the `save` function.
- If you need to save only bus objects, use the `Simulink.Bus.save` function.
- If you need to save only a configuration set, use the `Simulink.ConfigSet.saveAs` method.

`save` | `matlab.io.saveVariablesToScript` | `Simulink.Bus.save` | `Simulink.ConfigSet` | `Simulink.Bus.save`

Introduced in R2010a

simulink.schedule.createSchedule

Create a new schedule using provided schedule and ordering

Syntax

```
outputSchedule = createSchedule(inputSchedule, partitionOrder)
outputSchedule = createSchedule(inputSchedule, partitionOrder,
'IgnoreExtra',true)
```

Description

`outputSchedule = createSchedule(inputSchedule, partitionOrder)` creates a new `simulink.schedule.OrderedSchedule` object, `sch` with all the partitions present in the `simulink.schedule.OrderedSchedule` object, `inputSchedule`, according to order specified by the vector, `partitionOrder`.

`outputSchedule = createSchedule(inputSchedule, partitionOrder, 'IgnoreExtra',true)` creates a new `simulink.schedule.OrderedSchedule` object, `sch` with all the partitions present in the `simulink.schedule.OrderedSchedule`, `Schedule`, according to order specified by the parameter, `partitionOrder` while ignoring any partitions that are not already present in `sch`. `PartitionOrder` must contain all partitions of `inputSchedule`.

Input Arguments

inputSchedule — A `simulink.schedule.Orderedschedule` object
object

An existing `simulink.schedule.Orderedschedule` object copied to create new schedule.

partitionOrder — A vector of partition names
vector

Partition names in the desired order, specified as a vector of strings.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: `'IgnoreExtra', true`

IgnoreExtra — Ignore additional partitions
`false` (default) | `true`

When specified as `true`, the `createSchedule` function ignores any additional partitions in `partitionOrder` that are not present in the object, `inputSchedule`.

Output Arguments

outputSchedule — New `simulink.schedule.Orderedschedule` object
object

A new or modified `simulink.schedule.Orderedschedule` object.

See Also

`simulink.schedule.OrderedSchedule` | **Schedule Editor**

Topics

“Create Partitions”

Introduced in R2020a

Simulink.sdi.addToRun

Package: Simulink.sdi

Import data into existing run in Simulation Data Inspector using run ID

Syntax

```
sigIDs = Simulink.sdi.addToRun(runID, 'vars', var, var2, ..., varn)
sigIDs = Simulink.sdi.addToRun(runID, 'namevalue', sourceNames, sigValues)

sigIDs = Simulink.sdi.addToRun(runID, 'file', filename)
sigIDs = Simulink.sdi.addToRun(runID, 'file', filename, Name=Value)
```

Description

Import Data from Workspace

`sigIDs = Simulink.sdi.addToRun(runID, 'vars', var, var2, ..., varn)` imports data from one or more variables into the Simulation Data Inspector by adding one or more signals to the run that corresponds to the specified run ID.

To import data into a new run, use the `Simulink.sdi.Run.create` function or the `Simulink.sdi.createRun` function.

`sigIDs = Simulink.sdi.addToRun(runID, 'namevalue', sourceNames, sigValues)` imports data from one or more variables into the Simulation Data Inspector by adding one or more signals to the run that corresponds to the specified run ID. The `sourceNames` argument specifies values to use for the data source in the metadata for the signals added to the run.

Import Data from File

`sigIDs = Simulink.sdi.addToRun(runID, 'file', filename)` imports data from a file into the Simulation Data Inspector by adding one or more signals to the run that corresponds to the specified run ID. You can use a built-in file reader to import data from a MAT file, CSV file, Microsoft Excel file, or MDF file.

When you need to import data from a file that the built-in readers do not support, you can write your own reader using the `io.reader` class.

`sigIDs = Simulink.sdi.addToRun(runID, 'file', filename, Name=Value)` imports data from a file into the Simulation Data Inspector by adding one or more signals to the run that corresponds to the specified run ID according to options specified using one or more name-value arguments. For example, `sheets=["sheet1" "sheet2"]` specifies the sheets from which to import data when importing data from an Excel file.

Examples

Add Workspace Data to Run

This example shows how to use `Simulink.sdi.addToRun` to add workspace data to a run in the Simulation Data Inspector.

Generate Workspace Data

Generate workspace data to add to a simulation run in place of measured data, input data, or any other data that you want to associate with the simulation.

```
time = linspace(0, 60, 201);
cos_vals = 2*cos(2*pi/6.8*time);
cos_ts = timeseries(cos_vals, time);
cos_ts.Name = 'cosine';
```

Simulate Model

Simulate the `slexAircraftExample` model to create a run containing the simulation outputs.

```
load_system('slexAircraftExample');
sim('slexAircraftExample', 'SaveFormat', 'Dataset');
```

Add Workspace Data to Simulation Run

Add the workspace data to the run. Then, view the results in the Simulation Data Inspector.

```
% Get run ID
count = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(count);

% Add data to run
sigIDs = Simulink.sdi.addToRun(runID, 'vars', cos_ts);

Simulink.sdi.view
```

Input Arguments

runID — Run ID for run to which you want to add imported data

scalar

Run ID for run to which you want to add imported data, specified as a scalar.

The Simulation Data Inspector assigns a unique ID to each run when the run is created. You can access run IDs for runs in the Simulation Data Inspector using the `Simulink.sdi.getAllRunIDs` and `Simulink.sdi.getRunIDByIndex` functions.

var — Data to import

variable

Data to import, specified as a variable. The Simulation Data Inspector supports time-based data in which sample values are associated with sample times. The Simulation Data Inspector supports all loading and logging data formats, including `timeseries` and `Simulink.SimulationData.Dataset`.

Example: `myData`

sourceNames — Source names for imported data

cell array of character vectors

Source names for imported data, specified as a cell array of character vectors. The source name is used to set the `RootSource`, `TimeSource`, and `DataSource` properties of the `Simulink.sdi.Signal` objects created from the data specified by the `sigValues` input.

Provide a `sourceNames` input when you specify 'namevalue' for the second argument.

Example: {'sig1','sig2'}

sigValues — Data to import

cell array of variables

Data to import, specified as a cell array of variables.

Provide a `sigValues` input when you specify 'namevalue' for the second argument.

Example: {var1,var2}

filename — Name of file with data to import

character vector

Name of file with data to import, specified as a character vector. Provide a `filename` input when you specify 'file' for the second argument.

You can create a run from these types of files using file readers built into the Simulation Data Inspector:

- MAT-file
- CSV file
- Microsoft Excel file that contains data formatted according to “Microsoft Excel Import, Export, and Logging Format”.
- MDF file with one of these extensions:
 - .mdf
 - .mf4
 - .mf3
 - .data
 - .dat

When you need to import data from a file that the built-in readers do not support, you can write your own reader using the `io.reader` class. You can also write a custom reader to use instead of the built-in reader for any file extension. For an example, see “Import Data Using a Custom File Reader”.

Example: 'simulation.mat'

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, . . . ,NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Example: sheets=["sheet1" "sheet2"]

reader — File reader to use to import data

string | character vector

File reader to use to import data, specified as a string or character vector.

The Simulation Data Inspector prioritizes using a registered custom reader when one is available for the file. When you do not specify a reader, the Simulation Data Inspector uses the first custom reader registered for the file. If no custom readers are registered, the data is imported using the built-in reader.

Specify the reader input when:

- You want to use the built-in reader to import data for a file that is also supported by a custom reader.
- Multiple registered custom readers support the file.

To determine which readers are available to import your file, use the `io.reader.getSupportedReadersForFile` function.

Example: "MyExcelReader"

Example: "built-in"

sheets — Sheets in Excel file from which to import data

string array | cell array of character vectors

Sheets in Excel file from which to import data, specified as a string array or a cell array of character vectors. By default, the Simulation Data Inspector imports data from all sheets. Use the `sheets` name-value argument when you do not want to import data from all sheets in the Excel file.

When the data in the file does not include simulation numbers and source information, the data on each sheet is imported into a separate run. For more information about formatting data to import from an Excel file, see "Microsoft Excel Import, Export, and Logging Format".

Example: ["sheet1" "sheet2"]

model — Model with definitions of user-defined data types

string | character vector

Model with definitions of user-defined data types, specified as a string or character vector.

When you load data from an Excel file that defines signal data types using user-defined data types, such as enumerations, buses, or aliases, the Simulation Data Inspector needs access to the type definition to import the data. You can provide access to the type definitions by:

- Loading the associated object into the MATLAB workspace.
- Specifying the `model` name-value argument to use type definitions saved in the model workspace or a data dictionary.

For more information on formatting data to import from an Excel file, see "Microsoft Excel Import, Export, and Logging Format".

Example: "myModel.slx"

Output Arguments

sigIDs — Signal IDs for signals created from imported data

scalar | vector

Signal IDs for signals created from imported data, returned as a scalar or a vector.

`Simulink.sdi.Run` | `add` | `Simulink.sdi.copyRun`

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2011b

Simulink.sdi.addTrigger

Add trigger to signal to control display updates in the Simulation Data Inspector

Syntax

```
Simulink.sdi.addTrigger(sig)
Simulink.sdi.addTrigger(sig,Name,Value)
```

Description

`Simulink.sdi.addTrigger(sig)` adds a rising-edge trigger using normal mode and auto-level to the `Simulink.sdi.Signal` object, `sig`. The trigger determines when plots in the Simulation Data Inspector update to display new data for streaming signals.

`Simulink.sdi.addTrigger(sig,Name,Value)` adds trigger to the specified signal with trigger settings specified by one or more name-value pair arguments. For example, `'Mode','Normal'` configures normal mode behavior for the trigger. Triggers in the Simulation Data Inspector behave the same as triggers in the Scope block. For details regarding trigger types and settings, see “Scope Triggers Panel”.

Examples

Programmatically Configure Triggers in the Simulation Data Inspector

Add a trigger to a signal in the Simulation Data Inspector to specify criteria that determine when to update plots to display fresh data. Triggers can allow you to capture transient signal behavior and can help stabilize the display of periodic signals so you can take measurements.

Simulate the `Triggers` model. Data in the model logs to the Simulation Data Inspector.

```
open_system('Triggers');
out = sim('Triggers');
```

Then, add a trigger to the `Pulse` signal. Configure the trigger as a falling-edge trigger with a threshold of 0.5.

```
trigRun = Simulink.sdi.getCurrentSimulationRun('Triggers');
pulseSig = getSignalsByName(trigRun,'Pulse');
Simulink.sdi.addTrigger(pulseSig,'Type','Edge','Level',0.5);
```

You can verify that the trigger was added and configured correctly by opening the Simulation Data Inspector using `Simulink.sdi.view` and clicking the trigger icon next to the `Pulse` signal to check the configuration. You can also use the `Simulink.sdi.getTrigger` function to check which signal is used to generate trigger events and the trigger configuration.

```
[sig,trigOpts] = Simulink.sdi.getTrigger;
```

```
sig.Name
```

```
ans =
'Pulse'
```

```

trigOpts
trigOpts = struct with fields:
    Mode: 'Auto'
    Type: 'Edge'
    Position: 0.5000
    Delay: 0
    SourceChannelComplexity: 'Scalar'
    Polarity: 'Positive'
    AutoLevel: 1
    Level: 0.5000
    UpperLevel: 0
    LowerLevel: 0
    Hysteresis: 0
    MinTime: 0
    MaxTime: Inf
    Timeout: 0
    Holdoff: 0

```

When you do not want to use a trigger to control when the Simulation Data Inspector updates the plots with fresh data, you can remove the trigger using the `Simulink.sdi.removeTrigger` function.

`Simulink.sdi.removeTrigger`

You can verify that the trigger was removed in the Simulation Data Inspector UI or using the `Simulink.sdi.getTrigger` function. The `Simulink.sdi.getTrigger` function returns an empty array of `Simulink.sdi.Signal` objects when no trigger is configured in the Simulation Data Inspector.

```

sig = Simulink.sdi.getTrigger;
size(sig)

ans = 1×2
     0     0

```

Input Arguments

sig — Signal used to detect trigger events

`Simulink.sdi.Signal` object

Signal used to detect trigger events, specified as a `Simulink.sdi.Signal` object.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: `'Type', 'PulseWidth', 'Polarity', 'Falling'` configures a falling-edge, auto-leveled trigger in auto mode.

Mode — When display updates in response to trigger event

Auto (default) | Normal | Once

When display updates in response to trigger event, specified as the comma-separated pair consisting of 'Mode' and one of these options:

- **Auto** — Plots update in response to each trigger event, and the plots update if no trigger event occurs for the duration of time range displayed.
- **Normal** — Plots update in response to each trigger event.
- **Once** — Plots update in response to the first trigger event. You can manually rearm the trigger using the Simulation Data Inspector.

Example: 'Mode', 'Normal' configures the trigger to use normal mode.

Position — Where trigger event appears in plot

50 (default) | numeric percentage

Where trigger event appears in plot, specified as the comma-separated pair consisting of 'Position' and a numeric percentage. By default, the trigger event appears in the middle of the plot, with a position of 0.5, or at the 50% position within the time span.

Example: 'Position', .3 positions the trigger event at the 30% point within the time span.

Type — Type of trigger to add to signal

Edge (default) | PulseWidth | Transition | Runt | Window | Timeout

Type of trigger to add to signal, specified as the comma-separated pair consisting of 'Type' and one of these options:

- **Edge** — Trigger when the signal crosses a threshold.
- **PulseWidth** — Trigger when the signal crosses twice between a low threshold and high threshold within a specified time.
- **Transition** — Trigger when the signal crosses a high threshold and a low threshold within a specified time.
- **Runt** — Trigger when a signal crosses a low threshold or a high threshold twice within a specified time.
- **Window** — Trigger when a signal stays within or outside a range defined by a high threshold and a low threshold for a specified time.
- **Timeout** — Trigger when a signal stays above or below a threshold longer than a specified time.

For details regarding options for each type of trigger, see “Scope Triggers Panel”.

Example: 'Type', 'PulseWidth' configures a pulse width trigger.

Polarity — Direction of signal value change that causes trigger event

valid polarity for trigger type

Direction of signal value change that causes trigger event, specified as the comma-separated pair consisting of 'Polarity' and a valid polarity for the trigger type.

Trigger Type	Polarity Options
Edge	<ul style="list-style-type: none"> • Rising — Trigger when the signal crosses the threshold while increasing in value. • Falling — Trigger when the signal crosses the threshold while decreasing in value. • Either — Trigger when the signal crosses the threshold while increasing or decreasing in value.
PulseWidth	<ul style="list-style-type: none"> • Positive — Trigger on a rising pulse when the signal crosses the low threshold for a second time. • Negative — Trigger on a falling pulse when the signal crosses the high threshold for a second time. • Either — Trigger on both rising and falling pulses.
Transition	<ul style="list-style-type: none"> • RiseTime — Trigger when the signal increases to cross from the low to the high threshold within the specified time. • FallTime — Trigger when the signal decreases to cross from the high threshold to the low threshold within the specified time. • Either — Trigger when the signal increases or decreases to cross the low and high thresholds within the specified time.
Runt	<ul style="list-style-type: none"> • Positive — Trigger on a rising pulse when the signal crosses the low threshold for a second time without crossing the high threshold. • Negative — Trigger on a falling pulse when the signal crosses the high threshold for a second time without crossing the low threshold. • Either — Trigger on rising or falling pulses that stay within the specified value thresholds.

Trigger Type	Polarity Options
Window	<ul style="list-style-type: none"> • Inside — Trigger when a signal stays within the specified value range for a duration between the <code>MinTime</code> and <code>MaxTime</code>. The trigger event occurs when the signal exits the specified value range. • Outside — Trigger when a signal is outside the specified value range for a duration between the <code>MinTime</code> and the <code>MaxTime</code>. The trigger event occurs when the signal reenters the specified value range. • Either — Trigger when the signal is inside or outside of the specified value range for a duration between the <code>MinTime</code> and the <code>MaxTime</code>.
Timeout	<ul style="list-style-type: none"> • Rising — Trigger when the signal remains above the threshold for longer than the specified time. • Falling — Trigger when the signal remains below the threshold for longer than the specified time. • Either — Trigger when the signal remains either above or below the threshold for longer than the specified time.

Example: `'Type', 'Edge', 'Polarity', 'Rising'` configures a rising-edge trigger.

AutoLevel — Whether to automatically determine trigger levels

`true` or `1` (default) | `false` or `0`

Whether to automatically determine trigger levels, specified as the comma-separated pair consisting of `'AutoLevel'` and `true` or `false`.

When you want to specify thresholds for the trigger, specify `'AutoLevel'` as `false`.

Example: `'AutoLevel', false` configures a trigger to use a user-specified level.

Level — Threshold for trigger events

numeric scalar

Threshold for trigger events, specified as the comma-separated pair consisting of `'Level'` and a numeric scalar.

You can only specify the `'Level'` name-value pair when you specify the `'Type'` name-value pair as `'Edge'` or `'Timeout'`.

Example: `'Type', 'Timeout', 'Level', '0.5'` configures a timeout trigger with a threshold of `0.5`.

Hysteresis — Signal value change required around threshold to cause trigger event

numeric scalar

Signal value change required around threshold to cause trigger event, specified as the comma-separated pair consisting of 'Hysteresis' and a numeric scalar. Specifying a hysteresis for the trigger results in noise rejection for trigger events.

You can only specify the 'Hysteresis' name-value pair when you specify the 'Type' name-value pair as 'Edge' or 'Timeout'.

Example: 'Type', 'Timeout', 'Hysteresis', '0.05' configures a timeout trigger that requires the signal value to change by more than 0.05 around the threshold to cause a trigger event.

UpperLevel — Upper threshold for trigger event

numeric scalar

Upper threshold for trigger event, specified as the comma-separated pair consisting of 'UpperLevel' and a numeric scalar.

You can only specify the 'UpperLevel' name-value pair when you specify the 'Type' name-value pair as 'PulseWidth', 'Transition', 'Runt', or 'Window'.

Example: 'Type', 'PulseWidth', 'UpperLevel', '0.9' configures a pulse width trigger with an upper threshold of 0.9.

LowerLevel — Lower threshold for trigger event

numeric scalar

Lower threshold for trigger event, specified as the comma-separated pair consisting of 'LowerLevel' and a numeric scalar.

You can only specify the 'LowerLevel' name-value pair when you specify the 'Type' name-value pair as 'PulseWidth', 'Transition', 'Runt', or 'Window'.

Example: 'Type', 'PulseWidth', 'LowerLevel', '0.1' configures a pulse width trigger with a lower threshold of 0.1.

MinTime — Lower time limit for trigger event

numeric scalar

Lower time limit for trigger event, specified as the comma-separated pair consisting of 'MinTime' and a numeric scalar. You can only specify the 'MinTime' name-value pair when you specify the 'Type' name-value pair as 'PulseWidth', 'Transition', 'Runt', or 'Window'. The significance of the lower time limit depends on the type of trigger.

- 'PulseWidth' — Minimum pulse width for trigger event.
- 'Transition' — Minimum rise or fall time for trigger event.
- 'Runt' — Minimum pulse width for trigger event.
- 'Window' — Minimum time spent within or outside value range for trigger event.

Example: 'Type', 'PulseWidth', 'MinTime', '0.1' configures a pulse width trigger with a minimum pulse width of 100ms.

MaxTime — Upper time limit for trigger event

numeric scalar

Upper time limit for trigger event, specified as the comma-separated pair consisting of 'MaxTime' and a numeric scalar. You can only specify the 'MaxTime' name-value pair when you specify the

'Type' name-value pair as 'PulseWidth', 'Transition', 'Runt', or 'Window'. The significance of the upper time limit depends on the type of trigger.

- 'PulseWidth' — Maximum pulse width for trigger event.
- 'Transition' — Maximum rise or fall time for trigger event.
- 'Runt' — Maximum pulse width for trigger event.
- 'Window' — Maximum time spent within or outside value range for trigger event.

Example: 'Type', 'PulseWidth', 'MaxTime', '0.5' configures a pulse width trigger with a maximum pulse width of 500ms.

Timeout — Time threshold for timeout trigger

numeric scalar

Time threshold for timeout trigger, specified as the comma-separated pair consisting of 'Timeout' and a numeric scalar.

You can only specify the 'Timeout' name-value pair when you specify the 'Type' name-value pair as 'Timeout'.

Example: 'Type', 'Timeout', 'Timeout', '0.5' configures a timeout trigger that causes an event when a signal is above or below the value threshold for longer than 500ms.

Delay — Trigger event offset from trigger position

numeric scalar

Trigger event offset from trigger position, specified as the comma-separated pair consisting of 'Delay' and a numeric scalar.

Example: 'Type', 'Edge', 'Delay', '0.1' configures an edge trigger where the trigger position marker is displayed 100ms after the trigger event.

Holdoff — Minimum time between trigger events

numeric scalar

Minimum time between trigger events, specified as the comma-separated pair consisting of 'Holdoff' and a numeric scalar. After a trigger event, the display does not update again for at least the holdoff time.

Example: 'Type', 'Edge', 'Holdoff', '1' configures an edge trigger with a holdoff of 1s. After a trigger event, the display does not update for at least 1s.

Alternative Functionality

You can add a trigger to a signal and configure the trigger options using the Simulation Data Inspector UI. For details, see “Control Display of Streaming Data Using Triggers”.

Simulink.sdi.cleanupWorkerResources

Clean up worker repositories

Syntax

```
Simulink.sdi.cleanupWorkerResources
```

Description

`Simulink.sdi.cleanupWorkerResources` removes redundant data from each parallel worker repository file used by the Simulation Data Inspector. Call this function while worker pools are running. The Simulation Data Inspector automatically cleans up repository files when you close the worker pool.

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')

% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

Initialize Parallel Workers

Use `gcp` to create a pool of local workers to run parallel simulations if you don't already have one. In an `spm` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spm
```

```
    % Load system and select signals to log
```

```

load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)

```

end

Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```

parfor index = 1:7

    % Select value for Ts
    Ts_val = Ts_vals(index);

    % Change the filter time constant and simulate
    modelWorkspace = get_param('slexAircraftExample','modelworkspace');
    modelWorkspace.assignin('Ts',Ts_val)
    sim('slexAircraftExample')

    % Create a worker run for each simulation
    workerRun(index) = Simulink.sdi.WorkerRun.getLatest

```

end

spmd

```

% Remove temporary directories
cd(workDir)
rmdir(tempDir, 's')
rmpath(workDir)

```

end

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```

ds(7) = Simulink.SimulationData.Dataset;

for a = 1:7
    ds(a) = workerRun(a).getDataset;
end
ds(1)

ans =
Simulink.SimulationData.Dataset '' with 2 elements

```

	Name	BlockPath
1 [1x1 Signal]	alpha, rad	...rcraftExample/Aircraft Dynamics Model
2 [1x1 Signal]	Stick	slexAircraftExample/Pilot

- Use braces { } to access, modify, or add elements using index.

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
end
```

```
datasetRef(1)
```

```
ans =
    DatasetRef with properties:
        Name: 'Run 3: slexAircraftExample'
        Run: [1x1 Simulink.sdi.Run]
    numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local Run objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7
    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);
end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2017b

Simulink.sdi.clear

Package: Simulink.sdi

Clear all data from the Simulation Data Inspector

Syntax

```
Simulink.sdi.clear
```

Description

`Simulink.sdi.clear` clears all plotted signals and deletes all data from the Simulation Data Inspector. The `Simulink.sdi.clear` function does not affect preferences or settings you have configured in the Simulation Data Inspector. Use the `Simulink.sdi.clearPreferences` function to reset the Simulation Data Inspector preferences to their default values. Use the `Simulink.sdi.clearAllSubPlots` function to clear all plotted signals without deleting any data from the Simulation Data Inspector.

Examples

Save a Simulation Data Inspector Session

This example creates, saves, and loads a Simulation Data Inspector session. The example logs data in the model `slexAircraftExample` and visualizes the logged data in a Simulation Data Inspector session. Each time you use the Simulation Data Inspector, you create and modify a session. You can save the data and associated visualization settings for a session in an MLDATX file using the `Simulink.sdi.save` function. When you want to review the data later, you can load the session using the `Simulink.sdi.load` function.

Log Data to the Simulation Data Inspector

This example logs data from a simulation of the model `slexAircraftExample` to the Simulation Data Inspector. The model is not configured to log data. Load the model and mark the `Stick`, the `alpha`, `rad`, and the `q`, `rad/sec` signals for logging.

```
load_system('slexAircraftExample')

Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')
```

For this example, run two simulations of the model. In the first simulation, use the sine wave output from the `Pilot` block, and in the second, use the square wave output.

```
set_param('slexAircraftExample/Pilot','WaveForm','sine')
sim('slexAircraftExample')

set_param('slexAircraftExample/Pilot','WaveForm','square')
sim('slexAircraftExample')
```

Visualize the Logged Data

You can use the Simulation Data Inspector programmatic interface to access the logged data from the simulations. When you access data using the Simulation Data Inspector programmatic interface, you can use functions to create plots in the Simulation Data Inspector.

To start, access the run IDs for the most recent two runs and then get the corresponding `Simulink.sdi.Run` object. The Run objects allow you to access the logged data for the simulations.

```
runIDs = Simulink.sdi.getAllRunIDs;
sineRunID = runIDs(end-1);
squareRunID = runIDs(end);

sineRun = Simulink.sdi.getRun(sineRunID);
squareRun = Simulink.sdi.getRun(squareRunID);
```

Suppose you want to analyze the relationship between the input and output for the model. Get the `Simulink.sdi.Signal` objects for the input and output signals from the two simulation runs.

```
sineOut = getSignalByIndex(sineRun,1);
sineIn = getSignalByIndex(sineRun,3);

squareOut = getSignalByIndex(squareRun,1);
squareIn = getSignalByIndex(squareRun,3);
```

Change the subplot layout in the Simulation Data Inspector to 2-by-1 and plot the signals from the first simulation run on the top plot and the signals from the second run on the bottom plot.

```
Simulink.sdi.setSubPlotLayout(2,1)

plotOnSubPlot(sineIn,1,1,true)
plotOnSubPlot(sineOut,1,1,true)

plotOnSubPlot(squareIn,2,1,true)
plotOnSubPlot(squareOut,2,1,true)
```

Save the Simulation Data Inspector Session

To view the plotted data in the Simulation Data Inspector, enter `Simulink.sdi.view` in the command window.

Then, save the Simulation Data Inspector session as an MLDATX file.

```
Simulink.sdi.save('myData.mldatx')
```

Load the Simulation Data Inspector Session

To mimic a scenario where you want to return to looking at the same data at a later point, clear the data from the Simulation Data Inspector and reset the subplot layout to 1-by-1.

```
Simulink.sdi.clear
Simulink.sdi.setSubPlotLayout(1,1)
```

Load the session file and resume working with the data. You can open the Simulation Data Inspector and view the results using the `Simulink.sdi.view` function.

```
Simulink.sdi.load('myData.mldatx');
```

[Simulink.sdi.clearPreferences](#) | [Simulink.sdi.deleteRun](#) |
[Simulink.sdi.deleteSignal](#) | [Simulink.sdi.clearAllSubPlots](#)

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2011b

Simulink.sdi.clearAllSubPlots

Clear plotted signals from all subplots in the Simulation Data Inspector

Syntax

```
Simulink.sdi.clearAllSubPlots
```

Description

`Simulink.sdi.clearAllSubPlots` clears plotted signals from all subplots in the Simulation Data Inspector, including any subplots with plotted data that are not visible in the current layout. Clearing plotted signals using the `Simulink.sdi.clearAllSubPlots` function does not delete data from the Simulation Data Inspector. To clear plotted signals and delete data from the Simulation Data Inspector, use the `Simulink.sdi.clear` function.

Examples

Clear Plotted Signals from All Subplots

You can programmatically clear plotted signals from all subplots in the Simulation Data Inspector. For example, clear plotted data at the start of a script that creates plots.

```
Simulink.sdi.clearAllSubPlots
```

Plot Signals from Simulation Run

This example demonstrates how to access the `Simulink.sdi.Run` object for a Simulation Data Inspector run created by logging signals. From the `Simulink.sdi.Run` object you can get `Simulink.sdi.Signal` objects that contain the logged signal data and metadata. You can use the `Signal` objects and the `plotOnSubPlot` function to plot the data in the Simulation Data Inspector.

Create a Simulation Run and Access the Run Object

The `ex_vdp` model logs two signals. To create a simulation run containing the logged data, simulate the model.

```
sim('ex_vdp');
```

The Simulation Data Inspector keeps track of runs by assigning a unique numeric run ID to each run created by simulation, importing data, or opening a session. To access the run object for the simulation you just performed, use the `Simulink.sdi.getAllRunIDs` function and take the last run ID in the returned vector.

```
runIDs = Simulink.sdi.getAllRunIDs;  
runID = runIDs(end);
```

Once you have the run ID for the run, you can use the `Simulink.sdi.getRun` function to get the `Simulink.sdi.Run` object that corresponds to the run. You can use the Run object to check the metadata associated with the run, including the number of signals in the run.

```
vdpRun = Simulink.sdi.getRun(runID);  
  
vdpRun.SignalCount  
ans = int32  
     2
```

Plot Data Using Signal Objects

Use the `getSignalByIndex` function to access signals from the Run object, `fuelRun`.

```
signal1 = getSignalByIndex(vdpRun,1);  
signal2 = getSignalByIndex(vdpRun,2);
```

Use the `Simulink.sdi.setSubPlotLayout` function to specify a 3-by-1 layout.

```
Simulink.sdi.setSubPlotLayout(2,1)
```

Before plotting the data, use the `Simulink.sdi.clearAllSubPlots` function to clear any data that is already plotted.

```
Simulink.sdi.clearAllSubPlots
```

Plot one signal on each subplot. To plot signals on the first subplot, you can set the `checked` property for the signal. To plot signals on subplots other than the first subplot, use the `plotOnSubPlot` function.

```
signal1.Checked = true;  
plotOnSubPlot(signal2,2,1,true);
```

View the Plotted Data

To view the plots you just created, open the Simulation Data Inspector using the `Simulink.sdi.view` function.

Introduced in R2019b

Simulink.sdi.clearPreferences

Restore Simulation Data Inspector preferences to default settings

Syntax

```
Simulink.sdi.clearPreferences
```

Description

`Simulink.sdi.clearPreferences` restores all Simulation Data Inspector preferences to their default values.

You can configure these preferences in the Simulation Data Inspector programmatically:

- Preferences:
 - Run naming rule — `Simulink.sdi.setRunNamingRule`
 - Subplot layout — `Simulink.sdi.setSubPlotLayout`
 - Signal grouping within a run — `Simulink.sdi.setTableGrouping`
- Time plot settings:
 - Border display — `Simulink.sdi.setBorderOn`
 - Grid display — `Simulink.sdi.setGridOn`
 - Data markers display — `Simulink.sdi.setMarkersOn`
 - Tick mark labels display — `Simulink.sdi.setTickLabelsDisplay`
 - Tick mark position — `Simulink.sdi.setTicksPosition`
- Archive preferences:
 - Archive behavior — `Simulink.sdi.setAutoArchiveMode`
 - Archive size limit — `Simulink.sdi.setArchiveRunLimit`

Examples

Restore All Simulation Data Inspector Preferences to Default Values

You can restore default values to all Simulation Data Inspector preferences programmatically using the `Simulink.sdi.clearPreferences` function.

```
Simulink.sdi.clearPreferences
```

Modify Run Naming Rule Then Restore Default

This example shows how to use the Simulation Data Inspector API to modify the Simulation Data Inspector run naming rule, check a run's name, restore default preferences, and check the run naming rule.

```
% Load model
load_system('sldemo_fuelsys')

% Modify run naming rule
Simulink.sdi.setRunNamingRule('<model_name> Run <run_index>')

% Simulate system
sim('sldemo_fuelsys')

% Check run name
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
fuelRun = Simulink.sdi.getRun(runID);
fuelRun.name

ans =
'sldemo_fuelsys Run 1'

% Clear preferences to reset the run naming rule
Simulink.sdi.clearPreferences

% Check run naming rule
Simulink.sdi.getRunNamingRule

ans =
'Run <run_index>: <model_name>'
```

Topics

“Configure the Simulation Data Inspector”

“Inspect and Compare Data Programmatically”

Introduced in R2017a

Simulink.sdi.close

Package: Simulink.sdi

Close the Simulation Data Inspector

Syntax

```
Simulink.sdi.close  
Simulink.sdi.close('filename')
```

Description

`Simulink.sdi.close` closes the **Simulation Data Inspector**.

`Simulink.sdi.close('filename')` closes the Simulation Data Inspector and saves the data in the file, `filename`.

Examples

Close the Simulation Data Inspector from the Command Line

You can close the Simulation Data Inspector from the MATLAB command line when you have finished inspecting and analyzing your data.

```
Simulink.sdi.close
```

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

Create `timeseries` objects to contain data for a sine signal and a cosine signal. Give each `timeseries` object a descriptive name.

```
time = linspace(0,20,100);  
  
sine_vals = sin(2*pi/5*time);  
sine_ts = timeseries(sine_vals,time);  
sine_ts.Name = 'Sine, T=5';  
  
cos_vals = cos(2*pi/8*time);  
cos_ts = timeseries(cos_vals,time);  
cos_ts.Name = 'Cosine, T=8';
```

Create a Run and Add Data

Use the `Simulink.sdi.view` function to open the Simulation Data Inspector.

```
Simulink.sdi.view
```

To import data into the Simulation Data Inspector from the workspace, create a `Simulink.sdi.Run` object using the `Simulink.sdi.Run.create` function. Add information about the run to its metadata using the `Name` and `Description` properties of the `Run` object.

```
sinusoidsRun = Simulink.sdi.Run.create;  
sinusoidsRun.Name = 'Sinusoids';  
sinusoidsRun.Description = 'Sine and cosine signals with different frequencies';
```

Use the `add` function to add the data you created in the workspace to the empty run.

```
add(sinusoidsRun, 'vars', sine_ts, cos_ts);
```

Plot the Data in the Simulation Data Inspector

Use the `getSignalByIndex` function to access `Simulink.sdi.Signal` objects that contain the signal data. You can use the `Simulink.sdi.Signal` object properties to specify the line style and color for the signal and plot it in the Simulation Data Inspector. Specify the `LineColor` and `LineDashed` properties for each signal.

```
sine_sig = getSignalByIndex(sinusoidsRun,1);  
sine_sig.LineColor = [0 0 1];  
sine_sig.LineDashed = '-.';  
  
cos_sig = sinusoidsRun.getSignalByIndex(2);  
cos_sig.LineColor = [0 1 0];  
cos_sig.LineDashed = '--';
```

Use the `Simulink.sdi.setSubPlotLayout` function to configure a 2-by-1 subplot layout in the Simulation Data Inspector plotting area. Then use the `plotOnSubplot` function to plot the sine signal on the top subplot and the cosine signal on the lower subplot.

```
Simulink.sdi.setSubPlotLayout(2,1);  
  
plotOnSubPlot(sine_sig,1,1,true);  
plotOnSubPlot(cos_sig,2,1,true);
```

Close the Simulation Data Inspector and Save Your Data

When you have finished inspecting the plotted signal data, you can close the Simulation Data Inspector and save the session to an `MLDATX` file.

```
Simulink.sdi.close('sinusoids.mldatx')
```

Introduced in R2013b

Simulink.sdi.compareRuns

Package: Simulink.sdi

Compare data in two simulation runs

Syntax

```
diffResult = Simulink.sdi.compareRuns(runID1,runID2)
diffResult = Simulink.sdi.compareRuns(runID1,runID2,Name=Value)
```

Description

`diffResult = Simulink.sdi.compareRuns(runID1,runID2)` compares the data in the runs that correspond to `runID1` and `runID2` and returns the result in the `Simulink.sdi.DiffRunResult` object `diffResult`. For more information about the comparison algorithm, see “How the Simulation Data Inspector Compares Data”.

`diffResult = Simulink.sdi.compareRuns(runID1,runID2,Name=Value)` compares the simulation runs that correspond to `runID1` and `runID2` using the options specified by one or more name-value arguments. For more information about comparison options, see “How the Simulation Data Inspector Compares Data”.

Examples

Compare Runs with Global Tolerance

You can specify global tolerance values to use when comparing two simulation runs. Global tolerance values are applied to all signals within the run. This example shows how to specify global tolerance values for a run comparison and how to analyze and save the comparison results.

First, load the session file that contains the data to compare. The session file contains data for four simulations of an aircraft longitudinal controller. This example compares data from two runs that use different input filter time constants.

```
Simulink.sdi.load('AircraftExample.mldatx');
```

To access the run data to compare, use the `Simulink.sdi.getAllRunIDs` function to get the run IDs that correspond to the last two simulation runs.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end - 1);
runID2 = runIDs(end);
```

Use the `Simulink.sdi.compareRuns` function to compare the runs. Specify a global relative tolerance value of 0.2 and a global time tolerance value of 0.5.

```
runResult = Simulink.sdi.compareRuns(runID1,runID2,'reltol',0.2,'timetol',0.5);
```

Check the `Summary` property of the returned `Simulink.sdi.DiffRunResult` object to see whether signals were within the tolerance values or out of tolerance.

```
runResult.Summary
ans = struct with fields:
    OutOfTolerance: 0
    WithinTolerance: 3
    Unaligned: 0
    UnitsMismatch: 0
    Empty: 0
    Canceled: 0
    EmptySynced: 0
    DataTypeMismatch: 0
    TimeMismatch: 0
    StartStopMismatch: 0
    Unsupported: 0
```

All three signal comparison results fell within the specified global tolerance.

You can save the comparison results to an MLDATX file using the `saveResult` function.

```
saveResult(runResult, 'InputFilterComparison');
```

Analyze Simulation Data Using Signal Tolerances

You can programmatically specify signal tolerance values to use in comparisons performed using the Simulation Data Inspector. In this example, you compare data collected by simulating a model of an aircraft longitudinal flight control system. Each simulation uses a different value for the input filter time constant and logs the input and output signals. You analyze the effect of the time constant change by comparing results using the Simulation Data Inspector and signal tolerances.

First, load the session file that contains the simulation data.

```
Simulink.sdi.load('AircraftExample.mldatx');
```

The session file contains four runs. In this example, you compare data from the first two runs in the file. Access the `Simulink.sdi.Run` objects for the first two runs loaded from the file.

```
runIDs = Simulink.sdi.getAllRunIDs;
runIDTs1 = runIDs(end-3);
runIDTs2 = runIDs(end-2);
```

Now, compare the two runs without specifying any tolerances.

```
noTolDiffResult = Simulink.sdi.compareRuns(runIDTs1, runIDTs2);
```

Use the `getResultByIndex` function to access the comparison results for the `q` and `alpha` signals.

```
qResult = getResultByIndex(noTolDiffResult, 1);
alphaResult = getResultByIndex(noTolDiffResult, 2);
```

Check the `Status` of each signal result to see whether the comparison result fell within our out of tolerance.

```
qResult.Status
```

```
ans =
    ComparisonSignalStatus enumeration
```

```
OutOfTolerance
```

```
alphaResult.Status
```

```
ans =  
    ComparisonSignalStatus enumeration  
  
    OutOfTolerance
```

The comparison used a value of 0 for all tolerances, so the `OutOfTolerance` result means the signals are not identical.

You can further analyze the effect of the time constant by specifying tolerance values for the signals. Specify the tolerances by setting the properties for the `Simulink.sdi.Signal` objects that correspond to the signals being compared. Comparisons use tolerances specified for the baseline signals. This example specifies a time tolerance and an absolute tolerance.

To specify a tolerance, first access the `Signal` objects from the baseline run.

```
runTs1 = Simulink.sdi.getRun(runIDTs1);  
qSig = getSignalsByName(runTs1,'q, rad/sec');  
alphaSig = getSignalsByName(runTs1,'alpha, rad');
```

Specify an absolute tolerance of 0.1 and a time tolerance of 0.6 for the `q` signal using the `AbsTol` and `TimeTol` properties.

```
qSig.AbsTol = 0.1;  
qSig.TimeTol = 0.6;
```

Specify an absolute tolerance of 0.2 and a time tolerance of 0.8 for the `alpha` signal.

```
alphaSig.AbsTol = 0.2;  
alphaSig.TimeTol = 0.8;
```

Compare the results again. Access the results from the comparison and check the `Status` property for each signal.

```
tolDiffResult = Simulink.sdi.compareRuns(runIDTs1,runIDTs2);  
qResult2 = getResultByIndex(tolDiffResult,1);  
alphaResult2 = getResultByIndex(tolDiffResult,2);
```

```
qResult2.Status
```

```
ans =  
    ComparisonSignalStatus enumeration  
  
    WithinTolerance
```

```
alphaResult2.Status
```

```
ans =  
    ComparisonSignalStatus enumeration  
  
    WithinTolerance
```

Configure Comparisons to Check Metadata

You can use the `Simulink.sdi.compareRuns` function to compare signal data and metadata, including data type and start and stop times. A single comparison may check for mismatches in one or more pieces of metadata. When you check for mismatches in signal metadata, the `Summary` property of the `Simulink.sdi.DiffRunResult` object may differ from a basic comparison because the `Status` property for a `Simulink.sdi.DiffSignalResult` object can indicate the metadata mismatch. You can configure comparisons using the `Simulink.sdi.compareRuns` function for imported data and for data logged from a simulation.

This example configures a comparison of runs created from workspace data three ways to show how the `Summary` of the `DiffSignalResult` object can provide specific information about signal mismatches.

Create Workspace Data

The `Simulink.sdi.compareRuns` function compares time series data. Create data for a sine wave to use as the baseline signal, using the `timeseries` format. Give the `timeseries` the name `Wave Data`.

```
time = 0:0.1:20;
sig1vals = sin(2*pi/5*time);
sig1_ts = timeseries(sig1vals,time);
sig1_ts.Name = 'Wave Data';
```

Create a second sine wave to compare against the baseline signal. Use a slightly different time vector and attenuate the signal so the two signals are not identical. Cast the signal data to the `single` data type. Also name this `timeseries` object `Wave Data`. The Simulation Data Inspector comparison algorithm will align these signals for comparison using the name.

```
time2 = 0:0.1:22;
sig2vals = single(0.98*sin(2*pi/5*time2));
sig2_ts = timeseries(sig2vals,time2);
sig2_ts.Name = 'Wave Data';
```

Create and Compare Runs in the Simulation Data Inspector

The `Simulink.sdi.compareRuns` function compares data contained in `Simulink.sdi.Run` objects. Use the `Simulink.sdi.createRun` function to create runs in the Simulation Data Inspector for the data. The `Simulink.sdi.createRun` function returns the run ID for each created run.

```
runID1 = Simulink.sdi.createRun('Baseline Run','vars',sig1_ts);
runID2 = Simulink.sdi.createRun('Compare to Run','vars',sig2_ts);
```

You can use the `Simulink.sdi.compareRuns` function to compare the runs. The comparison algorithm converts the signal data to the `double` data type and synchronizes the signal data before computing the difference signal.

```
basic_DRR = Simulink.sdi.compareRuns(runID1,runID2);
```

Check the `Summary` property of the returned `Simulink.sdi.DiffRunResult` object to see the result of the comparison.

```
basic_DRR.Summary
ans = struct with fields:
    OutOfTolerance: 1
    WithinTolerance: 0
        Unaligned: 0
    UnitsMismatch: 0
        Empty: 0
        Canceled: 0
    EmptySynced: 0
    DataTypeMismatch: 0
        TimeMismatch: 0
    StartStopMismatch: 0
        Unsupported: 0
```

The difference between the signals is out of tolerance.

Compare Runs and Check for Data Type Match

Depending on your system requirements, you may want the data types for signals you compare to match. You can use the `Simulink.sdi.compareRuns` function to configure the comparison algorithm to check for and report data type mismatches.

```
dataType_DRR = Simulink.sdi.compareRuns(runID1,runID2,'DataType','MustMatch');
dataType_DRR.Summary
```

```
ans = struct with fields:
    OutOfTolerance: 0
    WithinTolerance: 0
        Unaligned: 0
    UnitsMismatch: 0
        Empty: 0
        Canceled: 0
    EmptySynced: 0
    DataTypeMismatch: 1
        TimeMismatch: 0
    StartStopMismatch: 0
        Unsupported: 0
```

The result of the signal comparison is now `DataTypeMismatch` because the data for the baseline signal is double data type, while the data for the signal compared to the baseline is single data type.

Compare Runs and Check for Start and Stop Time Match

You can use the `Simulink.sdi.compareRuns` function to configure the comparison algorithm to check whether the aligned signals have the same start and stop times.

```
startStop_DRR = Simulink.sdi.compareRuns(runID1,runID2,'StartStop','MustMatch');
startStop_DRR.Summary
```

```
ans = struct with fields:
    OutOfTolerance: 0
    WithinTolerance: 0
        Unaligned: 0
    UnitsMismatch: 0
```

```

        Empty: 0
        Canceled: 0
        EmptySynced: 0
        DataTypeMismatch: 0
        TimeMismatch: 0
        StartStopMismatch: 1
        Unsupported: 0

```

The signal comparison result is now `StartStopMismatch` because the signals created in the workspace have different stop times.

Compare Runs with Alignment Criteria

When you compare runs using the Simulation Data Inspector, you can specify alignment criteria that determine how signals are paired with each other for comparison. This example compares data from simulations of a model of an aircraft longitudinal control system. The simulations used a square wave input. The first simulation used an input filter time constant of `0.1s` and the second simulation used an input filter time constant of `0.5s`.

First, load the simulation data from the session file that contains the data for this example.

```
Simulink.sdi.load('AircraftExample.mldatx');
```

The session file contains data for four simulations. This example compares data from the first two runs. Access the run IDs for the first two runs loaded from the session file.

```
runIDs = Simulink.sdi.getAllRunIDs;
runIDTs1 = runIDs(end-3);
runIDTs2 = runIDs(end-2);
```

Before running the comparison, define how you want the Simulation Data Inspector to align the signals between the runs. This example aligns signals by their name, then by their block path, and then by their Simulink identifier.

```
alignMethods = [Simulink.sdi.AlignType.SignalName
                Simulink.sdi.AlignType.BlockPath
                Simulink.sdi.AlignType.SID];
```

Compare the simulation data in your two runs, using the alignment criteria you specified. The comparison uses a small time tolerance to account for the effect of differences in the step size used by the solver on the transition of the square wave input.

```
diffResults = Simulink.sdi.compareRuns(runIDTs1,runIDTs2,'align',alignMethods,...
    'timetol',0.005);
```

You can use the `getResultByIndex` function to access the comparison results for the aligned signals in the runs you compared. You can use the `Count` property of the `Simulink.sdi.DiffRunResult` object to set up a `for` loop to check the `Status` property for each `Simulink.sdi.DiffSignalResult` object.

```
numComparisons = diffResults.count;
for k = 1:numComparisons
    resultAtIdx = getResultByIndex(diffResults,k);
```

```

sigID1 = resultAtIdx.signalID1;
sigID2 = resultAtIdx.signalID2;

sig1 = Simulink.sdi.getSignal(sigID1);
sig2 = Simulink.sdi.getSignal(sigID2);

displayStr = 'Signals %s and %s: %s \n';
fprintf(displayStr,sig1.Name,sig2.Name,resultAtIdx.Status);
end

```

```

Signals q, rad/sec and q, rad/sec: OutOfTolerance
Signals alpha, rad and alpha, rad: OutOfTolerance
Signals Stick and Stick: WithinTolerance

```

Input Arguments

runID1 — Baseline run identifier

integer

Numeric identifier for the baseline run in the comparison, specified as a run ID that corresponds to a run in the Simulation Data Inspector. The Simulation Data Inspector assigns run IDs when runs are created. You can get the run ID for a run by using the ID property of the `Simulink.sdi.Run` object, the `Simulink.sdi.getAllRunIDs` function, or the `Simulink.sdi.getRunIDByIndex` function.

runID2 — Identifier for run to compare

integer

Numeric identifier for the run to compare, specified as a run ID that corresponds to a run in the Simulation Data Inspector. The Simulation Data Inspector assigns run IDs when runs are created. You can get the run ID for a run by using the ID property of the `Simulink.sdi.Run` object, the `Simulink.sdi.getAllRunIDs` function, or the `Simulink.sdi.getRunIDByIndex` function.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: `AbsTol=x,Align=alignOpts`

Align — Signal alignment options

`Simulink.sdi.AlignType` scalar | `Simulink.sdi.AlignType` vector

Signal alignment options, specified as a `Simulink.sdi.AlignType` scalar or vector. The `Simulink.sdi.AlignType` enumeration includes a value for each option available for pairing each signal in the baseline run with a signal in the comparison run. You can specify one or more alignment options for the comparison. To use more than one alignment option, specify an array. When you specify multiple alignment options, the Simulation Data Inspector aligns signals first by the option in the first element of the array, then by the option in the second element array, and so on. For more information, see “Signal Alignment”.

Value	Aligns By
<code>Simulink.sdi.AlignType.BlockPath</code>	Path to the source block for the signal
<code>Simulink.sdi.AlignType.SID</code>	Simulink identifier For more information, see “Simulink Identifiers”.
<code>Simulink.sdi.AlignType.SignalName</code>	Signal name
<code>Simulink.sdi.AlignType.DataSource</code>	Path of the variable in the MATLAB workspace

Example: [`Simulink.sdi.AlignType.SignalName`,`Simulink.sdi.AlignType.BlockPath`] specifies signal alignment by signal name and then by block path.

AbsTol — Global absolute tolerance for comparison

0 (default) | positive-valued scalar

Global absolute tolerance for comparison, specified as a positive-valued scalar.

Global tolerances apply to all signals in the run comparison. To use a different tolerance value for a signal in the comparison, specify the tolerance you want to use on the `Simulink.sdi.Signal` object in the baseline run and set the `OverrideGlobalTol` property for that signal to `true`.

For more information about how tolerances are used in comparisons, see “Tolerance Specification”.

Example: 0.5

Data Types: `double`

RelTol — Global relative tolerance for comparison

0 (default) | positive-valued scalar

Global relative tolerance for comparison, specified as a positive-valued scalar. The relative tolerance is expressed as a fractional multiplier. For example, 0.1 specifies a 10 percent tolerance.

Global tolerances apply to all signals in the run comparison. To use a different tolerance value for a signal in the comparison, specify the tolerance you want to use on the `Simulink.sdi.Signal` object in the baseline run and set the `OverrideGlobalTol` property for that signal to `true`.

For more information about how tolerances are used in comparisons, see “Tolerance Specification”.

Example: 0.1

Data Types: `double`

TimeTol — Global time tolerance for comparison

0 (default) | positive-valued scalar

Global time tolerance for comparison, specified as a positive-valued scalar, using units of seconds.

Global tolerances apply to all signals in the run comparison. To use a different tolerance value for a signal in the comparison, specify the tolerance you want to use on the `Simulink.sdi.Signal` object in the baseline run and set the `OverrideGlobalTol` property for that signal to `true`.

For more information about tolerances in the Simulation Data Inspector, see “Tolerance Specification”.

Example: 0.2

Data Types: `double`

Data Type — Comparison sensitivity to signal data types

`"MustMatch"`

Comparison sensitivity to signal data types, specified as `"MustMatch"`. Specify `DataType="MustMatch"` when you want the comparison to be sensitive to data type mismatches in compared signals. When you specify this name-value argument, the algorithm compares the data types for aligned signals before synchronizing and comparing the signal data.

When signal data types do not match, the `Status` property of the `Simulink.sdi.DiffSignalResult` object for the result is set to `DataTypeMismatch`.

The `Simulink.sdi.compareRuns` function does not compare the data types of aligned signals unless you specify this name-value argument. When you do not specify this name-value argument, the comparison does compute results for signals with different data types.

When you specify that data types must match and configure the comparison to stop on the first mismatch, a data type mismatch stops the comparison. A stopped comparison may not compute results for all signals.

Time — Comparison sensitivity to signal time vectors

`"MustMatch"`

Comparison sensitivity to signal time vectors, specified as `"MustMatch"`. Specify `Time="MustMatch"` when you want the comparison to be sensitive to mismatches in the time vectors of compared signals. When you specify this name-value argument, the algorithm compares the time vectors of aligned signals before synchronizing and comparing the signal data.

When the time vectors for signals do not match, the `Status` property of the `Simulink.sdi.DiffSignalResult` object for the result is set to `TimeMismatch`.

Comparisons are not sensitive to differences in signal time vectors unless you specify this name-value argument. For comparisons that are not sensitive to differences in the time vectors, the comparison algorithm synchronizes the signals prior to the comparison. For more information about how synchronization works, see “How the Simulation Data Inspector Compares Data”.

When you specify that time vectors must match and configure the comparison to stop on the first mismatch, a time vector mismatch stops the comparison. A stopped comparison may not compute results for all signals.

StartStop — Comparison sensitivity to signal start and stop times

`"MustMatch"`

Comparison sensitivity to signal start and stop times, specified as `"MustMatch"`. Specify `StartStop="MustMatch"` when you want the comparison to be sensitive to mismatches in signal start and stop times. When you specify this name-value argument, the algorithm compares the start and stop times for aligned signals before synchronizing and comparing the signal data.

When the start times and stop times do not match, the `Status` property of the `Simulink.sdi.DiffSignalResult` object for the result is set to `StartStopMismatch`.

When you specify that start and stop times must match and configure the comparison to stop on the first mismatch, a start or stop time mismatch stops the comparison. A stopped comparison may not compute results for all signals.

StopOnFirstMismatch — Whether comparison stops on first detected mismatch`"Metadata" | "Any"`

Whether comparison stops on first detected mismatch without comparing remaining signals, specified as `"Metadata"` or `"Any"`. A stopped comparison may not compute results for all signals, and can return a mismatched result more quickly.

- **Metadata** — A mismatch in metadata for aligned signals causes the comparison to stop. Metadata comparisons happen before comparing signal data.

The Simulation Data Inspector always aligns signals and compares signal units. When you configure the comparison to stop on the first mismatch, an unaligned signal or mismatched units always causes the comparison to stop. You can specify additional name-value arguments to configure the comparison to check and stop on the first mismatch for additional metadata, such as signal data type, start and stop times, and time vectors.

- **Any** — A mismatch in metadata or signal data for aligned signals causes the comparison to stop.

ExpandChannels — Whether to compute comparison results for each channel in multidimensional signals`true or 1 (default) | false or 0`

Whether to compute comparison results for each channel in multidimensional signals, specified as logical `true` (1) or `false` (0).

- `true` or `1` — Comparison expands multidimensional signals represented as a single signal with nonscalar sample values to a set of signals with scalar sample values and computes a comparison result for each of these signals.

The representation of the multidimensional signal in the Simulation Data Inspector as a single signal with nonscalar sample values does not change.

- `false` or `0` — Comparison does not compute results for multidimensional signals represented as a single signal with nonscalar sample values.

Output Arguments**diffResult — Comparison results**`Simulink.sdi.DiffRunResult` object

Comparison results, returned as a `Simulink.sdi.DiffRunResult` object.

Limitations

The Simulation Data Inspector does not support comparing:

- Signals of data types `int64` or `uint64`.
- Variable-size signals.

“How the Simulation Data Inspector Compares Data”

Introduced in R2011b

Simulink.sdi.compareSignals

Package: Simulink.sdi

Compare data in two Simulink.sdi.Signal objects

Syntax

```
diff = Simulink.sdi.compareSignals(sigID1,sigID2)
```

Description

`diff = Simulink.sdi.compareSignals(sigID1,sigID2)` compares the signals that correspond to the signal IDs `sigID1` and `sigID2` and returns the results in a `Simulink.sdi.DiffSignalResult` object. For more information on how the comparison results are computed, see “How the Simulation Data Inspector Compares Data”.

Examples

Compare Two Signals in the Same Run

You can use the Simulation Data Inspector programmatic interface to compare signals within a single run. This example compares the input and output signals of an aircraft longitudinal controller.

First, load the session that contains the data.

```
Simulink.sdi.load('AircraftExample.mldatx');
```

Use the `Simulink.sdi.Run.getLatest` function to access the latest run in the data.

```
aircraftRun = Simulink.sdi.Run.getLatest;
```

Then, you can use the `Simulink.sdi.getSignalsByName` function to access the `Stick` signal, which represents the input to the controller, and the `alpha, rad` signal that represents the output.

```
stick = getSignalsByName(aircraftRun,'Stick');
alpha = getSignalsByName(aircraftRun,'alpha, rad');
```

Before you compare the signals, you can specify a tolerance value to use for the comparison. Comparisons use tolerance values specified for the baseline signal in the comparison, so set an absolute tolerance value of `0.1` on the `Stick` signal.

```
stick.AbsTol = 0.1;
```

Now, compare the signals using the `Simulink.sdi.compareSignals` function. The `Stick` signal is the baseline, and the `alpha, rad` signal is the signal to compare against the baseline.

```
comparisonResults = Simulink.sdi.compareSignals(stick.ID,alpha.ID);
match = comparisonResults.Status
```

```
match =
    ComparisonSignalStatus enumeration
```

```
OutOfTolerance
```

The comparison result is out of tolerance. You can use the `Simulink.sdi.view` function to open the Simulation Data Inspector to view and analyze the comparison results.

Compare Signals from Different Runs

This example shows how to compare signals from different simulation runs using the Simulation Data Inspector's `Simulink.sdi.compareSignals` function. When you only have one signal of interest to compare, using a signal comparison returns the `Simulink.sdi.diffSignalResult` object with the comparison data directly.

Generate Simulation Data

Use the `slexAircraftExample` model to generate simulation runs. Between the runs, change the time constant of the input filter.

```
% Load example model
load_system('slexAircraftExample')

% Mark the alpha, rad signal for streaming
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')

% Simulate system
out_1 = sim('slexAircraftExample');

% Change input filter time constant
modelWorkspace = get_param('slexAircraftExample','modelworkspace');
assignin(modelWorkspace,'Ts',0.2)

% Simulate again
out_2 = sim('slexAircraftExample');
```

Get Signal IDs for the Signal Comparison

Create run objects using the run IDs, and then use `getSignalIDByIndex` to get the signal IDs to pass to `Simulink.sdi.compareSignals`.

```
% Get run data
runIDs = Simulink.sdi.getAllRunIDs;

runID1 = runIDs(end-1);
runID2 = runIDs(end);

run1 = Simulink.sdi.getRun(runID1);
run2 = Simulink.sdi.getRun(runID2);

sigID1 = getSignalIDByIndex(run1,1);
sigID2 = getSignalIDByIndex(run2,1);
```

Compare Signals

Compare the signals, and open the Simulation Data Inspector to view the results.

```
diffResult = Simulink.sdi.compareSignals(sigID1,sigID2);
Simulink.sdi.view
```

Input Arguments

sigID1 — Signal ID of baseline signal

scalar

Signal ID for the baseline signal, specified as an integer. The Simulation Data Inspector assigns a signal ID to each signal when a run is created. You can get the signal ID for a signal using one of these functions:

- `getAllSignalIDs`
- `getSignalIDByIndex`
- `getSignalIDsByName`
- `Simulink.sdi.createRun`

sigID2 — Signal ID of signal to compare

scalar

Signal ID for the signal to compare, specified as an integer. The Simulation Data Inspector assigns a signal ID to each signal when a run is created. You can get the signal ID for a signal using one of these functions:

- `getAllSignalIDs`
- `getSignalIDByIndex`
- `getSignalIDsByName`
- `Simulink.sdi.createRun`

Output Arguments

diff — Signal comparison results

`Simulink.sdi.diffSignalResult` | array of `Simulink.sdi.diffSignalResult` objects

Signal comparison results, returned as a `Simulink.sdi.DiffSignalResult` object. Complex signal comparison results are returned as an array of two `DiffSignalResult` objects. One `DiffSignalResult` object contains the real data and the other contains the imaginary data. Check the `Name` property of the `DiffSignalResult` object to determine whether it contains real or imaginary data.

Limitations

The Simulation Data Inspector does not support comparing:

- Signals of data types `int64` or `uint64`.
- Variable-size signals.

Simulink.sdi.copyRun

Copy a Simulation Data Inspector run

Syntax

```
newRunID = Simulink.sdi.copyRun(runID)
[newRunID,runIndex] = Simulink.sdi.copyRun(runID)
[newRunID,runIndex,signalIDs] = Simulink.sdi.copyRun(runID)
```

Description

`newRunID = Simulink.sdi.copyRun(runID)` copies the run corresponding to `runID` and returns the run ID for the new run. The new run includes all the simulation data and metadata from the original run. You can modify the copy of the run by adding or deleting signals and metadata while still retaining the original run.

`[newRunID,runIndex] = Simulink.sdi.copyRun(runID)` copies the run corresponding to `runID` and returns the run ID and index in the Simulation Data Inspector repository for the new run. The new run includes all the simulation data and metadata from the original run.

`[newRunID,runIndex,signalIDs] = Simulink.sdi.copyRun(runID)` copies the run corresponding to `runID` and returns the signal IDs for the signals in the new run along with its run ID and index in the Simulation Data Inspector repository. The new run includes all the simulation data and metadata from the original run.

Examples

Compare a Subset of Signals

This example shows how to use `Simulink.sdi.copyRun` and `Simulink.sdi.deleteSignal` to create a copy of a run that contains a subset of the signals from the original run. You can use the copy to analyze and run comparisons on a subset of signals while still holding onto the original run that has all of the signals. For example, the model `sldemo_fuelsys` is configured to log ten signals. To compare the system's responses to different types of failures, you don't need to run the comparison on all of the logged signals. Deleting signals that do not represent the system's response before running the comparison saves processing time and simplifies the view of the results.

Create Runs

Load the model `sldemo_fuelsys` and run simulations to create runs in the Simulation Data Inspector. The first run simulates a failure of the throttle angle sensor, and the second run simulates a failure of the exhaust gas oxygen sensor.

```
load_system('sldemo_fuelsys')
modelWorkspace = get_param('sldemo_fuelsys','modelworkspace');
modelWorkspace.assignin('throttle_sw',0)
modelWorkspace.assignin('ego_sw',1)
sim('sldemo_fuelsys')
```

```
modelWorkspace.assignin('throttle_sw',1)
modelWorkspace.assignin('ego_sw',0)
sim('sldemo_fuelsys')
```

Copy the Run

Use the Simulation Data Inspector's programmatic interface to get `Simulink.sdi.Run` objects for the simulations, and then create copies of the runs.

```
% Get runs
runIDs = Simulink.sdi.getAllRunIDs;

runID1 = runIDs(end-1);
runID2 = runIDs(end);

run1 = Simulink.sdi.getRun(runID1);
run2 = Simulink.sdi.getRun(runID2);

% Create a copy of each run, truncRun
[truncRun1,runIndex1,signalIDs1] = Simulink.sdi.copyRun(runID1);
[truncRun2,runIndex2,signalIDs2] = Simulink.sdi.copyRun(runID2);
```

Delete Signals in Run Copy

The `sldemo_fuelsys` model is configured to log the values of the fault switches along with several signals representing the system's response. When you compare the system's response when a throttle angle sensor fails to its response when an exhaust gas oxygen sensor fails, comparing the fault switch states does not provide new information. Therefore, delete the switch signals before running the comparison to eliminate unnecessary computations.

```
Simulink.sdi.deleteSignal(signalIDs1(1))
Simulink.sdi.deleteSignal(signalIDs1(3))
Simulink.sdi.deleteSignal(signalIDs1(5))
Simulink.sdi.deleteSignal(signalIDs1(8))

Simulink.sdi.deleteSignal(signalIDs2(1))
Simulink.sdi.deleteSignal(signalIDs2(3))
Simulink.sdi.deleteSignal(signalIDs2(5))
Simulink.sdi.deleteSignal(signalIDs2(8))
```

Compare Truncated Runs

You can use the truncated runs you created with `Simulink.sdi.copyRun` and `Simulink.sdi.deleteSignal` to perform a comparison of the system's response to different types of failures. Then, open the Simulation Data Inspector to view the comparison results.

```
truncRunDiff = Simulink.sdi.compareRuns(truncRun1,truncRun2);

Simulink.sdi.view
```

Input Arguments

runID — Numeric run identifier
scalar

Run ID for the run you want to copy. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for your run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

Output Arguments

newRunID — Run ID for the copy

scalar

Run ID for the copy of the run.

runIndex — Run index for the copy

scalar

Index of the copy in the Simulation Data Inspector repository.

signalIDs — Numeric identifiers for the signals in the copy

matrix

Matrix containing the signal IDs for the copies of signals created in the copy of the run.

Simulink.sdi.copyRunViewSettings

Copy line style and color for signals from one run to another

Syntax

```
sigIDs = Simulink.sdi.copyRunViewSettings(run1,run2,plot)
```

Description

`sigIDs = Simulink.sdi.copyRunViewSettings(run1,run2,plot)` copies the line style and color specifications from `runID1` to `runID2` for matched signals. You can specify `run1` and `run2` with their run ID or as a `Simulink.sdi.Run` object. If `plot` is specified as `true`, `Simulink.sdi.copyRunViewSettings` also changes signal parameters in both runs so that aligned signals that are plotted come from the `run2`. The function returns an array of signal identifiers for the signals that the Simulation Data Inspector aligned between the two runs. To learn more about how the Simulation Data Inspector aligns signals between runs, see “How the Simulation Data Inspector Compares Data”.

Examples

Copy View Settings to a Run

This example shows how to copy view settings from one run to another and how to create figures using the `Simulink.sdi.CustomSnapshot` object.

Simulate Your Model and Get a Run Object

Configure the `vdp` model to save output data, and run a simulation to create data.

```
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
set_param('vdp/Mu','Gain','1');
sim('vdp');
```

Use the Simulation Data Inspector programmatic interface to access the run data.

```
runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

Modify Signal View Settings

Use the `Simulink.sdi.Run` object to access signals in the run. Then, modify the signal view settings. This example specifies the line color and style for each signal. The view settings for the run comprise the view settings for each signal and view settings specified for the plot area.

```
sig1 = vdpRun.getSignalByIndex(1);
sig2 = vdpRun.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
```

```
sig1.LineDashed = '-.-';
sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;
```

You can use properties of the `Simulink.sdi.CustomSnapshot` object to configure the plot settings, like the subplot layout and axis limits, and to plot signals. When you use a `Simulink.sdi.CustomSnapshot` object to create your figure, these plot settings do not affect the Simulation Data Inspector.

```
snap.Rows = 2;
snap.YRange = {[ -2.25 2.25], [ -3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)
```

Use `Simulink.sdi.snapshot` to generate the figure you specified in the properties of the `Simulink.sdi.CustomSnapshot` object.

```
fig = Simulink.sdi.snapshot("from", "custom", "to", "figure", "settings", snap);
```

Copy the View Settings to a New Simulation Run

Simulate the model again, with a different Mu value. Use the Simulation Data Inspector programmatic interface to access the simulation data.

```
set_param('vdp/Mu', 'Gain', '5')
sim('vdp');

runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);
```

To create a plot of the new output data that looks like the one you created in the previous step, you can copy the view settings to the run in a single line of code using `Simulink.sdi.copyRunViewSettings`. The `Simulink.sdi.copyRunViewSettings` function does not automatically update plot settings in `Simulink.sdi.CustomSnapshot` objects, so specify the plot input as `false`.

```
sigIDs = Simulink.sdi.copyRunViewSettings(runID, runID2, false);
```

Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[ -2.25 2.25], [-8 8]};
snap.plotOnSubPlot(1,1,sigIDs(1),true)
snap.plotOnSubPlot(2,1,sigIDs(2),true)

fig = snap.snapshot("to", "figure");
```

Input Arguments

run1 — Simulation Data Inspector run ID for source run

scalar | 'Simulink.sdi.Run' object

Run with the view settings you want to copy specified with its run ID or `Simulink.sdi.Run` object. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for your run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

run2 — Simulation Data Inspector run ID for destination run

scalar | 'Simulink.sdi.Run' object

Run you want to copy the view settings to, specified with its run ID or `Simulink.sdi.Run` object. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for your run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

plot — Specify whether to update plotted signals

true | false

Specifies whether the Simulation Data Inspector changes the plot settings in the runs corresponding to `run1` and `run2`.

- When `plot` is `true`, the Simulation Data Inspector modifies the signal parameters so that the aligned signals that are plotted come from `run2`.

- When `plot` is `false`, the Simulation Data Inspector does not change which signals are plotted.

Data Types: `logical`

Output Arguments

sigIDs — Signal IDs for aligned signals

`matrix`

Matrix containing the signal IDs for signals in `run2` that aligned with signals in `run1` and had view settings modified.

“Create Plots Using the Simulation Data Inspector”

Introduced in R2016a

Simulink.sdi.createRun

Import data into new run in Simulation Data Inspector and return run ID

Syntax

```
runID = Simulink.sdi.createRun
runID = Simulink.sdi.createRun(runName)

runID = Simulink.sdi.createRun(var)
runID = Simulink.sdi.createRun(runName, 'vars', var, var2, ..., varn)
runID = Simulink.sdi.createRun(runName, 'namevalue', sourceNames, sigValues)

runID = Simulink.sdi.createRun(runName, 'file', filename)
runID = Simulink.sdi.createRun(runName, 'file', filename, Name=Value)

[runID, runIndex] = Simulink.sdi.createRun(____)
[runID, runIndex, sigIDs] = Simulink.sdi.createRun(____)
```

Description

Create Empty Run

`runID = Simulink.sdi.createRun` creates an empty, unnamed run in the Simulation Data Inspector and returns the run ID for the created run.

You can use the `Simulink.sdi.getRun` function to access the `Simulink.sdi.Run` object that corresponds to the run. Set the properties on the Run object to add metadata to the run. Use the `Simulink.sdi.addToRun` function or the `add` function to add data to the run.

`runID = Simulink.sdi.createRun(runName)` creates an empty run named `runName`.

Import Data from Workspace

`runID = Simulink.sdi.createRun(var)` imports data from the scalar variable `var` into a new run in the Simulation Data Inspector. The run is named according to the input variable. For example, when `var` is a `timeseries` object, the run name comes from the `Name` property on the `timeseries` object.

`runID = Simulink.sdi.createRun(runName, 'vars', var, var2, ..., varn)` imports data from one or more variables into a new run in the Simulation Data Inspector named `runName`.

Use this syntax to import data from multiple variables or from a variable that represents an array of objects, such as an array of `Simulink.SimulationOutput` or `Simulink.SimulationData.Dataset` objects.

`runID = Simulink.sdi.createRun(runName, 'namevalue', sourceNames, sigValues)` imports data from one or more variables into a new run in the Simulation Data Inspector named `runName`. The cell array `sourceNames` specifies the names used to set the `RootSource`, `TimeSource`, and `DataSource` properties for the signals imported from the `sigValues` cell array.

Import Data from File

`runID = Simulink.sdi.createRun(runName, 'file', filename)` imports data from a file into a new run in the Simulation Data Inspector. You can use a built-in file reader to import data from a MAT file, CSV file, Microsoft Excel file, or an MDF file.

When you need to import data from a file that the built-in readers do not support, you can write your own reader using the `io.reader` class.

`runID = Simulink.sdi.createRun(runName, 'file', filename, Name=Value)` imports data from a file into a new run in the Simulation Data Inspector according to options specified using one or more name-value arguments. For example, `sheets=["sheet1" "sheet2"]` specifies the sheets from which to import data when importing data from an Excel file.

Return Additional Run Information

`[runID,runIndex] = Simulink.sdi.createRun(___)` returns the run ID and the run index in the Simulation Data Inspector for the created run.

`[runID,runIndex,sigIDs] = Simulink.sdi.createRun(___)` returns the run ID, run index in the Simulation Data Inspector, and the signal IDs for the signals in the created run.

Examples

Create a Run in the Simulation Data Inspector

You can programmatically import data into the Simulation Data Inspector by creating a run from data in the base workspace or a file. This example creates data in the workspace and then illustrates several methods of creating a Simulation Data Inspector run containing the data.

Create Data

Create data in the workspace. The Simulation Data Inspector supports time series data in many formats. This example creates data using the `timeseries` and `Simulink.SimulationData.Dataset` formats and saves the data in a MAT-file.

Create a sine signal and a cosine signal. Store the data for each signal in a `timeseries` object with a descriptive name.

```
time = 0:0.2:20;

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';
```

You can use the `Dataset` format to group related signal data together in a single object. The `Dataset` format is the default format for logged data and is supported for loading simulation input data. Create a `Dataset` object that contains the sinusoid `timeseries` data.

```
sinusoids_ds = Simulink.SimulationData.Dataset;
sinusoids_ds = addElement(sinusoids_ds,cos_ts);
sinusoids_ds = addElement(sinusoids_ds,sine_ts);
```

Scale each signal by a factor of 2 and create a Dataset object to contain the signal data for the results.

```
doubSine = 2*sine_ts;
doubCos = 2*cos_ts;

doubSinusoids_ds = Simulink.SimulationData.Dataset;
doubSinusoids_ds = addElement(doubSinusoids_ds,doubSine);
doubSinusoids_ds = addElement(doubSinusoids_ds,doubCos);
```

Finally, save the timeseries data to a MAT-file.

```
save sinusoids.mat sine_ts cos_ts
```

Open the Simulation Data Inspector

To view the runs you create in each section, open the Simulation Data Inspector by entering `Simulink.sdi.view` in the MATLAB™ Command Window.

Create a Run Using a Simulink.sdi.Run Object

You can import your data into a run in the Simulation Data Inspector by creating an empty run and then adding data to the run from the workspace or a file. Depending on your task, you can use the `Simulink.sdi.Run.create` function or the `Simulink.sdi.createRun` function to create the empty run. The `Simulink.sdi.Run.create` function returns the `Simulink.sdi.Run` object for the new run, and the `Simulink.sdi.createRun` function returns the run ID for the new run.

This example creates an empty run using the `Simulink.sdi.Run.create` function, gives the run a meaningful name and description, and then adds the sine and cosine timeseries data using the `add` function.

```
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals of different frequencies';

add(sinusoidsRun,'vars',sine_ts,cos_ts)
```

This example uses the `Simulink.sdi.createRun` function to create a new run in the Simulation Data Inspector called `My Waves` and then uses the `Simulink.sdi.addToRun` function to add the sine and cosine timeseries data to the run.

```
runID = Simulink.sdi.createRun('My Waves');
signalID = Simulink.sdi.addToRun(runID,'vars',sine_ts,cos_ts);
```

Create a Run from a Workspace Variable

You can create a run from a single variable in the workspace. After creating the run, you can add additional data, or you can create another run to contain your other data. The variable you use to create the run can be a `timeseries` object with data that corresponds to only one signal, or it can be a `Dataset` object that contains several signals.

When you use this syntax to create a run from a single workspace variable, the run takes the same name as the object used to create it.

```
runID = Simulink.sdi.createRun(sine_ts);
```

The `Simulink.sdi.createRun` function returns the run ID for the run it creates. You can use the `Simulink.sdi.getRun` function to access the Run object for the run.

```
sineRun = Simulink.sdi.getRun(runID);  
sineRun.Name
```

```
ans =  
'Sine, T=5'
```

Create a Run from Multiple Workspace Variables

When your data exists in multiple variables in your workspace, you can use the `Simulink.sdi.createRun` function with the `vars` option to import the data from multiple variables into a single run in the Simulation Data Inspector. You can also use this syntax to create a run for a single variable that uses a name you specify.

This example creates a run called `My Sinusoids` that contains data for the sine and cosine timeseries objects.

```
runID = Simulink.sdi.createRun('My Sinusoids', 'vars', sine_ts, cos_ts);
```

Create a Run and Specify Source Names

You can use the `namevalue` option of the `Simulink.sdi.createRun` function to create a run and specify names for the signals in the run. This syntax can be particularly helpful when you import individual leaf signals from hierarchical data.

This example creates a run containing the data for both the `Dataset` objects. Each `Dataset` object contains data for more than one signal, so the imported run data has hierarchy. The name-value syntax in this example specifies a name for the hierarchical node that corresponds to each `Dataset` object.

```
runID = Simulink.sdi.createRun('Waves', 'namevalue', {'Sinusoids', ...  
            'BigSinusoids'}, {sinusoids_ds, doubSinusoids_ds});
```

Create a Run from Data in a File

You can also use the `Simulink.sdi.createRun` function to import data into the Simulation Data Inspector from a file. Use the `file` option to import the data in the `simusoids.mat` file.

```
runID = Simulink.sdi.createRun('Wave Data', 'file', 'sinusoids.mat');
```

Create a Simulation Data Inspector Run and Access Signal Data

This example shows how to access signal data when you create a run in the Simulation Data Inspector.

Generate Data for Run

For this example, create timeseries data for sine and cosine signals.

```
% Create timeseries workspace data  
time = linspace(0, 20, 101);
```

```
sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';
```

```
cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Run and Return Signal IDs

You can use the `Simulink.sdi.createRun` syntax with multiple return arguments to get the signal IDs more directly instead of accessing the signal IDs through a `Simulink.sdi.Run` object.

```
[runID,runIndex,sigIDs] = Simulink.sdi.createRun('Sinusoids','vars',...
    sine_ts,cos_ts);
```

```
cosID = sigIDs(2);
cosSig = Simulink.sdi.getSignal(cosID);
```

Modify Signal Properties and View in the Simulation Data Inspector

You can use the `Simulink.sdi.Signal` object to view and modify signal properties and to plot signals in the Simulation Data Inspector.

```
cosSig.Checked = true;
cosSig.AbsTol = 0.05;
Simulink.sdi.view
cosSig.Name
```

Input Arguments

runName — Name for run

string | character vector

Name for run in Simulation Data Inspector, specified as a string or a character vector.

Example: 'Baseline Simulation'

var — Data to import

variable

Data to import, specified as a variable. The Simulation Data Inspector supports time-based data in which sample values are associated with sample times. The Simulation Data Inspector supports all loading and logging data formats, including `timeseries` and `Simulink.SimulationData.Dataset`.

Example: `myData`

sourceNames — Source names for imported data

cell array of character vectors

Source names for imported data, specified as a cell array of character vectors. The source name is used to set the `RootSource`, `TimeSource`, and `DataSource` properties of the `Simulink.sdi.Signal` objects created from the data specified by the `sigValues` input.

Provide a `sourceNames` input when you specify 'namevalue' for the second argument.

Example: {'sig1','sig2'}

sigValues – Data to import

cell array of variables

Data to import, specified as a cell array of variables.

Provide a `sigValues` input when you specify 'namevalue' for the second argument.

Example: {var1,var2}

filename – Name of file with data to import

character vector

Name of file with data to import, specified as a character vector. Provide a `filename` input when you specify 'file' for the second argument.

You can create a run from these types of files using file readers built into the Simulation Data Inspector:

- MAT-file
- CSV file
- Microsoft Excel file that contains data formatted according to “Microsoft Excel Import, Export, and Logging Format”.
- MDF file with one of these extensions:
 - .mdf
 - .mf4
 - .mf3
 - .data
 - .dat

When you need to import data from a file that the built-in readers do not support, you can write your own reader using the `io.reader` class. You can also write a custom reader to use instead of the built-in reader for any file extension. For an example, see “Import Data Using a Custom File Reader”.

Example: 'simulation.mat'

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, . . . , NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Example: `sheets=["sheet1" "sheet2"]`

reader – File reader to use to import data

string | character vector

File reader to use to import data, specified as a string or character vector.

The Simulation Data Inspector prioritizes using a registered custom reader when one is available for the file. When you do not specify a reader, the Simulation Data Inspector uses the first custom reader

registered for the file. If no custom readers are registered, the data is imported using the built-in reader.

Specify the reader input when:

- You want to use the built-in reader to import data for a file that is also supported by a custom reader.
- Multiple registered custom readers support the file.

To determine which readers are available to import your file, use the `io.reader.getSupportedReadersForFile` function.

Example: "MyExcelReader"

Example: "built-in"

sheets — Sheets in Excel file from which to import data

string array | cell array of character vectors

Sheets in Excel file from which to import data, specified as a string array or a cell array of character vectors. By default, the Simulation Data Inspector imports data from all sheets. Use the `sheets` name-value argument when you do not want to import data from all sheets in the Excel file.

When the data in the file does not include simulation numbers and source information, the data on each sheet is imported into a separate run. For more information about formatting data to import from an Excel file, see "Microsoft Excel Import, Export, and Logging Format".

Example: ["sheet1" "sheet2"]

model — Model with definitions of user-defined data types

string | character vector

Model with definitions of user-defined data types, specified as a string or character vector.

When you load data from an Excel file that defines signal data types using user-defined data types, such as enumerations, buses, or aliases, the Simulation Data Inspector needs access to the type definition to import the data. You can provide access to the type definitions by:

- Loading the associated object into the MATLAB workspace.
- Specifying the `model` name-value argument to use type definitions saved in the model workspace or a data dictionary.

For more information on formatting data to import from an Excel file, see "Microsoft Excel Import, Export, and Logging Format".

Example: "myModel.slx"

Output Arguments

runID — Run ID for run that contains imported data

scalar

Run ID for run that contains imported data, returned as a scalar.

runIndex — Run index in Simulation Data Inspector for run that contains imported data

scalar

Run index in Simulation Data Inspector for run that contains imported data, returned as a scalar.

sigIDs — Signal IDs for signals created from imported data

scalar | vector

Signal IDs for signals created from imported data, returned as a scalar or a vector.

Simulink.sdi.createRunOrAddToStreamedRun

Package: Simulink.sdi

Create a single run for all simulation outputs

Syntax

```
runID = Simulink.sdi.createRunOrAddToStreamedRun mdl, runName, varSources,
varValues)
```

Description

`runID = Simulink.sdi.createRunOrAddToStreamedRun mdl, runName, varSources, varValues)` creates a run with the data `varValues` if no run exists in the Simulation Data Inspector repository for the model `mdl`. If one or more runs for the model `mdl` exist in the Simulation Data Inspector repository, the function adds `varValues` to the most recent run associated with `mdl`. The run is named according to `runName`, and the sources for the data in `varValues` are named according to `varSources`.

Examples

Add Signals to a Run

This example shows how to use `Simulink.sdi.createRunOrAddToStreamedRun` to add data to an existing run for a model. In this example, you add data logged using the `Structure with Time` format to a run that contains logged signal data.

Simulate the Model

Open the `slexAircraftExample` model and mark the output of the Pilot block for logging. The logged signal data uses the `Dataset` format and streams to the Simulation Data Inspector during simulation. The model is configured to log outputs, states, and time as well as signals. Simulate the model and return a single output in the workspace with all the logged data. Use the `Structure with Time` format for logged states and outputs.

```
load_system('slexAircraftExample')

Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,1)

out = sim('slexAircraftExample','ReturnWorkspaceOutputs','on',...
        'SaveFormat','StructureWithTime');
```

Add Logged States Data to Run

The Simulation Data Inspector automatically created a run for the logged signal data. Add the logged states and outputs data to the existing run using `Simulink.sdi.createRunOrAddToStreamedRun`.

```
Simulink.sdi.createRunOrAddToStreamedRun('slexAircraftExample','Run 1',...
        {'out'},{out});
```

Open the Simulation Data Inspector to View Results

Use the `Simulink.sdi.view` function to open the Simulation Data Inspector and view the results.

Using `Simulink.sdi.createRunOrAddToStreamedRun` avoids redundancy in the data shown in the Simulation Data Inspector. When you use the `Simulink.sdi.createRun` function to import the output and states data, the Simulation Data Inspector creates a second run. When you use the `Simulink.sdi.addToRun` function to add the logged states and output data to the run, the Simulation Data Inspector imports a duplicate of the Pilot block output signal. Using `Simulink.sdi.createRunOrAddToStreamedRun`, you can include all simulation data in a single run without duplicating any signals.

Input Arguments

mdl — Name of model that created simulation data

character vector

Name of the model the simulation data is from, specified as a character vector.

Example: `'my_model'`

runName — Name for the run

character vector

Name for the new or augmented run. If `Simulink.sdi.createRunOrAddToStreamedRun` adds data to an existing run, the run is renamed according to `runName`.

Example: `'Run 1'`

varSources — Names to use for the sources of data

cell array of character vectors

Names for the sources of the data in `varValues`.

Example: `{'sig1','sig2'}`

varValues — Data to add to run

cell array

Cell array of data to incorporate into the run. `Simulink.sdi.createRunOrAddToStreamedRun` supports data in all logging and loading formats, including timeseries and `Simulink.SimulationData.Dataset`.

Example: `{sig1,sig2}`

Output Arguments

runID — Run identifier

scalar

Run identifier for the new or augmented run.

Introduced in R2017a

Simulink.sdi.deleteRun

Package: Simulink.sdi

Delete a run from the Simulation Data Inspector repository

Syntax

```
Simulink.sdi.deleteRun(runID)
```

Description

`Simulink.sdi.deleteRun(runID)` deletes the run corresponding to `runID`. When you delete a run, the indices of all runs following the deleted run change to account for the change in the run count. Deleting a run does not change any run IDs.

Examples

Delete a Run

You can delete a run from the Simulation Data Inspector repository to free up memory space or to declutter your workspace from data you do not need.

```
% Load and simulate sldemo_fuelsys model
openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')

% Get the run ID for the run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Delete the run
Simulink.sdi.deleteRun(runID)
```

Input Arguments

runID — Run identifier

scalar

Run ID for the run you want to delete. You can get the run ID for a run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

See Also

`Simulink.sdi.clear` | `Simulink.sdi.copyRun` | `Simulink.sdi.deleteSignal` |

Introduced in R2011b

Simulink.sdi.deleteSignal

Package: Simulink.sdi

Delete signal in the Simulation Data Inspector

Syntax

```
Simulink.sdi.deleteSignal(sigID)
```

Description

`Simulink.sdi.deleteSignal(sigID)` deletes the specified signal or signals from the Simulation Data Inspector.

Examples

Compare a Subset of Signals

This example shows how to use `Simulink.sdi.copyRun` and `Simulink.sdi.deleteSignal` to create a copy of a run that contains a subset of the signals from the original run. You can use the copy to analyze and run comparisons on a subset of signals while still holding onto the original run that has all of the signals. For example, the model `sldemo_fuelsys` is configured to log ten signals. To compare the system's responses to different types of failures, you don't need to run the comparison on all of the logged signals. Deleting signals that do not represent the system's response before running the comparison saves processing time and simplifies the view of the results.

Create Runs

Load the model `sldemo_fuelsys` and run simulations to create runs in the Simulation Data Inspector. The first run simulates a failure of the throttle angle sensor, and the second run simulates a failure of the exhaust gas oxygen sensor.

```
load_system('sldemo_fuelsys')
modelWorkspace = get_param('sldemo_fuelsys','modelworkspace');
modelWorkspace.assignin('throttle_sw',0)
modelWorkspace.assignin('ego_sw',1)
sim('sldemo_fuelsys')

modelWorkspace.assignin('throttle_sw',1)
modelWorkspace.assignin('ego_sw',0)
sim('sldemo_fuelsys')
```

Copy the Run

Use the Simulation Data Inspector's programmatic interface to get `Simulink.sdi.Run` objects for the simulations, and then create copies of the runs.

```
% Get runs
runIDs = Simulink.sdi.getAllRunIDs;
```

```

runID1 = runIDs(end-1);
runID2 = runIDs(end);

run1 = Simulink.sdi.getRun(runID1);
run2 = Simulink.sdi.getRun(runID2);

% Create a copy of each run, truncRun
[truncRun1,runIndex1,signalIDs1] = Simulink.sdi.copyRun(runID1);
[truncRun2,runIndex2,signalIDs2] = Simulink.sdi.copyRun(runID2);

```

Delete Signals in Run Copy

The `sldemo_fuelsys` model is configured to log the values of the fault switches along with several signals representing the system's response. When you compare the system's response when a throttle angle sensor fails to its response when an exhaust gas oxygen sensor fails, comparing the fault switch states does not provide new information. Therefore, delete the switch signals before running the comparison to eliminate unnecessary computations.

```

Simulink.sdi.deleteSignal(signalIDs1(1))
Simulink.sdi.deleteSignal(signalIDs1(3))
Simulink.sdi.deleteSignal(signalIDs1(5))
Simulink.sdi.deleteSignal(signalIDs1(8))

Simulink.sdi.deleteSignal(signalIDs2(1))
Simulink.sdi.deleteSignal(signalIDs2(3))
Simulink.sdi.deleteSignal(signalIDs2(5))
Simulink.sdi.deleteSignal(signalIDs2(8))

```

Compare Truncated Runs

You can use the truncated runs you created with `Simulink.sdi.copyRun` and `Simulink.sdi.deleteSignal` to perform a comparison of the system's response to different types of failures. Then, open the Simulation Data Inspector to view the comparison results.

```

truncRunDiff = Simulink.sdi.compareRuns(truncRun1,truncRun2);

Simulink.sdi.view

```

Input Arguments

sigID — Signal or signals to delete

scalar | vector

Signal to delete, specified as a scalar signal ID or vector of signal IDs. The Simulation Data Inspector assigns a unique numeric signal ID to each signal when a run is created for logged or imported data.

You can get the signal ID for a signal using one of these functions:

- `getAllSignalIDs`
- `getSignalIDByIndex`
- `getSignalIDsByName`
- `Simulink.sdi.createRun`

Introduced in R2016a

Simulink.sdi.DiffRunResult.getLatest

Access results from most recent comparison

Syntax

```
diffRes = Simulink.sdi.DiffRunResult.getLatest
```

Description

`diffRes = Simulink.sdi.DiffRunResult.getLatest` returns the `Simulink.sdi.DiffRunResult` object `diffRes` for the most recent comparison performed using the Simulation Data Inspector UI or programmatic interface.

Tip When you compare data using the Simulation Data Inspector UI, results are not returned in the workspace. You can use the `Simulink.sdi.DiffRunResult.getLatest` function to access results for comparisons performed using the Simulation Data Inspector UI. When you compare data using the `Simulink.sdi.compareRuns` or `Simulink.sdi.compareSignals` functions, the function returns the data in a `Simulink.sdi.DiffRunResult` object or a `Simulink.sdi.DiffSignalResult` object.

Examples

Access Results for a UI Comparison

Use the `Simulink.sdi.DiffRunResult.getLatest` function to access the results of the most recent comparison to save or process further. For more information about how to compare data using the Simulation Data Inspector UI, see “Compare Simulation Data”.

```
compResults = Simulink.sdi.DiffRunResult.getLatest;
```

Retrieve Comparison Results in a Workspace Variable

You can use the `Simulink.sdi.getCurrentComparison` function or the `Simulink.sdi.DiffRunResult.getResult` function to retrieve the results for the most recent comparison if you accidentally delete the returned results from the workspace using the `clear` function.

If you delete the contents of the Simulation Data Inspector using the `Simulink.sdi.clear` function, you cannot recover the results.

Compare Simulation Data

This example creates runs to compare by running two simulations of the model `ex_vdp` with different values for `Mu`.

```
load_system('ex_vdp')
```

```
set_param('ex_vdp/Mu', 'Gain', '2');
out1 = sim('ex_vdp');

set_param('ex_vdp/Mu', 'Gain', '5');
out2 = sim('ex_vdp');
```

Use the `Simulink.sdi.getAllRunIDs` function to access the run IDs for the runs created from the simulations. Then use the `Simulink.sdi.compareRuns` function to compare the data.

```
IDs = Simulink.sdi.getAllRunIDs;
runID1 = IDs(end-1);
runID2 = IDs(end);

diffRun = Simulink.sdi.compareRuns(runID1, runID2);
```

Suppose you clear the workspace and lose the `diffRun` variable with the comparison results.

```
clear diffRun
```

Retrieve Comparison Data in the Workspace

Use the `Simulink.sdi.getCurrentComparison` function to recover the comparison results.

```
diffRun = Simulink.sdi.getCurrentComparison

diffRun =
  DiffRunResult with properties:

    MatlabVersion: '9.12.0.1884302 (R2022a)'
    RunID1: 8869
    RunID2: 8890
    BaselineRunName: 'Run 1: ex_vdp'
    CompareToRunName: 'Run 2: ex_vdp'
    Count: 2
    DateCreated: 27-Feb-2022 03:00:54
    GlobalTolerance: [1x1 struct]
    Summary: [1x1 struct]
    Options: {'Units' 'MustMatch'}
    Status: Completed
    StopReason: []
```

You could also use the `Simulink.sdi.DiffRunResult.getLatest` function to recover the results.

```
clear diffRun

diffRun = Simulink.sdi.DiffRunResult.getLatest

diffRun =
  DiffRunResult with properties:

    MatlabVersion: '9.12.0.1884302 (R2022a)'
    RunID1: 8869
    RunID2: 8890
    BaselineRunName: 'Run 1: ex_vdp'
    CompareToRunName: 'Run 2: ex_vdp'
    Count: 2
    DateCreated: 27-Feb-2022 03:00:54
    GlobalTolerance: [1x1 struct]
```

```
Summary: [1x1 struct]
Options: {'Units' 'MustMatch'}
Status: Completed
StopReason: []
```

Output Arguments

diffRes — Results of most recent comparison

Simulink.sdi.DiffRunResult object

Results of the most recent comparison, returned as a Simulink.sdi.DiffRunResult object.

See Also

Simulink.sdi.DiffRunResult | Simulink.sdi.DiffSignalResult |
Simulink.sdi.compareRuns

Topics

“Compare Simulation Data”

Introduced in R2020a

Simulink.sdi.enablePCTSupport

Control when to import data from parallel simulations into the Simulation Data Inspector

Syntax

```
Simulink.sdi.enablePCTSupport(mode)
```

Description

`Simulink.sdi.enablePCTSupport(mode)` configures data import into the Simulation Data Inspector from parallel workers according to the mode specified by `mode`. You can configure the Simulation Data Inspector to import only data from local workers, or data from local and remote workers. You can also set the mode to manual, which allows you to manually import runs into the Simulation Data Inspector using the `Simulink.sdi.sendWorkerRunToClient` function. By default, the Simulation Data Inspector is configured for the manual import mode.

Examples

Enable Automatic Data Import for All Parallel Workers

Configure Simulation Data Inspector parallel worker support to import the output automatically from both local and remote workers.

```
Simulink.sdi.enablePCTSupport('all')
```

Disable Automatic Data Import from Parallel Workers

To prevent the output from Parallel Computing Toolbox workers from automatically importing into the Simulation Data Inspector, specify the manual support mode.

```
Simulink.sdi.enablePCTSupport('manual')
```

Manually Send Runs from Parallel Workers to the Simulation Data Inspector

This example shows how to use `Simulink.sdi.sendWorkerRunToClient` to send runs created using parallel workers manually to the Simulation Data Inspector.

Setup

This example runs several simulations of the `vdp` model, varying the value of the gain, `Mu`. To set up for the parallel simulation, define a vector of `Mu` values and configure the Simulation Data Inspector for manual Parallel Computing Toolbox support.

```
% Enable manual Parallel Computing Toolbox support
Simulink.sdi.enablePCTSupport('manual');
```

```
% Choose several Mu values
MuVals = [1 2 3 4];
```

Initialize Parallel Workers

Use `parpool` (Parallel Computing Toolbox) to start a pool of four parallel workers. This example calls `parpool` inside an if statement so you only create a parallel pool if you don't already have one. You can use `spmd` (Parallel Computing Toolbox) to run initialization code common to all workers. For example, load the `vdp` model and select signals to log to runs that we can send to the Simulation Data Inspector on the client MATLAB. To avoid data concurrency issues when simulating with `sim` in `parfor`, create a temporary directory on each worker. After the simulations complete, another `spmd` block deletes the temporary directories.

```
p = gcp('nocreate');
```

```
if isempty(p)
```

```
    parpool(4);
```

```
end
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd
```

```
% Load system and select signals to log
load_system('vdp')
Simulink.sdi.markSignalForStreaming('vdp/x1',1,'on')
Simulink.sdi.markSignalForStreaming('vdp/x2',1,'on')

% Create temporary directory for simulation on worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)
```

```
end
```

Run Parallel Simulations with parfor

To stream data from parallel workers to the Simulation Data Inspector, you have to run parallel simulations using `parfor` (Parallel Computing Toolbox). Each worker runs a `vdp` simulation with a different value of `Mu`. Simulink cannot access the contents of the `parfor` loop, so the variable `MuVal` is defined in the worker's workspace, where the `vdp` model can see it, using `assignin`.

```
parfor (index = 1:4)
```

```
% Set value of Mu in the worker's base workspace
assignin('base','MuVal',MuVals(index));

% Modify the value of Mu in the model and simulate
set_param('vdp/Mu','Gain','MuVal')
sim('vdp')
```

Access Data and Send Run to Client MATLAB

You can use the Simulation Data Inspector programmatic interface on the worker the same way you would in the client MATLAB. This example creates a `Simulink.sdi.Run` object and attaches the value of `Mu` used in the simulation with the `Tag` property.

```
% Attach metadata to the run
IDs = Simulink.sdi.getAllRunIDs;
lastIndex = length(IDs);
runID = Simulink.sdi.getRunIDByIndex(lastIndex);
parRun = Simulink.sdi.getRun(runID);
parRun.Tag = strcat('Mu = ', num2str(MuVals(index)));

% Send the run to the Simulation Data Inspector on the client MATLAB
Simulink.sdi.sendWorkerRunToClient
```

```
end
```

Close Temporary Directories and View Runs in the Simulation Data Inspector

Use another `spm` section to delete the temporary directories created on the workers once the simulations complete. In each simulation, `Simulink.sdi.sendWorkerRunToClient` imported runs from all the workers into the Simulation Data Inspector. You can view the data and check the run properties to see the value of `Mu` used during simulation.

```
spmd
```

```
% Remove temporary directories
cd(workDir)
rmdir(tempDir, 's')
rmpath(workDir)
```

```
end
```

```
Simulink.sdi.view
```

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')

% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

Initialize Parallel Workers

Use `gcp` to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd
```

```
% Load system and select signals to log
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)
```

```
end
```

Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7
```

```
% Select value for Ts
Ts_val = Ts_vals(index);

% Change the filter time constant and simulate
modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
modelWorkspace.assignin('Ts', Ts_val)
sim('slexAircraftExample')

% Create a worker run for each simulation
workerRun(index) = Simulink.sdi.WorkerRun.getLatest
```

```
end
```

```
spmd
```

```
% Remove temporary directories
cd(workDir)
rmdir(tempDir, 's')
rmpath(workDir)
```

```
end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;

for a = 1:7
    ds(a) = workerRun(a).getDataset;
end
ds(1)

ans =
Simulink.SimulationData.Dataset '' with 2 elements
```

	Name	BlockPath
1 [1x1 Signal]	alpha, rad	...rcraftExample/Aircraft Dynamics Model
2 [1x1 Signal]	Stick	slexAircraftExample/Pilot

- Use braces { } to access, modify, or add elements using index.

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
end

datasetRef(1)

ans =
DatasetRef with properties:
    Name: 'Run 3: slexAircraftExample'
    Run: [1x1 Simulink.sdi.Run]
    numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local `Run` objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

`Simulink.sdi.cleanupWorkerResources`

Input Arguments

mode — Parallel worker data import mode

'manual' (default) | 'local' | 'all'

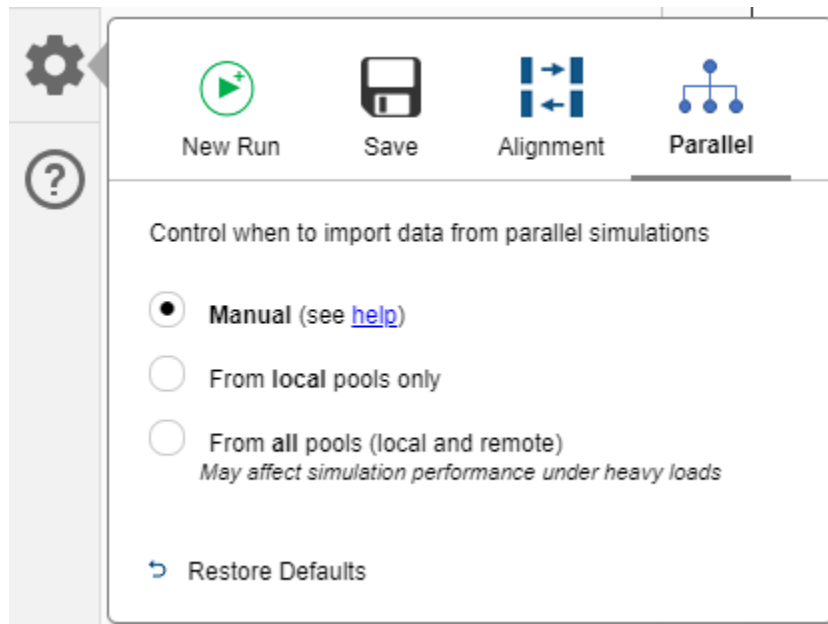

Simulation Data Inspector data import mode for data logged on parallel workers, specified as one of these options:

- 'manual' — Do not automatically import runs created on parallel workers. You can manually import runs created on parallel workers using the `Simulink.sdi.sendWorkerRunToClient` function.
- 'local' — Automatically import runs created on local workers.
- 'all' — Automatically import runs created on local and remote workers.

Data Types: char | string

Alternative Functionality

You can modify the parallel computing support mode in the Simulation Data Inspector by selecting **Preferences > Parallel**.

Compatibility Considerations

'none' input is no longer supported

Errors starting in R2020a

Starting in R2020a, the `Simulink.sdi.enablePCTSupport` function no longer supports the 'none' input option. To disable automatic import of data logged on parallel workers into the Simulation Data Inspector, use the 'manual' option.

Logical inputs are ignored

Behavior changed in R2020a

Starting in R2020a, the `Simulink.sdi.enablePCTSupport` function ignores logical inputs. In scripts that specify a logical input for the `Simulink.sdi.enablePCTSupport` function, replace a `0` or `false` input with the 'manual' input option and a `1` or `true` input with the 'all' option to achieve equivalent behavior.

Input values have changed

Behavior changed in R2018a

Starting in R2018a, the `Simulink.sdi.enablePCTSupport` input values changed to:

- 'local'
- 'none'
- 'all'
- 'manual'

In R2017b, the `Simulink.sdi.enablePCTSupport` function accepted a logical input to enable or disable Simulation Data Inspector support for data logged in parallel simulations.

- `true` or `1` enables support for automatically importing data from all parallel workers into the Simulation Data Inspector.

In R2018a, use the 'all' option for the same behavior. You can also use the new 'local' input when you want to automatically import data only from local workers.

- `false` or `0` disables all support for importing data logged on parallel workers.

In R2018a, use the 'none' option for the same behavior. You can also use the new 'manual' option when you want to analyze data on the worker to determine whether you want to import individual runs into the Simulation Data Inspector from a parallel worker.

`Simulink.sdi.sendWorkerRunToClient`

Topics

"Inspect and Compare Data Programmatically"

Introduced in R2017b

Simulink.sdi.exportRun

Export Simulation Data Inspector run data to the workspace or a file

Syntax

```
dataset = Simulink.sdi.exportRun(runID)
Simulink.sdi.exportRun(runID,Name,Value)
```

Description

`dataset = Simulink.sdi.exportRun(runID)` creates a `Simulink.SimulationData.Dataset` object in the base workspace with the data in the Simulation Data Inspector run identified by `runID`.

`Simulink.sdi.exportRun(runID,Name,Value)` exports the data in the run corresponding to `runID` to the base workspace or a file according to the options specified by one or more name-value pair arguments. You can export data for one or more runs to a MAT, MLDATX, or Microsoft Excel file. To export data for multiple runs to a file, you can specify the `runIDs` input as a vector of run IDs.

Examples

Export Run Data

This example shows how to export data from a run in the Simulation Data Inspector to a `Simulink.SimulationData.Dataset` object in the base workspace that you can use to further process your data. The method you choose to export your run depends on the processing you do in your script. If you have a run object for the run, you can use the `export` method to create a `Simulink.SimulationData.Dataset` object with the run data in the base workspace. If you do not have a run object, use the `Simulink.sdi.exportRun` function to export the run to the workspace.

Export Run Using `Simulink.sdi.exportRun`

Use the `Simulink.sdi.export` function to export run data to the workspace or a file when your workflow does not include creating a run object.

To create a run of simulation data, open the `vdp` model, mark signals for logging, and run a simulation.

```
load_system('vdp')

SignalHandles = get_param('vdp', 'Lines');

Simulink.sdi.markSignalForStreaming(SignalHandles(5).Handle, 'on')
Simulink.sdi.markSignalForStreaming(SignalHandles(6).Handle, 'on')

out = sim('vdp');
```

Use the `Simulink.sdi.getAllRunIDs` function to access the most recently created run.

```
runIDs = Simulink.sdi.getAllRunIDs;  
runID = runIDs(end);
```

Use the `Simulink.sdi.exportRun` function to export the run data to a `Dataset` object in the workspace.

```
simDataset = Simulink.sdi.exportRun(runID);
```

Export Run Using the export Function

When your task involves creating a Run object, you can use the `export` function to create a `Simulink.SimulationData.Dataset` object in the base workspace to further process the run data. For example, suppose you need to access Run objects for simulation runs with signal data you want to compare using the `Simulink.sdi.compareSignals` function.

Load a model and mark signals for logging. Then simulate the model to create run data.

```
load_system('vdp')  
  
SignalHandles = get_param('vdp', 'Lines');  
  
Simulink.sdi.markSignalForStreaming(SignalHandles(5).Handle, 'on')  
Simulink.sdi.markSignalForStreaming(SignalHandles(6).Handle, 'on')  
  
sim('vdp');
```

Use the `Simulink.sdi.getAllRunIDs` function to access the run ID for the most recently created run. Then, use the `Simulink.sdi.getRun` function to access the Run object corresponding to the run.

```
runIDs = Simulink.sdi.getAllRunIDs;  
runID = runIDs(end);  
vdpRun = Simulink.sdi.getRun(runID);
```

Use the `export` function to export the run data to a `Dataset` object in the workspace.

```
simDataset = export(vdpRun);
```

Input Arguments

runID — Run identifier

scalar | vector

Run identifier for the run you want to export to the workspace or a file. When you export data to a file, you can export more than one run by specifying the `runID` input as a vector of Simulation Data Inspector run IDs.

The Simulation Data Inspector assigns a unique run ID to each run. You can get the run ID for one or more runs using `Simulink.sdi.getAllRunIDs` and `Simulink.sdi.getRunIDByIndex`.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: 'to', 'file'

to — Where to export data

'variable' (default) | 'file'

Where to export data, specified as the comma-separated pair consisting of 'to' and 'variable' or 'file'.

When you export data to a file, you must also specify a file name using the 'filename' name-value pair argument. You can specify a file name with a .mat, .mldatx, or .xlsx extension.

When you export a run to a MAT-file, the data is saved in a `Simulink.SimulationData.Dataset` object. When you export more than one run to a MAT-file using the `Simulink.sdi.exportRun` function, the data is saved in a `Dataset` object, where each element is a `Dataset` object that contains the data for one exported run.

Data exported to a Microsoft Excel file is saved using the format described in “Microsoft Excel Import, Export, and Logging Format”.

When you export data to a Microsoft Excel file, you can specify additional options using the 'overwrite', 'metadata', and 'sharetimecolumn' name-value pairs.

Example: 'to', 'file'

filename — Name of file to contain exported data

string | character array

Name of the file to contain the exported data, specified as the comma-separated pair consisting of 'filename' and a string or character array. Include a .mat, .mldatx, or .xlsx extension in the file name to specify whether to export the data to a MAT-file, MLDATX file, or a Microsoft Excel file. When you do not specify an extension with a file name, the data exports to a MAT-file.

Use the 'filename' name-value pair argument when you specify the 'to' name-value pair argument with the value 'file'.

When you export data to a Microsoft Excel file, you can specify additional options using the 'overwrite', 'metadata', and 'sharetimecolumn' name-value pair arguments.

Example: 'filename', "mySpreadsheet.xlsx"

overwrite — Data to overwrite in existing Microsoft Excel file

'file' (default) | 'sheetonly'

Data to overwrite in existing Microsoft Excel file, specified as the comma-separated pair consisting of 'overwrite' and 'file' or 'sheetonly'.

- 'file' — Overwrite the entire file with the exported data.
- 'sheetonly' — Only overwrite sheets of the Microsoft Excel file with data that corresponds to the exported data.

When you export data to an existing MAT-file or MLDATX file, the exported data overwrites the entire file.

Example: 'overwrite', 'sheetonly'

metadata — Metadata to include in exported Microsoft Excel file

[] (default) | string array

Metadata to include in the exported Microsoft Excel file, specified as the comma-separated pair consisting of 'metadata' and a string array. By default, the export operation does not include any metadata. You can export this metadata to the Microsoft Excel file:

- `dataType` — Signal data type
- `units` — Signal units
- `blockPath` — Path to the source block for logged signals
- `interp` — Signal interpolation method
- `portIndex` — Index of the port on the source block for logged signals

You can specify the desired metadata in any order you choose in the string array. The order of the metadata in the string array does not affect the format in the exported file, which always matches the description in “Microsoft Excel Import, Export, and Logging Format”.

Example: 'metadata', ["units", "dataType"]

sharetimecolumn — Whether signals share time columns in exported Microsoft Excel file

'on' (default) | 'off'

Whether signals that have identical time data share time columns in the exported Microsoft Excel file, specified as the comma-separated pair consisting of 'sharetimecolumn' and 'on' or 'off'. By default, signals with the same time data share a time column in the exported file. When you specify the value as 'off', each signal in the exported file has its own time column.

Example: 'sharetimecolumn', 'off'

Output Arguments**dataset — Dataset containing run data**

Simulink.SimulationData.Dataset

Simulink.SimulationData.Dataset object containing the data from the run identified by runID.

Introduced in R2017a

Simulink.sdi.getAllRunIDs

Package: Simulink.sdi

Get all Simulation Data Inspector run identifiers

Syntax

```
runIDs = Simulink.sdi.getAllRunIDs
```

Description

`runIDs = Simulink.sdi.getAllRunIDs` returns a matrix of the run identifiers for all runs in the Simulation Data Inspector repository.

Examples

Get Simulation Data Inspector Run IDs

Many tasks performed using the Simulation Data Inspector programmatic interface start with obtaining the run ID for a simulation run. This example illustrates several methods to get the run ID for a run. You can use the run ID to access the `Simulink.sdi.Run` object that contains the run data and metadata and perform run comparisons using the `Simulink.sdi.compareRuns` function.

Create a Run

The model `sldemo_fuelsys` is already configured for logging. When you simulate the model, the Simulation Data Inspector automatically creates a run and assigns it a run ID.

```
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')
```

Get Run ID Using `Simulink.sdi.getAllRunIDs`

The `Simulink.sdi.getAllRunIDs` function returns an array of all run IDs for the runs in the Simulation Data Inspector repository, in order, with the most recently created run at the end.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Get Run ID Using `Simulink.sdi.getRunIDByIndex`

You can also use the `Simulink.sdi.getRunCount` and `Simulink.sdi.getRunIDByIndex` functions to get the run ID for a run. This method is useful if you also want to use `count` as a counting variable to index through the runs in the Simulation Data Inspector repository.

```
count = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(count);
```

Get Run ID from a `Simulink.sdi.Run` Object

You can also get the run ID from the `Simulink.sdi.Run` object that corresponds to the run. This example uses the `Simulink.sdi.getCurrentSimulationRun` function to get the Run object that

corresponds to the most recent simulation of the `sldemo_fuelsys` model. You can also use the `Simulink.sdi.Run.getLatest` function to access the most recently created Run object.

```
fuelsysRun = Simulink.sdi.getCurrentSimulationRun('sldemo_fuelsys');  
runID = fuelsysRun.ID;
```

Output Arguments

runIDs — Matrix of Simulation Data Inspector run IDs

matrix

Matrix of run IDs in the Simulation Data Inspector repository.

“Inspect and Compare Data Programmatically”

Introduced in R2017a

Simulink.sdi.getArchiveRunLimit

Get limit for number of runs to retain in Simulation Data Inspector archive

Syntax

```
limit = Simulink.sdi.getArchiveRunLimit
```

Description

`limit = Simulink.sdi.getArchiveRunLimit` returns the limit on the number of runs the Simulation Data Inspector retains in the archive. A return of -1 indicates no limit on the number of runs.

When you run multiple simulations in a single MATLAB session, the Simulation Data Inspector retains results from each simulation so you can analyze the results together. Use the Simulation Data Inspector archive to manage the number of runs the Simulation Data Inspector retains and to visually manage runs in the user interface.

Tip To automatically limit the number of runs, configure the Simulation Data Inspector to automatically move prior runs into the archive using the `Simulink.sdi.setAutoArchiveMode` function and specify the archive run limit.

For information about how to control the amount of data logged from simulation, see “Limit the Size of Logged Data”.

Examples

Stop Retaining Data in Simulation Data Inspector

You can configure the Simulation Data Inspector to retain only the logged data for your current simulation. In iterative design and debugging workflows, this configuration helps prevent accumulation of unwanted logged data on disk.

First, check the configuration of the Simulation Data Inspector archive. Save the archive preference values to restore your preferences after you finish designing or debugging.

```
limit = Simulink.sdi.getArchiveRunLimit;  
mode = Simulink.sdi.getAutoArchiveMode;
```

Configure the Simulation Data Inspector to automatically move runs into the archive. Then, set the archive run limit to 0.

```
Simulink.sdi.setAutoArchiveMode(true)  
Simulink.sdi.setArchiveRunLimit(0)
```

When you simulate your model, the Simulation Data Inspector deletes the previous run and updates the view to show signals from the current simulation.

When you finish designing or debugging your model, you can restore the Simulation Data Inspector archive back to the previous configuration.

```
Simulink.sdi.setArchiveRunLimit(limit)  
Simulink.sdi.setAutoArchiveMode(mode)
```

Output Arguments

limit — Maximum number of runs to store in Simulation Data Inspector archive

numeric scalar

Maximum number of runs to store in Simulation Data Inspector archive, returned as a numeric scalar. A value of -1 indicates no limit on the number of runs to retain in the archive.

Introduced in R2018b

Simulink.sdi.getAutoArchiveMode

Get Simulation Data Inspector run management mode

Syntax

```
archive = Simulink.sdi.getAutoArchiveMode
```

Description

`archive = Simulink.sdi.getAutoArchiveMode` returns a logical value that indicates whether the Simulation Data Inspector automatically manages runs using the archive.

- 1 — When you start a new simulation, the Simulation Data Inspector automatically moves the prior simulation run into the archive. In the user interface, the run moves into the collapsible **Archive** pane, and plots update to show data from the current simulation.
- 0 — The Simulation Data Inspector does not manage runs automatically with the archive or update plots.

Examples

Stop Retaining Data in Simulation Data Inspector

You can configure the Simulation Data Inspector to retain only the logged data for your current simulation. In iterative design and debugging workflows, this configuration helps prevent accumulation of unwanted logged data on disk.

First, check the configuration of the Simulation Data Inspector archive. Save the archive preference values to restore your preferences after you finish designing or debugging.

```
limit = Simulink.sdi.getArchiveRunLimit;  
mode = Simulink.sdi.getAutoArchiveMode;
```

Configure the Simulation Data Inspector to automatically move runs into the archive. Then, set the archive run limit to 0.

```
Simulink.sdi.setAutoArchiveMode(true)  
Simulink.sdi.setArchiveRunLimit(0)
```

When you simulate your model, the Simulation Data Inspector deletes the previous run and updates the view to show signals from the current simulation.

When you finish designing or debugging your model, you can restore the Simulation Data Inspector archive back to the previous configuration.

```
Simulink.sdi.setArchiveRunLimit(limit)  
Simulink.sdi.setAutoArchiveMode(mode)
```

Output Arguments

archive — Whether Simulation Data Inspector automatically manages runs using archive
true or 1 | false or 0

Whether Simulation Data Inspector automatically manages runs using archive, returned as logical 1 (true) or 0 (false).

See Also

`Simulink.sdi.setAutoArchiveMode` | `Simulink.sdi.setArchiveRunLimit` |
`Simulink.sdi.getArchiveRunLimit`

Topics

“Configure the Simulation Data Inspector”

Introduced in R2018b

Simulink.sdi.getBorderOn

Get border display setting for time plots

Syntax

```
border = Simulink.sdi.getBorderOn
```

Description

`border = Simulink.sdi.getBorderOn` returns the current setting for whether borders are displayed on time plots in the Simulation Data Inspector. The return value corresponds to the value of the **Show border** setting on the **Time Plot** section of the **Visualization Settings** in the Simulation Data Inspector. The setting applies to all time plots in the layout. By default, the Simulation Data Inspector displays the border on time plots.

Examples

Configure Time Plot Border Display

You can use the `Simulink.sdi.setBorderOn` function to show or hide the border on time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector shows the border on time plots.

This example starts by showing how to use the `Simulink.sdi.getBorderOn` function to determine whether the border is currently displayed. Subsequent sections show the code to hide and show the border. To show the result, the example generates an image using the `Simulink.sdi.snapshot` function with settings specified by a `Simulink.sdi.CustomSnapshot` object.

```
snapSettings = Simulink.sdi.CustomSnapshot;  
snapSettings.Width = 300;  
snapSettings.Height = 300;
```

Get Current Border Display Setting

Before modifying the border display setting for time plots, you can save the current setting to a variable in the workspace in case you want to restore the preference later.

```
border = Simulink.sdi.getBorderOn;
```

Hide the Border on Time Plots

```
Simulink.sdi.setBorderOn(false)  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Show the Border on Time Plots

```
Simulink.sdi.setBorderOn(true)  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Output Arguments

border — Border display setting for time plots

true or 1 | false or 0

Border display setting for time plots in the Simulation Data Inspector, returned as true (1) or false (0).

- true or 1 — Border displayed for time plots.
- false or 0 — Border hidden for time plots.

Topics

“Create Plots Using the Simulation Data Inspector”

Introduced in R2019b

Simulink.sdi.getCurrentComparison

Access results from most recent comparison

Syntax

```
diffRes = Simulink.sdi.getCurrentComparison
```

Description

`diffRes = Simulink.sdi.getCurrentComparison` returns the `Simulink.sdi.DiffRunResult` object `diffRes` for the most recent comparison performed using the Simulation Data Inspector UI or programmatic interface.

Tip When you compare data using the Simulation Data Inspector UI, results are not returned in the workspace. You can use the `Simulink.sdi.getCurrentComparison` function to access results for comparisons performed using the Simulation Data Inspector UI. When you compare data using the `Simulink.sdi.compareRuns` or `Simulink.sdi.compareSignals` functions, the function returns the data in a `Simulink.sdi.DiffRunResult` object or a `Simulink.sdi.DiffSignalResult` object.

Examples

Access Results for a UI Comparison

Use the `Simulink.sdi.getCurrentComparison` function to access the results of the most recent comparison to save or process further. For more information about how to compare data using the Simulation Data Inspector UI, see “Compare Simulation Data”.

```
compResults = Simulink.sdi.getCurrentComparison;
```

Retrieve Comparison Results in a Workspace Variable

You can use the `Simulink.sdi.getCurrentComparison` function or the `Simulink.sdi.DiffRunResult.getResult` function to retrieve the results for the most recent comparison if you accidentally delete the returned results from the workspace using the `clear` function.

If you delete the contents of the Simulation Data Inspector using the `Simulink.sdi.clear` function, you cannot recover the results.

Compare Simulation Data

This example creates runs to compare by running two simulations of the model `ex_vdp` with different values for `Mu`.

```
load_system('ex_vdp')
```

```
set_param('ex_vdp/Mu', 'Gain', '2');
out1 = sim('ex_vdp');
```

```
set_param('ex_vdp/Mu', 'Gain', '5');
out2 = sim('ex_vdp');
```

Use the `Simulink.sdi.getAllRunIDs` function to access the run IDs for the runs created from the simulations. Then use the `Simulink.sdi.compareRuns` function to compare the data.

```
IDs = Simulink.sdi.getAllRunIDs;
runID1 = IDs(end-1);
runID2 = IDs(end);
```

```
diffRun = Simulink.sdi.compareRuns(runID1, runID2);
```

Suppose you clear the workspace and lose the `diffRun` variable with the comparison results.

```
clear diffRun
```

Retrieve Comparison Data in the Workspace

Use the `Simulink.sdi.getCurrentComparison` function to recover the comparison results.

```
diffRun = Simulink.sdi.getCurrentComparison
```

```
diffRun =
  DiffRunResult with properties:

    MatlabVersion: '9.12.0.1884302 (R2022a)'
    RunID1: 8869
    RunID2: 8890
    BaselineRunName: 'Run 1: ex_vdp'
    CompareToRunName: 'Run 2: ex_vdp'
    Count: 2
    DateCreated: 27-Feb-2022 03:00:54
    GlobalTolerance: [1x1 struct]
    Summary: [1x1 struct]
    Options: {'Units' 'MustMatch'}
    Status: Completed
    StopReason: []
```

You could also use the `Simulink.sdi.DiffRunResult.getLatest` function to recover the results.

```
clear diffRun
```

```
diffRun = Simulink.sdi.DiffRunResult.getLatest
```

```
diffRun =
  DiffRunResult with properties:

    MatlabVersion: '9.12.0.1884302 (R2022a)'
    RunID1: 8869
    RunID2: 8890
    BaselineRunName: 'Run 1: ex_vdp'
    CompareToRunName: 'Run 2: ex_vdp'
    Count: 2
    DateCreated: 27-Feb-2022 03:00:54
    GlobalTolerance: [1x1 struct]
```

```
Summary: [1x1 struct]
Options: {'Units' 'MustMatch'}
Status: Completed
StopReason: []
```

Output Arguments

diffRes — Results of most recent comparison

`Simulink.sdi.DiffRunResult` object

Results of the most recent comparison, returned as a `Simulink.sdi.DiffRunResult` object.

See Also

`Simulink.sdi.DiffRunResult` | `Simulink.sdi.DiffSignalResult` |
`Simulink.sdi.compareRuns`

Topics

“Compare Simulation Data”

Introduced in R2020a

Simulink.sdi.getCurrentSimulationRun

Access data for in-progress or most recently completed simulation

Syntax

```
runObj = Simulink.sdi.getCurrentSimulationRun mdl
```

Description

`runObj = Simulink.sdi.getCurrentSimulationRun(mdl)` returns the `Simulink.sdi.Run` object that corresponds to the in-progress or most recently completed simulation of the model specified by `mdl`. If you delete the Run object that corresponds to the most recently completed simulation, the `Simulink.sdi.getCurrentSimulationRun` function returns empty.

Examples

Access Simulation Data Inspector Runs

Many tasks performed using the Simulation Data Inspector programmatic interface start by accessing the `Simulink.sdi.Run` object that corresponds to the logged or imported data you want to analyze. For example, you can use the Run object to access the `Simulink.sdi.Signal` objects that correspond to individual signals in the run.

This example shows how to access Run objects by using the `Simulink.sdi.Run.getLatest` function, the `Simulink.sdi.getCurrentSimulationRun` function, or the `Simulink.sdi.getRun` function.

Create a Run

The model `sldemo_fuelsys` is already configured for logging. When you simulate the model, the Simulation Data Inspector automatically creates a run and assigns it a run ID.

```
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')
```

Get Run Object Using `Simulink.sdi.Run.getLatest`

In this example, the run created when you simulated the model is the most recently created run in the Simulation Data Inspector. When you want to access the most recently created run, use the `Simulink.sdi.Run.getLatest` function.

```
fuelsysRun = Simulink.sdi.Run.getLatest;
```

Get Run Object Using `Simulink.sdi.getCurrentSimulationRun`

The run you want to access may not be the most recently created run in the Simulation Data Inspector. If the run corresponds to the most recent simulation of a model, you can use the `Simulink.sdi.getCurrentSimulationRun` function to access the Run object. You can also use the `Simulink.sdi.getCurrentSimulationRun` function to access data for an in-progress

simulation when the simulation streams data to the Simulation Data Inspector. This function can be useful when you are working with multiple models.

In this example, the run created when you simulated the model is the current simulation run for the `sldemo_fuelsys` model.

```
fuelsysRun = Simulink.sdi.getCurrentSimulationRun('sldemo_fuelsys');
```

Get Run Object from a Run ID

When your task also requires the run ID, you can use the `Simulink.sdi.getRun` function to get the corresponding `Simulink.sdi.Run` object that contains the run data and metadata.

```
runIDs = Simulink.sdi.getAllRunIDs;  
runID = runIDs(end);  
fuelsysRun = Simulink.sdi.getRun(runID);
```

Input Arguments

mdl — Model name

string | character vector

Name of the model that created the simulation data you want to access, specified as a string or character array.

Example: `'vdp'`

Data Types: `char` | `string`

Output Arguments

runObj — `Simulink.sdi.Run` object for the in-progress or most recently completed simulation

`Simulink.sdi.Run` object

`Simulink.sdi.Run` object that corresponds to the in-progress or most recently completed simulation.

Tips

- You can use the `Simulink.sdi.getCurrentSimulationRun` function to access logged data in a `StopFcn` model callback function. Workspace variable data is not available when the `StopFcn` callback executes, but the `Run` object is available because data streams to the Simulation Data Inspector.
- You can use the `Simulink.sdi.getCurrentSimulationRun` function to analyze run data on parallel workers to determine whether to send the run data to the Simulation Data Inspector.

See Also

`Simulink.sdi.getAllRunIDs` | `Simulink.sdi.Run` | `Simulink.sdi.getRun` | `Simulink.sdi.getRunCount` | `Simulink.sdi.getRunIDByIndex` | `Simulink.sdi.Run.getLatest`

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2020a

Simulink.sdi.getCursorPositions

Get position for active cursors in the Simulation Data Inspector

Syntax

```
t1 = Simulink.sdi.getCursorPositions
t1 = Simulink.sdi.getCursorPositions(view)
[t1,t2] = Simulink.sdi.getCursorPositions
[t1,t2] = Simulink.sdi.getCursorPositions(view)
```

Description

`t1 = Simulink.sdi.getCursorPositions` returns the value of the leftmost active cursor in the **Inspect** pane of the Simulation Data Inspector. Assign the return to a single output when one cursor is active.

`t1 = Simulink.sdi.getCursorPositions(view)` returns the value of the leftmost active cursor in the **Inspect** or **Compare** pane of the Simulation Data Inspector according to `view`. Assign the return to a single output when one cursor is active.

`[t1,t2] = Simulink.sdi.getCursorPositions` returns the positions of the active cursors in the **Inspect** pane of the Simulation Data Inspector.

`[t1,t2] = Simulink.sdi.getCursorPositions(view)` returns the positions of the active cursors in the **Inspect** or **Compare** pane of the Simulation Data Inspector according to `view`.

Examples

Programmatically Interact with Cursors in the Simulation Data Inspector

You can use the Simulation Data Inspector programmatic interface to specify the position of cursors on time plots or sparklines and to access the time that corresponds to the current cursor position.

Open the session file `vdp_mu.mldatx` to add and plot data in the Simulation Data Inspector. The session file contains data for a 20-second simulation of a model of the Van Der Pol equation, with signals `x1` and `x2` plotted on separate subplots in a 2-by-1 subplot layout.

```
open vdp_mu.mldatx;
```

Use the `Simulink.sdi.setNumCursors` function to add one cursor to the plot.

```
Simulink.sdi.setNumCursors(1);
```

Suppose you want to know the signal values 5 seconds into the simulation. Use the `Simulink.sdi.setCursorPositions` function to move the cursor to `t=5s` and read the signal values off from the cursor on each subplot. The asterisk next to the value in the cursor label indicates that the value is interpolated because the simulation did not include a calculation for a simulation time of exactly 5s.

```
Simulink.sdi.setCursorPositions('left',5);
```

Suppose you want to calculate the time between two peaks in the x2 signal. Add a second cursor using the `Simulink.sdi.setNumCursors` function or using the **Show/hide data cursors** button in the Simulation Data Inspector.

```
numCursors = Simulink.sdi.getNumCursors;
if(numCursors < 2)
    Simulink.sdi.setNumCursors(2);
end
```

Drag the cursors so the left cursor is positioned at the first peak in the x2 signal and the right cursor is positioned at the second peak. Alternatively, run this code that positions the cursors for you.

```
Simulink.sdi.setCursorPositions('left',5.921998549931304,'right',12.378442136906246);
```

The Simulation Data Inspector displays the difference between the two cursors in seconds. However, the cursor position and difference values are both rounded. Use the `Simulink.sdi.getCursorPosition` function to programmatically retrieve the exact time values that correspond to the cursor positions. Then, compute the difference between the times.

```
[t1,t2] = Simulink.sdi.getCursorPosition;
T = t2 - t1
```

```
T = NaN
```

Input Arguments

view — Plot area on which to return cursor positions

'inspect' (default) | 'compare'

Plot area for which to return cursor positions, specified as 'inspect' or 'compare'.

Example: `[t1,t2] = Simulink.sdi.getCursorPosition('compare')` returns the positions of two cursors on the **Compare** pane of the Simulation Data Inspector.

Data Types: char | string

Output Arguments

t1 — Left cursor position

scalar

Left cursor position, returned as a scalar. When no cursors are active in the plot area specified by `view`, the value for `t1` is returned as `NaN`.

Cursor identities are relative, not absolute. If the left cursor moves to the right of the right cursor, the left cursor becomes the right cursor and vice versa.

t2 — Right cursor position

scalar

Right cursor position, returned as a scalar. When fewer than two cursors are active in the plot area specified by `view`, the value for `t1` is returned as `NaN`.

Cursor identities are relative, not absolute. If the left cursor moves to the right of the right cursor, the left cursor becomes the right cursor and vice versa.

Introduced in R2021a

Simulink.sdi.getDeleteRunsOnLowSpace

Get configured behavior when size of logged data approaches configured limits

Syntax

```
deleteRuns = Simulink.sdi.getDeleteRunsOnLowSpace
```

Description

`deleteRuns = Simulink.sdi.getDeleteRunsOnLowSpace` returns the configured behavior for when the size of logged data approaches a configured size limit or free disk space requirement. When `deleteRuns` is `true`, logged data from prior simulations is deleted first to free space for continued logging in the current simulation. If deleting prior simulation data does not free enough disk space to continue logging through the end of the current simulation, recording data is disabled. When `deleteRuns` is `false`, recording data from the current simulation is disabled and no logged data from prior simulations is deleted.

Examples

Get Configured Logging Size Limits

You can limit the size of logged data by specifying a maximum size for the data or a minimum amount of disk space to leave empty. This example uses several functions to get the current configuration of logging size limits.

Use the `Simulink.sdi.getRequiredFreeSpace` function to get the configured minimum free disk space requirement. The returned value uses units of GB.

```
minDiskSpace = Simulink.sdi.getRequiredFreeSpace;
```

Use the `Simulink.sdi.getMaxDiskUsage` function to get the configured maximum size for data logged to disk. The returned value uses units of GB.

```
maxSize = Simulink.sdi.getMaxDiskUsage;
```

Use the `Simulink.sdi.getDeleteRunsOnLowSpace` function to get the configured behavior when approaching the logging limits. When `deleteRuns` is `true`, data from prior simulations is deleted first to free disk space for continued logging in the current simulation. If deleting runs does not free up enough space, recording logged data is disabled for the current simulation. When `deleteRuns` is `false`, recording logged data is disabled for the current simulation and data from prior simulations is retained.

```
deleteRuns = Simulink.sdi.getDeleteRunsOnLowSpace;
```

Output Arguments

deleteRuns — Behavior when logged data size approaches configured limits

1 | 0

Behavior when logged data size approaches configured limits, returned as 1 (`true`) or 0 (`false`).

- `true` — First delete data logged from prior simulations. If deleting prior simulation data does not free enough space, disable recording data.
- `false` — Disable recording data for current simulation. Do not delete prior simulation data.

When recording is disabled due to configured disk space requirements or logged data size limits, you need to enable recording again to log data in subsequent simulations. You can configure the record mode in the Simulation Data Inspector preferences or by using the `Simulink.sdi.setRecordData` function.

Topics

“Limit the Size of Logged Data”

“Configure the Simulation Data Inspector”

Introduced in R2021a

Simulink.sdi.getGridOn

Package: Simulink.sdi

Determine grid configuration for time plots

Syntax

```
grid = Simulink.sdi.getGridOn
```

Description

`grid = Simulink.sdi.getGridOn` returns the grid configuration for time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector shows horizontal and vertical grid lines.

Examples

Configure Grid for Time Plots in the Simulation Data Inspector

You can use `Simulink.sdi.setGridOn` to configure the appearance of the grid for time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector shows horizontal and vertical grid lines.

This example starts by showing how to use `Simulink.sdi.getGridOn` to access the current grid configuration. The subsequent sections show the code for each configuration option for time plot grid in the Simulation Data Inspector. To see the result, the example uses a `Simulink.sdi.CustomSnapshot` object to specify settings for the output of the `Simulink.sdi.snapshot` function.

```
snapSettings = Simulink.sdi.CustomSnapshot;  
snapSettings.Width = 300;  
snapSettings.Height = 300;
```

Get Initial Grid Setting

Before modifying the grid display preferences, you can save the current configuration to a variable in the workspace in case you want to restore the preferences later.

```
gridInit = Simulink.sdi.getGridOn;
```

Configure Horizontal Grid Lines

Show only horizontal grid lines in the Simulation Data Inspector.

```
Simulink.sdi.setGridOn('horizontal')  
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```

Configure Vertical Grid Lines

Show only vertical grid lines in the Simulation Data Inspector.

```
Simulink.sdi.setGridOn('vertical')  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Configure No Grid Lines

Show no grid lines in the Simulation Data Inspector.

```
Simulink.sdi.setGridOn('off')  
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```

Configure Horizontal and Vertical Grid Lines

Show horizontal and vertical grid lines in the Simulation Data Inspector.

```
Simulink.sdi.setGridOn('on')  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Output Arguments

grid — Time plot grid configuration

'on' (default) | 'horizontal' | 'vertical' | 'off'

Grid configuration for time plots in the Simulation Data Inspector.

- 'on' — Horizontal and vertical grid lines are shown on time plots in the Simulation Data Inspector.
- 'horizontal' — Only horizontal grid lines are shown on time plots in the Simulation Data Inspector.
- 'vertical' — Only vertical grid lines are shown on time plots in the Simulation Data Inspector.
- 'off' — No grid lines are shown on time plots in the Simulation Data Inspector.

Compatibility Considerations

Simulink.sdi.getGridOn return values have changed

Behavior changed in R2019b

Starting in R2019b, the `Simulink.sdi.getGridOn` return values changed to:

- 'on'
- 'horizontal'
- 'vertical'

- 'off'

In R2019a, the `Simulink.sdi.getGridOn` returned a logical value:

- `true` or `1` — Horizontal and vertical grid lines are shown on time plots in the Simulation Data Inspector.
- `false` or `0` — Horizontal and vertical grid lines are hidden on time plots in the Simulation Data Inspector.

Starting in R2019b, the 'on' return value is equivalent to the `true` or `1` return, and the 'off' return value is equivalent to the `false` or `0` return.

Simulink.sdi.getMarkersOn

Package: Simulink.sdi

Determine if data markers are shown in the Simulation Data Inspector

Syntax

```
markersOn = Simulink.sdi.getMarkersOn
```

Description

`markersOn = Simulink.sdi.getMarkersOn` returns a logical value indicating whether data markers are displayed on plots in the Simulation Data Inspector.

Examples

Store Marker State

You can check and store the value of the **Show markers** setting in the Simulation Data Inspector from the command window or in a script.

```
markersOn = Simulink.sdi.getMarkersOn;
```

Output Arguments

markersOn — Logical indication of marker state

false or 0 (default) | true or 1

Logical indication of whether markers are displayed on plots in the Simulation Data Inspector.

- true or 1 indicates that markers are displayed.
- false or 0 indicates that markers are not displayed.

“Inspect and Compare Data Programmatically”

Introduced in R2017b

Simulink.sdi.getMaxDiskUsage

Get configured maximum size for data logged to disk

Syntax

```
maxSize = Simulink.sdi.getMaxDiskUsage
```

Description

`maxSize = Simulink.sdi.getMaxDiskUsage` returns the maximum size configured for data logged to disk, in units of GB.

Examples

Get Configured Logging Size Limits

You can limit the size of logged data by specifying a maximum size for the data or a minimum amount of disk space to leave empty. This example uses several functions to get the current configuration of logging size limits.

Use the `Simulink.sdi.getRequiredFreeSpace` function to get the configured minimum free disk space requirement. The returned value uses units of GB.

```
minDiskSpace = Simulink.sdi.getRequiredFreeSpace;
```

Use the `Simulink.sdi.getMaxDiskUsage` function to get the configured maximum size for data logged to disk. The returned value uses units of GB.

```
maxSize = Simulink.sdi.getMaxDiskUsage;
```

Use the `Simulink.sdi.deleteRunsOnLowSpace` function to get the configured behavior when approaching the logging limits. When `deleteRuns` is true, data from prior simulations is deleted first to free disk space for continued logging in the current simulation. If deleting runs does not free up enough space, recording logged data is disabled for the current simulation. When `deleteRuns` is false, recording logged data is disabled for the current simulation and data from prior simulations is retained.

```
deleteRuns = Simulink.sdi.deleteRunsOnLowSpace;
```

Output Arguments

maxSize — Maximum size configured for data logged to disk

scalar

Maximum size configured for data logged to disk, returned as a scalar, in units of GB.

See Also

Simulink.sdi.getNumCursors

Check number of cursors active in the Simulation Data Inspector

Syntax

```
num = Simulink.sdi.getNumCursors
num = Simulink.sdi.getNumCursors(view)
```

Description

`num = Simulink.sdi.getNumCursors` returns the number of active cursors in the **Inspect** pane of the Simulation Data Inspector.

`num = Simulink.sdi.getNumCursors(view)` returns the number of active cursors in the **Inspect** or **Compare** pane of the Simulation Data Inspector, as specified by `view`.

Examples

Programmatically Interact with Cursors in the Simulation Data Inspector

You can use the Simulation Data Inspector programmatic interface to specify the position of cursors on time plots or sparklines and to access the time that corresponds to the current cursor position.

Open the session file `vdp_mu.mldatx` to add and plot data in the Simulation Data Inspector. The session file contains data for a 20-second simulation of a model of the Van Der Pol equation, with signals `x1` and `x2` plotted on separate subplots in a 2-by-1 subplot layout.

```
open vdp_mu.mldatx;
```

Use the `Simulink.sdi.setNumCursors` function to add one cursor to the plot.

```
Simulink.sdi.setNumCursors(1);
```

Suppose you want to know the signal values 5 seconds into the simulation. Use the `Simulink.sdi.setCursorPositions` function to move the cursor to `t=5s` and read the signal values off from the cursor on each subplot. The asterisk next to the value in the cursor label indicates that the value is interpolated because the simulation did not include a calculation for a simulation time of exactly 5s.

```
Simulink.sdi.setCursorPositions('left',5);
```

Suppose you want to calculate the time between two peaks in the x2 signal. Add a second cursor using the `Simulink.sdi.setNumCursors` function or using the **Show/hide data cursors** button in the Simulation Data Inspector.

```
numCursors = Simulink.sdi.getNumCursors;
if(numCursors < 2)
    Simulink.sdi.setNumCursors(2);
end
```

Drag the cursors so the left cursor is positioned at the first peak in the x2 signal and the right cursor is positioned at the second peak. Alternatively, run this code that positions the cursors for you.

```
Simulink.sdi.setCursorPositions('left',5.921998549931304,'right',12.378442136906246);
```

The Simulation Data Inspector displays the difference between the two cursors in seconds. However, the cursor position and difference values are both rounded. Use the `Simulink.sdi.getCursorPosition` function to programmatically retrieve the exact time values that correspond to the cursor positions. Then, compute the difference between the times.

```
[t1,t2] = Simulink.sdi.getCursorPosition;
T = t2 - t1
```

```
T = NaN
```

Input Arguments

view — Plot area for which to return number of active cursors

'inspect' (default) | 'compare'

Plot area for which to return number of active cursors, specified as 'inspect' or 'compare'.

Data Types: char | string

Output Arguments

num — Number of active cursors

0 | 1 | 2

Number of active cursors, returned as 0, 1, or 2.

Simulink.sdi.getRecordData

Check record mode for logging

Syntax

```
record = Simulink.sdi.getRecordData
```

Description

`record = Simulink.sdi.getRecordData` returns the currently configured value for the **Record mode** in the Simulation Data Inspector preferences. When `record` is `true` or `1`, logged data is available to view during simulation and is recorded to the Simulation Data Inspector and workspace for analysis after simulation. When `record` is `false` or `0`, logged data is not recorded and is only available to view during simulation.

Examples

Check Record Mode for Logging

You can use the `Simulink.sdi.getRecordData` function to check the configuration before starting a simulation to ensure you record data you want to save.

```
record = Simulink.sdi.getRecordData
```

```
record =  
    logical  
    1
```

The **Record mode** setting is restored to **View and record data** at the start of each MATLAB session.

Output Arguments

`record` — Record mode

1 | 0

Record mode, returned as 1 (true) or 0 (false).

- 1 — Logged data is stored on disk and available in the workspace and Simulation Data Inspector after simulation.
- 0 — Logged data is not stored on disk and is only available to view during simulation. After simulation, no logged data is available in the Simulation Data Inspector or workspace. For more information, see “View Data Only During Simulation”.

Simulink.sdi.getRequiredFreeSpace

Get configured minimum disk space requirement for logging

Syntax

```
minDiskSpace = Simulink.sdi.getRequiredFreeSpace
```

Description

`minDiskSpace = Simulink.sdi.getRequiredFreeSpace` returns the minimum free disk space requirement configured for logging, in units of GB.

Examples

Get Configured Logging Size Limits

You can limit the size of logged data by specifying a maximum size for the data or a minimum amount of disk space to leave empty. This example uses several functions to get the current configuration of logging size limits.

Use the `Simulink.sdi.getRequiredFreeSpace` function to get the configured minimum free disk space requirement. The returned value uses units of GB.

```
minDiskSpace = Simulink.sdi.getRequiredFreeSpace;
```

Use the `Simulink.sdi.getMaxDiskUsage` function to get the configured maximum size for data logged to disk. The returned value uses units of GB.

```
maxSize = Simulink.sdi.getMaxDiskUsage;
```

Use the `Simulink.sdi.deleteRunsOnLowSpace` function to get the configured behavior when approaching the logging limits. When `deleteRuns` is true, data from prior simulations is deleted first to free disk space for continued logging in the current simulation. If deleting runs does not free up enough space, recording logged data is disabled for the current simulation. When `deleteRuns` is false, recording logged data is disabled for the current simulation and data from prior simulations is retained.

```
deleteRuns = Simulink.sdi.deleteRunsOnLowSpace;
```

Output Arguments

minDiskSpace — Minimum free disk space requirement for logging

scalar

Minimum free disk space requirement for logging, returned as a scalar, in units of GB.

Simulink.sdi.getRun

Package: Simulink.sdi

Access data for a Simulation Data Inspector run

Syntax

```
run = Simulink.sdi.getRun(runID)
```

Description

`run = Simulink.sdi.getRun(runID)` returns a `Simulink.sdi.Run` object that provides access to the data in the run corresponding to the `runID`. The Simulation Data Inspector assigns run IDs when it creates a run. You can get the run ID for your run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

Examples

Access Simulation Data Inspector Runs

Many tasks performed using the Simulation Data Inspector programmatic interface start by accessing the `Simulink.sdi.Run` object that corresponds to the logged or imported data you want to analyze. For example, you can use the Run object to access the `Simulink.sdi.Signal` objects that correspond to individual signals in the run.

This example shows how to access Run objects by using the `Simulink.sdi.Run.getLatest` function, the `Simulink.sdi.getCurrentSimulationRun` function, or the `Simulink.sdi.getRun` function.

Create a Run

The model `sldemo_fuelsys` is already configured for logging. When you simulate the model, the Simulation Data Inspector automatically creates a run and assigns it a run ID.

```
load_system('sldemo_fuelsys')  
sim('sldemo_fuelsys')
```

Get Run Object Using Simulink.sdi.Run.getLatest

In this example, the run created when you simulated the model is the most recently created run in the Simulation Data Inspector. When you want to access the most recently created run, use the `Simulink.sdi.Run.getLatest` function.

```
fuelsysRun = Simulink.sdi.Run.getLatest;
```

Get Run Object Using Simulink.sdi.getCurrentSimulationRun

The run you want to access may not be the most recently created run in the Simulation Data Inspector. If the run corresponds to the most recent simulation of a model, you can use the `Simulink.sdi.getCurrentSimulationRun` function to access the Run object. You can also use

the `Simulink.sdi.getCurrentSimulationRun` function to access data for an in-progress simulation when the simulation streams data to the Simulation Data Inspector. This function can be useful when you are working with multiple models.

In this example, the run created when you simulated the model is the current simulation run for the `sldemo_fuelsys` model.

```
fuelsysRun = Simulink.sdi.getCurrentSimulationRun('sldemo_fuelsys');
```

Get Run Object from a Run ID

When your task also requires the run ID, you can use the `Simulink.sdi.getRun` function to get the corresponding `Simulink.sdi.Run` object that contains the run data and metadata.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
fuelsysRun = Simulink.sdi.getRun(runID);
```

Plot Signals from Simulation Run

This example demonstrates how to access the `Simulink.sdi.Run` object for a Simulation Data Inspector run created by logging signals. From the `Simulink.sdi.Run` object you can get `Simulink.sdi.Signal` objects that contain the logged signal data and metadata. You can use the `Signal` objects and the `plotOnSubPlot` function to plot the data in the Simulation Data Inspector.

Create a Simulation Run and Access the Run Object

The `ex_vdp` model logs two signals. To create a simulation run containing the logged data, simulate the model.

```
sim('ex_vdp');
```

The Simulation Data Inspector keeps track of runs by assigning a unique numeric run ID to each run created by simulation, importing data, or opening a session. To access the run object for the simulation you just performed, use the `Simulink.sdi.getAllRunIDs` function and take the last run ID in the returned vector.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Once you have the run ID for the run, you can use the `Simulink.sdi.getRun` function to get the `Simulink.sdi.Run` object that corresponds to the run. You can use the `Run` object to check the metadata associated with the run, including the number of signals in the run.

```
vdpRun = Simulink.sdi.getRun(runID);
```

```
vdpRun.SignalCount
```

```
ans = int32
      2
```

Plot Data Using Signal Objects

Use the `getSignalByIndex` function to access signals from the `Run` object, `fuelRun`.

```
signal1 = getSignalByIndex(vdpRun,1);
signal2 = getSignalByIndex(vdpRun,2);
```

Use the `Simulink.sdi.setSubPlotLayout` function to specify a 3-by-1 layout.

```
Simulink.sdi.setSubPlotLayout(2,1)
```

Before plotting the data, use the `Simulink.sdi.clearAllSubPlots` function to clear any data that is already plotted.

```
Simulink.sdi.clearAllSubPlots
```

Plot one signal on each subplot. To plot signals on the first subplot, you can set the checked property for the signal. To plot signals on subplots other than the first subplot, use the `plotOnSubPlot` function.

```
signal1.Checked = true;  
plotOnSubPlot(signal2,2,1,true);
```

View the Plotted Data

To view the plots you just created, open the Simulation Data Inspector using the `Simulink.sdi.view` function.

Input Arguments

runID — Numeric run identifier
scalar

Run ID for the run you want a `Simulink.sdi.Run` object for. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for a run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

Output Arguments

run — `Simulink.sdi.Run` object
'`Simulink.sdi.Run`'

`Simulink.sdi.Run` object for the run corresponding to the run ID.

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2011b

Simulink.sdi.getRunCount

Package: Simulink.sdi

Get number of runs in Simulation Data Inspector repository

Syntax

```
count = Simulink.sdi.getRunCount
```

Description

`count = Simulink.sdi.getRunCount` returns the number of runs in the Simulation Data Inspector repository. You can use the run count to loop over all runs in the Simulation Data Inspector repository to modify run or signal properties. For example, you could add an absolute tolerance to a signal in every run.

Examples

Apply a Tolerance to a Signal in Multiple Runs

You can use the Simulation Data Inspector programmatic interface to modify a parameter for the same signal in multiple runs. This example adds an absolute tolerance of 0.1 to a signal in all four runs of data.

First, clear the workspace and load the Simulation Data Inspector session with the data. The session includes logged data from four simulations of a Simulink® model of a longitudinal controller for an aircraft.

```
Simulink.sdi.clear  
Simulink.sdi.load('AircraftExample.mldatx');
```

Use the `Simulink.sdi.getRunCount` function to get the number of runs in the Simulation Data Inspector. You can use this number as the index for a for loop that operates on each run.

```
count = Simulink.sdi.getRunCount;
```

Then, use a for loop to assign the absolute tolerance of 0.1 to the first signal in each run.

```
for a = 1:count  
    runID = Simulink.sdi.getRunIDByIndex(a);  
    aircraftRun = Simulink.sdi.getRun(runID);  
    sig = getSignalByIndex(aircraftRun,1);  
    sig.AbsTol = 0.1;  
end
```

Output Arguments

count — Number of runs

scalar

Number of runs in the Simulation Data Inspector repository.

See Also

Introduced in R2011b

Simulink.sdi.getRunIDByIndex

Package: Simulink.sdi

Use Simulation Data Inspector run index to get run ID

Syntax

```
runID = Simulink.sdi.getRunIDByIndex(index)
```

Description

`runID = Simulink.sdi.getRunIDByIndex(index)` returns the run ID for the run with the specified index in the Simulation Data Inspector repository.

Examples

Get Simulation Data Inspector Run IDs

Many tasks performed using the Simulation Data Inspector programmatic interface start with obtaining the run ID for a simulation run. This example illustrates several methods to get the run ID for a run. You can use the run ID to access the `Simulink.sdi.Run` object that contains the run data and metadata and perform run comparisons using the `Simulink.sdi.compareRuns` function.

Create a Run

The model `sldemo_fuelsys` is already configured for logging. When you simulate the model, the Simulation Data Inspector automatically creates a run and assigns it a run ID.

```
load_system('sldemo_fuelsys')  
sim('sldemo_fuelsys')
```

Get Run ID Using Simulink.sdi.getAllRunIDs

The `Simulink.sdi.getAllRunIDs` function returns an array of all run IDs for the runs in the Simulation Data Inspector repository, in order, with the most recently created run at the end.

```
runIDs = Simulink.sdi.getAllRunIDs;  
runID = runIDs(end);
```

Get Run ID Using Simulink.sdi.getRunIDByIndex

You can also use the `Simulink.sdi.getRunCount` and `Simulink.sdi.getRunIDByIndex` functions to get the run ID for a run. This method is useful if you also want to use `count` as a counting variable to index through the runs in the Simulation Data Inspector repository.

```
count = Simulink.sdi.getRunCount;  
runID = Simulink.sdi.getRunIDByIndex(count);
```

Get Run ID from a Simulink.sdi.Run Object

You can also get the run ID from the `Simulink.sdi.Run` object that corresponds to the run. This example uses the `Simulink.sdi.getCurrentSimulationRun` function to get the Run object that

corresponds to the most recent simulation of the `sldemo_fuelsys` model. You can also use the `Simulink.sdi.Run.getLatest` function to access the most recently created Run object.

```
fuelsysRun = Simulink.sdi.getCurrentSimulationRun('sldemo_fuelsys');  
runID = fuelsysRun.ID;
```

Input Arguments

index — Run index in Simulation Data Inspector

integer

Positive, whole number index of the run in the Simulation Data Inspector repository.

Example: 3

Output Arguments

runID — Numeric run identifier

scalar

Numeric run identification assigned by the Simulation Data Inspector.

Simulink.sdi.getRunNamingRule

Package: Simulink.sdi

Get the Simulation Data Inspector rule for naming runs

Syntax

```
namingRule = Simulink.sdi.getRunNamingRule
```

Description

`namingRule = Simulink.sdi.getRunNamingRule` returns the run naming rule as a character vector. The run naming rule can contain one or more tokens that update for each run, for example, `<run_index>`. The run naming rule applies to runs automatically created through simulating a model in Simulink.

Examples

Modify Run Naming Rule Then Restore Default

This example shows how to use the Simulation Data Inspector API to modify the Simulation Data Inspector run naming rule, check a run's name, restore default preferences, and check the run naming rule.

```
% Load model
load_system('sldemo_fuelsys')

% Modify run naming rule
Simulink.sdi.setRunNamingRule('<model_name> Run <run_index>')

% Simulate system
sim('sldemo_fuelsys')

% Check run name
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
fuelRun = Simulink.sdi.getRun(runID);
fuelRun.name

ans =
'sldemo_fuelsys Run 1'

% Clear preferences to reset the run naming rule
Simulink.sdi.clearPreferences

% Check run naming rule
Simulink.sdi.getRunNamingRule

ans =
'Run <run_index>: <model_name>'
```

Output Arguments

namingRule — Naming rule for Simulation Data Inspector runs

character vector

Character vector that specifies the naming rule the Simulation Data Inspector uses to name the runs automatically created through simulating a Simulink model. The run naming rule can contain any of the following tokens that represent information pulled for each run:

- `<run_index>` - Run's index in the Simulation Data Inspector repository.
- `<model_name>` - Name of the model simulated to create the run.
- `<time_stamp>` - Start time for the simulation that created the run.
- `<sim_mode>` - Simulation mode used for the simulation that created the run.

Alternatives

You can view the run naming rule using the Simulation Data Inspector UI. You can find the **New Run** options under the Simulation Data Inspector **Preferences** menu.

Introduced in R2015a

Simulink.sdi.getSignal

Package: Simulink.sdi

Get Simulink.sdi.Signal object for a signal

Syntax

```
signalObj = Simulink.sdi.getSignal(sigID)
```

Description

`signalObj = Simulink.sdi.getSignal(sigID)` returns a `Simulink.sdi.Signal` object for the signal in the Simulation Data Inspector that corresponds to the signal ID, `sigID`.

Examples

Create a Simulation Data Inspector Run and Access Signal Data

This example shows how to access signal data when you create a run in the Simulation Data Inspector.

Generate Data for Run

For this example, create timeseries data for sine and cosine signals.

```
% Create timeseries workspace data
time = linspace(0, 20, 101);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Run and Return Signal IDs

You can use the `Simulink.sdi.createRun` syntax with multiple return arguments to get the signal IDs more directly instead of accessing the signal IDs through a `Simulink.sdi.Run` object.

```
[runID,runIndex,sigIDs] = Simulink.sdi.createRun('Sinusoids','vars',...
    sine_ts,cos_ts);

cosID = sigIDs(2);
cosSig = Simulink.sdi.getSignal(cosID);
```

Modify Signal Properties and View in the Simulation Data Inspector

You can use the `Simulink.sdi.Signal` object to view and modify signal properties and to plot signals in the Simulation Data Inspector.

```
cosSig.Checked = true;  
cosSig.AbsTol = 0.05;  
Simulink.sdi.view  
cosSig.Name
```

Input Arguments

sigID — Signal ID

scalar

Unique, numeric signal identifier, specified as an integer. The Simulation Data Inspector assigns a signal ID to each signal when a run is created. You can get the signal ID for a signal using one of these functions:

- `getAllSignalIDs`
- `getSignalIDByIndex`
- `getSignalIDsByName`
- `Simulink.sdi.createRun`

Output Arguments

signalObj — `Simulink.sdi.Signal` object

`Simulink.sdi.Signal` object

Signal that corresponds to the signal ID, `sigID`, returned as a `Simulink.sdi.Signal` object.

Simulink.sdi.getSignalInputProcessingMode

Get value of Input Processing signal property

Syntax

```
inputMode = Simulink.sdi.getSignalInputProcessingMode(blkPath,port)
inputMode = Simulink.sdi.getSignalInputProcessingMode(h)
```

Description

`inputMode = Simulink.sdi.getSignalInputProcessingMode(blkPath,port)` returns the value of the **Input Processing** property for the signal produced by the specified block and port. The **Input Processing** property specifies whether to log the signal as sample-based or frame-based.

`inputMode = Simulink.sdi.getSignalInputProcessingMode(h)` returns the value of the **Input Processing** property for the signal that corresponds to the specified line handle, `h`.

Examples

Check Signal Input Processing Setting Using Block Path

Check the value of the **Input Processing** property for the output signal of the Gain block **Mu** in the model `vdp` using the block path and the index of the output port that produces the signal.

```
open_system('vdp')
MuInputProc = Simulink.sdi.getSignalInputProcessingMode('vdp/Mu',1);
```

Check Signal Input Processing Setting Using Line Handle

Check the value of the **Input Processing** property for the output signal of the Gain block **Mu** in the model `vdp` using the line handle for the signal.

```
open_system('vdp')
MuLineHandles = get_param('vdp/Mu','LineHandles');
MuOutputHandle = MuLineHandles.Outputport;
MuInputProc = Simulink.sdi.getSignalInputProcessingMode(MuOutputHandle);
```

Input Arguments

blkPath — Block path for block that produces signal

string | character vector

Block path for the block that produces the signal, specified as a string or a character vector.

Example: "vdp/Mu"

port — Index of block output port that produces signal

scalar

Index of block output port that produces signal, specified as a numeric scalar.

Example: 1

h — Signal

line handle

Signal, specified as a line handle. To get the line handle for a signal, use the `get_param` function with the 'LineHandles' option. For example, to access the line handle for the output of the Mu block in the model `vdp`, use:

```
MuLineHandles = get_param('vdp/Mu', 'LineHandles');  
MuOutputLineHandle = MuLineHandles.Output;
```

Output Arguments

inputMode — Input processing used for signal

'sample' | 'frame'

Input processing used for signal, returned as 'sample' or 'frame'.

Signal **Input Processing** setting.

- 'sample' — Each element in a sample is treated as a channel.
- frame — Each column in a sample is treated as a channel.

Simulink.sdi.getStorageLocation

Get path to custom storage location for data logged to disk

Syntax

```
storagePath = Simulink.sdi.getStorageLocation
```

Description

`storagePath = Simulink.sdi.getStorageLocation` returns the configured custom location to store data logged to disk. When data logs to the temporary directory on your computer, the `Simulink.sdi.getStorageLocation` function returns an empty character array.

Note The location returned by the `Simulink.sdi.getStorageLocation` function applies for data logged to the workspace and Simulation Data Inspector and is *not* the location of the file created for data logged to a file.

Examples

Check Custom Storage Location

By default, data logged to the workspace and the Simulation Data Inspector is stored in the temporary directory on your computer. You may want to change the location of logged data when you need to log large amounts of data and a secondary drive provides more storage capacity. When you specify a custom storage location for logged data, you can use the `Simulink.sdi.getStorageLocation` function to access the path to the temporary file that contains the logged data.

```
storagePath = Simulink.sdi.getStorageLocation;  
storagePath =  
    'C:\Users\username\LoggedData'
```

Output Arguments

storagePath — Location of data logged to disk

character vector

Location of data logged to disk, returned as a character vector. An empty character vector indicates that the data is logged to the temporary directory on your computer.

Introduced in R2021a

Simulink.sdi.getStorageMode

Check if logging is configured to log data to disk or memory

Syntax

```
storageMode = Simulink.sdi.getStorageMode
```

Description

`storageMode = Simulink.sdi.getStorageMode` returns the configured logging storage mode as 'disk' or 'memory'. By default, data logged to the workspace and the Simulation Data Inspector is logged to disk.

Examples

Check Whether Data Logs to Disk or Memory

You can configure whether data logged in simulation logs to memory or to disk. By default, data is logged to disk and brought into memory on demand. If your machine has more RAM than disk space, you may want to log data to memory instead.

Use the `Simulink.sdi.getStorageMode` function to check whether logging is configured to store logged data on disk or in memory.

```
storageMode = Simulink.sdi.getStorageMode
```

```
storageMode =  
    'disk'
```

Output Arguments

storageMode — Where logged simulation data is stored on your machine

'disk' | 'memory'

Where logged simulation data is stored on your machine, returned as 'disk' or 'memory'.

“Configure the Simulation Data Inspector”

Introduced in R2021a

Simulink.sdi.getSubplotLimits

Get t - and y -axis limits for time plot in the Simulation Data Inspector

Syntax

```
[tMin,tMax,yMin,yMax] = Simulink.sdi.getSubplotLimits(r,c)
```

Description

`[tMin,tMax,yMin,yMax] = Simulink.sdi.getSubplotLimits(r,c)` returns the t - and y -axis limits for the subplot at the specified location in the Simulation Data Inspector subplot layout.

Examples

Copy y-Axis Range from One Subplot to Another

You can use the `Simulink.sdi.getSubplotLimits` and `Simulink.sdi.setSubplotLimits` functions to copy the axis limits from one subplot to another. For example, you can specify the same y -axis limits for two subplots that display the same signal from simulations that used different values of a model parameter. This example copies the y -axis settings from one subplot to another to analyze the effect of changing the value of μ in the model `vdp`.

Create the data in the Simulation Data Inspector by simulating the model `vdp` twice. The first time, specify the value of μ as 1. For the second simulation, set the value of μ to 2. The model logs data for the signals `x1` and `x2`.

```
open_system('ex_vdp');  
set_param('ex_vdp/Mu','Gain','1')  
sim('ex_vdp');  
  
set_param('ex_vdp/Mu','Gain','2')  
sim('ex_vdp');
```

Open the Simulation Data Inspector.

```
Simulink.sdi.view
```

Create plots in the Simulation Data Inspector to show the results from each simulation. Configure a 2x2 subplot layout so you can plot one signal on each plot, side by side.

```
Simulink.sdi.setSubPlotLayout(2,2)
```

Get the `Simulink.sdi.Signal` objects that correspond to each signal from each run, and plot one signal on each subplot. Plot the signals from the first simulation on the subplots in the first column and the signals from the second simulation on the subplots in the second column.

```
runIDs = Simulink.sdi.getAllRunIDs;  
runID1 = runIDs(end-1);  
runID2 = runIDs(end);
```

```
runMu1 = Simulink.sdi.getRun(runID1);  
runMu2 = Simulink.sdi.getRun(runID2);  
  
sig1 = getSignalByIndex(runMu1,1);  
sig2 = getSignalByIndex(runMu1,2);  
sig3 = getSignalByIndex(runMu2,1);  
sig4 = getSignalByIndex(runMu2,2);  
  
plotOnSubPlot(sig1,1,1,true);  
plotOnSubPlot(sig2,2,1,true);  
plotOnSubPlot(sig3,1,2,true);  
plotOnSubPlot(sig4,2,2,true);
```

The signals in the first column of plots look similar to those in the second column. However, the y-axis limits for the plots of the x2 signal are different.

Use the `Simulink.sdi.getSubplotLimits` function to copy the limits used for the subplot with the `x2` signal from the second simulation.

```
[~,~,ymin,ymax] = Simulink.sdi.getSubplotLimits(2,2);
```

Use the `Simulink.sdi.setSubplotLimits` function to apply the same y-axis limits to the subplot with the `x2` signal from the first run.

```
Simulink.sdi.setSubplotLimits(2,1,'yRange',[ymin,ymax]);
```

With the updated y-axis limits, the difference in the `x2` signal is more apparent.

Input Arguments

r — Subplot row index

integer

Subplot row index, specified as an integer between 1 and 8, inclusive. Use the *r* and *c* inputs together to specify the location of the subplot for which you want the axis limits.

Example: `[~,~,yMin,yMax] = Simulink.sdi.setSubplotLimits(2,2)` returns *y*-axis limits for the time plot in the second row of the second column of the subplot layout in the Simulation Data Inspector.

c — Subplot column index

integer

Subplot column index, specified as an integer value between 1 and 8, inclusive. Use the *r* and *c* inputs together to specify the location of the subplot for which you want the axis limits.

Example: `[~,~,yMin,yMax] = Simulink.sdi.setSubplotLimits(2,2)` returns the *y*-axis limits for the time plot in the second row of the second column of the subplot layout in the Simulation Data Inspector.

Output Arguments

tMin — *t*-axis minimum

double

t-axis minimum, returned as a double and the first element in a 1-by-4 vector of the form `[tMin,tMax,yMin,yMax]`.

tMax — *t*-axis maximum

double

t-axis maximum, returned as a double and the second element in a 1-by-4 vector of the form `[tMin,tMax,yMin,yMax]`.

yMin — *y*-axis minimum

double

y-axis minimum, returned as a double and the third element in a 1-by-4 vector of the form `[tMin,tMax,yMin,yMax]`.

yMax — *y*-axis maximum

double

y-axis maximum, returned as a double and the last element in a 1-by-4 vector of the form `[tMin,tMax,yMin,yMax]`.

Simulink.sdi.getTickLabelsDisplay

Get tick mark label setting for time plots

Syntax

```
tickLabels = Simulink.sdi.getTickLabelsDisplay
```

Description

`tickLabels = Simulink.sdi.getTickLabelsDisplay` returns the current setting for displayed tick mark labels on time plots in the Simulation Data Inspector. The return value corresponds to the value of the **Tick labels** setting on the **Time Plot** section of the **Visualization Settings** in the Simulation Data Inspector. The setting applies to all time plots in the layout. By default, the Simulation Data Inspector displays tick mark labels for both axes on time plots.

Examples

Configure Tick Mark Label Visibility for Time Plots

You can use the `Simulink.sdi.setTickLabelsDisplay` function to configure the visibility of tick mark labels for the t - and y -axes on time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector displays tick marks for both axes.

This example starts by showing how to use the `Simulink.sdi.getTickLabelsDisplay` function to access the current tick mark label visibility. Subsequent sections show the code to specify each available option for tick mark label visibility on time plots in the Simulation Data Inspector. To see the result of each configuration, the example generates an image using the `Simulink.sdi.snapshot` function with settings specified by a `Simulink.sdi.CustomSnapshot` object.

```
snapSettings = Simulink.sdi.CustomSnapshot;  
snapSettings.Width = 300;  
snapSettings.Height = 300;
```

Get Current Tick Mark Label Visibility

Before modifying the visibility of the tick mark labels on time plots, you can save the current configuration to a variable in the workspace in case you want to restore the preference later.

```
initTickLabels = Simulink.sdi.getTickLabelsDisplay;
```

Show Only t -Axis Tick Mark Labels

Show the tick mark labels for the t -Axis.

```
Simulink.sdi.setTickLabelsDisplay('t-axis')  
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```

Show Only y-Axis Tick Mark Labels

Show the tick mark labels for the y-axis.

```
Simulink.sdi.setTickLabelsDisplay('y-axis')  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Hide Tick Mark Labels

You can hide the tick mark labels for both axes.

```
Simulink.sdi.setTickLabelsDisplay('none')  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Show All Tick Mark Labels

By default, the Simulation Data Inspector shows tick mark labels for both axes on time plots.

```
Simulink.sdi.setTickLabelsDisplay('all')  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Output Arguments

tickLabels — Time plot axes that display tick mark labels

'all' | 't-axis' | 'y-axis' | 'none'

Time plot axes that display tick mark labels in the Simulation Data Inspector, returned as one of these options:

- 'all' — Tick mark labels displayed for both time plot axes.
- 't-axis' — Tick mark labels displayed only on the *t*-axis for time plots.
- 'y-axis' — Tick mark labels displayed only on the *y*-axis for time plots.
- 'none' — No tick mark labels displayed on time plots.

Simulink.sdi.getTicksPosition

Get tick mark position setting for time plots

Syntax

```
ticksPos = Simulink.sdi.getTicksPosition
```

Description

`ticksPos = Simulink.sdi.getTicksPosition` returns the current setting for the position of tick marks on time plots in the Simulation Data Inspector. The return value corresponds to the value of the **Ticks** setting on the **Time Plot** section of the **Visualization Settings** in the Simulation Data Inspector. The setting applies to all time plots in the layout. By default, the Simulation Data Inspector displays tick marks on the outside of the plot area for time plots.

Examples

Configure Position for Tick Marks on Time Plots

You can use `Simulink.sdi.setTicksPosition` function to specify the position for tick marks on time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector displays tick marks outside of the plot area for time plots.

This example starts by showing how to use the `Simulink.sdi.getTicksPosition` function to access the current position of tick marks. Subsequent sections show the code to specify each configuration option for the position of tick marks on time plots in the Simulation Data Inspector. To see the result, the example generates an image using `Simulink.sdi.snapshot` with settings specified by a `Simulink.sdi.CustomSnapshot` object.

```
snapSettings = Simulink.sdi.CustomSnapshot;  
snapSettings.Width = 300;  
snapSettings.Height = 300;
```

Get Current Tick Mark Position

Before modifying the position of tick marks on time plots, you can save the current configuration to a variable in the workspace in case you want to restore the preference later.

```
initTickPos = Simulink.sdi.getTicksPosition;
```

Position Tick Marks Inside Plot Area

Position the tick marks inside the plot area to increase the amount of space used by the plot area.

```
Simulink.sdi.setTicksPosition('inside')  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Hide Tick Marks on Time Plots

You can hide the tick marks for time plots in the Simulation Data Inspector. Hiding the tick marks expands the plot area.

```
Simulink.sdi.setTicksPosition('none')  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Position Tick Marks Outside Plot Area

By default, the Simulation Data Inspector displays tick marks outside of the plot area for time plots.

```
Simulink.sdi.setTicksPosition('outside')  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Output Arguments

ticksPos — Current setting for tick mark position on time plots

'outside' | 'inside' | 'none'

Current setting for the position of tick marks on time plots in the Simulation Data Inspector, returned as 'inside' or 'outside'.

Topics

“Create Plots Using the Simulation Data Inspector”

Introduced in R2019b

Simulink.sdi.getTrigger

Get signal and trigger options for trigger configured in the Simulation Data Inspector

Syntax

```
sig = Simulink.sdi.getTrigger
[sig,opts] = Simulink.sdi.getTrigger
```

Description

`sig = Simulink.sdi.getTrigger` returns the `Simulink.sdi.Signal` object for the signal used to trigger display updates in the Simulation Data Inspector.

`[sig,opts] = Simulink.sdi.getTrigger` returns the trigger options configured for the trigger in the Simulation Data Inspector.

Examples

Programmatically Configure Triggers in the Simulation Data Inspector

Add a trigger to a signal in the Simulation Data Inspector to specify criteria that determine when to update plots to display fresh data. Triggers can allow you to capture transient signal behavior and can help stabilize the display of periodic signals so you can take measurements.

Simulate the `Triggers` model. Data in the model logs to the Simulation Data Inspector.

```
open_system('Triggers');
out = sim('Triggers');
```

Then, add a trigger to the `Pulse` signal. Configure the trigger as a falling-edge trigger with a threshold of 0.5.

```
trigRun = Simulink.sdi.getCurrentSimulationRun('Triggers');
pulseSig = getSignalsByName(trigRun,'Pulse');
Simulink.sdi.addTrigger(pulseSig,'Type','Edge','Level',0.5);
```

You can verify that the trigger was added and configured correctly by opening the Simulation Data Inspector using `Simulink.sdi.view` and clicking the trigger icon next to the `Pulse` signal to check the configuration. You can also use the `Simulink.sdi.getTrigger` function to check which signal is used to generate trigger events and the trigger configuration.

```
[sig,trigOpts] = Simulink.sdi.getTrigger;
```

```
sig.Name
```

```
ans =
'Pulse'
```

```
trigOpts
```

```
trigOpts = struct with fields:
    Mode: 'Auto'
```

```

        Type: 'Edge'
        Position: 0.5000
        Delay: 0
    SourceChannelComplexity: 'Scalar'
        Polarity: 'Positive'
        AutoLevel: 1
        Level: 0.5000
    UpperLevel: 0
    LowerLevel: 0
    Hysteresis: 0
        MinTime: 0
        MaxTime: Inf
        Timeout: 0
        Holdoff: 0

```

When you do not want to use a trigger to control when the Simulation Data Inspector updates the plots with fresh data, you can remove the trigger using the `Simulink.sdi.removeTrigger` function.

```
Simulink.sdi.removeTrigger
```

You can verify that the trigger was removed in the Simulation Data Inspector UI or using the `Simulink.sdi.getTrigger` function. The `Simulink.sdi.getTrigger` function returns an empty array of `Simulink.sdi.Signal` objects when no trigger is configured in the Simulation Data Inspector.

```
sig = Simulink.sdi.getTrigger;
size(sig)
```

```
ans = 1x2
     0     0
```

Output Arguments

sig — Signal used to trigger display updates in the Simulation Data Inspector

`Simulink.sdi.Signal` object

Signal used to trigger display updates in the Simulation Data Inspector, returned as a `Simulink.sdi.Signal` object.

opts — Configuration of trigger in the Simulation Data Inspector

structure

Configuration of trigger in the Simulation Data Inspector, returned as a structure that contains these fields:

- Mode
- Type
- Position
- Delay

- SourceChannelComplexity
- Polarity
- AutoLevel
- Level
- UpperLevel
- LowerLevel
- Hysteresis
- MinTime
- MaxTime
- Timeout
- Holdoff

For details on trigger configuration, see “Scope Triggers Panel” and `Simulink.sdi.addTrigger`.

Simulink.sdi.getUnitSystem

Get current unit system configured in Simulation Data Inspector preferences

Syntax

```
unitSystem = Simulink.sdi.getUnitSystem
[unitSystem,overrideUnits] = Simulink.sdi.getUnitSystem
```

Description

`unitSystem = Simulink.sdi.getUnitSystem` returns the unit system configured in the Simulation Data Inspector preferences. For more information about unit preferences, see “Signal Display Units”. To specify unit preferences for the Simulation Data Inspector, use the `Simulink.sdi.setUnitSystem` function.

`[unitSystem,overrideUnits] = Simulink.sdi.getUnitSystem` returns the unit system and override units configured in the Simulation Data Inspector preferences.

Examples

Configure Unit Preferences in the Simulation Data Inspector

To specify a system of units to use for plotting signals in the Simulation Data Inspector, use the `Simulink.sdi.setUnitSystem` function. When you choose to display signals using the SI or US Customary unit system, the Simulation Data Inspector automatically changes the **Display Units** property for logged or imported signals that use units that are not part of the specified unit system. The signal data stored on disk does not change. Signals also have a **Stored Units** property, and the Simulation Data Inspector converts the data to plot the signal when the **Stored Units** and **Display Units** differ.

Specify a System of Units

By default, the Simulation Data Inspector displays signals using the units assigned to the signal during simulation or in the imported data. To facilitate analyzing multiple signals and data sets together, you can specify a system of units as a preference. The Simulation Data Inspector automatically updates the **Display Units** for logged or imported signals that use units that are invalid in the specified unit system. For example, a signal logged in a model using units of ft could be updated to use units of m when the system of units is specified as SI.

Use the `Simulink.sdi.setUnitSystem` function to configure the Simulation Data Inspector to display signals using units in the US Customary unit system.

```
Simulink.sdi.setUnitSystem('USCustomary');
```

Specify Override Units

When you want all signals that represent the same type of measurement to use the same **Display Units**, you can also specify override units. For example, to plot all signals that represent length using units of ft, specify ft as an override unit.

```
Simulink.sdi.setUnitSystem('USCustomary','Overrides','ft');
```

Check Unit Configuration

Use the `Simulink.sdi.getUnitSystem` function to check the current unit preferences configured in the Simulation Data Inspector.

```
[unitSystem,overrideUnits] = Simulink.sdi.getUnitSystem
```

```
unitSystem =  
'USCustomary'
```

```
overrideUnits =  
"ft"
```

Output Arguments

unitSystem — System of units used to define signal display units

character vector

System of units used to define signal display units, returned as a character vector.

overrideUnits — Units to override signal display units

string | string array

Units to override signal display units, returned as a string or string array. The Simulation Data Inspector displays all signals that represent a measurement type using specified override units. For example, if override units of `in` are specified, the Simulation Data Inspector displays all signals that represent length using units of `in`.

Simulink.sdi.isPCTSupportEnabled

Determine status and mode for Parallel Computing Toolbox support

Syntax

```
[enabled,mode] = Simulink.sdi.isPCTSupportEnabled
```

Description

`[enabled,mode] = Simulink.sdi.isPCTSupportEnabled` returns `enabled`, a logical indication of whether support for the Parallel Computing Toolbox is enabled, and `mode`, the mode of support enabled.

Examples

Check Status of Parallel Worker Support

Before running code that depends on whether automatic import of runs created by parallel workers is enabled, you can use the `Simulink.sdi.isPCTSupportEnabled` function to check the support status. The default behavior for the Simulation Data Inspector enables parallel worker support in `local` mode. In `local` mode, only runs created on local workers automatically import into the Simulation Data Inspector.

```
[enabled, mode] = Simulink.sdi.isPCTSupportEnabled
```

```
enabled =
```

```
    logical
```

```
    1
```

```
mode =
```

```
    'local'
```

Output Arguments

enabled — Logical indicator of parallel worker support

logical

Logical indication of parallel worker support.

- 1 indicates that support for parallel workers is enabled.
- 0 indicates that support for parallel workers is not enabled.

mode — Parallel worker support mode

local (default)

Mode of Parallel Computing Toolbox support.

- 'local' — Runs generated on local workers automatically import to the Simulation Data Inspector.
- 'none' — Parallel worker support is disabled.
- 'all' — Runs created from local and remote workers automatically import to the Simulation Data Inspector.
- 'manual' — Support for manual import of runs created by parallel workers using the `Simulink.sdi.sendWorkerRunToClient` function.

Simulink.sdi.isValidRunID

Package: Simulink.sdi

Determine whether a run ID is valid

Syntax

```
valid = Simulink.sdi.isValidRunID(runID)
```

Description

`valid = Simulink.sdi.isValidRunID(runID)` returns `true` if `runID` corresponds to a run in the Simulation Data Inspector repository.

Examples

Check Run ID Validity

This example shows how to check whether a run ID is valid. You can use `Simulink.sdi.isValidRunID` to ensure you have valid data throughout your script.

Create a Simulation Run

Simulate the model `sldemo_fuelsys` to create a run in the Simulation Data Inspector, and use `Simulink.sdi.getAllRunIDs` to get its run ID.

```
% Simulate model
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')

% Get run ID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Check Run ID Validity

Check to verify that the Simulation Data Inspector has a run corresponding to the run ID.

```
Simulink.sdi.isValidRunID(runID)

ans = logical
     1
```

Delete the Run and Check Validity

You can delete runs to clear out memory space or clean up the Simulation Data Inspector UI. When you delete a run, the run ID for that run becomes invalid.

```
Simulink.sdi.deleteRun(runID)

Simulink.sdi.isValidRunID(runID)
```

```
ans = logical  
     0
```

Input Arguments

runID — Simulation Data Inspector run identifier

scalar

Unique numeric identification for the run. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for your run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

Output Arguments

valid — Run validity indicator

logical

Run validity indicator. When `valid` is `true`, the `runID` is valid. When `valid` is `false`, the `runID` is invalid.

Simulink.sdi.load

Package: Simulink.sdi

Load a Simulation Data Inspector session or view

Syntax

```
valid = Simulink.sdi.load(fileName)
```

Description

`valid = Simulink.sdi.load(fileName)` loads the data and visualization settings in the Simulation Data Inspector session file or MAT file specified by `fileName` and returns 1 when `fileName` is a valid session file or a MAT file that contains data the Simulation Data Inspector supports.

Simulation Data Inspector views are also saved as MLDATX files. To load a view file, use the `Simulink.sdi.loadView` function.

Examples

Save a Simulation Data Inspector Session

This example creates, saves, and loads a Simulation Data Inspector session. The example logs data in the model `slexAircraftExample` and visualizes the logged data in a Simulation Data Inspector session. Each time you use the Simulation Data Inspector, you create and modify a session. You can save the data and associated visualization settings for a session in an MLDATX file using the `Simulink.sdi.save` function. When you want to review the data later, you can load the session using the `Simulink.sdi.load` function.

Log Data to the Simulation Data Inspector

This example logs data from a simulation of the model `slexAircraftExample` to the Simulation Data Inspector. The model is not configured to log data. Load the model and mark the `Stick`, the `alpha`, `rad`, and the `q`, `rad/sec` signals for logging.

```
load_system('slexAircraftExample')

Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')
```

For this example, run two simulations of the model. In the first simulation, use the sine wave output from the `Pilot` block, and in the second, use the square wave output.

```
set_param('slexAircraftExample/Pilot','WaveForm','sine')
sim('slexAircraftExample')

set_param('slexAircraftExample/Pilot','WaveForm','square')
sim('slexAircraftExample')
```

Visualize the Logged Data

You can use the Simulation Data Inspector programmatic interface to access the logged data from the simulations. When you access data using the Simulation Data Inspector programmatic interface, you can use functions to create plots in the Simulation Data Inspector.

To start, access the run IDs for the most recent two runs and then get the corresponding `Simulink.sdi.Run` object. The Run objects allow you to access the logged data for the simulations.

```
runIDs = Simulink.sdi.getAllRunIDs;
sineRunID = runIDs(end-1);
squareRunID = runIDs(end);

sineRun = Simulink.sdi.getRun(sineRunID);
squareRun = Simulink.sdi.getRun(squareRunID);
```

Suppose you want to analyze the relationship between the input and output for the model. Get the `Simulink.sdi.Signal` objects for the input and output signals from the two simulation runs.

```
sineOut = getSignalByIndex(sineRun,1);
sineIn = getSignalByIndex(sineRun,3);

squareOut = getSignalByIndex(squareRun,1);
squareIn = getSignalByIndex(squareRun,3);
```

Change the subplot layout in the Simulation Data Inspector to 2-by-1 and plot the signals from the first simulation run on the top plot and the signals from the second run on the bottom plot.

```
Simulink.sdi.setSubPlotLayout(2,1)

plotOnSubPlot(sineIn,1,1,true)
plotOnSubPlot(sineOut,1,1,true)

plotOnSubPlot(squareIn,2,1,true)
plotOnSubPlot(squareOut,2,1,true)
```

Save the Simulation Data Inspector Session

To view the plotted data in the Simulation Data Inspector, enter `Simulink.sdi.view` in the command window.

Then, save the Simulation Data Inspector session as an MLDATX file.

```
Simulink.sdi.save('myData.mldatx')
```

Load the Simulation Data Inspector Session

To mimic a scenario where you want to return to looking at the same data at a later point, clear the data from the Simulation Data Inspector and reset the subplot layout to 1-by-1.

```
Simulink.sdi.clear
Simulink.sdi.setSubPlotLayout(1,1)
```

Load the session file and resume working with the data. You can open the Simulation Data Inspector and view the results using the `Simulink.sdi.view` function.

```
Simulink.sdi.load('myData.mldatx');
```

Input Arguments

fileName — Name of session file or MAT file

string | character vector

Name of the session file or MAT file to load, specified as a string or character vector. You must specify the file extension to load data from an MLDATX file.

Example: 'myData.mldatx'

Example: 'myData.mat'

Output Arguments

valid — File validity indicator

logical

File validity indicator, returned as 1 (true) or 0 (false). A return value of 0 indicates that the Simulation Data Inspector did not load the session file or did not import data from the MAT file.

Introduced in R2011b

Simulink.sdi.loadView

Load a view file to visualize data in the Simulation Data Inspector

Syntax

```
Simulink.sdi.loadView(filename)
```

Description

`Simulink.sdi.loadView(filename)` applies the visualization information in the view file, `filename`, to the data in the Simulation Data Inspector.

A view contains information about the layout and plots in the graphical viewing area as well as properties of plotted signals. When you load a view, the Simulation Data Inspector uses the properties and preferences in the file to display data currently in the Simulation Data Inspector. Signals in the Simulation Data Inspector that align with the signals in the view are plotted in the graphical viewing area. Use a view to apply a consistent set of visualization settings to multiple sets of similar data.

The view file includes the following information:

- Subplot layout and visualization type
- Settings for each visualization type in the layout
- Signal selection mode
- Replay controls visibility
- Metadata displayed in the work area
- Settings for signal grouping in the work area
- Plotted signals and the line style and color for each plotted signal

A view file does not contain data. To load a session file that contains data and visualization information, use the `Simulink.sdi.load` function.

Examples

Save and Use a View

This example visualizes the output from the `ex_vdp` model, saves the configuration as a view, and then uses the view to visualize the output from another simulation of the same model.

To generate data to plot in the Simulation Data Inspector, simulate the model.

```
open_system('ex_vdp')
set_param('ex_vdp/Mu', 'Gain', '1')
sim('ex_vdp');
```

Programmatically Configure and Save a View

The `ex_vdp` model is configured to log two signals, `x1` and `x2`. Plot each signal on a subplot in a 2-by-1 layout.

```
Simulink.sdi.setSubPlotLayout(2,1)
```

To plot one signal on each subplot, first access the `Simulink.sdi.Run` object for the simulation.

```
runIDs = Simulink.sdi.getAllRunIDs;
ex_vdpRunID = runIDs(end);
ex_vdpRun = Simulink.sdi.getRun(ex_vdpRunID);
```

Then, you can access the data for each signal in a `Simulink.sdi.Signal` object and use the `plotOnSubPlot` function to specify where to plot each signal.

```
x1 = getSignalByIndex(ex_vdpRun,1);
x2 = getSignalByIndex(ex_vdpRun,2);
```

```
plotOnSubPlot(x1,1,1,true)
plotOnSubPlot(x2,2,1,true)
```

To view the result in the Simulation Data Inspector, enter `Simulink.sdi.view` in the command window.

Then, save the view.

```
Simulink.sdi.saveView('ex_vdpView.mldatx')
```

Use the View

To mimic a situation where the Simulation Data Inspector is configured differently and contains data from another simulation, this example clears data from the Simulation Data Inspector, loads a view that represents the default visualization configuration, and runs another simulation of the `ex_vdp` model.

```
Simulink.sdi.clear
Simulink.sdi.loadView('default.mldatx');
set_param('ex_vdp/Mu', 'Gain', '2')
sim('ex_vdp');
```

Use the `Simulink.sdi.loadView` function to apply the saved view from the previous simulation.

```
Simulink.sdi.loadView('ex_vdpView.mldatx')
```

You can open the Simulation Data Inspector to view the results using the `Simulink.sdi.view` function. The saved view includes information regarding the axes limits. When you use a view to apply visualization settings, you may need to adjust axes limits or zoom levels to fit data from a modified simulation.

Input Arguments

filename — Name of the view file
string | character vector

Name of the view file, specified as a string or character vector. You can specify `filename` as only the file name when the file is on the MATLAB path, or you can specify a full path to the file.

Example: `'myView.mldatx'`

Data Types: `char` | `string`

Simulink.sdi.markSignalForStreaming

Package: Simulink.sdi

Turn logging on or off for a signal

Syntax

```
Simulink.sdi.markSignalForStreaming(block,portIndex,log)
Simulink.sdi.markSignalForStreaming(portHandle,log)
Simulink.sdi.markSignalForStreaming(lineHandle,log)
```

Description

`Simulink.sdi.markSignalForStreaming(block,portIndex,log)` marks the signal on the specified `portIndex` of the specified block for logging when you specify `log` as 'on'. To stop logging a signal, specify `log` as 'off'.

`Simulink.sdi.markSignalForStreaming(portHandle,log)` marks the signal on the port specified by `portHandle` for logging when you specify `log` as 'on'. To stop logging a signal, specify `log` as 'off'.

`Simulink.sdi.markSignalForStreaming(lineHandle,log)` marks the signal with the specified `lineHandle` for logging when you specify `log` as 'on'. To stop logging a signal, specify `log` as 'off'.

Examples

Mark Signals for Logging with Port Handles

This example shows how to mark signals for logging using port handles.

Load Model and Mark Signals for Streaming

User `get_param` to get the port handles for the blocks with your signals of interest. Then, use the handle to mark the desired signals for logging.

```
load_system('vdp')

% Get port handles
x1_handles = get_param('vdp/x1','PortHandles');
x1 = x1_handles.Outputport(1);
x2_handles = get_param('vdp/x2','PortHandles');
x2 = x2_handles.Outputport(1);

% Mark signals for streaming
Simulink.sdi.markSignalForStreaming(x1,'on');
Simulink.sdi.markSignalForStreaming(x2,'on');
```

Simulate Model and View Signals in the Simulation Data Inspector

Simulate the model and then open the Simulation Data Inspector to view the logged signals.

```
sim('vdp');
Simulink.sdi.view
```

Mark Signals for Logging Using Line Handles

Load the model `slexAircraftExample`, and use `get_param` to get handles for the signals in the model. Then, use the line handles to mark signals of interest for logging.

```
load_system('slexAircraftExample')
```

Use the `get_param` function to get the line handles for the signals in the model.

```
lines = get_param('slexAircraftExample','Lines');
```

Use the `Simulink.sdi.markSignalForStreaming` function to mark two of the signals for logging using the line handles.

```
sig1handle = lines(1).Handle;
sig2handle = lines(2).Handle;

Simulink.sdi.markSignalForStreaming(sig1handle,'on')
Simulink.sdi.markSignalForStreaming(sig2handle,'on')
```

Simulate the model then open the Simulation Data Inspector to view the logged signal data.

```
out = sim('slexAircraftExample');
Simulink.sdi.view
```

Input Arguments

block — Source block path or handle

character vector

Block path for the block with the desired signal connected to one of its outputs.

Example: `'slexAircraftExample/Pilot'`

portIndex — Source block output port index

integer

Index of the port connected to the signal you want to mark for streaming.

Example: `1`

log — Logging state

'on' | 'off'

Logging state desired for signal.

- 'on' -- Turn logging on for a signal.
- 'off' -- Turn logging off for a signal.

portHandle — Source block output port handle

handle

Port handle for the source block's output port that connects to the signal.

Example: `x1_handles.Outputport(1)`

lineHandle — Signal line handle

handle

Line handle for the signal.

Example: `lines(1).Handle`

Simulink.sdi.registerCursorCallback

Register callback for cursor movements in the Simulation Data Inspector

Syntax

```
callbackID = Simulink.sdi.registerCursorCallback(func)
callbackID = Simulink.sdi.registerCursorCallback(func,view)
```

Description

`callbackID = Simulink.sdi.registerCursorCallback(func)` registers the callback function associated with the function handle `func` with the Simulation Data Inspector. The Simulation Data Inspector executes the callback when you move a cursor or change the number of cursors displayed on the **Inspect** pane.

`callbackID = Simulink.sdi.registerCursorCallback(func,view)` registers the callback function associated with the function handle `func` with the Simulation Data Inspector. The Simulation Data Inspector executes the callback when you move a cursor or change the number of cursors displayed on the pane specified by `view`.

Examples

Use Simulation Data Inspector Cursor Callback in App Designer App

You can use a Simulation Data Inspector cursor callback function to send cursor position data to an app you build using the App Designer. This example shows how to add a property to the app to store the callback ID and where to register and unregister the cursor callback. For an example of an App Designer app that uses a cursor callback, see “Synchronize Cursors in the Simulation Data Inspector with an App Designer App”.

Add a `callbackID` property to the app object.

```
properties (Access = private)
    callbackID
end
```

Define the behavior of the cursor callback function.

```
methods (Access = public)
    function myCursorCallback(app,~,~)
        if isvalid(app)
            ...
        end
    end
end
```

Register the cursor callback in the app `startupFcn`. This example registers the same callback on the **Inspect** pane and the **Compare** pane.

```
function startupFcn(app)
    app.callbackID = Simulink.sdi.registerCursorCallback(...
```

```

    @(t1,t2)myCursorCallback(app,t1,t2));
    app.callbackID(2) = Simulink.sdi.registerCursorCallback(...
        @(t1,t2)myCursorCallback(app,t1,t2), 'compare');
    ...
end

```

Unregister the cursor callback in the app `UIFigureCloseRequest` function.

```

function myAppUIFigureCloseRequest(app, event)
    Simulink.sdi.unregisterCursorCallback(app.callbackID(1));
    Simulink.sdi.unregisterCursorCallback(app.callbackID(2));
end

```

Input Arguments

func — Cursor callback to register

function handle

Cursor callback to register, specified as a function handle. The function that corresponds to the function handle must accept two input arguments, `t1` and `t2`, that correspond to the left and right cursor positions. When no cursors are displayed, `t1` and `t2` are `NaN`. When only one cursor is displayed, `t2` is `NaN`.

Example: `id = Simulink.sdi.registerCursorCallback(@(t1,t2)myFunc(t1,t2))` registers the function `myFunc` as the callback for cursor events on the **Inspect** pane of the Simulation Data Inspector.

Data Types: `function_handle`

view — Cursor event source

'inspect' (default) | 'compare'

Cursor event source, specified as 'inspect' or 'compare'.

- 'inspect' — Register callback for cursor events on the **Inspect** pane.
- 'compare' — Register callback for cursor events on the **Compare** pane.

The registered cursor callback executes for each cursor event. Cursor events occur when you move cursors or change the number of visible cursors.

Data Types: `char` | `string`

Output Arguments

callbackID — Registered callback ID

scalar

Registered callback ID, returned as a scalar. Use the callback ID to unregister the callback.

Introduced in R2021a

Simulink.sdi.removeTrigger

Remove trigger from signal in the Simulation Data Inspector

Syntax

```
Simulink.sdi.removeTrigger
```

Description

`Simulink.sdi.removeTrigger` removes the trigger from a signal in the Simulation Data Inspector. If a trigger exists in the Simulation Data Inspector, adding a trigger to a different signal also removes the existing trigger.

Examples

Programmatically Configure Triggers in the Simulation Data Inspector

Add a trigger to a signal in the Simulation Data Inspector to specify criteria that determine when to update plots to display fresh data. Triggers can allow you to capture transient signal behavior and can help stabilize the display of periodic signals so you can take measurements.

Simulate the Triggers model. Data in the model logs to the Simulation Data Inspector.

```
open_system('Triggers');  
out = sim('Triggers');
```

Then, add a trigger to the Pulse signal. Configure the trigger as a falling-edge trigger with a threshold of 0.5.

```
trigRun = Simulink.sdi.getCurrentSimulationRun('Triggers');  
pulseSig = getSignalsByName(trigRun,'Pulse');  
Simulink.sdi.addTrigger(pulseSig,'Type','Edge','Level',0.5);
```

You can verify that the trigger was added and configured correctly by opening the Simulation Data Inspector using `Simulink.sdi.view` and clicking the trigger icon next to the Pulse signal to check the configuration. You can also use the `Simulink.sdi.getTrigger` function to check which signal is used to generate trigger events and the trigger configuration.

```
[sig,trigOpts] = Simulink.sdi.getTrigger;
```

```
sig.Name
```

```
ans =  
'Pulse'
```

```
trigOpts
```

```
trigOpts = struct with fields:  
    Mode: 'Auto'  
    Type: 'Edge'  
    Position: 0.5000
```

```
        Delay: 0
SourceChannelComplexity: 'Scalar'
        Polarity: 'Positive'
        AutoLevel: 1
            Level: 0.5000
        UpperLevel: 0
        LowerLevel: 0
        Hysteresis: 0
            MinTime: 0
            MaxTime: Inf
            Timeout: 0
        Holdoff: 0
```

When you do not want to use a trigger to control when the Simulation Data Inspector updates the plots with fresh data, you can remove the trigger using the `Simulink.sdi.removeTrigger` function.

```
Simulink.sdi.removeTrigger
```

You can verify that the trigger was removed in the Simulation Data Inspector UI or using the `Simulink.sdi.getTrigger` function. The `Simulink.sdi.getTrigger` function returns an empty array of `Simulink.sdi.Signal` objects when no trigger is configured in the Simulation Data Inspector.

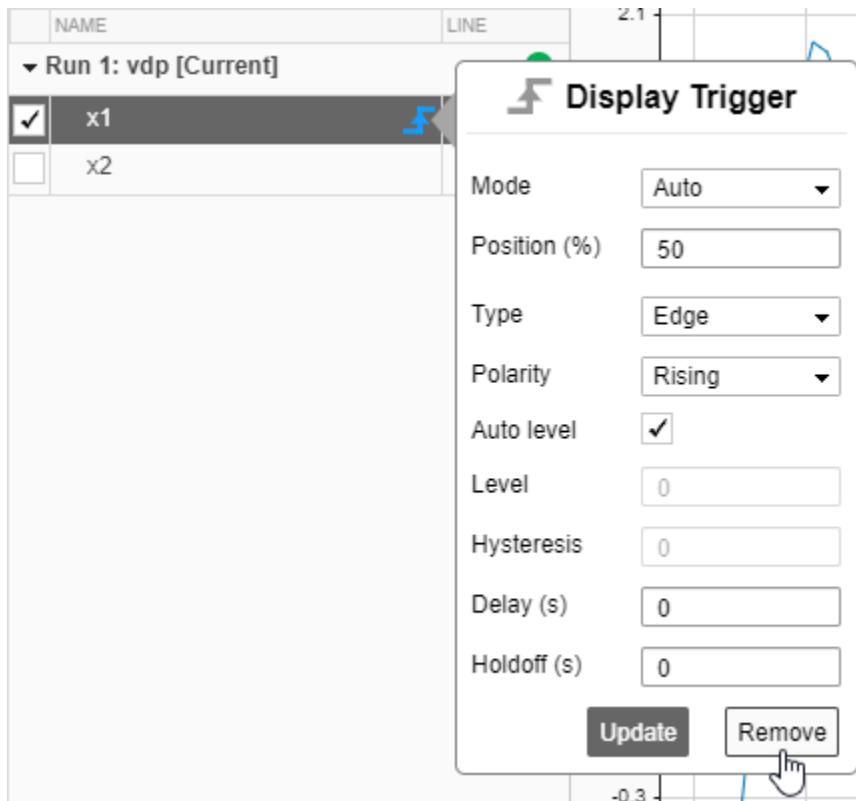

```
sig = Simulink.sdi.getTrigger;
size(sig)
```

```
ans = 1×2
```

```
    0    0
```

Alternative Functionality

To remove a trigger from a signal using the Simulation Data Inspector UI, click the trigger symbol next to the signal, then click **Remove**.

“Inspect and Compare Data Programmatically”

Introduced in R2020b

Simulink.sdi.report

Package: Simulink.sdi

Generate a Simulation Data Inspector report

Syntax

```
Simulink.sdi.report  
Simulink.sdi.report(Name,Value)
```

Description

`Simulink.sdi.report` creates a report that contains plot snapshots and metadata for signals plotted in the **Inspect** pane of the Simulation Data Inspector.

`Simulink.sdi.report(Name,Value)` creates a report as specified by one or more `Name,Value` pair arguments. Using this syntax, you can create a report of data plotted in the **Inspect** pane or a report of comparison results. You can specify details for each report.

Examples

Create a Report for Plotted Signals

Create a report that contains information about and plots of the signals plotted in the **Inspect** pane of the Simulation Data Inspector. By default, the report contains the metadata displayed for signals in the table on the **Inspect** pane. This example shows how to specify which metadata to include in the report.

Load the Session File

This example populates the Simulation Data Inspector with data and plotted signals by loading a saved session file. A session file contains the signal data as well as information about plotted signals and plot layout. Load the session file.

```
Simulink.sdi.load('ex_sl-demo_absbrake_slp_Ww.mldatx');
```

Create a Report for Plotted Signals

The report includes plots and metadata for the plotted signals. By default, the report includes the metadata that corresponds to the columns displayed in the signals table on the **Inspect** pane. You can include more data in the report by displaying more columns in the **Inspect** pane. You can also specify the information you want in the report programmatically using the 'ColumnsToReport' name-value pair and the enumeration class `Simulink.sdi.SignalMetaData`.

```
signalMetadata = [Simulink.sdi.SignalMetaData.Run, ...
    Simulink.sdi.SignalMetaData.Line, ...
    Simulink.sdi.SignalMetaData.BlockName, ...
    Simulink.sdi.SignalMetaData.SignalName];

Simulink.sdi.report('ReportType','Inspect', 'ReportOutputFile', ...
    'absbrake_slp_report.html', 'ColumnsToReport', signalMetadata);
```

The report shows tables of the metadata for plotted signals, organized by run, above a snapshot of the plot.

Create a Report for Comparison Results

Use the `Simulink.sdi.report` function to create a report of comparison results. The report is web-based and interactive, and you can switch between the interactive view and a printable view.

Load Comparison Results

This example loads previously computed comparison results that were saved in an MLDATX file using the `saveResult` function. The data came from two simulations of the `slexAircraftExample` model that used different time constant values for the input filter.

```
Simulink.sdi.load('slexAircraftExampleTsComparison.mldatx');
```

Create Comparison Report

Create a report that contains the comparison results using the `Simulink.sdi.report` function. You can specify a title and author for the report that display in the report header.

```
Simulink.sdi.report('ReportType','Compare','ReportTitle',...
    'Compare: Ts = 0.1 vs Ts = 1','ReportAuthor','Jane Smith');
```

The report opens in the system browser once it is generated. Select signals to see the results displayed in the plot and the metadata for the signals in the **Properties** pane. The report HTML file is in the `sdireports` folder in the working directory.

Input Arguments

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: `'ReportType','Compare','ShortenBlockPath',true`

ReportType — Type of report to create

`'Inspect'` (default) | `'Compare'`

Type of report to create, specified as the comma-separated pair consisting of `'ReportType'` and `'Inspect'` or `'Compare'`.

- `'Inspect'` -- Create a report that contains plot snapshots and metadata for signals plotted in the **Inspect** pane of the Simulation Data Inspector.
- `'Compare'` -- Create a report that summarizes comparison results. The comparison report is interactive and includes plot snapshots of comparison results as well as metadata for the compared signals.

Example: `'ReportType','Compare'`

ReportTitle — Report title displayed in header for comparison report

`'Compare: <Baseline Run> vs. <Compare To Run>'` (default) | character vector

Report title displayed in header for comparison report, specified as the comma-separated pair consisting of `'ReportTitle'` and a character vector.

You can only specify a report title for a comparison report.

Example: `'ReportTitle','Trial 1 vs. Trial 2'`

ReportAuthor — Report author displayed in header for comparison report`'<username>' (default) | character vector`

Report author displayed in header for comparison report, specified as the comma-separated pair consisting of 'ReportAuthor' and a character vector.

You can only specify a report author for a comparison report.

Example: 'ReportAuthor', 'John Smith'

ReportOutputFolder — Folder where report is saved`'<current working folder>/sdireports' (default) | path`

Folder where report is saved, specified as the comma-separated pair consisting of 'ReportOutputFolder' and a character vector.

Example: 'ReportOutputFolder', 'C:\Users\user1\Desktop'

ReportOutputFile — Report file name`'SDI_report.html' (default) | character vector`

Report file name, specified as the comma-separated pair consisting of 'ReportOutputFile' and a character vector.

Example: 'ReportOutputFile', 'MyReport.html'

PreventOverwritingFile — Whether to prevent overwriting report files`true (default) | false`

Whether to prevent overwriting report files, specified as the comma-separated pair consisting of 'PreventOverwritingFile' and true or false.

- `true` enables file overwrite protection.
- `false` disables file overwrite protection.

File overwrite protection prevents the Simulation Data Inspector from overwriting an existing file by appending the file name with a number that increments each time you generate a report. When you disable file overwrite protection, the Simulation Data Inspector overwrites the existing report file unless you specify a unique file name.

Example: 'PreventOverwritingFile', false

ColumnsToReport — Signal metadata to include in report for plotted signals`array`

Signal metadata to include in the report of signals plotted in the **Inspect** pane of the Simulation Data Inspector, specified as the comma-separated pair consisting of 'ColumnsToReport' and an array. By default, the **Inspect** report includes the block path, name, line style and color, and data source parameters for each plotted signal.

Note The `ColumnsToReport` input does not affect comparison reports. The comparison report always includes all signal metadata, and the summary at the top of the comparison report always includes the signal name, absolute tolerance, relative tolerance, maximum difference, and result for each signal comparison.

Specify metadata to include as an array, using the enumeration class `Simulink.sdi.SignalMetaData`. For example, to include the name of the simulation run and signal name:

```
signal_metadata = [Simulink.sdi.SignalMetaData.Run,...
                  Simulink.sdi.SignalMetaData.SignalName];
```

Then, specify `ColumnsToReport` as `signal_metadata` in the name-value pair:

```
Simulink.sdi.report('ColumnsToReport',signal_metadata)
```

The table summarizes the metadata available for Inspect report.

Column Value	Description
SignalName (default)	Signal name
Line (default)	Signal line style and color
SID	Simulink identifier For more information about SIDs, see “Simulink Identifiers”
Units	Signal measurement units
SigDataType	Signal data type
SigSampleTime	Method used to sample the signal
Model	Name of the model that generated the signal
BlockName	Name of the source block for the signal
BlockPath	Path to the source block for the signal
Port	Index of the signal on the output port of its block
Dimensions	Dimensions of the matrix containing the signal
Channel	Index of signal within matrix
Run	Name of the simulation run containing the signal
AbsTol	Absolute tolerance for the signal
RelTol	Relative tolerance for the signal
OverrideGlobalTol	Property that specifies whether signal tolerances take priority over global tolerances
TimeTol	Time tolerance for the signal
InterpMethod	Interpolation method
SyncMethod	Synchronization method used to coordinate signals for comparison
TimeSeriesRoot	Name of the variable associated with the signal for signals imported from the MATLAB workspace
TimeSource	Name of the array containing the time data for signals imported from the MATLAB workspace
DataSource	Name of the array containing the signal data for signals imported from the MATLAB workspace

Example: `'ColumnsToReport',metadata`

ShortenBlockPath — Whether to shorten block path in report`true (default) | false`

Whether to shorten block path in report, specified as the comma-separated pair consisting of 'ShortenBlockPath' and true or false.

- `true` -- Use the shortened block path in the report.
- `false` -- Include the full block path in the report.

Example: 'ShortenBlockPath', false

LaunchReport — Whether to open report when created`true (default) | false`

Whether to open the report when it is created, specified as the comma-separated pair consisting of 'LaunchReport' and true or false.

- `true` -- Open the report when it is created.
- `false` -- Do not open the report automatically.

Example: 'LaunchReport', false

SignalsToReport — Signals to include in comparison report`'ReportOnlyMismatchedSignals' (default) | 'ReportAllSignals'`

Signals to include in a comparison report, specified as the comma-separated pair consisting of 'SignalsToReport' and 'ReportOnlyMismatchedSignals' or 'ReportAllSignals'.

- `ReportOnlyMismatchedSignals` -- Include only signals with out of tolerance comparison results.
- `ReportAllSignals` -- Include all signals.

Example: 'SignalsToReport', 'ReportAllSignals'

Compatibility Considerations

ReportStyle input ignored

Behavior changed in R2020b

Starting in R2020b, the ReportStyle name-value pair input is ignored.

In R2020a, you could use the `Simulink.sdi.report` function to create two separate types of comparison report, and you could use the ReportStyle name-value pair to indicate the type of report to create.

From R2020b, the Simulation Data Inspector only produces one comparison report. You can switch between the interactive and printable view within the report.

Simulink.sdi.resetRunNamingRule

Package: Simulink.sdi

Revert the Simulation Data Inspector run naming rule to default

Syntax

```
Simulink.sdi.resetRunNamingRule
```

Description

`Simulink.sdi.resetRunNamingRule` resets the run naming rule the Simulation Data Inspector uses to assign a name to runs created through simulating a Simulink model to its default 'Run <run_index>: <model_name>'.

Examples

Modify then Reset Run Naming Rule

This example shows how to use the Simulation Data Inspector API to modify the Simulation Data Inspector run naming rule, check a run's name, reset the run naming rule to its default, and check the run naming rule.

```
% Load model
load_system('sldemo_fuelsys')

% Modify run naming rule
Simulink.sdi.setRunNamingRule('<model_name> Run <run_index>')

% Simulate system
sim('sldemo_fuelsys')

% Check run name
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
run = Simulink.sdi.getRun(runID);
run.name

ans =
'sldemo_fuelsys Run 1'

% Reset the run naming rule
Simulink.sdi.resetRunNamingRule

% Check run naming rule
Simulink.sdi.getRunNamingRule

ans =
'Run <run_index>: <model_name>'
```

Alternatives

You can reset the run naming rule to its default using the Simulation Data Inspector UI. Use the **Restore Defaults** button on the **New Run** tab under Simulation Data Inspector **Preferences**.

`Simulink.sdi.clearPreferences` restores the run naming rule, along with all other Simulation Data Inspector preferences.

`Simulink.sdi.clearPreferences` | `Simulink.sdi.setRunNamingRule` |
`Simulink.sdi.getRunNamingRule`

Topics

“Configure the Simulation Data Inspector”

“Inspect and Compare Data Programmatically”

Introduced in R2015a

Simulink.sdi.Run.create

Import data into new run in Simulation Data Inspector and return `Simulink.sdi.Run` object

Syntax

```
runObj = Simulink.sdi.Run.create
runObj = Simulink.sdi.Run.create(runName)

runObj = Simulink.sdi.Run.create(var)
runObj = Simulink.sdi.Run.create(runName, 'vars', var, var2, ..., varn)
runObj = Simulink.sdi.Run.create(runName, 'namevalue', sourceNames, sigValues)

runObj = Simulink.sdi.Run.create(runName, 'file', filename)
runObj = Simulink.sdi.Run.create(runName, 'file', filename, Name=Value)
```

Description

Create Empty Run

`runObj = Simulink.sdi.Run.create` creates the empty `Simulink.sdi.Run` object, `runObj`. You can add signals to the Run object using the `add` function or the `Simulink.sdi.addToRun` function.

`runObj = Simulink.sdi.Run.create(runName)` creates an empty run named `runName`.

Import Data from Workspace

`runObj = Simulink.sdi.Run.create(var)` imports data from the scalar variable `var` into a new run in the Simulation Data Inspector. The run is named according to the input variable. For example, when `var` is a `timeseries` object, the run name comes from the `Name` property on the `timeseries` object.

`runObj = Simulink.sdi.Run.create(runName, 'vars', var, var2, ..., varn)` imports data from one or more variables into a new run in the Simulation Data Inspector named `runName`.

Use this syntax to import data from multiple variables or from a variable that represents an array of objects, such as an array of `Simulink.SimulationOutput` or `Simulink.SimulationData.Dataset` objects.

`runObj = Simulink.sdi.Run.create(runName, 'namevalue', sourceNames, sigValues)` imports data from one or more variables into a new run in the Simulation Data Inspector named `runName`. The cell array `sourceNames` specifies the names used to set the `RootSource`, `TimeSource`, and `DataSource` properties for the signals imported from the `sigValues` cell array.

Import Data from File

`runObj = Simulink.sdi.Run.create(runName, 'file', filename)` imports data from a file into a new run in the Simulation Data Inspector named `runName`. You can use a built-in file reader to import data from a MAT file, CSV file, Microsoft Excel file, or an MDF file.

When you need to import data from a file that the built-in readers do not support, you can write your own reader using the `io.reader` class.

`runObj = Simulink.sdi.Run.create(runName, 'file', filename, Name=Value)` imports data from a file into a new run in the Simulation Data Inspector according to options specified using one or more name-value arguments. For example, `sheets=["sheet1" "sheet2"]` specifies the sheets from which to import data when importing data from an Excel file.

Examples

Create a Run in the Simulation Data Inspector

You can programmatically import data into the Simulation Data Inspector by creating a run from data in the base workspace or a file. This example creates data in the workspace and then illustrates several methods of creating a Simulation Data Inspector run containing the data.

Create Data

Create data in the workspace. The Simulation Data Inspector supports time series data in many formats. This example creates data using the `timeseries` and `Simulink.SimulationData.Dataset` formats and saves the data in a MAT-file.

Create a sine signal and a cosine signal. Store the data for each signal in a `timeseries` object with a descriptive name.

```
time = 0:0.2:20;

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';
```

You can use the `Dataset` format to group related signal data together in a single object. The `Dataset` format is the default format for logged data and is supported for loading simulation input data. Create a `Dataset` object that contains the sinusoid `timeseries` data.

```
sinusoids_ds = Simulink.SimulationData.Dataset;
sinusoids_ds = addElement(sinusoids_ds,cos_ts);
sinusoids_ds = addElement(sinusoids_ds,sine_ts);
```

Scale each signal by a factor of 2 and create a `Dataset` object to contain the signal data for the results.

```
doubSine = 2*sine_ts;
doubCos = 2*cos_ts;

doubSinusoids_ds = Simulink.SimulationData.Dataset;
doubSinusoids_ds = addElement(doubSinusoids_ds,doubSine);
doubSinusoids_ds = addElement(doubSinusoids_ds,doubCos);
```

Finally, save the `timeseries` data to a MAT-file.

```
save sinusoids.mat sine_ts cos_ts
```

Open the Simulation Data Inspector

To view the runs you create in each section, open the Simulation Data Inspector by entering `Simulink.sdi.view` in the MATLAB™ Command Window.

Create a Run Using a `Simulink.sdi.Run` Object

You can import your data into a run in the Simulation Data Inspector by creating an empty run and then adding data to the run from the workspace or a file. Depending on your task, you can use the `Simulink.sdi.Run.create` function or the `Simulink.sdi.createRun` function to create the empty run. The `Simulink.sdi.Run.create` function returns the `Simulink.sdi.Run` object for the new run, and the `Simulink.sdi.createRun` function returns the run ID for the new run.

This example creates an empty run using the `Simulink.sdi.Run.create` function, gives the run a meaningful name and description, and then adds the sine and cosine `timeseries` data using the `add` function.

```
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals of different frequencies';

add(sinusoidsRun, 'vars', sine_ts, cos_ts)
```

This example uses the `Simulink.sdi.createRun` function to create a new run in the Simulation Data Inspector called `My Waves` and then uses the `Simulink.sdi.addToRun` function to add the sine and cosine `timeseries` data to the run.

```
runID = Simulink.sdi.createRun('My Waves');
signalID = Simulink.sdi.addToRun(runID, 'vars', sine_ts, cos_ts);
```

Create a Run from a Workspace Variable

You can create a run from a single variable in the workspace. After creating the run, you can add additional data, or you can create another run to contain your other data. The variable you use to create the run can be a `timeseries` object with data that corresponds to only one signal, or it can be a `Dataset` object that contains several signals.

When you use this syntax to create a run from a single workspace variable, the run takes the same name as the object used to create it.

```
runID = Simulink.sdi.createRun(sine_ts);
```

The `Simulink.sdi.createRun` function returns the run ID for the run it creates. You can use the `Simulink.sdi.getRun` function to access the `Run` object for the run.

```
sineRun = Simulink.sdi.getRun(runID);
sineRun.Name
```

```
ans =
'Sine, T=5'
```

Create a Run from Multiple Workspace Variables

When your data exists in multiple variables in your workspace, you can use the `Simulink.sdi.createRun` function with the `vars` option to import the data from multiple variables into a single run in the Simulation Data Inspector. You can also use this syntax to create a run for a single variable that uses a name you specify.

This example creates a run called `My Sinusoids` that contains data for the sine and cosine timeseries objects.

```
runID = Simulink.sdi.createRun('My Sinusoids','vars',sine_ts,cos_ts);
```

Create a Run and Specify Source Names

You can use the `namevalue` option of the `Simulink.sdi.createRun` function to create a run and specify names for the signals in the run. This syntax can be particularly helpful when you import individual leaf signals from hierarchical data.

This example creates a run containing the data for both the `Dataset` objects. Each `Dataset` object contains data for more than one signal, so the imported run data has hierarchy. The name-value syntax in this example specifies a name for the hierarchical node that corresponds to each `Dataset` object.

```
runID = Simulink.sdi.createRun('Waves','namevalue',{'Sinusoids',...
    'BigSinusoids'},{sinusoids_ds,doubSinusoids_ds});
```

Create a Run from Data in a File

You can also use the `Simulink.sdi.createRun` function to import data into the Simulation Data Inspector from a file. Use the `file` option to import the data in the `sinusoids.mat` file.

```
runID = Simulink.sdi.createRun('Wave Data','file','sinusoids.mat');
```

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

Create timeseries objects to contain data for a sine signal and a cosine signal. Give each timeseries object a descriptive name.

```
time = linspace(0,20,100);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Run and Add Data

Use the `Simulink.sdi.view` function to open the Simulation Data Inspector.

```
Simulink.sdi.view
```

To import data into the Simulation Data Inspector from the workspace, create a `Simulink.sdi.Run` object using the `Simulink.sdi.Run.create` function. Add information about the run to its metadata using the `Name` and `Description` properties of the `Run` object.

```
sinusoidsRun = Simulink.sdi.Run.create;  
sinusoidsRun.Name = 'Sinusoids';  
sinusoidsRun.Description = 'Sine and cosine signals with different frequencies';
```

Use the `add` function to add the data you created in the workspace to the empty run.

```
add(sinusoidsRun, 'vars', sine_ts, cos_ts);
```

Plot the Data in the Simulation Data Inspector

Use the `getSignalByIndex` function to access `Simulink.sdi.Signal` objects that contain the signal data. You can use the `Simulink.sdi.Signal` object properties to specify the line style and color for the signal and plot it in the Simulation Data Inspector. Specify the `LineColor` and `LineDashed` properties for each signal.

```
sine_sig = getSignalByIndex(sinusoidsRun,1);  
sine_sig.LineColor = [0 0 1];  
sine_sig.LineDashed = '-.';  
  
cos_sig = sinusoidsRun.getSignalByIndex(2);  
cos_sig.LineColor = [0 1 0];  
cos_sig.LineDashed = '--';
```

Use the `Simulink.sdi.setSubPlotLayout` function to configure a 2-by-1 subplot layout in the Simulation Data Inspector plotting area. Then use the `plotOnSubplot` function to plot the sine signal on the top subplot and the cosine signal on the lower subplot.

```
Simulink.sdi.setSubPlotLayout(2,1);  
  
plotOnSubPlot(sine_sig,1,1,true);  
plotOnSubPlot(cos_sig,2,1,true);
```

Close the Simulation Data Inspector and Save Your Data

When you have finished inspecting the plotted signal data, you can close the Simulation Data Inspector and save the session to an MLDATX file.

```
Simulink.sdi.close('sinusoids.mldatx')
```

Input Arguments

runName — Name for run

string | character vector

Name for run in Simulation Data Inspector, specified as a string or a character vector.

Example: 'Baseline Simulation'

var — Data to import

variable

Data to import, specified as a variable. The Simulation Data Inspector supports time-based data in which sample values are associated with sample times. The Simulation Data Inspector supports all loading and logging data formats, including `timeseries` and `Simulink.SimulationData.Dataset`.

Example: `myData`

sourceNames — Source names for imported data

cell array of character vectors

Source names for imported data, specified as a cell array of character vectors. The source name is used to set the `RootSource`, `TimeSource`, and `DataSource` properties of the `Simulink.sdi.Signal` objects created from the data specified by the `sigValues` input.

Provide a `sourceNames` input when you specify 'namevalue' for the second argument.

Example: {'sig1','sig2'}

sigValues — Data to import

cell array of variables

Data to import, specified as a cell array of variables.

Provide a `sigValues` input when you specify 'namevalue' for the second argument.

Example: {var1,var2}

filename — Name of file with data to import

character vector

Name of file with data to import, specified as a character vector. Provide a `filename` input when you specify 'file' for the second argument.

You can create a run from these types of files using file readers built into the Simulation Data Inspector:

- MAT-file
- CSV file
- Microsoft Excel file that contains data formatted according to “Microsoft Excel Import, Export, and Logging Format”.
- MDF file with one of these extensions:
 - .mdf
 - .mf4
 - .mf3
 - .data
 - .dat

When you need to import data from a file that the built-in readers do not support, you can write your own reader using the `io.reader` class. You can also write a custom reader to use instead of the built-in reader for any file extension. For an example, see “Import Data Using a Custom File Reader”.

Example: 'simulation.mat'

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Example: sheets=["sheet1" "sheet2"]

reader — File reader to use to import data

string | character vector

File reader to use to import data, specified as a string or character vector.

The Simulation Data Inspector prioritizes using a registered custom reader when one is available for the file. When you do not specify a reader, the Simulation Data Inspector uses the first custom reader registered for the file. If no custom readers are registered, the data is imported using the built-in reader.

Specify the reader input when:

- You want to use the built-in reader to import data for a file that is also supported by a custom reader.
- Multiple registered custom readers support the file.

To determine which readers are available to import your file, use the `io.reader.getSupportedReadersForFile` function.

Example: "MyExcelReader"

Example: "built-in"

sheets — Sheets in Excel file from which to import data

string array | cell array of character vectors

Sheets in Excel file from which to import data, specified as a string array or a cell array of character vectors. By default, the Simulation Data Inspector imports data from all sheets. Use the `sheets` name-value argument when you do not want to import data from all sheets in the Excel file.

When the data in the file does not include simulation numbers and source information, the data on each sheet is imported into a separate run. For more information about formatting data to import from an Excel file, see "Microsoft Excel Import, Export, and Logging Format".

Example: ["sheet1" "sheet2"]

model — Model with definitions of user-defined data types

string | character vector

Model with definitions of user-defined data types, specified as a string or character vector.

When you load data from an Excel file that defines signal data types using user-defined data types, such as enumerations, buses, or aliases, the Simulation Data Inspector needs access to the type definition to import the data. You can provide access to the type definitions by:

- Loading the associated object into the MATLAB workspace.
- Specifying the `model` name-value argument to use type definitions saved in the model workspace or a data dictionary.

For more information on formatting data to import from an Excel file, see "Microsoft Excel Import, Export, and Logging Format".

Example: "myModel.slx"

Output Arguments

runObj — Imported data

Simulink.sdi.Run object

Imported data, returned as a Simulink.sdi.Run object. When you create an empty Run object, import data into the run using the add function or the Simulink.sdi.addToRun function.

Simulink.sdi.Run.getLatest

Get the most recently created Simulation Data Inspector run

Syntax

```
runObj = Simulink.sdi.Run.getLatest
```

Description

`runObj = Simulink.sdi.Run.getLatest` returns the most recently created run in the Simulation Data Inspector repository. A run is created when you simulate a model that logs data or when you import data into the Simulation Data Inspector.

Examples

Access Simulation Data Inspector Runs

Many tasks performed using the Simulation Data Inspector programmatic interface start by accessing the `Simulink.sdi.Run` object that corresponds to the logged or imported data you want to analyze. For example, you can use the Run object to access the `Simulink.sdi.Signal` objects that correspond to individual signals in the run.

This example shows how to access Run objects by using the `Simulink.sdi.Run.getLatest` function, the `Simulink.sdi.getCurrentSimulationRun` function, or the `Simulink.sdi.getRun` function.

Create a Run

The model `sldemo_fuelsys` is already configured for logging. When you simulate the model, the Simulation Data Inspector automatically creates a run and assigns it a run ID.

```
load_system('sldemo_fuelsys')  
sim('sldemo_fuelsys')
```

Get Run Object Using Simulink.sdi.Run.getLatest

In this example, the run created when you simulated the model is the most recently created run in the Simulation Data Inspector. When you want to access the most recently created run, use the `Simulink.sdi.Run.getLatest` function.

```
fuelsysRun = Simulink.sdi.Run.getLatest;
```

Get Run Object Using Simulink.sdi.getCurrentSimulationRun

The run you want to access may not be the most recently created run in the Simulation Data Inspector. If the run corresponds to the most recent simulation of a model, you can use the `Simulink.sdi.getCurrentSimulationRun` function to access the Run object. You can also use the `Simulink.sdi.getCurrentSimulationRun` function to access data for an in-progress simulation when the simulation streams data to the Simulation Data Inspector. This function can be useful when you are working with multiple models.

In this example, the run created when you simulated the model is the current simulation run for the `sldemo_fuelsys` model.

```
fuelsysRun = Simulink.sdi.getCurrentSimulationRun('sldemo_fuelsys');
```

Get Run Object from a Run ID

When your task also requires the run ID, you can use the `Simulink.sdi.getRun` function to get the corresponding `Simulink.sdi.Run` object that contains the run data and metadata.

```
runIDs = Simulink.sdi.getAllRunIDs;  
runID = runIDs(end);  
fuelsysRun = Simulink.sdi.getRun(runID);
```

Output Arguments

`runObj` — `Simulink.sdi.Run` object

`Simulink.sdi.Run` object

`Simulink.sdi.Run` object for the most recently created run in the Simulation Data Inspector.

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2020a

Simulink.sdi.save

Package: Simulink.sdi

Save Simulation Data Inspector session

Syntax

```
Simulink.sdi.save(fileName)
```

Description

`Simulink.sdi.save(fileName)` saves all runs, signals, and visualization settings as a Simulation Data Inspector session in the file `fileName`.

A session file includes data as well as visualization information. Use the `Simulink.sdi.load` function to open a session file in the Simulation Data Inspector. When the session file opens, you can choose to add the data to existing data in the Simulation Data Inspector or clear the existing data.

You can also save only the visualization information to apply to other sets of data. Save visualization information for reuse in a view file using the `Simulink.sdi.saveView` function.

Examples

Save a Simulation Data Inspector Session

This example creates, saves, and loads a Simulation Data Inspector session. The example logs data in the model `slexAircraftExample` and visualizes the logged data in a Simulation Data Inspector session. Each time you use the Simulation Data Inspector, you create and modify a session. You can save the data and associated visualization settings for a session in an MLDATX file using the `Simulink.sdi.save` function. When you want to review the data later, you can load the session using the `Simulink.sdi.load` function.

Log Data to the Simulation Data Inspector

This example logs data from a simulation of the model `slexAircraftExample` to the Simulation Data Inspector. The model is not configured to log data. Load the model and mark the `Stick`, the `alpha`, `rad`, and the `q`, `rad/sec` signals for logging.

```
load_system('slexAircraftExample')  
  
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')  
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on')  
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')
```

For this example, run two simulations of the model. In the first simulation, use the sine wave output from the `Pilot` block, and in the second, use the square wave output.

```
set_param('slexAircraftExample/Pilot','WaveForm','sine')  
sim('slexAircraftExample')
```

```
set_param('slexAircraftExample/Pilot','WaveForm','square')
sim('slexAircraftExample')
```

Visualize the Logged Data

You can use the Simulation Data Inspector programmatic interface to access the logged data from the simulations. When you access data using the Simulation Data Inspector programmatic interface, you can use functions to create plots in the Simulation Data Inspector.

To start, access the run IDs for the most recent two runs and then get the corresponding `Simulink.sdi.Run` object. The Run objects allow you to access the logged data for the simulations.

```
runIDs = Simulink.sdi.getAllRunIDs;
sineRunID = runIDs(end-1);
squareRunID = runIDs(end);

sineRun = Simulink.sdi.getRun(sineRunID);
squareRun = Simulink.sdi.getRun(squareRunID);
```

Suppose you want to analyze the relationship between the input and output for the model. Get the `Simulink.sdi.Signal` objects for the input and output signals from the two simulation runs.

```
sineOut = getSignalByIndex(sineRun,1);
sineIn = getSignalByIndex(sineRun,3);

squareOut = getSignalByIndex(squareRun,1);
squareIn = getSignalByIndex(squareRun,3);
```

Change the subplot layout in the Simulation Data Inspector to 2-by-1 and plot the signals from the first simulation run on the top plot and the signals from the second run on the bottom plot.

```
Simulink.sdi.setSubPlotLayout(2,1)

plotOnSubPlot(sineIn,1,1,true)
plotOnSubPlot(sineOut,1,1,true)

plotOnSubPlot(squareIn,2,1,true)
plotOnSubPlot(squareOut,2,1,true)
```

Save the Simulation Data Inspector Session

To view the plotted data in the Simulation Data Inspector, enter `Simulink.sdi.view` in the command window.

Then, save the Simulation Data Inspector session as an MLDATX file.

```
Simulink.sdi.save('myData.mldatx')
```

Load the Simulation Data Inspector Session

To mimic a scenario where you want to return to looking at the same data at a later point, clear the data from the Simulation Data Inspector and reset the subplot layout to 1-by-1.

```
Simulink.sdi.clear
Simulink.sdi.setSubPlotLayout(1,1)
```

Load the session file and resume working with the data. You can open the Simulation Data Inspector and view the results using the `Simulink.sdi.view` function.

```
Simulink.sdi.load('myData.mldatx');
```

Input Arguments

fileName — File name

character vector

Name for the session file.

Example: 'myData.mldatx'

Topics

“Inspect and Compare Data Programmatically”

“Save and Share Simulation Data Inspector Data and Views”

Introduced in R2011b

Simulink.sdi.saveView

Save visualization settings to apply to other data

Syntax

```
Simulink.sdi.saveView(filename)
```

Description

`Simulink.sdi.saveView(filename)` saves the current view in the Simulation Data Inspector to the file, `filename`.

A view contains information about the layout and plots in the graphical viewing area as well as properties of plotted signals. When you load a view, the Simulation Data Inspector uses the properties and preferences in the file to display data currently in the Simulation Data Inspector. Signals in the Simulation Data Inspector that align with the signals in the view are plotted in the graphical viewing area. Use a view to apply a consistent set of visualization settings to multiple sets of similar data.

The view file saves the following information:

- Subplot layout and visualization type
- Settings for each visualization type in the layout
- Signal selection mode
- Replay controls visibility
- Metadata displayed in the work area
- Settings for signal grouping in the work area
- Plotted signals and the line style and color for each plotted signal

A view file does not contain data. To save run data, export the data or save a session using the `Simulink.sdi.save` function.

Examples

Save and Use a View

This example visualizes the output from the `ex_vdp` model, saves the configuration as a view, and then uses the view to visualize the output from another simulation of the same model.

To generate data to plot in the Simulation Data Inspector, simulate the model.

```
open_system('ex_vdp')
set_param('ex_vdp/Mu', 'Gain', '1')
sim('ex_vdp');
```

Programmatically Configure and Save a View

The `ex_vdp` model is configured to log two signals, `x1` and `x2`. Plot each signal on a subplot in a 2-by-1 layout.

```
Simulink.sdi.setSubPlotLayout(2,1)
```

To plot one signal on each subplot, first access the `Simulink.sdi.Run` object for the simulation.

```
runIDs = Simulink.sdi.getAllRunIDs;
ex_vdpRunID = runIDs(end);
ex_vdpRun = Simulink.sdi.getRun(ex_vdpRunID);
```

Then, you can access the data for each signal in a `Simulink.sdi.Signal` object and use the `plotOnSubPlot` function to specify where to plot each signal.

```
x1 = getSignalByIndex(ex_vdpRun,1);
x2 = getSignalByIndex(ex_vdpRun,2);
```

```
plotOnSubPlot(x1,1,1,true)
plotOnSubPlot(x2,2,1,true)
```

To view the result in the Simulation Data Inspector, enter `Simulink.sdi.view` in the command window.

Then, save the view.

```
Simulink.sdi.saveView('ex_vdpView.mldatx')
```

Use the View

To mimic a situation where the Simulation Data Inspector is configured differently and contains data from another simulation, this example clears data from the Simulation Data Inspector, loads a view that represents the default visualization configuration, and runs another simulation of the `ex_vdp` model.

```
Simulink.sdi.clear
Simulink.sdi.loadView('default.mldatx');
set_param('ex_vdp/Mu', 'Gain', '2')
sim('ex_vdp');
```

Use the `Simulink.sdi.loadView` function to apply the saved view from the previous simulation.

```
Simulink.sdi.loadView('ex_vdpView.mldatx')
```

You can open the Simulation Data Inspector to view the results using the `Simulink.sdi.view` function. The saved view includes information regarding the axes limits. When you use a view to apply visualization settings, you may need to adjust axes limits or zoom levels to fit data from a modified simulation.

Input Arguments

filename — Name of view file

string | character array

Name of the view file, specified as a string or character array.

Example: 'myView.mldatx'

Data Types: char | string

“Save and Share Simulation Data Inspector Data and Views”

Introduced in R2020a

Simulink.sdi.sendWorkerRunToClient

Package: Simulink.sdi

Send run created on parallel workers to the Simulation Data Inspector

Syntax

```
Simulink.sdi.sendWorkerRunToClient
Simulink.sdi.sendWorkerRunToClient(run)
```

Description

`Simulink.sdi.sendWorkerRunToClient` sends the run most recently generated by the worker to the client MATLAB and imports the run to the Simulation Data Inspector.

`Simulink.sdi.sendWorkerRunToClient(run)` sends the run corresponding to `run` to the client MATLAB and imports the run to the Simulation Data Inspector.

Examples

Manually Send Runs from Parallel Workers to the Simulation Data Inspector

This example shows how to use `Simulink.sdi.sendWorkerRunToClient` to send runs created using parallel workers manually to the Simulation Data Inspector.

Setup

This example runs several simulations of the `vdp` model, varying the value of the gain, `Mu`. To set up for the parallel simulation, define a vector of `Mu` values and configure the Simulation Data Inspector for manual Parallel Computing Toolbox support.

```
% Enable manual Parallel Computing Toolbox support
Simulink.sdi.enablePCTSupport('manual');
```

```
% Choose several Mu values
MuVals = [1 2 3 4];
```

Initialize Parallel Workers

Use `parpool` (Parallel Computing Toolbox) to start a pool of four parallel workers. This example calls `parpool` inside an `if` statement so you only create a parallel pool if you don't already have one. You can use `spmd` (Parallel Computing Toolbox) to run initialization code common to all workers. For example, load the `vdp` model and select signals to log to runs that we can send to the Simulation Data Inspector on the client MATLAB. To avoid data concurrency issues when simulating with `sim` in `parfor`, create a temporary directory on each worker. After the simulations complete, another `spmd` block deletes the temporary directories.

```
p = gcp('nocreate');
```

```
if isempty(p)
```

```

    parpool(4);

end

Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.

```

```

spmd

```

```

% Load system and select signals to log
load_system('vdp')
Simulink.sdi.markSignalForStreaming('vdp/x1',1,'on')
Simulink.sdi.markSignalForStreaming('vdp/x2',1,'on')

% Create temporary directory for simulation on worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)

```

```

end

```

Run Parallel Simulations with parfor

To stream data from parallel workers to the Simulation Data Inspector, you have to run parallel simulations using `parfor` (Parallel Computing Toolbox). Each worker runs a `vdp` simulation with a different value of `Mu`. Simulink cannot access the contents of the `parfor` loop, so the variable `MuVal` is defined in the worker's workspace, where the `vdp` model can see it, using `assignin`.

```

parfor (index = 1:4)

```

```

% Set value of Mu in the worker's base workspace
assignin('base','MuVal',MuVals(index));

% Modify the value of Mu in the model and simulate
set_param('vdp/Mu','Gain','MuVal')
sim('vdp')

```

Access Data and Send Run to Client MATLAB

You can use the Simulation Data Inspector programmatic interface on the worker the same way you would in the client MATLAB. This example creates a `Simulink.sdi.Run` object and attaches the value of `Mu` used in the simulation with the `Tag` property.

```

% Attach metadata to the run
IDs = Simulink.sdi.getAllRunIDs;
lastIndex = length(IDs);
runID = Simulink.sdi.getRunIDByIndex(lastIndex);
parRun = Simulink.sdi.getRun(runID);
parRun.Tag = strcat('Mu = ',num2str(MuVals(index)));

% Send the run to the Simulation Data Inspector on the client MATLAB
Simulink.sdi.sendWorkerRunToClient

end

```

Close Temporary Directories and View Runs in the Simulation Data Inspector

Use another `spmd` section to delete the temporary directories created on the workers once the simulations complete. In each simulation, `Simulink.sdi.sendWorkerRunToClient` imported runs from all the workers into the Simulation Data Inspector. You can view the data and check the run properties to see the value of `Mu` used during simulation.

```
spmd
```

```
    % Remove temporary directories
    cd(workDir)
    rmdir(tempDir, 's')
    rmpath(workDir)
```

```
end
```

```
Simulink.sdi.view
```

Input Arguments

run — Run ID or `Simulink.sdi.Run` object

runID | `Simulink.sdi.Run` object

Run ID or `Simulink.sdi.Run` object corresponding to the run you want to import into the Simulation Data Inspector.

See Also

`Simulink.sdi.enablePCTSupport` | `Simulink.sdi.WorkerRun` |

Introduced in R2018a

Simulink.sdi.setArchiveRunLimit

Specify number of runs to retain in Simulation Data Inspector archive

Syntax

```
Simulink.sdi.setArchiveRunLimit(limit)
```

Description

`Simulink.sdi.setArchiveRunLimit(limit)` sets the limit `limit` for the number of runs to retain in the Simulation Data Inspector archive. When the number of runs in the archive reaches the specified limit, the Simulation Data Inspector deletes runs from the archive on a first-in, first-out basis.

Tip To automatically limit the number of runs, configure the Simulation Data Inspector to automatically move prior runs into the archive using the `Simulink.sdi.setAutoArchiveMode` function and specify the archive run limit.

For information about how to control the amount of data logged from simulation, see “Limit the Size of Logged Data”.

Examples

Limit Number of Runs Retained in Simulation Data Inspector

Configure the Simulation Data Inspector to automatically move prior simulation runs into the archive.

```
Simulink.sdi.setAutoArchiveMode(true)
```

Specify the number of runs to retain in the Simulation Data Inspector by setting the archive run limit. For example, specify the archive run limit as 5 to only retain five prior runs in addition to the current run.

```
Simulink.sdi.setArchiveRunLimit(5)
```

The Simulation Data Inspector automatically moves prior runs into the archive. Once the archive contains five runs, the Simulation Data Inspector deletes run data from the archive on a first-in, first-out basis.

Stop Retaining Data in Simulation Data Inspector

You can configure the Simulation Data Inspector to retain only the logged data for your current simulation. In iterative design and debugging workflows, this configuration helps prevent accumulation of unwanted logged data on disk.

First, check the configuration of the Simulation Data Inspector archive. Save the archive preference values to restore your preferences after you finish designing or debugging.

```
limit = Simulink.sdi.getArchiveRunLimit;
mode = Simulink.sdi.getAutoArchiveMode;
```

Configure the Simulation Data Inspector to automatically move runs into the archive. Then, set the archive run limit to 0.

```
Simulink.sdi.setAutoArchiveMode(true)
Simulink.sdi.setArchiveRunLimit(0)
```

When you simulate your model, the Simulation Data Inspector deletes the previous run and updates the view to show signals from the current simulation.

When you finish designing or debugging your model, you can restore the Simulation Data Inspector archive back to the previous configuration.

```
Simulink.sdi.setArchiveRunLimit(limit)
Simulink.sdi.setAutoArchiveMode(mode)
```

Input Arguments

limit – Maximum number of runs to store in Simulation Data Inspector archive

numeric scalar

Maximum number of runs to store in Simulation Data Inspector archive, specified as a whole numeric scalar. To configure no limit, specify -1.

Tips

To retain simulation results for only the current run, configure the Simulation Data Inspector to automatically archive simulation runs, and specify the archive run limit as 0.

```
Simulink.sdi.setAutoArchiveMode(true)
Simulink.sdi.setArchiveRunLimit(0)
```

“Limit the Size of Logged Data”

“Configure the Simulation Data Inspector”

Introduced in R2018b

Simulink.sdi.setAutoArchiveMode

Specify how Simulation Data Inspector manages simulation runs

Syntax

```
Simulink.sdi.setAutoArchiveMode(archive)
```

Description

`Simulink.sdi.setAutoArchiveMode(archive)` configures the Simulation Data Inspector to manage simulation runs according to `archive`.

When you run multiple simulations in a single MATLAB session, the Simulation Data Inspector retains results from each simulation so you can analyze the results together. Use the Simulation Data Inspector archive to manage the number of runs the Simulation Data Inspector retains and to visually manage runs in the user interface.

With automatic archiving enabled, when you start a simulation, the Simulation Data Inspector moves the prior run into the archive. In the user interface, prior runs automatically move into the collapsible **Archive** pane, and plots automatically update to show data from the current simulation.

With automatic archiving disabled, the Simulation Data Inspector does not move runs to the archive or automatically update plots.

Tip When you enable automatic archiving and specify an archive run limit, the Simulation Data Inspector automatically manages the number of runs it retains. Once the number of runs reaches the specified limit, the Simulation Data Inspector deletes runs from the archive on a first-in, first-out basis.

For more information about how to control the amount of data logged from simulation, see “Limit the Size of Logged Data”.

Examples

Limit Number of Runs Retained in Simulation Data Inspector

Configure the Simulation Data Inspector to automatically move prior simulation runs into the archive.

```
Simulink.sdi.setAutoArchiveMode(true)
```

Specify the number of runs to retain in the Simulation Data Inspector by setting the archive run limit. For example, specify the archive run limit as 5 to only retain five prior runs in addition to the current run.

```
Simulink.sdi.setArchiveRunLimit(5)
```

The Simulation Data Inspector automatically moves prior runs into the archive. Once the archive contains five runs, the Simulation Data Inspector deletes run data from the archive on a first-in, first-out basis.

Stop Retaining Data in Simulation Data Inspector

You can configure the Simulation Data Inspector to retain only the logged data for your current simulation. In iterative design and debugging workflows, this configuration helps prevent accumulation of unwanted logged data on disk.

First, check the configuration of the Simulation Data Inspector archive. Save the archive preference values to restore your preferences after you finish designing or debugging.

```
limit = Simulink.sdi.getArchiveRunLimit;  
mode = Simulink.sdi.getAutoArchiveMode;
```

Configure the Simulation Data Inspector to automatically move runs into the archive. Then, set the archive run limit to 0.

```
Simulink.sdi.setAutoArchiveMode(true)  
Simulink.sdi.setArchiveRunLimit(0)
```

When you simulate your model, the Simulation Data Inspector deletes the previous run and updates the view to show signals from the current simulation.

When you finish designing or debugging your model, you can restore the Simulation Data Inspector archive back to the previous configuration.

```
Simulink.sdi.setArchiveRunLimit(limit)  
Simulink.sdi.setAutoArchiveMode(mode)
```

Input Arguments

archive — Whether Simulation Data Inspector manages runs using archive

true or 1 (default) | false or 0

Whether Simulation Data Inspector manages runs using archive, specified as logical true (1) or false (0).

Data Types: logical

Simulink.sdi.setBorderOn

Display or hide border on time plots

Syntax

```
Simulink.sdi.setBorderOn(border)
```

Description

`Simulink.sdi.setBorderOn(border)` displays or hides the border on time plots in the Simulation Data Inspector according to the logical input, `border`. The function sets the value of the **Show border** setting on the **Time Plot** section of the **Visualization Settings** in the Simulation Data Inspector. The setting applies to all time plots in the layout. By default, the Simulation Data Inspector shows the border on time plots.

Examples

Configure Time Plot Border Display

You can use the `Simulink.sdi.setBorderOn` function to show or hide the border on time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector shows the border on time plots.

This example starts by showing how to use the `Simulink.sdi.getBorderOn` function to determine whether the border is currently displayed. Subsequent sections show the code to hide and show the border. To show the result, the example generates an image using the `Simulink.sdi.snapshot` function with settings specified by a `Simulink.sdi.CustomSnapshot` object.

```
snapSettings = Simulink.sdi.CustomSnapshot;  
snapSettings.Width = 300;  
snapSettings.Height = 300;
```

Get Current Border Display Setting

Before modifying the border display setting for time plots, you can save the current setting to a variable in the workspace in case you want to restore the preference later.

```
border = Simulink.sdi.getBorderOn;
```

Hide the Border on Time Plots

```
Simulink.sdi.setBorderOn(false)  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Show the Border on Time Plots

```
Simulink.sdi.setBorderOn(true)  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Input Arguments

border — Whether border is visible on time plots

`true` or `1` (default) | `false` or `0`

Whether the border is visible on time plots in the Simulation Data Inspector, specified as `true` (`1`) or `false` (`0`).

- `true` or `1` — Display border for time plots.
- `false` or `0` — Hide border for time plots.

Introduced in R2019b

Simulink.sdi.setCursorOptions

Configure shading options for cursors in the Simulation Data Inspector

Syntax

```
Simulink.sdi.setCursorOptions(Name,Value)
```

Description

`Simulink.sdi.setCursorOptions(Name,Value)` configures shading options for cursors in the Simulation Data Inspector according to one or more name-value pair arguments. For example, `'ShadeArea', 'InBetween'` configures the Simulation Data Inspector to apply shading to the area between two cursors. You can specify name-value pair arguments to configure the area to shade, the color and opacity of the shaded region, and whether signal data is emphasized in the shaded region.

Examples

Configure Shading Options for Cursors in the Simulation Data inspector

You can configure shading options for cursors to draw attention to a region of interest in a time plot. You can choose to emphasize or de-emphasize the signal data in the shaded region, and you can specify the shading color and opacity. By default, the Simulation Data Inspector shades areas gray with an opacity of 0.7 to de-emphasize signal data and shades areas light blue with an opacity of 0.7 when signal data is emphasized.

Suppose you want to highlight a signal transition by shading the area where the transition occurs a light yellow. Configure the cursors to highlight the area between the cursors a light yellow color.

```
Simulink.sdi.setCursorOptions('Emphasize',true,...
    'ShadeArea','InBetween','ShadeColor',[1 1 0.6]);
```

Input Arguments

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: `'ShadeArea', 'Lead', 'ShadeOpacity', 0.5` configures cursors to shade the area that leads the left-most cursor with an opacity of 0.5.

Type — Where to apply cursor options

'Inspect' (default) | 'Compare'

Where to apply cursor options, specified as the name-value pair consisting of 'Type' and 'Inspect' or 'Compare'. You can configure independent cursor options for the **Inspect** and **Compare** panes in the Simulation Data Inspector.

Example: 'Type', 'Compare' configures cursor options for the **Compare** pane.

Emphasize — Whether signal data is emphasized in the shaded region

true or 1 (default) | false or 0

Whether signal data is emphasized in shaded region, specified as the name-value pair consisting of 'Emphasize' and true or false. When emphasized, the signal data is plotted on top of the cursor shading.

Example: 'Emphasize', false configures cursor options to plot signal data under shaded region.

ShadeArea — Area to shade relative to cursors

'lead' (default) | 'lag' | 'leadandlag' | 'inbetween' | 'none'

Area to shade relative to cursors, specified as the name-value pair consisting of 'ShadeArea' and one of these options:

- 'lead' — Shade the plot area that leads the left-most cursor.
- 'lag' — Shade the plot area that lags the right-most cursor.
- 'leadandlag' — Shade the plot area outside of the cursors, when two cursors are displayed.
- 'inbetween' — Shade the plot area between the cursors, when two cursors are displayed.
- 'none' — Do not shade any plot area.

Example: 'ShadeArea', 'none' configures cursor options to not shade any region relative to the cursors.

ShadeColor — Color of the shaded area

[r g b] vector

Color of the shaded area, specified as the name-value pair consisting of 'ShadeColor' and an r g b vector with values between 0 and 1.

Example: 'ShadeColor', [0 0 1] configures the color of the shaded area as blue.

ShadeOpacity — Opacity of the shaded area

percentage value between 0 and 1

Opacity of the shaded area, specified as the name-value pair consisting of 'ShadeOpacity' and a percentage value between 0 and 1.

Example: 'ShadeOpacity', 0.5 configures the opacity of the shaded area as 0.5.

Topics

“Create Plots Using the Simulation Data Inspector”

Introduced in R2020a

Simulink.sdi.setCursorPositions

Specify active cursor positions in the Simulation Data Inspector

Syntax

```
Simulink.sdi.setCursorPositions(Name,Value)
```

Description

`Simulink.sdi.setCursorPositions(Name,Value)` configures the position for active cursors in the Simulation Data Inspector as specified by one or more name-value pair arguments.

Examples

Programmatically Interact with Cursors in the Simulation Data Inspector

You can use the Simulation Data Inspector programmatic interface to specify the position of cursors on time plots or sparklines and to access the time that corresponds to the current cursor position.

Open the session file `vdp_mu.mldatx` to add and plot data in the Simulation Data Inspector. The session file contains data for a 20-second simulation of a model of the Van Der Pol equation, with signals `x1` and `x2` plotted on separate subplots in a 2-by-1 subplot layout.

```
open vdp_mu.mldatx;
```

Use the `Simulink.sdi.setNumCursors` function to add one cursor to the plot.

```
Simulink.sdi.setNumCursors(1);
```

Suppose you want to know the signal values 5 seconds into the simulation. Use the `Simulink.sdi.setCursorPositions` function to move the cursor to `t=5s` and read the signal values off from the cursor on each subplot. The asterisk next to the value in the cursor label indicates that the value is interpolated because the simulation did not include a calculation for a simulation time of exactly 5s.

```
Simulink.sdi.setCursorPositions('left',5);
```

Suppose you want to calculate the time between two peaks in the x2 signal. Add a second cursor using the `Simulink.sdi.setNumCursors` function or using the **Show/hide data cursors** button in the Simulation Data Inspector.

```
numCursors = Simulink.sdi.getNumCursors;
if(numCursors < 2)
    Simulink.sdi.setNumCursors(2);
end
```

Drag the cursors so the left cursor is positioned at the first peak in the x2 signal and the right cursor is positioned at the second peak. Alternatively, run this code that positions the cursors for you.

```
Simulink.sdi.setCursorPositions('left',5.921998549931304,'right',12.378442136906246);
```

The Simulation Data Inspector displays the difference between the two cursors in seconds. However, the cursor position and difference values are both rounded. Use the `Simulink.sdi.getCursorPosition` function to programmatically retrieve the exact time values that correspond to the cursor positions. Then, compute the difference between the times.

```
[t1,t2] = Simulink.sdi.getCursorPosition;
T = t2 - t1
```

```
T = NaN
```

Input Arguments

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: `Simulink.sdi.setCursorPositions('right',10,'view','compare')` moves the right cursor on the **Compare** pane to 10s.

Left — Left cursor position

scalar

Left cursor position, specified as a finite scalar using units of s. Use the 'left' name-value pair argument to specify the position for a single active cursor.

Cursor identities are relative, not absolute. If you specify a value for the left cursor that moves it to the right of the right cursor, the left cursor becomes the right cursor and vice versa.

Example: `Simulink.sdi.setCursorPositions('left',0.5)` moves the left cursor to 500ms.

Data Types: double

right — Right cursor position

scalar

Right cursor position, specified as a finite scalar using units of s.

Cursor identities are relative, not absolute. If you specify a value for the left cursor that moves it to the right of the right cursor, the left cursor becomes the right cursor and vice versa.

Example: `Simulink.sdi.setCursorPositions('right',10)` moves the right cursor to 10s.

Tips

Use the 'left' name-value pair argument to specify the position for a single active cursor.

Data Types: double

view — Plot area on which to move cursors

'inspect' (default) | 'compare'

Plot area on which to move cursors, specified as 'inspect' or 'compare'.

Example: `Simulink.sdi.setCursorPositions('right',10,'view','compare')` moves the right cursor on the **Compare** pane to 10s.

Data Types: char | string

Simulink.sdi.setDeleteRunsOnLowSpace

Specify behavior when logged data size approaches configured limits

Syntax

```
Simulink.sdi.setDeleteRunsOnLowSpace(deleteRuns)
```

Description

`Simulink.sdi.setDeleteRunsOnLowSpace(deleteRuns)` configures the action to take when the size of logged data approaches the configured maximum size or minimum free disk space requirement. When `deleteRuns` is `true`, logged data from prior simulations is deleted first to free space for continued logging in the current simulation. If deleting prior simulation data does not free enough disk space to continue logging through the end of the current simulation, recording data is disabled. When `deleteRuns` is `false`, recording data from the current simulation is disabled and no logged data from prior simulations is deleted.

Examples

Configure Logged Data Size Limits

Logging data from simulation can produce large amounts of data that may fill up disk space. To mitigate issues related to filing disk space, you can specify a minimum disk space requirement, a maximum size for logged data, or both. To ensure the logged data does not exceed the specified maximum size or use enough disk space to violate the disk space requirement, prior run data may be deleted and recording logged data may be disabled. You can specify whether to prioritize continuing to log data in the current simulation or retaining prior simulation data.

Use the `Simulink.sdi.setRequiredFreeSpace` function to configure logging to leave at least 1 GB of disk space empty.

```
Simulink.sdi.setRequiredFreeSpace(1);
```

Use the `Simulink.sdi.setMaxDiskUsage` function to specify a maximum logged data size of 100 GB.

```
Simulink.sdi.setMaxDiskUsage(100);
```

When you configure logging size limits, you can also specify what to do when the logging limits are approached. You can choose whether to prioritize retaining data from prior runs or data in the current run.

By default, current simulation data is prioritized. If the size of logged data approaches configured limits, data from prior simulations is deleted. If deleting run data does not free enough space, recording logged data is disabled and no more data from the current simulation is saved. When you choose to prioritize logged data from prior simulations instead, recording is disabled as soon as the size of logged data approaches configured limits. You see a warning when run data is deleted and when recording is disabled.

Use the `Simulink.sdi.setDeleteRunsOnLowSpace` function to configure logging to prioritize retaining prior run data.

```
Simulink.sdi.setDeleteRunsOnLowSpace(false);
```

If recording is disabled due to the size of logged data, you need to enable recording again to save data from future simulations. Use the `Simulink.sdi.setRecordData` function to enable recording.

```
Simulink.sdi.setRecordData(true);
```

Input Arguments

deleteRuns — Behavior when logged data size approaches configured limits

`true` or `1` (default) | `false` or `0`

Behavior when logged data size approaches configured limits, specified as numeric or logical `1` (`true`) or `0` (`false`).

- `true` — First delete data logged from prior simulations. If deleting prior simulation data does not free enough space, disable recording data.
- `false` — Disable recording data for current simulation. Do not delete prior simulation data.

When recording is disabled due to configured disk space requirements or logged data size limits, you need to enable recording again to log data in subsequent simulations. You can configure the record mode in the Simulation Data Inspector preferences or using the `Simulink.sdi.setRecordData` function.

Data Types: `logical`

Simulink.sdi.setGridOn

Package: Simulink.sdi

Configure grid lines for time plots in the Simulation Data Inspector

Syntax

```
Simulink.sdi.setGridOn(grid)
```

Description

`Simulink.sdi.setGridOn(grid)` configures the grid lines for time plots in the Simulation Data Inspector according to the input, `grid`. The function configures the **Horizontal** and **Vertical** options on the **Time Plot** section of the **Visualization Settings** in the Simulation Data Inspector. The settings apply to the session and configure the grids for all time plots. By default, the Simulation Data Inspector shows horizontal and vertical grid lines.

Examples

Configure Grid for Time Plots in the Simulation Data Inspector

You can use `Simulink.sdi.setGridOn` to configure the appearance of the grid for time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector shows horizontal and vertical grid lines.

This example starts by showing how to use `Simulink.sdi.getGridOn` to access the current grid configuration. The subsequent sections show the code for each configuration option for time plot grid in the Simulation Data Inspector. To see the result, the example uses a `Simulink.sdi.CustomSnapshot` object to specify settings for the output of the `Simulink.sdi.snapshot` function.

```
snapSettings = Simulink.sdi.CustomSnapshot;  
snapSettings.Width = 300;  
snapSettings.Height = 300;
```

Get Initial Grid Setting

Before modifying the grid display preferences, you can save the current configuration to a variable in the workspace in case you want to restore the preferences later.

```
gridInit = Simulink.sdi.getGridOn;
```

Configure Horizontal Grid Lines

Show only horizontal grid lines in the Simulation Data Inspector.

```
Simulink.sdi.setGridOn('horizontal')  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Configure Vertical Grid Lines

Show only vertical grid lines in the Simulation Data Inspector.

```
Simulink.sdi.setGridOn('vertical')  
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```

Configure No Grid Lines

Show no grid lines in the Simulation Data Inspector.

```
Simulink.sdi.setGridOn('off')  
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```

Configure Horizontal and Vertical Grid Lines

Show horizontal and vertical grid lines in the Simulation Data Inspector.

```
Simulink.sdi.setGridOn('on')  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Input Arguments

grid — Visible grid lines

'on' (default) | 'horizontal' | 'vertical' | 'off'

Grid lines to show on time plots in the Simulation Data Inspector, specified as one of these options:

- 'on' — Horizontal and vertical grid lines
- 'horizontal' — Only horizontal grid lines
- 'vertical' — Only vertical grid lines
- 'off' — No grid lines

Compatibility Considerations

Specifying the input as a logical value is not recommended

Starting in R2019b, the `Simulink.sdi.setGridOn` input values changed to:

- 'on'
- 'horizontal'
- 'vertical'
- 'off'

In R2019a, the `Simulink.sdi.setGridOn` accepted a logical input to show or hide the grid on time plots in the Simulation Data Inspector:

- `true` or `1` shows horizontal and vertical grid lines on time plots in the Simulation Data Inspector.
- `false` or `0` hides horizontal and vertical grid lines on time plots in the Simulation Data Inspector.

Starting in R2019b, use the `'on'` input value for the same behavior as the `true` or `1` input, and use the `'off'` input value for the same behavior as the `false` or `0` input.

Simulink.sdi.setMarkersOn

Package: Simulink.sdi

Show or hide markers for plotted signals

Syntax

```
Simulink.sdi.setMarkersOn(value)
```

Description

`Simulink.sdi.setMarkersOn(value)` shows or hides markers on signals plotted in the Simulation Data Inspector according to the logical input, `value`. The function configures the **Show markers** setting in the Simulation Data Inspector. The setting applies to the session and shows or hides markers for all signals plotted in the Simulation Data Inspector. By default, markers are hidden in the Simulation Data Inspector.

Examples

Display Markers in the Simulation Data Inspector

```
Simulink.sdi.setMarkersOn(true);
```

Input Arguments

`value` — Logical input

false or 0 (default) | true or 1

Logical specification of whether markers are shown on plots in the Simulation Data Inspector.

- true or 1 shows markers on plots in the Simulation Data Inspector.
- false or 0 does not show markers on plots in the Simulation Data Inspector.

Data Types: logical

Simulink.sdi.setMaxDiskUsage

Specify maximum size for data logged to disk

Syntax

```
Simulink.sdi.setMaxDiskUsage(maxSize)
```

Description

`Simulink.sdi.setMaxDiskUsage(maxSize)` configures logging to use no more than the maximum amount of disk space specified by `maxSize`, in units of GB.

When you configure a maximum size for logged data, you can also configure the behavior when logged data approaches the maximum size using the `Simulink.sdi.setDeleteRunsOnLowSpace` function. For more information, see “Specify a Minimum Disk Space Requirement or Maximum Size for Logged Data”.

Examples

Configure Logged Data Size Limits

Logging data from simulation can produce large amounts of data that may fill up disk space. To mitigate issues related to filing disk space, you can specify a minimum disk space requirement, a maximum size for logged data, or both. To ensure the logged data does not exceed the specified maximum size or use enough disk space to violate the disk space requirement, prior run data may be deleted and recording logged data may be disabled. You can specify whether to prioritize continuing to log data in the current simulation or retaining prior simulation data.

Use the `Simulink.sdi.setRequiredFreeSpace` function to configure logging to leave at least 1 GB of disk space empty.

```
Simulink.sdi.setRequiredFreeSpace(1);
```

Use the `Simulink.sdi.setMaxDiskUsage` function to specify a maximum logged data size of 100 GB.

```
Simulink.sdi.setMaxDiskUsage(100);
```

When you configure logging size limits, you can also specify what to do when the logging limits are approached. You can choose whether to prioritize retaining data from prior runs or data in the current run.

By default, current simulation data is prioritized. If the size of logged data approaches configured limits, data from prior simulations is deleted. If deleting run data does not free enough space, recording logged data is disabled and no more data from the current simulation is saved. When you choose to prioritize logged data from prior simulations instead, recording is disabled as soon as the size of logged data approaches configured limits. You see a warning when run data is deleted and when recording is disabled.

Use the `Simulink.sdi.setDeleteRunsOnLowSpace` function to configure logging to prioritize retaining prior run data.

```
Simulink.sdi.setDeleteRunsOnLowSpace(false);
```

If recording is disabled due to the size of logged data, you need to enable recording again to save data from future simulations. Use the `Simulink.sdi.setRecordData` function to enable recording.

```
Simulink.sdi.setRecordData(true);
```

Input Arguments

maxSize — Maximum size for data logged to disk

0 (default) | scalar

Maximum size for data logged to disk, specified as a scalar, in units of GB. To configure no limit on the size of logged data, specify 0.

Example: `Simulink.sdi.setMaxDiskUsage(500)` configures logging to use no more than 500 GB of disk space.

Simulink.sdi.setNumCursors

Configure number of cursors active in Simulation Data Inspector

Syntax

```
Simulink.sdi.setNumCursors(num)
Simulink.sdi.setNumCursors(num,view)
```

Description

`Simulink.sdi.setNumCursors(num)` configures the Simulation Data Inspector to display the number of cursors specified by `num` in the **Inspect** pane plots.

`Simulink.sdi.setNumCursors(num,view)` configures the Simulation Data Inspector to display the number of cursors specified by `num` in the **Inspect** or **Compare** plot area, as specified by `view`.

Examples

Programmatically Interact with Cursors in the Simulation Data Inspector

You can use the Simulation Data Inspector programmatic interface to specify the position of cursors on time plots or sparklines and to access the time that corresponds to the current cursor position.

Open the session file `vdp_mu.mldatx` to add and plot data in the Simulation Data Inspector. The session file contains data for a 20-second simulation of a model of the Van Der Pol equation, with signals `x1` and `x2` plotted on separate subplots in a 2-by-1 subplot layout.

```
open vdp_mu.mldatx;
```

Use the `Simulink.sdi.setNumCursors` function to add one cursor to the plot.

```
Simulink.sdi.setNumCursors(1);
```

Suppose you want to know the signal values 5 seconds into the simulation. Use the `Simulink.sdi.setCursorPositions` function to move the cursor to `t=5s` and read the signal values off from the cursor on each subplot. The asterisk next to the value in the cursor label indicates that the value is interpolated because the simulation did not include a calculation for a simulation time of exactly 5s.

```
Simulink.sdi.setCursorPositions('left',5);
```

Suppose you want to calculate the time between two peaks in the x2 signal. Add a second cursor using the `Simulink.sdi.setNumCursors` function or using the **Show/hide data cursors** button in the Simulation Data Inspector.

```
numCursors = Simulink.sdi.getNumCursors;
if(numCursors < 2)
    Simulink.sdi.setNumCursors(2);
end
```

Drag the cursors so the left cursor is positioned at the first peak in the x2 signal and the right cursor is positioned at the second peak. Alternatively, run this code that positions the cursors for you.

```
Simulink.sdi.setCursorPositions('left',5.921998549931304,'right',12.378442136906246);
```

The Simulation Data Inspector displays the difference between the two cursors in seconds. However, the cursor position and difference values are both rounded. Use the `Simulink.sdi.getCursorPosition` function to programmatically retrieve the exact time values that correspond to the cursor positions. Then, compute the difference between the times.

```
[t1,t2] = Simulink.sdi.getCursorPosition;
T = t2 - t1
```

```
T = NaN
```

Input Arguments

num — Number of cursors to display

0 | 1 | 2

Number of cursors to display, specified as 0, 1, or 2.

view — Plot area in which to display cursors

'inspect' (default) | 'compare'

Plot area in which to display cursors, specified as 'inspect' or 'compare'.

Data Types: char | string

Simulink.sdi.setRecordData

Specify record mode for logging

Syntax

```
Simulink.sdi.setRecordData(record)
```

Description

`Simulink.sdi.setRecordData(record)` configures the logging **Record mode** according to the value of `record`. When `record` is `true`, logged data is available to view during simulation and for analysis after simulation. When `record` is `false`, data is only available for viewing during simulation and is not available after simulation in the workspace or the Simulation Data Inspector.

Examples

Configure Logging to View Data Only During Simulation

In certain scenarios, you may want to only view logged data during simulation and not save any data to disk. For example, when using the Simulation Data Inspector to visualize data streaming from hardware, you may only want to view the data live and not record it. Use the `Simulink.sdi.setRecordData` function to configure the **Record mode** setting in the Simulation Data Inspector programmatically. To view data only during simulation, specify the input as `false`.

```
Simulink.sdi.setRecordData(false)
```

When you want to record logged data on disk so that it is available for analysis after simulation, call the `Simulink.sdi.setRecordData` function with `true` as the input.

```
Simulink.sdi.setRecordData(true)
```

The **Record mode** setting is restored to **View and record data** at the start of each MATLAB session.

Input Arguments

record — Record mode

`true` or 1 (default) | `false` or 0

Record mode, specified as numeric or logical 1 (`true`) or 0 (`false`).

- `true` — Logged data is stored on disk and available in the workspace and the Simulation Data Inspector after simulation.
- `false` — Logged data is not stored on disk and is only available to view during simulation. After simulation, no logged data is available in the Simulation Data Inspector or workspace.

Specifying `record` as `false` can affect other applications. For more information, see “View Data Only During Simulation”.

Data Types: `logical`

Simulink.sdi.setRequiredFreeSpace

Specify minimum disk space to leave free when logging data

Syntax

```
Simulink.sdi.setRequiredFreeSpace(minDiskSpace)
```

Description

`Simulink.sdi.setRequiredFreeSpace(minDiskSpace)` configures logging to leave at least the number of GB specified by `minDiskSpace` free when logging data.

When you configure a minimum amount of disk space to leave free, you can also configure the behavior when the free disk space limit is approached using the `Simulink.sdi.setDeleteRunsOnLowSpace` function. For more information, see “Specify a Minimum Disk Space Requirement or Maximum Size for Logged Data”.

Examples

Configure Logged Data Size Limits

Logging data from simulation can produce large amounts of data that may fill up disk space. To mitigate issues related to filing disk space, you can specify a minimum disk space requirement, a maximum size for logged data, or both. To ensure the logged data does not exceed the specified maximum size or use enough disk space to violate the disk space requirement, prior run data may be deleted and recording logged data may be disabled. You can specify whether to prioritize continuing to log data in the current simulation or retaining prior simulation data.

Use the `Simulink.sdi.setRequiredFreeSpace` function to configure logging to leave at least 1 GB of disk space empty.

```
Simulink.sdi.setRequiredFreeSpace(1);
```

Use the `Simulink.sdi.setMaxDiskUsage` function to specify a maximum logged data size of 100 GB.

```
Simulink.sdi.setMaxDiskUsage(100);
```

When you configure logging size limits, you can also specify what to do when the logging limits are approached. You can choose whether to prioritize retaining data from prior runs or data in the current run.

By default, current simulation data is prioritized. If the size of logged data approaches configured limits, data from prior simulations is deleted. If deleting run data does not free enough space, recording logged data is disabled and no more data from the current simulation is saved. When you choose to prioritize logged data from prior simulations instead, recording is disabled as soon as the size of logged data approaches configured limits. You see a warning when run data is deleted and when recording is disabled.

Use the `Simulink.sdi.setDeleteRunsOnLowSpace` function to configure logging to prioritize retaining prior run data.

```
Simulink.sdi.setDeleteRunsOnLowSpace(false);
```

If recording is disabled due to the size of logged data, you need to enable recording again to save data from future simulations. Use the `Simulink.sdi.setRecordData` function to enable recording.

```
Simulink.sdi.setRecordData(true);
```

Input Arguments

minDiskSpace — Minimum amount of free disk space required

0.1 (default) | scalar

Minimum amount of free disk space required, specified as a scalar, in units of GB. The minimum disk space requirement is a way to limit the size of logged data. The **When low on disk space** setting specifies what happens when the minimum disk space requirement is approached. For more information, see “Specify a Minimum Disk Space Requirement or Maximum Size for Logged Data”.

Example: `Simulink.sdi.setRequiredFreeSpace(0.5)` configures logging to leave at least half a gigabyte of free disk space.

Simulink.sdi.setRunNamingRule

Package: Simulink.sdi

Specify the Simulation Data Inspector run naming rule

Syntax

```
Simulink.sdi.setRunNamingRule('rule')
```

Description

`Simulink.sdi.setRunNamingRule('rule')` sets the Simulation Data Inspector rule for naming runs created by simulating a Simulink model.

Examples

Modify Run Naming Rule Then Restore Default

This example shows how to use the Simulation Data Inspector API to modify the Simulation Data Inspector run naming rule, check a run's name, restore default preferences, and check the run naming rule.

```
% Load model
load_system('sldemo_fuelsys')

% Modify run naming rule
Simulink.sdi.setRunNamingRule('<model_name> Run <run_index>')

% Simulate system
sim('sldemo_fuelsys')

% Check run name
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
fuelRun = Simulink.sdi.getRun(runID);
fuelRun.name

ans =
'sldemo_fuelsys Run 1'

% Clear preferences to reset the run naming rule
Simulink.sdi.clearPreferences

% Check run naming rule
Simulink.sdi.getRunNamingRule

ans =
'Run <run_index>: <model_name>'
```

Input Arguments

'rule' — Simulation Data Inspector run naming rule

Run <run_index>: <model_name> (default) | character vector

Simulation Data Inspector run naming rule for runs created by simulating a Simulink model. The character vector specifying the run naming rule can include plain text and any of the following tokens that represent data pulled from each run:

- <run_index> - Run's index in the Simulation Data Inspector repository.
- <model_name> - Name of the model simulated to create the run.
- <time_stamp> - Start time for the simulation that created the run.
- <sim_mode> - Simulation mode used for the simulation that created the run.

Example: '<time_stamp> Simulation <run_index>: <model_name>'

Example: '<model_name> - <run_index>'

Alternatives

You can modify the run naming rule using the Simulation Data Inspector UI in the **Preferences** menu. You can rename a run by modifying the Name property of its `Simulink.sdi.Run` object.

Simulink.sdi.setSignalInputProcessingMode

Specify value for Input Processing signal property

Syntax

```
Simulink.sdi.setSignalInputProcessingMode(blkPath,port,mode)
Simulink.sdi.setSignalInputProcessingMode(h,mode)
```

Description

`Simulink.sdi.setSignalInputProcessingMode(blkPath,port,mode)` specifies `mode` as the value of the **Input Processing** property for the signal at the specified block path and port. You can only specify the **Input Processing** property for logged signals.

The **Input Processing** setting affects the format of the logged data and how the Simulation Data Inspector and dashboard blocks display the signal. You can configure a signal for frame-based or sample-based input processing.

`Simulink.sdi.setSignalInputProcessingMode(h,mode)` specifies `mode` as the value of the **Input Processing** property for the signal that corresponds to the line handle, `h`.

Examples

Programmatically Specify Input Processing Setting to Log a Frame-Based Signal

Many signal processing applications process data using frames, rather than individual signal values. A frame consists of signal values for several sample times. To process signals as frame-based in your model, specify frame-based processing in the blocks. To log and visualize frame-based signals, set the **Input Processing** setting to `Columns as channels (frame based)` in the Instrumentation Properties for the signal.

This example uses a model from the DSP System Toolbox™ to show how to programmatically specify the **Input Processing** setting for signals in a model using the `Simulink.sdi.setSignalInputProcessingMode` function. The model uses frame-based signals and demonstrates single sideband (SSB) modulation.

Configure Signal Logging

Open or load the model `ssbdemo_frame`. This example illustrates a scripting workflow and only loads the model.

```
load_system('ssbdemo_frame');
```

The model includes visualization blocks and does not use signal logging. Mark the signals that represent the upper sideband and lower sideband for logging.

```
upperSB_block = 'ssbdemo_frame/Up';
lowerSB_block = 'ssbdemo_frame/Down';
```

```
Simulink.sdi.markSignalForStreaming(upperSB_block,1,'on')
Simulink.sdi.markSignalForStreaming(lowerSB_block,1,'on')
```

If you simulate the model as-is, the signals would be logged as though they were sample-based, so each element in a sample would be treated as a separate channel. To log the signals as frame-based, specify the **Input Processing** setting for the signal as frame using the `Simulink.sdi.setSignalInputProcessingMode` function.

```
Simulink.sdi.setSignalInputProcessingMode(upperSB_block,1,'frame');
Simulink.sdi.setSignalInputProcessingMode(lowerSB_block,1,'frame');
```

After configuring the upper and lower sideband signals for logging and as frame-based, the data logs to the workspace and the Simulation Data Inspector in a frame-based format, so each column in a sample is treated as a channel in the signal. You can view and analyze the data in the Simulation Data Inspector or using its programmatic interface.

Input Arguments

blkPath — Block path for block that produces signal

string | character array

Block path for the block that produces the signal, specified as a string or character array.

Example: "vdp/Mu"

port — Number of block output port connected to signal

scalar

Block output port number for the port that produces the signal, specified as a scalar.

Example: 1

mode — Signal input processing setting

"sample" (default) | "frame"

Input Processing property value for the signal, returned as "signal" or "frame".

- **sample** — Sample-based input processing, where each element in a sample is treated as a channel.
- **frame** — Frame-based input processing, where each column in a sample is treated as a channel.

h — Signal line handle

line handle

Line handle for the signal. You can get the line handle for a signal using the `get_param` function with the 'LineHandles' option. For example, to access the line handle for the output of the Mu block in the model vdp:

```
MuLineHandles = get_param('vdp/Mu','LineHandles');  
MuOutputLineHandle = MuLineHandles.Outputport;
```

Example: MuOutputLineHandle

`get_param` | `Simulink.sdi.markSignalForStreaming` | `Simulink.sdi.getSignalInputProcessingMode`

Introduced in R2020a

Simulink.sdi.setStorageLocation

Specify location for logged data on disk

Syntax

```
Simulink.sdi.setStorageLocation(storagePath)
```

Description

`Simulink.sdi.setStorageLocation(storagePath)` configures `storagePath` as the location for simulation data logged to disk. By default, data is logged to the temporary directory on your computer.

Note Logging data to a network location can degrade performance.

Note The `Simulink.sdi.setStorageLocation` function configures the location of data logged to the workspace and Simulation Data Inspector when you log data to disk. The `Simulink.sdi.setStorageLocation` function does *not* configure the location of data logged to a file.

Examples

Specify Location of Logged Data

By default, data logged to the workspace and Simulation Data Inspector is stored in the temporary directory on your computer. You may want to change the location of logged data when you need to log large amounts of data and a secondary drive provides more storage capacity.

Use the `Simulink.sdi.setStorageLocation` function to specify the location for the file that holds data logged to disk.

```
Simulink.sdi.setStorageLocation('C:/Users/username/LoggedData');
```

Input Arguments

storagePath — Location of data logged to disk

character vector | string

Location of data logged to disk, specified as a character vector or string. By default, data logs to the temporary directory on your computer.

You may want to change the location of logged data when you need to log large amounts and a network location provides more storage capacity than your local machine. However, logging data to a network location can degrade performance.

Example: `'C:/Users/username/LoggedData'`

Data Types: char | string

Simulink.sdi.getStorageMode

Topics

“Configure the Simulation Data Inspector”

Introduced in R2021a

Simulink.sdi.setStorageMode

Specify whether to log data to disk or memory

Syntax

```
Simulink.sdi.setStorageMode(storageMode)
```

Description

`Simulink.sdi.setStorageMode(storageMode)` configures logging to log data to disk or to memory according to `storageMode`. By default, data logged to the workspace and the Simulation Data Inspector is logged to disk.

Note When you change the logging storage mode, data from prior simulations is deleted. You cannot change the logging storage mode while a simulation is running.

Examples

Log Simulation Data to Memory

You can configure whether data logged in simulation logs to memory or to disk. By default, data is logged to disk and brought into memory on demand. If your machine has more RAM than disk space, you may want to log data to memory instead.

Use the `Simulink.sdi.setStorageMode` function to configure logging to log data to memory.

```
Simulink.sdi.setStorageMode("memory");
```

Input Arguments

storageMode — Where logged simulation data is stored on your machine

'disk' (default) | 'memory'

Where logged simulation data is stored on your machine, specified as 'disk' or 'memory'. By default, data logged to the workspace and the Simulation Data Inspector is logged to disk.

When you change the storage mode to log data to memory:

- Data logged from prior simulations is deleted.
- Configuring limits on the size of logged data is not supported.

You cannot change the storage mode while a simulation is running.

When you configure a parallel worker to log to memory, sending logged data to the client is not supported.

Logging data to memory is not supported for rapid accelerator simulations or models deployed using Simulink Compiler.

Data Types: char | string

“Configure the Simulation Data Inspector”

Introduced in R2021a

Simulink.sdi.setSubPlotLayout

Package: Simulink.sdi

Set subplot layout in the Simulation Data Inspector

Syntax

```
Simulink.sdi.setSubPlotLayout(r,c)
```

Description

`Simulink.sdi.setSubPlotLayout(r,c)` sets the grid layout of plots in the **Simulation Data Inspector** using the specified number of rows, `r`, and columns, `c`.

Examples

Change Subplot Layout

```
% Change subplot layout to 4 rows and 2 columns  
Simulink.sdi.setSubPlotLayout(4,2);
```

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

Create `timeseries` objects to contain data for a sine signal and a cosine signal. Give each `timeseries` object a descriptive name.

```
time = linspace(0,20,100);  
  
sine_vals = sin(2*pi/5*time);  
sine_ts = timeseries(sine_vals,time);  
sine_ts.Name = 'Sine, T=5';  
  
cos_vals = cos(2*pi/8*time);  
cos_ts = timeseries(cos_vals,time);  
cos_ts.Name = 'Cosine, T=8';
```

Create a Run and Add Data

Use the `Simulink.sdi.view` function to open the Simulation Data Inspector.

```
Simulink.sdi.view
```

To import data into the Simulation Data Inspector from the workspace, create a `Simulink.sdi.Run` object using the `Simulink.sdi.Run.create` function. Add information about the run to its metadata using the `Name` and `Description` properties of the Run object.

```
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals with different frequencies';
```

Use the `add` function to add the data you created in the workspace to the empty run.

```
add(sinusoidsRun, 'vars', sine_ts, cos_ts);
```

Plot the Data in the Simulation Data Inspector

Use the `getSignalByIndex` function to access `Simulink.sdi.Signal` objects that contain the signal data. You can use the `Simulink.sdi.Signal` object properties to specify the line style and color for the signal and plot it in the Simulation Data Inspector. Specify the `LineColor` and `LineDashed` properties for each signal.

```
sine_sig = getSignalByIndex(sinusoidsRun,1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';

cos_sig = sinusoidsRun.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.LineDashed = '--';
```

Use the `Simulink.sdi.setSubPlotLayout` function to configure a 2-by-1 subplot layout in the Simulation Data Inspector plotting area. Then use the `plotOnSubplot` function to plot the sine signal on the top subplot and the cosine signal on the lower subplot.

```
Simulink.sdi.setSubPlotLayout(2,1);

plotOnSubPlot(sine_sig,1,1,true);
plotOnSubPlot(cos_sig,2,1,true);
```

Close the Simulation Data Inspector and Save Your Data

When you have finished inspecting the plotted signal data, you can close the Simulation Data Inspector and save the session to an `MLDATX` file.

```
Simulink.sdi.close('sinusoids.mldatx')
```

Input Arguments

r — Number of rows

integer

Number of rows in the subplot grid layout, specified as a whole number between 1 and 8, inclusive.

Example: 2

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | char

c — Number of columns

integer

Number of columns in the subplot grid layout, specified as a whole number between 1 and 8, inclusive.

Example: 2

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `char`

Introduced in R2016a

Simulink.sdi.setSubplotLimits

Specify subplot limits for time plots in the Simulation Data Inspector

Syntax

```
Simulink.sdi.setSubplotLimits(r,c,Name,Value)
```

Description

`Simulink.sdi.setSubplotLimits(r,c,Name,Value)` configures the time and y-axis limits for the subplot at the location specified by `r` and `c` according to the values specified by one or more name-value pair arguments. You can specify any combination of a *t*-axis minimum, *t*-axis maximum, *y*-axis minimum, and *y*-axis maximum using name-value pair arguments.

Note Limits for the *t*-axis apply to all linked time plots in the Simulation Data Inspector. For more information, see “Linked Subplots”.

Examples

Copy y-Axis Range from One Subplot to Another

You can use the `Simulink.sdi.getSubplotLimits` and `Simulink.sdi.setSubplotLimits` functions to copy the axis limits from one subplot to another. For example, you can specify the same *y*-axis limits for two subplots that display the same signal from simulations that used different values of a model parameter. This example copies the *y*-axis settings from one subplot to another to analyze the effect of changing the value of `Mu` in the model `vdp`.

Create the data in the Simulation Data Inspector by simulating the model `vdp` twice. The first time, specify the value of `Mu` as 1. For the second simulation, set the value of `Mu` to 2. The model logs data for the signals `x1` and `x2`.

```
open_system('ex_vdp');
set_param('ex_vdp/Mu','Gain','1')
sim('ex_vdp');

set_param('ex_vdp/Mu','Gain','2')
sim('ex_vdp');
```

Open the Simulation Data Inspector.

```
Simulink.sdi.view
```

Create plots in the Simulation Data Inspector to show the results from each simulation. Configure a 2x2 subplot layout so you can plot one signal on each plot, side by side.

```
Simulink.sdi.setSubPlotLayout(2,2)
```

Get the `Simulink.sdi.Signal` objects that correspond to each signal from each run, and plot one signal on each subplot. Plot the signals from the first simulation on the subplots in the first column and the signals from the second simulation on the subplots in the second column.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end-1);
runID2 = runIDs(end);

runMu1 = Simulink.sdi.getRun(runID1);
runMu2 = Simulink.sdi.getRun(runID2);

sig1 = getSignalByIndex(runMu1,1);
sig2 = getSignalByIndex(runMu1,2);
sig3 = getSignalByIndex(runMu2,1);
sig4 = getSignalByIndex(runMu2,2);

plotOnSubPlot(sig1,1,1,true);
plotOnSubPlot(sig2,2,1,true);
plotOnSubPlot(sig3,1,2,true);
plotOnSubPlot(sig4,2,2,true);
```

The signals in the first column of plots look similar to those in the second column. However, the y-axis limits for the plots of the x2 signal are different.

Use the `Simulink.sdi.getSubplotLimits` function to copy the limits used for the subplot with the x2 signal from the second simulation.

```
[~,~,ymin,ymax] = Simulink.sdi.getSubplotLimits(2,2);
```

Use the `Simulink.sdi.setSubplotLimits` function to apply the same y-axis limits to the subplot with the x2 signal from the first run.

```
Simulink.sdi.setSubplotLimits(2,1, 'yRange', [ymin,ymax]);
```

With the updated y-axis limits, the difference in the x2 signal is more apparent.

Input Arguments

r — Subplot row index
integer

Subplot row index, specified as an integer between 1 and 8, inclusive. Use the `r` and `c` inputs together to specify the location of the subplot for which you want to specify axis limits.

Example: `Simulink.sdi.setSubplotLimits(2,2,'yrange',[0,3])` configures y-axis limits for the time plot in the second row of the second column of the subplot layout in the Simulation Data Inspector.

c — Subplot column index

integer

Subplot column index, specified as an integer value between 1 and 8, inclusive. Use the `r` and `c` inputs together to specify the location of the subplot for which you want to specify axis limits.

Example: `Simulink.sdi.setSubplotLimits(2,2,'yrange',[0,3])` configures *y*-axis limits for the time plot in the second row of the second column of the subplot layout in the Simulation Data Inspector.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: `Simulink.sdi.setSubplotLimits(2,2,'ymin',0,'ymax',3)` configures *y*-axis limits for the time plot in the second row of the second column of the subplot layout in the Simulation Data Inspector.

View — Simulation Data Inspector view

'Inspect' (default) | 'Compare'

Simulation Data Inspector view, specified as 'Inspect' or 'Compare'. Specify the view with the subplot for which you want to specify limits. When you omit the 'View' argument, the limits are applied to the specified subplot in the inspect view.

Example: `Simulink.sdi.setSubplotLimits(2,1,'View','Compare','yRange',[-2,2])` configures *y*-axis limits for the difference plot in the compare view of the Simulation Data Inspector.

Data Types: char | string

tMin — t-axis minimum

scalar

t-axis minimum, specified as a scalar.

You can specify limits for the *t*-axis using the `tMin` and `tMax` name-value arguments, using the `tRange` argument, or using the `AllRange` argument. When you specify the `tMin` name-value pair argument, do not specify the `tRange` or `AllRange` arguments.

Data Types: double

tMax — t-axis maximum

scalar

t-axis maximum, specified as a scalar.

You can specify limits for the *t*-axis using the `tMin` and `tMax` name-value arguments, the `tRange` argument, or the `AllRange` argument. When you specify the `tMax` name-value argument, do not specify the `tRange` or `AllRange` arguments.

Data Types: double

yMin — y-axis minimum

scalar

y-axis minimum, specified as a scalar.

You can specify limits for the *y*-axis using the `yMin` and `yMax` name-value arguments, the `yRange` argument, or the `AllRange` argument. When you specify the `yMin` name-value argument, do not specify the `yRange` or `AllRange` arguments.

Data Types: `double`

yMax — *y*-axis maximum

scalar

y-axis maximum, specified as a scalar.

You can specify limits for the *y*-axis using the `yMin` and `yMax` name-value arguments, the `yRange` argument, or the `AllRange` argument. When you specify the `yMax` name-value argument, do not specify the `yRange` or `AllRange` arguments.

Data Types: `double`

tRange — *t*-axis range

1-by-2 vector

t-axis range, specified as a 1-by-2 vector that contains scalar numeric values.

You can specify limits for the *t*-axis using the `tMin` and `tMax` name-value arguments, the `tRange` argument, or the `AllRange` argument. When you specify the `tRange` name-value argument, do not specify the `tMin`, `tMax`, or `AllRange` arguments.

Example: `Simulink.sdi.setSubplotLimits(1,1,'tRange',[-1,20])` configures the *t*-axis range for the subplot in the first row and first column of the Simulation Data Inspector subplot layout.

Data Types: `double`

yRange — *y*-axis range

1-by-2 vector

y-axis range, specified as a 1-by-2 vector that contains scalar numeric values.

You can specify limits for the *y*-axis using the `yMin` and `yMax` name-value arguments, the `yRange` argument, or the `AllRange` argument. When you specify the `yRange` name-value argument, do not specify the `yMin`, `yMax`, or `AllRange` arguments.

Example: `Simulink.sdi.setSubplotLimits(1,1,'yRange',[-5,5])` configures the *y*-axis range for the subplot in the first row and first column of the Simulation Data Inspector subplot layout.

Data Types: `double`

AllRange — Ranges for *t*-axis and *y*-axis

1-by-4 vector

Ranges for *t*-axis and *y*-axis, specified as a 1-by-4 vector that contains scalar numeric values. The values specified in the vector are mapped to the *t*- and *y*-axis limits in this order: `[tMin,tMax,yMin,yMax]`.

When you specify the `AllRange` name-value argument, do not specify the `tMin`, `tMax`, `yMin`, `yMax`, `tRange`, or `yRange` arguments.

Example: `Simulink.sdi.setSubplotLimits(1,1,'AllRange',[-1,20,-5,5])` configures the *t*-axis range and *y*-axis range for the subplot in the first row and first column of the Simulation Data Inspector subplot layout.

Data Types: `double`

Simulink.sdi.setTableGrouping

Change signal grouping hierarchy in Inspect pane

Syntax

```
Simulink.sdi.setTableGrouping  
Simulink.sdi.setTableGrouping(group,group1,...,groupN)
```

Description

`Simulink.sdi.setTableGrouping` removes grouping for signals in the Simulation Data Inspector.

`Simulink.sdi.setTableGrouping(group,group1,...,groupN)` groups signals in the Simulation Data Inspector according to one or more specified options. Signal grouping is the same on the **Inspect** and **Compare** panes. You can group signals by any combination of domain, physical system hierarchy, data hierarchy, and model hierarchy.

Examples

Group Data by Model Hierarchy Then by Data Hierarchy

To help organize and find signals in the Simulation Data Inspector, you can group the signals. For example, you could group signals according to their location within a model hierarchy and then by data hierarchy.

```
Simulink.sdi.setTableGrouping('Subsystems','DataHierarchy');
```

Input Arguments

group — Signal grouping

'Domain' | 'DataHierarchy' | 'Subsystems' | 'PhysmodHierarchy'

Signal grouping, specified as one or more of these values:

- **Domain** — Group signals by domain.
- **DataHierarchy** — Group signals according to data hierarchy, such as the hierarchy for a bus.
- **SubSystems** — Group signals according to their location within the model hierarchy.
- **PhysmodHierarchy** — Group signals according to the Simscape hierarchy. This option is only available when you have a Simscape license.

You can specify up to three grouping options unless you have a Simscape license, in which case you can specify up to four.

By default, the Simulation Data Inspector groups signals by domain, then by physical system hierarchy (if you have a Simscape license), and then by data hierarchy.

Simulink.sdi.setTickLabelsDisplay

Configure tick label visibility for time plot axes

Syntax

```
Simulink.sdi.setTickLabelsDisplay(label)
```

Description

`Simulink.sdi.setTickLabelsDisplay(label)` displays labels for the tick marks on axes of time plots in the Simulation Data Inspector according to the input, `label`. The function sets the value of the **Tick labels** setting on the **Time Plot** section of the **Visualization Settings** in the Simulation Data Inspector. The setting applies to all time plots in the layout. By default, the Simulation Data Inspector displays tick mark labels for both axes.

Examples

Configure Tick Mark Label Visibility for Time Plots

You can use the `Simulink.sdi.setTickLabelsDisplay` function to configure the visibility of tick mark labels for the *t*- and *y*-axes on time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector displays tick marks for both axes.

This example starts by showing how to use the `Simulink.sdi.getTickLabelsDisplay` function to access the current tick mark label visibility. Subsequent sections show the code to specify each available option for tick mark label visibility on time plots in the Simulation Data Inspector. To see the result of each configuration, the example generates an image using the `Simulink.sdi.snapshot` function with settings specified by a `Simulink.sdi.CustomSnapshot` object.

```
snapSettings = Simulink.sdi.CustomSnapshot;  
snapSettings.Width = 300;  
snapSettings.Height = 300;
```

Get Current Tick Mark Label Visibility

Before modifying the visibility of the tick mark labels on time plots, you can save the current configuration to a variable in the workspace in case you want to restore the preference later.

```
initTickLabels = Simulink.sdi.getTickLabelsDisplay;
```

Show Only *t*-Axis Tick Mark Labels

Show the tick mark labels for the *t*-Axis.

```
Simulink.sdi.setTickLabelsDisplay('t-axis')  
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```

Show Only y-Axis Tick Mark Labels

Show the tick mark labels for the y-axis.

```
Simulink.sdi.setTickLabelsDisplay('y-axis')  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Hide Tick Mark Labels

You can hide the tick mark labels for both axes.

```
Simulink.sdi.setTickLabelsDisplay('none')  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Show All Tick Mark Labels

By default, the Simulation Data Inspector shows tick mark labels for both axes on time plots.

```
Simulink.sdi.setTickLabelsDisplay('all')  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Input Arguments

Label — Tick mark labels to display

'all' (default) | 't-axis' | 'y-axis' | 'none'

Tick mark labels to display on time plots in the Simulation Data Inspector, specified as one of these options:

- 'all' — Display tick mark labels for both time plot axes.
- 't-axis' — Display tick mark labels only on the *t*-axis for time plots.
- 'y-axis' — Display tick mark labels only on the *y*-axis for time plots.
- 'none' — Do not display tick mark labels.

Introduced in R2019b

Simulink.sdi.setTicksPosition

Configure position for tick marks on time plots in the Simulation Data Inspector

Syntax

```
Simulink.sdi.setTicksPosition(position)
```

Description

`Simulink.sdi.setTicksPosition(position)` sets the location of tick marks on time plots in the Simulation Data Inspector according to the input, `position`. The function configures the **Ticks** setting on the **Time Plot** section of the **Visualization Settings** in the Simulation Data Inspector. The setting applies to all time plots in the layout. By default, the Simulation Data Inspector displays tick marks on the outside of the plot area.

Examples

Configure Position for Tick Marks on Time Plots

You can use `Simulink.sdi.setTicksPosition` function to specify the position for tick marks on time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector displays tick marks outside of the plot area for time plots.

This example starts by showing how to use the `Simulink.sdi.getTicksPosition` function to access the current position of tick marks. Subsequent sections show the code to specify each configuration option for the position of tick marks on time plots in the Simulation Data Inspector. To see the result, the example generates an image using `Simulink.sdi.snapshot` with settings specified by a `Simulink.sdi.CustomSnapshot` object.

```
snapSettings = Simulink.sdi.CustomSnapshot;  
snapSettings.Width = 300;  
snapSettings.Height = 300;
```

Get Current Tick Mark Position

Before modifying the position of tick marks on time plots, you can save the current configuration to a variable in the workspace in case you want to restore the preference later.

```
initTickPos = Simulink.sdi.getTicksPosition;
```

Position Tick Marks Inside Plot Area

Position the tick marks inside the plot area to increase the amount of space used by the plot area.

```
Simulink.sdi.setTicksPosition('inside')  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Hide Tick Marks on Time Plots

You can hide the tick marks for time plots in the Simulation Data Inspector. Hiding the tick marks expands the plot area.

```
Simulink.sdi.setTicksPosition('none')  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Position Tick Marks Outside Plot Area

By default, the Simulation Data Inspector displays tick marks outside of the plot area for time plots.

```
Simulink.sdi.setTicksPosition('outside')  
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

Input Arguments

position — Position of tick marks on time plots

'outside' (default) | 'inside' | 'none'

Position of tick marks on time plots in the Simulation Data Inspector, specified as 'inside' or 'outside'.

Tip Move tick marks to the inside of time plots to increase the space available for the plot area.

Example: 'inside'

“Create Plots Using the Simulation Data Inspector”

Introduced in R2019b

Simulink.sdi.setUnitSystem

Specify system of units to define signal display units in the Simulation Data Inspector

Syntax

```
Simulink.sdi.setUnitSystem(unitSystem)
Simulink.sdi.setUnitSystem(unitSystem,"Overrides",overrideUnits)
```

Description

`Simulink.sdi.setUnitSystem(unitSystem)` configures the Simulation Data Inspector to use the specified unit system to define the display units for logged and imported signals.

The Simulation Data Inspector plots signals using the display units. The display units for a signal may differ from the stored units, which indicate units for the data as stored on disk. When you specify a system of units in the Simulation Data Inspector preferences, the Simulation Data Inspector automatically adjusts the display units for logged or imported signals that use units that are not valid in the specified system.

`Simulink.sdi.setUnitSystem(unitSystem,"Overrides",overrideUnits)` configures the Simulation Data Inspector to use the specified override units. Specify override units when you want a type of measurement, such as length, to use consistent units, such as m or ft, across all signals in the Simulation Data Inspector.

Examples

Configure Unit Preferences in the Simulation Data Inspector

To specify a system of units to use for plotting signals in the Simulation Data Inspector, use the `Simulink.sdi.setUnitSystem` function. When you choose to display signals using the SI or US Customary unit system, the Simulation Data Inspector automatically changes the **Display Units** property for logged or imported signals that use units that are not part of the specified unit system. The signal data stored on disk does not change. Signals also have a **Stored Units** property, and the Simulation Data Inspector converts the data to plot the signal when the **Stored Units** and **Display Units** differ.

Specify a System of Units

By default, the Simulation Data Inspector displays signals using the units assigned to the signal during simulation or in the imported data. To facilitate analyzing multiple signals and data sets together, you can specify a system of units as a preference. The Simulation Data Inspector automatically updates the **Display Units** for logged or imported signals that use units that are invalid in the specified unit system. For example, a signal logged in a model using units of ft could be updated to use units of m when the system of units is specified as SI.

Use the `Simulink.sdi.setUnitSystem` function to configure the Simulation Data Inspector to display signals using units in the US Customary unit system.

```
Simulink.sdi.setUnitSystem('USCustomary');
```

Specify Override Units

When you want all signals that represent the same type of measurement to use the same **Display Units**, you can also specify override units. For example, to plot all signals that represent length using units of ft, specify ft as an override unit.

```
Simulink.sdi.setUnitSystem('USCustomary','Overrides','ft');
```

Check Unit Configuration

Use the `Simulink.sdi.getUnitSystem` function to check the current unit preferences configured in the Simulation Data Inspector.

```
[unitSystem,overrideUnits] = Simulink.sdi.getUnitSystem  
  
unitSystem =  
'USCustomary'  
  
overrideUnits =  
"ft"
```

Input Arguments

unitSystem — System of units used to define signal display units

'Default' (default) | 'SI' | 'USCustomary'

System of units used to define signal display units, specified as 'Default', 'SI', or 'USCustomary'.

- **Default** — Use signal stored units.
- **SI** — Use units from the SI unit system for signal display units.
- **USCustomary** — Use units from the US Customary unit system for signal display units.

overrideUnits — Units to override signal display units

string | string array

Units to override signal display units, specified as a string or string array. Specify override units when you want all signals that represent the same measurement type to use consistent units. For example, specify override units of ft to display all signals that represent length measurements using units of ft.

Example: "Overrides",["in","lb"]

Data Types: string

Simulink.sdi.snapshot

Package: Simulink.sdi

Capture contents of Simulation Data Inspector plots

Syntax

```
fig = Simulink.sdi.snapshot
[fig,image] = Simulink.sdi.snapshot
Simulink.sdi.snapshot(Name,Value)
Simulink.sdi.snapshot(Name,Value)
Simulink.sdi.snapshot(Name,Value)
```

Description

`fig = Simulink.sdi.snapshot` creates a figure of the plotting area in the open Simulation Data Inspector session with the figure handle `fig`.

`[fig,image] = Simulink.sdi.snapshot` creates a figure of the plotting area in the open Simulation Data Inspector session with the figure handle `fig` and returns the image data in the array, `image`.

`Simulink.sdi.snapshot(Name,Value)` captures an image of the Simulation Data Inspector plots according to the options specified by name-value pairs.

`fig = Simulink.sdi.snapshot(Name,Value)` captures an image of the Simulation Data Inspector plots according to the options specified by name-value pairs. This syntax returns the figure handle, `fig`, if a figure is created.

`[fig, image] = Simulink.sdi.snapshot(Name,Value)` captures an image of the Simulation Data Inspector plots according to the options specified by name-value pairs. This syntax returns the figure handle, `fig`, and an array of image data, `image`, when appropriate for the specified options.

Examples

Copy View Settings to a Run

This example shows how to copy view settings from one run to another and how to create figures using the `Simulink.sdi.CustomSnapshot` object.

Simulate Your Model and Get a Run Object

Configure the `vdp` model to save output data, and run a simulation to create data.

```
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
set_param('vdp/Mu','Gain','1');
sim('vdp');
```

Use the Simulation Data Inspector programmatic interface to access the run data.

```
runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

Modify Signal View Settings

Use the `Simulink.sdi.Run` object to access signals in the run. Then, modify the signal view settings. This example specifies the line color and style for each signal. The view settings for the run comprise the view settings for each signal and view settings specified for the plot area.

```
sig1 = vdpRun.getSignalByIndex(1);
sig2 = vdpRun.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;
```

You can use properties of the `Simulink.sdi.CustomSnapshot` object to configure the plot settings, like the subplot layout and axis limits, and to plot signals. When you use a `Simulink.sdi.CustomSnapshot` object to create your figure, these plot settings do not affect the Simulation Data Inspector.

```
snap.Rows = 2;
snap.YRange = {[ -2.25 2.25], [ -3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)
```

Use `Simulink.sdi.snapshot` to generate the figure you specified in the properties of the `Simulink.sdi.CustomSnapshot` object.

```
fig = Simulink.sdi.snapshot("from", "custom", "to", "figure", "settings", snap);
```

Copy the View Settings to a New Simulation Run

Simulate the model again, with a different Mu value. Use the Simulation Data Inspector programmatic interface to access the simulation data.

```
set_param('vdp/Mu', 'Gain', '5')
sim('vdp');
```

```
runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);
```

To create a plot of the new output data that looks like the one you created in the previous step, you can copy the view settings to the run in a single line of code using `Simulink.sdi.copyRunViewSettings`. The `Simulink.sdi.copyRunViewSettings` function does not automatically update plot settings in `Simulink.sdi.CustomSnapshot` objects, so specify the plot input as `false`.

```
sigIDs = Simulink.sdi.copyRunViewSettings(runID, runID2, false);
```

Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25], [-8 8]};
```

```

snap.plotOnSubPlot(1,1,sigIDs(1),true)
snap.plotOnSubPlot(2,1,sigIDs(2),true)

fig = snap.snapshot("to","figure");

```

Input Arguments

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose `Name` in quotes.

Example: `'to','figure','props',{'Name','My Data'}`

from — Content to include in the snapshot

`'opened'` (default) | `'active'` | `'comparison'` | `'custom'`

Content to include in the snapshot.

- `'opened'` — Include all subplots in the graphical viewing area of the open Simulation Data Inspector session.
- `'active'` — Include only the active (selected) subplot in the open Simulation Data Inspector session.

- `'comparison'` — Include the comparison plots for the selected comparison run or signal in the open Simulation Data Inspector session.
- `'custom'` — Include contents specified by the `settings` name-value pair `Simulink.sdi.CustomSnapshot` object. You can use the `'from', 'custom'` option to create a snapshot without opening the Simulation Data Inspector or affecting your open Simulation Data Inspector session. Include a `settings` name-value pair when you specify `'from', 'custom'`.

Example: `'from', 'comparison'`

Data Types: `char | string`

to — Type of snapshot to create

`'image'` (default) | `'figure'` | `'file'` | `'clipboard'`

Type of snapshot to create.

- `'image'` — Create a figure and return the figure handle and an array of image data. When you specify `'to', 'image'`, the `fig` and `image` outputs both have value.
- `'figure'` — Create a figure and return the figure handle. When you specify `'to', 'figure'` the `fig` output has value, and the `image` output is empty.
- `'file'` — Save to a PNG file with the name specified by the `filename` name-value pair. If you do not specify a `filename` name-value pair, the file is named `plots.png`. When you specify `'to', 'file'`, the `fig` and `image` outputs are both empty.
- `'clipboard'` — Copy the plots to your system clipboard. From the clipboard, you can paste the image into another program such as Microsoft Word. When you specify `'to', 'clipboard'`, the `fig` and `image` outputs are both empty.

Example: `'to', 'file'`

Data Types: `char | string`

filename — Name for image file

`'plots.png'` (default) | character array | string

Name of the image file to store the snapshot when you specify `'to', 'file'`.

Example: `'filename', 'MyImage.png'`

Data Types: `char | string`

props — Properties to customize the figure

cell array

Figure properties, specified as a cell array. You can include settings for the figure properties described in Figure Properties.

Example: `'props', {'Name', 'MyData', 'NumberTitle', 'off'}`

Data Types: `char | string`

settings — Custom snapshot settings

`Simulink.sdi.CustomSnapshot`

`Simulink.sdi.CustomSnapshot` object specifying custom snapshot settings. You can use the `settings` name-value pair to specify the dimensions of the image in pixels, subplot layout, and limits for the `x`- and `y`-axes.

Example: 'settings', customSnap

Data Types: char | string

Output Arguments

fig — Figure handle

figure handle

Handle for the figure. When a figure is not created with your specified options, the `fig` output is empty.

image — Image data

array

Array of image data. The `image` output has value when you use `Simulink.sdi.snapshot` without any input arguments or without a `to` name-value pair and when you specify `'to', 'image'`.

Simulink.sdi.unregisterCursorCallback

Unregister cursor callback function

Syntax

```
Simulink.sdi.unregisterCursorCallback(callbackID)
```

Description

`Simulink.sdi.unregisterCursorCallback(callbackID)` unregisters the cursor callback function that corresponds to `callbackID`.

Examples

Use Simulation Data Inspector Cursor Callback in App Designer App

You can use a Simulation Data Inspector cursor callback function to send cursor position data to an app you build using the App Designer. This example shows how to add a property to the app to store the callback ID and where to register and unregister the cursor callback. For an example of an App Designer app that uses a cursor callback, see “Synchronize Cursors in the Simulation Data Inspector with an App Designer App”.

Add a `callbackID` property to the app object.

```
properties (Access = private)
    callbackID
end
```

Define the behavior of the cursor callback function.

```
methods (Access = public)
    function myCursorCallback(app,~,~)
        if isvalid(app)
            ...
        end
    end
end
```

Register the cursor callback in the app `startupFcn`. This example registers the same callback on the **Inspect** pane and the **Compare** pane.

```
function startupFcn(app)
    app.callbackID = Simulink.sdi.registerCursorCallback(...
        @(t1,t2)myCursorCallback(app,t1,t2));
    app.callbackID(2) = Simulink.sdi.registerCursorCallback(...
        @(t1,t2)myCursorCallback(app,t1,t2), 'compare');
    ...
end
```

Unregister the cursor callback in the app `UIFigureCloseRequest` function.

```
function myAppUIFigureCloseRequest(app, event)
    Simulink.sdi.unregisterCursorCallback(app.callbackID(1));
    Simulink.sdi.unregisterCursorCallback(app.callbackID(2));

end
```

Input Arguments

callbackID — Registered callback ID

scalar

Registered callback ID, specified as a scalar. The callback ID is returned when you register the callback using the `Simulink.sdi.registerCursorCallback` function.

“Synchronize Cursors in the Simulation Data Inspector with an App Designer App”

Introduced in R2021a

Simulink.sdi.view

Package: Simulink.sdi

Open the Simulation Data Inspector

Syntax

```
Simulink.sdi.view
```

Description

`Simulink.sdi.view` opens the **Simulation Data Inspector**. You can write a script to plot your data and customize the Simulation Data Inspector properties and then use `Simulink.sdi.view` to see the results.

Examples

Open the Simulation Data Inspector from the Command Line

You can open the Simulation Data Inspector from the MATLAB command line to visualize, inspect, and analyze your data.

```
Simulink.sdi.view
```

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

Create `timeseries` objects to contain data for a sine signal and a cosine signal. Give each `timeseries` object a descriptive name.

```
time = linspace(0,20,100);  
  
sine_vals = sin(2*pi/5*time);  
sine_ts = timeseries(sine_vals,time);  
sine_ts.Name = 'Sine, T=5';  
  
cos_vals = cos(2*pi/8*time);  
cos_ts = timeseries(cos_vals,time);  
cos_ts.Name = 'Cosine, T=8';
```

Create a Run and Add Data

Use the `Simulink.sdi.view` function to open the Simulation Data Inspector.

```
Simulink.sdi.view
```

To import data into the Simulation Data Inspector from the workspace, create a `Simulink.sdi.Run` object using the `Simulink.sdi.Run.create` function. Add information about the run to its metadata using the `Name` and `Description` properties of the Run object.

```
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals with different frequencies';
```

Use the `add` function to add the data you created in the workspace to the empty run.

```
add(sinusoidsRun, 'vars', sine_ts, cos_ts);
```

Plot the Data in the Simulation Data Inspector

Use the `getSignalByIndex` function to access `Simulink.sdi.Signal` objects that contain the signal data. You can use the `Simulink.sdi.Signal` object properties to specify the line style and color for the signal and plot it in the Simulation Data Inspector. Specify the `LineColor` and `LineDashed` properties for each signal.

```
sine_sig = getSignalByIndex(sinusoidsRun,1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';

cos_sig = sinusoidsRun.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.LineDashed = '--';
```

Use the `Simulink.sdi.setSubPlotLayout` function to configure a 2-by-1 subplot layout in the Simulation Data Inspector plotting area. Then use the `plotOnSubplot` function to plot the sine signal on the top subplot and the cosine signal on the lower subplot.

```
Simulink.sdi.setSubPlotLayout(2,1);

plotOnSubPlot(sine_sig,1,1,true);
plotOnSubPlot(cos_sig,2,1,true);
```

Close the Simulation Data Inspector and Save Your Data

When you have finished inspecting the plotted signal data, you can close the Simulation Data Inspector and save the session to an MLDATX file.

```
Simulink.sdi.close('sinusoids.mldatx')
```

Alternatives

You can open the Simulation Data Inspector from the Simulink Editor toolbar with the **Simulation**

Data Inspector button .

Simulink.SFunctionBuilder.add

Add input, output, parameter, library item, or state to S-Function Builder block

Syntax

```
Simulink.SFunctionBuilder.add(blk,elem)
Simulink.SFunctionBuilder.add(blk,elem,Name=Value)
```

Description

`Simulink.SFunctionBuilder.add(blk,elem)` adds the element `elem` with default options to the S-Function Builder block `blk`. Use the `Simulink.SFunctionBuilder.add` function to add:

- Input ports
- Output ports
- Parameters
- Library items
- Discrete states
- Continuous states

`Simulink.SFunctionBuilder.add(blk,elem,Name=Value)` adds the element `elem` with options specified using one or more name-value arguments to the S-Function Builder block `blk`. For example, to specify the data type for a port as `double`, set `DataType` to `double`.

The options you can specify depend on the type of element you add.

Input Arguments

blk — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

elem — Type of element to add

'Input' | 'Output' | 'Parameter' | 'LibraryItem' | 'DiscreteState' | 'ContinuousState'

Type of element to add, specified as one of these options:

- 'Input'
- 'Output'

- 'Parameter'
- 'LibraryItem'
- 'DiscreteState'
- 'ContinuousState'

Data Types: char | string

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: `Name="in1", DataType="single"` specifies options to configure an input port with the name `in1` and data type `single`.

Name — Port or parameter name

string | character vector

Port or parameter name, specified as a string or a character vector. By default:

- Input ports are named `u0, u1, ... un`.
- Output ports are named `y0, y1, ... ,yn`.
- Parameters are named `p0, p1, ... , pn`.

Specify the `Name` name-value argument only when you add an input port, an output port, or a parameter.

Example: `Name="inputSignal"`

Data Types: char | string

DataType — Port or parameter data type

'double' (default) | 'single' | 'boolean' | 'int8' | 'int16' | 'int32' | 'uint8' | 'uint16' | 'uint32' | 'Fixdt:binary(a,b,c)' | 'Fixdt:slope and bias(a,b,c,d)' | 'Bus: <object name>'

Port or parameter data type, specified as one of these options:

- 'double'
- 'single'
- 'boolean'
- 'int8'
- 'int16'
- 'int32'
- 'uint8'
- 'uint16'
- 'uint32'
- 'Fixdt:binary(a,b,c)'

- 'Fixdt:slope and bias(a,b,c,d)'
- 'Bus: <object name>'

Parameters do not support fixed-point or bus data types.

Specify the `DataType` name-value argument only when you add an input port, an output port, or a parameter.

Example: `DataType="single"`

Data Types: `char` | `string`

Complexity — Port or parameter complexity

'real' (default) | 'complex'

Port or parameter complexity, specified as 'real' or 'complex'.

Specify the `Complexity` name-value argument only when you add an input port, an output port, or a parameter.

Example: `Complexity="complex"`

Data Types: `char` | `string`

Dimensions — Input or output port dimensions

'[1,1]' (default) | string | character vector

Input or output port dimensions, specified as a string or a character vector that defines the port dimensions as a scalar or vector.

Specify the `Dimensions` name-value argument only when you add an input or output port.

Example: `Dimensions="2"`

Example: `Dimensions="[1,2]"`

Data Types: `char` | `string`

Value — Parameter value

1 (default) | string | character vector

Parameter value, specified as a string or a character vector that defines the value of the parameter.

Specify the `Value` name-value argument only when you add a parameter.

Example: `Value="2"` specifies the parameter value as 2.

Example: `Value="[1 2]"` specifies the parameter value as [1 2].

Data Types: `char` | `string`

LibraryItemTag — Tag for library item

'SRC_PATH' (default) | 'LIB_PATH' | 'INC_PATH' | 'ENV_PATH' | 'ENTRY'

Tag for library item, specified as one of these options:

- 'SRC_PATH' — Object or library path
- 'LIB_PATH' — Include search path for header files and source files

- 'INC_PATH' — Search path for object files and source files
- 'ENV_PATH' — Environment variable
- 'ENTRY' — Object, source, or library file name or preprocessor directive, such as -DDEBUG

When you add a library item to an S-Function Builder block, use the `LibraryItemTag` and `LibraryItemValue` name-value arguments together to define the library item.

Specify the `LibraryItemTag` name-value argument only when you add a library item.

Example: `LibraryItemTag="LIB_PATH",LibraryItemValue="$MATLABROOT\customobjs"`

Data Types: `char` | `string`

LibraryItemValue — Library item value

`string` | character vector

Library item value, specified as a string or a character vector. The value you specify depends on the tag for the library item you add.

When you add a library item to an S-Function Builder block, use the `LibraryItemTag` and `LibraryItemValue` name-value arguments together to define the library item.

Example: `LibraryItemTag="LIB_PATH",LibraryItemValue="$MATLABROOT\customobjs"`

Data Types: `char` | `string`

InitialCondition — Initial condition for state

'0' (default) | `string` | character vector

Initial condition for state, specified as a string or a character vector that defines the initial value for the state.

Specify the `InitialCondition` name-value argument only when you add a discrete or continuous state.

Example: `InitialCondition="1"` specifies the initial condition for the added state as 1.

Data Types: `char` | `string`

Simulink.SFunctionBuilder.build

Build S-function and generate MEX file for S-Function Builder block

Syntax

```
Simulink.SFunctionBuilder.build(blk)
```

Description

`Simulink.SFunctionBuilder.build(blk)` builds the S-function and generates the MEX file for the S-Function Builder block `blk`.

To build the S-function without generating the MEX file, use the `Simulink.SFunctionBuilder.generateCodeOnly` function.

Input Arguments

blk — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

Simulink.SFunctionBuilder.delete

Remove input, output, parameter, library item, or state from S-Function Builder block

Syntax

```
Simulink.SFunctionBuilder.delete(blk,elem,Name=name)
Simulink.SFunctionBuilder.delete(blk,elem,Index=ind)
```

Description

`Simulink.SFunctionBuilder.delete(blk,elem,Name=name)` deletes the item `item` with the specified name `name` from the S-Function Builder block `blk`. Use this syntax to delete input ports, output ports, and parameters.

`Simulink.SFunctionBuilder.delete(blk,elem,Index=ind)` deletes the item `item` at the specified index `ind` from the S-Function Builder block `blk`. Use this syntax to delete library items, discrete states, and continuous states.

Input Arguments

blk — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

elem — Type of element to delete

'Input' | 'Output' | 'Parameter' | 'LibraryItem' | 'DiscreteState' |
'ContinuousState'

Type of element to delete, specified as one of these options:

- 'Input'
- 'Output'
- 'Parameter'
- 'LibraryItem'
- 'DiscreteState'
- 'ContinuousState'

Tips

The way to specify which element to delete depends on the type of element you want to delete.

- To specify which input port, output port, or parameter to delete, specify the **Name** name-value argument.
- To specify which library item, discrete state, or continuous state to delete, specify the **Index** name-value argument.

Data Types: `char` | `string`

name — Name of input port, output port, or parameter to delete

`string` | character vector

Name of input port, output port, or parameter to delete, specified as a string or a character vector.

Example: `Name="in1"`

Data Types: `char` | `string`

ind — Index of library item, discrete state, or continuous state to delete

scalar

Index of library item, discrete state, or continuous state to delete, specified as a scalar.

Example: `Index=1`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

Simulink.SFunctionBuilder.generateCodeOnly

Build S-function without generating MEX file for S-Function Builder block

Syntax

```
Simulink.SFunctionBuilder.generateCodeOnly(blk)
```

Description

`Simulink.SFunctionBuilder.generateCodeOnly(blk)` builds the S-function for the specified S-Function Builder block `blk` without generating the MEX file.

To build the S-function and generate the MEX file, use the `Simulink.SFunctionBuilder.build` function.

Input Arguments

blk — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

Simulink.SFunctionBuilder.getBuildOptions

Get build options for S-Function Builder block

Syntax

```
buildOpts = Simulink.SFunctionBuilder.getBuildOptions(blk)
```

Description

`buildOpts = Simulink.SFunctionBuilder.getBuildOptions(blk)` returns a structure with fields that indicate which build options are enabled for the S-Function Builder block `blk`.

Input Arguments

blk — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

Output Arguments

buildOpts — Build options for S-Function Builder block

structure

Build options for S-Function Builder block, returned as a structure that contains these fields:

- `ShowCompileSteps` — Option to log build steps
- `CreateDebuggableMEX` — Option to include debugging information in MEX file
- `GenerateWrapperTLC` — Option to generate TLC file
- `EnableSupportForCoverage` — Option to build S-function that supports model coverage
- `EnableSupportForDesignVerifier` — Option to build S-function that supports Simulink Design Verifier

The value of each field is a logical indication of whether that build option is enabled.

Simulink.SFunctionBuilder.getSettings

Get settings for S-Function Builder block

Syntax

```
sFunSettings = Simulink.SFunctionBuilder.getSettings(blk)
```

Description

`sFunSettings = Simulink.SFunctionBuilder.getSettings(blk)` returns a structure with fields that indicate the value for each setting for the S-Function Builder block `blk`.

Input Arguments

blk — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

Output Arguments

sFunSettings — S-Function Builder block settings

structure

S-Function Builder block settings, returned as a structure that contains these fields:

- `NumberDiscreteStates` — Number of discrete states
- `DiscreteStatesIC` — Initial conditions for discrete states
- `NumberContinuousStates` — Number of continuous states
- `ContinuousStatesIC` — Initial conditions for continuous states
- `ArrayLayout` — Array layout for code
- `SampleMode` — Sample mode for S-function
- `SampleTime` — Sample time for S-function
- `NumberOfPWorks` — Number of PWorks pointers for S-function
- `UseSimStruct` — Whether wrapper has access to SimStruct
- `DirectFeedthrough` — Whether S-function has direct feedthrough

Simulink.SFunctionBuilder.getSFunctionName

Get name of S-function generated by S-Function Builder block

Syntax

```
SFunName = Simulink.SFunctionBuilder.getSFunctionName(blk)
```

Description

`SFunName = Simulink.SFunctionBuilder.getSFunctionName(blk)` returns the name for the S-function generated by the S-Function Builder block `blk`. The S-function name is used as a prefix for all wrapper functions built by the S-Function Builder block.

Input Arguments

blk — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

Output Arguments

SFunName — S-function name

empty (default) | string | character vector

S-function name, returned as a string or a character vector.

Data Types: `char` | `string`

Simulink.SFunctionBuilder.getTargetLanguage

Get language for S-function generated using S-Function Builder block

Syntax

```
lang = Simulink.SFunctionBuilder.getTargetLanguage(blk)
```

Description

`lang = Simulink.SFunctionBuilder.getTargetLanguage(blk)` returns the target language for the S-function built by the S-Function Builder block `blk`.

Input Arguments

blk — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

Output Arguments

lang — S-function language

'inherit' | 'cpp' | 'c'

S-function language, returned as one of these values:

- 'inherit' — Language inherited from the **Language** model configuration parameter .
- 'cpp' — C++
- 'c' — C

Simulink.SFunctionBuilder.getUserCode

Get code for method of S-function generated using S-Function Builder block

Syntax

```
userCode = Simulink.SFunctionBuilder.getUserCode(blk,methodType)
```

Description

`userCode = Simulink.SFunctionBuilder.getUserCode(blk,methodType)` returns the user code `userCode` specified for the method indicated by `methodType` of the S-Function Builder block `blk`.

Input Arguments

blk — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

methodType — S-function method code to get

'includes' | 'externs' | 'start' | 'output' | 'update' | 'derivatives' | 'terminate'

S-function method code to get, specified as one of these options:

- 'includes' — Return S-function include statements.
- 'externs' — Return global variable declarations for S-function.
- 'start' — Return code defined for start method of S-function.
- 'output' — Return code defined for output method.
- 'update' — Return code defined for update method.
- 'derivatives' — Return code defined for derivatives method.
- 'terminate' — Return code defined for terminate method.

Data Types: char

Output Arguments

userCode — Code for specified method of S-function

character vector

Code for specified method of S-function, returned as a character vector.

Simulink.SFunctionBuilder.list

List inputs, outputs, parameters, library items, and states for S-Function Builder block

Syntax

```
elemList = Simulink.SFunctionBuilder.list(blk,elem)
elemList = Simulink.SFunctionBuilder.list(blk,elem,Format=listFormat)
```

Description

`elemList = Simulink.SFunctionBuilder.list(blk,elem)` returns a structure that lists the items of type `elem` configured for the S-Function Builder block `blk`. Use the `Simulink.SFunctionBuilder.list` function to list configurations for:

- Input ports
- Output ports
- Parameters
- Library items
- States

`elemList = Simulink.SFunctionBuilder.list(blk,elem,Format=listFormat)` returns a list of the items of type `elem` configured for the S-Function Builder block `blk` using the format `listFormat`. You can return the list as a structure or a table.

Input Arguments

blk — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

elem — Type of element to list

'Input' | 'Output' | 'Parameter' | 'LibraryItem' | 'States'

Type of element to list, specified as one of these options:

- 'Input' — Input ports
- 'Output' — Output ports
- 'Parameter' — Parameters
- 'LibraryItem' — Library items
- 'States' — States

Data Types: char | string

ListFormat — Format of list to return

'Structure' (default) | 'Table'

Format of list to return, specified as 'Structure' or 'Table'. When you do not specify the Format name-value argument, the `Simulink.SFunctionBuilder.list` function returns a structure.

- 'Structure' — Return the list of elements configured for the S-Function Builder block as a structure. The fields in the structure depend on the type of element you specify.
- 'Table' — Return the list of elements configured for the S-Function Builder block as a MATLAB table. The columns in the table depend on the type of element you specify.

Data Types: char | string

Output Arguments

elemList — List of elements configured for S-Function Builder block

structure | MATLAB table

List of elements configured for S-Function Builder block, returned as a structure or a MATLAB table.

Simulink.SFunctionBuilder.setBuildOptions

Set build options for S-Function Builder block

Syntax

```
Simulink.SFunctionBuilder.setBuildOptions(blk,Name=Value)
```

Description

`Simulink.SFunctionBuilder.setBuildOptions(blk,Name=Value)` sets build options specified using one or more name-value arguments for the S-Function Builder block `blk`. For example, to include debugging information in the generated MEX file, specify `CreateDebuggableMEX` as `true`.

To configure S-function settings such as access to the `SimStruct`, sample mode, and sample time, use the `Simulink.SFunctionBuilder.setSettings` function.

To specify the language for the S-function, use the `Simulink.SFunctionBuilder.setTargetLanguage` function.

Input Arguments

blk — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

Name-Value Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: `CreateDebuggableMEX=true`

ShowCompileSteps — Option to log build steps

0 or false (default) | 1 or true

Option to log build steps, specified as logical 1 (true) or 0 (false).

Example: `ShowCompileSteps=true`

Data Types: `logical`

CreateDebuggableMEX — Option to include debugging information in generated MEX file

0 or false (default) | 1 or true

Option to include debugging information in generated MEX file, specified as logical 1 (true) or 0 (false).

Example: CreateDebuggableMEX=true

Data Types: logical

GenerateWrapperTLC — Option to generate TLC file

1 or true (default) | 0 or false

Option to generate TLC file, specified as logical 1 (true) or 0 (false).

Example: GenerateWrapperTLC=false

Data Types: logical

EnableSupportForCoverage — Option to build S-function that supports model coverage

0 or false (default) | 1 or true

Option to build S-function that supports model coverage, specified as logical 1 (true) or 0 (false).

Example: EnableSupportForCoverage=true

Data Types: logical

EnableSupportForDesignVerifier — Option to build S-function that supports Simulink Design Verifier

0 or false (default) | 1 or true

Option to build S-function that supports Simulink Design Verifier, specified as logical 1 (true) or 0 (false).

Example: EnableSupportForDesignVerifier=true

Data Types: logical

Simulink.SFunctionBuilder.setSettings

Set settings for S-Function Builder block

Syntax

```
Simulink.SFunctionBuilder.setSettings(blk,Name=Value)
```

Description

`Simulink.SFunctionBuilder.setSettings(blk,Name=Value)` sets the settings specified using one or more name-value arguments for the S-Function Builder block `blk`. Use the `Simulink.SFunctionBuilder.setSettings` function to configure:

- The array layout for your code
- The sample mode for the S-function
- The sample time for the S-function
- The number of pointers used in the S-function code
- Whether to make the `SimStruct` available to the S-Function Builder wrapper functions
- Support for direct feedthrough.

To configure the build options for the S-Function Builder block, use the `Simulink.SFunctionBuilder.setBuildOptions` function.

To specify a name for the S-function, use the `Simulink.SFunctionBuilder.setSFunctionName` function.

To specify the language for the S-function, use the `Simulink.SFunctionBuilder.setTargetLanguage` function.

Input Arguments

blk — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, . . . , NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example:

ArrayLayout — Array layout for code

'Column' (default) | 'Row'

Array layout for code, specified as 'Column' or 'Row'.

Example: ArrayLayout="Row"

Data Types: char | string

SampleMode — Sample mode for S-function

'Inherited' (default) | 'Continuous' | 'Discrete'

Sample mode for S-function, specified as 'Inherited', 'Continuous', or 'Discrete'. The sample mode for the block determines when the block computes a new output value.

- 'Inherited' — The S-Function Builder block inherits sample time from the block connected to the input port.
- 'Continuous' — The S-Function Builder block computes a new output value for every simulation time step.
- 'Discrete' — The S-Function Builder block computes a new output value at a fixed sample time you specify.

Example: SampleMode="Continuous"

Data Types: char | string

SampleTime — Discrete sample time for S-function

'Inherited' (default) | scalar | string | character vector

Discrete sample time for S-function, specified as a scalar, a string, or a character vector. By default, the sample time for an S-Function Builder block is 'Inherited' because the default sample mode is 'Inherited'.

Specify the SampleTime name-value argument only when the SampleMode is set to Discrete.

Example: SampleMode="Discrete", SampleTime=0.2

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | char | string

NumberOfPWorks — Number of pointers used in S-function

0 (default) | scalar | string | character vector

Number of pointers used in S-function, specified as a scalar, a string, or a character vector.

S-functions that use PWorks do not support model operating points.

Example: NumberOfPWorks=3

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | char | string

UseSimStruct — Option to enable access to SimStruct in wrapper functions

0 or false (default) | 1 or true

Option to enable access to SimStruct in wrapper functions, specified as logical 0 (`false`) or 1 (`true`). When you enable access to the SimStruct, you can use SimStruct macros and functions in the code you write for the `Outputs_wrapper`, `Derivatives_wrapper`, and `Update_wrapper` functions.

Example: `UseSimStruct=true`

Data Types: `logical`

DirectFeedthrough — Whether S-function has direct feedthrough

1 or `true` (default) | 0 or `false`

Whether S-function has direct feedthrough, specified as logical 1 (`true`) or 0 (`false`).

The direct feedthrough flag for the S-function affects block execution order and is used to detect algebraic loops.

For more information, see “S-Function Concepts”.

Example: `DirectFeedthrough=false`

Data Types: `logical`

Simulink.SFunctionBuilder.setSFunctionName

Set name of S-function for S-Function Builder block

Syntax

```
Simulink.SFunctionBuilder.setSFunctionName(blk,SFunName)
```

Description

`Simulink.SFunctionBuilder.setSFunctionName(blk,SFunName)` sets the name of the S-function built by the S-Function Builder block `blk` to the name specified by `SFunName`. The S-function name is used as a prefix for all wrapper functions built by the S-Function Builder block.

Input Arguments

blk — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

SFunName — S-function name

empty (default) | string | character vector

S-function name, specified as a string or a character vector.

Example: "mySFunction"

Data Types: char | string

Simulink.SFunctionBuilder.setTargetLanguage

Set language for S-function generated using S-Function Builder block

Syntax

```
Simulink.SFunctionBuilder.setTargetLanguage(blk, lang)
```

Description

`Simulink.SFunctionBuilder.setTargetLanguage(blk, lang)` sets the target language for the S-function generated by the S-Function Builder block `blk` to the specified language `lang`.

To specify build options such as whether the MEX file includes debugging information, use the `Simulink.SFunctionBuilder.setBuildOptions` function.

Input Arguments

blk — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

lang — S-function language

'inherited' (default) | 'cpp' | 'c'

S-function language, specified as one of these options:

- 'inherited' — Language inherited from the **Language** model configuration parameter
- 'cpp' — C++
- 'c' — C

Data Types: char | string

Simulink.SFunctionBuilder.setUserCode

Set code for methods of S-function generated using S-Function Builder block

Syntax

```
Simulink.SFunctionBuilder.setUserCode(blk,methodType,userCode)
```

Description

`Simulink.SFunctionBuilder.setUserCode(blk,methodType,userCode)` specifies the code `userCode` as part of the S-function for the S-Function Builder block `blk`. Use this function to specify include statements, global variables, and code for the S-function methods.

Input Arguments

blk — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

methodType — S-function method for which to specify code

'include' | 'externs' | 'start' | 'output' | 'update' | 'derivatives' | 'terminate'

S-function method for which to specify code, specified as one of these options:

- 'include' — Include statement
- 'externs' — Global variable declaration
- 'start' — Start method

Use the start method to allocate memory at the start of the simulation. Reference the allocated memory throughout the S-function code using `PWorks`.

- 'output' — Output method

The output method computes the block output values for each simulation time step.

- 'update' — Update method

The update method computes the value of discrete states for the next simulation time step. Only define the update method when the S-function has discrete states.

- 'derivatives' — Derivatives method

The derivatives method computes the value of state derivatives. Only define the derivatives method when the S-function has continuous states.

- 'terminate' — Terminate method

Use the terminate method to deallocate memory at the end of simulation.

Example: `Simulink.SFunctionBuilder.setUserCode(blk,"output", "*y0 = myCFunction(*u0);")`

Tips

- To specify include paths and library paths, add one or more library items using the `Simulink.SFunctionBuilder.add` function.
- To configure the number of PWorks, use the `Simulink.SFunctionBuilder.setSettings` function.
- To add discrete or continuous states, use the `Simulink.SFunctionBuilder.add` function.

Data Types: char | string

userCode — Code for S-function method

string | character vector

Code for S-function method, specified as a string or a character vector that defines C or C++ code for part of the S-function.

Example: `Simulink.SFunctionBuilder.setUserCode(blk,"output", "*y0 = myCFunction(*u0);")`

Tips

To specify the target language for the S-function, use the `Simulink.SFunctionBuilder.setTargetLanguage` function.

Data Types: char | string

Simulink.SFunctionBuilder.update

Update attributes for input port, output port, or parameter of S-Function Builder block

Syntax

```
Simulink.SFunctionBuilder.update(blk,elem,Name=elemName,FieldToUpdate=field,NewValue=newVal)
```

Description

`Simulink.SFunctionBuilder.update(blk,elem,Name=elemName,FieldToUpdate=field,NewValue=newVal)` updates the value of the specified property for an input port, output port, or parameter of the S-Function Builder block `blk`.

To add a new input port, output port, or parameter to an S-Function Builder block, use the `Simulink.SFunctionBuilder.add` function.

Input Arguments

blk — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

elem — Type of element to update

'Input' | 'Output' | 'Parameter'

Type of element to update, specified as one of these options:

- 'Input' — Update property for input port on S-Function Builder block.
- 'Output' — Update property for output port on S-Function Builder block.
- 'Parameter' — Update property for parameter of S-Function Builder block.

Data Types: char | string

elemName — Name of input port, output port, or parameter to update

string | character vector

Name of input port, output port, or parameter to update, specified as a string or a character vector.

Data Types: char | string

field — Property of input port, output port, or parameter to update

'Name' | 'DataType' | 'Complexity' | 'Dimensions' | 'Value'

Property of input port, output port, or parameter to update, specified as one of these options:

- 'Name' — Update input port, output port, or parameter name.
- 'DataType' — Update input port, output port, or parameter data type.
- 'Complexity' — Update input port, output port, or parameter complexity.
- 'Dimensions' — Update input port or output port dimensions.

Do not specify `FieldToUpdate='Dimensions'` when you specify the second input argument as 'Parameter'.

- 'Value' — Update parameter value.

Do not specify `FieldToUpdate='Value'` when you specify the second input argument as 'Input' or 'Output'.

Data Types: `char` | `string`

newValue — New value for property of input port, output port, or parameter

`string` | character vector

New value for property of input port, output port, or parameter, specified as a string or a character vector that contains the new value. The values you can specify depend on the property you want to update.

Property to Update	Valid Values
Name	Valid port name
Data type	'double' 'single' 'boolean' 'int8' 'int16' 'int32' 'uint8' 'uint16' 'uint32' 'Fixdt:binary(a,b,c)' 'Fixdt:slope and bias(a,b,c,d)' 'Bus: <object name>'
Complexity	'real' 'complex'
Port dimensions	scalar or vector

Property to Update	Valid Values
Parameter value	Valid value for specified parameter

Data Types: char | string

Introduced in R2022a

Simulink.SimulationData.createStructOfTimeseries

Create structure of timeseries data to load as simulation input for bus

Syntax

```
tsStruct = Simulink.SimulationData.createStructOfTimeseries(busObj,
tsStructIn)
tsStruct = Simulink.SimulationData.createStructOfTimeseries(busObj,
tsCellArray)
tsStructArray = Simulink.SimulationData.createStructOfTimeseries(busObj,
tsCellArray,dims)
tsStruct = Simulink.SimulationData.createStructOfTimeseries(tsArray)
```

Description

`tsStruct = Simulink.SimulationData.createStructOfTimeseries(busObj, tsStructIn)` creates a structure with attributes that match those specified by the `Simulink.Bus` object, `busObj`, and data specified by the structure of timeseries objects, `tsStructIn`.

When the names in the input structure do not match the names specified by the bus object, the function renames the fields in the output structure to match the bus object specification. When other attributes such as data type and complexity do not match, the function returns an error.

You can use this syntax to create a simulation input that fully or partially specifies the data for a bus. You can also use this syntax to rename the structure elements to match the names in the `Simulink.Bus` object.

`tsStruct = Simulink.SimulationData.createStructOfTimeseries(busObj, tsCellArray)` creates a structure of timeseries objects with attributes that match those specified by the `Simulink.Bus` object, `busObj`, and data specified by the cell array of timeseries objects, `tsCellArray`.

When the names in the input structure do not match the names specified by the bus object, the function renames the fields in the output structure to match the bus object specification. When other attributes such as data type and complexity do not match, the function returns an error.

You can use this syntax to create simulation input that fully or partially specifies the data for a bus using a flat list of timeseries objects. The function maps the timeseries objects to the hierarchy specified by the `Simulink.Bus` object using a depth-first search.

`tsStructArray = Simulink.SimulationData.createStructOfTimeseries(busObj, tsCellArray,dims)` creates an array of timeseries structures where the attributes of each structure match those defined by the `Simulink.Bus` object, `busObj` with the data specified by the cell array of timeseries objects, `tsCellArray`. The input `dims` specifies the dimensions of the array.

`tsStruct = Simulink.SimulationData.createStructOfTimeseries(tsArray)` creates a structure of timeseries objects from the bus data stored in the `Simulink.TsArray` object, `tsArray`. In versions before R2016a, signal logging creates `Simulink.TsArray` objects to store

logged bus data. Use this syntax when you want to use bus data logged in a release before R2016a using ModelDataLogs format as simulation input.

Examples

Use Logged Bus Data as Simulation Input

You can use the `Simulink.SimulationData.createStructOfTimeseries` function to create structures of `timeseries` objects to use as simulation input for bus signals. This example shows you how to create a structure of timeseries to load into a model using timeseries data logged from a different simulation.

Create a Structure of Timeseries

Open the `ex_log_structtimeseries` model.

```
open_system('ex_log_structtimeseries')
```

The model uses Constant blocks and Bus Creator blocks to build two buses, `bus1` and `bus2`, with signals `a`, `b`, `c`, and `d`. The model uses signal logging to log the bus data. Create bus data by simulating the model.

```
out = sim('ex_log_structtimeseries');
```

View the data in the logging variable `logouts`. Signal logging creates a `Simulink.SimulationData.Dataset` object with `Simulink.SimulationData.Signal` objects as elements.

```
logouts = out.logouts
```

```
logouts =
```

```
Simulink.SimulationData.Dataset 'logout' with 2 elements
```

	Name	BlockPath
1	[1x1 Signal]	bus1 ex_log_structtimeseries/Bus Creator
2	[1x1 Signal]	bus2 ex_log_structtimeseries/Bus Creator1

- Use braces { } to access, modify, or add elements using index.

You can use the `get` function to select the `Simulink.SimulationData.Signal` object for `bus2`. The bus data is in the `Values` property of the `Simulink.SimulationData.Signal` object. The data representing `bus2` is logged in a structure containing `timeseries` objects named `c` and `d`.

```
logout.get(2).Values
```

```
ans =
```

```
struct with fields:
    c: [1x1 timeseries]
    d: [1x1 timeseries]
```

Loading Model Configuration

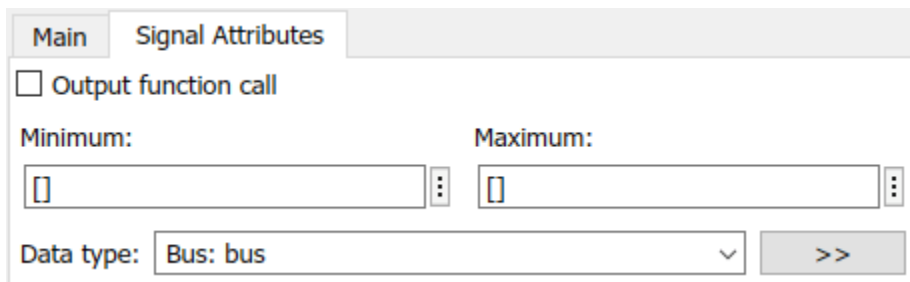

Open the `ex_load_structtimeseries` model, which uses the logged simulation data as input.

```
open_system('ex_load_structtimeseries')
```

The model uses the `InBus` Inport block to load input bus data. A `Bus Selector` block chooses signals from the bus to display on `Display` blocks.

Double-click the `InBus` block and check its **Data type** on the **Signal Attributes** tab of the dialog. The data type is specified by a `Simulink.Bus` object called `bus`.

Close the dialog and open the Model Explorer. On the **Callbacks** tab, you can see the model uses its `PreLoadFcn` to define the `Simulink.Bus` object that defines the data type for the Inport block.

Open the Configuration Parameters and view the specification for the **Input** parameter on the **Data Import/Export** pane. The model uses the variable `inputBus` for its **Input**.

Create Simulation Input from the Structure of timeseries Data

To load the data logged for `bus1`, you only need to assign the structure data to the Input variable for the model.

```
inputBus = logcout.get(1).Values
```

```
inputBus =  
    struct with fields:  
        a: [1x1 timeseries]  
        b: [1x1 timeseries]
```

When you simulate the model, the Display blocks show the values 1 and 2 logged in `bus1` and loaded into the model.

To load the data logged for `bus2`, you need to use the `Simulink.Bus` object that defines the Inport block data type and `Simulink.SimulationData.createStructOfTimeseries` to create a structure of `timeseries` with names specified by the `Simulink.Bus` object.

```
inputBus = Simulink.SimulationData.createStructOfTimeseries('bus', ...  
    logcout.get(2).Values)
```

```
inputBus =  
    struct with fields:  
        a: [1x1 timeseries]  
        b: [1x1 timeseries]
```

When you simulate the model, the Display blocks show the values 3 and 4 logged in `bus2` and loaded into the model.

Partially Specify Simulation Input for a Bus

This example shows how to use the `Simulink.SimulationData.createStructOfTimeseries` function to create partially specified simulation input for a bus. This example logs data from `ex_log_structtimeseries` and then loads that data into `ex_load_structtimeseries`.

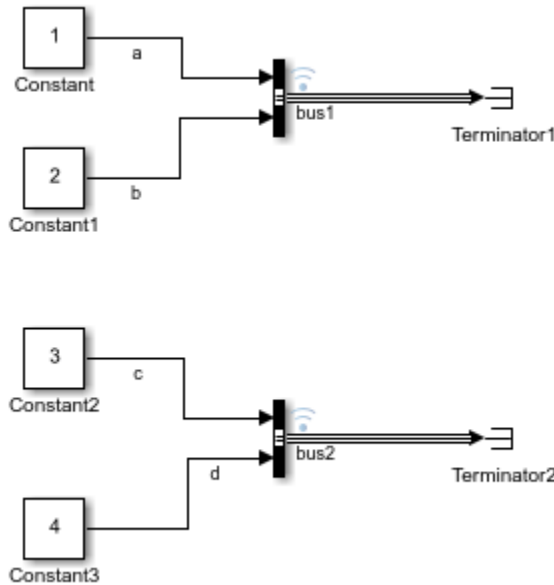

Create timeseries Data

First, open and simulate the `ex_log_structtimeseries` model. The model logs two bus signals, `bus1` and `bus2`, created using Constant blocks and Bus Creator blocks. Access the `logcout` Dataset in the `Simulink.SimulationOutput` object, `out`.

```
open_system('ex_log_structtimeseries')  
out = sim('ex_log_structtimeseries');
```

```
logout = out.logout;
```

You can use a structure of timeseries data or a cell array of timeseries data to partially specify simulation input for a bus.

Partially Specify Bus Data with a Structure of timeseries Data

Open the model `ex_load_structtimeseries` that will load some of the data you logged in the previous section.

```
open_system('ex_load_structtimeseries')
```

Use the `get` function to access the structure of timeseries data logged for bus1.

```
bus1 = logout.get(1).Values;
```

Then, replace the b data with `[]`.

```
bus1.b = [];
```

The `ex_load_structtimeseries` model uses the variable `inputBus` as its **Input**. The `Simulink.Bus` object, `bus`, that defines the data type for the Inport block is defined in the `PreLoadFcn` callback for the `ex_load_structtimeseries` model. Because the signal names in `bus1` match the `Simulink.Bus` object specification for the Inport block in the `ex_load_structtimeseries` model, you can use the logged structure without modification. To load the data for `bus1`, assign `bus1` to the variable `inputBus`.

```
inputBus = bus1;
```

Simulate the model. The Display blocks show the logged value 1 for a and 0 for b. The simulation uses ground values when you do not specify data for the signal.

```
loadOut = sim('ex_load_structtimeseries');
```

Now, load the data logged for bus2. The signal names in bus2 do not match the `Simulink.Bus` object specification for the Inport block in the `ex_load_structtimeseries` model. Modify the data in the structure to partially specify input data for the bus. Then, use the `Simulink.SimulationData.createStructOfTimeseries` function to change the names in the structure to match the bus specification.

```
bus2 = logout.get(2).Values;  
bus2.d = [];  
inputBus = bus2;  
inputBus = Simulink.SimulationData.createStructOfTimeseries('bus',inputBus);
```

Simulate the model. The Display blocks show the logged value 3 for a and 0 for b.

```
loadOut = sim('ex_load_structtimeseries');
```

Partially Specify Bus Data with a Cell Array of Timeseries Data

When you have `timeseries` data, you can use `Simulink.SimulationData.createStructOfTimeseries` to partially specify simulation input for a bus using a cell array of the `timeseries` data. Load the `timeseries` data for signal d in bus2 as part of a partial bus specification for the Inport block in the `ex_load_structtimeseries` model. The `PreLoadFcn` callback for the `ex_load_structtimeseries` model defines the `Simulink.Bus` object, `bus`, that defines the data type for the Inport block.

```
d = logout.get(2).Values.d;  
  
inputBus = Simulink.SimulationData.createStructOfTimeseries('bus',...  
    {d, []});
```

Simulate the model. The Display block for signal a in the `ex_load_structtimeseries` model shows the data logged in signal d from the `ex_log_structtimeseries` model. The Display block for signal b shows 0.

```
loadOut = sim('ex_load_structtimeseries');
```

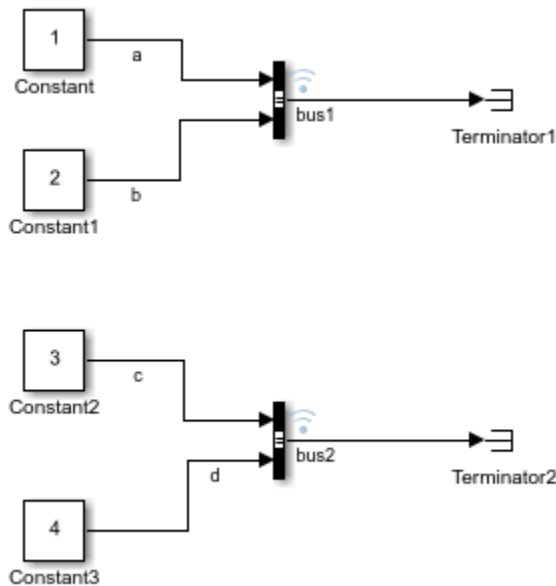

Load Simulation Input Data for an Array of Buses

This example shows how to use the `Simulink.SimulationData.createStructOfTimeseries` function to generate simulation input for an array of buses. You create `timeseries` data by simulating one model. Then, you create an input structure using the logged data to load into an array of buses in another model.

Create timeseries Data

To start, open the `ex_log_structtimeseries` model.

```
open_system('ex_log_structtimeseries')
```

The model creates two buses, bus1 and bus2, using Constant blocks and Bus Creator blocks. The signals are named a, b, c, and d. Create logged bus data by simulating the model.

```
out = sim('ex_log_structtimeseries');
```

The output out contains a Simulink.SimulationData.Dataset object, log sout, with the logged data. You can access the bus1 and bus2 signals using the get function. The data for each signal is in the Simulink.SimulationData.Signal object Values parameter. You can access the bus elements using a dot followed by the signal name. bus1 is the first signal in the Dataset object and contains signals a and b. bus2 contains signals c and d.

```
log sout = out.log sout;
```

```
a = log sout.get(1).Values.a;
b = log sout.get(1).Values.b;
c = log sout.get(2).Values.c;
d = log sout.get(2).Values.d;
```

Loading Model Configuration

Open the model ex_structtimeseries_aob, which uses an array of buses as input.

```
open_system('ex_load_structtimeseries_aob')
```

The model uses the InAoB Inport block to load simulation input. Selector blocks select a bus from the array of buses, and Bus Selector blocks select signals to show in the Display blocks.

Double-click the InAoB block and look at the **Signal Attributes** pane of the dialog. The **Data type** for the block is set to **Bus** with the type defined by the Simulink.Bus object, bus. The **Port dimensions** parameter is set to [2 1].

You can see the definition for the Simulink.Bus object, bus, in the **Callbacks** tab in the Model Explorer. This model uses the PreLoadFcn to define the bus object.

Open the Model Configuration Parameters and look at the **Input** parameter. The model uses the variable inputAoB as input.

Create Array of Buses Simulation Input

Use Simulink.SimulationData.createStructOfTimeseries and the data logged in the first section to create a structure to load as simulation input for the array of buses. Specify the dimensions as [2 1] to match the dimensions of the InAoB block.

```
inputAoB = Simulink.SimulationData.createStructOfTimeseries('bus', ...
    {a,b,c,d}, [2 1]);
```

When you simulate the model, the Display blocks show the data for signals a, b, c, and d logged from the ex_log_structtimeseries model. The array of buses contains two buses with signals a and b. Simulink.SimulationData.createStructOfTimeseries renamed signals c and d to match the Simulink.Bus specification used by the array of buses.

```
inputAoB(2)
```

```
ans =
```

```
struct with fields:
```

```
  a: [1x1 timeseries]
  b: [1x1 timeseries]
```

Simulate the model. The display blocks show the logged values.

```
aob_out = sim('ex_load_structtimeseries_aob');
```

Create a Structure of timeseries Objects from a Simulink.TsArray Object

In releases before R2016a, when you log simulation data using ModelDataLogs format, bus data is stored as a Simulink.TSArray object. You cannot log data using ModelDataLogs format using a release after R2016a. In this example, the logged data, log sout, was logged in ModelDataLogs format using a release before R2016a. The variable log sout contains data for a single bus, bus1.

```
log sout
```

```
log sout =
```

```
Simulink.ModelDataLogs (log_modeldatalogs):
  Name           Elements  Simulink Class
  bus1           2        TsArray
```

To load the logged data as simulation input for a bus, create a structure of timeseries objects from the data in bus1.

```
struct_of_ts = ...
Simulink.SimulationData.createStructOfTimeseries(logsout.bus1)

struct_of_ts =

    const1_sig: [1x1 timeseries]
    const2_sig: [1x1 timeseries]
```

Input Arguments

busObj — Name of Simulink.Bus object

character vector

Name of the Simulink.Bus object that specifies the attributes for the data in the output structure of timeseries objects. When you want to load the structure of timeseries objects as simulation input for a bus, the busObj is the bus that defines the data type for the root-level Inport block.

Simulink.SimulationData.createStructOfTimeseries validates the input timeseries attributes including data type and complexity against the Simulink.Bus object specification. When element names do not match between the Simulink.Bus specification and the input timeseries data, Simulink.SimulationData.createStructOfTimeseries renames the timeseries data to match the bus specification. When other attributes do not match, the function returns an error.

Example: 'MyInputBus'

tsStructIn — Structure of timeseries objects

structure of timeseries data

Structure of timeseries data for use in creating the output structure of timeseries objects according to the Simulink.Bus object. The structure must have the same hierarchy as the Simulink.Bus object.

To partially specify data for a bus, use [] in the place of the bus element you want to use ground values.

tsCellArray — Cell array of timeseries objectscell array of `timeseries` objects

Cell array of `timeseries` objects specifying the data for the output structure of `timeseries` objects.

To partially specify data for a bus, use `[]` in the place of the bus element you want to use ground values.

The `Simulink.SimulationData.createStructOfTimeseries` function maps the `timeseries` elements of the cell array to the hierarchy specified by the `Simulink.Bus` object using a depth-first search.

Example: `{ts1,ts2,ts3}`

Example: `{ts1,[],ts3}`

Dependencies

When you specify the `dims` argument, the number of cells in the cell array must match the number of individual signal elements in the `Simulink.Bus` object multiplied by the product of the specified dimensions.

dims — Dimensions for output array

vector

Dimensions for the array of `timeseries` structures, specified as a vector.

When you specify the dimensions as a scalar, `n`, the function creates a 1-by-`n` array.

Example: `[2,1]`

Dependencies

When you specify the `dims` argument, the number of cells in the cell array must match the number of individual signal elements in the `Simulink.Bus` object multiplied by the product of the specified dimensions.

Data Types: `double`

tsArray — Simulink.TsArray object`Simulink.TsArray`

`Simulink.TsArray` object.

In versions prior to R2016a, signal logging creates `Simulink.TsArray` objects to store logged bus data. Use this syntax when you want to use data logged using `ModelDataLogs` format in a version before R2016a to create simulation input for a bus.

Example: `myTsArrayObj`

Output Arguments**tsStruct — Structure of timeseries objects**

struct

Structure of `timeseries` objects with attributes specified by the `Simulink.TsArray` or `Simulink.Bus` input. You can load the structure of `timeseries` objects as simulation input for a bus.

tsStructArray – Array of timeseries structures

array

Array of structures of `timeseries` objects with dimensions specified by the `dims` input.

Simulink.SimulationData.DatasetRef. getDatasetVariableNames

List names of Dataset variables in MAT-file

Syntax

```
varNames = Simulink.SimulationData.DatasetRef.getDatasetVariableNames(  
matFile)
```

Description

`varNames = Simulink.SimulationData.DatasetRef.getDatasetVariableNames(matFile)` lists the names of variables for Dataset data in a MAT-file.

Examples

List Variable Names in MAT-File

Suppose that you simulate a model using the default variable names for signal logging data and states data. You enable the **Configuration Parameters > Data Import/Export > Log Dataset data to file** and use the default MAT-file name of `out.mat`.

List the variable names in the MAT-file.

```
varNames = Simulink.SimulationData.DatasetRef.getDatasetVariableNames('out.mat')  
  
varNames =  
    'xout' 'logout'
```

Tips

To get the names of Dataset variables in the MAT-file, using the `Simulink.SimulationData.DatasetRef.getDatasetVariableNames` function processes faster than using the `who`, or `whos` functions.

Input Arguments

matFile — MAT-file that contains Dataset variables

character vector

MAT-file that contains Dataset variables, specified as a character vector. The character vector specifies the path to the MAT-file.

Output Arguments

varNames — Names of Dataset variables in MAT-file

cell array

Names of Dataset variables in MAT-file, returned as a cell array.

Simulink.SimulationData.forEachTimeseries

Call function on each timeseries object

Syntax

```
dataResults = Simulink.SimulationData.forEachTimeseries(functionHandle,
inputData)
```

Description

`dataResults = Simulink.SimulationData.forEachTimeseries(functionHandle, inputData)` runs the specified function handle on all MATLAB timeseries objects contained in `inputData`.

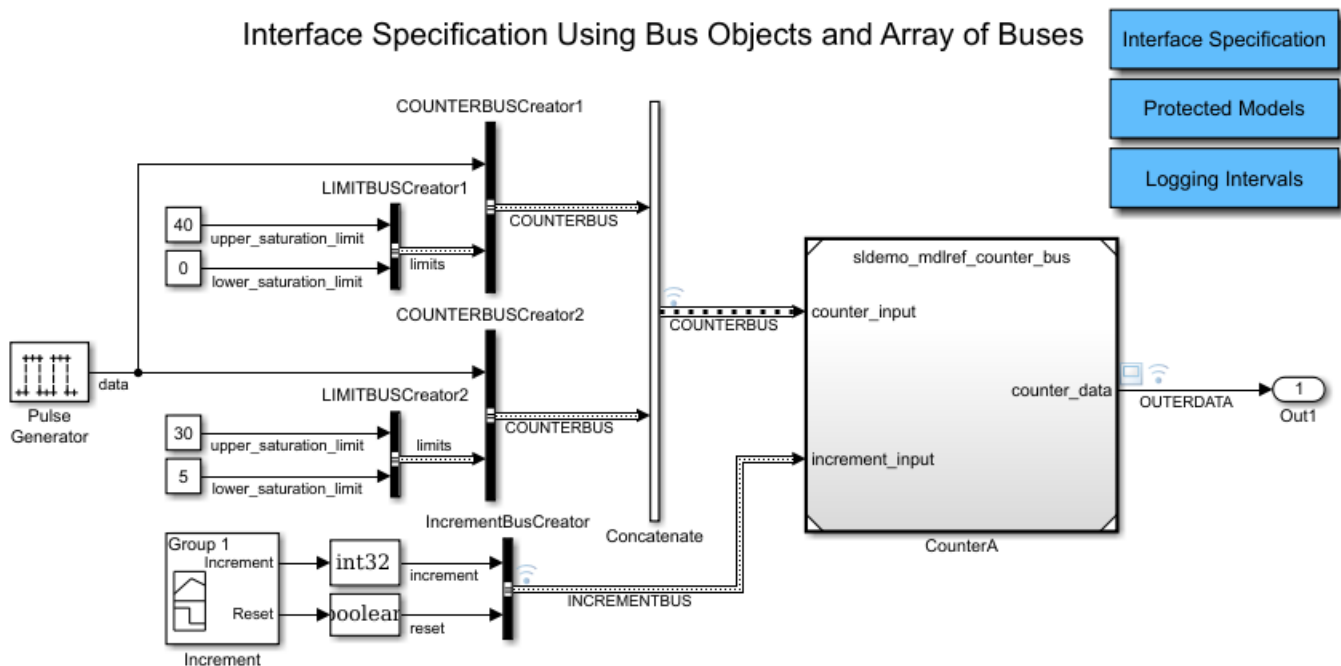

Examples

Find Minimum for Logged Bus Signal Data

This example shows how to use the `forEachTimeseries` function to run the `min` function on each timeseries object in the logged data for the `COUNTERBUS` signal.

Open the model and simulate it.

```
openExample('sldemo_mdref_bus')
sim('sldemo_mdref_bus');
```

Access the signal logging data. For this model, that data is stored in the `topOut` variable.

```
topOut
```

```
Simulink.SimulationData.Dataset 'topOut' with 4 elements
```

	Name	BlockPath
1 [1x1 Signal]	COUNTERBUS	sldemo_mdref_bus/Concatenate
2 [1x1 Signal]	OUTERDATA	sldemo_mdref_bus/CounterA
3 [1x1 Signal]	INCREMENTBUS	sldemo_mdref_bus/IncrementBusCreator
4 [1x1 Signal]	INNERDATA	...erA\sldemo_mdref_counter_bus/COUNTER

- Use braces `{ }` to access, modify, or add elements using index.

Find the values for the COUNTERBUS element.

```
counterbusData = topOut{1}.Values
```

```
counterbusData =
```

```
2x1 struct array with fields:
```

```
data
limits
```

Run the `min` function on the counterbus data.

```
ret = Simulink.SimulationData.forEachTimeseries(@min,counterbusData)
```

```
ret =
```

```
2x1 struct array with fields:
```

```
data
limits
```

Explore the returned data.

```
ret(1)
```

```
ans =
```

```
data: 0
limits: [1x1 struct]
```

```
ret(2).limits
```

```
ans =
```

```
upper_saturation_limit: 40
lower_saturation_limit: 0
```

Input Arguments

functionHandle — Function to run on MATLAB timeseries objects

function handle

Function to run on `timeseries` objects, specified as a function handle. For information about specifying function handles, see “Pass Function to Another Function”.

The function that you use with `forEachTimeseries`:

- Can be either a built-in function or a user-specified function
- Must return a scalar

If the function that you use with `forEachTimeseries` takes:

- One argument, specify the function handle and the input data. For example:

```
ret = Simulink.SimulationData.forEachTimeseries(@min,data);
```

- More than one argument, specify the function handle as `@(x)` and then specify the function, using `x` as the first argument. For remaining arguments, specify values. For example, this command runs the `resample` function on MATLAB timeseries objects in `data`, for the time vector `[2.5 3]`.

```
ret = Simulink.SimulationData.forEachTimeseries(@(x)...  
(resample(x,[2.5 3])),data);
```

inputData — Data to run specified function on

MATLAB timeseries object | array of timeseries | structure with timeseries at leaf nodes | array of structures with timeseries at leaf nodes

Data to run specified function on, specified as timeseries data.

Output Arguments

dataResults — Data resulting from running specified function

MATLAB timeseries object | array of timeseries | structure with timeseries at leaf nodes | array of structures with timeseries at leaf nodes

Data resulting from running specified function, returned using the format and hierarchy of the input data.

Simulink.SimulationData.signalLoggingSelector

Open Signal Logging Selector

Syntax

```
Simulink.SimulationData.signalLoggingSelector(modelName)
```

Description

`Simulink.SimulationData.signalLoggingSelector(modelName)` opens the Signal Logging Selector dialog box for the model that you specify with `modelName`.

Input Arguments

`modelName`

Character vector that specifies the name of the model for which you want to open the Signal Logging Selector dialog box.

Example

Open the Signal Logging Selector dialog box for `sldemo_mdref_bus`.

```
openExample('sldemo_mdref_bus');  
Simulink.SimulationData.signalLoggingSelector('sldemo_mdref_bus')
```

“Override Signal Logging Settings”

Introduced in R2011a

Simulink.SimulationData.updateDatasetFormatLogging

Convert model and its referenced models to use `Dataset` format for signal logging

Syntax

```
Simulink.SimulationData.updateDatasetFormatLogging(top_model)
Simulink.SimulationData.updateDatasetFormatLogging(top_model, variants)
```

Description

Note The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format. You do not need to use this command to update the signal logging format for a model that uses model referencing. Opening the model in R2016a or later uses `Dataset` format for all signal logging.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy `ModelDataLogs` API”.

`Simulink.SimulationData.updateDatasetFormatLogging(top_model)` converts the top-level model and all of its referenced models to use the `Dataset` format for signal logging instead of the `ModelDataLogs` format. You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If a `Model` block has the **Generate preprocessor conditionals** option selected, the function converts all the variants; otherwise, the function converts only the active variant.

`Simulink.SimulationData.updateDatasetFormatLogging(top_model, variants)` specifies which variant models to convert to use the `Dataset` signal logging format. For details about the `variants` argument, see “Input Arguments” on page 2-986

Input Arguments

`top_model`

Character vector that specifies the name of the top-level model.

variants

Character vector that specifies which variant models to update:

- 'ActivePlusCodeVariants' — (Default) Search all variants if any generate preprocessor conditionals. Otherwise, search only the active variant.
- 'ActiveVariants' — Convert only the active variant.
- 'AllVariants' — Convert all variants.

More About

Dataset

The *Dataset* format causes Simulink to use a `Simulink.SimulationData.Dataset` object to store the logged signal data. The *Dataset* format use MATLAB timeseries objects to formatting the data.

ModelDataLogs

The *ModelDataLogs* format causes Simulink to use a `Simulink.ModelDataLogs` object to store the logged signal data. `Simulink.Timeseries` and `Simulink.TsArray` objects provide the format for the data.

Tips

- The conversion function sets the `SignalLoggingSaveFormat` parameter value to `Dataset` for all the updated models.
- If you want to save the format updates that the conversion function makes, then ensure that the top-level model, referenced models, and variant models are accessible and writable.
- If a model has no other unsaved changes, the conversion function saves the format updates to the model. If the model has unsaved changes, the function updates the format, but does not save those changes.
- If you use this function for a model that does not include any referenced models, the function converts the top-level model use the *Dataset* format.

Topics

"Migrate Scripts That Use Legacy ModelDataLogs API"

Introduced in R2011a

find

Access and display values of simulation results

Syntax

```
output = find(simout, 'VarName')  
output = simOut.find('VarName')
```

Description

output = find(simout, 'VarName') finds the VarName in Simulink.SimulationOutput. Specify *VarName* in single quotes.

output = simOut.find('VarName') is a syntax with dot notation for the find method.

Input Arguments

simout — Simulation output

object

Simulation output to find VarName in.

VarName — Name of the Variable

character vector

Name of logged variable for which you seek values.

Output Arguments

Value

Value of the logged variable name specified in input.

Examples

Simulate vdp and store the values of the variable *youtNew* in *yout*.

```
simOut = sim('vdp','SaveState','on','StateSaveName','xoutNew',...  
            'SaveOutput','on','OutputSaveName','youtNew');  
yout = simOut.find('youtNew')
```

See Also

get | who | Simulink.SimulationOutput

get

Access and display values of simulation results

Syntax

```
output = get(simOut, 'VarName')  
output = simOut.get('VarName')
```

Description

`output = get(simOut, 'VarName')` accepts one variable name. Specify *VarName* inside single quotes.

`output = simOut.get('VarName')` is a syntax with dot notation to accept one variable name.

Tip A simpler alternative to using the `get` function is to use dot notation. For example, to access data for the `xout` output variable, you can use this command:

```
simOut.xout
```

Input Arguments

simout — Simulation object to get metadata from

object

Simulation object to get metadata from, specified as a `SimulationOutput` object.

VarName — Name of the Variable

character vector

Name of logged variable for which you seek values.

Output Arguments

Value

Value of the logged variable name specified in input.

Examples

Simulate `vdp` and store the values of the variable `youtNew` in `yout`.

```
simOut = sim('vdp',...  
            'SaveState','on','StateSaveName','xoutNew',...  
            'SaveOutput','on','OutputSaveName','youtNew');  
yout = simOut.get('youtNew')
```

Alternatives

A simpler alternative is to use dot notation. For example, to access data for the `xout` output variable, you can use this command:

```
simOut.xout
```

Another alternative is to use `Simulink.SimulationOutput.who` and then `Simulink.SimulationOutput.find`.

See Also

`find` | `who`

getSimulationMetadata

Return SimulationMetadata object for simulation

Syntax

```
mData = getSimulationMetadata(simout)
mData = simout.getSimulationMetadata()
```

Description

`mData = getSimulationMetadata(simout)` retrieves metadata information in a SimulationMetadata object from Simulink.SimulationOutput object.

`mData = simout.getSimulationMetadata()` is a syntax with dot notation to retrieve metadata information in a SimulationMetadata object.

Input Arguments

simout — Simulation object to get metadata from
object

Simulation output to get metadata from.

Output Arguments

mData — Simulink.SimulationMetadata object stored in the simout SimulationOutput object
object

SimulationMetadata object stored in the simout SimulationOutput object.

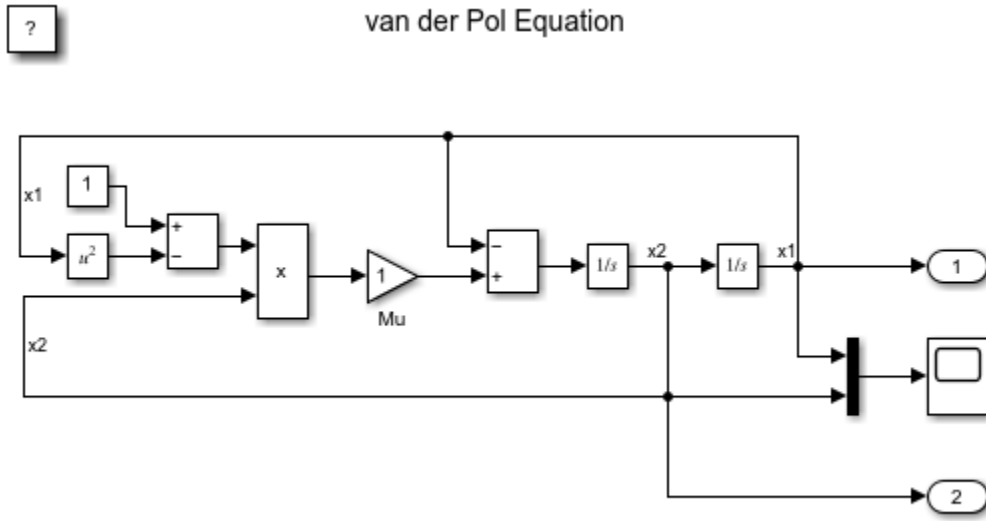

Examples

Retrieve Metadata From vdp Simulation

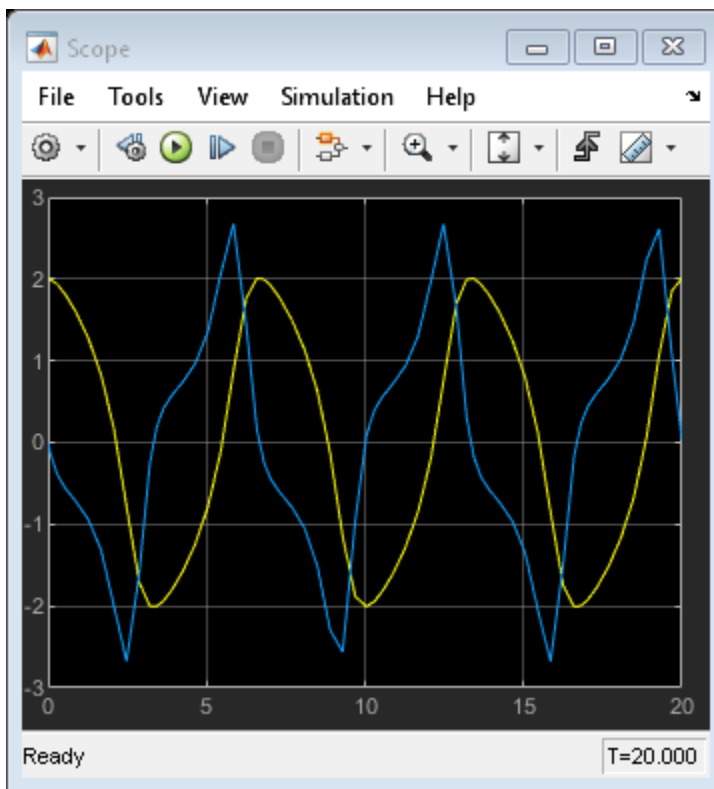

Simulate the vdp model and retrieve metadata information from the simulation.

Simulate the vdp model. Save the results of the Simulink.SimulationOutput object in simout

```
open_system('vdp')
simout = sim(bdroot,'ReturnWorkspaceOutputs','on');
```

Copyright 2004-2020 The MathWorks, Inc.

Retrieve metadata information about this simulation using mData.

```
mData=simout.getSimulationMetadata()
```

```
mData =
```

```
SimulationMetadata with properties:
```

```
ModelInfo: [1x1 struct]
TimingInfo: [1x1 struct]
ExecutionInfo: [1x1 struct]
UserString: ''
UserData: []
```

Alternatives

A simpler alternative to use dot notation with the `SimulationMetadata` property. For example:

```
simOut.SimulationMetadata.ModelInfo
```

Another alternative is to display simulation metadata in the Variable Editor using one of these approaches:

- Select the **Show Simulation Metadata** check box (which displays the data in a tree structure).
- Double-click the **SimulationMetadata** row.
- View the `SimulationMetadata` object.

See Also

[Simulink.SimulationMetadata | setUserData | setUserString | SimulationOutput](#)

setUserData

Store custom data in SimulationMetadata object that SimulationOutput object contains

Syntax

```
simoutNew = setUserData(simout,CustomData)
simoutNew = simout.setUserData(CustomData)
```

Description

`simoutNew = setUserData(simout,CustomData)` assigns a copy of `Simulink.SimulationOutput` to `simoutNew`. The copy contains `CustomData` in its `SimulationMetadata` object.

`simoutNew = simout.setUserData(CustomData)` is a syntax with dot notation to assign the modified copy of `Simulink.SimulationOutput` to `simoutNew`.

Input Arguments

simout — Simulation Output

object

Simulation output in which to modify custom data

CustomData — Data to store in a metadata object

data

Any custom data you want to store in the metadata object.

Output Arguments

simoutNew — Simulation object that stores metadata object with custom data

object

A copy of the `simout` `SimulationOutput` object that contains `CustomData` in its `SimulationMetadata` object, returned as an object.

Examples

Store Data in SimulationMetadata Object of vdp Simulation

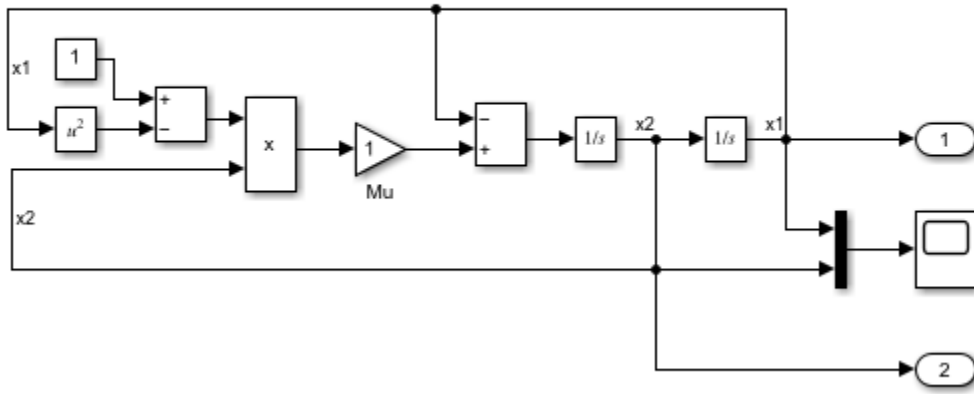

Simulate the `vdp` model. Store custom data in the `SimulationMetadata` object that the `SimulationOutput` object contains.

Simulate the `vdp` model. Save the results of the `Simulink.SimulationOutput` object in `simout`.

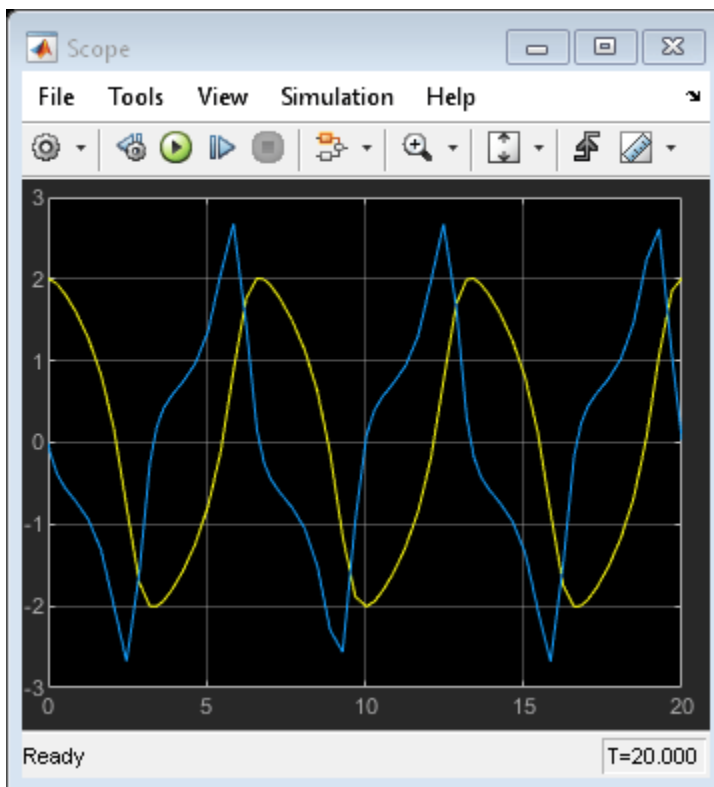

```
open_system('vdp')
simout=sim(bdroot,'ReturnWorkspaceOutputs','on');
```

van der Pol Equation

Copyright 2004-2020 The MathWorks, Inc.

Store custom data about the simulation in the SimulationMetadata object that simout contains.

```
simout=simout.setUserData(struct('param1','value1','param2','value2','param3','value3'));
```

Use SimulationOutput.getSimulationMetadata to retrieve the information you stored.

```
mData=simout.getSimulationMetadata();
disp(mData.UserData)
```

```
param1: 'value1'  
param2: 'value2'  
param3: 'value3'
```

setUserString

Store custom character vector in SimulationMetadata object in SimulationOutput object

Syntax

```
simoutNew = setUserString(simout, CustomString)
simoutNew = simout.setUserString(CustomString)
```

Description

`simoutNew = setUserString(simout, CustomString)` assigns a copy of `Simulink.SimulationOutput` to `simoutNew`. The copy contains `CustomString` in its `SimulationMetadata` object.

`simoutNew = simout.setUserString(CustomString)` is a syntax with dot notation to assign the modified copy of `Simulink.SimulationOutput` to `simoutNew`.

Input Arguments

simout — Simulation Output
object

Simulation output in which to set custom string.

CustomString — Character vector to store in a metadata object
character vector or a string

Any custom character vector you want to store in the metadata object.

Output Arguments

simoutNew — Simulation object that stores metadata object with custom character vector
object

A copy of the `simout` `SimulationOutput` object that contains `CustomString` in its `SimulationMetadata` object, returned as an object.

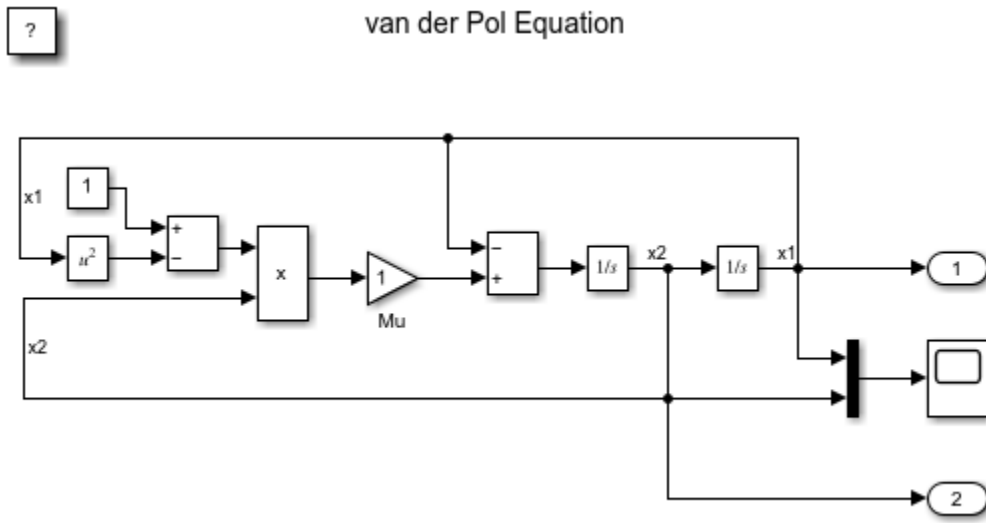

Examples

Store a Character Vector in SimulationMetadata Object of vdp Simulation

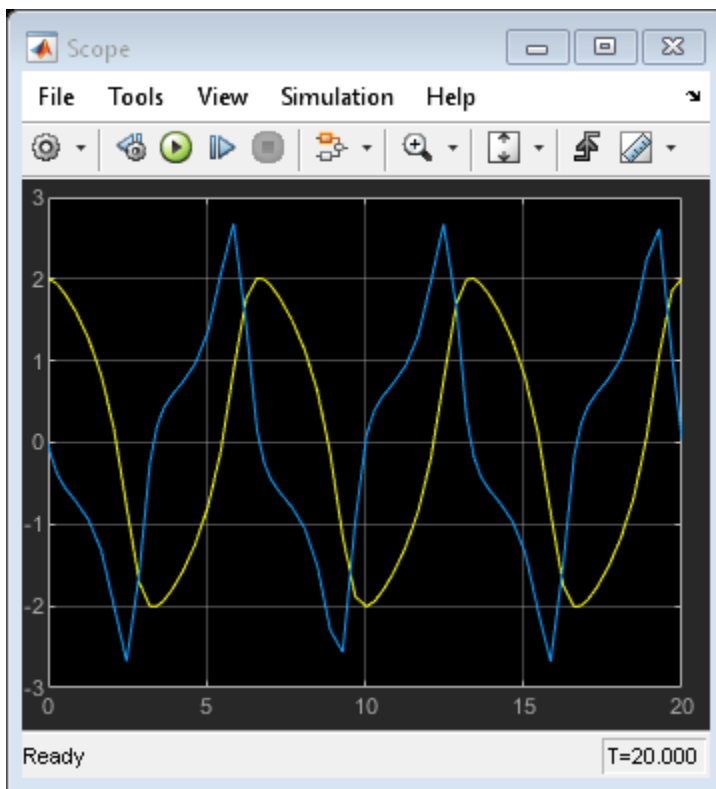

Simulate the `vdp` model. Store a custom character vector in the `SimulationMetadata` object that the `SimulationOutput` object contains.

Simulate the `vdp` model. Save the results of the `Simulink.SimulationOutput` object in `simout`.

```
open_system('vdp')
simout=sim(bdroot,'ReturnWorkspaceOutputs','on');
```

Copyright 2004-2020 The MathWorks, Inc.

Store a character vector to describe the simulation.

```
simout=simout.setUserString('First Simulation');
```

Use `SimulationOutput.getSimulationMetadata` to retrieve the information you stored.

```
mData=simout.getSimulationMetadata();
disp(mData.UserString)
```

First Simulation

Simulink.SimulationMetadata | getSimulationMetadata | setUserData |
Simulink.SimulationOutput

who

Access and display output variable names of simulation

Syntax

```
simOutVar = who(simOut)  
simOutVar = simOut.who
```

Description

simOutVar = who(simOut) returns the names of all simulation output variables, including workspace variables.

simOutVar = simOut.who is a syntax with dot notation to return the names of all simulation output variables, including workspace variables.

Input Arguments

simout — Simulation object to get metadata from
object

Simulation output to get metadata from.

Output Arguments

simOutVar

Character vector array of output variable names of simulation.

Examples

Simulate vdp and store the character vector values of the output variable names.

```
simOut = sim('vdp','SaveState','on','StateSaveName','xoutNew',...  
            'SaveOutput','on','OutputSaveName','youtNew');  
simOutVar = simOut.who
```

find | get | Simulink.SimulationOutput

Simulink.SubSystem.convertToModelReference

Convert subsystem to model reference

Syntax

```
Simulink.SubSystem.convertToModelReference(gcf,'UseConversionAdvisor',true)
```

```
[tf,h] = Simulink.SubSystem.convertToModelReference(subsys,model)
```

```
[tf,h] = Simulink.SubSystem.convertToModelReference(subsys,model,Name,Value)
```

Description

`Simulink.SubSystem.convertToModelReference(gcf,'UseConversionAdvisor',true)` opens the **Model Reference Conversion Advisor** for the selected Subsystem block.

`[tf,h] = Simulink.SubSystem.convertToModelReference(subsys,model)` converts the specified subsystems to referenced models.

For each subsystem that the function converts, it:

- Creates a model.
- Copies the contents of the subsystem into the new model.
- Updates any root-level input and output blocks and the configuration parameters of the model to match the compiled attributes of the original subsystem.
- Copies the contents of the model workspace of the original model to the new model.

Before you use this function, load the model containing the subsystem.

`[tf,h] = Simulink.SubSystem.convertToModelReference(subsys,model,Name,Value)` specifies options using one or more name-value arguments.

Examples

Open the Model Reference Conversion Advisor

Open the f14 model.

```
open_system('f14');
```

In the f14 model, select the Controller subsystem output signal and click **Log Signals**.

In the Simulink Editor, select the Controller subsystem. Open the **Model Reference Conversion Advisor** from the command window.

```
Simulink.SubSystem.convertToModelReference(gcf,'UseConversionAdvisor',true);
```

Perform the conversion using the advisor.

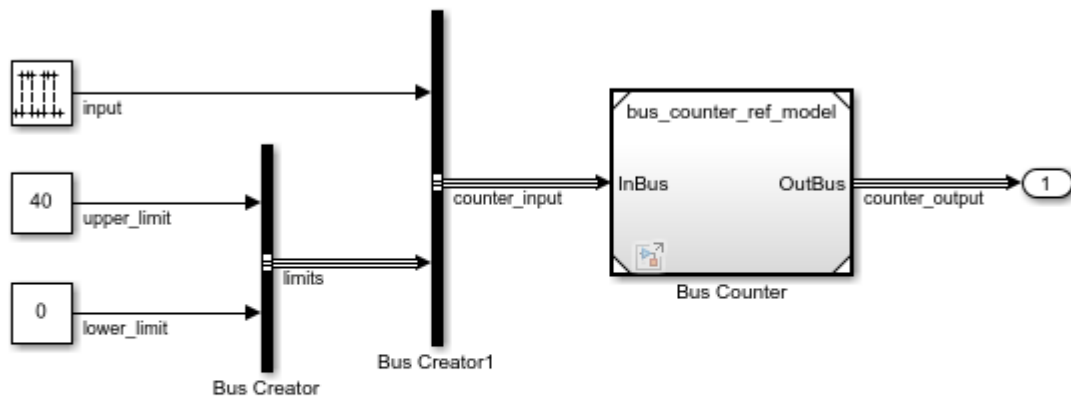

Programmatically Convert Subsystem to Referenced Model

Convert the Bus Counter subsystem to a referenced model named `bus_counter_ref_model`.

```
open_system('sldemo_mdref_conversion');
Simulink.SubSystem.convertToModelReference(...
    'sldemo_mdref_conversion/Bus Counter', ...
    'bus_counter_ref_model', ...
    'AutoFix',true,...
    'ReplaceSubsystem',true,...
    'CheckSimulationResults',true);
```

Successfully converted Subsystem block to Model block.

Conversion to Model Reference Example

Double-click here to convert the Bus Counter subsystem to a referenced model.

Copyright 1990-2020 The MathWorks, Inc.

Convert Multiple Subsystems to Referenced Models

Convert the two subsystems with one command.

```
open_system('f14');
set_param(gcs,'SaveOutput','on','SaveFormat','Dataset');
set_param(gcs,'SignalResolutionControl','UseLocalSettings');
Simulink.SubSystem.convertToModelReference(...
    {'f14/Controller','f14/Aircraft Dynamics Model'},...
    {'controller_ref_model','aircraft_dynamics_ref_model'},...
    'ReplaceSubsystem',true,...
```

```
'AutoFix',true,...
'CheckSimulationResults',true)
```

Input Arguments

subsys — Subsystem names or handles

numeric array | character vector | cell array of character vectors | string array

Subsystem names or handles, specified as a numeric array, character vector, cell array of character vectors, or string array.

For information on which subsystems you can convert, see “Conditionally Execute Referenced Models”.

Data Types: double | char | string

model — Referenced model names

character vector | cell array of character vectors | string array

Referenced model names, specified as a character vector, cell array of character vectors, or string array. Each model name must be 59 characters or less.

If you specify multiple subsystems to convert, specify the same number of referenced model names. Each model name corresponds to the specified subsystem, in the same order.

Data Types: char | string

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: `Simulink.SubSystem.convertToModelReference...
(engineSubsys,engineModelRef,'ReplaceSubsystem',true)`

Conversion

AutoFix — Option to fix all conversion issues that can be fixed automatically

false (default) | true

Option to fix all conversion issues that can be fixed automatically, specified as true or false.

If you set `AutoFix` to true, the function fixes all conversion issues that it can fix. For issues that the function cannot fix, the conversion process generates error messages that you address by modifying the model.

Note If you set `Force` to true, then the function does not automatically fix conversion issues.

Data Types: logical

Force — Option to complete conversion even with errors

false (default) | true

Option to complete conversion even with errors, specified as `true` or `false`.

If `true`, the function returns conversion errors as warnings and continues with the conversion without fixing the errors, even if you set `AutoFix` to `true`. The `Force` option allows you to use the function to do the initial steps of the conversion and then complete the conversion process yourself.

Data Types: `logical`

DataFileName — Name of file for storing conversion data

character vector

Name of file for storing conversion data, specified as a character vector. You can specify an absolute or relative path.

You can save the conversion data in a MAT file (default) or a MATLAB file. If you use a `.m` file extension, the function serializes all variables to a MATLAB file.

By default, the function uses a file name consisting of the model name plus `_conversion_data.mat`.

Data Types: `char`

Model Interface

CreateWrapperSubsystem — Option to insert wrapper subsystem to preserve model layout

`false` (default) | `true`

Option to insert wrapper subsystem to preserve model layout, specified as `true` or `false`.

When you convert a subsystem to a referenced model, you can have the conversion process insert a wrapper subsystem to preserve the layout of the parent model. The subsystem wrapper contains the Model block from the conversion.

The conversion creates a wrapper subsystem automatically if the conversion modifies the Model block interface by adding ports.

Data Types: `logical`

CreateBusObjectsForAllBuses — Option to create bus objects for interface definition

`false` (default) | `true`

Option to create bus objects for interface definition, specified as `true` or `false`.

Models require a defined interface, unlike subsystems. To define an interface that contains virtual buses, the new model must use either of these options:

- In Bus Element and Out Bus Element blocks
- Inport and Outport blocks that specify `Simulink.Bus` objects

By default, the conversion does not create Bus objects. Instead, the conversion uses In Bus Element and Out Bus Element blocks to support virtual buses at the model interface, and the new model contains the original subsystem.

When you set this parameter to `true`, the conversion creates Bus objects for all virtual buses connected to Inport and Outport blocks that do not specify Bus objects. The conversion keeps the Inport and Outport blocks at the model interface, and they specify the new Bus objects.

Data Types: `logical`

CopyCodeMappings — Option to copy code mappings from parent model to new model

`false` (default) | `true`

Option to copy code mappings from parent model to the new model, specified as `true` or `false`.

If `true`, the function copies the existing code mapping configurations from the parent model to the new referenced model.

If `false`, the function does not copy the existing code mapping configurations from the parent model to the new model.

Data Types: `logical`

Model Implementation

ReplaceSubsystem — Option to replace Subsystem blocks with Model blocks

`false` (default) | `true`

Option to replace Subsystem blocks with Model blocks, specified as `true` or `false`.

If you set the value to `true`, consider making a backup of the original model before you convert the subsystems. If you want to undo the conversion, having a backup makes it easier to restore the model.

If you set `ReplaceSubsystem` to `true`, the conversion action depends on whether you use the automatic fix options.

- If you use the automatic fixes, then the conversion replaces the Subsystem block with a Model block unless the automatic fixes change the input or output ports. If the ports change, then the conversion includes the contents of the subsystem in a Model block that is inserted in the Subsystem block.
- If you do not use the automatic fixes, then the conversion replaces the Subsystem block with a Model block.

Data Types: `logical`

SimulationModes — Simulation mode for Model blocks

`'Normal'` (default) | `'Accelerator'`

Simulation mode for Model blocks, specified as `'Normal'` or `'Accelerator'`. The simulation mode setting applies to the Model blocks that reference the models that the conversion creates.

Data Types: `char` | `string`

BuildTarget — Model reference targets to generate

`'Sim'` | `'Coder'`

Model reference targets to generate, specified as `'Sim'` or `'Coder'`.

- `'Sim'` — Model reference simulation target
- `'Coder'` — Code generation target

Data Types: `char`

Simulation Results Comparison

CheckSimulationResults — Option to check simulation results before and after conversion

`false` (default) | `true`

Option to check simulation results before and after conversion, specified as `true` or `false`.

Before performing the conversion:

- Enable signal logging for the subsystem output signals of interest in the model.
- Set `CheckSimulationResults` to `true`.
- Set `AbsoluteTolerance`.
- Set `RelativeTolerance`.
- Set `SimulationModes` to the simulation mode used by the original model.

If the difference between simulation results exceeds the tolerance level, the function displays a message.

Data Types: `logical`

AbsoluteTolerance — Absolute signal tolerance for comparison

`1e-06` (default) | numeric scalar

Absolute signal tolerance for comparison, specified as a numeric scalar.

Use this option only if you set `CheckSimulationResults` to `true`.

Data Types: `double`

RelativeTolerance — Relative signal tolerance for comparison

`1e-06` (default) | numeric scalar

Relative signal tolerance for comparison, specified as a numeric scalar.

Use this option only if you set `CheckSimulationResults` to `true`.

Data Types: `double`

Output Arguments

tf — True or false result

`1` | `0` | logical array

True or false result, returned as `1` or `0` of data type `logical`.

A value of `1` indicates a successful conversion.

If you set `Force` to `true`, the function returns a value of `1` if the conversion completes. However, the simulation results can differ from the simulation results for the model before conversion.

h — Handles of created Model blocks

numeric array

Handles of the created Model blocks, returned as a numeric array.

Data Types: `double`

Tips

- You cannot convert a parent subsystem and a child of that subsystem at the same time.
- Specifying multiple subsystems to convert with one command can save time compared to converting each subsystem separately. The multiple subsystem conversion process compiles the model once.
- If you specify multiple subsystems to convert, the conversion process attempts to convert each subsystem. Successfully converted subsystems produce referenced models, even if the conversions of other subsystems fail.
- If you specify multiple subsystems, consider:
 - In the input arguments, setting 'Autofix', 'ReplaceSubsystem', and 'CheckSimulationResults' to true.
 - In the model, setting a short simulation time.
- A data dictionary saves bus objects that it creates as part of the conversion process when both of these conditions exist:
 - The top model uses a data dictionary.
 - All changes to the top model are saved.
- To maintain the behavior of a masked subsystem, perform these additional tasks:
 - For masked callbacks, icons, ports, and documentation, create a backup copy of the masked subsystem before converting it to a referenced model. After conversion, copy the content from the Mask Editor of the backup masked subsystem to the Mask Editor of the new Model block.
 - Replace mask parameters with model arguments (see “Parameterize Instances of a Reusable Referenced Model”).

Note Referenced models do not support the functionality that you can achieve with mask initialization code to create masked parameters.

Compatibility Considerations

'BuildTarget' argument value 'RTW' is not recommended

Not recommended starting in R2019a

In R2019a, an argument value used with the `Simulink.SubSystem.convertToModelReference` function was updated. The legacy argument value is supported for backward compatibility.

To take advantage of the updated 'BuildTarget' argument value, use 'Coder' instead of 'RTW'.

Introduced in R2006a

Simulink.SubSystem.copyContentsToBlockDiagram

Copy graphical contents from subsystem to empty system

Syntax

```
Simulink.SubSystem.copyContentsToBlockDiagram(subsys, sys)
```

Description

`Simulink.SubSystem.copyContentsToBlockDiagram(subsys, sys)` copies the blocks, lines, and annotations of the specified subsystem to the top-level block diagram of the specified system. It does not affect nongraphical information such as configuration sets.

To use this function:

- The specified system must be loaded in memory.
- The specified subsystem must be loaded in memory.
- The specified system must not contain any blocks or lines. Other types of information can exist in the system and are unaffected by the function. To delete the graphical content of the system, use `Simulink.BlockDiagram.deleteContents`.

Examples

Copy Subsystem Contents to Model

Copy the graphical contents of a subsystem to a new model.

Open the f14 model.

```
open_system('f14');
```

Create an empty model named f14Controller.

```
model = new_system('f14Controller');  
open_system(model)
```

Copy the graphical contents from the f14/Controller subsystem to the empty f14Controller model.

```
Simulink.SubSystem.copyContentsToBlockDiagram('f14/Controller', model)
```

Input Arguments

subsys — Subsystem block path or handle

character vector | string scalar | numeric scalar

Subsystem block path or handle, specified as a character vector, string scalar, or numeric scalar.

Example: 'model1/Subsystem'

Data Types: `double` | `char` | `string`

sys — System name or handle

character vector | string scalar | numeric scalar

System name or handle, specified as a character vector, string scalar, or numeric scalar.

A system name must not include a path or extension.

Example: `'model2'`

Data Types: `double` | `char` | `string`

Tips

To flatten a model hierarchy by replacing a subsystem with its contents, use the `Simulink.BlockDiagram.expandSubsystem` function.

Introduced in R2007a

Simulink.SubSystem.deleteContents

Delete contents of subsystem

Syntax

```
Simulink.SubSystem.deleteContents(subsys)
```

Description

`Simulink.SubSystem.deleteContents(subsys)` deletes the blocks, lines, and annotations in the specified subsystem, which must be loaded in memory.

Examples

Delete Subsystem Contents

Open the f14 model.

```
open_system('f14')
```

Delete the graphical contents from the f14/Controller subsystem.

```
Simulink.SubSystem.deleteContents('f14/Controller')
```

Input Arguments

subsys — Subsystem block path or handle

character vector | string scalar | numeric scalar

Subsystem block path or handle, specified as a character vector, string scalar, or numeric scalar.

Data Types: double | char | string

Simulink.SubSystem.getChecksum

Return checksum of nonvirtual subsystem

Syntax

```
[checksum,details] = Simulink.SubSystem.getChecksum(subsys)
```

Description

`[checksum,details] = Simulink.SubSystem.getChecksum(subsys)` returns the checksum of the specified nonvirtual subsystem. Simulink computes the checksum based on the subsystem parameter settings and the blocks the subsystem contains. Virtual subsystems do not have checksums.

One use of this command is to determine why code generated for a subsystem is not being reused.

Note `Simulink.SubSystem.getChecksum` compiles the model that contains the specified subsystem, if the model is not already in a compiled state. If you need to get the checksum for multiple subsystems and want to avoid multiple compiles, use the command `,model([], [], [], 'compile')` to place the model in a compiled state before using `Simulink.SubSystem.getChecksum`.

This command accepts the argument `subsys`, which is the full name or handle of the nonvirtual subsystem block for which you are returning checksum data.

Examples

Run getChecksum on Model

Run the function `Simulink.SubSystem.getChecksum` on the model `rtwdemo_ssreuse`. In the MATLAB editor window, both output structures are displayed. In the workspace pane, double-click on either of the structures to view its contents.

Load the model `rtwdemo_ssreuse`.

```
rtwdemo_ssreuse
```

Select subsystem `SS1` and execute the follow line of code in the MATLAB editor to get the full name and path to the subsystem `SS1`:

```
path_ss1 = gcb
```

Run the function `getChecksum` on the subsystem with the following command:

```
[chksum1, chksum1_details] = Simulink.SubSystem.getChecksum(path_ss1)
```

The output structures `chksum1` and `chksum1_details` will store the output of the `getChecksum` function call.

```

checksum1 =
    struct with fields:
        Value: [4x1 uint32]
        MarkedUnique: 0

checksum1_details =
    struct with fields:
        ContentsChecksum: [1x1 struct]
        InterfaceChecksum: [1x1 struct]
        ContentsChecksumItems: [359x1 struct]
        InterfaceChecksumItems: [60x1 struct]

```

Input Arguments

subsys — Name or handle of nonvirtual subsystem

character vector

Input the full name of the nonvirtual subsystem for which you want to calculate the checksum.

Data Types: char

Output Arguments

checksum — A structure that stores the value of the checksum and indicates whether **subsys** contains unique block or subsystem properties which prevent generated code reuse

structure

Checksum information, returned as a structure with the fields:

Value - 4x1 uint32 - Array of four 32-bit integers that represents the subsystem's 128-bit checksum

MarkedUnique - bool - True if the subsystem or the blocks it contains have properties that would prevent the code generated for the subsystem from being reused; otherwise, false

details — A structure that stores checksum data on model contents and the interface

structure

Checksum information, returned as a structure with the fields:

ContentsChecksum - structure - A structure of the same form as **checksum**, representing a checksum that provides information about all blocks in the system.

InterfaceChecksum - structure - A structure of the same form as **checksum**, representing a checksum that provides information about the subsystem's block parameters and connections

ContentsChecksumItems — Structure array that Simulink uses to compute the checksum for **ContentsChecksum**

structure

Structure array returned with the following fields:

Handle - char array Object for which Simulink added an item to the checksum. For a block, the handle is a full block path. For a block port, the handle is the full block path and a character vector that identifies the port.

Identifier - char array - Descriptor of the item Simulink added to the checksum. If the item is a documented parameter, the identifier is the parameter name

Value - type - Value of the item Simulink added to the checksum. If the item is a parameter, Value is the value returned by `get_param(handle, identifier)`.

InterfaceChecksumItems — Structure array that Simulink uses to compute the checksum for InterfaceChecksum

structure

Structure array returned with the following fields:

Handle - char array Object for which Simulink added an item to the checksum. For a block, the handle is a full block path. For a block port, the handle is the full block path and a character vector that identifies the port.

Identifier - char array - Descriptor of the item Simulink added to the checksum. If the item is a documented parameter, the identifier is the parameter name

Value - type - Value of the item Simulink added to the checksum. If the item is a parameter, Value is the value returned by `get_param(handle, identifier)`.

Introduced in R2006b

Simulink.suppressDiagnostic

Suppress a diagnostic from a specific block

Syntax

```
Simulink.suppressDiagnostic(source, message_id)
Simulink.suppressDiagnostic(diagnostic)
```

Description

`Simulink.suppressDiagnostic(source, message_id)` suppresses all instances of diagnostics represented by `message_id` thrown by the blocks specified by `source`.

`Simulink.suppressDiagnostic(diagnostic)` suppresses the diagnostics associated with MSLDiagnostic object `diagnostic`.

Examples

Suppress a Warning Thrown By a Block

Using the model from “Suppress Diagnostic Messages Programmatically”, use the `Simulink.suppressDiagnostic` function to suppress the parameter precision loss warning thrown by the Constant block, `one`.

```
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one', ...
    'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

Input Arguments

source — Block or model object throwing the diagnostic

block path | block handle

The source of the diagnostic, specified as a block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the `gcb` function.

To get the block handle, use the `getSimulinkBlockHandle` function.

Data Types: char | cell

message_id — message identifier of diagnostic

message identifier | cell array of message identifiers

Message identifier of the diagnostic, specified as a character vector or a cell array of character vectors. You can find the message identifier of diagnostics thrown during simulation by accessing the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object associated with a simulation. You can also use the `lastwarn` function.

Data Types: char | cell

diagnostic – Diagnostic object

MSLDiagnostic object

Diagnostic specified as an MSLDiagnostic object. Access the MSLDiagnostic object through the ExecutionInfo property of the Simulink.SimulationMetadata object.

Data Types: struct

slblocksearchdb.trainfrommodel

Train suggestion engine to improve quick insert results based on one model

Syntax

```
slblocksearchdb.trainfrommodel(model)
```

Description

`slblocksearchdb.trainfrommodel(model)` improves quick insert search results based on a single model.

Examples

Use a Single Model for Training

Train the suggestion engine to use a model to improve results. Assume 'MyModels' is in the current folder. This code uses a relative path.

```
slblocksearchdb.trainfrommodel('MyModels/model.slx')
```

Input Arguments

model — Model for training the suggestion engine

model path

Model to train the suggestion engine, specified as a character vector or string scalar of the full model path or relative path. Include the `.slx` or `.mdl` extension

Example: 'H:/MyModels/model.slx' 'mymodel.slx'

See Also

`slblocksearchdb.untrainmodel` | `slblocksearchdb.untrainmodelsindir`

Topics

"Improve Quick Block Insert Results"

Introduced in R2018a

slblocksearchdb.trainfrommodelsindir

Train suggestion engine to improve quick insert results based on models in a folder

Syntax

```
slblocksearchdb.trainfrommodelsindir(folder)
slblocksearchdb.trainfrommodelsindir(folder,'exclude',exclusions)
```

Description

`slblocksearchdb.trainfrommodelsindir(folder)` improves search results based on the models in `folder`, recursively.

`slblocksearchdb.trainfrommodelsindir(folder,'exclude',exclusions)` excludes the specified models from updating the suggestion engine.

Examples

Train Suggestion Engine and Exclude Folders and Models

Create the cell array `exPath` for a folder you want to exclude and a model you want to exclude. To train the suggestion engine, use the cell array in the `slblocksearchdb.trainfrommodelsindir` command.

```
exPath = {'MyModels/testmodels' 'MyModels/myvdp.slx'}
slblocksearchdb.trainfrommodelsindir('MyModels','exclude',exPath)
```

The command uses the models in the folder 'MyModels' with the exclusions you specified.

Input Arguments

folder — Folder whose models to use for training

folder path

Folder whose models to use for training the suggestion engine, specified as an absolute or relative path character vector or string scalar.

Example: 'H:/MyModels/trainingmodels' 'MyModels'

exclusions — Models to exclude from training models

cell array of character vectors | string array

Models to exclude from training the suggestion engine, specified as a cell array of character vectors or a string array. Specify folders or models to exclude as a full or relative path. Model names must include the file extension `.slx` or `.mdl`.

Example: {'H:/MyModels/trainingmodels' 'MyModels/trainingmodels2' 'MyModels/myvdp.slx'}

slblocksearchdb.untrainall

Remove the effects of all added models from the suggestion engine

Syntax

```
slblocksearchdb.untrainall
```

Description

`slblocksearchdb.untrainall` removes the models added to the suggestion engine to improve quick insert results. Use this function when you want to return the database to the default state.

Examples

Add Models and Remove All

Add some models to the suggestion engine.

```
slblocksearchdb.trainfrommodelsindir('MyModels')  
slblocksearchdb.trainfrommodel('C:/users/TrainingModels/mymodel.slx')
```

Remove all added models from the suggestion engine.

```
slblocksearchdb.untrainall
```

“Improve Quick Block Insert Results”

Introduced in R2018a

slblocksearchdb.untrainmodel

Remove the effect of a model from the suggestion engine

Syntax

```
slblocksearchdb.untrainmodel('model')
```

Description

`slblocksearchdb.untrainmodel('model')` removes the effects of a single model from the suggestion engine.

Examples

Remove a Model from the Suggestion Engine

Train the suggestion engine to use a model to improve results.

```
slblocksearchdb.trainfrommodel('MyModels/model.slx')
```

Remove the model from the suggestion engine.

```
slblocksearchdb.untrainmodel('MyModels/model.slx')
```

Input Arguments

model — Model to remove from the suggestion engine

model path

Model whose effects to remove from the suggestion engine, specified as the full or relative path character vector or string scalar. Include the `.slx` or `.mdl` extension.

Example: `'H:/MyModels/model.slx'`

slblocksearchdb.untrainmodelsindir

Remove the effects of models from the suggestion engine

Syntax

```
slblocksearchdb.untrainmodelsindir(folder)
slblocksearchdb.untrainmodelsindir(folder,'exclude',exclusions)
```

Description

`slblocksearchdb.untrainmodelsindir(folder)` removes models in `folder` from the suggestion engine, recursively.

`slblocksearchdb.untrainmodelsindir(folder,'exclude',exclusions)` excludes the specified models from updating the suggestion engine.

Examples

Remove the Effects of Models from Suggestion Engine

Create the cell array `exPath` for a folder and a model whose effects you do not want to remove from the suggestion engine. Then use the cell array in the `slblocksearchdb.untrainmodelsindir` command.

```
exPath = {'MyModels/subfolder' 'MyModels/myvdp.slx'}
slblocksearchdb.untrainmodelsindir('MyModels','exclude',exPath)
```

The command removes the models in the folder 'MyModels' with the exclusions you specified.

Input Arguments

folder — Folder whose models to remove from the suggestion engine

folder path

Folder whose models to remove from the suggestion engine, specified as an absolute or relative path character vector or string scalar.

Example: 'H:/MyModels/trainingmodels' 'MyModels'

exclusions — Folders and models to exclude from removing

cell array of character vectors | string array

Folders or models to exclude from removing from the suggestion engine, specified as a cell array of character vectors or a string array. Specify the folders or models to exclude as a full or relative path. For models, include the `.slx` or `.mdl` extension.

Example: {'H:/MyModels/trainingmodels' 'MyModels/trainingmodels2' 'MyModels/myvdp.slx'}

“Improve Quick Block Insert Results”

Introduced in R2018a

slbuild

Build standalone executable file or model reference target for model

Syntax

```
slbuild(model)
slbuild(model,buildSpec)
slbuild(model,Name,Value)
blockHandle = slbuild(subsystem)
blockHandle = slbuild(subsystem,'Mode','ExportFunctionCalls')
blockHandle = slbuild(subsystem,Name,Value)
```

Description

`slbuild(model)` builds a standalone Simulink Coder binary executable file from the specified model, using the current configuration parameter settings. If the model is not loaded, `slbuild` loads the model before starting the build process.

`slbuild(model,buildSpec)` builds a standalone Simulink Coder binary executable file from the model according to the specified code generation action.

`slbuild(model,Name,Value)` builds a standalone Simulink Coder binary executable file from the model as specified by one or more name-value arguments.

`blockHandle = slbuild(subsystem)` generates subsystem code and builds a Simulink Coder binary executable file by using the current configuration parameter settings of your model. If the selected system target file creates an S-Function block, the function returns a non-empty block handle to an autogenerated S-Function wrapper. Before you run the command, you must open or load the parent model.

`blockHandle = slbuild(subsystem,'Mode','ExportFunctionCalls')` generates code from the subsystem that includes function calls that you can export to external application code. This command requires Embedded Coder. If the **Create block** configuration parameter is set to `SIL`, the function returns the handle to a `SIL` block. You can then use the `SIL` block for numerical equivalence testing.

`blockHandle = slbuild(subsystem,Name,Value)` generates subsystem code and builds a Simulink Coder binary executable file as specified by one or more name-value arguments.

Examples

Generate Code and Build Executable File for Model

Generate C code for model `rtwdemo_rtwintr0`.

```
slbuild('rtwdemo_rtwintr0')
% Same operation as ...
% slbuild('rtwdemo_rtwintr0','StandaloneCoderTarget')
```

For the generic real-time (GRT) target, the coder generates these code files and places them in folders `rtwdemo_rtwintrg_grt_rtw` and `slprj/grt/_sharedutils`.

Model Files	Shared Files	Interface Files	Other Files
<code>rtwdemo_rtwintrg.c</code>	<code>rtwtypes.h</code>	<code>rtmodel.h</code>	none
<code>rtwdemo_rtwintrg.h</code>	<code>multiword_types.h</code>		
<code>rtwdemo_rtwintrg_private.h</code>	<code>builtin_typeid_types.h</code>		
<code>rtwdemo_rtwintrg_types.h</code>			

If the following model configuration parameters settings apply, the coder generates additional results.

Parameter Setting	Results
Code Generation > Generate code only pane is cleared	Executable file <code>rtwdemo_rtwintrg.exe</code>
Code Generation > Report > Create code generation report is selected	Report appears, providing information and links to generated code files, subsystem and code interface reports, entry-point functions, inports, outports, interface parameters, and data stores

Build Multiple Top Models

This example shows how to use `slbuild` to generate executable code for two models, `sldemo_mdref_depgraph` and `rtwdemo_counter`. `sldemo_mdref_depgraph` is a top model that references models. The example also shows how to build the referenced models in parallel.

Create a local folder.

```
if exist(fullfile('.', 'myTempFolder'), 'dir')
    rmdir('myTempFolder', 's')
end
mkdir myTempFolder
cd myTempFolder
```

Copy `sldemo_mdref_depgraph`, which references models, to the local folder.

```
src_dir = fullfile(matlabroot, ...
    'toolbox', ...
    'simulink', ...
    'simdemos', ...
    'simfeatures', ...
    'modelreference');
copyfile(fullfile(src_dir, ...
    'sldemo_mdref_depgraph.slx'), ...
    '.');
```

Enable parallel building of models referenced by `sldemo_mdref_depgraph`.

```
load_system('sldemo_mdref_depgraph')
set_param('sldemo_mdref_depgraph', ...
'EnableParallelModelReferenceBuilds', 'on');
```

Initialize MATLAB workers for parallel building of referenced models.

```
set_param('sldemo_mdref_depgraph', ...
'ParallelModelReferenceMATLABWorkerInit', ...
'Copy Base Workspace');
```

Build the models.

```
slbuild({'sldemo_mdref_depgraph', 'rtwdemo_counter'})
```

In myTempFolder, the build process creates standalone executable files, sldemo_mdref_depgraph.exe and rtwdemo_counter.exe.

For each model, in the Command Window, the build process displays a build summary.

```
Build Summary|
Code generation targets built:
Model                Action                Rebuild Reason
=====

sldemo_mdref_depgraph  Code generated and compiled  Code generation information file does not exist.

7 of 7 models built (0 models already up to date)
Build duration: 0h 3m 56.859s
### Starting build procedure for: rtwdemo_counter
### Successful completion of build procedure for: rtwdemo_counter

Build Summary
Top model targets built:
Model                Action                Rebuild Reason
=====
rtwdemo_counter       Code generated and compiled  Code generation information file does not exist.

1 of 1 models built (0 models already up to date)
Build duration: 0h 1m 12.556s
```

Force Top Model Build

Generate code and build an executable file for rtwdemo_mdref_top, which refers to model rtwdemo_mdref_bot, regardless of model checksums and parameter settings.

```
slbuild('rtwdemo_mdleftop','StandaloneCoderTarget', ...
    'ForceTopModelBuild',true)
```

Generate Code and Build Executable File for Subsystem

Generate C code for subsystem Amplifier in model rtwdemo_rtwintr0.

```
rtwdemo_rtwintr0
slbuild('rtwdemo_rtwintr0/Amplifier')
```

The code generator produces code files in the Amplifier_grt_rtw and slprj/grt/_sharedutils folders.

In your current working folder, the build process creates an executable file (Amplifier.exe).

Build Subsystem for Exporting Code to External Application

To export function calls to external application code, build an executable file from a function-call subsystem.

```
rtwdemo_exporting_functions
set_param('rtwdemo_exporting_functions','GenCodeOnly','off');
slbuild('rtwdemo_exporting_functions/rtwdemo_subsystem','Mode','ExportFunctionCalls')
```

The executable file rtwdemo_subsystem.exe appears in your working folder.

Create SIL Block for Testing

From a function-call subsystem, create a SIL block that you can use to test the code generated from a model.

Open subsystem rtwdemo_subsystem in model rtwdemo_exporting_functions and set the **Create block** configuration parameter to SIL.

Create the SIL block.

```
mysilblockhandle = slbuild('rtwdemo_exporting_functions/rtwdemo_subsystem',...
    'Mode','ExportFunctionCalls')
```

The code generator produces a SIL block for the generated subsystem code. You can add the block to an environment or test harness model that supplies test vectors or stimulus input. You can then run simulations that perform SIL tests and verify that the generated code in the SIL block produces the same result as the original subsystem.

Input Arguments

model — Specifies model for the build process

handle | character vector | cell array of handles or character vectors

If you specify the model name as a handle or character vector, the build process creates a standalone executable file or model reference target.

If you specify multiple models through a cell array of handles or character vectors, the build process applies `buildSpec` to each model in the cell array.

Example: `gcs`

subsystem – Subsystem name

handle | character vector | cell array of handles or character vectors

Name of subsystem from which you want to generate code or build an executable file, specified as a handle or character vector representing the subsystem name or the full block path.

You can specify multiple subsystems through a cell array of handles or character vectors

Example: `'rtwdemo_exporting_functions/rtwdemo_subsystem'`

buildSpec – Specifies the code generation action for the build process

'StandaloneCoderTarget' (default) | 'ModelReferenceSimTarget' |
'ModelReferenceCoderTarget' | 'CleanTopModel'

`buildSpec` directs the code generator to perform the selected build action for the model and the build process:

- Honors the setting of the **Rebuild** parameter on the **Model Referencing** pane of the Configuration Parameters dialog box.
- Requires a Simulink Coder license only if you build a model reference Simulink Coder target, not if you build a model reference simulation target only.

The `buildSpec` argument must be one of the following.

buildSpec Value	Build Action
'StandaloneCoderTarget'	Builds a standalone Simulink Coder binary executable file for the specified model, using the current model configuration settings. It also builds model reference coder targets for the referenced models. If the specified model is not loaded, <code>slbuild</code> loads it before initiating the build process.
'ModelReferenceSimTarget'	Builds a model reference simulation target (does not require a Simulink Coder license).
'ModelReferenceCoderTarget'	Builds a model reference Simulink Coder target.
'CleanTopModel'	Cleans the model build area enough to trigger regeneration of the top model code at the next build.

Example: `'ModelReferenceSimTarget'`

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose `Name` in quotes.

Example: `'UpdateThisModelReferenceTarget', 'Force'`

UpdateThisModelReferenceTarget — Conditional rebuild option for model reference build

'Force' | 'IfOutOfDateOrStructuralChange' | 'IfOutOfDate'

Conditional rebuild option for the model reference build, specified as the comma-separated pair consisting of 'UpdateThisModelReferenceTarget' and 'Force', 'IfOutOfDateOrStructuralChange', or 'IfOutOfDate'.

This option applies only to the specified model, not to any models referenced by the specified model.

'UpdateThisModelReferenceTarget' Value	Equivalent Rebuild Option	Rebuild Action
'Force'	Always	Unconditionally rebuilds the model.
'IfOutOfDateOrStructuralChange'	If any changes detected	Rebuilds the model if the build process detects any changes.
'IfOutOfDate'	If any changes in known dependencies detected	Rebuilds the model if the build process detects any changes in known dependencies of this model.

For more information on the different rebuild options, see **Rebuild**.

Example: 'UpdateThisModelReferenceTarget', 'Force'

Dependencies

To use this option, set buildSpec to 'ModelReferenceSimTarget' or 'ModelReferenceCoderTarget'.

Data Types: char | string

ForceTopModelBuild — Force top model of model hierarchy to build

false (default) | true

Option to force the top model of the model hierarchy to build, specified as the comma-separated pair consisting of 'ForceTopModelBuild' and true or false.

Setting the value to true directs the code generator to generate code and build an executable file for the top model of the model hierarchy, regardless of model checksums and parameter settings.

Example: 'ForceTopModelBuild', true

Dependencies

To use this option, set buildSpec to 'StandaloneCoderTarget'.

Data Types: logical

GenerateCodeOnly — Generate code only

false | true

If you do not specify a value, the **Generate code only** (GenCodeOnly) option on the **Code Generation** pane controls build process behavior.

If you specify a value, the argument overrides the **Generate code only** (GenCodeOnly) option on the **Code Generation** pane:

- true -- Generate code only.

- `false` -- Generate code and build executable file.

Mode — Export function calls (for subsystem builds only)`'ExportFunctionCalls' | 'Normal'`

- `'ExportFunctionCalls'` -- If you have Embedded Coder, generates code from subsystem that includes function calls that you can export to external application code.
- `'Normal'` -- Does not export function calls.

ExportFunctionFileName — Function name

character vector

Name the exported function for the specified subsystem.

Example:

```
slbuild(subsystem, 'Mode', 'ExportFunctionCalls', 'ExportFunctionFileName',  
fcname)
```

OpenBuildStatusAutomatically — Display build information`false (default) | true`

Option to display the build information, specified as the comma-separated pair consisting of `'OpenBuildStatusAutomatically'` and `true` or `false`.

To display build information in the Build Status window, specify `true`. The default is `false`. For more information about using the status window, see “Monitor Parallel Building of Referenced Models” (Simulink Coder).

The Build Status window supports parallel builds of referenced model hierarchies. Do not use the Build Status window for serial builds.

Dependencies

To use this option, set `buildSpec` to `'StandaloneCoderTarget'`.

Data Types: `logical`

ObfuscateCode — Generate obfuscated C code`false (default) | true`

Specify whether to generate obfuscated C code:

- `true` -- Generate obfuscated C code that you can share with third parties with reduced likelihood of compromising intellectual property.
- `false` -- Generated C code is not obfuscated.

IncludeModelReferenceSimulationTargets — Build model reference simulation targets`false (default) | true`

Option to build model reference simulation targets, specified as the comma-separated pair consisting of `'IncludeModelReferenceSimulationTargets'` and `true` or `false`.

Dependencies

To use this option, set `buildSpec` to `'StandaloneCoderTarget'`.

Data Types: `logical`

Output Arguments

blockHandle — Block handle

handle

Block handle to an autogenerated S-Function wrapper block.

Compatibility Considerations

slbuild does not generate model reference simulation targets by default

Behavior changed in R2020b

Starting in R2020b, the `slbuild` function does not generate model reference simulation targets by default. Excluding the model reference simulation targets allows for faster code generation for model hierarchies.

You can generate both the simulation and code generation targets with the default `buildSpec` value ('`StandaloneCoderTarget`') by setting `IncludeModelReferenceSimulationTargets` to `true`.

When you specify '`ModelReferenceCoderTarget`' for the `buildSpec` argument, `slbuild` no longer builds a model reference simulation target. It builds only a model reference Simulink Coder target.

'ModelReferenceCoderTargetOnly' is not recommended

Not recommended starting in R2020b

Starting in R2020b, the `buildSpec` argument values '`ModelReferenceCoderTarget`' and '`ModelReferenceCoderTargetOnly`' have the same behavior. '`ModelReferenceCoderTargetOnly`' is not recommended. Use '`ModelReferenceCoderTarget`' instead.

There are no plans to remove '`ModelReferenceCoderTargetOnly`'.

'StandaloneRTWTarget', 'ModelReferenceRTWTarget', and 'ModelReferenceRTWTargetOnly' are not recommended

Not recommended starting in R2019a

In R2019a, these `buildSpec` argument values received new names for clarity:

- '`StandaloneRTWTarget`' — Use '`StandaloneCoderTarget`' instead.
- '`ModelReferenceRTWTarget`' — Use '`ModelReferenceCoderTarget`' instead.
- '`ModelReferenceRTWTargetOnly`' — Use '`ModelReferenceCoderTargetOnly`' instead.

There are no plans to remove the legacy `buildSpec` argument values.

Extended Capabilities

Automatic Parallel Support

Accelerate code by automatically running computation in parallel using Parallel Computing Toolbox™.

To build referenced models in parallel, in the top model, select the configuration parameter check box **Enable parallel model reference builds**. For more information, see “Reduce Build Time for Referenced Models by Using Parallel Builds” (Simulink Coder).

In Parallel Computing Toolbox commands, for example, a `parfor` or `spmd` loop, do not invoke `rtwbuild`, `rtwrebuild`, or `slbuild` commands that build models that are configured for parallel builds.

slCharacterEncoding

Specify encoding to use in code generated from Simulink models

Syntax

```
slCharacterEncoding(encoding)  
encoding = slCharacterEncoding()
```

Description

`slCharacterEncoding(encoding)` specifies the character set used in the code generated from Simulink models. The character set encoding affects the comments in the generated code.

`encoding = slCharacterEncoding()` returns the current Simulink character set encoding.

Examples

Specify Encoding for ASCII Characters

Suppose that you generate code for an embedded target and the compiler you use requires that the source code contain only ASCII characters.

Use this command:

```
slCharacterEncoding('US-ASCII')
```

Specify Encoding for Non-ASCII Characters

Suppose that you have a model that contains non-ASCII characters (multilingual characters, special symbols) and you want these annotations to be easily readable in your generated code.

If your compiler supports UTF-8, on Windows, use this command:

```
slCharacterEncoding('UTF-8')
```

UTF-8 is the default encoding on Linux and Mac.

Specify Encoding for Non-English Locale

Suppose that your model contains Japanese text but your machine is configured for an English-language locale. You want to generate code with 'Shift_JIS' encoded text so that your team members who use 'Shift_JIS' as their locale-specific encoding can see the Japanese text in the generated code.

Use this command:

```
slCharacterEncoding('Shift_JIS')
```

Input Arguments

encoding – Character encoding to use for the generated code
'US-ASCII' | 'UTF-8' | other supported encodings

Set the character encoding to a supported encoding value.

“Open a Model That Has Different Character Encoding”

Introduced before R2006a

slConvertCustomMenus

Convert custom toolbar menu into toolstrip tab

Syntax

```
slConvertCustomMenus
slConvertCustomMenus(Name=Value)
```

Description

`slConvertCustomMenus` converts a custom Simulink toolbar menu into a toolstrip tab that is stored in a toolstrip component called `custom` in the current folder. The new tab has the title **Custom** and contains a single section with the same name as the top level of the toolbar menu. The section is populated with the converted toolbar menu items:

- Action schemas and toggle schemas are converted into push buttons.
- Container schemas are converted into drop-down buttons.

The toolbar menu is not automatically deleted during the conversion. To remove it, delete or comment out the corresponding `addCustomMenuFcn` call in the `sl_customization.m` file, save the file, and rebuild the toolstrip by entering `sl_refresh_customizations` in the MATLAB Command Window.

If a toolstrip component called `custom` already exists in the current folder, a prompt will appear in the Command Window asking you for permission to overwrite the component.

When the conversion is complete, the new tab can be edited like any other custom toolstrip tab. You can adjust the layout of the tab, its labels, and its functionality. See “Create Custom Simulink Toolstrip Tabs” for details.

`slConvertCustomMenus(Name=Value)` converts a custom Simulink toolbar menu into a toolstrip tab that is stored in a toolstrip component whose name and resource location can be specified by name-value arguments.

Permission to overwrite an existing toolstrip component of the same name and at the same location as the one that the conversion creates can be specified via name-value argument as well. If you do not specify this argument and such a component exists, a prompt will appear in the Command Window asking you for permission to overwrite the component.

Examples

Convert Toolbar Menu into Toolstrip Tab

Start with the custom Simulink toolbar menu defined by this `sl_customization.m` file.

```
function sl_customization( cm )
    cm.addCustomMenuFcn( 'Simulink:ToolsMenu', @toolsMenu );
end

%% Tool Menu customization
```

```
function schemas = toolsMenu()
    schemas = {
        @toolsMenu1, ...
        @toolsMenu2, ...
        @toolsMenu3
    };
end

function schema = toolsMenu1( cbinfo )
    schema = sl_action_schema;
    schema.tag = 'toolsMenu1';
    schema.label = 'Tools Menu 1';
    schema.callback = @toolsMenu1CB;
end

function schema = toolsMenu2( cbinfo )
    schema = sl_action_schema;
    schema.tag = 'toolsMenu2';
    schema.label = 'Tools Menu 2';
    schema.callback = @toolsMenu2CB;
end

function schema = toolsMenu3( cbinfo )
    schema = sl_container_schema;
    schema.tag = 'toolsMenu3';
    schema.label = 'Tools Menu 3';
    schema.childrenFcns = {
        @toolsMenu31, ...
        @toolsMenu32
    };
end

function schema = toolsMenu31( cbinfo )
    schema = sl_action_schema;
    schema.tag = 'toolsMenu31';
    schema.label = 'Tools Menu 31';
    schema.callback = @toolsMenu31CB;
end

function schema = toolsMenu32( cbinfo )
    schema = sl_action_schema;
    schema.tag = 'toolsMenu32';
    schema.label = 'Tools Menu 32';
    schema.callback = @toolsMenu32CB;
end

function toolsMenu1CB( cbinfo )
    disp( 'Executing toolsMenu1' );
end

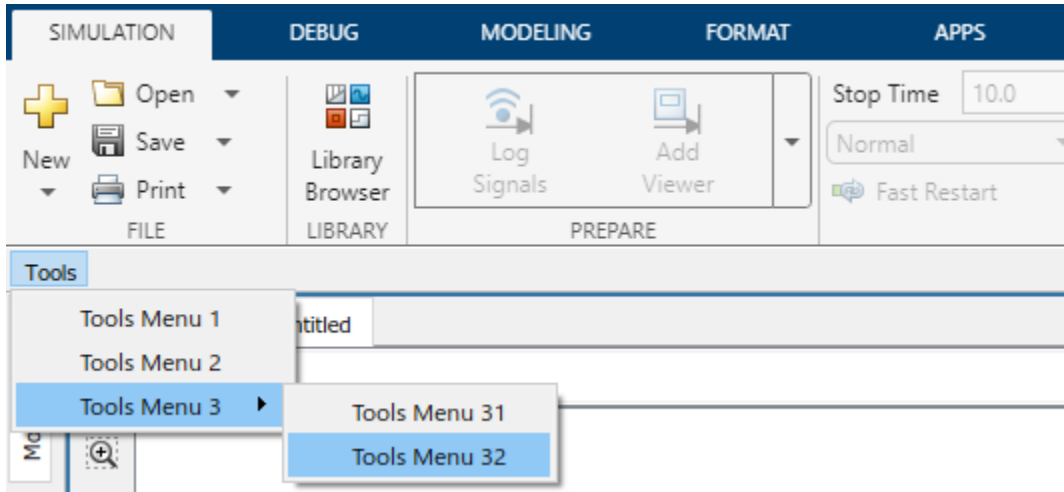

function toolsMenu2CB( cbinfo )
    disp( 'Executing toolsMenu2' );
end

function toolsMenu31CB( cbinfo )
    disp( 'Executing toolsMenu31' );
end
```

```
function toolsMenu32CB( cbinfo )
    disp( 'Executing toolsMenu32' );
end
```

To see the toolbar menu, open Simulink.

If this menu is converted in its current state, the conversion of its callback functions will fail because they are saved in the `sl_customization.m` file. To enable the conversion of the callback functions for Tools Menu 2 and Tools Menu 3, save them in separate function files: `toolsMenu2CB.m`, `toolsMenu31CB.m`, and `toolsMenu32CB.m`.

For comparison, leave the callback function for Tools Menu 1 in the `sl_customization.m` file.

Convert the toolbar menu into a toolstrip tab. In the Command Window, enter this:

```
slConvertCustomMenus;
```

Delete the custom toolbar menu by commenting out the `addCustomMenuFcn` call in the `sl_customization.m` file, and then saving the file.

```
function sl_customization( cm )
    %cm.addCustomMenuFcn( 'Simulink:ToolsMenu', @toolsMenu );
end
```

To see the results of the menu conversion, open a blank model in Simulink.

Rebuild the toolstrip by entering the `sl_refresh_customizations` command in the Command Window.

Open and view the **Custom** tab.

The tab has a single section titled **Tools** because that is the title of the top level of the toolbar menu from which the tab was created.

The action schemas `Tools Menu 1` and `Tools Menu 2` from the toolbar menu are converted into push buttons of the same names in the tab.

The container schema `Tools Menu 3` in the toolbar menu has a pop-up list, and is converted into a drop-down button.

Click on the `Tools Menu 1` push button. The diagnostic viewer shows an error message, stating that the callback of the `Tools Menu 1` action schema failed to convert. This is because the callback function of that schema is saved in the `sl_customization.m` file.

Click on the `Tools Menu 2`, `Tools Menu 31`, and `Tools Menu 32` buttons. The callbacks execute without error because the callback functions for these buttons are saved in separate function files.

Input Arguments

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose `Name` in quotes.

Example: `slConvertCustomMenus(CompName="Name", CompFolder="Folder")`

CompName — Name of toolstrip component

"custom" (default) | string | character vector

Name of toolstrip component, specified as a string or character vector.

Data Types: char | string

CompFolder — File path of toolstrip component

pwd (default) | string | character vector

File path of toolstrip component, specified as a string or character vector.

Data Types: char | string

Replace — Permission to overwrite

true or 1 | false or 0

Permission to overwrite an existing toolbar component of the same name and at the same location as the one that the conversion creates, specified as a numeric or logical 1 (`true`) or 0 (`false`).

Data Types: `logical`

Limitations

- When converting a custom toolbar menu into a toolbar tab, any functionality that custom tabs do not support is ignored. However, you can edit the generated tab. For more information, see “Create Custom Simulink Toolbar Tabs”.
- If a toolbar component with the name specified by `CompName` already exists in the `CompFolder` location at the time of conversion, a prompt will appear in the Command Window asking you for permission to overwrite the component. If a component of another name already exists in the `CompFolder` location, the menu cannot be converted.
- The conversion of a schema callback fails if its function handle points to a function local to the `sl_customization.m` file. Move all callback functions into separate function files.

Tips

To delete custom tab elements that are the result of a conversion, you can do one of the following:

- Call `slDestroyToolbarComponent`.
- Delete the resources folder located at `CompFolder` and call `slReloadToolbarConfig`.
- Delete the JSON files of the tab in the resources folder located at `CompFolder` and call `slReloadToolbarConfig`.

`slCreateToolbarTab` | `slDestroyToolbarComponent` | `sl_refresh_customizations`

Topics

“Add Items to Model Editor Menus”

“Create Custom Simulink Toolbar Tabs”

Introduced in R2022a

slCreateToolstripComponent

Create custom Simulink Toolstrip component

Syntax

```
slCreateToolstripComponent(component)  
slCreateToolstripComponent(component,Name=Value)
```

Description

`slCreateToolstripComponent(component)` creates a `resources` folder for a custom Simulink Toolstrip component in the current folder and adds the current folder to the MATLAB path.

`slCreateToolstripComponent(component,Name=Value)` sets properties using name-value arguments. For example, `slCreateToolstripComponent("custom",Location="B:\path\customtab")` creates the `resources` folder for a component named `custom` in the `B:\path\customtab` directory and adds `B:\path\customtab` to the MATLAB path.

Examples

Create Simulink Toolstrip Component

A Simulink Toolstrip component contains the definition for one or more custom tabs. Before you create a custom tab, you must create the component that will contain it.

To work with the Simulink Toolstrip, start Simulink. For example, in the MATLAB Command Window, enter:

```
start_simulink
```

Create a custom Simulink Toolstrip component by using the `slCreateToolstripComponent` function. For example, name the component `custom`.

```
slCreateToolstripComponent("custom");
```

This command creates a `resources` folder in your current folder and adds your current folder to the MATLAB path. The `resources` folder contains two folders and one JSON file.

- `icons` folder — Location of icons used by custom tab elements
- `json` folder — Location of JSON files that define custom tabs
- `sl_toolstrip_plugins.json` — JSON file that must not be edited

Create Temporary Simulink Toolstrip Component

By default, Simulink Toolstrip components persist across sessions. You can create a temporary Simulink Toolstrip component that persists only during the current session.

Create a temporary custom Simulink Toolstrip component by using the `slCreateToolstripComponent` function. For example, name the component `temp`.

```
slCreateToolstripComponent("temp",Persist=false);
```

This command creates a `resources` folder in your current folder and adds your current folder to the MATLAB path. The `resources` folder contains two folders and one JSON file.

- `icons` folder — Location of icons used by custom tab elements
- `json` folder — Location of JSON files that define custom tabs
- `sl_toolstrip_plugins.json` — JSON file that must not be edited

When you open a new MATLAB session, the `temp` component is not loaded.

Input Arguments

component — Component name

character vector | string scalar

Component name, specified as a character vector or string scalar.

The component name appears in the `sl_toolstrip_plugins.json` file as the value for the `Name` property. Do not edit this file.

Example: `slCreateToolstripComponent("custom")`

Data Types: `char` | `string`

Name-Value Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Example: `slCreateToolstripComponent("custom",Location="B:\path\customtab",Persist=false)`

Location — Storage location for component files

current folder (default) | character vector | string scalar

Storage location for component files, specified as a character vector or string scalar. The function adds the storage location to the MATLAB path.

By default, the function generates the component files in a `resources` folder in the current folder.

Example: `slCreateToolstripComponent("custom",Location="B:\path\customtab")`

Data Types: `char` | `string`

Persist — Option to load component for new MATLAB sessions

true or 1 (default) | false or 0

Option to load component for new MATLAB sessions, specified as a numeric or logical 1 (true) or 0 (false).

Example: `slCreateToolstripComponent("custom",Persist=false)`

Data Types: double | logical

Topics

“Create Custom Simulink Toolstrip Tabs”

“Add Prepopulated Custom Tab to Simulink Toolstrip”

Introduced in R2021b

slCreateToolstripTab

Create custom tab for Simulink Toolstrip

Syntax

```
slCreateToolstripTab(tab,component)
slCreateToolstripTab(tab,component,Name=Value)
```

Description

`slCreateToolstripTab(tab,component)` creates a blank custom tab in the specified Simulink Toolstrip component, opens the JSON file that defines the custom tab, and reloads the toolstrip configuration.

`slCreateToolstripTab(tab,component,Name=Value)` sets properties using name-value arguments. For example, `slCreateToolstripTab('toolsTab','custom',Title="Tools")` creates a **Tools** tab.

Examples

Create Untitled Custom Tab in Simulink Toolstrip

A Simulink Toolstrip component contains the definition for one or more custom tabs. Before you create a custom tab, you must create the component to contain it.

To work with the Simulink Toolstrip, start Simulink. For example, in the MATLAB Command Window, enter:

```
start_simulink
```

Create a custom Simulink Toolstrip component by using the `slCreateToolstripComponent` function. For example, name the component `custom`.

```
slCreateToolstripComponent("custom");
```

This command creates a `resources` folder in your current folder and adds your current folder to the MATLAB path. The `resources` folder contains two folders and one JSON file.

- `icons` folder — Location of icons used by custom tab elements
- `json` folder — Location of JSON files that define custom tabs
- `sl_toolstrip_plugins.json` — JSON file that must not be edited

Create an untitled custom tab with the `slCreateToolstripTab` function.

For example, create the tab `customTab` in the `custom` component.

```
slCreateToolstripTab("customTab","custom");
```

The function creates a JSON file in the `json` folder that contains information about the tab. For example:

```
{
  "version": "R2021b",
  "entries": [
    {
      "type": "Tab",
      "id": "customTab",
      "title": ""
    }
  ]
}
```

Open a model. For example, open the vdp model.

vdp

The Simulink Toolstrip displays a blank tab without a title.

Create Titled Custom Tab in Simulink Toolstrip

A Simulink Toolstrip component contains the definition for one or more custom tabs. Before you create a custom tab, you must create the component to contain it.

To work with the Simulink Toolstrip, start Simulink. For example, in the MATLAB Command Window, enter:

```
start_simulink
```

Create a custom Simulink Toolstrip component by using the `slCreateToolstripComponent` function. For example, name the component `custom`.

```
slCreateToolstripComponent("custom");
```

This command creates a `resources` folder in your current folder and adds your current folder to the MATLAB path. The `resources` folder contains two folders and one JSON file.

- `icons` folder — Location of icons used by custom tab elements
- `json` folder — Location of JSON files that define custom tabs
- `sl_toolstrip_plugins.json` — JSON file that must not be edited

Create a custom tab with the `slCreateToolstripTab` function.

For example, create the tab `customTab` in the `custom` component, and title the tab `CUSTOM TAB`.

```
slCreateToolstripTab("customTab","custom",Title="CUSTOM TAB");
```

The function creates a JSON file named `customTab.json` in the `json` folder that defines the tab.

Open a model. For example, open the vdp model.

vdp

The Simulink Toolstrip displays a blank tab titled CUSTOM TAB.

Input Arguments

tab — Tab ID

character vector | string scalar

Tab ID, specified as a character vector or string scalar.

The tab ID appears in the JSON file that defines the tab as the value for the `id` property in the JSON object where `"type": "Tab"`.

Data Types: `char` | `string`

component — Component name

character vector | string scalar

Component name, specified as a character vector or string scalar.

The component name appears in the `sl_toolstrip_plugins.json` file as the value for the `Name` property. Do not edit this file.

Data Types: `char` | `string`

Name-Value Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Example: `slCreateToolstripTab('customTab','custom',Title="Custom Tab")`

Title — Tab title

"" (default) | character vector | string scalar

Tab title, specified as a character vector or string scalar.

Tab titles use all uppercase letters even when you specify a title with lowercase letters.

The tab title appears in the JSON file that defines the tab as the value for the `title` property of the JSON object where `"type": "Tab"`.

Data Types: `char` | `string`

FileName — Name of file that defines tab

`<tabname>.json` (default) | character vector | string scalar

Name of file that defines the tab, specified as a character vector or string scalar.

Data Types: `char` | `string`

`slCreateToolstripComponent` | `slToolstripDeveloperMode` | `slReloadToolstripConfig`

Topics

“Create Custom Simulink Toolstrip Tabs”

“Add Prepopulated Custom Tab to Simulink Toolstrip”

Introduced in R2021b

sldebug

Start simulation in debug mode

Syntax

```
sldebug('sys')
```

Description

`sldebug('sys')` starts a simulation in debug mode. See “Debugger Command-Line Interface” for information about using the debugger.

Examples

The following command:

```
sldebug('vdp')
```

loads the Simulink example model `vdp` into memory and starts the simulation in debug mode. Alternatively, you can achieve the same result by using the `sim` command:

```
sim('vdp', 'debug', 'on')
```

See Also

`sim`

Introduced in R2006a

slDestroyToolstripComponent

Destroy Simulink Toolstrip component

Syntax

```
slDestroyToolstripComponent(component)  
slDestroyToolstripComponent(component,RemoveFromPath)
```

Description

`slDestroyToolstripComponent(component)` destroys the specified Simulink Toolstrip component, removes the component directory from the MATLAB path, and deletes the resource subdirectory that the component directory contains.

`slDestroyToolstripComponent(component,RemoveFromPath)` destroys the specified Simulink Toolstrip component and deletes the resource subdirectory that the component directory contains. When `RemoveFromPath` is set to `true`, the command also removes the component directory from the MATLAB path. When `RemoveFromPath` is set to `false`, the command does not remove the component directory from the MATLAB path.

Examples

Delete Custom Simulink Toolstrip Component

Suppose you have a Simulink Toolstrip component that you no longer need named `custom`.

Delete the component named `custom`. In the MATLAB Command Window, enter:

```
slDestroyToolstripComponent("custom")
```

Input Arguments

component — Component name

character vector | string scalar

Component name, specified as a character vector or string scalar.

The component name appears in the `sl_toolstrip_plugins.json` file as the value for the "Name" property. Do not edit this file.

Example: `slDestroyToolstripComponent("custom")`

Data Types: `char` | `string`

RemoveFromPath — Option to remove component resource directory from path

`true` or `1` (default) | `false` or `0`

Option to remove component resource directory from path, specified as a numeric or logical 1 (`true`) or 0 (`false`).

Example: `slDestroyToolstripComponent("custom",RemoveFromPath=false)`

Data Types: `logical`

Introduced in R2021b

sldiagnostics

Display diagnostic information about Simulink system

Syntax

```
sldiagnostics('sys')
[txtRpt, sRpt] = sldiagnostics('sys')
[txtRpt, sRpt] = sldiagnostics('sys', options)
[txtRpt, sRpt] = sldiagnostics('sys', 'CompileStats')
[txtRpt, sRpt] = sldiagnostics('sys', 'RTWBuildStats')
```

Description

`sldiagnostics('sys')` displays the following diagnostic information associated with the model or subsystem specified by `sys`:

- Number of each type of block
- Number of each type of Stateflow object
- Number of states, outputs, inputs, and sample times of the root model.
- Names of libraries referenced and instances of the referenced blocks
- Time and additional memory used for each compilation phase of the root model

If the model specified by `sys` is not loaded, then `sldiagnostics` loads the model before performing the analysis.

The command `sldiagnostics('sys', options)` displays only the diagnostic information associated with the specific operations listed as `options` character vectors. The table below summarizes the options available and their corresponding valid input and output.

With `sldiagnostics`, you can input the name of a model or the path to a subsystem. For some analysis options, `sldiagnostics` can analyze only a root model. If you provide an incompatible input for one of these analyses, then `sldiagnostics` issues a warning. Finally, if you input a Simulink Library, then `sldiagnostics` cannot perform options that require a model compilation (**Update Diagram**). Instead, `sldiagnostics` issues a warning.

During the analysis, `sldiagnostics` will follow library links but will not follow or analyze Model References. See `find_mdhrefs` for more information on finding all Model blocks and referenced models in a specified model.

Option	Valid Inputs	Output
CountBlocks	root model, library, or subsystem	Lists all unique blocks in the system and the number of occurrences of each. This includes blocks that are nested in masked subsystems or hidden blocks.
CountSF	root model, library, or subsystem	Lists all unique Stateflow objects in the system and the number of occurrences of each.

Option	Valid Inputs	Output
Sizes	root model	Lists the number of states, outputs, inputs, and sample times, as well as a flag indicating direct feedthrough, used in the root model.
Libs	root model, library, or subsystem	Lists all unique libraries referenced in the root model, as well as the names and numbers of the library blocks.
CompileStats	root model	Lists the time and additional memory used for each compilation phase of the root model. This information helps users troubleshoot model compilation speed and memory issues.
RTWBuildStats	root model	Lists the same information as the <code>CompileStats</code> diagnostic. When issued with the second output argument <code>sRpt</code> , it captures the same statistics included in <code>CompileStats</code> and also the Simulink Coder build statistics. You must explicitly specify this option, because it is not part of the default analysis.
All	not applicable	Performs all diagnostics.

Note Running the `CompileStats` diagnostic before simulating a model for the first time will show greater memory usage. However, subsequent runs of the `CompileStats` diagnostic on the model will require less memory usage.

`[txtRpt, sRpt] = sldiagnostics('sys')` returns the diagnostic information as a textual report `txtRpt` and a structure array `sRpt`, which contains the following fields that correspond to the diagnostic options:

- `blocks`
- `stateflow`
- `sizes`
- `links`
- `compilestats`

`[txtRpt, sRpt] = sldiagnostics('sys', options)` returns only the specified options. If your chosen options specify just one type of analysis, then `sRpt` contains the results of only that analysis.

`[txtRpt, sRpt] = sldiagnostics('sys', 'CompileStats')` returns information on time and memory usage in `txtRpt` and `sRpt`.

`[txtRpt, sRpt] = sldiagnostics('sys', 'RTWBuildStats')` includes Simulink Coder build statistics in addition to the information reported for `CompileStats` in the `sRpt` output.

- `txtRpt` contains the formatted textual output of time spent in each of the phases in Simulink and Simulink Coder (if you specified `RTWBuildStats`), for example:

```

Compile Statistics For: rtwdemo_counter
  Cstat1: 0.00 seconds Model compilation pre-start
  Cstat2: 0.00 seconds Stateflow compile pre-start notification
  Cstat3: 0.10 seconds Post pre-comp-start engine event
  Cstat4: 10.00 seconds Stateflow compile start notification
  Cstat5: 0.00 seconds Model compilation startup completed

```

- `sRpt` is a MATLAB structure containing time and memory usage for each of the phases, for example:

```

sRpt =
Model:      'myModel1'
Statistics:  [1x134 struct]

```

The size of the `sRpt.Statistics` array indicates the number of compile and build phases executed during the operation. Examine the Statistics fields:

```

sRpt.Statistics(1) =
Description:      'Phase1'
CPUTime:         7.2490
WallClockTime    4.0092
ProcessMemUsage: 26.2148
ProcessMemUsagePeak: 28.6680
ProcessVMSize:   15.9531

```

`CPUTime` and `WallClockTime` show the elapsed time for the phase in seconds. `ProcessMemUsage`, `ProcessMemUsagePeak` and `ProcessVMSize` show the memory consumption during execution of the phase in MB.

Examine these key metrics to understand the performance:

- `WallClockTime`—The real-time elapsed in each phase in seconds. Sum the `WallClockTime` in each phase to get the total time taken to perform the operation:

```
ElapsedTime = sum([statRpt.Statistics(:).WallClockTime]);
```

- `ProcessMemUsage`—The amount of memory consumed in each phase. Sum the `ProcessMemUsage` across all the phases to get the memory consumption during the entire operation:

```
TotalMemory = sum([statRpt.Statistics(:).ProcessMemUsage]);
```

- `ProcessMemUsagePeak`—The maximum amount of allocated memory in each phase. Get the maximum of this metric across all the phases to find the peak memory allocation during the operation:

```
PeakMemory = max([statRpt.Statistics(:).ProcessMemUsagePeak]);
```

Note Memory statistics are available only on the Microsoft Windows platform.

Examples

The following command counts and lists each type of block used in the `sldemo_bounce` model that comes with Simulink software.

```
sldiagnostics('sldemo_bounce', 'CountBlocks')
```

The following command counts and lists both the unique blocks and Stateflow objects used in the `sf_boiler` model that comes with Stateflow software; the textual report returned is captured as `myReport`.

```
myReport = sldiagnostics('sf_boiler', 'CountBlocks', 'CountSF')
```

The following commands open the `f14` model that comes with Simulink software, and counts the number of blocks used in the `Controller` subsystem.

```
sldiagnostics('f14/Controller', 'CountBlocks')
```

The following command runs the `Sizes` and `CompileStats` diagnostics on the `f14` model, capturing the results as both a textual report and structure array.

```
[txtRpt, sRpt] = sldiagnostics('f14', 'Sizes', 'CompileStats')
```

`find_system` | `get_param`

Introduced in R2006a

sldiagviewer.createStage

Create a stage to display diagnostic messages

Syntax

```
myStage = sldiagviewer.createStage(StageName)
myStage = sldiagviewer.createStage(__, 'modelName', Value)
```

Description

`myStage = sldiagviewer.createStage(StageName)` creates a stage with the given stage name in the model specified. In the Diagnostic Viewer, errors, warnings, and information messages are displayed in groups based on the operation, such as model load, simulation, and build. These groups are called stages. When you create a stage object, Simulink initializes the stage. When you close the stage object, Simulink ends the stage. If you delete a parent stage object, the corresponding parent and its child stage close in the Diagnostic Viewer.

`myStage = sldiagviewer.createStage(__, 'modelName', Value)` is a required name-value pair that specifies the model in which the diagnostics is run.

Examples

Create Stage and Display Diagnostic Messages

Use the `createStage` function to create a stage to display diagnostic messages in the Diagnostic Viewer.

```
% Create a stage to display all the messages
```

```
myStage = sldiagviewer.createStage('Analysis', 'modelName', 'vdp');
```

```
myStage =
    Stage with no properties.
```

Input Arguments

StageName — Name of stage

character vector

Name of the stage, specified as a character vector.

Example: 'Analysis'

Data Types: `string`

Value — Name of model

character vector

Name of model, specified as a comma-separated pair consisting of 'ModelName' and a character vector or string.

Example: 'vdp'

Output Arguments

myStage — Handle to created stage

stage object

Handle to the created stage, returned as a stage object.

[“Report Diagnostic Messages Programmatically”](#)

Introduced in R2014a

sldiagviewer.diary

Log simulation warnings and errors and build information to file

Syntax

```
sldiagviewer.diary
sldiagviewer.diary(filename)
sldiagviewer.diary(toggle)
sldiagviewer.diary(filename, 'UTF-8')
```

Description

`sldiagviewer.diary` intercepts build information, warnings, and errors transmitted to the Diagnostic Viewer and logs them to a text file `diary.txt` in the current folder.

`sldiagviewer.diary(filename)` toggles the logging state of the text file specified by `filename`.

`sldiagviewer.diary(toggle)` turns logging to the log file on or off. The setting applies to the last file name you specified for logging or to `diary.txt` if you did not specify a file name.

`sldiagviewer.diary(filename, 'UTF-8')` specifies the character encoding for the log file `filename`.

Examples

Log Build Information and Simulation Warnings and Errors

Start logging build information and simulation warnings and errors to `diary.txt`.

```
sldiagviewer.diary
open_system('vdp')
slbuild('vdp')
```

Open `diary.txt` to view logs.

```
### Starting build procedure for model: vdp
### Build procedure for model: 'vdp' aborted due to an error.
...
```

Log to Specific File

Set up logging to a file.

```
sldiagviewer.diary('C:\MyLogs\log1.txt')
```

Toggle File Logging State

Switch the logging state of a file.

```
sdiagviewer.diary('C:\MyLogs\log1.txt') % Start logging
open_system('vdp')
slbuild('vdp')

sdiagviewer.diary('off') % Switch off logging

openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')
open_system('sldemo_fuelsys')
slbuild('sldemo_fuelsys')

sdiagviewer.diary('on') % Resume logging
```

Specify Log File Name and Character Encoding

Set the file name to log to and the character encoding to use.

```
sdiagviewer.diary('C:\MyLogs\log1.txt','UTF-8')
```

Input Arguments

toggle — Logging state

'off' | 'on'

Logging state, specified as 'on' or 'off'.

Example: `sdiagviewer.diary('on')`

filename — Name of file to log data to

character vector

Name of file to log data to, specified as a character vector.

Example: `sdiagviewer.diary('C:\Simulations\mySimulationDiary.txt')`

“Customize Diagnostic Messages”

Introduced in R2014a

sldiagviewer.reportError

Report error messages in Diagnostic Viewer

Syntax

```
output = sldiagviewer.reportError(Message)
myStage = sldiagviewer.reportError(__, 'Component', Value)
```

Description

`output = sldiagviewer.reportError(Message)` reports the message as an error.

`myStage = sldiagviewer.reportError(__, 'Component', Value)` specifies the name of the component. For example, Stateflow or Model Advisor.

Examples

Report an Error Message

Create a stage and use the `reportError` function to report an error message in the Diagnostic Viewer for the specified model.

```
vdp

% Create a stage
my_stage = sldiagviewer.createStage('StageName', 'ModelName', 'vdp');
%% write some code inside try, which will throw an error
try
    i = p;
catch error
end
sldiagviewer.reportError(error);

output =
    logical
         1
```

The diagnostic window opens up for the model vdp. It shows the StageName and the error message

Input Arguments

Message — Message to be displayed

MSLException object | MException object | string

This message is displayed as an error in the Diagnostic Viewer.

Example: 'This is a custom error message.'

Value — Component name

character vector | string

The name of the component specified as the comma-separated pair consisting of 'Component' and a character vector or string.

Example: Stateflow

Output Arguments

output — shows the success or failure of the operation

logical

Shows whether the message was displayed successfully.

Introduced in R2014a

sldiagviewer.reportInfo

Report information messages in Diagnostic Viewer

Syntax

```
output = sldiagviewer.reportInfo(Message)
myStage = sldiagviewer.reportInfo(__, 'Component' Value)
```

Description

`output = sldiagviewer.reportInfo(Message)` reports the message as information.

`myStage = sldiagviewer.reportInfo(__, 'Component' Value)` specifies the name of the component.

Examples

Report an Information Message

Create a stage and use the `reportInfo` function to report a message as information in the Diagnostic Viewer for the specified model.

```
% Create a Stage to display all the messages
```

```
my_stage = sldiagviewer.createStage('Analysis', 'ModelName', 'vdp');
```

```
% Report a custom info message to Diagnostic Viewer
```

```
sldiagviewer.reportInfo('Information message.', 'Component', 'Stateflow');
```

```
output =
    logical
         1
```

Input Arguments

Message — Message to be displayed

MSLException object | MException object | string

This message is displayed in the Diagnostic Viewer as an information.

Example: 'This is a custom information message.'

Value — Component name

character vector | string

The name of the component specified as the comma-separated pair consisting of 'Component' and a character vector or string.

Example: Stateflow

Output Arguments

output — shows the success or failure of the operation
logical

Shows whether the message was displayed successfully.

sldiagviewer.reportWarning

Report warning messages in Diagnostic Viewer

Syntax

```
output = sldiagviewer.reportWarning(Message)
myStage = sldiagviewer.reportWarning(__, 'Component', Value)
```

Description

`output = sldiagviewer.reportWarning(Message)` reports a message as warning in the diagnostic Viewer.

`myStage = sldiagviewer.reportWarning(__, 'Component', Value)` specifies the name of the component. For example, Model Advisor or Stateflow.

Examples

Report a Warning in Diagnostic Viewer

Create a stage and use the `reportWarning` function to report a warning message in the Diagnostic Viewer for the specified model.

```
vdp

% Create a stage
my_stage = sldiagviewer.createStage('StageName', 'ModelName', 'vdp');
%% write some code inside try, which will throw an error
try
    i = p;
catch error
end
sldiagviewer.reportWarning(error);

output =
    logical
         1
```

The diagnostic window opens up for the model `vdp`. It shows the `StageName` and the warning message in yellow.

Input Arguments

Message — Message to display

MSLException object | MException object | string

This message is displayed as a warning in the Diagnostic Viewer.

Example: 'This is a custom warning message.'

Value — Component name

character vector | string

The name of the component specified as the comma-separated pair consisting of 'Component' and a character vector or string.

Example: Stateflow

Output Arguments

output — shows the success or failure of the operation

logical

Shows whether the message was displayed successfully.

sldiagviewer.reportSimulationMetadataDiagnostics

Display errors and warnings in `Simulink.SimulationOutput` in Diagnostic Viewer

Syntax

```
sldiagviewer.reportSimulationMetadataDiagnostics(simOut)
```

Description

`sldiagviewer.reportSimulationMetadataDiagnostics(simOut)` displays errors and warnings saved in the `Simulink.SimulationOutput` object `simOut` in the Diagnostic Viewer.

Examples

Display Errors and Warnings in Diagnostic Viewer

Simulate a model and assign the output to the `Simulink.SimulationOutput` object in `simOut`. Then, use the `reportSimulationMetadataDiagnostics` function to display errors and warnings in the Diagnostic Viewer.

Create a single `SimulationInput` object for the model.

```
vdp
set_param('vdp/Mu', 'Gain', 'z')
delete_line('vdp', 'Product/1', 'Mu/1');
model = 'vdp';
in = Simulink.SimulationInput(model);
```

Create an array of `SimulationInput` objects by using the `for` loop.

```
in(1:5) = in;
```

Simulate all the `SimulationInput` objects in the array to output the indices of the models with errors or warnings. The output is returned in a single `Simulink.SimulationOutput` object.

```
simOut = sim(in);
sldiagviewer.reportSimulationMetadataDiagnostics(simOut(1));
```

Open the Diagnostic Viewer to show errors and warnings in the `Simulink.SimulationOutput` object with the results from the first simulation.

```
sldiagviewer.reportSimulationMetadataDiagnostics(simOut(1));
```

Input Arguments

simOut — Simulation output that contains errors and warnings

`Simulink.SimulationOutput` object

Simulation output that contains errors and warnings, specified as a `Simulink.SimulationOutput` object.

See Also

`Simulink.SimulationOutput`

Introduced in R2020b

sldiscmdl

Discretize model that contains continuous blocks

Syntax

```
sldiscmdl('model_name',sample_time)
sldiscmdl('model_name',sample_time,method)
sldiscmdl('model_name',sample_time,options)
sldiscmdl('model_name',sample_time,method,freq)
sldiscmdl('model_name',sample_time,method,options)
sldiscmdl('model_name',sample_time,method,freq,options)
[old_blks,new_blks] = sldiscmdl('model_name',sample_time,method,freq,options)
```

Description

`sldiscmdl('model_name',sample_time)` discretizes the model named '*model_name*' using the specified *sample_time*. The model does not need to be open, and the units for *sample_time* are simulation seconds.

`sldiscmdl('model_name',sample_time,method)` discretizes the model using *sample_time* and the transform method specified by *method*.

`sldiscmdl('model_name',sample_time,options)` discretizes the model using *sample_time* and criteria specified by the *options* cell array. This array consists of four elements: {*target*, *replace_with*, *put_into*, *prompt*}.

`sldiscmdl('model_name',sample_time,method,freq)` discretizes the model using *sample_time*, *method*, and the critical frequency specified by *freq*. The units for *freq* are Hz. When you specify *freq*, *method* must be 'prewarp'.

`sldiscmdl('model_name',sample_time,method,options)` discretizes the model using *sample_time*, *method*, and *options*.

`sldiscmdl('model_name',sample_time,method,freq,options)` discretizes the model using *sample_time*, *method*, *freq*, and *options*. When you specify *freq*, *method* must be 'prewarp'.

`[old_blks,new_blks] = sldiscmdl('model_name',sample_time,method,freq,options)` discretizes the model using *sample_time*, *method*, *freq*, and *options*. When you specify *freq*, *method* must be 'prewarp'. The function also returns two cell arrays that contain full path names of the original, continuous blocks and the new, discretized blocks.

Input Arguments

model_name

Name of the model to discretize.

sample_time

Sample-time specification for the model:

Scalar value	Sample time with zero offset, such as 1
Two-element vector	Sample time with nonzero offset, such as [1 0.1]

method

Method of converting blocks from continuous to discrete mode:

'zoh' (default)	Zero-order hold on the inputs
'foh'	First-order hold on the inputs
'tustin'	Bilinear (Tustin) approximation
'prewarp'	Tustin approximation with frequency prewarping
'matched'	Matched pole-zero method

For single-input, single-output (SISO) systems only

freq

Critical frequency in Hz. This input applies only when the *method* input is 'prewarp'.

options

Cell array {*target*, *replace_with*, *put_into*, *prompt*}, where each element can take the following values:

<i>target</i>	'all' (default)	Discretize all continuous blocks
	'selected'	Discretize only selected blocks in the model
	'full_blk_path'	Discretize specified block
<i>replace_with</i>	'parammask' (default)	Create discrete blocks whose parameters derive from the corresponding continuous blocks
	'hardcoded'	Create discrete blocks with hard-coded parameters placed directly into each block dialog box
<i>put_into</i>	'copy' (default)	Create discretization in a copy of the original model
	'variant'	Create discretization candidate in a variant subsystem
	'current'	Apply discretization to the current model
	'untitled'	Create discretization in a new untitled window
<i>prompt</i>	'on' (default)	Show discretization information at the command prompt
	'off'	Do not show discretization information at the command prompt

Examples

Discretize all continuous blocks in the `slexAircraftExample` model using a 1-second sample time:

```
openExample('slexAircraftExample');
sldiscmdl('slexAircraftExample',1);
```

Discretize the `Aircraft Dynamics Model` subsystem in the `slexAircraftExample` model using a 1-second sample time, a 0.1-second offset, and a first-order hold transform method:

```
sldiscmdl('slexAircraftExample',[1 0.1],'foh',...
{'slexAircraftExample/Aircraft Dynamics Model',...
'parammask','copy','on'});
```

Discretize the `Aircraft Dynamics Model` subsystem in the `slexAircraftExample` model and retrieve the full path name of the second discretized block:

```
[old_blks,new_blks] = sldiscmdl('slexAircraftExample',[1 0.1],...
'foh',{'slexAircraftExample/Aircraft Dynamics Model','parammask',...
'copy','on'});
% Get full path name of the second discretized block
new_blks{2}
```

Discretize all continuous blocks in the `slexAircraftExample` model using a 1-second sample time:

```
openExample('slexAircraftExample');
[old_blk,new_blk] = sldiscmdl('f14',1,'zoh',...
{'f14/Aircraft Dynamics Model',...
'parammask','variant','on'})
```

--discretizing 'f14/Aircraft Dynamics Model' and putting results into a variant subsystem

```
old_blk =

    1x1 cell array

    {'f14/Aircraft Dynamics Model'}

new_blk =

    1x1 cell array

    {'f14/Aircraft↔Dynamics↔Model'}
```

slEditToolstripAction

Open file that defines custom Simulink Toolstrip action

Syntax

```
slEditToolstripAction(action)
```

Description

`slEditToolstripAction(action)` opens the file that defines the specified custom toolstrip action.

Examples

Edit Custom Toolstrip Action

Suppose you have many JSON files that define actions for a custom tab in a toolstrip component named `custom`.

To open the file that defines a custom action, such as `myAction`, use the `slEditToolstripAction` function.

```
slEditToolstripAction("custom:myAction")
```

Input Arguments

action — Fully qualified action name

character vector | string scalar

Fully qualified action name, specified as a character vector or string scalar. The fully qualified name is the name of the toolstrip component followed by a colon and the full path to the action within the toolstrip component.

When an action is defined at the top level of a toolstrip component, the fully qualified action name consists of these parts:

- 1 Name of the toolstrip component followed by a colon
- 2 Action ID

When an action is defined in the JSON object for a control, the action does not use an action ID. The fully qualified action name consists of these parts:

- 1 Name of the toolstrip component followed by a colon
- 2 Tab ID followed by a forward slash
- 3 Section ID or index followed by a forward slash
- 4 Column ID or index followed by a forward slash

5 Control ID or index

Example: `slEditToolstripAction("custom:myAction")` opens the file that defines `myAction` for the custom toolstrip component.

Example: `slEditToolstripAction("custom:customTab/2/1/3")` opens the file that defines the action for the third control in the first column of the second section on the tab named `customTab` in the custom toolstrip component.

Data Types: `char` | `string`

Introduced in R2021b

slEditToolstripCommand

Open file that defines custom Simulink Toolstrip command

Syntax

```
slEditToolstripCommand(action)
```

Description

`slEditToolstripCommand(action)` opens the file that defines the custom Simulink Toolstrip command.

For scripts, the file that defines the action also defines the command. When you set `commandType` to `Script`, the `command` property directly specifies the script. When you set the `command` property to the name of a script on the MATLAB path, the function opens the JSON file, not the referenced MATLAB script.

Examples

Edit Custom Toolstrip Command

Suppose you have many files that define commands for a custom tab in a toolstrip component named `custom`.

To open the file that defines a command for an action, such as `myAction`, use the `slEditToolstripCommand` function.

```
slEditToolstripCommand("custom:myAction");
```

Input Arguments

action — Fully qualified action name

character vector | string scalar

Fully qualified action name, specified as a character vector or string scalar. The fully qualified name is the name of the toolstrip component followed by a colon and the full path to the action within the toolstrip component.

When an action is defined at the top level of a toolstrip component, the fully qualified action name consists of these parts:

- 1 Name of the toolstrip component followed by a colon
- 2 Action ID

When an action is defined in the JSON object for a control, the action does not use an action ID. The fully qualified action name consists of these parts:

- 1 Name of the toolstrip component followed by a colon

- 2 Tab ID followed by a forward slash
- 3 Section ID or index followed by a forward slash
- 4 Column ID or index followed by a forward slash
- 5 Control ID or index

Example: `slEditToolstripCommand("custom:myAction")` opens the file that defines `myAction` for the custom toolstrip component.

Example: `slEditToolstripCommand("custom:customTab/2/1/3")` opens the file that defines the command for the third control in the first column of the second section on the tab named `customTab` in the custom toolstrip component.

Data Types: `char` | `string`

slEditToolstripIcon

Open file that defines custom Simulink Toolstrip icon

Syntax

```
slEditToolstripIcon(icon)
```

Description

slEditToolstripIcon(icon) opens the file that defines the specified custom toolstrip icon.

Examples

Edit Custom Toolstrip Icon

Suppose you have many JSON files that define icons for a custom tab in a toolstrip component named `custom`.

To open the file that defines a custom icon, such as `myIcon`, use the `slEditToolstripIcon` function.

```
slEditToolstripIcon("custom:myIcon");
```

Input Arguments

icon — Fully qualified icon name

character vector | string scalar

Fully qualified icon name, specified as a character vector or string scalar. The fully qualified name is the name of the toolstrip component followed by a colon and the full path to the icon within the toolstrip component.

When an icon is defined at the top level of a toolstrip component, the fully qualified icon name consists of these parts:

- 1 Name of the toolstrip component followed by a colon
- 2 Icon ID

When an icon is defined in the JSON object for a top-level action, the fully qualified icon name consists of these parts:

- 1 Name of the toolstrip component followed by a colon
- 2 Action ID

When an icon is defined in the JSON object for a nested action, the fully qualified icon name consists of these parts:

- 1 Name of the toolstrip component followed by a colon

- 2** Tab ID followed by a forward slash
- 3** Section ID or index followed by a forward slash
- 4** Column ID or index followed by a forward slash
- 5** Control ID or index

Example: `slEditToolstripIcon("custom:myIcon")` opens the file that defines `myIcon` for the `custom` toolstrip component.

Example: `slEditToolstripIcon("custom:customTab/2/1/3")` opens the file that defines the icon for the third control in the first column of the second section on the tab named `customTab` in the `custom` toolstrip component.

Data Types: `char` | `string`

Topics

“Create Custom Simulink Toolstrip Tabs”

“Add Prepopulated Custom Tab to Simulink Toolstrip”

Introduced in R2021b

sLEditToolstripWidget

Open file that defines custom Simulink Toolstrip tab, section, column, or control

Syntax

```
sLEditToolstripWidget(widget)
```

Description

`sLEditToolstripWidget(widget)` opens the file that defines the specified custom toolstrip widget, which can be a custom tab, section, column, or control.

Examples

Edit Custom Toolstrip Widget

Suppose you have multiple JSON files that define custom tabs in a toolstrip component named `custom`.

To open the file that defines a custom tab named `customTab`, use the `sLEditToolstripWidget` function.

```
sLEditToolstripWidget("custom:customTab")
```

Input Arguments

widget — Fully qualified widget name

character vector | string scalar

Fully qualified widget name, specified as a character vector or string scalar. The fully qualified name is the name of the toolstrip component followed by a colon and the full path to the widget within the toolstrip component. When the widget has a parent JSON object, the fully qualified name includes the ID or index of each JSON object above the widget.

Example: `sLEditToolstripWidget("custom:customTab")` opens the file that defines the tab named `customTab` in the `custom` toolstrip component.

Example: `sLEditToolstripWidget("custom:customTab/2")` opens the file that defines the second section on the tab named `customTab` in the `custom` toolstrip component.

Example: `sLEditToolstripWidget("custom:customTab/2/1")` opens the file that defines the first column of the second section on the tab named `customTab` in the `custom` toolstrip component.

Example: `sLEditToolstripWidget("custom:customTab/2/1/3")` opens the file that defines the third control in the first column of the second section on the tab named `customTab` in the `custom` toolstrip component.

Data Types: char | string

slExportFavoriteCommands

Export favorite commands from Simulink quick access toolbar

Syntax

```
slExportFavoriteCommands(file)
```

Description

`slExportFavoriteCommands(file)` exports the contents of the Simulink **Favorite Commands** gallery to the specified file.

Examples

Export Simulink Favorite Commands

Suppose you create a set of favorite commands in the Simulink **Favorite Commands** gallery that you want to share with team members. You can export the contents of your Simulink **Favorite Commands** gallery to a file.

For example, export the gallery contents to a file named `slFavorites.mat` in the `B:\path\` directory.

In the MATLAB Command Window, enter:

```
slExportFavoriteCommands('B:\path\slFavorites.mat');
```

Input Arguments

file — File name or path

character vector | string scalar

File name or path, including a `.mat` file extension, specified as a character vector or string scalar.

Example: `slExportFavoriteCommands('B:\path\slFavorites.mat')`

Data Types: `char` | `string`

See Also

`slImportFavoriteCommands` | `slResetFavoriteCommands`

Topics

“Access Frequently Used Features and Commands in Simulink”

Introduced in R2021b

slexpr

Generate expression to use in value of parameter object

Syntax

```
expressionOut = slexpr(expressionIn)
```

Description

`expressionOut = slexpr(expressionIn)` converts the MATLAB-syntax expression `expressionIn` to an object, `expressionOut`, that you can use to set the `Value` property of a parameter object (such as `Simulink.Parameter`). When you use multiple parameter objects to set block parameter values, you can use the expression to model mathematical relationships between the objects. For more information, see “Set Variable Value by Using a Mathematical Expression”.

Examples

Model Relationship Between Mass, Length, and Moment of Inertia of Metronome

In the base workspace, create three `Simulink.Parameter` objects that represent the mass, length, and moment of inertia of a pointlike metronome.

```
m = Simulink.Parameter;  
r = Simulink.Parameter;  
J = Simulink.Parameter;
```

Set the mass to 0.1 kg and the length to 1.0 m.

```
m.Value = 0.1;  
r.Value = 1.0;
```

Set the value of the moment of inertia to the mass times the square of the length.

```
J.Value = slexpr('m*r^2');
```

Simulink preserves the expression, $m*r^2$. If you change the value of the mass or the length, Simulink recalculates the value of the moment of inertia.

Input Arguments

expressionIn — Target expression

string | character vector

Target expression, specified as a string or character vector.

Example: "myParam + myOtherParam"

Data Types: char | string

Output Arguments

expressionOut — Simulink representation of expression

`Simulink.data.Expression` object

Simulink representation of the target expression, returned as a `Simulink.data.Expression` object. A `Simulink.data.Expression` object has no use outside the `Value` property of a parameter object.

slImportFavoriteCommands

Import favorite commands to Simulink quick access toolbar

Syntax

```
backup = slImportFavoriteCommands(file)
backup = slImportFavoriteCommands(file,'overwrite')
```

Description

`backup = slImportFavoriteCommands(file)` imports favorite commands and categories from the specified file to the Simulink **Favorite Commands** gallery.

`backup = slImportFavoriteCommands(file,'overwrite')` overwrites the contents of the Simulink **Favorite Commands** gallery with the contents of the specified file.

Examples

Import Simulink Favorite Commands

Suppose a team member shares a file that contains favorite commands you want to use in Simulink, and you want to merge the file contents with the contents of your Simulink **Favorite Commands** gallery.

In the MATLAB Command Window, enter:

```
slImportFavoriteCommands('B:\path\slFavorites.mat');
```

Overwrite Simulink Favorite Commands

Suppose a team member shares a file that contains favorite commands you want to use in Simulink, and you want to overwrite the contents of your Simulink **Favorite Commands** gallery with the file contents.

In the MATLAB Command Window, enter:

```
slImportFavoriteCommands('B:\path\slFavorites.mat','overwrite');
```

Input Arguments

file — File name or path

character vector | string scalar

File name or path, including a `.mat` file extension, specified as a character vector or string scalar.

Example: `slImportFavoriteCommands('B:\path\slFavorites.mat')`

Data Types: `char` | `string`

Output Arguments

backup — Backup of previous state

character vector

Backup of previous state, returned as a character vector.

To restore the previous state, you can pass the returned value as the input to the function and overwrite the current state.

slIsFileChangedOnDisk

Determine whether model has changed since it was loaded

Syntax

```
tf = slIsFileChangedOnDisk(sys)
```

Description

`tf = slIsFileChangedOnDisk(sys)` returns whether the file that contains block diagram `sys` has changed on disk since the block diagram was loaded.

Examples

Return Error When File Has Changed

To ensure that code is not generated for a model whose file has changed on disk since it was loaded, include the following in the 'entry' section of the `STF_make_rtw_hook.m` file.

```
if (slIsFileChangedOnDisk(sys))  
    error('File has changed on disk since it was loaded. Aborting code generation.');
```

For more information, see “Customize Build Process with STF_make_rtw_hook File” (Simulink Coder).

Input Arguments

sys — System name

character vector | string scalar

System name, specified as a character vector or string scalar.

Data Types: `char` | `string`

Output Arguments

tf — True or false result

1 | 0

True or false result, returned as a 1 or 0 of data type `logical`.

- 1 (`true`) — File that contains block diagram `sys` has changed on disk since the block diagram was loaded.
- 0 (`false`) — File that contains block diagram `sys` has not changed on disk since the block diagram was loaded.

“Model File Change Notification”

Introduced in R2007b

sLibraryBrowser

Open Simulink Library Browser

Syntax

```
sLibraryBrowser  
sLibraryBrowser('open')  
sLibraryBrowser('noshow')  
libraryhandle = sLibraryBrowser  
sLibraryBrowser('close')
```

Description

sLibraryBrowser opens the Simulink Library Browser.

If you want to load the Simulink block library, use `load_system simulink` instead.

If you want to start Simulink without opening any windows, use the faster `start_simulink` instead.

sLibraryBrowser('open') opens the Library Browser.

sLibraryBrowser('noshow') loads the Library Browser in memory without making it visible. Use this to make future calls to sLibraryBrowser('open') faster.

libraryhandle = sLibraryBrowser returns the handle of the Library Browser object.

sLibraryBrowser('close') closes the Library Browser.

Examples

Open and Close Library Browser

```
sLibraryBrowser  
sLibraryBrowser('close')
```

Load Library Browser and Get Handle

```
libraryhandle = sLibraryBrowser('noshow')
```

Compatibility Considerations

LibraryBrowser.LBStandalone object replaces LibraryBrowser.LibraryBrowser2 object
Behavior changed in R2016b

In previous releases, these two commands returned a LibraryBrowser.LibraryBrowser2 object:

```
lb = sLibraryBrowser  
lb = LibraryBrowser.LibraryBrowser2
```

Starting in R2016b, each command returns a `LibraryBrowser.LBStandalone` object. The functions to access Library Browser operations such as `show` and `refresh` support `LibraryBrowser.LBStandalone` objects.

`LibraryBrowser.LBStandalone`

Topics

“Build and Edit a Model Interactively”

Introduced in R2016a

slLoadedToolstripComponents

Find loaded custom Simulink Toolstrip components

Syntax

```
components = slLoadedToolstripComponents
```

Description

`components = slLoadedToolstripComponents` returns the name, path, and persistence of loaded custom Simulink Toolstrip components.

Examples

Remove Custom Tab by Finding Loaded Custom Simulink Toolstrip Components

Suppose you have a custom tab that you want to remove from the Simulink Toolstrip.

Find the loaded custom Simulink Toolstrip components. In the MATLAB Command Window, enter:

```
components = slLoadedToolstripComponents
```

```
components =
```

```
    1×2 struct array with fields:
```

```
    name  
    path  
    persisted
```

The function finds two loaded components.

Get information about the first component.

```
components(1)
```

```
ans =
```

```
    struct with fields:
```

```
    name: 'tools'  
    path: 'B:\path\components\tools'  
    persisted: 0
```

The function returns the name (`tools`), path (`B:\path\components\tools`), and persistence (`0`) of the component. This component does not persist across MATLAB sessions.

Get information about the second component.

```
components(2)
```

```
ans =
    struct with fields:
        name: 'custom'
        path: 'B:\path\customtab'
        persisted: 1
```

The function returns the name (`custom`), path (`B:\path\customtab`), and persistence (`1`) of the component. This component persists across MATLAB sessions.

Inspect the JSON files in the `B:\path\customtab\resources\json` folder of the second component to determine whether the second component defines the custom tab you want to remove. Also check whether the component defines custom tabs that you want to keep.

Remove the custom tab by performing one of these actions:

- Remove the parent folder of the `resources` folder from the MATLAB path.
- Stop the custom Simulink Toolstrip component from persisting across MATLAB sessions by using the `slPersistToolstripComponent` function.
- Rename the `resources` folder to prevent it from being found.
- Edit the JSON file that defines the custom tab.
- Destroy the custom Simulink Toolstrip component using the `slDestroyToolstripComponent` function.

Then, reload the toolstrip configuration.

```
slReloadToolstripConfig;
```

Output Arguments

components — Name, path, and persistence of loaded components

structure array

Name, path, and persistence of loaded components, returned as a structure array.

See Also

`slCreateToolstripComponent` | `slDestroyToolstripComponent` | `slPersistToolstripComponent`

Topics

“Create Custom Simulink Toolstrip Tabs”

“Add Prepopulated Custom Tab to Simulink Toolstrip”

Introduced in R2021b

slmdliscui

Open Model Discretizer GUI

Syntax

```
slmdliscui  
slmdliscui('model')
```

Description

slmdliscui opens the Model Discretizer. A model does not need to be open.

slmdliscui('model') opens the Model Discretizer for the model or library called '*name*'.

To use the Model Discretizer, you must have a Control System Toolbox license, version 5.2 or later.

Examples

Open the Model Discretizer for the sllexAircraftExample model:

```
openExample('sllexAircraftExample');  
slmdliscui('sllexAircraftExample')
```

Open the Model Discretizer for the discretizing library:

```
slmdliscui('discretizing')
```

Introduced before R2006a

slPersistToolstripComponent

Specify whether custom Simulink Toolstrip component persists across MATLAB sessions

Syntax

```
slPersistToolstripComponent(component,persistence)
```

Description

`slPersistToolstripComponent(component,persistence)` specifies whether to add the path for the specified custom Simulink Toolstrip component to the list of paths to restore for each MATLAB session.

Examples

Remember Custom Simulink Toolstrip Component Across Sessions

Suppose you create a custom tab that you want to remain in the Simulink Toolstrip the next time you open Simulink.

Specify that the component persists in future MATLAB sessions. For example, specify that a component named `custom` persists across sessions. In the MATLAB Command Window, enter:

```
slPersistToolstripComponent("custom",true);
```

Input Arguments

component — Name of component to persist across sessions

character vector | string scalar

Name of component to persist across sessions, specified as a character vector or string scalar.

Data Types: `char` | `string`

persistence — Option for component to persist across sessions

`true` | `false`

Option for component to persist across sessions, specified as `true` or `false`.

Data Types: `logical`

Topics

“Create Custom Simulink Toolstrip Tabs”

“Add Prepopulated Custom Tab to Simulink Toolstrip”

Introduced in R2021b

slprofreport

(Not recommended) Regenerate profiler report from data, ProfileData, saved from previous run

Syntax

```
slprofreport(model_nameProfileData)
```

Description

When you run a model with the profiler enabled, the simulation generates the data and saves it in the variable, `model_nameProfileData`. `slprofreport(model_nameProfileData)` generates a profiler report based on the data in `model_nameProfileData`, saved from the model run.

Input Arguments

ProfileData

Variable containing profiler data from a model run. The variable name consists of the model name and ProfileData, for example, `vdpProfileData`.

Default: None

Examples

Regenerate Simulink Profiler Results

Regenerate the Profiler report for model `vdp`

In the MATLAB Command Window, start the `vdp` model.

In the Simulink editor window, run `vdp` model with Simulink Profiler enabled.

Simulink stores the data to the variable `vdpProfileData`.

To review the report, in the MATLAB Command Window

```
slprofreport(vdpProfileData)
```

The Simulink Profiler Report window is displayed.

Compatibility Considerations

slprofreport is not recommended

Not recommended starting in R2020a

Starting in R2020a, the `slprofreport` function is no longer recommended to load saved **Simulink Profiler** reports. The reports are saved to a MAT file and can be directly loaded into the current workspace.

For profiling reports saved before R2019b, you can use the `slprofreport` function to load the report.

See Also

Topics

“Save Profiler Results”

“How Profiler Captures Performance Data”

Introduced in R2012a

slproject.create

(Not recommended) Create blank project

Note `slproject.create` is not recommended. Use `matlab.project.createProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
proj = slproject.create
proj = slproject.create(path)
proj = slproject.create(name)
```

Description

`proj = slproject.create` creates and opens a project using the blank project template from the Simulink start page, and returns a project object. Use the project object to manipulate the currently open project at the command line. The new project is created in the default project folder. To change the default folder for new projects, on the MATLAB Home tab, click **Preferences**. In the Preferences dialog box, on the MATLAB Project pane, set the **Default folder**.

`proj = slproject.create(path)` creates the project at the location specified by path.

`proj = slproject.create(name)` creates the project in the default folder, with the name specified by name.

Examples

Create a Blank Project in the Default Folder

```
slproject.create
```

You can control the default folder for new projects using the project preferences.

Create a Blank Project in a Specified Folder

```
proj = slproject.create('C:\work\myprojectname');
```

Create a Named Blank Project in the Default Folder

```
proj = slproject.create('myprojectname');
```

Input Arguments

path — Path for the new project location

character vector

Path for the new project location, specified as a character vector. If you do not specify the path, `slproject.create` creates the project in the default location. You can change the default location in the project preferences.

Example: `C:\work\projectname`

Data Types: `char`

name — Name for the new project

character vector

Name for the new project, specified as a character vector.

Example: `myproject`

Data Types: `char`

Output Arguments

proj — Project

project object

Project, returned as a project object. Use the project object to manipulate the currently open project at the command line.

Properties of `proj` output argument.

Project Property	Description
Name	Project name
Information	Information about the project such as the description, source control integration, repository location, and whether it is a top-level project.
Dependencies	Dependencies between project files in a MATLAB digraph object.
Shortcuts	Shortcut files in the project.
ProjectPath	Folders that the project puts on the MATLAB path.
ProjectReferences	Folders that contain referenced projects. Contains read-only project objects for referenced projects.
Categories	Categories of project labels.
Files	Paths and names of project files.
RootFolder	Full path to project root folder.

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but,

after R2019a, new features will be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

You can continue to use `simulinkproject` and related functions listed in `methods(simulinkproject)`. New functions added after R2019a, such as `runChecks` and `listImpactedFiles`, do not work with `simulinkproject`. Use `currentProject` instead.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

Topics

“Create and Reference a Project Programmatically” on page 13-520

“Automate Project Tasks Using Scripts”

Introduced in R2017a

slproject.getCurrentProject

(To be removed) Manipulate current project at command line

Note `slproject.getCurrentProject` will be removed in a future release. Use `currentProject` instead.

Syntax

```
proj = slproject.getCurrentProject
```

Description

`proj = slproject.getCurrentProject` gets the current project open in the Project Tool and returns a project object `proj` that you can use to manipulate the project programmatically. If no project is open, then you see an error.

Note `slproject.getCurrentProject` is replaced by `slproject.getCurrentProjects`.

Examples

Get Airframe Example Project

Open the Airframe project and use `slproject.getCurrentProject` to get a project object to manipulate the project at the command line.

```
sldemo_slproject_airframe  
proj = slproject.getCurrentProject
```

```
proj =
```

```
    ProjectManager with properties:
```

```
        Name: 'Simulink Project Airframe Example'  
        Categories: [1x1 slproject.Category]  
        Shortcuts: [1x8 slproject.Shortcut]  
        ProjectPath: [1x7 slproject.PathFolder]  
        ProjectReferences: [1x0 slproject.ProjectReference]  
        Files: [1x30 slproject.ProjectFile]  
        RootFolder: 'C:\Work\Simulink\Projects\slexamples\airframe'
```

Output Arguments

proj – Project

project object

Project, returned as a project object. Use the project object to manipulate the currently open project at the command line.

See Also

Functions

`currentProject` | `simulinkproject` | `slproject.getCurrentProjects` | `slproject.loadProject`

Introduced in R2013a

slproject.getCurrentProjects

(Not recommended) List all top-level projects

Note `slproject.getCurrentProjects` is not recommended. Use `matlab.project.rootProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
projects = slproject.getCurrentProjects
```

Description

`projects = slproject.getCurrentProjects` returns a list of all open top-level projects. Currently only one or zero top-level projects can be loaded. Returns an object array of 1 or 0 `ProjectManager` objects `projects` that you can use to manipulate the project programmatically. Use `slproject.getCurrentProjects` for project automation scripts.

If you execute `slproject.getCurrentProjects` inside a project shortcut, it returns only the project that the shortcut belongs to. If the shortcut belongs to a referenced project, it returns the referenced project.

Examples

Get Airframe Example Project

Open the Airframe project and use `slproject.getCurrentProjects` to get a project object to manipulate the project at the command line.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects
```

```
proj =
```

```

```

Examine the labels of the eighth file.

```
proj.Files(8).Labels
```

```
ans =

Label with properties:

File: 'C:\Work\airframe\data\system_model.sldd'
Data: []
DataType: 'none'
Name: 'Design'
CategoryName: 'Classification'
```

Get a particular file.

```
myfile = findFile(proj, 'models/AnalogControl.slx')
```

```
myfile =
```

```
ProjectFile with properties:

Path: 'C:\Temp\airframe\models\AnalogControl.slx'
Labels: [1x1 slproject.Label]
Revision: '2'
SourceControlStatus: Unmodified
```

Find out what you can do with the file.

```
methods(myfile)
```

```
Methods for class slproject.ProjectFile:
```

```
addLabel
removeLabel
findLabel
```

Output Arguments

projects – Projects

object array of 1 or 0 ProjectManager objects

Projects, returned as an object array of 1 or 0 ProjectManager objects. Use the project object to manipulate the currently open project at the command line.

Properties of ProjectManager objects in output argument.

Project Property	Description
Name	Project name
Categories	Categories of project labels
Shortcuts	Shortcut files in project
ProjectPath	Folders that the project puts on the MATLAB path
ProjectReferences	Folders that contain referenced projects
Files	Paths and names of project files
RootFolder	Full path to project root folder

Tips

Alternatively, you can use `simulinkproject` to get a project object, but `simulinkproject` also opens and gives focus to the Project Tool. Use `simulinkproject` to open projects and explore projects interactively. Use `slproject.getCurrentProjects` for project automation scripts.

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features will be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

You can continue to use `simulinkproject` and related functions listed in `methods(simulinkproject)`. New functions added after R2019a, such as `runChecks` and `listImpactedFiles`, do not work with `simulinkproject`. Use `currentProject` instead.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

Functions

`matlab.project.rootProject` | `simulinkproject` | `slproject.loadProject` | `slproject.getCurrentProject`

Introduced in R2016a

slproject.loadProject

(Not recommended) Load project

Note `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

Syntax

```
slproject.loadProject(projectPath);
proj = slproject.loadProject(projectPath)
```

Description

`slproject.loadProject(projectPath)`; loads the project specified by the `.prj` file or folder `projectPath` in the Project Tool, and closes any currently open project.

`proj = slproject.loadProject(projectPath)` loads the project and returns a project object `proj` for manipulating the project. Use `slproject.loadProject` for project automation scripts.

Examples

Load Project

Load a project from a folder called 'C:/projects/project1/'. Replace this path with the location of your project.

```
proj = slproject.loadProject('C:/projects/project1/')
```

Get Airframe Example Project

Open the Airframe project and use `slproject.getCurrentProjects` to get a project object to manipulate the project at the command line.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects
```

```
proj =
```

```
  ProjectManager with properties:
```

```
      Name: 'Simulink Project Airframe Example'
      Categories: [1x1 slproject.Category]
      Shortcuts: [1x8 slproject.Shortcut]
      ProjectPath: [1x7 slproject.PathFolder]
      ProjectReferences: [1x0 slproject.ProjectReference]
```

```
Files: [1x30 slproject.ProjectFile]
RootFolder: 'C:\Work\Simulink\Projects\airframe'
```

Find Project Commands

Get the Airframe project.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects;
```

Find project commands.

```
methods(proj)
```

Methods for class slproject.ProjectManager:

```
addFile                findCategory
addFolderIncludingChildFiles  findFile
close                  isLoading
createCategory         listModifiedFiles
export                 refreshSourceControl
```

```
reload
removeCategory
removeFile
```

Examine Project Properties

After you get a project object, you can examine project properties.

Get the airframe project.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects;
```

Examine the project files.

```
files = proj.Files
```

```
files =
```

```
1x30 ProjectFile array with properties:
```

```
Path
Labels
Revision
SourceControlStatus
```

Examine the labels of the 13th file.

```
proj.Files(13).Labels
```

```
ans =
```

Label with properties:

```
File: 'C:\Temp\airframe\models\AnalogControl.slx'
  Data: []
  DataType: 'none'
  Name: 'Design'
  CategoryName: 'Classification'
```

Get a particular file by name.

```
myfile = findFile(proj, 'models/AnalogControl.slx')
```

```
myfile =
```

ProjectFile with properties:

```
Path: 'C:\Temp\airframe\models\AnalogControl.slx'
Labels: [1x1 slproject.Label]
Revision: '2'
SourceControlStatus: Unmodified
```

Find out what you can do with the file.

```
methods(myfile)
```

Methods for class slproject.ProjectFile:

```
addLabel
removeLabel
findLabel
```

Input Arguments

projectPath — Full path to project file or folder

character vector

Full path to project .prj file or the path to the project root folder, specified as a character vector.

Example: 'C:/projects/project1/myProject.prj'

Example: 'C:/projects/project1/'

Output Arguments

proj — Project

project object

Project, returned as a project object. Use the project object to manipulate and explore the project at the command line.

Properties of proj output argument.

Project Property	Description
Name	Project name
Categories	Categories of project labels

Project Property	Description
Shortcuts	Shortcut files in project
ProjectPath	Folders that the project puts on the MATLAB path
ProjectReferences	Folders that contain referenced projects
Files	Paths and names of project files
RootFolder	Full path to project root folder

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features will be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

You can continue to use `simulinkproject` and related functions listed in `methods(simulinkproject)`. New functions added after R2019a, such as `runChecks` and `listImpactedFiles`, do not work with `simulinkproject`. Use `currentProject` instead.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

`simulinkproject` | `slproject.getCurrentProjects`

Topics

“What Are Projects?”

Introduced in R2013a

sl_refresh_customizations

Refresh customizations in the current MATLAB session

Syntax

```
sl_refresh_customizations
```

Description

`sl_refresh_customizations`:

- Runs all `sl_customization.m` files on the MATLAB path and in the current folder
- Rebuilds the Simulink Toolstrip
- Rebuilds all Simulink Editor menus
- Rebuilds the Simulink Library Browser menus and toolbars
- Clears the Library Browser cache and refreshes the Library Browser
- Reloads the Viewers and Generators Manager data

Examples

Refresh Library Browser and Toolstrip Tab

Use the `sl_refresh_customizations` command to show the changes that an `sl_customization.m` file makes to the order of the libraries in the Simulink Library Browser and the changes that a modified JSON file makes to the Simulink Toolstrip. Start by changing the order of the libraries in the Library Browser. By default, the libraries are listed in ascending order of priority, and libraries that have the same priority are in alphabetical order. The Simulink library has a sort priority of `-1`. All other libraries have a sort priority of `0`. The Simulink library is the first library listed in the browser because it has the highest priority.

Open a blank model in Simulink.

Open the Simulink Library Browser. The first library listed in the browser is the Simulink library.

Create an `sl_customization.m` file that gives the Simulink Extras library a priority of `-2`. This priority is higher than that of the Simulink library.

```
function sl_customization( cm )  
    cm.LibraryBrowserCustomizer.applyOrder({'Simulink Extras', -2});  
end
```

Save the `sl_customization.m` file to the MATLAB path.

Check the Simulink Library Browser. The order of the libraries is unchanged.

Now, modify the toolstrip. Create an empty custom toolstrip tab by entering this in the MATLAB Command Window.

```
slCreateToolstripComponent("custom");
slCreateToolstripTab("customTab","custom",Title="CUSTOM TAB");
```

In the `customTab.json` file that is generated, change the title of the tab from `CUSTOM TAB` to `NEW NAME`.

```
{
  "version": "R2021b",
  "entries":
  [
    {
      "type": "Tab",
      "id": "customTab",
      "title": "NEW TAB"
    }
  ]
}
```

Save the `customTab.json` file.

Check the title of the custom tab. Even though the title in the `customTab.json` file is now `NEW NAME`, the title displayed in the toolstrip is still `CUSTOM TAB`.

To see your changes implemented on the Library Browser and toolstrip, rebuild both with this single command.

```
sl_refresh_customizations
```

Check the Library Browser. The order of the libraries has changed: the `Simulink Extras` library is above the `Simulink` library.

Check the toolstrip. The name of the custom tab has changed from CUSTOM TAB to NEW TAB.

Tips

If you only need to refresh the Library browser displayed in the current MATLAB session, you can also do so using the `refresh` command.

If you only need to refresh the toolstrip displayed in the current MATLAB session, you can also do so using the `slReloadToolstripConfig` command.

“Reorder Libraries”

“Register Customizations with Simulink”

Introduced in R2022a

slReloadToolstripConfig

Reload Simulink Toolstrip configuration

Syntax

```
slReloadToolstripConfig
```

Description

`slReloadToolstripConfig` reloads the Simulink Toolstrip configuration. Use this function after you make changes to the JSON files that define custom tabs.

Examples

Reload Simulink Toolstrip

After you modify a JSON file that defines a custom tab, use the `slReloadToolstripConfig` function to reload the toolstrip configuration with your changes.

In the MATLAB Command Window, enter:

```
slReloadToolstripConfig;
```

The function searches the MATLAB path for resources folders that contain a valid `sl_toolstrip_plugins.json` file.

To temporarily modify the toolstrip configuration, perform one of these actions before you call this function:

- Add folders that contain resources folders to the MATLAB path.
- Remove folders that contain resources folders from the MATLAB path.

If the custom tab does not appear:

- Debug and correct errors in the JSON code.
- Add the folder that contains the corresponding resources folder to the MATLAB path.

slResetFavoriteCommands

Reset Simulink Favorite Commands gallery

Syntax

```
backup = slResetFavoriteCommands
```

Description

`backup = slResetFavoriteCommands` resets the Simulink **Favorite Commands** gallery and saves a backup of the previous state of the gallery.

Examples

Reset Simulink Favorite Commands Gallery

Suppose you want to delete all the commands and custom categories in the Simulink **Favorite Commands** gallery.

In the MATLAB Command Window, enter:

```
slResetFavoriteCommands;
```

Output Arguments

backup — Backup of previous state

character vector

Backup of previous state, returned as a character vector.

To restore the previous state, you can pass the returned value as the input to the `slImportFavoriteCommands` function and overwrite the current state.

See Also

`slImportFavoriteCommands` | `slExportFavoriteCommands`

Topics

“Access Frequently Used Features and Commands in Simulink”

Introduced in R2021b

slToolstripDeveloperMode

Enable developer mode for Simulink Toolstrip

Syntax

```
tf = slToolstripDeveloperMode(status)
```

Description

`tf = slToolstripDeveloperMode(status)` enables a developer mode that lets you get action and icon names for controls, such as push buttons, in the Simulink Toolstrip.

To display the action and icon names in the MATLAB Command Window, pause on the control in the Simulink Toolstrip and press **Ctrl**. On a Mac, press **command** (⌘) instead of **Ctrl**.

Examples

Enable Simulink Toolstrip Developer Mode

In the MATLAB Command Window, enable developer mode for the Simulink Toolstrip.

```
slToolstripDeveloperMode('on')
```

```
ans =
```

```
logical
```

```
0
```

The function enables developer mode for the Simulink Toolstrip. The returned value indicates that developer mode was disabled before you entered this command.

Input Arguments

status — Desired status of developer mode

on/off logical value

Desired status of developer mode, specified as 'on' or 'off', or as numeric or logical 1 (true) or 0 (false). A value of 'on' is equivalent to true, and 'off' is equivalent to false. Thus, you can use the value of this property as a logical value. The value is stored as an on/off logical value of type `matlab.lang.OnOffSwitchState`.

By default, developer mode for the Simulink Toolstrip is disabled. Enable developer mode when you want to get the action and icon names of items in the Simulink Toolstrip.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char`

Output Arguments

tf — Previous status of developer mode

1 | 0

Previous status of developer mode, returned as a 1 or 0 of data type `logical`.

slxcinfo

Query contents of Simulink cache files

Syntax

```
info = slxcinfo(filename)
```

Description

`info = slxcinfo(filename)` creates a MATLAB table that lists the contents of the specified Simulink cache file. The table information includes the corresponding Simulink model name, MATLAB release, platform, and target type.

Examples

Query Contents of Simulink Cache File

Suppose you have a Simulink cache file named `model.slxc`. To return a table that lists the artifacts in the Simulink cache file, you would enter:

```
info = slxcinfo('model.slxc')
```

```
info =
```

```
7×4 table
```

Model	Release	Platform	Target
"model"	"R2020a"	"all"	"Variable usage information"
"model"	"R2020a"	"win64"	"Rapid accelerator target"
"model"	"R2020a"	"win64"	"Accelerator target"
"model"	"R2020b"	"all"	"Variable usage information"
"model"	"R2020b"	"win64"	"Rapid accelerator target"
"model"	"R2020b"	"win64"	"Accelerator target"
"model"	"R2020b"	"win64"	"grt Top model Model specific"

Input Arguments

filename — Name or path of Simulink cache file

character vector | string scalar

Name or path of the Simulink cache file, including the `.slxc` extension, specified as a character vector or string scalar.

Example: `slxcinfo('model.slxc')`

Data Types: `char` | `string`

Output Arguments

info — Simulink cache file contents

MATLAB table

Simulink cache file contents, returned as a MATLAB table.

Alternative Functionality

In the Current Folder browser, double-click the Simulink cache file to open the Simulink cache report.

“Simulink Cache Files for Incremental Code Generation” (Simulink Coder)

Introduced in R2020b

slxcunpack

Unpack simulation and code generation targets from Simulink cache file

Syntax

```
info = slxcunpack(filename)
info = slxcunpack(filename,Name,Value)
```

Description

`info = slxcunpack(filename)` unpacks the simulation and code generation artifacts from the specified Simulink cache file for the current platform and MATLAB release. Code generation artifacts must apply to the current system target file and folder configuration.

When using this function, consider these limitations:

- Do not use this function during model callbacks, model updates, simulation, or code generation. This function loads the model associated with the Simulink cache file.
- Do not use this function as part of asynchronous functions, such as `parfor` and `parfeval`.
- The contents of the Simulink cache file might be out of date. Simulation and code generation can update the artifacts on disk and in the Simulink cache file.

`info = slxcunpack(filename,Name,Value)` specifies additional options using one or more name-value pair arguments.

Examples

Unpack Artifacts from Simulink Cache File

Suppose you have this setup:

- R2020b MATLAB release
- 64-bit Windows operating system
- `grt.tlc` system target file — For more information, see **System target file**.
- `Model specific` code generation folder structure — For more information, see **Code generation folder structure**.

And you have two Simulink cache files:

- `topmodel.slxc` is a Simulink cache file for the top model in a model hierarchy.
- `refmodel.slxc` is a Simulink cache file for the only referenced model in the model hierarchy.

To unpack the simulation and code generation artifacts that correspond to your setup from the Simulink cache file, you would enter:

```
info = slxcunpack('topmodel.slxc')
```

```
info =
```

5×4 table

Model	Release	Platform	Target
"topmodel"	"R2020b"	"win64"	"Rapid accelerator target"
"topmodel"	"R2020b"	"win64"	"Accelerator target"
"topmodel"	"R2020b"	"win64"	"grt Top model Model specific"
"refmodel"	"R2020b"	"win64"	"Model reference simulation target"
"refmodel"	"R2020b"	"win64"	"grt Model reference Model specific"

The returned table lists the artifacts that the function unpacks into the **Simulation cache folder** and **Code generation folder**.

Unpack Only Simulation Artifacts from Simulink Cache File

Suppose you have this setup:

- R2020b MATLAB release
- 64-bit Windows operating system

And you have two Simulink cache files:

- `topmodel.slx` is a Simulink cache file for the top model in a model hierarchy.
- `refmodel.slx` is a Simulink cache file for the only referenced model in the model hierarchy.

To unpack the simulation artifacts that correspond to your setup from the Simulink cache file and display status messages, you would enter:

```
info = slxcunpack('topmodel.slx','Target','Simulation','Verbose',true)
```

```
### Rapid accelerator target for 'topmodel': Unpacked.
### Accelerator target for 'topmodel': Unpacked.
### Model reference simulation target for 'refmodel': Unpacked.
```

```
info =
```

3×4 table

Model	Release	Platform	Target
"topmodel"	"R2020b"	"win64"	"Rapid accelerator target"
"topmodel"	"R2020b"	"win64"	"Accelerator target"
"refmodel"	"R2020b"	"win64"	"Model reference simulation target"

The returned table lists the artifacts that the function unpacks into the **Simulation cache folder**.

Input Arguments

filename — Name of Simulink cache file

character vector | string scalar

Name of the Simulink cache file, including the `.slx` extension, specified as a character vector or string scalar.

Note The Simulink cache file must be in the **Simulation cache folder**, which, by default, is the current working folder (`pwd`).

Data Types: char | string

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: `slxcunpack('model.slxc','Target','Simulation')`

Target — Type of target to unpack

'All' (default) | 'Simulation' | 'CodeGeneration'

Type of target to unpack, specified as the comma-separated pair consisting of 'Target' and 'All', 'Simulation', or 'CodeGeneration'. If 'All', the function unpacks both simulation and code generation targets.

The unpacked simulation targets can be accelerator targets, rapid accelerator targets, and model reference simulation targets.

Data Types: char | string

UnpackReferencedModels — Option to unpack referenced model targets

true (default) | false

Option to unpack referenced model targets, specified as the comma-separated pair consisting of 'UnpackReferencedModels' and true or false. If true, the function also unpacks the Simulink cache files that correspond to referenced models.

Data Types: logical

Verbose — Option to display status messages

false (default) | true

Option to display status messages, specified as the comma-separated pair consisting of 'Verbose' and true or false.

Data Types: logical

Output Arguments

info — Unpacked Simulink cache file contents

MATLAB table

Unpacked Simulink cache file contents, returned as a MATLAB table.

Introduced in R2020b

solverprofiler.profileModel

Examine model for performance analysis using the Solver Profiler programmatic interface

Syntax

```
res = solverprofiler.profileModel(model)
res = solverprofiler.profileModel(model, Name, Value)
```

Description

`res = solverprofiler.profileModel(model)` runs the Solver Profiler on the specified model and stores the results in `res`.

`res = solverprofiler.profileModel(model, Name, Value)` specifies the Solver Profiler parameters using one or more `Name, Value` arguments.

Examples

Examine a Model with Default Settings

Examine the model `f14` using the default settings.

```
model = 'f14';
res = solverprofiler.profileModel(model);
```

Inspect the summary of the results.

```
res.summary

struct with fields:

    solver: 'ode45'
    tStart: 0
    tStop: 60
    absTol: 1.0000e-06
    relTol: 1.0000e-04
    hMax: 0.1000
    hAverage: 0.0444
    steps: 1352
    profileTime: 0.9974
    zcNumber: 0
    resetNumber: 600
    jacobianNumber: 0
    exceptionNumber: 195
```

Open the results in the Solver Profiler to visualize them. This step is equivalent to enabling `OpenSP` when calling the function.

```
solverprofiler.exploreResult(res)
```

Configure Solver Profiler and Examine a Model

Examine the model `ssc_actuator_custom_pneumatic` with a fully specified configuration.

```
model = 'ssc_actuator_custom_pneumatic';
res = solverprofiler.profileModel(model, ...
    'SaveStates' , 'On' , ...
    'SaveZCSignals' , 'On' , ...
    'SaveSimscapeStates' , 'On' , ...
    'SaveJacobian' , 'On' , ...
    'StartTime' , 5 , ...
    'StopTime' , 50 , ...
    'BufferSize' , 10000 , ...
    'Timeout' , 5 , ...
    'OpenSP' , 'On' , ...
    'DataFullFile' , fullfile(pwd, 'ssc_profiling_result.mat'));
```

Input Arguments

model — Name of model to profile

string | character vector

Name of model to profile, specified as a string or a character vector.

Example: `h = solverprofiler.profileModel('vdp')`

Name-Value Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: `'StartTime',0,'StopTime',10,'SaveStates','On'`

SaveStates — Save model states to file

off (default) | on

By default, the profiler does not save the states of the model. Enabling this parameter configures the profiler to save the states to a MAT-file.

Example: `'SaveStates','On'`

SaveSimscapeStates — Save Simscape states to file

off (default) | on

Enable this parameter to save Simscape states to a MAT-file.

Example: `'SaveSimscapeStates','On'`

SaveJacobian — Save model Jacobian

off (default) | on

Option to log the solver Jacobian matrices to memory. This option is useful for simulations that use implicit solvers. For a comparison of solvers, see “Compare Solvers”.

Example: `'SaveJacobian','On'`

SaveZCSignals — Save zero-crossing signal to MAT file

off (default) | on

Option to save the zero-crossing signal to a MAT file, specified as either 'off' or 'on'.

Example: 'SaveZCSignals', 'On'

StartTime — Profiler start time

model start time (default) | scalar

Time, in seconds, of the simulation that the profiler starts analyzing the model. This is not the same as the start time of the simulation.

Example: 'StartTime', 5

StopTime — Profiler stop time

model stop time (default) | scalar

Time, in seconds, of the simulation to which the profiler should profile the model. By default, the analysis continues until the end of the simulation. Changing this parameter does not change the stop time of the model which you specify in the Model Configuration Parameters.

A value less than the configured stop time of the model stops the profiling and simulation at **StopTime**.

Example: 'StopTime', 30

BufferSize — Memory impact of logging

50000 (default) | positive scalar

Maximum number of events that are logged. If the number of logged events reaches this value and memory is available, increase **BufferSize**. If memory is limited, consider lowering the value.

Example: 'BufferSize', 60000

TimeOut — Maximum time to wait for solver to resume

positive scalar

Time, in seconds, to wait before the profiler stops running. This option is useful in situations where the simulation is unable to proceed. The profiler waits for the specified time and quits if no progress has been made.

Example: 'TimeOut', 10

OpenSP — Open the Solver Profiler dialog box

off (default) | on

Option to open the Solver Profiler dialog box after profiling has completed.

Example: 'OpenSP', 'On'

DataFullFile — Path and name of saved results

character vector of full file path

By default, the profiling results are saved in a MAT-file named `model_@_dd_Month_yyyy_hh_mm_ss.mat` in the current working folder. You can specify a different file name by which to save the results in the current working folder. To save the file in a different location, specify the full path of the file, including the file name.

Example: 'DataFullFile', 'C:\Users\myusername\Documents\profiled\vdpr_results.mat'

Output Arguments

res — High-level summary of profiling results

structure

Profiling results, returned as a structure with the fields:

file — Full path and name of saved results

character vector

Path and name of the MAT-file where the results of the profiling operation are stored as MAT file. By default, they are stored in the current working folder with a file name having the pattern: `model_@_dd_Month_yyyy_hh_mm_ss.mat`. To store them in a different location or by a different name, specify `DataFullFile` when calling `solverprofiler.profileModel`.

summary — Summary of profiling results

structure

A high-level summary of the results of the profiling operation, returned as a structure. The summary provides an overview of the performance of the simulation and health of the model.

The summary structure contains these fields.

Field	Purpose	Values	Description
<code>solver</code>	Solver used by simulation	any of the solvers supported by Solver Profiler	Solver used by the simulation as configured in the Configuration Parameters for the model. For a list of all the solvers, see "Solver". The Solver Profiler does not support models without any continuous states.
<code>tStart</code>	Start time of simulation	scalar	Start time, in seconds, for the simulation of the model during the profiling operation.
<code>tStop</code>	Stop time of simulation	scalar	Stop time, in seconds, of the simulation during the profiling operation. If <code>StopTime</code> is set to be earlier than the configured <code>StopTime</code> of the model, the simulation stops at <code>StopTime</code> .
<code>absTol</code>	Absolute tolerance of the solver	positive scalar	Absolute tolerance of the solver as specified in the configuration settings for the model. For more information, see "Absolute tolerance"
<code>relTol</code>	Relative tolerance of the solver	positive scalar	Relative tolerance of the solver as specified in the configuration settings of the model. For more information, see "Relative tolerance"
<code>hMax</code>	Maximum step size	positive scalar	Largest time step that the solver can take. See "Max step size".

Field	Purpose	Values	Description
hAverage	Average step size	positive scalar	Average size of the time step taken by the solver.
steps	Total steps taken	positive scalar	Total number of time steps taken by the solver.
profileTime	Time to profile	positive scalar	Time, in seconds, taken by the Solver Profiler to examine the model.
zcNumber	Total number of zero crossings	nonnegative scalar	Number of times zero crossings occur during the simulation of the model. The detection of these zero crossings incurs computational cost and can slow down the simulation. For information on zero-crossing detection, see “Zero-Crossing Detection”.
resetNumber	Number of solver resets	nonnegative scalar	Number of times the solver has to reset its parameters.
jacobiannNumber	Number of Jacobian updates	nonnegative scalar	Number of times the solver Jacobian matrix is updated during a simulation. For more information, see “Explicit Versus Implicit Continuous Solvers”.
exceptionNumber	Number of solver exceptions	nonnegative scalar	Total number of solver exceptions encountered during a simulation. These exceptions are events where the solver is unable to solve the model states to the specified accuracy. As a result, the solver runs adjusted trials which increase computational cost.

Data Types: struct

“Choose a Solver”

Introduced in R2017b

start_simulink

Start Simulink without opening any windows

Syntax

```
start_simulink
```

Description

`start_simulink` starts Simulink without opening any models, the Start Page, or the Simulink Library Browser. Use this in startup scripts to start Simulink without any other window taking the focus away from the MATLAB Desktop. For example, use `start_simulink` in the MATLAB `startup.m` file, when starting MATLAB with the `-r` command line option, or in project startup scripts. Opening a model for the first time in a MATLAB session is much quicker after running `start_simulink`.

If you want to open the Simulink Start Page to create or open models, use the `simulink` function instead.

If you want to open the Library Browser, use `sLibraryBrowser`.

Examples

Start Simulink When Starting MATLAB

Use the `-r` command line option to start Simulink when starting MATLAB, without opening any windows.

On Windows, create a desktop shortcut with the following target:

```
matlabroot\bin\win64\matlab.exe -r start_simulink
```

On Linux® and Mac, enter:

```
matlab -r start_simulink
```

See Also

`simulink` | `sLibraryBrowser` | `openProject`

Topics

“Automate Startup Tasks”

Introduced in R2015b

stringtype

Create string data type

Syntax

```
string = stringtype(maximum_length)
stringtype(maximum_length)
```

Description

`string = stringtype(maximum_length)` creates a Simulink string data type with a maximum length. Alternatively, you can also create string data types using the String Constant, String Concatenate, and Compose String blocks.

`stringtype(maximum_length)` creates a Simulink string data type with a maximum length that you can type directly on the MATLAB command line or in the **Output data type** parameter of the String Constant, String Concatenate, or Compose String block.

Tip Specifying `stringtype(0)` creates a string data type with no maximum length. This syntax is the same as specifying `string` for Simulink block data types.

Examples

Create a String Data Type of Maximum Length 10

Create a string data type of maximum length 10.

```
h=stringtype(10)
```

h =

StringType with properties:

```
MaximumLength: 10
Description: ''
DataScope: 'Auto'
HeaderFile: ''
```

Input Arguments

maximum_length — Maximum length

scalar

Maximum length of string data type, specified as a scalar, from 1 to 32766. This value can be an integer, MATLAB variable, or MATLAB expression.

Data Types: double

Output Arguments

string — **String data type object**

scalar

String object, specified as a scalar.

Introduced in R2018a

trim

Find trim point of dynamic system

Syntax

```
[x,u,y,dx] = trim('sys')
[x,u,y,dx] = trim('sys',x0,u0,y0)
[x,u,y,dx] = trim('sys',x0,u0,y0,ix,iu,iy)
[x,u,y,dx] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx)
[x,u,y,dx,options] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx,options)
[x,u,y,dx,options] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx,options,t)
```

Description

Note `trim` provides only basic trimming functionality. For full trimming functionality, use Simulink Control Design software. For more information, see “Compute Steady-State Operating Points” (Simulink Control Design).

A trim point, also known as an equilibrium point, is a point in the parameter space of a dynamic system at which the system is in a steady state. For example, a trim point of an aircraft is a setting of its controls that causes the aircraft to fly straight and level. Mathematically, a trim point is a point where the system's state derivatives equal zero. `trim` starts from an initial point and searches, using a sequential quadratic programming algorithm, until it finds the nearest trim point. You must supply the initial point implicitly or explicitly. If `trim` cannot find a trim point, it returns the point encountered in its search where the state derivatives are closest to zero in a min-max sense; that is, it returns the point that minimizes the maximum deviation from zero of the derivatives. `trim` can find trim points that meet specific input, output, or state conditions, and it can find points where a system is changing in a specified manner, that is, points where the system's state derivatives equal specific nonzero values.

`[x,u,y,dx] = trim('sys')` finds the equilibrium point of the model 'sys', nearest to the system's initial state, `x0`. Specifically, `trim` finds the equilibrium point that minimizes the maximum absolute value of `[x-x0,u,y]`. If `trim` cannot find an equilibrium point near the system's initial state, it returns the point at which the system is nearest to equilibrium. Specifically, it returns the point that minimizes `abs(dx)` where `dx` represents the derivative of the system. You can obtain `x0` using this command.

```
[sizes,x0,xstr] = sys([],[],[],0)
```

`[x,u,y,dx] = trim('sys',x0,u0,y0)` finds the trim point nearest to `x0`, `u0`, `y0`, that is, the point that minimizes the maximum value of

```
abs([x-x0; u-u0; y-y0])
```

`[x,u,y,dx] = trim('sys',x0,u0,y0,ix,iu,iy)` finds the trim point closest to `x0`, `u0`, `y0` that satisfies a specified set of state, input, and/or output conditions. The integer vectors `ix`, `iu`, and `iy` select the values in `x0`, `u0`, and `y0` that must be satisfied. If `trim` cannot find an equilibrium point that satisfies the specified set of conditions exactly, it returns the nearest point that satisfies the conditions, namely,

```
abs([x(ix)-x0(ix); u(iu)-u0(iu); y(iy)-y0(iy)])
```

`[x,u,y,dx] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx)` finds specific nonequilibrium points, that is, points at which the system's state derivatives have some specified nonzero value. Here, `dx0` specifies the state derivative values at the search's starting point and `idx` selects the values in `dx0` that the search must satisfy exactly.

`[x,u,y,dx,options] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx,options)` specifies an array of optimization parameters that `trim` passes to the optimization function that it uses to find trim points. The optimization function, in turn, uses this array to control the optimization process and to return information about the process. `trim` returns the `options` array at the end of the search process. By exposing the underlying optimization process in this way, `trim` allows you to monitor and fine-tune the search for trim points.

The following table describes how each element affects the search for a trim point. Array elements 1, 2, 3, 4, and 10 are particularly useful for finding trim points.

No.	Default	Description
1	0	Specifies display options. 0 specifies no display; 1 specifies tabular output; -1 suppresses warning messages.
2	10^{-4}	Precision the computed trim point must attain to terminate the search.
3	10^{-4}	Precision the trim search goal function must attain to terminate the search.
4	10^{-6}	Precision the state derivatives must attain to terminate the search.
5	N/A	Not used.
6	N/A	Not used.
7	N/A	Used internally.
8	N/A	Returns the value of the trim search goal function (λ in goal attainment).
9	N/A	Not used.
10	N/A	Returns the number of iterations used to find a trim point.
11	N/A	Returns the number of function gradient evaluations.
12	0	Not used.
13	0	Number of equality constraints.
14	100*(Number of variables)	Maximum number of function evaluations to use to find a trim point.
15	N/A	Not used.
16	10^{-8}	Used internally.
17	0.1	Used internally.
18	N/A	Returns the step length.

`[x,u,y,dx,options] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx,options,t)` sets the time to `t` if the system is dependent on time.

Note If you fix any of the state, input or output values, `trim` uses the unspecified free variables to derive the solution that satisfies these constraints.

Examples

Finding Steady-State Points

The Simulink `trim` function uses a model to determine steady-state points of a dynamic system that satisfy input, output, and state conditions that you specify. Consider, for example, this model, called `ex_lmod`.

You can use the `trim` function to find the values of the input and the states that set both outputs to 1. First, make initial guesses for the state variables (x) and input values (u), then set the desired value for the output (y).

```
x = [0; 0; 0];
u = 0;
y = [1; 1];
```

Use index variables to indicate which variables are fixed and which can vary.

```
ix = [];      % Don't fix any of the states
iu = [];      % Don't fix the input
iy = [1;2];   % Fix both output 1 and output 2
```

Invoking `trim` returns the solution. Your results might differ because of roundoff error.

```
[x,u,y,dx] = trim('lmod',x,u,y,ix,iu,iy)
```

```
x =
    0.0000
    1.0000
    1.0000
u =
    2
y =
    1.0000
    1.0000
dx =
    1.0e-015 *
   -0.2220
   -0.0227
    0.3331
```

Note that there might be no solution to equilibrium point problems. If that is the case, `trim` returns a solution that minimizes the maximum deviation from the desired result after first trying to set the derivatives to zero. For a description of the `trim` syntax, see `trim`.

Finding Equilibrium Points

Consider a linear state-space system modeled using a State-Space block

$$\begin{aligned}\dot{x} &= Ax + Bu \\ y &= Cx + Du\end{aligned}$$

The A , B , C , and D matrices to enter at the command line or in the block parameters dialog are:.

```
A = [-0.09 -0.01; 1 0];
B = [ 0 -7; 0 -2];
C = [ 0 2; 1 -5];
D = [-3 0; 1 0];
```

Example 1

To find an equilibrium point in this model called `sys`, use:

```
[x,u,y,dx,options] = trim('sys')
x =
    0
    0
u =
    0
    0
y =
    0
    0
dx =
    0
    0
```

The number of iterations taken is:

```
options(10)
ans =
    7
```

Example 2

To find an equilibrium point near $x = [1;1]$, $u = [1;1]$, enter

```
x0 = [1;1];
u0 = [1;1];
[x,u,y,dx,options] = trim('sys', x0, u0);
x =
    1.0e-13 *
    -0.5160
    -0.5169
u =
    0.3333
    0.0000
y =
    -1.0000
```

```

    0.3333
dx =
    1.0e-12 *
    0.1979
    0.0035

```

The number of iterations taken is

```

options(10)
ans =
    25

```

Example 3

To find an equilibrium point with the outputs fixed to 1, use:

```

y = [1;1];
iy = [1;2];
[x,u,y,dx] = trim('sys', [], [], y, [], [], iy)
x =
    0.0009
   -0.3075
u =
   -0.5383
    0.0004
y =
    1.0000
    1.0000
dx =
    1.0e-15 *
   -0.0170
    0.1483

```

Example 4

To find an equilibrium point with the outputs fixed to 1 and the derivatives set to 0 and 1, use

```

y = [1;1];
iy = [1;2];
dx = [0;1];
idx = [1;2];
[x,u,y,dx,options] = trim('sys', [], [], y, [], [], iy, dx, idx)
x =
    0.9752
   -0.0827
u =
   -0.3884
   -0.0124
y =
    1.0000
    1.0000
dx =
    0.0000
    1.0000

```

The number of iterations taken is

```
options(10)
ans =
    13
```

Limitations

The trim point found by `trim` starting from any given initial point is only a local value. Other, more suitable trim points may exist. Thus, if you want to find the most suitable trim point for a particular application, it is important to try a number of initial guesses for x , u , and y .

Algorithms

`trim` uses a sequential quadratic programming algorithm to find trim points. See “Sequential Quadratic Programming (SQP)” (Optimization Toolbox) for a description of this algorithm.

Introduced before R2006a

tunablevars2parameterobjects

Create Simulink parameter objects from tunable parameters

Syntax

```
tunablevars2parameterobjects ('modelName')  
tunablevars2parameterobjects ('modelName', class)
```

Description

`tunablevars2parameterobjects ('modelName')` creates `Simulink.Parameter` objects in the base workspace for the variables listed in the specified model's Tunable Parameters dialog, then deletes the source information from the dialog. To preserve the information, save the resulting Simulink parameter objects into a MAT-file.

If a tunable variable is already defined as a numeric variable in the base workspace, the variable will be replaced by a parameter object and the original variable will be copied to the object's Value property.

If a tunable variable is already defined as a Simulink parameter object, the object will not be modified but the information for the variable will still be deleted from the Tunable Parameters dialog.

If a tunable variable is defined as any other class of variable, the variable will not be modified and the information for the variable will not be deleted from the Tunable Parameters dialog.

`tunablevars2parameterobjects ('modelName', class)` creates objects of the specified class rather than `Simulink.Parameter` objects.

Input Arguments

modelName

Model name or handle

class

Parameter class to use for creating objects

Default: `Simulink.Parameter`

See Also

`Simulink.Parameter`

Topics

"Tunable Parameters"

Introduced in R2007b

unpack

Extract signal logging objects from signal logs and write them into MATLAB workspace

Syntax

```
log.unpack  
tsarray.unpack  
log.unpack('systems')  
log.unpack('all')
```

Description

Note The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy `ModelDataLogs` API”.

`log.unpack` or `unpack(log)` extracts the top level elements of the `Simulink.ModelDataLogs` or `Simulink.SubsysDataLogs` object named **log** (e.g., `logout`).

`log.unpack('systems')` or `unpack(log, 'systems')` extracts `Simulink.Timeseries` and `Simulink.TsArray` objects from the `Simulink.ModelDataLogs` or `Simulink.SubsysDataLogs` object named `log`. This command does not extract `Simulink.Timeseries` objects from `Simulink.TsArray` objects nor does it write intermediate `Simulink.ModelDataLogs` or `Simulink.SubsysDataLogs` objects to the MATLAB workspace.

`log.unpack('all')` or `unpack(log, 'all')` extracts all the `Simulink.Timeseries` objects contained by the `Simulink.ModelDataLogs`, `Simulink.TsArray`, or `Simulink.SubsysDataLogs` object named `log`.

`tsarray.unpack` extracts the time-series objects of class `Simulink.Timeseries` from the `Simulink.TsArray` object named `tsarray`.

upgradeadvisor

Open Upgrade Advisor

Syntax

```
upgradeadvisor('modelname')  
upgrader = upgradeadvisor('modelname')
```

Description

`upgradeadvisor('modelname')` opens the Upgrade Advisor for the model specified by `modelname`. This command loads the model if necessary, but does not open it in the Simulink Editor. Use the Upgrade Advisor to help you upgrade and improve models with the current release.

`upgrader = upgradeadvisor('modelname')` returns an object that you can use to analyze and upgrade a hierarchy of models programmatically. If you specify an output, then the Upgrade Advisor does not open. You can use the methods `analyze` and `upgrade` with the `upgrader` object output of the `upgradeadvisor` function.

- To programmatically analyze a model for recommended upgrades, create an `upgrader` object and use the method `analyze`.
- To programmatically analyze and upgrade a model, create an `upgrader` object and use the method `upgrade`.
- To configure options before running `analyze` or `upgrade`, see “Examples” on page 2-1136.

Tip For an example showing how to programmatically upgrade a whole project, see “Upgrade Simulink Models Using a Project” on page 13-516.

Input Arguments

modelname

Name or handle to the model, specified as a character vector.

Output Arguments

upgrader

Object for analyzing and upgrading the hierarchy of models programmatically.

Examples

Open Upgrade Advisor on a Model

To open the Upgrade Advisor on the `vdp` example model:

```
upgradeadvisor('vdp')
```

To open the Upgrade Advisor on the currently selected model:

```
upgradeadvisor(bdroot)
```

Programmatically Analyze and Upgrade a Model

- 1 Get an upgrader object. This example uses a writable copy of the vdp model.

```
load_system('vdp'); save_system('vdp',fullfile(tempdir, 'myvdp'))
upgrader = upgradeadvisor('myvdp')
```

```
upgrader =
```

```
Upgrader with properties:
```

```
ChecksToSkip: {}
SkipLibraries: 0
SkipBlocksets: 1
OneLevelOnly: 0
ShowReport: 1
RootModel: 'myvdp'
ReportFile: ''
```

- 2 To analyze the model for recommended upgrades, following library links and model references, run:

```
analyze(upgrader);
```

You see a report of issues found.

- 3 To analyze the model and automatically fix all issues (where automated fixes are available), run:

```
upgrade(upgrader);
```

This command follows library links and model references, and saves any fixes to the model files.

You see a report of issues found and actions taken.

- 4 To find the location of the report:

```
reportLocation = upgrader.ReportFile
```

- 5 You can configure options before running analyze or upgrade.

- Specify checks to skip before running analyze or upgrade. Find the ID for a check in the Upgrade Advisor by right-clicking the check and selecting **Send Check ID to Workspace**. Then set the `upgrader.ChecksToSkip` property. For example:

```
upgrader.ChecksToSkip = {'mathworks.design.CSStoVSSConvert'};
upgrade(upgrader);
```

- Specify running the Upgrade Advisor on only the current model without following library links or model references, or analyzing test harnesses that are saved as external models:

```
upgrader.OneLevelOnly = true; % default false
```

- Specify running the Upgrade Advisor on the current model, following model references but not library links:

```
upgrader.SkipLibraries = true; % default false
```

- Specify running the Upgrade Advisor on the current model, including upgrading files in blocksets or toolboxes:

```
upgrader.SkipBlocksets = false; % default true
```

By default, the Upgrade Advisor does not upgrade files in blocksets or toolboxes. The Upgrade Advisor detects blocksets from the output of `ver` and the existence of a `Contents.m` file.

- To turn off showing the report after analyze or upgrade, set:

```
upgrader.ShowReport = false; % default true
```

Tip For an example showing how to programmatically upgrade a whole project, see “Upgrade Simulink Models Using a Project” on page 13-516.

Tips

- The Upgrade Advisor can identify cases where you can benefit by changing your model to use new features and settings in Simulink. The Advisor provides advice for transitioning to new technologies, and upgrading a model hierarchy.

The Upgrade Advisor can also identify cases where a model will not work because changes and improvements in Simulink require changes to a model.

The Upgrade Advisor offers options to perform recommended actions automatically or instructions for manual fixes.

Alternatives

You can also open the Upgrade Advisor from the Simulink Editor. In the **Modeling** tab, select **Model Advisor > Upgrade Advisor**.

Alternatively, you can open the Upgrade Advisor from the Model Advisor. In the Model Advisor, under **By Task checks**, expand the folder **Upgrading to the Current Simulink Version** and select the check **Open the Upgrade Advisor**.

view_mdhrefs

Analyze and visualize model referencing dependencies without library dependencies

Syntax

```
view_mdhrefs(sys)
```

Description

`view_mdhrefs` opens the Dependency Analyzer with library dependencies omitted. To open a specific configuration of the Dependency Analyzer, use `depview` with programmatic options. The Dependency Analyzer provides the same options regardless of how you open it.

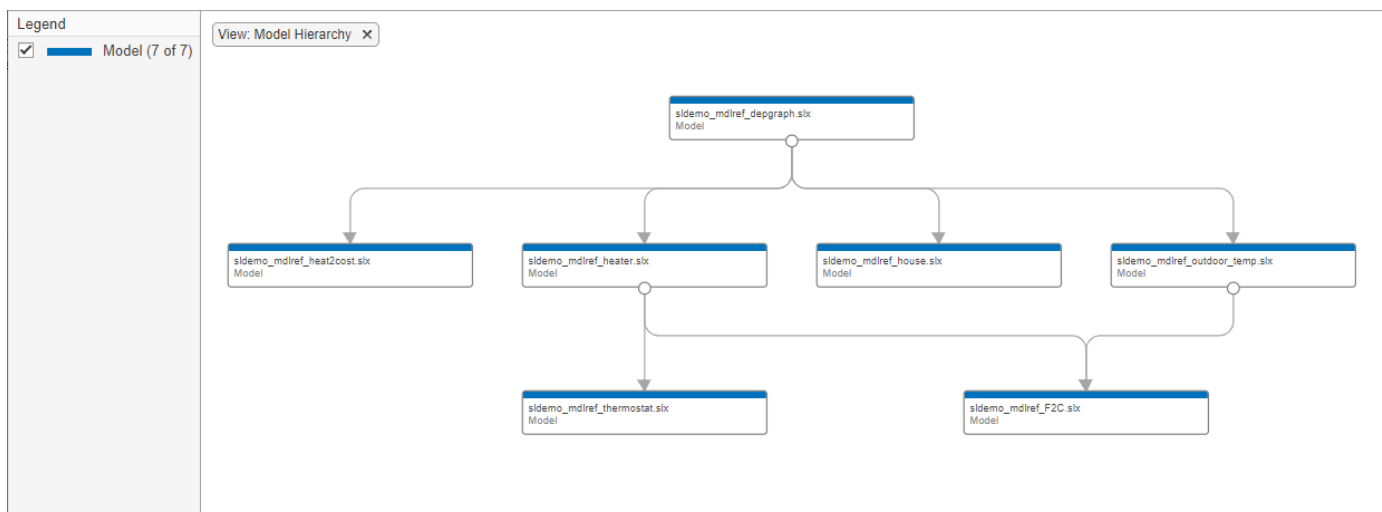

`view_mdhrefs(sys)` opens the Dependency Analyzer. It displays a graph of model referencing dependencies for the specified model. The nodes in the graph represent Simulink models. The directed lines indicate model dependencies.

Examples

Open Dependency Analyzer without Library Dependencies

Open the Dependency Analyzer for the `sldemo_mdhref_depgraph` model.

```
view_mdhrefs('sldemo_mdhref_depgraph');
```

Input Arguments

sys — Model name or path
character vector

The full name or path of a model, specified as a character vector.

Data Types: char

See Also

Blocks

Model

Functions

Introduced before R2006a

who

List names of top-level data logging objects in Simulink `ModelDataLogs` data log

Syntax

```
log.who
```

```
tsarray.who
```

```
log.who('systems')
```

```
log.who('all')
```

Description

Note To list names of top-level data logging objects in `Dataset` format, use `find`.

The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy `ModelDataLogs` API”.

`log.who` or `who(log)` lists the names of the top-level signal logging objects contained by `log`, where `log` is the handle of a `Simulink.ModelDataLogs` object name.

`tsarray.who` or `who(tsarray)` lists the names of `Simulink.TimeSeries` objects contained by the `Simulink.TsArray` object named `tsarray`.

`log.who('systems')` or `who(log, 'systems')` lists the names of all signal logging objects contained by `log` except for `Simulink.Timeseries` objects stored in `Simulink.TsArray` objects contained by `log`.

`log.who('all')` or `who(log, 'all')` lists the names of all the `Simulink.Timeseries` objects contained by the `Simulink.ModelDataLogs`, `Simulink.TsArray`, or `Simulink.SubsysDataLogs` object named `log`.

For information about other uses of `who`, use the `help` function for `who` in the MATLAB Command Window.

Tip To get the names of Dataset variables in the MAT-file, using the `Simulink.SimulationData.DatasetRef.getDatasetVariableNames` function processes faster than using the `who` or `whos` functions.

whos

List names and types of top-level data logging objects in Simulink ModelDataLogs data log

Syntax

```
log.whos
```

```
tsarray.whos
```

```
log.whos('systems')
```

```
log.whos('all')
```

Description

Note To list names of top-level data logging objects in Dataset format, use `find`.

The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy ModelDataLogs API”.

`log.whos` or `whos(log)` lists the names and types of the top-level signal logging objects contained by `log`, where `log` is the handle of a `Simulink.ModelDataLogs` object name.

`tsarray.whos` or `whos(tsarray)` lists the names and types of `Simulink.TimeSeries` objects contained by the `Simulink.TsArray` object named `tsarray`.

`log.whos('systems')` or `whos(log, 'systems')` lists the names and types of all signal logging objects contained by `log` except for `Simulink.Timeseries` objects stored in `Simulink.TsArray` objects contained by `log`.

`log.whos('all')` or `whos(log, 'all')` lists the names and types of all the `Simulink.Timeseries` objects contained by the `Simulink.ModelDataLogs`, `Simulink.TsArray` or `Simulink.SubsysDataLogs` object named `log`.

For information about other uses of `whos`, use the `help` function for `who` in the MATLAB Command Window.

Tip To get the names of Dataset variables in the MAT-file, using the `Simulink.SimulationData.DatasetRef.getDatasetVariableNames` function processes faster than using the `who` or `whos` functions.

Topics

“Load Big Data for Simulations”

Introduced before R2006a

addChoice

Package: Simulink

Add choices to variant parameter object

Syntax

```
P = addChoice(P,Choices{Condition,Value})
```

Description

`P = addChoice(P,Choices{Condition,Value})` adds a new variant choice to the variant parameter object `P`. A variant choice consists of a variant condition and a value specified as `Condition` and `Value`, respectively. You can add multiple choices to `p` by specifying condition-value pairs in a cell array. No two values of a variant variable can be associated with the same variant condition.

Note Adding a value to an existing variant condition results in an error.

Examples

Add Variant Choice

Create a `Simulink.VariantVariable` object.

```
P = Simulink.VariantVariable;
```

Add a variant choice to the object.

```
P = addChoice(P, {'V==1', 3.5});
```

Add Multiple Variant Choices

Create a `Simulink.VariantVariable` object.

```
P = Simulink.VariantVariable;
```

Add multiple variant choices to the object.

```
P = addChoice(P, {'V==1', 3.5, 'V==2', 8.3});
```

Input Arguments

P — Variant parameter object

`Simulink.VariantVariable` object

Variant parameter object created using `Simulink.VariantVariable`, specified as a `Simulink.VariantVariable` object. The choices that you specify using `addChoice` are added to this object.

Condition, Value — Variant condition and associated value

cell array

Variant condition and associated value, specified as a cell array. A variant condition is a control expression that determines the active value of the variant parameter object. During simulation, when a variant condition evaluates to `true`, the value associated with the condition becomes active. When a variant condition evaluates to `false`, the value associated the condition becomes inactive. You can add multiple values of the object by specifying condition-value pairs in a cell array.

You can specify the variant condition as boolean MATLAB expressions that contain one or more operands and operators. See “Types of Variant Control Variables (Operands) in Variant Parameters” and “Types of Operators in Variant Parameters”.

You can specify values of numeric, enumerated, or `Simulink.Parameter` type. See, “Numeric Variant Control Values for Rapid Prototyping of Variant Parameters”, “Improve Code Readability of Variant Parameters Using Enumerated Types”, and “Reuse Variant Parameter Values from Handwritten Code Using `Simulink.Parameter` Variables”.

Example: `{ 'V==2' , 5 }`

Data Types: `struct`

`setChoice` | `getChoice` | `removeChoice` | `Simulink.VariantVariable`

Topics

“Change Active Values and Activation Time of Variant Parameters”

Introduced in R2021a

getChoice

Package: Simulink

Return choices of variant parameter object

Syntax

```
choices = getChoice(P)
choices = getChoice(P,Condition)
```

Description

`choices = getChoice(P)` returns all the choices of variant parameter `p` in a cell array.

`choices = getChoice(P,Condition)` returns the value associated with the variant condition `Condition`. You can specify multiple conditions of variant parameter `p` in a cell array.

Examples

Get All Variant Choices

Create a `Simulink.VariantVariable` object.

```
p = Simulink.VariantVariable('Choices',{ 'V==1',8, 'V==2',9})
```

Get all variant choices of the object.

```
choices = getChoice(p)
```

Get Specific Variant Choices

Create a `Simulink.VariantVariable` object.

```
p = Simulink.VariantVariable('Choices',{ 'V==1',8, 'V==2',9})
```

Get the value associated with variant condition `V==1`.

```
choice = getChoice(p, 'V==2')
```

Input Arguments

P — Variant parameter object

`Simulink.VariantVariable` object

Variant parameter object created using `Simulink.VariantVariable`, specified as a `Simulink.VariantVariable` object.

Condition – Variant control expression

string

Variant control expression corresponding to the value to be returned, specified as a string. You can get multiple choices of the object by specifying conditions in a cell array.

Example: 'V==2'

Data Types: char

See Also

[addChoice](#) | [setChoice](#) | [removeChoice](#) | [Simulink.VariantVariable](#)

Topics

“Change Active Values and Activation Time of Variant Parameters”

Introduced in R2021a

setChoice

Package: Simulink

Modify existing choices of variant parameter object

Syntax

```
P = setChoice(P,Choices{Condition,Value})
```

Description

`P = setChoice(P,Choices{Condition,Value})` replaces the value associated with the variant condition `Condition` by the new value `Value`. You can modify multiple values of variant variable `P` by specifying condition-value pairs in a cell array. If the choice corresponding to the specified condition already exists, the associated value is overridden. Otherwise, a new choice is added.

Examples

Modify Variant Choice

Create a `Simulink.VariantVariable` object.

```
P = Simulink.VariantVariable('Choices',{ 'V==1',8, 'V==2',9})
```

Modify a variant choice associated with the variant condition `V==1`.

```
P = setChoice(P, {'V==1', 3.5});
```

Modify Multiple Variant Choices

Create a `Simulink.VariantVariable` object.

```
P = Simulink.VariantVariable('Choices',{ 'V==1',8, 'V==2',9, 'V==3',12})
```

Modify variant choices associated with variant conditions `V==1` and `V==3`.

```
P = setChoice(P, {'V==1', 3.5, 'V==3',20});
```

Input Arguments

P — Variant parameter object

`Simulink.VariantVariable` object

Variant parameter object created using `Simulink.VariantVariable`, specified as a `Simulink.VariantVariable` object. This object is updated with the new values that you specify using `setChoice`.

Condition, Value — Variant condition and associated value

cell array

Variant condition and its associated value, specified as a cell array. Simulink replaces the existing value of the specified variant condition with the new value. You can modify multiple values of the object by specifying condition-value pairs in a cell array.

You can specify the variant condition as boolean MATLAB expressions that contain one or more operands and operators. See “Types of Variant Control Variables (Operands) in Variant Parameters” and “Types of Operators in Variant Parameters”.

Example: { 'V==2' , 5 }

Data Types: struct

Topics

“Change Active Values and Activation Time of Variant Parameters”

Introduced in R2021a

removeChoice

Package: Simulink

Remove choices from variant parameter object

Syntax

```
P = removeChoice(P,Condition)
```

Description

`P = removeChoice(P,Condition)` removes the condition-value pair from variant variable `P` corresponding to condition `Condition`. You can remove multiple choices from `P` by specifying conditions in a cell array. Specifying variant conditions that do not exist results in an error.

Examples

Remove Variant Choice

Create a `Simulink.VariantVariable` object.

```
P = Simulink.VariantVariable('Choices',{ 'V==1',8, 'V==2',9, 'V==3',20})
```

Remove the variant choice associated with condition `V==2`.

```
P = removeChoice(P, 'V==2');
```

Remove Multiple Variant Choices

Create a `Simulink.VariantVariable` object.

```
P = Simulink.VariantVariable('Choices',{ 'V==1',8, 'V==2',9, 'V==3',20})
```

Remove variant choices associated with conditions `V==2` and `V==3`.

```
P = removeChoice(P, {'V==2','V==3'});
```

Input Arguments

P — Variant parameter object

`Simulink.VariantVariable` object

Variant parameter object created using `Simulink.VariantVariable`, specified as an `Simulink.VariantVariable` object. The choices that you specify using `removeChoice` are removed from this object.

Condition — Variant control expression

string

Variant control expression corresponding to the value to be removed, specified as a string. You can remove multiple choices from the object by specifying conditions in a cell array.

Example: 'V==2'

Data Types: char

Topics

“Change Active Values and Activation Time of Variant Parameters”

Introduced in R2021a

modelfinder

Search and open example models

Syntax

```
modelfinder(str)
modelfinder(Name,Value)
```

Description

`modelfinder(str)` finds models that match the specified search string. If there is more than one match, then all matching items are displayed as a list and you are prompted to select one.. Other options in the prompt include `q` to quit and `m` to see more results. If there are more than three words in the search term, then `modelfinder` treats the search as a natural language query and finds models that satisfy the natural language query.

`modelfinder(Name,Value)` specifies search options using one or more name-value arguments. For example, you can filter models based on the combination of specific search strings and blocks.

Examples

Models Matching Search String

Use this command to display models that has the word `autosar`.

```
modelfinder('autosar');
```

1. AUTOSARCounterExample
2. AuthorAUTOSARCompositionsInArchitectureModelExample
3. > autosar_tpc_actuator
4. > autosar_tpc_composition
5. > autosar_tpc_controller
6. > autosar_tpc_pedal_sensor
7. > autosar_tpc_system
8. > autosar_tpc_throttle_sensor1
9. > autosar_tpc_throttle_sensor2
10. > autosar_tpc_throttle_sensor_monitor
11. ConfigureAndSimulateAUTOSARFiMServiceCallsExample
12. > autosar_bsw_fim
13. > autosar_bsw_fimmonitor
14. > autosar_bsw_fimoperationcycle
15. > autosar_bsw_fimsensor1
16. > autosar_bsw_fimsensor2
17. CreateAndConfigureAUTOSARAdaptiveSoftwareComponentExample
18. DesignAUTOSARComponentsExample
19. > autosar_composition
20. > autosar_swc_actuator
21. > autosar_swc_controller
22. > autosar_swc_monitor
23. > autosar_swc_pedal_sensor
24. > autosar_swc_throttle_sensor
25. > autosar_system

```
Showing 1-25 of 68 matches. Enter (m) for more results.  
Enter the example number you want to open (choose number) OR  
see more results (m) OR quit (q)
```

Using Natural Language Query

Use this command to filter models that satisfies the query how to make a pendulum.

```
modelfinder('solar panel models in simulink')
```

1. GenerateHDLFromMultipleSimscapeNetworksExample
2. > Solar_Power_Inverter_Multiple_Network_HDL
3. > Solar_Power_Inverter_Multiple_Network_StateSpace
4. HybridSolarPanelExample
- > sscv_hybrid_solar_panel
5. PartitionLargeNetworkIntoMultipleSmallerNetworksExample
- > Solar_Power_Inverter_Single_Network_HDL
6. ee_mars_helicopter_system
7. ee_solar_boostconverter_maxpowerpoint
8. ee_solar_generator
9. ee_solar_gridconnected_singlephase
10. ee_solar_gridconnected_threephase
11. ee_solar_inverter
12. ee_solar_panel
13. ee_solar_standalone_acsystem_withbatterybackup
14. ee_solar_standalone_dcsystem_withbatterybackup
15. power_microgrid
16. sm_solar_tracker

Enter the example number you want to open (choose number) OR quit (q) :

Models with Additional Filters

You can filter models that contains specific search string and blocks . For example, use this command to filter models that contains the word motor and the block gain.

```
modelfinder('fluid', 'blocks', {'condenser'}, 'verbose', 'off')
```

1. ssc_rankine_cycle
2. ssc_refrigeration
3. sscfluids_condenser_evaporator
4. sscfluids_ev_thermal_management
5. sscfluids_liquid_air_energy_storage
6. sscfluids_refrigeration
7. sscfluids_refrigeration_step2
8. sscfluids_refrigeration_step3
9. sscfluids_refrigeration_step4
10. sscfluids_refrigeration_step5
11. sscfluids_refrigeration_step6
12. sscfluids_refrigerator
13. sscfluids_residential_air_source_heat_pump

Enter the example number you want to open (choose number) OR quit (q) :

Input Arguments

str — Search string

(default) | ''

Search string specified as string. You can use wildcard (*) characters in the search. If there are more than three words in the string modelfinder treats it as natural language query.

Example: `modelfinder('autosar')`

Data Types: `char` | `string`

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Example: `modelfinder('fluid', 'blocks', {'condenser'})` finds models with the search string `fluid` having block name `condenser`. “Models with Additional Filters” on page 2-1154

blocks — Block names in search criteria

(default) | ''

Block names in search criteria specified as string. This argument limits the models displayed in the search result based on blocks present in the models.

Example: `modelfinder('motor', 'blocks', 'gain')`

Data Types: `char` | `string`

verbose — Option to display path of matched model and matched character from search term

(default) | off

If you specify this argument as on, search results are displayed with the path of the matched models and the matching characters from the search term. Additional information about the matched component, such as model name, annotations, and description is displayed. Search results that appear indented and prefixed with > are individual Simulink models that are part of a bigger example or project. You may open an individual model or an entire example, with the corresponding number.

Example: `modelfinder('pmsm models using discrete pulse generator', 'verbose', 'on')`

Data Types: `char` | `string`

resultsPerPage — Number of results displayed per page

(default) | 20

Number of results per page specified as positive integer. By default, 20 results are displayed per page.

Note The number of results displayed may vary to preserve the model hierarchy in output.

Example: `modelfinder('pmsm models using discrete pulse generator', 'resultsPerPage', 5)`

Data Types: `char` | `string`

See Also

`modelfinder.registerFolder` | `modelfinder.unregisterFolder` | “Use modelfinder to Index Simulink Models and Improve its Discoverability within an Organization”

Introduced in R2022a

modelfinder.registerFolder

Register folder path to search index of modelfinder

Syntax

```
modelfinder.registerFolder(pathToFolder)
```

Description

`modelfinder.registerFolder(pathToFolder)` registers all models from the path to modelfinder search result. The function searches for models recursively within the specified folder.

Input Arguments

pathToFolder — Path to folder

(default) | string

Path to folder specified as string. Specify the path of the models to be included for indexing.

Example: `modelfinder.registerFolder("~/Desktop/myFolder")`

Example: `modelfinder.registerFolder(["~/Desktop/myFolder1", "~/Desktop/myFolder2"])`

See Also

`modelfinder` | `modelfinder.unregisterFolder` | “Use modelfinder to Index Simulink Models and Improve its Discoverability within an Organization”

Introduced in R2022a

modelfinder.unregisterFolder

Unregister folder path from search path of modelfinder

Syntax

```
modelfinder.unregisterFolder(pathToFolder)
```

Description

`modelfinder.unregisterFolder(pathToFolder)` unregisters all model from the specified `pathToFolder` from `modelfinder` search index so that the models does not appear in search results. The function unregisters all models recursively within the specified folder.

Input Arguments

pathToFolder — Path to folder

(default) | string

Path to folder specified as string. Specify path of the models to be excluded from indexing.

Example: `modelfinder.unregisterFolder("~/Desktop/myFolder")`

Example: `modelfinder.unregisterFolder(["~/Desktop/myFolder1", "~/Desktop/myFolder2"])`

convertAllSubsystemReferenceBlockToSubsystem

Converts all subsystem reference blocks to regular Subsystem blocks

Syntax

```
Simulink.SubsystemReference.convertAllSubsystemReferenceBlocksToSubsystem(  
path)
```

Description

`Simulink.SubsystemReference.convertAllSubsystemReferenceBlocksToSubsystem(path)` converts all subsystem reference blocks inside a given block diagram to regular Subsystem blocks.

Input Arguments

path — Path of the block diagram

(default) | string

The path of the block diagram specified as string. You can also specify handle as input argument

Examples

```
>> Simulink.SubsystemReference.convertAllSubsystemReferenceBlocksToSubsystem('mdl1')
```

See Also

`Simulink.SubsystemReference`

Introduced in R2022a

convertSubsystemReferenceBlockToSubsystem

Converts a subsystem reference block to a regular Subsystem block

Syntax

```
Simulink.SubsystemReference.convertSubsystemReferenceBlockToSubsystem(path)
```

Description

`Simulink.SubsystemReference.convertSubsystemReferenceBlockToSubsystem(path)` converts subsystem reference block to regular Subsystem block for a given block

Input Arguments

path — Path of the subsystem reference block

(default) |

The path of the subsystem reference block that needs to be converted to Subsystem is specified. You can also specify the handle of the subsystem reference block.

Examples

```
>> Simulink.SubsystemReference.convertSubsystemReferenceBlockToSubsystem('mdl1/Subsystem Reference')
```

See Also

`Simulink.SubsystemReference`

Introduced in R2022a

convertSubsystemToSubsystemReference

Converts a Subsystem block to subsystem reference

Syntax

```
Simulink.SubsystemReference.convertSubsystemToSubsystemReference(path, name)
```

Description

`Simulink.SubsystemReference.convertSubsystemToSubsystemReference(path, name)` converts a Subsystem block to subsystem reference. The converted subsystem reference block takes the name given in `name`. It returns true, if the conversion is successful. False otherwise.

Input Arguments

path — Path of the subsystem

(default) | string

The path of the Subsystem that must be converted to subsystem reference is specified as string. You can also specify the handle of the Subsystem.

name — Name for the converted subsystem

(default) | string

Name for the converted subsystem is specified as string.

Examples

```
>> Simulink.SubsystemReference.convertSubsystemToSubsystemReference('mdl1/Subsystem2', 'ssref4')
ans =
    logical
     1
```

See Also

`Simulink.SubsystemReference`

Introduced in R2022a

getActiveInstances

Returns all the active instances of subsystem references

Syntax

```
Simulink.SubsystemReference.getActiveInstances(path)
```

Description

`Simulink.SubsystemReference.getActiveInstances(path)` returns all the active instances of subsystem reference blocks which point to the subsystem file.

Input Arguments

path — Path of the subsystem reference file

(default) | string

The path of the subsystem reference file that is being referred in other Subsystem blocks. You can also specify the handle of the subsystem reference.

Output Arguments

path — Path of the active instances

An array consisting of the path of all the active instances is returned.

Examples

Get all active instances of the subsystem

```
>>Simulink.SubsystemReference.getActiveInstances('mdl2/Subsystem Reference')
```

```
ans =
```

```
4×1 cell array
```

```
    {'ssref1'           }  
    {'mdl1/Subsystem1' }  
    {'mdl2/Subsystem Reference'}  
    {'mdl1/Subsystem/Subsystem Reference'}
```

See Also

`Simulink.SubsystemReference`

Introduced in R2022a

getAllDirtyInstances

Returns child Subsystem block diagrams that are referred in the given block diagram and are also being edited

Syntax

```
Simulink.SubsystemReference.getAllDirtyInstances(path)
```

Description

`Simulink.SubsystemReference.getAllDirtyInstances(path)` returns all the child Subsystem block diagrams that are referred in the given block diagram and are also being edited.

Input Arguments

path — Path of the block diagram
(default) | string

The path of the block diagram specified as string. You can also specify the handle of the block diagram.

Output Arguments

block name — List of subsystem block diagrams that are being edited and referred in the given block diagram

It returns list of subsystem block diagrams that are being edited and referred in the given block diagram. It is not necessary that the subsystem block diagram is being edited directly. It might be edited through an instance.

Examples

```
>> Simulink.SubsystemReference.getAllDirtyInstances('mdl1')  
  
ans =  
  
    'ssref1'
```

See Also

`Simulink.SubsystemReference`

Introduced in R2022a

getAllInstances

Returns all subsystem reference blocks inside a block diagram

Syntax

```
Simulink.SubsystemReference.getAllInstances(path)
```

Description

`Simulink.SubsystemReference.getAllInstances(path)` returns all subsystem reference blocks inside a block diagram.

Input Arguments

path — System or model name

(default) | string

The path of the system or model name specified as string. You can also specify the handle of the system or model name.

Output Arguments

path — Path of all the subsystem reference blocks

(default) |

It return an array consisting of the path of all the subsystem reference blocks that is inside a block diagram.

Examples

```
>> Simulink.SubsystemReference.getAllInstances('mdl1')
```

```
ans =
```

```
2×1 cell array
```

```
    {'mdl1/Subsystem1'           }  
    {'mdl1/Subsystem/Subsystem Reference' }
```

See Also

`Simulink.SubsystemReference`

Introduced in R2022a

getAllReferencedSubsystemBlockDiagrams

Returns all the child Subsystem block diagrams for a given block diagram

Syntax

```
Simulink.SubsystemReference.getAllReferencedSubsystemBlockDiagrams(path)
```

Description

`Simulink.SubsystemReference.getAllReferencedSubsystemBlockDiagrams(path)` returns all the child Subsystem block diagrams for a given block diagram.

Input Arguments

path — Path of the system or block diagram

(default) | string

The path of the system or block diagram is specified as string. You can also specify the handle of the system or block diagram.

Output Arguments

block name — Name of the block

An array consisting of the name of the child blocks is returned. The output doesn't contain duplicates. So, if a subsystem-block diagram is referred twice, it appears only once in the output. The type of the output(name or handle) is same as the type of the input

Examples

```
>> Simulink.SubsystemReference.getAllReferencedSubsystemBlockDiagrams('mdl2')
```

```
ans =
```

```
2×1 cell array
```

```
 {'ssref1'}  
 {'ssref2'}
```

See Also

`Simulink.SubsystemReference`

Introduced in R2022a

getNearestParentSubsystemReferenceBlock

Returns the nearest parent subsystem reference for a block

Syntax

```
Simulink.SubsystemReference.getNearestParentSubsystemReferenceBlock(path)
```

Description

`Simulink.SubsystemReference.getNearestParentSubsystemReferenceBlock(path)` returns the nearest parent subsystem reference for a block.

Input Arguments

path — Path of the block for which the nearest parent must be returned

(default) | string

The path of the block for which the nearest parent must be returned. You can also specify the handle of the block.

Output Arguments

path — Path of the nearest parent

The path of the nearest parent subsystem reference for the given block is returned. If the given block is not inside any subsystem reference block, the output will be empty

Examples

```
>> Simulink.SubsystemReference.getNearestParentSubsystemReferenceBlock(gcf)
```

```
ans =
```

```
    'mdl1/Subsystem/Subsystem Reference'
```

See Also

`Simulink.SubsystemReference`

Introduced in R2022a

getSystemOwningTheLock

Returns the system that has acquired the lock for editing

Syntax

```
Simulink.SubsystemReference.getSystemOwningTheLock(path)
```

Description

`Simulink.SubsystemReference.getSystemOwningTheLock(path)` For a given system, it returns the system that has acquired the lock for editing.

Input Arguments

path — Path of the subsystem reference

(default) |

The path of the subsystem reference specified as a string. You can also specify the handle of the subsystem reference.

Output Arguments

path — Path of the system owning the lock

The path of the system owning the lock for the given subsystem reference is returned. Output will be empty if no instance is editing.

Examples

```
>>Simulink.SubsystemReference.getSystemOwningTheLock('mdl2/Subsystem Reference')
```

```
ans =
```

```
    'mdl1/Subsystem1'
```

See Also

`Simulink.SubsystemReference`

Introduced in R2022a

isSystemLocked

Checks if the system is locked due to an edit or update to the subsystem reference

Syntax

```
Simulink.SubsystemReference.isSystemLocked(path)
```

Description

`Simulink.SubsystemReference.isSystemLocked(path)` returns `true`, if the system is locked because of an edit or update to the subsystem reference. It returns `false`, otherwise.

Input Arguments

path — Path of the system

(default) | string

The path of the subsystem reference is specified as string. You can also specify the handle of the system.

Examples

```
>>Simulink.SubsystemReference.isSystemLocked('mdl2/Subsystem Reference')
```

```
ans =
```

```
    logical
```

```
     1
```

See Also

`Simulink.SubsystemReference`

Introduced in R2022a

addPortConstraint

Create a Port Constraint on a mask object

Syntax

```
maskObj.addPortConstraint(Name=Value)
```

Description

`maskObj.addPortConstraint(Name=Value)`. Create port constraint on a mask object by adding name value pair arguments. Name is a mandatory argument. The remaining arguments can be added later.

Input Arguments

port constraint — Handle to mask object

Port constraint object

Handle to the mask object

Data Types: char | cell

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Name — Name of the constraint

(default) | string

Name of the constraint specified as string.

ParameterConditions — Parameters and its values

(default) |

The list of parameters and the values are specified as cell array.

Rule — Datatype, complexity, and dimension associated with the constraint

(default) |

The datatype, complexity, and dimension for the constraint is specified.

DiagnosticLevel — Type of diagnostic message

(default) | error

You can display an error or warning message when the constraint validation fails. Specify the type of diagnostic level here.

DiagnosticMessage — Diagnostic message

(default) |

Specify the diagnostic message that must be displayed when the validation fails.

Example

Create port constraint with mask object

```
% Create an instance of Simulink.Mask.ParameterCondition
p1 = Simulink.Mask.ParameterCondition;
p1.Name = 'param1';
p1.Values = {'on'};
p2=Simulink.Mask.ParameterCondition;
p1.Name = 'param2';
p1.Values = {'0','1'};
pc = Simulink.Mask.PortConstraint;
pc.Name = pc1;
pc.ParameterConditions = [p1,p2];
pc.Rule.DataType = {'double','int8'};
pc.Rule.Complexity={'real'};
pc.DiagnosticLevel = 'warning';
pc.DiagnosticLevel = 'Invalid data at port';
maskObj.addPortConstraint(pc);
```

Create port constraint directly with name-value pair arguments

```
%Get mask object
aMaskObj = Simulink.Mask.get('model\subsystem');

%Add port constraint
aMaskObj.addPortConstraint('Name','pc3','ParameterConditions',
    { {'Name','parameter1','Values',{'10','20'} },
    {'Name','parameter2','Values',{'10','20'} } },
    'Rule', {'DataType', {'double','int32'}, 'Complexity', {'real'} } ,
    'DiagnosticLevel', 'error','DiagnosticMessage', 'Invalid Data')

ans =

    PortConstraint with properties:

        Name: 'pc3'
    ParameterConditions: [1x2 Simulink.Mask.ParameterCondition]
        Rule: [1x1 Simulink.Mask.PortConstraintRule]
    DiagnosticLevel: 'error'
    DiagnosticMessage: 'Invalid Data'

%Get the Rule object
pc1.Rule

ans =

    PortConstraintRule with properties:

        DataType: {2x1 cell}
        Dimension: {0x1 cell}
        Complexity: {'real'}
    FixedPointConstraint: [1x1 Simulink.Mask.FixedPointConstraint]
```

See Also

getPortConstraint

Get the attributes of the specified Port Constraint

Syntax

```
aMaskObj.getPortConstraint(name)
```

Description

`aMaskObj.getPortConstraint(name)` retrieves the attributes of the specified port constraint.

Input Arguments

Name — Name of the port constraint

(default) |

Specify the name of the port constraint to get all the values of the constraint. An error is displayed if the port constraint does not exist.

Output Arguments

Name — Name of the constraint

The name for the constraint is displayed

ParameterConditions — Mask parameters and its values

The list of mask parameters and the values are displayed as an array of `Simulink.Mask.ParameterConditions`.

Rule — Datatype, complexity, and dimension associated with the constraint

The datatype, complexity, and dimension that are allowed for the constraint is displayed.

DiagnosticLevel — Type of diagnostic message

The type of diagnostic message such as error or warning that must be displayed when the constraint validation fails.

DiagnosticMessage — Diagnostic message

The diagnostic message that must be displayed when the validation fails.

Examples

```
aMaskObj.getPortConstraint('pc3')
```

```
ans =
```

PortConstraint with properties:

```
        Name: 'pc3'  
ParameterConditions: [1×2 Simulink.Mask.ParameterCondition]  
        Rule: [1×1 Simulink.Mask.PortConstraintRule]  
  DiagnosticLevel: 'error'  
DiagnosticMessage: 'Invalid Data'
```

removePortConstraint

Removes the specified port constraint

Syntax

```
aMaskObj.removePortConstraint(name)
```

Description

`aMaskObj.removePortConstraint(name)` removes the specified port constraint.

Input Arguments

Name — Name of the port constraint

(default) |

Removes the specified port constraint. An error is displayed if the port constraint does not exist.

Example: `aMaskObj.removePortConstraint('pc3');`

removeAllPortConstraints

Removes all the port constraints on the masked block

Syntax

```
aMaskObj.removeAllPortConstraints
```

Description

`aMaskObj.removeAllPortConstraints` removes all the port constraints on the masked block.

Examples

```
aMaskObj.removeAllPortConstraints();
```

addParameterCondition

Creates a mask parameter condition for the constraint

Syntax

```
constraintObj.addParameterCondition(name, value)
```

Description

`constraintObj.addParameterCondition(name, value)` creates mask parameter conditions on the constraint using the parameter name and the permitted values.

Input Arguments

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Name — Name of the parameter

(default) |

Specify the name of the masked parameter.

Data Types: `string`

Value — The values for the parameter

(default) |

Specify the values for the masked parameter as a cell array.

Data Types: `cell`

Examples

```
% Create an instance of Simulink.Mask.PortConstraint
consObj = Simulink.Mask.PortConstraint

% Add the parameter condition
consObj.addParameterCondition('Name', 'p1', 'Values', {'10', '20'})

ans =
```

ParameterCondition with properties:

```
    Name: 'p1'
  Values: {2×1 cell}
```

See Also

getParameterCondition

Returns the parameter condition associated with the constraint

Syntax

```
consObj.getParameterCondition(parameter name)
```

Description

`consObj.getParameterCondition(parameter name)` displays the parameter name and the values as a cell array.

Input Arguments

Parameter Name — Name of masked parameter
(default) |

Specify the name of the masked parameter.

Data Types: char | string

Output Arguments

Name — Name of the masked parameter

The name of the masked parameter is displayed as string.

Value — The permitted values for the parameter

The values of the masked parameter is displayed as cell array.

Examples

```
consObj.getParameterCondition('p1')
```

```
ans =
```

```
ParameterCondition with properties:
```

```
    Name: 'p1'  
   Values: {2×1 cell}
```

consObj.removeParameterCondition(parameter name)
```

Description

`consObj.removeParameterCondition(parameter name)` removes the specified parameter condition from the constraint.

Input Arguments

Parameter Name — Name of masked parameter

(default) |

Specify the name of the masked parameter that must be removed from the constraint.

Example: `consObj.removeParameterCondition('p1')`

Data Types: `string`

See Also

[addParameterCondition](#) | [getParameterCondition](#) | [removeAllParameterCondition](#)

Topics

“Validate Input and Output Port Signals Using Port Constraints”

Introduced in R2022a

removeAllParameterConditions

Removes all parameter conditions on a Constraint

Syntax

```
consObj.removeAllParameterConditions
```

Description

`consObj.removeAllParameterConditions` removes all the parameter conditions on the Constraint.

Examples

```
consObj.removeAllParameterConditions
```

See Also

[addParameterCondition](#) | [getParameterCondition](#) | [removeParameterCondition](#)

Topics

“Validate Input and Output Port Signals Using Port Constraints”

Introduced in R2022a

setRule

Creates rules that are validated against the data at a port

Syntax

```
consObj.setRule(rule)
consObj.setRule(Name, Value)
```

Description

`consObj.setRule(rule)` create an object of `Simulink.Mask.PortConstraintRule` and then add the object to the port constraint.

`consObj.setRule(Name, Value)` create name-value pairs of the rule and add it to the port constraint object.

Input Arguments

rule — handle to `Simulink.Mask.PortConstraint` object

(default) | "

Create an object of `Simulink.Mask.PortConstraint` and then add the object to the port constraint.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

DataType — Permitted data types

(default) | ""

The permitted data types for the constraint is specified as a cell array.

Dimension — Permitted dimension

(default) | ""

The permitted dimension for the constraint is specified as a cell array.

Complexity — Permitted complexity

(default) | "

Specify the permitted complexity for the constraint.

Examples

Set Rules Using an Object of `ConstraintRule`

```
%Get an instance of Simulink.Mask.PortConstraintRule
rule = Simulink.Mask.PortConstraintRule;
```

```
pc1.DataType = {'double', 'int32'};
pc1.complexity = {'real'};
consObj.setRule(rule);
```

Set Rules as Name-Value Pair Arguments

```
% Create an instance of Simulink.Mask.PortConstraint to set the rule
constraint.setRule('DataType',{'fixedpoint'}, 'Dimension',{'scalar'},
'Complexity',{'real'})
```

```
ans =
```

```
PortConstraintRule with properties:
```

```
    DataType: {'fixedpoint'}
    Dimension: {'scalar'}
    Complexity: {'real'}
    FixedPointConstraint: [1x1 Simulink.Mask.FixedPointConstraint]
```

```
rule = constraint.getRule
```

```
rule =
```

```
PortConstraintRule with properties:
```

```
    DataType: {'fixedpoint'}
    Dimension: {'scalar'}
    Complexity: {'real'}
    FixedPointConstraint: [1x1 Simulink.Mask.FixedPointConstraint]
```

```
%Define the properties of FixedPointConstraint
rule.FixedPointConstraint.Scaling = "binary";
rule.FixedPointConstraint.Signedness = "unsigned";
rule.FixedPointConstraint.WordLength = "[8:12]";
rule.FixedPointConstraint
```

```
ans =
```

```
FixedPointConstraint with properties:
```

```
    Scaling: 'binary'
    Bias: ''
    Signedness: 'unsigned'
    WordLength: '[8:12]'
```

“Validate Input and Output Port Signals Using Port Constraints”

Introduced in R2022a

removeRule

Removes all the datatype, complexity, and dimension attributes of the port constraint rule

Syntax

```
consObj.removeRule()
```

Description

`consObj.removeRule()` clears all the data type, complexity, and dimension attributes of the port constraint rule. The empty rule object will be still available in the port constraint object.

Examples

```
consObj.removeRule
```

See Also

`setRule`

Topics

addPortConstraintAssociation

Associate the port constraints to port identifiers

Syntax

```
aMaskObj.addPortConstraintAssociation(port constraint name, port identifiers)
```

Description

`aMaskObj.addPortConstraintAssociation(port constraint name, port identifiers)` associated the specified port constraint to the specified port identifiers. You can associate multiple port identifiers to the same port constraint.

Input Arguments

port constraint name — Name of the Port Constraint
(default) | ""

Specify the name of the port constraint.

Data Types: char | string

port identifier — Name of the Port Identifiers
(default) | ""

Specify the name of the port identifiers as a cell array. You can associate same port constraint with multiple port identifiers.

Data Types: cell

Examples

```
% Get a mask object
aMaskObj = Simulink.Mask.get(gcf);
aMaskObj.PortIdentifiers;
aMaskObj.addPortConstraintAssociation('pc3',{'pi_1'});
```

getPortConstraintAssociation

Returns the Port Identifiers associated with the Port Constraint

Syntax

```
aMaskObj.getPortConstraintAssociation(Port constraint name)
```

Description

`aMaskObj.getPortConstraintAssociation(Port constraint name)` returns the port identifiers associated with port constraint.

Input Arguments

port constraint name — Name of the port constraint

(default) |

Specify the name of the port constraint.

Data Types: char | string

Examples

```
aMaskObj.getPortConstraintAssociation('pc3')
```

See Also

`addPortConstraintAssociation` | `removePortConstraintAssociation` | `removeAllPortConstraintAssociation`

removePortConstraintAssociation

Removes the association between the port constraint and the port identifiers

Syntax

```
aMaskObj.removePortConstraintAssociation(port constraint, port identifier)
aMaskObj.removePortConstraintAssociation(port constraint)
```

Description

`aMaskObj.removePortConstraintAssociation(port constraint, port identifier)` removes the association between the specified port constraint and the port identifier.

`aMaskObj.removePortConstraintAssociation(port constraint)` removes all the associated port identifiers with the port constraint.

Input Arguments

port constraint — Port constraint name

(default) |

Specify the name of the port constraint.

Data Types: char | string

port identifier — Port identifier

(default) |

Specify the name of the port identifier that must be removed from the port constraint association.

Data Types: char | string

Examples

```
%Specify the port constraint and port identifier
aMaskObj.removePortConstraintAssociation('pc3','pi_1');
%Specify port constraint
aMaskObj.removePortConstraintAssociation('pc3');
```

removeAllPortConstraintAssociation

Removes the associations of all port constraints in the mask

Syntax

```
aMaskObj.removeAllPortConstraintAssociation()
```

Description

`aMaskObj.removeAllPortConstraintAssociation()` removes the associations of all the port constraints in the mask object.

Examples

```
aMaskObj.removeAllPortConstraintAssociations;
```

Topics

“Validate Input and Output Port Signals Using Port Constraints”

Introduced in R2022a

addPortIdentifier

Creates a port identifier to identify the port in the mask

Syntax

```
maskObj (Name=Value)
```

Description

maskObj (Name=Value) creates a port identifier to identify a particular port in the mask object.

Input Arguments

Name-Value Pair Arguments

Specify optional pairs of arguments as Name1=Value1, ..., NameN=ValueN, where Name is the argument name and Value is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Name — Name of the port identifier

(default) | string

Name for the port identifier that helps to identify the port in the mask object, specified as string.

Data Types: char | string

Type — Type of the port

(default) | input

Select the type of the port as **Input** or **Output**.

Data Types: string

IdentifierType — Type of the identifier

(default) | index

Type of identifier specified as name or index. Specify name to identify the ports using name, or specify index to identify the ports using port index.

Data Types: string

Identifier — Port identifier appearing in the block

(default) | ''

Specify the name of the port in case Identifier Type is name. Port name is unique amongst all ports in a block. Enter indices in case Identifier Type is index. You can map multiple ports to one port identifier if the Identifier Type is index.

Data Types: string

Examples

```
aMaskObj.addPortIdentifier('Name','pi1','Type','Input','IdentifierType','index','Identifier','2')
```

```
ans =
```

```
PortIdentifier with properties:
```

```
    Name: 'pi1'  
    Type: 'Input'  
IdentifierType: 'index'  
Identifier: '2'
```

```
aMaskObj.addPortIdentifier('Name','pi2','IdentifierType','name','Identifier','common_gain')
```

```
ans =
```

```
PortIdentifier with properties:
```

```
    Name: 'pi2'  
    Type: ''  
IdentifierType: 'name'  
Identifier: 'common_gain'
```

getPortIdentifier

Returns the attributes of the specified port identifier

Syntax

```
aMaskObj.getPortIdentifier(portIdentifier)
```

Description

`aMaskObj.getPortIdentifier(portIdentifier)` returns the attributes of the specified port identifier.

Input Arguments

Port Identifier — Name of the Port Identifier

(default) | string

Name of the port identifier specified as string.

Data Types: char | string

Output Arguments

Name — Name of the port identifier

(default) | string

Name of the port identifier, returned as string.

Data Types: char | string

Type — Type of the port

(default) | Input

The type of the port returned as **Input** or **Output**.

Data Types: string

IdentifierType — Type of the identifier

(default) | index

The type of identifier returned as name or index.

Data Types: string

Identifier — Port identifier appearing in the block

(default) | "

The port identifier appearing in the block returned as string.

Data Types: string

Examples

```
aMaskObj.getPortIdentifier('pil')
```

```
ans =
```

```
PortIdentifier with properties:
```

```
    Name: 'pil'  
    Type: 'Input'  
IdentifierType: 'index'  
Identifier: '2'
```

removePortIdentifier

Removes the specified port identifier on the mask object

Syntax

```
aMaskObj.removePortIdentifier(portIdentifier)
```

Description

`aMaskObj.removePortIdentifier(portIdentifier)` removes the specified port identifier on the mask object.

Input Arguments

Port Identifier — Name of the Port identifier

(default) | string

Name of the port identifier that must be removed from the mask object, specified as string or char.

Example: `aMaskObj.removePortIdentifier('pil');`

Data Types: char | string

Mask Icon Drawing Commands

color	Change drawing color of subsequent mask icon drawing commands
disp	Display text on masked subsystem icon
dpoly	Display transfer function on masked subsystem icon
droots	Display transfer function on masked subsystem icon
fprintf	Display variable text centered on masked subsystem icon
image	Display RGB image on masked subsystem icon
patch	Draw color patch of specified shape on masked subsystem icon
plot	Draw graph connecting series of points on masked subsystem icon
port_label	Draw port label on masked subsystem icon
text	Display text at specific location on masked subsystem icon
block_icon	Promote a block icon image to the masked Subsystem

color

Change drawing color of subsequent mask icon drawing commands

Syntax

```
color(colorstr)
```

Here, *colorstr* must be a character vector.

Description

`color(colorstr)` sets the drawing color of all subsequent mask drawing commands to the color specified by the string *colorstr*.

colorstr must be one of the following supported color strings.

```
blue  
green  
red  
cyan  
magenta  
yellow  
black
```

Entering any other string or specifying the color using RGB values results in a warning at the MATLAB command prompt; Simulink ignores the color change. The specified drawing color does not influence the color used by the `patch` or `image` drawing commands.

Examples

The following commands

```
color('cyan');  
roots([-1], [-2 -3], 4)  
color('magenta')  
port_label('input',1,'in')  
port_label('output',1,'out')
```

draw the following mask icon.

See Also

`roots` | `port_label`

Introduced in R2006b

disp

Display text on masked subsystem icon

Syntax

```
disp(text)
disp(text, 'texmode', 'on')
```

Description

`disp(text)` displays *text* centered on the block icon. *text* is any MATLAB expression that evaluates to a string.

`disp(text, 'texmode', 'on')` allows you to use TeX formatting commands in *text*. The TeX formatting commands in turn allow you to include symbols and Greek letters in icon text. See “Interpreter” for information on the TeX formatting commands supported by Simulink software.

Examples

The following command

```
disp('\itEquation: \alpha^2 + \beta^2 \rightarrow \gamma^2, \chi, \phi_3 = \bfcool', 'texmode','on')
```

draws the equation that appears on this masked block icon.

See Also

`fprintf` | `port_label` | `text`

Introduced in R2007a

dpoly

Display transfer function on masked subsystem icon

Syntax

```
dpoly(num, den)
```

```
dpoly(num, den, 'character')
```

Description

`dpoly(num, den)` displays the transfer function whose numerator is *num* and denominator is *den*.

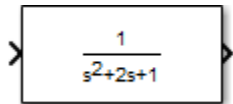

`dpoly(num, den, 'character')` specifies the name of the transfer function independent variable. The default is *s*.

When Simulink draws the block icon, the initialization commands execute and the resulting equation appears on the block icon, as in the following examples:

- To display a continuous transfer function in descending powers of *s*, enter

```
dpoly(num, den)
```

For example, for `num = [0 0 1]`; and `den = [1 2 1]` the icon looks like:

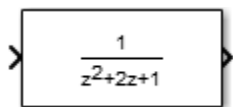

$$\frac{1}{s^2 + 2s + 1}$$

- To display a discrete transfer function in descending powers of *z*, enter

```
dpoly(num, den, 'z')
```

For example, for `num = [0 0 1]`; and `den = [1 2 1]`; the icon looks like:

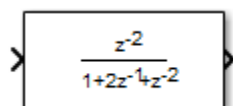

$$\frac{1}{z^2 + 2z + 1}$$

- To display a discrete transfer function in ascending powers of $1/z$, enter

```
dpoly(num, den, 'z-')
```

For example, for *num* and *den* as defined previously, the icon looks like:

$$\frac{z^{-2}}{1 + 2z^{-1} + z^{-2}}$$

If the parameters are not defined or have no values when you create the icon, Simulink software displays three question marks (? ? ?) in the icon. When you define parameter values in the Mask

Settings dialog box, Simulink software evaluates the transfer function and displays the resulting equation in the icon.

See Also

`disp` | `port_label` | `text` | `droots`

droots

Display transfer function on masked subsystem icon

Syntax

```
droots(zero, pole, gain)
droots(zero, pole, gain, 'z')
droots(zero, pole, gain, 'z-')
```

Description

`droots(zero, pole, gain)` displays the transfer function whose *zero* is *zero*, *pole* is *pole*, and *gain* is *gain*.

`droots(zero, pole, gain, 'z')` and `droots(zero, pole, gain, 'z-')` expresses the transfer function in terms of z or $1/z$.

When Simulink draws the block icon, the initialization commands execute and the resulting equation appears on the block icon, as in the following examples:

- To display a zero-pole gain transfer function, enter

```
droots(z, p, k)
```

For example, the preceding command creates this icon for these values:

```
z = []; p = [-1 -1]; k = 1;
```

If the parameters are not defined or have no values when you create the icon, Simulink software displays three question marks (? ? ?) in the icon. When you define parameter values in the Mask Settings dialog box, Simulink software evaluates the transfer function and displays the resulting equation in the icon.

See Also

`disp` | `port_label` | `text` | `dpoly`

Introduced in R2007a

fprintf

Display variable text centered on masked subsystem icon

Syntax

```
fprintf(text)
fprintf(formatSpec, var)
```

Description

The `fprintf` command displays formatted text centered on the icon and can display *formatSpec* along with the contents of *var*.

Note While this `fprintf` function is identical in name to its corresponding MATLAB function, it provides only the functionality described on this page.

`formatSpec` can be a character vector in single quotes, or a string scalar.

Formatting Operator

A formatting operator starts with a percent sign, %, and ends with a conversion character. The conversion character is required. Optionally, you can specify identifier, flags, field width, precision, and subtype operators between % and the conversion character. (Spaces are invalid between operators and are shown here only for readability).

Conversion Character

This table shows conversion characters to format numeric and character data as text.

Value Type	Conversion	Details
Integer, signed	%d or %i	Base 10
Integer, unsigned	%u	Base 10
	%o	Base 8 (octal)
	%x	Base 16 (hexadecimal), lowercase letters a-f
	%X	Same as %x, uppercase letters A-F
Floating-point number	%f	Fixed-point notation (Use a precision operator to specify the number of digits after the decimal point.)

Value Type	Conversion	Details
	<code>%e</code>	Exponential notation, such as <code>3.141593e+00</code> (Use a precision operator to specify the number of digits after the decimal point.)
	<code>%E</code>	Same as <code>%e</code> , but uppercase, such as <code>3.141593E+00</code> (Use a precision operator to specify the number of digits after the decimal point.)
	<code>%g</code>	The more compact of <code>%e</code> or <code>%f</code> , with no trailing zeros (Use a precision operator to specify the number of significant digits.)
	<code>%G</code>	The more compact of <code>%E</code> or <code>%f</code> , with no trailing zeros (Use a precision operator to specify the number of significant digits.)
Characters or strings	<code>%c</code>	Single character
	<code>%s</code>	Character vector or string array. The type of the output text is the same as the type of <code>formatSpec</code> .

Examples

The command

```
fprintf('Hello');
```

displays the text 'Hello' on the icon.

The command

```
fprintf('Hello = %d',17);
```

uses the decimal notation format (`%d`) to display the variable 17.

See Also

`disp` | `port_label` | `text`

Introduced before R2006a

image

Display RGB image on masked subsystem icon

Syntax

```
image(a)
image(a, position)
image(a, position, rotation)
```

Description

`image(a)` displays the image *a*, where *a* is an *m*-by-*n*-by-3 array of RGB values. If necessary, use the MATLAB commands `imread` and `ind2rgb` to read and convert bitmap files (such as GIF) to the necessary matrix format.

`image(a, position)` creates the image at the specified position as follows.

Position	Description
<code>[x, y, w, h]</code>	Position (<i>x</i> , <i>y</i>) and size (<i>w</i> , <i>h</i>) of the image where the position is relative to the lower-left corner of the mask. The image scales to fit the specified size.
<code>'center'</code>	Center of the mask
<code>'top-left'</code>	Top left corner of the mask, unscaled
<code>'bottom-left'</code>	Bottom left corner of the mask, unscaled
<code>'top-right'</code>	Top right corner of the mask, unscaled
<code>'bottom-right'</code>	Bottom right corner of the mask, unscaled

`image(a, position, rotation)` allows you to specify whether the image rotates (`'on'`) or remains stationary (`'off'`) as the icon rotates. The default is `'off'`.

Note Images in formats `.cur`, `.hdf4`, `.ico`, `.pcx`, `.ras`, `.xwd`, `.svg` (full version) cannot be used as block mask images.

Examples

You can use different commands depending on your requirement to add an image. These commands can be added in the **Icon & Ports** pane of the Mask Editor dialog box.

Syntax	Description
<code>image('icon.jpg')</code>	Reads the icon image from a JPEG file named <code>icon.jpg</code> in the MATLAB path.
<code>[data, map]=image('label.gif');</code> <code>pic=ind2rgb(data,map);</code>	Reads and converts a GIF file, <code>label.gif</code> , to the appropriate matrix format.
<code>image(pic)</code>	Reads the converted label image.

See Also

patch | plot

Introduced before R2006a

patch

Draw color patch of specified shape on masked subsystem icon

Syntax

```
patch(x, y)
patch(x, y, [r g b])
```

Description

`patch(x, y)` creates a solid patch having the shape specified by the coordinate vectors `x` and `y`. The patch's color is the current foreground color.

`patch(x, y, [r g b])` creates a solid patch of the color specified by the vector `[r g b]`, where `r` is the red component, `g` the green, and `b` the blue. For example,

```
patch([0 .5 1], [0 1 0], [1 0 0])
```

creates a red triangle on the mask's icon.

Examples

The command

```
patch([0 .5 1], [0 1 0], [1 0 0])
```

creates a red triangle on the mask's icon.

See Also

`image` | `plot`

Introduced before R2006a

plot

Draw graph connecting series of points on masked subsystem icon

Syntax

```
plot(Y)
plot(X1,Y1,X2,Y2,...)
```

Description

`plot(Y)` plots, for a vector Y , each element against its index. If Y is a matrix, it plots each column of the matrix as though it were a vector.

`plot(X1,Y1,X2,Y2,...)` plots the vectors $Y1$ against $X1$, $Y2$ against $X2$, and so on. Vector pairs must be the same length and the list must consist of an even number of vectors.

Plot commands can include `NaN` and `inf` values. When Simulink software encounters `NaNs` or `infs`, it stops drawing, and then begins redrawing at the next numbers that are not `NaN` or `inf`. The appearance of the plot on the icon depends on the units defined by the **Icon units** option in the Mask Editor.

Simulink software displays three question marks (? ? ?) in the block icon and issues warnings in these situations:

- When you have not defined values for the parameters used in the drawing commands (for example, when you first create the mask, but have not yet entered values in the Mask Settings dialog box)
- When you enter a masked block parameter or drawing command incorrectly

The `plot` command in masking supports a subset of the syntax of the MATLAB `plot` command. The `plot` command in masking supports all numeric data types and accepts only numbers as input.

Examples

The command

```
plot([0 1 5], [0 0 4])
```

generates the plot that appears on the icon for the Ramp block, in the Sources library.

See Also

`image`

Introduced before R2006a

port_label

Draw port label on masked subsystem icon

Syntax

```
port_label('port_type', port_number, 'label')
port_label('port_type', port_number, 'label', 'texmode', 'on')
```

Description

`port_label('port_type', port_number, 'label')` draws a label on a port. Valid values for `port_type` include the following.

Value	Description
input	Simulink input port
output	Simulink output port
lconn	Physical Modeling connection port on the left side of a masked subsystem
rconn	Physical Modeling connection port on the right side of a masked subsystem
Enable	Label for the enable port in a masked Triggered or Enabled and Triggered subsystem.
trigger	Label for the trigger port in a masked Triggered or Enabled and Triggered subsystem.
action	Label for the action port in a masked Switch Case Action Subsystem.

The input argument `port_number` is an integer, and `label` is text specifying the port's label.

Note Physical Modeling port labels are assigned based on the nominal port location. If the masked subsystem has been rotated or flipped, for example, a port labeled using 'lconn' as the `port_type` may not appear on the left side of the block.

`port_label('port_type', port_number, 'label', 'texmode', 'on')` lets you use TeX formatting commands in `label`. The TeX formatting commands allow you to include symbols and Greek letters in the port label. See "Interpreter" for information on the TeX formatting commands that the Simulink software supports.

Note Simulink does not support LaTeX formatting commands.

Examples

The command

```
port_label('input', 1, 'a')
```

defines a as the label of input port 1.

The command

```
port_label('Enable','En')
```

defines En as the label of Enable port.

The command

```
port_label('trigger','Tr')
```

defines Tr as the label of trigger port.

The command

```
port_label('action','Switch():')
```

defines Switch(): as the label of action port.

The command

```
port_label('trigger','\surd m','interpreter','tex')
```

defines the label of trigger port with TeX interpretation.

The commands

```
disp('Card\nSwapper');  
port_label('input',1,'\spadesuit','texmode','on');  
port_label('output',1,'\heartsuit','texmode','on');
```

draw playing card symbols as the labels of the ports on a masked subsystem.

See Also

disp | fprintf | text

Introduced before R2006a

text

Display text at specific location on masked subsystem icon

Syntax

```
text(x, y, 'text')
text(x, y, 'text', 'horizontalAlignment', 'halign',
     'verticalAlignment', 'valign')
text(x, y, 'text', 'texmode', 'on')
```

Description

The `text` command places a character vector at a location specified by the point (x, y) whose units are defined by the **Icon units** option in the Mask Editor.

`text(x,y, text, 'texmode', 'on')` allows you to use TeX formatting commands in `text`. The TeX formatting commands in turn allow you to include symbols and Greek letters in icon text. See “Interpreter” for information on the TeX formatting commands supported by Simulink software.

You can optionally specify the horizontal and/or vertical alignment of the text relative to the point (x, y) in the `text` command.

The `text` command offers the following horizontal alignment options.

Option	Aligns
'left'	The left end of the text at the specified point
'right'	The right end of the text at the specified point
'center'	The center of the text at the specified point

The `text` command offers the following vertical alignment options.

Option	Aligns
'base'	The baseline of the text at the specified point
'bottom'	The bottom line of the text at the specified point
'middle'	The midline of the text at the specified point
'cap'	The capitals line of the text at the specified point
'top'	The top of the text at the specified point

Note While this `text` function is identical in name to its corresponding MATLAB function, it provides only the functionality described on this page.

Examples

Text Alignment

Center the mask icon text foobar.

```
text(0.5, 0.5, 'foobar', 'horizontalAlignment', 'center')
```

Equation in Mask Icon

Draw a left-aligned equation as the mask icon.

In the Icons & Ports dialog of the Mask Editor, set **Icon units** to Normalized.

In the **Icon drawing commands** text box, enter the following command.

```
text(.05,.5,'\itEquation:} \Sigma \alpha^2 +  
\beta^2 \rightarrow \infty, \Pi, \phi_3 = {\bfcool}',  
'hor','left','texmode','on')
```

Equation

See Also

disp | fprintf | port_label

Introduced before R2006a

block_icon

Promote a block icon image to the masked Subsystem

Syntax

```
block_icon(BlockName)
```

Description

`block_icon(BlockName)` displays the underneath block icon image on the masked Subsystem icon. For more information, see `slexMaskDrawingExamples`.

Input Arguments

BlockName — Name of the underneath block

`string`

The name of the underneath block whose icon image you want to display on the Subsystem block that encapsulates the specified block. For more information, see `slexMaskDrawingExamples`

Data Types: `string`

See Also

`Simulink.Mask` | `slexMaskDrawingExamples`

Introduced in R2006b

Simulink Debugger Commands

ashow	Show algebraic loop
atrace	Set algebraic loop trace level for
bafter	Insert breakpoint after specified method
break	Insert breakpoint before specified method
bshow	Show specified block
clear	Clear breakpoints from model
continue	Continue simulation
disp	Display block's I/O when simulation stops
ebreak	Enable (or disable) breakpoint on solver errors
elist	List simulation methods in order in which they are executed during simulation
emode	Toggle model execution between accelerated and normal mode
etrace	Enable or disable method tracing
help	Display help for debugger commands
nanbreak	Set or clear nonfinite value break mode
next	Advance simulation to start of next method at current level in model's execution list
probe	I/O and state data for blocks
quit	Stop simulation debugger
rbreak	Break simulation before solver reset
run	Run simulation to completion
slist	Sorted list of model blocks
states	Current state values
status	Debugging options in effect
step	Advance simulation by one or more methods
stimes	Model sample times
stop	Stop simulation
strace	Set solver trace level
systems	List nonvirtual systems of model
tbreak	Set or clear time breakpoint
trace	Display block's I/O each time block executes
undisp	Remove block from debugger's list of display points
untrace	Remove block from debugger's list of trace points
where	Display current location of simulation in simulation loop
xbreak	Break when debugger encounters step-size-limiting state
zcbreak	Toggle breaking at nonsampled zero-crossing events
zclist	List blocks containing nonsampled zero crossings

ashow

Show algebraic loop

Syntax

```
ashow  
ashow gcb  
ashow s:b  
ashow s#n  
ashow clear
```

Description

ashow returns a list of algebraic loops in the current model.

ashow gcb returns the algebraic loop containing the currently selected block.

ashow s:b returns the algebraic loop containing block b in system s

ashow s#n returns the nth algebraic loop in the system s

ashow clear removes algebraic loop highlighting in the current model

Examples

Use ashow to Find Algebraic Loops in the Simulink Debugger

This example shows you how to find algebraic loops and step through a simulation in the Simulink Debugger.

Highlight algebraic loops during debugging

Open the `ex_sl_demo_hydcyl` model Start the Simulink debugger. Select **Debug > Breakpoints List > Debug Model** from the toolstrip. You can also start the debugger from the MATLAB command line using `sldebug`

```
sldebug('ex_sl_demo_hydcyl');
```

Run the debugger. In the MATLAB command prompt, enter:

```
ashow
```

```
Found 1 Algebraic loop(s):  
System#Algebraic loop id, number of blocks in loop  
- 0#1, 9 blocks in loop
```

The `ashow` command returns the algebraic loops in the model as well as the number of blocks contained within.

Find algebraic loops containing selected block

Select any nonvirtual block in the model. For example, select the PlotResults block, which is a Scope block.

In the MATLAB command prompt, enter

```
ashow gcb
```

Block sldemo_hydcyl/PlotResults isn't in an algebraic loop.

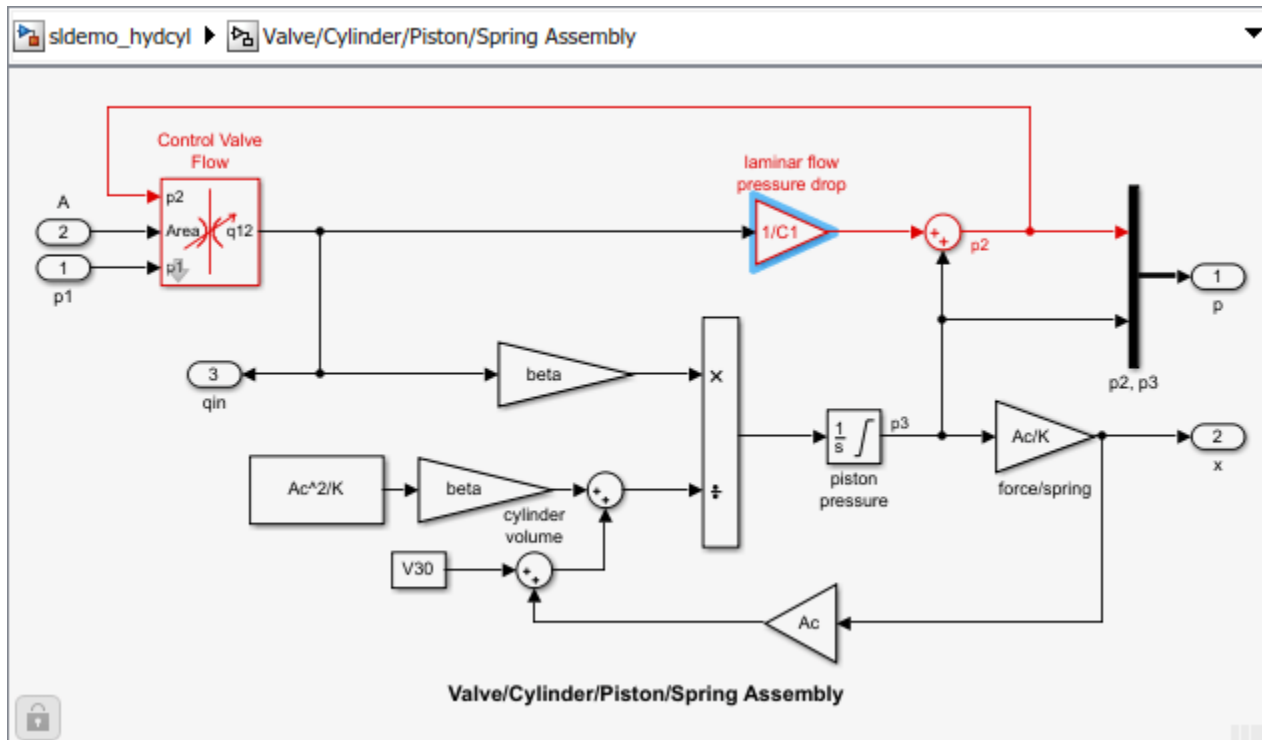

The PlotResults block does not belong in any algebraic loop.

In the MATLAB command prompt, enter

```
ashow gcb
```

```
- sldemo_hydcyl/Valve//Cylinder//Piston//Spring Assembly/Control Valve Flow/IC
- sldemo_hydcyl/Valve//Cylinder//Piston//Spring Assembly/Control Valve Flow/signed sqrt
- sldemo_hydcyl/Valve//Cylinder//Piston//Spring Assembly/Control Valve Flow/Product
- sldemo_hydcyl/Valve//Cylinder//Piston//Spring Assembly/laminar flow pressure drop
- sldemo_hydcyl/Valve//Cylinder//Piston//Spring Assembly/Sum7
- sldemo_hydcyl/Pump/IC
- sldemo_hydcyl/Valve//Cylinder//Piston//Spring Assembly/Control Valve Flow/Sum1 (algebraic variable)
- sldemo_hydcyl/Pump/Sum1
- sldemo_hydcyl/Pump/leakage (algebraic variable)
```

The laminar flow pressure drop block is contained in an algebraic loop with 8 other blocks.

Input Arguments

gcb – Currently selected block

gcb

Currently selected block, specified as gcb.

Example: `ashow gcb`

s:b – Block in model

system index:block index

Block index in the model, specified as system index:block index.

Example: `ashow 1:1`

Data Types: double

s#n – Algebraic loop index

system index#loop index

Algebraic loop index, specified as system index#loop index

Example: `ashow 0#1`

Data Types: double

clear – Remove highlighting

clear

Remove algebraic loop highlighting from model.

See Also

atrace

Topics

“Identify Algebraic Loops in Your Model”

Introduced before R2006a

atrace

Set algebraic loop trace level for

Syntax

```
atrace level
```

```
at level
```

Arguments

level Trace level (0 = none, 4 = everything).

Description

The `atrace` command sets the algebraic loop trace level for a simulation.

Command	Displays for Each Algebraic Loop
<code>atrace 0</code>	No information
<code>atrace 1</code>	The loop variable solution, the number of iterations required to solve the loop, and the estimated solution error
<code>atrace 2</code>	Same as level 1
<code>atrace 3</code>	Level 2 plus Jacobian matrix used to solve loop
<code>atrace 4</code>	Level 3 plus intermediate solutions of the loop variable

See Also

`states` | `systems`

Introduced before R2006a

bafter

Insert breakpoint after specified method

Syntax

```
bafter
```

```
ba
```

```
bafter m:mid
```

```
bafter <(taskId)sysIdx:blkIdx | gcb> [mth] [tid:TID]
```

```
bafter <s:sysIdx | gcs> [mth] [tid:TID]
```

```
bafter model [mth] [tid:TID]
```

```
bafter modelName <(taskId)sysIdx:blkIdx | gcb> [mth] [tid:TID]
```

Arguments

<i>mid</i>	Method ID
<i>taskId</i>	Task ID
<i>blkIdx</i>	Block ID
gcb	Currently selected block
<i>sysIdx</i>	System ID
<i>gcs</i>	Currently selected system
model	Currently selected model
<i>mth</i>	A method name, e.g., <code>Outputs.Major</code>
<i>TID</i>	Task ID
<i>modelName</i>	The name of the referenced model within the hierarchy of the top model, which is under debugging.

Description

`bafter` inserts a breakpoint after the current method.

Instead of `bafter`, you can use the short form of `ba` with any of the syntaxes.

`bafter m:mid` inserts a breakpoint after the method specified by *mid* (see “Method ID”).

`bafter (taskId)sysIdx:blkIdx` inserts a breakpoint after each invocation of the method of the block specified by *sysIdx:blkIdx* (see “Block ID”) in major time steps. `bafter gcb` inserts a breakpoint after each invocation of a method of the currently selected block (see `gcb`) in major time steps.

`bafter s:sysIdx` inserts a breakpoint after each method of the root system or nonvirtual subsystem specified by the system ID: *sysIdx*.

Note The `systems` command displays the system IDs for all nonvirtual systems in the currently selected model.

`bafter gcs` inserts a breakpoint after each method of the currently selected nonvirtual system.

`bafter model` inserts a breakpoint after each method of the currently selected model.

The optional `meth` parameter allow you to set a breakpoint after a particular block, system, or model method and task. For example, `bafter gcb Outputs` sets a breakpoint after the Outputs method of the currently selected block.

The optional TID parameter allows you to set a breakpoint after invocation of a method by a particular task. For example, suppose that the currently selected nonvirtual subsystem operates on task 2 and 3. Then `bafter gcs Outputs tid:2` sets a breakpoint after the invocation of the subsystem's Outputs method that occurs when task 2 is active.

See Also

`break` | `ebreak` | `tbreak` | `xbreak` | `nanbreak` | `zcbreak` | `rbreak` | `clear` | `where` | `slist` | `systems`

Introduced before R2006a

break

Insert breakpoint before specified method

Syntax

```
break
```

```
b
```

```
break m:mid
```

```
break mdl
```

```
break mdl [mth] [tid:TID]
```

```
break <(taskId)sysIdx:blkIdx | gcb> [mth] [tid:TID]
```

```
break <(taskId)sysIdx:blkIdx | gcb>
```

```
break <s:sysIdx | gcs> [mth] [tid:TID]
```

```
break modelName [mth] [tid:TID]
```

```
break modelName < (taskId)sysIdx:blkIdx> [mth] [tid:TID]
```

Arguments

<i>mid</i>	Method ID
<i>taskId</i>	Task ID
<i>sysIdx:blkIdx</i>	Block ID
gcb	Currently selected block
<i>sysIdx</i>	System ID
<i>gcs</i>	Currently selected system
modelName	Currently selected model
<i>mth</i>	A method name, e.g., Outputs.Major
<i>TID</i>	task ID
<i>mdl</i>	Given model

Description

`break` inserts a breakpoint before the current method.

Instead of `break`, you can use the short form of `b` with any of the syntaxes.

`break mdl` breaks at each method of model (`mdl`). `mdl` refers to the top model.

`break mdl [mth] [tid:TID]` breaks at the method `[mth]` at `tid` (TID) of model (`mdl`).

`break m:mid` inserts a breakpoint before the method specified by `mid` (see “Method ID”).

`break (taskIdx)sysIdx:blkIdx` inserts a breakpoint before each invocation of the method of the block specified by `sysIdx:blkIdx` (see “Block ID”) in major time steps. `break gcb` inserts a breakpoint before each invocation of a method of the currently selected block (see `gcb`) in major times steps.

`break s:sysIdx` inserts a breakpoint at each method of the root system or nonvirtual subsystem specified by the system ID: `sysIdx`.

Note The `systems` command displays the system IDs for all nonvirtual systems in the currently selected model.

`break gcs` inserts a breakpoint at each method of the currently selected nonvirtual system.

`break model` inserts a breakpoint at each method of the currently selected model.

Note Do not use a model name instead of identifier `model` in the `break model` command.

The optional `meth` parameter allow you to set a breakpoint at a particular block, system, or model method. For example, `break gcb Outputs` sets a breakpoint at the `Outputs` method of the currently selected block.

The optional TID parameter allows you to set a breakpoint at the invocation of a method by a particular task. For example, suppose that the currently selected nonvirtual subsystem operates on task 2 and 3. Then `break gcs Outputs tid:2` sets a breakpoint at the invocation of the subsystem's `Outputs` method that occurs when task 2 is active.

`break <(taskIdx)sysIdx:blkIdx | gcb>` breaks at each method of block `((taskIdx)sysIdx:blkIdx)`.

`break modelName < (taskIdx)sysIdx:blkIdx> [meth] [tid:TID]` breaks at the method `[meth]` at `tid` (TID) of block `((taskIdx)sysIdx:blkIdx)` in the model (`modelName`).

See Also

`bafter` | `clear` | `ebreak` | `nanbreak` | `rbreak` | `systems` | `tbreak` | `where` | `xbreak` | `zcbreak` | `slist`

Introduced before R2006a

bshow

Show specified block

Syntax

```
bshow (t)s:b
```

```
bshow [modelName] (taskIdx)sysIdx:blkIdx
```

```
bs s:b
```

Arguments

(t)s:b	The block whose task index is <i>t</i> , system index is <i>s</i> and block index is <i>b</i> .
modelName s:b	The name of the model that is referenced followed by the block whose system index is <i>s</i> and block index is <i>b</i> .

Description

The `bshow` command opens the model window containing the specified block and selects the block.

`bshow [modelName] (taskIdx)sysIdx:blkIdx` shows block in system, `sysIdx`, with sorted list index, `blkIdx`, in the given task, `taskIdx`. The system and block are picked from the top model, unless referenced model is specified through `modelName`.

See Also

`slist`

Introduced before R2006a

clear

Clear breakpoints from model

Syntax

```
clear
```

```
cl
```

```
clear m:mid
```

```
clear id
```

```
clear <(taskId)sysIdx:blkIdx | gcb>
```

Arguments

<i>mid</i>	Method ID
<i>id</i>	Breakpoint ID
<i>taskId</i>	Task ID
<i>sysIdx:blkI</i> <i>dx</i>	Block ID
gcb	Currently selected block

Description

`clear` clears a breakpoint from the current method.

Instead of `clear`, you can use the short form of `cl` with any of the syntaxes.

`clear m:mid` clears a breakpoint from the method specified by *mid*.

`clear id` clears the breakpoint specified by the breakpoint ID *id*.

`clear sysIdx:blkIdx` clears any breakpoints set on the methods of the block specified by *sysIdx:blkIdx*.

`clear gcb` clears any breakpoints set on the methods of the currently selected block.

See Also

`break` | `bafter` | `slist`

Introduced before R2006a

continue

Continue simulation

Syntax

```
continue
```

```
c
```

Description

The `continue` command continues the simulation from the current breakpoint. If animation mode is not enabled, the simulation continues until it reaches another breakpoint or its final time step. If animation mode is enabled, the simulation continues in animation mode to the first method of the next major time step, ignoring breakpoints.

See Also

`run` | `stop` | `quit`

Introduced before R2006a

disp

Display block's I/O when simulation stops

Syntax

```
disp
```

```
d
```

```
disp gcb
```

```
disp (t)s:b
```

```
disp modelName (t)s:b
```

Arguments

Syntax and Description

Syntax	Description
(t)s:b	The block whose task index is t , system index is s and block index is b .
modelName s:b	The name of the referenced model within the hierarchy of the top model, which is under debugging followed by the block whose task index is t , system index is s and block index is b .
gcb	Current block.

Description

The `disp` command registers a block as a display point. The debugger displays the inputs and outputs of all display points in the MATLAB Command Window whenever the simulation halts. Invoking `disp` without arguments shows a list of display points. Use `undisp` to unregister a block.

Instead of `disp`, you can use the short form of `d` with any of the syntaxes.

See Also

`undisp` | `slist` | `probe` | `trace`

Introduced before R2006a

ebreak

Enable (or disable) breakpoint on solver errors

Syntax

ebreak

eb

Description

This command causes the simulation to stop if the solver detects a recoverable error in the model. If you do not set or disable this breakpoint, the solver recovers from the error and proceeds with the simulation without notifying you.

See Also

break | bafter | tbreak | xbreak | nanbreak | zcbreak | rbreak | clear | where | slist | systems

Introduced before R2006a

elist

List simulation methods in order in which they are executed during simulation

Syntax

```
elist
```

```
el
```

```
elist m:mid [tid:TID]
```

```
elist <gcs | s:sysIdx> [mth] [tid:TID]
```

```
elist <gcb | (taskId)sysIdx:blkIdx> [mth] [tid:TID]
```

```
elist [modelName] <(taskId)sysIdx:blkIdx >
```

Description

Instead of `elist`, you can use the short form of `el` with any of the syntaxes.

`elist m:mid` lists the methods invoked by the system or nonvirtual subsystem method corresponding to the method id *mid* (see the `where` command for information on method IDs), e.g.,

```
(sldebug @19): elist m:19

RootSystem.Outputs 'vdp' [tid=0] : ← Calling method
 0:0 Integrator.Outputs 'vdp/x1' [tid=0]
 0:1 Outport.Outputs 'vdp/Out1' [tid=0]
 0:2 Integrator.Outputs 'vdp/x2' [tid=0]
 ...
 ↑      ↑      ↑      ↑
Block id Method Block Task id
```

The method list specifies the calling method followed by the methods that it calls in the order in which they are invoked. The entry for the calling method includes

- The name of the method

The name of the method is prefixed by the type of system that defines the method, e.g., `RootSystem`.

- The name of the model or subsystem instance on which the method is invoked
- The ID of the task that invokes the method

The entry for each called method includes

- The ID (*(taskId)sysIdx:blkIdx*) of the block instance on which the method is invoked

The block ID is prefixed by a number specifying the system that contains the block (the *sysIdx*). This allows Simulink software to assign the same block ID to blocks residing in different subsystems.

- The name of the method

The method name is prefixed with the type of block that defines the method, e.g., Integrator.

- The name of the block instance on which the method is invoked
- The task that invokes the method

The optional task ID parameter (**tid:TID**) allows you to restrict the displayed lists to methods invoked for a specified task. You can specify this option only for system or atomic subsystem methods that invoke Outputs or Update methods.

`elist <gcs | s:sysIdx>` lists the methods executed for the currently selected system (specified by the `gcs` command) or the system or nonvirtual subsystem specified by the system ID *sysIdx*, e.g.,

```
(sdebug @19): elist gcs

RootSystem.Start 'vdp':
  0:0 Integrator.Start 'vdp/x1'
  0:2 Integrator.Start 'vdp/x2'
  0:4 Scope.Start 'vdp/Scope'
  0:5 Fcn.Start 'vdp/Fcn'
  0:6 Product.Start 'vdp/Product'
  0:7 Gain.Start 'vdp/Mu'
  0:8 Sum.Start 'vdp/Sum'

RootSystem.Initialize 'vdp':
  0:0 Integrator.Initialize 'vdp/x1'
  ...
```

The system ID of a model's root system is 0. You can use the debugger's `systems` command to determine the system IDs of a model's subsystems.

Note The `elist` and `where` commands use block IDs to identify subsystems in their output. The block ID for a subsystem is not the same as the system ID displayed by the `systems` command. Use the `elist (taskIdx)sysIdx:blkIdx` form of the `elist` command to display the methods of a subsystem whose block ID appears in the output of a previous invocation of the `elist` or `where` command.

`elist m:mid [tid:TID]` displays the system execution list(s) identified by the system method, `mid` and `tid`.

`elist <gcs | s:sysIdx> mth` lists methods of type *mth* to be executed for the system specified by the `gcs` command or the system ID *sysIdx*, e.g.,

```
(sldebug @19): elist gcs Start

RootSystem.Start 'vdp':
  0:0 Integrator.Start 'vdp/x1'
  0:2 Integrator.Start 'vdp/x2'
  0:4 Scope.Start 'vdp/Scope'
  0:5 Fcn.Start 'vdp/Fcn'
  0:6 Product.Start 'vdp/Product'
  0:7 Gain.Start 'vdp/Mu'
  0:8 Sum.Start 'vdp/Sum'
  ...
```

Use `elist gcb` to list the methods invoked by the nonvirtual subsystem currently selected in the model.

`elist m:mid [tid:TID]` displays the system execution list(s) identified by the system method, `mid` and `tid`.

`elist [modelName] < (taskIdx)sysIdx:blkIdx >` displays the system execution list(s) identified by the subsystem block ((*taskIdx*)*sysIdx:blkIdx*), method, `mth`, and `tid` in the referenced model identified by `modelName`.

`elist <gcb | (taskIdx)sysIdx:blkIdx> [mth] [tid:TID]` displays the system execution list(s) identified by the subsystem block ((*taskIdx*)*sysIdx:blkIdx*), method, `mth`, and `tid`.

See Also

where | `slist` | `systems`

Introduced before R2006a

emode

Toggle model execution between accelerated and normal mode

Syntax

emode

em

Description

Toggles the simulation between accelerated and normal mode when using the Accelerator mode in Simulink software. For more information, see “Run Accelerator Mode with the Simulink Debugger”.

Introduced before R2006a

etrace

Enable or disable method tracing

Syntax

```
etrace level level-number
```

```
et level level-number
```

Description

This command enables or disables method tracing, depending on the value of `level`:

Level	Description
0	Turn tracing off.
1	Trace model methods.
2	Trace model and system methods.
3	Trace model, system, and block methods.

When method tracing is on, the debugger prints a message at the command line every time a method of the specified level is entered or exited. The message specifies the current simulation time, whether the simulation is entering or exiting the method, the method id and name, and the name of the model, system, or block to which the method belongs.

See Also

`elist` | `where` | `trace`

Introduced before R2006a

help

Display help for debugger commands

Syntax

help

?

h

Description

The help command displays a list of debugger commands in the command window. The list includes the syntax and a brief description of each command.

Introduced before R2006a

nanbreak

Set or clear nonfinite value break mode

Syntax

nanbreak

na

Description

The `nanbreak` command causes the debugger to break whenever the simulation encounters a nonfinite (NaN or Inf) value. If nonfinite break mode is set, `nanbreak` clears it.

See Also

`break` | `bafter` | `rbreak` | `tbreak` | `xbreak` | `zcbreak`

Topics

`ebreak`

Introduced before R2006a

next

Advance simulation to start of next method at current level in model's execution list

Syntax

next

n

Description

The `next` command advances the simulation to the start of the next method at the current level in the model's method execution list.

Note The `next` command has the same effect as the `step over` command. See `step` for more information.

See Also

`step`

Introduced before R2006a

probe

I/O and state data for blocks

Syntax

```
probe
probe (t)s:b
probe modelName (t)s:b
probe gcb
probe level level-type
p
```

Description

`probe` sets the Simulink debugger to interactive probe mode. In this mode, the debugger displays the I/O of a selected block. To exit interactive probe mode, enter a debugger command or press the **Enter** key.

`probe (t)s:b` displays the I/O of the block whose task index is *t*, system index is *s* and block index is *b*.

`probe modelName (t)s:b` displays the I/O of the block whose task index is *t* system index is *s* and block index is *b* in the *modelName* model.

`probe gcb` displays the I/O of the currently selected block.

`probe level level-type` sets the verbosity level for `probe`, `trace`, and `dis`. If *level-type* is `io`, the debugger displays block I/O. If *level-type* is `all` (default), the debugger displays all information for the current state of a block, including inputs and outputs, states, and zero crossings.

`p` is the short form of the command.

Examples

Display I/O for the currently selected block `Out2` in the model `vdp` using the Simulink debugger.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

```
probe gcb
```

The MATLAB Command Window displays:

```
probe: Data of 0:3 Output block 'vdp/Out2':
U1      = [0]
```

See Also

disp | trace

Introduced in R2007a

quit

Stop simulation debugger

Syntax

```
quit  
q
```

Description

`quit` stops the Simulink debugger and returns to the MATLAB command prompt.

`q` is the short form of the command.

Examples

Start the Simulink debugger for the model `vdp` and then stop it.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

```
quit
```

See Also

`stop`

Introduced before R2006a

rbreak

Break simulation before solver reset

Syntax

```
rbreak  
rb
```

Description

`rbreak` enables (or disables) a solver reset breakpoint if the breakpoint is disabled (or enabled). The breakpoint causes the debugger to halt the simulation whenever an event requires a solver reset. The halt occurs before the solver resets.

`rb` is the short form of the command.

Examples

Start Simulink debugger for the model `vdp` and a set breakpoint before a solver reset.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` is replaced with the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

```
rbreak
```

The MATLAB Command Window displays:

```
Break on solver reset request           : enabled
```

See Also

`break` | `bafter` | `nanbreak` | `ebreak` | `tbreak` | `xbreak` | `zcbreak`

Introduced before R2006a

run

Run simulation to completion

Syntax

```
run  
r
```

Description

`run` starts the simulation from the current breakpoint to its final time step. It ignores breakpoints and display points.

`r` is the short form of the command

Examples

Continue the simulation for the model `vdp` using the Simulink debugger.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

```
run
```

See Also

`continue` | `stop` | `quit`

Introduced before R2006a

slist

Sorted list of model blocks

Syntax

```
slist
sli
```

Description

`slist` displays a list of blocks for the root system and each nonvirtual subsystem sorted according to data dependencies and other criteria.

For each system (root or nonvirtual), `slist` displays:

- Title line specifying the name of the system, the number of nonvirtual blocks that the system contains, and the number of blocks in the system that have direct feedthrough ports.
- Entry for each block in the order in which the blocks appear in the sorted list.

For each block entry, `slist` displays the block ID and the name and type of the block. The block ID consists of a system index and a block index separated by a colon (`sysIdx:blkIdx`).

- Block index is the position of the block in the sorted list.
- System index is the order in which the Simulink software generated the system sorted list. The system index has no special significance. It simply allows blocks that appear in the same position in different sorted lists to have unique identifiers.

Simulink software uses sorted lists to create block method execution lists (see `elist`) for root system and nonvirtual subsystem methods. In general, root system and nonvirtual subsystem methods invoke the block methods in the same order as the blocks appear in the sorted list.

Exceptions occur in the execution order of block methods. For example, execution lists for multicast models group together all blocks operating at the same rate and in the same task. Slower groups appear later than faster groups. The grouping of methods by task can result in a block method execution order that is different from the block sorted order. However, within groups, methods execute in the same order as the corresponding blocks appear in the sorted list.

`sli` is the short form of the command.

Examples

Display a sorted list of the root system in the `vdp` model using the Simulink debugger.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

slist

When 'Signal storage reuse' in the Configuration Parameters is enabled, block I/O values displayed in the debugger may not be correct. In order to preserve block output signal values, disable 'Signal storage reuse' in the Configuration Parameters dialog box. The MATLAB Command Window displays:

```
---- Sorted list for 'vdp' [11 nonvirtual block(s), directFeed=0]
      Total number of tasks = 2
- Sorted list of task index [0], 10 nonvirtual block(s)
(0)0:1  'vdp/x1' (Integrator)
        Input ports: [0]
        Output ports: [0]
(0)0:2  'vdp/Out1' (Outport)
        Input ports: [0]
        Output ports: []
(0)0:3  'vdp/x2' (Integrator)
        Input ports: [0]
        Output ports: [0]
(0)0:4  'vdp/Out2' (Outport)
        Input ports: [0]
        Output ports: []

states

Current state values

Syntax

states

Description

states displays a list of the current states of the model. The list includes the index, current value, system:block:element ID, state vector name, and block name for each state.

Examples

Display information about the states for the vdp model.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt >> changes to the Simulink debugger prompt (sldebug @0): >>.

- 2 Enter:

```
states
```

The MATLAB Command Window displays:

```
Continuous States:
Idx  Value                                     (system:block:element Name  'BlockName')
  0   0                                     (0:0:0  CSTATE  'vdp/x1')
  1   0                                     (0:2:0  CSTATE  'vdp/x2')
```

Introduced before R2006a

status

Debugging options in effect

Syntax

Description

Display a list of the debugging options in effect.

Examples

View Debugger Status for vdp

Start the debugger with vdp. The command prompt changes to the Simulink debugger prompt (sldebug @0): >>.

```
sldebug 'vdp'
```

Display the debugging status.

```
status
```

```
%------%

Introduced before R2006a

step

Advance simulation by one or more methods

Syntax

```
step
step in
step over
step out
step top
step blockmth
s
```

Description

`step` or `step in` advances the simulation to the next method in the current time step.

`step over` advances the simulation over the next method.

`step out` advances the simulation the end of the current simulation point hierarchy.

`step top` advances the simulation to the first method executed in the next time step.

`step blockmth` advances the simulation to the next method that operates on a block.

`s` is the short form of the command.

If `step` advances the simulation to the start of a block method, the debugger points at the block on which the method operates.

.

Examples

The following diagram illustrates the effect of various forms of the `step` command for the model `vdp`.

Introduced in R2007a

stimes

Model sample times

Syntax

```
stimes
sti
```

Description

`stimes` displays information about the model sample times, including the sample time period, offset, and task ID.

`sti` is the short form of the command.

Examples

Display sample times for the model `vdp` using the Simulink debugger.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

```
stimes
```

The MATLAB Command Window displays:

```
--- Sample times for 'vdp' [Number of sample times = 2]
  1. tid=0 (continuous)
  2. tid=1 (value = inf in ModelWideParameterChangeEvent)
```

Introduced before R2006a

stop

Stop simulation

Syntax

```
stop
```

Description

`stop` stops the simulation of the model you are debugging.

Examples

Start and stop a simulation for the model `vdp` using the Simulink debugger.

- 1 Start a debugger session. In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Start a simulation of the model. Enter:

```
run
```

- 3 Stop the simulation. Enter:

```
stop
```

See Also

`continue` | `run` | `quit`

Introduced before R2006a

strace

Set solver trace level

Syntax

```
strace level
i
```

Description

`strace level` causes the solver to display diagnostic information in the MATLAB Command Window, depending on the value of `level`. Values are 0 (no information) or 4 (maximum information about time steps, integration steps, zero crossings, and solver resets).

`i` is the short form of the command.

Examples

Display maximum information about a simulation for the model `vdp` using the Simulink debugger.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Get information about the notation. Enter:

```
help time
```

The MATLAB Command Window displays:

```
Time is displayed as:
TM = <time while in MajorTimeStep>
Tm = <time while in MinorTimeStep>
Tr = <time while in solver reset>
Tz = <time at or just after zero crossing>
TzL = <time while in major step just before (at left post of) zero crossing>
TzR = <time while in major step at or just after (at right post of) zero crossing>
Ts = <time of successful integration step>
Tf = <time of failed integration step>
Tn = <time while in Newton iteration> (when using implicit solvers)
Tj = <time during Jacobian evaluation> (when using implicit solvers)

Step size is displayed as:
Hm = <step size at the start of solver phase>
Hs = <successful integration step size>
Hf = <failed integration step size>
Hn = <step size during Newton iteration> (when using implicit solvers)
Hz = <value of 'TM - TzL' during zero crossing search>
Iz = <value of 'Tz - TzL' during zero crossing search>
```

- 3 Set trace to display all information. Enter:

```
strace 1
```

When diagnostic tracing is on, the debugger displays the start of major and minor time steps.

```
[TM = 13.21072088374186 ] Start of Major Time Step
[Tm = 13.21072088374186 ] Start of Minor Time Step
```

The debugger displays integration information. This information includes the time step of the integration method, step size of the integration method, outcome of the integration step, normalized error, and index of the state.

```
[Tm = 13.21072088374186 ] [H = 0.2751116230148764 ] Begin Integration Step
[Tf = 13.48583250675674 ] [Hf = 0.2751116230148764 ] Fail [Er = 1.0404e+000]
  [Ix = 1]
[Tm = 13.21072088374186 ] [H = 0.2183536061326544 ] Retry
[Ts = 13.42907448987452 ] [Hs = 0.2183536061326539 ] Pass [Er = 2.8856e-001]
  [Ix = 1]
```

For zero crossings, the debugger displays information about the iterative search algorithm when the zero crossing occurred. This information includes the time step of the zero crossing, step size of the zero crossing detection algorithm, length of the time interval bracketing the zero crossing, and a flag denoting the rising or falling direction of the zero crossing.

```
[Tz = 3.615333333333301 ] Detected 1 Zero Crossing Event 0[F]
  Begin iterative search to bracket zero crossing event
[Tz = 3.621111157580072 ] [Hz = 0.005777824246771424 ] [Iz = 4.2222e-003] 0[F]
[Tz = 3.621116982080098 ] [Hz = 0.005783648746797265 ] [Iz = 4.2164e-003] 0[F]
[Tz = 3.621116987943544 ] [Hz = 0.005783654610242994 ] [Iz = 4.2163e-003] 0[F]
[Tz = 3.621116987943544 ] [Hz = 0.005783654610242994 ] [Iz = 1.1804e-011] 0[F]
[Tz = 3.621116987949452 ] [Hz = 0.005783654616151157 ] [Iz = 5.8962e-012] 0[F]
[Tz = 3.621116987949452 ] [Hz = 0.005783654616151157 ] [Iz = 5.1514e-014] 0[F]
  End iterative search to bracket zero crossing event
```

When solver resets occur, the debugger displays the time at which the solver was reset.

```
[Tr = 6.246905153573676 ] Process Solver Reset
[Tr = 6.246905153573676 ] Reset Zero Crossing Cache
[Tr = 6.246905153573676 ] Reset Derivative Cache
```

systems

List nonvirtual systems of model

Syntax

```
systems  
sys
```

Description

systems displays the nonvirtual subsystems for a model in the MATLAB Command Window.

sys is the short form of the command.

Examples

Display the nonvirtual systems for the model `sldemo_enginewc` using the Simulink debugger.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'sldemo_enginewc'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

```
systems
```

The MATLAB Command Window displays the nonvirtual subsystems.

```
Nonvirtual subsystems in model 'sldemo_enginewc':  
0 'sldemo_enginewc/Compression'  
1 'sldemo_enginewc/Controller'  
2 'sldemo_enginewc/Throttle & Manifold/Throttle/TmpAtomicSubsysAtSwitchInport1'  
3 'sldemo_enginewc/valve timing/positive edge to dual edge conversion'  
4 'sldemo_enginewc'
```

slist

Introduced before R2006a

tbreak

Set or clear time breakpoint

Syntax

`tbreak`

`tb`

`tbreak t`

Description

The `tbreak` command sets a breakpoint at the specified time step. If a breakpoint already exists at the specified time, `tbreak` clears the breakpoint. If you do not specify a time, `tbreak` toggles a breakpoint at the current time step.

Instead of `tbreak`, you can use the short form of `tb`, with or without `t`.

Introduced before R2006a

trace

Display block's I/O each time block executes

Syntax

```
trace gcb  
trace (t)s:b
```

```
tr gcb  
trace (t)s:b
```

Arguments

(t)s:b The block whose task index is t, system index is s and block index is b.
gcb Current block.

Description

The trace command registers a block as a trace point. The debugger displays the I/O of each registered block each time the block executes.

See Also

disp | probe | untrace | slist | strace

Introduced before R2006a

undisp

Remove block from debugger's list of display points

Syntax

```
undisp gcb
```

```
und gcb
```

```
undisp (t)s:b
```

```
und (t)s:b
```

Arguments

(t)s:b The block whose task index is **t**, system index is **s** and block index is **b**.

gcb Current block.

Description

The `undisp` command removes the specified block from the debugger's list of display points.

See Also

`disp` | `slist`

Introduced before R2006a

untrace

Remove block from debugger's list of trace points

Syntax

```
untrace gcb
```

```
unt gcb
```

```
untrace (t)s:b
```

```
unt (t)s:b
```

Arguments

(t)s:b The block whose task index is *t*, system index is *s* and block index is *b*.

gcb Current block.

Description

The `untrace` command removes the specified block from the debugger's list of trace points.

See Also

`trace` | `slist`

Introduced before R2006a

where

Display current location of simulation in simulation loop

Syntax

where [detail]

w [detail]

Description

The where command displays the current location of the simulation in the simulation loop, for example,

```
sldebug 07): where
0 >> vdp.Simulate
1 >> vdp.Start
2 >> RootSystem.Start 'vdp'
7 >| 0:8 Sum.Start 'Sum'
```

The display consists of a list of simulation nodes with the last entry being the node that is about to be entered or exited. Each entry contains the following information:

- Method ID
 - The method ID identifies a specific invocation of a method.
- A symbol specifying its state:
 - >> (active)
 - >| (about to be entered)
 - <| (about to be exited)
- Name of the method invoked (e.g., RootSystem.Start)
- Name of the block or system on which the method is invoked (e.g., Sum)
- System and block ID (sysIdx:blkIdx) of the block on which the method is invoked

For example, 0:8 indicates that the specified method operates on block 8 of system 0.

where detail, where detail is any nonnegative integer, includes inactive nodes in the display.

```
0 >> vdp.Simulate
  1   >> vdp.Start
  2     >> RootSystem.Start 'vdp'
  3       0:4 Scope.Start 'Scope'
  4         0:5 Fcn.Start 'Fcn'
  5           0:6 Product.Start
'Product '
  6             0:7 Gain.Start 'Mu'
  7               >| 0:8 Sum.Start 'Sum'
```

See Also

step

Introduced before R2006a

xbreak

Break when debugger encounters step-size-limiting state

Syntax

```
xbreak
```

```
x
```

Description

The `xbreak` command pauses execution of the model when the debugger encounters a state that limits the size of the steps that the solver takes. If `xbreak` mode is already on, `xbreak` turns the mode off.

See Also

`break` | `bafter` | `zcbreak` | `tbreak` | `nanbreak` | `rbreak`

Topics

`ebreak`

Introduced before R2006a

zcbreak

Toggle breaking at nonsampled zero-crossing events

Syntax

zcbreak

zcb

Description

The `zcbreak` command causes the debugger to break when a nonsampled zero-crossing event occurs. If zero-crossing break mode is already on, `zcbreak` turns the mode off.

See Also

`break` | `bafter` | `xbreak` | `tbreak` | `nanbreak` | `zclist`

Introduced before R2006a

zclist

List blocks containing nonsampled zero crossings

Syntax

```
zclist
```

```
zcl
```

Description

The `zclist` command displays a list of blocks in which nonsampled zero crossings can occur. The command displays the list in the MATLAB Command Window.

Simulink.ModelDataLogs	Container for signal data logs of a model
Simulink.MSFcnRunTimeBlock	Get run-time information about Level-2 MATLAB S-function block
Simulink.RunTimeBlock	Allow Level-2 MATLAB S-function and other MATLAB programs to get information about block while simulation is running
Simulink.SampleTime	Object containing sample time information
Simulink.SimState.ModelSimState	(Not recommended) Access SimState snapshot data

coder.BuildConfig class

Package: coder

Build context during code generation

Description

The code generator creates an object of this class to facilitate access to the build context. The build context encapsulates the settings used by the code generator including:

- Target language
- Code generation target
- Target hardware
- Build toolchain

Use `coder.BuildConfig` methods in the methods that you write for the `coder.ExternalDependency` class.

Construction

The code generator creates objects of this class.

Methods

<code>getHardwareImplementation</code>	Get handle of copy of hardware implementation object
<code>getStdLibInfo</code>	Get standard library information
<code>getTargetLang</code>	Get target code generation language
<code>getToolchainInfo</code>	Returns handle of copy of toolchain information object
<code>isCodeGenTarget</code>	Determine if build configuration represents specified target
<code>isMatlabHostTarget</code>	Determine if hardware implementation object target is MATLAB host computer

Copy Semantics

Value. To learn how value classes affect copy operations, see [Copying Objects](#).

Examples

Use `coder.BuildConfig` methods to access the build context in `coder.ExternalDependency` methods

This example shows how to use `coder.BuildConfig` methods to access the build context in `coder.ExternalDependency` methods. In this example, you use:

- `coder.BuildConfig.isMatlabHostTarget` to verify that the code generation target is the MATLAB host. If the host is not MATLAB report an error.
- `coder.BuildConfig.getStdLibInfo` to get the link-time and run-time library file extensions. Use this information to update the build information.

Write a class definition file for an external library that contains the function `adder`.

```

=====
% This class abstracts the API to an external Adder library.
% It implements static methods for updating the build information
% at compile time and build time.
=====

classdef AdderAPI < coder.ExternalDependency
    %#codegen

    methods (Static)

        function bName = getDescriptiveName(~)
            bName = 'AdderAPI';
        end

        function tf = isSupportedContext(buildContext)
            if buildContext.isMatlabHostTarget()
                tf = true;
            else
                error('adder library not available for this target');
            end
        end

        function updateBuildInfo(buildInfo, buildContext)
            % Get file extensions for the current platform
            [~, linkLibExt, execLibExt, ~] = buildContext.getStdLibInfo();

            % Add file paths
            hdrFilePath = fullfile(pwd, 'codegen', 'dll', 'adder');
            buildInfo.addIncludePaths(hdrFilePath);

            % Link files
            linkFiles = strcat('adder', linkLibExt);
            linkPath = hdrFilePath;
            linkPriority = '';
            linkPrecompiled = true;
            linkLinkOnly = true;
            group = '';
            buildInfo.addLinkObjects(linkFiles, linkPath, ...
                linkPriority, linkPrecompiled, linkLinkOnly, group);

            % Non-build files for packaging
            nbFiles = 'adder';
            nbFiles = strcat(nbFiles, execLibExt);
            buildInfo.addNonBuildFiles(nbFiles, '', '');
        end

        %API for library function 'adder'
        function c = adder(a, b)
            if coder.target('MATLAB')

```

```
        % running in MATLAB, use built-in addition
        c = a + b;
    else
        % Add the required include statements to the generated function code
        coder.cinclude('adder.h');
        coder.cinclude('adder_initialize.h');
        coder.cinclude('adder_terminate.h');
        c = 0;

        % Because MATLAB Coder generated adder, use the
        % housekeeping functions before and after calling
        % adder with coder.ceval.

        coder.ceval('adder_initialize');
        c = coder.ceval('adder', a, b);
        coder.ceval('adder_terminate');
    end
end
end
end
```

“Build Process Customization” (MATLAB Coder)

Introduced in R2013b

coder.ExternalDependency class

Package: coder

Interface to external code

Description

`coder.ExternalDependency` is an abstract class for developing an interface between external code and MATLAB code intended for code generation. You can define classes that derive from `coder.ExternalDependency` to encapsulate the interface to external libraries, object files, and C/C++ source code. This encapsulation allows you to separate the details of the interface from your MATLAB code.

To define a class derived from `coder.ExternalDependency`, create a subclass. For example:

```
classdef myClass < coder.ExternalDependency
```

You must define all of the methods listed in “Methods” on page 5-6. These methods are static and are not compiled. The code generator invokes these methods in MATLAB after code generation is complete to configure the build for the generated code. The `RTW.BuildInfo` and `coder.BuildConfig` objects that describe the build information and build context are automatically created during the build process. The `updateBuildInfo` method provides access to these objects. For more information on build information customization, see “Build Process Customization” (MATLAB Coder).

You also define methods that call the external code. These methods are compiled. For each external function that you want to call, write a method to define the programming interface to the function. In the method, use `coder.ceval` to call the external function.

Methods

<code>getDescriptiveName</code>	Return descriptive name for external dependency
<code>isSupportedContext</code>	Determine if build context supports external dependency
<code>updateBuildInfo</code>	Update build information

Examples

Encapsulate the Interface to an External C Dynamic Library

This example shows how to encapsulate the interface to an external C dynamic linked library using `coder.ExternalDependency`.

Write a function `adder` that returns the sum of its inputs.

```
function c = adder(a,b)
%#codegen
c = a + b;
end
```

Generate a library that contains adder.

```
codegen('adder', '-args', {-2,5}, '-config:dll', '-report')
```

Write the class definition file AdderAPI.m to encapsulate the library interface.

```
%=====
% This class abstracts the API to an external Adder library.
% It implements static methods for updating the build information
% at compile time and build time.
%=====

classdef AdderAPI < coder.ExternalDependency
    %#codegen

    methods (Static)

        function bName = getDescriptiveName(~)
            bName = 'AdderAPI';
        end

        function tf = isSupportedContext(buildContext)
            if buildContext.isMatlabHostTarget()
                tf = true;
            else
                error('adder library not available for this target');
            end
        end

        function updateBuildInfo(buildInfo, buildContext)
            % Get file extensions for the current platform
            [~, linkLibExt, execLibExt, ~] = buildContext.getStdLibInfo();

            % Add file paths
            hdrFilePath = fullfile(pwd, 'codegen', 'dll', 'adder');
            buildInfo.addIncludePaths(hdrFilePath);

            % Link files
            linkFiles = strcat('adder', linkLibExt);
            linkPath = hdrFilePath;
            linkPriority = '';
            linkPrecompiled = true;
            linkLinkOnly = true;
            group = '';
            buildInfo.addLinkObjects(linkFiles, linkPath, ...
                linkPriority, linkPrecompiled, linkLinkOnly, group);

            % Non-build files for packaging
            nbFiles = 'adder';
            nbFiles = strcat(nbFiles, execLibExt);
            buildInfo.addNonBuildFiles(nbFiles, '', '');
        end

        %API for library function 'adder'
        function c = adder(a, b)
            if coder.target('MATLAB')
                % running in MATLAB, use built-in addition
                c = a + b;
            end
        end
    end
end
```

```

else
    % Add the required include statements to the generated function code
    coder.cinclude('adder.h');
    coder.cinclude('adder_initialize.h');
    coder.cinclude('adder_terminate.h');
    c = 0;

    % Because MATLAB Coder generated adder, use the
    % housekeeping functions before and after calling
    % adder with coder.ceval.

    coder.ceval('adder_initialize');
    c = coder.ceval('adder', a, b);
    coder.ceval('adder_terminate');
end
end
end
end
end

```

Write a function `adder_main` that calls the external library function `adder`.

```

function y = adder_main(x1, x2)
    %#codegen
    y = AdderAPI.adder(x1, x2);
end

```

Generate a MEX function for `adder_main`. The MEX Function exercises the `coder.ExternalDependency` methods.

```
codegen('adder_main', '-args', {7,9}, '-report')
```

Copy the library to the current folder using the file extension for your platform. For Windows, use:

```
copyfile(fullfile(pwd, 'codegen', 'dll', 'adder', 'adder.dll'));
```

For Linux, use:

```
copyfile(fullfile(pwd, 'codegen', 'dll', 'adder', 'adder.so'));
```

Run the MEX function and verify the result.

```
adder_main_mex(2,3)
```

eventData

Provide information about block method execution events

Description

Simulink software creates an instance of this class when a block method execution event occurs during simulation and passes it to any listeners registered for the event (see `add_exec_event_listener`). The instance specifies the type of event that occurred and the block whose method execution triggered the event. See “Access Block Data During Simulation” for more information.

Parent

None

Children

None

Property Summary

Name	Description
“Type” on page 5-9	Type of method execution event that occurred.
“Source” on page 5-10	Block that triggered the event.

Properties

Type

Description

Type of method execution event that occurred. Possible values are:

event	Occurs...
'PreOutputs '	Before a block's Outputs method executes.
'PostOutputs '	After a block's Outputs method executes.
'PreUpdate '	Before a block's Update method executes.
'PostUpdate '	After a block's Update method executes.
'PreDerivatives '	Before a block's Derivatives method executes.
'PostDerivatives '	After a block's Derivatives method executes.

io.reader class

Package: io

Base class used to define custom variable or file reader for Simulation Data Inspector

Description

Use the `io.reader` base class to specify how to import custom variable and file formats into the **Simulation Data Inspector**. Write a class definition file that uses the `io.reader` methods to specify how to extract information like time and data values from the variable or file. Use this syntax as the first line in the class definition file to inherit from the `io.reader` class, where `MyReader` is the name of your subclass:

```
classdef MyReader < io.reader
```

For an example that shows how to write and use a custom file reader, see “Import Data Using a Custom File Reader”.

For an example that shows how to write and use a custom workspace data reader, see “Import Workspace Variables Using a Custom Data Reader”.

The `io.reader` class is a `handle` class.

Class Attributes

Abstract	true
HandleCompatible	true

For information on class attributes, see “Class Attributes”.

Properties

FileName — Name of imported file

'' (default) | character array

Name of imported file when using the subclass to import a file, specified as a character array.

Example: 'MyCustomFile'

Attributes:

GetAccess	public
SetAccess	public

VariableName — Name of imported variable

'' (default) | character array

Name of imported variable or signal, specified as a character array.

Example: 'MyVar'

Attributes:

GetAccess	public
SetAccess	public

VariableValue — Imported variable

variable

Imported variable. The VariableValue property has the same data type as the variable in the workspace or file. Use the VariableValue property to access the variable data inside method definitions.

Example: MyVar

Attributes:

GetAccess	public
SetAccess	public

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical | char | string | struct | enumerated | bus | table | cell | categorical | datetime | duration | calendarDuration | fi

Methods**Public Methods****Abstract Methods**

getName	Get names for data imported using a custom reader
getDataValues	Return data values for data imported using a custom reader
getTimeValues	Return time values for data imported using a custom reader

Commonly Used Methods

getChildren	Return custom reader object for each node and signal in data imported using a custom reader
supportsFile	Return logical indication of whether custom reader supports file
registerFileReader	Register custom file reader for use in the Simulation Data Inspector
unregisterFileReader	Unregister custom file reader for the Simulation Data Inspector
supportsVariable	Return logical indication of whether custom reader supports variable
registerWorkspaceReader	Register custom workspace reader for the Simulation Data Inspector
unregisterWorkspaceReader	Unregister custom workspace reader for the Simulation Data Inspector

Static Methods

io.reader.getRegisteredFileReaders	Return all custom file readers registered for the Simulation Data Inspector
io.reader.getSupportedReadersForFile	Return all readers available to import file
io.reader.getRegisteredWorkspaceReaders	Return all custom workspace readers registered for the Simulation Data Inspector

Additional Public Methods

<code>getDescription</code>	<pre>desc = getDescription(obj)</pre> <p>Return a character array or string that provides a description of the custom file reader to display in the import dialog in the Simulation Data Inspector.</p>
<code>getSampleDimensions</code>	<pre>dims = getSampleDimensions(obj)</pre> <p>Return a vector that represents the dimensions of a single sample. For a scalar signal, return [1]. Return a single value for wide signals ([3]).</p>
<code>getSignalDescription</code>	<pre>desc = getSignalDescription(obj)</pre> <p>Return a character array or string to use as the value for the Description property of the imported Simulink.sdi.Signal object.</p>
<code>getBlockPath</code>	<pre>blkPath = getBlockPath(obj)</pre> <p>Return a character array, string, or Simulink.SimulationData.BlockPath object that represents the source of the signal.</p>
<code>getPortIndex</code>	<pre>portInd = getPortIndex(obj)</pre> <p>Return an integer that corresponds to the index of the block output port that produces the signal.</p>
<code>getInterpolation</code>	<pre>int = getInterpolation(obj)</pre> <p>Return a character array or string that contains <code>zoh</code> to use zero-order hold interpolation or <code>linear</code> to use linear interpolation.</p>
<code>getUnit</code>	<pre>sigUnit = getUnit(obj)</pre> <p>Return a character array or string that contains the unit of measure for the signal.</p>
<code>isEventBasedSignal</code>	<pre>eventBased = isEventBasedSignal(obj)</pre> <p>Return true when the signal is event-based or a message.</p>

getChildren

Class: `io.reader`

Package: `io`

Return custom reader object for each node and signal in data imported using a custom reader

Syntax

```
childObj = getChildren(obj)
```

Description

`childObj = getChildren(obj)` returns an array of custom reader objects that correspond to hierarchical nodes and signals in data imported into the Simulation Data Inspector using a custom file or workspace reader. Use the `getChildren` method to preserve the hierarchy for imported data. When you import multiple signals from a file, you can use the `getChildren` method to import the data as a flat list of signals contained under a top-level node that corresponds to the file.

Input Arguments

obj — Custom data reader

`io.reader` subclass object

Custom data reader, specified as an object of a class that inherits from the `io.reader` base class.

Example: `MyCustomFileReader`

Output Arguments

childObj — Hierarchical nodes and signals

cell array of `io.reader` subclass objects

Hierarchical nodes and signals in imported data, returned as a cell array of `io.reader` subclass objects.

Examples

Structure Data Imported from File

This example uses the `getChildren` method to import multiple signals from a file as a flat list of signals contained in a top-level node that represents the file. Specify code for the `getChildren` method in the class definition file.

This example does not show a complete class definition. All custom readers must define behavior for the `getName`, `getTimeValues`, and `getDataValues` methods. For an example that shows the complete class definition and import workflow, see “Import Data Using a Custom File Reader”.

In this example, the `getChildren` method reads the data from the file using the `readtable` function. The custom reader in this example always uses the data in the first column as time, so the

first variable name is cleared and not used. The `getChildren` method creates a custom reader object for the top-level node that corresponds to the file and for each signal in the file and assigns values to the `FileName` and `VariableName` properties.

```
classdef ExcelFirstColumnTimeReader < io.reader
    methods
        % ...

        function childObj = getChildren(obj)
            childObj = {};
            if isempty(obj.VariableName)
                t = readtable(obj.FileName);
                vars = t.Properties.VariableNames;
                vars(1) = [];
                childObj = cell(size(vars));
                for idx = 1:numel(vars)
                    childObj{idx} = ExcelFirstColumnTimeReader;
                    childObj{idx}.FileName = obj.FileName;
                    childObj{idx}.VariableName = vars{idx};
                end
            end
        end
    end

    % ...
end
end
```

Structure Data Imported from Workspace

This example uses the `getChildren` method to import an array of structures stored in a variable in the base workspace. Specify code for the `getChildren` method in the class definition file.

This example does not show a complete class definition. All custom readers must define behavior for the `getName`, `getTimeValues`, and `getDataValues` methods, and workspace data readers need to define the `supportsVariable` method. For an example that shows the complete class definition and import workflow for a workspace data reader, see “Import Workspace Variables Using a Custom Data Reader”.

In this example, the `getChildren` method creates a custom reader object for each structure in the input variable when the variable is an array of structures. The workspace reader in this example defines a `ChannelIndex` property that the `getChildren` method uses to identify each object it creates.

```
classdef SimpleStructReader < io.reader

    properties
        ChannelIndex
    end

    methods
        % ...

        function childObj = getChildren(obj)
            childObj = {};
            if ~isscalar(obj.VariableValue) && isempty(obj.ChannelIndex)
```

```
numChannels = numel(obj.VariableValue);
childObj = cell(numChannels,1);
for idx = 1:numChannels
    childObj{idx} = SimpleStructReader;
    childObj{idx}.VariableName = sprintf('%s(%d)',obj.VariableName,idx);
    childObj{idx}.VariableValue = obj.VariableValue;
    childObj{idx}.ChannelIndex = idx;
end
end
end
% ...
end
end
```

getDataValues

Class: `io.reader`

Package: `io`

Return data values for data imported using a custom reader

Syntax

```
dataVals = getDataValues(obj)
```

Description

`dataVals = getDataValues(obj)` returns data values to use for data imported into the Simulation Data Inspector using a custom file or workspace variable reader. Specify code for the `getDataValues` method to extract signal values from a proprietary file or variable format.

Input Arguments

obj — Custom data reader

`io.reader` subclass object

Custom data reader, specified as an object of a class that inherits from the `io.reader` base class.

Example: `MyCustomFileReader`

Output Arguments

dataVals — Signal values

numeric array | enum array | logical array | string array

Signal values, returned as an array of numeric, enumeration, logical, or string values. For scalar signals and wide signals, the first dimension of the array aligns with time and must match the length of the time vector returned by `getTimeValues`. For multidimensional signals, the last dimension aligns with time and must match the length of the time vector returned by `getTimeValues`.

Attributes

Abstract true

To learn about attributes of methods, see [Method Attributes](#).

Examples

Get Signal Values for Data Imported from File

Write the function definition for the `getDataValues` method to return signal values to use for data imported from a file. The custom reader in this example imports the data from the file with a

hierarchical structure, treating the file as the top node. Specify the code for the `getDataValues` method in the class definition file.

This example does not show a complete class definition. All custom readers must define behavior for the `getName`, `getTimeValues`, and `getDataValues` methods. For an example that shows the complete class definition and import workflow, see “Import Data Using a Custom File Reader”.

In this example, the `getChildren` method reads the data from the file using the `readtable` function and returns an array of custom reader objects for the top-level node that corresponds to the file and for each signal in the file. Then, the `getDataValues` method reads the data using the `readtable` function and selects the signal data to return for each signal in the file using the `VariableName` property of each custom reader object.

```
classdef ExcelFirstColumnTimeReader < io.reader
    methods
        % ...

        function childObj = getChildren(obj)
            childObj = {};
            if isempty(obj.VariableName)
                t = readtable(obj.FileName);
                vars = t.Properties.VariableNames;
                vars(1) = [];
                childObj = cell(size(vars));
                for idx = 1:numel(vars)
                    childObj{idx} = ExcelFirstColumnTimeReader;
                    childObj{idx}.FileName = obj.FileName;
                    childObj{idx}.VariableName = vars{idx};
                end
            end
        end

        function dataVals = getDataValues(obj)
            dataVals = [];
            if ~isempty(obj.VariableName)

                dataVals = t.(obj.VariableName);
            end
        end

        % ...
    end
end
```

Get Signal Values from Workspace Variable

Write the function definition for the `getDataValues` method to return signal values from a workspace variable. Specify the code executed by the `getDataValues` method in the class definition file.

This example does not show a complete class definition. All custom readers must define behavior for the `getName`, `getTimeValues`, and `getDataValues` methods, and workspace data readers need to define the `supportsVariable` method. For an example that shows the complete class definition and import workflow for a workspace data reader, see “Import Workspace Variables Using a Custom Data Reader”.

The custom reader in this example imports a structure or an array of structures from the workspace. The structures must contain fields for the signal data (*d*), the time data (*t*), and the signal name (*n*). When the variable to import is a scalar structure, the `getDataValues` method returns the data from the *d* field of the structure.

When the variable is an array of structures, the custom reader uses both the `getDataValues` and `getChildren` methods to import the data. The `getChildren` method creates a custom reader object for each structure in the array and sets the `ChannelIndex` property to identify the index of the signal data within the array. Then, the `getDataValues` method uses the `ChannelIndex` property value to select the appropriate structure from the `VariableValue` property value, which is the array of structures.

```
classdef SimpleStructReader < io.reader

    properties
        ChannelIndex
    end

    methods
        % ...

        function childObj = getChildren(obj)
            childObj = {};
            if ~isscalar(obj.VariableValue) && isempty(obj.ChannelIndex)
                numChannels = numel(obj.VariableValue);
                childObj = cell(numChannels,1);
                for idx = 1:numChannels
                    childObj{idx} = SimpleStructReader;
                    childObj{idx}.VariableName = sprintf('%s(%d)',obj.VariableName,idx);
                    childObj{idx}.VariableValue = obj.VariableValue;
                    childObj{idx}.ChannelIndex = idx;
                end
            end
        end

        function dataVals = getDataValues(obj)
            if isscalar(obj.VariableValue)
                dataVals = obj.VariableValue.d;
            elseif ~isempty(obj.ChannelIndex)
                varVal = obj.VariableValue(obj.ChannelIndex);
                dataVals = varVal.d;
            else
                dataVals = [];
            end
        end

        % ...
    end
end
```

Get names for data imported using a custom reader

Syntax

```
retName = getName(obj)
```

Description

`retName = getName(obj)` returns the name to use in the **Simulation Data Inspector** for a signal or hierarchical node in data imported from the workspace or a file.

Input Arguments

obj — Custom data reader

`io.reader` subclass object

Custom data reader, specified as an object of a class that inherits from the `io.reader` base class.

Example: `MyCustomFileReader`

Output Arguments

retName — Signal name

character array

Signal name used by the **Simulation Data Inspector**, returned as a character array.

Attributes

Abstract true

Examples

Get Names for Data Imported from File

Write the function definition for the `getName` method to return names for signals imported from a file. The custom reader in this example imports the data from the file with a hierarchical structure, treating the file as the top node. Specify code for the `getName` method in the class definition file.

This example does not show a complete class definition. All custom readers must define behavior for the `getName`, `getTimeValues`, and `getDataValues` methods. For an example that shows the complete class definition and import workflow, see “Import Data Using a Custom File Reader”.

In this example, the `getName` and `getChildren` methods work together to assign the appropriate name to each imported signal. The `getChildren` method reads the data from the file using the `readtable` function. The method then constructs a cell array that contains a custom reader object for each signal read from the file.

The `getName` method uses the `FileName` property of the custom reader object to return the file name as the name for the top-level node. The `getName` method uses the `VariableName` property to return the signal name extracted from the file to use as the signal name for each imported signal.

```
classdef ExcelFirstColumnTimeReader < io.reader
    methods
        % ...

        function childObj = getChildren(obj)
            childObj = {};
            if isempty(obj.VariableName)
                t = readtable(obj.FileName);
                vars = t.Properties.VariableNames;
                vars(1) = [];
                childObj = cell(size(vars));
                for idx = 1:numel(vars)
                    childObj{idx} = ExcelFirstColumnTimeReader;
                    childObj{idx}.FileName = obj.FileName;
                    childObj{idx}.VariableName = vars{idx};
                end
            end
        end

        function retName = getName(obj)
            if isempty(obj.VariableName)
                fullName = obj.FileName;
                splitName = split(fullName,["\" "/""]);
                retName = splitName{end};
            else
                retName = obj.VariableName;
            end
        end

        % ...
    end
end
```

Get Names for Data Imported from Workspace

Write the function definition for the `getName` method to return signal names for data imported from the workspace. Specify code for the `getName` method in the class definition file.

This example does not show a complete class definition. All custom readers must define behavior for the `getName`, `getTimeValues`, and `getDataValues` methods, and workspace data readers need to define the `supportsVariable` method. For an example that shows the complete class definition and import workflow for a workspace data reader, see “Import Workspace Variables Using a Custom Data Reader”.

The custom reader in this example imports a structure or an array of structures from the workspace. The structures must contain fields for the signal data (`d`), the time data (`t`), and the signal name (`n`).

When the variable to import is a scalar structure, the `getName` method returns the value in the `n` field of the imported structure.

When the variable is an array of structures, the custom reader uses both the `getName` and `getChildren` methods to return signal names. The `getChildren` method creates a custom reader object for each structure in the array and sets the `ChannelIndex` property to identify the index of the signal data within the array. Then, the `getName` method uses the `ChannelIndex` property value to select the appropriate structure from the `VariableValue` property value, which is the array of structures.

```
classdef SimpleStructReader < io.reader

    properties
        ChannelIndex
    end

    methods
        % ...

        function childObj = getChildren(obj)
            childObj = {};
            if ~isscalar(obj.VariableValue) && isempty(obj.ChannelIndex)
                numChannels = numel(obj.VariableValue);
                childObj = cell(numChannels,1);
                for idx = 1:numChannels
                    childObj{idx} = SimpleStructReader;
                    childObj{idx}.VariableName = sprintf('%s(%d)',obj.VariableName,idx);
                    childObj{idx}.VariableValue = obj.VariableValue;
                    childObj{idx}.ChannelIndex = idx;
                end
            end
        end

        function retName = getName(obj)
            if isscalar(obj.VariableValue)
                retName = char(obj.VariableValue.n);
            elseif ~isempty(obj.ChannelIndex)
                varVal = obj.VariableValue(obj.ChannelIndex);
                retName = char(varVal.n);
            else
                retName = 'Signal Array';
            end
        end

        % ...
    end
end
```

Register Custom File Reader for the Simulation Data Inspector

This example shows how to register a custom file reader with the Simulation Data Inspector, verify registration was successful, and unregister a file reader.

Register the Custom File Reader

This example registers the file reader `ExcelFirstColumnTime`. For an example that shows how to author the custom file reader, see “Import Data Using a Custom File Reader”. As the name suggests, the custom file reader for this example supports Microsoft Excel™ files. Register the reader for the `.xlsx` and `.xls` extensions.

```
registerFileReader(ExcelFirstColumnTimeReader, [".xlsx" ".xls"]);
```

Verify Custom Reader Registration

To verify registration of a custom reader, you can use the `io.reader.getRegisteredFileReaders` method or the `io.reader.getSupportedReadersForFile` method.

The `io.reader.getRegisteredFileReaders` returns a string array that contains the names of all registered custom file readers.

```
io.reader.getRegisteredFileReaders
```

```
ans = 1x2 string
    "ExcelFirstColumnTimeReader"    "ExcelFirstColumnTimeReader"
```

You can also use the `io.reader.getSupportedReadersForFile` method to see all reader options for a specific file. The `built-in` option in the returned string array indicates that the Simulation Data Inspector has a built-in Excel file reader.

```
io.reader.getSupportedReadersForFile('CustomFile.xlsx')
```

```
ans = 1x2 string
    "ExcelFirstColumnTimeReader"    "built-in"
```

Unregister a Custom File Reader

To unregister a custom file reader, use the `unregisterFileReader` method. All custom readers are unregistered when you close a MATLAB™ session.

```
unregisterFileReader(ExcelFirstColumnTimeReader, [".xlsx" ".xls"])
```

io.reader.getRegisteredWorkspaceReaders

Class: io.reader

Package: io

Return all custom workspace readers registered for the Simulation Data Inspector

Syntax

```
readers = io.reader.getRegisteredWorkspaceReaders
```

Description

`readers = io.reader.getRegisteredWorkspaceReaders` returns an array of strings that indicate all custom workspace readers registered for the Simulation Data Inspector.

Output Arguments

readers — Custom workspace readers registered for the Simulation Data Inspector

array of strings

Custom workspace readers registered for the Simulation Data Inspector, returned as an array of strings.

Attributes

Static true

To learn about attributes of methods, see Method Attributes.

Examples

Register Custom Workspace Reader for the Simulation Data Inspector

This example shows how to register a custom workspace data reader with the Simulation Data Inspector, verify registration was successful, and unregister the workspace reader.

This example registers a custom workspace data reader called `SimpleStructReader`. For an example that shows how to author the custom workspace reader, see “Import Workspace Variables Using a Custom Data Reader”.

```
registerWorkspaceReader(SimpleStructReader);
```

To verify registration of a custom workspace reader, use the `io.reader.getRegisteredWorkspaceReaders` method, which returns a string array that contains the names of all registered custom workspace readers.

```
io.reader.getRegisteredWorkspaceReaders
```

```
ans =  
"SimpleStructReader"
```

To unregister a custom workspace reader, use the `unregisterWorkspaceReader` method. All readers are unregistered when you close the MATLAB™ session.

```
unregisterWorkspaceReader(SimpleStructReader);
```

io.reader.getSupportedReadersForFile

Class: io.reader

Package: io

Return all readers available to import file

Syntax

```
readers = io.reader.getSupportedReadersForFile(filename)
```

Description

`readers = io.reader.getSupportedReadersForFile(filename)` returns all readers in the Simulation Data Inspector that support importing the file specified by `filename`.

Input Arguments

filename — Name of or path to file to import

character array | string

Name of or path to file to import, specified as a character array or string.

Example: 'MyDataFile.csv'

Data Types: char | string

Output Arguments

readers — File readers available to import file

array of strings

File readers available to import file, returned as an array of strings. When the Simulation Data Inspector has a built-in reader for the file, the array contains "built-in".

Attributes

Static true

To learn about attributes of methods, see Method Attributes.

Examples

Register Custom File Reader for the Simulation Data Inspector

This example shows how to register a custom file reader with the Simulation Data Inspector, verify registration was successful, and unregister a file reader.

Register the Custom File Reader

This example registers the file reader `ExcelFirstColumnTime`. For an example that shows how to author the custom file reader, see “Import Data Using a Custom File Reader”. As the name suggests, the custom file reader for this example supports Microsoft Excel™ files. Register the reader for the `.xlsx` and `.xls` extensions.

```
registerFileReader(ExcelFirstColumnTimeReader, [".xlsx" ".xls"]);
```

Verify Custom Reader Registration

To verify registration of a custom reader, you can use the `io.reader.getRegisteredFileReaders` method or the `io.reader.getSupportedReadersForFile` method.

The `io.reader.getRegisteredFileReaders` returns a string array that contains the names of all registered custom file readers.

```
io.reader.getRegisteredFileReaders
ans = 1x2 string
    "ExcelFirstColumnTimeReader"    "ExcelFirstColumnTimeReader"
```

You can also use the `io.reader.getSupportedReadersForFile` method to see all reader options for a specific file. The `built-in` option in the returned string array indicates that the Simulation Data Inspector has a built-in Excel file reader.

```
io.reader.getSupportedReadersForFile('CustomFile.xlsx')
ans = 1x2 string
    "ExcelFirstColumnTimeReader"    "built-in"
```

Unregister a Custom File Reader

To unregister a custom file reader, use the `unregisterFileReader` method. All custom readers are unregistered when you close a MATLAB™ session.

```
unregisterFileReader(ExcelFirstColumnTimeReader, [".xlsx" ".xls"]);
```

getTimeValues

Class: `io.reader`

Package: `io`

Return time values for data imported using a custom reader

Syntax

```
timeVals = getTimeValues(obj)
```

Description

`timeVals = getTimeValues(obj)` returns time values to use for data imported into the **Simulation Data Inspector** using a custom file or workspace variable reader. Specify code for the `getTimeValues` method to extract the data from a proprietary file or variable format.

Input Arguments

obj — Custom data reader

`io.reader` subclass object

Custom data reader, specified as an object of a class that inherits from the `io.reader` base class.

Example: `MyCustomFileReader`

Output Arguments

timeVals — Time values for imported data

column vector

Time values for imported data, returned as a column vector.

Attributes

Abstract true

To learn about attributes of methods, see [Method Attributes](#).

Examples

Get Time Values for Data Imported from File

Write the function definition for the `getTimeValues` method to return time values to use for data imported from a file. The custom reader in this example always uses the data in the first column of the file as time. Specify the code for the `getTimeValues` method in the class definition file.

This example does not show a complete class definition. All custom readers must define behavior for the `getName`, `getTimeValues`, and `getDataValues` methods. For an example that shows the complete class definition and import workflow, see “Import Data Using a Custom File Reader”.

In this example, the `getTimeValues` method reads the data from the file using the `readtable` function and returns the data from the first column to use as the time values for imported signals.

```
classdef ExcelFirstColumnTimeReader < io.reader
    methods
        % ...

        function timeVals = getTimeValues(obj)
            timeVals = [];
            if ~isempty(obj.VariableName)
                t = readtable(obj.FileName);
                timeName = t.Properties.VariableNames{1};
                timeVals = t.(timeName);
            end
        end
    end

    % ...
end
end
```

Get Time Values for Data Imported from Workspace

Write the function definition for the `getTimeValues` method to return time values for data imported from the workspace. Specify the code executed by the `getTimeValues` method in the class definition file.

This example does not show a complete class definition. All custom readers must define behavior for the `getName`, `getTimeValues`, and `getDataValues` methods, and workspace data readers need to define the `supportsVariable` method. For an example that shows the complete class definition and import workflow for a workspace data reader, see “Import Workspace Variables Using a Custom Data Reader”.

The custom reader in this example imports a structure or an array of structures from the workspace. The structures must contain fields for the signal data (`d`), the time data (`t`), and the signal name (`n`). When the variable to import is a scalar structure, the `getTimeValues` method returns the value in the `t` field of the imported structure.

When the variable is an array of structures, the custom reader uses both the `getTimeValues` and `getChildren` methods to return time data. The `getChildren` method creates a custom reader object for each structure in the array and sets the `ChannelIndex` property to identify the index of the signal data within the array. Then, the `getTimeData` method uses the `ChannelIndex` property value to select the appropriate structure from the `VariableValue` property value, which is the array of structures.

```
classdef ExcelFirstColumnTimeReader < io.reader

    properties
        ChannelIndex
    end
end
```

```
methods
% ...

function childObj = getChildren(obj)
    childObj = {};
    if ~isscalar(obj.VariableValue) && isempty(obj.ChannelIndex)
        numChannels = numel(obj.VariableValue);
        childObj = cell(numChannels,1);
        for idx = 1:numChannels
            childObj{idx} = SimpleStructReader;
            childObj{idx}.VariableName = sprintf('%s(%d)',obj.VariableName,idx);
            childObj{idx}.VariableValue = obj.VariableValue;
            childObj{idx}.ChannelIndex = idx;
        end
    end
end

function timeVals = getTimeValues(obj)
    if isscalar(obj.VariableValue)
        timeVals = obj.VariableValue.t;
    elseif ~isempty(obj.ChannelIndex)
        varVal = obj.VariableValue(obj.ChannelIndex);
        timeVals = varVal.t;
    else
        timeVals = [];
    end
end

% ...
end
end
```

registerFileReader

Class: `io.reader`

Package: `io`

Register custom file reader for use in the Simulation Data Inspector

Syntax

```
registerFileReader(obj,ext)
```

Description

`registerFileReader(obj,ext)` registers the custom file reader `obj` with the Simulation Data Inspector to use for files with extensions specified by `ext`. To use a custom file reader in the Simulation Data Inspector, you must register the reader at the start of each MATLAB session.

Tip To verify registration, use the `io.reader.getRegisteredFileReaders` method or the `io.reader.getSupportedReadersForFile` method.

Input Arguments

obj — Custom data reader

`io.reader` subclass object

Custom data reader, specified as an object of a class that inherits from the `io.reader` base class.

Example: `MyCustomFileReader`

ext — File extensions supported by custom reader

character vector | string | cell array of character vectors | cell array of strings

File extensions supported by custom reader, specified as a character vector, string, cell array of character vectors, or cell array of strings.

Example: `[".xlsx" ".xls"]`

Data Types: `char` | `string` | `cell`

Examples

Register Custom File Reader for the Simulation Data Inspector

This example shows how to register a custom file reader with the Simulation Data Inspector, verify registration was successful, and unregister a file reader.

Register the Custom File Reader

This example registers the file reader `ExcelFirstColumnTime`. For an example that shows how to author the custom file reader, see “Import Data Using a Custom File Reader”. As the name suggests,

the custom file reader for this example supports Microsoft Excel™ files. Register the reader for the .xlsx and .xls extensions.

```
registerFileReader(ExcelFirstColumnTimeReader, [".xlsx" ".xls"]);
```

Verify Custom Reader Registration

To verify registration of a custom reader, you can use the `io.reader.getRegisteredFileReaders` method or the `io.reader.getSupportedReadersForFile` method.

The `io.reader.getRegisteredFileReaders` returns a string array that contains the names of all registered custom file readers.

```
io.reader.getRegisteredFileReaders  
  
ans = 1x2 string  
    "ExcelFirstColumnTimeReader"    "ExcelFirstColumnTimeReader"
```

You can also use the `io.reader.getSupportedReadersForFile` method to see all reader options for a specific file. The `built-in` option in the returned string array indicates that the Simulation Data Inspector has a built-in Excel file reader.

```
io.reader.getSupportedReadersForFile('CustomFile.xlsx')  
  
ans = 1x2 string  
    "ExcelFirstColumnTimeReader"    "built-in"
```

Unregister a Custom File Reader

To unregister a custom file reader, use the `unregisterFileReader` method. All custom readers are unregistered when you close a MATLAB™ session.

```
unregisterFileReader(ExcelFirstColumnTimeReader, [".xlsx" ".xls"]);
```

registerWorkspaceReader

Class: `io.reader`

Package: `io`

Register custom workspace reader for the Simulation Data Inspector

Syntax

```
registerWorkspaceReader(obj)
```

Description

`registerWorkspaceReader(obj)` registers the custom workspace reader specified by `obj` for the Simulation Data Inspector. To use a custom workspace reader, you must register the reader at the start of each MATLAB session.

Tip To verify registration, use the `io.reader.getRegisteredWorkspaceReaders` method.

Input Arguments

obj — Custom data reader

`io.reader` subclass object

Custom data reader, specified as an object of a class that inherits from the `io.reader` base class.

Example: `MyCustomReader`

Examples

Register Custom Workspace Reader for the Simulation Data Inspector

This example shows how to register a custom workspace data reader with the Simulation Data Inspector, verify registration was successful, and unregister the workspace reader.

This example registers a custom workspace data reader called `SimpleStructReader`. For an example that shows how to author the custom workspace reader, see “Import Workspace Variables Using a Custom Data Reader”.

```
registerWorkspaceReader(SimpleStructReader);
```

To verify registration of a custom workspace reader, use the `io.reader.getRegisteredWorkspaceReaders` method, which returns a string array that contains the names of all registered custom workspace readers.

```
io.reader.getRegisteredWorkspaceReaders
```

```
ans =  
"SimpleStructReader"
```

To unregister a custom workspace reader, use the `unregisterWorkspaceReader` method. All readers are unregistered when you close the MATLAB™ session.

```
unregisterWorkspaceReader(SimpleStructReader);
```

supportsFile

Class: `io.reader`

Package: `io`

Return logical indication of whether custom reader supports file

Syntax

```
supported = supportsFile(obj, filename)
```

Description

`supported = supportsFile(obj, filename)` returns the logical value `supported` that indicates whether the custom reader specified by `obj` supports the file specified by `filename`. The Simulation Data Inspector always checks whether a file is supported based on the file extension alone. Use the `supportsFile` method to specify code for additional support validation.

Input Arguments

obj — Custom data reader

`io.reader` subclass object

Custom data reader, specified as an object of a class that inherits from the `io.reader` base class.

Example: `MyCustomFileReader`

filename — Name of file to import

character vector | string

Name of file to import, specified as a character vector or string.

Example: `'MyDataFile.xlsx'`

Data Types: `char` | `string`

Output Arguments

supported — Whether custom reader supports file

logical

Whether custom reader supports file, returned as a logical value.

Examples

Determine Whether Custom File Reader Supports File

Write the function definition for the `supportsFile` method to determine whether the custom reader supports the data in the file. This example does not show a complete class definition. All custom readers must define behavior for the `getName`, `getTimeValues`, and `getDataValues` methods. For

an example that shows the complete class definition and import workflow, see “Import Data Using a Custom File Reader”.

In this example, the `supportsFile` method reads the data in the file using the `readtable` function and checks that the file contains data in more than one column.

```
classdef ExcelFirstColumnTimeReader < io.reader
    methods
        % ...

        function childObj = getChildren(obj)
            try
                t = readtable(filename);
                supported = height(t) > 0 && numel(t.Properties.VariableNames) > 1;
            catch
                supported = false;
            end
        end
    end
    % ...
end
end
```

See Also

Functions

`getDataValues` | `getName` | `getTimeValues` | `supportsFile`

Topics

“Import Data Using a Custom File Reader”

“Microsoft Excel Import, Export, and Logging Format”

Introduced in R2020b

supportsVariable

Class: `io.reader`

Package: `io`

Return logical indication of whether custom reader supports variable

Syntax

```
supported = supportsVariable(obj,var)
```

Description

`supported = supportsVariable(obj,var)` returns the logical value `supported` that indicates whether the custom workspace reader specified by `obj` supports the variable specified by `var`. When you write a custom workspace reader, you must implement the `supportsVariable` method in the class definition.

Input Arguments

obj — Custom data reader

`io.reader` subclass object

Custom data reader, specified as an object of a class that inherits from the `io.reader` base class.

Example: `MyCustomReader`

var — Workspace variable to import

variable

Workspace variable to import, specified as a variable in the base workspace.

Example: `myVar`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `string` | `struct` | `table` | `cell` | `categorical` | `datetime` | `duration` | `calendarDuration` | `fi`

Complex Number Support: Yes

Output Arguments

supported — Whether custom reader supports variable

logical

Whether the custom reader supports variable, returned as a logical value.

Examples

Determine Whether Custom Reader Supports Variable

Write the function definition for the `supportsVariable` method to return true only when the reader can import the input variable. Specify the code for the `supportsVariable` method in the class definition file.

This example does not show a complete class definition. All custom readers must define behavior for the `getName`, `getTimeValues`, and `getDataValues` methods, and workspace data readers need to define the `supportsVariable` method. For an example that shows the complete class definition and import workflow for a workspace data reader, see “Import Workspace Variables Using a Custom Data Reader”.

The custom reader in this example imports a structure or an array of structures from the workspace. The structures must contain fields for the signal data (`d`), the time data (`t`), and the signal name (`n`). The `supportsVariable` method returns true when:

- 1 The input variable is a structure or array of structures that contains the appropriate fields.
- 2 The `n` field of each structure contains a character array or string to represent the signal name.
- 3 The `t` field of each structure is a column vector of double data.
- 4 The `d` field of each structure contains numeric data and is the same size as the `t` field, meaning there is a sample value for each time step.

```
classdef ExcelFirstColumnTimeReader < io.reader

    methods
        % ...

        function supported = supportsVariable(~, val)
            % Support structure with fields t (time), d (data), and n (name)
            supported = ...
                isstruct(val) && ...
                isfield(val, 't') && ...
                isfield(val, 'd') && ...
                isfield(val, 'n');
            if supported
                for idx = 1:numel(val)
                    varName = val(idx).n;
                    time = val(idx).t;
                    varData = val(idx).d;

                    % Name must be string or character array
                    if ~ischar(varName) && ~isstring(varName)
                        supported = false;

                    % Time must be double column vector
                    elseif ~isa(time, 'double') || ~iscolumn(time)
                        supported = false;

                    % Data size must match time size
                    else
                        timeSz = size(time);
                        dataSz = size(varData);

                        if ~isnumeric(varData) || ~isequal(dataSz, timeSz)
                            supported = false;
                        end
                    end
                end
            end
        end
    end
end
```

```
        end
    end
end
end

% ...
end
end
```

unregisterFileReader

Class: `io.reader`

Package: `io`

Unregister custom file reader for the Simulation Data Inspector

Syntax

```
unregisterFileReader(obj,ext)
```

Description

`unregisterFileReader(obj,ext)` unregisters the custom file reader specified by `obj` for the extensions specified by `ext`. All custom file and workspace variable readers are unregistered when you close MATLAB.

Tip To verify the unregister operation, use the `io.reader.getRegisteredFileReaders` method or the `io.reader.getSupportedReadersForFile` method.

Input Arguments

obj — Custom data reader

`io.reader` subclass object

Custom data reader, specified as an object of a class that inherits from the `io.reader` base class.

Example: `MyCustomFileReader`

ext — File extensions supported by custom reader

character vector | string | cell array of character vectors | cell array of strings

File extensions supported by custom reader, specified as a character vector, string, cell array of character vectors, or cell array of strings.

Example: `[".xlsx" ".xls"]`

Data Types: `char` | `string` | `cell`

Examples

Register Custom File Reader for the Simulation Data Inspector

This example shows how to register a custom file reader with the Simulation Data Inspector, verify registration was successful, and unregister a file reader.

Register the Custom File Reader

This example registers the file reader `ExcelFirstColumnTime`. For an example that shows how to author the custom file reader, see “Import Data Using a Custom File Reader”. As the name suggests,

the custom file reader for this example supports Microsoft Excel™ files. Register the reader for the .xlsx and .xls extensions.

```
registerFileReader(ExcelFirstColumnTimeReader, [".xlsx" ".xls"]);
```

Verify Custom Reader Registration

To verify registration of a custom reader, you can use the `io.reader.getRegisteredFileReaders` method or the `io.reader.getSupportedReadersForFile` method.

The `io.reader.getRegisteredFileReaders` returns a string array that contains the names of all registered custom file readers.

```
io.reader.getRegisteredFileReaders
ans = 1x2 string
    "ExcelFirstColumnTimeReader"    "ExcelFirstColumnTimeReader"
```

You can also use the `io.reader.getSupportedReadersForFile` method to see all reader options for a specific file. The `built-in` option in the returned string array indicates that the Simulation Data Inspector has a built-in Excel file reader.

```
io.reader.getSupportedReadersForFile('CustomFile.xlsx')
ans = 1x2 string
    "ExcelFirstColumnTimeReader"    "built-in"
```

Unregister a Custom File Reader

To unregister a custom file reader, use the `unregisterFileReader` method. All custom readers are unregistered when you close a MATLAB™ session.

```
unregisterFileReader(ExcelFirstColumnTimeReader, [".xlsx" ".xls"]);
```

unregisterWorkspaceReader

Class: `io.reader`

Package: `io`

Unregister custom workspace reader for the Simulation Data Inspector

Syntax

```
unregisterWorkspaceReader(obj)
```

Description

`unregisterWorkspaceReader(obj)` unregisters the custom workspace reader specified by `obj` from the Simulation Data Inspector. All custom file and workspace variable readers are unregistered when you close MATLAB.

Input Arguments

obj — Custom data reader

`io.reader` subclass object

Custom data reader, specified as an object of a class that inherits from the `io.reader` base class.

Example: `MyCustomReader`

Examples

Register Custom Workspace Reader for the Simulation Data Inspector

This example shows how to register a custom workspace data reader with the Simulation Data Inspector, verify registration was successful, and unregister the workspace reader.

This example registers a custom workspace data reader called `SimpleStructReader`. For an example that shows how to author the custom workspace reader, see “Import Workspace Variables Using a Custom Data Reader”.

```
registerWorkspaceReader(SimpleStructReader);
```

To verify registration of a custom workspace reader, use the `io.reader.getRegisteredWorkspaceReaders` method, which returns a string array that contains the names of all registered custom workspace readers.

```
io.reader.getRegisteredWorkspaceReaders
```

```
ans =  
"SimpleStructReader"
```

To unregister a custom workspace reader, use the `unregisterWorkspaceReader` method. All readers are unregistered when you close the MATLAB™ session.

```
unregisterWorkspaceReader(SimpleStructReader);
```

Introduced in R2020b

matlab.io.datastore.sd datastore class

Package: matlab.io.datastore

Datastore for Simulation Data Inspector signals

Description

A `matlab.io.datastore.sd datastore` object provides access to signals logged to the Simulation Data Inspector that are too large to fit into memory. An `sd datastore` object references the data for a single signal. The `read` method loads the signal data referenced by an `sd datastore` object in a chunk-wise manner such that each chunk always fits into memory. You can use an `sd datastore` object to create a tall timetable for your signal data. For more information about working with tall arrays, see “Tall Arrays”.

Note `matlab.io.datastore.sd datastore` does not support parallel computations. If you have a Parallel Computing Toolbox license, use `mapreducer(0)` to set the execution environment to the local MATLAB client before creating a tall timetable from the `matlab.io.datastore.sd datastore`.

Construction

`ds = dsrObj.getAsDatastore(arg)` creates the `sd datastore`, `ds`, for the signal in the `Simulink.sdi.DatasetRef` object selected by the search criterion `arg`. You can specify `arg` as an integer representing the index of the desired signal within the `Simulink.sdi.DatasetRef` object, or as a character vector containing the name of the signal.

`ds = matlab.io.datastore.sd datastore(signalID)` creates the `sd datastore`, `ds`, for the signal corresponding to the specified `signalID`.

Input Arguments

arg — Element selection criterion

character vector | integer

Search criterion used to retrieve the element from the `Simulink.sdi.DatasetRef` object. For name-based searches, specify `arg` as a character vector. For index-based searches, `arg` is an integer, representing the index of the desired element.

Example: 'MySignal'

Example: 3

signalID — Numeric signal identifier

integer

Numeric signal identifier generated for the signal by the Simulation Data Inspector. You can get the signal ID for a signal using methods of the `Simulink.sdi.Run` object containing the signal or as a return from the `Simulink.sdi.createRun` function.

Properties

Name — Signal name

character vector

Name of the signal specified as a character vector.

Example: 'My Signal'

Signal — Simulink.sdi.Signal object

Simulink.sdi.Signal object

Simulink.sdi.Signal object associated with the sdidatastore. The Signal property provides access to the signal data and metadata.

Methods

hasdata	Determine if data is available to read
preview	Return preview of data in sdidatastore
read	Read a chunk of data from an sdidatastore
readall	Read all data from an sdidatastore
reset	Reset the read position

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects.

Examples

Create a Tall Timetable for a Simulation Data Inspector Signal

This example shows how to create a tall timetable for a signal in the Simulation Data Inspector repository. You can create the tall timetable using a Simulink.sdi.Signal object or by first creating a matlab.io.datastore.sdidatastore for the signal. You can use a matlab.io.datastore.sdidatastore to incrementally read and process signal data for signals that do not fit into memory. A tall timetable handles the data chunking and processing in the background. In general, you can work with tall timetables very similarly to how you work with in-memory data.

Create Data and Access Signal ID

Whether you create your tall timetable using a Simulink.sdi.Signal object or a matlab.io.datastore.sdidatastore, start by creating data and accessing the signal ID for a signal of interest. The sldemo_fuelsys model is configured to log signals which stream to the Simulation Data Inspector repository when you simulate the model.

```
open_system('sldemo_fuelsys')
sim('sldemo_fuelsys')
```

Then, use the Simulation Data Inspector programmatic interface to access the signal ID for a signal of interest. For example, access the ego signal.

```
runCount = Simulink.sdi.getRunCount;
latestRunID = Simulink.sdi.getRunIDByIndex(runCount);
latestRun = Simulink.sdi.getRun(latestRunID);

egoSigID = latestRun.getSignalIDByIndex(7);
```

Create a Tall Timetable Using a `matlab.io.datastore.sdidatastore`

In general, tall timetables are backed by datastores. Create a `matlab.io.datastore.sdidatastore` object to reference the signal data in the Simulation Data Inspector repository.

```
egoDs = matlab.io.datastore.sdidatastore(egoSigID);
```

Check the name of the datastore to verify you have the signal you expect.

```
egoDs.Name
```

```
ans =
'fuel'
```

Create a tall timetable from the `matlab.io.datastore.sdidatastore` to use for processing the signal data. When you have a Parallel Computing Toolbox™ license, you need to explicitly set the execution environment to the local MATLAB® session using `mapreducer` before creating the tall timetable. The `matlab.io.datastore.sdidatastore` object does not support parallel computations.

```
mapreducer(0);
```

```
egoTt = tall(egoDs)
```

```
egoTt =
```

```
Mx1 tall timetable
```

Time	Data
0 sec	1.209
0.00056199 sec	1.209
0.0033719 sec	1.209
0.01 sec	1.1729
0.02 sec	1.1409
0.03 sec	1.1124
0.04 sec	1.0873
0.05 sec	1.0652
⋮	⋮
⋮	⋮

Create a Tall Timetable Using a `Simulink.sdi.Signal` Object

The `Simulink.sdi.Signal` class has a method to create a tall timetable directly, allowing you to skip the step of creating a datastore by creating it behind the scenes. Use the signal ID to access the `Simulink.sdi.Signal` object for the ego signal. Then, use the `getTable` method to create the tall timetable.

```
egoSig = Simulink.sdi.getSignal(egoSigID);
```

```
egoTt = egoSig.getAsTall
```

```
egoTt =
```

```
Mx1 tall timetable
```

Time	Data
0 sec	1.209
0.00056199 sec	1.209
0.0033719 sec	1.209
0.01 sec	1.1729
0.02 sec	1.1409
0.03 sec	1.1124
0.04 sec	1.0873
0.05 sec	1.0652
:	:
:	:

Use the Tall Timetable to Process Your Signal Data

When you use the tall timetable `egoTt`, its underlying datastore reads chunks of data and passes them to the tall timetable to process. Neither the datastore nor the tall timetable retain any of the data in memory after processing. Also, the tall timetable defers processing for many operations. For example, calculate the mean value of the signal.

```
egoMean = mean(egoTt.Data)
```

```
egoMean =
```

```
tall double
```

```
?
```

You can use the `gather` function to evaluate a variable and write its value to the workspace, or you can use the `write` function to write the results to disc. When you use `gather`, be sure the results fit into memory.

```
egoMean = gather(egoMean)
```

```
Evaluating tall expression using the Local MATLAB Session:
```

```
- Pass 1 of 1: Completed in 2.5 sec
```

```
Evaluation completed in 2.7 sec
```

```
egoMean = 1.3292
```

When you perform multiple operations on a tall timetable, evaluation of the results for each step is deferred until you explicitly request the results with `write` or `gather`. During evaluation, MATLAB optimizes the number of passes it makes through the tall timetable, which can significantly speed up processing time for analyzing very large signals. For more information about working with tall arrays, see “Tall Arrays for Out-of-Memory Data”.

Process Signal Data Using a `matlab.io.datastore.sdidatastore`

A `matlab.io.datastore.sdidatastore` references signal data in the Simulation Data Inspector repository. When the signal is too large to fit into memory, you can use the

`matlab.io.datastore.sd datastore` to incrementally process the data manually or to create a tall timetable for the signal that handles the incremental processing for you. This example shows how to process data using a `matlab.io.datastore.sd datastore`.

Create a `matlab.io.datastore.sd datastore` for a Signal

Simulate the `sldemo_fuelsys` model, which is configured to log several signals, to create data in the Simulation Data Inspector repository.

```
sim('sldemo_fuelsys')
```

Use the Simulation Data Inspector programmatic interface to get the signal ID for the signal.

```
runCount = Simulink.sdi.getRunCount;
latestRunID = Simulink.sdi.getRunIDByIndex(runCount);
latestRun = Simulink.sdi.getRun(latestRunID);
speedSigID = latestRun.getSignalIDByIndex(4);
```

Use the signal ID to create a `matlab.io.datastore.sd datastore` for the speed signal.

```
speedSDIDs = matlab.io.datastore.sd datastore(speedSigID);
```

Verify the Contents of the Datastore

Check the `Name` property of the `matlab.io.datastore.sd datastore` to verify that it matches your expectations.

```
speedSDIDs.Name
```

```
ans =
'map'
```

You can also use the `preview` method to check that the first ten samples in the signal look correct.

```
speedSDIDs.preview
```

```
ans=10x1 timetable
      Time      Data
-----
0 sec          0.589
0.00056199 sec 0.58772
0.0033719 sec  0.58148
0.01 sec       0.56765
0.02 sec       0.54897
0.03 sec       0.53264
0.04 sec       0.51837
0.05 sec       0.50594
0.055328 sec   0.5
0.055328 sec   0.5
```

Process Signal Data with the `matlab.io.datastore.sd datastore`

When your signal is too large to fit into memory, you can use the `readData` method to read chunks of data from the Simulation Data Inspector repository to incrementally process your data. Use the

hasdata method as the condition for a while loop to incrementally process the whole signal. For example, find the maximum signal value.

```
latestMax = [];  
  
while speedSDIds.hasdata  
    speedChunk = speedSDIds.read;  
    speedChunkData = speedChunk.Data;  
    latestMax = max([speedChunkData; latestMax]);  
  
end  
  
latestMax  
  
latestMax = 0.8897
```

On each read operation, the read method updates the read position for the start of the next read operation. After reading some or all of the `matlab.io.datastore.sd datastore`, you can reset the read position to start again from the beginning of the signal.

```
speedSDIds.reset
```

Process Signal Data in Memory

When the signal referenced by your `matlab.io.datastore.sd datastore` fits into memory, you can use the `readall` method to read all the signal data into memory for processing, rather than reading and processing the data incrementally with the `read` method. The `readall` method returns a `timetable` with all the signal data.

```
speedTimetable = speedSDIds.readall;  
  
speedMax = max(speedTimetable.Data)  
  
speedMax = 0.8897
```

Introduced in R2017b

hasdata

Class: `matlab.io.datastore.sd datastore`

Package: `matlab.io.datastore`

Determine if data is available to read

Syntax

```
tf = sdi_ds.hasdata
```

Description

`tf = sdi_ds.hasdata` returns logical 1 if the `matlab.io.datastore.sd datastore`, `sdi_ds`, has data available to read. When `sdi_ds` does not have data available to read, `hasdata` returns 0.

Output Arguments

tf — Data availability indication

logical

Logical indication of whether the `matlab.io.datastore.sd datastore` has data available to read. When data is available, `tf` is 1. When data is not available, `tf` is 0.

Examples

Process Signal Data Using a `matlab.io.datastore.sd datastore`

A `matlab.io.datastore.sd datastore` references signal data in the Simulation Data Inspector repository. read

Class: `matlab.io.datastore.sd datastore`

Package: `matlab.io.datastore`

Read a chunk of data from an `sd datastore`

Syntax

```
data = sdi_ds.read
```

Description

`data = sdi_ds.read` reads a chunk of samples from the `matlab.io.datastore.sd datastore`, `sdi_ds`, and updates the read position for `sdi_ds` to the point following the endpoint of the returned data. The samples are returned in the `timetable`, `data`. The number of samples read by the `read` method vary, and the returned `timetable` always fits into memory. Use the `read` method to incrementally process signals that are too large to fit into memory.

Output Arguments

data — Chunk of data read from `sd datastore`

`timetable`

Chunk of samples read from the `matlab.io.datastore.simulationdatastore`, returned as a `timetable`.

Examples

Process Signal Data Using a `matlab.io.datastore.sd datastore`

A `matlab.io.datastore.sd datastore` references signal data in the Simulation Data Inspector repository. When the signal is too large to fit into memory, you can use the `matlab.io.datastore.sd datastore` to incrementally process the data manually or to create a tall `timetable` for the signal that handles the incremental processing for you. This example shows how to process data using a `matlab.io.datastore.sd datastore`.

0.055328 sec   0.5
```

Process Signal Data with the `matlab.io.datastore.sd datastore`

When your signal is too large to fit into memory, you can use the `readData` method to read chunks of data from the Simulation Data Inspector repository to incrementally process your data. Use the `hasdata` method as the condition for a while loop to incrementally process the whole signal. For example, find the maximum signal value.

```
latestMax = [];
while speedSDIds.hasdata
    speedChunk = speedSDIds.read;
    speedChunkData = speedChunk.Data;
    latestMax = max([speedChunkData; latestMax]);
end
latestMax
latestMax = 0.8897
```

On each read operation, the `read` method updates the read position for the start of the next read operation. After reading some or all of the `matlab.io.datastore.sd datastore`, you can reset the read position to start again from the beginning of the signal.

```
speedSDIds.reset
```

Process Signal Data in Memory

When the signal referenced by your `matlab.io.datastore.sd datastore` fits into memory, you can use the `readall` method to read all the signal data into memory for processing, rather than reading and processing the data incrementally with the `read` method. The `readall` method returns a `timetable` with all the signal data.

```
speedTimetable = speedSDIds.readall;
```

```
speedMax = max(speedTimetable.Data)
```

```
speedMax = 0.8897
```

Alternatives

You can use your `matlab.io.datastore.sd datastore` to create a tall `timetable` to process signals too large to fit into memory. The tall `timetable` handles loading and processing the chunks of signal data for you. The `matlab.io.datastore.sd datastore` reference page includes an example that shows how to process your data using a tall `timetable`. For more information about working with tall `timetables`, see “Tall Arrays”.

readall

Class: `matlab.io.datastore.sd datastore`

Package: `matlab.io.datastore`

Read all data from an `sd datastore`

Syntax

```
data = sdi_ds.readall
```

Description

`data = sdi_ds.readall` reads all the data in the `matlab.io.datastore.sd datastore`, `sdi_ds`, into memory, returning the `timetable`, `data`. Use `readall` only when the signal referenced by the `matlab.io.datastore.sd datastore` fits into memory.

Output Arguments

data — **timetable of data**

`timetable`

All the data in the `matlab.io.datastore.sd datastore`, returned in a `timetable`.

Examples

Process Signal Data Using a `matlab.io.datastore.sd datastore`

A `matlab.io.datastore.sd datastore` references signal data in the Simulation Data Inspector repository. When the signal is too large to fit into memory, you can use the `matlab.io.datastore.sd datastore` to incrementally process the data manually or to create a tall `timetable` for the signal that handles the incremental processing for you.     speedChunk = speedSDIds.read;  
    speedChunkData = speedChunk.Data;  
    latestMax = max([speedChunkData; latestMax]);  
  
end  
  
latestMax  
  
latestMax = 0.8897
```

On each read operation, the `read` method updates the read position for the start of the next read operation. After reading some or all of the `matlab.io.datastore.sd datastore`, you can reset the read position to start again from the beginning of the signal.

```
speedSDIds.reset
```

Process Signal Data in Memory

When the signal referenced by your `matlab.io.datastore.sd datastore` fits into memory, you can use the `readall` method to read all the signal data into memory for processing, rather than reading and processing the data incrementally with the `read` method. The `readall` method returns a `timetable` with all the signal data.

```
speedTimetable = speedSDIds.readall;  
  
speedMax = max(speedTimetable.Data)  
  
speedMax = 0.8897
```

Alternatives

When your signals fit into memory, you can use other classes and functions of the Simulation Data Inspector programmatic interface, like the `Simulink.sdi.Signal` class, to access and process simulation data.

Topics

"Datastore"

Introduced in R2017b

reset

Class: `matlab.io.datastore.sd datastore`

Package: `matlab.io.datastore`

Reset the read position

Syntax

```
sdi_ds.reset
```

Description

`sdi_ds.reset` resets the read position for the `matlab.io.datastore.sd datastore`, `sdi_ds`, to the beginning.

Examples

Process Signal Data Using a `matlab.io.datastore.sd datastore`

A `matlab.io.datastore.sd datastore` references signal data in the Simulation Data Inspector repository. When the signal is too large to fit into memory, you can use the `matlab.io.datastore.sd datastore` to incrementally process the data manually or to create a tall timetable for the signal that handles the incremental processing for you. This example shows how to process data using a `matlab.io.datastore.sd datastore`.

Create a `matlab.io.datastore.sd datastore` for a Signal

Simulate the `sldemo_fuelsys` model, which is configured to log several signals, to create data in the Simulation Data Inspector repository.

```
sim('sldemo_fuelsys')
```

Use the Simulation Data Inspector programmatic interface to get the signal ID for the signal.

```
runCount = Simulink.sdi.getRunCount;  
latestRunID = Simulink.sdi.getRunIDByIndex(runCount);  
latestRun = Simulink.sdi.getRun(latestRunID);  
speedSigID = latestRun.getSignalIDByIndex(4);
```

Use the signal ID to create a `matlab.io.datastore.sd datastore` for the speed signal.

```
speedSDIDs = matlab.io.datastore.sd datastore(speedSigID);
```

Verify the Contents of the Datastore

Check the Name property of the `matlab.io.datastore.sd datastore` to verify that it matches your expectations.

```
speedSDIDs.Name
```

```
ans =
'map'
```

You can also use the `preview` method to check that the first ten samples in the signal look correct.

```
speedSDIds.preview
```

```
ans=10x1 timetable
      Time      Data
-----
0 sec          0.589
0.00056199 sec 0.58772
0.0033719 sec  0.58148
0.01 sec       0.56765
0.02 sec       0.54897
0.03 sec       0.53264
0.04 sec       0.51837
0.05 sec       0.50594
0.055328 sec   0.5
0.055328 sec   0.5
```

Process Signal Data with the `matlab.io.datastore.sd datastore`

When your signal is too large to fit into memory, you can use the `readData` method to read chunks of data from the Simulation Data Inspector repository to incrementally process your data. Use the `hasdata` method as the condition for a while loop to incrementally process the whole signal. For example, find the maximum signal value.

```
latestMax = [];
while speedSDIds.hasdata
    speedChunk = speedSDIds.read;
    speedChunkData = speedChunk.Data;
    latestMax = max([speedChunkData; latestMax]);
end
latestMax
```

```
latestMax = 0.8897
```

On each read operation, the `read` method updates the read position for the start of the next read operation. After reading some or all of the `matlab.io.datastore.sd datastore`, you can reset the read position to start again from the beginning of the signal.

```
speedSDIds.reset
```

Process Signal Data in Memory

When the signal referenced by your `matlab.io.datastore.sd datastore` fits into memory, you can use the `readall` method to read all the signal data into memory for processing, rather than reading and processing the data incrementally with the `read` method. The `readall` method returns a `timetable` with all the signal data.

```
speedT timetable = speedSDIds.readall;  
speedMax = max(speedT timetable.Data)  
speedMax = 0.8897
```

“Datastore”

Introduced in R2017b

matlab.io.datastore.SimulationDatastore class

Package: matlab.io.datastore

Datastore for inputs and outputs of Simulink models

Description

A `matlab.io.datastore.SimulationDatastore` object enables a Simulink model to interact with big data. You can load big data as simulation input and log big output data from a simulation. To simulate models with big data, you store the data in a MAT-file and refer to the data through a `SimulationDatastore` object. See “Work with Big Data for Simulations”.

A `SimulationDatastore` object refers to big simulation data (which a MAT-file stores) for one signal. If the MAT-file stores simulation data for a bus signal, a `SimulationDatastore` object refers to the data for one leaf signal element in the bus. You can use the datastore object to inspect and access the data and, through a parent object such as `Simulink.SimulationData.Signal`, simulate a Simulink model with the data.

To analyze the datastore data, you can use the methods and properties of the `SimulationDatastore` object as well as MATLAB tools such as the `tall` function. For more information about the MATLAB tools, see “Getting Started with Datastore”.

Construction

After you store big simulation data in a `Simulink.SimulationData.Dataset` object in a MAT-file, a signal element in the `Dataset` object points to the big data. To create a `matlab.io.datastore.SimulationDatastore` object that refers to the big data:

- 1 At the command prompt or in a script, create a `Simulink.SimulationData.DatasetRef` object that refers to the `Dataset` object in the MAT-file.
- 2 Use one of these techniques:
 - Use one-based, curly-brace indexing (for example, `{1}`) to return an object that represents the target signal element, such as `Simulink.SimulationData.Signal` or `Simulink.SimulationData.State`. For example, for a `DatasetRef` object named `logout_ref`, to create a `Signal` object that refers to the second signal element, use this code:

```
myLoggedSig = logout_ref{2}
```
 - Use the `getAsDatastore` method of the `DatasetRef` object to return an object that represents the target signal element. For more information, see `getAsDatastore`.

The `SimulationDatastore` object resides in the `Values` property of the returned object.

Properties

FileName — Name and path of file that contains big data

character vector

Name and path of the file that contains the big data, returned as a character vector. This property is read-only.

Data Types: `char`

NumSamples — Total number of samples (time steps) in the datastore

`integer`

Total number of samples (time steps) in the datastore, returned as an integer. The `readall` method extracts this many samples from the big data. This property is read-only.

Data Types: `uint64`

ReadSize — Amount of data to read at a time

`100` (default) | `scalar double`

Amount of data to read at a time, in number of samples (time steps), specified as a scalar double. The `read` method extracts this many samples from the big data.

Data Types: `double`

Methods

<code>hasdata</code>	Determine if data is available to read
<code>isPartitionable</code>	Determine whether datastore is partitionable
<code>isShuffleable</code>	Determine whether datastore is shuffleable
<code>preview</code>	Return subset of data from datastore
<code>progress</code>	Return percentage of data that you have read from a datastore
<code>read</code>	Read data in datastore
<code>readall</code>	Read all data in datastore
<code>reset</code>	Reset datastore to initial state

Copy Semantics

Handle. To learn how handle classes affect copy operations, see [Copying Objects](#).

Limitations

- `SimulationDatastore` does not support using a parallel pool with Parallel Computing Toolbox installed. To analyze data using tall arrays or run MapReduce algorithms, set the global execution environment to be the local MATLAB session using `mapreducer`. Enter this code:

```
mapreducer(0)
```

For information about controlling parallel resources, see “Run mapreduce on a Parallel Pool” (Parallel Computing Toolbox).

- You cannot use a MATLAB tall variable as simulation input data.

Examples

Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a `matlab.io.datastore.SimulationDatastore` object.

Log Big Data from Model

Open the example model `sldemo_fuelsys`.

```
open_system('sldemo_fuelsys')
```

[Open the Dashboard](#) subsystem to simulate any combination of sensor failures.

Copyright 1990-2017 The MathWorks, Inc.

Select **Configuration Parameters > Data Import/Export > Log Dataset data to file**.

```
set_param('sldemo_fuelsys', 'LoggingToFile', 'on')
```

Simulate the model.

```
sim('sldemo_fuelsys')
```

The MAT-file `out.mat` appears in your current folder. The file contains data for logged signals such as `fuel` (which is at the root level of the model).

At the command prompt, create a `DatasetRef` object that refers to the logging variable by name, `sldemo_fuelsys_output`.

```
DSRef = Simulink.SimulationData.DatasetRef('out.mat', 'sldemo_fuelsys_output');
```

Preview Big Data

Use curly braces (`{` and `}`) to extract the signal element `fuel`, which is the tenth element in `DSRef`, as a `Simulink.SimulationData.Signal` object that contains a `SimulationDatastore` object.

```
SimDataSig = DSRef{10};
```

To more easily interact with the `SimulationDatastore` object that resides in the `Values` property of the `Signal` object, store a handle in a variable named `DStore`.

```
DStore = SimDataSig.Values;
```

Use the `preview` method to inspect the first five samples of logged data for the `fuel` signal.

```
preview(DStore)
```

```
ans =
```

```
10x1 timetable
```

Time	Data
-----	-----
0 sec	1.209
0.00056199 sec	1.209
0.0033719 sec	1.209
0.01 sec	1.1729
0.02 sec	1.1409
0.03 sec	1.1124
0.04 sec	1.0873
0.05 sec	1.0652
0.055328 sec	1.0652
0.055328 sec	1.0652

Inspect Specific Sample

Inspect the 603rd sample of logged `fuel` data.

Set the `ReadSize` property of `DStore` to a number that, considering memory resources, your computer can tolerate. For example, set `ReadSize` to 200.

```
DStore.ReadSize = 200;
```

Read from the datastore three times. Each read operation advances the reading position by 200 samples.

```
read(DStore);
read(DStore);
read(DStore);
```

Now that you are very close to the 603rd sample, set `ReadSize` to a smaller number. For example, set `ReadSize` to 5.

```
DStore.ReadSize = 5;
```

Read from the datastore again.

```
read(DStore)
```

```
ans =
```

```
5x1 timetable
```

Time	Data
5.79 sec	1.6097
5.8 sec	1.6136
5.81 sec	1.6003
5.82 sec	1.5904
5.83 sec	1.5832

The third sample of read data is the 603rd sample in the datastore.

Inspect Earlier Sample

Inspect the 403rd sample of logged `fuel` data. Due to previous read operations, the datastore now reads starting from the 606th sample, so you must reset the datastore. Then, you can read from the first sample up to the 403rd sample.

Use the `reset` method to reset `DStore`.

```
reset(DStore);
```

Set `ReadSize` to 200 again.

```
DStore.ReadSize = 200;
```

Read from the datastore twice to advance the read position to the 401st sample.

```
read(DStore);
read(DStore);
```

Set `ReadSize` to 5 again.

```
DStore.ReadSize = 5;
```

Read from the datastore.

```
read(DStore)
```

```
ans =
```

```
5x1 timetable
```

Time	Data
3.85 sec	0.999
3.86 sec	0.99219
3.87 sec	0.98538
3.88 sec	0.97858

3.89 sec 0.97179

Extract Multiple Samples

Extract samples 1001 through 1020 (a total of 20 samples).

Reset the datastore.

```
reset(DStore)
```

Advance to sample 1001.

```
DStore.ReadSize = 200;
```

```
for i = 1:5  
    read(DStore);  
end
```

Prepare to extract 20 samples from the datastore.

```
DStore.ReadSize = 20;
```

Extract samples 1001 through 1020. Store the extracted data in a variable named `targetSamples`.

```
targetSamples = read(DStore)
```

```
targetSamples =
```

```
20x1 timetable
```

Time	Data
9.7 sec	1.5828
9.71 sec	1.5733
9.72 sec	1.5664
9.73 sec	1.5614
9.74 sec	1.5579
9.75 sec	1.5553
9.76 sec	1.5703
9.77 sec	1.582
9.78 sec	1.5913
9.79 sec	1.5988
9.8 sec	1.605
9.81 sec	1.6101
9.82 sec	1.6145
9.83 sec	1.6184
9.84 sec	1.6049
9.85 sec	1.595
9.86 sec	1.5877
9.87 sec	1.5824
9.88 sec	1.5785
9.89 sec	1.5757

Find Maximum Value of Data in Datastore

Reset the datastore.

```
reset(DStore)
```

Write a while loop, using the `hasdata` method, to incrementally analyze the data in chunks of 200 samples.

```
DStore.ReadSize = 200;
runningMax = [];
while hasdata(DStore)
    tt = read(DStore);
    rawChunk = tt.Data;
    runningMax = max([rawChunk; runningMax]);
end
```

Now, the variable `runningMax` stores the maximum value in the entire datastore.

```
runningMax
```

```
runningMax =
```

```
    1.6423
```

hasdata

Class: `matlab.io.datastore.SimulationDatastore`

Package: `matlab.io.datastore`

Determine if data is available to read

Syntax

```
tf = hasdata(dst)
```

Description

`tf = hasdata(dst)` returns logical 1 (true) if there is data available to read from the datastore (`matlab.io.datastore.SimulationDatastore` object) specified by `dst`. Otherwise, it returns logical 0 (false).

Input Arguments

dst — Input datastore

`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

Examples

Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a `matlab.io.datastore.SimulationDatastore` object.

isPartitionable

Class: `matlab.io.datastore.SimulationDatastore`

Package: `matlab.io.datastore`

Determine whether datastore is partitionable

Syntax

```
tf = isPartitionable(ds)
```

Description

`tf = isPartitionable(ds)` returns logical 1 (true) if the datastore `ds` is partitionable. Otherwise, the result is logical 0 (false).

Input Arguments

ds — Input datastore

datastore

Input datastore. You can use these datastores as input:

- MATLAB datastores — Datastores created using MATLAB datastore functions. For a complete list of datastores, see “Select Datastore for File Format or Application”.
- Combined and transformed datastores — Datastores created using the `combine` and `transform` functions.
- Custom datastores — Datastores created using the custom datastore framework. Any datastore that subclasses from `matlab.io.Datastore` supports the `isPartitionable` function. See “Develop Custom Datastore” for more information.

Examples

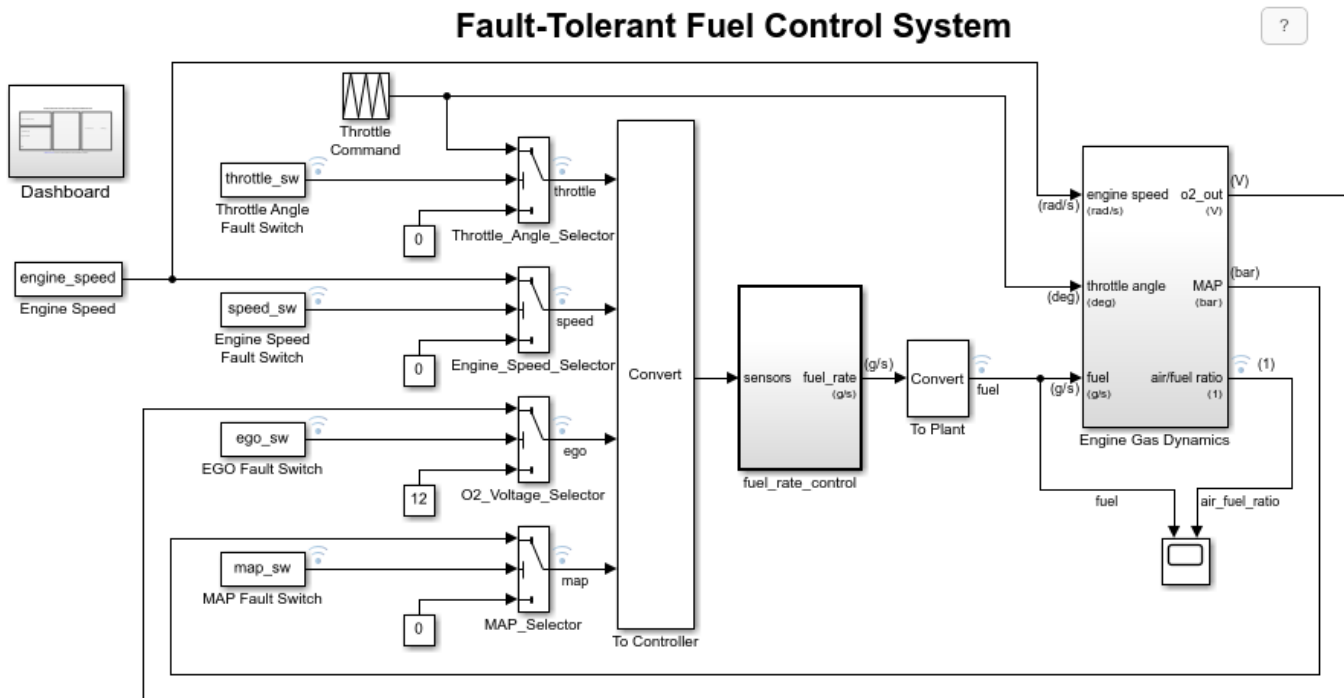

Test Partitionability of Simulation Datastore

This example shows how to determine the partitionability of a `matlab.io.datastore.SimulationDatastore` object that contains big data from a simulation.

Log Big Data from Model

Open the example model `sldemo_fuelsys`.

```
open_system('sldemo_fuelsys')
```

[Open the Dashboard](#) subsystem to simulate any combination of sensor failures.

Copyright 1990-2017 The MathWorks, Inc.

Select **Configuration Parameters > Data Import/Export > Log Dataset data to file.**

```
set_param('sldemo_fuelsys', 'LoggingToFile', 'on')
```

Simulate the model.

```
sim('sldemo_fuelsys')
```

The MAT-file `out.mat` appears in your current folder. The file contains data for logged signals such as `fuel` (which is at the root level of the model).

At the command prompt, create a `DatasetRef` object that refers to the logging variable by name, `sldemo_fuelsys_output`.

```
DSRef = Simulink.SimulationData.DatasetRef('out.mat', 'sldemo_fuelsys_output');
```

Preview Big Data

Use curly braces (`{}` and `}`) to extract the signal element `fuel`, which is the tenth element in `DSRef`, as a `Simulink.SimulationData.Signal` object that contains a `SimulationDatastore` object.

```
SimDataSig = DSRef{10};
```

To more easily interact with the `SimulationDatastore` object that resides in the `Values` property of the `Signal` object, store a handle in a variable named `DStore`.

```
DStore = SimDataSig.Values;
```

Determine if the datastore is partitionable.

```
if isPartitionable(DStore)
    disp('Datastore is partitionable.')
else
    disp('Datastore is not partitionable.')
end
```

Datastore is not partitionable.

isShuffleable

Class: `matlab.io.datastore.SimulationDatastore`

Package: `matlab.io.datastore`

Determine whether datastore is shuffleable

Syntax

```
tf = isShuffleable(ds)
```

Description

`tf = isShuffleable(ds)` returns logical 1 (true) if the datastore `ds` is shuffleable. Otherwise, the result is logical 0 (false).

You can use the `shuffle` function on shuffleable datastores to randomize the ordering of files, while preserving the row associations of files in different datastores.

Input Arguments

ds — Input datastore

datastore

Input datastore. You can use these datastores as input:

- MATLAB datastores — Datastores created using MATLAB `datastore` functions. For a complete list of datastores, see “Select Datastore for File Format or Application”.
- Combined and transformed datastores — Datastores created using the `combine` and `transform` functions.
- Custom datastores — Datastores created using the custom datastore framework. Any datastore that subclasses from `matlab.io.Datastore` supports the `isShuffleable` function. See “Develop Custom Datastore” for more information.

```

Preview Big Data

Use curly braces (`{}` and `}`) to extract the signal element `fuel`, which is the tenth element in `DSRef`, as a `Simulink.SimulationData.Signal` object that contains a `SimulationDatastore` object.

```
SimDataSig = DSRef{10};
```

To more easily interact with the `SimulationDatastore` object that resides in the `Values` property of the `Signal` object, store a handle in a variable named `DStore`.

```
DStore = SimDataSig.Values;
```

Determine if the datastore is shuffleable.

```
if isShuffleable(DStore)
    disp('Datastore is shuffleable.')
else
    disp('Datatstore is not shuffleable.')
end
```

Datatstore is not shuffleable.

Topics

“Getting Started with Datastore”

Introduced in R2020a

preview

Class: `matlab.io.datastore.SimulationDatastore`

Package: `matlab.io.datastore`

Return subset of data from datastore

Syntax

```
data = preview(dst)
```

Description

`data = preview(dst)` returns a subset of data from datastore (`matlab.io.datastore.SimulationDatastore` object) `dst` without changing its current read position. `preview` returns only the first ten samples (time steps) of data in the datastore. Use this method to quickly inspect and verify that the data appears as you expect.

Input Arguments

dst — Input datastore

`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

Output Arguments

data — Subset of data

`timetable` object

Subset of data, returned as a `timetable` object. For information about `timetable`, see “Timetables”.

Examples

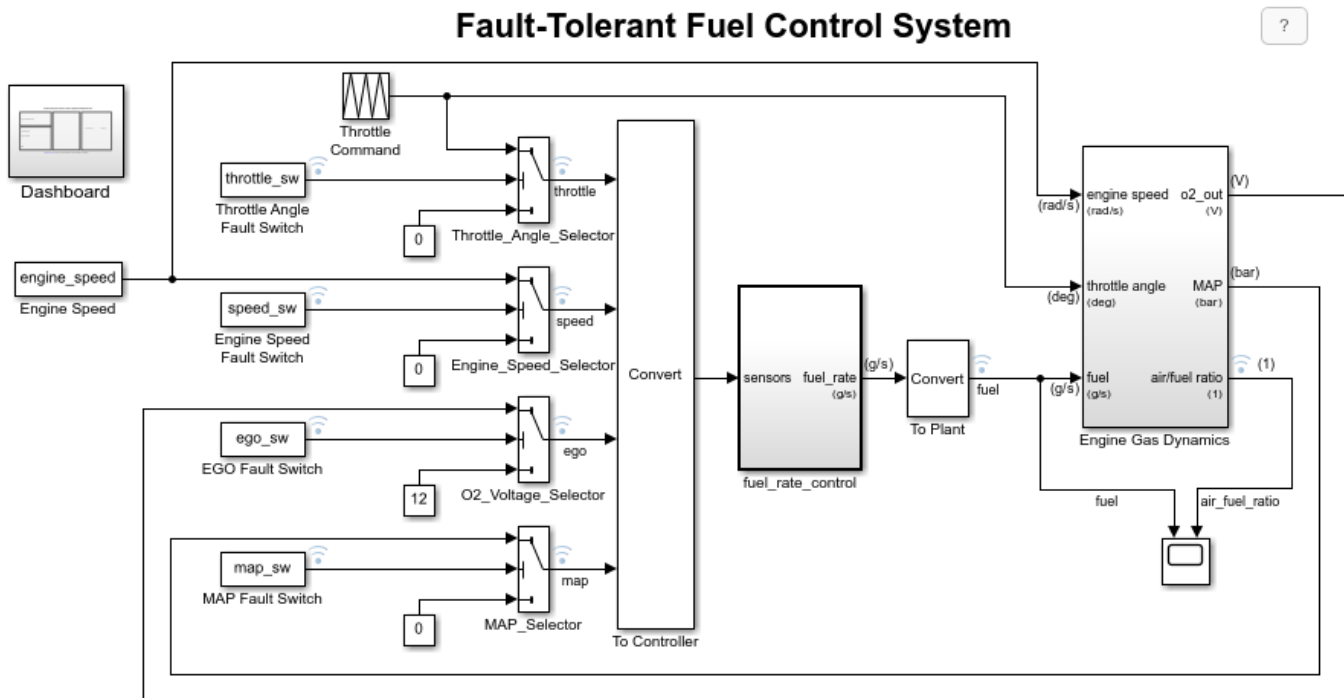

Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a `matlab.io.datastore.SimulationDatastore` object.

Log Big Data from Model

Open the example model `sldemo_fuelsys`.

```
open_system('sldemo_fuelsys')
```

[Open the Dashboard](#) subsystem to simulate any combination of sensor failures.

Copyright 1990-2017 The MathWorks, Inc.

Select **Configuration Parameters > Data Import/Export > Log Dataset data to file.**

```
set_param('sldemo_fuelsys', 'LoggingToFile', 'on')
```

Simulate the model.

```
sim('sldemo_fuelsys')
```

The MAT-file `out.mat` appears in your current folder. The file contains data for logged signals such as `fuel` (which is at the root level of the model).

At the command prompt, create a `DatasetRef` object that refers to the logging variable by name, `sldemo_fuelsys_output`.

```
DSRef = Simulink.SimulationData.DatasetRef('out.mat', 'sldemo_fuelsys_output');
```

Preview Big Data

Use curly braces (`{}` and `}`) to extract the signal element `fuel`, which is the tenth element in `DSRef`, as a `Simulink.SimulationData.Signal` object that contains a `SimulationDatastore` object.

```
SimDataSig = DSRef{10};
```

To more easily interact with the `SimulationDatastore` object that resides in the `Values` property of the `Signal` object, store a handle in a variable named `DStore`.

```
DStore = SimDataSig.Values;
```

Use the `preview` method to inspect the first five samples of logged data for the `fuel` signal.

```
preview(DStore)
```

```
ans =
```

```
10x1 timetable
```

Time	Data
0 sec	1.209
0.00056199 sec	1.209
0.0033719 sec	1.209
0.01 sec	1.1729
0.02 sec	1.1409
0.03 sec	1.1124
0.04 sec	1.0873
0.05 sec	1.0652
0.055328 sec	1.0652
0.055328 sec	1.0652

Inspect Specific Sample

Inspect the 603rd sample of logged fuel data.

Set the `ReadSize` property of `DStore` to a number that, considering memory resources, your computer can tolerate. For example, set `ReadSize` to 200.

```
DStore.ReadSize = 200;
```

Read from the datastore three times. Each read operation advances the reading position by 200 samples.

```
read(DStore);  
read(DStore);  
read(DStore);
```

Now that you are very close to the 603rd sample, set `ReadSize` to a smaller number. For example, set `ReadSize` to 5.

```
DStore.ReadSize = 5;
```

Read from the datastore again.

```
read(DStore)
```

```
ans =
```

```
5x1 timetable
```

Time	Data
5.79 sec	1.6097
5.8 sec	1.6136
5.81 sec	1.6003
5.82 sec	1.5904

```
5.83 sec    1.5832
```

The third sample of read data is the 603rd sample in the datastore.

Inspect Earlier Sample

Inspect the 403rd sample of logged fuel data. Due to previous read operations, the datastore now reads starting from the 606th sample, so you must reset the datastore. Then, you can read from the first sample up to the 403rd sample.

Use the `reset` method to reset `DStore`.

```
reset(DStore);
```

Set `ReadSize` to 200 again.

```
DStore.ReadSize = 200;
```

Read from the datastore twice to advance the read position to the 401st sample.

```
read(DStore);
read(DStore);
```

Set `ReadSize` to 5 again.

```
DStore.ReadSize = 5;
```

Read from the datastore.

```
read(DStore)
```

```
ans =
```

```
5x1 timetable
```

Time	Data
3.85 sec	0.999
3.86 sec	0.99219
3.87 sec	0.98538
3.88 sec	0.97858
3.89 sec	0.97179

Extract Multiple Samples

Extract samples 1001 through 1020 (a total of 20 samples).

Reset the datastore.

```
reset(DStore)
```

Advance to sample 1001.

```
DStore.ReadSize = 200;
```

```
for i = 1:5
    read(DStore);
end
```

Prepare to extract 20 samples from the datastore.

```
DStore.ReadSize = 20;
```

Extract samples 1001 through 1020. Store the extracted data in a variable named `targetSamples`.

```
targetSamples = read(DStore)
```

```
targetSamples =
```

```
20x1 timetable
```

Time	Data
9.7 sec	1.5828
9.71 sec	1.5733
9.72 sec	1.5664
9.73 sec	1.5614
9.74 sec	1.5579
9.75 sec	1.5553
9.76 sec	1.5703
9.77 sec	1.582
9.78 sec	1.5913
9.79 sec	1.5988
9.8 sec	1.605
9.81 sec	1.6101
9.82 sec	1.6145
9.83 sec	1.6184
9.84 sec	1.6049
9.85 sec	1.595
9.86 sec	1.5877
9.87 sec	1.5824
9.88 sec	1.5785
9.89 sec	1.5757

Find Maximum Value of Data in Datastore

Reset the datastore.

```
reset(DStore)
```

Write a `while` loop, using the `hasdata` method, to incrementally analyze the data in chunks of 200 samples.

```
DStore.ReadSize = 200;
runningMax = [];
while hasdata(DStore)
    tt = read(DStore);
    rawChunk = tt.Data;
    runningMax = max([rawChunk; runningMax]);
end
```

Now, the variable `runningMax` stores the maximum value in the entire datastore.

```
runningMax
```

```
runningMax =
```

```
    1.6423
```

“Work with Big Data for Simulations”

Introduced in R2017a

progress

Class: `matlab.io.datastore.SimulationDatastore`

Package: `matlab.io.datastore`

Return percentage of data that you have read from a datastore

Syntax

```
p = progress(dst)
```

Description

`p = progress(dst)` returns the percentage, as a number between 0 and 1, of the data that you have read from a datastore (`matlab.io.datastore.SimulationDatastore` object). For example, a return value of 0.55 means you have read 55% of the data. Use the `progress` method and the `NumSamples` property to determine the current read position.

You read data from a `SimulationDatastore` object by using the `read` method.

Input Arguments

dst — Input datastore

`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

Output Arguments

p — Percentage of data that you have read from the datastore

scalar double

Percentage of data that you have read from the datastore, returned as a scalar double.

Data Types: double

“Work with Big Data for Simulations”

Introduced in R2017a

read

Class: `matlab.io.datastore.SimulationDatastore`

Package: `matlab.io.datastore`

Read data in datastore

Syntax

```
data = read(dst)
[data,info] = read(dst)
```

Description

`data = read(dst)` returns data from a datastore (`matlab.io.datastore.SimulationDatastore` object). Subsequent calls to the `read` function continue reading from the endpoint of the previous call. Use the `ReadSize` property of the `SimulationDatastore` object to specify the amount of data, in samples (time steps), to read at a time. Use the `progress` method and the `NumSamples` property to determine the current read position.

`[data,info] = read(dst)` also returns information about the extracted data in `info`.

Input Arguments

dst — Input datastore

`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

Output Arguments

data — Output data

`timetable` object

Output data, returned as a `timetable` object. For information about `timetable`, see “Timetables”.

info — Information about read data

structure array

Information about read data, returned as a structure. The structure has one field, `FileName`, which is a fully resolved path containing the path string, the name of the file, and the file extension.

Examples

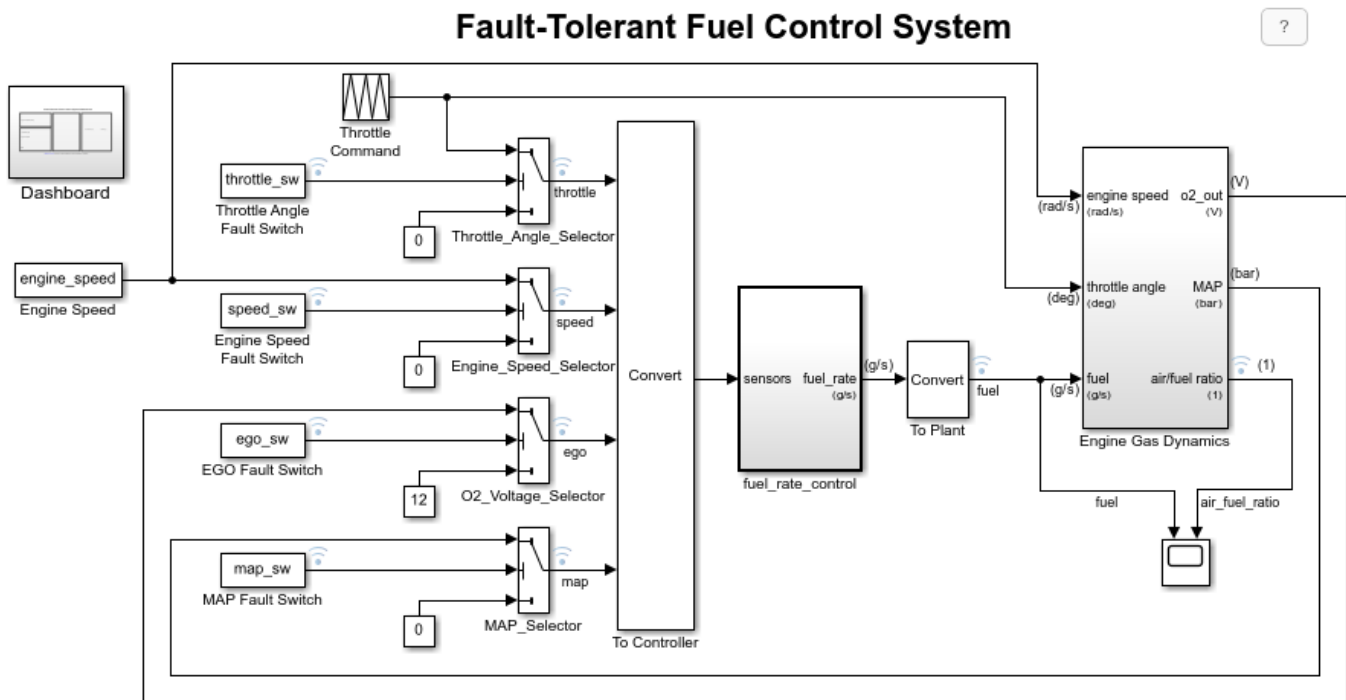

Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a `matlab.io.datastore.SimulationDatastore` object.

Log Big Data from Model

Open the example model `sldemo_fuelsys`.

```
open_system('sldemo_fuelsys')
```

[Open the Dashboard](#) subsystem to simulate any combination of sensor failures.

Copyright 1990-2017 The MathWorks, Inc.

Select **Configuration Parameters > Data Import/Export > Log Dataset data to file.**

```
set_param('sldemo_fuelsys', 'LoggingToFile', 'on')
```

Simulate the model.

```
sim('sldemo_fuelsys')
```

The MAT-file `out.mat` appears in your current folder. The file contains data for logged signals such as `fuel` (which is at the root level of the model).

At the command prompt, create a `DatasetRef` object that refers to the logging variable by name, `sldemo_fuelsys_output`.

```
DSRef = Simulink.SimulationData.DatasetRef('out.mat', 'sldemo_fuelsys_output');
```

Preview Big Data

Use curly braces (`{` and `}`) to extract the signal element `fuel`, which is the tenth element in `DSRef`, as a `Simulink.SimulationData.Signal` object that contains a `SimulationDatastore` object.

```
SimDataSig = DSRef{10};
```

To more easily interact with the `SimulationDatastore` object that resides in the `Values` property of the `Signal` object, store a handle in a variable named `DStore`.

```
DStore = SimDataSig.Values;
```

Use the `preview` method to inspect the first five samples of logged data for the `fuel` signal.

```
preview(DStore)
```

```
ans =

“Work with Big Data for Simulations”

Introduced in R2017a

readall

Class: `matlab.io.datastore.SimulationDatastore`

Package: `matlab.io.datastore`

Read all data in datastore

Syntax

```
data = readall(dst)
```

Description

`data = readall(dst)` returns all the data in the datastore (`matlab.io.datastore.SimulationDatastore` object) specified by `dst`.

If all the data in the datastore does not fit in memory, `readall` returns an error. To determine how many samples (time steps) a datastore holds, inspect the `NumSamples` property of the `SimulationDatastore` object.

Input Arguments

dst — Input datastore

`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

Output Arguments

data — All data in the datastore

`timetable` object

All data in the datastore, returned as a `timetable` object. For information about `timetable`, see “Timetables”.

See Also

“Work with Big Data for Simulations”

Introduced in R2017a

reset

Class: `matlab.io.datastore.SimulationDatastore`

Package: `matlab.io.datastore`

Reset datastore to initial state

Syntax

```
reset(dst)
```

Description

`reset(dst)` sets the read position of the datastore (`matlab.io.datastore.SimulationDatastore` object) specified by `dst` to the first sample in the datastore. Use `reset` to reread data from a datastore. You read from a datastore by using the `read` method.

Input Arguments

dst — Input datastore

`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

Examples

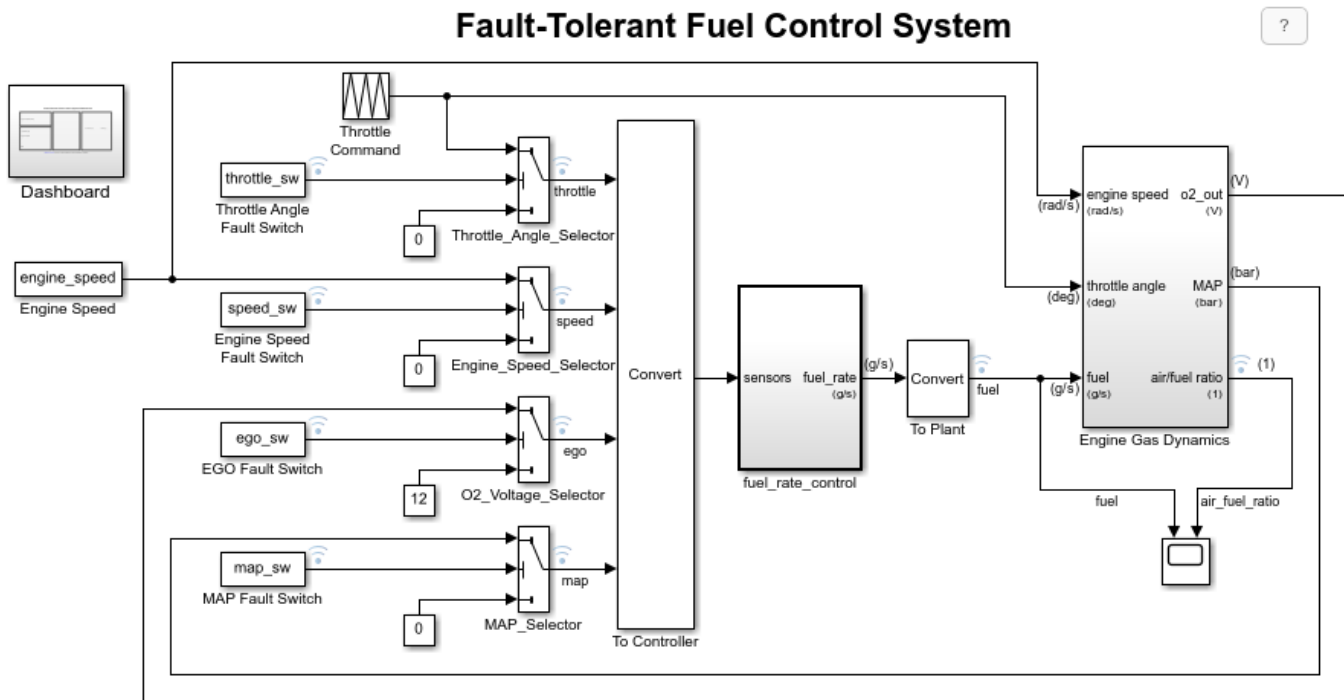

Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a `matlab.io.datastore.SimulationDatastore` object.

allowModelReferenceDiscreteSampleTimeInheritanceImpl

Model reference sample time inheritance status for discrete sample times

Syntax

```
flag = allowModelReferenceDiscreteSampleTimeInheritanceImpl(obj)
```

Description

`flag = allowModelReferenceDiscreteSampleTimeInheritanceImpl(obj)` specifies whether a System object in a referenced model is allowed to inherit the sample time of the parent model. Use this method only for System objects that use discrete sample time and are intended for inclusion in Simulink via the MATLAB System block.

Run-Time Details

During model compilation, Simulink sets the referenced model sample time inheritance before the System object `setupImpl` method is called.

Method Authoring Tips

You must set `Access = protected` for this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `allowModelReferenceDiscreteSampleTimeInheritanceImpl` method does not use the object, you can replace this input with `~`.

Output Arguments

flag — discrete sample time inheritance flag

true | false

Flag indicating whether model reference discrete sample time inheritance is allowed for the MATLAB System block containing the System object, returned as a logical value.

The default value for this argument depends on the number of inputs to the System object. If you want to use the default value, you do not need to include this method in your System object class definition file.

Number of System object Inputs	Default Value and Override Effects
No inputs	<p>Default: <code>false</code> — Model reference discrete sample time inheritance is not allowed.</p> <p>If your System object uses discrete sample time in its algorithm, override the default by returning <code>true</code> from <code>allowModelReferenceDiscreteSampleTimeInheritanceImpl</code>.</p>
One or more inputs	<p>Default: <code>true</code> — If no other Simulink constraint prevents it, model reference sample time inheritance is allowed.</p>

Examples

Set Sample Time Inheritance for System Object

For a System object that has one or more inputs, to disallow model reference discrete sample time inheritance for that object, set the sample time inheritance to `false`. Include this code in your class definition file for the object.

```
methods (Access = protected)
    function flag = allowModelReferenceDiscreteSampleTimeInheritanceImpl(~)
        flag = false;
    end
end
```

Introduced in R2016a

getInputNamesImpl

Names of MATLAB System block input ports

Syntax

```
names = getInputNamesImpl(obj)
```

Description

`names = getInputNamesImpl(obj)` specifies the names of the input ports from System object, `obj` implemented in a MATLAB System block. The size of `names` matches the number of inputs returned by the `getNumInputs` method. If you change a property value that changes the number of inputs, the names of those inputs also change.

Class Information

This method is part of the `matlab.System` class.

Run-Time Details

`getInputNamesImpl` is called by the MATLAB System block.

Method Authoring Tips

You must set `Access = protected` for this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getInputNamesImpl` method does not use the object, you can replace this input with `~`.

Output Arguments

names — Names of inputs

empty string array (default) | string array

Names of the inputs for the specified object, returned as a string array whose length equals the number of inputs.

Examples

“Customize MATLAB System Block Appearance”

See Also

`getNumInputsImpl` | `getOutputNamesImpl`

Topics

“Specify Input and Output Names”

“Customize MATLAB System Block Appearance”

Introduced in R2013b

getOutputNamesImpl

Names of MATLAB System block output ports

Syntax

```
names = getOutputNamesImpl(obj)
```

Description

`names = getOutputNamesImpl(obj)` specifies the names of the output ports from System object, `obj` implemented in a MATLAB System block. The size of `names` matches the number of outputs returned by the `getNumOutputs` method. If you change a property value that affects the number of outputs, the names of those outputs also change.

Class Information

This method is part of the `matlab.System` class.

Run-Time Details

`getOutputNamesImpl` is called by the MATLAB System block.

Method Authoring Tips

You must set `Access = protected` for this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getOutputNamesImpl` method does not use the object, you can replace this input with `~`.

Output Arguments

names — Names of outputs

empty string array (default) | string array

Names of the outputs for the specified object, returned as a string array whose length equals the number of outputs.

Examples

“Customize MATLAB System Block Appearance”

See Also

`getNumOutputsImpl` | `getInputNamesImpl`

Topics

“Specify Input and Output Names”

Introduced in R2013b

getPropertyGroupsImpl

Property groups for System object display

Syntax

```
group = getPropertyGroupsImpl
```

Description

`group = getPropertyGroupsImpl` specifies how to display properties in the block dialog of a MATLAB System block. You can specify:

- Sections — Arrange properties into sections (panel on the MATLAB System block dialog) with `matlab.system.display.Section`.
- Section Groups — Arrange properties and sections into groups (tabs on the MATLAB System block dialog) with `matlab.system.display.SectionGroup`.
- Order of properties — Specify the order of properties within sections/groups
- Order of sections — Specify the order of sections within groups.

If you create a section, but that section is not in a section group, its properties appear above the block dialog tab panels.

Run-Time Details

In Simulink, `getPropertyGroupsImpl` modifies the MATLAB System block dialog.

In MATLAB, `getPropertyGroupsImpl` modifies how properties appear when the System object is displayed at the MATLAB command line. `getPropertyGroupsImpl` defines the order and groupings of properties. If your `getPropertyGroupsImpl` defines multiple section groups, only properties from the first section group are displayed at the command line. To display properties in other sections, a link is provided at the end of a System object property display. Group titles are also displayed at the command line.

Method Authoring Tips

- You must set `Access = protected` for this method.
- If you include a `getPropertyGroupsImpl` method but do not list all properties, the excluded properties do not appear in the dialog box.
- To omit the `Main` title for the first group of properties, in `matlab.system.display.SectionGroup`, set `TitleSource` to `'Auto'`.
- By default if you do not customize this method in your System object, the MATLAB System block dialog displays all public properties in the order specified in the System object class file.
- To customize property names, add comments above each property. For an example, see “System Object to Block Dialog Box Default Mapping”.

Output Arguments

group — Property sections and groups

array of `SectionGroup` or `Section` objects

Property groups and sections to pass to the MATLAB System block, specified as an array of `matlab.system.display.Section` and `matlab.system.display.SectionGroup` objects.

Examples

“Customize System Block Dialog Box”

See Also

`matlab.system.display.Header` | `matlab.system.display.Section` |

getSimulateUsingImpl

Specify value for Simulate using parameter

Syntax

```
simmode = getSimulateUsingImpl
```

Description

`simmode = getSimulateUsingImpl` specifies the simulation mode of the System object implemented in a MATLAB System block. The simulation mode restricts your System object to simulation using either code generation or interpreted execution. The associated `showSimulateUsingImpl` method controls whether the **Simulate using** option is displayed on the dialog box.

Run-Time Details

`getSimulateUsingImpl` is called by the MATLAB System block.

Method Authoring Tips

You must set `Access = protected` and `Static` for this method.

Output Arguments

simmode — Simulation mode

"Code generation" | "Interpreted execution"

Simulation mode, returned as the string "Code generation" or "Interpreted execution". If you do not include the `getSimulateUsingImpl` method in your class definition file, the simulation mode is unrestricted. Depending on the value returned by the associated `showSimulateUsingImpl` method, the simulation mode is displayed on the dialog box as either a dropdown list or not at all.

Examples

Specify the Simulation Mode

In the class definition file of your System object, define the simulation mode to display in the MATLAB System block. To prevent **Simulate using** from displaying, see `showSimulateUsingImpl`.

```
methods (Static, Access = protected)
    function simMode = getSimulateUsingImpl
        simMode = "Interpreted execution";
    end
end
```

`showSimulateUsingImpl`

Topics

“Control Simulation Type in MATLAB System Block”

Introduced in R2015a

getSimulinkFunctionNamesImpl

Register Simulink function names used in your System object

Syntax

```
names = getSimulinkFunctionNamesImpl(obj)
```

Description

`names = getSimulinkFunctionNamesImpl(obj)` specifies the Simulink function names used in the System object `obj`.

If you use a Simulink function in your System object, you can only call a Simulink function from the `stepImpl`, `updateImpl`, or `outputImpl` method.

Run-Time Details

`getSimulinkFunctionNamesImpl` is invoked by the MATLAB System during model compilation to obtain the list of Simulink functions being called from the System object. Simulink uses this information to resolve the function names to a Simulink function declared in a Simulink Function block. If `getSimulinkFunctionNamesImpl` does not return the name of a function being called in the System object methods, Simulink attempts to resolve the function to a function on the MATLAB path.

Method Authoring Tips

You must set `Access = protected` for this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getSimulinkFunctionNamesImpl` method does not use the object, you can replace this input with `~`.

Output Arguments

names — Simulink function names

{ ' ' } (default) | cell array of character vectors | string array

The names of the Simulink function you want to call from your System object.

Examples

“Call Simulink Functions from a MATLAB System Block”

“Call Simulink Functions from MATLAB System Block”

Introduced in R2019a

getInterfaceImpl

Set System object as message or data

Syntax

```
interface = getInterfaceImpl(obj)
```

Description

MATLAB `interface = getInterfaceImpl(obj)` specifies the inputs and outputs of a System block as either data or a message.

Run-Time Details

`getInterfaceImpl` is part of the `matlab.System` class and is called before the `setupImpl` method.

Method Authoring Tips

You must set `Access = protected` for this method.

You cannot modify any properties in this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getInterfaceImpl` method does not use the object, you can replace this input with `~`.

Output Arguments

interface — MATLAB System block interface

scalar of interface objects | vector of interface objects

MATLAB System block interface, returned as a scalar or vector of `matlab.system.interface.*` objects. Use `matlab.system.interface.Input(signalName,signalType)` to define input signal types. Use `matlab.system.interface.Output(signalName,signalType)` to define output signal types.

- `signalName` - Defines the name of the port. Represented by a character array.
- `signalType` - Defines the type of port. The value is either `matlab.system.interface.Data` or `matlab.system.interface.Message`.

Examples

Process Message Payload Using MATLAB System Block

This example shows how to send, receive, and process messages using the MATLAB System block. Use System objects to author blocks to model custom behavior to send and receive messages and manipulate the message payload.

Load and Open the Model

Open the model of the Message Send and Receive system. This model contains a random number generator as a data source. Based on that data, the Message Sender sends a message with a sine wave payload to a queue block. The queue block stores the messages, and the Message Receiver converts the message back to data.

```
open_system('slexMessageArrivalExample');
```

Use getInterfaceImpl System Object API to Specify Message Ports

`getInterfaceImpl` is used in this example to specify the input and output message ports in the MATLAB System block for both the Message Sender and the Message Receiver. For the Message Sender, `getInterfaceImpl` is used to define the output of the MATLAB System block as a message. This action prompts the System object to create a message output. For the Message Receiver, `getInterfaceImpl` is used to define the input of the System object as a message and the output as data.

```
%Function to send messages
function interface = getInterfaceImpl(~)
    import matlab.system.interface.*;
    interface = Output("Out1", Message);
end

%Function to receive messages and output as data
function interface = getInterfaceImpl(obj)
    import matlab.system.interface.*;
    interface = [Input("In1", Message), ...
                Output("Out1", Data), Output("out2", Data)];
end
```

Set the Propagators and Sample time

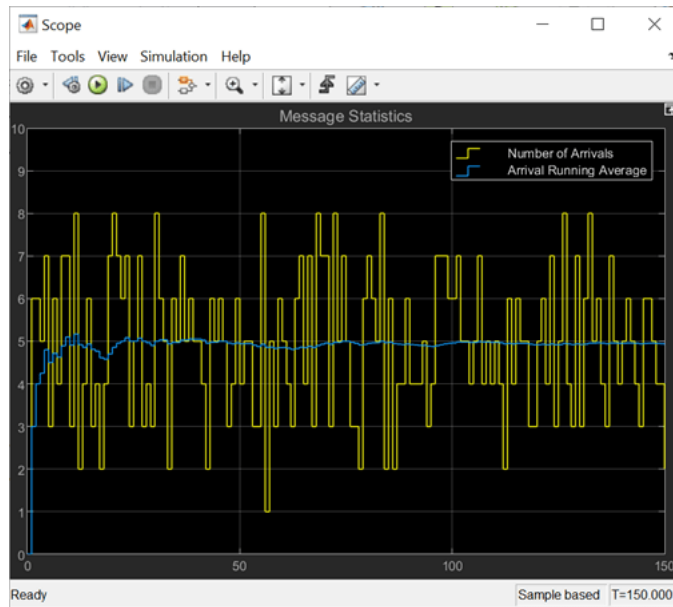

The following four propagators need to be set in the Message Sender: `getOutputSizeImpl`, `getOutputDataTypeImpl`, `isOutputComplexImpl`, `isOutputFixedSizeImpl`.

In this example, the message queue has a maximum capacity of 16 messages. The random number generator has a sample time of 0.1. The receiver has a sample time of 1. The Message Receiver sample time is set in the MATLAB System block using the `getSampleTimeImpl` API.

```
function sts = getSampleTimeImpl(obj)
    sts = createSampleTime(obj, 'Type', 'Discrete', ...
        'SampleTime', obj.SampleTime);
end
```

Simulate the Model and Review Results

The Scope block displays the results. These results show that as you run more simulations, the random number generator produces a number greater than zero 50% of the time, as expected.

"Messages"

Introduced in R2021a

showFiSettingsImpl

Fixed point data type tab visibility for System objects

Syntax

```
flag = showFiSettingsImpl
```

Description

`flag = showFiSettingsImpl` specifies whether the Data Types tab appears on the MATLAB System block dialog box. The Data Types tab includes parameters to control processing of fixed point data the MATLAB System block. You cannot specify which parameters appear on the tab. If you implement `showFiSettingsImpl`, the simulation mode is set to code generation.

The parameters that appear on the Data Types tab, which cannot be customized, are:

- **Saturate on integer overflow** — a check box to control the action to take on integer overflow for built-in integer types. The default is that the box is checked, which indicates to saturate. This is also the default for when **Same as MATLAB** is selected as the **MATLAB System fimath** option.
- **Treat these inherited Simulink signal types as fi objects** — a pull down that indicates which inherited data types to treat as fi data types. Valid options are:
 - Fixed point (default)
 - Fixed point & integer
- **MATLAB System fimath** has two radio button options:
 - **Same as MATLAB** (default) — uses the current MATLAB fixed-point math settings.
 - **Specify Other** — enables the edit box for specifying the desired fixed-point math settings.

For information on setting fixed-point math, see `fimath`.

Run-Time Details

`showFiSettingsImpl` is called by the MATLAB System block. For more information, see “Simulink Engine Phases Mapped to System Object Methods”.

Method Authoring Tips

- If you do not want to display the tab, you do not need to implement this method in your class definition file.
- You must set `Access = protected` for this method.

Output Arguments

flag — Display Data Types tab

false (default) | true

Flag indicating whether to display the Data Types tab on the MATLAB System block mask, returned as a logical scalar value. Returning a `true` value displays the tab. A `false` value does not display the tab.

Examples

Show the Data Types Tab

Show the Data Types tab on the MATLAB System block dialog box.

```
methods (Static, Access = protected)
    function isVisible = showFiSettingsImpl
        isVisible = true;
    end
end
```

If you set the flag, `isVisible`, to `true`, the tab appears as follows when you add the object to Simulink with the MATLAB System block.

Topics

“Customize System Block Dialog Box”

Introduced in R2016a

showSimulateUsingImpl

Visibility of Simulate using parameter

Syntax

```
flag = showSimulateUsingImpl
```

Description

`flag = showSimulateUsingImpl` specifies whether **Simulate using** appears on the MATLAB System block dialog box.

Run-Time Details

`showSimulateUsingImpl` is called by the MATLAB System block.

Method Authoring Tips

You must set `Access = protected` and `Static` for this method.

Output Arguments

flag — Display parameter on block dialog box

`true` (default) | `false`

Flag indicating whether to display the **Simulate using** parameter and dropdown list on the MATLAB System block mask. `true` displays the parameter and dropdown list. `false` hides the parameter and dropdown list.

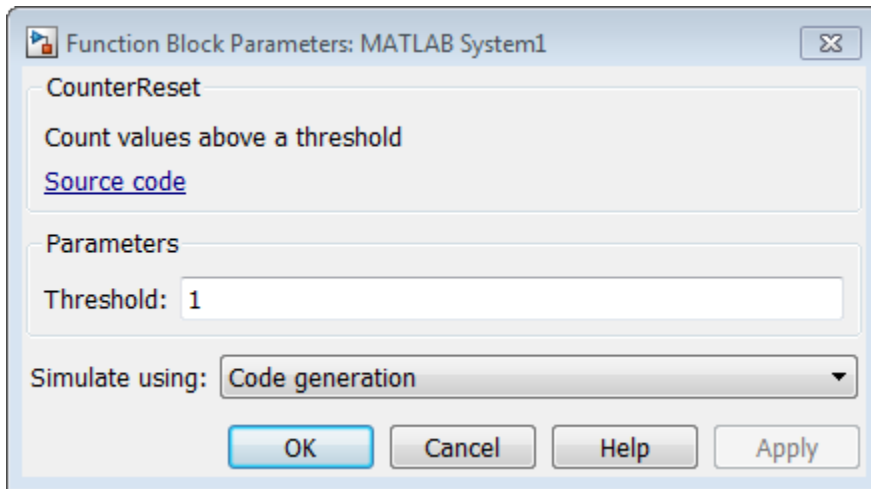

Examples

Hide the Simulate using Parameter

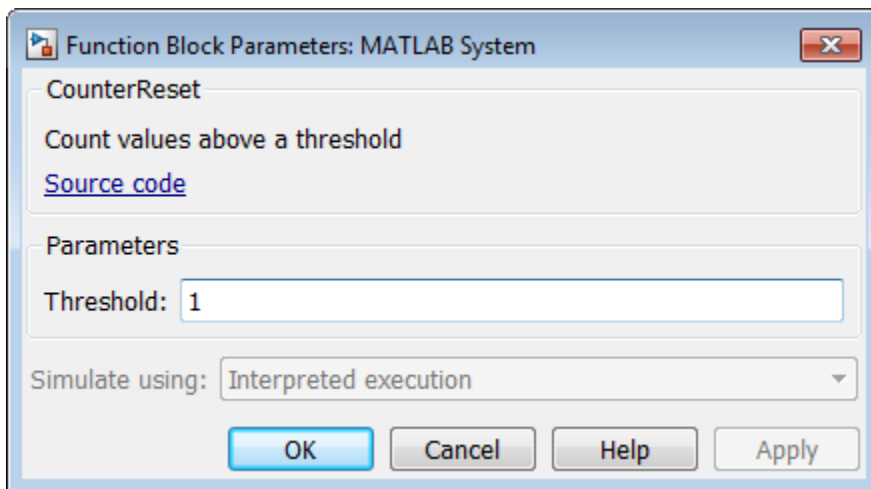

Hide the **Simulate using** parameter on the MATLAB System block dialog box.

```
methods (Static, Access = protected)
    function flag = showSimulateUsingImpl
        flag = false;
    end
end
```

If you set the `flag` to `true` or omit the `showSimulateUsingImpl` method, which defaults to `true`, the dialog appears as follows when you add the object to Simulink with the MATLAB System block.

If you also specify a single value for `getSimulateUsingImpl`, the dialog appears as follows when you add the object to Simulink with the MATLAB System block.

Topics

“Control Simulation Type in MATLAB System Block”

Introduced in R2015a

getGlobalNamesImpl

Global variable names for MATLAB System block

Syntax

```
name = getGlobalNamesImpl(obj)
```

Description

`name = getGlobalNamesImpl(obj)` specifies the names of global variables that are declared in a System object for use in a Simulink P-code file. For P-code files, in addition to declaring your global variables in `stepImpl`, `outputImpl`, or `updateImpl`, you must include the `getGlobalNamesImpl` method. You declare global variables in a cell array in the `getGlobalNamesImpl` method. System objects that contain these global variables are included in Simulink using a MATLAB System block. To enable a global variable in Simulink, your model also must include a Data Store Memory block with a **Data Store Name** that matches the global variable name.

Run-Time Details

`getGlobalNamesImpl` is called by the MATLAB System block.

Method Authoring Tips

You must set `Access = protected` for this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getGlobalNamesImpl` method does not use the object, you can replace this input with `~`.

Output Arguments

name — Global variable names

cell array of character vectors

Cell array containing the global variable names. The elements of the cell array are character vectors.

Examples

Specify Global Names

Specify two global names in your class definition file.

```
methods(Access = protected)
    function glnames = getGlobalNamesImpl(obj)
```

```
    glnames = {'FEE','OTHERFEE'};
end

function y = stepImpl(obj,u)
    global FEE
    global OTHERFEE
    y = u - FEE * obj.lastData + OTHERFEE;
    obj.lastData = u;
end
end
```

getHeaderImpl

Header for System object display

Syntax

```
header = getHeaderImpl
```

Description

`header = getHeaderImpl` specifies the dialog header to display on the MATLAB System block dialog box. If you do not specify the `getHeaderImpl` method, no title or text appears for the header in the block dialog box.

Run-Time Details

`getHeaderImpl` is called by the MATLAB System block.

Method Authoring Tips

You must set `Access = protected` for this method.

Output Arguments

header — Header text

`matlab.system.display.Header` class

Header text specified as a `matlab.system.display.Header` class.

Examples

Define Header for System Block Dialog Box

Define a header in your class definition file for the `EnhancedCounter` System object.

```
methods (Static, Access = protected)
    function header = getHeaderImpl
        header = matlab.system.display.Header('EnhancedCounter',...
            'Title','Enhanced Counter');
    end
end
```

See Also

`getPropertyGroupsImpl`

Topics

“Add Header Description”

Introduced in R2013b

getDiscreteStateImpl

Discrete state property values

Syntax

```
s = getDiscreteStateImpl(obj)
```

Description

`s = getDiscreteStateImpl(obj)` returns a struct `s` of internal state value properties, which have the `DiscreteState` attribute. The field names of the struct are the object's `DiscreteState` property names. To restrict or change the values returned by `getDiscreteState` method, you can override this `getDiscreteStateImpl` method.

Run-Time Details

`getDiscreteStateImpl` is called by the `setup` method. For details, see

“Detailed Call Sequence”.

Method Authoring Tips

- You must set `Access = protected` for this method.
- You cannot modify any properties in this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getDiscreteStateImpl` method does not use the object, you can replace this input with `~`.

Output Arguments

s — State values

struct

State values, returned as a struct.

Examples

Get Discrete State Values

Use the `getDiscreteStateImpl` method in your class definition file to get the discrete states of the object.

```
methods (Access = protected)
    function s = getDiscreteStateImpl(obj)
```

```
end  
end
```

See Also

setupImpl

Topics

“Define Property Attributes”

Introduced in R2012b

supportsMultipleInstanceImpl

Support System object in Simulink For Each subsystem

Syntax

```
flag = supportsMultipleInstanceImpl(obj)
```

Description

`flag = supportsMultipleInstanceImpl(obj)` specifies whether the System object can be used in a Simulink For Each subsystem via the MATLAB System block. To enable For Each support, you must include the `supportsMultipleInstanceImpl` in your class definition file and have it return `true`. Do not enable For Each support if your System object allocates exclusive resources that may conflict with other System objects, such as allocating file handles, memory by address, or hardware resources.

Run-Time Details

During Simulink model compilation and propagation, the MATLAB System block calls the `supportsMultipleInstance` method, which then calls the `supportsMultipleInstanceImpl` method to determine For Each support.

Method Authoring Tips

- You must set `Access = protected` for this method.
- You cannot modify any properties in this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `supportsMultipleInstanceImpl` method does not use the object, you can replace this input with `~`.

Output Arguments

flag — Support for For Each subsystem flag

false (default) | true

Boolean value indicating whether the System object can be used in a For Each subsystem. The default value, if you do not include the `supportsMultipleInstanceImpl` method, is `false`.

Examples

Enable For-Each Support for System Object

Specify in your class definition file that the System object can be used in a Simulink For Each subsystem.

```
methods (Access = protected)
    function flag = supportsMultipleInstanceImpl(obj)
        flag = true;
    end
end
```

See Also

matlab.System

Topics

“Enable For Each Subsystem Support”

Introduced in R2014b

processTunedPropertiesImpl

Action when tunable properties change

Syntax

```
processTunedPropertiesImpl(obj)
```

Description

`processTunedPropertiesImpl(obj)` specifies the algorithm to perform when one or more tunable property values change. This method is called as part of the next call to the System object after a tunable property value changes. A property is tunable only if its `Nontunable` attribute is false, which is the default.

Run-Time Details

`processTunedPropertiesImpl` is called when you run the System object.

In MATLAB when multiple tunable properties are changed before running the System object, `processTunedPropertiesImpl` is called only once for all the changes. `isChangedProperty` returns true for all the changed properties.

In Simulink, when a parameter is changed in a MATLAB System block dialog, the next simulation step calls `processTunedPropertiesImpl` before calling `stepImpl`. All tunable parameters are considered changed and `processTunedPropertiesImpl` method is called for each of them. `isChangedProperty` returns true for all the dialog properties.

For details, see “Detailed Call Sequence”.

Method Authoring Tips

- You must set `Access = protected` for this method.
- Use this method when a tunable property affects the value of a different property.
- If the System object will be used in the Simulink MATLAB System block, you cannot modify any tunable properties in this method.
- To check if a property has changed since `stepImpl` was last called, use `isChangedProperty` within `processTunedPropertiesImpl`. See “Specify Action When Tunable Property Changes” on page 5-136 for an example.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `processTunedPropertiesImpl` method does not use the object, you can replace this input with `~`.

Examples

Specify Action When Tunable Property Changes

Use `processTunedPropertiesImpl` to recalculate the lookup table if the value of either the `NumNotes` or `MiddleC` property changes before the next call to the System object. `propChange` indicates if either property has changed.

```
methods (Access = protected)
function processTunedPropertiesImpl(obj)
    propChange = isChangedProperty(obj, 'NumNotes') || ...
                isChangedProperty(obj, 'MiddleC')
    if propChange
        obj.pLookupTable = obj.MiddleC * (1+log(1:obj.NumNotes)/log(12));
    end
end
end
```

matlab.system.mixin.CustomIcon class

Package: matlab.system.mixin

Custom icon mixin class

Note The `matlab.system.mixin.CustomIcon` mixin will be removed in a future release. You no longer need to inherit from this mixin in your `System` object. The associated `getIcon` method has been moved to the `matlab.System` class.

Description

`matlab.system.mixin.CustomIcon` is a class that specifies the `getIcon` method. This method customizes the name of the icon used for the `System` object implemented through a MATLAB System block.

To use this method, you must subclass from this class in addition to the `matlab.System` base class. Type the following syntax as the first line of your class definition file, where `ObjectName` is the name of your object:

```
classdef ObjectName < matlab.system &...  
    matlab.system.mixin.CustomIcon
```

The `matlab.system.mixin.CustomIcon` class is a handle class.

Compatibility Considerations

matlab.system.mixin.CustomIcon will be removed

Not recommended starting in R2020a

The `matlab.system.mixin.CustomIcon` mixin will be removed in a future release. You no longer need to inherit from this mixin in your `System` object. The associated method has been moved to the `matlab.System` class.

Remove `matlab.system.mixin.CustomIcon` from the `classdef` line of your `System` object.

`matlab.System` | `matlab.system.display.Icon`

Topics

“Add Text to Block Icon”

Introduced in R2017a

getIconImpl

Name to display as block icon

Syntax

```
icon = getIconImpl(obj)
```

Description

`icon = getIconImpl(obj)` specifies the text or image to display on the block icon of the MATLAB System block. If you do not specify the `getIconImpl` method, the block displays the class name of the System object as the block icon. For example, if you specify `pkg.MyObject` in the MATLAB System block, the default icon is labeled `MyObject`.

Run-Time Details

`getIconImpl` is called by the MATLAB System block during Simulink model compilation.

Method Authoring Tips

You must set `Access = protected` for this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getIconImpl` method does not use the object, you can replace this input with `~`.

Output Arguments

icon — Block icon

character vector | cell array of character vectors | string | string array |
`matlab.system.display.Icon` object

The text or image to display as the block icon. Each cell is displayed as a separate line.

Examples

Add System Block Icon Name

Specify in your class definition file the name of the block icon as 'Enhanced Counter' using two lines.

```
methods (Access = protected)
    function icon = getIconImpl(~)
        icon = {'Enhanced', 'Counter'};
```

```
end  
end
```

Add Image to MATLAB System Block

Define an image in your class definition file.

```
methods(Access = protected)  
    function icon = getIconImpl(~)  
        % Define icon for System block  
        icon = matlab.system.display.Icon('my_icon.png');  
    end  
end
```

The image now appears on the System block icon.

Topics

“Customize System Block Appearance”

“Customize MATLAB System Block Appearance”

Introduced in R2017a

matlab.system.display.Header class

Package: matlab.system.display

Header for System objects properties

Syntax

```
matlab.system.display.Header(N1,V1,...Nn,Vn)
matlab.system.display.Header(Obj,...)
```

Description

`matlab.system.display.Header(N1,V1,...Nn,Vn)` specifies a header for the System object, with the header properties defined in Name-Value (N,V) pairs. You use `matlab.system.display.Header` within the `getHeaderImpl` method. The available header properties are

- **Title** — Header title. The default value is an empty character vector.
- **Text** — Header description. The default value is an empty character vector.
- **ShowSourceLink** — Show link to source code for the object.

`matlab.system.display.Header(Obj,...)` creates a header for the specified System object (`Obj`) and sets the following property values:

- **Title** — Set to the `Obj` class name.
- **Text** — Set to help summary for `Obj`.
- **ShowSourceLink** — Set to `true` if `Obj` is MATLAB code. In this case, the **Source Code** link is displayed. If `Obj` is P-coded and the source code is not available, set this property to `false`.

You can use `mfilename('class')` from within this method to get the name of the System object. If you set any Name-Value pairs, those property values override the default settings.

Examples

Define System Block Header

Define a header in your class definition file.

```
methods (Static, Access = protected)
    function header = getHeaderImpl
        header = matlab.system.display.Header(mfilename('class'), ...
            'Title','AlternativeTitle',...
            'Text','An alternative class description');
    end
end
```

The resulting output appears as follows. In this case, **Source code** appears because the `ShowSourceLink` property was set to `true`.

matlab.system.display.Section class

Package: matlab.system.display

Property group section for System objects

Syntax

```
matlab.system.display.Section(N1,V1,...Nn,Vn)
matlab.system.display.Section(Obj,...)
```

Description

`matlab.system.display.Section(N1,V1,...Nn,Vn)` creates a property group section for displaying System object properties, which you define using property Name-Value pairs (N,V). You use `matlab.system.display.Section` to define property groups using the `getPropertyGroupsImpl` method. The available Section properties are:

- **Title** — Section title. The default value is an empty character vector.
- **TitleSource** — Source of section title. Valid values are 'Property' and 'Auto'. The default value is 'Property', which uses the character vector from the Title property. If the Obj name is given, the default value is Auto, which uses the Obj name.
- **Description** — Section description. The default value is an empty character vector.
- **PropertyList** — Section property list as a cell array of property names. The default value is an empty array. If the Obj name is given, the default value is all eligible display properties.
- **Type** — Container type. For example, tab, group, panel, and collapsible panel.
- **Row** — Specify the row in which the containers need to be placed (current/new). You can specify the row using the enum class `matlab.system.display.internal.Row`.
- **AlignPrompts** — Specify a boolean value to control align prompts within the containers.

Note Certain properties are not eligible for display either in a dialog box or in the System object summary on the command-line. Property types that cannot be displayed are: hidden, abstract, private or protected access, discrete state, and continuous state. Dependent properties do not display in a dialog box, but do display in the command-line summary.

`matlab.system.display.Section(Obj,...)` creates a property group section for the specified System object (Obj) and sets the following property values:

- **TitleSource** — Set to 'Auto', which uses the Obj name.
- **PropertyList** — Set to all publicly-available properties in the Obj.

You can use `mfilename('class')` from within this method to get the name of the System object. If you set any Name-Value pairs, those property values override the default settings.

Examples

Define Property Groups

Define two property groups in your class definition file by specifying their titles and property lists.

```
classdef MultipleGroupsWithSection < matlab.System
    % MultipleGroupsWithTabs Customize block dialog with multiple tabs and parameter groups.

    % Public, tunable properties
    properties
        %StartValue Start Value
        StartValue = 0

        %EndValue End Value
        EndValue = 10

        Threshold = 1
    end
    % Public Nontunable
    properties(Nontunable)
        %UseThreshold Use threshold
        UseThreshold (1,1) logical = true
    end

    methods (Static, Access = protected)
        function groups = getPropertyGroupsImpl
            valueGroup = matlab.system.display.Section(...
                'Title', 'Value parameters', ...
                'PropertyList', {'StartValue', 'EndValue'}, ...
                'SectionType', matlab.system.display.SectionType.tab);

            thresholdGroup = matlab.system.display.Section(...
                'Title', 'Threshold parameters', ...
                'PropertyList', {'Threshold', 'UseThreshold'}, ...
                'SectionType', matlab.system.display.SectionType.tab);
            groups = [valueGroup, thresholdGroup];
        end
    end
end
```

When you specify the System object in the MATLAB System block, the resulting dialog box appears as follows.

“Customize System Block Dialog Box”

matlab.system.display.Action class

Package: matlab.system.display

Custom button

Syntax

```
matlab.system.display.Action(action)
matlab.system.display.Action(action,Name,Value)
```

Description

`matlab.system.display.Action(action)` specifies a button to display on the MATLAB System block. This button executes a function by launching a System object method or invoking any MATLAB function or code.

A typical button function launches a figure. The launched figure is decoupled from the block dialog box. Changes to the block are not synced to the displayed figure.

You define `matlab.system.display.Action` within the `getPropertyGroupsImpl` method in your class definition file. You can define multiple buttons using separate instances of `matlab.system.display.Action` in your class definition file.

`matlab.system.display.Action(action,Name,Value)` includes `Name,Value` pair arguments, which you can use to specify any properties.

Input Arguments

action

Action taken when the user presses the specified button on the MATLAB System block dialog. The action is defined as a function handle or as a MATLAB command. If you define the action as a function handle, the function definition must define two inputs. These inputs are a `matlab.system.display.ActionData` object and a System object instance, which can be used to invoke a method.

A `matlab.system.display.ActionData` object is the callback object for a display action. You use the `UserData` property of `matlab.system.display.ActionData` to store persistent data, such as a figure handle.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Properties

You specify these properties as part of the input using `Name, Value` pair arguments. Optionally, you can define them using `object.property` syntax.

- `ActionCalledFcn` — Action to take when the button is pressed. You cannot specify this property using a `Name-Value` pair argument.
- `Label` — Text to display on the button. The default value is an empty character vector.
- `Description` — Text for the button tooltip. The default value is an empty character vector.
- `Placement` — Character vector indicating where on a separate row in the property group to place the button. Valid values are `'first'`, `'last'`, or a property name. If you specify a property name, the button is placed above that property. The default value is `'last'`.
- `Alignment` — Character vector indicating how to align the button. Valid values are `'left'` and `'right'`. The default value is `'left'`.

Examples

Define Button on MATLAB System Block

Define a **Visualize** button and its associated function to open a figure that plots a ramp using the parameter values in the block dialog.

```
methods(Static, Access = protected)
    function group = getPropertyGroupsImpl
        group = matlab.system.display.Section(mfilename('class'));
        group.Actions = matlab.system.display.Action(@(~,obj)...
            visualize(obj), 'Label', 'Visualize');
    end
end

methods
    function obj = PlotRamp(varargin)
        setProperties(obj, nargin, varargin{:});
    end

    function visualize(obj)
        figure;
        d = 1:obj.RampLimit;
        plot(d);
    end
end
```

When you specify the System object in the MATLAB System block, the resulting block dialog box appears as follows.

To open the same figure, rather than multiple figures, when the button is pressed more than once, use this code instead.

```

methods(Static,Access = protected)
    function group = getPropertyGroupsImpl
        group = matlab.system.display.Section(mfilename('class'));
        group.Actions = matlab.system.display.Action(@(actionData,obj)...
            visualize(obj,actionData),'Label','Visualize');
    end
end

methods
    function obj = ActionDemo(varargin)
        setProperties(obj,nargin,varargin{:});
    end

    function visualize(obj,actionData)
        f = actionData.UserData;
        if isempty(f) || ~ishandle(f)
            f = figure;
            actionData.UserData = f;
        else
            figure(f); % Make figure current
        end

        d = 1:obj.RampLimit;
        plot(d);
    end
end

```

matlab.system.display.SectionGroup class

Package: matlab.system.display

Section group for System objects

Syntax

```
matlab.system.display.SectionGroup(N1,V1,...Nn,Vn)
matlab.system.display.SectionGroup(Obj,...)
```

Description

`matlab.system.display.SectionGroup(N1,V1,...Nn,Vn)` creates a group for displaying System object properties and display sections created with `matlab.system.display.Section`. You define such sections or properties using property Name-Value pairs (N,V). A section group can contain both properties and sections. You use `matlab.system.display.SectionGroup` to define section groups using the `getPropertyGroupsImpl` method. Section groups display as separate tabs in the MATLAB System block. The available Section properties are:

- **Title** — Group title. The default value is an empty character vector.
- **TitleSource** — Source of group title. Valid values are 'Property' and 'Auto'. The default value is 'Property', which uses the character vector from the **Title** property. If the **Obj** name is given, the default value is **Auto**, which uses the **Obj** name. In the System object property display at the MATLAB command line, you can omit the default "Main" title for the first group of properties by setting **TitleSource** to 'Auto'.
- **Description** — Group or tab description that appears above any properties or panels. The default value is an empty character vector.
- **PropertyList** — Group or tab property list as a cell array of property names. The default value is an empty array. If the **Obj** name is given, the default value is all eligible display properties.
- **Sections** — Group sections as an array of section objects. If the **Obj** name is given, the default value is the default section for the **Obj**.
- **Type** — Container type. For example, tab, group, panel, and collapsible panel.
- **Row** — Specify the row in which the containers need to be placed (current/new). You can specify the row using the enum class `matlab.system.display.internal.Row`.
- **AlignPrompts** — Specify a boolean value to control align prompts within the containers.

`matlab.system.display.SectionGroup(Obj,...)` creates a section group for the specified System object (**Obj**) and sets the following property values:

- **TitleSource** — Set to 'Auto'.
- **Sections** — Set to `matlab.system.display.Section` object for **Obj**.

You can use `mfilename('class')` from within this method to get the name of the System object. If you set any Name-Value pairs, those property values override the default settings.

Examples

Define Block Dialog Containers

Define in your class definition file two tabs, each containing specific properties. For this example, you use the `matlab.system.display.SectionGroup`, `matlab.system.display.Section`, and `getPropertyGroupsImpl` methods.

```
classdef MultipleGroupsWithSectionGroup < matlab.System
    % MultipleGroupsWithTabs Customize block dialog with multiple tabs and parameter groups.

    % Public, tunable properties
    properties
        %StartValue Start Value
        StartValue = 0

        %EndValue End Value
        EndValue = 10

        Threshold = 1

        %BlockLimit Limit
        BlockLimit = 55
    end
    % Public Nontunable
    properties(Nontunable)
        %IC1 First initial condition
        IC1 = 0

        %IC2 Second initial condition
        IC2 = 10

        %IC3 Third initial condition
        IC3 = 100

        %UseThreshold Use threshold
        UseThreshold (1,1) logical = true
    end

    methods (Static, Access = protected)
        function groups = getPropertyGroupsImpl
            % Section to always display above any tabs.
            alwaysSection = matlab.system.display.Section(...
                'Title', '', 'PropertyList', {'BlockLimit'});

            % Group with no sections
            initTab = matlab.system.display.SectionGroup(...
                'Title', 'Initial conditions', ...
                'PropertyList', {'IC1', 'IC2', 'IC3'}, ...
                'GroupType', matlab.system.display.SectionType.group);

            % Section for the value parameters
            valueSection = matlab.system.display.Section(...
                'Title', 'Value parameters', ...
                'PropertyList', {'StartValue', 'EndValue'}, ...
                'SectionType', matlab.system.display.SectionType.collapsiblepanel);

            % Section for the threshold parameters
            thresholdSection = matlab.system.display.Section(...
                'Title', 'Threshold parameters', ...
```

```

        'PropertyList',{ 'Threshold', 'UseThreshold'},...
        'SectionType', matlab.system.display.SectionType.collapsiblepanel);

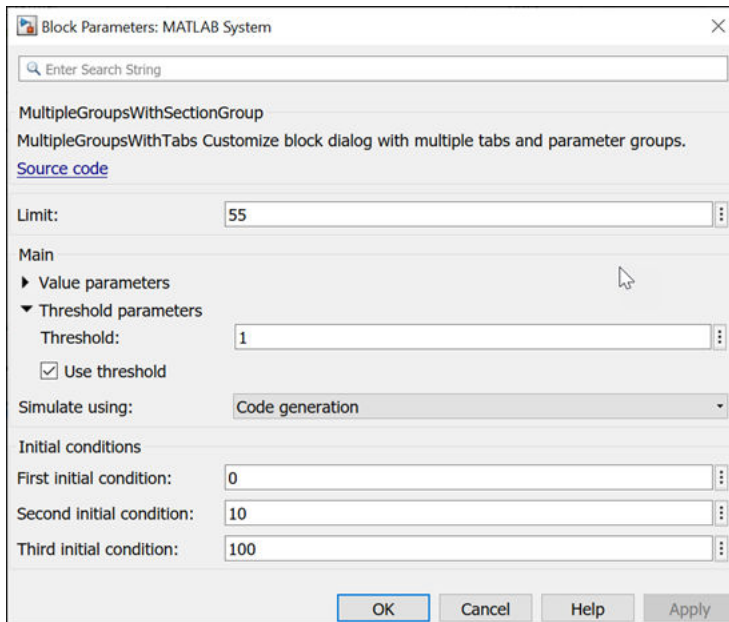

% Group with two sections: the valueSection and thresholdSection sections
mainTab = matlab.system.display.SectionGroup(...
    'Title', 'Main', ...
    'Sections', [valueSection, thresholdSection],...
    'GroupType', matlab.system.display.SectionType.group);

% Return an array with the group-less section, the group with
% two sections, and the group with no sections.
groups = [alwaysSection, mainTab, initTab];
end
end
end

```

The resulting dialog appears as follows when you add the object to Simulink with the MATLAB System block.

Topics

“Customize System Block Dialog Box”

matlab.system.display.Icon class

Package: matlab.system.display

Custom icon image

Syntax

```
icon = matlab.system.display.Icon(imageFile)
```

Description

`icon = matlab.system.display.Icon(imageFile)` sets the `imageFile` image as the MATLAB System block icon. To set the icon image, use the `icon` output argument from `getIconImpl`.

Input Arguments

imageFile — Image file

character array

Image file to display on the block icon, specified as a character array. If the image is not on the path, use the full path to your image file.

The image file must be in a file format supported for block masks. See “Draw Static Icon”.

Example: "image.png"

Examples

Add Image to MATLAB System Block

Define an image in your class definition file.

```
methods(Access = protected)
    function icon = getIconImpl(~)
        % Define icon for MATLAB System block
        icon = matlab.system.display.Icon("my_icon.png");
    end
end
```

The image now appears on the MATLAB System block icon.

“Customize System Block Appearance”

Introduced in R2017a

matlab.system.mixin.Propagates class

Package: matlab.system.mixin

Signal characteristics propagation mixin class

Note The `matlab.system.mixin.Propagates` mixin will be removed in a future release. You no longer need to inherit from this mixin in your System object. The associated propagation methods have been moved to the `matlab.System` class.

Description

`matlab.system.mixin.Propagates` specifies the output size, data type, and complexity of a System object. Use this mixin class and its methods when you will include your System object in Simulink via the MATLAB System block. This mixin is called by the MATLAB System block during Simulink model compilation.

Note If your System object has exactly one input and one output and no discrete property states, or if you do not need bus support, you do not have to implement any of these methods. The `matlab.system.mixin.Propagates` provides default values in these cases.

Implement the methods of this class when Simulink cannot infer the output specifications directly from the inputs or when you want bus support. If you do not include this mixin, Simulink cannot propagate the output or bus data type, an error occurs.

To use this mixin, subclass from this `matlab.system.mixin.Propagates` in addition to subclassing from the `matlab.System` base class. Type the following syntax as the first line of your class definition file. `ObjectName` is the name of your System object.

```
classdef ObjectName < matlab.System &...  
    matlab.system.mixin.Propagates
```

The `matlab.system.mixin.Propagates` class is a handle class.

Compatibility Considerations

matlab.system.mixin.Propagates will be removed

Not recommended starting in R2020a

The `matlab.system.mixin.Propagates` mixin will be removed in a future release. You no longer need to inherit from this mixin in your System object. The associated propagation methods have been moved to the `matlab.System` class.

Remove `matlab.system.mixin.Propagates` from the `classdef` line of your System object.

“Set Output Size”

“Set Output Complexity”

“Set Fixed- or Variable-Size Output”

“Set Discrete State Output Specification”

Introduced in R2014a

getDiscreteStateSpecificationImpl

Discrete state size, data type, and complexity

Syntax

```
[size,dataType,complexity] = getDiscreteStateSpecificationImpl(obj,propertyName)
```

Description

[size,dataType,complexity] = getDiscreteStateSpecificationImpl(obj,propertyName) returns the size, data type, and complexity of the discrete state property. This property must be a discrete state property. You must define this method if your System object has discrete state properties and is used in the MATLAB System block.

Run-Time Details

getDiscreteStateSpecificationImpl is called by the MATLAB System block during Simulink model compilation.

Method Authoring Tips

- You must set Access = protected for this method.
- You cannot modify any properties in this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your getDiscreteStateSpecificationImpl method does not use the object, you can replace this input with ~.

propertyName — Discrete state property name

property name

Name of discrete state property of the System object

Output Arguments

size — Property size

[1 1] (default) | numeric vector

Vector containing the length of each dimension of the property.

dataType — Property data type

double (default) | character vector

Data type of the property. For built-in data types, `dataType` is a character vector. For fixed-point data types, `dataType` is a numeric type object.

complexity — Complexity of the property

`false` (default) | `true`

Complexity of the property as a scalar, logical value:

- `true` — complex
- `false` — real

Examples

Specify Discrete State Property Size, Data Type, and Complexity

Specify in your class definition file the size, data type, and complexity of a discrete state property.

```
methods (Access = protected)
    function [sz,dt,cp] = getDiscreteStateSpecificationImpl(~,name)
        sz = [1 1];
        dt = "double";
        cp = false;
    end
end
```

“Set Discrete State Output Specification”

Introduced in R2013b

getOutputDataTypeImpl

Data types of output ports

Syntax

```
[dt_1,dt_2,...,dt_n] = getOutputDataTypeImpl(obj)
```

Description

`[dt_1,dt_2,...,dt_n] = getOutputDataTypeImpl(obj)` returns the data type of each output port as a character vector for built-in data types or as a numeric object for fixed-point data types. The number of outputs must match the value returned from the `getNumOutputsImpl` method or the number of output arguments listed in the `stepImpl` method.

For System objects with one input and one output and where you want the input and output data types to be the same, you do not need to implement this method. In this case, `getOutputDataTypeImpl` assumes the input and output data types are the same and returns the data type of the input.

If your System object has more than one input or output, and you use propagation, you must set the output data types in the `getOutputDataTypeImpl` method. For Simulink, if the input and output data types are different, you might have to cast the output value to the data type of the appropriate `dt_n` output argument. You specify this casting in the `stepImpl` method. For bus output, you must specify the name of the output bus in `getOutputDataTypeImpl`.

If needed to determine the output data type, you can use `propagatedInputDataType` within the `getOutputDataTypeImpl` method to obtain the input type.

Run-Time Details

`getOutputDataTypeImpl` is called by the MATLAB System block.

Method Authoring Tips

- You must set `Access = protected` for this method.
- You cannot modify any properties in this method.
- If you are debugging your code and examine the data types before Simulink completes propagation, you might see outputs with empty, `[]`, data types. This occurs because Simulink has not completed setting the output data types.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getOutputDataTypeImpl` method does not use the object, you can replace this input with `~`.

Output Arguments

dt_1, dt_2, ... — Property data type

character vector | numeric type object

Data type of the property. For built-in data types, dt is a character vector. For fixed-point data types, dt is a numeric type object.

Examples

Specify Output Data Type

Specify, in your class definition file how to control the output data type from a MATLAB System block. This example shows how to use the `getOutputDataTypeImpl` method to change the output data type from single to double, or propagate the input as a double. It also shows how to cast the data type to change the output data type in the `stepImpl` method.

```
classdef DataTypeChange < matlab.System & ...
    matlab.system.mixin.Propagates

    properties(Nontunable)
        Quantize = false
    end

    methods(Access = protected)
        function y = stepImpl(obj,u)
            if obj.Quantize == true
                % Cast for output data type to differ from input.
                y = single(u);
            else
                % Propagate output data type.
                y = u;
            end
        end

        function out = getOutputDataTypeImpl(obj)
            if obj.Quantize == true
                out = "single";
            else
                out = propagatedInputDataType(obj,1);
            end
        end
    end
end
```

Specify Bus Output

Specify, in your class definition file, that the System object data type is a bus. You must also include a property to specify the bus name.

```
properties(Nontunable)
    OutputBusName = "myBus";
end
```

```
methods (Access = protected)
    function out = getOutputDataTypeImpl(obj)
        out = obj.OutputBusName;
    end
end
```

The data type of the output bus must be defined upfront. The `propagatedInputDataType` method does not support propagation of bus data types to the output data type.

`propagatedInputDataType`

Topics

“Set Output Data Type”

Introduced in R2013b

getOutputSizeImpl

Sizes of output ports

Syntax

```
[sz_1,sz_2,...,sz_n] = getOutputSizeImpl(obj)
```

Description

[sz_1,sz_2,...,sz_n] = getOutputSizeImpl(obj) returns the size of each output port. The number of outputs must match the value returned from the getNumOutputs method or the number of output arguments listed in the stepImpl method.

If your System object has only one input and one output and you want the input and output sizes to be the same, you do not need to implement this method. In this case getOutputSizeImpl assumes that the input and output sizes are the same and returns the size of the input. For variable-size inputs in MATLAB, the size varies each time you run your object. For variable-size inputs in Simulink, the output size is the maximum input size.

You must implement the getOutputSizeImpl method to define the output size, if:

- Your System object has more than one input or output
- You need the output and input sizes to be different.

If the output size differs from the input size, you must also use the propagatedInputSize method

Run-Time Details

During Simulink model compilation and propagation, the MATLAB System block calls the getOutputSizeImpl method to determine the output size.

All inputs default to variable-size inputs. For these inputs, the output size is the maximum input size.

Method Authoring Tips

- You must set Access = protected for this method.
- In this method, you cannot modify any properties.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your getOutputSizeImpl method does not use the object, you can replace this input with ~.

Output Arguments

sz_1, sz_2, ... — Output size

numeric vector

Vector containing the size of each output port.

Examples

Specify Output Size

Specify in your class definition file the size of a System object output.

```
methods (Access = protected)
    function sz_1 = getOutputSizeImpl(obj)
        sz_1 = [1 1];
    end
end
```

Specify Multiple Output Ports

Specify in your class definition file the sizes of multiple System object outputs.

```
methods (Access = protected)
    function [sz_1, sz_2] = getOutputSizeImpl(obj)
        sz_1 = propagatedInputSize(obj, 1);
        sz_2 = [1 1];
    end
end
```

Specify Output When Using Propagated Input Size

Specify in your class definition file the size of System object output when it depends on the propagated input size.

```
methods (Access = protected)
    function varargout = getOutputSizeImpl(obj)
        varargout{1} = propagatedInputSize(obj, 1);
        if obj.HasSecondOutput
            varargout{2} = [1 1];
        end
    end
end
```

See Also

`propagatedInputSize`

Topics

“Set Output Size”

Introduced in R2013b

isOutputComplexImpl

Complexity of output ports

Syntax

```
[cp_1, cp_2, ..., cp_n] = isOutputComplexImpl(obj)
```

Description

[cp_1, cp_2, ..., cp_n] = isOutputComplexImpl(obj) returns whether each output port has complex data. The number of outputs must match the value returned from the `getNumOutputs` method or the number of output arguments listed in the `stepImpl` method.

For System objects with one input and one output and where you want the input and output complexities to be the same, you do not need to implement this method. In this case `isOutputComplexImpl` assumes the input and output complexities are the same and returns the complexity of the input.

If your System object has more than one input or output or you need the output and input complexities to be different, you must implement the `isOutputComplexImpl` method to define the output complexity. You also must use the `propagatedInputComplexity` method if the output complexity differs from the input complexity.

Run-Time Details

During Simulink model compilation and propagation, the MATLAB System block calls the `isOutputComplex` method, which then calls the `isOutputComplexImpl` method to determine the output complexity.

Method Authoring Tips

- You must set `Access = protected` for this method.
- You cannot modify any properties in this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `isOutputComplexImpl` method does not use the object, you can replace this input with `~`.

Output Arguments

cp_1, cp_2, ... — Complexity flag

true | false

Logical, scalar value indicating whether the specific output port is complex (`true`) or real (`false`).

Examples

Specify Output as Real-Valued

Specify in your class definition file that the output from a System object is a real value.

```
methods (Access = protected)
    function c1 = isOutputComplexImpl(obj)
        c1 = false;
    end

“Set Output Complexity”

Introduced in R2013b

isOutputFixedSizeImpl

Fixed- or variable-size output ports

Syntax

```
[flag_1,flag_2,...flag_n] = isOutputFixedSizeImpl(obj)
```

Description

[flag_1,flag_2,...flag_n] = isOutputFixedSizeImpl(obj) returns whether each output port is fixed size. The number of outputs must match the value returned from the `getNumOutputs` method, which is the number of output arguments listed in the `stepImpl` method.

For System objects with one input and one output and where you want the input and output fixed sizes to be the same, you do not need to implement this method. In this case `isOutputFixedSizeImpl` assumes the input and output fixed sizes are the same and returns the fixed size of the input.

If your System object has more than one input or output or you need the output and input fixed sizes to be different, you must implement the `isOutputFixedSizeImpl` method to define the output fixed size. You also must use the `propagatedInputFixedSize` method if the output fixed size status differs from the input fixed size status.

Run-Time Details

During Simulink model compilation and propagation, the MATLAB System block calls the `isOutputFixedSize` method, which then calls the `isOutputFixedSizeImpl` method to determine the output fixed size.

All inputs default to variable-size inputs. For these inputs, the output size is the maximum input size.

Method Authoring Tips

- You must set `Access = protected` for this method.
- You cannot modify any properties in this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `isOutputFixedSizeImpl` method does not use the object, you can replace this input with `~`.

Output Arguments

flag_1, flag2, ... — Fixed size flag

true | false

Logical, scalar value indicating whether the specific output port is fixed size (`true`) or variable size (`false`).

Examples

Specify Output as Fixed Size

Specify in your class definition file that the output from a System object is of fixed size.

```
methods (Access = protected)
    function c1 = isOutputFixedSizeImpl(obj)
        c1 = true;
    end
end
```

See Also

`propagatedInputFixedSize`

Topics

“Set Fixed- or Variable-Size Output”

Introduced in R2013b

propagatedInputComplexity

Complexity of input during Simulink propagation

Syntax

```
flag = propagatedInputComplexity(obj, index)
```

Description

`flag = propagatedInputComplexity(obj, index)` returns `true` or `false` to indicate whether the input argument for the indicated System object is complex. `index` specifies the input for which to return the complexity flag.

You can use `propagatedInputComplexity` only from within the `isOutputComplexImpl` method in your class definition file. Use `isOutputComplexImpl` when:

- Your System object has more than one input or output.
- The input complexity determines the output complexity.
- The output complexity must differ from the input complexity.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `propagatedInputComplexity` method does not use the object, you can replace this input with `~`.

index — Input index

positive integer

Index of the specified input. Do not count the `obj` in the `index`. The first input is always `obj`.

Output Arguments

flag — Complexity flag

`true` | `false`

Complexity of the specified input, returned as `true` or `false`

Examples

Match Input and Output Complexity

Get the complexity of the second input when you run the object and set the output to match it. Assume that the first input has no impact on the output complexity.

```
methods (Access = protected)
  function outcomplx = isOutputComplexImpl(obj)
    outcomplx = propagatedInputComplexity(obj,2);
  end
end
```

See Also

isOutputComplexImpl

Topics

“Set Output Complexity”

Introduced in R2014a

propagatedInputDataType

Data type of input during Simulink propagation

Syntax

```
dt = propagatedInputDataType(obj,index)
```

Description

`dt = propagatedInputDataType(obj,index)` returns the data type of an input argument for a System object. `index` specifies the input for which to return the data type.

You can use `propagatedInputDataType` only from within `getOutputDataTypeImpl`. Use `getOutputDataTypeImpl` when:

- Your System object has more than one input or output.
- The input data type status determines the output data type.
- The output data type must differ from the input data type.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `propagatedInputDataType` method does not use the object, you can replace this input with `~`.

index — Input index

positive integer

Index of the specified input. Do not count the `obj` in the `index`. The first input is always `obj`.

Output Arguments

dt — Input data type

character vector | numeric type object

Data type of the specified input, returned as a character vector for floating-point input or as a numeric type for fixed-point input.

Examples

Match Input and Output Data Type

Get the data type of the second input. If the second input data type is `double`, then the output data type is `int32`. For all other cases, the output data type matches the second input data type. Assume that the first input has no impact on the output.

```
methods (Access = protected)
  function dt = getOutputDataTypeImpl(obj)
    if strcmpi(propagatedInputDataType(obj,2), 'double')
      dt = 'int32';
    else
      dt = propagatedInputDataType(obj,2);
    end
  end
end
```

Introduced in R2014a

propagatedInputFixedSize

Fixed-size status of input during Simulink propagation

Syntax

```
flag = propagatedInputFixedSize(obj,index)
```

Description

`flag = propagatedInputFixedSize(obj,index)` returns `true` or `false` to indicate whether an input argument of a System object is fixed size. `index` specifies the input for which to return the fixed-size flag.

You can use `propagatedInputFixedSize` only from within `isOutputFixedSizeImpl`. Use `isOutputFixedSizeImpl` when:

- Your System object has more than one input or output.
- The input fixed-size status determines the output fixed-size status.
- The output fixed-size status must differ from the input fixed-size status.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `propagatedInputFixedSize` method does not use the object, you can replace this input with `~`.

index — Input index

positive integer

Index of the specified input. Do not count the `obj` in the `index`. The first input is always `obj`.

Output Arguments

flag — Fixed size flag

`true` | `false`

Fixed-size status of the specified input, returned as `true` or `false`.

Examples

Match Fixed-Size Status of Input and Output

Get the fixed-size status of the third input and set the output to match it. Assume that the first and second inputs have no impact on the output.

```
methods (Access = protected)
  function outtype = isOutputFixedSizeImpl(obj)
    outtype = propagatedInputFixedSize(obj,3)
  end
end
```

See Also

isOutputFixedSizeImpl

Topics

“Set Fixed- or Variable-Size Output”

Introduced in R2014a

propagatedInputSize

Size of input during Simulink propagation

Syntax

```
size = propagatedInputSize(obj,index)
```

Description

`size = propagatedInputSize(obj,index)` returns, as a vector, the input size of the specified System object. The `index` specifies the input for which to return the size information. (Do not count the `obj` in the `index`. The first input is always `obj`.)

You can use `propagatedInputSize` only from within the `getOutputSizeImpl` method in your class definition file. Use `getOutputSizeImpl` when:

- Your System object has more than one input or output.
- The input size determines the output size.
- The output size must differ from the input size.

Note For variable-size inputs, the propagated input size from `propagatedInputSize` differs depending on the environment.

- MATLAB — `propagatedInputSize` returns the size of the inputs used when you run the object for the first time.
 - Simulink — `propagatedInputSize` returns the upper bound of the input sizes.
-

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `propagatedInputSize` method does not use the object, you can replace this input with `~`.

index — Input index

integer

Index of the specified input

Output Arguments

size — Input size

numeric vector

Size of the specified input, returned as a vector

Examples

Match Size of Input and Output

Get the size of the second input. If the first dimension of the second input has a size greater than 1, then set the output size to a 1 x 2 vector. For all other cases, the output is a 2 x 1 matrix. Assume that the first input has no impact on the output size.

```
methods (Access = protected)
    function outsize = getOutputSizeImpl(obj)
        size = propagatedInputSize(obj,2);
        if size(1) == 1
            outsize = [1,2];
        else
            outsize = [2,1];
        end
    end
end
```

“Set Output Size”

Introduced in R2014a

matlab.system.mixin.Nondirect class

Package: matlab.system.mixin

Nondirect feedthrough mixin class

Note The `matlab.system.mixin.Nondirect` mixin will be removed in a future release. You no longer need to inherit from this mixin in your System object. The associated methods have been moved to the `matlab.System` class.

Description

`matlab.system.mixin.Nondirect` is a class that uses the `output` and `update` methods to process nondirect feedthrough data through a System object.

For System objects that use direct feedthrough, the object's input is needed to generate the output at that time. For these direct feedthrough objects, running the System object calculates the output and updates the state values. For nondirect feedthrough, however, the object's output depends only on the internal states at that time. The inputs are used to update the object states. For these objects, calculating the output with `outputImpl` is separated from updating the state values with `updateImpl`. If you use the `matlab.system.mixin.Nondirect` mixin and include the `stepImpl` method in your class definition file, an error occurs. In this case, you must include the `updateImpl` and `outputImpl` methods instead.

The following cases describe when System objects in Simulink use direct or nondirect feedthrough.

- System object supports code generation and does not inherit from the `Propagates` mixin — Simulink automatically infers the direct feedthrough settings from the System object code.
- System object supports code generation and inherits from the `Propagates` mixin — Simulink does not automatically infer the direct feedthrough settings. Instead, it uses the value returned by the `isInputDirectFeedthroughImpl` method.
- System object does not support code generation — Default `isInputDirectFeedthroughImpl` method returns `false`, indicating that direct feedthrough is not enabled. To override the default behavior, implement the `isInputDirectFeedthroughImpl` method in your class definition file.

Use the `Nondirect` mixin to allow a System object to be used in a Simulink feedback loop. A delay object is an example of a nondirect feedthrough object.

To use this mixin, you must subclass from this class in addition to subclassing from the `matlab.System` base class. Type the following syntax as the first line of your class definition file, where `ObjectName` is the name of your object:

```
classdef ObjectName < matlab.system & matlab.system.mixin.Nondirect
```

Compatibility Considerations

matlab.system.mixin.Nondirect will be removed

Not recommended starting in R2020a

The `matlab.system.mixin.Nondirect` mixin will be removed in a future release. You no longer need to inherit from this mixin in your `System` object. The associated methods have been moved to the `matlab.System` class.

Remove `matlab.system.mixin.Nondirect` from the `classdef` line of your `System` object

isInputDirectFeedthroughImpl

Direct feedthrough status of input

Syntax

```
[flag1,...,flagN] = isInputDirectFeedthroughImpl(obj)
[flag1,...,flagN] = isInputDirectFeedthroughImpl(obj,input,input2,...)
```

Description

[flag1,...,flagN] = isInputDirectFeedthroughImpl(obj) specifies whether each input is a direct feedthrough input. If direct feedthrough is true, the output depends on the input at each time instant.

[flag1,...,flagN] = isInputDirectFeedthroughImpl(obj,input,input2,...) uses one or more of the System object input specifications to determine whether inputs have direct feedthrough.

If you do not include the isInputDirectFeedthroughImpl method in your System object class definition file, all inputs are assumed to be direct feedthrough.

Code Generation

The following cases describe when System objects in Simulink code generation use direct or nondirect feedthrough.

System object's code generation support	Uses a propagation Impl method	Simulink Code Generation Result
Y	N	Simulink automatically infers the direct feedthrough settings from the System object code.
Y	Y	Simulink does not automatically infer the direct feedthrough settings. Instead, it uses the value returned by the isInputDirectFeedthroughImpl method.
N	—	Default isInputDirectFeedthroughImpl method returns false, indicating that direct feedthrough is not enabled. To override the default behavior, implement the isInputDirectFeedthroughImpl method in your class definition file.

Run-Time Details

isInputDirectFeedthroughImpl is called by the MATLAB System block.

Method Authoring Tips

- You must set Access = protected for this method.
- You cannot modify, implement, or access tunable properties in this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `isInputDirectFeedthroughImpl` method does not use the object, you can replace this input with `~`.

input1, input2, ... — Inputs to the System object

inputs to the System object algorithm

Inputs to the algorithm (`stepImpl`) of the System object. The inputs list must match the order of inputs in the `stepImpl` signature.

Output Arguments

flag1, ..., flagN — Output flag for each input to the System object

logical

Logical value, either `true` or `false` indicating whether the input is direct feedthrough. The number of output flags must match the number of inputs to the System object (inputs to `stepImpl`, `outputImpl`, or `updateImpl`).

Examples

Specify Input as Nondirect Feedthrough

Use `isInputDirectFeedthroughImpl` in your class definition file for marking all inputs as nondirect feedthrough.

```
methods (Access = protected)
    function flag = isInputDirectFeedthroughImpl(~)
        flag = false;
    end
end
```

Complete Class Definition

```
classdef intDelaySysObj < matlab.System
    % intDelaySysObj Delay input by specified number of samples.

    properties
        InitialOutput = 0;
    end
    properties (Nontunable)
        NumDelays = 1;
    end
    properties (DiscreteState)
        PreviousInput;
    end

    methods (Access = protected)
        function validatePropertiesImpl(obj)
```

```
    if ((numel(obj.NumDelays)>1) || (obj.NumDelays <= 0))
        error('Number of delays must be > 0 scalar value.');
```

```
    end
    if (numel(obj.InitialOutput)>1)
        error('Initial Output must be scalar value.');
```

```
    end
end

function setupImpl(obj)
    obj.PreviousInput = ones(1,obj.NumDelays)*obj.InitialOutput;
end

function resetImpl(obj)
    obj.PreviousInput = ones(1,obj.NumDelays)*obj.InitialOutput;
end

function [y] = outputImpl(obj,~)
    y = obj.PreviousInput(end);
end
function updateImpl(obj, u)
    obj.PreviousInput = [u obj.PreviousInput(1:end-1)];
end
function flag = isInputDirectFeedthroughImpl(~)
    flag = false;
end
end
end
```

[updateImpl](#) | [outputImpl](#)

Topics

“Use Update and Output for Nondirect Feedthrough”

Introduced in R2013b

outputImpl

Output calculation from input or internal state of System object

Syntax

```
[y1,y2,...,yN] = outputImpl(obj,u1,u2,...,uN)
```

Description

`[y1,y2,...,yN] = outputImpl(obj,u1,u2,...,uN)` specifies the algorithm to output the System object states. The output values are calculated from the states and property values. Any inputs that you set to nondirect feedthrough are ignored during output calculation.

Run-Time Details

`outputImpl` is called by the internal `output` method. It is also called before the `updateImpl` method. For sink objects, calling `updateImpl` before `outputImpl` locks the object. For all other types of objects, calling `updateImpl` before `outputImpl` causes an error.

Method Authoring Tips

- You must set `Access = protected` for this method.
- If the System object will be used in the Simulink MATLAB System block, you cannot modify any tunable properties in this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `outputImpl` method does not use the object, you can replace this input with `~`.

u1,u2,...,uN — Inputs to the algorithm

inputs

Inputs from the algorithm. The number of inputs must match the number of inputs returned by the `getNumInputs` method. Nondirect feedthrough inputs are ignored during normal execution of the System object. However, for code generation, you must provide these inputs even if they are empty.

Output Arguments

y1,y2,...,yN — Outputs of the algorithm

outputs

Outputs calculated from the specified algorithm. The number of outputs must match the number of outputs returned by the `getNumOutputs` method.

Examples

Set Up Output that Does Not Depend on Input

Specify in your class definition file that the output does not directly depend on the current input with the `outputImpl` method. `PreviousInput` is a property of the `obj`.

```
methods (Access = protected)
  function [y] = outputImpl(obj, ~)
    y = obj.PreviousInput(end);
  end
end
```

See Also

`updateImpl` | `isInputDirectFeedthroughImpl`

Topics

“Use Update and Output for Nondirect Feedthrough”

Introduced in R2013b

updateImpl

Update object states based on inputs

Syntax

```
updateImpl(obj, input1, input2, ...)
```

Description

`updateImpl(obj, input1, input2, ...)` specifies the algorithm to update the System object states. You implement this method when your algorithm outputs depend only on the object's internal state and internal properties.

Run-Time Details

`updateImpl` is called by the `update` method and after the `outputImpl` method.

For sink objects, calling `updateImpl` before `outputImpl` locks the object. For all other types of objects, calling `updateImpl` before `outputImpl` causes an error.

Method Authoring Tips

- Do not use this method to update the outputs from the inputs.
- You must set `Access = protected` for this method.
- If the System object will be used in the Simulink MATLAB System block, you cannot modify any tunable properties in this method.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `updateImpl` method does not use the object, you can replace this input with `~`.

input1, input2, ... — Inputs to the System object

inputs to the System object

List the inputs to the System object. The order of inputs must match the order of inputs defined in the `stepImpl` method.

Examples

Set Up Output that Does Not Depend on Current Input

Update the object with previous inputs. Use `updateImpl` in your class definition file. This example saves the `u` input and shifts the previous inputs.

```
methods (Access = protected)
    function updateImpl(obj,u)
        obj.PreviousInput = [u obj.PreviousInput(1:end-1)];
    end
end
```

matlab.system.mixin.SampleTime class

Control sample time for System objects in Simulink

Note The `matlab.system.mixin.SampleTime` mixin will be removed in a future release. You no longer need to inherit from this mixin in your System object. The associated sample time methods have been moved to the `matlab.System` class.

Description

`matlab.system.mixin.SampleTime` specifies the sample time specifications for a System object when it is included in a MATLAB System block. Inherit from this mixin class and use its methods to control the sample time of your System object in Simulink, via the MATLAB System block.

With this mixin, you can:

- Specify the sample time type
- Specify the sample time
- Customize the sample time with offsets and tick times
- Get the current simulation time

System objects that inherit from this mixin class must also inherit from `matlab.System`. For example:

```
classdef MySystemObject < matlab.System & matlab.system.mixin.SampleTime
```

The `matlab.system.mixin.SampleTime` class is a handle class.

Methods

Compatibility Considerations

matlab.system.mixin.SampleTime will be removed

Not recommended starting in R2020a

The `matlab.system.mixin.SampleTime` mixin will be removed in a future release. You no longer need to inherit from this mixin in your System object. The associated sample time methods have been moved to the `matlab.System` class.

Remove `matlab.system.mixin.SampleTime` from the `classdef` line of your System object.

Topics

“Specify Sample Time for MATLAB System Block System Objects”

Introduced in R2017b

getSampleTimeImpl

Specify sample time type, offset time, and sample time

Syntax

```
sts = getSampleTimeImpl(obj)
```

Description

`sts = getSampleTimeImpl(obj)` returns the sample time specification created within the method body, `sts`, for the System object `obj`. Specify the sample time specification within the body of `getSampleTimeImpl` by calling `createSampleTime`. The sample time specification affects the simulation time when the System object is included in a MATLAB System block.

Run-Time Details

`getSampleTimeImpl` is called during setup by `setupImpl`.

Method Authoring Tips

You must set `Access = protected` for this method.

Default Behavior

If you do not include this method in your System object definition, the sample time is inherited.

Input Arguments

obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getSampleTimeImpl` method does not use the object, you can replace this input with `~`.

Output Arguments

sts — Sample time specification object

sample time specification object

An object defining the sample time specification values. You create this object with the `createSampleTime` function.

Examples

Specify Inherited Sample Time

Specify that the MATLAB System block should inherit the sample from upstream blocks, except if the sample time type is controllable.

```
function sts = getSampleTimeImpl(obj)
    sts = createSampleTime(obj, 'ErrorOnPropagation', 'Controllable');
end
```

Specify Discrete Sample Time

Specify a discrete sample time for the MATLAB System block.

```
function sts = getSampleTimeImpl(obj)
    sts = createSampleTime(obj, 'Type', 'Discrete', ...
        'SampleTime', 10.2, 'OffsetTime', 0.5);
end
```

See Also

Topics

“Specify Sample Time for MATLAB System Block System Objects”

Introduced in R2017b

getSampleTime

Query sample time

Syntax

```
sts = getSampleTime(obj)
```

Description

`sts = getSampleTime(obj)` returns the sample time specification for the System object `obj` when the System object is included in a MATLAB System block. You can call `getSampleTime` in the `stepImpl` method to change the algorithm based on the sample time.

Before sample time has propagated throughout the MATLAB System block model, `getSampleTime` returns the `getSampleTimeImpl` sample time specification. If your system object does not override `getSampleTimeImpl`, the default Inherited sample time specification is returned.

After sample time has propagated, `getSampleTime` returns the sample time specification populated with the actual MATLAB System block sample time type, sample time, and offset time.

Input Arguments

obj — System object

System object

System object included in a MATLAB System block that you want to query.

Output Arguments

sts — Sample time specification object

sample time specification object

The sample time specification for the System object. For more details about sample time specification objects, see `createSampleTime`.

Examples

Return Sample Time

This example of `stepImpl` returns a count value `y`, the current simulation time `ct`, and the sample time `st`. The sample time is obtained by calling `getSampleTime`.

```
function [y,ct,st] = stepImpl(obj,u)
    y = obj.Count + u;
    obj.Count = y;
    ct = getCurrentTime(obj);
    sts = getSampleTime(obj);
    st = sts.SampleTime;
end
```

For a complete class definition, see “Specify Sample Time for MATLAB System Block System Objects”.

Topics

“Specify Sample Time for MATLAB System Block System Objects”

Introduced in R2017b

getCurrentTime

Current simulation time in MATLAB System block

Syntax

```
time = getCurrentTime(obj)
```

Description

`time = getCurrentTime(obj)` returns the current simulation time in the MATLAB System block. Call this method in the `stepImpl` method of your System object.

Dependencies

If the MATLAB System block is operating in continuous sample time, `getCurrentTime` may return non-monotonic times due to solver operation.

Input Arguments

obj – System object

system object

System object included in a MATLAB System block that you want to query.

Output Arguments

time – Current simulation time

double

The current simulation time of the MATLAB System block that contains the System object.

Examples

Return Current Simulation Time

This example of `stepImpl` returns a count value `y` and the current simulation time `ct`. The simulation time is obtained by calling `getCurrentTime`.

```
function [y,ct] = stepImpl(obj,u)
    y = obj.Count + u;
    obj.Count = y;
    ct = getCurrentTime(obj);
end
```

For a complete class definition, see “Specify Sample Time for MATLAB System Block System Objects”.

See Also

`createSampleTime` | `getSampleTime` | `getSampleTimeImpl`

Topics

“Specify Sample Time for MATLAB System Block System Objects”

Introduced in R2017b

createSampleTime

Create sample time specification object

Syntax

```
sts = createSampleTime(obj)
sts = createSampleTime(obj, 'Type', Type)
sts = createSampleTime(obj, 'Type', Type, Name, Value)
```

Description

`sts = createSampleTime(obj)` creates a sample time specification object for inherited sample time for the System object `obj`. Use this sample time specification object in the `getSampleTimeImpl` method of your System object. The sample time specification affects the simulation time when the System object is included in a MATLAB System block. If you do not include this method in your System object definition, the sample time is inherited.

`sts = createSampleTime(obj, 'Type', Type)` creates a sample time specification object with the specified sample time type.

`sts = createSampleTime(obj, 'Type', Type, Name, Value)` creates a sample time specification object with additional options specified by one or more `Name, Value` pair arguments. `Name` is a property name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Dependencies

You can only call `createSampleTime` from the `getSampleTimeImpl` method of your System object.

Input Arguments

obj – System object

System object

System object that you want to specify the sample time.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: `'Type', 'Fixed In Minor Step'`

Type – Sample time type

`'Inherited'` (default) | `'Controllable'` | `'Discrete'` | `'Fixed In Minor Step'`

Type of sample time you want the System object to use in Simulink. For descriptions of the different types of sample times, see:

- 'Inherited' - "Inherited Sample Time"
- 'Controllable' - "Controllable Sample Time"
- 'Discrete' - "Discrete Sample Time"
- 'Fixed In Minor Step' - "Fixed-in-Minor-Step"

Example: `createSampleTime('Type','Fixed In Minor Step')`

AllowPropagation — Allow the propagated sample time

'Controllable' | 'Constant' | 'Continuous' | cell array of character vectors | string array

For Inherited sample time only.

Specify one or more sample times you want to allow your object to use. When the sample time type is set to `Inherited` and the MATLAB System block receives the specified sample time, the block allows the sample time to propagate. You can specify multiple sample time types as a cell array or string array.

Example: `createSampleTime('Type','Inherited','AllowPropagation',{'Controllable','Continuous'})`

AlternatePropagation — Alter the propagated sample time

'Controllable' | 'Constant' | 'Continuous' | cell array of character vectors | string array

For Inherited sample time only.

Specify one or more sample times you do not want your object to use. When the sample time type is set to `Inherited` and you do not want the MATLAB System block to use the specified inherited sample time type, an alternative sample time is used by the block instead. You can specify multiple sample time types. For each sample time type, Simulink substitutes a different sample time type:

- 'Controllable' — The base rate of the controlled sample is propagated instead. Use this option if your System object depends on having constant time between each sample-time hit.
- 'Constant' — The base rate of the model is propagated instead, either the fastest discrete rate or fixed in minor step.
- 'Continuous' — The fastest discrete rate is propagated instead.

Example:

`createSampleTime('Type','Inherited','AlternatePropagation','Controllable')`

ErrorOnPropagation — Error on the propagated sample time

'Controllable' | 'Constant' | 'Continuous' | cell array of character vectors | string array

For Inherited sample time only.

Specify one or more sample times you do not want your object to use. When the sample time type is set to `Inherited` and the MATLAB System block receives the specified sample time, Simulink throws an error.

Example:

`createSampleTime('Type','Inherited','ErrorOnPropagation','Controllable')`

SampleTime — Time between samples

1 (default) | positive number

For Discrete sample time only.

Specify the time between sample hits in Simulink.

Example: `createSampleTime('Type','Discrete','SampleTime',1)`

Data Types: `single` | `double`

OffsetTime — Offset from sample time

0 (default) | nonnegative number less than `SampleTime`

For `Discrete` sample time only.

Specify the offset time for the sample hit. The offset is a time interval indicating an update delay. The block is updated later in the sample interval than other blocks operating at the same sample rate.

The offset time must be nonnegative and less than `SampleTime`.

Example: `createSampleTime('Type','Discrete','SampleTime',2,'OffsetTime',1)`

Data Types: `single` | `double`

TickTime — Time between sample time hits

-1 (default) | positive scalar

Required for `Controllable` sample time only.

Specify the time between controllable sample time hits. The tick time must be a positive scalar.

Example: `createSampleTime('Type','Controllable','TickTime',obj.TickTime)`

Data Types: `single` | `double`

Output Arguments

sts — Sample time specification object

sample time specification object

The sample time specification object. This object has the following properties:

- `Type` — Type of sample time
- `SampleTime` — Time between samples
- `OffsetTime` — Offset from sample time

Use this object as the return value of `getSampleTimeImpl`.

Examples

Create Inherited Sample Time Specification Object

Specify that the MATLAB System block inherits the sample from upstream blocks. Inherited sample time is the default, so no additional arguments are needed.

```
function sts = getSampleTimeImpl(obj)
    sts = createSampleTime(obj);
end
```

Create Discrete Sample Time Object

Specify a discrete sample time specification for the MATLAB System block, including offset time and the sample time.

```
function sts = getSampleTimeImpl(obj)
    sts = createSampleTime(obj, 'Type', 'Discrete', ...
        'SampleTime', 10.2, 'OffsetTime', 0.5);
end
```

Topics

“Specify Sample Time for MATLAB System Block System Objects”

Introduced in R2017b

setNumTicksUntilNextHit

Set the number of ticks in Simulink sample time

Syntax

```
setNumTicksUntilNextHit(obj,ticks)
```

Description

`setNumTicksUntilNextHit(obj,ticks)` sets the number of ticks in Simulink sample time to wait until the next call to `stepImpl`, or `outputImpl/updateImpl`.

Dependencies

To use this method, set your System object to controllable sample time with `createSampleTime('Type','Controllable')`. Otherwise, your System object gives a compilation error.

You can only call this method from `stepImpl`, `outputImpl`, `updateImpl`, or `resetImpl`.

Input Arguments

obj — System object

System object

System object that you want to specify the sample time.

ticks — Number of ticks in Simulink sample time

positive integer scalar

Number of ticks in Simulink sample time to wait until the next call to `stepImpl` or `outputImpl/updateImpl`. Specify this number as a positive integer scalar less than `intmax('uint64')`.

The number of sample time ticks to wait until the next hit is persistent. If you don't update this number, Simulink uses the previously set value of number of ticks to wait.

Simulink.BlockCompDworkData

Provide postcompilation information about block's DWork vector

Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the “Dwork” on page 5-470 method of a block's run-time object after the model containing the block has been compiled.

Parent

Simulink.BlockData

Children

None

Property Summary

Name	Description
“Usage” on page 5-200	Usage type of this DWork vector.
“UsedAsDiscState” on page 5-201	True if this DWork vector is being used to store the values of a block's discrete states.

Properties

Usage

Description

Returns a character vector indicating how this DWork vector is used. Permissible values are:

- DWork
- DState
- Scratch
- Mode

Data Type

character vector

Access

RW for MATLAB S-function blocks, RO for other blocks.

UsedAsDiscState**Description**

True if this DWork vector is being used to store the values of a block's discrete states.

Data Type

Boolean

Access

RW for MATLAB S-Function blocks, R0 for other blocks.

Introduced before R2006a

Simulink.BlockCompInputPortData

Provide postcompilation information about block input port

Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the “InputPort” on page 5-471 method of a block's run-time object after the model containing the block has been compiled.

Parent

Simulink.BlockPortData

Children

None

Property Summary

Name	Description
“DirectFeedthrough” on page 5-202	True if this port has direct feedthrough.
“Overwritable” on page 5-202	True if this port is overwritable.

Properties

DirectFeedthrough

Description

True if this input port has direct feedthrough.

Data Type

Boolean

Access

RW for MATLAB S functions, RO for other blocks.

Overwritable

Description

True if this input port is overwritable.

Data Type

Boolean

Access

RW for MATLAB S functions, RO for other blocks.

Introduced before R2006a

Simulink.BlockCompOutputPortData

Provide postcompilation information about block output port

Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the “OutputPort” on page 5-472 method of a block's run-time object after the model containing the block has been compiled.

Parent

Simulink.BlockPortData

Children

None

Property Summary

Name	Description
“Reusable” on page 5-214	Specifies whether an output port's memory is reusable.

Properties

Reusable

Description

Specifies whether an output port's memory is reusable. Options are: `NotReusableAndGlobal` and `ReusableAndLocal`.

Data Type

character vector

Access

RW for MATLAB S functions, RO for other blocks.

Introduced before R2006a

Simulink.BlockData

Provide run-time information about block-related data, such as block parameters

Description

This class defines properties that are common to objects that provide run-time information about a block's ports and work vectors.

Parent

None

Children

Simulink.BlockPortData, Simulink.BlockCompDworkData

Property Summary

Name	Description
"AliasedThroughDataType" on page 5-205	Fundamental base data type.
"AliasedThroughDataTypeID" on page 5-206	Fundamental base data type ID.
"Complexity" on page 5-206	Numeric type (real or complex) of the block data.
"Data" on page 5-206	The block data.
"DataAsDouble" on page 5-207	The block data in double form.
"Datatype" on page 5-207	Data type of the block data.
"DatatypeID" on page 5-207	Index of the data type of the block data.
"Dimensions" on page 5-208	Dimensions of the block data.
"Name" on page 5-208	Name of the block data.
"Type" on page 5-208	Type of block data (e.g., a parameter).

Properties

AliasedThroughDataType

Description

Data type aliases allow a data type (B) to be recursively aliased to another alias type or `BaseType` (A). If alias type A is aliased to another alias type that is aliased to another alias type and so forth, this property allows the alias type to be iteratively searched (aliased through) until the type is no longer an alias type and that final result is the value of the property returned. For example, assume that you have created the Simulink Alias types A and B as follows:

```
A=Simulink.AliasType('double')
```

A =

```
Simulink.AliasType
  Description: ''
  HeaderFile: ''
  BaseType: 'double'
B=Simulink.AliasType('A')

B =
Simulink.AliasType
  Description: ''
  HeaderFile: ''
  BaseType: 'A'
```

If the data type of an item of block data is B, this property returns the base type A instead of B.

Data Type

character vector

Access

R0

AliasedThroughDataTypeID**Description**

Index of the data type alias returned by the `AliasedThroughDataType` property.

Data Type

integer

Access

R0

Complexity**Description**

Numeric type (real or complex) of the block data.

Data Type

character vector

Access

RW for MATLAB S functions, R0 for other blocks.

Data**Description**

The block data.

Data Type

The data type specified by the “Datatype” on page 5-207 or “DatatypeID” on page 5-207 properties of this object.

Access

RW

DataAsDouble**Description**

The block data's in double form.

Data Type

double

Access

R0

Datatype**Description**

Data type of the values of the block-related object.

Data Type

character vector

Access

R0

DatatypeID**Description**

Index of the data type of the values of the block-related object. enter the numeric value for the desired data type, as follows:

Data Type	Value
'inherited'	-1
'double'	0
'single'	1
'int8'	2
'uint8'	3
'int16'	4
'uint16'	5
'int32'	6
'uint32'	7
'boolean' or fixed-point data types	8

Data Type

integer

Access

RW for MATLAB S functions, R0 for other blocks

Dimensions**Description**

Dimensions of the block-related object, e.g., parameter or DWork vector.

Data Type

array

Access

RW for MATLAB S functions, R0 for other blocks

Name**Description**

Name of block-related object, e.g., a block parameter or DWork vector.

Data Type

character vector

Access

RW for MATLAB S functions, R0 for other blocks

Type**Description**

Type of block data. Possible values are:

Type	Description
'BlockPreCompInputPortData '	This object contains data for an input port before the model is compiled.
'BlockPreCompOutputPortData '	This object contains data for an output port before the model is compiled.
'BlockCompInputPortData '	This object contains data for an input port after the model is compiled.
'BlockCompOutputPortData '	This object contains data for an output port after the model is compiled.
'BlockPreCompDworkData '	This object contains data for a DWork vector before the model is compiled.
'BlockCompDworkData '	This object contains data for a DWork vector after the model is compiled.
'BlockDialogPrmData '	This object describes a dialog box parameter of a Level-2 MATLAB S-function.

Type	Description
'BlockRuntimePrmData'	This object describes a run-time parameter of a Level-2 MATLAB S-function.
'BlockCompContStatesData'	This object describes the continuous states of the block at the current time step.
'BlockDerivativesData'	This object describes the derivatives of the block's continuous states at the current time step.

Data Type

character vector

Access

R0

Introduced before R2006a

Simulink.BlockPortData

Describe block input or output port

Description

This class defines properties that are common to objects that provide run-time information about a block's ports.

Parent

Simulink.BlockData

Children

Simulink.BlockPreCompInputPortData, Simulink.BlockPreCompOutputPortData, Simulink.BlockCompInputPortData, Simulink.BlockCompOutputPortData

Property Summary

Name	Description
"IsBus" on page 5-210	True if this port is connected to a bus.
"IsSampleHit" on page 5-210	True if this port produces output or accepts input at the current simulation time step.
"SampleTime" on page 5-211	Sample time of this port.
"SampleTimeIndex" on page 5-211	Sample time index of this port.

Properties

IsBus

Description

True if this port is connected to a bus.

Data Type

Boolean

Access

R0

IsSampleHit

Description

True if this port produces output or accepts input at the current simulation time step.

Data Type

Boolean

Access

R0

SampleTime**Description**

Sample time of this port.

Data Type

[period offset] where period and offset are values of type double. See “Specify Sample Time” for more information.

Access

RW for MATLAB S functions, R0 for other blocks

SampleTimeIndex**Description**

Sample time index of this port.

Data Type

integer

Access

R0

Introduced before R2006a

Simulink.BlockPreComplInputPortData

Provide precompilation information about block input port

Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the “InputPort” on page 5-471 method of a block's run-time object before the model containing the block has been compiled.

Parent

Simulink.BlockPortData

Children

None

Property Summary

Name	Description
“DirectFeedthrough” on page 5-212	True if this port has direct feedthrough.
“Overwritable” on page 5-212	True if this port is overwritable.

Properties

DirectFeedthrough

Description

True if this input port has direct feedthrough.

Data Type

Boolean

Access

RW for MATLAB S functions, R0 for other blocks

Overwritable

Description

True if this input port is overwritable.

Data Type

Boolean

Access

RW for MATLAB S functions, RO for other blocks

Introduced before R2006a

Simulink.BlockPreCompOutputPortData

Provide precompilation information about block output port

Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the “OutputPort” on page 5-472 method of a block's run-time object before the model containing the block has been compiled.

Parent

Simulink.BlockPortData

Children

none

Property Summary

Name	Description
“Reusable” on page 5-214	Specifies whether an output port's memory is reusable.

Properties

Reusable

Description

Specifies whether an output port's memory is reusable. Options are: `NotReusableAndGlobal` and `ReusableAndLocal`.

Data Type

character vector

Access

RW for MATLAB S functions, RO for other blocks

Introduced before R2006a

Simulink.Breakpoint class

Package: Simulink

Store and share data for a breakpoint set, configure the data for ASAP2 and AUTOSAR code generation

Description

An object of the `Simulink.Breakpoint` class stores breakpoint set data for a lookup table. You can use that data in one or more Prelookup blocks. With the object, you can specify a data type and code generation settings for the breakpoint set and share the set between multiple lookup tables. Use `Simulink.Breakpoint` objects and `Simulink.LookupTable` objects to configure COM_AXIS code generation for calibration.

The code generated for a `Simulink.Breakpoint` object is an array or a structure with two fields. If you configure the object to appear as a structure, one field stores the specified breakpoint set data and one scalar field stores the number of elements in the breakpoint set data. You can configure the structure type name, the field name, and other characteristics by using the properties of the object.

To package lookup table and breakpoint set data into a single structure in the generated code, for example, for STD_AXIS code generation, use a `Simulink.LookupTable` object to store all of the data. See “Package Shared Breakpoint and Table Data for Lookup Tables”.

To subclass from `Simulink.Breakpoint` and inherit from this base class, type this syntax as the first line of your class definition file, where *myBreakpoint* is the name of your new class:

```
classdef myBreakpoint < Simulink.Breakpoint
```

For an example on subclassing, see “Define Data Classes”.

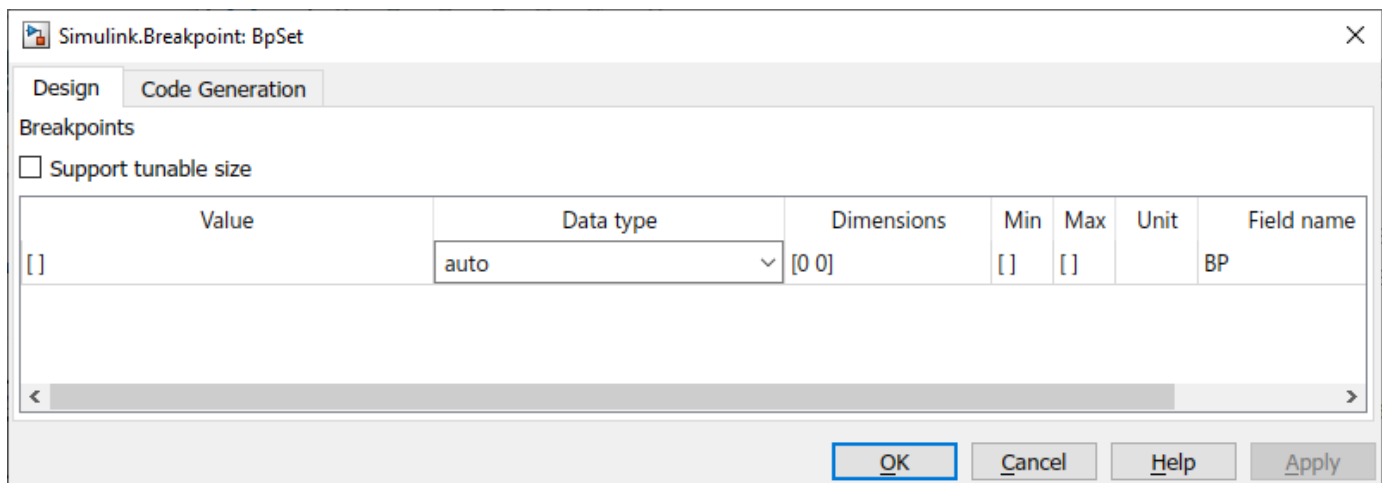

If you add properties to the subclass, you can see them by displaying the subclass object at the MATLAB command line. In the property dialog box, these properties display in a new tab.

Construction

`BpSet = Simulink.Breakpoint` returns a `Simulink.Breakpoint` object named `BpSet` with default property values.

To create a `Simulink.Breakpoint` object by using the Model Explorer, use the button  on the toolbar. The default name for the object is `Object`.

Property Dialog Box

Breakpoints

The breakpoint set information. You can configure these characteristics:

Support tunable size

Specification to enable tuning the effective size of the table in the generated code. If you select this option, in the generated code, the `Simulink.Breakpoint` object appears as a structure variable. The structure has one field to store the breakpoint vector data and one field to store the number of elements in the breakpoint vector. You can change the value of the second field to adjust the effective size of the table.

If you clear this option, the `Simulink.Breakpoint` object appears in the generated code as a separate array variable instead of a structure.

Value

Breakpoint set data. Specify a vector with at least two elements.

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector. When you click **Apply** or **OK**, the object executes the expression and uses the result to set the value of this property.

When you set **Data type** to `auto`, to set **Value**, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

You can edit this data by using a more intuitive interface in a lookup table block. See “Import Lookup Table Data from MATLAB”.

Data type

Data type of the breakpoint set. The default setting is `auto`, which means that the breakpoint set acquires a data type from the value that you specify in **Value**. If you use an untyped expression such as `[1 2 3]` to set **Value**, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint data use the data type specified by the expression or object. Enumerated data types are also supported.

You can explicitly specify an integer data type, half data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Dimensions

Dimension lengths of the breakpoint set.

To use symbolic dimensions, specify a character vector. See “Implement Dimension Variants for Array Sizes in Generated Code” (Embedded Coder).

Min

Minimum value of the elements in the breakpoint set. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Max

Maximum value of the elements in the breakpoint set. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Stored Int Min

For `Simulink.Breakpoint` objects with a fixed-point data type, the minimum value of the elements in the breakpoint set, specified as a stored integer value. The value is derived from the real-world value **Min**. This property is available only in the property dialog box.

Stored Int Max

For `Simulink.Breakpoint` objects with a fixed-point data type, the maximum value of the elements in the breakpoint set, specified as a stored integer value. The value is derived from the real-world value **Max**. This property is available only in the property dialog box.

Unit

Physical unit of the elements in the breakpoint set. You can specify text such as `degC`. See “Unit Specification in Simulink Models”.

Field name

Name of a structure field in the generated code. This field stores the breakpoint set data. The default value is `BP`. To change the field name, specify text.

This column appears only if you select **Support tunable size**.

Tunable size name

Name of a structure field in the generated code. This scalar field stores the length of the breakpoint set (the number of elements), which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory. The default name is `N`. To change the field name, specify text.

This column appears only if you select **Support tunable size**.

Description

Description of the breakpoint set. You can specify text such as `This breakpoint set represents the pressure input`.

Data definition: Storage class

Storage class of the structure variable (if you select **Support tunable size**) or array variable in the generated code. The variable stores the breakpoint set data. The default setting is `Auto`.

For more information about storage classes, see “C Code Generation Configuration for Model Interface Elements” (Simulink Coder).

If you have Embedded Coder, you can choose a custom storage class. For information about custom storage classes, see “Organize Parameter Data into a Structure by Using Struct Storage Class” (Embedded Coder).

Data definition: Identifier

Alternative name for the variable in the generated code. The default value is empty, in which case the generated code uses the name of the `Simulink.Breakpoint` object as the name of the variable. To set the identifier, specify text.

To enable this property, set **Data definition: Storage class** to a setting other than `Auto`.

Data definition: Alignment

Data alignment boundary in the generated code. The starting memory address for the data allocated for the structure or array variable is a multiple of the value that you specify. The default value is `-1`, which allows the code generator to determine an optimal alignment based on usage.

Specify a positive integer that is a power of 2, not exceeding 128. For more information about using data alignment for code replacement, see “Data Alignment for Code Replacement” (Embedded Coder).

Struct Type definition: Name

Name of the structure type that the structure variable uses in the generated code. The default value is empty. Specify text.

This property appears only if you select **Support tunable size**.

Struct Type definition: Data scope

Scope of the structure type definition (imported from your handwritten code or exported from the generated code). The default value is `Auto`. When you select `Auto`:

- If you do not specify a value in the **Struct Type definition: Header file** box, the generated code exports the structure type definition to the file `model_types.h`. `model` is the name of the model.
- If you specify a value in the **Struct Type definition: Header file** box, such as `myHdr.h`, the generated code imports the structure type definition from `myHdr.h`.

To explicitly specify the data scope:

- To import the structure type definition into the generated code from your custom code, select `Imported`.
- To export the structure type definition from the generated code, select `Exported`.

If you do not specify a value in the **Struct Type definition: Header file** box, the generated code imports or exports the type definition from or to *StructName.h*. *StructName* is the name that you specify with the property **Struct Type definition: Name**.

This property appears only if you select **Support tunable size**.

Struct Type definition: Header file

Name of the header file that contains the structure type definition. You can import the definition from a header file that you create, or export the definition into a generated header file. To control the scope of the structure type, adjust the setting for the **Struct Type definition: Data scope** property.

This property appears only if you select **Support tunable size**.

Properties

Breakpoints — Breakpoint set data

`Simulink.lookuptable.Breakpoint` object

Breakpoint set data, specified as a `Simulink.lookuptable.Breakpoint` object. Use this embedded object to configure the structure field names and characteristics of the breakpoint set data such as breakpoint values, data type, and dimensions.

CoderInfo — Code generation settings for variable

`Simulink.CoderInfo` object

Code generation settings for the structure variable (if you set `SupportTunableSize` to `true`) or array variable (`false`) that stores the breakpoint set data, specified as a `Simulink.CoderInfo` object. You can specify a storage class or custom storage class by using this embedded object. For more information, see `Simulink.CoderInfo`.

StructTypeInfo — Settings for structure type in the generated code

`Simulink.lookuptable.StructTypeInfo` object

Settings for the structure type that the structure variable uses in the generated code, specified as a `Simulink.lookuptable.StructTypeInfo` object.

If you set `SupportTunableSize` to `false`, the `Simulink.Breakpoint` object does not appear in the generated code as a structure. The code generator ignores this property.

SupportTunableSize — Option to generate code that enables tunability of table size

`false` (default) | `true`

Option to generate code that enables tunability of the effective size of the table, specified as `true` or `false`. See the **Support Tunable Size** parameter.

Data Types: `logical`

Copy Semantics

Handle. To learn how handle classes affect copy operations, see [Copying Objects](#).

Examples

Share Breakpoint Data Between One-Dimensional Lookup Tables

- 1 Create a `Simulink.Breakpoint` object named `myBpSet`.

```
myBpSet = Simulink.Breakpoint
```

- 2 Specify the breakpoint data.

```
myBpSet.Breakpoints.Value = [-2 -1 0 1 2];
```

- 3 Create a `Simulink.LookupTable` object named `FirstLUTObj`.

```
FirstLUTObj = Simulink.LookupTable;
```

- 4 Specify the table data.

```
FirstLUTObj.Table.Value = [1.1 2.2 3.3 4.4 5.5];
```

- 5 Set first `FirstLUTObj` to Reference.

```
FirstLUTObj.BreakpointsSpecification = 'Reference';
```

- 6 Configure the lookup table object to refer to the breakpoint set object.

```
FirstLUTObj.Breakpoints = {'myBpSet'};
```

- 7 Create another `Simulink.LookupTable` object to store a different set of table data. Configure the lookup table object to refer to the same breakpoint set object.

```
SecondLUTObj = Simulink.LookupTable;
SecondLUTObj.Table.Value = [1.2 2.3 3.4 4.5 5.6];
SecondLUTObj.BreakpointsSpecification = 'Reference';
SecondLUTObj.Breakpoints = {'myBpSet'};
```

You can use `FirstLUTObj` and `SecondLUTObj` to specify the table data in two different Interpolation Using Prelookup blocks. Use `myBpSet` to specify the breakpoint set data in one or two Prelookup blocks that provide the inputs for the Interpolation Using Prelookup blocks.

Limitations

- You cannot generate code according to the `FIX_AXIS` style.
- When blocks in a subsystem use `Simulink.LookupTable` or `Simulink.Breakpoint` objects, you cannot set data type override (see “Control Fixed-Point Instrumentation and Data Type Override”) only on the subsystem. Instead, set data type override on the entire model.

Introduced in R2016b

Simulink.CodeImporter class

Package: Simulink

Import custom C/C++ code into Simulink

Description

Use the `Simulink.CodeImporter` class to import custom C/C++ code into Simulink for modeling, verification, and validation. Instances of this class are used to specify custom code to import into Simulink.

The `Simulink.CodeImporter` class is a handle class.

Creation

Description

`obj = Simulink.CodeImporter()` creates an instance of the `CodeImporter` with the `LibraryFileName` property set to "untitled".

`obj = Simulink.CodeImporter(LibName)`, where `LibName` is a file name chosen by the user and specified as a string or character vector, creates an instance of the `CodeImporter` with the `LibraryFileName` property set to `LibName`.

Properties

LibraryFileName — Name of Simulink library file and generated artifacts

"untitled" (default) | string | character vector

Name of Simulink library file and generated artifacts created for the imported code, specified as a string or a character vector. Name must be a valid MATLAB variable name. The same file name is used with different extensions for the data dictionary and other artifacts generated when code is imported.

Example: "pumpController"

Data Types: string | character vector

OutputFolder — Location of generated library file and generated artifacts

"" (default) | string | character vector

Location of generated library file and generated artifacts, specified as a string or a character vector. If left blank, the current MATLAB folder is used.

File locations that are part of the `CustomCode` property can be specified relative to this folder.

Example: "C:\HeatPump\Controller"

Data Types: string | character vector

CustomCode — Custom C or C++ code files and associated properties to import

CustomCode object

C or C++ code files and associated properties to import, specified as an object of class `Simulink.CodeImporter.CustomCode`. Use this property to specify code importing options, such as source and header files, folder paths, libraries, and compiler and linker flags. For information, see `Simulink.CodeImporter.CustomCode`.

```
%% Create code importer object
```

```
obj = Simulink.CodeImporter;
```

```
%% Set the custom code to import
```

```
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
```

```
obj.CustomCode.IncludePaths = ["/include"];
```

```
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];
```

```
obj.CustomCode
```

```
ans =
```

```
CustomCode with properties:
```

```

    SourceFiles: ["src/pumpController.c" "src/utils.c"]
  InterfaceHeaders: "pumpController.h"
    IncludePaths: "./include"
      Libraries: [1x0 string]
        Defines: [1x0 string]
      Language: "C"
    CompilerFlags: [1x0 string]
      LinkerFlags: [1x0 string]
GlobalVariableInterface: 0
  FunctionArrayLayout: NotSpecified
```

ParseInfo — Information regarding parsed custom code

Simulink.CodeImporter.ParseInfo object

Information regarding the parsed custom code, specified as an object of class `Simulink.CodeImporter.ParseInfo`. This property is read-only. Parsing needs to be successful to obtain information regarding custom code. For information, see `Simulink.CodeImporter.ParseInfo`.

Example:

```
s = obj.parse;
```

```
obj.ParseInfo
```

```
ans =
```

```
ParseInfo with properties:
```

```

    Success: 1
  AvailableFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
    EntryFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
  AvailableTypes: "pump_control_bus"
      Errors: []
```

Options — Additional options used by Code Importer during import for library creation

Options object

Additional options used by Code Importer during import for library creation, specified as an object of class `Simulink.CodeImporter.Options`. Use this object to change the default values for the size of an argument passed by a pointer to a function, and the Simulink library browser name. For information, see `Simulink.CodeImporter.Options`.

Example:

```
>> obj.Options

ans =

Options with properties:

    PassByPointerDefaultSize: "-1"
        CreateTestHarness: 0
    LibraryBrowserName: ""

>> obj.Options.LibraryBrowserName = "Controller Library";
>> obj.Options

ans =

Options with properties:

    PassByPointerDefaultSize: "-1"
        CreateTestHarness: 0
    LibraryBrowserName: "Controller Library"
```

Methods

Public Methods

<code>parse</code>	Analyze custom code for functions, types, global variables, and their dependencies
<code>import</code>	Import custom code, functions, and types into Simulink
<code>addToProject</code>	Add custom code and imported artifacts to MATLAB project
<code>view</code>	Launch Simulink Code Importer wizard
<code>save</code>	Save import settings to JSON format text file
<code>load</code>	Load import settings from saved import settings file
<code>computeInterfaceHeaders</code>	Compute interface headers from specified source files

Examples

Import Custom Code

Specify location and options for custom code.

```
%% Create code importer object
obj = Simulink.CodeImporter('PumpController');

%% Set the custom code to import
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = ["/include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];

%% Specify name for Library Browser
obj.Options.LibraryBrowserName = "Controller Library";
```

Parse custom code and examine results.

```
%% Parse custom code
s = obj.parse;
obj.ParseInfo

ans =

    ParseInfo with properties:

        Success: 1
    AvailableFunctions: ["Controller"      "setFanTempThreshold"      "setPumpTempThreshold"]
      EntryFunctions: ["Controller"      "setFanTempThreshold"      "setPumpTempThreshold"]
    AvailableTypes: "pump_control_bus"
        Errors: []
```

Import parsed code into Simulink

```
%% Import code
s = obj.import;
```

Topics

“Import Custom C/C++ Code Using the Simulink Code Importer”

Introduced in R2021a

addToProject

Package: Simulink

Add custom code and imported artifacts to MATLAB project

Syntax

```
success = obj.addToProject(ProjectFilePath)
```

Description

`success = obj.addToProject(ProjectFilePath)`, where `obj` is an object of class `Simulink.CodeImporter` or `sltest.CodeImporter`, adds the specified custom C/C++ code and the artifacts generated when importing custom code (using the `import` method) to an existing MATLAB project. Generated artifacts include a Simulink library and a data dictionary, and for objects of class `sltest.CodeImporter`, a sandbox folder. If you choose to generate a test harness and test files for the imported blocks, generated artifacts also include Simulink Test files (Simulink Test license required).

Invoke `addToProject` only after a successful import of custom code.

Input Arguments

ProjectFilePath — Name of existing MATLAB project

character vector | string scalar

Name of existing MATLAB project, specified as a character vector or string scalar. The path can be a full path or a path relative to the current MATLAB folder. For `addToProject` to be successful, all custom code files and the Simulink library and other generated artifacts must be located in either the same folder as the MATLAB project or in direct or indirect subfolders of that folder.

Data Types: character vector | string scalar

Output Arguments

success — Success indicator

logical scalar

Success indicator of whether code and artifacts are added to project, returned as a logical scalar. If not successful, Simulink throws an error.

See Also

`Simulink.CodeImporter`

Introduced in R2021a

build

Class: Simulink.CodeImporter

Package: Simulink

Detect code errors that prevent imported Simulink library from simulation

Syntax

```
output_args = method(input_args,Name,Value)
```

Description

`output_args = method(input_args,Name,Value)` <verb phase> with additional options specified by one or more `Name,Value` pair arguments.

Input Arguments

name1 —
(default) |

Example:

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `string` | `struct` | `table` | `cell` | `function_handle` | `categorical` | `datetime` | `duration` | `calendarDuration` | `fi`
Complex Number Support: Yes

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example:

name2 —
(default) |

Example:

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `string` | `struct` | `table` | `cell` | `function_handle` | `categorical` | `datetime` | `duration` | `calendarDuration` | `fi`
Complex Number Support: Yes

Output Arguments

name3 —

Examples

(examples)

See Also

Introduced in R2022a

computeInterfaceHeaders

Class: Simulink.CodeImporter

Package: Simulink

Compute interface headers from specified source files

Syntax

```
listOfHdr = obj.computeInterfaceHeaders()
```

Description

`listOfHdr = obj.computeInterfaceHeaders()`, where `obj` is an object of class `Simulink.CodeImporter`, computes the interface header information for the custom code specified in the `CustomCode` of `obj`.

Output Arguments

listOfHdr — List of interface header files

string array

List of interface header files computed from specified custom code, returned as a string array. This value can be used to populate the `InterfaceHeader` property of the `CustomCode` property of `obj`.

See Also

`Simulink.CodeImporter` | `Simulink.CodeImporter.CustomCode`

Introduced in R2021b

import

Package: Simulink

Import custom code, functions, and types into Simulink

Syntax

```
success = obj.import()  
success = obj.import(Name1,Value1,...,NameN,ValueN)
```

Description

`success = obj.import()`, where `obj` is an object of class `Simulink.CodeImporter`, parses the specified custom code and imports it into Simulink with default import options. If the custom code was not previously parsed or if the custom code or the settings of `obj.CustomCode` have changed since the custom code was parsed, then the `ParseInfo` property of `obj` is populated or repopulated with the information resulting from the parse.

`success = obj.import(Name1,Value1,...,NameN,ValueN)` parses the specified custom code and imports it into Simulink with options based on the specified name-value arguments.

Examples

Import Custom Code

Specify location and options for custom code, then import the code into Simulink.

```
%% Create code importer object  
obj = Simulink.CodeImporter;  
  
%% Set library file name and output folder  
obj.LibraryFileName = "pumpController";  
obj.OutputFolder = ".";  
  
%% Set the custom code to import  
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];  
obj.CustomCode.IncludePaths = ["/include"];  
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];  
  
%% Parse custom code and configure function  
obj.parse();  
fcn = obj.ParseInfo.getFunctions("Controller");  
fcn.PortSpecification.ReturnArgument.Label = "control_out";  
  
%% Import function "Controller"  
obj.import('Functions', ["Controller"]);
```

Input Arguments

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose `Name` in quotes.

Example: `obj.import('Functions',["Controller"],'EntryFunctionsOnly','On');`

EntryFunctionsOnly — Option to limit import to entry-point functions

'On' (default) | 'Off'

Option to limit import to entry-point functions, specified as 'On' or 'Off'. If specified as 'On', only entry-point functions from the custom code, that is, functions not called by other functions in the custom code, are imported into the Simulink library. Otherwise, all available custom code functions are imported.

Data Types: char | string

Functions — Functions to import

"" (default) | cell array of character vectors | string array

Functions to import, specified as a cell array of character vectors or a string array. Specify this argument to limit import to the named custom code functions. Otherwise, all available custom code functions or all available entry-point custom code functions are imported.

Data Types: char | string

Types — Additional types to import

"" (default) | cell array of character vectors | string array

Additional types to import, specified as a cell array of character vectors or a string array. All types required by the imported functions are imported. Additional types are defined in the interface headers.

Data Types: char | string

Overwrite — Option to overwrite existing Simulink library

'Off' (default) | 'On'

Option to overwrite existing Simulink library with the same name as the name specified in the `LibraryFileName` property, specified as 'On' or 'Off'. If set to 'Off' and there is an existing Simulink library with the same name, custom code is imported into the existing library without changing block settings applied in the library after previous imports of custom code. If set to 'On', the existing library is overwritten by the library created from the custom code import, and any prior changes to the existing library are lost. If there is no existing Simulink library with the same name, a new library is created.

Data Types: char | string

AddToProject — Option to add custom code and generated artifacts to existing MATLAB project

project file path

Option to add custom code and generated artifacts to existing MATLAB project, specified as a file path. Artifacts include a library file for imported functions and a data dictionary for imported types. If `obj.Options.CreateTestHarness` is set to `true` and Simulink Test is installed, artifacts also include a Simulink Test file.

Data Types: `char` | `string`

Output Arguments

success — Whether import is successful

logical scalar

Whether import is successful, specified as a logical scalar. Simulink throws an exception if the import is unsuccessful.

See Also

`Simulink.CodeImporter.ParseInfo` | `Simulink.CodeImporter.Options` |
`Simulink.CodeImporter.CustomCode` | `Simulink.CodeImporter`

Introduced in R2021a

load

Class: Simulink.CodeImporter

Package: Simulink

Load import settings from saved import settings file

Syntax

```
success = obj.load(filename)
```

Description

`success = obj.load(filename)`, where `obj` is an object of class `Simulink.CodeImporter`, loads import settings from a saved import settings JSON file, `filename`, created using the `save` method.

Input Arguments

filename — Name or path of file with saved import settings

character vector | string scalar

Name or path of JSON file with saved import settings, specified as a character vector or string scalar.

Example: `'importsettings.json'`

Data Types: `char` | `string`

Output Arguments

success — Indicator of whether loading import settings is successful

logical scalar

Indicator of whether loading import settings is successful, returned as a logical scalar.

See Also

`Simulink.CodeImporter`

Introduced in R2020a

parse

Package: Simulink

Analyze custom code for functions, types, global variables, and their dependencies

Syntax

```
success = obj.parse()
success = obj.parse('Force', 'On')
success = obj.parse('Force', 'Off')
```

Description

`success = obj.parse()`, where `obj` is an object of `Simulink.CodeImporter` or `sltest.CodeImporter` class, parses the custom code, but does not re-parse the custom code if the custom code has been parsed previously and neither the custom code nor the settings of `obj.CustomCode` have changed since the previous parse. Results of a successful parse or error information from an unsuccessful parse are stored in the `ParseInfo` property of `obj`.

`success = obj.parse('Force', 'On')` parses the custom code irrespective of whether any changes have been made since a previous parse.

`success = obj.parse('Force', 'Off')` has the same effect as `success = obj.parse()`.

Examples

Parse Custom Code

```
%% Create code importer object
obj = Simulink.CodeImporter;

%% Set the custom code to import
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = [".include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];

%% Parse custom code
s = obj.parse;
obj.ParseInfo

ans =

    ParseInfo with properties:

        Success: 1
    AvailableFunctions: ["Controller"      "setFanTempThreshold"      "setPumpTempThreshold"]
        EntryFunctions: ["Controller"      "setFanTempThreshold"      "setPumpTempThreshold"]
        AvailableTypes: "pump_control_bus"
        Errors: []
```

Output Arguments

success — Indicator of whether parsing is successful

logical scalar

Indicator of whether parsing is successful, returned as a logical scalar. Simulink throws an exception if parsing is unsuccessful.

See Also

`Simulink.CodeImporter`

Introduced in R2021a

save

Class: Simulink.CodeImporter

Package: Simulink

Save import settings to JSON format text file

Syntax

```
filepath = obj.save(filename)
filepath = obj.save(filename, 'Overwrite', 'Off')
filepath = obj.save(filename, 'Overwrite', 'On')
```

Description

`filepath = obj.save(filename)` or `filepath = obj.save(filename, 'Overwrite', 'Off')`, where `obj` is an object of class `Simulink.CodeImporter`, saves import settings in JSON format to the specified file `filename` and returns the full path to the saved file. Import settings include `LibraryFileName`, `OutputFolder`, `CustomCode`, `Options`, selected functions and types, and function configurations. You can subsequently load the settings from this file using the `load` method.

`filepath = obj.save(filename, 'Overwrite', 'On')` overwrites the specified file `filename` if the file already exists.

Input Arguments

filename — Name or path of file to be used to save import settings

character vector | string scalar

Name or path of file to be used to save import settings, specified as a character vector or string scalar.

Example: `'importsettings.json'`

Data Types: `char` | `string`

Output Arguments

filepath — Full path to saved file

character vector

Full path to saved file, returned as a character vector.

See Also

`Simulink.CodeImporter`

Introduced in R2020a

view

Package: Simulink

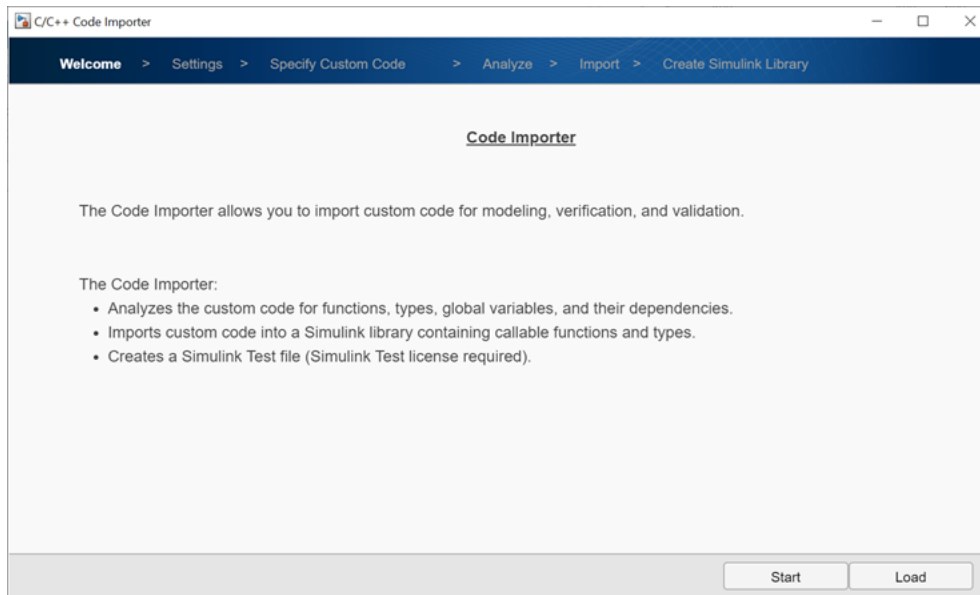

Launch Simulink Code Importer wizard

Syntax

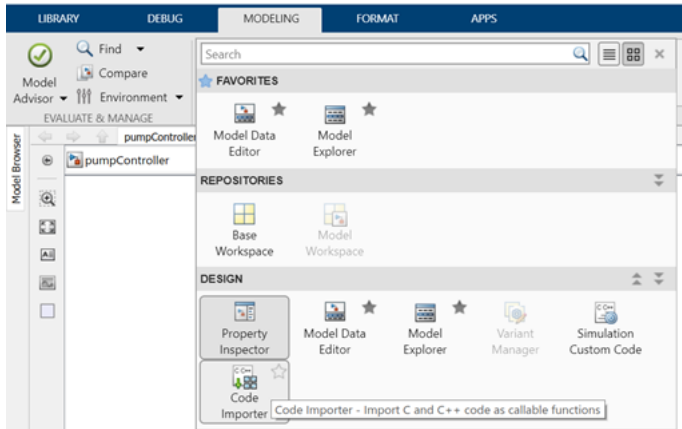

`obj.view`

Description

`obj.view`, where `obj` is an object of `Simulink.CodeImporter` class, launches the Simulink Code Importer wizard, a graphical user interface for the Simulink Code Importer. A series of screens leads you through the process of creating a Simulink library from your custom code.

Note You can also launch the Simulink Code Importer wizard from within Simulink. On the Simulink toolstrip, go to the **Modeling** tab. From **Design**, select Code Importer.

See Also

[Simulink.CodeImporter](#)

Introduced in R2021a

Simulink.CodeImporter.CustomCode class

Package: Simulink.CodeImporter

Specify custom code settings for Simulink.CodeImporter and sltest.CodeImporter classes

Description

The Simulink.CodeImporter.CustomCode class is a handle class.

Creation

When you create an object of class Simulink.CodeImporter, an object of class Simulink.CodeImporter.CustomCode is automatically created as the CustomCode property of that object. Do not create an object of class Simulink.CodeImporter.CustomCode directly.

Properties

Note The first four properties listed below (SourceFiles, InterfaceHeaders, IncludePaths, and Libraries) let you specify file path information about the location of your custom code. To enable portability, specify this information as a file path relative to the folder specified in the OutputFolder property of the relevant Simulink.CodeImporter object rather than as an absolute path.

SourceFiles — Source files to be imported

cell array of character vectors | string array

Source files to be imported, specified as a cell array of character vector or a string array. Supported files include .c and .cpp files. Each file name can be specified as a path relative to the folder specified in the OutputFolder property of the relevant Simulink.CodeImporter object or as an absolute path.

Providing a value for SourceFiles is optional for Simulink.CodeImporter and optional for sltest.CodeImporter when the TestType is IntegrationTest.

Example: {'foo.c', 'bar.c'}

Example: ['.\\foo.c', '..\\bar.c']

Example: fullfile(pwd, 'Src', 'foo.c')

Data Types: cell array of character vectors | string array

InterfaceHeaders — Interface headers to be imported

cell array of character vectors | string array

Interface headers to be imported, specified as a cell array of character vectors or a string array. Supported files include .h and .hpp files. Each file name can be specified as a path relative to the folder specified in the OutputFolder property of the relevant Simulink.CodeImporter object or

as an absolute path. Interface headers should contain the function declarations and type definitions that you want to bring into Simulink. These declarations and definitions are usually contained in the export header of your C code library.

Example: {'foo.h', 'bar.h'}

Example: [".\foo.h", "..\bar.h"]

Example: fullfile(pwd, 'Hdr', 'foo.h')

Data Types: cell array of character vectors | string array

IncludePaths — Folders containing included header files

cell array of character vectors | string array

Folders containing included header files for the parser to find, specified as a cell array of character vectors or a string array. Each folder path can be specified as a path relative to the folder specified in the `OutputFolder` property of the relevant `Simulink.CodeImporter` object or as an absolute path.

Example: {'.', '..\..\'}

Example: [".\Include1", "..\Include2"]

Example: fullfile(pwd, 'Include1')

Data Types: cell array of character vectors | string array

Libraries — Libraries that contain custom object code to link

cell array of character vectors | string array

Libraries that contain custom object code to link, specified as a cell array of character vectors or a string array. Supported files include `.obj`, `.dll`, `.lib`, `.so`, `.o`, `.a`, and `.dylib` files. Each file name can be specified as a path relative to the folder specified in the `OutputFolder` property of the relevant `Simulink.CodeImporter` object or as an absolute path.

Providing libraries is optional.

Example: {'foo.lib', 'foo.dll'}

Example: [".\foo.so", "..\bar.so"]

Data Types: cell array of character vectors | string array

Defines — Preprocessor macro definitions to be added to the compiler command line

cell array of character vectors | string array

Preprocessor macro definitions to be added to the compiler command line, specified as a cell array of character vectors or a string array. `'-D'` is optional in defines.

Example: {'-D DEF1', '-D DEF2'}

Example: ["DEF1", "DEF2"]

Data Types: cell array of character vectors | string array

Language — Custom code language

'C' (default) | 'C++'

Custom code language, specified as `'C'` or `'C++'`. C and C++ are the only supported languages.

Data Types: character vector | string scalar

CompilerFlags — Additional compiler flags

cell array of character vectors | string array

Additional compiler flags to be added to the compiler command line, specified as a cell array of character vectors or a string array.

Example: {'/O2' , '/Og'}

Example: "-g"

Data Types: cell array of character vectors | string array

LinkerFlags — Additional linker flags

cell array of character vectors | string array

Additional linker flags to be added to the linker command line, specified as a cell array of character vectors or a string array.

Example: {'/WX'}

Data Types: cell array of character vectors | string array

GlobalVariableInterface — Option to enable global variables as function interfaces

false (default) | true

Option to enable global variables as function interfaces, specified as a logical scalar. If set to true, global variables accessed by the custom code functions will be treated as function interfaces in the generated Simulink library. See “Call C Caller Block and Specify Ports” and “Enable global variables as function interfaces”.

Data Types: logical scalar

FunctionArrayLayout — Default array layout for custom code functions

NotSpecified (default) | RowMajor | ColumnMajor | Any

Default array layout for custom code functions to use to access input argument arrays, specified as **NotSpecified**, **RowMajor**, **ColumnMajor**, or **Any**. You can override the default for an individual function by using the `ArrayLayout` property of the `Simulink.CodeImporter.Function` object corresponding to that function. Matrix data passed to and from your C functions is converted to the function array layout you specify. See “Integrate C Code Using C Caller Blocks” and “Default function array layout”.

Data Types: enum

Examples

Specify Custom Code for Import

Create an object of class `Simulink.CodeImporter`. Set the properties of its `CustomCode` property to specify custom code to import into Simulink.

```
obj = Simulink.CodeImporter("pumpController");
```

```
obj.OutputFolder = ".";
```

```
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];  
obj.CustomCode.IncludePaths = ["/include"];  
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utls.c"];
```

See Also

[Simulink.CodeImporter](#) | [Simulink.CodeImporter.Options](#) |
[Simulink.CodeImporter.ParseInfo](#) | [Simulink.CodeImporter.Function](#) |
[Simulink.CodeImporter.SimulinkPortSpecification](#)

Introduced in R2021a

Simulink.CodeImporter.Function class

Package: Simulink.CodeImporter

Access and configure detailed information about parsed custom code functions

Description

Access detailed information about parsed custom code functions obtained from `Simulink.CodeImporter` or `sltest.CodeImporter` class instance. Configure information about custom code functions for importing into Simulink.

The `Simulink.CodeImporter.Function` class is a handle class.

Creation

One or more objects of this class are automatically created when you invoke the `getFunctions` method of an object of class `Simulink.CodeImporter.ParseInfo`. A `Simulink.CodeImporter.Function` object is created for each function in the parsed custom code for which `getFunctions` is invoked. Do not create an object of class `Simulink.CodeImporter.Function` directly.

Properties

Name — Function name

string scalar

Function name, returned as a string scalar.

Example: "Controller"

Data Types: string scalar

CPrototype — C prototype

string scalar

C prototype for function, returned as a string scalar.

Example: "pump_control_bus Controller(real_T Tset, real_T Troom_in);"

Data Types: string scalar

PortSpecification — Port specification of function

SimulinkPortSpecification object

Port specification of function, specified as an object of class `Simulink.CodeImporter.SimulinkPortSpecification`.

IsEntry — Whether function is entry-point function

logical scalar

Whether function is an entry-point function, returned as a logical scalar. An entry-point function is not called by other functions in the custom code.

IsDefined — Whether function is defined

logical scalar

Whether function is defined, returned as a logical scalar. This scalar indicates whether custom code contains a function body defining the function in addition to a function prototype defined in a header.

IsDeterministic — Whether function is deterministic

logical scalar

Whether function is deterministic, specified as a logical scalar. A deterministic function always produces the same outputs for the same input values. Specifying a function as deterministic enables the corresponding C Caller block to be used in a For Each subsystem and with continuous sample time, and optimizes the use of the block in conditional input branch execution. See “Deterministic functions”.

IsStub — Whether function is stubbed

logical scalar

Whether function is stubbed, returned as a logical scalar. This scalar indicates whether, for a unit test, a stub for undefined symbols was generated for the function (Simulink Test license required).

ArrayLayout — Array layout for function

NotSpecified (default) | ColumnMajor | RowMajor | Any

Array layout for function, returned as NotSpecified, ColumnMajor, RowMajor, or Any. If NotSpecified, then the default setting for the custom code as specified in the FunctionArrayLayout property of the relevant SimulinkCode.CustomCode object is used. Otherwise, the value specified for the function overrides the default.

Data Types: enum

Methods

Public Methods

gotoDefinition	<p>Display function definition in the MATLAB editor with function name highlighted.</p> <p>Syntax: fcobj.gotoDefinition or fcobj.gotoDefinition(), where fcobj is an object of class Function</p>
gotoDeclaration	<p>Display function declaration in MATLAB editor with function name highlighted.</p> <p>Syntax: fcobj.gotoDeclaration or fcobj.gotoDeclaration(), where fcobj is an object of class Function</p>

Examples

Parse Custom Code Functions

Specify and parse custom code, then query information regarding custom code functions.

```
obj = Simulink.CodeImporter;

%% Set library file name and output folder
obj.LibraryFileName = "pumpController";
obj.OutputFolder = ".";

%% Set the custom code to import
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = ["/include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];

%% Parse code
obj.parse;
parseobj = obj.ParseInfo

ans =

    ParseInfo with properties:

        Success: 1
    AvailableFunctions: ["Controller"      "setFanTempThreshold"      "setPumpTempThreshold"]
        EntryFunctions: ["Controller"      "setFanTempThreshold"      "setPumpTempThreshold"]
        AvailableTypes: "pump_control_bus"
        Errors: []

fcnobj = parseobj.getFunctions(["Controller"])

fcnobj =

    Function with properties:

        Name: "Controller"
        CPrototype: "pump_control_bus Controller(real_T Tset, real_T Troom_in);"
    PortSpecification: [1x1 Simulink.CodeImporter.SimulinkPortSpecification]
        IsEntry: 1
        IsDefined: 1
        IsStub: 0
        ArrayLayout: NotSpecified
        IsDeterministic: 0
```

See Also

[Simulink.CodeImporter](#) | [Simulink.CodeImporter.CustomCode](#) |
[Simulink.CodeImporter.Options](#) | [Simulink.CodeImporter.ParseInfo](#) |
[Simulink.CodeImporter.SimulinkPortSpecification](#)

Introduced in R2021a

Simulink.CodeImporter.Options class

Package: Simulink.CodeImporter

Specify additional import options for Simulink.CodeImporter and sltest.CodeImporter classes

Description

Use the Simulink.CodeImporter class to specify options for importing custom code beyond what is specified in the CustomCode property of the relevant Simulink.CodeImporter object.

The Simulink.CodeImporter.Options class is a handle class.

Creation

When you create an object of class Simulink.CodeImporter, an object of class Simulink.CodeImporter.Options is automatically created as the Options property of that object. Do not create an object of class Simulink.CodeImporter.Options directly.

Properties

PassByPointerDefaultSize — Default size of C argument passed by pointer to function

'-1' (default) | character vector | string scalar

Default size of C argument passed by pointer to function in the generated C Caller block port specifications, specified as a character vector or string scalar. By default, the value is set to '-1', meaning that the size is inherited. A value of '1' indicates that arguments passed by address to functions are scalars, unless you override this setting in the Simulink.CodeImporter.SimulinkPortSpecification corresponding to a particular function.

Data Types: character vector | string scalar

CreateTestHarness — Automatic creation of test harness during import

true (default) | false

Automatic creation of test harness during import, specified as a logical scalar. Specify whether the Simulink Code Importer should automatically create a test harness for each block in the generated Simulink library (Simulink Test license required).

Data Types: logical

LibraryBrowserName — Name by which generated Simulink library appears in Simulink Library Browser

"" (default) | character vector | string scalar

Name by which generated Simulink library appears in Simulink Library Browser, specified as a character vector or string scalar. By default, the value is an empty string, meaning that the generated library does not appear in the Simulink Library Browser. If you specify a name, the Simulink Code Importer generates the file slblocks.m as part of the artifacts the Code Importer creates.

Example: "Controller Library"

Data Types: character vector | string scalar

Examples

Set Custom Code Options

Create a `Simulink.CodeImporter` object and set options.

```
obj = Simulink.CodeImporter;  
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];  
obj.CustomCode.IncludePaths = [".include"];  
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];  
obj.Options.LibraryBrowserName="Controller Library";
```

`obj.Options`

ans =

Options with properties:

```
PassByPointerDefaultSize: "-1"  
CreateTestHarness: 0  
LibraryBrowserName: "Controller Library"
```

[Simulink.CodeImporter.SimulinkPortSpecification](#)

Introduced in R2021a

Simulink.CodeImporter.ParseInfo class

Package: Simulink.CodeImporter

Information about parsed custom code

Description

The `Simulink.CodeImporter.ParseInfo` class has read-only properties that store more information about the parsed custom code. Parsing needs to be successful to obtain information regarding custom code.

The `Simulink.CodeImporter.ParseInfo` class is a handle class.

Creation

When you create an object of class `Simulink.CodeImporter`, an object of class `Simulink.CodeImporter.ParseInfo` is automatically created as the `ParseInfo` property of that object. Do not create an object of class `Simulink.CodeImporter.ParseInfo` directly.

Properties

Success — Whether parsing of custom code is successful

`true` | `false`

Whether parsing of custom code is successful, specified as a logical scalar with value `false` before successful parsing of specified custom code, then `true` after successful parsing.

Data Types: `logical` scalar

AvailableFunctions — Functions compatible with Simulink in custom code

string array

Functions compatible with Simulink in custom code, returned as a string array.

Example: `["myCustomFcn1", "myCustomFcn2", "myCustomFcn3"]`

Data Types: `string` array

EntryFunctions — Entry-point functions in custom code

string array

Entry-point functions in custom code, returned as a string array. Entry-point functions are not called by other custom code functions. `EntryFunctions` is a subset of `AvailableFunctions`.

Example: `["myCustomFcn1", "myCustomFcn3"]`

Data Types: `string` array

AvailableTypes — Data types compatible with Simulink in custom code

string array

Data types compatible with Simulink in custom code, returned as a string array. Types are user-defined, such as struct and enum.

Example: ["myStruct1", "myStruct2"]

Data Types: string array

Errors — Error messages from failed parse

character vector

Error messages from failed parse of the specified custom code (Success is equal to false), returned as a character vector. Multiple error message are concatenated into a single character vector. If the parsing is successful (Success is equal to true), Errors is a null vector.

Data Types: character vector

Methods

Public Methods

Simulink.CodeImporter.ParseInfo.getFunctions Obtain detailed information regarding functions in custom code

Examples

Parse Custom Code

```
obj = Simulink.CodeImporter;

%% Set library file name and output folder
obj.LibraryFileName = "pumpController";
obj.OutputFolder = ".";

%% Set the custom code to import
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = [".include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];
obj.parse;
obj.ParseInfo

ans =

    ParseInfo with properties:

        Success: 1
    AvailableFunctions: ["Controller"      "setFanTempThreshold"      "setPumpTempThreshold"]
        EntryFunctions: ["Controller"      "setFanTempThreshold"      "setPumpTempThreshold"]
    AvailableTypes: "pump_control_bus"
        Errors: []
```

`Simulink.CodeImporter.SimulinkPortSpecification`

Introduced in R2021a

Simulink.CodeImporter.ParseInfo.getFunctions

Package: Simulink.CodeImporter

Obtain detailed information regarding functions in custom code

Syntax

```
fcnobjs = obj.ParseInfo.getFunctions()
fcnobjs = obj.ParseInfo.getFunctions(fcnlist)
```

Description

`fcnobjs = obj.ParseInfo.getFunctions()`, where `obj` is an object of class `Simulink.CodeImporter` or `sltest.CodeImporter`, returns an array of objects of class `Simulink.CodeImporter.Function` with detailed information on all Simulink compatible functions in the custom code.

Note If your code has a function with a pointer output, specify the size of the output by setting the port specification in the returned function object.

`fcnobjs = obj.ParseInfo.getFunctions(fcnlist)` returns an array of objects of class `Simulink.CodeImporter.Function` with detailed information on the custom code functions specified in `fcnlist`.

Examples

Get Custom Code Function Information

Specify and parse custom code, then query information regarding custom code functions.

```
obj = Simulink.CodeImporter;

%% Set library file name and output folder
obj.LibraryFileName = "pumpController";
obj.OutputFolder = ".";

%% Set the custom code to import
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = [".include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];

%% Parse code
obj.parse;
parseobj = obj.ParseInfo

ans =

    ParseInfo with properties:
```

```

        Success: 1
    AvailableFunctions: ["Controller"      "setFanTempThreshold"      "setPumpTempThreshold"]
    EntryFunctions: ["Controller"      "setFanTempThreshold"      "setPumpTempThreshold"]
    AvailableTypes: "pump_control_bus"
    Errors: []

fcnobjs = parseobj.getFunctions()
fcnobjs =

    1×3 Function array with properties:

        Name
        CPrototype
        PortSpecification
        IsEntry
        IsDefined
        IsStub
        ArrayLayout
        IsDeterministic

>> fcnobjs(1)

ans =

    Function with properties:

        Name: "Controller"
        CPrototype: "pump_control_bus Controller(real_T Tset, real_T Troom_in);"
        PortSpecification: [1×1 Simulink.CodeImporter.SimulinkPortSpecification]
        IsEntry: 1
        IsDefined: 1
        IsStub: 0
        ArrayLayout: NotSpecified
        IsDeterministic: 0

```

Input Arguments

fcnlist — Names of functions

cell array of character vectors | string array

Names of functions in custom code about which to obtain information, specified as a cell array of character vectors or a string array. **fcnlist** must be limited to names contained in `obj.ParseInfo.AvailableFunctions`, that is, functions compatible with Simulink in the specified custom code.

Data Types: cell array of character vectors | string array

Output Arguments

fcnobjs — Information about functions in custom code

array of `Simulink.CodeImporter.Function` objects

Information about functions in custom code, returned as an array of `Simulink.CodeImporter.Function` objects, where each object corresponds to one function. Each

object includes the function name, C prototype, port specification, whether function is an entry-point function, and whether function is defined in the custom code. See `Simulink.CodeImporter.Function`.

`Simulink.CodeImporter.ParseInfo` | `Simulink.CodeImporter`

Introduced in R2021a

Simulink.CodeImporter.SimulinkPortSpecification class

Package: Simulink.CodeImporter

Configure port specification for imported custom code

Description

Configure port specification for custom code function arguments imported as C Caller blocks via `Simulink.CodeImporter` or `sltest.CodeImporter` class instances, that is, configure how C/C++ interfaces map to Simulink interfaces for custom code functions.

This class is analogous to the `FunctionPortSpecification` class that is used to configure C Caller block properties outside the context of the Simulink Code Importer. The properties and methods of this class behave similarly to the like-named properties and methods of the `FunctionPortSpecification` class.

The `SimulinkPortSpecification` class is a handle class.

Creation

One or more objects of this class are automatically created when you invoke the `getFunctions` method of an object of class `Simulink.CodeImporter.ParseInfo`. One `Simulink.CodeImporter.SimulinkPortSpecification` object is created for each function in the parsed custom code for which `getFunctions` is invoked as the `PortSpecification` property of the `Function` object corresponding to that function. Do not create an object of class `Simulink.CodeImporter.SimulinkPortSpecification` directly.

Properties

InputArguments — Port specification for input arguments

`FunctionArgument` object

Port specification for input arguments, specified as a `FunctionArgument` Object.

ReturnArgument — Port specification for function return argument

`FunctionArgument` object | scalar

Port specification for function return argument, specified as a scalar or an empty `FunctionArgument` Object.

GlobalArguments — Port specification for custom code global variables used as function arguments

`FunctionArgument` object | scalar

Port specification for custom code global variables used as function arguments, specified as a scalar or an empty `FunctionArgument` Object.

Methods

Public Methods

`getGlobalArg` Get an object definition of a global variable in a C Caller block

Examples

Configure Port Specifications for Custom Code Library Blocks

Specify and parse custom code, then customize port specification before importing into Simulink.

```
%% Create code importer object
obj = Simulink.CodeImporter;

%% Set library file name and output folder
obj.LibraryFileName = "pumpController";
obj.OutputFolder = ".";

%% Set the custom code to import
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = ["/include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];

%% Parse custom code and configure function
obj.parse();
fcn = obj.ParseInfo.getFunctions("Controller");
fcn.PortSpecification.ReturnArgument.Label = "control_out";

fcn.PortSpecification.ReturnArgument

ans =

    FunctionArgument with properties:

        Name: 'out'
    PortNumber: 1
        Size: '1'
        Type: 'Bus: pump_control_bus'
        Label: 'control_out'
        Scope: 'Output'
```

getGlobalArg

Class: Simulink.CodeImporter.SimulinkPortSpecification

Package: Simulink.CodeImporter

Get an object definition of a global variable in a C Caller block

Syntax

```
output_args = getGlobalArg(input_args,Name,Value)
```

Description

`output_args = getGlobalArg(input_args,Name,Value)` <verb phrase> with additional options specified by one or more `Name,Value` pair arguments.

Input Arguments

input_args —
(default) |

Example:

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `string` | `struct` | `table` | `cell` | `function_handle` | `categorical` | `datetime` | `duration` | `calendarDuration` | `fi`
Complex Number Support: Yes

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, . . . ,NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example:

Name —
(default) |

Example:

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `string` | `struct` | `table` | `cell` | `function_handle` | `categorical` | `datetime` | `duration` | `calendarDuration` | `fi`
Complex Number Support: Yes

Output Arguments

output_args –

Attributes

To learn about attributes of methods, see Method Attributes.

Simulink.dialog.Button class

Package: Simulink.dialog

Create a button dialog control

Description

Use an instance of Simulink.dialog.Button class to add a button dialog control.

Properties

Name

Uniquely identifies the dialog control and is a required field.

Type: character vector

Prompt

Specifies the text displayed on the button dialog control.

Type: character vector

Default: empty

FilePath

Specifies the path to the image file to be shown on the button dialog control.

Type: character vector

Default: empty

Callback

Specifies the MATLAB command (s) to be executed when the dialog control is invoked.

Type: character vector

Default: empty

Row

Specifies whether dialog control is placed on the current row or on a new row.

Type: character vector

Value: 'current' | 'new'

Default: 'current'

Enabled

Indicates whether container is active on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Visible

Indicates whether container is displayed on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

See Also

[Simulink.dialog.Control](#) | “Create Block Masks”

Simulink.dialog.Container class

Package: Simulink.dialog

Create instances of a container dialog control

Description

Use an instance of Simulink.dialog.Container class to add container type dialog control.

Properties

Name

Uniquely identifies the container dialog control and is a required field.

Type: character vector

Enabled

Indicates whether container is active on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Visible

Indicates whether container is displayed on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

AlignPrompts

Allows you to align the parameters vertically on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'off'

DialogControls

Specifies the child dialog controls contained in the container.

Type: Simulink.dialog.Control

Default: Empty array

Methods

<code>addDialogControl</code>	Add dialog control elements to mask dialog box
<code>getDialogControl</code>	Search for a specific dialog control on the mask
<code>removeDialogControl</code>	Remove dialog control element from mask dialog box

addDialogControl

Class: Simulink.dialog.Container

Package: Simulink.dialog

Add dialog control elements to mask dialog box

Syntax

```
successIndicator = maskObj.addDialogControl(controlType,controlIdentifier)  
successIndicator = maskObj.addDialogControl(Name,Value)
```

Description

`successIndicator = maskObj.addDialogControl(controlType,controlIdentifier)` adds dialog control elements like text, hyperlinks, or tabs to mask dialog box. First get the mask object and assign it to the variable `maskObj`

`successIndicator = maskObj.addDialogControl(Name,Value)` specifies the `Name` and `Value` arguments for an element on the mask dialog box. You can specify multiple `Name-Value` pairs.

Input Arguments

controlType — Value type of dialog control element

character vector

Type of dialog control element, specified

- 'panel'
- 'group'
- 'tabcontainer'
- 'tab'
- 'collapsiblepanel'
- 'text'
- 'image'
- 'hyperlink'
- 'pushbutton'

controlIdentifier — Unique identifier for the element

character vector

Specifies the programmatic identifier for the element of mask dialog box. Use a name that is unique and does not have space between words. For more information, see “Variable Names”.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' ') and is case-sensitive.

You can specify several name and value pair arguments in any order as Name1, Value1, . . . , NameN, ValueN.

Type

Type of control that is used to specify the value of this dialog control element. Type is a required argument. The permitted values are 'panel', 'group', 'tabcontainer', 'tab', 'collapsiblepanel', 'text', 'image', 'hyperlink', and 'pushbutton'. If the parent dialog control type is 'tabcontainer', the child dialog control must be 'tab'.

Name

The identifier of the dialog control element. Name is a required argument. This field is available for all dialog control types.

Prompt

Text that is displayed in the dialog control element on the Mask dialog box. This field is available for all except for panel and image dialog control types.

Default: empty

Enabled

Option to specify whether you can set value for the dialog control element. This field is available for all dialog control types.

Default: 'on'

Visible

Option to set whether the dialog control element is hidden or visible to the user. This field is available for all dialog control types.

Default: 'on'

Callback

Container for MATLAB code that executes when you edit the dialog control element and click **Apply**. This field is available only for the hyperlink and push button dialog control types.

Default: empty

Row

Option to set whether the dialog control is placed in the new row or the same row. This field is available for all dialog control types.

Default: empty

FilePath

Contains the path to an image file. This field is available for image, and push button dialog control types.

Default: empty

Container

Option to specifies a container for the child dialog control. The permitted values are the names of 'panel', 'group', and 'tab' dialog controls.

Examples

Add Dialog Control Elements to Mask Dialog Box

Get mask object and add dialog control element to it.

```
% Get mask object on model Engine
maskObj = Simulink.Mask.get('Engine/Gain');

% Add hyperlink to mask dialog box

maskLink = maskObj.addDialogControl('hyperlink','link_1');
maskLink.Prompt = 'Mathworks Home Page';
maskLink.Callback = 'web(''www.mathworks.com'')'

% Alternative method to add hyperlink

maskLink = maskObj.addDialogControl('hyperlink','link_2');
maskLink.Prompt = 'www.mathworks.com';

% Add text to mask dialog box

maskText = maskObj.addDialogControl('text','text_tag');
maskText.Prompt = 'Enable range checking';

% Add button to mask dialog box

maskButton = maskObj.addDialogControl('pushbutton','button_tag');
maskButton.Prompt = 'Compute';
```

Add Dialog Control Elements to Mask Dialog Box Tabs

Create tabs on the mask dialog box and add elements to these tabs.

```
% Get mask object on a block named 'GainBlock'
maskObj = Simulink.Mask.get('GainBlock/Gain');

% Create a tab container

maskObj.addDialogControl('tabcontainer','allTabs');
tabs = maskObj.getDialogControl('allTabs');

% Create tabs and name them

maskTab1 = tabs.addDialogControl('tab','First');
maskTab1.Prompt = 'First tab';
```

```
maskTab2 = tabs.addDialogControl('tab','Second');
maskTab2.Prompt = 'Second tab';

% Add elements to one of the tabs

firstTab = tabs.getDialogControl('First');
firstTab.addDialogControl('text','textOnFirst');
firstTab.getDialogControl('textOnFirst').Prompt = 'Tab one';
```

Add Dialog Control Element Using Name-Value Pair

Add dialog control element and specify values for it

```
% Get mask object on model Engine

maskObj = Simulink.Mask.get('Engine/Gain');

% Add a dialog box and specify values for it

maskDialog = maskObj.addDialogControl('Type','text',...
'Prompt','hello','Visible','off');
```

[Simulink.dialog.Container](#) | “Create Block Masks”

Introduced in R2014a

getDialogControl

Class: Simulink.dialog.Container

Package: Simulink.dialog

Search for a specific dialog control on the mask

Syntax

```
[control, phandle] = handle.getDialogControl(controlIdentifier)
```

Description

[control, phandle] = handle.getDialogControl(controlIdentifier), search for a specific child dialog control recursively on the mask dialog box.

Input Arguments

controlIdentifier

Name of the dialog control being searched on the mask dialog box.

Default:

Output Arguments

control

Target dialog control being searched on the mask dialog box.

phandle

Parent of the dialog control being searched mask dialog box.

Examples

Find a dialog control

Find a text dialog control on the mask dialog box. maskObj is the handle to the mask object. The getDialogControl method returns the handle to the dialog control (hdlgctrl) and handle to the parent dialog control (phandle).

```
[hdlgctrl, phandle] = maskObj.getDialogControl('txt_var')
```

See Also

Simulink.dialog.Container | “Create Block Masks”

removeDialogControl

Class: Simulink.dialog.Container

Package: Simulink.dialog

Remove dialog control element from mask dialog box

Syntax

```
successIndicator = maskVariable.removeDialogControl(controlIdentifier)
```

Description

`successIndicator = maskVariable.removeDialogControl(controlIdentifier)` removes dialog control element, specified by `controlIdentifier`, like text, hyperlinks, or tabs from a mask dialog box. First get the mask object and assign it to the variable `maskVariable`.

Successful removal of a dialog control element returns a Boolean value of 1.

Input Arguments

controlIdentifier — Unique identifier for the element

character vector

Programmatic identifier for the dialog control element of mask dialog box, specified as a character vector.

Examples

Remove Dialog Control Element from Mask Dialog Box

```
% Get mask object on the Gain block in the model Engine.
```

```
maskObj = Simulink.Mask.get('Engine/Gain');
```

```
% Remove element named AllTab from mask dialog box.
```

```
maskTab = maskObj.removeDialogControl('AllTab');
```

Simulink.dialog.Group class

Package: Simulink.dialog

Create an instance of a group dialog control

Description

Use an instance of Simulink.dialog.Group class to create an instance of group dialog control.

Properties

Name

Uniquely identifies the group dialog control and is a required field.

Type: character vector

Prompt

Specifies the text displayed on the group.

Type: character vector

Default: Empty character vector

Row

Specifies whether group is placed on the current row or on a new row.

Type: character vector

Values: 'current' | 'new'

Default: 'new'

Enabled

Specifies whether group is active on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

Visible

Specifies whether group is displayed on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

DialogControls

Specifies the child dialog controls contained in the group.

Type: Simulink.dialog.Control

Default: Empty array

Methods

addDialogControl	Add dialog control elements to mask dialog box
getDialogControl	Search for a specific dialog control on the mask
removeDialogControl	Remove dialog control element from mask dialog box

Simulink.dialog.Hyperlink class

Package: Simulink.dialog

Create a hyperlink dialog control

Description

Use an instance of Simulink.dialog.Hyperlink class to add a hyperlink dialog control.

Properties

Name

Uniquely identifies the dialog control and is a required field.

Type: character vector

Prompt

Specifies the text displayed on the hyperlink.

Type: character vector

Default: empty

Callback

Specifies the MATLAB command (s) to be executed when the dialog control is invoked.

Type: character vector

Default: empty

Row

Specifies whether hyperlink is placed on the current row or on a new row.

Type: character vector

Value: 'current' | 'new'

Default: 'new'

Enabled

Indicates whether hyperlink is active on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Visible

Indicates whether hyperlink is displayed on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Simulink.dialog.Image class

Package: Simulink.dialog

Create an image dialog control

Description

Use an instance of `Simulink.dialog.Image` class to add an image dialog control.

Properties

Name

Uniquely identifies the dialog control and is a required field.

Type: character vector

FilePath

Specifies the path to the image file to be displayed on the dialog box.

Type: character vector

Default: empty

Row

Specifies whether dialog control is placed on the current row or on a new row.

Type: character vector

Value: 'current' | 'new'

Default: 'new'

Enabled

Indicates whether image is active on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Visible

Indicates whether image is displayed on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Simulink.dialog.ListBoxControl class

Package: Simulink.dialog

Control list box programmatically

Description

Use an instance of `Simulink.dialog.ListBoxControl` class to perform the following operations:

- Get selected items from the list box
- Set selected items in the list box

Properties

Name

Uniquely identifies the dialog control and is a required field.

Type: character vector

Prompt

Specifies the text displayed on the button dialog control.

Type: character vector

Default: empty

Type Options

Specifies the options shown in the list box.

Type: cell array

Default: empty

Callback

Specifies the MATLAB code to execute when the dialog control is invoked.

Type: character vector

Default: empty

Row

Specifies whether dialog control is placed on the current row or on a new row.

Type: character vector

Value: 'current' | 'new'

Default: 'current'

Enabled

Indicates whether container is active on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Visible

Indicates whether container is displayed on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Multiselect

Indicates whether container is enabled for multiple selection.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Methods

getSelectedItems	Get the values of selected items from a list box
setSelectedItems	Set values for a list box

Topics

“Control Masks Programmatically”

“Create Block Masks”

getSelectedItems

Class: Simulink.dialog.ListBoxControl

Package: Simulink.dialog

Get the values of selected items from a list box

Syntax

```
getItems = listBoxControl.getSelectedItems
```

Description

`getItems = listBoxControl.getSelectedItems` gets the information of the selected items from the list box.

Output Arguments

getItems — value of selected items

cell array

Value of the selected items, returned as a cell array.

Examples

```
% Get block mask handle
maskObj = Simulink.Mask.get(gcb);

% Get listbox handle
listBoxControl = maskObj.getDialogControl('Control2');

% Get selected items
getItems = listBoxControl.getSelectedItems;

getItems =
    1x2 cell array
    {'Hello', 'World'}
```

See Also

[Simulink.Mask](#) | “Create Block Masks”

Introduced in R2019a

setSelectedItems

Class: Simulink.dialog.ListBoxControl

Package: Simulink.dialog

Set values for a list box

Syntax

```
setItems = listBoxControl.setSelectedItems({string1', 'string2', ...})
```

Description

`setItems = listBoxControl.setSelectedItems({string1', 'string2', ...})` sets the values for the selected items in the list box.

Input Arguments

listControl — List box handle

table object

Handle to the list box, specified as an object. You can use the `getDialogControl` command to get the list box handle. For more information, see `getDialogControl`.

For example, `listboxControl = maskObj.getDialogControl('listboxname')`. Here, `maskObj` is the mask object and `listboxname` is the name of the list box.

Data Types: cell array

string1 — value to be set

string

Value to be set for selected items in the list box

For example, 'Hello'.

Examples

```
% Get block mask handle
maskObj = Simulink.Mask.get(gcb);

% Get listbox handle
listboxControl = maskObj.getDialogControl('Control2');

% Set selected items
listboxControl.setSelectedItems({'Hello', 'World'});
```

`Simulink.Mask` | “Create Block Masks”

Introduced in R2019a

Simulink.dialog.LookupTableControl class

Package: Simulink.dialog

Control mask lookup tables programmatically

Description

Create an instance of `Simulink.dialog.LookupTableControl` to add values for table and breakpoints data in the lookup table control.

Properties

Public Properties

Name — Unique name

(default) | empty

Specifies unique name for the LUT control.

Data Types: `String`

Prompt — Display text

(default) | empty

Specifies the text displayed on the lookup table control.

Data Types: `String`

Row — Placement of the LUT control

(default) | new

Specifies whether dialog control is placed on the current row or on a new row.

Data Types: `Character vector`

Enabled — Is LUT control active

(default) | on

Indicates whether lookup table control is active on the mask dialog box.

Data Types: `Logical`

Visible — Visibility of LUT control on mask dialog

(default) | on

Indicates whether lookup table control is displayed on the mask dialog box.

Data Types: `Logical`

HorizontalStretch — Resizing of LUT control along the dialog

(default) | on

Indicates if lookup table control gets resized along with the dialog.

Data Types: Logical

Tooltip — Tooltip text

(default) | empty

Tool tip text for the lookup table control.

Data Types: String

Table — Table data class

(default) | empty

A class that holds the properties of table data.

Data Types: String

Breakpoints — Breakpoint data set class

(default) | empty

A class that holds the properties of an array of breakpoint data.

Data Types: String

LookupTableObject — Name of the object holding data

(default) | empty

Specifies the name of the Simulink.LookupTable object in the base workspace or model workspace that holds the table and breakpoint data.

Data Types: String

DataSpecification — Value array or table object

(default) | empty

Indicates if the table and breakpoints data is specified explicitly or through a lookup table object.

Data Types: String

Examples

Add Table and Breakpoint Data

```
new_system('LUTexample');
add_block('built-in/subsystem','LUTexample/subsystem');
save_system;
open_system('LUTexample');
maskObj = Simulink.Mask.create(gcf);
maskObj = Simulink.Mask.get(gcf);
bp1 = maskObj.addParameter('Name','torque','Prompt','Torque:','Type','edit');
bp2 = maskObj.addParameter('Name','speed','Prompt','Engine speed:','Type','edit');
table = maskObj.addParameter('Name','fuelflowtable','Prompt','Fuel Flow Map:','Type','edit');
lutControl = maskObj.addDialogControl('Name','fuelflowlut','Type','lookuptablecontrol');
lutControl.Table.Name = 'fuelflowtable';
lutControl.Table.Unit = 'kg/s';
lutControl.Breakpoints(1).Name = 'torque';
lutControl.Breakpoints(1).Unit = 'Nm';
lutControl.Breakpoints(1).FieldName = 'Torque';
```

```
lutControl.Breakpoints(2).Name = 'speed';  
lutControl.Breakpoints(2).FieldName = 'Speed';  
save_system;
```

Topics

“Visualize and Edit N-Dimensional Data Using Mask Lookup Table Control”

Introduced in R2021b

Simulink.dialog.LookupTableControlbreakpoints class

Package: Simulink.dialog

Control breakpoint data set for mask lookup table

Description

Create an instance of `Simulink.dialog.LookupTableControl.Breakpoints` to specify the properties of the breakpoint data set in the lookup table control. The value of the `Breakpoints` property is an array of `Simulink.dialog.LookupTableControl.Breakpoints` objects. Each embedded object represents one breakpoint set.

Properties

Name — Name of the parameter

(default) | empty

Name of the parameter specifying the breakpoint data.

Data Types: `String`

Units — Units for the breakpoint data

(default) | empty

Specifies the units for the breakpoint data.

Data Types: `String`

FieldName — Display name

(default) | empty

Specifies the display name for the breakpoint data.

Data Types: `String`

Min — Minimum value

(default) | empty

Control the minimum value that can be specified for any cell in the table. This is a read only field and cannot be set through lookup table control.

Data Types: `String`

Max — Maximum value

(default) | empty

Control the maximum value that can be specified for any cell in the table. This is a read only field and cannot be set through lookup table control.

Data Types: `String`

Examples

Add Breakpoint Data Set

```
Set breakpoint properties of Dimension 1.  
>>lutControl.Breakpoints(1).Name = 'torque';  
>>lutControl.Breakpoints(1).Unit = 'Nm';  
>>lutControl.Breakpoints(1).FieldName = 'Torque';
```

```
Set Breakpoint properties of Dimension 2  
>>lutControl.Breakpoints(2).Name = 'speed';  
>>lutControl.Breakpoints(2).Unit = 'rpm';  
>>lutControl.Breakpoints(2).FieldName = 'Speed';
```

Simulink.dialog.LookupTableControlTable class

Package: Simulink.dialog

Control table data for mask lookup table

Description

Create an instance of `Simulink.dialog.LookupTableControlTable` to specify the properties of the table data in the lookup table control.

Properties

Public Properties

Name — Name of the parameter

(default) | empty

Name of the parameter specifying the table data.

Data Types: String

Units — Units for table data

(default) | empty

Specifies the units for the table data.

Data Types: String

FieldName — Display name

(default) | empty

Specifies the display name for the table data.

Data Types: String

Min — Minimum value

(default) | empty

Control the minimum value that can be specified for any cell in the table. This is a read only field and cannot be set through lookup table control.

Data Types: String

Max — Maximum value

(default) | empty

Control the maximum value that can be specified for any cell in the table. This is a read only field and cannot be set through lookup table control.

Data Types: String

Examples

Add Table Data

```
>>lutControl.Table.Name = 'fuelflowtable';  
>>lutControl.Table.Unit = 'kg/s' ;  
>>lutControl.Table.FieldName = 'Fuel Flow';
```

Simulink.dialog.Panel class

Package: Simulink.dialog

Create an instance of a panel dialog control

Description

Use an instance of `Simulink.dialog.Panel` class to create an instance of panel dialog control.

Properties

Name

Uniquely identifies the panel dialog control and is a required field.

Type: character vector

Row

Specifies whether panel is placed on the current row or on a new row.

Type: character vector

Values: 'current' | 'new'

Default: 'new'

Enabled

Specifies whether panel is active on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

Visible

Specifies whether panel is displayed on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

DialogControls

Specifies the child dialog controls contained in the panel.

Type: Simulink.dialog.Control

Default: Empty array

Methods

<code>addDialogControl</code>	Add dialog control elements to mask dialog box
<code>getDialogControl</code>	Search for a specific dialog control on the mask
<code>removeDialogControl</code>	Remove dialog control element from mask dialog box

See Also

Simulink.dialog.parameter.Control class

Package: Simulink.dialog.parameter

Create a parameter dialog control

Description

Use an instance of `Simulink.dialog.parameter.Control` class to add a parameter dialog control.

Properties

Name

Uniquely identifies the dialog control element. This is a required field and has the same value as its underlying parameter name.

Type: character vector

Row

Specifies whether the dialog control is placed on the current row or on a new row.

Type: character vector

Value: 'current' | 'new'

Default: 'new'

See Also

`Simulink.dialog.Control` | "Create Block Masks"

Simulink.dialog.parameter.CustomTable class

Package: `Simulink.dialog.parameter`

Create custom tables programmatically

Description

Use an instance of `Simulink.dialog.parameter.CustomTable` class to perform the following operations:

- Create and remove custom tables
- Insert, remove, and get values of columns.
- Insert, remove, swap, and add rows.

Methods

<code>addColumn</code>	Add new column in the custom table
<code>addRow</code>	Add a new row in the custom table
<code>getChangedCells</code>	Get all the changed cells of a custom table
<code>getColumn</code>	Get the column properties
<code>getNumberOfColumns</code>	Get value of a table cell
<code>getNumberOfRows</code>	Get the number of rows available in a custom table
<code>getSelectedRows</code>	Get all the selected rows of a custom table
<code>getTableCell</code>	Get the properties of a custom table cell
<code>getValue</code>	Get value of a table cell
<code>insertColumn</code>	Insert a column at a specific position in the custom table
<code>insertRow</code>	Insert a row at a specific position in a custom table
<code>removeColumn</code>	Remove an existing column from a specific position in a custom table
<code>removeRow</code>	Remove an existing row from a specific position in a custom table
<code>setTableCell</code>	Set the properties of a custom table cell
<code>swapRows</code>	Swap two existing rows in a custom table

“Create Block Masks”

addColumn

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Add new column in the custom table

Syntax

```
tableControl.addColumn(Name, Value)
```

Description

`tableControl.addColumn(Name, Value)` adds a column with the specified properties in the custom table.

Input Arguments

tableControl — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: char vector | cell array

Specify optional comma-separated pairs of `Name, Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Add column.
tableControl.addColumn( 'Name', 'HDL Name', 'Type', 'edit' );
```

See Also

[Simulink.Mask](#) | “Create Block Masks”

Introduced in R2019a

addRow

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Add a new row in the custom table

Syntax

```
NewRow = tableControl.addRow(RowValue)
```

Description

`NewRow = tableControl.addRow(RowValue)` adds a row with the specified properties in the custom table.

Input Arguments

tableControl — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: char vector

RowValue — Row Values for each column

table object

Row values specified for the number of columns available. If five values are provided for `RowValue` in a custom table with five columns, one row is added to the table. If 10 row values are added for such a table, then two rows are added.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: char vector | cell array

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Add a row with six column values.
tableControl.addRow( 'sig5', 'Input', 'Inherit', 'Inherit', 'on', 'Inherit' );
```

See Also

Simulink.Mask | “Create Block Masks”

Introduced in R2019a

getChangedCells

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Get all the changed cells of a custom table

Syntax

```
changedCells = tableControl.getChangedCells()
```

Description

`changedCells = tableControl.getChangedCells()` gets the properties of a cell in the custom table.

Output Arguments

changedCells — Cells in a custom table whose values have been changed

cell array

Shows the changed cells in a custom table.

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcb);  
  
% Get custom table handle.  
tableControl = maskObj.getDialogControl('myTable');  
  
% Get changed cells.  
changedCell = tableControl.getchangedCells( );
```

```
ans =
```

```
    1×4 cell array
```

```
    {1×2 double}    {1×2 double}    {1×2 double}    {1×2 double}  
Output: Cell Array  
Input: None
```

`Simulink.Mask` | “Create Block Masks”

Introduced in R2019a

getColumn

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Get the column properties

Syntax

```
FetchColumn = tableControl.getColumn(column)
```

Description

`FetchColumn = tableControl.getColumn(column)` fetches the information from the specified column of the custom table.

Input Arguments

tableControl — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: integer

columnIndex — Column Index

string | character array

Index of the column in the custom table.

For example, '4'.

Output Arguments

fetchcolumn — Column properties

column object

Column object

Examples

```
% Get block mask handle.
```

```
maskObj = Simulink.Mask.get(gcb);
```

```
% Get custom table handle.
```

```
tableControl = maskObj.getDialogControl('myTable');
```

```
% Get properties of column 3.  
tableControl.getColumn(3);
```

```
ans =
```

```
TableParamColumnInfo with properties:
```

```
    Name: 'Data Type'  
    Type: 'popup'  
  Enabled: 'on'  
TypeOptions: {4x1 cell}
```

getNumberOfColumns

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Get value of a table cell

Syntax

```
numberOfColumns = tableControl()
```

Description

`numberOfColumns = tableControl()` gets the number of columns in a custom table.

Output Arguments

numberOfColumns — Table cell value

integer

Number of columns in the custom table returned as an integer.

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcf);  
  
% Get custom table handle.  
tableControl = maskObj.getDialogControl('myTable');  
  
% Get cell value.  
numberOfColumns = tableControl.getNumberOfColumns();
```

See Also

[Simulink.Mask](#) | “Create Block Masks”

getNumberOfRows

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Get the number of rows available in a custom table

Syntax

```
numberOfRows = tableControl()
```

Description

`numberOfRows = tableControl()` gets the number of rows in a custom table.

Output Arguments

numberOfRows — Number of Rows

integer

Number of rows in the custom table returned as an integer.

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcf);  
  
% Get custom table handle.  
tableControl = maskObj.getDialogControl('myTable');  
  
% Get number of rows.  
numberOfRows = tableControl.getNumberOfRows();
```

[Simulink.Mask](#) | “Create Block Masks”

Introduced in R2019a

getSelectedRows

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Get all the selected rows of a custom table

Syntax

```
selectedRows = tableControl.getSelectedRows()
```

Description

`selectedRows = tableControl.getSelectedRows()` fetches the information from the specified column of a custom table.

Output Arguments

selectedRows — Row information

numeric array

Value of the specified rows, returned as a numeric array.

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcb);  
  
% Get custom table handle.  
tableControl = maskObj.getDialogControl('myTable');  
  
% Get selected rows.  
selectedRows = tableControl.getSelectedRows();
```

```
ans =
```

```
     3     4
```

[Simulink.Mask](#) | “Create Block Masks”

Introduced in R2019a

getTableCell

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Get the properties of a custom table cell

Syntax

```
tableCell = tableControl.getTableCell([rowIdx colIdx])
```

Description

`tableCell = tableControl.getTableCell([rowIdx colIdx])` gets the properties of a cell in a custom table.

Input Arguments

tableControl — Custom table handle

table object

Handle to a custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: numeric array

rowIdx — Row index

Row index number of the custom table cell for which the value is being fetched.

For example, '3'.

colIdx — Column index

Column index number of the custom table cell for which the value is being fetched.

For example, '5'.

Output Arguments

tableCell — Table cell object

cell object

Properties of the table cell, returned as a cell array.

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcb);
```

```
% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Get cell properties.
tableCell = tableControl.getTableCell( [2 2] );

tableCell =

    CustomTableParamCellObject with properties:

        Value: 'Inherit'
        Type: 'popup'
        Enabled: 'off'
        TypeOptions: {4x1 cell}

tableCell.Value = 'Value'
```

See Also

[Simulink.Mask](#) | “Create Block Masks”

getValue

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Get value of a table cell

Syntax

```
tableCellValue = tableControl.getValue([rowIdx colIdx])
```

Description

`tableCellValue = tableControl.getValue([rowIdx colIdx])` gets the value of a cell in a custom table.

Input Arguments

tableControl — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: numeric array

rowIdx — Row index

|

Row index number of the custom table cell for which the value is being fetched.

For example, [2 2].

colIdx — Column index

|

Column index number of the custom table cell for which the value is being fetched.

For example,[2 2].

Output Arguments

tableCellValue — Table cell value

character vector

Value of the table cell, returned as a character vector.

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcf);  
  
% Get custom table handle.  
tableControl = maskObj.getDialogControl('myTable');  
  
% Get cell value.  
tableCellValue = tableControl.getValue([2 2]);
```

```
ans =  
    'Input'
```

See Also

[Simulink.Mask](#) | “Create Block Masks”

Introduced in R2019a

insertColumn

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Insert a column at a specific position in the custom table

Syntax

```
tableControl.insertColumn(columnIndex[Name,Value])
```

Description

`tableControl.insertColumn(columnIndex[Name,Value])` inserts a column with the specified properties at a specified index in a custom table.

Input Arguments

tableControl — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: char vector | cell array

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Type — Type of control

edit | checkbox | popup

Type of control that is used to specify the value of this parameter. The permitted values are: edit (default), checkbox, popup.

TypeOptions — Options that are displayed within a popup control or in a promoted parameter

''

The options that are displayed within a popup control or in a promoted parameter. This field is a cell array.

Enabled — Specify whether the user can set the value

'on' | 'off'

Option to specify whether the user can set parameter value.

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcf);  
  
% Get custom table handle.  
tableControl = maskObj.getDialogControl('myTable');  
  
% Insert a column at the fifth position.  
tableControl.insertColumn(5,'Name', 'HDL Name', 'Type', 'edit');
```

See Also

[Simulink.Mask](#) | “Create Block Masks”

insertRow

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Insert a row at a specific position in a custom table

Syntax

```
InsertedRow = tableControl.insertRow(rowIndex,string1,string2)
```

Description

`InsertedRow = tableControl.insertRow(rowIndex,string1,string2)` inserts a row with specified properties at the specified index in a custom table.

Input Arguments

tableControl — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: `char` vector | `cell` array

rowIndex — Row Index

Index in table at which the new row is to be inserted.

For example, '4'.

Examples

```
% Get block mask handle.
```

```
maskObj = Simulink.Mask.get(gcb);
```

```
% Get custom table handle.
```

```
tableControl = maskObj.getDialogControl('myTable');
```

```
% Insert Row.
```

```
tableControl.insertRow( rowIndex,'insertSig4', 'Input', 'Inherit', 'Inherit', 'on', 'Inherit' );
```

removeColumn

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Remove an existing column from a specific position in a custom table

Syntax

```
tableControl.removeColumn(columnIndex)
```

Description

`tableControl.removeColumn(columnIndex)` removes a column from the specified index in a custom table.

Input Arguments

tableControl — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: `string`

columnIndex — Column Index

integer

Column index number of the custom table from which the column is to be removed.

For example, '4'.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Remove the third column.
tableControl.removeColumn(3);
```

See Also

`Simulink.Mask` | “Create Block Masks”

removeRow

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Remove an existing row from a specific position in a custom table

Syntax

```
tableControl.removeRow(rowIndex)
```

Description

`tableControl.removeRow(rowIndex)` removes the row from a specified position in a custom table.

Input Arguments

tableControl — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: integer

rowIndex — Row Index

Row index number of the custom table from which the row is to be removed.

For example, '4'.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Remove row with index number 6.
tableControl.removeRow(6);
```

setTableCell

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Set the properties of a custom table cell

Syntax

```
tableCell = tableControl.setTableCell([rowIdx colIdx], Type customtable,  
Evaluate, off)
```

Description

`tableCell = tableControl.setTableCell([rowIdx colIdx], Type customtable, Evaluate, off)` sets the specified properties of a cell in a custom table.

Input Arguments

tableControl — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: Numeric Array Name Value Pair

rowIdx — Row index

Row index number of the custom table cell for which the value is being fetched.

For example, '3'.

colIdx — Column index

Column index number of the custom table cell for which the value is being fetched.

For example, '5'.

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcb);  
  
% Get custom table handle.  
tableControl = maskObj.getDialogControl('myTable');  
  
% Get cell properties.
```

```
tableCell = tableControl.setTableCell([2 2]);
```

swapRows

Class: Simulink.dialog.parameter.CustomTable

Package: Simulink.dialog.parameter

Swap two existing rows in a custom table

Syntax

```
tableControl.swapRows(rowIndex1, rowIndex2)
```

Description

`tableControl.swapRows(rowIndex1, rowIndex2)` swaps specified rows in a custom table.

Input Arguments

tableControl — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: integer

rowIndex1 — Row Index value

integer

Row index number of the first row to be swapped with another row.

For example, '4'.

rowIndex2 — Row Index value

integer

Row index number of the second row to be swapped with another row.

For example, '5'.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Swap rows 3 and 6.
```

```
tableControl.swapRows(3,6);
```

Simulink.dialog.Tab class

Package: Simulink.dialog

Create an instance of a tab dialog control

Description

Use an instance of Simulink.dialog.Tab class to create an instance of tab dialog control.

Properties

Name

Uniquely identifies the tab dialog control and is a required field.

Type: character vector

Prompt

Specifies the text displayed on the tab.

Type: character vector

Default: Empty character vector

Enabled

Specifies whether tab is active on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

Visible

Specifies whether tab is displayed on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

DialogControls

Specifies the child dialog controls contained in the tab dialog control.

Type: Simulink.dialog.Control

Default: Empty array

Methods

<code>addDialogControl</code>	Add dialog control elements to mask dialog box
<code>getDialogControl</code>	Search for a specific dialog control on the mask
<code>removeDialogControl</code>	Remove dialog control element from mask dialog box

Simulink.dialog.TabContainer class

Package: Simulink.dialog

Create an instance of a tab container dialog control

Description

Use an instance of `Simulink.dialog.TabContainer` class to create an instance of tab container dialog control. Tab container dialog box be used to group the tab dialog controls.

Properties

Name

Uniquely identifies the tab container dialog control and is a required field.

Type: character vector

Row

Specifies whether tab container is placed on the current row or on a new row.

Type: enumerated string

Values: 'current' | 'new'

Default: 'new'

Enabled

Specifies whether tab container is active on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

Visible

Specifies whether tab container is displayed on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

DialogControls

Specifies the child dialog controls contained in the group. `Simulink.dialog.TabContainer` class can only contain `Simulink.dialog.Tab` dialog control.

Type: Simulink.dialog.Tab

Default: Empty array

Methods

addDialogControl	Add dialog control elements to mask dialog box
getDialogControl	Search for a specific dialog control on the mask
removeDialogControl	Remove dialog control element from mask dialog box

See Also

Simulink.dialog.Group | Simulink.dialog.Panel | Simulink.dialog.Tab |
Simulink.dialog.Container | Simulink.dialog.Control | “Create Block Masks”

Simulink.dialog.Text class

Package: Simulink.dialog

Create a text dialog control

Description

Use an instance of `Simulink.dialog.Text` class to add a text dialog control.

Properties

Name

Uniquely identifies the dialog control element and is a required field.

Type: character vector

Prompt

Specifies the text displayed on the mask dialog box.

Type: character vector

Default: empty

WordWrap

Specifies whether to wrap long text to the next line on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Row

Specifies whether dialog control is placed on the current row or on a new row.

Type: character vector

Value: 'current' | 'new'

Default: 'new'

Enabled

Indicates whether dialog control is active on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Visible

Indicates whether dialog control is displayed on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

`Simulink.dialog.Control` | "Create Block Masks"

Simulink.dialog.TreeControl class

Package: Simulink.dialog

Control Tree control programmatically

Description

Use an instance of Simulink.dialog.TreeControl class to perform the following operations:

- Get selected items from the tree
- Set selected items in the tree

Properties

Name

Uniquely identifies the dialog control and is a required field.

Type: character vector or string

Prompt

Specifies the text displayed on the tree dialog control.

Type: character vector or string

Default: empty

TreeItems

Specifies the items shown in the tree.

Type: cell array

Default: empty

Callback

Specifies the MATLAB command (s) to be executed when the dialog control is invoked.

Type: character vector or string

Default: empty

Row

Specifies whether dialog control is placed on the current row or on a new row.

Type: character vector

Value: 'current' | 'new'

Default: 'current'

Enabled

Indicates whether tree control is active on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Visible

Indicates whether tree control is displayed on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Multiselect

Indicates whether tree control is enabled for multiple selection.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Tooltip

Indicates whether tree control has a tooltip configured.

Type: character vector or string

Default: empty

Methods

setSelectedItems(TreeControl)	Set values for a tree
getSelectedItems(TreeControl)	Get the values of selected items from a tree hierarchy

See Also

setSelectedItems(TreeControl)

Class: Simulink.dialog.TreeControl

Package: Simulink.dialog

Set values for a tree

Syntax

```
treeControl.setSelectedItems({'Node1/ChildNode1', 'Node1/ChildNode2'})
```

Description

`treeControl.setSelectedItems({'Node1/ChildNode1', 'Node1/ChildNode2'})` set the values for the selected items in the tree.

Input Arguments

TreeControl — tree handle

table object

Handle to the tree, specified as an object. You can use the `getDialogControl` command to get the tree handle. For more information, see `getDialogControl`.

For example, `treeControl = maskObj.getDialogControl('TreeControl')`. Here, `maskObj` is the mask object and `TreeControl` is the name of the tree.

Data Types: cell array

value — value to be set

cell-array of string

Value to be set for selected items in the tree.

Examples

```
maskObj = Simulink.Mask.get( gcb );  
treeControl = maskObj.getDialogControl('Control2')
```

```
% Set selected items  
treeControl.setSelectedItems({'Node1/ChildNode1', 'Node1/ChildNode2'})
```

getSelectedItems(TreeControl)

Class: Simulink.dialog.TreeControl

Package: Simulink.dialog

Get the values of selected items from a tree hierarchy

Syntax

```
selectedItems = treeControl.getSelectedItems()
```

Description

`selectedItems = treeControl.getSelectedItems()` fetches the information of the selected items in the tree.

Output Arguments

selectedItems — value of selected items

cell array

Value of the selected items, returned as a cell array.

Examples

```
% Get block mask handle
maskObj = Simulink.Mask.get(gcf);

% Get tree handle
treeControl = maskObj.getDialogControl('TreeControl');
treeControl.getSelectedItems();
```

```
ans =
```

```
4×1 cell array
```

```
 {'Node1/ChildNode1'}
 {'Node1/ChildNode2'}
 {'Node2/ChildNode1'}
 {'Node2/ChildNode2'}
```

Simulink.GlobalDataTransfer class

Package: Simulink

Configure concurrent execution data transfers

Description

The `Simulink.GlobalDataTransfer` object contains the data transfer information for the concurrent execution of a model. To access the properties of this class, use the `get_param` function to get the handle for this class, and then use dot notation to access the properties. For example:

```
dt=get_param(gcs,'DataTransfer');  
dt.DefaultTransitionBetweenContTasks
```

```
ans =
```

```
Ensure deterministic transfer (minimum delay)
```

Properties

DefaultTransitionBetweenSyncTasks

Global setting for data transfer handling option when the source and destination of a signal are in two different and periodic tasks.

Data Type: Enumeration. Can be one of:

- 'Ensure data integrity only'
- 'Ensure deterministic transfer (maximum delay)'
- 'Ensure deterministic transfer (minimum delay)'

Access: Read/write

DefaultTransitionBetweenContTasks

Global setting for the data transfer handling option for signals that have a continuous sample time.

Data Type: Enumeration. Can be one of:

- 'Ensure data integrity only'
- 'Ensure deterministic transfer (maximum delay)'
- 'Ensure deterministic transfer (minimum delay)'

Access: Read/write

DefaultExtrapolationMethodBetweenContTasks

Global setting for the data transfer extrapolation method for signals that have a continuous sample time.

Data Type: Enumeration. Can be one of:

- 'None'
- 'Zero Order Hold'
- 'Linear'
- 'Quadratic'

Access: Read/write

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects.

Examples

Access the properties of this class.

```
dt=get_param(gcs, 'DataTransfer');  
dt.DefaultTransitionBetweenContTasks
```

```
ans =
```

Ensure deterministic transfer (minimum delay)

Simulink.io.BaseWorkspace class

Package: Simulink.io

Read data in format used by base workspace

Description

Simulink.io.BaseWorkspace inherits from the Simulink.io.FileType base class. It reads data formatted in a format used by the base workspace. Use base workspace file types to move data to and from the base workspace to a function, automated process, or user interface. To import data from the base workspace, use this command.

```
classdef BaseWorkspace < Simulink.io.FileType
```

The Simulink.io.BaseWorkspace class is a handle class.

Class Attributes

Abstract	false
HandleCompatible	true

For information on class attributes, see “Class Attributes”.

Properties

iofile.BaseWorkspace — Base workspace reader

character array

Base workspace reader, specified as a character array.

Attributes:

GetAccess	public
SetAccess	public

Data Types: char | string

Methods

Specialized Operators and Functions

These methods specialize standard MATLAB operators and functions for objects in this class.

isFileSupported	This method always returns true because it operates only on data in the base workspace.
getFileDescription	This method returns the base workspace file reader description.

Examples

Read Data in Base Workspace Format

Read data in base workspace format from file, `foo.mat`.

Set up a timeseries variable, `ts`. If `ts` is a variable in the workspace, the object ignores `fileName`.

```
ts = timeseries([0;9]);
```

Set up reader.

```
aReader = Simulink.io.BaseWorkspace();
resultOfWhos = whos( aReader );
```

Load the reader, which has no inputs.

```
varsOnFileStruct = load(aReader);
```

Load one variable.

```
var = loadAVariable(aReader,'ts');
```

Import the file.

```
importedVars = import(aReader);
```

Export to a file.

```
ds = Simulink.SimulationData.Dataset;
ds = ds.addElement(timeseries([1:10]',[1:10]'),'Signal1');
ds = ds.addElement(timeseries([1:10]',[11:20]'),'Signal2');
ds = ds.addElement(timeseries([1:10]',[21:30]'),'Signal3');
%filePath is ignored, must be provided because the API ruleset
filePath = '';
didWrite = aReader.export(filePath,{'ds'},{ds},0);
```

“Create Custom File Type for Import to Signal Editor”

Introduced in R2021a

Simulink.io.FileType class

Package: Simulink.io

Base class for file type readers for Simulink interfaces such as Signal Editor

Description

Simulink.io.FileType is the base class for Simulink.io.FileType objects. In your class definition file, you must subclass your object from this base class. Simulink requires direct inheritance from FileType. Subclassing allows you to use the implementation methods and service methods provided by this class to build your object. Type this syntax as the first line of your class definition file to directly inherit from the Simulink.io.FileType base class, where ObjectName is the name of your object:

```
classdef ObjectName < Simulink.io.FileType
```

The Simulink.io.FileType class is a handle class.

Class Attributes

Abstract	true
HandleCompatible	true

For information on class attributes, see “Class Attributes”.

Properties

FileName — File name

character array

File name of file that contains custom signals for import to Signal Editor, specified as a character array.

Attributes:

GetAccess	public
SetAccess	public

Methods

Public Methods

exportImpl	Export signals to file
Simulink.io.FileType.getFileTypeDescription	Get custom file reader description
Simulink.io.FileType.isFileSupported	Check if file type is supported in Simulink
Simulink.io.FileType.isInput	Check if input is acceptable Simulink input
Simulink.io.FileType.isSimulinkParameter	Check if input is Simulink parameter
loadImpl	Load signal names from custom FileType object
loadAVariableImpl	Load specified variable from MAT-file
validateFileNameImpl	Validate contents of custom MAT-file

whosImpl

Determine contents of MAT-file associated with Simulink.io.FileType object

Specialized Operators and Functions

These methods specialize standard MATLAB operators and functions for objects in this class.

export	<p>This method calls the <code>exportImpl</code> method.</p> <p>From Signal Editor, write the structure of signals to a MAT-file. The structure must contain two cell arrays; one for signal names and one for signal values. Specify if the method appends to or overwrites the contents of the MAT-file. The method indicates if it succeeded in writing to the MAT-file and returns any error messages.</p>
import	<p><code>[importedData, warnStr] = import(reader)</code></p> <p>To import custom signals for a custom file type, identify the custom file type <i>reader</i> as a <code>Simulink.io.FileType</code> object. The method returns the found variable as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”. The method returns a structure with two fields, <code>Data</code> and <code>Name</code>. <code>Data</code> is a cell array of signals and <code>Name</code> is a cell array of character vectors of the corresponding signal names.</p>
importAVariable	<p><code>varOut = importAVariable(reader,variableName)</code></p> <p>To import a specified variable for a custom file type, identify the custom file type reader as a <code>Simulink.io.FileType</code> object. Use <i>VariableName</i>, specified as a character array, to extract the desired signal from the file of custom format signals. The method returns the found variable, returned as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”.</p>
load	<p>This method calls the <code>loadImpl</code> method.</p> <p>Load the signal listed in the custom file type.</p>
loadAVariable	<p>This method calls the <code>loadAVariableImpl</code> method.</p> <p>Validate the format of the signals in the custom MAT-file <code>fileName</code> with the associated <code>Simulink.io.FileType</code> reader.</p>

<code>validateFileName</code>	<p>This method calls the <code>validateFileNameImpl</code> method.</p> <p>Validate the format of the signals in the custom MAT-file <code>fileName</code> with the associated <code>Simulink.io.FileType</code> reader.</p>
<code>whos</code>	<p>This method calls the <code>whosImpl</code> method.</p> <p>Return the contents of the custom file type MAT-file.</p>

Examples

Subclass FileType

Define a `Simulink.io.FileType` class.

```
classdef MySignalMatFile < Simulink.io.FileType
end
```

Interact with FileType Using Specialized Functions

Interact with `FileType` using specialized functions. This example refers to the `open('Simulink.io.CreateSignals')` sample file.

Get contents of `foo.mat`.

```
fileName = 'foo.mat';
aReader = Simulink.io.CreateSignals(fileName);
resultOfWhos = whos(aReader);
```

Import custom signals from `foo.mat`.

```
aFileType = Simulink.io.CreateSignals('foo.mat');
out = import(aFileType);
```

Load the custom signals in `foo.mat`.

```
aFileType = Simulink.io.CreateSignals('foo.mat');
out = load(aFileType);
```

Load a variable from `foo.mat`.

```
aFileType = Simulink.io.CreateSignals('foo.mat');
out = loadAVariable(aFileType, 'bar');
```

Export the signals from Signal Editor.

```
ds = Simulink.SimulationData.Dataset;
ds = ds.addElement(timeseries([1:10]', [1:10]'), 'Siganl1');
ds = ds.addElement(timeseries([1:10]', [11:20]'), 'Siganl2');
ds = ds.addElement(timeseries([1:10]', [21:30]'), 'Siganl3');
```

```
aReader = Simulink.io.CreateSignals('myFileToExport.mat');  
didWrite = aReader.export(filePath,{'ds'},{ds},0);
```

exportImpl

Class: Simulink.io.FileType

Package: Simulink.io

Export signals to file

Syntax

```
[didWrite,errMsg] = exportImpl(exportFileName,varNames,varValues,isAppend)
```

Description

`[didWrite,errMsg] = exportImpl(exportFileName,varNames,varValues,isAppend)` exports signals from Signal Editor using the specified variables and returns `didWrite` and `errMsg` and saves them to `exportFileName`.

Input Arguments

exportFileName — File name for exported signals

character array

File name for exported signals, specified as a character array.

Data Types: `char`

varNames — Signal names

cell array of character vectors

Signal names, specified as a cell array of character vectors.

Data Types: `cell`

varValues — Signal values

cell array of signal variables

Signal values associated with the signals in `varNames`, specified as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”.

Data Types: `cell`

isAppend — Append or overwrite signal file

false or 0 (default) | true or 1

Append or overwrite signal file, specified as true (1) or false (0).

Data Types: `logical`

Output Arguments

didWrite — Whether signals were successfully written

false or 0 | true or 1

Whether the signals were successfully written to `exportFileName`, returned as true (1) or false (0).

errMsg — Error message

character array

Error message, indicating errors with the reporting process, returned as a character array.

Examples

Subclass FileType Class and Implement exportImpl Method

Subclass `FileType` class and implement `exportImpl` method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement the static method `exportImpl`.

methods

```
function [didWrite,errMsg] = exportImpl(obj,fileName,cellOfVarNames, ...
    cellOfVarValues,isAppend)
    didWrite = false;
    errMsg = '';

    saveStruct = struct;

    for k = 1: length (cellOfVarNames)
        saveStruct.(cellOfVarNames{k}) = cellOfVarValues{k};
    end

    try
        if isAppend
            save(fileName,'-struct','saveStruct','-append');
        else
            save(fileName,'-struct','saveStruct');
        end
        didWrite = true;
    catch ME

        % Optional, return errMsg or throw hard error.
        % Returning an error message allows your automated
        % processes to carry on while allowing you to report the
        % error at a later time.
        errMsg = ME.message;
    end
end
end
end
```

Simulink.io.FileType.getFileTypeDescription

Class: Simulink.io.FileType

Package: Simulink.io

Get custom file reader description

Syntax

```
FileReaderDescription = getFileTypeDescription()
```

Description

`FileReaderDescription = getFileTypeDescription()` returns the file reader description.

Output Arguments

FileReaderDescription — FileType description

character array

FileType description, returned as a character array. When writing the file type description, consider describing the data layout of the file.

Examples

Subclass FileType Class and Implement getFileTypeDescription Method

Subclass FileType class and implement the getFileTypeDescription method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement the static method getFileTypeDescription.

```
methods ( Static )  
  
    function aFileReaderDescription = getFileTypeDescription( )  
        aFileReaderDescription = ['Return a char array describing your reader.'];  
    end

Simulink.io.FileType.isFileSupported

Class: Simulink.io.FileType

Package: Simulink.io

Check if file type is supported in Simulink

Syntax

```
isSupported = isFileSupported(fullFile)
```

Description

`isSupported = isFileSupported(fullFile)` checks if the file located at `fullFile` is supported in Simulink.

Input Arguments

fullFile — Fully qualified file name

character array

Fully qualified file name, specified as a character array.

Example: `C:\mydir\mySignals.csv`

Data Types: `char`

Output Arguments

isSupported — File supported indicator

true (1) | false (0)

File support indicator, returned as true (1) or false (0).

Examples

Subclass FileType Class and Implement isFileSupported Method

Subclass `FileType` class and implement the `isFileSupported` method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement the static method `isFileSupported`.

```
methods ( Static )
```

```
    function isSupported = isFileSupported( fileLocation )
        isSupported = false;
        if exist( fileLocation, 'file' )
            isSupported = true;
        end
```

```
end  
end
```

Simulink.io.FileType.isInput

Class: Simulink.io.FileType

Package: Simulink.io

Check if input is acceptable Simulink input

Syntax

```
isSimulinkInput = Simulink.io.FileType.isInput(ts)
```

Description

`isSimulinkInput = Simulink.io.FileType.isInput(ts)` checks if the `ts` argument is a MATLAB variable that can be used as Simulink simulation input.

Input Arguments

ts — Simulink input

MATLAB variable

Simulink input, specified as a MATLAB variable. This variable must be an acceptable Simulink input, such as the data formats listed at “Data Format or Type”.

Example: `timeseries([0;9])`

Data Types: `char` | `string`

Output Arguments

isSimulinkInput — File input indicator

't' (true) | 'f' (false)

File input indicator, returned as 't' (true) or 'f' (false).

Examples

Check Appropriateness of Input

Check if the `timeseries` `ts` is an input supported by Simulink.

Create `timeseries` variable `ts`.

```
ts = timeseries([sin(0:.01:100)'])
```

```
timeseries
```

Common Properties:

```
    Name: 'unnamed'
```

```
    Time: [10001x1 double]
```

```
TimeInfo: [1x1 tsdata.timemetadata]  
    Data: [10001x1 double]  
DataInfo: [1x1 tsdata.datametadata]
```

More properties, Methods

Check if *ts* is accepted by Simulink.

```
Simulink.io.FileType.isInput(ts)
```

```
ans =
```

```
    logical
```

```
    1
```

Simulink.io.FileType.isSimulinkParameter

Class: Simulink.io.FileType

Package: Simulink.io

Check if input is Simulink parameter

Syntax

```
isParameter = Simulink.io.FileType.isSimulinkParameter(aParam)
```

Description

`isParameter = Simulink.io.FileType.isSimulinkParameter(aParam)` checks if the `aParam` argument is a supported Simulink.Parameter type:

- Simulink.Simulation.ModelParameter
- Simulink.Simulation.BlockParameter
- Simulink.Simulation.Variable
- Simulink.op.ModelOperatingPoint

Input Arguments

aParam — Simulink parameter

vector of Simulink parameters | Simulink parameter as scalar

Simulink parameter, specified as a vector or scalar of one of these types:

- Simulink.Simulation.ModelParameter (can be scalar or vector)
- Simulink.Simulation.BlockParameter (can be scalar or vector)
- Simulink.Simulation.Variable (can be scalar or vector)
- Simulink.op.ModelOperatingPoint (must be scalar)

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical | char | string | struct | table | cell | function_handle | categorical | datetime | duration | calendarDuration | fi

Complex Number Support: Yes

Output Arguments

isParameter — Simulink parameter indicator

true (1) | false (0)

Simulink parameter indicator, returned as true (1) or false (0).

Examples

Check if Input Parameter Is Simulink Parameter

Check if the parameter *aParam* is a Simulink parameter.

Create parameter *aParam*.

```
aParam = Simulink.Simulation.BlockParameter('f/g', 'Gain', '5')
```

```
aParam =
```

```
BlockParameter with properties:
```

```
BlockPath: 'f/g'  
Name: 'Gain'  
Value: '5'
```

Check if the parameter *aParam* is a Simulink parameter.

```
Simulink.io.FileType.isSimulinkParameter(aParam)
```

```
ans =
```

```
logical
```

```
1
```

loadAVariableImpl

Class: Simulink.io.FileType

Package: Simulink.io

Load specified variable from MAT-file

Syntax

```
varOut = loadAVariableImpl(MATfile,varName)
```

Description

`varOut = loadAVariableImpl(MATfile,varName)` loads the specified variable from the MAT-file.

Input Arguments

MATfile — File name of MAT-file

character array

File name of the MAT-file that contains signals to load, specified as a character array.

Data Types: char

varName — Variable name

character array

Variable name to load, specified as a character array.

Data Types: char

Output Arguments

varOut — Found variable

cell array of signal variables

Found variables to load, returned as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”.

Examples

Subclass FileType Class and Implement loadAVariableImpl Method

Subclass `FileType` class and implement `loadAVariableImpl` method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement the static method `loadAVariableImpl`.

```
methods
```

```
function structOut = loadAVariableImpl(obj,varName)

    % Assume loading a variable from a MAT-file.
    data = load(obj.FileName,varName);

    if isempty(fieldnames(data))
        error([varName ' was not found on the file.']);
    end

    if isSimulinkSignalFormat(data.(varName))
        structOut.(varName) = ...
            data.(varName);
    else
        error([varName ' is not a Simulink signal format.']);
    end
end
end

Introduced in R2020a

loadImpl

Class: Simulink.io.FileType

Package: Simulink.io

Load signal names from custom FileType object

Syntax

```
matFileData = loadImpl(reader)
```

Description

`matFileData = loadImpl(reader)` loads the signal names listed in the custom FileType object.

Run-Time Details

`loadImpl` is called via `load` when you run the `Simulink.io.FileType` object. You can also run the application, which calls `load`. For details, see “Create Custom File Type for Import to Signal Editor”.

Input Arguments

reader — Signals to load

`Simulink.io.FileType`

Signals to load, specified as a `Simulink.io.FileType` object.

Data Types: `char`

Output Arguments

matFileData — Signals

cell array of signal variables

Variables of signals to load, returned as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”.

Examples

Subclass FileType Class and Implement loadImpl Method

Subclass `FileType` class and implement the `loadImpl` method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement the static method `loadImpl`.

methods

```
function structOut = loadImpl(obj)
```

```
structOut = struct;

%assume mat-file
data = load(obj.FileName);
varsOnFile = fieldnames(data);

for k = 1: length(varsOnFile)

    if isSimulinkSignalFormat(data.(varsOnFile{k}))
        structOut.(varsOnFile{k}) = ...
            data.(varsOnFile{k});
    end
end
end
end
```

validateFileNameImpl

Class: Simulink.io.FileType

Package: Simulink.io

Validate contents of custom MAT-file

Syntax

```
validateFileNameImpl(reader, fileName)
```

Description

`validateFileNameImpl(reader, fileName)` validates the format of the signals in the custom MAT-file `fileName` with the associated `Simulink.io.FileType` reader.

Input Arguments

reader — Reader

`Simulink.io.FileType` object

Reader, specified as a `Simulink.io.FileType` object.

fileName — File name of MAT-file

character array

File name of a MAT-file that contains custom signals, specified as a character array.

Data Types: `char`

Examples

Subclass FileType Class and Implement validateFileNameImpl Method

Subclass `FileType` class and implement the `validateFileNameImpl` method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement static method `validateFileNameImpl`.

```
function validateFileNameImpl(aFile, filename) %#ok<INUSL>
%validateFileNameImpl

[-, ~, fileExt] = fileparts( filename );
isSupported = strcmpi(fileExt, '.mat');

if ~isSupported
    error('This file format is not supported by application.');
```

```
end
```

end

Introduced in R2020a

whosImpl

Class: Simulink.io.FileType

Package: Simulink.io

Determine contents of MAT-file associated with Simulink.io.FileType object

Syntax

```
signals = whosImpl(reader)
```

Description

`signals = whosImpl(reader)` returns a structure containing the contents of the MAT-file associated with the `Simulink.io.FileType` object.

Run-Time Details

`whosImpl` is called via `whos` when you run the application. For details, see “Create Custom File Type for Import to Signal Editor”.

Input Arguments

reader — Reader

Simulink.io.FileType object

Reader, specified as a `Simulink.io.FileType` object.

Output Arguments

signals — Contents of MAT-file

array of structures

Contents of the MAT-file, returned as an array of structures. This structure has a signal name ['char array'] and an optional signal type of a supported type. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”.

Examples

Subclass FileType Class and Implement whosImpl Method

Subclass `FileType` class and implement the `whosImpl` method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement the static method `whosImpl`.

methods

```
function outOnFile = whosImpl(obj)
    onFile = whos(obj.FileName);
```

```
numVars = length(onFile);  
outOnFile(1).name = [];  
outOnFile(1).type = [];  
for k = 1: length(numVars)  
    outOnFile(k).name = onFile(k).name;  
    if strcmpi( onFile(k).class, 'Simulink.SimulationData.Dataset' )  
        outOnFile(k).type = 'Dataset';  
    else  
        % Assume Signal(timeseries or timetable)  
        % other acceptable types  
        % - Bus      : for bus signals  
        % - Ground: for grounds (empty double)  
        % - FunctionCall: for single column double data arrays  
        outOnFile(k).type = 'Signal';  
    end  
end  
end  
end
```

Simulink.io.MatFile class

Package: Simulink.io

Read data in MAT-file format

Description

Simulink.io.MatFile inherits from the Simulink.io.FileType base class. The class reads data formatted in a format used by MAT-files. To import data from a MAT-file, use this class.

```
classdef MatFile < Simulink.io.FileType
```

The Simulink.io.MatFile class is a handle class.

Class Attributes

Abstract	false
HandleCompatible	true

For information on class attributes, see “Class Attributes”.

Properties

iofile.STAMatFile – MAT-file reader

character array

MAT-file reader, specified as a character array.

Attributes:

GetAccess	public
SetAccess	public

Data Types: char | string

Methods

Specialized Operators and Functions

These methods specialize standard MATLAB operators and functions for objects in this class.

isFileSupported	This method always returns true because it operates only on data in the MAT-file.
getFileTypeId	This method returns the MAT-file reader description for MAT-files containing data with loading and logging signal formats that Simulink supports.

Examples

Read Data in MAT-File Format

Read data in MAT-file format from the file `foo.mat`.

```
fileName = 'foo.mat';  
aReader = Simulink.io.MatFile(fileName);  
resultOfWhos = whos(aReader);
```

Load the reader, which has no inputs.

```
varsOnFileStruct = load(aReader);
```

Load one variable.

```
var = loadAVariable(aReader, 'ts');
```

Import all the variables from the MAT-file, `foo.mat`.

```
importedVars = import(aReader);
```

Export the dataset to a MAT-file named `bar.mat`.

```
ds = Simulink.SimulationData.Dataset;  
ds = ds.addElement(timeseries([1:10]', [1:10]'), 'Signal1');  
ds = ds.addElement(timeseries([1:10]', [11:20]'), 'Signal2');  
ds = ds.addElement(timeseries([1:10]', [21:30]'), 'Signal3');
```

```
filePath = 'bar.mat';  
didWrite = aReader.export(filePath, {'ds'}, {ds}, 0);
```

Simulink.io.ModelWorkspace class

Package: Simulink.io

Read data in format used by model workspace

Description

Simulink.io.ModelWorkspace inherits from the Simulink.io.FileType base class. It reads data formatted in a format used by the model workspace. Use model workspace file types to move data to and from the model workspace to a function, an automated process, or a user interface. To import data from the model workspace, use this command.

```
classdef ModelWorkspace < Simulink.io.FileType
```

The Simulink.io.ModelWorkspace class is a handle class.

Class Attributes

Abstract	false
HandleCompatible	true

For information on class attributes, see “Class Attributes”.

Properties

DataSource — Source for initializing variables in model workspace

'Model File' (default) | 'MAT-File' | 'MATLAB Code' | 'MATLAB File'

Source for initializing the variables in the model workspace, specified as one of these character vectors:

- 'Model File' — The variables are stored in the model file. When you save the model, you also save the variables.
- 'MATLAB Code' — The variables are created by MATLAB code that you write and store in the model file.
- 'MAT-File' — The variables are stored in a MAT-file, which you can manage and manipulate separately from the model file.
- 'MATLAB File' — The variables are created by MATLAB code in a script file, which you can manage and manipulate separately from the model file.

Attributes:

GetAccess	public
SetAccess	public

Data Types: char | string

FileName — Name of external file that stores or creates variables

'' (empty character vector) (default) | character vector

Name of the external file that stores or creates variables, specified as a character vector. To enable this property, set `DataSource` to 'MAT-File' or 'MATLAB File'.

Attributes:

GetAccess public
SetAccess public

Data Types: char | string

MATLABCode — MATLAB code for initializing variables

' ' (empty character vector) (default) | character vector

MATLAB code for initializing variables, specified as a character vector. To enable this property, set `DataSource` to 'MATLAB Code'.

Attributes:

GetAccess public
SetAccess public

Data Types: char | string

Methods

Specialized Operators and Functions

These methods specialize standard MATLAB operators and functions for objects in this class.

<code>isFileSupported</code>	This method always returns true because it operates only on data in the base workspace.
<code>getFileTypeIdDescription</code>	This method returns the base workspace file reader description.

Examples

Read Data in Model Workspace Format

Set up `myExample` to use with the model workspace and perform basic operations.

Set up the model workspace for the `myExample`. Assign `timeseries([1;3])` as the value of `aSignal`.

```
myExample;
```

```
mWS = get_param('myExample','ModelWorkspace');  
assignin(mWS, 'aSignal', timeseries([1;3]));
```

Determine the contents of the MAT-file `aFileType` associated with the `Simulink.io.ModelWorkspace` object.

```
aFileType = Simulink.io.ModelWorkspace( 'myExample.slx' );
```

```
%whos on file
out = whos( aFileType )
```

```
out =

  struct with fields:

    name: 'aSignal'
    type: 'Signal'
```

Load signal names from the aFileType of the myExample model workspace.

```
aFileType = Simulink.io.ModelWorkspace( 'myExample.slx' );
%load
out = load( aFileType )
```

```
out =

  struct with fields:

    aSignal: [1x1 timeseries]
```

```
aFileType = Simulink.io.ModelWorkspace( 'myExample.slx' );
%import all
out = import( aFileType )
```

```
out =

  struct with fields:

    Data: {[1x1 timeseries]}
    Names: {'aSignal'}
```

```
out =

  struct with fields:

    Data: {[1x1 timeseries]}
    Names: {'aSignal'}
```

Import the specified variable *aSignal* from the model workspace.

```
aFileType = Simulink.io.ModelWorkspace( 'myExample.slx' );
var = importAVariable( aFileType, 'aSignal'
```

```
timeseries

  Common Properties:
    Name: 'unnamed'
    Time: [2x1 double]
    TimeInfo: [1x1 tsdata.timemetadata]
    Data: [2x1 double]
    DataInfo: [1x1 tsdata.datametadata]
```

More properties, Methods

Write a structure of signals to a MAT-file.

```
ts = timeseries([11112;36532415]);
aFileType = Simulink.io.ModelWorkspace( 'minportsOnly_withOutputs.slx' );
```

```
[didWrite, errMsg ] = export( aFileType, 'minportsOnly_withOutputs.slx', ...  
    {'ts'}, {ts}, ...  
    false )
```

```
didWrite =
```

```
    logical
```

```
    1
```

```
errMsg =
```

```
    0x0 empty char array
```

“Create Custom File Type for Import to Signal Editor”

Introduced in R2021b

Simulink.io.PluggableNamespace class

Package: Simulink.io

Register Simulink.io.FileType objects from different name space

Description

Use the Simulink.io.PluggableNamespace class interface to implement a name space to register Simulink.io.FileType objects from custom name spaces.

In your class definition file, you must subclass your object from this base class. Simulink requires direct inheritance from PluggableNamespace.

The process to contain the new class is similar to the one to create a custom file type. To contain your class, create a folder and add that folder path to the MATLAB path. In that folder, create a +Simulink folder, and inside that folder, create a +io folder.

To examine issues with the registration of these objects, use the Simulink.io.getFileTypeDiagnostics function.

The Simulink.io.PluggableNamespace class is a handle class.

Class Attributes

Abstract	false
HandleCompatible	true

For information on class attributes, see “Class Attributes”.

Creation

Description

`classdef SimulinkIOPlugin < Simulink.io.PluggableNamespace` creates a name space.

Properties

NameSpace — Name space to register

character array

Name space to register, specified as a character array.

Example: `Namespace = 'Simulink.io'`

Attributes:

GetAccess	public
-----------	--------

Data Types:

Examples

Create Pluggable Name Space

Create a pluggable name space, MyNamespace.

Inherit from the `Simulink.io.PluggableNamespace` base class.

```
classdef MyNamespace < Simulink.io.PluggableNamespace
```

Implement the property, `Namespace`, as `MyNamespace`.

```
    properties (Access = public, Constant)
        Namespace = 'MyNamespace';
    end
end
```

You can now create a folder on the MATLAB path, create a folder such as `+MyNamespace` and place your file types in that folder.

SetAccess	public

Data Types:

Methods

Specialized Operators and Functions

These methods specialize standard MATLAB operators and functions for objects in this class.

export	<p>This method calls the <code>exportImpl</code> method.</p> <p>From Signal Editor, write the structure of signals to a MAT-file. The structure must contains two cell arrays; one for signal names and one for signal values. Specify if the method appends to or overwrites the contents of the MAT-file. The method indicates if it succeeded in writing to the MAT-file and returns any error messages.</p>
import	<p><code>[importedData, warnStr] = import(reader)</code></p> <p>To import custom signals for a custom file type, identify the custom file type <i>reader</i> as a <code>Simulink.io.FileType</code> object. The method returns the found variable as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”. The method returns a structure with two fields, <code>Data</code> and <code>Name</code>. <code>Data</code> is a cell array of signals and <code>Name</code> is a cell array of character vectors of the corresponding signal names.</p>
importAVariable	<p><code>varOut = importAVariable(reader,variableName)</code></p> <p>To import a specified variable for a custom file type, identify the custom file type reader as a <code>Simulink.io.FileType</code> object. Use <i>VariableName</i>, specified as a character array, to extract the desired signal from the file of custom format signals. The method returns the found variable, returned as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”.</p>
load	<p>This method calls the <code>loadImpl</code> method.</p> <p>Load the signal listed in the custom file type.</p>
loadAVariable	<p>This method calls the <code>loadAVariableImpl</code> method.</p> <p>Validate the format of the signals in the custom MAT-file <code>fileName</code> with the associated <code>Simulink.io.FileType</code> reader.</p>
validateFileName	<p>This method calls the <code>validateFileNameImpl</code> method.</p> <p>Validate the format of the signals in the custom MAT-file <code>fileName</code> with the associated <code>Simulink.io.FileType</code> reader.</p>

whos	This method calls the whosImpl method. Return the contents of the custom file type MAT-file.
------	---

Examples

Interact with SignalBuilderSpreadsheet Using Specialized Functions

Interact with FileType using specialized functions. This example refers to the open('Simulink.io.CreateSignals') sample file.

Get contents of Signal Builder format foo.xlsx spreadsheet.

```
fileName = 'foo.xlsx';
aReader = Simulink.io.SignalBuilderSpreadsheet(fileName);
resultOfWhos = whos( aReader );
```

Load the custom signals in foo.xlsx.

```
fileName = 'foo.xlsx';

aReader = Simulink.io.SignalBuilderSpreadsheet(fileName);
varsOnFileStruct = load(aReader, 'myGroup1');
```

Load a variable from foo.xlsx.

```
fileName = 'foo.xlsx';

aReader = Simulink.io.SignalBuilderSpreadsheet(fileName);
var = loadAVariable(aReader, 'myGroup1');
```

Import custom signals from foo.xlsx.

```
fileName = 'foo.xlsx';

aReader = Simulink.io.SignalBuilderSpreadsheet(fileName);
importedVars = import(aReader, 'myGroup1');
```

Export the signals from Signal Editor.

```
ds = Simulink.SimulationData.Dataset;
ds = ds.addElement(timeseries([1:10]', [1:10]'), 'Signal1'); %#ok<*NBRAK>
ds = ds.addElement(timeseries([1:10]', [11:20]'), 'Signal2');
ds = ds.addElement(timeseries([1:10]', [21:30]'), 'Signal3');

aReader = Simulink.io.SignalBuilderSpreadsheet('myFileToExport.xls');
didWrite = aReader.export(filePath, {'ds'}, {ds}, 0);
```

Simulink.io.SLDVMatFile class

Package: Simulink.io

Read Simulink Design Verifier format data in MAT-file

Description

The `Simulink.io.SLDVMatFile` class inherits from the `Simulink.io.MatFile` reader class, which inherits from the `Simulink.io.FileType` base class. This class reads the data in the `sldvData` structure used by Simulink Design Verifier. The data is contained in a MAT-file. To import data from a MAT-file that contains the `sldvData` structure, use this class.

```
classdef Simulink.io.SLDVMatFile < Simulink.io.MatFile
```

The `Simulink.io.SLDVMatFile` class is a `handle` class.

Class Attributes

Abstract false

HandleCompatible true

For information on class attributes, see “Class Attributes”.

whos	<p>This method calls the <code>whosImpl</code> method.</p> <p>Return the list of <code>sldvData</code> structure datasets.</p>

Examples

Read Data in Simulink Design Verifier MAT-File Format

List the test cases in a Simulink Design Verifier MAT-file. The `whos()` method returns a structure with the fields `name` and `type`. The structure contains the names of all the test cases in the `sldvData` structure file along with the type `Dataset`.

```
fileName = 'foo.mat';  
aReader = Simulink.io.SLDVMatFile(fileName);  
resultOfWhos = whos(aReader);
```

Load the data. The `load()` method converts the test case data in the `sldvData` structure into `Simulink.SimulationData.Dataset` objects. The result is a structure where each field is the name of the test case and the value is the corresponding dataset object.

```
loadedVars = load(aReader);
```

Import the data. Similarly to `load()`, the `import()` method converts the test case data in the `sldvData` structure into `Simulink.SimulationData.Dataset` objects. The result is a structure with fields `Data` and `Names`. The `Names` field contains the name of the test cases. The `Data` field contains the corresponding dataset objects.

```
importedVars = import(aReader);
```

Simulink.LookupTable class

Package: Simulink

Store and share lookup table and breakpoint data, configure data for ASAP2 and AUTOSAR code generation

Description

An object of the `Simulink.LookupTable` class stores lookup table and breakpoint data. You can use that data in a lookup table block such as the n-D Lookup Table block. With the object, you can specify data types and code generation settings for the table and the breakpoint sets.

When you store all of the table and breakpoint set data in a single `Simulink.LookupTable` object, all of the data appears in a single structure in the generated code. To configure `STD_AXIS` code generation for calibration, use this technique.

To share a breakpoint set between multiple lookup tables, for example for `COM_AXIS` code generation, use a `Simulink.Breakpoint` object in one or more Prelookup blocks. Use `Simulink.LookupTable` objects in Interpolation Using Prelookup blocks. Then, configure the lookup table objects to refer to the breakpoint object. For more information, see “Package Shared Breakpoint and Table Data for Lookup Tables”.

To subclass from `Simulink.LookupTable` and inherit from this base class, type this syntax as the first line of your class definition file, where *myLookuptable* is the name of your new class:

```
classdef myLookuptable < Simulink.LookupTable
```

For an example on subclassing, see “Define Data Classes”.

If you add properties to the subclass, you can see them by displaying the subclass object at the MATLAB command line. In the property dialog box, these properties display in a new tab.

Construction

`LUTObj = Simulink.LookupTable` returns a `Simulink.LookupTable` object `LUTObj` with default property values.

To create a `Simulink.LookupTable` object by using the Model Explorer, use the button  on the toolbar. The default name for the object is `Object`.

Property Dialog Box

Setting **Breakpoints specification** to `Explicit` (default) displays this view of the property dialog box.

The bottom of the dialog box contains the table and breakpoint data values. For more information on this tabular area, see “Edit Lookup Table Data with Lookup Table Spreadsheet”. The contents of this table are equivalent to the **Value** property, visible when the **Breakpoints specification** property is set to Even spacing or Reference.

Number of table dimensions

Number of dimensions of the lookup table. Specify an integer value up to 30 (inclusive). For example, to represent a three-dimensional lookup table, specify the integer 3.

Table

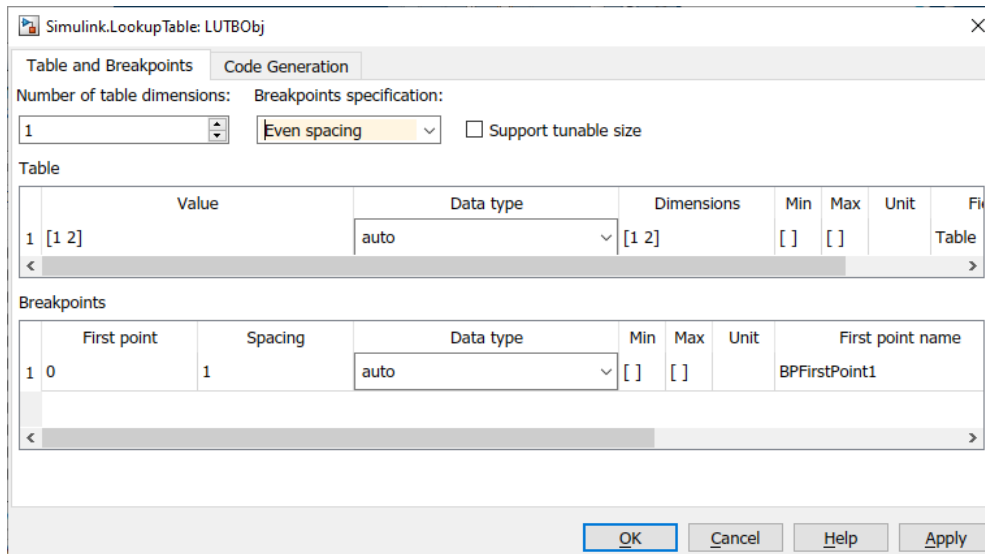

Information for the table data. You can configure these characteristics:

Value

Table data. Specify a numeric vector or multidimensional array with at least two elements.

The **Value** table data is the same as the contents of the tabular interface visible at the bottom of the dialog box when the **Breakpoints specification** property is set to **Explicit**. For more information on this tabular area, see “Edit Lookup Table Data with Lookup Table Spreadsheet”.

Note This property appears only if **Breakpoints specification** is set to Even spacing or Reference.

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector or multidimensional array. When you click **Apply** or **OK**, the object executes the expression and uses the result to set the value of this property.

When you set **Data type** to `auto`, to set **Value**, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

When you specify table data with three or more dimensions, **Value** displays the data as an expression that contains a call to the `reshape` function. To edit the values in the data, modify the first argument of the `reshape` call, which contains all of the values in a serialized vector. When you add or remove elements along a dimension, you must also correct the argument that represents the length of the modified dimension.

You can edit this data by using a more intuitive interface in a lookup table block. See “Import Lookup Table Data from MATLAB”.

Data type

Data type of the table data. The default setting is `auto`, which means that the table data acquire a data type from the value that you specify in **Value**. If you use an untyped expression such as `[1 2 3]` to set **Value**, the table data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the table data use the data type specified by the expression or object. Enumerated data types are also supported.

You can explicitly specify an integer data type, half data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Dimensions

Dimension lengths of the lookup table data.

To use symbolic dimensions, specify a character vector. See “Implement Dimension Variants for Array Sizes in Generated Code” (Embedded Coder).

Min

Minimum value of the elements in the table data. The default value is empty, []. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Max

Maximum value of the elements in the table data. The default value is empty, []. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Stored Int Min

For `Simulink.LookupTable` objects with a fixed-point data type, the minimum value of the elements in the table data, specified as a stored integer value. The value is derived from the real-world value **Min**. This property is available only in the property dialog box.

Stored Int Max

For `Simulink.LookupTable` objects with a fixed-point data type, the maximum value of the elements in the table data, specified as a stored integer value. The value is derived from the real-world value **Max**. This property is available only in the property dialog box.

Unit

Physical units of the elements in the lookup table. You can specify text such as `degC`. See “Unit Specification in Simulink Models”.

Field name

Name of a structure field in the generated code. This field stores the table data if you configure the `Simulink.LookupTable` object to appear in the generated code as a structure. The default value is `Table`. To change the field name, specify text.

Description

Description of the lookup table. You can specify text such as `This lookup table describes the action of a pump`.

Breakpoints

Breakpoint set information. Each row is one breakpoint set. To configure additional breakpoint sets, specify an integer value in the **Number of table dimensions** box.

For the breakpoint sets, you can configure these characteristics:

Specification

Source for the information of the breakpoint sets, specified as `Explicit values` (default), `Reference`, or `Even spacing`.

- To store all of the table and breakpoint set data in the `Simulink.LookupTable` object, set **Specification** to `Explicit values`.

The `Simulink.LookupTable` object appears in the generated code as a single structure variable.

- To store the table data in the `Simulink.LookupTable` object and store the breakpoint set data in `Simulink.Breakpoint` objects, set **Specification** to `Reference`.

The `Simulink.LookupTable` object appears in the generated code as a separate array variable that contains the table data. Each `Simulink.Breakpoint` object appears as a separate array or structure variable that contains the breakpoint set data.

- To store the table data and evenly spaced breakpoints in the `Simulink.LookupTable` object, set **Specification** to `Even spacing`. Use the **First point** and **Spacing** parameters to generate a set of evenly spaced breakpoints.

Note When **Specification** is set to `Explicit values` or `Even spacing`, you can change the order of the tunable size, breakpoint, and table entries in a lookup table object-generated structure.

Support tunable size

Specification to enable tuning the effective size of the table in the generated code. In the code, the structure that corresponds to the object has an extra field for each breakpoint vector. Each extra field stores the length of the corresponding breakpoint vector. You can change the value of each field to adjust the effective size of the table.

This property appears only if you set **Specification** to `Explicit values` or `Even spacing`.

Note If you store breakpoint data in `Simulink.Breakpoint` objects by setting **Specification** to `Reference`, to enable tuning of the table size in the generated code, use the **Support tunable size** property of each `Simulink.Breakpoint` object.

Value

Data for the breakpoint set. Specify a numeric vector with at least two elements.

Note This property appears only if **Breakpoints specification** is set to `Even spacing` or `Reference`. The **Value** breakpoint set data is the same as the contents of the tabular interface visible at the bottom of the dialog box when the **Breakpoints specification** property is set to `Explicit`. For more information on this tabular area, see “Edit Lookup Table Data with Lookup Table Spreadsheet”.

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector. When you click **Apply** or **OK**, the object executes the expression and uses the result to set the value of this property.

When you set **Data type** to `auto`, to set **Value**, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

You can edit this data by using a more intuitive interface in a lookup table block. See “Import Lookup Table Data from MATLAB”.

Data type

Data type of the breakpoint set. The default setting is `auto`, which means that the breakpoint set acquires a data type from the value that you specify in **Value**. If you use an untyped

expression such as `[1 2 3]` to set **Value**, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint data use the data type specified by the expression or object.

You can explicitly specify an integer data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Dimensions

Dimension lengths of the breakpoint set.

To use symbolic dimensions, specify a character vector. See “Implement Dimension Variants for Array Sizes in Generated Code” (Embedded Coder).

Min

Minimum value of the elements in the breakpoint set. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Max

Maximum value of the elements in the breakpoint set. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Unit

Physical unit of the elements in the breakpoint set. You can specify text such as `degF`. See “Unit Specification in Simulink Models”.

Field name

Name of a structure field in the generated code. This field stores the breakpoint set data. The default value is `BP1` for the first breakpoint set and `BP2` for the second set. To change the field name, specify text.

Tunable size name

Name of a structure field in the generated code. This field stores the length (number of elements) of the breakpoint set, which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory. The default name is `N1` for the first breakpoint set and `N2` for the second set. To change the field name, specify text.

This column appears only if you select **Support tunable size**.

Description

Description of the breakpoint set. You can specify text such as `This breakpoint set represents the pressure input`.

First point

First point in evenly spaced breakpoint data. This parameter is available when **Specification** is set to `Even spacing`.

Spacing

Spacing between points in evenly spaced breakpoint data. This parameter is available when **Specification** is set to `Even spacing`.

Name

Name of the `Simulink.Breakpoint` object that stores the information for this breakpoint set.

This column appears only if you set **Specification** to `Reference`.

First point name

Name of the `Simulink.Breakpoint` object that stores the information for the first point. This parameter is available when **Specification** is set to `Even spacing`.

Spacing name

Name of the `Simulink.Breakpoint` object that stores the information for the spacing. This parameter is available when **Specification** is set to `Even spacing`.

Data definition: Storage class

Storage class of the structure variable (if you set **Specification** to `Explicit values` or `Even spacing`) or array variable (`Reference`) in the generated code. The variable stores the table data and, if the variable is a structure, the breakpoint set data. The default setting is `Auto`.

For more information about storage classes, see “C Code Generation Configuration for Model Interface Elements” (Simulink Coder).

If you have Embedded Coder, you can choose a custom storage class. For information about custom storage classes, see “Organize Parameter Data into a Structure by Using Struct Storage Class” (Embedded Coder).

Data definition: Identifier

Alternative name for the structure variable (if you set **Specification** to `Explicit values` or `Even spacing`) or array variable (`Reference`) in the generated code. The default value is empty, in which case the generated code uses the name of the `Simulink.LookupTable` object as the name of the structure or array variable. To set the identifier, specify text.

To enable this property, set **Data definition: Storage class** to a setting other than `Auto`.

Data definition: Alignment

Data alignment boundary in the generated code. The starting memory address for the data allocated for the structure or array variable is a multiple of the value that you specify. The default value is `-1`, which allows the code generator to determine an optimal alignment based on usage.

Specify a positive integer that is a power of 2, not exceeding 128. For more information about using data alignment for code replacement, see “Data Alignment for Code Replacement” (Embedded Coder).

Struct Type definition: Name

Name of the structure type that the structure variable uses in the generated code. The default value is empty. Specify text.

This property appears only if you set **Specification** to `Explicit values` or `Even spacing`.

Struct Type definition: Data scope

Scope of the structure type definition (imported from your custom code or exported from the generated code). The default value is `Auto`. When you select `Auto`:

- If you do not specify a value in the **Struct Type definition: Header file** box, the generated code exports the structure type definition to the file `model_types.h`. `model` is the name of the model.
- If you specify a value in the **Struct Type definition: Header file** box, such as `myHdr.h`, the generated code imports the structure type definition from `myHdr.h`.

To explicitly specify the data scope:

- To import the structure type definition into the generated code from your custom code, select `Imported`.
- To export the structure type definition from the generated code, select `Exported`.

If you do not specify a value in the **Struct Type definition: Header file** box, the generated code imports or exports the type definition from or to `StructName.h`. `StructName` is the name that you specify by using the property **Struct Type definition: Name**.

This property appears only if you set **Specification** to `Explicit` values or `Even spacing`.

Struct Type definition: Header file

Name of the header file that contains the structure type definition. You can import the definition from a header file that you create, or export the definition into a generated header file. To control the scope of the structure type, adjust the setting for the **Struct Type definition: Data scope** property.

This property appears only if you set **Specification** to `Explicit` values or `Even spacing`.

Table and breakpoint value edit area

Information for table and breakpoint data. You can enter a MATLAB expression in the associated text box or add data directly in the accompanying table. Select the desired data type:

- **Table** — Table data. Specify a numeric vector or multidimensional array with at least two elements.

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector or multidimensional array. When you press **Enter**, the object executes the expression and uses the result to set the value of this property.

When you specify table data with three or more dimensions, the table displays the data as an expression that contains a call to the `reshape` function. To edit the values in the data, modify the first argument of the `reshape` call, which contains all of the values in a serialized vector. When you add or remove elements along a dimension, you must also correct the argument that represents the length of the modified dimension.

You can edit this data using a more intuitive interface in a lookup table block. See “Import Lookup Table Data from MATLAB”.

- **BPN** — Data for the breakpoint set.

Specify a numeric vector with at least two elements.

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector. When you press **Enter**, the object executes the expression and uses the result to set the value of this property.

You can edit this data by using a more intuitive interface in a lookup table block. See “Import Lookup Table Data from MATLAB”.

Entering or manipulating data in the table is simple and intuitive. Like Microsoft Excel spreadsheets, you can work with the table with operations such as:

- Select table elements
- Use standard keyboard shortcuts such as:
 - Copy — **Ctrl+C**
 - Paste — **Ctrl+V**
 - Undo — **Ctrl+Z**
 - Delete
 - Redo — **Shift+Ctrl+Z**

Properties

Breakpoints — Breakpoint set information

vector of `Simulink.lookuptable.Breakpoint` objects | cell array of character vectors

Breakpoint set information, specified as a vector of `Simulink.lookuptable.Breakpoint` objects, a cell array of character vectors, or a vector of `Simulink.lookuptable.Evenspacing` objects.

If you use a vector of `Simulink.lookuptable.Breakpoint` objects, each object represents a breakpoint set. To use a vector of `Simulink.lookuptable.Breakpoint` objects, set the property `BreakpointsSpecification` to 'Explicit values'.

If you use a cell array of character vectors, each character vector represents the name of a `Simulink.Breakpoint` object. To use a cell array of character vectors, set the property `BreakpointsSpecification` to 'Reference'.

If you use a vector of `Simulink.lookuptable.Evenspacing` objects, each object represents a breakpoint set. To use a vector of `Simulink.lookuptable.Evenspacing` objects, set the property `BreakpointsSpecification` to 'Even Spacing'.

BreakpointsSpecification — Source of breakpoint set information

'Explicit values' (default) | 'Reference' | 'Even spacing'

Source of the breakpoint set information, specified as 'Explicit values' (default), 'Even spacing', or 'Reference'. See the **Breakpoints > Specification** parameter.

Data Types: char

CoderInfo — Code generation settings for structure or array variable

`Simulink.CoderInfo` object

Code generation settings for the structure variable (if you set `BreakpointsSpecification` to 'Explicit values' or 'Even spacing') or array variable ('Reference') that stores the lookup

table and breakpoint sets, specified as a `Simulink.CoderInfo` object. You can specify a storage class or custom storage class by using this embedded object. See `Simulink.CoderInfo`.

StructTypeInfo — Settings for structure type in the generated code

`Simulink.lookuptable.StructTypeInfo` object

Settings for the structure type that the structure variable uses in the generated code, specified as a `Simulink.lookuptable.StructTypeInfo` object.

If you set `BreakpointsSpecification` to 'Reference', the `Simulink.LookupTable` object does not appear in the generated code as a structure. The code generator ignores this property.

SupportTunableSize — Option to generate code that enables tunability of table size

`false` (default) | `true`

Option to generate code that enables tunability of the effective size of the table, specified as `true` or `false`. See the **Support Tunable Size** parameter.

Data Types: `logical`

Table — Information for table data

`Simulink.lookuptable.Table` object

Information for the table data, specified as a `Simulink.lookuptable.Table` object.

Copy Semantics

Handle. To learn how handle classes affect copy operations, see [Copying Objects](#).

Examples

Represent a One-Dimensional Lookup Table

- 1 Create a `Simulink.LookupTable` object named `LUTObj`.

```
LUTObj = Simulink.LookupTable;
```

- 2 Specify the table data.

```
LUTObj.Table.Value = [1.1 2.2 3.3 4.4 5.5];
```

- 3 Specify the breakpoint set data.

```
LUTObj.Breakpoints(1).Value = [-2 -1 0 1 2];
```

- 4 Specify a name for the structure type in the generated code.

```
LUTObj.StructTypeInfo.Name = 'myLUTStruct';
```

You can use `LUTObj` in a 1-D Lookup Table block dialog box. In the block, set **Data specification** to `Lookup table object` and **Name** to `LUTObj`.

To view the data, use the property dialog as described in “[Edit Lookup Table Data with Lookup Table Spreadsheet](#)”.

Represent a Two-Dimensional Lookup Table

- 1 Create a `Simulink.LookupTable` object named `LUTObj`.

```
LUTObj = Simulink.LookupTable;
```

- 2 Specify the table data.

```
LUTObj.Table.Value = [1.1 2.2 3.3 4.4 5.5; ...
                    6.6 7.7 8.8 9.9 10.1];
```

- 3 Specify the breakpoint set data. In the `Breakpoints` property, use the vector index 2 to set the values in the second breakpoint set.

```
LUTObj.Breakpoints(1).Value = [-1 1];
```

```
LUTObj.Breakpoints(2).Value = [-2 -1 0 1 2];
```

`LUTObj` creates a `Simulink.lookuptable.Breakpoint` object as the second vector element in the value of the `Breakpoints` property. Except for the `Value` property, the new object has default property values.

- 4 Specify a name for the structure type in the generated code.

```
LUTObj.StructTypeInfo.Name = 'myLUTStruct';
```

You can use `LUTObj` in a 2-D Lookup Table block dialog box.

To view the data, use the property dialog as described in “Edit Lookup Table Data with Lookup Table Spreadsheet”.

Evenly Space Every Second Value Starting from 1

To evenly space every second value starting from 1, use the `Breakpoint` object.

- 1 Create a `Simulink.LookupTable` object named `LUTObj`.

```
LUTObj=Simulink.LookupTable
```

```
LUTObj =
```

```
LookupTable with properties:
```

```

        Table: [1x1 Simulink.lookuptable.Table]
BreakpointsSpecification: 'Explicit values'
        Breakpoints: [1x1 Simulink.lookuptable.Breakpoint]
SupportTunableSize: 0
        CoderInfo: [1x1 Simulink.CoderInfo]
        StructTypeInfo: [1x1 Simulink.lookuptable.StructTypeInfo]
```

- 2 Set up the breakpoint property to even spacing.

```
LUTObj.BreakpointsSpecification='Even spacing'
```

```
LUTObj =
```

```
LookupTable with properties:
```

```

        Table: [1x1 Simulink.lookuptable.Table]
BreakpointsSpecification: 'Even spacing'
        Breakpoints: [1x1 Simulink.lookuptable.Evenspacing]
SupportTunableSize: 0
        CoderInfo: [1x1 Simulink.CoderInfo]
StructTypeInfo: [1x1 Simulink.lookuptable.StructTypeInfo]

```

3 Get the properties of the breakpoint.

```
LUTObj.Breakpoints(1)
```

```
ans =
```

```
Evenspacing with properties:
```

```

    FirstPoint: 0
      Spacing: 1
    DataType: 'auto'
         Min: []
         Max: []
         Unit: ''
FirstPointName: 'BPFirstPoint1'
  SpacingName: 'BPSpacing1'
TunableSizeName: 'N1'
  Description: ''

```

4 To set the first point property, use the Breakpoint object `FirstPoint` property.

```
LUTObj.Breakpoints(1).FirstPoint=1
```

5 To set the spacing property, use the Breakpoint object.

```
LUTObj.Breakpoints(1).Spacing=2
```

6 Get the properties of the breakpoint.

```
LUTObj.Breakpoints(1)
```

```
ans =
```

```
Evenspacing with properties:
```

```

    FirstPoint: 1
      Spacing: 2
    DataType: 'auto'
         Min: []
         Max: []
         Unit: ''
FirstPointName: 'BPFirstPoint1'
  SpacingName: 'BPSpacing1'
TunableSizeName: 'N1'
  Description: ''

```

Control Code Generation for Lookup Table and Breakpoint Sets

Create a `Simulink.LookupTable` object named `LUTObj`.

```
LUTObj = Simulink.LookupTable;
```

Specify the table data.

```
LUTObj.Table.Value = [1.00 2.25 3.50 4.75 6.00; ...
                    7.25 8.50 9.75 11.00 12.25];
```

Specify the breakpoint set data. In the Breakpoints property, use the array index 2 to create an additional Simulink.lookupable.BreakpointInfo object, which represents the second breakpoint set.

```
LUTObj.Breakpoints(1).Value = [-1 1];
```

```
LUTObj.Breakpoints(2).Value = [-2 -1 0 1 2];
```

Specify data types for the lookup table and each breakpoint set.

```
LUTObj.Table.DataType = 'fixdt(1,16,2)';
```

```
LUTObj.Breakpoints(1).DataType = 'int16';
```

```
LUTObj.Breakpoints(2).DataType = 'int16';
```

Specify unique names for the structure fields that store the table data and breakpoint sets in the generated code.

```
LUTObj.Table.FieldName = 'myTable';
```

```
LUTObj.Breakpoints(1).FieldName = 'myBPSet1';
```

```
LUTObj.Breakpoints(2).FieldName = 'myBPSet2';
```

Export the structure variable definition from the generated code by using the storage class ExportedGlobal.

```
LUTObj.CoderInfo.StorageClass = 'ExportedGlobal';
```

Name the structure type in the generated code LUTStructType. Export the structure type definition to a generated header file named myLUTHdr.h.

```
LUTObj.StructTypeInfo.Name = 'LUTStructType';
LUTObj.StructTypeInfo.DataScope = 'Exported';
LUTObj.StructTypeInfo.HeaderFileName = 'myLUTHdr.h';
```

In an n-D Lookup Table block in a model, set **Data specification** to Lookup table object and **Name** to LUTObj.

```
load_system('myModel_LUTObj')
set_param('myModel_LUTObj/Lookup Table', 'DataSpecification', 'Lookup table object', ...
         'LookupTableObject', 'LUTObj')
```

Generate code from the model.

```
slbuild('myModel_LUTObj')
```

```
### Starting build procedure for: myModel_LUTObj
### Generated code for 'myModel_LUTObj' is up to date because no structural, parameter or code re
### Successful completion of code generation for: myModel_LUTObj
```

Build Summary

```
0 of 1 models built (1 models already up to date)
Build duration: 0h 0m 2.141s
```

The generated code defines the structure type `LUTStructType` in the generated header file `myLUTHdr.h`.

```
file = fullfile('myModel_LUTObj_ert_rtw','myLUTHdr.h');
rtwdemodbtype(file,'typedef struct {' LUTStructType;',1,1)

typedef struct {
    int16_T myBPSet1[2];
    int16_T myBPSet2[5];
    int16_T myTable[10];
} LUTStructType;
```

The code uses the global structure variable `LUTObj` to store the table and breakpoint set data. The table data is scaled based on the specified fixed-point data type.

```
file = fullfile('myModel_LUTObj_ert_rtw','myModel_LUTObj.c');
rtwdemodbtype(file,'LUTStructType LUTObj = {' /* Variable: LUTObj',1,1)

LUTStructType LUTObj = {
    { -1, 1 },

    { -2, -1, 0, 1, 2 },

    { 4, 29, 9, 34, 14, 39, 19, 44, 24, 49 }
} ; /* Variable: LUTObj
```

Limitations

When blocks in a subsystem use `Simulink.LookupTable` or `Simulink.Breakpoint` objects, you cannot set data type override only on the subsystem. Instead, set data type override on the entire model.

Introduced in R2016b

Simulink.lookuptable.Breakpoint class

Package: Simulink.lookuptable

Configure breakpoint set data for lookup table object

Description

An object of the Simulink.lookuptable.Breakpoint class stores breakpoint set information for a lookup table. The object resides in the Breakpoints property of a Simulink.LookupTable object or Simulink.Breakpoint object.

You can use Simulink.LookupTable and Simulink.Breakpoint objects to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

To represent multiple breakpoint sets for a multidimensional lookup table, store a vector of Simulink.lookuptable.Breakpoint objects in the Breakpoints property of a Simulink.LookupTable object.

To share a breakpoint set between multiple lookup tables, use a Simulink.Breakpoint object to store and configure the breakpoint set information. Use the object in a Prelookup block and create Simulink.LookupTable objects to use in Interpolation Using Prelookup blocks.

Construction

When you create a Simulink.LookupTable object or Simulink.Breakpoint object, a Simulink.lookuptable.Breakpoint object appears as the value of the Breakpoints property.

To create more Simulink.lookuptable.Breakpoint objects for a Simulink.LookupTable object, use this technique:

Access the Breakpoints property by specifying a vector index.

To create a Simulink.lookuptable.Breakpoint object, you can set the value of any of the object properties. The Simulink.LookupTable object creates the Simulink.lookuptable.Breakpoint object with default property values, and sets the property that you specified.

The value of the Breakpoints property is an array of Simulink.lookuptable.Breakpoint objects. Each embedded object represents one breakpoint set.

For example, suppose that you create a Simulink.LookupTable object named LUTObj. To create more breakpoint sets, access the Breakpoints property by specifying vector indices:

```
LUTObj.Breakpoints(1).Value = [-1 1];  
LUTObj.Breakpoints(2).Value = [-2 -1 0 1 2];  
LUTObj.Breakpoints(3).Value = [-5 -3 0 3 5];
```

The object LUTObj creates additional Simulink.lookuptable.Breakpoint objects and sets the Value property of each object. LUTObj now stores information for three breakpoint sets.

Properties

Data Type — Data type of breakpoint set elements

'auto' (default) | character vector

Data type of breakpoint set elements, specified as a character vector. You can explicitly specify an integer, half data type, a floating-point, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

The default value, 'auto', means that the breakpoint set acquires a data type from the value that you specify in the `Value` property. If you use an untyped expression such as `[1 2 3]` to set `Value`, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint data use the data type specified by the expression or object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Example: 'int16'

Example: 'myTypeAlias'

Data Types: char

Description — Description of breakpoint set

' ' (default) | character vector

Description of the breakpoint set, specified as a character vector.

Example: 'This breakpoint set represents the pressure input.'

Data Types: char

Dimensions — Dimension lengths of breakpoint set

[0 0] (default) | numeric vector

Dimension lengths of the breakpoint set, returned as a numeric vector or specified as a character vector.

To use symbolic dimensions, specify a character vector.

FieldName — Name of structure field that stores breakpoint set data

'BP' (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the breakpoint set data.

The code generator uses this property only under these circumstances, which cause the breakpoint data to appear in the generated code as a structure field:

- The `Simulink.lookupable.Breakpoint` object exists in a `Simulink.LookupTable` object and in the `Simulink.LookupTable` object you set `BreakpointsSpecification` to 'Explicit values'.
- The `Simulink.lookupable.Breakpoint` object exists in a `Simulink.Breakpoint` object and in the `Simulink.Breakpoint` object you set `SupportTunableSize` to true.

Example: 'MyBkptSet1'

Data Types: char

Max — Maximum value of breakpoint set elements

[] (default) | numeric double value

Maximum value of the elements of the breakpoint set, specified as a numeric, real value of the data type double.

Example: 17.23

Data Types: double

Min — Minimum value of breakpoint set elements

[] (default) | numeric double value

Minimum value of the elements of the breakpoint set, specified as a numeric, real value of the data type double.

Example: -52.6

Data Types: double

TunableSizeName — Name of structure field that stores length of breakpoint set

'N' (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the length of the breakpoint set, which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory.

The code generator uses this property only under these circumstances, which enable a tunable table size in the generated code:

- The `Simulink.lookuptable.Breakpoint` object exists in a `Simulink.LookupTable` object and in the `Simulink.LookupTable` object you set:
 - `BreakpointsSpecification` to 'Explicit values'.
 - `SupportTunableSize` to true.
- The `Simulink.lookuptable.Breakpoint` object exists in a `Simulink.Breakpoint` object and in the `Simulink.Breakpoint` object you set `SupportTunableSize` to true.

Example: 'LengthForDim1'

Data Types: char

Unit — Physical unit of breakpoint set

' ' (default) | character vector

Physical unit of the elements of the breakpoint set, specified as a character vector.

Example: 'inches'

Data Types: char

Value — Breakpoint set data

[] (default) | numeric vector

The breakpoint set data, specified as a numeric vector with at least two elements. To control the data type of the breakpoint set, use the `DataType` property of the `Simulink.lookupable.Breakpoint` object.

When you set `DataType` to 'auto', to set the `Value` property, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

Example: `[10 20 30]`

Data Types: `single` | `double` | `half` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fi`

Copy Semantics

[Simulink.LookupTable](#) | [Simulink.Breakpoint](#)

Introduced in R2016b

Simulink.lookupable.Evenspacing class

Package: Simulink.lookupable

Configure even spacing set data for lookup table object

Description

An object of the Simulink.lookupable.Evenspacing class stores event spacing set information for a lookup table. The object resides in the Evenspacing property of a Simulink.LookupTable object.

You can use Simulink.LookupTable objects to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

To represent multiple breakpoint sets for a multidimensional lookup table, store a vector of Simulink.lookupable.Evenspacing objects in the Evenspacing property of a Simulink.LookupTable object.

Construction

When you create a Simulink.LookupTable object and set BreakpointSpecification to 'Even spacing', a Simulink.lookupable.Evenspacing object appears as the value of the Breakpoints property.

To create more Simulink.lookupable.Evenspacing objects for a Simulink.LookupTable object, use this technique:

Access the Breakpoints property by specifying a vector index.

To create a Simulink.lookupable.Evenspacing object, you can set the value of any of the object properties. The Simulink.LookupTable object creates the Simulink.lookupable.Evenspacing object with default property values, and sets the property that you specified.

The value of the Breakpoints property is an array of Simulink.lookupable.Evenspacing objects. Each embedded object represents one breakpoint set.

For example, suppose that you create a Simulink.LookupTable object named myLUTObj. To create more breakpoint sets, access the Breakpoints property by specifying scalar indices for FirstPoint and Spacing properties. To create more even spacing breakpoint sets, update the object with this pair of properties:

```
LUTObj.Breakpoints(1).FirstPoint=-1;
LUTObj.Breakpoints(1).Spacing=2;
LUTObj.Breakpoints(1).FirstPoint=-2;
LUTObj.Breakpoints(1).Spacing=1;
LUTObj.Breakpoints(1).FirstPoint=-5;
LUTObj.Breakpoints(1).Spacing=2;
```

The object `myLUTObj` creates additional `Simulink.lookupable.Evenspacing` objects and sets the `FirstPoint` and `Spacing` properties of each object. `LUTObj` now stores information for three breakpoint sets.

Properties

FirstPoint — First point in evenly spaced breakpoint data

[] (default) | numeric scalar

First point in evenly spaced breakpoint data, specified as a numeric scalar. To control the data type of the breakpoint set, use the `DataType` property of the `Simulink.lookupable.Evenspacing` object.

When you set `DataType` to 'auto', to set the `FirstPoint` property, use a typed expression such as `single(1)` or use the `fi` constructor to embed a `fi` object.

Example: -1

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fi`

Spacing — Spacing between points in evenly spaced breakpoint data

[] (default) | numeric, positive, monotonically increasing scalar

Spacing between points in evenly spaced breakpoint data, specified as a numeric scalar. To control the data type of the breakpoint set, use the `DataType` property of the `Simulink.lookupable.Evenspacing` object.

When you set `DataType` to 'auto', to set the `Spacing` property, use a typed expression such as `single(1)` or use the `fi` constructor to embed an `fi` object.

Example: -1

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fi`

DataType — Data type of breakpoint set elements

'auto' (default) | character vector

Data type of breakpoint set elements, specified as a character vector. You can explicitly specify an integer, a floating-point, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

The default value, 'auto', means that the breakpoint set acquires a data type from the value that you specify in the `Value` property. If you use an untyped expression such as `[1 2 3]` to set `Value`, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint data use the data type specified by the expression or object.

For more information about data types in Simulink, see "Data Types Supported by Simulink". To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see "Control Data Types of Lookup Table Objects" (Simulink Coder).

Example: 'int16'

Example: 'myTypeAlias'

Data Types: `char`

Min — Minimum value of breakpoint set elements

[] (default) | numeric double value

Minimum value of the elements of the breakpoint set, specified as a numeric, real value of the data type `double`.

Example: `-52.6`

Data Types: `double`

Max — Maximum value of breakpoint set elements

[] (default) | numeric double value

Maximum value of the elements of the breakpoint set, specified as a numeric, real value of the data type `double`.

Example: `17.23`

Data Types: `double`

Unit — Physical unit of breakpoint set

' ' (default) | character vector

Physical unit of the elements of the breakpoint set, specified as a character vector.

Example: `'inches'`

Data Types: `char`

FirstPointName — Name of the Simulink.LookupTable.Evenspacing object that stores the information for the first point

'BPFIRSTPOINT1' (default) | character vector

Name of the `Simulink.Breakpoint` object that stores the information for the first point, specified as a character vector. Generated code uses this name to display the first point.

Example: `'myFirstPointName'`

Data Types: `char`

SpacingName — Name of the Simulink.LookupTable.Evenspacing object that stores the information for the spacing

'auto' (default) | character vector

Name of the `Simulink.Breakpoint` object that stores the information for the spacing, specified as a character vector. Generated code uses this name to display the spacing.

Example: `'mySpacing'`

Data Types: `char`

TunableSizeName — Name of structure field that stores length of breakpoint set

'N' (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the length of the breakpoint set, which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory.

The code generator uses the property only under these circumstances, which enable a tunable table size in the generated code:

- The `Simulink.lookupable.Evenspacing` object exists in a `Simulink.LookupTable` object, in which you set `BreakpointsSpecification` to `'Even spacing'` and `SupportTunableSize` to `true`.

Example: `'LengthForDim1'`

Data Types: `char`

Description — Description of breakpoint set

`''` (default) | `character vector`

Description of the breakpoint set, specified as a character vector.

Example: `'This breakpoint set represents the pressure input.'`

Data Types: `char`

Copy Semantics

`Simulink.LookupTable` | `Simulink.lookupable.Breakpoint`

Introduced in R2017b

Simulink.lookupable.StructTypeInfo class

Package: Simulink.lookupable

Configure settings for structure type that lookup table object uses in the generated code

Description

An object of the `Simulink.lookupable.StructTypeInfo` class controls the structure type that the generated code creates to store data for lookup table objects. The `Simulink.lookupable.StructTypeInfo` object resides in the `StructTypeInfo` property of a `Simulink.LookupTable` object or `Simulink.Breakpoint` object. Use these parent objects to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

A `Simulink.LookupTable` object appears as a structure in the generated code when you set the `Specification` property to 'Explicit values'. A `Simulink.Breakpoint` object appears as a structure in the generated code when you set the `SupportTunableSize` property to true.

Construction

When you create a `Simulink.LookupTable` or `Simulink.Breakpoint` object, a `Simulink.lookupable.StructTypeInfo` object appears as the value of the `StructTypeInfo` property.

Properties

DataScope — Scope of structure type definition

'Auto' (default) | 'Exported' | 'Imported'

Scope of structure type definition, specified as a character vector.

Data Types: char

HeaderFileName — Name of header file that contains structure type definition

' ' (default) | character vector

Name of the header file that contains the structure type definition, specified as a character vector.

Example: 'myHdr.h'

Data Types: char

Name — Name of structure type

' ' (default) | character vector

Name of the structure type, specified as a character vector.

Data Types: char

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects.

`Simulink.LookupTable` | `Simulink.Breakpoint`

Introduced in R2016b

Simulink.lookuptable.Table class

Package: Simulink.lookuptable

Configure table data for lookup table object

Description

An object of the Simulink.lookuptable.Table class stores table information for a lookup table. The object resides in the Table property of a Simulink.LookupTable object. You can use the Simulink.LookupTable object to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

Construction

When you create a Simulink.LookupTable object, a Simulink.lookuptable.Table object appears as the value of the Table property.

Properties

Data Type — Data type of table data elements

'auto' (default) | character vector

Data type of the table data elements, specified as a character vector. You can explicitly specify an integer data type, half data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a Simulink.AliasType object.

The default value, 'auto', means that the table data acquire a data type from the value that you specify in the Value property. If you use an untyped expression such as [1 2 3] to set Value, the table data use the data type double. If you specify a typed expression such as single([1 2 3]) or an fi object, the table data use the data type specified by the expression or object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in Simulink.LookupTable and Simulink.Breakpoint objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Example: 'int16'

Example: 'myTypeAlias'

Data Types: char

Description — Description of table data

' ' (default) | character vector

Description of the table data, specified as a character vector.

Example: 'This lookup table describes the action of a pump.'

Data Types: char

Dimensions — Dimension lengths of table data

[0 0] (default) | numeric vector

Dimension lengths of the table data, returned as a numeric vector or specified as a character vector.

To use symbolic dimensions, specify a character vector.

FieldName — Name of a structure field in the generated code

'Table' (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the table data if you configure the `Simulink.LookupTable` object to appear in the generated code as a structure.

Example: 'MyPumpTable'

Data Types: char

Max — Maximum value of table data elements

[] (default) | numeric double value

Maximum value of the elements of the table data, specified as a numeric, real value of the data type `double`.

Example: 17.23

Data Types: double

Min — Minimum value of table data elements

[] (default) | numeric double value

Minimum value of the elements of the table data, specified as a numeric, real value of the data type `double`.

Example: -52.6

Data Types: double

Unit — Physical unit of table elements

' ' (default) | character vector

Physical unit of the elements of the table data, specified as a character vector.

Example: 'degC'

Data Types: char

Value — Table data

[] (default) | numeric vector or multidimensional array

The table data, specified as a numeric vector or multidimensional array with at least two elements. To control the data type of the table data, use the `DataType` property of the `Simulink.lookupable.Table` object.

When you set `DataType` to 'auto', to set the `Value` property, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

Example: [10 20 30; 40 50 60]

Data Types: single | double | half | int8 | int16 | int32 | uint8 | uint16 | uint32 | fi

`Simulink.LookupTable` | `Simulink.Breakpoint`

Introduced in R2016b

Simulink.Mask class

Package: Simulink

Control masks programmatically

Description

Use an instance of `Simulink.Mask` class to perform the following operations:

- Create, copy, and delete masks.
- Create, edit, and delete mask parameters.
- Determine the block that owns the mask.
- Obtain workspace variables defined for a mask.

Properties

Type

Specifies the mask type of the associated block.

Type: character vector | string scalar

Default: Empty character vector

Description

Specifies the block description of the associated block.

Type: character vector | string scalar

Default: Empty character vector

Help

Specifies the help text that is displayed for the mask.

Type: character vector | string scalar

Default: Empty character vector

Initialization

Specifies the initialization commands for the associated block.

Type: character vector | string scalar

Default: Empty character vector

SelfModifiable

Indicates that the block can modify itself and its content.

Type: boolean

Values: 'on' | 'off'

Default: 'off'

Display

Specifies MATLAB code for drawing the block icon.

Type: character vector | string scalar

Default: Empty character vector

IconFrame

Sets the visibility of the block frame. (Visible is on, Invisible is off).

Type: boolean

Values: 'on' | 'off'

Default: 'on'

IconOpaque

Sets the transparency of the icon (Opaque is on, Transparent is off).

Type: boolean

Values: 'on' | 'off'

Default: 'on'

RunInitForIconRedraw

Specifies whether Simulink must run mask initialization before executing the mask icon commands.

Type: enum

Values: 'auto' | 'on' | 'off'

Default: 'auto'

IconRotate

Sets icon to rotate with the block.

Type: enum

Values: 'none' | 'port'

Default: 'none'

PortRotate

Specifies the port rotation policy for the masked block.

Type: enum

Values: 'default' | 'physical'

Default: 'default'

IconUnits

Specifies the units for the drawing commands.

Type: enum

Values: 'pixels' | 'autoscale' | 'normalized'

Default: 'autoscale'

Methods

<code>addCrossParameterConstraint</code>	Add cross-parameter constraint
<code>addDialogControl</code>	Add dialog control elements to mask dialog box
<code>addParameter</code>	Add a parameter to a mask
<code>addParameterConstraint</code>	Add parameter constraint to a mask
<code>copy</code>	Copy a mask from one block to another
<code>create</code>	Create a mask on a Simulink block
<code>delete</code>	Unmask a block and delete the mask from memory
<code>get</code>	Get a block mask as a mask object
<code>getAssociatedParametersOfConstraint</code>	Get mask parameters associated with a constraint
<code>getCrossParameterConstraint</code>	Get cross-parameter constraint
<code>getDialogControl</code>	Search for a specific dialog control on the mask
<code>getOwner</code>	Determine the block that owns a mask
<code>getParameter</code>	Get a mask parameter using its name
<code>getParameterConstraint</code>	Get mask parameter constraint properties
<code>getWorkspaceVariables</code>	Get all the variables defined in the mask workspace for a masked block
<code>numParameters</code>	Determine the number of parameters in a mask
<code>removeAllCrossParameterConstraints</code>	Delete all cross-parameter constraints from a mask
<code>removeAllParameterConstraints</code>	Delete all mask parameter constraints
<code>removeAllParameters</code>	Remove all existing parameters from a mask
<code>removeCrossParameterConstraint</code>	Delete a cross-parameter constraint
<code>removeDialogControl</code>	Remove dialog control element from mask dialog box
<code>removeParameter</code>	Remove parameter from mask dialog box
<code>removeParameterConstraint</code>	Delete a mask parameter constraint
<code>set</code>	Set the properties of an existing mask

“Create Block Masks”

addCrossParameterConstraint

Class: Simulink.Mask

Package: Simulink

Add cross-parameter constraint

Syntax

```
CrossConstraint = maskObj.addCrossParameterConstraint(Name,Value)
```

Description

`CrossConstraint = maskObj.addCrossParameterConstraint(Name,Value)` adds a constraint among parameters of a mask.

Input Arguments

maskObj — Block mask handle

mask object

Block mask handle, specified as a mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: `char` | `cell`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Name — Cross-parameter constraint name

character vector | string

Cross-parameter constraint name, specified as a character vector. Must be a valid MATLAB value.

Rule — Cross-parameter constraint rule

MATLAB expression | string

Cross-parameter constraint rule, specified as a valid MATLAB expression that returns logical true or false. You can specify multiple rules by separating them with a logical operators like `&&`. For example, `parameter1 > parameter2 && parameter2 > parameter3`. Here, `parameter1`, `parameter2` and `parameter3` are parameters of a mask.

ErrorMessage — Error message

character vector | string

Optional field. Specifies the error message to be displayed when the cross parameter constraint rule is not satisfied. You can specify the error message as character vector or as a message catalog ID. If you use the message catalog ID to specify an error, the error message must not have any holes in it. Simulink displays a default error message if no user-defined error message is found.

Output Arguments

CrossConstraint — Cross parameter constraint

cell array

Handle to the cross-parameter constraint, returned as a cell array.

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcb);  
  
% Add cross parameter constraint.  
CrossConstraint = maskObj.addCrossParameterConstraint('Name','crossconstraint1',...  
'MATLABexpression','upperbound > lowerbound','ErrorMessage','Incorrect value specified.')
```

ans =

```
    CrossParameterConstraints with properties:  
        Name: 'crossconstraint1'  
MATLABexpression: 'upperbound > lowerbound'  
        ErrorMessage: 'Incorrect value specified.'
```

[Simulink.Mask](#) | “Create Block Masks”

Introduced in R2018a

addDialogControl

Class: Simulink.Mask

Package: Simulink

Add dialog control elements to mask dialog box

Syntax

```
successIndicator = maskObj.addDialogControl(controlType,controlIdentifier)
successIndicator = maskObj.addDialogControl(Name,Value)
```

Description

`successIndicator = maskObj.addDialogControl(controlType,controlIdentifier)` adds dialog control elements like text, hyperlinks, or tabs to mask dialog box. First get the mask object and assign it to the variable `maskObj`

`successIndicator = maskObj.addDialogControl(Name,Value)` specifies the `Name` and `Value` arguments for an element on the mask dialog box. You can specify multiple `Name-Value` pairs.

Input Arguments

controlType — Value type of dialog control element

character vector | string scalar

Type of dialog control element, specified

- 'panel'
- 'group'
- 'tabcontainer'
- 'tab'
- 'collapsiblepanel'
- 'text'
- 'image'
- 'hyperlink'
- 'pushbutton'

controlIdentifier — Unique identifier for the element

character vector | string scalar

Specifies the programmatic identifier for the element of mask dialog box. Use a name that is unique and does not have space between words. For more information, see “Variable Names”.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' ') and is case-sensitive.

You can specify several name and value pair arguments in any order as Name1, Value1, . . . , NameN, ValueN.

Type

Type of control that is used to specify the value of this dialog control element. Type is a required argument. The permitted values are 'panel', 'group', 'tabcontainer', 'tab', 'collapsiblepanel', 'text', 'image', 'hyperlink', and 'pushbutton'.

Default: empty

Name

The identifier of the dialog control element. Name is a required argument. This field is available for all dialog control types.

Default: empty

Prompt

Text that is displayed in the dialog control element on the Mask dialog box. This field is available for all except for panel and image dialog control types.

Default: empty

Tooltip

Tooltip for the dialog control element.

Default: empty

Enabled

Option to specify whether you can set value for the dialog control element. This field is available for all dialog control types.

Default: 'on'

Visible

Option to set whether the dialog control element is hidden or visible to the user. This field is available for all dialog control types.

Default: 'on'

Callback

Container for MATLAB code that executes when you edit the dialog control element and click **Apply**. This field is available only for the hyperlink and pushbutton dialog control types.

Default: empty

Row

Option to set whether the dialog control is placed in the new row or the same row. This field is available for all dialog control types.

Default: empty

Filepath

Contains the path to an image file. This field is available for image, and pushbutton dialog control types.

Default: empty

Container

Option to specify a container for the child dialog control. The permitted values are the names of 'panel', 'group', and 'tab' dialog controls.

Examples Add Dialog Control Elements to Mask Dialog Box

Get mask object and add dialog control element to it.

```
% Get mask object on model Engine
new_system('Engine');
add_block('built-in/gain','Engine/gain');
save_system;
open_system('Engine');
maskObj = Simulink.Mask.create(gcf);
maskObj = Simulink.Mask.get(gcf);
save_system;
% Add hyperlink to mask dialog box

maskLink = maskObj.addDialogControl('hyperlink','link');
maskLink.Prompt = 'Mathworks Home Page';
maskLink.Callback = 'web(''www.mathworks.com'')'

maskLink =
    Hyperlink with properties:
        Name: 'link'
        Prompt: 'Mathworks Home Page'
        Callback: 'web(''www.mathworks.com'')'
        Row: 'new'
        Enabled: 'on'
        Visible: 'on'
        HorizontalStretch: 'on'
        Tooltip: ''

% Add text to mask dialog box
maskText = maskObj.addDialogControl('text','text_tag');
maskText.Prompt = 'Enable range checking';

% Add button to mask dialog box
maskButton = maskObj.addDialogControl('pushbutton','button_tag');
maskButton.Prompt = 'Compute';
save_system;
```

Add Dialog Control Elements to Mask Dialog Box Tabs

Create tabs on the mask dialog box and add elements to these tabs.

```
% Get mask object on a block named 'GainBlock'
add_block('built-in/gain','Engine/gain1');
maskObj = Simulink.Mask.create(gcf);
maskObj = Simulink.Mask.get(gcf);

% Create a tab container

maskObj.addDialogControl('tabcontainer','allTabs');
tabs = maskObj.getDialogControl('allTabs');

% Create tabs and name them

maskTab1 = tabs.addDialogControl('tab','First');
maskTab1.Prompt = 'First tab';

maskTab2 = tabs.addDialogControl('tab','Second');
maskTab2.Prompt = 'Second tab';

% Add elements to one of the tabs

firstTab = tabs.getDialogControl('First');
firstTab.addDialogControl('text','textOnFirst');
firstTab.getDialogControl('textOnFirst').Prompt = 'Tab one';
save_system;
```

Add Dialog Control Element Using Name-Value Pair

Add dialog control element and specify values for it.

```
% Get mask object on model Engine

add_block('built-in/gain','Engine/gain2');
maskObj = Simulink.Mask.create(gcf);
maskObj = Simulink.Mask.get(gcf);

% Add a dialog box and specify values for it

maskDialog = maskObj.addDialogControl('Name','abc','Type','text','Prompt','hello','Visible','off');
save_system;
```

[Simulink.Mask](#) | “Create Block Masks” | [Control Masks Programmatically](#)

Introduced in R2014a

addParameter

Class: Simulink.Mask

Package: Simulink

Add a parameter to a mask

Syntax

```
p = Simulink.Mask.get(blockName)
p.addParameter(Name, Value)
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.addParameter(Name, Value)` appends a parameter to the mask. If you do not specify name-value pairs as arguments with this command, Simulink generates name for the mask parameter with control type set to edit.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, . . . , NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Type — Type of control that specifies the value of the parameter

Type of control that is used to specify the value of this parameter. The permitted values are: edit, checkbox, popup, combobox, listbox, radiobutton, slider, dial, spinbox, unit, textarea, breakpoint, customtable, tree, unit, min, max.

TypeOptions — Options that are displayed within a popup control or in a promoted parameter

The options that are displayed within a popup control or in a promoted parameter. This field is a cell array.

Name — Name of the mask parameter

The name of the mask parameter. This name is assigned to the mask workspace variable created for this parameter.

Prompt — Text that identifies the parameter on the mask parameter dialog box

Text that identifies the parameter on the Mask Parameters dialog box.

Value — Default value of the Mask Parameter on the mask parameter dialog box

The default value of the mask parameter in the Mask Parameters dialog box. Type specific; depends on the Type of the parameter

Evaluate — Option to specify whether to evaluate the parameter

(default) | on

Option to specify whether parameter must be evaluated.

Tunable — Option to specify whether parameter is tunable

(default) | on

Option to specify whether parameter is tunable.

Enabled — Option to specify whether user can set parameter value

(default) | on

Option to specify whether user can set parameter value.

Visible — Set the visibility of the mask parameter

(default) | on

Option to set whether mask parameter is hidden or visible to the user.

Callback — Set the MATLAB code that need to be executed when there is a change in the mask parameter dialog box

(default) | empty

Container for MATLAB code that executes when user makes a change in the Mask Parameters dialog box.

Container — Set this option to specify a container for the child parameters

(default) | empty

Option to specify a container for the child parameters. The permitted values are the names of 'panel', 'group', and 'tab'.

ExamplesAdd Popup Parameter

Step 1: Get mask as an object using a masked block's path.

```
new_system('paramexample');  
add_block('built-in/subsystem', 'paramexample/subsystem');  
save_system;  
open_system('paramexample');  
p= Simulink.Mask.create(gcb);  
p= Simulink.Mask.get(gcb);
```

Step 2: Add a parameter to the mask without specifying name-value pairs for parameter attributes.

```
p.addParameter;
```

Step 3: Add a mask parameter of type popup that cannot be evaluated.

```
p.addParameter('Type','popup','TypeOptions',{'Red' 'Blue' 'Green'},'Evaluate','off');  
save_system;
```

See Also

[Simulink.Mask](#) | “Create Block Masks”

addParameterConstraint

Class: Simulink.Mask

Package: Simulink

Add parameter constraint to a mask

Syntax

```
paramConstraint = maskObj.addParameterConstraint(Name,Value)
```

Description

`paramConstraint = maskObj.addParameterConstraint(Name,Value)` adds a constraint to the specified mask. Constraints can only be associated to the **Edit** type mask parameters.

Input Arguments

maskObj — Block mask handle

mask object

Block mask handle, specified as a mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`

Data Types: char | cell

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name, Value` arguments. `Name` is the argument name and `Value` is the corresponding value. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Name — Mask constraint name

character vector | string

Required field. Must be a valid MATLAB name. Specifies a name for the mask parameter constraint.

Parameters — Mask parameter name

cell array of character vector | string

Optional field. Specifies the **Edit** mask parameter name to which you want to associate the constraint.

Rules — Rule for mask parameter constraint

Data Type | Dimension | Complexity | Sign | Finiteness | Minimum | Maximum | CustomConstraint

Required field. Rules are defined within curly braces. A constraint can have single or multiple rules.

Name-Value Pairs for Rules

Name	Value
DataType	double, single, numeric, integer, int8, uint8, int16, uint16, int32, uint32, boolean, enum, fixdt
Dimension	scalar, rowvector, columnvector, 2dmatrix, ndmatrix
Complexity	real, complex
Sign	positive, negative, zero
Finiteness	finite, inf, -inf, NaN
Minimum	character vector
Maximum	character vector
CustomConstraint	Valid MATLAB expression returning logical true or false.
CustomErrorMessage	character vector or a message catalog ID. If you use the message catalog ID to specify an error, the error message must not have any holes in it. This error message is specifically for custom constraint validation failure.

Output Arguments

paramConstraint — Mask parameter constraint

character vector | string

Handle to the mask parameter constraint, returned as a character vector. You can associate a constraint to the mask parameter either during or after creating the constraint.

Examples

Create Mask Constraint with Single Rule

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Create mask constraint with single rule.
paramConstraint = maskObj.addParameterConstraint('Name','const2',...
'Parameters',{'Parameter2'}, 'Rules', {'DataType', 'uint8'})
```

ans =

Constraints with properties:

```
      Name: 'const2'
ConstraintRules: [1x1 Simulink.Mask.ParameterConstraintRules]
```

Create Mask Constraint with Multiple Rules

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);
```

```
% Create mask constraint with multiple rules.  
paramConstraint = maskObj.addParameterConstraint('Name','const3',...  
'Parameters',{'Parameter3'}, 'Rules', {{'DataType', 'uint8'},{'DataType', {'fixdt(1,8,4)'}}})
```

```
ans =
```

```
Constraints with properties:
```

```
      Name: 'const3'  
ConstraintRules: [1x2 Simulink.Mask.ParameterConstraintRules]
```

[Simulink.Mask](#) | “Create Block Masks”

Introduced in R2018a

Simulink.Mask.copy

Class: Simulink.Mask

Package: Simulink

Copy a mask from one block to another

Syntax

```
pSource = Simulink.Mask.get(srcBlockName)
pDest = Simulink.Mask.create(destBlockName)
pDest.copy(pSource)
```

Description

`pSource = Simulink.Mask.get(srcBlockName)` gets the mask on the source block specified by `blockName` as a mask object.

`pDest = Simulink.Mask.create(destBlockName)` creates an empty mask on the destination block specified by `destBlockName`.

`pDest.copy(pSource)` overwrites the destination mask with the source mask.

Input Arguments

`srcBlockName`

The handle to the source block or the path to the source block inside the model.

Note The source block should be masked.

`destBlockName`

The handle to the destination block or the path to the destination block inside the model.

Note The destination block should have an empty mask. Otherwise, the copied mask will overwrite the non-empty mask.

Examples

- 1 Create an empty mask on the destination block using the block's path.

```
pDest = Simulink.Mask.create('myModel/Subsystem');
```

- 2 Get source mask as an object using the source block's path.

```
pSource = Simulink.Mask.get('myModel/Abs');
```

- 3 Make the destination mask a copy of the source mask.

```
pDest.copy(pSource);
```

Simulink.Mask | “Create Block Masks”

Simulink.Mask.create

Class: Simulink.Mask

Package: Simulink

Create a mask on a Simulink block

Syntax

```
p = Simulink.Mask.create(blockName)
```

Description

`p = Simulink.Mask.create(blockName)` creates an empty mask on the block specified by `blockName`. If the specified block is already masked, an error message appears.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Examples

- 1 Create a mask using a block's handle.

Note In the model, select the block to be masked.

```
p = Simulink.Mask.create(gcbh);
```

- 2 Create a mask using the block's path.

```
p = Simulink.Mask.create('myModel/Subsystem');
```

See Also

Simulink.Mask | "Create Block Masks"

delete

Class: Simulink.Mask

Package: Simulink

Unmask a block and delete the mask from memory

Syntax

```
p = Simulink.Mask.get(blockName)
p.delete
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.delete` unmask the block and deletes the mask from memory.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```
- 2 Unmask the block using the mask object and delete the mask from memory.

```
p.delete;
```

`Simulink.Mask` | "Create Block Masks"

Simulink.Mask.get

Class: Simulink.Mask

Package: Simulink

Get a block mask as a mask object

Syntax

```
p = Simulink.Mask.get(blockName)
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object. If the specified block is not masked, a null value returns.

Input Arguments

`blockName`

The handle to the block or the path to the block inside the model.

Examples

- 1 Get mask as an object using a masked block's handle.

Note In the model, select the masked block.

```
p = Simulink.Mask.get(gcbh);
```

- 2 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

Simulink.Mask | "Create Block Masks"

getAssociatedParametersOfConstraint

Class: Simulink.Mask

Package: Simulink

Get mask parameters associated with a constraint

Syntax

```
maskParam = maskObj.getAssociatedParametersOfConstraint(paramConstraintName)
```

Description

`maskParam = maskObj.getAssociatedParametersOfConstraint(paramConstraintName)` gets the parameters that are associated with a mask constraint.

Input Arguments

maskObj — Block mask handle

mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: char | cell

paramConstraintName — Mask constraint name

character vector | string

Name of the constraint for which you want to find the associated mask parameters, specified as character vector.

Output Arguments

maskParam — Mask parameter name

cell array of character vector

Mask parameter, specified as a cell array.

Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Find parameters associated with the constraint.
maskParam = maskObj.getAssociatedParametersOfConstraint('const3')

ans =

    1×1 cell array
```

```
{'Parameter1'}
```

See Also

[Simulink.Mask](#) | “Create Block Masks”

Introduced in R2018a

getCrossParameterConstraint

Class: Simulink.Mask

Package: Simulink

Get cross-parameter constraint

Syntax

```
CrossConstraint = maskObj.getCrossParameterConstraint(CrossConstraintName)
```

Description

`CrossConstraint = maskObj.getCrossParameterConstraint(CrossConstraintName)` gets the properties of a cross parameter constraint on a mask. Apply a cross-parameter constraint to specify rules between mask parameter values.

Input Arguments

maskObj — Block mask handle

mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: `char` | `cell`

CrossConstraintName — Cross-constraint name

character vector | string

Name of the cross-parameter constraint for which you get the constraint properties, specified as the mask object.

Output Arguments

CrossConstraint — Cross-constraint property

cell array

Cross-parameter constraint properties, returned as a cell array.

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcb);  
  
% Get cross constraint.  
CrossConstraint = maskObj.getCrossParameterConstraint('crossparam1')  
  
ans =
```

```
CrossParameterConstraints with properties:  
    Name: 'crossparam1'  
    Rule: 'Parameter2 > Parameter3'  
    ErrorMessage: ''
```

getDialogControl

Class: Simulink.Mask

Package: Simulink

Search for a specific dialog control on the mask

Syntax

```
[control, phandle] = handle.getDialogControl(cname)
```

Description

`[control, phandle] = handle.getDialogControl(cname)` , search for a specific child dialog control recursively on the mask dialog.

Input Arguments

cname

Name of the dialog control being searched on the mask dialog.

Default:

Output Arguments

control

Target dialog control being searched on the mask dialog.

phandle

Parent of the dialog control being searched mask dialog.

Examples

Find a dialog control

Find a text dialog control on the mask dialog box. `maskObj` is the handle to the mask object. The `getDialogControl` method returns the handle to the dialog control (`hdlgctrl`) and handle to the parent dialog control (`phandle`).

```
[hdlgctrl, phandle] = maskObj.getDialogControl('txt_var')
```

`Simulink.Mask` | “Create Block Masks”

getOwner

Class: Simulink.Mask

Package: Simulink

Determine the block that owns a mask

Syntax

```
p = Simulink.Mask.get(blockName)
p.getOwner
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.getOwner` returns the interface to the block that owns the mask.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Get the interface to the block that owns the mask.

```
p.getOwner;
```

`Simulink.Mask` | "Create Block Masks"

getParameter

Class: Simulink.Mask

Package: Simulink

Get a mask parameter using its name

Syntax

```
p = Simulink.Mask.get(blockName)
param = p.getParameter(paramName)
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`param = p.getParameter(paramName)` returns an array of mask parameters.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

paramName

The name of the parameter you want to get.

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Get a mask parameter by using its name.

```
param = p.getParameter('intercept');
```

`Simulink.Mask` | "Create Block Masks"

getParameterConstraint

Class: Simulink.Mask

Package: Simulink

Get mask parameter constraint properties

Syntax

```
paramConstraint = maskObj.getParameterConstraint(paramConstraintName)
```

Description

`paramConstraint = maskObj.getParameterConstraint(paramConstraintName)` gets the properties of a mask parameter constraint.

Input Arguments

maskObj — Block mask handle

mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: char | cell

paramConstraintName — Mask constraint name

character vector | string

Name of the constraint of which you want get the properties, specified as character vector.

Output Arguments

paramConstraint — Mask constraint property

cell array of character vector

Constraint properties, returned as a cell array.

Examples

```
% Get block mask handle.
```

```
maskObj = Simulink.Mask.get(gcb);
```

```
% Find parameters associated with the constraint.
```

```
paramConstraint = maskObj.getParameterConstraint('const3')
```

```
ans =
```

```
Constraints with properties:
```

```
Name: 'const3'  
ConstraintRules: [1x2 Simulink.Mask.ParameterConstraintRules]
```

getWorkspaceVariables

Class: Simulink.Mask

Package: Simulink

Get all the variables defined in the mask workspace for a masked block

Syntax

```
p = Simulink.Mask.get(blockName)
vars = p.getWorkspaceVariables
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`vars = p.getWorkspaceVariables` returns as a structure all the variables defined in the mask workspace for the masked block.

Input Arguments

`blockName`

The handle to the block or the path to the block inside the model.

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```
- 2 Get all the variables defined in the mask workspace for the masked block.

```
vars = p.getWorkspaceVariables;
```

`Simulink.Mask` | "Create Block Masks"

numParameters

Class: Simulink.Mask

Package: Simulink

Determine the number of parameters in a mask

Syntax

```
p = Simulink.Mask.get(blockName)
p.numParameters
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.numParameters` returns the number of parameters in the mask.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Get the number of parameters in the mask.

```
p.numParameters;
```

`Simulink.Mask` | "Create Block Masks"

removeAllCrossParameterConstraints

Class: Simulink.Mask

Package: Simulink

Delete all cross-parameter constraints from a mask

Syntax

```
maskObj.removeAllCrossParameterConstraints()
```

Description

`maskObj.removeAllCrossParameterConstraints()` deletes all cross-constraints from a mask.

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcb);  
  
% Remove all cross constraints from the mask.  
maskObj.removeAllCrossParameterConstraints()
```

See Also

`Simulink.Mask` | “Create Block Masks”

Introduced in R2018a

removeAllParameterConstraints

Class: Simulink.Mask

Package: Simulink

Delete all mask parameter constraints

Syntax

```
maskObj.removeAllParameterConstraints()
```

Description

`maskObj.removeAllParameterConstraints()` deletes all the parameter constraints from a mask.

Input Arguments

maskObj — Block mask handle

mask object

Handle to the block mask. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information see, `Simulink.Mask.get`

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcb);  
  
% Remove all constraints from the mask.  
maskObj.removeAllParameterConstraints()
```

See Also

`Simulink.Mask` | “Create Block Masks”

Introduced in R2018a

removeAllParameters

Class: Simulink.Mask

Package: Simulink

Remove all existing parameters from a mask

Syntax

```
p = Simulink.Mask.get(blockName)
p.removeAllParameters
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.removeAllParameters` deletes all existing parameters from the mask.

Input Arguments

`blockName`

The handle to the block or the path to the block inside the model.

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Delete all existing parameters from the mask.

```
p.removeAllParameters;
```

See Also

`Simulink.Mask` | "Create Block Masks"

removeCrossParameterConstraint

Class: Simulink.Mask

Package: Simulink

Delete a cross-parameter constraint

Syntax

```
maskObj.removeCrossParameterConstraint(CrossConstraint)
```

Description

`maskObj.removeCrossParameterConstraint(CrossConstraint)` deletes the specified cross-constraint.

Input Arguments

maskObj — Block mask handle

mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: `char` | `cell`

CrossConstraint — Cross constraint name

character vector | string

Name of the cross-constraint to be removed, specified as character vector.

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcb);  
  
% Remove cross-constraint of name 'const1'.  
maskObj.removeCrossParameterConstraint('const1')
```

See Also

`Simulink.Mask` | “Create Block Masks”

Introduced in R2018a

removeDialogControl

Class: Simulink.Mask

Package: Simulink

Remove dialog control element from mask dialog box

Syntax

```
successIndicator = maskVariable.removeDialogControl(controlIdentifier)
```

Description

`successIndicator = maskVariable.removeDialogControl(controlIdentifier)` removes dialog control element, specified by `controlIdentifier`, like text, hyperlinks, or tabs from a mask dialog box. First get the mask object and assign it to the variable `maskVariable`.

Successful removal of a dialog control element returns a Boolean value of 1.

Input Arguments

controlIdentifier — Unique identifier for the element

character vector | string scalar

Programmatic identifier for the dialog control element of mask dialog box.

Examples

Remove Dialog Control Element from Mask Dialog Box

```
% Get mask object on the Gain block in the model Engine.
```

```
maskObj = Simulink.Mask.get('Engine/Gain');
```

```
% Remove element named AllTab from mask dialog box.
```

```
p = maskObj.removeDialogControl('AllTab');
```

See Also

Simulink.Mask | “Create Block Masks”

Introduced in R2013b

removeParameter

Class: Simulink.Mask

Package: Simulink

Remove parameter from mask dialog box

Syntax

```
successIndicator = maskVariable.removeParameter(controlIdentifier)
```

Description

`successIndicator = maskVariable.removeParameter(controlIdentifier)` removes parameter, specified by `controlIdentifier`, like edit, check box, popup from an existing mask dialog box. First get the mask object and assign it to the variable `maskVariable`.

Successful removal of a parameter returns a Boolean value of 1.

Input Arguments

controlIdentifier — Unique identifier for the parameter

character vector | string scalar

Programmatic identifier for the parameter of mask dialog box, specified as a character vector.

Examples

Remove Parameter from Mask Dialog Box

```
% Get mask object on the Gain block in the model Engine.  
maskObj = Simulink.Mask.get('Engine/Gain');  
  
% Remove parameter named checkbox1 from mask dialog box.  
p = maskObj.removeParameter('checkbox1');
```

Note You can also use the index number as the `controlIdentifier`.

See Also

Simulink.Mask | “Create Block Masks”

Introduced in R2012b

removeParameterConstraint

Class: Simulink.Mask

Package: Simulink

Delete a mask parameter constraint

Syntax

```
maskObj.removeParameterConstraint(paramConstraint)
```

Description

`maskObj.removeParameterConstraint(paramConstraint)` deletes the specified mask parameter constraint.

Input Arguments

maskObj — Block mask handle

mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: char | cell

paramConstraint — Mask constraint name

character vector | string

Name of the mask parameter constraint to be deleted, specified as character vector.

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcb);  
  
% Remove mask constraint with name 'const1'.  
maskObj.removeParameterConstraint('const1')
```

See Also

`Simulink.Mask` | “Create Block Masks”

Introduced in R2018a

set

Class: Simulink.Mask

Package: Simulink

Set the properties of an existing mask

Syntax

```
p = Simulink.Mask.get(blockName)
p.set(Name,Value)
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.set(Name,Value)` sets mask properties that you specify using name-value pairs as arguments.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, . . . ,NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Type

Text used as title for mask documentation that user sees on clicking **Help** in the Mask Parameters dialog box.

Default: empty

Description

Text used as summary for mask documentation that user sees on clicking **Help** in the Mask Parameters dialog box.

Default: empty

Help

Text used as body text for mask documentation that user sees on clicking **Help** in the Mask Parameters dialog box.

Default: empty

Initialization

MATLAB code that initializes the mask.

Default: empty

SelfModifiable

Option to set whether the mask can modify itself during simulation.

Default: 'off'

Display

MATLAB code that draws the mask icon.

Default: empty

IconFrame

Option to specify whether the mask icon appears inside a visible block frame.

Default: 'on'

MaskIconOpaque

Option to set the mask icon as opaque or transparent.

Default: 'opaque'

RunInitForIconRedraw

Option to specify whether Simulink should run mask initialization before executing the mask icon commands.

Default: 'off'

IconRotate

Option to specify icon rotation.

Default: 'none'

PortRotate

Option to specify port rotation.

Default: 'default'

IconUnits

Option to specify whether mask icon is autoscaled, normalized, or scaled in pixels.

Default: 'autoscale'

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Modify the mask so that its mask icon is transparent and its documentation summarizes what it does.

```
p.set('IconOpaque','off','Type','Random number generator','Description',...  
'This block generates random numbers.');
```

Simulink.Mask.Constraints class

Package: Simulink.Mask

Create Mask Constraint

Description

Use an instance of the `Simulink.Mask.Constraint` to add or remove a parameter constraint rule.

Properties

DataType

Specifies the data type associated with the constraint rule.

Type: double, single, numeric, integer, int8, uint8, int16, uint16, int32, uint32, boolean, enum, fixdt, string

Default: Empty

Dimension

Specifies the dimension associated with the constraint rule.

Type: scalar, rowvector, columnvector, 2dmatrix, ndmatrix

Default: Empty

Complexity

Specifies the complexity associated with the constraint rule.

Type: real, complex

Default: Empty

Sign

Specifies the sign associated with the constraint rule.

Type: positive, negative, zero

Default: Empty

Finiteness

Specifies the finiteness associated with the constraint rule.

Type: finite, inf, -inf, NaN

Default: Empty

Range

Specifies the range associated with the constraint rule.

Type: Minimum, Maximum

Default: Empty

CustomConstraint

Specifies the custom constraint associated with the constraint rule.

Type: Valid MATLAB expression

Default: Empty

CustomErrorMessage

Specifies the custom error message associated with the custom constraint rule.

Type: Character vector

Default: Empty

Methods

addParameterConstraintRule

Add rules to a parameter constraint

removeParameterConstraintRule

Delete a mask parameter constraint rule

See Also

Introduced in R2018a

addParameterConstraintRule

Class: Simulink.Mask.Constraints

Package: Simulink.Mask

Add rules to a parameter constraint

Syntax

```
paramConstRule = paramConstraint.addParameterConstraintRule(Name,Value)
```

Description

`paramConstRule = paramConstraint.addParameterConstraintRule(Name,Value)` adds rule to a parameter constraint.

Input Arguments

paramConstraint — Handle to mask constraint

constraint object

Handle to the mask parameter constraint for which you want to add constraint rules, specified as constraint object.

Data Types: char | cell

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Name-Value Pair for Rules

Name	Value
DataType	double, single, numeric, integer, int8, uint8, int16, uint16, int32, uint32, boolean, enum, fixdt
Dimension	scalar, rowvector, columnvector, 2dmatrix, ndmatrix
Complexity	real, complex
Sign	positive, negative, zero
Finiteness	finite, inf, -inf, NaN
Minimum	string
Maximum	string
CustomConstraint	Valid MATLAB expression

Output Arguments

paramConstRule — Mask constraint rule

cell array

Mask constraint rule, specified as a cell array.

Examples

```
% Get mask constraint handle
paramConstraint = maskObj.getParameterConstraint('const3');

% Add rules to the constraint.
paramConstRule = paramConstraint.addParameterConstraintRule('DataType','int8')

ans =

    ParameterConstraintRules with properties:

        DataType: 'int8'
        Dimension: {0x1 cell}
        Complexity: {0x1 cell}
           Sign: {0x1 cell}
        Finiteness: {0x1 cell}
          Minimum: ''
          Maximum: ''
    CustomConstraint: ''
```

See Also

removeParameterConstraintRule

Class: Simulink.Mask.Constraints

Package: Simulink.Mask

Delete a mask parameter constraint rule

Syntax

```
paramConstraint.removeParameterConstraintRule(RuleIndex)
```

Description

`paramConstraint.removeParameterConstraintRule(RuleIndex)` deletes the specified constraint rule from a mask parameter constraint.

Input Arguments

paramConstraint — Handle to constraint

constraint object

Handle to mask parameter constraint of which you want to remove constraint rule, specified as an object.

Data Types: char | cell

RuleIndex — Constraint rule index

integer

Index number of the mask constraint rule, specified as an integer.

Examples

```
% Get block mask handle.  
maskObj = Simulink.Mask.get(gcb);  
  
% Get mask constraint handle.  
paramConstraint = maskObj.getParameterConstraint('const3');  
  
% Remove mask constraint rule.  
paramConstraint.removeParameterConstraintRule(1)
```

Simulink.Mask | “Create Block Masks”

Introduced in R2018a

Simulink.Mask.EnumerationBase class

Derive an enumeration class to hold numeric values of any datatype

Description

The members of the enumeration class derived from `Simulink.Mask.EnumerationBase` can hold values of any numeric datatype. The datatype of the enumeration members should be consistent.

Methods

Public Methods

<code>getValueArrayName</code>	Simulink creates an internal array which holds the value corresponding to each enumeration members. You can customize the name of the array as the return value of the function.
<code>addClassNameToEnumNames</code>	This method belongs to <code>Simulink.IntEnumType</code> . Override this function to return true to prefix the member name with the class name, false otherwise.

Examples

Derive an enumeration class from `Simulink.Mask.EnumerationBase`

```
classdef XFactor < Simulink.Mask.EnumerationBase
    enumeration
        alpha(.001, 'alpha (.001)')
        beta(.0001, 'beta (.0001)')
        gamma(.00001, 'gamma (.00001)')
    end
end
```

See Also

`Simulink.Mask.EnumerationTypeOptions`

Topics

“Tune Mask Popup Parameters by Referencing an External Enumeration File”

Introduced in R2021a

Simulink.Mask.EnumerationTypeOptions class

Parse information from enumeration file derived from `Simulink.IntEnumType` and `Simulink.Mask.EnumerationBase`

Description

Create an instance of `Simulink.Mask.EnumerationTypeOptions` to parse the information from the enumeration file into the object.

Creation

```
enumObj = Simulink.Mask.EnumerationTypeOptions('ExternalEnumerationClass', 'XFactor')
```

Properties

Public Properties

ExternalEnumerationClass — Reference external enumeration class

empty (default) | Name of the enumeration file

This property holds the name of the enumeration class file.

Data Types: char

EnumerationMembers — Contains the information parsed from the enumeration file

empty (default) | MemberName | DescriptiveName | Value

This property holds the member name, display name, and numeric value specified in the enumeration file.

Data Types: `Simulink.Mask.EnumerationMember`

Examples

Display the properties of the enumeration members

```
>> obj = Simulink.Mask.EnumerationTypeOptions('ExternalEnumerationClass', 'XFactor')
```

```
obj =
  EnumerationTypeOptions with properties:
```

```
ExternalEnumerationClass: 'XFactor'
  EnumerationMembers: [1x3 Simulink.Mask.EnumerationMember]
```

```
>> obj.EnumerationMembers(1)
```

```
ans =
  EnumerationMember with properties:
```

```
MemberName: 'alpha'  
DescriptiveName: 'alpha (.001)'  
Value: 1.0000e-03
```

“Tune Mask Popup Parameters by Referencing an External Enumeration File”

Introduced in R2021a

Simulink.MaskParameter class

Package: Simulink

Control mask parameters programmatically

Description

Use an instance of `Simulink.MaskParameter` to set the properties of mask parameters.

Properties

Type

Specifies the mask parameter type.

Type: character vector

Values:

'edit' | 'checkbox' | 'popup' | 'combobox' | 'listbox' | 'radiobutton' | 'slider' | 'dial' | 'spinbox' | 'unit' | 'textarea' | 'customtable' | 'unidt' | 'min' | 'max' | 'promote'

Default: 'edit'

TypeOptions

Specifies the option for the parameter if it exists, otherwise, it is empty. Applicable for parameters of type popup, radio, textarea, combobox, Datatypestr, and promote .

Type: cell array of character vectors

Default: {''}

Name

Specifies the name of the mask parameter. This name is assigned to the mask workspace variable created for the mask parameter. The mask parameter name must not match the built-in parameter name.

Type: character vector

Default: Auto generated

Prompt

Specifies a character vector that appears as the label associated with the parameter on the mask dialog.

Type: character vector

Default: Empty character vector

Value

Specifies the value of the mask parameter. Masking supports all value types.

Default: Default value depends on the type of mask parameter. For example, the default value for `Checkbox` is 'on' while the default value for `Listbox` is { ' ' } and accepts a cell array of character vectors.

Evaluate

Indicates if the parameter value is to be evaluated in MATLAB or treated as a character vector when the block is evaluated.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

Tunable

Indicates if the parameter value can be changed during simulation.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

NeverSave

Indicates if the parameter value gets saved in the model file.

Type: boolean

Values: 'on' | 'off'

Default: 'off'

Hidden

Indicates if the parameter should never show on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'off'

ReadOnly

Indicates if the parameter on the mask dialog box is editable or is read-only.

Type: boolean

Values: 'on' | 'off'

Default: 'off'

Enabled

Indicates if the parameter is enabled in the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

Visible

Indicates if the parameter is visible in the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

ShowTooltip

Indicates if tool tip is enabled for the mask parameter.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

Callback

Specifies the MATLAB code that executes when a user changes the parameter value from the mask dialog box.

Type: character vector

Default: Empty character vector

TabName

Specifies the tab name of the mask dialog box where the parameter is displayed.

Type: character vector

Default: Empty character vector

Alias

Specifies the alternate name for mask parameter.

Type: character vector

Default: Empty character vector

DialogControl

Specifies the layout options of mask dialog.

Type: Class of type Simulink.dialog.parameter.<Typeofparameter>

Values:

'Edit' | 'Checkbox' | 'Popup' | 'Combobox' | 'Listbox' | 'RadioButton' | 'Slider' | 'Dial' | 'Spinbox' | 'Unit' | 'TextArea' | 'CustomTable' | 'Min' | 'Max'

Default: Edit

ConstraintName

Indicates the constraint associated with a parameter. To associate a constraint programmatically the constraint must be already available. To associate a constraint from a mat file use the format <matfilename>:<constraintname>.

Type: character vector

Default: Empty character vector

Methods

set Set properties of mask parameters

Topics

“Control Masks Programmatically”

“Create Block Masks”

set

Class: Simulink.MaskParameter

Package: Simulink

Set properties of mask parameters

Syntax

```
Simulink.MaskParameter.set(Name,Value)
```

Description

`Simulink.MaskParameter.set(Name,Value)` sets the properties of a mask parameter.

Input Arguments

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, . . . ,NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Type

Type of control that is used to specify the value of this parameter.

Default: edit

TypeOptions

The options that are displayed within a popup control or in a promoted parameter. This field is a cell array.

Default: empty

Name

The name of the mask parameter. This name is assigned to the mask workspace variable created for this parameter.

Default: empty

Prompt

Text that identifies the parameter on the Mask Parameters dialog.

Default: empty

Value

The default value of the mask parameter in the Mask Parameters dialog.

Default: Type specific; depends on the Type of the parameter

Evaluate

Option to specify whether parameter must be evaluated.

Default: 'on'

Tunable

Option to specify whether parameter is tunable.

Default: 'on'

Enabled

Option to specify whether user can set parameter value.

Default: 'on'

Visible

Option to set whether mask parameter is hidden or visible to the user.

Default: 'on'

Callback

Container for MATLAB code that executes when user makes a change in the Mask Parameters dialog and clicks **Apply**.

Default: empty

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Get a mask parameter.

```
a = p.Parameters(1);
```

- 3 Edit mask parameter so it is of type popup, cannot be evaluated.

```
a.set('Type','popup','TypeOptions',{'Red' 'Blue' 'Green'},...  
      'Evaluate','off');
```

Simulink.ModelDataLogs

Container for signal data logs of a model

Description

Note The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you simulate a model from an earlier release that had used `ModelDataLogs` format, the model uses `Dataset` format to log data.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format can facilitate post-processing with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses `ModelDataLogs`, you can encounter situations that require updates to your code or model. For more information about updating scripts, see “Migrate Scripts That Use Legacy `ModelDataLogs` API”.

In releases before R2016a, when you set **Configuration Parameters > Data Import/Export > Signal logging format** to `ModelDataLogs`, logging data produces one or more `Simulink.ModelDataLogs` objects that contain logged data. Logging creates an instance of this class for the top model and for each model referenced by the top model that contains logged signals. The `ModelDataLogs` object for the top model is assigned to a variable in the base workspace. The name of the variable is specified by the **Configuration Parameters > Data Import/export > Signal logging name** parameter. The default value is `logout`.

A `ModelDataLogs` object has a variable number of properties. The first property, `Name`, specifies the name of the model whose signal data the object contains or, if the model is a referenced model, the name of the Model block that references the model. The remaining properties reference objects that contain signal data logged during simulation of the model. The objects may be instances of these types of objects:

- `Simulink.ModelDataLogs`
Container for the data logs of a model
- `Simulink.SubsysDataLogs`
Container for the data logs of a subsystem
- `Simulink.Timeseries`
Data log for any signal except a mux or bus signal
- `Simulink.TsArray`
Data log for a mux or bus signal

The names of the properties identify the data being logged as follows:

- For signal data logs, the name of the signal
- For a subsystem or model log container, the name of the subsystem or model, respectively

Consider, for example, the following model.

As indicated by the testpoint icons, this model specifies that Simulink software should log the signals named `step` and `scope` in the root system and the signal named `clk` in the subsystem named `Delayed Out`. After you simulate this model in a release earlier than R2016a, the MATLAB workspace contains the following variable:

```
Simulink.ModelDataLogs (siglgex):
  Name                elements  Simulink Class
  scope                2        TsArray
  step                 1        Timeseries
  ('Delayed Out')     2        SubsysDataLogs
```

You can use fully qualified object names or the Simulink `unpack` command to access the signal data. For example, to access the amplitudes of the `clk` signal in the `Delayed Out` subsystem in a `logout` object, enter

```
data = logout('Delayed Out').clk.Data;
```

or

```
>> logout.unpack('all');
>> data = clk.Data;
```

Access Logged Signal Data Saved in ModelDataLogs Format

The `Simulink.ModelDataLogs` object contains signal data objects to capture signal logging information for specific model elements.

Model Element	Signal Data Object
Top-level or referenced model	Simulink.ModelDataLogs
Subsystem in a model	Simulink.SubsysDataLogs
Signal other than a bus or Mux signal	Simulink.Timeseries
Bus signal or Mux signal	Simulink.TsArray

Handling Spaces and Newlines in Logged Names

Signal names in data logs can have spaces or newlines in their names when the signal:

- Is named and the name includes a space or newline character.
- Is unnamed and originates in a block whose name includes a space or newline character.
- Exists in a subsystem or referenced model, and the name of the subsystem, Model block, or of any superior block includes a space or newline character.

The following model shows a signal whose name contains a space, a signal whose name contains a newline, and an unnamed signal that originates in a block whose name contains a newline:

The following example shows how to handle spaces or new lines in logged names, if a model uses `ModelDataLogs` for the signal logging format.

```
logstdout
```

```
logstdout =
```

```
Simulink.ModelDataLogs (model_name):
  Name                Elements Simulink Class
  ('x y')              1      Timeseries
  ('a
b')                   1      Timeseries
  ('SL_Sine
Wave1')               1      Timeseries
```

You cannot access any of the `Simulink.Timeseries` objects in this log using TAB name completion or by typing the name to MATLAB. This syntax is not recognized because the space or newline in each name appears to the MATLAB parser as a separator between identifiers. For example:

```
logout.x y
```

```
??? logout.x y
```

```
|
Error: Unexpected MATLAB expression.
```

To reference a `Simulink.Timeseries` object whose name contains a space, enclose the element containing the space in single quotes:

```
logout.('x y')
```

```
    Name: 'x y'
  BlockPath: 'model_name/Sine'
   PortIndex: 1
 SignalName: 'x y'
  ParentName: 'x y'
   TimeInfo: [1x1 Simulink.TimeInfo]
         Time: [51x1 double]
         Data: [51x1 double]
```

To reference a `Simulink.Timeseries` object whose name contains a newline, concatenate to construct the element containing the newline:

```
cr=sprintf('\n')
logout.(['a' cr 'b'])
```

The same techniques work when a space or newline in a data log derives from the name of:

- An unnamed logged signal's originating block
- A subsystem or Model block that contains any logged signal
- Any block that is superior to such a block in the model hierarchy

This code can reference logged data for the signal:

```
logout.(['SL_Sine' cr 'Wave1'])
```

For names with multiple spaces, newlines, or both, repeat and combine the two techniques as needed to specify the intended name to MATLAB.

Bus Signals

`ModelDataLogs` format stores each logged bus signal data in a separate `Simulink.TsArray` object.

The hierarchy of a bus signal is preserved in the logged signal data. The logged name of a signal in a virtual bus derives from the name of the source signal. The logged name of a signal in a nonvirtual bus derives from the applicable bus object, and can differ from the name of the source signal. See “Composite Signals” for information about those capabilities.

Introduced before R2006a

Simulink.MSFcnRunTimeBlock

Get run-time information about Level-2 MATLAB S-function block

Description

This class allows a Level-2 MATLAB S-function or other MATLAB program to obtain information from Simulink software and provide information to Simulink software about a Level-2 MATLAB S-Function block. Simulink software creates an instance of this class for each Level-2 MATLAB S-Function block in a model. Simulink software passes the object to the callback methods of Level-2 MATLAB S-functions when it updates or simulates a model, allowing the callback methods to get and provide block-related information to Simulink software. See “Write Level-2 MATLAB S-Functions” for more information.

You can also use instances of this class in MATLAB programs to obtain information about Level-2 MATLAB S-Function blocks during a simulation. See “Access Block Data During Simulation” for more information.

The Level-2 MATLAB S-function template *matlabroot/toolbox/simulink/blocks/msfuntmpl.m* shows how to use a number of the following methods.

Parent Class

Simulink.RunTimeBlock

Derived Classes

None

Property Summary

Name	Description
“AllowSignalsWithMoreThan2D” on page 5-455	enable Level-2 MATLAB S-function to use multidimensional signals.
“DialogPrmsTunable” on page 5-455	Specifies which of the S-function's dialog parameters are tunable.
“NextTimeHit” on page 5-455	Time of the next sample hit for variable sample time S-functions.

Method Summary

Name	Description
“AutoRegRuntimePrms” on page 5-455	Register this block's dialog parameters as run-time parameters.

Name	Description
"AutoUpdateRuntimePrms" on page 5-456	Update this block's run-time parameters.
"IsDoingConstantOutput" on page 5-456	Determine whether the current simulation stage is the constant sample time stage.
"IsMajorTimeStep" on page 5-457	Determine whether the current simulation time step is a major time step.
"IsSampleHit" on page 5-457	Determine whether the current simulation time is one at which a task handled by this block is active.
"IsSpecialSampleHit" on page 5-457	Determine whether the current simulation time is one at which multiple tasks handled by this block are active.
"RegBlockMethod" on page 5-458	Register a callback method for this block.
"RegisterDataTypeFxpBinaryPoint" on page 5-458	Register fixed-point data type with binary point-only scaling.
"RegisterDataTypeFxpFSlopeFixexpBias" on page 5-459	Register fixed-point data type with [Slope Bias] scaling specified in terms of fractional slope, fixed exponent, and bias.
"RegisterDataTypeFxpSlopeBias" on page 5-460	Register data type with [Slope Bias] scaling.
"SetAccelRunOnTLC" on page 5-461	Specify whether to use this block's TLC file to generate the simulation target for the model that uses it.
"SetPreCompInpPortInfoToDynamic" on page 5-462	Set precompiled attributes of this block's input ports to be inherited.
"SetPreCompOutPortInfoToDynamic" on page 5-462	Set precompiled attributes of this block's output ports to be inherited.
"SetPreCompPortInfoToDefaults" on page 5-462	Set precompiled attributes of this block's ports to the default values.
"SetSimViewingDevice" on page 5-462	Specify whether block is a viewer.
"SupportsMultipleExecInstances" on page 5-463	
"WriteRTWParam" on page 5-463	Write custom parameter information to Simulink Coder file.

Properties

AllowSignalsWithMoreThan2D

Description

Allow Level-2 MATLAB S-functions to use multidimensional signals. You must set the AllowSignalsWithMoreThan2D property in the setup method.

Data Type

Boolean

Access

RW

DialogPrmsTunable

Description

Specifies whether a dialog parameter of the S-function is tunable. Tunable parameters are registered as run-time parameters when you call the “AutoRegRuntimePrms” on page 5-455 method. Note that SimOnlyTunable parameters are not registered as run-time parameters. For example, the following lines initializes three dialog parameters where the first is tunable, the second in not tunable, and the third is tunable only during simulation.

```
block.NumDialogPrms = 3;
block.DialogPrmsTunable = {'Tunable', 'Nontunable', 'SimOnlyTunable'};
```

Data Type

array

Access

RW

NextTimeHit

Description

Time of the next sample hit for variable sample-time S-functions.

Data Type

double

Access

RW

Methods

AutoRegRuntimePrms

Purpose

Register a block's tunable dialog parameters as run-time parameters.

Syntax

```
AutoRegRuntimePrms;
```

Description

Use in the `PostPropagationSetup` method to register this block's tunable dialog parameters as run-time parameters.

AutoUpdateRuntimePrms**Purpose**

Update a block's run-time parameters.

Syntax

```
AutoUpdateRuntimePrms;
```

Description

Automatically update the values of the run-time parameters during a call to `ProcessParameters`.

See the S-function `matlabroot/toolbox/simulink/simdemos/simfeatures/adapt_lms.m` in the Simulink model `sldemo_msfcn_lms` for an example.

IsDoingConstantOutput**Purpose**

Determine whether this is in the constant sample time stage of a simulation.

Syntax

```
bVal = IsDoingConstantOutput;
```

Description

Returns true if this is the constant sample time stage of a simulation, i.e., the stage at the beginning of a simulation where Simulink software computes the values of block outputs that cannot change during the simulation (see “Constant Sample Time”). Use this method in the `Outputs` method of an S-function with port-based sample times to avoid unnecessarily computing the outputs of ports that have constant sample time, i.e., `[inf, 0]`.

```
function Outputs(block)
.
.
    if block.IsDoingConstantOutput
        ts = block.OutputPort(1).SampleTime;
        if ts(1) == Inf
            %% Compute port's output.
            end
        end
    end
.
.
%% end of Outputs
```

See “Specifying Port-Based Sample Times” for more information.

IsMajorTimeStep**Purpose.**

Determine whether current time step is a major or a minor time step.

Syntax

```
bVal = IsMajorTimeStep;
```

Description

Returns true if the current time step is a major time step; false, if it is a minor time step. This method can be called only from the `Outputs` or `Update` methods.

IsSampleHit**Purpose**

Determine whether the current simulation time is one at which a task handled by this block is active.

Syntax

```
bVal = IsSampleHit(stIdx);
```

Arguments

`stIdx`

Global index of the sample time to be queried.

Description

Use in `Outputs` or `Update` block methods when the MATLAB S-function has multiple sample times to determine whether a sample hit has occurred at `stIdx`. The sample time index `stIdx` is a global index for the Simulink model. For example, consider a model that contains three sample rates of 0.1, 0.2, and 0.5, and a MATLAB S-function block that contains two rates of 0.2 and 0.5. In the MATLAB S-function, `block.IsSampleHit(0)` returns true for the rate 0.1, not the rate 0.2.

This block method is similar to `ssIsSampleHit` for C-MeX S-functions, however `ssIsSampleHit` returns values based on only the sample times contained in the S-function. For example, if the model described above contained a C-MeX S-function with sample rates of 0.2 and 0.5, `ssIsSampleHit(S,0,tid)` returns true for the rate of 0.2.

Use port-based sample times to avoid using the global sample time index for multi-rate systems (see `Simulink.BlockPortData`).

IsSpecialSampleHit**Purpose**

Determine whether the current simulation time is one at which multiple tasks implemented by this block are active.

Syntax

```
bVal = IsSpecialSampleHit(stIdx1,stIdx1);
```

Arguments

stIdx1

Index of sample time of first task to be queried.

stIdx2

Index of sample time of second task to be queried.

Description

Use in `Outputs` or `Update` block methods to ensure the validity of data shared by multiple tasks running at different rates. Returns true if a sample hit has occurred at `stIdx1` and a sample hit has also occurred at `stIdx2` in the same time step (similar to `ssIsSpecialSampleHit` for C-Mex S-functions).

When using the `IsSpecialSampleHit` macro, the slower sample time must be an integer multiple of the faster sample time.

RegBlockMethod**Purpose**

Register a block callback method.

Syntax

```
RegBlockMethod(methName, methHandle);
```

Arguments

methName

Name of method to be registered.

methHandle

MATLAB function handle of the callback method to be registered.

Description

Registers the block callback method specified by `methName` and `methHandle`. Use this method in the `setup` function of a Level-2 MATLAB S-function to specify the block callback methods that the S-function implements.

RegisterDataTypeFxpBinaryPoint**Purpose**

Register fixed-point data type with binary point-only scaling.

Syntax

```
dtID = RegisterDataTypeFxpBinaryPoint(isSigned, wordLength, fractionalLength,  
obeyDataTypeOverride);
```

Arguments

isSigned

true if the data type is signed.

false if the data type is unsigned.

wordLength

Total number of bits in the data type, including any sign bit.

fractionalLength

Number of bits in the data type to the right of the binary point.

obeyDataTypeOverride

`true` indicates that the **Data Type Override** setting for the subsystem is to be obeyed. Depending on the value of **Data Type Override**, the resulting data type could be `Double`, `Single`, `ScaledDouble`, or the fixed-point data type specified by the other arguments of the function.

`false` indicates that the **Data Type Override** setting is to be ignored.

Description

This method registers a fixed-point data type with Simulink software and returns a data type ID. The data type ID can be used to specify the data types of input and output ports, run-time parameters, and DWork states. It can also be used with all the standard data type access methods defined for instances of this class, such as "DatatypeSize" on page 5-469.

Use this function if you want to register a fixed-point data type with binary point-only scaling. Alternatively, you can use one of the other fixed-point registration functions:

- Use "RegisterDataTypeFxpFSlopeFixexpBias" on page 5-459 to register a data type with [Slope Bias] scaling by specifying the word length, fractional slope, fixed exponent, and bias.
- Use "RegisterDataTypeFxpSlopeBias" on page 5-460 to register a data type with [Slope Bias] scaling.

If the registered data type is not one of the Simulink built-in data types, a Fixed-Point Designer license is checked out.

RegisterDataTypeFxpFSlopeFixexpBias**Purpose**

Register fixed-point data type with [Slope Bias] scaling specified in terms of fractional slope, fixed exponent, and bias

Syntax

```
dtID = RegisterDataTypeFxpFSlopeFixexpBias(isSigned, wordLength,
fractionalSlope, fixedexponent, bias, obeyDataTypeOverride);
```

Arguments**isSigned**

`true` if the data type is signed.

`false` if the data type is unsigned.

wordLength

Total number of bits in the data type, including any sign bit.

fractionalSlope

Fractional slope of the data type.

`fixedexponent`

exponent of the slope of the data type.

`bias`

Bias of the scaling of the data type.

`obeyDataTypeOverride`

`true` indicates that the **Data Type Override** setting for the subsystem is to be obeyed. Depending on the value of **Data Type Override**, the resulting data type could be `True Doubles`, `True Singles`, `ScaledDouble`, or the fixed-point data type specified by the other arguments of the function.

`false` indicates that the **Data Type Override** setting is to be ignored.

Description

This method registers a fixed-point data type with Simulink software and returns a data type ID. The data type ID can be used to specify the data types of input and output ports, run-time parameters, and DWork states. It can also be used with all the standard data type access methods defined for instances of this class, such as “DatatypeSize” on page 5-469.

Use this function if you want to register a fixed-point data type by specifying the word length, fractional slope, fixed exponent, and bias. Alternatively, you can use one of the other fixed-point registration functions:

- Use “RegisterDataTypeFxpBinaryPoint” on page 5-458 to register a data type with binary point-only scaling.
- Use “RegisterDataTypeFxpSlopeBias” on page 5-460 to register a data type with [Slope Bias] scaling.

If the registered data type is not one of the Simulink built-in data types, a Fixed-Point Designer license is checked out.

RegisterDataTypeFxpSlopeBias

Purpose

Register data type with [Slope Bias] scaling.

Syntax

```
dtID = RegisterDataTypeFxpSlopeBias(isSigned, wordLength, totalSlope, bias, obeyDataTypeOverride);
```

Arguments

`isSigned`

`true` if the data type is signed.

`false` if the data type is unsigned.

`wordLength`

Total number of bits in the data type, including any sign bit.

`totalSlope`

Total slope of the scaling of the data type.

bias

Bias of the scaling of the data type.

obeyDataTypeOverride

`true` indicates that the **Data Type Override** setting for the subsystem is to be obeyed. Depending on the value of **Data Type Override**, the resulting data type could be `True Doubles`, `True Singles`, `ScaledDouble`, or the fixed-point data type specified by the other arguments of the function.

`false` indicates that the **Data Type Override** setting is to be ignored.

Description

This method registers a fixed-point data type with Simulink software and returns a data type ID. The data type ID can be used to specify the data types of input and output ports, run-time parameters, and DWork states. It can also be used with all the standard data type access methods defined for instances of this class, such as “DatatypeSize” on page 5-469.

Use this function if you want to register a fixed-point data type with [Slope Bias] scaling. Alternatively, you can use one of the other fixed-point registration functions:

- Use “RegisterDataTypeFxpBinaryPoint” on page 5-458 to register a data type with binary point-only scaling.
- Use “RegisterDataTypeFxpFSlopeFixexpBias” on page 5-459 to register a data type by specifying the word length, fractional slope, fixed exponent, and bias

If the registered data type is not one of the Simulink built-in data types, a Fixed-Point Designer license is checked out.

SetAccelRunOnTLC

Purpose

Specify whether to use block's TLC file to generate code for the Accelerator mode of Simulink software.

Syntax

```
SetAccelRunOnTLC(bVal);
```

Arguments

`bVal`

May be `'true'` (use TLC file) or `'false'` (run block in interpreted mode).

Description

Specify if the block should use its TLC file to generate code that runs with the accelerator. If this option is `'false'`, the block runs in interpreted mode. See the S-function `msfcn_times_two.m` in the Simulink model `msfcndemo_timestwo` for an example.

Note The default JIT Accelerator mode does not support inlining of user-written TLC S-Functions. Please see “How Acceleration Modes Work” and “Control S-Function Execution” for more information.

SetPreCompInPortInfoToDynamic**Purpose**

Set precompiled attributes of this block's input ports to be inherited.

Syntax

```
SetPreCompInPortInfoToDynamic;
```

Description

Initialize the compiled information (dimensions, data type, complexity, and sampling mode) of this block's input ports to be inherited. See the S-function *matlabroot/toolbox/simulink/simdemos/simfeatures/adapt_lms.m* in the Simulink model *sldemo_msfcn_lms* for an example.

SetPreCompOutPortInfoToDynamic**Purpose**

Set precompiled attributes of this block's output ports to be inherited.

Syntax

```
SetPreCompOutPortInfoToDynamic;
```

Description

Initialize the compiled information (dimensions, data type, complexity, and sampling mode) of the block's output ports to be inherited. See the S-function *matlabroot/toolbox/simulink/simdemos/simfeatures/adapt_lms.m* in the Simulink model *sldemo_msfcn_lms* for an example.

SetPreCompPortInfoToDefaults**Purpose**

Set precompiled attributes of this block's ports to the default values.

Syntax

```
SetPreCompPortInfoToDefaults;
```

Description

Initialize the compiled information (dimensions, data type, complexity, and sampling mode) of the block's ports to the default values. By default, a port accepts a real scalar sampled signal with a data type of double.

SetSimViewingDevice**Purpose**

Specify whether this block is a viewer.

Syntax

```
SetSimViewingDevice(bVal);
```

Arguments

bVal

May be 'true' (is a viewer) or 'false' (is not a viewer).

Description

Specify if the block is a viewer/scope. If this flag is specified, the block will be used only during simulation and automatically stubbed out in generated code.

SupportsMultipleExecInstances**Purpose**

Specify whether or not a For Each Subsystem supports an S-function inside of it.

Syntax

```
SupportsMultipleExecInstances(bVal);
```

Arguments

bVal

May be 'true' (S-function is supported) or 'false' (S-function is not supported).

Description

Specify if an S-function can operate within a For Each Subsystem.

WriteRTWParam**Purpose**

Write a custom parameter to the Simulink Coder information file used for code generation.

Syntax

```
WriteRTWParam(pType, pName, pVal)
```

Arguments

pType

Type of the parameter to be written. Valid values are 'string' and 'matrix'.

pName

Name of the parameter to be written.

pVal

Value of the parameter to be written.

Description

Use in the `WriteRTW` method of the MATLAB S-function to write out custom parameters. These parameters are generally settings used to determine how code should be generated in the TLC file for the S-function. See the S-function `matlabroot/toolbox/simulink/simdemos/simfeatures/adapt_lms.m` in the Simulink model `sldemo_msfcn_lms` for an example.

Introduced before R2006a

Simulink.RunTimeBlock

Allow Level-2 MATLAB S-function and other MATLAB programs to get information about block while simulation is running

Description

This class allows a Level-2 MATLAB S-function or other MATLAB program to obtain information about a block. Simulink software creates an instance of this class or a derived class for each block in a model. Simulink software passes the object to the callback methods of Level-2 MATLAB S-functions when it updates or simulates a model, allowing the callback methods to get block-related information from and provide such information to Simulink software. See “Write Level-2 MATLAB S-Functions” in Writing S-Functions for more information. You can also use instances of this class in MATLAB programs to obtain information about blocks during a simulation. See “Access Block Data During Simulation” for more information.

Note Simulink.RunTimeBlock objects do not support MATLAB sparse matrices. For example, the following line of code attempts to assign a sparse identity matrix to the run-time object's output port data. This line of code in a Level-2 MATLAB S-function produces an error:

```
block.Outputport(1).Data = speye(10);
```

Parent Class

None

Derived Classes

Simulink.MSFcnRunTimeBlock

Property Summary

Name	Description
“BlockHandle” on page 5-466	Block's handle.
“CurrentTime” on page 5-466	Current simulation time.
“NumDworks” on page 5-466	Number of discrete work vectors used by the block.
“NumOutputPorts” on page 5-467	Number of block output ports.
“NumContStates” on page 5-467	Number of block's continuous states.
“NumDworkDiscStates” on page 5-467	Number of block's discrete states
“NumDialogPrms” on page 5-467	Number of parameters that can be entered on S-function block's dialog box.
“NumInputPorts” on page 5-468	Number of block's input ports.

Name	Description
"NumRuntimePrms" on page 5-468	Number of run-time parameters used by block.
"SampleTimes" on page 5-468	Sample times at which block produces outputs.

Method Summary

Name	Description
"ContStates" on page 5-468	Get a block's continuous states.
"DataTypeIsFixedPoint" on page 5-469	Determine whether a data type is fixed point.
"DatatypeName" on page 5-469	Get name of a data type supported by this block.
"DatatypeSize" on page 5-469	Get size of a data type supported by this block.
"Derivatives" on page 5-470	Get a block's continuous state derivatives.
"DialogPrm" on page 5-470	Get a parameter entered on an S-function block's dialog box.
"Dwork" on page 5-470	Get one of a block's DWork vectors.
"FixedPointNumericType" on page 5-471	Determine the properties of a fixed-point data type.
"InputPort" on page 5-471	Get one of a block's input ports.
"OutputPort" on page 5-472	Get one of a block's output ports.
"RuntimePrm" on page 5-472	Get one of the run-time parameters used by a block.

Properties

BlockHandle

Description

Block's handle.

Access

R0

CurrentTime

Description

Current simulation time.

Access

R0

NumDworks

Description

Number of data work vectors.

Access

RW

See Also

ssGetNumDWork

NumOutputPorts**Description**

Number of output ports.

Access

RW

See Also

ssGetNumOutputPorts

NumContStates**Description**

Number of continuous states.

Access

ssGetNumSFcnParams

SampleTimes**Description**

Block's sample times.

Access

RW for MATLAB S-functions, RO for all other blocks.

Methods**ContStates****Purpose**

Get a block's continuous states.

Syntax

```
states = ContStates();
```

Description

Get vector of continuous states.

See Also

ssGetContStates

DataTypesFixedPoint**Purpose**

Determine whether a data type is fixed point.

Syntax

```
bVal = DataTypeIsFixedPoint(dtID);
```

Arguments

dtID

Integer value specifying the ID of a data type.

Description

Returns `true` if the specified data type is a fixed-point data type.

DatatypeName**Purpose**

Get the name of a data type.

Syntax

```
name = DatatypeName(dtID);
```

Arguments

dtID

Integer value specifying ID of a data type.

Description

Returns the name of the data type specified by `dtID`.

See Also

“DatatypeSize” on page 5-469

DatatypeSize**Purpose**

Get the size of a data type.

Syntax

```
size = DatatypeSize(dtID);
```

Arguments

dtID

Integer value specifying the ID of a data type.

Description

Returns the size of the data type specified by dtID.

See Also

“DatatypeName” on page 5-469

Derivatives**Purpose**

Get derivatives of a block's continuous states.

Syntax

```
derivs = Derivatives();
```

Description

Get vector of state derivatives.

See Also

ssGetdX

DialogPrm**Purpose**

Get an S-function's dialog parameters.

Syntax

```
param = DialogPrm(pIdx);
```

Arguments

pIdx

Integer value specifying the index of the parameter to be returned.

Description

Get the specified dialog parameter. In the case of the S-function, each DialogPrm corresponds to one of the elements in the comma-separated list of parameters in the **S-function parameters** dialog field.

See Also

ssGetSFcnParam, “RuntimePrm” on page 5-472

Dwork**Purpose**

Get one of a block's DWork vectors.

Syntax

```
dworkObj = Dwork(dwIdx);
```

Arguments

dwIdx

Integer value specifying the index of a work vector.

Description

Get information about the DWork vector specified by dwIdx where dwIdx is the index number of the work vector. This method returns an object of type `Simulink.BlockCompDworkData`.

See Also

ssGetDWork

FixedPointNumericType**Purpose**

Get the properties of a fixed-point data type.

Syntax

```
eno = FixedPointNumericType(dtID);
```

Arguments

dtID

Integer value specifying the ID of a fixed-point data type.

Description

Returns an object of `embedded.Numeric` class that contains the attributes of the specified fixed-point data type.

Note `embedded.Numeric` is also the class of the `numerictype` objects created by Fixed-Point Designer software. For information on the properties defined by `embedded.Numeric` class, see “`numerictype` Object Properties” (Fixed-Point Designer).

InputPort**Purpose**

Get an input port of a block.

Syntax

```
port = InputPort(pIdx);
```

Arguments

pIdx

Integer value specifying the index of an input port.

Description

Get the input port specified by pIdx, where pIdx is the index number of the input port. For example,

```
port = rto.InputPort(1)
```

returns the first input port of the block represented by the run-time object `rto`.

This method returns an object of type `Simulink.BlockPreCompInputPortData` or `Simulink.BlockCompInputPortData`, depending on whether the model that contains the port is uncompiled or compiled. You can use this object to get and set the input port's uncompiled or compiled properties, respectively.

See Also

`ssGetInputPortSignalPtrs`, `Simulink.BlockPreCompInputPortData`, `Simulink.BlockCompInputPortData`, “OutputPort” on page 5-472

OutputPort**Purpose**

Get an output port of a block.

Syntax

```
port = OutputPort(pIdx);
```

Arguments

`pIdx`

Integer value specifying the index of an output port.

Description

Get the output port specified by `pIdx`, where `pIdx` is the index number of the output port. For example,

```
port = rto.OutputPort(1)
```

returns the first output port of the block represented by the run-time object `rto`.

This method returns an object of type `Simulink.BlockPreCompOutputPortData` or `Simulink.BlockCompOutputPortData`, depending on whether the model that contains the port is uncompiled or compiled, respectively. You can use this object to get and set the output port's uncompiled or compiled properties, respectively.

See Also

`ssGetInputPortSignalPtrs`, `Simulink.BlockPreCompOutputPortData`, `Simulink.BlockCompOutputPortData`

RuntimePrm**Purpose**

Get an S-function's run-time parameters.

Syntax

```
param = RuntimePrm(pIdx);
```

Arguments

pIdx

Integer value specifying the index of a run-time parameter.

Description

Get the run-time parameter whose index is pIdx. This run-time parameter is a Simulink.BlockData on page 5-205 object of type Simulink.BlockRunTimePrmData.

ssGetRunTimeParamInfo

Introduced before R2006a

Simulink.SampleTime class

Package: Simulink

Object containing sample time information

Description

The `SampleTime` class represents the sample time information associated with an individual sample time.

Use the methods `Simulink.Block.getSampleTimes` and `Simulink.BlockDiagram.getSampleTimes` to retrieve the values of the `SampleTime` properties for a block and for a block diagram, respectively.

Properties

Value

A two-element array of doubles that contains the period and offset of the sample time

Description

A $1 \times n$ character array that describes the sample time type

ColorRGBValue

A 1×3 array of doubles that contains the red, green and blue (RGB) values of the sample time color

Annotation

A $1 \times n$ character array that represents the annotation of a specific sample time (for example, 'D1')

OwnerBlock

For asynchronous and variable sample times, `OwnerBlock` is a character vector containing the full path to the block that controls the sample time. For all other types of sample times, it is an empty character vector.

ComponentSampleTimes

If the sample time is an async union or if the sample time is hybrid and the component sample times are available, then the array `ComponentSampleTimes` contains `Simulink.SampleTime` objects.

Copy Semantics

Value. To learn how value classes affect copy operations, see [Copying Objects in the MATLAB Programming Fundamentals documentation](#).

Examples

Retrieve the sample time information for the 'vdp' model.

```
ts = Simulink.BlockDiagram.getSampleTimes('vdp')
```

Simulink returns:

```
ts =
```

```
1x2 Simulink.SampleTime
Package: Simulink
```

Properties:

```
Value
Description
ColorRGBValue
Annotation
OwnerBlock
ComponentSampleTimes
```

Methods

To examine the values of the properties:

```
ts(1), ts(2)
```

```
ans =
```

```
Simulink.SampleTime
Package: Simulink
```

Properties:

```
Value: [0 0]
Description: 'Continuous'
ColorRGBValue: [0 0 0]
Annotation: 'Cont'
OwnerBlock: []
ComponentSampleTimes: {}
```

Methods

```
ans =
```

```
Simulink.SampleTime
Package: Simulink
```

Properties:

```
Value: [Inf 0]
Description: 'Constant'
ColorRGBValue: [1 0.2600 0.8200]
Annotation: 'Inf'
OwnerBlock: []
ComponentSampleTimes: {}
```

Methods

simulink.schedule.OrderedSchedule class

Package: simulink.schedule

Creates an OrderedSchedule object containing priority order of the partitions of a model

Description

The `simulink.schedule.OrderedSchedule` object is a representation of the execution order of the partitions of the specified model. Access this object as a model parameter with `get_param`. You can use the `OrderedSchedule` object to modify the schedule of the partitions of the model through the command line.

You can use `set_param` to apply the schedule to the model.

Creation

`get_param mdl, 'Schedule'` creates an `OrderedSchedule` object for the specified model, `mdl`.

Properties

Order — Priority order of the partitions

table

Priority order of the partitions, specified as a table where:

- The row names are names of the partitions.
- The first column is the index of the partition. Modify the index to change the order of the partitions.
- The second column shows the type of the partitions.
- The third column shows the trigger of the partition. This column lists either the sample time of the partitions, or the hit times at which the partitions execute.

RateSections — Sections of the order table

array

`RateSections` is an array of objects containing a portion of the order table with a single rate. Use `RateSections` to easily modify the order of the execution of partitions within valid groups.

Description — Description of the OrderedSchedule object

string

Purpose of an individual schedule object, specified as a string.

Examples

Create and Analyze Random Schedules for a Model Using the Schedule Editor API

This example uses the Schedule Editor API to perform operations on the schedule. Then it uses a function to generate random schedules and analyze them in Simulation Data Inspector

Open the Model and get the Schedule Object

Open a model of a Throttle Position Control system and use `get_param` to obtain the `simulink.schedule.OrderedSchedule` object. This object contains the current schedule.

```
model = 'ScheduleEditorAPIWithSubsystemPartitions';
open_system(model);
schedule = get_param(model, 'Schedule')
```

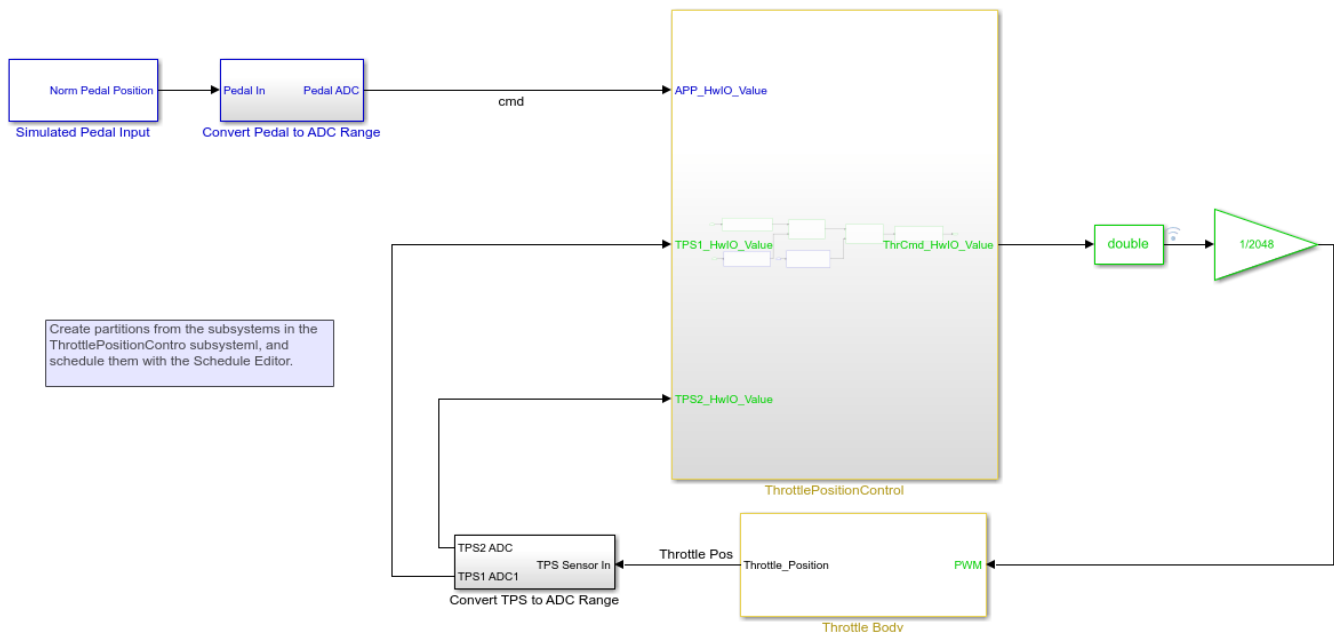

```
schedule =
```

```
OrderedSchedule with properties:
```

```
Order: [9x3 table]
RateSections: [3x1 simulink.schedule.RateSection]
Events: [0x1 simulink.schedule.Event]
Description: ''
```

Schedule Subsystem Partitions with the Schedule Editor

Copyright 2018 The MathWorks, Inc.

Examine the Schedule Object

The schedule object has an `Order` property that contains the execution order of the partitions in the model. The `Order` property displays a table that contains partition names, their index, type, and their trigger.

```
schedule.Order
```

```
ans =
```

```
9x3 table
```

	Index	Type	Trigger
Cont	1	Periodic	"0"
TPSSecondaryRun5ms	2	Periodic	"0.005"
MonitorRun5ms	3	Periodic	"0.005"
ControllerRun5ms	4	Periodic	"0.005"
ActuatorRun5ms	5	Periodic	"0.005"
D2	6	Periodic	"0.005"
D3	7	Periodic	"0.01"
APPSnsrRun	8	Periodic	"0.01"
TPSPPrimaryRun10ms	9	Periodic	"0.01"

Use the index variable in the Order table to change the execution order of the model

```
schedule.Order.Index('ActuatorRun5ms') = 2;
schedule.Order
```

```
ans =
```

```
9x3 table
```

	Index	Type	Trigger
Cont	1	Periodic	"0"
ActuatorRun5ms	2	Periodic	"0.005"
TPSSecondaryRun5ms	3	Periodic	"0.005"
MonitorRun5ms	4	Periodic	"0.005"
ControllerRun5ms	5	Periodic	"0.005"
D2	6	Periodic	"0.005"
D3	7	Periodic	"0.01"
APPSnsrRun	8	Periodic	"0.01"
TPSPPrimaryRun10ms	9	Periodic	"0.01"

Any moves within the Order property that are made to modify the schedule should result in valid schedule. To perform the schedule modifications and valid moves easier, each partition is grouped with partitions of the same rate in the RateSections property. Each element of the RateSection property contains an order table with partitions of the same rate.

```
schedule.RateSections(2)
schedule.RateSections(2).Order
```

```
ans =
```

```
RateSection with properties:
```

```
Rate: "0.005"
Order: [5x3 table]
```

```
ans =
```

```
5x3 table
```

	Index	Type	Trigger
ActuatorRun5ms	2	Periodic	"0.005"
TPSSecondaryRun5ms	3	Periodic	"0.005"
MonitorRun5ms	4	Periodic	"0.005"
ControllerRun5ms	5	Periodic	"0.005"
D2	6	Periodic	"0.005"

Use the index variable to move the partitions within RateSections.

```
schedule.RateSections(2).Order.Index('ActuatorRun5ms') = 5;
schedule.Order
```

```
ans =
```

```
9x3 table
```

	Index	Type	Trigger
Cont	1	Periodic	"0"
TPSSecondaryRun5ms	2	Periodic	"0.005"
MonitorRun5ms	3	Periodic	"0.005"
ControllerRun5ms	4	Periodic	"0.005"
ActuatorRun5ms	5	Periodic	"0.005"
D2	6	Periodic	"0.005"
D3	7	Periodic	"0.01"
APPSnsrRun	8	Periodic	"0.01"
TPSPPrimaryRun10ms	9	Periodic	"0.01"

Create a Function to Generate Random Schedules

In this section, we create three different functions: `randomSchedule`, `generateSimulationInputs` and `simulateRandomSchedules`

`randomSchedule` function is used to create random schedules by using random permutations of index modifications in the `schedule` object. Using the `Order` and the `RateSections` properties of the `schedule` object, partitions in the schedules are moved around in different, random combinations. With these randomly created schedules, models are simulated and compared to study the effect of different schedules on simulation. In the function `randomSchedule`, the input is the model name. Then use `get_param` to obtain the `simulink.schedule.OrderedSchedule` object of the model. The schedule object and its properties are used to modify and randomize the schedules. Create a variable `firstExecutionOrder` for the first rate section of the model. The `rateSections(1).ExecutionOrder = [firstExecutionOrder(1,:); reSchedule(firstExecutionOrder(2:end,:))]` line of code calls the function `reSchedule` which creates random permutations of the indexes.

type `randomSchedule`

```

function schedule = randomSchedule(model)
    % schedule = randomSchedule(model) Produces a
    % simulink.schedule.OrderedSchedule that has a randomized permutation
    % of the model's original execution order schedule

    arguments
        model char = bdroot
    end

    schedule = get_param(model, 'Schedule');

    rateSections = schedule.RateSections;
    firstOrder = rateSections(1).Order;

    % This assumes that the slowest discrete rate is at index 1. This may
    % not be the case for all models (ex. JMAAB-B).
    rateSections(1).Order = [firstOrder(1,:); reSchedule(firstOrder(2:end,:))];

    for i=2:length(rateSections)
        rateSections(i).Order = reSchedule(rateSections(i).Order);
    end

    schedule.RateSections = rateSections;
end

function out = reSchedule(in)
    numPartitions = height(in);
    in.Index = in.Index(randperm(numPartitions));
    out = in;
end

```

To analyze the effects of different schedules on the model, simulate the model with the different schedules. In this function, create an array of `Simulink.SimulationInput` objects. Through this array of `Simulink.SimulationInput` objects, you can apply the schedules to the model with the `setModelParameters` method of the `Simulink.SimulationInput` object.

type `generateSimulationInputs`

```

function in = generateSimulationInputs(model, numSimulations)
    % in = generateSimulationInputs(model, numSimulations) Generates
    % numSimulations Simulink.SimulationInput objects each containing a
    % different, randomized execution order schedule
    arguments
        model char = bdroot
        numSimulations double = 10
    end

    in(numSimulations) = Simulink.SimulationInput();
    in = in.setModelName(model);
    for idx = 1:numSimulations
        in(idx) = in(idx).setModelParameter('Schedule', randomSchedule(model));
    end
end

```

In the last function, use the array of `Simulink.SimulationInput` objects to run multiple simulations. Once the simulations are complete, you can plot the output of all the simulations in Simulation Data Inspector.

type `simulateRandomSchedules`

```
function out = simulateRandomSchedules(model, numSimulations)
    % out = simulateRandomSchedules(model, numSimulations) Simulates a
    % model numSimulations number of times. Each simulation has a
    % randomized execution order schedule.
    arguments
        model char = bdroot
        numSimulations double = 10
    end

    in = generateSimulationInputs(model, numSimulations);
    out = sim(in);
    plot(out);
end
```

Execute the Functions

Now run the above functions for the `ScheduleEditorAPIWithSubsystemPartitions` model. First, use the `randomSchedule` function to create randomly generated schedules, then, use the `generateSimulationInputs` function to generate an array of `Simulink.SimulationInput` objects, and use the `simulateRandomSchedule` function to simulate the model with different schedules and plot their results for comparison. Let's run simulations with 15 randomly generated schedules.

```
simulateRandomSchedules(model, 15)
```

```

Simulink.sdi.constraints.MatchesSignal class

Package: Simulink.sdi.constraints

Superclasses: matlab.unittest.constraints.Constraint

Constraint that compares time series data with tolerances using the Simulation Data Inspector

Description

Use the `Simulink.sdi.constraints.MatchesSignal` constraint to compare time series data against an expected value as part of a test. You can configure the constraint to use a combination of absolute, relative, and time tolerance values for the comparison. You can also specify additional options to configure the comparison behavior using a `Simulink.sdi.constraints.MatchesSignalOptions` object or using one or more name-value pair arguments on page 5-483. For more information about how tolerances and alignment options affect comparisons, see “How the Simulation Data Inspector Compares Data”.

Note The `MatchesSignal` constraint uses the Simulation Data Inspector to perform comparisons and requires a license for one of these products:

- Simulink
 - Signal Processing Toolbox™
 - MATLAB Coder
 - Fixed-Point Designer
-

Creation

Description

`MatchesSignal(expVal)` creates a constraint that determines whether time series data representing an actual value matches the data specified by the expected value, `expVal` on page 5-0 .

`MatchesSignal(expVal,Name,Value)` creates a constraint with additional properties on page 5-485 specified by one or more `Name,Value` pair arguments.

Input Arguments

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose `Name` in quotes.

Example: `'IgnoringDataTypes',true`

IgnoringDataTypes — Constraint behavior when data types do not match

false (default) | true

Configure constraint sensitivity to the actual value having a different data type from the expected value.

- `false` — The constraint checks whether the expected value and actual value data types match.
- `true` — The constraint is insensitive to data type mismatches between the expected value and actual value.

Example: `'IgnoringDataTypes', true`

IgnoringSignalsNotAligned — Constraint behavior when signals do not align

`false` (default) | `true`

Configure constraint sensitivity to one or more signals not aligning between the expected value and actual value.

- `false` — The constraint checks for signals that do not align between the expected value and actual value.
- `true` — The constraint is insensitive to one or more signals not aligning between the expected value and actual value.

Example: `'IgnoringSignalsNotAligned', true`

IgnoringExtraData — Constraint behavior when the actual value covers a different time interval from the expected value

`false` (default) | `true`

Configure the constraint sensitivity to the actual value containing data outside of the time interval defined by the expected value.

- `false` — The constraint checks whether the actual value contains data outside the time interval defined by the expected value.
- `true` — The constraint is insensitive to the actual value containing data outside the time interval defined by the expected value.

Example: `'IgnoringExtraData', true`

AligningBy — Signal alignment criteria

string array

Alignment criteria for the comparison. When the expected value contains more than one signal, the Simulation Data Inspector comparison algorithm aligns signals for comparison between the expected and actual values. By default, the Simulation Data Inspector aligns by data source, then by block path, then by SID, and then by signal name. For details about the Simulation Data Inspector alignment algorithm, see “How the Simulation Data Inspector Compares Data”.

Specify alignment criteria as a string array with one or more of these options listed in the order in which you want them considered:

- `BlockPath` — The path to the source block for the signal.
- `SID` — Simulink identifier. For more information, see “Simulink Identifiers”.
- `SignalName` — The name of the signal.
- `DataSource` — Path of the variable.

Example: 'AligningBy', ["SignalName", "BlockPath"] specifies signal alignment by signal name and then by block path.

Properties

Expected — Expected value to use as the baseline for the comparison

time series data | string scalar | character array

Expected value to use as the baseline for the comparison. The data for the expected value must pair data values with time. The data can be in any format supported by the Simulation Data Inspector. The Simulation Data Inspector requires data in a format that associates sample values with time.

Supported formats include `timeseries`, `Structure with time`, and `Dataset`.

You can specify the expected value for the constraint using a variable in the workspace that contains the data or by specifying the full path or file name of a file that contains the data, as a string scalar or a character array.

Attributes:

GetAccess	public
SetAccess	immutable

MatchesSignalOptions — Constraint comparison configuration options

`Simulink.sdi.constraints.MatchesSignalOptions`

`Simulink.sdi.constraints.MatchesSignalOptions` object that specifies options to configure the comparison for the constraint. By default, the comparison uses the default alignment settings for the Simulation Data Inspector and has strict acceptance criteria, meaning that the comparison does not ignore any checks. You can use the `MatchesSignalOptions` property to configure how the constraint aligns signals in the expected and actual runs and whether tests using the constraint are sensitive to:

- The actual value having a different data type from the expected value.
- One or more signals not aligning between the expected and actual runs.
- The actual value containing data outside the time interval defined by the expected value.

You can specify the `MatchesSignalOptions` property for the constraint using individual name-value pair arguments on page 5-483 or using the name-value pair 'WithOptions' with a `Simulink.sdi.constraints.MatchesSignalOptions` object as the value. When you specify the `MatchesSignalOptions` property using a `MatchesSignalOptions` object, you can use a single name-value pair to configure all the options for comparisons that use the constraint.

Attributes:

GetAccess	public
SetAccess	immutable

Data Types: `Simulink.sdi.constraints.MatchesSignalOptions`

AbsTol — Absolute tolerance for comparison

0 (default) | scalar

Absolute tolerance for comparisons using the constraint. For details about how the Simulation Data Inspector uses tolerance values in comparisons, see “How the Simulation Data Inspector Compares Data”.

Example: 0.1

Example: 2

Attributes:

GetAccess	public
SetAccess	immutable

Data Types: double

RelTol — Relative tolerance for comparison

0 (default) | scalar

Relative tolerance for comparisons using the constraint. For example, specify 0.1 to use a 10% tolerance for the comparison. For details about how the Simulation Data Inspector uses tolerance values in comparisons, see “How the Simulation Data Inspector Compares Data”.

Example: 0.05

Attributes:

GetAccess	public
SetAccess	immutable

Data Types: double

TimeTol — Time tolerance for comparison

0 (default) | scalar

Time tolerance for comparisons using the constraint, in seconds. For details about how the Simulation Data Inspector uses tolerance values in comparisons, see “How the Simulation Data Inspector Compares Data”.

Example: 0.001

Attributes:

GetAccess	public
SetAccess	immutable

Data Types: double

Examples

Create Tests for Time Series Comparisons

This example shows how to use the `Simulink.sdi.constraints.MatchesSignal` constraint to compare time series data using data generated in the workspace. You can use the `MatchesSignal` constraint to compare data from many sources, including measured test data in a file and logged simulation outputs.

When you use the `MatchesSignal` constraint, you can specify absolute, relative, and time tolerances to use in the comparison. The `MatchesSignal` constraint uses the Simulation Data Inspector comparison algorithm, which includes steps for alignment and synchronization. For more information about the algorithm, see “How the Simulation Data Inspector Compares Data”.

The `MatchesSignal` constraint uses the Simulation Data Inspector for the time series comparison and requires one of these products:

- Simulink®
- Signal Processing Toolbox™
- MATLAB Coder™
- Fixed-Point Designer™

Create Time Series Data

This example generates workspace data in `timeseries` format for illustrative purposes only. You can use the `MatchesSignal` constraint to compare data from other sources, such as simulation outputs or a file containing test data, and the constraint can compare time series data in any format supported by the Simulation Data Inspector.

In this example, the first signal is a `timeseries` object containing data for a sine wave with the name `Wave Data`.

```
time = 0:0.1:20;
sig1vals = sin(2*pi/5*time);
sig1_ts = timeseries(sig1vals,time);
sig1_ts.Name = 'Wave Data';
```

The second signal is also a sine wave at the same frequency, with a slight attenuation and sampled at a different rate. Because the comparison algorithm for the `MatchesSignal` constraint includes a synchronization step, comparing these two signals with different time vectors does not always result in a test failure. The second signal is also named `Wave Data` so the alignment algorithm can pair the signals for comparison.

```
time2 = 0:0.05:20;
sig2vals = 0.98*sin(2*pi/5*time2);
sig2_ts = timeseries(sig2vals,time2);
sig2_ts.Name = 'Wave Data';
```

Create a Test Case and Compare the Signals

This example uses an interactive test for illustrative purposes. You can use the `MatchesSignal` constraint with other types of unit tests in the MATLAB testing framework. For example, to write class-based unit tests, see “Write Simple Test Case Using Classes”.

Create a `TestCase` instance for interactive use.

```
import matlab.unittest.TestCase

testCase = TestCase.forInteractiveUse;
```

Compare `sig1_ts` and `sig2_ts` using the `MatchesSignal` constraint. Use `sig1_ts` for the expected value in the instance of the `MatchesSignal` constraint.

```
import Simulink.sdi.constraints.MatchesSignal

testCase.verifyThat(sig2_ts,MatchesSignal(sig1_ts));
```

```
Verification failed.
-----
Framework Diagnostic:
```

```

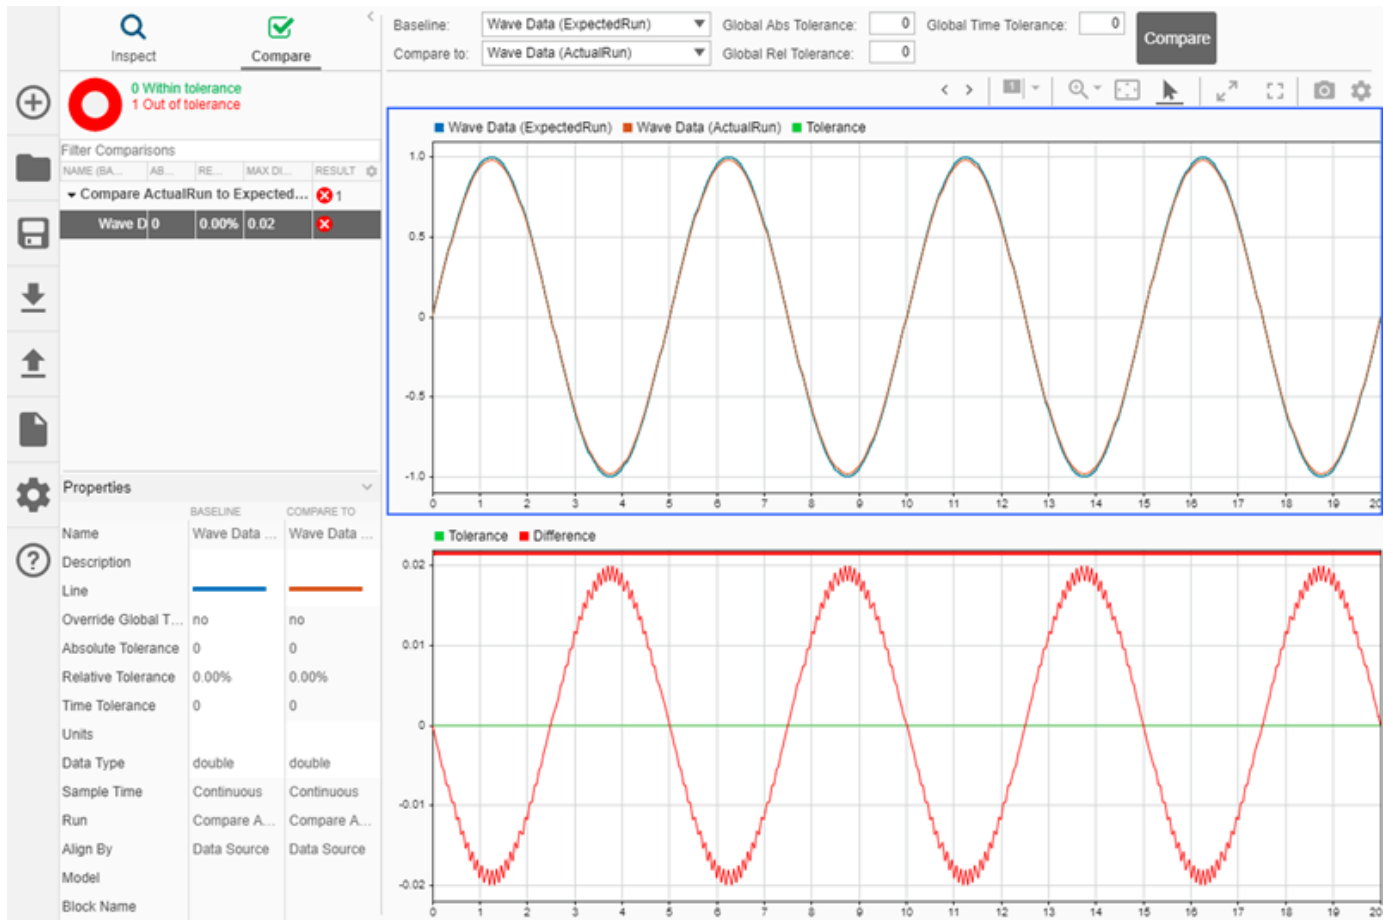

-----
MatchesSignal(<Value>) failed.
--> The following aligned signals did not match:

      Name          ActualSignals    ExpectedSignals
      -----          -
      Wave Data     <Actual>.Data    <Expected>.Data

Comparison results have been saved to:

In B:\matlab\tools\build_using_matlab\BML.m (BML) at 13

```

The diagnostic information shows that the verification failed. When a test fails, the comparison results and original run data are saved in a Simulation Data Inspector session file. Click the link for the MLDATX file to open the session in the Simulation Data Inspector, where you can investigate the data compared by the test and the comparison results. When you inspect the results, you can see the attenuation creates the difference and causes the comparison to fail.

Specify an absolute tolerance of `0.02` for the instance of the `MatchesSignal` constraint to use in the comparison.

```
testCase.verifyThat(sig2_ts,MatchesSignal(sig1_ts,'AbsToL',0.02));
```

Verification passed.

Configure MatchesSignal Constraint Behavior

This example shows how to configure the comparison behavior of a `Simulink.sdi.constraints.MatchesSignal` constraint using a `Simulink.sdi.constraints.MatchesSignalOptions` object. You can use a `MatchesSignalOptions` object to configure multiple comparison properties with a single name-value pair input in the construction of the `MatchesSignal` instance.

Create Time Series Data

This example creates workspace data to use for illustrative purposes only. You can use the `MatchesSignal` constraint to compare data from other sources, such as simulation outputs or a file containing test data, and the constraint can compare time series data in any format supported by the Simulation Data Inspector.

In this example, the first signal is a `timeseries` object with the name `Wave Data` that contains data for a sine wave.

```
time = 0:0.1:20;
sig1vals = sin(2*pi/5*time);
sig1_ts = timeseries(sig1vals,time);
sig1_ts.Name = 'Wave Data';
```

The second signal is also a sine wave at the same frequency, with a slight attenuation and sampled at a different rate. Because the comparison algorithm for the `MatchesSignal` constraint includes a synchronization step, comparing these two signals with different time vectors does not necessarily result in a test failure. The second signal is cast to `single` data type and also named `Wave Data` so the alignment algorithm can pair the signals for comparison.

```
time2 = 0:0.1:22;
sig2vals = single(0.98*sin(2*pi/5*time2));
sig2_ts = timeseries(sig2vals,time2);
sig2_ts.Name = 'Wave Data';
```

Configure a `MatchesSignal` Instance and Compare the Data

You can use a `MatchesSignalOptions` object to specify how an instance of the `MatchesSignal` constraint handles conditions such as mismatched data types and how signals are aligned between the actual and expected data sets. You can specify the properties of the `MatchesSignalOptions` object to suit the test you want to write. For example, if you want your test to compare data of varying types and a data type match is not functionally relevant, you could set the `IgnoreDataTypes` property to `true`.

Create a `MatchesSignalOptions` object to create a `MatchesSignal` instance that ignores data type mismatches and data samples outside the time interval the actual and expected signals share.

```
import Simulink.sdi.constraints.MatchesSignalOptions
opts = MatchesSignalOptions('IgnoringDataTypes',true,'IgnoringExtraData',true);
```

Create a `TestCase` instance for interactive use and compare `sig1_ts` and `sig2_ts` using the `MatchesSignal` constraint, the `MatchesSignalOptions` object, and an absolute tolerance of `0.02`.

```
import matlab.unittest.TestCase
testCase = TestCase.forInteractiveUse;

import Simulink.sdi.constraints.MatchesSignal
testCase.verifyThat(sig2_ts,MatchesSignal(sig1_ts,'AbsTol',0.02,'WithOptions',opts))
```

Verification passed.

The test passes. When you run the same test again without the options defined by the `MatchesSignalOptions` object, the test fails due to the mismatched data types.

```
testCase.verifyThat(sig2_ts,MatchesSignal(sig1_ts,'AbsTol',0.02))
```

Verification failed.

```
-----
Framework Diagnostic:
-----
```

```
MatchesSignal(<Value>,'AbsTol',0.02) failed.
```

```
--> Data types do not match for the following aligned signals:
```

Compatibility Considerations

Enhanced diagnostic information

Behavior changed in R2020a

Starting in R2020a, when a test that uses the `Simulink.sdi.constraints.MatchesSignal` constraint fails, the diagnostic information provides a path and link to a Simulation Data Inspector session file that includes the comparison results and the original data compared by the test. Open the session file to inspect the data and comparison results in the Simulation Data Inspector.

In previous releases, the diagnostic information included a path and link to a static image of the comparison results. The diagnostic information no longer includes the image.

Simulink.sdi.constraints.MatchesSignalOptions class

Package: Simulink.sdi.constraints

Specify comparison options for Simulink.sdi.MatchesSignal constraint

Description

Use a Simulink.sdi.constraints.MatchesSignalOptions object to configure the comparison behavior and acceptance criteria for an instance of the Simulink.sdi.constraints.MatchesSignal constraint.

Note The MatchesSignal constraint uses the Simulation Data Inspector to perform comparisons and requires a license for one of these products:

- Simulink
 - Signal Processing Toolbox
 - MATLAB Coder
 - Fixed-Point Designer
-

Creation

Description

MatchesSignalOptions creates an instance of the Simulink.sdi.constraints.MatchesSignalOptions class with properties that correspond to a constraint that does not ignore any checks and uses the default alignment settings for the Simulation Data Inspector.

MatchesSignalOptions(Name, Value) creates an instance of the Simulink.sdi.constraints.MatchesSignalOptions class with comparison behavior using properties on page 5-492 specified by one or more Name, Value pair arguments.

Properties

IgnoreDataTypes — Constraint behavior when data types do not match

false (default) | true

Constraint sensitivity to the actual value having a different data type from the expected value.

- false — The constraint checks whether the expected value and actual value data types match.
- true — The constraint is insensitive to data type mismatches between the expected value and actual value.

You can specify the IgnoreDataTypes property in the constructor using the 'IgnoringDataTypes' name-value pair argument.

Attributes:

GetAccess	public
SetAccess	public

IgnoreSignalsNotAligned — Constraint behavior when signals do not align

false (default) | true

Constraint sensitivity to one or more signals not aligning between the expected value and actual value.

- `false` — The constraint checks for signals that do not align between the expected value and actual value.
- `true` — The constraint is insensitive to one or more signals not aligning between the expected value and actual value.

You can specify the `IgnoreSignalsNotAligned` property in the constructor using the `'IgnoringSignalsNotAligned'` name-value pair argument.

Attributes:

GetAccess	public
SetAccess	public

IgnoreExtraData — Constraint behavior when the actual value covers a different time interval from the expected value

false (default) | true

Constraint sensitivity to the actual value containing data outside of the time interval defined by the expected value.

- `false` — The constraint checks whether the actual value contains data outside the time interval defined by the expected value.
- `true` — The constraint is insensitive to the actual value containing data outside the time interval defined by the expected value.

You can specify the `IgnoreExtraData` property in the constructor using the `'IgnoringExtraData'` name-value pair argument.

Attributes:

GetAccess	public
SetAccess	public

Alignment — Signal alignment criteria

string array

Alignment criteria for the comparison. When the expected value contains more than one signal, the Simulation Data Inspector comparison algorithm aligns signals for comparison between the expected and actual values. By default, the Simulation Data Inspector aligns by data source, then by block path, then by SID, and then by signal name. For details about the Simulation Data Inspector alignment algorithm, see “How the Simulation Data Inspector Compares Data”.

Specify alignment criteria as a string array with one or more of these options listed in the order in which you want them considered:

- `BlockPath` — The path to the source block for the signal.
- `SID` — Simulink identifier. For more information, see “Simulink Identifiers”.
- `SignalName` — The name of the signal.
- `DataSource` — Path of the variable.

You can specify the `Alignment` property in the constructor using the `'AligningBy'` name-value pair argument.

Examples

Configure MatchesSignal Constraint Behavior

This example shows how to configure the comparison behavior of a `Simulink.sdi.constraints.MatchesSignal` constraint using a `Simulink.sdi.constraints.MatchesSignalOptions` object. You can use a `MatchesSignalOptions` object to configure multiple comparison properties with a single name-value pair input in the construction of the `MatchesSignal` instance.

Create Time Series Data

This example creates workspace data to use for illustrative purposes only. You can use the `MatchesSignal` constraint to compare data from other sources, such as simulation outputs or a file containing test data, and the constraint can compare time series data in any format supported by the Simulation Data Inspector.

In this example, the first signal is a `timeseries` object with the name `Wave Data` that contains data for a sine wave.

```
time = 0:0.1:20;
sig1vals = sin(2*pi/5*time);
sig1_ts = timeseries(sig1vals,time);
sig1_ts.Name = 'Wave Data';
```

The second signal is also a sine wave at the same frequency, with a slight attenuation and sampled at a different rate. Because the comparison algorithm for the `MatchesSignal` constraint includes a synchronization step, comparing these two signals with different time vectors does not necessarily result in a test failure. The second signal is cast to `single` data type and also named `Wave Data` so the alignment algorithm can pair the signals for comparison.

```
time2 = 0:0.1:22;
sig2vals = single(0.98*sin(2*pi/5*time2));
sig2_ts = timeseries(sig2vals,time2);
sig2_ts.Name = 'Wave Data';
```

Configure a MatchesSignal Instance and Compare the Data

You can use a `MatchesSignalOptions` object to specify how an instance of the `MatchesSignal` constraint handles conditions such as mismatched data types and how signals are aligned between the actual and expected data sets. You can specify the properties of the `MatchesSignalOptions` object to suit the test you want to write. For example, if you want your test to compare data of varying types and a data type match is not functionally relevant, you could set the `IgnoreDataTypes` property to `true`.

Create a `MatchesSignalOptions` object to create a `MatchesSignal` instance that ignores data type mismatches and data samples outside the time interval the actual and expected signals share.

```
import Simulink.sdi.constraints.MatchesSignalOptions
opts = MatchesSignalOptions('IgnoringDataTypes',true,'IgnoringExtraData',true);
```

Create a `TestCase` instance for interactive use and compare `sig1_ts` and `sig2_ts` using the `MatchesSignal` constraint, the `MatchesSignalOptions` object, and an absolute tolerance of `0.02`.

```
import matlab.unittest.TestCase
testCase = TestCase.forInteractiveUse;

import Simulink.sdi.constraints.MatchesSignal
testCase.verifyThat(sig2_ts,MatchesSignal(sig1_ts,'AbsTol',0.02,'WithOptions',opts))
```

Verification passed.

The test passes. When you run the same test again without the options defined by the `MatchesSignalOptions` object, the test fails due to the mismatched data types.

```
testCase.verifyThat(sig2_ts,MatchesSignal(sig1_ts,'AbsTol',0.02))
```

Verification failed.

```
-----
Framework Diagnostic:
```

```
-----
MatchesSignal(<Value>,'AbsTol',0.02) failed.
```

```
--> Data types do not match for the following aligned signals:
```

Name	ActualSignals	ActualDataType	ExpectedSignals	ExpectedData
"Wave Data"	"<Actual>.Data"	{'single'}	"<Expected>.Data"	{'double'}

```
-----

Simulink.sdi.CustomSnapshot class

Package: Simulink.sdi

Specify settings for a snapshot without opening or affecting the Simulation Data Inspector

Description

Use a `Simulink.sdi.CustomSnapshot` object to specify settings for a snapshot you want to create without opening the Simulation Data Inspector or affecting the open session. Creating a snapshot using a `Simulink.sdi.CustomSnapshot` object is the best option for fully scripted workflows. You can specify the snapshot dimensions in pixels, the subplot layout, and limits for the x- and y- axes. You can use the `clearSignals` and `plotOnSubplot` methods to plot signals you want to include in the snapshot. To capture the snapshot, you can pass the `Simulink.sdi.CustomSnapshot` object as the value for the `settings` name-value pair for the `Simulink.sdi.snapshot` function or use the `snapshot` method.

Construction

`snap = Simulink.sdi.CustomSnapshot` creates a `Simulink.sdi.CustomSnapshot` object.

Properties

Width — Image width

600 (default) | scalar

Image width, in pixels.

Example: 750

Height — Image height

400 (default) | scalar

Image height, in pixels.

Example: 500

Rows — Number of subplot rows

1 (default) | scalar

Number of subplot rows, specified as a scalar between 1 and 8, inclusive. Use `Rows` and `Columns` to set your desired subplot layout.

Example: 2

Columns — Number of subplot columns

1 (default) | scalar

Number of subplot columns, specified as a scalar between 1 and 8, inclusive. Use `Rows` and `Columns` to set your desired subplot layout.

Example: 3

TimeSpan — X-axis limits

2x1 matrix

Limits for the time axis in the snapshot. The time axis limits are the same for all subplots. By default, the time axis adjusts to accommodate the largest time range of the plotted signals.

Example: [0 20]

YRange — Y-axis limits

cell array

Cell array of 1-by-2 matrices specifying the y-axis limits for all subplots in the custom snapshot. By default, YRange is [-3 3] for all subplots.

Example: {[-10 10],[0 100]}

Methods

`clearSignals` Clear signals plotted on subplots of a `Simulink.sdi.CustomSnapshot` object
`plotOnSubPlot` Plot signals on `Simulink.sdi.CustomSnapshot` object subplots
`snapshot` Create a custom snapshot

Copy Semantics

Handle. To learn how handle classes affect copy operations, see [Copying Objects](#).

Examples**Copy View Settings to a Run**

This example shows how to copy view settings from one run to another and how to create figures using the `Simulink.sdi.CustomSnapshot` object.

Simulate Your Model and Get a Run Object

Configure the `vdp` model to save output data, and run a simulation to create data.

```
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
set_param('vdp/Mu','Gain','1');
sim('vdp');
```

Use the Simulation Data Inspector programmatic interface to access the run data.

```
runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

Modify Signal View Settings

Use the `Simulink.sdi.Run` object to access signals in the run. Then, modify the signal view settings. This example specifies the line color and style for each signal. The view settings for the run comprise the view settings for each signal and view settings specified for the plot area.

```
sig1 = vdpRun.getSignalByIndex(1);  
sig2 = vdpRun.getSignalByIndex(2);  
  
sig1.LineColor = [0 0 1];  
sig1.LineDashed = '-.';  
  
sig2.LineColor = [1 0 0];  
sig2.LineDashed = ':';
```

Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;
```

You can use properties of the `Simulink.sdi.CustomSnapshot` object to configure the plot settings, like the subplot layout and axis limits, and to plot signals. When you use a `Simulink.sdi.CustomSnapshot` object to create your figure, these plot settings do not affect the Simulation Data Inspector.

```
snap.Rows = 2;  
snap.YRange = {[-2.25 2.25], [-3 3]};  
snap.plotOnSubPlot(1,1,sig1,true)  
snap.plotOnSubPlot(2,1,sig2,true)
```

Use `Simulink.sdi.snapshot` to generate the figure you specified in the properties of the `Simulink.sdi.CustomSnapshot` object.

```
fig = Simulink.sdi.snapshot("from", "custom", "to", "figure", "settings", snap);
```

Copy the View Settings to a New Simulation Run

Simulate the model again, with a different Mu value. Use the Simulation Data Inspector programmatic interface to access the simulation data.

```
set_param('vdp/Mu','Gain','5')
sim('vdp');
```

```
runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);
```

To create a plot of the new output data that looks like the one you created in the previous step, you can copy the view settings to the run in a single line of code using `Simulink.sdi.copyRunViewSettings`. The `Simulink.sdi.copyRunViewSettings` function does not automatically update plot settings in `Simulink.sdi.CustomSnapshot` objects, so specify the plot input as `false`.

```
sigIDs = Simulink.sdi.copyRunViewSettings(runID,runID2,false);
```

Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25],[-8 8]};
```

```
snap.plotOnSubPlot(1,1,sigIDs(1),true)
snap.plotOnSubPlot(2,1,sigIDs(2),true)

fig = snap.snapshot("to","figure");
```

Topics

“Inspect and Compare Data Programmatically”

“Create Plots Using the Simulation Data Inspector”

Introduced in R2018a

clearSignals

Class: Simulink.sdi.CustomSnapshot

Package: Simulink.sdi

Clear signals plotted on subplots of a Simulink.sdi.CustomSnapshot object

Syntax

```
snap.clearSignals
```

Description

`snap.clearSignals` clears plotted signals from all subplots in the Simulink.sdi.CustomSnapshot object, `snap`. Using the `clearSignals` method does not affect any subplots or signals in your open Simulation Data Inspector session.

Examples

Copy View Settings to a Run

This example shows how to copy view settings from one run to another and how to create figures using the Simulink.sdi.CustomSnapshot object.

Simulate Your Model and Get a Run Object

Configure the vdp model to save output data, and run a simulation to create data.

```
load_system('vdp')
set_param('vdp', 'SaveFormat', 'Dataset', 'SaveOutput', 'on')
set_param('vdp/Mu', 'Gain', '1');
sim('vdp');
```

Use the Simulation Data Inspector programmatic interface to access the run data.

```
runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

Modify Signal View Settings

Use the Simulink.sdi.Run object to access signals in the run. Then, modify the signal view settings. This example specifies the line color and style for each signal. The view settings for the run comprise the view settings for each signal and view settings specified for the plot area.

```
sig1 = vdpRun.getSignalByIndex(1);
sig2 = vdpRun.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;
```

You can use properties of the `Simulink.sdi.CustomSnapshot` object to configure the plot settings, like the subplot layout and axis limits, and to plot signals. When you use a `Simulink.sdi.CustomSnapshot` object to create your figure, these plot settings do not affect the Simulation Data Inspector.

```
snap.Rows = 2;
snap.YRange = {[ -2.25 2.25], [ -3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)
```

Use `Simulink.sdi.snapshot` to generate the figure you specified in the properties of the `Simulink.sdi.CustomSnapshot` object.

```
fig = Simulink.sdi.snapshot("from","custom","to","figure","settings",snap);
```

Copy the View Settings to a New Simulation Run

Simulate the model again, with a different Mu value. Use the Simulation Data Inspector programmatic interface to access the simulation data.

```
set_param('vdp/Mu', 'Gain', '5')
sim('vdp');
```

```
runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);
```

To create a plot of the new output data that looks like the one you created in the previous step, you can copy the view settings to the run in a single line of code using `Simulink.sdi.copyRunViewSettings`. The `Simulink.sdi.copyRunViewSettings` function does not automatically update plot settings in `Simulink.sdi.CustomSnapshot` objects, so specify the plot input as `false`.

```
sigIDs = Simulink.sdi.copyRunViewSettings(runID, runID2, false);
```

Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25], [-8 8]};
snap.plotOnSubPlot(1,1,sigIDs(1),true)
snap.plotOnSubPlot(2,1,sigIDs(2),true)
```

```
fig = snap.snapshot("to", "figure");
```

plotOnSubPlot

Class: Simulink.sdi.CustomSnapshot

Package: Simulink.sdi

Plot signals on Simulink.sdi.CustomSnapshot object subplots

Syntax

```
snap.plotOnSubPlot(row, column, signal, plot)
```

Description

`snap.plotOnSubPlot(row, column, signal, plot)` plots the signal on the subplot in the Simulink.sdi.CustomSnapshot object, `snap`, specified by `row` and `column` when `plot` is true. When `plot` is false, `plotOnSubPlot` clears the signal from the subplot.

Input Arguments

row — Subplot row

scalar

Row for subplot on which you want to plot a signal. Specify `row` as a value from 1 through 8, inclusive.

Example: 2

column — Subplot column

scalar

Column for subplot on which you want to plot a signal. Specify `column` as a value from 1 through 8, inclusive.

Example: 3

signal — Signal to plot

Simulink.sdi.Signal | signal ID

Signal ID or Simulink.sdi.Signal object corresponding to the signal you want to plot.

Example: sigID

plot — Plot indicator

logical

Logical indicator of whether to plot or clear the signal from the subplot.

- `true` - Plot the signal.
- `false` - Clear the signal.

Example: true

Data Types: logical

Examples

Copy View Settings to a Run

This example shows how to copy view settings from one run to another and how to create figures using the `Simulink.sdi.CustomSnapshot` object.

Simulate Your Model and Get a Run Object

Configure the `vdp` model to save output data, and run a simulation to create data.

```
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
set_param('vdp/Mu','Gain','1');
sim('vdp');
```

Use the Simulation Data Inspector programmatic interface to access the run data.

```
runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

Modify Signal View Settings

Use the `Simulink.sdi.Run` object to access signals in the run. Then, modify the signal view settings. This example specifies the line color and style for each signal. The view settings for the run comprise the view settings for each signal and view settings specified for the plot area.

```
sig1 = vdpRun.getSignalByIndex(1);
sig2 = vdpRun.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;
```

You can use properties of the `Simulink.sdi.CustomSnapshot` object to configure the plot settings, like the subplot layout and axis limits, and to plot signals. When you use a `Simulink.sdi.CustomSnapshot` object to create your figure, these plot settings do not affect the Simulation Data Inspector.

```
snap.Rows = 2;
snap.YRange = {[ -2.25 2.25], [ -3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)
```

Use `Simulink.sdi.snapshot` to generate the figure you specified in the properties of the `Simulink.sdi.CustomSnapshot` object.

```
fig = Simulink.sdi.snapshot("from","custom","to","figure","settings",snap);
```

Copy the View Settings to a New Simulation Run

Simulate the model again, with a different Mu value. Use the Simulation Data Inspector programmatic interface to access the simulation data.

```
set_param('vdp/Mu','Gain','5')
sim('vdp');
```

```
runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);
```

To create a plot of the new output data that looks like the one you created in the previous step, you can copy the view settings to the run in a single line of code using `Simulink.sdi.copyRunViewSettings`. The `Simulink.sdi.copyRunViewSettings` function does not automatically update plot settings in `Simulink.sdi.CustomSnapshot` objects, so specify the plot input as `false`.

```
sigIDs = Simulink.sdi.copyRunViewSettings(runID,runID2,false);
```

Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25],[-8 8]};
```

```
snap.plotOnSubPlot(1,1,sigIDs(1),true)
snap.plotOnSubPlot(2,1,sigIDs(2),true)

fig = snap.snapshot("to","figure");
```

“Create Plots Using the Simulation Data Inspector”

Introduced in R2018a

snapshot

Class: Simulink.sdi.CustomSnapshot

Package: Simulink.sdi

Create a custom snapshot

Syntax

```
fig = snap.snapshot
[fig,image] = snap.snapshot
fig = snap.snapshot(Name,Value)
[fig,image] = snap.snapshot
```

Description

`fig = snap.snapshot` creates a figure according to the properties of the Simulink.sdi.CustomSnapshot object, `snap`, and returns the handle for the figure, `fig`.

`[fig,image] = snap.snapshot` creates a figure according to the properties of the Simulink.sdi.CustomSnapshot object, `snap`, and returns the handle for the figure, `fig`, and an array of image data, `image`.

`fig = snap.snapshot(Name,Value)` creates a figure according to the properties of the Simulink.sdi.CustomSnapshot object, `snap`, with additional options specified by one or more Name,Value pair arguments. This syntax returns the figure handle, `fig`.

`[fig,image] = snap.snapshot` creates a figure according to the properties of the Simulink.sdi.CustomSnapshot object, `snap`, with additional options specified by one or more Name,Value pair arguments. This syntax returns the figure handle, `fig`, and an array of image data, `image`.

Input Arguments

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: `'to','figure','props',{'Name','My Data'}`

to — Type of snapshot to create

`'image'` (default) | `'figure'` | `'file'` | `'clipboard'`

Type of snapshot to create.

- `'image'` — Create a figure and return the figure handle and an array of image data. When you specify `'to','image'`, the `fig` and `image` outputs both have value.

- `'figure'` — Create a figure and return the figure handle. When you specify `'to'`, `'figure'` the `fig` output has value, and the `image` output is empty.
- `'file'` — Save to a PNG file with the name specified by the `filename` name-value pair. If you do not specify a `filename` name-value pair, the file is named `plots.png`. When you specify `'to'`, `'file'`, the `fig` and `image` outputs are both empty.
- `'clipboard'` — Copy the plots to your system clipboard. From the clipboard, you can paste the image into another program such as Microsoft Word. When you specify `'to'`, `'clipboard'`, the `fig` and `image` outputs are both empty.

Example: `'to','file'`

Data Types: `char` | `string`

filename — Name for image file

`'plots.png'` (default) | character array | string

Name of the image file to store the snapshot when you specify `'to','file'`.

Example: `'filename','MyImage.png'`

Data Types: `char` | `string`

props — Properties to customize the figure

cell array

Figure properties, specified as a cell array. You can include settings for the figure properties described in Figure Properties.

Example: `'props',{'Name','MyData','NumberTitle','off'}`

Data Types: `char` | `string`

Output Arguments

fig — Figure handle

figure handle

Handle for the figure. When a figure is not created with your specified options, the `fig` output is empty.

image — Image data

array

Array of image data. The `image` output has value when you use `Simulink.sdi.snapshot` without any input arguments or without a `to` name-value pair and when you specify `'to','image'`.

Examples

Copy View Settings to a Run

This example shows how to copy view settings from one run to another and how to create figures using the `Simulink.sdi.CustomSnapshot` object.

Simulate Your Model and Get a Run Object

Configure the `vdp` model to save output data, and run a simulation to create data.

```
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
set_param('vdp/Mu','Gain','1');
sim('vdp');
```

Use the Simulation Data Inspector programmatic interface to access the run data.

```
runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

Modify Signal View Settings

Use the `Simulink.sdi.Run` object to access signals in the run. Then, modify the signal view settings. This example specifies the line color and style for each signal. The view settings for the run comprise the view settings for each signal and view settings specified for the plot area.

```
sig1 = vdpRun.getSignalByIndex(1);
sig2 = vdpRun.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;
```

You can use properties of the `Simulink.sdi.CustomSnapshot` object to configure the plot settings, like the subplot layout and axis limits, and to plot signals. When you use a `Simulink.sdi.CustomSnapshot` object to create your figure, these plot settings do not affect the Simulation Data Inspector.

```
snap.Rows = 2;
snap.YRange = {[ -2.25 2.25], [-3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)
```

Use `Simulink.sdi.snapshot` to generate the figure you specified in the properties of the `Simulink.sdi.CustomSnapshot` object.

```
fig = Simulink.sdi.snapshot("from","custom","to","figure","settings",snap);
```

Copy the View Settings to a New Simulation Run

Simulate the model again, with a different Mu value. Use the Simulation Data Inspector programmatic interface to access the simulation data.

```
set_param('vdp/Mu','Gain','5')
sim('vdp');
```

```
runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);
```

To create a plot of the new output data that looks like the one you created in the previous step, you can copy the view settings to the run in a single line of code using `Simulink.sdi.copyRunViewSettings`. The `Simulink.sdi.copyRunViewSettings` function does not automatically update plot settings in `Simulink.sdi.CustomSnapshot` objects, so specify the plot input as `false`.

```
sigIDs = Simulink.sdi.copyRunViewSettings(runID,runID2,false);
```

Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25],[-8 8]};
```

```
snap.plotOnSubPlot(1,1,sigIDs(1),true)
snap.plotOnSubPlot(2,1,sigIDs(2),true)

fig = snap.snapshot("to","figure");
```

Simulink.sdi.DatasetRef class

Package: Simulink.sdi

Access data in Simulation Data Inspector repository

Description

The `Simulink.sdi.DatasetRef` object provides access to data in the Simulation Data Inspector without loading the entire set of data into memory. The object is compatible with the `Simulink.SimulationData.DatasetRef` class.

Construction

`dsr_array = Simulink.sdi.DatasetRef` constructs an array that contains a `Simulink.sdi.DatasetRef` object that corresponds to each run in the Simulation Data Inspector.

`dsr_array = Simulink.sdi.DatasetRef(domain)` creates an array of `DatasetRef` objects that contains a `Simulink.sdi.DatasetRef` object for each run, with the contents of each run limited to the specified domain.

`dsr = Simulink.sdi.DatasetRef(runID)` creates a `Simulink.sdi.DatasetRef` object that references the run specified by the run identifier, `runID`.

`dsr = Simulink.sdi.DatasetRef(runID, domain)` creates a `Simulink.sdi.DatasetRef` object that references the run specified by `runID` with contents specified by `domain`.

`dsr = Simulink.sdi.DatasetRef(runID, domain, repositoryPath)` creates a `Simulink.sdi.DatasetRef` object that references the run specified by the run identifier, `runID`. The `DatasetRef` object contains the contents specified by `domain` from the repository specified by `repositoryPath`.

Input Arguments

domain — Data to reference in DatasetRef object

'signals' | 'outports' | 'dsm' | 'state' | 'param' | ...

Data to reference in `DatasetRef` object, specified as one of the following:

- 'signals' — Signals produced by signal logging.
- 'outports' — Model output signals, represented by top-level Output blocks.
- 'dsm' — Data Store Memory blocks.
- 'state' — Simulink states.
- 'param' — Parameter data for block parameters and variables tuned using dashboard blocks.
- 'sf_data' — Stateflow local data.
- 'sf_state' — Stateflow states.
- 'sf_state_child' — Stateflow child activity.
- 'sf_state_leaf' — Stateflow leaf activity.

- 'slt_verify' — Assertion blocks and verify assessments in Simulink Test.

runID — Run identifier

integer

Specifies the run containing the data for the `Simulink.sdi.DatasetRef` object.

repositoryPath — Path containing the run

string | character vector

Specifies the location of the run containing the data for the `Simulink.sdi.DatasetRef` object.

Properties

Name — Run name

character vector

The name of the run that corresponds with the `Simulink.sdi.DatasetRef` object.

Example: 'Run 1'

Run — Simulink.sdi.Run object

`Simulink.sdi.Run` object

`Simulink.sdi.Run` object associated with the `Simulink.sdi.DatasetRef` object.

numElements — Number of top-level elements in run

`Simulink.sdi.Run` object

Number of top-level elements in the `Simulink.sdi.Run` object associated with the `Simulink.sdi.DatasetRef` object.

Methods

<code>compare</code>	Compare runs with <code>DatasetRef</code> objects
<code>getAsDatastore</code>	Retrieve element as <code>sdidatastore</code> object
<code>getElement</code>	Retrieve <code>DatasetRef</code> element by index
<code>getElementNames</code>	Get character vectors of element names
<code>getSignal</code>	Return <code>Signal</code> object
<code>plot</code>	Open the Simulation Data Inspector to view and compare data

Copy Semantics

Handle. To learn how handle classes affect copy operations, see [Copying Objects](#).

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sl_demo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sldemo_absbrake to create a run of logged signals
load_system('ex_sldemo_absbrake')
sim('ex_sldemo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell
    {'yout'}
    {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
    Ww: [1x1 timeseries]
    Vs: [1x1 timeseries]
    Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2017b

compare

Class: Simulink.sdi.DatasetRef

Package: Simulink.sdi

Compare runs with DatasetRef objects

Syntax

```
[matches, mismatches, results] = dsrObj.compare(other)
```

Description

`[matches, mismatches, results] = dsrObj.compare(other)` returns the number of matches, number of mismatches, and comparison results for a comparison of data in a `Simulink.sdi.DatasetRef` object. The comparison results are returned as a `Simulink.sdi.DiffRunResult` object.

Input Arguments

other — Comparison data

MAT-file | variable

Comparison data, which can come from another `Simulink.sdi.DatasetRef` object, a Dataset in the workspace, or a MAT-file.

Example: 'data.mat'

Example: var

Output Arguments

matches — Number of matching signals

integer

Number of signals that matched within tolerance in the comparison.

mismatches — Number of mismatched signals

integer

Number of signals that did not match within tolerance in the comparison.

results — Simulink.sdi.DiffRunResult object with comparison results

`Simulink.sdi.DiffRunResult` object

Results of the comparison, returned in a `Simulink.sdi.DiffRunResult` object.

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sl_demo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sl_demo_absbrake to create a run of logged signals
load_system('ex_sl_demo_absbrake')
sim('ex_sl_demo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell
    {'yout'}
    {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
    Ww: [1x1 timeseries]
    Vs: [1x1 timeseries]
    Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sl_demo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sl_demo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

Alternatives

Using the Simulation Data Inspector API, you could create runs for the data you want to compare and use `Simulink.sdi.compareRuns` for the comparison. You can also view runs created from simulation, import data to runs, and compare runs with the Simulation Data Inspector UI.

“How the Simulation Data Inspector Compares Data”

Introduced in R2017b

getAsDatastore

Class: Simulink.sdi.DatasetRef

Package: Simulink.sdi

Retrieve element as sdatastore object

Syntax

```
[elementDatastore, name, index] = SDIDatasetRef.getAsDatastore(arg)
```

Description

[elementDatastore, name, index] = SDIDatasetRef.getAsDatastore(arg) returns the requested element as a matlab.io.datastore.sdatastoreobject, along with the element name and index.

Input Arguments

arg — Element selection criterion

integer | character vector

Search criterion used to retrieve the element from the Simulink.sdi.DatasetRefobject. For name-based searches, specify arg as a character vector. For index-based searches, arg is an integer, representing the index of the desired element.

Example: 'MySignal'

Example: 3

Output Arguments

elementDatastore — Element as sdatastore

sdatastore object

Element as matlab.io.datastore.sdatastore object.

name — Element name

character vector

The name of the element.

index — Element index in DatasetRef object

integer

The index of the element in the Simulink.sdi.DatasetRef object.

Examples

Create an `sdidatastore` Object for a Signal

This example shows how to create a `sdidatastore` object for a signal in a `Simulink.sdi.DatasetRef` object.

```
% Simulate model sldemo_fuelsys to create a run of logged signals
sim('sldemo_fuelsys')
```

```
% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

```
% Get the run object
fuelRun = Simulink.sdi.getRun(runID);
```

```
% Make a Simulink.sdi.DatasetRef object
run_DSRef = fuelRun.getDatasetRef;
```

```
% Get the names of the elements in the object
names = run_DSRef.getElementNames
```

```
names = 16x1 cell
    {'CheckRange'           }
    {'air_fuel_ratio'      }
    {'speed'               }
    {'map'                 }
    {'ego'                 }
    {'throttle'           }
    {'fuel'                }
    {'EGO Fault Switch:1'  }
    {'Engine Speed Fault Switch:1' }
    {'MAP Fault Switch:1'  }
    {'Throttle Angle Fault Switch:1'}
    {'ego_sw'              }
    {'engine_speed'        }
    {'speed_sw'            }
    {'map_sw'              }
    {'throttle_sw'        }
```

```
% Get sdidatastore object for fuel signal
fuel_ds = run_DSRef.getAsDatastore(10);
```

Alternatives

You can construct a `sdidatastore` object for a specified signal using `matlab.io.datastore.sdidatastore`.

getElement

Class: Simulink.sdi.DatasetRef

Package: Simulink.sdi

Retrieve DatasetRef element by index

Syntax

```
[element, name, index] = SDIdatasetRef.getElement(index)
```

Description

`[element, name, index] = SDIdatasetRef.getElement(index)` returns the element within the Run in the Simulink.sdi.DatasetRef object at the specified index.

Input Arguments

index — Index of element

integer

Location of the element in the Simulink.sdi.DatasetRef object.

Output Arguments

element — Run element in the DatasetRef object

signal

Element from the run in the Simulink.sdi.DatasetRef object.

name — Element name

character vector

Name of the element retrieved from the Simulink.sdi.DatasetRef object.

index — Location of element

integer

Location of the element within the Simulink.sdi.DatasetRef object.

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the Simulink.sdi.DatasetRef object by comparing two runs of the `ex_sl-demo-absbrake` system with different desired slip ratios.

```
% Simulate model ex_sl-demo-absbrake to create a run of logged signals
load_system('ex_sl-demo-absbrake')
sim('ex_sl-demo-absbrake')
```

```
% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell
    {'yout'}
    {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
    Ww: [1x1 timeseries]
    Vs: [1x1 timeseries]
    Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

getElementNames

Class: Simulink.sdi.DatasetRef

Package: Simulink.sdi

Get character vectors of element names

Syntax

```
names = dsrObj.getElementNames
```

Description

`names = dsrObj.getElementNames` returns a cell array of character vectors containing the names of the elements in `dsrObj`.

Output Arguments

names — Element names

cell array

Names of the top level elements in the `Simulink.sdi.DatasetRef` object in a cell array.

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sl_demo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sl_demo_absbrake to create a run of logged signals
load_system('ex_sl_demo_absbrake')
sim('ex_sl_demo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell
    {'yout'}
    {'slp' }
```

```
% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
    Ww: [1x1 timeseries]
    Vs: [1x1 timeseries]
    Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_slldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_slldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

getSignal

Class: Simulink.sdi.DatasetRef

Package: Simulink.sdi

Return Signal object

Syntax

```
sigObj = SDIDatasetRef.getSignal(searchArg)
```

Description

`sigObj = SDIDatasetRef.getSignal(searchArg)` returns the `Simulink.sdi.Signal` object corresponding to the search argument, `searchArg`.

Input Arguments

searchArg — Search parameter

character vector | integer

The search parameters to select the `Simulink.sdi.Signal` object. The `searchArg` can be a character vector or string targeting a signal name or an integer for an index-based search.

Example: 'throttle'

Example: 2

Output Arguments

sigObj — Simulink.sdi.Signal object

`Simulink.sdi.Signal` object

The `Simulink.sdi.Signal` object corresponding to the search query.

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sl-demo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sl-demo_absbrake to create a run of logged signals
load_system('ex_sl-demo_absbrake')
sim('ex_sl-demo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
```

```

brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell
    {'yout'}
    {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
    Ww: [1x1 timeseries]
    Vs: [1x1 timeseries]
    Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_slldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_slldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot

```

Alternatives

If the signal is a top-level element in the `Simulink.sdi.DatasetRef` object, you can use the `getElement` method to get the `Simulink.sdi.Signal` object by index.

plot

Class: Simulink.sdi.DatasetRef

Package: Simulink.sdi

Open the Simulation Data Inspector to view and compare data

Syntax

```
SDIDatasetRef.plot
```

Description

`SDIDatasetRef.plot` opens the Simulation Data Inspector, where you can view and compare runs and signals.

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sl-demo-absbrake` system with different desired slip ratios.

```
% Simulate model ex_sl-demo-absbrake to create a run of logged signals
load_system('ex_sl-demo-absbrake')
sim('ex_sl-demo-absbrake')
```

```
% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

```
% Get the run object
brakeRun = Simulink.sdi.getRun(runID);
```

```
% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;
```

```
% Get the names of the elements in the object
names = run_DSRef.getElementNames
```

```
names = 2x1 cell
    {'yout'}
    {'slp' }
```

```
% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);
```

```
% View signals in outputs
outputs = yout.Values
```

```
outputs = struct with fields:
    Ww: [1x1 timeseries]
```

```
Vs: [1x1 timeseries]
Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_slldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_slldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

Alternatives

You can use the `Simulink.sdi.view` function to open the Simulation Data Inspector. For information on using the UI to open the Simulation Data Inspector, see “View Data in the Simulation Data Inspector”.

Simulink.sdi.WorkerRun class

Package: Simulink.sdi

Access simulation data from parallel workers

Description

The `Simulink.sdi.WorkerRun` class provides access to run data generated on Parallel Computing Toolbox parallel workers. Create a `Simulink.sdi.WorkerRun` object on the worker, and then use the object to access data in your local MATLAB session.

Construction

`workerRun = Simulink.sdi.WorkerRun(runID)` creates a `Simulink.sdi.WorkerRun` object with the run identifier specified by `runID`.

`workerRun = Simulink.sdi.WorkerRun.getLatest` creates a `Simulink.sdi.WorkerRun` object of the most recent run.

Input Arguments

runID — Run identifier

integer

Run identifier

Methods

<code>getDataset</code>	Create Dataset of worker run data
<code>getDatasetRef</code>	Create DatasetRef for worker run
<code>getLatest</code>	Create worker run for latest run
<code>getLocalRun</code>	Create local run from worker run

Copy Semantics

Handle. To learn how handle classes affect copy operations, see [Copying Objects](#).

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')
```

```
% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

Initialize Parallel Workers

Use `gcp` to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd
```

```
% Load system and select signals to log
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)
```

```
end
```

Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7
```

```
% Select value for Ts
Ts_val = Ts_vals(index);

% Change the filter time constant and simulate
modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
modelWorkspace.assignin('Ts', Ts_val)
sim('slexAircraftExample')
```

```

% Create a worker run for each simulation
workerRun(index) = Simulink.sdi.WorkerRun.getLatest

end

spmd

% Remove temporary directories
cd(workDir)
rmdir(tempDir, 's')
rmpath(workDir)

```

```
end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;
```

```
for a = 1:7
    ds(a) = workerRun(a).getDataset;
```

```
end
```

```
ds(1)
```

```
ans =
Simulink.SimulationData.Dataset '' with 2 elements
```

		Name	BlockPath
1	[1x1 Signal]	alpha, rad	...rcraftExample/Aircraft Dynamics Model
2	[1x1 Signal]	Stick	slexAircraftExample/Pilot

- Use braces { } to access, modify, or add elements using index.

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
```

```
end
```

```
datasetRef(1)
```

```
ans =
DatasetRef with properties:

    Name: 'Run 3: slexAircraftExample'
     Run: [1x1 Simulink.sdi.Run]
numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local Run objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

Alternatives

You can also access, view, and analyze simulation data from Parallel Computing Toolbox workers using the Simulation Data Inspector UI.

getDataset

Class: Simulink.sdi.WorkerRun

Package: Simulink.sdi

Create Dataset of worker run data

Syntax

```
dataset = workerRun.getDataset  
dataset = workerRun.getDataset(domain)
```

Description

`dataset = workerRun.getDataset` returns a `Simulink.SimulationData.Dataset` object of the data corresponding to the `Simulink.sdi.WorkerRun` object.

`dataset = workerRun.getDataset(domain)` returns a `Simulink.SimulationData.Dataset` object of the data corresponding to the `Simulink.sdi.WorkerRun` object limited to the scope specified by `domain`.

Input Arguments

domain — Scope specifier

'signals' | 'outports'

Scope limiting argument that selects the data to return in the `Simulink.SimulationData.Dataset` object.

- 'signals' limits the data returned in the Dataset to signals in the WorkerRun.
- 'outports' limits the data returned in the Dataset to output data in the WorkerRun.

Output Arguments

dataset — Simulink.SimulationData.Dataset object

`Simulink.SimulationData.Dataset` object

`Simulink.SimulationData.Dataset` object containing the data from the `Simulink.sdi.WorkerRun` object.

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')
```

```
% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

Initialize Parallel Workers

Use `gcp` to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

getDatasetRef

Class: Simulink.sdi.WorkerRun

Package: Simulink.sdi

Create DatasetRef for worker run

Syntax

```
datasetRef = workerRun.getDatasetRef  
datasetRef = workerRun.getDatasetRef(domain)
```

Description

`datasetRef = workerRun.getDatasetRef` returns a `Simulink.SimulationData.DatasetRef` object referencing the data in the `Simulink.sdi.WorkerRun` object, `workerRun`.

`datasetRef = workerRun.getDatasetRef(domain)` returns a `Simulink.SimulationData.DatasetRef` object referencing the data in the `Simulink.sdi.WorkerRun` object, `workerRun`, limited to the scope specified by `domain`.

Input Arguments

domain — Scope limiting input

'signals' | 'outports'

Scope limiting argument that selects the data to reference in the `Simulink.SimulationData.DatasetRef` object.

- 'signals' limits the data referenced in the `DatasetRef` to signals in the `WorkerRun`.
- 'outports' limits the data referenced in the `DatasetRef` to output data in the `WorkerRun`.

Output Arguments

datasetRef — Simulink.SimulationData.DatasetRef object

`Simulink.sdi.DatasetRef` object

`Simulink.sdi.DatasetRef` object referencing the data in the Parallel Computing Toolbox worker run.

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')
```

```
% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

Initialize Parallel Workers

Use `gcp` to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd
```

```
% Load system and select signals to log
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)
```

```
end
```

Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7
```

```
% Select value for Ts
Ts_val = Ts_vals(index);

% Change the filter time constant and simulate
modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
modelWorkspace.assignin('Ts', Ts_val)
sim('slexAircraftExample')
```

```

% Create a worker run for each simulation
workerRun(index) = Simulink.sdi.WorkerRun.getLatest

end

spmd

% Remove temporary directories
cd(workDir)
rmdir(tempDir, 's')
rmpath(workDir)

```

```
end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;
```

```
for a = 1:7
    ds(a) = workerRun(a).getDataset;
```

```
end
```

```
ds(1)
```

```
ans =
Simulink.SimulationData.Dataset '' with 2 elements
```

		Name	BlockPath
1	[1x1 Signal]	alpha, rad	...rcraftExample/Aircraft Dynamics Model
2	[1x1 Signal]	Stick	slexAircraftExample/Pilot

- Use braces { } to access, modify, or add elements using index.

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2017b

Simulink.sdi.WorkerRun.getLatest

Class: Simulink.sdi.WorkerRun

Package: Simulink.sdi

Create worker run for latest run

Syntax

```
runObj = Simulink.sdi.WorkerRun.getLatest
```

Description

`runObj = Simulink.sdi.WorkerRun.getLatest` creates a `Simulink.sdi.WorkerRun` object for the latest run on a Parallel Computing Toolbox worker.

Output Arguments

runObj — Local Simulink.sdi.Run object

Simulink.sdi.WorkerRun object

Simulink.sdi.WorkerRun object to access the data from the latest Parallel Computing Toolbox worker run.

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is  
% enabled.  
Simulink.sdi.clear  
Simulink.sdi.enablePCTSupport('local')
```

```
% Define Ts values  
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

Initialize Parallel Workers

Use `gcp` to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd
```

```
% Load system and select signals to log
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)
```

```
end
```

Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7
```

```
% Select value for Ts
Ts_val = Ts_vals(index);

% Change the filter time constant and simulate
modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
modelWorkspace.assignin('Ts', Ts_val)
sim('slexAircraftExample')

% Create a worker run for each simulation
workerRun(index) = Simulink.sdi.WorkerRun.getLatest
```

```
end
```

```
spmd
```

```
% Remove temporary directories
cd(workDir)
rmdir(tempDir, 's')
rmpath(workDir)
```

```
end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;
```

```

for a = 1:7
    ds(a) = workerRun(a).getDataset;
end
ds(1)

ans =
Simulink.SimulationData.Dataset '' with 2 elements

      Name      BlockPath
-----
1 [1x1 Signal]  alpha, rad  ...rcraftExample/Aircraft Dynamics Model
2 [1x1 Signal]  Stick      slexAircraftExample/Pilot

- Use braces { } to access, modify, or add elements using index.

```

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```

for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
end

datasetRef(1)

ans =
DatasetRef with properties:

    Name: 'Run 3: slexAircraftExample'
    Run: [1x1 Simulink.sdi.Run]
 numElements: 2

```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local `Run` objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```

for c = 1:7

    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end

```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

Simulink.sdi.cleanupWorkerResources

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2017b

getLocalRun

Class: Simulink.sdi.WorkerRun

Package: Simulink.sdi

Create local run from worker run

Syntax

```
runObj = workerRun.getLocalRun
```

Description

`runObj = workerRun.getLocalRun` creates the local `Simulink.sdi.Run` object `runObj` for the `Simulink.sdi.WorkerRun` object `workerRun`. Use `getLocalRun` in the client MATLAB to access the `Simulink.sdi.WorkerRun` data.

Output Arguments

runObj — Local `Simulink.sdi.Run` object

`Simulink.sdi.Run` object

Local `Simulink.sdi.Run` object.

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is  
% enabled.  
Simulink.sdi.clear  
Simulink.sdi.enablePCTSupport('local')
```

```
% Define Ts values  
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

Initialize Parallel Workers

Use `gcp` to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd
```

```
% Load system and select signals to log
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)
```

```
end
```

Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7
```

```
% Select value for Ts
Ts_val = Ts_vals(index);

% Change the filter time constant and simulate
modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
modelWorkspace.assignin('Ts', Ts_val)
sim('slexAircraftExample')

% Create a worker run for each simulation
workerRun(index) = Simulink.sdi.WorkerRun.getLatest
```

```
end
```

```
spmd
```

```
% Remove temporary directories
cd(workDir)
rmdir(tempDir, 's')
rmpath(workDir)
```

```
end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;
```

```

for a = 1:7
    ds(a) = workerRun(a).getDataset;
end
ds(1)

ans =
Simulink.SimulationData.Dataset '' with 2 elements

           Name      BlockPath
-----
1 [1x1 Signal]    alpha, rad    ...rcraftExample/Aircraft Dynamics Model
2 [1x1 Signal]    Stick        slexAircraftExample/Pilot

- Use braces { } to access, modify, or add elements using index.

```

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```

for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
end

datasetRef(1)

ans =
DatasetRef with properties:

    Name: 'Run 3: slexAircraftExample'
    Run: [1x1 Simulink.sdi.Run]
 numElements: 2

```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local `Run` objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```

for c = 1:7

    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end

```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

Simulink.sfunction.Analyzer class

Package: Simulink.sfunction

Create a Simulink S-function analyzer object

Description

This class enables you to perform checks on S-functions within a model or a library. These checks include MEX compiler setup check, source code check, MEX-file check, parameter robustness check for S-functions. The check result can be accessed either from a MATLAB structure or an HTML report.

The S-function analyzer checks the source code of the S-functions based on the S-function names. The S-function source code can be automatically included in the analysis if the source file is a single .c or .cpp file in the MATLAB path that has the same name as the S-function. Otherwise, the build information can be specified through the S-function Analyzer APIs. If no source code is available on the specified path, the analysis is skipped.

Construction

`sfunAnalyzer = Simulink.sfunction.Analyzer(model)` creates a `Simulink.sfunction.Analyzer` object with the model you specify. In this case, the source code for the S-function can be automatically included in the analysis if the source code file is a single .c or .cpp file in the MATLAB path that has the same name as the S-function. For example, if the specified model contains an S-function called `mysfun`, and the source file for `mysfun` is a single file `mysfun.c` in the MATLAB path, a `Simulink.sfunction.analyzer.BuildInfo` object is automatically created and included in the analysis.

`sfunAnalyzer = Simulink.sfunction.Analyzer(model, 'BuildInfo', {bdInfo})` creates a `Simulink.sfunction.Analyzer` object with the model and a `Simulink.sfunction.analyzer.BuildInfo` object named `bdInfo`.

`sfunAnalyzer = Simulink.sfunction.Analyzer(model, 'Options', {opts})` creates a `Simulink.sfunction.Analyzer` object with the model and a `Simulink.sfunction.analyzer.Options` object named `opts`.

Input Arguments

model — Specify a model in the path

character vector | string

Names of the model in the path, specified as a string or character vector.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: 'BuildInfo', {buildInfo}

BuildInfo — Specify the buildinfo object

cell array

A cell array of buildinfo objects. See `Simulink.sfunction.analyzer.BuildInfo` for more information.

Options — Specify the S-function analyzer running options

object

An object to specify S-function analyzer running options. These checks include Polyspace Code Prover™ and parameter robustness checks. See `Simulink.sfunction.analyzer.Options` for more information.

Methods

<code>generateReport</code>	Generate an HTML report of S-function checks
<code>run</code>	Perform checks on S-functions

Introduced in R2017b

findSfunctions

Find and return all eligible S-functions in a model

Syntax

```
sfuns = Simulink.sfunction.analyzer.findSfunctions(model)
```

Description

`sfuns = Simulink.sfunction.analyzer.findSfunctions(model)` returns all eligible S-functions in a model for the S-function checks. Rules are applied to filter out all ineligible S-functions.

Input Arguments

model — A Simulink model or library in path

character vector | string vector

A Simulink model or library in path specified as a string or a character vector.

Output Arguments

sfuns — A list of all eligible S-functions

cell array of character vectors

Eligible S-functions in the model, specified as a cell array of character vectors.

run

Class: Simulink.sfunction.Analyzer

Package: Simulink.sfunction

Perform checks on S-functions

Syntax

```
result = run()
```

Description

`result = run()` returns a struct containing the result from the analyzer checks. An example result struct has the following fields:

```
TimeGenerated: '19-Jul-2017 19:25:32'  
Platform: 'win64'  
Release: '(R2017b)'  
SimulinkVersion: '9.0'  
ExemptedBlocks: {}  
MexConfiguration: [1x1 mex.CompilerConfiguration]  
Data: [4x4 struct]
```

Output Arguments

result — Sfunction.Analyzer structure

MATLAB structure

MATLAB structure containing the result of S-function analyzer.

Introduced in R2017b

Simulink.sfunction.analyzer.BuildInfo class

Package: Simulink.sfunction.analyzer

Create an object to represent build information

Description

Simulink.sfunction.analyzer.BuildInfo object captures the build information for S-functions, such as source files, header files, and linking libraries, for use with the Simulink.sfunction.Analyzer class.

Construction

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile)` creates a Simulink.sfunction.analyzer.BuildInfo object.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'SrcPath', {srcpaths}, 'ExtraSrcFileList', {srcfilelist})` creates a Simulink.sfunction.analyzer.BuildInfo object for a C-MEX S-function source file, a list of extra source files located in the specified path.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'ObjFileList', {objfilelist})` creates a Simulink.sfunction.analyzer.BuildInfo object for C-MEX S-function source file and list of extra objective code files.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'IncPaths', {incpathslist})` creates a Simulink.sfunction.analyzer.BuildInfo object for C-MEX S-function source file and paths to the folders including header files.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'LibFileList', {libfilelist}, 'LibPaths', {libpaths})` creates a Simulink.sfunction.analyzer.BuildInfo object for C-MEX S-function source file and library files and library file paths used for building.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'PreProcDefList', {preprocdir})` creates a Simulink.sfunction.analyzer.BuildInfo object for C-MEX S-function source file and pre-processor directives list.

Input Arguments

SfcnFile — S-function source file

character vector | string

S-function source file having the same name as the S-function.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: 'SrcPath', {srcpath}

SrcPath — Source file path

cell array of character vectors | string

Search paths to extra S-function source files that are referenced by SfcnFile, specified as a cell array or a string.

ExtraSrcFileList — Extra source file list

cell array of character vectors | string

List of extra S-function source files, specified as a cell array or string.

ObjFileList — Extra objective code

cell array

List of objective files used for building, specified as a cell array.

IncPaths — Search paths for header files

cell array of character vectors | string

Specify paths to include folders for header files, specified as a cell array or a string.

LibFileList — External libraries list

cell array of character vectors | string

List of external library files used for building, specified as a cell array or string.

LibPaths — Search paths for external libraries

cell array of character vectors | string

Search paths for external library files used for building, specified as a cell array or a string.

PreProcDefList — Preprocessor directives

cell array of character vectors | string

List of the preprocessor directives, specified as a cell array or a string.

Output Arguments

bdInfo — BuildInfo object

object

Build information for the S-functions supplied to the S-function analyzer. Returns a `simulink.sfunction.analyzer.BuildInfo` object.

Examples

Create a `bdInfo` object for an S-function `mysfun` that includes a source file `mysfun.c`:

Basic Use

```
bdInfo = Simulink.sfunction.analyzer.BuildInfo('mysfun.c');
```

The output `bdInfo` has the following fields:

```
bdInfo =
```

```
BuildInfo with properties:
```

```

    SfcnFile: 'mysfun.c'
    SfcnName: 'mysfun'
    SrcType: 'C'
    SrcPaths: {}
    ExtraSrcFileList: {}
    ObjFileList: {}
    IncPaths: {}
    LibFileList: {}
    LibPaths: {}
    PreProcDefList: {}

```

Advanced Use

Create a `bdInfo` object for an S-function `mysfun` that includes a source file `mysfun.c` and also includes:

- List of extra source files, `extra1.c` and `extra2.c`
- Paths to source file folders, `/path1` and `/path2`.
- List of objective files, `o1.obj` and `o2.obj`.
- List of library files, `l1.lib` and `l2.lib`.
- Library paths, `/libpath1`.
- Pre-processor running directives, `-DDEBUG`.

```

Simulink.sfunction.analyzer.BuildInfo('mysfun.c',...
    'ExtraSrcFileList',{extra1.c,extra2.c},... %specify extra s
    'SrcPaths',{/path1,/path2},... %specify paths t
    'ObjFileList',{o1.obj,o2.obj},... %specify object
    'LibFileList',{l1.lib,l2.lib},... %specify library
    'LibPaths',{/libpath1},... %specify library
    'PreProcDefList',{DEBUG}); %specify preproc

```

[Simulink.sfunction.analyzer.Options | findSfunctions](#)

Introduced in R2017b

Simulink.sfunction.analyzer.Options class

Package: Simulink.sfunction.analyzer

Create an object to specify options for running S-function checks

Description

Simulink.sfunction.analyzer.Options object is created through the constructor Simulink.sfunction.analyzer.Options(). Simulink.sfunction.analyzer.Options object captures the options for running S-function checks. These checks include whether to enable Polyspace and Parameter Robustness checks, maximum model simulation time and output path for result report.

Construction

opts= Simulink.sfunction.analyzer.Options() returns a options object with these property values:

```
EnablePolyspace: 0
EnableRobustness: 0
EnableUsePublishedOnly: 0
ReportPath: pwd
ModelSimTimeOut: 10
```

Properties

EnablePolyspace — Polyspace Code Prover check

False (default) | True

Boolean type check to determine whether to include Polyspace Code Prover check.

Note These checks usually take some time to run.

EnableRobustness — Parameter robustness check

False (default) | True

Boolean type check to indicate whether to include Robustness checks.

Note These checks usually take some time to run.

ReportPath — Generated report directory

current working directory (default) | character array

Path to the generated report directory.

ModelSimTimeOut — Maximum model simulation time

10 (default) | scalar

Maximum model simulation time in seconds.

EnableUsePublishedOnly — Check for use of only documented APIs

False (default) | True

Check to indicate if any undocumented S-function APIs are used in the code.

Simulink.SimState.ModelSimState class

Package: Simulink.SimState

(Not recommended) Access SimState snapshot data

Note Simulink.SimState.ModelSimState is not recommended. Use Simulink.op.ModelOperatingPoint instead.

Description

The Simulink.SimState.ModelSimState class contains all of the information associated with a “snapshot” of a simulation, including the logged states, the time of the snapshot, and the start time of the simulation. To access these data for a block, use the `getBlockSimState` method or the `loggedStates` property.

Properties

description

Specify a description. By default, Simulink generates a character vector based on your model name.

loggedStates

The logged states are the continuous and discrete states of the blocks in a model. These states represent a subset of the complete simulation state (SimState) of the model.

If `loggedStates` is in Dataset format, you cannot assign a structure or a Simulink.SimulationData.Dataset object with a different number of elements than that of the Dataset object used for `loggedStates`.

If the `loggedStates` is in Structure format, you cannot assign a Dataset object.

Attributes:

dependent

`loggedStates` is obtained from the saved states of the block. `loggedStates` depends on the full state being saved in the SimState object, unlike, properties like `description`, which are independent of the save states.

snapshotTime

Time at which Simulink takes a “snapshot” of the complete simulation states. This data is read only.

startTime

Time at which the simulation starts. This data is read only.

Methods

`getBlockSimState` (Not recommended) Access `SimState` of individual Stateflow Chart, MATLAB Function, or S-function block

`setBlockSimState` (Not recommended) Set `SimState` of individual Stateflow Chart, MATLAB Function, or S-function block

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects in the MATLAB Programming Fundamentals documentation.

getBlockSimState

Class: Simulink.SimState.ModelSimState

Package: Simulink.SimState

(Not recommended) Access SimState of individual Stateflow Chart, MATLAB Function, or S-function block

Note Simulink.SimState.ModelSimState.getBlockSimState is not recommended. Use `get` instead.

Syntax

```
blockSimState = getBlockSimState(x, 'blockpath')
```

Description

`blockSimState = getBlockSimState(x, 'blockpath')` returns the SimState of the block specified as `blockpath`. `blockpath` must be either a Stateflow Chart, MATLAB Function, or S-function block. For other types of blocks, see the `loggedStates` property of the Simulink.SimState.ModelSimState class.

Input Arguments

x

The `x` argument is a Simulink.SimState.ModelSimState object.

blockpath

The path to the block for which you are requesting the SimState values.

Output Arguments

blockSimState

The SimState of the block specified.

Examples

```
chartState = getBlockSimState(x, 'mymodel/chart')
```

To get the SimState of a block that is in a referenced model, specify the full path of the block relative to the root model.

```
openExample('sldemo_fuelsys_dd');  
rootModel = 'sldemo_fuelsys_dd';  
opt = struct('SaveFinalState','on','SaveCompleteFinalSimState','on','StopTime','1');
```

```
simOut = sim(rootModel,opt);  
x = simOut.xFinal;  
blockPath = 'sldemo_fuelsys_dd/Fuel Rate Controller|sldemo_fuelsys_dd_controller/control_logic';  
chartState = getBlockSimState(x,blockPath)
```

See Also

setBlockSimState

setBlockSimState

Class: Simulink.SimState.ModelSimState

Package: Simulink.SimState

(Not recommended) Set SimState of individual Stateflow Chart, MATLAB Function, or S-function block

Note Simulink.SimState.ModelSimState.setBlockSimState is not recommended. Use set instead.

Syntax

```
setBlockSimState(x, 'blockpath', blockSimState)
```

Description

setBlockSimState(x, 'blockpath', blockSimState) sets the SimState of the block specified as *blockpath*. *blockpath* must be either a Stateflow Chart, MATLAB Function, or S-function block. For other types of blocks, see the `loggedStates` property of the Simulink.SimState.ModelSimState class.

Input Arguments

x

The argument *x* is a Simulink.SimState.ModelSimState object.

blockpath

The path to the block for which you are setting the SimState values

blockSimState

The SimState of the block specified.

Examples

```
newObj = setBlockSimState(obj, 'mymodel/chart', newChartState);
```

See Also

getBlockSimState

Simulink.Simulation.BlockParameter class

Package: Simulink.Simulation

Block parameters in Simulink.SimulationInput objects

Description

The `Simulink.Simulation.BlockParameter` object specifies the block parameter, path of the block, and the value of the block parameter used by the `Simulink.SimulationInput` object during simulation.

In most cases, there is no need to create an object of this class directly. It is recommended that you use the `setBlockParameter` method on the `Simulink.SimulationInput` object to add a block parameter to the `Simulink.SimulationInput` object.

Creation

`bp = Simulink.Simulation.BlockParameter('BlockPath', 'Name', 'Value')` creates a `Simulink.Simulation.BlockParameter` object, `bp`, that specifies the block parameter, `Name`, with a `Value` on its path, `BlockPath`.

Properties

BlockPath — Path of the block

character vector

Path of the block, specified as a character vector.

Name — Name of the block parameter

character vector

Name of the block parameter, specified as a character vector.

Value — Value of the block parameter

character vector

Value of the block parameter, specified as a character vector.

Topics

“Running Multiple Simulations”

“Run Parallel Simulations for a Thermal Model of a House Using `parsim`”

Introduced in R2020a

Simulink.Simulation.Future class

Package: Simulink.Simulation

Create Future object for simulation

Description

Create a `Simulink.Simulation.Future` object when you execute `parsim` with the `'RunInBackground'` argument set to `'on'`. The `parsim` command runs multiple simulations in parallel using the inputs specified with an array of `Simulink.SimulationInput` objects. You can use this object to monitor the status of ongoing simulations, fetch outputs of completed simulations, or cancel ongoing simulations.

The `parsim` command uses the Parallel Computing Toolbox license to run the simulations in parallel. `parsim` runs the simulations in serial if a parallel pool cannot be created or if Parallel Computing Toolbox is not used.

Construction

`future = parsim(in, 'RunInBackground', 'on')` creates a `Simulink.Simulation.Future` object, `future`, while running multiple simulations in parallel using the inputs specified in the `Simulink.SimulationInput` object, `in`.

Input Arguments

in — `Simulink.SimulationInput` object array

object (default) | array

A `Simulink.SimulationInput` object or an array of `Simulink.SimulationInput` objects is used to run multiple simulations. Specify parameters and values of a model to run multiple simulations without making it dirty.

Example: `in = Simulink.SimulationInput('vdp'), in(1:10) = Simulink.SimulationInput('vdp')`

'RunInBackground' — `parsim` argument to enable `RunInBackground`

'off' (default) | 'on'

Set to `'on'`, to run simulations asynchronously, keeping the MATLAB command prompt available.

Properties

Diary — Log of outputs from the simulation

text file

Text log of outputs from the simulation.

This property is read-only.

ID — Numeric identifier of the future object

scalar integer

ID of the `future` object, specified as a scalar integer.

This property is read-only.

Read — Whether the outputs have been read

1 | 0

Whether a call to `fetchNext` or `fetchOutputs` has read the outputs in the `Simulink.Simulation.Future` object array, specified as 1 if true and 0 if false.

This property is read-only.

State — Current state of future object array

'pending' | 'queued' | 'running' | 'finished' | 'failed' | 'unavailable'

Current state of future object array, specified as 'pending', 'queued', 'running', 'finished', 'failed', or 'unavailable'.

This property is read-only.

Methods

Method	Purpose
<code>cancel</code>	Cancel a pending, queued, or running <code>Simulink.Simulation.Future</code> object
<code>fetchNext</code>	Fetch next available unread output from <code>Simulink.Simulation.Future</code> object array
<code>fetchOutputs</code>	Retrieve <code>Simulink.SimulationOutput</code> from <code>Simulink.Simulation.Future</code>
<code>wait</code>	Wait for <code>Simulink.Simulation.Future</code> objects to complete simulation

Examples

Create a `Simulink.Simulation.Future` Object

This example shows how to create a `Simulink.Simulation.Future` object array and use it to retrieve outputs and see the status of simulations.

This example runs several simulations of the `vdp` model, varying the value of the gain `Mu`.

Open the model and define a vector of `Mu` values.

```
open_system('vdp');
Mu_Values = [0.5:0.25:5];
MuVal_length = length(Mu_Values);
```

Using `Mu_Values`, initialize an array of `Simulink.SimulationInput` objects. To preallocate the array, a loop index is made to start from the largest value.

```
for i = MuVal_length:-1:1
    in(i) = Simulink.SimulationInput('vdp');
```

```
        in(i) = in(i).setBlockParameter('vdp/Mu',...  
            'Gain',num2str(Mu_Values(i)));  
end
```

Simulate the model using `parsim`. Set it to 'RunInBackground', to be able to use the command prompt, while simulations are running.

```
Future = parsim(in, 'RunInBackground', 'on');
```

Use the `fetchNext` method on Future simulations.

```
for i = 1:MuVal_length  
    [completedIdx, simOut] = fetchNext(Future)  
end
```

`parsim` | `batchsim` | `batch` | `cancel` | `fetchNext` | `fetchOutputs` | `wait`

Classes

`Simulink.SimulationInput`

Introduced in R2018a

cancel

Cancel a pending, queued, or running `Simulink.Simulation.Future` object

Syntax

```
cancel(Future)
```

Description

`cancel(Future)` stops the objects of the `Simulink.Simulation.Future` array, `Future`, that are currently in 'pending', 'queued', or 'running' state. For elements of the Futures in the 'finished' state, no action is taken.

Examples

Cancel Simulations of Future Objects

This example shows how to use the `cancel` method on an array of future objects to stop the simulations.

This example runs several simulations of the `vdp` model, varying the value of the gain `Mu`.

Open the model and define a vector of `Mu` values.

```
open_system('vdp');  
Mu_Values = [0.5:0.25:1000];  
MuVal_length = length(Mu_Values)
```

Using `Mu_Values`, initialize an array of `Simulink.SimulationInput` objects. To preallocate the array, a loop index is made to start from the largest value.

```
for i = MuVal_length:-1:1  
    in(i) = Simulink.SimulationInput('vdp');  
    in(i) = in(i).setBlockParameter('vdp/Mu', ...  
        'Gain', num2str(Mu_Values(i)));  
end
```

Simulate the model using `parsim`. Set to 'RunInBackground' to enable the use the command prompt, while simulations are running.

```
Future = parsim(in, 'RunInBackground', 'on');
```

Now, assume that you want to run simulations with different values of `Mu` and cancel the ongoing simulations.

`cancel(Future)`

Input Arguments

Future — `Simulation.Simulink.Future` object

array

Array of `Simulation.Simulink.Future` objects. To create `Future`, run `parsim` with `'RunInBackground'` option set to `'on'`.

Example: `Future = parsim(in, 'RunInBackground', 'on')`

See Also

Functions

`parsim` | `batchsim` | `batch` | `fetchOutputs` | `fetchNext` | `wait`

Classes

`Simulink.Simulation.Future` | `Simulink.SimulationInput`

Introduced in R2018a

fetchNext

Fetch next available unread output from `Simulink.Simulation.Future` object array

Syntax

```
[idx,simOut] = fetchNext(Future)
[idx,simOut] = fetchNext(Future, Timeout)
```

Description

`[idx,simOut] = fetchNext(Future)` waits for the unread element of `Simulink.Simulation.Future` array, `Future`, to reach a 'finished' state. It returns the index of the simulation that finished, and the corresponding `Simulink.SimulationOutput` object.

`[idx,simOut] = fetchNext(Future, Timeout)` waits for a maximum of `Timeout` seconds for a result to become available. If the timeout expires before any result is available, `simOut` is returned as an empty array.

An error is reported if there are no elements in `Future` with property `Read` as false. You can check for any unread futures using `anyUnread = ~all([F.Read])`.

`fetchNext` displays an error if any element of `Future` with a 'finished' state encounters an error during execution. The `Read` property of that element becomes `true` allowing any subsequent call to `fetchNext` to proceed.

Examples

Create a Simulink.Simulation.Future Object

This example shows how to create a `Simulink.Simulation.Future` object array and use it to retrieve outputs and see the status of simulations.

This example runs several simulations of the `vdp` model, varying the value of the gain `Mu`.

Open the model and define a vector of `Mu` values.

```
open_system('vdp');
Mu_Values = [0.5:0.25:5];
MuVal_length = length(Mu_Values);
```

Using `Mu_Values`, initialize an array of `Simulink.SimulationInput` objects. To preallocate the array, a loop index is made to start from the largest value.

```
for i = MuVal_length:-1:1
    in(i) = Simulink.SimulationInput('vdp');
    in(i) = in(i).setBlockParameter('vdp/Mu',...
        'Gain',num2str(Mu_Values(i)));
end
```

Simulate the model using `parsim`. Set it to 'RunInBackground' to be able to use the command prompt, while simulations are running.

```
Future = parsim(in, 'RunInBackground', 'on');
```

Use the `fetchNext` method on `Future`.

```
for i = 1:MuVal_length
    [completedIdx, simOut] = fetchNext(Future)
end
```

Input Arguments

Future — `Simulation.Simulink.Future` object

array

Array of `Simulation.Simulink.Future` objects. To create `Future`, run `parsim` with 'RunInBackground' option set to 'on'.

Example: `Future = parsim(in, 'RunInBackground', 'on')`

Timeout — Number of seconds specified for `fetchNext` to time out

scalar

Specify a `Timeout` for `fetchNext` to retrieve the results from the `Simulation.Simulink.Future` array, `Future`.

Example: `[idx, simOut] = fetchNext(Future, 45)`

Output Arguments

idx — Index of the simulation

integer

When `fetchNext` method is used on an array of `Simulink.Simulation.Future` objects, it returns the index of the simulation whose output is being retrieved.

simOut — Simulation object containing logged simulation results

object | array

Array of `Simulink.SimulationOutput` objects that contain all of the logged simulation results. The size of the array is equal to the size of the array of `Simulink.SimulationInput` objects.

All simulation outputs (logged time, states, and signals) are returned in a single `Simulink.SimulationOutput` object. You define the model time, states, and output that are logged using the **Data Import/Export** pane of the Model Configuration Parameters dialog box. You can log signals using blocks such as the To Workspace and Scope blocks. The **Viewers & Generators Manager** tool can directly log signals.

fetchOutputs

Retrieve `Simulink.SimulationOutput` from `Simulink.Simulation.Future` objects

Syntax

```
simOut = fetchOutputs(Future)
```

Description

`simOut = fetchOutputs(Future)` fetches the output from an array of `Simulink.Simulation.Future` objects, `Future`, after each element of `Future` is in a 'finished' state. `fetchOutputs` returns an array of `Simulink.SimulationOutput` objects.

Examples

Create a Future and Retrieve Outputs Using fetchOutputs

This example shows how to use the `fetchOutputs` method on an array of future objects to retrieve a `Simulink.SimulationOutput` array.

This example runs several simulations of the `vdp` model, varying the value of the gain `Mu`.

Open the model and define a vector of `Mu` values.

```
open_system('vdp');
Mu_Values = [0.5,0.75,1,1.25];
MuVal_length = length(Mu_Values);
```

Using `Mu_Values`, initialize an array of `Simulink.SimulationInput` objects. To preallocate the array, a loop index is made to start from the largest value.

```
for i = MuVal_length:-1:1
    in(i) = Simulink.SimulationInput('vdp');
    in(i) = in(i).setBlockParameter('vdp/Mu',...
        'Gain',num2str(Mu_Values(i)));
end
```

Simulate the model using `parsim`. Set to 'RunInBackground' to enable the use of command prompt, while simulations are running.

```
Future = parsim(in,'RunInBackground','on');
```

Use the `fetchOutputs` method on `Future`

```
simOut = fetchOutputs(Future)
```

```
simOut =  
1x4 Simulink.SimulationOutput array
```

Input Arguments

Future — **Simulation.Simulink.Future** object

array

Array of `Simulation.Simulink.Future` objects. To create, `Future`, run `parsim` with 'RunInBackground' option set to 'on'.

Example: `Future = parsim(in, 'RunInBackground', 'on')`

Output Arguments

simOut — **Simulation object containing logged simulation results**

object

Array of `Simulink.SimulationOutput` objects that contain all of the logged simulation results. The size of the array is equal to the size of the array of `Simulink.SimulationInput` objects.

All simulation outputs (logged time, states, and signals) are returned in a single `Simulink.SimulationOutput` object. You define the model time, states, and output that are logged using the **Data Import/Export** pane of the Model Configuration Parameters dialog box. You can log signals using blocks such as the To Workspace and Scope blocks. The **Viewers & Generators Manager** tool can directly log signals.

`Simulink.Simulation.Future` | `Simulink.SimulationInput`

Introduced in R2018a

wait

Wait for `Simulink.Simulation.Future` objects to complete simulation

Syntax

```
Ok = wait(Future)
```

Description

`Ok = wait(Future)` blocks the command prompt until each element of the `Simulink.Simulation.Future` array, `Future` is in a 'finished' state.

Examples

Wait for the Future Array to Complete Simulations

This example shows how to use the `wait` method on an array of future objects.

This example runs several simulations of the `vdp` model, varying the value of the gain `Mu`.

Open the model and define a vector of `Mu` values.

```
open_system('vdp');
Mu_Values = [0.5:0.25:5];
MuVal_length = length(Mu_Values);
```

Using `Mu_Values`, initialize an array of `Simulink.SimulationInput` objects. To preallocate the array, a loop index is made to start from the largest value.

```
for i = MuVal_length:-1:1
    in(i) = Simulink.SimulationInput('vdp');
    in(i) = in(i).setBlockParameter('vdp/Mu', ...
        'Gain', num2str(Mu_Values(i)));
end
```

Simulate the model using `parsim`. Set to 'RunInBackground' to enable the use of command prompt while the simulations are running and to create an array of `Simulink.Simulation.Future` objects.

```
Future = parsim(in, 'RunInBackground', 'on');
```

Use the `wait` method on `Future` to block the execution.

```
Ok = wait(Future)
```

Input Arguments

Future — `Simulation.Simulink.Future` object

array

Array of `Simulation.Simulink.Future` objects. To create `Future`, run `parsim` with `'RunInBackground'` option set to `'on'`.

Example: `Future = parsim(in, 'RunInBackground', 'on')`

Output Arguments

Ok — Whether the wait is completed successfully

1 | 0

`Ok` is `true` if the wait completes successfully, `false` if any of the `Future` objects failed execution or were canceled. Specified as 1 if true, 0 if false.

Introduced in R2017b

Simulink.Simulation.Job class

Package: Simulink

Execute `batchsim` to create a `Simulink.Simulation.Job` object, `simJob`

Description

Execute `batchsim` command with a parallel pool to create a `Simulink.Simulation.Job` object. The `batchsim` command offloads multiple simulations to run in batch using the inputs specified with an array of `Simulink.SimulationInput` objects. You can use this object to monitor the status of a batch job, fetch outputs of a completed batch job, or cancel one or more jobs.

The `batchsim` command uses the Parallel Computing Toolbox™ license to run the simulations on compute cluster. If a parallel pool cannot be created `batchsim` runs the simulations in serial. In the absence of Parallel Computing Toolbox license, `batchsim` errors out.

Construction

`simJob = batchsim(in)` creates a `Simulink.Simulation.Job` object, `simJob`, while running multiple simulations in batches on a compute cluster using the inputs specified in the `Simulink.SimulationInput` object, `in`.

`createSimulationJob(batchJob)` creates a `Simulink.Simulation.Job` object from a `parallel.job` object, `batchJob`. Use the `createSimulationJob` command to retrieve the job object returned by the `batchsim` command.

Input Arguments

in — `Simulink.SimulationInput` object array

object (default) | array

A `Simulink.SimulationInput` object or an array of `Simulink.SimulationInput` objects used to run multiple simulations. Specify parameters and values of a model to run multiple simulations without making it dirty.

Example: `in = Simulink.SimulationInput('vdp'), in(1:10) = Simulink.SimulationInput('vdp')`

Properties

AdditionalPaths — Folders to add to MATLAB search path of workers

character vector | string | string array | array of character vectors

Specified folders to add to MATLAB search path of parallel workers.

This property is read-only.

AttachedFiles — Files and folders sent to the workers

character vector | string | string array | array of character vectors

Files and folders to send to the parallel workers.

This property is read-only.

AutoAddClientPath — Whether user-added entries on client path are added to each worker path

true (default) | false

Whether user-added entries on the client path are added to each parallel worker path at the start of the batch job, specified as true or false.

CreateDateTime — Date and time of simJob creation

datetime object

Date and time at which the batch job was created, specified as a datetime object.

This property is read-only.

EnvironmentVariables — Environment variables sent to the workers

character vector | string | string array | array of character vectors

Defines the names of environment variables that are copied from a client session to the parallel workers.

This property is read-only after job submission.

FinishDateTime — Date and time of simJob completion

datetime object

Date and time at when the batch job completes execution, specified as a datetime object.

This property is read-only.

ID — Numeric identifier of the simJob object

scalar integer

ID of the future object, specified as a scalar integer.

This property is read-only.

Name — simJob name

string | character vector

Name of the job object, specified as a string.

Parent — Cluster object containing simJob

parallel.cluster object

Cluster object that contains the Simulink.Simulation.Job object, simJob.

StartDateTime — Date and time when simJob starts running

datetime object

Date and time when the Simulink.Simulation.Job starts running, specified as a datetime object.

This property is read-only.

State — Current state of future object array

'pending' | 'queued' | 'running' | 'finished' | 'failed'

Current state of future object array, specified as 'pending', 'queued', 'running', 'finished', or 'failed'.

This property is read-only.

SubmitDateTime — Date and time of simJob submission

datetime object

Date and time when the Simulink.Simulation.Job is submitted, specified as a datetime object.

This property is read-only.

Tag — Label associated with simJob

string

Label associated with Simulink.Simulation.Job object.

Type — Job Type

independent | pool

Type of the Simulink.Simulation.Job object, specified as independent or pool.

UserData — Data associated with simJob

string

Stores any data associated with a job object. The data is stored in a client MATLAB session, and is not available on the workers.

UserName — Name of the user who creates the simJob object

string | character vector

Name of the user who creates the Simulink.Simulation.Job object.

Methods

Method	Purpose
cancel	Cancel a pending, queued, or running Simulink.Simulation.Job object
diary	Display or save Command Window text of batch job
fetchOutputs	Retrieve an array of Simulink.SimulationOutput objects from all simulations in Simulink.Simulation.Job
listAutoAttachedFiles	List of files automatically attached to job, task, or parallel pool
wait	Wait for Simulink.Simulation.Job object to change state

Examples

Run Parallel Simulations With `batchsim` to Create `Simulink.Simulation.Job`

This example shows how to run parallel simulations in batch using the `sldemo_househeat` model. `batchsim` offloads simulations to the compute cluster, enabling you to carry out other tasks while the batch job is processing, or close the client MATLAB and access the batch job later.

Observe the model behavior for different temperature set points.

1. Open the model.

```
open_system('sldemo_househeat');
```

2. Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

3. Using the `setPointValues`, initialize an array of `Simulink.SimulationInput` objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
    in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point',...
        'Value',num2str(setPointValues(i)));
end
```

4. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job ID to access the job object later from any machine. `NumWorkers` displays how many workers are running the simulations - the number of workers specified in the 'Pool' argument plus an additional head worker.

```
simJob = batchsim(in,'Pool',3)

           ID: 1
           Type: pool
    NumWorkers: 4
      Username: #####
           State: running
SubmitDateTime: ##-###-#### #:##:##
  StartDateTime:
Running Duration: 0 days 0h 0m 0s
```

cancel

Package: Simulink

Cancel a pending, queued, or running `Simulink.Simulation.Job` object

Syntax

```
cancel(simJob)
cancel(simJob, 'Message')
```

Description

`cancel(simJob)` stops the `Simulink.Simulation.Job` object, `simJob`, that is currently in 'pending', 'queued', or 'running' state.

`cancel(simJob, 'Message')` stops the `Simulink.Simulation.Job` object, `simJob`, that is in 'pending', 'queued', or 'running' state and displays a user-specified message.

The `State` property of `Simulink.Simulation.Job` object is set to finished, and other pending simulations are canceled. Canceling a job object disables you to fetch results from it. A canceled job object cannot be started again.

Note On canceling the job, the results of the completed simulations in the job are also lost.

Examples

Cancel a Batch Job

This example shows how to use the `cancel` method on a `simJob` object to stop simulations. The example runs several simulations of the `vdp` model, varying the value of the gain `Mu`.

1. Open the model and define a vector of `Mu` values.

```
open_system('vdp');
mu_Values = [0.5:0.25:1000];
muVal_Length = length(mu_Values);
```

2. Using `mu_Values`, initialize an array of `Simulink.SimulationInput` objects.

```
in(1:muVal_Length) = Simulink.SimulationInput('vdp');
for i = 1:1:muVal_Length
    in(i) = in(i).setBlockParameter('vdp/Mu', ...
        'Gain', num2str(mu_Values(i)));
end
```

3. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The simulations are offloaded onto the default cluster profile.

```
simJob = batchsim(in, 'Pool',3);
```

4. Now, assume that you want to run simulations with different values of Mu and cancel the ongoing simulations.

```
cancel(simJob)
```

Input Arguments

simJob — **Simulink.Simulation.Job** object
object

A `Simulink.Simulation.Job` object. To create a `simJob`, run `batchsim`.

Example: `simJob = batchsim(in, 'Pool',6)`

diary

Package: Simulink

Display or save Command Window text of `Simulink.Simulation.Job` object

Syntax

```
diary(simJob)
diary(simJob, 'filename')
```

Description

`diary(simJob)` displays the Command Window output from the `Simulink.Simulation.Job` object, `simJob`, in the MATLAB Command Window. The Command Window output is captured only if the `batchsim` command includes the `'CaptureDiary'` argument with a value of `true`.

`diary(simJob, 'filename')` causes the Command Window output from the batch job to be appended to the specified file. Open the file, `filename`, with any text editor.

Examples

Display the Diary of `simJob`

This example uses `sldemo_househeat` model to show how to display the diary of the `Simulink.Simulation.Job` object, `simJob`. To create a `simJob`, you run parallel simulations using the `batchsim` command.

1. Open the model.

```
open_system('sldemo_househeat');
```

2. Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

3. Using `setPointValues`, initialize an array of `Simulink.SimulationInput` objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
    in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point',...
    'Value', num2str(setPointValues(i)));
end
```

4. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job ID to access the job object later from any machine. `NumWorkers` displays how many workers are running the simulations - the number of workers specified in the `'Pool'` argument plus an additional head worker.

```

simJob = batchsim(in, 'Pool',3)

        ID: 1
        Type: pool
    NumWorkers: 4
        Username: #####
        State: running
    SubmitDateTime: ##-###-#### #:##:##
    StartDateTime:
    Running Duration: 0 days 0h 0m 0s

```

5. Use the `diary` method of the `Simulink.Simulation.Job` object to display the output of the batch job in the MATLAB command window.

Note that the diary is not displayed here because this is an example model.

```
diary(simJob)
```

Input Arguments

simJob — `Simulink.Simulation.Job` object
object

A `Simulink.Simulation.Job` object. To create a `simJob`, run `batchsim`.

Example: `simJob = batchsim(in, 'Pool',4)`

'filename' — File to append with Command Window output text
string

Specify a file to append with Command Window output text from the `Simulink.Simulation.Job` object.

Example: `diary(simJob, 'abc.txt')`

fetchOutputs

Package: Simulink

Retrieve an array of `Simulink.SimulationOutput` objects from all simulations in `Simulink.Simulation.Job`

Syntax

```
out = fetchOutputs(simJob)
```

Description

`out = fetchOutputs(simJob)` returns an array of `Simulink.SimulationOutput` objects containing the results of the simulations in a batch job, `simJob`.

`fetchOutputs` reports an error if the job is not in the 'finished' state, or if one of its simulations encounters an error during execution. Use the `wait` method to wait for the job to complete before fetching outputs.

Examples

Fetch Outputs of the Batch Simulations

This example shows how to run parallel simulations in batch and fetch the resulting `Simulink.SimulationOutput` objects from the `Simulink.Simulation.Job` object. `batchsim` command offloads simulations to the compute cluster, enabling you to carry out other tasks while the batch job is processing, or close the client MATLAB and access the batch job later.

1. Open the model.

```
open_system('sldemo_househeat');
```

2. Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

3. Using `setPointValues`, initialize an array of `Simulink.SimulationInput` objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
    in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point',...
        'Value',num2str(setPointValues(i)));
end
```

4. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job ID to access the job object later from any machine. `NumWorkers` displays

how many workers are running the simulations - the number of workers specified in the 'Pool' argument plus an additional head worker.

```
simJob = batchsim(in, 'Pool', 3)

        ID: 1
        Type: pool
    NumWorkers: 4
        Username: #####
        State: running
    SubmitDateTime: ##-##-#### #:##:##
    StartDateTime:
    Running Duration: 0 days 0h 0m 0s
```

5. Access the results of the batch job using the `fetchOutputs` method. `fetchOutputs` returns an array of `Simulink.SimulationOutput` objects. You can fetch outputs only once `simJob` is in finished state.

```
out = fetchOutputs(simJob)
```

```
1x11 Simulink.SimulationOutput array
```

Input Arguments

simJob — Simulink.Simulation.Job object

object

A `Simulink.Simulation.Job` object. To create `simJob`, run `batchsim`.

Example: `simJob = batchsim(in, 'Pool', 4)`

Output Arguments

out — Simulation object containing logged simulation results

object

Array of `Simulink.SimulationOutput` objects that contain all of the logged simulation results. The size of the array is equal to the size of the array of `Simulink.SimulationInput` objects passed to `batchsim`.

All simulation outputs (logged time, states, and signals) are returned in a single `Simulink.SimulationOutput` object. You define the model time, states, and output that are logged using the **Data Import/Export** pane of the Model Configuration Parameters dialog box. You can log signals using blocks such as the To Workspace and Scope blocks. The **Signal & Scope Manager** tool can directly log signals.

getSimulationJobs

Get all `Simulink.Simulation.Job` objects from cluster

Syntax

```
jobs = getSimulationJobs(myCluster)
```

Description

`jobs = getSimulationJobs(myCluster)` returns an array of `Simulink.Simulation.Job` objects that correspond to the jobs created by executing of `batchsim` on cluster, `myCluster`.

Examples

Get a Simulink.Simulation.Job Object from the Cluster

This example shows how to access a `batchsim` job that was submitted to a cluster. Assume that `myCluster` is a `parallel.Cluster` object on which the `Simulink.Simulation.Job` object is running.

```
jobs = getSimulationJobs(myCluster)
```

1×2 Job array:

	ID	Type	State	FinishDateTime	Username
1	3	pool	queued		#####
2	4	pool	queued		#####

The output displays all the `Simulink.Simulation.Job` objects on cluster, `myCluster`.

Input Arguments

myCluster — `parallel.Cluster` object

object

Cluster object representing parallel cluster compute resources.

Output Arguments

jobs — Array of `Simulink.Simulation.Job` objects

array

Array of `Simulink.Simulation.Job` objects submitted by executing `batchsim` command.

listAutoAttachedFiles

Package: Simulink

List of files automatically attached to the `Simulink.Simulation.Job` object or parallel pool

Syntax

```
listAutoAttachedFiles(simJob)
```

Description

`listAutoAttachedFiles(simJob)` performs a dependency analysis on the `Simulink.Simulation.Job` job object, `simJob`. Then it displays a list of the code files that are already attached or are going to be automatically attached to the job object, `simJob`.

Examples

Run Parallel Simulations with `batchsim` and List Attached Files

This example shows how to run parallel simulations in batch and list any attached files. `batchsim` offloads simulations to the compute cluster, enabling you to carry out other tasks while the batch job is processing, or close the client MATLAB and access the batch job later.

1. Open the model.

```
open_system('sldemo_househeat');
```

2. Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

3. Using the `setPointValues`, initialize an array of `Simulink.SimulationInput` objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
    in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point',...
    'Value',num2str(setPointValues(i)));
end
```

4. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job ID to access the job object later from any machine. `NumWorkers` displays how many workers are running the simulations - the number of workers specified in the `'Pool'` argument plus an additional head worker.

```
simJob = batchsim(in,'Pool',3)
```

```
    ID: 1
  Type: pool
```

```
    NumWorkers: 4
    Username: #####
    State: running
    SubmitDateTime: ##-##-#### #:##:##
    StartDateTime:
    Running Duration: 0 days 0h 0m 0s
```

If `AutoAttachFiles` property of `Simulink.Simulation.Job` is set to true in the cluster profile, then the job running on the cluster has the necessary code files automatically attached to it. Use the `listAutoAttachedFiles` method to view the attached files.

Note that the list of attached files is not displayed here because this is an example model.

```
listAutoAttachedFiles(simJob)
```

Input Arguments

simJob — `Simulink.Simulation.Job` object
object

A `Simulink.Simulation.Job` object. To create a `simJob`, run `batchsim`.

Example: `simJob = batchsim(in,'Pool',4)`

wait

Package: Simulink

Wait for Simulink.Simulation.Job object to change state

Syntax

```
wait(simJob)
wait(simJob,'stateOfJob')
wait(simJob,'stateOfJob',timeout)
```

Description

`wait(simJob)` blocks execution in a client session until the job identified by the object `simJob` reaches the 'finished' state or fails. This occurs when all the simulations finish execution on the workers.

`wait(simJob,'stateOfJob')` blocks execution in the client session until the specified job object changes state to the value of 'state'. The valid states to wait for are 'queued', 'running', and 'finished'. If the object is currently or has already been in the specified state, `wait` is not performed and execution returns immediately. For example, if you execute `wait(simJob,'queued')` for a job already in the 'finished' state, the call returns immediately.

`wait(simJob,'stateOfJob',timeout)` blocks execution until either the job reaches the specified 'state', or timeout seconds elapse, whichever happens first.

Examples

Wait for Simulations in simJob to Finish

This example shows uses the `sldemo_househeat` model to show how to wait for the batch simulations to finish.

1. Open the model.

```
open_system('sldemo_househeat');
```

2. Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

3. Using the `setPointValues`, initialize an array of Simulink.SimulationInput objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
    in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point',...
        'Value',num2str(setPointValues(i)));
end
```

4. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job ID to access the job object later from any machine. `NumWorkers` displays how many workers are running the simulations - the number of workers specified in the 'Pool' argument plus an additional head worker.

```
simJob = batchsim(in, 'Pool', 3)

        ID: 1
        Type: pool
    NumWorkers: 4
        Username: #####
        State: running
    SubmitDateTime: ##-###-#### #:##:##
    StartDateTime:
    Running Duration: 0 days 0h 0m 0s
```

5. Now, wait for the job to finish before retrieving the outputs.

```
wait(simJob)
```

Input Arguments

simJob — **Simulink.Simulation.Job** object
object

A `Simulink.Simulation.Job` object. To create a `simJob`, run `batchsim`.

Example: `simJob = batchsim(in, 'Pool', '5')`

'stateOfJob' — **Value of the simulation job object State property to wait for**
'pending' | 'queued' | 'running' | 'finished' | 'failed' | 'unavailable'

Value of the State property of `Simulink.Simulation.Job` object to wait for.

Example: `wait(simJob, 'queued')`

timeout — **Maximum time to wait, in seconds**
object

Specify a timeout for `wait` to block execution in seconds.

Example: `wait(simJob, 5)`

Simulink.Simulation.Variable class

Package: Simulink.Simulation

Variables in Simulink.SimulationInput objects

Description

The `Simulink.Simulation.Variables` object specifies the variable and its value used by the `Simulink.SimulationInput` object during simulation. By default, this object overrides variables that already exist in the base workspace or the data dictionary.

In most cases, there is no need to create an object of this class directly. To add a variable to the `Simulink.SimulationInput` object use the `setVariable` method on the `Simulink.SimulationInput` object.

Creation

`var = Simulink.Simulation.Variable(variableName,Value)` creates a `Simulink.Simulation.Variables` object, `var`, that specifies the variable and its value.

`var = Simulink.Simulation.Variable(variableName,Value,'Workspace',WorkspaceName)` creates a `Simulink.Simulation.Variables` object, `var`, that specifies the variable defined in the specified workspace, `WorkspaceName` and its value. `Workspace` can either be a model's name to indicate that the variable is in a model workspace or 'global-workspace' to indicate that it is either in the base workspace or in a data dictionary.

Properties

variableName — Name of the variable

character vector

Name of the variable, specified as a character vector.

Value — Value of the variable

character vector

Value of the variable, specified as a character vector.

WorkspaceName — Name of the variable

character vector

Name of the workspace that the variable is defined in, specified as a character vector.

Simulink.SimulationData.BlockPath class

Package: Simulink.SimulationData

Fully specified Simulink block path

Description

Simulink creates block path objects when creating dataset objects for signal logging and data store logging. `Simulink.SimulationData.Signal` and `Simulink.SimulationData.DataStoreMemory` objects include block path objects.

You can create a block path that you can use with the `getElement` method to access a specific dataset element. If you want to create a dataset in MATLAB to use as a baseline to compare against a signal logging or data store logging dataset, then you need to create the block paths as part of that dataset.

The `Simulink.SimulationData.BlockPath` class is very similar to the `Simulink.BlockPath` class.

You do not have to have Simulink installed to use the `Simulink.SimulationData.BlockPath` class. However, you must have Simulink installed to use the `Simulink.BlockPath` class. If you have Simulink installed, consider using `Simulink.BlockPath` instead of `Simulink.SimulationData.BlockPath`, because the `Simulink.BlockPath` class includes a method for checking the validity of block path objects without you having to update the model diagram.

Property Summary

Name	Description
SubPath	Individual component within the block specified by the block path

Method Summary

Name	Description
BlockPath	Create a block path.
convertToCell	Convert a block path to a cell array of character vectors.
getBlock	Get a single block path in the model reference hierarchy.
getLength	Get the length of the block path.

Properties

SubPath

Description

Represents an individual component within the block specified by the block path.

For example, if the block path refers to a Stateflow chart, you can use SubPath to indicate the chart signals. For example:

```
Block Path:
    'sf_car/shift_logic'

SubPath:
    'gear_state.first'
```

Data Type

character vector

Access

RW

Methods

BlockPath

Purpose

Create block path

Syntax

```
blockpath_object = Simulink.SimulationData.BlockPath()
blockpath_object = Simulink.SimulationData.BlockPath(blockpath)
blockpath_object = Simulink.SimulationData.BlockPath(paths)
blockpath_object = Simulink.SimulationData.BlockPath(paths, subpath)
```

Input Arguments

blockpath

The block path object that you want to copy.

paths

A character vector or cell array of character vectors that Simulink uses to build the block path.

Specify each character vector in order, from the top model to the specific block for which you are creating a block path.

Each character vector must be a path to a block within the Simulink model. The block must be:

- A block in a single model
- A Model block (except for the last character vector, which may be a block other than a Model block)
- A block that is in a model that is referenced by a Model block that is specified in the previous character vector

subpath

A character vector that represents an individual component within a block.

Output Arguments

`blockpath_object`

The block path that you create.

Description

`blockpath_object = Simulink.SimulationData.BlockPath()` creates an empty block path.

`blockpath_object = Simulink.SimulationData.BlockPath(blockpath)` creates a copy of the block path of the block path object that you specify with the `source_blockpath` argument.

`blockpath = Simulink.SimulationData.BlockPath(paths)` creates a block path from the character vector or cell array of character vectors that you specify with the `paths` argument. Each character vector represents a path at a level of model hierarchy.

`blockpath = Simulink.SimulationData.BlockPath(paths, subpath)` creates a block path from the character vector or cell array of character vectors that you specify with the `paths` argument and creates a path for the individual component (for example, a signal) of the block.

Example

Create a block path object called `bp1`, using a cell array of character vectors representing elements of the block path.

```
bp1 = Simulink.SimulationData.BlockPath(...  
{'sldemo_mdref_depgraph/thermostat', ...  
'sldemo_mdref_heater/Fahrenheit to Celsius', ...  
'sldemo_mdref_F2C/Gain1'})
```

The resulting block path reflects the model reference hierarchy for the block path.

```
bp1 =
```

```
Simulink.BlockPath  
Package: Simulink
```

```
Block Path:  
'sldemo_mdref_depgraph/thermostat'  
'sldemo_mdref_heater/Fahrenheit to Celsius'  
'sldemo_mdref_F2C/Gain1'
```

convertToCell**Purpose**

Convert block path to cell array of character vectors

Syntax

```
cellarray = blockPathObject.convertToCell()
```

Output Arguments

`cellarray`

The cell array of character vectors representing the elements of the block path.

Description

`cellarray = blockPathObject.convertToCell()` converts a block path to a cell array of character vectors.

Examples

```
bp1 = Simulink.SimulationData.BlockPath(...
{'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/Fahrenheit to Celsius', ...
'sldemo_mdref_F2C/Gain1'})
cellarray_for_bp1 = bp1.convertToCell()
```

The result is a cell array representing the elements of the block path.

```
cellarray_for_bp1 =
    'sldemo_mdref_depgraph/thermostat'
    'sldemo_mdref_heater/Fahrenheit to Celsius'
    'sldemo_mdref_F2C/Gain1'
```

getBlock**Purpose**

Get single block path in model reference hierarchy

Syntax

```
block = blockPathObject.getBlock(index)
```

Input Arguments

`index`

The index of the block for which you want to get the block path. The index reflects the level in the model reference hierarchy. An index of 1 represents a block in the top-level model, an index of 2 represents a block in a model referenced by the block of index 1, and an index of n represents a block that the block with index $n-1$ references.

Output Arguments

`block`

The block representing the level in the model reference hierarchy specified by the `index` argument.

Description

`blockpath = Simulink.SimulationData.BlockPath.getBlock(index)` returns the block path of the block specified by the `index` argument.

Example

Get the block for the second level in the model reference hierarchy.

```
bp1 = Simulink.SimulationData.BlockPath(...
{'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/Fahrenheit to Celsius', ...
```

```
'sldemo_mdhref_F2C/Gain1'})  
blockpath = bp1.getBlock(2)
```

The result is the thermostat block, which is at the second level in the block path hierarchy.

```
blockpath =  
sldemo_mdhref_heater/Fahrenheit to Celsius
```

getLength

Purpose

Get length of block path

Syntax

```
length = blockPathObject.getLength()
```

Output Arguments

length

The length of the block path. The length is the number of levels in the model reference hierarchy.

Description

`length = Simulink.SimulationData.BlockPath.getLength()` returns a numeric value that corresponds to the number of levels in the model reference hierarchy for the block path.

Example

Get the length of block path bp1.

```
bp1 = Simulink.SimulationData.BlockPath(...  
{'sldemo_mdhref_depgraph/thermostat', ...  
'sldemo_mdhref_heater/Fahrenheit to Celsius', ...  
'sldemo_mdhref_F2C/Gain1'})  
length_bp1 = bp1.getLength()
```

The result reflects that the block path has three elements.

```
length_bp1 =
```

```
3
```

[Simulink.BlockPath](#) | [Simulink.SimulationData.Dataset](#)

Introduced in R2012b

Simulink.SimulationData.DatasetRef class

Package: Simulink.SimulationData

Create Simulink.SimulationData.DatasetRef object

Description

To use a reference for accessing a Simulink.SimulationData.Dataset object stored in a MAT-file, create a Simulink.SimulationData.DatasetRef object. You can use this reference to avoid running out of memory, by retrieving data signal by signal, for data that you log to persistent storage. You can stream a DatasetRef object into a root-level input port or you can use it to create a SimulationDatastore object to use for streaming. For details, see “Load Big Data for Simulations”.

For parallel simulations, for which you specify an array of Simulink.SimulationInput objects, if you are logging to file, Simulink:

- Creates Simulink.SimulationData.DatasetRef objects to access output data in the MAT-file and includes those objects in the SimulationOutput object data
- Enables the CaptureErrors argument for simulation

Construction

`DSRefObj = Simulink.SimulationData.DatasetRef(location, identifier)` creates a reference to the contents of a Simulink.SimulationData.Dataset variable stored in a MAT-file.

Input Arguments

location — MAT-file containing Simulink.SimulationData.Dataset object to reference
character vector

MAT-file containing Simulink.SimulationData.Dataset object to reference, specified as a character vector. The character vector is a path to the MAT-file. Do not use a file name from one locale in a different locale.

identifier — Name of variable in MAT-file
character vector

Name of a Simulink.SimulationData.Dataset variable in MAT-file, specified as a character vector. When you log to persistent storage, Simulink uses the variable names specified for each kind of logging.

Suppose that you use the default variable name for signal logging (`logout`) and default MAT-file name for persistent storage logging (`mat.out`). After you simulate the model, then to create a reference to the Dataset object for signal logging, at the MATLAB command line, enter:

```
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat', 'logout');
```

Output Arguments

DSRefObj — Reference to Dataset object

`Simulink.SimulationData.DatasetRef` object

Reference to logging dataset, returned as a `Simulink.SimulationData.DatasetRef` object.

Properties

Location — MAT-file containing Simulink.SimulationData.Dataset object to reference

character vector

MAT-file containing `Simulink.SimulationData.Dataset` object to reference, specified as a character vector. The character vector is a path to the MAT-file. Include the `.mat` extension in the file name. Do not use a file name from one locale in a different locale.

Identifier — Name of variable in MAT-file

character vector

Name of a `Simulink.SimulationData.Dataset` variable in MAT-file, specified as a character vector. When you log to persistent storage, Simulink uses the variable names specified for each kind of logging (for example, 'logout' for signal logging data).

Methods

Use the `numElements`, `getElement`, and `getElementNames` methods for a `Simulink.SimulationData.DatasetRef` object the same way that you use those methods for a `Simulink.SimulationData.Dataset` object.

Method	Purpose
<code>numElements</code>	Get number of elements from dataset
<code>getElementNames</code>	Return names of all elements in dataset
<code>get</code> The <code>get</code> method is an alias for the <code>getElement</code> method.	Get element from dataset
Note You can use curly braces to streamline indexing syntax to access elements in a dataset reference, instead of using <code>get</code> or <code>getElement</code> methods. To get an element using curly braces, the index must be a scalar that is not greater than the number of elements in the variable. The <code>get</code> and <code>getElement</code> methods support specifying an element by name or block path, as well as by index.	
<code>getAsDatastore</code>	Get <code>matlab.io.datastore.SimulationDatastore</code> representation of element from a <code>DatasetRef</code> object

Method	Purpose
getDatasetVariableNames on page 2-980	List names of Dataset variables in MAT-file
plot	Plot data in the Simulation Data Inspector

Tip To get the names of Dataset variables in the MAT-file, using the `Simulink.SimulationData.DatasetRef.getDatasetVariableNames` function processes faster than using the `who` or `whos` functions.

Copy Semantics

You can copy `DatasetRef` object properties by value. However, copying the `DatasetRef` object produces a handle object. Copying the `DatasetRef` object does not copy the data in the MAT-file that the object references. For details about copy operations, see [Copying Objects in the MATLAB documentation](#).

Examples

Create References to Persistent Storage Dataset Objects

This example shows how to construct and use `Simulink.SimulationData.DatasetRef` objects to access data for a model that logs to persistent storage. This simple example shows the basic steps for logging to persistent storage. This example does not represent a realistic situation for logging to persistent storage, because it shows a short simulation with small memory requirements.

Open the `vdv` model.

In the **Configuration Parameters** > **Data Import/Export** pane, select these parameters:

- **States**
- **Log Dataset data to file**

Set the **Format** parameter to **Dataset**.

Leave the other parameter settings as they are and click **Apply**.

In the model, click a signal and from the action bar, select **Enable Data Logging**.

Simulate the model.

Get a list of Dataset variable names in the `out.mat` file.

```
varNames = Simulink.SimulationData.DatasetRef.getDatasetVariableNames('out.mat')
varNames =
    1x2 cell array
    'logout'    'xout'
```

Create a reference to the logged states data that is stored in `out.mat`. The variable for the logged states data is `xout`.

```
statesLogRef = Simulink.SimulationData.DatasetRef('out.mat','xout')
```

```
statesLogRef =
```

```
Simulink.SimulationData.DatasetRef
Characteristics:
  Location: out.mat (/my_files/out.mat)
  Identifier: xout
```

```
Resolved Dataset: 'xout' with 2 elements
```

	Name	BlockPath
1	' '	vdp/x1
2	' '	vdp/x2

Create a reference to the signal logging data that is stored in `out.mat`. The variable for the signal logging data is `logout`.

```
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat','logout')
```

```
sigLogRef =
```

```
Simulink.SimulationData.DatasetRef
Characteristics:
  Location: out.mat (/my_files/out.mat)
  Identifier: logout
```

```
Resolved Dataset: 'logout' with 1 element
```

	Name	BlockPath
1	x1	vdp/x1

Use the `numElements` to access the number of elements in the logged states dataset.

```
statesLogRef.numElements
```

```
ans =
```

```
2
```

Use the `DatasetRef` to access the first element of the signal logging dataset.

```
sigLogRef{1}
```

```
ans =
```

```
Simulink.SimulationData.Signal
Package: Simulink.SimulationData
```

```
Properties:
```

```
  Name: 'x1'
  PropagatedName: ''
  BlockPath: [1x1 Simulink.SimulationData.BlockPath]
  PortType: 'outport'
```

```
PortIndex: 1  
Values: [1x1 timeseries]
```

Methods, Superclasses

Delete the persistent storage MAT-file and try to use one of the DatasetRef objects.

```
delete('out.mat');  
statesLogRef.get(1)
```

```
File does not exist.
```

The statesLogRef still exists, but it is a reference to a Dataset object that is in a file that no longer exists.

Introduced in R2016a

getAsDatastore

Class: Simulink.SimulationData.DatasetRef

Package: Simulink.SimulationData

Get matlab.io.datastore.SimulationDatastore representation of element from referenced Dataset object

Syntax

```
element =  
Simulink.SimulationData.DatasetRef.getAsDatastore(datasetref_elements)
```

Description

element =
Simulink.SimulationData.DatasetRef.getAsDatastore(datasetref_elements) returns a matlab.io.datastore.SimulationDatastore representation of an element or collection of elements from the referenced dataset, based on index, name, or block path of the element.

You can represent a Dataset element as a matlab.io.datastore.SimulationDatastore object if the element was placed into the MAT-file using either of these approaches:

- Log Dataset format data to persistent storage (MAT-file).
- Place the element into a Simulink.SimulationData.Dataset object and saved the Dataset object to a v7.3 MAT-file.

The SimulationDatastore representation for a Dataset element creates a SimulationDatastore object for the Values field of that element. The SimulationDatastore representation supports streaming of the data for the Values property of the element into other simulations or into MATLAB.

Note You cannot use create a SimulationDatastore for Dataset elements that contain these types of data:

- Array
-

You can use SimulationDatastore objects to:

- Refer to logged simulation data that is stored on disk in a MAT-file.
- Specify signals to stream incrementally from disk to a simulation.
- Provide a basis for big data analysis using MATLAB functions.

Input Arguments

datasetref_element — Element of referenced dataset in MAT-file
index of the element

Element of a referenced dataset in a MAT-file, specified as an index, name (as a character vector), or block path (as a character vector).

Output Arguments

element — Element accessed using SimulationDatastore object

matlab.io.datastore.SimulationDatastore object | Simulink.SimulationData.Signal, Simulink.SimulationData.State or similar object, whose Values data uses a matlab.io.datastore.SimulationDatastore object

Element accessed using SimulationDatastore object, returned as either a matlab.io.datastore.SimulationDatastore object or a Simulink.Signal, Simulink.State, or similar object, whose Values data uses a matlab.io.datastore.SimulationDatastore object.

Examples

Use a SimulationDatastore to Reference a Signal's Data in a DatasetRef

Log signal data to persistent storage (select the **Log Dataset data to file** configuration parameter) and simulate a model.

Create a DatasetRef for the signal logging Dataset data (logout) in the out.mat MAT-file.

```
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat', 'logout');
firstSig = sigLogRef.getAsDatastore(1)
```

```
firstSig =
```

```
Simulink.SimulationData.Signal
Package: Simulink.SimulationData

Properties:
    Name: 'x1'
    PropagatedName: ''
    BlockPath: [1x1 Simulink.SimulationData.BlockPath]
    PortType: 'output'
    PortIndex: 1
    Values: [1x1 matlab.io.datastore.SimulationDatastore]
```

Load the data into another model. This approach streams the values of the signal x1 for another simulation.

```
ds = Simulink.SimulationData.Dataset;
ds{1} = sigLogRef{1};
sim('other_model', 'ExternalInput', 'ds');
```

Alternative

To streamline the use of indexing, you can use curly braces ({}) syntax to obtain a SimulationDatastore object for DatasetRef object signal values. The requirements and results are the same as using getAsDatastore. For example, if you log signal data to persistent storage (select the **Log Dataset data to file** configuration parameter) and simulate a model.

```
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat','logout');  
firstSig = sigLogRef{1}
```

```
ans =
```

```
Simulink.SimulationData.Signal  
Package: Simulink.SimulationData
```

```
Properties:
```

```
    Name: 'x1'  
PropagatedName: ''  
    BlockPath: [1x1 Simulink.SimulationData.BlockPath]  
    PortType: 'outport'  
    PortIndex: 1  
    Values: [1x1 matlab.io.datastore.SimulationDatastore]
```

Simulink.SimulationData.DataStoreMemory

Container for data store logging information

Description

Simulink uses `Simulink.SimulationData.DataStoreMemory` objects to store logging information from Data Store Memory blocks during simulation. The objects contain information about the blocks that write to the data store.

Property Summary

Name	Description
BlockPath on page 5-615	Location of Data Store Memory block for the logged data store
DSMWriterBlockPaths on page 5-615	Location of Data Store Write blocks that write to the data store
DSMWriters on page 5-616	Data Store Write blocks for each signal value
Name on page 5-616	Name of the data store dataset
Scope on page 5-616	Scope of the data store: 'local' or 'global'
Values on page 5-616	Time and data that were logged

Properties

BlockPath

Description

Location of Data Store Memory block for the logged data store.

Data Type

character vector

Access

RW

DSMWriterBlockPaths

Description

Location of blocks that write to the data store. Each element of the array contains the full block path of one writer block.

Data Type

Vector of `Simulink.SimulationData.BlockPath` objects

Access

R0

DSM Writers**Description**

The number of writes in the data store.

The *n*th element of `DSM Writers` contains the index of the element in `DSM WriterBlockPaths` that contains the block path of the writer that performed the *n*th write to `Values`.

Data Type

Integer vector

Access

R0

Name**Description**

Name of the data store dataset

Data Type

character vector

Access

R0

Scope**Description**

Scope of the data store: 'local' or 'global'

Data Type

character vector

Access

RW

Values**Description**

Time and data that were logged

Data Type

MATLAB timeseries

Access

Simulink.SimulationData.LoggingInfo

Signal logging override settings

Description

This object specifies a set of signal logging override settings.

Use a `Simulink.SimulationData.LoggingInfo` object to specify the signal logging override settings for a signal. You can use this object for the `LoggingInfo` property of a `Simulink.SimulationData.SignalLoggingInfo` object.

Property Summary

Name	Description
<code>DataLogging</code> on page 5-618	Signal logging mode.
<code>NameMode</code> on page 5-619	Source of signal logging name.
<code>LoggingName</code> on page 5-619	Custom signal logging name.
<code>DecimateData</code> on page 5-619	Use subset of sample points.
<code>Decimation</code> on page 5-619	Decimation value (n): Simulink logs every nth data point.
<code>LimitDataPoints</code> on page 5-620	Limit number of data points to log.
<code>MaxPoints</code> on page 5-620	Maximum number of data points to log (N). The set of logged data points is the last N data points generated by the simulation.

Method Summary

Name	Description
<code>LoggingInfo</code> on page 5-620	Create a set of signal logging override settings for a signal.

Properties

DataLogging

Description

Signal logging mode.

Indicates whether logging is enabled for this signal.

Data Type

logical value — {true} | false

Access

RW

NameMode**Description**

Source of signal logging name.

Indicates whether the signal logging name is a custom name ('true') or whether the signal logging name is the same as the signal name ('false').

Data Type

logical value — true | {false}

Access

RW

LoggingName**Description**

Custom signal logging name

The custom signal logging name to use for this signal, if the NameMode property is true.

Data Type

character vector

Access

RW

DecimateData**Description**

Log a subset of sample points, selecting data points at a specified interval. The first sample point is always logged.

Data Type

logical value — true | {false}

Access

RW

Decimation**Description**

Decimation value (n). If the DecimateData property is true, then Simulink logs every nth data point.

Data Type

positive integer

Access

RW

LimitDataPoints**Description**

Limit the number of data points to log.

Data Type

logical value — true | {false}

Access

RW

MaxPoints**Description**

Maximum number of data points to log (N). If the `LimitDataPoints` property is `true`, then the set of logged data points includes the last N data points generated by the simulation.

Data Type

positive integer

Access

RW

Methods**LoggingInfo****Purpose**

Create a `Simulink.SimulationData.LoggingInfo` object.

Syntax

```
logging_info_object = Simulink.SimulationData.LoggingInfo()  
logging_info_object = Simulink.SimulationData.LoggingInfo(object)
```

Input Arguments

`object`

A signal logging override settings object whose property values the constructor uses for the new `Simulink.SimulationData.LoggingInfo` object. The signal logging override object that you specify must be one of the following types of objects:

- `Simulink.SimulationData.LoggingInfo` object
- `Simulink.LoggingInfo` object

Output Arguments

`logging_info_object`

A `Simulink.SimulationData.LoggingInfo` object.

Description

`logging_info_object = Simulink.SimulationData.LoggingInfo()` creates a `Simulink.SimulationData.LoggingInfo` object that has default property values.

`logging_info_object = Simulink.SimulationData.LoggingInfo(object)` creates a `Simulink.SimulationData.LoggingInfo` object that copies the property values from the signal logging override object that you specify with the `object` argument.

Examples

The following example creates a `Simulink.SimulationData.LoggingInfo` object with default settings, changes the `DecimateData` and `Decimation` properties, and uses the object for the `LoggingInfo` property of a `Simulink.SimulationData.SignalLoggingInfo` object `mi`.

```
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', 'examples', 'ex_mdhref_counter_bus'),
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', 'examples', 'ex_bus_logging')));
log_info = Simulink.SimulationData.LoggingInfo();
log_info.DecimateData = true;
log_info.Decimation = 2;
mi = Simulink.SimulationData.SignalLoggingInfo('ex_bus_logging');
mi.LoggingInfo = log_info
```

```
Simulink.SimulationData.SignalLoggingInfo
  Package: Simulink.SimulationData
```

```
  BlockPath:
    'ex_bus_logging'
```

```
  OutputPortIndex: 1
```

```
  LoggingInfo:
    DataLogging: 1
    NameMode: 0
    LoggingName: ''
    DecimateData: 1
    Decimation: 2
    LimitDataPoints: 0
    MaxPoints: 5000
```

Simulink.SimulationData.ModelLoggingInfo

Signal logging override settings for a model

Description

This class is a collection of `Simulink.SimulationData.SignalLoggingInfo` objects that specify all signal logging override settings for a model.

Use methods and properties of this class to:

- Turn off logging for a signal or a Model block.
- Change logging settings for any signals that are marked for logging within a model.

You can control whether a top model and referenced models override signal logging settings or use the signal logging settings specified by the model. Use the `LoggingMode` and `LogAsSpecifiedByModels` properties to control which logging settings to apply.

Logging Mode for Models	Property Settings
For top model and all referenced models, use logging settings specified in the model.	Set <code>LoggingMode</code> to <code>LogAllAsSpecifiedInModel</code> .
For top model and all referenced models, use override signal logging settings.	Set <code>LoggingMode</code> to <code>OverrideSignals</code> .
For top model and referenced models, use a mix of override signal logging settings and the signal logging settings specified in the model.	Set <code>LoggingMode</code> to <code>OverrideSignals</code> . Include models you want to ignore override signal logging settings in the <code>LogAsSpecifiedByModels</code> cell array.

For more information and examples, see “Override Signal Logging Settings from MATLAB”.

Property Summary

Name	Description
<code>LoggingMode</code> on page 5-623	Signal logging override status
<code>LogAsSpecifiedByModels</code> on page 5-623	Source of signal logging settings for the top model or a top-level Model block
<code>Signals</code> on page 5-624	All signals that have signal override settings

Method Summary

Name	Description
<code>findSignal</code> on page 5-628	Find signals within the <code>Signals</code> vector, using block path and output port index.

Name	Description
<code>verifySignalAndModelPaths</code> on page 5-631	Verify signal and model paths for the model signal logging override object.
<code>getLogAsSpecifiedInModel</code> on page 5-629	Determine whether the model logs signals as specified in the model or uses override settings.
<code>setLogAsSpecifiedInModel</code> on page 5-630	Set the logging mode for the top model or a top-level Model block.
<code>createFromModel</code> on page 5-624	Create and populate a model signal logging override object with all logged signals in the model hierarchy.
<code>ModelLoggingInfo</code> on page 5-627	Set signals to log or override logging settings.

Properties

LoggingMode

Description

Signal logging override status. Values are:

- `OverrideSignals` — (Default) Uses the logging settings for signals, as specified in the `Signals` property. For models where `getLogAsSpecifiedInModel` is:
 - `true` — Logs all signals, as specified in the model.
 - `false` — Logs only the signals specified in the `Signals` property.
- `LogAllAsSpecifiedInModel` — Logs signals in the top model and all referenced models, as specified in the model. Simulink honors the signal logging indicators (blue antennae) and ignores the `Signals` property.

To change the logging mode for the top model or for a given referenced model, use the `setLogAsSpecifiedInModel` method.

Data Type

character array

Access

RW

LogAsSpecifiedByModels

Description

When `LoggingMode` is set to `'OverrideSignals'`, the `LogAsSpecifiedByModels` cell array specifies the top models and top-level Model blocks that ignore the `'OverrideSignals'` setting and log signals as specified in the models or Model blocks.

- For the top model and top-level Model blocks that the cell array includes, Simulink ignores the `Signals` property overrides.
- For a model or Model block that the cell array does *not* include, Simulink uses the `Signals` property to determine which signals to log.

When `LoggingMode` is set to `'LogAllAsSpecifiedInModel'`, Simulink ignores the `LogAsSpecifiedByModels` property.

Use the `getLogAsSpecifiedInModel` method to determine whether the top model or top-level Model block logs signals as specified in the model (default logging), and use `setLogAsSpecifiedInModel` to turn default logging on and off.

Data Type

cell array — For the top model, specify the model name. For Model blocks, specify the block path.

Access

RW

Signals

Description

Vector of `Simulink.SimulationData.SignalLoggingInfo` objects for all signals with signal logging override settings.

Data Type

vector of `Simulink.SimulationData.SignalLoggingInfo` objects

Access

RW

Methods

`createFromModel`

Purpose

Create a `Simulink.SimulationData.ModelLoggingInfo` object for a top model, with override settings for each logged signal in the model.

Syntax

```
model_logging_info_object = ...  
Simulink.SimulationData.ModelLoggingInfo.createFromModel(...  
model,options)
```

Input Arguments

`model`

Name of the top model for which to create a `Simulink.SimulationData.ModelLoggingInfo` object.

`options`

You can use any combination of the following option name and value pairs to control the kinds of systems from which to include logged signals.

- `FollowLinks`
 - `on` — (Default) Include logged signals from inside of libraries.

- `off` — Skip all libraries.
- `LookUnderMasks`
 - `all` — (Default) Include logged signals from all masked subsystems.
 - `none` — Skip all masked subsystems.
 - `graphical` — Include logged signals from masked subsystems that do not have a workspace or dialog box.
 - `functional` — Include logged signals from masked subsystems that do not have a dialog box.
- `Variants`
 - `ActiveVariants` — (Default) Include logged signals from only active subsystem and model variants.
 - `AllVariants` — Include logged signals from all subsystem and model variants.
- `RefModels`
 - `on` — (Default) Include logged signals from referenced models.
 - `off` — Skip all referenced models.

If you select more than one option, then the created `Simulink.SimulationData.ModelLoggingInfo` object includes signals that fit the combinations (the “AND”) of the specified options. For example, if you set `FollowLinks` to `on` and set `RefModels` to `off`, then the model signal logging override object does not include signals from library links that exist inside of referenced models.

Output Arguments

`model_logging_override_object`

`Simulink.SimulationData.ModelLoggingInfo` object for the top model.

Description

`model_logging_info_object = Simulink.SimulationData.ModelLoggingInfo.createFromModel(model)` creates a `Simulink.SimulationData.ModelLoggingInfo` object for the model that includes logged signals for the following kinds of systems:

- Libraries
- Masked subsystems
- Referenced models
- Active variants

`model_logging_override_object = Simulink.SimulationData.ModelLoggingInfo.createFromModel(model, options)` creates a `Simulink.SimulationData.ModelLoggingInfo` object for the model. The included logged signals reflect the options settings for the following kinds of systems:

- Libraries
- Masked subsystems

- Referenced models
- Variants

Examples

The following example creates a model logging override object for the `sldemo_mdhref_bus` model and automatically adds each logged signal in the model to that object:

```
openExample('sldemo_mdhref_bus')
mi = Simulink.SimulationData.ModelLoggingInfo.createFromModel(...
'sldemo_mdhref_bus')

mi =

ModelLoggingInfo with properties:

    Model: 'sldemo_mdhref_bus'
  LoggingMode: 'OverrideSignals'
LogAsSpecifiedByModels: {}
    Signals: [1x4 Simulink.SimulationData.SignalLoggingInfo]
```

To apply the model override object settings, use:

```
set_param(sldemo_mdhref_bus, 'DataLoggingOverride', mi);
```

You can use the options for the `createFromModel` method to specify how the method should handle model components like variants and model references. For example, use the `Variants` option to create a `model_logging_override` object that includes logged signals in all variants of the `sldemo_variant_subsystems` model.

By default, the `sldemo_variant_subsystems` model does not log any signals. Start by configuring the output signals from the `Linear Controller` and `Nonlinear Controller` subsystems for logging.

```
% Open the sldemo_variant_subsystems model
sldemo_variant_subsystems;

% Mark the output of the Linear Controller subsystem for logging
ph = get_param('sldemo_variant_subsystems/Controller/Linear Controller',...
'PortHandles');
set_param(ph.Outputport(1), 'DataLogging', 'on');

% Mark the output of the Nonlinear Controller subsystem for logging
ph1 = get_param('sldemo_variant_subsystems/Controller/Nonlinear Controller',...
'PortHandles');
set_param(ph1.Outputport(1), 'DataLogging', 'on');
```

Then, use the `createFromModel` method to create a `model_logging_override` object that includes signals logged in all variant subsystems of the `sldemo_variant_subsystems` model.

```
% Create a model_logging_override object for the model including all variants
mi = Simulink.SimulationData.ModelLoggingInfo.createFromModel(...
'sldemo_variant_subsystems', 'Variants', 'AllVariants')

mi =

ModelLoggingInfo with properties:

    Model: 'sldemo_variant_subsystems'
  LoggingMode: 'OverrideSignals'
LogAsSpecifiedByModels: {}
    Signals: [1x2 Simulink.SimulationData.SignalLoggingInfo]
```

ModelLoggingInfo

Purpose

Specify signals to log or override logging settings.

Syntax

```
model_logging_override_object = ...
Simulink.SimulationData.ModelLoggingInfo(model)
```

Input Arguments

`model`

Name of the top model for which to create a `Simulink.SimulationData.ModelLoggingInfo` object

Output Arguments

`model_logging_override_object`

`Simulink.SimulationData.ModelLoggingInfo` object created for the specified top model.

Description

`model_logging_override_object = Simulink.SimulationData.ModelLoggingInfo(model)` creates a `Simulink.SimulationData.ModelLoggingInfo` object for the specified top model.

If you use the `Simulink.SimulationData.ModelLoggingInfo` constructor, specify a `Simulink.SimulationData.SignalLoggingInfo` object for each logged signal for which you want to override logging settings.

To check that you have specified valid signal logging override settings for a model, use the `verifySignalAndModelPaths` method with the `Simulink.SimulationData.ModelLoggingInfo` object for the model.

Examples

The following example shows how to log all signals as specified in the top model and all referenced models.

```
mi = Simulink.SimulationData.ModelLoggingInfo('sldemo_mdref_bus');
mi.LoggingMode = 'LogAllAsSpecifiedInModel'

mi =

  ModelLoggingInfo with properties:

      Model: 'sldemo_mdref_bus'
  LoggingMode: 'LogAllAsSpecifiedInModel'
  LogAsSpecifiedByModels: {}
      Signals: []
```

To apply the model override object settings, use:

```
set_param(sldemo_mdref_bus, 'DataLoggingOverride', mi);
```

The following example shows how to log only signals in the top model:

```
mi = ...
Simulink.SimulationData.ModelLoggingInfo('sldemo_mdref_bus');
```

```
mi.LoggingMode = 'OverrideSignals';  
mi = mi.setLogAsSpecifiedInModel('sldemo_mdref_bus', true);  
set_param('sldemo_mdref_bus', 'DataLoggingOverride', mi);
```

findSignal

Purpose

Find signals within the Signals vector, using a block path and optionally an output port index.

Syntax

```
signal_indices = ...  
    model_logging_override_object.findSignal(block_path)  
signal_indices = ...  
    model_logging_override_object.findSignal(...  
    block_path, port_index)
```

Input Arguments

block_path

Source block to search. The `block_path` must be one of the following:

- Character vector
- Cell array of character vectors
- `Simulink.BlockPath` object

port_index

Index of the output port to search. Specify a scalar greater than, or equal to, 1.

Output Arguments

signal_indices

Vector of numeric indices into the signals vector of the `Simulink.SimulationData.ModelLoggingInfo` object.

Description

`signal_indices = model_logging_override_object.findSignal(block_path)` finds the indices of the signals for the block path that you specify.

To find a *single* instance of a signal within a referenced model, use a `Simulink.BlockPath` object or a cell array with a *full path*.

To find *all* instances of a signal within a referenced model, use a character vector with the *relative* path of the signal within the referenced model.

To find a logged chart signal within a Stateflow chart, use a `Simulink.BlockPath` object and set the `SubPath` property to the name of the Stateflow chart signal.

`signal_indices = model_logging_override_object.findSignal(block_path, port_index)` finds the indices of the output signal for the port that you specify, for the block path that you specify.

Do not use the `port_index` argument for Stateflow chart signals.

Examples

To find a signal that is *not* in a Stateflow chart and that does *not* appear in multiple instances of a referenced model:

```
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', 'examples', 'ex_bus_logging')))
% Open the referenced model
ex_mdhref_counter_bus
mi = Simulink.SimulationData.ModelLoggingInfo.createFromModel(...
    'ex_bus_logging');
% Click the COUNTERBUSCreator block that is the source of
% the logged COUNTERBUS signal
signal_index = mi.findSignal(gcb)
```

```
signal_index =
    1
```

To find a signal in a specific instance of a referenced model that is not in a Stateflow chart, use the following approach:

```
signal_index = mi.findSignal({'ex_bus_logging/CounterA', ...
    'ex_mdhref_counter_bus/Bus Creator'})
```

```
signal_index =
    4
```

For an example that uses the `findSignal` method with a Stateflow chart, see “Override Logging Properties with the Command-Line API” (Stateflow).

getLogAsSpecifiedInModel

Purpose

Determine whether the model logs as specified in the model or uses override settings.

Syntax

```
logging_mode = ...
getLogAsSpecifiedInModel(model_logging_override_object, path)
```

Input Arguments

`model_logging_override_object`

A `Simulink.SimulationData.ModelLoggingInfo` object.

`path`

The path is a character vector that specifies one of the following:

- Name of the top model
- Block path of a Model block in the top model

Output Arguments

`logging_mode`

The `logging_mode` is:

- `true`, if the model specified by `path` is logged as specified in the model.

- `false`, if the model specified by `path` is logged using the override settings specified in the `Signals` property.

Description

`logging_mode = model_logging_override_object.getLogAsSpecifiedInModel(path)`
returns:

- `true`, if the model specified by `path` is logged as specified in the model.
- `false`, if the model specified by `path` is logged using the override settings specified in the `Signals` property.

Examples

In the following example, the `Simulink.SimulationData.ModelLoggingInfo` object `mi` uses the override settings specified in its `Signals` property.

```
mi = Simulink.SimulationData.ModelLoggingInfo('sldemo_mdref_bus');  
logging_mode = getLogAsSpecifiedInModel(mi, 'sldemo_mdref_bus')
```

```
logging_mode =
```

```
    0
```

setLogAsSpecifiedInModel**Purpose**

Set logging mode for top model or top-level Model block

Syntax

```
setLogAsSpecifiedInModel(override_object, path)
```

Input Arguments

`override_object`

`Simulink.SimulationData.ModelLoggingInfo` object.

`path`

Character vector that specifies one of the following:

- Name of the top model
- Block path of a Model block in the top model

`value`

Logging mode:

- `true`, if the model specified by `path` is logged as specified in the model
- `false`, if the model specified by `path` is logged using the override settings specified in the `Signals` property.

Description

`setLogAsSpecifiedInModel(override_object, path, value)` sets the `LoggingMode` property for a top model or a Model block in the top model.

Example

The following example shows how to log only signals in the top model, using the logging settings specified in that model:

```
sldemo_mdrefref_bus;
mi = Simulink.SimulationData.ModelLoggingInfo('sldemo_mdrefref_bus');
mi.LoggingMode = 'OverrideSignals';
mi = setLogAsSpecifiedInModel(mi, 'sldemo_mdrefref_bus', true);
set_param('sldemo_mdrefref_bus', 'DataLoggingOverride', mi);
```

verifySignalAndModelPaths**Purpose**

Verify paths in `Simulink.SimulationData.ModelLoggingInfo` object.

Syntax

```
verified_object = verifySignalAndModelPaths...
(model_logging_override_object, action)
```

Input Arguments

`model_logging_override_object`

The `Simulink.SimulationData.ModelLoggingInfo` object to verify. This argument is required.

`action`

The action that the function performs if verification fails. This argument is optional. Specify one of the following values:

- `error` — (default) Throw an error when verification fails
- `warnAndRemove` — Issue a warning when verification fails and update the `Simulink.SimulationData.ModelLoggingInfo` object.
- `remove` — Silently update the `Simulink.SimulationData.ModelLoggingInfo` object.

Output Arguments

`verified_object`

If the method detects no invalid paths, it returns the validated object. For example:

```
verified_object =

    Simulink.SimulationData.ModelLoggingInfo
    Package: Simulink.SimulationData

    Properties:
        Model: 'logging_top'
        LoggingMode: 'OverrideSignals'
        LogAsSpecifiedByModels: {}
        Signals: [1x11 Simulink.SimulationData.SignalLoggingInfo]
```

If the method detects an invalid path, it performs the action specified by the `action` argument. By default, it issues an error message.

Description

```
verified_object = verifySignalAndModelPaths(model_logging_override_object,
action)
```

For a `Simulink.SimulationData.ModelLoggingInfo` object, verify that:

- All character vectors in the `LogAsSpecifiedByModels` property are either the name of the top model or the block path of a `Model` block in the top model.
- The block paths for signals in the `Signals` property refer to valid blocks within the hierarchy of the top model.
- The `OutputPortIndex` property for all signals in the `Signals` property are valid for the given block.
- All signals in the `Signals` property refer to *logged* signals.

The `action` argument specifies what action the method performs. By default, the method returns an error if it detects an invalid path.

If you use the `Simulink.SimulationData.ModelLoggingInfo` constructor and specify a `Simulink.SimulationData.SignalLoggingInfo` object for each signal, then consider using the `verifySignalAndModelPaths` method to verify that your object definitions are valid.

Example

The following example shows how to validate the signal and block paths in a `Simulink.SimulationData.ModelLoggingInfo` object. Because the `action` argument is `warnAndRemove`, if the validation fails, the `verifySignalAndModelPaths` method issues a warning and updates the `Simulink.SimulationData.ModelLoggingInfo` object.

```
mi = Simulink.SimulationData.ModelLoggingInfo('sldemo_mdlref_bus');  
verified_object = verifySignalAndModelPaths...  
    (mi, 'warnAndRemove')
```

Topics

“Override Signal Logging Settings from MATLAB”
“Export Signal Data Using Signal Logging”
“Log Data Stores”

Introduced in R2012b

Simulink.SimulationData.Parameter class

Package: Simulink.SimulationData

Stores logged parameter data and metadata

Description

The `Simulink.SimulationData.Parameter` object stores data and metadata for logged block parameters. Tunable parameters connected to Dashboard blocks are logged to the Simulation Data Inspector during simulation. To access logged parameter data, you can export the simulation run from the Simulation Data Inspector using the UI or the `Simulink.sdi.exportRun` function. For more information about exporting simulation runs with the Simulation Data Inspector UI, see “Export Data to the Workspace or a File”.

Construction

`dataset = Simulink.sdi.exportRun(runID)` returns a `Simulink.SimulationData.Parameter` object as an element in `dataset` when the run corresponding to `runID` contains logged parameter data.

Input Arguments

runID — Run ID for a run with logged parameter data

integer

Run ID for the run containing logged parameter data. Run IDs are assigned by the Simulation Data Inspector. You can get the run ID for a simulation run using the `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex` function.

Output Arguments

dataset — Dataset containing the run data

`Simulink.SimulationData.Dataset`

`Simulink.SimulationData.Dataset` object containing the run data and metadata. When the run contains logged parameter data, the dataset contains a `Simulink.SimulationData.Parameter` object as an element for each logged parameter. The `Simulink.SimulationData.Parameter` element takes the name of the logged parameter. You can access a `Simulink.SimulationData.Parameter` object using `get`.

Properties

Name — Parameter name in Dashboard label

character vector

Parameter name as it appears in the label for the Dashboard block.

Example: 'Mu:Gain'

BlockPath — Path of the block associated with the parameter

`Simulink.SimulationData.BlockPath`

Path to the block the parameter or variable corresponds to, returned as a `Simulink.SimulationData.BlockPath` object.

Example: `vdp/Mu`

ParameterName — Parameter name

character vector

Name of the logged parameter as it appears in the block dialog box. For variables, the `ParameterName` property is empty.

Example: `'Gain'`

VariableName — Variable name

character vector

Name of the logged variable. For parameters, the `VariableName` property is empty.

Example: `'Zw'`

Values — Timeseries of parameter values

timeseries

timeseries of parameter values. For logged variables, the `timeseries` name is the variable name. For logged parameters, the `timeseries` name is empty.

Methods

`plot` Plot simulation output data in the Simulation Data Inspector

Copy Semantics

Value. To learn how value classes affect copy operations, see [Copying Objects](#).

Examples

Access Logged Parameter Data

This example shows how to access logged parameter data. Parameter data automatically logs to the Simulation Data Inspector when you connect a Dashboard block to a block parameter. Parameter data does not export to the workspace with other simulation data at the end of simulation. You can access the logged parameter data by exporting the run containing it from the Simulation Data Inspector.

Log Parameter Data

Run a simulation of the model `ex_vdp_param`, a modified version of the `vdp` model with an Edit block connected to the gain parameter of the Mu block. The parameter data logs with the signal data for signals marked for logging.

```
sim('ex_vdp_param');
```

Export Run

Use the Simulation Data Inspector programmatic interface to get the run ID for the `ex_vdp_param` simulation, and export the run.

```
index = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(index);

dataset = Simulink.sdi.exportRun(runID);
```

Access Parameter Data

Use the `get` method to access the `Simulink.SimulationData.Parameter` object for the logged parameter data. The `Values` property contains the timeseries data for the parameter.

```
muGain = dataset.get('Mu:Gain')

muGain =
  Simulink.SimulationData.Parameter
  Package: Simulink.SimulationData

  Properties:
    Name: 'Mu:Gain'
    BlockPath: [1x1 Simulink.SimulationData.BlockPath]
    Values: [1x1 timeseries]
```

Simulink.SimulationData.Signal

Container for signal logging information

Description

Simulink uses `Simulink.SimulationData.Signal` objects to store signal logging information during simulation. The objects contain information about the source block for the signal, including the port type and index.

Property Summary

Name	Description
BlockPath on page 5-636	Block path for the source block for the signal
Name on page 5-636	Name of signal element to use for name-based access
PropagatedName on page 5-636	Propagated signal name, if any
PortIndex on page 5-637	Numeric index of port that was logged
PortType on page 5-637	Type of port that was logged: for signal logging, the port type is 'outport'
Values on page 5-637	Time and data that were logged

Properties

BlockPath

Description

Block path for the source block for the signal

Data Type

`Simulink.SimulationData.BlockPath`

Access

RW

Name

Description

Name of signal element to use for name-based access

Data Type

character vector

Access

RW

PropagatedName**Description**

Propagated name of signal element

Signal logging and root Output block logging data for a signal captures the propagated signal name if the logging format is `Dataset` and:

- For signal logging, you:
 - Mark the signal for signal logging and in the Signal Properties dialog box select **Show Propagated Signals**.
 - Enable **Configuration Parameters > Data Import/Export > Signal logging**.
- For root Output block logging, you select **Configuration Parameters > Data Import/Export > Output**.

The propagated signal name does not include angle brackets (<>).

Data Type

character vector

Access

R0

PortIndex**Description**

Numeric index of port that was logged

Data Type

scalar real integer

Access

RW

PortType**Description**

Type of port that was logged: for signal logging, the port type is 'outport'

Data Type

character vector

Access

RW

Values**Description**

Time and data that were logged.

For an example of how to use the `Values` property and plot logged signal data, see “Logging Intervals” on page 13-361.

Data Type

- MATLAB `timeseries` object
- Structure of MATLAB `timeseries` objects (for bus signals)
- Array of structures of MATLAB `timeseries` objects (for array of buses signals)
- Array of MATLAB `timeseries` objects (for nonbus signals in a For Each subsystem)
- MATLAB `timetable` object
- Structure of MATLAB `timetable` objects (for bus signals)
- Array of structures of MATLAB `timetable` objects (for array of buses signals)
- Cell array of MATLAB `timetable` objects (for nonbus signals in a For Each subsystem)

plot

Package: Simulink.SimulationData

Plot simulation output data in the Simulation Data Inspector

Syntax

```
plot(simOutObj)
runObj = plot(simOutObj)
```

Description

`plot(simOutObj)` plots the simulation output data in the simulation output object, `simOutObj`, in the Simulation Data Inspector and opens the Simulation Data Inspector so you can view the plotted simulation output data. You can use the `plot` function to plot simulation results stored in these simulation output objects:

- `Simulink.SimulationOutput`
- `Simulink.SimulationData.DataStoreMemory`
- `Simulink.SimulationData.Parameter`
- `Simulink.SimulationData.Signal`
- `Simulink.SimulationData.State`
- `Stateflow.SimulationData.Data`
- `Stateflow.SimulationData.State`
- `sltest.Assessment`

These simulation output objects also have plot functions that plot the data in and then open the Simulation Data Inspector:

- `Simulink.SimulationData.Dataset`
- `Simulink.SimulationData.DatasetRef`

When a simulation output object contains fewer than eight signals to plot, the Simulation Data Inspector layout changes to 1-by- n , where n is the number of signals to plot, and plots one signal on each subplot. When the simulation output object contains more than eight signals to plot, the Simulation Data Inspector layout changes to 1-by-1 and plots the first signal in the simulation output object.

When some or all of the data in a `Simulink.SimulationOutput` object is in a Simulation Data Inspector run, the `plot` function opens the Simulation Data Inspector and plots all the signals in the run. When the data does not correspond to a run in the Simulation Data Inspector, the `plot` function imports the data to a new run. When you use the `plot` function to plot a single signal, the `plot` function always imports the data for the signal to a new run.

`runObj = plot(simOutObj)` returns the `Simulink.sdi.Run` object corresponding to the plotted data.

Examples

Access and Plot Simulation Output Data

The `ex_vdp_simout_plot` model used in this example is configured to log signals, outputs, and states and return all logged data in a single simulation output. The single simulation output is a `Simulink.SimulationOutput` object that contains one or more types of other simulation output objects, depending on the kinds of data you log. This example shows how to access each type of logged data and use the `plot` function to plot the data in the Simulation Data Inspector. To generate the `SimulationOutput` object containing all the logged data, simulate the model.

```
open_system('ex_vdp_simout_plot.slx')
out = sim('ex_vdp_simout_plot.slx');
```

Plot Data in a SimulationOutput Object

You can pass the single simulation output, stored in a `Simulink.SimulationOutput` object, to the `plot` function to view the data in the Simulation Data Inspector. When you plot data in a `SimulationOutput` object that corresponds to a run in the Simulation Data Inspector, data in the object that also logs to the Simulation Data Inspector is plotted. The model logs data using the `Dataset` format, so all logged data streams to the Simulation Data Inspector.

When you use the `plot` function to plot the data, the Simulation Data Inspector updates to a 1-by-8 layout and plots one signal on each subplot.

```
plot(out)
```

Plot Data for a Single Signal

When you plot the data for a single signal, the Simulation Data Inspector always imports the data for the signal to a new run. Use the `get` function for the `SimulationOutput` object to access the signal logging `Dataset` object, `logouts`.

```
logouts = get(out, 'logouts');
```

Then, use the `get` function for the `Dataset` object to access the data for the first element.

```
sig1 = get(logouts,1);
```

When you plot the data for the signal, the Simulation Data Inspector imports the signal to a new run, updates the layout to 1-by-1, and plots the signal.

```
plot(sig1)
```

Input Arguments

simOutObj — Simulation output object containing simulation data to plot

`Simulink.SimulationOutput` | `Simulink.SimulationData.DataStoreMemory` |
`Simulink.SimulationData.Parameter` | `Simulink.SimulationData.Signal` |
`Simulink.SimulationData.State` | `sltest.Assessment` |
`Stateflow.SimulationData.Data` | `Stateflow.SimulationData.State`

Simulation output object containing data you want to plot and view in the Simulation Data Inspector. This `plot` function supports these simulation output objects:

- `Simulink.SimulationOutput`
- `Simulink.SimulationData.DataStoreMemory`
- `Simulink.SimulationData.Parameter`
- `Simulink.SimulationData.Signal`
- `Simulink.SimulationData.State`
- `Stateflow.SimulationData.Data`
- `Stateflow.SimulationData.State`
- `sltest.Assessment`

Example: `plot(out)`

Output Arguments

runObj — Run that corresponds to plotted data

`Simulink.sdi.Run` object

Run that corresponds to the plotted data, returned as a `Simulink.sdi.Run` object.

Simulink.SimulationData.SignalLoggingInfo

Signal logging override settings for signal

Description

This object contains the signal override signal logging settings for a single logged signal.

Property Summary

Name	Description
BlockPath on page 5-642	Simulink.BlockPath of source block of a signal to log.
OutputPortIndex on page 5-642	Index of an output port to log.
LoggingInfo on page 5-643	Simulink.SimulationData.LoggingInfo object containing all logging override settings for a signal.

Method Summary

Name	Description
SignalLoggingInfo on page 5-643	Create a signal logging override object for a signal.

Properties

BlockPath

Description

Simulink.BlockPath of source block of signal to log. The block path represents the full model reference hierarchy.

To specify a specific instance of a signal, use an absolute path, reflecting the model reference hierarchy, starting at the top model. For example:

```
openExample('sldemo_mdref_bus')
sig_log_info = Simulink.SimulationData.SignalLoggingInfo(...
{'sldemo_mdref_bus/CounterA', ...
'sldemo_mdref_counter_bus/Bus Creator'})
```

Data Type

Simulink.BlockPath

Access

RW

OutputPortIndex

Description

Index of the output port to log. The index is a 1-based numeric value.

Data Type

nonzero integer

Access

RW

LoggingInfo**Description**

`Simulink.SimulationData.LoggingInfo` object containing logging override settings for a signal. The logging settings specify whether signal logging is overridden for this signal. The logging settings also can specify a logging name, a decimation factor, and a maximum number of data points.

Data Type

`Simulink.SimulationData.LoggingInfo` object

Access

RW

Methods**SignalLoggingInfo****Purpose**

Construct a `Simulink.SimulationData.SignalLoggingInfo` object.

Syntax

```
signal_logging_info_object = ...
    Simulink.SimulationData.SignalLoggingInfo()
signal_loggingInfo_object = ...
    Simulink.SimulationData.SignalLoggingInfo(path)
signalLoggingInfo_object = ...
    Simulink.SimulationData.SignalLoggingInfo(path,index)
```

Input Arguments

`path`

The block path of the source block for which the signal logging override settings apply. If you use this argument without also using the `port` argument, then Simulink sets the output port index to 1.

`index`

Output port index to which the signal logging override settings apply.

Output Arguments

`signal_logging_object`

`Simulink.SimulationData.SignalLoggingInfo` object that represents the override settings of a signal.

Description

`signal_logging_override_object = Simulink.SimulationData.SignalLoggingInfo()` creates a `Simulink.SimulationData.LoggingInfo` object that contains default logging settings for a signal.

`signal_logging_override_object = Simulink.SimulationData.SignalLoggingInfo(path)` creates a `Simulink.SimulationData.LoggingInfo` object, using the specified block path, and sets the output port index to 1.

`signal_logging_override_object = Simulink.SimulationData.SignalLoggingInfo(path, port)` creates a `Simulink.SimulationData.LoggingInfo` object that contains default logging settings for the specified block path and output port index.

Examples

The following example creates a `Simulink.SimulationData.SignalLoggingInfo` object for the first output port of the `Bus Creator` block in the `sldemo_mdref_bus` model.

```
openExample('sldemo_mdref_bus')
mi = Simulink.SimulationData.ModelLoggingInfo(...
'sldemo_mdref_bus');
mi.LoggingMode = 'OverrideSignals';
mi.Signals = ...
    Simulink.SimulationData.SignalLoggingInfo(...
        {'sldemo_mdref_bus/CounterA', ...
'sldemo_mdref_counter_bus/Bus Creator'}, 1)
```

The output is:

```
mi =
    Data.ModelLoggingInfo with properties:
        Model: 'sldemo_mdref_bus'
        LoggingMode: 'OverrideSignals'
        LogAsSpecifiedByModels: {}
        Signals: [1x1 Simulink.SimulationData.SignalLoggingInfo]

    Methods
```

Simulink.SimulationData.State class

Package: Simulink.SimulationData

State logging element

Description

Simulink uses `Simulink.SimulationData.State` objects to store state logging information during simulation. The objects contain state information about which block the state data is coming from and the type of state.

Properties

Name — Name of state element to use for name-based access

character vector

Name of state element to use for name-based access, specified as a character vector. If you do not specify a name, 'CSTATE' or 'DSTATE' is used, depending on whether it is a continuous or discrete state.

BlockPath — Block path for state source block

a `Simulink.SimulationData.BlockPath` object

Block path for state source block, specified as a `Simulink.SimulationData.BlockPath` object

Label — Type of state

'CSTATE' | 'DSTATE'

Type of state, returned as 'CSTATE' or 'DSTATE'. Read-only property.

- 'CSTATE' - Continuous state
- 'DSTATE' - Discrete state

Values — State element information

single MATLAB timeseries object | a structure of MATLAB timeseries objects

State element information, specified as a single MATLAB timeseries object or as a structure of MATLAB timeseries objects.

Methods

`plot` Plot simulation output data in the Simulation Data Inspector

Examples

Access Final State Information Saved Using the Dataset Format

This example shows how to save final state information using the Dataset format and then access the state data after simulation.

Load the model `vdp` and configure the model to log final states using the Dataset format. This example uses the default final states variable name, `xFinal`.

```
load_system('vdp');
set_param('vdp', 'SaveFinalState', 'on', 'SaveFormat', 'Dataset');
```

Simulate the model.

```
out = sim('vdp');
```

By default, models create a single simulation output that contains all logged data in a `Simulink.SimulationOutput` object. Get the `xFinal` Dataset object from the `SimulationOutput` object. The `xFinal` Dataset object contains data for two states.

```
xFinal = get(out, 'xFinal')
```

```
xFinal =
Simulink.SimulationData.Dataset 'xFinal' with 2 elements
```

		Name	BlockPath
1	[1x1 State]	''	vdp/x1
2	[1x1 State]	''	vdp/x2

- Use braces `{ }` to access, modify, or add elements using index.

Examine the data for the state that corresponds to the `x1` block.

```
state_x1 = get(xFinal, 1)
```

```
state_x1 =
Simulink.SimulationData.State
Package: Simulink.SimulationData

Properties:
    Name: ''
    BlockPath: [1x1 Simulink.SimulationData.BlockPath]
    Label: CSTATE
    Values: [1x1 timeseries]
```

Simulink.SimulationData.Unit class

Package: Simulink.SimulationData

Store units for simulation data

Description

Simulink creates `Simulink.SimulationData.Unit` objects to store unit information for signals when:

- Performing signal logging, which uses the `Dataset` format
- Logging root Output blocks, if in **Configurations Parameters** you select the **Output** parameter and set **Format** to `Dataset`
- Logging to a To Workspace block or To File block, if you set the **Save format** block parameter to the default of `Timeseries`

Construction

`unitsObj = Simulink.SimulationData.Unit(unitName)` creates a `Simulink.SimulationData.Unit` object with the unit that you specify.

Input Arguments

unitName — Name of logging data units

character vector

Name of logging data units, specified as a character vector.

Output Arguments

unitObj — Logging data units

`Simulink.SimulationData.Unit` object

Logging data units, returned as a `Simulink.SimulationData.Unit` object.

Properties

Name — Name of the units

character vector

Name of the units, specified as a character vector.

Methods

Method	Purpose
<code>setName</code>	Specify name of logging data unit

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects.

Examples

Create and Use Inches Logging Units

Create a `Simulink.SimulationData.Unit` object representing inches.

```
inchesUnit = Simulink.SimulationData.Unit('inches');
```

Create a MATLAB timeseries object and set its `Units` field to the `Simulink.SimulationData.Unit` object.

```
ts = timeseries(1:10);  
ts.DataInfo.Units = inchesUnit;  
ts.DataInfo.Units
```

```
ans =
```

```
Units with properties:
```

```
    Name: 'inches'
```

setName

Class: Simulink.SimulationData.Unit

Package: Simulink.SimulationData

Specify name of logging data units

Syntax

```
unitObject = setName(unitObj,unitName)
```

Description

`unitObject = setName(unitObj,unitName)` sets the name for the `Simulink.SimulationData.Unit` object to the name specified in `unitName`.

Input Arguments

unitObj — Logging data unit object to name

`Simulink.SimulationData.Unit` object

Logging data unit object to name, specified as a `Simulink.SimulationData.Unit` object.

unitName — Name of logging data unit

character vector

Name of logging data unit, specified as a character vector.

Output Arguments

name — Name of logging data units

character vector

Name of logging data units, returned as a character vector.

Examples

Name a Logging Data Unit Object

```
inchesUnit = Simulink.SimulationData.Unit('in');  
inchesUnit = setName(inchesUnit,'inches')
```

```
inchesUnit =
```

```
    Units with properties:
```

Name: 'inches'

Simulink.SimulationInput class

Package: Simulink

Creates `SimulationInput` objects to make changes to a model for multiple or individual simulations

Description

The `Simulink.SimulationInput` object allows you to make changes to a model and run simulations with those changes. These changes are temporarily applied to the model. Through `Simulink.SimulationInput` object, you can change:

- Initial state
- Model parameters
- Block parameters
- External inputs
- Variables

Through the `Simulink.SimulationInput` object, you can also specify MATLAB functions to run at the start and the end of each simulation by using `in.setPreSimFcn` and `in.setPostSimFcn`, respectively.

Construction

`in = Simulink.SimulationInput('modelName')` creates a `SimulationInput` object for a model.

Input Arguments

modelName — Name of the model

character vector

Create a `Simulink.SimulationInput` object by passing the name of the model as an argument.

Example: `in = Simulink.SimulationInput('cstr')`

Properties

modelName — Name of the model

character vector

Name of the model for which the `SimulationInput` object is created.

InitialState — Initial state

`Simulink.op.ModelOperatingPoint` object

Initial state of the model for a simulation specified as a `Simulink.op.ModelOperatingPoint` object.

ExternalInput — External Input

numerical array, dataset object, timeseries, character array

External inputs added to the model for a simulation.

BlockParameters — Block parameters

array of `Simulink.Simulation.BlockParameter`

Block parameters of the model that are modified.

Variables — Variables

array of `Simulink.Simulation.Variable`

Variables of the model that are modified.

ModelParameters — Model parameters

array of `Simulink.Simulation.ModelParameter`

Model parameters of the model that are modified.

PreSimFcn — Function

MATLAB function

MATLAB function to run before the start of the simulation.

PostSimFcn — Function

MATLAB function

MATLAB function to run after each simulation.

UserString — User string

character array

Brief description of the simulation specified as a character array.

Methods

Method	Purpose
<code>setModelParameter</code>	Set model parameters to be used for a specific simulation through <code>SimulationInput</code> object.
<code>setBlockParameter</code>	Set block parameters to be used for a specific simulation through <code>SimulationInput</code> object.
<code>setInitialState</code>	Set initial state to be used for a specific simulation through <code>SimulationInput</code> object.
<code>setExternalInput</code>	Set external inputs for a simulation through <code>SimulationInput</code> object.
<code>setVariable</code>	Set variables for a simulation through <code>SimulationInput</code> object.
<code>setPreSimFcn</code>	Specify a MATLAB function to run before start of each simulation through <code>SimulationInput</code> object.
<code>setPostSimFcn</code>	Specify a MATLAB function to run after each simulation is complete through <code>SimulationInput</code> object.

Method	Purpose
<code>applyToModel</code>	Apply changes to the model specified through a <code>SimulationInput</code> object.
<code>validate</code>	Validate the contents of the <code>SimulationInput</code> object.
<code>loadVariablesFromMATFile</code>	Load variables from MAT-file into a <code>Simulink.SimulationInput</code> object.

Examples

Create a `Simulink.SimulationInput` Object

This example shows you how to create a `SimulationInput` object.

Open the model.

```
openExample('simulink/OpenTheModelExample');
open_system('ex_sldemo_househeat');
load_system('ex_sldemo_househeat')
```

Create a single `SimulationInput` object for a model.

```
model = 'ex_sldemo_househeat';
in = Simulink.SimulationInput(model);
```

Create an Array of `Simulink.SimulationInput` Objects

This example shows you how to create an array of `SimulationInput` objects.

Create an array of `SimulationInput` objects by using the for loop.

```
model = 'vdp';
for i = 10:-1:1
    in(i) = Simulink.SimulationInput(model);
end
```

Set Block Parameters using an Array of `Simulink.SimulationInput` Objects

This example modifies the block parameters of a model through the `SimulationInput` object.

Open the model.

```
openExample('simulink/OpenTheModelExample');
open_system('ex_sldemo_househeat');
load_system('ex_sldemo_househeat')
```

Create a `SimulationInput` object for this model.

```
mdl = 'sldemo_househeat';
in = Simulink.SimulationInput(mdl);
```

Modify block parameter.

```
in = in.setBlockParameter('ex_sldemo_househeat/Set Point', 'Value', '300');
```

Simulate the model.

```
out = sim(in)
```

Use Dataset as External Inputs with a Simulink.SimulationInput Objects

This example shows how use Dataset objects to set external inputs with Simulink.SimulationInput objects.

Open the model

```
mdl = 'sldemo_mdlref_counter';
open_system(mdl);
```

Create a Dataset object for this model.

```
t = (0:0.01:10)';
ds = Simulink.SimulationData.Dataset;
ds = ds.setElement(1, timeseries(5*ones(size(t)),t)); % First element
ds = ds.setElement(2, timeseries(10*sin(t),t)); % Second element
ds = ds.setElement(3, timeseries(-5*ones(size(t)),t)); % Third element
```

Create a Simulink.SimulationInput object and set the external inputs

```
in = Simulink.SimulationInput('sldemo_mdlref_counter');
in = in.setExternalInput('ds.getElement(1),ds.getElement(2),ds.getElement(3)');
```

Add other remaining variables in the expressions. Ensure that the dataset is also on the SimulationInput object.

Simulate the model.

```
in = in.setVariable('ds',ds);
```

Simulate the model

```
out = parsim(in)
```

applyToModel

Apply changes to the model specified through a `SimulationInput` object, `in`

Syntax

```
in.applyToModel
in.applyToModel('EnableConfigSetRefUpdate', 'on')
```

Description

`in.applyToModel` applies the changes specified through the `SimulationInput` object to the model. You can use it to debug a model or to interactively analyze a simulation.

`in.applyToModel('EnableConfigSetRefUpdate', 'on')` applies the changes specified through the `SimulationInput` object to the model. You can use it to debug a model or to interactively analyze a simulation.

Examples

Apply Changes Made Through the `Simulink.SimulationInput` Object to the Model

This example shows how to modify a model through a `SimulationInput` object and save those modifications.

Open the model and create a `SimulationInput` object.

```
open_system('sldemo_househeat');
in = Simulink.SimulationInput('sldemo_househeat');
```

Modify block parameter, model parameters and a variable through `SimulationInput` object.

```
in = in.setBlockParameter('sldemo_househeat/Set Point', 'Value', '75');
in = in.setVariable('cost', 50, 'Workspace', 'sldemo_househeat');
in = in.setModelParameter('StartTime', '1', 'StopTime', '5');
```

Apply the modifications made in the above step to the model.

```
in.applyToModel
```

Input Arguments

'EnableConfigSetRefUpdate' — Enables `ConfigSetRef` parameter to be updated in the `Simulink.SimulationInput` object

'off' (default) | 'on'

Specify `EnableConfigSetRefUpdate` flag to 'on' to apply the `ConfigSetRefs` settings to the `Simulink.SimulationInput` object, for the model that uses reference config sets.

loadVariablesFromMATFile

Load variables from MAT-file into a `Simulink.SimulationInput` object, `in`

Syntax

```
in = in.loadVariablesFromMATFile('filename')
```

Description

`in = in.loadVariablesFromMATFile('filename')` loads variables from the specified MAT-file into the `Variables` property of `Simulink.SimulationInput`.

Examples

Load Variables From MAT-File

This example shows how to load variables from MAT-File into `Simulink.SimulationInput` object using the `loadVariablesFromMATFile` method.

Create a `Simulink.SimulationInput` Object

Create a `Simulink.SimulationInput` object for the example model.

```
mdl = 'ex_loadVar_sldemo_househeat';
in = Simulink.SimulationInput(mdl);
in
```

```
in =
```

```
SimulationInput with properties:
```

```
    ModelName: 'ex_loadVar_sldemo_househeat'
   InitialState: [0x0 Simulink.op.ModelOperatingPoint]
  ExternalInput: []
 ModelParameters: [0x0 Simulink.Simulation.ModelParameter]
BlockParameters: [0x0 Simulink.Simulation.BlockParameter]
    Variables: [0x0 Simulink.Simulation.Variable]
    PreSimFcn: []
    PostSimFcn: []
    UserString: ''
```

Load Variables From MAT-File

Use the `loadVariablesFromMATFile` method of the `Simulink.SimulationInput` object.

```
in = in.loadVariablesFromMATFile('sldemo_househeat_data.mat');
in
```

```
in =
```

SimulationInput with properties:

```

    ModelName: 'ex_loadVar_sldemo_househeat'
    InitialState: [0x0 Simulink.op.ModelOperatingPoint]
    ExternalInput: []
    ModelParameters: [0x0 Simulink.Simulation.ModelParameter]
    BlockParameters: [0x0 Simulink.Simulation.BlockParameter]
    Variables: [1x25 Simulink.Simulation.Variable]
    PreSimFcn: []
    PostSimFcn: []
    UserString: ''

```

Simulate the Model

The model uses the loaded variables for simulation

```
out = sim(in)
```

out =

```

    Simulink.SimulationOutput:
        sldemo_househeat_output: [1x1 Simulink.SimulationData.Dataset]

    SimulationMetadata: [1x1 Simulink.SimulationMetadata]
    ErrorMessage: [0x0 char]

```

Input Arguments

filename — Name of the MAT file

character vector | string scalar

Name of MAT-file, specified as a character vector or string scalar.

Example: 'myFile'

removeVariable

Remove a variable from a `Simulink.SimulationInput` object or an array of `Simulink.SimulationInput` objects

Syntax

```
in = in.removeVariable('VariableName')
in = in.removeVariable('VariableName', 'Workspace', 'ModelName')
```

Description

`in = in.removeVariable('VariableName')` removes all the variables with the name `VariableName` from the `Simulink.SimulationInput` object.

`in = in.removeVariable('VariableName', 'Workspace', 'ModelName')` removes variable specified in base and model workspace by `ModelName` from the `Simulink.SimulationInput` object.

Examples

Modify and Remove a Variable for a Simulation

This example modifies the model parameters through the `SimulationInput` object.

Open the model.

```
openExample('simulink/OpenTheModelExample');
open_system('ex_sl_demo_househeat');
```

Create a `SimulationInput` object for this model

```
in = Simulink.SimulationInput mdl;
```

Set the variable value to 50.

```
in = in.setVariable('cost', 50);
```

By default, this variable is placed in the global workspace scope.

Assume that you added the variable accidentally and want to remove it

```
in = in.removeVariable('cost');
```

Input Arguments

'VariableName' — Name of variable

string

Name of the variable present in the `Simulink.SimulationInput` object

Example: 'Gain'

'Workspace' — Workspace for the variable

character vector

Set the scope of the variable by specifying the workspace.

Example: 'Workspace', 'sldemo_househeat'

Introduced in R2019a

setBlockParameter

Set block parameters to be used for a specific simulation through `SimulationInput` object, `in`

Syntax

```
in = in.setBlockParameter('BlockPath','ParameterName','Value',... 'BlockPathN'  
'ParameterNameN','ValueN')
```

Description

`in = in.setBlockParameter('BlockPath','ParameterName','Value',... 'BlockPathN'
'ParameterNameN','ValueN')` sets the parameter on the block specified at `BlockPath` with the properties `ParameterName` and `Value`. You can use the `setBlockParameter` method to specify block parameters in model reference hierarchy. You can set multiple block parameters in a model using the same `SimulationInput` object.

You can use `getBlockParameter('BlockPath','ParameterName')` method to get the value of block parameter and the `removeBlockParameter('BlockPath','ParameterName')` method to remove block parameter from the `Simulink.SimulationInput` object.

Examples

Modify a Block Parameter for a Simulation

This example modifies the block parameters of a model through the `SimulationInput` object.

Open the model

```
mdl = 'sldemo_househeat';  
open_system(mdl);
```

Create a `SimulationInput` object for this model.

```
in = Simulink.SimulationInput(mdl);
```

Modify block parameter.

```
in = in.setBlockParameter('sldemo_househeat/Set Point','Value','300');
```

Simulate the model.

```
out = sim(in)
```

Modify Multiple Block Parameters for a Simulation

This example modifies the block parameters of a model through the `SimulationInput` object.

Open the model

```
mdl = 'vdp';
open_system(mdl);
```

Create a `SimulationInput` object for this model.

```
in = Simulink.SimulationInput(mdl);
```

Modify block parameter.

```
in = in.setBlockParameter('vdp/Mu','Gain','40','vdp/Product','Position',[50 100 110 120]);
```

Simulate the model.

```
out = sim(in)
```

Input Arguments

'BlockPath' — Path of the block

character vector

BlockPath is the path of the block for which the parameter is changed

Example: 'sldemo_househeat/Set Point'

'ParameterName' — Block parameter name

character vector

Specify optional comma-separated pairs of `ParameterName`, `Value` arguments. `ParameterName` is the parameter name and `Value` is the corresponding value. `ParameterName` must appear inside single quotes (' '). Block parameter values are typically specified as character vectors. You can specify several name and value pair arguments in any order as `Name1`, `Value1`, ..., `NameN`, `ValueN`. `ParameterNameN`, `ValueN` pairs follow the same syntax as `set_param`.

Example: 'Value', '350'

Introduced in R2017a

setExternalInput

Set external inputs for a simulation through `SimulationInput` object, `in`

Syntax

```
in = in.setExternalInput([t, u1,..uN])
in = in.setExternalInput(ds)
in = in.setExternalInput(ts)
```

Description

`in = in.setExternalInput([t, u1,..uN])` allows you to directly specify numerical arrays as inputs to a model if a model has root inports.

`in = in.setExternalInput(ds)` allows you to directly specify dataset objects as external inputs to a model if a model has root inports.

`in = in.setExternalInput(ts)` allows you to directly specify timeseries object as external input if a model has a single root inport.

Examples

Set Numerical Arrays as External Inputs Through a `Simulink.SimulationInput` Object

This example shows how to set numerical arrays as external inputs.

Open the model

```
open_system('sldemo_mdlref_counter');
```

Create a `SimulationInput` object for this model.

```
in = Simulink.SimulationInput('sldemo_mdlref_counter');
```

Prepare external inputs.

```
t = (0:0.01:10)';
u1 = 5*ones(size(t));
u2 = 10*sin(t);
u3 = -5*ones(size(t));
```

Set external inputs to the model.

```
in = in.setExternalInput([t, u1, u2, u3]);
```

Simulate the model.

```
out = sim(in);
```

Input Arguments

[t, u1, ..uN] – Numerical array

numerical array

Numerical array to be used as an external input.

ds – Dataset object

`Simulink.SimulationData.Dataset` object

Dataset object to be used as an external input

ts – Time series

time object handle

Time series to be used as an external input

setInitialState

Package: Simulink

Configure Simulink.SimulationInput object to set initial state for simulation

Syntax

```
simIn = setInitialState(simIn,xInitial)
```

Description

`simIn = setInitialState(simIn,xInitial)` sets the value of the `InitialState` property for the `Simulink.SimulationInput` object `simIn` using the contents of the variable `xInitial`. Simulations run using the `SimulationInput` object `simIn` start from the initial state or operating point stored in the `InitialState` property of the object.

Examples

Save and Restore Model Operating Point

Open the model `sldemo_tonegen`.

```
model = "sldemo_tonegen";
open_system(model);
```

Create a `Simulink.SimulationInput` object to specify parameter values to use in simulation.

```
simIn = Simulink.SimulationInput(model);
```

Configure the simulation to stop after ten seconds and save the final operating point in a variable named `finalOP`.

```
simIn = setModelParameter(simIn,"StopTime","10",...
    "SaveFinalState","on","SaveOperatingPoint","on",...
    "FinalStateName","finalOP");
```

Simulate the model using the settings configured on the `SimulationInput` object.

```
out = sim(simIn);
```

Access the saved operating point, returned as part of the single `Simulink.SimulationOutput` object.

```
finalOP = out.finalOP
```

```
finalOP =
    Simulink.op.ModelOperatingPoint
```

```
    Operating point of the model 'sldemo_tonegen' at simulation time 10.
```

```
    Properties
```

```

loggedStates
description
startTime (Read-only)
snapshotTime (Read-only)

```

Methods

```

get
set

```

Create a `SimulationInput` object to configure another simulation that uses the operating point saved from the first simulation.

```
simIn2 = Simulink.SimulationInput(model);
```

Configure the model to simulate to a stop time of twenty seconds.

```
simIn2 = setModelParameter(simIn2, "StopTime", "20");
```

Use the `setInitialState` function to specify the initial state for the simulation using the `Simulink.op.ModelOperatingPoint` object saved from the first simulation.

```
simIn2 = setInitialState(simIn2, finalOP);
```

Simulate the model from the initial operating point.

```
out2 = sim(simIn2);
```

Input Arguments

simIn — Simulation input to specify initial state

`Simulink.SimulationInput` object

Simulation input to specify initial state, specified as a `Simulink.SimulationInput` object.

xInitial — Initial state or operating point

`Simulink.op.ModelOperatingPoint` object | `Simulink.SimulationData.Dataset` object | structure

Initial state or operating point, specified as a `Simulink.op.ModelOperatingPoint` object, a `Simulink.SimulationData.Dataset` object, or a structure that matches the `Structure` or `Structure with Time logging format`.

setModelParameter

Set model parameters to be used for a specific simulation through `SimulationInput` object, `in`

Syntax

```
in = in.setModelParameter('ParameterName', 'Value', ... 'ParameterNameN',
'ValueN')
```

Description

`in = in.setModelParameter('ParameterName', 'Value', ... 'ParameterNameN', 'ValueN')` sets a model parameter `Name` with a `Value`. You can add multiple model parameters to the model using the same `SimulationInput` object.

You can use `getModelParameter('ParameterName')` method to get the value of model parameter and the `removeModelParameter('ParameterName')` method to remove model parameter from the `Simulink.SimulationInput` object.

Examples

Modify a Model Parameter for a Simulation

This example modifies the model parameters of through the `SimulationInput` object

Open the model.

```
mdl = 'sldemo_househeat';
open_system(mdl);
```

Create a `SimulationInput` object for this model.

```
in = Simulink.SimulationInput(mdl);
```

Specify a timeout of 5 seconds and modify model parameters, `StartTime` and `StopTime`

```
in = in.setModelParameter('Timeout',5);
in = in.setModelParameter('StartTime','1','StopTime','4');
```

Simulate the model.

```
out = sim(in)
```

Input Arguments

'ParameterName', 'Value', ... 'ParameterNameN', 'ValueN' — Block parameter name character vector

Specify optional comma-separated pairs of `ParameterName`, `Value` arguments. `ParameterName` is the parameter name and `Value` is the corresponding value. `ParameterName` must appear inside single quotes (' '). Model parameter values are typically specified as character vectors. You can

specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. `ParameterNameN, ValueN` pairs follow the same syntax as `set_param`.

Example: `'StartTime', '1'`

Introduced in R2017a

setPostSimFcn

Package: Simulink

Specify a MATLAB function to run after each simulation is complete through `SimulationInput` object, `in`

Syntax

```
in = in.setPostSimFcn(func)
```

Description

`in = in.setPostSimFcn(func)` registers the callback function associated with the function handle `func` after each simulation is complete. The `Simulink.SimulationInput` object is passed as an argument to this function. `func` is any MATLAB function and can be used to do the post processing on the output. To return post processed data, you must return it as values in a struct. These values are then packed into the `Simulink.SimulationOutput` output to replace the usual logged data or add new data to the `Simulink.SimulationOutput` object.

Examples

Specify a MATLAB function for Postprocessing of the Output

This example specifies a MATLAB Function through `SimulationInput` object to run after each simulation is complete.

Create a `PostSimFcn` to get the mean of the output.

```
function newout = postsim(out);  
newout.mean = mean(out.yout);  
end
```

Create a `SimulationInput` object for a model.

```
in = Simulink.SimulationInput('vdp');  
in = in.setPostSimFcn(@(x) postsim(x));  
in = in.setModelParameter('SaveOutput','on');
```

Simulate the model.

```
out = sim(in)
```

View your result

```
out.mean
```

It is best practice to avoid using 'ErrorMessage' and 'SimulationMetadata' as field names in the function.

Input Arguments

func — Function to run after each simulation completes

function handle | function name

Function to run after each simulation completes, specified as a function handle or a function name. `setPostSimFcn` passes the `Simulink.SimulationInput` object in the shape of `y` argument. For example:

```
in = in.setPreSimFcn(@myfunc, y)
```

where `myfunc` is a MATLAB function such as

```
function f = myfunc(x)
f ...%Compute function value with x as an input argument
```

You can also specify `func` as a function handle for an anonymous function:

```
in = in.setPostSimFcn(@(y) myfunction(arg1, arg2 ...))
```

Introduced in R2017a

setPreSimFcn

Specify a MATLAB function to run before start of each simulation through `SimulationInput` object, `in`

Syntax

```
in = in.setPreSimFcn(func)
```

Description

`in = in.setPreSimFcn(func)` registers the callback function associated with the function handle `func` before each simulation starts. The `Simulink.SimulationInput` object is passed as an argument to this function. `func` is any MATLAB function and can be used to modify the `Simulink.SimulationInput` object. If you use `func` to modify the `Simulink.SimulationInput` object, you must return `Simulink.SimulationInput` object as the only output argument.

Input Arguments

func — Function to run before each simulation starts

function handle | function name

Function to run before each simulation starts, specified as a function handle or a function name. `setPreSimFcn` passes the `Simulink.SimulationInput` object in the shape of `x` argument. For example:

```
in = in.setPreSimFcn(@myfunc, x)
```

where `myfunc` is a MATLAB function such as

```
function f = myfunc(x)
f ...%Compute function value with x as an input argument
```

You can also specify `func` as a function handle for an anonymous function:

```
in = in.setPreSimFcn(@(x) myfunction(arg1, arg2 ...))
```

showContents

View the contents of the `Simulink.SimulationInput` object

Syntax

```
showContents(in)
```

Description

`showContents(in)` displays the contents of the `Simulink.SimulationInput` object as a table. The method, `showContents`, lets you view all the information such as block parameters, variables, model parameters, external Inputs and the initial states that are set in the `Simulink.SimulationInput` object. You can view the contents of a single `Simulink.SimulationInput` object at a given time.

Examples

View the Contents of the `Simulink.SimulationInput` Object

This example shows the contents of the `Simulink.SimulationInput` object by using the `showContents` method on the object.

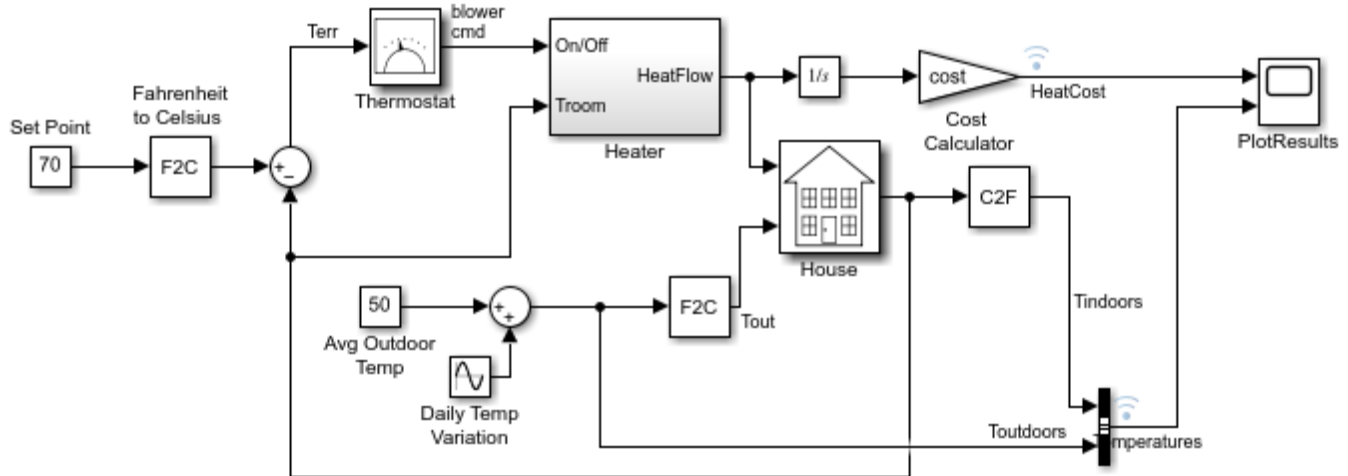

Open and Load Model

Open and load the model .

```
open_system('ex_sldemo_househeat')  
load_system('ex_sldemo_househeat')
```

Thermal Model of a House

Note: Time given in units of hours

Copyright 1990-2012 The MathWorks, Inc.

Create a SimulationInput Object for a Model

Create a `Simulink.SimulationInput` object for the model `ex_sl-demo_househeat`.

```
in = Simulink.SimulationInput('ex_sl-demo_househeat');
```

Set a Variable and Model Parameters on the Model

```
in = in.setVariable('cost',50);
in = in.setModelParameter('Start','0','Stop','50');
```

View the Contents of the Simulink.SimulationInput Object, in

```
in.showContents
```

```
ModelName: 'ex_sl-demo_househeat'
```

```
ModelParameters:
```

Index	Name	Value
1	Start	'0'
2	Stop	'50'

```
Variables:
```

Index	Name	Value	Workspace
1	cost	50	global-workspace

RuntimeFcns: 1x1 RuntimeFcns

Input Arguments

in — **Simulink.SimulationInput** object used to simulate the model
object

A `Simulink.SimulationInput` object that is used to specify changes to the model for a simulation.

setVariable

Set variables for a simulation through `SimulationInput` object, `in`

Syntax

```
in=in.setVariable(varName, varValue)
in = in.setVariable(varName, varValue,Workspace, ModelName)
```

Description

`in=in.setVariable(varName, varValue)` assigns a `Value` to variable `Name`. You can add multiple variables to the model using the same `SimulationInput` object.

`in = in.setVariable(varName, varValue,Workspace, ModelName)` assigns the `varValue` to variable `varName`. Variables that are defined through the `SimulationInput` object are placed in the global workspace scope by default. The term global workspace is specific to the `Simulink.SimulationInput` object and its methods. Variables in the global workspace scope take precedence if a variable with the same name exists in the base workspace or the data dictionary. The variables in the model workspace take precedence over the global workspace scope. To change the value of a model workspace variable, set the scope by specifying the model name when you add the variable to the `SimulationInput` object.

While using the `setVariable` method, you can specify only one variable at a time.

You can use `getVariable('VariableName')` method to get the value of variable and the `removeVariable('VariableName')` method to remove variable from the `Simulink.SimulationInput` object

For information on using nonscalar variables, structure variables and parameter objects, see “Sweep Nonscalars, Structures, and Parameter Objects”.

Examples

Modify a Variable for a Simulation

This example modifies the model parameters of through the `SimulationInput` object.

Open the model.

Open the model.

```
openExample('simulink/OpenTheModelExample');
open_system('ex_sl-demo_househeat');
load_system('ex_sl-demo_househeat')
```

Create a `SimulationInput` object for this model

```
in = Simulink.SimulationInput('ex_sl-demo_househeat');
```

Set the variable value to 50.

```
in = in.setVariable('cost',50);
```

By default, this variable is placed in the global workspace scope.

Simulate the model.

```
out = sim(in)
```

Modify a Variable for a Simulation in the Model Workspace

This example modifies the model parameters of `sldemo_househeat` through the `SimulationInput` object.

Set path and open the model.

```
openExample('simulink/OpenTheModelExample');
open_system('ex_sldemo_househeat');
load_system('ex_sldemo_househeat')
```

Create a `SimulationInput` object for this model

```
in = Simulink.SimulationInput('ex_sldemo_househeat');
```

Set the variable to 50 and set the scope to model workspace.

```
in = in.setVariable('cost',50,'Workspace','ex_sldemo_househeat');
```

Simulate the model.

```
out = sim(in)
```

Input Arguments

varName, varValue — Variable name and its corresponding value

character vector

Specify optional comma-separated pairs of `Name, Value` arguments. `Name` is the argument name and `Value` is the literal value of the variable. `Name` must appear inside single quotes (`' '`).

Example: `'StartTime','1'`

Workspace — Workspace for the variable

modelName

Set the scope of the defined variable by specifying the model name

Example: `'Workspace','sldemo_househeat'`

validate

Validate the contents of the `SimulationInput` object, `in`

Syntax

```
in.validate
```

Description

`in.validate` validates the changes made to the model through the `SimulationInput` object. This method validates all the changes made to the model through the `SimulationInput` object.

Examples

Validate Changes Made Through the SimulationInput Object

This example modifies and validates the variable of the model through the `SimulationInput` object.

Open the model.

```
openExample('simulink/OpenTheModelExample');  
mdl = 'ex_sl-demo_househeat';  
open_system(mdl);
```

Create a `SimulationInput` object for this model

```
in = Simulink.SimulationInput(mdl);
```

Modify a model parameter

```
in = in.setModelParameter('InvalidParamName','5');
```

Validate this change

```
in.validate
```

Simulink.SimulationMetadata class

Package: Simulink

Access metadata of simulation runs

Description

The `SimulationMetadata` class contains information about a simulation run including:

- Model information
- Timing information
- Execution and diagnostic information
- Custom character vector to tag the simulation
- Custom data to describe the simulation

`SimulationMetadata` packages this information with the `SimulationOutput` object. To use `SimulationMetadata`, use one of these approaches:

- In **Configuration Parameters > Data Import/Export**, under **Save options**, select **Single simulation output**.
- Use `set_param` to set `ReturnWorkspaceOutputs` to on.

```
set_param(model_name, 'ReturnWorkspaceOutputs', 'on');
```

To retrieve the `SimulationMetadata` object, use the `getSimulationMetadata` method on a `SimulationOutput` object.

Properties

ModelInfo — Information about the model and simulation operating environment

structure

The `ModelInfo` structure has these fields.

Field Name	Type	Description
<code>ModelName</code>	char	Name of the model
<code>ModelVersion</code>	char	Version of the model
<code>ModelFilePath</code>	char	Absolute location of the <code>.mdl/.slx</code> file
<code>UserID</code>	char	System user ID of the machine used for the simulation
<code>MachineName</code>	char	Hostname of the machine used for the simulation
<code>Platform</code>	char	Operating system of the machine used for the simulation

Field Name	Type	Description
ModelStructuralChecksum	4-by-1 uint32	Structural checksum of the model calculated after an update diagram
SimulationMode	char	Simulation mode
StartTime	double	Simulation start time
StopTime	double	Time at which the simulation was terminated
SolverInfo	structure	Solver information: <ul style="list-style-type: none"> Fixed-step solvers - Solver type, name, and fixed step size Variable solvers - Solver type, name, and max step size (initial setting)
SimulinkVersion	structure	Version of Simulink
LoggingInfo	structure	Metadata about logging to persistent storage: <ul style="list-style-type: none"> LoggingToFile field — Indicates whether logging to persistent storage is enabled ('on' or 'off') LoggingFileName field — Specifies the resolved file name for the persistent storage MAT-file (if LoggingToFile is 'on').

ExecutionInfo — Structure to store information about a simulation run

structure

Structure to store information about a simulation run, including the reason a simulation stopped and any diagnostics reported during the simulation. The structure has these fields.

Field Name	Type	Description
StopEvent	Nontranslated character vector	<p>Reason the simulation stopped, represented by one of the following:</p> <ul style="list-style-type: none"> • ReachedStopTime - Simulation stopped upon reaching stop time and no errors were reported during execution. StopEvent has value ReachedStopTime, even if errors are reported in the stop callbacks, which are executed after the simulation ends. • ModelStop - Simulation stopped by a block or by solver before reaching stop time. • StopCommand - Simulation stopped manually by clicking the Stop button or using the set_param command. • DiagnosticError - Simulation stopped because an error was reported during simulation. • KeyboardControlC - Simulation stopped using keystroke Ctrl+C. • PauseCommand - Simulation paused manually by clicking the Pause button or using the set_param command. • ConditionalPause - Simulation paused using a conditional breakpoint. • PauseTime - Simulation paused at or after specified pause time. • StepForward - Simulation paused after clicking step forward. • StepBackward - Simulation paused after clicking step backward. • Timeout - Simulation stopped because execution time exceeded timeout specified by Timeout.
StopEventSource	Simulink.SimulationData.BlockPath	Source of stop event, if it is a valid Simulink object.
StopEventDescription	Translated character vector	Superset of information stored in StopEvent and StopEventSource.

Field Name	Type	Description
ErrorDiagnostic	struct	<p>Error reported during simulation, represented by the following fields:</p> <ul style="list-style-type: none"> • Diagnostic - MSLDiagnostic object that includes object paths, ID, message, cause, and stack. • SimulationPhase - Represented by one of these: Initialization, Execution, or Termination. • SimulationTime - Simulation time represented as a double, if reported during Execution; else, represented as []. <p>By passing the name-value pair 'CaptureErrors', 'on' to the sim command, errors generated during simulation are reported in ExecutionInfo.ErrorDiagnostic. The sim command does not capture generated errors.</p>
WarningDiagnostics	Array of struct	<p>Array of all warnings reported during the simulation. Each array item is represented by the following fields:</p> <ul style="list-style-type: none"> • Diagnostic - MSLDiagnostic object that includes object paths, ID, message, cause, and stack. • SimulationPhase - Represented as: Initialization, Execution, or Termination. • SimulationTime - Simulation time represented as a double, if reported during Execution; else, represented as [].

TimingInfo — Structure to store profiling information about the simulation

structure

Structure to store profiling information about the simulation, including the time stamps for the start and end of the simulation. The structure has these fields.

Field Name	Type	Description
WallClockTimestampStart	character vector	Wall clock time when the simulation started, in YYYY-MM-DD HH:MI:SS format with microsecond resolution
WallClockTimestampStop	character vector	Wall clock time when the simulation stopped, in YYYY-MM-DD HH:MI:SS format with microsecond resolution

Field Name	Type	Description
InitializationElapsedWallTime	double	Time spent before execution, in seconds
ExecutionElapsedWallTime	double	Time spent during execution, in seconds
TerminationElapsedWallTime	double	Time spent after execution, in seconds
TotalElapsedWallTime	double	Total time spent in initialization, execution, and termination, in seconds
ProfilerData	Simulink.profiler.Data	Profiling results of the model, returned as a Simulink.profiler.Data object Note The ProfilerData field is shown only when the Profile and ReturnWorkspaceOutputs model parameters are enabled

The ExecutionElapsedWallTime includes the time that Simulink spent to roll back or step back in a simulation. The ExecutionElapsedWallTime does not include the time spent between steps. For example, if you use Stepper to step through a simulation, the ExecutionElapsedWallTime time does not include the time when the simulation is in a paused state. For more information about using Stepper, see “How Simulation Stepper Helps With Model Analysis”.

UserString — Custom character vector to describe the simulation

character vector

Use Simulink.SimulationOutput.setUserString to directly store a character vector in the SimulationMetadata object that is contained in the SimulationOutput object.

UserData — Custom data to store in SimulationMetadata object that is contained in the SimulationOutput object

character vector

Use Simulink.SimulationOutput.setUserData to store custom data in the SimulationMetadata object that is contained in the SimulationOutput object.

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects.

Examples

Get a SimulationMetadata Object for vdp Simulation

Simulate the vdp model. Retrieve metadata from a SimulationMetadata object of the simulation.

Simulate the vdp model. Save the results of the Simulink.SimulationOutput object in simout.

```
open_system('vdp');
simout = sim(bdroot, 'ReturnWorkspaceOutputs', 'on');
```

Copyright 2004-2020 The MathWorks, Inc.

Retrieve metadata information about this simulation using `mData`. This is the `SimulationMetadata` object that `simout` contains.

```
mData=simout.getSimulationMetadata()
```

```
mData =
```

SimulationMetadata with properties:

```

    ModelInfo: [1x1 struct]
    TimingInfo: [1x1 struct]
    ExecutionInfo: [1x1 struct]
    UserString: ''
    UserData: []

```

Store custom data or string in simout.

```

simout=simout.setUserData(struct('param1','value1','param2','value2','param3','value3'));
simout=simout.setUserString('Store first simulation results');

```

Retrieve the custom data you stored from mData.

```

mData=simout.getSimulationMetadata()
disp(mData.UserData)

```

mData =

SimulationMetadata with properties:

```

    ModelInfo: [1x1 struct]
    TimingInfo: [1x1 struct]
    ExecutionInfo: [1x1 struct]
    UserString: 'Store first simulation results'
    UserData: [1x1 struct]

    param1: 'value1'
    param2: 'value2'
    param3: 'value3'

```

Retrieve the custom string you stored from mData.

```

mData=simout.getSimulationMetadata()
disp(mData.UserString)

```

mData =

SimulationMetadata with properties:

```

    ModelInfo: [1x1 struct]
    TimingInfo: [1x1 struct]
    ExecutionInfo: [1x1 struct]
    UserString: 'Store first simulation results'
    UserData: [1x1 struct]

```

Store first simulation results

Simulink.SubsysDataLogs

Container for subsystem signal data logs

Description

Note Before R2016a, the `Simulink.SubsysDataLogs` class was used in conjunction with the `ModelDataLogs` logging data format. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format.

However, you can use data that was logged in a previous release using `ModelDataLogs` format.

In releases before R2016a, Simulink created instances of this class to contain logs for signals in a subsystem models were logged in `ModelDataLogs` format. Objects of this class have a variable number of properties. The first property, named `Name`, is the name of the subsystem whose log data this object contains. The remaining properties are signal log or signal log container objects containing the data logged for the subsystem specified by this object's `Name` property.

For example, suppose you have this logged data from a model run in a release earlier than R2016a:

```
Simulink.SubsysDataLogs (Gain):
  Name          elements  Simulink Class
  a              1         Timeseries
  m              2         TsArray
```

You can use either fully qualified log names or the `unpack` command to access the signal logs contained by a `SubsysDataLogs` object. For example, to access the amplitudes logged for signal `a` in the preceding example, you could enter the following at the MATLAB command line:

```
data = logout.Gain.a.Data;
```

or

```
>> logout.unpack('all');
data = a.Data;
```

sldiagviewer class

Generate, display, and log diagnostic messages in the Diagnostic Viewer

Description

Use an instance of `sldiagviewer` class to perform the following operations:

- Create a stage
- Report Error
- Report warning
- Report Info

The `sldiagviewer` class is a `handle` class.

Methods

Public Methods

Introduced in R2014a

Simulink.SuppressedDiagnostic class

Package: Simulink

Suppress diagnostic messages from a specified block

Description

A `Simulink.SuppressedDiagnostic` object contains information related to diagnostic warnings or errors that are suppressed from being thrown during simulation.

Construction

The Diagnostic Viewer in Simulink includes an option to suppress certain diagnostics. This feature enables you to suppress warnings or errors for specific objects in your model. Click the **Suppress** button next to the warning in the Diagnostic Viewer to suppress the warning from the specified source. This action creates a `Simulink.SuppressedDiagnostic` object. You can access this object at the MATLAB command line using the `Simulink.getSuppressedDiagnostics` function. You can add a comment for the suppressed diagnostic. You can restore the diagnostic by clicking **Restore**.

`DiagnosticObject = Simulink.SuppressedDiagnostic(source, message_id)` creates a suppressed diagnostic object. The object suppresses all instances of diagnostics represented by `message_id` thrown by the blocks specified by `source`.

Input Arguments

source — System, block, or model object throwing diagnostic

model | subsystem | block path | block handle

The source of the diagnostic, specified as a model, subsystem, block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the `gcb` function.

To get the block handle, use the `getSimulinkBlockHandle` function.

Data Types: `char` | `cell` | `string`

message_id — message identifier of diagnostic

message identifier

The message identifier of the diagnostic, specified as a character vector or string. You can find the message identifier of diagnostics thrown during simulation by accessing the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object associated with a simulation. You can also use the `lastwarn` function.

Data Types: char | string

Properties

Comments — Comments associated with the suppression object

character vector

Comments associated with the suppression object, specified as a character vector. This property is optional.

Data Types: char

ID — Message identifier of the diagnostic that was suppressed

character vector

The message identifier of the diagnostic that was suppressed, specified as a character vector.

Data Types: char

LastModified — Date and time the suppression object was last modified

character vector

Date and time the suppression object was last modified, specified as a character vector. This property is read-only.

Data Types: char

LastModifiedBy — Name of the user who was last to add or edit the suppression object

character vector

Name of the user who last added or edited the suppression object, specified as a character vector. This property is optional.

Data Types: char

Source — block path of the source of the diagnostic

character vector

The block path of the model object that has a suppressed diagnostic, specified as a character vector.

Data Types: char

Methods

restore Remove specified diagnostic suppressions

suppress Suppress diagnostic specified by Simulink.SuppressedDiagnostic object

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects.

Examples

Create a Simulink.SuppressedDiagnostic Object

Using the model from “Suppress Diagnostic Messages Programmatically”, create and then restore a diagnostic suppression.

Create a `Simulink.SuppressedDiagnostic` object, suppression to suppress the parameter precision loss warning thrown by the Constant block, one.

```
suppression = Simulink.SuppressedDiagnostic('Suppressor_CLI_Demo/one', ...  
'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

The parameter precision loss warning is no longer thrown in future simulations of this model.

Add accountability information to the object by editing the `LastModifiedBy` and `Comments` properties of the object.

```
suppression.LastModifiedBy = 'John Doe';  
suppression.Comments = 'Reviewed: Joe Schmoe'
```

```
suppression =
```

```
SuppressedDiagnostic with properties:
```

```
    Source: 'Suppressor_CLI_Demo/one'  
      Id: 'SimulinkFixedPoint:util:fxpParameterPrecisionLoss'  
LastModifiedBy: 'John Doe'  
    Comments: 'Reviewed: Joe Schmoe'  
  LastModified: '2016-Jun-01 17:25:21'
```

You can restore the diagnostic using the `restore` method.

```
restore(suppression);
```

“Suppress Diagnostic Messages Programmatically”

Class Attributes

Property Attributes

Introduced in R2016b

restore

Class: Simulink.SuppressedDiagnostic

Package: Simulink

Remove specified diagnostic suppressions

Syntax

```
restore(SuppressedDiagnostic)
```

Description

restore(SuppressedDiagnostic) removes the specified suppressed diagnostic object.

Input Arguments

SuppressedDiagnostic — Suppressed diagnostic object to restore

Simulink.SuppressedDiagnostic object

Simulink.SuppressedDiagnostic object

Examples

Restore a Suppressed Diagnostic

Using the model from “Suppress Diagnostic Messages Programmatically”, create and then restore a diagnostic suppression.

Create a Simulink.SuppressedDiagnostic object, suppression to suppress the parameter precision loss warning from the Constant block, one.

```
suppression = Simulink.SuppressedDiagnostic('Suppressor_CLI_Demo/one', ...  
'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

You can restore the diagnostic using the restore method.

```
restore(suppression);
```

Restore All Suppressed Diagnostics

Using the model from “Suppress Diagnostic Messages Programmatically”, restore all diagnostic suppressions associated with a model.

Use the Simulink.suppressDiagnostic function to suppress the parameter precision loss and parameter underflow warnings from the Constant block, one.

```
diags = {'SimulinkFixedPoint:util:fxpParameterPrecisionLoss', 'SimulinkFixedPoint:util:fxpParamete  
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one',diags);
```

Use the `Simulink.getSuppressedDiagnostics` function to get all suppressions associated with the model, returned as an array of `Simulink.SuppressedDiagnostic` objects.

```
suppressed_diagnostics = Simulink.getSuppressedDiagnostics('Suppressor_CLI_Demo')
```

```
suppressed_diagnostics =
```

```
1×2 SuppressedDiagnostic array with properties:
```

```
Source  
Id  
LastModifiedBy  
Comments  
LastModified
```

Restore all diagnostics using the `restore` method and iterating through the `suppressed_diagnostics` array.

```
for iter = 1:numel(suppressed_diagnostics)  
    restore(suppressed_diagnostics(iter));  
end
```

Simulink.TimeInfo

Provide information about time data in `Simulink.Timeseries` object

Description

Simulink software creates instances of these objects to describe the time data that it includes in `Simulink.Timeseries` objects.

Note The `Simulink.Timeseries` class is supported for backwards compatibility. The `ModelDataLogs` format created `Simulink.Timeseries` objects for signal logging data. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to `Dataset` Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy `ModelDataLogs` API”.

Properties

Name	Access	Description
Units	RW	The units, e.g., 'seconds', in which the time series data are expressed in the associated <code>Simulink.Timeseries</code> object.
Start	RW	If the associated signal is not in a conditionally executed subsystem, this field contains the simulation time of the first signal value recorded in the associated <code>Simulink.Timeseries</code> object. If the signal is in a conditionally executed subsystem, this field contains an array of times when the system became active.
end	RW	If the associated signal is not in a conditionally executed subsystem, this field contains the simulation time of the last signal value recorded in the associated <code>Simulink.Timeseries</code> object. If the signal is in a conditionally executed subsystem, this field contains an array of times when the system became inactive.
Increment	RW	The interval between simulation times at which signal data is logged in the associated <code>Simulink.Timeseries</code> object. If the signal is aperiodic (continuous signal with variable-step solver), this property has a value of NaN. A signal is periodic if it has a discrete sample time (not continuous or constant) or is continuous with a fixed-step solver.

Name	Access	Description
Length	W	The number of signal samples recorded in the associated <code>Simulink.Timeseries</code> object, i.e., the length of the arrays referenced by the object's <code>Time</code> and <code>Data</code> properties.

Simulink.Timeseries

Store data for any signal except mux or bus signal

Description

Note The `Simulink.Timeseries` class is supported for backwards compatibility. The `ModelDataLogs` format created `Simulink.Timeseries` objects for signal logging data. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy `ModelDataLogs` API”.

Simulink software creates instances of this class to store signal data that it logs for any signal except a mux or bus signal, which are stored in a `Simulink.TsArray`. See “Export Signal Data Using Signal Logging” for more information.

Properties

Name	Access	Description
Name	RW	Name of this signal log.
BlockPath	RW	Path of the block that output the signal logged in this signal log.
PortIndex	RW	Index of the output port that emitted the signal logged in this signal log.
SignalName	RW	Name of the signal logged in this signal log.
ParentName	RW	Name of the parent of the signal recorded in this log, if the signal is an element of a mux or a virtual bus; otherwise, the same as <code>SignalName</code> .
TimeInfo	RW	An object of <code>Simulink.TimeInfo</code> class that describes the time data in this log.
Time	RW	An array containing the simulation times at which signal data was logged.
Data	RW	An array containing the signal data.

See Also

Introduced before R2006a

Simulink.TsArray

Store data for mux or bus signal

Description

Note Before R2016a, the `Simulink.TsArray` class was used in conjunction with the `ModelDataLogs` logging data format. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format.

However, you can use data that was logged in a previous release using `ModelDataLogs` format.

In releases earlier than R2016a, Simulink software created instances of this class to contain the data that it logs for a mux or bus signal. Other types of signals were stored in a `Simulink.Timeseries`.

Objects of the `Simulink.TsArray` class have a variable number of properties. The first property, called `Name`, specifies the log name of the logged signal. The remaining properties reference logs for the elements of the logged signal: `Simulink.Timeseries` objects for elementary signals and `Simulink.TsArray` objects for mux or bus signals. The name of each property is the log name of the corresponding signal.

For example, suppose you have this logged data from a model run in a release earlier than R2016a that was configured to log in `ModelDataLogs` format.

```
logout.b2
```

```
Simulink.TsArray (untitled/Bus Creator1):
  Name           elements  Simulink Class
  x1              1         Timeseries
  b1              2         TsArray
```

The `Simulink.ModelDataLogs` object, named `logout`, contains a `Simulink.TsArray` object, named `b2`, that contains the logs for the elements of `b2` (that is, the elementary signal `x1` and the bus signal `b1`). Entering the fully qualified name of the `Simulink.TsArray` object, (`logout.b2`) at the MATLAB command line reveals the structure of the signal log for this model.

You can use either fully qualified log names or the `unpack` command to access the signal logs contained by a `Simulink.TsArray` object. For example, to access the amplitudes logged for signal `x1` in the preceding example, you can enter the following at the MATLAB command line:

```
data = logout.b2.x1.Data;
```

or

```
logout.unpack('all');
data = x1.Data;
```

Simulink.Variant class

Package: Simulink

Specify conditions that control variant selection

Description

An object of the `Simulink.Variant` class represents a conditional expression called a variant control. The object allows you to specify a Boolean expression that activates a specific variant choice when it evaluates to `true`.

A variant control comprises one or more variant control variables, specified using MATLAB variables or `Simulink.Parameter` objects.

You specify variant controls for each variant choice represented in a Variant Subsystem or Model Variant block. For a given Variant Subsystem or Model Variant block, only one variant control can evaluate to `true` at a time. When a variant control evaluates to `true`, Simulink activates the variant choice that corresponds to that variant control.

Construction

`variantControl = Simulink.Variant(conditionExpression)` creates a variant control.

Properties

conditionExpression — Variant condition expression

'(default)' | character vector

Variant condition expression, specified as a character vector containing one or more of these operands and operators.

Operands

- Variable names that resolve to MATLAB variables or `Simulink.Parameter` objects with integer or enumerated data type and scalar literal values
- Variable names that resolve to `Simulink.Variant` objects
- Scalar literal values that represent integer or enumerated values

Operators

- Parentheses for grouping
- Arithmetic, relational, logical, or bit-wise operators

The variant condition expression evaluates to a Boolean value. This property has read and write access.

Example: `'(Fuel==2 || Emission==1) && Ratio==2'`

Examples

Create Variant Controls Using MATLAB Variables

Use MATLAB variables when you want to simulate the model but are not considering code generation.

Create MATLAB variables with scalar literal values.

```
Fuel = 3;
Emission = 1;
Ratio = 3;
```

Develop conditional expressions using the variables.

```
Variant1 = Simulink.Variant('Fuel==1 && Emission==2');
Variant2 = Simulink.Variant('(Fuel==2 || Emission==1) && Ratio==2');
Variant3 = Simulink.Variant('Fuel==3 || Ratio==4');
```

Create Variant Controls Using Simulink.Parameter Objects

If you want to generate preprocessor conditionals for code generation, use `Simulink.Parameter` objects.

Create variant `Simulink.Parameter` objects with scalar literal values.

```
Fuel = Simulink.Parameter(3);
Emission = Simulink.Parameter(1);
Ratio = Simulink.Parameter(3);
```

Specify the custom storage class for these objects as `ImportedDefine` so that the values are specified by an external header file.

Other valid values for the custom storage class are `Define` and `CompilerFlag`

Note If you generate code with startup activation time, specify the supported custom storage class for the objects. For more information on built-in and custom storage classes supported with startup activation time see “Storage Classes for Different Variant Activation Times”.

```
Fuel.CoderInfo.StorageClass = 'Custom';
Fuel.CoderInfo.CustomStorageClass = 'ImportedDefine';

Emission.CoderInfo.StorageClass = 'Custom';
Emission.CoderInfo.CustomStorageClass = 'ImportedDefine';

Ratio.CoderInfo.StorageClass = 'Custom';
Ratio.CoderInfo.CustomStorageClass = 'ImportedDefine';
```

Develop conditional expressions using the variables and create variant controls.

```
Variant1 = Simulink.Variant('Fuel==1 && Emission==2');
Variant2 = Simulink.Variant('(Fuel==2 || Emission==1) && Ratio==2');
Variant3 = Simulink.Variant('Fuel==3 || Ratio==4');
```

Simulink.VariantConfigurationAnalysis class

Package: Simulink

Analyze variant configurations programmatically

Description

Use the `Simulink.VariantConfigurationAnalysis` class to analyze variant configurations for a model by specifying either named variant configurations or variable groups. The class returns a variant configuration analysis object and has methods that can be used to:

- Get a list of active blocks for variant configuration.
- Find blocks that are active across all variant configurations.
- Find blocks that are inactive in all variant configurations.
- Get a list of blocks that differ in active choice between variant configurations.
- Get a list of active models for variant configuration.
- Get a list of libraries that are used in variant configuration.
- View variant configuration analysis in user interface.
- Hide the variant configuration analysis report.
- View variant conditions for blocks in a given variant configuration.

Creation

`varConfigObj = Simulink.VariantConfigurationAnalysis(model,Name,Value)` returns a variant configuration analysis object for the model specified by `model` and sets the `ModelName` and `Configurations` properties.

Input Arguments

Name-Value Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: `'NamedConfigurations', {'config1', 'config2'}`

NamedConfigurations — Names of variant configurations

string | cell array of strings

Names of variant configurations, specified as a string or a cell array of strings. Use this argument to perform the analysis by specifying named variant configurations defined for the model.

You can use Variant Manager to create named variant configurations for a model, save them in a variant configuration object of type `Simulink.VariantConfigurationData`, and associate this

object with the model. You can specify one or more configuration names defined in this variant configuration object for the analysis.

Note If the model is associated with a variant configuration object, then the `VariantConfigurationObject` model parameter contains the name of the corresponding variant configuration object.

Example: `NamedConfigurations={'config1', 'config2'}`

VariableGroups — Variant control variable names and values

struct array

Variant control variable names and values, specified as a struct array. Use this argument to perform the analysis by specifying values for the variant control variables used by the model.

You can specify multiple variable groups that represent the different variant configurations to be analyzed. In each variable group, you must specify the variant control variables and their values that must be used for the analysis.

To define the variable groups, provide a struct array with these fields:

- **Name** — Name of variable group
- **VariantControls** — Cell array with variant control variable names and their values

Example: `'VariableGroups',[struct('Name', 'V1W1',... 'VariantControls', {'V',1,'W',1})),struct('Name', 'V1W2',... 'VariantControls', {'V',1,'W',2})]`

Note Specifying both `NamedConfigurations` and `VariableGroups` is not supported.

Properties

ModelName — Name of the model

character vector

Name of model to be analyzed, specified as a character vector.

Example: `'slexVariantReducer'`

Attributes:

<code>GetAccess</code>	<code>public</code>
<code>SetAccess</code>	<code>private</code>

Data Types: character vector

Configurations — Names of variant configurations or variable groups

cell array of strings

Names of variant configurations or variable groups to be analyzed, specified as a cell array of strings.

Example: `{'config1', 'config2'}`

Attributes:

GetAccess	public
SetAccess	private

Data Types: character vector

Methods**Public Methods**

getActiveBlocks	Returns a list of active blocks for variant configuration
getAlwaysActiveBlocks	Displays a list of blocks that are always active across all variant configurations
getBlockDifferences	Returns a list of blocks that differ in active choice between variant configurations
getDependentLibraries	Returns a list of libraries that are used in variant configurations
getDependentModels	Returns a list of active models for variant configurations
getNeverActiveBlocks	Returns a list of blocks that are inactive in all variant configurations
getVariantCondition	Returns variant conditions for blocks in given variant configuration
hideUI	Hides variant configuration analysis report
showUI	Displays variant configuration analysis in user interface view

Examples**Create Variant Configuration Analysis Object for Model**

Create a variant configuration analysis object by specifying either named variant configurations or variable groups.

Open the model `slexVariantReducer`.

```
open_system('slexVariantReducer');
```

The model has two named variant configurations, `config1` and `config2`. The named configurations are saved in a variant configuration object, `slexVariantReducer_config`, associated with the model.

Analyze the model using the named configurations.

```
VarConfigObjnc = Simulink.VariantConfigurationAnalysis('slexVariantReducer', ...
    'NamedConfigurations',{'config1', 'config2'})
```

```
VarConfigObjnc =
    VariantConfigurationAnalysis with properties:
```

```
    ModelName: 'slexVariantReducer'
    Configurations: {'config1' 'config2'}
```

Next, specify variable groups for analysis.

The `slexVariantReducer` model contains two variant control variables V and W.

Analyze the model using two variable groups, V1W1 and V2W2:

```
VarConfigObjvg = Simulink.VariantConfigurationAnalysis(...  
    'slexVariantReducer',...  
    'VariableGroups',[struct('Name','V1W1','VariantControls',{ 'V',1,'W',2})  
    struct('Name','V1W2','VariantControls',{ 'V',1,'W',2})])
```

```
VarConfigObjvg =  
    VariantConfigurationAnalysis with properties:
```

```
    ModelName: 'slexVariantReducer'  
    Configurations: {'V1W1' 'V1W2'}
```

getActiveBlocks

Class: Simulink.VariantConfigurationAnalysis

Package: Simulink

Returns a list of active blocks for variant configuration

Syntax

```
activeBlocks = VarConfigObj.getActiveBlocks(ConfigName)
```

Description

`activeBlocks = VarConfigObj.getActiveBlocks(ConfigName)` returns a list of active blocks for variant configuration.

Input Arguments

VarConfigObj — Variant configuration object

character vector

Variant configuration object for a specified configuration. You can use the `Simulink.VariantConfigurationAnalysis` method to obtain this value.

ConfigName — Variant configuration name

character vector | string

Specifies the name of variant configuration.

Output Arguments

activeBlocks — List of active blocks

cell array

Returns a list of active blocks as a cell array.

Examples

```
% Add model to path
addpath(fullfile(matlabroot,'examples','simulink_variants','main'));

% Open model
open_system('slexVariantManagement');

% Get variant configuration object
VarConfigObj = Simulink.VariantConfigurationAnalysis('slexVariantManagement', 'NamedConfigurations', {'LinInterStd', ...
'NonLinExterLowFid', 'NonLinExterHighFid'})

% Get active blocks
ActiveBlocks = VarConfigObj.getActiveBlocks('LinInterStd')
```

getAlwaysActiveBlocks

Class: Simulink.VariantConfigurationAnalysis

Package: Simulink

Displays a list of blocks that are always active across all variant configurations

Syntax

```
alwaysActiveBlocks = VarConfigObj.getAlwaysActiveBlocks()
```

Description

`alwaysActiveBlocks = VarConfigObj.getAlwaysActiveBlocks()` displays a list of blocks that are always active across all variant configurations.

Input Arguments

VarConfigObj — Variant configuration object

character vector

Variant configuration object for a specified configuration. You can use the `Simulink.VariantConfigurationAnalysis` method to obtain this value.

Output Arguments

alwaysActiveBlocks — List of always active blocks

cell array

Displays a list of blocks that are always active, as a cell array.

Examples

```
% Add model to path
addpath(fullfile(matlabroot,'examples','simulink_variants','main'));

% Open model
open_system('slexVariantManagement');

% Get variant configuration object
VarConfigObj = Simulink.VariantConfigurationAnalysis('slexVariantManagement', 'NamedConfigurations', {'LinInterStd', ...
'NonLinExterLowFid', 'NonLinExterHighFid'})

% Get always active blocks
alwaysActiveBlocks = VarConfigObj.getAlwaysActiveBlocks()
```

getBlockDifferences

Class: Simulink.VariantConfigurationAnalysis

Package: Simulink

Returns a list of blocks that differ in active choice between variant configurations

Syntax

```
getBlockDifferences = VarConfigObj.getBlockDifferences()
```

Description

`getBlockDifferences = VarConfigObj.getBlockDifferences()` returns a list of blocks that are active in some of the analyzed configurations and inactive in other configurations.

Input Arguments

VarConfigObj — Variant configuration object

character vector

Variant configuration object for a specified configuration. You can use the `Simulink.VariantConfigurationAnalysis` method to obtain this value.

Output Arguments

getBlockDifferences — List of blocks that differ in active choice

cell array

Returns a list of blocks that differ in active choice between variant configurations, as a cell array.

Examples

```
% Add model to path
addpath(fullfile(matlabroot,'examples','simulink_variants','main'));

% Open model
open_system('slexVariantManagement');

% Get variant configuration object
VarConfigObj = Simulink.VariantConfigurationAnalysis('slexVariantManagement', 'NamedConfigurations', {'LinInterStd', ...
'NonLinExterLowFid', 'NonLinExterHighFid'})

% Get block differences
getBlockDifferences = VarConfigObj.getBlockDifferences()
```

Introduced in R2019a

getDependentLibraries

Class: Simulink.VariantConfigurationAnalysis

Package: Simulink

Returns a list of libraries that are used in variant configurations

Syntax

```
dependentLibraries = VarConfigObj.getDependentLibraries(ConfigName)
```

Description

`dependentLibraries = VarConfigObj.getDependentLibraries(ConfigName)` returns a list of libraries that are used in variant configuration.

Input Arguments

VarConfigObj — Variant configuration object

character vector

Variant configuration object for a specified configuration. You can use the `Simulink.VariantConfigurationAnalysis` method to obtain this value.

ConfigName — Variant configuration name

character vector | string

Specifies the name of variant configuration.

Output Arguments

dependentLibraries — List of libraries

cell array

Returns a list of libraries, as a cell array.

Examples

```
% Add model to path
addpath(fullfile(matlabroot,'examples','simulink_variants','main'));

% Open model
open_system('slexVariantConfigurationAnalysis');

% Get variant configuration object
VarConfigObj = Simulink.VariantConfigurationAnalysis('slexVariantConfigurationAnalysis', 'NamedConfigurations', {'VendorACtrlNonLinear', 'VendorACtrlFuzzy'})

% Get dependent libraries
dependentLibraries = VarConfigObj.getDependentLibraries('VendorACtrlLinear')
```

getDependentModels

Class: Simulink.VariantConfigurationAnalysis

Package: Simulink

Returns a list of active models for variant configurations

Syntax

```
dependentModels = VarConfigObj.getDependentModels(ConfigName)
```

Description

`dependentModels = VarConfigObj.getDependentModels(ConfigName)` returns a list of active models for variant configuration.

Input Arguments

VarConfigObj — Variant configuration object

character vector

Variant configuration object for a specified configuration. You can use the `Simulink.VariantConfigurationAnalysis` method to obtain this value.

ConfigName — Variant configuration name

character vector | string

Specifies the name of variant configuration.

Output Arguments

dependentModels — List of models

cell array

Returns a list of active models, as a cell array.

Examples

```
% Add model to path
addpath(fullfile(matlabroot,'examples','simulink_variants','main'));

% Open model
open_system('slexVariantManagement');

% Get variant configuration object
VarConfigObj = Simulink.VariantConfigurationAnalysis('slexVariantManagement', 'NamedConfigurations', {'LinInterStd', ...
'NonLinExterLowFid', 'NonLinExterHighFid'})

% Get dependent models
dependentModels = VarConfigObj.getDependentModels('NonLinExterLowFid')
```

getNeverActiveBlocks

Class: Simulink.VariantConfigurationAnalysis

Package: Simulink

Returns a list of blocks that are inactive in all variant configurations

Syntax

```
getNeverActiveBlocks = VarConfigObj.getNeverActiveBlocks()
```

Description

`getNeverActiveBlocks = VarConfigObj.getNeverActiveBlocks()` returns a list of blocks that are inactive in all variant configurations.

Input Arguments

VarConfigObj — Variant configuration object

character vector

Variant configuration object for a specified configuration. You can use the `Simulink.VariantConfigurationAnalysis` method to obtain this value.

Output Arguments

neverActiveBlocks — List of never active blocks

cell array

Returns a list of blocks that are never active, as a cell array.

Examples

```
% Add model to path
addpath(fullfile(matlabroot,'examples','simulink_variants','main'));

% Open model
open_system('slexVariantManagement');

% Get variant configuration object
VarConfigObj = Simulink.VariantConfigurationAnalysis('slexVariantManagement', 'NamedConfigurations', {'LinInterStd', ...
'NonLinExterLowFid', 'NonLinExterHighFid'})

% Get never active blocks
neverActiveBlocks = VarConfigObj.getNeverActiveBlocks()
```

getVariantCondition

Class: Simulink.VariantConfigurationAnalysis

Package: Simulink

Returns variant conditions for blocks in given variant configuration

Syntax

```
variantCondition = VarConfigObj.getVariantCondition(ConfigName,BlockName)
```

Description

`variantCondition = VarConfigObj.getVariantCondition(ConfigName,BlockName)`, returns the variant condition for block specified by `BlockName` in given variant configuration.

Input Arguments

VarConfigObj — Variant configuration object

character vector

Variant configuration object for a specified configuration. You can use the `Simulink.VariantConfigurationAnalysis` method to obtain this value.

ConfigName — Variant configuration name

character vector | string

Specifies the name of variant configuration.

BlockName — Block name

character vector | string

Name of the block.

Output Arguments

variantCondition — Variant conditions for a block

cell array

Returns variant conditions for blocks in given variant configuration.

Examples

```
% Add model to path
addpath(fullfile(matlabroot,'examples','simulink_variants','main'));

% Open model
open_system('slexVariantManagement');

% Get variant configuration object
VarConfigObj = Simulink.VariantConfigurationAnalysis('slexVariantManagement',...
'NamedConfigurations', {'LinInterStd','NonLinExterLowFid','NonLinExterHighFid'})
```

```
% Get variant condition
VariantCondition = VarConfigObj.getVariantCondition('NonLinExterLowFid',...
'slexVariantManagement/Controller/Linear Controller')
```

hideUI

Class: Simulink.VariantConfigurationAnalysis

Package: Simulink

Hides variant configuration analysis report

Syntax

```
VarConfigObj.hideUI()
```

Description

VarConfigObj.hideUI(), hides the variant configuration analysis report.

Examples

```
% Add model to path
addpath(fullfile(matlabroot,'examples','simulink_variants','main'));

% Open model
open_system('slexVariantManagement');

% Get variant configuration object
VarConfigObj = Simulink.VariantConfigurationAnalysis('slexVariantManagement', 'NamedConfigurations', {'LinInterStd', ...
'NonLinExterLowFid', 'NonLinExterHighFid'})

% Hide UI
VarConfigObj.hideUI()
```

showUI

Class: Simulink.VariantConfigurationAnalysis

Package: Simulink

Displays variant configuration analysis in user interface view

Syntax

```
VarConfigObj.showUI()
```

Description

`VarConfigObj.showUI()`, displays variant configuration analysis in user interface view.

Examples

```
% Add model to path
addpath(fullfile(matlabroot, 'examples', 'simulink_variants', 'main'));

% Open model
open_system('slexVariantManagement');

% Get variant configuration object
VarConfigObj = Simulink.VariantConfigurationAnalysis('slexVariantManagement', 'NamedConfigurations', {'LinInterStd', ...
'NonLinExterLowFid', 'NonLinExterHighFid'})

% Show UI
VarConfigObj.showUI()
```

Simulink.VariantConfigurationData class

Package: Simulink

Class representing a variant configurations data object

Description

The variant configuration data object, stores a collection of variant configurations, constraints, and the name of the default active configuration. The `Simulink.VariantConfigurationData` class has properties that enable you to add, modify, or remove variant configurations, constraints, and control variables. Use an instance of `Simulink.VariantConfigurationData` class to do the following:

- Define and edit variant configurations.
- Add control variables to variant configurations.
- Add copy of variant configuration.
- Delete existing variant configurations, constraints, and sub model configurations.
- Set a specific configuration as default active.
- Validate model using default or a specific variant configuration.
- Query or create variant configurations data object for a given model.

Properties

VariantConfigurations

Set of variant configurations. The names of the configurations must be unique and valid MATLAB variable names.

Constraints

Set of constraints that must always be satisfied by the model for all variant configurations. The name of the constraints must be unique and valid MATLAB variable names.

DefaultConfigurationName

Name of the variant configuration to be used by default for validation.

Methods

<code>addConfiguration</code>	Add a new variant configuration to the variant configuration data object
<code>addConstraint</code>	Add a constraint to the variant configuration data object
<code>addControlVariables</code>	Add control variables to an existing variant configuration
<code>addCopyOfConfiguration</code>	Add a copy of an existing variant configuration to the variant configuration data object
<code>addSubModelConfigurations</code>	Add to a variant configuration the names of the configurations to be used for submodels
<code>getConfiguration</code>	Returns the variant configuration with a given name from a variant configuration data object
<code>getDefaultConfiguration</code>	Returns default variant configuration, if any, for a variant configuration data object
<code>getFor</code>	Get existing variant configuration data object for a model
<code>removeConfiguration</code>	Remove a variant configuration with a given name from the variant configuration data object
<code>removeConstraint</code>	Remove a constraint from the variant configuration data object
<code>removeControlVariable</code>	Remove a control variable from a variant configuration
<code>removeSubModelConfiguration</code>	Remove from a variant configuration, the configuration to be used for a sub model.
<code>setDefaultConfigurationName</code>	Set name of the default variant configuration for a variant configuration data object
<code>validateModel</code>	Activate and validate all variant blocks in a model hierarchy
<code>VariantConfigurationData</code>	Object constructor with optional arguments for variant configurations, constraints, and default configuration name

Examples

```
load_system(model);  
% Create variant config and associate it with model  
variantConfig = Simulink.VariantConfigurationData;  
set_param(model, 'VariantConfigurationObject', 'variantConfig');
```

“Variant Manager Overview”

addConfiguration

Class: Simulink.VariantConfigurationData

Package: Simulink

Add a new variant configuration to the variant configuration data object

Syntax

```
vcdataObj.addConfiguration(name)
vcdataObj.addConfiguration(name,description)
vcdataObj.addConfiguration(name,description,controlVars)
vcdataObj.addConfiguration(name,description,controlVars,
subModelConfigurations)
```

Description

`vcdataObj.addConfiguration(name)` adds a new variant configuration with a given name to the variant configuration data object.

`vcdataObj.addConfiguration(name,description)` adds a new variant configuration with a given name and optional description to the variant configuration data object.

`vcdataObj.addConfiguration(name,description,controlVars)` adds a new variant configuration with a given name, optional description, and control variables to the variant configuration data object.

`vcdataObj.addConfiguration(name,description,controlVars,subModelConfigurations)` adds a new variant configuration with a given name, optional description, control variables, and submodel configurations to the variant configuration data object.

Input Arguments

name

Name of variant configuration being added.

description

Description text for the variant configuration being added.

controlVars

Control variables for the variant configuration being added. This argument must be a vector of structures with required fields: **Name** and **Value**. The values assigned to the **Name** field must be unique and valid MATLAB variable names. The **Value** field can contain either character vectors or `Simulink.Parameter` objects. The values of control variables are checked during validation of the variant configuration.

subModelConfigurations

Vector of structures containing fields: `ModelName`, `ConfigurationName`. The names of submodels must be unique and valid MATLAB variable names and configuration names must be valid MATLAB variables.

Examples

```
% Define the variant configuration data object  
vcdataObj = Simulink.VariantConfigurationData;
```

```
% Add a variant configuration LinInterExp  
vcdataObj.addConfiguration('LinInterExp')
```

See Also

`Simulink.VariantConfigurationData` | `addControlVariables` | `addSubModelConfigurations`

addConstraint

Class: Simulink.VariantConfigurationData

Package: Simulink

Add a constraint to the variant configuration data object

Syntax

```
vcdataObj.addConstraint(nameOfConstraint)
vcdataObj.addConstraint(nameOfConstraint,condition)
vcdataObj.addConstraint(nameOfConstraint,condition,description)
```

Description

`vcdataObj.addConstraint(nameOfConstraint)` adds a new constraint with a given name to `vcdataObj`.

`vcdataObj.addConstraint(nameOfConstraint,condition)` adds a new constraint with a given name and condition expression to `vcdataObj`.

`vcdataObj.addConstraint(nameOfConstraint,condition,description)` adds a new constraint with a given name, condition expression, and description to `vcdataObj`.

Input Arguments

nameOfConstraint

Name of constraint being added. Must be unique and valid MATLAB variable name.

condition

Boolean expression that must evaluate to true. When the expression evaluates to true, it means the constraint is satisfied.

description

Text that describes the constraint.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add a constraint named LinNotExtern
vcdataObj.addConstraint('LinNotExtern',...
'Ctrl~=1||PlantLocation~=1','Description of the constraint')
```

See Also

removeConfiguration

addControlVariables

Class: Simulink.VariantConfigurationData

Package: Simulink

Add control variables to an existing variant configuration

Syntax

```
vcdataObj.addControlVariables(nameOfConfiguration,controlVars)
```

Description

`vcdataObj.addControlVariables(nameOfConfiguration,controlVars)`, adds control variables to a variant configuration.

Input Arguments

nameOfConfiguration

Specifies the name of an existing configuration.

controlVars

Control variables being added. This argument must be a vector of structures with required fields: Name and Value. The values assigned to the Name field must be unique and valid MATLAB variable names. The Value field can contain either character vectors or Simulink.Parameter objects. The values of control variables are checked during validation of the variant configuration.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add a variant configuration named LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
'Linear Internal Experimental Plant Controller');

% Add control variables SmartSensor1Mod and PlanLocation
vcdataObj.addControlVariables('LinInterExp',...
    cell2struct({'SmartSensor1Mod', '2';...
                'PlanLocation', '1'},...
                {'Name', 'Value'}, 2))
```

[Simulink.VariantConfigurationData | removeControlVariable | addSubModelConfigurations | removeSubModelConfiguration](#)

addCopyOfConfiguration

Class: Simulink.VariantConfigurationData

Package: Simulink

Add a copy of an existing variant configuration to the variant configuration data object

Syntax

```
vcdataObj.addCopyOfConfiguration(nameOfExistingConfiguration)
vcdataObj.addCopyOfConfiguration(nameOfExistingConfiguration,
nameOfTobeAddedConfiguration)
```

Description

`vcdataObj.addCopyOfConfiguration(nameOfExistingConfiguration)`, adds a new configuration with a default name (default name is based on existing configuration name being copied) as a copy of the existing configuration to the variant configuration data object.

`vcdataObj.addCopyOfConfiguration(nameOfExistingConfiguration, nameOfTobeAddedConfiguration)`, adds a new configuration with a specified name, as a copy of the existing configuration, to the variant configuration data object.

Input Arguments

nameOfExistingConfiguration

Name of existing configuration.

Default:

nameOfTobeAddedConfiguration

Name of new configuration to be added as a copy of the configuration.

Default:

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the variant configuration LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
    'Linear Internal Experimental Plant Controller');

% Add a copy of variant configuration LinInterExp
% and name the copy as LinExtExp
vcdataObj.addCopyOfConfiguration('LinInterExp', 'LinExtExp')
```

See Also

Simulink.VariantConfigurationData | addConfiguration | removeConfiguration |
setDefaultConfigurationName

addSubModelConfigurations

Class: Simulink.VariantConfigurationData

Package: Simulink

Add to a variant configuration the names of the configurations to be used for submodels

Syntax

```
vcdataObj.addSubModelConfigurations(nameOfConfiguration,  
subModelConfigurations)
```

Description

`vcdataObj.addSubModelConfigurations(nameOfConfiguration, subModelConfigurations)`, specifies names of the configurations to be used for submodels.

Input Arguments

nameOfConfiguration

Name for the configuration of submodels that are model references.

subModelConfigurations

Vector of structures containing fields: `ModelName`, `ConfigurationName`. The names of submodels must be unique and valid MATLAB variable names and configuration names must be valid MATLAB variables.

Examples

- 1 Add the path to the model file.

```
addpath(fullfile(matlabroot,'examples','simulink_variants','main'));
```

- 2 Load the model.

```
load_system('slexVariantManagement');
```

- 3 Obtain variant configuration data object for the model.

```
vcdataObj = Simulink.VariantConfigurationData.getFor('slexVariantManagement');
```

- 4 Add a new submodel configuration to `LinInterExpNoNoise`.

```
vcdataObj.addSubModelConfigurations('LinInterExpNoNoise',...  
[struct('ModelName', 'slexVariantManagementExternalPlantMdlRef',...  
'ConfigurationName', 'LowFid')])
```

See Also

[Simulink.VariantConfigurationData](#) | [removeSubModelConfiguration](#) | [addControlVariables](#) | [removeControlVariable](#)

getConfiguration

Class: Simulink.VariantConfigurationData

Package: Simulink

Returns the variant configuration with a given name from a variant configuration data object

Syntax

```
vcdataObj.getConfiguration(nameOfConfiguration)
```

Description

`vcdataObj.getConfiguration(nameOfConfiguration)` returns a specific variant configuration that is associated with the variant configuration data object.

Input Arguments

nameOfConfiguration

Name of the variant configuration to be returned.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the variant configuration LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
    'Linear Internal Experimental Plant Controller');

% Add a control variable SmartSensor1Mod
vcdataObj.addControlVariables('LinInterExp',...
    [struct('Name','SmartSensor1Mod','Value','2')]);

% Obtain information on the variant configuration..
% LinInterExp from the variant configuration data object
vc = vcdataObj.getConfiguration('LinInterExp')
```

See Also

[Simulink.VariantConfigurationData](#) | [addConfiguration](#) | [removeConfiguration](#) | [getDefaultConfiguration](#)

getDefaultConfiguration

Class: Simulink.VariantConfigurationData

Package: Simulink

Returns default variant configuration, if any, for a variant configuration data object

Syntax

```
vcdataObj.getDefaultConfiguration
```

Description

`vcdataObj.getDefaultConfiguration` returns the default variant configuration. If no default variant configuration is defined, then `[]` is returned.

Note Setting a default variant configuration for a variant configuration data object is not recommended. Activate and validate the model using a specific variant configuration instead. If you set a default configuration, compiling or simulating the model will apply the default configuration irrespective of the variant control variable values in the global workspace.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the variant configuration named LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
    'Linear Internal Experimental Plant Controller');

% Add the variant configuration LinInterStd
vcdataObj.addConfiguration('LinInterStd',...
    'Linear Internal Standard Plant Controller');

% Set LinExtExp as the default variant configuration
vcdataObj.setDefaultConfigurationName('LinInterExp');

% Obtain the default variant configuration
defvc = vcdataObj.getDefaultConfiguration
```

See Also

`Simulink.VariantConfigurationData` | `getConfiguration` | `setDefaultConfigurationName`

getFor

Class: Simulink.VariantConfigurationData

Package: Simulink

Get existing variant configuration data object for a model

Syntax

```
Simulink.VariantConfigurationData.getFor(modelNameOrHandle)
```

Description

`Simulink.VariantConfigurationData.getFor(modelNameOrHandle)`, returns the variant configuration object for the model. If no default variant configuration is defined, then `[]` is returned.

Input Arguments

modelNameOrHandle

Model name or handle.

Examples

Get Variant Configuration Object for Model

Open the model `slexVariantManagement`.

```
model='slexVariantManagement';
open_system(model);
```

Get the existing variant configuration object for the model.

```
Simulink.VariantConfigurationData.getFor(model)
```

```
ans =
  VariantConfigurationData with properties:
      VariantConfigurations: [1x6 struct]
      Constraints: [1x1 struct]
  DefaultConfigurationName: ''
```

Get the name of variant configuration object associated with the model.

```
get_param(model, 'VariantConfigurationObject')
```

```
ans =
'vcd'
```

See Also

`Simulink.VariantConfigurationData`

removeConfiguration

Class: Simulink.VariantConfigurationData

Package: Simulink

Remove a variant configuration with a given name from the variant configuration data object

Syntax

```
vcdataObj.removeConfiguration(nameOfConfiguration)
```

Description

`vcdataObj.removeConfiguration(nameOfConfiguration)` removes the configuration from the variant configuration data object.

Input Arguments

nameOfConfiguration

Name of the configuration to be removed.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the LinInterExp variant configuration
% to the variant configuration data object
vcdataObj.addConfiguration('LinInterExp',...
    'Linear Internal Experimental Plant Controller');

% Remove the LinInterExp configuration
% from the variant configuration data object
vcdataObj.removeConfiguration('LinInterExp')
```

See Also

removeConstraint

Class: Simulink.VariantConfigurationData

Package: Simulink

Remove a constraint from the variant configuration data object

Syntax

```
vcdataObj.removeConstraint(nameOfConstraint)
```

Description

`vcdataObj.removeConstraint(nameOfConstraint)`, removes the constraint from the variant configuration data object.

Input Arguments

nameOfConstraint

Name of the constraint to be removed.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add a constraint named LinNotExtern
vcdataObj.addConstraint('LinNotExtern','((Ctrl~=1)...
    || (PlantLocation ~=1))',...
    'Description of the constraint');

% Remove the constraint LinNotExtern
% from the variant configuration
vcdataObj.removeConstraint('LinNotExtern')
```

See Also

Simulink.VariantConfigurationData | addConstraint

removeControlVariable

Class: Simulink.VariantConfigurationData

Package: Simulink

Remove a control variable from a variant configuration

Syntax

```
vcdataObj.removeControlVariable(nameOfConfiguration,nameOfControlVariable)
```

Description

`vcdataObj.removeControlVariable(nameOfConfiguration,nameOfControlVariable)` removes a control variable from a variant configuration.

Input Arguments

nameOfConfiguration

Name of the variant configuration.

nameOfControlVariable

Name of the control variable to be deleted.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add a variant configuration named LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
    'Linear Internal Experimental Plant Controller');

% Add control variables SmartSensor1Mod and PlanLocation
vcdataObj.addControlVariables('LinInterExp',...
    [struct('Name','SmartSensor1Mod','Value','2')]);

% Remove the control variable SmartSensor1Mod
% from the configuration LinInterExp
vcdataObj.removeControlVariable('LinInterExp',...
    'SmartSensor1Mod')
```

See Also

Simulink.VariantConfigurationData | addControlVariables

removeSubModelConfiguration

Class: Simulink.VariantConfigurationData

Package: Simulink

Remove from a variant configuration, the configuration to be used for a sub model.

Syntax

```
vcdataObj.removeSubModelConfiguration(nameOfConfiguration,nameOfSubModel)
```

Description

`vcdataObj.removeSubModelConfiguration(nameOfConfiguration,nameOfSubModel)`, removes the configuration specified for a submodel.

Input Arguments

nameOfConfiguration

Name of the submodel configuration to be removed.

nameOfSubModel

Name of the submodel from which the configuration must be removed.

Examples

- 1 Add the path to the model file.

```
addpath(fullfile(matlabroot,'examples','simulink_variants','main'));
```

- 2 Load the model.

```
load_system('slexVariantManagement');
```

- 3 Obtain variant configuration data object for the model.

```
vcdataObj = Simulink.VariantConfigurationData.getFor('slexVariantManagement');
```

- 4 Add a new submodel configuration to LinInterExpNoNoise.

```
vcdataObj.addSubModelConfigurations('LinInterExpNoNoise',...  
    [struct('ModelName','slexVariantManagementExternalPlantMdlRef',...  
        'ConfigurationName','LowFid')]);
```

- 5 Remove the submodel configuration LinInterExpNoNoise from the submodel slexVariantManagementExternalPlantMdlRef.

```
vcdataObj.removeSubModelConfiguration('LinInterExpNoNoise',...  
    'slexVariantManagementExternalPlantMdlRef')
```

See Also

Simulink.VariantConfigurationData | addSubModelConfigurations

setDefaultConfigurationName

Class: Simulink.VariantConfigurationData

Package: Simulink

Set name of the default variant configuration for a variant configuration data object

Syntax

```
vcdataObj.setDefaultConfigurationName(nameOfConfiguration)
```

Description

`vcdataObj.setDefaultConfigurationName(nameOfConfiguration)` sets the default configuration name. A variant configuration must exist with the same name. If an empty value is passed, then the default configuration name is cleared.

Input Arguments

nameOfConfiguration

Name of the configuration to be set as the default.

Note Setting a default variant configuration for a variant configuration data object is not recommended. Activate and validate the model using a specific variant configuration instead. If you set a default configuration, compiling or simulating the model will apply the default configuration irrespective of the variant control variable values in the global workspace.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the LinInterExp variant configuration
vcdataObj.addConfiguration('LinInterExp',...
    'Linear Internal Experimental Plant Controller');

% Set the configuration LinInterExp as default
vcdataObj.setDefaultConfigurationName('LinInterExp');

% Obtain the default variant configuration
dconfig = vcdataObj.getDefaultConfiguration
```

See Also

Simulink.VariantConfigurationData | getDefaultConfiguration

validateModel

Class: Simulink.VariantConfigurationData

Package: Simulink

Activate and validate all variant blocks in a model hierarchy

Syntax

```
Simulink.VariantConfigurationData.validateModel(modelName)
```

```
Simulink.VariantConfigurationData.validateModel(modelName, configName)
```

Description

`Simulink.VariantConfigurationData.validateModel(modelName)`, activates and validates the model and referenced models during simulation.

`Simulink.VariantConfigurationData.validateModel(modelName, configName)`, activates and validates the model and referenced models during simulation optionally using a variant configuration.

Note Activation of a variant configuration performed by this method differs from the Simulink update diagram process. See “Differences Between Variant Manager Activation and the Update Diagram Process”.

Input Arguments

modelName

Name of the model

configName

Name of the configuration to be activated and validated

Examples

- 1 Add the path to the model file.

```
addpath(fullfile(matlabroot, 'examples', 'simulink_variants', 'main'));
```

- 2 Load the model.

```
load_system('slexVariantManagement');
```

- 3 Activate and validate the model `slexVariantManagement` using the configuration `LinInterExpNoNoise`.

```
[valid, errors] = Simulink.VariantConfigurationData.validateModel...  
('slexVariantManagement', 'LinInterExpNoNoise')
```

See Also

Simulink.VariantConfigurationData | getFor

VariantConfigurationData

Class: Simulink.VariantConfigurationData

Package: Simulink

Object constructor with optional arguments for variant configurations, constraints, and default configuration name

Syntax

```
vardataObj = Simulink.VariantConfigurationData(variantConfigurations)
```

Description

`vardataObj = Simulink.VariantConfigurationData(variantConfigurations)`, constructor that creates an empty variant configuration data object. Optionally, can also accept constraints and a default configuration name as inputs.

Input Arguments

variantConfigurations

Configurations that are part of the variant configuration data object.

constraints

Constraints to be satisfied by the model.

defaultConfigurationName

Name of the default configuration

Examples

```
% Create an empty variant configuration data object  
vcdataObj = Simulink.VariantConfigurationData
```

See Also

`Simulink.VariantConfigurationData` | `addConfiguration` | `addConstraint` | `addControlVariables` | `addSubModelConfigurations`

Simulink.VariantControl class

Package: Simulink

Create a variant control variable object

Description

The `Simulink.VariantControl` class creates a variant control variable object to associate the value of a variant control variable with a variant activation time. Use the `Simulink.VariantControl` object to determine the active value of variant parameter during simulation.

Creation

`variantControlVariable = Simulink.VariantControl` creates a variant control variable object with no value and `'ActivationTime'` set to `'update diagram'`.

`variantControlVariable = Simulink.VariantControl(Name, Value)` creates a variant control variable object as specified by `Name, Value` pair arguments. Using this syntax, you create an object and associate its value with a variant activation time.

Input Arguments

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose `Name` in quotes.

Example: `'Value', 1, 'ActivationTime', 'update diagram'`

Value — Value of variant control variable object

scalar variable | enumerated type | `Simulink.Parameter`

Value of variant control variable object, specified as scalar variables, enumerated types, or `Simulink.Parameter` object.

Example: `'Value', 1`

ActivationTime — Activation time of active value

`'update diagram'` (default) | `'update diagram analyze all choices'` | `'code compile'` | `'startup'`

Simulink can set active value of the variant parameters at different stages of the simulation and code generation workflow. Based on the stage you specify using this property, Simulink determines if the generated code must contain only the active values or both active and inactive values of variant parameters. The property also determines whether to analyze all the values of the variant parameters for incompatibilities in signal attributes. For more information on variant activation time, see “Activate Variant During Different Stages of Simulation and Code Generation Workflow”.

When you specify the variant activation time as:

- `'update diagram'` -- Simulink does not analyze the values of variant parameters for incompatibilities in signal attributes. It generates code only for the active values of variant parameters.
- `'update diagram analyze all choices'` -- Simulink analyzes both active and inactive values of variant parameters for incompatibilities in signal attributes, however it generates code only for the active values of variant parameters.
- `'code compile'` -- Simulink analyzes both active and inactive values of variant parameters for incompatibilities in signal attributes and it also generates code for both active and inactive values of the variant parameters. The values are enclosed in C preprocessor conditional statements `#if` and `#endif` that are conditionally compiled when you compile the generated code.
- `'startup'` -- Simulink analyzes both active and inactive values of variant parameters for incompatibilities in signal attributes and it also generates code for both active and inactive values of the variant parameters. The values are enclosed in regular `if` conditions inside the `model_initialize` function of the generated code that are conditionally evaluated when you run the executable that is built from the code.

Example: `'ActivationTime', 'code compile'`

Methods

Specialized Operators and Functions

These methods specialize standard MATLAB operators and functions for objects in this class.

<code>ne</code>	Compare if the inputs are not equal.
<code>eq</code>	Compares if the inputs are equal.
<code>not</code>	Returns logical NOT of input.

Examples

Numeric Variant Control Values for Rapid Prototyping of Variant Parameters

Numeric values allow you to rapidly prototype variant values when you are still building your model. Numeric values help you focus more on building your variant values than on developing the expressions that activate those choices.

You can define numeric control values in locations listed in “Storage Locations for Variant Control Variables (Operands) in Variant Blocks”.

Open the `slexVariantParameters` model.

```
open_system('slexVariantParameters')
```

In the MATLAB Editor, specify variant choices in their simplest form as numeric values in `Simulink.VariantVariable` objects K1 and K2.

```
K1 = Simulink.VariantVariable('Choices',{ 'V==1', 3.5, 'V==2', 8.5})
```

```
K1 =  
VariantVariable with 2 choices:
```

Condition	Value
V == 1	3.5000
V == 2	8.5000

Specification: ''

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

```
K2 = Simulink.VariantVariable('Choices',{ 'V==1', 4.5, 'V==2', 9.5})
```

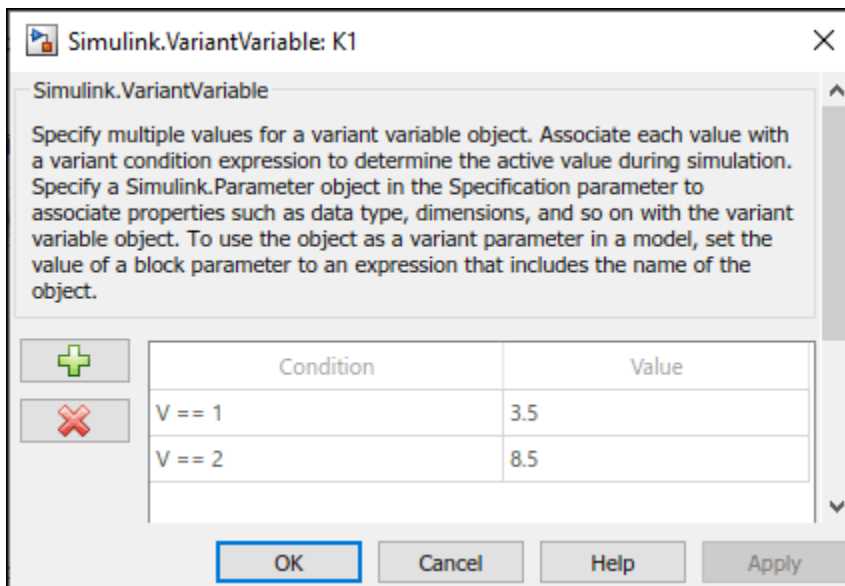

K2 =
VariantVariable with 2 choices:

Condition	Value
V == 1	4.5000
V == 2	9.5000

Specification: ''

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

Once you successfully create the `Simulink.VariantVariable` objects, you can modify them by using the methods described in “Public Methods” on page 5-771 or from the `VariantVariable` dialog box.

Activate one of the variant values by defining a control variable, `V`, and setting its value to 1 in a `Simulink.VariantControl` object.

```
V = Simulink.VariantControl('Value', 1, 'ActivationTime', 'update diagram')
```

```
V =
  VariantControl with properties:

      Value: 1
  ActivationTime: 'update diagram'
```

When you simulate the model, the condition `V == 1` evaluates to `true`. `K1` is assigned a value of 3.5 and `K2` is assigned a value of 8.5.

```
sim('slexVariantParameters')
```

If you change the value of `V` to 2, Simulink® sets the value of `K1` and `K2` to 4.5 and 9.5 during simulation. You can change the value of `V` using this command or from `Simulink.VariantControl` dialog box.

```
V.Value = 2;
sim('slexVariantParameters')
```

Enumerated Types to Improve Code Readability of Variant Control Variables of Variant Parameters

Use enumerated types to give meaningful names to integers used as variant control values. For more information on enumerated type data, see “Use Enumerated Data in Simulink Models”.

In the MATLAB® Editor, define the classes that map enumerated values to meaningful names.

Open the `slexVariantParameters` model.

```
open_system('slexVariantParameters')
```

Specify the variant condition expressions `V == EngType.Small` and `V == EngType.Big` in `Simulink.VariantVariable` objects `K1` and `K2`.

```
K1 = Simulink.VariantVariable('Choices', {'V == EngType.Small',3.5,'V == EngType.Big',8.5})
```

```
K1 =
  VariantVariable with 2 choices:
```

Condition	Value
<code>V == EngType.Big</code>	8.5000
<code>V == EngType.Small</code>	3.5000

```
Specification: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

```
K2 = Simulink.VariantVariable('Choices', {'V == EngType.Small',4.5,'V == EngType.Big',9.5})
```

```
K2 =
  VariantVariable with 2 choices:
```

Condition	Value
V == EngType.Big	9.5000
V == EngType.Small	4.5000

Specification: ''

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

Here, `EngType` is an integer-based enumeration class that is derived from the built-in data type, `int32`. The class has two enumeration values, `Small` and `Big`. These enumerated values have underlying integer values 1 and 2. In this example, the enumeration class is defined in the base workspace. You can choose to define the class in other storage locations as listed in “Storage Locations for Variant Control Variables (Operands) in Variant Blocks”.

type `EngType.m`

```
classdef EngType < Simulink.IntEnumType
    enumeration
        Small (1)
        Big (2)
    end
end
```

Once you successfully create the `Simulink.VariantVariable` objects, you can modify them by using the methods described in “Public Methods” on page 5-771 or from the `VariantVariable` dialog box.

Activate one of the variant values by defining the control variable `V` and setting its value to `EngType.Small` in `Simulink.VariantControl` object `V`.

```
V = Simulink.VariantControl('Value',EngType.Small,'ActivationTime','code compile')
```

```
V =
VariantControl with properties:

    Value: Small
ActivationTime: 'code compile'
```

When you simulate the model, the condition `V == 1` evaluates to `true`. `K1` is assigned a value of 3.5, and `K2` is assigned a value of 8.5.

```
sim('slexVariantParameters')
```

If you change the value of `V` to 2, Simulink® sets the value of `K1` and `K2` to 4.5 and 9.5 during simulation. You can change the value of `V` using this command or from `Simulink.VariantControl` dialog box.

```
V.Value = 2
```

```
V =
VariantControl with properties:

    Value: 2
ActivationTime: 'code compile'
```

```
sim('slexVariantParameters')
```

The code that you generate using enumerated types contains the names of the values rather than integers.

```
% slexVariantParameters_private.h
% #if V == EngType_Big || V == EngType_Small
%     /* Variable: K1 Referenced by: '<Root>/Gain' */
%     #if V == EngType_Big
%         #define rtCP_Gain_K1                (8.5)
%     #elif V == EngType_Small
%         #define rtCP_Gain_K1                (3.5)
%     #endif
% #endif
%
% #if V == EngType_Big || V == EngType_Small
%     /* Variable: K2 Referenced by: '<Root>/Gain1' */
%     #if V == EngType_Big
%         #define rtCP_Gain1_K2               (9.5)
%     #elif V == EngType_Small
%         #define rtCP_Gain1_K2               (4.5)
%     #endif
% #endif
% #endif
% #endif                                     /* RTW_HEADER_slexVariantParameters_private_h_ */
```

Note that for variant parameters with “startup” activation time, only enumerations that are defined using these techniques are supported:

- Using the function `Simulink.defineIntEnumType`
- By subclassing built-in integer data types `int8`, `int16`, `int32`, `uint8`, or `uint16`, or by subclassing `Simulink.IntEnumType`

These enumerations are also supported when permanently stored in a Simulink® data dictionary. See “Enumerations in Data Dictionary”.

Simulink.Parameter Type of Variant Control Variables for Code Generation of Variant Parameters

If you intend to generate code for a model containing variant parameters, specify variant control variables as `Simulink.Parameter` objects. `Simulink.Parameter` objects allow you to specify other attributes, such as data type and storage class, and control the appearance and placement of variant control variables in generated code.

- You can define a variant control variable of type `Simulink.Parameter` only in the base workspace or in a data dictionary. Defining `Simulink.Parameter` type of variant control variables in the mask or model workspace is not supported. For more information on storage locations for variant control variables, see “Storage Locations for Variant Control Variables (Operands) in Variant Blocks”.
- `Simulink.Parameter` objects within structures and that have data types other than `Simulink.Bus` objects are not supported.

Open the `slexVariantParameters` model.

```
open_system('slexVariantParameters')
```

In the MATLAB Editor, define a `Simulink.Parameter` object.

```
VSS_MODE = Simulink.Parameter;
VSS_MODE.Value = 1;
VSS_MODE.DataType = 'int32';
VSS_MODE.CoderInfo.StorageClass = 'Custom';
VSS_MODE.CoderInfo.CustomStorageClass = 'Define';
VSS_MODE.CoderInfo.CustomAttributes.HeaderFile = 'demo_macros.h';
```

Variant control variables defined as `Simulink.Parameter` objects can have any of the storage classes listed in “Storage Classes for Different Variant Activation Times” (Embedded Coder).

You can also convert a scalar variant control variable into a `Simulink.Parameter` object. For more information, see “Convert Variant Control Variables into `Simulink.Parameter` Objects”.

Specify the object as a variant control in `Simulink.VariantVariable` objects K1 and K2.

```
K1 = Simulink.VariantVariable('Choices',{ 'V == 1', 3.5, 'V == 2', 8.5})
```

```
K1 =
VariantVariable with 2 choices:
```

Condition	Value
V == 1	3.5000
V == 2	8.5000

```
Specification: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or

```
remove choices
```

```
K2 = Simulink.VariantVariable('Choices',{ 'V == 1', 4.5, 'V == 2', 9.5})
```

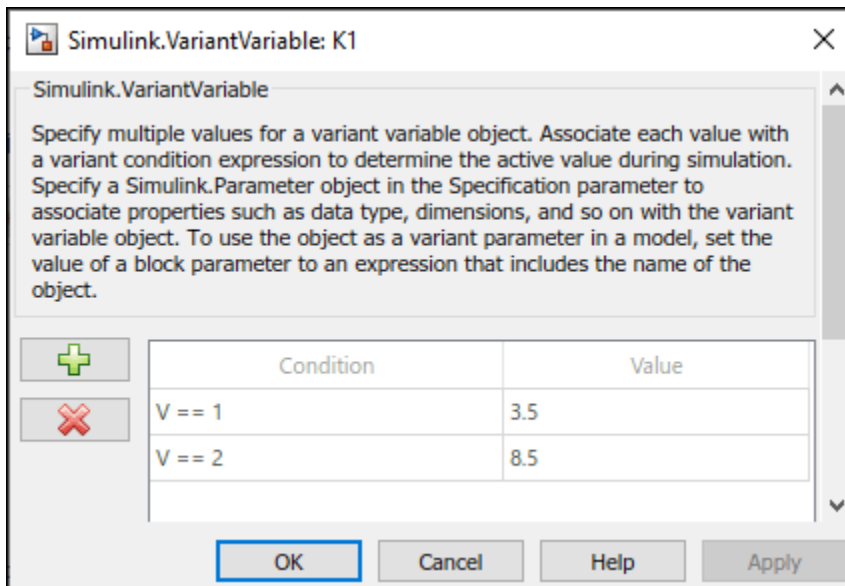

```
K2 =
VariantVariable with 2 choices:
```

Condition	Value
V == 1	4.5000
V == 2	9.5000

```
Specification: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

Once you successfully create the `Simulink.VariantVariable` objects, you can modify them by using the methods described in “Public Methods” on page 5-771 or from the `VariantVariable` dialog box.

Activate one of the variant values by defining a control variable `V` and setting its value to `VSS_MODE` in a `Simulink.VariantControl` object.

```
V = Simulink.VariantControl('Value',VSS_MODE,'ActivationTime','code compile')
```

```
V =
VariantControl with properties:
```

```
Value: [1x1 Simulink.Parameter]
ActivationTime: 'code compile'
```

When you simulate the model, the condition `V == 1` evaluates to `true`. `K1` is assigned a value of 3.5, and `K2` is assigned a value of 8.5.

```
sim ('slexVariantParameters')
```

If you change the value of `VSS_MODE` to 2, Simulink® sets the value of `K1` and `K2` to 4.5 and 9.5 during simulation. You can change the value of `V` using this command or from Simulink.VariantControl dialog box.

```
VSS_MODE.Value = 2;
V.Value = VSS_MODE;
sim ('slexVariantParameters')
```

Generate code from the model. For information on how to generate code, see “Generate Code Using Embedded Coder” (Embedded Coder)

The generated code contains both `Linear` and `Nonlinear` choices in preprocessor conditionals `#if` and `#elif` because of the code `compile` activation time. The variant control variable `V` is defined using a macro — `#define` directive — in the header file `demo_macros.h`. You can control the appearance and placement of `V` in the generated code and prevent optimizations from eliminating storage for `V` using the storage class property. For more information, see “Storage Classes for Different Variant Activation Times” (Embedded Coder).

```
% demo_macros.h
% /* Exported data define */
%
% /* Definition for custom storage class: Define */
% #define V      2      /* Referenced by:
%                       * '<Root>/Gain'
%                       * '<Root>/Gain1'
%                       */
% #endif              /* RTW_HEADER_demo_macros_h_ */
%
% /*
```

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using MATLAB® Coder™.

For more information on code generation with variant parameters, see “Options to Represent Variant Parameters in Generated Code” (Embedded Coder).

Simulink.VariantManager class

Package: Simulink

Access Variant Manager functionality programmatically

Description

The variant manager class provides a set of methods to access Variant Manager functionality from the MATLAB command-line. Use an instance of `Simulink.VariantManager` class to:

- Convert the Subsystems or Model block to a Variant Subsystem.
- Find variant control variables used in variant control expressions.
- Generate a reduced model for specified variant configurations.
- Display or control behavior of variant condition legend.

Creation

`variantmanager = Simulink.VariantManager` creates a variant manager object.

Methods

Public Methods

<code>findVariantControlVars</code>	Find variables used in variant control expressions
<code>reduceModel</code>	Generate reduced model for specified variant configurations
<code>convertToVariant</code>	Convert Subsystem, or Model block, or Variant Model block to a Variant Subsystem block
<code>variantLegend</code>	Display or control behavior of variant condition legend

Examples

Find Variant Control Variables for a Model

Open the model `slexVariantManagement`.

```
cd(fullfile(matlabroot, 'examples', 'simulink_variants', 'main'));
model = 'slexVariantManagement';
open_system(model);
```

Create an object of the `Simulink.VariantManager` class.

```
varmgr=Simulink.VariantManager;
```

Find the variant control variables.

```
vars = varmgr.findVariantControlVars(model)
```

```
vars=6x1 struct array with fields:
    Name
```

Value
Exists
Source
SourceType

“Variant Manager Overview”

Introduced in R2016a

convertToVariant

Class: Simulink.VariantManager

Package: Simulink

Convert Subsystem, or Model block, or Variant Model block to a Variant Subsystem block

Syntax

```
variant_subsystem = Simulink.VariantManager.convertToVariant(block)
variant_subsystem = Simulink.VariantManager.convertToVariant(blockHandle)
```

Description

`variant_subsystem = Simulink.VariantManager.convertToVariant(block)` or `variant_subsystem = Simulink.VariantManager.convertToVariant(blockHandle)` converts a Subsystem, or Model block, or Variant Model block to a Variant Subsystem block. A Variant Subsystem can contain Subsystems, Model blocks, or both as choices.

Consider this model with Subsystem block.

You can convert this Subsystem block to a Variant Subsystem block using the `convertToVariant` method.

Similarly you can convert a Variant Model block to a Variant Subsystem block.

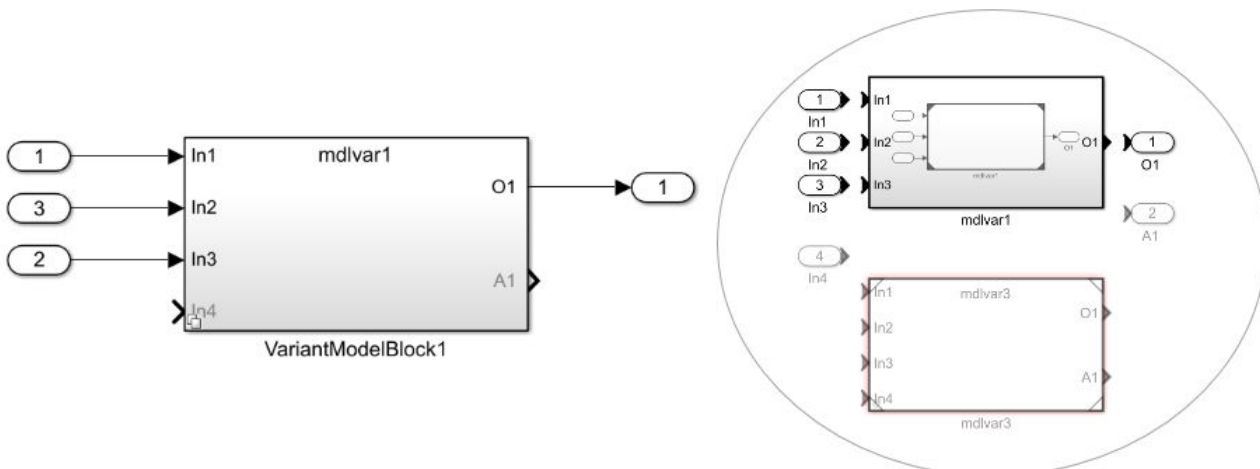

To convert a Variant Model block to a Variant Subsystem block, you can also use the Upgrade Advisor check, **Identify Variant Model blocks and convert those to Variant Subsystem containing Model block choices**. This check provides a **Fix** button to convert Variant Model blocks to Variant Subsystem blocks. For more information on using Upgrade Advisor check to convert a Variant Model block to a Variant Subsystem block, see “Upgrade Advisor Checks”

If there are inconsistencies in the port name or port number in models referenced by Variant Model block, Simulink corrects these inconsistencies while converting the Variant Model block to Variant Subsystem block.

Consider this model with Variant Model block having different port names.

When you convert this Variant Model block to a Variant Subsystem block, the inconsistencies are corrected automatically.

Note Future releases will no longer support using a Model block to contain model variants. You can use the `convertToVariant` method to convert model variants so that Model blocks are contained in a Variant Subsystem. Use of a Variant Subsystem block provides these advantages:

- Allows you to mix Model and Subsystem blocks as variant choices
- Supports flexible I/O, so that all variants do not need to have the same number of input and output ports

For an example of a model that uses a Variant Subsystem block as a container for variant models, see “Model Reference Variants” on page 13-456.

Limitations

You cannot convert a Subsystem block that meets the following condition:

- The Subsystem block is in a Simscape model that has Editing Mode set to **Restricted**.
- The Variant Model block has a mix of control ports or there is a name mismatch in control port types.
- The Variant Model block has control ports with different port numbers and name mapping.

Input Arguments

block — Subsystem or Model block to convert

block path | block handle

The path or block handle of the Subsystem or Model block to convert to a Variant Subsystem block. Specify a block path as a character vector and a block handle as a scalar.

Output Arguments

variant_subsystem — Handle of Variant Subsystem block

scalar returned by Simulink

If you specify an output argument, the method returns the block handle of the Variant Subsystem block created by the conversion.

Examples

Convert Subsystem Block to Variant Subsystem

Use the `convertToVariant` method to convert a Subsystem block to a Variant Subsystem block.

Open a model that contains a Subsystem block.

```
open_system(model);
```

Use the `convertToVariant` method to convert a subsystem in the model to a Variant Subsystem.

```
Simulink.VariantManager.convertToVariant(<subsystem block path>);
```

Alternative Functionality

Simulink Editor

In the Simulink Editor, right-click the Model block and select **Subsystems & Model Reference > Convert to > Variant Subsystem**.

“What Are Variants and When to Use Them”

Introduced in R2017b

reduceModel

Class: Simulink.VariantManager

Package: Simulink

Generate reduced model for specified variant configurations

Syntax

```
Simulink.VariantManager.reduceModel(Model)
Simulink.VariantManager.reduceModel(Model, Name, Value)
```

Description

`Simulink.VariantManager.reduceModel(Model)` creates a reduced model for the specified configuration. The referenced models and library blocks are also reduced. By default, the name of the reduced model and any reduced child referenced model name is the original model name suffixed with `_r`.

`Simulink.VariantManager.reduceModel(Model, Name, Value)` specifies the reduction parameters in the `Name` and `Value` arguments form.

Input Arguments

Model — Model to be reduced

character vector

Required field. Model to be reduced, specified as a character vector.

Name-Value Pair Arguments

Specify optional `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. You can specify several name and value arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

NamedConfigurations — Variant configuration name

{' '} | character vector | 'cell array'

Specifies the names of variant configurations. By default, current values of variant control variables are used for reduction.

VariableGroups — Variant control variable value

{' '} | 'cell array'

Specifies the variant control variable values to be used for reduction. By default, the current values of variant control variables are used.

The specified values must be a cell array with variant control variable names and their corresponding values.

Note 'VariableGroups' and 'NamedConfigurations' are mutually exclusive.

Consider this example:

```
Simulink.VariantManager.reduceModel('iv_model', ...
                                   'VariableGroups',...
                                   {'V',1,'W',1},{V',2,'W',2})
```

FullRangeVariables — Variant control variable value

{''} | 'cell array'

Specifies the full-range variant control variable values to be used for reduction. This allows you to reduce a model for all valid values of the specified variant control variable. Provide a reference value for variant control variable that results in a successful model compilation.

Consider this example:

```
Simulink.VariantManager.reduceModel('slexVariantReducer',...
                                   'VariableGroups',{'V',1},...
                                   'FullRangeVariables',{'W',1});
```

You can specify a variant control variable, 'W', as a full-range variant control variable. This allows you to reduce the model for all valid values of variable 'W'. In the example, full-range variant control variable W uses a reference value of 1.

CompileMode — Compilation mode

{'sim'} | 'codegen'

Specifies whether the model should be compiled for simulation or code generation mode as part of reduction. If the model contains variant blocks with the **Variant control mode** parameter set to `sim` or `codegen`, you can specify the value as `codegen` to retain the code generation branches of the blocks in the reduced model. For the default value `sim`, Variant Reducer compiles and retains the simulation branches in the top-level model.

OutputFolder — Folder to store the reduced model

character vector

Specifies the folder to place the reduced models and related artifacts. By default, the reduced models are generated in `./reducedModel` subfolder in the original model folder.

PreserveSignalAttributes — Preserve the signal attributes in the reduced model

{true} | false

When the value is `true`, the Variant Reducer preserves the compiled signal attributes between the original and reduced models by adding signal specification blocks at appropriate block ports in the reduced model. Compiled signal attributes include signal data types, signal dimensions, compiled sample times, etc.

Verbose — Displays step details

true | {false}

When the value is `true`, the Variant Reducer displays details of the steps performed during model reduction.

ModelSuffix — Reduced model name suffix

{_r}

Specifies the suffix to append to the reduced models and the related artifacts.

GenerateSummary — Generates a summary html file

true | {false}

When the value is `true`, the Variant Reducer generates a html file with details about the reduced model and any modifications that may be required for masks and callbacks.

Note To generate summary, you must have **Simulink Report Generator** license.

Examples

```
% Reduce model based on its variant control variable values in the base workspace.
Simulink.VariantManager.reduceModel('sldemo_variant_subsystems');
```

```
% Reduce the model associated with a variant configuration data object and configurations to be retained in the reduced model.
Simulink.VariantManager.reduceModel('slexVariantManagement', ...
    'NamedConfigurations', {'LinInterStd',
        'NonLinExterHighFid'})
```

```
% Reduce the model by specifying variant control variable values. Here, two groups are specified corresponding to
% {V==1, W==1}, and {V==2, W==2} respectively.
Simulink.VariantManager.reduceModel('iv_model', ...
    'VariableGroups',...
    {'V',1,'W',1},{V',2,'W',2});
```

```
% Reduce the model by specifying variant control variable values where 'W' is a full-range variant control variable and
% automatically maps the specification to correspond to the following four explicit groups: {V==1, W==1}, {V==1, W==2},
% {V==2, W==1}, and {V==2, W==2}.
Simulink.VariantManager.reduceModel('slexVariantReducer',...
    'VariableGroups',...
    {'V',1},...
    'FullRangeVariables',{'W',1});
```

```
% Reduce the model by specifying the compilation mode as code generation.
Simulink.VariantManager.reduceModel...
('slexVariantReducer','NamedConfigurations', {'config1'}, 'CompileMode', 'codegen', 'OutputFolder', 'L:\Models');
```

Simulink.VariantManager

variantLegend

Introduced in R2016a

variantLegend

Class: Simulink.VariantManager

Package: Simulink

Display or control behavior of variant condition legend

Syntax

```
Simulink.VariantManager.variantLegend(modelName, action)
```

Description

`Simulink.VariantManager.variantLegend(modelName, action)` displays or performs a specified action on the variant condition legend.

Input Arguments

modelName — Model for which the variant legend is displayed

character vector

Model for which the variant legend is displayed, specified as a character vector.

action — Task to be performed on the variant legend

'open' | 'print' | 'showCodeConditions' | 'close'

Task to be performed on the variant condition legend for the model. You can specify the task as:

- 'open' — Displays the variant condition legend for a model. The model must be open. If the legend is opened for the first time, the model is updated.
- 'print' — Prints the data in the variant condition legend. The legend must be open. There is no preview before printing the legend.
- 'showCodeConditions' — Displays code generation conditions column in the variant condition legend. The legend must be open. `showCodeConditions` is used as a name-value pair and accepts 'on' or 'off' as its values.
- 'close' — Closes the variant condition legend belonging to the specified model.

Examples

```
model = 'sldemo_variant_subsystems';  
open_system(model);  
% Open the variant condition legend  
Simulink.VariantManager.variantLegend(model, 'open');  
% Display the code generation conditions  
Simulink.VariantManager.variantLegend(model, 'showCodeConditions', 'on');
```

Introduced in R2017b

findVariantControlVars

Class: Simulink.VariantManager

Package: Simulink

Find variables used in variant control expressions

Syntax

```
vars = findVariantControlVars(Model)
vars = findVariantControlVars(Model, 'SearchReferencedModels', 'on')
```

Description

`vars = findVariantControlVars(Model)` returns the variant control variables used by variant blocks and variant parameters in the model, `Model`. If the variant control is a `Simulink.Variant` object, then the variables are retrieved from the variant condition within the object.

`vars = findVariantControlVars(Model, 'SearchReferencedModels', 'on')` enables the search in referenced models.

Input Arguments

Model — Model name

character vector

Model name for which variant control variables must be found, specified as character vector.

Data Types: char

'SearchReferencedModels' — Option to search in referenced models

'on' (default) | 'off'

Option to search in referenced models within the given model, specified as 'on' or 'off'. By default, search is enabled for referenced models.

Data Types: char

Output Arguments

vars — Variant control variables for model

struct

Variant control variables for model, returned as an N -by-1 struct with fields:

Name: Name of the variable used in the variant control expression.

Value: Value of the variable. This field will be \emptyset if the variable is not defined in the global workspace of the model.

Exists: Logical value that indicates if the variable is defined in the global workspace of the model. If the variable is defined in the global workspace, value is `true`; otherwise `false`.

Source: Value is either base workspace or the *name* of the data dictionary where the variable is stored.

SourceType: Value is either base workspace or data dictionary depending on where the variable is stored.

Examples

Find Variant Control Variables for a Model

Open the model `slexVariantManagement`.

```
cd(fullfile(matlabroot, 'examples', 'simulink_variants', 'main'));
model = 'slexVariantManagement';
open_system(model);
```

Create an object of the `Simulink.VariantManager` class.

```
varmgr=Simulink.VariantManager;
```

Find the variant control variables.

```
vars = varmgr.findVariantControlVars(model)
```

```
vars=6x1 struct array with fields:
```

```
    Name
    Value
    Exists
    Source
    SourceType
```

Topics

“Introduction to Variant Controls”

Introduced in R2015a

Simulink.VariantVariable class

Package: Simulink

Create a variant parameter object

Description

The `Simulink.VariantVariable` class creates a variant parameter object. You can specify multiple values for each object. You can also specify properties such as dimension, data type, and so on. Each value of the object is associated with a variant condition expression. Set the parameter values and properties in the object, then reference the object from the block.

Before you create a new `Simulink.VariantVariable` object, create a `Simulink.VariantControl` object representing the variant control variable to be used in the `Simulink.VariantVariable` object.

Note You can create the variant parameter object only in a base or in a data dictionary.

Creation

`P= Simulink.VariantVariable` creates an empty variant parameter object.

`P= Simulink.VariantVariable(Name, Value)` creates a variant parameter object as specified by one or more `Name, Value` pair arguments. Using this syntax, you can specify multiple values for the object and associate each value with a variant condition expression. You can also specify other properties of the object such as data types, storage class, dimensions, and so on.

Input Arguments

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: `'Specification', 'Pspec', 'Choices', {'V==1', 4.5, 'V==2', 9.5}`

Specification — Properties of variant parameter object

`Simulink.Parameter` object name

Properties of variant parameter object such as data type, dimensions, storage class, and so on, specified as the `Simulink.Parameter` object. The default storage class of a `Simulink.Parameter` object is `Auto`. If you specify the storage class as `Auto`, the value of the object is inline to the literal value in the generated code. If you specify the storage class of the object anything other than `Auto`, the object is represented as tunable parameters using symbolic names in the generated code. For more information, see “Options to Represent Variant Parameters in Generated Code” (Embedded Coder).

Example: 'Specification', 'Pspec'

Choices — Variant conditions and values

cell array

Variant conditions and values, specified as a struct. During simulation, when a variant condition evaluates to `true`, its associated value becomes active. When a variant condition evaluates to `false`, its associated value becomes inactive. No two values of the same variant parameter must be associated with the same variant condition.

You can specify the variant condition as boolean MATLAB expressions that contain one or more operands and operators. See “Types of Variant Control Variables (Operands) in Variant Parameters” and “Types of Operators in Variant Parameters”.

You can specify values of numeric, enumerated, or `Simulink.Parameter` type. See, “Numeric Variant Control Values for Rapid Prototyping of Variant Parameters”, “Improve Code Readability of Variant Parameters Using Enumerated Types”, and “Reuse Variant Parameter Values from Handwritten Code Using `Simulink.Parameter` Variables”.

Example: 'Choices', {'V==1', 4.5, 'V==2', 9.5}

Methods

Public Methods

`addChoice` Add choices to variant parameter object
`getChoice` Return choices of variant parameter object
`setChoice` Modify existing choices of variant parameter object
`removeChoice` Remove choices from variant parameter object

Specialized Operators and Functions

These methods specialize standard MATLAB operators and functions for objects in this class.

<code>bitcmp</code>	Performs bit-wise complement on input.
<code>eq</code>	Compares if the inputs are equal.
<code>gt</code>	Compares if the first input is greater than the second input.
<code>mrdivide</code>	Divides the first input by the second input.
<code>or</code>	Performs a logical OR on inputs.
<code>uminus</code>	Negates the input.
<code>bitor</code>	Performs bit-wise OR on inputs.
<code>ge</code>	Compares if the first input is greater than or equal to the second input.
<code>le</code>	Compares if the first input is less than or equal to the second input.
<code>mtimes</code>	Multiplies the inputs.
<code>plus</code>	Adds the inputs.
<code>uplus</code>	Returns the value of the input.

and	Performs logical AND on inputs.
bitshift	Shift bits by specified number of places.
lt	Compares if the first input is less than the second input.
ne	Compares if the inputs are not equal.
bitand	Performs bit-wise AND on inputs.
bitxor	Performs bit-wise XOR on inputs.
minus	Subtracts the second input from the first input.
not	Returns logical NOT of input.

Examples

Numeric Variant Control Values for Rapid Prototyping of Variant Parameters

Numeric values allow you to rapidly prototype variant values when you are still building your model. Numeric values help you focus more on building your variant values than on developing the expressions that activate those choices.

You can define numeric control values in locations listed in “Storage Locations for Variant Control Variables (Operands) in Variant Blocks”.

Open the `slexVariantParameters` model.

```
open_system('slexVariantParameters')
```

In the MATLAB Editor, specify variant choices in their simplest form as numeric values in `Simulink.VariantVariable` objects K1 and K2.

```
K1 = Simulink.VariantVariable('Choices',{ 'V==1', 3.5, 'V==2', 8.5})
```

```
K1 =  
VariantVariable with 2 choices:
```

Condition	Value
V == 1	3.5000
V == 2	8.5000

```
Specification: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

```
K2 = Simulink.VariantVariable('Choices',{ 'V==1', 4.5, 'V==2', 9.5})
```

```
K2 =  
VariantVariable with 2 choices:
```

Condition	Value
V == 1	4.5000

```
V == 2      9.5000
```

```
Specification: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

Once you successfully create the `Simulink.VariantVariable` objects, you can modify them by using the methods described in “Public Methods” on page 5-771 or from the `VariantVariable` dialog box.

Activate one of the variant values by defining a control variable, `V`, and setting its value to 1 in a `Simulink.VariantControl` object.

```
V = Simulink.VariantControl('Value', 1, 'ActivationTime', 'update diagram')
```

```
V =
  VariantControl with properties:
      Value: 1
  ActivationTime: 'update diagram'
```

When you simulate the model, the condition `V == 1` evaluates to `true`. `K1` is assigned a value of 3.5 and `K2` is assigned a value of 8.5.

```
sim('slexVariantParameters')
```

If you change the value of `V` to 2, Simulink® sets the value of `K1` and `K2` to 4.5 and 9.5 during simulation. You can change the value of `V` using this command or from `Simulink.VariantControl` dialog box.

```
V.Value = 2;
sim('slexVariantParameters')
```

Simulink.Parameter Type of Variant Control Variables for Code Generation of Variant Parameters

If you intend to generate code for a model containing variant parameters, specify variant control variables as `Simulink.Parameter` objects. `Simulink.Parameter` objects allow you to specify other attributes, such as data type and storage class, and control the appearance and placement of variant control variables in generated code.

- You can define a variant control variable of type `Simulink.Parameter` only in the base workspace or in a data dictionary. Defining `Simulink.Parameter` type of variant control variables in the mask or model workspace is not supported. For more information on storage locations for variant control variables, see “Storage Locations for Variant Control Variables (Operands) in Variant Blocks”.
- `Simulink.Parameter` objects within structures and that have data types other than `Simulink.Bus` objects are not supported.

Open the `slexVariantParameters` model.

```
open_system('slexVariantParameters')
```

In the MATLAB Editor, define a `Simulink.Parameter` object.

```
VSS_MODE = Simulink.Parameter;
VSS_MODE.Value = 1;
VSS_MODE.DataType = 'int32';
VSS_MODE.CoderInfo.StorageClass = 'Custom';
VSS_MODE.CoderInfo.CustomStorageClass = 'Define';
VSS_MODE.CoderInfo.CustomAttributes.HeaderFile = 'demo_macros.h';
```

Variant control variables defined as `Simulink.Parameter` objects can have any of the storage classes listed in “Storage Classes for Different Variant Activation Times” (Embedded Coder).

You can also convert a scalar variant control variable into a `Simulink.Parameter` object. For more information, see “Convert Variant Control Variables into `Simulink.Parameter` Objects”.

Specify the object as a variant control in `Simulink.VariantVariable` objects K1 and K2.

```
K1 = Simulink.VariantVariable('Choices',{'V == 1', 3.5, 'V == 2', 8.5})
```

```
K1 =
VariantVariable with 2 choices:
```

Condition	Value
V == 1	3.5000
V == 2	8.5000

```
Specification: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

```
K2 = Simulink.VariantVariable('Choices',{'V == 1', 4.5, 'V == 2', 9.5})
```

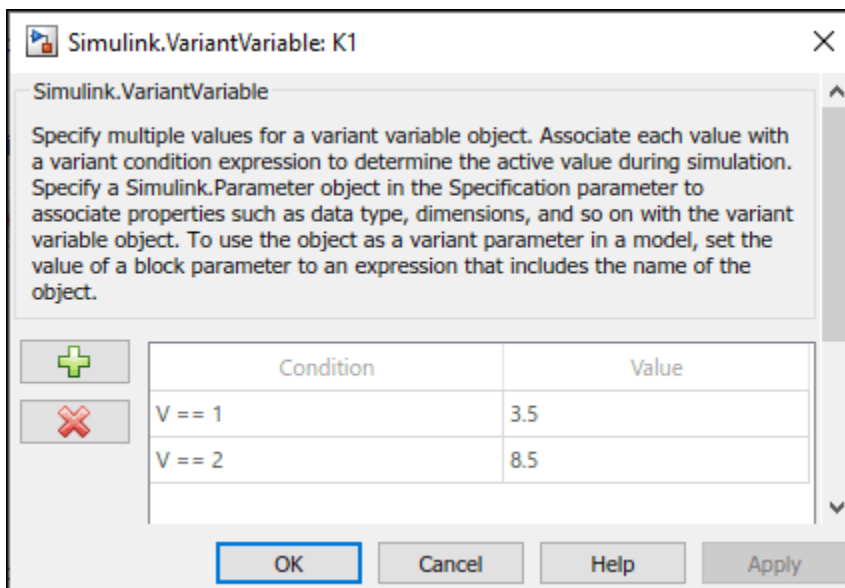

```
K2 =
VariantVariable with 2 choices:
```

Condition	Value
V == 1	4.5000
V == 2	9.5000

```
Specification: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

Once you successfully create the `Simulink.VariantVariable` objects, you can modify them by using the methods described in “Public Methods” on page 5-771 or from the `VariantVariable` dialog box.

Activate one of the variant values by defining a control variable `V` and setting its value to `VSS_MODE` in a `Simulink.VariantControl` object.

```
V = Simulink.VariantControl('Value',VSS_MODE,'ActivationTime','code compile')
```

```
V =
VariantControl with properties:
```

```
Value: [1x1 Simulink.Parameter]
ActivationTime: 'code compile'
```

When you simulate the model, the condition `V == 1` evaluates to `true`. `K1` is assigned a value of 3.5, and `K2` is assigned a value of 8.5.

```
sim('slexVariantParameters')
```

If you change the value of `VSS_MODE` to 2, Simulink® sets the value of `K1` and `K2` to 4.5 and 9.5 during simulation. You can change the value of `V` using this command or from Simulink.VariantControl dialog box.

```
VSS_MODE.Value = 2;
V.Value = VSS_MODE;
sim('slexVariantParameters')
```

Generate code from the model. For information on how to generate code, see “Generate Code Using Embedded Coder” (Embedded Coder)

The generated code contains both `Linear` and `Nonlinear` choices in preprocessor conditionals `#if` and `#elif` because of the code `compile` activation time. The variant control variable `V` is defined using a macro — `#define` directive — in the header file `demo_macros.h`. You can control the appearance and placement of `V` in the generated code and prevent optimizations from eliminating storage for `V` using the storage class property. For more information, see “Storage Classes for Different Variant Activation Times” (Embedded Coder).

```
% demo_macros.h
% /* Exported data define */
%
% /* Definition for custom storage class: Define */
% #define V      2          /* Referenced by:
%                          * '<Root>/Gain'
%                          * '<Root>/Gain1'
%                          */
% #endif                  /* RTW_HEADER_demo_macros_h_ */
%
% /*
```

Simulink.Variant Objects for Variant Condition Reuse of Variant Parameters

After identifying the variant values that your model requires, you can construct complex variant conditions to control the activation of your variant parameter values by defining variant conditions as `Simulink.Variant` objects. `Simulink.Variant` objects enable you to reuse common variant conditions across models and help you encapsulate complex variant condition expressions.

- You can define a variant control variable of type `Simulink.Variant` only in the base workspace or in a data dictionary. Defining `Simulink.Variant` type of variant control variables in the mask or model workspace is not supported. For more information on storage locations for variant control variables, see “Storage Locations for Variant Control Variables (Operands) in Variant Blocks”.
- `Simulink.Variant` within structures are not supported.

Open the `slexVariantParameters` model.

```
open_system('slexVariantParameters')
```

In the MATLAB® Editor, encapsulate variant control expressions as `Simulink.Variant` objects.

```
LinearController=Simulink.Variant('V==1');
NonLinearController=Simulink.Variant('V==2');
```

Specify the `Simulink.Variant` objects as the variant controls in a `Simulink.VariantVariable` objects K1 and K2.

```
K1 = Simulink.VariantVariable('Choices',{'LinearController',3.5,'NonLinearController',8.5})
```

```
K1 =  
VariantVariable with 2 choices:
```

Condition	Value
LinearController	3.5000
NonLinearController	8.5000

```
Specification: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

```
K2 = Simulink.VariantVariable('Choices',{'LinearController',4.5,'NonLinearController',9.5})
```

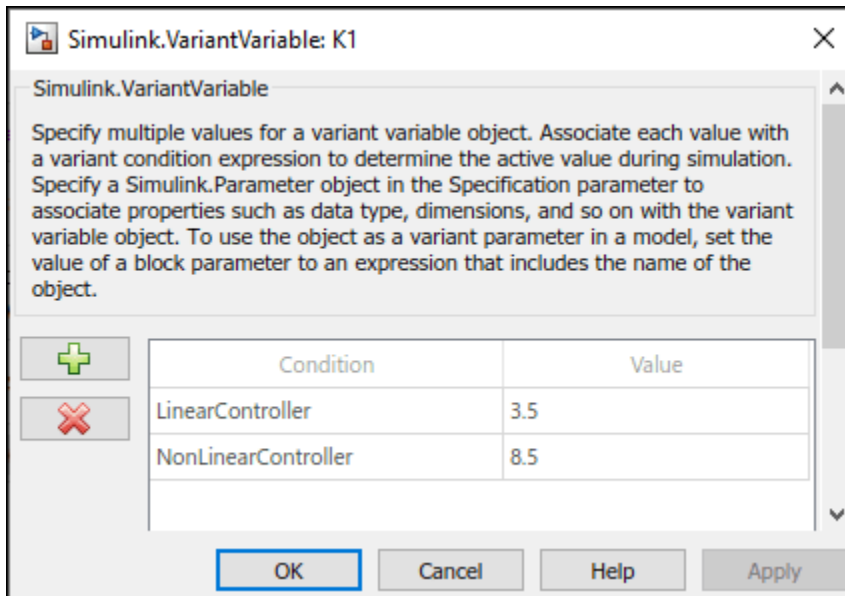

```
K2 =  
VariantVariable with 2 choices:
```

Condition	Value
LinearController	4.5000
NonLinearController	9.5000

```
Specification: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

Once you successfully create the `Simulink.VariantVariable` objects, you can modify them by using the methods described in “Public Methods” on page 5-771 or from the `VariantVariable` dialog box.

Activate one of the variant values by defining a `Simulink.VariantControl` object `V` and setting its value to 1.

```
V = Simulink.VariantControl('Value',1,'ActivationTime','update diagram')
```

```
V =  
VariantControl with properties:  
    Value: 1  
    ActivationTime: 'update diagram'
```

When you simulate the model, the condition `V == 1` evaluates to `true`. `K1` is assigned a value of 3.5, and `K2` is assigned a value of 8.5.

```
sim('slexVariantParameters')
```

If you change the value of `V` to 2, Simulink® sets the value of `K1` and `K2` to 4.5 and 9.5 during simulation. You can change the value of `V` using this command or from `Simulink.VariantControl` dialog box.

```
V.Value = 2;  
sim('slexVariantParameters')
```

Using this approach, you can develop complex variant condition expressions that are reusable.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using MATLAB® Coder™.

- For variant parameters associated with the startup activation time, you can generate code for both active and inactive choices by installing Simulink Coder or Embedded Coder.

- For variant parameters associated with the `code compile` activation time:
 - You must install Simulink Coder to generate code for only active values of variant parameters. Generating code using Simulink Coder is supported only if values of a variant parameter have same dimension.
 - You must install Embedded Coder to generate code for both active and inactive values of variant parameters. Generating code using Embedded Coder is supported for variant parameters values having same and different dimensions.

For more information on code generation with variant parameters, see “Options to Represent Variant Parameters in Generated Code” (Embedded Coder).

SubsystemReference class

Control subsystem reference programmatically

Description

Use the methods of `Simulink.SubsystemReference` to query and control the subsystem reference blocks.

Methods

Public Methods

<code>convertAllSubsystemReferenceBlockToSubsystem</code>	Converts all subsystem reference blocks to regular Subsystem blocks
<code>convertSubsystemReferenceBlockToSubsystem</code>	Converts a subsystem reference block to a regular Subsystem block
<code>convertSubsystemToSubsystemReference</code>	Converts a Subsystem block to subsystem reference
<code>getActiveInstances</code>	Returns all the active instances of subsystem references
<code>getAllDirtyInstances</code>	Returns child Subsystem block diagrams that are referred in the given block diagram and are also being edited
<code>getAllInstances</code>	Returns all subsystem reference blocks inside a block diagram
<code>getAllReferencedSubsystemBlockDiagrams</code>	Returns all the child Subsystem block diagrams for a given block diagram
<code>getNearestParentSubsystemReferenceBlock</code>	Returns the nearest parent subsystem reference for a block
<code>getSystemOwningTheLock</code>	Returns the system that has acquired the lock for editing
<code>isSystemLocked</code>	Checks if the system is locked due to an edit or update to the subsystem reference

Introduced in R2022a

Simulink.Mask.PortConstraint class

Create mask port constraints programmatically

Description

Use an instance of the `Simulink.Mask.PortConstraint` to add or remove port constraint on a masked block.

Properties

Public Properties

Name — Identifies the constraint

(default) | ""

Uniquely identifies the port constraint.

Data Types: `string`

ParameterCondition — Mask parameter condition

(default) | ""

Set mask parameter conditions for the constraints. The port constraints are active on the associated port only when the port satisfies all the parameter conditions.

Rule — Datatype, complexity, and dimension associated with the constraint

(default) | ""

Specify the allowed datatype, complexity, and dimension with an object of `PortConstraintRule`.

Data Types: `string`

DiagnosticLevel — Type of diagnostic message

(default) | `error`

You can display an error or warning message when the constraint validation fails. Specify the type of diagnostic level here.

Data Types: `string`

DiagnosticMessage — Diagnostic message

(default) | ""

Specify the diagnostic message that must be displayed when the validation fails.

Data Types: `string`

Methods

Public Methods

`addPortConstraint` Create a Port Constraint on a mask object

<code>getPortConstraint</code>	Get the attributes of the specified Port Constraint
<code>removePortConstraint</code>	Removes the specified port constraint
<code>removeAllPortConstraint</code>	Removes all the port constraints on the masked block

Topics

“Validate Input and Output Port Signals Using Port Constraints”

Introduced in R2022a

Simulink.Mask.ParameterCondition class

Create mask parameter conditions

Description

Create an object of `Simulink.Mask.ParameterCondition` to create mask parameter conditions for constraints.

Properties

Public Properties

Name — Name of the mask parameter

(default) | empty

Name of the mask parameter specified as string. The mask parameter must be present in the mask object.

Data Types: `string`

Value — Possible values for the mask parameter

(default) | empty

The list of values for the mask parameter specified as a cell array. The list of values are specified as comma separated values.

Data Types: `cell`

Methods

Public Methods

<code>addParameterCondition</code>	Creates a mask parameter condition for the constraint
<code>getParameterCondition</code>	Returns the parameter condition associated with the constraint
<code>removeParameterCondition</code>	Removes the specified parameter condition on the constraint
<code>removeAllParameterCondition</code>	Removes all parameter conditions on a Constraint

Introduced in R2022a

Simulink.Mask.PortConstraintRule class

Create an instance of `Simulink.Mask.PortConstraintRule` to define the rules of a Port Constraint

Description

The Port Constraint is validated against the permitted **Data Types**, **Dimension**, and **Complexity** of the port signal values.

Properties

Public Properties

DataType — Permitted data types

(default) | ""

Specify the allowed data types as a cell array. You can set the Signedness, bias, Wordlength, and Scaling for fixed point data type.

Data Types: `string`

Dimension — Permitted dimension for the port signals

(default) | ""

Specify the allowed dimensions that the port signals can hold as a cell array. It can be scalar, vector, 2dmatrix, and ndmatrix, rowvector, and colvector.

Data Types: `cell`

Complexity — Complexity of the port signal

(default) | ""

Specify the allowed complexity as a cell array. It can be real or complex.

Methods

Public Methods

`setRule` Creates rules that are validated against the data at a port

`removeRule` Removes all the datatype, complexity, and dimension attributes of the port constraint rule

Topics

“Validate Input and Output Port Signals Using Port Constraints”

Introduced in R2022a

Simulink.Mask.PortIdentifier class

Create Port Identifiers to identify ports of a block in the mask object

Description

Create an instance of `Simulink.Mask.PortIdentifier` to create and set the properties for the Port Identifier.

Properties

Public Properties

Name — Name of the port identifier in the mask

(default) | ''

Specify the name for the port, this name uniquely identifies the port identifier in the mask.

Data Types: `string`

Type — Type of port

(default) | `Input`

Specify the type of the port as either `Input` or `Output`.

Data Types: `string`

Identifier Type — Type identifier

(default) | `Index`

Specify the type of identifier as name or index. Specify name if you want to identify the ports using name, otherwise specify index, if you want to identify the ports using port index.

Data Types: `string`

Identifier — Port Identifier appearing in the block

(default) | ''

Specify the name of the port in case identifier type is name. Port name is unique amongst all ports in a block. Enter indices in case identifier type is index. You can map multiple ports to one port identifier when the identifier type is index. You can specify the identifiers in one of these formats:

- **Index:** Specify the index to associate the port to the port identifier. For example, "3". This associates port "3" to the port identifier.
- **Lower port index:Upper port index:** Specify the lower port index and upper port index to associate all the ports between the indices to the port identifier. For example, 2:4. This associates the ports 2, 3, and 4 to the port identifier.
- **List of port indices:** Specify the ports separated by comma to associate the ports to the port identifier. For example, 3,5,7. This associates the ports 3, 5, and 7 to the port identifier. Duplicates are not allowed.

- **Port name: String:** Specify the name of the port.

Data Types: `string`

Methods

Public Methods

<code>addPortIdentifier</code>	Creates a port identifier to identify the port in the mask
<code>getPortIdentifier</code>	Returns the attributes of the specified port identifier
<code>remove PortIdentifier</code>	Removes the specified port identifier on the mask object
<code>removeAllPortIdentifiers</code>	Removes all the port identifiers on the mask object

Programmatic Model Editor Appearance Parameters

Use the following parameters to control how your model appears in the Simulink editor. To query and/or modify the value of a parameter, use `get_param` or `set_param`.

Model Appearance Parameters

Parameter	Description	Values
BlockNameDataTip	Specifies whether to display the block name as a data tip. In the Simulink Editor, in the Debug tab, select Information Overlays > Name in Tooltip .	'on' {'off'}
BlockParametersDataTip	Specifies whether to display a block parameter in a data tip. In the Simulink Editor, in the Debug tab, select Information Overlays > Parameters in Tooltip .	'on' {'off'}
BlockDescription-StringDataTip	Specifies whether to display the user description for a block as a data tip. In the Simulink Editor, in the Debug tab, select Information Overlays > Description in Tooltip .	'on' {'off'}
BrowserLookUnderMasks	Show masked subsystems in the Model Browser. On the Modeling tab, select Environment > Model Browser . In the Model Browser pane, click  and select Systems with Mask Parameters .	'on' {'off'}
BrowserShowLibraryLinks	Show library links in the Model Browser. On the Modeling tab, select Environment > Model Browser . In the Model Browser pane, click  and select Library Links .	'on' {'off'}
CompiledModelBlockNormalModeVisibility	For a top model that is being simulated or that is in a compiled state, return information about which Model blocks have normal mode visibility enabled.	Return values indicate which Model blocks have normal mode visibility enabled.

Parameter	Description	Values
DefaultAnnotationFontName DefaultBlockFontName DefaultLineFontName	Name of font to use for new annotation text, block text, or signal line labels and on existing annotations, block names, or signal lines whose FontName property is set to 'auto'. To set, on the Format tab, click the Font Properties button arrow, then click Fonts for Model .	character vector
DefaultAnnotationFontSize DefaultBlockFontSize DefaultLineFontSize	Size of font to use for new annotation text, block text, or signal line labels and on existing annotations, blocks, or signal lines whose FontSize property is set to -1. To set, on the Format tab, click the Font Properties button arrow, then click Fonts for Model .	positive integer
DefaultAnnotationFontAngle DefaultBlockFontAngle DefaultLineFontAngle	Angle of font for new annotation text, block text, or signal line labels and on existing annotations, blocks, or signal lines whose FontAngle property is set to 'auto'. To set, on the Format tab, click the Font Properties button arrow, then click Fonts for Model .	{'normal'} 'italic'
DefaultAnnotationFontWeight DefaultBlockFontWeight DefaultLineFontWeight	Weight of font for new annotation text, block text, or signal line labels and on existing annotations, blocks, or signal lines whose FontWeight property is set to 'auto'. To set, on the Format tab, click the Font Properties button arrow, then click Fonts for Model .	{'normal'} 'bold'
HideAutomaticNames	Hides block names given automatically by the Simulink Editor. See "Hide or Display Block Names".	{'on'} 'off'

Parameter	Description	Values
LineUpdate	<p>Specifies when to update line routing to avoid overlapping lines and obstacles in the model.</p> <p>When set to the default 'deferred', scripts postpone line routing until they pause or complete. To perform deferred line routing within a script, you can use function <code>Simulink.BlockDiagram.routeLine</code>.</p>	{'deferred'} 'none' 'immediate'
ModelBrowserVisibility	<p>Show the Model Browser.</p> <p>In the Simulink Editor, in the Modeling tab, select Environment > Model Browser.</p>	'on' {'off'}
ModelBrowserWidth	<p>Width of the Model Browser pane in the model window. To display the Model Browser pane, see the <code>ModelBrowserVisibility</code> parameter.</p>	integer — {200}
ModelBlockNormalModeVisibility	<p>Use with <code>set_param</code> to set normal mode visibility on for the specified Model blocks.</p> <p>You can set this parameter with the Model Block Normal Mode Visibility dialog box. For details, see “Specify the Instance Having Normal Mode Visibility”.</p>	<p>With <code>set_param</code>, use an array of <code>Simulink.BlockPath</code> objects or cell array of cell arrays of character vectors of paths to blocks or models.</p> <p>With <code>set_param</code>, an empty array specifies to use the Simulink default selection for the instance to have normal mode visibility enabled.</p>
ModelBlockNormalModeVisibilityBlockPath	<p>Return information about which Model blocks have normal mode visibility enabled. Use with a model that you are editing.</p>	<p>Return values indicate which Model blocks have normal mode visibility enabled. See “Simulate Multiple Referenced Model Instances in Normal Mode”.</p>
PortDataTypeDisplayFormat	<p>When you display port data types in a model, choose whether to display data type aliases, base data types, or both.</p> <p>In the Simulink Editor, in the Debug tab, set by Information Overlays > Base Data Types and Information Overlays > Alias Data Types.</p>	{'AliasTypeOnly'} 'BaseTypeOnly' 'BaseAndAliasTypes'

Parameter	Description	Values
ReqHilite	Highlights all the blocks in the Simulink diagram that have requirements associated with them. In the Simulink Editor, in the Apps tab, under Verification, Validation, and Test , click Requirements Viewer . The Requirements Viewer tab appears. Click Highlight Links .	'on' {'off'}
SampleTimeAnnotations	In the Simulink Editor, in the Debug tab, select Information Overlays > Text .	'on' {'off'}
SampleTimeColors	In the Simulink Editor, in the Debug tab, select Information Overlays > Colors .	'on' {'off'}
ScreenColor	Background color of the model window. In the Simulink Editor, on the Format tab, set Background .	'black' {'white'} 'red' 'green' 'blue' 'cyan' 'magenta' 'yellow' 'gray' 'lightBlue' 'orange' 'darkGreen' [r,g,b,a] where r, g, b, and a are the red, green, blue, and alpha values of the color normalized to the range 0.0 to 1.0. The alpha value is ignored.
ShowLinearization-Annotations	Toggles linearization icons in the model.	{'on'} 'off'
ShowLineDimensions	Show signal dimensions on this model's block diagram. In the Simulink Editor, on the Debug tab, select Information Overlays > Signal Dimensions .	'on' {'off'}
ShowLoopsOnError	Highlight invalid loops graphically.	{'on'} 'off'
ShowModelReferenceBlockIO	Toggles display of I/O mismatch on block. In the Simulink Editor, in the Debug tab, select Information Overlays > Ref. Model I/O Mismatch .	'on' {'off'}
ShowModelReference-BlockVersion	Toggles display of version on block. In the Simulink Editor, in the Debug tab, select Information Overlays > Ref. Model Version .	'on' {'off'}

Parameter	Description	Values
ShowPageBoundaries	<p>Toggles display of page boundaries on the Simulink Editor canvas.</p> <p>In the Simulink Editor, in the Simulation tab, select Print > Show Page Boundaries.</p>	'on' {'off'}
ShowPortDataTypes	<p>Show data types of ports on this model's block diagram.</p> <p>In the Simulink Editor, in the Debug tab, select Information Overlays > Base Data Types.</p>	'on' {'off'}
ShowPortUnits	<p>Show units of ports, subsystem, and model block icons on the model block diagram.</p> <p>In the Simulink Editor, in the Debug tab, select Information Overlays > Port Units.</p>	'on' {'off'}
ShowStorageClass	<p>Show storage classes of signals on this model's block diagram.</p> <p>In the Simulink Editor, in the Debug tab, select Information Overlays > Storage Class.</p>	'on' {'off'}
ShowTestPointIcons	<p>Show test point icons on this model's block diagram.</p> <p>In the Simulink Editor, in the Debug tab, select Information Overlays > Log & Testpoint.</p>	{'on'} 'off'
ShowViewerIcons	<p>Show viewer icons on this model's block diagram.</p> <p>In the Simulink Editor, in the Debug tab, select Information Overlays > Viewers.</p>	{'on'} 'off'
ZoomFactor	<p>Zoom factor of the Simulink Editor window expressed as a percentage of normal (100%) or by the keywords FitSystem or FitSelection.</p> <p>In the Simulink Editor, on the Modeling tab, select one of the options under Environment > Zoom.</p>	{'100'} 'FitSystem' 'FitSelection'

Parameter	Description	Values
WideLines	<p>Draws lines that carry vector or matrix signals wider than lines that carry scalar signals.</p> <p>In the Simulink Editor, on the Debug tab, select Information Overlays > Nonscalar Signals.</p>	'on' {'off'}

About Common Block Properties

This table lists the properties common to all Simulink blocks, including block callback properties (see “Callbacks for Customized Model Behavior”). Examples of commands that change these properties follow this table (see “Examples of Setting Block Properties” on page 6-25).

Common Block Properties

Property	Description	Values
AncestorBlock	Name of the library block that the block is linked to (for blocks with a disabled link).	character vector
AttributesFormatString	Block annotation text (corresponds to block properties).	character vector
BackgroundColor	Block background color.	color value <code>'[r,g,b]'</code> <code>'[r,g,b,a]'</code> r, g, and b, are the red, green, blue values of the color in the range 0.0 to 1.0. If specified, the alpha value (a) is ignored. Possible color values are 'black', 'white', 'red', 'green', 'blue', 'cyan', 'magenta', 'yellow', 'gray', 'lightBlue', 'orange', 'darkGreen'.
BlockDescription	Block description shown at the top of the block parameters dialog box or property inspector.	character array
BlockType	Block type (read-only).	character array
BlockKeywords	Associates one or more keywords with a custom library block.	character vector string scalar string array
ClipboardFcn	Function called when block is copied to the clipboard (Ctrl+C) or when the menu item Copy is selected.	function character vector
CloseFcn	Function called when <code>close_system</code> is run on block.	function character vector
Commented	Exclude block from simulation.	{'off'} 'on' 'through'
CompiledBusType	Returns whether the signal connected to a port is not a bus, is a virtual, or is a nonvirtual bus (read-only). Specify a port or line handle when using <code>get_param</code> . For example: <code>ports = get_param(gcb,'PortHandles');</code> <code>feval(gcs,[],[],[],'compile');</code> <code>bt = get_param(ports.Outport,'CompiledBusType')</code> See "Display Bus Information".	'NOT_BUS' 'VIRTUAL_BUS' 'NON_VIRTUAL_BUS'

Property	Description	Values
CompiledIsActive	<p>Specifies whether the block status is active or not at compile time.</p> <p>CompiledIsActive returns off if any one of these conditions is true at compile time:</p> <ul style="list-style-type: none"> Block is inactive path of Inline Variant. Block is inactive choice of Variant Subsystem. Block is commented out is within a Subsystem block that is commented out. Block is inactive due to condition propagated from Variant Subsystem block. <p>CompiledIsActive returns off for inactive choices and returns on for active choices of Variant Subsystem.</p>	'off' 'on'
CompiledPortComplexSignals	<p>Complexity of port signals after updating diagram. You must compile the model before querying this property. For example:</p> <pre>vdp([],[],[],'compile'); d = get_param(gcf,'CompiledPortComplexSignals'); vdp([],[],[],'term');</pre>	structure array
CompiledPortDataTypes	<p>Data types of port signals after updating diagram. You must compile the model before querying this property. See CompiledPortComplexSignals.</p>	structure array
CompiledPortDesignMin	<p>Design minimum of port signals after updating diagram. You must compile the model before querying this property. For example:</p> <pre>feval(gcs, [],[],[],'compile'); ports = get_param(gcf,'PortHandles'); min = get_param(ports.Outport, 'CompiledPortDesignMin'); feval(model, [],[],[],'term');</pre>	structure array

Property	Description	Values
CompiledPortDesignMax	Design maximum of port signals at compile time. You must compile the model before querying this property. For example: <pre>feval(gcs, [], [], [], 'compile'); ports = get_param(gcb, 'PortHandles'); max = get_param(ports.Outputport, 'CompiledPortDesignMax'); feval(model, [], [], [], 'term');</pre>	structure array
CompiledPortDimensions	Dimensions of port signals after updating diagram. You must compile the model before querying this property. For details, see “Get Compiled Port Dimensions”.	numeric array
CompiledPortDimensionsMode	Indication whether the port signal has a variable size (after updating diagram). You must compile the model before querying this property. See “Determine Whether Signal Line Has Variable Size”.	double number. 0 indicates the signal does not have a variable size. 1 indicates the signal has a variable size.
CompiledPortFrameData	Frame mode of port signals after updating diagram. You must compile the model before querying this property.	structure array
CompiledPortWidths	Structure of port widths after updating diagram. You must compile the model before querying this property.	structure array
CompiledSampleTime	Block sample time after updating diagram. You must compile the model before querying this property.	vector [sample time, offset time] or cell {[sample time 1, offset time 1]; [sample time 2, offset time 2]; ... [sample time n, offset time n]}
ContinueFcn	Function called at the restart of a simulation (after a pause).	function character vector
CopyFcn	Function called when block is copied. See “Block Callback Parameters” for details.	function character vector
DataTypeOverrideCompiled	For internal use.	
DeleteFcn	Function called when block is deleted. See “Block Callback Parameters” for details.	MATLAB expression

Property	Description	Values
DestroyFcn	Function called when block is destroyed. See “Block Callback Parameters” for details.	MATLAB expression
Description	Description of block. Set by the Description field in the General pane of the Block Properties dialog box.	text and tokens
Diagnostics	For internal use.	
DialogParameters	List of names/attributes of block-specific parameters for an unmasked block, or mask parameters for a masked block.	structure
DropShadow	Display drop shadow.	{'off'} 'on'
ExtModeLoggingSupported	Enable a block to support uploading of signal data in external mode (for example, with a scope block).	{'off'} 'on'
ExtModeLoggingTrig	Enable a block to act as the trigger block for external mode signal uploading.	{'off'} 'on'
