ExtModeUploadOption	Enable a block to upload signal data in external mode when the Select all check box on the External Signal & Triggering dialog box is not selected. A value of <code>log</code> indicates the block uploads signals. A value of <code>none</code> indicates the block does not upload signals. The value <code>monitor</code> is currently not in use. If the Select all check box on the External Signal & Triggering dialog box is selected, it overrides this parameter setting.	{'none'} 'log' 'monitor'
FontAngle	Font angle.	'normal' 'italic' 'oblique' {'auto'}
FontName	Font name.	character array
FontSize	Font size. A value of -1 specifies that this block inherits the font size specified by the <code>DefaultBlockFontSize</code> model parameter.	real {'-1'}
FontWeight	Font weight.	'light' 'normal' 'demi' 'bold' {'auto'}

Property	Description	Values
ForegroundColor	Foreground color of block icon.	color value '[r,g,b]' '[r,g,b,a]' r, g, and b, are the red, green, blue values of the color in the range 0.0 to 1.0. The value changes if it is too similar to the canvas color (ScreenColor parameter). Use get_param to return the actual value. If specified, the alpha value (a) is ignored. Possible color values are 'black', 'white', 'red', 'green', 'blue', 'cyan', 'magenta', 'yellow', 'gray', 'lightBlue', 'orange', 'darkGreen'.
Handle	Block handle.	real
HideAutomaticName	Specify whether the block name given automatically by the Simulink Editor displays in the model. To hide automatic names, use the default setting of 'on'. (The HideAutomaticNames parameter for the model must also be set to 'on'.) Set to 'off' to display the name, and also set the block ShowName parameter to 'on'. Blocks whose ShowName parameter is 'off' are hidden regardless of this setting. For more information on how the parameters interact, see "Hide or Display Block Names".	{'on'} 'off'
HiliteAncestors	For internal use.	
InitFcn	Initialization function for a block. Created on the Callbacks pane of the Model Properties dialog box. For more information, see "Create Model Callbacks". On non-masked blocks, updating the diagram or running the simulation call this function.	MATLAB expression
InputSignalNames	Names of input signals.	cell array

Property	Description	Values
IntrinsicDialogParameters	List of names/attributes of block-specific parameters (regardless of whether the block is masked or unmasked). Use instead of <code>DialogParameters</code> if you want block-specific parameters for masked or unmasked blocks.	structure
IOSignalStrings	Block paths to objects that are connected to the Viewers & Generators Manager. Simulink software saves these paths when the model is saved.	list
IOType	Viewers & Generators Manager type. For internal use.	
IsStateOwnerBlock	Indicates whether the block is a supported state owner block that can be used with the State Reader and State Writer blocks (read-only). See State Reader and State Writer.	'off' 'on'
LibraryVersion	For a linked block, the initial value of this property is the <code>ModelVersion</code> of the library at the time the link was created. The value updates with increments in the model version of the library.	character vector — {'1.1'}
LineHandles	Handles of lines connected to block.	structure
LinkData	Array of details about changes to the blocks inside the link that differ between a parameterized link and its library, listing the block names and parameter values. Use [] to reset to deparameterized, e.g., <code>set_param(gcb, 'linkData', [])</code> .	cell array
LinkStatus	Link status of block. Updates out-of-date linked blocks when queried using <code>get_param</code> . See “Control Linked Block Programmatically”.	'none' 'resolved' 'unresolved' 'implicit' 'inactive' 'restore' 'propagate' 'propagateHierarchy' 'restoreHierarchy'
LoadFcn	Function called when block is loaded.	MATLAB expression
MinMaxOverflow-Logging_Compiled	For internal use.	

Property	Description	Values
ModelCloseFcn	Function called when model is closed. The ModelCloseFcn is called prior to the block's DeleteFcn and DestroyFcn callbacks, if either are set.	MATLAB expression
ModelParamTableInfo	For internal use.	
MoveFcn	Function called when block is moved.	MATLAB expression
Name	Block or signal name. To specify a signal name, use the corresponding port or line handle. <code>ports = get_param(gcf, 'PortHandles');</code> <code>set_param(ports.Outputport(1), 'Name', 'NewName');</code> Alternatively, to name an output signal of a block, you can use SignalNameFromLabel.	character vector
NameChangeFcn	Function called when block name is changed.	MATLAB expression
NamePlacement	Position of block name.	{'normal'} 'alternate'
ObjectParameters	Names/attributes of block's parameters.	structure
OpenFcn	Function called when this Block Parameters dialog box opens.	MATLAB expression
Orientation	Where block faces.	{'right'} 'left' 'up' 'down'
OutputSignalNames	Names of output signals.	cell array
Parent	Name of the system that owns the block.	character vector {'untitled'}
ParentCloseFcn	Function called when parent subsystem is closed. The ParentCloseFcn of blocks at the root model level is not called when the model is closed.	MATLAB expression
PauseFcn	Function called at the pause of a simulation.	function character vector

Property	Description	Values
PortConnectivity	<p>The value of this property is an array of structures, each of which describes one of the block's input or output ports. Each port structure has the following fields:</p> <ul style="list-style-type: none"> • Type Specifies the port's type and/or number. The value of this field can be: <ul style="list-style-type: none"> • n, where n is the number of the port for data ports • 'enable' if the port is an enable port • 'trigger' if the port is a trigger port • 'state' for state ports • 'ifaction' for action ports • 'LConn#' for a left connection port where # is the port's number • 'RConn#' for a right connection port where # is the port's number • Position The value of this field is a two-element vector, $[x\ y]$, that specifies the port's position. • SrcBlock Handle of the block connected to this port. This field is null for output ports and -1 for unconnected input ports. SrcBlock property is a valid source handle for Variant Subsystem blocks. • SrcPort Number of the port connected to this port, starting at zero. This field is null for both output ports and unconnected input ports. • DstBlock Handle of the block to which this port is connected. This field is 	structure array

Property	Description	Values
	<p>null for input ports and contains a 1-by-0 empty matrix for unconnected output ports.</p> <ul style="list-style-type: none"><li data-bbox="570 394 727 426">• DstPort <p>Number of the port to which this port is connected, starting at zero. This field is null for input ports and contains a 1-by-0 empty matrix for unconnected output ports. For Simscape blocks, the field contains port handles.</p>	

Property	Description	Values
PortHandles	<p>The value of this property is a structure that specifies the handles of the block's ports. The structure has the following fields:</p> <ul style="list-style-type: none"> • Inport Handles of the block's input ports. • Outputport Handles of the block's output ports. • Enable Handle of the block's enable port. • Trigger Handle of the block's trigger port. • State Handle of the block's state port. • LConn Handles of the block's left connection ports (for blocks that support Physical Modeling tools). • RConn Handles of the block's right connection ports (for blocks that support Physical Modeling tools). • Ifaction Handle of the block's action port. • Reset Handle of the block's reset port. 	structure array
PortRotationType	Type of port rotation used by this block (read-only).	'default' 'physical'

Property	Description	Values
Ports	<p>A vector that specifies the number of each kind of port this block has. The order of the vector's elements corresponds to the following port types:</p> <ul style="list-style-type: none"> • Inport • Outport • Enable • Trigger • State • LConn • RConn • Ifaction • Reset 	vector
Position	<p>Position of block in model window.</p> <p>To help with block alignment, the position you set can differ from the actual block position by a few pixels. Use <code>get_param</code> to return the actual position.</p>	<p>vector of coordinates, in pixels: [left top right bottom]</p> <p>The origin is the upper-left corner of the Simulink Editor canvas before any canvas resizing. Supported coordinates are between -1073740824 and 1073740823, inclusive. Positive values are to the right of and down from the origin. Negative values are to the left of and up from the origin.</p>
PostSaveFcn	Function called after the block is saved.	MATLAB expression
PreCopyFcn	Function called before the block is copied. See "Block Callback Parameters" for details.	MATLAB expression
PreDeleteFcn	Function called before the block is deleted. See "Block Callback Parameters" for details.	MATLAB expression
PreSaveFcn	Function called before the block is saved. See "Block Callback Parameters" for details.	MATLAB expression
Priority	Specifies the block's order of execution relative to other blocks in the same model. Set by the Priority field on the General pane of the Block Properties dialog box.	character vector { ' ' }
ReferenceBlock	Name of the library block to which this block links.	character vector { ' ' }

Property	Description	Values
RequirementInfo	For internal use.	
RTWData	User specified data, used by Simulink Coder software. Intended only for use with user written S-functions. See the section “S-Function RTWdata” (Simulink Coder) for details.	
SampleTime	Value of the sample time parameter. See “Specify Sample Time” for more details.	character vector
Selected	Status of whether or not block is selected.	{'on'} 'off'
ShowName	Display or hide block name. To display a block name given by the Simulink Editor (automatic names), set the block 'HideAutomaticName' parameter to 'off' and ShowName to 'on'. To hide an automatic block name given by the Editor, set ShowName to 'on', HideAutomaticName to 'on', and HideAutomaticNames on the model to 'on'. For more information on how the parameters interact, see “Hide or Display Block Names”.	{'on'} 'off'
SignalHierarchy	If the signal is a bus, returns the name and hierarchy of the signals in the bus (read-only). Specify a port or line handle when using <code>get_param</code> . For example: <code>ports = get_param(gcf,'PortHandles');</code> <code>feval(gcs,[],[],[],'compile');</code> <code>sh = get_param(ports.Outport,'SignalHierarchy');</code> See “Display Bus Information”.	values reflect the structure of the signal that you specify
StartFcn	Function called at the start of a simulation.	MATLAB expression
StatePerturbation-ForJacobian	State perturbation size to use during linearization. See “Change Perturbation Level of Blocks Perturbed During Linearization” (Simulink Control Design) for details.	character vector

Property	Description	Values
StaticLinkStatus	Link status of block. Does not update out-of-date linked blocks when queried using <code>get_param</code> . See also <code>LinkStatus</code> .	'none' 'resolved' 'unresolved' 'implicit' 'inactive' 'restore' 'propagate' 'propagateHierarchy' 'restoreHierarchy'
StopFcn	Function called at the termination of a simulation.	MATLAB expression
Tag	Text that appears in the block label that Simulink software generates. Set by the Tag field on the General pane of the Block Properties dialog box.	character vector {' '}
Type	Simulink object type (read-only).	'block'
UndoDeleteFcn	Function called when block deletion is undone.	MATLAB expression
UserData	User-specified data that can have any MATLAB data type.	{'[]'}
UserDataPersistent	Status of whether or not <code>UserData</code> will be saved in the model file.	'on' {'off'}
VariantConfigurationObject	Specifies the variant configuration object that is associated with the model. See “Export, Save, Refresh, and Load a Variant Configuration Data Object”.	{' '} The value is an empty character vector if no configuration object is associated; otherwise, it is the name of a <code>Simulink.VariantConfigurationData</code> object.

Examples of Setting Block Properties

These examples illustrate how to change common block properties.

This command changes the orientation of the Gain block in the `myModel` system so it faces the opposite direction (right to left).

```
set_param('myModel/Gain','Orientation','left')
```

This command associates an `OpenFcn` callback with the Gain block in the `myModel` system.

```
set_param('myModel/Gain','OpenFcn','my_open_cb')
```

This command sets the `Position` property of the Gain block in the `myModel` system. The block is 75 pixels wide by 25 pixels high.

```
set_param('myModel/Gain','Position',[50 250 125 275])
```

Block-Specific Parameters

To write scripts that create and modify models, you can use the `get_param` and `set_param` functions to query and modify the properties and parameters of a block or diagram. Use the tables to determine the programmatic name of a parameter or property in a block dialog box.

Programmatic Parameters of Blocks and Models

Programmatic parameters that describe a model are model parameters. Parameters that describe a block are block parameters. Parameters that are common to all Simulink blocks are common block parameters (see “Common Block Properties” on page 6-12). Many blocks also have unique block-specific parameters. A masked block can have mask parameters (see “Mask Parameters” on page 6-131).

The model and block properties also include callbacks, which are commands that execute when a certain model or block event occurs. These events include opening a model, simulating a model, copying a block, opening a block, etc. See “Model, Block, and Port Callbacks”.

Tip For block parameters that accept array values, the number of elements in the array cannot exceed what `int_T` can represent. This limitation applies to both simulation and Simulink Coder code generation.

The maximum number of characters that a parameter edit field can contain is 49,000.

Block-Specific Parameters and Programmatic Equivalents

The tables list block-specific parameters for Simulink blocks. The type of the block appears in parentheses after the block name. Some Simulink blocks work as masked subsystems. The tables indicate masked blocks by adding the designation "masked subsystem" after the block type.

The type listed for nonmasked blocks is the value of the `BlockType` parameter (see "Common Block Properties" on page 6-12). The type listed for masked blocks is the value of the `MaskType` parameter (see "Mask Parameters" on page 6-131).

The **Dialog Box Prompt** column indicates the text of the prompt for the parameter in the block dialog box. The **Values** column shows the type of value required (scalar, vector, variable), the possible values (separated with a vertical line), and the default value (enclosed in braces).

Continuous Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Derivative (Derivative)		
CoefficientInTFApproximation	Coefficient c in the transfer function approximation $s/(c*s+1)$ used for linearization	{'inf'}
Integrator (Integrator)		
ExternalReset	External reset	{'none'} 'rising' 'falling' 'either' 'level' 'level hold'
InitialConditionSource	Initial condition source	{'internal'} 'external'
InitialCondition	Initial condition	scalar or vector — {'0'}
LimitOutput	Limit output	{'off'} 'on'
UpperSaturationLimit	Upper saturation limit	scalar or vector — {'inf'}
LowerSaturationLimit	Lower saturation limit	scalar or vector — {'-inf'}
ShowSaturationPort	Show saturation port	{'off'} 'on'
ShowStatePort	Show state port	{'off'} 'on'
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'} {'-1'} any real scalar or vector
IgnoreLimit	Ignore limit and reset when linearizing	{'off'} 'on'
ZeroCross	Enable zero-crossing detection	'off' {'on'}
ContinuousStateAttributes	State Name	{' '} user-defined
WrapState	Wrap state	{'off'} 'on'
WrappedStateUpperValue	Upper value of wrapped state	scalar or vector — {'pi'}
WrappedStateLowerValue	Lower value of wrapped state	scalar or vector — {'-pi'}
Second-Order Integrator (SecondOrderIntegrator)		
ICSourceX	Initial condition source x	{'internal'} 'external'
ICX	Initial condition x	scalar or vector — {'0'}
LimitX	Limit x	{'off'} 'on'
UpperLimitX	Upper limit x	scalar or vector — {'inf'}
LowerLimitX	Lower limit x	scalar or vector — {'-inf'}
WrapStateX	Enable wrapping of x	{'off'} 'on'
WrappedUpperValueX	Upper value for wrapping x	scalar or vector — {'pi'}
WrappedLowerValueX	Lower value for wrapping x	scalar or vector — {'-pi'}
AbsoluteToleranceX	Absolute tolerance x	character vector, scalar, or vector — {'auto'} {'-1'} any real scalar or vector
StateNameX	State name x	{ } user-defined

Block (Type)/Parameter	Dialog Box Prompt	Values
ICSourceDXDT	Initial condition source dx/dt	{'internal'} 'external'
ICDXDT	Initial condition dx/dt	scalar or vector — {'0'}
LimitDXDT	Limit dx/dt	{'off'} 'on'
UpperLimitDXDT	Upper limit dx/dt	scalar or vector — {'inf'}
LowerLimitDXDT	Lower limit dx/dt	scalar or vector — {'-inf'}
AbsoluteToleranceDXDT	Absolute tolerance dx/dt	character vector, scalar, or vector — {'auto'} {'-1'} any real scalar or vector
StateNameDXDT	State name dx/dt	{ } user-defined
ExternalReset	External reset	{'none'} 'rising' 'falling' 'either'
ZeroCross	Enable zero-crossing detection	{'on'} 'off'
ReinitDXDTwhenXreachesSaturation	Reinitialize dx/dt when x reaches saturation	{'off'} 'on'
IgnoreStateLimitsAndResetForLinearization	Ignore state limits and the reset for linearization	{'off'} 'on'
ShowOutput	Show output	{'both'} 'x' 'dxdt'
State-Space (StateSpace)		
A	A	matrix — {'1'}
B	B	matrix — {'1'}
C	C	matrix — {'1'}
D	D	matrix — {'1'}
InitialCondition	Initial conditions	vector — {'0'}
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'} {'-1'} any real scalar or vector
ContinuousStateAttributes	State Name	{' '} user-defined
Transfer Fcn (TransferFcn)		
Numerator	Numerator coefficients	vector or matrix — {'[1]'}
Denominator	Denominator coefficients	vector — {'[1 1]'}
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'} {'-1'} any real scalar or vector
ContinuousStateAttributes	State Name	{' '} user-defined
Transport Delay (TransportDelay)		
DelayTime	Time delay	scalar or vector — {'1'}
InitialOutput	Initial output	scalar or vector — {'0'}
BufferSize	Initial buffer size	scalar — {'1024'}
FixedBuffer	Use fixed buffer size	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
TransDelayFeedthrough	Direct feedthrough of input during linearization	{'off'} 'on'
PadeOrder	Pade order (for linearization)	{'0'}
Variable Time Delay (VariableTimeDelay)		
VariableDelayType	Select delay type	'Variable transport delay' {'Variable time delay'}
MaximumDelay	Maximum delay	scalar or vector — {'10'}
InitialOutput	Initial output	scalar or vector — {'0'}
MaximumPoints	Initial buffer size	scalar — {'1024'}
FixedBuffer	Use fixed buffer size	{'off'} 'on'
ZeroDelay	Handle zero delay	{'off'} 'on'
TransDelayFeedthrough	Direct feedthrough of input during linearization	{'off'} 'on'
PadeOrder	Pade order (for linearization)	{'0'}
ContinuousStateAttributes	State Name	{' '} user-defined
Variable Transport Delay (VariableTransportDelay)		
VariableDelayType	Select delay type	{'Variable transport delay'} 'Variable time delay'
MaximumDelay	Maximum delay	scalar or vector — {'10'}
InitialOutput	Initial output	scalar or vector — {'0'}
MaximumPoints	Initial buffer size	scalar — {'1024'}
FixedBuffer	Use fixed buffer size	{'off'} 'on'
TransDelayFeedthrough	Direct feedthrough of input during linearization	{'off'} 'on'
PadeOrder	Pade order (for linearization)	{'0'}
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'} {'-1'} any positive real scalar or vector
ContinuousStateAttributes	State Name	{' '} user-defined
Zero-Pole (ZeroPole)		
Zeros	Zeros	vector — {'[1]'} vector — {'[0 -1]'} vector — {'[1]'} character vector, scalar, or vector — {'auto'} {'-1'} any positive real scalar or vector
Poles	Poles	
Gain	Gain	
AbsoluteTolerance	Absolute tolerance	
ContinuousStateAttributes	State Name	{' '} user-defined

Discontinuities Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Backlash (Backlash)		
BacklashWidth	Deadband width	scalar or vector — {'1'}
InitialOutput	Initial output	scalar or vector — {'0'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Coulomb & Viscous Friction (Coulombic and Viscous Friction) (masked subsystem)		
offset	Coulomb friction value (Offset)	{'[1 3 2 0]'}
gain	Coefficient of viscous friction (Gain)	{'1'}
Dead Zone (DeadZone)		
LowerValue	Start of dead zone	scalar or vector — {'-0.5'}
UpperValue	End of dead zone	scalar or vector — {'0.5'}
SaturateOnIntegerOverflow	Saturate on integer overflow	'off' {'on'}
LinearizeAsGain	Treat as gain when linearizing	'off' {'on'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Dead Zone Dynamic (Dead Zone Dynamic) (masked subsystem)		
Hit Crossing (HitCross)		
HitCrossingOffset	Hit crossing offset	scalar or vector — {'0'}
HitCrossingDirection	Hit crossing direction	'rising' 'falling' {'either'}
ShowOutputPort	Show output port	'off' {'on'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Quantizer (Quantizer)		
QuantizationInterval	Quantization interval	scalar or vector — {'0.5'}
LinearizeAsGain	Treat as gain when linearizing	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Rate Limiter (RateLimiter)		
RisingSlewLimit	Rising slew rate	{'1'}
FallingSlewLimit	Falling slew rate	{'-1'}
SampleTimeMode	Sample time mode	'continuous' {'inherited'}
InitialCondition	Initial condition	{'0'}
LinearizeAsGain	Treat as gain when linearizing	'off' {'on'}
Rate Limiter Dynamic (Rate Limiter Dynamic) (masked subsystem)		
Relay (Relay)		

Block (Type)/Parameter	Dialog Box Prompt	Values
OnSwitchValue	Switch on point	{'eps'}
OffSwitchValue	Switch off point	{'eps'}
OnOutputValue	Output when on	{'1'}
OffOutputValue	Output when off	{'0'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via back propagation' {'Inherit: All ports same datatype'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
Saturation (Saturate)		
UpperLimit	Upper limit	scalar or vector — {'0.5'}
LowerLimit	Lower limit	scalar or vector — {'-0.5'}
LinearizeAsGain	Treat as gain when linearizing	'off' {'on'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via back propagation' {'Inherit: Same as input'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
Saturation Dynamic (Saturation Dynamic) (masked subsystem)		
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Same as second input'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutputDataTypeScalingMode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate on integer overflow	{'off'} 'on'
Wrap To Zero (Wrap To Zero) (masked subsystem)		
Threshold	Threshold	{'255'}

Discrete Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Delay (Delay)		
DelayLengthSource	Delay length > Source	{'Dialog'} 'Input port'
DelayLength	Delay length > Value	{'2'}
DelayLengthUpperLimit	Delay length > Upper limit	{'100'}
InitialConditionSource	Initial condition > Source	{'Dialog'} 'Input port'
InitialCondition	Initial condition > Value	{'0.0'}
ExternalReset	External reset	{'None'} 'Rising' 'Falling' 'Either' 'Level' 'Level hold'
InputProcessing	Input processing	'Columns as channels (frame based)' {'Elements as channels (sample based)'} 'Inherited'
UseCircularBuffer	Use circular buffer for state	{'off'} 'on'
PreventDirectFeedthrough	Prevent direct feedthrough	{'off'} 'on'
RemoveDelayLengthCheckInGeneratedCode	Remove delay length check in generated code	{'off'} 'on'
DiagnosticForDelayLength	Diagnostic for delay length	{'None'} 'Warning' 'Error'
SampleTime	Sample time (-1 for inherited)	{'-1'}
StateName	State name	{''}
StateMustResolveToSignalObject	State name must resolve to Simulink signal object	{'off'} 'on'
StateSignalObject	Signal object class Code generation storage class	Simulink.Signal object Object of a class that is derived from Simulink.Signal
StateStorageClass	Code generation storage class	{'Auto'} 'Model default' 'ExportedGlobal' 'ImportedExtern' 'ImportedExternPointer' 'Custom'
CodeGenStateStorageTypeQualifier	Code generation storage type qualifier	{''}
Difference (Difference) (masked subsystem)		
ICPrevInput	Initial condition for previous input	{'0.0'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutputDataTypeScalingMode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Discrete Derivative (Discrete Derivative) (masked subsystem)		
gainval	Gain value	{'1.0'}
ICPrevScaledInput	Initial condition for previous weighted input $K*u/Ts$	{'0.0'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutputDataTypeScalingMode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Discrete FIR Filter (Discrete FIR Filter)		
CoefSource	Coefficient source	{'Dialog parameters'} 'Input port'
FilterStructure	Filter structure	{'Direct form'} 'Direct form symmetric' 'Direct form antisymmetric' 'Direct form transposed' 'Lattice MA' Note You must have a DSP System Toolbox license to use a filter structure other than Direct form.
Coefficients	Coefficients	vector — {'[0.5 0.5]'} Note You must have a DSP System Toolbox license to use a filter structure other than Direct form.
InputProcessing	Input processing	'Columns as channels (frame based)' {'Elements as channels (sample based)'} Note You must have a DSP System Toolbox license to use a filter structure other than Direct form.
InitialStates	Initial states	scalar or vector — {'0'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
CoefMin	Coefficients minimum	{'[]'}
CoefMax	Coefficients maximum	{'[]'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
TapSumDataTypeStr	Tap sum data type	{'Inherit: Same as input'} 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)'
CoefDataTypeStr	Coefficients data type	{'Inherit: Same word length as input'} 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
ProductDataTypeStr	Product output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Same as input' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)'
AccumDataTypeStr	Accumulator data type	{'Inherit: Inherit via internal rule'} 'Inherit: Same as input' 'Inherit: Same as product output' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)'
StateDataTypeStr	State data type	'Inherit: Same as input' {'Inherit: Same as accumulator'} 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)'
OutDataTypeStr	Output data type	'Inherit: Same as input' {'Inherit: Same as accumulator'} 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16)' 'fixdt(1,16,0)'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} 'on'
Discrete Filter (DiscreteFilter)		
Numerator	Numerator coefficients	vector — {'[1]'}'
Denominator	Denominator coefficients	vector — {'[1 0.5]'}'
IC	Initial states	{'0'}
SampleTime	Sample time (-1 for inherited)	{'1'}
a0EqualsOne	Optimize by skipping divide by leading denominator coefficient (a0)	{'off'} 'on'
NumCoefMin	Numerator coefficient minimum	{'[]'}
NumCoefMax	Numerator coefficient maximum	{'[]'}
DenCoefMin	Denominator coefficient minimum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
DenCoefMax	Denominator coefficient maximum	{'[]'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
StateDataTypeStr	State data type	{'Inherit: Same as input' 'int8' 'int16' 'int32' 'fixdt(1,16,0)'}
NumCoefDataTypeStr	Numerator coefficient data type	{'Inherit: Inherit via internal rule' 'int8' 'int16' 'int32' 'fixdt(1,16)' 'fixdt(1,16,0)'}
DenCoefDataTypeStr	Denominator coefficient data type	{'Inherit: Inherit via internal rule' 'int8' 'int16' 'int32' 'fixdt(1,16)' 'fixdt(1,16,0)'}
NumProductDataTypeStr	Numerator product output data type	{'Inherit: Inherit via internal rule' 'Inherit: Same as input' 'int8' 'int16' 'int32' 'fixdt(1,16,0)'}
DenProductDataTypeStr	Denominator product output data type	{'Inherit: Inherit via internal rule' 'Inherit: Same as input' 'int8' 'int16' 'int32' 'fixdt(1,16,0)'}
NumAccumDataTypeStr	Numerator accumulator data type	{'Inherit: Inherit via internal rule' 'Inherit: Same as input' 'Inherit: Same as product output' 'int8' 'int16' 'int32' 'fixdt(1,16,0)'}
DenAccumDataTypeStr	Denominator accumulator data type	{'Inherit: Inherit via internal rule' 'Inherit: Same as input' 'Inherit: Same as product output' 'int8' 'int16' 'int32' 'fixdt(1,16,0)'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule' 'Inherit: Same as input' 'int8' 'int16' 'int32' 'fixdt(1,16,0)'}
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} 'on'
StateName	State name	{''}
StateMustResolveToSignal Object	State name must resolve to Simulink signal object	{'off'} 'on'
StateSignalObject	Signal object class	Simulink.Signal object

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWStateStorageType Qualifier	Code generation storage type qualifier	{''}
Discrete-Time Integrator (DiscreteIntegrator)		
IntegratorMethod	Integrator method	{'Integration: Forward Euler'} 'Integration: Backward Euler' 'Integration: Trapezoidal' 'Accumulation: Forward Euler' 'Accumulation: Backward Euler' 'Accumulation: Trapezoidal'
gainval	Gain value	{'1.0'}
ExternalReset	External reset	{'none'} 'rising' 'falling' 'either' 'level' 'sampled level'
InitialConditionSource	Initial condition source	{'internal'} 'external'
InitialCondition	Initial condition	scalar or vector — {'0'}
InitialConditionSetting	Initial condition setting	{'State (most efficient)'} 'Output' 'Compatibility'
SampleTime	Sample time (-1 for inherited)	{'1'}
LimitOutput	Limit output	{'off'} 'on'
UpperSaturationLimit	Upper saturation limit	scalar or vector — {'inf'}
LowerSaturationLimit	Lower saturation limit	scalar or vector — {'-inf'}
ShowSaturationPort	Show saturation port	{'off'} 'on'
ShowStatePort	Show state port	{'off'} 'on'
IgnoreLimit	Ignore limit and reset when linearizing	{'off'} 'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
StateName	State name	{''}
StateMustResolveTo SignalObject	State name must resolve to Simulink signal object	{'off'} 'on'
StateSignalObject	Signal object class Code generation storage class	Simulink.Signal object Object of a class that is derived from Simulink.Signal
StateStorageClass	Code generation storage class	{'Auto'} 'Model default' 'ExportedGlobal' 'ImportedExtern' 'ImportedExternPointer' 'Custom'
RTWStateStorageType Qualifier	Code generation storage type qualifier	{''}
First-Order Hold (First-Order Hold) (masked subsystem)		
Ts	Sample time	{'1'}
Memory (Memory)		
InitialCondition	Initial condition	scalar or vector — {'0'}
InheritSampleTime	Inherit sample time	{'off'} 'on'
LinearizeMemory	Direct feedthrough of input during linearization	{'off'} 'on'
LinearizeAsDelay	Treat as a unit delay when linearizing with discrete sample time	{'off'} 'on'
StateName	State name	{''}
StateMustResolveTo SignalObject	State name must resolve to Simulink signal object	{'off'} 'on'
StateSignalObject	Signal object class Code generation storage class	Simulink.Signal object Object of a class that is derived from Simulink.Signal
StateStorageClass	Code generation storage class	{'Auto'} 'Model default' 'ExportedGlobal' 'ImportedExtern' 'ImportedExternPointer' 'Custom'
RTWStateStorageType Qualifier	Code generation storage type qualifier	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
Tapped Delay (S-Function) (Tapped Delay Line) (masked subsystem)		
vinit	Initial condition	{'0.0'}
samptime	Sample time	{'-1'}
NumDelays	Number of delays	{'4'}
DelayOrder	Order output vector starting with	{'Oldest'} 'Newest'
includeCurrent	Include current input in output vector	{'off'} 'on'
Transfer Fcn First Order (First Order Transfer Fcn) (masked subsystem)		
PoleZ	Pole (in Z plane)	{'0.95'}
ICPrevOutput	Initial condition for previous output	{'0.0'}
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Transfer Fcn Lead or Lag (Lead or Lag Compensator) (masked subsystem)		
PoleZ	Pole of compensator (in Z plane)	{'0.95'}
ZeroZ	Zero of compensator (in Z plane)	{'0.75'}
ICPrevOutput	Initial condition for previous output	{'0.0'}
ICPrevInput	Initial condition for previous input	{'0.0'}
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Transfer Fcn Real Zero (Transfer Fcn Real Zero) (masked subsystem)		
ZeroZ	Zero (in Z plane)	{'0.75'}
ICPrevInput	Initial condition for previous input	{'0.0'}
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Unit Delay (UnitDelay)		
InitialCondition	Initial condition	scalar or vector — {'0'}

Block (Type)/Parameter	Dialog Box Prompt	Values
InputProcessing	Input processing	'Columns as channels (frame based)' {'Elements as channels (sample based)'} 'Inherited'
SampleTime	Sample time (-1 for inherited)	{'-1'}
StateName	State name	{''}
StateMustResolveToSignalObject	State name must resolve to Simulink signal object	{'off'} 'on'
StateSignalObject	Signal object class Code generation storage class	Simulink.Signal object Object of a class that is derived from Simulink.Signal
StateStorageClass	Code generation storage class	{'Auto'} 'Model default' 'ExportedGlobal' 'ImportedExtern' 'ImportedExternPointer' 'Custom'
CodeGenStateStorageTypeQualifier	Code generation storage type qualifier	{''}
Zero-Order Hold (ZeroOrderHold)		
SampleTime	Sample time (-1 for inherited)	{'1'}

Logic and Bit Operations Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Bit Clear (Bit Clear) (masked subsystem)		
iBit	Index of bit (0 is least significant)	{'0'}
Bit Set (Bit Set) (masked subsystem)		
iBit	Index of bit (0 is least significant)	{'0'}
Bitwise Operator (S-Function) (Bitwise Operator) (masked subsystem)		
logicop	Operator	{'AND' 'OR' 'NAND' 'NOR' 'XOR' 'NOT'}
UseBitMask	Use bit mask ...	'off' {'on'}
NumInputPorts	Number of input ports	{'1'}
BitMask	Bit Mask	{'bin2dec('11011001')'}
BitMaskRealWorld	Treat mask as	'Real World Value' {'Stored Integer'}
Combinatorial Logic (CombinatorialLogic)		
TruthTable	Truth table	{'[0 0;0 1;0 1;1 0;0 1;1 0;1 0;1 1]'
SampleTime	Sample time (-1 for inherited)	{'-1'}
Compare To Constant (Compare To Constant) (masked subsystem)		
relop	Operator	'==' '~=' '<' {'<='} '>=' '>'
const	Constant value	{'3.0'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
ZeroCross	Enable zero-crossing detection	'off' {'on'}
Compare To Zero (Compare To Zero) (masked subsystem)		
relop	Operator	'==' '~=' '<' {'<='} '>=' '>'
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
ZeroCross	Enable zero-crossing detection	'off' {'on'}
Detect Change (Detect Change) (masked subsystem)		
vinit	Initial condition	{'0'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Detect Decrease (Detect Decrease) (masked subsystem)		
vinit	Initial condition	{'0.0'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Detect Fall Negative (Detect Fall Negative) (masked subsystem)		
vinit	Initial condition	{'0'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Detect Fall Nonpositive (Detect Fall Nonpositive) (masked subsystem)		

Block (Type)/Parameter	Dialog Box Prompt	Values
vinit	Initial condition	{'0'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Detect Increase (Detect Increase) (masked subsystem)		
vinit	Initial condition	{'0.0'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Detect Rise Nonnegative (Detect Rise Nonnegative) (masked subsystem)		
vinit	Initial condition	{'0'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Detect Rise Positive (Detect Rise Positive) (masked subsystem)		
vinit	Initial condition	{'0'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Extract Bits (Extract Bits) (masked subsystem)		
bitsToExtract	Bits to extract	{'Upper half'} 'Lower half' 'Range starting with most significant bit' 'Range ending with least significant bit' 'Range of bits'
numBits	Number of bits	{'8'}
bitIdxRange	Bit indices ([start end], 0-based relative to LSB)	{'[0 7]'}
outScalingMode	Output scaling mode	{'Preserve fixed-point scaling'} 'Treat bit field as an integer'
Interval Test (Interval Test) (masked subsystem)		
IntervalClosedRight	Interval closed on right	'off' {'on'}
uplimit	Upper limit	{'0.5'}
IntervalClosedLeft	Interval closed on left	'off' {'on'}
lowlimit	Lower limit	{'-0.5'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Interval Test Dynamic (Interval Test Dynamic) (masked subsystem)		
IntervalClosedRight	Interval closed on right	'off' {'on'}
IntervalClosedLeft	Interval closed on left	'off' {'on'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Logical Operator (Logic)		
Operator	Operator	{'AND'} 'OR' 'NAND' 'NOR' 'XOR' 'NXOR' 'NOT'
Inputs	Number of input ports	{'2'}

Block (Type)/Parameter	Dialog Box Prompt	Values
IconShape	Icon shape	{'rectangular'} 'distinctive'
SampleTime	Sample time (-1 for inherited)	{'-1'}
AllPortsSameDT	Require all inputs and output to have the same data type	{'off'} 'on'
OutDataTypeStr	Output data type	'Inherit: Logical (see Configuration Parameters: Optimization)' {'boolean'} 'fixdt(1,16)'
Relational Operator (RelationalOperator)		
Operator	Relational operator	'==' '~=' '<' {'<='} '>=' '>' 'isInf' 'isNaN' 'isFinite'
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have the same data type	{'off'} 'on'
OutDataTypeStr	Output data type	'Inherit: Logical (see Configuration Parameters: Optimization)' {'boolean'} 'fixdt(1,16)'
Shift Arithmetic (ArithShift)		
BitShiftNumberSource	Bits to shift > Source	{'Dialog'} 'Input port'
BitShiftDirection	Bits to shift > Direction	'Left' 'Right' {'Bidirectional'}
BitShiftNumber	Bits to shift > Number	{'8'}
BinPtShiftNumber	Binary points to shift > Number	{'0'}
DiagnosticForOORShift	Diagnostic for out-of-range shift value	{'None'} 'Warning' 'Error'
CheckOORBitShift	Check for out-of-range 'Bits to shift' in generated code	{'off'} 'on'
nBitShiftRight	Deprecated in R2011a	
nBinPtShiftRight	Deprecated in R2011a	

Lookup Table Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Cosine (Cosine) (masked subsystem)		
Formula	Output formula	'sin(2*pi*u)' {'cos(2*pi*u)'} 'exp(j*2*pi*u)' 'sin(2*pi*u) and cos(2*pi*u)'
NumDataPoints	Number of data points for lookup table	{'(2^5)+1'}
OutputWordLength	Output word length	{'16'}
InternalRulePriority	Internal rule priority for lookup table	{'Speed'} 'Precision'
Direct Lookup Table (n-D) (LookupNDDirect)		
NumberOfTableDimensions	Number of table dimensions	'1' {'2'} '3' '4'
InputsSelectThisObjectFromTable	Inputs select this object from table	{'Element'} 'Vector' '2-D Matrix'
TableIsInput	Make table an input	{'off'} 'on'
Table	Table data	{'[4 5 6;16 19 20;10 18 23]}'
DiagnosticForOutOfRangeInput	Diagnostic for out-of-range input	'None' {'Warning'} 'Error'
SampleTime	Sample time (-1 for inherited)	{'-1'}
TableMin	Table minimum	{'[]}'
TableMax	Table maximum	{'[]}'
TableDataTypeStr	Table data type	{'Inherit: Inherit from 'Table data''} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'boolean' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} 'on'
maskTabDims	Deprecated in R2009b	
explicitNumDims	Deprecated in R2009b	
outDims	Deprecated in R2009b	
tabIsInput	Deprecated in R2009b	
mxTable	Deprecated in R2009b	
clipFlag	Deprecated in R2009b	
samptime	Deprecated in R2009b	
Interpolation Using Prelookup (Interpolation_n-D)		
NumberOfTableDimensions	Number of table dimensions	'1' {'2'} '3' '4'

Block (Type)/Parameter	Dialog Box Prompt	Values
Table	Table data > Value	{'sqrt([1:11]' * [1:11])'}
TableSource	Table data > Source	{'Dialog'} 'Input port'
TableSpecification	Specification	{'Explicit values'} 'Lookup table object' To set this parameter from 'Explicit values' to 'Lookup table object', use the same call to set_param to set the parameter LookupTableObject. For example: <pre>set_param('myModel/myInterpBlock',... 'TableSpecification',... 'Lookup table object',... 'LookupTableObject','myLUTObject')</pre>
LookupTableObject	Name of lookup table object	{''}
InterpMethod	Interpolation method	'Flat' {'Linear point-slope'} 'Nearest' 'Linear Lagrange'
ExtrapMethod	Extrapolation method	'Clip' {'Linear'}
ValidIndexMayReachLast	Valid index input may reach last index	{'off'} 'on'
DiagnosticForOutOfRangeInput	Diagnostic for out-of-range input	{'None'} 'Warning' 'Error'
RemoveProtectionIndex	Remove protection against out-of-range index in generated code	{'off'} 'on'
NumSelectionDims	Number of sub-table selection dimensions	{'0'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
TableDataTypeStr	Table data > Data Type	'Inherit: Inherit from 'Table data'' {'Inherit: Same as output'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
TableMin	Table data > Minimum	{'[]'}
TableMax	Table data > Maximum	{'[]'}
IntermediateResultsDataTy peStr	Intermediate results > Data Type	{'Inherit: Inherit via internal rule'} 'Inherit: Same as output' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output > Data Type	'Inherit: Inherit via back propagation' {'Inherit: Inherit from table data'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutMin	Output > Minimum	{'[]'}
OutMax	Output > Maximum	{'[]'}
InternalRulePriority	Internal rule priority	{'Speed'} 'Precision'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} 'on'
CheckIndexInCode	Deprecated in R2011a	
n-D Lookup Table, 1-D Lookup Table, 2-D Lookup Table (Lookup_n-D)		
NumberOfTableDimensions	Number of table dimensions	'1' '2' '3' '4'. Default is '1' for 1-D Lookup Table, '2' for 2-D Lookup Table, '3' for n-D Lookup Table.
DataSpecification	(n-D Lookup Table) Data specification	{'Table and breakpoints'} 'Lookup table object' To set this parameter from 'Table and breakpoints' to 'Lookup table object', use the same call to set_param to set the parameter LookupTableObject. For example: set_param('myModel/myLookupBlock',... 'DataSpecification','Lookup table... object',... 'LookupTableObject','myLUTObject')
LookupTableObject	Name of lookup table object.	{''}
Table	Table data	{'reshape(repmat([4 5 6;16 19 20;10 18 23],1,2),[3,3,2])'}
BreakpointsSpecification	Breakpoints specification	{'Explicit values'} 'Even spacing'
BreakpointsFor-Dimension1FirstPoint	First point	{'1'}
BreakpointsFor-Dimension2FirstPoint	First point	{'1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
BreakpointsForDimension3FirstPoint	First point	{'1'}
...
BreakpointsForDimension30FirstPoint	First point	{'1'}
BreakpointsForDimension1Spacing	Spacing	{'1'}
BreakpointsForDimension2Spacing	Spacing	{'1'}
BreakpointsForDimension3Spacing	Spacing	{'1'}
...
BreakpointsForDimension30Spacing	Spacing	{'1'}
BreakpointsForDimension1	Breakpoints 1	{'[10,22,31]}'}
BreakpointsForDimension2	Breakpoints 2	{'[10,22,31]}'}
BreakpointsForDimension3	Breakpoints 3	{'[5, 7]}'}
...
BreakpointsForDimension30	Breakpoints 30	{'[1:3]}'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InterpMethod	Interpolation method	'Flat' 'Nearest' {'Linear point-slope'} 'Linear Lagrange' 'Cubic spline'
ExtrapMethod	Extrapolation method	'Clip' {'Linear'} 'Cubic spline'
UseLastTableValue	Use last table value for inputs at or above last breakpoint	{'off'} 'on'
DiagnosticForOutOfRangeInput	Diagnostic for out-of-range input	{'None'} 'Warning' 'Error'
RemoveProtectionInput	Remove protection against out-of-range input in generated code	{'off'} 'on'
IndexSearchMethod	Index search method	'Evenly spaced points' 'Linear search' {'Binary search'}
BeginIndexSearchUsingPreviousIndexResult	Begin index search using previous index result	{'off'} 'on'
UseOneInputPortForAllInputData	Use one input port for all input data	{'off'} 'on'
SupportTunableTableSize	Support tunable table size in code generation	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
MaximumIndicesForEachDimension	Maximum indices for each dimension	{'[]'}
TableDataTypeStr	Table data > Data Type	'Inherit: Inherit from 'Table data'' {'Inherit: Same as output'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
TableMin	Table data > Minimum	{'[]'}
TableMax	Table data > Maximum	{'[]'}
BreakpointsForDimension1DataTypeStr	Breakpoints 1 > Data Type	{'Inherit: Same as corresponding input'} 'Inherit: Inherit from 'Breakpoint data'' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
BreakpointsForDimension1Min	Breakpoints 1 > Minimum	{'[]'}
BreakpointsForDimension1Max	Breakpoints 1 > Maximum	{'[]'}
BreakpointsForDimension2DataTypeStr	Breakpoints 2 > Data Type	{'Inherit: Same as corresponding input'} 'Inherit: Inherit from 'Breakpoint data'' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
BreakpointsForDimension2Min	Breakpoints 2 > Minimum	{'[]'}
BreakpointsForDimension2Max	Breakpoints 2 > Maximum	{'[]'}
...
BreakpointsForDimension30DataTypeStr	Breakpoints 30 > Data Type	{'Inherit: Same as corresponding input'} 'Inherit: Inherit from 'Breakpoint data'' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
BreakpointsForDimension30 Min	Breakpoints 30 > Minimum	{'[]'}
BreakpointsForDimension30 Max	Breakpoints 30 > Maximum	{'[]'}
FractionDataTypeStr	Fraction > Data Type	{'Inherit: Inherit via internal rule'} 'double' 'single' 'fixdt(1,16,0)'
IntermediateResults DataTypeStr	Intermediate results > Data Type	'Inherit: Inherit via internal rule' {'Inherit: Same as output'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutDataTypeStr	Output > Data Type	'Inherit: Inherit via back propagation' 'Inherit: Inherit from table data' {'Inherit: Same as first input'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutMin	Output > Minimum	{'[]'}
OutMax	Output > Maximum	{'[]'}
InternalRulePriority	Internal rule priority	{'Speed'} 'Precision'
InputSameDT	Require all inputs to have the same data type	'off' {'on'}
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' 'Floor' 'Nearest' 'Round' {'Simplest'} 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
ProcessOutOfRangeInput	Deprecated in R2009b	
Lookup Table Dynamic (Lookup Table Dynamic) (masked subsystem)		
LookUpMeth	Lookup Method	'Interpolation-Extrapolation' {'Interpolation-Use End Values'} 'Use Input Nearest' 'Use Input Below' 'Use Input Above'

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	{'fixdt('double')} 'Inherit: Inherit via back propagation' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutputDataTypeScaling Mode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Prelookup (PreLookup)		
BreakpointsSpecification	Specification	{'Explicit values'} 'Even spacing' 'Breakpoint object' To set this parameter from 'Explicit values' or 'Even spacing' to 'Breakpoint object', use the same call to set_param to set the parameter BreakpointObject. For example: set_param('myModel/myPrelookupBlock', ... 'BreakpointsSpecification', ... 'Breakpoint object', ... 'BreakpointObject', 'myBPObject')
BreakpointObject	Name of breakpoint object	{''}
BreakpointsFirstPoint	First point	{'10'}
BreakpointsSpacing	Spacing	{'10'}
BreakpointsNumPoints	Number of points	{'11'}
BreakpointsData	Value	{'[10:10:110]'}
BreakpointsDataSource	Source	{'Dialog'} 'Input port'
IndexSearchMethod	Index search method	'Evenly spaced points' 'Linear search' {'Binary search'}
BeginIndexSearchUsing PreviousIndexResult	Begin index search using previous index result	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
OutputOnlyTheIndex	Output only the index	{'off'} 'on'
ExtrapMethod	Extrapolation method	'Clip' {'Linear'}
UseLastBreakpoint	Use last breakpoint for input at or above upper limit	{'off'} 'on'
DiagnosticForOutOfRange Input	Diagnostic for out-of-range input	{'None'} 'Warning' 'Error'
RemoveProtectionInput	Remove protection against out-of-range input in generated code	{'off'} 'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
BreakpointDataTypeStr	Breakpoint > Data Type	{'Inherit: Same as input'} 'Inherit: Inherit from Breakpoint data' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
BreakpointMin	Breakpoint > Minimum	{'[]'}
BreakpointMax	Breakpoint > Maximum	{'[]'}
IndexDataTypeStr	Index > Data Type	'int8' 'uint8' 'int16' 'uint16' 'int32' {'uint32'} 'fixdt(1,16)'
FractionDataTypeStr	Fraction > Data Type	{'Inherit: Inherit via internal rule'} 'double' 'single' 'fixdt(1,16,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
ProcessOutOfRangeInput	Deprecated in R2011a	
Sine (Sine) (masked subsystem)		
Formula	Output formula	{'sin(2*pi*u)'} 'cos(2*pi*u)' 'exp(j*2*pi*u)' 'sin(2*pi*u) and cos(2*pi*u)'
NumDataPoints	Number of data points for lookup table	{'(2^5)+1'}
OutputWordLength	Output word length	{'16'}
InternalRulePriority	Internal rule priority for lookup table	{'Speed'} 'Precision'

Math Operations Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Abs (Abs)		
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via internal rule' 'Inherit: Inherit via back propagation' {'Inherit: Same as input'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
Add (Sum)		
IconShape	Icon shape	{'rectangular'} 'round'
Inputs	List of signs	{'++'}
CollapseMode	Sum over	{'All dimensions'} 'Specified dimension'
CollapseDim	Dimension	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have the same data type	{'off'} 'on'
AccumDataTypeStr	Accumulator data type	{'Inherit: Inherit via internal rule'} 'Inherit: Same as first input' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} {'Inherit: Inherit via back propagation'} {'Inherit: Same as first input'} {'Inherit: Same as accumulator'} {'double'} {'single'} {'int8'} {'uint8'} {'int16'} {'uint16'} {'int32'} {'uint32'} {'int64'} {'uint64'} {'fixdt(1,16,0)'} {'fixdt(1,16,2^0,0)'}
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} {'on'}
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} {'on'}
Algebraic Constraint (Algebraic Constraint)		
Constraint	Constraint on input signal	{'f(z) = 0'} 'f(z) = z'
Solver	Algebraic Loop Solver	{'auto'} 'Trust Region' 'Line Search'
Tolerance	Solver Tolerance	{'auto'}
InitialGuess	Initial guess	{'0'}
Assignment (Assignment)		
NumberOfDimensions	Number of output dimensions	{'1'}
IndexMode	Index mode	'Zero-based' {'One-based'}
OutputInitialize	Initialize output (Y)	{'Initialize using input port <Y0>'} 'Specify size for each dimension in table'
IndexOptionArray	Index Option	'Assign all' {'Index vector (dialog)'} 'Index vector (port)' 'Starting index (dialog)' 'Starting index (port)'
IndexParamArray	Index	cell array
OutputSizeArray	Output Size	cell array

Block (Type)/Parameter	Dialog Box Prompt	Values
DiagnosticForDimensions	Action if any output element is not assigned	'Error' 'Warning' {'None'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
IndexOptions	See the IndexOptionArray parameter for more information.	
Indices	See the IndexParamArray parameter for more information.	
OutputSizes	See the OutputSizeArray parameter for more information.	
Bias (Bias)		
Bias	Bias	{'0.0'}
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
Complex to Magnitude-Angle (ComplexToMagnitudeAngle)		
Output	Output	'Magnitude' 'Angle' {'Magnitude and angle'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Complex to Real-Imag (ComplexToRealImag)		
Output	Output	'Real' 'Imag' {'Real and imag'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Divide (Product)		
Inputs	Number of inputs	{'*/'}
Multiplication	Multiplication	{'Element-wise(.*)' } 'Matrix(*)'
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have same data type	{'off'} 'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'Inherit: Same as first input' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
Dot Product (DotProduct)		
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have same data type	'off' {'on'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'Inherit: Same as first input' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutputDataTypeScaling Mode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
Find (Find)		
IndexOutputFormat	Index output format	{'Linear indices'} 'Subscripts'
NumberOfInputDimensions	Number of input dimensions	integer — {'1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
IndexMode	Index mode	{'Zero-based'} 'One-based'
ShowOutputForNonzero InputValues	Show output port for nonzero input values	{'off'} 'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16)'
Gain (Gain)		
Gain	Gain	{'1'}
Multiplication	Multiplication	{'Element-wise(K.*u)'} 'Matrix(K*u)' 'Matrix(u*K)' 'Matrix(K*u) (u vector)'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'Inherit: Same as input' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
ParamMin	Parameter minimum	{'[]'}
ParamMax	Parameter maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
ParamDataTypeStr	Parameter data type	{'Inherit: Inherit via internal rule'} 'Inherit: Same as input' 'Inherit: Inherit from 'Gain'' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
Magnitude-Angle to Complex (MagnitudeAngleToComplex)		
Input	Input	'Magnitude' 'Angle' {'Magnitude and angle'}
ConstantPart	Magnitude or Angle	{'0'}
ApproximationMethod	Approximation method	{'None'} 'CORDIC'
NumberOfIterations	Number of iterations	{'11'}
ScaleReciprocalGainFactor	Scale output by reciprocal of gain factor	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Math Function (Math)		
Operator	Function	{'exp'} 'log' '10^u' 'log10' 'magnitude^2' 'square' 'pow' 'conj' 'reciprocal' 'hypot' 'rem' 'mod' 'transpose' 'hermitian'
OutputSignalType	Output signal type	{'auto'} 'real' 'complex'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via internal rule' 'Inherit: Inherit via back propagation' {'Inherit: Same as first input'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	'off' {'on'}
Matrix Concatenate (Concatenate)		
NumInputs	Number of inputs	{'2'}
Mode	Mode	'Vector' {'Multidimensional array'}
ConcatenateDimension	Concatenate dimension	{'2'}
MinMax (MinMax)		
Function	Function	{'min'} 'max'
Inputs	Number of input ports	{'1'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have the same data type	{'off'} 'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}

OutMax	Output maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} {'Inherit: Inherit via back propagation'} {'Inherit: Same as first input'} {'Inherit: Same as accumulator'} {'double'} {'single'} {'int8'} {'uint8'} {'int16'} {'uint16'} {'int32'} {'uint32'} {'int64'} {'uint64'} {'fixdt(1,16,0)'} {'fixdt(1,16,2^0,0)'}
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} {'on'}
RndMeth	Integer rounding mode	{'Ceiling'} {'Convergent'} {'Floor'} {'Nearest'} {'Round'} {'Simplest'} {'Zero'}
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} {'on'}
Sum of Elements (Sum)		
IconShape	Icon shape	{'rectangular'} {'round'}
Inputs	List of signs	{'+'}
CollapseMode	Sum over	{'All dimensions'} {'Specified dimension'}
CollapseDim	Dimension	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have the same data type	{'off'} {'on'}
AccumDataTypeStr	Accumulator data type	{'Inherit: Inherit via internal rule'} {'Inherit: Same as first input'} {'double'} {'single'} {'int8'} {'uint8'} {'int16'} {'uint16'} {'int32'} {'uint32'} {'fixdt(1,16,0)'} {'fixdt(1,16,2^0,0)'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} {'Inherit: Inherit via back propagation'} {'Inherit: Same as first input'} {'Inherit: Same as accumulator'} {'double'} {'single'} {'int8'} {'uint8'} {'int16'} {'uint16'} {'int32'} {'uint32'} {'int64'} {'uint64'} {'fixdt(1,16,0)'} {'fixdt(1,16,2^0,0)'}
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} {'on'}
RndMeth	Integer rounding mode	{'Ceiling'} {'Convergent'} {'Floor'} {'Nearest'} {'Round'} {'Simplest'} {'Zero'}
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} {'on'}
Trigonometric Function (Trigonometry)		
Operator	Function	{'sin'} {'cos'} {'tan'} {'asin'} {'acos'} {'atan'} {'atan2'} {'sinh'} {'cosh'} {'tanh'} {'asinh'} {'acosh'} {'atanh'} {'sincos'} {'cos + jsin'}
ApproximationMethod	Approximation method	{'None'} {'CORDIC'}
NumberOfIterations	Number of iterations	{'11'}
OutputSignalType	Output signal type	{'auto'} {'real'} {'complex'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Unary Minus (UnaryMinus)		
SampleTime	Sample time (-1 for inherited)	{'-1'}
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} {'on'}
Vector Concatenate (Concatenate)		
NumInputs	Number of inputs	{'2'}
Mode	Mode	{'Vector'} {'Multidimensional array'}
Weighted Sample Time Math (SampleTimeMath)		
TsampMathOp	Operation	{'+'} {'-'} {'*'} {'/'} {'Ts Only'} {'1/Ts Only'}

Block (Type)/Parameter	Dialog Box Prompt	Values
weightValue	Weight value	{'1.0'}
TsampMathImp	Implement using	{'Online Calculations'} 'Offline Scaling Adjustment'
OutDataTypeStr	Output data type	{'Inherit via internal rule'} 'Inherit via back propagation'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
OutputDataTypeScaling Mode	Deprecated in R2009b	
DoSatur	Deprecated in R2009b	

Model Verification Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Assertion (Assertion)		
Enabled	Enable assertion	'off' {'on'}
AssertionFailFcn	Simulation callback when assertion fails	{''}
StopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Check Dynamic Gap (Checks_DGap) (masked subsystem)		
enabled	Enable assertion	'off' {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
export	Output assertion signal	{'off'} 'on'
icon	Select icon type	{'graphic'} 'text'
Check Dynamic Range (Checks_DRange) (masked subsystem)		
enabled	Enable assertion	'off' {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
export	Output assertion signal	{'off'} 'on'
icon	Select icon type	{'graphic'} 'text'
Check Static Gap (Checks_SGap) (masked subsystem)		
max	Upper bound	{'100'}
max_included	Inclusive upper bound	'off' {'on'}
min	Lower bound	{'0'}
min_included	Inclusive lower bound	'off' {'on'}
enabled	Enable assertion	'off' {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
export	Output assertion signal	{'off'} 'on'
icon	Select icon type	{'graphic'} 'text'
Check Static Range (Checks_SRange) (masked subsystem)		
max	Upper bound	{'100'}
max_included	Inclusive upper bound	'off' {'on'}
min	Lower bound	{'0'}
min_included	Inclusive lower bound	'off' {'on'}

Block (Type)/Parameter	Dialog Box Prompt	Values
enabled	Enable assertion	'off' {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
export	Output assertion signal	{'off'} 'on'
icon	Select icon type	{'graphic'} 'text'
Check Discrete Gradient (Checks_Gradient) (masked subsystem)		
gradient	Maximum gradient	{'1'}
enabled	Enable assertion	'off' {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
export	Output assertion signal	{'off'} 'on'
icon	Select icon type	{'graphic'} 'text'
Check Dynamic Lower Bound (Checks_DMin) (masked subsystem)		
Enabled	Enable assertion	'off' {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
export	Output assertion signal	{'off'} 'on'
icon	Select icon type	{'graphic'} 'text'
Check Dynamic Upper Bound (Checks_DMax) (masked subsystem)		
enabled	Enable assertion	'off' {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
export	Output assertion signal	{'off'} 'on'
icon	Select icon type	{'graphic'} 'text'
Check Input Resolution (Checks_Resolution) (masked subsystem)		
resolution	Resolution	{'1'}
enabled	Enable assertion	'off' {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
export	Output assertion signal	{'off'} 'on'
Check Static Lower Bound (Checks_SMin) (masked subsystem)		
min	Lower bound	{'0'}
min_included	Inclusive boundary	'off' {'on'}

Block (Type)/Parameter	Dialog Box Prompt	Values
enabled	Enable assertion	'off' {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
export	Output assertion signal	{'off'} 'on'
icon	Select icon type	{'graphic'} 'text'
Check Static Upper Bound (Checks_SMax) (masked subsystem)		
max	Upper bound	{'0'}
max_included	Inclusive boundary	'off' {'on'}
enabled	Enable assertion	'off' {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
export	Output assertion signal	{'off'} 'on'
icon	Select icon type	{'graphic'} 'text'

Model-Wide Utilities Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Block Support Table (Block Support Table) (masked subsystem)		
DocBlock (DocBlock) (masked subsystem)		
ECoderFlag	Embedded Coder Flag	{''}
DocumentType	Document Type	{'Text'} 'RTF' 'HTML'
Model Info (CMBlock) (masked subsystem)		
InitialSaveTempField	InitialSaveTempField	{''}
InitialBlockCM	InitialBlockCM	{'None'}
BlockCM	BlockCM	{'None'}
Frame	Show block frame	'off' {'on'}
SaveTempField	SaveTempField	{''}
DisplayStringWithTags	DisplayStringWithTags	{'Model Info'}
MaskDisplayString	MaskDisplayString	{'Model Info'}
HorizontalTextAlignment	Horizontal text alignment	{'Center'}
LeftAlignmentValue	LeftAlignmentValue	{'0.5'}
SourceBlockDiagram	SourceBlockDiagram	{'untitled'}
TagMaxNumber	TagMaxNumber	{'20'}
CMTag1	CMTag1	{''}
CMTag2	CMTag2	{''}
CMTag3	CMTag3	{''}
CMTag4	CMTag4	{''}
CMTag5	CMTag5	{''}
CMTag6	CMTag6	{''}
CMTag7	CMTag7	{''}
CMTag8	CMTag8	{''}
CMTag9	CMTag9	{''}
CMTag10	CMTag10	{''}
CMTag11	CMTag11	{''}
CMTag12	CMTag12	{''}
CMTag13	CMTag13	{''}
CMTag14	CMTag14	{''}
CMTag15	CMTag15	{''}
CMTag16	CMTag16	{''}
CMTag17	CMTag17	{''}
CMTag18	CMTag18	{''}
CMTag19	CMTag19	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
CMTag20	CMTag20	{''}
Timed-Based Linearization (Timed Linearization) (masked subsystem)		
LinearizationTime	Linearization time	{'1'}
SampleTime	Sample time (of linearized model)	{'0'}
Trigger-Based Linearization (Triggered Linearization) (masked subsystem)		
TriggerType	Trigger type	{'rising'} {'falling'} {'either'} {'function-call'}
SampleTime	Sample time (of linearized model)	{'0'}

Ports & Subsystems Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Action Port (ActionPort)		
InitializeStates	States when execution is resumed	{'held'} 'reset'
PropagateVarSize	Propagate sizes of variable-size signals	{'Only when execution is resumed'} 'During execution'
Atomic Subsystem (SubSystem)		
ShowPortLabels	Show port labels Note The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' {'FromPortIcon'} 'FromPortBlockName' 'SignalName' 'off' 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} 'ReadOnly' 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'} 'ExplicitOnly' 'None'
TreatAsAtomicUnit	Treat as atomic unit	'off' {'on'}
TreatAsGroupedWhenPropagatingVariantConditions	Treat as grouped when propagating variant conditions	'off' {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} 'on'
CheckFcnCallInpInsideContextMsg	Warn if function-call inputs are context-specific	{'off'} 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Function packaging	{'Auto'} 'Inline' 'Nonreusable function' 'Reusable function'
RTWFcnNameOpts	Function name options	{'Auto'} 'Use subsystem name' 'User specified'
RTWFcnName	Function name	{''}
RTWFileNameOpts	File name options	{'Auto'} 'Use subsystem name' 'Use function name' 'User specified'
RTWFileName	File name (no extension)	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
FunctionInterfaceSpec	Function interface This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'void_void'} 'Allow arguments (Optimized)' 'Allow arguments (Match graphical interface)'
FunctionWithSeparateData	"Function with separate data" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'off'} 'on'
RTWMemSecFuncInitTerm	"Memory section for initialize/terminate functions" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'} 'Default' list of memory sections from model's package
RTWMemSecFuncExecute	"Memory section for execution functions" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'} 'Default' list of memory sections from model's package
RTWMemSecDataConstants	"Memory section for constants" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'} 'Default' list of memory sections from model's package
RTWMemSecDataInternal	"Memory section for internal data" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'} 'Default' list of memory sections from model's package
RTWMemSecDataParameters	"Memory section for parameters" on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'} 'Default' list of memory sections from model's package
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by Data type override on the Fixed-Point Tool.	{'UseLocalSettings'} 'ScaledDouble' 'Double' 'Single' 'Off'

Block (Type)/Parameter	Dialog Box Prompt	Values
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by Fixed-point instrumentation mode on the Fixed-Point Tool.	{'UseLocalSettings'} 'MinMaxAndOverflow' 'OverflowOnly' 'ForceOff'
SimViewingDevice	No dialog box prompt If set to 'on', designates the block as a Signal Viewing Subsystem — an atomic subsystem that encapsulates processing and viewing of signals received from the target system in External mode. For more information, see “Signal Viewing Subsystems” (Simulink Coder).	{'off'} 'on'
IsSubsystemVirtual		boolean — {'off'} 'on' Read-only
Code Reuse Subsystem (SubSystem)		
ShowPortLabels	Show port labels Note The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' {'FromPortIcon'} 'FromPortBlockName' 'SignalName' 'off' 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} 'ReadOnly' 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'} 'ExplicitOnly' 'None'
TreatAsAtomicUnit	Treat as atomic unit	'off' {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} 'on'
CheckFcnCallInpInsideContextMsg	Warn if function-call inputs are context-specific	{'off'} 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWSystemCode	Function packaging	'Auto' 'Inline' 'Nonreusable function' {'Reusable function'}
RTWFcnNameOpts	Function name options	'Auto' {'Use subsystem name'} 'User specified'
RTWFcnName	Function name	{''}
RTWFileNameOpts	File name options	'Auto' {'Use subsystem name'} 'Use function name' 'User specified'
RTWFileName	File name (no extension)	{''}
RTWMemSecFuncInitTerm	<p>“Memory section for initialize/terminate functions” on page 1-0</p> <p>This parameter requires a license for Embedded Coder software and an ERT-based system target file.</p>	{'Inherit from model'} 'Default' list of memory sections from model's package
RTWMemSecFuncExecute	<p>“Memory section for execution functions” on page 1-0</p> <p>This parameter requires a license for Embedded Coder software and an ERT-based system target file.</p>	{'Inherit from model'} 'Default' list of memory sections from model's package
RTWMemSecDataConstants	<p>“Memory section for constants” on page 1-0</p> <p>This parameter requires a license for Embedded Coder software and an ERT-based system target file.</p>	{'Inherit from model'} 'Default' list of memory sections from model's package
RTWMemSecDataInternal	<p>“Memory section for internal data” on page 1-0</p> <p>This parameter requires a license for Embedded Coder software and an ERT-based system target file.</p>	{'Inherit from model'} 'Default' list of memory sections from model's package
RTWMemSecDataParameters	<p>“Memory section for parameters” on page 1-0</p> <p>This parameter requires a license for Embedded Coder software and an ERT-based system target file.</p>	{'Inherit from model'} 'Default' list of memory sections from model's package
DataTypeOverride	<p>No dialog box prompt</p> <p>Specifies data type used to override fixed-point data types. Set by Data type override on the Fixed-Point Tool.</p>	{'UseLocalSettings'} 'ScaledDouble' 'Double' 'Single' 'Off'

Block (Type)/Parameter	Dialog Box Prompt	Values
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by Fixed-point instrumentation mode on the Fixed-Point Tool.	{'UseLocalSettings'} 'MinMaxAndOverflow' 'OverflowOnly' 'ForceOff'
IsSubsystemVirtual		boolean — {'off'} 'on' Read-only
Configurable Subsystem (SubSystem)		
ShowPortLabels	Show port labels Note The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' {'FromPortIcon'} 'FromPortBlockName' 'SignalName' 'off' 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{'self'}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} 'ReadOnly' 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'} 'ExplicitOnly' 'None'
TreatAsAtomicUnit	Treat as atomic unit	{'off'} 'on'
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} 'on'
CheckFcnCallInpInsideContextMsg	Warn if function-call inputs are context-specific	{'off'} 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Function packaging	{'Auto'} 'Inline' 'Nonreusable function' 'Reusable function'
RTWFcnNameOpts	Function name options	{'Auto'} 'Use subsystem name' 'User specified'
RTWFcnName	Function name	{''}
RTWFileNameOpts	File name options	{'Auto'} 'Use subsystem name' 'Use function name' 'User specified'
RTWFileName	File name (no extension)	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by Data type override on the Fixed-Point Tool.	{'UseLocalSettings'} 'ScaledDouble' 'Double' 'Single' 'Off'
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by Fixed-point instrumentation mode on the Fixed-Point Tool.	{'UseLocalSettings'} 'MinMaxAndOverflow' 'OverflowOnly' 'ForceOff'
SimViewingDevice	No dialog box prompt If set to 'on', designates the block as a Signal Viewing Subsystem — an atomic subsystem that encapsulates processing and viewing of signals received from the target system in External mode. For more information, see “Signal Viewing Subsystems” (Simulink Coder).	{'off'} 'on'

RTWSystemCode	Function packaging	{'Auto'} 'Inline' 'Nonreusable function' 'Reusable function'
RTWFcnNameOpts	Function name options	{'Auto'} 'Use subsystem name' 'User specified'
RTWFcnName	Function name	{' '}

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWFileNameOpts	File name options	{'Auto'} 'Use subsystem name' 'Use function name' 'User specified'
RTWFileName	File name (no extension)	{''}
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by Data type override on the Fixed-Point Tool.	{'UseLocalSettings'} 'ScaledDouble' 'Double' 'Single' 'Off'
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by Fixed-point instrumentation mode on the Fixed-Point Tool.	{'UseLocalSettings'} 'MinMaxAndOverflow' 'OverflowOnly' 'Off'
IsSubsystemVirtual		boolean — {'off'} 'on' Read-only
In1 (Inport)		
Port	Port number	{'1'}
IconDisplay	Icon display	'Signal name' {'Port number'} 'Port number and signal name'
LatchByDelayingOutsideSignal	Latch input by delaying outside signal	{'off'} 'on'
LatchInputForFeedbackSignals	Latch input for feedback signals of function-call subsystem outputs	{'off'} 'on'
Interpolate	Interpolate data	'off' {'on'}
UseBusObject	Specify properties via bus object	{'off'} 'on'
BusObject	Bus object for specifying bus properties	{'BusObject'}
BusOutputAsStruct	Output as nonvirtual bus	{'off'} 'on'
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Data type	{'Inherit: auto'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
Unit	Specify physical unit of the input signal to the block.	{'inherit'} '<Enter unit>'
UnitNoProp	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	'<Enter unit>'
SignalType	Signal type	{'auto'} 'real' 'complex'
Model (ModelReference)		
ModelNameDialog	The name of the referenced model exactly as you typed it in, with any surrounding white space removed. When you set <code>ModelNameDialog</code> programmatically or interactively, Simulink automatically sets the values of <code>ModelName</code> and <code>ModelFile</code> based on the value of <code>ModelNameDialog</code> .	{'<Enter Model Name>'}
ModelName	The value of <code>ModelNameDialog</code> stripped of any file name extension that you provided. For backward compatibility, setting <code>ModelName</code> programmatically actually sets <code>ModelNameDialog</code> , which then sets <code>ModelName</code> as described. You cannot use <code>get_param</code> to obtain the <code>ModelName</code> of a protected model, because the name without a suffix would be ambiguous. Use <code>get_param</code> on <code>ModelFile</code> instead. You can test <code>ProtectedModel</code> to determine programmatically whether a referenced model is protected.	character vector — Set automatically when <code>ModelNameDialog</code> is set.

Block (Type)/Parameter	Dialog Box Prompt	Values
ModelFile	The value of ModelNameDialog with a file name extension. The suffix of the first match Simulink finds becomes the suffix of ModelFile. Setting ModelFile programmatically actually sets ModelNameDialog, which then sets ModelFile as described.	character vector — Set automatically when ModelNameDialog is set.
ProtectedModel	Read-only boolean indicating whether the model referenced by the block is protected (on) or unprotected (off).	boolean — 'off' 'on' — Set automatically when ModelNameDialog is set.
InstanceParameters	Structure array of instance-specific parameters on the Model block.	structure with fields: Name, Value, Path, and Argument.
ParameterArgumentNames	Names of instance-specific parameters that the referenced model defines. Corresponds to the Name column in the table on the Instance parameters tab.	{ '' }
ParameterArgumentValues	Values for model arguments. Corresponds to the Value column in the table on the Instance parameters tab.	structure with no fields
SimulationMode	Specifies whether to simulate the model by generating and executing code or by interpreting the model in Simulink software.	{ 'Normal' } 'Accelerator' 'Software-in-the-loop (SIL)' 'Processor-in-the-loop (PIL)'
DefaultDataLogging		{ 'off' } 'on'
Out1 (Output)		
Port	Port number	{ '1' }
IconDisplay	Icon display	'Signal name' { 'Port number' } 'Port number and signal name'
UseBusObject	Specify properties via bus object	{ 'off' } 'on'
BusObject	Bus object for validating input bus	{ 'BusObject' }
BusOutputAsStruct	Output as nonvirtual bus in parent model	{ 'off' } 'on'
PortDimensions	Port dimensions (-1 for inherited)	{ '-1' }
VarSizeSig	Variable-size signal	{ 'Inherit' } 'No' 'Yes'
SampleTime	Sample time (-1 for inherited)	{ '-1' }
OutMin	Minimum	{ '[]' }
OutMax	Maximum	{ '[]' }

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Data type	{'Inherit: auto'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>' 'Bus: <object name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
Unit	Specify physical unit of the input signal to the block. For a list of acceptable units, see Allowed Units.	{'inherit'} '<Enter unit>'
UnitNoProp	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	'<Enter unit>'
SignalObject	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “Design Data Interface by Configuring Inport and Outport Blocks” (Simulink Coder).	Simulink.Signal object Object of a class that is derived from Simulink.Signal
StorageClass	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “Design Data Interface by Configuring Inport and Outport Blocks” (Simulink Coder).	{'Auto'} 'Model default' 'ExportedGlobal' 'ImportedExtern' 'ImportedExternPointer' 'Custom'
SignalName	Signal name	character vector
SignalType	Signal type	{'auto'} 'real' 'complex'
OutputWhenDisabled	Output when disabled	{'held'} 'reset'
InitialOutput	Initial output	{'[]'}
MustResolveToSignalObject	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “For Signals”.	{'off'} 'on'
Subsystem (SubSystem)		

Block (Type)/Parameter	Dialog Box Prompt	Values
ShowPortLabels	Show port labels Note The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' {'FromPortIcon'} 'FromPortBlockName' 'SignalName' 'off' 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} 'ReadOnly' 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'} 'ExplicitOnly' 'None'
TreatAsAtomicUnit	Treat as atomic unit	{'off'} 'on'
TreatAsGroupedWhenPropagatingVariantConditions	Treat as grouped when propagating variant conditions	'off' {'on'}
VariantControl	Variant control	{'Variant'} '(default)'
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} 'on'
CheckFcnCallInpInsideContextMsg	Warn if function-call inputs are context-specific	{'off'} 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Code generation function packaging	{'Auto'} 'Inline' 'Nonreusable function' 'Reusable function'
RTWFcnNameOpts	Code generation function name options	{'Auto'} 'Use subsystem name' 'User specified'
RTWFcnName	Code generation function name	{''}
RTWFileNameOpts	Code generation file name options	{'Auto'} 'Use subsystem name' 'Use function name' 'User specified'
RTWFileName	Code generation file name (no extension)	{''}
DataTypeOverride	Specifies data type used to override fixed-point data types. Set by Data type override on the Fixed-Point Tool.	{'UseLocalSettings'} 'ScaledDouble' 'Double' 'Single' 'Off'

Block (Type)/Parameter	Dialog Box Prompt	Values
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by Fixed-point instrumentation mode on the Fixed-Point Tool.	{'UseLocalSettings'} 'MinMaxAndOverflow' 'OverflowOnly' 'ForceOff'
IsSubsystemVirtual		boolean — {'on'} 'off' Read-only
Virtual	For internal use	
Switch Case (SwitchCase)		
CaseConditions	Case conditions (e.g., {1,[2,3]})	{' {1}'}
ShowDefaultCase	Show default case	'off' {'on'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{' -1'}
CaseShowDefault	Deprecated in R2009b	
Switch Case Action Subsystem (SubSystem)		
ShowPortLabels	Show port labels Note The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' {'FromPortIcon'} 'FromPortBlockName' 'SignalName' 'off' 'on'
BlockChoice	Block choice	{' '}
TemplateBlock	Template block	{' '}
MemberBlocks	Member blocks	{' '}
Permissions	Read/Write permissions	{'ReadWrite'} 'ReadOnly' 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{' '}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'} 'ExplicitOnly' 'None'
TreatAsAtomicUnit	Treat as atomic unit	'off' {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} 'on'
CheckFcnCallInpInsideContextMsg	Warn if function-call inputs are context-specific	{'off'} 'on'
SystemSampleTime	Sample time (-1 for inherited)	{' -1'}
RTWSystemCode	Code generation function packaging	{'Auto'} 'Inline' 'Nonreusable function' 'Reusable function'

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWFcnNameOpts	Code generation function name options	{'Auto'} 'Use subsystem name' 'User specified'
RTWFcnName	Code generation function name	{''}
RTWFileNameOpts	Code generation file name options	{'Auto'} 'Use subsystem name' 'Use function name' 'User specified'
RTWFileName	Code generation file name (no extension)	{''}
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by Data type override on the Fixed-Point Tool.	{'UseLocalSettings'} 'ScaledDouble' 'Double' 'Single' 'Off'
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by Fixed-point instrumentation mode on the Fixed-Point Tool.	{'UseLocalSettings'} 'MinMaxAndOverflow' 'OverflowOnly' 'ForceOff'
IsSubsystemVirtual		boolean — {'off'} 'on' Read-only
Trigger (TriggerPort)		
TriggerType	Trigger type	{'rising'} 'falling' 'either' 'function-call'
IsSimulinkFunction	Configure the Function-call subsystem to be a Simulink Function	{'off'} 'on'
StatesWhenEnabling	States when enabling	{'held'} 'reset' 'inherit'
PropagateVarSize	Propagate sizes of variable-size signals	{'During execution'} 'Only when enabling'
ShowOutputPort	Show output port	{'off'} 'on'
OutputDataType	Output data type	{'auto'} 'double' 'int8'
SampleTimeType	Sample time type	{'triggered'} 'periodic'
SampleTime	Sample time	{'1'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
TriggerSignalSampleTime	Trigger signal sample time	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Data type	{'Inherit: auto'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>'
Interpolate	Interpolate data	'off' {'on'}
Triggered Subsystem (SubSystem)		
ShowPortLabels	Show port labels Note The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' {'FromPortIcon'} 'FromPortBlockName' 'SignalName' 'off' 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} 'ReadOnly' 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'} 'ExplicitOnly' 'None'
TreatAsAtomicUnit	Treat as atomic unit	'off' {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} 'on'
CheckFcnCallInpInsideContextMsg	Warn if function-call inputs are context-specific	{'off'} 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Code generation function packaging	{'Auto'} 'Inline' 'Nonreusable function' 'Reusable function'
RTWFcnNameOpts	Code generation function name options	{'Auto'} 'Use subsystem name' 'User specified'
RTWFcnName	Code generation function name	{''}
RTWFileNameOpts	Code generation file name options	{'Auto'} 'Use subsystem name' 'Use function name' 'User specified'

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWFileName	Code generation file name (no extension)	{''}
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by Data type override on the Fixed-Point Tool.	{'UseLocalSettings'} 'ScaledDouble' 'Double' 'Single' 'Off'
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by Fixed-point instrumentation mode on the Fixed-Point Tool.	{'UseLocalSettings'} 'MinMaxAndOverflow' 'OverflowOnly' 'ForceOff'
IsSubsystemVirtual		boolean — {'off'} 'on' Read-only
Unit Conversion		
OutDataTypeStr	Output data type	{'Inherit via internal rule'} 'Inherit via back propagation'
Unit System Configuration		
AllowAllUnitSystems	Allow or restrict unit systems.	boolean — {'on'} 'off'
UnitSystems	Displays allowed unit system.	cell array of character vectors — {'SI', 'English', 'SI (extended)', 'CGS'}
While Iterator (WhileIterator)		
MaxIters	Maximum number of iterations (-1 for unlimited)	{'5'}
WhileBlockType	While loop type	{'while'} 'do-while'
ResetStates	States when starting	{'held'} 'reset'
ShowIterationPort	Show iteration number port	{'off'} 'on'
OutputDataType	Output data type	{'int32'} 'int16' 'int8' 'double'
While Iterator Subsystem (SubSystem)		
ShowPortLabels	Show port labels Note The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' {'FromPortIcon'} 'FromPortBlockName' 'SignalName' 'off' 'on'
BlockChoice	Block choice	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} 'ReadOnly' 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'} 'ExplicitOnly' 'None'
TreatAsAtomicUnit	Treat as atomic unit	'off' {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} 'on'
CheckFcnCallInpInsideContextMsg	Warn if function-call inputs are context-specific	{'off'} 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Code generation function packaging	{'Auto'} 'Inline' 'Nonreusable function' 'Reusable function'
RTWFcnNameOpts	Code generation function name options	{'Auto'} 'Use subsystem name' 'User specified'
RTWFcnName	Code generation function name	{''}
RTWFileNameOpts	Code generation file name options	{'Auto'} 'Use subsystem name' 'Use function name' 'User specified'
RTWFileName	Code generation file name (no extension)	{''}
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by Data type override on the Fixed-Point Tool.	{'UseLocalSettings'} 'ScaledDouble' 'Double' 'Single' 'Off'
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by Fixed-point instrumentation mode on the Fixed-Point Tool.	{'UseLocalSettings'} 'MinMaxAndOverflow' 'OverflowOnly' 'ForceOff'
IsSubsystemVirtual		boolean — {'off'} 'on' Read-only
Variant Subsystem (Subsystem)		
Variant	No dialog box prompt Check if the subsystem is a Variant Subsystem block.	boolean — {'off'} 'on' Read-only

Block (Type)/Parameter	Dialog Box Prompt	Values
VariantChoices	No dialog box prompt List of variant choices in a Variant Subsystem block.	{ ' ' } The value is an empty structure array if the block is not a Variant Subsystem block. Otherwise, the value is a structure array with fields: Name and BlockName. Read-only
VariantControl	Variant control for the choice block of a Variant Subsystem block.	{ ' ' } The value is an empty character vector if the block is not a variant choice. Otherwise, the value is the variant control for the choice block.
VariantControlMode	Specifies the mode used to determine the active variant choice.	{'expression'} 'label' 'sim codegen switching'
LabelModeActiveChoice	Specifies the variant control label of the active choice for the Variant Subsystem block when VariantControlMode is specified as label.	{ ' ' } The value is an empty character vector if the VariantControlMode for the Variant Subsystem block is not label. Otherwise, the value is the variant control label for the active choice.
TreatAsGroupedWhenPropagatingVariantConditions	No dialog box prompt Specifies if the subsystem is treated as a group when propagating variant conditions.	boolean — {'on'} 'off'
GeneratePreprocessorConditionals	No dialog box prompt Specifies if all the choices are to be analyzed and if preprocessor conditionals should be generated.	boolean — {'off'} 'on'
PropagateVariantConditions	Specifies if variant conditions on the ports inside the Variant Subsystem block should be propagated outside the block. Note Use the “Propagate conditions outside of variant subsystem” on page 1-0 parameter instead.	boolean — {'off'} 'on'
AllowZeroVariantControls	Specifies if the Variant Subsystem block is allowed to have no active choices.	boolean — {'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
Variant Activation Time	Specifies when the active choice of a Variant Subsystem block is set. The Variant activation time parameter is available only when you set the Variant control mode parameter to expression or sim codegen switching.	{'update diagram'} 'update diagram analyze all choices' 'code compile'

Signal Attributes Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Bus to Vector (BusToVector)		
Data Type Conversion (DataTypeConversion)		
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via back propagation'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
ConvertRealWorld	Input and output to have equal	{'Real World Value (RWV)' 'Stored Integer (SI)'} 'Stored Integer (SI)'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
Data Type Conversion Inherited (Conversion Inherited) (masked subsystem)		
ConvertRealWorld	Input and Output to have equal	{'Real World Value'} 'Stored Integer'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Data Type Duplicate (DataTypeDuplicate)		
NumInputPorts	Number of input ports	{'2'}
Data Type Propagation (Data Type Propagation) (masked subsystem)		
PropDataTypeMode	1. Propagated data type	'Specify via dialog' {'Inherit via propagation rule'}
PropDataType	1.1. Propagated data type (e.g., fixdt(1,16), fixdt('single'))	{'fixdt(1,16)'} 'fixdt('single')'

Block (Type)/Parameter	Dialog Box Prompt	Values
IfRefDouble	1.1. If any reference input is double, output is	{'double'} 'single'
IfRefSingle	1.2. If any reference input is single, output is	'double' {'single'}
IsSigned	1.3. Is-Signed	'IsSigned1' 'IsSigned2' {'IsSigned1 or IsSigned2'} 'TRUE' 'FALSE'
NumBitsBase	1.4.1. Number-of-Bits: Base	'NumBits1' 'NumBits2' {'max([NumBits1 NumBits2])'} 'min([NumBits1 NumBits2])' 'NumBits1+NumBits2'
NumBitsMult	1.4.2. Number-of-Bits: Multiplicative adjustment	{'1'}
NumBitsAdd	1.4.3. Number-of-Bits: Additive adjustment	{'0'}
NumBitsAllowFinal	1.4.4. Number-of-Bits: Allowable final values	{'1:128'}
PropScalingMode	2. Propagated scaling	'Specify via dialog' {'Inherit via propagation rule'} 'Obtain via best precision'
PropScaling	2.1. Propagated scaling: Slope or [Slope Bias] ex. 2 ⁻⁹	{'2 ⁻¹⁰ '}
ValuesUsedBestPrec	2.1. Values used to determine best precision scaling	{' [5 -7]'}
SlopeBase	2.1.1. Slope: Base	'Slope1' 'Slope2' 'max([Slope1 Slope2])' {'min([Slope1 Slope2])'} 'Slope1*Slope2' 'Slope1/Slope2' 'PosRange1' 'PosRange2' 'max([PosRange1 PosRange2])' 'min([PosRange1 PosRange2])' 'PosRange1*PosRange2' 'PosRange1/PosRange2'
SlopeMult	2.1.2. Slope: Multiplicative adjustment	{'1'}
SlopeAdd	2.1.3. Slope: Additive adjustment	{'0'}

Block (Type)/Parameter	Dialog Box Prompt	Values
BiasBase	2.2.1. Bias: Base	{'Bias1'} 'Bias2' 'max([Bias1 Bias2])' 'min([Bias1 Bias2])' 'Bias1*Bias2' 'Bias1/Bias2' 'Bias1+Bias2' 'Bias1-Bias2'
BiasMult	2.2.2. Bias: Multiplicative adjustment	{'1'}
BiasAdd	2.2.3. Bias: Additive adjustment	{'0'}
Data Type Scaling Strip (Scaling Strip) (masked subsystem)		
IC (InitialCondition)		
Value	Initial value	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Probe (Probe)		
ProbeWidth	Probe width	'off' {'on'}
ProbeSampleTime	Probe sample time	'off' {'on'}
ProbeComplexSignal	Detect complex signal	'off' {'on'}
ProbeSignalDimensions	Probe signal dimensions	'off' {'on'}
ProbeFramedSignal	Detect framed signal	'off' {'on'}
ProbeWidthDataType	Data type for width	{'double'} 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'Same as input'
ProbeSampleTimeDataType	Data type for sample time	{'double'} 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'Same as input'
ProbeComplexityDataType	Data type for signal complexity	{'double'} 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'boolean' 'Same as input'
ProbeDimensionsDataType	Data type for signal dimensions	{'double'} 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'Same as input'
ProbeFrameDataType	Data type for signal frames	{'double'} 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'boolean' 'Same as input'
Rate Transition (RateTransition)		

Block (Type)/Parameter	Dialog Box Prompt	Values
Integrity	Ensure data integrity during data transfer	'off' {'on'}
Deterministic	Ensure deterministic data transfer (maximum delay)	'off' {'on'}
InitialCondition	Initial conditions	{'0'}
OutPortSampleTimeOpt	Output port sample time options	{'Specify'} 'Inherit' 'Multiple of input port sample time'
OutPortSampleTimeMultiple	Sample time multiple (>0)	{'1'}
OutPortSampleTime	Output port sample time	{'-1'}
Signal Conversion (SignalConversion)		
ConversionOutput	Output	{'Signal copy'} 'Virtual bus' 'Nonvirtual bus'
OutDataTypeStr	Data type	{'Inherit: auto'} 'Bus: <object name>'
OverrideOpt	Exclude this block from 'Block reduction' optimization	{'off'} 'on'
Signal Specification (SignalSpecification)		
Dimensions	Dimensions (-1 for inherited)	{'-1'}
VarSizeSig	Variable-size signal	{'Inherit'} 'No' 'Yes'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>' 'Bus: <object name>'
BusOutputAsStruct	Require nonvirtual bus	{'off'} 'on'
Unit	Specify physical unit of the input signal to the block. For a list of acceptable units, see Allowed Units.	{'inherit'} '<Enter unit>'
UnitNoProp	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	'<Enter unit>'

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
SignalType	Signal type	{'auto'} 'real' 'complex'
Weighted Sample Time (SampleTimeMath)		
TsampMathOp	Operation	'+' '-' '*' '/' {'Ts Only'} '1/Ts Only'
weightValue	Weight value	{'1.0'}
TsampMathImp	Implement using	{'Online Calculations'} 'Offline Scaling Adjustment'
OutDataTypeStr	Output data type	{'Inherit via internal rule'} 'Inherit via back propagation'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
OutputDataTypeScaling Mode	Deprecated in R2009b	
DoSatur	Deprecated in R2009b	
Width (Width)		
OutputDataTypeScaling Mode	Output data type mode	{'Choose intrinsic data type'} 'Inherit via back propagation' 'All ports same datatype'
DataType	Output data type	{'double'} 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32'

Signal Routing Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Bus Assignment (BusAssignment)		
AssignedSignals	Elements that are being assigned	{ '' }
InputSignals	Elements in the bus	matrix — { '{' } }
Bus Creator (BusCreator)		
InheritFromInputs	Use names from inputs instead of from bus object	{ 'on' } 'off' If set to 'on', overrides bus signal names from inputs. Otherwise, inherits bus signal names from a bus object.
Inputs	Number of inputs	{ '2' }
DisplayOption		'none' 'signals' { 'bar' }
NonVirtualBus	Output as nonvirtual bus	{ 'off' } 'on'
OutDataTypeStr	Data type	{ 'Inherit: auto' } 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>' 'Bus: <object name>'
Bus Selector (BusSelector)		
OutputSignals	Selected elements	character vector — in the form 'signal1,signal2'
OutputAsBus	Output as bus	{ 'off' } 'on'
InputSignals	Signals in bus	matrix — { '{' } }
Data Store Memory (DataStoreMemory)		
DataStoreName	Data store name	{ 'A' }
ReadBeforeWriteMsg	Detect read before write	'none' { 'warning' } 'error'
WriteAfterWriteMsg	Detect write after write	'none' { 'warning' } 'error'
WriteAfterReadMsg	Detect write after read	'none' { 'warning' } 'error'
InitialValue	Initial value	{ '0' }
StateMustResolveToSignalObject	Data store name must resolve to Simulink signal object	{ 'off' } 'on'
DataLogging	Log Signal Data	'off' { 'on' }
DataLoggingNameMode	Logging Name	{ 'SignalName' } 'Custom'
DataLoggingName	Logging Name	{ '' }
DataLoggingLimitDataPoints	Limit data points to last	'off' { 'on' }
DataLoggingMaxPoints	Limit data points to last	non-zero integer {5000}

Block (Type)/Parameter	Dialog Box Prompt	Values
DataLoggingDecimateData	Decimation	'off' {'on'}
DataLoggingLimitDataPoints	Decimation	non-zero integer {2}
StateStorageClass	Storage class	{'Auto'} 'Model default' 'ExportedGlobal' 'ImportedExtern' 'ImportedExternPointer' 'Custom'
StateSignalObject	Signal object class Storage class	Simulink.Signal object Object of a class that is derived from Simulink.Signal
RTWStateStorageTypeQualifier	Code generation type qualifier	{''}
VectorParams1D	Interpret vector parameters as 1-D	'off' {'on'}
ShowAdditionalParam	Show additional parameters	{'off'} 'on'
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
SignalType	Signal type	{'auto'} 'real' 'complex'
Data Store Read (DataStoreRead)		
DataStoreElements	Corresponds to the parameters on the Element Selection tab of the block dialog box. See "Specification using the command line".	
DataStoreName	Data store name	{'A'}
SampleTime	Sample time	{'0'}
Data Store Write (DataStoreWrite)		
DataStoreElements	Corresponds to the parameters on the Element Assignment tab of the block dialog box. See "Specification using the command line".	

Block (Type)/Parameter	Dialog Box Prompt	Values
DataStoreName	Data store name	{'A'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Demux (Demux)		
Outputs	Number of outputs	{'2'}
DisplayOption	Display option	'none' {'bar'}
Environment Controller (Environment Controller) (masked subsystem)		
From (From)		
GotoTag	Goto tag	{'A'}
IconDisplay	Icon display	'Signal name' {'Tag'} 'Tag and signal name'
Goto (Goto)		
GotoTag	Goto tag	{'A'}
IconDisplay	Icon display	'Signal name' {'Tag'} 'Tag and signal name'
TagVisibility	Tag visibility	{'local'} 'scoped' 'global'
Goto Tag Visibility (GotoTagVisibility)		
GotoTag	Goto tag	{'A'}
Index Vector (MultiPortSwitch)		
DataPortOrder	Data port order	{'Zero-based contiguous'} 'One-based contiguous' 'Specify indices'
Inputs	Number of data ports	{'1'}
zeroidx	Deprecated in R2010a	
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all data port inputs to have the same data type	{'off'} 'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} 'on'
AllowDiffInputSizes	Allow different data input sizes (Results in variable-size output signal)	{'off'} 'on'
Manual Switch (Manual Switch) (masked subsystem)		
varsize	Allow different input sizes (Results in variable-size output signal)	{'off'} 'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
Merge (Merge)		
Inputs	Number of inputs	{'2'}
InitialOutput	Initial output	{'[]'}
AllowUnequalInputPortWidths	Allow unequal port widths	{'off'} 'on'
InputPortOffsets	Input port offsets	{'[]'}
Multiport Switch (MultiPortSwitch)		
DataPortOrder	Data port order	'Zero-based contiguous' {'One-based contiguous'} 'Specify indices'
Inputs	Number of data ports	{'3'}
zeroidx	Deprecated in R2010a	
DataPortIndices	Data port indices	{'1,2,3'}
DataPortForDefault	Data port for default case	{'Last data port'} 'Additional data port'
DiagnosticForDefault	Diagnostic for default case	'None' 'Warning' {'Error'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all data port inputs to have the same data type	{'off'} 'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
AllowDiffInputSizes	Allow different data input sizes (Results in variable-size output signal)	{'off'} 'on'
Mux (Mux)		
Inputs	Number of inputs	{'2'}
DisplayOption	Display option	'none' 'signals' {'bar'}
UseBusObject	For internal use	
BusObject	For internal use	
NonVirtualBus	For internal use	
Selector (Selector)		
NumberOfDimensions	Number of input dimensions	{'1'}
IndexMode	Index mode	'Zero-based' {'One-based'}
IndexOptionArray	Index Option	'Select all' {'Index vector (dialog)'} 'Index vector (port)' 'Starting index (dialog)' 'Starting index (port)'
IndexParamArray	Index	cell array
OutputSizeArray	Output Size	cell array
InputPortWidth	Input port size	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
IndexOptions	See the IndexOptionArray parameter for more information.	
Indices	See the IndexParamArray parameter for more information.	
OutputSizes	See the IndexParamArray parameter for more information.	
Switch (Switch)		
Criteria	Criteria for passing first input	{'u2 >= Threshold'} 'u2 > Threshold' 'u2 ~= 0'
Threshold	Threshold	{'0'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
InputSameDT	Require all data port inputs to have the same data type	{'off'} 'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
AllowDiffInputSizes	Allow different input sizes (Results in variable-size output signal)	{'off'} 'on'
Variant Source (VariantSource)		
VariantControls	Variant control	{'Variant'} '(default)'
LabelModeActiveChoice	Label mode active choice	{''}
AllowZeroVariantControls	Allow zero active variant controls	{'off'} 'on'
ShowConditionOnBlock	Show variant condition on block	{'off'} 'on'
VariantActivationTime	Variant activation time	'update diagram' 'update diagram analyze all choices' 'code compile'
CompiledActiveVariantControl		string – {''} The value is a empty string if no variant is active; or the name of the active variant. Compile the model before querying this property.
CompiledActiveVariantPort		string – {'-1'} The value is -1 if no variant is active; or the index of the active variant. Compile the model before querying this property.
Variant Sink (VariantSink)		

Block (Type)/Parameter	Dialog Box Prompt	Values
VariantControls	Variant control	{'Variant'} '(default)'
LabelModeActiveChoice	Label mode active choice	{''}
AllowZeroVariantControls	Allow zero active variant controls	{'off'} 'on'
ShowConditionOnBlock	Show variant condition on block	{'off'} 'on'
VariantActivationTime	Variant activation time	'update diagram' 'update diagram analyze all choices' 'code compile'
CompiledActiveVariantControl		string – {''} The value is a empty string if no variant is active; or the name of the active variant. Compile the model before querying this property.
CompiledActiveVariantPort		string – {'-1'} The value is -1 if no variant is active; or the index of the active variant. Compile the model before querying this property.
Vector Concatenate (Concatenate)		
NumInputs	Number of inputs	{'2'}
Mode	Mode	{'Vector'} 'Multidimensional array'

Sinks Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Display (Display)		
Numeric display format	Format	{'short'} 'long' 'short_e' 'long_e' 'bank' 'hex (Stored Integer)' 'binary (Stored Integer)' 'decimal (Stored Integer)' 'octal (Stored Integer)'
Decimation	Decimation	{'1'}
Floating	Floating display	{'off'} 'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
Floating Scope (Scope)		
Floating		'off' {'on'}
Location		vector — {'[376 294 700 533]'}
Open		{'off'} 'on'
NumInputPorts		Do not change this parameter with the command-line. To add inputs, use the signal selector button  .
TickLabels		'on' 'off' {'OneTimeTick'}
ZoomMode		{'on'} 'xonly' 'yonly'
AxesTitles		character vector
Grid		'off' {'on'} 'xonly' 'yonly'
TimeRange		{'auto'}
YMin		{'-5'}
YMax		{'5'}
SaveToWorkspace		{'off'} 'on'
SaveName		{'ScopeData'}
DataFormat		{'StructureWithTime'} 'Structure' 'Array'
LimitDataPoints		'off' {'on'}
MaxDataPoints		{'5000'}
Decimation		{'1'}
SampleInput		{'off'} 'on'
SampleTime		{'0'}
Out1 (Output)		

Block (Type)/Parameter	Dialog Box Prompt	Values
Port	Port number	{'1'}
IconDisplay	Icon display	'Signal name' {'Port number'} 'Port number and signal name'
BusOutputAsStruct	Output as nonvirtual bus in parent model	{'off'} 'on'
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
VarSizeSig	Variable-size signal	{'Inherit'} 'No' 'Yes'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>' 'Bus: <object name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
SignalObject	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “Design Data Interface by Configuring Inport and Outport Blocks” (Simulink Coder).	Simulink.Signal object Object of a class that is derived from Simulink.Signal
StorageClass	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “Design Data Interface by Configuring Inport and Outport Blocks” (Simulink Coder).	{'Auto'} 'Model default' 'ExportedGlobal' 'ImportedExtern' 'ImportedExternPointer' 'Custom'
SignalName	Signal name	character vector
SignalType	Signal type	{'auto'} 'real' 'complex'
OutputWhenDisabled	Output when disabled	{'held'} 'reset'
InitialOutput	Initial output	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
MustResolveToSignalObject	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “For Signals”.	{'off'} 'on'
Scope (Scope)		
Floating		{'off'} 'on'
Location		vector — {'[188 390 512 629]'} 629]'
Open		{'off'} 'on'
NumInputPorts		Do not change this parameter with the set_param command. Instead, use the TimeScopeConfiguration object or Number of Input Ports parameter in the Scope block.
TickLabels		'on' 'off' {'OneTimeTick'}
ZoomMode		{'on'} 'xonly' 'yonly'
AxesTitles		character vector
Grid		'off' {'on'} 'xonly' 'yonly'
TimeRange		{'auto'}
YMin		{'-5'}
YMax		{'5'}
SaveToWorkspace		{'off'} 'on'
SaveName		{'ScopeData1'}
DataFormat		{'StructureWithTime'} 'Structure' 'Array'
LimitDataPoints		'off' {'on'}
MaxDataPoints		{'5000'}
Decimation		{'1'}
SampleInput		{'off'} 'on'
SampleTime		{'0'}
Stop Simulation		
Terminator		
To File (ToFile)		
FileName	File name	{'untitled.mat'}
MatrixName	Variable name	{'ans'}
SaveFormat	Save format	{'Timeseries'} 'Array'
Decimation	Decimation	{'1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
SampleTime	Sample time (-1 for inherited)	{'-1'}
To Workspace (ToWorkspace)		
VariableName	Variable name	{'simout'}
MaxDataPoints	Limit data points to last	{'inf'}
Decimation	Decimation	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
SaveFormat	Save format	{'Timeseries'} 'Structure With Time' 'Structure' 'Array'
FixptAsFi	Log fixed-point data as a fi object	{'off'} 'on'

Sources Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Band-Limited White Noise (Band-Limited White Noise) (masked subsystem)		
Cov	Noise power	{' [0.1] '}
Ts	Sample time	{'0.1'}
seed	Seed	{' [23341] '}
VectorParams1D	Interpret vector parameters as 1-D	'off' {'on'}
Chirp Signal (chirp) (masked subsystem)		
f1	Initial frequency	{'0.1'}
T	Target time	{'100'}
f2	Frequency at target time	{'1'}
VectorParams1D	Interpret vectors parameters as 1-D	'off' {'on'}
Clock (Clock)		
DisplayTime	Display time	{'off'} 'on'
Decimation	Decimation	{'10'}
Constant (Constant)		
Value	Constant value	{'1'}
VectorParams1D	Interpret vector parameters as 1-D	'off' {'on'}
SampleTime	Sampling time	{'Sample based'} 'Frame based'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit from 'Constant value''} 'Inherit: Inherit via back propagation' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'boolean' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>'}
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
SampleTime	Sample time	{'inf'}
FramePeriod	Frame period	{'inf'}
Counter Free-Running (Counter Free-Running) (masked subsystem)		
NumBits	Number of Bits	{'16'}

Block (Type)/Parameter	Dialog Box Prompt	Values
tsamp	Sample time	{'-1'}
Counter Limited (Counter Limited) (masked subsystem)		
uplimit	Upper limit	{'7'}
tsamp	Sample time	{'-1'}
Digital Clock (DigitalClock)		
SampleTime	Sample time	{'1'}
Enumerated Constant (EnumeratedConstant)		
OutDataTypeStr	Output data type	{'Enum: SLDemoSign'}
Value	Value	{'SLDemoSign.Positive'} 'SLDemoSign.Zero' 'SLDemoSign.Negative'
SampleTime	Sample time	{'inf'}
From File (FromFile)		
FileName	File name	{'untitled.mat'}
ExtrapolationBeforeFirstDataPoint	Data extrapolation before first data point	{'Linear extrapolation'} 'Hold first value' 'Ground value'
InterpolationWithinTimeRange	Data interpolation within time range	{'Linear interpolation'} 'Zero order hold'
ExtrapolationAfterLastDataPoint	Data extrapolation after last data point	{'Linear extrapolation'} 'Hold last value' 'Ground value'
SampleTime	Sample time	{'0'}
From Workspace (FromWorkspace)		
VariableName	Data	{'simin'}
OutDataTypeStr	Output Data type	{'Inherit: auto'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>' 'Bus: <object name>'
SampleTime	Sample time	{'0'}
Interpolate	Interpolate data	'off' {'on'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
OutputAfterFinalValue	Form output after final data value by	{'Extrapolation'} 'Setting to zero' 'Holding final value' 'Cyclic repetition'

Block (Type)/Parameter	Dialog Box Prompt	Values
Ground		
In1 (Inport)		
Port	Port number	{'1'}
IconDisplay	Icon display	'Signal name' {'Port number'} 'Port number and signal name'
BusOutputAsStruct	Output as nonvirtual bus	{'off'} 'on'
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
VarSizeSig	Variable-size signal	{'Inherit'} 'No' 'Yes'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>' 'Bus: <object name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
Unit	Specify physical unit of the input signal to the block. For a list of acceptable units, see Allowed Units.	{'inherit'} '<Enter unit>'
UnitNoProp	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	'<Enter unit>'
SignalType	Signal type	{'auto'} 'real' 'complex'
LatchByDelayingOutsideSignal	Latch input by delaying outside signal	{'off'} 'on'
LatchInputForFeedbackSignals	Latch input for feedback signals of function-call subsystem outputs	{'off'} 'on'
OutputFunctionCall	Output a function-call trigger signal	{'off'} 'on'
Interpolate	Interpolate data	'off' {'on'}
Pulse Generator (DiscretePulseGenerator)		

Block (Type)/Parameter	Dialog Box Prompt	Values
PulseType	Pulse type	{'Time based'} 'Sample based'
TimeSource	Time (t)	{'Use simulation time'} 'Use external signal'
Amplitude	Amplitude	{'1'}
Period	Period	{'10'}
PulseWidth	Pulse width	{'5'}
PhaseDelay	Phase delay	{'0'}
SampleTime	Sample time	{'1'}
VectorParams1D	Interpret vector parameters as 1-D	'off' {'on'}
Ramp (Ramp) (masked subsystem)		
slope	Slope	{'1'}
start	Start time	{'0'}
InitialOutput	Initial output	{'0'}
VectorParams1D	Interpret vector parameters as 1-D	'off' {'on'}
Random Number (RandomNumber)		
Mean	Mean	{'0'}
Variance	Variance	{'1'}
Seed	Seed	{'0'}
SampleTime	Sample time	{'0.1'}
VectorParams1D	Interpret vector parameters as 1-D	'off' {'on'}
Repeating Sequence (Repeating table) (masked subsystem)		
rep_seq_t	Time values	{'[0 2]'}
rep_seq_y	Output values	{'[0 2]'}
Repeating Sequence Interpolated (Repeating Sequence Interpolated) (masked subsystem)		
OutValues	Vector of output values	{'[3 1 4 2 1].''}
TimeValues	Vector of time values	{'[0 0.1 0.5 0.6 1].''}
LookUpMeth	Lookup Method	{'Interpolation-Use End Values'} 'Use Input Nearest' 'Use Input Below' 'Use Input Above'
tsamp	Sample time	{'0.01'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	'Inherit: Inherit via back propagation' {'double'} 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutputDataTypeScaling Mode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
Repeating Sequence Stair (Repeating Sequence Stair) (masked subsystem)		
OutValues	Vector of output values	{'[3 1 4 2 1].''}
tsamp	Sample time	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via back propagation' {'double'} 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'boolean' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>'
OutputDataTypeScaling Mode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
ConRadixGroup	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
Signal Builder (Sigbuilder block) (masked subsystem)		
Signal Editor (SignalEditor)		
Filename	File name	{'untitled.mat'}
ActiveScenario	Active scenario	{'Scenario'}

Block (Type)/Parameter	Dialog Box Prompt	Values
ActiveSignal	Signals	{'Signal 1'}
IsBus	Output a bus signal	'on' {'off'}
OutputBusObjectStr	Select bus object	{'Bus: BusObject'}
SampleTime	Sample time	{'0'}
Interpolate	Interpolate data	{'off'} 'on'
ZeroCross	Enable zero-crossing detection	{'off'} 'on'
OutputAfterFinalValue	Form output after final data value by	{'Setting to zero'} 'Extrapolation' 'Holding final value'
Unit	Unit	{'inherit'}
PreserveSignalName	—	boolean — {'off'} 'on'
NumberOfScenarios	—	Read-only. Use get_param to get this value.
NumberOfSignals	—	Read-only. Use get_param to get this value.
Signal Generator (SignalGenerator)		
WaveForm	Wave form	{'sine'} 'square' 'sawtooth' 'random'
TimeSource	Time (t)	{'Use simulation time'} 'Use external signal'
Amplitude	Amplitude	{'1'}
Frequency	Frequency	{'1'}
Units	Units	'rad/sec' {'Hertz'}
VectorParams1D	Interpret vector parameters as 1-D	'off' {'on'}
Sine Wave (Sin)		
SineType	Sine type	{'Time based'} 'Sample based'
TimeSource	Time	{'Use simulation time'} 'Use external signal'
Amplitude	Amplitude	{'1'}
Bias	Bias	{'0'}
Frequency	Frequency	{'1'}
Phase	Phase	{'0'}
Samples	Samples per period	{'10'}
Offset	Number of offset samples	{'0'}
SampleTime	Sample time	{'0'}
VectorParams1D	Interpret vector parameters as 1-D	'off' {'on'}
Step (Step)		
Time	Step time	{'1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
Before	Initial value	{'0'}
After	Final value	{'1'}
SampleTime	Sample time	{'0'}
VectorParams1D	Interpret vector parameters as 1-D	'off' {'on'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
Uniform Random Number (UniformRandomNumber)		
Minimum	Minimum	{'-1'}
Maximum	Maximum	{'1'}
Seed	Seed	{'0'}
SampleTime	Sample time	{'0.1'}
VectorParams1D	Interpret vector parameters as 1-D	'off' {'on'}
Waveform Generator (WaveformGenerator)		
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via back propagation' {'Inherit: Inherit from table data'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'int64' 'uint64' 'boolean' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' 'Floor' {'Nearest'} 'Round' 'Simplest' 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} 'on'
SelectedSignal	Output signal	{'1'}
SampleTime	Sample time	{'0'}

String Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Compose String (Compose String)		
Format	Format	scalar {"%d %f"} "%d" "%i" "%o" "%x" "%X" "%f" "%e" "%E" "%g" "%G" "%s" optional operators and text
OutDataTypeStr	Output data type	{"stringtype(255)} "stringtype(N)" "string"
Scan String (Scan String)		
Format	Format	scalar {"%d %f"} "%d" "%i" "%o" "%x" "%X" "%f" "%e" "%E" "%g" "%G" "%s" optional operators and text
String Compare (String Compare)		
CaseSensitive	Case sensitivity for string compare	'off' {'on'}
CompareOption	Amount of characters to compare	{"Entire string"} "First N characters"
NumberOfCharacters	Number of characters to compare	{'1'} scalar
String Concatenate (String Concatenate)		
Inputs	Number of inputs	{"2"}
OutDataTypeStr	Output data type	{"stringtype(128)} "stringtype(N)" "string"
String Constant (String Constant)		
String	String	{"Hello!"} scalar
OutDataTypeStr	Output data type	{"stringtype(128)} "stringtype(N)" "string"
String to ASCII (String to ASCII)		
OutputVectorSize	Output vector size	{"31"} scalar
String to Double (String to Double)		
Format	Format	scalar {"%d %f"} "%d" "%i" "%o" "%x" "%X" "%f" "%e" "%E" "%g" "%G" "%s" optional operators and text
String to Enum (String to Enum)		

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	{"Enum: S1DemoSign"} <data type expression>
String to Single (String to Single)		
Format	Format	scalar {"%f"} "%d" "%i" "%o" "%x" "%X" "%f" "%e" "%E" "%g" "%G" "%s" optional operators and text
Substring (Substring)		
InheritMaximumLength	Inherit maximum length from input	'off' {'on'}
OutDataTypeStr	Output data type	{"stringtype(31)} "stringtype(N)" "string"
StringFromIdxToEnd	Output string from 'idx' to end	{'off'} 'on'

User-Defined Functions Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
MATLAB Function (Stateflow) (masked subsystem)		
MATLAB System (MATLABSystem)		
System	System object class name	{''}
Level-2 MATLAB S-Function (M-S-Function)		
FunctionName	S-function name	{'mlfile'}
Parameters	Arguments	{''}
Interpreted MATLAB Function (MATLABFcn)		
MATLABFcn	MATLAB function	{'sin'}
OutputDimensions	Output dimensions	{'-1'}
OutputSignalType	Output signal type	{'auto'} 'real' 'complex'
Output1D	Collapse 2-D results to 1-D	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
S-Function (S-Function)		
FunctionName	S-function name	{'system'}
Parameters	S-function parameters	{''}
SFunctionModules	S-function modules	{''}
S-Function Builder (S-Function Builder) (masked subsystem)		
FunctionName	S-function name	{'system'}
Parameters	S-function parameters	{''}
SFunctionModules	S-function modules	{''}

Additional Discrete Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Fixed-Point State-Space (Fixed-Point State-Space) (masked subsystem)		
A	State Matrix A	{'[2.6020 -2.2793 0.6708; 1 0 0; 0 1 0]}'
B	Input Matrix B	{'[1; 0; 0]}'
C	Output Matrix C	{'[0.0184 0.0024 0.0055]}'
D	Direct Feedthrough Matrix D	{'[0.0033]}'
InitialCondition	Initial condition for state	{'0.0'}
InternalDataType	Data type for internal calculations	{'fixdt('double')}'
StateEqScaling	Scaling for State Equation AX+BU	{'2^0'}
OutputEqScaling	Scaling for Output Equation CX+DU	{'2^0'}
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Transfer Fcn Direct Form II (Transfer Fcn Direct Form II) (masked subsystem)		
NumCoefVec	Numerator coefficients	{'[0.2 0.3 0.2]}'
DenCoefVec	Denominator coefficients excluding lead (which must be 1.0)	{'[-0.9 0.6]}'
vinit	Initial condition	{'0.0'}
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Transfer Fcn Direct Form II Time Varying (Transfer Fcn Direct Form II Time Varying) (masked subsystem)		
vinit	Initial condition	{'0.0'}
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Unit Delay Enabled (Unit Delay Enabled) (masked subsystem)		

Block (Type)/Parameter	Dialog Box Prompt	Values

Increment Real World (Real World Value Increment) (masked subsystem)		
Increment Stored Integer (Stored Integer Value Increment) (masked subsystem)		

Mask Parameters

About Mask Parameters

This section lists parameters that describe masked blocks. You can use these descriptive parameters with `get_param` and `set_param` to obtain and specify the properties of a block mask.

The descriptive mask parameters listed in this section apply to all masks, and provide access to all mask properties. Be careful not to confuse these descriptive mask parameters with the mask-specific parameters defined for an individual mask in the Mask Editor **Parameters** pane.

See “Masking Fundamentals” and “Mask Editor Overview” for information about block masks and the Mask Editor.

Mask Parameters

Parameter	Description/Prompt	Values
Mask	Turns mask on or off.	{ 'on' } 'off'
MaskCallbackString	Mask parameter callbacks that are executed when the respective parameter is changed on the dialog. Set by the Dialog callback field on the Parameters pane of the Mask Editor dialog box. For more information, see “Mask Callback Code”.	pipe-delimited character vector { ' ' }
MaskCallbacks	Cell array version of MaskCallbackString.	cell array { ' [] ' }
MaskDescription	Block description. Set by the Mask description field on the Documentation pane of the Mask Editor dialog box.	character vector { ' ' }
MaskDisplay	Drawing commands for the block icon. Set by the Icon Drawing commands field on the Icon & Ports pane of the Mask Editor dialog box.	character vector { ' ' }
MaskEditorHandle	For internal use only.	
MaskEnableString	Option that determines whether a parameter is greyed out in the dialog. Set by the Enable parameter check box on the Parameters pane of the Mask Editor dialog box.	pipe-delimited character vector { ' ' }
MaskEnables	Cell array version of MaskEnableString.	cell array of character vectors, each either 'on' or 'off' { ' [] ' }
MaskHelp	Block help. Set by the Mask help field on the Documentation pane of the Mask Editor dialog box.	character vector { ' ' }
MaskIconFrame	Set the visibility of the icon frame (Visible is on, Invisible is off). Set by the Block Frame option on the Icon & Ports pane of the Mask Editor dialog box.	{ 'on' } 'off'
MaskIconOpaque	Set the transparency of the icon. Set by the Icon Transparency option on the Icon & Ports pane of the Mask Editor dialog box.	{ 'opaque' } 'transparent' 'opaque-with-ports'

Parameter	Description/Prompt	Values
MaskIconRotate	Set the rotation of the icon (Rotates is on, Fixed is off). Set by the Icon Rotation option on the Icon & Ports pane of the Mask Editor dialog box.	'on' {'off'}
MaskIconUnits	Set the units for the drawing commands. Set by the Icon Units option on the Icon & Ports pane of the Mask Editor dialog box.	'pixel' {'autoscale'} 'normalized'
MaskInitialization	Initialization commands. Set by the Initialization commands field on the Initialization pane of the Mask Editor dialog box.	MATLAB command {' '}
MaskNames	Cell array of mask dialog parameter names. Set inside the Variable column in the Parameters pane of the Mask Editor dialog box.	matrix {' []'}
MaskPortRotate	Specify the port rotation policy for the masked block. Set in the Port Rotation area on the Icon & Ports pane of the Mask Editor dialog box. For more information, see “Format a Model”.	{'default'} 'physical'
MaskPrompts	List of dialog parameter prompts (see below). Set inside the Dialog parameters area on the Parameters pane of the Mask Editor dialog box.	cell array of character vectors {' []'}
MaskPromptString	List of dialog parameter prompts (see below). Set inside the Dialog parameters area on the Parameters pane of the Mask Editor dialog box.	character vector {' '}
MaskPropertyName	Pipe-delimited version of MaskNames.	character vector {' '}
MaskRunInitForIconRedraw	Specifies whether Simulink must run mask initialization before executing the mask icon commands.	{'auto'} 'on' 'off'
MaskSelfModifiable	Indicates that the block can modify itself. Set by the Allow library block to modify its contents check box on the Initialization pane of the Mask Editor dialog box.	'on' {'off'}

Parameter	Description/Prompt	Values
MaskStyles	Determines whether the dialog parameter is a check box, edit field, or pop-up list. Set by the Type column in the Parameters pane of the Mask Editor dialog box.	cell array {' [] '} edit, checkbox, popup, combobox, radiobutton, slider, dial, spinbox, unit, textarea, customtable, unidt, min, max.
MaskStyleString	Comma-separated version of MaskStyles.	character vector { ' ' }
MaskTabNameString	For internal use only.	
MaskTabNames	For internal use only.	
MaskToolTipsDisplay	Determines which mask dialog parameters to display in the tooltip for this masked block. Specify as a cell array of 'on' or 'off' values, each of which indicates whether to display the parameter named at the corresponding position in the cell array returned by MaskNames.	cell array of 'on' and 'off' {''}
MaskToolTipString	Comma-delimited version of MaskToolTipsDisplay.	character vector { ' ' }
MaskTunableValues	Allows the changing of mask dialog values during simulation. Set by the Tunable column in the Parameters pane of the Mask Editor dialog box.	cell array of character vectors { ' [] ' }
MaskTunableValueString	Comma-delimited character vector version of MaskTunableValues.	delimited character vector { ' ' }
MaskType	Mask type. Set by the Mask type field on the Documentation pane of the Mask Editor dialog box.	character vector { 'Stateflow' }
MaskValues	Dialog parameter values.	cell array { ' [] ' }
MaskValueString	Delimited character vector version of MaskValues.	delimited character vector { ' ' }
MaskVarAliases	Specify aliases for a block's mask parameters. The aliases must appear in the same order as the parameters appear in the block's MaskValues parameter.	cell array { ' [] ' }
MaskVarAliasString	For internal use only.	
MaskVariables	List of the dialog parameters' variables (see below). Set inside the Dialog parameters area on the Parameters pane of the Mask Editor dialog box.	character vector { ' ' }

Parameter	Description/Prompt	Values
MaskVisibilities	Specifies visibility of parameters. Set with the Show parameter check box in the Options for selected parameter area on the Parameters pane of the Mask Editor dialog box.	matrix {' []'}
MaskVisibilityString	Delimited character vector version of MaskVisibilities.	character vector {' '}
MaskWSVariables	List of the variables defined in the mask workspace (read only).	matrix {' []'}

See Control Masks Programmatically, for more information on setting the mask parameters from the MATLAB command line.

Tools and Apps

Bus Editor

Create, modify, and manage bus objects

Description

The **Bus Editor** lets you interactively create, modify, and manage `Simulink.Bus` and `Simulink.ConnectionBus` objects and the `Simulink.BusElement` or `Simulink.ConnectionElement` objects that they contain.

The **Sources** pane provides available sources, which are the MATLAB base workspace and open data dictionaries. The objects that you create are stored in the selected source. In the toolstrip, you can create or open a data dictionary. You can also import objects defined by a MAT file, function, or script into the base workspace.

An interactive table displays information about the objects, such as hierarchy and properties. You can select which columns appear in the table by using the **Columns** list in the toolstrip. Use the table to:

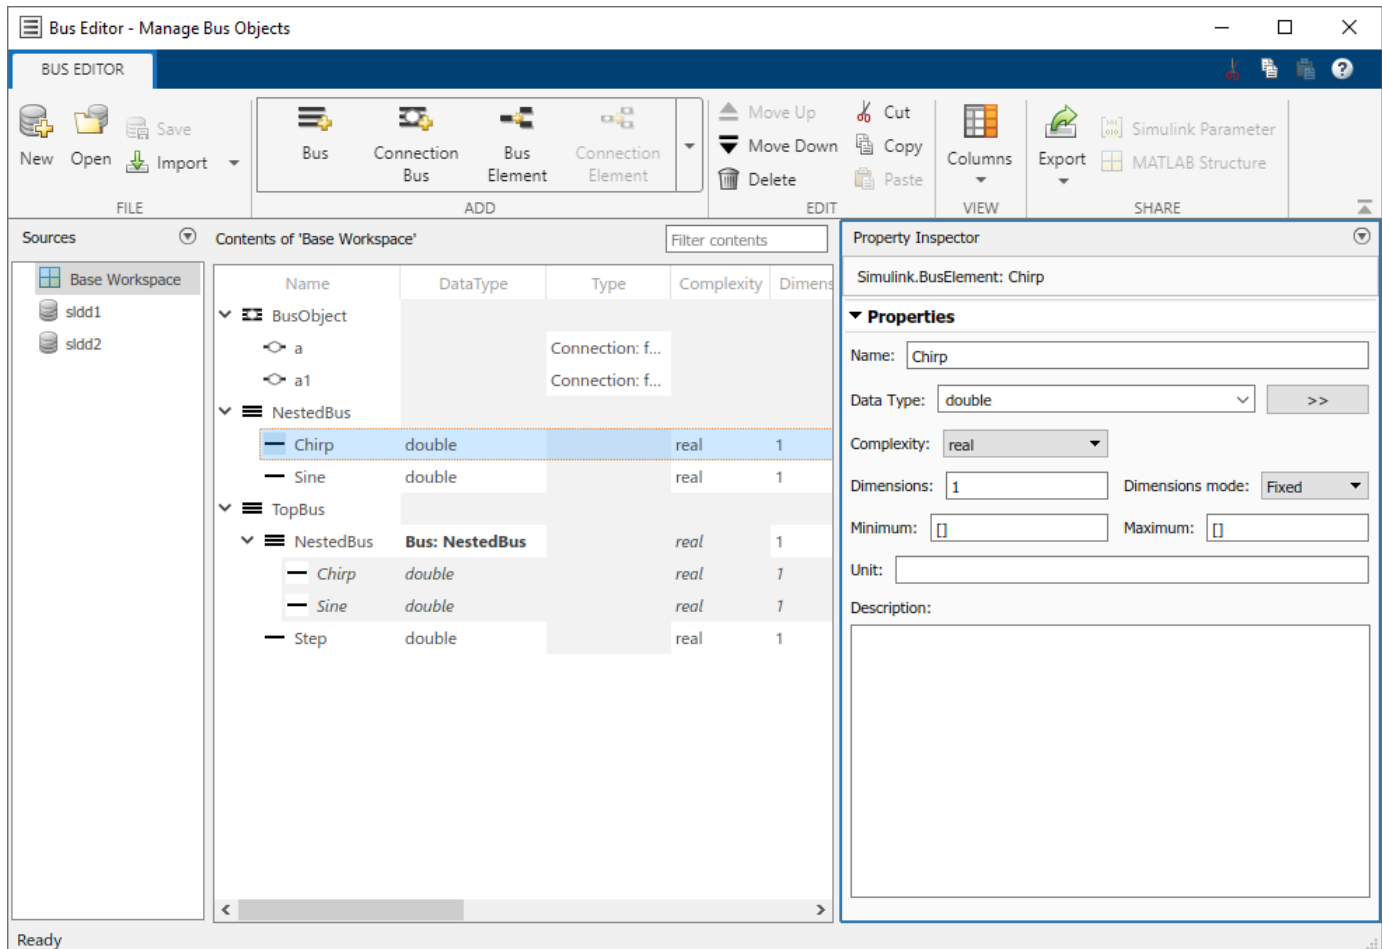

- Filter contents — Enter a universal filter or a column-specific filter.
- Change values — Double-click a value in the table and enter a new value. Edit the properties of a bus object and its elements at the top level, not where the bus object is specified as a data type.
- Reorder elements — Drag the elements to a new position or use the **Move Up** and **Move Down** buttons in the toolstrip.
- Cut, copy, and paste elements — Use keyboard shortcuts or the corresponding buttons in the toolstrip.
- Delete elements — Press the **Delete** key or click the **Delete** button in the toolstrip. When you delete a bus object, you also delete the element objects it contains. Update any blocks that specify the deleted object. To find where a bus object is used in a model, see “Finding Blocks That Use a Specific Variable”.

In the table, you can edit multiple selected objects of the same type at the same time.

The **Property Inspector** pane lets you focus on one object at a time and edit its properties. When you enter a value that is not supported, a diagnostic message appears in this pane.

Note The Bus Editor does not support undo or redo actions. Changes that create, reorder, or delete objects take effect immediately in the base workspace.

The **Bus Editor** can export object definitions to a MAT file (.mat) or function (.m). It can also create a MATLAB structure or `Simulink.Parameter` object from a `Simulink.Bus` object. You can find these actions in the **Share** section of the toolstrip.

Open the Bus Editor

- Simulink Toolstrip: On the **Modeling** tab, in the **Design** gallery, click **Bus Editor**.
- MATLAB Command Window: Enter `buseditor`.
- Model Explorer: In a bus object dialog box, click **Launch Bus Editor**.

Examples

Create Bus Objects Using Bus Editor

Suppose you want to define an interface for a model with a `Simulink.Bus` object. For this example, the interface receives signals named `sine`, `chirp`, `constant`, `pulse`, and `saw`. You want the interface to group all the signals. Within that group, you want the interface to group the sinusoidal and nonsinusoidal signals.

You can create the objects in the base workspace or a data dictionary. In the **Sources** pane, select the location to contain the new objects.

- To create a data dictionary, in the Bus Editor toolstrip, click **New**. In the dialog box, specify a name for the data dictionary. Then, click **Save**.
- To open a data dictionary, in the Bus Editor toolstrip, click **Open**. In the dialog box, specify the data dictionary that you want to open. Then, click **Open**.

Create three `Simulink.Bus` objects.

- 1 In the toolstrip, in the **Add** gallery, click **Bus** three times to create three `Bus` objects.
- 2 Name the objects `interface`, `sinusoidal`, and `nonsinusoidal`. Double-click each object name in the table and enter the new name or use the **Property Inspector** pane.

Add `Simulink.BusElement` objects to the `Bus` objects.

- 1 Select the object named `interface`, and add three `BusElement` objects to it. In the toolstrip, click **Bus Element** three times.
- 2 Name the elements `constant`, `sinusoidal_bus`, and `nonsinusoidal_bus`. Double-click each object name in the table and enter the new name or use the **Property Inspector** pane.
- 3 Similarly, select the `sinusoidal` bus object and add two elements to it named `sine` and `chirp`.
- 4 Select the `nonsinusoidal` bus object and add two elements to it named `pulse` and `saw`.

Any element in a bus can be another bus, which can in turn contain subordinate buses, to any depth. To mimic this bus hierarchy, a bus-element object can specify a bus object data type.

Nest the `Bus` objects named `sinusoidal` and `nonsinusoidal` in the `Bus` object named `interface`.

- 1 For the object named `sinusoidal_bus`, set **Data Type** to `Bus: sinusoidal`.
- 2 For the object named `nonsinusoidal_bus`, set **Data Type** to `Bus: nonsinusoidal`.

The object named `interface` now matches the desired hierarchy for the component interface. To specify the object at a component interface, you can specify it as the data type of In Bus Element, Inport, Out Bus Element, and Outport blocks.

Save Bus Objects Using Bus Editor

When you create or modify bus objects in the base workspace or a data dictionary, save the objects for future use. If blocks specify these objects, the objects are required for simulation.

The **Bus Editor** can save bus objects in a MAT file (`.mat`), MATLAB function (`.m`), or data dictionary (`.slidd`).

To save the objects that are in the base workspace:

- 1 In the **Sources** pane, select the base workspace.
- 2 In the toolstrip, click the **Export** button arrow. Then, select one of the options, which create a MAT file or MATLAB function.

For MATLAB functions, you have the option to save the objects in a compressed cell format or a more readable object format.

- 3 In the Export dialog box, specify the file name, then click **Save**.

Alternatively, cut or copy the objects from the base workspace. Then, paste them in a data dictionary.

To save the objects that are in a data dictionary:

- 1 In the **Sources** pane, select the modified data dictionary.
- 2 In the toolstrip, click **Save**. Alternatively, right-click the data dictionary and select **Save changes**.

Manage Bus Objects Using Bus Editor

You can use the **Bus Editor** to manage bus objects from multiple sources.

You can import bus objects from a function, script, or MAT file.

- 1 In the toolstrip, click the **Import** button arrow, then select one of the options.
- 2 In the Import into Base Workspace dialog box, select the file that defines the bus objects and click **Open**.

The import loads the complete contents of the file, not just the bus objects. The table displays the available bus objects in alphabetical order.

You can also open a data dictionary to manage its bus objects.

- 1 In the toolstrip, click **Open**.
- 2 In the Open dialog box, select the data dictionary that defines the bus objects and click **Open**.

Use filters to quickly find bus elements by name or property value. The filter can be a search term or regular expression. For information about regular expressions, see “Regular Expressions”.

To quickly find elements with a `double` data type, type `double` in either the **Filter contents** box or the **Filter by DataType** box that appears when you pause on the **DataType** column heading and click the button that appears. As you type, the table updates dynamically to show only the objects whose names or property values match the filter and their parents. The comparison is not case-sensitive.

Modify Bus Objects Using Bus Editor

You can use the **Bus Editor** to modify bus objects in the base workspace and data dictionaries.

To edit one or more objects of the same type in the Bus Editor:

- 1 Select the objects that you want to update.
 - To select multiple noncontiguous objects, hold **Ctrl** and select each element.
 - To select multiple contiguous objects, hold **Shift** and select the first and last element.
 - To select all objects, first select one object. Then, press **Ctrl+A**.
- 2 Double-click the property value that you want to change for all the selected elements that are the same type of object. Then, specify the new value.

When you commit the new value, the change applies to all the selected objects that are the same type of object.

You can also edit one object at a time in the **Property Inspector** pane.

To edit an element of a nested bus object, right-click the dimmed element and select **Go to** to bring you to the editable instance of the element.

To reorder elements, select and drag the elements to a new position or use the **Move Up** and **Move Down** buttons in the toolbar.

You can edit contents in the filtered view just like the unfiltered view. Elements that no longer match the filter disappear from the table. Conversely, if some activity outside the **Bus Editor** changes a filtered object so that it passes the current filter, the object immediately becomes visible.

Operations affect only the available objects. An object that a filter hides is unaffected by the operation. To act on all available objects, clear the filter.

Initialize Buses and Arrays of Buses Using Bus Editor

You can use the **Bus Editor** to create MATLAB structures for initialization.

Suppose you have a Simulink.Bus object named MyData that contains two elements named temperature and pressure.

- temperature — Signal with a data type of int16
- pressure — Nested array of buses with a data type of Bus: PressureBus and dimensions specified as [1 3]

The nested Bus object named PressureBus has two elements named s1 and s2.

Name	DataType	Dimensions
MyData		
temperature	int16	1
pressure	Bus: PressureBus	[1 3]
s1	double	1
s2	double	1
PressureBus		
s1	double	1
s2	double	1

Select the Bus object named MyData. Then, in the toolbar, click **MATLAB Structure**.

Specify a name and location for the new MATLAB structure.

The MATLAB structure specifies an initial condition of 0 for each element.

```
MyData_MATLABStruct = struct;
MyData_MATLABStruct.temperature = int16(0);
MyData_MATLABStruct.pressure = struct;
MyData_MATLABStruct.pressure(1).s1 = 0;
MyData_MATLABStruct.pressure(1).s2 = 0;
MyData_MATLABStruct.pressure(2).s1 = 0;
```

```
MyData_MATLABStruct.pressure(2).s2 = 0;
MyData_MATLABStruct.pressure(3).s1 = 0;
MyData_MATLABStruct.pressure(3).s2 = 0;
```

Optionally, change the initial conditions of the structure elements.

Use the MATLAB structure to specify the **Initial condition** parameter of a block such as a Unit Delay block.

To create a MATLAB structure for a top-level Bus object that defines an array of buses, use the `Simulink.Bus.createMATLABStruct` function.

Tips

- A bus object cannot directly or indirectly reference itself. If you define a circular structure, the Bus Editor keeps the original data type of the element that would have completed the circle.
- Display only the columns that are relevant to you in the Bus Editor. For example, if you do not use `Simulink.ConnectionBus` objects, in the Bus Editor toolstrip, click **Columns** and clear **Type**.
- When you have a model that creates a bus with a Bus Creator block, you can use the `Simulink.Bus.createObject` function to create the corresponding objects instead of creating each `Simulink.Bus` and `Simulink.BusElement` object individually.

Compatibility Considerations

Custom import and export functions are not supported

Starting in R2022a, the **Bus Editor** loads faster and has an updated interface for creating, modifying, and managing bus objects. However, the **Bus Editor** no longer supports custom import and export functions.

Remove the `cm.BusEditorCustomizer.importCallbackFcn` and `cm.BusEditorCustomizer.exportCallbackFcn` registration functions from the `sl_customization` function. To eliminate both customizations in one operation for a customization manager object named `cm`, use this command.

```
cm.BusEditorCustomizer.clear
```

For more information about customizations, see “Register Customizations with Simulink”.

MATLAB Function Block Editor

Create, edit, and debug MATLAB code in MATLAB Function blocks

Description

The **MATLAB Function Block Editor** allows you to view, edit, and create the MATLAB functions for a MATLAB Function block. When you update the MATLAB code, Simulink updates the MATLAB Function block with input and output ports that match the input and output arguments in the MATLAB function. The **MATLAB Function Block Editor** opens in the **Simulink Editor**.

Open the MATLAB Function Block Editor

- Double-click a MATLAB Function block.
- Select a MATLAB Function block and, in the **Function** tab, click **Open in Simulink**.

Examples

Open and Use the MATLAB Function Block Editor

Add a MATLAB Function to your model to open the **MATLAB Function Block Editor**.

- 1 In the **Simulation** tab, click **Library Browser**. Select **Simulink > User-Defined Functions**. Drag a MATLAB Function block to the Simulink canvas.
- 2 Double-click the block to open the **MATLAB Function Block Editor**. Replace the function body code with the following:

```
y = 2*u;
```

- 3 Return to the model by clicking the Up to Parent button . Add a Sine Wave block as the input signal and add a Scope block to capture the input and output of the MATLAB Function block.

- 4 Run the simulation and open the Scope block to see the effects of the code.

Redefine the Function Header

Rename the default function and adjust function arguments to automatically update the block inports, outports, and block icon.

- 1 Create a new MATLAB Function block and open the **MATLAB Function Block Editor**.
- 2 In the function header, change the text to:

```
function [x y] = test_function(u1, u2)
```
- 3 Return to the model window. The name on the block icon is now `test_function`, and the block has two input ports for **u1** and **u2**, and two output ports **x** and **y**.

Add Variables with the Symbols Pane

Add function arguments and content to the MATLAB Function block by using the **Symbols** pane.

- 1 Create a new MATLAB Function block and double-click the block to open the **MATLAB Function Block Editor**.
- 2 Open the **Symbols** pane and Property Inspector. In the **Function** tab, click **Edit Data**.
- 3 In the **Symbols** pane, click the Create Data button .
- 4 Select the new data and adjust the properties in the Property Inspector.

For more information, see “Create and Define MATLAB Function Block Variables”.

Add Breakpoints to Debug a Function

You can add breakpoints to debug MATLAB Function blocks.

- 1 Create a new MATLAB Function block and open the **MATLAB Function Block Editor**.
- 2 Enter the following code:

```
function [mult,add,subtract] = number_operations(u1,u2)

add = u1 + u2;
subtract = u1 - u2;
mult = u1 * u2;
```
- 3 Click line numbers 3 and 4 to add two breakpoints. The line numbers highlight in red.
- 4 Run the simulation. The simulation stops at the first breakpoint. Click the **Continue** button to simulate until the next breakpoint. If the last breakpoint has been reached, click **Continue** to advance to the next time step.

Investigate Code by Running a Report

Run a report on your MATLAB function code to find information on variables and help detect warnings and errors.

- 1 Create a new MATLAB Function block and open the **MATLAB Function Block Editor**.
- 2 Enter the following code:

```
function [mult,add,subtract] = number_operations(u1,u2)

add = u1 + u2;
subtract = u1 - u2;
mult = u1 * u2;
```
- 3 Click the Function Report button .
- 4 The report lists variables in the **Variables** tab at the bottom. Click any of the variable names to highlight instances where the variable appears in the code.
- 5 In the function code, point to or click any variable or expression to see a dialog box with more information.
 - “Debug MATLAB Function Blocks”
 - “Implement MATLAB Functions in Simulink with MATLAB Function Blocks”
 - “Call MATLAB Function Files in MATLAB Function Blocks”

Parameters

Prepare

Edit Data — Opens the Symbols pane and Property Inspector

button

Opens the **Symbols** pane and the Property Inspector. Click the button to define function variables and edit properties.

Navigate

Go To — Goes to specified code

button

Goes to specified code, including functions and line numbers.

Find — Finds and replaces code in function

button

Finds specified text written in the **MATLAB Function Block Editor**. You can also use the **Ctrl+F** keyboard shortcut. If you want to find and replace code, use the **Ctrl+H** keyboard shortcut. This parameter has the same functionality as the MATLAB Editor. For more information, see “Find and Replace Text in Files and Go to Location”.

Code

Refactor — Converts selected code to a function

button

Converts selected code to a function. Use this feature on code that is not already contained in a function. You can create a separate file for the function code or you can convert code into a local function.

- 1 To convert code and save it in a separate m-file, select the code and click **Refactor > Convert to Function**. The code saves as a m-file and the **MATLAB Function Block Editor** calls the code by the name you specify. To run the model without error, the m-file must be on the path.
- 2 To convert code into a local function, select the code and click **Refactor > Convert to Local Function**. The **MATLAB Function Block Editor** creates a local function at the bottom of the code and replaces the selected code with a function call to the local function.

Comment — Comments out code

button

Comments out code. Select the lines you want to comment and click the Comment button . The button adds one % to the selected lines each time you press it. You can also select the code and use the **Ctrl+R** keyboard shortcut.

Uncomment — Removes comments from code

button

Removes comments from code. Select the lines you want to uncomment and click the Uncomment button . The button removes one % from the selected lines each time you press it. You can also select the code and use the **Ctrl+T** keyboard shortcut.

Wrap Comments — Wraps comments

button

Wraps comments. Select the lines you want to comment and click the Wrap comments button .

The **MATLAB Function Block Editor** does not wrap comments with:

- 1 Code section titles (comments that begin with %%).
- 2 Long contiguous text, such as URLs.
- 3 Bulleted list items (text that begins with * or #) onto the preceding line.

Smart Indent — Formats code with smart indenting

button

Formats code with smart Indenting. Smart indenting automatically formats code to improve code readability, such as when you use functions or logical statements. To manually deploy smart

indenting, select the lines of code and click the Smart Indent button . By default, the **MATLAB Function Block Editor** automatically uses smart indenting. For more information, see “Edit and Format Code”.

Increase Indent — Increases the code indent

button

Increases the code indent by one tab indent. To increase the indent, select the lines of code and click the Increase Indent button .

Decrease Indent — Decreases the code indent

button

Decreases the code indent by one tab indent if the code is indented. To decrease the indent, select the lines code and click the Decrease Indent button .

Specify fixed-point data — Builds fi object constructors

button

Builds fi object constructors with a user interface. To open the interface, click the Specify fixed-point data button . Click the arrow next to the icon to select additional fi constructors. For more information, see “Building fimath Object Constructors in a GUI” (Fixed-Point Designer). This features requires a Fixed-Point Designer license.

Compile**Update Model — Updates the model and checks for errors**

button

Updates the model and checks for errors. Expand the menu under **Update Model** to select from two options.

- **Update Model:** Compiles the model and checks for static errors.
- **Refresh blocks:** Updates the model blocks to reflect changes made.

You can also use the **Ctrl+Shift+D** keyboard shortcut to update the model. For more information, see “Update Diagram and Run Simulation” and “Simulation Phases in Dynamic Systems”.

Simulate

Stop Time — Specifies the simulation stop time

10 (default) | scalar

Specifies the simulation stop time.

Simulation Mode — Changes the simulation mode

menu item

Changes the simulation mode. You can select from **Normal**, **Accelerator** or **Rapid Accelerator**. For more information, see “Choosing a Simulation Mode”.

Fast Restart — Enables fast restart

"off" (default) | "on"

Enables fast restart for model simulation. Fast restart can improve performance by preventing compiling. For more information, see “Get Started with Fast Restart”.

Step Back — Steps back in simulation

button

Steps back in simulation. You must configure this option first with the Simulation Stepping Options. If you have not configured these options, the button opens the Simulation Stepping Options window. For more information, see “Simulation Stepping Options”.

Run — Runs the simulation

button

Runs the simulation. You can run a single simulation, or run multiple simulations by creating design studies with **Multiple Simulations** and selecting **Run All** from the drop down. Adjust the time pacing by selecting **Simulation Pacing** from the drop down.

Step Forward — Steps through the simulation at each time step

button

Steps through the simulation at each time step. For more information, see “Step Through a Simulation”.

Stop — Stops the simulation

button

Stops the simulation.

Debug Code

Step over — Steps over the breakpoint during debugging

button

Steps over the breakpoint during debugging in the MATLAB Function block. When you press the button, the debugger steps past function calls and does not enter called functions for line-by-line execution. You can use this button only after simulation stops at a breakpoint.

Step In — Goes to next line of code during debugging

button

Goes to next line of code during debugging in the MATLAB Function block. If the line calls a local function, step into the first line of the local function. You can use this button only after simulation stops at a breakpoint.

Step out — Exits line-by-line function execution during debugging

button

Exits line-by-line function execution during debugging of the current function or local function. If in a local function, the debugger continues to the line following the call to this local function. You can use this button only after simulation stops at a breakpoint.

Report**Function Report — Opens a report**

button

Opens a report that contains information about the MATLAB Function. You can use this report to find information about variables and expressions in the code. For more information, see “MATLAB Function Reports”.

Finder

Find and optionally replace values in Simulink models, libraries, and subsystems

Description

Use the **Finder** to search Simulink models, libraries, and subsystems for elements that contain the search string that you enter.

The search can match the string anywhere in the element, such as in the name or in the parameter values. You can customize the search to look only in certain types of elements or for elements with specific parameter settings.

From the search results, you can select and navigate to elements. You can also replace found instances of the search string with another string.

By default, the **Finder** searches all model elements in the current system, its referenced models, its linked blocks, and its masked systems for case-insensitive partial or full matches.

The screenshot shows the 'Finder: Search from top model' window. The search term 'speed' is entered in the search bar, and the results are displayed in a table. The table has columns for Name, Type, Propert..., Label S..., Script, and Description. The search results are as follows:

Name	Type	Propert...	Label S...	Script	Description
sldemo_fuelsys	Model				
Dashboard	Subsystem				
Engine Speed (rpm)	Annotation				
Engine Speed	Annotation				
fuel_rate_control	Subsystem				
control_logic	Subsystem				
Speed.speed_estimate	Subsystem				
Speed Estimation	Annotation				
Speed Estimation	Lookup_n-D				
Table data:	Property	SpeedEst			
speed	Output				
Saturation	Saturate				

Open the Finder

- In the Simulink Toolstrip, on the **Modeling** tab, click **Find**.
- In the Simulink quick access toolbar, click the **Find** button .

If the **Find** button  is not in the quick access toolbar, click the **Common Controls** button  and select the **Find** check box.

- With the Simulink Editor selected, press **Ctrl+F**.

Examples

Search One Level of Model

In this example, you search the top level of the `sldemo_fuelsys` model for any model element that contains the number 2.

- 1 Open the “Modeling a Fault-Tolerant Fuel Control System” on page 13-119 example model `sldemo_fuelsys`.

```
openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')
sldemo_fuelsys
```

- 2 Open the **Finder**. On the **Modeling** tab, click **Find**.
- 3 Click the **Change the search scope**  button arrow and select **Search this level only**.
- 4 In the search box, enter 2.

Model elements that contain the search string appear in a table. The first element in the table is selected.

- 5 To move to the next element, click the down arrow .
- 6 Use the up and down arrows to move through the rest of the found elements. Alternatively, scroll through the table and click an element to select it.

Perform Advanced Search

When a search returns too many results, use the advanced search settings to narrow your search.

The advanced search settings allow you to:

- Include only the elements you are interested in, such as blocks, annotations, or signals.
- Omit block parameter values from the search.
- Search for case-sensitive matches.
- Search for exact matches.
- Search using regular expressions.
- Omit masked systems, linked blocks, and referenced models from the search.
- Search based on property values such as `BlockDescription` or `BlockType`.

In this example, you search the `sldemo_fuelsys` model for all elements that contain the string `speed`. You then use the **Advanced settings** pane to refine your results.

- 1 Open the “Modeling a Fault-Tolerant Fuel Control System” on page 13-119 example model `sldemo_fuelsys`.

```
openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')
sldemo_fuelsys
```

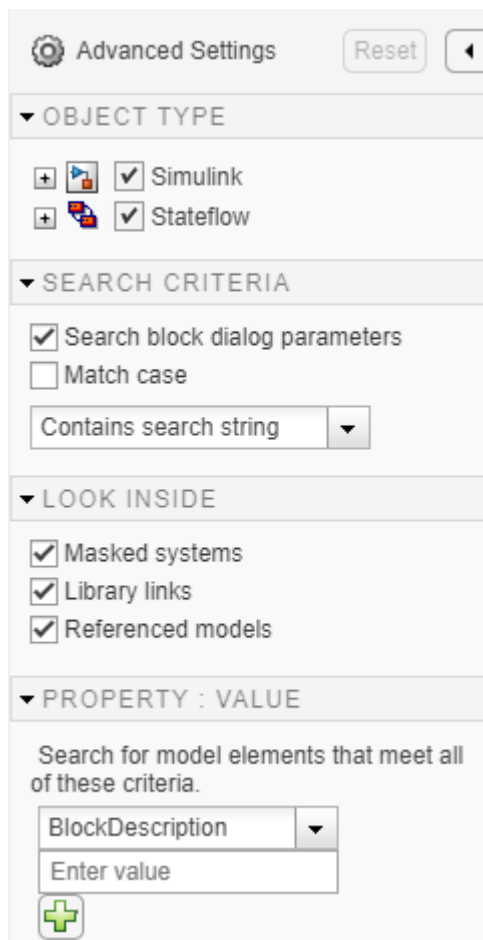

- 2 Open the **Finder**. On the **Modeling** tab, click **Find**.
- 3 Enter the search string. For example, enter **speed**.

Model elements that contain the search string appear in a table. The first element in the table is selected.

Alternatively, you can enter the search string after you specify the search settings

- 4 Click the **Advanced settings** button .

The **Advanced Settings** pane opens.

- 5 Specify the advanced settings you want. For example, in the **Property:Value** section, change **BlockDescription** to **BlockType**. In the corresponding text box, type **Constant** and click the **Add property and value** button .

Note In the **Property:Value** section, if you want to search based on a property that is not in the list, select **Other**, then enter the full programmatic name of the property. To find the programmatic name, in the Property Inspector, pause on the property. You cannot use regular expressions or partial matches for the property name.

6 Click **Find** to find results that match the updated search criteria.

To restore the default advanced settings, click **Reset**.

Find and Replace Text

You can find and replace text using the **Finder**.

For search results to support replacement:

- You must have write access for the field.
- The field value must be the same as when you performed the search.
- The text formatting must be plain.

In this example, you search the `sldemo_fuelsys` model for the string `rad` and replace `rad` with `deg`.

1 Open the “Modeling a Fault-Tolerant Fuel Control System” on page 13-119 example model `sldemo_fuelsys`.

```
openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')
sldemo_fuelsys
```

2 Open the **Finder**. On the **Modeling** tab, click **Find**.

3 In the search box, enter the search string. For example, enter `rad`.

Model elements that contain the search string appear in a table.

4 To the left of the search box, click the **Find** button arrow, and select **Replace**.

Replace options appear in the Finder.

5 In the text box next to the **Replace** button, enter the replacement string. For example, enter `deg`.

6 Select the instance you want to replace, then click **Replace**.

Finder: Search from top model

Replace [rad] Find Result 2 of 4 [deg] Replace Replaced 1 Revert

Name	Type	Property Value	Description	Source	Destination
▼ sldemo_fuelsys	Model				
▼ Engine Gas Dynamics	Subsystem				
▼ Throttle & Manifold	Subsystem				
▼ Intake Manifold	Subsystem				
▼ N (deg/sec)	Inport				
Unit (e.g., m, m/s^2, N*m):	Property	rad/s			
▼ Engine Speed, N	Inport				
Unit (e.g., m, m/s^2, N*m):	Property	rad/s			
▼ engine speed	Inport				
Unit (e.g., m, m/s^2, N*m):	Property	rad/s			

Alternatively, replace all instances of the found string by clicking **Replace > Replace All**.

Note If you stop the replacement operation before it completes, the completed replacements do not revert.

- 7 To view a replacement in the model, double-click the row that corresponds to the replaced element.

If you want to revert replacements, you must revert them before you perform another search or close the **Finder**. To revert replacements, select the instance to revert, then click **Revert**. Alternatively, click the **Revert** button arrow and select **Revert All**. The **Finder** applies the inverse replacements to restore the original values.

- “Build and Edit a Model Interactively”

Tips

- To select the starting point for your search, use the Model Browser.
- To go to and select the element in the model, double-click an item in the list.
- To search for any model elements that match the search criteria, enter an asterisk (*) in the search box.
- To search for a string that contains a colon, escape the colon using a backslash (for example, `Earth\ : a planet`), or use single or double quotes around the expression (for example, `'Earth: a planet'` or `"Earth: a planet"`).
- You can interact with search results while the search runs. However, you can sort the results only after the search is complete.
- To stop a search and view partial search results, in the Finder, click the **Stop** button.
- For table display options, pause on the **Name** heading and click the arrow that appears. The menu provides options to expand, collapse, and sort results. To sort the table based on another column, pause on the corresponding table heading and click the arrow that appears.

Introduced in R2016b

Instrumentation Properties

View and edit logging and visualization properties for logged signal

Description

Use the Instrumentation Properties dialog box to configure logging and visualization settings for logged signals, including a data access callback function to process logged data during simulation and logging sample time.

Open the Instrumentation Properties

- Right-click the logging badge on a signal that is marked for logging and select **Properties**.

Parameters

Logging and Visualization

Use custom name — Signal logging name

string | character vector

Select this option to specify a name for logged signal data that is different from the name of the signal in the model. By default, logged signal data uses the name of the signal specified in the model.

The **Use custom name** property is the same as the **Logging name** property that you configure using the **Signal Properties** dialog box.

Programmatic Use

To specify the logging name programmatically, use the `set_param` function to configure the `DataLoggingNameMode` and `DataLoggingName` parameters for the port handle that corresponds to the block output port that produces the signal. For an example, see “Signal-Specific Logging Name Specified Programmatically”.

Parameter: `DataLoggingNameMode`

Value: 'SignalName' | 'Custom'

Default: 'SignalName'

Parameter: `DataLoggingName`

Type: string | character vector

Decimate data — Option to log every *n*th sample value

'off' (default) | 'on'

When you want to reduce the effective sample rate for logged data, select **Decimate data** and specify the desired decimation factor in the text box. For example, if you specify a decimation factor of 2, every other signal value is logged.

Consider data requirements for each signal before reducing the number of data points logged in simulation. Decimation can cause aliasing if the effective sample rate is too low.

For more information, see “Specify Signal Values to Log” and “Limit the Size of Logged Data”.

Programmatic Use

To configure this option programmatically, use the `set_param` function to configure the `DataLoggingDecimateData` and `DataLoggingDecimation` parameters for the port handle that corresponds to the block output port that produces the signal.

Parameter: `DataLoggingDecimateData`

Value: 'on' | 'off'

Default: 'off'

Parameter: `DataLoggingDecimation`

Value: numeric scalar

Type: string | character vector

Default: '2'

Limit data points to last — Option to log only last *n* data points

'off' (default) | 'on'

When you only want to save or analyze the data from the end of a simulation, you can configure logging to capture only the last n signal values. Select **Limit data points to last** and specify the number of data points you want to log.

When you only log the last simulation values, dashboard blocks and the Simulation Data Inspector do not display data during simulation. Consider data requirements for each signal before you reduce the number of data points logged in simulation.

For more information, see “Specify Signal Values to Log” and “Limit the Size of Logged Data”.

Programmatic Use

To configure this option programmatically, use the `set_param` function to specify the `DataLoggingLimitDataPoints` and `DataLoggingMaxPoints` parameters for the port handle that corresponds to the block output port that produces the signal.

Parameter: `DataLoggingLimitDataPoints`

Value: 'on' | 'off'

Default: 'off'

Parameter: `DataLoggingMaxPoints`

Value: numeric scalar

Type: string | character vector

Default: '5000'

Logging sample time — Sample time for logged signal data

-1 (default) | scalar

Specify the sample time to use for logging the data for the selected signal. By default, the logging sample time is inherited (-1) from the block that produces the signal. For continuous logging sample time, specify the value as 0. To use a discrete sample time for logging data, specify the sampling interval as a scalar.

Specifying a logging sample time may add a new sample time to the model. When you specify a logging sample time, the model calculates a value for the exact time hits. When you use a fixed-step solver, the logging sample time you specify must be a multiple of the base rate for the model.

Logging sample time is not supported for signals inside conditional subsystems or conditional referenced models.

The **Logging sample time** property is the same as the **Sample time** property you configure using the **Signal Properties** dialog box.

Programmatic Use

To configure this option programmatically, use the `set_param` function to configure the `DataLoggingSampleTime` parameter for the port handle that corresponds to the block output port that produces the signal.

Parameter: `DataLoggingSampleTime`

Value: numeric scalar

Type: string | character vector

Default: '-1'

Input processing — Option to log data as samples or as frames

Elements as channels (sample based) (default) | Columns as channels (frame based)

Specify how multidimensional data is logged and interpreted by the Simulation Data Inspector. By default, signals are logged as sample-based, with each element in a multidimensional sample treated as a channel.

When logging a frame-based signal, set **Input processing** to `Columns as channels (frame based)`. A frame-based signal buffers a batch of samples to create a frame of data. When you log the data as frame-based, each column in a sample is treated as a channel, and the row dimension is treated as evenly-spaced samples within the channel.

You can also remove the buffering from a frame-based signal after simulation using the Simulation Data Inspector. For more information, see “Convert Representation of Frame-Based Data”.

Programmatic Use

To programmatically configure or access the **Input processing** property for a logged signal, use the `Simulink.sdi.setSignalInputProcessingMode` function and the `Simulink.sdi.getSignalInputProcessingMode` function.

Complex format — Option to specify how complex signal is displayed in Simulation Data Inspector

`Real-Imaginary (default) | Magnitude-Phase | Magnitude | Phase`

Complex signal data is logged as a single signal. Use the **Complex format** property to specify how to display a complex signal in the Simulation Data Inspector. By specifying the complex format in the Instrumentation Properties, you save the preference in the model so logged data is displayed consistently for each simulation. You can also modify the complex format for a signal in the Simulation Data Inspector, after data is logged from simulation or imported.

For all complex formats, you plot the complex signal as one signal. Some formats display components of the plotted signal as separate traces.

- **Real-Imaginary** — Plot real and imaginary components as separate traces.

The signal line color specifies the color of the real component. The imaginary component uses a different shade of the specified line color.

- **Magnitude-Phase** — Plot magnitude and phase components as separate traces.

The signal line color specifies the color of the magnitude component. The phase component uses a different shade of the specified line color.

- **Magnitude** — Plot only the magnitude component.
- **Phase** — Plot only the phase component.

Subplots — Option to plot signals in Simulation Data Inspector from model

`scalar between 1 and 64`

When you specify a value for the **Subplots** property, the signal is plotted on the corresponding subplot or subplots in the Simulation Data Inspector. You can use this property to save a plotting configuration in the model. However, the property does not affect the subplot layout in the Simulation Data Inspector or clear signals that are already plotted.

Custom style and color — Option to configure signal line style and color in model

`'off' (default) | 'on'`

When enabled, you can configure the line style and color used to display the signal in the Simulation Data Inspector and on Dashboard Scope blocks and save the preference in the model so the signal is displayed consistently across MATLAB sessions.

Specifying the line style and color in the model does not prevent you from changing the line style and color in the Simulation Data Inspector. The Dashboard Scope block and the Simulation Data Inspector always display a signal using the line style and color specified in the logged signal properties, as displayed in the **Properties** pane in the Simulation Data Inspector.

Line — Line style, color, and width for Simulation Data Inspector and Dashboard Scope blocks

line style, width, and color

Set the line style, width, and color used to display the signal on Dashboard Scope blocks and in the Simulation Data Inspector.

Specifying the line style and color in the model does not prevent you from changing the line style and color in the Simulation Data Inspector. The Dashboard Scope block and the Simulation Data Inspector always display a signal using the line style and color specified in the logged signal properties, as displayed in the **Properties** pane in the Simulation Data Inspector.

Dependencies

To enable the **Line** property, select **Custom style and color**.

Data Access

Enable run-time data access — Option to stream signal data to MATLAB function during simulation

'on' (default) | 'off'

When enabled, you can specify a data access callback function that processes or visualizes the logged signal data during simulation. The function receives data in packets asynchronously throughout the simulation, and the function executes each time it receives new data. For more information, see “Access Data in a MATLAB Function During Simulation”.

Function name — MATLAB function that receives signal data during simulation

name of MATLAB function

Name of the data access callback function that processes or visualizes signal data during simulation. The data access callback function always receives signal data as the first argument and may also receive simulation time and a function parameter as additional arguments. When the function receives all three arguments, simulation time is the second argument. For more information, see “Access Data in a MATLAB Function During Simulation”.

For more information about writing MATLAB functions, see “Create Functions in Files”.

Dependencies

To enable the **Function name** property, select **Enable run-time data access**.

Include simulation time — Option to send simulation time to MATLAB function

'on' (default) | 'off'

Option to send simulation time along with signal data to the data access callback function during simulation. The data access callback function always receives signal data as the first argument and

may also receive simulation time and a function parameter as additional arguments. When a function receives all three arguments, simulation time is the second argument. For more information, see “Access Data in a MATLAB Function During Simulation”.

Dependencies

To enable the **Include simulation time** property, select **Enable run-time data access**.

Function parameter — Option to use parameter to identify data source

numeric | text

When you specify a value for the **Function parameter**, the data access callback receives the specified value as a second or third argument depending on whether time is included with data sent to the callback function. When you use the same data access callback function to process data for more than one signal, specify a function parameter to identify which signal data the function receives in a given call. For more information, see “Access Data in a MATLAB Function During Simulation”.

Dependencies

To enable the **Function parameter** property, select **Enable run-time data access**.

Introduced in R2018a

Library Browser

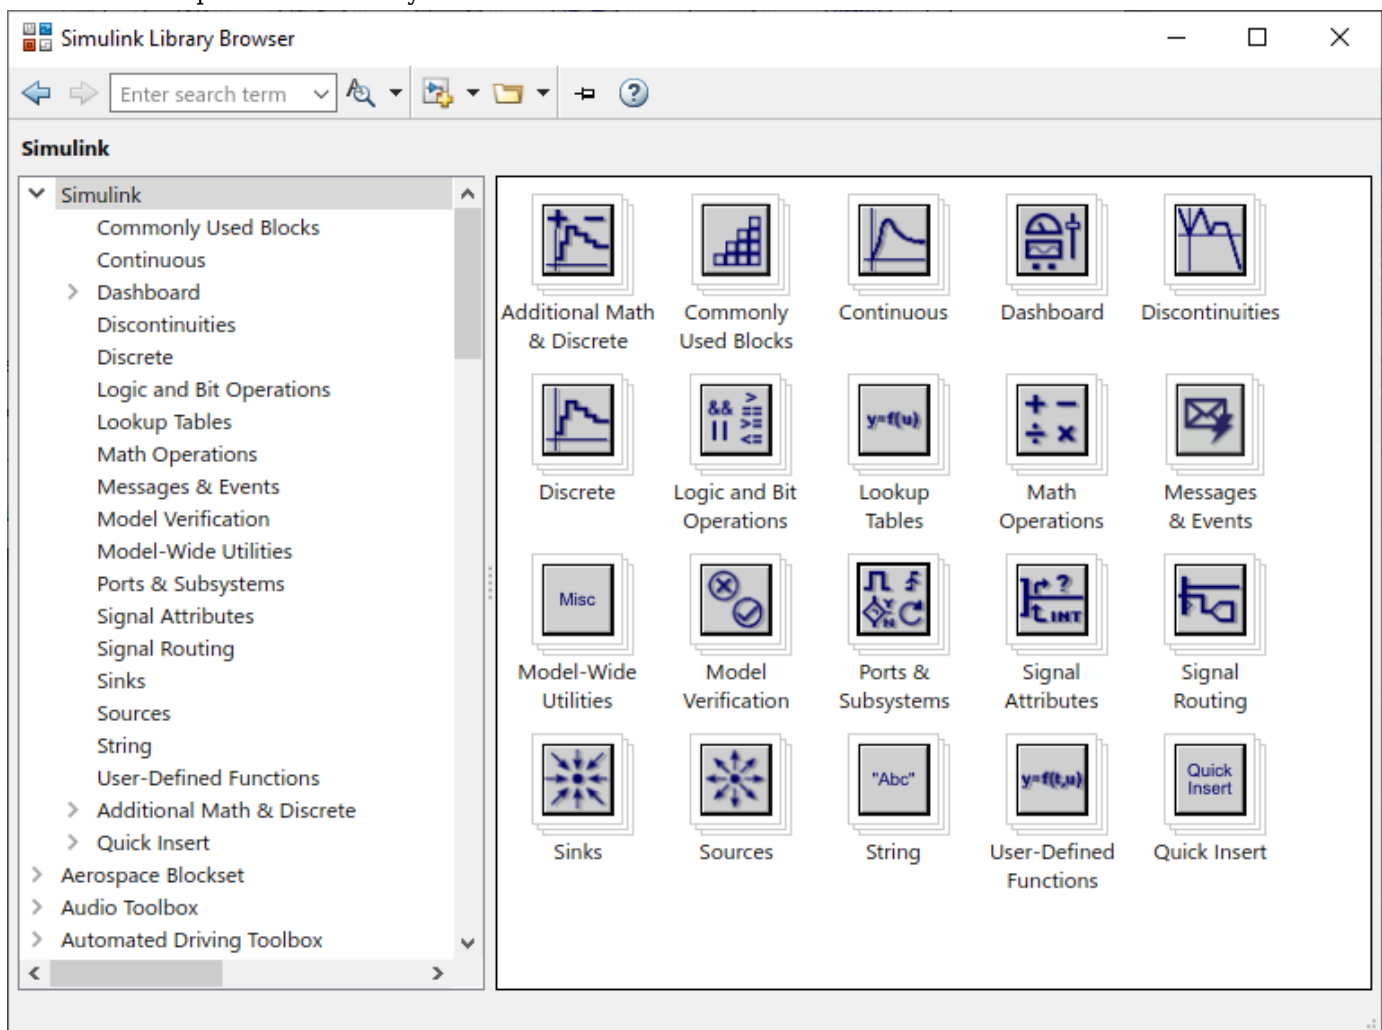

Find and add blocks to your model

Description

The **Library Browser** displays a tree view of the Simulink libraries on your system. Use the **Library Browser** to locate blocks and annotations to add to your model.

To navigate the libraries, select libraries from the tree or double-click sublibraries in the right pane. When you select libraries in the tree, the contents of the library appear in the right pane. Sublibraries, blocks, and text and image annotations can appear in the right pane. Pause on any item to see a description. Right-click any item to see options. For example, right-click a block to see options to view block parameters, open help for the block, and add an instance of the block to a model.

When you find the item you are looking for, you can drag it into your model or right-click it and select the option to add it to your model.

Open the Library Browser

- In the Simulink Toolstrip, on the **Simulation** tab, click **Library Browser**.

You must have a Simulink model, library, or subsystem open to see the Simulink Toolstrip.

- In the MATLAB Command Window, enter `slLibraryBrowser`.

Examples

Search for Blocks in the Library Browser

You can search for blocks and annotations using the search controls.

- 1 In the search box, type the search term or select it from the list of recent search terms.

For annotations, you can search for any of the text in the annotation or any part of its description.

- 2 To use regular expressions, case-sensitive search, or whole-word search, click the **Search for subsystems, blocks, and annotations** button arrow, then select the search options you want to use.

- 3 Press **Enter** to start the search.

The blocks pane displays the blocks found, grouped by library.

To see where the search string matches, pause on a block.

To navigate to a block library, right-click the block, then select **Select in library view**.

Add Blocks to Models from the Library Browser

You can add instances of a library block from the Library Browser to an open model.

Drag the block from the Library Browser to the Simulink Editor canvas.

Alternatively, right-click the block in the Library Browser and select **Add block to model** or **Add block to a new model**. If no model is open, this option creates a model and adds the block to it.

Blocks that you have recently added to your model from the Library Browser appear in the **Recently Used** library at the bottom of the left pane.

Sort Blocks in the Library Browser

By default, library contents appear in alphabetical order. Subsystems appear first, then blocks, and then annotations. If you prefer to view the contents of the libraries in the order set by the developer of the library, right-click the right pane and select **Sort in library model order**. This setting stays in effect from session to session.

To return to the alphabetical order, right-click and select **Sort in alphabetical order**. Depending on the library, some items might not appear in alphabetical order. For example, in the **Simulink** library, the **Quick Insert** library appears as the last item regardless of the sorting option you choose.

Create Custom Libraries

You can create your own libraries and, optionally, have them appear in the **Library Browser**.

For more information, see “Create Custom Library”.

Refresh the Library Browser

Refresh your Library Browser if you:

- Modify existing libraries or resave them in .slx file format.
- Move or delete your library files.
- Add a library.
- Change your Library Browser customizations. See “Customize Library Browser Appearance”.

To refresh the libraries displayed in the Library Browser, right-click in the libraries pane and select **Refresh Library Browser**. The Library Browser updates to display any libraries or blocks added to or deleted from the MATLAB path since the Library Browser was last opened or refreshed.

Tips

You can use keyboard shortcuts to interact with the **Library Browser**.

Task	Action
Open Library Browser from a model	Ctrl+Shift+L
Move selection down	Down arrow
Move selection up	Up arrow
Expand a library	Right arrow
Collapse a library	Left arrow
Refresh libraries	F5

Task	Action
Navigate to parent library	Esc
Navigate from search result to library containing block	Ctrl+R
Insert the selected block in a new model	Ctrl+I
Increase zoom	Ctrl+Plus (+)
Decrease zoom	Ctrl+Minus (-)
Reset zoom to default	Alt+1
Find a block	Ctrl+F
Close Library Browser	Ctrl+W

Model Data Editor

Inspect and edit data items (signals, parameters, and states) in a table that you can sort, group, and filter

Description

The **Model Data Editor** enables you to inspect and edit data items such as signals, block parameters (for example, the **Gain** parameter of a Gain block), and data stores in a list that you can sort, group, and filter. You can then configure properties and parameters, such as data types and dimensions, without having to locate the items in the block diagram.

Use the Model Data Editor to configure multiple signals, states, and algorithmic parameters. The Model Data Editor can set only certain parameters and properties such as data types, initial values, and physical units. To work with one model element at a time, open the **Property Inspector**. To perform batch operations, open the Model Data Editor.

For information about setting block properties and parameters, see “Signal Properties”.

When creating and debugging a model, you can configure multiple data items at once by selecting the corresponding signals and blocks in the block diagram. Work with the selected items in the Model Data Editor instead of opening individual dialog boxes. Use this technique to more quickly view and compare properties of multiple signals that are close to each other in the diagram, for example, in a subsystem.

Use the Model Data Editor to configure:

- Instrumentation for signals and data stores, which allows you to view and collect the simulation values. For example, you can log signals to compare data in the Simulation Data Inspector.
- Design attributes such as data type, minimum and maximum value, and physical units. You can use these attributes to:
 - Specify the values of numeric block parameters.
 - Control the interaction (interface) between components through Inport and Outport blocks and data stores (see “Configure Data Interfaces”).
 - Specify the dimensions of nonscalar signals in a model.

Note The Model Data Editor does not show information about data items in referenced models (which you reference with Model blocks). To work with data items in a referenced model, open the Model Data Editor in that model.

Columns in the Data Table

Use this table to find more information about the purpose of the columns in the Model Data Editor.

Column Name	Purpose and More Information
Source	Shows the name of the block that defines the data item. For signals, also shows the number of the block port that generates the signal. For workspace variables, shows the name of the workspace or data dictionary that contains the variable.
Signal Name or Name	Sets the name of the signal, state, or data store. For information about naming signals, see “Signal Names and Labels”. For parameters, displays the programmatic name of each parameter. For workspace variables, sets the name of the variable.
Data Type	“Control Data Types of Signals” and “Control Block Parameter Data Types”
Min and Max	“Specify Signal Ranges” and “Specify Minimum and Maximum Values for Block Parameters”
Dimensions	“Determine Signal Dimensions”
Complexity	Sets the numeric complexity of the data item.
Sample Time	“What Is Sample Time?”
Unit	“Unit Specification in Simulink Models”
Test Point	“Configure Signals as Test Points”
Log Data	“Iterate Model Design Using the Simulation Data Inspector”
Resolve	Corresponds to the Signal name must resolve to Simulink signal object check box in the Signal Properties dialog box and similar check boxes in block dialog boxes for states and data stores. See “Use Signal Objects”.
Shared	Corresponds to the Share across model instances parameter of the Data Store Memory block. See Data Store Memory.
Initial Value	Sets the initial value of the state or data store. See “Initialize Signal Values”.
Value	“Set Block Parameter Values”
Argument	Configures a variable in a model workspace as a model argument. See “Parameterize Instances of a Reusable Referenced Model”.
Path	Shows the location of the block in the model and provides a link to the block in the Simulink Editor. Visible when you click the Change Scope button.

Two Entries Per Cell in the Data Table

When a cell contains two entries (for instance, in the **Data Type** column), the entry on the right side of the cell indicates compiled information. The compiled information shows you the value that the data item uses for simulation.

For example, the default data type setting for most signals in a model is `Inherit: Inherit via internal rule`. With this setting, after you update the block diagram, Simulink chooses a specific data type, such as `single`, for the signal to use for simulation. In the Model Data Editor, the cell in the **Data Type** column shows `Inherit: Inherit via internal rule` on the left side and `single` on the right side.

Open the Model Data Editor

- In the Simulink Toolstrip, on the **Modeling** tab, click **Model Data Editor**.
- While in the Simulink Editor, press **Ctrl+Shift+E**.

Examples

Configure Distant Data Items

In this example, use the Model Data Editor to log signals in different subsystems and referenced models so you can inspect their data using the **Simulation Data Inspector**.

The “Using a Data Dictionary to Manage the Data for a Fuel Control System” on page 13-134 example model `sldemo_fuelsys_dd` represents the fueling system of a vehicle engine. The referenced model `sldemo_fuelsys_dd_controller` controls the rate of fuel flow to the engine.

First, explore the example models.

- 1 Open the example model `sldemo_fuelsys_dd` and the referenced model `sldemo_fuelsys_dd_controller`.

```
openExample('simulink_automotive/UseDDForFuelContSysExample')
sldemo_fuelsys_dd
sldemo_fuelsys_dd_controller
```

- 2 Navigate to the `airflow_calc` subsystem.

The Pumping Constant block contains a lookup table that describes the performance of a fuel pump. You can stream the output of this block to the Simulation Data Inspector.

- 3 Navigate to the root of the model and into the `fuel_calc` subsystem.
- 4 Navigate into the `feedforward_fuel_rate` subsystem.

The Output block named `ff_fuel_rate` passes feedforward information to the fuel rate control algorithm.

- 5 Navigate back to the `fuel_calc` subsystem and into the `switchable_compensation` subsystem.

The Inport block named `ff_fuel_rate` carries the feedforward information. You can stream the output of this Inport block.

Then, log signals for data inspection.

- 1 Navigate to the root of the `sldemo_fuelsys_dd_controller` model.
- 2 In the Model Data Editor, inspect the **Signals** tab.
- 3 Set the **Change view** drop-down to Instrumentation.

- 4 Activate the **Change scope** button  to display the contents of the subsystems.

The Model Data Editor identifies all the signals in the model. The **Path** column appears.

- 5 In the **Filter Contents** box, type `ff_fuel_rate`.

The Model Data Editor updates the list of signals to include only those named `ff_fuel_rate`. You can click the link in the **Path** column to view where the signal resides within the model.

- 6 Select the **Log Data** check box for the signal whose path is `sldemo_fuelsys_dd_controller/fuel_calc/switchable_compensation`.

This instructs Simulink to send the data for the logged signals to the Simulation Data Inspector.

- 7 Filter the signals again using the text `Pumping Constant`.

The table contains one row that corresponds to the output of the Pumping Constant block.

- 8 Select the **Log Data** check box for the `Pumping Constant` signal.
- 9 Simulate the system model, `sldemo_fuelsys_dd`. During the simulation, double-click a Manual Switch block, such as `Engine Speed Selector`, to disturb the fuel control system.

- 10 When the simulation finishes, the **Simulation Data Inspector** button  is highlighted. This indicates that there is data to inspect and compare. Click the **Simulation Data Inspector** button.

- 11 In the left pane, expand the **Run** node that corresponds to the simulation run and select the check boxes for the signals whose data you want to inspect and compare.

The Simulation Data Inspector presents the values for the selected signals on the same graph.

Find and Organize Data by Filtering, Sorting, and Grouping

In the example model `sldemo_fuelsys_dd_controller`, variables and parameter objects set the values of block parameters. The variables and objects reside in a data dictionary. Use the Model Data Editor to display these dictionary entries together in a group.

- 1 Open the `sldemo_fuelsys_dd_controller` model.
- 2 In the example model, open the Model Data Editor and select the **Parameters** tab.
- 3 Activate the **Change scope** button to display the contents of the subsystems.
- 4 Click the **Show/refresh additional information** button to display rows that correspond to the dictionary entries.
- 5 Right-click the **Source** column header and select **Group by This Column**.

The Model Data Editor groups the list by block or workspace (including a group for the dictionary entries).

- 6 Find the group labeled **Source: Dictionary**. Now, you can use the Model Data Editor to inspect and modify the attributes of the variables and objects in the dictionary.

The Model Data Editor allows you to filter a list of data items by using one or a combination of these methods:

- To filter the data table through a text search, use the **Filter contents** box.
- To filter based on the blocks or signals that you select in the model, next to the **Filter contents** box, click the **Filter using selection** button. Then, as you click blocks and signals in the model, the Model Data Editor shows you only the rows that are relevant to that block or signal. If you lasso multiple blocks or signals, the Model Data Editor shows only the rows that are relevant to those model elements.
- To filter based on column-specific criteria, point to a column header and click the filter icon . As you type in the text box, the editor applies a substring filter to the column contents. After the filter is applied, the column displays a smaller filter icon  next to the column header. To edit a filter, remove a filter, or remove all column filters, click this icon.

Select Multiple Data Items from Block Diagram

In the example model `sldemo_househeat`, use the Model Data Editor to log the signals in the Heater subsystem for inspection using the **Simulation Data Inspector**.

- 1 Open the `sldemo_househeat` model.
- 2 In the `sldemo_househeat` model, open the **Heater** subsystem.
- 3 Open the Model Data Editor and select the **Signals** tab.

The Model Data Editor identifies all the signals in the subsystem.

- 4 In the Model Data Editor, set the **Change view** drop-down list to **Instrumentation**.
- 5 Using the Simulink Editor, select all the signals in the subsystem. Optionally, do not select the output of the Constant block because the signal value does not change during the simulation.

In response, the Model Data Editor highlights the rows that correspond to the signals you selected.

- 6 In the Model Data Editor, for any of the signals, click the check box in the **Log Data** column.

The Model Data Editor selects the check box for all of the selected signals.

- 7 Simulate the model.
- 8 Open the Simulation Data Inspector and, in the leftmost pane, expand the **Run** node that corresponds to the simulation run. Select the check boxes for the signals whose values you want to inspect and compare.

Interact with a Model That Uses Workspace Variables

When you use workspace variables (such as numeric MATLAB variables and `Simulink.AliasType` objects) to share settings between data items, you can interact with those variables through the Model Data Editor. You do not need to work outside the Editor to configure the data items. In the Editor, click the **Show/refresh additional information** button, which finds variables that the model uses by updating the block diagram.

This example shows how to work with objects that a model uses to set block parameter values. You modify the value of a variable that the model `sldemo_fuelsys` uses.

- 1 Open the “Modeling a Fault-Tolerant Fuel Control System” on page 13-119 example model `sldemo_fuelsys`.

```
openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')
sldemo_fuelsys
```

- 2 Open the Model Data Editor **Parameters** tab.
- 3 In the Model Data Editor, click the **Show/refresh additional information** button.

The data table now contains rows that correspond to variables and objects that the model uses.

- 4 In the model, navigate into the `fuel_rate_control` subsystem and then the `airflow_calc` subsystem.
- 5 In the Model Data Editor, next to the **Filter contents** box, select the **Filter using selection** button.

With this button selected, when you select a block or signal in the block diagram, the data table shows only the data items and workspace variables that are relevant to that block or signal.

- 6 In the model, click the lookup table block labeled **Pumping Constant**.

The Model Data Editor shows that the block uses three workspace variables. The block acquires some breakpoint values from the variable `SpeedVect`.

Now, you can use the columns in the Model Data Editor to configure the properties of SpeedVect.

You can further interact with a variable to:

- Configure other properties that the columns do not represent:
 - 1** In the model, open the Property Inspector. On the **Modeling** tab, under **Design**, click **Property Inspector**.
 - 2** In the Model Data Editor, select the row that corresponds to the target variable or object. If the Property Inspector does not respond, select a different row and then select the target row again.
 - 3** Use the Property Inspector to configure the target properties.
- Move the variable between workspaces and data dictionaries and configure the variable alongside other variables. Use the Model Explorer. To open the Model Explorer, in the Model Data Editor data table, double-click the icon in the leftmost column. For more information about using the Model Explorer, see “Edit and Manage Workspace Variables by Using Model Explorer”.
- Rename a variable everywhere it is used by blocks in Simulink models. In the Model Data Editor, right-click the variable and select **Rename All**. You can rename only variables that the function `Simulink.findVars` supports.
- Find blocks that use a specific variable. In the Model Data Editor, right-click the variable and select **Find Where Used**.

Inspect Individual Data Item

To focus on an individual data item, use one of these techniques:

- In the Model Data Editor, next to the **Filter contents** box, select the **Filter using selection** button. Then, in the model, click the block or signal that corresponds to the data item.

Use this technique to configure the item by using the columns in the data table.

- In the model, open the Property Inspector. On the **Modeling** tab, under **Design**, click **Property Inspector**. Then, in the data table, click the target row. The Property Inspector shows the properties of the data item. If the Property Inspector does not respond when you click the target row, click a different row and then click the target row again.

Use this technique to inspect all of the properties that the Model Data Editor can access at once (in other words, the union of the columns available in the **Design** and **Instrumentation** views).

- In the model, open the Property Inspector. Then, in the data table, for the target row, double-click the cell in the leftmost column (the icon). In the model, select the highlighted block or signal.

Use this technique to inspect all properties, including those that the Model Data Editor cannot access.

Navigate from Model Data Editor to Block Diagram

To navigate from a data item in the Model Data Editor to the block in the diagram that owns the data item, double-click the icon in the left-most column. The Simulink Editor then focuses on the relevant

block. Use this technique to navigate to blocks when you select **Change scope** to view the contents of subsystems below the current system.

- “Use the Model Data Editor for Batch Editing”
- “Using a Data Dictionary to Manage the Data for a Fuel Control System” on page 13-134

Limitations

- You cannot access these attributes by using the Model Data Editor:
 - Any settings related to code generation. Instead, use the Code Mappings editor or code mappings API.
 - For mask parameters:
 - Any settings for tunable mask parameters other than the parameter value.
 - Any settings for nontunable mask parameters.
- Note that some built-in blocks are masked and can have tunable or nontunable mask parameters.
- Any settings for parameters of Simscape blocks.
 - Any settings for data items in referenced models. Instead, open the Model Data Editor in the referenced models.
 - Any settings for variables that are not defined in the base workspace, a model workspace, or a data dictionary. For example, you cannot access the attributes of variables created by mask initialization code.
 - On the **Parameters** tab, the data type, minimum value, and maximum value of a Constant block. Use the **Signals** tab instead.

For some settings that you cannot access with the Model Data Editor, you can use the **Property Inspector** instead. Open the Property Inspector and select the target data item in the model, not in the Model Data Editor. For mask parameters, use the mask dialog box or the Mask Editor as described in “Masking Fundamentals”.

- The Model Data Editor does not show Stateflow data. However, the Model Data Editor shows the data for Simulink functions that you define inside Stateflow charts.

To manage Stateflow data, events, and messages in a chart, see “Manage Symbols in the Stateflow Editor” (Stateflow).

- On the **Parameters** tab, these variables are not available:
 - Variables used by non-tunable block parameters. For example, the minimum and maximum parameters on a Gain block or the `Sample time` on a Constant block.
 - Variant control variables
 - Variables used for symbolic dimensions

Model Explorer

View, modify, and add elements of Simulink models, Stateflow charts, and workspace variables

Description

Use the Model Explorer to view, modify, and add elements of Simulink models, Stateflow charts, and workspace variables.

The Model Explorer lets you focus on specific elements (for example, blocks, signals, and properties) without navigating through the model or chart.

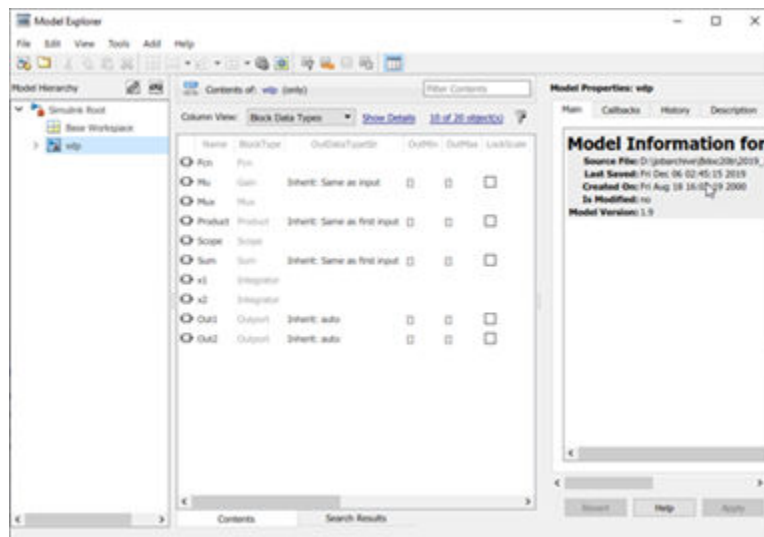

Use the Model Explorer to search for:

- Variables in workspaces and data dictionaries
- Variable usage in a model
- Instances of a type of block
- Block parameters and parameter values

You can combine search criteria and iteratively refine the results. Search in the Model Explorer for model elements, starting with the node you select in the model hierarchy. You can search the entire model, in a particular system, or in a system and all the systems below it in the hierarchy. Using your search results, you can apply changes to multiple elements at once.

To manipulate model data (block parameters, signals, and states) in a searchable, sortable table, consider using the **Model Data Editor**. You can specify data attributes such as parameter values, signal names, and initial values for states.

To create, modify, and view the entries in a data dictionary, use the Model Explorer. See “Edit and Manage Workspace Variables by Using Model Explorer” and “View and Revert Changes to Dictionary Data”.

Open the Model Explorer

- In the Simulink Toolstrip, on the **Modeling** tab, click **Model Explorer**.
- In an open model in the Simulink Editor, right-click a block and select **Explore**.
- In an open Stateflow chart, right-click the drawing area and select **Explore**.

Examples

Add Objects to a Model, Chart, or Workspace

You can use the Model Explorer to add many kinds of objects to a model, chart, or workspace. The types of objects that you can add depend on the node that you select in the **Model Hierarchy** pane.

Use toolbar buttons or the **Add** menu to add objects. The **Add** menu lists the types of objects you can add.

Cut, Copy, and Paste Objects Between Workspaces

You can cut, copy, and paste objects from one workspace into another workspace.

- 1 In the **Contents** pane, perform one of these actions:
 - Right-click the workspace object you want to cut or copy. Select **Cut** or **Copy**.
 - Click the workspace object you want to cut or copy. In the **Edit** menu, select **Cut** or **Copy**.
 - Click the workspace object you want to cut or copy. In the toolbar, click the **Cut** button  or **Copy** button .
- 2 To paste the workspace object that you cut or copied, in the **Model Hierarchy** pane:
 - Right-click the workspace into which you want to paste the object, and select **Paste**.
 - Click the workspace into which you want to paste the object. In the **Edit** menu, select **Paste**.
 - Click the workspace into which you want to paste the object. In the toolbar, click the **Paste** button .

When you copy and paste (or drag and drop), you can manage the resolution of name conflicts. In the dialog box, choose an action for each item whose name conflicts with an existing item.

- **Skip** — Default action when the conflicting items have the same value.
- **Replace** — Default action when the conflicting items have different values.
- **Keep both** — Preserve both copies. The name given to the copied item follows the naming rules that are used in the MATLAB workspace.

If the source and destination are the same, the software resolves the name conflict by following the naming rules that are used in the MATLAB workspace.

You can also cut, copy, and paste by selecting an object and performing drag and drop operations.

Edit Object Properties

You can edit object properties in the Model Explorer.

In the **Contents** pane, first select the row that contains the value, and then click the value. Change the value of the selected property by typing or selecting a new value.

To assign the same property value to multiple objects in the **Contents** pane, select the objects and then change one of the values of the selected objects. The Model Explorer assigns the new property value to all of the selected objects.

Alternatively, you can edit values for model elements in the **Dialog** pane. To display the **Dialog** pane, click **View > Show Dialog Pane**.

To edit workspace variables, such as arrays or structures, you can use the Variable Editor.

To open a properties dialog box for an object, in the **Model Hierarchy** pane, right-click the object and select **Properties**. Alternatively, click an object and from the **Edit** menu, select **Properties**.

Search and Refine Search Results

To find objects that might not be currently displayed, search.

In this example, you search for elements that have an **Integer rounding mode** parameter. You then refine the results to include only n-D Lookup table blocks. You can use the search results to find out more about how these values are set or make batch changes to the elements found by the search.

- 1 Open the “Modeling a Fault-Tolerant Fuel Control System” on page 13-119 example model `sldemo_fuelsys`.

```
openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')
sldemo_fuelsys
```
- 2 On the **Modeling** tab, click **Model Explorer**.
- 3 To specify the scope of the search, use the **Model Hierarchy** pane in combination with the **View > Show Current System and Below** setting. For example, to search the current system and loaded systems below it, select the `sldemo_fuelsys` node and enable **View > Show Current System and Below**.
- 4 Display the search bar by enabling **View > Toolbars > Search Bar**.
- 5 In the search bar, set:
 - **Search** to by Property Name
 - **Property** to Rounding

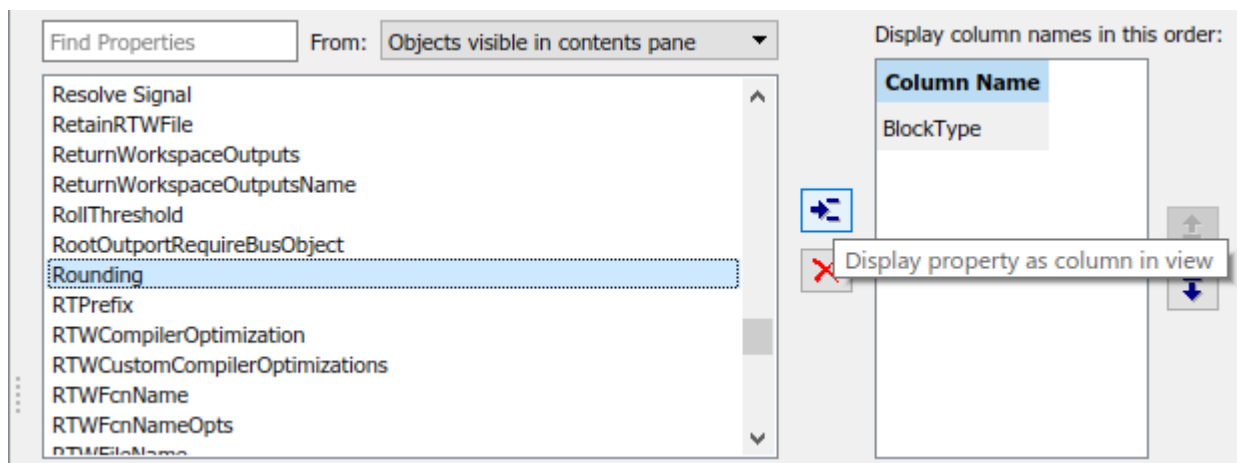

Rounding is the programmatic name for the **Integer rounding mode** parameter. Block reference pages list the programmatic name for a parameter in the parameter description.
- 6 Click **Search**. In the **Search Results** box, results appear. You can go to an item by clicking the link to the path.
- 7 Refine the search. In the search bar, click the **Search Options** button  and select **Refine Search**.

The search button label changes to **Refine**. Additional search criteria act on the previous set of results.

- 8 Set **Search** to by **Block Type** and set **Type** to **Lookup_n-D**. Click **Refine**.
- 9 To work further with the values, click **Show Details**.

Suppose the property you are interested in learning more about or acting on is **Rounding**. First, add a column for it. Select **Rounding** from the list (you can enter it in the **Find Properties** box to locate it quickly), and click the **Display property as column in view** button .

A column for **Rounding** appears in the search results. For any column, you can view, sort, and change values for multiple items. For example, to change the **Rounding** values on all of the n-D Lookup Table blocks in this search, select all the items in the list. In the **Rounding** column, click any cell and select a new value from the list (for example, **Floor**).

Tip To view a summary of the search options that you used, expand the **Number of objects found** box by clicking the **Show Search Details** button .

You can use the Model Explorer to create, modify, and view the entries in a data dictionary. See “Edit and Manage Workspace Variables by Using Model Explorer” and “View and Revert Changes to Dictionary Data”.

Display Partial or Whole Model Hierarchy Contents

By default, the Model Explorer displays objects for the system that you select in the **Model Hierarchy** pane. It does not display data for child systems. You can override that setting, so that the Model Explorer displays objects for the whole hierarchy of the currently selected system.

To toggle between displaying only the current system and displaying the whole system hierarchy of the current system, use one of these techniques:

- Select **View > Show Current System and Below**.
- Click the **Show contents of current system and below** button  at the top of the **Contents** pane.

When you select the **Show Current System and Below** option:

- The **Model Hierarchy** pane highlights the current system and its child systems.
- After the path in the **Contents** pane, the text (and below) appears.

Loading very large models for the current system and below can be slow. To stop the loading process at any time, either click the **Show contents of current system only** button or click another node in the tree hierarchy.

If you show the current system and below, you might want to change the view to better reflect the displayed system contents.

The setting for the **Show Current System and Below** option is persistent across Simulink sessions.

Note To open a graphical object (for example, a model, subsystem, or chart) in a Simulink Editor window from the Model Explorer, right-click the object in the **Model Hierarchy** pane, then select **Open**.

Display Linked Library Subsystems and Masked Subsystems

By default, the Model Explorer does not display the contents of linked library subsystems or masked subsystems in the **Model Hierarchy** pane.

To display the contents of linked library subsystems or masked subsystems, use one of these approaches:

- At the top of the **Model Hierarchy** pane, click the **Show/Hide Library Links** button  or the **Show/Hide Masked Subsystems** button .
- From the **View** menu, select **Show Library Links** or **Show Masked Subsystems**.

Linked subsystems and masked subsystems are visible in the **Contents** pane, regardless of how you configure the **Model Hierarchy** pane.

Note Search does not find elements in linked library or masked subsystems that are not displayed in the **Model Hierarchy** pane.

For subsystems that are both linked and masked, how you set the linked subsystems and masked subsystems options affects which subsystems appear in the **Model Hierarchy** pane, as described in the following table.

Settings	Subsystems Displayed in the Model Hierarchy Pane
Show Library Links Hide Masked Subsystems	Only library-linked, unmasked subsystems
Hide Library Links Show Masked Subsystems	Only masked subsystems that are not library-linked subsystems
Show Library Links Show Masked Subsystems	All library-linked or masked subsystems

Expand and Edit Referenced Models

To browse a model that includes Model blocks, you can expand the **Model Hierarchy** pane nodes of the Model blocks.

To browse a model referenced by a Model block:

- 1 Right-click the referenced model node in the **Model Hierarchy** pane.
- 2 Select **Open Model**.

The referenced model opens as a top model and appears as a separate node in the **Model Hierarchy** pane. While you can expand the Model block node and display the corresponding contents, you must use the node that corresponds to the referenced model to edit them.

For example, the `sldemo_mdref_depgraph` model includes Model blocks that reference other models. If you open the `sldemo_mdref_depgraph` model and expand that model node in the **Model Hierarchy** pane, you see that the model contains several Model blocks, including `heat2cost`.

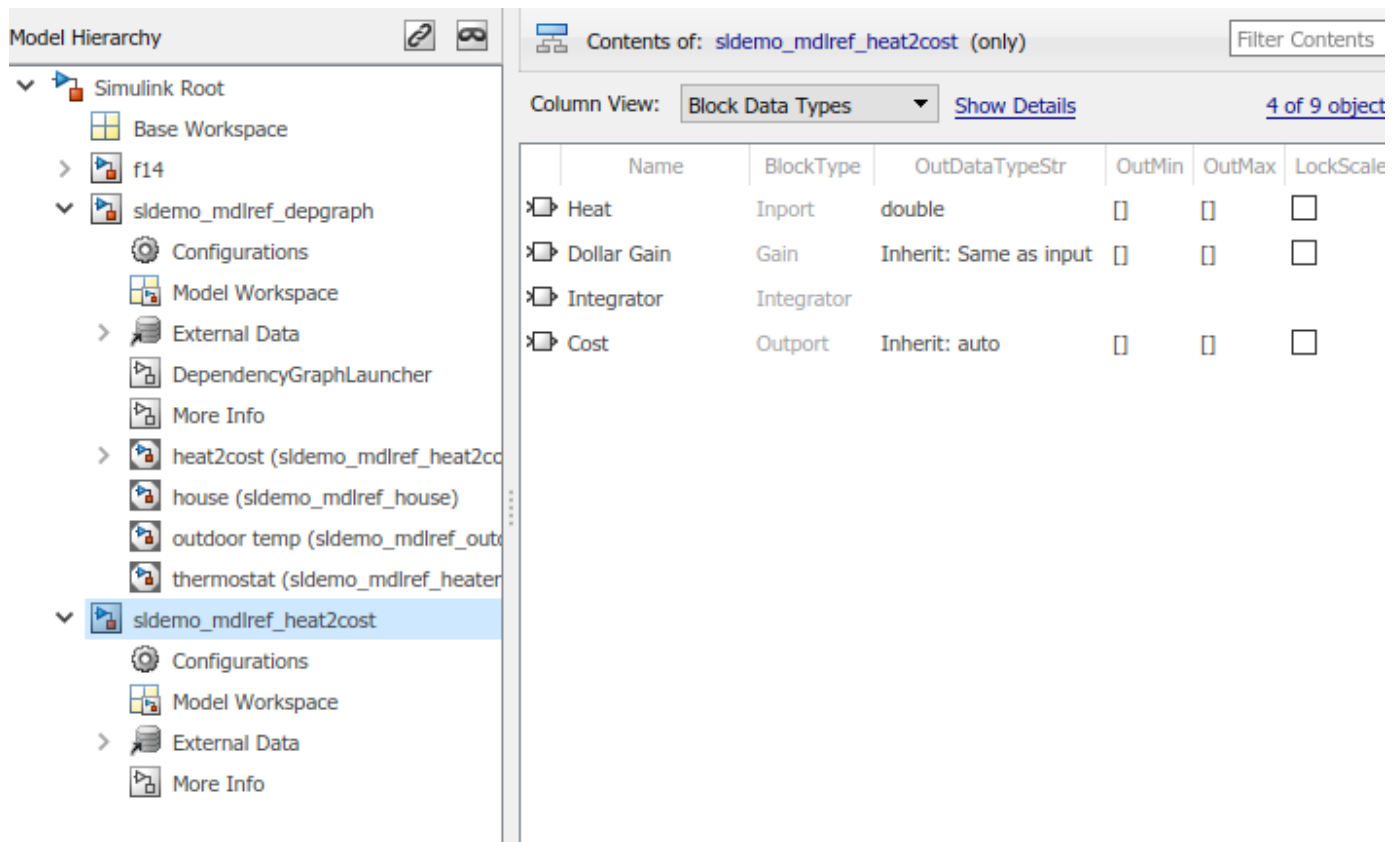

If you right-click the `heat2cost` Model block node and select **Open Model**, the **Contents** pane displays the objects in the `heat2cost` Model block. You can expand the `heat2cost` node.

The screenshot shows the Simulink Model Hierarchy and Column View panes. The Model Hierarchy pane on the left shows a tree structure starting from Simulink Root, with the 'heat2cost' block selected. The Column View pane on the right shows the contents of the 'heat2cost' block, displaying a table of block data types.

Name	BlockType	OutDataTypeStr	OutMin	OutMax	Loc
Model Workspace					
Heat	Inport	double			
Dollar Gain	Gain	Inherit: Same as input			
Integrator	Integrator				
Cost	Output	Inherit: auto			

You can browse the contents of the referenced model, but you cannot edit the objects in the Model block.

To edit the referenced model, expand the referenced model node in the **Model Hierarchy** pane, and then access the properties of objects in the referenced model. For example, expand the `sldemo_mdref_heat2cost` node.

The screenshot shows the Model Explorer interface. On the left is the 'Model Hierarchy' pane, which is expanded to show the 'sldemo_mdref_heat2cost' model. On the right is the 'Contents of: sldemo_mdref_heat2cost (only)' pane, which is set to 'Column View: Block Data Types'. Below this, a table displays the data types for four objects:

Name	BlockType	OutDataTypeStr	OutMin	OutMax	LockScale
Heat	Inport	double	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Dollar Gain	Gain	Inherit: Same as input	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Integrator	Integrator				
Cost	Output	Inherit: auto	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

For information about referenced models, see “Model Reference Basics”.

Change Font Size

You can change the font size in the Model Explorer panes.

To increase the font size, press **Ctrl+Plus (+)**. Alternatively, from the Model Explorer **View** menu, select **Increase Font Size**.

To decrease the font size, press **Ctrl+Minus (-)**. Alternatively, from the Model Explorer **View** menu, select **Decrease Font Size**.

The changes remain in effect for the Model Explorer and in Simulink dialog boxes across Simulink sessions.

Create Views

If a default view that ships with the Model Explorer does not meet your needs, you can modify or create a view.

To open the View Manager dialog box, select **View > Column View > Manage Views**.

To copy and rename an existing view:

- 1 In the View Manager dialog box, select the view that you want to use as the starting point for your new view.
- 2 Click the **Copy** button.

A new row appears at the bottom of the View Manager table. The new row contains the name of the view you copied, followed by a number in parentheses. For example, if you copy the Stateflow view, the initial name of the copied view is Stateflow (1).

To create a new view, in the View Manager dialog box, click the **New** button. A new view row appears at the bottom of the View Manager table.

After you create a view, you can name and describe the view:

- 1 Double-click the name of the view in the **View** column and enter a name for the view.
- 2 Double-click the text in the **Description** column and enter a description for the view.
- 3 Click **OK**.

Customize Views and Filter Contents

You can control the information the **Contents** pane displays and directly manipulate column headings.

To control which property columns to display, use the **View > Column View** option.

To control which types of objects to display, use the **View > Row Filter** option.

To focus on specific objects in the **Contents** pane, based on a search string, filter contents.

As you customize the table represented by the current view, you change the current view definition. The Model Explorer saves the following changes to the table as part of the column view definition:

- Grouping by property
- Sorting in a column
- Changing the order of property columns
- Adding a property column
- Hiding and removing property columns

When you change from one view to another view, the Model Explorer saves any customizations that you have made to the previous view.

For example, suppose you set **Column View** to **Block Data Types** view and you hide the **LockScale** property column. If you then switch to use the **Data Objects** view, and later use the **Block Data Types** view again, the **Block Data Types** view no longer includes the **LockScale** column that you hid.

At the end of a Simulink session, the Model Explorer saves the view customizations that you made during that session. When you reopen the Model Explorer, Simulink uses the customized view, and maintains any changes that you made to the view in the previous session.

If you modify a default view that ships with the Model Explorer, you can reset it to factory settings. With the default view as the current view, in the **Contents** pane, click **Show Details**, then click **Options > Reset This View to Factory Settings**.

To reset the factory settings for *all* default views in one step, in the View Manager dialog box, click the **Options > Reset All Views to Factory Settings**.

Note When you reset all views, the Model Explorer removes all the custom views you have created. Before you reset views to factory settings, export any views that you will want to use in the future. For more information, see “Manage Views” on page 7-49.

Manage Views

In the View Manager, you can delete, reposition, export, and import views for use by the Model Explorer.

To open the View Manager, select **View > Column View > Manage Views**.

To delete a view from the **Column View** list of views:

- 1 In the View Manager dialog box, select one or more views that you want to remove from the list.
- 2 Click the **Delete** button or press the **Delete** key.
- 3 Click **OK**.

Deleting a view using the View Manager dialog box permanently deletes that view from the Model Explorer interface. If you think you or someone else might want to use a view again, consider exporting the view before you delete it.

To change the position of a view in the **Column View** list:

- 1 In the View Manager dialog box, select one or more views that you wish to move up or down in the table of views.
- 2 Click the up or down arrow buttons to the right of the table. Repeat this step until the view appears where you want it to be in the table.
- 3 Click **OK**.

To export views that you or others can then import:

- 1 In the View Manager dialog box, select one or more views that you want to export.
- 2 Click the **Export** button. The Export Views dialog box opens with check marks next to the views that you selected.
- 3 Click **OK**. An Export to File Name dialog box opens.

Navigate to the folder where you want to export the view. By default, the Model Explorer exports views to the current folder in MATLAB.

- 4 Specify the file name for the exported view. The file is saved as a `.mat` file.
- 5 Click **OK**.

To import view files for use by the Model Explorer:

- 1 In the View Manager dialog box, click **Import**. The Select .mat File to Import dialog box opens.
- 2 Navigate to the folder that contains the view you want to import.
- 3 Select the MAT-file containing the view that you want to import and click **Open**. A confirmation dialog box opens. Click **OK** to import the view.

The imported views are added at the bottom of the View Manager table. The Model Explorer automatically renames the view if a name conflict occurs.

- “Build and Edit a Model Interactively”

Parameters

Search Bar

Search — Specify the type of objects or properties to include in the search

by Name | by Property Name | by Property Value | by Block Type | ...

Open the search bar by selecting **View > Toolbars > Search Bar**.

Use the **Search** setting to specify the type of objects or properties to include in the search.

Search Type Option	Description
by Name	Searches a model or chart for all objects that have the specified string in the name of the object.
by Property Name	Searches for objects that have a specified property. Specify the target property name from a list of properties that objects in the search domain can have.
by Property Value	Searches for objects with a property value that matches the value you specify. Specify the name of the property, the value to be matched, and the type of match (for example, equals, less than, or greater than).
by Block Type	Searches for blocks of a specified block type. Select the target block type from the list of types contained in the currently selected model.
by Stateflow Type	Searches for Stateflow objects of a specified type.
for Variable Usage	Searches for blocks that use variables defined in a workspace. Select the base workspace or a model workspace (model name) and, optionally, the name of a variable.
for Referenced Variables	Searches for variables that a model or block uses. Specify the name of the model or block in the by System field. The model or block must be in the Model Hierarchy pane.
for Unused Variables	Searches for variables that are defined in a workspace but not used by any model or block. Select the name of the workspace from the drop-down list for the in Workspace field.
for Library Links	Searches for library links in the current model.
by Class	Searches for Simulink objects of a specified class.

Search Type Option	Description
for Fixed Point Capable	Searches a model for all blocks that support fixed-point computations.
for Model References	Searches a model for references to other models.
by Dialog Prompt	Searches a model for all objects whose dialogs contain the prompt you specify.
by String	Searches a model for all objects in which the string you specify occurs.

Search Options – Specify search strings

name | property | type | variables | ...

Use search option settings to specify the scope of the search.

Search Option	Description
Match Whole String	Do not allow partial string matches (for example, do not allow sub to match substring).
Match Case	Considers case when matching strings (for example, Gain does not match gain).
Regular Expression	Considers a string to be matched as a regular expression.
Evaluate Property Values During Search	This option applies only for searches by property value. If enabled, Model Explorer evaluates the value of each property as a MATLAB expression and compares the result to the search value. If this option is disabled, the Model Explorer compares the unevaluated property value to the search value.
Refine Search	Enables you to search the initial search results. The second search operation searches for objects that meet both the original and the new search criteria.

By default, search strings are case-insensitive and are treated as regular expressions. The search allows partial string matches. You cannot use wildcard characters in search strings. For example, if you enter *1 as a name search string, you get no search results unless there is an item whose name starts with the characters *1. If there is an out1 item, the search results do not include that item.

Model Hierarchy Pane

Simulink Root – Display display nodes representing the MATLAB workspace, Simulink models, and Stateflow charts

node structure

Expand **Simulink Root** to display nodes representing the MATLAB workspace, Simulink models, and Stateflow charts that are in the current session.

Base Workspace – MATLAB workspace

node structure

Base Workspace represents the MATLAB workspace. The MATLAB workspace is the base workspace for Simulink models and Stateflow charts. Variables defined in this workspace are visible to all open models and charts.

Expanding a model or chart node in the **Model Hierarchy** pane displays nodes representing the following elements, as applicable, for the models and charts you have open.

Node	Description
Configurations	Select the Configurations node to show the model's configuration sets and configuration references in the Contents pane. For information about adding, deleting, saving, and moving configuration sets, see “Manage Configuration Sets for a Model”.
Model Workspace	For information about how to use the Model Explorer to work with model workspace variables, see these topics: <ul style="list-style-type: none"> • “Edit and Manage Workspace Variables by Using Model Explorer” • “Model Workspaces”
External data	Expand the External Data node to display external data sources for the model, including the base workspace (if access is enabled), and data dictionaries.
Top-level subsystems	Expand a node representing a subsystem to display underlying subsystems.
Model blocks	Expand model blocks to show contents of referenced models.
Stateflow charts	<ul style="list-style-type: none"> • Expand a node representing a Stateflow chart to display the top-level states of the chart. • Expand a node representing a state to display its substates.

Contents Pane

Contents Pane — Describe contents of node

table

The **Contents** pane displays one of two tables containing information about models and charts, depending on the tab that you select:

- The **Contents** tab displays an object property table for the node that you select in the **Model Hierarchy** pane.
- The **Search Results** tab displays the search results table.

You can also click **Show Details** to add and modify the columns that appear in the tables.

The **Contents** pane displays a table of model and chart object data.

In the **Contents** tab and in the **Search Results** tab:

- Table columns correspond to object properties (for example, Name and BlockType).

The table displays the first two columns (the object icon and the Name property) persistently, so that these columns remain visible regardless of how far you scroll to the right.

- Table rows correspond to objects (for example, blocks, and states).

The objects and properties displayed in the **Contents** pane depend on:

- The column view that you select in the **Column View** menu
- The node that you select in the **Model Hierarchy** pane
- The kind of object (for example, subsystem or chart) that you select in the **Model Hierarchy** pane
- The **View > Row Filter** options that you select

The link next to **Contents of** at the top of the **Contents** pane links to the currently selected node in the **Model Hierarchy** pane. The model data displayed in the **Contents** pane reflects the setting of the **Current System and Below** option.

Column View — Named set of properties

properties

The Model Explorer uses views to specify sets of property columns to display in the **Contents** pane.

Each kind of node in the **Model Hierarchy** pane displays specific properties in the **Contents** pane. For example, a Simulink model or subsystem node displays properties such as:

- `BlockType` (block type)
- `OutDataTypeStr` (output data type)
- `OutMin` (minimum value for the block output)

Generally, a column view does not contain the total set of properties for all the objects in a node. Specifying a subset of properties to display can streamline the task of exploring and editing model and chart object properties and increase the density of the data displayed in the **Contents** pane.

You can use a view to capture the following characteristics of the model information to show in the Model Explorer:

- Properties that you want to display in the **Contents** pane
- The layout of the **Contents** pane (for example, grouping by property, the order of property columns, and sorting)

You can use views in the following ways:

- Use the standard views that ship with the Model Explorer
- Customize the standard views
- Create your own views

The first time you open the Model Explorer, Simulink automatically applies one of the standard views to the node you select in the **Model Hierarchy** pane. The Model Explorer applies a view based on the kind of node you select.

The Model Explorer assigns one of four categories of nodes in the **Model Hierarchy** pane. The Model Explorer initially associates a default view with each node category. The four node categories are:

Node Category	Kinds of Hierarchy Nodes Included	Initial Associated View
Simulink	Models, subsystems, and root level models	Block Data Types
Workspace	Base and model workspace objects	Data Objects
Stateflow	Stateflow charts and states	Stateflow
Configurations	Configurations section node	Configurations
Other	Objects that do not fit into one of the first three categories; for example, configuration sets	Default

The **Column View** field at the top of the **Contents** pane displays the view that the Model Explorer is currently using.

In the **Contents** pane, from the **Column View** list, you can select a different view. If you select a different view, then the Model Explorer associates that view with the category of the current node. For example, suppose the selected node in the **Model Hierarchy** pane is a Simulink model, and the current view is **Data Objects**. If you change the view to **Signals**, then when you select another Simulink model node, the Model Explorer uses the **Signals** view.

By default, the Model Explorer automatically applies a view based on the category of node that you select and the last view used for that node. You can manually select a view from the **Column View** list that better meets your current task.

You can shift from the default mode of having the Model Explorer automatically apply views to a mode in which you must manually select a view to change views.

To enable the manual view selection mode:

- 1 Select **View > Column View > Manage Views**.

The View Manager dialog box opens.

- 2 In the View Manager dialog box, click the **Options** button and clear **Change View Automatically**.

In the manual view selection mode, if you switch to a different kind of node in the **Model Hierarchy** pane that has a different view associated with it, the **Contents** pane displays a yellow informational bar suggesting a view to use.

You can manage views (for example, create a new view or export a view) using the View Manager dialog box. To open the View Manager dialog box, select the **Manage Views** option from either:

- The **View > Column View** menu
- The options listed when you click the **Options** button in the column view details section

The View Manager dialog box displays a list of defined views and provides tools for you to manage views.

You can manage views in several ways, including creating, deleting, reordering, exporting, importing, and resetting views.

Tip Interface — Display or hide tips

tip field

The tip interface appears immediately above the table in the **Contents** pane. It does not appear if, in the View Manager dialog box, you clear **Options > Change View Automatically**. The tip interface displays a link for changing the current view to a suggested view. To choose the suggested view displayed in the tip bar, click the link. To hide the currently displayed tip, from the menu button on the right side of the tip bar, select **Hide This Tip**.

Initially, the suggested view is the default view associated with a node. If you associate a different view with a node category, then the tip suggests the most recently selected view when you select similar nodes.

To change from manual specification of views to automatic specification, from the tip interface, select the down arrow and **Change View Automatically**.

To enable the tip interface, in the **View** menu, select **Column View > Manage Views**. In the View Manager, enable **Options > Change View Automatically**.

Dialog Pane

Dialog Pane — Display properties of objects

dialog pane

Use the **Dialog** pane to view and change properties of objects that you select in the **Model Hierarchy** pane or in the **Contents** pane.

By default, the **Dialog** pane appears to the right of the **Contents** pane. To show or hide the **Dialog** pane, use one of these approaches:

- From the **View** menu, select **Show Dialog Pane**.
- From the main toolbar, click the **Dialog View** button .

To edit property values using the **Dialog** pane:

- 1 In the **Contents** pane, select an object (such as a block or signal). The **Dialog** pane displays the properties of the object you selected.
- 2 Change a property (for example, the port number of an Outport block).
- 3 Click **Apply** to accept the change, or click **Revert** to return to the original value.

By default, clicking outside the **Dialog** pane when a field has unapplied changes causes the Apply Changes dialog box to appear. Click **Apply** to accept the changes or **Ignore** to revert to the original settings.

To prevent the Apply Changes dialog box from displaying:

- 1 In the dialog box, click the **In the future Apply or Ignore (whichever I select) without asking** check box.
- 2 If you want Simulink to apply changes without warning you, press **Apply**. If you want Simulink to ignore changes without warning you, press **Ignore**.

To restore the **Apply Changes** dialog box, from the **Tools** menu, select **Prompt if dialog has unapplied changes**.

When you select a numeric MATLAB variable or a `Simulink.Parameter` object in a model workspace, the **Argument** check box appears in the **Dialog** pane. This check box configures the variable or object as a model argument. See “Parameterize Instances of a Reusable Referenced Model”.

Programmatic Use

`daexplr` opens the Model Explorer.

Model Reference Conversion Advisor

Convert subsystems to referenced models

Description

The Model Reference Conversion Advisor converts subsystems, including conditional and referenced subsystems, to referenced models.

Converting subsystems to referenced models is beneficial for modeling large, complex systems and for team-based development. Many large models use a combination of subsystems and referenced models. To decide whether to convert a subsystem to a referenced model, see “Choose Among Types of Model Components”.

When the conversion encounters an issue, the advisor helps you review and fix the issue. Preparing the contents of a Subsystem block can eliminate or reduce the number of issues that the advisor identifies. Addressing these issues in the model editing environment can be more efficient than switching repeatedly between the advisor and the Simulink Editor.

The Model Reference Conversion Advisor does not support conversion for some types of subsystems. For example:

- Subsystem blocks with Simscape Multibody components that cross the subsystem boundary
- Asynchronous subsystems — To convert asynchronous subsystems to referenced models that accept asynchronous function calls, see “Asynchronous Support Limitations” (Simulink Coder).

Open the Model Reference Conversion Advisor

- In the Simulink Editor, select a Subsystem block. In the Simulink Toolstrip, on the **Subsystem Block** tab, select **Convert > Model Block**.
- In the MATLAB command window, use the `Simulink.SubSystem.convertToModelReference` function with the 'UseConversionAdvisor' argument set to true.

Examples

Set Subsystem Conversion Options

Specify input parameters that determine the output of the conversion and control whether the advisor automatically attempts to fix conversion errors.

When you open the advisor, in the left pane, the top node is selected. This node identifies the Subsystem block that the advisor will convert to a referenced model and provides conversion input parameters. You can use the default parameter values or change the values to customize the conversion.

Input Parameter	Description
New model name	<p>The advisor provides a model name based on the Subsystem block name that is unique in the MATLAB path.</p> <p>The model name cannot exceed 59 characters. For more information, see “Model Names”.</p> <hr/> <p>Tip If the advisor generates an error indicating that the target referenced model already exists, then use the New model name parameter to specify a new file name.</p>
Conversion data file name	<p>The advisor creates a file for storing data created during the conversion. By default, the advisor uses the model name at the beginning of the file name and appends the file name with <code>_conversion_data.mat</code>. For example, for a subsystem in a model named <code>myModel</code>, the conversion file name is <code>myModel_conversion_data.mat</code>.</p> <p>You can save the conversion data in a MAT-file (default) or a MATLAB file. If you use a <code>.m</code> file extension, the advisor serializes all variables to a MATLAB file.</p> <hr/> <p>Note If the top model uses a data dictionary, you cannot select this option.</p>
Fix errors automatically (if possible)	<p>By default, if an advisor check finds an error that the advisor can fix, the advisor provides a Fix button. Click it to have the advisor fix the issue.</p> <p>If you enable this parameter, the advisor fixes all the conversion errors it can without displaying the Fix button.</p>
Replace the content of a subsystem with a Model block	<p>By default, the advisor updates the original model by inserting a Model block. The advisor action depends on whether you use the automatic fix options.</p> <ul style="list-style-type: none"> • If you use the automatic fixes, then the advisor replaces the Subsystem block with a Model block unless the automatic fixes change the input or output ports. If the ports change, the advisor includes the contents of the subsystem in a Model block and inserts it into the Subsystem block. • If you do not use the automatic fixes, then the advisor replaces the Subsystem block with a Model block. <p>Clear this parameter to have the advisor open a new Simulink Editor window that contains only a Model block that references the newly created referenced model. The advisor does not update the original model in the other Simulink Editor window.</p>

Input Parameter	Description
Copy code mappings	<p>Copy the code mapping information from the parent model to the new, converted referenced model. By default, this parameter is cleared.</p> <p>Code mapping information includes configurations of model data elements for code generation. This parameter does not affect simulation.</p> <p>For more information, see “Convert Subsystem to Referenced Model and Generate Code” (Simulink Coder).</p>
Model block simulation mode	<p>Simulation mode for the new Model block that references the referenced model.</p> <ul style="list-style-type: none"> • Normal (default) • Accelerator
Check simulation results after conversion	<p>Compare top-model simulation results before and after conversion.</p> <p>To use this option, before performing the conversion:</p> <ul style="list-style-type: none"> • Enable signal logging for the subsystem output signals of interest. • Select Replace the content of a subsystem with a Model block. • Set the Model block simulation mode option in the advisor to the same simulation mode as the original model. • Specify the Stop time, Absolute tolerance, and Relative tolerance. <p>To see the results after the conversion is complete, click View comparison results. The advisor displays the results of the comparison in the Simulation Data Inspector. For more information, see “Compare Simulation Results Before and After Conversion”.</p>
Stop time	<p>By default, the advisor uses the stop time of the top model, unless the stop time of the top model is <code>inf</code>. If the stop time of the top model is <code>inf</code>, the advisor uses a default stop time of 10.</p> <p>To use this option, select Check simulation results after conversion.</p>
Absolute tolerance	<p>The absolute signal tolerance for the simulation run comparison. The default is $1e-06$.</p> <p>To use this option, select Check simulation results after conversion.</p>
Relative tolerance	<p>The relative signal tolerance for the simulation run comparison. The default is $1e-03$.</p> <p>To use this option, select Check simulation results after conversion.</p>
Show report after run	<p>After the conversion completes, open a report that summarizes the conversion setup and results.</p>

Automatically Convert Subsystem to Referenced Model

The Model Reference Conversion Advisor can step through each check automatically.

- 1 After you configure the subsystem conversion options, click **Convert**.

The Model Reference Conversion Advisor steps through each check automatically.

- 2 Address any issues that the advisor reports. The advisor provides a **Fix** button for any issues it can fix automatically.
- 3 After you address the reported issues, click **Continue**.

After the Model Reference Conversion Advisor successfully runs all checks, it completes the conversion.

Check Conversion Input Parameters

Verify that all conversion input parameters are valid.

For information on conversion input parameters, see “Set Subsystem Conversion Options” on page 7-58.

- 1 In the left pane, select the **Check conversion input parameters** node.
- 2 Click the **Run This Task** button.
- 3 Address any issues that the advisor reports. The advisor provides a **Fix** button for any issues it can fix automatically.
- 4 After you address the reported issues, click **Continue**.

Check Model Configurations

Verify that the model configurations meet model referencing requirements. This check identifies model configuration parameter settings that are not valid for model references.

- 1 In the left pane, select the **Check model configurations** node.
- 2 Click the **Run This Task** button.
- 3 Address any issues that the advisor reports. The advisor provides a **Fix** button for any issues it can fix automatically.
- 4 After you address the reported issues, click **Continue**.

Check Subsystem Interface

Verify whether the subsystem interface meets model reference requirements.

- 1 In the left pane, select the **Check subsystem interface** node.
- 2 Click the **Run This Task** button.

The advisor verifies that the type of subsystem is one that the advisor can convert. Then, it verifies that the interfaces to specific types of subsystems, such as masked subsystems, meet conversion requirements.

- 3 Address any issues that the advisor reports. The advisor provides a **Fix** button for any issues it can fix automatically.

- 4 After you address the reported issues, click **Continue**.

Check Subsystem Content

Verify whether the subsystem content meets model reference requirements.

- 1 In the left pane, select the **Check subsystem content** node.
- 2 Click the **Run This Task** button.

The advisor checks whether the model compiles successfully. Upon successful compilation, the advisor checks whether the blocks in the subsystem meet the requirements for conversion.

- 3 Address any issues that the advisor reports. The advisor provides a **Fix** button for any issues it can fix automatically.
- 4 After you address the reported issues, click **Continue**.

Complete Conversion

After all checks run successfully, complete the conversion.

- 1 In the left pane, select the **Complete conversion** node.
- 2 Click the **Run This Task** button.

The Model Reference Conversion Advisor:

- Creates a referenced model from the subsystem.
- Creates the `Simulink.Bus` objects, `Simulink.Signal` objects, and tunable parameters that the referenced model requires.
- By default, replaces the Subsystem block with a Model block that references the new model.
- Inserts the Model block in a Subsystem block if the automatic fixes added ports to the Model block interface.
- Creates an HTML conversion summary report in the `s\prj` folder. This report summarizes the results of the conversion process, including the results of the fixes that the advisor performed. This report also describes the elements that the advisor copies.
- Optionally checks the consistency of simulation results before and after conversion.
- Copies the following elements from the original model to the new referenced model.
 - **Configuration set** — If the parent model uses:
 - A configuration set that is not a referenced configuration set, the advisor copies the entire configuration set to the referenced model
 - A referenced configuration set, then both the parent and referenced models use the same referenced configuration set
 - **Variables** — The advisor copies only the model workspace variables that the subsystem used in the original model to the model workspace of the referenced model. If the model that contained the subsystem uses a data dictionary, then the referenced model uses the same data dictionary.

- **Requirements links** — The advisor copies requirements links created with Requirements Toolbox™ software to the Model block from the original Subsystem block.

If you are not satisfied with the conversion results, you can restore the model to its initial state. After you successfully run the **Complete conversion** check, use the **Click here to restore the original model** link.

If you selected **Check simulation results after conversion**, you can view the results by using the **Click here to view the comparison results** link.

Compare Simulation Results Before and After Conversion

If you selected **Check simulation results after conversion**, the Model Reference Conversion Advisor provides a comparison of top-model simulation results before and after conversion.

After you successfully run the **Complete conversion** check, click **Click here to view the comparison results**. The results display in the **Simulation Data Inspector**. A green check mark indicates that simulation results are within tolerance between the baseline model and the model with the new referenced model.

For more information, see “Compare Simulation Data”.

Multiple Simulations

Run multiple simulations from the Simulink Editor

Description

Multiple Simulations panel allows you to setup multiple simulations for a block parameter that you want to vary, for example, for a parameter sweep, or Monte-Carlo simulations. You can pick the block parameter of interest from the model canvas and specify values that you want to use for the simulations. You can also specify variables for the simulations. With the **Multiple Simulations** panel, you can provide configurations such as **Use Parallel** to run your simulations in parallel. To run the simulations that you have set up, first, select the design study, then click the **Run All** button in the **Simulation** section on the Simulink toolstrip. Once the simulations are complete, you can view and manage the results in **Simulation Manager**.

Open the Multiple Simulations

- To open the **Multiple Simulations** panel, navigate to the **Prepare** section on the Simulink

toolstrip. In the **Inputs & Parameter Tuning** section, click **Multiple Simulations**

Examples

- “Multiple Simulations Panel: Simulate for Different Values of Stiffness for a Vehicle Dynamics System”

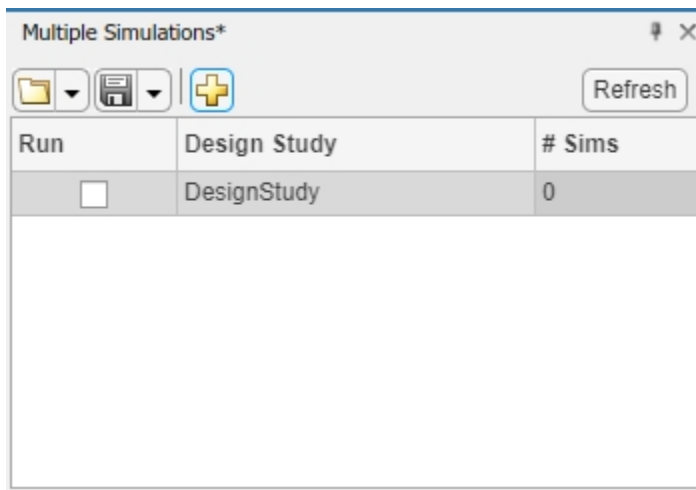

Programmatic Use

`parsim(in)` is the command line equivalent syntax for the command line.

More About

Design Study

In the panel, you can click the right most button to create a new design study. A new design study object is added to the panel. The name of this design study is automatically populated. To change the name, double click on the name and enter your preferred name. A design study is an object that allows you to set up simulations. Once you configure and set up the values for the simulations, you can select this design study and click **Run All** on the Simulink toolstrip to run the simulations.

Property Inspector

Edit parameters and properties for any Simulink model element

Description

The Simulink **Property Inspector** enables you to use a single interface to edit parameters and properties for any model element.

You can leave the Property Inspector open as you build your model, and it updates with your selection. You can use the Property Inspector to edit:

- Block parameters and properties
- Stateflow elements
- Annotations, areas, and images
- Signals
- Model properties

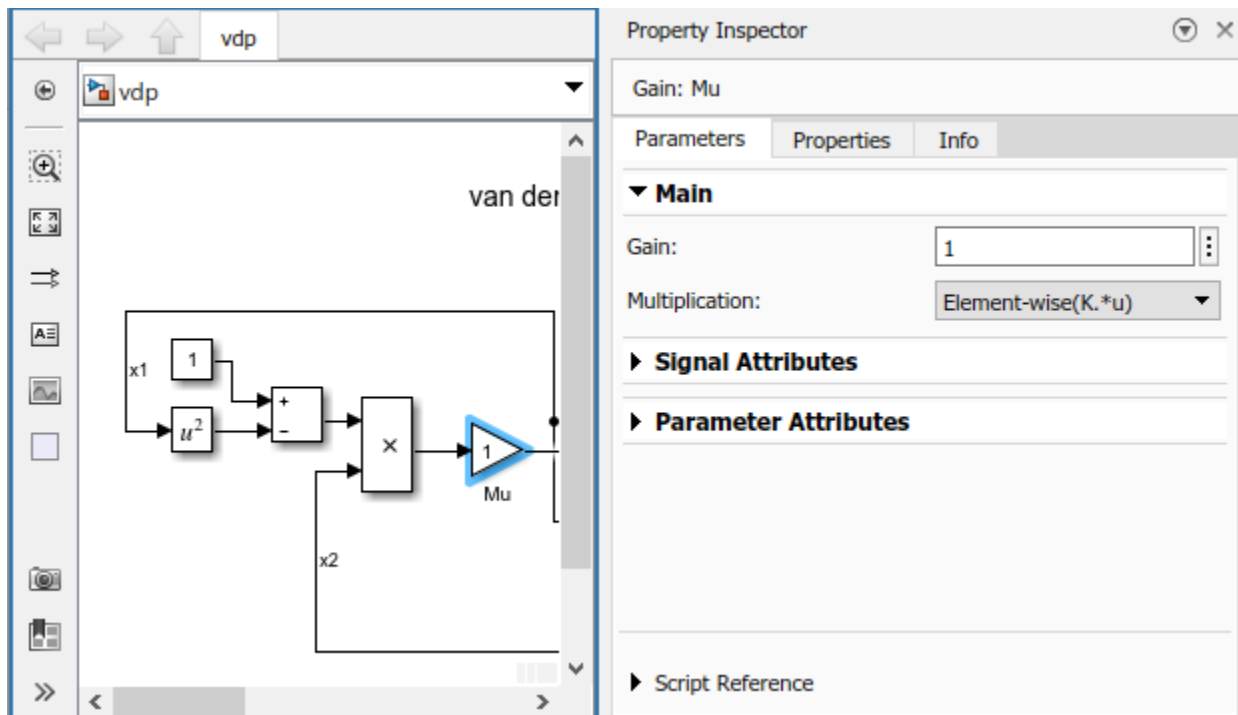

When you open the Property Inspector, it opens as a pane in the current Simulink Editor window. You can drag the Property Inspector from the default location and dock it in another location in the editor. The down arrow to the right of the pane title provides options to undock, minimize, and open help for the pane.

The Property Inspector lets you quickly set parameters and properties as you work. Values take effect when you set them. For more information on setting block parameters and properties, see “Add Blocks and Set Parameters”.

Note You can alternatively open a dialog box for a selected model element by right-clicking and selecting an item such as **Properties**, or for blocks, **Block Parameters**. Double-clicking a block generally opens a block dialog box. (Use one of the menu commands on Subsystem and Model blocks.)

The Property Inspector and dialog boxes operate on a single selected element. The main difference is that the Property Inspector updates with each selection, and the dialog box shows settings for only the element you opened it from. For this reason, the dialog box is useful if:

- You are moving through the model hierarchy and want to see or set element parameters or properties as you navigate the model.
 - You want to compare the parameters or properties of similar elements.
 - The settings are advanced and appear only in the dialog box.
-

Open the Property Inspector

- In the Simulink Toolstrip, on the **Modeling** tab, in the **Design** gallery, select **Property Inspector**.
- While in the Simulink Editor, press **Ctrl+Shift+I**.

Examples

Set Block Parameter Value

You can set parameters on most blocks. Parameters allow you to specify how a block operates in the model.

- 1 Open the vdp model.
vdp
- 2 Open the Property Inspector. On the **Modeling** tab, in the **Design** gallery, click **Property Inspector**.
- 3 In the model, select the Gain block named Mu.
- 4 In the Property Inspector, set the **Gain** parameter to 2, then press **Enter**.

Referenced Files Pane

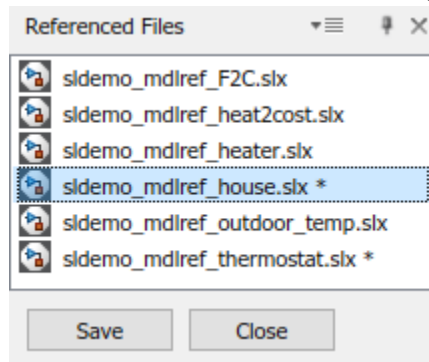

View, save, and close referenced subsystems and models

Description

The **Referenced Files** pane allows you to view, save, and close referenced subsystems and models in the corresponding model hierarchy.

The **Referenced Files** pane shows a flat list of model and subsystem files that are loaded and referenced by the model hierarchy. Opening the top model in the model hierarchy does not load the referenced models in the model hierarchy. Load referenced models by opening them in the Simulink Editor or by using a function such as `load_system`. Referenced subsystems load when you load the models that reference them.

When you save a model using the **Referenced Files** pane, you also save the models it references. When you close a model using the **Referenced Files** pane, you also close the models it references that are not open in another model hierarchy. Before you can close a modified model, you must choose whether to save the corresponding changes, which include changes to the model workspace.

Open the Referenced Files Pane

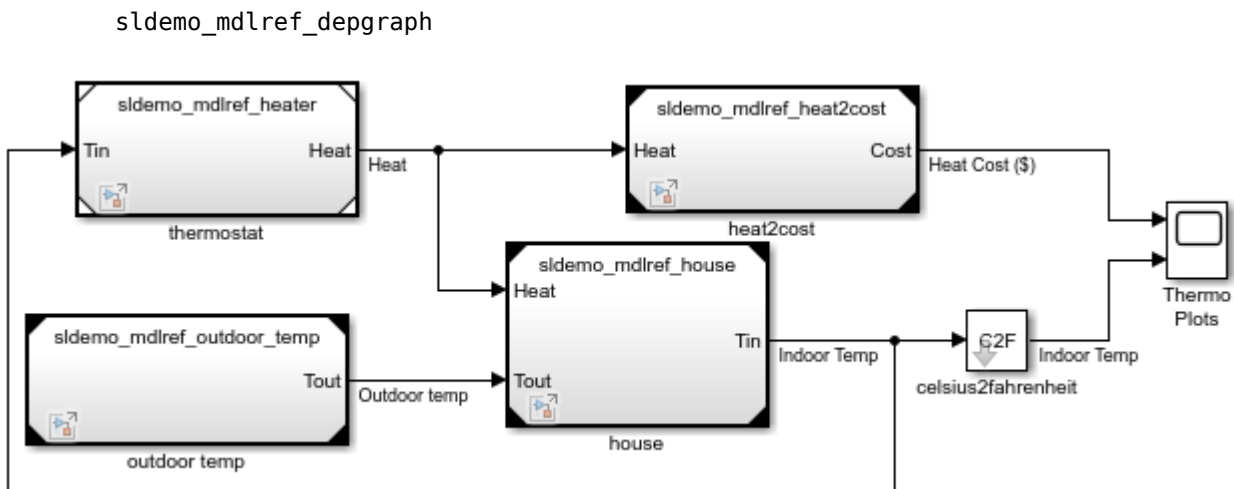

- On the **Modeling** tab, in the **Design** gallery, click **Referenced Files**.
- If a referenced file in the model hierarchy has been modified, on the **Simulation** tab, click the **Save All** button arrow, then click **Save Referenced Files > Manage Referenced Files**.
- Navigate into a referenced model in the model hierarchy. The **Referenced Files** pane opens as a tab on the left side of the Simulink Editor unless you have previously hidden the pane.

Examples

Individually Save and Close Referenced Models

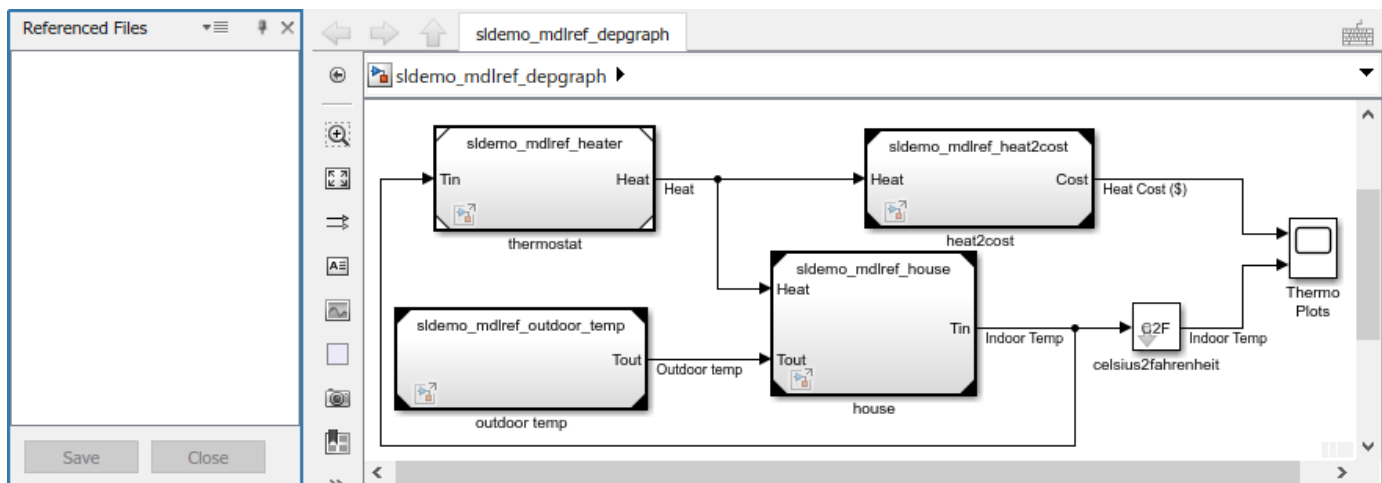

Save and discard changes to individual referenced models in a model hierarchy.

Open the top model in a model hierarchy that contains multiple referenced models.

On the Simulink Toolstrip **Modeling** tab, in the **Design** gallery, click **Referenced Files**.

The **Referenced Files** pane opens. It does not show any referenced subsystems or models. The `sldemo_mdref_depgraph` model does not reference any subsystems, but it references multiple models. The referenced models must be loaded to appear in the **Referenced Files** pane.

Double-click the block named `thermostat`.

The `sldemo_mdref_heater` model loads and opens. When **Show Only Modified Files** in the **Filter contents** list (☰) is cleared, this model appears in the **Referenced Files** pane. Otherwise, you must modify the file before it appears.

Modify `sldemo_mdref_heater` by moving a block.

Next to the model name, the dirty flag (*) indicates that the model has unsaved changes.

Double-click the block named `Fahrenheit` to `Celsius`.

The `sldemo_mdref_F2C` model loads and opens.

Modify `sldemo_mdref_F2C` by moving a block.

Next to the model name, the dirty flag (*) indicates that the model has unsaved changes.

Suppose you want to keep your changes to `sldemo_mdref_F2C`, and you want to discard your changes to `sldemo_mdref_heater`.

If you select `sldemo_mdref_heater` and click **Close**, you receive a message asking whether to save the changes to `sldemo_mdref_heater` and `sldemo_mdref_F2C` before closing both models. Unless a referenced model is open in another model hierarchy, closing its parent model closes the referenced model.

To keep your changes to `sldemo_mdref_F2C`, select it in the **Referenced Files** pane and click **Save**. Then, select `sldemo_mdref_heater` and click **Close**.

Introduced in R2020b

Schedule Editor

View and edit the schedule of model components (partitions)

Description

The Schedule Editor is a scheduling tool that represents the components in the model known as partitions, the data connections between them, and the order of those partitions.

Partitions are the components of the model that execute independently as tasks. The data connections between the partitions show the flow of the data between those partitions. The scheduling of these partitions is based on the rates and the events in the model. This schedule is shown in the **Order** table in the Schedule Editor.

Using the Schedule Editor, you can:

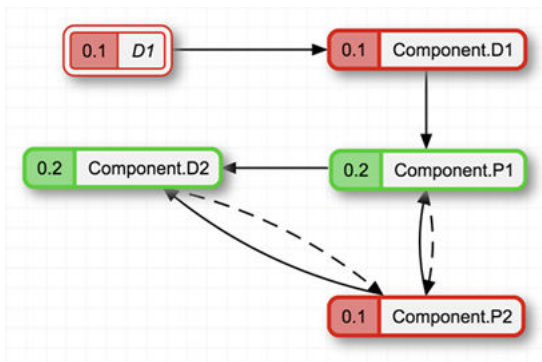

- Create partitions and specify their order.
- Edit and analyze the schedule of the executable partitions without disturbing the structure of the model.
- Visualize how Simulink executes partitions.

Changes made in the Schedule Editor affect both, simulation and code generation.

Using the Schedule Editor

The Schedule Editor consists of two parts representing two different views of partitions in the model:

- A graph that shows the partitions and the data connections between them.

- A table that shows the order in which the partitions execute.

ORDER		
Order	Name	Trigger
1	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: black; margin-right: 5px;"></div> Cont <i>implicit</i> </div> <div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: red; margin-right: 5px;"></div> D1 <i>implicit</i> </div>	0 0.001
2	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> D2 <i>implicit</i> </div>	0.005
3	▶ ThrottleControl.APPSnsrRun	
4	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> ThrottleControl.ActuatorRun5ms </div>	0.005
5	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> ThrottleControl.TPSSecondaryRun5ms </div>	0.005
6	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> ThrottleControl.MonitorRun5ms </div>	0.005
7	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> ThrottleControl.ControllerRun5ms </div>	0.005
8	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: blue; margin-right: 5px;"></div> D3 <i>implicit</i> </div>	0.01
9	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: blue; margin-right: 5px;"></div> ThrottleControl.TPSPrimaryRun10ms </div>	0.01

Changing one of the views impacts the other.

To use the Schedule Editor, select **Schedule Editor** in the **Design** section of the **Modeling** tab. If the model is already partitioned, you can open the Schedule Editor by clicking the  badge, which appears above the blocks. To see the default partitions present in the model in the Schedule Editor, update the diagram by clicking the  icon on the toolbar or by selecting **Ctrl+D**. As you create partitions in the model and update the diagram, partitions appear in the Schedule Editor.

To check how the partitions map to the model, right-click the partitions and select **Show Source**. The Simulink model window appears with every block corresponding to the partition highlighted.

Order

The **Order** shows the order in which the partitions execute. To change the order, you can drag and drop the partitions. You can also use the **Up** and **Down** arrows on the toolbar. Partitions are sorted based on their rates. You can only reorder the partitions with the same rate. Clicking a partition in the **Order**, highlights the corresponding partition in the graph. On changing the order, the connections that are affected by this specified change get highlighted.

3	▶ ThrottleControl.APPSnsrRun	
4	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> ThrottleControl.ActuatorRun5ms </div>	0.005
5	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> ThrottleControl.TPSSecondaryRun5ms </div>	0.005
6	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> ThrottleControl.MonitorRun5ms </div>	0.005
7	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> ThrottleControl.ControllerRun5ms </div>	0.005
8	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: blue; margin-right: 5px;"></div> D3 <i>implicit</i> </div>	0.01
9	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: blue; margin-right: 5px;"></div> ThrottleControl.TPSPrimaryRun10ms </div>	0.01

Connections

Connections between the partitions show data dependencies. You can right-click the connections between the partitions to change the constraints on data connections. The different types of connections illustrate how the partitions behave with each other.

The types of connections are:

- **Dependency** — Indicates that the source always runs before the destination. The dependency connection is a solid line.

- **Delay** — Indicates that the destination runs before the source. When the destination runs before the source, a scheduling delay is introduced. The delay connection is a dashed line.

You can put these types of constraints on connections:

- **Allow Delay** — Inserts a delay when required. When you specify this constraint for a connection, Simulink inserts a delay for that connection only when necessary. The unlock icon on the connections signifies an allowed delay. When you select this constraint on a connection, Simulink prefers these connections to be turned into a delay if necessary over other connections.

This constraint is displayed as one of these options.

- **Prevent Delay** — Prevents delay from being inserted in the connection. When you specify this constraint for a connection, Simulink ensures that the connection is a dependency. The lock icon on the connection indicates that the connection is locked as a dependency and is not changed to a delay.

Events

The **Events** panel allows you to manage events in the Schedule Editor. The events in the Schedule Editor can bind with aperiodic partitions to schedule their execution. You can create events in the Schedule Editor and use these events to send from Stateflow to schedule execution of an aperiodic partition. To send the events from the Stateflow chart, use the `send(eventName)` command.

In the **Events** panel, you can see the listeners and the broadcasters of the event. The icon denotes the listeners, and the icon denotes the broadcasters. When you bind the aperiodic partition with an event, the aperiodic partition executes when that event is sent. The broadcaster of the event shows you the path of the Stateflow chart that sends the event.

Click the icon to create an event in the Schedule Editor, and select a listener partition from the drop down. You can also bind an event by dragging and dropping the event over a valid aperiodic partition.

When an event is bound to a partition, the event name appears on the left side of the partition and in the **Trigger** column of the **Order** table.

The screenshot displays the Schedule Editor interface. The main workspace shows a block diagram with several blocks representing partitions and their execution order. The blocks are:

- Cont**: A control block with a sample time of 0.001 and a trigger of D1.
- ThrottleControl.TPSSecondaryRun5ms**: A block with a sample time of 0.005 and a trigger of D2.
- ThrottleControl.TPSPPrimaryRun10ms**: A block with a sample time of 0.01 and a trigger of D3.
- ThrottleControl.APPSnsrRun**: A block with a sample time of 0.01 and a trigger of D3.
- ThrottleControl.MonitorRun5ms**: A block with a sample time of 0.005 and a trigger of D2.
- ThrottleControl.ControllerRun5ms**: A block with a sample time of 0.005 and a trigger of D2.
- ThrottleControl.ActuatorRun5ms**: A block with a sample time of 0.005 and a trigger of D2.
- ThrottleControl.D2**: A block with a sample time of 0.005 and a trigger of D2.

 The **ORDER** table on the right lists the execution order of these blocks:

Order	Name	Trigger
0	Cont	D1
1	ThrottleControl.TPSSecondaryRun5ms	D2
2	ThrottleControl.TPSPPrimaryRun10ms	D3
3	ThrottleControl.APPSnsrRun	D3
4	ThrottleControl.MonitorRun5ms	D2
5	ThrottleControl.ControllerRun5ms	D2
6	ThrottleControl.ActuatorRun5ms	D2
7	ThrottleControl.D2	D2

Open the Schedule Editor

- Simulink: In the **Modeling** tab, expand the **Design** section and select **Schedule Editor** from **System Design**.
- Simulink model: Click the badge on the partitioned blocks.

Examples

- “Schedule an Export-Function Model Using the Schedule Editor”
- “Schedule a Rate-Based Model Using the Schedule Editor”
- “Events in Schedule Editor”

Parameters

Manage Partitions

Partition Name — Name of the partitions

character vector

Name of the partitions created. Double-click the name to edit and use the enter key to save the partition name.

Sample Time — Sample time for partitions to execute

discrete value | variable

Sample time at which the partitions execute. The sample time is a discrete value or a defined variable that contains a discrete value.

Property Inspector**Hit times — Times for aperiodic partitions to execute**

vector

Times at which the aperiodic partitions execute, specified as a vector of discrete values.

Connections — Data connections between partitions

Auto (default) | Delay | Dependency | Prevent Delays | Allow Delays

Dependency between the partitions is shown as a solid line. A delay between the partitions is shown as a dashed line. The arrow tail and head denote the source and destination, respectively.

Specify constraints on the connections by right-clicking the lines and selecting the constraint type.

More About**Order**

By default, the **Order** table is expanded. **Order** shows the order of partition execution. Edit the order by dragging the partitions or using the **Up** and **Down** arrows on the toolstrip.

Manage Partitions

By default, the **Manage Partitions** panel is collapsed. Expand the panel to create partitions, edit names and/or sample times of the existing partitions, and remove existing partitions. Changes made in the **Manage Partitions** panel take effect after updating the diagram.

Property Inspector

The **Property Inspector** shows information about the selected partition. It shows the rate at which the partition executes and the connections on that partition. Enter the **Hit times** when you select an aperiodic partition in the **Property Inspector**.

Arrange

The **Arrange** button organizes the partition graph.

Layout

By default, the **Order** panel and the **Property Inspector** panel are expanded. From the **Layout** drop-down, select the preferred panels to be expanded as per preference. Clearing the panels collapses them.

Introduced in R2019a

Sequence Viewer

Visualize messages, events, states, transitions, and functions

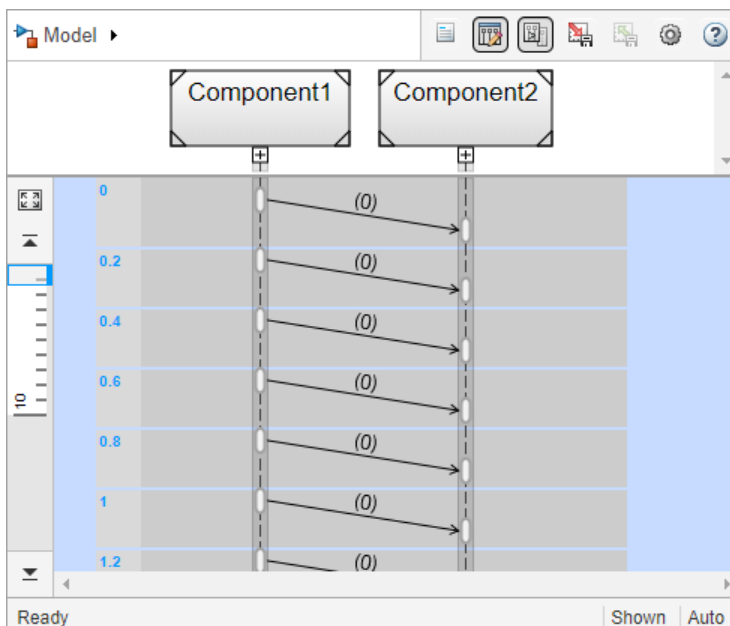

Description

The Sequence Viewer visualizes message flow, function calls, and state transitions.

Use the Sequence Viewer to see the interchange of messages, events, function calls in Simulink models, Simulink behavior models in System Composer and between Stateflow charts in Simulink models.

In the Sequence Viewer window, you can view event data related to Stateflow chart execution and the exchange of messages between Stateflow charts. The Sequence Viewer window shows messages as they are created, sent, forwarded, received, and destroyed at different times during model execution. The Sequence Viewer window also displays state activity, transitions, and function calls to Stateflow graphical functions, Simulink functions, and MATLAB functions. For more information, see “Use the Sequence Viewer to Visualize Messages, Events, and Entities”.

Note The Sequence Viewer does not display function calls generated by MATLAB Function blocks and S-functions.

Open the Sequence Viewer

- Simulink Toolstrip: On the **Simulation** tab, in the **Review Results** section, click **Sequence Viewer**.

Examples

Using the Sequence Viewer Tool

- 1 To activate logging events, in the Simulink Toolstrip, under the **Simulation** tab, in the **Prepare** section, click **Log Events**.
 - 2 Simulate your model.
 - 3 To open the tool, in the Simulink Toolstrip, under the **Simulation** tab, in the **Review Results** section, click **Sequence Viewer**.
- “Use the Sequence Viewer to Visualize Messages, Events, and Entities”
 - “Simulink Messages Overview”

Parameters

Time Precision for Variable Step — Digits for time increment precision

3 (default) | scalar

Number of digits for time increment precision. When using a variable step solver, change this parameter to adjust the time precision for the sequence viewer. By default the block supports 3 digits of precision. Minimum and maximum precision are 1 and 16, respectively.

Suppose the block displays two events that occur at times 0.1215 and 0.1219. Displaying these two events precisely requires 4 digits of precision. If the precision is 3, then the block displays two events at time 0.121.

Programmatic Use

Block Parameter: SequenceViewerTimePrecision

Type: character vector

Values: '3' | scalar

Default: '3'

History — Maximum number of previous events to display

1000 (default) | scalar

Total number of events before the last event to display. Minimum and maximum number of events are 0 and 25000, respectively.

For example, if **History** is 5 and there are 10 events in your simulation, then the block displays 6 events, including the last event and the five events prior the last event. Earlier events are not displayed. The time ruler is greyed to indicate the time between the beginning of the simulation and the time of the first displayed event.

Each send, receive, drop, or function call event is counted as one event, even if they occur at the same simulation time.

Programmatic Use

Block Parameter: SequenceViewerHistory

Type: character vector

Values: '1000' | scalar

Default: '1000'

“Simulink Messages Overview”

Introduced in R2020b

Signal Properties

View and edit signal properties

Description

Use the Signal Properties dialog box to view and edit properties for signals in your model. Using the Signal Properties dialog box, you can mark a signal for logging, specify a signal name, and configure logging options, including which data points to log and the logging sample time.

When your model is configured for concurrent execution, the Signal Properties dialog box also includes a **Data Transfer** tab. For more information, see “Configure Data Transfer Settings Between Concurrent Tasks” and “Configure Your Model for Concurrent Execution”.

Open the Signal Properties

- Right-click a signal line in the model and select **Properties**.
- When you select a signal line in your model, the Signal Properties are available in the Property Inspector.

Parameters

Signal Name Properties

Signal name — Signal name

string | character vector

Specify a name for the signal as a character vector or string.

When you select **Signal name must resolve to Simulink signal object**, the name must match the name of a `Simulink.Signal` object in the base workspace, the model workspace, or a data dictionary. The signal name can implicitly resolve to a `Simulink.Signal` object when you do not select **Signal name must resolve to Simulink signal object**. For more information, see “Explicit and Implicit Symbol Resolution”.

By default, the name for logged signal data matches the signal name specified in the model. To use a different name for the logged signal data, specify the name for the logged data using the **Logging Name** property.

Programmatic Use

To specify a signal name programmatically, use the `set_param` function to set the `Name` property for the line handle that corresponds to the signal or the port handle that corresponds to the block output port that produces the signal. For an example, see “Name a Signal Programmatically”.

Parameter: Name

Type: string | character vector

Signal name must resolve to Simulink signal object — Explicit signal name resolution

'off' (default) | 'on'

When enabled, the signal name specified in the Signal Properties dialog box must match the name of a `Simulink.Signal` object in the base workspace, the model workspace, or a data dictionary. When disabled, the signal name can implicitly resolve to a `Simulink.Signal` object. For more information, see “Explicit and Implicit Symbol Resolution”.

By default, signals that require resolution to a `Simulink.Signal` object are marked with the signal resolution icon to the left of the signal label. For more information, see “Signal to Object Resolution Indicator”.

Programmatic Use

To configure this option for a signal programmatically, use the `set_param` function to set the `MustResolveToSignalObject` property for the port handle that corresponds to the block output port that produces the signal. For an example, see “Use Signal Objects”.

Parameter: `MustResolveToSignalObject`

Value: 'on' | 'off'

Default: 'off'

Show propagated signals — Option to display propagated signal name

'off' (default) | 'on'

When a downstream signal originates from a block that supports signal label propagation, you can enable this option on the downstream signal line to display the propagated signal name as a label on the signal line.

For example, the output signal from the Subsystem block is configured for signal label propagation. The propagated signal label <const> comes from the name of the upstream Constant block output signal const.

For more information see, “Signal Label Propagation”.

Tips

To display propagated signal labels for all signals, in the Simulink Editor, on the **Debug** tab, select **Information Overlays**, then select **Propagated Signal Labels**.

Dependencies

The **Show propagated signals** property is only available for signals produced by blocks that support signal label propagation.

Programmatic Use

To configure a signal to display its propagated name programmatically, use the `set_param` function to specify the value of the `ShowPropagatedSignals` property for the port handle that corresponds to the block output port that produces the signal. For an example, see “Display Propagated Signal Labels”.

Parameter: `ShowPropagatedSignals`

Value: 'on' | 'off'

Default: 'off'

Logging and Accessibility

Log signal data — Signal logging

'off' (default) | 'on'

Select this option to mark a signal for logging. When the **Signal logging** option in the model configuration parameters is enabled, data for signals marked for logging is sent to the workspace and the Simulation Data Inspector during simulation. For more information, see “Export Signal Data Using Signal Logging”.

Programmatic Use

You can control whether to log a signal programmatically using the `Simulink.sdi.markSignalForStreaming` function or by using the `set_param` function to configure the `DataLogging` property of the port handle that corresponds to the block output port that produces the signal.

Parameter: `DataLogging`

Value: 'on' | 'off'

Default: 'off'

Test point — Test point designation

'off' (default) | 'on'

When enabled, the signal is designated as a test point. For more information, see “Configure Signals as Test Points”.

Programmatic Use

To designate a signal as a test point programmatically, use the `set_param` function to specify the value of the `TestPoint` property for the port handle that corresponds to port that produces the signal.

Parameter: `TestPoint`

Value: 'on' | 'off'

Default: 'off'

Logging Name — Name for logged signal data

'SignalName' (default) | 'Custom'

Specify a name for the logged signal data. By default, logged signal data uses the name of the signal specified in the model.

To specify a logging name for a signal that is different from the name of the signal in the model, select `Custom` and specify the logging name in the text box.

Dependencies

To enable the **Logging Name** property, select **Log signal data**.

Programmatic Use

To specify the logging name programmatically, use the `set_param` function to configure the `DataLoggingNameMode` and `DataLoggingName` parameters for the port handle that corresponds to the block output port that produces the signal. For an example, see “Signal-Specific Logging Name Specified Programmatically”.

Parameter: `DataLoggingNameMode`

Value: 'SignalName' | 'Custom'

Default: 'SignalName'

Parameter: `DataLoggingName`

Type: string | character vector

Limit data points to last — Option to log only last *n* data points

'off' (default) | 'on'

When you only want to save or analyze the data from the end of a simulation, you can configure logging to capture only the last *n* signal values. Select **Limit data points to last** and specify the number of data points you want to log.

When you only log the last simulation values, dashboard blocks and the Simulation Data Inspector do not display data during simulation. Consider data requirements for each signal before you reduce the number of data points logged in simulation.

For more information, see “Specify Signal Values to Log” and “Limit the Size of Logged Data”.

Dependencies

To enable the **Limit data points to last** property, select **Log signal data**.

Programmatic Use

To configure this option programmatically, use the `set_param` function to configure the `DataLoggingLimitDataPoints` and `DataLoggingMaxPoints` parameters for the port handle that corresponds to the block output port that produces the signal.

Parameter: `DataLoggingLimitDataPoints`

Value: 'on' | 'off'

Default: 'off'

Parameter: `DataLoggingMaxPoints`

Value: numeric scalar

Type: string | character vector

Default: '5000'

Decimation — Option to log every *n*th data point

'off' (default) | 'on'

When you want to reduce the effective sample rate for logged data, select **Decimation** and specify the desired decimation factor in the text box. For example, if you specify a decimation factor of 2, every other signal value is logged.

Consider data requirements for each signal before reducing the number of data points logged in simulation. Decimation can cause aliasing if the effective sample rate is too low.

For more information, see “Specify Signal Values to Log” and “Limit the Size of Logged Data”.

Dependencies

To enable the **Decimation** property, select **Log signal data**.

Programmatic Use

To configure this option programmatically, use the `set_param` function to configure the `DataLoggingDecimateData` and `DataLoggingDecimation` parameters for the port handle that corresponds to the block output port that produces the signal.

Parameter: `DataLoggingDecimateData`

Value: 'on' | 'off'

Default: 'off'

Parameter: `DataLoggingDecimation`

Value: numeric scalar

Type: string | character vector

Default: '2'

Sample time — Logging sample time

-1 (default) | scalar

Specify the sample time to use for logging the data for the selected signal. By default, the logging sample time is inherited (-1) from the block that produces the signal. For continuous logging sample time, specify the value as 0. To use a discrete sample time for logging data, specify the sampling interval as a scalar.

Specifying a logging sample time may add a new sample time to the model. When you specify a logging sample time, the model calculates a value for the exact time hits. When you use a fixed-step solver, the logging sample time you specify must be a multiple of the base rate for the model.

Logging sample time is not supported for signals inside conditional subsystems or conditional referenced models.

Dependencies

To enable the **Sample time** property, select **Log signal data**.

Programmatic Use

To configure this option programmatically, use the `set_param` function to configure the `DataLoggingSampleTime` parameter for the port handle that corresponds to the block output port that produces the signal.

Parameter: `DataLoggingSampleTime`

Value: numeric scalar

Type: string | character vector

Default: `'-1'`

Documentation

Description — Signal description

string | character vector

You can provide a description of the signal that shows in the **Info** tab of the Property Inspector when the signal is selected.

The description specified in the Signal Properties dialog box does not appear in generated code. To provide a signal description that becomes a comment in generated code, use a `Simulink.Signal` object.

Programmatic Use

To configure this option programmatically, use the `set_param` function to configure the `Description` parameter for the port handle that corresponds to the block output port that produces the signal.

Parameter: `Description`

Type: string | character vector

Document Link — Link to documentation about signal

MATLAB expression

Specify a MATLAB expression that opens documentation for the signal. For example, you can call the `web` function to open an HTML file. When you specify a value for the **Document link** property, you can click the **Document link** field label to open the document.

Programmatic Use

To programmatically specify a document link, use the `set_param` property to specify the `DocumentLink` property of the port handle that corresponds to the block output port that produces the signal.

Parameter: `DocumentLink`

Type: string | character vector

Simulation Data Inspector

Inspect and compare data and simulation results to validate and iterate model designs

Description

The Simulation Data Inspector visualizes and compares multiple kinds of data.

Using the Simulation Data Inspector, you can inspect and compare time series data at multiple stages of your workflow. This example workflow shows how the Simulation Data Inspector supports all stages of the design cycle:

1 “View Data in the Simulation Data Inspector”.

Run a simulation in a model configured to log data to the Simulation Data Inspector, or import data from the workspace or a MAT-file. You can view and verify model input data or inspect logged simulation data while iteratively modifying your model diagram, parameter values, or model configuration.

2 “Inspect Simulation Data”.

Plot signals on multiple subplots, zoom in and out on specified plot axes, and use data cursors to understand and evaluate the data. “Create Plots Using the Simulation Data Inspector” to tell your story.

3 “Compare Simulation Data”

Compare individual signals or simulation runs and analyze your comparison results with relative, absolute, and time tolerances. The compare tools in the Simulation Data Inspector facilitate iterative design and allow you to highlight signals that do not meet your tolerance requirements. For more information about the comparison operation, see “How the Simulation Data Inspector Compares Data”.

4 “Save and Share Simulation Data Inspector Data and Views”.

Share your findings with others by saving Simulation Data Inspector data and views.

You can also harness the capabilities of the Simulation Data Inspector from the command line. For more information, see “Inspect and Compare Data Programmatically”.

Open the Simulation Data Inspector

- Simulink Toolstrip: On the **Simulation** tab, under **Review Results**, click **Data Inspector**.
- Click the streaming badge on a signal to open the Simulation Data Inspector and plot the signal.
- MATLAB command prompt: Enter `Simulink.sdi.view`.

Examples

Apply a Tolerance to a Signal in Multiple Runs

You can use the Simulation Data Inspector programmatic interface to modify a parameter for the same signal in multiple runs. This example adds an absolute tolerance of `0.1` to a signal in all four runs of data.

First, clear the workspace and load the Simulation Data Inspector session with the data. The session includes logged data from four simulations of a Simulink® model of a longitudinal controller for an aircraft.

```
Simulink.sdi.clear
Simulink.sdi.load('AircraftExample.mldatx');
```

Use the `Simulink.sdi.getRunCount` function to get the number of runs in the Simulation Data Inspector. You can use this number as the index for a for loop that operates on each run.

```
count = Simulink.sdi.getRunCount;
```

Then, use a for loop to assign the absolute tolerance of `0.1` to the first signal in each run.

```
for a = 1:count
    runID = Simulink.sdi.getRunIDByIndex(a);
    aircraftRun = Simulink.sdi.getRun(runID);
    sig = getSignalByIndex(aircraftRun,1);
    sig.AbsTol = 0.1;
end
```

- “View Data in the Simulation Data Inspector”
- “Inspect Simulation Data”
- “Compare Simulation Data”
- “Iterate Model Design Using the Simulation Data Inspector”

Programmatic Use

`Simulink.sdi.view` opens the Simulation Data Inspector from the MATLAB command line.

Simulink Editor

Create models and set model properties

Description

The Simulink Editor allows you to create and configure system models.

The Simulink Editor is a tool for building models. In addition to providing standard methods for working with diagrams in a vector graphics editor, the editor provides shortcuts that help you to add and connect blocks. The Simulink Editor also gives you access to the tools you need for technical operations such as importing data, simulating your model, and analyzing model performance.

Open the Simulink Editor

- Create a model. On the MATLAB **Home** tab, click **Simulink** and choose a model template.

Alternatively, if you already have the Library Browser open, click the **New Model** button .

- Open an existing model. To open recent models, on the MATLAB **Home** tab, click **Simulink**.

Alternatively, if you know the name of the model you want to open, enter the name in the MATLAB Command Window, such as `vdp`.

Tip The first model that you open in a MATLAB session takes longer to open than subsequent models. By default, MATLAB does not start Simulink until you open the first model to reduce MATLAB startup time and avoid unnecessary system memory use.

To speed up opening the first model, you can configure MATLAB startup to also start Simulink. For more information on how to start Simulink without opening models or the Library Browser, see the [start_simulink](#) reference page.

Examples

Interactively Build Models

When you build a model in the Simulink Editor, you use common techniques for working with graphics objects.

Actions you can perform in the Simulink Editor include:

- Selecting using click, shift-click, and dragging
- Resizing objects using handles and moving objects by dragging
- Cutting, copying, and pasting
- Undoing and redoing up to 101 operations

Note After you undo or redo block parameter changes, a visual cue appears that shows the current values of the affected parameters. Some parameter changes are not affected by the undo or redo commands. After you undo or redo changes to block parameters, use the cue to see the parameters affected.

A small subset of parameters cannot be undone. Changing these parameters clears the undo history when you make the change in the Property Inspector or in the block dialog box.

You can also zoom and scroll the editing area. On the **Modeling** tab, select **Environment > Zoom**, and select the zoom or view you want to use. If you are using a supported touch display platform, you can pinch to zoom and swipe to scroll. The supported touch display devices include Microsoft Windows platforms with a Windows 7 certified or Windows 8 certified touch display and Macintosh platforms with an Apple Magic Trackpad.

The editor supports additional shortcuts for scrolling that are unique to Simulink. Shortcuts and other interactive model building techniques are summarized in “Keyboard Shortcuts and Mouse Actions for Simulink Modeling”. For a tutorial, see “Build and Edit a Model Interactively”.

Detect Model Design Errors

The Simulink Editor can provide you with visual cues for some model design issues. Highlighted blocks alert you to issues. To see a description of the issue, pause on a highlighted block and click the error or warning symbol.

Similar to the Diagnostic Viewer, if an error or warning has a predefined fix, the notification dialog box lists actions and may include a **Fix** button to apply these changes.

Simulink can detect block errors and warnings, such as:

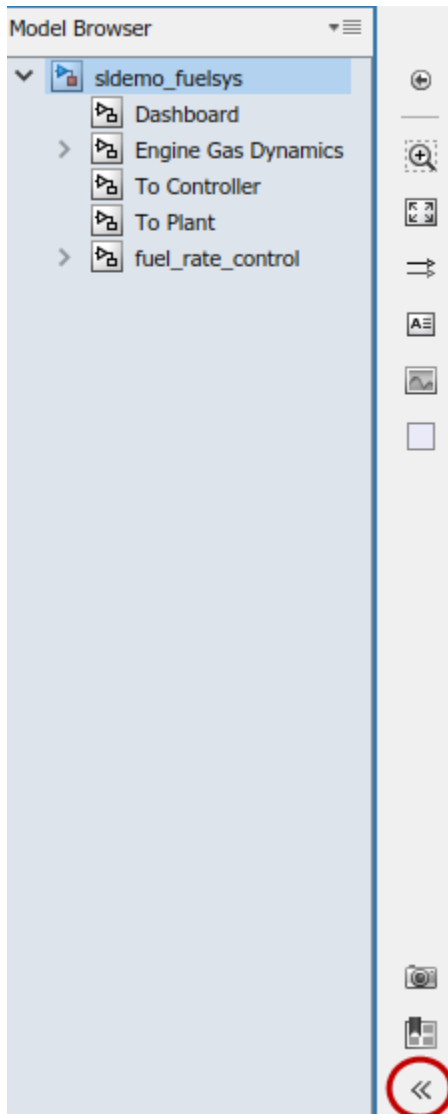

- Goto and From block mismatches.
- Duplicate data store blocks. The value of the Duplicate data store names parameter determines whether to display a warning or an error symbol.

The **Errors and Warnings** option is enabled by default. To turn off this option, in the **Debug** tab, select **Diagnostics > Edit-Time Errors & Warnings**.

Explore Model Hierarchy

Use the Model Browser to navigate a model hierarchy using a tree structure. The browser helps you to understand the organization of your model and explore systems within systems.

To display the Model Browser, in the Simulink Editor, in the **Modeling** tab, select **Environment > Model Browser**. You can toggle the Model Browser display by clicking the **Hide/Show Model Browser** control .

In the Model Browser, you can specify whether to display blocks that are linked to a library or to masked subsystems. Click  and select **Library Links** or **Systems with Mask Parameters**. For information on these types of blocks, see “Linked Blocks” and “Masking Fundamentals”.

Set Properties and Parameters

As you build a model, you can set parameters and properties on model elements. For example, you can set parameters and properties for blocks that affect how the block functions. You can also set properties on Stateflow charts, signal lines, visual elements such as annotations, and on the model.

Based on your workflow and goals, set parameters and properties using:

- The **Property Inspector**, which stays open in the editor as you work and updates based on the current selection

- A dialog box that is associated with an element, such as a specific block
- The **Model Data Editor**, which stays open and displays information about signals, states, and algorithmic block parameters (for instances, gains and filter coefficients) in a table

For blocks whose parameter value appears on the block icon, you can select the block, pause on the value, and edit the value directly. For more information, see “Set Block Parameters”.

- “Build and Edit a Model Interactively”

Parameters

Toolstrip — Access and discover Simulink capabilities

Simulation | **Debug** | **Modeling** | **Format** | **Apps**

To support common user workflow tasks, tabs called **Simulation**, **Debug**, **Modeling**, **Format**, and **Apps** provide functionality corresponding to each task.

The **Apps** tab provides a gallery of applications from the Simulink family of products. Apps may open a new contextual tab, a separate window, or they may be a shortcut to the configuration parameters.

After you open a gallery, you can mark buttons as favorites. Buttons that are favorites appear at the top of the gallery for quicker access. You can drag these buttons to reorder them.

When you select a model component, a contextual tab displays tools to assist you. For example, when you select a Subsystem block, the **Subsystem Block** tab appears. If you select a Stateflow chart, the **State Chart** tab appears. When the block or chart is no longer selected, the contextual tabs disappear.

The preferences folder saves the product-specific tabs that you have open for a model. Open tabs that require a license checkout do not persist after you close the model.

To add custom tabs to the Simulink Toolstrip, see “Create Custom Simulink Toolstrip Tabs”.

The quick access toolbar contains frequently used options such as save, undo, and redo. To customize the quick access toolbar, see “Access Frequently Used Features and Commands in Simulink”.

Commands also appear on context menus. Context menus appear when you right-click a model element or a blank area of the editor. For example, if you right-click a block, the menus display the commands relevant for working on blocks, such as clipboard and alignment operations. Some commands appear only on a context menu.

Palette — Access additional shortcuts along the left side of the editor

icons

The palette along the left side of the editor provides shortcuts to commands you can use to modify the model appearance and navigate the model. For example, the palette includes a shortcut for adding annotations and other visuals, like boxed-in areas for labeling the model. It also provides a zoom button for zooming on a particular part of the model.

Hide/Show Explorer Bar — Hide or display a bar that shows where you are in the model hierarchy

off (default) | on

The **Hide/Show Explorer Bar** button in the upper left corner of the editor window displays a bar that shows where you are in the model hierarchy.

Hide/Show Model Browser — Hide or display a hierarchical view of the model

off (default) | on

The **Hide/Show Model Browser** button displays the **Model Browser** pane. You can use this pane to view and navigate a hierarchical view of the model.

Show Perspectives Views — Enable code, requirements, and interface perspectives

off (default) | on

The icon in the lower-right corner opens additional views of the model. One such view is the interface view, which helps you to trace model interfaces. Click the control to see these views.

Model Data Access — Retrieve model data

off (default) | on

A badge in the lower-left corner indicates that a model has external data sources, such as a data dictionary, or that there is data in the model workspace. Click the badge, then use the menu to navigate to these data sources.

- To open the Model Explorer with the **Model Workspace** node selected, click the **Model Workspace** link.
- To open the Model Explorer with the **External Data** node for the model selected, click the **External Data** link.
- To add or change a linked data dictionary, click the gear icon to open the **External Data** tab of the Model Properties dialog box.

Programmatic Use

simulink opens the Simulink Start Page. Select a model or template to open the Simulink Editor.

Simulink Fundamentals

Self-paced, interactive course available as part of Online Training Suite subscription or for individual purchase

Description

Simulink Fundamentals is a self-paced, interactive course that is included with the Online Training Suite. If you do not have access to the Online Training Suite, you can purchase access to the course.

Simulink Fundamentals will teach you to:

- Use the Simulink environment.
- Model continuous and discrete dynamic systems.
- Organize growing models in subsystems that create visual and functional hierarchy.
- Componentize models by referencing other models and creating libraries.
- Optimize simulation performance.

Simulink Fundamentals uses tasks to teach concepts incrementally, such as through a real-life example with a 3D printer. You receive automated assessments and feedback after submitting tasks. Your progress is saved when you exit the course, so you can complete the course in multiple sessions.

Tip Simulink Fundamentals build upon concepts covered in **Simulink Onramp**. To get the most out of Simulink Fundamentals, take Simulink Onramp first.

Simulink Onramp is a self-paced, interactive tutorial that offers a quick and high-level introduction to Simulink. It is free and no subscription is required.

The screenshot displays the Simulink Fundamentals training interface. On the left, the 'Task 1' description explains the goal: to complete a nozzle algorithm by adding a Logical Operator block. The central workspace shows a Simulink model titled 'Nozzle Algorithm'. It includes 'Reference signals' (desired_x, desired_y), 'Simulated sensor data' (meas_x, meas_y), and a 'Nozzle Algorithm' block containing an 'Extrude_end' block, a 'meas_pos' block, and a 'Select X Position' block. The assessment panel on the right lists requirements: 'Does the model contain the following block? Logical Operator', 'Are the following blocks connected correctly? Logical Operator, Scope', 'Are the following blocks connected correctly? From Workspace, Logical Operator', and 'Are the following blocks connected correctly? Compare To Constant, Logical Operator'.

Open the Simulink Fundamentals

- On the Simulink Start Page, on the **Learn** tab, click the button that appears when you pause on any of the items in the **Simulink Fundamentals** group.
- In the MATLAB Command Window, enter `learning.simulink.launchOnramp('slbe')`.

If you do not have access to the Simulink Fundamentals course, you can explore access options at Self-Paced Online Courses.

If you use a release prior to R2022a, upgrade to the latest release to take this course. Alternatively, take Simulink Fundamentals online.

Simulink Onramp

Self-paced, interactive tutorial included with Simulink license

Description

Simulink Onramp is a self-paced, interactive tutorial that helps you get started with Simulink. It is included with a Simulink license.

After completing Simulink Onramp, you will be able to create, modify, and troubleshoot Simulink models that simulate dynamic systems and perform basic signal analysis.

To teach concepts incrementally, Simulink Onramp uses tasks. You receive automated assessments and feedback after submitting tasks. Your progress is saved when you exit the training, so you can complete the training in multiple sessions.

Using Simulink Onramp, you can explore:

- Simulink blocks and signals
- Signal value visualizations during simulation
- Math and logic operators for algorithms
- How to access help from documentation
- MATLAB variables and functions in Simulink
- Dynamic systems in Simulink
- Discrete-time systems
- Continuous-time systems
- Simulation duration

Simulink Onramp helps you practice what you learn with these projects:

- Automotive Performance Modes
- Modeling a Thermostat
- Peregrine Falcon Dive

The screenshot displays the Simulink Onramp training environment. On the left, the 'Training - Tasks' window shows 'Task 1' with instructions: 'Connect the signal line labeled velocity to the Signal Assessment block. The line will change from dashed, red to solid, black when connected.' Below the instructions are buttons for 'Hint', 'See Solution', 'Reset', 'Submit', and 'Next task'. The central window shows a Simulink model titled 'Simulink_Onramp' with the equation $\Sigma F = ma$ and $-mg + \alpha v^2 = ma$. The model includes a 'Gravitational force' block (9.81*1), a '1/mass' block, an 'Integrator' block (1/s), and a 'Signal Assessment' block. A feedback loop includes a 'Drag force coefficients' block (0.05) and a velocity feedback block (v^2). On the right, the 'Training - Assessment' window shows 'Task 1 Signal' with a plot of 'Value' vs 'Time'. The plot shows a blue curve ('My signal') starting at 0 and decaying towards a value of approximately -14.5 over 10 seconds. A legend indicates 'Signal requirement' (orange line) and 'My signal' (blue line). Below the plot, a 'Requirements' section shows a green checkmark and the text 'Does the connected signal meet the requirement?'.

Open the Simulink Onramp

- On the Simulink Start Page, on the **Learn** tab, click the **Launch** button that appears when you pause on **Simulink Onramp**.
- On the Simulink Toolstrip quick access toolbar, click **Help > Learn Simulink**.
- In the MATLAB Command Window, enter `learning.simulink.launchOnramp('simulink')`.

Simulink Profiler

Identify sources of simulation slowdowns

Description

Use the **Simulink Profiler** to examine model and block execution and identify issues that can contribute to poor simulation performance.

The screenshot displays the Simulink Profiler interface. The main window shows a Simulink model titled "Anti-Windup PID Control Example". The model consists of a reference input $r(t)$ entering a summing junction, followed by a PID controller block, a saturation block labeled "Plant Actuator" with input $u(t)$ and output $SAT(u)$, a first-order process block with transfer function $\frac{1}{10s + 1}$, a dead time block, and a scope block labeled "yout".

The Profiler Report pane at the bottom shows a table with the following data:

Path	Time Plot (Dark Band = Self Time)	Total Time (s)	Self Time (s)	Number of Calls
sldemo_antiwindup	[Bar chart]	4.247	1.198	18013
Scope	[Bar chart]	2.398	2.398	6004
Scope1	[Bar chart]	0.642	0.642	6004
PID Controller	[Bar chart]	0.004	0.000	0
Filter	[Bar chart]	0.001	0.000	0
Integrator	[Bar chart]	0.001	0.000	0
D Gain	[Bar chart]	0.000	0.000	0
I Gain	[Bar chart]	0.000	0.000	0
N Gain	[Bar chart]	0.000	0.000	0

A tooltip for the Integrator block shows: Self Time (dark band): 0.000, Total Time: 0.001.

The Property Inspector pane on the right shows the Simulink Profiler details for the model, including a total time breakdown and a self time breakdown table:

Exec Node	Time (s)	Calls
simulationPhase	0.767	1
initializationPhase	0.338	1
terminationPhase	0.034	1
sldemo_antiwindup...	0.019	1
sldemo_antiwindup...	0.014	1
solverPhase	0.007	2000
sldemo_antiwindup...	0.006	2001
simulate(sldemo_a...	0.004	1
sldemo_antiwindup...	0.003	4000
ode3.Integrate	0.002	2000
sldemo_antiwindup...	0.002	1
sldemo_antiwindup...	0.001	5999
sldemo_antiwindup...	0.001	2001
sldemo_antiwindup...	0.001	1
sldemo_antiwindup...	0.000	1
reset	0.000	1
sldemo_antiwindup...	0.000	1
sldemo_antiwindup...	0.000	1

Open the Simulink Profiler

- 1 Open a model.
- 2 On the **Debug** tab, select **Performance Advisor > Simulink Profiler**.
- 3 On the **Profile** tab, click **Profile**.

When simulation is complete, the **Profiler Report** pane opens and displays the simulation profile for the model. You can share the results of the Profiling Run by exporting the report to HTML, as well as by saving the profiling data to a MAT file.

The screenshot displays the Simulink Profiler interface for a model named 'sldemo_antiwindup'. The main window shows a block diagram of an Anti-Windup PID Control system. The diagram includes a reference input $r(t)$, a summing junction, a PID controller block, a saturation block labeled 'Plant Actuator' with input $u(t)$ and output $SAT(u)$, a first-order process block with transfer function $\frac{1}{10s + 1}$, a dead time block, and an output $y(t)$ labeled 'yout'. The copyright notice 'Copyright 2009-2020 The MathWorks, Inc.' is visible at the bottom of the diagram.

The Profiler Report (sldemo_antiwindup @ 21-Dec-2020 12:39:31) is shown below the diagram. It includes a table with the following columns: Path, Time Plot (Dark Band = Self Time), Total Time (s), Self Time (s), and Number of Calls.

Path	Time Plot (Dark Band = Self Time)	Total Time (s)	Self Time (s)	Number of Calls
sldemo_antiwindup	[Bar]	4.247	1.198	18013
Scope	[Bar]	2.398	2.398	6004
Scope1	[Bar]	0.642	0.642	6004
PID Controller	[Bar]	0.004	0.000	0
Filter	[Bar]	0.001	0.000	0
Integrator	[Bar]	0.001	0.000	0
D Gain	[Bar]	0.000	0.000	0
I Gain	[Bar]	0.000	0.000	0
N Gain	[Bar]	0.000	0.000	0

A tooltip for the PID Controller block shows: Self Time (dark band): 0.000, Total Time: 0.001.

The Property Inspector on the right shows the Simulink Profiler details for 'sldemo_antiwindup'. It provides a total time breakdown: Total Time Breakdown for sldemo_antiwindup: 4.247 s (Total Time) = 1.198 s (Self Time) + 3.049 s (Total Time of children). It also includes a self-time breakdown table:

Exec Node	Time (s)	Calls
simulationPhase	0.767	1
initializationPhase	0.338	1
terminationPhase	0.034	1
sldemo_antiwindup...	0.019	1
sldemo_antiwindup...	0.014	1
solverPhase	0.007	2000
sldemo_antiwindup...	0.006	2001
simulate(sldemo_a...	0.004	1
sldemo_antiwindup...	0.003	4000
ode3.Integrate	0.002	2000
sldemo_antiwindup...	0.002	1
sldemo_antiwindup...	0.001	5999
sldemo_antiwindup...	0.001	2001
sldemo_antiwindup...	0.001	1
sldemo_antiwindup...	0.000	1
reset	0.000	1
sldemo_antiwindup...	0.000	1
sldemo_antiwindup...	0.000	1

The status bar at the bottom shows 'Ready', '148%', and 'ode3'.

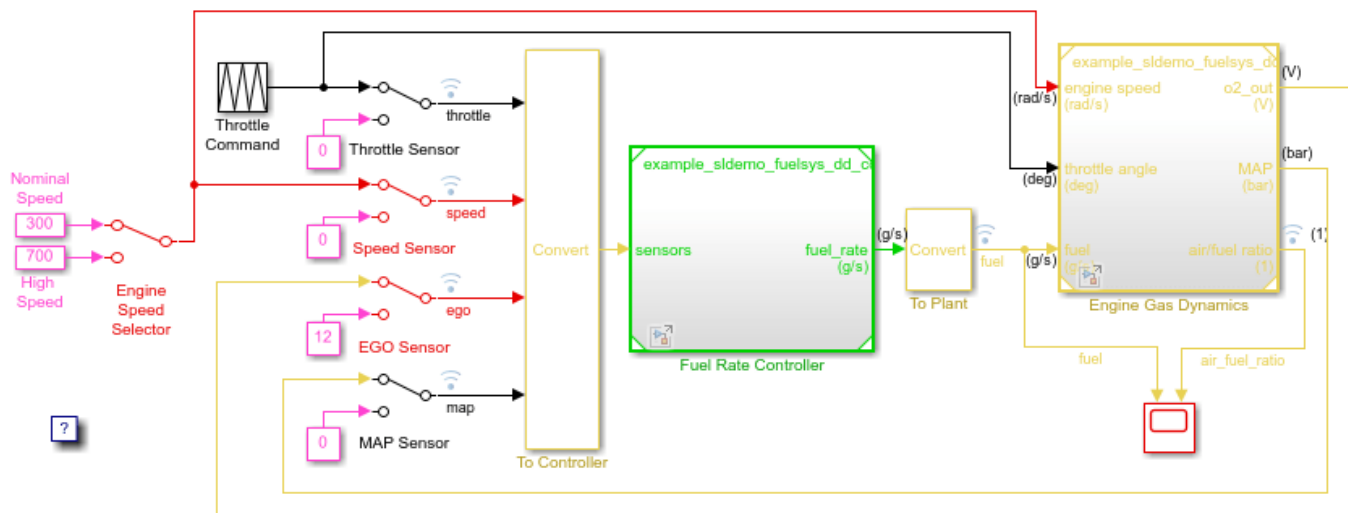

Examples

Identify Performance Slowdowns Using the Simulink Profiler

This example shows how to use the Simulink Profiler to track down the source of a simulation slowdown in your model.

This example uses a modified version of the `sldemo_fuel_sys_dd` model, (the Modeling a Fault-Tolerant Fuel Control System example) model with a slowdown artificially inserted.

Fault-Tolerant Fuel Control System

The sensor switches simulate any combination of sensor failures.
The Engine Speed Selector switch simulates different engine speeds (rad/s).

Copyright 1990-2017 The MathWorks, Inc.

Open the profiler for your model from the **Debug** tab by selecting **Performance Advisor > Simulink Profiler**.

The screenshot shows the MATLAB/Simulink Profiler interface. The main workspace displays a Simulink model titled "Fault-Tolerant Fuel Control System". The model includes blocks for "Throttle Command", "Throttle Sensor", "Speed Sensor", "EGO Sensor", "MAP Sensor", "Fuel Rate Controller", and "Engine Gas Dynamics". The Profiler Report pane is open at the bottom, showing a table with the following columns: Path, Time Plot (Dark Band = Self Time), Total Time (s), Self Time (s), and Number of Calls. The status bar at the bottom indicates "Ready", "81%", and "FixedStepAuto".

Click **Profile** to profile the model. When simulation completes, the Profiler Report pane opens.

Observe that the Engine Gas Dynamics block takes a large portion of the total profiling time (177.759s out of 231.443s) of the top model. This is a useful place to start looking for the problematic block in the model.

Fault-Tolerant Fuel Control System

The diagram shows a control system with inputs: Throttle Command (deg), Speed Sensor (rad/s), EGO Sensor (V), and MAP Sensor (bar). These feed into a 'Fuel Rate Controller' block. The controller outputs 'fuel_rate (g/s)', which is converted to 'fuel (g/s)' and sent to the 'Engine' block. The engine outputs 'throttle and speed (deg)' and 'engine speed (rad/s)'. There are also 'To Controller' and 'To Plant' conversion blocks.

Profiler Report (profiling_example_fuelcontrol_model @ 21-Dec-2020 13:13:27)

Path	Time Plot (Dark Band = Self Time)	Total Time (s)	Self Time (s)	Number of Calls
profiling_example_fuelcontrol_model	[Bar]	198.379	16.524	9000015
Engine Gas Dynamics	[Bar]	160.690	7.286	8000014
Throttle Command	[Bar]	12.096	0.000	0
To Controller	[Bar]	2.553	0.000	0
Scope	[Bar]	2.194	2.194	1000004
EGO Sensor	[Bar]	1.058	1.058	2000009
MAP Sensor	[Bar]	0.930	0.930	4000009

Property Inspector: Simulink Profiler

Detail: Engine Gas Dynamics

Total Time Breakdown for Engine Gas Dynamics:
 160.690 s (Total Time) = 7.286 s (Self Time) + 153.404 s (Total Time of children)

Note: Model hierarchy view does not include compile time

Self Time Breakdown for Engine Gas Dynamics:

Exec Node	Time (s)	Calls
ModelReferen...	2.825	2000000
ModelReferen...	1.801	1000001
ModelReferen...	1.368	1000001
ModelReferen...	1.065	2999999
ToAsyncQueu...	0.223	1000001
ModelReferen...	0.002	1
ModelReferen...	0.001	1
ModelReferen...	0.001	1
ModelReferen...	0.001	1
ToAsyncQueu...	0.000	1
ModelReferen...	0.000	1
ModelReferen...	0.000	1
ModelReferen...	0.000	1
ToAsyncQueu...	0.000	1
ModelReferen...	0.000	1
ToAsyncQueu...	0.000	1
ToAsyncQueu...	0.000	1

Recursively expand the block hierarchy view. By default, the profiler sorts the blocks at the same level of the model in descending order of **Total Time(s)**.

Fault-Tolerant Fuel Control System

The sensor switches simulate any combination of sensor failures. The Engine Speed Selector switch simulates different engine speeds (rad/s).

Copyright 1990-2017 The MathWorks, Inc.

Profiler Report (profiling_example_fuelcontrol_model @ 21-Dec-2020 13:13:27)

Path	Time Plot (Dark Band = Self Time)	Total Time (s)	Self Time (s)	Number of Calls
profiling_example_fuelcontrol_model		198.379	16.524	9000015
Engine Gas Dynamics		160.690	7.286	8000014
Mixing & Combustion		127.246	0.000	0
EGO Sensor		124.698	0.371	1000006
For Iterator Subsystem		122.215	55.689	1000004
In1		66.526	66.526	500000501
For Iterator		0.000	0.000	1

Ready 93% auto(ode3)

Observe that the For Iterator subsystem accounts for approximately 98% of the execution time of the EGO Sensor subsystem. It is highly probable that this is the source of the slow performance of the model.

The screenshot shows the Simulink Profiler interface. The main workspace displays a block diagram with a 'For Iterator' block and a 'double (V)' block. The Profiler Report (profiling_example_fuelcontrol_model @ 21-Dec-2020 13:13:27) is visible at the bottom, showing a table of performance metrics. The Property Inspector on the right shows details for the 'In1' block, including a total time breakdown and a self-time breakdown table.

Path	Time Plot (Dark Band = Self Time)	Total Time (s)	Self Time (s)	Number of Calls
EGO Sensor	[Time Plot]	124.698	0.371	1000006
For Iterator Subsystem	[Time Plot]	122.215	55.689	1000004
In1	[Time Plot]	66.526	66.526	50000501
For Iterator	[Time Plot]	0.000	0.000	1
EGO Sensor	[Time Plot]	2.111	2.111	2000013
System Lag	[Time Plot]	1.747	0.000	0
Product	[Time Plot]	0.544	0.544	3000005

Exec Node	Time (s)	Calls
Inport.Output...	66.526	500000...
Inport.Cleanu...	0.000	1

Delete the block, reconnect the broken signal, and profile the model again. You should see significantly faster simulation times.

To compare the results between the two runs, click **Add Report Panel** and select the previous run from the **Run** list.

You can share the results of a selected run as an HTML report or as a MAT file. To share the profiler report, from the **Share** menu, select **Generate Report** for an HTML report or **Export** to save the results in a MAT file. The profiling results are exported to the current working folder in MATLAB™.

To view the generated report, you can open it in a supported web browser or use the built-in browser by passing the file path to the web command. If you have MATLAB Report Generator™ installed, you can also use rptview to view the report.

The screenshot shows the Simulink Profiler interface. On the left, the 'PROFILER' tab is active, displaying a 'Time Plot (Dark Band = Self Time)' for the model 'profiling_example_fuelcontrol_model'. A 'Generate report' dialog box is open, with 'Generate report' and 'Export' options highlighted. The main window displays a 'Simulink Profiler Report for profiling_example_fuelcontrol_model' generated on 05-Jan-2021 at 15:24:58. The report includes a 'Summary' section with the following data:

- Total Time (s): 46.200
- Run: profiling_example_fuelcontrol_model @ 05-Jan-2021 14:53:14

The 'Execution Stack' section contains the following table:

Path	Total Time (s)	Self Time (s)	Number of Calls
--simulate(profiling_example_fuelcontrol_model)	46.200003	0.004166	1
---compilePhase	28.807228	28.807228	1
---simulationPhase	16.334963	2.178103	1
-----profiling_example_fuelcontrol_model.Outputs.Major	11.032283	0.115601	74108
-----ModelReference.Outputs.Major	9.973248	0.140053	74108
-----example_sldemo_fuelsys_dd_plant.Outputs.Major	9.833195	0.040779	74108
-----RootSubSystem.Outputs.Major	9.775145	0.080781	74108
-----AtomicSubSystem.Outputs.Major	9.164628	0.024024	74108
-----ForIteratorSubSystem.Outputs.Major	9.008826	3.965829	74108

Solver Profiler

Identify solver performance bottlenecks

Description

Use the **Solver Profiler** to examine solver and model behavior to identify issues that can contribute to poor simulation performance.

Use the **Solver Profiler** to analyze a model for patterns that affect its simulation. The **Solver Profiler** presents graphical and statistical information about the simulation, solver settings, events, and errors. You can use this data to identify locations in the model that caused simulation bottlenecks.

In addition, there are multiple factors that can limit the simulation speed. The Solver Profiler logs and reports all the major events that occur when simulating a model:

- Zero-crossing events
- Solver exception events
- Solver reset events
- Jacobian computation events

These events are common and necessary for an accurate simulation. However, they do incur computational cost and frequent occurrences can slow down or even stall the simulation.

Available actions

- **Trace**
- **Configure**
- **Explore**

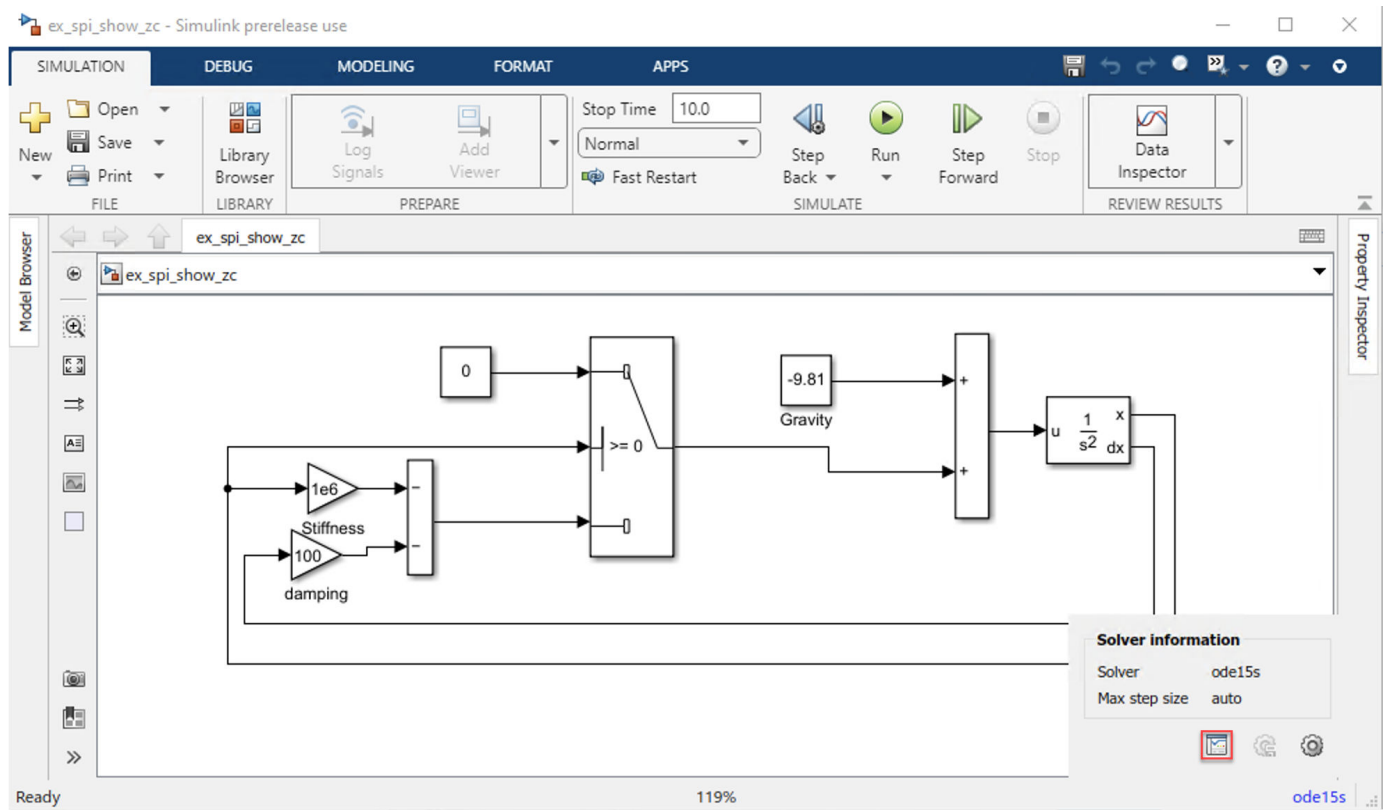

Information Panes

- **Statistics**
- **Step Size**
- **Suggestions**

Open the Solver Profiler

Open the Solver Profiler by clicking the hyperlink in the lower-right corner of the Simulink Editor.

Examples

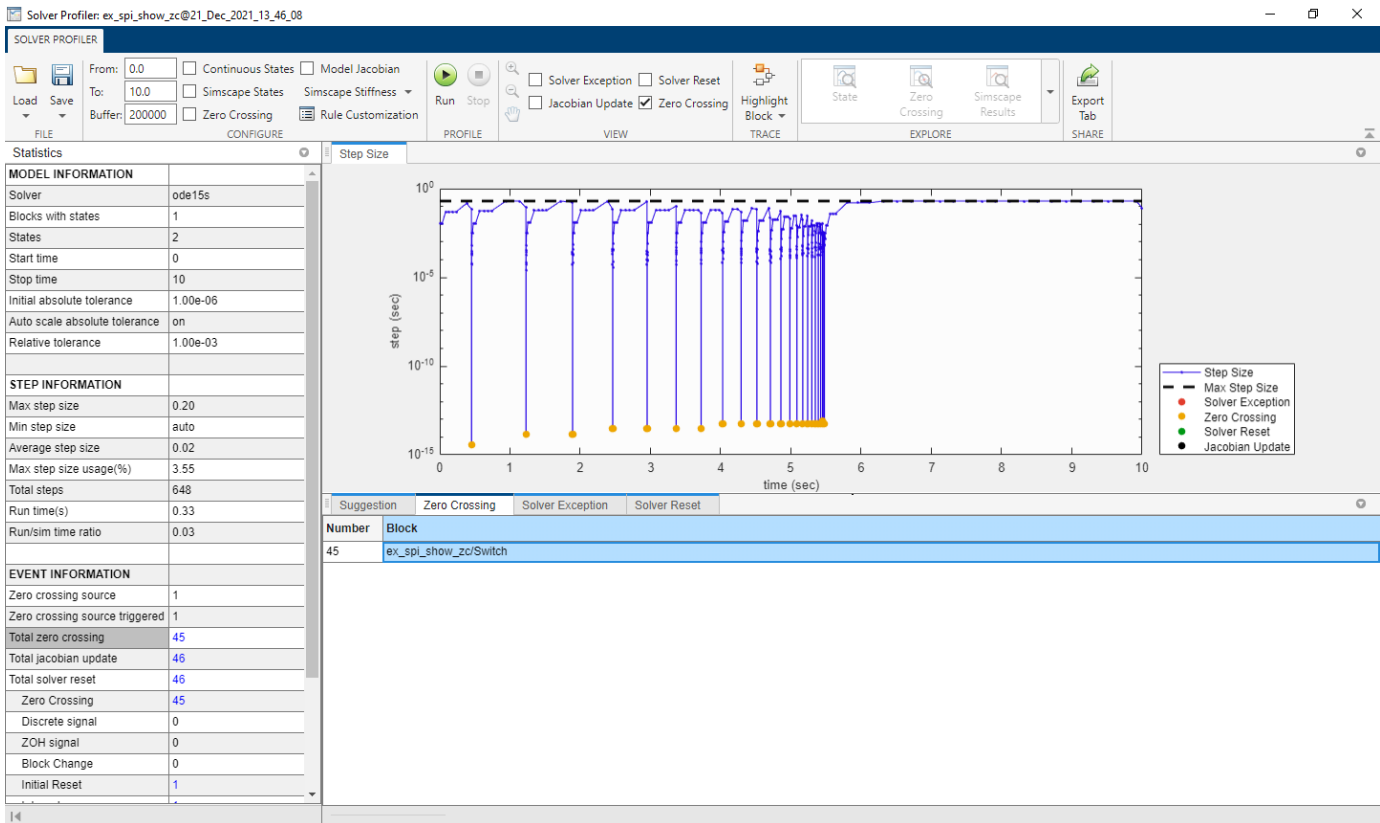

Locate source blocks for solver events

This example shows how to find the source of particular solver events or zero-crossings using a model that simulates a ball bouncing off the ground. As the ball comes to rest, the density of zero-crossings increase, leading to a solver slowdown.

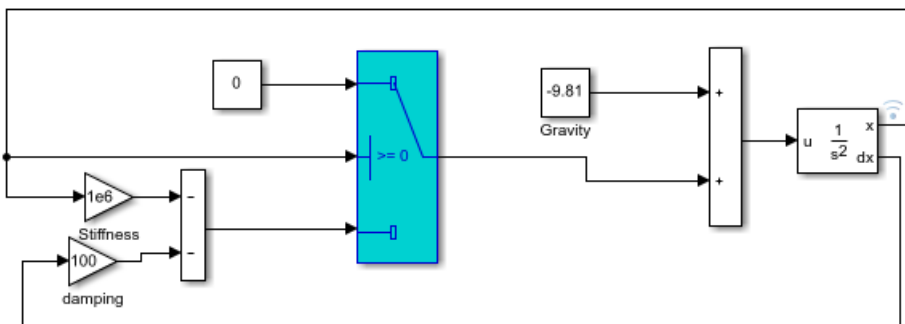

To begin, open the `ex_spi_show_zc` model, click **Debug**, open the drop down menu of **Performance Advisor**, select Solver Profiler.

Click **Run** to profile the model.

Notice that the model has 45 Zero Crossing events. To obtain more details, click **Total zero crossing** from Statistic pane or **Zero Crossing** tab from the suggestion pane to bring the zero-crossing table to the front. From the **Zero Crossing** tab, you will notice that the `ex_spi_show_zc/Switch` block caused all 45 zero crossing events. Click `ex_spi_show_zc/Switch` from the table, all zero crossing events are shown on the Step Size plot as yellow dots.

If you click on the **Highlight Block** from the **Trace** tab, you will notice that the `ex_spi_show_zc/Switch` block causes the zero crossing events to be highlighted in the model. All zero crossing events caused by the Switch block are highlighted in the **Step Size** plot.

- “Examine Model Dynamics Using Solver Profiler”
- “Solver Resets”
- “Zero-Crossing Events”
- “Solver Exception Events”
- “Jacobian Logging and Analysis”

Parameters

Configure

From — Profiler start time

model start time (default) | scalar

Time, in seconds, of the simulation that the profiler starts analyzing the model. This is not the same as the start time of the simulation.

To — Profiler stop time

model stop time (default) | scalar

Time, in seconds, of the simulation to which the profiler should profile the model. By default, the analysis continues until the end of the simulation. Changing this parameter does not change the stop time of the model which you specify in the Model Configuration Parameters.

A value less than the configured stop time of the model stops the profiling and simulation at `StopTime`.

Buffer — Memory impact of logging

50000 (default) | positive scalar

Maximum number of events that are logged. If the number of logged events reaches this value and memory is available, increase `BufferSize`. If memory is limited, consider lowering the value.

Continuous States — Save model states to file

off (default) | on

By default, the profiler does not save the states of the model. Enabling this parameter configures the profiler to save the states to the profiler data MAT file.

If you select this parameter, it will enable the States explorer.

Simscape States — Save Simscape states to file

off (default) | on

Enable this parameter to save Simscape states to the profiler data MAT file.

If you select this parameter, it will enable the Simscape explorer.

Zero Crossing — Save zero crossing data to file

off (default) | on

Enable this parameter to save zero crossing information to the profiler data MAT file

If you select this parameter, it will enable the Zero-Crossing explorer.

Model Jacobian — Save model Jacobian

off (default) | on

Option to log the solver Jacobian matrices to memory. This option is useful for simulations that use implicit solvers. For a comparison of solvers, see “Compare Solvers”.

For a more detailed explanation of the solver Jacobian, see “Choose a Jacobian Method for an Implicit Solver”.

Simscape Stiffness — Log stiffness analysis of Simscape states

array

Log stiffness analysis Simscape states, specified as an array. This parameter provides an array of time points that you want to log the Simscape Stiffness states to the profiler data MAT file. Enable this parameter to show Simscape Stiffness tab in the Suggestion Pane.

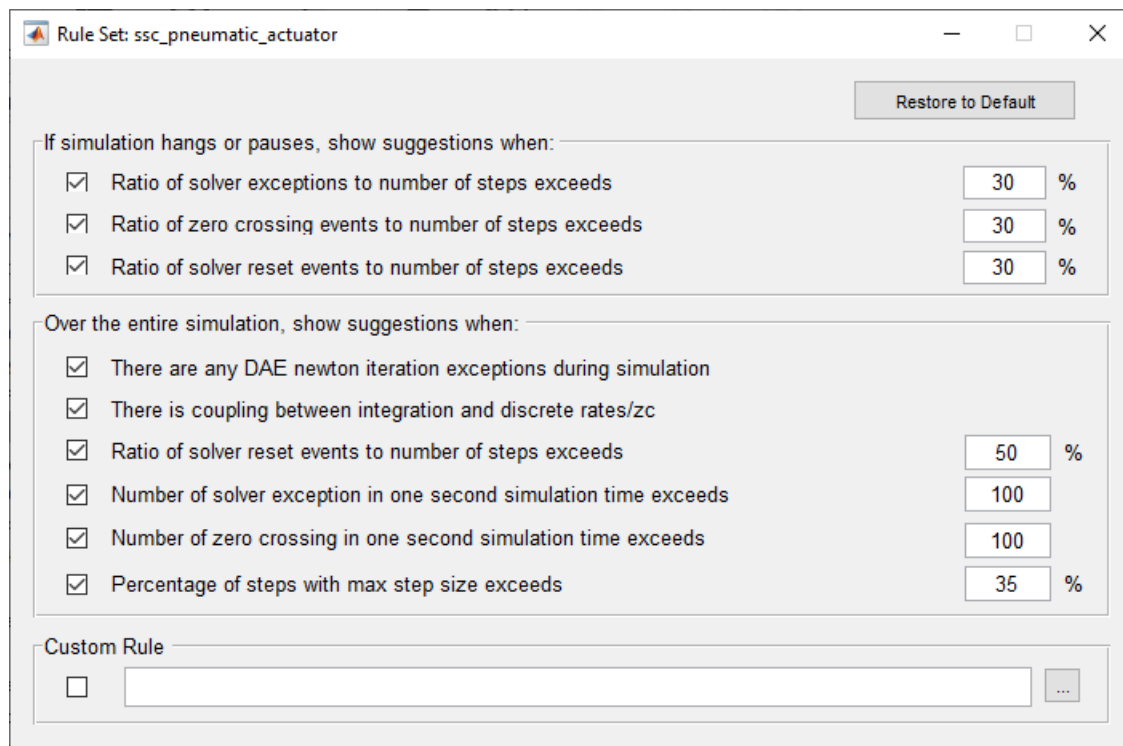

Enable this parameter to log the stiffness analysis of Simscape states to the profiler data MAT file. For more information on Simscape representation of stiffness and other physical system concepts, see “How Simscape Models Represent Physical Systems” (Simscape)

Rule Customization — Change thresholds for profiler rules

off (default) | on

Click **Rule Customization** in the Solver Profiler to access the rule set. You can change the thresholds for most of these rules and also select which rules you want to apply selectively during a simulation run.

To modify a rule, enable its customization and then enter a desired threshold value.

Custom Rule Set

You can override the settings on the **Rule Set** dialog box by specifying a custom rule set.

Create a rule set as a MATLAB script and specify the path to the script in the **Custom Rule Set** section of the **Rule Set** dialog box.

A simple rule set example looks as follows:

```
function diagnosticsString = customRule(profilerData)
    if isempty(profilerData.zcEvents)
```

```

        diagnosticsString{1} = 'No zero crossing event detected.';
    else
        diagnosticsString{1} = 'Zero-crossing events detected.';
    end
end

```

The input to the function is an array of structures called `profilerData`. This array of structures organizes all the information that the Solver Profiler collects during a profiling run. It contains the following substructures.

Substructure	Fields
<code>stateInfo</code> : Stores information on block states	<ul style="list-style-type: none"> • <code>name</code>: Block name • <code>value</code>: State values • <code>blockIdx</code>: Block ID
<code>blockInfo</code> : Cross-reference of blocks and state IDs	<ul style="list-style-type: none"> • <code>name</code>: Block name • <code>stateIdx</code>: State ID
<code>zcSrcInfo</code> : Stores information on blocks causing zero crossing events	<ul style="list-style-type: none"> • <code>name</code>: Block name • <code>blockIdx</code>: Block ID
<code>zcEvents</code> : Cross-reference of the time stamps of zero crossing events and the corresponding state IDs	<ul style="list-style-type: none"> • <code>t</code>: Event timestamp • <code>srcIdx</code>: Block ID
<code>exceptionEvents</code> : Cross-reference of exception event timestamps, the ID of the corresponding state that caused the event, and the cause.	<ul style="list-style-type: none"> • <code>t</code>: Event timestamp • <code>stateIdx</code>: State ID • <code>cause</code>: Cause of exception
<code>resetTime</code> : Stores timestamps of solver resets.	None
<code>tout</code> : Stores simulation times.	None

View

Solver Exception — Show solver exception events

off (default) | on

Enable this parameter to highlight solver exception events in the Step Size plot of the Solver Profiler.

Solver Reset — Show solver reset events

off (default) | on

Enable this parameter to highlight solver reset events in the Step Size plot of the Solver Profiler.

Jacobian Update — Show Jacobian update events

off (default) | on

Enable this parameter to highlight Jacobian update events in the Step Size plot of the Solver Profiler.

Zero Crossing — Show zero crossing events

off (default) | on

Enable this parameter to highlight zero crossing events in the Step Size plot of the Solver Profiler.

States Explorer

Visualize states in model

Description

Use the **State Explorer** to view individual state dynamics of your model

Open the States Explorer

- Profile the model using the **Solver Profiler**. Ensure that the **Continuous States** parameter is enabled.
- Select **States** in the **Explore** section of the **Solver Profiler** toolstrip.

Examples

Interactively explore states

This example shows how to use States Explorer to explore Newton Exceptions.

To begin, open the `ex_spi_show_zc` model, click **Debug**, open the drop down menu of **Performance Advisor**, select Solver Profiler.

Enable the “Continuous States” on page 7-0 parameter in the **Configure** section of the toolbar and run Solver Profiler.

When profiling has completed, launch State Explorer. Select **Newton/DAE Exception** in the **Filter** section of the State Explorer toolbar.

There is an increase in the density of Newton exceptions through the simulation. Zoom in on the State plot between the 5 and 6 second mark.

A closer examination reveals that each bounce causes two Newton iterations to switch from positive to negative corresponding to two zero crossing events. For more details, see “Interactively Explore Zero Crossings” on page 7-123. Around 5.48 seconds, the bouncing ball being simulated in the model comes to ‘rest’, hence the isolated single Newton iteration exception.

Introduced in R2016a

Zero Crossing Explorer

Visualize and interactively explore zero-crossing events

Description

Use the **Zero Crossing Explorer** to visualize and analyze zero crossing events that occur for each state in your model.

Open the Zero Crossing Explorer

- Profile the model using the **Solver Profiler**. Ensure that the **Zero Crossing** parameter is enabled.
- Select **Zero Crossing** in the **Explore** section of the **Solver Profiler** toolstrip.

Examples

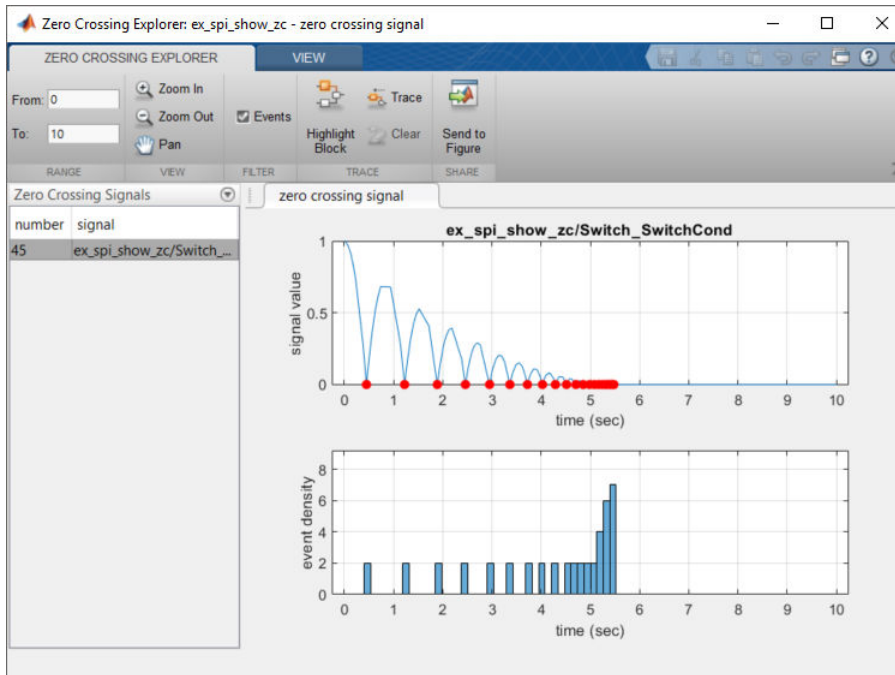

Interactively Explore Zero Crossings

Use the **Zero Crossing Explorer** to examine clusters of zero crossing events

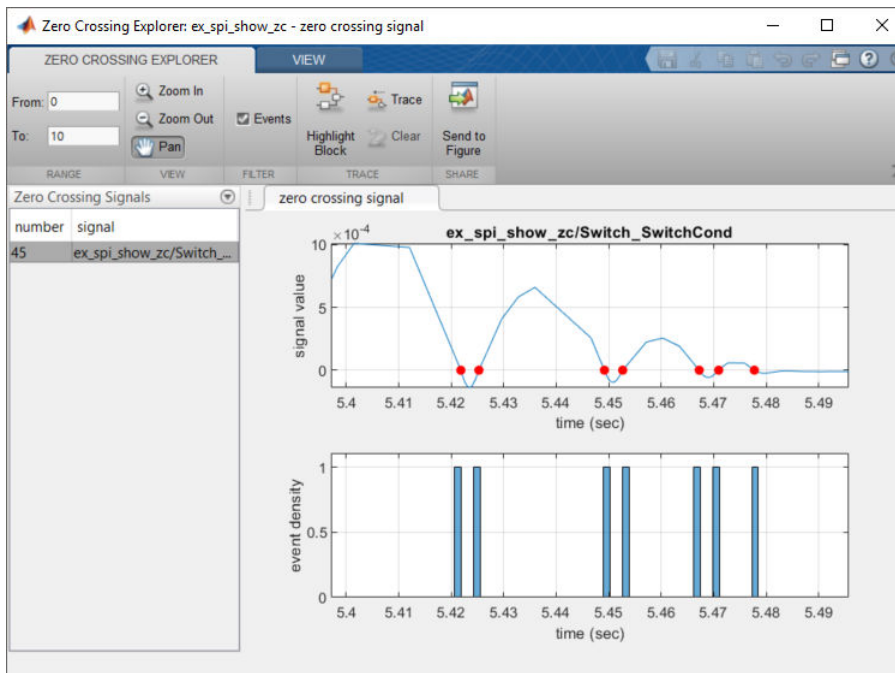

Open the `ex_spi_show_zc` model and launch the **Solver Profiler**.

Enable the **Zero Crossing** parameter in the **Configure** section of the toolstrip and run the **Solver Profiler**.

When profiling has completed, launch the **Zero Crossing Explorer**

There is an increase in the density of zero crossing events halfway through the simulation. Zoom in on the **event density** plot between the 5 and 6 second mark.

A closer examination reveals that each bounce corresponds to two zero crossings — from positive to negative and vice-versa. This is an artefact of numerically solving state dynamics that approach 0 value. Around 5.48 seconds, the ball being simulated in the model comes to 'rest', hence the isolated single zero crossing event.

Objects

LibraryBrowser.LBStandalone

Display, hide, size, and position Simulink Library Browser

Description

`LibraryBrowser.LBStandalone` objects allow you to programmatically display, hide, size, and position the Simulink Library Browser.

Creation

Get the handle of the Library Browser object using either the `LibraryBrowser.LibraryBrowser2` or `slLibraryBrowser` function.

Properties

IsOnTop — Always put Library Browser window on top

`false` or `0` (default) | `true` or `1`

Always put the Library Browser window on top of other Simulink Editor windows, specified as a numeric or logical `1` (`true`) or `0` (`false`).

Object Functions

<code>refresh</code>	Refresh Simulink Library Browser
<code>show</code>	Display Simulink Library Browser
<code>hide</code>	Hide Simulink Library Browser
<code>getPosition</code>	Get position of Simulink Library Browser
<code>setPosition</code>	Set position of Simulink Library Browser

Examples

Keep Library Browser in Front of Other Windows

Create an object that lets you programmatically access the Library Browser.

```
lb = LibraryBrowser.LibraryBrowser2;
```

Set the `IsOnTop` property of the Library Browser to `1` (`true`) using dot notation to access the property.

```
lb.IsOnTop = 1;
```

Compatibility Considerations

LibraryBrowser.LBStandalone object replaces LibraryBrowser.LibraryBrowser2 object
Behavior changed in R2016b

In previous releases, these two commands returned a `LibraryBrowser.LibraryBrowser2` object:

```
lb = slLibraryBrowser  
lb = LibraryBrowser.LibraryBrowser2
```

Starting in R2016b, each command returns a `LibraryBrowser.LBStandalone` object. The functions to access Library Browser operations such as `show` and `refresh` support `LibraryBrowser.LBStandalone` objects.

getPosition

Package: LibraryBrowser

Get position of Simulink Library Browser

Syntax

```
position = getPosition(lb)
```

Description

`position = getPosition(lb)` returns the position of the Simulink Library Browser.

Examples

Get Position of Library Browser

```
lb = LibraryBrowser.LibraryBrowser2;  
getPosition(lb)
```

```
ans =
```

```
    50    279    600    600
```

Input Arguments

lb — Simulink Library Browser

LibraryBrowser.LBStandalone object

Simulink Library Browser, specified as a `LibraryBrowser.LBStandalone` object.

Output Arguments

position — Position of Library Browser

numeric array

Position of Library Browser, returned as a numeric array of integers, in pixels: upper-left x-coordinate, upper-left y-coordinate, width, and height.

hide

Package: LibraryBrowser

Hide Simulink Library Browser

Syntax

```
hide(lb)
```

Description

hide(lb) hides the Simulink Library Browser.

Examples

Hide Library Browser

```
lb = LibraryBrowser.LibraryBrowser2;  
hide(lb)
```

Input Arguments

lb — Simulink Library Browser

LibraryBrowser.LBStandalone object

Simulink Library Browser, specified as a LibraryBrowser.LBStandalone object.

Introduced in R2016b

refresh

Package: LibraryBrowser

Refresh Simulink Library Browser

Syntax

```
refresh(lb)
```

Description

`refresh(lb)` updates the Simulink Library Browser with changes that affect it. Examples include adding a library to the Library Browser, removing a library from the Library Browser, and making changes to your custom libraries, `slblocks` function, or `sl_customization.m` file.

Examples

Refresh Library Browser

Refresh the Library Browser when you have made any changes that affect libraries on your MATLAB path that are registered in the Library Browser.

```
lb = LibraryBrowser.LibraryBrowser2;  
refresh(lb)
```

Input Arguments

lb — Simulink Library Browser

LibraryBrowser.LBStandalone object

Simulink Library Browser, specified as a LibraryBrowser.LBStandalone object.

setPosition

Package: LibraryBrowser

Set position of Simulink Library Browser

Syntax

```
setPosition(lb,position)
```

Description

`setPosition(lb,position)` sets the position of the Simulink Library Browser.

Examples

Set Position of Library Browser

```
lb = LibraryBrowser.LibraryBrowser2;  
setPosition(lb,[70 250 500 500])
```

Input Arguments

lb — Simulink Library Browser

LibraryBrowser.LBStandalone object

Simulink Library Browser, specified as a `LibraryBrowser.LBStandalone` object.

position — New position of Library Browser

numeric array

New position of Library Browser, specified as a numeric array of integers, in pixels: upper-left x-coordinate, upper-left y-coordinate, width, and height.

Data Types: `double`

Stateflow.EMChart

Stateflow interface to MATLAB Function block

Description

Use `Stateflow.EMChart` objects to configure MATLAB Function blocks through the Stateflow programmatic interface. For more information, see “Overview of the Stateflow API” (Stateflow).

Tip You can also configure the properties of a MATLAB Function block programmatically by using a `MATLABFunctionConfiguration` object. This object provides a direct interface to the properties of a MATLAB Function block. For more information, see “Configure MATLAB Function Blocks Programmatically”.

Creation

Each MATLAB Function block has its own `Stateflow.EMChart` object. When you add a MATLAB Function block to a Simulink model, a `Stateflow.EMChart` object is automatically created for it. For example, you can use the function `add_block` to add a MATLAB Function with the name `MATLAB Function` to a model called `myModel`:

```
add_block("simulink/User-Defined Functions/MATLAB Function", ...
         "myModel/MATLAB Function")
```

Then, to access the `Stateflow.EMChart` object, call the `find` function for the loaded system:

```
block = find(get_param("myModel", "Object"), ...
            "-isa", "Stateflow.EMChart", "Name", "MATLAB Function");
```

Properties

Stateflow API objects have properties that correspond to the values you set in the Stateflow Editor. To access or modify a property, use dot notation. To access or modify multiple properties for multiple API objects, use the `get` and `set` functions, respectively. For more information, see “Modify Properties and Call Functions of Stateflow Objects” (Stateflow).

Content

Name — Name of MATLAB Function block

"MATLAB Function" (default) | string scalar | character vector

Name of the MATLAB Function block, specified as a string scalar or character vector.

Script — Code for MATLAB Function block

string scalar | character vector

Code for the MATLAB Function block, specified as a string scalar or character vector. To enter multiple lines of code, you can:

- Call the MATLAB function `sprintf` and use `\n` to insert newline characters:

```
str = sprintf("function y=f(x)\ny=x+1;\nend");
block.Script = str;
```

- Enter a concatenated text expression that uses the function `newline` to create newline characters:

```
str = "function y=f(x)" + newline + ...
      "y=x+1;" + newline + ...
      "end";
block.Script = str;
```

SupportVariableSizing — Whether MATLAB Function block supports variable-size data

true or 1 (default) | false or 0

Whether the MATLAB Function block supports variable-size data, specified as a numeric or logical 1 (true) or 0 (false). For more information, see “Declare Variable-Size Outputs”.

AllowDirectFeedthrough — Whether MATLAB Function block supports direct feedthrough semantics

true or 1 (default) | false or 0

Whether the MATLAB Function block supports direct feedthrough semantics, specified as a numeric or logical 1 (true) or 0 (false). For more information, see “Allow direct feedthrough”.

VectorOutputs1D — Whether MATLAB Function block outputs column vectors as one-dimensional data

false or 0 (default) | true or 1

Whether the MATLAB Function block outputs column vectors as one-dimensional data, specified as a numeric or logical 0 (false) or 1 (true). For more information, see “Interpret output column vectors as one-dimensional data”.

Interface

Inputs — Input arguments

array of `Stateflow.Data` objects

This property is read-only.

Input arguments of the MATLAB Function block, specified as an array of `Stateflow.Data` objects. The value of this property depends on the inputs defined in the `Script` property for the block.

Outputs — Output arguments

array of `Stateflow.Data` objects

This property is read-only.

Output arguments of the MATLAB Function block, specified as an array of `Stateflow.Data` objects. The value of this property depends on the outputs defined in the `Script` property for the block.

Discrete and Continuous-Time Semantics

ChartUpdate — Activation method for MATLAB Function block

"INHERITED" (default) | "CONTINUOUS" | "DISCRETE"

Activation method for the MATLAB Function block, specified as "CONTINUOUS", "DISCRETE", or "INHERITED". For more information, see "Update method".

SampleTime — Sample time for activating MATLAB Function block

"-1" (default) | string scalar | character vector

Sample time for activating the MATLAB Function block, specified as a string scalar or character vector. This property applies only when the `ChartUpdate` property for the MATLAB function is "DISCRETE".

Integer and Fixed-Point Data

SaturateOnIntegerOverflow — Whether data saturates on integer overflow

true or 1 (default) | false or 0

Whether the data in the MATLAB Function block saturates on integer overflow, specified as a numeric or logical 1 (true) or 0 (false). When this property is disabled, the data in the function wraps on integer overflow. For more information, see "Saturate on integer overflow".

TreatAsFi — Inherited Simulink signals to treat as fi objects

"Fixed-point" (default) | "Fixed-point & Integer"

Inherited Simulink signals to treat as Fixed-Point Designer `fi` objects, specified as one of these values:

- "Fixed-point" — The MATLAB Function block treats all fixed-point inputs as `fi` objects.
- "Fixed-point & Integer" — The MATLAB Function block treats all fixed-point and integer inputs as `fi` objects.

EmlDefaultFimath — Default fimath properties

"Same as MATLAB Default" (default) | "Other:UserSpecified"

Default `fimath` properties for the MATLAB Function block, specified as one of these values:

- "Same as MATLAB Default" — Use the same `fimath` properties as the current default `fimath` object.
- "Other:UserSpecified" — Use the `InputFimath` property to specify the default `fimath` object.

InputFimath — Default fimath object

string scalar | character vector

Default `fimath` object, specified as a string scalar or character vector. When the `EmlDefaultFimath` property for the MATLAB Function block is "Other:UserSpecified", you can use this property to:

- Enter an expression that constructs a `fimath` object.
- Enter the variable name for a `fimath` object in the MATLAB or model workspace.

Hierarchy

Machine — Machine that contains MATLAB Function block

Stateflow.Machine object

This property is read-only.

Machine that contains the MATLAB Function block, specified as a `Stateflow.Machine` object.

Path — Location of MATLAB Function block in model hierarchy

string scalar | character vector

This property is read-only.

Location of the MATLAB Function block in the model hierarchy, specified as a character vector.

Dirty — Whether MATLAB Function block has changed

true or 1 | false or 0

Whether the MATLAB Function block has changed after being opened or saved, specified as a numeric or logical 1 (true) or 0 (false).

Locked — Whether MATLAB Function block is locked

false or 0 (default) | true or 1

Whether the MATLAB Function block is locked, specified as a numeric or logical 1 (true) or 0 (false). Enable this property to prevent changes in the MATLAB Function block.

Iced — Whether MATLAB Function block is locked

false or 0 (default) | true or 1

This property is read-only.

Whether the MATLAB Function block is locked, specified as a numeric or logical 1 (true) or 0 (false). This property is equivalent to the property `Locked`, but is used internally to prevent changes in the MATLAB Function block during simulation.

Identification**Description — Description**

"" (default) | string scalar | character vector

Description for the MATLAB Function block, specified as a string scalar or character vector.

Document — Document link

"" (default) | string scalar | character vector

Document link for the MATLAB Function block, specified as a string scalar or character vector.

Tag — User-defined tag

[] (default) | any data type

User-defined tag for the MATLAB Function block, specified as data of any type.

Id — Unique identifier

scalar

This property is read-only.

Unique identifier, specified as an integer scalar. Use this property to distinguish the MATLAB Function block from other objects in the model. The value of this property is reassigned every time you start a new MATLAB session and may be recycled after an object is deleted.

Object Functions

find	Identify specified objects in hierarchy
getChildren	Identify children of object
dialog	Open properties dialog box
view	Display object in editing environment

Examples

Program MATLAB Function Block

Access the Stateflow.EMChart object for a MATLAB Function block named My Function in a model called myModel.

```
block = find(get_param(gcs,"Object"), ...
    "-isa","Stateflow.EMChart","Path","myModel/My Function");
```

Store the MATLAB code to calculate the mean and standard deviation for a vector of values as a string scalar.

```
str = "function [mean,stdev] = stats(vals)" + newline + ...
    "% Calculates a statistical mean and a standard" + newline + ...
    "% deviation for the values in vals." + newline + newline + ...
    "len = length(vals);" + newline + ...
    "mean = avg(vals,len);" + newline + ...
    "stdev = sqrt(sum(((vals-avg(vals,len)).^2))/len);" + newline + ...
    "plot(vals,"-"+");" + newline + newline + ...
    "function mean = avg(array,size)" + newline + ...
    "mean = sum(array)/size;";
```

Populate the block with code by modifying the Script property of the corresponding Stateflow.EMChart object.

```
block.Script = str;
```

Open the function in the **MATLAB Function Block Editor**.

```
view(block)
```

The editor shows this code.

```
function [mean,stdev] = stats(vals)
% Calculates a statistical mean and a standard
% deviation for the values in vals.

len = length(vals);
mean = avg(vals,len);
stdev = sqrt(sum(((vals-avg(vals,len)).^2))/len);
plot(vals,"-"+");

function mean = avg(array,size)
mean = sum(array)/size;
```

Import Code from MATLAB Function

Open a Simulink model called myModel.

```
open_system("myModel")
```

Add a MATLAB Function block to myModel named My Function.

```
blockPath = "myModel/My Function";  
add_block("simulink/User-Defined Functions/MATLAB Function",blockPath)
```

Populate the block with code from the MATLAB function myFunction.m.

```
block = find(get_param("myModel","Object"),"-isa", ...  
            "Stateflow.EMChart","Path",blockPath);  
block.Script = fileread("myFunction.m");
```

Find Number of MATLAB Function Blocks in Model

Open a Simulink model called myModel.

```
open_system("myModel")
```

Find the MATLAB Function blocks in the model.

```
blocks = find(get_param("myModel","Object"),"-isa","Stateflow.EMChart");
```

Count the number of blocks.

```
numel(blocks)
```

Simulink.AliasType

Create alias for signal and parameter data type

Description

Use a `Simulink.AliasType` to create an alias of a built-in data type such as `int8`.

The name of the object is the alias. The data type to which an alias refers, such as `int8`, is the base type. Alias names cannot be:

- Floating-point types: `half`, `single`, `double`
- Integer types: `int8`, `uint8`, `int16`, `uint16`, `int32`, `uint32`, `int64`, or `uint64`.
- Fixed-Point Designer types beginning with `sfix`, `ufix`, or `flt`.

You create the object in the base workspace or a data dictionary. To use the alias, you use the name of the object to set data types for signals, states, and parameters in a model.

Using aliases to specify signal and parameter data types can greatly simplify global changes to the data types that a model specifies. In particular, changing the data type of all signals, states, and parameters whose data type is specified by an alias requires changing only the base type of the alias. By contrast, changing the data types of signals, states, and parameters whose data types are specified by an actual type name requires respecifying the data type of each signal and parameter individually.

You can use objects of this class to create an alias for Simulink built-in data types, fixed-point data types, enumerated data types, `Simulink.NumericType` objects, and other `Simulink.AliasType` objects. The code that you generate from a model (Simulink Coder) uses the alias only if you use an ERT-based system target file (Embedded Coder).

Alternatively, to define and name a numeric data type, you can use an object of the class `Simulink.NumericType`.

Creation

You can use either the Model Explorer or MATLAB commands to create a data type alias.

To use the Model Explorer to create an alias:

- 1 On the Model Explorer **Model Hierarchy** pane, select `Base Workspace`.

You must create data type aliases in the MATLAB workspace or in a data dictionary. If you attempt to create an alias in a model workspace, Simulink software displays an error.

- 2 From the Model Explorer **Add** menu, select **Simulink.AliasType**.

Simulink software creates an instance of a `Simulink.AliasType` object and assigns it to a variable named `Alias` in the MATLAB workspace.

- 3 Rename the variable to a more appropriate name, for example, a name that reflects its intended usage.

To change the name, edit the name displayed in the **Name** field on the Model Explorer **Contents** pane.

- 4 On the Model Explorer **Dialog** pane, in the **Base type** field, enter the name of the data type that this alias represents.

You can specify the name of any existing standard or user-defined data type in this field. Skip this step if the base type is `double` (the default).

To generate `Simulink.AliasType` objects that correspond to `typedef` statements in your external C code, consider using the `Simulink.importExternalCTypes` function.

To create a data type alias programmatically, use the `Simulink.AliasType` function described below.

Syntax

```
aliasObj = Simulink.AliasType
aliasObj = Simulink.AliasType(baseType)
```

Description

`aliasObj = Simulink.AliasType` returns a `Simulink.AliasType` object with default property values.

`aliasObj = Simulink.AliasType(baseType)` returns a `Simulink.AliasType` object and initializes the value of the `BaseType` property by using `baseType`.

Properties

For information about properties in the property dialog box of a `Simulink.AliasType` object, see “`Simulink.AliasType` Property Dialog Box”.

BaseType — Name of base data type

'double' (default) | character vector | string scalar

Name of the base data type that this alias renames, specified as a character vector or string scalar. You can specify the name of a standard data type, such as `int8` or `half`, or the name of a custom data type, such as the name of another `Simulink.AliasType` object or the name of an enumeration.

To specify a fixed-point data type, you can use a call to the `fixdt` function, such as `'fixdt(0,16,7)'`.

You can, with one exception, specify a nonstandard data type, e.g., a data type defined by a `Simulink.NumericType` object, by specifying the data type name. The exception is a `Simulink.NumericType` whose `DataTypeMode` is `Fixed-point: unspecified scaling`.

Note `Fixed-point: unspecified scaling` is a partially specified type whose definition is completed by the block that uses the `Simulink.NumericType`. Forbidding its use in alias types avoids creating aliases that have different base types depending on where they are used.

Corresponds to **Base type** in the property dialog box.

Example: 'int8'

Example: 'myOtherAlias'

Data Types: char | string

DataScope — Specification to generate or import type definition in the generated code

'Auto' (default) | 'Exported' | 'Imported'

Specification to generate or import the type definition (typedef) in the generated code (Simulink Coder), specified as 'Auto', 'Exported', or 'Imported'.

The table shows the effect of each option.

Value	Action
'Auto' (default)	If no value is specified for <code>HeaderFile</code> , export the type definition to <code>model_types.h</code> , where <code>model</code> is the model name. If you have an Embedded Coder license, and you have specified a data type replacement, then export the type definition to <code>rtwtypes.h</code> . If a value is specified for <code>HeaderFile</code> , import the data type definition from the specified header file.
'Exported'	Export the data type definition to a header file, which can be specified in the <code>HeaderFile</code> property. If no value is specified for <code>HeaderFile</code> , the header file name defaults to <code>type.h</code> . <code>type</code> is the data type name.
'Imported'	Import the data type definition from a header file, which can be specified in the <code>HeaderFile</code> property. If no value is specified for <code>HeaderFile</code> , the header file name defaults to <code>type.h</code> . <code>type</code> is the data type name.

For more information, see “Control File Placement of Custom Data Types” (Embedded Coder).

Corresponds to **Data scope** in the property dialog box.

Description — Custom description of data type alias

'' (empty character vector) (default) | character vector

Custom description of the data type alias, specified as a character vector.

Corresponds to **Description** in the property dialog box.

Example: 'This type alias corresponds to a floating-point implementation.'

Data Types: char

HeaderFile — Name of header file that contains type definition in the generated code

'' (empty character vector) (default) | character vector

Name of the header file that contains the type definition (typedef) in the generated code, specified as a character vector.

If this property is specified, the specified name is used during code generation for importing or exporting. If this property is empty, the value defaults to `type.h` if `DataScope` equals 'Imported' or 'Exported', or defaults to `model_types.h` if `DataScope` equals 'Auto'.

By default, the generated `#include` directive uses the preprocessor delimiter `"` instead of `<` and `>`. To generate the directive `#include <myTypes.h>`, specify `HeaderFile` as '`<myTypes.h>`'.

For more information, see “Control File Placement of Custom Data Types” (Embedded Coder).

Corresponds to **Header file** in the property dialog box.

Example: 'myHdr.h'

Example: 'myHdr'

Example: 'myHdr.hpp'

Data Types: char

Examples

Create Alias for Enumerated Data Type

To create an alias for an enumerated type called `SLDemoSign`:

```
myEnumAlias = Simulink.AliasType('Enum: SLDemoSign');
```

Create Alias for Fixed-Point Data Type

To create an alias for a fixed-point data type by using a `Simulink.AliasType` object, set the `BaseType` property of the object by using a call to the `fixdt` function. The value of `BaseType` must be specified as a character vector.

For example, this code creates an alias for an unsigned fixed-point data type with word length 16 and fraction length 7.

```
myFixptAlias = Simulink.AliasType;  
myFixptAlias.BaseType = 'fixdt(0,16,7)';
```

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using MATLAB® Coder™.

A `Simulink.AliasType` object appears in the generated code as a `typedef` statement. The generated code uses the named type to define and declare data (variables).

The `Simulink.AliasType` class does not support multiword base data types for code generation.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Simulink.Annotation

Create and specify properties of text, image, and area annotations

Description

Annotations are visual elements that you can use to add descriptive notes and callouts to your model. You can programmatically access and modify them as `Simulink.Annotation` objects.

To interactively create and modify annotations, see “Describe Models Using Notes and Annotations”.

Creation

Syntax

```
a = Simulink.Annotation(sys,name)
a = Simulink.Annotation(path,Name,Value)
```

Description

`a = Simulink.Annotation(sys,name)` creates an annotation with the specified name and default properties in the specified system or subsystem.

`a = Simulink.Annotation(path,Name,Value)` creates an annotation with properties on page 8-23 specified using name-value pairs. For example, `Simulink.Annotation('model/annotation','BackgroundColor','yellow')` creates an annotation with a yellow background. You can specify multiple name-value pairs. Enclose each property name in quotes.

Input Arguments

sys — System or subsystem to contain annotation

character vector | string scalar

System or subsystem to contain annotation, specified as a character vector or string scalar.

Data Types: `char` | `string`

name — Name of new annotation

character vector

Name of new annotation, specified as a character vector.

Data Types: `char`

path — Path to new annotation

character vector | string scalar

Path to new annotation, specified as a character vector or string scalar composed of the system name and the annotation name.

Example: `Simulink.Annotation('model/annotation')`

Data Types: char | string

Properties

Interaction

Selected — Option to select annotation

'off' (default) | on/off logical value

Option to select or deselect the annotation, specified as 'on' or 'off', or numeric or logical 1 (true) or 0 (false). A value of 'on' is equivalent to true, and 'off' is equivalent to false. Thus, you can use the value of this property as a logical value. The value is stored as an on/off logical value of type OnOffSwitchState.

- 'on' — Select annotation.
- 'off' — Remove selection from annotation.

Data Types: logical | char | string

Text

Name — Text of annotation

character vector | string scalar

Text of annotation, specified as a character vector or string scalar.

Same as Text.

Data Types: char | string

Text — Text of annotation

character vector | string scalar

Text of annotation, specified as a character vector or string scalar.

Same as Name.

Data Types: char | string

Interpreter — Option to format text style

'off' (default) | 'rich' | 'tex'

Option to format text style, specified as 'off' for plain text, 'rich' for rich text, or 'tex' for text that contains LaTeX commands. When you format a plain text annotation using the formatting toolbar, the annotation becomes a rich text annotation.

TeXMode — Option to render TeX markup

'off' (default) | on/off logical value

Option to render TeX markup, specified as 'on' or 'off', or numeric or logical 1 (true) or 0 (false). A value of 'on' is equivalent to true, and 'off' is equivalent to false. Thus, you can use the value of this property as a logical value. The value is stored as an on/off logical value of type OnOffSwitchState.

- 'on' — Render TeX markup.

- 'off' — Do not render TeX markup.

MarkupType — Option to make markup annotation

'model' (default) | 'markup'

Option to make markup annotation, specified as 'model' or 'markup'.

Note Set the 'ShowMarkup' model parameter to 'on' to show markup annotations or 'off' to hide markup annotations.

Font

FontName — Font name

'auto' (default) | character vector | string scalar

This property affects only plain text annotations.

Font name, specified as a character vector or string scalar. The default value, 'auto', uses the default font specified for annotations in the Font Styles dialog box. To open the Font Styles dialog box, on the **Format** tab, click the **Font Properties** button arrow, then click **Fonts for Model**.

Data Types: char | string

FontSize — Font size, in points

-1 (default) | numeric scalar

This property affects only plain text annotations.

Font size, in points, specified as a numeric scalar. The default value, -1, uses the default font size for annotations specified in the Font Styles dialog box. To open the Font Styles dialog box, on the **Format** tab, click the **Font Properties** button arrow, then click **Fonts for Model**.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

FontWeight — Character thickness

'auto' (default) | 'normal' | 'bold' | 'light' | 'demi'

This property affects only plain text annotations.

Character thickness, specified as one of the values listed in the table.

Value	Description
'auto'	The default weight for annotations specified in the Font Styles dialog box. To open the Font Styles dialog box, on the Format tab, click the Font Properties button arrow, then click Fonts for Model .
'normal'	Normal font weight.
'bold'	Bold font weight.
'light'	Not recommended.
'demi'	Not recommended.

FontAngle – Angle of annotation font

'auto' (default) | 'normal' | 'italic' | 'oblique'

This property affects only plain text annotations.

Angle of annotation font, specified as one of the values listed in the table.

Value	Description
'auto'	The default font angle specified for annotations in the Font Styles dialog box. To open the Font Styles dialog box, on the Format tab, click the Font Properties button arrow, then click Fonts for Model .
'normal'	Normal font.
'italic'	Italic font.
'oblique'	Oblique font (usually the same as italic font).

Colors and Effects**BackgroundColor – Background color of annotation**

'white' (default) | RGB value array | 'automatic' (transparent) | 'black' | 'red' | 'green' | 'blue' | ...

Background color of annotation, specified as one of the values listed in this table.

Value	Description
'automatic'	Transparent
'black'	Black
'white'	White
'red'	Red
'green'	Green
'blue'	Blue
'cyan'	Cyan
'magenta'	Magenta
'yellow'	Yellow
'gray'	Gray
'lightBlue'	Light blue
'orange'	Orange
'darkGreen'	Dark green
RGB value array, specified as '[r , g , b]' where r, g, and b are the red, green, and blue values of the color normalized to the range 0.0 to 1.0.	Fully opaque custom color

Data Types: char | string

ForegroundColor – Foreground color of annotation

'black' (default) | RGB value array | 'white' | 'red' | 'green' | 'blue' | ...

Foreground color of annotation, specified as one of the values listed in this table.

Value	Description
'black'	Black
'white'	White
'red'	Red
'green'	Green
'blue'	Blue
'cyan'	Cyan
'magenta'	Magenta
'yellow'	Yellow
'gray'	Gray
'lightBlue'	Light blue
'orange'	Orange
'darkGreen'	Dark green
RGB value array, specified as '[r,g,b]' where r, g, and b are the red, green, and blue values of the color normalized to the range 0.0 to 1.0.	Fully opaque custom color

Data Types: char | string

DropShadow — Option to display drop shadow

'off' (default) | on/off logical value

Option to display drop shadow, specified as 'on' or 'off', or numeric or logical 1 (true) or 0 (false). A value of 'on' is equivalent to true, and 'off' is equivalent to false. Thus, you can use the value of this property as a logical value. The value is stored as an on/off logical value of type `OnOffSwitchState`.

- 'on' — Display drop shadow.
- 'off' — Do not display drop shadow.

Size and Position

FixedHeight — Option to control annotation height

'off' (default) | on/off logical value

Option to control annotation height, specified as 'on' or 'off', or numeric or logical 1 (true) or 0 (false). A value of 'on' is equivalent to true, and 'off' is equivalent to false. Thus, you can use the value of this property as a logical value. The value is stored as an on/off logical value of type `OnOffSwitchState`.

- 'on' — The annotation does not resize to accommodate text changes. The visible text may be truncated.
- 'off' — The annotation automatically resizes to accommodate text changes.

Interactively resizing the annotation sets this parameter to 'on'.

VerticalAlignment — Vertical anchor point of annotation

'top' (default) | 'middle' | 'bottom' | 'cap' | 'baseline'

Vertical anchor point of annotation, specified as one of the values listed in this table.

Value	Description
'top'	The top of the annotation remains fixed as the annotation grows or shrinks.
'middle'	The middle of the annotation remains fixed as the annotation grows or shrinks.
'bottom'	The bottom of the annotation remains fixed as the annotation grows or shrinks.
'cap'	Not recommended.
'baseline'	Not recommended.

Dependencies

To enable `VerticalAlignment`, set `FixedHeight` to 'off'.

FixedWidth — Option to control annotation width

'off' (default) | on/off logical value

Option to control annotation width, specified as 'on' or 'off', or numeric or logical 1 (true) or 0 (false). A value of 'on' is equivalent to true, and 'off' is equivalent to false. Thus, you can use the value of this property as a logical value. The value is stored as an on/off logical value of type `OnOffSwitchState`.

- 'on' — The annotation does not resize to accommodate text changes. When text cannot fit inside the annotation bounds, it wraps onto the next line.
- 'off' — The annotation automatically resizes to accommodate text changes.

Interactively resizing the annotation sets this parameter to 'on'.

HorizontalAlignment — Horizontal alignment of text within annotation

'left' (default) | 'center' | 'right'

Horizontal alignment of text within annotation, specified as one of the values listed in the table.

Value	Result
'left'	Text in the annotation is left justified.
'center'	Text in the annotation is centered.
'right'	Text in the annotation is right justified.

InternalMargins — Space between bounding box and borders

[0 0 0 0] (default) | 1x4 array

Space between bounding box of text and borders of annotation, specified as a 1x4 array. The array provides the space between the text and each side of the annotation. The elements of the array specify the space at the left, top, right, and bottom sides in order ([left top right bottom]).

Supported coordinates are between -1073740824 and 1073740823, inclusive.

Data Types: double

Position — Location of annotation

[0 0 28 14] (default) | 1x4 array

Location of annotation, specified as a 1x4 array. The array provides the locations of the annotation sides, in pixels. The elements of the array specify the locations of the left, top, right, and bottom sides in order ([left top right bottom]).

The origin is the upper-left corner of the Simulink Editor canvas before any canvas resizing. Positive values are to the right of and down from the origin. Negative values are to the left of and up from the origin. Supported coordinates are between -1073740824 and 1073740823, inclusive.

Dependencies

- To programmatically move the location of the right side without moving the left side the same amount, `FixedWidth` must be set to 'on'.
- To programmatically move the location of the bottom side without moving the top side the same amount, `FixedHeight` must be set to 'on'.

Data Types: double

Metadata**Description — Description of annotation**

character vector | string scalar

Description of annotation, specified as a character vector or string scalar.

Data Types: char | string

Tag — Text tag for annotation

character vector | string scalar

Text tag for annotation, specified as a character vector or string scalar.

Data Types: char | string

UserData — Data to associate with annotation

user data

Data to associate with annotation.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical | char | string | struct | table | cell | function_handle | categorical | datetime | duration | calendarDuration | fi

Callback Functions**ClickFcn — MATLAB code that executes when you click annotation**

character vector | string scalar

MATLAB code that executes when you click annotation, specified as a character vector or string scalar.

For more information, see “Make Annotations Interactive”.

Dependencies

When `UseDisplayTextAsClickCallback` is set to 'on', the `ClickFcn` value matches the `Name` and `Text` value.

Data Types: char | string

UseDisplayTextAsClickCallback — Option to use text as click function

'off' (default) | on/off logical value

Option to use text as click function, specified as 'on' or 'off', or numeric or logical 1 (true) or 0 (false). A value of 'on' is equivalent to true, and 'off' is equivalent to false. Thus, you can use the value of this property as a logical value. The value is stored as an on/off logical value of type `OnOffSwitchState`.

- 'on' — Clicking the annotation runs the annotation text specified by `Text`, which is interpreted as a valid MATLAB expression.
- 'off' — Clicking the annotation runs the function specified by `ClickFcn`, if available. If a click function is not specified, clicking the annotation does not run a function.

For more information, see “Make Annotations Interactive”.

LoadFcn — MATLAB code to execute when model containing annotation loads

character vector | string scalar

MATLAB code to execute when model containing annotation is loaded, specified as a character vector or string scalar. For more information, see “Make Annotations Interactive”.

Data Types: char | string

DeleteFcn — MATLAB code to execute before programmatically deleting annotation

character vector | string scalar

MATLAB code to execute before programmatically deleting annotation, specified as a character vector or string scalar.

For more information, see “Make Annotations Interactive”.

Data Types: char | string

Information (Read-Only)**Type — Annotation type**

'annotation' (default)

This property is read-only.

Annotation type, returned as 'annotation'.

AnnotationType — Type of annotation

'note_annotation' | 'area_annotation' | 'image_annotation'

This property is read-only.

Type of annotation, specified as 'note_annotation' for a text-based note, 'area_annotation' for an area, or 'image_annotation' for an image.

To programmatically create an area, see “Create Area Programmatically”.

To programmatically create an image-only annotation, see `setImage`.

IsImage — Check whether annotation is image-only annotation

'off' (default) | 'on'

This property is read-only.

Check whether annotation is an image-only annotation, returned as 'on' or 'off'.

PlainText — Text in annotation

vector

This property is read-only.

Text in annotation, without formatting, returned as a vector.

Handle — Annotation handle

double

This property is read-only.

Annotation handle, returned as a double.

Parent — System that contains annotation

character vector

This property is read-only.

System that contains annotation, returned as a character vector.

Path — Path to annotation

character vector

This property is read-only.

Path to annotation, returned as a character vector.

Object Functions

<code>view</code>	Find annotation
<code>setImage</code>	Specify image to display as annotation
<code>delete</code>	Delete annotation

Examples

Create Annotation Programmatically

Programmatically create, modify, and view an annotation.

Open a new model.

```
open_system(new_system)
```

Create an annotation with default properties using the `Simulink.Annotation` function.

```
a = Simulink.Annotation(gcs, 'This is an annotation.');
```

After creating the annotation, use dot notation to set property values. For example, apply an 18-point font and light blue background to the annotation.

```
a.FontSize = 18;
a.BackgroundColor = 'lightBlue';
```

To view and briefly highlight the new annotation, use the `view` function.

```
view(a)
```

Create Annotation with Custom Properties

Programmatically create an annotation with custom properties.

Open a model.

```
new_system('CreateAnnotationModel')
open_system('CreateAnnotationModel')
```

Create an annotation with custom properties specified as comma-separated pairs consisting of the property and value by using the `Simulink.Annotation` function. For example, apply an 18-point font and light blue background to the annotation.

```
a = Simulink.Annotation('CreateAnnotationModel/This is an annotation.',...
'FontSize',18, 'BackgroundColor', 'lightblue');
```

Tips

- To programmatically modify an existing annotation, use the `find_system` function to get the annotation handle, then use the `get_param` function to get the object. For example:

```
h = find_system(gcs, 'FindAll', 'on', 'Type', 'annotation');
a1 = get_param(h(1), 'Object');
```
- If an annotation invoked a currently executing callback function, use the `getCallbackAnnotation` to determine which annotation invoked it. The function returns the corresponding `Annotation` object. This function is also useful if you write a callback function in a separate MATLAB file that contains multiple callback calls.

Alternative Functionality

You also can create annotations using the `add_block` function. For example:

- `add_block('built-in/Note', 'model/This is a note.', 'BackgroundColor', 'yellow')` creates a note annotation with a yellow background.
- `add_block('built-in/Area', 'model/This is an Area.', 'Position', [120, 100, 230, 200])` creates an area annotation at the specified position.

To interactively create an annotation and edit its properties, see “Describe Models Using Notes and Annotations”.

Introduced before R2006a

delete

Package: Simulink

Delete annotation

Syntax

```
delete(a)
```

Description

`delete(a)` deletes the specified annotation.

Examples

Delete Annotation

Programmatically delete an annotation.

Open the vdp model.

```
vdp
```

To get the handles for the annotations in the model, use the `find_system` function.

```
h = find_system(gcs, 'FindAll', 'on', 'Type', 'annotation');
```

To identify the annotations, query the text inside the annotations.

```
get_param(h, 'PlainText')  
  
ans = 2x1 cell  
    {'Copyright 2004-2020 The MathWorks, Inc.'}  
    {'van der Pol Equation'}
```

To delete the title of the model ('van der Pol Equation'), get the `Simulink.Annotation` object that corresponds to the second handle.

```
a = get_param(h(2), 'Object');
```

Delete the annotation from the model.

```
delete(a)
```

Input Arguments

a — Annotation

`Simulink.Annotation` object

Annotation, specified as a `Simulink.Annotation` object.

setImage

Package: Simulink

Specify image to display as annotation

Syntax

```
setImage(a,img)
```

Description

`setImage(a,img)` changes the annotation to display only the specified image.

Examples

Add Image to Model

Add an image to your model, such as a logo, by creating an image-only annotation.

Open a new model and create an annotation in it.

```
open_system(new_system)
a = Simulink.Annotation(gcs,'This is an annotation.');
```

Change the annotation to display only the specified image.

```
img = fullfile(matlabroot,'toolbox','matlab','imagesci','peppers.png');
setImage(a,img)
```

Input Arguments

a — Annotation

Simulink.Annotation object

Annotation, specified as a Simulink.Annotation object.

img — Image filename

character vector | string scalar

Image filename, specified as a character vector or string scalar. The filename must contain the file extension and can include a partial path, complete path, relative path, or no path.

Data Types: char | string

view

Package: Simulink

Find annotation

Syntax

```
view(a)
```

Description

`view(a)` displays and briefly highlights the specified annotation.

Examples

Create Annotation Programmatically

Programmatically create, modify, and view an annotation.

Open a new model.

```
open_system(new_system)
```

Create an annotation with default properties using the `Simulink.Annotation` function.

```
a = Simulink.Annotation(gcs, 'This is an annotation.');
```

After creating the annotation, use dot notation to set property values. For example, apply an 18-point font and light blue background to the annotation.

```
a.FontSize = 18;  
a.BackgroundColor = 'lightBlue';
```

To view and briefly highlight the new annotation, use the `view` function.

```
view(a)
```

Input Arguments

a — Annotation

`Simulink.Annotation` object

Annotation, specified as a `Simulink.Annotation` object.

Simulink.BlockPath

Fully specified Simulink block path

Description

A `Simulink.BlockPath` object represents a fully specified block path that uniquely identifies a block within a model hierarchy, even when the model hierarchy references the same model multiple times.

Creation

Use either the `Simulink.BlockPath` or `gcbp` function to create a `Simulink.BlockPath` object. To get a `Simulink.BlockPath` object for the most recently clicked or loaded block, use the `gcbp` function.

Syntax

```
bp = Simulink.BlockPath
bp = Simulink.BlockPath(blockpath)
bp = Simulink.BlockPath(paths)
bp = Simulink.BlockPath(paths, subpath)
```

Description

`bp = Simulink.BlockPath` creates an empty `BlockPath` object.

`bp = Simulink.BlockPath(blockpath)` creates a copy of the specified `BlockPath` object.

`bp = Simulink.BlockPath(paths)` creates a `BlockPath` object from the specified character vector or cell array of character vectors. Each character vector represents a path at a level of the model hierarchy. Simulink builds the full block path based on the character vectors.

`bp = Simulink.BlockPath(paths, subpath)` additionally specifies an individual component of the block, such as a signal, that you specify with the `subpath` argument.

Input Arguments

blockpath — Existing `BlockPath` object

`BlockPath` object

Existing `BlockPath` object that you want to copy, specified as a `BlockPath` object.

paths — Paths used to build block path

character vector | cell array of character vectors

Paths used to build the block path, specified as a character vector or cell array of character vectors.

Specify each character vector in order, from the top model to the specific block for which you are creating a `BlockPath` object.

Each character vector must be a path to a block within the Simulink model. The block must be:

- A block in a single model
- A Model block (except for the last character vector, which may be a block other than a Model block)
- A block in the model referenced by the Model block that the previous character vector specifies

subpath — Individual component of block

character vector

Individual component of a block, such as a signal, specified as a character vector.

Properties

SubPath — Component of block

' ' (default) | character vector

Component of the block, specified as a character vector that provides the block path. For example, if the block path refers to a Stateflow chart, you can use `SubPath` to indicate the chart signals.

Example: `'gear_state.first'`

Data Types: `char`

Object Functions

<code>convertToCell</code>	Convert block path to cell array of character vectors
<code>getBlock</code>	Get single block path in model reference hierarchy
<code>getLength</code>	Get number of hierarchy levels in block path
<code>open</code>	Open specified model, library, subsystem, or block
<code>validate</code>	Determine whether block path represents valid block hierarchy

Examples

Create Simulink.BlockPath Object Using Cell Array

Create a block path object called `bp2`, using a cell array of character vectors representing elements of the block path.

```
sldemo_mdref_depgraph
bp2 = Simulink.BlockPath({'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/Fahrenheit to Celsius', ...
'sldemo_mdref_F2C/Gain1'})
```

`bp2 =`

```
Simulink.BlockPath
Package: Simulink
```

```
Block Path:
sldemo_mdref_depgraph/thermostat
sldemo_mdref_heater/Fahrenheit to Celsius
sldemo_mdref_F2C/Gain1
```

The resulting block path reflects the model reference hierarchy for the block path.

Functions

`gcbp`

Introduced in R2010b

convertToCell

Package: Simulink

Convert block path to cell array of character vectors

Syntax

```
cellarray = convertToCell(bp)
```

Description

`cellarray = convertToCell(bp)` converts a block path to a cell array of character vectors.

Examples

Create Cell Array that Represents Block Path

Open the example model, which references multiple models.

```
sldemo_mdhref_depgraph
```

Create a `Simulink.BlockPath` object.

```
bp = Simulink.BlockPath({'sldemo_mdhref_depgraph/thermostat', ...  
'sldemo_mdhref_heater/Fahrenheit to Celsius', ...  
'sldemo_mdhref_F2C/Gain1'});
```

Create a cell array that represents the elements of the block path.

```
cellarray = convertToCell(bp)
```

```
cellarray =
```

```
3x1 cell array
```

```
    {'sldemo_mdhref_depgraph/thermostat'      }  
    {'sldemo_mdhref_heater/Fahrenheit to Celsius'}  
    {'sldemo_mdhref_F2C/Gain1'                }
```

Input Arguments

bp — Fully specified block path

`Simulink.BlockPath` object

Fully specified block path, specified as a `Simulink.BlockPath` object. This block path uniquely identifies a block within a model hierarchy, even when the model hierarchy references the same model multiple times.

Output Arguments

cellarray — Block path elements

cell array of character vectors

Block path elements, returned as a cell array of character vectors.

See Also

Objects

Simulink.BlockPath

Functions

getBlock | getLength | open | validate

Introduced in R2010b

getBlock

Package: Simulink

Get single block path in model reference hierarchy

Syntax

```
block = getBlock(bp,index)
```

Description

`block = getBlock(bp,index)` returns the block path of the block at the level of the model reference hierarchy specified by the `index` argument.

Examples

Get Block Path for Specified Model Hierarchy Level

Open the example model, which references multiple models.

```
sldemo_mdhref_depgraph
```

Create a `Simulink.BlockPath` object.

```
bp = Simulink.BlockPath({'sldemo_mdhref_depgraph/thermostat', ...  
'sldemo_mdhref_heater/Fahrenheit to Celsius', ...  
'sldemo_mdhref_F2C/Gain1'});
```

Get the block for the second level in the model reference hierarchy.

```
blockpath = getBlock(bp,2)
```

```
blockpath =
```

```
    'sldemo_mdhref_heater/Fahrenheit to Celsius'
```

Get the block for the third level in the model reference hierarchy.

```
blockpath = getBlock(bp,3)
```

```
blockpath =
```

```
    'sldemo_mdhref_F2C/Gain1'
```

Input Arguments

bp — Fully specified block path

`Simulink.BlockPath` object

Fully specified block path, specified as a `Simulink.BlockPath` object. This block path uniquely identifies a block within a model hierarchy, even when the model hierarchy references the same model multiple times.

index — Index of block

integer

Index of the block for which you want to get the block path, specified as an integer. The index reflects the level in the model reference hierarchy. For example:

- An index of 1 represents a block in the top model.
- An index of 2 represents a block in the model that is referenced by the Model block of index 1.
- An index of n represents a block in the model that is referenced by the Model block of index n - 1.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64`

Output Arguments**block — Block path of block**

character vector

Block path of the block at the level of the model reference hierarchy specified by the `index` argument, returned as a character vector.

See Also**Objects**

`Simulink.BlockPath`

Functions

`convertToCell` | `getLength` | `open` | `validate`

Introduced in R2010b

getLength

Package: Simulink

Get number of hierarchy levels in block path

Syntax

```
length = getLength(bp)
```

Description

`length = getLength(bp)` returns a numeric value that corresponds to the number of levels in the model reference hierarchy for the block path.

Examples

Get Number of Hierarchy Levels in Block Path

Create a `Simulink.BlockPath` object that represents a referenced model within a model hierarchy.

```
load_system('sldemo_mdhref_depgraph')
bp = Simulink.BlockPath({'sldemo_mdhref_depgraph/thermostat', ...
'sldemo_mdhref_heater/Fahrenheit to Celsius'});
```

Get the number of hierarchy levels in the block path for the `Simulink.BlockPath` object.

```
length = getLength(bp)
```

```
length =
```

```
2
```

Input Arguments

bp — Fully specified block path

`Simulink.BlockPath` object

Fully specified block path, specified as a `Simulink.BlockPath` object. This block path uniquely identifies a block within a model hierarchy, even when the model hierarchy references the same model multiple times.

Output Arguments

length — Length of block path

integer

Length of the block path, returned as an integer. The length is the number of levels in the model reference hierarchy.

See Also

Objects

Simulink.BlockPath

Functions

convertToCell | getBlock | open | validate

Introduced in R2010b

open

Package: Simulink

Open specified model, library, subsystem, or block

Syntax

```
open(bp)  
open(bp, Name, Value)
```

Description

`open(bp)` opens the specified model, library, subsystem, or block. This is equivalent to double-clicking the model or library in the Current Folder browser or the subsystem or block in the Simulink Editor.

`open(bp, Name, Value)` opens the specified model, library, subsystem, or block with additional options.

Examples

Open Referenced Model in Context of Model Hierarchy

Create a `Simulink.BlockPath` object that represents a referenced model within a model hierarchy.

```
load_system('sldemo_mdref_depgraph')  
bp = Simulink.BlockPath({'sldemo_mdref_depgraph/thermostat', ...  
    'sldemo_mdref_heater/Fahrenheit to Celsius'});
```

Open the referenced model specified by `bp` in the context of the model hierarchy.

```
open(bp)
```

Open Referenced Model in New Window

Open the `sldemo_mdref_depgraph` model.

```
sldemo_mdref_depgraph
```

Create a `Simulink.BlockPath` object that represents a referenced model within a model hierarchy.

```
bp = Simulink.BlockPath({'sldemo_mdref_depgraph/thermostat', ...  
    'sldemo_mdref_heater/Fahrenheit to Celsius'})
```

Open the referenced model specified by `bp` in a new window.

```
open(bp, 'OpenType', 'new-window')
```

Input Arguments

bp — Fully specified block path

Simulink.BlockPath object

Fully specified block path, specified as a Simulink.BlockPath object. This block path uniquely identifies a block within a model hierarchy, even when the model hierarchy references the same model multiple times.

Name-Value Pair Arguments

Specify optional pairs of arguments as Name1=Value1, . . . , NameN=ValueN, where Name is the argument name and Value is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: open(bp, 'OpenType', 'new-window')

OpenType — Option to open object in new tab or window

'current-tab' (default) | 'new-tab' | 'new-window'

Option to open object in a new tab or window, specified as the comma-separated pair consisting of 'OpenType' and 'current-tab', 'new-tab', or 'new-window'. This option determines whether the subsystem or model specified by a Simulink.BlockPath object opens in the current window and tab, a new tab, or a new window, respectively.

Data Types: char | string

Force — Option to open object under block mask

'off' (default) | 'on'

Option to open the object under the block mask, specified as the comma-separated pair consisting of 'Force' and 'off' or 'on'. When this argument is set to 'off', the function opens the block mask. When this argument is set to 'on', the function opens the dialog box of the block under the mask or opens the masked system in a new tab, which is equivalent to the **Look Under Mask** menu item. It forces the Simulink.BlockPath object to open, regardless of the block mask.

Data Types: char | string

See Also

Objects

Simulink.BlockPath

Functions

open_system | validate

Introduced in R2019a

validate

Package: Simulink

Determine whether block path represents valid block hierarchy

Syntax

```
validate(bp)
```

Description

`validate(bp)` determines whether the block path represents a valid block hierarchy. If the block path is invalid, the function returns an error. The function checks that:

- All elements in the block path represent valid blocks
- Each element except the last is a valid Model block and references the model of the following element

Examples

Validate Block Path

Create a `Simulink.BlockPath` object that incorrectly represents a referenced model within a model hierarchy.

```
load_system('sldemo_mdref_depgraph')
bp = Simulink.BlockPath({'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/F2C'});
```

Check whether the block path is valid.

```
validate(bp);
```

The function returns an error because the block path is invalid. It does not specify the name of a block in the `sldemo_mdref_heater` model.

Create a `Simulink.BlockPath` object that correctly represents the referenced model within a model hierarchy.

```
bp = Simulink.BlockPath({'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/Fahrenheit to Celsius'});
```

Check whether the block path is valid.

```
validate(bp);
```

The block path is valid, so the function does not return an error.

Input Arguments

bp — Fully specified block path

`Simulink.BlockPath` object

Fully specified block path, specified as a `Simulink.BlockPath` object. This block path uniquely identifies a block within a model hierarchy, even when the model hierarchy references the same model multiple times.

Introduced in R2010b

Simulink.Bus

Specify properties of buses

Description

A `Simulink.Bus` object is a data type that, when used with `Simulink.BusElement` objects, specifies and validates the properties of a bus. When you simulate or update a model, Simulink checks whether buses connected to blocks match the `Simulink.Bus` object data types that the blocks specify.

A `Bus` object specifies only the architectural properties of a bus. For example, a bus object can specify element names, hierarchy, order, and data types. A `Bus` object cannot specify the values of the signals in a bus.

A `Bus` object is analogous to a structure definition in C: it defines the members of the bus but does not create the bus. A `Bus` object is also similar to a cable connector. The connector defines all the pins and their configuration and controls what types of wires can be connected to it. Similarly, a `Bus` object defines the configuration and properties of the signals that the associated bus must have.

`Bus` objects contain `Simulink.BusElement` objects. Each `BusElement` object specifies the properties of a signal in a bus, such as its name, data type, and dimension. The order of the `BusElement` objects in the `Bus` object defines the order of the signals in the bus.

A `Bus` object can specify properties that were not defined by constituent signals, but were left to be inherited.

To create and modify `Bus` objects in the base workspace or a data dictionary, you can use the **Bus Editor**, **Model Explorer**, or MATLAB commands. You cannot store `Bus` objects in model workspaces.

To use `Bus` objects in a model, see “Specify Bus Properties with `Simulink.Bus` Object Data Types”.

Creation

You can create a `Bus` object in multiple ways.

- To programmatically create a `Bus` object, use the `Simulink.Bus` function described below.
- To interactively create a `Bus` object, use the **Bus Editor** or **Model Explorer**.
- To create `Bus` objects from blocks in a model, MATLAB data, and external C code, see “Create Bus Objects Programmatically”.

Syntax

```
name = Simulink.Bus
```

Description

`name = Simulink.Bus` returns a `Bus` object with default property values. The name of the `Bus` object is the name of the MATLAB variable to which you assign the `Bus` object.

Properties

Description — Bus description

' ' (default) | character vector

Bus description, specified as a character vector. Use the description to document information about the Bus object, such as the kind of signal it applies to or where the Bus object is used. This information does not affect Simulink processing.

Data Types: char | string

Elements — Elements of bus

empty array (default) | array of Simulink.BusElement objects

Elements of bus, specified as an array of Simulink.BusElement objects. Each BusElement object defines the name, data type, dimensions, and other properties of a signal within the bus. For more information, see Simulink.BusElement.

DataScope — Data type definition mode in generated code

'Auto' (default) | 'Exported' | 'Imported'

Data type definition mode in generated code, specified as 'Auto', 'Exported', or 'Imported'. This property specifies whether during code generation the data type definition is imported from, or exported to, the header file specified with the HeaderFile property.

Value	Action
'Auto' (default)	Import the data type definition from the specified header file. If you do not specify the header file, export the data type definition to the default header file.
'Exported'	Export the data type definition to the specified header file or default header file.
'Imported'	Import the data type definition from the specified header file or default header file.

Data Types: char | string

HeaderFile — C header file used with data type definition

' ' (default) | character vector

C header file used with data type definition, specified as a character vector. Based on the value of the DataScope property, import the data type definition from or export the data type definition to the header file. The Simulink Coder software uses this property for code generation. Simulink software ignores this property.

By default, the generated #include directive uses the preprocessor delimiter " instead of < and >. To generate the directive #include <myTypes.h>, specify HeaderFile as <myTypes.h>.

Data Types: char | string

Alignment — Data alignment boundary

-1 (default) | integer

Data alignment boundary, specified as an integer, in number of bytes. The Simulink Coder software uses this property for code generation. Simulink software ignores this property.

The starting memory address for the data allocated for the bus is a multiple of the `Alignment` setting. If the object occurs in a context that requires alignment, you must specify an `Alignment` value with a positive integer that is a power of 2, not exceeding 128.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64`

PreserveElementDimensions — Specification to preserve dimensions of multidimensional bus elements

`'false'` (default) | `'true'`

Specification for the code generator to preserve dimensions of multidimensional bus elements in the generated code. For more information, see “Preserve Dimensions of Bus Elements in Generated Code” (Embedded Coder).

Data Types: `logical`

Examples

Create Bus Objects from Bus Element Objects

Create a hierarchy of `Simulink.Bus` objects using arrays of `Simulink.BusElement` objects.

Create an array that contains two `BusElement` objects, named `Chirp` and `Sine`, in the base workspace.

```
elems(1) = Simulink.BusElement;  
elems(1).Name = 'Chirp';  
  
elems(2) = Simulink.BusElement;  
elems(2).Name = 'Sine';
```

Array indexing lets you create and access the elements of the array. Dot notation lets you access property values of the elements.

Create a `Bus` object, named `Sinusoidal`, that contains the elements defined in the `elems` array.

```
Sinusoidal = Simulink.Bus;  
Sinusoidal.Elements = elems;
```

To create a hierarchy of `Bus` objects, create another `Bus` object to reference the `Bus` object named `Sinusoidal`.

Create an array that contains two `BusElement` objects, named `NestedBus` and `Step`. Specify the `Bus` object named `Sinusoidal` as the data type of the `NestedBus` element.

```
clear elems  
  
elems(1) = Simulink.BusElement;  
elems(1).Name = 'NestedBus';  
elems(1).DataType = 'Bus: Sinusoidal';  
  
elems(2) = Simulink.BusElement;  
elems(2).Name = 'Step';
```

Create a `Bus` object, named `TopBus`, that contains the elements defined in the `elems` array.

```
TopBus = Simulink.Bus;  
TopBus.Elements = elems;
```

You can view the hierarchy of the created objects in the **Bus Editor**.

Simulink.BusElement

Specify properties of elements of buses

Description

A `Simulink.BusElement` object is an element of a `Simulink.Bus` object that validates the properties of an element in a bus. When you simulate or update a model, Simulink checks whether the properties specified by the `BusElement` object match the properties specified by the corresponding bus elements.

`BusElement` objects exist only within the `Bus` object. You can specify a `Bus` object, but not a `BusElement` object, as a data type.

To create and modify `Bus` and `BusElement` objects in the base workspace or a data dictionary, you can use the **Bus Editor**, **Model Explorer**, or MATLAB commands. You cannot store `Bus` objects in model workspaces.

Creation

You can create a `BusElement` object in multiple ways.

- To programmatically create a `BusElement` object, use the `Simulink.BusElement` function (described here).
- To interactively create a `BusElement` object, use the **Bus Editor** or **Model Explorer**.
- To create `BusElement` objects from blocks in a model, MATLAB data, and external C code, see “Create Bus Objects Programmatically”.

Syntax

```
be = Simulink.BusElement
```

Description

`be = Simulink.BusElement` returns a `BusElement` object with default property values.

Properties

Name — Name of element

'a' (default) | character vector

Name of element, specified as a character vector.

Note To validate the properties of a signal against a `BusElement` object, the signal name must be a valid identifier that starts with an alphabetic character or underscore (`_`), followed by alphanumeric characters or underscores.

Data Types: char | string

Complexity — Numeric type of element

'real' (default) | 'complex'

Numeric type of the element, specified as 'real' or 'complex'.

Data Types: char | string

Dimensions — Dimensions of element

1 (default) | scalar | vector

Dimensions of element, specified as a scalar or vector.

To use symbolic dimensions in generated code, see “Implement Dimension Variants for Array Sizes in Generated Code” (Embedded Coder).

Data Types: double

Data Type — Data type of element

'double' (default) | character vector | string scalar

Data type of element, specified as a character vector or string scalar.

Click the **Show data type assistant** button  to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

You can specify any of these options:

- Built-in Simulink data type — For example, specify 'single' or 'uint8'. See “Data Types Supported by Simulink”.
- Fixed-point data type — Use the `fixdt` function. For example, specify 'fixdt(1,16,0)'.
- Enumerated data type — Use the name of the type preceded by `Enum:`. For example, specify 'Enum: myEnumType'.
- Bus data type — Use the name of the `Simulink.Bus` object preceded by `Bus:`. For example, specify 'Bus: myBusObject'.
- Value type — Use the name of the `Simulink.ValueType` object preceded by `ValueType:`. For example, specify 'ValueType: windVelocity'.
- Custom data type — Use a MATLAB expression that specifies the type. For example, you can specify a `Simulink.NumericType` object whose `DataTypeMode` property is set to a value other than 'Fixed-point: unspecified scaling'.

Specifying a `Simulink.Bus` object allows you to create Bus objects that specify hierarchical buses (that is, buses that contain other buses).

When you specify a `Simulink.ValueType` or `Simulink.Bus` object, the object defines more than the data type. The object also defines properties such as **Min**, **Max**, and **Unit**. The property values specified by the `ValueType` object override the corresponding property values specified by a block. For example, suppose a block sets **Unit** to ft/s. When the **Data type** of the block specifies a `ValueType` object that has m/s as its unit, the block uses m/s instead of ft/s.

Data Types: char | string

Min — Minimum value of element

[] (default) | scalar

Minimum value of the element, specified as a scalar. This value must be a finite real double scalar or, if the element is a bus, the value must be empty, [].

Data Types: double

Max — Maximum value of element

[] (default) | scalar

Maximum value of the element, specified as a scalar. This value must be a finite real double scalar or, if the element is a bus, the value must be empty, [].

Data Types: double

DimensionsMode — Specify how to handle size of element

'Fixed' (default) | 'Variable'

Specify how to handle size of element, specified as 'Fixed' or 'Variable'.

Data Types: char | string

Unit — Physical unit for expressing element

' ' (default) | character vector

Physical unit for expressing element, specified as a character vector.

For more information, see “Unit Specification in Simulink Models”.

Example: 'inches'

Data Types: char | string

Description — Bus element description

' ' (default) | character vector

Bus element description, specified as a character vector. Use the description to document information about the BusElement object, such as the kind of signal it applies to. This information does not affect Simulink processing.

Data Types: char | string

Examples

Create Bus Objects from Bus Element Objects

Create a hierarchy of Simulink.Bus objects using arrays of Simulink.BusElement objects.

Create an array that contains two BusElement objects, named Chirp and Sine, in the base workspace.

```
elems(1) = Simulink.BusElement;  
elems(1).Name = 'Chirp';
```

```
elems(2) = Simulink.BusElement;  
elems(2).Name = 'Sine';
```

Array indexing lets you create and access the elements of the array. Dot notation lets you access property values of the elements.

Create a `Bus` object, named `Sinusoidal`, that contains the elements defined in the `elems` array.

```
Sinusoidal = Simulink.Bus;
Sinusoidal.Elements = elems;
```

To create a hierarchy of `Bus` objects, create another `Bus` object to reference the `Bus` object named `Sinusoidal`.

Create an array that contains two `BusElement` objects, named `NestedBus` and `Step`. Specify the `Bus` object named `Sinusoidal` as the data type of the `NestedBus` element.

```
clear elems

elems(1) = Simulink.BusElement;
elems(1).Name = 'NestedBus';
elems(1).DataType = 'Bus: Sinusoidal';

elems(2) = Simulink.BusElement;
elems(2).Name = 'Step';
```

Create a `Bus` object, named `TopBus`, that contains the elements defined in the `elems` array.

```
TopBus = Simulink.Bus;
TopBus.Elements = elems;
```

You can view the hierarchy of the created objects in the **Bus Editor**.

```
buseditor
```

Compatibility Considerations

Simulink.BusElement objects no longer support the `SampleTime` property

Errors starting in R2020b

The `SampleTime` property of `Simulink.BusElement` objects is no longer supported.

`BusElement` objects that specify a sample time cause an error during compile. To remove the sample time specification from a `BusElement` object, set its `SampleTime` to `-1`.

`Simulink.Bus.cellToObject` continues to accept cell arrays that specify sample time for bus elements. `Simulink.Bus.objectToCell`, `Simulink.Bus.save`, and `Simulink.Bus.createObject` continue to return cell arrays or arrays that include the sample time when it is noninherited. When the sample time is inherited (`-1`), they omit it. Similarly, the **Bus Editor** and **Model Explorer** omit the sample time when it is inherited.

To specify the sample time for an element of a bus, use the `SampleTime` block parameter of corresponding blocks. For example, you can use `In Bus Element`, `Out Bus Element`, and `Signal Specification` blocks to specify sample time.

Simulink.BusElement objects will no longer support the `SamplingMode` property

Not recommended starting in R2016b

In R2016b, the `SamplingMode` property of `Simulink.BusElement` objects was removed. Scripts that use the `SamplingMode` property of `Simulink.BusElement` objects continue to work. `Simulink.Bus.cellToObject` continues to require the `SamplingMode` field and `Simulink.Bus.objectToCell` continues to include the sampling mode in the output cell arrays.

In a future release, support for the `SamplingMode` property will be removed.

To specify whether a signal is sample-based or frame-based, define the sampling mode of input signals at the block level instead of at the signal level.

Simulink.CoderInfo

Specify information needed to generate code for signal, state, or parameter data

Description

Use a `Simulink.CoderInfo` object to specify code generation settings for signal, state, and parameter data in a model.

Simulink creates a `Simulink.CoderInfo` object for each data object that you create. Data objects represent signal, state, or parameter data. The `Simulink.CoderInfo` object exists in the `CoderInfo` property of each data object.

Data objects include objects of these classes:

- `Simulink.Parameter`
- `Simulink.Signal`
- `Simulink.LookupTable`
- `Simulink.Breakpoint`
- `Simulink.DualScaledParameter`

Use the properties of the `Simulink.CoderInfo` object to configure the representation of the parent data object in the generated code.

You can set the properties of a `Simulink.CoderInfo` object through the `CoderInfo` property or the property dialog box of the parent data object. For example, the following MATLAB expression sets the `StorageClass` property of a `Simulink.CoderInfo` object used by a signal object named `mysignal`.

```
mysignal.CoderInfo.StorageClass = 'ExportedGlobal';
```

Creation

When you create a data object, Simulink sets the value of the `CoderInfo` property by creating a `Simulink.CoderInfo` object. You do not need to create a `Simulink.CoderInfo` object explicitly.

Properties

Identifier — Alternative name for code generation

' ' (empty character vector) (default) | character vector

Alternative name for the data in the generated code, specified as a character vector.

Example: `'myOtherName'`

Data Types: `char`

Alignment — Data alignment boundary

-1 (default) | positive integer

Data alignment boundary for this data, specified as a positive integer that is a power of 2, not exceeding 128. Specify an integer number of double data type. See “Data Alignment for Code Replacement” (Embedded Coder) for more information.

Example: 8

Data Types: double

Complex Number Support: Yes

CustomAttributes — Custom storage class attributes of this data

`SimulinkCSC.AttribClass_Simulink_Default` object (default) | custom attributes object

Custom storage class attributes of this data, returned as a custom attributes object. You must set the property `StorageClass` to 'Custom' to enable this property.

Depending on the custom storage class that you apply by using the `CustomStorageClass` property of the `Simulink.CoderInfo` object, Simulink sets the value of this property by creating a custom attributes object. Then, you can set the values of the properties of the custom attributes object. See “Organize Parameter Data into a Structure by Using Struct Storage Class” (Embedded Coder) for more information.

CustomStorageClass — Custom storage class of this data

'Default' (default) | character vector

Custom storage class of this data, specified as a character vector. You must set the property `StorageClass` to 'Custom' to enable this property.

For a list of valid custom storage classes (Embedded Coder) when you create the data object from the `Simulink` package, see “Choose Storage Class for Controlling Data Representation in Generated Code” (Embedded Coder).

Example: 'ExportToFile'

Data Types: char

StorageClass — Storage class of this data

'Auto' (default) | character vector

Storage class of this data, specified as a character vector. For more information, see “C Code Generation Configuration for Model Interface Elements” (Simulink Coder).

Example: 'ExportedGlobal'

Data Types: char

Examples

Configure Code Generation Settings Programmatically

For examples that show how to configure code generation settings for a data item programmatically, see “C Code Generation Configuration for Model Interface Elements” (Simulink Coder) and “Organize Parameter Data into a Structure by Using Struct Storage Class” (Embedded Coder).

Simulink.ConfigSet

Model configuration set

Description

Use the `Simulink.ConfigSet` object to access a model configuration set. Get information about your configuration set and manage configuration parameters.

The `Simulink.ConfigSet` object is a `handle` object.

Creation

Use the `getActiveConfigSet` function to get the active configuration set for a model. Use the `getConfigSet` function to get a model configuration set by name.

Properties

Description — Description of the configuration set

character vector

Description of the configuration set, specified as a character vector. Use the description to provide additional information about a configuration set, such as its purpose.

Name — Name of the configuration set

character vector

Name of the configuration set, specified by a character vector. This name represents the configuration set in the Model Explorer.

Object Functions

<code>copy</code>	Copy configuration set or reference
<code>getFullName</code>	
<code>getModel</code>	
<code>get_param</code>	Get parameter names and values
<code>isActive</code>	
<code>isValidParam</code>	
<code>saveAs</code>	
<code>setPropEnabled</code>	
<code>set_param</code>	Set system and block parameter values

Examples

Get the Active Configuration Set for a Model

Open the model `vdp` and get the active configuration set.

```
vdp  
configSetObj = getActiveConfigSet('vdp');
```

“Manage Configuration Sets for a Model”

“Share a Configuration with Multiple Models”

Introduced in R2006a

Simulink.ConfigSetRef

Link model to freestanding configuration set

Description

Use the ConfigSetRef object to allow a model to reference configuration sets that are not saved in a model.

The Simulink.ConfigSetRef object is a handle object.

Creation

Create a ConfigSetRef object by using the getConfigSet function to call a model configuration reference by name.

Properties

Description — Description of configuration reference

character vector

Description of the configuration reference, specified as a character vector. Use this property to provide additional information about a configuration reference, such as its purpose. This field can remain blank.

Name — Name of configuration reference

character vector

Name of the configuration reference, specified as a character vector. This name represents the configuration reference in the Model Explorer.

SourceName — Variable that contains referenced configuration set

character vector

Name of the variable in the workspace or the data dictionary that contains the referenced configuration set, specified as a character vector.

Object Functions

copy	Copy configuration set or reference
getFullName	
getModel	
get_param	Get parameter names and values
getRefConfigSet	
isActive	
refresh	

Examples

Create and Reference a Freestanding Configuration Set

Use a `ConfigSetRef` object to allow a model to use a freestanding configuration set, which is not associated with a model.

Open the model `vdp`. Create a freestanding configuration set by copying the configuration set of the model.

```
model = 'vdp';  
open_system(model)  
  
freeConfigSet = copy(getActiveConfigSet(model));
```

Create a configuration reference. To point the reference to your freestanding configuration, set the `SourceName` property to `freeConfigSet`, the base workspace variable that represents your configuration. Name the reference `vdpConfigRef`.

```
configRef = Simulink.ConfigSetRef;  
set_param(configRef, 'SourceName', 'freeConfigSet');  
set_param(configRef, 'Name', 'vdpConfigRef');
```

Attach the configuration reference to the `vdp` model and activate it.

```
attachConfigSet('vdp', configRef);  
setActiveConfigSet('vdp', 'vdpConfigRef');
```

See Also

“Automate Model Configuration by Using a Script”

Introduced in R2007a

copy

Copy configuration set or reference

Syntax

```
copyCs = copy(cs)
```

Description

`copyCs = copy(cs)` returns a copy of a configuration set or configuration reference.

Examples

Attach New Configuration Set to a Model

Create a copy of a configuration set and attach it to a model.

Get the active configuration set for your model.

```
activeConfig = getActiveConfigSet ('vdp');
```

Copy the active configuration set.

```
develConfig = copy(activeConfig);
```

Give the copied configuration set a name.

```
develConfig.Name = 'develConfig';
```

Attach the new configuration set to the model.

```
attachConfigSet('vdp',develConfig);
```

Input Arguments

cs — Configuration set

`ConfigSet` object | `ConfigSetRef` object

Configuration set object to copy, specified as a `ConfigSet` object or a `Simulink.ConfigSetRef` object.

Output Arguments

copyCs — Copy of configuration set

`ConfigSet` object

A copy of the configuration set, returned as a `ConfigSet` object or a `ConfigSetRef` object.

Symbol

C Function block data symbol

Description

Define C Function block symbols and their properties.

Creation

Access a `Symbol` object through one of the following methods.

- `addSymbol` function
- `getSymbol` function
- Access the `Symbols` property of a `SymbolSpec` object.

Properties

Name — Symbol name in source code

character vector

Symbol name in source code, specified as a character vector.

Data Types: character

PortNumber — Port number

scalar integer

Port number, specified as a scalar integer. For input and output symbols, `PortNumber` indicates the port index on the block. For parameter symbols, `PortNumber` indicates the order that the symbol appears in the block parameter mask.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

Size — Size dimensions of the symbol

'1' (default) | character vector

Size of the symbol data specified as a character vector containing a scalar integer. The C Function block supports only scalars and vectors. Matrices and higher-dimension arrays are not supported. You can use a size expression to define the size of an output. Use -1 to inherit size.

Data Types: character

Type — Data type of symbol

'double' (default) | character vector

Data type of the symbol, specified as a character vector that evaluates to a numeric data type, or as a `Simulink.AliasType` object.

Example: `mySymbol.DataType = 'int32'`

Data Types: char

Scope — Scope of the symbol

'Input' (default) | 'Output' | 'Persistent' | 'Parameter' | 'Constant'

Scope of the symbol, specified as one of the following values.

- **Input** — Input symbol to the C Function block.
- **Output** — Output symbol to the C Function block.
- **Parameter** — Define a symbol as parameter. The parameter name is defined by the `Label` property of the symbol.
- **Persistent** — Define a symbol as persistent data.
- You can define a void pointer using the `Persistent` scope in the C Function block. A *void pointer* is a pointer that can store any type of data that you create or allocate.
- **Constant** — Define a symbol as constant using value-size or numeric expressions.

Data Types: character

Label — Symbol label

character vector

Symbol label, specified as a character vector. For symbols with their scope set to `Input` or `Output`, this label appears as the port name on the block. For symbols with their scope set to `Parameter`, this label is the label that appears on the block parameter mask. If the scope is `Constant`, the label is the constant expression. You cannot define a label for `Persistent` symbols.

Data Types: character

SymbolSpec

Query and configure C Function block data symbols

Description

Use the SymbolSpec object to query and configure C Function block symbol definitions and their properties.

Creation

Syntax

```
myCFunctionObj = get_param(CFcnBlk, 'SymbolSpec')
```

Description

`myCFunctionObj = get_param(CFcnBlk, 'SymbolSpec')` creates a C Function block symbol configuration object for the specified C Function block.

Input Arguments

CFcnBlk — C Function block

character vector

C Function block path specified as a character vector, or a handle to the C Function block.

Properties

Symbols — Symbols defined in the C Function block

Symbol object | array of Symbol objects

The symbols defined in the C Function block, specified as a Symbol object, or an array of Symbol objects.

Symbol objects define the properties of each symbol in the C Function block.

Object Functions

<code>addSymbol</code>	Add a symbol object definition to a C Function block
<code>getSymbol</code>	Get a symbol object definition of a C Function block
<code>deleteSymbol</code>	Delete a symbol object definition from a C Function block

Blocks

C Function

Topics

“Integrate External C/C++ Code into Simulink Using C Function Blocks”

Introduced in R2020a

addSymbol

Package: Simulink.CFunctionBlock

Add a symbol object definition to a C Function block

Syntax

```
mySymbol = addSymbol(mySymbolSpec)
mySymbol = addSymbol(mySymbolSpec, name)
```

Description

`mySymbol = addSymbol(mySymbolSpec)` creates a `Symbol` object, `mySymbol`, and adds the symbol to the `SymbolSpec` object, `mySymbolSpec`.

`mySymbol = addSymbol(mySymbolSpec, name)` creates a `Symbol` object, `mySymbol`, with the `Name` property specified by `name` and adds the symbol to the `SymbolSpec` object `mySymbolSpec`.

Examples

Specify and Edit Symbol Attributes Used in a C Function Block

Access and edit the properties of a symbol used in a C Function block.

Obtain the `SymbolSpec` object of the C Function block in your model using `get_param`. For example, select the C Function block in the model canvas and enter the following at the command line.

```
mySymbolSpec = get_param(gcb, 'SymbolSpec');
```

Use the `addSymbol` function to specify a new parameter symbol, `myParam`, in your C Function block code.

```
myParam = addSymbol(mySymbolSpec, 'myParam')
```

The `Symbol` object, `myParam`, uses default properties. Specify the scope of the symbol using the `Scope` property.

```
myParam.Scope = 'Parameter';
```

You can use the `getSymbol` function to access symbols specified for the block. For example, access the parameter symbol you added.

```
myParam = getSymbol(mySymbolSpec, 'myParam');
```

Edit the label of the parameter in the Block Parameters dialog using the `Label` property.

```
myParam.Label = 'Amplitude';
```

To delete a symbol from the `SymbolSpec` object, use the `deleteSymbol` function.

```
deleteSymbol(mySymbolSpec, 'myParam');
```

Input Arguments

mySymbolSpec — Symbol specifications of C Function block

SymbolSpec object

Symbol specifications of C Function block, specified as a SymbolSpec object.

name — Name of symbol

character vector

Name of the symbol, specified as a character vector.

Data Types: character

Output Arguments

mySymbol — Symbol

Symbol object

Symbol added to the C Function block, returned as a Symbol object. The Symbol object has default properties, except when you specify a name for the symbol in the input arguments. You can edit the properties of the Symbol object after creation.

Topics

“Integrate External C/C++ Code into Simulink Using C Function Blocks”

Introduced in R2020a

getSymbol

Package: Simulink.CFunctionBlock

Get a symbol object definition of a C Function block

Syntax

```
mySymbol = getSymbol(mySymbolSpec, name)
```

Description

`mySymbol = getSymbol(mySymbolSpec, name)` returns the `Symbol` object with the `Name` property specified by `name` associated with the `SymbolSpec` object.

Examples

Specify and Edit Symbol Attributes Used in a C Function Block

Access and edit the properties of a symbol used in a C Function block.

Obtain the `SymbolSpec` object of the C Function block in your model using `get_param`. For example, select the C Function block in the model canvas and enter the following at the command line.

```
mySymbolSpec = get_param(gcf, 'SymbolSpec');
```

Use the `addSymbol` function to specify a new parameter symbol, `myParam`, in your C Function block code.

```
myParam = addSymbol(mySymbolSpec, 'myParam')
```

The `Symbol` object, `myParam`, uses default properties. Specify the scope of the symbol using the `Scope` property.

```
myParam.Scope = 'Parameter';
```

You can use the `getSymbol` function to access symbols specified for the block. For example, access the parameter symbol you added.

```
myParam = getSymbol(mySymbolSpec, 'myParam');
```

Edit the label of the parameter in the Block Parameters dialog using the `Label` property.

```
myParam.Label = 'Amplitude';
```

To delete a symbol from the `SymbolSpec` object, use the `deleteSymbol` function.

```
deleteSymbol(mySymbolSpec, 'myParam');
```

Input Arguments

mySymbolSpec — Symbol specifications of C Function block

SymbolSpec object

Symbol specifications of C Function block, specified as a SymbolSpec object.

name — Name of symbol

character vector

Name of the symbol, specified as a character vector.

Data Types: character

Output Arguments

mySymbol — Symbol

Symbol object

Symbol associated with the C Function block, returned as a Symbol object.

deleteSymbol

Package: Simulink.CFunctionBlock

Delete a symbol object definition from a C Function block

Syntax

```
deleteSymbol(mySymbolSpec, name)
```

Description

`deleteSymbol(mySymbolSpec, name)` deletes the `Symbol` object with the `Name` property specified by `name` from the `SymbolSpec` object.

Examples

Specify and Edit Symbol Attributes Used in a C Function Block

Access and edit the properties of a symbol used in a C Function block.

Obtain the `SymbolSpec` object of the C Function block in your model using `get_param`. For example, select the C Function block in the model canvas and enter the following at the command line.

```
mySymbolSpec = get_param(gcf, 'SymbolSpec');
```

Use the `addSymbol` function to specify a new parameter symbol, `myParam`, in your C Function block code.

```
myParam = addSymbol(mySymbolSpec, 'myParam')
```

The `Symbol` object, `myParam`, uses default properties. Specify the scope of the symbol using the `Scope` property.

```
myParam.Scope = 'Parameter';
```

You can use the `getSymbol` function to access symbols specified for the block. For example, access the parameter symbol you added.

```
myParam = getSymbol(mySymbolSpec, 'myParam');
```

Edit the label of the parameter in the Block Parameters dialog using the `Label` property.

```
myParam.Label = 'Amplitude';
```

To delete a symbol from the `SymbolSpec` object, use the `deleteSymbol` function.

```
deleteSymbol(mySymbolSpec, 'myParam');
```

Input Arguments

mySymbolSpec — Symbol specifications of C Function block

SymbolSpec object

Symbol specifications of C Function block, specified as a SymbolSpec object.

name — Name of symbol

character vector

Name of the symbol to delete, specified as a character vector.

Data Types: character

Simulink.ConnectionBus

Specify properties of physical connection buses

Description

A `Simulink.ConnectionBus` object is a data type that, when used with `Simulink.ConnectionElement` objects, lets you design rigid interface specifications for Simscape conserving connections. When you apply such rigid specification to a Simscape Bus or Connection Port block, the block ports become typed by the interface and do not accept connections to a different domain type.

A `ConnectionBus` object specifies the architectural properties of an interface, such as element names, hierarchy, and domain types. A `ConnectionBus` object is similar to a cable connector. The connector defines all the pins and their configuration and controls what types of wires can be connected to it. Similarly, a `ConnectionBus` object defines the configuration and domain types of the ports of the associated Simscape Bus or Connection Port blocks.

`ConnectionBus` objects contain `Simulink.ConnectionElement` objects. Each `ConnectionElement` object specifies the properties of a port in a connection bus, such as its name and domain type. To create nested connection buses, specify a `ConnectionElement` on the parent bus and set its type as the child `ConnectionBus` object.

To create and modify `ConnectionBus` objects in the base workspace or a data dictionary, you can use the **Bus Editor**, the **Model Explorer**, or MATLAB commands. You cannot store `ConnectionBus` objects in model workspaces.

To simulate a model containing blocks that use a `ConnectionBus` object, that `ConnectionBus` object must be in the base workspace or in a data dictionary. You save and load `ConnectionBus` objects similar to `Simulink.Bus` objects. For more information, see “Determine How to Manage `Simulink.Bus` Objects”.

To apply an existing connection bus specification to a Simscape Bus or Connection Port block, use the **Connection type** parameter and select the bus name from the drop-down list.

Creation

Syntax

```
name = Simulink.ConnectionBus
```

Description

`name = Simulink.ConnectionBus` returns a `ConnectionBus` object with default property values. The name of the `ConnectionBus` object is the name of the MATLAB variable to which you assign the `ConnectionBus` object.

Properties

Description — Connection bus description

' ' (default) | character vector

Connection bus description, specified as a character vector. Use the description to document information about the `ConnectionBus` object, such as the application it is used for or domain types of its ports. This information does not affect Simulink processing.

Data Types: `char` | `string`

Elements — Elements of connection bus

empty array (default) | array of `Simulink.ConnectionElement` objects

Elements of connection bus, specified as an array of `Simulink.ConnectionElement` objects. Each `ConnectionElement` object defines the properties of a conserving connection within the bus, such as its name and domain type. For more information, see `Simulink.ConnectionElement`.

Examples

Create Connection Bus and Connection Element Objects Using MATLAB Commands

Define a rigid interface with one mechanical translational and one electrical port by creating a `ConnectionBus` object containing a two-element array of `ConnectionElement` objects. Array indexing lets you create and access multiple elements in an array. Dot notation lets you access property values.

Create a `ConnectionBus` object called `MechElec`:

```
MechElec = Simulink.ConnectionBus
```

```
MechElec =
```

```
ConnectionBus with properties:
```

```
Description: ''
Elements: [0x0 Simulink.ConnectionElement]
```

By default, the connection bus has no description and an empty array of connection elements.

Use the dot notation to fill in the description:

```
MechElec.Description = 'Rigid interface with one mechanical and one electrical port'
```

```
MechElec =
```

```
ConnectionBus with properties:
```

```
Description: 'Rigid interface with one mechanical and one electrical port'
Elements: [0x0 Simulink.ConnectionElement]
```

Create a `ConnectionElement` object to define the mechanical translational port:

```
mech = Simulink.ConnectionElement
```

```
mech =  
  
    ConnectionElement with properties:  
        Name: 'a'  
        Type: 'Connection: <domain name>'  
        Description: ''
```

This command creates a `ConnectionElement` object with default properties.

Change the `ConnectionElement` name to `mech`:

```
mech.Name = 'mech'
```

```
mech =  
  
    ConnectionElement with properties:  
        Name: 'mech'  
        Type: 'Connection: <domain name>'  
        Description: ''
```

Specify the domain type for the connection:

```
mech.Type = 'Connection: foundation.mechanical.translational.translational'
```

```
mech =  
  
    ConnectionElement with properties:  
        Name: 'mech'  
        Type: 'Connection: foundation.mechanical.translational.translational'  
        Description: ''
```

For a list of Foundation domain types, see “Domain-Specific Line Styles” (Simscape).

Optionally, fill in the port description:

```
mech.Description = 'Mechanical translational port'
```

```
mech =  
  
    ConnectionElement with properties:  
        Name: 'mech'  
        Type: 'Connection: foundation.mechanical.translational.translational'  
        Description: 'Mechanical translational port'
```

Similarly, create another `ConnectionElement` object to define the electrical port:

```
elec = Simulink.ConnectionElement;  
elec.Name = 'elec';  
elec.Type = 'Connection: foundation.electrical.electrical';  
elec.Description = 'Electrical port'
```

```
elec =  
  
    ConnectionElement with properties:  
        Name: 'elec'
```

```
Type: 'Connection: foundation.electrical.electrical'  
Description: 'Electrical port'
```

Add the two elements to the `ConnectionBus` object:

```
MechElec.Elements = [mech elec]
```

```
MechElec =
```

```
ConnectionBus with properties:
```

```
Description: 'Rigid interface containing one mechanical and one electrical port'  
Elements: [2x1 Simulink.ConnectionElement]
```

You can view the created objects in the **Bus Editor**:

```
buseditor
```

Alternatives

To interactively create a `ConnectionBus` object, use the **Bus Editor** or the **Model Explorer**.

Simulink.ConnectionElement

Specify properties of elements of physical connection buses

Description

A `Simulink.ConnectionElement` object is an element of a `Simulink.ConnectionBus` object. It validates the properties of a physical connection port.

`ConnectionElement` objects exist only within the `ConnectionBus` object. You can specify a `ConnectionBus` object, but not a `ConnectionElement` object, as a data type.

When you simulate or update a model, Simulink checks whether the ports connected to Simscape Bus or Connection Port blocks with rigid interface specifications match the properties of the corresponding `ConnectionElement` objects.

To create and modify `ConnectionBus` and `ConnectionElement` objects in the base workspace or a data dictionary, you can use the **Bus Editor**, the **Model Explorer**, or MATLAB commands. You cannot store `ConnectionBus` and `ConnectionElement` objects in model workspaces.

Creation

Syntax

```
ce = Simulink.ConnectionElement
```

Description

`ce = Simulink.ConnectionElement` returns a `ConnectionElement` object with default property values.

Properties

Name — Name of element

'a' (default) | character vector

Name of element, specified as a character vector. The element name must be a valid MATLAB identifier that starts with an alphabetic character or underscore (`_`), followed by alphanumeric characters or underscores.

Data Types: `char` | `string`

Type — Connection type of element

'Connection: <domain name>' (default) | registered Simscape domain | Simscape Multibody conserving connection type | `ConnectionBus` object present in the base workspace or a data dictionary

Connection type of element, specified as a Simscape Foundation domain name, a custom domain name registered in your MATLAB session, or a Simscape Multibody conserving connection type.

For a list of Foundation domains, see “Domain-Specific Line Styles” (Simscape).

Selecting a `ConnectionBus` object present in the base workspace or a data dictionary lets you create nested connection buses.

If you create `ConnectionElement` objects interactively, by using the **Bus Editor** or the **Model Explorer**, the drop-down list automatically contains all the valid domain and connection types.

Data Types: `char` | `string`

Description — Connection element description

`''` (default) | character vector

Connection element description, specified as a character vector. Use the description to document information about the `ConnectionElement` object, such as the domain type. This information does not affect Simulink processing.

Data Types: `char` | `string`

Examples

Create Connection Bus and Connection Element Objects Using MATLAB Commands

Define a rigid interface with one mechanical translational and one electrical port by creating a `ConnectionBus` object containing a two-element array of `ConnectionElement` objects. Array indexing lets you create and access multiple elements in an array. Dot notation lets you access property values.

Create a `ConnectionBus` object called `MechElec`:

```
MechElec = Simulink.ConnectionBus
```

```
MechElec =
```

```
ConnectionBus with properties:
```

```
  Description: ''
  Elements: [0x0 Simulink.ConnectionElement]
```

By default, the connection bus has no description and an empty array of connection elements.

Use the dot notation to fill in the description:

```
MechElec.Description = 'Rigid interface with one mechanical and one electrical port'
```

```
MechElec =
```

```
ConnectionBus with properties:
```

```
  Description: 'Rigid interface with one mechanical and one electrical port'
  Elements: [0x0 Simulink.ConnectionElement]
```

Create a `ConnectionElement` object to define the mechanical translational port:

```
mech = Simulink.ConnectionElement
```

```
mech =  
  
    ConnectionElement with properties:  
  
        Name: 'a'  
        Type: 'Connection: <domain name>'  
        Description: ''
```

This command creates a `ConnectionElement` object with default properties.

Change the `ConnectionElement` name to `mech`:

```
mech.Name = 'mech'
```

```
mech =  
  
    ConnectionElement with properties:  
  
        Name: 'mech'  
        Type: 'Connection: <domain name>'  
        Description: ''
```

Specify the domain type for the connection:

```
mech.Type = 'Connection: foundation.mechanical.translational.translational'
```

```
mech =  
  
    ConnectionElement with properties:  
  
        Name: 'mech'  
        Type: 'Connection: foundation.mechanical.translational.translational'  
        Description: ''
```

For a list of Foundation domain types, see “Domain-Specific Line Styles” (Simscape).

Optionally, fill in the port description:

```
mech.Description = 'Mechanical translational port'
```

```
mech =  
  
    ConnectionElement with properties:  
  
        Name: 'mech'  
        Type: 'Connection: foundation.mechanical.translational.translational'  
        Description: 'Mechanical translational port'
```

Similarly, create another `ConnectionElement` object to define the electrical port:

```
elec = Simulink.ConnectionElement;  
elec.Name = 'elec';  
elec.Type = 'Connection: foundation.electrical.electrical';  
elec.Description = 'Electrical port'
```

```
elec =  
  
    ConnectionElement with properties:  
  
        Name: 'elec'
```

```
Type: 'Connection: foundation.electrical.electrical'  
Description: 'Electrical port'
```

Add the two elements to the `ConnectionBus` object:

```
MechElec.Elements = [mech elec]
```

```
MechElec =
```

```
ConnectionBus with properties:
```

```
Description: 'Rigid interface containing one mechanical and one electrical port'  
Elements: [2x1 Simulink.ConnectionElement]
```

You can view the created objects in the **Bus Editor**:

```
buseditor
```

Alternatives

To interactively create a `ConnectionElement` object, use the **Bus Editor** or the **Model Explorer**.

FunctionPortSpecification

Query and configure C Caller block properties

Description

Query and configure the C Caller block function definition and return argument. Configure the C Caller block input arguments programmatically.

Creation

`myCCallerObj = get_param(gcb, 'FunctionPortSpecification')` creates a C Caller block configuration object for the selected C Caller block.

Properties

CPrototype — C function mapping to the C Caller block

character vector

Displays the mapping of the C function input to the C Caller block in the model. You cannot edit this property using the command line. To edit the C function mapping, edit the source code of the C Caller block.

Example: `real_T add(real_T u1, real_T u2);`

Data Types: char

InputArguments — List of function input arguments

FunctionArgument object

Returns the list of function input arguments in a “FunctionArgument Object” on page 8-88.

ReturnArgument — List of function output arguments

FunctionArgument scalar

Returns a scalar or an empty “FunctionArgument Object” on page 8-88.

Data Types: char

GlobalArguments — List of global arguments

FunctionArgument scalar

Returns a scalar or an empty “FunctionArgument Object” on page 8-88.

Data Types: char

FunctionArgument Object

The `FunctionArgument` is a class that carries port specification information of a C Caller block programmatically. The `FunctionArgument` object has these properties:

- 1 **Name** — Name of the variable in the source code, specified as a character vector. This property is read-only.
- 2 **PortNumber** — Port number of the InputArgument that has been edited, specified as uint32. This property is read-only.
- 3 **Size** — Size of the Simulink port dimensions specified as a character vector. You can edit this property if it is allowed in the function definition.
- 4 **Type** — Simulink data type for the specified port specified as a character vector. You can edit this property if it is allowed in the function definition.
- 5 **Label** — Port label on the Simulink block specified as a character vector. You can change the port label programmatically, for example:

```
myCCallerObj.my_CCaller.InputArguments(1).Label = 'inputport1'
```

```
my_CCallerObj =
```

```
FunctionPortSpecification with properties:
```

```
    CPrototype: 'real_T add(real_T u1, real_T u2);'
  InputArguments: [1x2 Simulink.CustomCode.FunctionArgument]
  ReturnArgument: [1x1 Simulink.CustomCode.FunctionArgument]
 GlobalArguments: [1x0 Simulink.CustomCode.FunctionArgument]
```

- 6 **Scope** — Mapping of the Simulink scope to the input argument specified as a character vector. If the variable is defined as a constant qualifier, the argument can be an input or a parameter. If no constant qualifier exists, you can change an output argument to an input, inputoutput, or to a parameter. If your scope fits any of the scenarios above, you can change it programmatically:

```
my_CCallerObj.InputArguments(1).Scope = 'parameter'
```

```
my_CCallerObj =
```

```
FunctionPortSpecification with properties:
```

```
    CPrototype: 'extern real_T add(real_T u1, real_T u2);'
  InputArguments: [1x2 Simulink.CustomCode.FunctionArgument]
  ReturnArgument: [1x1 Simulink.CustomCode.FunctionArgument]
 GlobalArguments: [1x0 Simulink.CustomCode.FunctionArgument]
```

Object Functions

`getGlobalArg` Get an object definition of a global variable in a C Caller block

Examples

Create a C Caller Configuration Object

This example creates a C Caller configuration object using the 'slexCCallerExample' demo model.

```
my_CCallerObj = get_param('slexCCallerExample/C Caller','FunctionPortSpecification')
```

```
my_CCallerObj =
```

```
FunctionPortSpecification with properties:
```

```
    CPrototype: 'real_T add(real_T u1, real_T u2);'
```

```
InputArguments: [1x2 Simulink.CustomCode.FunctionArgument]
ReturnArgument: [1x1 Simulink.CustomCode.FunctionArgument]
GlobalArguments: [1x0 Simulink.CustomCode.FunctionArgument]
```

Create a `FunctionArgument` object for the 1st input port:

```
inargone = my_CCallerObj.InputArguments(1)
inargone =
```

FunctionArgument with properties:

```
    Name: 'u1'
PortNumber: 1
    Size: '1'
    Type: 'double'
    Label: 'u1'
    Scope: 'Parameter'
```

Change the label for the first input port:

```
inargone.Label = 'inputport1'
inargone =
```

FunctionArgument with properties:

```
    Name: 'u1'
PortNumber: 1
    Size: '1'
    Type: 'double'
    Label: 'inputport1'
    Scope: 'Parameter'
```

getGlobalArg

Package: Simulink.CustomCode

Get an object definition of a global variable in a C Caller block

Syntax

```
GlobalArg = PortSpecObj.getGlobalArg(globalVariableName)
```

Description

GlobalArg = PortSpecObj.getGlobalArg(globalVariableName), where PortSpecObj is an object of class FunctionPortSpecification or Simulink.CodeImporter.SimulinkPortSpecification, creates a FunctionArgument on page 8-88 object. To use global variables in a model that uses C Caller blocks, turn on the **Enable custom code globals as function interface** setting from **Configuration Parameters > Simulation Target**.

Examples

Create Handle to Global Variable in C Caller Block

Access the properties of a global variable used in a C Caller block.

Create a FunctionPortSpecification object.

```
myFunctionPortSpecObject = get_param(gcb, 'FunctionPortSpecification')
```

Query and create a FunctionArgument object for the global argument.

```
myGlobalVariable = myFunctionPortSpecObject.getGlobalArg('myGlobalVariableName')
```

```
myGlobalVariable =
```

```
FunctionArgument with properties:
```

```
    Name: 'myGlobalVarPort'
PortNumber: 1
    Size: '1'
    Type: 'double'
    Label: 'myGlobalVarPort'
    Scope: 'Input'
```

Input Arguments

globalVariableName — Name of global variable

character vector | string scalar

Name of global variable, specified as a character vector.

Data Types: char

Output Arguments

GlobalArg — Global argument object

FunctionArgument object

Global argument object associated with the C Caller block, returned as a FunctionArgument object.

Simulink.data.Dictionary

Configure data dictionary

Description

A `Simulink.data.Dictionary` object represents a data dictionary. The object allows you to perform operations on the data dictionary such as save or discard changes, import data from the base workspace, and add other data dictionaries as references.

Creation

The functions `Simulink.data.dictionary.create` and `Simulink.data.dictionary.open` create a `Simulink.data.Dictionary` object.

Properties

DataSources — Referenced data dictionaries

cell array of character vectors

This property is read-only.

Referenced data dictionaries by file name, returned as a cell array of character vectors. This property only lists directly referenced dictionaries whose parent is the `Simulink.data.Dictionary` object.

EnableAccessToBaseWorkspace — Specify whether models can use design data in the base workspace

`false` (default) | `true`

Whether linked models can use design data in the base workspace, specified as `true` or `false`.

To determine whether a dictionary provides access to the base workspace (including through referenced dictionaries), query the `HasAccessToBaseWorkspace` property.

For more information about this property, including restrictions that limit your ability to interact with base workspace data through the dictionary, see “Continue to Use Shared Data in the Base Workspace”.

Data Types: `logical`

HasAccessToBaseWorkspace — Query whether models can use design data in the base workspace

`0` (default) | `1`

This property is read-only.

Query whether models can use design data in the base workspace, returned as `1` (true) or `0` (false). If the dictionary or a referenced dictionary has the `EnableAccessToBaseWorkspace` property set to `true`, this property returns `1`.

Use this property to determine whether models that link to the dictionary can use design data in the base workspace. You do not need to query each referenced dictionary to determine whether it has the `EnableAccessToBaseWorkspace` property set to `true`.

Data Types: `logical`

HasUnsavedChanges — Indicator of unsaved changes

0 | 1

This property is read-only.

Indicator of unsaved changes to the data dictionary, returned as 0 or 1. The value is 1 if changes have been made since last data dictionary save and 0 if not.

NumberOfEntries — Total number of entries in data dictionary

integer

This property is read-only.

Total number of entries in data dictionary, including those in referenced dictionaries, returned as an integer.

Object Functions

<code>addDataSource</code>	Add reference data dictionary to parent data dictionary
<code>close</code>	Close connection between data dictionary and <code>Simulink.data.Dictionary</code> object
<code>discardChanges</code>	Discard changes to data dictionary
<code>exportToVersion</code>	Export a <code>Simulink.data.Dictionary</code> object to a previous version
<code>filepath</code>	Full path and file name of data dictionary
<code>getSection</code>	Return <code>Simulink.data.dictionary.Section</code> object to represent data dictionary section
<code>hide</code>	Remove data dictionary from Model Explorer
<code>importEnumTypes</code>	Import enumerated type definitions to data dictionary
<code>importFromBaseWorkspace</code>	Import base workspace variables to data dictionary
<code>listEntry</code>	List data dictionary entries
<code>removeDataSource</code>	Remove reference data dictionary from parent data dictionary
<code>saveChanges</code>	Save changes to data dictionary
<code>show</code>	Show data dictionary in Model Explorer

Examples

Create New Data Dictionary and Data Dictionary Object

Create a data dictionary file `myNewDictionary.sldd` and a `Simulink.data.Dictionary` object representing the new data dictionary. Assign the object to variable `ddl`.

```
ddl = Simulink.data.dictionary.create('myNewDictionary.sldd')
```

```
ddl =
```

```
data dictionary with properties:
```

```
    DataSources: {0x1 cell}
```

```
HasUnsavedChanges: 0  
  NumberOfEntries: 0
```

Open Existing Data Dictionary

Create a `Simulink.data.Dictionary` object representing the existing data dictionary `myDictionary_ex_API.sldd`. Assign the object to variable `dd2`.

```
dd2 = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')
```

```
dd2 =
```

```
Dictionary with properties:
```

```
  DataSources: {'myRefDictionary_ex_API.sldd'}  
HasUnsavedChanges: 0  
  NumberOfEntries: 4
```

“Store Data in Dictionary Programmatically”

“What Is a Data Dictionary?”

Introduced in R2015a

addDataSource

Package: Simulink.data

Add reference data dictionary to parent data dictionary

Syntax

```
addDataSource(dictionaryObj, refDictionaryFile)
```

Description

`addDataSource(dictionaryObj, refDictionaryFile)` adds a data dictionary, `refDictionaryFile`, as a reference dictionary to a parent dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object.

The parent dictionary contains all the entries that are defined in the referenced dictionary until the referenced dictionary is removed from the parent dictionary. The `DataSource` property of an entry indicates the dictionary that defines the entry.

Examples

Add a Reference Data Dictionary to a Parent Data Dictionary

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Add the data dictionary `mySubDictionary_ex_API.sldd` as a reference dictionary to `myDictionary_ex_API.sldd`.

```
addDataSource(myDictionaryObj, 'mySubDictionary_ex_API.sldd');
```

Confirm the addition by viewing the `DataSources` property of variable `myDictionaryObj`. The property returns the name of the newly referenced dictionary.

```
myDictionaryObj.DataSources
```

```
ans =
```

```
    'myRefDictionary_ex_API.sldd'  
    'mySubDictionary_ex_API.sldd'
```

Input Arguments

dictionaryObj — Parent data dictionary

`Simulink.data.Dictionary` object

Parent data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for

example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

refDictionaryFile — File name of data dictionary to reference

character vector

File name of data dictionary to reference, specified as a character vector that includes the `.sldd` extension. The data dictionary file must be on your MATLAB path.

Example: `'mySubDictionary_ex_API.sldd'`

Data Types: `char`

Alternatives

You can use the Model Explorer window to manage reference dictionaries. See “Partition Dictionary Data Using Referenced Dictionaries” for more information.

See Also

`Simulink.data.Dictionary` | `removeDataSource`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

close

Package: Simulink.data

Close connection between data dictionary and Simulink.data.Dictionary object

Syntax

```
close(dictionaryObj)
```

Description

`close(dictionaryObj)` closes the connection between the Simulink.data.Dictionary object `dictionaryObj` and the data dictionary it represents. `dictionaryObj` remains as a Simulink.data.Dictionary object but no longer represents any data dictionary.

Examples

Close Connection Between Data Dictionary Object and Data Dictionary

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a Simulink.data.Dictionary object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Remove connection between `myDictionaryObj` and `myDictionary_ex_API.sldd`.

```
close(myDictionaryObj);
```

Input Arguments

dictionaryObj — Target Simulink.data.Dictionary object

handle to Simulink.data.Dictionary object

Target Simulink.data.Dictionary object, specified as a handle to the object.

Tips

- Use the `close` function in a custom MATLAB function to disassociate a Simulink.data.Dictionary object from a data dictionary. Custom MATLAB functions can create and store variables and objects in function workspaces but cannot delete those variables and objects.
- The `close` function does not affect the content or the state of the represented data dictionary. The function does not discard unsaved changes to the represented dictionary or entries. You can save or discard them later.

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

discardChanges

Package: Simulink.data

Discard changes to data dictionary

Syntax

```
discardChanges(dictionaryObj)
```

Description

`discardChanges(dictionaryObj)` discards all changes made to the specified data dictionary since the last time changes to the dictionary were saved using the `saveChanges` function. `discardChanges` also discards changes made to referenced data dictionaries. The changes to the target dictionary and its referenced dictionaries are permanently lost.

Examples

Discard Changes to Data Dictionary

Create a `Simulink.data.Dictionary` object representing the data dictionary `myDictionary_ex_API.sldd` and assign the object to variable `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
    DataSources: {'myRefDictionary_ex_API.sldd'}  
    HasUnsavedChanges: 0  
    NumberOfEntries: 4
```

Make a change to `myDictionary_ex_API.sldd` by adding an entry named `myNewEntry` with value 237. View the `HasUnsavedChanges` property of `myDictionaryObj` to confirm a change was made.

```
dDataSectObj = getSection(myDictionaryObj, 'Design Data');  
addEntry(dDataSectObj, 'myNewEntry', 237);  
myDictionaryObj
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
    DataSources: {'myRefDictionary_ex_API.sldd'}  
    HasUnsavedChanges: 1  
    NumberOfEntries: 5
```

Discard all changes to `myDictionary_ex_API.sldd`. The `HasUnsavedChanges` property of `myDictionaryObj` indicates changes were discarded.

```
discardChanges(myDictionaryObj)
myDictionaryObj

myDictionaryObj =

    Dictionary with properties:

        DataSourcees: {'myRefDictionary_ex_API.slidd'}
        HasUnsavedChanges: 0
        NumberOfEntries: 4
```

Input Arguments

dictionaryObj — Target data dictionary

Simulink.data.Dictionary object

Target data dictionary, specified as a Simulink.data.Dictionary object. Before you use this function, represent the target dictionary with a Simulink.data.Dictionary object by using, for example, the Simulink.data.dictionary.create or Simulink.data.dictionary.open function.

Alternatives

You can use the Model Explorer window to discard changes to data dictionaries. See “View and Revert Changes to Dictionary Entries” for more information.

saveChanges | Simulink.data.Dictionary

Topics

“Store Data in Dictionary Programmatically”

“What Is a Data Dictionary?”

Introduced in R2015a

exportToVersion

Package: Simulink.data

Export a Simulink.data.Dictionary object to a previous version

Syntax

```
Simulink.data.Dictionary.exportToVersion(dictionaryObj, target_folder, version)
```

Description

Simulink.data.Dictionary.exportToVersion(dictionaryObj, target_folder, version) exports the data dictionary dictionaryObj to the folder target_folder in a format that the specified previous Simulink version can load. The function also exports references to the specified folder. The file names of the dictionary and its references are preserved.

Examples

Export a Data Dictionary to a Previous Version

Represent the data dictionary sldemo_fuelsys_dd_controller.sldd with a Simulink.data.Dictionary object named myDictionaryObj.

```
openExample('sldemo_fuelsys_dd_controller');  
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

Export the data dictionary to a previous version of Simulink.

```
exportToVersion(myDictionaryObj, 'myR2018aFolder', 'R2018a');
```

Input Arguments

dictionaryObj — Data dictionary

Simulink.data.Dictionary object

Data dictionary, specified as a Simulink.data.Dictionary object. Before you use this function, represent the target dictionary with a Simulink.data.Dictionary object by using, for example, the Simulink.data.dictionary.create or Simulink.data.dictionary.open function.

target_folder — Folder for dictionary

string scalar | character vector

Target folder for the new version of the dictionary, specified as a character vector or string scalar.

Example: 'myR2018aFolder'

Data Types: char | string

version — MATLAB release name

string scalar | character vector

MATLAB release name, specified as a character vector or string scalar, which specifies a previous Simulink version. The release name is not case sensitive.

`Simulink.data.Dictionary.exportToVersion` exports the data dictionary to a format that the specified previous Simulink version can load. The value must be R2014a or later. You cannot export to your current version.

Example: 'R2018a'

Data Types: `char` | `string`

filepath

Package: Simulink.data

Full path and file name of data dictionary

Syntax

```
dictionaryFilePath = filepath(dictionaryObj)
```

Description

`dictionaryFilePath = filepath(dictionaryObj)` returns the full path and file name of the data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object.

Examples

Return Path of Data Dictionary File

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Return the full path of `myDictionary_ex_API.sldd` and assign it to variable `myDictionaryFilePath`.

```
myDictionaryFilePath = filepath(myDictionaryObj)
```

```
myDictionaryFilePath =
```

```
C:\Users\jsmith\myDictionary_ex_API.sldd
```

Input Arguments

dictionaryObj — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

`Simulink.data.Dictionary`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

getSection

Package: Simulink.data

Return Simulink.data.dictionary.Section object to represent data dictionary section

Syntax

```
sectionObj = getSection(dictionaryObj,sectionName)
```

Description

sectionObj = getSection(dictionaryObj,sectionName) returns a Simulink.data.dictionary.Section object representing one section, sectionName, of a data dictionary dictionaryObj, a Simulink.data.Dictionary object.

When you access the **Embedded Coder** section of a data dictionary, getSection returns a coder.Dictionary object representing the Embedded Coder Dictionary in the data dictionary.

Examples

Create New Data Dictionary Section Object

Open the data dictionary myDictionary_ex_API.sldd and represent it with a Simulink.data.Dictionary object named myDictionaryObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
dDataSectObj = getSection(myDictionaryObj, 'Design Data')
```

```
dDataSectObj =
```

```
    Section with properties:
```

```
        Name: 'Design Data'
```

Input Arguments

dictionaryObj — Data dictionary containing target section

Simulink.data.Dictionary object

Data dictionary containing target section, specified as a Simulink.data.Dictionary object. Before you use this function, represent the dictionary with a Simulink.data.Dictionary object by using, for example, the Simulink.data.dictionary.create or Simulink.data.dictionary.open function.

sectionName — Name of target data dictionary section

character vector

Name of target data dictionary section, specified as a character vector.

Example: 'Design Data'

Example: 'Configurations'

Example: 'EmbeddedCoder'

Data Types: char

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

hide

Package: Simulink.data

Remove data dictionary from Model Explorer

Syntax

```
hide(dictionaryObj)
```

Description

`hide(dictionaryObj)` removes the data dictionary `dictionaryObj` from the **Model Hierarchy** pane of Model Explorer. The target dictionary no longer appears as a node in the model hierarchy tree. Use this function when you are finished working with a data dictionary and want to reduce clutter in the Model Explorer.

Examples

Hide Data Dictionary from Model Explorer

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Open Model Explorer and display the new data dictionary as the selected tree node in the **Model Hierarchy** pane.

```
show(myDictionaryObj)
```

With Model Explorer open, at the MATLAB command prompt, call the `hide` function to observe the removal of `myDictionary_ex_API.sldd` from the model hierarchy tree.

```
hide(myDictionaryObj)
```

Input Arguments

dictionaryObj — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Tips

- To add a data dictionary as a node in the model hierarchy tree in Model Explorer, use the `show` function or use the interface to open and view the dictionary in Model Explorer.

- The hide function does not affect the content of the target dictionary.

Alternatives

You can remove a data dictionary from the **Model Hierarchy** pane of Model Explorer by right-clicking the dictionary tree node and selecting **Close**.

“Store Data in Dictionary Programmatically”

Introduced in R2015a

importEnumTypes

Package: Simulink.data

Import enumerated type definitions to data dictionary

Syntax

```
importedTypes = importEnumTypes(dictionaryObj,targetTypes)
[importedTypes,importFailures] = importEnumTypes(dictionaryObj,targetTypes)
```

Description

`importedTypes = importEnumTypes(dictionaryObj,targetTypes)` imports to the data dictionary `dictionaryObj` the definitions of one or more enumerated types `targetTypes`. `importEnumTypes` does not import MATLAB variables created using enumerated types but instead, in support of those variables, imports the definitions of the types. The target data dictionary stores the definition of a successfully imported type as an entry. This syntax returns a list of the names of successfully imported types. `importEnumTypes` saves changes made to the target dictionary, so before you use `importEnumTypes`, confirm that unsaved changes are acceptable.

`[importedTypes,importFailures] = importEnumTypes(dictionaryObj,targetTypes)` additionally returns a list of any target types that were not successfully imported. You can inspect the list to determine the reason for each failure.

Examples

Import Enumerated Data to Data Dictionary

Create a data dictionary `myNewDictionary.sldd` in your current working folder and a `Simulink.data.Dictionary` object representing the new data dictionary. Assign the object to the variable `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.create('myNewDictionary.sldd');
```

Run the script in the MATLAB file `myDataEnum_ex_API.m`. The file defines an enumerated type named `InstrumentTypes` using the `Simulink.defineIntEnumType` function and creates three variables based on the new type. Then, import the new variables from the base workspace to `myDictionary_ex_API.sldd`.

```
myDataEnum_ex_API
importFromBaseWorkspace(myDictionaryObj,'varList',...
{'firstEnumVariable','secondEnumVariable','thirdEnumVariable'});
```

Clear the imported variables from the base workspace. Before you can import an enumerated data type definition to the target data dictionary, you must clear the base workspace of any variables created using the target type.

```
clear firstEnumVariable
clear secondEnumVariable
clear thirdEnumVariable
```

Import the data type definition to `myDictionary_ex_API.slidd`.

```
importEnumTypes(myDictionaryObj, {'InstrumentTypes'})

ans =

    className: 'InstrumentTypes'
    renamedFiles: {}
```

Input Arguments

dictionaryObj — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

targetTypes — Enumerated type definitions to import

cell array of character vectors | string array

Enumerated type definitions to import, specified as a cell array of character vectors or a string array. If any target types are defined using `classdef` blocks in MATLAB files or P-files, the files must be available on your MATLAB path so that `importEnumTypes` can disable them.

Example: `{'myEnumType'}`

Example: `{'myFirstEnumType', 'mySecondEnumType', 'myThirdEnumType'}`

Data Types: `cell`

Output Arguments

importedTypes — Target types successfully imported

array of structures

Target enumerated type definitions successfully imported, returned as an array of structures. Each structure in the array represents one imported type. The `className` field of each structure identifies a type by name and the `renamedFiles` field identifies any renamed MATLAB files or P-files.

importFailures — Target types not imported

array of structures

Enumerated type definitions targeted but not imported, returned as an array of structures. Each structure in the array represents one type not imported. The `className` field of each structure identifies a type by name and the `reason` field explains the failure.

Tips

- Before you can import an enumerated data type definition to a data dictionary, you must clear the base workspace of any variables created using the target type.
- You can define an enumerated type using a `classdef` block in a MATLAB file or a P-file. `importEnumTypes` imports type definitions directly from these files if you specify the names of

the types to import using the input argument `targetTypes` and if the files defining the types are on your MATLAB path.

- To avoid conflicting definitions for imported types, `importEnumTypes` renders MATLAB files or P-files ineffective by appending `.save` to their names. The `.save` extensions cause variables to rely on the definitions in the target data dictionary and not on the definitions in the files. You can remove the `.save` extensions to restore the files to their original state.
- You can use `importEnumTypes` to import enumerated types defined using the `Simulink.defineIntEnumType` function. Because such types are not defined using MATLAB files or P-files, `importEnumTypes` does not rename any files.
- Use the function `Simulink.findVars` to generate a list of the enumerated types that are used by a model. Then, use the list with `importEnumTypes` to import the definitions of the types to a data dictionary. See “Enumerations in Data Dictionary” for more information.

`Simulink.data.Dictionary` | `importFromBaseWorkspace`

Topics

“Enumerations in Data Dictionary”

“Store Data in Dictionary Programmatically”

Introduced in R2015a

importFromBaseWorkspace

Package: Simulink.data

Import base workspace variables to data dictionary

Syntax

```
importedVars = importFromBaseWorkspace(dictionaryObj)
importedVars = importFromBaseWorkspace(dictionaryObj,Name,Value)
[importedVars,existingVars] = importFromBaseWorkspace(____)
[importedVars,existingVars,unsupportedVars] = importFromBaseWorkspace(____)
```

Description

`importedVars = importFromBaseWorkspace(dictionaryObj)` imports all variables from the MATLAB base workspace to the data dictionary `dictionaryObj` without overwriting existing entries in the dictionary. If any base workspace variables are already in the dictionary, the function present a warning and a list.

This syntax returns a list of names of the successfully imported variables. A variable is considered successfully imported only if `importFromBaseWorkspace` assigns the value of the variable to the corresponding entry in the target data dictionary.

`importedVars = importFromBaseWorkspace(dictionaryObj,Name,Value)` imports base workspace variables to a data dictionary, with additional options specified by one or more `Name,Value` pair arguments.

`[importedVars,existingVars] = importFromBaseWorkspace(____)` additionally returns a list of variables that were not overwritten. Use this syntax if `existingVarsAction` is set to 'none', the default value, which prevents existing dictionary entries from being overwritten.

`[importedVars,existingVars,unsupportedVars] = importFromBaseWorkspace(____)` additionally returns a list of unsupported variables that were not imported. When there are unsupported variables in the base workspace, if you call this function without the `unsupportedVars` output argument, Simulink reports a warning.

Examples

Import All Base Workspace Variables to Data Dictionary

In the MATLAB base workspace, create variables to import.

```
a = 'Char Variable';
myVariable = true;
fuelFlow = 324;
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import all base workspace variables to the data dictionary and return a list of successfully imported variables. If any base workspace variables are already in `myDictionary_ex_API.sldd`, `importFromBaseWorkspace` presents a warning and a list of the affected variables.

```
importFromBaseWorkspace(myDictionaryObj);
```

```
Warning: The following variables were not imported because  
they already exist in the dictionary:  
    fuelFlow
```

Specify Variables to Import to Data Dictionary from Base Workspace

In the MATLAB base workspace, create variables to import.

```
b = 'Char Variable';  
mySecondVariable = true;  
airFlow = 324;
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import only the new base workspace variables to the data dictionary.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', ...  
{'b', 'mySecondVariable', 'airFlow'});
```

Import Variables from Base Workspace and Overwrite Conflicts

In the MATLAB base workspace, create a variable to import.

```
fuelFlow = 324;
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`. `myDictionary_ex_API.sldd` already contains an entry called `fuelFlow`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the variable `fuelFlow` and overwrite the corresponding entry in `myDictionary_ex_API.sldd`.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', {'fuelFlow'}, ...  
'existingVarsAction', 'overwrite');
```

`importFromBaseWorkspace` assigns the value of the base workspace variable `fuelFlow` to the value of the corresponding entry in `myDictionary_ex_API.sldd`.

Return Variables Not Imported to Data Dictionary from Base Workspace

Return a list of variables that are not imported from the MATLAB base workspace because they are already in the target data dictionary.

In the MATLAB base workspace, create variables to import.

```
fuelFlow = 324;
myNewVariable = 'This is a character vector.'
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`. `myDictionary_ex_API.sldd` already contains an entry called `fuelFlow`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the variables `fuelFlow` and `myNewVariable` to the data dictionary. Specify names for the output arguments of `importFromBaseWorkspace` to return the names of successfully and unsuccessfully imported variables.

```
[importedVars,existingVars] = importFromBaseWorkspace(myDictionaryObj,...
'varList',{'fuelFlow','myNewVariable'})
```

```
importedVars =
```

```
    'myNewVariable'
```

```
existingVars =
```

```
    'fuelFlow'
```

`importFromBaseWorkspace` does not import the variable `fuelFlow` because it is already in the target data dictionary.

Input Arguments

dictionaryObj — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: `'varList',{'fuelFlow'}, 'existingVarsAction','overwrite'` imports the variable `fuelFlow` and overwrites the corresponding entry in the data dictionary.

clearWorkspaceVars — Flag to clear base workspace of imported variables

false (default) | true

Flag to clear the base workspace of any successfully imported variables, specified as the comma-separated pair consisting of `'clearWorkspaceVars'` and `true` or `false`.

Example: `'clearWorkspaceVars',true`

Data Types: `logical`

existingVarsAction — Action to take for existing dictionary variables

`'none'` (default) | `'error'` | `'overwrite'`

Action to take for existing dictionary variables, specified as the comma-separated pair consisting of `'existingVarsAction'` and `'none'`, `'error'`, or `'overwrite'`.

If you specify `'none'`, `importFromBaseWorkspace` attempts to import target variables but does not import or make any changes to variables that are already in the data dictionary.

If you specify `'error'`, `importFromBaseWorkspace` returns an error, without importing any variables, if any target variables are already in the data dictionary.

If you specify `'overwrite'`, `importFromBaseWorkspace` imports all target variables and overwrites any variables that are already in the data dictionary.

Example: `'existingVarsAction','error'`

Data Types: `char`

varList — Variables to import

cell array of character vectors | string array

Names of specific base workspace variables to import, specified as the comma-separated pair consisting of `'varList'` and a cell array of character vectors or a string array. If you want to import only one variable, specify the name inside a cell array. If you do not specify `'varList'`, `importFromBaseWorkspace` imports all variables from the MATLAB base workspace.

Example: `'varList',{'a','myVariable','fuelFlow'}`

Example: `'varList',{'fuelFlow'}`

Data Types: `cell`

Output Arguments

importedVars — Successfully imported variables

cell array of character vectors

Names of successfully imported variables, returned as a cell array of character vectors. A variable is considered successfully imported only if `importFromBaseWorkspace` assigns the value of the variable to the corresponding entry in the target data dictionary.

existingVars — Existing variables that were not imported

cell array of character vectors

Names of target variables that were not imported due to their existence in the target data dictionary, returned as a cell array of character vectors. `existingVars` has content only if `'existingVarsAction'` is set to `'none'` which is also the default. In that case `importFromBaseWorkspace` imports only variables that are not already in the target data dictionary.

unsupportedVars — Unsupported variables that were not imported

cell array of character vectors

Names of unsupported target variables that were not imported, returned as a cell array of character vectors. If this output argument is not included in the function call when there are unsupported variables, Simulink reports a warning. For the types of variables that can be imported into a data dictionary, see “Valid Design Data Classes”.

Tips

- `importFromBaseWorkspace` can import MATLAB variables created from enumerated data types but cannot import the definitions of the enumerated types. Use the `importEnumTypes` function to import enumerated data type definitions to a data dictionary. If you import variables of enumerated data types to a data dictionary but do not import the enumerated type definitions, the dictionary is less portable and might not function properly if used by someone else.
- If the value of a variable is a `timeseries` object (which a data dictionary cannot store) or a structure with fields identical to a `timeseries` object, `importFromBaseWorkspace` cannot import the variable.

Alternatives

- When you use the Simulink Editor to link a model to a data dictionary, you can choose to import model variables from the base workspace. See “Migrate Single Model to Use Dictionary” for more information.
- You can also use the Model Explorer window to drag-and-drop variables from the base workspace into a data dictionary.

`Simulink.data.Dictionary` | `importEnumTypes`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

listEntry

Package: Simulink.data

List data dictionary entries

Syntax

```
listEntry(dictionaryObj)  
listEntry(dictionaryObj,Name,Value)
```

Description

`listEntry(dictionaryObj)` displays in the MATLAB Command Window a table of information about all the entries in the data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object. The displayed information includes the name of each entry, the name of the section containing each entry, the status of each entry, the date and time each entry was last modified, the last user name to modify each entry, and the class of the value each entry contains. By default, the function sorts the list of entries alphabetically by entry name.

`listEntry(dictionaryObj,Name,Value)` displays the entries in a data dictionary with additional options specified by one or more `Name,Value` pair arguments.

To return the value of a data dictionary entry at the command prompt, use the `getValue` method of a `Simulink.data.dictionary.Entry` object. See “Store Data in Dictionary Programmatically”.

Examples

List All Entries in Data Dictionary

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
openExample('sldemo_fuelsys_dd_controller');  
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List all the entries in the data dictionary.

```
listEntry(myDictionaryObj)
```

Sort List of Data Dictionary Entries in Descending Order

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
openExample('sldemo_fuelsys_dd_controller');  
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List all the entries in the data dictionary and sort the list in descending order by entry name.

```
listEntry(myDictionaryObj, 'Ascending', false)
```

Filter List of Data Dictionary Entries by Name

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
openExample('sldemo_fuelsys_dd_controller');
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List only the entries in the data dictionary whose names begin with `max`.

```
listEntry(myDictionaryObj, 'Name', 'max*')
```

Sort List of Data Dictionary Entries by Time of Modification

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
openExample('sldemo_fuelsys_dd_controller');
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List all the entries in the dictionary and sort the list by the date and time each entry was last modified.

```
listEntry(myDictionaryObj, 'SortBy', 'LastModified')
```

Input Arguments

dictionaryObj — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: `'SortBy', 'LastModified'` sorts the entries in the data dictionary by the date and time each entry was last modified.

Ascending — Sort order of list

`true` (default) | `false`

Sort order of the list of data dictionary entries, specified as the comma-separated pair consisting of `'Ascending'` and `true` or `false`. If you specify `false`, `listEntry` sorts the list in descending order.

Example: 'Ascending',false

Data Types: logical

Class — Criteria to filter list by class

character vector

Criteria to filter the list of data dictionary entries by class, specified as the comma-separated pair consisting of 'Class' and a character vector identifying a valid class. The function lists only entries whose values are of the specified class.

Example: 'Class', 'Simulink.Parameter'

Data Types: char

LastModifiedBy — Criteria to filter list by user name of last modifier

character vector

Criteria to filter the list of data dictionary entries by the user name of the last user to modify each entry, specified as the comma-separated pair consisting of 'LastModifiedBy' and a character vector identifying the specified user name. The function lists only entries that were last modified by the specified user name.

Example: 'LastModifiedBy', 'jsmith'

Data Types: char

Limit — Maximum number of entries to list

integer

Maximum number of entries to list, specified as the comma-separated pair consisting of 'Limit' and an integer. The function lists up to the specified number of entries starting from the top of the sorted and filtered list.

Example: 'Limit', 9

Data Types: double

Name — Criteria to filter list by entry name

character vector

Criteria to filter the list of data dictionary entries by entry name, specified as the comma-separated pair consisting of 'Name' and a character vector defining the filter criteria. You can use an asterisk character, *, as a wildcard to represent any number of characters. The function lists only entries whose names match the filter criteria.

Example: 'Name', 'fuelFlow'

Example: 'Name', 'fuel*'

Data Types: char

Section — Criteria to filter list by data dictionary section

character vector

Criteria to filter the list of data dictionary entries by section, specified as the comma-separated pair consisting of 'Section' and a character vector identifying the target section. The function lists only entries that are contained in the target section.

Example: 'Section', 'Design Data'

SortBy – Flag to sort list by specific property

'Name' (default) | 'Section' | 'LastModified' | 'LastModifiedBy'

Flag to sort the list of data dictionary entries by a specific property, specified as the comma-separated pair consisting of 'SortBy' and a character vector identifying a property in the list of entries. Valid properties include 'Name', 'Section', 'LastModified', and 'LastModifiedBy'.

Example: 'SortBy','LastModifiedBy'

“What Is a Data Dictionary?”

Introduced in R2015a

removeDataSource

Package: Simulink.data

Remove reference data dictionary from parent data dictionary

Syntax

```
removeDataSource(dictionaryObj, refDictionaryFile)
```

Description

`removeDataSource(dictionaryObj, refDictionaryFile)` removes a referenced data dictionary, `refDictionaryFile`, from a parent dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object.

The parent dictionary no longer contains the entries that are defined in the referenced dictionary.

Examples

Remove Referenced Data Dictionary from Parent Data Dictionary

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`. The `DataSources` property of `myDictionaryObj` indicates `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
    DataSources: {'myRefDictionary_ex_API.sldd'}  
HasUnsavedChanges: 0  
    NumberOfEntries: 4
```

Remove `myRefDictionary_ex_API.sldd` from `myDictionary_ex_API.sldd`.

```
removeDataSource(myDictionaryObj, 'myRefDictionary_ex_API.sldd');
```

View the properties of the `Simulink.data.Dictionary` object `myDictionaryObj`, which represents the parent data dictionary. The `DataSources` property confirms the removal of `myRefDictionary_ex_API.sldd`.

```
myDictionaryObj
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
    DataSources: {0x1 cell}
```

```
HasUnsavedChanges: 1
NumberOfEntries: 3
```

Input Arguments

dictionaryObj — Parent data dictionary

Simulink.data.Dictionary object

Parent data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

refDictionaryFile — File name of referenced data dictionary

character vector

File name of referenced data dictionary, specified as a character vector that includes the `.sldd` extension. The data dictionary file must be on your MATLAB path.

Example: `'myRefDictionary_ex_API.sldd'`

Data Types: `char`

Alternatives

You can use Model Explorer to manage reference dictionaries. See “Partition Dictionary Data Using Referenced Dictionaries” for more information.

See Also

`Simulink.data.Dictionary` | `addDataSource`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

saveChanges

Package: Simulink.data

Save changes to data dictionary

Syntax

```
saveChanges(dictionaryObj)
```

Description

`saveChanges(dictionaryObj)` saves all changes made to a data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object. `saveChanges` also saves changes made to referenced data dictionaries. The previous states of the target dictionary and its referenced dictionaries are permanently lost.

Examples

Save Changes to Data Dictionary

Create a new data dictionary `myNewDictionary.sldd` and represent the Design Data section with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.create('myNewDictionary.sldd')  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

```
myDictionaryObj =
```

```
data dictionary with properties:
```

```
    DataSources: {0x1 cell}  
    HasUnsavedChanges: 0  
    NumberOfEntries: 0
```

Change `myNewDictionary.sldd` by adding an entry named `myNewEntry` with value 237. View the `HasUnsavedChanges` property of `myDictionaryObj` to confirm a change was made.

```
addEntry(dDataSectObj, 'myNewEntry', 237);  
myDictionaryObj
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
    DataSources: {0x1 cell}  
    HasUnsavedChanges: 1  
    NumberOfEntries: 1
```

Save all changes to `myNewDictionary.sldd`. The `HasUnsavedChanges` property of `myDictionaryObj` indicates changes were saved.

```
saveChanges(myDictionaryObj)
myDictionaryObj

myDictionaryObj =

    Dictionary with properties:
        DataSources: {0x1 cell}
        HasUnsavedChanges: 0
        NumberOfEntries: 1
```

Input Arguments

dictionaryObj — Target data dictionary

Simulink.data.Dictionary object

Target data dictionary, specified as a Simulink.data.Dictionary object. Before you use this function, represent the target dictionary with a Simulink.data.Dictionary object by using, for example, the Simulink.data.dictionary.create or Simulink.data.dictionary.open function.

Alternatives

You can use Model Explorer to save changes to a data dictionary by right-clicking on the dictionary tree node in the **Model Hierarchy** pane and selecting **Save Changes**.

See Also

Simulink.data.Dictionary | discardChanges

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

show

Package: Simulink.data

Show data dictionary in Model Explorer

Syntax

```
show(dictionaryObj)
show(dictionaryObj, openModelExplorer)
```

Description

`show(dictionaryObj)` opens Model Explorer and displays the data dictionary `dictionaryObj` as the selected tree node in the **Model Hierarchy** pane.

`show(dictionaryObj, openModelExplorer)` enables you to add the target dictionary to the **Model Hierarchy** pane without opening Model Explorer.

Examples

Show Data Dictionary in Model Explorer

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Open Model Explorer and display `myDictionary_ex_API` as the selected node of the model hierarchy tree in the **Model Hierarchy** pane.

```
show(myDictionaryObj)
```

Add Data Dictionary to Model Hierarchy Tree

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Add `myDictionary_ex_API.sldd` to the model hierarchy tree without opening Model Explorer.

```
show(myDictionaryObj, false)
```

You can confirm the addition of `myDictionary_ex_API` to the model hierarchy tree by manually opening Model Explorer.

Input Arguments

dictionaryObj — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

openModelExplorer — Flag to open Model Explorer

`true` (default) | `false`

Flag to open Model Explorer, specified as `true` or `false`.

Data Types: `logical`

Tips

- Use the `hide` function to remove a data dictionary from the tree in the **Model Hierarchy** pane of Model Explorer. The dictionary does not appear in the hierarchy again until you use the `show` function or you open and view the dictionary in the Model Explorer using the interface.

See Also

`Simulink.data.Dictionary` | `hide`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

Simulink.data.dictionary.Entry

Configure data dictionary entry

Description

An object of the `Simulink.data.dictionary.Entry` class represents one entry of a data dictionary. The object allows you to perform operations such as assign the entry a value or change the name of the entry.

Before you can create a new `Simulink.data.dictionary.Entry` object, you must create a `Simulink.data.dictionary.Section` object representing the data dictionary section that contains the target entry. However, once created, the `Simulink.data.dictionary.Entry` object exists independently of the `Simulink.data.dictionary.Section` object. Use the function `getSection` to create a `Simulink.data.dictionary.Section` object.

Creation

Syntax

Description

The functions `addEntry`, `getEntry`, and `find` create `Simulink.data.dictionary.Entry` objects.

Properties

DataSource — File name of containing data dictionary

character vector

File name of containing data dictionary, specified as a character vector. Changes you make to this property affect the represented data dictionary entry.

Example: `'myDictionary.sldd'`

Data Types: `char`

LastModified — Date and time of last modification

character vector

Date and time of last modification to entry, returned in Coordinated Universal Time (UTC) as a character vector. This property is read only.

LastModifiedBy — Name of last user to modify entry

character vector

Name of last user to modify entry, returned as a character vector. This property is read only.

Name — Name of entry

character vector

Name of entry, specified as a character vector. Changes you make to this property affect the represented data dictionary entry.

Data Types: char

Status — State of entry

'New' | 'Modified' | 'Unchanged' | 'Deleted'

State of entry, returned as 'New', 'Modified', 'Unchanged', or 'Deleted'. The state is valid since the last data dictionary save. If the state is 'Deleted', the represented entry was deleted from its data dictionary. This property is read only.

Object Functions

deleteEntry	Delete data dictionary entry
discardChanges	Discard changes to data dictionary entry
find	Search in array of data dictionary entries
getValue	Return value of data dictionary entry
setValue	Set value of data dictionary entry
showChanges	Display changes made to data dictionary entry

Examples

Add Entry to Data Dictionary and Modify its Value

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Add an entry `myEntry` with value 27 to the Design Data section of `myDictionary_ex_API.sldd`. Assign the returned `Simulink.data.dictionary.Entry` object to variable `e`.

```
e = addEntry(dDataSectObj, 'myEntry', 27)
```

```
e =
```

Entry with properties:

```

        Name: 'myEntry'
        Value: 27
        DataSource: 'myDictionary_ex_API.sldd'
        LastModified: '2014-Aug-26 18:42:08.439709'
        LastModifiedBy: 'jsmith'
        Status: 'New'
```

Change the value of `myEntry` from 27 to the character vector 'My New Value'.

```
setValue(e, 'My New Value')
```

```
e
```

```
e =
```

Entry with properties:

```

        Name: 'myEntry'
        Value: 'My New Value'
        DataSource: 'myDictionary_ex_API.sldd'
        LastModified: '2014-Aug-26 18:45:58.336598'
        LastModifiedBy: 'jsmith'
        Status: 'New'

```

Return Value of Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```

myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');

```

Return the value of the entry `fuelFlow` and assign the value to the variable `fuelFlowValue`.

```
fuelFlowValue = getValue(fuelFlowObj)
```

```
fuelFlowValue =
```

```
237
```

Move Entry Within Data Dictionary Hierarchy

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`. `myDictionary_ex_API.sldd` references the data dictionary `myRefDictionary_ex_API.sldd`.

```

myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');

```

Create a `Simulink.data.dictionary.Entry` object representing the entry `fuelFlow`, which resides in `myDictionary_ex_API.sldd`. Assign the object to variable `e`.

```
e = getEntry(dDataSectObj, 'fuelFlow')
```

```
e =
```

```
Entry with properties:
```

```

        Name: 'fuelFlow'
        Value: 237
        DataSource: 'myDictionary_ex_API.sldd'
        LastModified: '2014-Sep-05 13:12:06.099278'
        LastModifiedBy: 'jsmith'
        Status: 'Unchanged'

```

Migrate the entry `fuelFlow` to the reference data dictionary `myRefDictionary_ex_API.sldd` by modifying the `DataSource` property of `e`.

```
e.DataSource = 'myRefDictionary_ex_API.sldd'
```

```
e =
```

```
Entry with properties:
```

```
Name: 'fuelFlow'  
Value: 237  
DataSource: 'myRefDictionary_ex_API.sldd'  
LastModified: '2014-Sep-05 13:12:06.099278'  
LastModifiedBy: 'jsmith'  
Status: 'Modified'
```

Because `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`, both dictionaries belong to the same dictionary hierarchy, allowing you to migrate the entry `fuelFlow` between them.

`Simulink.data.dictionary.Section` | `getEntry` | `Simulink.data.Dictionary`

Topics

“Store Data in Dictionary Programmatically”
“What Is a Data Dictionary?”

Introduced in R2015a

deleteEntry

Package: Simulink.data.dictionary

Delete data dictionary entry

Syntax

```
deleteEntry(entryObj)
```

Description

`deleteEntry(entryObj)` deletes the data dictionary entry represented by `entryObj`, a `Simulink.data.dictionary.Entry` object. The represented entry no longer exists in the data dictionary that defined it.

The function sets the `Status` properties of any `Simulink.data.dictionary.Entry` objects representing the deleted entry to `'Deleted'`. You can access only the `Status` properties of the objects.

Examples

Delete Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');  
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Delete the entry `fuelFlow` from the data dictionary `myDictionary_ex_API.sldd`. `myDictionary_ex_API.sldd` no longer contains the `fuelFlow` entry.

```
deleteEntry(fuelFlowObj)
```

Input Arguments

entryObj — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

Alternatives

You can use the Model Explorer window to view the contents of a data dictionary and delete entries.

See Also

Simulink.data.dictionary.Entry | addEntry

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

discardChanges

Package: Simulink.data.dictionary

Discard changes to data dictionary entry

Syntax

```
discardChanges(entryObj)
```

Description

`discardChanges(entryObj)` discards all changes made to the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object, since the last time the containing data dictionary was saved using the `saveChanges` function. The changes to the entry are permanently lost.

Examples

Discard Changes to Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');  
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Change the entry `fuelFlow` by assigning it the new value 493. Confirm a change was made by viewing the `Status` property of `fuelFlowObj`.

```
setValue(fuelFlowObj, 493);  
fuelFlowObj
```

```
fuelFlowObj =
```

```
Entry with properties:
```

```
    Name: 'fuelFlow'  
    Value: 493  
    DataSource: 'myDictionary_ex_API.sldd'  
    LastModified: '2014-Sep-05 13:14:30.661978'  
    LastModifiedBy: 'jsmith'  
    Status: 'Modified'
```

Discard all changes to the entry `fuelFlow`. The `Status` property of `fuelFlowObj` shows that changes were discarded.

```
discardChanges(fuelFlowObj)  
fuelFlowObj
```

```
fuelFlowObj =
```

```
Entry with properties:
```

```
Name: 'fuelFlow'  
Value: 237  
DataSource: 'myDictionary_ex_API.sldd'  
LastModified: '2014-Sep-05 13:12:06.099278'  
LastModifiedBy: 'jsmith'  
Status: 'Unchanged'
```

Input Arguments

entryObj — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

Tips

- You can use the `discardChanges` function or the `saveChanges` function with an entire data dictionary, discarding or saving changes to all entries in the dictionary at once. However, only the `discardChanges` function can additionally operate on individual entries. You cannot use the `saveChanges` function to save changes to individual entries.

Alternatives

You can use Model Explorer and the Comparison Tool to discard changes to data dictionary entries. See “View and Revert Changes to Dictionary Entries” for more information.

See Also

`Simulink.data.dictionary.Entry` | `saveChanges`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

find

Package: Simulink.data.dictionary

Search in array of data dictionary entries

Syntax

```
foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN)
foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN,options)
```

Description

`foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN)` searches the array of data dictionary entries `targetEntries` using search criteria `PName1,PValue1,...,PNameN,PValueN`, and returns an array of entries matching the criteria. This syntax matches the search criteria with the properties of the target entries, which are `Simulink.data.dictionary.Entry` objects, but not with the properties of their values. See `Simulink.data.dictionary.Entry` for a list of data dictionary entry properties.

`foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN,options)` searches for data dictionary entries using additional search options. For example, you can match the search criteria with the values of the target entries.

Examples

Search Data Dictionary Entry Values for Specific Class

Search in an array of data dictionary entries `myEntryObjs` for entries whose values are objects of the class `Simulink.Parameter`.

```
foundEntries = find(myEntryObjs, '-value', '-class', 'Simulink.Parameter')
```

Search Data Dictionary Entries for Modifying User

Search in an array of data dictionary entries `myEntryObjs` for entries that were last modified by the user `jsmith`.

```
foundEntries = find(myEntryObjs, 'LastModifiedBy', 'jsmith')
```

Search Data Dictionary Entries Using Multiple Criteria

Search in an array of data dictionary entries `myEntryObjs` for entries that were last modified by the user `jsmith` or whose names begin with `fuel`.

```
foundEntries = find(myEntryObjs, 'LastModifiedBy', 'jsmith', '-or', ...
'-regexp', 'Name', 'fuel*')
```

Search Data Dictionary Entries Using Regular Expressions

Search in an array of data dictionary entries `myEntryObjs` for entries whose names begin with `Press`.

```
foundEntries = find(myEntryObjs, '-regexp', 'Name', 'Press*')
```

Search Data Dictionary Entries for Specific Value

Search in an array of data dictionary entries `myEntryObjs` for entries whose values are 273. If you find more than one entry, store the entries in an array called `foundEntries`.

```
foundEntries = [];
for i = 1:length(myEntryObjs)
    if getValue(myEntryObjs(i)) == 237
        foundEntries = [foundEntries myEntryObjs(i)];
    end
end
```

Search Data Dictionary Entry Values for Specific Property

Search in an array of data dictionary entries `myEntryObjs` for entries whose values have a property `DataType`.

```
foundEntries = find(myEntryObjs, '-value', '-property', 'DataType')
```

Input Arguments

targetEntries — Data dictionary entries to search

array of `Simulink.data.dictionary.Entry` objects

Data dictionary entries to search, specified as an array `Simulink.data.dictionary.Entry` objects. Before you use this function, represent the target entries with `Simulink.data.dictionary.Entry` objects by using, for example, the `getEntry` function.

Example: `[myEntryObj1, myEntryObj2, myEntryObj3]`

PName1, PValue1, ..., PNameN, PValueN — Search criteria

name-value pairs representing properties

Search criteria, specified as one or more name-value pairs representing names and values of properties of the target data dictionary entries. For a list of the properties of a data dictionary entry, see `Simulink.data.dictionary.Entry`. If you specify more than one name-value pair, the returned entries meet all of the criteria.

If you include the `'-value'` option to search in the values of the target entries, the search criteria apply to the values of the entries rather than to the entries themselves.

Example: 'LastModifiedBy','jsmith'

Example: 'DataSource','myRefDictionary_ex_API.sldd'

options — Additional search options

supported option codes

Additional search options, specified as one or more of the following supported option codes.

'-value'	This option causes <code>find</code> to search only in the values of the target data dictionary entries. Specify this option before any other search criteria or <code>options</code> arguments.
'-and', '-or', '-xor', or '-not' logical operators	These options modify or combine multiple search criteria or other option codes.
'-property',propertyName	This name-value pair causes <code>find</code> to search for entries or values that have the property <code>propertyName</code> regardless of the value of the property. Specify <code>propertyName</code> as a character vector.
'-class',className	This name-value pair causes <code>find</code> to search for entries or values that are objects of the class <code>className</code> . Specify <code>className</code> as a character vector.
'-isa',className	This name-value pair causes <code>find</code> to search for entries or values that are objects of the class or of any subclass derived from the class <code>className</code> . Specify <code>className</code> as a character vector.
'-regexp'	This option allows you to use regular expressions in your search criteria. This option affects only search criteria that follow '-regexp'.

Example: '-value'

Example: '-value','-property','CoderInfo'

Example: '-value','-class','Simulink.Parameter'

Output Arguments

foundEntries — Data dictionary entries matching search criteria

array of `Simulink.data.dictionary.Entry` objects

Data dictionary entries matching the specified search criteria, returned as an array of `Simulink.data.dictionary.Entry` objects.

See Also

`Simulink.data.dictionary.Entry` | `find`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

getValue

Package: Simulink.data.dictionary

Return value of data dictionary entry

Syntax

```
entryValue = getValue(entryObj)
```

Description

`entryValue = getValue(entryObj)` returns the value of the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

Examples

Return Value of Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Return the value of the entry `fuelFlow` and assign the value to variable `fuelFlowValue`.

```
fuelFlowValue = getValue(fuelFlowObj)
```

```
fuelFlowValue =
```

```
    237
```

Input Arguments

entryObj — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

See Also

`Simulink.data.dictionary.Entry` | `setValue`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

setValue

Package: Simulink.data.dictionary

Set value of data dictionary entry

Syntax

```
setValue(entryObj, newValue)
```

Description

`setValue(entryObj, newValue)` assigns the value `newValue` to the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

Examples

Set Value of Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Set the value of the entry `fuelFlow` to 493. Then, view the `Value` property of `fuelFlowObj` to observe the change.

```
setValue(fuelFlowObj, 493)
fuelFlowObj
```

```
fuelFlowObj =
```

```
Entry with properties:
```

```
    Name: 'fuelFlow'
    Value: 493
    DataSource: 'myDictionary_ex_API.sldd'
    LastModified: '2014-Sep-05 13:37:22.161124'
    LastModifiedBy: 'jsmith'
    Status: 'Modified'
```

Input Arguments

entryObj — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

newValue — Value to assign to data dictionary entry

MATLAB expression

Value to assign to data dictionary entry, specified as a MATLAB expression. The expression must return a value that is supported by the data dictionary section that contains the entry.

Example: 27.5

Example: myBaseWorkspaceVariable

Example: Simulink.Parameter

Alternatives

You can use the Model Explorer window to view and change the values of data dictionary entries.

Introduced in R2015a

showChanges

Package: Simulink.data.dictionary

Display changes made to data dictionary entry

Syntax

```
showChanges(entryObj)
```

Description

showChanges(entryObj) opens the Comparison Tool to show changes made to the data dictionary entry entryObj, a Simulink.data.dictionary.Entry object. The Comparison Tool displays the properties of entryObj as they were when the data dictionary was last saved and as they were when the showChanges function was called.

Examples

View Unsaved Changes to Data Dictionary Entry

Represent the data dictionary entry fuelFlow with a Simulink.data.dictionary.Entry object named fuelFlowObj. fuelFlow is defined in the data dictionary myDictionary_ex_API.sldd.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Make a change to the entry fuelFlow by assigning it the new value 494.

```
setValue(fuelFlowObj, 494);
```

Observe the unsaved change to the entry fuelFlow. The Comparison Tool opens and compares side by side the current state of the entry with its most recently saved state.

```
showChanges(fuelFlowObj)
```

Input Arguments

entryObj — Target data dictionary entry

Simulink.data.dictionary.Entry object

Target data dictionary entry, specified as a Simulink.data.dictionary.Entry object. Before you use this function, represent the target entry with a Simulink.data.dictionary.Entry object by using, for example, the getEntry function.

Alternatives

You can use Model Explorer and the Comparison Tool to view changes to data dictionary entries. See “View and Revert Changes to Dictionary Entries” for more information.

Simulink.data.dictionary.EnumTypeDefinition

Store enumerated type definition in data dictionary

Description

A `Simulink.data.dictionary.EnumTypeDefinition` object defines an enumerated data type in a data dictionary. You store the object in a data dictionary entry so models linked to the dictionary can use the enumerated type definition.

In the MATLAB base workspace, `Simulink.data.dictionary.EnumTypeDefinition` objects retain information about an enumerated type but do not define the type for use by other variables or by models.

Creation

Syntax

```
Simulink.data.dictionary.EnumTypeDefinition
```

Description

When you use the function `importEnumTypes` to import the definitions of enumerated types to a data dictionary, Simulink creates a `Simulink.data.dictionary.EnumTypeDefinition` object in the dictionary for each imported definition. The dictionary stores each object in an individual entry.

The `Simulink.data.dictionary.EnumTypeDefinition` function creates a `Simulink.data.dictionary.EnumTypeDefinition` object with default property values and a single enumeration member that has underlying integer value 0.

Properties

AddClassNameToEnumNames — Flag to control enumeration identifiers in generated code

false (default) | true

Flag to prefix enumerations with the class name in generated code, specified as `true` or `false`.

If you specify `true`, when you generate code the identifier of each enumeration member begins with the name of the enumeration class. For example, an enumeration class `LEDcolor` with enumeration members `GREEN` and `RED` defines the enumeration members in generated code as `LEDcolor_GREEN` and `LEDcolor_RED`.

Data Types: `logical`

DataScope — Flag to control data type definition in generated code

'Auto' (default) | 'Imported' | 'Exported'

Flag to control data type definition in generated code, specified as `'Auto'`, `'Imported'`, or `'Exported'`. The table describes the behavior of generated code for each value.

Value	Action
Auto (default)	<p>If you do not specify the property <code>Headerfile</code>, export the data type definition to <code>model_types.h</code>, where <i>model</i> is the model name.</p> <p>If you specify <code>Headerfile</code>, import the data type definition from the specified header file.</p>
Exported	<p>Export the data type definition to a separate header file.</p> <p>If you do not specify the property <code>Headerfile</code>, the header file name defaults to <code>type.h</code>, where <i>type</i> is the data type name.</p>
Imported	<p>Import the data type definition from a separate header file.</p> <p>If you do not specify the property <code>Headerfile</code>, the header file name defaults to <code>type.h</code>, where <i>type</i> is the data type name.</p>

DefaultValue — Default enumeration member

' ' (default) | character vector

Default enumeration member, specified as a character vector. Specify `DefaultValue` as the name of an enumeration member you have already defined.

When you create a `Simulink.data.dictionary.EnumTypeDefinition` object, `DefaultValue` is an empty character vector, ' ', and Simulink uses the first enumeration member as the default member.

Example: 'enumMember1'

Description — Description of enumerated data type in generated code

' ' (default) | character vector

Description of the enumerated data type, specified as a character vector. Use this property to explain the purpose of the type in generated code.

Example: 'Two possible colors of LED indicator: GREEN and RED.'

Data Types: char

HeaderFile — Name of header file defining enumerated data type in generated code

' ' (default) | character vector

Name of the header file that defines the enumerated data type in generated code, specified as a character vector. Use a `.h` extension to specify the file name.

If you do not specify `HeaderFile`, generated code uses a default header file name that depends on the value of the `DataScope` property.

Example: 'myTypeIncludeFile.h'

Data Types: char

StorageType — Data type of underlying integer values

' ' (default) | character vector

Data type of the integer values underlying the enumeration members, specified as a character vector. Generated code stores the underlying integer values using the data type you specify.

You can specify one of these supported integer types:

- 'int8'
- 'int16'
- 'int32'
- 'uint8'
- 'uint16'

To store the underlying integer values in generated code using the native integer type of the target hardware, specify `StorageType` as an empty character vector, ' ', which is the default value.

Example: 'int16'

' '

Object Functions

`appendEnumeral` Add enumeration member to enumerated data type definition in data dictionary
`removeEnumeral` Remove enumeration member from enumerated data type definition in data dictionary

Examples**Programmatically Create Enumerated Type Definition in Data Dictionary**

Create an object that can store the definition of an enumerated type. By default, the new type defines a single enumeration member `enum1` with underlying integer value 0.

```
myColors = Simulink.data.dictionary.EnumTypeDefinition
```

```
myColors =
```

```
    Simulink.data.dictionary.EnumTypeDefinition
        enum1
```

Add some enumeration members to the definition of the type.

```
appendEnumeral(myColors, 'Orange', 1, ' ')
appendEnumeral(myColors, 'Black', 2, ' ')
appendEnumeral(myColors, 'Cyan', 3, ' ')
myColors
```

```
myColors =
```

```
    Simulink.data.dictionary.EnumTypeDefinition
        enum1
        Orange
        Black
        Cyan
```

Remove the default enumeration member `enum1`. Since `enum1` is the first enumeration member in the list, identify it with index 1.

```
removeEnumeral(myColors,1)
myColors
myColors =
    Simulink.data.dictionary.EnumTypeDefinition
        Orange
        Black
        Cyan
```

Customize the enumerated type by configuring the properties of the object representing it.

```
myColors.Description = 'These are my favorite colors.';
myColors.DefaultValue = 'Cyan';
myColors.HeaderFile = 'colorsType.h';
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the object that defines the enumerated type `myColors` to the dictionary.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', {'myColors'});
```

Alternatives

You can use Model Explorer to add and modify enumerated data types stored in a data dictionary.

“Use Enumerated Data in Simulink Models”

Introduced in R2015a

appendEnumeral

Package: Simulink.data.dictionary

Add enumeration member to enumerated data type definition in data dictionary

Syntax

```
appendEnumeral(typeObj,memberName,memberValue,memberDesc)
```

Description

`appendEnumeral(typeObj,memberName,memberValue,memberDesc)` adds an enumeration member to the enumerated type definition stored by `typeObj`, a `Simulink.data.dictionary.EnumTypeDefinition` object.

Examples

Programmatically Create Enumerated Type Definition in Data Dictionary

Create an object that can store the definition of an enumerated type. By default, the new type defines a single enumeration member `enum1` with underlying integer value 0.

```
myColors = Simulink.data.dictionary.EnumTypeDefinition
```

```
myColors =
```

```
    Simulink.data.dictionary.EnumTypeDefinition
        enum1
```

Add some enumeration members to the definition of the type.

```
appendEnumeral(myColors,'Orange',1,'')
appendEnumeral(myColors,'Black',2,'')
appendEnumeral(myColors,'Cyan',3,'')
myColors
```

```
myColors =
```

```
    Simulink.data.dictionary.EnumTypeDefinition
        enum1
        Orange
        Black
        Cyan
```

Remove the default enumeration member `enum1`. Since `enum1` is the first enumeration member in the list, identify it with index 1.

```
removeEnumeral(myColors,1)
myColors
```

```
myColors =
```

```

Simulink.data.dictionary.EnumTypeDefinition
    Orange
    Black
    Cyan

```

Customize the enumerated type by configuring the properties of the object representing it.

```

myColors.Description = 'These are my favorite colors.';
myColors.DefaultValue = 'Cyan';
myColors.HeaderFile = 'colorsType.h';

```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the object that defines the enumerated type `myColors` to the dictionary.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', {'myColors'});
```

Input Arguments

typeObj — Target enumerated type definition

`Simulink.data.dictionary.EnumTypeDefinition` object

Target enumerated type definition, specified as a `Simulink.data.dictionary.EnumTypeDefinition` object.

memberName — Name of new enumeration member

character vector

Name of the new enumeration member, specified as a character vector.

Example: 'myNewEnumMember'

Data Types: char

memberValue — Integer value underlying new enumeration member

integer

Integer value underlying the new enumeration member, specified as an integer.

The definition of the enumeration class determines the integer data type used in generated code to store the underlying values of enumeration members.

Example: 3

Data Types: single | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | double

memberDesc — Description of new enumeration member

character vector

Description of the new enumeration member, specified as a character vector.

If you do not want to supply a description for the enumeration member, use an empty character vector.

Example: 'Enumeration member number 1.'

Example: ''

Data Types: char

Alternatives

You can use Model Explorer to add enumeration members to the enumerated data type represented by a `Simulink.data.dictionary.EnumTypeDefinition` object.

Introduced in R2015a

removeEnumeral

Package: Simulink.data.dictionary

Remove enumeration member from enumerated data type definition in data dictionary

Syntax

```
removeEnumeral(typeObj,memberNum)
```

Description

`removeEnumeral(typeObj,memberNum)` removes an enumeration member from the enumerated type definition stored by `typeObj`, a `Simulink.data.dictionary.EnumTypeDefinition` object.

Examples

Programmatically Create Enumerated Type Definition in Data Dictionary

Create an object that can store the definition of an enumerated type. By default, the new type defines a single enumeration member `enum1` with underlying integer value 0.

```
myColors = Simulink.data.dictionary.EnumTypeDefinition
myColors =
    Simulink.data.dictionary.EnumTypeDefinition
        enum1
```

Add some enumeration members to the definition of the type.

```
appendEnumeral(myColors,'Orange',1,'')
appendEnumeral(myColors,'Black',2,'')
appendEnumeral(myColors,'Cyan',3,'')
myColors
myColors =
    Simulink.data.dictionary.EnumTypeDefinition
        enum1
        Orange
        Black
        Cyan
```

Remove the default enumeration member `enum1`. Since `enum1` is the first enumeration member in the list, identify it with index 1.

```
removeEnumeral(myColors,1)
myColors
myColors =
```

```

Simulink.data.dictionary.EnumTypeDefinition
  Orange
  Black
  Cyan

```

Customize the enumerated type by configuring the properties of the object representing it.

```

myColors.Description = 'These are my favorite colors.';
myColors.DefaultValue = 'Cyan';
myColors.HeaderFile = 'colorsType.h';

```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the object that defines the enumerated type `myColors` to the dictionary.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', {'myColors'});
```

Input Arguments

typeObj — Target enumerated type definition

`Simulink.data.dictionary.EnumTypeDefinition` object

Target enumerated type definition, specified as a `Simulink.data.dictionary.EnumTypeDefinition` object.

memberNum — Index of target enumeration member

integer

Index of target enumeration member, specified as an integer.

The first enumeration member in an enumerated type definition has index 1. For example, suppose an enumerated type `BasicColors` has this definition:

```

myColors =
    Simulink.data.dictionary.EnumTypeDefinition
      Orange
      Black
      Cyan

```

To remove the enumeration member `Black`, specify `memberNum` as 2. To remove the enumeration member `Cyan`, specify 3.

Do not specify `memberNum` using the integer value underlying an enumeration member. The integer value underlying the member is not equivalent to the index of the member.

Example: 3

```
Data Types: single | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | double
```

Alternatives

You can use Model Explorer to remove enumeration members from the enumerated data type represented by a `Simulink.data.dictionary.EnumTypeDefinition` object.

See Also

`Simulink.data.dictionary.EnumTypeDefinition | appendEnumeral`

Topics

“Store Data in Dictionary Programmatically”

“Use Enumerated Data in Simulink Models”

Introduced in R2015a

Simulink.data.dictionary.Section

Configure data dictionary section

Description

An object of the `Simulink.data.dictionary.Section` class represents one section of a data dictionary, such as Design Data or Configurations. The object allows you to perform operations on the section such as add or delete entries and import data from files.

Before you can create a `Simulink.data.dictionary.Section` object, you must create a `Simulink.data.Dictionary` object representing the target data dictionary. Once created, the `Simulink.data.dictionary.Section` object exists independently of the `Simulink.data.Dictionary` object.

You cannot use the data dictionary programmatic interface (see “Store Data in Dictionary Programmatically”) to access the **Embedded Coder** section of a data dictionary. Instead, see Embedded Coder Dictionary (Embedded Coder).

Creation

Syntax

Description

The function `getSection` creates a `Simulink.data.dictionary.Section` object.

Properties

Name — Name of data dictionary section

character vector

Name of data dictionary section, returned as a character vector. This property is read only.

Object Functions

<code>addEntry</code>	Add new entry to data dictionary section
<code>assignin</code>	Assign value to data dictionary entry
<code>deleteEntry</code>	Delete data dictionary entry
<code>evalin</code>	Evaluate MATLAB expression in data dictionary section
<code>exist</code>	Check existence of data dictionary entry
<code>exportToFile</code>	Export data dictionary entries from section to MAT-file or MATLAB file
<code>find</code>	Search in data dictionary section
<code>getEntry</code>	Create <code>Simulink.data.dictionary.Entry</code> object to represent data dictionary entry
<code>importFromFile</code>	Import variables from MAT-file or MATLAB file to data dictionary section

Examples

Create New Data Dictionary Section Object

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
dDataSectObj = getSection(myDictionaryObj, 'Design Data')
```

```
dDataSectObj =
```

```
    Section with properties:
```

```
        Name: 'Design Data'
```

See Also

`getSection` | `Simulink.data.Dictionary`

Topics

“Store Data in Dictionary Programmatically”

“What Is a Data Dictionary?”

Introduced in R2015a

addEntry

Package: Simulink.data.dictionary

Add new entry to data dictionary section

Syntax

```
addEntry(sectionObj,entryName,entryValue)
entryObj = addEntry(sectionObj,entryName,entryValue)
```

Description

addEntry(sectionObj,entryName,entryValue) adds an entry, with name entryName and value entryValue, to the data dictionary section sectionObj, a Simulink.data.dictionary.Section object.

entryObj = addEntry(sectionObj,entryName,entryValue) returns a Simulink.data.dictionary.Entry object representing the newly added data dictionary entry.

Examples

Add Entry to Design Data Section of Data Dictionary

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Add an entry to the Design Data section of myDictionary_ex_API.sldd an entry myNewEntry with value 237.

```
addEntry(dDataSectObj,'myNewEntry',237)
```

Add New Simulink.Parameter Object to Data Dictionary

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Add an entry to the Design Data section of myDictionary_ex_API.sldd. Name the new entry myNewParam and assign a Simulink.Parameter object to the value.

```
addEntry(dDataSectObj,'myNewParam',Simulink.Parameter)
```

The expression `Simulink.Parameter` constructs a new `Simulink.Parameter` object, and the `addEntry` function assigns the object to the value of the new data dictionary entry `myNewParam`.

Input Arguments

sectionObj — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

entryName — Name of new data dictionary entry

character vector

Name of new data dictionary entry, specified as a character vector.

Example: `'myNewEntry'`

Data Types: `char`

entryValue — Value of new data dictionary entry

MATLAB expression

Value of new data dictionary entry, specified as a MATLAB expression that returns any valid data dictionary content.

Example: `27.5`

Example: `myBaseWorkspaceVariable`

Example: `Simulink.Parameter`

Tips

- `addEntry` returns an error if the entry name you specify with `entryName` is already the name of an entry in the target data dictionary section or in the same section of any referenced dictionaries.

Alternatives

You can use Model Explorer to add entries to a data dictionary in the same way you can use it to add variables to a model workspace or the base workspace.

See Also

`Simulink.data.dictionary.Section` | `Simulink.data.dictionary.Entry` | `assignin`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

assignin

Package: Simulink.data.dictionary

Assign value to data dictionary entry

Syntax

```
assignin(sectionObj,entryName,entryValue)
```

Description

`assignin(sectionObj,entryName,entryValue)` assigns the value `entryValue` to the data dictionary entry `entryName` in the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object. If an entry with the specified name is not in the target section, `assignin` creates the entry with the specified name and value.

If an entry with the name specified by input argument `entryName` is not defined in the target data dictionary section but is defined in a referenced dictionary, `assignin` does not create a new entry in the target section but operates on the entry in the referenced dictionary.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

Examples

Assign Value to Data Dictionary Entry

Assign a value to a data dictionary entry by operating on a `Simulink.data.dictionary.Section` object.

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Assign the value 237 to an entry `myAssignedEntry` in the data dictionary `myDictionary_ex_API.sldd`. If an entry named `myAssignedEntry` is not in `myDictionary_ex_API.sldd`, create it.

```
assignin(dDataSectObj,'myAssignedEntry',237)
```

Input Arguments

sectionObj — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

entryName — Name of target data dictionary entry

character vector

Name of target data dictionary entry, specified as a character vector. If a matching entry does not already exist, the functions creates a new entry using the specified name.

Example: 'myEntry'

Data Types: char

entryValue — Value to assign to data dictionary entry

MATLAB expression

Value to assign to data dictionary entry, specified as a MATLAB expression that returns any valid data dictionary content.

Example: 27.5

Example: myBaseWorkspaceVariable

Example: Simulink.Parameter

Alternatives

You can use the Model Explorer window to view and change the values of data dictionary entries.

See Also

`Simulink.data.dictionary.Section | setValue`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

deleteEntry

Package: Simulink.data.dictionary

Delete data dictionary entry

Syntax

```
deleteEntry(sectionObj,entryName)
deleteEntry(sectionObj,entryName,'DataSource',dictionaryName)
```

Description

`deleteEntry(sectionObj,entryName)` deletes a data dictionary entry `entryName` from the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object. If there are multiple entries with the specified name in a hierarchy of reference dictionaries, the function deletes all the entries. If you represent a data dictionary entry with one or more `Simulink.data.dictionary.Entry` objects and later delete the entry using the `deleteEntry` function, the objects remain with their `Status` property set to 'Deleted'.

`deleteEntry(sectionObj,entryName,'DataSource',dictionaryName)` deletes an entry that is defined in the data dictionary `DictionaryName`. Use this syntax to uniquely identify an entry that is defined more than once in a hierarchy of referenced data dictionaries.

Examples

Delete Entry from Data Dictionary Section

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`. The Design Data section of `myDictionary_ex_API.sldd` already contains an entry named `fuelFlow`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Delete the entry `fuelFlow` from the data dictionary `myDictionary_ex_API.sldd`. `myDictionary_ex_API.sldd` no longer contains the `fuelFlow` entry.

```
deleteEntry(dDataSectObj,'fuelFlow')
```

Delete Entry from Reference Data Dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Delete the entry `myRefEntry` from the data dictionary `myRefDictionary_ex_API.sldd`. `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`, and `myRefDictionary_ex_API.sldd` defines an entry `myRefEntry`.

```
deleteEntry(dDataSectObj, 'myRefEntry', 'DataSource', ...  
'myRefDictionary_ex_API.sldd')
```

Input Arguments

sectionObj — Target data dictionary section

Simulink.data.dictionary.Section object

Target data dictionary section, specified as a Simulink.data.dictionary.Section object. Before you use this function, represent the target section with a Simulink.data.dictionary.Section object by using, for example, the getSection function.

entryName — Name of target data dictionary entry

character vector

Name of target data dictionary entry, specified as a character vector.

Example: 'myEntry'

Data Types: char

dictionaryName — Name of data dictionary that defines target entry

character vector

File name of data dictionary that defines the target entry, specified as a character vector including the .sldd extension.

Example: 'mySubDictionary_ex_API.sldd'

Data Types: char

Alternatives

You can use the Model Explorer window to delete entries from a data dictionary in the same way you can delete variables from a model workspace or the base workspace.

See Also

Simulink.data.dictionary.Section | addEntry | Simulink.data.dictionary.Entry

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

evalin

Package: Simulink.data.dictionary

Evaluate MATLAB expression in data dictionary section

Syntax

```
returnValue = evalin(sectionObj,expression)
```

Description

`returnValue = evalin(sectionObj,expression)` evaluates a MATLAB expression in the data dictionary section `sectionObj` and returns the values returned by `expression`.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

Examples

List All Entries in Data Dictionary Section

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Execute the `whos` command in the Design Data section of `myDictionary_ex_API.sldd`.

```
evalin(dDataSectObj,'whos')
```

Name	Size	Bytes	Class	Attributes
fuelFlow	1x1	8	double	
myRefEntry	1x1	1	logical	
parameterGain37	1x1	112	Simulink.Parameter	

Input Arguments

sectionObj — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

expression — MATLAB expression to evaluate

character vector

MATLAB expression to evaluate, specified as a character vector.

Example: 'a = 5.3'

Example: 'whos'

Example: 'CurrentSpeed.Value = 290.73'

Data Types: char

Tips

- `evalin` allows you to treat a data dictionary section as a MATLAB workspace. You can think of entries contained in the section as workspace variables you can manipulate with MATLAB expressions.

`Simulink.data.dictionary.Section` | `Simulink.data.evalinGlobal`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

exist

Package: Simulink.data.dictionary

Check existence of data dictionary entry

Syntax

```
doesExist = exist(sectionObj,entryName)
```

Description

`doesExist = exist(sectionObj,entryName)` determines if the data dictionary section `sectionObj` contains an entry by the name of `entryName` and returns an indication.

Examples

Determine if Data Dictionary Entry Exists

Determine if an entry exists in a data dictionary by searching for the name of the entry

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Determine if an entry `fuelFlow` exists in the Design Data section of `myDictionary_ex_API.sldd`.

```
exist(dDataSectObj,'fuelFlow')
```

```
ans =
```

```
    1
```

Determine if an entry `myEntry` exists in the Design Data section of `myDictionary_ex_API.sldd`.

```
exist(dDataSectObj,'myEntry')
```

```
ans =
```

```
    0
```

Input Arguments

sectionObj — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

entryName — Name of target entry

character vector

Name of target entry, specified as a character vector.

Example: 'myEntry'

Data Types: char

Output Arguments**doesExist — Indication of entry existence**

0 | 1

Indication of entry existence, returned as 0 if false and 1 if true.

Tips

- `exist` also determines if a matching entry exists in the same section of any referenced data dictionaries. For example, if `sectionObj` represents the Design Data section of a data dictionary `myDictionary_ex_API.sldd`, `exist` searches the Design Data section of `myDictionary_ex_API.sldd` and the Design Data sections of any dictionaries referenced by `myDictionary_ex_API.sldd`.

Alternatives

You can use Model Explorer to search a data dictionary for an entry.

See Also`Simulink.data.dictionary.Section | find | Simulink.data.existsInGlobal`**Topics**

"Store Data in Dictionary Programmatically"

Introduced in R2015a

exportToFile

Package: Simulink.data.dictionary

Export data dictionary entries from section to MAT-file or MATLAB file

Syntax

```
exportToFile(sectionObj, fileName)
```

Description

`exportToFile(sectionObj, fileName)` exports to a MAT or MATLAB file all the values of the entries contained in the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object. `exportToFile` exports the values of all entries, including those defined in referenced dictionaries.

Examples

Export Data Dictionary Entries to MAT or MATLAB Files

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`. Represent the Configurations section of `myDictionary_ex_API.sldd` with an object named `configSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
configSectObj = getSection(myDictionaryObj, 'Configurations');
```

Export the entries from the Design Data section of `myDictionary_ex_API.sldd` to a MATLAB file in your current working folder.

```
exportToFile(dDataSectObj, 'myDictionaryDesignData.m')
```

Export the entries from the Configurations section of `myDictionary_ex_API.sldd` to a MAT-file in your current working folder.

```
exportToFile(configSectObj, 'myDictionaryConfigurations.mat')
```

```
Exported 1 entries from scope 'Configurations'
to MAT-file myDictionaryConfigurations.mat.
```

Input Arguments

sectionObj — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

fileName — Name of MAT or MATLAB file

character vector

Name of target MAT or MATLAB file, specified as a character vector. `exportToFile` supplies a file extension `.mat` if you do not specify an extension.

Example: 'myNewFile.mat'

Example: 'myNewFile.m'

Data Types: char

Limitation

The `exportToFile` method does not export enumerated data types (which are stored as `Simulink.data.dictionary.EnumTypeDefinition` objects). To transfer or copy an enumerated type from one dictionary to another, use the `getEntry` and `addEntry` methods of `Simulink.data.dictionary.Section` objects.

Alternatives

You can use Model Explorer to export data dictionary entries to a file. See “Export Design Data from Dictionary” for more information.

`Simulink.data.dictionary.Section` | `importFromFile`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

find

Package: Simulink.data.dictionary

Search in data dictionary section

Syntax

```
foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN)
foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN,options)
```

Description

`foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN)` searches the data dictionary section `sectionObj` using search criteria `PName1,PValue1,...,PNameN,PValueN`, and returns an array of matching entries that were found in the target section. This syntax matches the search criteria with the properties of the entries in the target section but not with the properties of their values. See `Simulink.data.dictionary.Entry` for a list of data dictionary entry properties.

`foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN,options)` searches for data dictionary entries using additional search options. For example, you can match the search criteria with the values of the entries in the target section.

Examples

Return Array of All Entries in Data Dictionary Section

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Return all of the entries stored in the Design Data section of the data dictionary `myDictionary_ex_API.sldd`.

```
allEntries = find(dDataSectObj)
```

Search Data Dictionary Section for Specific Class

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries whose values are objects of the `Simulink.Parameter` class.

```
foundEntries = find(dDataSectObj, '-value', '-class', 'Simulink.Parameter')
```

Search Data Dictionary Section for Modifying User

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries that were last modified by the user `jsmith`.

```
foundEntries = find(dDataSectObj, 'LastModifiedBy', 'jsmith')
```

Search Data Dictionary Section Using Multiple Criteria

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries that were last modified by the user `jsmith` or whose names begin with `fuel`.

```
foundEntries = find(dDataSectObj, 'LastModifiedBy', 'jsmith', '-or', ...  
    '-regexp', 'Name', 'fuel*')
```

Search Data Dictionary Section Using Regular Expressions

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries whose names begin with `fuel`.

```
foundEntries = find(dDataSectObj, '-regexp', 'Name', 'fuel*')
```

Search Data Dictionary Section for Specific Value

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Return all of the entries stored in the Design Data section of the data dictionary `myDictionary_ex_API.sldd`.

```
allEntries = find(dDataSectObj);
```

Find the entries with value 237. If you find more than one entry, store the entries in an array called `foundEntries`.

```
foundEntries = [];
for i = 1:length(allEntries)
    if getValue(allEntries(i)) == 237
        foundEntries = [foundEntries allEntries(i)];
    end
end
```

Search Data Dictionary Section for Specific Property

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries whose values have a property `DataType`.

```
foundEntries = find(dDataSectObj, '-value', '-property', 'DataType')
```

Input Arguments

`sectionObj` — Data dictionary section to search

`Simulink.data.dictionary.Section` object

Data dictionary section to search, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

`PName1, PValue1, . . . , PNameN, PValueN` — Search criteria

name-value pairs representing properties

Search criteria, specified as one or more name-value pairs representing names and values of properties of the entries in the target data dictionary section. For a list of the properties of a data dictionary entry, see `Simulink.data.dictionary.Entry`. If you specify more than one name-value pair, the returned entries meet all of the criteria.

If you include the `'-value'` option to search in the values of the entries, the search criteria apply to the values of the entries rather than to the entries themselves.

Example: `'LastModifiedBy', 'jsmith'`

Example: `'DataSource', 'myRefDictionary_ex_API.sldd'`

`options` — Additional search options

supported option codes

Additional search options, specified as one or more of the following supported option codes.

'-value'	This option causes <code>find</code> to search only in the values of the entries in the target data dictionary section. Specify this option before any other search criteria or options arguments.
'-and', '-or', '-xor', '-not' logical operators	These options modify or combine multiple search criteria or other option codes.
'-property', <code>propertyName</code>	This name-value pair causes <code>find</code> to search for entries or values that have the property <code>propertyName</code> regardless of the value of the property. Specify <code>propertyName</code> as a character vector.
'-class', <code>className</code>	This name-value pair causes <code>find</code> to search for entries or values that are objects of the class <code>className</code> . Specify <code>className</code> as a character vector.
'-isa', <code>className</code>	This name-value pair causes <code>find</code> to search for entries or values that are objects of the class or of any subclass derived from the class <code>className</code> . Specify <code>className</code> as a character vector.
'-regexp'	This option allows you to use regular expressions in your search criteria. This option affects only search criteria that follow '-regexp'.

Example: '-value'

Example: '-value', '-property', 'CoderInfo'

Example: '-value', '-class', 'Simulink.Parameter'

Output Arguments

foundEntries — Data dictionary entries matching search criteria

array of `Simulink.data.dictionary.Entry` objects

Data dictionary entries matching the specified search criteria, returned as an array of `Simulink.data.dictionary.Entry` objects.

Alternatives

You can use Model Explorer to search a data dictionary for entries using arbitrary criteria.

See Also

`Simulink.data.dictionary.Section` | `exist` | `Simulink.data.dictionary.Entry` | `find`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

getEntry

Package: Simulink.data.dictionary

Create Simulink.data.dictionary.Entry object to represent data dictionary entry

Syntax

```
entryObj = getEntry(sectionObj,entryName)
entryObj = getEntry(sectionObj,entryName,'DataSource',dictionaryName)
```

Description

entryObj = getEntry(sectionObj,entryName) returns an array of Simulink.data.dictionary.Entry objects representing data dictionary entries entryName found in the data dictionary section sectionObj, a Simulinkdata.dictionary.Section object. getEntry returns multiple objects if multiple entries have the specified name in a reference hierarchy of data dictionaries.

entryObj = getEntry(sectionObj,entryName,'DataSource',dictionaryName) returns an object representing a data dictionary entry that is defined in the data dictionary dictionaryName. Use this syntax to uniquely identify an entry that is defined more than once in a hierarchy of referenced data dictionaries.

Examples

Set Value of Data Dictionary Entry

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Represent the data dictionary entry fuelFlow with a Simulink.data.dictionary.Entry object named fuelFlowObj. fuelFlow is defined in the data dictionary myDictionary_ex_API.sldd.

```
fuelFlowObj = getEntry(dDataSectObj,'fuelFlow');
```

Set the value of the entry fuelFlow to 493.

```
setValue(fuelFlowObj,493)
```

Set Value of Entry in Reference Dictionary

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Represent the data dictionary entry `myRefEntry` with a `Simulink.data.dictionary.Entry` object named `refEntryObj`. `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`, and `myRefDictionary_ex_API.sldd` defines an entry `myRefEntry`.

```
refEntryObj = getEntry(dDataSectObj, 'myRefEntry', 'DataSource', ...  
'myRefDictionary_ex_API.sldd');
```

Set the value of the entry `myRefEntry` to 493.

```
setValue(refEntryObj, 493)
```

Input Arguments

sectionObj — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

entryName — Name of target data dictionary entry

character vector

Name of target data dictionary entry, specified as a character vector.

Example: `'myEntry'`

Data Types: `char`

dictionaryName — Name of data dictionary containing target entry

character vector

File name of data dictionary containing the target entry, specified as a character vector including the `.sldd` extension.

Example: `'mySubDictionary_ex_API.sldd'`

Data Types: `char`

Output Arguments

entryObj — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, returned as one or more `Simulink.data.dictionary.Entry` objects.

See Also

`Simulink.data.dictionary.Section` | `addEntry` | `Simulink.data.dictionary.Entry` | `getValue`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

importFromFile

Package: Simulink.data.dictionary

Import variables from MAT-file or MATLAB file to data dictionary section

Syntax

```
importedVars = importFromFile(sectionObj,fileName)
importedVars = importFromFile(sectionObj,fileName,'existingVarsAction',
existAction)
[importedVars,existingVars] = importFromFile( __ )
```

Description

`importedVars = importFromFile(sectionObj,fileName)` imports variables defined in the MAT-file or MATLAB file `fileName` to the data dictionary section `sectionObj` without overwriting any variables that are already in the target section. If any variables are already in the target section, the function displays a warning and a list in the MATLAB Command Window. This syntax returns a list of variables that were successfully imported. A variable is considered successfully imported only if `importFromFile` assigns the value of the variable to the corresponding entry in the target data dictionary.

`importedVars = importFromFile(sectionObj,fileName,'existingVarsAction',existAction)` imports variables that are already in the target section by taking a specified action `existAction`. For example, you can choose to use the variable values in the target file to overwrite the corresponding values in the target section.

`[importedVars,existingVars] = importFromFile(__)` returns a list of variables in the target section that were not overwritten. Use this syntax if `existingVarsAction` is set to 'none', the default value, which prevents existing dictionary entries from being overwritten.

Examples

Import to Data Dictionary from File

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Import all variables contained in the file `myData_ex_API.m` to the data dictionary and return a list of successfully imported variables. If any variables are already in `myDictionary_ex_API.sldd`, `importFromFile` returns a warning and a list of the affected variables.

```
importFromFile(dDataSectObj,'myData_ex_API.m')
```

```
Warning: The following variables were not imported because
they already exist in the dictionary:
    fuelFlow
```

```
ans =
    'myFirstEntry'
    'mySecondEntry'
    'myThirdEntry'
```

Import Variables from File and Overwrite Conflicts

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Import all variables contained in the file `myData_ex_API.m` to the data dictionary, overwrite any variables that are already in the dictionary, and return a list of successfully imported variables.

```
importFromFile(dDataSectObj,'myData_ex_API.m','existingVarsAction','overwrite')
```

```
ans =
    'fuelFlow'
    'myFirstEntry'
    'mySecondEntry'
    'myThirdEntry'
```

Return Variables Not Imported to Data Dictionary from File

Return a list of variables that are not imported from a file because they are already in the target data dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Import all variables contained in the file `myData_ex_API.m` to the data dictionary. Specify names for the output arguments of `importFromFile` to return the names of successfully and unsuccessfully imported variables.

```
[importedVars,existingVars] = importFromFile(dDataSectObj,'myData_ex_API.m')
```

```
importedVars =
    'myFirstEntry'
    'mySecondEntry'
    'myThirdEntry'
```

```
existingVars =
    'fuelFlow'
```

`importFromFile` does not import the variable `fuelFlow` because it is already in the target data dictionary.

Input Arguments

sectionObj — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

fileName — Name of MAT or MATLAB file

character vector

Name of target MAT or MATLAB file, specified as a character vector. `importFromFile` automatically supplies a file extension `.mat` if you do not specify an extension.

Example: `'myFile.mat'`

Example: `'myFile.m'`

Data Types: `char`

existAction — Action to take for existing dictionary variables

`'none'` (default) | `'overwrite'` | `'error'`

Action to take for existing dictionary variables, specified as `'none'`, `'overwrite'`, or `'error'`.

If you specify `'none'`, `importFromFile` attempts to import target variables but does not import or make any changes to variables that are already in the data dictionary section.

If you specify `'overwrite'`, `importFromFile` imports all target variables and overwrites any variables that are already in the data dictionary section.

If you specify `'error'`, `importFromFile` returns an error, without importing any variables, if any target variables are already in the data dictionary section.

Example: `'overwrite'`

Data Types: `char`

Output Arguments

importedVars — Successfully imported variables

cell array of character vectors

Names of successfully imported variables, returned as a cell array of character vectors. A variable is considered successfully imported only if `importFromFile` assigns its value to the corresponding entry in the target data dictionary.

existingVars — Variables that were not imported

cell array of character vectors

Names of target variables that were not imported due to their existence in the target data dictionary, returned as a cell array of character vectors. `existingVars` has content only if `existAction` is set

to 'none', which is also the default. In that case `importFromFile` imports only variables that are not already in the target data dictionary.

Tips

- `importFromFile` can import MATLAB variables created from enumerated data types but cannot import the definitions of the enumerated types. Use the `importEnumTypes` function to import enumerated data type definitions to a data dictionary. If you import variables of enumerated data types to a data dictionary but do not import the enumerated type definitions, the dictionary is less portable and might not function properly if used by someone else.

Alternatives

You can use the Model Explorer to import variables to a data dictionary from a file. See “Import Data to Dictionary from File” for more information.

`Simulink.data.dictionary.Section` | `exportToFile` | `importEnumTypes`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

Simulink.DualScaledParameter

Specify name, value, units, and other properties of Simulink dual-scaled parameter

Description

Use `Simulink.DualScaledParameter` so that you can define an object that stores two scaled values of the same physical value.

For example, for temperature measurement, you can store a Fahrenheit scale and a Celsius scale with conversion defined by a computation method that you provide. Given one scaled value, the `Simulink.DualScaledParameter` computes the other scaled value using the computation method.

A dual-scaled parameter inherits some properties from the `Simulink.Parameter` class. A dual-scaled parameter has:

- A calibration value. The value that you prefer to use.
- A main value. The real-world value that Simulink uses.
- An internal stored integer value. The value that is used in the embedded code.

You can use `Simulink.DualScaledParameter` objects in your model for both simulation and code generation. The parameter computes the internal value before code generation via the computation method. This offline computation results in leaner generated code.

If you provide the calibration value, the parameter computes the main value using the computation method. This method can be a first-order rational function.

$$y = \frac{ax + b}{cx + d}$$

- x is the calibration value.
- y is the main value.
- a and b are the coefficients of the CalToMain compute numerator.
- c and d are the coefficients of the CalToMain compute denominator.

If you provide the calibration minimum and maximum values, the parameter computes minimum and maximum values of the main value. Simulink performs range checking of parameter values. The software alerts you when the parameter object value lies outside a range that corresponds to its specified minimum and maximum values and data type.

Creation

Create a `Simulink.DualScaledParameter` object:

- By using the **Model Data Editor**. Instead of creating a `Simulink.Parameter` object, create a `Simulink.DualScaledParameter` object.
- By using the **Model Explorer**:

- 1 In the **Model Hierarchy** pane, select a workspace or data dictionary.
 - 2 On the toolbar, select **Add > Add Custom**.
 - 3 In the Model Explorer — Select Object dialog box, set **Object class** to `Simulink.DualScaledParameter`.
- By using the `Simulink.DualScaledParameter` function, described below.

Syntax

`DSParam = Simulink.DualScaledParameter`

Description

`DSParam = Simulink.DualScaledParameter` returns a `Simulink.DualScaledParameter` object with default property values.

Properties

For information about properties in the property dialog box of a `Simulink.DualScaledParameter` object, see “`Simulink.DualScaledParameter` Property Dialog Box”.

CalibrationValue — Calibration value of this parameter

`[]` (default) | finite, real, double number

Calibration value of this parameter, specified as a finite, real, double number. This value represents the value that you prefer to use.

Before specifying `CalibrationValue`, you must specify `CalToMainCompuNumerator` and `CalToMainCompuDenominator` to define the computation method. The parameter uses the computation method and the calibration value to calculate the main value that Simulink uses.

Corresponds to **Calibration value** in the property dialog box.

Example: 5.34

Data Types: double

CalibrationMin — Calibration minimum value of this parameter

`[]` (default) | finite, real, double, scalar number

Calibration minimum value of this parameter, specified as a finite, real, double, scalar number. The default value, `[]`, means the minimum is unspecified.

Before specifying `CalibrationMin`, you must specify `CalToMainCompuNumerator` and `CalToMainCompuDenominator` to define the computation method. The parameter uses the computation method and the calibration minimum value to calculate the minimum or maximum value that Simulink uses. A first order rational function is strictly monotonic, either increasing or decreasing. If it is increasing, setting the calibration minimum sets the main minimum value. If it is decreasing, setting the calibration minimum sets the main maximum.

If the parameter value is less than the minimum value or if the minimum value is outside the range of the parameter data type, Simulink generates a warning. In these cases, when updating the diagram or starting a simulation, Simulink generates an error.

Corresponds to **Calibration minimum** in the property dialog box.

Example: 10.51

Data Types: double

CalibrationMax — Calibration maximum value of this parameter

[] (default) | finite, real, double, scalar number

Calibration maximum value of this parameter, specified as a finite, real, double, scalar number. The default value, [], means the maximum is unspecified.

Before specifying `CalibrationMax`, you must specify `CalToMainCompuNumerator` and `CalToMainCompuDenominator` to define the computation method. The parameter uses the computation method and the calibration maximum value to calculate the corresponding maximum or minimum value that Simulink uses. A first order rational function is strictly monotonic, either increasing or decreasing. If it is increasing, setting the calibration maximum sets the main maximum value. If it is decreasing, setting the calibration maximum sets the main minimum.

If the parameter value is less than the minimum value or if the minimum value is outside the range of the parameter data type, Simulink generates a warning. In these cases, when updating the diagram or starting a simulation, Simulink generates an error.

Corresponds to **Calibration maximum** in the property dialog box.

Example: -10.51

Data Types: double

CalToMainCompuNumerator — Numerator coefficients of the computation method

[] (default) | finite, real, double scalar | finite, real, double vector

Numerator coefficients of the computation method, specified as a scalar number or vector of values for the numerator coefficients *a* and *b* of the first-order linear equation:

$$y = \frac{ax + b}{cx + d}$$

The default value is [] (unspecified). Specify finite, real, double scalar values for *a* and *b*. For example, [1 1] or, for reciprocal scaling, 1.

Once you have applied `CalToMainCompuNumerator`, you cannot change it.

Corresponds to **CalToMain compute numerator** in the property dialog box.

Example: [1 1]

Example: 1

Data Types: double

CalToMainCompuDenominator — Denominator coefficients of the computation method

[] (default) | finite, real, double scalar | finite, real, double vector

Denominator coefficients of the computation method, specified as a scalar number or vector of values for the denominator coefficients *c* and *d* of the first-order linear equation:

$$y = \frac{ax + b}{cx + d}$$

The default value is `[]` (unspecified). Specify finite, real, double scalar values for `c` and `d`. For example, `[1 1]`.

Once you have applied `CalToMainCompuDenominator`, you cannot change it.

Corresponds to **CalToMain compute denominator** in the property dialog box.

Example: `[1 1]`

Data Types: `double`

CalibrationName — Name of the calibration parameter

`''` (empty character vector) (default) | character vector

Name of the calibration parameter, specified as a character vector.

Corresponds to **Calibration name** in the property dialog box.

Example: `'This is a calibration parameter.'`

Data Types: `char`

CalibrationDocUnits — Measurement units for this calibration parameter's value

`''` (empty character vector) (default) | character vector

Measurement units for this calibration parameter's value, specified as a character vector.

Corresponds to **Calibration units** in the property dialog box.

Example: `'Fahrenheit'`

Data Types: `char`

IsConfigurationValid — Information about validity of configuration

`true` (default) | `false`

This property is read-only.

Information about the validity of the object configuration, returned as `true` (valid) or `false` (invalid). If Simulink detects an issue with the configuration, it sets this field to `false` and provides information in the `DiagnosticMessage` property.

Corresponds to **Is configuration valid** in the property dialog box.

Data Types: `logical`

DiagnosticMessage — Diagnostic information about invalid configuration

`''` (empty character vector) (default) | character vector

This property is read-only.

Diagnostic information about an invalid object configuration, returned as a character vector. If you specify invalid property settings, Simulink displays a message in this field. Use the diagnostic information to help you fix an invalid configuration issue.

Corresponds to **Diagnostic message** in the property dialog box.

Data Types: `char`

Examples

Create and Update a Dual-Scaled Parameter

Create a `Simulink.DualScaledParameter` object that stores a temperature as both Fahrenheit and Celsius.

Create a `Simulink.DualScaledParameter` object.

```
Temp = Simulink.DualScaledParameter;
```

Set the computation method that converts between Fahrenheit and Celsius.

```
Temp.CalToMainCompuNumerator = [1 -32];  
Temp.CalToMainCompuDenominator = [1.8];
```

Set the value of the temperature that you want to see in Fahrenheit.

```
Temp.CalibrationValue = 212
```

```
Temp =
```

```
DualScaledParameter with properties:
```

```
    CalibrationValue: 212  
    CalibrationMin: []  
    CalibrationMax: []  
    CalToMainCompuNumerator: [1 -32]  
    CalToMainCompuDenominator: 1.8000  
    CalibrationName: ''  
    CalibrationDocUnits: ''  
    IsConfigurationValid: 1  
    DiagnosticMessage: ''  
    Value: 100  
    CoderInfo: [1x1 Simulink.CoderInfo]  
    Description: ''  
    DataType: 'auto'  
    Min: []  
    Max: []  
    Unit: ''  
    Complexity: 'real'  
    Dimensions: [1 1]
```

The `Simulink.DualScaledParameter` calculates `Temp.Value` which is the value that Simulink uses. `Temp.CalibrationValue` is 212 (degrees Fahrenheit), so `Temp.Value` is 100 (degrees Celsius).

Name the value and specify the units.

```
Temp.CalibrationName = 'TempF';  
Temp.CalibrationDocUnits = 'Fahrenheit';
```

Set calibration minimum and maximum values.

```
Temp.CalibrationMin = 0;  
Temp.CalibrationMax = 300;
```

If you specify a calibration value outside this allowable range, Simulink generates a warning.

Specify the units that Simulink uses.

```
Temp.Unit = 'degC';
```

Open the Simulink.DualScaledParameter dialog box.

open `Temp`

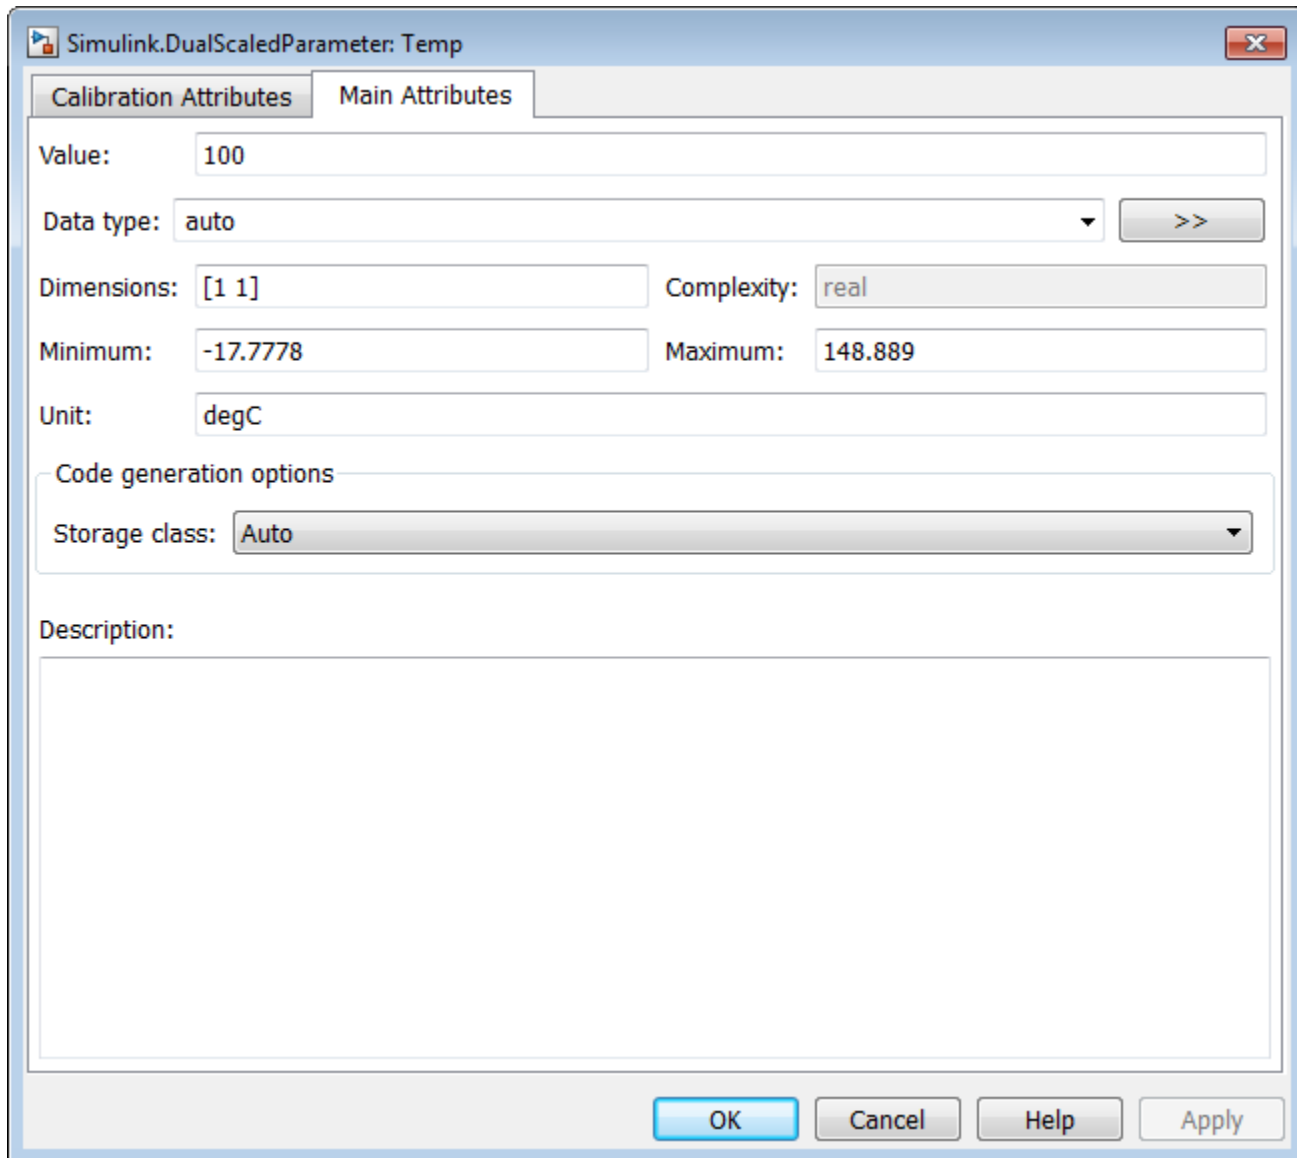

The screenshot shows the 'Simulink.DualScaledParameter: Temp' dialog box. It has two tabs: 'Calibration Attributes' and 'Main Attributes'. The 'Calibration Attributes' tab is active. The fields are as follows:

Field	Value
Calibration value:	212
Calibration minimum:	0
Calibration maximum:	300
CalToMain compute numerator:	[1 -32]
CalToMain compute denominator:	1.8
Calibration name:	'TempF'
Calibration units:	'Fahrenheit'

Below the calibration fields is a 'Parameter validation' section. It contains a checkbox 'Is configuration valid:' which is checked, and a text area for 'Diagnostic message:' which is empty. At the bottom of the dialog are four buttons: 'OK', 'Cancel', 'Help', and 'Apply'.

The **Calibration Attributes** tab displays the calibration value and the computation method that you specified.

In the dialog box, click the **Main Attributes** tab.

This tab displays information about the value used by Simulink.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using MATLAB® Coder™.

To control the appearance of a `Simulink.DualScaledParameter` object in the generated code, use the **Storage class** property, which the object inherits from `Simulink.Parameter`.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Introduced in R2013b

Simulink.FindOptions

Specify options for finding blocks in models and subsystems

Description

`Simulink.FindOptions` objects allow you to constrain a search with the `Simulink.findBlocks` and `Simulink.findBlocksOfType` functions.

Creation

Syntax

```
f = Simulink.FindOptions
f = Simulink.FindOptions(Name,Value)
```

Description

`f = Simulink.FindOptions` creates a `FindOptions` object that uses the default search options.

`f = Simulink.FindOptions(Name,Value)` sets properties on page 8-188 using name-value pairs. For example, `Simulink.FindOptions('SearchDepth',1)` creates a `FindOptions` object with a search depth of 1. You can specify multiple name-value pairs. Enclose each property name in single quotes.

Properties

CaseSensitive — Option to match case when searching

`true` (default) | `false`

Option to match case when searching, specified as `true` for case-sensitive search or `false` for case-insensitive search.

Data Types: `logical`

FollowLinks — Option for search to follow library links

`false` (default) | `true`

Option for search to follow library links, specified as `true` or `false`. If `true`, search follows links into library blocks.

Data Types: `logical`

IncludeCommented — Option for search to include commented blocks

`true` (default) | `false`

Option for search to include commented blocks, specified as `true` or `false`.

Data Types: `logical`

LookUnderMasks — Options to search masked blocks`'all'` (default) | `'none'` | `'functional'` | `'graphical'`

Options to search masked blocks, specified as:

- `'all'` — Search in all masked blocks.
- `'none'` — Prevent searching in masked systems.
- `'functional'` — Include masked subsystems that do not have dialogs.
- `'graphical'` — Include masked subsystems that do not have workspaces or dialogs.

Data Types: `char` | `string`**Variants — Options to search variant subsystems**`'AllVariants'` (default) | `'ActiveVariants'` | `'ActivePlusCodeVariants'`

Note The `Variants` argument will be removed. Use `MatchFilter` instead. For more information, see [Compatibility Considerations on page 8-192](#).

Options to search variant subsystems, specified as:

- `'AllVariants'` — Search all variant choices.
- `'ActiveVariants'` — Search only active variant choices.
- `'ActivePlusCodeVariants'` — Search all variant choices in the Variant Subsystem that are active in simulation and is part of the generated code.

This search constraint applies only to Variant Subsystem blocks that have the **Variant control mode** set to `expression` or `label`. Use the `Simulink.FindOptions` object with the `MatchFilter` option to operate on all types of variant blocks.

Data Types: `char` | `string`**MatchFilter — Function handle to match elements**`function handle`

Function handle to match elements in a search, such as blocks, system, lines, ports, and annotations. Use `MatchFilter` to determine whether elements should be included or skipped in a search.

The named function must be defined within a MATLAB program file. The function takes the handle of the element as input and returns two outputs.

```
function [match, prune] = func(element)
```

- The input `element` is the handle of the block being processed.
- The first output, `match`, is a logical value. If `false`, search skips the element.
- The second output, `prune`, is an optional logical value that only applies when `element` is a subsystem. The default value is `false`. If this value is set to `true`, the entire subsystem is omitted from the search.

Example: Use `MatchFilter` to find all Gain blocks in the model `vdp` with a gain value between 1 and 10.

```

function match = gainOneToTen(blk)
match = false;
if strcmp(get_param(blk, 'Type'), 'block') ...
    && strcmp(get_param(blk, 'BlockType'), 'Gain')
    gainValue = str2double(get_param(blk, 'Gain'));
    match = gainValue >= 1 && gainValue <= 10;
end
end

load_system('vdp');
findOptObj = Simulink.FindOptions('MatchFilter', @gainOneToTen);
blks=getfullname((Simulink.findBlocks('vdp', findOptObj)));

```

Variants: Simulink provides `Simulink.match.activeVariants` and `Simulink.match.codeCompileVariants` match filter functions for variant blocks, which you can use to find active variants or code compile variant blocks. To do so, compile the model and apply the appropriate `MatchFilter` options:

- `Simulink.match.activeVariants` - Matches blocks that are active in simulation after model compilation
- `Simulink.match.codeCompileVariants` - Matches blocks that are part of generated code after model compilation

Note To get correct results, you must **compile the model** before using `Simulink.match.activeVariants` and `Simulink.match.codeCompileVariants` filters. If the model is not compiled, these filters return all blocks in the model.

Example: Use the `Simulink.match.activeVariants` option to find active variants in a model:

```

addpath(fullfile(matlabroot, 'examples', 'simulink_variants', 'main'));
model='sldemo_variant_subsystems';
load_system(model);
assignin('base', 'VSS_MODE', 2);
set_param(model, 'SimulationCommand', 'update');
findOptObj= Simulink.FindOptions('MatchFilter', @Simulink.match.activeVariants);
blks=getfullname((Simulink.findBlocks(model, findOptObj)))

```

Example: Use the `Simulink.match.codeCompileVariants` option to find variant choices that are part of the generated C code:

```

addpath(fullfile(matlabroot, 'examples', 'simulink_variants', 'main'));
load_system('sldemo_variant_subsystems');
assignin('base', 'VSS_MODE', 2);
sldemo_variant_subsystems([], [], [], 'compileForCodegen');
findOptObj = Simulink.FindOptions('MatchFilter', @Simulink.match.codeCompileVariants);
blks=getfullname((Simulink.findBlocks('sldemo_variant_subsystems', findOptObj)));
sldemo_variant_subsystems([], [], [], 'term');

```

RegExp — Option to treat search text as regular expression

false (default) | true

Option to treat search text as a regular expression, specified as true or false. To learn more about MATLAB regular expressions, see “Regular Expressions”.

Data Types: logical

SearchDepth — Levels in model to search

-1 (default) | positive integer

Levels in model to search, specified as a positive integer. The default (-1) is to search all levels. Specify:

- 1 — Search in the top-level system.
- 2 — Search the top-level system and its children, 3 to search an additional level, and so on.

Data Types: int32

Examples**Specify Search Options**

Create a `Simulink.FindOptions` object that specifies a search depth of 1.

```
f = Simulink.FindOptions('SearchDepth',1);
```

Using the `FindOptions` object, search for all blocks in the subsystem named `Unlocked`, but not in any of its children.

```
openExample('sldemo_clutch');
bh = Simulink.findBlocks('sldemo_clutch/Unlocked',f);
```

The `Simulink.findBlocks` function returns the block handles.

To get the block path, use the `getfullname` function.

```
bp = getfullname(bh)
```

```
bp =
```

```
20x1 cell array
```

```
{'sldemo_clutch/Unlocked/Tfmaxk' }
{'sldemo_clutch/Unlocked/Tin' }
{'sldemo_clutch/Unlocked/Enable' }
{'sldemo_clutch/Unlocked/E_Sum' }
{'sldemo_clutch/Unlocked/Engine←Damping' }
{'sldemo_clutch/Unlocked/Engine←Inertia' }
{'sldemo_clutch/Unlocked/Engine←Integrator' }
{'sldemo_clutch/Unlocked/Goto' }
{'sldemo_clutch/Unlocked/Goto1' }
{'sldemo_clutch/Unlocked/Max←Dynamic←Friction←Torque' }
{'sldemo_clutch/Unlocked/V_Sum' }
{'sldemo_clutch/Unlocked/Vehicle←Damping' }
{'sldemo_clutch/Unlocked/Vehicle←Inertia' }
{'sldemo_clutch/Unlocked/Vehicle←Integrator' }
{'sldemo_clutch/Unlocked/W_Slip' }
{'sldemo_clutch/Unlocked/slip direction' }
{'sldemo_clutch/Unlocked/w0' }
{'sldemo_clutch/Unlocked/w0 ' }
```

```
{'sldemo_clutch/Unlocked/we' }  
{'sldemo_clutch/Unlocked/wv' }
```

Compatibility Considerations

Variants argument will be removed

Warns starting in R2021a

The `Variants` option will be removed from `Simulink.FindOptions` in a future release. Scripts that use the `Variants` option continue to work with a warning.

To find variant blocks in a model that are active during simulation or code generation, you can compile the model and use the `Simulink.FindOptions` object with the `MatchFilter` option.

`Simulink.FindOptions` does not support the use of `MatchFilter` along with the `Variants` option.

This command produces an error:

```
f = Simulink.FindOptions('MatchFilter',...  
@Simulink.match.activeVariants, 'Variants', 'ActiveVariants');  
blocks=Simulink.findBlocks('sldemo_variant_subsystems',f)
```

Introduced in R2018a

Simulink.HMI.InstrumentedSignals

Save and restore signal logging specification

Description

A `Simulink.HMI.InstrumentedSignals` object acts as a specification for logged signals in a model, including signals in subsystems, library instances, and Stateflow charts. You can get a `Simulink.HMI.InstrumentedSignals` object for the logging configuration in your model using the `get_param` function with the `InstrumentedSignals` model parameter. You can save several logging configurations as `Simulink.HMI.InstrumentedSignals` objects and easily swap the logging configuration for your model using `set_param`.

Note An `InstrumentedSignals` object for a model does not include signals logged inside referenced models. To get a list of logged signals in a referenced model, create an `InstrumentedSignals` object for the referenced model.

Creation

The `get_param` function returns a `Simulink.HMI.InstrumentedSignals` object for the `InstrumentedSignals` model parameter.

Properties

Model — Model name

character vector

Name of the model that corresponds to the list of logged signals.

Example: 'sldemo_fuelsys'

Count — Number of logged signals

integer

Number of logged signals in the model.

Example: 10

Data Types: `uint32`

Examples

Save and Restore a Set of Logged Signals

This example shows how to use the `Simulink.HMI.InstrumentedSignals` object to save a set of logged signals to restore after running a simulation with a different signal logging configuration.

Save the Initial Signal Logging Configuration

This example uses the `sldemo_fuelsys` model, which is configured to log 10 signals. Open the model and use the `get_param` function to get a `Simulink.HMI.InstrumentedSignals` object representing the signal logging configuration.

```
load_system sldemo_fuelsys

initSigs = get_param('sldemo_fuelsys','InstrumentedSignals');
```

You can save the initial signal logging configuration in a MAT-file for later use.

```
save initial_instSigs.mat initSigs
```

Remove All Logging Badges

To return to a baseline of no logged signals, you can use the `set_param` function to remove all logging badges from signals in your model. Then, you can easily select a different configuration of signals to log in the Simulink™ Editor or using the `Simulink.sdi.markSignalForStreaming` function.

```
set_param('sldemo_fuelsys','InstrumentedSignals',[])
```

Restore Saved Logging Configuration

After working with a different set of logged signals, you can restore a saved configuration using the `Simulink.HMI.InstrumentedSignals` object. For example, if you saved the logging configuration to a MAT-file, you can load the MAT-file contents into the workspace and use the `set_param` function to restore the previously saved logging configuration.

```
load initial_instSigs.mat

set_param('sldemo_fuelsys','InstrumentedSignals',initSigs)
```

Simulink.HMI.ParamSourceInfo

Information about Dashboard block variable and parameter connections

Description

Use a `Simulink.HMI.ParamSourceInfo` object to connect a Dashboard block to a variable or parameter programmatically using the `set_param` function. The `get_param` function returns a `Simulink.HMI.ParamSourceInfo` object when you use the function to query the connection information for a Dashboard block connected to a variable or parameter.

The `Simulink.HMI.ParamSourceInfo` object contains four properties. Some of the properties apply to connecting Dashboard blocks to parameters, and some apply for connecting Dashboard blocks to variables. Not all fields have a value for a connection because a given Dashboard block connects to either a parameter or a variable.

Creation

Syntax

```
paramSourceInfo = Simulink.HMI.ParamSourceInfo
```

Description

`paramSourceInfo = Simulink.HMI.ParamSourceInfo` creates the empty `Simulink.HMI.ParamSourceInfo` object, `paramSourceInfo`.

Properties

BlockPath — Path to the block associated with the parameter or variable

`Simulink.BlockPath`

`Simulink.BlockPath` object for the block associated with the parameter or variable. You can create a `Simulink.BlockPath` object for a block by passing a character array describing the path to `Simulink.BlockPath`. You can get a character array describing the block path for a selected block using the `gcb` function.

Example: `Simulink.BlockPath('vdp/Mu')`

ParamName — Name of the connected tunable block parameter

character array

Name of the connected tunable block parameter, specified as a character array. A `Simulink.HMI.ParamSourceInfo` object connected to a variable does not have a value for the `ParamName` property.

Example: `Gain`

VarName — Name of the connected variable

character array

Name of the connected variable, specified as a character array. A

`Simulink.HMI.ParamSourceInfo` object connected to a tunable parameter does not have a value for the `VarName` property.

Example: `Mu`

Element — Element of nonscalar variable or parameter value to connect

character array

Element of nonscalar variable or parameter value to connect, specified as a character array.

When the value of the variable or parameter you want to tune using a dashboard block is nonscalar, use the `Element` property to specify the scalar element of the nonscalar value that you want to tune. To connect to a scalar element in a vector or matrix, specify the element index. To connect to an element of a bus or structure, specify the element in the context of the bus or structure hierarchy by using dots to indicate different levels in the hierarchy, and omit the top level. The value of the `VarName` property or the `ParamName` property specifies the top level.

Example: `3` connects the block to the third element of the variable specified by the `VarName` property or the parameter specified by the `ParamName` property.

Example: `(3,2)` connects the block to the element in the third row and second column of the variable specified by the `VarName` property or the parameter specified by the `ParamName` property.

Example: `a.b` connects the block to element `b` of the nested structure or bus `a` within the value of the variable specified by the `VarName` property or the parameter specified by the `ParamName` property.

WksType — Source workspace for the connected variable

'base' | 'model' | data dictionary file path

Source workspace for the connected variable, specified as a character array. The source workspace can be the base workspace, model workspace, or a data dictionary. When the source workspace is a data dictionary, the `WksType` property value is the file path for the data dictionary, specified as a character array. A `Simulink.HMI.ParamSourceInfo` object connected to a tunable parameter does not have a value for the `WksType` property.

Example: `'modelData.sldd'`

Examples

Programmatically Add and Connect a Dashboard Block

This example shows how to programmatically add Dashboard blocks to a model and connect them to elements in the model. The example adds a Dashboard Scope block and a Slider block to the `vdp` model and connects and configures the blocks.

Add Blocks

Use the `add_block` function to add a Dashboard Scope block and a Slider block to the `vdp` model. This example also specifies the position of the blocks.

```
open_system('vdp')

scopePos = [550 140 800 305];
sliderPos = [550 30 800 120];
```

```
add_block('simulink_hmi_blocks/Dashboard Scope','vdp/Dashboard Scope',...
         'Position',scopePos)
add_block('simulink_hmi_blocks/Slider','vdp/Slider','Position',sliderPos)
```

Connect the Dashboard Scope Block

Use a cell array of `Simulink.HMI.SignalSpecification` objects to connect the Dashboard block to the x1 and x2 signals. The `Simulink.HMI.SignalSpecification` object specifies a connected signal using the block path and port index for the source of the signal. The default value for the `OutputPortIndex` is 1, so this example does not specify the output port for the x1 and x2 signals.

```
x1_sigSpec = Simulink.HMI.SignalSpecification;
x1_sigSpec.BlockPath = Simulink.BlockPath('vdp/x1');

x2_sigSpec = Simulink.HMI.SignalSpecification;
x2_sigSpec.BlockPath = Simulink.BlockPath('vdp/x2');

connection_dashboardScope = {x1_sigSpec x2_sigSpec};
```

Use the `set_param` function to configure the connected signals for the Dashboard Scope block.

```
set_param('vdp/Dashboard Scope',"Binding",connection_dashboardScope)
```

Connect and Configure the Slider Block

Use a `Simulink.HMI.ParamSourceInfo` object and the `set_param` function to connect the Slider block to the Gain parameter of the Mu block. To connect a parameter, the `Simulink.HMI.ParamSourceInfo` needs to specify the block path for the block that corresponds to the parameter and the name of the parameter.

```
slider_param = Simulink.HMI.ParamSourceInfo;
slider_param.BlockPath = Simulink.BlockPath('vdp/Mu');
slider_param.ParamName = 'Gain';

set_param('vdp/Slider',"Binding",slider_param)
```

Configure the scale for the slider for a range of 1 to 10 with a tick mark spacing of 1.

```
slider_limits = [1 1 10];

set_param('vdp/Slider',"Limits",slider_limits)
```

Introduced in R2019a

Simulink.HMI.SignalSpecification

Programmatically connect a Dashboard block to a signal

Description

Use a `Simulink.HMI.SignalSpecification` object to programmatically connect a Dashboard block to a signal.

The `SignalSpecification` object contains the block path, port index, and frame processing mode for a signal. To connect a Dashboard block to a signal, specify the corresponding `SignalSpecification` object as the value for the `Binding` parameter for the block using the `set_param` function.

Creation

Syntax

```
sigSpec = Simulink.HMI.SignalSpecification
```

Description

`sigSpec = Simulink.HMI.SignalSpecification` creates an empty `Simulink.HMI.SignalSpecification` object. Specify the block path and port index that correspond to the origin of the signal you want to connect.

Properties

BlockPath — Path of the block with the signal as an output

`Simulink.BlockPath` (default) | character vector

Block path for the block that has the signal you want to connect as an output, specified as a character vector or a `Simulink.BlockPath` object.

```
Example: sigSpec.BlockPath = 'vdp/Mu';
```

```
Example: sigSpec.BlockPath = myBlockPath;
```

OutputPortIndex — Block output port corresponding to the signal

1 (default) | scalar

Output port index corresponding to the signal, specified as a scalar, real integer.

```
Example: sigSpec.OutputPortIndex = 2;
```

FrameProcessingMode — Processing mode for the signal data

"sample" (default) | "frame"

Processing mode for the signal data, specified as `sample` or `frame`.

- `sample` — Each element in a sample of the signal is processed as a channel.
- `frame` — Each column in a sample of the signal is processed as a channel.

Example: `sigSpec.FrameProcessingMode = "frame";`

Note Only the Dashboard Scope block supports frame-based data.

Examples

Programmatically Add and Connect a Dashboard Block

This example shows how to programmatically add Dashboard blocks to a model and connect them to elements in the model. The example adds a Dashboard Scope block and a Slider block to the `vdp` model and connects and configures the blocks.

Add Blocks

Use the `add_block` function to add a Dashboard Scope block and a Slider block to the `vdp` model. This example also specifies the position of the blocks.

```
open_system('vdp')

scopePos = [550 140 800 305];
sliderPos = [550 30 800 120];

add_block('simulink_hmi_blocks/Dashboard Scope','vdp/Dashboard Scope',...
'Position',scopePos)
add_block('simulink_hmi_blocks/Slider','vdp/Slider','Position',sliderPos)
```

Connect the Dashboard Scope Block

Use a cell array of `Simulink.HMI.SignalSpecification` objects to connect the Dashboard block to the `x1` and `x2` signals. The `Simulink.HMI.SignalSpecification` object specifies a connected signal using the block path and port index for the source of the signal. The default value for the `OutputPortIndex` is 1, so this example does not specify the output port for the `x1` and `x2` signals.

```
x1_sigSpec = Simulink.HMI.SignalSpecification;
x1_sigSpec.BlockPath = Simulink.BlockPath('vdp/x1');

x2_sigSpec = Simulink.HMI.SignalSpecification;
x2_sigSpec.BlockPath = Simulink.BlockPath('vdp/x2');

connection_dashboardScope = {x1_sigSpec x2_sigSpec};
```

Use the `set_param` function to configure the connected signals for the Dashboard Scope block.

```
set_param('vdp/Dashboard Scope',"Binding",connection_dashboardScope)
```

Connect and Configure the Slider Block

Use a `Simulink.HMI.ParamSourceInfo` object and the `set_param` function to connect the Slider block to the `Gain` parameter of the `Mu` block. To connect a parameter, the `Simulink.HMI.ParamSourceInfo` needs to specify the block path for the block that corresponds to the parameter and the name of the parameter.

```
slider_param = Simulink.HMI.ParamSourceInfo;  
slider_param.BlockPath = Simulink.BlockPath('vdp/Mu');  
slider_param.ParamName = 'Gain';
```

```
set_param('vdp/Slider','Binding',slider_param)
```

Configure the scale for the slider for a range of 1 to 10 with a tick mark spacing of 1.

```
slider_limits = [1 1 10];
```

```
set_param('vdp/Slider','Limits',slider_limits)
```

MATLABFunctionConfiguration

MATLAB Function block property configuration

Description

The MATLABFunctionConfiguration object controls the MATLAB Function block properties such as the description, sample time, and function script.

Tip You can also configure a MATLAB Function block programmatically by using a Stateflow.EMChart object. This object provides access to the inputs, outputs, and properties of a MATLAB Function block. For more information, see “Configure MATLAB Function Blocks Programmatically”.

Creation

Each MATLAB Function block has its own MATLABFunctionConfiguration object. To access this object, use the `get_param` function. For example, if the model `myModel` contains a MATLAB Function block called `MATLAB Function`, enter:

```
config = get_param("myModel/MATLAB Function", ...
    "MATLABFunctionConfiguration");
```

Properties

Path — Path of block relative to model

string scalar | character vector

Path of the MATLAB Function block relative to the model, specified as a string scalar or character vector.

Data Types: string | char

FunctionScript — Code for MATLAB Function block

string scalar | character vector

Code for the MATLAB Function block, specified as a string scalar or character vector.

Data Types: string | char

UpdateMethod — Update method for MATLAB Function block

"Inherited" (default) | "Discrete" | "Continuous"

Update method for the MATLAB Function block, specified as one of these values:

- "Inherited" — The input signal at the trigger port determines when the block is updated during a simulation. A signal from a connected Simulink block triggers the port. If `UpdateMethod` is changed to "Inherited", `Sample Time` is automatically set to -1.

- "Discrete" — The Simulink model generates an implicit event at regular time intervals to awaken the block at the rate you specify in the `SampleTime` property. Other blocks in the model can have different sample times.
- "Continuous" — The MATLAB Function block updates at major time steps only, although it computes outputs and local continuous variables during minor and major time steps. If the `UpdateMethod` is changed to "Continuous", `Sample Time` is automatically set to 0.

When you set `UpdateMethod` to "Inherited" or "Continuous" and attempt to change `SampleTime`, Simulink displays a warning and ignores the input sample time.

UI Use

In the Property Inspector or Model Explorer, set **Update method** to Inherited, Discrete, or Continuous.

Data Types: enumerated

SampleTime — Sample time

"-1" (default) | "0" | string scalar | character vector

Sample time of the MATLAB Function block, specified as a string scalar or character vector. Sample time is only valid when `UpdateMethod` is set to "Discrete". If `UpdateMethod` is set to "Continuous" or "Inherited", any changes made to the sample time are ignored.

UI Use

In the Property Inspector or Model Explorer, enter a value for the **Sample Time** parameter.

Data Types: string | char

Description — Description

string scalar | character vector

Description of the MATLAB Function block, specified as a string scalar or character vector.

UI Use

In the Property Inspector or Model Explorer, enter a description in the **Description** box.

Data Types: string | char

DocumentLink — Documentation link

string scalar | character vector

Documentation link for the MATLAB Function block, specified as a string scalar or character vector.

UI Use

In the Property Inspector or Model Explorer, enter a link in the **Document link** box.

Data Types: string | char

SupportVariableSizing — Whether MATLAB Function block supports variable-size data

true or 1 (default) | false or 0

Whether the MATLAB Function block supports variable-size data, specified as a numeric or logical 1 (true) or 0 (false).

UI Use

In the Property Inspector or Model Explorer, select **Support variable-size arrays** to enable this setting.

Data Types: `logical`

AllowDirectFeedthrough — Whether MATLAB Function block supports direct feedthrough semantics

`true` or `1` (default) | `false` or `0`

Whether the MATLAB Function block supports direct feedthrough semantics, specified as a numeric or logical `1` (`true`) or `0` (`false`). The block has direct feedthrough if the output of the block directly depends on the input of the block. The block does not have direct feedthrough if the outputs of the block depend on the internal states and properties rather than the input of the block.

UI Use

In the Property Inspector or Model Explorer, select **Allow direct feedthrough** to enable this setting.

Data Types: `logical`

VectorOutputs1D — Whether MATLAB Function block outputs column vectors as one-dimensional data

`false` or `0` (default) | `true` or `1`

Whether the MATLAB Function block outputs column vectors as one-dimensional data, specified as a numeric or logical `0` (`false`) or `1` (`true`). When enabled, the block converts vectors of size N -by-1 to one-dimensional signals with a signal size equal to N .

UI Use

In the Property Inspector or Model Explorer, select or clear **Interpret output column vectors as one-dimensional data**.

Data Types: `logical`

SaturateonIntegerOverflow — Whether data saturates on integer overflow

`true` or `1` (default) | `false` or `0`

Whether the data in the MATLAB Function block saturates on integer overflow, specified as a numeric or logical `1` (`true`) or `0` (`false`). If this setting is set to `true`, the overflows saturate to either the minimum or maximum value that the data type can represent. If the setting is `false`, the overflow wraps to the appropriate value that the data type can represent. If your model has a possible overflow and you want to apply saturation protection in your generated code, it is recommended to enable this setting. If you have performance restrictions or are not concerned with integer overflow, you can disable this setting.

UI Use

In the Property Inspector or Model Explorer, select **Saturate on integer overflow** to enable this setting.

Data Types: `logical`

TreatAsFi — Inherited signals to treat as fi objects

`"FixedPoint"` (default) | `"FixedPointAndInteger"`

Inherited Simulink signals to treat as Fixed-Point Designer `fi` objects, specified as one of these values:

- `"FixedPoint"` — The MATLAB Function block treats all fixed-point inputs as `fi` objects.
- `"FixedPointAndInteger"` — The MATLAB Function block treats all fixed-point and integer inputs as `fi` objects.

To learn more about `fi` objects, see “`fi` Object Properties” (Fixed-Point Designer).

UI Use

In the Property Inspector or Model Explorer, set **Treat these inherit Simulink signal types as `fi` objects** to `Fixed-point` or `Fixed-point and & Integer`.

Data Types: `enumerated`

FimathMode — Default `fimath` properties

`"SameAsMATLAB"` (default) | `"UserSpecified"`

Default `fimath` properties for the MATLAB Function block, specified as one of these values:

- `"SameAsMATLAB"` — Use the same `fimath` properties as the current default `fimath` object.
- `"UserSpecified"` — Use the `Fimath` property to specify the default `fimath` object.

To learn more about fixed-point math, see `fimath`.

UI Use

In the Property Inspector or Model Explorer, set **MATLAB Function `fimath`** to `Same as MATLAB` or `Specify Other`.

Data Types: `enumerated`

Fimath — Default `fimath` object

`string` scalar | `character` vector

Default `fimath` object, specified as a `string` scalar or `character` vector. When the `FimathMode` property for the MATLAB Function block is `"UserSpecified"`, you can use this property to:

- Enter an expression that constructs a `fimath` object.
- Enter the variable name for a `fimath` object in the MATLAB or model workspace.

To learn more about `fimath` object properties, see “`fimath` Object Properties” (Fixed-Point Designer).

UI Use

In the Property Inspector or Model Explorer, set **MATLAB Function `fimath`** to `Specify Other` and enter a `fimath` expression.

Data Types: `string` | `char`

Object Functions

<code>openReport</code>	Open MATLAB function report
<code>closeReport</code>	Close MATLAB function report
<code>getReport</code>	Generate MATLAB function report

Examples

Configure MATLAB Function Block Properties

Access the MATLABFunctionConfiguration object for the MATLAB Function block in the model `call_stats_block1` described in “Implement MATLAB Functions in Simulink with MATLAB Function Blocks”.

```
config = get_param("call_stats_block1/MATLAB Function", ...
    "MATLABFunctionConfiguration");
```

Set the value of the Description property.

```
config.Description = "Calculate the mean and standard deviation for a vector of values.";
```

Create Custom Report for MATLAB Function Block

Access the MATLABFunctionConfiguration object for the MATLAB Function block in the model `call_stats_block2` described in “Implement MATLAB Functions in Simulink with MATLAB Function Blocks”.

```
config = get_param("call_stats_block2/MATLAB Function", ...
    "MATLABFunctionConfiguration");
```

Create the MATLABFunctionReport object for the MATLAB Function block.

```
report = getReport(config);
```

Access the `coder.Function` objects in the report.

```
functions = report.Functions;
```

Create a custom report that lists the functions and variables in the MATLAB Function block.

```
for i = 1:numel(functions)
    fprintf("Function %s uses these variables:\n", functions(i).Name)
    variables = functions(i).Variables;
    for j = 1:numel(variables)
        fprintf("%d. %s -- %s\n", j, variables(j).Name, variables(j).Scope)
    end
    fprintf("\n")
end
```

```
Function stats uses these variables:
```

```
1. mean -- Output
2. stdev -- Output
3. vals -- Input
4. len -- Local
```

```
Function avg uses these variables:
```

```
1. mean -- Output
```

- 2. array -- Input
- 3. size -- Input

closeReport

Package: Simulink

Close MATLAB function report

Syntax

```
closeReport(config)
```

Description

`closeReport(config)` closes the MATLAB function report for a MATLAB Function block.

Examples

Open and Close MATLAB Function Report

Access the `MATLABFunctionConfiguration` object for the MATLAB Function block in the model `call_stats_block2` described in “Implement MATLAB Functions in Simulink with MATLAB Function Blocks”.

```
config = get_param("call_stats_block2/MATLAB Function", ...  
    "MATLABFunctionConfiguration");
```

Open the MATLAB function report.

```
openReport(config)
```

Close the MATLAB function report.

```
closeReport(config)
```

Input Arguments

config — MATLAB Function block property configuration

`MATLABFunctionConfiguration` object

MATLAB Function block property configuration, specified as a `MATLABFunctionConfiguration` object.

Data Types: `MATLABFunctionConfiguration`

See Also

[MATLAB Function](#) | [MATLABFunctionConfiguration](#) | [openReport](#)

Topics

“MATLAB Function Reports”

“Configure MATLAB Function Blocks Programmatically”

Introduced in R2021a

getReport

Package: Simulink

Generate MATLAB function report

Syntax

```
report = getReport(config)
```

Description

`report = getReport(config)` returns the `MATLABFunctionReport` object for a MATLAB Function block. Use the `MATLABFunctionReport` object to access information about the functions and variables used by the MATLAB Function block.

Examples

Create Custom Report for MATLAB Function Block

Access the `MATLABFunctionConfiguration` object for the MATLAB Function block in the model `call_stats_block2` described in “Implement MATLAB Functions in Simulink with MATLAB Function Blocks”.

```
config = get_param("call_stats_block2/MATLAB Function", ...
    "MATLABFunctionConfiguration");
```

Create the `MATLABFunctionReport` object for the MATLAB Function block.

```
report = getReport(config);
```

Access the `coder.Function` objects in the report.

```
functions = report.Functions;
```

Create a custom report that lists the functions and variables in the MATLAB Function block.

```
for i = 1:numel(functions)
    fprintf("Function %s uses these variables:\n", functions(i).Name)
    variables = functions(i).Variables;
    for j = 1:numel(variables)
        fprintf("%d. %s -- %s\n", j, variables(j).Name, variables(j).Scope)
    end
    fprintf("\n")
end
```

Function stats uses these variables:

1. mean -- Output
2. stdev -- Output
3. vals -- Input
4. len -- Local

Function avg uses these variables:

1. mean -- Output
2. array -- Input
3. size -- Input

Input Arguments

config — MATLAB Function block property configuration

MATLABFunctionConfiguration object

MATLAB Function block property configuration, specified as a MATLABFunctionConfiguration object.

Tips

The first time that you create a MATLABFunctionReport object or open the MATLAB function report, Simulink automatically updates your model. If you make subsequent changes to the MATLAB code in the block, you must update your model before you generate a new MATLABFunctionReport object. Otherwise, the object does not reflect your changes. From the **Modeling** tab, select **Update Model**, or use the **Ctrl+D** keyboard shortcut. If you are in the **MATLAB Function Block Editor**, update the model by using the **Ctrl+Shift+D** keyboard shortcut instead. For more information, see “Update Diagram and Run Simulation”.

openReport

Package: Simulink

Open MATLAB function report

Syntax

```
openReport(config)
```

Description

`openReport(config)` opens the MATLAB function report for a MATLAB Function block.

Examples

Open and Close MATLAB Function Report

Access the `MATLABFunctionConfiguration` object for the MATLAB Function block in the model `call_stats_block2` described in “Implement MATLAB Functions in Simulink with MATLAB Function Blocks”.

```
config = get_param("call_stats_block2/MATLAB Function", ...  
    "MATLABFunctionConfiguration");
```

Open the MATLAB function report.

```
openReport(config)
```

Close the MATLAB function report.

```
closeReport(config)
```

Input Arguments

config — MATLAB Function block property configuration

`MATLABFunctionConfiguration` object

MATLAB Function block property configuration, specified as a `MATLABFunctionConfiguration` object.

Data Types: `MATLABFunctionConfiguration`

Tips

The first time that you open the MATLAB function report, Simulink automatically updates your model. If you make subsequent changes to the MATLAB code in the block, you must update your model before you reopen the report. Otherwise, the report does not reflect your changes. From the **Modeling** tab, select **Update Model**, or use the **Ctrl+D** keyboard shortcut. If you are in the

MATLAB Function Block Editor, update the model by using the **Ctrl+Shift+D** keyboard shortcut instead. For more information, see “Update Diagram and Run Simulation”.

MATLABFunctionReport

MATLAB function report

Description

Use MATLABFunctionReport objects to access information about the functions and variables used by MATLAB Function blocks.

Creation

To create a MATLABFunctionReport object for a MATLAB Function block, call the `getReport` function on the MATLABFunctionConfiguration object for the block. For example, if the model `myModel` contains a MATLAB Function block called `MATLAB Function`, enter:

```
config = get_param("myModel/MATLAB Function", ...  
    "MATLABFunctionConfiguration");  
report = getReport(config);
```

Properties

Functions — Functions in block

array of `coder.Function` objects

This property is read-only.

Functions in the MATLAB Function block, specified as an array of `coder.Function` objects. The array contains one `coder.Function` object for each function in the block. Use these objects to access information such as the name, scope, and type of the variables used by each function. For more information, see `coder.Function` Properties.

Data Types: `coder.Function`

Examples

Create Custom Report for MATLAB Function Block

Access the MATLABFunctionConfiguration object for the MATLAB Function block in the model `call_stats_block2` described in “Implement MATLAB Functions in Simulink with MATLAB Function Blocks”.

```
config = get_param("call_stats_block2/MATLAB Function", ...  
    "MATLABFunctionConfiguration");
```

Create the MATLABFunctionReport object for the MATLAB Function block.

```
report = getReport(config);
```

Access the `coder.Function` objects in the report.

```
functions = report.Functions;
```

Create a custom report that lists the functions and variables in the MATLAB Function block.

```
for i = 1:numel(functions)
    fprintf("Function %s uses these variables:\n", functions(i).Name)
    variables = functions(i).Variables;
    for j = 1:numel(variables)
        fprintf("%d. %s -- %s\n", j, variables(j).Name, variables(j).Scope)
    end
    fprintf("\n")
end
```

```
Function stats uses these variables:
```

```
1. mean -- Output
2. stdev -- Output
3. vals -- Input
4. len -- Local
```

```
Function avg uses these variables:
```

```
1. mean -- Output
2. array -- Input
3. size -- Input
```

Tips

The first time that you create a `MATLABFunctionReport` object or open the MATLAB function report, Simulink automatically updates your model. If you make subsequent changes to the MATLAB code in the block, you must update your model before you generate a new `MATLABFunctionReport` object. Otherwise, the object does not reflect your changes. From the **Modeling** tab, select **Update Model**, or use the **Ctrl+D** keyboard shortcut. If you are in the **MATLAB Function Block Editor**, update the model by using the **Ctrl+Shift+D** keyboard shortcut instead. For more information, see “Update Diagram and Run Simulation”.

Simulink.MDLInfo

Extract SLX, SLXP, or MDL file information without loading file

Description

`Simulink.MDLInfo` objects extract information from an SLX, SLXP or MDL file without loading it into memory.

To extract the description and metadata from a file without creating an `MDLInfo` object, use the `Simulink.MDLInfo.getDescription` and `Simulink.MDLInfo.getMetadata` functions, respectively.

Creation

Syntax

```
info = Simulink.MDLInfo(file)
```

Description

`info = Simulink.MDLInfo(file)` creates an `MDLInfo` object called `info` and populates the properties with the information from the specified model file.

Input Arguments

file — Name of SLX, SLXP, or MDL file

character vector | string scalar

Name of the SLX, SLXP, or MDL file, specified as a character vector or string scalar.

The file name can include a partial path, complete path, relative path, or no path. When you do not provide a path, the file extension is optional.

To avoid unexpected results caused by shadowed files that share a name, specify a fully qualified file name.

Example: `Simulink.MDLInfo('vdp')`

Example: `Simulink.MDLInfo('mymodel.slx')`

Example: `Simulink.MDLInfo('mydir/mymodel.slx')`

Example: `Simulink.MDLInfo('C:/mydir/mymodel.slx')`

Data Types: `char` | `string`

Properties

File Name and Contents

BlockDiagramName — Name of block diagram

character vector

This property is read-only.

Name of the block diagram, returned as a character vector.

The name of the block diagram matches the file name, but without an extension.

Data Types: `char`

BlockDiagramType — Type of file

character vector

This property is read-only.

Type of file, returned as a character vector.

Data Types: `char`

FileName — Fully qualified file name

character vector

This property is read-only.

Fully qualified file name, returned as a character vector.

Data Types: `char`

Interface — Description of inputs, outputs, and references

structure

This property is read-only.

Description of inputs, outputs, and references, returned as a structure.

The structure includes the names and attributes of the top-level ports, model references, and subsystem references.

Data Types: `struct`

IsLibrary — True or false result

1 | 0

This property is read-only.

True or false result, returned as a 1 or 0 of data type `logical`.

- 1 (`true`) — File is a library.
- 0 (`false`) — File is not a library.

Data Types: `logical`

User-Specified Information

Description — User-specified description

character vector

This property is read-only.

User-specified description for the file, returned as a character vector.

Tips

- To extract the description without loading the model or creating an MDLInfo object, use the `Simulink.MDLInfo.getDescription` function.
- To view the description without loading the model or creating an MDLInfo object, in the MATLAB Command Window, enter:

```
help 'mymodelName'
```

- To view the description for an open model, open the **Description** tab in the Model Properties dialog box.

Data Types: char

Metadata — Names and values of arbitrary data

structure

This property is read-only.

Names and values of arbitrary data associated with the file, returned as a structure.

The structure fields can be character vectors, numeric matrices of type `double`, or more structures.

Tips

To extract the metadata structure without loading the model or creating an MDLInfo object, use the `Simulink.MDLInfo.getMetadata` function.

Data Types: struct

Save Information

ReleaseUpdateLevel — Release update used to save file

positive integer

This property is read-only.

Release update used to save the file, returned as a positive integer.

- 0 — The file was saved in a general release, for example, 'R2020a', or was saved in a release before R2020a.
- Positive integer — The file was saved in an update release, for example, 2, if the model was saved in 'R2020a Update 2'.

Data Types: int32

LastModifiedBy — Name of user who last saved file

character vector

This property is read-only.

Name of the user who last saved the file, returned as a character vector.

Data Types: char

LastSavedArchitecture — Platform used to save file

character vector

This property is read-only.

Platform used to save the file, returned as a character vector.

Example: 'glnxa64'

Data Types: char

ModelVersion — Version number

character vector

This property is read-only.

Version number of the file, returned as a character vector.

Data Types: char

ReleaseName — MATLAB release used to save file

character vector

This property is read-only.

MATLAB release used to save the file, returned as a character vector.

Example: 'R2020a'

Data Types: char

SavedCharacterEncoding — Character encoding

character vector

This property is read-only.

Character encoding when the file was saved, returned as a character vector.

Example: 'UTF-8'

Data Types: char

SimulinkVersion — Simulink version number used to save file

character vector

This property is read-only.

Simulink version number used to save the file, returned as a character vector.

Example: '10.1'

Data Types: char

Examples

Get Model Information

Create a `Simulink.MDLInfo` object that corresponds to the `vdp.slx` file.

```
info = Simulink.MDLInfo('vdp.slx');
```

Get information about the file, such as the type of file, by using dot notation to access the property values.

```
type = info.BlockDiagramType
```

```
type =
```

```
    'Model'
```

`vdp` is a model file.

Find Referenced Models Without Loading Top Model

Get information about the `sldemo_mdhref_depgraph` model.

```
info = Simulink.MDLInfo('sldemo_mdhref_depgraph');
```

Get the interface information.

```
info.Interface
```

```
ans =
```

```
    struct with fields:
```

```

        Inports: [0x1 struct]
        Outports: [0x1 struct]
        Trigports: [0x1 struct]
        Enableports: [0x1 struct]
        ModelVersion: '1.84'
        SubsystemReferences: {0x1 cell}
        ModelReferences: {4x1 cell}
        ParameterArgumentNames: ''
        TestPointedSignals: [0x1 struct]
        ProvidedFunctions: [0x1 struct]
        IsExportFunctionModel: 0
        IsArchitectureModel: 0
        IsAUTOSARArchitectureModel: 0
        ResetEvents: [0x1 struct]
        HasInitializeEvent: 0
        HasTerminateEvent: 0
        PreCompExecutionDomainType: 'Unset'
        ParameterArguments: [0x1 struct]
        ExternalFileReference: [4x1 struct]
```

Get the referenced models.

```
info.Interface.ModelReferences
```

```
ans =  
  
4x1 cell array  
  
{'sldemo_mdref_depgraph/heat2cost|sldemo_mdref_heat2cost'      }  
{'sldemo_mdref_depgraph/house|sldemo_mdref_house'              }  
{'sldemo_mdref_depgraph/outdoor temp|sldemo_mdref_outdoor_temp'}  
{'sldemo_mdref_depgraph/thermostat|sldemo_mdref_heater'        }
```

Add and Check File Metadata

Create a structure that contains metadata information.

```
m.TestStatus = 'untested';  
m.ExpectedCompletionDate = '01/01/2011';
```

Create a model, update the 'Metadata' parameter, and save the metadata in the model.

```
new_system('MDLInfoMetadataModel')  
set_param('MDLInfoMetadataModel','Metadata',m)  
save_system('MDLInfoMetadataModel')
```

Check the model for metadata by using an MDLInfo object.

```
info = Simulink.MDLInfo('MDLInfoMetadataModel');  
info.Metadata
```

```
ans =  
  
struct with fields:  
  
    TestStatus: 'untested'  
ExpectedCompletionDate: '01/01/2011'
```

Topics

“Manage Model Versions and Specify Model Properties”

Introduced in R2009b

Simulink.ModelAdvisor

Run Model Advisor from MATLAB file

Description

To run the Model Advisor, use instances of this class in MATLAB programs. For example, you can perform a standard set of checks.

Many `Simulink.ModelAdvisor` object methods require or return IDs. An *ID* is a unique identifier for a Model Advisor check, task, or group. IDs must remain constant. A `Simulink.ModelAdvisor` object includes methods that enable you to retrieve the ID or IDs for:

- All checks, tasks, and groups
- Checks belonging to groups and tasks
- The active check
- Selected checks, tasks, and groups

To find check IDs in the Model Advisor, use the check context menu.

Find	Action
Check ID	<ol style="list-style-type: none"> 1 In the left pane of the Model Advisor, select the check. 2 Right-click the check name and select Send Check ID to Workspace. The ID is displayed in the Command Window and sent to the base workspace.
Check IDs for selected checks in a folder	<ol style="list-style-type: none"> 1 In the left pane of the Model Advisor, select the checks for which you want IDs. Clear the other checks in the folder. 2 Right-click the folder and select Send Check ID to Workspace. An array of the selected check IDs are sent to the base workspace.

If you have a Simulink Check license, consider using the `ModelAdvisor.run` function or the `Advisor.Application.run` method instead of the `Simulink.ModelAdvisor.runCheck` or `runTask` functions.

Consider using `Advisor.Application` class if you have a large model with subsystems and model references. `Advisor.Application` does not run checks on library models. If you want to run checks on multiple independent models that are not in a model reference hierarchy or you want to leverage parallel processing, use `ModelAdvisor.run` to run Model Advisor checks on your model.

Creation

Syntax

```
ma = Simulink.ModelAdvisor.getModelAdvisor(system)
```

Description

MATLAB creates an instance of this object for each model that you open in the current MATLAB session. To get a handle to a model's Model Advisor object, execute this command: `ma = Simulink.ModelAdvisor.getModelAdvisor(system)` where `system` is the name of the model or subsystem that you want to check. Your program can then use the Model Advisor object methods to initialize and run the Model Advisor checks.

Input Arguments

system — Model or subsystem name

character vector

Model or subsystem that the Model Advisor checks.

Data Types: `char`

Properties

EmitInputParametersToReport — Display check input parameters in Model Advisor report

`true` (default) | `false`

A value of `true` displays input parameters in the Model Advisor report. A value of `false` does not display input parameters in the Model Advisor report.

Data Types: `char`

Object Functions

<code>closeReport</code>	Close Model Advisor report
<code>deselectCheck</code>	Clear Model Advisor check
<code>deselectCheckAll</code>	Clear Model Advisor checks
<code>deselectCheckForGroup</code>	Clear Model Advisor checks for groups
<code>deselectCheckForTask</code>	Clear Model Advisor checks that belong to a specified task or set of tasks
<code>deselectTask</code>	Clear Model Advisor checks that belong to a specified task or set of tasks
<code>deselectTaskAll</code>	Clear all Model Advisor tasks
<code>displayReport</code>	Display report in Model Advisor window
<code>exportReport</code>	Create copy of Model Advisor report
<code>filterResultWithExclusion</code>	Filter excluded objects
<code>getBaselineMode</code>	Determine whether Model Advisor is in baseline data generation mode
<code>getCheckAll</code>	Get check IDs of all Model Advisor checks
<code>getCheckForGroup</code>	Get checks belonging to Model Advisor check group
<code>getCheckForTask</code>	Get checks belonging to a task
<code>getCheckResult</code>	Get Model Advisor check results
<code>getCheckResultData</code>	Obtain Model Advisor check result data
<code>getCheckResultStatus</code>	Obtain Model Advisor check result status
<code>getGroupAll</code>	Get all groups of checks that Model Advisor runs
<code>getInputParameters</code>	Get Model Advisor check input parameters
<code>getSelectedCheck</code>	Get currently selected Model Advisor checks
<code>getSelectedSystem</code>	Get system that Model Advisor targets
<code>getSelectedTask</code>	Get selected Model Advisor tasks
<code>getTaskAll</code>	Get tasks run by Model Advisor
<code>runCheck</code>	Run currently selected checks
<code>runTask</code>	Run currently selected tasks

<code>selectCheck</code>	Select checks
<code>selectCheckAll</code>	Select all checks
<code>selectCheckForGroup</code>	Select check group
<code>selectCheckForTask</code>	Select checks for a specific task or tasks
<code>selectTask</code>	Select Model Advisor task
<code>selectTaskAll</code>	Select all Model Advisor tasks
<code>setActionEnable</code>	Set status for check action
<code>setBaselineMode</code>	Set Model Advisor baseline mode
<code>setCheckErrorSeverity</code>	Set severity of check failure
<code>setCheckResult</code>	Set result for currently running check
<code>setCheckResultData</code>	Set result data for currently running check
<code>setCheckResultStatus</code>	Set status for currently running check
<code>setInputParameters</code>	Specify input parameters
<code>verifyCheckRan</code>	Verify that Model Advisor ran a set of checks
<code>verifyCheckResult</code>	Generate baseline Model Advisor check results file or compare current check results to baseline check results
<code>verifyCheckResultStatus</code>	Verify that a model passed or failed a set of checks
<code>verifyHTML</code>	Generate baseline Model Advisor report or compare current report to baseline report

Topics

“Run Model Advisor Checks”

Introduced in R2006a

closeReport

Package: Simulink

Close Model Advisor report

Syntax

`closeReport(ma)`

Description

For a Model Advisor object, use the `closeReport(ma)` method to close a Model Advisor Report.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to close the corresponding Model Advisor report.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

deselectCheck

Package: Simulink

Clear Model Advisor check

Syntax

```
output = deselectCheck(ma,checkID)
```

Description

For a Model Advisor object, use the `output = deselectCheck(ma,checkID)` method to clear a Model Advisor check. This method cannot clear disabled checks.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object that you want to clear Model Advisor check(s).

checkID — Check IDs associated with Model Advisor check(s)

character vector | cell array of character vectors

Model Advisor Check IDs for which you want to clear from the Model Advisor.

Example: 'mathworks.design.UnconnectedLinesPorts'

Output Arguments

output — Logical value

boolean

A logical value indicating whether Simulink cleared the specified check. A value of 1 indicates success. A value of 0 indicates that Simulink was not able to clear the specified check.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

deselectCheckAll

Package: Simulink

Clear Model Advisor checks

Syntax

```
output = deselectCheckAll(ma)
```

Description

For a Model Advisor object, use the `output = deselectCheckAll(ma)` method to clear all selected Model Advisor checks. This method cannot clear disabled checks.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to clear all selected Model Advisor checks.

Output Arguments

output — Logical value

`boolean`

A logical value indicating whether Simulink cleared all selected checks. A value of 1 indicates success. A value of 0 indicates that Simulink did not clear all checks.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

deselectCheckForGroup

Package: Simulink

Clear Model Advisor checks for groups

Syntax

```
output = deselectCheckForGroup(ma,groupName)
```

Description

For a Model Advisor object, use the `output = deselectCheckForGroup(ma,groupName)` method to clear all selected Model Advisor checks for one or more groups. To locate the group name, use the `getGroupAll` method.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to clear all selected Model Advisor checks for one or more groups.

groupName — Check group names

character vector | cell array of character vectors

Name of group or groups that contain the selected Model Advisor checks that you want to clear.

Output Arguments

output — Logical value

boolean

A logical value indicating whether Simulink cleared the checks for the specified group. A value of 1 indicates success. A value of 0 indicates that Simulink did not clear the specified checks.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

deselectCheckForTask

Package: Simulink

Clear Model Advisor checks that belong to a specified task or set of tasks

Syntax

```
output = deselectCheckForTask(ma,task)
```

Description

For a Model Advisor object, use the `output = deselectCheckForTask(ma,task)` method to clear all selected Model Advisor checks for one or more tasks. To locate the task name, use the `getTaskAll` method.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to clear all selected Model Advisor checks for a task or tasks

task — Task name

character vector | cell array of character vectors

Name of task or tasks that contain selected Model Advisor checks that you want to clear.

Output Arguments

output — Logical value

boolean

A logical value indicating whether Simulink cleared the checks for the specified group. A value of 1 indicates success. A value of 0 indicates that Simulink did not clear the specified checks.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

deselectTask

Package: Simulink

Clear Model Advisor checks that belong to a specified task or set of tasks

Syntax

```
output = deselectTask(ma,task)
```

Description

For a Model Advisor object, use the `output = deselectTask(ma,task)` method to clear all selected Model Advisor checks for one or more tasks. To locate the task name, use the `getTaskAll` method.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to clear all selected Model Advisor checks for a task or tasks

task — Task name

character vector | cell array of character vectors

Name of task or tasks that contain selected Model Advisor checks that you want to clear.

Output Arguments

output — Logical value

boolean

A logical value indicating whether Simulink removed the checks for the specified task. A value of 1 indicates success. A value of 0 indicates that Simulink was not able to clear the checks for the specified task.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

deselectTaskAll

Package: Simulink

Clear all Model Advisor tasks

Syntax

```
output = deselectTaskAll(ma)
```

Description

For a Model Advisor object, use the `output = deselectTaskAll(ma)` method to clear all selected Model Advisor checks for all tasks.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to clear all selected Model Advisor checks for all tasks

Output Arguments

output — Logical value

`boolean`

A logical value indicating whether Simulink cleared the checks for all tasks. A value of 1 indicates success. A value of 0 indicates that Simulink did not clear the checks.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

displayReport

Package: Simulink

Display report in Model Advisor window

Syntax

```
displayReport(ma)
```

Description

For a Model Advisor object, use the `displayReport(ma)` method to display a Model Advisor report in the Model Advisor window. The report includes the most recent results of running checks on the system corresponding to the Model Advisor object and the current selection status of checks, groups, and tasks for the system.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to open the corresponding Model Advisor report.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

exportReport

Package: Simulink

Create copy of Model Advisor report

Syntax

```
[output, message] = exportReport(ma, destination)
```

Description

For a Model Advisor object, use the `[output, message] = exportReport(ma, destination)` method to create a copy of a Model Advisor report. The report includes the most recent results of running checks on the system corresponding to the Model Advisor object and the current selection status of checks, groups, and tasks for the system.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to export the corresponding Model Advisor report.

destination — Path name

character vector

Path name to report file location.

Output Arguments

output — Logical value

boolean

A logical value indicating whether Simulink created a report in location that you specify by `destination` input argument. A value of 1 indicates success. A value of 0 indicates that Simulink did not create a copy of the report in the specified location.

message — Reason why report was not created

character vector

This output argument is empty if a report is created. If a report was not created, this argument contains the reason why.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

filterResultWithExclusion

Package: Simulink

Filter excluded objects

Syntax

```
filteredResultHandles = filterResultWithExclusion(ma,ResultHandles)
```

Description

Use the `filteredResultHandles = filterResultWithExclusion(ma,ResultHandles)` method to filter objects that have exclusions enabled and cause a check warning or failure.

This method is intended for excluding objects from custom checks that you create by using the Model Advisor customization API, available with Simulink Check.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to filter objects causing exclusion enabled checks to warn or fail.

ResultHandles — Array of model objects causing a check warning or failure

array of model objects

Array of objects causing a check warning or failure.

Output Arguments

filteredResultHandles — Array of objects causing a check warning or failure

array of objects

An array of objects causing exclusion enabled checks to warn or fail.

Simulink.ModelAdvisor

Topics

“Exclude Blocks From Custom Checks” (Simulink Check)

Introduced in R2006a

getBaselineMode

Package: Simulink

Determine whether Model Advisor is in baseline data generation mode

Syntax

```
mode = getBaselineMode(ma)
```

Description

`mode = getBaselineMode(ma)` returns true if the Model Advisor is in baseline data mode. Baseline data mode causes the verification methods of the Model Advisor, for example, `verifyHTML`, to generate baseline data.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to determine if it is in baseline data mode.

Output Arguments

mode — Boolean value indicating baseline mode

0 (default)

A value of 1 indicates that the Model Advisor is in baseline data generation mode.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

getCheckAll

Package: Simulink

Get check IDs of all Model Advisor checks

Syntax

```
CheckIDs = getCheckAll(ma)
```

Description

The `CheckIDs = getCheckAll(ma)` method returns a cell array of character vectors specifying the Check IDs of all checks that the Model Advisor performs.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to get the Check IDs of all checks that the Model Advisor performs.

Output Arguments

CheckIDs — Model Advisor Check IDs

cell array of character vectors

Cell array of character vectors specifying the Check IDs of all Model Advisor checks.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

getCheckForGroup

Package: Simulink

Get checks belonging to Model Advisor check group

Syntax

```
groupChecks = getCheckForGroup(ma,groupName)
```

Description

For a Model Advisor object, use the `groupChecks = getCheckForGroup(ma,groupName)` method to get all of the Model Advisor checks in a group. To locate the group name, use the `getGroupAll` method.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to get all of the Model Advisor checks corresponding to a check group.

groupName — Check group name

character vector

Name of group that contains the Model Advisor checks.

Example: 'Simulink Coder'

Output Arguments

groupChecks — Model Advisor checks

cell array of character vectors

Checks that belong to a Model Advisor group.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

getCheckForTask

Package: Simulink

Get checks belonging to a task

Syntax

```
taskChecks = getCheckForTask(ma,taskID)
```

Description

For a Model Advisor object, use the `taskChecks = getCheckForTask(ma,taskID)` method to get all of the Model Advisor checks that are part of a task. To locate the task name, use the `getTaskAll` method.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to get all of the Model Advisor checks that are part of a task.

taskID — Task name

character vector

Name of task that contains the Model Advisor checks.

Example: '_SYSTEM_By Task_Modeling_Physical_Systems'

Output Arguments

taskChecks — Model Advisor checks

cell array of character vectors

Checks that are part of a Model Advisor task

See Also

Simulink.ModelAdvisor

Introduced in R2006a

getCheckResult

Package: Simulink

Get Model Advisor check results

Syntax

```
results = getCheckResult(ma,checkID)
```

Description

For a Model Advisor object, use the `results = getCheckResult(ma,checkID)` method to get the results of running a check or set of checks.

This method enables you to access results generated by custom checks that you create using the Model Advisor customization API, an optional feature available with Simulink Check software. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to obtain check results.

checkID — Check IDs associated with Model Advisor check

character vector|cell array of character vectors

Model Advisor Check IDs for which you want to obtain results.

Example: 'mathworks.design.UnconnectedLinesPorts'

Output Arguments

results — Check results

cell array

Cell array of check results. The result format depends on the check data.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

getCheckResultData

Package: Simulink

Obtain Model Advisor check result data

Syntax

```
results = getCheckResultData(ma,checkID)
```

Description

For a Model Advisor object, use the `results = getCheckResultData(ma,checkID)` method to get the check result data for a specified set of checks.

This method enables you to access results generated by custom checks that you create using the Model Advisor customization API, an optional feature available with Simulink Check software. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to obtain check result data.

checkID — Check IDs associated with Model Advisor checks

character vector|cell array of character vectors

Model Advisor Check IDs that you want to obtain results

Example: 'mathworks.design.UnconnectedLinesPorts'

Output Arguments

results — Check results

cell array

Data from a check result or cell array of data from check results. The data format depends on the checks that generate the data.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

getCheckResultStatus

Package: Simulink

Obtain Model Advisor check result status

Syntax

```
status = getCheckResultStatus(ma,checkID)
```

Description

After running a set of checks, use the `status = getCheckResultStatus(ma,checkID)` method to determine whether these checks passed or failed.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to determine whether a check or set of checks passed or failed.

checkID — Model Advisor Check IDs

character vector | cell array of character vectors

Model Advisor Check IDs for which you want to obtain results.

Example: 'mathworks.design.UnconnectedLinesPorts'

Output Arguments

status — Pass or fail

Boolean | cell array of Boolean values

Boolean value or cell array of Boolean values indicating the pass or fail status of a check or set of checks.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

getGroupAll

Package: Simulink

Get all groups of checks that Model Advisor runs

Syntax

```
groupChecks = getGroupAll(ma)
```

Description

For a Model Advisor object, use the `groupChecks = getGroupAll(ma)` method to get all groups of checks that the Model Advisor runs.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to determine all Model Advisor check groups.

Output Arguments

groupChecks — Model Advisor check groups

cell array of character vectors

IDs of check groups that the Model Advisor runs.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

getInputParameters

Package: Simulink

Get Model Advisor check input parameters

Syntax

```
params = getInputParameters(ma,CheckID)
```

Description

Use the `params = getInputParameters(ma,CheckID)` method to get the input parameters for a Model Advisor check.

This method enables you to access custom checks that you create using Simulink Check. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you determine the input parameters for specific Model Advisor check.

CheckID — Model Advisor check

character vector

Model Advisor check ID for which to obtain its input parameters. If you use the method inside a check callback function, you can omit this argument.

Example: `'mathworks.design.UnconnectedLinesPorts'`

Output Arguments

params — Input parameters

cell array of `ModelAdvisor.InputParameter` objects

Cell array that contains the `ModelAdvisor.InputParameter` objects for a Model Advisor check.

See Also

`Simulink.ModelAdvisor`

Topics

“Run Model Advisor Checks”

Introduced in R2006a

getListViewParameters

Package: Simulink

Get Model Advisor checklist parameters displayed in checklist view

Syntax

```
params = getListViewParameters(ma,CheckID)
```

Description

Use the `params = getListViewParameters(ma,CheckID)` method to get the list view of parameters for a Model Advisor check.

This method enables you to access custom checks that you create by using Simulink Check. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you determine the list view of parameters for a specific Model Advisor check.

CheckID — Model Advisor check

character vector

Name of Model Advisor check for which to obtain its parameters in list view. You can omit this argument if you use the method inside a check callback function.

Example: 'mathworks.design.UnconnectedLinesPorts'

Output Arguments

params — Input parameters

cell array of ModelAdvisor.ListViewParameter objects

Cell array that contains the ModelAdvisor.ListViewParameter objects for a Model Advisor check.

See Also

Simulink.ModelAdvisor | ModelAdvisor.ListViewParameter

Introduced in R2006a

getSelectedCheck

Package: Simulink

Get currently selected Model Advisor checks

Syntax

```
CheckIDs = getSelectedCheck(ma)
```

Description

Use the `CheckIDs = getSelectedCheck(ma)` method to obtain the selected Model Advisor checks for a corresponding `Simulink.ModelAdvisor` object.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to obtain the selected Model Advisor checks.

Output Arguments

CheckIDs — Model Advisor checks

cell array of character vectors

Check IDs of currently selected Model Advisor checks.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

getSelectedSystem

Package: Simulink

Get system that Model Advisor targets

Syntax

```
system = getSelectedSystem(ma)
```

Description

Use the `system = getSelectedSystem(ma)` method to obtain the model or subsystem that is the target of the `Simulink.ModelAdvisor` object.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to obtain the model or subsystem that the object targets.

Output Arguments

system — Model or subsystem

character vector

Name of the model or subsystem that the `ModelAdvisor` object `ma` targets.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

getSelectedTask

Package: Simulink

Get selected Model Advisor tasks

Syntax

```
TaskIDs = getSelectedTask(ma)
```

Description

Use the `TaskIDs = getSelectedTask(ma)` method to obtain the tasks that are selected for the `Simulink.ModelAdvisor` object `ma`.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to obtain the currently selected tasks.

Output Arguments

TaskIDs — Model Advisor Task IDs

cell array of character vectors

Cell array of selected Task IDs for the `Simulink.ModelAdvisor` object that you specify as an input.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

getTaskAll

Package: Simulink

Get tasks run by Model Advisor

Syntax

```
TaskIDs = getTaskAll(ma)
```

Description

Use the `TaskIDs = getTaskAll(ma)` method to obtain the tasks that are run for the `Simulink.ModelAdvisor` object `ma`.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to obtain the tasks that the Model Advisor ran.

Output Arguments

TaskIDs — Model Advisor Task IDs

cell array of character vectors

Cell array of Task IDs that are run for the `Simulink.ModelAdvisor` object that you specify as an input.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

runCheck

Package: Simulink

Run currently selected checks

Syntax

```
success = runCheck(ma,checkID)
```

Description

The `success = runCheck(ma,checkID)` method runs selected Model Advisor checks. Invoking this method is equivalent to selecting the **Run Checks** button on the Model Advisor.

If you have a Simulink Check license, consider using the `ModelAdvisor.run` function or the `Advisor.Application.run` method instead of the `Simulink.ModelAdvisor.runCheck` or `runTask` functions.

Consider using `Advisor.Application` class if you have a large model with subsystems and model references. `Advisor.Application` does not run checks on library models. If you want to run checks on multiple independent models that are not in a model reference hierarchy or you want to leverage parallel processing, use `ModelAdvisor.run` to run Model Advisor checks on your model.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to run Model Advisor.

checkID — Model Advisor check IDs

character vector | cell array of character vectors

If you want to run the Model Advisor on a subset of the currently selected Model Advisor checks, specify this optional input parameter.

Example: `'mathworks.design.UnconnectedLinesPorts'`

Output Arguments

success — Boolean value indicating whether the Model Advisor ran on selected checks

Boolean

Boolean value that indicates whether the Model Advisor ran on the selected checks. A value of 1 indicates that the Model Advisor successfully ran on the selected checks. A value of 0 indicates that the Model Advisor did not run on the selected checks.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

runTask

Package: Simulink

Run currently selected tasks

Syntax

```
success = runTask(ma)
```

Description

The `success = runTask(ma)` method runs selected Model Advisor tasks. Invoking this method is equivalent to the **Run Checks** button on the Model Advisor.

If you have a Simulink Check license, consider using the `ModelAdvisor.run` function or the `Advisor.Application.run` method instead of the `Simulink.ModelAdvisor.runCheck` or `runTask` functions.

Consider using `Advisor.Application` class if you have a large model with subsystems and model references. `Advisor.Application` does not run checks on library models. If you want to run checks on multiple independent models that are not in a model reference hierarchy or you want to leverage parallel processing, use `ModelAdvisor.run` to run Model Advisor checks on your model.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to run the Model Advisor.

Output Arguments

success — Boolean value indicating whether the Model Advisor ran selected tasks

Boolean

Boolean value that indicates whether the Model Advisor ran on the selected tasks. A value of 1 indicates that the Model Advisor successfully ran on the selected tasks. A value of 0 indicates that the Model Advisor did not run on the selected tasks.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

selectCheck

Package: Simulink

Select checks

Syntax

```
success = selectCheck(ma,checkID)
```

Description

The `success = selectCheck(ma,checkID)` method selects Model Advisor checks.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to select Model Advisor checks.

checkID — Model Advisor Check IDs

character vector | cell array of character vectors

Model Advisor checks for you to select.

Example: 'mathworks.design.UnconnectedLinesPorts'

Output Arguments

success — Boolean value indicating whether the Model Advisor selected the checks

Boolean

Boolean value that indicates whether the Model Advisor selected the checks. A value of 1 indicates that the Model Advisor successfully selected the specified checks. A value of 0 indicates that the Model Advisor did not select the specified checks.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

selectCheckAll

Package: Simulink

Select all checks

Syntax

```
success = selectCheckAll(ma)
```

Description

The `success = selectCheckAll(ma)` method selects all Model Advisor checks.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to select all Model Advisor checks.

Output Arguments

success — Boolean value indicating whether all Model Advisor checks are selected

`Boolean`

`Boolean` value that indicates whether all Model Advisor checks are selected. A value of `1` indicates that the Model Advisor successfully selected all checks. A value of `0` indicates that the Model Advisor did not select all checks.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

selectCheckForGroup

Package: Simulink

Select check group

Syntax

```
success = selectCheckForGroup(ma,groupName)
```

Description

The `success = selectCheckForGroup(ma,groupName)` method selects all Model Advisor checks in the group that you specify.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to select the Model Advisor checks.

groupName — Check group name

character vector | cell array of character vectors

Name of groups that contain the Model Advisor checks that you want to select.

Output Arguments

success — Boolean value indicating whether the Model Advisor selected the checks

Boolean

Boolean value that indicates whether the Model Advisor selected the checks. A value of 1 indicates that the Model Advisor successfully selected the specified checks. A value of 0 indicates that the Model Advisor did not select the specified checks.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

selectCheckForTask

Package: Simulink

Select checks for a specific task or tasks

Syntax

```
success = selectCheckforTask(ma,taskIDs)
```

Description

Use the `success = selectCheckforTask(ma,taskIDs)` method to select the checks for a task or tasks.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to select checks for a specific task or tasks.

taskIDs — Model Advisor Task IDs

cell array of character vectors | character vector

Cell array of Task IDs for the Simulink.ModelAdvisor object that you specify as an input.

Output Arguments

success — Boolean value indicating whether the checks are selected

Boolean

Boolean value that indicates whether the Model Advisor successfully selected the checks for the specified task or tasks. A value of 1 indicates that the Model Advisor successfully selected the checks. A value of 0 indicates that the Model Advisor did not select the checks.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

selectTask

Package: Simulink

Select Model Advisor task

Syntax

```
success = selectTask(ma, TaskIDs)
```

Description

The `success = selectTask(ma, TaskIDs)` method selects the Model Advisor tasks.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to select Model Advisor tasks.

TaskIDs — Model Advisor Task IDs

cell array of character vectors

Cell array of Task IDs that you want to select for the Simulink.ModelAdvisor object, which you specify as an input.

Output Arguments

success — Boolean value indicating whether Model Advisor selected tasks

Boolean

Boolean value that indicates whether the Model Advisor selected tasks. A value of 1 indicates that the Model Advisor successfully selected the tasks. A value of 0 indicates that the Model Advisor did not select the tasks.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

selectTaskAll

Package: Simulink

Select all Model Advisor tasks

Syntax

```
success = selectTaskAll(ma)
```

Description

The `success = selectTaskAll(ma)` method selects all Model Advisor tasks.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to select the Model Advisor tasks.

Output Arguments

success — Boolean value indicating whether Model Advisor selected tasks

`Boolean`

`Boolean` value that indicates whether the Model Advisor selected tasks. A value of 1 indicates that the Model Advisor successfully selected the tasks. A value of 0 indicates that the Model Advisor did not select the tasks.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

setActionEnable

Package: Simulink

Set status for check action

Syntax

```
setActionEnable(ma, value)
```

Description

The `setActionEnable(ma, value)` method enables or disables the Action box. Only a check callback function can invoke this method.

This method enables you to access custom checks that you create by using the Model Advisor customization API, an optional feature that is available with Simulink Check software. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to set check action status.

value — Boolean value indicating whether to enable or disable the Model Advisor Action box

Boolean

Boolean value that indicates whether to enable or disable Model Advisor **Action** box. To enable the box, specify a value of `true`. To disable the box, specify a value of `false`.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

setBaselineMode

Package: Simulink

Set Model Advisor baseline mode

Syntax

```
setBaselineMode(ma,mode)
```

Description

Use the `setBaselineMode(ma,mode)` method to set the Model Advisor baseline mode. Baseline mode causes the Model Advisor verify methods to generate baseline comparison data for verifying the results of a Model Advisor run.

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to set the baseline mode.

mode — Boolean value indicating the Model Advisor baseline mode

`Boolean`

Boolean value that indicates the Model Advisor baseline mode. A value of `true` indicates that baseline mode is on. A value of `false` indicates that baseline mode is off.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

setCheckErrorSeverity

Package: Simulink

Set severity of check failure

Syntax

```
setCheckErrorSeverity(ma, value)
```

Description

Use the `setCheckErrorSeverity(ma, value)` method to set the check error severity for the currently running check. Only the callback function of a check can invoke this method.

This method enables you to access custom checks that you create by using the Model Advisor customization API, an optional feature that is available with Simulink Check software. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

Input Arguments

***ma* — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to set the check error severity for the currently running check.

***value* — Integer indicating severity of failure**

0 (default) | integer

A value of 0 indicates a warning check result. A value of 1 indicates a failed check result.

See Also

`Simulink.ModelAdvisor`

Introduced in R2006a

setCheckResult

Package: Simulink

Set result for currently running check

Syntax

```
success = setCheckResult(ma,result)
```

Description

Use the `success = setCheckResult(ma,result)` method to set the check result for the currently running check. Only the callback function of a check can invoke this method.

This method enables you to access custom checks that you create using the Model Advisor customization API, an optional feature that is available with Simulink Check software. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to set the result for the currently running check.

result — Result to be set

character vector | cell array of character vectors

Character vector or cell array that specifies the result of the currently running check.

Output Arguments

success — Boolean value indicating whether the result is set

Boolean

Boolean value that indicates whether the Model Advisor successfully set the result for the currently running check. A value of 1 indicates that the Model Advisor successfully set the result. A value of 0 indicates that the Model Advisor did not set the result.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

setCheckResultData

Package: Simulink

Set result data for currently running check

Syntax

```
success = setCheckResultData(ma,data)
```

Description

Use the `success = setCheckResultData(ma,data)` method to set the check result data for the currently running check. Only the callback function of a check can invoke this method.

This method enables you to access custom checks that you create with the Model Advisor customization API, an optional feature that is available with Simulink Check software. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to set result data for the currently running check.

data — Result data

cell array of character vectors

Result data that you specify for a custom check.

Output Arguments

success — Boolean value indicating whether result data is set

Boolean

Boolean value that indicates whether the Model Advisor successfully set result data for the currently running check. A value of 1 indicates that the Model Advisor successfully set the data. A value of 0 indicates that the Model Advisor did not set the data.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

setCheckResultStatus

Package: Simulink

Set status for currently running check

Syntax

```
success = setCheckResultStatus(ma,status)
```

Description

The `success = setCheckResultStatus(ma,status)` method sets the status for the currently running check. Only the callback function of a check can invoke this method.

This method enables you to access custom checks that you create with the Model Advisor customization API, an optional feature that is available with Simulink Check software. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to set the status for the currently running check.

status — Status of currently running check

Char | Boolean

For char type inputs, `pass` | `fail` | `warn` values indicate the status of the check that just ran. If you use `char` as input parameter, you do not need to update the severity of the error using the `setCheckErrorSeverity` function.

Boolean value that indicates the status of the check that just ran. A value of `true` indicates that the check passed. A value of `false` indicates that the check failed.

Output Arguments

success — Boolean value indicating whether the Model Advisor successfully set the status

Boolean

Boolean value that indicates whether the Model Advisor successfully set the status of the currently running check. A value of 1 indicates that the Model Advisor successfully set the status. A value of 0 indicates that the Model Advisor did not set the status.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

setInputParameters

Package: Simulink

Specify input parameters

Syntax

```
success = setInputParameters(ma, checkID, InputParameters)
```

Description

Use the `success = setInputParameters(ma, checkID, InputParameters)` method to specify input parameters for a Model Advisor check.

This method enables you to access custom checks that you create using Simulink Check. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which to specify the input parameters for the specific Model Advisor check.

checkID — Model Advisor check

character vector

Model Advisor check ID to which the input parameters apply. If you use this method inside a current active check function, you can omit this argument.

Example: `'mathworks.design.UnconnectedLinesPorts'`

InputParameters — Input parameters

cell array of `ModelAdvisor.InputParameter` objects

Cell array that contains the `ModelAdvisor.InputParameter` objects for a Model Advisor check.

Output Arguments

success — Boolean value indicating whether the input parameters were specified for check

Boolean

Boolean value that indicates whether the Model Advisor specified the input parameters. A value of 1 indicates that the Model Advisor successfully specified the input parameters for the check. A value of 0 indicates that the Model Advisor did not specify the input parameters.

Topics

“Create Model Advisor Checks” (Simulink Check)

“Fix a Model to Comply with Conditions that You Specify with the Model Advisor” (Simulink Check)

“Review a Model Against Conditions that You Specify with the Model Advisor” (Simulink Check)

Introduced in R2006a

setListViewParameters

Package: Simulink

Specify list-view parameters for check

Syntax

```
setListViewParameters(ma,checkID, params)
```

Description

The `setListViewParameters(ma,checkID, params)` method sets the list-view parameters for a check. Only the callback function of a check can invoke this method.

This method enables you to access custom checks that you create with the Model Advisor customization API, an optional feature that is available with Simulink Check software. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

Input Arguments

ma — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to set list-view parameters.

checkID — Model Advisor Check ID

character vector

Character vector specifying the identifier for a Model Advisor check.

params — Cell array of `ModelAdvisor.ListViewParameter` objects

`ModelAdvisor.ListViewParameter` objects

Set the list-view parameters for the check.

See Also

`Simulink.ModelAdvisor` | `ModelAdvisor.ListViewParameter`

Introduced in R2006a

verifyCheckRan

Package: Simulink

Verify that Model Advisor ran a set of checks

Syntax

```
[success, missingChecks, additionalChecks]= verifyCheckRan(ma,CheckIDs)
```

Description

Use the `[success, missingChecks, additionalChecks]= verifyCheckRan(ma,CheckIDs)` method to verify that the Model Advisor ran a set of checks.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to verify that a set of checks ran

CheckIDs — Model Advisor Check IDs

cell array of character vectors

Cell array of character vectors specifying the identifiers of Model Advisor checks that you want to verify have run.

Output Arguments

success — Boolean value indicating whether the Model Advisor ran checks

Boolean

Boolean value that indicates whether the Model Advisor successfully ran a set of checks. A value of 1 indicates that the Model Advisor successfully ran the checks. A value of 0 indicates that the Model Advisor did not run the checks.

missingChecks — Cell array of Check IDs

cell array of character vectors

Cell array of character vectors specifying the identifiers of specified Model Advisor checks that did not run.

additionalChecks — Model Advisor Check IDs

cell array of character vectors

Cell array of character vectors specifying the identifiers of unspecified Model Advisor checks that ran.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

verifyCheckResult

Package: Simulink

Generate baseline Model Advisor check results file or compare current check results to baseline check results

Syntax

```
[success, message]= verifyCheckResult(ma,baseline,CheckIDs)
```

Description

Use the `[success, message]= verifyCheckResult(ma,baseline,CheckIDs)` method to generate a baseline Model Advisor check results file or compare to current check results to baseline check results. If the Model Advisor is in baseline mode, this method stores the most recent results of running the checks that you specify by the `CheckIDs` argument in a MAT-file. For the MAT-file, use the location that you specify by using the `baseline` input argument.

To generate a baseline report, put the Model Advisor in baseline mode. Then invoke this method with the `baseline` argument set to the location where you want to store the baseline results. To perform a current-to-baseline report comparison, first check that the Model Advisor is not in baseline mode. Then, invoke this method with the path of the baseline report as the value of the `baseline` input argument.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to verify that a set of checks ran.

baseline — Path of the baseline check results MAT-file

character vector

To perform a current-to-baseline report comparison, make sure that the Model Advisor is not in baseline mode and specify a path to the baseline report.

CheckIDs — Model Advisor Check IDs

cell array of character vectors

Cell array of character vectors specifying the identifiers of Model Advisor checks that you want to verify by using check results.

Output Arguments

success — Boolean value indicating whether the method succeeded

Boolean

Boolean value that indicates whether the method ran successfully. A value of 1 indicates that the method verified that the current check results match the baseline results. A value of 0 indicates that

the Model Advisor did not verify check results. If the method is unable to store the check results at the specified location, it returns false in the output variable success. The reason for the failure is in the message argument.

message — Error message

character vector

Error message indicating why Simulink did not verify check result.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

verifyCheckResultStatus

Package: Simulink

Verify that a model passed or failed a set of checks

Syntax

```
[success message]= verifyCheckResultStatus(ma, baseline, checkIDs)
```

Description

Use the `[success message]= verifyCheckResultStatus(ma, baseline, checkIDs)` method to verify that a model has passed or failed a set of checks.

Before invoking the `verifyCheckResultStatus` method, run the checks that you specify with `checkIDs`. Then use the `getCheckResultStatus` method to obtain the boolean values for the baseline argument.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to verify that a set of checks passed.

baseline — Statuses from running most recent round of checks

Cell array of Boolean variables

Statuses from the most recent checks run that you specify by Check IDs.

checkIDs — Model Advisor Check IDs

cell array of character vectors

Cell array of character vectors specifying the identifiers of Model Advisor checks that you want to verify have run.

Output Arguments

success — Boolean value indicating whether the check statuses match the baseline

Boolean

Boolean value that indicates whether the statuses match the baseline. A value of 1 indicates that the statuses match. A value of 0 indicates that the statuses do not match the baseline.

message — Message indicating status

character vector

Message indicating whether the method successfully verified the check result statuses.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

verifyHTML

Package: Simulink

Generate baseline Model Advisor report or compare current report to baseline report

Syntax

```
[success message]= verifyHTML(ma,baseline)
```

Description

Use the `[success message]= verifyHTML(ma,baseline)` method to generate a Model Advisor report or to compare a current report to a baseline report.

This method enables you to compare a Model Advisor report with a baseline report to determine if they differ. You can use the method to generate the baseline report and perform current-to-baseline report comparisons. To generate a baseline report, use the `setBaselineMode` method to put the Model Advisor in baseline mode. Invoke this method with the baseline argument set to the location where you want to store the baseline report. To perform a current-to-baseline report comparison, first make sure that the Model Advisor is not in baseline mode. Then, invoke this method with the path of the baseline report as the value of the `baseline` input argument.

Input Arguments

ma — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to generate a baseline report or compare current report to baseline report

baseline — Path of Model Advisor report

character vector

Path to baseline Model Advisor report

Output Arguments

success — Boolean value indicating whether the method is successful

Boolean

Boolean value that indicates whether the method is successful. If the Model Advisor is in baseline mode, this method stores the most recently generated Model Advisor report at the location specified by the `baseline` input argument. If the method is unable to store a copy of the report at the specified location, it returns `false` in the output variable `success`. The reason for the failure is in the output variable `message`. If the Model Advisor is not in baseline mode, this method compares the report most recently generated by the Model Advisor with the report specified by `baseline`. If the current report has the same content as the baseline report, this method returns `true` as the value of the `success` output variable.

message — Message indicating status

character vector

Message indicating whether the Model Advisor is able to successfully store a report.

See Also

Simulink.ModelAdvisor

Introduced in R2006a

Simulink.ModelWorkspace

Interact with the model workspace of a model programmatically

Description

Use a `Simulink.ModelWorkspace` object to interact with a model workspace. For example, you can add and remove variables, set the data source of the workspace, and save changes to the workspace.

For more information, see “Model Workspaces”.

Creation

To create a `Simulink.ModelWorkspace`, use the `get_param` function to query the value of the model parameter `ModelWorkspace`. For example, to create an object named `mdlWks` that represents the model workspace of a model named `myModel.slx`:

```
mdlWks = get_param('myModel', 'ModelWorkspace')
```

Properties

DataSource — Source for initializing variables in model workspace

'Model File' (default) | 'MAT-File' | 'MATLAB Code' | 'MATLAB File'

Source for initializing the variables in the model workspace, specified as one of these character vectors:

- 'Model File' — The variables are stored in the model file. When you save the model, you also save the variables.
- 'MATLAB Code' — The variables are created by MATLAB code that you write and store in the model file.
- 'MAT-File' — The variables are stored in a MAT-file, which you can manage and manipulate separately from the model file.
- 'MATLAB File' — The variables are created by MATLAB code in a script file, which you can manage and manipulate separately from the model file.

Data Types: char

FileName — Name of external file that stores or creates variables

' ' (empty character vector) (default) | character vector

Name of the external file that stores or creates variables, specified as a character vector. To enable this property, set `DataSource` to 'MAT-File' or 'MATLAB File'.

Example: 'myFile.mat'

Example: 'myFile.m'

Data Types: char

MATLABCode — MATLAB code for initializing variables

' ' (empty character vector) (default) | character vector

MATLAB code for initializing variables, specified as a character vector. To enable this property, set `DataSource` to 'MATLAB Code'.

Example: `sprintf('% Create variables that this model uses.\n\nK = 0.00983;\n\nP = Simulink.Parameter(5);')`

Data Types: char

Object Functions

<code>getVariable</code>	Return value of variable in the model workspace of a model
<code>getVariablePart</code>	Get value of variable property in model workspace
<code>setVariablePart</code>	Set property of variable in model workspace
<code>hasVariable</code>	Determine whether variable exists in the model workspace of a model
<code>whos</code>	Return list of variables in the model workspace of a model
<code>saveToSource</code>	Save model workspace changes to the external data source of the model workspace
<code>save</code>	Save contents of model workspace to a MAT-file
<code>reload</code>	Reinitialize variables from the data source of a model workspace
<code>evalin</code>	Evaluate expression in the model workspace of a model
<code>clear</code>	Clear variables from the model workspace of a model
<code>assignin</code>	Assign value to variable in the model workspace of a model

Examples**Interact With Model Workspace Programmatically**

Create a variable in the model workspace of a model. Then, modify the variable and query the variable value to confirm the modification.

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object `mdlWks` that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a variable named `myVar` with value 5.12 in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)
```

Apply a new value, 7.22. To do so, first create a temporary copy of the variable by using the `getVariable` function. Then, modify the copy and use it to overwrite the original variable in the model workspace.

```
temp = getVariable(mdlWks, 'myVar');
temp = 7.22;
assignin(mdlWks, 'myVar', temp)
```

Confirm the new value by querying the value of the variable.

```
getVariable(mdlWks, 'myVar')
```

ans =

7.2200

“Manage Design Data”

Introduced before R2006a

assignin

Package: Simulink

Assign value to variable in the model workspace of a model

Syntax

```
assignin mdlWks, varName, varValue)
```

Description

`assignin(mdlWks, varName, varValue)` assigns the value `varValue` to the MATLAB variable `varName` in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`. If the variable does not exist, `assignin` creates it.

Examples

Assign Value to Variable in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a variable named `myVar` with value `5.12` in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)
```

Input Arguments

mdlWks — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

varName — Name of target variable

character vector

Name of the target variable, specified as a character vector.

Example: `'myVar'`

Data Types: `char`

varValue — Value to assign to target variable

valid value

Value to assign to the target value, specified as a valid value. For example, you can specify a literal number, a structure, or an expression that evaluates to a valid value.

If you specify the name of a handle object, such as a `Simulink.Parameter` object, use the `copy` function to create a separate copy of the object.

Example: `5.12`

Example: `struct('a',5.12,'b',7.22)`

Example: `Simulink.Parameter(5.12)`

Example: `copy(myExistingParameterObject)`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `string` | `struct` | `table` | `cell` | `categorical` | `datetime` | `duration` | `calendarDuration` | `fi`

Complex Number Support: Yes

See Also

`Simulink.ModelWorkspace`

Introduced before R2006a

clear

Package: Simulink

Clear variables from the model workspace of a model

Syntax

```
clear mdlWks
```

Description

`clear(mdlWks)` removes all variables from the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

Examples

Clear Variables From Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a variable named `myVar` with value `5.12` in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)
```

Clear all variables from the model workspace, including `myVar`.

```
clear(mdlWks)
```

Input Arguments

mdlWks — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

See Also

`Simulink.ModelWorkspace`

Introduced before R2006a

evalin

Package: Simulink

Evaluate expression in the model workspace of a model

Syntax

```
result = evalin mdlWks, expression)
```

Description

`result = evalin(mdlWks, expression)` evaluates the expression `expression` in the model workspace represented by the `Simulink.ModelWorkspace` object represented by `mdlWks`. The function returns the result of the expression in `result`.

Note For setting and getting variable properties in the model workspace, consider using `setVariablePart` and `getVariablePart` instead of `evalin` because:

- The functions do not create new variables or cause unintended results.
- `getVariablePart` does not dirty the model.

For information on these alternatives, see `Simulink.ModelWorkspace`.

Examples

Evaluate Expression in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create some variables in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)  
assignin(mdlWks, 'myOtherVar', 7.22)
```

Evaluate the expression `myLastVar = myVar + myOtherVar` in the model workspace. The expression creates another variable, `myLastVar`, whose value is the sum of the first two variables.

```
evalin(mdlWks, 'myLastVar = myVar + myOtherVar');
```

Input Arguments

mdlWks — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

expression — Expression to evaluate

character vector

Expression to evaluate, specified as a character vector.

Example: `'myLastVar = myVar + myOtherVar'`

Data Types: `char`

Output Arguments

result — Result of expression

number, structure, or other MATLAB value

Result of the evaluated expression, returned as a number, structure, or other MATLAB value.

See Also

`Simulink.ModelWorkspace`

Introduced before R2006a

getVariable

Package: Simulink

Return value of variable in the model workspace of a model

Syntax

```
varValue = getVariable mdlWks, varName)
```

Description

`varValue = getVariable(mdlWks, varName)` returns the value of the variable whose name is `varName` that exists in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

If the value of the target variable is a handle to a handle object (such as `Simulink.Parameter`), `getVariable` returns a copy of the handle. Changes you make to the variable in the model workspace or to the returned variable (`variableValue`) affect both variables.

To return a deep copy of the handle object, use the `copy` method of the object. To modify a handle object that you store in a model workspace, it is a best practice to use both the `getVariable` and `assignin` methods (see “Modify Property Value of Handle Object” on page 8-283).

Examples

Return Value of Variable in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a variable named `myVar` in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)
```

Return the value of the new variable. Store the value in another variable named `varValue`.

```
varValue = getVariable(mdlWks, 'myVar');
```

Modify Property Value of Handle Object

Modify a property of the `Simulink.Parameter` object `K`, which is defined in model `mdl.slx`. When you call `getVariable`, use the `copy` method because `Simulink.Parameter` is a handle class.

```
wksp = get_param mdl, 'ModelWorkspace';
value = copy(getVariable(wksp, 'K'));
```

```
value.DataType = 'single';  
assignin(wksp, 'K', value);
```

Input Arguments

mdlWks — Target model workspace

Simulink.ModelWorkspace object

Target model workspace, specified as a Simulink.ModelWorkspace object.

varName — Name of target variable

character vector

Name of the target variable, specified as a character vector.

Example: 'myVariable'

Data Types: char

Output Arguments

varValue — Value of target variable

number, structure, or other MATLAB value

Value of the target variable, returned as a number, structure, or other MATLAB value.

See Also

get_param | Simulink.ModelWorkspace

Introduced in R2012a

getVariablePart

Package: Simulink

Get value of variable property in model workspace

Syntax

```
varValue = getVariablePart mdlWks, varName.Property)
```

Description

`varValue = getVariablePart(mdlWks, varName.Property)` returns the value of the variable property named `varName.Property` that exists in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

If the value of the variable property is a handle to a handle object (such as `Simulink.Parameter`), `getVariablePart` returns a copy of the handle.

Using `getVariablePart` is preferable to using `evalin` for getting variable properties in the model workspace because:

- The function does not dirty the model.
- Use of the function does not result in the creation of a new variable or other unintended results.

Examples

Return Value of Variable Properties in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a structure named `myStruct` with fields `a`, `b`, and `c`.

```
aStruct.a = 10;  
aStruct.b = {1,2,3,4,5};  
aStruct.c = Simulink.Parameter(7);  
mdlWks.assignin('myStruct', aStruct);
```

Return the values of the structure fields. Store the values in `varValuea`, `varValueb`, and `varValuec`.

```
varValuea = getVariablePart mdlWks, 'myStruct.a');  
varValueb = getVariablePart mdlWks, 'myStruct.b{1}';  
varValuec = getVariablePart mdlWks, 'myStruct.c.Value');
```

Input Arguments

mdlWks — Target model workspace

Simulink.ModelWorkspace object

Target model workspace, specified as a Simulink.ModelWorkspace object.

varName.Property — Name of target variable property

character vector

Name of the target variable property, specified as a character vector.

Example: 'myVariable.Property'

Data Types: char

Output Arguments

varValue — Value of variable property

number, structure, or other MATLAB value

Value of the variable property, returned as a number, structure, or other MATLAB value.

If the value of the variable property is a handle to a handle object (such as Simulink.Parameter), getVariablePart returns a copy of the handle.

See Also

Simulink.ModelWorkspace

Introduced in R2018b

hasVariable

Package: Simulink

Determine whether variable exists in the model workspace of a model

Syntax

```
varExists = hasVariable mdlWks, varName)
```

Description

`varExists = hasVariable(mdlWks, varName)` returns 1 if a variable whose name is `varName` exists in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

Examples

Determine Existence of Variable in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a variable named `myVar` in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)
```

Determine whether a variable named `myVar` exists in the model workspace.

```
exists = hasVariable(mdlWks, 'myVar')
```

```
exists =  
    1
```

Input Arguments

mdlWks — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

varName — Name of target variable

character vector

Name of the target variable, specified as a character vector.

Example: `'myVariable'`

Data Types: char

Output Arguments

varExists — Indication of existence

1 | 0

Indication of variable existence, returned as 1 (true) or 0.

See Also

[get_param](#) | [Simulink.ModelWorkspace](#)

Introduced in R2012a

reload

Package: Simulink

Reinitialize variables from the data source of a model workspace

Syntax

```
reload mdlWks
```

Description

`reload(mdlWks)` reinitializes the variables in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`. When you set the `DataSource` property of the model workspace to `'MAT-File'`, `'MATLAB File'`, or `'MATLAB Code'`, `reload` overwrites variables that exist in the model workspace by loading the associated MAT-file or by running the associated MATLAB code.

Examples

Reinitialize Variables in a Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Configure the model workspace to use some MATLAB code as a data source.

```
mdlWks.DataSource = 'MATLAB Code';  
mdlWks.MATLABCode = sprintf('myVar = 5.12;\nmyOtherVar = 7.22;');
```

Create variables in the model workspace by executing the MATLAB code.

```
reload(mdlWks)
```

Assign new values to the variables in the model workspace.

```
assignin(mdlWks, 'myVar', 5.22)  
assignin(mdlWks, 'myOtherVar', 7.33)
```

Overwrite the new values with the values specified by the MATLAB code.

```
reload(mdlWks)
```

Confirm that the variables have the values specified by the MATLAB code.

```
myVarValue = getVariable(mdlWks, 'myVar')  
myOtherVarValue = getVariable(mdlWks, 'myOtherVar')
```

```
myVarValue =
```

```
    5.1200
```

```
myOtherVarValue =
```

```
    7.2200
```

Input Arguments

mdlWks — Target model workspace

Simulink.ModelWorkspace object

Target model workspace, specified as a Simulink.ModelWorkspace object.

See Also

Simulink.ModelWorkspace

Introduced before R2006a

save

Package: Simulink

Save contents of model workspace to a MAT-file

Syntax

```
save mdlWks, fileName)
```

Description

`save mdlWks, fileName)` saves the variables in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks` to the MAT-file specified by `fileName`.

When you set the `DataSource` property of the model workspace to 'MAT-File' or 'MATLAB File', to save to the file that acts as the external data source of the model, use `saveToSource` instead of `save`.

Examples

Save Contents of Model Workspace to MAT-File

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create some variables in the model workspace.

```
assignin mdlWks, 'myVar', 5.12  
assignin mdlWks, 'myOtherVar', 7.22)
```

Save the variables to a new MAT-file named `myVars.mat`.

```
save(mdlWks, 'myVars.mat')
```

The MAT-file appears in your current folder.

Input Arguments

mdlWks — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

fileName — Name of target MAT-file

character vector

Name of the target MAT-file, specified as a character vector.

Example: 'myFile.mat'

Data Types: char

See Also

Simulink.ModelWorkspace

Introduced before R2006a

saveToSource

Package: Simulink

Save model workspace changes to the external data source of the model workspace

Syntax

```
saveToSource mdlWks
```

Description

`saveToSource mdlWks` saves the variables in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks` to the MAT-file or script file specified by the `FileName` property of the model workspace.

When you set the `DataSource` property of the model workspace to 'MAT-File' or 'MATLAB File', the `FileName` property specifies the name of the file that acts as the external data source of the workspace. As you make changes to the variables in the model workspace, use `saveToSource` to permanently save the changes in the external data source.

Examples

Save Variables to External Data Source of Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create some variables in the model workspace.

```
assignin mdlWks, 'myVar', 5.12  
assignin mdlWks, 'myOtherVar', 7.22
```

Configure the model workspace to use a MAT-file named `myVars.mat` as the data source.

```
mdlWks.DataSource = 'MAT-File';  
mdlWks.FileName = 'myVars.mat';
```

Save the variables to the external data source (the MAT-file).

```
saveToSource mdlWks
```

The file appears in your current folder.

Input Arguments

mdlWks — Target model workspace

Simulink.ModelWorkspace object

Target model workspace, specified as a Simulink.ModelWorkspace object.

See Also

Simulink.ModelWorkspace

Introduced before R2006a

setVariablePart

Package: Simulink

Set property of variable in model workspace

Syntax

```
varValue = setVariablePart mdlWks, varName.Property, varValue)
```

Description

`varValue = setVariablePart(mdlWks, varName.Property, varValue)` assigns `varValue` to the MATLAB variable property `varName.Property` in the model workspace represented by the Simulink.ModelWorkspace object `mdlWks`.

Using `setVariablePart` is preferable to using `evalin` for assigning variable properties in the model workspace because the `setVariablePart` function does not create a new variable or cause unintended results.

Examples

Assign Value to Variable Properties in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a Simulink.ModelWorkspace object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a structure named `myStruct` with fields `a`, `b`, and `c`.

```
aStruct.a = 10;  
aStruct.b = {1,2,3,4,5};  
aStruct.c = Simulink.Parameter(7);  
mdlWks.assignin('myStruct', aStruct);
```

Assign new values to the structure fields.

```
setVariablePart(mdlWks, 'myStruct.a', 2);  
setVariablePart(mdlWks, 'myStruct.b{1}', 2);  
setVariablePart(mdlWks, 'myStruct.c', Simulink.Parameter(2));
```

Return the new values of the structure fields. Store the values in `varValuea`, `varValueb`, and `varValuec`.

```
varValuea = getVariablePart mdlWks, 'myStruct.a')
varValueb = getVariablePart mdlWks, 'myStruct.b{1}')
varValuec = getVariablePart mdlWks, 'myStruct.c.Value')
```

Input Arguments

mdlWks — Target model workspace

Simulink.ModelWorkspace object

Target model workspace, specified as a Simulink.ModelWorkspace object.

varName.Property — Name of target variable property

character vector

Name of the target variable property, specified as a character vector.

Example: 'myVariable.Property'

Data Types: char | string

varValue — Value to assign to variable property

valid value

Value to assign to the value property, specified as a valid value. For example, you can specify a literal number, a structure, or an expression that evaluates to a valid value.

If you specify the name of a handle object, such as a Simulink.Parameter object, use the copy function to create a separate copy of the object.

Example: 5.12

Example: struct('a',5.12,'b',7.22)

Example: Simulink.Parameter(5.12)

Example: copy(myExistingParameterObject)

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical | char | string | struct | table | cell | categorical | datetime | duration | calendarDuration | fi

Complex Number Support: Yes

See Also

Simulink.ModelWorkspace

Introduced in R2018b

whos

Package: Simulink

Return list of variables in the model workspace of a model

Syntax

```
varList = whos mdlWks)
```

Description

`varList = whos(mdlWks)` returns a list of the variables in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

Examples

Return List of Variables in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create some variables in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)
assignin(mdlWks, 'myOtherVar', 7.22)
```

Display a list of the variables in the model workspace.

```
whos(mdlWks)
```

Name	Size	Bytes	Class	Attributes
myOtherVar	1x1	8	double	
myVar	1x1	8	double	

Input Arguments

mdlWks — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

Output Arguments

varList — List of variables

nested structure array

List of variables, returned as a nested structure array. For details about the information in the list, see `whos`.

See Also

`Simulink.ModelWorkspace`

Introduced before R2006a

Simulink.NumericType

Specify floating-point, integer, or fixed-point data type

Description

Use a `Simulink.NumericType` object to set and share numeric data types for signal, state, and parameter data in a model.

- 1 Create an instance of this class in the MATLAB base workspace, a model workspace, or a data dictionary. To create a numeric type in a model workspace, you must clear the **Is alias** property.
- 2 Set the properties of the object to create a custom floating point, integer, or fixed point data type.
- 3 Assign the data type to all signals and parameters of your model that you want to conform to the data type.

Assigning a data type in this way allows you to change the data types of the signals and parameters in your model by changing the properties of the object that describe them. You do not have to change the model itself.

To rename a data type in a model and in the code that you generate from a model (by generating a typedef statement), you can use an object of the class `Simulink.AliasType`.

Creation

To create a `Simulink.NumericType` object interactively, use the Model Explorer:

- 1 On the Model Explorer **Model Hierarchy** pane, select a workspace, such as the base workspace, or a data dictionary.
- 2 From the Model Explorer **Add** menu, select **Simulink.NumericType**.

The Model Explorer creates an instance of a `Simulink.NumericType` object and assigns it to a variable named `Numeric` in the target workspace.

- 3 Rename the variable to a more appropriate name, for example, a name that reflects its intended usage.

To change the name, edit the name displayed in the **Name** field on the Model Explorer **Contents** pane.

- 4 On the Model Explorer **Dialog** pane, use the **Data type mode** property to select a data type that the object represents.

To create a `Simulink.NumericType` object programmatically, use the `Simulink.NumericType` function described below.

Syntax

```
typeObj = Simulink.NumericType
```

Description

`typeObj = Simulink.NumericType` returns a `Simulink.NumericType` object with default property values.

Properties**Bias — Bias for slope and bias scaling**

0 (default) | real number

Bias for slope and bias scaling of a fixed-point data type (Fixed-Point Designer), specified as a real number.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

Corresponds to **Bias** in the property dialog box.

Example: 3

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

DataScope — Specification to generate or import type definition in the generated code

'Auto' (default) | 'Exported' | 'Imported'

Specification to generate or import the type definition (typedef) in the generated code (Simulink Coder), specified as 'Auto', 'Exported', or 'Imported'.

The table shows the effect of each option.

Value	Action
'Auto' (default)	If no value is specified for <code>HeaderFile</code> , export the type definition to <code>model_types.h</code> . <code>model</code> is the model name. If a value is specified for <code>HeaderFile</code> , import the data type definition from the specified header file.
'Exported'	Export the data type definition to a header file, which can be specified in the <code>HeaderFile</code> property. If no value is specified for <code>HeaderFile</code> , the header file name defaults to <code>type.h</code> . <code>type</code> is the data type name.
'Imported'	Import the data type definition from a header file, which can be specified in the <code>HeaderFile</code> property. If no value is specified for <code>HeaderFile</code> , the header file name defaults to <code>type.h</code> . <code>type</code> is the data type name.

For more information, see “Control File Placement of Custom Data Types” (Embedded Coder).

Corresponds to **Data scope** in the property dialog box.

DataTypeMode — Mode of numeric data type

'Double' (default) | 'Single' | 'Half' | 'Boolean' | 'Fixed-point: unspecified scaling' | 'Fixed-point: binary point scaling' | 'Fixed-point: slope and bias scaling'

Mode of the numeric data type, specified as one of these character vectors:

- 'Double' — Same as the MATLAB double type.
- 'Single' — Same as the MATLAB single type.
- 'Half' — Half-precision floating-point type.
- 'Boolean' — Same as the MATLAB boolean type.
- 'Fixed-point: unspecified scaling' — A fixed-point data type with unspecified scaling.
- 'Fixed-point: binary point scaling' — A fixed-point data type with binary-point scaling.
- 'Fixed-point: slope and bias scaling' — A fixed-point data type with slope and bias scaling.

Selecting a half-precision or fixed-point data type mode can, depending on the other dialog box options that you select, cause the model to run only on systems that have a Fixed-Point Designer license.

Corresponds to **Data type mode** in the property dialog box.

Data Types: char

DataTypeOverride — Data type override mode

'Inherit' (default) | 'Off'

Data type override mode, specified as 'Inherit' or 'Off'.

- If you specify 'Inherit', the data type override setting for the context in which this numeric type is used (block, signal, Stateflow chart in Simulink) applies to this numeric type.
- If you specify 'Off', data type override does not apply to this numeric type.

For more information about data type override, see “Control Data Type Override”.

Corresponds to **Data type override** in the property dialog box.

Data Types: char

Description — Custom description of data type

' ' (empty character vector) (default) | character vector

Custom description of the data type, specified as a character vector.

Corresponds to **Description** in the property dialog box.

Example: 'This is a floating-point data type.'

Data Types: char

FixedExponent — Exponent for binary point scaling

0 (default) | real number

Exponent for binary point scaling, specified as a real number. Setting this property causes Simulink software to set the FractionLength and Slope properties accordingly, and vice versa. This property applies only if the DataTypeMode is Fixed-point: binary point scaling or Fixed-point: slope and bias scaling.

If you use a number with a data type other than double to set the value, Simulink converts the value to double.

This property does not appear in the property dialog box.

Example: -8

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

FractionLength — Bit length of the fractional portion of a fixed-point number

0 (default) | real integer

Bit length of the fractional portion of a fixed-point number (Fixed-Point Designer), specified as a real integer. This property equals `-FixedExponent`. Setting this property causes Simulink software to set the `FixedExponent` property accordingly, and vice versa.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

Corresponds to **Fraction length** in the property dialog box.

Example: 8

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

HeaderFile — Name of header file that contains type definition in the generated code

' ' (empty character vector) (default) | character vector

Name of the header file that contains the type definition (typedef) in the generated code, specified as a character vector.

If this property is specified, the specified name is used during code generation for importing or exporting. If this property is empty, the value defaults to `type.h` if `DataScope` equals `'Imported'` or `'Exported'`, or defaults to `model_types.h` if `DataScope` equals `'Auto'`.

By default, the generated `#include` directive uses the preprocessor delimiter `"` instead of `<` and `>`. To generate the directive `#include <myTypes.h>`, specify `HeaderFile` as `'<myTypes.h>'`.

For more information, see “Control File Placement of Custom Data Types” (Embedded Coder).

Corresponds to **Header file** in the property dialog box.

Example: `'myHdr.h'`

Example: `'myHdr'`

Example: `'myHdr.hpp'`

Data Types: `char`

IsAlias — Specification to create data type alias using object name

`false` (default) | `true`

Specification to create a data type alias by using the name of the object, specified as `true` (yes) or `false` (no).

If you specify `true`, the object acts as a data type alias in a similar manner to a `Simulink.AliasType` object. For more information, see “Control Data Type Names in Generated Code” (Embedded Coder).

Corresponds to **Is alias** in the property dialog box.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

Signedness — Signedness of fixed-point data type

'Signed (default)' | 'Unsigned' | 'Auto'

Signedness of a fixed-point data type (Fixed-Point Designer), specified as 'Signed' (signed), 'Unsigned' (unsigned), or 'Auto' (inherit signedness).

Corresponds to **Signedness** in the property dialog box.

Data Types: `char`

SignednessBool — Signedness of fixed-point data type

`false` | `true`

Signedness of a fixed-point data type (Fixed-Point Designer), specified as a Boolean.

Corresponds to **Signedness** in the property dialog box.

Data Types: `logical`

Slope — Slope for slope and bias scaling of fixed-point data type

2^0 (default) | real number

Slope for slope and bias scaling of a fixed-point data type (Fixed-Point Designer), specified as a real number.

This property equals $\text{SlopeAdjustmentFactor} * 2^{\text{FixedExponent}}$. If $\text{SlopeAdjustmentFactor}$ is 1.0, Simulink software displays the value of this field as $2^{\text{SlopeAdjustmentFactor}}$. Otherwise, it displays it as a numeric value. Setting this property causes Simulink software to set the `FixedExponent` and `SlopeAdjustmentFactor` properties accordingly, and vice versa.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

This property appears only if `DataTypeMode` is `Fixed-point: slope and bias scaling`.

Corresponds to **Slope** in the property dialog box.

Example: 5.2

Example: 2^9

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

SlopeAdjustmentFactor — Slope for slope and bias scaling of fixed-point data type

1 (default) | real number

Slope for slope and bias scaling of a fixed-point data type (Fixed-Point Designer), specified as a real number in the range [1, 2).

Setting this property causes Simulink software to adjust the `Slope` property accordingly, and vice versa. This property applies only if `DataTypeMode` is `Fixed-point: slope and bias scaling`.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

This property does not appear in the property dialog box.

Example: 1.7

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

WordLength — Word size of fixed-point or integer data type

16 (default) | `integer`

Word size of a fixed-point (Fixed-Point Designer) or integer data type, specified as an integer number of bits.

This property appears only if `DataTypeMode` is `Fixed-point`.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

Corresponds to **Word length** in the property dialog box.

Example: 8

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

Object Functions

<code>isboolean</code>	Determine whether numeric type represents the Boolean data type <code>boolean</code>
<code>isdouble</code>	Determine whether numeric type represents the double-precision, floating-point data type <code>double</code>
<code>isfixed</code>	Determine whether numeric type represents a fixed-point data type
<code>isfloat</code>	Determine whether numeric type represents a floating-point data type
<code>isscalingbinarypoint</code>	Determine whether fixed-point numeric type has binary-point scaling
<code>isscalingslopebias</code>	Determine whether numeric type represents a fixed-point data type with slope-and-bias scaling
<code>isscalingunspecified</code>	Determine whether numeric type represents a data type with unspecified scaling
<code>issingle</code>	Determine whether numeric type represents the single-precision, floating-point data type <code>single</code>
<code>ishalf</code>	Determine whether numeric type represents the half-precision, floating-point data type <code>half</code>

Examples

Share a Data Type Between Separate Algorithms, Data Paths, Models, and Bus Elements

See “Share a Data Type Between Separate Algorithms, Data Paths, Models, and Bus Elements”.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using MATLAB® Coder™.

When you select the **Is alias** property, a `Simulink.NumericType` object appears in the generated code as a `typedef` statement. The generated code uses the named type to define and declare data (variables).

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

isboolean

Package: Simulink

Determine whether numeric type represents the Boolean data type `boolean`

Syntax

```
indication = isboolean(numericType)
```

Description

`indication = isboolean(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents the Boolean data type `boolean` and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

numericType — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents boolean

1 | 0

Indication of whether the target object represents boolean, returned as 1 (true) or 0 (false).

See Also

isdouble

Package: Simulink

Determine whether numeric type represents the double-precision, floating-point data type `double`

Syntax

```
indication = isdouble(numericType)
```

Description

`indication = isdouble(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents the double-precision, floating-point data type `double` and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

numericType — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents double

1 | 0

Indication of whether the target object represents double, returned as 1 (true) or 0 (false).

isfixed

Package: Simulink

Determine whether numeric type represents a fixed-point data type

Syntax

```
indication = isfixed(numericType)
```

Description

`indication = isfixed(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents a fixed-point data type and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

numericType — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents a fixed-point type

1 | 0

Indication of whether the target object represents a fixed-point type, returned as 1 (true) or 0 (false).

isfloat

Package: Simulink

Determine whether numeric type represents a floating-point data type

Syntax

```
indication = isfloat(numericType)
```

Description

`indication = isfloat(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents a floating-point data type such as `double`, `single`, or `half`, and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

numericType — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents a floating-point type

1 | 0

Indication of whether the target object represents a floating-point type, returned as 1 (true) or 0 (false).

ishalf

Package: Simulink

Determine whether numeric type represents the half-precision, floating-point data type `half`

Syntax

```
indication = ishalf(numericType)
```

Description

`indication = ishalf(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents the half-precision, floating-point data type `half` and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

numericType — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents half

1 | 0

Indication of whether the target object represents `half`, returned as 1 (true) or 0 (false).

isscalingbinarypoint

Package: Simulink

Determine whether fixed-point numeric type has binary-point scaling

Syntax

```
indication = isscalingbinarypoint(numericType)
```

Description

`indication = isscalingbinarypoint(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents a fixed-point data type with binary-point scaling and 0 (false) otherwise. A numeric type object can use binary-point scaling if you explicitly specify it or if you specify trivial slope-and-bias scaling (the slope is an integer power of two and the bias is zero).

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

numericType — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents fixed-point type with binary-point scaling

1 | 0

Indication of whether the target object represents a fixed-point type with binary-point scaling, returned as 1 (true) or 0 (false).

isscalingslopebias

Package: Simulink

Determine whether numeric type represents a fixed-point data type with slope-and-bias scaling

Syntax

```
indication = isscalingslopebias(numericType)
```

Description

`indication = isscalingslopebias(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents a fixed-point data type with nontrivial slope-and-bias scaling and 0 (false) otherwise. A slope-and-bias fixed-point type has trivial scaling if the slope is an integer power of two and the bias is zero.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

numericType — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents fixed-point type with slope-and-bias scaling

1 | 0

Indication of whether the target object represents a fixed-point type with nontrivial slope-and-bias scaling, returned as 1 (true) or 0 (false).

isscalingunspecified

Package: Simulink

Determine whether numeric type represents a data type with unspecified scaling

Syntax

```
indication = isscalingunspecified(numericType)
```

Description

`indication = isscalingunspecified(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents a fixed-point or scaled double data type with unspecified scaling and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

numericType — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents a type with unspecified scaling

1 | 0

Indication of whether the target object represents a type with unspecified scaling, returned as 1 (true) or 0 (false).

issingle

Package: Simulink

Determine whether numeric type represents the single-precision, floating-point data type `single`

Syntax

```
indication = issingle(numericType)
```

Description

`indication = issingle(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents the single-precision, floating-point data type `single` and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

Input Arguments

numericType — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

Output Arguments

indication — Indication of whether target object represents `single`

1 | 0

Indication of whether the target object represents `single`, returned as 1 (true) or 0 (false).

Simulink.op.ModelOperatingPoint

Complete information that represents model operating point in simulation

Description

A `Simulink.op.ModelOperatingPoint` object contains a complete representation of a model operating point that you can use to specify the initial state for a simulation. For example, when you run a set of simulations for a model of a system that has a startup phase or initialization behavior, you can simulate the model through the end of the startup or initialization phase once, save the model operating point, then run a set of simulations that use the operating point as the initial state. If you do not modify the model, simulating a model using a `Simulink.op.ModelOperatingPoint` object as the initial state produces the same results as a simulation with no initial state specified.

The operating point for a model represents the model state in simulation, including logged block states, hidden block states, the state of the solver and execution engine, and output values for some blocks. For more information, see “Use Model Operating Point for Faster Simulation Workflow”.

Creation

A model configured to save the final operating point creates a `Simulink.op.ModelOperatingPoint` object when the simulation completes or when you pause or stop the simulation. To configure a model to save the final operating point:

- 1 On the **Modeling** tab, click **Model Settings**.
- 2 In the Configuration Parameters dialog box, select **Data Import/Export**.
- 3 Select **Final states** and **Save final operating point**.

By default, the `Simulink.op.ModelOperatingPoint` object is saved using a variable called `xFinal`. To save the operating point using a different variable name, specify the variable name you want to use in the **Final states** text box.

When you return simulation results using a single simulation output, the `Simulink.op.ModelOperatingPoint` object is returned as part of the `Simulink.SimulationOutput` object that contains all the simulation data.

Properties

description — Description of saved operating point

string | character vector

Description of saved operating point, specified as a string or a character vector. The `ModelOperatingPoint` object has a default description that includes the name of the model and the simulation time at which the operating point was saved.

Example: Operating point of the model 'vdp' at simulation time
3.2137655751098118

Tips

The simulation time at which the model operating point was saved is also stored in the `snapshotTime` property.

LoggedStates — Operating point information for built-in blocks

`Simulink.SimulationData.Dataset` object | structure

Operating point information for built-in blocks, specified as a `Simulink.SimulationData.Dataset` object or a structure.

The format of the data in the `loggedStates` property for a `ModelOperatingPoint` object created from simulation depends on the format used for logging states and output data. To configure the format for logging states and outputs, use the Configuration Parameters dialog box. On the **Modeling** tab, click **Model Settings**. Then, on the **Data Import/Export** pane, select a value for the **Format** parameter.

Format parameter value	Format of loggedStates property value
Dataset	<code>Simulink.SimulationData.Dataset</code> object
<ul style="list-style-type: none"> • Structure with time • Structure • Array 	Structure that contains block states data

Tips

- The `loggedStates` property contains the operating point information for built-in blocks and S-functions that do not implement custom operating point behavior. To access or modify the operating point information for a Stateflow chart, a MATLAB System block, or an S-function with a custom operating point implementation, use the `get` and `set` functions.
- Not all operating point information for built-in blocks is exposed in the `loggedStates` property for viewing or editing. For example, the `loggedStates` property does not include operating point information for:
 - Blocks inside For Each subsystems
 - Simscape blocks
 - Blocks inside referenced models that execute in accelerator mode
- You cannot change the format for the data in the `loggedStates` property after a `ModelOperatingPoint` object is created.

snapshotTime — Simulation time at which operating point was saved

double

This property is read-only.

Simulation time at which operating point was saved, returned as a double.

startTime — Start time of simulation that created operating point

double

This property is read-only.

Start time of simulation that created operating point, returned as a double.

Object Functions

`get` Get operating point information for Stateflow chart, MATLAB System block, or S-function
`set` Set operating point information for Stateflow chart, MATLAB System block, or S-function

Examples

Save and Restore Model Operating Point

Open the model `sldemo_tonegen`.

```
model = "sldemo_tonegen";
open_system(model);
```

Create a `Simulink.SimulationInput` object to specify parameter values to use in simulation.

```
simIn = Simulink.SimulationInput(model);
```

Configure the simulation to stop after ten seconds and save the final operating point in a variable named `finalOP`.

```
simIn = setModelParameter(simIn,"StopTime","10",...
    "SaveFinalState","on","SaveOperatingPoint","on",...
    "FinalStateName","finalOP");
```

Simulate the model using the settings configured on the `SimulationInput` object.

```
out = sim(simIn);
```

Access the saved operating point, returned as part of the single `Simulink.SimulationOutput` object.

```
finalOP = out.finalOP
```

```
finalOP =
    Simulink.op.ModelOperatingPoint

    Operating point of the model 'sldemo_tonegen' at simulation time 10.
```

Properties

```
loggedStates
description
startTime (Read-only)
snapshotTime (Read-only)
```

Methods

```
get
set
```

Create a `SimulationInput` object to configure another simulation that uses the operating point saved from the first simulation.

```
simIn2 = Simulink.SimulationInput(model);
```

Configure the model to simulate to a stop time of twenty seconds.

```
simIn2 = setModelParameter(simIn2, "StopTime", "20");
```

Use the `setInitialState` function to specify the initial state for the simulation using the `Simulink.op.ModelOperatingPoint` object saved from the first simulation.

```
simIn2 = setInitialState(simIn2, finalOP);
```

Simulate the model from the initial operating point.

```
out2 = sim(simIn2);
```

Tips

When you want to save an operating point from a simulation, disable **Block reduction** before simulating the model.

get

Package: Simulink.op

Get operating point information for Stateflow chart, MATLAB System block, or S-function

Syntax

```
op = get(modelOP,blockPath)
```

Description

`op = get(modelOP,blockPath)` returns the operating point information `op` for the model element at the specified path `blockPath`. Use the `get` function to access operating point information for:

- Stateflow charts
- MATLAB System blocks
- S-functions with custom operating point implementation

To access the state for a built-in block, use the `loggedStates` property of the `Simulink.op.ModelOperatingPoint` object.

Examples

Get Operating Point for Stateflow Chart

To get the operating point for a Stateflow chart that is inside a referenced model, specify the full path to the chart relative to the top model.

```
model = 'sldemo_fuelsys_dd';
opt = struct('SaveFinalState','on','SaveOperatingPoint','on','StopTime','1');
simOut = sim(model,opt);
modelOp = simOut.xFinal;
blockPath = 'sldemo_fuelsys_dd/Fuel Rate Controller|sldemo_fuelsys_dd_controller/control_logic';
chartOp = get(modelOp,blockPath)
```

Input Arguments

modelOP — Model operating point

`Simulink.op.ModelOperatingPoint` object

Model operating point, specified as a `Simulink.op.ModelOperatingPoint` object.

blockPath — Path to model element whose operating point you want to access

string | character vector

Path to model element whose operating point you want to access, specified as a string or a character vector.

You cannot access or modify operating point information for Stateflow charts, MATLAB System blocks, or S-functions inside referenced models simulated using accelerator mode.

Output Arguments

op — Element operating point

Stateflow.op.BlockOperatingPoint object | S-function operating point | MATLAB System block operating point

Element operating point, returned as a Stateflow.op.BlockOperatingPoint object, an S-function operating point, or a MATLAB System block operating point.

Tips

- For more information about working with operating points for Stateflow charts, see “Methods for Interacting with the Operating Point of a Chart” (Stateflow).
- Use the `ssSetOperatingPointVisibility` function to specify whether operating point information for an S-function is accessible from the `ModelOperatingPoint` object.

set

Package: Simulink.op

Set operating point information for Stateflow chart, MATLAB System block, or S-function

Syntax

```
set(modelOP,blockPath,op)
```

Description

`set(modelOP,blockPath,op)` sets the operating point `op` for the model element at the specified path `blockPath`. Use the `set` function to specify operating point information for:

- Stateflow charts
- MATLAB System blocks
- S-functions with custom operating point implementation

To modify the operating point information for a built-in block, use the `loggedStates` property for the `Simulink.op.ModelOperatingPoint` object.

Examples

Set Operating Point for Stateflow Chart

Specify the operating point for the Stateflow chart 'mymodel/chart' as the contents of the variable `newChartOperPoint`.

```
newOperPoint = set(myOperPoint,'mymodel/chart',newChartOperPoint)
```

Input Arguments

modelOP — Model operating point

`Simulink.op.ModelOperatingPoint` object

Model operating point, specified as a `Simulink.op.ModelOperatingPoint` object.

blockPath — Path to element whose operating point you want to modify

string | character vector

Path to element whose operating point you want to modify, specified as a string or a character vector.

You cannot access or modify operating point information for Stateflow charts, MATLAB System blocks, or S-functions inside model references that execute in accelerator mode.

op — Operating point information to set

`Stateflow.op.BlockOperatingPoint` object | S-function operating point | MATLAB System block operating point

Operating point information to set, specified as a `Stateflow.op.BlockOperatingPoint` object, an S-function operating point, or a MATLAB System block operating point.

Tips

- For more information about working with operating points for Stateflow charts, see “Methods for Interacting with the Operating Point of a Chart” (Stateflow).
- Use the `ssSetOperatingPointVisibility` function to specify whether operating point information for an S-function is accessible from the `ModelOperatingPoint` object.

Simulink.Parameter

Store, share, and configure parameter values

Description

Create a `Simulink.Parameter` object to set the value of one or more block parameters in a model, such as the **Gain** parameter of a Gain block. You create the object in a workspace or in a data dictionary. Set the parameter value in the object, then reference the object from the block.

Use a `Simulink.Parameter` object to:

- Share a value among multiple block parameters.
- Represent an engineering constant or a tunable calibration parameter.
- Separate a parameter value from its data type and other properties.
- Configure parameter data for code generation.

The `Value` property of the object stores the parameter value. To use the object in a model, set the value of a block parameter to an expression that includes the name of the object. Omit the `Value` property from the expression. For more information, see “Use Parameter Objects”.

For more information about block parameters, see “Set Block Parameter Values” and “How Generated Code Stores Internal Signal, State, and Parameter Data” (Simulink Coder).

Creation

Create a `Simulink.Parameter` object:

- Directly from a block dialog box or the Property Inspector. See “Create, Edit, and Manage Workspace Variables”.
- By using the Model Data Editor. Inspect the **Parameters** tab. Right-click the row that contains a variable and from the context menu, select **Convert to parameter object**.
- By using the Model Explorer. See “Create Data Objects from Built-In Data Class Package Simulink”.
- By using the `Simulink.Parameter` function described below.

Syntax

```
paramObj = Simulink.Parameter  
paramObj = Simulink.Parameter(paramValue)
```

Description

`paramObj = Simulink.Parameter` returns a `Simulink.Parameter` object with default property values.

`paramObj = Simulink.Parameter(paramValue)` returns a `Simulink.Parameter` object and initializes the `Value` property to `paramValue`.

Properties

For information about the properties in the property dialog box of a `Simulink.Parameter` object, see “`Simulink.Parameter` Property Dialog Box”.

CoderInfo — Specifications for generating code for parameter object

`Simulink.CoderInfo` object

Specifications for generating code for the parameter object, returned as a `Simulink.CoderInfo` object.

This property is read only. Instead, modify the properties of the `Simulink.CoderInfo` object that this property contains.

For example, the `StorageClass` property of the `Simulink.CoderInfo` object determines how Simulink code generation toolboxes allocate memory for the parameter object in the generated code. For more information, see “C Code Generation Configuration for Model Interface Elements” (Simulink Coder) and “Choose Storage Class for Controlling Data Representation in Generated Code” (Embedded Coder).

Complexity — Numeric complexity of parameter value

'real' (default) | 'complex'

Numeric complexity of the parameter value, specified as either 'real' or 'complex'. For `Simulink.Parameter` objects in the model workspace, use this property to configure the complexity of a model argument. See “Parameterize Instances of a Reusable Referenced Model”.

For numeric values, Simulink derives the complexity from the parameter value that you specify in the `Value` property. In this case, changing the complexity results in error.

When the value is a structure or a mathematical expression, Simulink ignores the specified complexity.

Data Types: char

DataType — Data type of parameter value

'auto' (default) | character vector

Data type of the parameter value in the `Value` property, specified as 'auto' or a character vector. When you simulate the model or generate code, Simulink casts the value to the specified data type.

If you specify 'auto', the default setting, the parameter object uses the same data type as the block parameters that use the object. See “Reduce Maintenance Effort with Data Type Inheritance”.

When you set the `Value` property to something other than a double number, the object typically sets the `DataType` property based on the value of the `Value` property. For example, when you set the `Value` property to `int8(5)`, the object sets the value of the `DataType` property to 'int8'.

To explicitly specify a built-in data type (see “Data Types Supported by Simulink”), specify one of these options:

- 'double'
- 'single'
- 'half'
- 'int8'
- 'uint8'
- 'int16'
- 'uint16'
- 'int32'
- 'uint32'
- 'int64'
- 'uint64'
- 'boolean'

To specify a fixed-point data type, use the `fixdt` function. For example, specify `'fixdt(1,16,5)'`.

If you use a `Simulink.AliasType` or `Simulink.NumericType` object to create and share custom data types in your model, specify the name of the object.

To specify an enumerated data type, use the name of the type preceded by `Enum:`. For example, specify `'Enum: myEnumType'`.

When you store a structure or array of structures in the `Value` property of the object, the object sets the `DataType` property to `'struct'`. To specify a `Simulink.Bus` object as the data type, use the name of the bus object preceded by `Bus:`. For example, specify `'Bus: myBusObject'`.

Example: `'auto'`

Example: `'int8'`

Example: `'fixdt(1,16,5)'`

Example: `'myAliasTypeObject'`

Example: `'Enum: myEnumType'`

Example: `'Bus: myBusObject'`

Data Types: char

Description — Custom description of parameter object

`''` (default) | character vector

Custom description of the parameter object, specified as a character vector. Use this property to document the significance that the parameter object has in your algorithm.

If you have an Embedded Coder license, you can configure this description to appear in the generated code as a comment. See “Simulink data object descriptions” (Embedded Coder).

Example: `'This parameter represents the maximum rotation speed of the engine.'`

Data Types: char

Dimensions — Dimensions of parameter value

`[0 0]` (default) | row vector | character vector

Dimensions of the value stored in the `Value` property, returned as a row vector or specified as a character vector. When the `Value` property is empty (set to `[]`), you can configure the `Dimensions`. Otherwise, the property is derived from `Value`.

When you set the `Value` property of the object, the object sets the value of the `Dimensions` property to a `double` row vector. The vector is the same vector that the `size` function returns.

If you are configuring the object as a model argument, and you intend to provide a value for the object elsewhere in the parent model reference hierarchy, you can leave the `Value` property empty (set to `[]`) and set the `Dimensions` and `Data Type` properties explicitly. See “Parameterize Instances of a Reusable Referenced Model”.

To use symbolic dimensions, specify a character vector. See “Implement Dimension Variants for Array Sizes in Generated Code” (Embedded Coder).

Example: `[1 3]`

Example: `'[1 myDimParam]'`

Data Types: `double` | `char`

Max — Maximum value of parameter

`[]` (default) | real `double` scalar

Maximum value that the `Value` property of the object can store, specified as a real `double` scalar.

The default value is empty, which means the parameter value does not have a maximum.

If you store a complex number in the `Value` property, the `Max` property applies separately to the real and imaginary parts.

If you store a structure in the `Value` property, the object ignores the `Max` property. Instead, use a `Simulink.Bus` object as the data type of the parameter object and specify a maximum value for each field by using the elements of the bus object. See “Control Field Data Types and Characteristics by Creating Parameter Object”.

If `Value` is greater than the maximum value or if the maximum value is outside the range of the object data type, Simulink generates a warning. When updating the diagram or starting a simulation, Simulink generates an error.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Example: `5.32`

Data Types: `double`

Min — Minimum value of parameter

`[]` (default) | real `double` scalar

Minimum value that the `Value` property of the object can store, specified as a real `double` scalar.

The default value is empty, which means the parameter value does not have a minimum.

If you store a complex number in the `Value` property, the `Min` property applies separately to the real and imaginary parts.

If you store a structure in the `Value` property, the object ignores the `Min` property. Instead, use a `Simulink.Bus` object as the data type of the parameter object and specify a minimum value for each field by using the elements of the bus object. See “Control Field Data Types and Characteristics by Creating Parameter Object”.

If `Value` is less than the minimum value or if the minimum value is outside the range of the object data type, Simulink generates a warning. When updating the diagram or starting a simulation, Simulink generates an error.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”

Example: `-0.92`

Data Types: `double`

Unit — Physical unit of parameter value

`''` (default) | character vector

Physical unit of parameter value, specified as a character vector that describes a valid unit. For more information, see “Unit Specification in Simulink Models”.

Example: `'degC'`

Data Types: `char`

Value — Value to use in block parameters

`[]` (default) | numeric | boolean | enum | structure | scalar | array | <mathematical expression>

Value to use in block parameters, specified as any of these valid values:

- Numeric value
- Boolean value
- Instance of enumerated type
- Structure
- Scalar or array
- Mathematical expression (see “Set Variable Value by Using a Mathematical Expression”)

If you use a `Simulink.Parameter` object to set the block parameter value in a reusable referenced model, you can compile and simulate the model as a referenced model with the value for the object left empty (`Value` set to `[]`) as long as you provide an explicit value somewhere in the parent model reference hierarchy. In this case, you cannot simulate the model directly. When the value is empty, you must provide the `Data Type` and `Dimensions` for the object. Although you have specified an empty value, Simulink still synthesizes a `Value` by using one of these:

- `Max`.
- `Min`, if you have not specified `Max`.
- `1`, if you have not specified either `Min` or `Max`.

See “Parameterize Instances of a Reusable Referenced Model”.

You can also use MATLAB syntax to specify the value.

Example Expression	Description
15.23	Specifies a scalar value
[3 4; 9 8]	Specifies a matrix
3+2i	Specifies a complex value
struct('A',20,'B',5)	Specifies a structure with two fields, A and B, with double-precision values 20 and 5. Organize block parameters into structures (see “Organize Related Block Parameter Definitions in Structures”) or initialize the signal elements in a bus (see “Specify Initial Conditions for Bus Elements”).
slexpr('myVar + myOtherVar')	Specifies the expression myVar + myOtherVar where myVar and myOtherVar are other MATLAB variables or parameter objects. Simulink preserves this mathematical relationship between the object and the variables.

To use a `Simulink.Parameter` object to store a value of a particular numeric data type, specify the ideal value with the `Value` property and control the type with the `DataType` property.

If you set the `Value` property by using a typed expression such as `single(32.5)`, the `DataType` property changes to reflect the new type. A best practice is to use an expression that is not typed to avoid accumulating numerical error through repeated quantizations or data type saturation, especially for fixed-point data types.

Example: 3.15

Example: 1.2 + 3.2i

Example: true

Example: myEnumType.myEnumValue

Example: struct('field1',15,'field2',7.32)

Example: slexpr('myVar + myOtherVar')

Data Types: double | single | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical | struct | fi | enum

Complex Number Support: Yes

Examples

Use Parameter Object to Set Value of Gain Parameter

- 1 At the command prompt, create a `Simulink.Parameter` object.

```
myParam = Simulink.Parameter;
```

- 2 Assign a numeric value to the `Value` property.

```
myParam.Value = 15.23;
```

- 3 Specify the minimum and maximum values the parameter can take with the `Min` and `Max` properties.

```
myParam.Min = 10.11;
myParam.Max = 25.27;
```

- 4 Open a new Simulink model. Add a Gain block and set its **Gain** parameter to myParam. During simulation, the **Gain** parameter uses the value 15.23.

Change Value Stored by Parameter Object

- 1 At the command prompt, create a Simulink.Parameter object that stores the value 2.52.

```
myParam = Simulink.Parameter(2.52);
```

- 2 Change the value by accessing the Value property of the object. This technique preserves the values of the other properties of the object.

```
myParam.Value = 1.13;
```

Create Parameter Object with Specific Numeric Data Type

To reduce model maintenance, you can leave the `DataType` property at its default value, `auto`. The parameter object acquires a data type from the block parameter that uses the object.

To reduce the risk of the data type changing when you make changes to signal data types and other data types in your model, you can explicitly specify a data type for the parameter object. For example, when you generate code that exports parameter data to your custom code, explicitly specify a data type for the object.

- 1 At the MATLAB command prompt, create a Simulink.Parameter object that stores the value 18.25.

```
myParam = Simulink.Parameter(18.25);
```

The expression `18.25` returns the number 18.25 with the double-precision, floating-point data type `double`. The `Value` property stores the number 18.25 with double precision.

- 2 Use the `DataType` property to specify the single-precision data type `single`.

```
myParam.DataType = 'single';
```

When you simulate or generate code, the object casts the value of the `Value` property, 18.25, to the data type specified by the `DataType` property, `single`.

Set Parameter Value to a Mathematical Expression

This example shows how to set the value of a parameter object, `myParam`, to the sum of two other variables, `myVar` and `myOtherVar`. With this technique, when you change the values of the independent variables, Simulink immediately calculates the new value of the parameter object.

- 1 Create the two independent variables.

```
myVar = 5.2;
myOtherVar = 9.8;
```

- 2 Create the parameter object.

```
myParam = Simulink.Parameter;
```

- 3 Set the value of the parameter object to the expression `myVar + myOtherVar`.

```
myParam.Value = slexpr('myVar + myOtherVar')
```

When you simulate or generate code, the expression evaluates to 15.

Simulink.profiler.Data

Programmatically access Simulink Profiler information

Description

The `Simulink.profiler.Data` object provides access to simulation profiling metadata.

Creation

Access the `Simulink.profiler.Data` object from the `SimulationMetadata.TimingInfo` field of the `Simulink.SimulationOutput` object.

Properties

run — Profiling session identifier

character vector | string scalar

This is a read only property.

Identifier of the profiling session, returned as a character vector or string scalar.

Example: `'vdp @ 21-Nov-2019 13:48:00'`

Data Types: `char` | `string`

UserString — User documentation of profiling session

"" (default) | character vector | string scalar

Use the `UserString` field to document relevant information about the current profiling session

Example: `profilingData.UserString = "Updated gain to reduce chatter.";`

Data Types: `char` | `string`

rootUINode — Block hierarchy of the model

`Simulink.profiler.UINode` object

Block hierarchy of the model, returned as a `Simulink.profiler.UINode` object with the following fields:

Field	Value	Description
<code>totalTime</code>	double	Execution time of the block, as well as its children.
<code>selfTime</code>	double	Execution time of the block, excluding its children
<code>numberOfCalls</code>	double	Number of times the block was executed during the simulation.

Field	Value	Description
children	Simulink.profiler.UINode array	Contents of the current block
path	string scalar	Path of the block relative to the top level of the model. Note The path of the rootUINode field is the name of the model

A `Simulink.profiler.UINode` object corresponds to a row in the block hierarchy view of the Simulink Profiler.

rootExecNode — Execution stack of the model

`Simulink.profiler.ExecNode`

Execution phases of the model, returned as a `Simulink.profiler.ExecNode` object with the following fields:

Field	Value	Description
totalTime	double	Execution time of the stack element, as well as its children.
selfTime	double	Execution time of the stack element, excluding its children
numberOfCalls	double	Number of times the stack element was executed during the simulation.
location		Specific phase of the model's execution
children	Simulink.profiler.ExecNode array	Similar tasks corresponding to the execution phase of the parent.
objectPath	string scalar	Path of the model element corresponding to the current element of the execution stack. Note The objectPath field of the rootExecNode is the name of the model

A `Simulink.profiler.ExecNode` object corresponds to a row in the execution stack view of the Simulink Profiler.

Simulink.sdi.DiffRunResult

Access run comparison results

Description

The `Simulink.sdi.DiffRunResult` object provides access to run comparison metadata and comparison results. Use the `getSignalByIndex` function to access the metadata and comparison results for each signal in the run comparison.

Creation

A `Simulink.sdi.DiffRunResult` object is created when you perform a comparison using the Simulation Data Inspector.

When you compare data using the UI, use the `Simulink.sdi.getCurrentComparison` function to access the results in a `Simulink.sdi.DiffRunResult` object.

Programmatic comparisons using the `Simulink.sdi.compareRuns` function or the `compare` function return a `DiffRunResult` object.

Properties

MatlabVersion — Software version used to create object

character vector

This property is read-only.

Version of MATLAB used to create the `DiffRunResult` object, returned as a character vector.

RunID1 — Baseline run ID

integer

This property is read-only.

Run identifier for the comparison baseline run, returned as an integer.

RunID2 — ID for run to compare

integer

This property is read-only.

Run identifier of the run to compare, returned as an integer.

Count — Number of signals compared

integer

This property is read-only.

Number of signals that aligned between the two runs in the comparison, returned as an integer. For more information on how signals are aligned for comparisons, see “Signal Alignment”.

DateCreated — Object creation date

`datetime`

This property is read-only.

Date and time the `Simulink.sdi.DiffRunResult` object was created, returned as a `datetime` object.

Data Types: `datetime`

GlobalTolerance — Global tolerance values used for comparison

`structure`

This property is read-only.

Global tolerance values used for the run comparison, returned as a structure with fields:

- `AbsTol` — Global absolute tolerance used for the run comparison.
- `RelTol` — Global relative tolerance used for the run comparison.
- `TimeTol` — Global time tolerance used for the run comparison.

For more information about how tolerances are used and calculated for comparisons, see “Tolerance Specification”.

Summary — Comparison results summary

`structure`

This property is read-only.

Comparison results summary, returned as a structure with a field for each `Status` a signal comparison result could have. The value of each field indicates the number of signals in the run comparison with the corresponding `Status`.

- `WithinTolerance` — Signal comparison completed, and all data points compared fell within the specified tolerance.
- `OutOfTolerance` — Signal comparison completed, and some data points compared fell outside of the specified tolerance.
- `Unaligned` — Signal from the baseline run did not align with a signal in the run to compare.
- `Empty` — Aligned signal in the baseline run or run to compare contains no data.
- `EmptySynced` — Synchronized signal in the baseline run or run to compare contains no data. An empty synchronized signal can mean that the signals do not overlap or, if you specified the intersection synchronization method, that they included none of the same time points.
- `Canceled` — Signal result not computed because the user canceled the comparison.
- `Pending` — Comparison is in progress and the signal result computation has not started.
- `Processing` — Signal result computation in progress.
- `UnitsMismatch` — The signal units in the baseline run and run to compare do not match.
- `DataTypeMismatch` — The signal data types in the baseline run and run to compare do not match. Only results of comparisons configured to check signal data types can have this status.

- **TimeMismatch** — The signal time vectors in the baseline run and run to compare do not match. Only results of comparisons configured to check signal time vectors can have this status.
- **StartStopMismatch** — The signal start and stop times in the baseline run and run to compare do not match. Only results of comparisons configured to check signal start and stop times can have this status.
- **Unsupported** — The Simulation Data Inspector comparison algorithm does not support this type of signal. For example, signals with data types that lose precision when converted to `double` are not supported.

For more information about alignment, tolerances, and synchronization, see “How the Simulation Data Inspector Compares Data”. For more information about how to configure a comparison to check additional metadata, see `Simulink.sdi.compareRuns`.

Options — Comparison configuration

`n-by-2` cell array

This property is read-only.

Configuration options used for the comparison, returned as an `n-by-2` cell array. Each row in the cell array corresponds to an option used by the comparison. Every comparison requires that aligned signal units match, so the `Options` property always includes a row to indicate that units must match. Other possible configuration options correspond to these name-value pairs for the `Simulink.sdi.compareRuns` function:

- `DataType`
- `Time`
- `StartStop`
- `StopOnFirstMismatch`

Status — Status of run comparison

`Completed` | `Canceled` | `Stopped`

This property is read-only.

Status of the run comparison, indicating how the comparison ended, returned as one of the following:

- `Completed` — Comparison finished computing all results
- `Canceled` — Comparison ended because the user canceled the comparison operation in the UI
- `Stopped` — Comparison ended because the comparison detected a mismatch and was configured to stop on the first mismatch

StopReason — Signal result that stopped the run comparison

`Simulink.sdi.DiffSignalResult`

This property is read-only.

Signal result for signal comparison that caused the run comparison to stop without comparing remaining signals, returned as a `Simulink.sdi.DiffSignalResult` object. The `StopReason` property is empty when the comparison completes without detecting a mismatch and when the comparison is not configured to stop on the first mismatch. You can configure a simulation to stop on the first mismatch using the `Simulink.sdi.compareRuns` function and the `'StopOnFirstMismatch'` name-value pair.

Object Functions

getResultByIndex Return signal comparison result
 saveResult Save comparison results to an MLDATX file

Examples

Analyze Simulation Data Using Signal Tolerances

You can programmatically specify signal tolerance values to use in comparisons performed using the Simulation Data Inspector. In this example, you compare data collected by simulating a model of an aircraft longitudinal flight control system. Each simulation uses a different value for the input filter time constant and logs the input and output signals. You analyze the effect of the time constant change by comparing results using the Simulation Data Inspector and signal tolerances.

First, load the session file that contains the simulation data.

```
Simulink.sdi.load('AircraftExample.mldatx');
```

The session file contains four runs. In this example, you compare data from the first two runs in the file. Access the `Simulink.sdi.Run` objects for the first two runs loaded from the file.

```
runIDs = Simulink.sdi.getAllRunIDs;  
runIDTs1 = runIDs(end-3);  
runIDTs2 = runIDs(end-2);
```

Now, compare the two runs without specifying any tolerances.

```
noTolDiffResult = Simulink.sdi.compareRuns(runIDTs1,runIDTs2);
```

Use the `getResultByIndex` function to access the comparison results for the `q` and `alpha` signals.

```
qResult = getResultByIndex(noTolDiffResult,1);  
alphaResult = getResultByIndex(noTolDiffResult,2);
```

Check the `Status` of each signal result to see whether the comparison result fell within our out of tolerance.

```
qResult.Status
```

```
ans =  
  ComparisonSignalStatus enumeration  
    OutOfTolerance
```

```
alphaResult.Status
```

```
ans =  
  ComparisonSignalStatus enumeration  
    OutOfTolerance
```

The comparison used a value of 0 for all tolerances, so the `OutOfTolerance` result means the signals are not identical.

You can further analyze the effect of the time constant by specifying tolerance values for the signals. Specify the tolerances by setting the properties for the `Simulink.sdi.Signal` objects that

correspond to the signals being compared. Comparisons use tolerances specified for the baseline signals. This example specifies a time tolerance and an absolute tolerance.

To specify a tolerance, first access the `Signal` objects from the baseline run.

```
runTs1 = Simulink.sdi.getRun(runIDTs1);
qSig = getSignalsByName(runTs1,'q, rad/sec');
alphaSig = getSignalsByName(runTs1,'alpha, rad');
```

Specify an absolute tolerance of 0.1 and a time tolerance of 0.6 for the `q` signal using the `AbsTol` and `TimeTol` properties.

```
qSig.AbsTol = 0.1;
qSig.TimeTol = 0.6;
```

Specify an absolute tolerance of 0.2 and a time tolerance of 0.8 for the `alpha` signal.

```
alphaSig.AbsTol = 0.2;
alphaSig.TimeTol = 0.8;
```

Compare the results again. Access the results from the comparison and check the `Status` property for each signal.

```
tolDiffResult = Simulink.sdi.compareRuns(runIDTs1, runIDTs2);
qResult2 = getResultByIndex(tolDiffResult,1);
alphaResult2 = getResultByIndex(tolDiffResult,2);
```

```
qResult2.Status
```

```
ans =
  ComparisonSignalStatus enumeration
    WithinTolerance
```

```
alphaResult2.Status
```

```
ans =
  ComparisonSignalStatus enumeration
    WithinTolerance
```

Configure Comparisons to Check Metadata

You can use the `Simulink.sdi.compareRuns` function to compare signal data and metadata, including data type and start and stop times. A single comparison may check for mismatches in one or more pieces of metadata. When you check for mismatches in signal metadata, the `Summary` property of the `Simulink.sdi.DiffRunResult` object may differ from a basic comparison because the `Status` property for a `Simulink.sdi.DiffSignalResult` object can indicate the metadata mismatch. You can configure comparisons using the `Simulink.sdi.compareRuns` function for imported data and for data logged from a simulation.

This example configures a comparison of runs created from workspace data three ways to show how the Summary of the DiffSignalResult object can provide specific information about signal mismatches.

Create Workspace Data

The `Simulink.sdi.compareRuns` function compares time series data. Create data for a sine wave to use as the baseline signal, using the `timeseries` format. Give the `timeseries` the name `Wave Data`.

```
time = 0:0.1:20;
sig1vals = sin(2*pi/5*time);
sig1_ts = timeseries(sig1vals,time);
sig1_ts.Name = 'Wave Data';
```

Create a second sine wave to compare against the baseline signal. Use a slightly different time vector and attenuate the signal so the two signals are not identical. Cast the signal data to the `single` data type. Also name this `timeseries` object `Wave Data`. The Simulation Data Inspector comparison algorithm will align these signals for comparison using the name.

```
time2 = 0:0.1:22;
sig2vals = single(0.98*sin(2*pi/5*time2));
sig2_ts = timeseries(sig2vals,time2);
sig2_ts.Name = 'Wave Data';
```

Create and Compare Runs in the Simulation Data Inspector

The `Simulink.sdi.compareRuns` function compares data contained in `Simulink.sdi.Run` objects. Use the `Simulink.sdi.createRun` function to create runs in the Simulation Data Inspector for the data. The `Simulink.sdi.createRun` function returns the run ID for each created run.

```
runID1 = Simulink.sdi.createRun('Baseline Run','vars',sig1_ts);
runID2 = Simulink.sdi.createRun('Compare to Run','vars',sig2_ts);
```

You can use the `Simulink.sdi.compareRuns` function to compare the runs. The comparison algorithm converts the signal data to the `double` data type and synchronizes the signal data before computing the difference signal.

```
basic_DRR = Simulink.sdi.compareRuns(runID1,runID2);
```

Check the `Summary` property of the returned `Simulink.sdi.DiffRunResult` object to see the result of the comparison.

```
basic_DRR.Summary
ans = struct with fields:
    OutOfTolerance: 1
    WithinTolerance: 0
    Unaligned: 0
    UnitsMismatch: 0
    Empty: 0
    Canceled: 0
    EmptySynced: 0
    DataTypeMismatch: 0
    TimeMismatch: 0
    StartStopMismatch: 0
```

```
Unsupported: 0
```

The difference between the signals is out of tolerance.

Compare Runs and Check for Data Type Match

Depending on your system requirements, you may want the data types for signals you compare to match. You can use the `Simulink.sdi.compareRuns` function to configure the comparison algorithm to check for and report data type mismatches.

```
dataType_DRR = Simulink.sdi.compareRuns(runID1,runID2, 'DataType', 'MustMatch');  
dataType_DRR.Summary
```

```
ans = struct with fields:  
    OutOfTolerance: 0  
    WithinTolerance: 0  
    Unaligned: 0  
    UnitsMismatch: 0  
    Empty: 0  
    Canceled: 0  
    EmptySynced: 0  
    DataTypeMismatch: 1  
    TimeMismatch: 0  
    StartStopMismatch: 0  
    Unsupported: 0
```

The result of the signal comparison is now `DataTypeMismatch` because the data for the baseline signal is double data type, while the data for the signal compared to the baseline is single data type.

Compare Runs and Check for Start and Stop Time Match

You can use the `Simulink.sdi.compareRuns` function to configure the comparison algorithm to check whether the aligned signals have the same start and stop times.

```
startStop_DRR = Simulink.sdi.compareRuns(runID1,runID2, 'StartStop', 'MustMatch');  
startStop_DRR.Summary
```

```
ans = struct with fields:  
    OutOfTolerance: 0  
    WithinTolerance: 0  
    Unaligned: 0  
    UnitsMismatch: 0  
    Empty: 0  
    Canceled: 0  
    EmptySynced: 0  
    DataTypeMismatch: 0  
    TimeMismatch: 0  
    StartStopMismatch: 1  
    Unsupported: 0
```

The signal comparison result is now `StartStopMismatch` because the signals created in the workspace have different stop times.

Alternatives

You can view and inspect comparison results using the Simulation Data Inspector UI. For more information, see “Compare Simulation Data”.

For software tests, see the `Simulink.sdi.constraints.MatchesSignal` constraint.

Topics

“Inspect and Compare Data Programmatically”

“How the Simulation Data Inspector Compares Data”

“Compare Simulation Data”

Introduced in R2012b

getResultByIndex

Package: Simulink.sdi

Return signal comparison result

Syntax

```
diffSig = getResultByIndex(diffRes,index)
```

Description

`diffSig = getResultByIndex(diffRes,index)` returns the `Simulink.sdi.DiffSignalResult` object `diffSig` at the specified index in the `Simulink.sdi.DiffRunResult` object, `diffRes`.

Examples

Analyze Simulation Data Using Signal Tolerances

You can programmatically specify signal tolerance values to use in comparisons performed using the Simulation Data Inspector. In this example, you compare data collected by simulating a model of an aircraft longitudinal flight control system. Each simulation uses a different value for the input filter time constant and logs the input and output signals. You analyze the effect of the time constant change by comparing results using the Simulation Data Inspector and signal tolerances.

First, load the session file that contains the simulation data.

```
Simulink.sdi.load('AircraftExample.mldatx');
```

The session file contains four runs. In this example, you compare data from the first two runs in the file. Access the `Simulink.sdi.Run` objects for the first two runs loaded from the file.

```
runIDs = Simulink.sdi.getAllRunIDs;  
runIDs1 = runIDs(end-3);  
runIDs2 = runIDs(end-2);
```

Now, compare the two runs without specifying any tolerances.

```
noTolDiffResult = Simulink.sdi.compareRuns(runIDs1,runIDs2);
```

Use the `getResultByIndex` function to access the comparison results for the `q` and `alpha` signals.

```
qResult = getResultByIndex(noTolDiffResult,1);  
alphaResult = getResultByIndex(noTolDiffResult,2);
```

Check the `Status` of each signal result to see whether the comparison result fell within our out of tolerance.

```
qResult.Status
```

```
ans =  
    ComparisonSignalStatus enumeration
```

```
    OutOfTolerance
```

```
alphaResult.Status
```

```
ans =
    ComparisonSignalStatus enumeration

    OutOfTolerance
```

The comparison used a value of 0 for all tolerances, so the `OutOfTolerance` result means the signals are not identical.

You can further analyze the effect of the time constant by specifying tolerance values for the signals. Specify the tolerances by setting the properties for the `Simulink.sdi.Signal` objects that correspond to the signals being compared. Comparisons use tolerances specified for the baseline signals. This example specifies a time tolerance and an absolute tolerance.

To specify a tolerance, first access the `Signal` objects from the baseline run.

```
runTs1 = Simulink.sdi.getRun(runIDTs1);
qSig = getSignalsByName(runTs1,'q, rad/sec');
alphaSig = getSignalsByName(runTs1,'alpha, rad');
```

Specify an absolute tolerance of 0.1 and a time tolerance of 0.6 for the `q` signal using the `AbsTol` and `TimeTol` properties.

```
qSig.AbsTol = 0.1;
qSig.TimeTol = 0.6;
```

Specify an absolute tolerance of 0.2 and a time tolerance of 0.8 for the `alpha` signal.

```
alphaSig.AbsTol = 0.2;
alphaSig.TimeTol = 0.8;
```

Compare the results again. Access the results from the comparison and check the `Status` property for each signal.

```
tolDiffResult = Simulink.sdi.compareRuns(runIDTs1,runIDTs2);
qResult2 = getResultByIndex(tolDiffResult,1);
alphaResult2 = getResultByIndex(tolDiffResult,2);
```

```
qResult2.Status
```

```
ans =
    ComparisonSignalStatus enumeration

    WithinTolerance
```

```
alphaResult2.Status
```

```
ans =
    ComparisonSignalStatus enumeration

    WithinTolerance
```

Input Arguments

diffRes — Run comparison results

`Simulink.sdi.DiffRunResult` object

Run comparison results containing the signal result you want to access, specified as a `Simulink.sdi.DiffRunResult` object.

index — Index of signal in run comparison results

integer

Index of the signal in the `Simulink.sdi.DiffRunResult` object, specified as an integer.

Example: 2

Output Arguments

diffSig — Comparison results for signal at specified index

`Simulink.sdi.DiffSignalResult` object

Comparison results for the signal at the specified index, returned as a `Simulink.sdi.DiffSignalResult` object.

See Also

`Simulink.sdi.DiffRunResult` | `Simulink.sdi.DiffSignalResult`

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2012b

saveResult

Package: Simulink.sdi

Save comparison results to an MLDATX file

Syntax

```
saveResult(DiffRes, fileName)
saveResult(DiffRes, fileName, saveRuns)
```

Description

`saveResult(DiffRes, fileName)` saves the comparison results in the `Simulink.sdi.DiffRunResult` object, `DiffRes`, and original run data to the MLDATX file, `fileName`. You can load the MLDATX file containing the runs and comparison results into the Simulation Data Inspector using the `Simulink.sdi.load` or `open` functions.

`saveResult(DiffRes, fileName, saveRuns)` saves the comparison results with or without the original run data, depending on the specified value for `saveRuns`.

Examples

Compare Runs with Global Tolerance

You can specify global tolerance values to use when comparing two simulation runs. Global tolerance values are applied to all signals within the run. This example shows how to specify global tolerance values for a run comparison and how to analyze and save the comparison results.

First, load the session file that contains the data to compare. The session file contains data for four simulations of an aircraft longitudinal controller. This example compares data from two runs that use different input filter time constants.

```
Simulink.sdi.load('AircraftExample.mldatx');
```

To access the run data to compare, use the `Simulink.sdi.getAllRunIDs` function to get the run IDs that correspond to the last two simulation runs.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end - 1);
runID2 = runIDs(end);
```

Use the `Simulink.sdi.compareRuns` function to compare the runs. Specify a global relative tolerance value of 0.2 and a global time tolerance value of 0.5.

```
runResult = Simulink.sdi.compareRuns(runID1, runID2, 'reltol', 0.2, 'timetol', 0.5);
```

Check the `Summary` property of the returned `Simulink.sdi.DiffRunResult` object to see whether signals were within the tolerance values or out of tolerance.

```
runResult.Summary
```

```
ans = struct with fields:
    OutOfTolerance: 0
    WithinTolerance: 3
    Unaligned: 0
    UnitsMismatch: 0
    Empty: 0
    Canceled: 0
    EmptySynced: 0
    DataTypeMismatch: 0
    TimeMismatch: 0
    StartStopMismatch: 0
    Unsupported: 0
```

All three signal comparison results fell within the specified global tolerance.

You can save the comparison results to an MLDATX file using the `saveResult` function.

```
saveResult(runResult, 'InputFilterComparison');
```

Input Arguments

DiffRes — Run comparison results

`Simulink.sdi.DiffRunResult` object

Run comparison results that contain the data you want to save, specified as a `Simulink.sdi.DiffRunResult` object.

fileName — MLDATX file name

string | character vector

Name of the MLDATX file where you want to save the results, specified as a string or character array.

Example: `'ComparisonResults'`

saveRuns — Whether to save original run data

1 or true (default) | 0 or false

Whether to save the original run data for the compared runs, specified as a logical 1 (true) or 0 (false). By default, the `saveResult` function saves the original run data along with the comparison results.

Simulink.sdi.DiffSignalResult

Access signal comparison results

Description

When you compare runs or signals using the **Simulation Data Inspector**, the results are returned as either a `Simulink.sdi.DiffSignalResult` object or a `Simulink.sdi.DiffRunResult` object that contains one or more `Simulink.sdi.DiffSignalResult` objects. The `DiffSignalResult` object contains the data and metadata for signal comparison results, such as the difference signal, tolerance data, and the synchronized signal data.

Creation

When you use the Simulation Data Inspector to compare runs or signals, you can access signal comparison results in a `Simulink.sdi.DiffSignalResult` object two ways:

- By using the `Simulink.sdi.compareSignals` function to compare signals.
- By using the `getResultByIndex` function to access `DiffSignalResult` objects in `Simulink.sdi.DiffRunResult` objects.

Properties

Name — Baseline signal name

character vector

This property is read-only.

Baseline signal name, returned as a character vector. When comparison results are complex, the name of the `DiffSignalResult` object that contains the real data is appended with (`real`), and the name of the `DiffSignalResult` object that contains the imaginary data is appended with (`imag`).

Status — Comparison result signal status

`WithinTolerance` | `OutOfTolerance` | `Unaligned` | `Pending` | `Processing` | ...

This property is read-only.

Status of the signal comparison corresponding to the `DiffSignalResult` object, returned as one of the following options. The status can indicate where a given signal comparison is in the comparison process during a long comparison, or it can indicate information about the result of the signal comparison.

- `WithinTolerance` — Signal comparison completed, and all data points compared fell within the specified tolerance.
- `OutOfTolerance` — Signal comparison completed, and some data points compared fell outside of the specified tolerance.

- **Unaligned** — Signal from the baseline run did not align with a signal in the run to compare.
- **Empty** — Aligned signal in the baseline run or run to compare contains no data.
- **EmptySynced** — Synchronized signal in the baseline run or run to compare contains no data. An empty synchronized signal can mean that the signals do not overlap or, if you specified the intersection synchronization method, that they included none of the same time points.
- **Canceled** — Signal result not computed because the user canceled the comparison or the algorithm ended the comparison before computing this signal result.
- **Pending** — Comparison is in progress and the signal result computation has not started.
- **Processing** — Signal result computation in progress.
- **UnitsMismatch** — The signal units in the baseline run and run to compare do not match.
- **DataTypeMismatch** — The signal data types in the baseline run and run to compare do not match. Only results of comparisons configured to check signal data types can have this status.
- **TimeMismatch** — The signal time vectors in the baseline run and run to compare do not match. Only results of comparisons configured to check signal time vectors can have this status.
- **StartStopMismatch** — The signal start and stop times in the baseline run and run to compare do not match. Only results of comparisons configured to check signal start and stop times can have this status.
- **Unsupported** — The Simulation Data Inspector comparison algorithm does not support this type of signal. For example, signals with data types that lose precision when converted to `double` are not supported.

For more information about alignment, tolerances, and synchronization, see “How the Simulation Data Inspector Compares Data”. For more information about configuring comparisons to check for additional metadata, see `Simulink.sdi.compareRuns`.

AlignBy — Property by which signals aligned for comparison

character vector

This property is read-only.

Property by which signals aligned in a run comparison, returned as a character vector. When the `DiffSignalResult` object was created from a signal comparison, the `AlignBy` property is empty. For more information about how run comparisons align signals, see “How the Simulation Data Inspector Compares Data”.

SignalID1 — Baseline signal ID

integer

This property is read-only.

Unique signal identifier for the baseline signal in the comparison, returned as an integer.

SignalID2 — Signal ID of the signal to compare

integer

This property is read-only.

Unique signal identifier for the signal to compare against the baseline signal, returned as an integer.

MaxDifference — Maximum difference

double

This property is read-only.

Maximum difference between the two comparison signals, returned as a double.

Sync1 — Synchronized Baseline signal

`timeseries`

This property is read-only.

Synchronized baseline signal, returned as a `timeseries` object. For more information about synchronization, see “How the Simulation Data Inspector Compares Data”.

Sync2 — Synchronized Compare to signal

`timeseries`

This property is read-only.

Synchronized signal to compare, returned as a `timeseries` object. For more information about synchronization, see “How the Simulation Data Inspector Compares Data”.

Diff — Difference signal

`timeseries`

This property is read-only.

Difference signal resulting from the comparison, returned as a `timeseries` object.

Examples

Compare Two Signals in the Same Run

You can use the Simulation Data Inspector programmatic interface to compare signals within a single run. This example compares the input and output signals of an aircraft longitudinal controller.

First, load the session that contains the data.

```
Simulink.sdi.load('AircraftExample.mldatx');
```

Use the `Simulink.sdi.Run.getLatest` function to access the latest run in the data.

```
aircraftRun = Simulink.sdi.Run.getLatest;
```

Then, you can use the `Simulink.sdi.getSignalsByName` function to access the `Stick` signal, which represents the input to the controller, and the `alpha, rad` signal that represents the output.

```
stick = getSignalsByName(aircraftRun, 'Stick');
alpha = getSignalsByName(aircraftRun, 'alpha, rad');
```

Before you compare the signals, you can specify a tolerance value to use for the comparison. Comparisons use tolerance values specified for the baseline signal in the comparison, so set an absolute tolerance value of `0.1` on the `Stick` signal.

```
stick.AbsTol = 0.1;
```

Now, compare the signals using the `Simulink.sdi.compareSignals` function. The `Stick` signal is the baseline, and the `alpha, rad` signal is the signal to compare against the baseline.

```
comparisonResults = Simulink.sdi.compareSignals(stick.ID,alpha.ID);
match = comparisonResults.Status

match =
  ComparisonSignalStatus enumeration

  OutOfTolerance
```

The comparison result is out of tolerance. You can use the `Simulink.sdi.view` function to open the Simulation Data Inspector to view and analyze the comparison results.

Alternatives

You can view and inspect comparison results using the Simulation Data Inspector UI. For more information, see “Compare Simulation Data”.

Simulink.sdi.Run

Access run signals and metadata

Description

The `Simulink.sdi.Run` object contains run metadata and allows you to access the `Simulink.sdi.Signal` objects that contain data and metadata for the signals in the run. You can also use a `Simulink.sdi.Run` object to import data into the Simulation Data Inspector from the workspace or a file.

Creation

The Simulation Data Inspector creates `Simulink.sdi.Run` objects when you import data or simulate a model that logs data. You can access a Run object in the Simulation Data Inspector three ways:

- When you want to access a run that corresponds to a specific run ID, use the `Simulink.sdi.getRun` function.

Tip Use the `Simulink.sdi.getAllRunIDs` function to get the run IDs for all the runs in the Simulation Data Inspector.

- When you want to access the most recently created run in the Simulation Data Inspector, use the `Simulink.sdi.Run.getLatest` function.
- When you want to access the run that corresponds to the in-progress or most recently completed simulation of a model, use the `Simulink.sdi.getCurrentSimulationRun` function.

You can also programmatically create a `Simulink.sdi.Run` object to import data into the Simulation Data Inspector.

- Create an empty run in the Simulation Data Inspector using the `Simulink.sdi.Run.create` function.
- Create an empty run in the Simulation Data Inspector or import data into the Simulation Data Inspector using the `Simulink.sdi.createRun`.

Tip Use the `add` function or the `Simulink.sdi.addToRun` function to import data into an empty Run object.

Properties

ID — Run ID

integer

This property is read-only.

Unique numerical identification for the run, returned as an integer.

Name — Run name

character vector | string

Run name, specified as a character vector or string.

By default, the `Name` property is empty when you use the `Simulink.sdi.Run.create` function to create a run.

You can specify the run name when you use the `Simulink.sdi.createRun` function to create a run.

When you create a run by simulating a model that logs data, the run name is generated according to the run-naming rule in the Simulation Data Inspector. You can modify the run-naming rule in the Simulation Data Inspector in the UI or by using the `Simulink.sdi.setRunNamingRule` function.

Example: 'Run 1: vdp'

Description — Run description

[] (default) | character vector | string

Description of the run, specified as a character vector or string. By default, `Description` is empty. Use the `Description` property to add notes about the significance of the data within the run, like the test or simulation conditions used to create the data.

Example: 'Initial simulation'

Tag — Information tag

[] (default) | character vector | string

Tag for additional run information, specified as a character vector or string. By default, `Tag` is empty. You can use the `Tag` property to attach additional information to the `Run` object. For example, you could use the `Tag` property to include parameter values used for the simulation that created the run in the `Run` object metadata.

Example: 'Gain = 2'

DateCreated — Run creation timestamp

datetime object

Date and time the run was created, returned as a `datetime` object.

Example: 07-Dec-2019 13:55:25

Data Types: `datetime`

RunIndex — Index of run in Simulation Data Inspector

integer

This property is read-only.

Index of the run in the Simulation Data Inspector when the run was created, returned as an integer. The `RunIndex` matches the run number in the run name when you use the run index as part of the run-naming rule.

If you delete runs from the Simulation Data Inspector, the value of the `RunIndex` property may not match the index of the run ID in the vector returned by the `Simulink.sdi.getAllRunIDs` function.

SignalCount — Number of signals in run

integer

This property is read-only.

Number of signals in the run, returned as an integer.

Model — Model simulated to create run

character vector

Name of the model simulated to create the run, returned as a character vector. The `Model` property is empty for runs created by importing data into the Simulation Data Inspector.

SimMode — Simulation mode

character vector

Simulation mode used in the simulation that created the run, returned as a character vector. The `SimMode` property is empty for runs created by importing data into the Simulation Data Inspector.

StartTime — Run start time

scalar

First time point shared by all signals in the run, returned as a scalar.

StopTime — Run stop time

scalar

Last time point shared by all signals in the run, returned as a scalar.

SLVersion — Software version used for model simulation that created run

character vector

Version of Simulink used for the simulation that created the run, returned as a character vector. The `SLVersion` property is empty for runs created by importing data into the Simulation Data Inspector.

ModelVersion — Version of model simulated to create run

character vector

Version of the model that was simulated to create the run, returned as a character vector. The version of a model is stored in its model properties. The `ModelVersion` property is empty for runs created by importing data into the Simulation Data Inspector.

UserID — System account

character vector

System account used to perform the simulation that created the run, returned as a character vector. The `UserID` property is empty for runs created by importing data into the Simulation Data Inspector.

MachineName — Name of machine used for simulation

character vector

Name of the machine used to perform the simulation that created the run, returned as a character vector. The `MachineName` property is empty for runs created by importing data into the Simulation Data Inspector.

Platform — Operating system on machine used for simulation

character vector

Operating system on the machine used to perform the simulation, returned as a character vector. The `Platform` property is empty for runs that do not correspond to a simulation.

Example: 'PCWIN64'

TaskName — Task name

[] (default) | character vector

Name of the simulation task that corresponds to the run, returned as a character vector. The `TaskName` property is empty unless the run was created using Parallel Computing Toolbox workers.

SolverType — Type of solver used in simulation that created run

'Variable-Step' | 'Fixed-Step'

Type of solver used in the simulation that created the run, returned as 'Variable-Step' or 'Fixed-Step'. The `SolverType` property is empty for runs created by importing data into the Simulation Data Inspector.

SolverName — Name of solver used in simulation that created run

character vector

Name of the solver used in the simulation that created the run, returned as a character vector. The `SolverName` property is empty for runs created by importing data into the Simulation Data Inspector.

Example: ode45

SolverStepSize — Solver step size used in simulation

character vector

Step size used by the solver during the simulation, returned as a character vector. If the simulation used a fixed-step solver, the `SolverStepSize` property indicates the fixed step size used in the simulation. If the simulation used a variable-step solver, the `SolverStepSize` property indicates the maximum step size used in the simulation.

Example: '0.4'

Status — Simulation status

character vector

Simulation status, returned as a character vector. When the simulation is running, the `Status` property is 'Running'. When a simulation is paused or completes, the `Status` property takes the value from the `StopEvent` field of the `Simulink.SimulationMetadata` object `StopEvent` property. The `StopEvent` property has one of these values:

- `ReachedStopTime` — The simulation completed with no reported errors, not including errors reported in the `StopFcn` callback, which executes after the simulation stops.
- `ModelStop` — A block or solver stopped the simulation before the simulation stop time.
- `StopCommand` — A **Stop** button press or `set_param` function call ended the simulation.
- `DiagnosticError` — A reported error ended the simulation.
- `KeyboardControlC` — A `Ctrl+C` keyboard entry ended the simulation.
- `PauseCommand` — A **Pause** button press or `set_param` function call paused the simulation.
- `ConditionalPause` — A conditional breakpoint paused the simulation.

- **PauseTime** — A specified pause time paused the simulation.
- **StepForward** — The simulation paused after stepping forward while stepping through a simulation.
- **StepBackward** — The simulation paused after stepping backward while stepping through a simulation.
- **Timeout** — The simulation stopped after the simulation execution time exceeded the timeout time specified using the 'Timeout' name-value pair for the `sim` function.

StopEventSource — Block that issued stop event

`Simulink.SimulationData.BlockPath`

Block that issued the stop event that stopped the simulation, returned as a `Simulink.SimulationData.BlockPath` object.

StopEventDescription — Translated description of simulation stop

character vector

Translated description of the simulation stop, returned as a character vector. The `StopEventDescription` includes a description of the stop event and the associated simulation time, if applicable. The `StopEventDescription` property takes its value from the `StopEventDescription` field of the `Simulink.SimulationMetadata` object `ExecutionInfo` property.

Example: 'Pause command issued at time 100'

ExecutionErrors — Errors that occurred during simulation

character vector

Errors that occurred during simulation, returned as a character vector.

ExecutionWarnings — Warnings that occurred during simulation

character vector

Warnings that occurred during simulation, returned as a character vector.

ModelInitializationTime — Time to initialize model for simulation that created run

double

Time required to initialize the model for the simulation that created the run, returned as a double. The `ModelInitializationTime` property is empty for runs created by importing data into the Simulation Data Inspector.

ModelExecutionTime — Execution time for simulation that created run

double

Execution time for the simulation that created the run, returned as a double. The `ModelExecutionTime` property is empty for runs created by importing data into the Simulation Data Inspector.

ModelTerminationTime — Time to terminate simulation that created run

double

Time to terminate the simulation that created the run, returned as a double. The `ModelTerminationTime` property is empty for runs created by importing data into the Simulation Data Inspector.

ModelTotalElapsedTime — Total simulation time for simulation that created run

double

Total simulation time for the simulation that created the run, returned as a double. The `ModelTotalElapsedTime` property is empty for runs created by importing data into the Simulation Data Inspector.

UserString — User-specified string

character vector

User-specified string that corresponds to the simulation, returned as a character vector. Often, the `UserString` provides a brief description of the simulation. You specify the `UserString` for a simulation in the `Simulink.SimulationInput` object for the simulation.

Object Functions

<code>add</code>	Import data into existing run in Simulation Data Inspector using <code>Simulink.sdi.Run</code> object
<code>export</code>	Export run to base workspace or file
<code>getAllSignalIDs</code>	Get all signal IDs for signals in <code>Simulink.sdi.Run</code> object
<code>getAllSignals</code>	Get all signals in <code>Simulink.sdi.Run</code> object
<code>getDatasetRef</code>	Create a <code>Simulink.sdi.DatasetRef</code> object for a run
<code>getSignalByIndex</code>	Get signal in <code>Simulink.sdi.Run</code> object by index
<code>getSignalIDByIndex</code>	Get signal ID for signal at specified index in <code>Simulink.sdi.Run</code> object
<code>getSignalIDsByName</code>	Get signal IDs for signals inside <code>Simulink.sdi.Run</code> object using signal name
<code>getSignalsByName</code>	Access signals in a <code>Simulink.sdi.Run</code> object using signal name
<code>isValidSignalID</code>	Check whether signal ID corresponds to signal in <code>Simulink.sdi.Run</code> object

Examples**Plot Signals from Simulation Run**

This example demonstrates how to access the `Simulink.sdi.Run` object for a Simulation Data Inspector run created by logging signals. From the `Simulink.sdi.Run` object you can get `Simulink.sdi.Signal` objects that contain the logged signal data and metadata. You can use the `Signal` objects and the `plotOnSubPlot` function to plot the data in the Simulation Data Inspector.

Create a Simulation Run and Access the Run Object

The `ex_vdp` model logs two signals. To create a simulation run containing the logged data, simulate the model.

```
sim('ex_vdp');
```

The Simulation Data Inspector keeps track of runs by assigning a unique numeric run ID to each run created by simulation, importing data, or opening a session. To access the run object for the simulation you just performed, use the `Simulink.sdi.getAllRunIDs` function and take the last run ID in the returned vector.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Once you have the run ID for the run, you can use the `Simulink.sdi.getRun` function to get the `Simulink.sdi.Run` object that corresponds to the run. You can use the `Run` object to check the metadata associated with the run, including the number of signals in the run.

```
vdpRun = Simulink.sdi.getRun(runID);  
vdpRun.SignalCount  
ans = int32  
     2
```

Plot Data Using Signal Objects

Use the `getSignalByIndex` function to access signals from the Run object, `fuelRun`.

```
signal1 = getSignalByIndex(vdpRun,1);  
signal2 = getSignalByIndex(vdpRun,2);
```

Use the `Simulink.sdi.setSubPlotLayout` function to specify a 3-by-1 layout.

```
Simulink.sdi.setSubPlotLayout(2,1)
```

Before plotting the data, use the `Simulink.sdi.clearAllSubPlots` function to clear any data that is already plotted.

```
Simulink.sdi.clearAllSubPlots
```

Plot one signal on each subplot. To plot signals on the first subplot, you can set the checked property for the signal. To plot signals on subplots other than the first subplot, use the `plotOnSubPlot` function.

```
signal1.Checked = true;  
plotOnSubPlot(signal2,2,1,true);
```

View the Plotted Data

To view the plots you just created, open the Simulation Data Inspector using the `Simulink.sdi.view` function.

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

Create timeseries objects to contain data for a sine signal and a cosine signal. Give each timeseries object a descriptive name.

```
time = linspace(0,20,100);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Run and Add Data

Use the `Simulink.sdi.view` function to open the Simulation Data Inspector.

```
Simulink.sdi.view
```

To import data into the Simulation Data Inspector from the workspace, create a `Simulink.sdi.Run` object using the `Simulink.sdi.Run.create` function. Add information about the run to its metadata using the `Name` and `Description` properties of the Run object.

```
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals with different frequencies';
```

Use the `add` function to add the data you created in the workspace to the empty run.

```
add(sinusoidsRun, 'vars', sine_ts, cos_ts);
```

Plot the Data in the Simulation Data Inspector

Use the `getSignalByIndex` function to access `Simulink.sdi.Signal` objects that contain the signal data. You can use the `Simulink.sdi.Signal` object properties to specify the line style and color for the signal and plot it in the Simulation Data Inspector. Specify the `LineColor` and `LineDashed` properties for each signal.

```
sine_sig = getSignalByIndex(sinusoidsRun,1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';

cos_sig = sinusoidsRun.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.LineDashed = '--';
```

Use the `Simulink.sdi.setSubPlotLayout` function to configure a 2-by-1 subplot layout in the Simulation Data Inspector plotting area. Then use the `plotOnSubPlot` function to plot the sine signal on the top subplot and the cosine signal on the lower subplot.

```
Simulink.sdi.setSubPlotLayout(2,1);

plotOnSubPlot(sine_sig,1,1,true);
plotOnSubPlot(cos_sig,2,1,true);
```

Close the Simulation Data Inspector and Save Your Data

When you have finished inspecting the plotted signal data, you can close the Simulation Data Inspector and save the session to an MLDATX file.

```
Simulink.sdi.close('sinusoids.mldatx')
```

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
```

```

Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')

% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];

```

Initialize Parallel Workers

Use `gcp` to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd
```

```

% Load system and select signals to log
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)

```

```
end
```

Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7
```

```

% Select value for Ts
Ts_val = Ts_vals(index);

% Change the filter time constant and simulate
modelWorkspace = get_param('slexAircraftExample','modelworkspace');
modelWorkspace.assignin('Ts',Ts_val)
sim('slexAircraftExample')

% Create a worker run for each simulation
workerRun(index) = Simulink.sdi.WorkerRun.getLatest

```

```
end
```

```
spmd
```

```

% Remove temporary directories
cd(workDir)
rmdir(tempDir, 's')
rmpath(workDir)

```

```
end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;
```

```

for a = 1:7
    ds(a) = workerRun(a).getDataset;
end
ds(1)

```

```
ans =
Simulink.SimulationData.Dataset '' with 2 elements
```

	Name	BlockPath
1 [1x1 Signal]	alpha, rad	...rcraftExample/Aircraft Dynamics Model
2 [1x1 Signal]	Stick	slexAircraftExample/Pilot

- Use braces { } to access, modify, or add elements using index.

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```

for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
end

```

```
datasetRef(1)
```

```
ans =
DatasetRef with properties:
    Name: 'Run 3: slexAircraftExample'
    Run: [1x1 Simulink.sdi.Run]
numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local `Run` objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```

for c = 1:7
    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);

```

```
Runs(c).Description = desc;  
Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);
```

```
end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

Alternatives

You can view run metadata and import data using the Simulation Data Inspector UI. For more information, see “View Data in the Simulation Data Inspector”.

“Inspect and Compare Data Programmatically”

Introduced in R2012b

add

Package: Simulink.sdi

Import data into existing run in Simulation Data Inspector using `Simulink.sdi.Run` object

Syntax

```
add(runObj,var)
add(runObj,'vars',var,var2,...,varn)
add(runObj,'namevalue',sourceNames,sigValues)

add(runObj,'file',filename)
add(runObj,'file',filename,Name=Value)
```

Description

Import Data from Workspace

`add(runObj,var)` imports the data in the variable `var` into the Simulation Data Inspector by adding a signal to the run that corresponds to the specified `Simulink.sdi.Run` object.

To import data into a new run, use the `Simulink.sdi.Run.create` function or the `Simulink.sdi.createRun` function.

`add(runObj,'vars',var,var2,...,varn)` imports data from one or more variables into the Simulation Data Inspector by adding one or more signals to the run that corresponds to the specified Run object.

`add(runObj,'namevalue',sourceNames,sigValues)` imports data from one or more variables into the Simulation Data Inspector by adding one or more signals to the run that corresponds to the specified Run object. The `sourceNames` argument specifies values to use for the data source in the metadata for the signals added to the run.

Import Data from File

`add(runObj,'file',filename)` imports data from a file into the Simulation Data Inspector by adding one or more signals to the run that corresponds to the specified Run object. You can use a built-in file reader to import data from a MAT file, CSV file, Microsoft Excel file, or MDF file.

When you need to import data from a file that the built-in readers do not support, you can write your own reader using the `io.reader` class.

`add(runObj,'file',filename,Name=Value)` imports data from a file into the Simulation Data Inspector by adding one or more signals to the run that corresponds to the specified Run object. For example, `sheets=["sheet1" "sheet2"]` specifies the sheets from which to import data when importing data from an Excel file.

Examples

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

Create timeseries objects to contain data for a sine signal and a cosine signal. Give each timeseries object a descriptive name.

```
time = linspace(0,20,100);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Run and Add Data

Use the `Simulink.sdi.view` function to open the Simulation Data Inspector.

```
Simulink.sdi.view
```

To import data into the Simulation Data Inspector from the workspace, create a `Simulink.sdi.Run` object using the `Simulink.sdi.Run.create` function. Add information about the run to its metadata using the `Name` and `Description` properties of the Run object.

```
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals with different frequencies';
```

Use the `add` function to add the data you created in the workspace to the empty run.

```
add(sinusoidsRun,'vars',sine_ts,cos_ts);
```

Plot the Data in the Simulation Data Inspector

Use the `getSignalByIndex` function to access `Simulink.sdi.Signal` objects that contain the signal data. You can use the `Simulink.sdi.Signal` object properties to specify the line style and color for the signal and plot it in the Simulation Data Inspector. Specify the `LineColor` and `LineDashed` properties for each signal.

```
sine_sig = getSignalByIndex(sinusoidsRun,1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';

cos_sig = sinusoidsRun.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.LineDashed = '--';
```

Use the `Simulink.sdi.setSubPlotLayout` function to configure a 2-by-1 subplot layout in the Simulation Data Inspector plotting area. Then use the `plotOnSubplot` function to plot the sine signal on the top subplot and the cosine signal on the lower subplot.

```
Simulink.sdi.setSubPlotLayout(2,1);
```

```
plotOnSubPlot(sine_sig,1,1,true);
plotOnSubPlot(cos_sig,2,1,true);
```

Close the Simulation Data Inspector and Save Your Data

When you have finished inspecting the plotted signal data, you can close the Simulation Data Inspector and save the session to an MLDATX file.

```
Simulink.sdi.close('sinusoids.mldatx')
```

Input Arguments

runObj — Run to which you want to add imported data

Simulink.sdi.Run object

Run to which you want to add imported data, specified as a Simulink.sdi.Run object.

var — Data to import

variable

Data to import, specified as a variable. The Simulation Data Inspector supports time-based data in which sample values are associated with sample times. The Simulation Data Inspector supports all loading and logging data formats, including timeseries and Simulink.SimulationData.Dataset.

Example: myData

sourceNames — Source names for imported data

cell array of character vectors

Source names for imported data, specified as a cell array of character vectors. The source name is used to set the RootSource, TimeSource, and DataSource properties of the Simulink.sdi.Signal objects created from the data specified by the sigValues input.

Provide a sourceNames input when you specify 'namevalue' for the second argument.

Example: {'sig1','sig2'}

sigValues — Data to import

cell array of variables

Data to import, specified as a cell array of variables.

Provide a sigValues input when you specify 'namevalue' for the second argument.

Example: {var1,var2}

filename — Name of file with data to import

character vector

Name of file with data to import, specified as a character vector. Provide a filename input when you specify 'file' for the second argument.

You can create a run from these types of files using file readers built into the Simulation Data Inspector:

- MAT-file
- CSV file
- Microsoft Excel file that contains data formatted according to “Microsoft Excel Import, Export, and Logging Format”.
- MDF file with one of these extensions:
 - .mdf
 - .mf4
 - .mf3
 - .data
 - .dat

When you need to import data from a file that the built-in readers do not support, you can write your own reader using the `io.reader` class. You can also write a custom reader to use instead of the built-in reader for any file extension. For an example, see “Import Data Using a Custom File Reader”.

Example: `'simulation.mat'`

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, . . . , NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Example: `sheets=["sheet1" "sheet2"]`

reader — File reader to use to import data

string | character vector

File reader to use to import data, specified as a string or character vector.

The Simulation Data Inspector prioritizes using a registered custom reader when one is available for the file. When you do not specify a reader, the Simulation Data Inspector uses the first custom reader registered for the file. If no custom readers are registered, the data is imported using the built-in reader.

Specify the reader input when:

- You want to use the built-in reader to import data for a file that is also supported by a custom reader.
- Multiple registered custom readers support the file.

To determine which readers are available to import your file, use the `io.reader.getSupportedReadersForFile` function.

Example: `"MyExcelReader"`

Example: `"built-in"`

sheets — Sheets in Excel file from which to import data

string array | cell array of character vectors

Sheets in Excel file from which to import data, specified as a string array or a cell array of character vectors. By default, the Simulation Data Inspector imports data from all sheets. Use the `sheets` name-value argument when you do not want to import data from all sheets in the Excel file.

When the data in the file does not include simulation numbers and source information, the data on each sheet is imported into a separate run. For more information about formatting data to import from an Excel file, see “Microsoft Excel Import, Export, and Logging Format”.

Example: `["sheet1" "sheet2"]`

model — Model with definitions of user-defined data types

string | character vector

Model with definitions of user-defined data types, specified as a string or character vector.

When you load data from an Excel file that defines signal data types using user-defined data types, such as enumerations, buses, or aliases, the Simulation Data Inspector needs access to the type definition to import the data. You can provide access to the type definitions by:

- Loading the associated object into the MATLAB workspace.
- Specifying the `model` name-value argument to use type definitions saved in the model workspace or a data dictionary.

For more information on formatting data to import from an Excel file, see “Microsoft Excel Import, Export, and Logging Format”.

Example: `"myModel.slx"`

“View Data in the Simulation Data Inspector”

Introduced in R2017b

export

Package: Simulink.sdi

Export run to base workspace or file

Syntax

```
ds = export(runObj)
export(runObj,Name,Value)
```

Description

`ds = export(runObj)` exports the `Simulink.sdi.Run` object `runObj` to the base workspace as the `Simulink.SimulationData.Dataset` object `ds`.

`export(runObj,Name,Value)` exports the `Simulink.sdi.Run` object `runObj` to the base workspace or a file according to the options specified by one or more name-value pair arguments.

Examples

Export Run Data

This example shows how to export data from a run in the Simulation Data Inspector to a `Simulink.SimulationData.Dataset` object in the base workspace that you can use to further process your data. The method you choose to export your run depends on the processing you do in your script. If you have a run object for the run, you can use the `export` method to create a `Simulink.SimulationData.Dataset` object with the run data in the base workspace. If you do not have a run object, use the `Simulink.sdi.exportRun` function to export the run to the workspace.

Export Run Using Simulink.sdi.exportRun

Use the `Simulink.sdi.export` function to export run data to the workspace or a file when your workflow does not include creating a run object.

To create a run of simulation data, open the vdp model, mark signals for logging, and run a simulation.

```
load_system('vdp')

SignalHandles = get_param('vdp', 'Lines');

Simulink.sdi.markSignalForStreaming(SignalHandles(5).Handle, 'on')
Simulink.sdi.markSignalForStreaming(SignalHandles(6).Handle, 'on')

out = sim('vdp');
```

Use the `Simulink.sdi.getAllRunIDs` function to access the most recently created run.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Use the `Simulink.sdi.exportRun` function to export the run data to a `Dataset` object in the workspace.

```
simDataset = Simulink.sdi.exportRun(runID);
```

Export Run Using the export Function

When your task involves creating a Run object, you can use the `export` function to create a `Simulink.SimulationData.Dataset` object in the base workspace to further process the run data. For example, suppose you need to access Run objects for simulation runs with signal data you want to compare using the `Simulink.sdi.compareSignals` function.

Load a model and mark signals for logging. Then simulate the model to create run data.

```
load_system('vdp')

SignalHandles = get_param('vdp', 'Lines');

Simulink.sdi.markSignalForStreaming(SignalHandles(5).Handle, 'on')
Simulink.sdi.markSignalForStreaming(SignalHandles(6).Handle, 'on')

sim('vdp');
```

Use the `Simulink.sdi.getAllRunIDs` function to access the run ID for the most recently created run. Then, use the `Simulink.sdi.getRun` function to access the Run object corresponding to the run.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
vdpRun = Simulink.sdi.getRun(runID);
```

Use the `export` function to export the run data to a `Dataset` object in the workspace.

```
simDataset = export(vdpRun);
```

Input Arguments

runObj — Run with data to export

`Simulink.sdi.Run` object

Run with data to export, specified as a `Simulink.sdi.Run` object.

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: `'to', 'file'`

to — Where to export data

`'variable'` (default) | `'file'`

Where to export data, specified as the comma-separated pair consisting of `'to'` and `'variable'` or `'file'`.

When you export data to a file, you must also specify a file name using the `'filename'` name-value pair argument. You can specify a file name with a `.mat`, `.mlDATX`, or `.xlsx` extension.

When you export a run to a MAT-file, the data is saved in a `Simulink.SimulationData.Dataset` object. When you export more than one run to a MAT-file using the `Simulink.sdi.exportRun` function, the data is saved in a `Dataset` object, where each element is a `Dataset` object that contains the data for one exported run.

Data exported to a Microsoft Excel file is saved using the format described in “Microsoft Excel Import, Export, and Logging Format”.

When you export data to a Microsoft Excel file, you can specify additional options using the `'overwrite'`, `'metadata'`, and `'sharetimecolumn'` name-value pairs.

Example: `'to', 'file'`

filename — Name of file to contain exported data

string | character array

Name of the file to contain the exported data, specified as the comma-separated pair consisting of `'filename'` and a string or character array. Include a `.mat`, `.mlDATX`, or `.xlsx` extension in the file name to specify whether to export the data to a MAT-file, MLDATX file, or a Microsoft Excel file. When you do not specify an extension with a file name, the data exports to a MAT-file.

Use the `'filename'` name-value pair argument when you specify the `'to'` name-value pair argument with the value `'file'`.

When you export data to a Microsoft Excel file, you can specify additional options using the `'overwrite'`, `'metadata'`, and `'sharetimecolumn'` name-value pair arguments.

Example: `'filename', 'mySpreadsheet.xlsx'`

overwrite — Data to overwrite in existing Microsoft Excel file

`'file'` (default) | `'sheetonly'`

Data to overwrite in existing Microsoft Excel file, specified as the comma-separated pair consisting of `'overwrite'` and `'file'` or `'sheetonly'`.

- `'file'` — Overwrite the entire file with the exported data.
- `'sheetonly'` — Only overwrite sheets of the Microsoft Excel file with data that corresponds to the exported data.

When you export data to an existing MAT-file or MLDATX file, the exported data overwrites the entire file.

Example: `'overwrite', 'sheetonly'`

metadata — Metadata to include in exported Microsoft Excel file

`[]` (default) | string array

Metadata to include in the exported Microsoft Excel file, specified as the comma-separated pair consisting of `'metadata'` and a string array. By default, the export operation does not include any metadata. You can export this metadata to the Microsoft Excel file:

- `dataType` — Signal data type

- `units` — Signal units
- `blockPath` — Path to the source block for logged signals
- `interp` — Signal interpolation method
- `portIndex` — Index of the port on the source block for logged signals

You can specify the desired metadata in any order you choose in the string array. The order of the metadata in the string array does not affect the format in the exported file, which always matches the description in “Microsoft Excel Import, Export, and Logging Format”.

Example: `'metadata', ["units", "dataType"]`

sharetimecolumn — Whether signals share time columns in exported Microsoft Excel file
`'on'` (default) | `'off'`

Whether signals that have identical time data share time columns in the exported Microsoft Excel file, specified as the comma-separated pair consisting of `'sharetimecolumn'` and `'on'` or `'off'`. By default, signals with the same time data share a time column in the exported file. When you specify the value as `'off'`, each signal in the exported file has its own time column.

Example: `'sharetimecolumn', 'off'`

Output Arguments

ds — Exported run data

`Simulink.SimulationData.Dataset` object

Exported run data, returned as a `Simulink.SimulationData.Dataset` object.

Alternatives

You can export data programmatically for one or more runs using the `Simulink.sdi.exportRun` function, or you can use the Simulation Data Inspector UI. For more information, see “Save and Share Simulation Data Inspector Data and Views”.

Introduced in R2017b

getAllSignalIDs

Package: Simulink.sdi

Get all signal IDs for signals in Simulink.sdi.Run object

Syntax

```
sigIDs = getAllSignalIDs(runObj)
```

Description

`sigIDs = getAllSignalIDs(runObj)` returns an array, `sigIDs`, that contains the signal IDs for all signals in the Simulink.sdi.Run object `runObj`. Use the `getAllSignalIDs` function when you need to work with many or all of the signals in the run. When you only need to analyze a specific signal, you can access the single `Signal` object using the `getSignalIDsByName` function or the `getSignalIDByIndex` function.

Examples

Get Signal IDs for All Signals in a Run

You can use the `getAllSignalIDs` function to access an array containing the signal IDs for all the signals in a run. This example simulates the `slexAircraftExample` model to create run data and then shows how to get the signal IDs for the signals in the run and use the IDs to compare the signals.

Create a Run

This example creates a run in the Simulation Data Inspector by simulating a model that logs data. Load the `slexAircraftExample` model and mark the `Stick` and `alpha, rad` signals for logging.

```
load_system('slexAircraftExample')
```

```
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
```

```
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')
```

Simulate the model.

```
out = sim('slexAircraftExample');
```

Access Run Data and Signal IDs

Use the `Simulink.sdi.getCurrentSimulationRun` function to access the run created when you simulated the `slexAircraftExample` model.

```
airRun = Simulink.sdi.getCurrentSimulationRun('slexAircraftExample');
```

Get an array of the signal IDs for the logged signals using the `getAllSignalIDs` function.

```
sigIDs = getAllSignalIDs(airRun);
```

Compare Logged Signals

You can use the signal IDs to compare the logged signals. Use the `Simulink.sdi.getSignal` function to get the `Simulink.sdi.Signal` object with the first ID in the array `sigIDs`. Check the `Name` property for the returned `Signal` object.

```
sigID1 = sigIDs(1);
sig1 = Simulink.sdi.getSignal(sigID1);
sig1.Name
```

```
ans =
'alpha, rad'
```

Use the input signal, `Stick`, as the baseline signal in the signal comparison.

```
sigID2 = sigIDs(2);
DSR = Simulink.sdi.compareSignals(sigID2, sigID1);
DSR.Status
```

```
ans =
  ComparisonSignalStatus enumeration
    OutOfTolerance
```

The signals do not match. You can use the tolerance properties of the `Signal` objects to programmatically analyze the data, or you can open the Simulation Data Inspector using the `Simulink.sdi.view` function to view and analyze the comparison results using the UI.

Input Arguments

runObj — Run containing signals you want to access

`Simulink.sdi.Run` object

Run containing the signals you want to access, specified as a `Simulink.sdi.Run` object.

Output Arguments

sigIDs — Signal IDs for signals in run

array

Signal IDs for the signals in the run, returned as an array.

See Also

`Simulink.sdi.Signal` | `Simulink.sdi.Run` | `getAllSignals` | `getSignalsByName` | `getSignalIDsByName` | `getSignalByIndex` | `getSignalIDByIndex` | `Simulink.sdi.getSignal` | `getSignal`

getAllSignals

Package: Simulink.sdi

Get all signals in Simulink.sdi.Run object

Syntax

```
sigs = getAllSignals(runObj)
```

Description

`sigs = getAllSignals(runObj)` returns an array of `Simulink.sdi.Signal` objects, `sigs`, that correspond to the signals contained in the `Simulink.sdi.Run` object `runObj`. Use the `getAllSignals` function when you need to work with many or all of the signals in the run. When you need to analyze a specific signal, you can access the single `Signal` object using the `getSignalsByName` function or the `getSignalByIndex` function.

Examples

Get All Signals in a Run

You can use the `getAllSignals` function to access `Simulink.sdi.Signal` objects for each signal in a `Simulink.sdi.Run` object when you want to analyze all the data in the run. This example shows how to access and inspect signal data logged in the `sldemo_autotrans` model.

Create a Run

This example creates a run in the Simulation Data Inspector by simulating a model that logs data.

```
out = sim('sldemo_autotrans');
```

Access Run and Signal Data

Access the run and signal data using the Simulation Data Inspector programmatic interface. Use the `Simulink.sdi.getCurrentSimulationRun` function to get the `Run` object created when you simulated the `sldemo_autotrans` model.

```
autoRun = Simulink.sdi.getCurrentSimulationRun('sldemo_autotrans');
```

Use the `getAllSignals` function to get an array of `Signal` objects containing the logged signal data.

```
autoSigs = getAllSignals(autoRun);
```

You can use a `for` loop to inspect or analyze the data in each `Signal` object in the array. For example, you could check the name of each signal.

```
count = length(autoSigs);  
for idx = 1:count  
    sig = autoSigs(idx);
```

```
name = sig.Name;
formatSpec = "The signal at index %d is named %s\n";
fprintf(formatSpec,idx,name)
end
```

```
The signal at index 1 is named EngineRPM
The signal at index 2 is named Throttle
The signal at index 3 is named Brake
The signal at index 4 is named ShiftLogic:1
The signal at index 5 is named ImpellerTorque
The signal at index 6 is named OutputTorque
The signal at index 7 is named VehicleSpeed
The signal at index 8 is named TransmissionRPM
```

Input Arguments

runObj — Run containing signals you want to access

Simulink.sdi.Run object

Run containing the signals you want to access, specified as a Simulink.sdi.Run object.

Output Arguments

sigs — Signals contained in run

array of Simulink.sdi.Signal objects

Signals contained in the run, returned as an array of Simulink.sdi.Signal objects.

getDatasetRef

Package: Simulink.sdi

Create a Simulink.sdi.DatasetRef object for a run

Syntax

```
sdiDSRef = getDatasetRef(runObj)
```

Description

`sdiDSRef = getDatasetRef(runObj)` creates a `Simulink.sdi.DatasetRef` object, `sdiDSRef`, that references the data in the `Simulink.sdi.Run` object `runObj`. Use a `DatasetRef` object to process your data when the data is too large to fit into memory.

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sl-demo-absbrake` system with different desired slip ratios.

```
% Simulate model ex_sl-demo-absbrake to create a run of logged signals
load_system('ex_sl-demo-absbrake')
sim('ex_sl-demo-absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell
    {'yout'}
    {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
    Ww: [1x1 timeseries]
```

```
Vs: [1x1 timeseries]
Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

Input Arguments

runObj — Run with data that does not fit in memory

Simulink.sdi.Run object

Run with data you want to process that does not fit into memory, specified as a `Simulink.sdi.Run` object.

Output Arguments

sdiDSRef — Reference to run data

Simulink.sdi.DatasetRef object

Reference to run data that you can use to process data that does not fit into memory, returned as a `Simulink.sdi.DatasetRef` object.

See Also

`Simulink.sdi.Run` | `Simulink.sdi.DatasetRef`

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2017b

getSignalByIndex

Package: Simulink.sdi

Get signal in Simulink.sdi.Run object by index

Syntax

```
sig = getSignalByIndex(runObj,idx)
```

Description

`sig = getSignalByIndex(runObj,idx)` returns the Simulink.sdi.Signal object, `sig`, at the index specified by `idx` within the Simulink.sdi.Run object `runObj`.

Examples

Plot Signals from Simulation Run

This example demonstrates how to access the Simulink.sdi.Run object for a Simulation Data Inspector run created by logging signals. From the Simulink.sdi.Run object you can get Simulink.sdi.Signal objects that contain the logged signal data and metadata. You can use the Signal objects and the plotOnSubPlot function to plot the data in the Simulation Data Inspector.

Create a Simulation Run and Access the Run Object

The `ex_vdp` model logs two signals. To create a simulation run containing the logged data, simulate the model.

```
sim('ex_vdp');
```

The Simulation Data Inspector keeps track of runs by assigning a unique numeric run ID to each run created by simulation, importing data, or opening a session. To access the run object for the simulation you just performed, use the Simulink.sdi.getAllRunIDs function and take the last run ID in the returned vector.

```
runIDs = Simulink.sdi.getAllRunIDs;  
runID = runIDs(end);
```

Once you have the run ID for the run, you can use the Simulink.sdi.getRun function to get the Simulink.sdi.Run object that corresponds to the run. You can use the Run object to check the metadata associated with the run, including the number of signals in the run.

```
vdpRun = Simulink.sdi.getRun(runID);
```

```
vdpRun.SignalCount
```

```
ans = int32  
     2
```

Plot Data Using Signal Objects

Use the `getSignalByIndex` function to access signals from the Run object, `fuelRun`.

```
signal1 = getSignalByIndex(vdpRun,1);  
signal2 = getSignalByIndex(vdpRun,2);
```

Use the `Simulink.sdi.setSubPlotLayout` function to specify a 3-by-1 layout.

```
Simulink.sdi.setSubPlotLayout(2,1)
```

Before plotting the data, use the `Simulink.sdi.clearAllSubPlots` function to clear any data that is already plotted.

```
Simulink.sdi.clearAllSubPlots
```

Plot one signal on each subplot. To plot signals on the first subplot, you can set the checked property for the signal. To plot signals on subplots other than the first subplot, use the `plotOnSubPlot` function.

```
signal1.Checked = true;  
plotOnSubPlot(signal2,2,1,true);
```

View the Plotted Data

To view the plots you just created, open the Simulation Data Inspector using the `Simulink.sdi.view` function.

Input Arguments

runObj — Run that contains desired signal

Simulink.sdi.Run object

Run that contains the signal you want to access, specified as a `Simulink.sdi.Run` object.

idx — Index of signal in run

integer

Index of the signal within the run, specified as an integer.

Output Arguments

sig — Signal at specified index

Simulink.sdi.Signal object

Signal at the specified index in the Run object, returned as a `Simulink.sdi.Signal` object.

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2012b

getSignalIDByIndex

Package: Simulink.sdi

Get signal ID for signal at specified index in Simulink.sdi.Run object

Syntax

```
sigID = getSignalIDByIndex(runObj,idx)
```

Description

`sigID = getSignalIDByIndex(runObj,idx)` returns the signal ID `sigID` for the signal at the specified index `idx` in the Simulink.sdi.Run object `runObj`.

Tip You can use the signal ID to get the Simulink.sdi.Signal object that contains the signal data and metadata or perform a signal comparison using the Simulink.sdi.compareSignals function.

Examples

Compare Two Signals in the Same Run

You can use the Simulation Data Inspector programmatic interface to compare signals within a single run. This example compares the input and output signals of an aircraft longitudinal controller.

First, load the session that contains the data.

```
Simulink.sdi.load('AircraftExample.mldatx');
```

Use the Simulink.sdi.Run.getLatest function to access the latest run in the data.

```
aircraftRun = Simulink.sdi.Run.getLatest;
```

Then, you can use the Simulink.sdi.getSignalsByName function to access the `Stick` signal, which represents the input to the controller, and the `alpha, rad` signal that represents the output.

```
stick = getSignalsByName(aircraftRun,'Stick');  
alpha = getSignalsByName(aircraftRun,'alpha, rad');
```

Before you compare the signals, you can specify a tolerance value to use for the comparison. Comparisons use tolerance values specified for the baseline signal in the comparison, so set an absolute tolerance value of 0.1 on the `Stick` signal.

```
stick.AbsTol = 0.1;
```

Now, compare the signals using the Simulink.sdi.compareSignals function. The `Stick` signal is the baseline, and the `alpha, rad` signal is the signal to compare against the baseline.

```
comparisonResults = Simulink.sdi.compareSignals(stick.ID,alpha.ID);  
match = comparisonResults.Status
```

```
match =  
    ComparisonSignalStatus enumeration  
  
    OutOfTolerance
```

The comparison result is out of tolerance. You can use the `Simulink.sdi.view` function to open the Simulation Data Inspector to view and analyze the comparison results.

Input Arguments

runObj – Run that contains desired signal

`Simulink.sdi.Run` object

Run that contains the desired signal, specified as a `Simulink.sdi.Run` object.

idx – Index of signal in run

integer

Index of the signal within the run, specified as an integer.

Output Arguments

sigID – Signal ID

integer

Unique numeric signal identifier, returned as an integer.

Introduced in R2012b

getSignalIDsByName

Package: Simulink.sdi

Get signal IDs for signals inside Simulink.sdi.Run object using signal name

Syntax

```
sigIDs = getSignalIDsByName(runObj,name)
```

Description

`sigIDs = getSignalIDsByName(runObj,name)` returns one or more signal IDs for signals in the Simulink.sdi.Run object with the specified name, name.

Examples

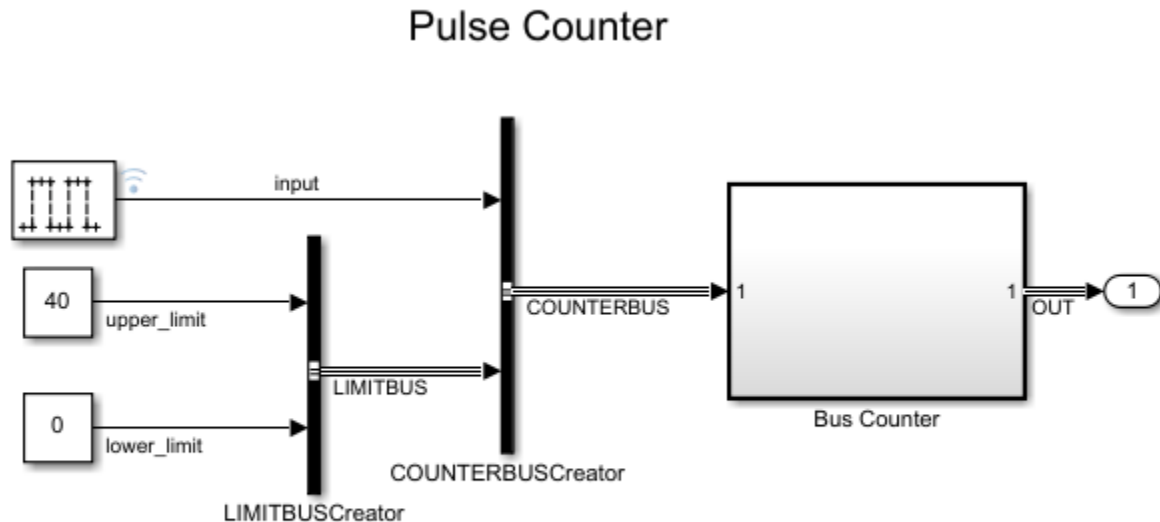

Get Signal IDs by Signal Name

You can access signal IDs for signals inside a Simulink.sdi.Run object by specifying the name of the signal for which you want the signal ID. You can use the signal ID to compare signals using the Simulink.sdi.compareSignals function, access the Simulink.sdi.Signal object for the signal using the Simulink.sdi.getSignal function, or delete the signal from the Simulation Data Inspector using the Simulink.sdi.deleteSignal function.

This example shows how to use the getSignalIDsByName function to access a signal using its name or its block path and how to access the signal ID for a signal contained inside a bus.

Create Data in the Simulation Data Inspector

This example uses a model of a pulse counter to create simulation data in the Simulation Data Inspector. The model has two input signals that define the upper and lower limits for the counter, and one input pulse signal with pulses to count. The model uses buses to send data into the Bus Counter subsystem and out of it to an Outport block. The model is configured to log the pulse signal, input, and the output signal, OUT, which is connected to the Outport block.

Simulate the model to create a run that contains the logged data in the Simulation Data Inspector.

```
out = sim('ex_pulse_counter');
```

Access Signal IDs

Use the Simulation Data Inspector programmatic interface to access the logged data. The `Simulink.sdi.Run.getLatest` function returns the `Simulink.sdi.Run` object that corresponds to the most recently created run. You can access the signal IDs for logged signals from the `Simulink.sdi.Run` object.

```
countRun = Simulink.sdi.Run.getLatest;
```

Use the `getSignalIDsByName` function to access the signal ID for the input signal.

```
inSigID = getSignalIDsByName(countRun, 'input');
```

In a more complicated model, multiple signals might have the same name. In that case, using only the signal name with the `getSignalIDsByName` function results in an array of signal IDs for all logged signals in the model that use that name. To avoid duplicate results, you can specify the block path and signal name together. Use dots to separate elements of the block path instead of slashes. For example, to access the signal ID for the input signal, you could also specify the name as `'ex_pulse_counter.Pulse Generator.input'`.

```
inSigID = getSignalIDsByName(countRun, 'ex_pulse_counter.Pulse Generator.input');
```

Access Signal IDs for Signals Inside Composite Signals

The output logged in the `ex_pulse_counter` model is a bus signal. You can access the signal ID that corresponds to the top bus signal, `OUT`, the nested bus, `LIMITBUS`, and the individual signals in the bus: `output`, `upper_limit`, and `lower_limit`.

To access the signal ID for the top bus, specify the signal name, `OUT`.

```
OUTSigID = getSignalIDsByName(countRun, 'OUT');
```

To access the signal ID for the nested bus, specify the path to the signal in the bus hierarchy.

```
LIMITBUSSigID = getSignalIDsByName(countRun, 'OUT.LIMITBUS');
```

To access the signal ID for one of the individual signals, specify the path to the signal in the bus hierarchy. You cannot access the signal using only the signal name. The `Name` property of the `Signal` object includes the bus hierarchy.

```
upper_limitSigID = getSignalIDsByName(countRun, 'OUT.LIMITBUS.upper_limit');
upper_limitSig = Simulink.sdi.getSignal(upper_limitSigID);
upper_limitSig.Name
```

```
ans =
'OUT.LIMITBUS.upper_limit'
```

Input Arguments

runObj — Run containing signals with IDs you want to access

`Simulink.sdi.Run` object

Run containing the signals with the signal IDs you want to access, specified as a `Simulink.sdi.Run` object.

name — Name of signal with ID you want to access

character vector | string

Name of the signal with the signal ID you want to access, specified as a character vector or string.

A model can use the same signal name for more than one signal. In that case, when you want to access the signal ID for a specific signal, you can include the block path for the block that produces the signal in the name argument. For example, specify name as `'slexAircraftExample.Pilot.Stick'` to access the signal ID for the signal named `Stick` that is the output of the `Pilot` block in the `slexAircraftExample` model.

To access signals inside composite signals, specify the path to the signal through the hierarchy of the composite signal. For example, specify name as `'COUNTERBUS.LIMITBUS.lower_limit'` to access the signal ID for the `lower_limit` signal inside the bus `LIMITBUS` that is nested in the bus `COUNTERBUS`.

Data Types: `char` | `string`

Output Arguments

sigIDs — Signal IDs for signals with specified name

scalar | array

One or more signal IDs for signals with the specified name, returned as a scalar or array.

`Simulink.sdi.compareSignals` | `Simulink.sdi.deleteSignal` | `Simulink.sdi.getSignal` | `getSignalsByName`

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2020a

getSignalsByName

Package: Simulink.sdi

Access signals in a `Simulink.sdi.Run` object using signal name

Syntax

```
sigs = getSignalsByName(runObj,name)
```

Description

`sigs = getSignalsByName(runObj,name)` returns one or more `Simulink.sdi.Signal` objects with the name specified by name.

Examples

Access Simulink.sdi.Signal Objects by Name

You can use the Simulation Data Inspector programmatic interface to access `Simulink.sdi.Signal` objects that correspond to logged or imported data. Using the `getSignalsByName` function, you can specify the name of the signal you want to get from a `Simulink.sdi.Run` object. You can access data for individual signals and composite signals.

Create Data in the Simulation Data Inspector

This example uses a model of a pulse counter to create simulation data in the Simulation Data Inspector. The model has two input signals that define the upper and lower limit for the counter, and one input pulse signal with pulses to count. The model uses buses to send data into the `Bus Counter` subsystem and out of it to an `Outport` block. The model is configured to log the pulse signal, `input`, and the output connected to the `Outport` block.

Pulse Counter

Copyright 1990-2014 The MathWorks, Inc.

Simulate the model to create a run that contains the logged data in the Simulation Data Inspector.

```
out = sim('ex_pulse_counter');
```

Access Signals in the Simulation Data Inspector

Use the Simulation Data Inspector programmatic interface to access the logged data. The `Simulink.sdi.Run.getLatest` function returns the `Simulink.sdi.Run` object that corresponds to the most recently created run.

```
countRun = Simulink.sdi.Run.getLatest;
```

Use the `getSignalsByName` function to access the input signal. Check the `Name` property of the returned `Simulink.sdi.Signal` object.

```
inSig = getSignalsByName(countRun, 'input');
inSig.Name
```

```
ans =
'input'
```

The input signal is not a composite signal, so the `Children` property of the `Signal` object is empty.

```
inChildren = inSig.Children;
size(inChildren)
```

```
ans = 1x2
```

```
0    0
```

Now, use the `getSignalsByName` function to access the output signal, `OUT`. `OUT` is a bus signal that contains the output signal from the counter, `output`, and the counter limit signals, `upper_limit` and `lower_limit`, in a nested bus named `LIMITBUS`.

```
outSig = getSignalsByName(countRun, 'OUT');
```

Check the Name and Children properties for the returned Signal object. The Children property value contains two Signal objects that correspond to the signals at the next level of hierarchy in the OUT bus.

```
outSig.Name
```

```
ans =  
'OUT'
```

```
outChildren = outSig.Children;  
size(outChildren)
```

```
ans = 1×2  
      1     2
```

Because the Signal object `outSig` corresponds to a composite signal, you cannot plot the signal data in the Simulation Data Inspector using the Checked property or the `plotOnSubPlot` function. To plot data in the composite signal, access the individual Signal objects.

Access Signals Inside a Composite Signal

You can access the signals inside the OUT bus and LIMITBUS by indexing into the Children property of the corresponding Signal object. For example, you can access the output signal from the OUT bus Signal object.

```
outChildren = outSig.Children;  
outputSig = outChildren(1);  
outputSig.Name
```

```
ans =  
'OUT.output'
```

You can also get the Signal object for the output signal by specifying the path to the signal through the bus hierarchy.

```
outputSig = getSignalsByName(countRun, 'OUT.output');  
outputSig.Name
```

```
ans =  
'OUT.output'
```

To access the `upper_limit` signal, specify the full path to the signal within the bus.

```
upper_limitSig = getSignalsByName(countRun, 'OUT.LIMITBUS.upper_limit');  
upper_limitSig.Name
```

```
ans =  
'OUT.LIMITBUS.upper_limit'
```

Input Arguments

runObj — Run containing signals you want to access

Simulink.sdi.Run object

Run containing the signals you want to access, specified as a `Simulink.sdi.Run` object.

name — Name of signal you want to access

character vector | string

Name of the signal you want to access, specified as a character vector or string.

A model can use the same signal name for more than one signal. In that case, when you want to access a specific signal, you can include the block path for the block that produces the signal in the name argument. For example, specify name as `'slexAircraftExample.Pilot.Stick'` to access the signal named `Stick` that is the output of the `Pilot` block in the `slexAircraftExample` model.

To access signals inside composite signals, specify the path to the signal through the hierarchy of the composite signal. For example, specify name as `'COUNTERBUS.LIMITBUS.lower_limit'` to access the `lower_limit` signal inside the bus `LIMITBUS` that is nested in the bus `COUNTERBUS`.

Data Types: `char` | `string`

Output Arguments

sigs — Signals matching specified name

`Simulink.sdi.Signal` object | array of `Simulink.sdi.Signal` objects

One or more signals matching the specified name, returned as a `Simulink.sdi.Signal` object or an array of `Simulink.sdi.Signal` objects.

isValidSignalID

Package: Simulink.sdi

Check whether signal ID corresponds to signal in Simulink.sdi.Run object

Syntax

```
isValid = isValidSignalID(runObj,sigID)
```

Description

`isValid = isValidSignalID(runObj,sigID)` returns the logical indication `isValid` of whether the signal ID `sigID` corresponds to a signal in the Simulink.sdi.Run object `runObj`.

Input Arguments

runObj — Run in Simulation Data Inspector

Simulink.sdi.Run object

Run in the Simulation Data Inspector, specified as a Simulink.sdi.Run object.

sigID — Signal ID

integer

Unique numeric signal identifier, specified as an integer. The Simulation Data Inspector assigns a signal ID to each signal when a run is created. You can get the signal ID for a signal using one of these functions:

- `getAllSignalIDs`
- `getSignalIDByIndex`
- `getSignalIDsByName`
- `Simulink.sdi.createRun`

Output Arguments

isValid — Signal validity

logical

Signal validity, returned as a logical 1 or 0.

- 1 — The specified signal ID corresponds to a signal in the specified run.
- 0 — The specified signal ID does not correspond to a signal in the specified run.

Simulink.sdi.Signal

Access signal data and metadata

Description

A `Simulink.sdi.Signal` object contains data and metadata for a signal in the **Simulation Data Inspector**. You can use the `Signal` object properties to inspect signal metadata, visualize signals on time plots, and compare signals using the `Simulink.sdi.compareSignals` function.

Creation

A `Simulink.sdi.Signal` object is created for each signal you log in a model simulation or import into the Simulation Data Inspector. You can access `Signal` objects in the Simulation Data Inspector several ways. Generally, to access a `Signal` object, you first need to get the `Simulink.sdi.Run` object that contains the signal.

- The `Simulink.sdi.getSignal` function returns a `Signal` object that corresponds to the signal ID you provide.
- The `getSignal` function returns the `Signal` object with the specified signal ID inside the specified `Run` object.
- The `getSignalByIndex` function returns the `Signal` object at the specified index within the specified `Run` object.

Properties

Signal Properties

ID — Signal identifier

integer

This property is read-only.

Unique number identifying the signal, returned as an integer. The Simulation Data Inspector assigns a unique numeric ID to each run and signal.

RunID — Run identifier

integer

This property is read-only.

Run identifier for the run that contains the signal, returned as an integer. The Simulation Data Inspector assigns a unique numeric ID to each run and signal.

Name — Signal name

character vector | string

Name of the signal, specified as a character vector or a string. When the `Signal` object contains data logged from a simulation, the name matches the name specified for the signal in the model. If the

model does not specify the name, the signal name is the block path to the block that produces the signal.

Example: 'fuel'

Domain — Signal type

'Signals' | 'Outports' | 'States' | 'Data Store Memory' | 'Parameters' | ...

Signal type, specified as one of these options:

- 'Signals' — Signal logging data.
- 'Outports' — Output logging data.
- 'States' — States logging data.
- 'Data Store Memory' — Data store memory logging data.
- 'Parameters' — Logged parameter data.
- 'Stateflow' — Stateflow data.
- 'Simscape' — Simscape data.
- 'Assessments' — Simulink Test assessment data.
- 'Profiling' — Execution profiling data.

The Domain property is empty for data not created by logging simulation data.

Description — Signal description

' ' (default) | character vector | string

Description of the signal, specified as a character vector or a string. You can use the Description property to annotate the signal or identify the signal content beyond the Name. When you log Simscape data to the Simulation Data Inspector, the Description property is populated automatically for each node.

Stored Units — Units of signal data stored on disk

character vector | string

This property is read-only.

Units of signal data stored on disk, specified as a character vector or a string. For signals generated from simulating a model, the stored units of the Signal objects use the units specified in the model. When you specify display units for a signal without units, the same units are used to set the stored units. To analyze a signal alongside another that uses different units, modify the display units for the signal. The Simulation Data Inspector performs the conversion to plot the data using the display units.

You can convert the stored units for a signal using the convertUnits function. Stored unit conversion does not support undo and may result in precision loss.

Example: 'g/s'

Display Units — Units used to display signal data in the Simulation Data Inspector

character vector | string

Units used to display signal data in the Simulation Data Inspector, specified as a character vector or a string. The display units for a signal may differ from the stored units that reflect the data stored on disk. Modify signal display units to analyze data in the Simulation Data Inspector. Unit preferences in

the Simulation Data Inspector may change the display units for logged and imported signal data. For more information, see “Signal Display Units”.

Example: 'm/s'

Data Type — Data type for signal data

character vector | string

This property is read-only.

Data type of signal data, returned as a character vector or string.

Example: 'double'

Complexity — Complexity of signal data

"real" | "complex"

This property is read-only.

Complexity of signal data, returned as "real" or "complex".

Example: "real"

SampleTime — Signal sample time

character vector

This property is read-only.

Signal sample time, returned as a character vector or scalar. A value of 'Continuous' indicates a variable-step simulation.

Example: 'Continuous'

Example: '0.1'

Model — Name of model that produced signal

character vector

This property is read-only.

Name of the model that produced the signal, returned as a character vector. The `Model` property is empty for `Signal` objects that contain data that was not produced by simulating a model.

Example: 'sldemo_fuelsys'

BlockPath — Block path for block that produced signal

character vector

This property is read-only.

Block path for the block that produced the signal, returned as a character array. The `BlockPath` property is a relative path that does not include model hierarchy. The `BlockPath` property is empty for `Signal` objects that contain data that was not produced by simulating a model.

Example: 'sldemo_fuelsys/Engine Gas Dynamics'

FullBlockPath — Complete block path for block that produced the signal

character vector | cell array

This property is read-only.

Complete block path for the block that produced the signal, including the full model hierarchy, returned as a character vector. For signals within referenced models, `FullBlockPath` is a cell array that contains the full path. For other signals, `FullBlockPath` is identical to `BlockPath`. The `FullBlockPath` property is empty for `Signal` objects that contain data that was not produced by simulating a model.

BlockName — Name of block that produced signal

character vector

This property is read-only.

Name of the block that produced the signal, returned as a character vector. The `BlockName` property is empty for `Signal` objects that contain data that was not produced by simulating a model.

Example: 'Engine Gas Dynamics'

PortIndex — Block port index

integer

This property is read-only.

Index of the output port connected to the signal on the block that produces the signal. The `PortIndex` property is empty for `Signal` objects that contain data that was not produced by simulating a model.

Example: 1

Dimensions — Signal dimensions

integer | integer array

This property is read-only.

Signal dimensions, returned as an integer or integer array.

Example: [1 2]

Channel — Index of signal within matrix

integer array

This property is read-only.

Index of the signal within a matrix, returned as an integer array.

NumPoints — Number of samples in signal

integer

This property is read-only.

Number of samples in the signal, returned as an integer.

Values — Signal values

timeseries | structure

Time and data values for the signal, returned as a `timeseries` object for non-bus signals or structure matching the bus hierarchy for bus signals.

RootSource — High-level structure that contains the imported signal

character vector

This property is read-only.

Name of the high-level structure containing the signal, returned as a character vector. The `RootSource` property only has value for imported signals.

Example: When you import the `Simulink.SimulationOutput` object `simOut` containing structure `xout`, the `RootSource` is `'simOut.get('xout')`

TimeSource — Source of imported signal time data

character vector

This property is read-only.

Path to the signal time data, returned as a character vector. The `TimeSource` property only has value for imported signals.

Example: When you import the `Simulink.SimulationOutput` object `simOut` containing structure `xout`, the `TimeSource` is `'simOut.get('xout').time'`

DataSource — Source of imported signal data

character vector

This property is read-only.

Path to the signal sample values, returned as a character array. The `DataSource` property only has value for imported signals.

Example: When you import the `Simulink.SimulationOutput` object `simOut` containing structure `xout`, the `DataSource` is `'simOut.get('xout').signals(1).values'`

Children — Signals contained by composite signal`Simulink.sdi.Signal` vector

This property is read-only.

Signals contained by the composite signal, returned as `Simulink.sdi.Signal` objects. The `Children` property is empty for scalar signals.

Visualization Properties**ComplexFormat — Display format for complex signals**`"real-imaginary" | "magnitude" | "magnitude-phase" | "phase"`

Complex format used to display complex signal data in the Simulation Data Inspector, specified as one of the following values. You can modify the `ComplexFormat` property for a `Signal` object to change how the Simulation Data Inspector displays the signal data when the object contains data for a complex signal.

- `"real-imaginary"` — The real and imaginary components of the signal display together when you plot the signal. The imaginary component of the signal is plotted with a different shade of the **Line Color**.
- `"magnitude"` — The magnitude of the signal displays when you plot the signal.

- "magnitude-phase" — The magnitude and phase of the signal display together when you plot the signal.
- "phase" — The phase of the signal displays when you plot the signal. The phase is plotted with a different shade of the **Line Color**.

Data Types: char | string

Checked — Whether signal is plotted

0 or false (default) | 1 or true

Whether the signal is plotted, specified as a logical value. Setting Checked to false clears the signal from all subplots. Setting Checked to true plots the signal on the active subplot.

Data Types: logical

LineColor — Signal line color

1-by-3 vector

Color of signal in plots, specified as a 1-by-3 RGB vector with values between 0 and 1.

Example: [0 0.5 0.5]

Data Types: double

LineDashed — Signal line style

'-' | '--' | ':' | '-.'

Signal line style used when the signal is plotted in the Simulation Data Inspector, specified as one of these options:

- '-' — Solid
- '--' — Dashed
- ':' — Dotted
- '-.' — Dash-dotted

LineWidth — Signal line width

1 (default) | integer between 1 and 20

Signal line width used when the signal is plotted in the Simulation Data Inspector, specified as an integer between 1 and 20, inclusive.

InterpMethod — Interpolation method

'linear' (default) | 'zoh' | 'none'

Interpolation method used in data visualization and the synchronization step of comparisons, specified as one of the following values:

- 'zoh' — Zero-order hold interpolation
- 'linear' — Linear interpolation
- 'none' — No interpolation

For more information about the interpolation options, see “How the Simulation Data Inspector Compares Data”.

Comparison Properties

AbsTol — Absolute tolerance

0 (default) | scalar

Absolute tolerance to use in signal comparisons, specified as a positive-valued scalar.

The Simulation Data Inspector uses tolerances specified in the signal properties of the baseline signal when the `OverrideGlobalTol` property is set to `1` or `true`. For more information about tolerances in the Simulation Data Inspector, see “How the Simulation Data Inspector Compares Data”.

Example: `0.1`

Data Types: `double`

RelTol — Relative tolerance

0 (default) | scalar

Relative tolerance to use in signal comparisons, specified as a positive-valued scalar. The relative tolerance is expressed as a fractional multiplier. For example, `0.1` specifies a 10 percent tolerance.

The Simulation Data Inspector uses tolerances specified in the signal properties of the baseline signal when the `OverrideGlobalTol` property is set to `1` or `true`. For more information about tolerances in the Simulation Data Inspector, see “How the Simulation Data Inspector Compares Data”.

Example: `0.05`

Data Types: `double`

TimeTol — Time tolerance

0 (default) | scalar

Time tolerance for the signal used in signal comparisons, specified as a positive-valued scalar. Specify the time tolerance in seconds.

The Simulation Data Inspector uses tolerances specified in the signal properties of the baseline signal when the `OverrideGlobalTol` property is set to `1` or `true`. For more information about tolerances in the Simulation Data Inspector, see “How the Simulation Data Inspector Compares Data”.

Example: `0.1`

Data Types: `double`

OverrideGlobalTol — Whether comparisons use signal tolerance

0 or `false` (default) | `1` or `true`

Whether comparisons use signal tolerance values instead of global tolerance values, specified as a logical value. Set the `OverrideGlobalTol` property to `1` or `true` to use the tolerance values defined in the `Signal` object properties. Set the property to `0` or `false` to use global tolerance values.

For more information about tolerances in the Simulation Data Inspector, see “How the Simulation Data Inspector Compares Data”.

Data Types: `logical`

SyncMethod — Synchronization method

'union' (default) | 'intersection'

Method used to synchronize signals in comparisons, specified as 'union' or 'intersection'. For more information about the synchronization options, see “How the Simulation Data Inspector Compares Data”.

Object Functions

<code>convertUnits</code>	Convert units of <code>Simulink.sdi.Signal</code> object
<code>export</code>	Export data for signal in Simulation Data Inspector to workspace or file
<code>getAsTall</code>	Create tall timetable from <code>Simulink.sdi.Signal</code> object
<code>plotOnSubPlot</code>	Plot <code>Simulink.sdi.Signal</code> object on Simulation Data Inspector subplot

Examples

Analyze Simulation Data Using Signal Tolerances

You can programmatically specify signal tolerance values to use in comparisons performed using the Simulation Data Inspector. In this example, you compare data collected by simulating a model of an aircraft longitudinal flight control system. Each simulation uses a different value for the input filter time constant and logs the input and output signals. You analyze the effect of the time constant change by comparing results using the Simulation Data Inspector and signal tolerances.

First, load the session file that contains the simulation data.

```
Simulink.sdi.load('AircraftExample.mldatx');
```

The session file contains four runs. In this example, you compare data from the first two runs in the file. Access the `Simulink.sdi.Run` objects for the first two runs loaded from the file.

```
runIDs = Simulink.sdi.getAllRunIDs;
runIDs1 = runIDs(end-3);
runIDs2 = runIDs(end-2);
```

Now, compare the two runs without specifying any tolerances.

```
noTolDiffResult = Simulink.sdi.compareRuns(runIDs1,runIDs2);
```

Use the `getResultByIndex` function to access the comparison results for the `q` and `alpha` signals.

```
qResult = getResultByIndex(noTolDiffResult,1);
alphaResult = getResultByIndex(noTolDiffResult,2);
```

Check the `Status` of each signal result to see whether the comparison result fell within our out of tolerance.

```
qResult.Status
```

```
ans =
    ComparisonSignalStatus enumeration
    OutOfTolerance
```

```
alphaResult.Status
```

```
ans =
    ComparisonSignalStatus enumeration
```

```
OutOfTolerance
```

The comparison used a value of 0 for all tolerances, so the `OutOfTolerance` result means the signals are not identical.

You can further analyze the effect of the time constant by specifying tolerance values for the signals. Specify the tolerances by setting the properties for the `Simulink.sdi.Signal` objects that correspond to the signals being compared. Comparisons use tolerances specified for the baseline signals. This example specifies a time tolerance and an absolute tolerance.

To specify a tolerance, first access the `Signal` objects from the baseline run.

```
runTs1 = Simulink.sdi.getRun(runIDTs1);
qSig = getSignalsByName(runTs1, 'q, rad/sec');
alphaSig = getSignalsByName(runTs1, 'alpha, rad');
```

Specify an absolute tolerance of 0.1 and a time tolerance of 0.6 for the `q` signal using the `AbsTol` and `TimeTol` properties.

```
qSig.AbsTol = 0.1;
qSig.TimeTol = 0.6;
```

Specify an absolute tolerance of 0.2 and a time tolerance of 0.8 for the `alpha` signal.

```
alphaSig.AbsTol = 0.2;
alphaSig.TimeTol = 0.8;
```

Compare the results again. Access the results from the comparison and check the `Status` property for each signal.

```
tolDiffResult = Simulink.sdi.compareRuns(runIDTs1, runIDTs2);
qResult2 = getResultByIndex(tolDiffResult, 1);
alphaResult2 = getResultByIndex(tolDiffResult, 2);
```

```
qResult2.Status
```

```
ans =
  ComparisonSignalStatus enumeration
    WithinTolerance
```

```
alphaResult2.Status
```

```
ans =
  ComparisonSignalStatus enumeration
    WithinTolerance
```

Define Comparison and Visualization Properties for a Signal

This example shows how to obtain a `Simulink.sdi.Signal` object and modify its properties using the Simulation Data Inspector programmatic interface.

Create Data in the Simulation Data Inspector

When you simulate a model that logs data, a run is created in the Simulation Data Inspector to contain the logged data. You can also create a run in the Simulation Data Inspector by importing data. This example simulates the `slexAircraftExample` model and logs the data in Dataset format.

```
simOut = sim('slexAircraftExample', 'SaveFormat', 'Dataset');
```

Get a Simulink.sdi.Signal Object

The programmatic simulation returns the logged data in the workspace variable `simOut`. You can access the logged data in that variable. However, to use the Simulation Data Inspector programmatic interface, you need to access the logged data in `Simulink.sdi.Run` and `Simulink.sdi.Signal` objects.

First, use the `Simulink.sdi.getCurrentSimulationRun` to get the Run object that was created when you simulated the `slexAircraftExample` model.

```
aircraftRun = Simulink.sdi.getCurrentSimulationRun('slexAircraftExample');
```

You can use the `getAllSignals` function to access the Signal objects for all the signals in the run. From the returned array of Signal objects, select the first signal.

```
signals = getAllSignals(aircraftRun);
sig = signals(1);
```

Modify the Signal Properties

The `Simulink.sdi.Signal` object has properties that specify options for comparing and visualizing the signal. Specify a line style and color for the signal. Then, use the `Simulink.sdi.setSubPlotLayout` to configure the Simulation Data Inspector to show a single subplot, and use the `plotOnSubPlot` function to plot the signal.

```
sig.LineColor = [1 0.4 0.6];
sig.LineDashed = '-';
```

```
Simulink.sdi.setSubPlotLayout(1,1)
plotOnSubPlot(sig,1,1,true)
```

Use the `Simulink.sdi.view` function to open the Simulation Data Inspector and view the plotted signal.

Compare Two Signals in the Same Run

You can use the Simulation Data Inspector programmatic interface to compare signals within a single run. This example compares the input and output signals of an aircraft longitudinal controller.

First, load the session that contains the data.

```
Simulink.sdi.load('AircraftExample.mldatx');
```

Use the `Simulink.sdi.Run.getLatest` function to access the latest run in the data.

```
aircraftRun = Simulink.sdi.Run.getLatest;
```

Then, you can use the `Simulink.sdi.getSignalsByName` function to access the `Stick` signal, which represents the input to the controller, and the `alpha, rad` signal that represents the output.

```
stick = getSignalsByName(aircraftRun, 'Stick');
alpha = getSignalsByName(aircraftRun, 'alpha, rad');
```

Before you compare the signals, you can specify a tolerance value to use for the comparison. Comparisons use tolerance values specified for the baseline signal in the comparison, so set an absolute tolerance value of 0.1 on the `Stick` signal.

```
stick.AbsTol = 0.1;
```

Now, compare the signals using the `Simulink.sdi.compareSignals` function. The `Stick` signal is the baseline, and the `alpha, rad` signal is the signal to compare against the baseline.

```
comparisonResults = Simulink.sdi.compareSignals(stick.ID,alpha.ID);
match = comparisonResults.Status
```

```
match =
    ComparisonSignalStatus enumeration
        OutOfTolerance
```

The comparison result is out of tolerance. You can use the `Simulink.sdi.view` function to open the Simulation Data Inspector to view and analyze the comparison results.

Plot Signals from Simulation Run

This example demonstrates how to access the `Simulink.sdi.Run` object for a Simulation Data Inspector run created by logging signals. From the `Simulink.sdi.Run` object you can get `Simulink.sdi.Signal` objects that contain the logged signal data and metadata. You can use the `Signal` objects and the `plotOnSubPlot` function to plot the data in the Simulation Data Inspector.

Create a Simulation Run and Access the Run Object

The `ex_vdp` model logs two signals. To create a simulation run containing the logged data, simulate the model.

```
sim('ex_vdp');
```

The Simulation Data Inspector keeps track of runs by assigning a unique numeric run ID to each run created by simulation, importing data, or opening a session. To access the run object for the simulation you just performed, use the `Simulink.sdi.getAllRunIDs` function and take the last run ID in the returned vector.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Once you have the run ID for the run, you can use the `Simulink.sdi.getRun` function to get the `Simulink.sdi.Run` object that corresponds to the run. You can use the `Run` object to check the metadata associated with the run, including the number of signals in the run.

```
vdpRun = Simulink.sdi.getRun(runID);
```

```
vdpRun.SignalCount
```

```
ans = int32
     2
```

Plot Data Using Signal Objects

Use the `getSignalByIndex` function to access signals from the Run object, `fuelRun`.

```
signal1 = getSignalByIndex(vdpRun,1);  
signal2 = getSignalByIndex(vdpRun,2);
```

Use the `Simulink.sdi.setSubPlotLayout` function to specify a 3-by-1 layout.

```
Simulink.sdi.setSubPlotLayout(2,1)
```

Before plotting the data, use the `Simulink.sdi.clearAllSubPlots` function to clear any data that is already plotted.

```
Simulink.sdi.clearAllSubPlots
```

Plot one signal on each subplot. To plot signals on the first subplot, you can set the checked property for the signal. To plot signals on subplots other than the first subplot, use the `plotOnSubPlot` function.

```
signal1.Checked = true;  
plotOnSubPlot(signal2,2,1,true);
```

View the Plotted Data

To view the plots you just created, open the Simulation Data Inspector using the `Simulink.sdi.view` function.

“How the Simulation Data Inspector Compares Data”

Introduced in R2012b

collapse

Package: Simulink.sdi

Represent multidimensional signal as a single signal with nonscalar sample values

Syntax

```
collapse(sigObj)
```

Description

`collapse(sigObj)` converts the representation of the signal that corresponds to the `Simulink.sdi.Signal` object `sigObj` from a set of signals with scalar sample values to a single signal with nonscalar sample values.

When you convert the representation of a multidimensional signal from a set of scalar signals, called channels, to a single signal with nonscalar sample values:

- The `Signal` object that previously contained the data for the first channel contains the data for the multidimensional signal.
- The `Signal` objects for all other channels no longer contain data.
- The signal IDs for all other channels become invalid.

Examples

Convert Representation of Multidimensional Signal Data

When you analyze multidimensional signal data using the Simulation Data Inspector, you can choose whether to represent the data as a single signal with multidimensional sample values or as a set of signals, called *channels*, with scalar sample values. Use the Simulation Data Inspector programmatic interface to convert the representation of a signal created by logging the output of the Mux block in the model `vdp`.

Open and Simulate the Model

Open the model `vdp`, mark the output of the Mux block for logging, and name the Mux block output signal. Then, simulate the model.

```
open_system('vdp');  
  
MuxPort = get_param('vdp/Mux','PortHandles');  
set_param(MuxPort.Outputport,'DataLogging','on');  
  
MuxSig = get_param(MuxPort.Outputport,'Line');  
set_param(MuxSig,'Name','Mux');  
  
sim('vdp');
```

Access the Run and Signal Data

By default, the output of the Mux block is represented as channels in the Simulation Data Inspector because it contains fewer than four channels, so the run contains two signals: one for each channel in the Mux block output.

Use the `Simulink.sdi.getCurrentSimulationRun` function to access the `Simulink.sdi.Run` object that contains the simulation data. Then, check how many `Simulink.sdi.Signal` objects the Run object contains using the `SignalCount` property on the Run object.

```
runObj = Simulink.sdi.getCurrentSimulationRun('vdp');
runObj.SignalCount
```

```
ans = int32
     2
```

Signals with multidimensional data have a top-level `Signal` object that does not contain data. The `Children` property of the top-level signal object contains one or more `Signal` objects associated with the top-level composite signal that contain the data. Because the top-level signals do not contain data, they are not counted to determine the value of the `SignalCount` property for the Run object.

Use the `getSignalsByName` function to access the top-level `Signal` object for the Mux block output.

```
topSig = getSignalsByName(runObj, 'Mux');
```

Use the `Children` property to access the `Signal` object for each channel.

```
sig1 = topSig.Children(1);
sig1.Name
```

```
ans =
'Mux(1)'
```

```
sig2 = topSig.Children(2);
sig2.Name
```

```
ans =
'Mux(2)'
```

Convert Channels to a Multidimensional Signal

Use the `collapse` function to convert the representation of the Mux block output so you access the data as a single signal with multidimensional sample values.

```
collapse(sig1)
```

The Run object now contains only one signal with multidimensional sample values.

```
runObj.SignalCount
```

```
ans = int32
     1
```

The `Children` property of the top-level `Signal` object now contains only one signal.

```
size(topSig.Children)
```

```
ans = 1x2
```

```
1 1
```

After you convert a signal from channels to multidimensional representation, the `Signal` object that previously contained the data for the first channel contains the data for the multidimensional signal.

```
sig1.Values.Data
```

```
ans = 64x2
```

```

After conversion, the signal IDs for the `Signal` objects that contained data for other channels become invalid.

```
isValidSignalID(runObj,sig2.ID)
```

```
ans = logical
0
```

Convert a Multidimensional Signal to Channels

Use the `expand` function to convert the Mux output back to channels.

```
expand(sig1)
```

After converting a multidimensional signal to channels, the `Signal` object that previously contained the data for the multidimensional signal contains the data for the first channel. New `Signal` objects are created for other channels.

```
sig1.Name
```

```
ans =
'Mux(1)'
```

The `Run` object and the `Children` property of the top-level `Signal` object both contain two signals.

```
runObj.SignalCount
```

```
ans = int32
2
```

```
size(topSig.Children)
```

```
ans = 1x2
1 2
```

Access the new `Signal` object that contains the data for the second channel.

```
newSig = topSig.Children(2);  
newSig.Name
```

```
ans =  
'Mux(2)'
```

Input Arguments

sigObj — Channel of multidimensional signal to convert to single signal

`Simulink.sdi.Signal` object

Channel of multidimensional signal to convert to a single signal, specified as a `Simulink.sdi.Signal` object.

See Also

Objects

`Simulink.sdi.Signal` | `Simulink.sdi.Run`

Functions

`expand` | `convertToFrames`

Introduced in R2021b

convertDataType

Package: Simulink.sdi

Convert data type for signal in Simulation Data Inspector

Syntax

```
convertDataType(sigObj, dataType)
```

Description

`convertDataType(sigObj, dataType)` converts the data in the `Simulink.sdi.Signal` object `sigObj` to the specified data type `dataType`.

The `convertDataType` function supports converting to all built-in data types. For more information, see “Data Types Supported by Simulink”. When you have a license for Fixed-Point Designer, you can also convert to fixed-point data types defined using the `fixdt` function.

You cannot convert the data type for a signal produced by logging simulation data while the simulation that produces the signal is in progress.

Warning You cannot undo a data type conversion in the Simulation Data Inspector. Some data types allow more precision in the stored data values than others. Conversion to a data type with less precision can result in permanent loss of precision in data values.

Examples

Convert Data Type for Logged Signal

Simulate the model `vdp` while logging outputs using the `Dataset` format.

```
mdl = "vdp";
open_system(mdl)
out = sim(mdl, SaveOutput="on", SaveFormat="Dataset");
```

Access the `Simulink.sdi.Run` object that contains the logged data and metadata in the Simulation Data Inspector:

```
run1 = Simulink.sdi.getCurrentSimulationRun(mdl);
```

Access the `Simulink.sdi.Signal` object that contains the data for the signal `x1`.

```
x1Sig = getSignalsByName(run1, "x1");
```

Check the `DataType` property for the signal. The model uses the `double` data type for the signal.

```
x1Sig.DataType
```

```
ans =
'double'
```

Convert the data type for the signal from `double` to `single`. You cannot undo a data type conversion in the Simulation Data Inspector. When you convert to a data type with less precision in the stored data values, precision lost due to conversion is permanent. A warning occurs when the data type conversion causes a loss in precision.

```
convertDataType(x1Sig, "single");
```

Warning: Changing the data type of signal 'x1' from 'double' to 'single' causes precision loss t

Check the `DataType` property for the signal again.

```
x1Sig.DataType
```

```
ans =  
'single'
```

Convert Data Type for Imported Signal

Create time and signal data that represents a sine wave.

```
time = 0.01*(0:1000);  
time = time';  
data = 50*sin(2*pi/3*time);
```

By default, MATLAB® creates `double` data. To represent a scenario where another process creates `int32` data you want to analyze in the Simulation Data Inspector, convert the data type for the signal values to `int32`.

```
data = cast(data, "int32");
```

Create a `timeseries` object using the time and data values for the signal. Then, name the `timeseries` object `Sine Wave`.

```
sigTS = timeseries(data,time);  
sigTS.Name = "Sine Wave";
```

Import the signal into the Simulation Data Inspector.

```
runObj = Simulink.sdi.Run.create("Imported Data", "vars", sigTS);
```

Access the `Simulink.sdi.Signal` object with the data values. Then, check the signal data type.

```
sigObj = getSignalsByName(runObj, "Sine Wave");  
sigObj.DataType
```

```
ans =  
'int32'
```

Use the `convertDataType` function to convert the data type to `double`. Then, check the signal data type again.

```
convertDataType(sigObj, "double");  
sigObj.DataType
```

```
ans =  
'double'
```

Input Arguments

sigObj — Signal with data to convert

`Simulink.sdi.Signal` object

Signal with data to convert, specified as a `Simulink.sdi.Signal` object.

dataType — Desired data type for signal

string | character vector

Desired data type for signal, specified as a string or a character vector.

You can convert to any built-in data type by specifying the name for the data type as a string or character vector. For example, to convert to an 8-bit unsigned integer data type, specify the data type as `"uint8"`. For more information about built-in data types and their names, see “Data Types Supported by Simulink”.

When you have a license for Fixed-Point Designer, you can also convert to fixed-point data types defined using the `fixdt` function. To convert to a fixed-point data type, specify the `fixdt` command as a string or a character vector.

Example: `"int16"` specifies conversion to the built-in signed 16-bit integer data type

Example: `"fixdt(1,12,4)"` specifies conversion to a fixed-point data type defined using the `fixdt` function

Topics

“Modify Signal Properties in the Simulation Data Inspector”

Introduced in R2022a

convertToFrames

Package: Simulink.sdi

Remove buffering from frames of frame-based signal

Syntax

```
convertToFrames(sigObj)
```

Description

`convertToFrames(sigObj)` removes the buffering from each frame of the frame-based signal that corresponds to the `Simulink.sdi.Signal` object `sigObj`. For example, suppose `sigObj` is a frame-based signal with 64-by-2 sample values. The `convertToFrames` function interprets each 64-by-2 sample as 64 evenly spaced 1-by-2 samples.

To convert the representation of a signal using the `convertToFrames` function, the signal must have a discrete sample rate, and the sample values must be nonscalar with fixed dimensions. The `convertToFrames` function does not support variable-size signals. The Simulation Data Inspector does not support converting frames for imported data.

Examples

Interpret Data in Simulation Data Inspector as Frame-Based

Some applications buffer several samples of a signal into a *frame* to process with a single computation. When you log a frame-based signal to the Simulation Data Inspector, you can view and analyze the data for each frame using an array plot, or you can convert the representation of the signal data to undo the buffering. This example converts the representation of a frame-based signal from the model `sfcndemo_frame`.

Simulating the model for this example requires a license for DSP System Toolbox™. Converting frame-based data in the Simulation Data Inspector does not require a license for DSP System Toolbox.

Open the model `sfcndemo_frame`. Then, mark the output from the A/D Converter block for logging and specify a name for the signal line.

```
open_system('sfcndemo_frame');
ADPort = get_param(find_system(gcs, 'FindAll', 'on', 'name', 'A/D Converter'), 'PortHandles');
set_param(ADPort.Outputport, 'DataLogging', 'on');
```

```
ADLine = get_param(ADPort.Outputport, 'Line');
set_param(ADLine, 'Name', 'Noisy Signal');
```

Simulate the model.

```
out = sim('sfcndemo_frame', 'StopTime', '99.84');
```

Use the `Simulink.sdi.getCurrentSimulationRun` function to access the simulation data.

```
runObj = Simulink.sdi.getCurrentSimulationRun('sfcndemo_frame');
```

Use the `getSignalsByName` function to access the `Simulink.sdi.Signal` object for the A/D Converter block output signal named `Noisy Signal`.

```
NoisySig = getSignalsByName(runObj, 'Noisy Signal');
```

Check the dimensions for a sample of the signal. The signal has two channels with a frame size of 64, resulting in sample values with dimensions 64-by-2. Because each sample is two-dimensional, the samples are concatenated along the third dimension, such that the time values align with the third dimension of the array of sample values.

```
size(NoisySig.Values.Data(:,:,1))
```

```
ans = 1×2
      64    2
```

To analyze the the data for the signal over the duration of the simulation, use the `convertToFrames` function to interpret the signal as frame-based.

```
convertToFrames(NoisySig);
```

Check the dimensions for a sample of the signal. After interpreting the signal as frame-based, each sample is a vector, and time aligns with the first dimension of the array of sample values.

```
size(NoisySig.Values.Data(1,:))
```

```
ans = 1×2
      1    2
```

Because the resulting signal has fewer than four elements in each sample, the Simulation Data Inspector also automatically converts the signal to channels. You can access the `Signal` objects for each channel using the `Children` property of the original `Signal` object.

```
NoisyChannel1 = NoisySig.Children(1);
NoisyChannel1.Name
```

```
ans =
'Noisy Signal(1)'
```

```
NoisyChannel2 = NoisySig.Children(2);
NoisyChannel2.Name
```

```
ans =
'Noisy Signal(2)'
```

Each channel has scalar sample values.

```
size(NoisyChannel1.Values.Data(1,:))
```

```
ans = 1×2
      1    1
```

Input Arguments

sigObj — Signal with data to convert

`Simulink.sdi.Signal` object

Signal with data to convert, specified as a `Simulink.sdi.Signal` object. The `convertToFrames` function does not support variable-size signals.

See Also

Objects

`Simulink.sdi.Signal` | `Simulink.sdi.Run`

Functions

`collapse` | `expand`

Introduced in R2021b

convertUnits

Package: Simulink.sdi

Convert units of Simulink.sdi.Signal object

Syntax

```
convertUnits(sig,units)
```

Description

`convertUnits(sig,units)` converts the stored units of the `Simulink.sdi.Signal` object `sig` to the units specified by `units`. When you convert the stored units, the display units are updated. For a list of supported units, see [Allowed Units](#). You can use the `convertUnits` function to convert the units of `Simulink.sdi.Signal` objects that contain data of all built-in and fixed-point types.

Note Unit conversion does not support undo and may lead to precision loss.

Examples

Programmatically Convert Signal Units

Use the `convertUnits` function to convert the stored units of a `Simulink.sdi.Signal` object. This example uses data generated by simulating the model `sldemo_autotrans`. When you convert the stored units of the `Signal` object, the Simulation Data Inspector performs a conversion on the data and updates the signal display units any plots that display the signal. Changing the stored units of a `Signal` object does not affect the model that created the signal.

Generate Simulation Data

Simulate the `sldemo_autotrans` model to create a run in the Simulation Data Inspector. Then, use the `Simulink.sdi.Run.getLatest` function to access the `Run` object that corresponds to the simulation.

```
out = sim('sldemo_autotrans');  
autoRun = Simulink.sdi.Run.getLatest;
```

Inspect the Signal Properties

Get the `Simulink.sdi.Signal` object for the `EngineRPM` signal and check the `StoredUnits` and `DisplayUnits` properties.

```
engine_sig = getSignalsByName(autoRun, 'EngineRPM');  
engine_sig.StoredUnits  
ans =  
 'rpm'
```

```
engine_sig.DisplayUnits
```

```
ans =  
'rpm'
```

Convert Stored Units

Use the `convertUnits` function to convert the `EngineRPM` signal units to `rad/s`. When you convert the stored units, the display units are updated. Then, change the signal name to reflect the new units.

```
convertUnits(engine_sig, 'rad/s')  
engine_sig.Name = 'EngineFreq, rad/s';
```

Check the modified signal properties.

```
engine_sig.StoredUnits
```

```
ans =  
'rad/s'
```

```
engine_sig.DisplayUnits
```

```
ans =  
'rad/s'
```

```
engine_sig.Name
```

```
ans =  
'EngineFreq, rad/s'
```

Input Arguments

sig — Signal with units to convert

`Simulink.sdi.Signal` object

Signal with units to convert, specified as a `Simulink.sdi.Signal` object.

units — Desired signal units

string | character vector

Desired signal units, specified as a string or character vector. For a list of accepted units, see [Allowed Units](#).

Example: 'm'

Example: "ft/s"

Data Types: char | string

expand

Package: Simulink.sdi

Represent multidimensional signal as group of signals with scalar sample values

Syntax

```
expand(sigObj)
```

Description

`expand(sigObj)` converts the representation of the signal that corresponds to the `Simulink.sdi.Signal` object `sigObj` from a single signal with nonscalar sample values to a set of signals with scalar sample values: one signal, called a channel, for each element in the multidimensional sample values.

Expanding a signal creates a new `Signal` object for each channel except the channel that corresponds to the first element in the multidimensional signal value. The data for the first channel in the multidimensional signal is stored in the `Signal` object that previously contained the multidimensional signal data.

The `expand` function does not support variable-size signals.

Examples

Convert Representation of Multidimensional Signal Data

When you analyze multidimensional signal data using the Simulation Data Inspector, you can choose whether to represent the data as a single signal with multidimensional sample values or as a set of signals, called *channels*, with scalar sample values. Use the Simulation Data Inspector programmatic interface to convert the representation of a signal created by logging the output of the Mux block in the model `vdp`.

Open and Simulate the Model

Open the model `vdp`, mark the output of the Mux block for logging, and name the Mux block output signal. Then, simulate the model.

```
open_system('vdp');  
  
MuxPort = get_param('vdp/Mux','PortHandles');  
set_param(MuxPort.Outputport,'DataLogging','on');  
  
MuxSig = get_param(MuxPort.Outputport,'Line');  
set_param(MuxSig,'Name','Mux');  
  
sim('vdp');
```

Access the Run and Signal Data

By default, the output of the Mux block is represented as channels in the Simulation Data Inspector because it contains fewer than four channels, so the run contains two signals: one for each channel in the Mux block output.

Use the `Simulink.sdi.getCurrentSimulationRun` function to access the `Simulink.sdi.Run` object that contains the simulation data. Then, check how many `Simulink.sdi.Signal` objects the Run object contains using the `SignalCount` property on the Run object.

```
runObj = Simulink.sdi.getCurrentSimulationRun('vdp');
runObj.SignalCount
```

```
ans = int32
      2
```

Signals with multidimensional data have a top-level `Signal` object that does not contain data. The `Children` property of the top-level signal object contains one or more `Signal` objects associated with the top-level composite signal that contain the data. Because the top-level signals do not contain data, they are not counted to determine the value of the `SignalCount` property for the Run object.

Use the `getSignalsByName` function to access the top-level `Signal` object for the Mux block output.

```
topSig = getSignalsByName(runObj, 'Mux');
```

Use the `Children` property to access the `Signal` object for each channel.

```
sig1 = topSig.Children(1);
sig1.Name
```

```
ans =
'Mux(1)'
```

```
sig2 = topSig.Children(2);
sig2.Name
```

```
ans =
'Mux(2)'
```

Convert Channels to a Multidimensional Signal

Use the `collapse` function to convert the representation of the Mux block output so you access the data as a single signal with multidimensional sample values.

```
collapse(sig1)
```

The Run object now contains only one signal with multidimensional sample values.

```
runObj.SignalCount
```

```
ans = int32
      1
```

The `Children` property of the top-level `Signal` object now contains only one signal.

```
size(topSig.Children)
```

```
ans = 1x2
```

```
1 1
```

After you convert a signal from channels to multidimensional representation, the `Signal` object that previously contained the data for the first channel contains the data for the multidimensional signal.

```
sig1.Values.Data
```

```
ans = 64x2
```

```
2.0000 0
2.0000 -0.0002
2.0000 -0.0012
2.0000 -0.0062
1.9998 -0.0306
1.9943 -0.1398
1.9379 -0.3840
1.8155 -0.5570
1.5990 -0.7204
1.2687 -0.9452
⋮
```

After conversion, the signal IDs for the `Signal` objects that contained data for other channels become invalid.

```
isValidSignalID(runObj,sig2.ID)
```

```
ans = logical
0
```

Convert a Multidimensional Signal to Channels

Use the `expand` function to convert the Mux output back to channels.

```
expand(sig1)
```

After converting a multidimensional signal to channels, the `Signal` object that previously contained the data for the multidimensional signal contains the data for the first channel. New `Signal` objects are created for other channels.

```
sig1.Name
```

```
ans =
'Mux(1)'
```

The `Run` object and the `Children` property of the top-level `Signal` object both contain two signals.

```
runObj.SignalCount
```

```
ans = int32
2
```

```
size(topSig.Children)
```

```
ans = 1x2
1 2
```

Access the new `Signal` object that contains the data for the second channel.

```
newSig = topSig.Children(2);  
newSig.Name
```

```
ans =  
'Mux(2)'
```

Input Arguments

sigObj – Multidimensional signal to convert to channels

`Simulink.sdi.Signal` object

Multidimensional signal to convert to channels, specified as a `Simulink.sdi.Signal` object. The `expand` function does not support variable-size signals.

Objects

`Simulink.sdi.Signal` | `Simulink.sdi.Run`

Functions

`collapse` | `convertToFrames`

Introduced in R2021b

export

Package: Simulink.sdi

Export data for signal in Simulation Data Inspector to workspace or file

Syntax

```
sigData = export(sig)
sigData = export(sig,startTime,endTime)
export( ___,Name=Value)
```

Description

`sigData = export(sig)` exports the data for one or more signals in the Simulation Data Inspector to the workspace.

- If `sig` is a scalar `Simulink.sdi.Signal` object, then `sigData` is a `timeseries` object.
- If `sig` is an array of `Simulink.sdi.Signal` objects, then `sigData` is a `Simulink.SimulationData.Dataset` object that contains a `Simulink.SimulationData.Signal` object for each signal in the input array.

`sigData = export(sig,startTime,endTime)` exports to the workspace the portion of one or more signals within the interval defined by the start time `startTime` and the end time `endTime`.

`export(___,Name=Value)` exports one or more signals in the Simulation Data Inspector to the workspace or a file according to the options specified by one or more name-value arguments.

For most signals, you can choose to export the data to the workspace, a MAT file, or a Microsoft Excel file.

When the signal contains video data, you can export the signal to an MP4 file. Exporting a video signal to an MP4 file is not supported for Linux operating systems.

Examples

Export Signal Data to the Workspace

This example shows how to create a run in the Simulation Data Inspector, access the data, and export the signal data to a `timeseries` object in the workspace.

Simulate the model `sldemo_fuelsys` to create a run in the Simulation Data Inspector that contains the logged data.

```
sim('sldemo_fuelsys');
```

Use the `Simulink.sdi.getCurrentSimulationRun` function to access the run.

```
fuelRun = Simulink.sdi.getCurrentSimulationRun('sldemo_fuelsys');
```

Use the `getSignalByIndex` function to get the second signal in the `Simulink.sdi.Run` object.

```
sig = getSignalByIndex(fuelRun,2);
```

Export the signal data to the workspace using the `export` function.

```
ts = export(sig);
```

Input Arguments

sig — Signal to export

`Simulink.sdi.Signal` object | array of `Simulink.sdi.Signal` objects

Signal to export, specified as a `Simulink.sdi.Signal` object or an array of `Simulink.sdi.Signal` objects.

startTime — Start of signal portion to export

numeric scalar

Start of signal portion to export, specified as a numeric scalar.

Example: `sigData = export(sig,0,10)` exports to the workspace the portion of the signal `sig` between the times 0 and 10.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64`

endTime — End of signal portion to export

numeric scalar

End of signal portion to export, specified as a numeric scalar.

Example: `sigData = export(sig,0,10)` exports to the workspace the portion of the signal `sig` between the times 0 and 10.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64`

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

Example: `to="file",filename="mySpreadshee.xlsx"`

to — Where to export data

'variable' (default) | 'file'

Where to export data, specified as:

- 'variable' — Export one or more signals to the workspace.
- 'file' — Export one or more signals to a MAT file, a Microsoft Excel file, or an MP4 file.

When you export data to a file, specify a file name using the `filename` name-value argument.

Example: `to="file",filename="mySpreadsheet.xlsx"`

filename — Name and type of file to which to export data

string | character vector

Name and type of file to which to export data, specified as a string or character vector. Include a file extension to specify the type of file:

- `.mat` — Export data to MAT file.
- `.xlsx` — Export data to Microsoft Excel file.
- `.mp4` — Export data to MP4 file.

When you do not specify an extension with the file name, the data exports to a MAT file.

To specify the `filename` name-value argument, you must specify the `to` name-value argument as `'file'`.

To export a video signal to an MP4 file:

- The signal must be 2D or 3D and contain RGB or monochrome video data.
- The data type for the signal values must be `double`, `single`, or `uint8`.
- The signal must be represented as a single signal with multidimensional sample values.

You may need to convert the representation of the signal using the `collapse` function before exporting the signal data. For more information, see “Analyze Multidimensional Signal Data”.

Example: `to="file",filename="mySpreadsheet.xlsx"`

Tips

- When you export one signal to a MAT file, the data is saved in the MAT file as a `timeseries` object.
- When you export multiple signals to a MAT file, the data is saved as a `Simulink.SimulationData.Dataset` object that contains a `Simulink.SimulationData.Signal` object for each exported signal.
- Data exported to a Microsoft Excel file is saved using the format described in “Microsoft Excel Import, Export, and Logging Format”.
- When you export data to a Microsoft Excel file, you can specify additional options using the `overwrite`, `metadata`, and `sharetimecolumn` name-value arguments.

overwrite — Data to overwrite in existing Microsoft Excel file`'file'` (default) | `'sheetonly'`

Data to overwrite in existing Microsoft Excel file, specified as `'file'` or `'sheetonly'`.

- `'file'` — Overwrite the entire file with the exported data.
- `'sheetonly'` — Overwrite only sheets of the Microsoft Excel file that contain data that corresponds to the exported data.

Specify the `overwrite` name-value argument only when you export data to a Microsoft Excel file.

When you export data to an existing MAT file, the exported data overwrites the entire file.

Example: `overwrite="sheetonly"`

metadata — Metadata to include in exported Microsoft Excel file

[] (default) | string array

Metadata to include in the exported Microsoft Excel file, specified as a string array. By default, the exported file does not include any metadata. You can export this metadata to a Microsoft Excel file:

- `dataType` — Signal data type
- `units` — Signal units
- `blockPath` — Path to the source block for logged signals
- `interp` — Signal interpolation method
- `portIndex` — Index of the port on the source block for logged signals

The order of metadata options in the string array does not determine the order of the metadata in the exported file, which always matches the description in “Microsoft Excel Import, Export, and Logging Format”.

Example: `metadata=["units" "dataType"]`

sharetimecolumn — Option for signals to share time columns in exported Microsoft Excel file

'on' (default) | 'off'

Option for signals that have identical time data to share time columns in the exported Microsoft Excel file, specified as 'on' or 'off'. By default, signals that have identical time data share a time column in the exported file. When you specify the value as 'off', each signal in the exported file has its own time column.

Example: `sharetimecolumn='off'`

Output Arguments**sigData — Exported signal data**

timeseries object | Simulink.SimulationData.Dataset object

Exported signal data, returned as a timeseries object or a Simulink.SimulationData.Dataset object.

Alternatives

You can export data to the workspace or a file using the Simulation Data Inspector. For more information, see “Save and Share Simulation Data Inspector Data and Views”.

getAsTall

Package: Simulink.sdi

Create tall timetable from Simulink.sdi.Signal object

Syntax

```
tt = getAsTall(sig)
```

Description

`tt = getAsTall(sig)` returns a tall timetable containing the time and data values in the Simulink.sdi.Signal object `sig`. For more information on working with tall arrays, see “Tall Arrays for Out-of-Memory Data”.

Examples

Get Tall Timetable of Signal Data

This example shows how to generate a tall timetable from the signal data in a Simulink.sdi.Signal object.

Create a run containing logged data in the Simulation Data Inspector by simulating the model `sldemo_fuelsys`.

```
sim('sldemo_fuelsys');
```

Use the `Simulink.sdi.getAllRunIDs` function to get the run ID for the run that corresponds to the simulation. Then use the `Simulink.sdi.getRun` function to get the `Simulink.sdi.Run` object that corresponds to the run ID.

```
runIDs = Simulink.sdi.getAllRunIDs;  
runID = runIDs(end);
```

```
fuelRun = Simulink.sdi.getRun(runID);
```

Use the `getSignalByIndex` function to get the `Simulink.sdi.Signal` object that corresponds to the second signal in the run.

```
sig = getSignalByIndex(fuelRun,2);
```

Get a tall timetable containing the signal data by using the `getAsTall` function.

```
tt = getAsTall(sig)
```

```
tt =
```

```
    Mx1 tall timetable
```

```
      Time
```

```
      Data
```

```
_____

Input Arguments

sig — Signal to return as a tall timetable

`Simulink.sdi.Signal` object

Signal to return as a tall timetable, specified as a `Simulink.sdi.Signal` object.

Output Arguments

tt — Tall timetable

tall timetable

Data from the `Simulink.sdi.Signal`, returned as a tall timetable.

See Also

`Simulink.sdi.Signal` | `export` | `Simulink.sdi.exportRun` | `tall`

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2017b

plotOnSubPlot

Package: Simulink.sdi

Plot Simulink.sdi.Signal object on Simulation Data Inspector subplot

Syntax

```
plotOnSubplot(sig,r,c,checked)
```

Description

`plotOnSubplot(sig,r,c,checked)` plots or clears the signal that corresponds to the Simulink.sdi.Signal object `sig` on the subplot specified by `r` and `c`.

Examples

Plot Signals from Simulation Run

This example demonstrates how to access the Simulink.sdi.Run object for a Simulation Data Inspector run created by logging signals. From the Simulink.sdi.Run object you can get Simulink.sdi.Signal objects that contain the logged signal data and metadata. You can use the Signal objects and the plotOnSubPlot function to plot the data in the Simulation Data Inspector.

Create a Simulation Run and Access the Run Object

The `ex_vdp` model logs two signals. To create a simulation run containing the logged data, simulate the model.

```
sim('ex_vdp');
```

The Simulation Data Inspector keeps track of runs by assigning a unique numeric run ID to each run created by simulation, importing data, or opening a session. To access the run object for the simulation you just performed, use the Simulink.sdi.getAllRunIDs function and take the last run ID in the returned vector.

```
runIDs = Simulink.sdi.getAllRunIDs;  
runID = runIDs(end);
```

Once you have the run ID for the run, you can use the Simulink.sdi.getRun function to get the Simulink.sdi.Run object that corresponds to the run. You can use the Run object to check the metadata associated with the run, including the number of signals in the run.

```
vdpRun = Simulink.sdi.getRun(runID);
```

```
vdpRun.SignalCount
```

```
ans = int32  
     2
```

Plot Data Using Signal Objects

Use the `getSignalByIndex` function to access signals from the Run object, `fuelRun`.

```
signal1 = getSignalByIndex(vdpRun,1);  
signal2 = getSignalByIndex(vdpRun,2);
```

Use the `Simulink.sdi.setSubPlotLayout` function to specify a 3-by-1 layout.

```
Simulink.sdi.setSubPlotLayout(2,1)
```

Before plotting the data, use the `Simulink.sdi.clearAllSubPlots` function to clear any data that is already plotted.

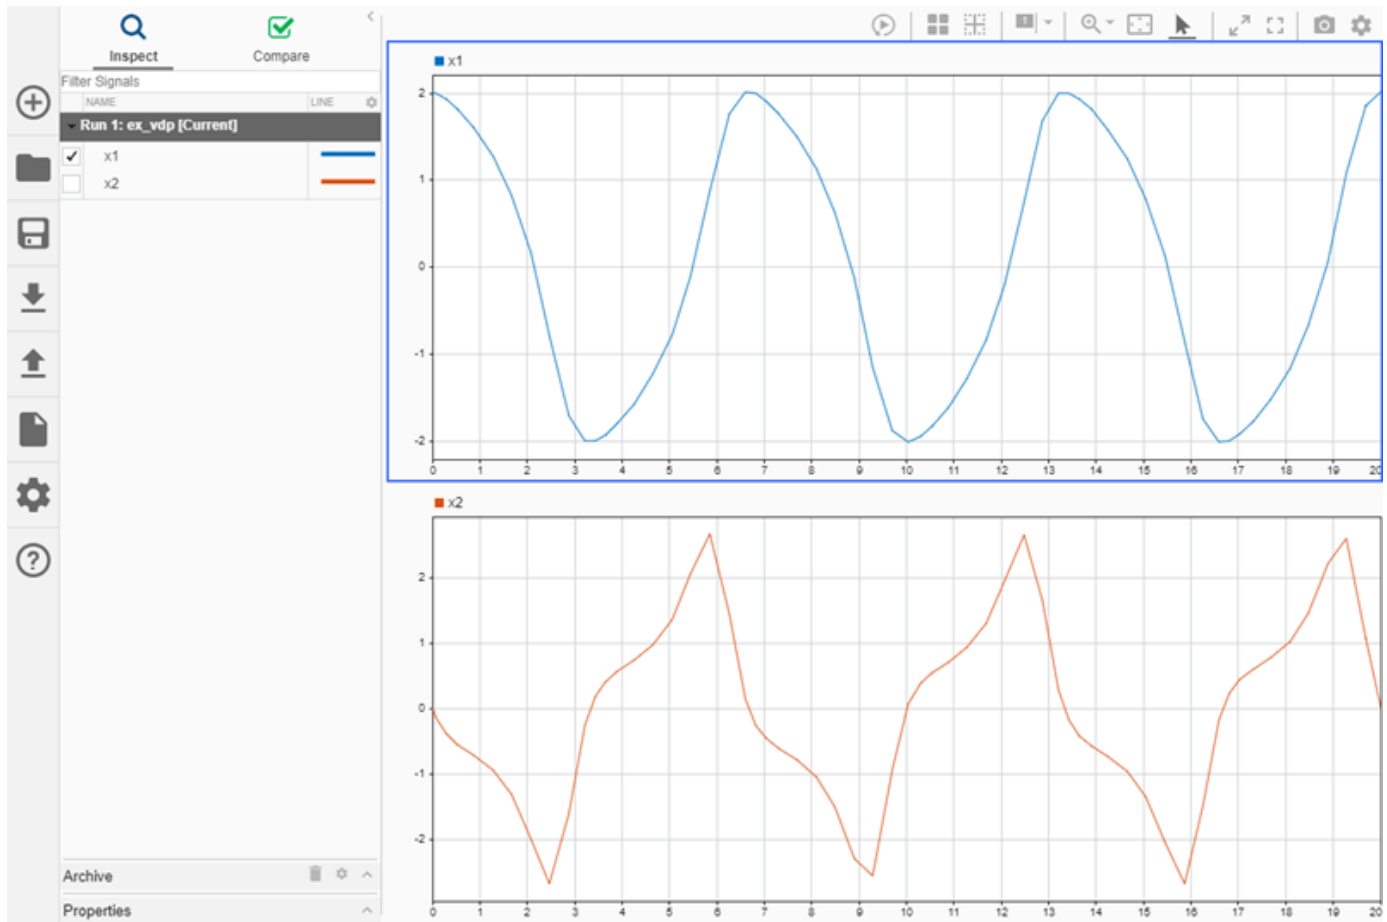

```
Simulink.sdi.clearAllSubPlots
```

Plot one signal on each subplot. To plot signals on the first subplot, you can set the checked property for the signal. To plot signals on subplots other than the first subplot, use the `plotOnSubPlot` function.

```
signal1.Checked = true;  
plotOnSubPlot(signal2,2,1,true);
```

View the Plotted Data

To view the plots you just created, open the Simulation Data Inspector using the `Simulink.sdi.view` function.

Input Arguments

sig – Signal to plot

`Simulink.sdi.Signal` object

Signal to plot, specified as a `Simulink.sdi.Signal` object.

r – Row index

integer

Row index for the subplot, specified as an integer between 1 and 8, inclusive.

Example: 1

c – Column index

integer

Column index for the subplot, specified as an integer between 1 and 8, inclusive.

Example: 2

checked – Plot or clear signal

`true` | `false`

Plot or clear the signal on the subplot, specified as one of these values:

- `true` plots the signal on the subplot.
- `false` clears the signal from the subplot.

Data Types: `logical`

Alternatives

You can use the Simulation Data Inspector UI to modify the plot layout and plotted signals. For more information, see “Inspect Simulation Data”.

Simulink.Signal

Specify instance-specific properties of signal or discrete state

Description

This object enables you to create workspace objects that you can use to assign or validate the attributes of a signal or discrete state, such as its data type, numeric type, dimensions, and so on.

You can use a signal object to:

- Assign values to signal attributes that are left unassigned (have a value of `-1` or `auto`) by the signal source.
- Validate signal attributes whose values are explicitly assigned by the signal source. Such attributes have values other than `-1` or `auto`. Successful validation guarantees that the signal has the attributes that you intended it to have.

You can create a `Simulink.Signal` object in the MATLAB workspace or in a model workspace.

Use signal objects to assign or validate signal or discrete state attributes by giving the signal or discrete state the same name as the workspace variable that references the `Simulink.Signal` object.

For more information about using signal objects, see “Use Simulink.Signal Objects to Specify and Control Signal Attributes” and “Data Objects”.

To assign or validate the properties of signals based on an application-specific type, such as wind velocity, use a `Simulink.ValueType` object.

Creation

Create a `Simulink.Signal` object:

- By using the Model Data Editor. See “For Signals”.
- By using the Model Explorer. See “Create Data Objects from Built-In Data Class Package Simulink”.
- Directly from a signal properties dialog box or the Property Inspector in a model. See “Create Signal Object from Signal Properties Dialog Box”.
- By using the `Simulink.Signal` function, described below.

Syntax

```
signalObj = Simulink.Signal
```

Description

`signalObj = Simulink.Signal` returns a `Simulink.Signal` object with default property values.

Properties

For information about properties in the property dialog box of a `Simulink.Signal` object, see “Property Dialog Box”.

CoderInfo — Specifications for generating code for signal

`Simulink.CoderInfo` object

Information used by Simulink Coder for generating code for this signal. The value of this property is an object of `Simulink.CoderInfo` class.

For more information, see “C Code Generation Configuration for Model Interface Elements” (Simulink Coder) and “Choose Storage Class for Controlling Data Representation in Generated Code” (Embedded Coder).

Complexity — Numeric complexity of signal

'auto' (default) | 'real' | 'complex'

Character vector specifying the numeric type of this signal. Valid values are 'auto' (determined by Simulink), 'real', or 'complex'.

Data Types: char

DataType — Data type of signal

'auto' (default) | character vector

Character vector specifying the data type of this signal.

The default value, 'auto', specifies that Simulink should determine the data type. You can specify a built-in data type (for example, 'uint8' or 'single'), a data type such as 'half', or a custom data type. To specify a custom data type, use a MATLAB expression that specifies the type, (for example, the name of a `Simulink.NumericType` object that you create in the base workspace).

To specify a bus object as the data type for the signal object, use the 'Bus: <object_name>' syntax. See “Bus Support” for details about what you need to do if you specify a bus object as the data type.

Example: 'auto'

Example: 'int8'

Example: 'fixdt(1,16,5)'

Example: 'myAliasTypeObject'

Example: 'Enum: myEnumType'

Example: 'Bus: myBusObject'

Data Types: char

Description — Custom description of signal

' ' (empty character vector) (default) | character vector

Description of this signal. This field is intended for use in documenting this signal.

This property is used by the Simulink Report Generator and for code generation.

If you have an Embedded Coder license, you can add the signal description as a comment for the variable declaration in generated code:

- Specify a storage class for the signal object other than `Auto`.
- On the **Code Generation > Comments** pane of the model Configuration Parameters dialog box, select the model configuration parameter **Simulink data object descriptions**. For more information, see “Simulink data object descriptions” (Embedded Coder).

Example: `'This signal represents the rotation speed of the engine.'`

Data Types: `char`

Dimensions — Dimensions of signal

`-1` (default) | row vector | character vector

Scalar or vector specifying the dimensions of this signal.

Valid values are `-1` (the default) specifying any dimensions, `N` specifying a vector signal of size `N`, or `[M N]` specifying an `MxN` matrix signal.

To use symbolic dimensions, specify a character vector.

Example: `[1 3]`

Example: `'[1 myDimParam]'`

Data Types: `double` | `char`

DimensionsMode — Dimension mode of signal

`'auto'` (default) | `'Fixed'` | `'Variable'`

Dimensions mode of the signal. Valid values are:

- `'auto'` — Allows variable-size and fixed-size signals.
- `'Fixed'` — Allows only fixed-size signals. Does not allow variable-size signals.
- `'Variable'` — Allows only variable-size signals.

For information about variable-size signals, see “Variable-Size Signal Basics”.

Max — Maximum value of signal

`[]` (empty) (default) | real double scalar

Maximum value that this signal can have.

The default value is `[]` (unspecified). Specify a finite, real, double, scalar value.

Note If you specify a bus object as the data type for a signal, do not set the maximum value for bus data on the signal property dialog box. Simulink ignores this setting. Instead, set the maximum values for bus elements of the bus object specified as the data type. For information on the Maximum property of a bus element, see `Simulink.BusElement`.

Simulink uses this value in the following ways:

- When updating the diagram or starting a simulation, Simulink generates an error if the initial value of the signal is greater than the maximum value or if the maximum value is outside the range of the data type of the signal.
- When you enable the **Simulation range checking** diagnostic, Simulink alerts you during simulation if the signal value is greater than the maximum value (see “Simulation range checking”).

Example: 5.32

Data Types: double

Min — Minimum value of signal

[] (empty) (default) | real double scalar

Minimum value that this signal can have.

The default value is [] (unspecified). Specify a finite, real, double, scalar value.

Note If you specify a bus object as the data type for a signal, do not set the minimum value for bus data on the signal property dialog box. Simulink ignores this setting. Instead, set the minimum values for bus elements of the bus object specified as the data type. For information on the Minimum property of a bus element, see `Simulink.BusElement`.

Simulink uses this value in the following ways:

- When updating the diagram or starting a simulation, Simulink generates an error if the signal's initial value is less than the minimum value or if the minimum value is outside the range for the data type of the signal.
- When you enable the **Simulation range checking** diagnostic, Simulink alerts you during simulation if the signal value is less than the minimum value (see “Simulation range checking”).

Example: -0.92

Data Types: double

InitialValue — Initial value of signal or state

' ' (empty character vector) (default) | character vector

Signal or state value before a simulation takes its first time step.

You can specify any MATLAB expression, including the name of a workspace variable, that evaluates to a numeric scalar value or array.

At the command prompt or in a script, even if you use a number, specify the initial value as a character vector.

```
mySigObject.InitialValue='5.3';
```

```
mySigObject.InitialValue = 'myNumericVariable';
```

To specify an initial value for a signal that uses a numeric data type other than `double`, cast the initial value to the signal data type. For example, you can specify `'single(73.3)'` to use 73.3 as the initial value for a signal of data type `single`.

If you use a bus object as the data type for the signal object, set `InitialValue` to a character vector containing either `0` or a MATLAB structure that matches the bus object. See “Bus Support” for details.

If the initial value evaluates to a MATLAB structure, then in the **Configuration Parameters** dialog box, set “Underspecified initialization detection” to `Simplified`.

If necessary, Simulink converts the initial value to ensure type, complexity, and dimension consistency with the corresponding block parameter value. If you specify an invalid value or expression, an error message appears when you update the model. Also, Simulink performs range checking of the initial value. The software alerts you when the initial value of the signal lies outside a range that corresponds to its specified minimum and maximum values and data type.

Classic initialization mode: In this mode, initial value settings for signal objects that represent the following signals and states override the corresponding block parameter initial values if undefined (specified as `[]`):

- Output signals of conditionally executed subsystems and Merge blocks
- Block states

Simplified initialization mode: In this mode, if a signal object is attached to the signal line connected to the Outport block of a conditionally executed subsystem, Simulink uses the initial value from the `Simulink.Signal` object.

Example: `'15.23'`

Example: `'myInitParam'`

Data Types: `char`

SampleTime — Sample time of signal

`-1` (default) | `double` scalar or array

Rate at which this signal should be updated.

See “Specify Sample Time” for details.

Example: `0.001`

Example: `2`

Data Types: `double`

Unit — Physical unit of signal value

`''` (default) | valid unit

Physical unit used for expressing this signal value (for example, inches).

For more information, see “Unit Specification in Simulink Models”.

Example: `'degC'`

Data Types: `char`

Examples

Simulink.Signal Examples

For examples that show how to use `Simulink.Signal` objects, see “Use Simulink.Signal Objects to Specify and Control Signal Attributes” and “Data Objects”.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using MATLAB® Coder™.

To control the appearance of a `Simulink.Signal` object in the generated code, use the **Storage class** property.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Simulink.SimulationData.Dataset

Access logged simulation data or group simulation input data

Description

A `Simulink.SimulationData.Dataset` object groups related data. Logged simulation results are often grouped in `Dataset` objects. You can also use a `Dataset` object to group simulation input data when you load initial states and when you load external input data using `Inport` blocks or the `Signal Editor` block.

A `Dataset` object created by logging simulation data contains one or more elements. Each element contains data for one logged signal, output, data store, or state. Each element is an object, and the type of the object depends on the data it contains.

- Signals and outputs — `Simulink.SimulationData.Signal` object
- States and final states — `Simulink.SimulationData.State` object
- Data stores — `Simulink.SimulationData.DataStoreMemory` object

When you create a `Dataset` object that groups simulation input data, each element contains data for a signal, bus, or array of buses. You can add data in any format supported by the loading method you use.

Type of Input	Data Formats
Scalar, vector, or multidimensional signal	<ul style="list-style-type: none"> • <code>timeseries</code> • <code>timetable</code> • <code>Simulink.SimulationData.Signal</code> • <code>matlab.io.datastore.SimulationDataStore</code> • <code>matlab.io.datastore.sd datastore</code> • Structure with one field called <code>signals.values</code> that contains data for a single signal and a field called <code>time</code> that optionally includes time data • Array where the first column contains time data and subsequent columns contain data for a signal
Bus	<ul style="list-style-type: none"> • Structure of <code>timeseries</code>, <code>timetable</code>, or <code>matlab.io.datastore.SimulationDataStore</code> objects that matches the hierarchy of the bus • <code>Simulink.SimulationData.Signal</code>
Array of buses	<ul style="list-style-type: none"> • Array of structures • <code>Simulink.SimulationData.Signal</code>

Type of Input	Data Formats
Function-call signal	<ul style="list-style-type: none"> N-by-1 vector <code>Simulink.SimulationData.Signal</code>

Creation

Logging simulation data often creates a `Simulink.SimulationData.Dataset` object, including when you:

- Log data using signal logging.
- Log outputs, states, or final states using the `Dataset` format.
- Log data stores.
- Log data to the workspace or a MAT file using the Record block.
- Log data in `Dataset` format using a Scope block.
- Log data using a Floating Scope or Scope Viewer.

To group external input data for a model in a `Dataset` object, you can:

- Create an empty `Dataset` object and add the input data using the `addElement` function.
- Use the `createInputDataset` to create a `Dataset` object that contains an element for each root-level Inport block or In Bus Element block in a model. Then, specify the data for each element.
- Use the Signal Editor to interactively create and edit `Dataset` objects that contain simulation input data. For details, see “Create and Edit Signal Data”.

You can also create a `Dataset` object by converting data that uses another format to use the `Dataset` format. Having all data in a common format can facilitate postprocessing. For details, see “Convert Logged Data to Dataset Format”.

Syntax

```
ds = Simulink.SimulationData.Dataset
ds = Simulink.SimulationData.Dataset(dataToConvert)
ds = Simulink.SimulationData.Dataset(dataToConvert, "DatasetName", dsName)
```

Description

`ds = Simulink.SimulationData.Dataset` creates an empty, unnamed `Dataset` object to which you can add elements. Use this syntax to manually create a `Dataset` object that contains external input data to load using Inport or In Bus Element blocks.

`ds = Simulink.SimulationData.Dataset(dataToConvert)` creates an unnamed `Dataset` object that contains one or more elements that contain the data `dataToConvert`. Use this syntax to convert data that uses another format to use the `Dataset` format. For details, see “Convert Logged Data to Dataset Format”.

The conversion process only converts data for one input at a time. To convert data for multiple variables, convert each variable one at a time, then use the `concat` function to combine the resulting `Dataset` objects.

`ds = Simulink.SimulationData.Dataset(dataToConvert, "DatasetName", dsName)` creates a `Dataset` object with the name specified by `dsName` that contains one or more elements that contain the data `dataToConvert`. Use this syntax to convert data that uses another format to use the `Dataset` format. For details, see “Convert Logged Data to Dataset Format”.

Input Arguments

dataToConvert — Data to convert to Dataset format

`timeseries` object | `timetable` | `structure` | `array` | `Simulink.ModelDataLogs` object

Data to convert to `Dataset` format, specified as a `timeseries` object, a `timetable`, a `structure`, an `array`, or a `Simulink.ModelDataLogs` object. The results of conversion depend on the format of the input data.

Input Data	Conversion Results
<code>timeseries</code> object or <code>timetable</code>	<code>Dataset</code> object that contains one <code>Simulink.SimulationData.Signal</code> object with the <code>timeseries</code> or <code>timetable</code> data in its <code>Values</code> property.
<code>ModelDataLogs</code> object	<code>Dataset</code> object that contains one or more <code>Simulink.SimulationData.Signal</code> objects that contain the data for each signal in the input object.
<code>Structure</code> that matches the <code>Structure</code> with <code>time</code> logging format.	<code>Dataset</code> object that contains one or more <code>Simulink.SimulationData.Signal</code> objects that contain the data for each signal in the input <code>structure</code> .
<code>Structure</code> that matches the <code>Structure</code> logging format	<code>Dataset</code> object that contains one or more <code>Simulink.SimulationData.Signal</code> objects that contain the data for each signal in the input <code>structure</code> . Because the input does not contain time data, the conversion creates a time vector for each signal that starts at 0 and uses a sampling interval of 1.
<code>Array</code>	<code>Dataset</code> object that contains one <code>Simulink.SimulationData.Signal</code> object. The <code>Values</code> property of the <code>Signal</code> object contains a <code>timeseries</code> object, and the <code>Data</code> property of the <code>timeseries</code> object contains the entire array. Because the input does not contain time data, the conversion creates a time vector for the signal that starts at 0 uses a sampling interval of 1.

For more information, see “Convert Logged Data to Dataset Format” and “Dataset Conversion for Logged Data”.

dsName — Dataset object name

`string` | `character vector`

Dataset object name, specified as a string or character vector.

Output Arguments

ds — Dataset object

`Simulink.SimulationData.Dataset` object

Dataset object, returned as a `Simulink.SimulationData.Dataset` object. The Dataset object is empty when you do not specify input arguments. Create an empty Dataset object when you want to group simulation input data in a single variable.

When you specify input arguments, the Dataset object contains one or more elements that contain the input data. The results of conversion depend on the format of the input data.

Input Data	Conversion Results
timeseries object	Dataset object that contains one <code>Simulink.SimulationData.Signal</code> object with the timeseries data in its <code>Values</code> property.
ModelDataLogs object	Dataset object that contains one or more <code>Simulink.SimulationData.Signal</code> objects that contain the data for each signal in the input object.
Structure that matches the Structure with time logging format	Dataset object that contains one or more <code>Simulink.SimulationData.Signal</code> objects that contain the data for each signal in the input structure.
Structure that matches the Structure logging format	Dataset object that contains one or more <code>Simulink.SimulationData.Signal</code> objects that contain the data for each signal in the input structure. Because the input does not contain time data, the conversion creates a time vector for each signal that starts at 0 and uses a sampling interval of 1.
Array	Dataset object that contains one <code>Simulink.SimulationData.Signal</code> object. The <code>Values</code> property of the Signal object contains a timeseries object, and the <code>Data</code> property of the timeseries object contains the entire array. Because the input does not contain time data, the conversion creates a time vector for the signal that starts at 0 uses a sampling interval of 1.

For more information, see “Convert Logged Data to Dataset Format” and “Dataset Conversion for Logged Data”.

Properties

Name — Dataset object name

string | character vector

Dataset object name, specified as a string or character vector. When you create a **Dataset** object to group simulation input data, you specify the name for the **Dataset** object. The name you specify does not need to match the name of the variable that contains the **Dataset** object.

The **Name** property of **Dataset** objects created by logging simulation data is set to match the logging variable name specified in the model configuration parameters.

- **Output** — Default: `yout`
- **Signal logging** — Default: `logout`
- **States** — Default: `xout`
- **Data stores** — Default: `dsmout`
- **Final states** — Default: `xFinal`

Object Functions

<code>addElement</code>	Add element to end of a Dataset object
<code>concat</code>	Concatenate dataset to another dataset
<code>exportToPreviousRelease</code>	Save a Dataset object to a MAT-file you can open in any release
<code>extractTimetable</code>	Extract data from <code>Simulink.SimulationData.Dataset</code> or <code>Simulink.SimulationData.Signal</code> objects into timetables
<code>find</code>	Get element or collection of elements from dataset
<code>get</code>	Get element or collection of elements from dataset
<code>getElementNames</code>	Return names of all elements in dataset
<code>numElements</code>	Get number of elements in data set
<code>plot</code>	Plot data in the Simulation Data Inspector
<code>removeElement</code>	Remove element from <code>Simulink.SimulationData.Dataset</code> object
<code>setElement</code>	Change element stored at specified index

Examples

Access Data Logged Using Dataset Format

Log the outputs of the `vdp` model and access the logged data.

Open the model. Configure output logging using the **Dataset** format and simulate the model using the `sim` function.

```
open_system('vdp');
out = sim('vdp', 'SaveOutput', 'on', 'SaveFormat', 'Dataset');
```

All logged data is returned in a single variable, `out`, as a `Simulink.SimulationOutput` object. The `SimulationOutput` object contains a `Simulink.SimulationData.Dataset` object that groups each kind of logged data. This example only logs outputs, so there is one **Dataset** object, `yout`.

```
out
```

```
out =
  Simulink.SimulationOutput:
```

```

        yout: [1x1 Simulink.SimulationData.Dataset]

SimulationMetadata: [1x1 Simulink.SimulationMetadata]
ErrorMessage: [0x0 char]

```

Access the `Dataset` object that includes the logged output data using a dot and the name of the `Dataset` object. The `Dataset` object contains a `Simulink.SimulationData.Signal` object for each output.

```
outputs = out.yout
```

```
outputs =
Simulink.SimulationData.Dataset 'yout' with 2 elements
```

	Name	BlockPath
1 [1x1 Signal]	x1	vdp/Out1
2 [1x1 Signal]	x2	vdp/Out2

- Use braces { } to access, modify, or add elements using index.

The `Signal` object has metadata about the signal, including the path to the block and index of the port that produces the signal. Use the `getElement` function to access the `Signal` object that contains the data for signal `x1` by name. You can also use curly braces({}) to access elements in a `Dataset` object by index.

```
outputX1 = getElement(outputs, 'x1')
```

```
outputX1 =
Simulink.SimulationData.Signal
Package: Simulink.SimulationData

Properties:
    Name: 'x1'
    PropagatedName: ''
    BlockPath: [1x1 Simulink.SimulationData.BlockPath]
    PortType: 'inport'
    PortIndex: 1
    Values: [1x1 timeseries]
```

Methods, Superclasses

The signal data is stored in the `Values` property of the `Signal` object as a `timeseries` object. The time values are in the `Time` property of the `timeseries` object. The signal values are in the `Data` property.

```
outputValsX1 = outputX1.Values

timeseries

Common Properties:
    Name: 'x1'
    Time: [64x1 double]
    TimeInfo: tsdata.timemetadadata
```

```
        Data: [64x1 double]
        DataInfo: tsdata.datametadate

outputTimesX1 = outputValsX1.Time
outputTimesX1 = 64x1

Group Simulation Inputs Using Dataset Object

Create data for three simulation input signals and group them in a `Dataset` object. A simple model loads the contents of the `Dataset` object using three root-level Inport blocks. Dashboard Scope blocks in the model display each signal created using the loaded input data.

First, create the signal data to load into the model. Use the expression in this example to create the evenly-spaced time vector for an input signal, especially when modeling discrete input signals. MATLAB® supports several other methods for creating an evenly-spaced vector, but other methods can introduce double-precision rounding errors in the time data, which can lead to unexpected simulation results.

```
sampleTime = 0.01;
numSteps = 1001;
time = sampleTime*(0:numSteps-1);
time = time';
```

Create signal data for a sine signal, a cosine signal, and a linear signal.

```
sineVals = sin(2*pi/3*time);
cosVals = cos(2*pi/3*time);
lineVals = time;
```

Create a `timeseries` object to contain the data for each signal. Give each `timeseries` object a descriptive name so signals are easy to identify once they are grouped in the `Dataset` object.

```
sineTS = timeseries(sineVals,time,'Name','Sine Wave');
cosTS = timeseries(cosVals,time,'Name','Cosine Wave');
lineTS = timeseries(lineVals,time,'Name','Line');
```

Create a `Dataset` object and use the `addElement` function to add each `timeseries` object to the `Dataset` object.

```
inputData = Simulink.SimulationData.Dataset;
inputData.Name = 'inputData';
inputData = addElement(inputData,sineTS);
inputData = addElement(inputData,cosTS);
inputData = addElement(inputData,lineTS)
```

```
inputData =
Simulink.SimulationData.Dataset 'inputData' with 3 elements
```

		Name	BlockPath
1	[1x1 timeseries]	Sine Wave	''
2	[1x1 timeseries]	Cosine Wave	''
3	[1x1 timeseries]	Line	''

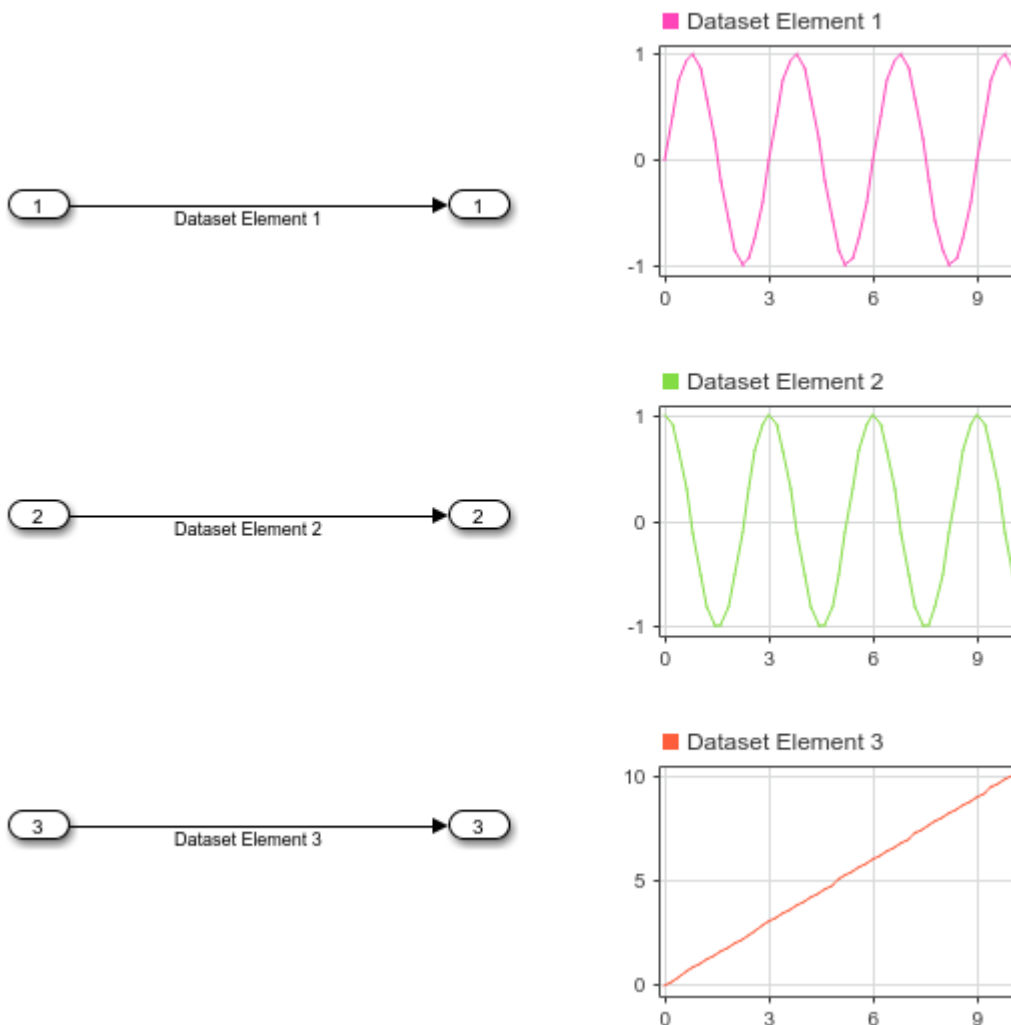

- Use braces { } to access, modify, or add elements using index.

When you load external input data using root-level Inport blocks, you specify the data to load using the **Input** parameter in the Model Configuration Parameters on the Data Import/Export pane. Open the model `LoadInputDataset` and see that the **Input** parameter is specified as `inputData`.

```
open_system('LoadInputDataset.slx');
```

Simulate the model. The Dashboard Scope block connected to the first Inport block shows the sine signal, the Dashboard Scope block connected to the second Inport block shows the cosine signal, and the Dashboard Scope block connected to the third Inport block shows the linear signal.

```
out = sim('LoadInputDataset.slx');
```

You can swap the order of elements in the Dataset object and see the change reflected in how the elements are mapped to the Inport blocks.

```
inputData{1} = lineTS;
inputData{3} = sineTS
```

```
inputData =
Simulink.SimulationData.Dataset 'inputData' with 3 elements
```

	Name	BlockPath
1 [1x1 timeseries]	Line	''
2 [1x1 timeseries]	Cosine Wave	''
3 [1x1 timeseries]	Sine Wave	''

- Use braces { } to access, modify, or add elements using index.

Simulate the model again. The Dashboard Scope block that displays the first element now shows the line, and the Dashboard Scope block that displays the third element shows the sine wave, reflecting the new order of elements in the Dataset object.

```
out = sim('LoadInputDataset.slx');
```

Tips

- You can use curly braces ({}) to access, add, or modify an element in a Dataset object by index.
- To access, add, or modify an element of a Dataset object by name, use the getElement, addElement, and setElement functions.
- When you group simulation inputs using Dataset objects, you can use the Signal Editor or the Signal Editor block to easily change which Dataset object provides input for the simulation.

- When you load external input data from a `Dataset` object using root-level Inport blocks, you can use the Root Inport Mapper to map each element in the `Dataset` object to an Inport block by block name, block path, signal name, or port order. You can also write your own function to map the data. For more information, see “Map Root Inport Signal Data”.
- When you save data in a `Dataset` object to a MAT file, consider saving to a Version 7.3 MAT file if the contents of the `Dataset` object are too large to fit in memory. You can create a `Simulink.SimulationData.DatasetRef` that references a `Dataset` object in a MAT file without loading the data into memory for data processing or for loading big data. For more information, see “Load Big Data for Simulations”.
- To save a `Dataset` object to a MAT file that you can open in an earlier release, use the `exportToPreviousRelease` function instead of the `save` function.
- You can write your own reader to import data from a file into a `Dataset` object in the base workspace, the model workspace, or the Signal Editor using the `Simulink.io.FileType` class. For more information, see “Create Custom File Type for Import to Signal Editor”.

addElement

Add element to end of a Dataset object

Syntax

```
dataset = addElement(dataset,element)
dataset = addElement(dataset,element,name)
```

Description

`dataset = addElement(dataset,element)` adds an element to the `Simulink.SimulationData.Dataset` dataset.

`dataset = addElement(dataset,element,name)` adds an element to the `Simulink.SimulationData.Dataset` data set and gives the element the name that you specify with the name argument. If the object already has a name, the element instead uses the name you specify by using the name argument.

Input Arguments

dataset — Data set

`SimulationData.Dataset` object

The data set to which to add the element.

element — Element to add

`Simulink.SimulationData.Signal` object | `Simulink.SimulationData.State` object | `Simulink.SimulationData.DataStoreMemory` object | timeseries object | `matlab.io.datastore.SimulationDatastore` object

Element to add to the data set, specified as a `Simulink.SimulationData.Signal`, `Simulink.SimulationData.DataStoreMemory`, or `matlab.io.datastore.SimulationDatastore` object.

name — Name for element

character vector

Name for element, specified as a character vector.

Output Arguments

dataset — Data set

character vector

The data set to which you add the element, returned as a character vector. The new element is added to the end of the data set.

Examples

Create a Data Set

Create a data set and add three elements to it.

```
time = 0.1*(0:100)';
ds = Simulink.SimulationData.Dataset;
element1 = Simulink.SimulationData.Signal;
element1.Name = 'A';
element1.Values = timeseries(sin(time),time);
ds = addElement(ds,element1);
element2 = Simulink.SimulationData.Signal;
element2.Name = 'B';
element2.Values = timeseries(2*sin(time),time);
ds = addElement(ds,element2);
element3 = Simulink.SimulationData.Signal;
element3.Name = 'C';
element3.Values = timeseries(3*sin(time),time);
ds = addElement(ds,element3);
ds
```

ds =

Simulink.SimulationData.Dataset '' with 3 elements

		Name	BlockPath
1	[1x1 Signal]	A	''
2	[1x1 Signal]	B	''
3	[1x1 Signal]	C	''

- Use braces { } to access, modify, or add elements using index.

Create a Run in the Simulation Data Inspector

You can programmatically import data into the Simulation Data Inspector by creating a run from data in the base workspace or a file. This example creates data in the workspace and then illustrates several methods of creating a Simulation Data Inspector run containing the data.

Create Data

Create data in the workspace. The Simulation Data Inspector supports time series data in many formats. This example creates data using the `timeseries` and `Simulink.SimulationData.Dataset` formats and saves the data in a MAT-file.

Create a sine signal and a cosine signal. Store the data for each signal in a `timeseries` object with a descriptive name.

```
time = 0:0.2:20;

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';
```

You can use the `Dataset` format to group related signal data together in a single object. The `Dataset` format is the default format for logged data and is supported for loading simulation input data. Create a `Dataset` object that contains the sinusoid timeseries data.

```
sinusoids_ds = Simulink.SimulationData.Dataset;
sinusoids_ds = addElement(sinusoids_ds,cos_ts);
sinusoids_ds = addElement(sinusoids_ds,sine_ts);
```

Scale each signal by a factor of 2 and create a `Dataset` object to contain the signal data for the results.

```
doubSine = 2*sine_ts;
doubCos = 2*cos_ts;

doubSinusoids_ds = Simulink.SimulationData.Dataset;
doubSinusoids_ds = addElement(doubSinusoids_ds,doubSine);
doubSinusoids_ds = addElement(doubSinusoids_ds,doubCos);
```

Finally, save the timeseries data to a MAT-file.

```
save sinusoids.mat sine_ts cos_ts
```

Open the Simulation Data Inspector

To view the runs you create in each section, open the Simulation Data Inspector by entering `Simulink.sdi.view` in the MATLAB™ Command Window.

Create a Run Using a `Simulink.sdi.Run` Object

You can import your data into a run in the Simulation Data Inspector by creating an empty run and then adding data to the run from the workspace or a file. Depending on your task, you can use the `Simulink.sdi.Run.create` function or the `Simulink.sdi.createRun` function to create the empty run. The `Simulink.sdi.Run.create` function returns the `Simulink.sdi.Run` object for the new run, and the `Simulink.sdi.createRun` function returns the run ID for the new run.

This example creates an empty run using the `Simulink.sdi.Run.create` function, gives the run a meaningful name and description, and then adds the sine and cosine timeseries data using the `add` function.

```
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals of different frequencies';

add(sinusoidsRun,'vars',sine_ts,cos_ts)
```

This example uses the `Simulink.sdi.createRun` function to create a new run in the Simulation Data Inspector called `My Waves` and then uses the `Simulink.sdi.addToRun` function to add the sine and cosine timeseries data to the run.

```
runID = Simulink.sdi.createRun('My Waves');
signalID = Simulink.sdi.addToRun(runID,'vars',sine_ts,cos_ts);
```

Create a Run from a Workspace Variable

You can create a run from a single variable in the workspace. After creating the run, you can add additional data, or you can create another run to contain your other data. The variable you use to create the run can be a `timeseries` object with data that corresponds to only one signal, or it can be a `Dataset` object that contains several signals.

When you use this syntax to create a run from a single workspace variable, the run takes the same name as the object used to create it.

```
runID = Simulink.sdi.createRun(sine_ts);
```

The `Simulink.sdi.createRun` function returns the run ID for the run it creates. You can use the `Simulink.sdi.getRun` function to access the Run object for the run.

```
sineRun = Simulink.sdi.getRun(runID);
sineRun.Name
```

```
ans =
'Sine, T=5'
```

Create a Run from Multiple Workspace Variables

When your data exists in multiple variables in your workspace, you can use the `Simulink.sdi.createRun` function with the `vars` option to import the data from multiple variables into a single run in the Simulation Data Inspector. You can also use this syntax to create a run for a single variable that uses a name you specify.

This example creates a run called `My Sinusoids` that contains data for the sine and cosine `timeseries` objects.

```
runID = Simulink.sdi.createRun('My Sinusoids','vars',sine_ts,cos_ts);
```

Create a Run and Specify Source Names

You can use the `namevalue` option of the `Simulink.sdi.createRun` function to create a run and specify names for the signals in the run. This syntax can be particularly helpful when you import individual leaf signals from hierarchical data.

This example creates a run containing the data for both the `Dataset` objects. Each `Dataset` object contains data for more than one signal, so the imported run data has hierarchy. The name-value syntax in this example specifies a name for the hierarchical node that corresponds to each `Dataset` object.

```
runID = Simulink.sdi.createRun('Waves','namevalue',{'Sinusoids',...
    'BigSinusoids'},{sinusoids_ds,doubSinusoids_ds});
```

Create a Run from Data in a File

You can also use the `Simulink.sdi.createRun` function to import data into the Simulation Data Inspector from a file. Use the `file` option to import the data in the `simusoids.mat` file.

```
runID = Simulink.sdi.createRun('Wave Data','file','sinusoids.mat');
```

Alternative

To streamline indexing syntax, you can use curly braces (`{}`) to add an element to a dataset, instead of using `addElement`. For the index, use a scalar that is greater than the number of elements by one. The new element becomes the last element of the dataset.

```
time = 0.1*(0:100)';
ds = Simulink.SimulationData.Dataset;
element1 = Simulink.SimulationData.Signal;
element1.Name = 'A';
```

```
element1.Values = timeseries(sin(time),time);  
ds{1} = element1;  
element2 = Simulink.SimulationData.Signal;  
element2.Name = 'B';  
element2.Values = timeseries(2*sin(time),time);  
ds{2} = element2;  
element3 = Simulink.SimulationData.Signal;  
element3.Name = 'C';  
element3.Values = timeseries(3*sin(time),time);  
ds{3} = element3;
```

Introduced in R2011a

concat

Concatenate dataset to another dataset

Syntax

```
dataset1 = concat(dataset1,dataset2)
```

Description

`dataset1 = concat(dataset1,dataset2)` concatenates the elements of `dataset2` to `dataset1`.

Input Arguments

dataset1 — Dataset to concatenate to

data set

Dataset to concatenate to with `dataset2`, returned as a cell array.

dataset2 — Dataset to concatenate

data set

Data set to concatenate to `dataset1`, specified as a cell array.

Output Arguments

dataset1 — Concatenated dataset

data set

Concatenated dataset from `dataset1` and `dataset2`.

Examples

Concatenate ds1 to ds

Convert output from two To Workspace blocks to Dataset format and concatenate them.

```
mdl = 'myvdp';  
open_system(mdl);  
sim(mdl)  
ds = Simulink.SimulationData.Dataset(simout);  
ds1 = Simulink.SimulationData.Dataset(simout1);  
dsfinal = concat(ds,ds1);
```

exportToPreviousRelease

Package: Simulink.SimulationData

Save a Dataset object to a MAT-file you can open in any release

Syntax

```
exportToPreviousRelease(ds, filename, dsname)
exportToPreviousRelease( ____, version)
exportToPreviousRelease( ____, '-append' )
exportToPreviousRelease( ____, '-nocompression' )
```

Description

`exportToPreviousRelease(ds, filename, dsname)` saves the `Simulink.SimulationData.Dataset` object, `ds`, to the MAT-file specified by the `filename` input, using the name specified by the `dsname` input. You can load the Dataset saved in the file in any release that supports the Dataset format. When you do not use this function to save a Dataset object to a file, you may not be able to load the data in releases prior to R2017a. When you do not need to open and use the Dataset data in a release prior to R2017a, you can use the `save` function.

`exportToPreviousRelease(____, version)` saves data stored in a Dataset object to a MAT-file you can load in a previous release, using the MAT-file version specified by `version`.

`exportToPreviousRelease(____, '-append')` adds data stored in a Dataset object to a MAT-file you can load in a previous release without overwriting the contents of the MAT-file.

`exportToPreviousRelease(____, '-nocompression')` saves the Dataset object to a MAT-file without compression. The `'-nocompression'` option only supports Version 7 and Version 7.3 MAT-files.

Examples

Save a Dataset to a MAT-File to Load in a Prior Release

You can use the `exportToPreviousRelease` function to save data stored in a `Simulink.SimulationData.Dataset` object in a MAT-file that you can load in a previous release. This example saves data logged from a simulation in a MAT-file using the `exportToPreviousRelease` function, and then appends another Dataset object containing data logged from another simulation to the same MAT-file.

Save Dataset Data to a MAT-File

To create a Dataset object containing logged data, run a simulation of the `ex_vdp` model that logs data for signals `x1` and `x2`. The model is configured to generate a single simulation output containing all simulation data, including the signal logging data stored in the Dataset object, `logout`.

```
open_system('ex_vdp.slx')
out = sim('ex_vdp');
logouts = out.logouts;
```

Use the `exportToPreviousRelease` function to save the signal logging data to a MAT-file you can share with colleagues and collaborators who may use different Simulink™ versions.

```
exportToPreviousRelease(logouts, 'vdpLoggedData.mat', 'ex_vdpSim1')
```

Append Additional Data to the MAT-File

You can use the `exportToPreviousRelease` function to add data to a MAT-file. For example, if you run another simulation that logs data and get new results you want to share. You can load the `Dataset` object saved using the `exportToPreviousRelease` function in any release that supports the `Dataset` format.

```
set_param('ex_vdp/Mu', 'Gain', '0.5')
out = sim('ex_vdp');
logouts = out.logouts;
```

```
exportToPreviousRelease(logouts, 'vdpLoggedData.mat', 'ex_vdpSim2', '-append')
```

Input Arguments

ds — Dataset object containing data you want to load in an earlier release

`Simulink.SimulationData.Dataset` object

`Simulink.SimulationData.Dataset` object you want to save in a MAT-file and load in a previous release.

Example: `logouts`

filename — Name of file to export data to

string | character array

Name of the file to export data to. If the file does not exist, the `exportToPreviousRelease` function creates the file. When the file exists, you can overwrite the data in the file, or you can use the `'-append'` input to append the `Dataset` data to the file.

Example: `'myfile.mat'`

Data Types: `char` | `string`

dsname — Name to use for the saved Dataset object in the MAT-file

string | character array

Name to use for the `Dataset` object saved in the MAT-file. The name does not have to match the name of the `Dataset` object containing the data you want to save in the MAT-file.

Example: `'myLoggedData'`

Data Types: `char` | `string`

version — MAT-file version

`'-v7'` (default) | `'-v7.3'` | `'-v6'`

MAT-file version. By default, the `exportToPreviousRelease` function creates Version 7 MAT-files, unless you have changed the preference for the default MAT-file version created by save operations. For more information, see “MAT-File Versions”. You cannot save `Dataset` data to Version 4 MAT-files.

Data Types: `char` | `string`

“MAT-File Versions”

Introduced in R2019b

extractTimetable

Package: Simulink.SimulationData

Extract data from `Simulink.SimulationData.Dataset` or `Simulink.SimulationData.Signal` objects into timetables

Syntax

```
TT = extractTimetable(ds)
TT = extractTimetable(ds,Name=Value)
```

Description

`TT = extractTimetable(ds)` extracts data from multiple elements of `ds` into a timetable. The input argument `ds` is a `Simulink.SimulationData.Dataset` or `Simulink.SimulationData.Signal` object.

`TT = extractTimetable(ds,Name=Value)` extracts data into one or more timetables according to options that are specified by one or more name-value arguments. For example, the `SignalNames` argument specifies the names of the signals to extract from `ds`.

You can return the data as:

- A single timetable that includes all elements that contain time series data, synchronized to the union of the time stamps of all signals.
- A cell array of timetables that each contain data for signals that share the same sample time.
- A cell array of timetables that each contain time series data for a single signal.

Examples

Extract Signals into Timetable

Extract signals from a `Simulink.SimulationData.Dataset` object into a timetable.

First, create a `Dataset` object and add two signals to it. To calculate data for the signals, use the `sin` and `cos` functions. Each signal is in its own `timeseries` object. These signals both have a 0.1-second time step.

```
Time = 0.1*(0:99)';
ds = Simulink.SimulationData.Dataset;

element1 = Simulink.SimulationData.Signal;
element1.Name = "Sine";
element1.Values = timeseries(sin(Time),Time);
ds = addElement(ds,element1);

element2 = Simulink.SimulationData.Signal;
element2.Name = "Cosine";
element2.Values = timeseries(cos(Time),Time);
ds = addElement(ds,element2)
```

```
ds =
Simulink.SimulationData.Dataset '' with 2 elements
```

		Name	BlockPath
1	[1x1 Signal]	Sine	''
2	[1x1 Signal]	Cosine	''

- Use braces { } to access, modify, or add elements using index.

Next, extract data from `ds` and put the data into a timetable. The timetable `TT` has two variables, `Sine` and `Cosine`, that contain data from both elements of `ds`.

```
TT = extractTimetable(ds)
```

```
TT=100x2 timetable
   Time      Sine      Cosine
   -----
0 sec      0          1
0.1 sec    0.099833    0.995
0.2 sec    0.19867    0.98007
0.3 sec    0.29552    0.95534
0.4 sec    0.38942    0.92106
0.5 sec    0.47943    0.87758
0.6 sec    0.56464    0.82534
0.7 sec    0.64422    0.76484
0.8 sec    0.71736    0.69671
0.9 sec    0.78333    0.62161
1 sec      0.84147    0.5403
1.1 sec    0.89121    0.4536
1.2 sec    0.93204    0.36236
1.3 sec    0.96356    0.2675
1.4 sec    0.98545    0.16997
1.5 sec    0.99749    0.070737
      :
```

Add a third signal to `ds` with a time vector that has a 0.05-second time step.

```
Time2 = 0.05*(0:149)';
element3 = Simulink.SimulationData.Signal;
element3.Name = "Tangent";
element3.Values = timeseries(tan(Time2),Time2);
ds = addElement(ds,element3)
```

```
ds =
Simulink.SimulationData.Dataset '' with 3 elements
```

		Name	BlockPath
1	[1x1 Signal]	Sine	''
2	[1x1 Signal]	Cosine	''
3	[1x1 Signal]	Tangent	''

- Use braces { } to access, modify, or add elements using index.

Extract the data from the three elements of `ds`. The elements have `timeseries` objects whose time vectors do not match. Thus, the vector of row times of `TT` is the union of the time vectors of the three `timeseries` objects. Then, the `extractTimetable` function synchronizes data from the three signals to its row times. The function fills in missing values for the row times where Sine and Cosine do not provide data.

```
TT2 = extractTimetable(ds)
```

```
TT2=175x3 timetable
      Time      Sine      Cosine      Tangent
      -----

0.75 sec      NaN          NaN      0.9316
      :
```

Return Timetables for Each Sample Time and Synchronize Them

Extract data from signals that have time vectors with different sample times. To avoid returning a timetable that contains NaNs, return the data in a cell array of timetables. Then, synchronize the output timetables by using linear interpolation to fill gaps in the data.

Create a `Dataset` object that has three elements. The first two elements have the same time vector and sample time. The third element has a time vector with a different sample time.

```
Time1 = 0.1*(0:99)';
ds = Simulink.SimulationData.Dataset;

element1 = Simulink.SimulationData.Signal;
element1.Name = "Sine";
element1.Values = timeseries(sin(Time1),Time1);
ds = addElement(ds,element1);

element2 = Simulink.SimulationData.Signal;
element2.Name = "Cosine";
element2.Values = timeseries(cos(Time1),Time1);
ds = addElement(ds,element2);

Time2 = 0.05*(0:149)';
```

```

element3 = Simulink.SimulationData.Signal;
element3.Name = "Tangent";
element3.Values = timeseries(tan(Time2),Time2);
ds = addElement(ds,element3)

ds =
Simulink.SimulationData.Dataset '' with 3 elements

```

		Name	BlockPath
1	[1x1 Signal]	Sine	''
2	[1x1 Signal]	Cosine	''
3	[1x1 Signal]	Tangent	''

- Use braces { } to access, modify, or add elements using index.

Extract data from the signals into timetables. To avoid NaNs in the output, extract signals by sample time.

```
TT = extractTimetable(ds,OutputFormat="cell-by-sampletime")
```

```
TT=1x2 cell array
    {150x1 timetable}    {100x2 timetable}
```

Display the first timetable. The timetable contains the data from `ds{3}` and has a sample time of 0.05 seconds.

```
TT{1}
```

```
ans=150x1 timetable
    Time    Tangent
    _____  _____
    0 sec          0

Dataset with Timetable and timeseries Objects

A Dataset object can have some elements that contain timetables and other elements that contain timeseries objects. The extractTimetable function extracts data from both sets of elements and returns all data in one timetable.

Create a Dataset object with one element that has a timetable.

```
ds = Simulink.SimulationData.Dataset;
element1 = Simulink.SimulationData.Signal;
element1.Name = "TrigFuncs";
element1.Values = timetable(seconds(0:99)',sin(0:99)',cos(0:99)',...
                           VariableNames=["Sine","Cosine"])
```

```
element1 =
  Simulink.SimulationData.Signal
  Package: Simulink.SimulationData

  Properties:
    Name: 'TrigFuncs'
    PropagatedName: ''
    BlockPath: [1x1 Simulink.SimulationData.BlockPath]
    PortType: 'inport'
    PortIndex: 1
    Values: [100x2 timetable]
```

Methods, Superclasses

```
ds = addElement(ds,element1);
```

Add another element that has a timeseries object.

```
element2 = Simulink.SimulationData.Signal;
element2.Name = "Tangent";
element2.Values = timeseries(tan(0:99),0:99)
```

```
element2 =
  Simulink.SimulationData.Signal
  Package: Simulink.SimulationData

  Properties:
    Name: 'Tangent'
    PropagatedName: ''
    BlockPath: [1x1 Simulink.SimulationData.BlockPath]
    PortType: 'inport'
    PortIndex: 1
    Values: [1x1 timeseries]
```

Methods, Superclasses

```
ds = addElement(ds,element2);
```

Extract all the data and return one timetable.

```
TT = extractTimetable(ds)
```

```

To extract all data from elements with a one-second sample time, you must use different name-value arguments because one element has a timetable and the others have `timeseries` objects.

- To extract data from timetables with a one-second sample time, use the `TimeStep` argument. Specify the sample time as a duration value.
- To extract data from `timeseries` objects with a one-second sample time, use the `SampleTime` argument. Specify the sample time as a numeric value.

```
TT = extractTimetable(ds,TimeStep=seconds(1),SampleTime=1)
```

```

Match Template to Data

Create a `Dataset` object that has elements with different time vectors.

```

Time1 = 0.1*(0:99)';
ds = Simulink.SimulationData.Dataset;

element1 = Simulink.SimulationData.Signal;
element1.Name = "Sine";
element1.Values = timeseries(sin(Time1),Time1);
ds = addElement(ds,element1);

Time2 = 0.05*(0:99)';
element2 = Simulink.SimulationData.Signal;
element2.Name = "Cosine";
element2.Values = timeseries(cos(Time2),Time2);
ds = addElement(ds,element2);

Time3 = (0:99)';
element3 = Simulink.SimulationData.Signal;
element3.Name = "Tangent";
element3.Values = timeseries(tan(Time3),Time3);
ds = addElement(ds,element3)

ds =
Simulink.SimulationData.Dataset '' with 3 elements

```

		Name	BlockPath
1	[1x1 Signal]	Sine	''
2	[1x1 Signal]	Cosine	''
3	[1x1 Signal]	Tangent	''

- Use braces { } to access, modify, or add elements using index.

If you have data stored in another `Dataset` object, then you can use one of its elements as a template. You can extract data from elements of `ds` whose time properties match the time properties of the template.

Create a second `Dataset` object with one element.

```

ds2 = Simulink.SimulationData.Dataset;
templ = Simulink.SimulationData.Signal;
templ.Name = "Template";
templ.Values = timeseries(randi(100,1),(0:99)');
ds2 = addElement(ds2,templ)

ds2 =
Simulink.SimulationData.Dataset '' with 1 element

```

		Name	BlockPath
1	[1x1 Signal]	Template	''

- Use braces { } to access, modify, or add elements using index.

Return data from the elements of `ds` that match the time properties of `ds2{1}`. The template matches the time properties of the third element of `ds`, named "Tangent".

```

TT = extractTimetable(ds,Template=ds2{1})

```

```

TT=100x1 timetable
    Time      Tangent
    _____  _____

   15 sec        -0.85599
      ⋮

```

Input Arguments

ds — Object that contains time series data

Simulink.SimulationData.Dataset object | Simulink.SimulationData.Signal object

Object that contains time series data, specified as a Simulink.SimulationData.Dataset or Simulink.SimulationData.Signal object.

Name-Value Arguments

Specify optional pairs of arguments as Name1=Value1, . . . , NameN=ValueN, where Name is the argument name and Value is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Example: TT = extractTimetable(ds,OutputFormat="cell-by-sampletime")

Arguments for All Inputs

OutputFormat — Output format and grouping

"timetable" (default) | "cell-by-signal" | "cell-by-sampletime" | "cell-by-timestep"

Output format and grouping of time series data, specified as one of the values described in the table.

Value	Output Format
"timetable"	Timetable that contains the synchronized union of all signal data, padded with missing values.
"cell-by-signal"	Cell array that contains a timetable for each signal found in the input.

Value	Output Format
"cell-by-sampletime"	Cell array that contains a timetable for each sample time found in the input.
"cell-by-timestep"	

Example: `TT = extractTimetable(ds,OutputFormat="cell-by-signal")` returns a cell array where each element is a timetable that contains data from a corresponding element of `ds`.

SignalNames — Names of signals

string array | pattern object

Names of signals to extract the timetable, specified as a string array or a `pattern` object.

Example: `TT = extractTimetable(ds,SignalNames=["Sensor1","Sensor2"])` extracts data from signals named "Sensor1" or "Sensor2".

Example: `TT = extractTimetable(ds,SignalNames="Sensor" + wildcardPattern)` extracts data from signals whose names start with "Sensor".

Template — Template to match to time properties of input

timeseries object | timetable | `Simulink.SimulationData.Signal` object | name of signal in `ds`

Template to match to time properties of input signals, specified as a `timeseries` object, timetable, `Simulink.SimulationData.Signal` object, or the name of a signal in `ds`.

- If the template is or contains a `timeseries` object, then `extractTimetable` matches it only to elements of `ds` that contain `timeseries` objects.
- If the template is or contains a timetable, then `extractTimetable` matches it only to elements of `ds` that contain timetables.

Example: `TT = extractTimetable(ds,Template=ds{1})` extracts data from all elements of `ds` whose time properties match the time properties of the first element of `ds`.

Arguments for Inputs with Signals That Contain timeseries Objects

SampleTime — Sample time

one or more positive numeric values

Sample time, specified as one or more positive numeric values. When you specify the value of `SampleTime`, this function extracts data from all signals in `ds` that have `timeseries` objects whose time vectors have the specified sample time. The sample time is interpreted as a time interval in seconds.

If you provide multiple sample times in a numeric array, then the output is a timetable synchronized to the union of all signals that have `timeseries` objects with any of the specified sample times, unless you also specify the value of `OutputFormat`.

Example: `TT = extractTimetable(ds,SampleTime=0.5)` extracts data from any signals that have `timeseries` objects where the sample time is 0.5 seconds and returns the data in one timetable.

Example: `TT = extractTimetable(ds,SampleTime=[0.5,1.0],OutputFormat="cell-by-sampletime")` extracts data from signals that have `timeseries` objects where the sample time is either 0.5 or 1.0 seconds and returns a cell array that contains two timetables.

TimeVector – Time vector

datetime vector | duration vector

Time vector, specified as a `datetime` vector or `duration` vector.

The output timetable contains data from all signals in `ds` that have `timeseries` objects whose time vector matches the value of `TimeVector`.

Example: `TT = extractTimetable(ds,TimeVector=seconds(0:99))` extracts data from signals that have `timeseries` objects whose time vector is an array spanning 0–99 seconds with a sample time of one second.

Arguments for Inputs with Signals That Contain Timetables**SampleRate – Sample rate**

one or more positive numeric values

Sample rate, specified as one or more positive numeric values. When you specify the value of `SampleRate`, this function extracts data from all signals in `ds` that have timetables with the specified sample rate. The sample rate is interpreted as a rate in Hertz (Hz).

If you provide multiple sample rates in a numeric array, then the output is a timetable synchronized to the union of all signals that have timetables with any of the specified sample rates, unless you also specify the value of `OutputFormat`.

You can use this argument in combination with the `StartTime` name-value argument.

Example: `TT = extractTimetable(ds,SampleRate=100)` extracts data from any signals that have timetables where the sample rate is 100 Hz and returns the data in one timetable.

Example: `TT = extractTimetable(ds,SampleRate=[100,200],OutputFormat="cell-by-sampletime")` extracts data from signals that have timetables where the sample rate is either 100 or 200 Hz and returns a cell array that contains two timetables.

Example: `TT = extractTimetable(ds,SampleRate=100,StartTime=seconds(25))` extracts data from any signals that have timetables where the sample rate is 100 Hz and the signal starts at 25 seconds.

TimeStep – Time step

duration array

Time step, specified as a `duration` array. When you specify the value of `TimeStep`, this function extracts the timetable that contains data from all signals in `ds` that have timetables with the specified time step.

If you provide multiple time steps in an array, then the output is a timetable synchronized to the union of all signals that have timetables with any of the specified time steps, unless you also specify the value of `OutputFormat`.

You can use this argument in combination with the `StartTime` name-value argument.

Example: `TT = extractTimetable(ds,TimeStep=seconds(0.5))` extracts data from any signals that have timetables where the time step is 0.5 seconds and returns the data in one timetable.

Example: `TT = extractTimetable(ds,TimeStep=seconds([0.5,1.0]),OutputFormat="cell-by-sampletime")` extracts data from signals that have timetables where the time step is either 0.5 or 1.0 seconds and returns a cell array that contains two timetables.

Example: `TT = extractTimetable(ds,TimeStep=seconds(0.5),StartTime=seconds(10))` extracts data from any signals that have timetables where the time step is 0.5 seconds and the signal starts at 10 seconds.

RowTimes — Time vector

`datetime vector` | `duration vector`

Time vector, specified as a `datetime` vector or `duration` vector.

The output timetable contains data from all the signals in `ds` that have timetables whose row times are in a time vector that matches the vector specified by `RowTimes`.

Example: `TT = extractTimetable(ds,RowTimes=seconds(0:99))` extracts data from any signals that have timetables whose time vector is an array spanning 0-99 seconds with a time step of one second.

StartTime — Start time

`datetime scalar` | `duration scalar`

Start time, specified as a `datetime` scalar or `duration` scalar.

The output timetable contains data from all the signals in `ds` that have timetables whose row times start with a value matches the value specified by `StartTime`.

You can use `StartTime` in combination with either the `SampleRate` or `TimeStep` name-value arguments.

Example: `TT = extractTimetable(ds,StartTime=seconds(50))` extracts data from any signals that have timetables where the signal starts at 50 seconds.

Example: `TT = extractTimetable(ds,SampleRate=100,StartTime=seconds(25))` extracts data from any signals that have timetables where the sample rate is 100 Hz and the signal starts at 25 seconds.

Example: `TT = extractTimetable(ds,TimeStep=seconds(0.5),StartTime=seconds(10))` extracts data from any signals that have timetables where the time step is 0.5 seconds and the signal starts at 10 seconds.

find

Get element or collection of elements from dataset

Syntax

```
[datasetOut,retIndex]=find(datasetIn,Name,Value,...)
```

```
[datasetOut,retIndex]=find(datasetIn,Name,Value,'-logicaloperator',...Name,Value,...)
```

```
[datasetOut,retIndex]=find(datasetIn,'-regexp',Name,Value,...)
```

Description

`[datasetOut,retIndex]=find(datasetIn,Name,Value,...)` returns a `Simulink.SimulationData.Dataset` object and indices of the elements whose property values match the specified property names and values. Specify optional comma-separated pairs of `Name,Value` properties. `Name` is the property name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name-value pair properties in any order as `Name1,Value1,...,NameN,ValueN`.

`[datasetOut,retIndex]=find(datasetIn,Name,Value,'-logicaloperator',...Name,Value,...)` applies the logical operator to the matching property value. You can combine multiple logical operators. Logical operator can be one of:

- -or
- -and

If you do not specify an operation, the method assumes -and.

`[datasetOut,retIndex]=find(datasetIn,'-regexp',Name,Value,...)` matches elements using regular expressions as if the value of the property is passed to the `regexp` function as:

```
regexp(element.Name,Value)
```

The method applies regular expression matching to the name-value pairs that appear after -regexp. If there is no -regexp, the method matches elements as if the value of the property is passed as:

```
isequal(element.Name,Value)
```

For more information on -regexp, see “-regexp With Multiple Block Paths” on page 8-474.

-regexp With Multiple Block Paths

-regexp works with properties of type `char`. To specify multiple block paths, you can use `Simulink.SimulationData.BlockPath` and `Simulink.BlockPath`. For example, when a signal is logged in a referenced model, you can use `Simulink.SimulationData.BlockPath` to specify multiple block paths.

The method returns elements that contain a **BlockPath** property where one or more of the individual block paths match the specified `Value` path when you use:

- - regexp with the **BlockPath** Name property.
- Value as a character vector or scalar object of type `Simulink.SimulationData.BlockPath` with one block path

Input Arguments

datasetIn — `SimulationData.Dataset`

`SimulationData.Dataset` object

`SimulationData.Dataset` object in which to search for matching elements.

Name — Name of property

character vector

Name of property to find in the element.

Value — Value of property

character vector | double | `Simulink.SimulationData.BlockPath`

Value of property to find in the element.

Output Arguments

datasetOut — `SimulationData.Dataset` data set

`SimulationData.Dataset`

`SimulationData.Dataset` object that contains the elements that match the specified criteria. If there is no matching `SimulationData.Dataset` object, the returned `SimulationData.Dataset` object contains no elements.

retIndex — Indices

vector

Indices of the elements `datasetIn` that match the specified criteria.

Examples

Find Block Path

Find a specific block path (specified by character vector) and port index.

```
dsOut = find(dsIn, 'BlockPath', 'vdp/x1', 'PortIndex', 1)
```

Find Elements

Find elements that have either name or propagated name as `InValve`.

```
dsOut = find(dsIn, 'Name', 'InValve', '-or', 'PropagatedName', 'InValve')
dsOut = find(dsIn, '-regex', 'Name', 'In*', '-or', ...
             '-regex', 'PropagatedName', 'In*')
```

Find and Change Element

Find and replace all elements containing `specified_name` with a `new_name`.

```
[dsOut,idxInDs] = find(ds, 'specified_name');
for idx=1: length(idxInDs)
    % process each element
    elm = get(dsOut, idx);
    elm.Name= 'New_Name'
    dsIn = setElement(dsIn, idxInDs(idx), elm);
end
```

Find Signals in subSys Using -regexp

Find all signals logged in a `subSys` using `-regexp`.

```
dsOut = find(dsIn, '-regexp', 'BlockPath', 'mdl/subSys/.*')
```

Find Signals in Referenced Model

Find all signals logged in the Model block.

```
dsOut = find(dsIn, '-regexp', 'BlockPath', 'refmdl/ModelBlk')
```

Alternative

You can use curly braces to streamline indexing syntax to get an element in a dataset, instead of using `find`. The index must be a scalar that is not greater than the number of elements in the variable. For example, get the second element of the `logout` dataset.

```
logout{2}
```

Also, you can use the `get` method to get an element or collection of elements from a dataset.

get

Get element or collection of elements from dataset

Syntax

```
element = get(dataset,index)
element = get(dataset,name)
element = get(dataset,{name})
```

Description

`element = get(dataset,index)` returns the element corresponding to the `index`. The `getElement` method uses the same syntax and behavior as the `get` method.

`element = get(dataset,name)` returns the element whose name matches `name`. When `name` is in a cell array, return the index of the element whose name matches `name`.

`element = get(dataset,{name})` returns a single element if only one element name matches, a `SimulationData.Dataset` if multiple elements with this name exist.

If you use **Log Dataset data to file** to create the MAT-file, use `getAsDatastore` for fast access to the data.

Input Arguments

dataset — Dataset

`SimulationData.Dataset` object

The data set from which to get the element.

index — Index value of element to get

scalar numeric

Index value of element to get. The index reflects the index value of a data set element.

name — Name for data set element

character array | cell array

Name for a data set element, specified as:

- A character array reflecting the name of the data set element
- A cell array containing one character vector. To return a `SimulationData.Dataset` object that can contain one element, use this format. Consider this form when writing scripts.

Output Arguments

element — Element

element | `SimulationData.Dataset` object | empty object

The element that the `get` method finds.

- If `index` is the first argument after the data set, the method returns the element at the `index`.
- If `name` is the first argument after the data set:
 - If the method finds one element, it returns the element.
 - If the method finds more than one element, return a Dataset that contains the elements.
 - If the method does not find an element, it returns an empty object.

Examples

Access Dataset Elements

Access `Simulink.SimulationData.Dataset` elements in the top model of the `ex_bus_logging` model. The signal logging dataset is `topOut`.

```
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', ...
'examples', 'ex_bus_logging')));
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', ...
'examples', 'ex mdlref_counter_bus')));
sim('ex_bus_logging')
topOut
```

`topOut =`

```
Simulink.SimulationData.Dataset
Package: Simulink.SimulationData
```

```
Characteristics:
      Name: 'topOut'
  Total Elements: 4
```

```
Elements:
  1: 'COUNTERBUS'
  2: 'OUTPUTBUS'
  3: 'INCREMENTBUS'
  4: 'inner_bus'
```

```
-Use get or getElement to access elements by index, name or
  block path.
-Use addElement or setElement to add or modify elements.
```

```
Methods, Superclasses
```

Access Dataset Elements with Index

Access the element at `index` if the first argument is a numeric value.

```
e1 = logout.get(1);
```

Access Dataset Elements with Characters

Access the element whose name matches `name`.

```
el = logout.get('name');
```

Access Dataset Elements with Cell Array

Return a dataset if the first argument is a cell array with a character vector as the first element.

```
ds = logout.get({'my_name'});
```

Alternatives

You can use curly braces to streamline indexing syntax to get an element in a dataset, instead of using `get` or `getElement`. The index must be a scalar that is not greater than the number of elements in the variable. For example, get the second element of the `logout` dataset.

```
logout{2}
```

Also, you can use the `find` method to get an element or collection of elements from a dataset.

getElementNames

Return names of all elements in dataset

Syntax

```
element_list = getElementNames(dataset)
```

Description

`element_list = getElementNames(dataset)` returns the names of all of the elements in the `Simulink.SimulationData.Dataset` object.

Input Arguments

dataset — Data set

`SimulationData.Dataset` object

The data set from which to the element name.

Output Arguments

element_list — Data set

cell array

Data set, returned as a cell array of the character vectors containing names of all of the elements of the dataset.

Examples

Return Names of Elements

Return the names of the elements for the `topOut` data set (the signal logging data).

```
open_system(docpath(fullfile(docroot,'toolbox','simulink',...
'examples','ex_bus_logging')));
open_system(docpath(fullfile(docroot,'toolbox','simulink',...
'examples','ex mdlref_counter_bus')));
sim('ex_bus_logging')
el_names = topOut.getElementNames
```

```
el_names =
    'COUNTERBUS'
    'OUTPUTBUS'
```

```
'INCREMENTBUS'  
'inner_bus'
```

numElements

Get number of elements in data set

Syntax

```
length = numElements(dataset)
```

Description

`length = numElements(dataset)` gets the number of elements in the top-level dataset. To get the number of elements of a nested data set, use `numElements` with the nested data set.

Input Arguments

dataset — Data set

`SimulationData.Dataset` object

The data set from which to get the number of elements.

Output Arguments

length — Number of elements

double

Number of elements, returned as a double.

Examples

Get Number of Elements

Get the number of elements in the signal logging data set for the `ex_bus_logging`.

```
length = topOut.numElements()
```

plot

Plot data in the Simulation Data Inspector

Syntax

```
plot(ds)
plot(ds,viewer)
runObj = plot(ds)
```

Description

`plot(ds)` plots the data in the `Simulink.SimulationData.Dataset` or `Simulink.SimulationData.DatasetRef` in the **Simulation Data Inspector**. When there are eight signals or fewer in the `Dataset` or `DatasetRef` object, the Simulation Data Inspector plot layout changes to 1-by-n, where n is equal to the number of signals, and plots one signal on each subplot. When the `Dataset` or `DatasetRef` object contains more than eight signals, the Simulation Data Inspector plot layout changes to 1-by-1 and plots the first signal.

`plot(ds,viewer)` displays the plot in the Simulation Data Inspector or Signal Preview window, according to the value specified for `viewer`.

`runObj = plot(ds)` plots the data in the `Dataset` object and returns the corresponding `Simulink.sdi.Run` object.

Input Arguments

ds — Dataset or DatasetRef object with data to plot

`Simulink.SimulationData.Dataset` object | `Simulink.SimulationData.DatasetRef` object

`Dataset` or `DatasetRef` object that contains the data to plot.

viewer — Viewer to use to plot data

'datainspector' (default) | 'preview'

Viewer used to plot the data, specified as 'datainspector' or 'preview'. When you do not specify the viewer input, the plot function plots data in the Simulation Data Inspector.

- 'datainspector' — Plot data in the **Simulation Data Inspector**.
- 'viewer' — Plot data in the Signal Preview window. For more information, see “Preview Signal Data”.

Output Arguments

runObj — `Simulink.sdi.Run` object corresponding to the plotted data

`Simulink.sdi.Run` object

`Simulink.sdi.Run` object corresponding to the plotted data. When you view data in a Signal Preview window, the plot function returns empty (`[]`).

Examples

Plot a Data Set

Create a `timeseries` object `ts` and add elements to plot in the Simulation Data Inspector.

```
% Create a timeseries object
ts = timeseries([0;20],[0;10]);
% Create a SimulationData.Dataset
ds = Simulink.SimulationData.Dataset();
% Place timeseries object in dataset
ds = ds.addElement(ts,'ts');
% Plot the element
plot(ds);
```

Compatibility Considerations

'sdi' input is not recommended

Not recommended starting in R2019b

Starting in R2019b, specify the `viewer` argument for the `plot` function as `'datainspector'` to view plotted data in the Simulation Data Inspector.

setElement

Change element stored at specified index

Syntax

```
dataset = setElement(dataset,index,... element)
dataset = setElement(index,element, name)
```

Description

`dataset = setElement(dataset,index,... element)` changes the element stored at the specified index, for an existing index. If `index` is one greater than the number of elements in the data set, the function adds the element at the end of the data set.

`dataset = setElement(index,element, name)` changes the element stored at the specified index and gives it the name that you specify. You can use `name` to identify an element that does not have a name. If the signal already has a name, the element instead uses the name you specify by using the `name` argument.

Input Arguments

dataset — Data set

`SimulationData.Dataset` object

The data set for which to set the element.

index — Index

scalar

Index for the added element, specified as a scalar numeric value. The value must be between 1 and the number of elements plus 1.

element — Element to replace existing element

`Simulink.SimulationData.Signal` object | `Simulink.SimulationData.DataStoreMemory` object

Element to replace existing element or to add to the data set, specified as a `Simulink.SimulationData.Signal` object or `Simulink.SimulationData.DataStoreMemory` object.

name — Element name

character vector

Element name, returned as a character vector.

Output Arguments

dataset — Data set

character vector

Data set in which you change or add an element, specified as a character vector.

Examples

Set Element Name

Set element name.

```
ds = Simulink.SimulationData.Dataset
element1 = Simulink.SimulationData.Signal
element1.Name = 'A'
ds = ds.addElement(element1)
element2 = Simulink.SimulationData.Signal
element2.Name = 'B'
elementNew = Simulink.SimulationData.Signal
ds = ds.setElement(2,elementNew,'B1')
ds
```

ds =

```
Simulink.SimulationData.Dataset
Package: Simulink.SimulationData
```

```
Characteristics:
      Name: 'topOut'
  Total Elements: 2
```

```
Elements:
  1: 'A'
  2: 'B1'
```

Use `getElement` to access elements by index, name or block path.

Methods, Superclasses

Alternative

You can use curly braces to streamline indexing syntax to change an element in a dataset, instead of using `setElement`. The index must be a scalar that is not greater than the number of elements in the variable. For example, change the name of second element of the `logout` dataset.

```
logout{2}.Name = 'secondSignal'
```

Introduced in R2011a

removeElement

Package: Simulink.SimulationData

Remove element from Simulink.SimulationData.Dataset object

Syntax

```
ds = removeElement(ds,ind)
```

Description

`ds = removeElement(ds,ind)` removes the elements at the indices specified by `ind` from the Simulink.SimulationData.Dataset object `ds`.

Examples

Remove Signal from Dataset Object

Open the model `LogDataDatasetFormat`. The model logs the data generated by three source blocks using the Dataset format.

```
open_system("LogDataDatasetFormat.slx");
```

Simulate the model.

```
out = sim("LogDataDatasetFormat.slx");
```

By default, all logged data is returned in a single variable in the workspace as a Simulink.SimulationOutput object.

out

```
out =  
  Simulink.SimulationOutput:  
  
      tout: [101x1 double]  
      yout: [1x1 Simulink.SimulationData.Dataset]  
  
  SimulationMetadata: [1x1 Simulink.SimulationMetadata]  
  ErrorMessage: [0x0 char]
```

Check the contents of the Simulink.SimulationData.Dataset object, `yout`, that contains the logged output data.

```
yout = out.yout
```

```
yout =  
Simulink.SimulationData.Dataset 'yout' with 3 elements
```

Name	BlockPath
------	-----------

1	[1x1 Signal]	Sine Wave	LogDataDatasetFormat/Out1
2	[1x1 Signal]	Pulse	LogDataDatasetFormat/Out2
3	[1x1 Signal]	White Noise	LogDataDatasetFormat/Out3

- Use braces { } to access, modify, or add elements using index.

Suppose you want to use the logged outputs as input for another simulation that does not use the `White Noise` signal. To create a `Dataset` object that you can load as external input data for that simulation, remove the `White Noise` signal from the `Dataset` object `yout`. The `White Noise` signal is the third signal in the `Dataset` object, so specify the index as 3. Then, rename the `Dataset` object with the input data.

```
inputData = removeElement(yout,3);
inputData.Name = "Input Data";
inputData
```

```
inputData =
Simulink.SimulationData.Dataset 'Input Data' with 2 elements
```

		Name	BlockPath
1	[1x1 Signal]	Sine Wave	LogDataDatasetFormat/Out1
2	[1x1 Signal]	Pulse	LogDataDatasetFormat/Out2

- Use braces { } to access, modify, or add elements using index.

The value of the variable `yout` remains unchanged. To modify the value of the variable `yout`, assign the return from the `removeElement` function back to `yout`.

```
yout = removeElement(yout,3)
```

```
yout =
Simulink.SimulationData.Dataset 'yout' with 2 elements
```

		Name	BlockPath
1	[1x1 Signal]	Sine Wave	LogDataDatasetFormat/Out1
2	[1x1 Signal]	Pulse	LogDataDatasetFormat/Out2

- Use braces { } to access, modify, or add elements using index.

The original `Dataset` object in the `SimulationOutput` object remains unchanged. To modify the data in the `SimulationOutput` object, access the `Dataset` object through the `SimulationOutput` object instead of assigning it to a separate variable.

```
out.yout = removeElement(out.yout,3);
out.yout
```

```
ans =
Simulink.SimulationData.Dataset 'yout' with 2 elements
```

		Name	BlockPath
1	[1x1 Signal]	Sine Wave	LogDataDatasetFormat/Out1

```
2 [1x1 Signal]      Pulse      LogDataDatasetFormat/Out2
```

- Use braces { } to access, modify, or add elements using index.

Input Arguments

ds — Data set from which to remove element

`Simulink.SimulationData.Dataset` object

Data set from which to remove element, specified as a `Simulink.SimulationData.Dataset` object.

ind — Index of element to remove from data set

scalar | vector

Index of element to remove from data set, specified as a scalar or a vector. To remove more than one element from the data set, specify a vector that contains the index for each element you want to remove.

Example: 1

Example: [1 3]

Output Arguments

ds — Data set with element removed

`Simulink.SimulationData.Dataset` object

Data set with element removed, returned as a `Simulink.SimulationData.Dataset` object.

Introduced in R2011a

Simulink.SimulationOutput

Access simulation results

Description

The `Simulink.SimulationOutput` object includes all logged simulation data and a `SimulationMetadata` object that describes simulation conditions. The `Simulink.SimulationOutput` object also contains useful metadata about the simulation, simulation run time. You can use the `Simulink.SimulationOutput` object to inspect results of the simulation, and you can use the `plot` function on the `Simulink.SimulationOutput` object to visualize the results. For simulation invoked using the **Run** or **Step Forward** buttons in Simulink, the `Simulink.SimulationOutput` object is stored in the base workspace, with the name specified in the model parameters. `Simulink.SimulationOutput` is writable.

Creation

By default, each simulation you run, creates a `Simulink.SimulationOutput` object that contains all data logged in the simulation, and a `Simulink.SimulationMetadata` object with the simulation metadata. You can access the `SimulationOutput` objects in several ways.

- The `Simulink.SimulationOutput` object returns the logged data for the simulation.
- You can use `who`, `get`, and `find` methods to access the output variable names and their respective values.

In the **Configuration Parameters**, the model setting **Single simulation output**, controls whether simulation output is returned in a `Simulink.SimulationOutput` object or if data is expanded in the base workspace. You can also use the command line API for this behavior by setting `ReturnWorkspaceOutputs` to `on` as a name-value argument pair with the `sim` command.

Properties

SimulationMetadata — Metadata for simulations

`Simulink.SimulationMetadata` object

Metadata for simulations, returned as a `Simulink.SimulationMetadata` object. Fields other than the `UserData` and `UserString` fields are read-only.

ErrorMessage — Simulation logging error messages

character vector

This property is read-only.

Simulation logging error messages returned as a character vector. The `ErrorMessage` property is empty when the simulation runs without errors.

Object Functions

<code>find</code>	Access and display values of simulation results
<code>get</code>	Access and display values of simulation results
<code>getSimulationMetadata</code>	Return <code>SimulationMetadata</code> object for simulation
<code>setUserData</code>	Store custom data in <code>SimulationMetadata</code> object that <code>SimulationOutput</code> object contains
<code>setUserString</code>	Store custom character vector in <code>SimulationMetadata</code> object in <code>SimulationOutput</code> object
<code>who</code>	Access and display output variable names of simulation
<code>plot</code>	Plot simulation output data in the Simulation Data Inspector

Examples

View Simulation Output and Metadata

Simulate a model, place the results of the `Simulink.SimulationOutput` object in `simOut` and view the simulation metadata.

Simulate the `vdp` model.

```
simOut = sim('vdp', 'SaveState', 'on', 'StateSaveName', 'xoutNew', ...
            'SaveOutput', 'on', 'OutputSaveName', 'youtNew')
```

```
Simulink.SimulationOutput:
```

```
    xoutNew: [65x2 double]
    youtNew: [65x2 double]
```

```
SimulationMetadata: [1x1 Simulink.SimulationMetadata]
ErrorMessage: [0x0 char]
```

Get the values of the variable `youtNew`.

```
simOut.youtNew
```

Simulink returns and displays the values.

Get the timing information for the simulation.

```
myMetadata = simOut.SimulationMetadata
```

```
myMetadata =
```

```
SimulationMetadata with properties:
```

```
    ModelInfo: [1x1 struct]
    TimingInfo: [1x1 struct]
    ExecutionInfo: [1x1 struct]
    UserString: ''
    UserData: []
```

```
myMetadata.TimingInfo
```

```
ans =
```

```
struct with fields:
```

```
    WallClockTimestampStart: '2016-12-30 08:47:51.739935'  
    WallClockTimestampStop: '2016-12-30 08:47:58.185579'  
    InitializationElapsedWallTime: 5.9166  
    ExecutionElapsedWallTime: 0.1910  
    TerminationElapsedWallTime: 0.3380  
    TotalElapsedWallTime: 6.4456
```

sltrace.Graph

Provide tracing information as graph for structure analysis

Description

An `sltrace.Graph` object stores tracing information generated by the `sltrace` function.

Creation

You can create `sltrace.Graph` object using the `sltrace` function.

Properties

TraceGraph — Tracing graph with edges and nodes

`digraph`

Tracing graph with edges and nodes, returned as a `digraph` object. A node in the graph is decided by a block port on the tracing path and shown as `'NodeIndex'`. For each node, `TraceGraph.Nodes` provides a table with more details, including `Block`, `PortNumber` and `PortType`. If `'BlockPath'` is set to `'on'` in `sltrace`, then the `Block` column of the `TraceGraph.Nodes` table will be shown as `Simulink.BlockPath`.

`TraceGraph.Edges` shows a table that contains the `EndNodes` of the `digraph` object, and the `Segments` between them. `Segments` is an array of segment handles that are connected together to form a line between two blocks. If the `EndNodes` belong to the same block, their `Segments` is marked as `'Internal'`. If the end nodes are from connectionless block pairs, such as the pair formed by `'From'` and `'Goto'`, then their `Segments` is marked as `'Hidden'`.

SrcBlocks, DstBlocks — Blocks on the tracing path

array of block handles | `Simulink.BlockPath` array

Blocks on tracing path, specified as an array of block handles or `Simulink.BlockPath` objects. If tracing in the direction of source, source blocks are returned in `g.SrcBlocks`. If tracing in the direction of the destination, destination blocks are returned in `g.DstBlocks`.

Object Functions

`highlight` Highlight tracing results
`removeHighlights` Remove highlighted tracing results

Examples

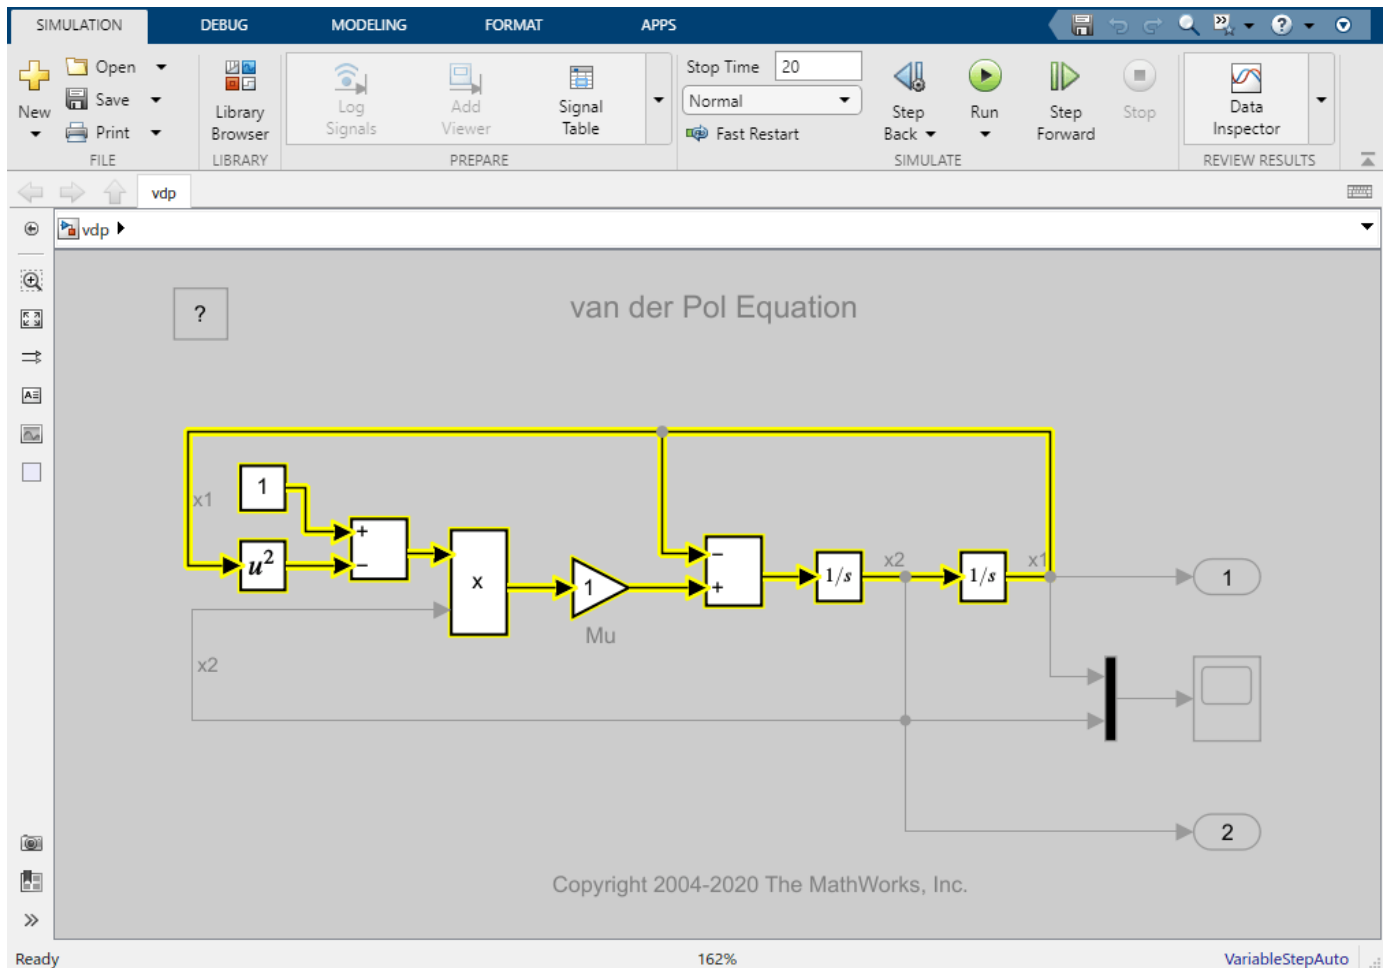

Trace All Sources in Model

This example shows how to trace from the first inport of the block `vdp/x1` to all sources.

```
open_system('vdp')
G = sltrace('vdp/x1', 'Source', 'Port', 1, 'TraceAll', 'on');
```

Highlight the tracing results and plot the trace graph.

```
highlight(G)
```

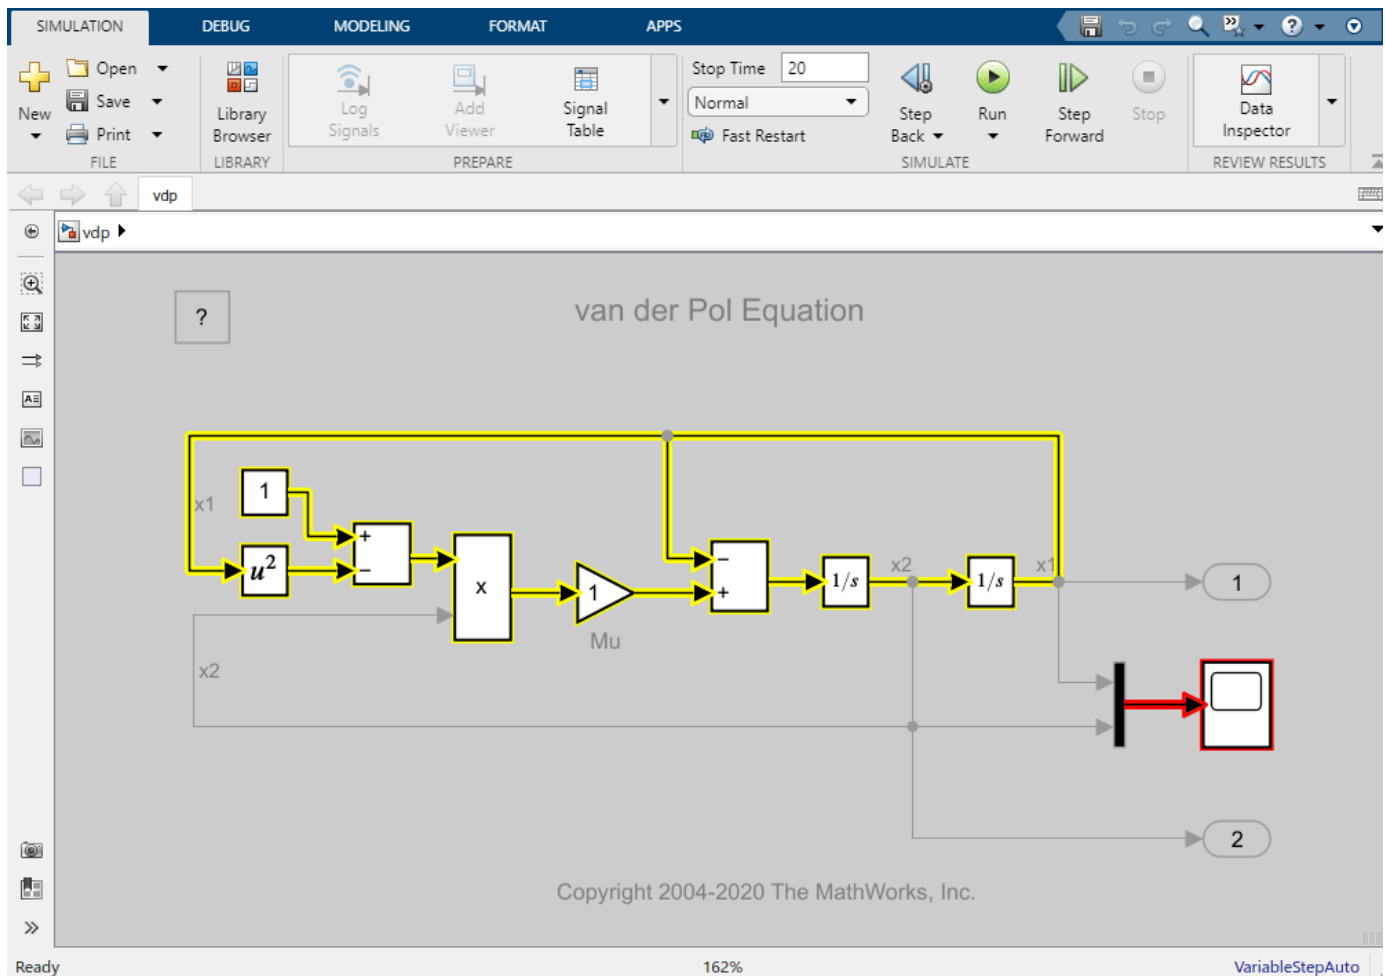

```
plot(G.TraceGraph)
```

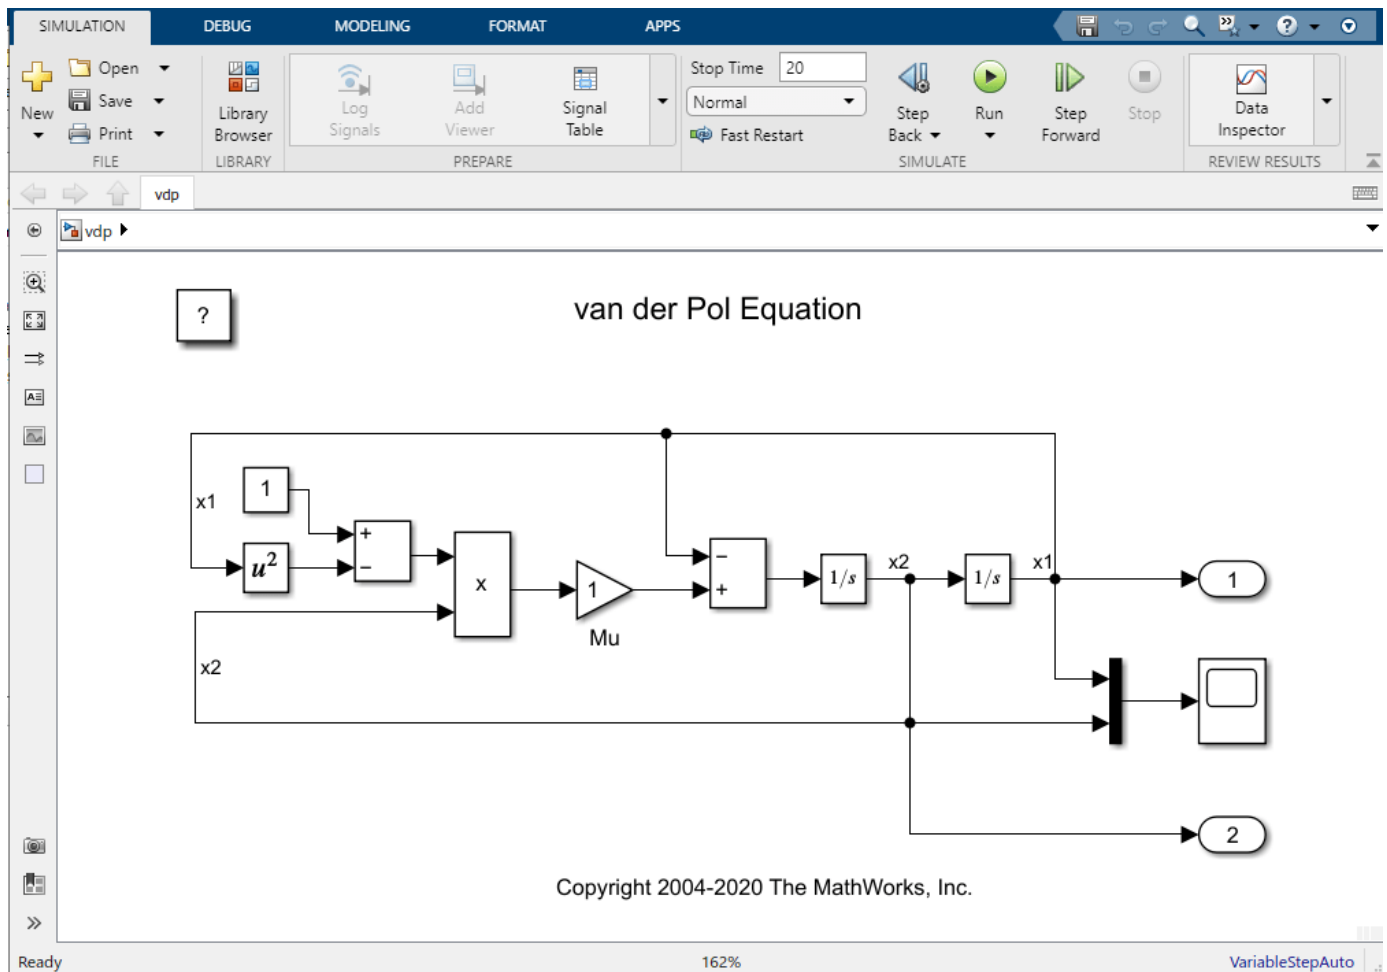

Highlight the block vdp/Scope and the line connecting to the inport of vdp/Scope.

```
bh = get_param('vdp/Scope','Handle');
inportH = get_param('vdp/Scope','PortHandles').Inport;
lh = get_param(inportH,'line');
highlight(G,[bh, lh])
```

Remove the highlighting.

`removeHighlight(G)`

See Also
sltrace

Topics

“Find Shortest Control Path in Simulink Model” on page 13-654

Introduced in R2021b

highlight

Package: Simulink

Highlight tracing results

Syntax

```
highlight(g)  
highlight(g,target)
```

Description

`highlight(g)` highlights all tracing results, blocks and lines in the `sltrace.Graph` object `g`.

`highlight(g,target)` highlights the blocks and lines specified in `target`.

Examples

Trace All Sources in Model

This example shows how to trace from the first inport of the block `vdp/x1` to all sources.

```
open_system('vdp')  
G = sltrace('vdp/x1', 'Source', 'Port', 1, 'TraceAll', 'on');
```

Highlight the tracing results and plot the trace graph.

```
highlight(G)
```

```
plot(G.TraceGraph)
```

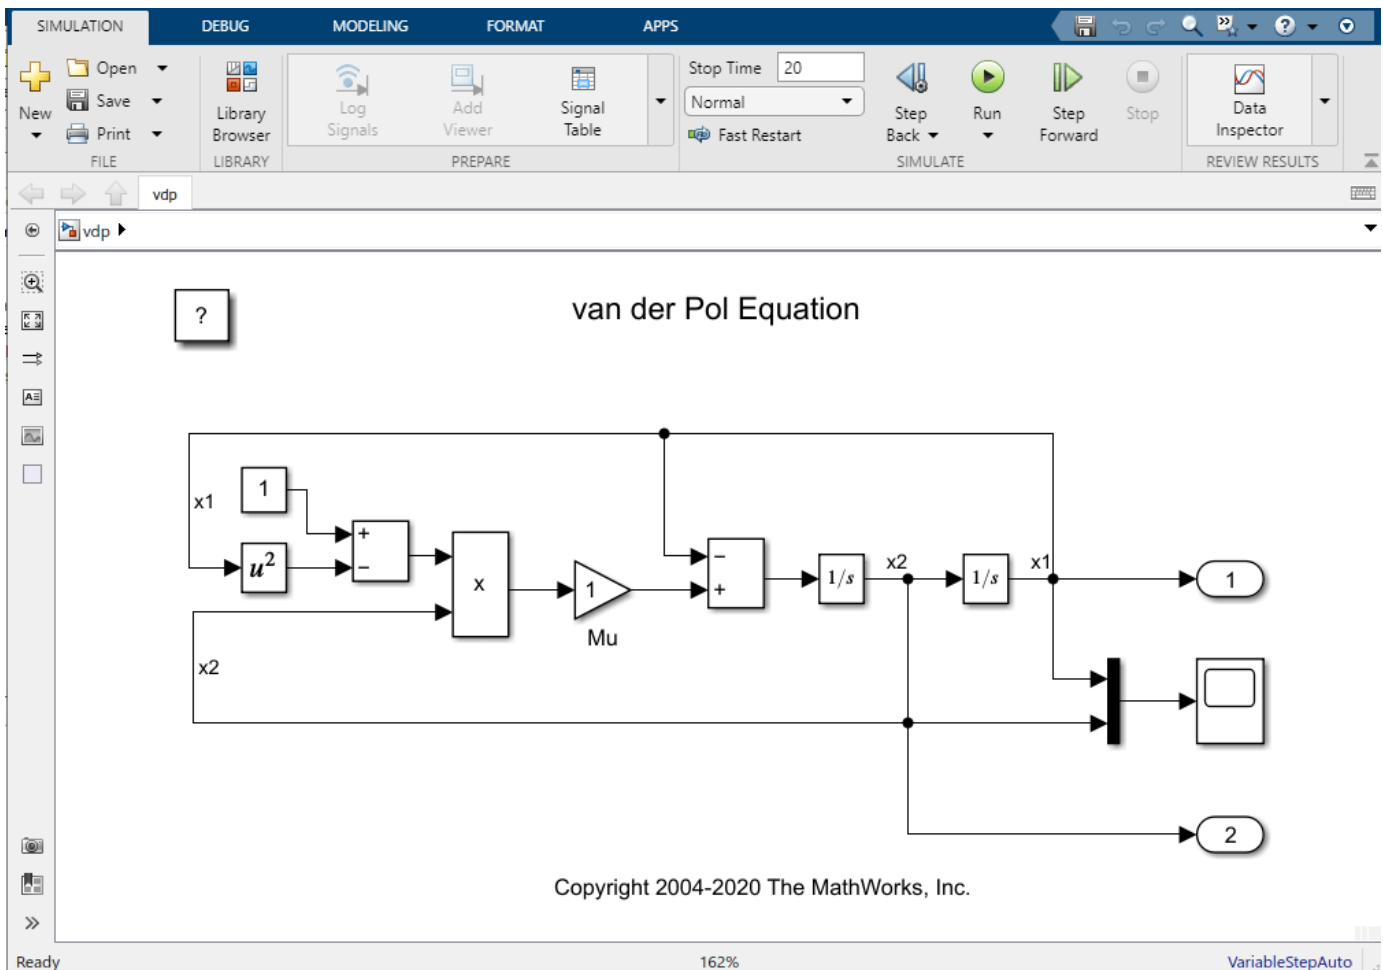

Highlight the block vdp/Scope and the line connecting to the inport of vdp/Scope.

```
bh = get_param('vdp/Scope', 'Handle');  
inportH = get_param('vdp/Scope', 'PortHandles').Inport;  
lh = get_param(inportH, 'line');  
highlight(G, [bh, lh])
```

Remove the highlighting.

`removeHighlight(G)`

Input Arguments

g – Graph object

`sltrace.Graph` object

Graph created by `sltrace` function, specified as a `sltrace.Graph` object.

target – Items to highlight

block handle | line handle | array of block or line handles

Specific items to highlight, specified as a block handle, a line handle, or an array of block and line handles.

Example: `g.highlight([bh, seg]);`

See Also

`removeHighlight` | `sltrace.Graph` | `sltrace`

Introduced in R2021b

removeHighlight

Package: Simulink

Remove highlighted tracing results

Syntax

```
removeHighlight(g)
```

Description

`removeHighlight(g)` removes all highlighting in a model created by the `highlight` function of `sltrace.Graph` object `g`.

Examples

Trace All Sources in Model

This example shows how to trace from the first inport of the block `vdp/x1` to all sources.

```
open_system('vdp')  
G = sltrace('vdp/x1', 'Source', 'Port', 1, 'TraceAll', 'on');
```

Highlight the tracing results and plot the trace graph.

```
highlight(G)
```

```
plot(G.TraceGraph)
```

Highlight the block vdp/Scope and the line connecting to the inport of vdp/Scope.

```
bh = get_param('vdp/Scope', 'Handle');  
inportH = get_param('vdp/Scope', 'PortHandles').Inport;  
lh = get_param(inportH, 'line');  
highlight(G, [bh, lh])
```

Remove the highlighting.

removeHighlight(G)

Input Arguments

g — Graph object

sltrace.Graph object

Graph created by sltrace function, specified as a sltrace.Graph object.

See Also

highlight | sltrace.Graph | sltrace

Introduced in R2021b

Simulink.ValueType

Specify properties of signals based on application-specific value types

Description

A `Simulink.ValueType` object is an application-specific set of properties that corresponds to a type of value, such as wind velocity. With `ValueType` objects, you specify the properties once and reuse that specification for each signal that represents the same type of value.

To create and modify `ValueType` objects in the base workspace or a data dictionary, you can use the **Model Explorer** or MATLAB commands. You cannot store `ValueType` objects in model workspaces.

Specify a `ValueType` object:

- At an interface with Inport, Outport, In Bus Element, or Out Bus Element blocks
- In a model with Signal Specification blocks
- In a `Simulink.BusElement` object

Use `ValueType` objects to validate the properties of a signal and enforce consistency between connected blocks at an interface.

Creation

Use either the `Simulink.ValueType` function described here or the **Model Explorer** to create a `ValueType` object.

Syntax

```
vt = Simulink.ValueType
```

Description

`vt = Simulink.ValueType` returns a `ValueType` object with default property values.

Properties

Data Type — Data type

'double' (default) | character vector | string scalar

Data type, specified as a character vector or string scalar.

You can specify any of these options:

- Built-in Simulink data type — For example, specify 'single' or 'uint8'. See “Data Types Supported by Simulink”.
- Fixed-point data type — Use the `fixdt` function. For example, specify 'fixdt(1,16,0)'.

- Enumerated data type — Use the name of the type preceded by Enum:. For example, specify 'Enum: myEnumType'.
- Custom data type — Use a MATLAB expression that specifies the type. For example, you can specify a Simulink.NumericType object whose DataTypeMode property is set to a value other than 'Fixed-point: unspecified scaling'.

Data Types: char | string

Min — Minimum value

[] (default) | scalar

Minimum value, specified as a finite real double scalar.

Data Types: double

Max — Maximum value

[] (default) | scalar

Maximum value, specified as a finite real double scalar.

Data Types: double

Unit — Physical unit

' ' (default) | character vector | string scalar

Physical unit, specified as a character vector or string scalar.

For more information, see “Unit Specification in Simulink Models”.

Example: 'inches'

Data Types: char | string

Complexity — Numeric type

'real' (default) | 'complex'

Numeric type, specified as 'real' or 'complex'.

Data Types: char | string

Dimensions — Dimensions

1 (default) | scalar | vector

Dimensions, specified as a scalar or vector.

Data Types: double

DimensionsMode — Option to allow only fixed-size or variable-size signals

'Fixed' (default) | 'Variable'

Option to allow only fixed-size or variable-size signals, specified as 'Fixed' or 'Variable', respectively.

Data Types: char | string

Description — Description

' ' (default) | character vector | string scalar

Description, specified as a character vector or string scalar. Use the description to document information about the `ValueType` object, such as the kind of signal it applies to. This information does not affect Simulink processing.

Data Types: `char` | `string`

Examples

Specify Signal Properties for Value Type

In the MATLAB Command Window, define a reusable set of properties that correspond to wind velocity by using the `Simulink.ValueType` function.

Create a `ValueType` object with default properties.

```
windVelocity = Simulink.ValueType
```

```
windVelocity =
  ValueType with properties:

    DataType: 'double'
      Min: []
      Max: []
      Unit: ''
    Complexity: 'real'
    Dimensions: 1
    DimensionsMode: 'Fixed'
    Description: ''
```

Specify the desired property values for wind velocity.

```
windVelocity.DataType = 'single';
windVelocity.Min = 11;
windVelocity.Max = 17;
windVelocity.Unit = 'm/s';
windVelocity.Dimensions = [2 4 3];
windVelocity.Description = 'Wind velocity value type'
```

```
windVelocity =
  ValueType with properties:

    DataType: 'single'
      Min: 11
      Max: 17
      Unit: 'm/s'
    Complexity: 'real'
    Dimensions: [2 4 3]
    DimensionsMode: 'Fixed'
    Description: 'Wind velocity value type'
```

Simulink.VariableUsage

Store information about the relationship between variables and blocks in models

Description

A `Simulink.VariableUsage` object describes where a variable is used in models.

Use this information to:

- Prepare to permanently store the variables in files and workspaces. For more information about storing variables for a model, see “Determine Where to Store Variables and Objects for Simulink Models”.
- Reduce the number of variables that you need to store by eliminating unused variables.
- Prepare to partition variables and establish variable ownership when you work in a team.

To analyze variable usage in models, use `Simulink.VariableUsage` objects together with the `Simulink.findVars` function. The function returns and accepts `Simulink.VariableUsage` objects as arguments. For more information, see `Simulink.findVars`.

A `Simulink.VariableUsage` object can also describe the usage of an enumerated data type.

Only a `Simulink.VariableUsage` constructor or the `Simulink.findVars` function can set property values in a `Simulink.VariableUsage` object. The properties are otherwise read only.

Creation

The `Simulink.findVars` function returns `Simulink.VariableUsage` objects.

To create variable usage objects for use as a filter when using `Simulink.findVars`, use the `Simulink.VariableUsage` function described below.

Syntax

```
variableUsageObj = Simulink.VariableUsage(varNames,sourceName)
```

Description

`variableUsageObj = Simulink.VariableUsage(varNames,sourceName)` creates an array of `Simulink.VariableUsage` objects to describe the variables `varNames`. The constructor sets the `Name` property of each object to one of the variable names specified by `varNames`, and sets the `Source` property of all the objects to the source specified by `sourceName`. You can specify `varNames` with variables that are not used in any loaded models.

Input Arguments

varNames — Names of target variables

character vector | cell array of character vectors

Names of target variables, specified as a character vector or a cell array of character vectors. The constructor creates a `Simulink.VariableUsage` object for each variable name.

Example: `'k'`

Example: `{'k','asdf','fuelFlow'}`

Data Types: `char` | `cell`

sourceName — Name of variable source

character vector

Name of the source that defines the target variables, specified as a character vector. For example, you can specify the MATLAB base workspace or a data dictionary as a source. The constructor also determines and sets the `SourceType` property of each of the returned `Simulink.VariableUsage` objects.

Example: `'base workspace'`

Example: `'myModel'`

Example: `'myDictionary.sldd'`

Data Types: `char`

Properties

Name — Name of variable or enumerated type

`''` (empty character vector) (default) | character vector

This property is read-only.

The name of the variable or enumerated data type the object describes, returned as a character vector.

Source — Name of defining workspace

`''` (empty character vector) (default) | character vector

This property is read-only.

The name of the workspace or data dictionary that defines the described variable, returned as a character vector. The table shows some examples.

Source Value	Meaning
<code>'base workspace'</code>	MATLAB base workspace
<code>'MyModel'</code>	Model workspace for the model <code>MyModel</code>
<code>'MyModel/Mask1'</code>	Mask workspace for the masked block <code>Mask1</code> in the model <code>MyModel</code>
<code>'sldemo_fuelsys_dd_controller.sldd'</code>	The data dictionary named <code>'sldemo_fuelsys_dd_controller.sldd'</code>

The table shows some examples if you created the `Simulink.VariableUsage` object by using the `Simulink.findVars` function to find enumerated data types.

Source Value	Meaning
'BasicColors.m'	The enumerated type is defined in the MATLAB file 'BasicColors.m'.
' '	The enumerated type is defined dynamically and has no source.
'sldemo_fuelsys_dd_controller.sldd'	The enumerated type is defined in the data dictionary named 'sldemo_fuelsys_dd_controller.sldd'.

SourceType — Type of defining workspace

'unknown source' (default) | 'base workspace' | 'model workspace' | 'mask workspace' | 'data dictionary'

This property is read-only.

The type of the workspace that defines the variable, returned as a character vector. The possible values are:

- 'base workspace'
- 'model workspace'
- 'mask workspace'
- 'data dictionary'

If you created the `Simulink.VariableUsage` object by using the `Simulink.findVars` function to find enumerated data types, the possible values are:

- 'MATLAB file'
- 'dynamic class'
- 'data dictionary'

Users — Blocks that use the variable or models that use the enumerated type

{ } (empty cell array) (default) | cell array of character vectors

This property is read-only.

Blocks that use the variable or models that use the enumerated type, returned as a cell array of character vectors. Each character vector names a block or model that uses the variable or enumerated type. The `Simulink.findVars` function populates this property.

Object Functions

`intersect` Return intersection of two arrays of `Simulink.VariableUsage` objects
`setdiff` Return difference between two arrays of `Simulink.VariableUsage` objects
`union` Return union of two arrays of `Simulink.VariableUsage` objects

Examples

Create Object That Represents Variable in Base Workspace

Return a `Simulink.VariableUsage` object for a variable `k` in the base workspace.

```
var = Simulink.VariableUsage('k', 'base workspace');
```

You can use `var` as a filter for the `Simulink.findVars` function.

Represent All Variables in the Base Workspace

Return an array of `Simulink.VariableUsage` objects containing one object for each variable returned by the `whos` command in the base workspace.

```
vars = Simulink.VariableUsage(whos,'base workspace')
```

Represent All Variables in a Model Workspace

Return an array of `Simulink.VariableUsage` objects that describes all the variables in a model workspace.

```
hws = get_param('mymodel','ModelWorkspace');  
vars = Simulink.VariableUsage(hws.whos,'MyModel')
```

Represent All Variables in a Mask Workspace

Return an array of `Simulink.VariableUsage` objects that describes all the variables in a mask workspace.

```
maskVars = get_param('mymodel/maskblock','MaskWSVariables');  
vars = Simulink.VariableUsage(maskVars,'mymodel/maskblock');
```

“Using a Data Dictionary to Manage the Data for a Fuel Control System” on page 13-134

Introduced in R2012b

intersect

Package: Simulink

Return intersection of two arrays of Simulink.VariableUsage objects

Syntax

```
VarsOut = intersect(VarsIn1,VarsIn2)
```

Description

`VarsOut = intersect(VarsIn1,VarsIn2)` returns an array that identifies the variables described in `VarsIn1` and in `VarsIn2`, which are arrays of Simulink.VariableUsage objects. If a variable is described by a Simulink.VariableUsage object in `VarsIn1` and in `VarsIn2`, the function returns a Simulink.VariableUsage object that stores the variable usage information from both objects in the `Users` property.

`intersect` compares the `Name`, `Source`, and `SourceType` properties of the Simulink.VariableUsage objects in `VarsIn1` with the same properties of the objects in `VarsIn2`. If `VarsIn1` and `VarsIn2` each contain Simulink.VariableUsage objects that have the same values for these three properties, they both describe the same variable.

To create Simulink.VariableUsage objects that describe the usage of variables in a model, use the Simulink.findVars function.

Examples

Compare Variables Used by Models

Given two models, discover the variables needed by both models.

```
model1Vars = Simulink.findVars('model1');  
model2Vars = Simulink.findVars('model2');  
commonVars = intersect(model1Vars,model2Vars);
```

Input Arguments

VarsIn1 — First array of variables for comparison

array of Simulink.VariableUsage objects

First array of variables for comparison, specified as an array of Simulink.VariableUsage objects.

VarsIn2 — Second array of variables for comparison

array of Simulink.VariableUsage objects

Second array of variables for comparison, specified as an array of Simulink.VariableUsage objects.

Output Arguments

VarsOut — Variables described in both input arrays

array of `Simulink.VariableUsage` objects

Variables that are described in both input arrays, returned as an array of `Simulink.VariableUsage` objects. The function returns an object for each variable that is described in `VarsIn1` and in `VarsIn2`.

See Also

`Simulink.findVars` | `Simulink.VariableUsage` | `setdiff` | `union`

Topics

“Manage Design Data”

Introduced in R2012b

setdiff

Package: Simulink

Return difference between two arrays of `Simulink.VariableUsage` objects

Syntax

```
VarsOut = setdiff(VarsIn1,VarsIn2)
```

Description

`VarsOut = setdiff(VarsIn1,VarsIn2)` returns an array that identifies the variables described in `VarsIn1` but not in `VarsIn2`, which are arrays of `Simulink.VariableUsage` objects. If a variable is described by a `Simulink.VariableUsage` object in `VarsIn1` but not in `VarsIn2`, the function returns a copy of the object.

`setdiff` compares the `Name`, `Source`, and `SourceType` properties of the `Simulink.VariableUsage` objects in `VarsIn1` with the same properties of the objects in `VarsIn2`. If `VarsIn1` and `VarsIn2` each contain a `Simulink.VariableUsage` object with the same values for these three properties, the objects describe the same variable, and `setdiff` does not return an object to describe it.

To create `Simulink.VariableUsage` objects that describe the usage of variables in a model, use the `Simulink.findVars` function.

Examples

Determine Variable Usage Difference Between Models

Given two models, discover the variables that are needed by the first model but not the second model.

```
model1Vars = Simulink.findVars('model1');  
model2Vars = Simulink.findVars('model2');  
differentVars = setdiff(model1Vars,model2Vars);
```

Find Variables Not Used by Model

Locate all variables in the base workspace that are not used by a loaded model that has been recently compiled.

```
models = find_system('type','block_diagram','LibraryType','None');  
base_vars = Simulink.VariableUsage(who,'base workspace');
```

```
used_vars = Simulink.findVars(models, 'WorkspaceType', 'base');  
unusedVars = setdiff(base_vars, used_vars);
```

Input Arguments

VarsIn1 — First array of variables for comparison

array of `Simulink.VariableUsage` objects

First array of variables for comparison, specified as an array of `Simulink.VariableUsage` objects.

VarsIn2 — Second array of variables for comparison

array of `Simulink.VariableUsage` objects

Second array of variables for comparison, specified as an array of `Simulink.VariableUsage` objects.

Output Arguments

VarsOut — Variables described in first array but not second array

array of `Simulink.VariableUsage` objects

Variables that are described in the first input array but not in the second input array, returned as an array of `Simulink.VariableUsage` objects. The function returns an object for each variable that is described in `VarsIn1` but not in `VarsIn2`.

See Also

`Simulink.findVars` | `Simulink.VariableUsage` | `intersect` | `union`

Topics

“Manage Design Data”

Introduced in R2012b

union

Package: Simulink

Return union of two arrays of `Simulink.VariableUsage` objects

Syntax

```
VarsOut = union(VarsIn1,VarsIn2)
```

Description

`VarsOut = union(VarsIn1,VarsIn2)` returns an array that is a combined set of the variables from `VarsIn1` and `VarsIn2`, which are arrays of `Simulink.VariableUsage` objects. The output array does not contain duplicates. If a variable is described by a `Simulink.VariableUsage` object in `VarsIn1` and in `VarsIn2`, the function returns a `Simulink.VariableUsage` object that stores the variable usage information from both objects in the `Users` property.

To create `Simulink.VariableUsage` objects that describe the usage of variables in a model, use the `Simulink.findVars` function.

Examples

Find the Union of Variables Used by Models

Given two models, discover the combined set of variables from both models.

```
model1Vars = Simulink.findVars('model1');  
model2Vars = Simulink.findVars('model2');  
unionVars = union(model1Vars,model2Vars);
```

Input Arguments

VarsIn1 — First array of variables for union

array of `Simulink.VariableUsage` objects

First array of variables for union, specified as an array of `Simulink.VariableUsage` objects.

VarsIn2 — Second array of variables for union

array of `Simulink.VariableUsage` objects

Second array of variables for union, specified as an array of `Simulink.VariableUsage` objects.

Output Arguments

VarsOut — Combined set of variables described in input arrays

array of `Simulink.VariableUsage` objects

Combined set of variables that are described in input arrays, returned as an array of `Simulink.VariableUsage` objects. The function returns an object for each variable that is described in `VarsIn1` or in `VarsIn2`.

Topics

“Manage Design Data”

Introduced in R2019b

Simulink.WorkspaceVar

Store information about workspace variables and blocks that use them

Note `Simulink.WorkspaceVar` is not recommended. Use `Simulink.VariableUsage` instead.

Description

A `Simulink.WorkspaceVar` object describes attributes of a workspace variable and lists the blocks that use the variable.

Creation

The `Simulink.findVars` function returns one or more `Simulink.WorkspaceVar` objects that embody the results of searching for variables.

Only the `Simulink.WorkspaceVar` function can set any field value in a `Simulink.WorkspaceVar` object. The fields are otherwise read-only.

Syntax

```
varObj = Simulink.WorkspaceVar(varNames, wkspName)
```

Description

`varObj = Simulink.WorkspaceVar(varNames, wkspName)` creates an array of `Simulink.WorkspaceVar` objects to describe the variables `varNames`. The constructor sets the `Name` property of each object to one of the variable names specified by `varNames`, and sets the `Workspace` property of all the objects to the workspace specified by `wkspName`. You can specify `varNames` with variables that are not used in any loaded models.

Input Arguments

varNames — Names of target variables

character vector | cell array of character vectors

Names of target variables, specified as a character vector or a cell array of character vectors. The constructor creates a `Simulink.WorkspaceVar` object for each variable name. You can specify `varNames` with variables that are not used in any loaded models.

Example: `'k'`

Example: `{'k', 'asdf', 'fuelFlow'}`

Data Types: `char` | `cell`

wkspName — Name of containing workspace

character vector

Name of the workspace that defines the target variables, specified as a character vector. For example, you can specify the MATLAB base workspace. The constructor also determines and sets the `WorkspaceType` property of each of the returned `Simulink.WorkspaceVar` objects.

Example: `'base workspace'`

Example: `'myModel'`

Example: `'myDictionary.slidd'`

Data Types: `char`

Properties

Name — Name of variable

`''` (empty character vector) (default) | character vector

This property is read-only.

Name of the variable described by the object, returned as a character vector.

Workspace — Name of workspace that contains variable

`''` (empty character vector) (default) | character vector

This property is read-only.

Name of the workspace that contains the variable, returned as a character vector. For example:

Workspace value	Meaning
<code>'base workspace'</code>	The MATLAB base workspace
<code>'MyModel'</code>	The model workspace for the model <code>MyModel</code> .
<code>'MyModel/Mask1'</code>	The mask workspace for the masked block <code>Mask1</code> in the model <code>MyModel</code> .

WorkspaceType — Type of workspace containing variable

`'unknown'` (default) | `'base'` | `'model'` | `'mask'`

This property is read-only.

Type of workspace that contains the variable, returned as a character vector. The possible values are:

- `'base'` — The base workspace
- `'model'` — A model workspace
- `'mask'` — A mask workspace

UsedByBlocks — Users of variable

`{}` (empty cell array) (default) | cell array of character vectors

This property is read-only.

Users of the variable, returned as a cell array of character vectors. Each character vector identifies a block that uses the variable. The `Simulink.findVars` function populates this property.

Object Functions

`intersect` Return intersection of two arrays of `Simulink.VariableUsage` objects
`setdiff` Return difference between two arrays of `Simulink.VariableUsage` objects

Examples

Create Object That Represents Variable in Base Workspace

Return a `Simulink.WorkspaceVar` object for a variable `k` in the base workspace.

```
var = Simulink.WorkspaceVar('k', 'base workspace');
```

Represent All Variables in the Base Workspace

Return an array of `Simulink.WorkspaceVar` objects containing one object for each variable returned by the `whos` command in the base workspace.

```
vars = Simulink.WorkspaceVar(who,WkspName)
```

Represent All Variables in a Model Workspace

Return an array of `Simulink.WorkspaceVar` objects that describes all the variables in a model workspace.

```
hws = get_param('mymodel', 'ModelWorkspace');  
vars=Simulink.WorkspaceVar(hws.whos, 'MyModel')
```

Represent All Variables in a Mask Workspace

Return an array of `Simulink.WorkspaceVar` objects that describes all the variables in a mask workspace.

```
maskVars = get_param('mymodel/maskblock', 'MaskWSVariables');  
vars = Simulink.WorkspaceVar(maskVars, 'mymodel/maskblock');
```

`Simulink.findVars` | `setdiff` | `intersect`

Introduced in R2010a

TimeScopeConfiguration

Control Scope block appearance and behavior

Description

Scope configuration properties control the appearance and behavior of a scope block. Create a scope configuration object with `get_param`, and then change property values using the object with dot notation.

Creation

`myScopeConfiguration = get_param(gcbh, 'ScopeConfiguration')` creates a scope configuration object for the selected scope block.

Properties

Name — Title on a scope window

block name (default) | character vector | string scalar

Title on a scope window, specified as a character vector or string scalar.

NumInputPorts — Number of input ports

'1' (default) | character vector

Number of input ports on a scope block, specified as a character vector or string scalar. The maximum number of input ports is 96.

ActiveDisplay — Display for setting display-specific properties

'1' (default) | character vector

Display for setting display-specific properties, specified as a character vector or string. The number of a display corresponds to its column-wise placement index. For multi-column layouts, the displays are numbered down and then across.

Dependency

Setting this property selects the display for setting the properties `ShowGrid`, `ShowLegend`, `Title`, `PlotAsMagnitudePhase`, `YLabel`, and `YLimits`.

AxesScaling — How to scale y-axes

'Manual' (default) | 'Auto' | 'Updates'

How to scale y-axes, specified as one of these values:

- 'Manual' — Manually scale y-axes with the **Scale Y-axis Limits** button.
- 'Auto' — Scale y-axes during and after simulation.
- 'Updates' — Scale y-axes after specified number of block updates (time intervals).

Dependency

If this property is set to 'Updates', also specify the property `AxesScalingNumUpdates`

AxesScalingNumUpdates — Number of updates before scaling y-axes

'10' (default) | character vector | string scalar

Number of updates before scaling y-axes, specified as a character vector or string scalar.

Dependency

Activate this property by setting `AxesScaling` to 'Updates'.

DataLogging — Save scope data

false (default) | true

Set this property to `true` to save scope data to a variable in the MATLAB workspace.

This property does not apply to floating scopes and scope viewers.

Dependency

If this property is set to `true`, you must also specify the properties `DataLoggingVariableName` and `DataLoggingSaveFormat`.

DataLoggingVariableName — Variable name for saving scope data

'ScopeData' (default) | character vector | string scalar

Variable name for saving scope data in the MATLAB workspace, specified as a character vector or string scalar. This property does not apply to floating scopes and scope viewers.

Dependency

Activate this property by setting `DataLogging` to `true`.

DataLoggingSaveFormat — Variable format for saving scope data

'Dataset' (default) | 'Structure With Time' | 'Structure' | 'Array'

Variable format for saving scope data to the MATLAB workspace, specified as one of these values:

- 'Dataset' — Save data as a dataset object. This format does not support variable-size data, MAT-file logging, or external mode archiving. See `Simulink.SimulationData.Dataset`.
- 'StructureWithTime' — Save data as a structure with associated time information. This format does not support single- or multiport frame-based data, or multirate data.
- 'Structure' — Save data as a structure. This format does not support multirate data.
- 'Array' — Save data as an array with associated time information. This format does not support multiport sample-based data, single- or multiport frame-based data, variable-size data, or multirate data.

This property does not apply to floating scopes and scope viewers.

Dependency

Activate this property by setting `DataLogging` to `true`.

DataLoggingLimitDataPoints — Limit buffered data

false (default) | true

Set to `true` to limit buffered data before plotting and saving data.

For simulations with **Stop time** set to `inf`, always set this parameter to `true`.

Dependency

If this property is set to `true`, also specify the number of data values to plot and save with the property `DataLoggingMaxPoints`.

DataLoggingMaxPoints — Maximum number of data values

`'5000'` (default) | character vector | string scalar

Maximum number of data values to plot and save, specified as a character vector or string scalar. The data values that are plotted and saved are from the end of a simulation. For example, setting this property to 100 saves the last 100 data points.

Dependency

Activate this property by setting `DataLoggingLimitDataPoints` to `true`. Specifying this property limits the data values a scope plots and the data values saved in the MATLAB variable specified in `DataLoggingVariableName`.

DataLoggingDecimateData — Reduce scope data

`false` (default) | `true`

Set this property to `true` to reduce scope data before plotting and saving.

Dependency

If this property is set to `true`, you must also specify the `DataLoggingDecimation` property.

DataLoggingDecimation — Decimation factor

`'1'` (default) | character vector | string scalar

Decimation factor applied to the signal data before plotting and saving, specified as a character vector or string scalar. The scope buffers every N^{th} data point, where N is the decimation factor you specify. A value of 1 buffers all data values.

Dependency

Activate this property by setting `DataLoggingDecimateData` to `true`.

FrameBasedProcessing — Frame-based processing of signals

`false` (default for Time Scope block) | `true` (default for Scope block)

Set this property to `true` to process signals as frame-based.

- `false` — Process signal values in a channel at each time interval (sample based).
- `true` — Process signal values in a channel as a group of values from multiple time intervals (frame based). Frame-based processing is available only with discrete input signals.

LayoutDimensions — Number of display rows and columns

`[1 1]` (default) | `[numberOfRows numberOfColumns]`

Number of display rows and columns, specified with as a two-element vector. The maximum layout dimension is 16-by-16.

- If the number of displays is equal to the number of ports, signals from each port appear on separate displays.
- If the number of displays is less than the number of ports, signals from additional ports appear on the last y-axis.

MaximizeAxes — Maximize size of signal plots

'Auto' (default) | 'On' | 'Off'

Specify whether or not to maximize the size of signal plots:

- 'Auto' — If `Title` and `YLabel` are not specified, maximize all plots.
- 'On' — Maximize all plots. Values in `Title` and `YLabel` are hidden.
- 'Off' — Do not maximize plots.

Each of the plots expands to fit the full display. Maximizing the size of signal plots removes the background area around the plots.

MinimizeControls — Hide menu and toolbar

false (default) | true

Set this property to `true` to hide the menu and toolbar.

If you dock the scope, this property is inactive.

OpenAtSimulationStart — Open scope when starting simulation

true (default for Time Scope) | false (default for Scope)

Set this property to `true` to open the scope when the simulation starts.

PlotAsMagnitudePhase — Magnitude and phase plots

false (default) | true

Specify whether or not to display the magnitude and phase plots:

- `false` — Display signal plot.

If the signal is complex, plot the real and imaginary parts on the same y-axis (display).

- `true` — Display magnitude and phase plots.

If the signal is real, plot the absolute value of the signal for the magnitude. The phase is 0 degrees for positive values and 180 degrees for negative values.

Dependency

Set the `ActiveDisplay` property before setting this property.

Position — Size and location of the scope

[left bottom width height]

Size and location of scope window, specified as a four-element vector consisting of the left, bottom, width, and height positions, in pixels.

By default, a scope window appears in the center of your screen with a width of 560 pixels and height of 420 pixels.

ShowGrid — Vertical and horizontal grid lines`true` (default) | `false`

Set this property to `true` to display vertical and horizontal grid lines.

Dependency

Set the `ActiveDisplay` property before setting this property.

SampleTime — Time interval`'-1'` (default) | character vector | string scalar

Time interval between Scope block updates during a simulation, specified as a character vector or string scalar. This property does not apply to floating scopes and scope viewers.

ShowLegend — Signal legend`false` (default) | `true`

Set this property to `true` to display the legend.

Names listed in the legend are the signal names from the model. For signals with multiple channels, a channel index is appended after the signal name. See the Scope block reference for an example.

Dependency

Set the `ActiveDisplay` property before setting this property.

ShowTimeAxisLabel — Display or hide x-axis labels`true` (default for Time Scope block) | `false` (default for Scope block)

Set this property to `true` to display the x-axis labels.

Dependency

Set the `ActiveDisplay` property before setting this property.

If this property is set to `true`, also set `TimeAxisLabels`. If `TimeAxisLabels` is set to `'None'`, this property is inactive.

TimeAxisLabels — How x-axis labels display`'All'` (default for Time Scope block) | `'Bottom'` (default for Scope block) | `'None'`

How x-axis labels display, specified as one of these values:

- `'All'` — Display x-axis labels on all displays.
- `'Bottom'` — Display x-axis labels only on the bottom display.
- `'None'` — Do not display labels and deactivate `ShowTimeAxisLabel` property.

Dependency

Set the `ActiveDisplay` property before specifying this property.

Set `ShowTimeAxisLabel` to `true` and set `Maximize axes` to `'Off'`.

TimeDisplayOffset — x-axis range offset`'0'` (default) | character vector | string scalar

x-axis range offset number, specified as a character vector or string scalar. For input signals with multiple channels, enter a scalar or vector of offsets.

- Scalar — Offset all channels of an input signal by the same value.
- Vector — Independently offset the channels.

TimeSpan — Length of x-axis range to display

'0' (default) | character vector | string scalar | 'Auto'

Length of x-axis range to display, specified as one of these values:

- Positive real number — Any value less than the total simulation time specified as a character vector or string scalar.
- 'Auto' — Difference between the simulation start and stop times.

The block calculates the beginning and end times of the x-axis range using the `TimeDisplayOffset` and `TimeSpan` properties. For example, if you set `TimeDisplay` to 10 and the `TimeSpan` to 20, the scope sets the x-axis range from 10 to 30.

TimeSpanOverrunAction — How to display data

'Wrap' (default) | 'Scroll'

How to display data beyond the visible x-axis range, specified as one of these values:

- 'Wrap' — Draw a full screen of data from left to right, clear the screen, and then restart drawing of data.
- 'Scroll' — Move data to the left as new data is drawn on the right. This mode is graphically intensive and can affect run-time performance.

You can see the effects of this option only when plotting is slow with large models or small step sizes.

TimeUnits — Units to display on the x-axis

'Metric' (default for Time Scope block) | 'None' (default for Scope block) | 'Seconds'

Units to display on the x-axis, specified as one of these values:

- 'Metric' — Display time units based on the length of the `TimeSpan` property.
- 'None' — Display Time on the x-axis.
- 'Seconds' — Display Time (seconds) on the x-axis.

Title — Title for display

'%<SignalLabel>' (default) | character vector | string scalar

Title for a display, specified as a character vector or string scalar. The default value `%<SignalLabel>` uses the input signal name for the title.

Dependency

Set the `ActiveDisplay` property before setting this property.

Visible — Visibility of scope window

true (default) | false

Set this property to true to make the scope window visible.

YLabel — Y-axis label`''` (default) | character vector | string scalar

y-axis label for active display, specified as a character vector or string scalar.

Dependency

Set the `ActiveDisplay` property before setting this property.

If `PlotAsMagnitudePhase` is `true`, the value of `YLabel` is hidden and plots are labeled `Magnitude` and `Phase`.

YLimits — Minimum and maximum values of y-axis`[-10 10]` (default) | [`ymin ymax`]

Minimum and maximum values of y-axis, specified as a two-element numeric vector.

Dependency

Set the `ActiveDisplay` property before setting this property.

When `PlotAsMagnitudePhase` is `true`, this property specifies the y-axis limits for the magnitude plot. The y-axis limits of the phase plot are always `[-180 180]`.

Examples**Create Scope Configuration Object**

This example creates a scope configuration object using the `'vdp'` model which models the van der Pol equation.

```
open_system('vdp')
myScopeConfiguration = get_param('vdp/Scope','ScopeConfiguration');
myScopeConfiguration.NumInputPorts = '2';
```

Simulink Check Overview

Use the Simulink Model Advisor checks to configure your model for simulation.

See Also

- “Run Model Advisor Checks”
- “Simulink Coder Checks” (Simulink Coder)
- “Simulink Check Checks” (Simulink Check)

Migrating to Simplified Initialization Mode Overview

Simplified initialization mode was introduced in R2008b to improve the consistency of simulation results. This mode is especially important for models that do not specify initial conditions for conditionally executed subsystem output ports. For more information, see “Simplified Initialization Mode” and “Classic Initialization Mode”.

Use the Model Advisor checks in **Migrating to Simplified Initialization Mode** to help migrate your model to simplified initialization mode.

See Also

- “Simplified Initialization Mode”
- “Classic Initialization Mode”
- “Underspecified initialization detection”
- “Check usage of Merge blocks” on page 9-25

- “Check model settings for migration to simplified initialization mode” on page 9-35

Identify unconnected lines, input ports, and output ports

Check ID: `mathworks.design.UnconnectedLinesPorts`

Check for unconnected lines or ports.

Description

This check lists unconnected lines or ports. These can have difficulty propagating signal attributes such as data type, sample time, and dimensions.

Note Ports connected to ground/terminator blocks will pass this test.

Results and Recommended Actions

Condition	Recommended Action
Lines, input ports, or output ports are unconnected.	Connect the signals. Double-click the list of unconnected items to locate failure.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

Tips

Use the `PortConnectivity` command to obtain an array of structures describing block input or output ports.

See Also

“Common Block Properties” on page 6-12 for information on the `PortConnectivity` command.

“Model Advisor Exclusion Overview” (Simulink Check)

Check root model Inport block specifications

Check ID: `mathworks.design.RootInportSpec`

Check that root model Inport blocks fully define dimensions, sample time, and data type.

Description

Using root model Inport blocks that do not fully define dimensions, sample time, or data type can lead to undesired simulation results. Simulink software back-propagates dimensions, sample times and data types from downstream blocks unless you explicitly assign them values.

Results and Recommended Actions

Condition	Recommended Action
Root-level Inport blocks have undefined attributes.	Fully define the attributes of the root-level Inport blocks.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

Tips

The following configurations pass this check:

- **Configuration Parameters > Solver > Periodic sample time constraint** is set to Ensure sample time independent
- For export-function models, *inherited sample time* is not flagged.

See Also

- “About Data Types in Simulink”.
- “Determine Signal Dimensions”.
- “Specify Sample Time”.
- “Model Advisor Exclusion Overview” (Simulink Check)

Check optimization settings

Check ID: `mathworks.design.OptimizationSettings`

Check for optimizations that can lead to non-optimal code generation and simulation.

Description

This check reviews the status of optimizations that can improve code efficiency and simulation time.

Results and Recommended Actions

Condition	Recommended Action
<p>The specified optimizations are off.</p>	<p>Select the following optimization check boxes on the Optimization pane in the Configuration Parameters dialog box:</p> <ul style="list-style-type: none"> • “Remove root level I/O zero initialization” (Embedded Coder) • “Remove internal data zero initialization” (Embedded Coder) <p>Select the following optimization check boxes on the Optimization pane in the Configuration Parameters dialog box:</p> <ul style="list-style-type: none"> • “Inline invariant signals” (Simulink Coder) (only if you have a Simulink Coder license) <p>Select the following optimization check boxes in the Configuration Parameters dialog box:</p> <ul style="list-style-type: none"> • “Block reduction” • “Conditional input branch execution” • “Implement logic signals as Boolean data (vs. double)” • “Use memset to initialize floats and doubles to 0.0” (Simulink Coder) • “Remove code from floating-point to integer conversions that wraps out-of-range values” (Simulink Coder) (only if you have a Simulink Coder license) • “Signal storage reuse” (Simulink Coder) (only if you have a Simulink Coder license) • “Enable local block outputs” (Simulink Coder) • “Reuse local block outputs” (Simulink Coder) • “Eliminate superfluous local variables (Expression folding)” (Simulink Coder) <p>Select the following optimization check boxes on the Optimization pane in the Configuration Parameters dialog box:</p> <hr/> <p>Note Model Advisor checks these parameters only if there is a Stateflow chart in the model.</p> <hr/> <ul style="list-style-type: none"> • “Use bitsets for storing state configuration” (Simulink Coder) • “Use bitsets for storing Boolean data” (Simulink Coder)
<p>“Application lifespan (days)” is set as infinite. This could lead to expensive 64-bit counter usage.</p>	<p>Choose a stop time if this is not intended.</p>

Condition	Recommended Action
The specified diagnostics, which can increase the time it takes to simulate your model, are set to warning or error.	Select none for: <ul style="list-style-type: none"> • Solver data inconsistency • Array bounds exceeded • Diagnostics > Data Validity > Simulation range checking
The specified Embedded Coder parameters are off.	If you have an Embedded Coder license and you are using an ERT-based system target file: <ul style="list-style-type: none"> • Select Single output/update function. For details, see “Single output/update function” (Simulink Coder). • Select Ignore test point signals. For details, see “Ignore test point signals” (Embedded Coder). • Set Pass reusable subsystem outputs as to <code>Individual</code> arguments. For details, see “Pass reusable subsystem outputs as” (Embedded Coder).

Tips

If the system contains Model blocks and the referenced model is in Accelerator mode, simulating the model requires generating and compiling code.

check

See Also

- “Model Configuration Parameters: Code Generation Optimization” (Simulink Coder)

Check diagnostic settings ignored during accelerated model reference simulation

Check ID: `mathworks.design.ModelRefSIMConfigCompliance`

Checks for referenced models for which Simulink changes configuration parameter settings during accelerated simulation.

Description

For models referenced in accelerator mode, Simulink ignores the settings of the following configuration parameters that you set to a value other than None.

- **Array bounds exceeded**
- **Diagnostics > Data Validity > Inf or NaN block output**
- **Diagnostics > Data Validity > Division by singular matrix**
- **Diagnostics > Data Validity > Wrap on overflow**

Also, for models referenced in accelerator mode, Simulink ignores the following **Configuration Parameters > Diagnostics > Data Validity > Data Store Memory block** parameters if you set them to a value other than `Disable all`. For details, see “Data Store Diagnostics”.

- **Detect read before write**

- **Detect write after read**
- **Detect write after write**

Results and Recommended Actions

Condition	Recommended Action
You want to see the results of running the identified diagnostics with settings to produce warnings or errors.	Simulate the model in Normal mode and resolve diagnostic warnings or errors.

Check for parameter tunability information ignored for referenced models

Check ID: `mathworks.design.ParamTunabilityIgnored`

Checks if parameter tunability information is included in the Model Parameter Configuration dialog box.

Description

Simulink software ignores tunability information specified in the Model Parameter Configuration dialog box. This check identifies those models containing parameter tunability information that Simulink software will ignore if the model is referenced by other models.

Results and Recommended Actions

Condition	Recommended Action
Model contains ignored parameter tunability information.	Click the links to convert to equivalent Simulink parameter objects in the MATLAB workspace.

See Also

- “Create Tunable Calibration Parameter in the Generated Code” (Simulink Coder)

Check for implicit signal resolution

Check ID: `mathworks.design.ImplicitSignalResolution`

Identify models that attempt to resolve named signals and states to `Simulink.Signal` objects.

Description

Requiring Simulink software to resolve all named signals and states is inefficient and slows incremental code generation and model reference. This check identifies those signals and states for which you may turn off implicit signal resolution and enforce resolution.

Results and Recommended Actions

Condition	Recommended Action
Not all signals and states are resolved.	Turn off implicit signal resolution and enforce resolution for each signal and state that does resolve.

See Also

“Resolve Signal Objects for Output Variables”.

Check for optimal bus virtuality

Check ID: `mathworks.design.OptBusVirtuality`

Identify virtual buses that could be made nonvirtual. Making these buses nonvirtual improves generated code efficiency.

Description

This check identifies blocks incorporating virtual buses that cross a subsystem boundary. Changing these to nonvirtual improves generated code efficiency.

Results and Recommended Actions

Condition	Recommended Action
Blocks that specify a virtual bus crossing a subsystem boundary.	Change the highlighted bus to nonvirtual.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- “Signal Basics”
- “Types of Composite Signals”
- “Model Advisor Exclusion Overview” (Simulink Check)

Check for Discrete-Time Integrator blocks with initial condition uncertainty

Check ID: `mathworks.design.DiscreteTimeIntegratorInitCondition`

Identify Discrete-Time Integrator blocks with state ports and initial condition ports that are fed by neither an Initial Condition nor a Constant block.

Description

Discrete-Time Integrator blocks with state port and initial condition ports might not be suitably initialized unless they are fed from an Initial Condition or Constant block. This is more likely to happen when Discrete-Time Integrator blocks are used to model second-order or higher-order dynamic systems.

Results and Recommended Actions

Condition	Recommended Action
Discrete-Time Integrator blocks are not initialized during the model initialization phase.	Add a Constant or Initial Condition block to feed the external Initial Condition port.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- IC block
- Discrete-Time Integrator block
- Constant block
- “Model Advisor Exclusion Overview” (Simulink Check)

Identify disabled library links

Check ID: `mathworks.design.DisabledLibLinks`

Search model for disabled library links.

Description

Disabled library links can cause unexpected simulation results. Resolve disabled links before saving a model.

Note This check may overlap with “Check model for block upgrade issues” on page 9-41.

Results and Recommended Actions

Condition	Recommended Action
Library links are disabled.	Click the Library Link > Resolve link option in the context menu.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

Tips

- Use the Model Browser to find library links.
- To enable a broken link, right-click a block in your model to display the context menu. Select **Library Link > Resolve link**.

See Also

“Restore Disabled Links”

“Model Advisor Exclusion Overview” (Simulink Check)

Check for large number of function arguments from virtual bus across model reference boundary

Check ID: `mathworks.design.CheckVirtualBusAcrossModelReferenceArgs`

Checks virtual bus signals that cross model reference boundaries and flags cases where using virtual buses across a model reference boundary increases the number of function arguments significantly.

Description

To improve the speed of the code generation process, you can use this check to reduce the number of generated function arguments. If the check finds a model that where many arguments will be generated for a function, you can click **Update Model** to modify the model so that it generates fewer arguments.

Results and Recommended Action

Methods that generate many function arguments as the result of a virtual bus signal crossing model reference boundary slow down the code generation process.

Condition	Recommended Action
Methods are listed that generate a large number of arguments for the current the model configuration that this check can reduce by modifying the model.	Click Update Model .

Clicking **Update Model** resets Inport and Outport block parameters and inserts Signal Conversion blocks, as necessary, to reduce the number of generated function arguments for the model.

See Also

“Use Buses at Model Interfaces”

Identify parameterized library links

Check ID: `mathworks.design.ParameterizedLibLinks`

Search model for parameterized library links.

Description

Parameterized library links that are unintentional can result in unexpected parameter settings in your model. This can result in improper model operation.

Results and Recommended Actions

Condition	Recommended Action
Parameterized links are listed.	Verify that the links are intended to be parameterized.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

Tips

- Right-click a block in your model to display the context menu. Choose **Link Options** and click **Go To Library Block** to see the original block from the library.
- To parameterize a library link, choose **Look Under Mask**, from the context menu and select the parameter.

See Also

“Restore Disabled Links”

“Model Advisor Exclusion Overview” (Simulink Check)

Identify unresolved library links

Check ID: mathworks.design.UnresolvedLibLinks

Search the model for unresolved library links, where the specified library block cannot be found.

Description

Check for unresolved library links. Models do not simulate while there are unresolved library links.

Results and Recommended Actions

Condition	Recommended Action
Library links are unresolved.	Locate missing library block or an alternative.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

“Fix Unresolved Library Links”

“Model Advisor Exclusion Overview” (Simulink Check)

Identify configurable subsystem blocks for converting to variant subsystem blocks

Check ID: `mathworks.design.CSStoVSSConvert`

Search the model to identify configurable subsystem blocks at the model or subsystem level.

Results and Recommended Actions

Condition	Recommended Action
Configurable subsystem blocks are identified.	Convert these blocks to variant subsystem blocks to avoid compatibility issues. See Configurable Subsystem.

Capabilities and Limitations

You can run this check on your library models.

See Also

“Convert to Variant Subsystem” on page 1-198

Identify Variant Model blocks and convert those to Variant Subsystem containing Model block choices

Check ID: `mathworks.design.ConvertMdlrefVarToVSS`

Search the model to identify Variant Model blocks.

Results and Recommended Actions

Condition	Recommended Action
Variant Model blocks available in the model are listed.	Convert these blocks to Variant Subsystem blocks.

See Also

“Convert to Variant Subsystem Block”

Identify Variant blocks using Variant objects with empty conditions

Check ID: `mathworks.design.emptyVariant0bjects`

Search the model to identify the Variant blocks or library having empty Variant objects.

Results and Recommended Actions

Condition	Recommended Action
The Variant blocks in the model or library having empty Variant objects are listed.	Use valid conditions in the variant objects.

See Also

“Introduction to Variant Controls”

Check usage of function-call connections

Check ID: `mathworks.design.CheckForProperFcnCallUsage`

Check model diagnostic settings that apply to function-call connectivity and that might impact model execution.

Description

Check for connectivity diagnostic settings that might lead to non-deterministic model execution.

Results and Recommended Actions

Condition	Recommended Action
Configuration parameter “Context-dependent inputs” is set to Warning. This might lead to non-deterministic model execution.	Set Configuration parameter “Context-dependent inputs” to Error.

See Also

Function-Call Subsystem

Check Data Store Memory blocks for multitasking, strong typing, and shadowing issues

Check ID: `mathworks.design.DataStoreMemoryBlkIssue`

Look for modeling issues related to Data Store Memory blocks.

Description

Checks for multitasking data integrity, strong typing, and shadowing of data stores of higher scope.

Results and Recommended Actions

Condition	Recommended Action
The Duplicate data store names check is set to none or warning.	Consider setting the “Duplicate data store names” check to error in the Configuration Parameters dialog box, on the Diagnostics > Data Validity pane.

Condition	Recommended Action
<p>The data store variable names are not strongly typed in one of the following:</p> <ul style="list-style-type: none"> • Signal Attributes pane of the Block Parameters dialog for the Date Store Memory block • Global data store name 	<p>Specify a data type other than auto by taking one of the following actions:</p> <ul style="list-style-type: none"> • Choose a data type other than <code>Inherit: auto</code> on the Signal Attributes pane of the Block Parameters dialog for the Date Store Memory block. • If you are using a global data store name, then specify its data type in the <code>Simulink.Signal</code> object.
<p>The Multitask data store check is set to none or warning.</p>	<p>Consider setting the “Multitask data store” check to error in the Configuration Parameters dialog box, on the Diagnostics > Data Validity pane.</p>

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

See Also

- “Local and Global Data Stores”

Check if read/write diagnostics are enabled for data store blocks

Check ID: `mathworks.design.DiagnosticDataStoreBlk`

For data store blocks in the model, enable the read-and-write diagnostics order checking to detect run-time issues.

Description

Check for the read-and-write diagnostics order checking. By enabling the read-and-write diagnostics, you detect potential run-time issues.

Results and Recommended Actions

Condition	Recommended Action
<p>The Detect read before write check is disabled.</p>	<p>Consider enabling “Detect read before write” in the Configuration Parameter dialog box Diagnostics > Data Validity pane.</p>

Condition	Recommended Action
The Detect write after read check is disabled.	Consider enabling “Detect write after read” in the Configuration Parameter dialog box Diagnostics> Data Validity pane.
The Detect write after write check is disabled.	Consider enabling “Detect write after write” in the Configuration Parameter dialog box Diagnostics> Data Validity pane.

Capabilities and Limitations

Exclude blocks and charts from this check if you have a Simulink Check license.

Tips

.

- The run-time diagnostics can slow simulations down considerably. Once you have verified that Simulink does not generate warnings or errors during simulation, set them to **Disable all**.

Check data store block sample times for modeling errors

Check ID: `mathworks.design.DataStoreBlkSampleTime`

Identify modeling errors due to the sample times of data store blocks.

Description

Check data store blocks for continuous or fixed-in-minor-step sample times.

Results and Recommended Actions

Condition	Recommended Action
Data store blocks in your model have continuous or fixed-in-minor-step sample times.	Consider making the listed blocks discrete or replacing them with either Memory or Goto and From blocks.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

- “Fixed-in-Minor-Step”
- “Model Advisor Exclusion Overview” (Simulink Check)

Check for potential ordering issues involving data store access

Check ID: `mathworks.design.OrderingDataStoreAccess`

Look for read/write issues which may cause inaccuracies in the results.

Description

During an **Update Diagram**, identify potential issues relating to read-before-write, write-after-read, and write-after-write conditions for data store blocks.

Results and Recommended Actions

Condition	Recommended Action
Reading and writing (read-before-write or write-after-read condition) occur out of order.	Consider restructuring your model so that the Data Store Read block executes before the Data Store Write block.
Multiple writes occur within a single time step.	Change the model to write data only once per time step or refer to the following Tips section.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

Tips

This check performs a static analysis which might not identify every instance of improper usage. Specifically, Function-Call Subsystems, Stateflow Charts, MATLAB for code generation, For Iterator Subsystems, and For Each Subsystems can cause both missed detections and false positives. For a more comprehensive check, consider enabling the following diagnostics on the **Diagnostics > Data Validity** pane in the Configuration Parameters dialog box: “Detect read before write”, “Detect write after read”, and “Detect write after write”.

Check structure parameter usage with bus signals

Check ID: `mathworks.design.MismatchedBusParams`

Identify blocks and `Simulink.Signal` objects that initialize bus signals by using mismatched structures.

Description

In a model, you can use a MATLAB structure to initialize a bus signal. For example, if you pass a bus signal through a Unit Delay block, you can set the **Initial condition** parameter to a structure. For basic information about initializing buses by using structures, see “Specify Initial Conditions for Bus Elements”.

Run this check to generate efficient and readable code by matching the shape and numeric data types of initial condition structures with those of bus signals. Matching these characteristics avoids unnecessary explicit typecasts and replaces field-by-field structure assignments with, for example, calls to `memcpy`.

Partial Structures

This check lists blocks and `Simulink.Signal` objects that initialize bus signals by using partial structures. During the iterative process of creating a model, you can use partial structures to focus on a subset of signal elements in a bus. For a mature model, use full structures to:

- Generate readable and efficient code.
- Support a modeling style that explicitly initializes unspecified signals. When you use partial structures, Simulink implicitly initializes unspecified signals.

For more information about full and partial structures, see “Create Full Structures for Initialization” and “Create Partial Structures for Initialization”.

Data Type Mismatches

This check lists blocks and `Simulink.Signal` objects whose initial condition structures introduce data type mismatches. The fields of these structures have numeric data types that do not match the data types of the corresponding bus signal elements.

This check does not detect a mismatch for blocks, such as the Unit Delay block, that implicitly convert the data type of initial condition to the input signal.

When you configure an initial condition structure to appear as a tunable global structure in the generated code, avoid unnecessary explicit typecasts by matching the data types. See “Generate Tunable Initial Condition Structure for Bus Signal” (Simulink Coder).

Results and Recommended Actions

Condition	Recommended Action
Block or signal object uses partial structure	Consider using the function <code>Simulink.Bus.createMATLABStructure</code> to create a full initial condition structure.
Data types of structure fields do not match data types of corresponding signal elements	Consider defining the structure as a <code>Simulink.Parameter</code> object, and creating a <code>Simulink.Bus</code> object to use as the data type of the bus signal and of the parameter object. To control numeric data types, use the <code>Simulink.BusElement</code> objects in the bus object.

Check Delay, Unit Delay and Zero-Order Hold blocks for rate transition

Check ID: `mathworks.design.ReplaceZOHDelayByRTB`

Identify Delay, Unit Delay, or Zero-Order Hold blocks that are used for rate transition. Replace these blocks with actual Rate Transition blocks.

Description

If a model uses Delay, Unit Delay, or Zero-Order Hold blocks to provide rate transition between input and output signals, Simulink makes a hidden replacement of these blocks with built-in Rate Transition blocks. In the compiled block diagram, a yellow symbol and the letters “RT” appear in the upper-left corner of a replacement block. This replacement can affect the behavior of the model, as follows:

- These blocks lose their algorithmic design properties to delay a signal or implement zero-order hold. Instead, they acquire rate transition behavior.
- This modeling technique works only in specific transition configurations (slow-to-fast for Delay and Unit Delay blocks, and fast-to-slow for Zero-Order Hold block). Set the block sample time to be equal to the slower rate (source for the Delay and Unit Delay blocks and destination for the Zero-Order Hold block).
- When the block sample time of a downstream or upstream block changes, these Delay, Unit Delay and Zero-Order Hold blocks might not perform rate transition. For example, setting the source and destination sample times equal stops rate transition. The blocks then assume their original algorithmic design properties.
- The block sample time shows incomplete information about sample time rates. The block code runs at two different rates to handle data transfer. However, the block sample time and sample time color show it as a single-rate block. Tools and MATLAB scripts that use sample time information base their behavior on this information.

An alternative is to replace Delay, Unit Delay, or Zero-Order Hold blocks with actual Rate Transition blocks.

- The technique ensures unambiguous results in block behavior. Delay, Unit Delay, or Zero-Order Hold blocks act according to their algorithmic design to delay and hold signals respectively. Only Rate Transition blocks perform actual rate transition.
- Using an actual Rate Transition block for rate transition offers a configurable solution to handle data transfer if you want to specify deterministic behavior or the type of memory buffers to implement.

Use this check to identify instances in your model where Delay, Unit Delay or Zero-Order Hold blocks undergo hidden replacement to provide rate transition between signals. Click **Upgrade Model** to replace these blocks with actual Rate Transition blocks.

Results and Recommended Actions

Condition	Recommended Action
Model has no instances of Delay, Unit Delay, or Zero-Order Hold blocks used for rate transition.	No action required.
Model has instances of Delay, Unit Delay, or Zero-Order Hold blocks used for rate transition.	<p>The check identifies these instances and allows you to upgrade the model.</p> <ol style="list-style-type: none"> 1 Click Upgrade Model to replace with actual Rate Transition blocks. 2 Save changes to your model.

If you do not choose to replace the Delay, Unit Delay, and/or Zero-Order Hold blocks with actual Rate Transition blocks, Simulink continues to perform a hidden replacement of these blocks with built-in rate transition blocks.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

Check for calls to `slDataTypeAndScale`

Check ID: `mathworks.design.CallsSlDataTypeAndScale`

Identify calls to the internal function `slDataTypeAndScale`.

Description

In some previous versions of Simulink, opening a model that had been saved in an earlier version triggers an automatic upgrade to code for data type handling. The automatic upgrade inserts calls to the internal function `slDataTypeAndScale`. Although Simulink continues to support some uses of the function, if you eliminate calls to it, you get cleaner and faster code.

Simulink does not support calls to `slDataTypeAndScale` when:

- The first argument is a `Simulink.AliasType` object.
- The first argument is a `Simulink.NumericType` object with property `IsAlias` set to true.

Running **Check for calls to `slDataTypeAndScale`** identifies calls to `slDataTypeAndScale` that are required or recommended for replacement. In most cases, running the check and following the recommended action removes the calls. You can ignore calls that remain. Run the check unless you are sure there are not calls to `slDataTypeAndScale`.

Results and Recommended Actions

Condition	Recommended Action
Required Replacement Cases	Manually or automatically replace calls to <code>slDataTypeAndScale</code> . Cases listed require you to replace calls to <code>slDataTypeAndScale</code> .
Recommended Replacement Cases	For the listed cases, it is recommended that you manually or automatically replace calls to <code>slDataTypeAndScale</code> .
Manual Inspection Cases	Inspect each listed case to determine whether it should be manually upgraded.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

Tips

- Do not manually insert a call to `slDataTypeAndScale` into a model. The function was for internal use only.
- Running **Check for calls to `slDataTypeAndScale`** calls the Simulink function `slRemoveDataTypeAndScale`. Calling this function directly provides a wider range of conversion options. However, you very rarely need more conversion options.

See Also

- For more information about upgrading data types and scales, in the MATLAB Command Window, execute the following:
 - `help slDataTypeAndScale`
 - `help slRemoveDataTypeAndScale`
- “Model Advisor Exclusion Overview” (Simulink Check)

Check bus signals treated as vectors

Check ID: `mathworks.design.BusTreatedAsVector`

Identify bus signals that Simulink treats as vectors.

Description

You cannot use bus signals that the Simulink software implicitly converts to vectors. Instead, either insert a Bus to Vector conversion block between the bus signal and the block input port that it feeds, or use the `Simulink.BlockDiagram.addBusToVector` command.

Results and Recommended Actions

Condition	Recommended Action
Bus signals are implicitly converted to vectors.	Use <code>Simulink.BlockDiagram.addBusToVector</code> or insert a Bus to Vector block.
Model is not configured to identify bus signals that Simulink treats as vectors.	In the Configuration Parameters dialog box, on the Diagnostics > Connectivity pane, set Bus signal treated as vector to error .

Action Results

Clicking **Modify** inserts a Bus to Vector block at the input ports of blocks that implicitly convert bus signals to vectors.

Tips

- Run this check before running **Check consistency of initialization parameters for Output and Merge blocks**.
- For more information, see “Identify Automatic Bus Conversions”.

Check for potentially delayed function-call subsystem return values

Check ID: `mathworks.design.DelayedFcnCallSubsys`

Identify function-call return values that might be delayed because Simulink software inserted an implicit Signal Conversion block.

Description

So that signals reside in contiguous memory, Simulink software can automatically insert an implicit Signal Conversion block in front of function-call initiator block input ports. This can result in a one-step delay in returning signal values from calling function-call subsystems. The delay can be avoided by ensuring the signal originates from a signal block within the function-call system. Or, if the delay is acceptable, insert a Unit Delay block in front of the affected input ports.

Results and Recommended Actions

Condition	Recommended Action
The listed block input ports could have an implicit Signal Conversion block.	<p>Decide if a one-step delay in returning signal values is acceptable for the listed signals.</p> <ul style="list-style-type: none"> • If the delay is not acceptable, rework your model so that the input signal originates from within the calling subsystem. • If the delay is acceptable, insert a Unit Delay block in front of each listed input port.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

Unit Delay block

“Model Advisor Exclusion Overview” (Simulink Check)

Identify block output signals with continuous sample time and non-floating point data type

Check ID: `mathworks.design.OutputSignalSampleTime`

Find continuous sample time, non-floating-point output signals.

Description

Non-floating-point signals might not represent continuous variables without loss of information.

Results and Recommended Actions

Condition	Recommended Action
Signals with continuous sample times have a non-floating-point data type.	On the identified signals, either change the sample time to be discrete or fixed-in-minor-step ([0 1]).

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

Check usage of Merge blocks

Check ID: `mathworks.design.MergeBlkUsage`

Identify Merge blocks with parameter settings that can lead to unexpected behavior, and help migrate your model to simplified initialization mode.

Note Run this check along with the other checks in the “Migrating to Simplified Initialization Mode Overview” on page 9-4.

Description

Simplified initialization mode was introduced in R2008b to improve the consistency of simulation results. For more information, see “Simplified Initialization Mode” and “Classic Initialization Mode”.

This Model Advisor check identifies settings in the Merge blocks in your model that can cause problems if you use classic initialization mode. It also recommends settings for consistent behavior of Merge blocks. The results of the subchecks contain two types of statements: Failed and Warning. Failed statements identify issues that you must address manually before you can migrate the model to the simplified initialization mode. Warning statements identify issues or changes in behavior that can occur after migration.

Results and Recommended Actions

Condition	Recommended Action
Check the run-time diagnostic setting of the Merge block.	<ol style="list-style-type: none"> 1 In the Configuration Parameters dialog box, set “Detect multiple driving blocks executing at the same time step” to <code>error</code>. 2 Verify that the model simulates without errors before running this check again.
Check for Model blocks that are using the PIL simulation mode.	The simplified initialization mode does not support the Processor-in-the-loop (PIL) simulation for model references.
Check for library blocks with instances that cannot be migrated.	Examine the failed subcheck results for each block to determine the corrective actions.
Check for single-input Merge blocks.	<p>Replace both the Mux block used to produce the input signal and the Merge block with one multi-input Merge block.</p> <p>Single-input Merge blocks are not supported in the simplified initialization mode.</p>

Condition	Recommended Action
Check for root Merge blocks that have an unspecified Initial output value.	<p>If you do not specify an explicit value for the Initial output parameter of root Merge blocks, then Simulink uses the default initial value of the output data type.</p> <p>A root Merge block is a Merge block with an output port that does not connect to another Merge block. For information on the default initial value, see “Initialize Signal Values”.</p>
Check for Merge blocks with nonzero input port offsets.	<p>Clear the Allow unequal port widths parameter of the Merge block.</p> <hr/> <p>Note Consider using Merge blocks only for signal elements that require true merging. You can combine other elements with merged elements using the Concatenate block.</p>
Check for Merge blocks that have unconnected inputs or that have inputs from non-conditionally executed subsystems.	<p>Set the Number of inputs parameter of the Merge block to the number of Merge block inputs. You must connect each input to a signal.</p> <p>Verify that each Merge block input is driven by a conditionally executed subsystem. Merge blocks cannot be driven directly by an Iterator Subsystem or a block that is not a conditionally executed subsystem.</p>
Check for Merge blocks with inputs that are combined or reordered outside of conditionally executed subsystems.	<p>Verify that combinations or reordering of Merge block input signals takes place within a conditionally executed subsystem. Such designs may use Mux, Bus Creator, or Selector blocks.</p>
Check for Merge blocks with inconsistent input sample times.	<p>Verify that input signals to each Merge block have the same Sample time.</p> <p>Failure to do so could result in unpredictable behavior. Consequently, the simplified initialization mode does not allow inconsistent sample times.</p>
Check for Merge blocks with multiple input ports that are driven by a single source.	<p>Verify that the Merge block does not have multiple input signals that are driven by the same conditionally executed subsystem or conditionally executed Model block.</p>

Condition	Recommended Action
Check for Merge blocks that use signal objects to specify the Initial output value.	<p>Verify that the following behavior is acceptable.</p> <p>In the simplified initialization mode, signal objects cannot specify the Initial output parameter of the Merge block. While you can still initialize the output signal for a Merge block using a signal object, the initialization result may be overwritten by that of the Merge block.</p> <hr/> <p>Note Simulink generates a warning that the initial value of the signal object has been ignored.</p>

Check usage of Outport blocks

Check ID: `mathworks.design.InitParamOutportMergeBlk`

Identify Outport blocks and conditional subsystems with parameter settings that can lead to unexpected behavior, and help migrate your model to simplified initialization mode.

Note Run this check along with the other checks in the “Migrating to Simplified Initialization Mode Overview” on page 9-4.

Description

Simplified initialization mode was introduced in R2008b to improve the consistency of simulation results. This mode is especially important for models that do not specify initial conditions for conditionally executed subsystem output ports. For more information, see “Simplified Initialization Mode” and “Classic Initialization Mode”.

This Model Advisor check identifies Outport blocks and conditional subsystems in your model that can cause problems if you use the simplified initialization mode. It also recommends settings for consistent behavior of Outport blocks. The results of the subchecks contain two types of statements: Failed and Warning. Failed statements identify issues that you must address manually before you can migrate the model to the simplified initialization mode. Warning statements identify issues or changes in behavior that can occur after migration.

Results and Recommended Actions

Condition	Recommended Action
Check for blocks inside of the Iterator Subsystem that require elapsed time.	<p>Within an Iterator Subsystem hierarchy, do not use blocks that require a service that maintains the time that has elapsed between two consecutive executions.</p> <p>Since an Iterator Subsystem can execute multiple times at a given time step, the concept of elapsed time is not well-defined between two such executions. Using these blocks inside of an Iterator Subsystem can cause unexpected behavior.</p>
Check for Outport blocks that have conflicting signal buffer requirements.	<p>The Outport block has a function-call trigger or function-call data dependency signal passing through it, along with standard data signals. Some of the standard data signals require an explicit signal buffer for the initialization of the output signal of the corresponding subsystem. However, buffering function-call related signals lead to a function-call data dependency violation.</p> <p>Consider modifying the model to pass function-call related signals through a separate Outport block. For examples of function-call data dependency violations, see the example model <code>sl_subsys_semantics</code>.</p> <p>A standard data signal may require an additional signal copy for one of the following reasons:</p> <ul style="list-style-type: none"> • The Outport block is driven by a block with output that cannot be overwritten. The Ground block and the Constant block are examples of such blocks. • The Outport block shares the same signal source with another Outport block in the same subsystem or in one nested within the current subsystem but having a different initial output value. • The Outport block connects to the input of a Merge block • One of the input signals of the Outport block is specifying a <code>Simulink.Signal</code> object with an explicit initial value.

Condition	Recommended Action
Check for Outport blocks that are driven by a bus signal and whose Initial output value is not scalar.	For Outport blocks driven by bus signals, classic initialization mode does not support Initial Condition (IC) structures, while simplified initialization mode does. Hence, when migrating a model from classic to simplified mode, specify a scalar for the Initial Output parameter. After migration completes, to specify different initial values for different elements of the bus signal, use IC structures. For more information, see "Create Initial Condition Structures".
Check for Outport blocks that require an explicit signal copy.	<p>An explicit copy of the bus signal driving the Outport block is required for the initialization of the output signal of the corresponding subsystem. Insert a Signal Conversion block before the Outport block, then set the Output parameter of the Signal Conversion block to Bus copy.</p> <p>A standard data signal may require an additional signal copy for one or more of the following reasons:</p> <ul style="list-style-type: none"> • A block with output that cannot be overwritten is driving the Outport block. The Ground block and the Constant block are examples of such blocks. • The Outport block shares the same signal source with another Outport block in the same subsystem or in one nested within the current subsystem but having a different initial output value. • The Outport block connects to the input of a Merge block • One of the input signals of the Outport block is specifying a <code>Simulink.Signal</code> object with an explicit initial value.
Check for merged Outport blocks that inherit the Initial Output value from Outport blocks that have been configured to reset when the blocks become disabled.	When Outport blocks are driving a Merge block, do not set their Output when disabled parameters to reset .
Check for merged Outport blocks that are driven by nested conditionally executed subsystems.	Determine if the new behavior of the Outport blocks is acceptable. If it is not acceptable, modify the model to account for the new behavior before migrating to the simplified initialization mode.

Condition	Recommended Action
Check for merged Outport blocks that reset when the blocks are disabled.	<p>Set the Output when disabled parameter of the Outport block to <code>held</code>. This setting is required because the Outport block connects to a Merge block.</p> <p>For more information, see Outport.</p>
Check for Outport blocks that have an undefined Initial output value with invalid initial condition sources.	<p>Verify that the following behavior is acceptable.</p> <p>When the Initial output parameter is unspecified (<code>[]</code>), it inherits the initial output from the source blocks. If at least one of the sources of the Outport block is not a valid source to inherit the initial value, the block uses the default initial value for that data type.</p> <p>For simplified initialization mode, valid sources an Outport blocks can inherit the Initial output value from are: Constant, Initial Condition, Merge (with initial output), Stateflow chart, function-call model reference, or conditionally executed subsystem blocks.</p>
Check Outport blocks that have automatic rate transitions.	<p>Simulink has inserted a Rate Transition block at the input of the Outport block. Specify the Initial output parameter for each Outport block.</p> <p>Otherwise, perform the following procedure:</p> <ol style="list-style-type: none"> 1 In the Configuration Parameters dialog box, on the Solver pane, clear the option “Automatically handle rate transition for data transfer”. 2 Run this Model Advisor check again.
Check Outport blocks that have a special signal storage requirement and have an undefined Initial output value.	<p>Verify that the following behavior is acceptable.</p> <p>Specify the Initial output parameter for the Outport block. Set this value to <code>[]</code> (empty matrix) to use the default initial value of the output data type.</p>
Check the Initial output setting of Outport blocks that reset when they are disabled.	<p>Specify the Initial output parameter of the Outport block.</p> <p>You must specify the Initial output value for blocks that are configured to reset when they become disabled.</p>

Condition	Recommended Action
Check the Initial output setting for Outport blocks that pass through a function-call data dependency signal.	<p>You cannot specify an Initial output value for the Outport block because function-call data dependency signals are passing through it. To set the Initial output value:</p> <ol style="list-style-type: none"> 1 Set the Initial output parameter of the Outport block to []. 2 Provide the initial value at the source of the data dependency signal rather than at the Outport block.
Check for Outport blocks that use signal objects to specify the Initial output value.	<p>Verify that the following behavior is acceptable.</p> <p>In the simplified initialization mode, signal objects cannot specify the Initial output parameter of an Outport block. You can still initialize the input or output signals for an Outport block using signal objects, but the initialization results may be overwritten by those of the Outport block.</p> <p>Note If you are working with a conditionally executed subsystem Outport block, Simulink generates a warning that the initial value of the signal object has been ignored.</p>
Check for library blocks with instances that have warnings.	Examine the warning subcheck results for each block before migrating to the simplified initialization mode.
Check for merged Outport blocks that are either unconnected or connected to a Ground block.	<p>Verify that the following behavior is acceptable.</p> <p>The Outport block is driving a Merge block, but its inputs are either unconnected or connected to Ground blocks. In the classic initialization mode, unconnected or grounded outputs do not update the merge signal even when their parent conditionally executed subsystems are executing. In the simplified initialization mode, however, these outputs will update the merge signal with a value of zero when their parent conditionally executed subsystems are executing.</p>

Condition	Recommended Action
Check for Outport blocks that obtain the Initial output value from an input signal when they are migrated.	<p>Verify that the following behavior is acceptable.</p> <p>The Initial output parameter of the Outport block is not specified. As a result, the simplified initialization mode will assume that the Initial output value for the Outport block is derived from the input signal. This assumption may result in different initialization behavior.</p> <p>If this behavior is not acceptable, modify your model before you migrate to the simplified initialization mode.</p>
Check for outer Outport blocks that have an explicit Initial output .	<p>Verify that the following behavior is acceptable.</p> <p>In classic initialization mode, the Initial output and Output when disabled parameters of the Outport block must match those of their source Outport blocks.</p> <p>In simplified initialization mode, Simulink sets the Initial output parameter of outer Outport blocks to [] (empty matrix) and Output when disabled parameter to held.</p>
Check for blocks that read input from conditionally executed subsystems during initialization.	<p>Verify that the following behavior is acceptable.</p> <p>Some blocks, such as the Discrete-Time Integrator block, read their inputs from conditionally executed subsystems during initialization in the classic initialization mode. Simulink performs this step as an optimization technique.</p> <p>This optimization is not allowed in the simplified initialization mode because the output of a conditionally executed subsystem at the first time step after initialization may be different than the initial value declared in the corresponding Outport block. In particular, this discrepancy occurs if the subsystem is active at the first time step.</p>

Condition	Recommended Action
<p>Check for a migration conflict for Outport blocks that use a Dialog as the Source of initial output value.</p>	<p>Other instances of Outport blocks with the same library link either cannot be migrated or are being migrated in a different manner. Review the results from the Check for library blocks with instances that cannot be migrated to learn about the different migration paths for other instances of each Outport block.</p> <p>The Outport block will maintain its current settings and use its specified Initial output value.</p>
<p>Check for a migration conflict for Outport blocks that use Input signal as the Source of initial output value.</p>	<p>Other instances of Outport blocks with the same library link either cannot be migrated or are being migrated in a different manner. Review the results from the Check for library blocks with instances that cannot be migrated to learn about the different migration paths for other instances of each Outport block.</p> <p>The Outport block currently specifies an Initial output of [] (empty matrix), and the Output when disabled as held. This means that each output does not perform initialization, but implicitly relies on source blocks to initialize its input signal.</p> <p>After migration, the parameter Source of initial output value will be set to Input signal to reflect this behavior.</p>
<p>Check for a migration conflict for Outport blocks that have SimEvents semantics.</p>	<p>Other instances of Outport blocks with the same library link either cannot be migrated or are being migrated in a different manner. Review the results from the Check for library blocks with instances that cannot be migrated to learn about the different migration paths for other instances of each Outport block.</p> <p>The Outport blocks will continue to use an Initial output value of [] (empty matrix) and an Output when disabled setting of held. Simulink will maintain these settings because their parent conditionally executed subsystems are connected to SimEvents blocks.</p>

Condition	Recommended Action
Check for a migration conflict for innermost Outport blocks with variable-size input and unspecified Initial output .	<p>For these Outport blocks, the signal size varies only when the parent subsystem of the block is re-enabled. Therefore, Simulink implicitly assumes that the Initial output parameter is equal to 0, even though the parameter is unspecified, []. Consequently, unless you specify the parameter, the Model Advisor will explicitly set the parameter to 0 when the model is migrated to the simplified initialization mode.</p> <p>Other instances of Outport blocks with the same library link either cannot be migrated or are being migrated in a different manner. Review the results from the Check for library blocks with instances that cannot be migrated to learn about the different migration paths for other instances of each Outport block.</p>
Check for a migration conflict for Outport blocks that use a default ground value as the Initial output.	The parameter Initial output is set to [] (empty matrix) and the source of the Outport is an invalid initial condition source. Thus, the block uses the default initial value as the initial output in the simplified initialization mode. Other instances of Outport blocks with the same library link either have errors or are being migrated differently.
Check for a migration conflict for merged Outport blocks without explicit specification of Initial output .	Review the results from the subcheck Check for library blocks with instances that cannot be migrated to learn about different migration paths for other instances of each Outport block. For the remaining Outport blocks, Initial output is set to [] (empty matrix) and Output when disabled is set to held respectively, in simplified initialization mode.

Check usage of Discrete-Time Integrator blocks

Check ID: mathworks.design.DiscreteBlock

Identify Discrete-Time Integrator blocks with parameter settings that can lead to unexpected behavior, and help migrate your model to simplified initialization mode.

Note Run this check along with the other checks in the “Migrating to Simplified Initialization Mode Overview” on page 9-4.

Description

Simplified initialization mode was introduced in R2008b to improve the consistency of simulation results. For more information, see “Simplified Initialization Mode” and “Classic Initialization Mode”.

This Model Advisor check identifies settings in Discrete-Time Integrator blocks in your model that can cause problems if you use the simplified initialization mode. It also recommends settings for consistent behavior of Discrete-Time Integrator blocks. The results of the subchecks contain two types of statements: Failed and Warning. Failed statements identify issues that you must address manually before you can migrate the model to the simplified initialization mode. Warning statements identify issues or changes in behavior that can occur after migration.

Results and Recommended Actions

Condition	Recommended Action
Check for Discrete-Time Integrator blocks whose parameter Initial condition setting is set to Output.	Determine if the new behavior of the Discrete-Time Integrator blocks is acceptable. If it is not acceptable, modify the model to account for the new behavior before migrating to the simplified initialization mode.
Check for Discrete-Time Integrator blocks whose Initial condition setting parameter is set to State (most efficient) and are in a subsystem that uses triggered sample time.	Use periodic sample time for the block, or set Initial Condition setting to Output.
Check for blocks inside of the Iterator Subsystem that require elapsed time.	<p>Within an Iterator Subsystem hierarchy, do not use blocks that require a service that maintains the time that has elapsed between two consecutive executions.</p> <p>Since an Iterator Subsystem can execute multiple times at a given time step, the concept of elapsed time is not well-defined between two such executions. Using these blocks inside of an Iterator Subsystem can cause unexpected behavior.</p>

Check model settings for migration to simplified initialization mode

Note Do not run this check in isolation. Run this check along with the other checks in the “Migrating to Simplified Initialization Mode Overview” on page 9-4.

Check ID: `mathworks.design.ModelLevelMessages`

Identify settings in Model blocks and model configuration parameters that can lead to unexpected behavior, and help migrate your model to simplified initialization mode.

Description

Simplified initialization mode was introduced in R2008b to improve consistency of simulation results. For more information, see “Simplified Initialization Mode” and “Classic Initialization Mode”.

This Model Advisor check identifies issues in the model configuration parameters and Model blocks in your model that can cause problems when you migrate to simplified initialization mode. The results of the subchecks contain two types of statements: Failed and Warning. Failed statements identify issues that you must address manually before you can migrate the model to simplified initialization mode. Warning statements identify issues or changes in behavior that can occur after migration.

After running this Model Advisor consistency check, if you click **Explore Result** button, the messages pertain only to blocks that are not library-links.

Note Because it is difficult to undo these changes, select **File > Save Restore Point As** to back up your model before migrating to the simplified initialization mode.

For more information, see “Model Configuration Parameters: Connectivity Diagnostics”.

Results and Recommended Actions

Condition	Recommended Action
Verify that all Model blocks are using the simplified initialization mode.	Migrate the model referenced by the Model block to the simplified initialization mode, then migrate the top model.
Verify simplified initialization mode setting	Set Configuration Parameters > Underspecified initialization detection to Simplified .

Action Results

Clicking **Modify Settings** causes the following:

- The Model parameter is set to **simplified**
- If an Output block has the **Initial output** parameter set to the empty character vector, [], then the **SourceOfInitialOutputValue** parameter is set to **Input signal**.
- If an Outputport has an empty **Initial output** and a variable-size signal, then the **Initial output** is set to zero.

See Also

- “Migrating to Simplified Initialization Mode Overview” on page 9-4

Check S-functions in the model

Check ID: mathworks.design.SFuncAnalyzer

Perform quality checks on S-functions in Simulink models or subsystems.

Description

The S-function analyzer performs quality checks on S-functions to identify improvements and potential problems in the specified model.

Results and Recommended Actions

Condition	Recommended Action
Continuous states are modified in <code>mdlOutputs</code> method.	Modify Continuous States at a major time step and use <code>ssSetSolverNeedsReset</code> function in S-function code.
Continuous states are modified in the <code>mdlUpdate</code> method.	Modify Continuous States only at a major time step and use <code>ssSetSolverNeedsReset</code> function in S-function code.
S-function discrete states are modified in the <code>mdlOutputs</code> at a minor step.	Modify the discrete states only at a major step guarded by <code>ssIsMajorTimeStep</code> function.
S-function mode vector is modified in the <code>mdlOutputs</code> method at a minor step.	Modify the mode vector only at a major step guarded by <code>ssIsMajorTimeStep</code> function.
S-function is using static or global variables to declare internal states.	Declare the states explicitly using <code>ssSetNumDiscStates</code> function or "Model Global Data by Creating Data Stores".
S-function has continuous states but sample time is not declared continuous.	Specify continuous sample time using <code>ssSetSampleTime</code> function.
S-function has discrete states but the <code>mdlOutputs</code> and <code>mdlUpdate</code> methods are combined.	Define the <code>mdlOutputs</code> and <code>mdlUpdate</code> methods separately and modify discrete states only in <code>mdlUpdate</code> method.
S-function sets the <code>SS_OPTION_CAN_BE_CALLED_CONDITIONALLY</code> option when having state-like data or multiple sample times.	Remove the options when the S-function has state-like data or multiple sample times.
MEX compilers do not exist on the machine.	Check for the presence or install MEX compilers on the machine.
S-function encounters errors while compiling the model.	Check the Diagnostic Viewer output and recompile the model.

Check for non-continuous signals driving derivative ports

Check ID: `mathworks.design.NonContSigDerivPort`

Identify noncontinuous signals that drive derivative ports.

Description

Noncontinuous signals that drive derivative ports cause the solver to reset every time the signal changes value, which slows down simulation.

Results and Recommended Actions

Condition	Recommended Action
There are noncontinuous signals in the model driving derivative ports.	<ul style="list-style-type: none"> • Make the specified signals continuous. • Replace the continuous blocks receiving these signals with discrete state versions of the blocks.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

See Also

- “Simulink Models” on page 11-6
- “Simulation Phases in Dynamic Systems”
- “Model Advisor Exclusion Overview” (Simulink Check)

Runtime diagnostics for S-functions

Check ID: `mathworks.design.DiagnosticSFcn`

Check array bounds and solver consistency if S-Function blocks are in the model.

Description

Validates whether S-Function blocks adhere to the ODE solver consistency rules that Simulink applies to its built-in blocks.

Results and Recommended Actions

Condition	Recommended Action
Solver data inconsistency is set to none.	In the Configuration Parameters dialog box, set Solver data inconsistency to warning or error.
Array bounds exceeded is set to none.	In the Configuration Parameters dialog box, set Array bounds exceeded to warning or error

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

Identify unit mismatches in the model

Check ID: `mathworks.design.UnitMismatches`

Identify instances of unit mismatches between ports in the model.

Description

Check for instances of unit mismatches between ports in the model.

Results and Recommended Actions

Condition	Recommended Action
Unit mismatches found	Change one of the mismatched unit settings to match the unit settings for the other port.

See Also

- “Unit Specification in Simulink Models”.

Identify automatic unit conversions in the model

Check ID: `mathworks.design.AutoUnitConversions`

Identify instances of automatic unit conversions in the model.

Description

Identify instances of automatic unit conversions in the model.

Results and Recommended Actions

Condition	Recommended Action
Automatic unit conversions found	Check that the converted units are expected for the model.

See Also

- “Unit Specification in Simulink Models”.

Identify disallowed unit systems in the model

Check ID: `mathworks.design.DisallowedUnitSystems`

Identify instances of disallowed unit systems in the model.

Description

Identify instances of disallowed unit systems in the model.

Results and Recommended Actions

Condition	Recommended Action
Disallowed unit systems found	Either choose a unit that conforms to the configured unit system, or select another unit system. For more information, see “Restricting Unit Systems”.

See Also

- “Unit Specification in Simulink Models”.

Identify undefined units in the model

Check ID: `mathworks.design.UndefinedUnits`

Identify instances of unit specifications, not defined in the unit database, in the model.

Description

Identify instances of unit specifications, not defined in the unit database, in the model.

Results and Recommended Actions

Condition	Recommended Action
Undefined units found	Change the unit to one that Simulink supports.

See Also

- “Unit Specification in Simulink Models”.
- Allowed Units

Identify ambiguous units in the model

Check ID: `mathworks.design.AmbiguousUnits`

Identify instances of ambiguous unit specifications, such as duplicate unit names in the unit database, in the model.

Description

Identify instances of ambiguous unit specifications, such as duplicate unit names in the unit database, in the model.

Results and Recommended Actions

Condition	Recommended Action
Ambiguous units found	You can ignore the warning or specify the unit with corresponding unit system using the format <code>unit_system::unit_name</code> .

See Also

- “Unit Specification in Simulink Models”.
- Allowed Units

Check model for block upgrade issues

Check ID: `mathworks.design.Update`

Check for common block upgrade issues.

Description

Check blocks in the model for compatibility issues resulting from using a new version of Simulink software.

Results and Recommended Actions

Condition	Recommended Action
Blocks with compatibility issues found.	Click Modify to fix the detected block issues.
Check update status for the Level 2 API S-functions.	Consider replacing Level 1 S-functions with Level 2.

Action Results

Clicking **Modify** replaces blocks from a previous release of Simulink software with the latest versions.

See Also

- “Write Level-2 MATLAB S-Functions”.
- “Consult the Upgrade Advisor”.
- “Model Upgrades”

Check model for block upgrade issues requiring compile time information

Check ID: `mathworks.design.UpdateRequireCompile`

Check for common block upgrade issues.

Description

Check blocks for compatibility issues resulting from upgrading to a new version of Simulink software. Some block upgrades require the collection of information or data when the model is in the compile mode. For this check, the model is set to compiled mode and then checked for upgrades.

Results and Recommended Actions

Condition	Recommended Action
Model contains Lookup Table or Lookup Table (2-D) blocks and some of the blocks specify Use Input Nearest or Use Input Above for a lookup method.	Replace Lookup Table blocks and Lookup Table (2-D) blocks with n-D Lookup Table blocks. Do not apply Use Input Nearest or Use Input Above for lookup methods; select another option.
Model contains Lookup Table or Lookup Table (2-D) blocks and some blocks perform multiplication first during interpolation.	Replace Lookup Table blocks and Lookup Table (2-D) blocks with n-D Lookup Table blocks. However, because the n-D Lookup Table block performs division first, this replacement might cause a numerical difference in the result.
Model contains Lookup Table or Lookup Table (2-D) blocks. Some of these blocks specify Interpolation-Extrapolation as the Lookup method but their input and output are not the same floating-point type.	Replace Lookup Table blocks and Lookup Table (2-D) blocks with n-D Lookup Table blocks. Then change the extrapolation method or the port data types for block replacement.
Model contains Unit Delay blocks with Sample time set to -1 that inherit a continuous sample time.	Replace Unit Delay blocks with Memory blocks.

Check Data Store Memory blocks for multitasking

Action Results

Clicking **Modify** replaces blocks from a previous release of Simulink software with the latest versions.

See Also

- n-D Lookup Table
- Unit Delay

Check if SLX file compression is off

Check ID: `mathworks.design.CheckSLXFileCompressionLevel`

Check if SLX file compression is turned off to reduce Git™ repository size.

Description

Check whether compression for the SLX model is turned off.

Results and Recommended Actions

Condition	Recommended Action
Model, library, or subsystem is saved in SLX format. File compression is turned on.	Consider turning off file compression to optimize storage under source control.

Capabilities and Limitations

You can run this check on models, libraries, and subsystems checked in to Git source control.

See Also

- “Consult the Upgrade Advisor”.
- “Model Upgrades”

Check that the model or library is saved in current version

Check ID: `mathworks.design.CheckSavedInCurrentVersion`

Check that the model, library, or subsystem is saved in the current version of Simulink.

Description

Check whether the model file is saved in the current Simulink release.

Results and Recommended Actions

Condition	Recommended Action
Model, library, or subsystem not saved in the current version of Simulink.	Consider resaving the model file in the current version of Simulink.

Capabilities and Limitations

You can run this check on your models, libraries, and subsystems.

Tips

Projects can help you save all the models and libraries in your project to the current Simulink release. See “Upgrade All Project Models, Libraries, and MATLAB Code Files”.

- “Upgrade All Project Models, Libraries, and MATLAB Code Files”

Check model for SB2SL blocks

Check ID: `mathworks.simulink.SB2SL.Check`

Check that the model does not have outdated SB2SL blocks.

Description

Check if the model contains outdated SB2SL blocks.

Results and Recommended Actions

Condition	Recommended Action
Model contains outdated SB2SL blocks	Consider upgrading the model to current SB2SL blocks.

Action Results

Clicking **Update SB2SL Blocks** replaces blocks with the latest versions.

See Also

- “Consult the Upgrade Advisor”.

Check Model History properties

Check ID: mathworks.design.SLXModelProperties

Check for edited model history properties

Description

Check models for edited Model History property values that could be used with source control tool keyword substitution. This keyword substitution is incompatible with SLX file format.

In the MDL file format you can configure some model properties to make use of source control tool keyword substitution. If you save your model in SLX format, source control tools cannot perform keyword substitution. Information in the model file from such keyword substitution is cached when you first save the MDL file as SLX, and is not updated again. The Model Properties History pane and Model Info blocks in your model show stale information from then on.

Results and Recommended Actions

Condition	Recommended Action
Edited model history properties	Manually or automatically reset the properties to the default values. Click the button to reset, or to inspect and change these properties manually, open the Model Properties dialog and look in the History pane.

Capabilities and Limitations

You can run this check on your library models.

See Also

- “Consult the Upgrade Advisor”.
- “Model Upgrades”

Identify Model Info blocks that can interact with external source control tools

Check ID: `mathworks.design.ModelInfoKeywordSubstitution`

Use this check to find Model Info blocks that can be altered by external source control tools through keyword substitution.

Description

This check searches for character vectors in the Model Info block enclosed within dollar signs that can be overwritten by an external source control tool. Using third-party source control tool keyword expansion might corrupt your model files when you submit them. Keyword substitution is not available in SLX model file format.

For a more flexible interface to source control tools, use a Simulink project instead of the Model Info block. See “About Source Control with Projects”.

Results and Recommended Actions

Condition	Recommended Action
The Model Info block contains fields like this: <code>\$keyword\$</code>	Review the list of fields in the report, then remove the keyword character vectors from the Model Info block.

See Also

- “Consult the Upgrade Advisor”.
- “About Source Control with Projects”

Identify Model Info blocks that use the Configuration Manager

Check ID: `mathworks.design.ModelInfoConfigurationManager`

Use this check to find Model Info blocks that use the Configuration Manager.

Description

Model Info blocks using the Configuration Manager allow risky keyword substitution using external source control tools. Using third-party source control tool keyword expansion might corrupt your model files when you submit them. Keyword substitution is not available in SLX model file format. The Configuration Manager for the Model Info block will be removed in a future release.

For a more flexible interface to source control tools, use a Simulink project instead of the Model Info block. See “About Source Control with Projects”.

Results and Recommended Actions

Condition	Recommended Action
A Model Info block is using the Configuration Manager.	Click Remove the Configuration Manager .

See Also

- “Consult the Upgrade Advisor”.
- “About Source Control with Projects”

Check model for upgradable SerDes Toolbox blocks

Check ID: `mathworks.design.serdesUpgrades`

Lists blocks saved in a previous version of SerDes Toolbox™ that are outdated.

Description

This check searches for and lists SerDes Toolbox blocks that can be upgraded for compatibility with the current release.

Results and Recommended Actions

Condition	Recommended Action
Blocks saved in older versions of SerDes Toolbox are found.	Click Upgrade SerDes Toolbox Blocks to upgrade the SerDes Toolbox blocks to be compatible with the current release.

Action Results

Clicking **Upgrade SerDes Toolbox Blocks** upgrades the outdated SerDes Toolbox blocks to be compatible with the current release.

See Also

- “Design and Simulate SerDes Systems” (SerDes Toolbox)

Check model for legacy 3DoF or 6DoF blocks

Check ID: `mathworks.design.Aeroblks.CheckD0F`

Lists 3DoF and 6DoF blocks are outdated.

Description

This check searches for 3DoF and 6DoF blocks from library versions prior to 3.13 (R2014a).

Results and Recommended Actions

Condition	Recommended Action
Blocks configured with old versions of 3DoF or 6DoF blocks found.	Click Replace 3DoF and 6DoF Blocks to replace the blocks with latest versions.

Action Results

Clicking **Replace 3DoF and 6DoF Blocks** replaces blocks with the latest versions.

See Also

- “Equations of Motion” (Aerospace Blockset)

Check model for Aerospace Blockset navigation blocks

Check ID: `mathworks.design.Aeroblks.CheckNAV`

Searches for Three-Axis Inertial Measurement Unit, Three-Axis Gyroscope, and Three-Axis Accelerometer blocks prior to 3.21 (R2018a).

Description

This check searches for Three-Axis Inertial Measurement Unit, Three-Axis Gyroscope, and Three-Axis Accelerometer blocks that have been updated in R2018a.

Results and Recommended Actions

Condition	Recommended Action
Three-Axis Inertial Measurement Unit, Three-Axis Gyroscope, and Three-Axis Accelerometer blocks prior to R2018a.	In R2018a or later, if you did not previously solve for steady state conditions, save the model now. If you previously solved for steady state conditions for the model, solve for these steady state conditions again, and then save the model.

See Also

- Three-axis Accelerometer
- Three-axis Gyroscope
- Three-axis Inertial Measurement Unit

Check and update masked blocks in library to use promoted parameters

Check ID: `mathworks.design.CheckAndUpdateOldMaskedBuiltinBlocks`

Check for libraries that should be updated to use promoted parameters.

Description

This check searches libraries created before R2011b for masked blocks that should be updated to use promoted parameters. Since R2011b, if a block parameter is not promoted, its value in the linked

block is locked to its value in the library block. This check excludes blocks of type Subsystem, Model reference, S-Function and M-S-Function.

Results and Recommended Actions

Condition	Recommended Action
Libraries that need to be updated are found	Click Update . Once the libraries have been updated, run the check again

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- “Consult the Upgrade Advisor”.
- “Model Upgrades”
- “Model Advisor Exclusion Overview” (Simulink Check)

Check and update mask image display commands with unnecessary imread() function calls

Check ID: `mathworks.design.CheckMaskDisplayImageFormat`

Check identifies masks using image display commands with unnecessary calls to the `imread()` function.

Description

This check searches for the mask display commands that make unnecessary calls to the `imread()` function, and updates them with mask display commands that do not call the `imread()` function. Since 2013a, a performance and memory optimization is available for mask images specified using the image path instead of the RGB triple matrix.

Results and Recommended Actions

Condition	Recommended Action
Mask display commands that make unnecessary calls to the <code>imread()</code> function are found.	Click Update . Once the blocks have been updated, run the check again.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- “Consult the Upgrade Advisor”.
- “Model Upgrades”
- “Model Advisor Exclusion Overview” (Simulink Check)

Check and update mask to affirm icon drawing commands dependency on mask workspace

Check ID: `mathworks.design.CheckMaskRunInitFlag`

Check identifies if the mask icon drawing commands have dependency on the mask workspace.

Description

This check identifies if the mask icon drawing commands have dependency on the mask workspace and updates the `RunInitForIconRedraw` property accordingly. If there is no mask workspace dependency, the value of `RunInitForIconRedraw` is set to `off`, whereas, if there is mask workspace dependency the values is set to `on`.

Setting the values of `RunInitForIconRedraw` to `off` when there is no mask workspace dependency optimizes the performance by not executing the mask initialization code before drawing the block icon.

Results and Recommended Actions

Condition	Recommended Action
Mask drawing commands that are dependent or independent of the mask workspace are found.	Click Update . Once the blocks have been updated, run the check again.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- “Consult the Upgrade Advisor”.
- “Model Upgrades”
- “Model Advisor Exclusion Overview” (Simulink Check)

Identify masked blocks that specify tabs in mask dialog using MaskTabNames parameter

Check ID: `mathworks.design.CheckAndUpdateOldMaskTabnames`

This check identifies masked blocks that specify tabs in mask dialog using the `MaskTabNames` parameter.

Description

This check identifies masked blocks that use the `MaskTabNames` parameter to programmatically create tabs in the mask dialog. Since R2013b, dialog controls are used to group parameters in a tab on the mask dialog.

Results and Recommended Actions

Condition	Recommended Action
Masked blocks that use the <code>MaskTabNames</code> parameter to create tabs programmatically in the mask dialog are found.	Click Upgrade available in the Action section. Once the blocks have been updated, run the check again.

Capabilities and Limitations

You can run this check on your library models.

See Also

- “Consult the Upgrade Advisor”.
- “Model Upgrades”

Identify questionable operations for strict single-precision design

Check ID: `mathworks.design.StowawayDoubles`

For a strict single-precision design, this check identifies the blocks that introduce double-precision operations, and non-optimal model settings.

Description

For a strict single-precision design, this check identifies the blocks that introduce double-precision operations, and non-optimal model settings.

Results and Recommended Actions

Condition	Recommended Action
Double-precision floating-point operations found in model.	Verify that: <ul style="list-style-type: none"> • Block input and output data types are set correctly. • In the Configuration Parameters dialog box, Default for underspecified data type is set to <code>single</code>.

Condition	Recommended Action
Model uses a library standard that is not optimal for strict-single designs.	Verify that: <ul style="list-style-type: none"> All target-specific math libraries used by the model support single-precision implementations. Set Configuration Parameters > Language standard to C99 (ISO).
Logic signals are not implemented as Boolean data.	Verify that: <ul style="list-style-type: none"> In the Configuration Parameters dialog box, Implement logic signals as Boolean data is selected.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

See Also

- “Validate a Floating-Point Embedded Model”
- “Consult the Upgrade Advisor”.
- “Model Upgrades”
- “Model Advisor Exclusion Overview” (Simulink Check)

Check `get_param` calls for block `CompiledSampleTime`

Check ID: `mathworks.design.CallsGetParamCompiledSampleTime`

Use this check to identify MATLAB files in your working environment that contain `get_param` function calls to return the block `CompiledSampleTime` parameter.

Description

For multi-rate blocks (including subsystems), Simulink returns the block compiled sample time as a cell array of the sample rates in the block. The return value is a cell array of pairs of doubles. MATLAB code that accepts this return value only as pairs of doubles can return an error when called with a multi-rate block. Use this check to identify such code in your environment. Modify these instances of code to accept a cell array of pairs of doubles instead.

For example, consider a variable `blkTs`, which has been assigned the compiled sample time of a multi-rate block.

```
blkTs = get_param(block, 'CompiledSampleTime');
```

Here are some examples in which the original code works only if `blkTs` is a pair of doubles and the block is a single-rate block:

- Example 1

```
if isinf(blkTs(1))
    disp('found constant sample time')
end
```

Since blkTs is now a cell array, Simulink gives this error message:

Undefined function 'isinf' for input arguments of type 'cell'

Instead, use this code, for which blkTs can be a cell array or a pair of doubles.

```
if isequal(blkTs, [inf,0])
    disp('found constant sample time')
end
```

- Example 2

```
if all(blkTs == [-1,-1])
    disp('found triggered sample time')
end
```

For the above example, since blkTs is now a cell array, Simulink gives this error:

Undefined function 'eq' for input arguments of type 'cell'

Instead, use this code, for which blkTs can be a cell array or a pair of doubles.

```
if isequal(blkTs, [-1,-1])
    disp('found triggered sample time')
end
```

- Example 3

```
if (blkTs(1) == -1)
    disp('found a triggered context')
end
```

Again, since blkTs is now a cell array, Simulink gives this error:

Undefined function 'eq' for input arguments of type 'cell'

Instead, use this code.

```
if ~iscell(blkTs)
    blkTs = {blkTs};
end
for idx = 1:length(blkTs)
    thisTs = blkTs{idx};
    if (thisTs(1) == -1)
        disp('found a triggered context')
    end
end
```

The above code checks for a triggered type sample time (triggered or async). In cases in which a block has constant sample time ([inf,0]) in addition to triggered or async or when a block has multiple async rates, this alternative property detects the triggered type sample time.

This check scans MATLAB files in your environment. If the check finds instances of MATLAB code that contain `get_param` calls to output the block compiled sample time, Upgrade Advisor displays these results. It suggests that you modify code that accepts the block compiled sample time from multi-rate blocks.

Results and Recommended Actions

Condition	Recommended Action
No MATLAB files call <code>get_param(block,CompiledSampleTime)</code>	None
Some MATLAB files call <code>get_param(block,CompiledSampleTime)</code>	If files use the block <code>CompiledSampleTime</code> parameter from multi-rate blocks, modify these files to accept the parameter as a cell array of pairs of doubles

See Also

- “Sample Times in Subsystems”
- “Block Compiled Sample Time”

Check if all simulation outputs are returned as a single `Simulink.SimulationOutput` object

Check ID: `mathworks.design.CheckSingleSimulationOutput`

Use this check to identify if the simulation result is returned as a single `Simulink.SimulationOutput` object.

Description

This check scans your model to verify if the parameter `ReturnWorkspaceOutputs` is enabled. Enabling this parameter, returns simulation outputs in a `Simulink.SimulationOutput` when simulating interactively. Simulation outputs include signal, state, output, DSM logging, and scope and To Workspace block logging.

When `ReturnWorkspaceOutputs` is enabled, it provides:

- Easier management of simulation data.
- Automatic access to `SimulationMetadata`.
- Compatibility with multiple parallel simulations and batch simulations.

Results and Recommended Actions

Condition	Recommended Action
Simulation outputs are not returned as a single <code>Simulink.SimulationOutput</code> object	Return all simulation outputs as a single <code>Simulink.SimulationOutput</code> object

See Also

- “Single simulation output”
- `Simulink.SimulationOutput`

Check model for parameter initialization and tuning issues

Check ID: `mathworks.design.ParameterTuning`

Use this check to identify issues in the model that occur when you initialize parameters or tune them.

Description

This check scans your model for parameter initialization and tuning issues like:

- Rate mismatch between blocks
- Divide by zero issue in conditionally executed subsystems
- Invalid control port value in Index Vector blocks

Results and Recommended Actions

Condition	Recommended Action
The model has rate transition issues.	Select Automatically handle rate transition for data transfer in the Solver pane of the model configuration parameters.
The model has a divide by zero issue in a conditionally executed subsystem with a control port.	At the command prompt, run <code>set_param(control_port, 'DisallowConstTsAndPrmTs', 'on')</code>
The model has an invalid control port value in a conditionally executed subsystem.	At the command prompt, run <code>set_param(control_port, 'DisallowConstTsAndPrmTs', 'on')</code>

Action Results

Select **Upgrade model** to resolve issues in the model related to parameter initialization and tuning.

See Also

- “Automatic Rate Transition”

Check for virtual bus across model reference boundaries

Check ID: `mathworks.design.CheckVirtualBusAcrossModelReference`

Check virtual bus signals that cross model reference boundaries.

Description

This check identifies root-level Inport and Outport blocks in referenced models and Model blocks with virtual bus outputs that require updates to change to nonvirtual bus signals.

If the check identifies issues, click **Update Model** to convert root-level Inport and Outport blocks configured for virtual buses to use nonvirtual buses in these situations:

- For root-level Inport blocks — Enable the **Output as nonvirtual bus** parameter and insert a Signal Conversion block after the Inport block. The Signal Conversion block is configured to output a virtual bus.
- For root-level Outport blocks — Enable the **Output as nonvirtual bus in parent model** parameter.

- For Model blocks — For ports whose Outport blocks were updated to address issues, insert a Signal Conversion block after the corresponding ports of the Model block. The Signal Conversion block is configured to output a virtual bus.

Recommended Action and Results

To resolve issues, click **Upgrade Model**.

Note Run the **Analyze model hierarchy and continue upgrade sequence** check on the top-level model and then down through the model reference hierarchy.

Clicking **Upgrade Model** converts affected root-level Inport and Outport blocks configured for virtual buses to use nonvirtual buses in models where you:

- Use function prototype control
- Perform C++ code generation with the I/O arguments step method option.

Alternatively, you can change the C++ code generation function specification setting to Default step method:

- 1 In the **Configuration Parameters > Code Generation > Interface** pane, click **Configure C++ Class Interface**.
 - 2 In the dialog box, set the **Function specification** parameter to Default step method.
- Use buses that have variable-dimension signals
 - Use an associated non-auto storage class for Outport block signals
 - The conversion for non-auto storage class occurs only if you have the target generation license that the model requires. For example, an ERT target requires an Embedded Coder license.
 - Use Export-function models where an Outport block is driven by a nonvirtual bus
 - Have Model blocks that reference models containing Outport blocks that have been fixed — Clicking **Upgrade Model** updates Model blocks referencing the models that had Outport blocks fixed by the **Analyze model hierarchy and continue upgrade sequence** check.

See Also

- “Use Buses at Model Interfaces”

Check model for custom library blocks that rely on frame status of the signal

Check ID: `mathworks.design.DSPFrameUpgrade`

This check identifies custom library blocks in the model that depend on the frame status of the signal.

Description

This check searches for the custom library blocks in a model that depend on the frame status of the signal. The check analyzes the blocks, recommends fixes, and gives reasons for the fixes. You must make the fixes manually.

Results and Recommended Actions

Condition	Recommended Action
The check finds custom library blocks that depend on the frame status of the signal.	Follow the recommendation given by the Upgrade Advisor.

Capabilities and Limitations

You can run this check only on custom library blocks in your model.

You must make the fixes manually.

This check appears only if you have the DSP System Toolbox installed.

See Also

“Frame-based processing” (DSP System Toolbox)

Check model for S-function upgrade issues

Check ID: 'mathworks.design.CheckForSFcnUpgradeIssues'

Use this check on your model to identify your S-function's upgrade compatibility issues. These issues may include the use of 32-bit APIs, compilation with incompatible options, or use of deprecated separate complex APIs. Some common issues and information related to the fixes are described in results and recommendations section below.

Description

When upgrading your S-functions to use the features in the latest release, this check scans your model to warn against S-function upgrade incompatibility issues. If the result of this check gives a warning or error, fix your C MEX S-functions according to the description.

Results and Recommended Actions

Condition	Recommended Action
Custom-built S-functions are not supported.	Recompile your S-function with available compatible options. See “Custom-built MEX File Not Supported In Current Release” for more information.
S-function is not compiled with the latest API (mex -R2018a).	Recompile using the latest flag (mex -R2018a). See “MEX File Is Compiled With Outdated Option” for more information.
S-function uses 32-bit functions.	Modify your code according to the instructions in “MEX File Calls A 32-bit Function”.
S-function is using deprecated separate complex APIs (mxGetPi, mxSetPi, mxGetImagData, mxSetImagData).	Use interleaved complex APIs and recompile your code with the latest flag (mex -R2018a). See “Upgrade MEX Files to Use Interleaved Complex API” for more information.
S-function is using deprecated type-unsafe data API (mxGetData, mxSetData).	Use type-safe data APIs and recompile your code. See “MEX File Calls An Untyped Data Access Function” for more information.

Condition	Recommended Action
S-function is compiled with a future release and not supported in current release.	See “MEX File Built In MATLAB Release Not Supported In Current Release” to recompile your files.

See Also

- “MATLAB Data in C S-Functions”

Update System object syntax

Check ID: 'mathworks.design.CheckSystemObjectUpdate'

Use this check to identify and update any custom MATLAB System object in your model that have outdated syntax.

Description

This check scans your model to identify outdated System object syntax. If the check passes, all the syntax is up to date. If the check fails, you can update the syntax.

Results and Recommended Actions

Condition	Recommended Action
System object syntax is up to date.	None.
System object syntax requires update.	A report is generated for each unique System object associated with a MATLAB System block. Use Update to update the syntax.

See Also

- “Consult the Upgrade Advisor”

Check Rapid accelerator signal logging

Check ID: mathworks.design.CheckRapidAcceleratorSignalLogging

When simulating your model in rapid accelerator mode, use this check to find signals logged in your model that are globally disabled. Rapid accelerator mode supports signal logging. Use this check to enable signal logging globally.

Description

This check scans your model to see if a simulation is in rapid accelerator mode and whether the model contains signals with signal logging. If the check finds an instance and signal logging is globally disabled, an option to turn on signal logging globally appears.

Results and Recommended Actions

Condition	Recommended Action
Simulation mode is not rapid accelerator.	None. You can enable signal logging in rapid accelerator mode.
Simulation mode is rapid accelerator. Upgrade Advisor did not find signals with signal logging enabled.	None. The model does not use signal logging. Enable signal logging for signals and globally if you want to log signals.
Simulation mode is rapid accelerator. Upgrade Advisor found signals with signal logging enabled. However, global setting for signal logging was disabled.	Enable signal logging globally if you want to log signals with signal logging enabled.
Signal logging was already globally enabled.	None.

Action Results

Selecting **Modify** enables signal logging globally in your model.

See Also

- “Consult the Upgrade Advisor”.

Check virtual bus inputs to blocks

Check ID: `mathworks.design.VirtualBusUsage`

Check bus input signals for a set of blocks.

Description

Check bus input signals for a set of blocks.

Starting in R2015b, virtual bus signal inputs to blocks that require nonbus or nonvirtual bus input can cause an error. Examples of blocks that can specify a bus object as their output data type include a Bus Creator block and a root Inport block. The blocks that cause an error when they have a virtual bus input in this situation are:

- Assignment
- Delay

The Delay block causes an error only if you use the Block Parameters dialog box to:

- Set an initial condition that is a MATLAB structure or zero.
- Specify a value for **State name**.
- Permute Dimension
- Reshape
- Selector
- Unit Delay

The Unit Delay block causes an error only if you use the Block Parameters dialog box to:

- Set an initial condition that is a MATLAB structure or zero.
- Specify a value for **State name**.
- Vector Concatenate

Results and Recommended Actions

Condition	Recommended Action
Virtual bus signal input to these blocks: <ul style="list-style-type: none"> • Assignment • Delay (if you specify an initial condition from the dialog box that is a MATLAB structure or zero and the value for State name is not empty) • Permute Dimension • Reshape • Selector • Unit Delay (if you specify an initial condition that is a MATLAB structure or zero and the value for State name is not empty) • Vector Concatenate 	In the Upgrade Advisor, click Modify . The check inserts a Bus to Vector block to attempt to convert virtual bus input signals to vector signals. For issues that the Upgrade Advisor identifies but cannot fix, modify the model manually. For details, see “Identify Automatic Bus Conversions”.

Action Results

Clicking **Modify** inserts a Bus to Vector block at the input ports of blocks.

For many models, running the Upgrade Advisor modifies your model so that bus signals are not treated as vectors. However, for some models you can encounter compatibility issues even after running the check. Modify your model manually to address those issues.

After you compile the model using Upgrade Advisor, the Simulink Editor sometimes indicates that you need to save the model (the model is dirty), even though you did not make changes. To prevent this issue from reoccurring for this model, save the model.

Modeling Pattern	Issue	Solution
Data Store Memory block with Data Type set to Inherit: auto	A Data Store Memory block whose associated Data Store Read or Data Store Write blocks read or write bus signal data must use a bus object.	In the Data Store Memory block, set the Data Type signal attribute to Bus: <BusObject> .
Signal Conversion block Output parameter matches input bus type	A Signal Conversion block whose Output parameter is set to Nonvirtual bus requires a virtual bus input. A Signal Conversion block whose Output parameter is set to Virtual bus requires a nonvirtual bus input.	To create a copy of the input signal, set Output to Signal copy .

Modeling Pattern	Issue	Solution
Merge, Switch, or Multiport Switch block with multiple bus inputs	Merge, Switch, or Multiport Switch blocks with multiple bus inputs require those inputs to have the same names and hierarchy.	Reconfigure the model so that the bus inputs have the same names and hierarchy.
Root Inport block outputting a virtual bus and specifying a value for Port dimensions	A root Inport block that outputs to a virtual bus must inherit the dimensions.	Set the Inport block Port dimensions signal attribute to 1 or -1 (inherit).
Mux block with nonvirtual bus inputs	A Mux block cannot accept nonvirtual bus signals.	To treat the output as an array, replace the Mux block with a Vector Concatenate block. If you want a virtual bus output, use a Bus Creator block to combine the signals.
Bus to Vector block without a virtual bus signal input	A nonbus signal does not need a Bus to Vector block.	Remove the Bus to Vector block.
Assignment block with virtual bus inputs	The Upgrade Advisor converts the Assignment block Y0 port bus input to a vector.	Add a Bus to Vector block before the Assignment block.
S-function using a nonvirtual bus	An S-function that is not a Level-2 C S-function does not support nonvirtual bus signals.	Change the S-function to be a Level-2 C S-function. Consider using an S-Function Builder block to create a Level-2 C S-function.
Stateflow chart with parameterized data type	In a Stateflow chart, you cannot parameterize the data type of an input or output in terms of another input or output if the data type is a bus object.	For the parameterized port, set Data Type to Bus: <object name>.
Subsystem with bus operations in a Stateflow chart	An Inport block inside a subsystem in a Stateflow chart requires a bus object data type if its signal is a bus.	In the Inport block, set Data type to Bus: <object name>.
Ground block used as a bus source	The output signal of a Ground block cannot be a source for a bus.	Use a Constant block with Constant value set to 0 and the Output data type signal attribute set to Bus: <object name>.
Root Outport block with a single-element bus object data type	The input to the Outport block must be a bus if it specifies a bus object as its data type.	In the Outport block, set Data type to Inherit: auto .

Check for root outports with constant sample time

Check ID: `mathworks.design.CheckConstRootOutportWithInterfaceUpgrade`

Use this check to identify root outports with a constant sample time used with an AUTOSAR target, Function Prototype Control, or the model C++ class interface.

Description

Root outports with constant sample time are not supported when using an AUTOSAR target, Function Prototype Control, or the model C++ class interface. Use this check to identify root Outport blocks with this condition and modify the blocks as recommended.

Results and Recommended Actions

Condition	Recommended Action
Root outport with constant sample time used with an AUTOSAR target, Function Prototype Control or the model C++ class interface.	Consider one of the following: <ul style="list-style-type: none"> • Set the sample time of the block to the fundamental sample time. • Identify the source of the constant sample time and set its sample time to the fundamental sample time. • Place a Rate Transition block with inherited sample time (-1) before the block.

See Also

- “Consult the Upgrade Advisor”.

Analyze model hierarchy and continue upgrade sequence

Check ID: `com.mathworks.Simulink.UpgradeAdvisor.UpgradeModelHierarchy`

Check for child models and guide you through upgrade checks.

Description

This check identifies child models of this model, and guides you through upgrade checks to run both non-compile and compile checks. The Advisor provides tools to help with these tasks:

- If the check finds child models, it offers to run the Upgrade Advisor upon each child model in turn and continue the upgrade sequence. If you have a model hierarchy you need to check and update each child model in turn.
- If there are no child models, you still need to continue the check sequence until you have run both non-compile and compile checks.

You must run upgrade checks in this order: first the checks that do not require compile time information and do not trigger an Update Diagram, then the compile checks.

Click **Continue Upgrade Sequence** to run the next checks. If there are child models, this will open the next model. Keep clicking **Continue Upgrade Sequence** until the check passes.

Results and Recommended Actions

Condition	Recommended Action
Child models found	Click Continue Upgrade Sequence to run the next checks. If there are child models, this will close the current Upgrade Advisor session, and open Upgrade Advisor for the next model in the hierarchy.
No child models, but more checks to run	If there are no child models, click Continue Upgrade Sequence to refresh the Upgrade Advisor with compilation checks selected. The compile checks trigger an Update Diagram (marked with ^). Run the next checks and take advised actions. When you return to this check, click Continue Upgrade Sequence until this check passes.

Tips

Best practice for upgrading a model hierarchy is to check and upgrade each model starting at the leaf end and working up to the root model.

When you click **Continue Upgrade Sequence**, the Upgrade Advisor opens the leaf model as far inside the hierarchy as it can find. Subsequent steps guide you through upgrading your hierarchy from leaf to root model.

When you open the Upgrade Advisor, the checks that are selected do not require compile time information and do not trigger an Update Diagram. Checks that trigger an Update Diagram are not selected to run by default, and are marked with ^. When you use the Upgrade Advisor on a hierarchy, keep clicking **Continue Upgrade Sequence** to move through this sequence of analysis:

- 1 The Upgrade Advisor opens each model and library in turn, from leaf to root, and selects the non-compile checks. Run the checks, take any advised actions, then click **Continue Upgrade Sequence** to open the next model and continue.
- 2 When you reach the root end of the hierarchy, the Upgrade Advisor then opens each model again in the same order (but not libraries) and selects only the checks that require a model compile. Run the checks, take any advised actions, then click **Continue Upgrade Sequence** to open the next model. Continue until you reach the end of the hierarchy and this check passes.

Check Access to Data Stores

Check ID: `mathworks.design.ConflictsForDataStoreReadWriters`

Identify potential execution order sensitivity when reading and writing to data stores.

Description

The execution order of blocks that read and write to the same data store can change the simulation result. When blocks in the same hierarchy access the same data store, the execution order is not deterministic.

Results and Recommended Actions

Condition	Recommended Action
Data Store Memory block accessed by multiple blocks in the same hierarchy.	To enforce execution order for the blocks, consider the following: <ul style="list-style-type: none"> • Add a data dependency between the blocks. • Set block priority. • Move blocks into separate Function-Call Subsystem blocks and schedule them.

Check relative execution orders for Data Store Read and Data Store Write blocks

Check ID: `mathworks.design.TaskBasedSorting`

Check relative execution order changes between legacy and task-based sorting for Data Store Read and Data Store Write blocks.

Description

Legacy models used block sorting to determine block execution order. With task-based sorting, the relative execution order involving Data Store Memory blocks can change. This check detects the changes and provides an option to update your model with the original execution order.

Results and Recommended Actions

Condition	Recommended Action
Execution order with a Data Store Memory block changes. You want the original execution order.	Click the Modify button.

See Also

- “Control and Display Execution Order”

Check for case mismatches in references to models and libraries

Check ID: `mathworks.design.CaseSensitiveBlockDiagramNames`

Identify and fix case-insensitive references to models and libraries.

Description

Starting R2020a, Simulink model and library names are case-sensitive. This check detects and provides an option to fix case-insensitive references to models and libraries.

Results and Recommended Actions

Condition	Recommended Action
The check finds case mismatches in references to models and libraries.	Follow the recommendation given by the Upgrade Advisor.

See Also

- “Consult the Upgrade Advisor”

Check model for Signal Builder blocks

Check ID: `mathworks.design.Sigbldr.upgradeCheck`

Searches for Signal Builder blocks in models.

Description

Find Signal Builder blocks in models and replace them with equivalently configured Signal Editor blocks.

Results and Recommended Actions

Condition	Recommended Action
Model contains one or more Signal Builder blocks.	To replace all Signal Builder blocks with equivalent Signal Editor blocks, click the associated link.

See Also

- Signal Editor
- “Consult the Upgrade Advisor”

Check output dimensions of MATLAB Function blocks

Check ID: `mathworks.simulink.MLFBOutputDimensions`

Check lists all the MATLAB Function blocks that have the **Interpret output column vectors as one-dimensional data** property enabled. If the property is enabled, the block converts output column vectors of size N-by-1 to one-dimensional signals with a signal size equal to N.

Results and Recommended Actions

Condition	Recommended Action
MATLAB Function block produces one-dimensional output data and has property enabled	<p>Clicking the Fix It button does not disable the property for the MATLAB function block. To disable the property:</p> <ol style="list-style-type: none"> 1 Select the MATLAB Function block. 2 Open the Property Inspector. In the Modeling tab, in the Design section, click Property Inspector. 3 In the General tab, clear the Interpret output column vectors as one-dimensional data property. <p>Check the simulation behavior of the model, as disabling the property changes the size propagation of the MATLAB function block.</p>
MATLAB Function block does not produce one-dimensional data and has property enabled	Click the Fix It button to disable the property for the MATLAB function block.

Check model for RF Blockset Divider blocks using Wilkinson power divider component with broken connections

Check ID: `mathworks.design.rfblockset.ce.checkDisconnectedDividerBlocks`

Search the model and list the RF Blockset™ Divider blocks using the Wilkinson power divider component with broken port connections on port **3**.

Description

Starting R2021a, port positions of the RF Blockset Divider blocks using the Wilkinson power divider component are changed. This check searches and lists the Divider blocks using the Wilkinson power divider component model with broken port connections on port 3 prior to R2021a. You can then rewire the connections using the Modify button.

Results and Recommended Actions

Condition	Recommended Action
Models have RF Blockset Divider blocks using the Wilkinson power divider component with broken port connections on port 3.	Click the Modify button to rewire the broken connections on port 3 of the RF Blockset Divider blocks.

Action Results

Clicking **Modify** rewires the broken port connections on port 3 of the RF Blockset Divider blocks.

Note The **Modify** button will attempt to automatically rewire all the broken connections at port 3 of the Divider blocks using the Wilkinson power divider component in your model. To ensure accuracy, you must subsequently:

- Examine the details listed under the **Result** pane of the Upgrade Advisor.
 - The first list enumerates the RF Blockset Divider blocks using the Wilkinson power divider component that require manual rewiring due to model complexity.
 - The second list enumerates the automatically rewired blocks.
 - Fixed and unfixed Divider blocks are temporarily highlighted in colors green and red, respectively. Click the **Remove all temporary block highlighting** link at the bottom of the **Result** pane to remove the highlights.
-

Identify Environment Controller Blocks and Replace Them with Variant Source Blocks

Check ID:mathworks.design.ReplaceEnvironmentControllerBlk

Search for Environment Controller blocks in the model.

Description

Find Environment Controller blocks in the model and replace them with Variant Source blocks with the **Variant control mode** parameter set to 'sim codegen switching'.

Results and Recommended Actions

Condition	Recommended Action
Model contains one or more Environment Controller blocks.	Replace Environment Controller blocks with Variant Source blocks with the Variant control mode parameter set to 'sim codegen switching'.

Capabilities and Limitations

- You can run this check on your library models.
- You cannot use this check to identify Environment Controller blocks in referenced models and linked blocks.

See Also

- “Environment Controller block has been removed” on page 1-586
- Variant Source

Check for machine-parented data

Check ID: `mathworks.stateflow.MachineParentedData.check`

Check the model for instances of machine-parented data.

Description

Machine-parented data prevents models from reusing generated code and other code optimizations. Machine-parented data is also incompatible with many Simulink and Stateflow features. To make Stateflow data accessible to other charts and blocks in a model, use chart-parented data of scope `Data Store Memory`. For more information, see “Best Practices for Using Data in Charts” (Stateflow) and “Access Data Store Memory from a Chart” (Stateflow).

Note Machine-parented data will no longer be supported in a future release.

Results and Recommended Actions

Condition	Recommended Action
A Simulink model contains Stateflow machine-parented data.	Upgrade the model by converting machine-parented data to chart-parented data with values in the model workspace.

Action Results

Clicking **Upgrade model** creates chart-parented data in the charts that use machine-parented data.

- If a machine-parented data object has a scope of `Parameter`, the new chart-parented data object has a scope of `Parameter`. The value is stored as a `Simulink.Parameter` object in the model workspace.
- If a machine-parented data object has any other scope, the new chart-parented data object has a scope of `Data Store Memory`. The value is stored as a `Simulink.Signal` object in the model workspace.

Capabilities and Limitations

Automatic conversion fails when:

- The model workspace contains a `Simulink.Parameter` or `Simulink.Signal` object with the same name as the machine-parented data.
- The model contains chart-parented data, events, or messages with the same name as the machine-parented data.
- The machine-parented data uses Stateflow semantics that do not have an equivalent for `Simulink.Parameter` or `Simulink.Signal` objects.

Simulink Performance Advisor Check Overview

Use Performance Advisor checks to improve model simulation time.

See Also

“Improve Simulation Performance Using Performance Advisor”

Baseline

Establish a measurement to compare the performance of a simulation after Performance Advisor implements improvements.

See Also

“Create a Performance Advisor Baseline Measurement”

Checks that Require Update Diagram

These checks require that **Update Diagram** occurs in order to run.

See Also

“Improve Simulation Performance Using Performance Advisor”

Checks that Require Simulation to Run

These checks require simulation to run in order to collect sufficient performance data. Performance Advisor reports the results after simulation completes.

See Also

“Improve Simulation Performance Using Performance Advisor”

Check Simulation Modes Settings

These checks evaluate simulation modes (Normal, Accelerator, Rapid Accelerator, Rapid Accelerator with up-to-date check off) and identify the optimal mode to achieve fastest simulation.

See Also

“What Is Acceleration?”

Check Compiler Optimization Settings

Use these checks to select compiler optimization settings for improved performance.

See Also

“Compiler optimization level”

Check Hardware Acceleration Settings

Use the check to compare three hardware acceleration options based on their simulation times.

See Also

“Hardware acceleration”

Create baseline

Select this check to create a baseline when Performance Advisor runs. You can also create a baseline manually. A baseline is the measurement of simulation performance before you run checks in Performance Advisor. The baseline includes the time to run the simulation and the simulation results (signals logged). Before you create a baseline for a model, in the **Data Import/Export** pane of the Configuration Parameters dialog box:

- Select the **States** check box.
- Set the **Format** parameter to `Structure with time`.

See Also

“Create a Performance Advisor Baseline Measurement”

Identify resource-intensive diagnostic settings

To improve simulation speed, disable diagnostics where possible. For example, some diagnostics, such as **Solver data inconsistency** or **Array bounds exceeded**, incur run-time overheads during simulations.

See Also

- “Diagnostics”
- “Improve Simulation Performance Using Performance Advisor”

Check optimization settings

To improve simulation speed, enable optimizations where possible. For example, if some optimizations, such as Block Reduction, are disabled, enable these optimizations to improve simulation speed.

You can also trade off compile-time speed for simulation speed by setting the compiler optimization level. Compiler optimizations for accelerations are disabled by default. Enabling them accelerates simulation runs but results in longer build times. The speed and efficiency of the C compiler used for Accelerator and Rapid Accelerator modes also affects the time required in the compile step.

See Also

- “Model Configuration Parameters: Code Generation Optimization” (Simulink Coder)
- “Improve Simulation Performance Using Performance Advisor”

Identify inefficient lookup table blocks

To improve simulation speed, use properly configured lookup table blocks.

See Also

- “Lookup Tables”
- “Optimize Generated Code for Lookup Table Blocks”
- “Optimize Breakpoint Spacing in Lookup Tables”

- “Improve Simulation Performance Using Performance Advisor”

Check MATLAB System block simulation mode

In general, to improve simulation speed, choose `Code generation` for the **Simulate using** parameter of the MATLAB System block. Because data exchange between MATLAB and Simulink passes through several software layers, `Interpreted execution` usually slows simulations, particularly if the model needs many data exchanges.

This check identifies which MATLAB System blocks can generate code and changes the **Simulate using** parameter value to `Code generation` where possible.

While `Code generation` does not support all MATLAB functions, the subset of the MATLAB language that it does support is extensive. By using this `Code generation`, you can improve performance.

See Also

- MATLAB System
- “Simulation Modes”
- “Improve Simulation Performance Using Performance Advisor”

Identify Interpreted MATLAB Function blocks

To improve simulation speed, replace `Interpreted MATLAB Function` blocks with `MATLAB Function` blocks where possible. Because data exchange between MATLAB and Simulink passes through several software layers, `Interpreted MATLAB Function` blocks usually slow simulations, particularly if the model needs many data exchanges.

Additionally, because you cannot compile an `Interpreted MATLAB Function`, an `Interpreted MATLAB Function` block impedes attempts to use an acceleration mode to speed up simulations.

While `MATLAB Function` blocks do not support all MATLAB functions, the subset of the MATLAB language that it does support is extensive. By replacing your `interpreted MATLAB` code with code that uses only this embeddable MATLAB subset, you can improve performance.

See Also

- MATLAB Function
- “Improve Simulation Performance Using Performance Advisor”

Identify simulation target settings

To improve simulation speed, disable simulation target settings where possible. For example, in the Configuration Parameters dialog box, clear the **Simulation Target > Echo expression without semicolons** check box to improve simulation speed.

See Also

- “Model Configuration Parameters: Simulation Target”
- “Improve Simulation Performance Using Performance Advisor”

Check model reference rebuild setting

To improve simulation speed, in the Configuration Parameters dialog box, verify that the **Model Referencing > Rebuild** parameter is set to **If any changes in known dependencies detected**.

See Also

- “Rebuild”
- “Improve Simulation Performance Using Performance Advisor”

Identify Scope blocks

Opened and uncommented Scope blocks can impact simulation performance. To improve simulation performance, close and comment out Scope blocks. Right-click a scope block, and then select **Comment Out**.

For opened Scopes, you can improve simulation speed by reducing updates. From the Scope **Simulation** menu, select **Reduce Updates to Improve Performance**.

See Also

- “Improve Simulation Performance Using Performance Advisor”

Identify active instrumentation settings on the model

Identify active instrumentation settings on the model. The fixed-point instrumentation mode controls which objects log minimum, maximum, and overflow data during simulation. Instrumentation is required to collect simulation ranges using the Fixed-Point Tool. These ranges are used to propose data types for the model (requires Fixed-Point Designer). When you are not actively converting your model to fixed point, disable the fixed-point instrumentation to restore the maximum simulation speed to your model.

In the **Apps** tab, select **Fixed-Point Tool**. Under **System under design**, click **Continue**.

In the Model Hierarchy pane, the Fixed-Point Tool denotes systems that currently have instrumentation turned on with (mmo), or (o). Right-click the system in the model hierarchy and, under **Fixed-point instrumentation mode**, select **Use local settings** or **Force off**.

See Also

- Fixed-Point Instrumentation and Data Type Override (Fixed-Point Designer)

Check model reference parallel build

To improve simulation, verify the number of referenced models in the model. If there are two or more referenced models, build the model in parallel if possible.

Performance Advisor analyzes the model and estimates the build time on the current computer as if it were using several cores. It also estimates the parallel build time for the model in the same way an estimation would be performed if Parallel Computing Toolbox or MATLAB Parallel Server software were installed on the computer. Performance Advisor performs this estimate as follows:

- 1 Search the model for referenced models that do not refer to other referenced models.
- 2 Calculate the average number of blocks in each of the referenced models that do not refer to other referenced models.
- 3 Of the list of referenced models that do not refer to others, select a referenced model whose number of blocks is closest to the calculated average.
- 4 Build this model to obtain the build time.
- 5 Based on the number of blocks and the build time for this referenced model, estimate the build time for all other referenced models.
- 6 Based on these build times, estimate the parallel build time for the top model.

To calculate the overhead time introduced by the parallel build mechanism, set the Parallel Build Overhead Time Estimation Factor. Performance Advisor calculates the estimated build time with overhead as:

$$(1 + \text{Parallel Build Overhead Time Estimation Factor}) * (\text{Build time on a single machine})$$

See Also

- “Enable parallel model reference builds”
- “Improve Simulation Performance Using Performance Advisor”

Check Delay block circular buffer setting

To improve simulation, check that each Delay block in the model uses the appropriate buffer type. By default, the block uses an array buffer (the **Use circular buffer for state** option is not selected).

However, when the delay length is large, a circular buffer can improve execution speed by keeping the number of copy operations constant.

If the Delay block is currently using an array buffer, and all of the following conditions are true, Performance Advisor selects a circular buffer:

- The Delay block is in sample-based mode, i.e., either the **Input processing** parameter is set to `Elements as channels (sample based)`, or the input signal type is set to `Sample based`.
- The value or upper limit of the delay length is 10 or greater.
- The size of the state—equal to the delay length multiplied by the total of all output signal widths—is 1000 or greater.

See Also

- Delay
- “Improve Simulation Performance Using Performance Advisor”

Check continuous and discrete rate coupling

If your model contains both discrete and continuous rates, the coupling between these rates can slow down simulation. Performance Advisor checks for these conditions in your model.

- The model is using a variable step solver.
- The model contains both continuous and discrete rates.
- The fastest discrete rate is relatively smaller than **Max step size** determined by the solver.

Setting the `DecoupledContinuousIntegration` parameter to on might speed up simulation.

See Also

- “Solver Selection Criteria”
- “Speed Up Simulation”
- “Improve Simulation Performance Using Performance Advisor”

Check zero-crossing impact on continuous integration

If your model contains zero-crossings which do not impact the continuous integration, the simulation might slow down when all the following conditions are satisfied:

- The model uses a variable-step solver.
- The model contains blocks that have continuous states and zero-crossings.
- Some of the zero-crossings do not affect the integration of the continuous states.

Setting the `MinimalZcImpactIntegration` parameter to On might speed up simulation.

See Also

- “Speed Up Simulation”
- “Solver Selection Criteria”
- “Improve Simulation Performance Using Performance Advisor”

Check discrete signals driving derivative port

Run this check if your simulation has many unnecessary resets. A discrete signal driving a block with continuous states triggers a reset at every sample time hit of the block. These resets are computationally expensive. Performance Advisor checks for these signals and blocks and provides a list of the same.

You can edit the model around the discovered discrete signals that drive these blocks to remove such cases. For example, inserting a Zero Order Hold block between the discrete signal and the corresponding block with continuous states might help resolve the issue.

See Also

- “Speed Up Simulation”
- “Modeling Techniques That Improve Performance”

Check solver type selection

To improve simulation, check that the model uses the appropriate solver type.

Explicit vs. Implicit Solvers

Selecting a solver depends on the approximation of the model stiffness at the beginning of the simulation. A stiff system has both slowly and quickly varying continuous dynamics. Implicit solvers are specifically designed for stiff problems, whereas explicit solvers are designed for non-stiff problems. Using non-stiff solvers to solve stiff systems is inefficient and can lead to incorrect results. If a non-stiff solver uses a very small step size to solve your model, check to see if you have a stiff system.

Model	Recommended Solver
Represents a stiff system	ode15s
Does not represent a stiff system	ode45

Performance Advisor uses the heuristic shown in the table to choose between explicit and implicit solvers.

Original Solver	Performance Advisor Action
Variable step solver	Calculates the system stiffness at 0 first. Then: <ul style="list-style-type: none"> • If the stiffness is greater than 1000, Performance Advisor chooses ode15s. • If the stiffness is less than 1000, Performance Advisor chooses ode45.
Fixed-step continuous solver	<ul style="list-style-type: none"> • If the stiffness is greater than 1000, Performance Advisor chooses ode14x. • If the stiffness is less than 1000, Performance Advisor chooses ode3.

This heuristic works best if the system stiffness does not vary during simulation. If the system stiffness varies with time, choose the most appropriate solver for that system rather than the one Performance Advisor suggests.

See Also

- “Solver Selection Criteria”
- “Speed Up Simulation”
- “Improve Simulation Performance Using Performance Advisor”

Select multi-thread co-simulation setting on or off

Adjust co-simulation settings for better performance and accuracy.

- Validate and revert changes if simulation time increases — Performance Advisor reverts previous co-simulation settings when the simulation time increases.
- Validate and revert changes if degree of accuracy is greater than tolerance — Performance Advisor reverts previous co-simulation settings if the degree of accuracy is greater than tolerance.

Tip You can use the `tic` and `toc` functions to measure the simulation time.

Identify co-simulation signals for numerical compensation

Identify co-simulation signals that may need explicit numerical compensation.

- Validate and revert changes if time of simulation increases — Performance Advisor reverts previous co-simulation settings the simulation time increases.
- Validate and revert changes if degree of accuracy is greater than tolerance — Performance Advisor reverts co-simulations if the degree of accuracy is greater than tolerance.

Tip You can use the `tic` and `toc` functions to measure the simulation time.

Check Dataflow Domain Settings

To increase the throughput of a dataflow domain, it can be advantageous to increase the latency of the system. The Performance Advisor analyzes the dataflow domains in your model and finds the optimal latency settings. The analysis also identifies any other multithreading limitations in the dataflow domains.

The dataflow analysis is a multistep process where the analysis may simulate the model with run-time profiling enabled for each block inside the dataflow domains before running partitioning analysis.

After the analysis completes, the Performance Advisor suggests a latency value that optimizes the throughput of the system for the multicore CPU architecture of the host computer and identifies any other multithreading limitations in the dataflow domains

Select simulation mode

To achieve fastest simulation time, use this check to evaluate the following modes and identify the optimal selection:

- Normal
- Accelerator
- Rapid Accelerator
- Rapid Accelerator with up-to-date check off

In Normal mode, Simulink interprets your model during each simulation run. If you change the model frequently, this is generally the preferred mode to use because it requires no separate compilation step. It also offers the most flexibility to make changes to your model.

In Accelerator mode, Simulink compiles a model into a binary shared library or DLL where possible, eliminating the block-to-block overhead of an interpreted simulation in Normal mode. Accelerator mode supports the debugger and profiler, but not runtime diagnostics.

In Rapid Accelerator mode, simulation speeds are fastest but this mode only works with models where C-code is available for all blocks in the model. Also, this mode does not support the debugger or profiler.

When choosing Rapid Accelerator with up-to-date check off, Performance Advisor does not perform an up-to-date check during simulation. You can run the Rapid Accelerator executable repeatedly while tuning parameters without incurring the overhead of up-to-date checks. For instance, if you have a large model or a model that makes extensive use of model reference, this method of execution can increase efficiency.

For models with 3-D signals, Normal or Accelerator modes work best.

Select compiler optimizations on or off

Use this check to determine whether performing compiler optimization can help improve simulation speed. The optimization can only be performed in Accelerator or Rapid Accelerator modes.

Note This check will be skipped if MATLAB is not configured to use an optimizing compiler.

Select hardware acceleration setting

This check will compare three hardware acceleration options based on their simulation times.

- **Off** — Hardware acceleration is disabled and no SIMD is used.
- **Leverage generic hardware (Faster, no rebuild)** — Leverage SIMD instructions for hardware generic to Simulink system requirements. This option does not require rebuilding the model for simulation when the host computer changes.
- **Leverage native hardware (Fastest, rebuild allowed)** — Leverage SIMD instructions for hardware native to the host computer. This option may require rebuilding the model for simulation when the host computer changes.

You can select the hardware acceleration based on the comparison.

- “Hardware acceleration”

Final Validation

This check validates the overall performance improvement of simulation time and accuracy in a model. If the performance is worse than the original model, Performance Advisor discards all changes to the model and loads the original model.

Global settings for validation do not apply to this check. If you have not validated the performance improvement from changes resulting from other checks, use this check to perform a final validation of all changes to a model.

- “What is Simulink Online?” on page 11-49

Maximum Size Limits of Simulink Models

The following table documents some limits on the size and complexity of Simulink models.

Model Feature	Limit
Maximum number of levels in a block diagram	1024
Maximum number of branches in a line	1024
Maximum length of a parameter name	63
Maximum length of a parameter character vector value	32768
Maximum size of a model window, as determined by supported coordinates	-1073740824 to 1073740823, inclusive
Maximum number of bytes for a single logged data point	90 MB
Maximum number of bytes of logged simulation data	Limited by available hard drive space
Maximum number of bytes for an individual block I/O buffer length	$2^{31}-1$ bytes
Maximum number of bytes for an individual DWork buffer length	$2^{31}-1$ bytes
Maximum length of integer and fixed-point data types	128 bits
Maximum length of string data type	32,766 characters

Systems and Models

The concepts in this topic provide a consistent and common language for using Simulink software tools.

System

A system is a group of interdependent physical and functional parts with measurable characteristics that change over time.

For example, a vehicle is a *system* with multiple parts. Measurable characteristics include the linear speed of the vehicle and the rotational speed of the wheels.

System Component

A system component is part of a *system* that interacts with the other parts of the *system*. The interactions between components define the structure and behavior of the *system*.

For example, a cruise control module is a *system component* in a vehicle *system*. A microcontroller and the hardware associated with it define the structure while a software algorithm to control speed defines the behavior.

Model

A model is a mathematical description of a *system* derived either from physical laws or experimental data. The description typically uses a set of variables with a set of differential and difference equations that define the relationships between the variables.

In the following example for a vehicle, $u(t)$ is the force (N) moving a vehicle forward, $v(t)$ is the velocity (m/s), b is a drag coefficient (N·s/m), and m is the mass of the vehicle (kg).

The vehicle is a continuous system. For continuous systems, differential equations describe the rate of change for variables with the equations defined for all values of time. The velocity of the vehicle $v(t)$ and its acceleration $v'(t)$ are defined with the following first order differential equation.

$$mv'(t) + bv(t) = u(t)$$

You can create a Simulink model for this equation by adding blocks, specifying block behavior, and using signal lines to connect the blocks to each other. The following Simulink block diagram implements the differential equation.

Model Component

A model component is part of a *model* that interacts with the other parts through an interface of inputs and outputs. Simulink implements *model components* using Subsystem and Model blocks. A Model block references another Simulink model saved in a separate file.

In the following example, the control model was saved in the Simulink model file `control_model.slx`, and then referenced from a Model block in a second Simulink model. A Subsystem block was added for modeling the vehicle mechanics.

Typically, controllers are built with discrete systems using a computer to implement the control algorithm. For discrete systems, difference equations describe the rate of change for variables defined only at specific times. For example, the control signal for a simple discrete PI (proportional-integral) controller can be defined with the following difference equation.

$$PI[n] = e[n]K_p + (e[n] + \text{integral}[n-1])K_i$$

Where $e[n]$ is the error between a signal whose value is controlled (velocity) and the specified value (set velocity), K_p is the proportion constant, K_i is the integration constant, and n is the time step.

The following Simulink *block diagram* implements the difference equation.

See also: “Model a Continuous System”, “Component-Based Modeling Guidelines”, “Create Custom Library”, “Model Reference Basics”.

Differential Algebraic Equations

Some systems of equations contain additional constraints that involve the independent variable and the state vector in addition to differential equations. Such systems are called differential algebraic equations (DAEs),

The term algebraic refers to equations that do not involve any derivatives.

In Simulink models, algebraic loops are algebraic constraints. Models with algebraic loops define a system of differential algebraic equations.

For example,

$$\begin{aligned}x' &= x \\ 0 &= -x + u - 2x\end{aligned}$$

is a system of differential algebraic equations implemented in the following Simulink model

Simulink Models

A model is an abstract and simplified description of a system using mathematical equations and diagrams. The modeling concepts in this topic provide context for understanding the process of mathematically describing a system with Simulink software tools.

Block Diagram

A block diagram is a visual representation of a model in the Simulink Editor. The editor allows you to add blocks selected from block libraries representing elementary model components. Elementary components include integrator, gain, and sum blocks. Blocks are connected to each other with signal and event lines to visually construct the model equations.

Block Diagram Semantics

A classic block diagram of a system is drawn graphically with blocks and lines. The history of these block diagrams is derived from engineering areas such as Feedback Control Theory and Signal Processing. A block within a block diagram defines a model in itself. The relationships between elementary models are represented by signal lines connecting the blocks. The blocks and lines in a block diagram collectively describe the overall model of a system.

Simulink extends classic block diagrams by:

- Adding a set of equations (block methods) to each block that defines the time-based relationships between the input signals, output signals, and block state variables.
- Adding parameters to each block that specify the coefficients from the model equations.
- Providing an engine for numerical solution of the block diagram by evaluating the relationships over time, where time starts at a user-specified “start time” and ends at a user-specified “stop time.”

See also: “Simulink Block Diagrams”, “Build and Edit a Model Interactively”, “Simulation”.

Blocks

A block is a basic modeling construct of the Simulink Editor. Add blocks from the built-in Simulink libraries to perform specific operations. You can also create custom blocks. Some blocks have input signals, output signals, and states. Most blocks have parameters that you use to specify block behavior. Whether a block has parameters and the nature of those parameters is specific to each block.

Each block represents a set of equations for the Simulink engine. The equations are represented as block methods. The blocks shown above have the following block methods.

$$\begin{cases} x[n+1] = u[n] \\ y[n] = x[n] \end{cases} \quad \begin{cases} \frac{dx}{dt} = u(t) \\ y(t) = x(t) \end{cases} \quad y(t) = 2 * x(t) \quad y(t) = 5$$

Block methods are evaluated during the simulation of a block diagram. The evaluation of the block methods is performed within a simulation loop, where each cycle through the simulation loop represents the evaluation of the block diagram at a given point in time.

Virtual Blocks

Virtual blocks organize and provide graphical hierarchy in a model, but they do not affect the simulation result. During model simulation, Simulink expands the blocks in place before execution, a process known as flattening. This expansion is similar to the way macros work in a programming language such as C or C++.

Simulink defines the following virtual blocks:

- Virtual Subsystem - Use a virtual subsystem to encapsulate related and functional parts within a larger model. A Virtual Subsystem block has the check box for the parameter **Treat as atomic unit** cleared.

- Inport and Outport - Use port blocks to move data (signals) and events (function calls) from outside a Subsystem block or Model block to within the block, and vice versa.

- Bus Creator, Bus Assignment, Bus Selector - Bus blocks combine signals into a virtual bus and manage the routing of signals around a complex block diagram. Virtual buses are a graphical convenience and do not change the behavior of the model.

See “Nonvirtual and Virtual Blocks”, “Signal Types”, “Types of Composite Signals”.

Nonvirtual Blocks

Nonvirtual blocks provide execution control and graphical hierarchy in a model. Simulink defines the following nonvirtual Subsystem and Model blocks:

- Atomic Subsystem and Model - Blocks within an Atomic Subsystem block or a Model block that references a model execute as a single unit (atomic execution) at each time step. For an Atomic Subsystem block, the check box for the parameter **Treat as atomic unit** is selected.

You can place any Simulink block in an Atomic Subsystem or referenced model, including blocks with different execution rates. This flexibility provides the advantage of grouping functional aspects of a model at the execution level.

In the following example, the vehicle model is an Atomic Subsystem block containing blocks that model the mechanics of a car. The control model is referenced from a Model block.

- Enabled and/or Triggered - Atomic Subsystem or Model block whose execution is controlled by external data from a signal. Contains an Enable or Trigger block, or both. For the Trigger block, the parameter **Trigger type** is set to rising, falling, or either.

- Function-Call - Atomic Subsystem or Model block whose execution is controlled by an event from a function-call initiator (such as a Stateflow chart or a Function-Call Generator, S-Function, or Hit Crossing block). Contains a Trigger block with **Trigger type** set to function-call.

Simulink defines the following nonvirtual components only for Subsystem blocks.

- Action Subsystem - Atomic Subsystem block whose execution is controlled by an event from an action initiator (e.g., If or Switch Case block). Contains an Action Port block within the Subsystem block.

- While Iterator Subsystem - Atomic Subsystem block that runs multiple iterations during each model time step. Contains a While Iterator block that controls the number of iterations by evaluating a logical condition.

A while iterator subsystem is similar to a function-call subsystem in that it can run for any number of iterations at a given time step. The while iterator subsystem differs from a function-call subsystem in that there is no separate initiator.

- For Iterator Subsystem - Atomic Subsystem block that runs a fixed number of iterations during each model time step. Contains a For Iterator block that controls the number of iterations.

See “Nonvirtual and Virtual Blocks”.

Block Mask

A block mask is a custom block parameter interface that displays only selected block parameters. A mask for a Subsystem block allows you to provide an interface for setting parameters on blocks inside the Subsystem block without having to navigate the model hierarchy.

See “Masking Fundamentals”.

Custom Blocks

Custom blocks are new blocks that extend the built-in functionality of Simulink. You can create libraries of custom blocks to use in your model.

The following blocks define the algorithm of a custom block either graphically with a block diagram or programmatically:

- MATLAB Function - Code a MATLAB function using the MATLAB language that runs in a Simulink model. See “Implement MATLAB Functions in Simulink with MATLAB Function Blocks”.
- MATLAB System - Bring existing System objects based on `matlab.System` into Simulink. See “MATLAB System Block”.
- Subsystem - Draw a block diagram representing an algorithm, wrap this diagram in an instance of the Simulink Subsystem block, then provide the block with a parameter dialog using a Simulink block mask. See Subsystem.
- C Caller - Integrate your external C code into a Simulink model. See “Integrate C Code Using C Caller Blocks”.
- S-Function - Create a custom block programmatically by creating a MATLAB file or a MEX file that contains the block's system functions. The resulting file is called an S-function. You then associate the S-function with instances of the Simulink S-Function block in your model. See S-Function.

See “Types of Custom Blocks”, “Block Authoring and Simulation Integration”.

Lines

A line is a basic modeling construct of the Simulink Editor. Lines connect the output ports of blocks with the input ports of other blocks.

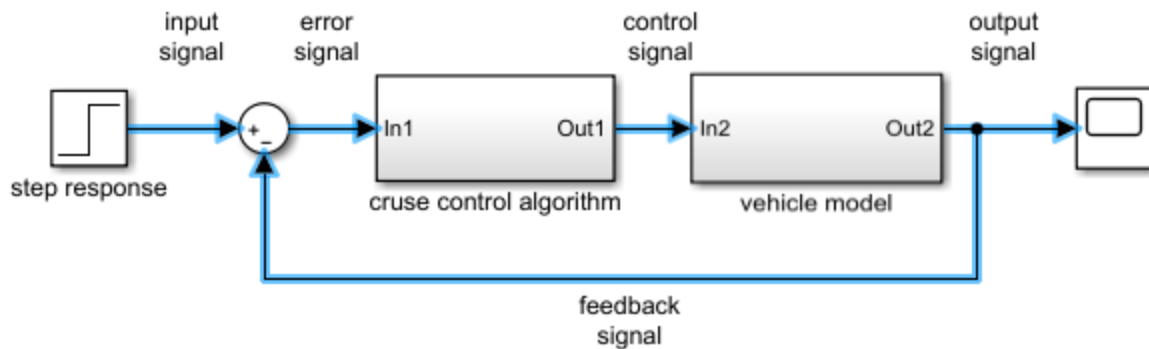

Signal Lines

Signal lines transfer data during a simulation from one block to another block. Signals are time-varying quantities that have values at all points in time (continuous) or at specified time points

(discrete). The source of a signal corresponds to the block that writes to the signal during evaluation of its block output method. The destination of a signal is the block that reads the signal during the evaluation of its block input method.

You can specify signal attributes, including signal name, data type (e.g., double, 32-bit integer), numeric type (e.g., real, complex) and dimension (e.g., one-dimensional, two-dimensional, multi-dimension array). Many blocks can accept or output a signal of any data type or dimensionality. Other blocks impose restrictions on the attributes of the signals they can handle.

During a simulation, save data from a signal by logging the signals.

Event Lines

In response to a function-call or action initiator, event lines send an event to a Subsystem or Model block. The block that receives the event executes the blocks within it one or more times during a time step. Function-call initiators include Stateflow charts, Function-Call Generator blocks, S-Function blocks, and Hit Crossing blocks. Action initiators include If and Switch Case blocks.

See “Signals” and “Signal Basics”.

Data

Data includes the parameter and input signal values that Simulink uses to produce the output values resulting from simulating the behavior of a model.

Types of data:

- Model parameters - Variables to specify block and signal parameters in a model. Includes MATLAB variables, parameter and signal data objects, data type objects, and bus objects.
- Model configuration parameters - Parameters that determine how your model runs by specifying the settings that control model behavior.

- Simulation data - Input data to drive a simulation and output data generated by a simulation.
- Data Objects - Instances of data classes that allow you to specify characteristics of signals, states, and block parameters. Use the `Simulink.Signal` and `Simulink.Parameter` classes to create data objects. See “Data Objects”.

Location of data:

- **Block parameters** - Use block parameters to directly specify numerical values. You can also enter a variable name and define its value in the Simulink model workspace, a Simulink data dictionary, or the MATLAB base workspace.

- **MATLAB base workspace** - Use the MATLAB base workspace to save variables that are separate from the model in a MAT-file or MATLAB script.

Simulink treats the base workspace and the data dictionary as a single global name space. If the base workspace and a referenced data dictionary have identical variable names, Simulink uses the variable value in the data dictionary.

The MATLAB base workspace contains variables that are global and visible to all Simulink models.

See “Comparison of Signal Loading Techniques”, “Export Simulation Data”.

- **Simulink model workspace** - Use the model workspace to define and store local data variables. Variables defined in a model workspace are visible only within the scope of the model with a unique name space. Therefore, you can use the same variable name in multiple model workspaces and you can assign a unique variable value to the name in each model.

Define variables in the data dictionary using Model Explorer. In the **Modeling** tab, click **Model Explorer** . In the left pane, select Model Workspace.

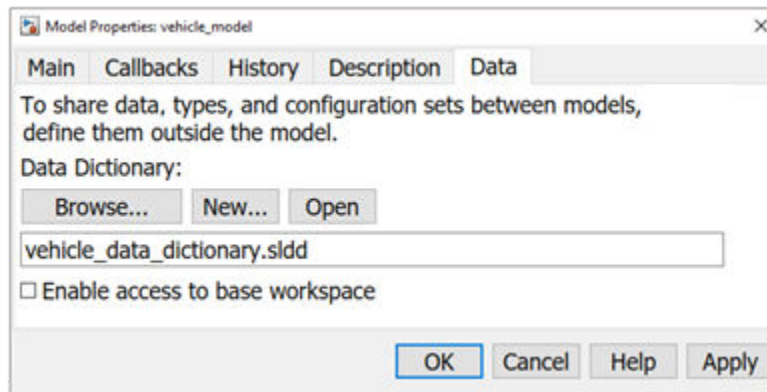

Values for the model workspace variables are initialized from values saved with the model, from a separate MAT-file or MATLAB file, or using MATLAB code saved with the model.

See “Model Workspaces”, “Specify Source for Data in Model Workspace”.

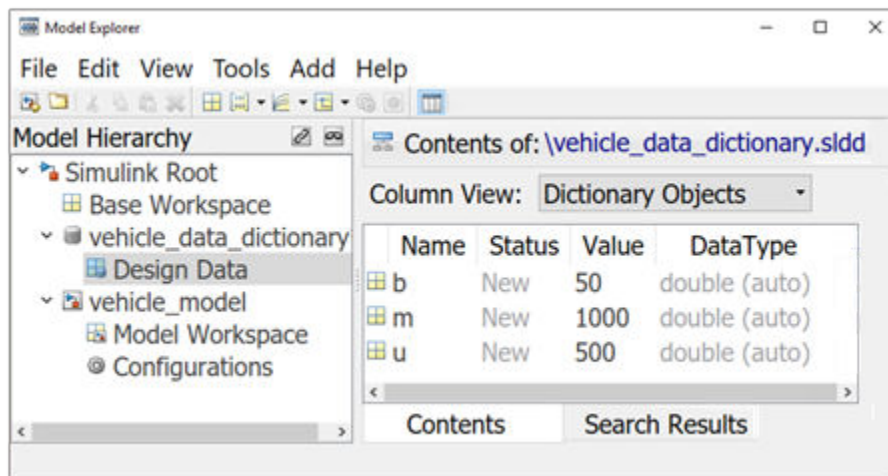

- **Simulink data dictionary** - Use a data dictionary to define and store global data, share data between models, and track changes made to the data. Data is saved in a file separate from the model.

Create a data dictionary file. In the **Modeling** tab, under **Design**, click **Data Dictionary** . Click **New** and enter a file name with an extension `.sldd`.

Define variables in the data dictionary using Model Explorer. In the **Modeling** tab, click **Model Explorer** . In the left pane, select **Design Data**.

See “What Is a Data Dictionary?”.

- **Imported and exported data** - Import signals for a simulation from the MATLAB base workspace, a MAT-file, or a spreadsheet. Create input signals using a source block or the Signal Editor block. Use signal logging to export simulation results. Signals are saved as vectors [t, X, Y] for time, state and output at each major time step.

See also: “Determine Where to Store Variables and Objects for Simulink Models”, “Symbol Resolution”.

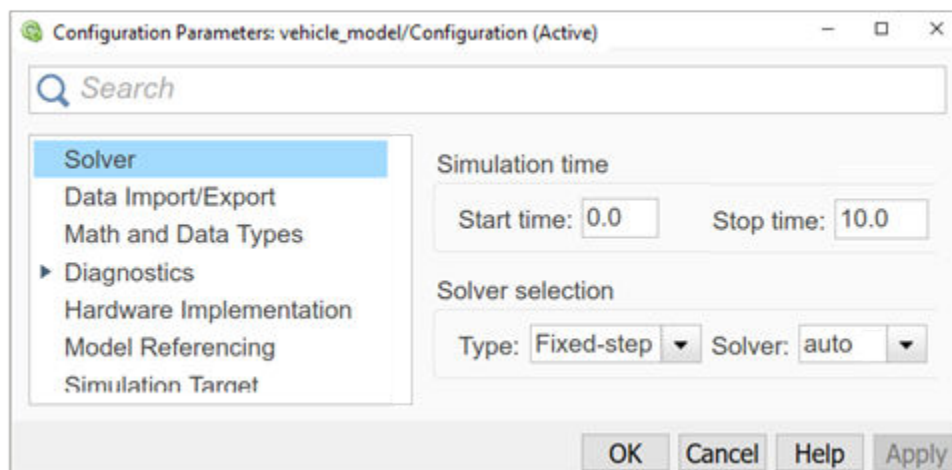

Parameters

Parameters are Simulink model characteristics that affect the simulation and code generation result.

Model Configuration Parameters

Model configuration parameters specify model behavior during compilation, simulation, and code generation, such as the solver to use and the types of errors and warnings to display.

To specify model configuration parameters, in the **Modeling** tab, click **Model Settings**. The Configuration Parameters dialog box opens.

See “Set Model Configuration Parameters for a Model”.

Block Parameters

Block parameters define model dynamics and mathematics. Whether a block has parameters that you can set and the nature of those parameters is specific to each block. To specify block parameters, open the block parameter dialog box, or in the **Modeling** tab, under **Design**, click one of the following:

- **Property Inspector** – Specify block parameters directly or enter a variable name for a parameter value.
- **Model Data Editor** – Specify block parameters with variables.
- **Model Explorer** – Specify block parameters with variables.

See “Set Block Parameter Values”.

Block Parameter Variables

If you have a single parameter used in many locations across a large model, updating every instance of that parameter can be a difficult task. Instead, enter a variable name as the value of a parameter, then define the variable once using one of the following methods:

- **Simulink Model Workspace** – Create model workspace variables and assign values to the variables. The parameters you define are specific to the model and saved with the model. Use a MATLAB variable for ease of maintenance. Use a `Simulink.Parameter` object to control additional properties including data type, dimensions, and units. See “Edit and Manage Workspace Variables by Using Model Explorer”.
- **Simulink Data Dictionary** – Create design data variables in a data dictionary and link the dictionary to a model. During model simulation, Simulink retrieves data from the data dictionary.
- **MATLAB Base Workspace** – In the MATLAB base workspace, define parameters using any MATLAB mechanism for defining a variable. For example, you can use a MAT-file and load the variables when you open the model. Use MATLAB expressions to specify parameter variable values. Simulink evaluates the expressions before running a simulation. See “Save and Load Workspace Variables”.

Using the MATLAB base workspace or a Simulink data dictionary to define variables is useful when you are using the same set of parameters for more than one model. This mechanism also allows you to use different sets of parameter values for the same model.

See also: “Share and Reuse Block Parameter Values by Creating Variables”, “Create, Edit, and Manage Workspace Variables”.

Model Argument and Instance Parameters

When you reference the same model from multiple Model blocks, you create instances of the model. You can set block parameters to use the same value or a different value for each instance of the model.

To use different values,

- 1 In the model workspace for the referenced model, create a MATLAB variable or `Simulink.Parameter` object.
- 2 Enter a parameter name and a default parameter **Value**. Select the **Argument** check box to create a model argument.
- 3 For a block in the referenced model, enter the name of the model argument for the value of a block parameter.
- 4 For each Model block, open the block parameters dialog box, select the **Instance parameters** tab, and enter a value for the instance parameter with the model argument name.

See also: “Parameterize Instances of a Reusable Referenced Model”.

Tunable Block Parameters

You can change the value of a tunable block parameter during a simulation. This allows you to determine interactively the most suitable value for a parameter. When you change the value of a tunable parameter, the change takes effect at the start of the next time step. For example, the gain parameter of the Gain block is tunable. You can change the block gain while a simulation is running. See “Tune and Experiment with Block Parameter Values”.

Setting Block Parameters with the Property Inspector

To specify parameters, in the **Modeling** tab, under **Design**, click **Property Inspector**. Click a block to display the block parameters and properties.

See also: “Specify Block Properties”.

Properties

Properties are Simulink model characteristics that generally do not affect the simulation result. To specify properties, in the **Modeling** tab, under **Design**, click **Property Inspector**.

Model Properties

With the Property Inspector opened, click a blank space within a block diagram, or in the **Modeling** tab, select **Model Settings > Model Properties**. Model properties include:

- General - Name and location of model file.
- Design Data - Variables defined outside the model that parameterize the model and its blocks and signals.
- Callbacks - Commands that execute when a specific model event occurs.

See “Manage Model Versions and Specify Model Properties”.

Block Properties

With the Property Inspector opened, select a block, then select the **Properties** tab. Block properties include:

- Block Annotation - Values of selected block parameters displayed below the block.
- Callbacks - Commands that execute when a specific block event occurs. For example, you can set up a MATLAB script to load and define block parameter variables using expressions.
- Priority - Set the relative execution order of blocks. A lower value executes the block before a larger priority value.
- Tags - Block identifiers that are programmatically searchable.

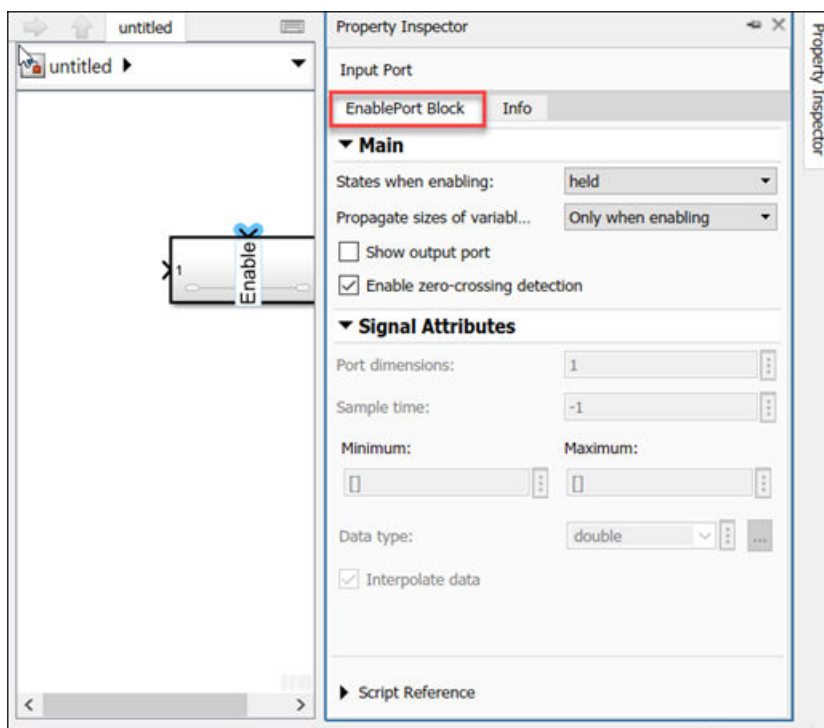

Port Properties

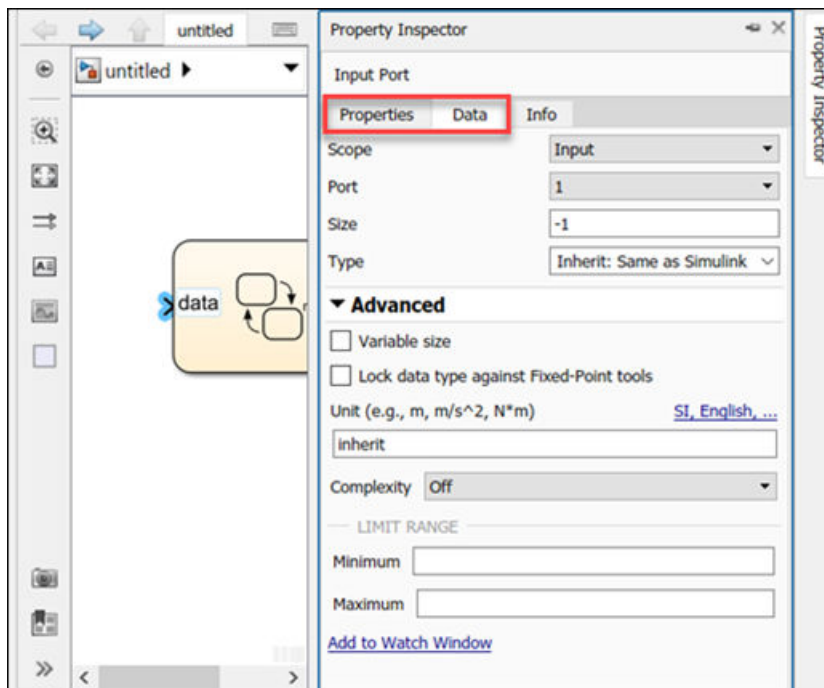

With the Property Inspector opened, select a port, then select the **Properties** tab. You can modify properties of port objects, signals, and port blocks with the Property Inspector. The ports on a subsystem block also have a port block tab, which contains properties of the associated port block.

- The port block properties are displayed for these subsystem blocks:
 - Subsystem, Atomic Subsystem, CodeReuse Subsystem
 - Variant Subsystem, Variant Model
 - For Each
 - For Iterator Subsystem
 - Function-Call Feedback Latch
 - Function-Call Subsystem
 - Function-Call Generator
 - Function-Call Split
 - If

- While Iterator Subsystem
- The ports on these blocks show a tab with the same name as the type of port block and list the properties that are shown in the Model Explorer window. For example, an **EnablePort Block** tab is shown for ports on an Enable block, and **Data**, **Message**, or **Event** tabs are shown for ports on Stateflow blocks.
- Enable block
- Trigger block
- Function Call block
- Reset block
- Action Port block
- Chart
- Truth Table
- State Transition Table
- Test Sequence
- matlabFunctionBlock

- The port properties of read-only blocks are not editable. For example, the port properties of locked linked library blocks, masked blocks, and protected referenced models are read-only.
- The port block properties on Model blocks are shown only if the model is loaded.

Setting Model and Block Properties with Property Inspector

To set properties, in the **Simulation** tab, under **Prepare**, click **Property Inspector**. Click an empty space to display the model properties. Click a block to display the block properties.

See also: “Specify Block Properties”, “Callbacks for Customized Model Behavior”.

State variables

The state of a model is defined by the values of its state variables. State variables are the set of variables whose values at time zero, along with the values of model inputs and the model equations, can determine the behavior of a model during a simulation. Examples of state variables include motor position and velocity, inductor current, capacitor voltage, solution temperature, and gas pressure.

If the current output value of a block is a function of the previous output value, the block defines a state variable that needs to be saved between time steps. Computing a block output hence entails saving the value of the state variable at the current time step for use in computing the output at a subsequent time step.

Working with States

The following facilities are provided for determining, initializing, and logging model states during simulation:

- The **Data Import/Export** pane of a model's Configuration Parameters dialog box (see “Save Block States and Simulation Operating Points”) allows you to specify initial values for model states, and to record the values of the states at each time step during simulation as an array or structure variable in the MATLAB workspace.

Open the Configuration Parameters dialog box. Select the **States** check block for logging to the MATLAB variable `xout`.

In the MATLAB Command Window, list the logged values for state of the Integrator block at each time step.

```
>> xout{1}.Values.Data
ans =
    0.0000
    1.8127
```

```
3.2968
4.5119 . . .
```

- The `model` command displays information about the states defined by a model, including the total number of states and the block that defines each state with its initial value.

List blocks in the model `vehicle_model` with states. In the MATLAB Command Window, enter the model function, then list blocks with states.

```
[sys,x0,str,ts] = vehicle_model([],[],[],'sizes')
str =
    {'vehicle_model/Integrator'}
```

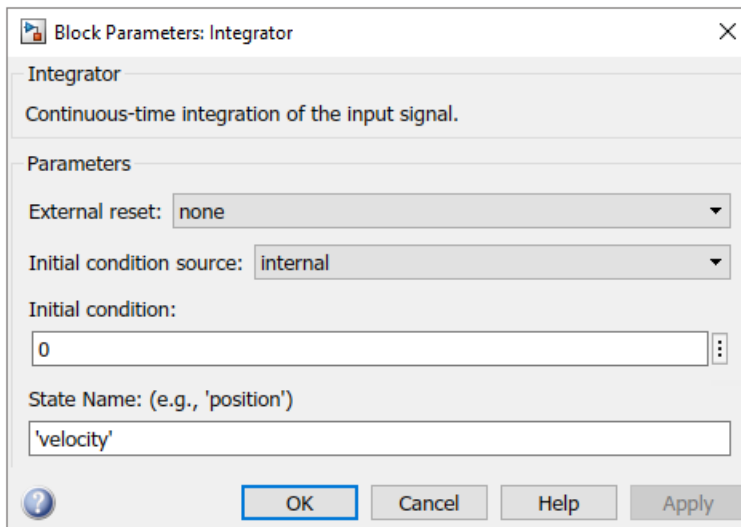

- The Simulink debugger displays the value of a state at each time step during a simulation, and the Simulink debugger's `states` command displays information about the model's current states (see “Simulink Debugger”).

In the MATLAB Command Window, start the Simulink debugger, then enter the command `states`.

```
sldebug 'vehicle_model'
(sldebug @0): >> states
```

```
Continuous States for 'vehicle_model':
Idx Value (system:block:element Name 'BlockName')
0. 0 (0:0:0 CSTATE 'vehicle_model/Integrator')
```

- The Block Parameters dialog box (and the `ContinuousStateAttributes` parameter) allows you to give names to states for those blocks (such as the Integrator) that employ continuous states. This can simplify analyzing data logged for states, especially when a block has multiple states.

Continuous States

A continuous state is defined for all values of time. An example of a continuous state would be the speed of a car shown on an analog speedometer with a needle position that changes continuously with the rotation of a tire.

Blocks with continuous states and the block parameter **Initial condition** include:

- Integrator

- State-Space
- Transfer Fcn

In general, excluding simple models, analytical methods do not exist for integrating states represented by ordinary differential equations. Integrating the states requires the use of numerical methods.

Discrete States

A discrete state is defined only at specific times. It is an approximation of a continuous state where the state is updated at periodic or aperiodic time intervals. An example of a discrete state would be the speed of a car shown on a digital speedometer that is updated every second as opposed to continuously.

Blocks with discrete states include:

- Discrete-Time Integrator
- Discrete State-Space
- Discrete Transfer Fcn
- Delay

Computing the discrete state for a block requires knowing its value at the previous time step and also the current input value to the block. Simulink provides two types of discrete solvers:

- Fixed-step discrete solver - determines a fixed step size that hits all the sample times for all the model's discrete states, regardless of whether the states actually change value at the sample time hits.
- Variable-step discrete solver - varies the step size to ensure that sample time hits occur only at times when the states change value.

Modeling Hybrid Systems

A hybrid model has both continuous and discrete states. Solving such a model entails choosing a step size that satisfies both the precision constraint on the continuous state integration and the sample time interval constraint on the discrete states. Simulink meets this requirement by passing the next sample time interval for the discrete solver as an additional constraint on the continuous solver. The continuous solver chooses a step size that advances the simulation up to but not beyond the time of the next discrete sample time. The continuous solver can take a time step short of the next sample time hit to meet its accuracy constraint but it cannot take a step beyond the next sample time hit even if its accuracy constraint allows it to.

You can simulate hybrid systems using any of the integration methods, but certain methods are more effective than others. For most hybrid systems, `ode23` and `ode45` are superior to the other solvers in terms of efficiency. Because of discontinuities associated with the sample and hold of the discrete blocks, do not use the `ode15s` and `ode113` solvers for hybrid systems.

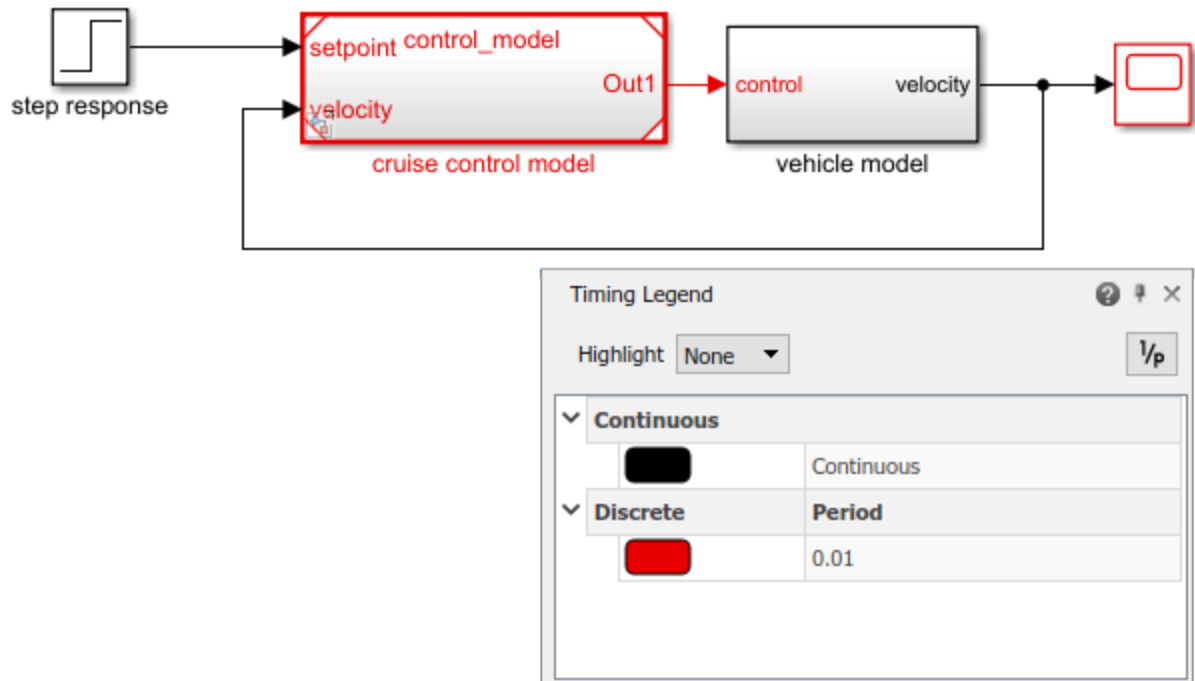

Sample Time

Sample time is the time interval that specifies the rate ($1 / \text{sample time}$) for executing block methods to produce outputs and update the internal states of blocks. Time is an inherent component of a block diagram in that the simulation results of a block diagram change with time.

Sample time is specified as:

- Continuous - Blocks run at variable times based on solver settings.
- Discrete - Blocks run at specific times that are explicitly specified.

In the following example, the controller runs at a discrete rate specified with a sample time of 0.01 seconds while Simulink determines the vehicle model to have a continuous sample time.

Determining a system's behavior over time thus entails repeatedly solving the model at intervals, called time steps or time intervals, from the start of the time span to the end of the time span. The process of solving a model at successive time steps is referred to as simulating the system that the model represents.

See also “What Is Sample Time?”, “Types of Sample Time”, “Specify Sample Time”, “View Sample Time Information”.

Block Sample Times

Every Simulink block has a sample time which defines when the block will execute. Most blocks allow you to specify the sample time via a `SampleTime` parameter. Common choices include discrete, continuous, and inherited sample times.

Common Sample Time Types	Sample Time	Examples
Discrete	$[T_s, T_o]$	Unit Delay, Digital Filter
Continuous	$[0, 0]$	Integrator, Derivative
Inherited	$[-1, 0]$	Gain, Sum

For discrete blocks, the sample time is a vector $[T_s, T_o]$ where T_s is the time interval or period between consecutive sample times and T_o is an initial offset to the sample time. In contrast, the sample times for nondiscrete blocks are represented by ordered pairs that use zero, a negative

integer, or infinity to represent a specific type of sample time. For example, continuous blocks have a nominal sample time of $[0, 0]$ and are used to model systems in which the states change continuously (e.g., a car accelerating), whereas you indicate the sample time type of an inherited block symbolically as $[-1, 0]$, and Simulink then determines the actual value based upon the context of the inherited block within the model.

Note that not all blocks accept all types of sample times. For example, a discrete block cannot accept a continuous sample time.

For a visual aid, Simulink allows the optional color-coding and annotation of any block diagram to indicate the type and speed of the block sample times. You can capture all of the colors and the annotations within a legend (see “View Sample Time Information”).

For a more detailed discussion of sample times, see “Sample Time”.

Units

Units are used to measure the total amount of a quantity.

Simulink units are specified as an Inport block or Outport block parameter at the boundaries of a Simulink model component. Simulink model components include Subsystem blocks, Model blocks, Stateflow charts, and Simulink to Simscape converter blocks. To display units on a model, in the **Debug** tab, select **Information Overlays > Units**.

See also: “Unit Specification in Simulink Models”, “Converting Units”.

Direct Feedthrough

Direct feedthrough is where the output port signal of a block is computed from the values of its input port signals. The output signal value is a function of the input signal values.

Blocks with direct feedthrough include the Gain, Product, Sum, and Math Function blocks.

Algebraic Loop

A signal loop between blocks with direct feedthrough is called an algebraic loop. An algebraic loop generally occurs when an input port of a block with direct feedthrough is driven directly by the output port of the same block or indirectly through other blocks with direct feedthrough.

In the following model, the two Gain blocks with direct feedthrough create an algebraic loop:

See also: “Algebraic Loop Concepts”.

Artificial Algebraic Loops

An *artificial algebraic loop* occurs when an atomic subsystem or Model block causes Simulink to detect an algebraic loop, even though the contents of the subsystem do not contain a direct feedthrough from the input to the output. When you create an atomic subsystem, all Inport blocks are direct feedthrough, resulting in an algebraic loop.

Start with the included model, which represents a simple proportional control of the plant described by

$$G(s) = \frac{1}{s^2 + 2s + 1}$$

which can be rewritten in state-space form as

$$\dot{x} = \begin{bmatrix} -2 & -1 \\ 1 & 0 \end{bmatrix} x + \begin{pmatrix} 0 \\ 1 \end{pmatrix} u$$

$$y = [0 \quad 1] x$$

The system has neither algebraic variables nor direct feedthrough and does not contain an algebraic loop.

Modify the model as described in the following steps:

- 1 Enclose the Controller and Plant blocks in a subsystem.
- 2 In the subsystem dialog box, select **Treat as atomic unit** to make the subsystem atomic.
- 3 In the **Diagnostics** pane of the Model Configuration Parameters, set the **Algebraic Loop** parameter to error.

When simulating this model, an algebraic loop occurs because the subsystem is direct feedthrough, even though the path within the atomic subsystem is not direct feedthrough. Simulation stops with an algebraic loop error.

Zero-Crossing Detection

Simulink uses a technique known as zero-crossing detection to accurately locate a discontinuity without resorting to excessively small time steps during a simulation. Usually this technique improves simulation run times.

Simulink Simulation

Simulating the model of a dynamic system allows you to gain insight about the behavior of a proposed system design without the time consuming process of actually building the system. The concepts in this topic provide a context for understanding how to control a model simulation with Simulink software tools.

Compilation

Compilation is the Simulink process where the block diagram is translated to an internal representation that interacts with the Simulink engine.

There are no model-level sets of differential equations that are solved numerically as a whole. Instead, the model-level equations correspond to the individual block equations that are solved numerically in a specific order.

Block Methods

The functionality of a single block is defined by multiple equations. These equations are represented as block methods. These block methods are evaluated (executed) during the execution of a block diagram. The evaluation of these block methods is performed within a simulation loop, where each cycle through the simulation loop represent the evaluation of the block diagram at a given point in time. Common block methods include:

- Derivative - Computes the derivatives of the block's continuous states at the current time step, given the block inputs and the values of the states at the previous time step.
- Update - Computes the value of the block's discrete states at the current time step, given its inputs at the current time step and its discrete states at the previous time step.
- Output - Computes the outputs of a block given its inputs at the current time step and its states at the previous time step.

$$\left\{ \begin{array}{ll} X = [x_c, x_d] & \text{Model states} \\ \dot{x}_c = f_c(X, U, t) & \text{Derivative method} \\ x_d[n + 1] = f_d(X, U, t) & \text{Update method} \\ Y = [y_1, y_2] & \\ Y = g(X, U, t) & \text{Output method} \end{array} \right.$$

$$X(t_0) = X_0 \quad \text{Initial model states}$$

Model Method

In addition to block methods, a set of methods is provided that compute the model properties and its outputs. The Simulink software similarly invokes these methods during simulation to determine a model's properties and its outputs. The model methods generally perform their tasks by invoking block methods of the same type. For example, the model Outputs method invokes the Outputs methods of the blocks that it contains in the order specified by the model to compute its outputs. The model Derivatives method similarly invokes the Derivatives methods of the blocks that it contains to determine the derivatives of its states.

See also: "Simulation Phases in Dynamic Systems".

Callback

Callbacks are MATLAB expressions that execute in response to a specific modeling action. Simulink provides model, block, and port callback parameters that identify specific kinds of modeling actions. You provide the code for callback parameters. Simulink executes the callback code when the associated modeling action occurs.

Model Callback

Model callback parameters include:

- `PreloadFcn` - Executes before a model loads. For example, you can provide code that loads the variable values a model uses into the MATLAB workspace.

See “Model Callbacks”.

Block Callback

Block callback parameters include:

- `OpenFcn` - Execute when you open a Subsystem block.
- `LoadFcn` - Execute after a diagram is loaded. For a Subsystem blocks, also execute block callback parameters for the blocks within Subsystem block.

Port Callback

Port callback parameter:

- `ConnectionCallback` - Execute code every time the connectivity of a port changes.

See “Port Callbacks”.

Execution Order

The Execution order is the sequence in which block output methods are called after evaluating direct feedthrough of each input port. To display execution order, in the **Debug** tab, select **Information Overlays > Execution Order**.

In the following model, the Integrator block output runs first, and then the loop of blocks connected to the Integrator block input. Missing execution numbers in a sequence are usually due to so-called “hidden buffer” blocks; see “Ensure Outputport is Virtual”.

See also: “Control and Display Execution Order”, “Simulation Phases in Dynamic Systems”.

Simulation

Simulation is the process after model *compilation* where block method outputs and states are computed at successive time steps over a specified time range using a numerical solver.

During each simulation loop, Simulink calculates a Δt to determine the time step $t(k+1) = t(k) + \Delta t$. The size of Δt is based on an estimated error between the simulated solution and the actual solution. At the end of a simulation, data results are given as vectors $[t, X, Y]$ for time, state and output at each time step.

See also: "Simulation Phases in Dynamic Systems", "Simulate a Model Interactively", "Speed Up Simulation".

Solver

A Solver finds an approximate solution for a set of model equations. Simulink uses established numerical solvers for this task.

Solver step size can be fixed or variable:

- Fixed step - Time step $T(k+1) = T(k) + \Delta t$ where Δt is constant. If step size is too large, simulation results can have a large error. In the following example, a step size of 2 distorts the shape of a sine wave signal. You can specify the size of the time step in the case of fixed-step solvers, or the solver can automatically determine the step size in the case of variable-step solvers.

- Variable step - Variable step solvers iterate to reach a solution based on an error tolerance. Time step $T(k+1) = T(k) + \Delta t_k$ where Δt_k changes from one simulation step to the next depending on the estimated error. Smaller time steps increase the accuracy of the simulation results. To minimize the computation workload, a variable-step solver chooses the largest step size consistent with achieving an overall level of precision specified by the error tolerance and observing zero-crossings. This ensures that all model states are computed to the accuracy specified by the user.

Choosing a solver method depends on the nature of the model equations. Euler's method is a simple numerical solver that calculates the next value of y by using the slope (y') of a tangent line to y . If y is a function that integrates a ramp function x with a slope of 1, $y' = x$, and a numerical solver would use the following equations.

$$x[n+1] = x[n] + \Delta t * 1$$

$$y[n+1] = y[n] + \Delta t * x[n+1]$$

Decreasing the step size increases the accuracy of the results. but it increases the time to complete a simulation. In the following example, a step size of 2 shows an error of about 20 percent after 10 seconds while a step size of 0.5 produces a result that is closer to the actual solution.

.

Simulink Tools

Code Generation Advisor - Simulink tool that checks a model for how objectives such as efficiency, traceability, and safety, map to code generation options in a model configuration set. To open and run the advisor, in the **Modeling** tab, click **Model Advisor**, and then click **Code Generation Advisor**.

Configuration Parameter dialog - Simulink tool to select and specify *model parameters*. To open the dialog box, in the **Simulation** tab, under **Configuration & Simulation**, click **Model Settings**.

Performance Advisor - Simulink tool that checks for conditions that might slow down a simulation. The advisor can automatically make changes to a model to address these conditions or you can review and apply suggested changes manually. To open the advisor, in the **Debug** tab, click **Performance Advisor**.

Property Inspector - Simulink tool to define and edit parameters and properties for models and blocks. To open the inspector in a Simulink Editor pane, in the **Modeling** tab, under **Design**, click **Property Inspector**.

Simulation Data Inspector - Simulink tool to visualize simulation results and compare results from multiple simulations. Select signals to log by right-clicking a signal and then selecting **Log Selected Signals**. After running a simulation, open the inspector by clicking the toolbar icon .

Upgrade Advisor - Simulink tool to identify new feature benefits and needed changes to your model when upgrading to a new release. To open the advisor, in the **Modeling** tab, select **Model Advisor** > **Upgrade Advisor**.

debugger, Simulink debugger - Simulink tool to troubleshoot model simulations by stepping through calls to the block-level methods. To open the debugger, in the **Debug** tab, select **Breakpoints List > Debug Model**.

Diagnostic Viewer - Simulink tool that displays error, warning, and information messages for conditions detected during a Simulink operation. To open the viewer, in the **Debug** tab, click **Diagnostics**.

Library Browser, Simulink Library Browser - Simulink tool for searching and selecting model blocks. To open the browser, click the Simulink Editor toolbar icon .

Model Advisor - Simulink tool that checks a Simulink model for conditions and configuration settings that cause inaccurate or inefficient simulation of a *model*. To open and run the advisor, in the **Modeling** tab, click **Model Advisor**.

Model Browser - Simulink tool to view and navigate the structure of a *model*. To open the Model Browser in a Simulink Editor pane, in the **Modeling** tab, select **Environment** > **Model Browser**.

Model Data Editor - Simulink tool to define and edit data items in a list that you can sort, group, and filter. For example, enter property and parameter values, such as data types and dimensions without having to locate the items in the block diagram. To open the Model Data Editor, in the Simulink Editor, in the **Modeling** tab, under **Design**, click **Model Data Editor**.

The screenshot displays the Simulink Model Data Editor for the 'cruise_control' model. The main workspace shows a block diagram with the following components and connections:

- step response**: A step function block that provides a 'setpoint' input to the control model.
- control model**: A block containing 'setpoint' and 'velocity' inputs. It is highlighted with a blue border.
- plant model**: A block containing 'control' and 'velocity' inputs. It receives the output from the control model.
- Scope**: An output block that receives the signal from the plant model.

The Model Data Editor window is open, showing the 'Signals' tab. The table below lists the dependencies:

	Source	Name	Data Type	Min	Max	Dimensions	Complexity	Sample Time	Unit	Resolve	
	control m...		double	-Inf	Inf	1	real	[0 0]	m/s	<input type="checkbox"/>	
	plant mo...		double	-Inf	Inf	1	real	[0 0]	inherit	<input type="checkbox"/>	
	step resp...		double	-Inf	Inf	1	real	0	[0 0]	m/s	<input type="checkbox"/>

The status bar at the bottom indicates 'Ready', '125%' zoom, and 'auto(ode3)' solver.

Model Dependency Viewer - Simulink tool to graph the models and libraries referenced directly or indirectly by the parent model. To open the viewer, in the **Modeling** tab, select **Compare > Dependencies > Models & Libraries**. In the following example, the `plant_model` is referenced from the parent `cruise_control` model.

Model Explorer - Simulink tool to view and modify elements of a Simulink model, Stateflow chart, or model workspace variables. To open the explorer window, in the **Modeling** tab, click **Model Explorer**.

Programming Constructs in Simulink

Simulink command - MATLAB command that is specific to Simulink modeling or simulation. Enter Simulink commands in the MATLAB Command Window or use in MATLAB scripts for testing a model programmatically. The following commands set simulation parameters, run a simulation, and saves the simulation results. In the first statement, `sim` is a *Simulink command* for running a simulation.

```
simOut = sim('cruise_control','SimulationMode','normal',...
            'AbsTol','1e-5','SaveState','on',...
            'StateSaveName','xout','SaveOutput','on',...
            'OutputSaveName','yout','SaveFormat','Dataset');
outputs = simOut.get('yout')
```

callback, model callback - MATLAB code that executes in response to a specific *model* or *block* action. To add a model callback, in the **Modeling** tab, under **Design**, click **Property Inspector**, then in the **Properties** tab, select a function from the **Callbacks** list, and then enter MATLAB code or the name of a MATLAB script.

In the following example, when Simulink loads a model it also loads a file into the MATLAB workspace with parameters values for the model.

Simulink function - Computational unit that calculates a set of outputs when provided with a set of inputs. A common text interface between function caller and function definition allows various definition formats using a Simulink Function block, exported Stateflow graphical function, or exported Stateflow MATLAB function.

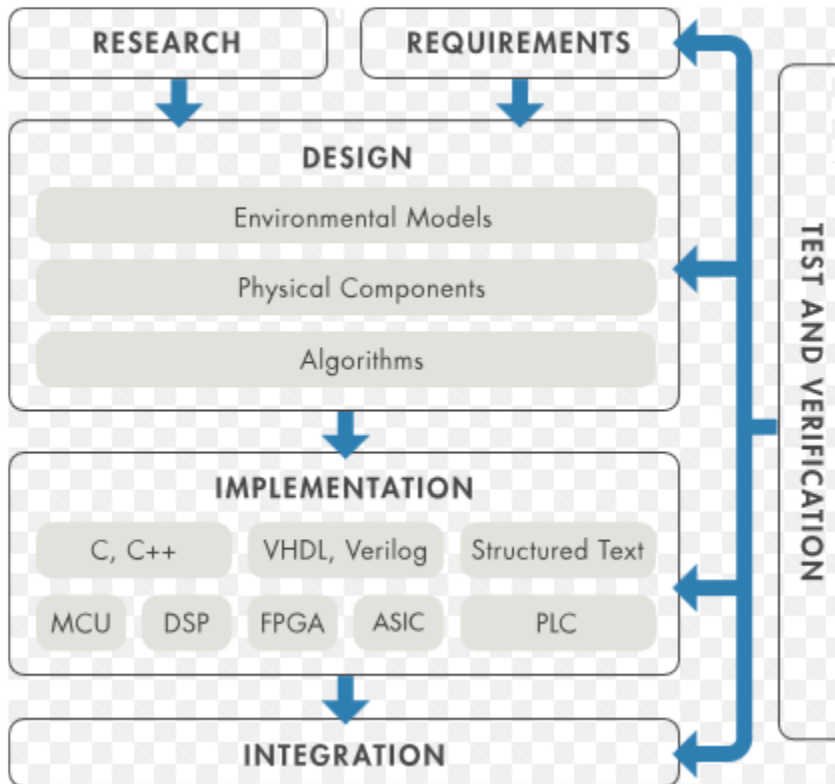

MATLAB Function -

S-function, system-function - Computer language description of a Simulink S-Function block written in MATLAB code, C, C++, or Fortran. C, C++, and Fortran S-functions are compiled as MEX files using the MATLAB mex utility.

```
Editor - E:\matlab\toolbox\simulink\simdemos\simfeatures\src\sfunmem.c
sfunmem.c* x +
1  /* File      : sfunmem.c
2  * Abstract:
3  *   A one integration-step delay and hold "memory" function.
4  *   Syntax:  [sys, x0] = sfunmem(t,x,u,flag)
5
6  #define S_FUNCTION_NAME sfunme
7  #include "simstruc.h"
8
9  /*=====
10 * S-function methods *
11 *=====*/
12 /* Function: mdlInitializeSizes =====
13 * Abstract:
14 *   Call mdlCheckParameters to verify that the parameters are okay,
15 *   then setup sizes of the various vectors.
16 */
17 static void mdlInitializeSizes(SimStruct *S)
18 {
19     ssSetNumSFcnParams(S, 0); /* Number of expected parameters */
20     if (ssGetNumSFcnParams(S) != ssGetSFcnParamsCount(S)) {
21         return; /* Parameter mismatch will be reported by Simulink */
22     }
```

Model Development Processes

model-based design - Development process that uses a system model as an executable specification throughout development. The process supports model and model component design, model simulation of dynamic behavior, code generation from the model, and continuous test and verification.

software-in-the-loop (SIL) simulation - Development process where compiled source code on a development computer executes as a separate process from the rest of the Simulink model. Typical goals include initial source code testing and verification by comparing *software-in-the-loop* results with model simulation results and system requirements.

In the following example, to run a software-in-the-loop simulation for the controller, right-click the Model block labeled `control_model` and then select **Block parameters**. From the **Simulation mode** list, select Software-in-the-loop (SIL).

processor-in-the-loop (PIL) simulation - Development process that cross-compiler source code and runs the resulting object code on a target processor using hardware-specific data attributes and sample time attributes. Typical goals include object code verification by comparing *processor-in-the-loop* results with model simulation and *software-in-the-loop (SIL)* results.

hardware-in-the-loop (HIL) simulation - Development process that pairs physical components, such as the hardware and software for a controller, with a virtual real-time implementation of a physical component, such as a plant.

In the following example, code for the controller model is generated and downloaded to the production controller hardware. Code is generated for the plant model and downloaded to a real-time hardware computer (e.g. Simulink Realtime).

Test Harness

Simulink model that provides a framework for testing the simulation behavior and outputs of another *model* or *model component*. Objectives of the *test harness* are to automate the testing process, execute a test suite with multiple test cases, and analyze results.

In the following model, a Signal Builder block provides test signals while outputs are logged for analysis in the *Simulation Data Inspector* or MATLAB.

What is Simulink Online?

Simulink Online™ provides access to the latest version of Simulink from a standard web browser using MathWorks hosted computing resources and storage.

With Simulink Online, you can:

- Access the latest version of Simulink with all the latest features available to you through your current license.
- Use Simulink in your web browser without any downloads, installation, or maintenance.
- Store up to 5 GB of MATLAB and Simulink files in your MATLAB Drive™.
- Collaborate with other Simulink users by giving them view-only or can-edit access to your files.
- Create a link to your work and share it globally.
- Synchronize your desktop files with Simulink Online and MATLAB Drive using the MATLAB Drive Connector.

To start using Simulink Online, go to <https://matlab.mathworks.com/>.

For more information about Simulink Online, including supported license types, specifications, limitations, and system requirements, see [Simulink Online](#).

Create Mux Signal and Extract Elements

This example shows how to create a mux signal and extract elements from the mux signal.

Open and simulate the example model, which creates a mux signal that contains three signals and extracts those signals using Demux and Selector blocks.

Copyright 2019 The MathWorks, Inc.

The **Signal Dimensions** information overlay displays the number of signals that the mux signal contains.

The **Nonscalar Signals** information overlay displays mux signals with thicker lines than scalar signals.

The Demux block extracts the elements of the mux signal in the order that the Mux block receives them.

The Selector block extracts the elements of the mux signal based on the specified **Index** in the dialog box. Because mux signals are vectors that provide index-based access to their elements, the Selector block uses `Index vector (dialog)` for the **Index Option**.

Manage Bus-to-Vector Conversions

This example shows how to find and manage implicit bus-to-vector conversions.

Blocks that do not accept buses may implicitly convert buses to vectors. When a bus is treated as a vector, bus elements become inaccessible.

Some buses cannot convert to vectors. For more information, see [Bus to Vector](#).

Identify Implicit Bus-to-Vector Conversions

Open and simulate model `ex_bus_to_vector`.

To accept the bus, the Gain blocks implicitly convert the bus to a vector.

To identify buses treated as vectors before simulation, use function `Simulink.BlockDiagram.addBusToVector`.

```
[blocks] = Simulink.BlockDiagram.addBusToVector('ex_bus_to_vector')

### Processing block diagram 'ex_bus_to_vector'
### Number of blocks left that are connected to a bus being used as a vector: 2
### Done processing block diagram 'ex_bus_to_vector'

blocks =

    1x2 struct array with fields:

        BlockPath
        InputPort
        LibPath
```

To identify buses treated as vectors during simulation, set the **Bus signal treated as vector** configuration parameter to `warning` or `error`. The default setting for **Bus signal treated as vector** is `none`, which generates no warning or error message when a block implicitly converts a bus to a vector.

Explicitly Define Bus-to-Vector Conversions

To insert Bus to Vector blocks where blocks implicitly convert buses to vectors, use function `Simulink.BlockDiagram.addBusToVector` with `reportOnly` set to `false`. When you use function `Simulink.BlockDiagram.addBusToVector` with `reportOnly` set to `false`, the function saves the model. To create a writable copy of model `ex_bus_to_vector`, this example uses the `save_system` function.

```
save_system('ex_bus_to_vector','ex_bus_to_vector_blocks');
[blocks,busToVectors] =
Simulink.BlockDiagram.addBusToVector('ex_bus_to_vector_blocks',true,false);
```

The Gain blocks no longer implicitly convert the bus to a vector. The inserted Bus to Vector blocks perform the conversion explicitly.

Bus to Vector blocks are virtual and do not affect simulation results, code generation, or performance.

Function `Simulink.BlockDiagram.addBusToVector` returns no remaining implicit bus-to-vector conversions.

```
[blocks] = Simulink.BlockDiagram.addBusToVector('ex_bus_to_vector_blocks')
```

```
###No buses used as vectors left to process
```

```
blocks =
```

```
1x0 empty struct array with fields:
```

```
BlockPath
InputPort
MixedAttributes
```

By specifying acceptable bus-to-vector conversions with Bus to Vector blocks, you can more easily identify unexpected conversions. Having configuration parameter **Bus signal treated as vector** set to **warning** or **error** alerts you when an unexpected bus-to-vector conversion occurs.

Initialize Your Model Using the Callback Button Block

This example shows how to use the Callback Button block to perform initialization routines on your model.

Explore the Model

The example model builds on the `sldemo_fuelsys` featured model. When you open the model, to bind the workspace variables to their Dashboard blocks, you have to update the model diagram. Here, the Callback Button block at the bottom of the Dashboard subsystem in the model has been configured to update the diagram on the release of the mouse button when you click the block.

Fault-Tolerant Fuel Control System Dashboard

You do not need to start a simulation for the Callback Button to react to your input. Just select and then click the Callback Button to run the initialization code. Double-click the Callback Button block to view and edit its parameters, including the press and click scripts.

- “Modeling a Fault-Tolerant Fuel Control System” on page 13-119

Control a Parameter Value with Callback Button Blocks

This example models control of a system that consists of two masses attached on either side of a spring. A control loop damps the oscillation of the spring that results when an external force acts on the system. The model uses Callback Button blocks to provide an interface for you to adjust the frequency of the external force before and during simulation.

Explore the Model

The model for this example adds two Callback Button blocks, labeled Frequency + and Frequency - to the Double Mass-Spring System model. When you simulate the model, an animation visualizes the system.

Click the button labeled Frequency + to increase the oscillation frequency. When you adjust the frequency of the external force, the Callback Button block displays a message in the command window indicating the new frequency value. You can adjust the parameter during a simulation and while the model is idle.

Both Callback Button blocks in this model are configured with a ClickFcn that responds to your clicks and a PressFcn that executes when you press the Callback Button block. Double-click the Frequency + Callback Button block to view its parameters.

When you click the Frequency + Callback Button block, the ClickFcn increases the frequency of the external force by 0.1. If you press the Callback Button block for more than the 500 ms Press Delay, the PressFcn increases the frequency of the external force by 0.1 every second.

Control the Duty Cycle of a PWM Signal Using Dashboard Blocks

This example shows how a simulation dashboard built using Dashboard blocks controls the duty cycle of a PWM signal generated by the model. The example is a modified version of the `sfcdemo_pwm` example. The PWM Generator block takes a duty cycle and period as inputs to generate a PWM output. You can control the source for the duty cycle using a switch.

Build the Dashboard Subsystem

To create the Dashboard subsystem in this example:

1. Add a Subsystem block to the model.
2. Delete the pre-populated contents of the subsystem.
3. Add the contents of the dashboard. The dashboard in this example includes a Rocker Switch block and a Knob block, which allow you to modify variables during simulation. The Dashboard Scope block displays the generated PWM signal.

Use areas in the Dashboard subsystem to group and label Dashboard blocks. For more information about creating areas, see "Box and Label Areas of a Model".

Connect Blocks in the Model

In this model, the Rocker Switch block in the Dashboard subsystem provides the interface for selecting the duty cycle source. A Switch block with a Constant block as its control input replaces the Manual Switch in the `sfcdemo_pwm` model. Replacing the Manual Switch block requires three

blocks but allows you to gather model controls and visualizations in a single view. The Rocker Switch block connects to the value of the Constant block. In this model, the Constant block value is set by the variable `duty_cycle_source`.

This model also uses the variable `duty_cycle` to set the magnitude of the duty cycle for both the duty cycle (constant) and duty cycle (varying) sources. The Knob block in the Dashboard subsystem connects to the `duty_cycle` variable, allowing you to modify its value during simulation.

The Dashboard Scope block displays the output of the PWM Generator block, allowing you to observe the generated PWM signal during simulation.

Interactively Simulate

This model uses simulation pacing to slow model execution so you can interact with the model during simulation. For more information, see “Simulation Pacing”.

Run the simulation. Use the Rocker Switch block to select the varying duty cycle input and observe the resulting PWM waveform on the Dashboard Scope block. Change the magnitude of the duty cycle using the Knob block and observe the effect on the generated PWM signal.

Control Merging Signals with the Push Button Block

This example model is a modified version of the “Merging Signals” on page 13-327 example. The mergedemo model illustrates how to use Simulink® to merge two different signals using source blocks and triggered subsystems. In the mergedemo model, a square wave enables and disables the triggered subsystems that provide input to the Merge block. In this model, you can control the enable signal for the triggered subsystems using the Signal Select Push Button block.

Model Modifications

To create this model from the mergedemo example:

1. Delete the Discrete Pulse Generator block controlling the triggered subsystem and the Scope block.
2. Add a Push Button block, an Outport block, a Constant block, and a Dashboard Scope block.
3. Connect the Outport block to the output of the Merge block.
4. Display the output signal of the Merge block on the Dashboard Scope.
5. Connect the Constant block to the input of the Data Type Conversion block and specify a variable name as its value. This model uses the variable name `signal_select`. Click the `Unrecognized functions or variables` error, and create the variable in the Model Workspace.

Now, the variable `signal_select` controls the triggered subsystems.

6. Press Ctrl+D to update the diagram so the variable you just created is available for connection.
7. Connect the Push Button block to the `signal_select` variable.

In this example, the On Value for the Push Button block is set to 0. When you press the Push Button block, the value of `signal_select` changes to 0, enabling the triggered subsystem connected to the sawtooth wave. If you want pressing the Push Button block to enable the triggered subsystem connected to the sine wave, set the On Value for the Push Button block to 1.

Interactive Simulation

This model uses simulation pacing to slow model execution so you can interact with the model during simulation. For more information about simulation pacing, see "Simulation Pacing".

Run the simulation. As the model simulates, press and hold the Signal Selection Push Button block. You can observe the effect of pressing the Push Button block on the Dashboard Scope block.

Tune the Relative Slip for an Anti-Lock Braking System

This example shows how to use a subsystem made of Dashboard blocks to tune the value of the `Desired relative slip` for the “Modeling an Anti-Lock Braking System” on page 13-167 example. You can use the Slider block or the Edit block to change the value of the `Desired relative slip` and observe the results during simulation on the Dashboard Scope block.

Build the Dashboard Subsystem

This model uses a Subsystem block to gather the controls and displays for the model in a single interface. To create the subsystem for this model:

1. Add a Subsystem block to the `sldemo_absbrake` model.
2. Delete the pre-populated contents of the subsystem. A subsystem of Dashboard blocks does not need Inport or Outport blocks because Dashboard blocks do not use ports to make connections.
3. Add the components of the dashboard.

The dashboard for this model includes an Edit block and a Slider block that both control the value of the `Desired relative slip` input. The Dashboard Scope block displays the resulting slip value, `slp` throughout the simulation.

You can use areas in the subsystem to group and label related controls and displays. For more information about creating areas, see “Box and Label Areas of a Model”.

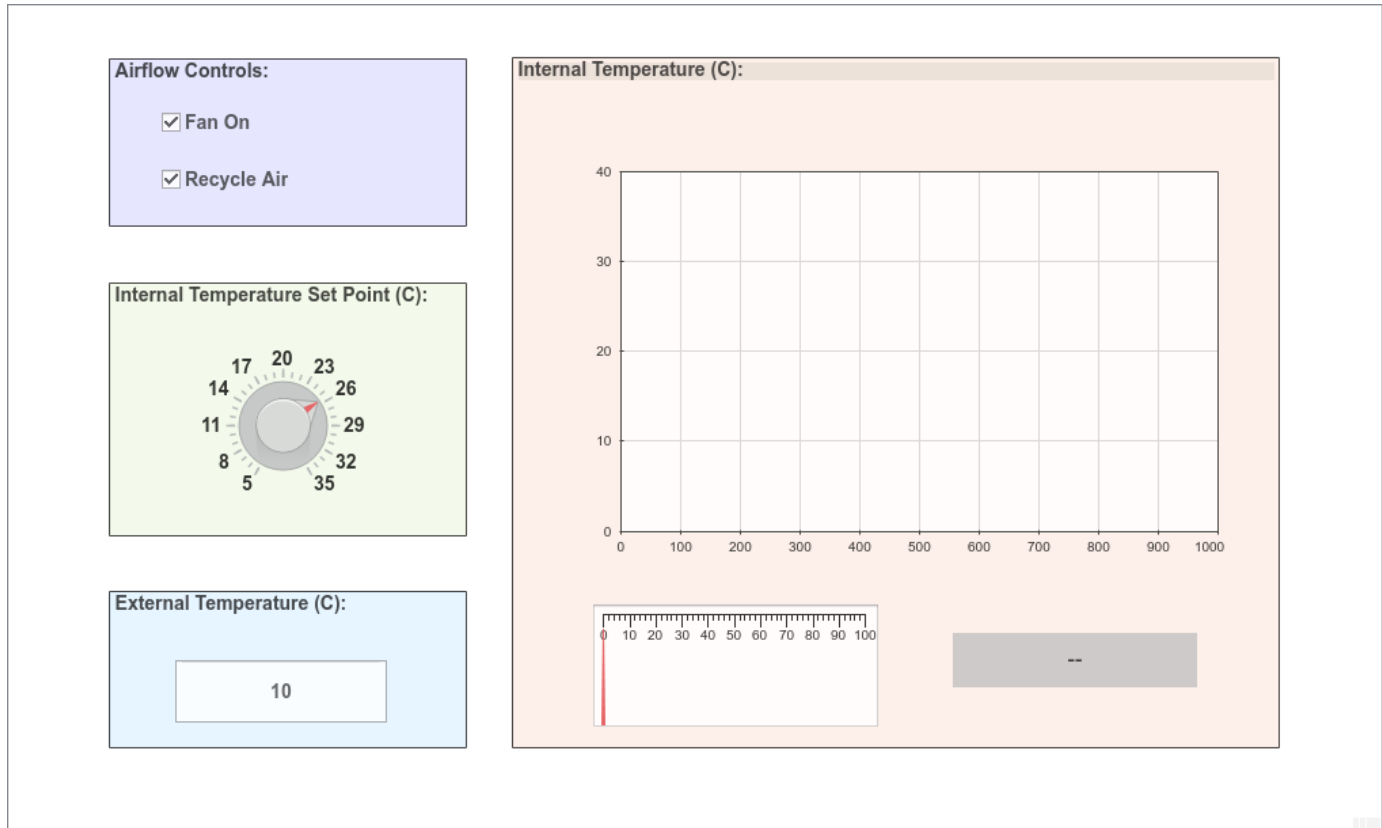

Interactively Simulate

You can use the Dashboard subsystem as a convenient interface to configure separate simulations that use different values for the `Desired relative slip`.

The Slider block and the Edit block both change the value of the `Desired relative slip` input. Use the Slider block to fine tune the value of the relative slip input, and use the Edit block to enter an exact value.

Interactively Simulate a Vehicle Climate Control System

In this example, you use a Dashboard of controls and displays to interactively simulate a climate control system of a car. You can adjust the fan and air recycling controls as well as set the internal temperature and modify the external temperature. A Linear Gauge block, a Dashboard Scope block, and a Display block show the internal temperature of the car. The model in this example adds the Dashboard to the `sldemo_auto_climatecontrol` model. For more information about the underlying model, see “Simulating Automatic Climate Control Systems” on page 13-192.

Build the Dashboard Subsystem

This model uses a Subsystem block to gather the controls and displays in a single interface for the model. To create the subsystem in this example:

1. Add a Subsystem block to the `sldemo_auto_climatecontrol` model.
2. Delete the prepopulated contents of the subsystem. The subsystem does not need inports or outports because the Dashboard blocks do not use ports to make connections.
3. Add the contents of the dashboard.

In the dashboard for this model:

- Two Check Box blocks turn the fans and air recycling on and off.
- A Knob block sets the internal temperature.

- An Edit block allows you to specify the external temperature.
- A Dashboard Scope block displays the value of the internal temperature over time.
- A Linear Gauge block displays the instantaneous internal temperature value.
- A Display block shows the instantaneous internal temperature value.

You can use areas in the subsystem to group and label related controls and displays. For more information about creating areas, see “Box and Label Areas of a Model”.

Connect Blocks in the Model

To explore connections between each block in the Dashboard subsystem and the model, you can select a block in the dashboard, pause on the ellipsis that appears above it, and click Jump to Connected Element. The Simulink® editor navigates to and highlights the block or signal connected to that block in the dashboard.

The Check Box blocks connect to the `dist_req` and `recycle_air` constant blocks. In the `sldemo_auto_climatecontrol` model, the fan and air recycling signals are controlled by Manual Switch blocks with two Constant blocks as inputs.

To replace a Manual Switch block in the `sldemo_auto_climatecontrol` model with a Check Box block:

1. Delete the Manual Switch block and one of the Constant blocks.
2. Connect the other Constant block directly to the Mux block.
3. Specify a variable as the Constant block value.

This model uses the variable `dist_req` to control the fans and the variable `recycle_air` to control air recycling.

4. Click the Unrecognized functions or variables error, and create the variable in the Model Workspace.

Now, the variable `dist_req` holds the state of the fans.

5. Press Ctrl+D to update the diagram so the variable you just created is available for connection.
6. Connect the Check Box block to the `dist_req` variable.

Follow a similar process to replace the air recycling manual switch.

The Knob block connects to the `USet` parameter of the User Setpoint in Celsius masked subsystem. Similarly, the Edit block connects to the `x` parameter of the External Temperature in Celsius masked

subsystem. The Dashboard Scope, Linear Gauge, and Display blocks all connect to the output signal of the Kelvin to Celsius subsystem.

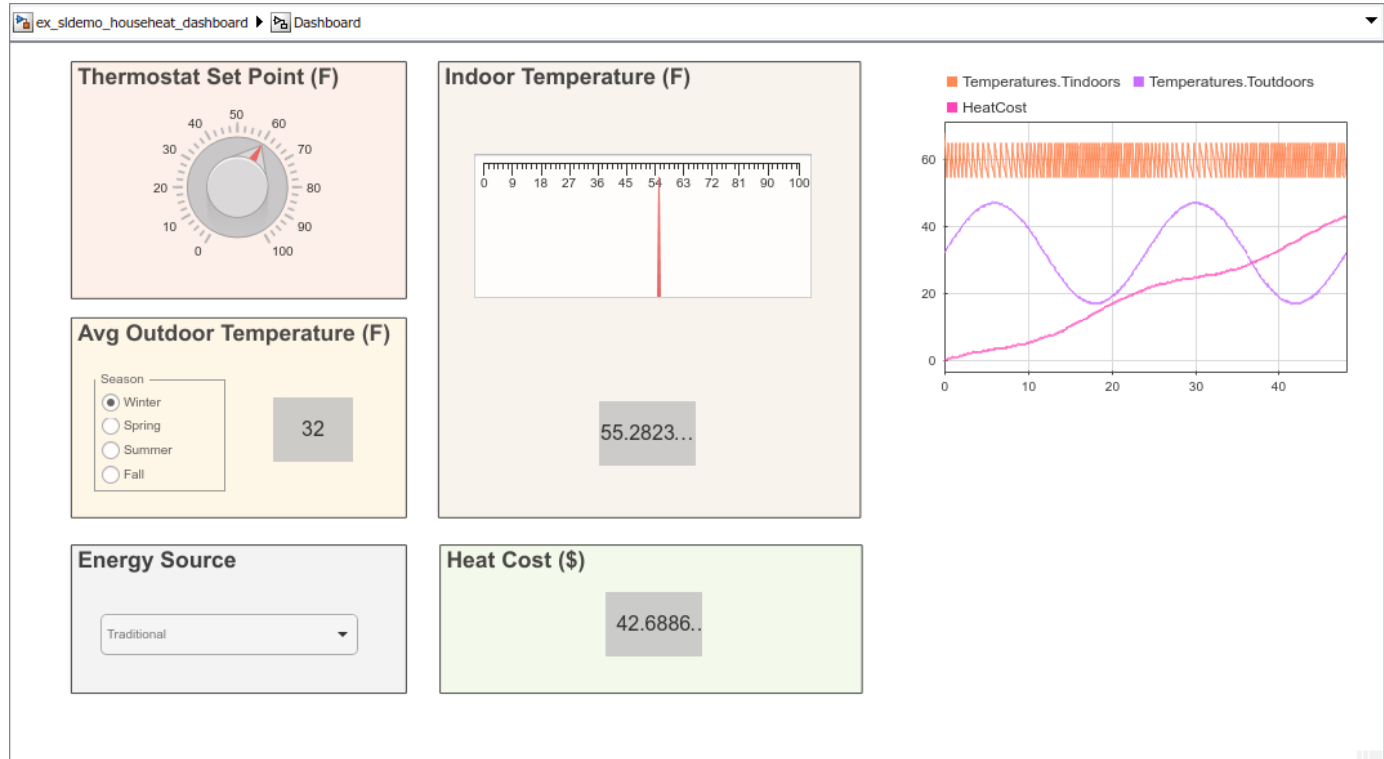

Interactive Simulation

This model uses simulation pacing to slow model execution so you can interact with the model during simulation. For more information, see “Simulation Pacing”.

Run the simulation. Use the Check Box blocks to control the fans and air recycling. Use the Knob block to adjust the internal temperature set point, and specify the external temperature with the Edit block. You can observe the resulting internal temperature on the Dashboard Scope block, the Linear Gauge block, and the Display block.

Interactively Simulate a Thermal Model of a House

This example uses a dashboard of controls and indicators to configure and then interactively simulate a thermal model of a house. You can configure the simulation to use either traditional or renewable energy sources and to use an outdoor temperature setpoint based on the season. During the simulation, you can adjust the thermostat and monitor the indoor temperature and heat cost. The model in this example adds a subsystem named Dashboard to the `sldemo_househeat` model. For more information about the underlying model, see “Thermal Model of a House” on page 13-22.

Build the Dashboard Subsystem

This model uses a Subsystem block to organize the controls and displays for the model in a single interface. To create the subsystem in this example:

1. Add a Subsystem block to the model.
2. Delete the prepopulated contents of the subsystem. A subsystem of Dashboard blocks does not require Inport or Outport blocks because Dashboard blocks do not use ports to make connections.
3. Add the components of the dashboard.

The dashboard for this model includes a Knob block, a Radio Button block, and a Combo Box block to modify simulation parameters. A Linear Gauge block, three Display blocks, and a Dashboard Scope block display key signals during simulation.

You can use areas in the subsystem to group and label related controls and displays. For more information about creating areas, see “Box and Label Areas of a Model”.

Connect Dashboard Blocks to the Model

To explore connections between each block in the Dashboard subsystem and the model, you can select a block in the dashboard, pause on the ellipsis that appears above it, and click Jump to Connected Element. The Simulink® editor navigates to and highlights the block or signal connected to that block in the dashboard.

- The Knob block connects to the Set Point block and allows you to adjust the thermostat set point in the model during simulation.
- The Radio Button Block connects to the Avg Outdoor Temp block and maps seasonal average temperatures for Boston, MA, to season labels. Right-click the Radio Button block and select Block Parameters from the context menu to modify the average temperature value used for each season.
- The Display block in the Avg Outdoor Temperature area shows the outdoor temperature value used in the simulation based on the selected season.
- The Combo Box block connects to the Gain block used to calculate the cost during simulation. Right-click the Combo Box block and select Block Parameters from the context menu to view or modify the cost, specified in units of cents per Joule.
- The Linear Scale and Display blocks in the Indoor Temperature area provide analog and digital indications of the instantaneous value of the house temperature during simulation.
- The Display block in the Heat Cost area shows the cumulative cost of heating the house over the course of the simulation is shown on a Display block.
- The Dashboard Scope block displays the heat cost, indoor temperature, and outdoor temperature in the same plot.

Interactively Simulate

This model uses simulation pacing to slow model execution so you can interact with the model during simulation. For more information, see “Simulation Pacing”.

The simulation is set up to run for 48 hours. Within that time period, it makes sense to use the Radio Button block and Combo Box block to configure a simulation for a particular season and energy source. If you want to run another type of simulation where you interactively modify the season or energy source, consider lengthening the simulation time to something more realistic for those types of changes.

Choose the season and energy source for a 48-hour simulation, and then run the simulation. During the simulation, use the Knob block to adjust the set point for the house thermostat, and observe the effect of the change on the indoor temperature and heat cost.

Create a Realistic Dashboard Using the Circular Gauge Block

You can use the Circular Gauge block to create a dashboard of controls and indicators for your model that looks how it would in a real system. This example model uses four Circular Gauge blocks and a MultiStateImage block to create a dashboard for the `sf_car` model like one you might see in a real car.

Explore the Model

To understand the connections between the Dashboard subsystem and the model, you can select each block and jump to the signal it displays in the model. To jump to the connected signal, first select a block. For example, select the speedometer gauge on the left. Select the **Gauge** tab that appears in the toolstrip and then select **Show Connection**. The model navigates to where the connected signal exists and briefly highlights the signal.

The Circular Gauge block on the left displays the `vehicle speed` signal, acting as a speedometer on the dashboard. The block uses the default Circular Gauge appearance and a value arc you can see when you simulate the model.

The Circular Gauge blocks at the top of the model display the throttle and brake signals. You can create this type of gauge by deleting the background image and needle image from the default Circular Gauge. Then, adjust the scale arc and select colors for the tick marks, scale, and value arc.

The Circular Gauge block on the right displays the engine RPM signal on a custom gauge face. You can create a gauge like this by deleting the background image in the default Circular Gauge and uploading your own.

The MultiStateImage block on the bottom displays the gear signal using seven segment display style number images that correspond to the value of the gear signal.

Monitor System During Simulation

You can use the dashboard to monitor the system response during simulation. The User Inputs block includes several simulation inputs to model different vehicle maneuvers. To change the simulation input, navigate to the top level of the model and open User Inputs. You can use the drop-down menu to choose the vehicle action for the model to simulate. Choose between a passing maneuver, gradual acceleration, hard braking, and coasting. To monitor the system response during simulation, navigate back to the Dashboard subsystem and press the play button to simulate the model.

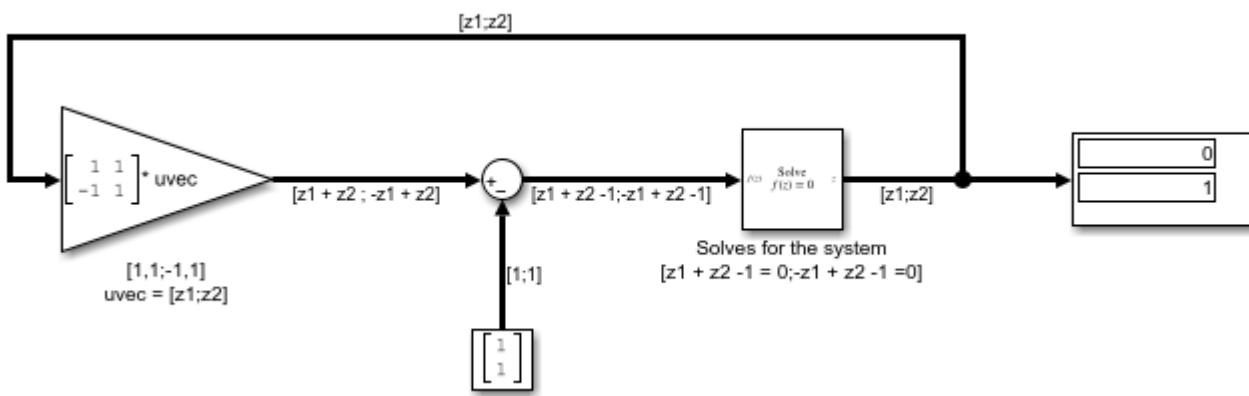

Solve a Linear System of Algebraic Equations

Use the Algebraic Constraint block to solve the system

$$\begin{aligned} z_1 + z_2 &= 1 \\ z_2 - z_1 &= 1 \end{aligned}$$

The model represents the problem in a vectorized form as

$$\begin{bmatrix} 1 & 1 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} z_1 \\ z_2 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

The signal fed to the Algebraic Constraint block $f(z)$ is a 2×1 vector of the form

$$\begin{bmatrix} z_1 + z_2 - 1 \\ -z_1 - 1 + z_2 - 1 \end{bmatrix}$$

The block is configured to constrain $f(z)$ to 0. Thus solving for $f(z) = 0$ yields the solution $z_1 = 0, z_2 = 1$

Model a Planar Pendulum

Consider a point mass m suspended by a massless rod of length l under the influence of gravity. The position of the mass can be expressed in Cartesian coordinates by (x,y) .

Modeling the System

A force balance of the mass gives the equations of motion in the x and y directions.

$$m\ddot{x} = F \sin \theta \quad (1)$$

$$m\ddot{y} + F \cos \theta = -mg \quad (2)$$

Let (u, v) be the velocities in (x, y) respectively. The system can be rewritten as a system of first order ODEs

$$\dot{x} = u \quad (3)$$

$$\dot{u} = -F \frac{x}{ml} \quad (4)$$

$$\dot{y} = v \quad (5)$$

$$\dot{v} = -F \frac{y}{ml} - g \quad (6)$$

where F is the tension in the rod. The system also possesses the geometric constraint

$$x^2 + y^2 = l^2 \quad (7)$$

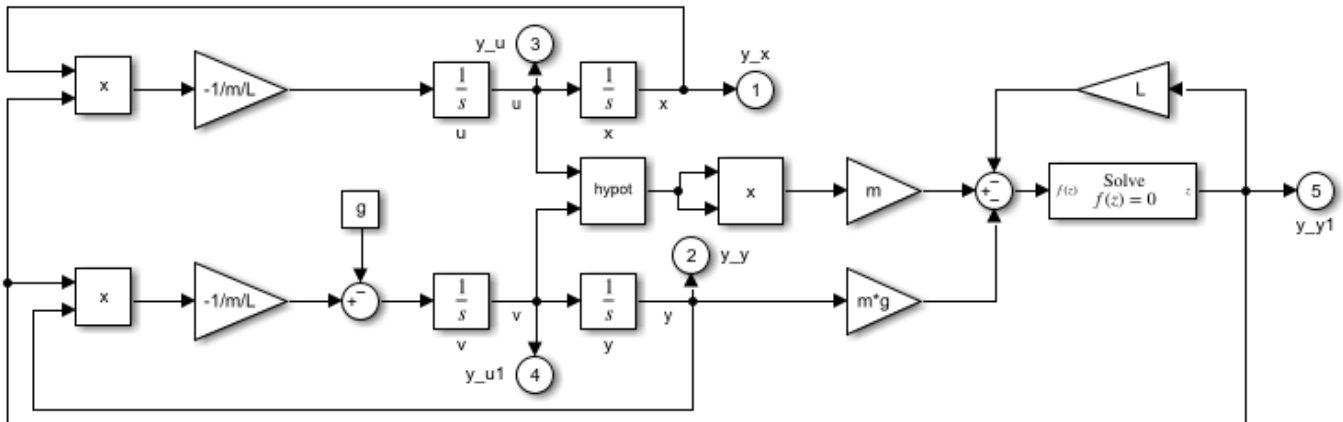

Differentiate (7) twice with respect to time t to arrive at

$$m(u^2 + v^2) - Fl - mgy = 0 \quad (8)$$

This relationship is useful since it allows F to be determined at every step for use in modeling the kinematics of the system.

Simulating the System

The system is simulated as shown in the figure below

Equation (8) contains one unknown F and is of the form $f(z) = 0$ where $f(z) = m(u^2 + v^2) - Fl - mgy$. The Algebraic Constraint block constrains $f(z)$ to 0 and solves for F in accordance with (8).

Hairer, Ernst, Christian Lubich, and Michel Roche. "The Numerical Solution Of Differential-Algebraic Systems By Runge-Kutta Methods." *Lecture Notes in Mathematics*. Vol. 1409, Berlin: Springer-Verlag, 1989: pp. 8-9.

Improved Linearization with Transfer Fcn Blocks

The Laplace domain transfer function for the operation of differentiation is:

$$\frac{Y(s)}{X(s)} = s$$

This equation is not a proper transfer function, nor does it have a state-space representation. As such, the Simulink software linearizes this block as an effective gain of 0 unless you explicitly specify that a proper first-order transfer function should be used to approximate the linear behavior of this block.

To improve linearization, you can also try to incorporate the derivative term in other blocks. For example, if you have a Derivative block in series with a Transfer Fcn block, try using a single Transfer Fcn block of the form

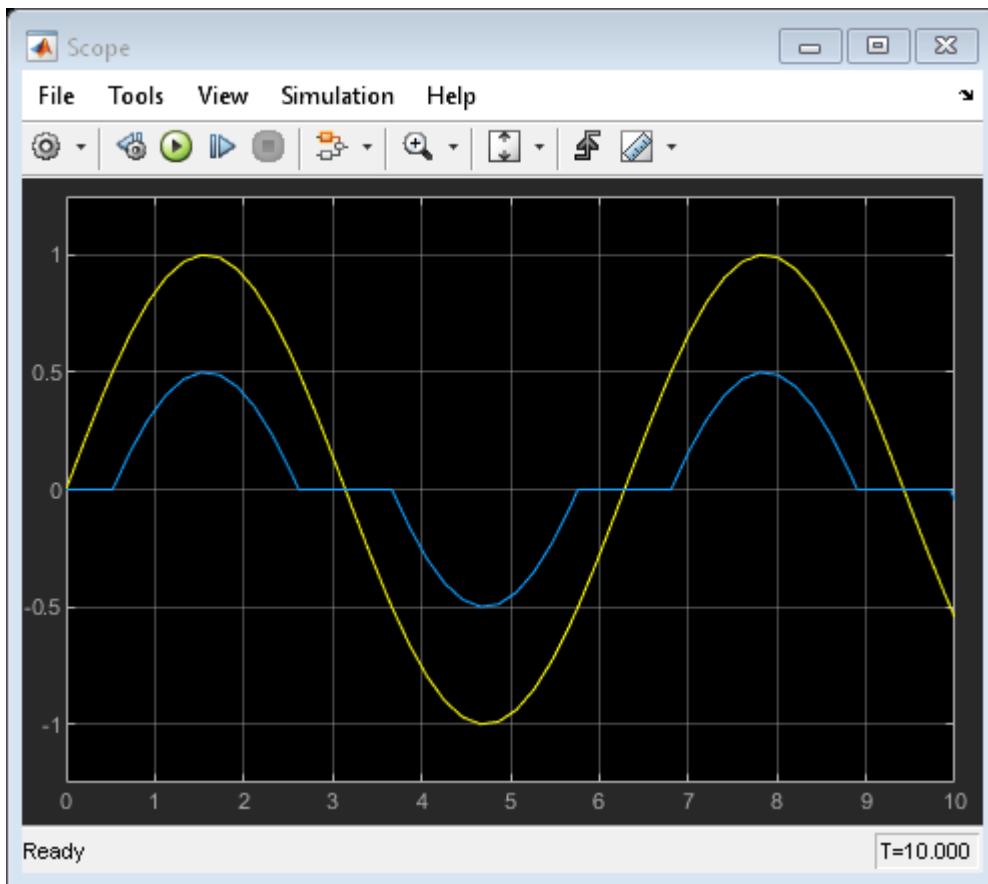

$$\frac{s}{s+a}$$

For example, you can replace the first set of blocks in this figure with the blocks below them:

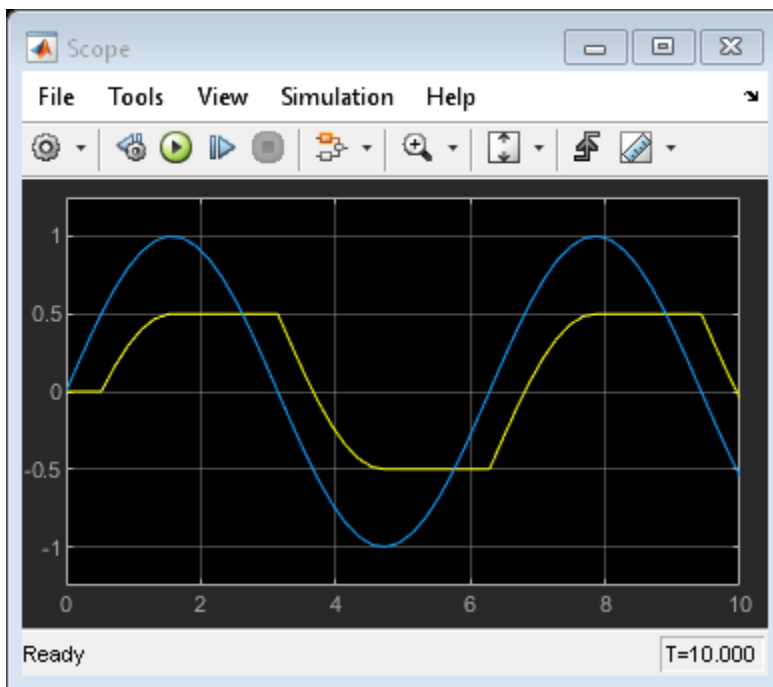

View Dead Zone Output on Sine Wave

This example shows the effect of the Dead Zone block on a sine wave. The model uses a dead zone lower limit of -0.5 and an upper limit as 0.5 . Set these values through the parameters **Start of Dead Zone** and **End of Dead Zone**.

View Backlash Output on Sine Wave

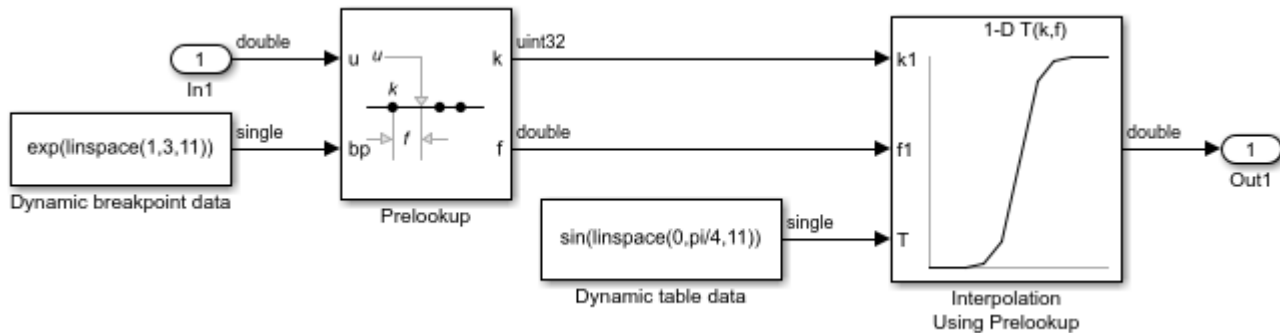

This example shows the effect of the Backlash block on a sine wave using default parameters. The initial **Deadband width** is 1 and the **Initial output** is 0.

The initial deadband is centered around 0 and has a width of 1, which extends .5 in each direction. The output from the Backlash block begins at 0 and does not change until the input reaches the edge of the deadzone at .5. Then the output engages in a positive direction and changes an equal amount as the input. After the input reaches a value of 1, it starts moving in a negative direction. At this point the output disengages and stays flat until the input passes through the deadband width of 1. Once the input reaches the end of the deadband zone at 0, then the output engages and starts moving in a negative direction with the input.

Prelookup With External Breakpoint Specification

This example shows how to feed a breakpoint dataset from a Constant block to the bp input port of the Prelookup block.

The Prelookup block inherits the following breakpoint attributes from the bp input port:

- **Minimum:** Inf
- **Maximum:** Inf
- **Data type:** single

Similarly, a Constant block feeds the table data values to the T input port of the Interpolation Using Prelookup block, which inherits the following attributes:

- **Minimum:** Inf
- **Maximum:** Inf
- **Data type:** single

Simulink® uses double-precision, floating-point data to perform the computations in this model. However, the model stores the breakpoint and table data as single-precision, floating-point data. Using a lower-precision data type to store breakpoint and table data reduces the memory requirement.

Prelookup with Evenly Spaced Breakpoints

This example shows how to specify evenly spaced breakpoint data in the Prelookup block.

In the **Breakpoints data** section, the **Specification** parameter is set to `Even spacing`. The parameters **First point**, **Spacing**, and **Number of points** are set to 25, 12, and 4 respectively. Specifying these parameters creates four evenly spaced breakpoints: [25, 37, 49, 61].

An alternative way to specify evenly spaced breakpoints is to set **Specification** to `Explicit values` and set **Value** to [25:12:61].

Simulink® uses double-precision, floating-point data to perform the computations in this model. However, the model stores the breakpoints and table data as double.

Configure the Prelookup Block to Output Index and Fraction as a Bus

This example shows how to output a bus containing the index (k) and fraction (f) from the Prelookup block. The bus object can then be used as an input to the Interpolation Using Prelookup block. The example also shows how to get the same results without using a bus object.

Open and simulate the model.

At the top of the model, open the dialog box for the Prelookup block. In the **Main** tab, note that **Output selection** is set to Index and fraction as bus. In the **Data Types** tab, note that **Output** is set to Bus: myBus. In the Simulink® Editor, select **Modeling>Model Settings>Model Properties** and open the **Callbacks** tab. In the model's PreLoadFcn, the code defines the bus object myBus, which specifies the index as the first bus element and the fraction as the second element.

Open the dialog box for the Interpolation Using Prelookup block. In the **Main** tab, note that **Require index and fraction as bus** check box is selected. That option configures the block to use the bus output from the Prelookup block.

Approximating the sinh Function Using the Lookup Table Dynamic Block

This example shows how to use the Lookup Table Dynamic block to approximate the \sinh function. The breakpoint data is given by the vector $[-5:5]$ and the table data is given by the vector $\sinh([-5:5])$. The input x is provided by the Constant block as a 1-by-3 vector containing values that are below, within, and above the breakpoint data values.

To see how each lookup method handles input values that are below, within, and above the breakpoint data values, change the value of the **Lookup Method** parameter on the Lookup Table Dynamic block.

The Lookup Table Dynamic block outputs the following values when using the specified lookup methods and inputs.

Lookup Method	Input	Output	Comment
Interpolation-Extrapolation	1.4	2.156	N/A
	5.2	83.59	N/A
Interpolation-Use End Values	1.4	2.156	N/A
	5.2	74.2	The block uses the value for $\sinh(5.0)$.
Use Input Above	1.4	3.627	The block uses the value for $\sinh(2.0)$.
	5.2	74.2	The block uses the value for $\sinh(5.0)$.
Use Input Below	1.4	1.175	The block uses the value for $\sinh(1.0)$.
	-5.2	-74.2	The block uses the value for $\sinh(-5.0)$.
Use Input Nearest	1.4	1.175	The block uses the value for $\sinh(1.0)$.

Create a Logarithm Lookup Table

This example shows how to use the n-D Lookup Table block to create a logarithm lookup table. The lookup table allows you to approximate the common logarithm (base 10) over the input range [1,10] without performing an expensive computation.

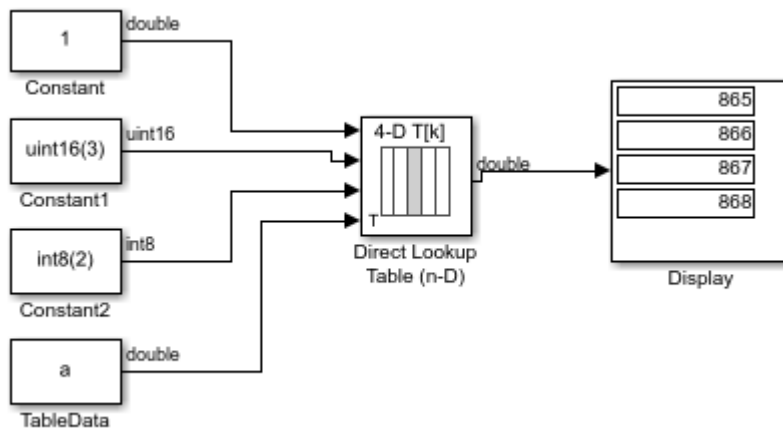

Providing Table Data as an Input to the Direct Lookup Table Block

This example shows how to provide table data as an input to the Direct Lookup Table block. In the following model, `a` is a 4-D array of linearly increasing values that you define with the following model preload function:

```
a = reshape(1:2800, [4 5 20 7]);
```

When you run the model, you get the following results:

The block labeled TableData feeds a 4-D array to the Direct Lookup Table (n-D) block, with a data type of double. Because the Direct Lookup Table (n-D) block uses zero-based indexing, the output is:

```
a(:,2,4,3)
```

The output has the same data type as the table data input signal: double.

Specifying Table Data in the Direct Lookup Table Block Dialog Box

This example shows how to specify table data on the dialog box of the Direct Lookup Table (n-D) block. In the following model, the table data is a 4-D array of linearly increasing values that you define with the following model preload function:

```
a = reshape(1:2800, [4 5 20 7]);
```

When you run the model, you get the following results:

Because the Direct Lookup Table (n-D) block uses zero-based indexing, the output is:

```
a(:,2,4,3)
```

The output data type matches the Direct Lookup Table block's **Table data type**, which is set to `int16`.

Using the Quantizer and Saturation blocks in sldemo_boiler

This example shows how the Quantizer and Saturation blocks are used in the model `ex_sldemo_boiler`. The ADC subsystem digitizes the input analog voltage by:

- Multiplying the analog voltage by 256/5 with the Gain block
- Rounding the value to integer floor with the Quantizer block
- Limiting the output to a maximum of 255 (the largest unsigned 8-bit integer value) with the Saturation block

This subsystem models a typical 8-bit analog-to-digital converter having an input range of 0-5 volts

Scalar Expansion with the Coulomb and Viscous Friction Block

This example shows a model with a scalar input to a Coulomb & Viscous Friction block that uses scalar expansion to output a vector.

Double click the friction block to see the parameters. **Coefficient of viscous friction (Gain)** is a scalar value 2, but **Coulomb friction value (Offset)** is a vector value [1 3 2 0]. Therefore, the block uses element-wise scalar expansion to compute the output.

Each output is calculated using this formula.

$$y = \text{sign}(x) .* (\text{Gain} .* \text{abs}(x) + \text{Offset})$$

For example, the first offset 1 is calculated as follows.

$$y = - * ((2 * 5) + 1)$$

$$y = -11$$

If the dimensions for the input and Offset are the same, then no expansion is necessary.

Sum Block Reorders Inputs

This example shows how the Sum block reorders inputs. If you use a - sign as the first operation, the block reorders the inputs, if possible, to use a + operation. For example, in the expression $\text{output} = -a - b + c$, the Sum block reorders the input so that $\text{output} = c - a - b$. To initialize the accumulator, the Sum block uses the first + input port.

The block avoids performing a unary minus operation on the first operand a because doing so can change the value of a for fixed-point data types. In that case, the output value differs from the result of accumulating the values for a , b , and c .

Both the constant inputs use `int8` data types. The Sum block also uses `int8` for the accumulator and output data types and has **Saturate on integer overflow** turned on. The Sum block reorders the inputs to give the ideal result of 127.

- 1 Reorders inputs from $(-Input1 + Input2)$ to $(Input2 - Input1)$.
- 2 Initializes the accumulator by using the first + input port. $Accumulator = \text{int8}(-1) = -1$
- 3 Continues to accumulate values. $Accumulator = Accumulator - \text{int8}(-128) = 127$
- 4 Calculates the block output. $Output = \text{int8}(127) = 127$

If the Sum block does not reorder the inputs, then you get the nonideal result of 126.

- 1 Initializes the accumulator by using the first input port. $Accumulator = \text{int8}(-(-128)) = 127$
- 2 Because saturation is on, the initial value of the accumulator saturates at 127 and does not wrap.
- 3 Continues to accumulate values. $Accumulator = Accumulator + \text{int8}(-1) = 126$
- 4 Calculates the block output. $Output = \text{int8}(126) = 126$

To explicitly specify a unary minus operation for $\text{output} = -a - b + c$, you can use the Unary Minus block in the Math Operations library.

Iterated Assignment with the Assignment Block

This example shows using the Assignment block to assign values computed in a For or While Iterator loop to successive elements. You can use vector, matrix or multidimensional signals and do the assignment in a single time step. In this model, the For Iterator block creates a vector signal each of whose elements equals $3 * i$ where i is the index of the element.

The iterator generates indices for the Assignment block. On the first iteration, the Assignment block copies the first input (Y0) to the output (Y) and assigns the second input (U) to the output Y(E1). On successive iterations, the Assignment block assigns the current value of U to Y(Ei), that is, without first copying Y0 to Y. These actions occur in a single time step.

View Sample Time Using the Digital Clock Block

This example shows how to view the simulation sample time at a specified sampling interval using the Digital Clock block. In this model, the Scope shows the output of a Digital Clock block with the **Sample time** set to 0.2.

In this configuration, the Digital Clock block outputs the simulation time every 0.2 seconds. Otherwise, the block holds the output at the previous value.

Bit Specification Using a Positive Integer

This example shows how to specify the **Number of bits** in the Counter Free-Running block as a positive integer.

At $t = 255$, the counter reaches the maximum value of $(2^8) - 1$. If you increase the stop time of the simulation to 256, the counter wraps to zero.

Bit Specification Using an Unsigned Integer Expression

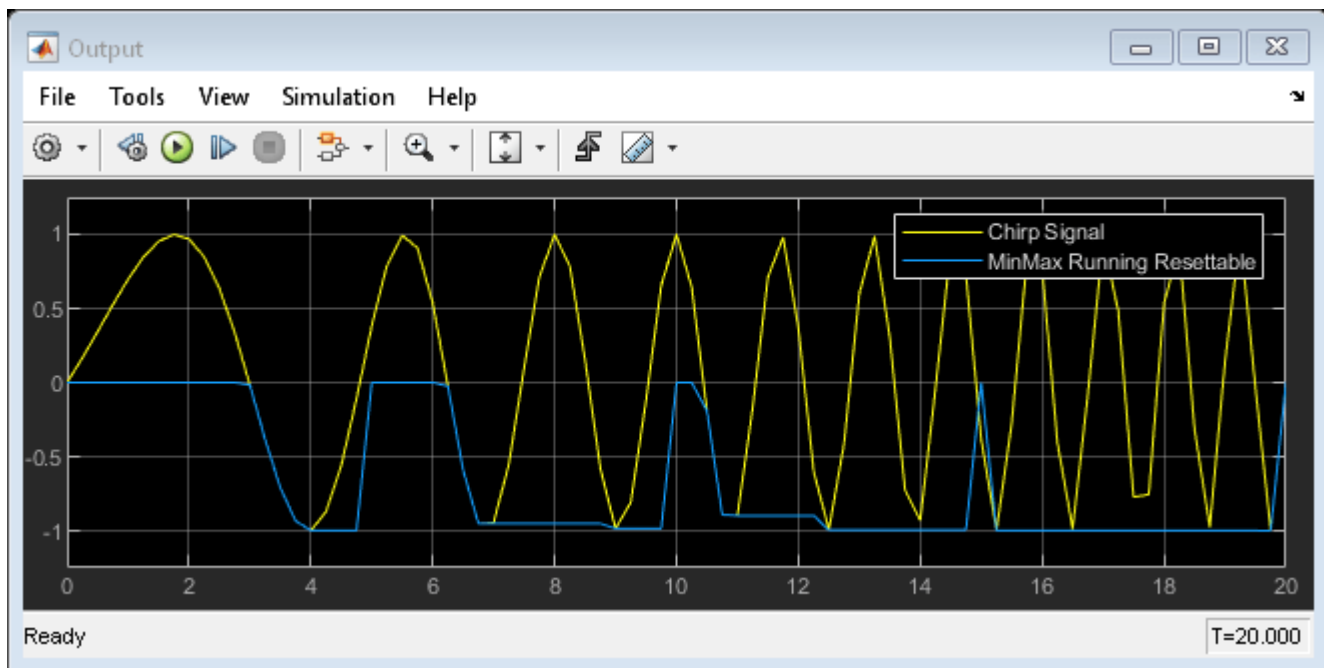

This example shows how to specify the **Number of bits** in the Counter Free-Running block as an unsigned integer expression.

At $t = 254$, the counter reaches the maximum value of $\text{uint8}(2^{(\text{uint8}(8))} - 1)$. If you increase the stop time of the simulation to 255, the counter wraps to zero.

Track Running Minimum Value of Chirp Signal

This example shows how to track the running minimum value of a signal generated by the Chirp Signal block.

The Chirp Signal block generates a sine wave whose frequency increases at a linear rate with time. The MinMax Running Resettable block tracks the minimum value of that chirp signal over time. The running minimum value is reset every 5 seconds by the Pulse Generator block.

Horizontal Matrix Concatenation

This example shows how to perform a horizontal matrix concatenation with the Matrix Concatenate block. When you set the **Concatenate dimension** parameter to 2 and the inputs are 2-D matrices, the block performs horizontal matrix concatenation and places the input matrices side-by-side to create the output matrix.

Vertical Matrix Concatenation

This example shows how to perform a vertical matrix concatenation with the Matrix Concatenate block. When you set the **Concatenate dimension** parameter to 1 and the inputs are 2-D matrices, the block performs vertical matrix concatenation and places the input matrices on top of each other to create the output matrix.

Multidimensional Matrix Concatenation

This example shows how to perform multidimensional matrix concatenation with the Matrix Concatenate block. When you set the **Concatenate dimension** parameter to 3 and the inputs are 2-D matrices, the block performs multidimensional matrix concatenation.

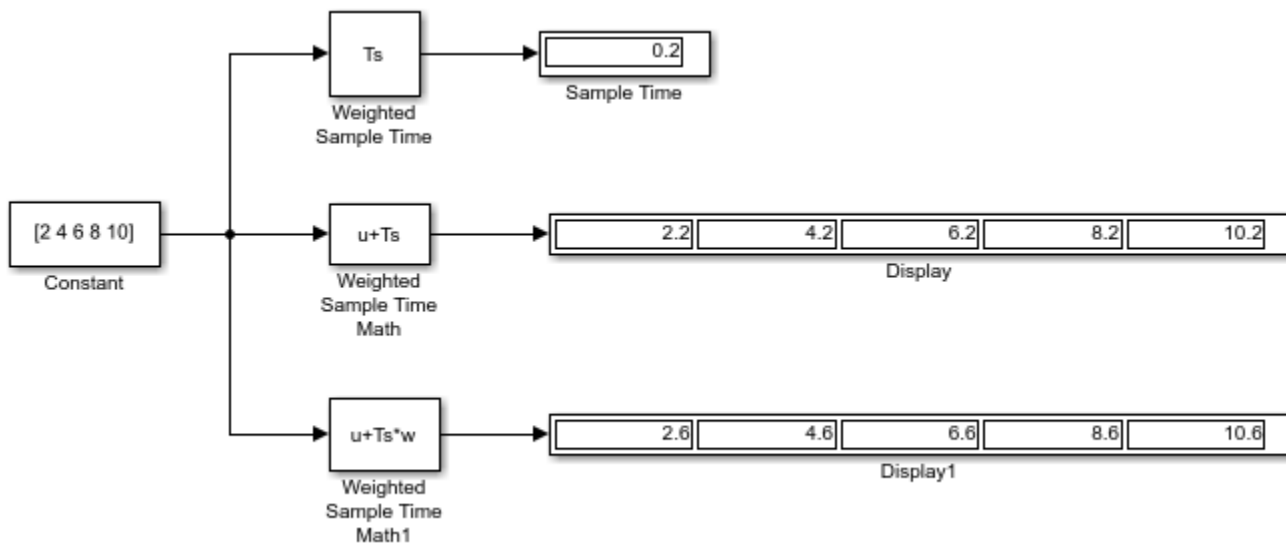

Unary Minus of Matrix Input

This example shows how to compute the unary minus of a matrix input.

Sample Time Math Operations Using the Weighted Sample Time Math Block

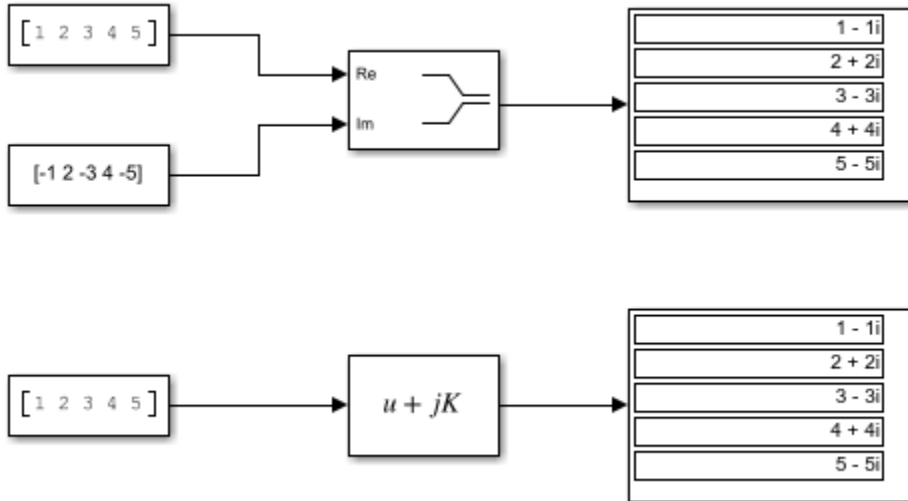

This example shows how to add the sample time value to a signal using the Weighted Sample Time Math block.

Using the Weighted Sample Time block, you can see the sample time of this model is 0.2 . When you set the **Operation** parameter to $+$ and the **Weight value** to 1 on the Weighted Sample Time Math block, the block adds the sample time value of 0.2 to the input signal. When you set the **Weight value** to 3 in the Weighted Sample Time Math1 block, the block adds $T_s * 3$ to the input signal, thus increasing each value by 0.6 .

Construct Complex Signal from Real and Imaginary Parts

This example shows how to use the Real-Imag to Complex block to construct a complex-valued signal from real and imaginary parts. You can provide both the real and imaginary parts as block inputs, or provide one value as an input, and the other on the block dialog box.

Construct Complex Signal from Magnitude and Phase Angle

This example shows how to use the Magnitude-Angle to Complex block to construct a complex-valued signal. You can provide both the magnitude and phase angle as block inputs, or provide one value as an input, and the other on the block dialog box.

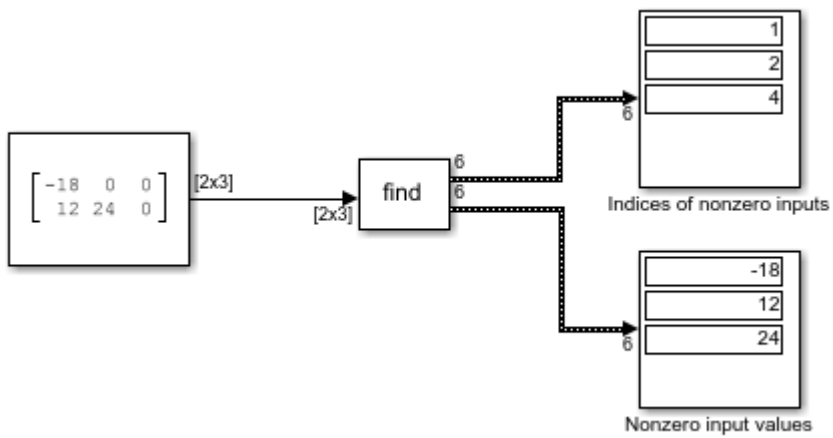

Find Nonzero Elements in an Array

This example shows how to use the Find block to find nonzero elements in an array. In the following model, the block is configured to output both the one-based linear index and the value of each nonzero element.

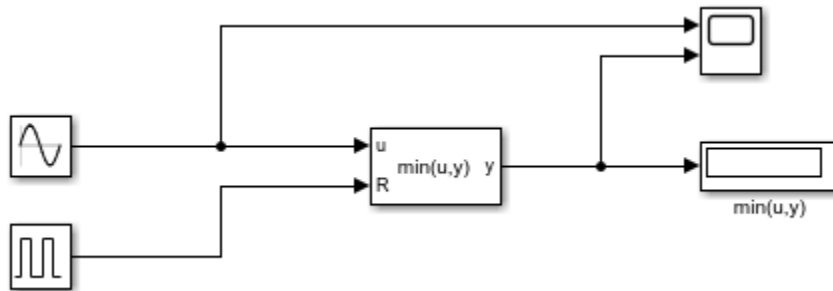

ans =

```
Simulink.SimulationOutput:  
    tout: [51x1 double]  
  
SimulationMetadata: [1x1 Simulink.SimulationMetadata]  
ErrorMessage: [0x0 char]
```

Calculate the Running Minimum Value with the MinMax Running Resettable Block

This example shows how to use the MinMax Running Resettable block to calculate the running minimum value. To watch how the running minimum value changes at each time step, you can use the Step Forward button to advance the simulation one step at a time.

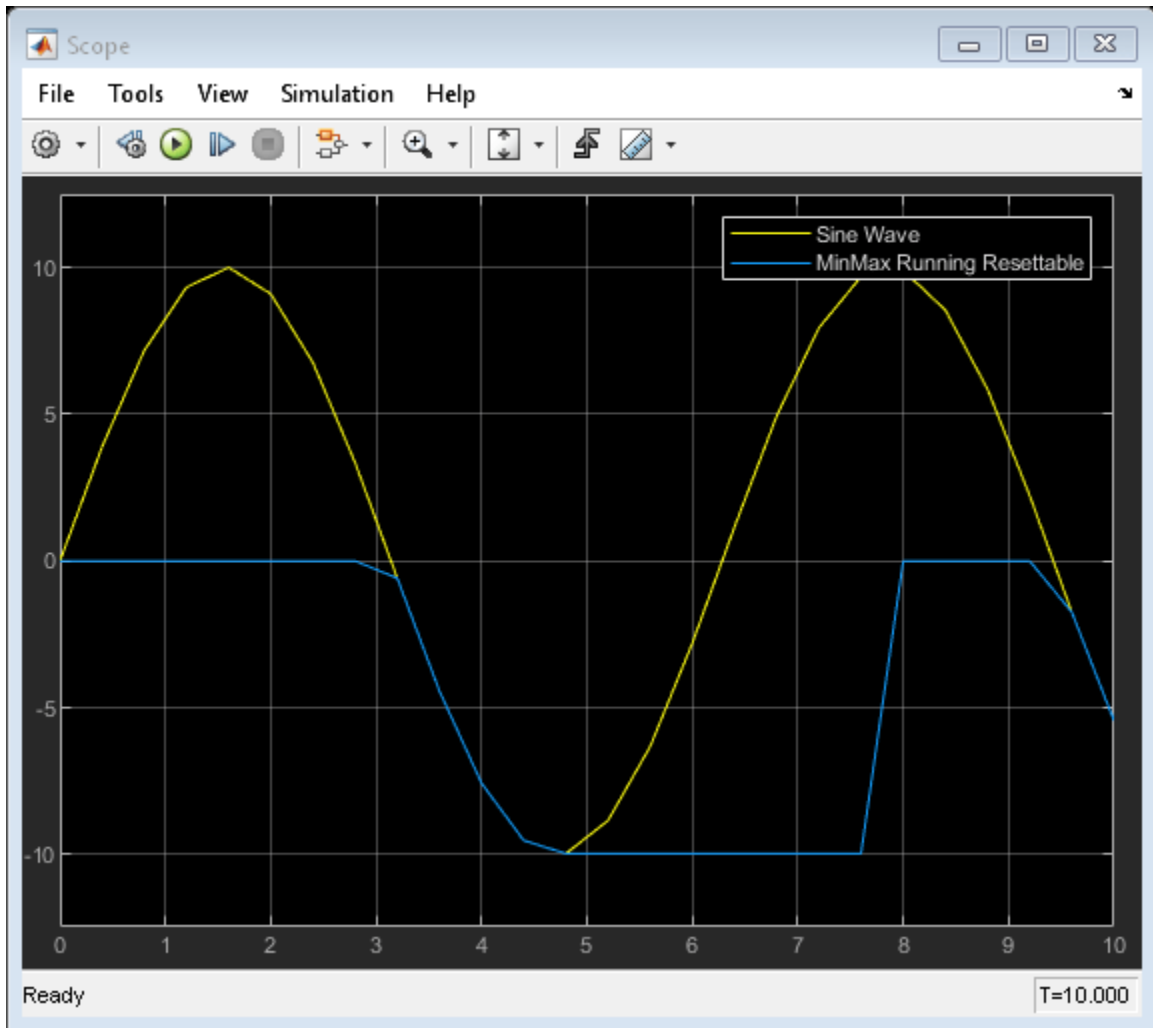

After running the full simulation, you can view the results in the Scope. The initial value of the running minimum is 0. It begins tracking the Sine Wave signal when the sine wave values turn negative. When the MinMax Running Resettable block receives a reset signal at $T=8$, the block resets the running minimum value to 0. The running minimum value tracks at 0 for a few time steps, until the sine wave values turn negative again.

ans =

```
Simulink.SimulationOutput:
      tout: [26x1 double]

SimulationMetadata: [1x1 Simulink.SimulationMetadata]
      ErrorMessage: [0x0 char]
```

Find Maximum Value of Input

This example shows how to use the MinMax block to output the maximum value of two sine waves.

After running the full simulation, you can view the results in the Scope. Initially, the maximum value (orange line) tracks SineWave2. When the SineWave2 values turn negative, the maximum value begins tracking SineWave1. When the SineWave2 values become positive again, the maximum value resumes tracking SineWave2.

ans =

```
Simulink.SimulationOutput:
      tout: [57x1 double]

SimulationMetadata: [1x1 Simulink.SimulationMetadata]
ErrorMessage: [0x0 char]
```

Permute Array Dimensions

This example shows how to use the Permute Dimensions block to permute the first and third dimensions of a 3-by-4-by-5 input array.

When you set the **Order** parameter to `[3, 2, 1]`, the block permutes the first and third dimensions, and outputs a 5-by-4-by-3 array.

Multiply Inputs of Different Dimensions with the Product Block

This example shows how to perform element-wise (\cdot) multiplication of inputs using the Product block. In this example, the Product block multiplies two scalars, a scalar and a vector, and two 2x2 matrices.

Multiply and Divide Inputs Using the Product Block

This example shows how to multiply and divide several input signals using the Product block.

Divide Inputs of Different Dimensions Using the Divide Block

This example shows how to perform element-wise (\cdot *) division of two inputs using the Divide block. In this example, the Divide block divides two scalars, a vector by a scalar, a scalar by a vector, and two matrices.

Complex Division Using the Product of Elements Block

This example shows how to perform element-wise complex division using the Product of Elements block.

The top Product of Elements block collapses the matrix input to a scalar by taking successive inverses of the four elements:

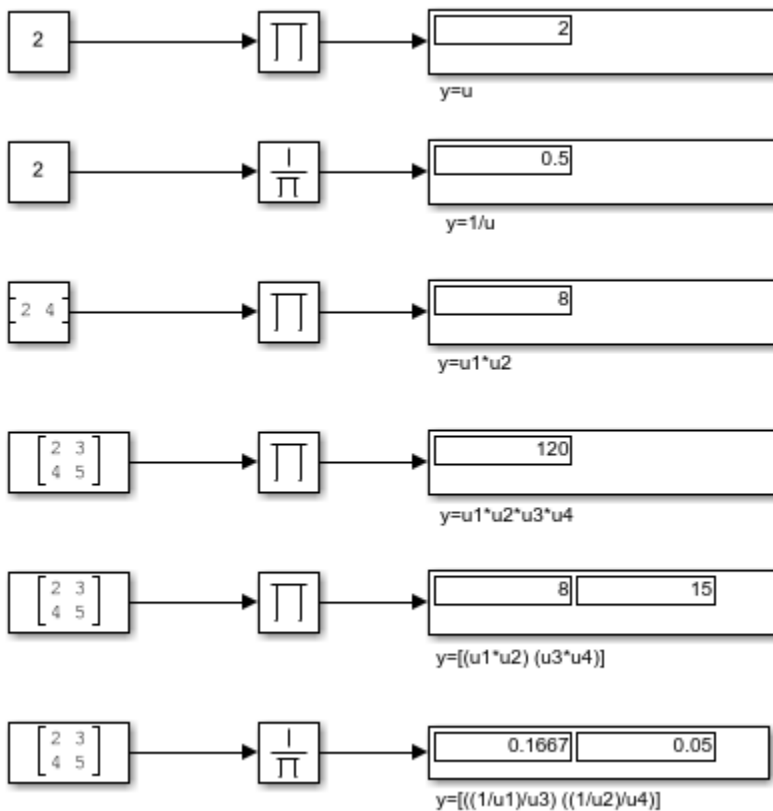

- $y = (((1/2+i)/3)/4-i)/5$

The bottom Product of Elements block collapses the matrix input to a vector by taking successive inverses along the second dimension:

- $y(1) = ((1/2+i)/3)$
- $y(2) = ((1/4-i)/5)$

Element-Wise Multiplication and Division Using the Product of Elements Block

This example shows how to use the Product of Elements block to perform element-wise multiplication and division of inputs.

sin Function with Floating-Point Input

This example shows how to use the Trigonometric Function block to compute the sine of a floating-point input. The output of the Trigonometric Function block has the same data type as the input because the input data type is floating-point and the **Approximation method** is none.

sincos Function with Fixed-Point Input

This example shows how to use the Trigonometric Function block to compute the CORDIC approximation of `sincos` for a fixed-point input signal.

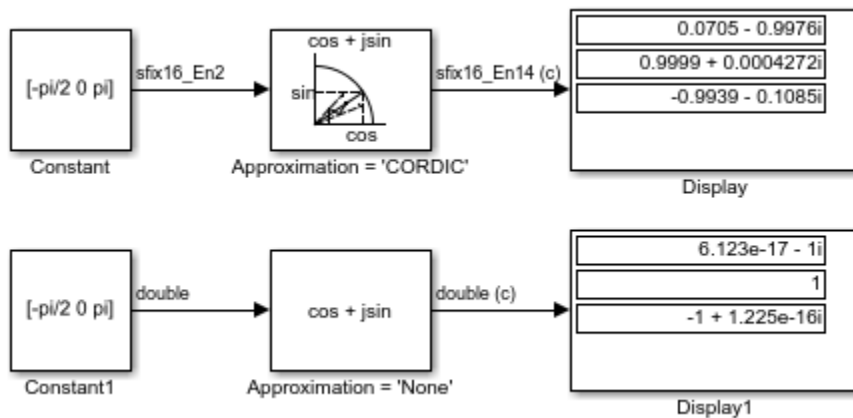

The Trigonometric Function block parameters are:

- **Function:** sincos
- **Approximation method:** CORDIC
- **Number of iterations:** 11

When using the CORDIC approximation method, the input to the Trigonometric Function block must be in the range $[-2\pi, 2\pi)$. The output type of the Trigonometric Function block is `fixdt(1, 13, 11)` because the input is a fixed-point signal and the **Approximation method** is set to CORDIC. The output fraction length equals the input word length minus two.

Trigonometric Function Block Behavior for Complex Exponential Output

This example compares the complex exponential output for two different configurations of the Trigonometric Function block.

When the **Approximation method** is CORDIC, the input data type can be fixed point, in this case: `fixdt(1,16,2)`. The output data type is `fixdt(1,16,14)` because the output fraction length equals the input word length minus two.

When the **Approximation method** is None, the input data type must be floating point. The output data type is the same as the input data type.

Control Algorithm Execution Using Enumerated Signal

This example shows how to use a signal of an enumerated data type to control the execution of a block algorithm. For basic information about using enumerated data types in models, see “Use Enumerated Data in Simulink Models”.

Define Enumerated Type

Copy the enumerated type definition `ex_SwitchCase_MyColors` into a script file in your current folder.

```
classdef ex_SwitchCase_MyColors < Simulink.IntEnumType
    enumeration
        Red(0)
        Yellow(1)
        Blue(2)
        Mauve(3)
    end
end
```

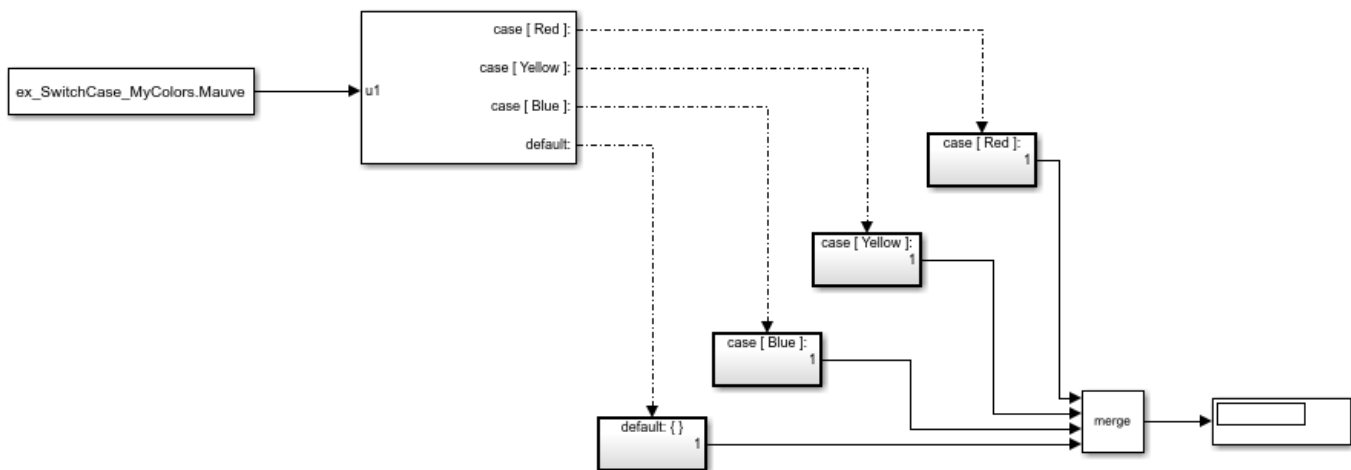

Alternatively, you can use the function `Simulink.defineIntEnumType` to define the type.

```
Simulink.defineIntEnumType('ex_SwitchCase_MyColors',...
    {'Red','Yellow','Blue','Mauve'},[0;1;2;3])
```

Explore Example Model

Open the example model `ex_enum_switch_case`.

```
open_system('ex_enum_switch_case')
```

Open the Enumerated Constant block dialog box. The constant output value is `ex_SwitchCase_MyColors.Blue`.

Open the Switch Case block dialog box. The **Case conditions** box is specified as a cell array containing three of the four possible enumeration members. The block has four outputs corresponding to the three specified enumeration members and a default case.

Open the Switch Case Action Subsystem blocks. The subsystems each contain a Constant block that uses a different constant value.

Control Execution During Simulation

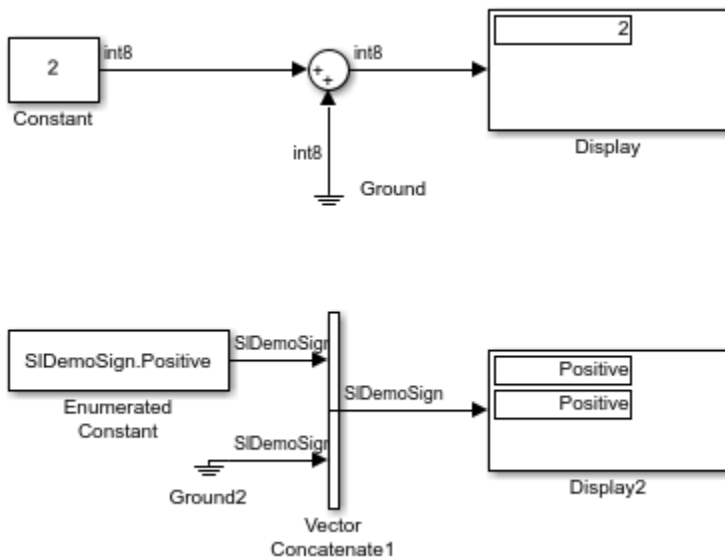

Simulate the model. The Display block shows the value 5, which corresponds to the case `ex_SwitchCase_MyColors.Blue`.

In the Enumerated Constant block dialog box, specify **Value** as `ex_SwitchCase_MyColors.Red` and click **Apply**. The Display block shows 19.

Specify **Value** as `ex_SwitchCase_MyColors.Mauve` and click **Apply**. The Display block shows 3, which corresponds to the default case.

Integer and Enumerated Data Type Support in the Ground Block

This example shows how to use the Ground block to ground block input ports that have integer and enumerated data types. In top row of this example, the output of the Constant block determines the data type (`int8`) of the port to which the Ground block is connected. That port determines the output data type of the Ground block, and the Ground block outputs a signal with zero value, and data type `int8`.

In the bottom row of this example, the Ground block is connected to a port with an enumerated data type. For enumerated data types, the Ground block outputs the default value of the enumeration. This behavior applies whether or not:

- The enumeration can represent zero
- The default value of the enumeration is zero

If the enumerated type does not have a default value, the Ground block outputs the first enumeration value in the type definition.

Fixed-Point Data Type Support in the Ground Block

This example shows how to use the Ground block to ground block input ports that have fixed-point data types. The top row of this example illustrates the Ground block behavior when the fixed-point data type can represent zero. In that case, the Ground block outputs a signal with zero value, and the same fixed-point data type as the port it is connected to.

In the bottom row of this example, the output of the Constant block determines the data type of the port to which the Ground block is connected (`fixdt(0,8,1,1)`). Because zero cannot be represented exactly by the data type `fixdt(0,8,1,1)`, the Ground block outputs a nonzero value that is the closest possible value to zero (in this case, 1).

Read 2-D Signals in Structure Format From Workspace

This example shows how to read a 2-D structure from the MATLAB workspace. When you open the model, the following code is executed by a PreLoadFcn callback:

```
t1 = 0.2 * [0:49]';
m = magic(10);
M = repmat(m,[1 1 length(t1)]);
data.time=t1;
data.signals.values = M;
data.signals.dimensions=[10 10];
```

This code creates 10-by-10 matrix (2-D signal) by using the `magic` function, and then creates a 3-D matrix by adding a time vector. The time vector must be a column vector. The `signals.values` field is a 3-D matrix where the third dimension corresponds to time. The `signals.dimensions` field is a two-element vector. The first element is the number of rows and the second element is the number of columns in the `signals.values` field.

When you run the model, the From Workspace block reads the structure `data` from the workspace.

Eliminate Singleton Dimension with the Squeeze Block

This example shows a model using the Squeeze block to eliminate a dimension of size 1.

The Squeeze block converts a multidimensional array from the Constant block of size 3-by-1-by-2 into a 3-by-2 signal.

Difference Between Time- and Sample-Based Pulse Generation

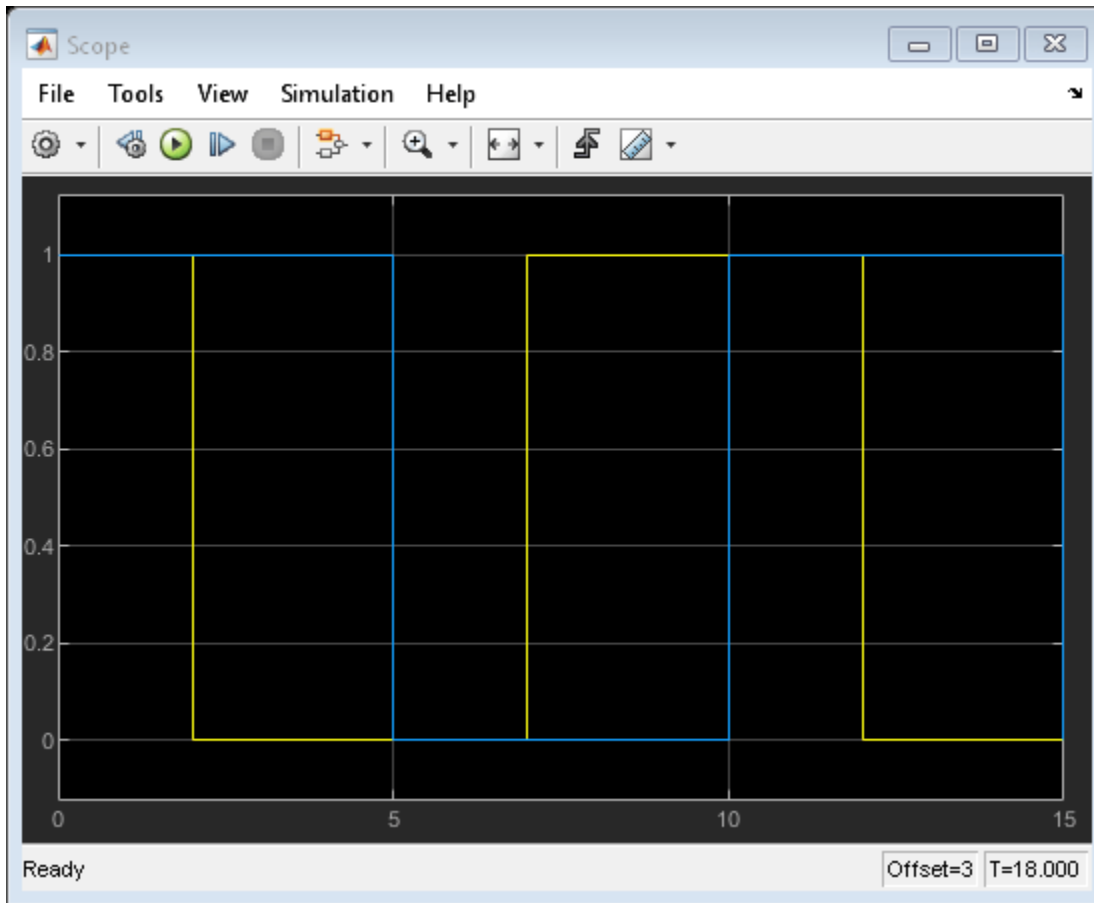

This example shows the difference in behavior of the Pulse Generator block in time-based and sample-based modes.

Consider this model, with two Pulse Generator blocks. One block has the **Pulse type** parameter set to Time based, and the other to Sample based. Both blocks are configured to output a pulse with an amplitude of one that is on for five seconds, followed by off for five seconds. The simulation time runs from three seconds to a stop time of 18 seconds. Notice the time offset notice in the lower right corner.

ans =

```
Simulink.SimulationOutput:  
    tout: [16x1 double]  
  
SimulationMetadata: [1x1 Simulink.SimulationMetadata]  
ErrorMessage: [0x0 char]
```

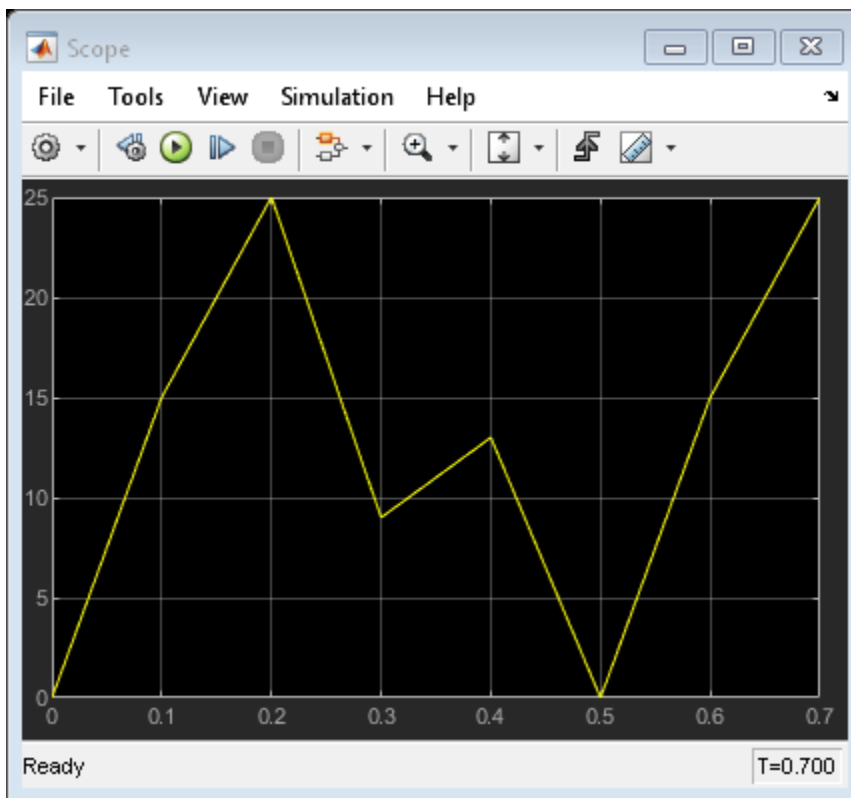

Notice that the time-based Pulse Generator produces an on signal for only two seconds and then switches to off. This is due to the block starting to compute the output from $t=0$ even though it does not output the simulation until $t=3$. The sample-based block outputs a pulse of five seconds on followed by five seconds off. In this case, the block output does not depend on simulation time and starts only when the simulation starts.

Specify a Waveform with the Repeating Sequence Block

This example shows how you specify a waveform with the Repeating Sequence block. In this model, the block defines the **Time values** parameter as $[0:0.1:0.5]$ and the **Output values** parameter as $[0\ 15\ 25\ 09\ 13\ 17]$. The stop time of the simulation is 0.7 second.

- Input period is 0.5 .
- Output at any time t is the output at time $t = t - 0.5n$, where $n = 0,1,2$, and so on.
- Sequence repeats at $t = 0.5n$.

At $t = 0.5$, the expected output is equal to the output at $t = 0$, which is 0 . Therefore, the last value in the **Output values** parameter vector $[0\ 15\ 25\ 09\ 13\ 17]$ does not appear.

Tune Phase Delay on Pulse Generator During Simulation

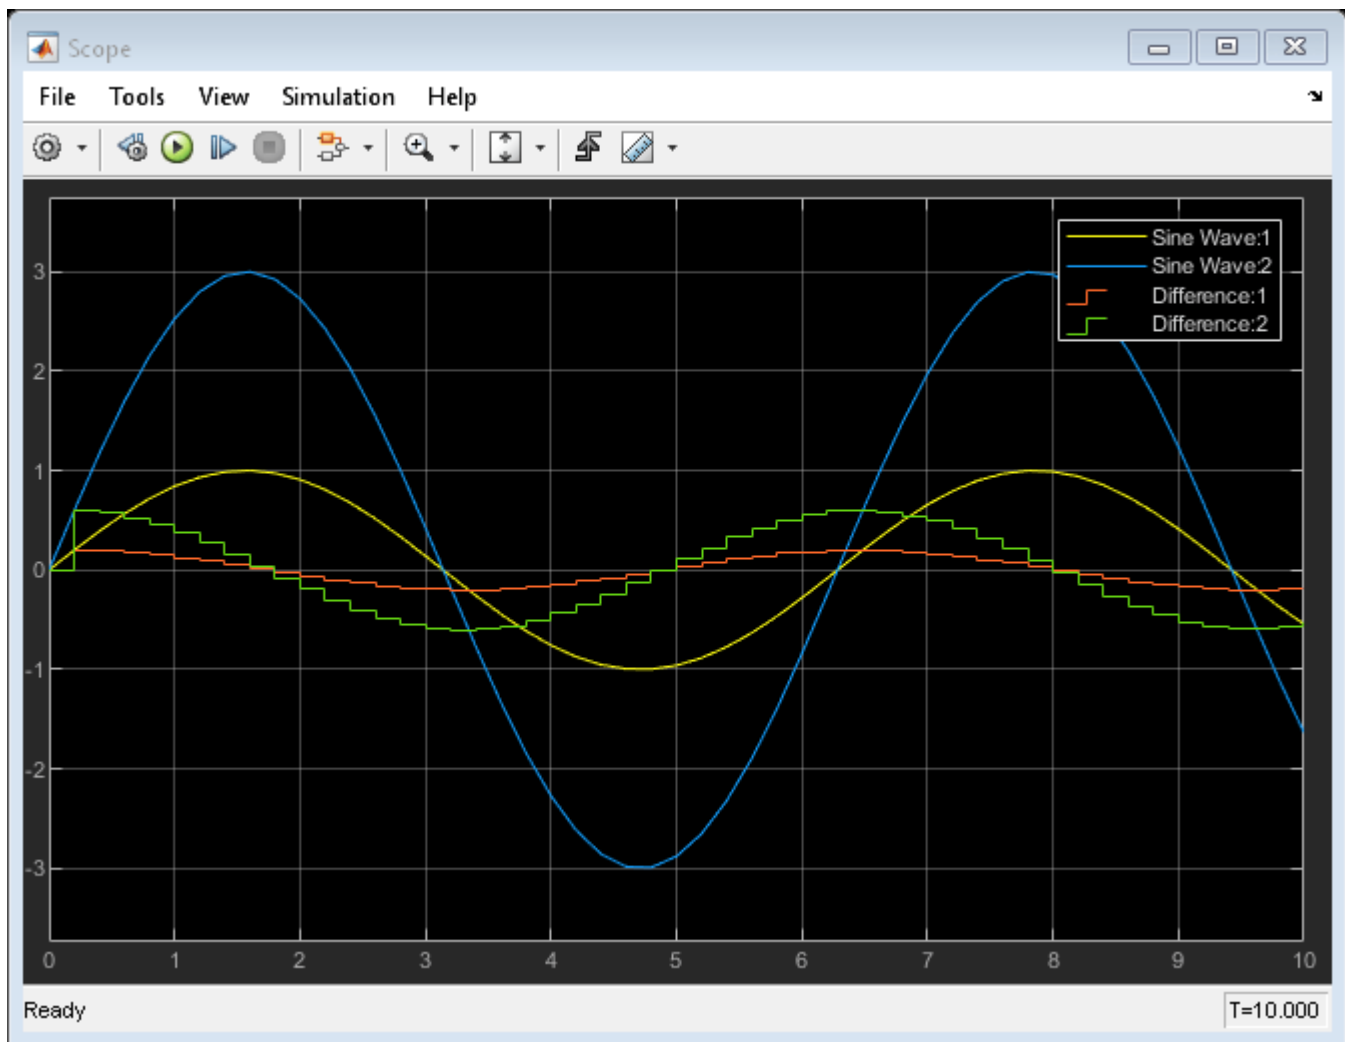

This example shows how to modify a model so that you can change a phase delay for a Pulse Generation block during simulation. You cannot tune the value of the **Phase delay** parameter during simulation. As a workaround, add a Constant block and a Variable Time Delay block.

In the Pulse Generator block, set the value of the **Phase delay** parameter to zero. Use the Constant block to specify the delay time in seconds. To tune the delay time during simulation, change the value stored in the Constant block.

Difference Sine Wave Signal

This example shows how to calculate the difference in a sine wave signal at each time step. The input is a 1-by-2 vector of sine waves, with amplitude 1 and 3. The difference block calculates the difference in each sine wave signal at every time step. The Scope block displays both the original sine waves and the output of the difference block.

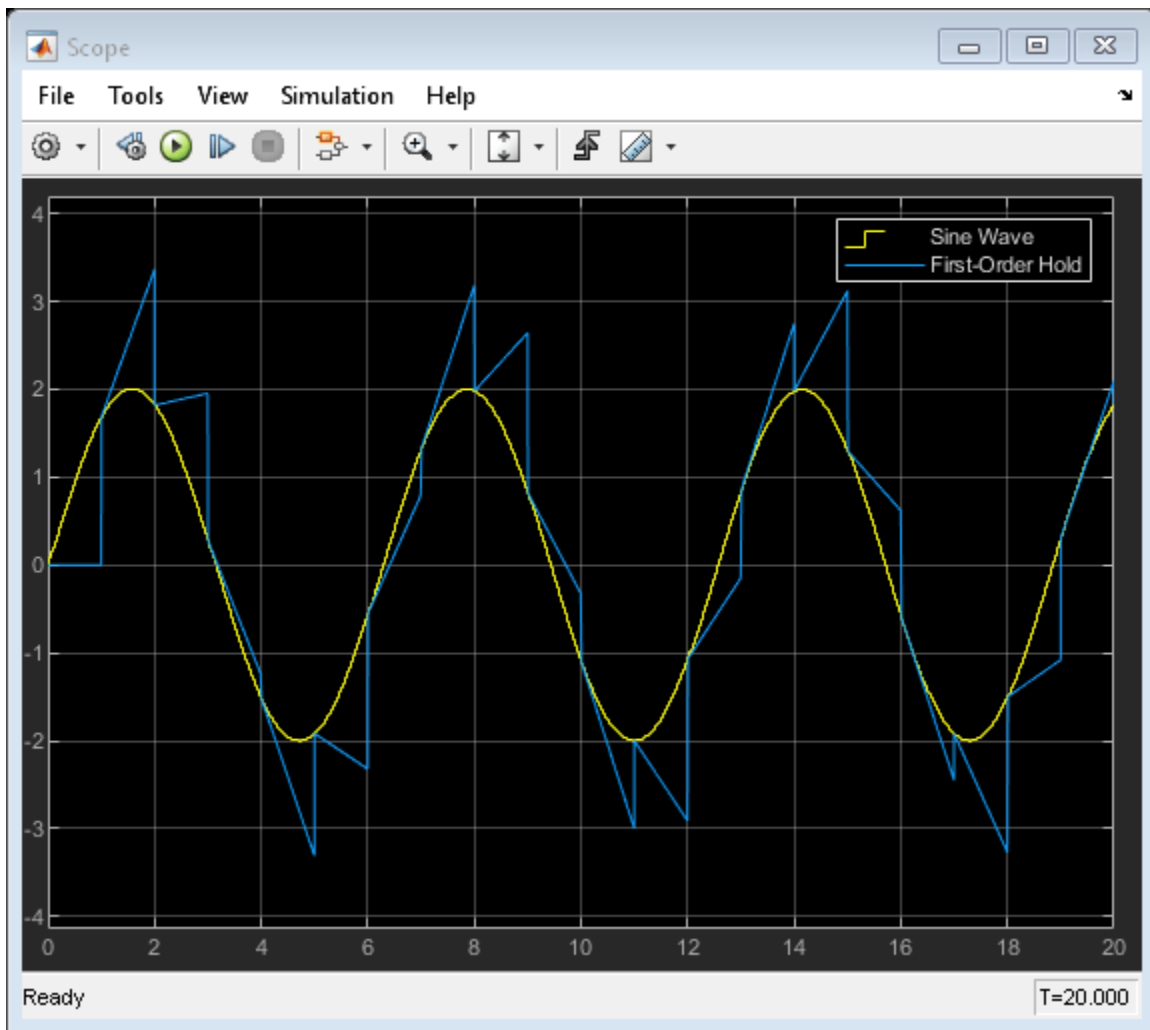

Discrete-Time Derivative of Floating-Point Input

This example shows how to use the Discrete Derivative block to compute the discrete-time derivative of a floating-point input signal. The unfiltered discrete-time derivative is compared to a filtered discrete-time derivative that is computed by the Discrete Filter block.

First-Order Sample-and-Hold of a Sine Wave

This example shows how to perform a first-order sample-and-hold of a sine wave signal using the First-Order Hold block.

Calculate and Display Simulation Step Size using Memory and Clock Blocks

This example shows how to use the Memory and Clock blocks to calculate and display the step size in a simulation. The Sum block subtracts the time at the previous time step, which the Memory block generates, from the current time, which the Clock block generates.

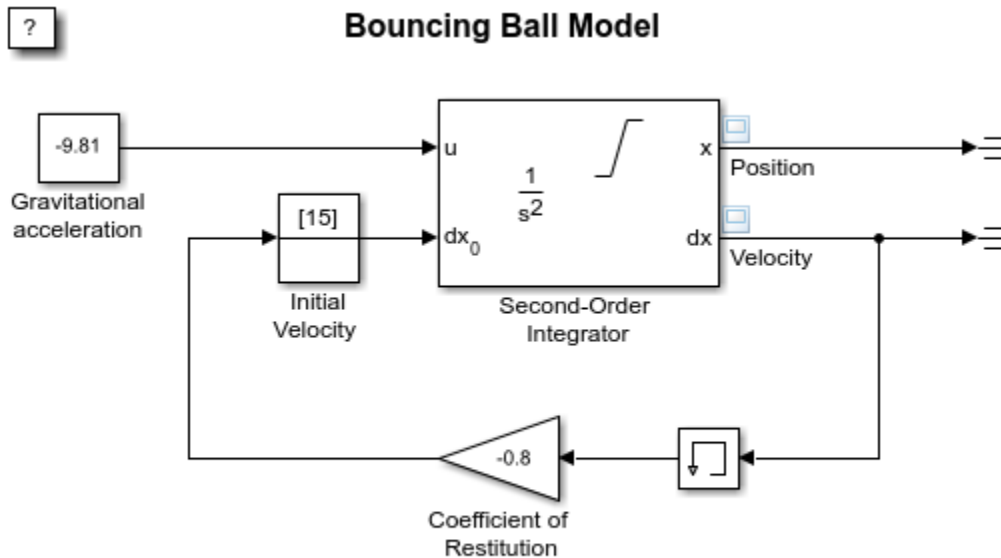

Because **Inherit sample time** is not selected for the Memory block, the block sample time depends on the type of solver for simulating the model. In this case, the model uses a fixed-step solver. Therefore, the sample time of the Memory block is the solver step size, or 1.

If you replace the Memory block with a Unit Delay block, you get the same results. The Unit Delay block inherits a discrete sample time of 1.

Capture the Velocity of a Bouncing Ball with the Memory Block

The `sldemo_bounce` example shows how to use the Second-Order Integrator and Memory blocks to capture the velocity of a bouncing ball just before it hits the ground.

```
open_system('sldemo_bounce');
```

Copyright 2004-2013 The MathWorks, Inc.

Because **Inherit sample time** is not selected for the Memory block, the block sample time depends on the type of solver for simulating the model. In this case, the model uses a variable-step (ode23) solver. Therefore, the sample time of the Memory block is continuous but fixed in minor time step: $[0, 1]$. When you run the model, you get these results.

```
sim('sldemo_bounce');
```

If you replace the Memory block with a Unit Delay block, you get the same results. However, a warning also appears due to the discrete Unit Delay block inheriting a continuous sample time.

For more information, see the model description.

Implement a Finite-State Machine with the Combinatorial Logic and Memory Blocks

The `ex_sl_demo_clutch` example shows how you can use the Memory block with the Combinatorial Logic block to implement a finite-state machine. This construct appears in the Friction Mode Logic/Lockup FSM subsystem:

Because **Inherit sample time** is not selected for the Memory block, the block sample time depends on the type of solver for simulating the model. In this case, the model uses a variable-step (`ode23`) solver. Therefore, the sample time of the Memory block is continuous but fixed in minor time step: $[0, 1]$.

Discrete-Time Integration Using the Forward Euler Integration Method

The `sldemo_fuelsys` model uses a Discrete-Time Integrator block in the `fuel_rate_control/airflow_calc` subsystem. This block uses the Forward Euler integration method.

When the Switch block feeds a nonzero value into the Discrete-Time Integrator block, integration occurs. Otherwise, integration does not occur.

Signal Routing with the From, Goto, and Goto Tag Visibility Blocks

This example shows how to use the From, Goto, and Goto Tag Visibility blocks to route signals in your model. The GotoGlobal block at the top-level of the model has the **Goto tag** parameter set to G and the **Tag visibility** set to global. Thus, the G tag can be seen by From and Goto blocks at any level of the model hierarchy, except locations that span nonvirtual subsystem boundaries (like the Atomic Subsystem in this model). The From block at the top level of the model can see and connect to the global G tag, but cannot see or connect to the scoped S tag or L local tag that are specified on Goto blocks further down in the model hierarchy.

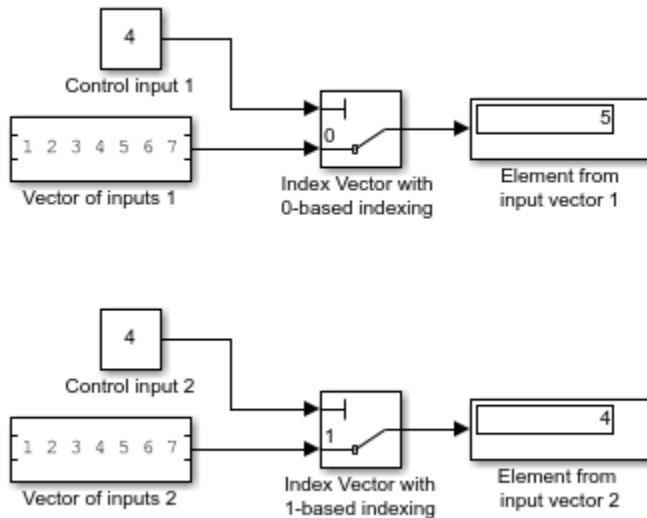

Inside of the Main Subsystem, the Goto block with **Goto tag** set to S has a **Tag visibility** of scoped. The Goto Tag Visibility block placed at the same level as that Goto block indicates the S tag can be seen by all From and Goto blocks at that level and below, except for locations that cross a nonvirtual subsystem boundary (i.e. the boundary with the Atomic Subsystem). Inside of Subsystem1 and Subsystem2, the From blocks can see and connect to the global Goto tag G, and the scoped Goto tag S.

Zero-Based and One-Based Indexing with the Index Vector Block

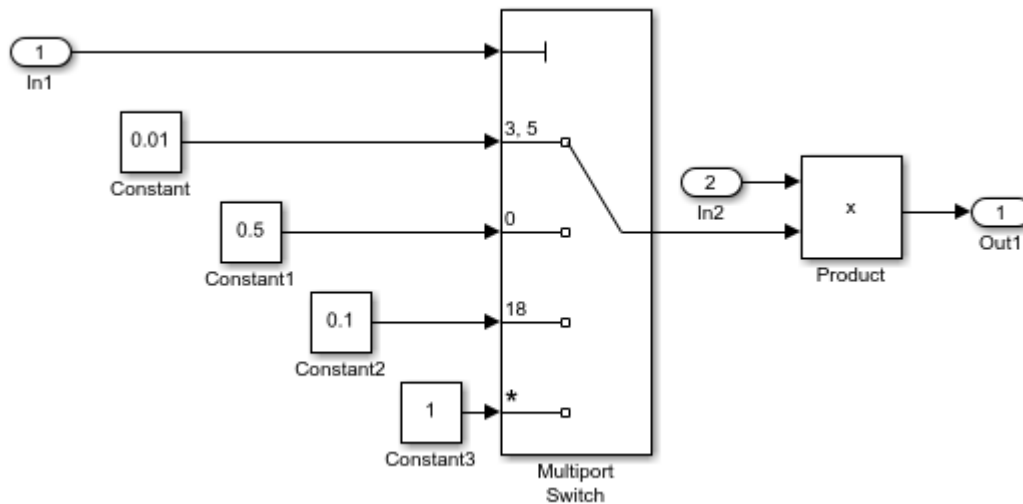

This example shows how the Index Vector block works with zero-based and one-based indexing.

The Index Vector block is from the Simulink Signal Routing library. It is a special configuration of the Multiport Switch block. To configure the Multiport Switch block as an Index Vector block, set the **Number of data ports** to 1 and **Data port order** to Zero-based contiguous.

Noncontiguous Values for Data Port Indices of Multiport Switch Block

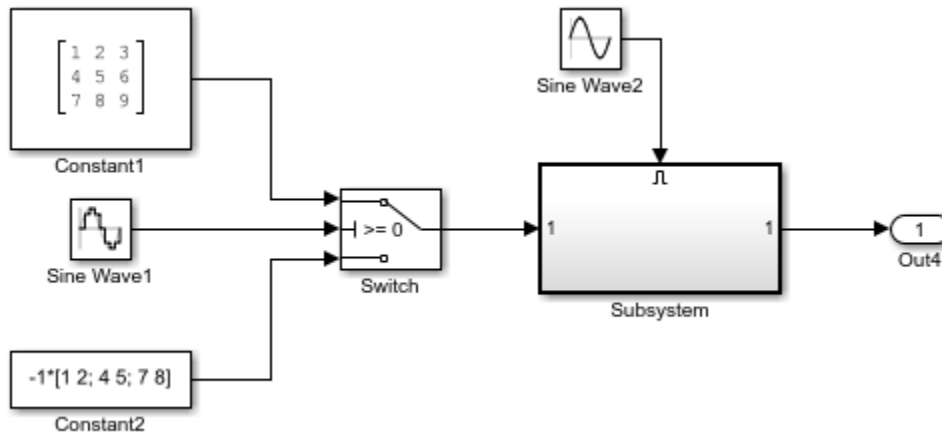

This example shows how to use a Multiport Switch block that specifies noncontiguous integer values for data ports. The values of the indices are visible on the data port labels. You do not have to open the block dialog box to determine which value maps to each data port.

When you set **Data port for default case** to `Additional data port`, an extra port with a * label appears. This port corresponds to the default case, which applies when the control input does not match the data port indices 3, 5, 0, or 18. When that happens in this example, the Multiport Switch block outputs a value of 1.

Using Variable-Size Signals on the Delay Block

This example shows how the Delay block supports variable-size signals for sample-based processing. The Switch block controls whether the input signal to the enabled subsystem is a 3-by-3 or 3-by-2 matrix.

The Delay block appears inside the enabled subsystem.

The model follows these rules for variable-size signals while using sample-based processing.

- Signal dimensions change only during state reset when the block is enabled.
- Initial condition must be scalar.

The rules are implemented by these blocks.

- Enable block sets **Propagate sizes of variable-size signals** to Only when enabling.
- Delay block sets the **Initial condition** to the scalar value 0.0.

Buses with the Delay Block for Frame-Based Processing

This example shows how the Delay block supports buses for frame-based processing.

Each Constant block supplies an input signal to the Bus Creator block, which outputs a two-dimensional bus. After the Delay block delays the bus by three sample periods, the Bus Selector block separates the bus back into the two original signals.

The model follows these rules for buses:

- For the initial condition, set the value on the dialog box.
- For frame-based processing, signal dimensions of the data input port u cannot be larger than two.

The model implements the rules by:

- Setting **Initial condition** to a scalar value of 0.
- Setting bus input to the Delay block as two dimensions.

Control Execution of Delay Block with Enable Port

This example shows how you can enable or disable the execution of the Delay block using an enable port. In this model, a ramp input signal feeds into a Delay block. The execution of the block is controlled by an enabling signal from the Pulse Generator block.

The blue line shows that the Delay block outputs the input signal value delayed by one time step while the enabling signal has a value of one. At $t=5$ the enabling signal transitions to zero and the Delay block stops executing. The output is held at the last value until the block is enabled again.

Zero-Based Indexing for Multiport Switch Data Ports

This example shows a Multiport Switch block that uses zero-based indexing for contiguous ordering of three data ports.

Copyright 2020 The MathWorks, Inc.

The indices are visible on the data port labels. You do not have to open the block dialog box to determine if the data ports use zero-based or one-based indexing.

When you set **Data port for default case** to **Last data port**, the last data port includes a * on the label (in this case, the label is *, 2). The comma after the * indicates that the data port index has a value. This port corresponds to the default case, which applies when the control input does not match the data port indices. In this example, the Multiport Switch block outputs a value of -0.1 when the control input does not match the data port indices of 0, 1, or 2.

One-Based Indexing for Multiport Switch Data Ports

The `sf_semantics_hotel_checkin` model uses a Multiport Switch block. This block uses one-based indexing for contiguous ordering of three data ports.

Copyright 2008-2013 The MathWorks, Inc.

When you increase the size of the block icon, the indices are visible on the data port labels. You do not have to open the block dialog box to determine whether the data ports use zero-based or one-based indexing.

Enumerated Names for Data Port Indices of the Multiport Switch Block

The `sldemo_fuelsys` model uses a Multiport Switch block in the `fuel_rate_control/fuel_calc/feedforward_fuel_rate` subsystem. This block uses the enumerated type `sld_FuelModes` to specify three data port indices: LOW, RICH, and DISABLED.

When you set **Data port for default case** to Last data port, the last data port includes a * on the label. The comma and ellipsis after the * indicate that the data port index has a value. This port corresponds to the default case, which applies when the control input does not match the data port indices LOW, RICH, or DISABLED. In this case, the Multiport Switch block outputs a value of 0.

Prevent Block Windup in Multiloop Control

This example shows how to use signal tracking to prevent block windup in a two-loop control system.

The Inner Loop subsystem contains a saturation limit:

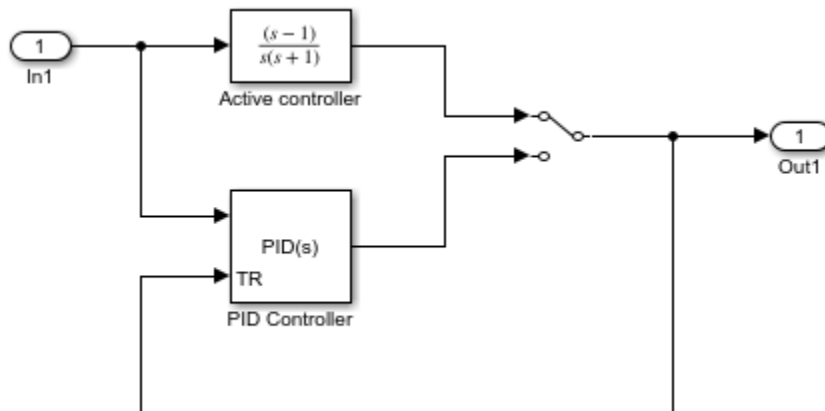

In this example, the inner loop has an effective gain of 1 when it does not saturate. When the inner loop does saturate, however, the integrator in the PID Controller can begin to wind up.

If the PID controller tracks the output of the inner loop, then its output never exceeds the saturated inner-loop output. To achieve this tracking, connect the Saturation block output to the tracking input of the PID Controller.

Bumpless Control Transfer

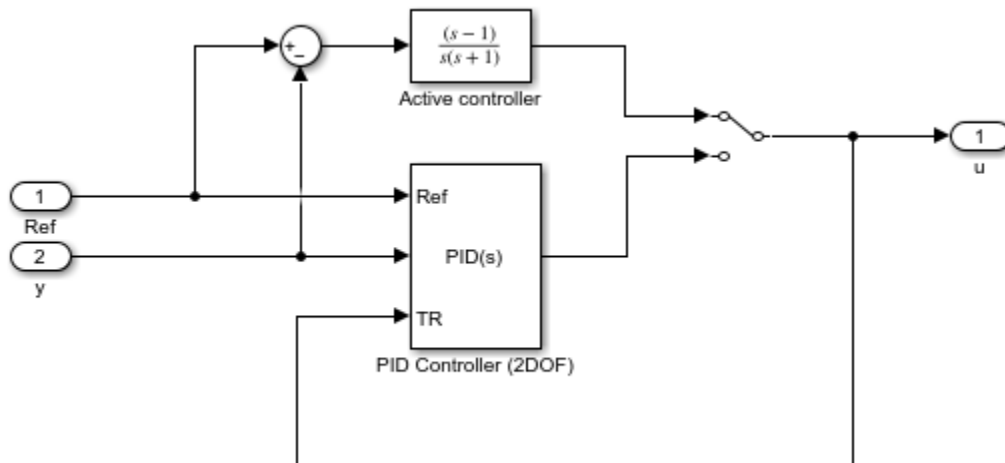

This example shows how to use signal tracking to achieve bumpless control transfer in a system that switches between a PID Controller block and another controller. You can make the PID controller track the output of the other controller by connecting the signal you want to track to the TR port of the PID Controller block. For example:

The input **In1** takes a reference signal that feeds both controllers. The output **Out1** drives a controlled system (not shown). A switch transfers control between the Active controller block (a Zero-Pole block) and the PID Controller block. When the Active controller is in the loop, the PID Controller block tracks its output. Thus, the two controllers have the same output when you switch to PID control, ensuring smooth operation.

Bumpless Control Transfer with a Two-Degree-of-Freedom PID Controller

This example shows how to use signal tracking to achieve bumpless control transfer in a system that switches between a PID Controller (2DOF) block and another controller. You can make the PID controller track the output of the other controller by connecting the signal you want to track to the TR port of the PID Controller block. For example:

The input Ref takes a reference signal, and the input y takes the measured feedback from the plant. These signals feed the 2DOF controller, and the difference between them feeds the Active controller block (a Zero-Pole block). The output u drives the plant. A switch transfers control between the active controller and the PID Controller (2DOF) block. When the Active controller is in the loop, the PID Controller (2DOF) block tracks its output. Thus, the two controllers have the same output when you switch to PID control, ensuring smooth operation.

Using a Bit Set block

If the Bit Set block is turned on for bit 2 bit 2 is set to 1.

A vector of constants $2.^{[0\ 1\ 2\ 3\ 4]}$ is represented in binary as [00001 00010 00100 01000 10000].

With bit 2 set to 1, the result is [00101 00110 00100 01100 10100], which is represented in decimal as [5 6 4 12 20].

Using a Bit Clear block

If the Bit Clear block is turned on for bit 2, bit 2 is set to 0.

A vector of constants $2.^{[0\ 1\ 2\ 3\ 4]}$ is represented in binary as [00001 00010 00100 01000 10000].

With bit 2 set to 1, the result is [00101 00110 00100 01100 10100], which is represented in decimal as [5 6 4 12 20].

With bit 2 set to 0, the result is [00001 00010 00000 01000 10000], which is represented in decimal as [1 2 0 8 16].

Two-Input AND Logic

This example builds a two-input AND function, which returns 1 when both input elements are 1, and 0 otherwise. To implement this function, specify the **Truth table** parameter value as [0; 0; 0; 1]. The portion of the model that provides the inputs to and the output from the Combinatorial Logic block might look like this:

The following table indicates the combination of inputs that generate each output. The input signal labeled **Input** corresponds to the column in the table labeled **Input 1**. Similarly, the input signal **Input 2** corresponds to the column with the same name. The combination of these values determines the row of the **Output** column of the table that is passed as block output. For example, if the input vector is [1 0], the input references the third row:

($2^{1*1} + 1$) The output value is 0.

Row	Input 1	Input 2	Output
1	0	0	0
2	0	1	0
3	1	0	0
4	1	1	1

Circuit Logic

This sample circuit has three inputs: the two bits (**a** and **b**) to be summed and a carry-in bit (**c**). It has two outputs: the carry-out bit (**c'**) and the sum bit (**s**).

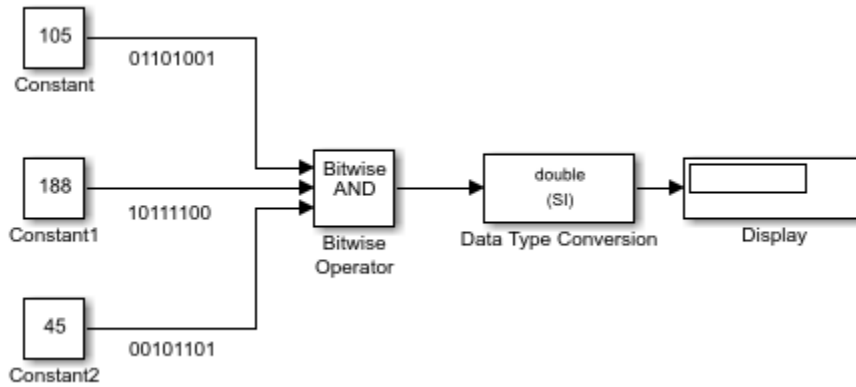

The truth table and corresponding outputs for each combination of input values for this circuit appear in the following table.

Inputs			Outputs	
a	b	c	c'	s
0	0	0	0	0
0	0	1	0	1
0	1	0	0	1
0	1	1	1	0
1	0	0	0	1
1	0	1	1	0
1	1	0	1	0
1	1	1	1	1

To implement this adder with the Combinatorial Logic block, you enter the 8-by-2 matrix formed by columns **c'** and **s** as the **Truth table** parameter. You can also implement sequential circuits (that is, circuits with states) with the Combinatorial Logic block by including an additional input for the state of the block and feeding the output of the block back into this state input.

Unsigned Inputs for the Bitwise Operator Block

The following model shows how the Bitwise Operator block works for unsigned inputs.

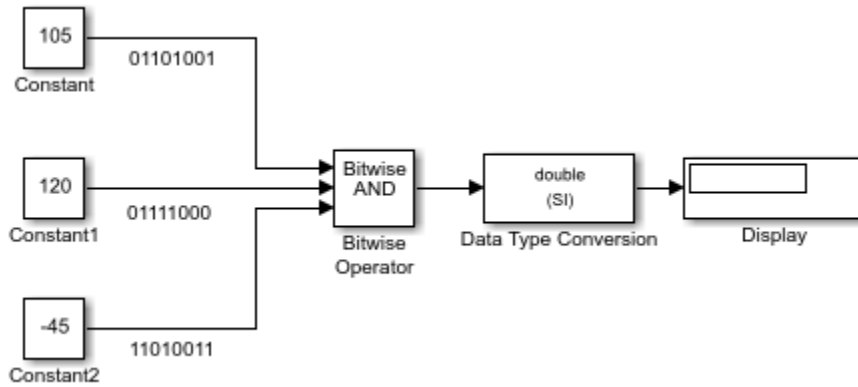

Each Constant block outputs an 8-bit unsigned integer (uint8). To determine the binary value of each Constant block output, use the dec2bin function. The results for all logic operations appear in the next table.

Operation	Binary Value	Decimal Value
AND	00101000	40
OR	11111101	253
NAND	11010111	215
NOR	00000010	2
XOR	11111000	248
NOT	N/A	N/A

Signed Inputs for the Bitwise Operator Block

The following model shows how the Bitwise Operator block works for signed inputs.

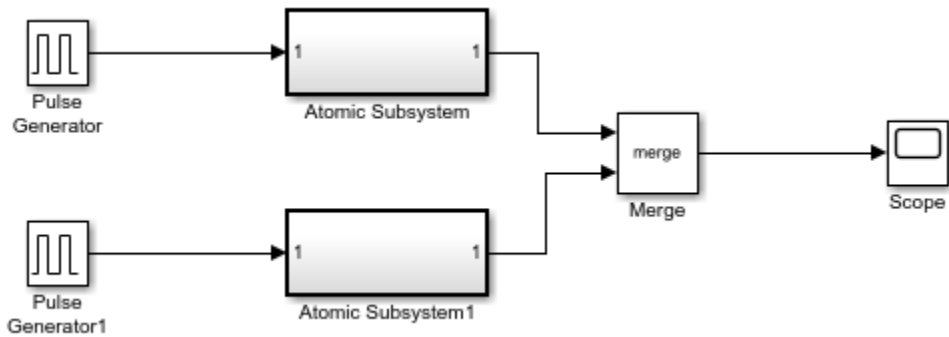

Each Constant block outputs an 8-bit signed integer (`int8`). To determine the binary value of each Constant block output, use the `dec2bin` function. The results for all logic operations appear in the next table.

Operation	Binary Value	Decimal Value
AND	01000000	64
OR	11111011	-5
NAND	10111111	-65
NOR	00000100	4
XOR	11000010	-62
NOT	N/A	N/A

Merge Block with Input from Atomic Subsystems

This example shows a Merge block with inputs from two atomic subsystems.

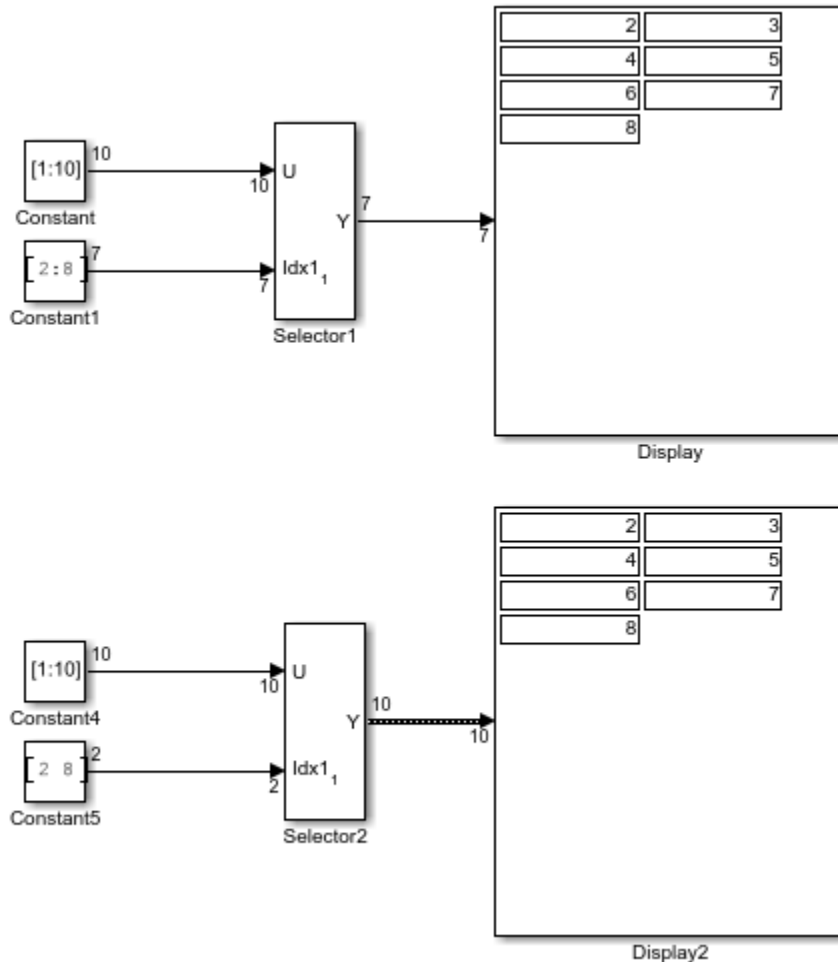

Each Atomic Subsystem block contains an enabled subsystem. This satisfies the requirement that inputs to a Merge block are from a conditionally executed subsystem.

Index Options with the Selector Block

This example shows two Selector blocks with the same kind of input signals, but two different **Index Option** settings.

Both Selector blocks select 7 values from the input signal that feeds the input port. The Selector1 block outputs a fixed-size signal, whereas the Selector2 block outputs a variable-size signal whose compiled signal dimension is 10 instead of 7.

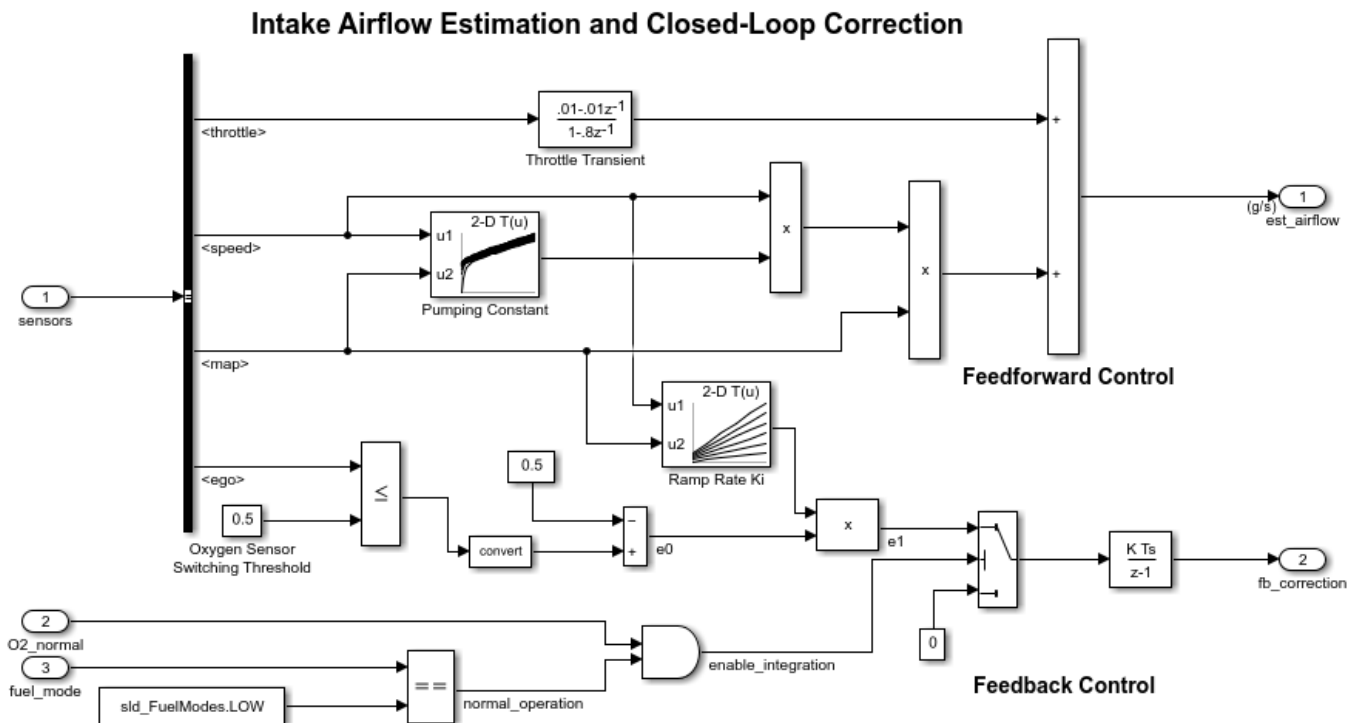

The Selector1 block sets **Index Option** to **Index vector (port)**, which uses the input signal from Constant1 as the index vector. The dimension of the input signal is 7, so the Display block shows the 7 values of the Constant1 block. The Selector2 block sets the **Input port size** parameter to 10, which is the size of the largest input signal to the Selector2 block.

The Selector2 block also sets the **Index Option** to **Starting and ending indices (port)**. The output is then set to the size of **Input port size** parameter (10), even though the size of the input signal is 7.

Switch Block with a Boolean Control Port Example

This example shows a Switch block with a Boolean input for the control port.

```
open_system('sldemo_fuelsys');
open_system('sldemo_fuelsys/fuel_rate_control/airflow_calc');
```

The value of the control port on the Switch block determines whether or not the feedback correction occurs. The control port value depends on the output of the Logical Operator block. When the Logical Operator block output is `true`, then the Switch block control port is 1 and the feedback control occurs. If the Logical Operator block output is `false` then the feedback control does not occur.

Merge Block with Unequal Input Widths Example

This example shows how to use the Merge block with inputs ports that have different widths. If you select **Allow unequal port widths**, the block accepts scalar and vector inputs having differing numbers of elements. You can specify an offset for each input signal relative to the beginning of the output signal. The width of the output signal is:

$$\max(w_1 + o_1, w_2 + o_2, \dots, w_n + o_n)$$

where w_n are the widths of the input signals, and o_n are the offsets.

The Merge block has the following output width.

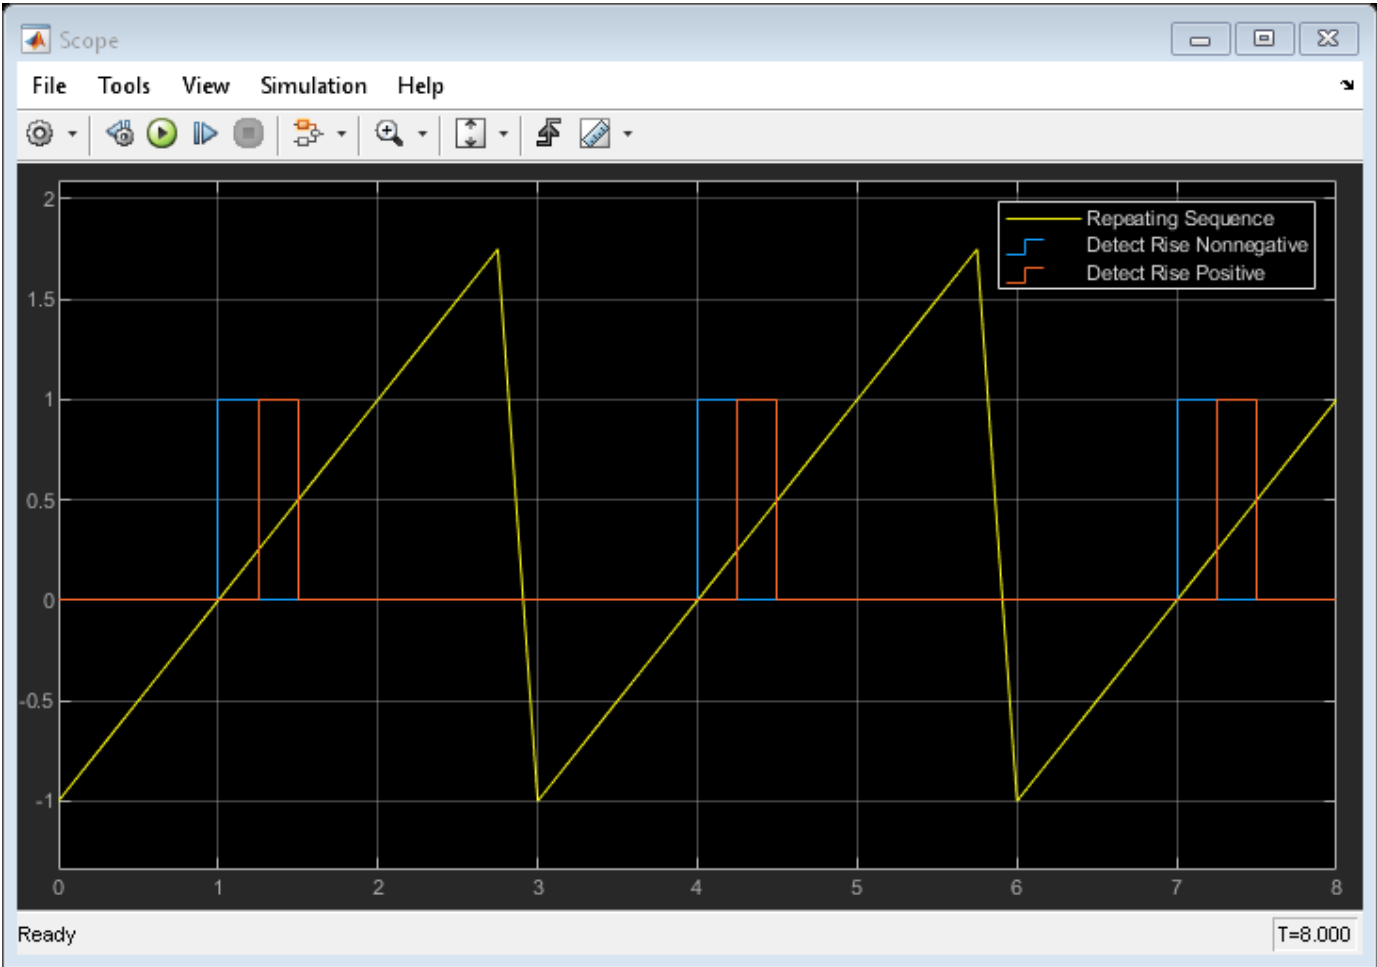

$$\max(2 + 0, 2 + 1) = 3$$

In this example, the offset of $v1$ is 0 and the offset of $v2$ is 1. The Merge block maps the elements of $v1$ to the first two elements of $v3$ and the elements of $v2$ to the last two elements of $v3$. Only the second element of $v3$ is effectively merged, as show in the scope output.

If you use Simplified Initialization Mode, you must clear the `Allow unequal port widths` check box. The input port offsets for all signals must be zero.

Detect Rising Edge of Signals

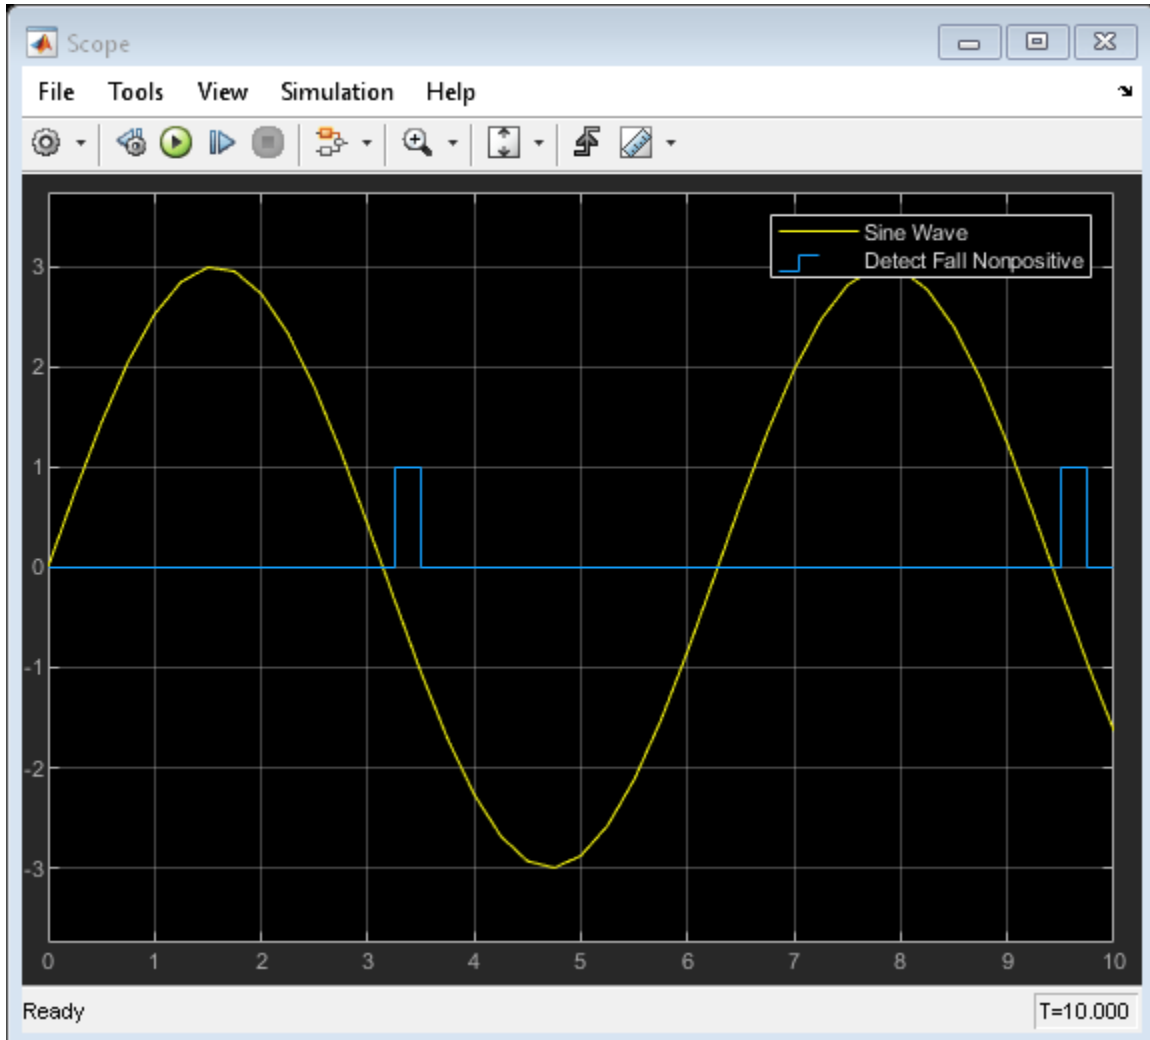

This example shows how to detect the rising edge of a signal using the Detect Rise Nonnegative and Detect Rise Positive blocks.

With a fixed-step size of 0.25, this example illustrates the difference between the Detect Rise Nonnegative and Detect Rise Positive blocks. The Detect Rise Nonnegative block outputs true (1) at $t=1$ because the input signal increased from a negative value to a nonnegative value (0). The Detect Rise Positive block outputs true (1) at $t=1.25$ because the input signal increased from a nonpositive value (0) to a strictly positive value.

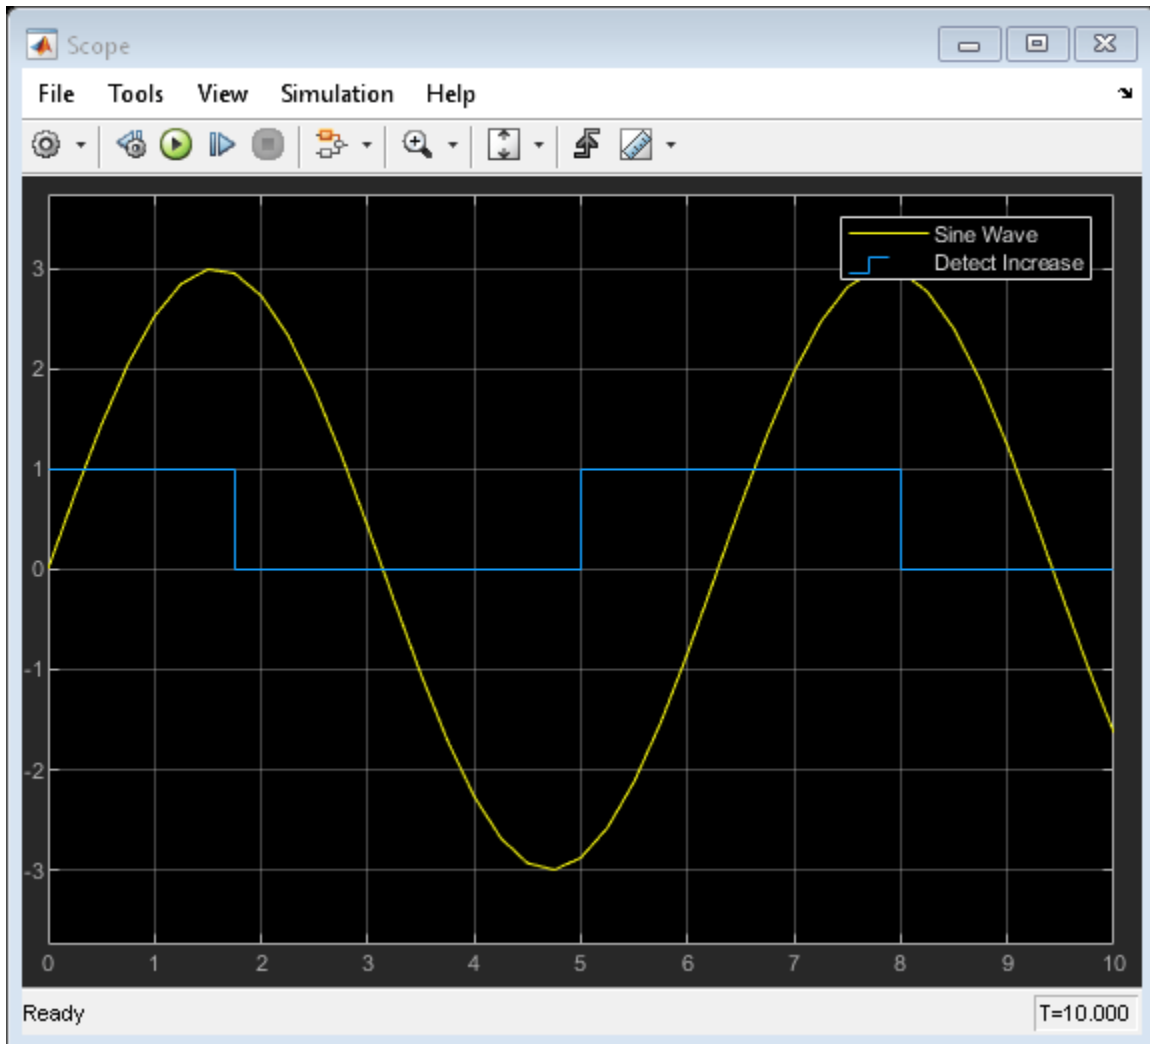

Detect Falling Edge Using the Detect Fall Nonpositive Block

This example shows how to use the Detect Fall Nonpositive block to detect a falling edge in the input signal. The block detects a falling edge when the signal value decreases from a strictly positive value to a nonpositive value. In this example, the **Initial condition** of the Detect Fall Nonpositive block is set to 1. This means that the Boolean expression $U/z \leq 0$ evaluates to true and the block assumes the initial value of the input signal is nonpositive.

Detect Increasing Signal Values with the Detect Increase Block

This example shows how to use the Detect Increase Block to detect increasing signal values. Because the **Initial condition** is set to -1, the block detects an increasing signal value starting at time $t=0$. If you change the **Initial condition** parameter to a nonnegative value, the block detects the first increasing signal value at $t=0.25$.

Extract Bits from Stored Integer Value

This example shows how to extract specific bits from the stored integer value of an input signal.

Detect Signal Values Within a Dynamically Specified Interval

This example shows how to detect when an input signal falls within a dynamically specified interval. The interval is defined by two Sine Wave blocks. When the input to the Interval Test Dynamic block falls between those sine waves, the Interval Test Dynamic block outputs true (1).

Model a Digital Thermometer Using the Polynomial Block

This example shows how the `ex_sl-demo_boiler` model uses the Polynomial block.

In the Boiler Plant model/digital thermometer subsystem, the Polynomial Block models a first-order polynomial using the coefficients [0.05 0.75]

This subsystem models a digital thermometer composed of a simple temperature sensor and an ADC. The transfer function of the sensor is:

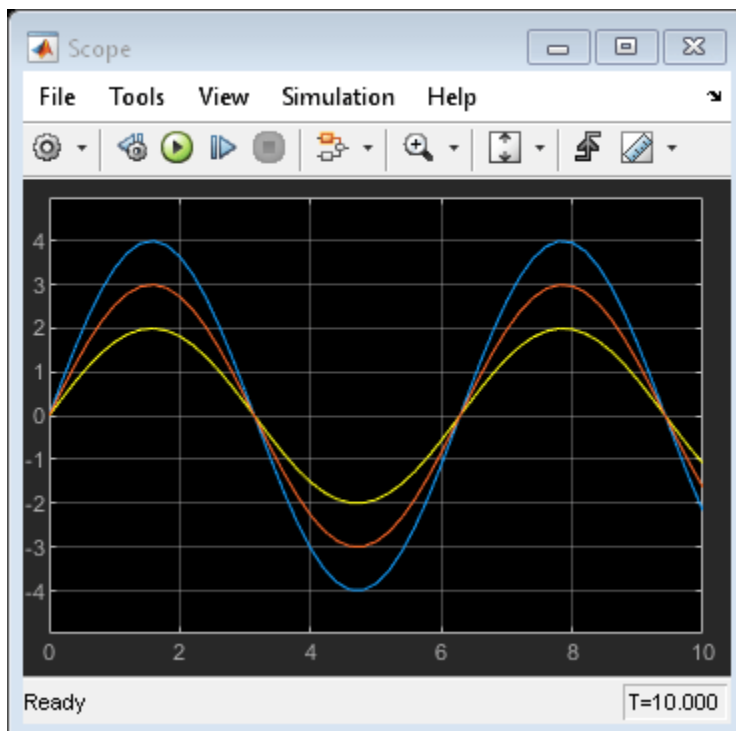

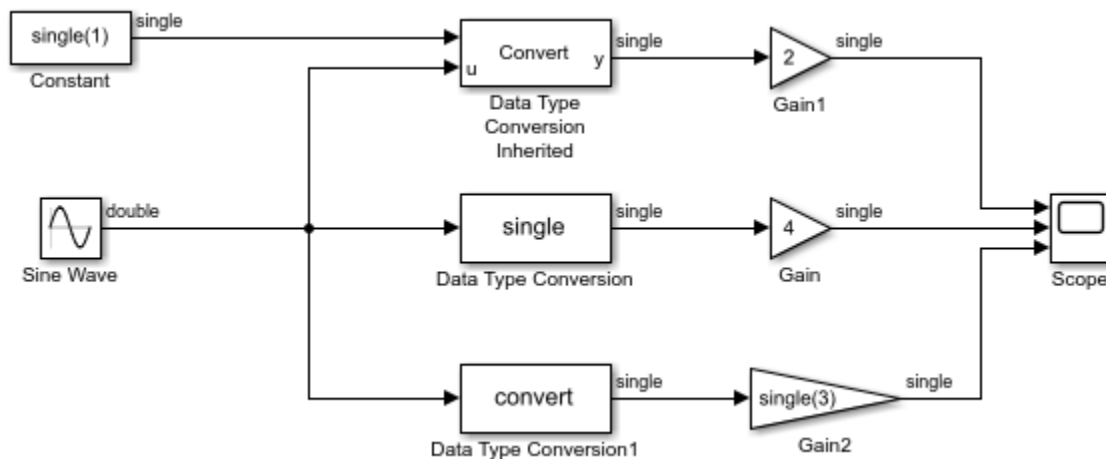

$$V = .05 * T + 0.75$$

for T in degrees C.

The conversion block inverts the combined transfer function of the sensor and ADC so that the output is an `sfix(8)` code representing T in degrees C.

Convert Data Types in Simulink Models

This example shows three different methods of converting data types in your model using the Data Type Conversion and Data Type Conversion Inherited blocks. In this model, a Sine Wave block generates the input signal. The Sine Wave block only outputs double-precision data types, so to generate a sine wave with a data type of single, you must perform a data type conversion.

In the first row, the Data Type Conversion Inherited block uses the data type coming from the Constant block (`single`) as the reference data type, and converts the sine wave to `single`.

In the second row, the Data Type Conversion block has the **Output data type** set to `single`, and the sine wave is converted accordingly.

In the third row, the Data Type Conversion1 block has the **Output data type** set to **Inherit**: **Inherit via back propagation**. Because the downstream Gain2 block has a data type of single, the Data Type Conversion1 block converts the sine wave to a data type of single.

Control Data Types with the Data Type Duplicate Block

This example shows how to control data types in your model using the Data Type Duplicate block. In this model, the data type of the Constant block (currently `single`) drives the data types throughout the model.

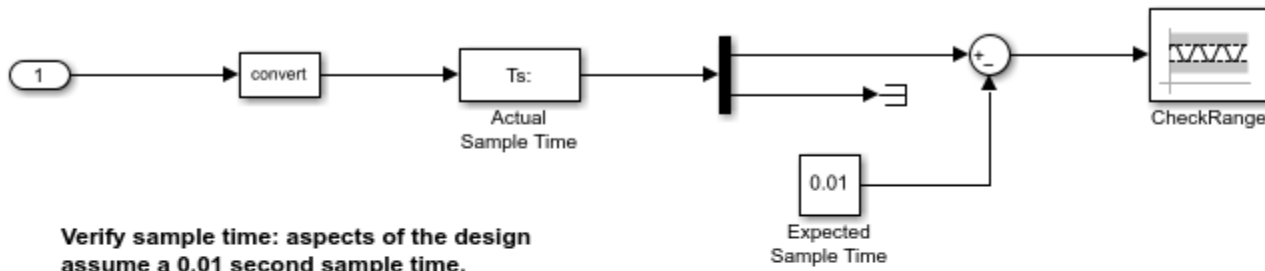

The Constant1 block has its **Output data type** parameter set to `Inherit: Inherit via back propagation`. Because the Constant1 and Constant blocks are both connected to the Data Type Duplicate block, the Constant1 block can inherit its data type from the Constant block. The Sum block has its **Output data type** set to `Inherit: Same as first input`, so it is also able to inherit its data type from the Constant block.

If you change the data type of the Constant block from `single` to `int32`, the `int32` data type propagates throughout the model.

Probe Sample Time of a Signal

The `sldemo_fuelsys` model shows how to check the sample time of a signal using the Probe block. This enables you to verify that the sample time matches the assumed value of the design.

The contents of this subsystem are excluded from the code Simulink Coder generates.

To work correctly this system must continue to

- * Contain no output ports
- * Enable its 'Treat as Atomic Unit' parameter
- * Specify its 'Mask type' parameter as "VerificationSubsystem"

Convert Signals Between Continuous Time and Discrete Time

The `sldemo_fuelsys` model shows how to use the Rate Transition block to convert signals between continuous time and discrete time.

[Open the Dashboard](#) subsystem to simulate any combination of sensor failures. Copyright 1990-2017 The MathWorks, Inc.

In the `To Controller` subsystem, the Rate Transition block converts the signal from continuous time to discrete time. This discrete-time signal can then be processed by the `fuel_rate_control` subsystem.

The To Plant subsystem uses the Rate Transition block to convert the discrete-time output of the fuel_rate_control subsystem back to continuous time.

- This system:
- Permits upstream signal data type to change
 - Converts signals from discrete to continuous time

Convert Mux Signal to Vector

This example shows how to use the Signal Conversion block to convert a mux signal to a vector.

Copyright 2011 The MathWorks, Inc.

The Mux block creates a mux signal that is input to the Signal Conversion block. To convert the mux signal to a vector, the **Output** parameter of the Signal Conversion block is set to `Signal copy`. The vector output from the Signal Conversion block is input to the Display block.

Convert Virtual Bus to Nonvirtual Bus

This example shows how to use the Signal Conversion block to convert a virtual bus to a nonvirtual bus.

Copyright 2011-2021 The MathWorks, Inc.

The Bus Creator block creates a virtual bus that is input to the Signal Conversion block. To convert the virtual bus to a nonvirtual bus, the Signal Conversion block has its **Output** parameter set to **Nonvirtual bus** and its **Data type** parameter set to a **Simulink.Bus** object. The specified **Bus** object matches the bus hierarchy of the bus from the Bus Creator block. The nonvirtual bus output from the Signal Conversion block is input to the Bus Selector block.

Remove Scaling from a Fixed-Point Signal

This example shows how to strip the scaling from a fixed-point input signal. To do so, the Data Type Scaling Strip block maps the input to the smallest built-in data type that has enough data bits to hold the input. The stored integer value of the input is the value of the output.

Stop Simulation Block with Relational Operator Block

This example shows how to control when a simulation stops by using a Stop Simulation block with a Relational Operator block. When you simulate the model, the model stops simulation when the simulation time reaches 10.

Output Simulation Data with Blocks

This example shows how To Workspace and To File blocks write data to the workspace and to a file respectively.

Open Example Model

```
open_system('ex_ToWorkspace_ToFile');
```

Output Simulation Data with Blocks

Copyright 1990-2018 The MathWorks, Inc.

Simulate with Default Parameter Values

1. To name the output variables and file, modify the **Variable name** and **File name** block parameter values by using the Block Parameters dialog boxes or the command line.

```
set_param('ex_ToWorkspace_ToFile/To Workspace',...
    'VariableName','simoutToWorkspace')
```

```
set_param('ex_ToWorkspace_ToFile/To File',...
    'FileName','simoutToFile.mat',...
    'MatrixName','simoutToFileVariable')
```

2. Simulate the model.

```
out = sim('ex_ToWorkspace_ToFile');
```

3. To view the input signal for the To Workspace and To File blocks, open the scope viewer.

4. To access the data stored by the To File block, load the output file.

```
load('simoutToFile.mat')
```

5. Plot the data stored by the To Workspace and To File blocks.

```
subplot(2,1,1)
plot(out.simoutToWorkspace,'-o')
legend('simoutToWorkspace')
```

```
subplot(2,1,2)
plot(simoutToFileVariable,'-o')
legend('simoutToFileVariable')
```

As shown by the plots, the data stored by each block is the same given the default block parameter values.

Simulate with Custom Parameter Values

1. To keep the data from the previous simulation, specify new names for the output variables and file.

```
set_param('ex_ToWorkspace_ToFile/To Workspace',...
    'VariableName', 'simoutToWorkspace2')
```

```
set_param('ex_ToWorkspace_ToFile/To File',...
    'FileName', 'simoutToFile2.mat',...
    'MatrixName', 'simoutToFileVariable2')
```

2. To change the amount of data collected, modify the **Limit data points to last**, **Decimation**, and **Sample time** block parameter values.

```
set_param('ex_ToWorkspace_ToFile/To Workspace',...
    'MaxDataPoints', '3',...
    'Decimation', '20',...
    'SampleTime', '0.5')
```

```
set_param('ex_ToWorkspace_ToFile/To File',...
    'Decimation', '20',...
    'SampleTime', '1')
```

The To File block does not provide the option to limit data points to the last data points collected.

3. Select **Single simulation output**, then modify the **Logging intervals** configuration parameter value.

```
set_param('ex_ToWorkspace_ToFile',...
    'ReturnWorkspaceOutputs','on',...
    'LoggingIntervals','[20,90]')
```

4. Simulate the model.

```
out = sim('ex_ToWorkspace_ToFile');
```

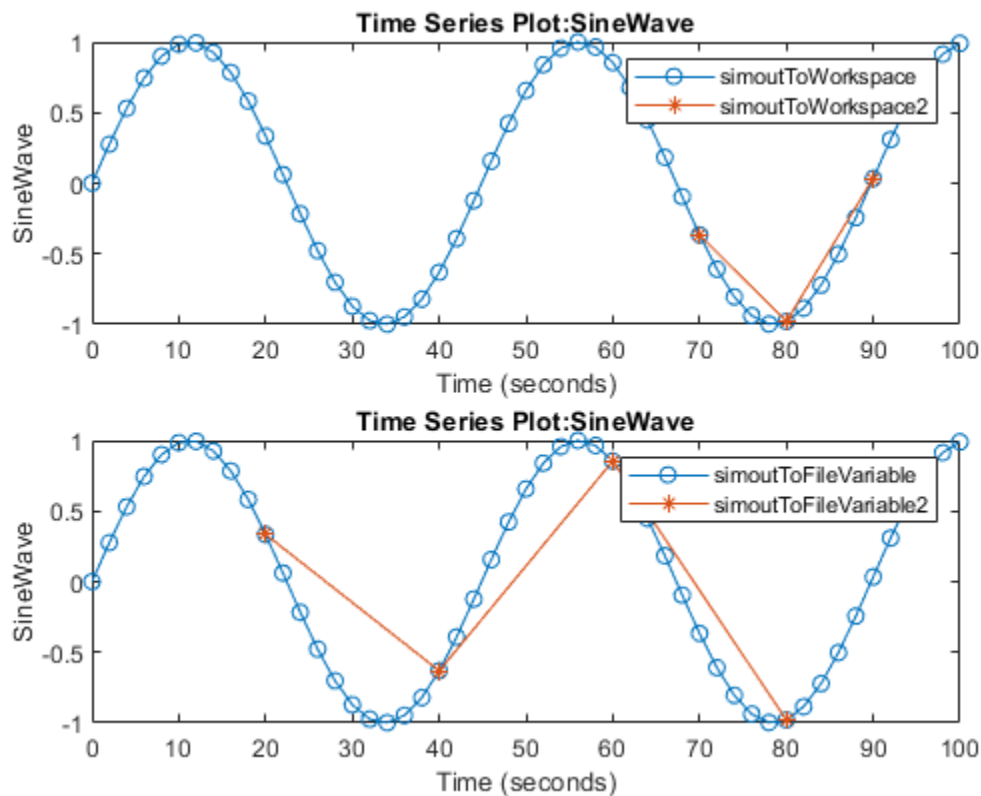

5. To access the data stored by the To File block, load the output file.

```
load('simoutToFile2.mat')
```

6. Plot the data stored by the To Workspace and To File blocks.

```
subplot(2,1,1)
hold on
plot(out.simoutToWorkspace2,'-*','DisplayName','simoutToWorkspace2')
hold off
```

```
subplot(2,1,2)
hold on
plot(simoutToFileVariable2,'-*','DisplayName','simoutToFileVariable2')
hold off
```

In this example, the To Workspace block collects data at 20, 30, 40, ..., 90 seconds. The data represents every 20th sample time within the logging intervals. When the simulation is completed or

paused, the To Workspace block writes only the last three collected sample points to the workspace: 70, 80, and 90 seconds.

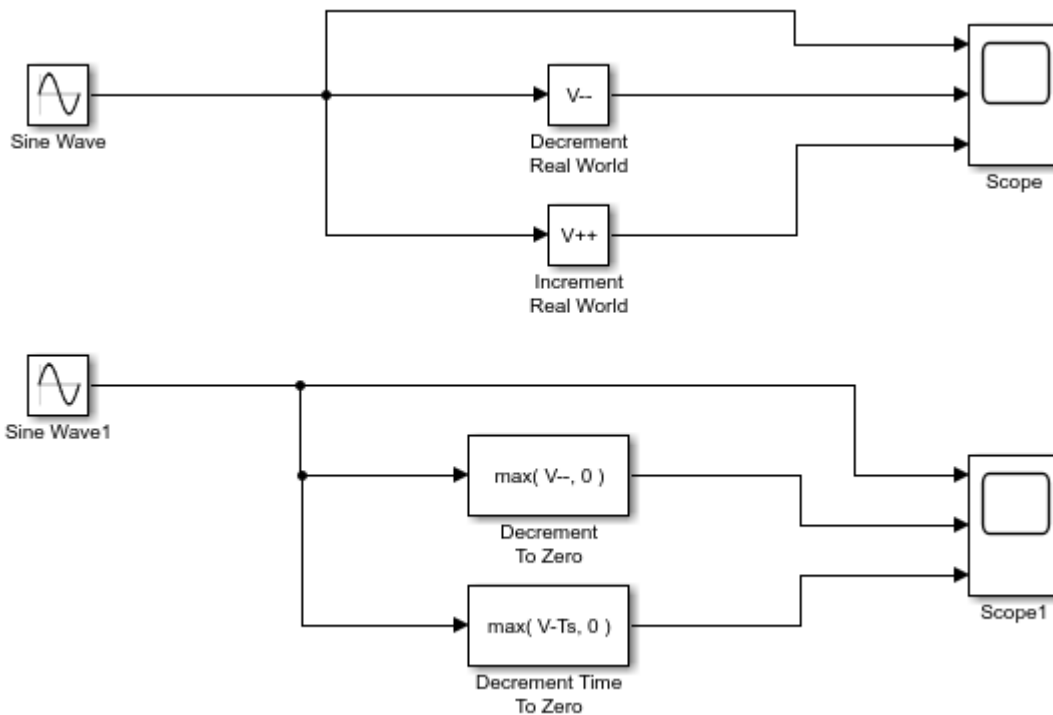

The To File block collects data at 20, 40, 60, and 80 seconds. The data similarly represents every 20th sample time within the logging intervals. However, the sample time for the To File block is double the sample time for the To Workspace block.

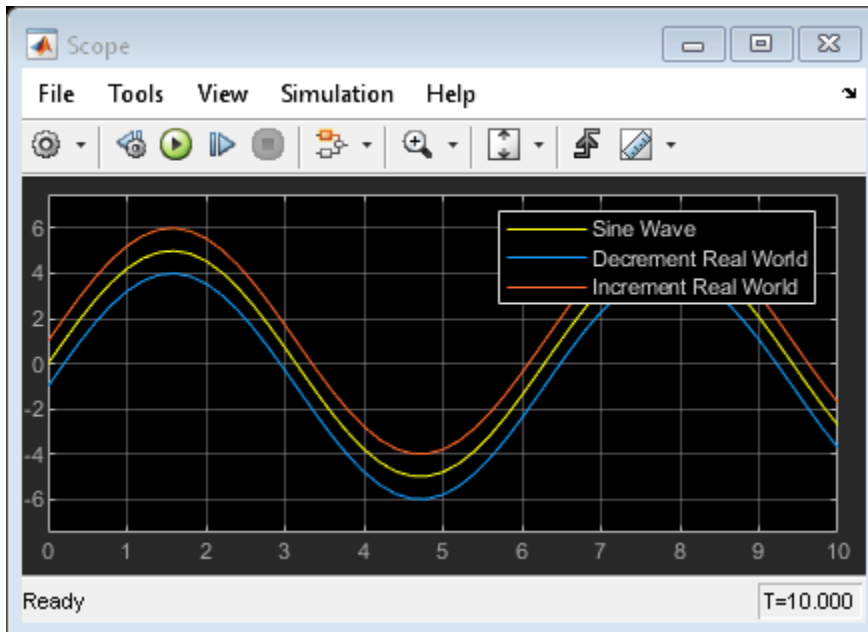

Increment and Decrement Real-World Values

This example shows how to increase and decrease the real-world value of a signal using the following blocks:

- Increment Real World
- Decrement Real World
- Decrement Time To Zero
- Decrement To Zero

The Scope block shows the output of a Sine Wave block with amplitude 5, as well as the real-world value of that signal incremented and decremented by one.

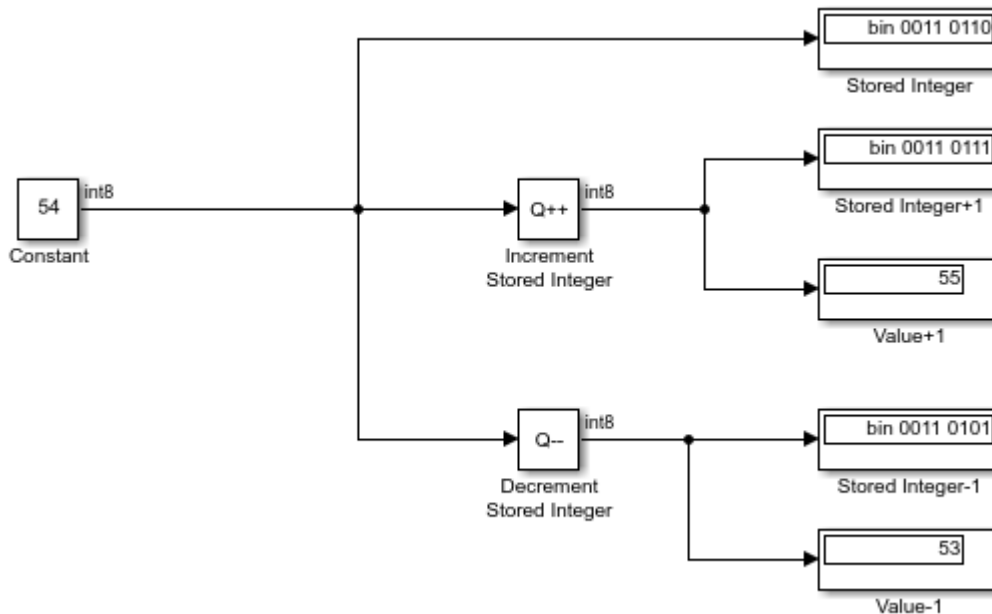

The Scope1 block shows the output of a Sine Wave block with amplitude 3, as well as the output of the Decrement To Zero and Decrement Time To Zero blocks:

- The Decrement To Zero block decreases the input sine wave signal by one, and ensures the value never goes below zero.
- The Decrement Time To Zero block decreases the input sine wave signal by the sample time, T_s , and ensures that the value never goes below zero.

Increment and Decrement Stored Integer Values

This example shows how to increase and decrease the stored integer value of a signal by one.

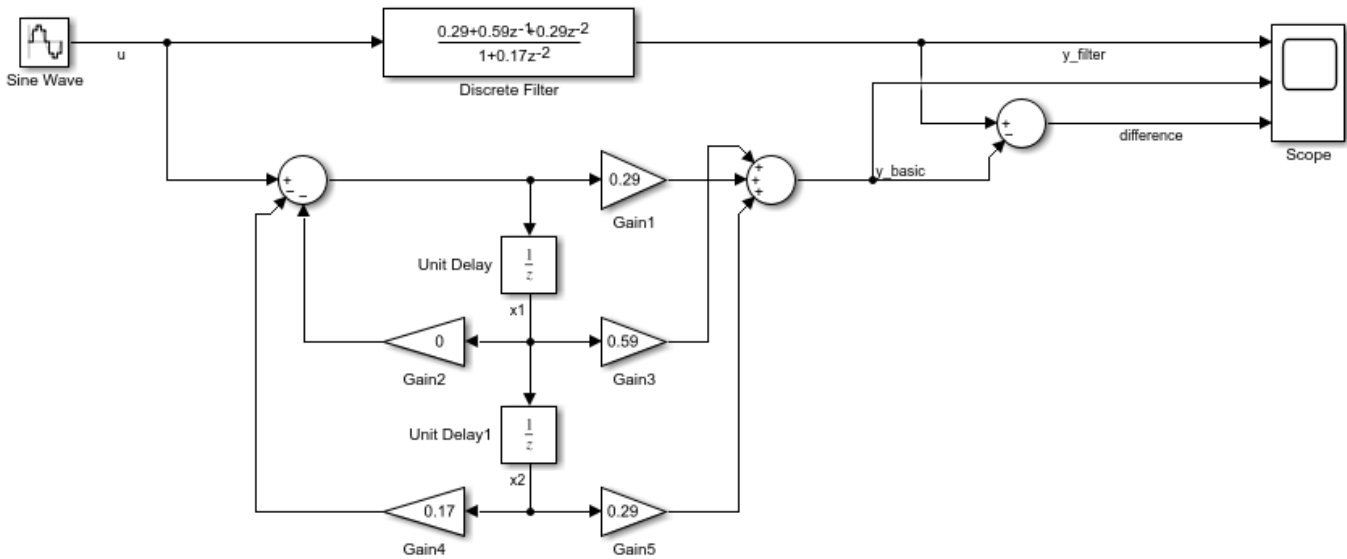

- The Increment Stored Integer block increases the stored integer value of the input signal by one.
- The Decrement Stored Integer block decreases the stored integer value of the input signal by one.

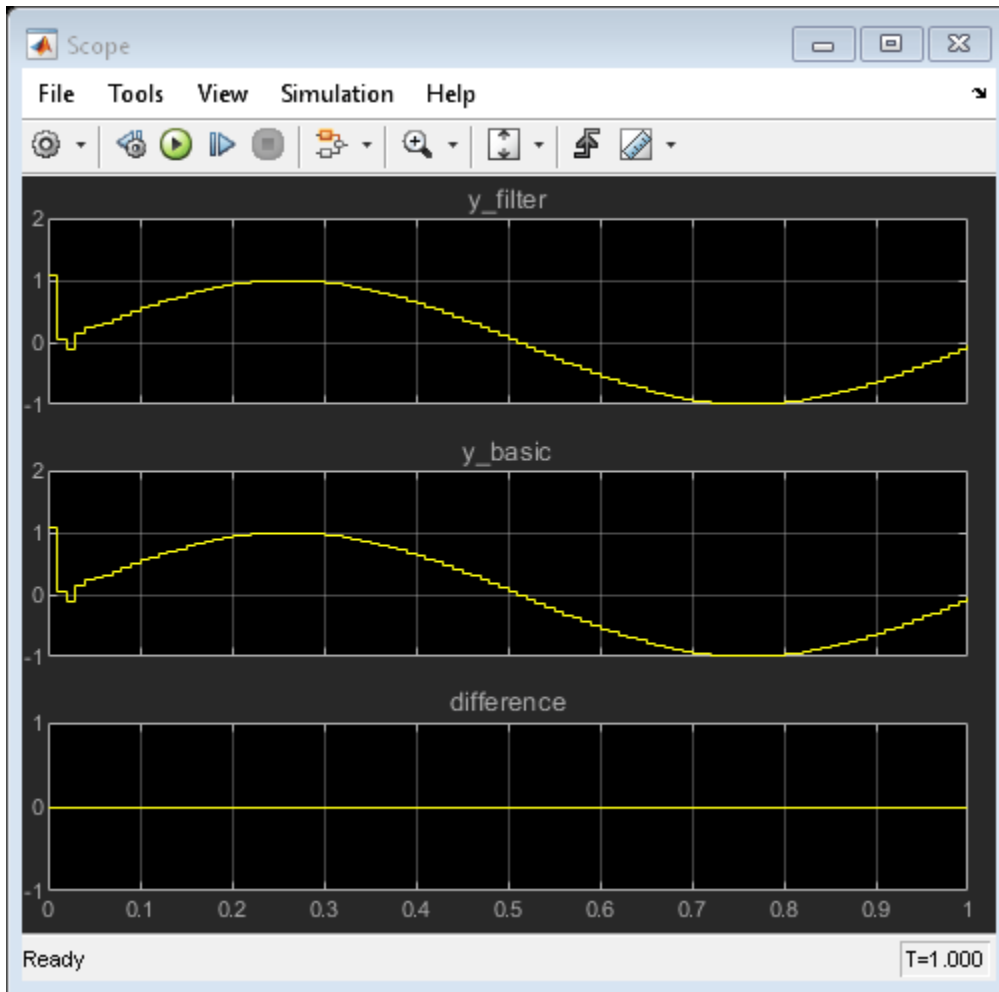

If you change the value of the input signal to 127 (the maximum value representable by an `int8` data type), incrementing the stored integer value by one causes an overflow. Because overflows in the Increment and Decrement Stored Integer blocks always wrap, the Increment Stored Integer block will output a value of -128.

Specify a Vector of Initial Conditions for a Discrete Filter Block

This example shows how to specify a vector of non-zero initial conditions for the Discrete Filter block.

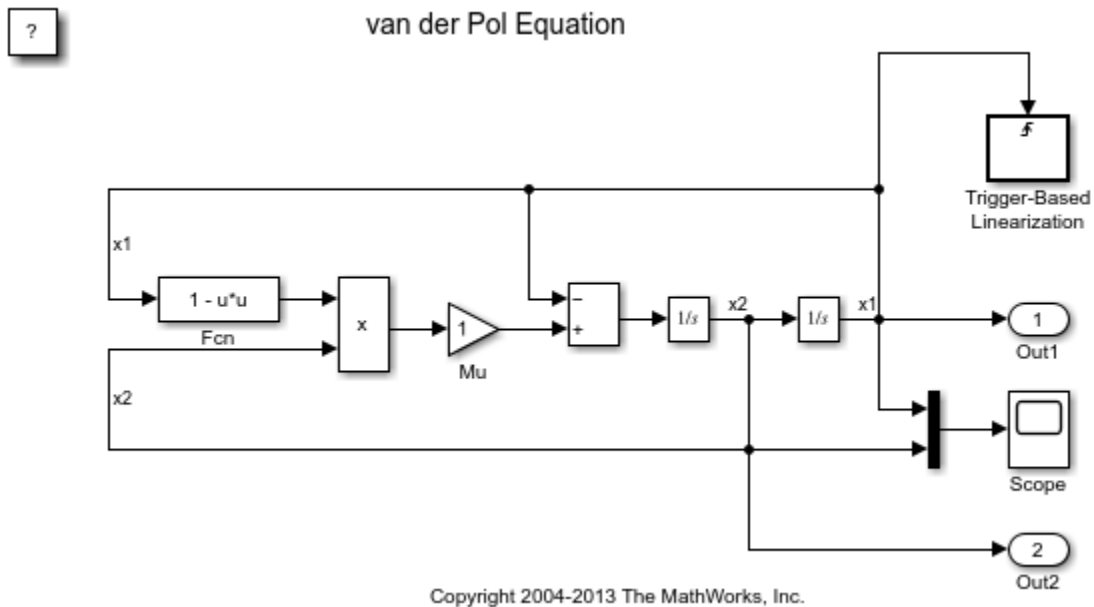

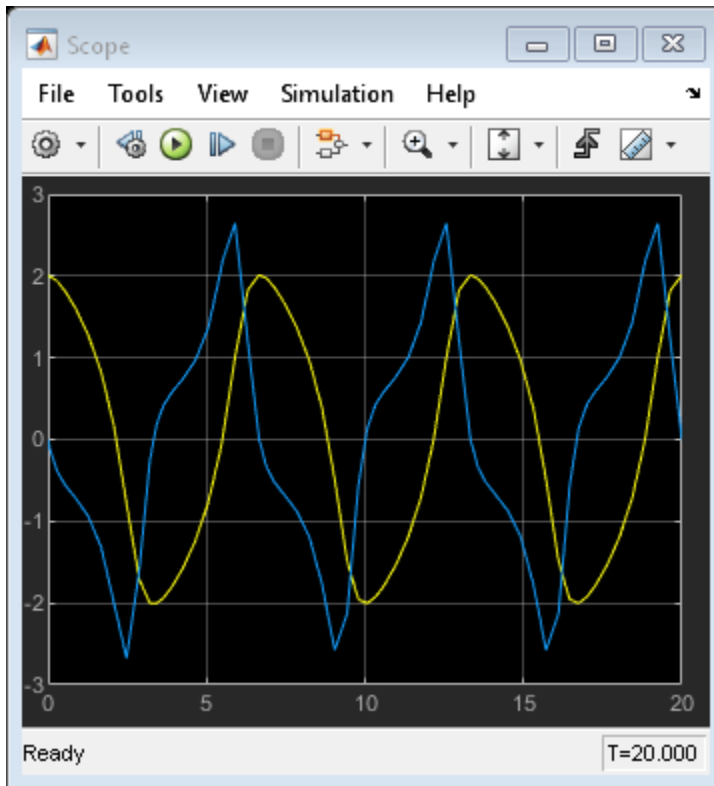

The Scope shows that with the **Initial states** of the Discrete Filter block set to $[1 \ 2]$, the difference between the signal filtered by the Discrete Filter block and the signal from the filter's building blocks is zero. This demonstrates that you can enter the initial conditions of the Discrete Filter block as a vector of $[1 \ 2]$. As an alternative, to achieve the same result, you can set the initial condition of Unit Delay to 1 and Unit Delay1 to 2.

Generate Linear Models for a Rising Edge Trigger Signal

You can use state and simulation time logging to extract the model states at operating points. In this example, the model is configured to get the states when the x1 signal triggers the Trigger-Based Linearization block on a rising edge.

In this model, the **Trigger type** of the Trigger-Based Linearization block is set to **rising**. On the Data Import/Export pane of the Model Configuration Parameters dialog box, the States and Time check boxes are selected.

After simulating the model, the following variables appear in the MATLAB workspace:

- `ex_vdp_triggered_linearization_Trigger_Based_Linearization`
- `tout`
- `xout`

To get the index to the first operating point time, execute the following command:

```
ind1 = find(ex_vdp_triggered_linearization_Trigger_Based_Linearization(1).OperPoint.t==tout);
```

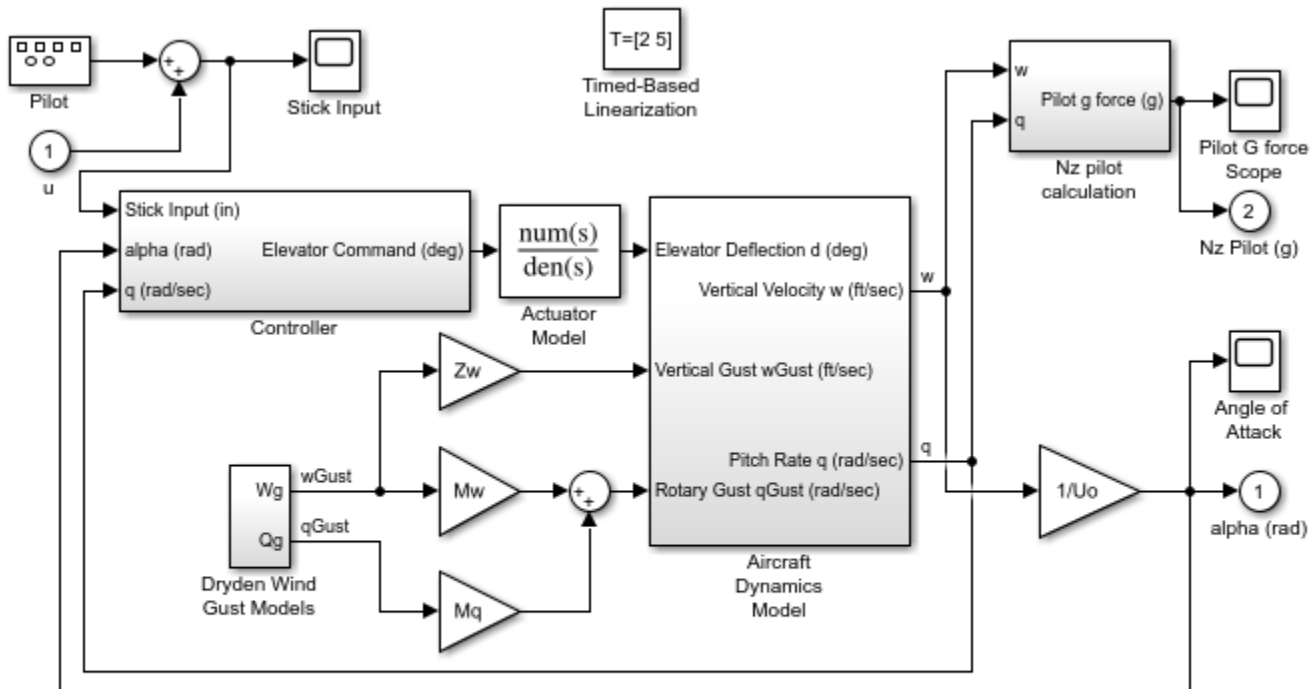

To get the state vector at this operating point, execute the following command:

```
x1 = xout(ind1,:);
```

Generate Linear Models at Predetermined Times

This example shows how to use the Timed-Based Linearization block to generate linear models at predetermined times.

In this model, the **Linearization time** of the Timed-Based Linearization block is set to [2 5]. On the Data Import/Export pane of the Model Configuration Parameters dialog box, the States and Time check boxes are selected. These settings enable you to get the states of the model at the simulation times of 2 and 5 seconds.

F-14 Flight Control

Copyright 1990-2014 The MathWorks, Inc.

After simulating the model, the following variables appear in the MATLAB workspace:

- `ex_f14_linearization_Timed_Based_Linearization`
- `tout`
- `xout`

To get the indices to the operating point times, execute the following command:

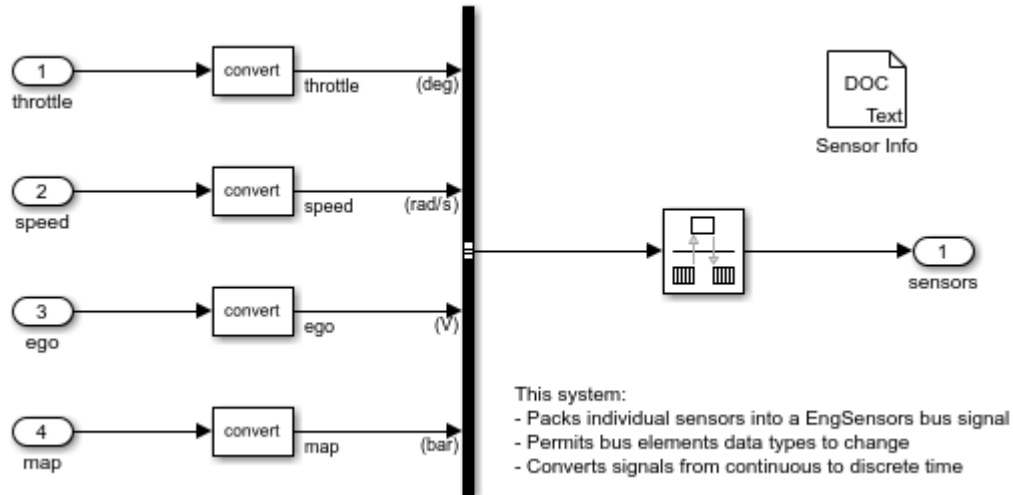

```
ind1 = find(ex_f14_linearization_Timed_Based_Linearization(1).OperPoint.t==tout);
```

To get the state vectors at the operating points, execute the following command:

```
ind2 = find(ex_f14_linearization_Timed_Based_Linearization(1).OperPoint.t==tout);
```

Capture Measurement Descriptions in a DocBlock

This example shows how to use a DocBlock to capture information about a model. In the `sldemo_fuelsys` model, a DocBlock labeled `Sensor Info` is used to document measurement descriptions inside of the `To_Controller` subsystem.

Square Root of Negative Values

This example shows how to compute the square root of a negative-valued input signal as complex-valued output.

ans =

```
Simulink.SimulationOutput:  
    tout: [51x1 double]  
  
SimulationMetadata: [1x1 Simulink.SimulationMetadata]  
ErrorMessage: [0x0 char]
```

By setting the **Function** to `sqrt` and **Output signal type** to `complex`, the block produces the correct result of $0 + 10i$ for an input of -100 . If you change the **Output signal type** to `auto` or `real`, the block outputs `NaN`.

Signed Square Root of Negative Values

This example shows how to compute the signed square root of a negative-valued input signal.

ans =

```
Simulink.SimulationOutput:
      tout: [51x1 double]

SimulationMetadata: [1x1 Simulink.SimulationMetadata]
ErrorMessage: [0x0 char]
```

When the block input is negative and you set the **Function** to `signedSqrt`, the Sqrt block output is the same for any setting of the **Output signal type** parameter. By setting the **Numerica display format** of the first Display block to `decimal (Stored Integer)`, you can see the value of the imaginary part for the complex output.

rSqrt of Floating-Point Inputs

This example shows how to compute the rSqrt of a floating-point input signal. The Sqrt block has the following settings:

- **Method** = Newton-Raphson
- **Number of iterations** = 1
- **Intermediate results data type** = Inherit: Inherit from input

After one iteration of the Newton-Raphson algorithm, the block output is within 0.0004 of the final value (0.4834).

ans =

```
Simulink.SimulationOutput:  
    tout: [51x1 double]  
  
SimulationMetadata: [1x1 Simulink.SimulationMetadata]  
ErrorMessage: [0x0 char]
```

rSqrt of Fixed-Point Inputs

This example shows how to compute the rSqrt of a fixed-point input signal. The Sqrt block has the following settings:

- **Method** = Newton-Raphson
- **Number of iterations** = 1
- **Intermediate results data type** = Inherit: Inherit from input

After one iteration of the Newton-Raphson algorithm, the block output is within 0.0459 of the final value (0.4834).

ans =

```
Simulink.SimulationOutput:  
    tout: [51x1 double]  
  
SimulationMetadata: [1x1 Simulink.SimulationMetadata]  
ErrorMessage: [0x0 char]
```

Model a Series RLC Circuit

Physical systems can be described as a series of differential equations in an implicit form,

$$F(t, x, \{\dot{x}\}) = 0, \text{ or in the implicit state-space form } E\dot{x} = Ax + Bu$$

If E is nonsingular, then the system can be easily converted to a system of ordinary differential equations (ODEs) and solved as such:

$$\dot{x} = (E^{-1}A)x + (E^{-1}B)u$$

Many times, states of a system appear without a direct relation to their derivatives, usually representing physical conservation laws. For example:

$$\begin{aligned} \dot{x}_1 &= x_2 \\ 0 &= x_1 + x_2 \end{aligned}$$

In this case, E is singular and cannot be inverted. This class of systems are commonly called *descriptor* systems and the equations are called differential-algebraic equations (DAEs).

Series RLC Circuit

Consider the simple series RLC circuit.

From Kirchoff's Voltage Law, the voltage drop across the circuit is equal to the sum of the voltage drop across each of its elements:

$$V_{AC} = V_R + V_L + V_C$$

From Kirchoff's Current Law:

$$I_{AC} = I_R = I_L = I_C$$

where the subscripts R , L , and C denote the resistance, inductance, and capacitance respectively.

$$V_R = I(t)R$$

$$V_L = LI_L \text{ or } \dot{I}_L = \frac{1}{L}V_L$$

$$V_C = V_{AC}(0) + \int_0^t I_C(\tau) d\tau \text{ or } \dot{V}_c = \frac{1}{C}I_c$$

In Implicit State-Space Form

Model the system in Simulink with $R = 10 \Omega$, $L = 1 \times 10^{-6} H$, $C = 1 \times 10^{-4} F$ to find the voltage across the resistor V_R . To use the Descriptor State-Space block, the system can be written in the implicit, or *descriptor*, state-space form $E\dot{x} = Ax + Bu$ as shown below.

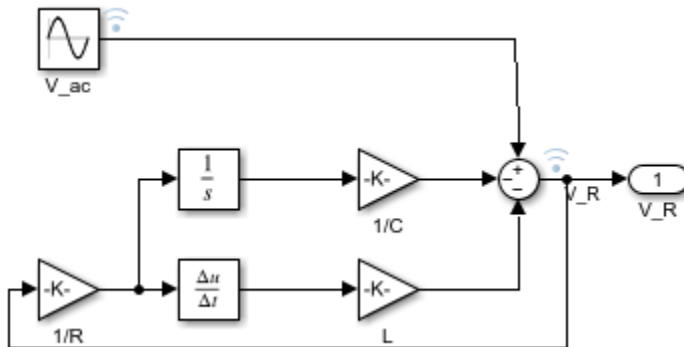

$$\begin{bmatrix} 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} \dot{V}_C \\ \dot{V}_L \\ \dot{V}_R \\ \dot{I}_L \\ \dot{I}_{AC} \end{bmatrix} = \begin{bmatrix} 0 & 0 & 0 & \frac{1}{C} & 0 \\ 1 & 1 & 1 & 0 & 0 \\ 0 & 0 & -1 & R & 0 \\ 0 & \frac{1}{L} & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & -1 \end{bmatrix} \begin{bmatrix} V_C \\ V_L \\ V_R \\ I_L \\ I_{AC} \end{bmatrix} + \begin{bmatrix} 0 \\ -1 \\ 0 \\ 0 \\ 0 \end{bmatrix} V_{AC}$$

where $x = [V_C \ V_L \ V_R \ I_L \ I_{AC}]^T$ is the state vector.

Set $C = [0 \ 0 \ 1 \ 0 \ 0]$ since the voltage across the resistor is being measured.

Compare this to modeling the system with an algebraic loop in order to find V_R .

The simulation of both models produces identical results. However, the Descriptor State-Space block allows you to make a simpler block diagram and avoid algebraic loops.

Extract Vector Elements and Distribute Evenly Across Outputs

This example shows how you can use the Demux block to distribute an input signal evenly over the desired number of outputs. For an input vector of length 6, when you set the **Number of outputs** parameter to 3, the Demux block creates three output signals, each of size 2.

Copyright 2018 The MathWorks, Inc.

See Also

Demux

Extract Vector Elements Using the Demux Block

When using the Demux block to extract and output elements from a vector input, you can use -1 in a vector expression to indicate that the block dynamically sizes the corresponding port. When a vector expression comprises both positive values and -1 values, the block assigns as many elements as needed to the ports with positive values. The block distributes the remaining elements as evenly as possible over the ports with -1 values.

In this example, the **Number of outputs** parameter of the Demux block is set to [-1, 3, -1]. Thus, the block outputs three signals where the second signal always has three elements. The sizes of the first and third signals depend on the size of the input signal. For an input vector with seven elements, the Demux block outputs two elements on the first port, three elements on the second port, and two elements on the third port.

Function-Call Feedback Latch on Feedback Signal Between Child and Parent

In this model, the Function-Call Feedback Latch block is on the feedback signal between the child and the parent. This arrangement prevents the signal value, read by the parent (FCSS1), from changing during execution of the child. In other words, the parent reads the value from the previous execution of the child (FCSS2).

Function-Call Subsystem with Merged Signal As Input

In this model a merged signal serves as the input to a function-call subsystem. Latching is necessary if one of the signals entering the Merge block forms a feedback loop with the function-call subsystem. In this example, one of the output signals from FCSS2 combines with the output of an Enabled Subsystem block and then feeds back into an inport of FCSS2.

Partitioning an Input Signal with the For Each Block

The following model demonstrates the partitioning of an input signal by a For Each block. Each row of this 2-by-3 input array contains three integers that represent the (x, y, z)-coordinates of a point. The goal is to translate each of these points based on a new origin at (-20, -10, -5) and to display the results.

By placing the process of summing an input signal and the new origin inside of a For Each Subsystem block, you can operate on each set of coordinates by partitioning the input signal into two row vectors. To accomplish such partitioning, use the default settings of 1 for both the partition dimension and the partition width. If you also use the default concatenation dimension of 1, each new set of coordinates stacks in the d1 direction, making your display a 2-by-3 array.

For Each | For Each Subsystem

Specifying the Concatenation Dimension in the For Each Block

This example shows how to specify a concatenation dimension in the For Each block. When you specify a **Concatenation Dimension** of 2 on the **Output Concatenation** tab, each set of results stacks in the d2 direction, and the result is a single row vector.

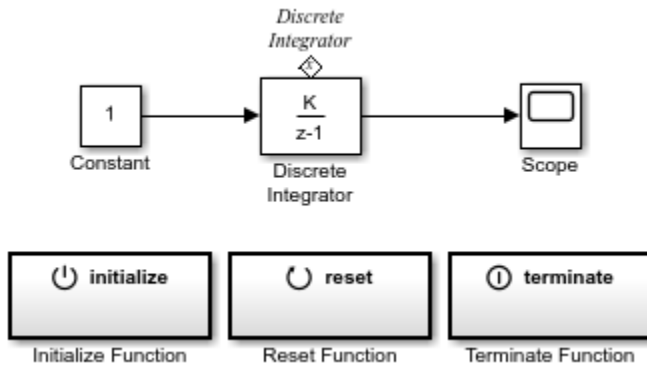

To learn how the For Each block and subsystem handle a model with states, see the For Each Subsystem block reference page.

PWM Control of a Boost Converter

This example shows you how to control a boost converter using the PWM block in Simulink. The boost converter is implemented using the Boost Converter (Simscape Electrical) block in the Simscape™ Electrical™ library.

A PWM signal is used to control the switching device, or gate, of the boost converter. The command signal, or duty cycle, is generated from the PID controller to track the desired step-up voltage (V_{ref}) of 18V

This is a relatively high frequency application; the switching gate operates at around 200kHz. Therefore, a pulse period of $1/200,000$ or $5e-6s$ is chosen for the PWM signal.

Given the small time steps, the `boostconverter_pwm` model provided with the example is loaded from a steady state at 0.069s.

A visualization of the boost converter operation around the 0.1s mark is shown below.

For alternate physical modeling implementations of PWM control, see “Pulse Width Modulation” (Simscape Electrical).

Voltage Controlled Oscillator

This example shows you how to model an ideal voltage controlled oscillator using the Variable Pulse Generator block to create the frequency oscillations.

A voltage controlled oscillator uses an input tuning voltage to produce waveforms of varying frequency. Over a small range of voltages, the relationship between the input voltage (V_{in}) and the output oscillation frequency (F) is proportional and can be expressed as

$$F(t) = K_c \cdot V_{in}(t) + F_0(1)$$

where

- K_c is the oscillator sensitivity in Hz/V
- f_0 is the quiescent frequency, or nominal frequency of the oscillator at $V_{in} = 0$

In the included `vco_using_vpg` model, the desired oscillation frequency signal $F_{in}(t)$ is generated using the formula shown in equation (1). In this model, the tuning voltage V_{in} is a sinusoidal waveform.

Nominal Frequency $f_0 = 42$ Hz

Oscillator Gain $K_c = 3$

Check Signal Lower Bound with Check Dynamic Lower Bound Block

Using the Check Dynamic Lower Bound block, you can check if an input signal falls below a changing lower bound during a simulation.

Copyright 2018 The MathWorks, Inc.

In this example, the Check Dynamic Lower Bound block compares the value of a tested input signal from a Step block at the **u** port to a Sine Wave block at the **min** port. The Check Dynamic Lower Bound block checks if the value of the signal at the **min** port is less than the value of the tested input signal. If it is, the block asserts `true` (1). Because the **Output assertion signal** parameter of the Check Dynamic Lower Bound block is selected, the block outputs the assertion value. Run the simulation to observe the model output.

At the start of the simulation, the Check Dynamic Lower Bound block outputs 0 because the value of the Sine Wave block is greater than the value of the Step block. At a time of 3.14, the sine wave dips below 0, causing the value of the Step block to exceed the sine wave. The Check Dynamic Lower Bound block recognizes this change and outputs 1.

At a time of 5, the Step block outputs a value of 0.5, which is still greater than the sine wave. The Step block value stays greater than the sine wave until the time reaches 6.81. The Check Dynamic Lower Bound block recognizes this change and the assertion fails. The assertion stays at 0 until the time reaches 8.90, where the sine wave goes below the value of the Step block.

Assertion | Check Dynamic Lower Bound

Check Signal Upper Bound with Check Dynamic Upper Bound Block

Using the Check Dynamic Upper Bound block, you can check if an input signal rises above a changing upper bound during a simulation.

Copyright 2018 The MathWorks, Inc.

In this example, the Check Dynamic Upper Bound block compares the value of a tested input signal from a Step block at the **u** port to a Sine Wave block at the **max** port. The Check Dynamic Upper Bound block checks if the value of the signal at the **max** port is greater than the value of the tested input signal. If it is, the block asserts `true` (1). Because the **Output assertion signal** parameter of the Check Dynamic Upper Bound block is selected, the block outputs the assertion value. Run the simulation to observe the model output.

At the start of the simulation, the Check Dynamic Upper Bound block outputs 1 because the value of the Sine Wave block is greater than the value of the Step block. At a time of 3.14, the sine wave dips below 0, causing the value of the Step block to exceed the sine wave. The Check Dynamic Upper Bound block recognizes this change and outputs 0.

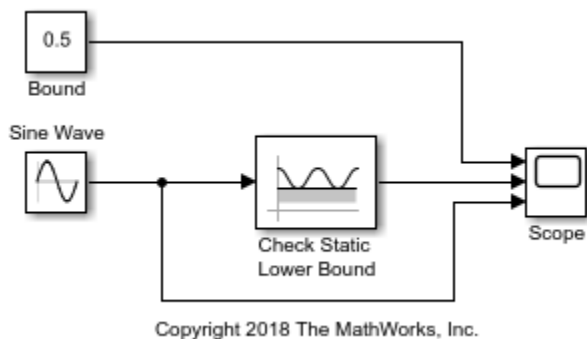

At a time of 5, the Step block outputs a value of 0.5, which is still greater than the sine wave. The Step block value stays greater than the sine wave until the time reaches 6.81. The Check Dynamic Upper Bound block recognizes this change and the assertion passes. The output stays at 1 until the time reaches 8.90, where the sine wave goes below the value of the Step block.

Assertion | Check Dynamic Upper Bound

Check Signal Lower Bound with Check Static Lower Bound Block

Using the Check Static Lower Bound block, you can check if an input signal falls below a defined value.

In this example, the Check Static Lower Bound block compares the value of a Sine Wave block to the value entered in the **Lower bound** parameter, which is 0.5. The Constant block, labeled Bound, illustrates this parameter in the Scope block but does not affect the parameter value. The Check Static Lower Bound block checks if the value of the input signal is greater than the **Lower bound**. If it is, the block asserts `true` (1). Because the **Output assertion signal** parameter of the block is selected, the block outputs the assertion value. Run the simulation to observe the model output.

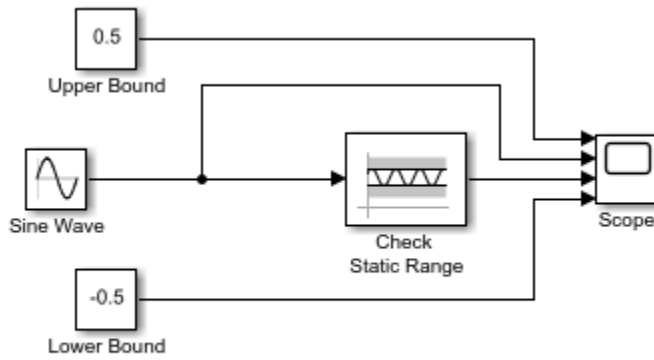

At the start of the simulation, the Check Static Lower Bound block outputs 0 because the value of the Sine Wave block is less than the bound. At a time of 0.52, the sine wave exceeds 0.5. The Check Static Lower Bound block recognizes this change and outputs 1. When the time reaches 2.62, the sine wave falls below the bound and the assertion is false. This pattern repeats until the simulation end time.

Assertion | Check Static Lower Bound

Check Signal Range with Check Static Range Block

Using the Check Static Range block, you can check if an input signal falls outside of an unchanging range of values.

Copyright 2018 The MathWorks, Inc.

In this example, the Check Static Range block compares the value of a Sine Wave block to the values entered in the **Upper bound** and **Lower bound** parameters, which are 0.5 and -0.5. The Constant blocks, labeled Upper Bound and Lower Bound, illustrate these parameters in the Scope block but do not affect the parameter values. The Check Static Range block checks if the value of the input signal is greater than the **Lower bound** value or less than the **Upper bound** value. If it is, the block asserts `true` (1). Because the **Output assertion signal** parameter of the block is selected, the block outputs the assertion value. Run the simulation to observe the model output.

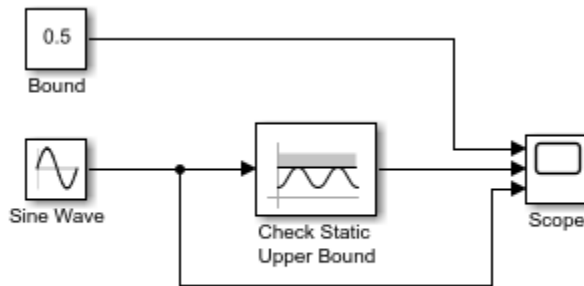

At the start of the simulation, the Check Static Range block outputs 1 because the value of the Sine Wave block is less than the **Upper bound** value. At a time of 0.52, the sine wave exceeds 0.5. The Check Static Range block recognizes this change and outputs 0. When the time reaches 2.62, the sine wave falls below the **Upper bound** value and the assertion is true. When the time reaches 3.67, the sine wave falls below the **Lower bound** value. The Check Static Range block recognizes this change and outputs 0. The output stays at 0 until the time is 5.76, when the sine wave then exceeds the **Lower bound** value. This pattern repeats until the simulation end time.

Assertion | Check Static Upper Bound

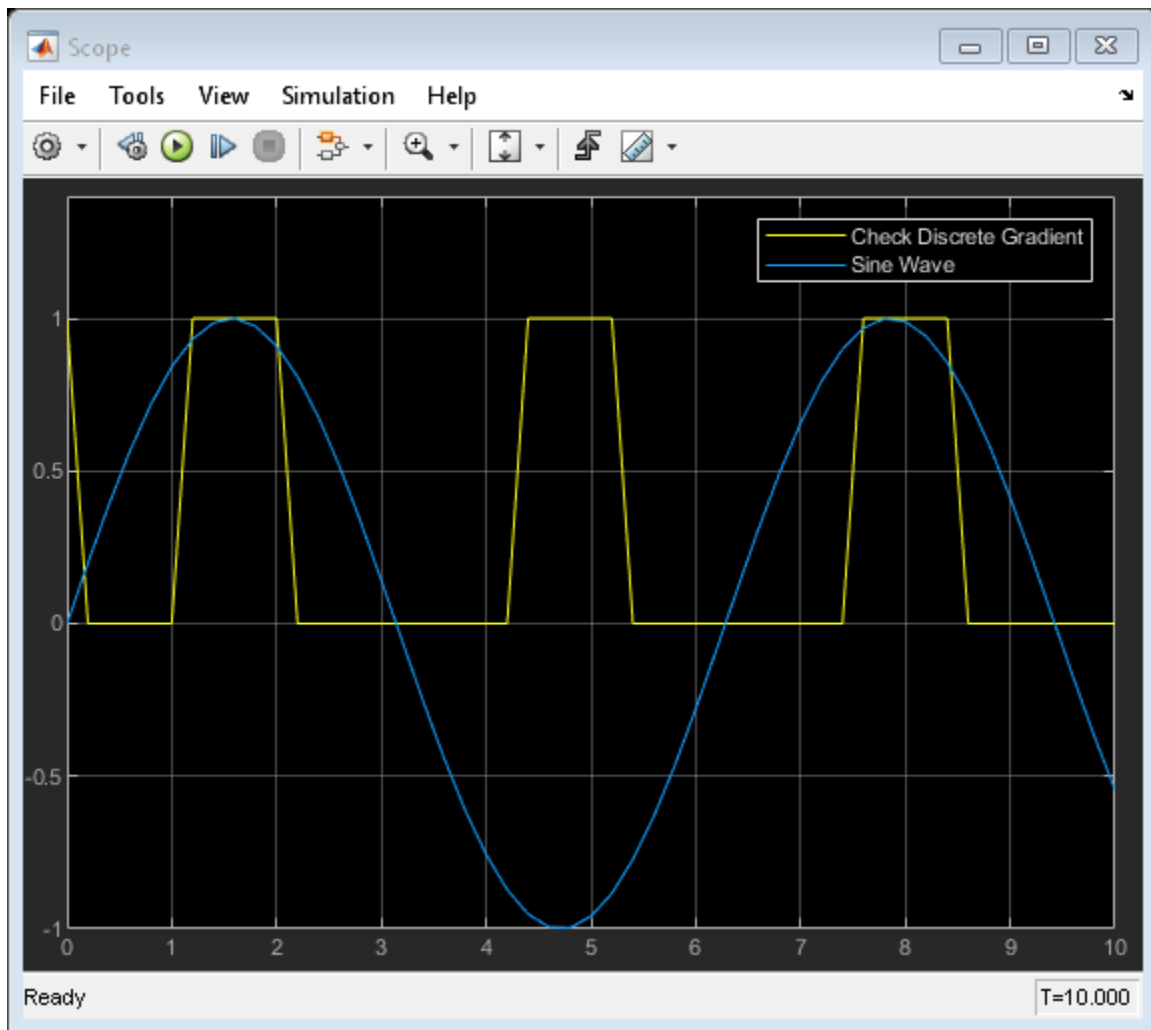

Check Signal Slope with Check Discrete Gradient Block

Using the Check Discrete Gradient block, you can check if the absolute value of the difference between successive samples of a signal is less than a defined value.

Copyright 2018, The MathWorks, Inc.

In this example, the Check Discrete Gradient block compares the value of an input signal from a Sine Wave block to the **Maximum gradient** parameter value, which is 0.1 . If the absolute value of the difference between successive samples of the signal is less than 0.1 , the block asserts `true (1)`. Because the **Output assertion signal** parameter of the block is selected, the block outputs the assertion value. The block requires a fixed-step discrete solver, which has been selected in the model. Run the simulation to observe the model output.

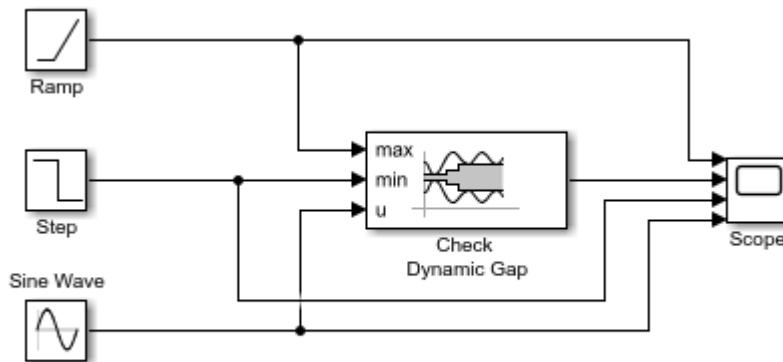

The block asserts `true` when the sine wave is near a maximum or minimum. In these sections of the signal, the absolute value of the gradient is less than the **Maximum gradient** value `0.1`. This pattern repeats until the simulation end time.

Assertion | Check Discrete Gradient

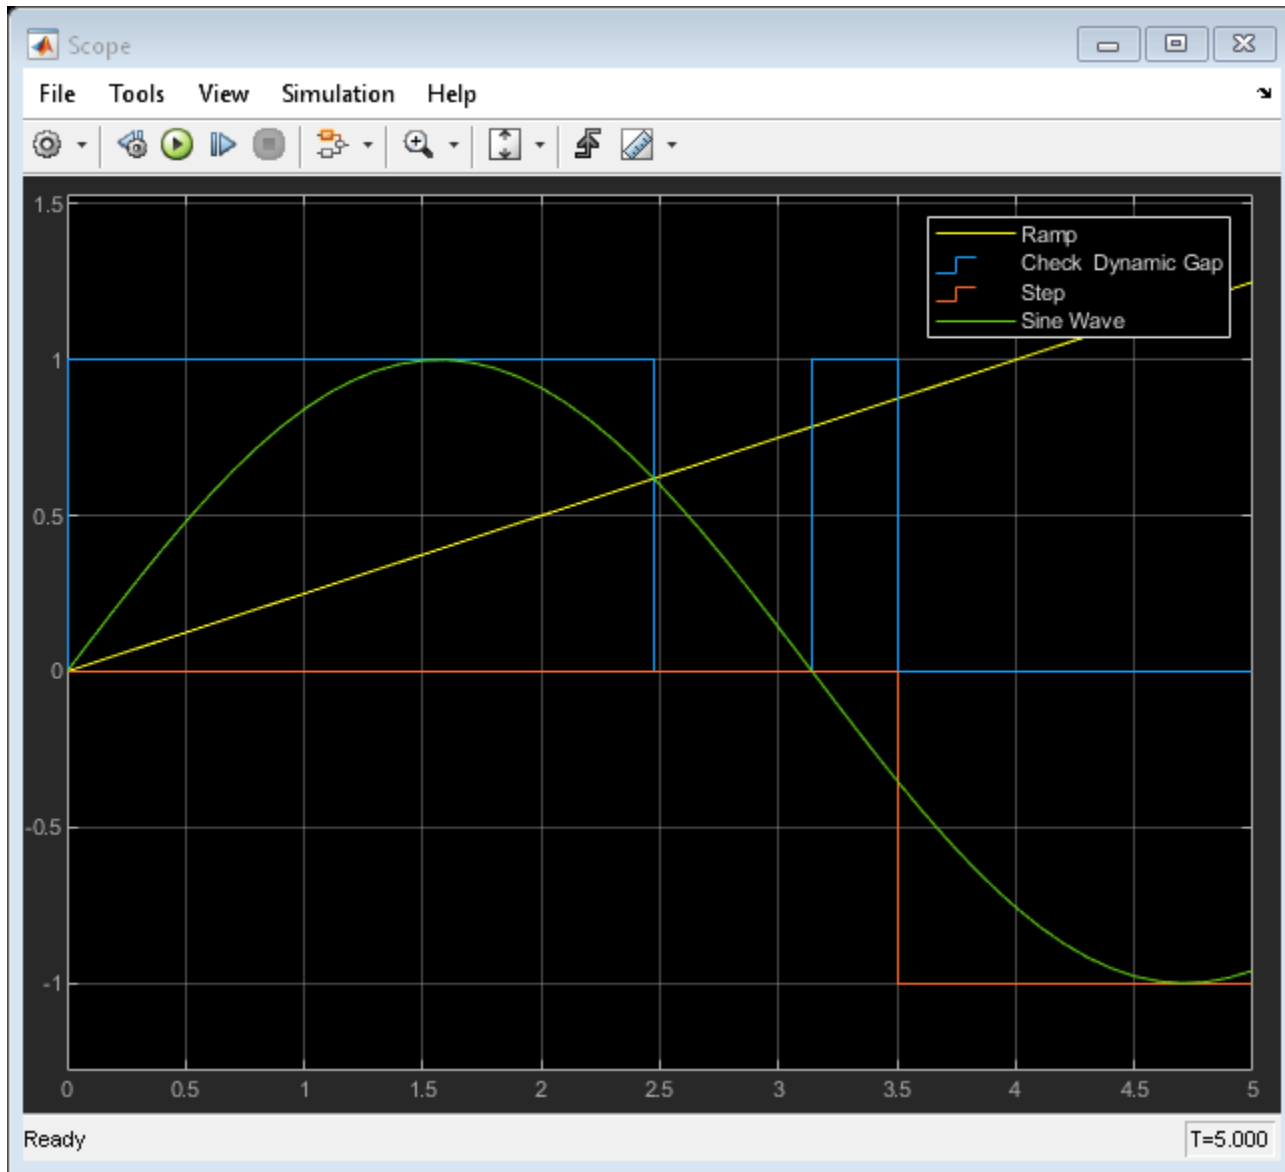

Check Signal Value with Check Dynamic Gap Block

This example shows how to check if an input signal falls inside a dynamic upper and lower bound using the Check Dynamic Gap block. In this example, the Check Dynamic Gap block compares the value of a tested input signal from a Sine Wave block at the **u** port to a Ramp block at the **max** port and a Step block at the **min** port.

Copyright 2018, The MathWorks, Inc.

The Check Dynamic Gap block checks if the value of the signal at the **max** port is less than the value of the test signal, and if the value of the signal at the **min** port is greater than the value of the test signal. If it is, the block asserts `true (1)`. Because the **Output assertion signal** parameter of the Check Dynamic Gap block is selected, the block outputs the assertion value. Run the simulation to observe the model output.

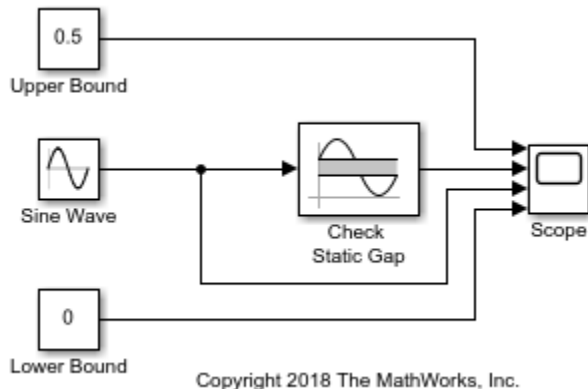

At the start of the simulation, the Check Dynamic Gap block output is 1. The output stays at 1 until the simulation time is 2.47, when the sine wave falls below the value of the Ramp block. The block output stays at 0 until the simulation time reaches 3.14, when the sine wave falls below the value of the Step block. The Step block activates when the simulation time reaches 3.5, placing the sine wave between the bounds. The Check Dynamic Gap block recognizes this change and sets the output to 0.

Assertion | Check Dynamic Gap

Check Signal Value with Check Static Gap Block

Using the Check Static Gap block, you can check if an input signal enters an unchanging gap of values.

In this example, the Check Static Gap block compares the value of a Sine Wave block to the values entered in the **Upper bound** and **Lower bound** parameters, which are 0.5 and 0. The Constant blocks, labeled Upper Bound and Lower Bound, illustrate these parameters in the Scope block but do not affect the parameter values. The Check Static Gap block checks if the value of the input signal is less than the **Lower bound** value or greater than the **Upper bound** value. If it is, the block asserts `true` (1). Because the **Output assertion signal** parameter of the block is selected, the block outputs the assertion value. Run the simulation to observe the model output.

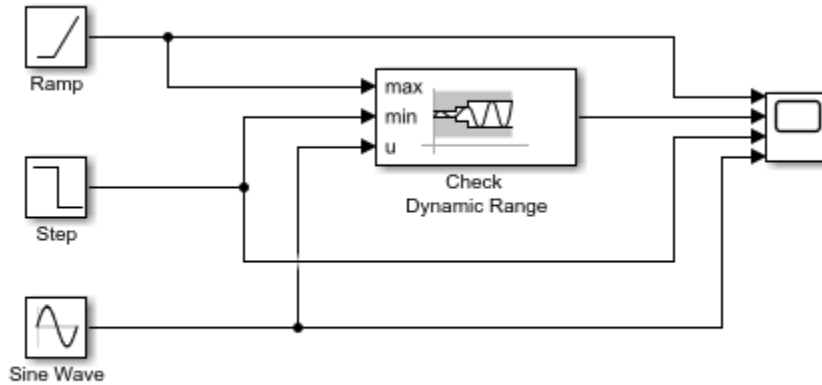

At the start of the simulation, the Check Static Gap block outputs 0 because the value of the Sine Wave block is less than the **Upper bound** value. At a time of 0.52, the sine wave exceeds 0.5. The Check Static Gap block recognizes this change and outputs 1. When the time reaches 2.62, the sine wave falls below the **Upper bound** value and the assertion is false. When the time reaches 3.14, the sine wave falls below the **Lower bound** value. The Check Static Gap block recognizes this change and outputs 1. The output stays at 1 until the time is 6.28, when the sine wave then exceeds the **Lower bound** value. This pattern repeats until the simulation end time.

Assertion | Check Static Gap

Check Signal Range with Check Dynamic Range Block

You can check if an input signal falls outside of a dynamic upper and lower bound by using the Check Dynamic Range block.

Copyright 2020 The MathWorks, Inc.

This model uses a Sine Wave block as a dynamic test signal. The Check Dynamic Range block determines if the value of the sine wave exceeds the signal from the Ramp block or falls below the signal from the Step block at each time step. In the Check Dynamic Range block, the **Output assertion signal** parameter is selected, so the output signal indicates if the assertion condition is true (1) or false (0). Press **Run** to observe the model output.

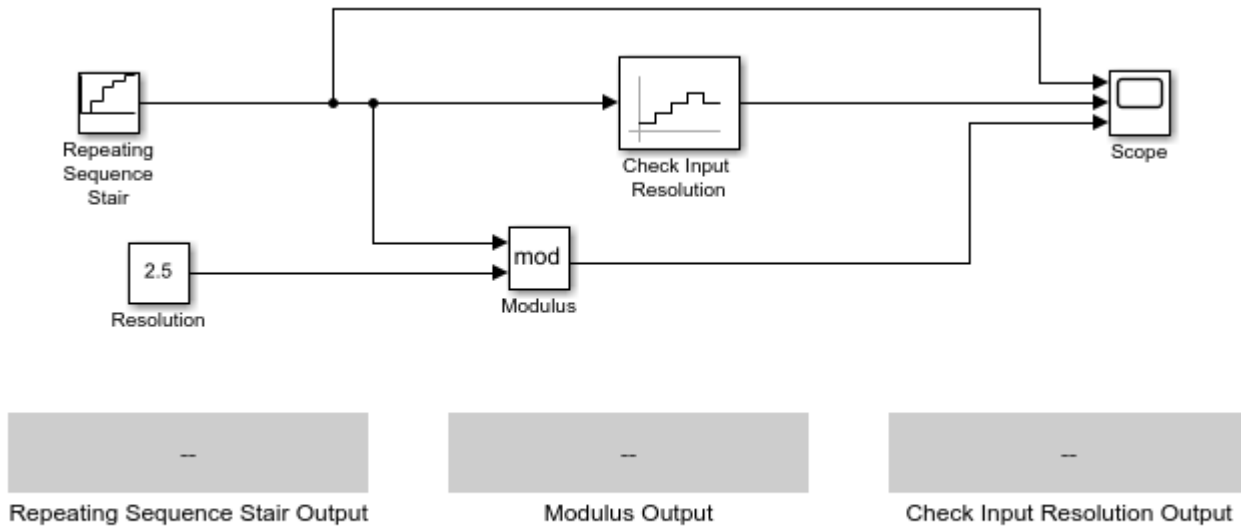

In the Scope block, you can see that the Check Dynamic Range block outputs 0 until the sine wave falls below the value of the Ramp block when the simulation time is 2.47. The block output stays at 1 until the simulation time reaches 3.14, when the sine wave falls below the value of the Step block. The Step block activates when the simulation time reaches 3.5, placing the sine wave between the bounds. The Check Dynamic Range block recognizes this change and outputs 1.

Assertion | Check Dynamic Range

Check Signal Resolution with Check Input Resolution Block

You can use a Check Input Resolution block to check when a signal has a specified resolution. The block can help verify if a signal is quantized within specification, such as when checking the output of an analog-to-digital converter.

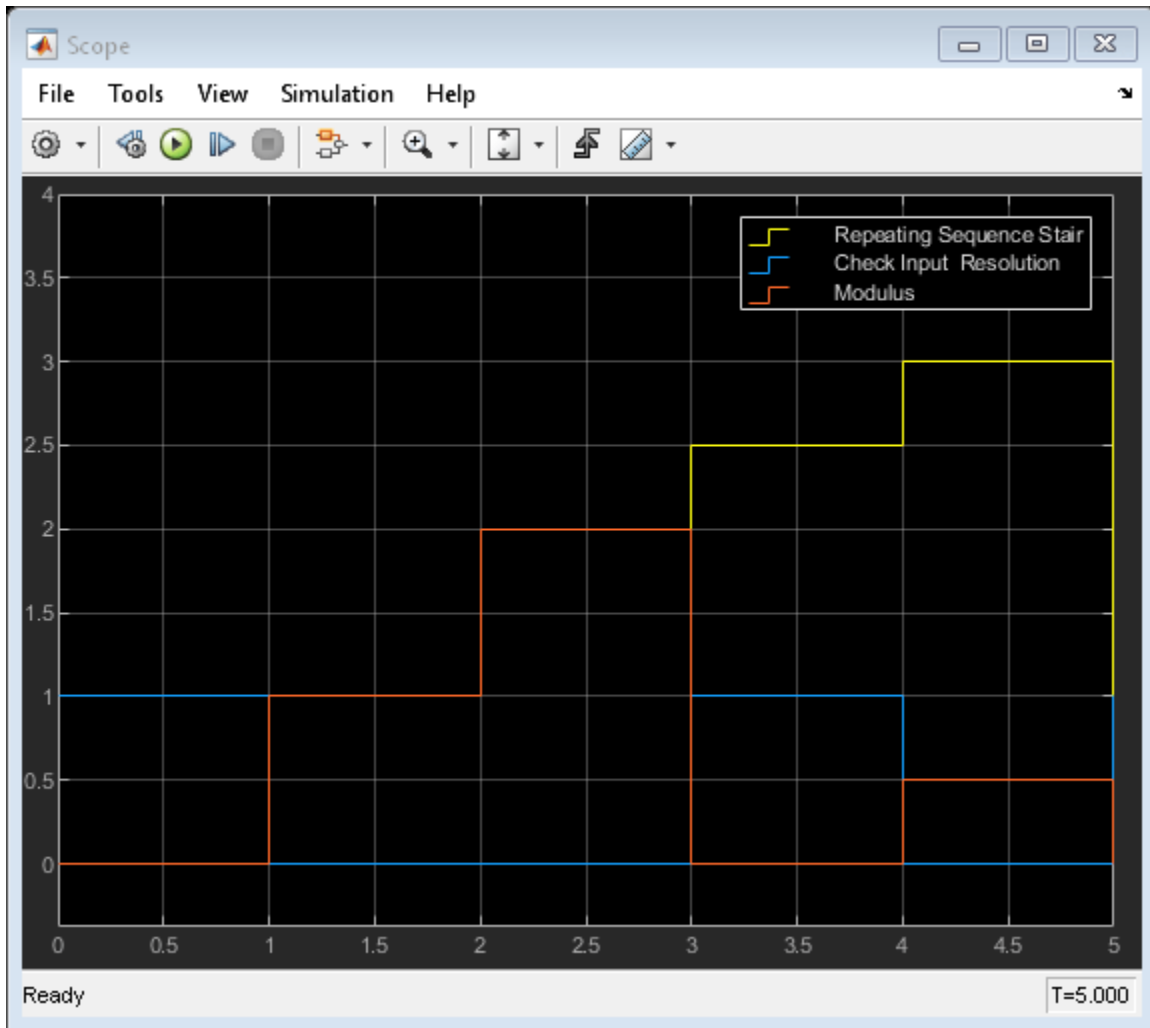

Copyright 2020 The MathWorks, Inc.

In this example, a Repeating Sequence Stair block outputs the values [0 1 2 2.5 3] in sequence starting at 0. During simulation, the block outputs each value in the vector for a time of 1.

First, the Check Input Resolution block calculates a modulus by calculating the remainder of the input value over the value of the **Resolution** parameter, which is set to 2.5. To illustrate this calculation, this example also uses a Math Function block, labeled Modulus, with the **Function** parameter set to `mod`. The Modulus block takes the value of the Repeating Sequence Stair block over the value of a Constant block, labeled Resolution, which has the same value as the **Resolution** parameter.

Then the Check Input Resolution block checks if the modulus is smaller than a tolerance of 0.01. If it is, the block asserts `true` (1). Because the **Output assertion signal** parameter of the Check Input Resolution Block is selected, the block outputs the assertion value. Run the simulation to observe the model output, or use the **Step Forward** button to step through each step.

When you run the model, the Scope block plots the Repeating Sequence Stair block output, the Modulus block output, and the Check Input Resolution block output. If you use the **Step Forward** button, the data populates the three Display blocks at each time step.

- 1 Initially, the modulus of the Repeating Sequence Stair block over the resolution is 0, so the Check Input Resolution block outputs 1.
- 2 When the simulation time reaches 1, the Repeating Sequence Stair block outputs 1. The modulus rises to 1, which is larger than the tolerance, causing the Check Input Resolution block to output 0.
- 3 The assertion stays at 0 until the time is 3, when the Repeating Sequence Stair block outputs 2.5. The modulus drops to 0, and the assertion returns to 1.
- 4 Finally, the Repeating Sequence Stair block outputs 3 when the time is 4, which causes the assertion to be 1.

The model repeats this pattern until the simulation end time.

Extract 3-by-2 Submatrix from Input Signal

This example shows how to use the Submatrix block to extract a 3-by-2 submatrix from the lower-right corner of a 5-by-7 input matrix. The following figure illustrates the operation of the Submatrix block with a 5-by-7 input matrix of random integer elements, `randi([0 9],5,7)`.

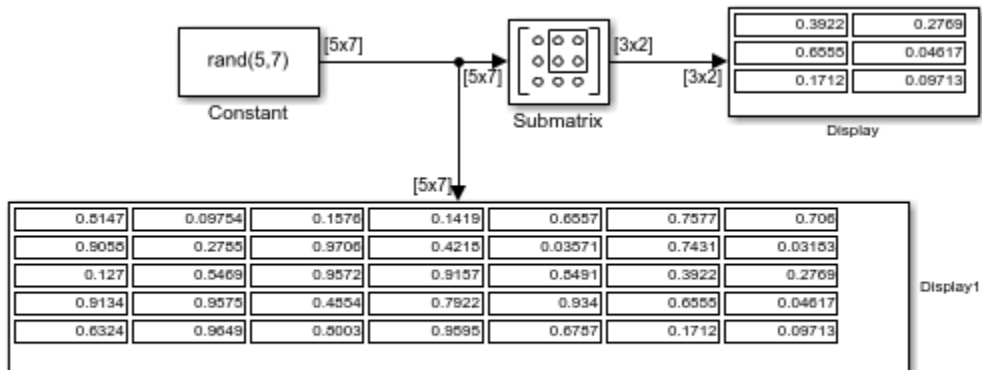

Here are the settings used for the Submatrix block in this example.

There are often several possible parameter combinations that you can use to select the same submatrix from the input. For example, in the case of a 5-by-7 input matrix, instead of specifying Last for **Ending column**, you could select the same submatrix by specifying:

- **Ending column** = Index
- **Ending column index** = 7

Open and simulate the model. You can see that the 3-by-2 submatrix from the lower-right corner of a 5-by-7 input matrix has been extracted.

Generate Diagonal Matrix from Vector Input

This example shows how to use the Create Diagonal Matrix block.

Open the Simulink model.

Copyright 2019-2021 The MathWorks, Inc.

The **Create Diagonal Matrix** block creates a diagonal matrix from the input values. The output matrix in the model has the input vector as its diagonal.

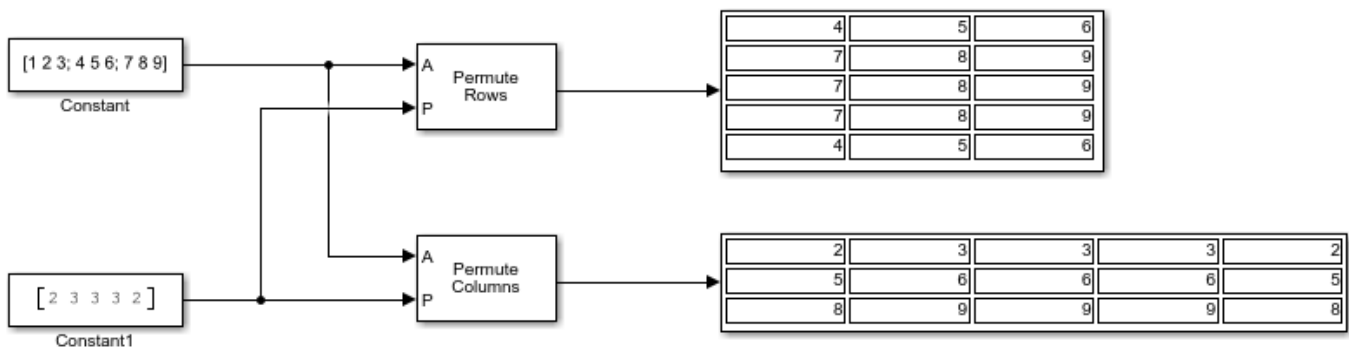

Run the model to verify the output.

Permute Matrix by Row or Column

This example shows how to use the Permute Block to permute blocks by row or column.

In the model, the top Permute Matrix block places the second row of the input matrix in the first and fifth rows of the output matrix. The block places the third row of the input matrix in the three middle rows of the output matrix. The bottom Permute Matrix block places the second column of the input matrix in the first and fifth columns of the output matrix. It places the third column of the input matrix in the three middle columns of the output matrix.

Rows and columns of A can appear any number of times in the output, or not at all depending on the index vector.

Copyright 2019-2021 The MathWorks, Inc.

Extract Diagonal of Matrix

This example shows how to use the Extract Diagonal block.

Open the Simulink model.

Copyright 2019-2021 The MathWorks, Inc.

The **Extract Diagonal** block returns the main diagonal of the input matrix. The main diagonal of the input matrix is [1,5,9].

Run the model to verify.

Simulation of a Bouncing Ball

This example shows how to use two different approaches to modeling a bouncing ball using Simulink®.

Overview

Figure 1: A ball is thrown up with a velocity of 15 m/s from a height of 10 m.

A bouncing ball model is a classic example of a **hybrid dynamic system**. A hybrid dynamic system is a system that involves both continuous dynamics, as well as, discrete transitions where the system dynamics can change and the state values can jump. The continuous dynamics of a bouncing ball is simply given by:

$$\frac{dv}{dt} = -g,$$

$$\frac{dx}{dt} = v,$$

where g is the acceleration due to gravity, $x(t)$ is the position of the ball and $v(t)$ is the velocity. Therefore, the system has two continuous states: position x and velocity v .

The hybrid system aspect of the model originates from the modeling of a collision of the ball with the ground. If one assumes a partially elastic collision with the ground, then the velocity before the collision, v^- , and velocity after the collision, v^+ , can be related by the coefficient of restitution of the ball, κ , as follows:

$$v^+ = -\kappa v^-, \quad x = 0$$

The bouncing ball therefore displays a jump in a continuous state (velocity) at the transition condition, $x = 0$.

A bouncing ball is one of the simplest models that shows the **Zeno phenomenon**. Zeno behavior is informally characterized by an infinite number of events occurring in a finite time interval for certain hybrid systems. As the ball loses energy in the bouncing ball model, a large number of collisions with the ground start occurring in successively smaller intervals of time. Hence the model experiences Zeno behavior. Models with **Zeno behavior** are inherently difficult to simulate on a computer, but are encountered in many common and important engineering applications.

Using Two Integrator Blocks to Model a Bouncing Ball

Open this model

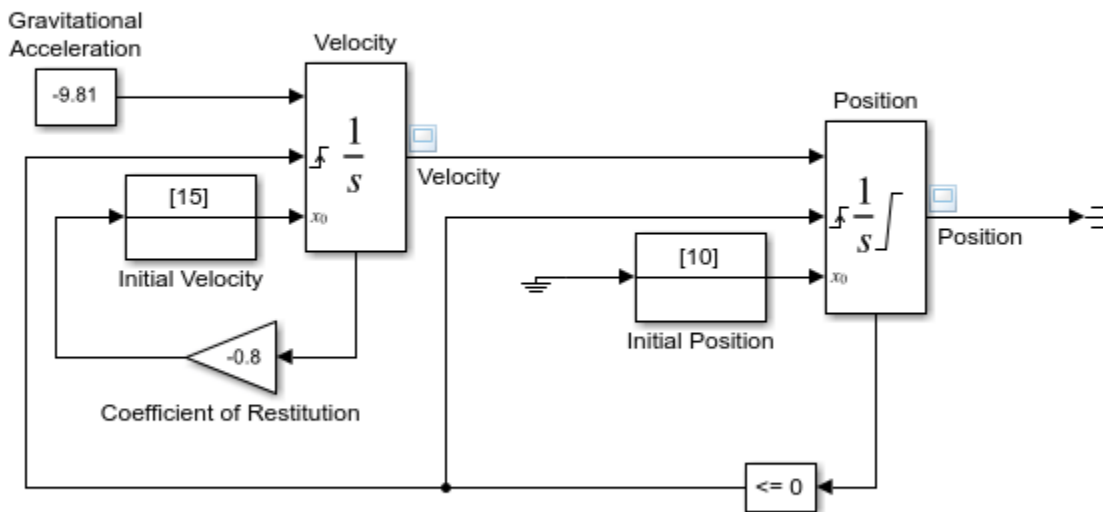

You can use two Integrator blocks to model a bouncing ball. The Integrator on the left is the velocity integrator modeling the first equation and the Integrator on the right is the position integrator. Navigate to the position integrator block dialog and observe that it has a lower limit of zero. This condition represents the constraint that the ball cannot go below the ground.

The state port of the position integrator and the corresponding comparison result is used to detect when the ball hits the ground and to reset both integrators. The state port of the velocity integrator is used for the calculation of v^+ .

Bouncing Ball Model

Two separate Integrators are less efficient than a single Second-Order Integrator for simulating a bouncing ball. [Click here to see sldemo_bounce for the recommended modeling approach.](#)

Copyright 1990-2013 The MathWorks, Inc.

To observe the Zeno behavior of the system, navigate to the Solver pane of the Configuration Parameters dialog box. In the 'Zero-crossing options' section, confirm that 'Algorithm' is set to 'Nonadaptive' and that the simulation 'Stop time' is set to 25 seconds. Run the simulation.

Observe that the simulation errors out as the ball hits the ground more and more frequently and loses energy. Consequently, the simulation exceeds the default limit of 1000 for the 'Number of consecutive zero crossings' allowed. Now navigate to the Configuration Parameters dialog box. In the 'Zero-crossing options' section, set the 'Algorithm' to 'Adaptive'. This algorithm introduces a sophisticated treatment of such chattering behavior. Therefore, you can now simulate the system beyond 20 seconds. Note, however, the chatter of the states between 21 seconds and 25 seconds and warning from Simulink about the strong chattering in the model around 20 seconds.

Using a Second-Order Integrator Block to Model a Bouncing Ball

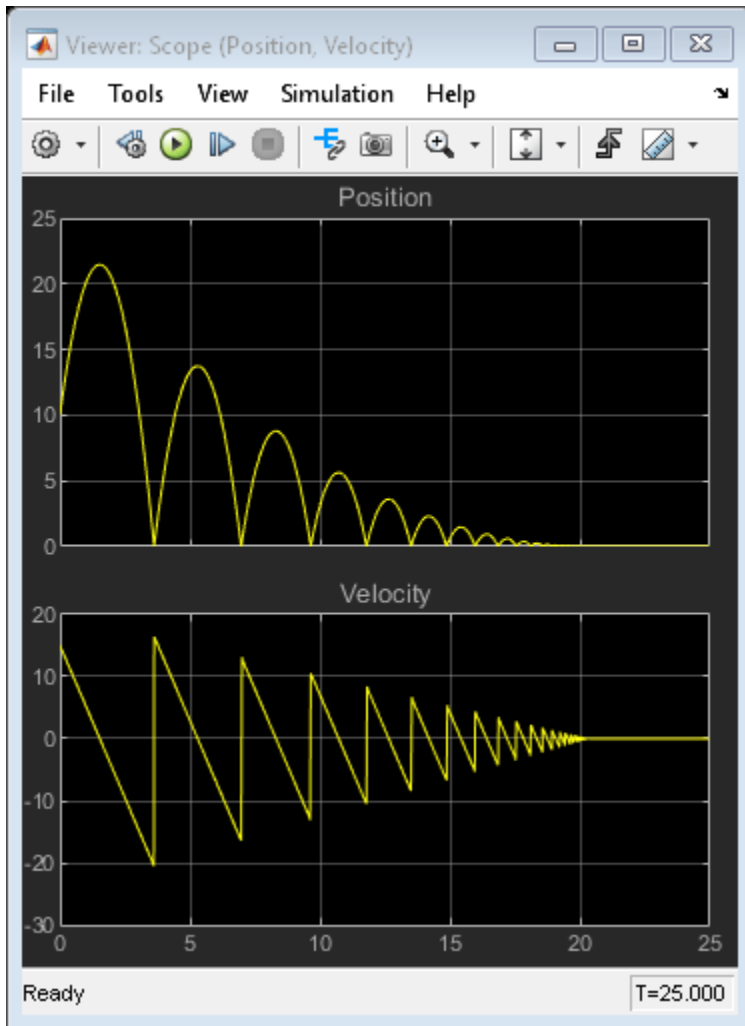

Open this model

You can use a single Second-Order Integrator block to model this system. The second equation $dx/dt = v$ is internal to the Second-Order Integrator block in this case. Navigate to the Second-Order

Integrator block dialog and notice that, as earlier, x has a lower limit of zero. Navigate to the Attributes tab on the block dialog and note that the option 'Reinitialize dx/dt when x reaches saturation' is checked. This parameter allows us to reinitialize dx/dt (v in the bouncing ball model) to a new value at the instant x reaches its saturation limit. For the bouncing ball model, this option therefore implies that when the ball hits the ground, its velocity can be set to a different value, i.e., to the velocity after the impact. Notice the loop for calculating the velocity after a collision with the ground. To capture the velocity v^- of the ball just before the collision, the dx/dt output port of the Second-Order Integrator block and a Memory block are used. v^- is then used to calculate the rebound velocity v^+ .

Copyright 2004-2013 The MathWorks, Inc.

Navigate to the Solver pane of the Configuration Parameters dialog box. Confirm that 'Algorithm' is set to 'Nonadaptive' in the 'Zero-crossing options' section and the simulation 'Stop Time' is set to 25 seconds. Simulate the model. Note that the simulation encountered no problems. You were able to simulate the model without experiencing excessive chatter after $t = 20$ seconds and without setting the 'Algorithm' to 'Adaptive'.

Second-Order Integrator Model Is the Preferable Approach to Modeling Bouncing Ball

One can analytically calculate the exact time t^* when the ball settles down to the ground with zero velocity by summing the time required for each bounce. This time is the sum of an infinite geometric series given by:

$$t^* = \frac{1}{g} \left(v_0 + v_1 \left(\frac{1 + \kappa}{1 - \kappa} \right) \right), \quad v_1 = \sqrt{v_0^2 + 2gx_0}.$$

Here x_0 and v_0 are initial conditions for position and velocity respectively. The velocity and the position of the ball must be identically zero for $t > t^*$. In the figure below, results from both simulations are plotted near t^* . The vertical red line in the plot is t^* for the given model parameters. For $t < t^*$ and far away from t^* , both models produce accurate and identical results. Hence, only a

magenta line from the second model is visible in the plot. However, the simulation results from the first model are inexact after t^* ; it continues to display excessive chattering behavior for $t > t^*$. In contrast, the second model using the Second-Order Integrator block settles to exactly zero for $t > t^*$.

Figure 2: Comparison of simulation results from the two approaches.

Figure 2 conclusively shows that the second model has superior numerical characteristics as compared to the first model. The reason for the higher accuracy associated with the Second-Order Integrator model is as follows. The second differential equation $dx/dt = v$ is internal to the Second-Order Integrator block. Therefore, the block algorithms can leverage this known relationship between the two states and deploy heuristics to clamp down the undesirable chattering behavior for certain conditions. These heuristics become active when the two states are no longer mutually consistent with each other due to integration errors and chattering behavior. You can thus use physical knowledge of the system to alleviate the problem of simulation getting stuck in a Zeno state for certain classes of Zeno models.

Single Hydraulic Cylinder Simulation

This example shows how to use Simulink® to model a hydraulic cylinder. You can apply these concepts to applications where you need to model hydraulic behavior. See two related examples that use the same basic components: four cylinder model and two cylinder model with load constraints.

- Note: This is a basic hydraulics example. You can more easily build hydraulic and automotive models using Simscape™ Driveline™ and Simscape Fluids™.
- **Simscape Fluids** provides component libraries for modeling and simulating fluid systems. It includes models of pumps, valves, actuators, pipelines, and heat exchangers. You can use these components to develop fluid power systems such as front-loader, power steering, and landing gear actuation systems. Engine cooling and fuel supply systems can also be developed with Simscape Fluids. You can integrate mechanical, electrical, thermal, and other systems using components available in the Simscape product family.
- **Simscape Driveline** provides component libraries for modeling and simulating one-dimensional mechanical systems. It includes models of rotational and translational components, such as worm gears, planetary gears, lead screws, and clutches. You can use these components to model the transmission of mechanical power in helicopter drivetrains, industrial machinery, vehicle powertrains, and other applications. Automotive components, such as engines, tires, transmissions, and torque converters, are also included.

Analysis and Physics of the Model

Figure 1 shows a schematic diagram of the basic model. The model directs the pump flow, Q , to supply pressure, p_1 , from which laminar flow, q_{1ex} , leaks to exhaust. The control valve for the piston/cylinder assembly is modeled as turbulent flow through a variable-area orifice. Its flow, q_{12} , leads to intermediate pressure, p_2 , which undergoes a subsequent pressure drop in the line connecting it to the actuator cylinder. The cylinder pressure, p_3 , moves the piston against a spring load, resulting in position x .

Figure 1: Schematic diagram of the basic hydraulic system

At the pump output, the flow is split between leakage and flow to the control valve. We model the leakage, q_{1ex} , as laminar flow (see Equation Block 1).

Equation Block 1

$$Q = q_{12} + q_{1ex}$$

$$q_{1ex} = C_2 \cdot p_1$$

$$p_1 = \frac{(Q - q_{12})}{C_2}$$

$$Q = \text{pump flow}$$

$$q_{12} = \text{control valve flow}$$

$$q_{1ex} = \text{leakage}$$

$$C_2 = \text{flow coefficient}$$

$$p_1 = \text{pump pressure}$$

We modeled turbulent flow through the control valve with the orifice equation. The sign and absolute value functions accommodate flow in either direction (see Equation Block 2).

Equation Block 2

$$q_{12} = C_d \cdot A \cdot \text{sgn}(p_1 - p_2) \cdot \sqrt{\frac{2}{\rho} |p_1 - p_2|}$$

$$C_d = \text{orifice discharge coefficient}$$

$$A = \text{orifice area}$$

$$p_2 = \text{pressure downstream of control valve}$$

$$\rho = \text{fluid density}$$

The fluid within the cylinder pressurizes due to this flow, $q_{12} = q_{23}$, minus the compliance of the piston motion. We also modeled fluid compressibility in this case (see Equation Block 3).

Equation Block 3

$$\frac{dp_3}{dt} = \frac{\beta}{V_3} \left(q_{12} - A_c \frac{dx}{dt} \right)$$

$$V_3 = V_{30} + A_c \cdot x$$

$$p_3 = \text{piston pressure}$$

$$\beta = \text{fluid bulk modulus}$$

$$V_3 = \text{fluid volume at } p_3$$

$$V_{30} = \text{fluid volume in the piston for } x = 0$$

$$A_c = \text{cylinder cross-sectional area}$$

We neglected the piston and spring masses because of the large hydraulic forces. We completed the system of equations by differentiating this relationship and incorporating the pressure drop between p_2 and p_3 . Equation Block 3 models laminar flow in the line from the valve to the actuator. Equation block 4 gives the force balance at the piston.

Equation Block 4

$$x = p_3 \frac{A_c}{K}$$

$$\frac{dx}{dt} = \frac{dp_3}{dt} \frac{A_c}{K}$$

$$q_{23} = q_{12} = C_1 (p_2 - p_3)$$

$$p_2 = p_3 + \frac{q_{12}}{C_1}$$

K = spring constant

C_1 = laminar flow coefficient

Modeling

Figure 2 shows the top level diagram of the model. The pump flow and the control valve orifice area are simulation inputs. The model is organized as two subsystems: the 'Pump' and the 'Valve/Cylinder/Piston/Spring Assembly'.

Opening the Model and Running the Simulation

To open this model, type `sldemo_hydcyl` at MATLAB® terminal (click on the hyperlink if you are using MATLAB Help). Press the "Play" button on the model toolbar to run the simulation.

The model logs relevant data to MATLAB workspace, into the Simulink.SimulationOutput object `out`. The signal logging data is stored in the `out` object, in a structure called `sldemo_hydcyl_output`. Logged signals have a blue indicator (see the model). For more information, see "View and Access Signal Logging Data".

Single Hydraulic Cylinder Simulation

Copyright 1990-2012 The MathWorks, Inc.

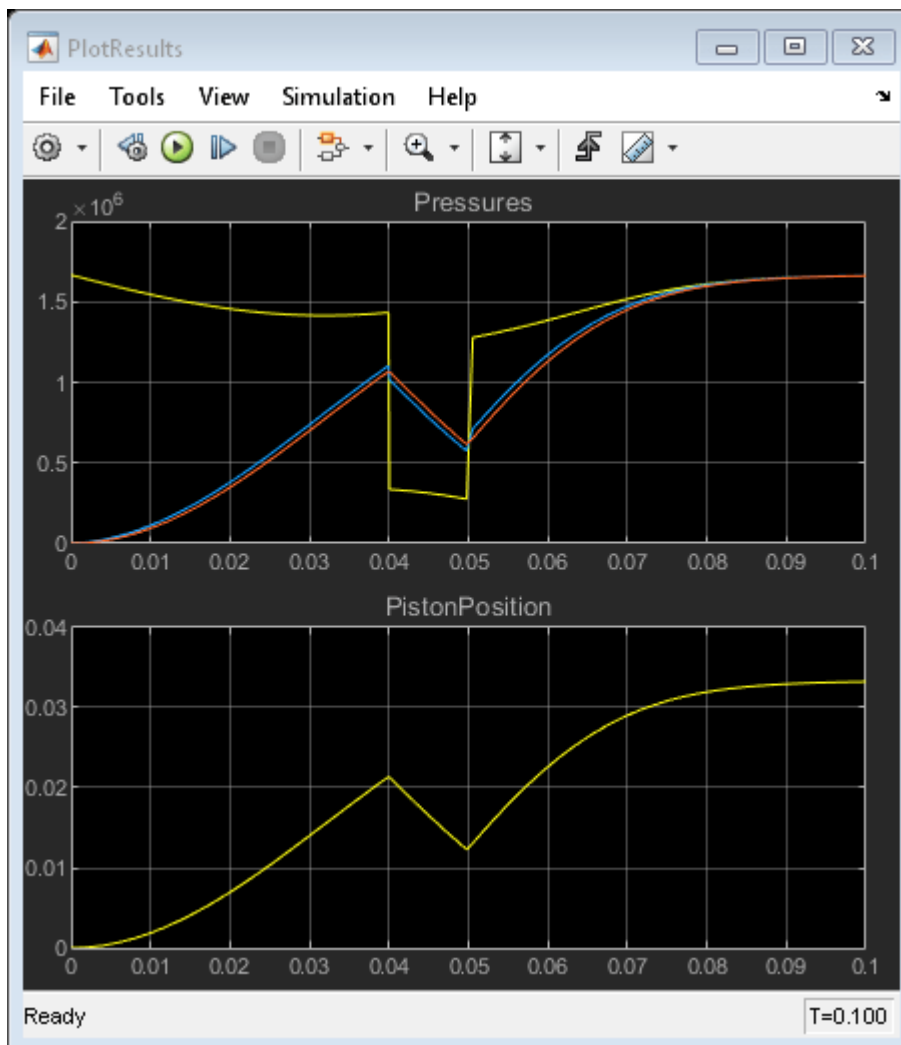

Figure 2: Single cylinder model and simulation results**'Pump' Subsystem**

Right-click the Pump masked subsystem and select **Mask > Look Under Mask**. The pump model computes the supply pressure as a function of the pump flow and the load (output) flow (Figure 3). Q_{pump} is the pump flow data (saved in the model workspace). A matrix with column vectors of time points and the corresponding flow rates $[T, Q]$ specifies the flow data. The model calculates pressure p_1 as indicated in Equation Block 1. Because $Q_{\text{out}} = q_{12}$ is a direct function of p_1 (via the control valve), an algebraic loop is formed. An estimate of the initial value, p_{10} , enables a more efficient solution.

**Figure 3:** The pump subsystem

We masked the 'Pump' subsystem in Simulink to allow the user to easily access the parameters (see Figure 4). The parameters to be specified are T , Q , p_{10} , and C_2 . We then assigned the masked block the icon shown in Figure 2, and saved it in a Simulink library.

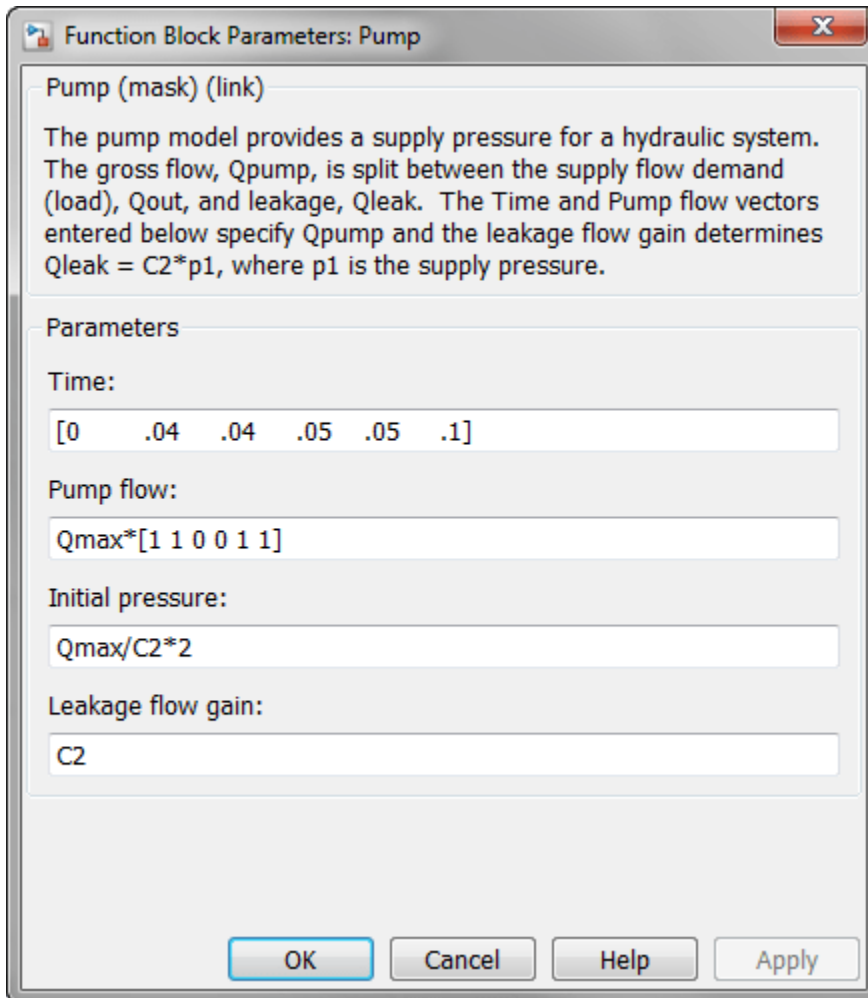

Figure 4: Entering pump parameters

'Valve/Cylinder/Piston/Spring Assembly' Subsystem

Right-click the 'Valve/Cylinder/Piston/Spring Assembly' subsystem and select **Mask > Look Under Mask** to see the Actuator subsystem (see Figure 5). A system of differential-algebraic equations models the cylinder pressurization with the pressure p_3 , which appears as a derivative in Equation Block 3 and is used as the state (integrator). If we neglect piston mass, the spring force and piston position are direct multiples of p_3 and the velocity is a direct multiple of p_3 's time derivative. This latter relationship forms an algebraic loop around the 'Beta' Gain block. The intermediate pressure p_2 is the sum of p_3 and the pressure drop due to the flow from the valve to the cylinder (Equation Block 4). This relationship also imposes an algebraic constraint through the control valve and the $1/C_1$ gain.

The control valve subsystem computes the orifice (Equation Block2). It uses as inputs the upstream and downstream pressures and the variable orifice area. The 'Control Valve Flow' Subsystem computes the signed square root:

$$y = \text{sgn}(u)\sqrt{|u|}$$

Three nonlinear functions are used, two of which are discontinuous. In combination, however, y is a continuous function of u .

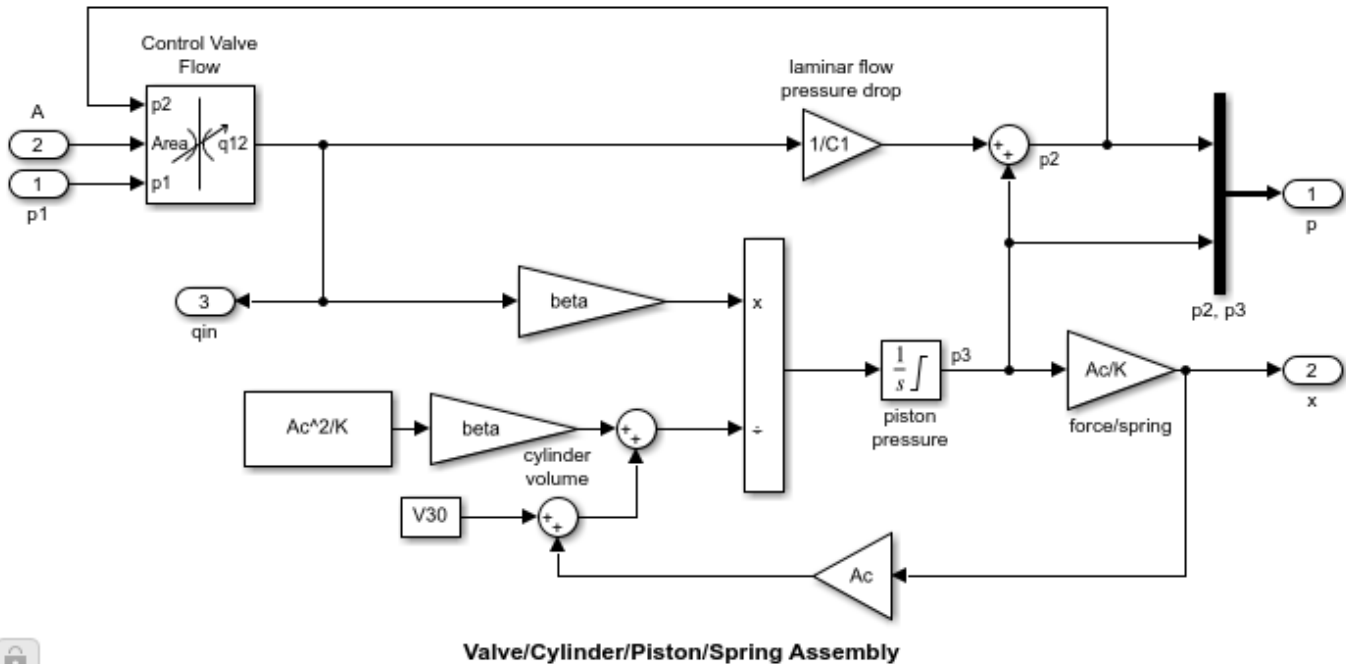

Figure 5: The valve/cylinder/piston/spring subsystem

Results

Simulation Parameters

We simulated the model using the following data. The information is loaded from a MAT-file - `sldemo_hydcyl_data.mat`, which is also used for the other two hydraulic cylinder models. The users can enter data via the Pump and Cylinder Masks shown in Figures 4 and 6.

$$C_d = 0.61$$

$$\rho = 800 \text{ kg/m}^3$$

$$C_1 = 2e - 8 \text{ m}^3/\text{sec}/\text{Pa}$$

$$C_2 = 3e - 9 \text{ m}^3/\text{sec}/\text{Pa}$$

$$\beta = 7e8 \text{ Pa}$$

$$A_c = 1e - 3 \text{ m}^2$$

$$K = 5e4 \text{ N/m}$$

$$V_{30} = 2.5e - 5 \text{ m}^3$$

$$T = [0 \ 0.04 \ 0.04 \ 0.05 \ 0.05 \ 0.1] \text{ sec}$$

$$Q = [0.005 \ 0.005 \ 0 \ 0 \ 0.005 \ 0.005] \text{ m}^3/\text{sec}$$

Assembly name:

Figure 6: Entering valve/cylinder/piston/spring assembly parameters

Plotting Simulation Results

The system initially steps to a pump flow of $0.005 \text{ m}^3/\text{sec}=300 \text{ l/min}$, abruptly steps to zero at $t=0.04 \text{ sec}$, then resumes its initial flow rate at $t=0.05 \text{ sec}$.

The control valve starts with zero orifice area and ramps to $1e-4 \text{ sq.m.}$ during the 0.1 sec simulation time. With the valve closed, all of the pump flow goes to leakage so the initial pump pressure increases to $p_{10} = Q/C2 = 1667 \text{ kPa}$.

As the valve opens, pressures p_2 and p_3 build up while p_1 decreases in response to the load increase as shown in Figure 7. When the pump flow cuts off, the spring and piston act like an accumulator and p_3 decreases continuously. Then the flow reverses direction, so p_2 , though relatively close to p_3 , falls abruptly. At the pump itself, all of the back-flow leaks and p_1 drops radically. The behavior reverses as the flow is restored.

The piston position is directly proportional to p_3 , where the hydraulic and spring forces balance. Discontinuities in the velocity at 0.04 sec and 0.05 sec indicate negligible mass. The model reaches a steady state when all of the pump flow again goes to leakage, now due to zero pressure drop across the control valve (which means $p_3 = p_2 = p_1 = p_{10}$).

Thermal Model of a House

This example shows how to use Simulink® to create the thermal model of a house. This system models the outdoor environment, the thermal characteristics of the house, and the house heating system.

The `sldemo_househeat_data.m` file initializes data in the model workspace. To make changes, you can edit the model workspace directly or edit the file and re-load the model workspace. To view the model workspace, from the Simulink Editor **Modeling** tab, click **Model Explorer**.

Open Model

First, open the `sldemo_househeat` model.

Initialize Model

This model calculates heating costs for a generic house. Opening the model loads the information about the house from the `sldemo_househeat_data.m` file. The file does the following:

- Defines the house geometry (size, number of windows)
- Specifies the thermal properties of house materials
- Calculates the thermal resistance of the house
- Provides the heater characteristics (temperature of the hot air, flow-rate)
- Defines the cost of electricity (0.09\$/kWhr)
- Specifies the initial room temperature (20 °C = 68 °F)
- **Note:** Time is given in units of hours. Certain quantities, like air flow-rate, are expressed per hour (not per second).

Model Components

Set Point

The Set Point is a constant block. It specifies the temperature that must be maintained indoors. By default, it is 70 °F. Temperatures are given in °F. The model converts the temperature to °C.

Thermostat

The Thermostat subsystem contains a Relay block. The thermostat allows fluctuations of 5 °F above or below the desired room temperature. If air temperature drops below 65 °F, the thermostat turns on the heater.

Open the Thermostat subsystem.

Thermostat Subsystem

Heater

The Heater subsystem models a constant air flow rate, \dot{M} , which is specified in the `sldemo_househeat_data.m` file. The thermostat signal turns the heater on or off. When the heater is on, it blows hot air at temperature T_{heater} (50 °C = 122 °F by default) at a constant flow rate of \dot{M} (1kg/sec = 3600kg/hr by default). Equation 1 expresses the heat flow into the room.

Equation 1

$$\frac{dQ}{dt} = (T_{heater} - T_{room}) \cdot \dot{M} \cdot c$$

$$\frac{dQ}{dt} = \text{heat flow from the heater into the room}$$

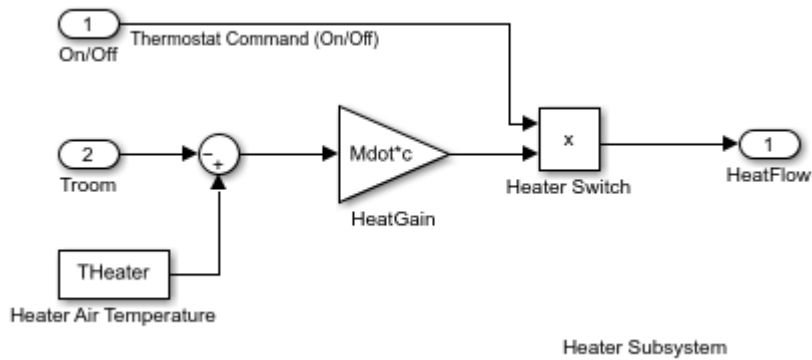

c = heat capacity of air at constant pressure

\dot{M} = air mass flow rate through heater (kg/hr)

T_{heater} = temperature of hot air from heater

T_{room} = current room air temperature

Open the Heater subsystem.

Cost Calculator

The Cost Calculator is a Gain block. Cost Calculator integrates the heat flow over time and multiplies it by the energy cost. The model plots the heating cost in the PlotResults scope.

House

The House is a subsystem that calculates room temperature variations. It takes into consideration the heat flow from the heater and heat losses to the environment. Heat losses and the temperature time derivative are expressed by Equation 2.

Equation 2

$$\left(\frac{dQ}{dt}\right)_{losses} = \frac{T_{room} - T_{out}}{R_{eq}}$$

$$\frac{dT_{room}}{dt} = \frac{1}{M_{air} \cdot c} \cdot \left(\frac{dQ_{heater}}{dt} - \frac{dQ_{losses}}{dt}\right)$$

M_{air} = mass of air inside the house

R_{eq} = equivalent thermal resistance of the house

Open the House subsystem.

Model the Environment

To simulate the environment, the model uses a heat sink with infinite heat capacity and time varying temperature, T_{out} . The constant block Avg Outdoor Temp specifies the average air temperature outdoors. The Daily Temp Variation Sine Wave block generates daily outdoor temperature fluctuations. You can vary these parameters and to see how they affect the heating costs.

Run Simulation and Visualize Results

Run the simulation. Use the PlotResults scope to visualize the results. The scope plots the heat cost and indoor versus outdoor temperatures. The temperature outdoor varies sinusoidally. The indoors temperature remains within 5 °C of the Set Point. The Time axis is in hours.

According to this model, it would cost about \$30 to heat the house for two days. Try varying the parameters and observe the system response.

Next Steps

This model calculates the heating costs only. If the temperature of the outside air is higher than the room temperature, the room temperature will exceed the desired Set Point.

You can modify this model to include an air conditioner. You can implement the air conditioner as a modified heater. To do this, add parameters like the following to `sldemo_househeat_data.m`.

- Cold air output
- Temperature of the stream from the air conditioner
- Air conditioner efficiency

To control both the air conditioner and the heater, modify the thermostat.

Approximating Nonlinear Relationships: Type S Thermocouple

This example shows how to approximate nonlinear relationships of a type S thermocouple.

Thermocouple Modeling and Signal Conversion

The thermocouple is one of the popular analog transducers today, along with other devices such as position sensors, strain gages, pressure transducers, and resistance temperature devices (RTDs). Operating under the principle of the Seebeck effect (a.k.a. thermoelectric effect), thermocouples have an empirically determined nonlinear behavior that is well known over each junction type's useful operating range. If you run the model, you will be able to see the cumulative effect of each component on dynamic measurement accuracy. This example will focus on models for each of these components in a dynamic temperature measurement system for a Type S (Platinum-10% Rhodium(+)) versus Platinum(-) : a thermocouple device and probe assembly, a signal conditioning method, an analog to digital converter (ADC), and a software specification for converting the ADC output into a temperature value. An additional section shows how to obtain and use standard NIST ITS-90 thermocouple data with Simulink® models. Look-up tables and a polynomial block are used in this design to capture the nonlinear behavior of the thermocouple. Note that the polynomial block is a viable alternative to look-up tables for some applications, minimizing ROM usage at the cost of some additional computation for the full polynomial representation.

```
open_system('sldemo_tc')
```

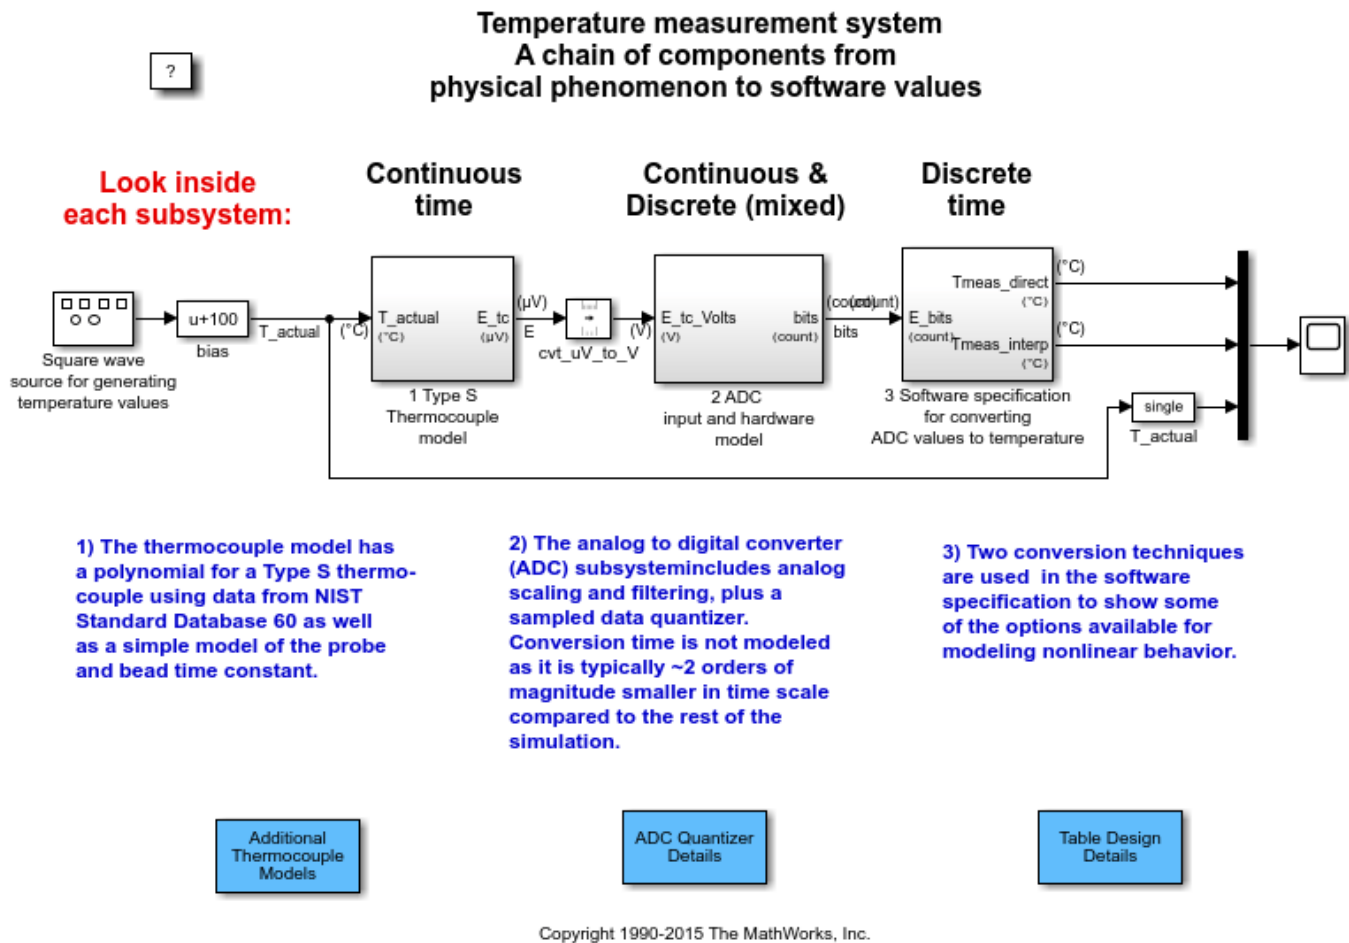

Figure 1: Temperature measurement system: a chain of components from physical phenomenon to software values

Simulating the Thermocouple Signal

The two main features of the thermocouple model are the probe and bead dynamics and the thermocouple's conversion of temperature into a millivolt signal. The probe+bead dynamics are modeled as a 30 msec first order system, and the nonlinear thermocouple behavior is modeled using the segment 1 polynomial data from NIST Standard Database 60 for a Type S thermocouple from -50 to 1063 degC. For numerical stability, the coefficients were scaled to return microvolts from the polynomial block. The output of the 1 Type S Thermocouple model subsystem is then converted to volts with a Unit Conversion block. Note that units are specified on the subsystem input and output ports and displayed on the subsystem icons. To learn more about units, see "Unit Specification in Simulink Models".

An alternative implementation to using the polynomial is an interpolated look-up table. Table data could be used in a look-up table block in place of the polynomial block. Sample data was constructed from NIST Standard Database 60 for a Type S thermocouple in file `sldemo_create_tc_tabledata.m`. Access to this database is described below in the section titled "Thermocouple Reference Data Download and Import Procedure".

Anti-Aliasing Filter and Analog to Digital Converter (ADC) Models

The ADC in this model expects a 0 to 5 volt signal, so the raw thermocouple sense voltage is biased and amplified corresponding to a range of -0.235 mV to 18.661 mV (-50 degC to 1765 degC). A third order Butterworth anti-aliasing filter was designed for $W_n = 15$ Hz using the Signal Processing Toolbox™:

```
[num,den] = butter(3, 15*2*pi, 'low', 's')
```

The output of the anti-aliasing filter feeds a sample-and-hold device that drives the quantization model. Since the sample period is 20 msec in this example, the conversion time is ignored as it is typically 2 orders of magnitude smaller for devices currently available. (Note: if the conversion time were an appreciable fraction of the sample period, it could not be ignored as it would significantly affect the system's dynamics.)

The quantization algorithm in the model takes in a 0 to 5 volt signal and outputs a 12-bit digital word in a 16-bit signed integer. A value of 0 corresponds to 0 Volts and a value of 4096 would correspond to 5 Volts. A change in the least significant bit (LSB) is about 1.2 mV. As 12 bits can only reach the value of 4095, the highest voltage that can be read by this device is approximately 4.9988 Volts. In order to have no more than 1/2 LSB error within the operating range, the quantizer changes values midway between each voltage point, resulting in a 1/2-width interval at 0 Volts and a 3/2-width interval just below 5 Volts. The last interval has 1 full LSB due to its 3/2-width size.

Understanding Data Converters

The `sldemo_adc_quantize` model allows you to explore the A/D converter component in more detail:

set(gcf, 'Color', [1, 1, 1]);
```

Figure 3: Quantization characteristic of ADC

```
ax = get(gcf, 'Children');  
set(ax(1), 'xlim', [4085, 4100]);
```

Figure 4: Quantization characteristic of ADC: zoomed in to top of range to reveal 1 LSB error behavior at high end (rest of range only has 1/2 LSB max error)

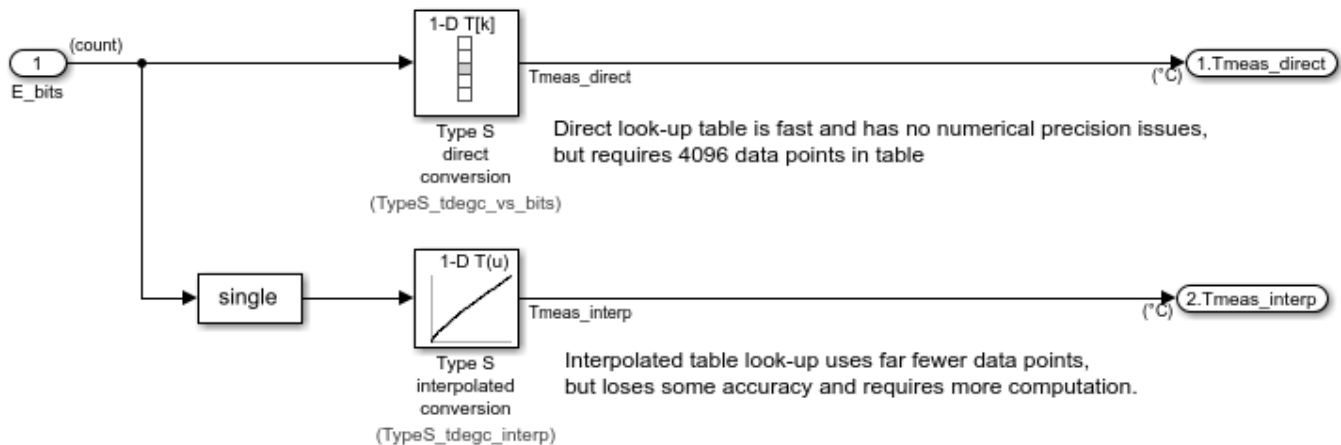

Software Specification for Converting ADC Output to Temperature Values

The input conversion subsystem requires a 16 bit unsigned integer input from the ADC whose full scale range is 0 to 4095 counts, corresponding to -0.235 mV and 18.6564 mV thermocouple loop voltage. The best accuracy and fastest algorithm for input conversion is a direct look-up table. Since the input is an integer from 0 to 4095, a table can be constructed that gives the thermocouple temperature corresponding to each possible input value, so the conversion process can be reduced to indexing into a table. This however, requires one number per ADC output value and for a 12-bit ADC, this can be a burden in memory constrained environments. For double precision data, this is a 16 kB ROM requirement. See file `sldemo_create_tc_tabledata.m` for the method used to construct the direct look-up table from the Type S thermocouple reference data. The error associated with this approach is entirely isolated to the table construction process as there is an output value associated with every possible input value - the run-time look-up process introduces no additional error.

An interpolated table was also put into the model, using only 664 bytes. This is a big reduction in ROM required compared to the direct table look-up, but it takes a bit longer to compute than an indirect memory access and introduces error into the measurement, which goes down as the number of points in the table increases.

```
open_system(sprintf('sldemo_tc/3 Software specification\nfor converting\nADC values to temperatur
```

Input: 0 to 4095 integer "counts" , where
0 counts corresponds to 0 input volts and -0.236 thermocouple millivolts
4096 counts corresponds to 5 input volts and 18.661 thermocouple millivolts

Tables derived from ITS-90 thermocouple reference data from NIST Standard Database 60 related to NIST Monograph 175 (ITS-90).

Thermocouple Reference Data Download and Import Procedure

Using the NIST ITS-90 Thermocouple Database (Standard Reference Database 60 from NIST Monograph 175), you can access the standard reference data describing the behavior for the eight standard thermocouple types. This database relates thermocouple output to the International Temperature Scale of 1990. Follow these steps to acquire and read in the data needed to fully exercise the support files included with this example:

1. Visit the NIST Standard database 60 site on the Internet and download the file all.tab to a local directory. This file is the one under the All Thermocouple Types hyperlink. After the download is complete, return to this page.
2. cd to the directory where you downloaded the all.tab thermocouple database
3. Parse the database and convert it to a MATLAB structure array using the conversion tool readstdtcdata.m:

```
tdata = readstdtcdata('all.tab');
save thermocouple_its90.mat tdata;
```

(tip: highlight the above MATLAB code and use right mouse menuitem "Evaluate Selection" to execute it)

You now have a complete set of temperature (T, degC) vs. voltage (E, mV) data, approximating polynomial coefficients, and inverse polynomial coefficients for the standard thermocouple types B, E, J, K, N, R, S, and T in the tdata variable of file thermocouple_its90.mat. The MATLAB script in sldemo_create_tc_tabledata.m uses this data to prepare lookup table block parameters used in the example model.

Conditioning Reference Data for Use in a Look-Up Table

If you review the thermocouple data tables in the `tcdata` structure or in `all.tab`, you will probably notice a few things:

- Repeated 0 degC temperature points in the data
- Repeated voltage points in the data due to the 3-digit output format
- Non-monotonic behavior with two temperatures having the same output, e.g., for the Type B thermocouple, $T(E)$ won't work but $E(T)$ does work

The `readstdtcdata()` routine will remove the repeated 0 degC temperature points from the data, but the repeated voltages due to the data format and non-monotonic behavior of some of the curve ends must be dealt with on an individual basis. A reference model named `sldemo_tc_blocks` was constructed using `sldemo_tc_blocks_data.mat`. It contains look-up tables with data populated from the interpolating polynomials for the eight standard thermocouples in `all.tab`:

```
open_system('sldemo_tc_blocks')
```

Full-Range 2 degrees Celsius Interpolated Thermocouple Tables created from ITS-90 Interpolating Polynomials

Note: this model has data in its Model Workspace.

Browse/Edit the model workspace from the View / Model Explorer menu item.

To use these blocks, load data into the model workspace or base workspace:

```
>> load sldemo_tc_blocks_data.mat
```

Digital Waveform Generation: Approximating a Sine Wave

This example shows some of the main steps needed to design and evaluate a sine wave data table for use in digital waveform synthesis applications in embedded systems and arbitrary waveform generation instruments.

Real-Time direct digital synthesis of analog waveforms using embedded processors and digital signal processors (DSPs) connected to digital-to-analog converters (DACs) is becoming pervasive even in the smallest systems. Developing waveforms for use in embedded systems or laboratory instruments can be streamlined using the tight integration of MATLAB® and Simulink®. You can develop and analyze the waveform generation algorithm and its associated data at your desktop before implementing it with Simulink® Coder™ on target hardware.

When feasible, the most accurate way to digitally synthesize a sine wave is to compute the full precision $\sin()$ function directly for each time step, folding ωt into the interval 0 to 2π . In real-time systems, the computational burden is typically too large to permit this approach. One popular way around this obstacle is to use a table of values to approximate the behavior of the $\sin()$ function, either from 0 to 2π , or even half wave or quarter wave data to leverage symmetry.

Tradeoffs to consider include algorithm efficiency, data ROM size required, and accuracy/spectral purity of the implementation. Similar analysis is needed when performing your own waveform designs. The table data and look-up algorithm alone do not determine performance in the field. Additional considerations such as the accuracy and stability of the real-time clock, and digital to analog converter are also needed in order to assess overall performance. The Signal Processing Toolbox™ and the DSP System Toolbox™ complement the capabilities of MATLAB and Simulink for work in this area.

Another popular way to approximate the behavior of the sine wave is to use the CORDIC approximation method. CORDIC is an acronym for COordinate Rotation DIGital Computer. The Givens rotation-based CORDIC algorithm is one of the most hardware-efficient algorithms because it requires only shift-add iterative operations.

If you have a Fixed- Point Designer license, then you can see “Compute Sine and Cosine Using CORDIC Rotation Kernel” (Fixed-Point Designer) for an example on CORDIC approximation.

The distortion analysis in this example is based on principles presented in "Digital Sine-Wave Synthesis Using the DSP56001/DSP56002", by Andreas Chrysafis, Motorola® Inc. 1988

Create a Table in Double Precision Floating Point

The following commands make a 256 point sine wave and measure its total harmonic distortion when sampled first on the points and then by jumping with a delta of 2.5 points per step using linear interpolation. Similar computations are done by replacing the sine values with CORDIC sine approximation. For frequency-based applications, spectral purity can be more important than absolute error in the table.

The file `ssinthd.m` is the core function in this example. It is used for calculating total harmonic distortion (THD) for digital sine wave generation with or without interpolation. This THD algorithm proceeds over an integral number of waves to achieve accurate results. The number of wave cycles used is A . Since the step size 'delta' is A/B and traversing A waves will hit all points in the table at least one time, which is needed to accurately find the average THD across a full cycle.

The relationship used to calculate THD is:

$$\text{THD} = (\text{ET} - \text{EF}) / \text{ET}$$

where ET = total energy, and EF = fundamental energy

The energy difference between ET and EF is spurious energy.

```
N      = 256;
angle = 2*pi * (0:(N-1))/N;

s      = sin( angle )';
thd_ref_1 = ssinthd( s, 1, N, 1, 'direct' )
thd_ref_2p5 = ssinthd( s, 5/2, 2*N, 5, 'linear' )

cs     = cordicsin( angle, 50 )';
thd_ref_1c = ssinthd(cs, 1, N, 1, 'direct' )
thd_ref_2p5c = ssinthd(cs, 5/2, 2*N, 5, 'linear' )
```

```
thd_ref_1 =
    4.8049e-32
```

```
thd_ref_2p5 =
    1.4176e-09
```

```
thd_ref_1c =
    1.2577e-30
```

```
thd_ref_2p5c =
    1.4176e-09
```

Put the Sine Wave Approximations in a Model

You can put the sine wave designed above into a Simulink model and see how it works as a direct lookup, with linear interpolation, and with CORDIC approximation. This model compares the output of the floating point tables to the `sin()` function. As expected from the THD calculations, the linear interpolation has a lower error than the direct table lookup in comparison to the `sin()` function. The CORDIC approximation shows a lower error margin when compared to the linear interpolation method. This margin depends on the number of iterations when computing the CORDIC sin approximation. You can typically achieve greater accuracy by increasing the number of iterations (corresponding to a longer computation time). The CORDIC approximation eliminates the need for explicit multipliers. It is used when multipliers are less efficient or non-existent in hardware.

Open the `sldemo_tonegen` model

```
open_system('sldemo_tonegen');
set_param('sldemo_tonegen', 'StopFcn', '');
out = sim('sldemo_tonegen');
currentFig = figure('Color',[1,1,1]);
subplot(3,1,1), plot(out.tonegenOut.time, out.tonegenOut.signals(1).values); grid
title({'Difference between direct look-up', 'and reference signal'});
```

```
subplot(3,1,2), plot(out.tonegenOut.time, out.tonegenOut.signals(2).values); grid
title({'Difference between interpolated look-up', 'and reference signal'});
subplot(3,1,3), plot(out.tonegenOut.time, out.tonegenOut.signals(3).values); grid
title({'Difference between CORDIC sine', 'and reference signal'});
```

Comparison in approximate sine wave accuracy between direct look-up, linear interpolation and CORDIC approximation vs. reference signal

Copyright 1990-2013 The MathWorks, Inc.

Taking a Closer Look at Waveform Accuracy

Zooming in on the signals between 4.8 and 5.2 seconds of simulation time (for example), you can see a different characteristic due to the different algorithms used:

```
ax = get(currentFig, 'Children');  
set(ax(3), 'xlim', [4.8, 5.2])  
set(ax(2), 'xlim', [4.8, 5.2])  
set(ax(1), 'xlim', [4.8, 5.2])
```

The Same Table, Implemented in Fixed Point

Now convert the floating point table into a 24 bit fractional number using 'nearest' rounding. The new table is tested for total harmonic distortion in direct lookup mode at 1, 2, and 3 points per step, then with fixed point linear interpolation.

```
bits = 24;
is = num2fixpt( s, sfrac(bits), [], 'Nearest', 'on');

thd_direct1 = ssinthd(is, 1, N, 1, 'direct')
thd_direct2 = ssinthd(is, 2, N, 2, 'direct')
thd_direct3 = ssinthd(is, 3, N, 3, 'direct')

thd_linterp_2p5 = ssinthd(is, 5/2, 2*N, 5, 'fixptlinear')

thd_direct1 =
    2.6423e-15

thd_direct2 =
    2.8660e-15

thd_direct3 =
```

```
2.6423e-15
```

```
thd_linterp_2p5 =
```

```
1.4175e-09
```

Compare Results for Different Tables and Methods

Choosing a table step rate of 8.25 points per step (33/4), jump through the double precision and fixed point tables in both direct and linear modes and compare distortion results:

```
thd_double_direct = ssinthd( s, 33/4, 4*N, 33, 'direct')
thd_sfrac24_direct = ssinthd(is, 33/4, 4*N, 33, 'direct')

thd_double_linear = ssinthd( s, 33/4, 4*N, 33, 'linear')
thd_sfrac24_linear = ssinthd(is, 33/4, 4*N, 33, 'fixptlinear')
```

```
thd_double_direct =
```

```
4.7061e-05
```

```
thd_sfrac24_direct =
```

```
4.7061e-05
```

```
thd_double_linear =
```

```
7.9741e-10
```

```
thd_sfrac24_linear =
```

```
8.1751e-10
```

Using Preconfigured Sine Wave Blocks

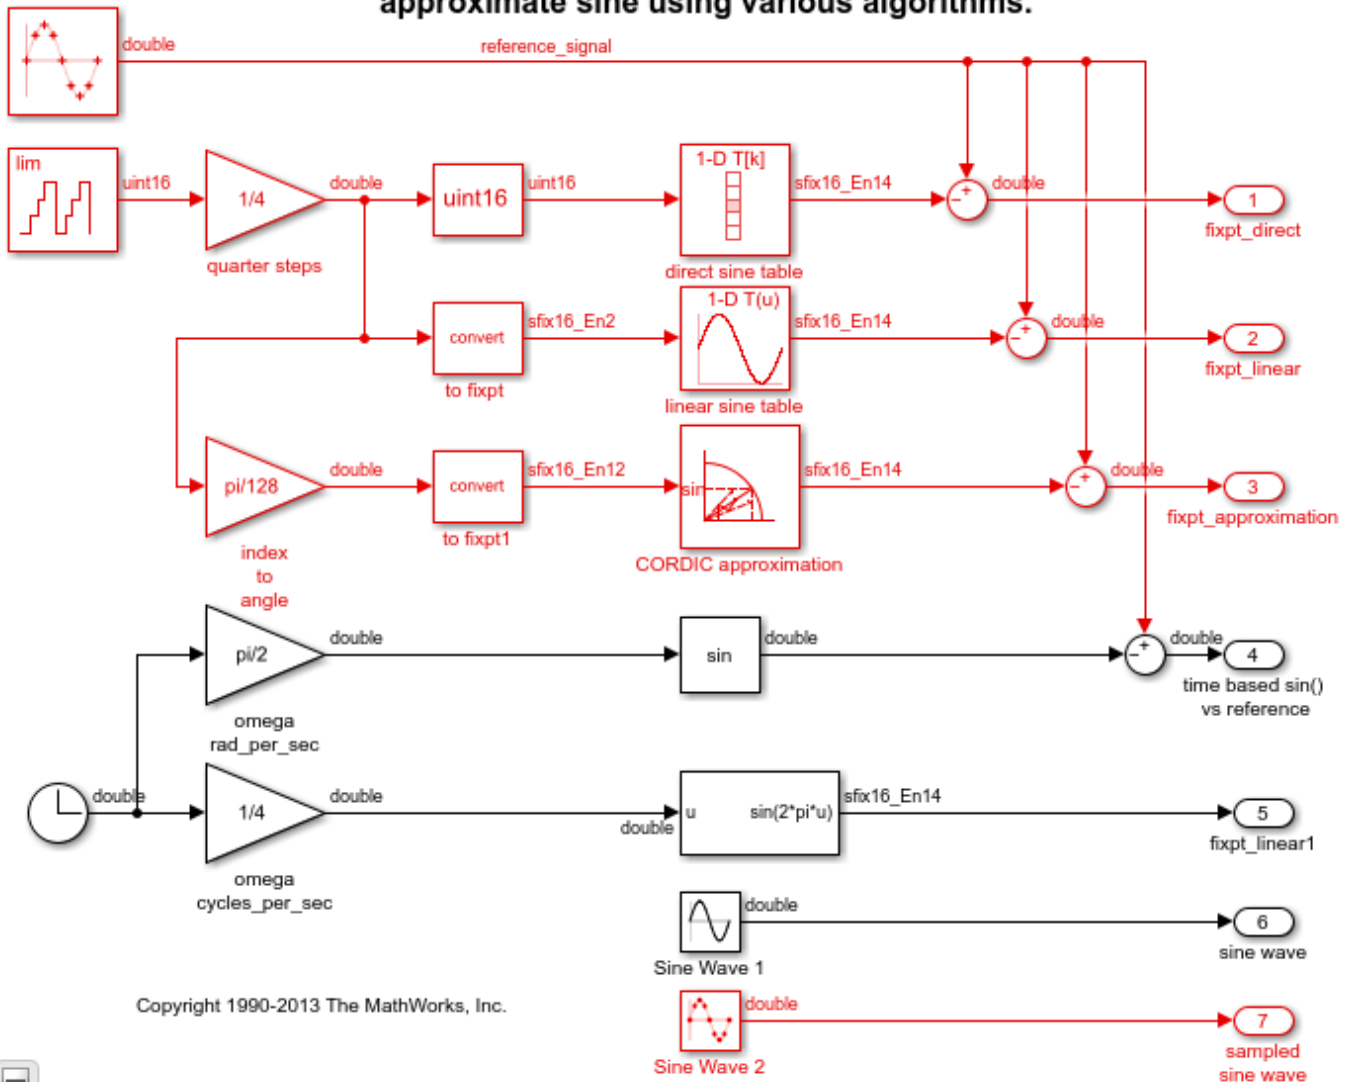

Simulink also includes a Sine Wave source block with continuous and discrete modes, plus fixed point Sin and Cosine function blocks that implement the function approximation with a linearly interpolated lookup table that exploits the quarter wave symmetry of sine and cosine. Example `sldemo_tonegen_fixpt` uses a sampled sine wave source as the reference signal and compares it with a lookup table with or without interpolation, and with CORDIC sine approximation in fixed point data types.

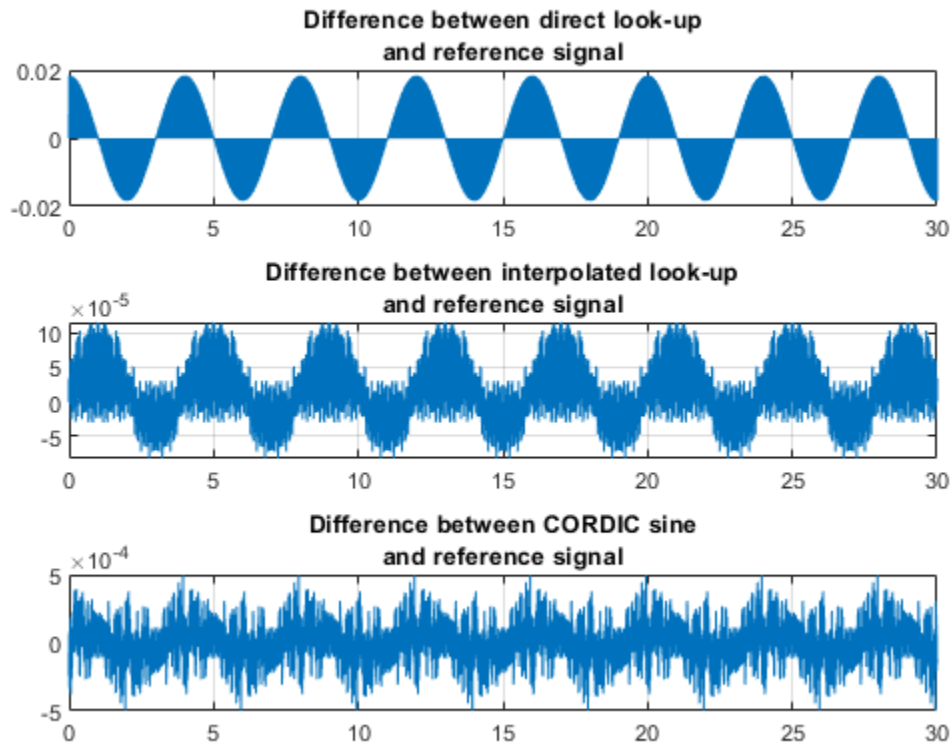

Open the `sldemo_tonegen_fixpt` model

```
open_system('sldemo_tonegen_fixpt');
set_param('sldemo_tonegen_fixpt', 'StopFcn', '');
out = sim('sldemo_tonegen_fixpt');
figure('Color',[1,1,1]);
subplot(3,1,1), plot(out.tonegenOut.time, out.tonegenOut.signals(1).values); grid
title({'Difference between direct look-up', 'and reference signal'});
subplot(3,1,2), plot(out.tonegenOut.time, out.tonegenOut.signals(2).values); grid
```

```
title({'Difference between interpolated look-up', 'and reference signal'});
subplot(3,1,3), plot(out.tonegenOut.time, out.tonegenOut.signals(3).values); grid
title({'Difference between CORDIC sine', 'and reference signal'});
```

Additional blocks to calculate sine and approximate sine using various algorithms.

Use of Sine Function with a Clock Input

The model also compares the sine wave source reference with the `sin()` function whose input angle in radians is time based (computed using a clock). This section tests the assumption that the clock input would return repeatable results from the `sin()` function for period 2π . The following plot shows that the `sin()` function accumulates error when its input is time based. This also shows that a sampled sine wave source is more accurate to use as a waveform generator.

```
subplot(1,1,1), plot(out.tonegenOut.time, out.tonegenOut.signals(4).values); grid
title({'Difference between time based sin()', 'and reference signal'});
```

Survey of Behavior for Direct Lookup and Linear Interpolation

The file `sldemo_sweeptable_thd.m` performs a full frequency sweep of the fixed point tables and will let us more thoroughly understand the behavior of this design. Total harmonic distortion of the 24-bit fractional fixed point table is measured at each step size, moving through it D points at a time, where D is a number from 1 to $N/2$, incrementing by 0.25 points. N is 256 points in this example; the 1, 2, 2.5, and 3 cases were done above. Frequency is discrete and therefore a function of the sample rate.

Notice the modes of the distortion behavior in the plot. They match with common sense: when retrieving from the table precisely at a point, the error is smallest; linear interpolation has a smaller error than direct lookup in between points. What is not intuitive is that the error is relatively constant for each of the modes up to the Nyquist frequency.

```
figure('Color',[1,1,1])
tic, sldemo_sweeptable_thd(24, 256), toc
```

Elapsed time is 0.895757 seconds.

Next Steps

To take this example further, try different table precision and element counts to see the effect of each. Using CORDIC approximation, try different numbers of iterations to see the effects on accuracy and computation time. You can investigate different implementation options for waveform synthesis algorithms using automatic code generation available from the Simulink Coder and production code generation using Embedded Coder™. Embedded Target products offer direct connections to a variety of real-time processors and DSPs, including connection back to the Simulink diagram while the target is running in real-time. The Signal Processing Toolbox and DSP System Toolbox offer prepackaged capabilities for designing and implementing a wide variety of sample-based and frame-based signal processing systems with MATLAB and Simulink.

```
bdclose('sldemo_tonegen');
bdclose('sldemo_tonegen_fixpt')
```

Use Model Reference with Local Solver in DC Motor

This example shows how to use local solvers to improve simulation performance in a DC motor with a mechanical load.

The subcomponents of a complex dynamic system often have different frequencies and time scales. For such systems, simulation speed can be accelerated by partitioning the model into different components and applying different solvers to components. Model reference with a local solver supports this approach by allowing the model reference with its own local solver to be referenced in a top model with a different solver.

Analysis and Physics of the Model

In this DC motor model, torque is generated when an armature current flows through the armature coil. The torque is proportional to the armature current and the strength of the magnetic field of the motor. For a simple DC motor, you can assume that the magnetic field is constant and derive these equations [1] on page 13-0 .

Torque T generated, where K_T is the motor torque constant and i is the armature current:

$$T = K_T i$$

Electro magnetic field e generated, where K_e is the motor voltage constant and θ is the angle of the armature/load:

$$e = K_e \frac{d\theta}{dt}$$

The DC motor is composed of two subcomponents:

- The electrical part, where L is the inductance and R is the resistance of the armature coil:

$$v = Ri + L \frac{di}{dt} + e = Ri + L \frac{di}{dt} + K \frac{d\theta}{dt}$$

- The mechanical part, where J is the total moment of inertia of the motor armature plus load:

$$J \frac{d^2\theta}{dt^2} = T - b \frac{d\theta}{dt} = K i - b \frac{d\theta}{dt}$$

These two subcomponents are coupled through two states variables, current i and the angular speed $\frac{d\theta}{dt}$.

The mechanical time constant can be approximated by assuming $b = 0$.

$$t_m = \frac{RJ}{K_e K_T}$$

The electrical time constant is

$$t_e = \frac{L}{R}$$

Model Parameters and Time Constant

Assume these values for the parameters used in this example.

Parameter	Value	Unit
K_t	0.025	Nm/A
K_e	0.025	V/rad/s
R	3	Ohm
L	$2.5e-6$	H
J	$3.2e-6$	Nms ²
b	$3.5e-6$	Nm/rad

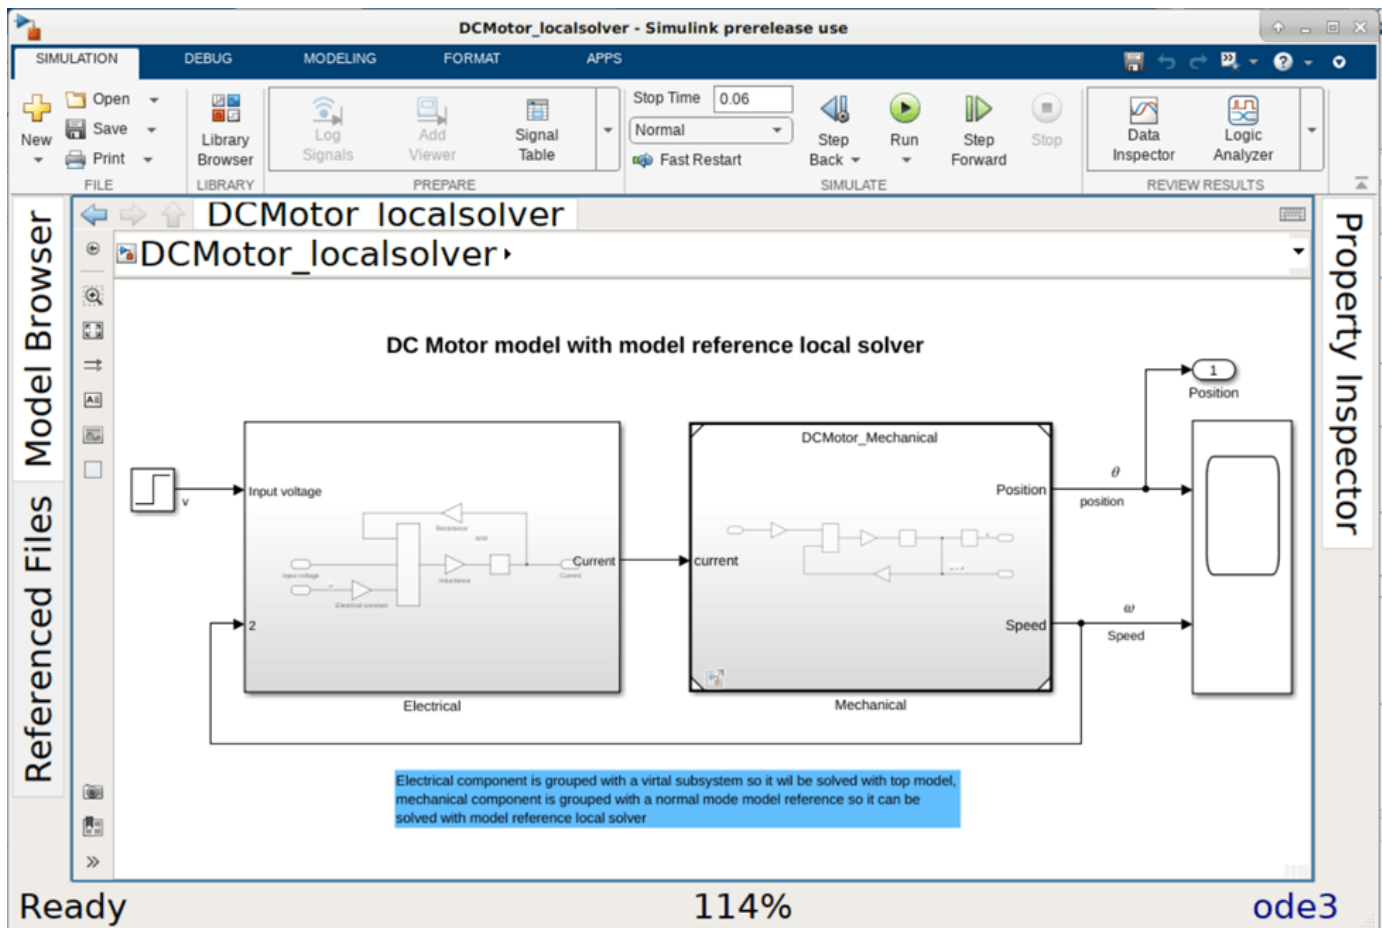

Thus, $t_m = \frac{RJ}{K_e K_t} = 0.0154$ s; and $t_e = \frac{L}{R} = 8.33e-07$ s.

If you use only one solver used to simulate this model, the step size required should be small enough to catch the electrical time constant. Assume a step size of $t_s = 2e-7$.

The time constant of two subcomponents of the model is quite different. Thus, local solver of model reference can be used to accelerate the model.

DC Model Using Model Reference

Based on the time constant analysis, you can partition the DC model into two components. Group the electrical part into a virtual subsystem so that it can be solved with the top solver. Group the mechanical part into a normal mode model reference so it can be solved with top solver or with the local solver. The DC motor is shown in this Simulink model.

Partition the overall model into mechanical and electrical part and load the top model.

```
topModel = 'DCMotor_localsolver';
bottomModel = 'DCMotor_Mechanical';
```

```
open_system(topModel)
load_system(bottomModel)
```

Simulation

Use a global solver with the small step size of $2e-7$ to simulate the model, then use this result as the baseline. Compute the time constants of the two components and use them to select the solver step size.

Calculate the electrical and mechanical system time constants T_m and T_e , respectively. Calculate the time constant ratio that can be used to select the local solver step size. Also compute the global solver step based on time constant. Generally, you can calculate step size by dividing the time constant by 5.

```
Tm = R*J/Ke/Kt;
Te = L/R;
```

```
timeConstantRatio = Tm/Te;
```

```
topStep = 2E-7;
localStep = topStep*10000;
```

Simulate the entire model with the top solver.

```
set_param(topModel, 'Solver', 'ode3', 'fixedStep', num2str(topStep));
set_param(bottomModel, 'UseModelRefSolver', 'off');
```

```
sim(topModel);
y1 = yout.signals.values;
```

Now, enable the local solver of the model reference that models the mechanical part of the model. Since the mechanical part has a much larger time constant than the electrical part, the step size of the local solver can be much larger than the global solver. Set the value to 2e-3.

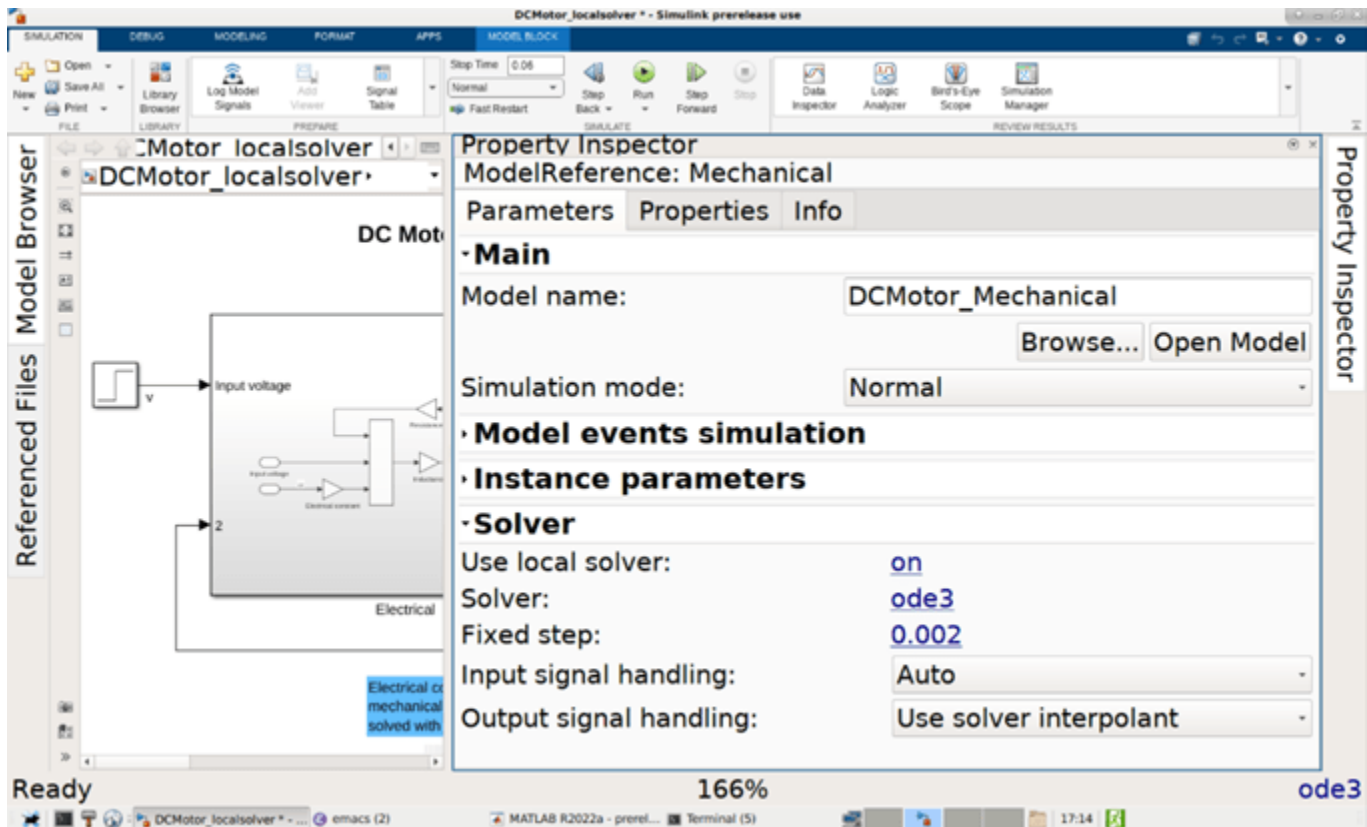

Simulate the model with two solvers. For the top, use an ode3 solver of step size 2e-7. For the local, use an ode3 solver of step size 2e-2. When using a local solver, use zero-order hold (ZOH) data handling at the input and output of the model reference. The local solver parameters can be accessed through the solver tab of the Property Inspector of the model reference.

```
set_param(topModel, 'Solver', 'ode3', 'fixedStep', num2str(topStep));
set_param(bottomModel, 'UseModelRefSolver', 'on');
set_param(bottomModel, 'Solver', 'ode3', 'fixedstep', num2str(localStep));
```

Set the instance-based parameters.

```
mechanical = [topModel '/Mechanical'];
set_param(mechanical, 'InputSignalHandling', 'Zero-order hold');
set_param(mechanical, 'OutputSignalHandling', 'Zero-order hold');
```

```
sim(topModel);
y2 = yout.signals.values;
```

For **Input Signal Handling**, select 'auto' option. For **Output Signal Handling**, select 'use solver interpolant'. Finally, simulate the model with local fixed-step solver plus data exchange.

```
set_param(topModel, 'Solver', 'ode3', 'fixedStep', num2str(topStep));
set_param(bottomModel, 'UseModelRefSolver', 'on');
set_param(bottomModel, 'Solver', 'ode3', 'fixedstep', num2str(localStep));
```

```
mechanical = [topModel '/Mechanical'];
set_param(mechanical, 'InputSignalHandling', 'Auto');
set_param(mechanical, 'OutputSignalHandling', 'Use solver interpolant');
sim(topModel);
```

```
sim(topModel);
y3 = yout.signals.values;
```

Results

This plot compares three simulation results. The figure shows the position step response of the DC motor when voltage is applied to the terminal and the motor starts to rotate. The smooth blue curve is the baseline. The orange step curve shows the result of using local solver and ZOH input output data handling. This strategy samples the input and output of the mechanical component with a sample rate of $2e-3$, and the local solver integrates its states with this step size. This strategy works well in this example as the result generated is fairly close to the baseline performance. The local solver using 'Auto' and 'Use solver interpolant' is the yellow curve. Compared to the ZOH strategy, this simulation result is even better. The orange line is smoother and closer to the baseline.

```
figure();
plot(tout, y1, 'LineWidth', 2); hold on;
```

```

plot(tout,y2,'LineWidth',1.5);hold on;
plot(tout,y3,'LineWidth',1.5);hold on;
legend('global solver ode3', 'plus local solver ode3', 'plus data compensation');
title('Simualte DC Motor model with global and local solver');
xlabel('Time(s)');
ylabel('Position(rad)');

```

Accurate Zero-Crossing Detection

This example shows how zero crossings work in Simulink®. In this model, three shifted sine waves are fed into an absolute value block and saturation block. At exactly $t = 5$, the output of the switch block changes from the absolute value to the saturation block. Zero crossings in Simulink will automatically detect exactly when the switch block changes its output, and the solver will step to the exact time that the event happens. This can be seen by examining the output in the scope.

Spiral Galaxy Formation Simulation Using MATLAB Function Blocks

This model was inspired by the classic paper "Galactic Bridges and Tails" (Toomre & Toomre 1972). The original paper explained how disc shaped galaxies could develop spiral arms. Two disc shape galaxies originally are far apart. They then fly by each other and almost collide. Once the galaxies are close enough, mutual gravitational forces cause spiral arms to form.

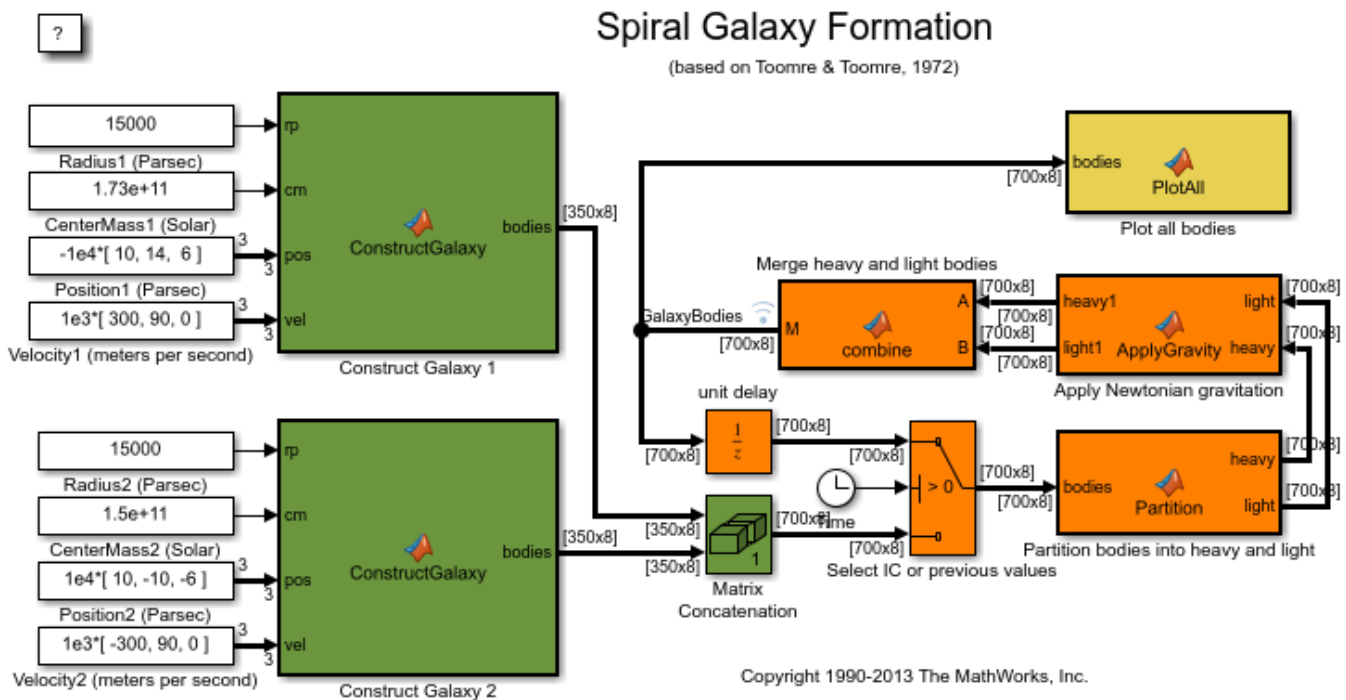

Except for the "PlotAll" visualization block's use of plotting routines, all MATLAB® function blocks in this model support code generation with Simulink® Coder™ and Embedded Coder™.

- Requirements:** For this example, Simulink® generates code for the simulation in a Simulink project directory created in the current working directory (pwd). If you do not want to affect the current directory (or if you cannot generate files in this directory), you should change your working directory.

Opening the Model and Running the Simulation

Open the model and run the simulation by executing the code below. If you are using MATLAB® Help, select the code you want to execute and press F9 (or select code, right click on selection and select "Evaluate Selection"). The Simulink model will load, compile, and run.

```
model = 'sldemo_eml_galaxy';
open_system(model);
sim(model);
```

Model Description

This section describes the model in detail and explains the role of each block in the model. The green blocks initialize the simulation, the orange blocks are the core of the simulation, and the yellow block makes the galaxy animation view.

Initial Conditions

The model requires initial conditions for each galaxy. The initial conditions are: galaxy radius in parsecs (rp), galaxy mass in solar mass units (cm), galaxy position in parsecs (pos), and galaxy velocity in m/s (vel).

In the model, constant blocks specify the initial conditions. The initial conditions have been chosen such that the galaxies will nearly collide at some point in time.

"ConstructGalaxy" Blocks

The initial conditions are passed to the MATLAB function blocks Construct Galaxy 1 and Construct Galaxy 2. These MATLAB function blocks contain MATLAB code that builds the galaxy models.

In a typical galaxy, most of the mass is concentrated in its center as a super-massive black hole and/or star agglomeration. We model the galaxy as a disc with radius r with most of its mass concentrated in the inner circle of radius $r/3$. In addition to this super-massive nucleus, the "ConstructGalaxy" MATLAB function block creates 349 random stars with masses ranging from 4 to 24 solar masses. These stars are randomly positioned within distance $r/3$ and r from the center of the galaxy. The stars initially move in circular orbits around the galaxy core. Every object (star or galaxy core) has mass, position (x, y, z) , and velocity (V_x, V_y, V_z) .

"Matrix Concatenation" Block

This block joins information about both galaxies. At this point the model has 700 objects: 1 core for each galaxy and 349 stars around each core. These 700 objects interact according to Newtonian mechanics.

"Partition" Block

This MATLAB function block separates all 700 objects into two groups: heavy bodies and light bodies. The heavy bodies are the galaxy cores. The light bodies are the stars. Because the galaxy cores are much heavier than individual stars, the model will consider only the heavy-heavy and heavy-light interactions. We can ignore the light-light body interactions. This will save a lot of time since 698 out of 700 bodies in the model are light.

"ApplyGravity" Block

This MATLAB function block uses Newtonian mechanics to compute the velocities and positions of the bodies at each step. The "combine" block is also a MATLAB function block. It merges the data about heavy and light objects together.

"PlotAll" Block

This MATLAB function block plots the bodies in a figure and updates the position of each star at every step in the simulation.

Closing the Model

Close the model without saving any changes. Clear data generated by simulation/example.

```
close_system(model,0);  
clear model sldemo_eml_galaxy_output;
```

Note:

- In this model, signal logging is turned on (observe that the 'GalaxyBodies' signal has a little blue signal logging antenna on it). The model saves output data in a `Dataset` object. Any other data is saved/modified in the model workspace to avoid cluttering the MATLAB workspace.
- To modify signal logging settings, right-click on the signal line and select "Signal Properties". In this example, the signal name is 'GalaxyBodies' and the "Log signal data" checkbox is checked.
- The logged data is saved to the MATLAB workspace as a `Dataset` object with the name 'sldemo_eml_galaxy_output'. Information on the 'GalaxyBodies' signal can be retrieved from this object by typing `sldemo_eml_galaxy_output.get('GalaxyBodies')` which returns a `Simulink.SimulationData.Signal` object. See more about working with these objects in the "Simulink.SimulationData.Signal" documentation.

Comments About the Model

Despite its simplicity, this model provides insight into how our own galaxy evolved. This example allows the user to maximally simplify the model and run a fast simulation. The user can easily modify this example by adding more galaxies.

Counters Using Conditionally Executed Subsystems

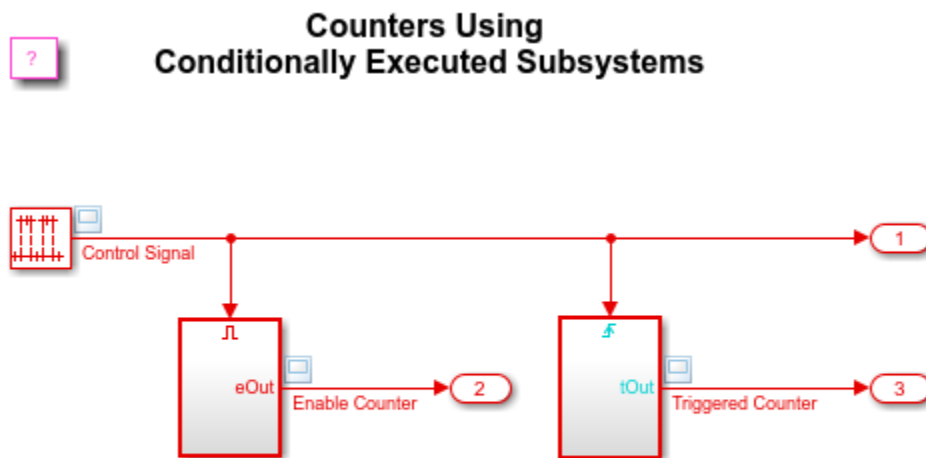

This model shows the contrast between enabled subsystems and triggered subsystems for the same control signal, through the use of counter circuits. After running the simulation, the scope shows three plots.

The first of these plots shows the control signal which is the output of the discrete pulse generator.

The second plot shows the output of the counter circuit in the enabled subsystem. The counter increments while the subsystem is enabled and then holds its output when the subsystem is disabled. The counter resets to zero when the subsystem is re-enabled because the enable port was configured to reset states when enabling.

The third plot shows the output of the counter circuit in the triggered subsystem. The counter increments every rising edge of the control signal.

The signals are shown in a Signal Viewer scope that does not require a scope block to be put into the block diagram. Instead, the "scope" icon notation on the ports show that a Signal Viewer is attached. Double click on the scope icon to make the Signal Viewer appear if it is hidden.

Friction Model with Hard Stops

This example shows how to model friction one way in Simulink®. The two integrators in the model calculate the velocity and position of the system, which is then used in the Friction Model to calculate the friction force.

Running the simulation shows the initial condition response on the Scope.

State Events

This example shows how to handle state events. Run the simulation and see the phase plane plot, where the state x_1 is along the X-axis and the state x_2 is along the Y-axis.

State-Event Handling

Simulating Systems with Variable Transport Delay Phenomena

This example shows two cases where you can use Simulink® to model variable transport delay phenomena.

Vertical Wheel Displacement on a One-Dimensional Car

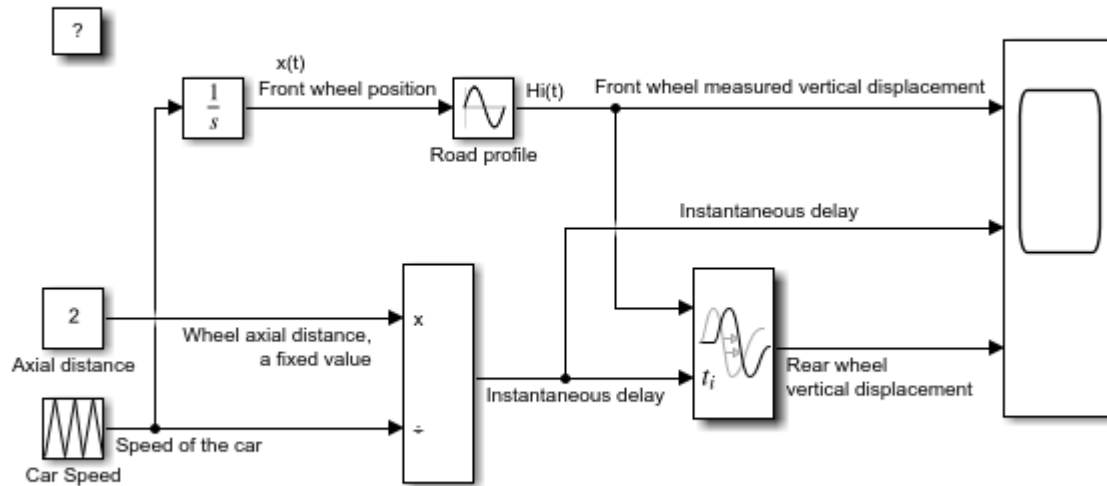

Figure 1: Illustration of a car with speed $v(t)$.

A car is running along a road with speed $v(t)$. A sensor is installed at the front wheel to measure the vertical displacement $H_i(t)$ of the front wheel caused by the road profile. If the wheels and road never lose contact, then the vertical displacement of the rear wheel, $H_o(t)$, can be seen as a variable transport delay of $H_i(t)$, which is determined by the length L between the two wheels and the speed $v(t)$.

Vertical displacement of the wheels of a one dimensional car

Copyright 1990-2013 The MathWorks, Inc.

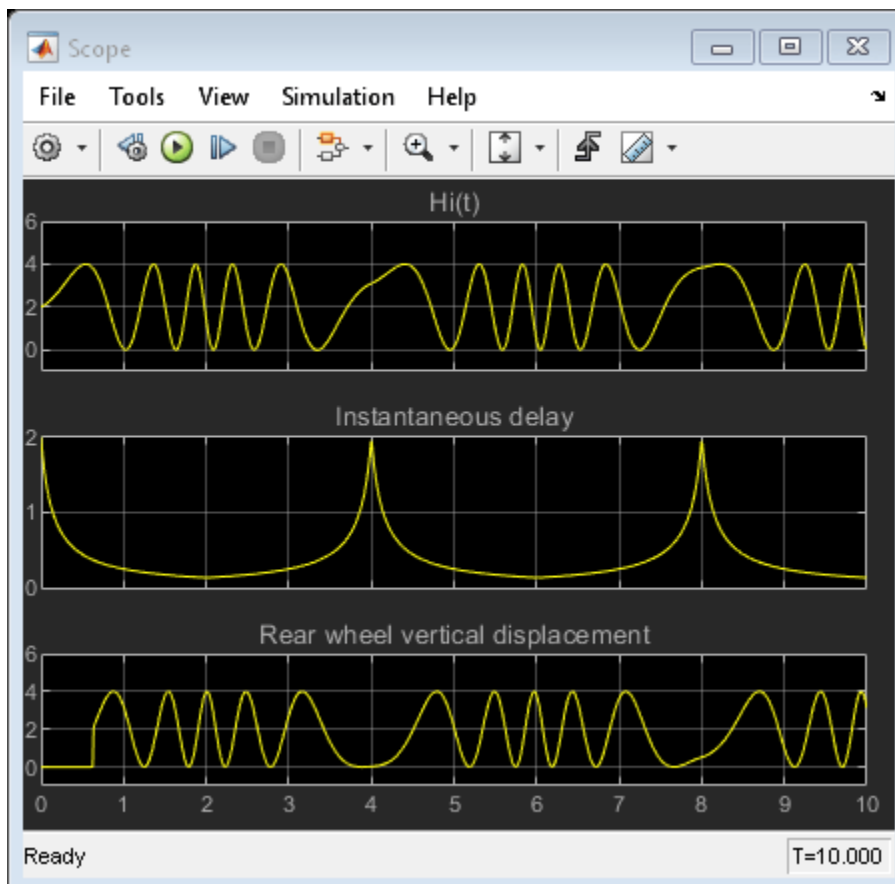

Figure 2: Vertical displacement of the wheels.

Incompressible Flow Through a Fixed Length Pipe

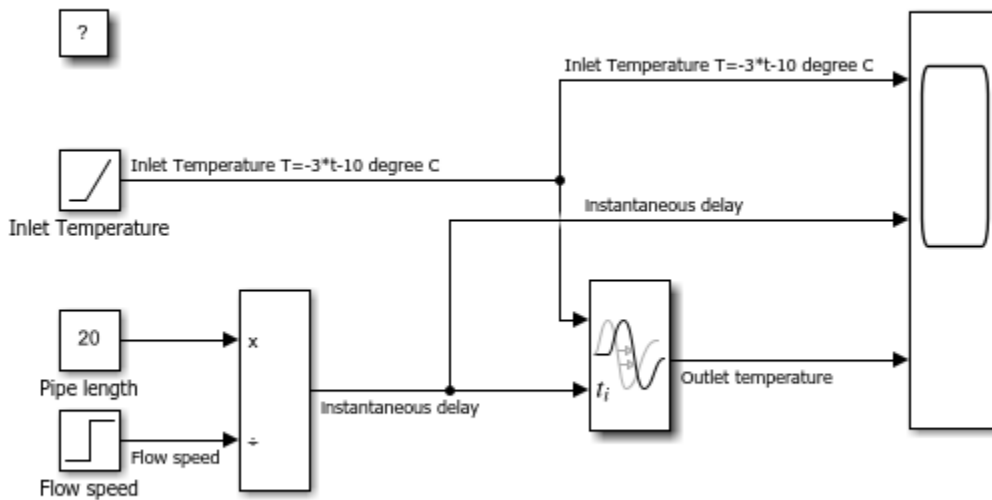

Figure 3: Illustration of a fixed-length pipe.

An incompressible flow goes through a pipe of length L with speed $v(t)$. At the inlet, the flow temperature is T_i . We can model the temperature at the outlet T_o as a variable transport delay of T_i . At time $t=0$, the pipe is empty and until $t=2$, there is no flow at the outlet. Thus, the output temperature before $t=2$ is the initial output temperature.

Modeling a Foucault Pendulum

This example shows how to model a Foucault pendulum. The Foucault pendulum was the brainchild of the French physicist Leon Foucault. It was intended to prove that Earth rotates around its axis. The oscillation plane of a Foucault pendulum rotates throughout the day as a result of axial rotation of the Earth. The plane of oscillation completes a whole circle in a time interval T , which depends on the geographical latitude.

Foucault's most famous pendulum was installed inside the Paris Pantheon. This was a 28kg metallic sphere attached to a 67 meter long wire. This example simulates a 67 meter long pendulum at the geographic latitude of Paris.

Simulink® Model

The simplest way to solve the Foucault pendulum problem in Simulink® is to build a model that solves the coupled differential equations for the system. This model is shown in Figure 1. The equations that describe the Foucault pendulum are given below. For details on the physics of the model and the derivation of these equations, see Analysis and Physics.

$$\ddot{x} = 2\Omega \sin \lambda \dot{y} - \frac{g}{L}x$$

$$\ddot{y} = -2\Omega \sin \lambda \dot{x} - \frac{g}{L}y$$

x, y = pendulum bob coordinates as seen by an observer on Earth

Ω = Earth's angular speed of revolution about its axis (*rad/sec*)

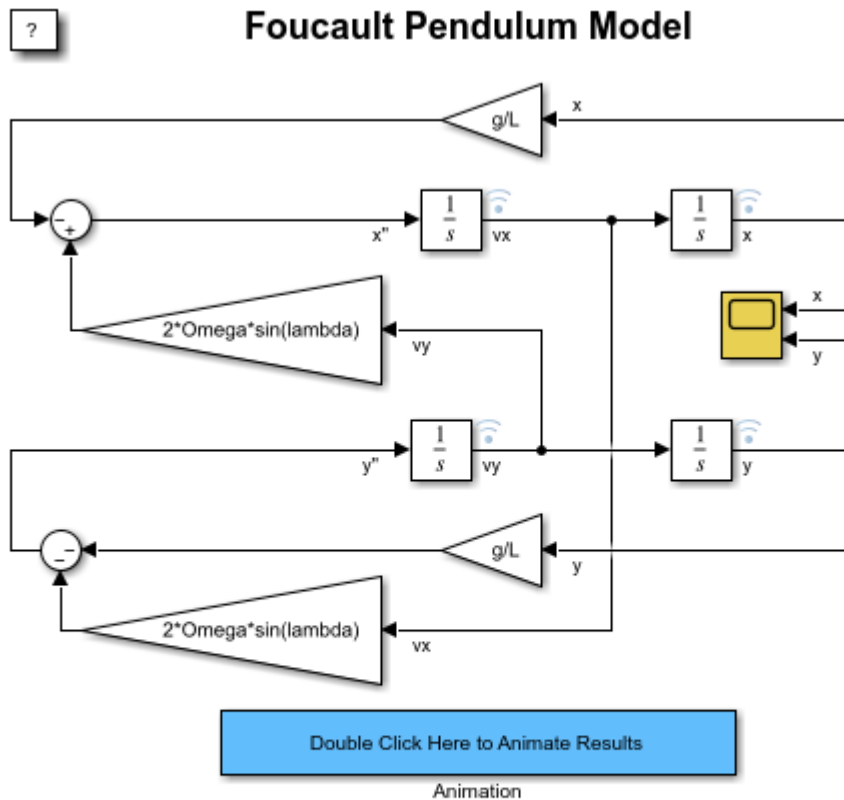

g = acceleration of gravity (*m/sec²*)

L = length of the pendulum string (*m*)

λ = geographic latitude (*rad*)

Opening the Model

Type `sldemo_foucault` in MATLAB® Command Window to open this model. This model logs simulation data to the variable `sldemo_foucault_output`. Logged signals have a blue indicator. For more information, see "Configure a Signal for Logging".

This model solves the differential equations for the Foucault Pendulum problem and plots the position of the pendulum bob in the XY plane. You can access or modify the parameters (g , Ω , λ , L and initial conditions) in MATLAB workspace.

Copyright 1990-2015 The MathWorks, Inc.

Figure 1: The Foucault pendulum model

Initial Conditions

This model loads the constants and initial conditions from the `sldemo_foucault_data.m` file. The contents of this file are shown in Table 1 below. You can modify simulation parameters directly in MATLAB workspace. The initial amplitude of the pendulum must be small compared to pendulum length, because the differential equations are valid only for small oscillations.

Table 1: Initial conditions

```

g = 9.83;           % acceleration of gravity (m/sec^2)
L = 67;            % pendulum length (m)
initial_x = L/100; % initial x coordinate (m)
initial_y = 0;     % initial y coordinate (m)
initial_xdot = 0;  % initial x velocity (m/sec)
initial_ydot = 0;  % initial y velocity (m/sec)
Omega=2*pi/86400;  % Earth's angular velocity of rotation about its axis (rad/sec)
lambda=49/180*pi; % latitude in (rad)

```

Running the Simulation

Press the "Play" button on the toolbar in the model window to run the simulation. The simulation will use a variable step stiff solver, ode23t. It will simulate a Foucault pendulum for 3600 seconds (you can change the simulation time). The model uses a default relative tolerance $RelTol = 1e-6$.

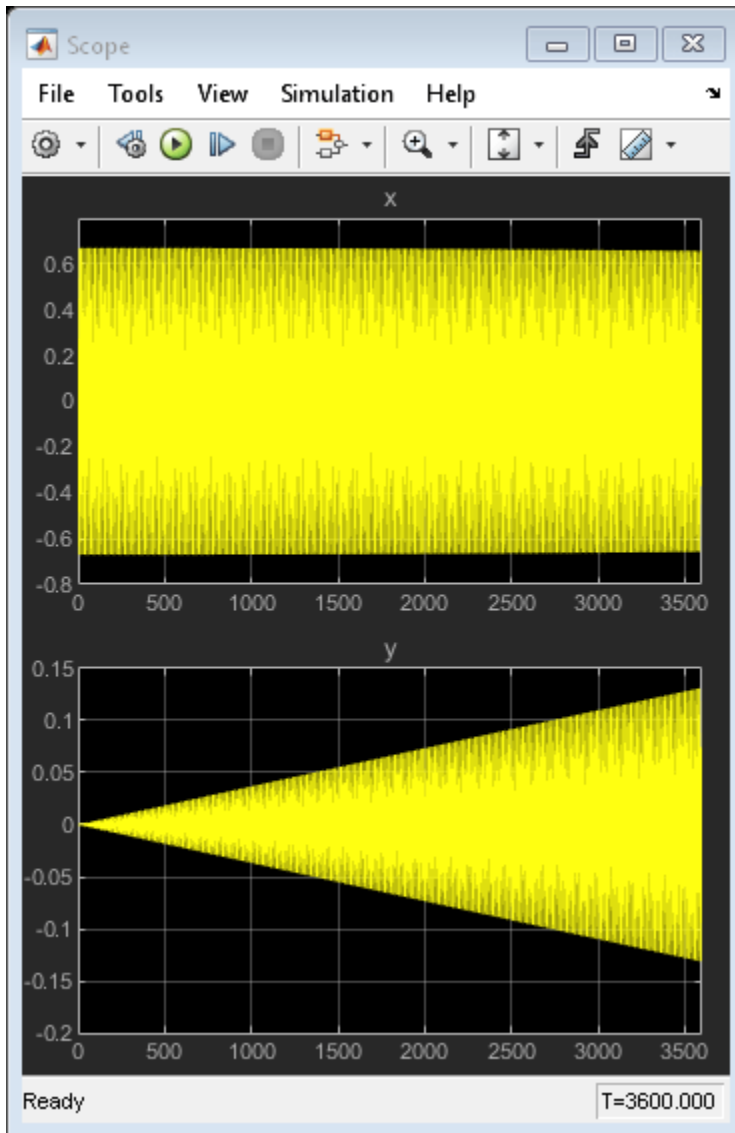

Figure 2: Foucault pendulum simulation results (simulation time of 3600 sec)

Results

The simulation results are shown in Figure 2 above. The simulation calculates the pendulum x and y coordinates, and the x and y velocity components of the pendulum.

The pendulum oscillation plane completes a 360 degree sweep in more than 24 hours. The sweep period is a function of geographic latitude λ (see derivation in Analysis and Physics).

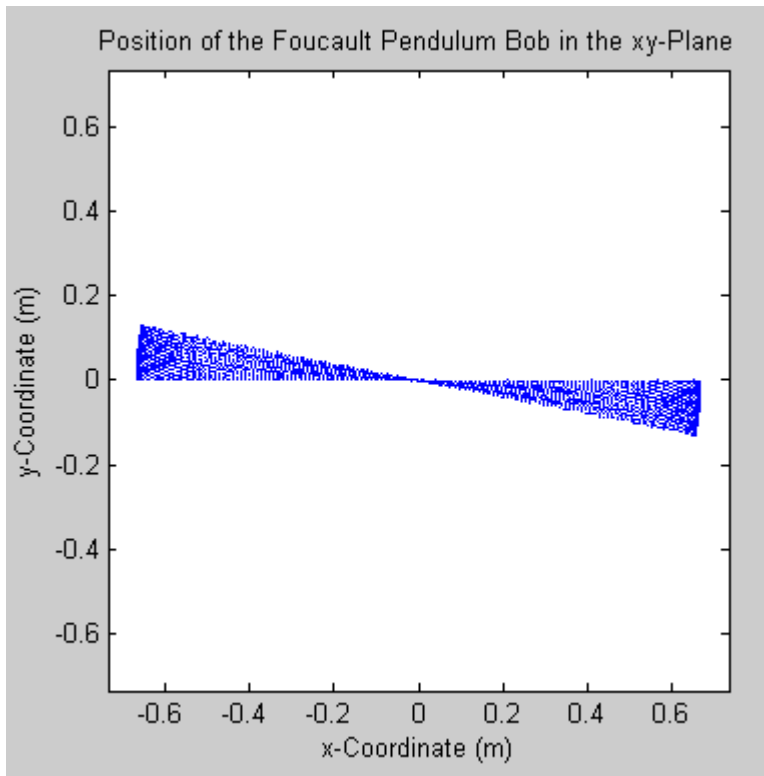

Figure 3: The Animation block shows how much the pendulum oscillation plane rotates in an hour

After you run the simulation, double click the animation block to animate the results.

- Note: The "Animate Results" portion of the example requires Signal Processing Toolbox™. Double-clicking on the animation block will cause an error if it is not installed. All other parts of the example will function correctly without the Signal Processing Toolbox.

The `sldemo_foucault_animate.m` file plots the position of the pendulum bob at different points in time. You can clearly see how the pendulum oscillation plane rotates.

- Note: If you are running the simulation at a large relative tolerance, the result will be numerically unstable over a long period of time. Make sure that you are using a stiff variable-step solver. Read more about numerical instability of stiff problems and solver performance in the "Exploring Variable-Step Solvers Using a Stiff Model" example.

Closing the Model

Close the model. Clear generated data.

Analysis and Physics

This section analyzes the Foucault pendulum and describes the physics behind it. The pendulum can be modeled as a point mass suspended on a wire of length L . The pendulum is located at the geographical latitude λ . It is convenient to use the reference frames shown in Figure 4: the inertial frame I (relative to the center of the Earth), and the non-inertial frame N (relative to an observer on Earth's surface). The non-inertial frame accelerates as a result of rotation.

Figure 4: The Inertial and Non-Inertial Frames for the Problem

Point O is the origin of the non-inertial frame N. It is the point on the surface of the earth beneath the point of suspension of the pendulum. The non inertial frame is chosen such that the z-axis points away from the center of the Earth and is perpendicular to Earth's surface. The x-axis points south and the y-axis points west.

As mentioned in the introduction, the oscillation plane of a Foucault pendulum rotates. The oscillation plane completes a full rotation in time T_{rot} given by the following formula, where T_{day} is the duration of one day (i.e. the time it takes the Earth to revolve around its axis once).

$$T_{rot} = T_{day} \cdot \sin \lambda$$

The sine factor requires further discussion. It is often incorrectly assumed that the oscillation plane of the pendulum is fixed in the inertial frame relative to the center of the Earth. This is only true at the north and south poles. To eliminate this confusion, think about the point S (see Figure 4), where the pendulum is suspended. In the inertial frame I, point S moves on a circle. The pendulum bob is suspended on a wire of constant length. For simplicity ignore the air friction. In the inertial frame I, there are only two forces that act on the bob - the wire tension T and the gravitational force F_g .

The vector r gives the position of the pendulum bob, B (see Figure 4). Newton's second law states that the sum of all forces acting on a body equals the mass times the acceleration of the body.

$$m \vec{r} = \vec{T} + \vec{F}_g$$

Throughout this proof, the dots denote time derivatives, arrows denote vectors, caps denote unitary vectors (i, j, and k along x, y, and z axes). A dot above the vector arrow indicated the time derivative of the vector. An arrow above the dot indicated the vector of the time derivative. See the difference between total acceleration and radial acceleration below.

Total Acceleration:

$$\ddot{\vec{r}} = \frac{d^2 \vec{r}}{dt^2} = \frac{d^2}{dt^2} (x\hat{i} + y\hat{j} + z\hat{k})$$

Radial Acceleration:

$$\vec{r} = \left(\frac{d^2 r}{dt^2} \right) = \ddot{x}\hat{i} + \ddot{y}\hat{j} + \ddot{z}\hat{k}$$

The acceleration of gravity points towards the center of the earth (negative z-direction).

$$g = 9.83 \text{ m/sec}^2$$

$$\vec{g} = -g\hat{k}$$

$$m\ddot{\vec{r}} = \vec{T} - mg\hat{k}$$

Decompose the acceleration term:

$$\vec{r} = r_x\hat{i} + r_y\hat{j} + r_z\hat{k}$$

$$\dot{\vec{r}} = (\dot{r}_x\hat{i} + \dot{r}_y\hat{j} + \dot{r}_z\hat{k}) + r_x\dot{\hat{i}} + r_y\dot{\hat{j}} + r_z\dot{\hat{k}}$$

The time derivatives of unit vectors appear because the non-inertial reference frame N is rotating in space. This means that the unitary vectors i, j, and k rotate in space. Their time derivatives are given below. Omega is Earth's angular velocity of revolution around its axis. The scalar Omega is the value of the angular velocity. The vectorial Omega is the vector angular velocity. Its direction is determined by the right hand rule.

$$\dot{\hat{i}} = \vec{\Omega} \times \hat{i}$$

$$\dot{\hat{j}} = \vec{\Omega} \times \hat{j}$$

$$\dot{\hat{k}} = \vec{\Omega} \times \hat{k}$$

Rewrite the time derivative of the vector r relative to Omega.

$$\dot{\vec{r}} = (\dot{r}_x\hat{i} + \dot{r}_y\hat{j} + \dot{r}_z\hat{k}) + \vec{\Omega} \times \vec{r} = \vec{\dot{r}} + \vec{\Omega} \times \vec{r}$$

Similarly, express the second time derivative of the vector r.

$$\ddot{\vec{r}} = \vec{\ddot{r}} + 2\vec{\Omega} \times \vec{\dot{r}} + \vec{\Omega} \times (\vec{\Omega} \times \vec{r})$$

\vec{r} = acceleration in the non-inertial frame N (x, y, z components)

$2\vec{\Omega} \times \vec{r}$ = Coriolis acceleration

$\vec{\Omega} \times (\vec{\Omega} \times \vec{r})$ = additional term due to rotation of non-inertial frame N

To simplify this equation, assume that Omega for Earth is very small. This allows us to ignore the third term in the equation above. In fact, the second term (which is already much smaller than the first term) is four orders of magnitude greater than the third term. This reduces the equation to the following form:

$$\ddot{\vec{r}} \simeq \vec{r} + 2\vec{\Omega} \times \dot{\vec{r}}$$

Newton's Second Law can be written and decomposed into x,y, and z components as follows:

$$m\ddot{\vec{r}} = \vec{T} - mg\hat{k} - 2m\vec{\Omega} \times \dot{\vec{r}}$$

$$m\ddot{x} = T_x + 2m\Omega\dot{y}\sin\lambda$$

$$m\ddot{y} = T_y - 2m\Omega(\dot{x}\sin\lambda + \dot{z}\cos\lambda)$$

$$m\ddot{z} = T_z - mg + 2m\Omega\dot{y}\cos\lambda$$

The angular amplitude of oscillations is small. Therefore, we can ignore the vertical velocity and vertical acceleration (z-dot and z-double-dot). The string tension components can be expressed using small angle approximations, which also considerably simplify the problem, making it two-dimensional (see below).

$$T_z = mg - 2m\Omega\dot{y}\cos\lambda \simeq mg$$

$$T_x = -T\frac{x}{L}$$

$$T_y = -T\frac{y}{L}$$

$$T_z = T\frac{L-z}{L} \simeq T$$

Characteristic Differential Equations

Finally the physics of the problem can be described by the system of coupled equations given below. The x and y coordinates specify the position of the pendulum bob as seen by an observer on Earth.

$$\ddot{x} - 2\Omega\sin\lambda\dot{y} + \frac{g}{L}x = 0$$

$$\ddot{y} + 2\Omega\sin\lambda\dot{x} + \frac{g}{L}y = 0$$

Analytic Solution (Approximate)

The following is an analytic solution to the Foucault pendulum problem. Unfortunately, it is not exact. If you try to substitute the analytic solution into the differential equations, uncanceled terms of the

order Omega squared will remain. However, because Omega is very small, we can ignore the uncanceled terms for practical purposes.

$$\eta = x + i \cdot y \text{ (complex number)}$$

$$\ddot{\eta} + (2i\Omega \sin \lambda)\dot{\eta} + \frac{g}{L}\eta = 0$$

$$\eta = \left(C_1 e^{i\sqrt{g/L}t} + C_2 e^{-i\sqrt{g/L}t} \right) e^{-i\Omega t \sin \lambda}$$

C_1, C_2 are complex integration constants

Actual Differential Equation System Is Asymmetric

During the derivation, terms involving Omega squared were ignored. This resulted in xy symmetry in the differential equations. If the Omega squared terms are taken into consideration, the differential equation system becomes asymmetric (see below).

$$\ddot{x} - 2\Omega \sin \lambda \dot{y} + \left(\frac{g}{L} - \Omega^2 \sin^2 \lambda \right) x = 0$$

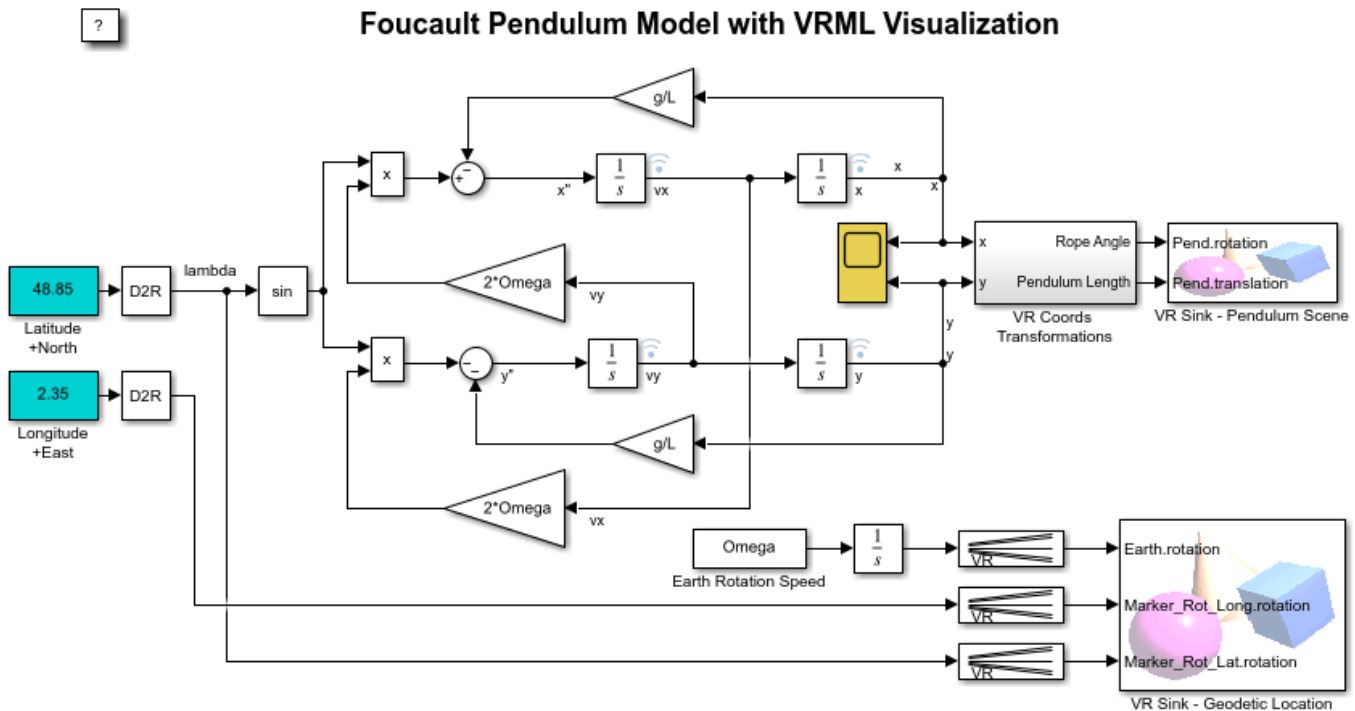

$$\ddot{y} + 2\Omega \sin \lambda \dot{x} + \left(\frac{g}{L} - \Omega^2 \right) y = 0$$

You can easily modify the current Foucault pendulum model to account for asymmetric differential equations. Simply edit the corresponding Gain blocks that contain g/L and add the necessary expression. This change will introduce a very small overall correction to the numerical result.

Foucault Pendulum Model with VRML Visualization

This example shows how to solve the differential equations for the Foucault Pendulum problem and displays the pendulum bob movement in the VRML scene. You can modify the Pendulum location by changing the Latitude / Longitude constant values in the model and other parameters (g , Ω , L and initial conditions) in MATLAB® workspace.

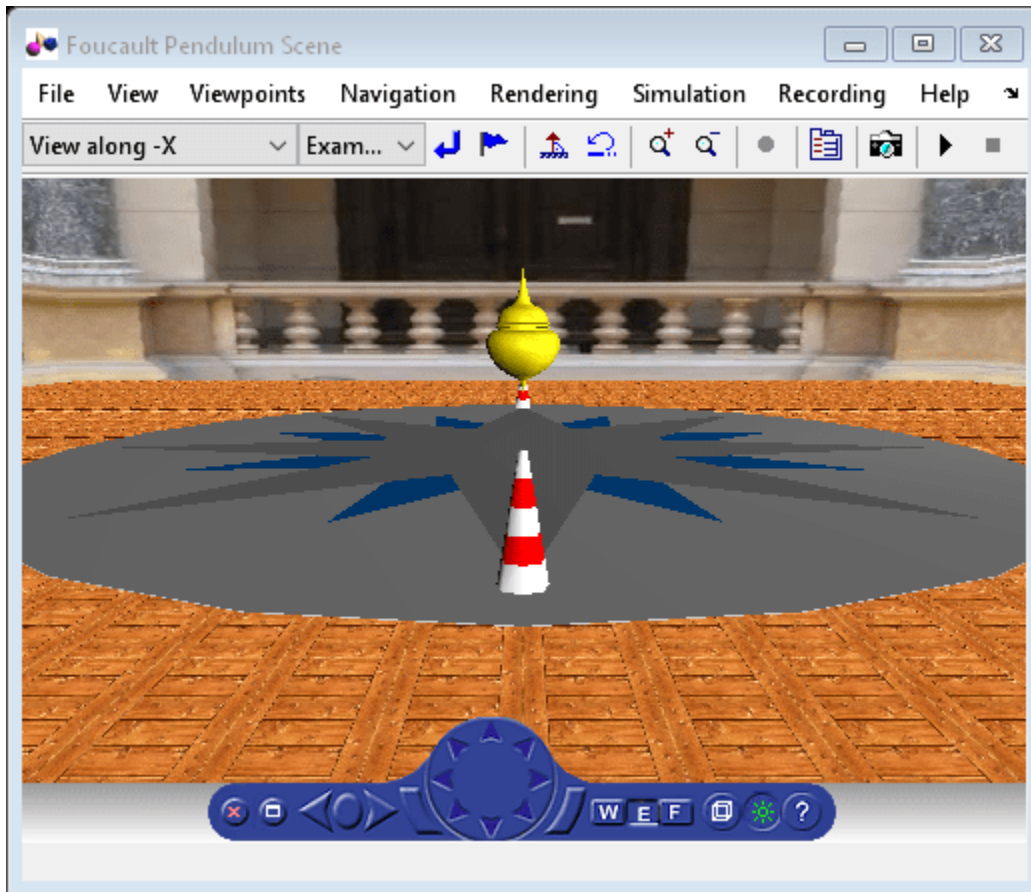

There are two VRML scenes associated with this model. The first scene shows the Foucault pendulum itself, the second shows geographical position of the pendulum on the Earth. During the simulation, two arrow markers indicate the current and the initial position of the pendulum in the Earth coordinate system.

This model solves the differential equations for the Foucault Pendulum problem and displays the pendulum bob movement in the VRML scene. You can modify the Pendulum location by changing the Latitude / Longitude constant values in the model and other parameters (g , Ω , L and initial conditions) in MATLAB(R) workspace.

Exploring Variable-Step Solvers Using a Stiff Model

This example shows the behaviour of variable-step solvers in a Foucault pendulum model. Simulink® solvers ode45, ode15s, ode23, and ode23t are used as test cases. Stiff differential equations are used to solve this problem. There is no exact definition of stiffness for equations. Some numerical methods are unstable when used to solve stiff equations and very small step-sizes are required to obtain a numerically stable solution to a stiff problem. A stiff problem may have a fast changing component and a slow changing component.

Foucault pendulum is an example of a stiff problem. The pendulum completes an oscillation in a few seconds (fast changing component) whereas the Earth completes a rotation about its axis in a day (slow changing component). The oscillation plane of the pendulum slowly rotates because of Earth's axial rotation. You can read more about the physics of a Foucault pendulum in Modelling a Foucault Pendulum.

The simulation calculates the position of the pendulum bob in the x-y plane as viewed by an observer on the surface of Earth. The total energy of the pendulum is then calculated and used to assess the performance of various Simulink solvers.

Foucault Pendulum Model

The Foucault pendulum is described by the system of coupled differential equations shown below. Friction and air drag are not taken into consideration (this greatly simplifies the equations). A full derivation of these equations is given in the Foucault Pendulum example.

$$\ddot{x} = 2\Omega \sin \lambda \dot{y} - \frac{g}{L}x$$

$$\ddot{y} = -2\Omega \sin \lambda \dot{x} - \frac{g}{L}y$$

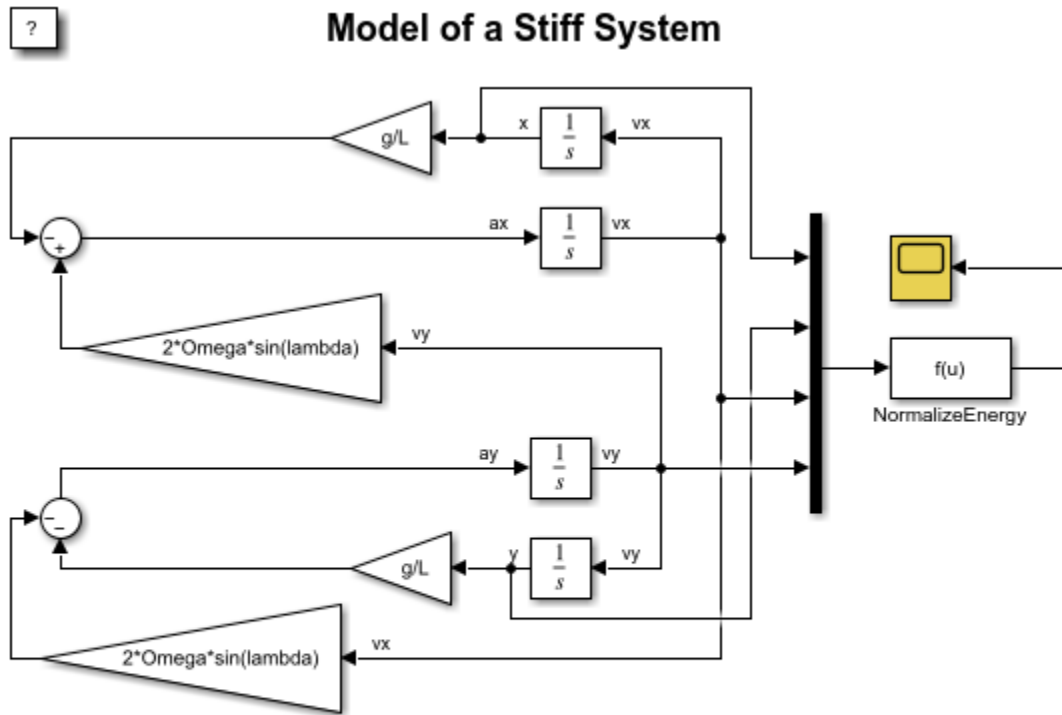

Ω = Earth's angular velocity of rotation around its axis

λ = geographic latitude

g = acceleration of gravity

x and y = coordinates of the pendulum bob

The model shown in Figure 1 is used to solve the differential equations describing a Foucault pendulum. Type `sldemo_solvers` in MATLAB® Command Window to open the model. The example simulates a Foucault pendulum for 86400 seconds. The constants and initial conditions are saved the model workspace.

This model simulates a Foucault pendulum (a stiff system). The model calculates the normalized pendulum energy, E.

Copyright 1990-2013 The MathWorks, Inc.

Figure 1: Foucault pendulum model used to assess solver performance

Variable Step Solvers

This example investigates the performance of ode45, ode15s, ode23, and ode23t variable-step solvers. To read more about a particular solver, such as ode45, type help ode45 in MATLAB Command Window.

Solver	Problem Type	Order of Accuracy	When to Use
ode45	Nonstiff	Medium	Most of the time. This should be the first solver you try.
ode23	Nonstiff	Low	For problems with crude error tolerances or for solving moderately stiff problems.
ode113	Nonstiff	Low to high	For problems with stringent error tolerances or for solving computationally intensive problems.
ode15s	Stiff	Low to medium	If ode45 is slow because the problem is stiff.
ode23s	Stiff	Low	If using crude error tolerances to solve stiff systems and the mass matrix is constant.
ode23t	Moderately Stiff	Low	For moderately stiff problems if you need a solution without numerical damping.
ode23tb	Stiff	Low	If using crude error tolerances to solve stiff systems.

Figure 2: List of variable-step solvers available in Simulink

Assessing Solver Performance

There are different ways to assess the performance of a solver. If a problem has a closed form solution, you could compare the solver results with the expected theoretical result. You could also monitor the time it takes to simulate a model using a particular solver.

Unfortunately there is no exact theoretical solution for the Foucault Pendulum problem. There is an approximate closed form solution, however it cannot be used to assess solver performance (see the Foucault pendulum example).

Total Energy Conservation

This example assesses solver performance by verifying the energy conservation law. In a frictionless environment, the total energy of the pendulum must remain constant. The calculated energy of the pendulum, however, will not remain constant as a result of limited numeric accuracy.

This example calculates the normalized total energy of the pendulum at every time-step. The relative error in energy equals the change in total energy over the course of the simulation. Ideally, the relative error in energy must be zero because energy is conserved. Total energy is the sum of potential and kinetic energy. "NormalizeEnergy" block calculates normalized pendulum energy using the expressions given below.

$$E = \frac{v_x^2 + v_y^2}{2} + g(L - \sqrt{L^2 - x^2 - y^2})$$

$$E_{normalized}(t) = \frac{E(t)}{E(0)}$$

$$E(0) = \text{initial total energy}$$

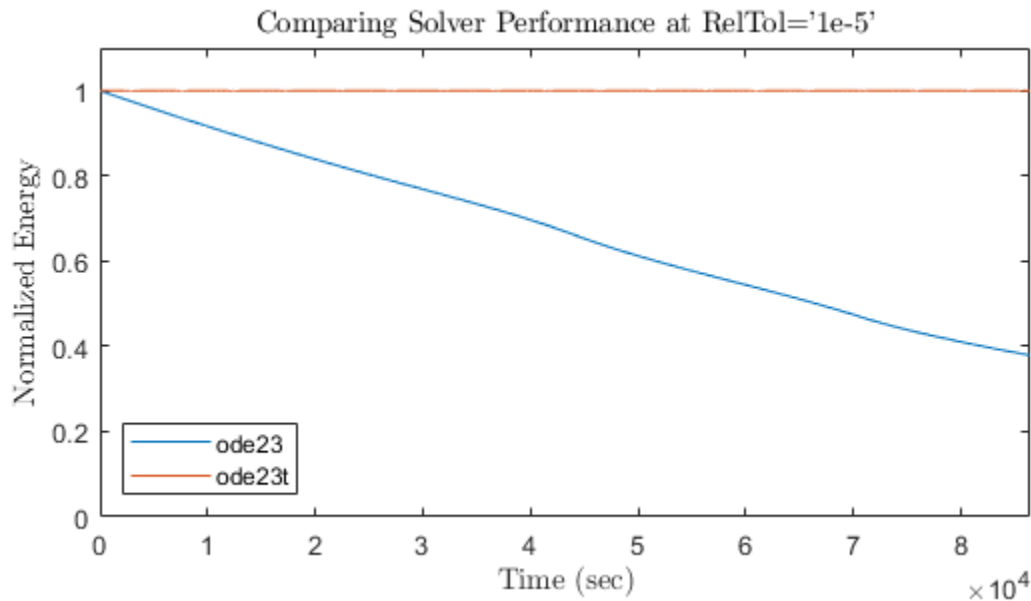

Figure 3: Normalized energy versus time

Figure 3 shows a plot of normalized energy versus time as calculated using ode23 and ode23t. It is clear that in this particular problem ode23t is much more accurate than ode23. In the simulation

that used `ode23`, the normalized pendulum energy decreased by more than 60%. A pendulum with lower energy has a lower oscillation amplitude. You can see this effect in Figure 4, where the amplitude of the pendulum calculated by `ode23` decreases as the oscillation plane rotates.

Figure 4: Pendulum position as calculated using `ode23` and `ode23t`

Figure 4 illustrates the difference between a stiff and a non-stiff solver. Each plot shows the position of the pendulum bob throughout a day (every 15th data point is plotted as a blue point). The black dot marks the initial position of the pendulum bob and the black line marks the initial pendulum oscillation plane. The red line indicates the oscillation plane after a day. The yellow line shows the oscillation plane at some intermediate point in time. Note that the oscillation plane of the pendulum does not complete a full rotation within a day. How fast the oscillation plane rotates depends on the geographical latitude (see details in the Foucault pendulum example). Observe that the pendulum amplitude in the left plot decreases whereas the amplitude in the right plot remains constant. For the same relative tolerance, `RelTol=1e-5`, the stiff solver gives a more accurate result, but requires more execution time.

Figure 5 shows a more detailed performance study of Simulink solvers. Four solvers were chosen to illustrate how relative error and simulation execution time vary as a function of relative tolerance. You can use the `sldemo_solvers_mcode.m` script for more extensive solver tests. This script generates C code from the model to speed up the simulations. Note that the script can take several minutes to execute.

```
Building RSim executable for model..
Time taken: 38.278023 seconds.
```

```
Running generated RSim executable..
Time taken: 104.197483 seconds.
```

Figure 5: Relative error and execution time for various solver settings. `AbsTol = '1e-7'` for all simulations.

Observe that in this example relative error does not decrease very significantly for relative tolerances below $1e-6$. This is a numeric solver limitation that depends on the particular model. Reducing the solver relative tolerance does not necessarily improve accuracy. You need to estimate the minimal accuracy that is required for your problem and choose the solver accordingly to minimize simulation costs. For example you may want to know the position of the Foucault pendulum bob within a few centimeters. It is unnecessary to calculate the position of a pendulum within a few microns because you cannot measure the position that accurately.

Conclusions

The numeric results of a simulation can behave differently depending on solver settings. This is crucial in the case of stiff problems. When working with stiff models, choose a solver that will give an

accurate result at a minimal price. The relative tolerance (variable-step solvers) or step size (fixed-step solvers) have to be small enough that the result is numerically stable. Although some solvers are more efficient than others, stiff solvers are better suited for solving stiff problems. Variable step solvers are more robust than fixed-step solvers.

Exploring the Solver Jacobian Structure of a Model

The example shows how to use Simulink® to explore the solver Jacobian sparsity pattern, and the connection between the solver Jacobian sparsity pattern and the dependency between components of a physical system. A Simulink model that models the synchronization of three metronomes placed on a free moving base are used.

The Solver Jacobian Pattern

In general, the continuous part of a Simulink model can be written as:

$$\begin{cases} \dot{x} = f(x, u) \\ y = g(x, u) \end{cases}$$

where x are the continuous states and u are the inputs. y are the outputs.

The matrix:

$$J_x = \frac{\partial f}{\partial x}$$

is called the system solver Jacobian matrix. When an implicit ODE solver is used to solve the system equations, J_x needs to be computed when needed. For example, the Jacobian matrix of a set of first order ODEs

$$\begin{cases} \dot{x}_1 = x_1 x_2 \\ \dot{x}_2 = x_2 \end{cases}$$

is

$$J_x = \begin{bmatrix} \frac{\partial f_1}{\partial x_1} & \frac{\partial f_1}{\partial x_2} \\ \frac{\partial f_2}{\partial x_1} & \frac{\partial f_2}{\partial x_2} \end{bmatrix} = \begin{bmatrix} x_2 & x_1 \\ 0 & 1 \end{bmatrix}$$

You can convert the solver Jacobian matrix to a Boolean sparse matrix by representing each non-zero element as 1, and each element that is always zero (hard zero) as 0. For example, the Boolean matrix corresponding to above Jacobian J_x is:

$$J_{xp} = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix},$$

where J_{xp} is called the solver Jacobian pattern matrix.

The solver Jacobian pattern matrix can be generated directly from the original system equations by using the following rule:

$$J_{xp}(i, j) = \begin{cases} 1 & \text{if } x_j \text{ is explicitly used to compute } \dot{x}_i \\ 0 & \text{otherwise} \end{cases}$$

As you can see, the solver Jacobian pattern matrix actually represents the dependency between the state variables and their derivatives. If computing of \dot{x}_i needs the value of x_j , then there exists a

dependency $\dot{x}_i \leftarrow x_j$ and $J_{xp}(i, j) = 1$. These dependencies are determined by the physical nature of the system, and thus by studying the solver Jacobian matrix, you can explore the physical structure of the physical system represented by the model. Simulink provides APIs for the user to get the solver Jacobian pattern matrix. The following shows how to access the solver Jacobian pattern and to use it to study the model.

The Pattern and Dependency: Synchronization of Metronomes

Synchronization is defined as an adjustment of rhythms of oscillating objects due to their weak interaction [1]. One of the first scientifically documented observations of synchronization was reported by the Dutch scientist Christiaan Huygens, the inventor of pendulum clock [2]. Huygens discovered that two pendulums attached to the same beam supported by chairs would swing in exact opposite direction after some time. A similar set up used in this example is shown in Figure 1.

Moving base with mass M
Pendulum with mass m , rotational inertia J , length r

Figure 1: Set up used in this example: three metronomes on a moving base

Modeling the System

The model of this physical system can be divided into two parts:

- The metronomes mechanism
- The moving base

The metronomes mechanism

Referring to Figure 1, the dynamic equations of a single metronome on a moving base can be derived as[3]:

$$\underbrace{\ddot{\theta}}_{\text{Angular acceleration}} + \underbrace{\frac{mrg}{J} \sin \theta}_{\text{Gravitational term}} + \underbrace{\frac{b}{J} \left[\left(\frac{\theta}{\theta_r} \right)^2 - 1 \right] \dot{\theta}}_{\text{Escapement and damping term}} + \underbrace{\left(\frac{rm \cos \theta}{J} \right) \ddot{x}}_{\text{Coupled inertial force term}} = 0 \quad (\text{eq.1})$$

The first two terms describe a simple pendulum without friction. The third term is used to approximate the escapement* and any damping of the metronome. This term increases the angular velocity for $\theta < \theta_0$ and decreases it for $\theta > \theta_0$ [3]. The last term is the coupled effect from the moving base, in terms of an inertial force.

The moving base

Assuming the motion of the base is frictionless, then the center of mass of the system will not change and you can derive the following:

$$x = -\frac{m}{M + 3m} r (\sin \theta_1 + \sin \theta_2 + \sin \theta_3),$$

where M is the mass of the base and m is the mass of the pendulum.

Then eq.1 can be changed to:

$$\ddot{x} = -\frac{m}{M + 3m} r \left[\ddot{\theta}_1 \cos \theta_1 - \sin \theta_1 (\dot{\theta}_1)^2 + \ddot{\theta}_2 \cos \theta_2 - \sin \theta_2 (\dot{\theta}_2)^2 + \ddot{\theta}_3 \cos \theta_3 - \sin \theta_3 (\dot{\theta}_3)^2 \right] \quad (eq.2)$$

The following shows the above system implemented using Simulink. The model contains three metronome subsystems and the moving base.

?

Exploring the Solver Jacobian Structure of a Model

Figure 2: The Simulink model of the metronomes system

Simulation of this system shows an interesting phenomenon: Synchronization. It shows that all three metronomes with different initial phase angle eventually become synchronized with each other. Figure 3 shows the simulation results. The main cause for synchronization is the moving base that links all these metronomes together. This physical connection can be observed from the dynamic equation of each metronome.

Also, this physical connection can also be observed from the solver Jacobian pattern of this model. The following MATLAB® code shows how to get the solver Jacobian pattern.

Time: 40

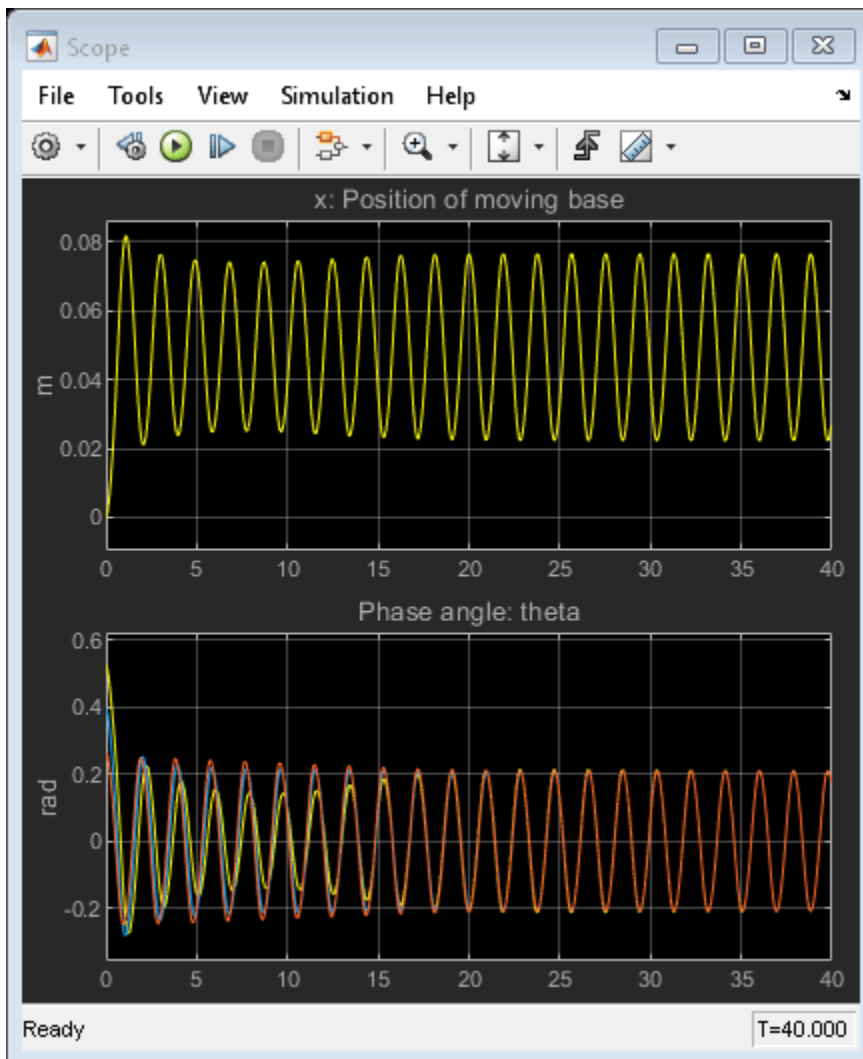

Figure 3: The synchronized metronomes

Steps to Get the Solver Jacobian Pattern

% 1. Set the solver to be any implicit solver

```
set_param mdl, 'Solver', 'ode15s');
```

% 2. Set the solver Jacobian method to be Sparse perturbation *

```
set_param mdl, 'SolverJacobianMethodControl', 'SparsePerturbation');
```

% 3. Get the solver Jacobian object.

```
J = Simulink.Solver.getSlvrJacobianPattern(mdl);
disp('J = ');
disp(J);
```

% 4. Show the pattern in a figure. use the method J.show

```
J.show;
```

% 5. Explore the pattern with the given state name and other information

```
stateNames = J.stateNames;
disp('stateNames = ');
disp(stateNames);
```

The results you will see are:

```
J =
SlvrJacobianPattern with properties:

    Jpattern: [8x8 double]
  numColGroup: 6
    colGroup: [8x1 double]
  stateNames: {8x1 cell}
  blockHandles: [8x1 double]

stateNames =
{'sldemo_metro/Moving base/Integrator1'           }
{'(sldemo_metro/Metronome1/Integrator2).(Theta1)' }
{'(sldemo_metro/Metronome2/Integrator2).(Theta2)' }
{'(sldemo_metro/Metronome3/Integrator2).(Theta3)' }
{'(sldemo_metro/Metronome3/Integrator1).(Thetadot_3)'}
{'(sldemo_metro/Metronome2/Integrator1).(Thetadot_2)'}
{'(sldemo_metro/Metronome1/Integrator1).(Thetadot_1)'}
{'sldemo_metro/Moving base/Integrator'           }
```

Figure 4: The solver Jacobian pattern

Properties of the Solver Jacobian Pattern Object

The solver Jacobian pattern J is an object. It contains the following properties:

`Jpattern`: A sparse mxArray which is the Jacobian pattern.

`numColGroup`: Number of column groups.

`colgroup`: A column partition of the sparse pattern matrix.

`stateNames`: A cell array containing the state name of each state.

`blockHandles`: Block handles of the owner of each state.

Study of the Solver Jacobian Pattern

Referring to Figure 4. First, the solver Jacobian of this model is sparse and the number of non-zero element is 28. Secondly, the number of column groups is 6; is less than the number of states 8.

The row 1-4 indicates the following dependencies:

$$\begin{aligned}\dot{x}_1 &\leftarrow x_8(\text{baseposition} \leftarrow \text{baseseed}) \\ \dot{x}_2 &\leftarrow x_7(\dot{\text{Theta}}1 \leftarrow \text{Thetadot1}) \\ \dot{x}_3 &\leftarrow x_6(\dot{\text{Theta}}2 \leftarrow \text{Thetadot2}) \\ \dot{x}_4 &\leftarrow x_5(\dot{\text{Theta}}3 \leftarrow \text{Thetadot3})\end{aligned}$$

These relations are clear since speed is the derivative of position. Row 5-8 shows the following relations:

$$\begin{aligned}\dot{x}_5 &\leftarrow x_{2-7} \\ \dot{x}_6 &\leftarrow x_{2-7} \\ \dot{x}_7 &\leftarrow x_{2-7} \\ \dot{x}_8 &\leftarrow x_{2-7}\end{aligned}$$

These relations show that to compute the angular acceleration of the metronomes or acceleration of the moving base, the angular position and angular speed of the metronomes are needed, but not the position and speed of the base. These relations can be found by studying eq.(1) and eq.(2) directly.

Conclusion

The Solver Jacobian pattern is a tool to study the data dependency relations between the derivatives of the state variables and the state variables. These relations usually reflect certain physical couplings in the physical system. By using the tools provided, you can discover these relations associated with a Simulink model, even without the original dynamic equations of the physical model.

Double Bouncing Ball: Use of Adaptive Zero-Crossing Location

This example shows how to choose the correct zero-crossing location algorithm, based on the system dynamics. For Zeno dynamic systems, or systems with strong chattering, you can select the adaptive zero-crossing detection algorithm through the Configure pane:

```
--> Solver
    --> Zero-crossing options
        --> Algorithm: [Nonadaptive, Adaptive]
```

The Double Bouncing Ball System

The Simulink® model in this example is used to simulate two bouncing balls. They start from the ground with different initial speeds, and their ground levels will change at different times.

Open the model

Copyright 1990-2013 The MathWorks, Inc.

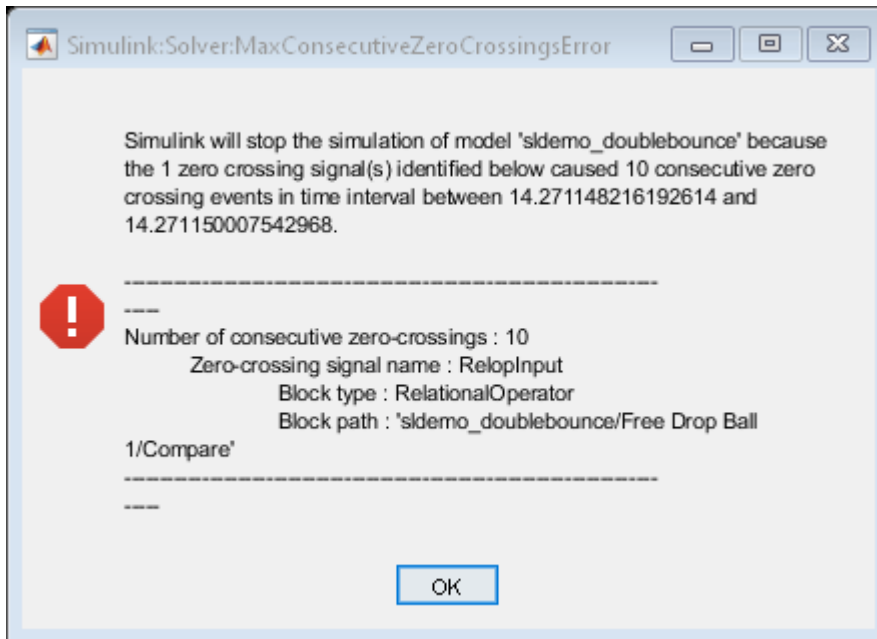

Figure 1: The double bouncing ball model and animation

Double Bouncing Balls With Non-adaptive Zero-Crossing Location Algorithm

If the Non-adaptive zero-crossing location algorithm is used, the consecutive zero-crossing error causes the simulation to stop. This system is actually a 'Zeno dynamic system'. When either ball is very close to the ground, Simulink will hang because too many zero crossings are detected in a very short period.

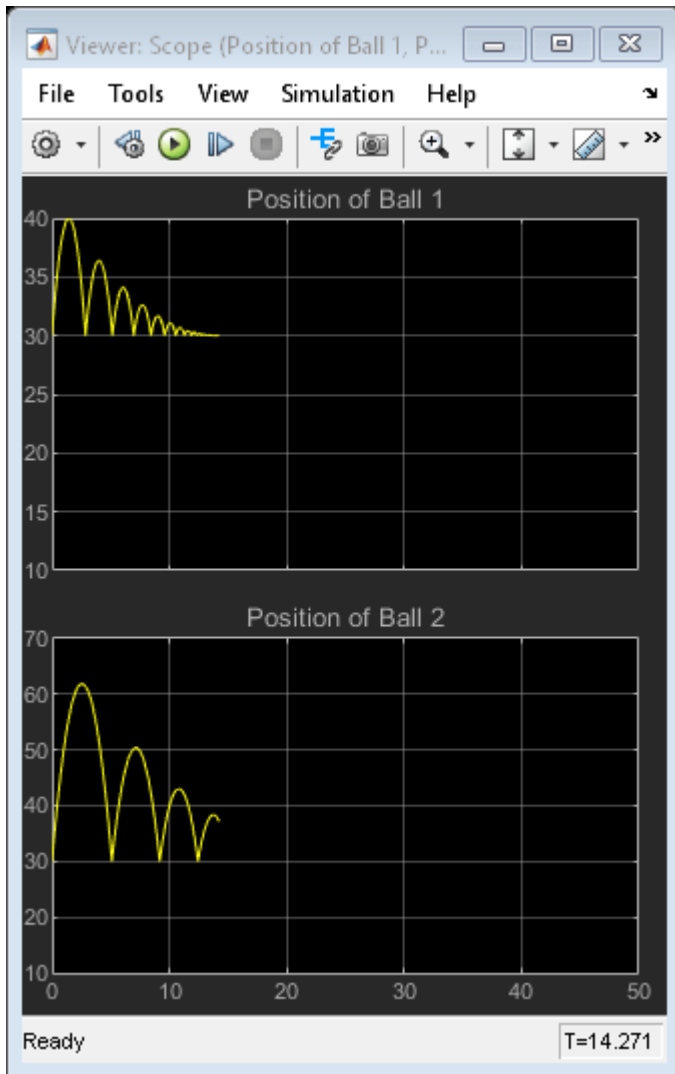

Figure 2: Vertical displacement of both balls with Non-adaptive zero-crossing location algorithm.

The simulation does not complete and an error message is shown. The ground level changing events cannot be observed.

Double Bouncing Balls With Adaptive Zero-Crossing Location Algorithm

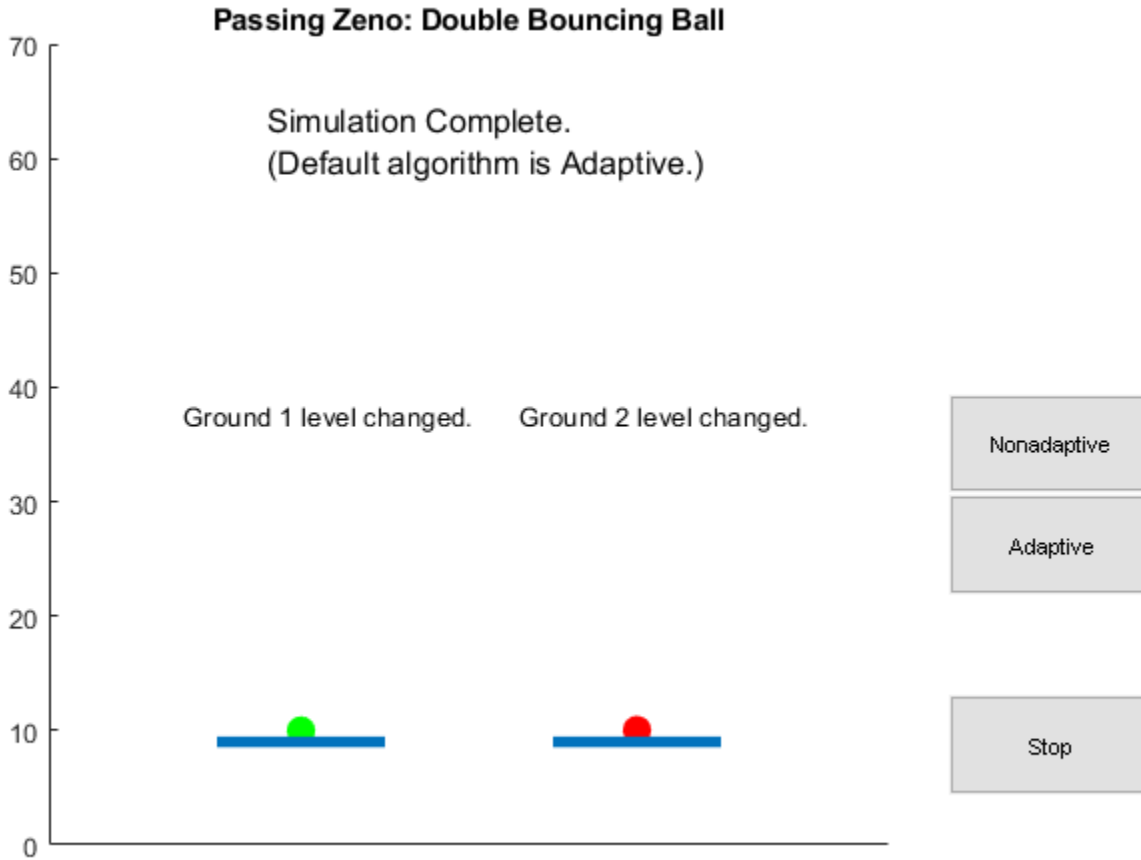

If the adaptive algorithm is selected, Simulink will adaptively turn on/off the process to precisely locate the zero-crossing time. The conditions to turn on/off the location are:

1) Zero-crossing signal value is below a threshold value. You can control the threshold value through the Configure pane:

```
--> Solver
    --> Zero-crossing options
        --> Algorithm: [Adaptive]
        --> Signal threshold
```

2) Consecutive zero-crossing diagnostic is hit. You can define consecutive zero crossing through the Configure pane:

```
--> Solver
--> Solver diagnostic controls
--> Time tolerance and
--> Number of consecutive zero crossings.
```

Figure 3: Vertical displacement of both balls with adaptive zero crossing location algorithm.

The simulation has completed. The ground level changing events can be observed. A warning is shown to inform you when searching for events is turned off.

Four Hydraulic Cylinder Simulation

This example shows how to use Simulink® to create a model with four hydraulic cylinders. See two related examples that use the same basic components: single cylinder model and model with two cylinders and load constraints.

- Note: This is a basic hydraulics example. You can more easily build hydraulic and automotive models using Simscape™ Driveline™ and Simscape Fluids™.
- **Simscape Fluids** provides component libraries for modeling and simulating fluid systems. It includes models of pumps, valves, actuators, pipelines, and heat exchangers. You can use these components to develop fluid power systems such as front-loader, power steering, and landing gear actuation systems. Engine cooling and fuel supply systems can also be developed with Simscape Fluids. You can integrate mechanical, electrical, thermal, and other systems using components available within the Simscape product family.
- **Simscape Driveline** provides component libraries for modeling and simulating one-dimensional mechanical systems. It includes models of rotational and translational components, such as worm gears, planetary gears, lead screws, and clutches. You can use these components to model the transmission of mechanical power in helicopter drivetrains, industrial machinery, vehicle powertrains, and other applications. Automotive components, such as engines, tires, transmissions, and torque converters, are also included.

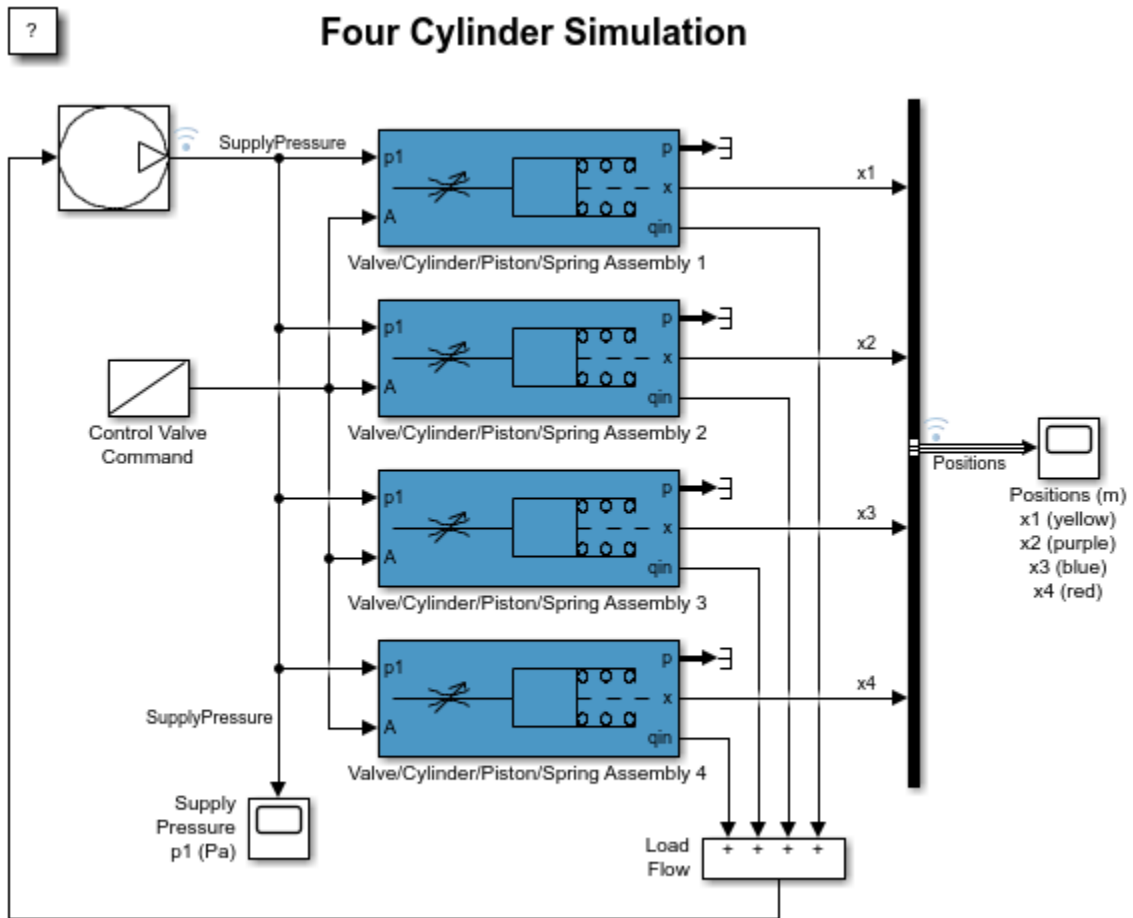

Modeling

Figure 1 shows the top level diagram of the model. This model has a single pump and four actuators. The same pump pressure (p_1) drives each cylinder assembly and the sum of their flows loads the pump. Although each of the four control valves could be controlled independently, as in an active suspension system, in this case all four receive the same commands, a linear ramp in orifice area from zero to 0.002 sq.m. .

Opening the Model and Running the Simulation

To open this model, type `sldemo_hydcyl4` at MATLAB® terminal (click on the hyperlink if you are using MATLAB Help). Press the "Play" button on the model toolbar to run the simulation.

The model logs relevant data to MATLAB workspace, into the Simulink.SimulationOutput object `out`. The signal logging data is stored within `out`, in a structure called `sldemo_hydcyl4_output`. Logged signals have a blue indicator (see the model). For more information, see "View and Access Signal Logging Data".

Copyright 1990-2012 The MathWorks, Inc.

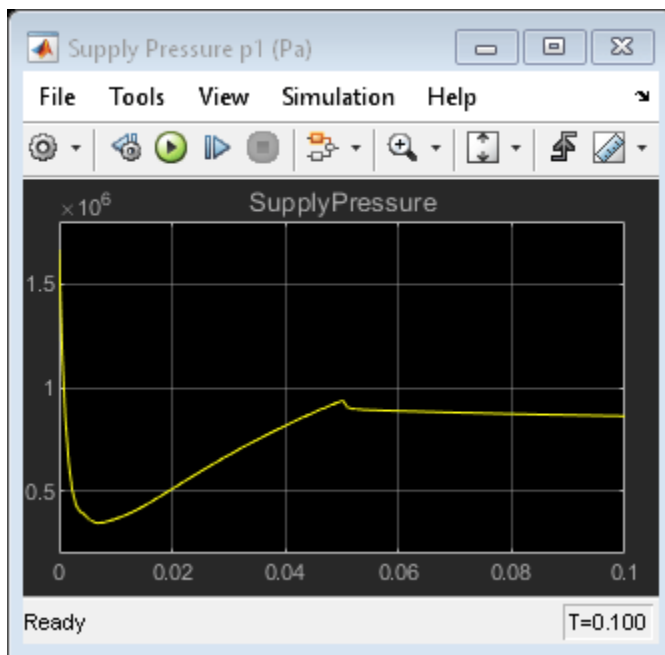

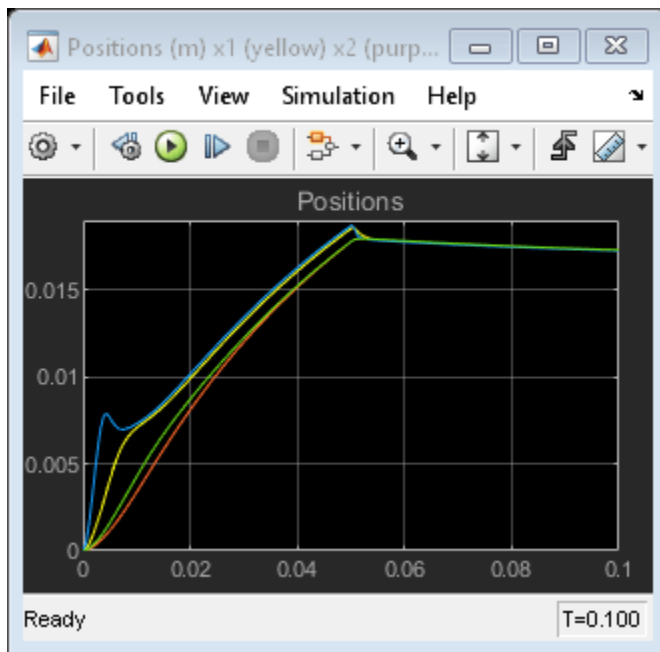

Figure 1: Four cylinder model and simulation results

Model Description

The pump flow begins at $0.005 \text{ m}^3/\text{sec}$ (just like in the single cylinder model), then it drops to $0.0025 \text{ m}^3/\text{sec}$ at $t=0.05 \text{ sec}$. The parameters $C1$, $C2$, Cd , ρ , and $V30$ are identical to those in the single cylinder model. However, by assuming individual values for K , A , and β , each one of the four cylinders exhibit distinctive transient responses. The table below gives the characteristics of the four actuators.

Parameter	Actuator1	Actuator2	Actuator3	Actuator4
Spring Constant	K	K/4	4K	K
Piston Area	Ac	Ac/4	4Ac	Ac
Bulk Modulus	Beta	Beta	Beta	Beta/1000

Beta = 7e8 Pa [fluid bulk modulus]
 K = 5e4 N/m [spring constant]
 Ac = 1e-3 m² [cylinder cross-sectional area]

The ratio of area and spring constant is the same for all pistons, so they should have the same steady state output. The dominant time constant for each actuator subsystem is proportional to

$$\frac{A_c^2}{K}$$

(result obtained from dimensional analysis), so we can expect the piston assembly 2 to be somewhat faster than assembly 1. The piston assembly 3 is expected to be slower than 1 or 2. The piston assembly 4 has a significantly lower bulk modulus beta (as would be the case with air), thus we expect piston 4 to respond more sluggishly than piston 1.

Results

Figure 2: Piston positions in four cylinder example

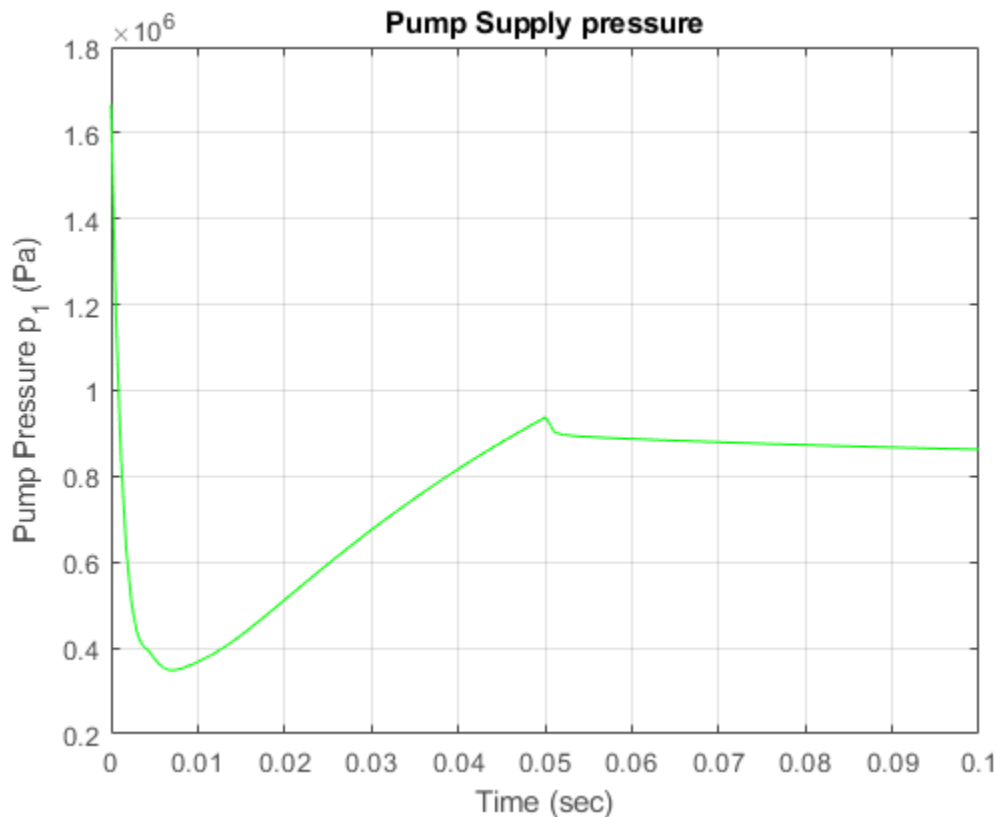

Figure 3: Pump Supply Pressure, p_1

The initial jolt of flow at $t=0$ is seen by the four actuators as a pressure impulse. The pump pressure (p_1), which is initially high, drops rapidly because there is a high flow demand from the four loads. During the initial transient (about 4 msec), distinct responses identify the individual dynamic characteristics of each assembly unit.

As predicted by the parameter values, actuator 2 responds much faster than actuator 1. The third and fourth pistons are much slower because they require more working fluid to move the same distance. In case 3, the piston displaces more volume due to its larger cross-sectional area. In case 4, although the displaced volume is the same as in case 1, the device requires more fluid because it is subsequently compressed.

As the pump pressure falls to the level within the cylinders, the distinctions in behavior are blurred. The individual responses blend into an overall system response which maintains the flow balance between the components. At $t=0.05$ sec, the pump flow drops to a level that is close to the equilibrium and the actuator flows are nearly zero. The individual steady state piston positions are equal, as predicted by the design.

Two Cylinder Model with Load Constraints

This example shows how to model a rigid rod supporting a large mass interconnecting two hydraulic actuators. The model eliminates the springs as it applies the piston forces directly to the load. These forces balance the gravitational force and result in both linear and rotational displacement.

See two related examples that use the same basic components: four cylinder model and single cylinder model.

- Note: This is a basic hydraulics example. You can more easily build hydraulic and automotive models using Simscape™ Driveline™ and Simscape Fluids™.
- **Simscape Fluids** provides component libraries for modeling and simulating fluid systems. It includes models of pumps, valves, actuators, pipelines, and heat exchangers. You can use these components to develop fluid power systems such as front-loader, power steering, and landing gear actuation systems. Engine cooling and fuel supply systems can also be developed with Simscape Fluids. You can integrate mechanical, electrical, thermal, and other systems using components available within the Simscape product family.
- **Simscape Driveline** provides component libraries for modeling and simulating one-dimensional mechanical systems. It includes models of rotational and translational components, such as worm gears, planetary gears, lead screws, and clutches. You can use these components to model the transmission of mechanical power in helicopter drivetrains, industrial machinery, vehicle powertrains, and other applications. Automotive components, such as engines, tires, transmissions, and torque converters, are also included.

Analysis and Physics of the Model

We assume the rotation angle of the rod is small. The equations of motion for the rod are given below in Equation Block 1. The equations describing the cylinder and pump behavior are the same as in the single cylinder example.

Equation Block 1:

$$M \frac{d^2 z}{dt^2} = F_b + F_a + F_{ext}$$

$$I \frac{d^2 \theta}{dt^2} = \frac{L}{2} F_b - \frac{L}{2} F_a$$

z – displacement at the center

M – total mass

F_a – piston A force

F_b – piston B force

F_{ext} – external force at center

θ – clockwise angular displacement

I – moment of inertia of the rod

L – rod length

The positions and velocities of the individual pistons follow directly from the geometry. See the corresponding equations below in Equation Block 2.

Equation Block 2:

$$z_a = z - \theta \frac{L}{2}$$

$$z_b = z + \theta \frac{L}{2}$$

$$\frac{dz_a}{dt} = \frac{dz}{dt} - \frac{d\theta}{dt} \frac{L}{2}$$

$$\frac{dz_b}{dt} = \frac{dz}{dt} + \frac{d\theta}{dt} \frac{L}{2}$$

z_a – piston A displacement

z_b – piston B displacement

Opening the Model and Running the Simulation

To open this model, type `sldemo_hydrod` into the MATLAB® Command Window (click the hyperlink if you are using MATLAB Help). To run the simulation, on the Simulation tab, press **Run**. The model:

- Logs signal data to the MATLAB workspace in the `Simulink.SimulationOutput` object `out`. The signal logging data is stored in `out`, in a `Simulink.SimulationData.Dataset` object called `sldemo_hydrod_output`.
- Logs continuous states data to MATLAB workspace. The states data is also contained in the `out` workspace variable, as a structure called `xout`. Each state is assigned a name in the model to facilitate working with logged data. The names of the states are available in the `stateName` field of `xout.signals`. For more information, see “Data Format for Logged Simulation Data”.
- Uses the customizable Circular Gauge and Vertical Gauge blocks to visualize the fluid flow, pressure, and linear displacement in the cylinders.

Figure 1: Two cylinder model and simulation results

'Mechanical Load' Subsystem

This subsystem is shown in Figure 2. It solves the equations of motion, which we compute directly using standard Simulink blocks. It is assumed that the rotation angle is small. Look under the mask of the 'Mechanical Load' subsystem to see its structure (right-click on the subsystem and select **Mask > Look Under Mask**).

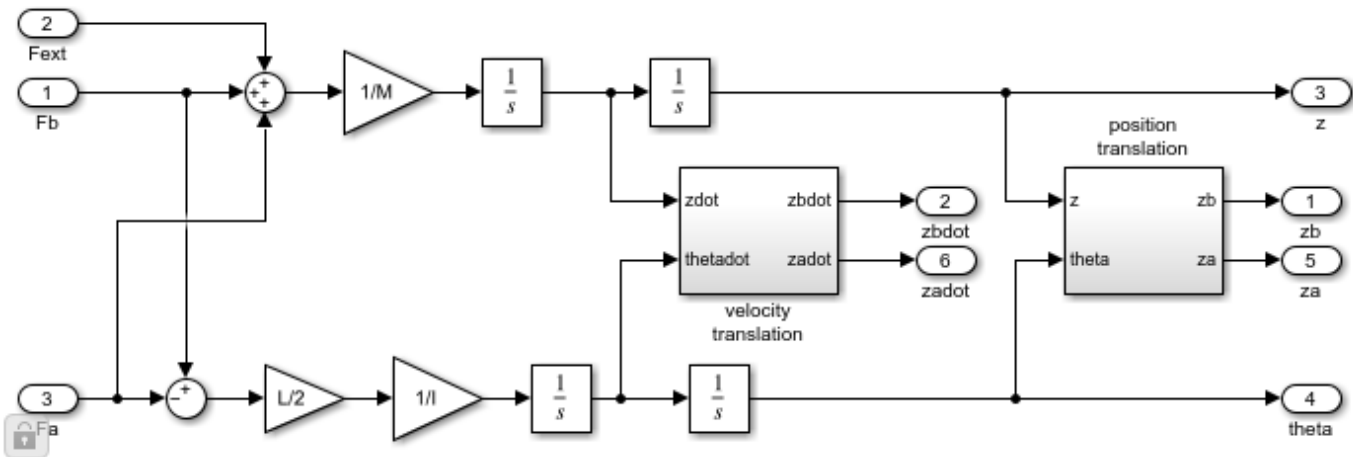

Figure 2: 'Mechanical Load' subsystem

Simulation Parameters

The parameters used in this simulation are identical to the parameters used in the single cylinder model, except for the following:

$L = 1.5 \text{ m}$
 $M = 2500 \text{ kg}$
 $I = 100 \text{ kg/m}^2$
 $Q_{\max} = 0.005 \text{ m}^3/\text{sec}$ (constant)
 $C_2 = 3e-9 \text{ m}^3/\text{sec}/\text{Pa}$
 $F_{\text{ext}} = -9.81 * M \text{ Newtons}$

Although the pump flow is constant, the model controls the valves independently. Initially, at $t = 0$, the cross-section of valve B is zero. It grows linearly to $1.2e-5 \text{ m}^2$ at $t = 0.01 \text{ sec}$, and then linearly decreases to zero at $t = 0.02 \text{ sec}$. The cross-section of valve A is $1.2e-5 \text{ sq.m.}$ at $t = 0$ and it linearly decreases to zero at $t = 0.01 \text{ sec}$, then it linearly increases to $1.2e-5 \text{ sq.m.}$ at $t = 0.02 \text{ sec}$. Then the behavior of the valves A and B repeats periodically with the same pattern. In other words the valves A and B are 180 degrees out of phase.

Results

Figures 3 and 4 show the linear and angular displacements of the rod. The linear displacement response is typical of a type-one integrating system. The relative positions and the angular movement of the rod illustrate the response of the two pistons to the out-of-phase control signals (the cross-section of the valves A and B).

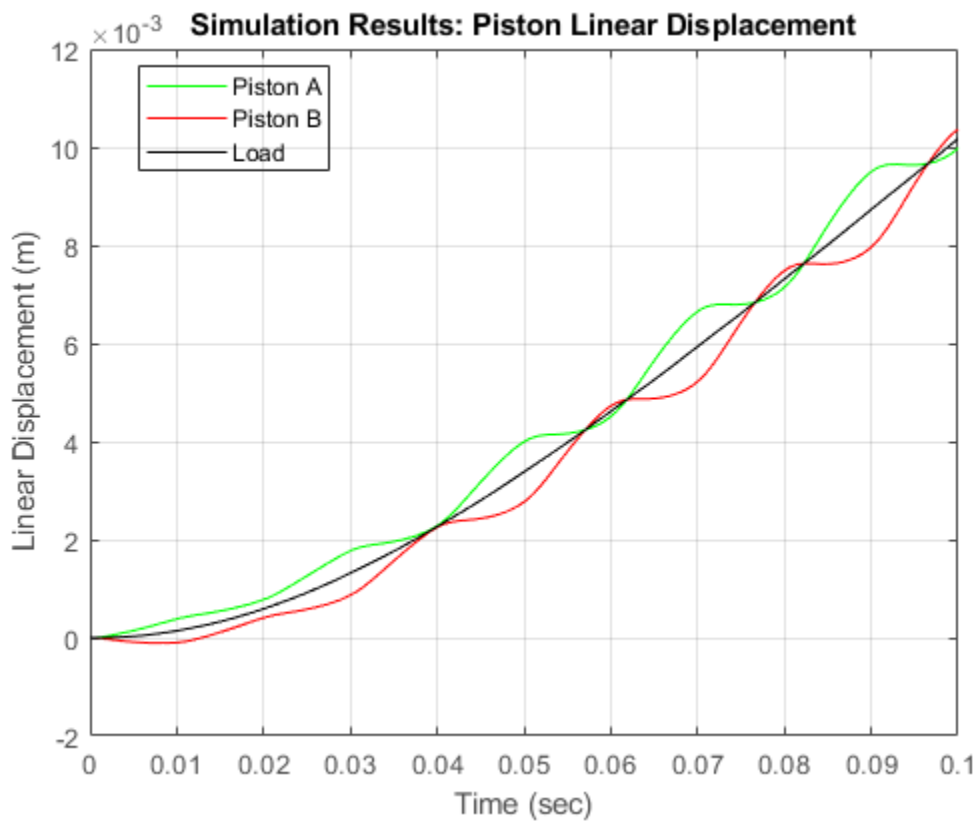

Figure 3: Linear displacement of the pistons and the load (load is in the middle of the rod)

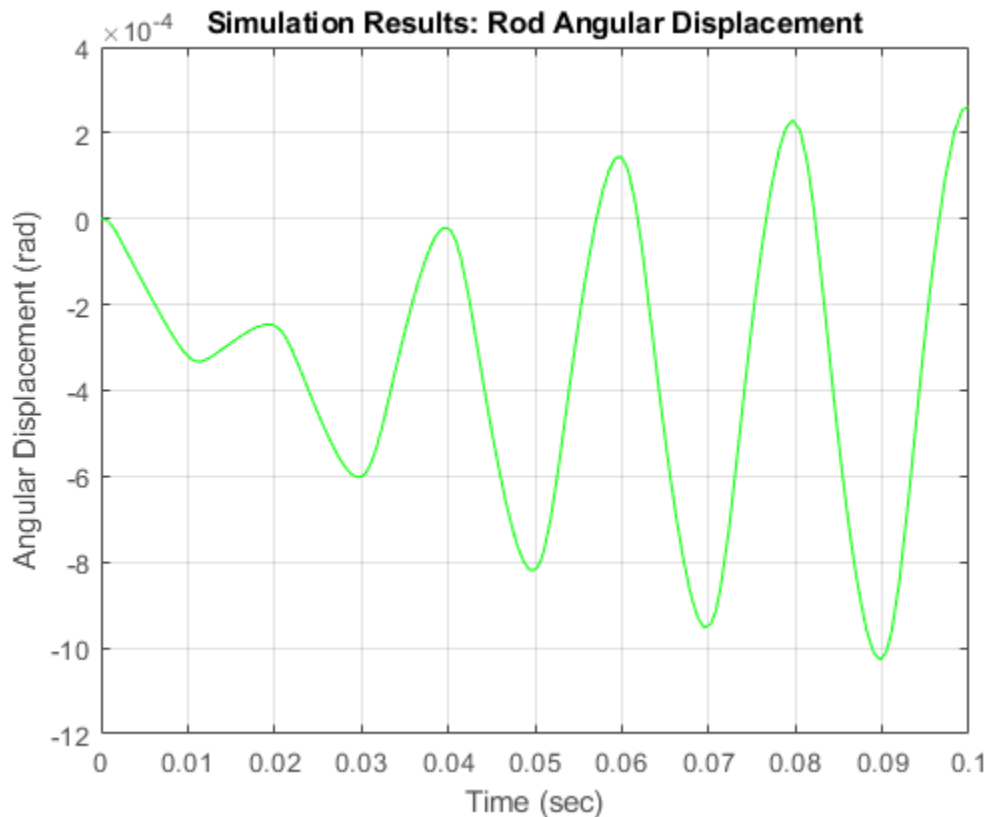

Figure 4: Angular displacement of the rod

Close Model

Close the model and clear all generated data.

Conclusions

Simulink provides a productive environment for simulating hydraulic systems, offering enhancements that provide enormous productivity in modeling and flexibility in numerical methods. The use of masked subsystems and model libraries facilitates structured modeling with automatic component updates. As users modify library elements, the models that use the elements automatically incorporate the new versions. Simulink can use differential-algebraic equations (DAEs) to model some fluid elements as incompressible and others as compliant, allowing efficient solutions for complex systems of interdependent circuits.

Models such as this one can ultimately be used as part of overall plant or vehicle systems. The hierarchical nature of Simulink allows independently developed hydraulic actuators to be placed, as appropriate, in larger system models (for example adding controls in the form of sensors or valves). In cases such as these, tools from the Control System Toolbox™ can analyze and tune the overall closed-loop system. The MATLAB/Simulink environment can thus support the entire design, analysis, and modeling cycle.

Modeling a Fault-Tolerant Fuel Control System

This example shows how to combine Stateflow® with Simulink® to efficiently model hybrid systems. This type of modeling is particularly useful for systems that have numerous possible operational modes based on discrete events. Traditional signal flow is handled in Simulink while changes in control configuration are implemented in Stateflow. The model described below represents a fuel control system for a gasoline engine. The system is highly robust in that individual sensor failures are detected and the control system is dynamically reconfigured for uninterrupted operation.

Analysis and Physics

Physical and empirical relationships form the basis for the throttle and intake manifold dynamics of this model. The air-fuel ratio is computed by dividing the air mass flow rate (pumped from the intake manifold) by the fuel mass flow rate (injected at the valves). The ideal (i.e. stoichiometric) mixture ratio provides a good compromise between power, fuel economy, and emissions. The target air-fuel ratio for this system is 14.6. Typically, a sensor determines the amount of residual oxygen present in the exhaust gas (EGO). This gives a good indication of the mixture ratio and provides a feedback measurement for closed-loop control. If the sensor indicates a high oxygen level, the control law increases the fuel rate. When the sensor detects a fuel-rich mixture, corresponding to a very low level of residual oxygen, the controller decreases the fuel rate.

Modeling

Figure 1 shows the top level of the Simulink model. To open the model, click **Open Model**. Press the Play button in the model window toolbar to run the simulation. The model loads necessary data into the model workspace from `sldemo_fuelsys_data.m`. The model logs relevant data to MATLAB workspace in a data structure called `sldemo_fuelsys_output` and streams the data to the Simulation Data Inspector. Logged signals are marked with a blue indicator while streaming signals are marked with the light blue badge (see Figure 1).

Note that loading initial conditions into the model workspace keeps simulation data isolated from data in other open models that you may have open. This also helps avoid MATLAB workspace cluttering. To view the contents of the model workspace select Modeling > Model Explorer, and click on Model Workspace from the Model Hierarchy list.

Notice that units are visible on the model and subsystem icons and signal lines. Units are specified on the ports and on the bus object.

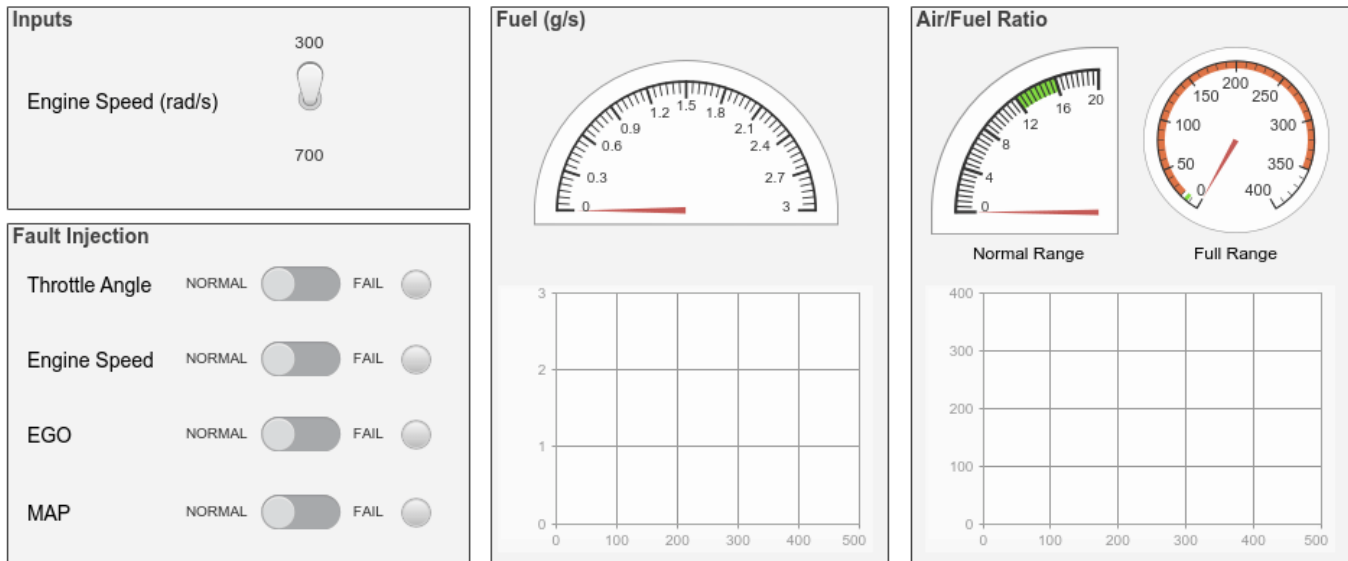

Figure 1: Top-level diagram for the fuel control system model

The Dashboard subsystem (shown in Figure 2) allows you to interact with the model during simulation. The Fault Injection switches can be moved from the Normal to Fail position to simulate sensor failures, while the Engine Speed selector switch can be toggled to change the engine speed. The fuel and air/fuel ratio signals are visualized using the dashboard gauges and scopes to provide visual feedback during a simulation run.

Fault-Tolerant Fuel Control System Dashboard

[Update Diagram](#) (Ctrl+D) to bind switches to model workspace variables.

Figure 2: Dashboard subsystem for the fuel control system model

The `fuel_rate_control` uses signals from the system's sensors to determine the fuel rate which gives a stoichiometric mixture. The fuel rate combines with the actual air flow in the engine gas dynamics model to determine the resulting mixture ratio as sensed at the exhaust.

You can selectively disable each of the four sensors (throttle angle, speed, EGO and manifold absolute pressure [MAP]) by using the slider switches in the dashboard subsystem, to simulate failures. Simulink accomplishes this by binding slider switches to the value parameter of the constant block. Double-click on the dashboard subsystem to open the control dashboard to change the position of the switch. Similarly, you can induce the failure condition of a high engine speed by toggling the engine speed switch on the dashboard subsystem. A Repeating Table block provides the throttle angle input and periodically repeats the sequence of data specified in the mask.

The `fuel_rate_control` block, shown in Figure 3, uses the sensor input and feedback signals to adjust the fuel rate to give a stoichiometric ratio. The model uses three subsystems to implement this strategy: control logic, airflow calculation, and fuel calculation. Under normal operation, the model estimates the airflow rate and multiplies the estimate by the reciprocal of the desired ratio to give the fuel rate. Feedback from the oxygen sensor provides a closed-loop adjustment of the rate estimation in order to maintain the ideal mixture ratio.

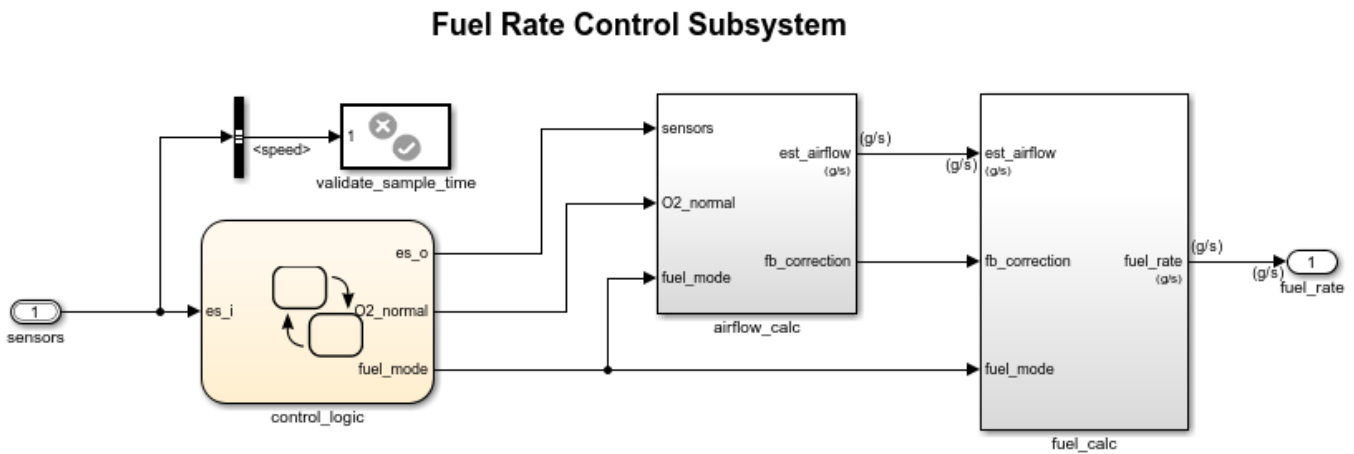

Figure 3: Fuel rate controller subsystem

Control Logic

A single Stateflow chart, consisting of a set of six parallel states, implements the control logic in its entirety. The four parallel states shown at the top of Figure 4 correspond to the four individual sensors. The remaining two parallel states at the bottom consider the status of the four sensors simultaneously and determine the overall system operating mode. The model synchronously calls the entire Stateflow diagram at a regular sample time interval of 0.01 sec. This permits the conditions for transitions to the correct mode to be tested on a timely basis.

To open the control_logic Stateflow chart, double-click on it in the fuel_rate_control subsystem.

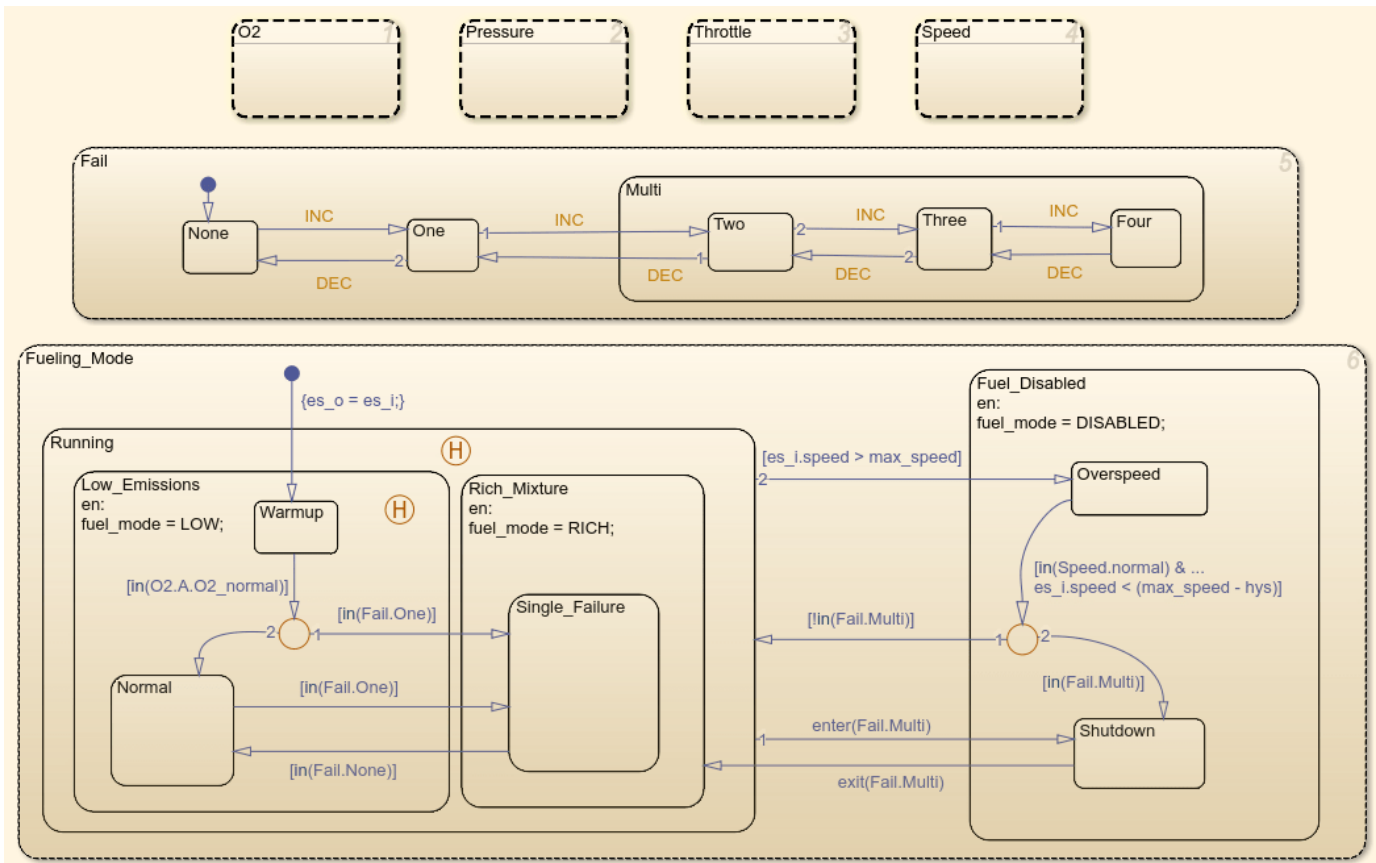

Figure 4: The control logic chart

When execution begins, all of the states start in their **normal** mode with the exception of the oxygen sensor (EGO). The `O2_warmup` state is entered initially until the warmup period is complete. The system detects throttle and pressure sensor failures when their measured values fall outside their nominal ranges. A manifold vacuum in the absence of a speed signal indicates a speed sensor failure. The oxygen sensor also has a nominal range for failure conditions but, because zero is both the minimum signal level and the bottom of the range, failure can be detected only when it exceeds the upper limit.

Regardless of which sensor fails, the model always generates the directed event broadcast `Fail.INC`. In this way the triggering of the universal sensor failure logic is independent of the sensor. The model also uses a corresponding sensor recovery event, `Fail.DEC`. The `Fail` state keeps track of the number of failed sensors. The counter increments on each `Fail.INC` event and decrements on each `Fail.DEC` event. The model uses a superstate, `Multi`, to group all cases where more than one sensor has failed.

The bottom parallel state represents the fueling mode of the engine. If a single sensor fails, operation continues but the air/fuel mixture is richer to allow smoother running at the cost of higher emissions. If more than one sensor has failed, the engine shuts down as a safety measure, since the air/fuel ratio cannot be controlled reliably.

During the oxygen sensor warm-up, the model maintains the mixture at normal levels. If this is unsatisfactory, you can change the design by moving the warm-up state to within the `Rich_Mixture`

superstate. If a sensor failure occurs during the warm-up period, the `Single_Failure` state is entered after the warm-up time elapses. Otherwise, the `Normal` state is activated at this time.

A protective overspeed feature has been added to the model by creating a new state in the `Fuel_Disabled` superstate. Through the use of history junctions, we assured that the chart returns to the appropriate state when the model exits the overspeed state. As the safety requirements for the engine become better specified, we can add additional shutdown states to the `Fuel_Disabled` superstate.

Sensor Correction

When a sensor fails, the model computes an estimate of the sensor. For example, open the pressure sensor calculation. Under normal sensor operation, the model uses the value of the pressure sensor. Otherwise, the model estimates the value.

The model computes an estimate of manifold pressure as a function of the engine speed and throttle position. To compute the value, the model uses a Simulink function inside Stateflow.

Airflow Calculation

The Airflow Calculation block (shown in Figure 6) is the location for the central control laws. This block is found inside the fuel_rate_control subsystem (open this block). The block estimates the intake air flow to determine the fuel rate which gives the appropriate air/fuel ratio. Closed-loop control adjusts the estimation according to the residual oxygen feedback in order to maintain the mixture ratio precisely. Even when a sensor failure mandates open-loop operation, the most recent closed-loop adjustment is retained to best meet the control objectives.

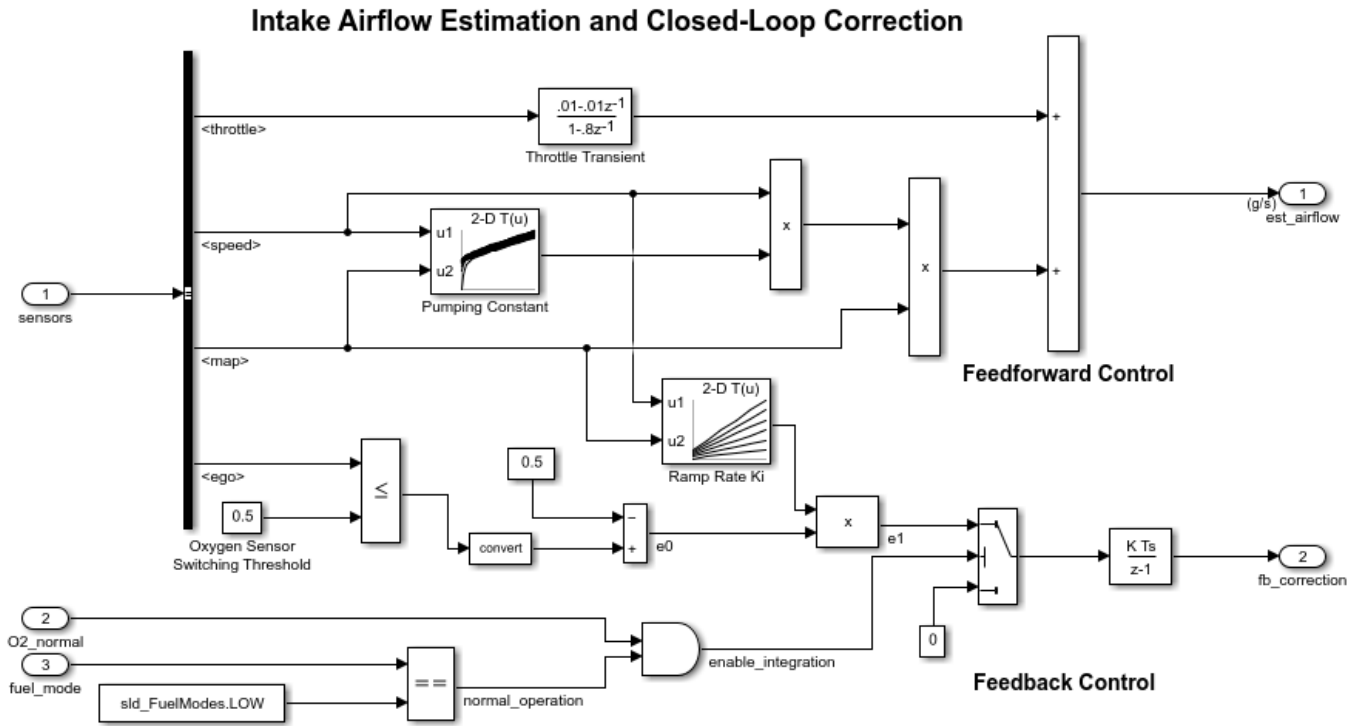

Figure 6: Airflow estimation and correction

Equation 1

The engine's intake air flow can be formulated as the product of the engine speed, the manifold pressure and a time-varying scale factor.

$$q = \frac{N}{4\pi} V_{cd} \nu \frac{P_m}{RT} = C_{pump}(N, P_m) N P_m = \text{intake mass flow}$$

N = engine angular speed (Rad/sec)

V_{cd} = engine cylinder displacement volume

ν = volumetric efficiency

P_m = manifold pressure

R, T = specific gas constant, gas temperature

C_{pump} is computed by a lookup table and multiplied by the speed and pressure to form the initial flow estimate. During transients, the throttle rate, with the derivative approximated by a high-pass filter, corrects the air flow for filling dynamics. The control algorithm provides additional correction according to Equation 2.

Equation 2

$$e_0 = 0.5 \text{ for } EGO \leq 0.5$$

$$e_0 = -0.5 \text{ for } EGO > 0.5$$

$$e_1 = K_i(N, P_m)e_0 \text{ for } EGO \leq 0.5$$

$$\dot{e}_2 = e_1 \text{ for LOW mode with valid EGO signal}$$

$$\dot{e}_2 = 0 \text{ for RICH, DISABLE or EGO warmup}$$

$e_0, e_1, e_2 =$ intermediate error signals

Figure 7: Engine Gas Dynamics subsystem

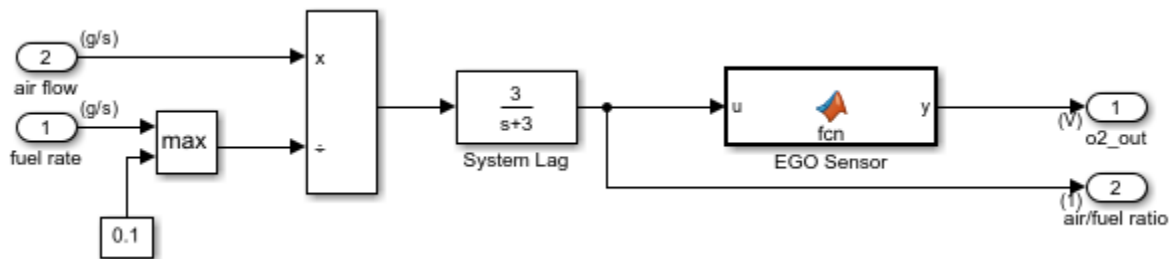

Figure 8: Mixing & Combustion block within the Engine Gas Dynamics subsystem

The nonlinear oxygen sensor (EGO Sensor block) is found inside the Mixing & Combustion block (see Figure 8) within the Engine Gas Dynamics subsystem (see Figure 7). EGO Sensor is modeled as a hyperbolic tangent function, and it provides a meaningful signal when in the vicinity of 0.5 volt. The raw error in the feedback loop is thus detected with a switching threshold, as indicated in Equation 2. If the air-fuel ratio is low (the mixture is lean), the original air estimate is too small and needs to be increased. Conversely, when the oxygen sensor output is high, the air estimate is too large and needs to be decreased. Integral control is utilized so that the correction term achieves a level that brings about zero steady-state error in the mixture ratio.

The normal closed-loop operation mode, LOW, adjusts the integrator dynamically to minimize the error. The integration is performed in discrete time, with updates every 10 milliseconds. When

operating open-loop however, in the RICH or O2 failure modes, the feedback error is ignored and the integrator is held. This gives the best correction based on the most recent valid feedback.

Fuel Calculation

The fuel_calc subsystem (within the fuel_rate_control subsystem, see Figure 9) sets the injector signal to match the given airflow calculation and fault status. The first input is the computed airflow estimation. This is multiplied with the target fuel/air ratio to get the commanded fuel rate. Normally the target is stoichiometric, i.e. equals the optimal air to fuel ratio of 14.6. When a sensor fault occurs, the Stateflow control logic sets the mode input to a value of 2 or 3 (RICH or DISABLED) so that the mixture is either slightly rich of stoichiometric or is shut down completely.

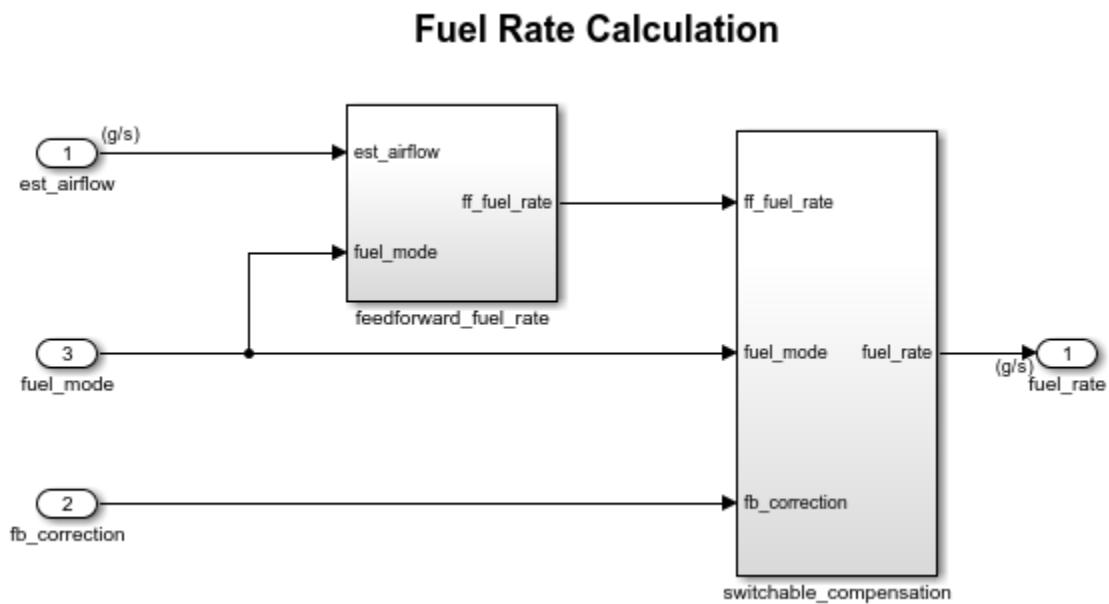

Figure 9: fuel_calc subsystem

The fuel_calc subsystem (Figure 9) employs adjustable compensation (Figure 10) in order to achieve different purposes in different modes. In normal operation, phase lead compensation of the feedback correction signal adds to the closed-loop stability margin. In RICH mode and during EGO sensor failure (open loop), however, the composite fuel signal is low-pass filtered to attenuate noise introduced in the estimation process. The end result is a signal representing the fuel flow rate which, in an actual system, would be translated to injector pulse times.

Loop Compensation and Filtering

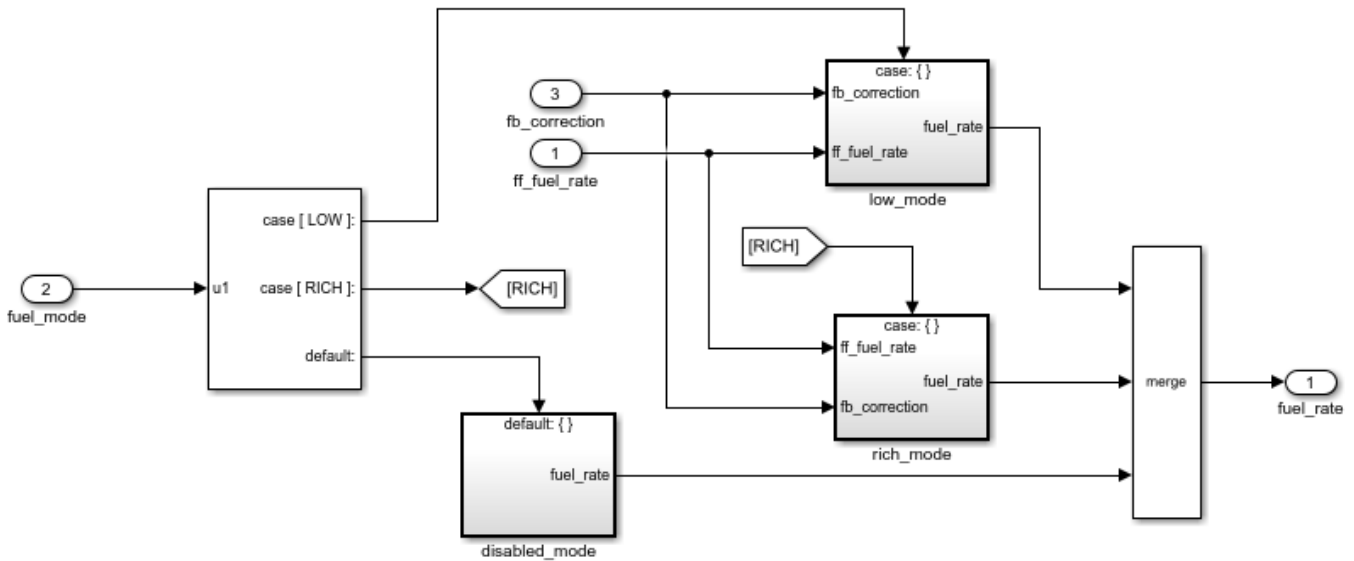

Figure 10: Switchable compensation subsystem

Results and Conclusions

Simulation results are shown in Figure 11 and Figure 12. The simulation is run with a throttle input that ramps from 10 to 20 degrees over a period of two seconds, then goes back to 10 degrees over the next two seconds. This cycle repeats continuously while the engine is held at a constant speed so

that the user can experiment with different fault conditions and failure modes. Click on a sensor fault switch in the dashboard subsystem to simulate the failure of the associated sensor. Repeat this operation to slide the switch back for normal operation.

Figure 11: Comparing the fuel flow rate for different sensor failures

Figure 11 compares the fuel flow rate under fault-free conditions (baseline) with the rate applied in the presence of a single failure in each sensor individually. In each case note the nonlinear relationship between fuel flow and the triangular throttle command (shown in Figure 13). In the baseline case, the fuel rate is regulated tightly, exhibiting a small ripple due to the switching nature of the EGO sensor's input circuitry. In the other four cases the system operates open loop. The control strategy is proven effective in maintaining the correct fuel profile in the single-failure mode. In each of the fault conditions, the fuel rate is essentially 125% of the baseline flow, fulfilling the design objective of 80% rich.

Figure 12: Comparing the air-fuel ratio for different sensor failures

Figure 12 plots the corresponding air/fuel ratio for each case. The baseline plot shows the effects of closed-loop operation. The mixture ratio is regulated very tightly to the stoichiometric objective of

14.6. The rich mixture ratio is shown in the bottom four plots of Figure 12. Although they are not tightly regulated, as in the closed-loop case, they approximate the objective of air/fuel ($0.8 \times 14.6 = 11.7$).

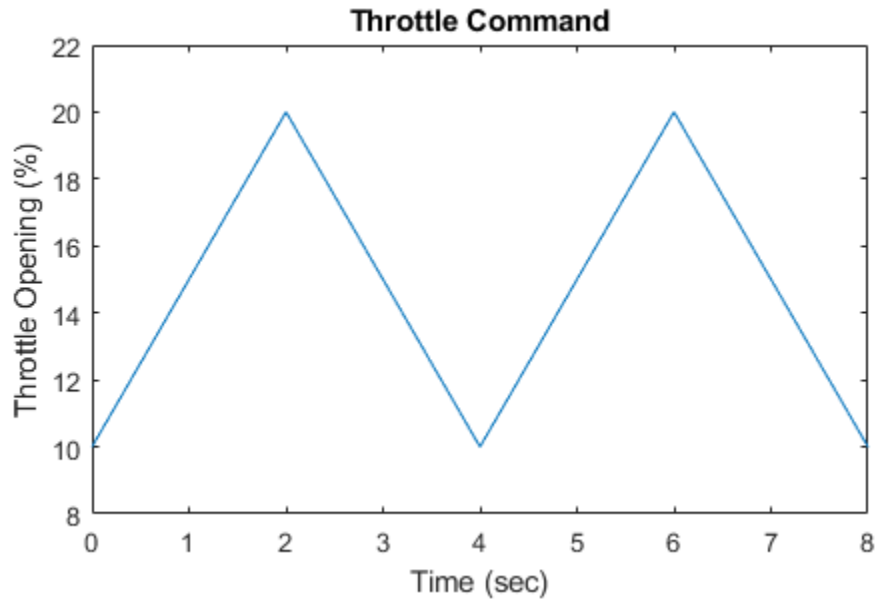

Figure 13: Throttle command

The transient behavior of the system is shown in Figure 14. With a constant 12 degree throttle angle and the system in steady-state, a throttle failure is introduced at $t = 2$ and corrected at $t = 5$. At the onset of the failure, the fuel rate increases immediately. The effects are seen at the exhaust as the rich ratio propagates through the system. The steady-state condition is then quickly recovered when closed-loop operation is restored.

Figure 14: Transient response to fault detection

Remarks

If you enable animation in the Stateflow debugger, the state transitions are highlighted in the Stateflow diagram (see Figure 4) as the various states are activated. The sequence of activation is indicated by changing colors. This closely coupled synergy between Stateflow and Simulink fosters the modeling and development of complete control systems.

Using a Data Dictionary to Manage the Data for a Fuel Control System

This example shows how to use data dictionaries to manage the data for a fuel rate control system designed using Simulink® and Stateflow®.

Familiarize Yourself with the Model

The `sldemo_fuelsys_dd` model is a closed-loop system containing a "plant" and "controller". The plant is used to validate the design of the controller. In this example, the plant and controller are represented by separate models that are referenced from the test harness model. Let's take a look at these models.

Open and Compile the Test Harness Model

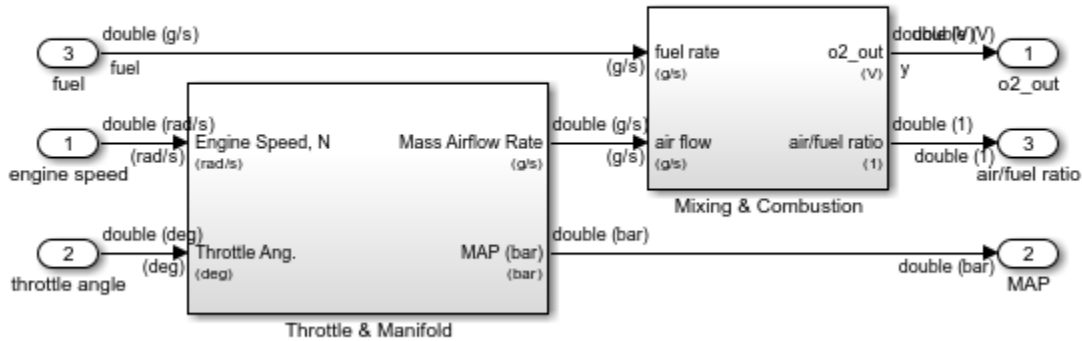

The sensor switches simulate any combination of sensor failures. The Engine Speed Selector switch simulates different engine speeds (rad/s).

Investigate the Data Used by the Controller

The global design data for the controller model is defined in a data dictionary. Using data dictionaries has many advantages over defining data in the base workspace.

The controller model is explicitly linked to a data dictionary. This link is set up on the **External Data** tab of the Model Properties dialog box. To open this dialog box, click the icon in the lower-left corner of the model window and select the gear icon on the right side.

To open the data dictionary in the Model Explorer, in the model window, click the same icon and select **External Data**. In Model Explorer, select `sldemo_fuelsys_dd_controller` under the **External Data** node.

In the **Contents** pane, you can see the parameter and signal objects that are used to configure the controller algorithm for simulation and code generation. In the **Dialog** pane on the right, you can see that the dictionary also contains a reference to another data dictionary, `sldemo_fuelsys_dd_types.sldd`, that defines the data type objects used by this model.

This data dictionary is configured for a float-point controller, as is seen by the data type display on the signal lines in the controller model. The data types dictionary, `sldemo_fuelsys_dd_types.sldd`, sources data type objects from the referenced dictionary `sldemo_fuelsys_dd_types_float.sldd`. To configure for a fixed-point controller, you could create a new dictionary that contains fixed-point data type objects and change the types dictionary (`sldemo_fuelsys_dd_types.sldd`) to reference that dictionary instead.

Investigate the Units Used by the Components

Notice that units are visible on the model and subsystem icons and signal lines. Units are specified on the ports and on the bus, signal and parameter objects in the data dictionary.

Simulate the Test Harness Model

The test harness model is also linked to a data dictionary (`sldemo_fuelsys_dd.sldd`). This data dictionary contains references to the data dictionaries for the plant and controller models but it does not contain any additional data.

Simulate the test harness model to validate the behavior of the controller in the floating-point configuration.

Modeling Engine Timing Using Triggered Subsystems

This example shows how to model a four-cylinder spark ignition internal combustion engine from the throttle to the crankshaft output. We used well-defined physical principles supplemented, where appropriate, with empirical relationships that describe the system's dynamic behavior without introducing unnecessary complexity.

Analysis and Physics

This example describes the concepts and details surrounding the creation of engine models with emphasis on important Simulink® modeling techniques. The basic model uses the enhanced capabilities of Simulink to capture time-based events with high fidelity. Within this simulation, a triggered subsystem models the transfer of the air-fuel mixture from the intake manifold to the cylinders via discrete valve events. This takes place concurrently with the continuous-time processes of intake flow, torque generation and acceleration. A second model adds an additional triggered subsystem that provides closed-loop engine speed control via a throttle actuator. These models can be used as standalone engine simulations. Or, they can be used within a larger system model, such as an integrated vehicle and powertrain simulation, in the development of a traction control system.

This model is based on published results by Crossley and Cook (1991). It describes the simulation of a four-cylinder spark ignition internal combustion engine. The Crossley and Cook work also shows how a simulation based on this model was validated against dynamometer test data. The ensuing sections (listed below) analyze the key elements of the engine model that were identified by Crossley and Cook:

- 1 Throttle
 - 2 Intake manifold
 - 3 Mass flow rate
 - 4 Compression stroke
 - 5 Torque generation and acceleration
- Note: Additional components can be added to the model to provide greater accuracy in simulation and to more closely replicate the behavior of the system.

Throttle

The first element of the model is the throttle body. The control input is the angle of the throttle plate. The rate at which the model introduces air into the intake manifold can be expressed as the product of two functions:

- 1 an empirical function of the throttle plate angle only
- 2 a function of the atmospheric and manifold pressures

In cases of lower manifold pressure (greater vacuum), the flow rate through the throttle body is sonic and is only a function of the throttle angle. This model accounts for this low pressure behavior with a switching condition in the compressibility equations shown in Equation 1.

Equation 1

$$\dot{m}_{ai} = f(\theta) \cdot g(P_m) = \text{mass flow rate into manifold (g/s)}$$

$$f(\theta) = 2.821 - 0.05231 \cdot \theta + 0.10299 \cdot \theta^2 - 0.00063 \cdot \theta^3$$

$$g(P_m) = 1; \text{ if } P_m \leq P_{amb}/2$$

$$g(P_m) = \frac{2}{P_{amb}} \sqrt{P_m P_{amb} - P_m^2}; \text{ if } P_{amb}/2 \leq P_m \leq P_{amb}$$

$$g(P_m) = -\frac{2}{P_m} \sqrt{P_m P_{amb} - P_{amb}^2}; \text{ if } P_{amb} \leq P_m \leq 2P_{amb}$$

$$g(P_m) = -1; \text{ if } P_m \geq 2P_{amb}$$

\dot{m}_{ai} → mass flow rate into manifold (g/s);

θ → throttle angle (deg);

P_m → manifold pressure (bar);

P_{amb} → ambient (atmospheric) pressure (bar);

Intake Manifold

The simulation models the intake manifold as a differential equation for the manifold pressure. The difference in the incoming and outgoing mass flow rates represents the net rate of change of air mass with respect to time. This quantity, according to the ideal gas law, is proportional to the time derivative of the manifold pressure (see Equation 2). Note that, unlike the model of Crossley and Cook (see also references 3 through 5), this model doesn't incorporate exhaust gas recirculation (EGR), although this can easily be added.

Equation 2

$$\dot{P}_m = \frac{RT}{V_m} (\dot{m}_{ai} - \dot{m}_{ao})$$

R → specific gas constant;

T → temperature (K);

V_m → manifold volume (m^3);

\dot{m}_{ao} → mass flow rate of air out of the manifold (g/s);

\dot{P}_m → rate of change of manifold pressure (bar/s);

Intake Mass Flow Rate

The mass flow rate of air that the model pumps into the cylinders from the manifold is described in Equation 3 by an empirically derived equation. This mass rate is a function of the manifold pressure and the engine speed.

Equation 3

$$\dot{m}_{ao} = -0.366 + 0.08979 \cdot N \cdot P_m - 0.0337 \cdot N \cdot P_m^2 + 0.0001 \cdot N^2 \cdot P_m$$

$N \rightarrow$ engine angular speed (rad/s);

$P_m \rightarrow$ manifold pressure (bar);

To determine the total air charge pumped into the cylinders, the simulation integrates the mass flow rate from the intake manifold and samples it at the end of each intake stroke event. This determines the total air mass that is present in each cylinder after the intake stroke and before compression.

Compression Stroke

In an inline four-cylinder four-stroke engine, 180 degrees of crankshaft revolution separate the ignition of each successive cylinder. This results in each cylinder firing on every other crank revolution. In this model, the intake, compression, combustion, and exhaust strokes occur simultaneously (at any given time, one cylinder is in each phase). To account for compression, the combustion of each intake charge is delayed by 180 degrees of crank rotation from the end of the intake stroke.

Torque Generation and Acceleration

The final element of the simulation describes the torque developed by the engine. An empirical relationship dependent upon the mass of the air charge, the air/fuel mixture ratio, the spark advance, and the engine speed is used for the torque computation (see Equation 4).

Equation 4

$$\begin{aligned} Torque_{eng} = & -181.3 + 379.36 \cdot m_a + 21.91 \cdot \left(\frac{A}{F}\right) - 0.85 \cdot \left(\frac{A}{F}\right)^2 + 0.26 \cdot \sigma - 0.0028 \cdot \sigma^2 + \\ & + 0.027 \cdot N - 0.000107 \cdot N^2 + 0.00048 \cdot N \cdot \sigma + 2.55 \cdot \sigma \cdot m_a - 0.05 \cdot \sigma^2 \cdot m_a \end{aligned}$$

$m_a \rightarrow$ mass of air in cylinder for combustion (g);

$\left(\frac{A}{F}\right) \rightarrow$ air to fuel ratio;

$\sigma \rightarrow$ spark advance (degrees before top - dead - center);

$Torque_{eng} \rightarrow$ torque produced by the engine (Nm);

Calculate the engine angular acceleration using Equation 5

Equation 5

$$J\dot{N} = Torque_{eng} - Torque_{load}$$

$J \rightarrow$ engine rotational moment of inertia ($kg \cdot m^2$);

$\dot{N} \rightarrow$ engine angular acceleration (rad/s^2);

Open-Loop Model

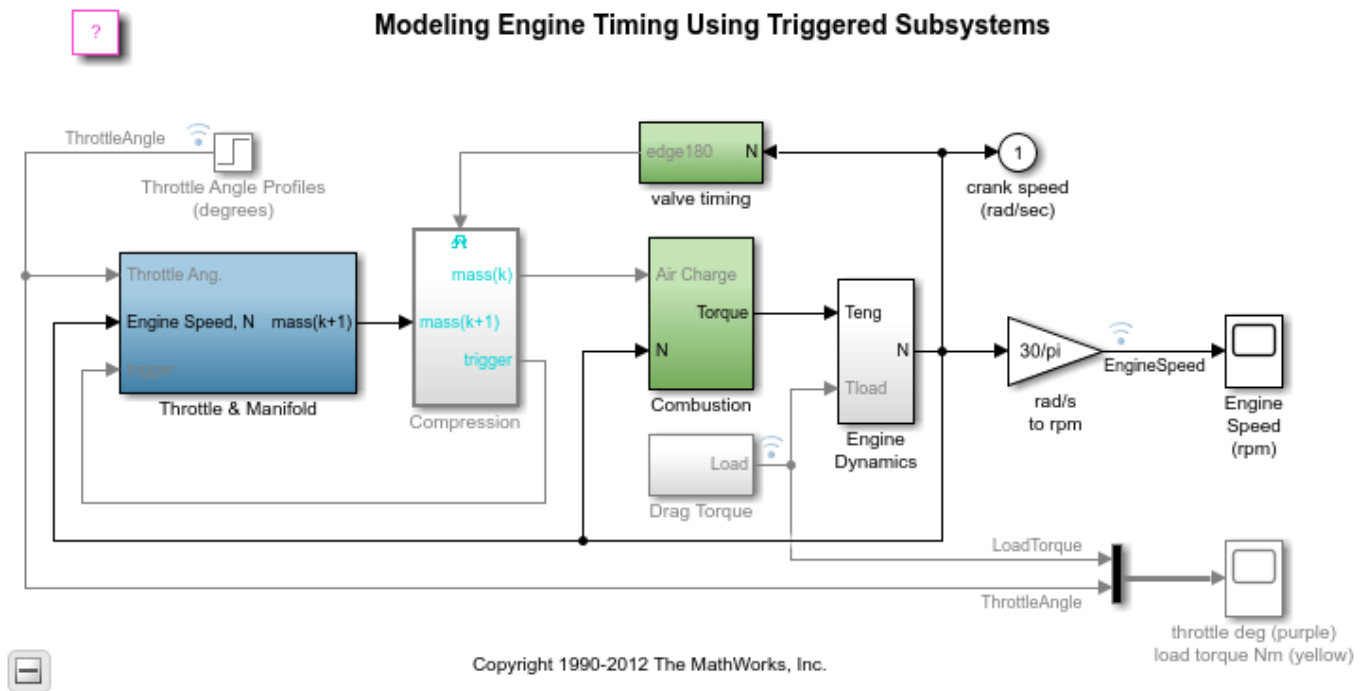

We incorporated the model elements described above into an engine model using Simulink. The following sections describe the decisions we made for this implementation and the key Simulink

elements used. This section shows how to implement a complex nonlinear engine model easily and quickly in Simulink environment. We developed this model in conjunction with Ken Butts, Ford Motor Company® (2).

Figure 1 shows the top level of the model. Note that, in general, the major blocks correspond to the high-level list of functions given in the model description in the preceding summary. Taking advantage of Simulink's hierarchical modeling capabilities, most of the blocks in Figure 1 are made up of smaller blocks. The following paragraphs describe these smaller blocks.

Running the Simulation

Press the "Play" button on the model toolbar to run the simulation.

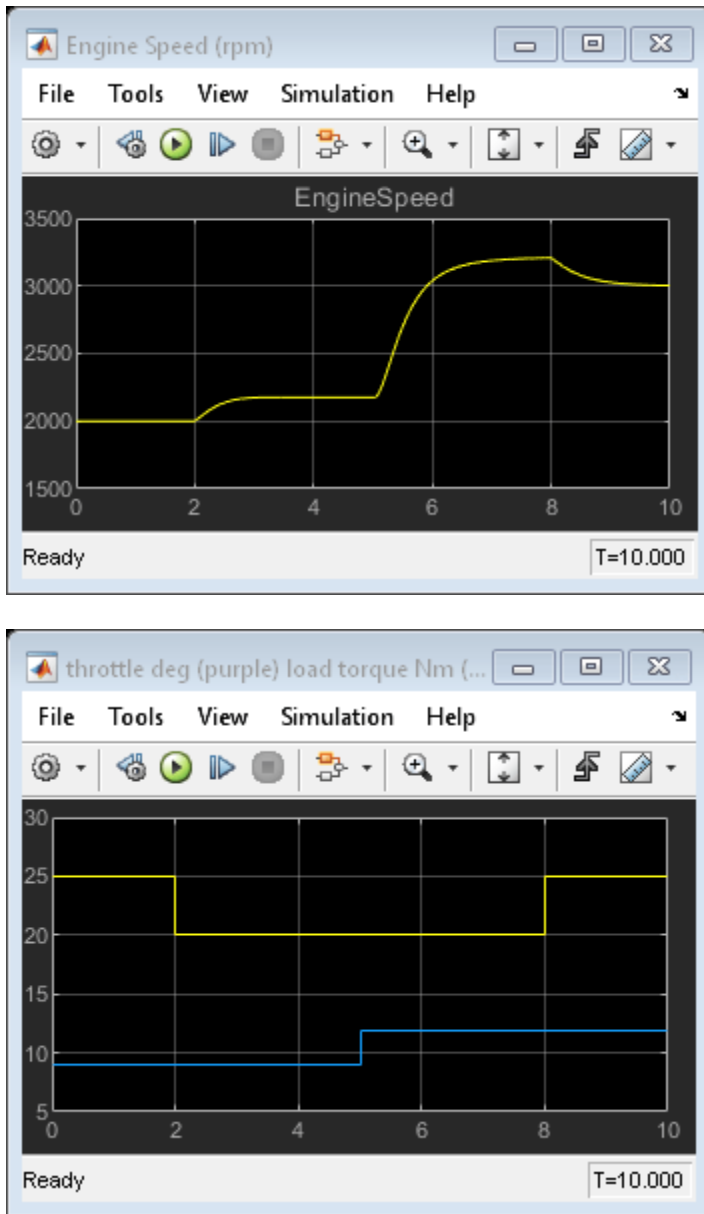

Figure 1: The top level of the engine model and simulation results

- Note: The model logs relevant data to MATLAB workspace in a structure called `sldemo_engine_output`. Logged signals have a blue indicator. Read more about Signal Logging in Simulink documentation.

Throttle/Manifold

In the model, double click on the 'Throttle & Intake Manifold' subsystem to open it. It contains two other subsystems - the 'Throttle' and the 'Intake Manifold' subsystems. Open the 'Throttle' and 'Intake Manifold' to see their components.

Intake Manifold Vacuum

Figure 2: The 'Throttle' and 'Intake Manifold' subsystems

Simulink models for the throttle and intake manifold subsystems are shown in Figure 2. The throttle valve behaves in a nonlinear manner and is modeled as a subsystem with three inputs. Simulink implements the individual equations, given in Equation 1, as function blocks. These provide a convenient way to describe a nonlinear equation of several variables. A 'Switch' block determines whether the flow is sonic by comparing the pressure ratio to its switch threshold, which is set at one half (Equation 1). In the sonic regime, the flow rate is a function of the throttle position only. The direction of flow is from the higher to lower pressure, as determined by the Sign block. With this in mind, the 'Min' block ensures that the pressure ratio is always unity or less.

The differential equation from Equation 2 models the intake manifold pressure. A Simulink function block computes the mass flow rate into the cylinder, a function of manifold pressure and engine speed (see Equation 3).

Intake and Compression

An integrator accumulates the cylinder mass air flow in the 'Intake' block (located inside the 'Throttle & Manifold' subsystem). The 'Valve Timing' block issues pulses that correspond to specific rotational positions in order to manage the intake and compression timing. Valve events occur each cam rotation, or every 180 degrees of crankshaft rotation. Each event triggers a single execution of the 'Compression' subsystem. The output of the trigger block within the 'Compression' subsystem then feeds back to reset the Intake integrator. In this way, although both triggers conceptually occur at the same instant in time, the integrator output is processed by the 'Compression' block immediately prior to being reset. Functionally, the 'Compression' subsystem uses a 'Unit Delay' block to insert 180 degrees (one event period) of delay between the intake and combustion of each air charge.

Consider a complete four-stroke cycle for one cylinder. During the intake stroke, the 'Intake' block integrates the mass flow rate from the manifold. After 180 degrees of crank rotation, the intake valve closes and the 'Unit Delay' block in the 'Compression' subsystem samples the integrator state. This value, the accumulated mass charge, is available at the output of the 'Compression' subsystem 180 degrees later for use in combustion. During the combustion stroke, the crank accelerates due to the generated torque. The final 180 degrees, the exhaust stroke, ends with a reset of the Intake integrator, prepared for the next complete 720 degrees cycle of this particular cylinder.

For four cylinders, we could use four 'Intake' blocks, four 'Compression' subsystems, etc., but each would be idle 75% of the time. We've made the implementation more efficient by performing the tasks of all four cylinders with one set of blocks. This is possible because, at the level of detail we've modeled, each function applies to only one cylinder at a time.

Combustion

Engine torque is a function of four variables. The model uses a 'Mux' block to combine these variables into a vector that provides input to the 'Torque Gen' block. A function block computes the engine torque (described empirically in Equation 4). The torque which loads the engine, computed by step functions in the Drag Torque block, is subtracted in the Engine Dynamics subsystem. The difference divided by the inertia yields the acceleration, which is integrated to arrive at the engine crankshaft speed.

Plotting Simulation Results

We used the following default inputs for the simulation:

$$\textit{Throttle} = 8.97 \text{ (deg) if } t < 5$$

$$\textit{Throttle} = 11.93 \text{ (deg) if } t \geq 5$$

$$\textit{Load} = 25 \text{ (Nm) if } t \leq 2 \text{ or } t \geq 8$$

$$\textit{Load} = 20 \text{ (Nm) if } 2 < t \leq 8$$

Try adjusting the throttle to compensate for the load torque. Figure 3 shows the simulated engine speed, the throttle commands which drive the simulation, and the load torque which disturbs it.

Figure 3a: Open-loop simulation inputs

Figure 3b: Open-loops simulation results

Closing Model

Close the model. Clear generated data.

Conclusions

The ability to model nonlinear, complex systems, such as the engine model described here, is one of Simulink's key features. The power of the simulation is evident in the presentation of the models above. Simulink retains model fidelity, including precisely timed cylinder intake events, which is critical in creating a model of this type. The basic engine model shows the flexibility of Simulink.

Engine Timing Model with Closed Loop Control

This example shows how to enhance a version of the open-loop engine model described in “Modeling Engine Timing Using Triggered Subsystems” on page 13-137. This model, `sldemo_enginewc`, contains a closed-loop and shows the flexibility and extensibility of Simulink® models. In this enhanced model, the objective of the controller is to regulate engine speed with a fast throttle actuator, such that changes in load torque have minimal effect. This is easily accomplished in Simulink by adding a discrete-time PI controller to the engine model.

Closed-Loop Model

We chose a control law which uses proportional plus integral (PI) control. The integrator is needed to adjust the steady-state throttle as the operating point changes, and the proportional term compensates for phase lag introduced by the integrator.

Equation 1

$$\theta = K_p(N_{set} - N) + K_I \int (N_{set} - N)dt$$

N_{set} = speed set point (rpm)

K_p = proportional gain

K_I = integral gain

Running the Simulation

Press the "Play" button on the model toolbar to run the simulation.

- Note: The model logs relevant data to MATLAB workspace in a structure called `sldemo_enginewc_output`. Logged signals have a blue indicator. Read more about Signal Logging in Simulink Help.

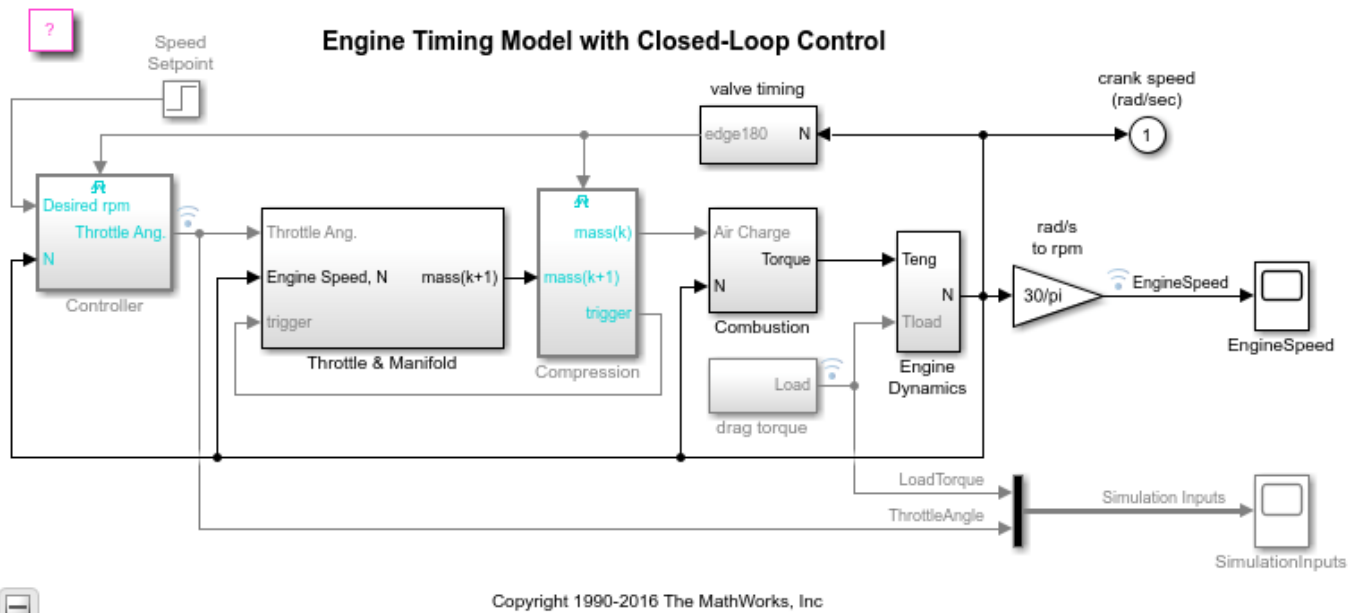

Figure 1: Closed-loop engine model and simulation results

In this model we employ a discrete-time controller, which is suitable for microprocessor implementation. The integral term in Equation 1 must thus be realized with a discrete-time approximation. As is typical in the industry, the controller execution is synchronized with the engine's crankshaft rotation. The controller is embedded in a triggered subsystem that is triggered by the valve timing signal described above.

The detailed construction of the 'Controller' subsystem is illustrated in Figure 2. Of note is the use of the 'PID Controller' block. This block implements a proportional-integral control system in discrete time. Note the setting for sample time set (internally) at -1. This indicates that the block inherits its sample time, in this case executing each time the subsystem is triggered. The key component that makes this a triggered subsystem is the 'Trigger' block shown at the bottom of Figure 2. Any subsystem can be converted to a triggered subsystem by dragging a copy of this block into the subsystem diagram from the Simulink Connections library.

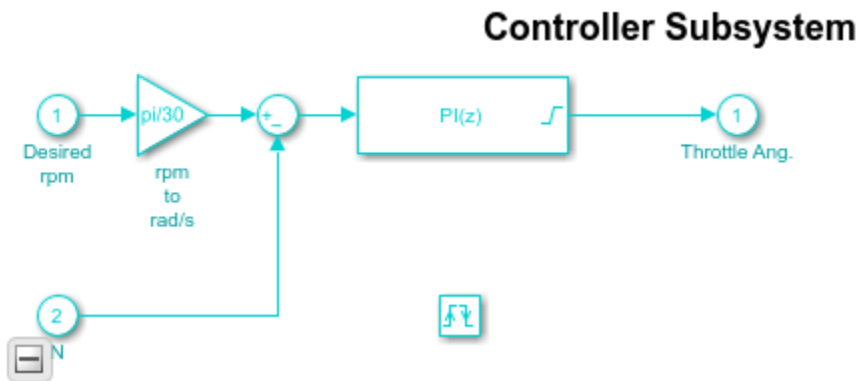

Figure 2: Speed controller subsystem

Results

Typical simulation results are shown in Figure 3. The speed set point steps from 2000 rpm to 3000 rpm at $t = 5$ sec. The torque disturbances are identical to those used in `sldemo_engine`, the open-loop model. Note the quick transient response, with zero steady-state error. Several alternative controller tunings (K_i and K_p) are shown. These can be adjusted by the user at MATLAB command line. This allows the engineer to understand the relative effects of parameter variations.

Figure 3: Typical simulation results

Closing Model

Close the model. Clear logged data.

Conclusions

The ability to model nonlinear, complex systems, such as the engine model described here, is one of Simulink's key features. The power of the simulation is evident in the presentation of the models above. Simulink retains model fidelity, including precisely timed cylinder intake events, which is critical in creating a model of this type. The complete speed control system shows the flexibility of Simulink. In particular, the Simulink modeling approaches allow rapid prototyping of an interrupt-driven engine speed controller.

Building a Clutch Lock-Up Model

This example shows how to use Simulink® to model and simulate a rotating clutch system. Although modeling a clutch system is difficult because of topological changes in the system dynamics during lockup, this example shows how Simulink's enabled subsystems easily handle such problems. We illustrate how to employ important Simulink modeling concepts in the creation of the clutch simulation. Designers can apply these concepts to many models with strong discontinuities and constraints that may change dynamically.

In the example, you use enabled subsystems to build the clutch model. Two enabled subsystems model the clutch dynamics in either the locked or unlocked position. After running the simulation, a GUI opens. Checking any of the boxes on the GUI produces a plot of any of the selected variables (versus time).

Analysis and Physics

The clutch system in this example consists of two plates that transmit torque between the engine and transmission (see Figure 1). There are two distinct modes of operation:

- 1) slipping - the two plates have differing angular velocities
- 2) lockup - the two plates rotate together.

Handling the transition between these two modes presents a modeling challenge. As the system loses a degree of freedom upon lockup, the transmitted torque goes through a step discontinuity. The magnitude of the torque drops from the maximum value supported by the friction capacity to a value that is necessary to keep the two halves of the system spinning at the same rate. The reverse transition, break-apart, is likewise challenging, as the torque transmitted by the clutch plates exceeds the friction capacity.

Figure 1: The clutch system, analyzed using a lumped-parameter model

Variables Used

The following variables are used in the analysis and modeling.

$$T_{in} = \text{input (engine) torque;}$$

F_n = normal force between friction plates;

I_e, I_v = moments of inertia for the engine and for the transmission/vehicle;

b_e, b_v = damping rates at the engine and transmission/vehicle sides of the clutch;

μ_k, μ_s = kinetic and static coefficients of friction;

ω_e, ω_v = angular speeds of the engine and transmission/vehicle input shafts;

r_1, r_2 = inner and outer radii of the clutch plate friction surfaces;

R = equivalent net radius;

T_{cl} = torque transmitted through the clutch;

T_l = friction torque required of the clutch to maintain lockup;

Equation 1

The state equations for the coupled system are derived as follows:

$$I_e \dot{\omega}_e = T_{in} - b_e \omega_e - T_{cl}$$

$$I_v \dot{\omega}_v = T_{cl} - b_v \omega_v$$

Equation 2

The torque capacity of the clutch is a function of its size, friction characteristics, and the normal force that is applied.

$$(T_f)_{\max} = \int \int_A \frac{r \times F_f}{A} da = \frac{F_n \mu}{\pi(r_2^2 - r_1^2)} \int_{r_1}^{r_2} \int_0^{2\pi} r^2 dr d\theta = \frac{2}{3} R F_n \mu$$

$$R = \frac{r_2^3 - r_1^3}{r_2^2 - r_1^2}$$

Equation 3

When the clutch is slipping, the model uses the kinetic coefficient of friction and the full capacity is available, in the direction that opposes slip.

$$T_{fmaxk} = \frac{2}{3} R F_n \mu_k$$

$$T_{cl} = \text{sgn}(\omega_e - \omega_v) T_{fmaxk}$$

where sgn denotes the sign function.

Equation 4

When the clutch is locked, the angular velocities of the engine and transmission input shafts are the same, and the system torque acts on the combined inertia as a single unit. So, we combine the differential equations (Equation 1) into a single equation for the locked state.

$$\omega_e = \omega_v = \omega$$

$$(I_e + I_v)\dot{\omega} = T_{in} - (b_e + b_v)\omega$$

Equation 5

Solving Equation 1 and Equation 4, the torque transmitted by the clutch while locked is:

$$T_{cl} = T_f = \frac{I_v T_{in} - (I_v b_e - I_e b_v)\omega}{I_v + I_e}$$

Equation 6

The clutch thus remains locked unless the magnitude of T_f exceeds the static friction capacity, T_{fmaxs} .

$$T_{fmaxs} = \frac{2}{3}RF_n\mu_s$$

The state diagram in Figure 2 describes the overall behavior of the clutch.

Figure 2: A state diagram describing the friction mode transitions

Modeling

There are two methods for solving this type of problem:

- 1) Compute the clutch torque transmitted at all times, and employ this value directly in the model.
- 2) Use two different dynamic models and switch between them at the appropriate times.

Because of its overall capabilities, Simulink can model either method. In this example, we describe a simulation for the second method. In the second method, switching between two dynamic models must be performed with care to ensure that the initialized states of the new model match the state values immediately prior to the switch. But, in either approach, Simulink facilitates accurate

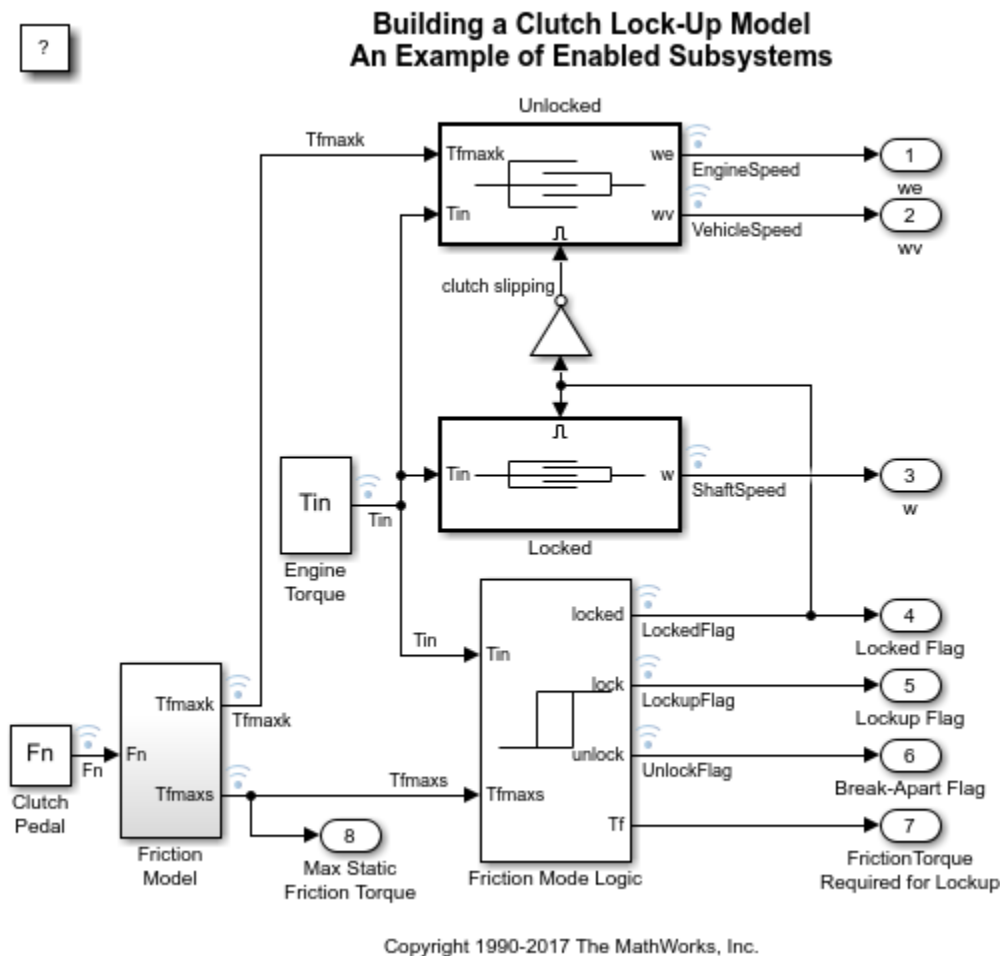

simulation due to its ability to recognize the precise moments at which transitions between lockup and slipping occur.

The simulation model for the clutch system uses enabled subsystems, a particularly useful feature in Simulink. The simulation can use one subsystem while the clutch is slipping and the other when it is locked. A diagram of the Simulink model appears in Figure 3.

Opening the Model and Running the Simulation

When the model is open, to run the simulation, click **Run**.

- Note: If you are using MATLAB Help, you can execute code from the example page by selecting the code and pressing F9. You can also Select Code > Right Click > Select "Evaluate Selection".

Figure 3: Top level diagram for the clutch model

- Note: The model logs relevant data to MATLAB workspace in a structure called `sldemo_clutch_output`. For information about signal logging, see "Configure a Signal for Logging".

The 'Unlocked' Subsystem

Double click on the 'Unlocked' subsystem in the model window to open it. This subsystem models both sides of the clutch, coupled by the friction torque. It is constructed around the integrator blocks which calculate engine and vehicle speeds (see Figure 4). The model uses gain, multiplication, and summation blocks to compute the speed derivatives (acceleration) from the states and the subsystem inputs of engine torque, T_{in} , and clutch capacity, T_{fmaxk} .

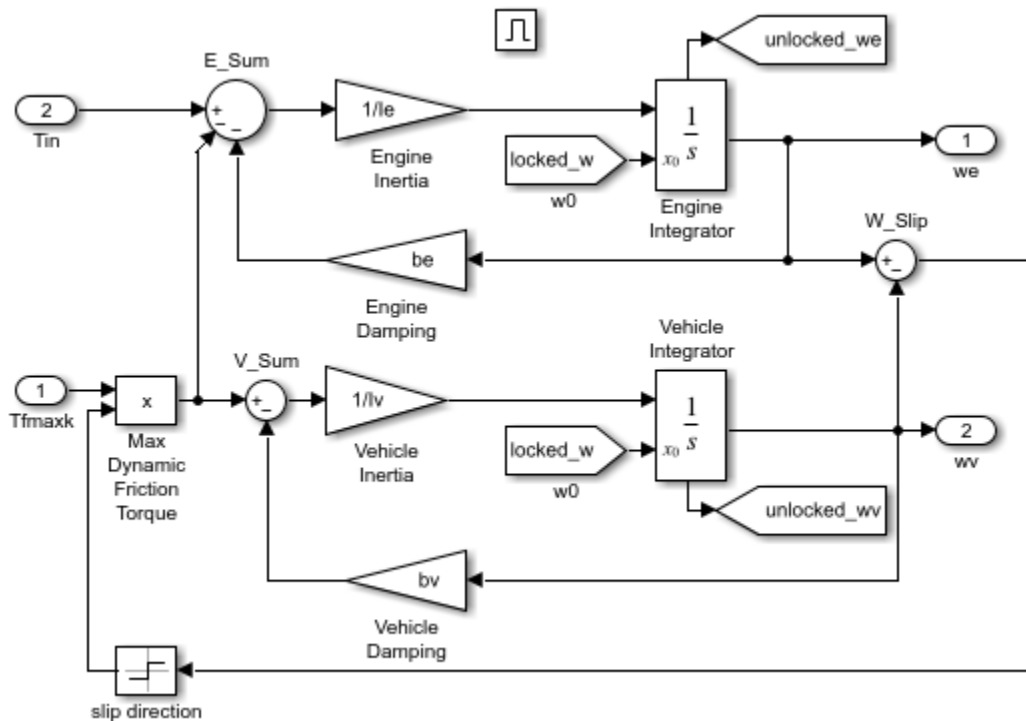

Figure 4: The 'Unlocked' subsystem

Enabled subsystems, such as 'Unlocked', feature several other noteworthy characteristics. The 'Enable' block at the top of the diagram in Figure 4, defines the model as an enabled subsystem. To create an enabled subsystem, we group the blocks together like any other subsystem. We then insert an 'Enable' block from the Simulink Connections library. This means that:

- An enable input appears on the subsystem block, identified by the pulse-shaped symbol used on the 'Enable' block itself.
- The subsystem executes only when the signal at the enable input is greater than zero.

In this example, the 'Unlocked' subsystem executes only when the supervising system logic determines that it should be enabled.

There is another important consideration when using systems that can be enabled or disabled. When the system is enabled, the simulation must reinitialize the integrators to begin simulating from the correct point. In this case, both sides of the clutch are moving at the same velocity the moment it unlocks. The 'Unlocked' subsystem, which had been dormant, needs to initialize both integrators at that speed in order to keep the system speeds continuous.

The simulation uses 'From' blocks to communicate the state of the locked speed to the initial condition inputs of the two integrators. Each 'From' block represents an invisible connection between itself and a 'Goto' block somewhere else in the system. The 'Goto' blocks connect to the state ports of the integrators so that the model can use these states elsewhere in the system without explicitly drawing in the connecting lines.

The 'Locked' Subsystem

Open the 'Locked' subsystem by double clicking on it in the model window. This is another enabled subsystem in the clutch model (see Figure 5). It uses a single state to represent the engine and vehicle speeds. It computes acceleration as a function of the speed and input torque. As in the 'Unlocked' case, a 'From' block provides the integrator initial conditions and a 'Goto' block broadcasts the state for use elsewhere in the model. While simulating, either the 'Locked' or the 'Unlocked' subsystem is active at all times. Whenever the control changes, the states are neatly handed off between the two.

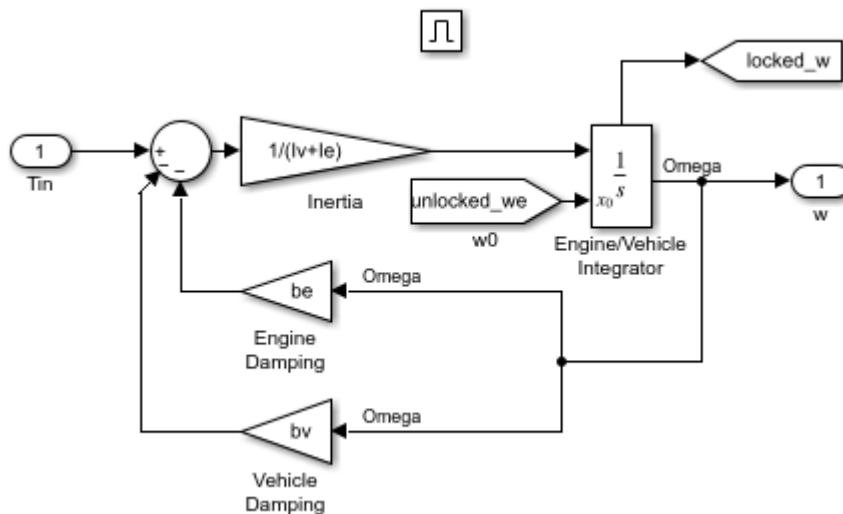

Figure 5: The 'Locked' Subsystem

- The 'Friction Mode Logic' Subsystem

The 'Friction Mode Logic' subsystem (shown in Figure 6) computes the static and kinetic friction (with the appropriate friction coefficient) according to the following formula:

$$T_{fmax} = \frac{2}{3}RF_n\mu$$

Open the 'Friction Mode Logic' subsystem by double clicking on it in the model window.

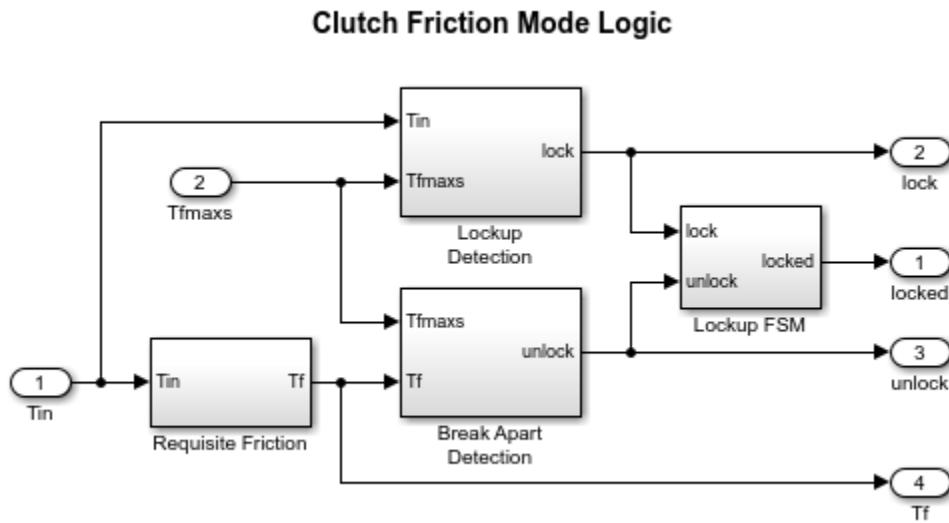

Figure 6: The 'Friction Mode Logic' Subsystem

- Other Components

The remaining blocks calculate the torque required for lockup (Equation 5), and implement the logic described in Figure 2. One key element is located in the 'Lockup Detection' subsystem within the 'Friction Mode Logic' subsystem. This is the 'Simulink Hit Crossing' block which precisely locates the instant at which the clutch slip reaches zero. This places the mode transition at exactly the right moment.

- System Inputs

The system inputs are normal force, F_n , and engine torque, T_{in} . Each of these is represented by a matrix table in the model workspace. The inputs are plotted in Figure 7. You can visualize various signals by checking the corresponding boxes on the 'Clutch Demo Signals' GUI.

Figure 7: System inputs: normal force and engine torque

Results

The following parameter values are used to show the simulation. These are not meant to represent the physical quantities corresponding to an actual system, but rather to facilitate a meaningful baseline example.

$$I_e = 1kg \cdot m^2$$

$$I_v = 5kg \cdot m^2$$

$$b_e = 2Nm/rad/sec$$

$$b_v = 1Nm/rad/sec$$

$$\mu_k = 1$$

$$\mu_s = 1.5$$

$$R = 1m$$

For the inputs shown above, the system velocities behave as shown in Figure 8 below. The simulation begins in the Unlocked mode, with an initial engine speed flare as the vehicle side accelerates its larger inertia. At about $t = 4$ sec, the velocities come together and remain locked, indicating that

the clutch capacity is sufficient to transmit the torque. At $t = 5$ sec, the engine torque begins to decrease, as does the normal force on the friction plates. Consequently, the onset of slip occurs at about $t = 6.25$ sec as indicated by the separation of the engine and vehicle speeds.

Figure 8: Angular velocities of the engine, vehicle and shaft for default inputs

Notice that the various states remain constant while they are disabled. At the time instants at which transitions take place, the state hand-off is both continuous and smooth. This is a result of supplying each integrator with the appropriate initial conditions to use when the state is enabled.

Closing Model

Close the model. Clear generated data.

Conclusions

This example shows how to use Simulink and its standard block library to model, simulate, and analyze a system with topological discontinuities. This is a powerful example of the 'Hit Crossing' block and how it can be used to capture specific events during a simulation. The Simulink model of

this clutch system can serve as a guide when creating models with similar characteristics. You can apply the principles used in this example to any system with topological discontinuities.

Modeling Clutch Lock-Up Using If Blocks

This example shows how to use If/Else subsystems to build a clutch model. An 'If' subsystem models the clutch dynamics in the locked position while an 'Else' subsystem models the unlocked position. One or the other is enabled using the 'If' block. The dot-dashed lines from the 'If' block denote control signals, which are used to enable If/Else (or other conditional) subsystems. Checking any of the boxes on the GUI produces a plot of any of the selected variables (versus time).

Analysis and Physics

The clutch system in this example consists of two plates that transmit torque between the engine and transmission. There are two distinct modes of operation:

- 1) slipping - the two plates have differing angular velocities
- 2) lockup - the two plates rotate together.

Handling the transition between these two modes presents a modeling challenge. As the system loses a degree of freedom upon lockup, the transmitted torque goes through a step discontinuity. The magnitude of the torque drops from the maximum value supported by the friction capacity to a value that is necessary to keep the two halves of the system spinning at the same rate. The reverse transition, break-apart, is likewise challenging, as the torque transmitted by the clutch plates exceeds the friction capacity.

- Note: You can find a detailed analysis of this system, including equations and diagrams, in the example for the clutch model with enabled subsystems.

Modeling

You can use the following two methods for solving this problem:

- 1) Compute the clutch torque transmitted at all times, and employ this value directly in the model.
- 2) Use two different dynamic models and switch between them at the appropriate times.

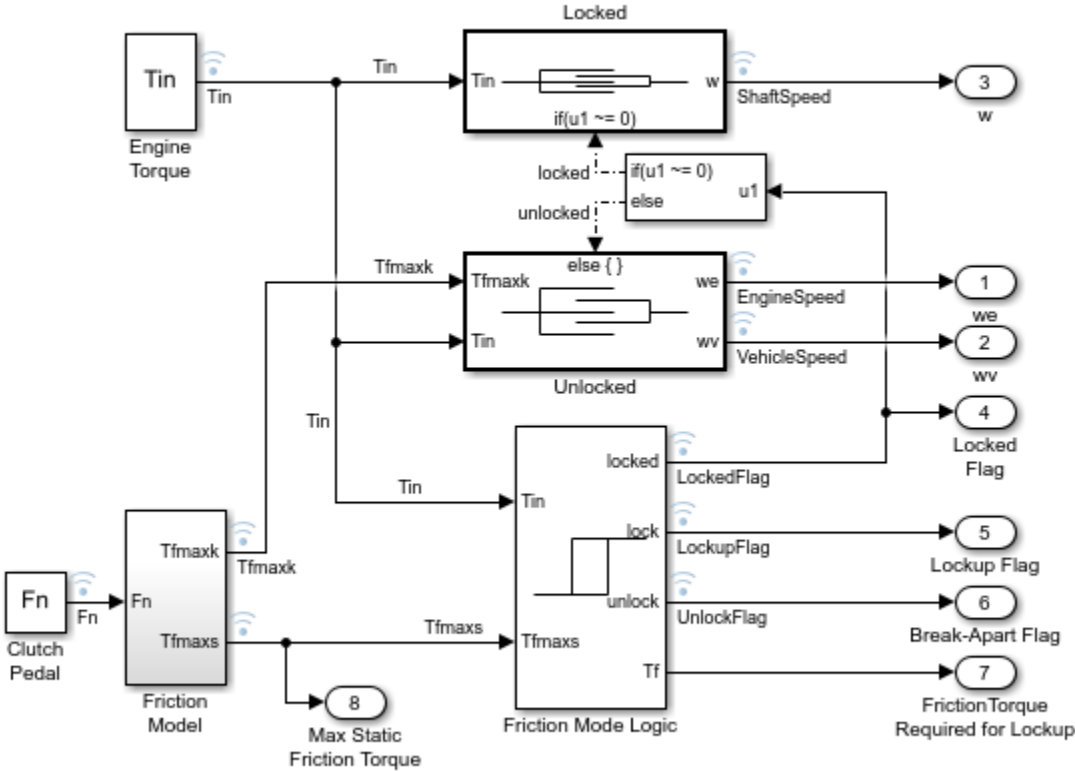

Simulink® can model either method. In this example, we describe a simulation for the second method. Switching between two dynamic models must be performed with care to ensure that the initialized states of the new model match the state values immediately prior to the switch. In either approach, Simulink facilitates accurate simulation due to its ability to recognize the precise moments at which transitions between lockup and slipping occur.

Running the Simulation

When the model is open, to run the simulation, click **Run**.

Clutch Simulation An Example of the If Block

Copyright 1990-2012 The MathWorks, Inc.

Figure 1: Top level diagram for the clutch model

- Note: The model logs relevant data to MATLAB workspace in a structure called `sldemo_clutch_if_output`. Logged signals have a blue indicator. For information about signal logging, see "Configure a Signal for Logging".

The 'If' Block

The 'If' block uses the `LockedFlag` signal to switch between the 'Locked' and 'Unlocked' subsystems. Double click on the 'If' block in the model to set its parameters (see Figure 2). `LockedFlag` represents the status of the clutch. `LockedFlag = 1` if the clutch is locked and `LockedFlag = 0` if the clutch is unlocked.

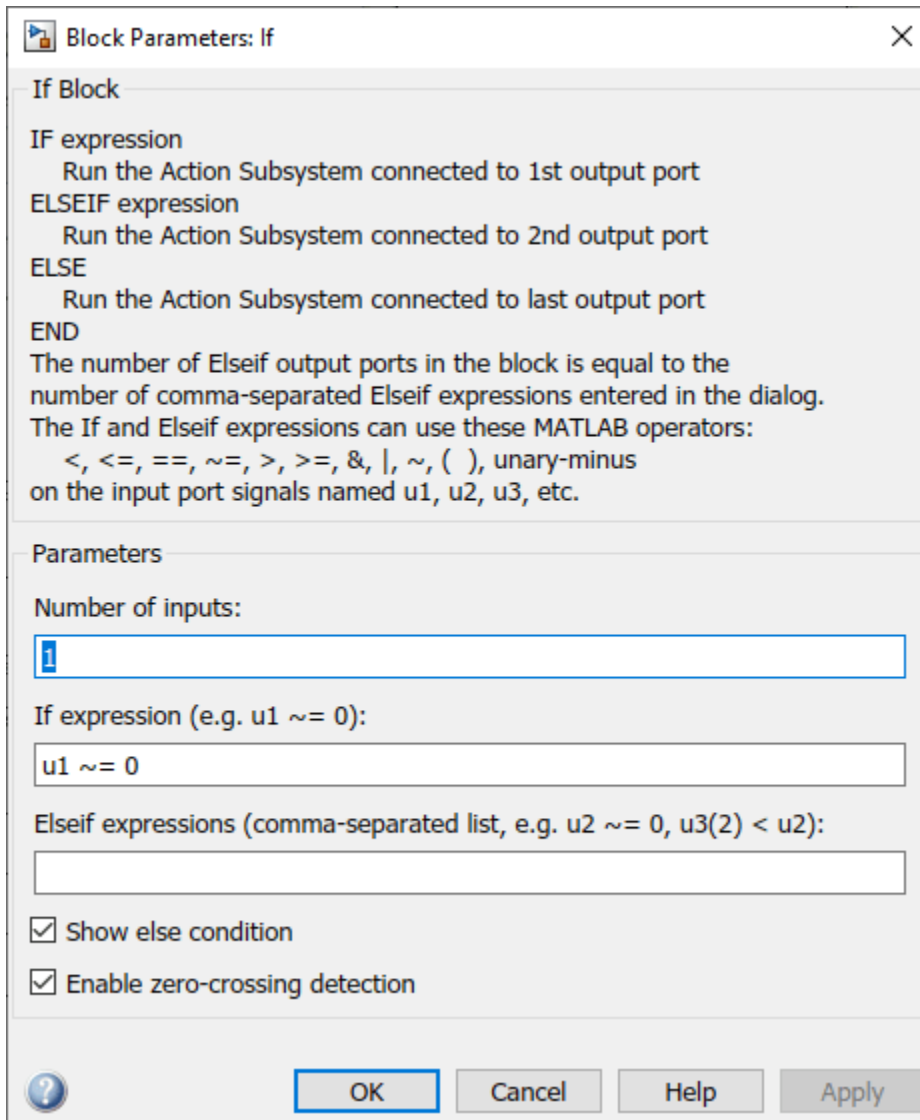

Figure 2: Setting 'If' block parameters

Results

The inputs for this model are the same as for the model that uses enabled subsystems (sldemo_clutch). System velocities behave as shown in Figure 3 below. As expected, the results obtained from sldemo_clutch and sldemo_clutch_if are identical.

Figure 3: Angular velocities of the engine, vehicle and shaft for default inputs

Closing Model

Close the model. Clear generated data.

Conclusions

This example shows how to use 'If' blocks in Simulink to model a system with topological discontinuities. This is an alternative to using enabled subsystems.

Modeling an Anti-Lock Braking System

This example shows how to model a simple model for an Anti-Lock Braking System (ABS). It simulates the dynamic behavior of a vehicle under hard braking conditions. The model represents a single wheel, which may be replicated a number of times to create a model for a multi-wheel vehicle.

This model uses the signal logging feature in Simulink®. The model logs signals to the MATLAB® workspace where you can analyze and view them. You can view the code in `ModelingAnAntiLockBrakingSystemExample.m` to see how this is done.

In this model, the wheel speed is calculated in a separate model named `sldemo_wheel_speed_absbrake`. This component is then referenced using a 'Model' block. Note that both the top model and the referenced model use a variable step solver, so Simulink will track zero-crossings in the referenced model.

Analysis and Physics

The wheel rotates with an initial angular speed that corresponds to the vehicle speed before the brakes are applied. We used separate integrators to compute wheel angular speed and vehicle speed. We use two speeds to calculate slip, which is determined by Equation 1. Note that we introduce vehicle speed expressed as an angular velocity (see below).

$$\omega_v = \frac{V}{R} \text{ (equals the wheel angular speed if there is no slip)}$$

Equation 1

$$\omega_v = \frac{V_v}{R_r}$$

$$slip = 1 - \frac{\omega_w}{\omega_v}$$

ω_v = vehicle speed divided by wheel radius

V_v = vehicle linear velocity

R_r = wheel radius

ω_w = wheel angular velocity

From these expressions, we see that slip is zero when wheel speed and vehicle speed are equal, and slip equals one when the wheel is locked. A desirable slip value is 0.2, which means that the number of wheel revolutions equals 0.8 times the number of revolutions under non-braking conditions with the same vehicle velocity. This maximizes the adhesion between the tire and road and minimizes the stopping distance with the available friction.

Modeling

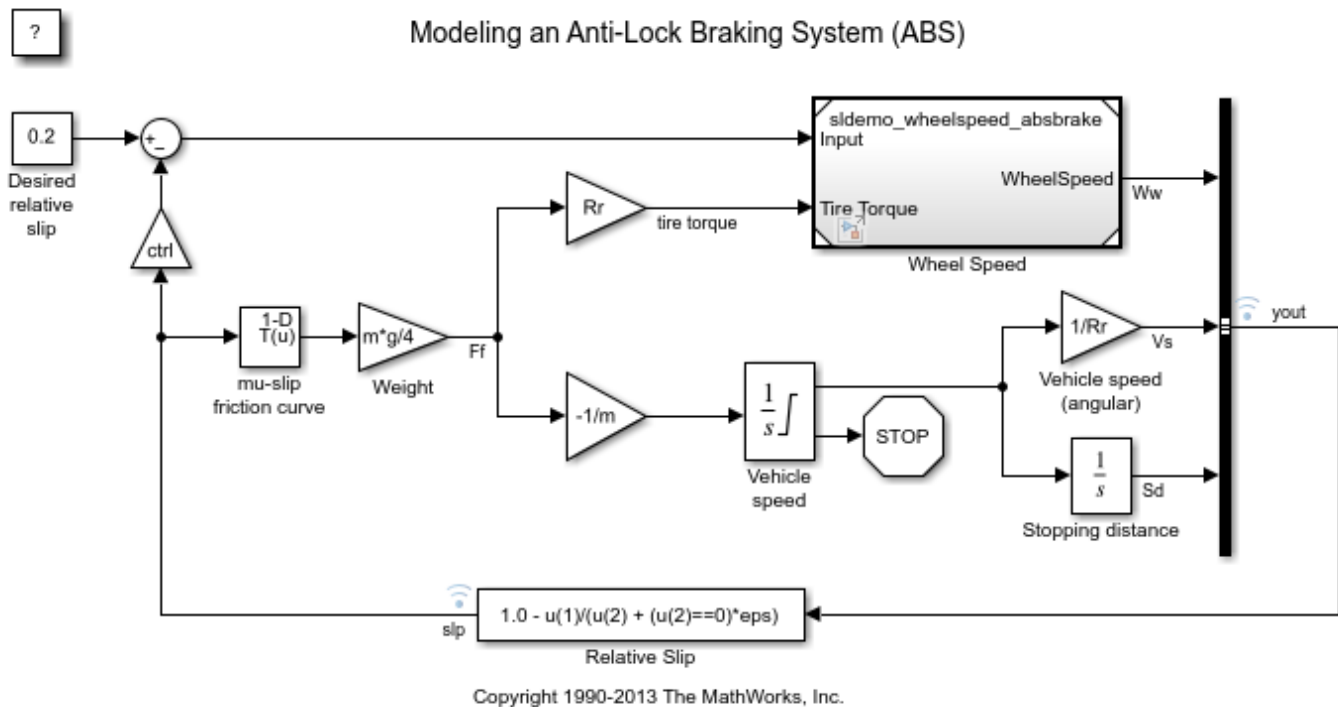

The friction coefficient between the tire and the road surface, μ , is an empirical function of slip, known as the mu-slip curve. We created mu-slip curves by passing MATLAB variables into the block diagram using a Simulink lookup table. The model multiplies the friction coefficient, μ , by the weight on the wheel, W , to yield the frictional force, F_f , acting on the circumference of the tire. F_f is

divided by the vehicle mass to produce the vehicle deceleration, which the model integrates to obtain vehicle velocity.

In this model, we used an ideal anti-lock braking controller, that uses 'bang-bang' control based upon the error between actual slip and desired slip. We set the desired slip to the value of slip at which the mu-slip curve reaches a peak value, this being the optimum value for minimum braking distance (see note below.).

- Note: In an actual vehicle, the slip cannot be measured directly, so this control algorithm is not practical. It is used in this example to illustrate the conceptual construction of such a simulation model. The real engineering value of a simulation like this is to show the potential of the control concept prior to addressing the specific issues of implementation.

Opening the Model

Double click on the Wheel Speed subsystem in the model window to open it. Given the wheel slip, the desired wheel slip, and the tire torque, this subsystem calculates the wheel angular speed.

?

Calculate the Wheel Speed for the Anti-Lock Braking System (ABS) Simulation

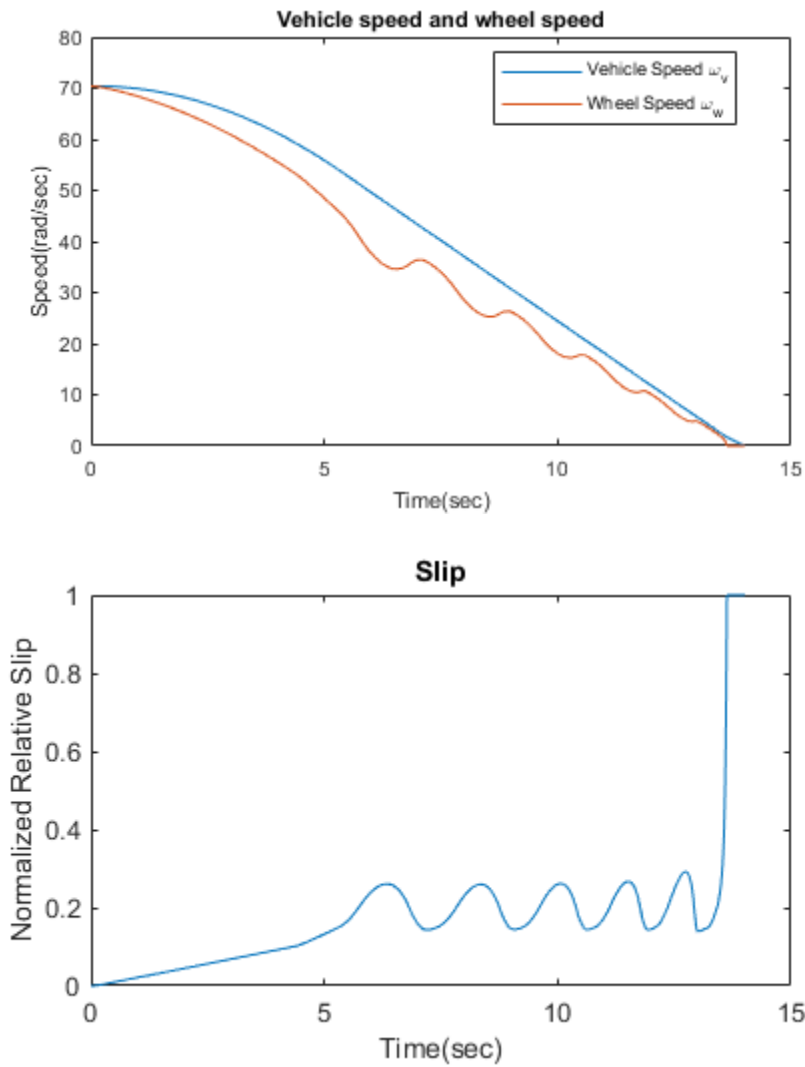

Copyright 1990-2013 The MathWorks, Inc.

To control the rate of change of brake pressure, the model subtracts actual slip from the desired slip and feeds this signal into a bang-bang control (+1 or -1, depending on the sign of the error). This on/off rate passes through a first-order lag that represents the delay associated with the hydraulic lines of the brake system. The model then integrates the filtered rate to yield the actual brake pressure. The resulting signal, multiplied by the piston area and radius with respect to the wheel (K_f), is the brake torque applied to the wheel.

The model multiplies the frictional force on the wheel by the wheel radius (R_r) to give the accelerating torque of the road surface on the wheel. The brake torque is subtracted to give the net torque on the wheel. Dividing the net torque by the wheel rotational inertia, I , yields the wheel acceleration, which is then integrated to provide wheel velocity. In order to keep the wheel speed and vehicle speed positive, limited integrators are used in this model.

Running the Simulation in ABS Mode

On the Simulation tab, click **Run** to run the simulation. You can also run the simulation by executing the `sim('sldemo_absbrake')` command in MATLAB. ABS is turned on during this simulation.

- Note: The model logs relevant data to MATLAB workspace in a structure called `sldemo_absbrake_output`. Logged signals have a blue indicator. In this case `yout` and `slp` are logged. Read more about Signal Logging in Simulink Help.

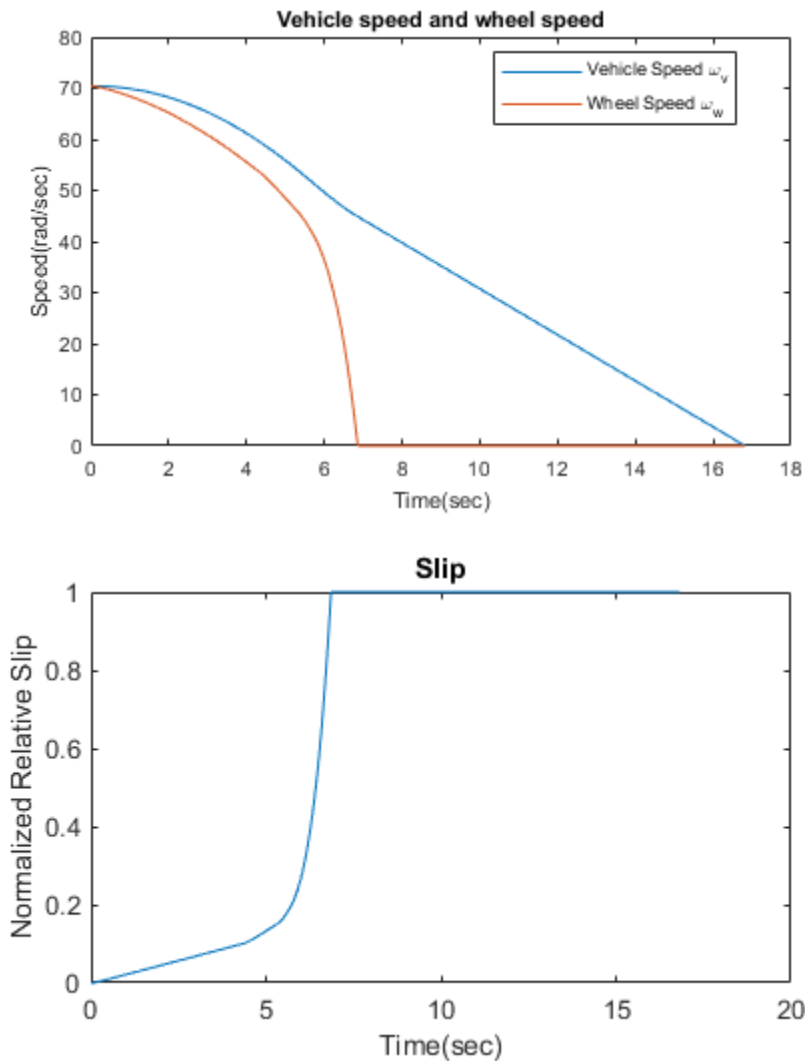

The plots above show the ABS simulation results (for default parameters). The first plot shows the wheel angular velocity and corresponding vehicle angular velocity. This plot shows that the wheel speed stays below vehicle speed without locking up, with vehicle speed going to zero in less than 15 seconds.

Running the Simulation Without ABS

For more meaningful results, consider the vehicle behavior without ABS. At the MATLAB command line, set the model variable `ctrl = 0`. This disconnects the slip feedback from the controller, resulting in maximum braking.

```
ctrl = 0;
```

Now run the simulation again. This will model braking without ABS.

Braking With ABS Versus Braking Without ABS

In the plot showing vehicle speed and wheel speed, observe that the wheel locks up in about seven seconds. The braking, from that point on, is applied in a less-than-optimal part of the slip curve. That is, when $\text{slip} = 1$, as the slip plot shows, the tire is skidding so much on the pavement that the friction force has dropped off.

This is, perhaps, more meaningful in terms of the comparison shown below. The distance traveled by the vehicle is plotted for the two cases. Without ABS, the vehicle skids about an extra 100 feet, taking about three seconds longer to come to a stop.

Closing the Model

Close the model. Close the 'Wheel Speed' subsystem. Clear logged data.

Conclusions

This model shows how you can use Simulink to simulate a braking system under the action of an ABS controller. The controller in this example is idealized, but you can use any proposed control algorithm in its place to evaluate the system's performance. You can also use the Simulink® Coder™ with Simulink as a valuable tool for rapid prototyping of the proposed algorithm. C code is generated and compiled for the controller hardware to test the concept in a vehicle. This significantly reduces the time needed to prove new ideas by enabling actual testing early in the development cycle.

For a hardware-in-the-loop braking system simulation, you can remove the 'bang-bang' controller and run the equations of motion on real-time hardware to emulate the wheel and vehicle dynamics. You can do this by generating real-time C code for this model using the Simulink Coder. You can then test an actual ABS controller by interfacing it to the real-time hardware, which runs the generated code. In this scenario, the real-time model would send the wheel speed to the controller, and the controller would send brake action to the model.

Automotive Suspension

This example shows how to model a simplified half-car model that includes an independent front and rear vertical suspension. The model also includes body pitch and bounce degrees of freedom. The example provides a description of the model to show how simulation can be used to investigate ride characteristics. You can use this model in conjunction with a powertrain simulation to investigate longitudinal shuffle resulting from changes in throttle setting.

Analysis and Physics

Free-body diagram of the half-car model

The illustration shows the modeled characteristics of the half-car. The front and rear suspension are modeled as spring/damper systems. A more detailed model would include a tire model, and damper nonlinearities such as velocity-dependent damping (with greater damping during rebound than compression). The vehicle body has pitch and bounce degrees of freedom. They are represented in the model by four states: vertical displacement, vertical velocity, pitch angular displacement, and pitch angular velocity. A full model with six degrees of freedom can be implemented using vector algebra blocks to perform axis transformations and force/displacement/velocity calculations.

Equation 1 describes the influence of the front suspension on the bounce (i.e. vertical degree of freedom):

$$F_f = 2K_f(L_f\theta - (z + h)) + 2C_f(L_f\dot{\theta} - \dot{z})$$

where:

F_f, F_r = upward force on body from front/rear suspension

K_f, K_r = front and rear suspension spring constant

C_f, C_r = front and rear suspension damping rate

L_f, L_r = horizontal distance from gravity center to front/rear suspension

$\theta, \dot{\theta}$ = pitch (rotational) angle and its rate of change

z, \dot{z} = bounce (vertical) distance and its rate of change

h = road height

Equations 2 describe pitch moments due to the suspension.

$$M_f = -L_f F_f$$

$$F_r = -2K_r(L_r\theta + (z + h)) - 2C_r(L_r\dot{\theta} + \dot{z})$$

$$M_r = L_r F_r$$

where:

M_f, M_r = Pitch moment due to front/rear suspension

Equations 3 resolves the forces and moments result in body motion, according to Newton's Second Law:

$$m_b \ddot{z} = F_f + F_r - m_b g$$

$$I_{yy} \ddot{\theta} = M_f + M_r + M_y$$

where:

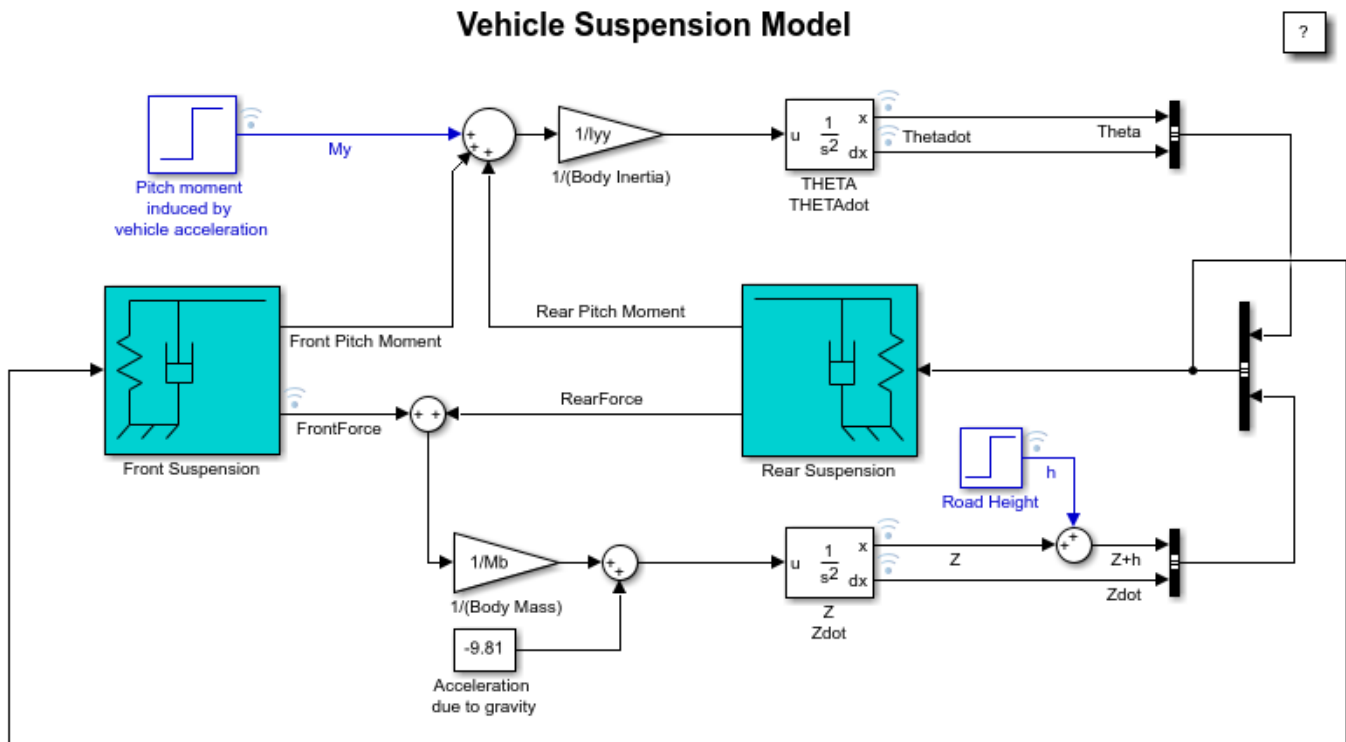

m_b = body mass

M_y = pitch moment induced by vehicle acceleration

I_{yy} = body moment of inertia about gravity center

Model

To open the model, type `sldemo_suspn` in the MATLAB® command window.

Copyright 1990-2021 The MathWorks, Inc.

Top-level diagram of the suspension model

The suspension model has two inputs, and both input blocks are blue on the model diagram. The first input is the road height. A step input here corresponds to the vehicle driving over a road surface with a step change in height. The second input is a horizontal force acting through the center of the wheels that results from braking or acceleration maneuvers. This input appears only as a moment about the pitch axis because the longitudinal body motion is not modeled.

Two DOF Spring/Damper Model

The Spring/Damper model used in FrontSuspension and RearSuspension subsystems

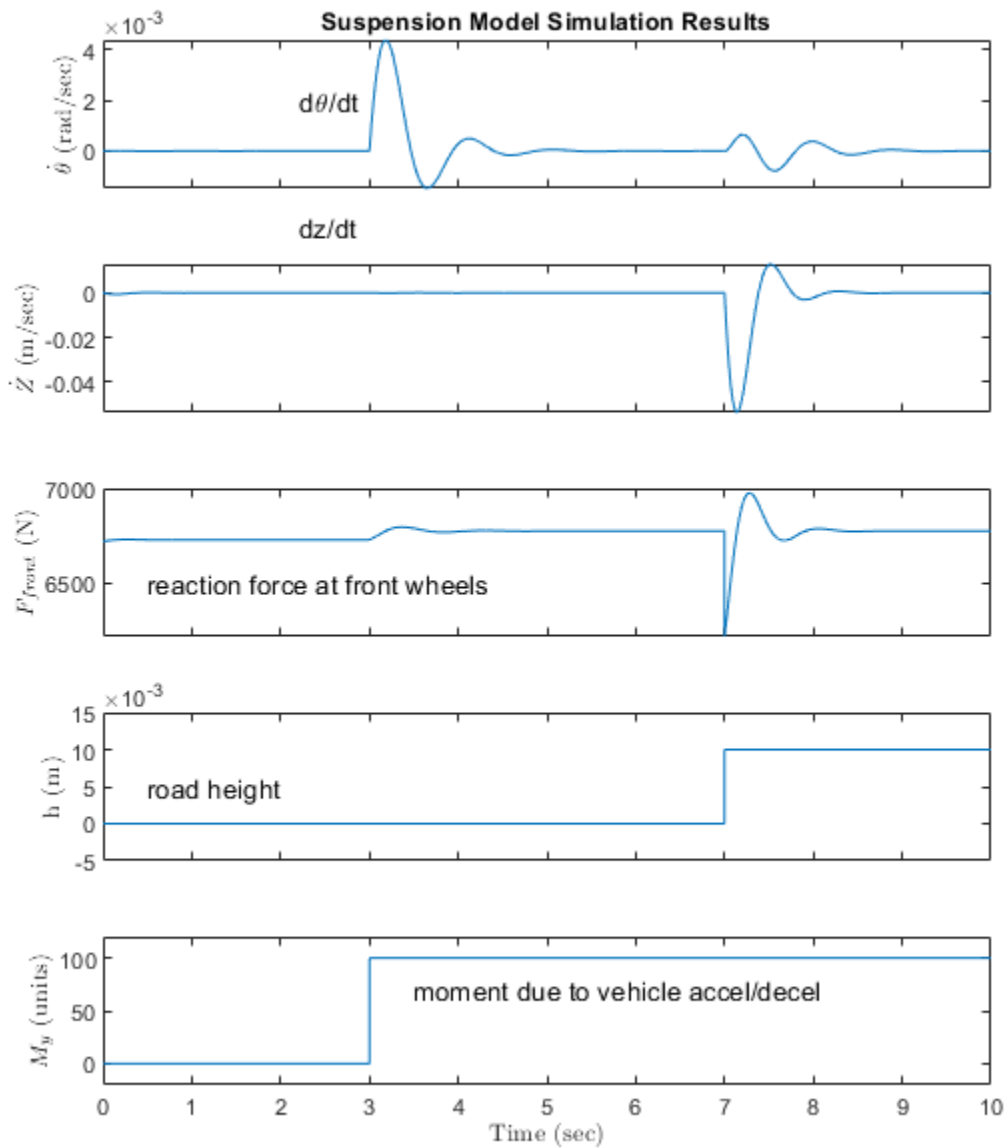

The spring/damper subsystem that models the front and rear suspensions is shown above. Right click on the Front/Rear Suspension block and select **Mask > Look Under Mask** to see the front/rear suspension subsystem. The suspension subsystems are used to model Equations 1-3. The equations are implemented directly in the Simulink® diagram through the straightforward use of Gain and Summation blocks.

The differences between front and rear are accounted for as follows. Because the subsystem is a masked block, a different data set (L, K and C) can be entered for each instance. Furthermore, L is thought of as the Cartesian coordinate x , being negative or positive with respect to the origin, or center of gravity. Thus, K_f , C_f , and $-L_f$ are used for the front suspension block whereas K_r , C_r , and L_r are used for the rear suspension block.

Run the Simulation

To run this model, on the **Simulation** tab, click **Run**. Initial conditions are loaded into the model workspace from the `sldemo_suspdta.m` file. To see the contents of the model workspace, in the Simulink Editor, on the **Modeling** tab, under **Design**, select **Model Explorer**. In the Model Explorer, look under the contents of the `sldemo_suspn` model and select "Model Workspace". Loading initial conditions in the model workspace prevents any accidental modifications of parameters and keeps MATLAB workspace clean.

Note that the model logs relevant data to MATLAB workspace in a data structure called `sldemo_suspn_output`. Type the name of the structure to see what data it contains.

Simulation results

Simulation results are displayed above. The results are plotted by the `sldemo_suspgraph.m` file. The default initial conditions are given in Table 1.

Table 1: Default initial conditions

```
Lf = 0.9;    % front hub displacement from body gravity center (m)
Lr = 1.2;    % rear hub displacement from body gravity center (m)
Mb = 1200;   % body mass (kg)
Iyy = 2100;  % body moment of inertia about y-axis in (kg m^2)
```

```
kf = 28000; % front suspension stiffness in (N/m)
kr = 21000; % rear suspension stiffness in (N/m)
cf = 2500; % front suspension damping in (N sec/m)
cr = 2000; % rear suspension damping in (N sec/m)
```

Close the Model

Close the model and delete generated data from MATLAB workspace.

Conclusions

This model allows you to simulate the effects of changing the suspension damping and stiffness, thereby investigating the tradeoff between comfort and performance. In general, racing cars have very stiff springs with a high damping factor, whereas passenger vehicles have softer springs and a more oscillatory response.

Modeling an Automatic Transmission Controller

This example shows how to model an automotive drivetrain with Simulink®. Stateflow® enhances the Simulink model with its representation of the transmission control logic. Simulink provides a powerful environment for the modeling and simulation of dynamic systems and processes. In many systems, though, supervisory functions like changing modes or invoking new gain schedules must respond to events that may occur and conditions that develop over time. As a result, the environment requires a language capable of managing these multiple modes and developing conditions. In the following example, Stateflow shows its strength in this capacity by performing the function of gear selection in an automatic transmission. This function is combined with the drivetrain dynamics in a natural and intuitive manner by incorporating a Stateflow block in the Simulink block diagram.

Analysis and Physics

The figure below shows the power flow in a typical automotive drivetrain. Nonlinear ordinary differential equations model the engine, four-speed automatic transmission, and vehicle. The model discussed in this example directly implements the blocks from this figure as modular Simulink subsystems. On the other hand, the logic and decisions made in the Transmission Control Unit (TCU) do not lend themselves to well-formulated equations. TCU is better suited for a Stateflow representation. Stateflow monitors the events which correspond to important relationships within the system and takes the appropriate action as they occur.

The throttle opening is one of the inputs to the engine. The engine is connected to the impeller of the torque converter which couples it to the transmission (see Equation 1).

Equation 1

$$I_{ei} \dot{N}_e = T_e - T_i$$

N_e = engine speed (RPM)

I_{ei} = moment of inertia of the engine and the impeller

T_e, T_i = engine and impeller torque

The input-output characteristics of the torque converter can be expressed as functions of the engine speed and the turbine speed. In this example, the direction of power flow is always assumed to be from the impeller to the turbine (see Equation 2).

Equation 2

$$T_i = \frac{N_e^2}{K^2}$$

$$K = f_2 \frac{N_{in}}{N_e} = \text{K-factor (capacity)}$$

N_{in} = speed of turbine (torque converter output) = transmission input speed (RPM)

$$R_{TQ} = f_3 \frac{N_{in}}{N_e} = \text{torque ratio}$$

The transmission model is implemented via static gear ratios, assuming small shift times (see Equation 3).

Equation 3

$$R_{TR} = f_4(\text{gear}) = \text{transmission ratio}$$

$$T_{out} = R_{TR} T_{in}$$

$$N_{in} = R_{TR} N_{out}$$

T_{in}, T_{out} = transmission input and output torques

N_{in}, N_{out} = transmission input and output speed (RPM)

The final drive, inertia, and a dynamically varying load constitute the vehicle dynamics (see Equation 4).

Equation 4

$$I_v \dot{N}_w = R_{fd}(T_{out} - T_{load})$$

I_v = vehicle inertia

N_w = wheel speed (RPM)

R_{fd} = final drive ratio

$T_{load} = f_5(N_w) = \text{load torque}$

The load torque includes both the road load and brake torque. The road load is the sum of frictional and aerodynamic losses (see Equation 5).

Equation 5

$$T_{load} = \text{sgn}(mph)(R_{load0} + R_{load2}mph^2 + T_{brake})$$

R_{load0}, R_{load2} = friction and aerodynamic drag coefficients

T_{load}, T_{brake} = load and brake torques

mph = vehicle linear velocity

The model programs the shift points for the transmission according to the schedule shown in the figure below. For a given throttle in a given gear, there is a unique vehicle speed at which an upshift takes place. The simulation operates similarly for a downshift.

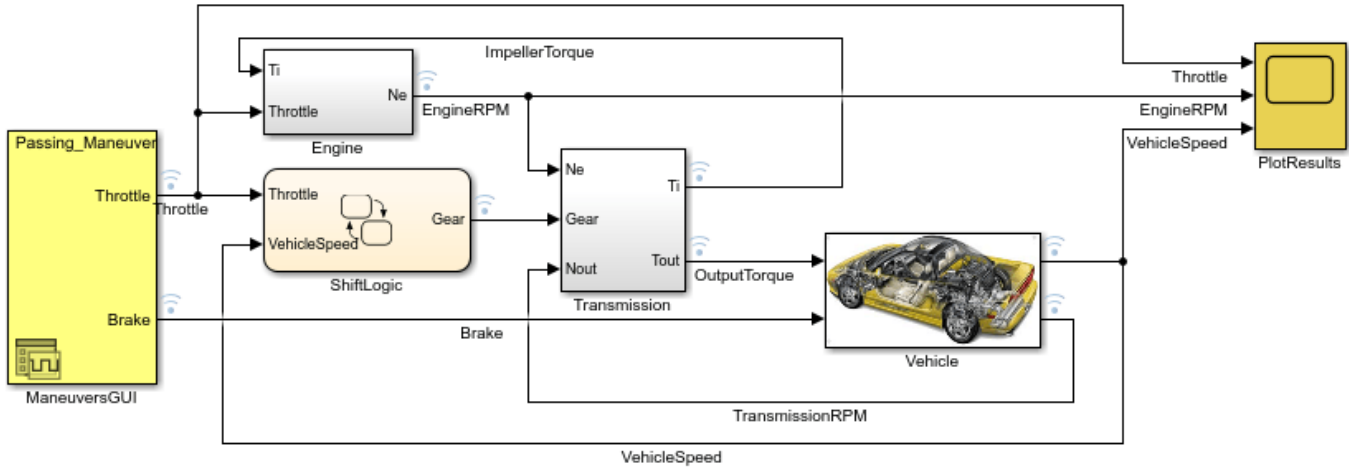

Modeling

When you open the model, the Initial conditions are set in the Model Workspace.

The top-level diagram of the model is shown in the figure below. To run the simulation, on the Simulation tab, click **Run**. Note that the model logs relevant data to MATLAB Workspace in a data structure called `sldemo_autotrans_output`. Logged signals have a blue indicator. After you run the simulation, you can view the components of the data structure by typing `sldemo_autotrans_output` in MATLAB Command Window. Also note that the units appear on the subsystem icons and signal lines.

Modeling an Automatic Transmission Controller

Copyright 1990-2021 The MathWorks, Inc.

Modeling

The Simulink model shown above is composed of modules which represent the engine, transmission, and the vehicle, with an additional shift logic block to control the transmission ratio. User inputs to the model are in the form of throttle (given in percent) and brake torque (given in ft-lb). The user inputs throttle and brake torques using the ManeuversGUI interface.

The Engine subsystem consists of a two-dimensional table that interpolates engine torque versus throttle and engine speed. The figure below shows the composite Engine subsystem. Double click on this subsystem in the model to view its structure.

Engine

The TorqueConverter and the TransmissionRatio blocks make up the Transmission subsystem, as shown in the figure below. Double click on the Transmission subsystem in the model window to view its components.

The TorqueConverter is a masked subsystem, which implements Equation 2. To open this subsystem, right click on it and select **Mask > Look Under Mask** from the drop-down menu. The mask requires a vector of speed ratios (N_{in}/N_e) and vectors of K-factor (f2) and torque ratio (f3). This figure shows the implementation of the TorqueConverter subsystem.

The transmission ratio block determines the ratio shown in Table 1 and computes the transmission output torque and input speed, as indicated in Equation 3. The figure that follows shows the block diagram for the subsystem that realizes this ratio in torque and speed.

Table 1: Transmission gear ratios

gear	Rtr = N_{in}/N_e
1	2.393
2	1.450
3	1.000
4	0.677

Transmission Gear Ratio

The Stateflow block labeled ShiftLogic implements gear selection for the transmission. Double click on ShiftLogic in the model window to open the Stateflow diagram. The Model Explorer is utilized to define the inputs as throttle and vehicle speed and the output as the desired gear number. Two dashed AND states keep track of the gear state and the state of the gear selection process. The overall chart is executed as a discrete-time system, sampled every 40 milliseconds. The Stateflow diagram shown below illustrates the functionality of the block.

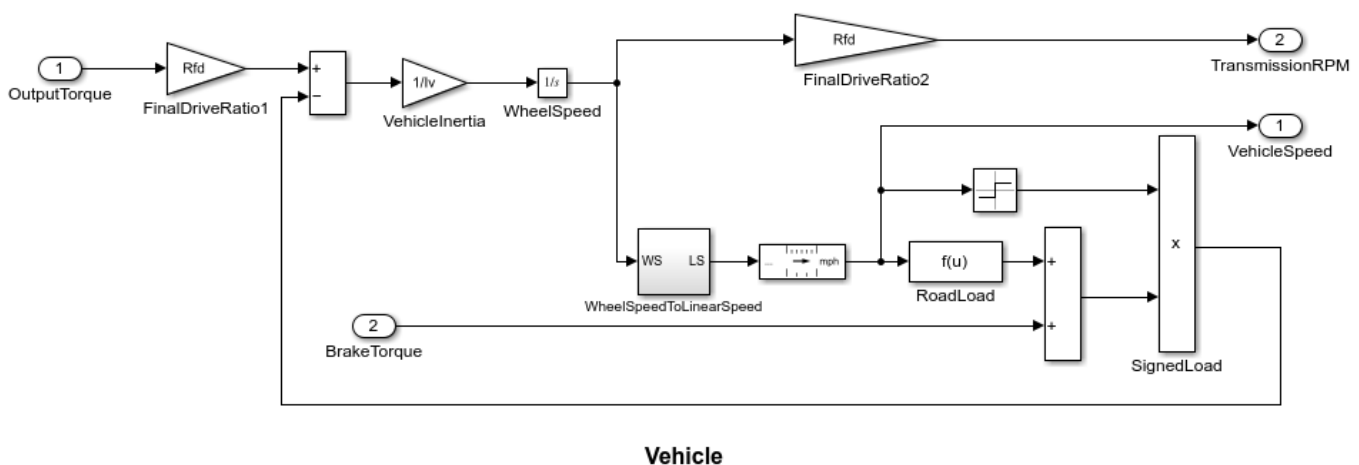

The shift logic behavior can be observed during simulation by enabling animation in the Stateflow debugger. The `selection_state` (always active) begins by performing the computations indicated in its `during` function. The model computes the upshift and downshift speed thresholds as a function of the instantaneous values of gear and throttle. While in `steady_state`, the model compares these values to the present vehicle speed to determine if a shift is required. If so, it enters one of the confirm states (`upshifting` or `downshifting`), which records the time of entry.

If the vehicle speed no longer satisfies the shift condition, while in the confirm state, the model ignores the shift and it transitions back to `steady_state`. This prevents extraneous shifts due to noise conditions. If the shift condition remains valid for a duration of `TWAIT` ticks, the model transitions through the lower junction and, depending on the current gear, it broadcasts one of the shift events. Subsequently, the model again activates `steady_state` after a transition through one of the central junctions. The shift event, which is broadcast to the `gear_selection` state, activates a transition to the appropriate new gear.

For example, if the vehicle is moving along in second gear with 25% throttle, the state `second` is active within `gear_state`, and `steady_state` is active in the `selection_state`. The `during` function of the latter, finds that an upshift should take place when the vehicle exceeds 30 mph. At the moment this becomes true, the model enters the `upshifting` state. While in this state, if the vehicle speed remains above 30 mph for `TWAIT` ticks, the model satisfies the transition condition leading down to the lower right junction. This also satisfies the condition `[gear == 2]` on the transition leading from here to `steady_state`, so the model now takes the overall transition from `upshifting` to `steady_state` and broadcasts the event `UP` as a transition action. Consequently, the transition from second to third is taken in `gear_state` which completes the shift logic.

The Vehicle subsystem uses the net torque to compute the acceleration and integrate it to compute the vehicle speed, per Equation 4 and Equation 5. The Vehicle subsystem is masked. To see the structure of the Vehicle block, right click on it and select **Mask > Look Under Mask** from the drop-down menu. The parameters entered in the mask menu are the final drive ratio, the polynomial coefficients for drag friction and aerodynamic drag, the wheel radius, vehicle inertia, and initial transmission output speed.

Results

The engine torque map, and torque converter characteristics used in the simulations are shown below.

Get the FactorK (second row) and the TorqueRatio (third row) vs SpeedRatio(first row)

The first simulation (passing maneuver) uses the throttle schedule given in Table 2 (this data is interpolated linearly).

Table 2: Throttle schedule for first simulation (passing maneuver)

Time (sec)	Throttle (%)
0	60
14.9	40
15	100
100	0
200	0

The first column corresponds to time; the second column corresponds to throttle opening in percent. In this case no brake is applied (brake torque is zero). The vehicle speed starts at zero and the engine at 1000 RPM. The following figure shows the plot for the baseline results, using the default parameters. As the driver steps to 60% throttle at $t=0$, the engine immediately responds by more than doubling its speed. This brings about a low speed ratio across the torque converter and, hence, a large torque ratio. The vehicle accelerates quickly (no tire slip is modeled) and both the engine and the vehicle gain speed until about $t = 2$ sec, at which time a 1-2 upshift occurs. The engine speed characteristically drops abruptly, then resumes its acceleration. The 2-3 and 3-4 upshifts take place at about four and eight seconds, respectively. Notice that the vehicle speed remains much smoother due to its large inertia.

At $t=15\text{sec}$, the driver steps the throttle to 100% as might be typical of a passing maneuver. The transmission downshifts to third gear and the engine jumps from about 2600 RPM to about 3700 RPM. The engine torque thus increases somewhat, as well as the mechanical advantage of the transmission. With continued heavy throttle, the vehicle accelerates to about 100 mph and then shifts into overdrive at about $t = 21 \text{ sec}$. The vehicle cruises along in fourth gear for the remainder of the simulation. Double click on the ManeuversGUI block and use the graphical interface to vary the throttle and brake history.

Running Multiple Scenarios and Collecting Coverage

You can run the model for all scenarios while collecting coverage. To see a saved design study for running all of the scenarios of `sldemo_autotrans`, open `sldemo_autotrans_design_study.mldatx` in the Multiple Simulations panel of `sldemo_autotrans`.

After the design study has been opened, enable the model coverage and cumulative collection in the model settings.

```
set_param('sldemo_autotrans', 'CovEnable', 'on');
set_param('sldemo_autotrans', 'CovEnableCumulative', 'on');
```

Once this is set, click the Run All (Coverage) button on the Simulation tab on the Simulink toolstrip. Then check model coverage of the design cases.

Closing the Model

Close the model, clear generated data.

Conclusions

You can enhance this basic system in a modular manner, for example, by replacing the engine or transmission with a more complex model. You can build large systems within this structure via step-wise refinement. The seamless integration of Stateflow control logic with Simulink signal processing enables the construction of a model that is efficient and visually intuitive.

Vehicle Electrical System

This example shows how to simulate the electrical system of a vehicle using Simulink® and Simscape Electrical™.

System Components

The system simulated consists of a few components. The main power source is the internal combustion (IC) engine that drives the shaft of the alternator. The alternator produces the AC power. The diode trio rectifies the AC current generated from the alternator to DC current that is applied to the alternator field. The indicator lamp lights when the system is turned on and the alternator is not producing power. The rectifier bridge converts the AC power into DC power. The smoothing capacitor, voltage sensor, battery, and vehicle loads are connected to the DC bus.

The alternator is a three-phase synchronous machine with its field current regulated to give control over the DC bus voltage. This is simulated by using the Synchronous Machine Round Rotor block.

The three-phase AC output of the alternator is fed into the 6-pulse rectifier bridge to give the DC voltage required to charge the car battery and to supply the balance of the electrical system of the car.

Operation of the System

When the IC engine is off, the battery supplies the current to the alternator field winding. The indicator lamp is turned on.

When the IC engine runs, the alternator will start to produce voltage and the diode trio will conduct and let the current flow to the alternator field winding. The indicator lamp is then turned off.

When the DC bus voltage reaches the upper voltage limit (which is 14.5 V in the model), the current flowing to the alternator field is bypassed. As a result, the DC bus voltage decreases. If it reaches the lower voltage limit (which is 13.5 V in the model), the diode trio is reconnected to the field winding.

Simulating Automatic Climate Control Systems

This example shows how to simulate an automatic climate control system in a car using Simulink® and Stateflow®.

- In the User Setpoint in Celsius block, enter a value for the desired air temperature in the car.
- In the External Temperature in Celsius block, enter a value for the external air temperature.
- The Thermometer Display block indicates the reading of a temperature sensor placed behind the driver's head. This is the temperature that the driver feels.

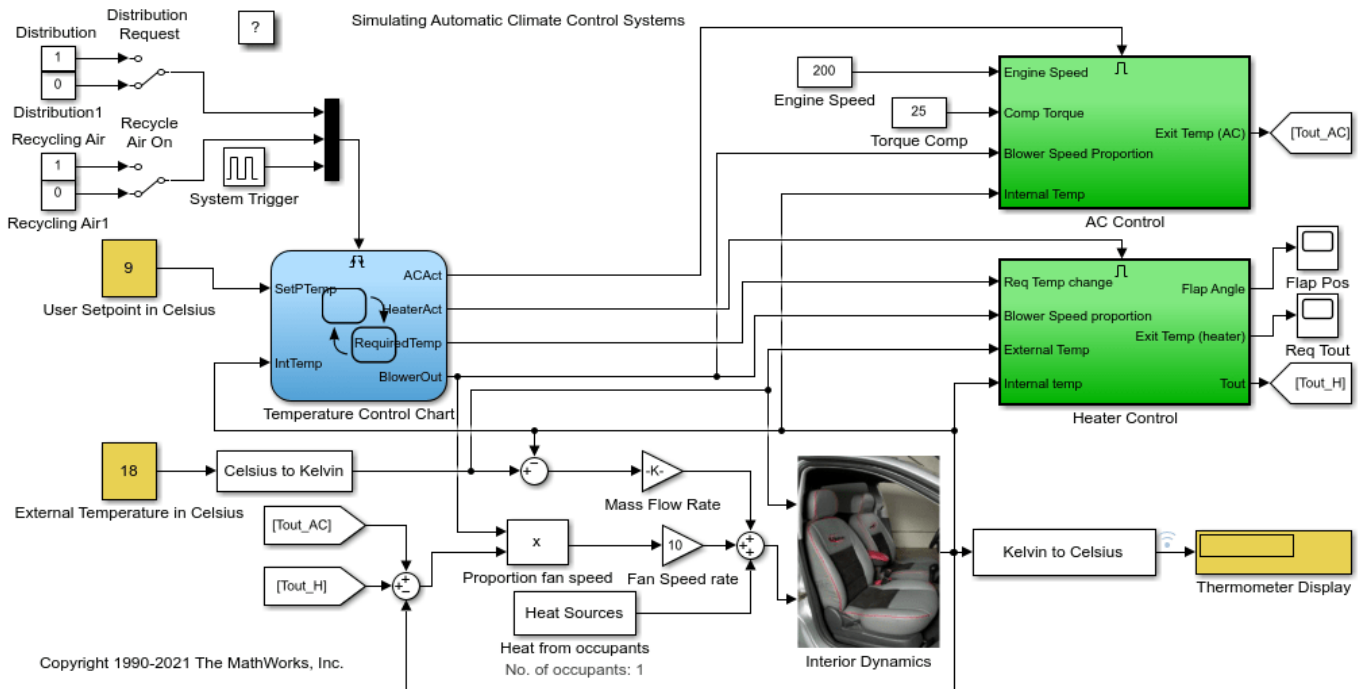

Figure 1: The automatic climate control system

Stateflow® Controller

Stateflow implements the supervisory controller. To see the control logic, open the chart.

The **Heater_AC** state shows that entering a setpoint temperature that is greater than the current car temperature by at least 0.5 deg C switches the heater system on. The heater remains active until the current temperature in the car is within 0.5 deg of the setpoint temperature. Similarly, when you enter a setpoint that is 0.5 deg C or less than the current car temperature, the air conditioner turns on. It stays active until the air temperature in the car is within 0.5 deg C of the setpoint temperature. To avoid continuously switching on and off the heater, the logic implements a dead band of 0.5 deg

In the **Blower** state, the greater the difference between the setpoint temperature and the current temperature, the harder the fan blows. This ensures that the temperature reaches the required value in a reasonable amount of time, despite the temperature difference. When the air temperature in the car is within 0.5 deg C of the setpoint temperature, the system switches off.

Two switches trigger the Stateflow charts that control the Air Distribution(**AirDist**) and Recycling Air (**Recyc_Air**) states. To facilitate effective window defrosting, the controller implements an internal

transition within these two states. When the defrost state is active, the controller turns off the recycling air.

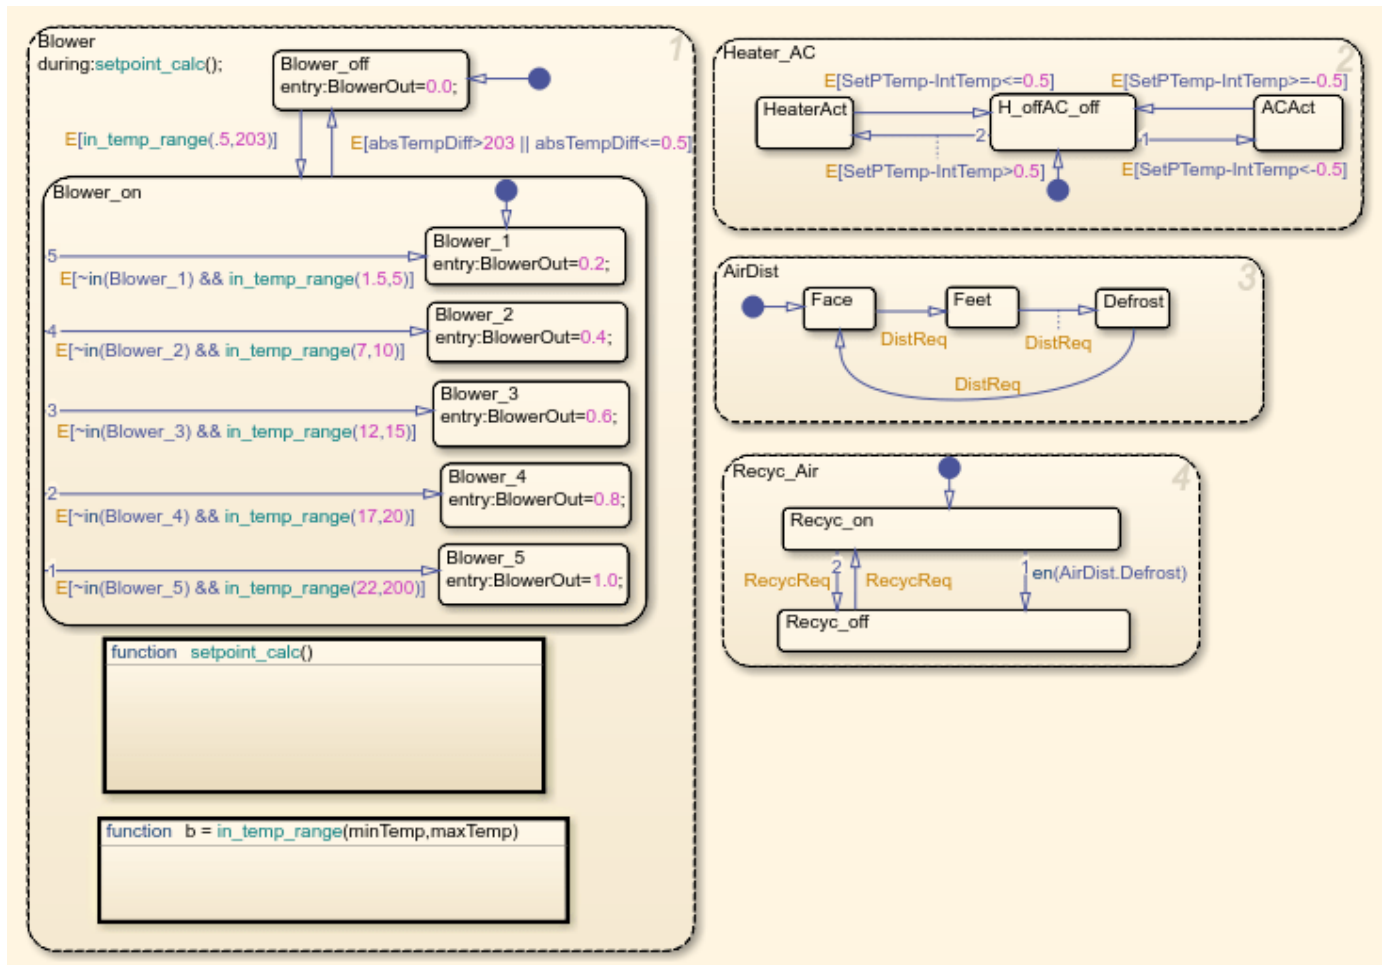

Figure 2: The supervisory control logic in Stateflow

Heater and Air Conditioner Models

The heater model implements this heat exchange equation:

$$T_{out} = T_s - (T_s - T_{in})e^{[-\pi \cdot D \cdot L \cdot hc] / (m_{dot} \cdot C_p)}$$

Where:

- T_s = constant (radiator wall temperature)
- $D = 0.004\text{m}$ (channel diameter)
- $L = 0.05\text{m}$ (radiator thickness)
- $N = 30000$ (Number of channels)
- $k = 0.026 \text{ W/mK}$ = constant (thermal conductivity of air)
- $C_p = 1007 \text{ J/kgK}$ = constant (specific heat of air)
- Laminar flow ($hc = 3.66(k/D) = 23.8 \text{ W/m}^2\text{K}$)

The models account for the heater flap. Similar to the blower operation, the greater the temperature difference between the required setpoint temperature and the current interior temperature, the greater the heating effect.

The air conditioner model implements this equation:

$$y \cdot (w \cdot T_{comp}) = \dot{m} \cdot (h_4 - h_1)$$

Where:

- y = efficiency
- \dot{m} = mass flow rate
- w = speed of the engine
- T_{comp} = compressor torque
- h_4, h_1 = enthalpy

The bang-bang control of the A/C system uses the engine speed and compressor torque to determine the temperature of the air that exits the A/C.

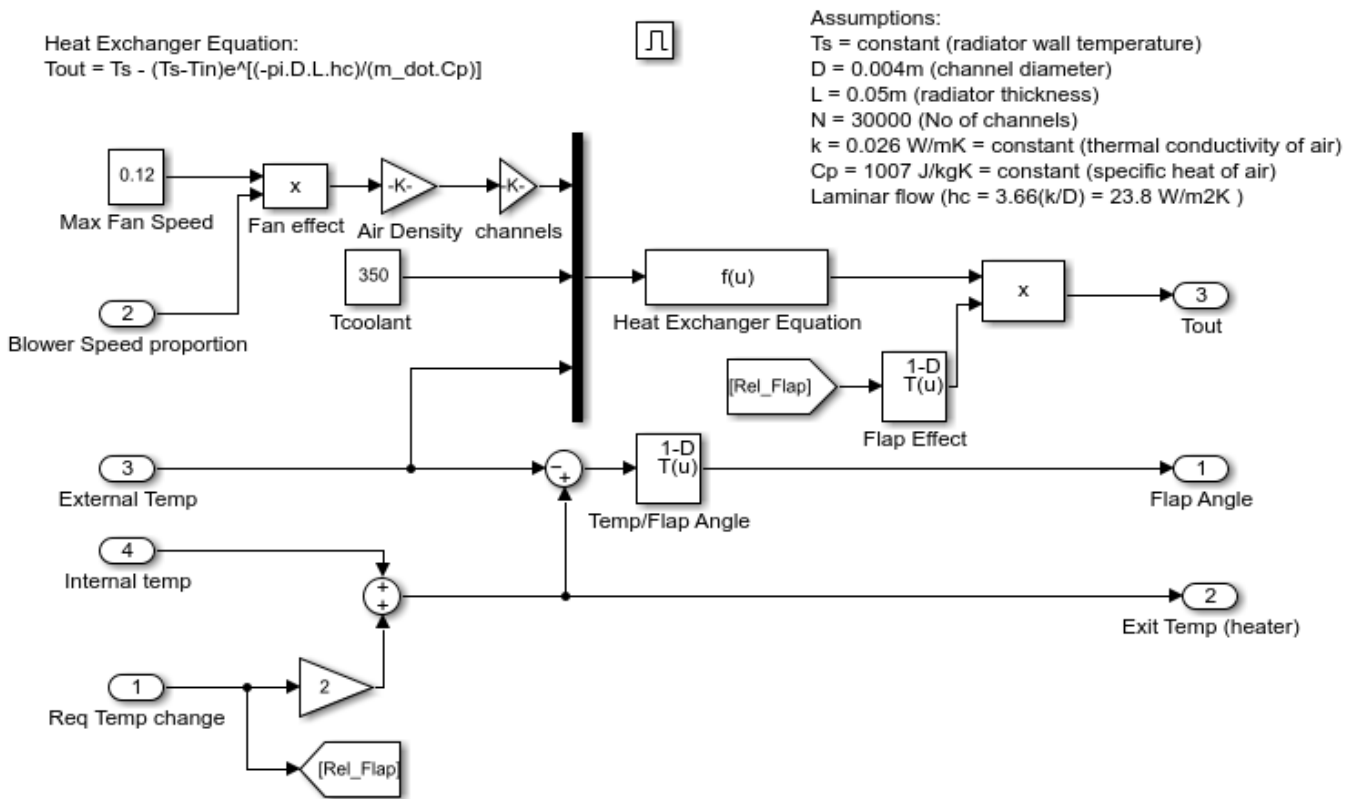

Figure 3: Heater control subsystem

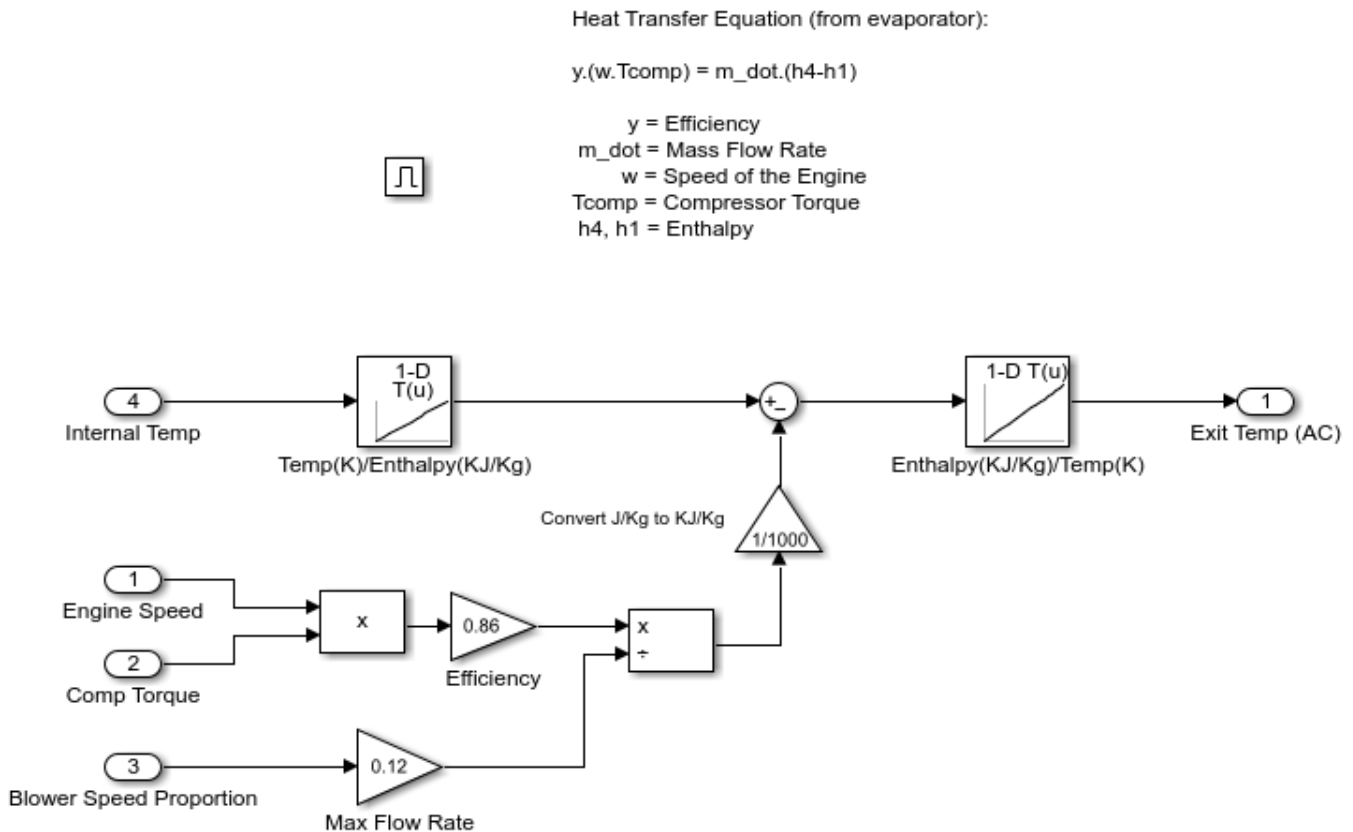

Figure 4: A/C control subsystem

Cabin Heat Transfer

These factors affect the temperature of the air felt by the driver:

- Temperature of the air exiting the vents
- Temperature of the outside air
- Number of people in the car

The factors are inputs into the thermodynamic model of the cabin interior. To account for the temperature of the air exiting the vents, the model calculates the difference between the vent air and the current car temperature and multiplies it by the fan speed proportion (mass flow rate). The model adds 100 W of energy is per person in the car. To account for air radiating into the car from the outside, the model multiplies the difference between the outside and interior air temperature by a smaller mass flow rate.

The Thermometer Display block displays the Interior Dynamics model output. It is a reading of a temperature sensor placed behind the driver's head. If you run the simulation with the default settings, the temperature reading starts at the external temperature of 18 °C and then cools to the user setpoint of 9 °C.

Vehicle Electrical and Climate Control Systems

This example shows how to interface the vehicle climate control system with a model of the electrical system to examine the loading effects of the climate control system on the entire electrical system of the car.

Copyright 2017-2019 The MathWorks, Inc.

Figure 1: Vehicle Electrical and Climate Control System

The Climate Control System

Double clicking on the ClimateControlSystem subsystem will open the model of the climate control system. Here the user can enter the temperature value they would like the air in the car to reach by double clicking on the USER SETPOINT IN CELSIUS Block and entering the value into the dialog box. The EXTERNAL TEMPERATURE IN CELSIUS can also be set by the user in a similar way. The numerical display on the right hand side of the model shows the reading of a temperature sensor placed behind the driver's head. This is the temperature that the driver should be feeling. When the model is run and the climate control is active, it is this display box whose value changes showing the change of temperature in the car.

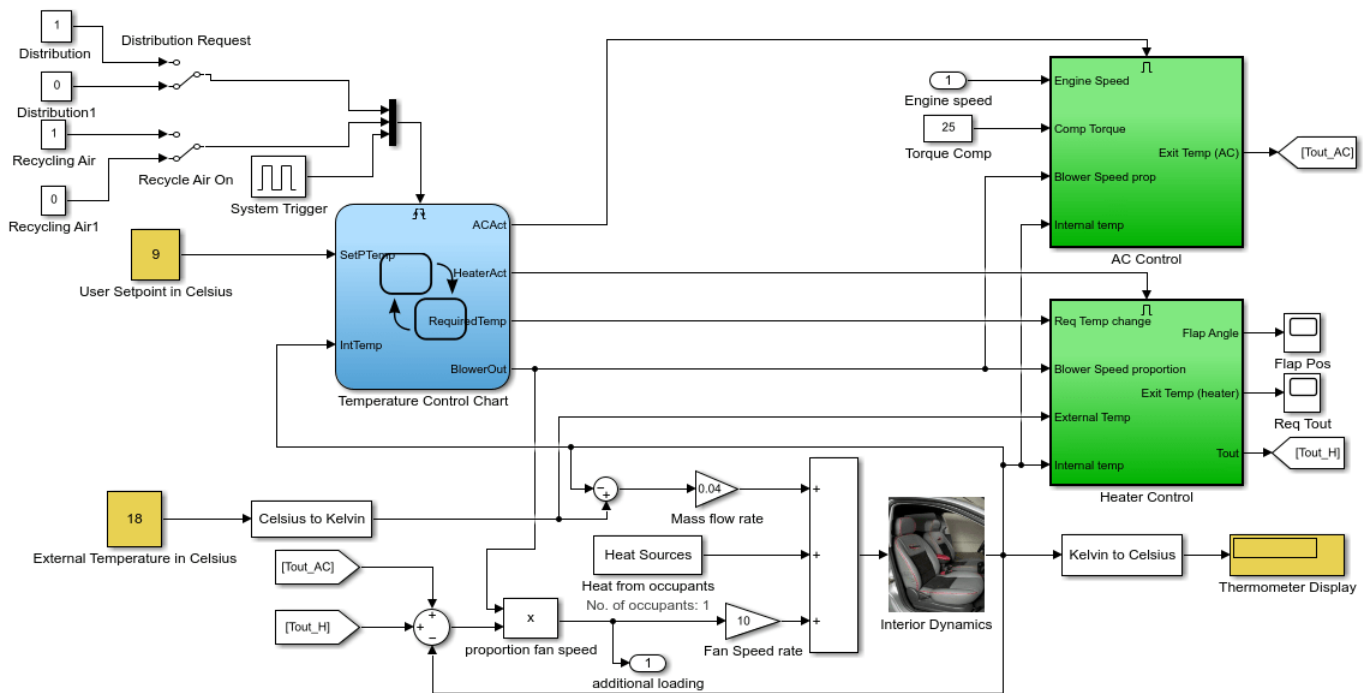

Figure 2: The automatic climate control system.

The Stateflow® Controller

The control of the system is implemented in Stateflow®. Double clicking on the Stateflow chart will show how this supervisory control logic has been formulated.

The **Heater_AC** state shows that when the user enters a setpoint temperature which is greater than the current temperature in the car by at least 0.5 deg C, the heater system will be switched on. The heater will remain active until the current temperature in the car reaches to within 0.5 deg of the setpoint temperature. Similarly, when the user enters a setpoint which is 0.5 deg C (or more) lower than the current car temperature, the Air Conditioner is turned on and stays active until the temperature of the air in the car reaches to within 0.5 deg C of the setpoint temperature. After which, the system will switch off. The dead band of 0.5 deg has been implemented to avoid the problem of continuous switching.

In the **Blower** State, the larger the difference between the setpoint temperature and the current temperature, the harder the fan blows. This ensures that the temperature will reach the required value in a reasonable amount of time, despite the temperature difference. Once again, when the temperature of the air in the car reaches to within 0.5 deg C of the setpoint temperature, the system will switch off.

The Air Distribution (**AirDist**) and Recycling Air States (**Recyc_Air**) are controlled by the two switches that trigger the Stateflow chart. An internal transition has been implemented within these two states to facilitate effective defrosting of the windows when required. When the defrost state is activated, the recycling air is turned off.

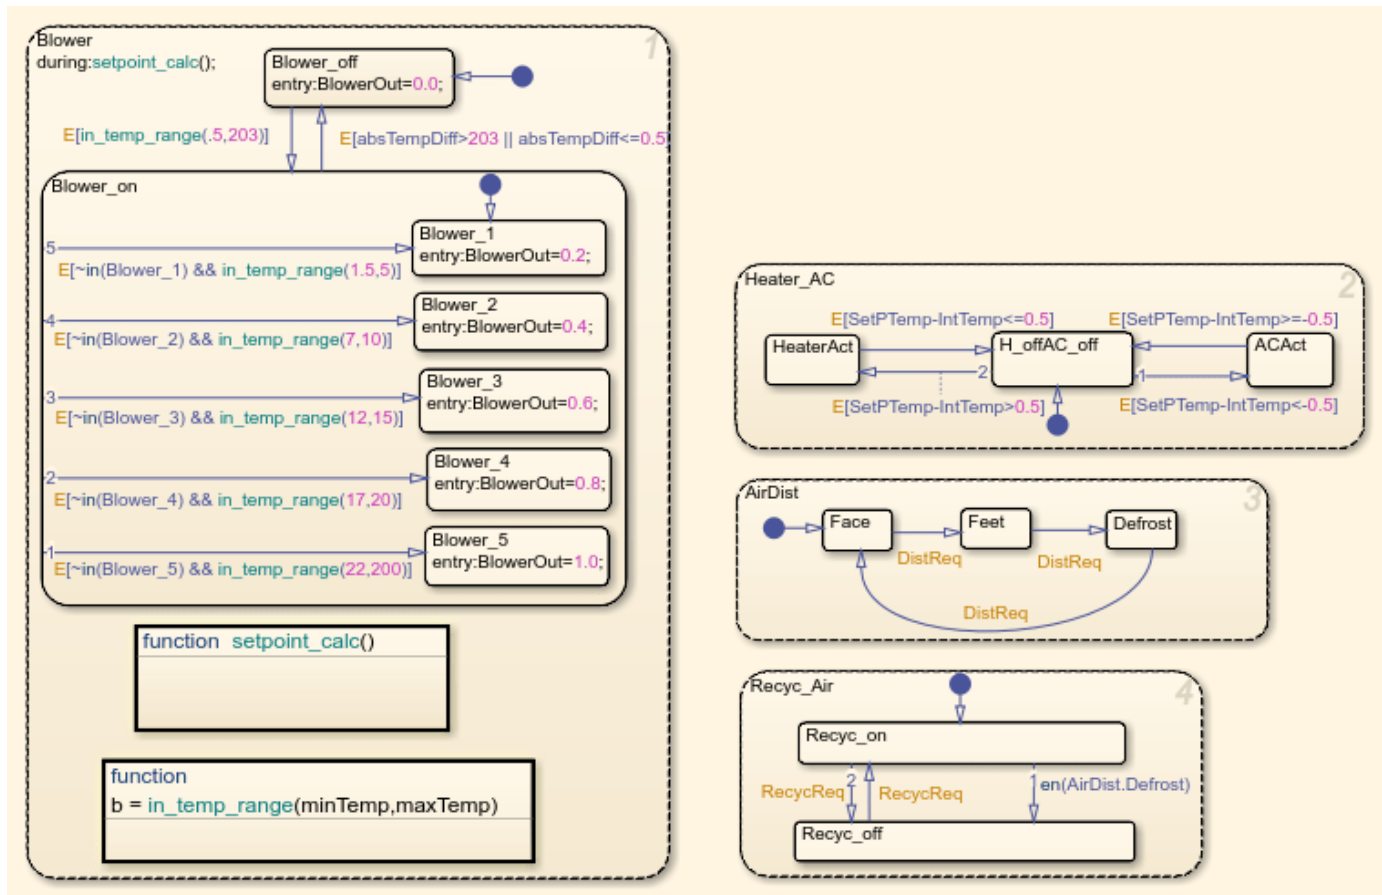

Figure 3: The supervisory control logic in Stateflow.

Heater and Air Conditioner Models

The heater model was built from the equation for a heat exchanger shown below:

$$T_{out} = T_s - (T_s - T_{in})e^{[-\pi \cdot D \cdot L \cdot hc / (m_{dot} \cdot C_p)]}$$

Where:

- T_s = constant (radiator wall temperature)
- D = 0.004m (channel diameter)
- L = 0.05m (radiator thickness)
- N = 30000 (Number of channels)
- k = 0.026 W/mK = constant (thermal conductivity of air)
- C_p = 1007 J/kgK = constant (specific heat of air)
- Laminar flow ($hc = 3.66(k/D) = 23.8 \text{ W/m}^2\text{K}$)

In addition, the effect of the heater flap is taken into account. Similar to the operation of the blower, the greater the temperature difference between the required setpoint temperature and the current temperature in the car, the more the heater flap is opened and the greater the heating effect.

The Air Conditioner system is one of the two places where the climate control model interfaces with the car's electrical system model. The compressor loads the engine of the car when the A/C system is active. The final temperature to exit from the A/C is calculated as follows:

$$y \cdot (w \cdot T_{comp}) = \dot{m} \cdot (h_4 - h_1)$$

Where:

- y = efficiency
- \dot{m} = mass flow rate
- w = speed of the engine
- T_{comp} = compressor torque
- h_4, h_1 = enthalpy

Here we have bang-bang control of the A/C system where the temperature of the air that exits the A/C is determined by the engine speed and compressor torque.

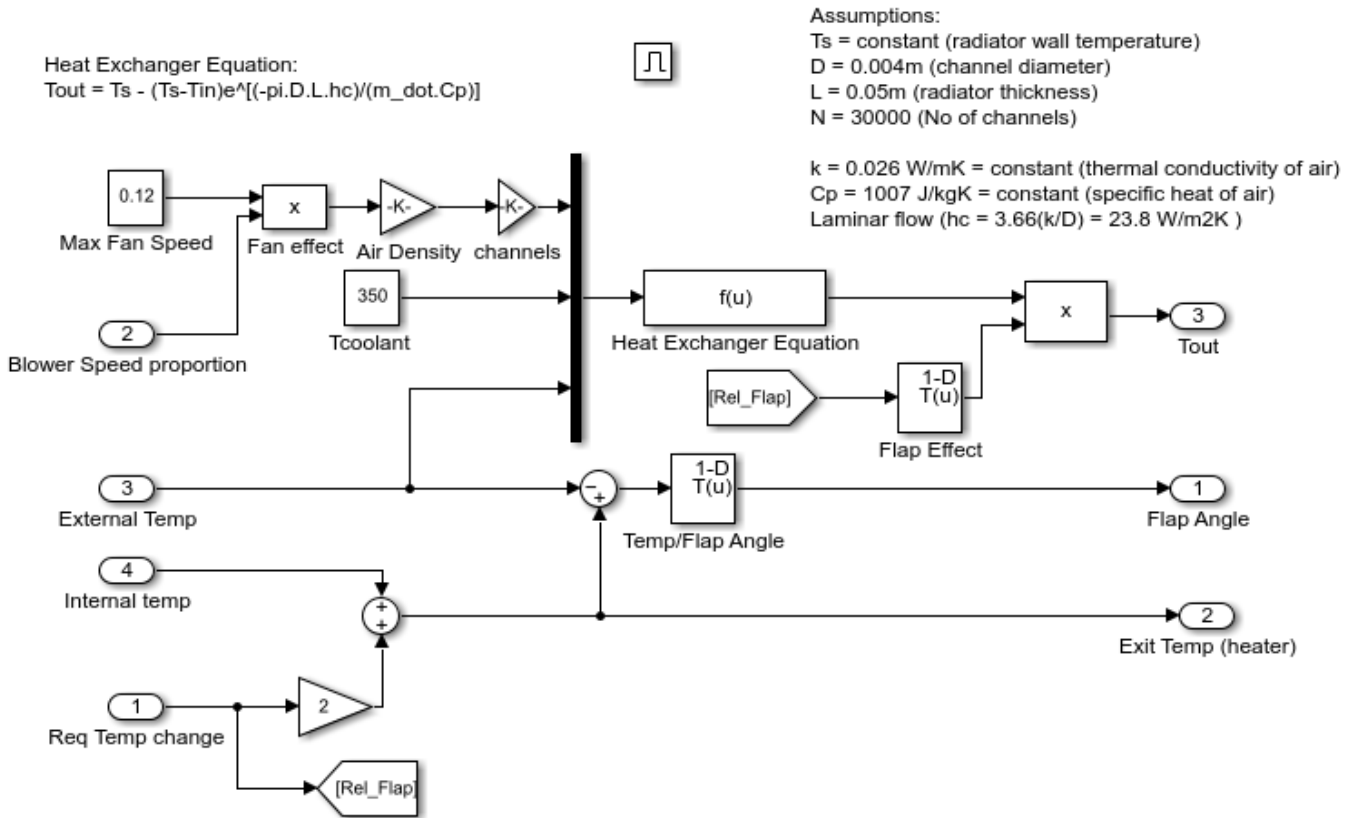

Figure 4: Heater control subsystem.

Figure 5: A/C control subsystem.

Heat Transfer in the Cabin

The temperature of the air felt by the driver is affected by all of these factors:

- The temperature of the air exiting the vents
- The temperature of the outside air
- The number of people in the car

These factors are inputs into the thermodynamic model of the interior of the cabin. We take into account the temperature of the air exiting the vents by calculating the difference between the vent air temperature and the current temperature inside the car and multiplying it by the fan speed proportion (mass flow rate). Then 100W of energy is added per person in the car. Lastly, the difference between the temperature of the outside air and the interior air temperature is multiplied by a lesser mass flow rate to account for the air radiating into the car from the outside.

The output of the interior dynamics model is fed to the display block as a measure of the temperature read by a sensor placed behind the driver's head.

The Electrical System

This electrical system models the car at idle speed. The PID controllers ensure that the car's alternator (modeled by a synchronous machine which has its field current regulated to control the output voltage) is also operating at the required speed. The alternator output is then fed through a 3-phase 6-pulse rectifier bridge to supply the voltage needed to charge the battery which supplies the voltage for the car's DC bus.

The fan used in the climate control system is fed off this DC bus as are the windscreen wipers, radio etc. As the difference between the setpoint temperature and the current temperature in the car drops, so does the fan speed and therefore so does the loading on the DC bus. The inclusion of feedback in the electrical system regulates the DC bus voltage.

The additional model of the car's electrical system allows for the changing of the engine speed. Changing the engine speed shows the effect on the DC bus voltage.

Power Window Control Project

This example shows how you can use MathWorks® software and the Model-Based Development process to go from concept to implementation for a power window system for an automobile. This example uses Simulink®, Simulink® Coverage™, DSP System Toolbox™, Simscape™ Multibody™, Fixed-Point Designer™, Simscape™ Electrical™, Simscape™, and Simulink® Real-Time™.

Overview of Design Requirements

In this example, consider the passenger-side power window system of an automobile. Note a critical aspect of this system is that it can never exert a force of more than 100 N on an object when closing the window, for example:

When the model detects such an object, it must lower the window by about 10 centimeters.

For more information on the design requirements, see “Power Window”.

Using Model-Based Development and Large Scale Modeling

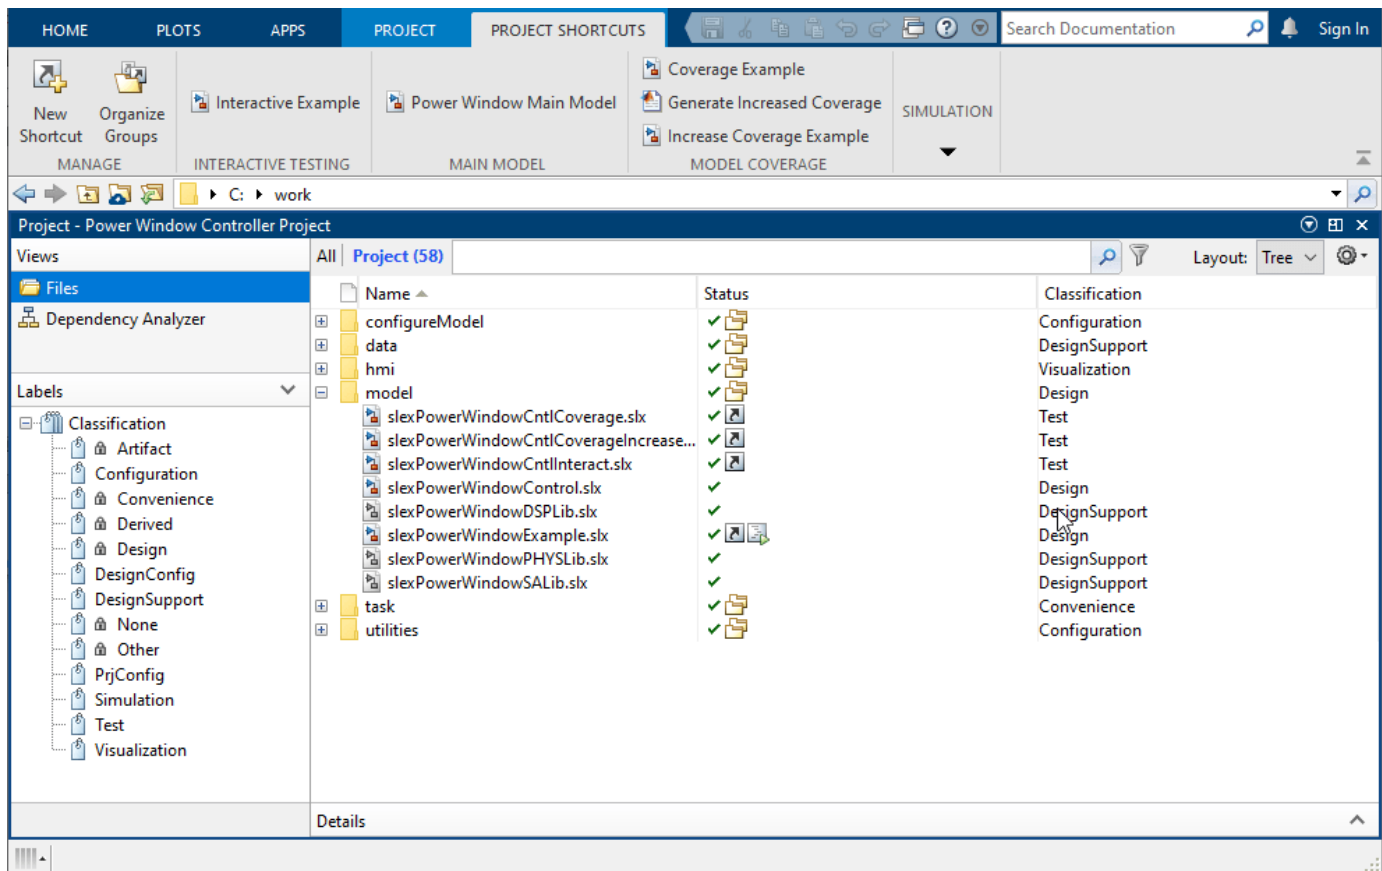

This example uses Model-Based Design and large scale modeling techniques such as,

- **Model Blocks** to separate the hierarchy into separate models.
- **Variant Subsystems Blocks** to model and switch between different design choices.
- **Libraries** to capture algorithms for reuse in variant subsystems.
- **Projects** to manage the files required for the system development.

Opening Power Window Control Project

Run the following command to create and open a working copy of the project files for this example.

```
slxPowerWindowStart
```

Exploring the Project

Upon visual inspection of the project, you can see features used to organize the example. These features are:

- Folders
- File Classification
- Shortcuts

Folders

The project is organized into the following folders:

- **configureModel** - MATLAB® files controlling the main system model variant configuration
- **data** - Images required by the project
- **hmi** - Files that animate the power window response
- **model** - Main system model, controller model, models for testing the controller, and libraries which support these models
- **task** - MATLAB files that simulate the model for the different model configurations and generate coverage reports for the controller
- **utilities** - MATLAB files to initialize the model, to generate spreadsheet input, to add data to the generated spreadsheet and to manage the project environment at startup and shutdown

File Classification

Files in Projects have different classifications visible in Labels pane. Each label describes the specific role a file contributes to the body of the project. In this project, new classifications were added, including:

- **Configuration** - Files that configure the project or model.
- **PrjConfig** - Files that configure the project by adding its files to the path at startup and removing them at shutdown
- **DesignConfig** - Files that determine which model configuration is active at a given time
- **Design** - Main system model and its referenced control model
- **DesignSupport** - Files such as libraries, data, and model simulation
- **Simulation** - Files that simulate the model for a specific configuration
- **Test** - Control coverage, the control interaction, and the test harness models
- **Visualization** - Files that animate the motion of the power window

Shortcuts

Project shortcuts are used to obtain quick access to project files that are used most often. Some shortcuts contain general tasks such as adding the project to the path at startup and removing it at shutdown. In addition, project shortcut groups help organize the shortcuts. The new shortcut groups are

- **Interactive Testing** - Files used for interactive testing of the controller
- **Main Model** - File for top level Simulink model
- **Model Coverage** - Files used for model coverage of the controller
- **Simulation** - Files used for simulation of model variant configurations

Exploring Simulink Models in Project

The Simulink models for this project are located in the model folder. The models of interest are:

- Main System Model
- Models for Testing

Main System Model

In this example under the model folder, the main system model is `slexPowerWindowExample`. This model consists of the driver and passenger switch blocks, which generate the inputs to the system. The inputs then go through the control system model, which validates the states of the passenger and driver inputs. The control system block also determines if there is an obstacle blocking the window's path. The referenced controller produces the window motion command signals sent to the active variant of the window system. The window system output is the feedback to the control system block.

To visualize the results of simulation, Simulation Data Inspector (SDI) logs the output data and Simulink 3D Animation™ animates the window's motion.

Model Variants

The main system model in this project uses the `Variant Subsystem` block to allow for multiple implementations of within a subsystem. The active implementation can be programmatically changed

prior to simulation. In the main model, there are four Variant Subsystem blocks each with variant choices that can be programmatically modified. Those four variant subsystems are:

- `slexPowerWindowExample/driver_switch`
- `slexPowerWindowExample/passenger_switch`
- `slexPowerWindowExample/window_system`
- `slexPowerWindowExample/power_window_control_system/detect_obstacle_endstop`

Each variant choice is associated with a variant control. The variant choice is active when its variant control evaluates to `true`.

Since there are four programmatically modifiable Variant Subsystem blocks in the main model, there are MATLAB files to control the combinations of variant choices to create model variant configurations which are found under the `DesignConfig` classification. Available model variant configurations are

- Power Window Controller Hybrid System Model
- Power Window Controller and Detailed Plant Model
- Power Window Controller With Data Acquisition Effects
- Power Window Controller With Controller Area Network (CAN) Communication

Power Window Controller Hybrid System Model

This model variant uses Stateflow® and Simulink to model both discrete event reactive behavior and continuous time behavior. It uses a low order plant model to validate the roll-up and roll-down behavior. You can simulate this variant configuration using the `SimHybridPlantLowOrder` shortcut. This shortcut activates only the variant subsystem corresponding to this model configuration. Since this model does not take into account power effects, the only output logged is position. Simulation Data Inspector (SDI) displays the logged position data.

Power Window Controller and Detailed Plant Model

This model variant shows a more detailed plant model that includes power effects in the electrical and mechanical domains is used to validate that the force exerted by the window on a trapped object never exceeds 100 N. This model variant requires Simscape™ Multibody™ and Simscape Power Systems™ products to be installed. You can simulate this variant configuration using the `SimHybridPlantPowerEffects` shortcut. Unlike the previous variant model, this variant configuration takes into account the power effects. SDI displays the logged data from armature current, position, and force exerted by the power window.

Power Window Controller With Data Acquisition Effects

This model variant shows additional effects due to implementation that affect the control. The phenomena included are signal conditioning to measure the armature current and quantization of the measurement. This model variant requires Simscape Multibody, Simscape Power Systems, DSP System Toolbox™, and Fixed-Point Designer™ products to be installed. You can simulate this variant configuration using the `SimHybridPlantPowerEffects+ControlDAQEffects` shortcut. Like the previous model, SDI displays the logged data from armature current, position, and force exerted by the power window.

Power Window Controller With CAN Communication

This model variant shows the use of a CAN to communicate the commands to control window movement. The switches that may be located in the center console of the vehicle and that produce the commands are included in this model variant. This model variant requires Simscape Multibody, Simscape Power Systems, DSP System Toolbox, and Fixed-Point Designer products to be installed. You can simulate this variant configuration on a machine running windows OS using the| SimCANCommunication| shortcut.

Models for Testing

To test the state machine that controls the power window, you can run the project shortcuts for testing. Available model shortcuts for testing the controller are

- InteractiveExample
- CoverageExample
- IncreaseCoverageExample

InteractiveExample

This model shortcut opens the model, slxPowerWindowCntlInteract. This model contains the power window controller which is a state machine. This model also contains inputs to the controller which are selected with manual switch blocks.

The power window controller has four external inputs:

- Passenger Input
- Driver Input
- Window Frame Endstops
- Obstacle Present

Passenger Input

This input consists of a vector with three elements:

- `neutral`: the passenger control switch is not depressed
- `up`: the passenger control switch generates the up signal
- `down`: the passenger control switch generates the down signal

Driver Input

This input consists of a vector with three elements:

- `neutral`: the driver control switch is not depressed
- `up`: the driver control switch generates the up signal
- `down`: the driver control switch generates the down signal

Window Frame Endstops

This input consists of a vector with two elements:

- `0`: window moves freely between top or bottom
- `1`: window is stuck at the top or bottom because of physical limitations

Obstacle Present

This input consists of a vector with two elements:

- 0: window moves freely between top or bottom
- 1: window has obstacle within its frame

You can interactively test the controller by simulating the model and selecting the desired combination of inputs via the manual switch blocks. After making the selection of inputs, you can verify the internal controller state and controller output against the desired result for this specific set of inputs.

CoverageExample

This model shortcut opens the model, `slexPowerWindowCntlCoverage`. This model contains the power window controller which is a state machine. This model also contains inputs to the controller which are repeating sequence blocks.

You can use the Simulink Coverage (TM) Model Coverage tool to validate the discrete event control of the window. The Model Coverage tool helps determine the extent to which a model test case exercises the conditional branches of the controller. It also helps evaluate whether all transitions in the discrete event control are taken given the test case we run. It also evaluates whether all clauses in a condition that enables a particular transition have become true. One transition may be enabled by multiple clauses, e.g., the transition from emergency back to neutral occurs when either 100 ticks have occurred or when the endstop is reached.

IncreaseCoverageExample

This model shortcut opens the model, `slexPowerWindowCntlCoverageIncrease`. This model contains the power window controller that is a state machine. This model also contains a From Spreadsheet block that provides multiple sets of inputs to the controller. These input sets combine with the one from the `CoverageExample` model to exercise more of the logic in the power window controller.

These input sets are:

- `Logged`: Logged from the `CoverageExample`.
- `LoggedObstacleOffEndStopOn`: Logged from the `CoverageExample` with ability to hit endstop.
- `LoggedObstacleOnEndStopOff`: Logged from the `CoverageExample` with obstacle in window.
- `LoggedObstacleOnEndStopOn`: Logged from the `CoverageExample` with obstacle in window and ability to hit endstop.
- `DriverLoggedPassengerNeutral`: Logged from the `CoverageExample` for only the driver. Passenger takes no action.
- `DriverDownPassengerNeutral`: Driver lowering window. Passenger takes no action.
- `DriverUpPassengerNeutral`: Driver raising window. Passenger takes no action.
- `DriverAutoDownPassengerNeutral`: Driver lowering window for 1 second (auto-down). Passenger takes no action.
- `DriverAutoUpPassengerNeutral`: Driver raising window for 1 second (auto-up). Passenger takes no action.
- `PassengerAutoDownDriverNeutral`: Passenger lowering window for 1 second (auto-down). Driver takes no action.
- `PassengerAutoUpDriverNeutral`: Passenger raising window for 1 second (auto-up). Driver takes no action.

The model coverage shortcut, `GenerateIncreasedCoverage`, uses the multiple input sets with the Simulink Coverage Model Coverage tool to validate the discrete event control of the window and generate a coverage report for the multiple input sets. The Model Coverage tool helps determine the extent to which a model test case exercises the conditional branches of the controller. It also helps evaluate if all transitions in the discrete event control have been taken into account given the input sets we run.

Developing the Apollo Lunar Module Digital Autopilot

"Working on the design of the Lunar Module digital autopilot was the highlight of my career as an engineer. When Neil Armstrong stepped off the LM (Lunar Module) onto the moon's surface, every engineer who contributed to the Apollo program felt a sense of pride and accomplishment. We had succeeded in our goal. We had developed technology that never existed before, and through hard work and meticulous attention to detail, we had created a system that worked flawlessly." -Richard J. Gran, *The Apollo 11 Moon Landing: Spacecraft Design Then and Now*

This example shows how Richard and the other engineers who worked on the Apollo Lunar Module digital autopilot design team could have done it using Simulink® and Aerospace Blockset™ if they had been available in 1961.

Model Description

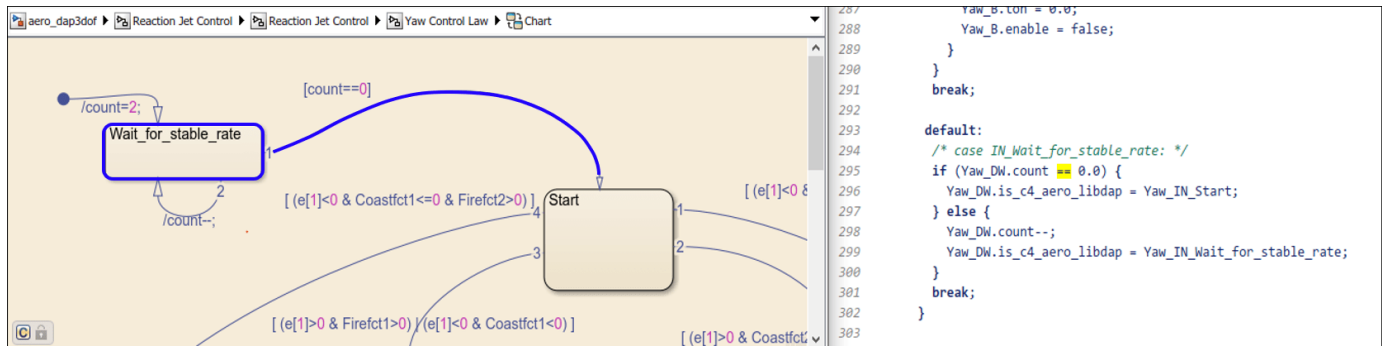

Developing the autopilot in Simulink takes a fraction of the time it took for the original design of the Apollo Lunar Module autopilot.

```
if ~bdIsLoaded("aero_dap3dof")
    open_system("aero_dap3dof");
end
```

The Reaction Jet Control subsystem models the digital autopilot design proposed (and implemented) by MIT Instrumentation Laboratories (MIT IL), now called Draper Laboratory. A Stateflow® diagram in the model specifies the logic that implements the phase-plane control algorithm described in the technical article *The Apollo 11 Moon Landing: Spacecraft Design Then and Now*. Depending on which region of the diagram the Lunar Module is executing, the Stateflow diagram is in either a Fire_region or a Coast_region. Note, the transitions between these different regions depend on

certain parameters. The Stateflow diagram determines whether to transition to another state and then computes which reaction jets to fire.

Translational and rotational dynamics of the Lunar Module are approximated in the Lunar Module Dynamics subsystem. Access various visualization methods of the Lunar Module states and autopilot performance in the Visualization area of the model, including Simulink scopes, animation with Simulink 3D Animation, and a phase plane plot.

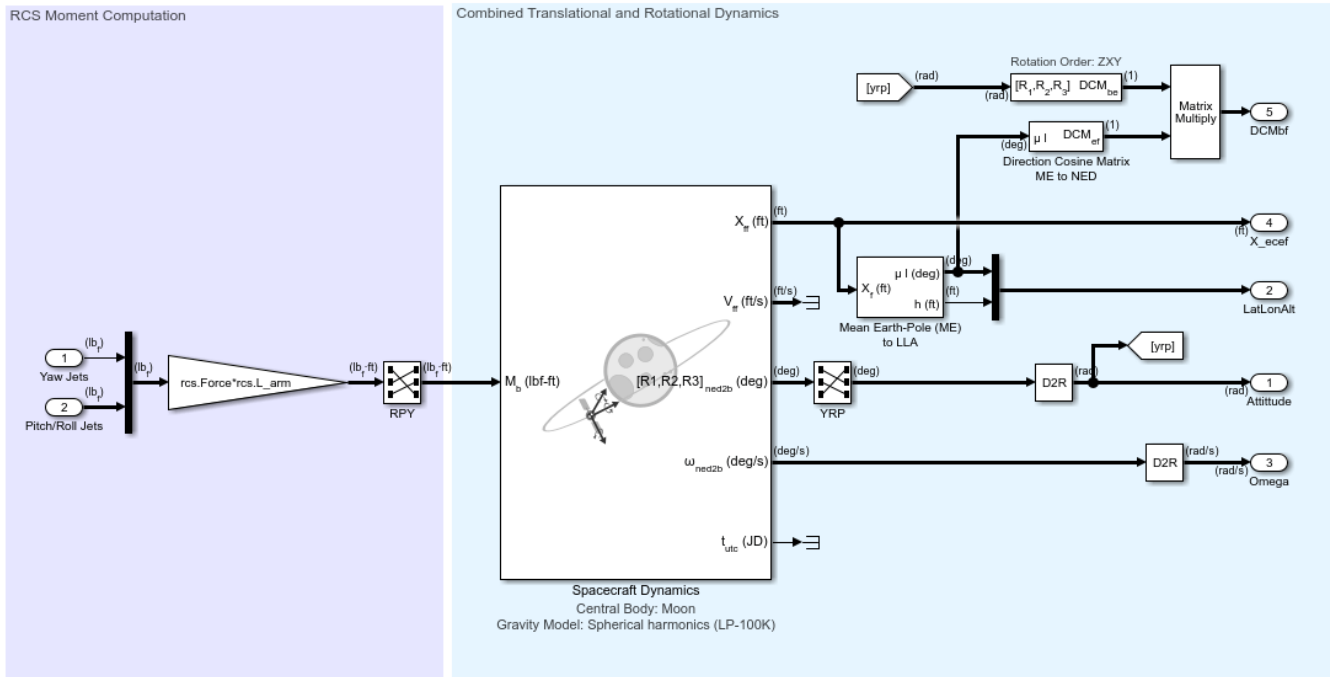

Interactive Controls

To interact with the Lunar Module model, vary autopilot settings and Lunar Module initial states in the Commands area. For example, to observe how the digital autopilot design handles increased initial body rates, use the slider components in Configure LM Attitude.

Mission Description

The LM digital autopilot has three degrees of freedom. This means that by design, the reaction jet thrusters are configured and commanded to rotate the vehicle without impacting the vehicle's orbital trajectory. Therefore, the translational dynamics in his model are approximated via orbit propagation using the Spacecraft Dynamics block from Aerospace Blockset. The block is configured to use Moon spherical harmonic gravity model LP-100K.

To demonstrate the digital autopilot design behavior, the "Descent Orbit Insertion" mission segment, just prior to the initiation of the powered descent, was selected from the *Apollo 11 Mission Report*.

NASA-S-69-3709

Figure 5-1 . - Lunar descent orbital events .

6T-5

(Image Credit: NASA)

The "Descent Orbit Insertion" burn began 101 hours, 36 minutes, and 14 seconds after lift-off and lasted 30 seconds. The burn set the Lunar module on a trajectory to lower its orbit from approximately 60 nautical miles to 50,000 ft over about an hour. At 50,000 ft, the Module initiated its powered descent.

Initialize the model `aero_dap3dof` with the approximate trajectory of the Lunar Module immediately after the descent orbit insertion burn.

```
mission.t_rangeZero           = datetime(1969,7,16,13,32,0); % lift-off
mission.t_descentInsertionStart = mission.t_rangeZero + hours(101) + minutes(36) + seconds(14);
mission.t_descentInsertion     = mission.t_descentInsertionStart + seconds(30);
mission.t_poweredDescentStart  = mission.t_rangeZero + hours(102) + minutes(33) + seconds(5.2);

disp(timetable([mission.t_rangeZero, mission.t_descentInsertionStart, ...
mission.t_descentInsertion, mission.t_poweredDescentStart]', ...
{'Range Zero (lift-off)', 'Descent Orbit Insertion (Engine ignition)', ...
'Descent Orbit Insertion (Engine cutoff)', 'Powered Descent (Engine ignition)'}', VariableName
```

Time	Mission Phase
16-Jul-1969 13:32:00	{'Range Zero (lift-off)'} }
20-Jul-1969 19:08:14	{'Descent Orbit Insertion (Engine ignition)'} }
20-Jul-1969 19:08:44	{'Descent Orbit Insertion (Engine cutoff)'} }
20-Jul-1969 20:05:05	{'Powered Descent (Engine ignition)'} }

The trajectory of the module at "Descent Orbit Insertion (Engine cutoff)" and "Powered Descent Initiation (Engine ignition)" is provided in the *Apollo 11 Mission Report* (Table 7-II.- Trajectory Parameters).

```
mission.Latitude_deg = [-1.16, 1.02]'; % [deg]
mission.Longitude_deg = [-141.88, 39.39]'; % [deg]
mission.Altitude_mi = [57.8, 6.4]'; % [nautical miles]
mission.Altitude_ft = convlength(mission.Altitude_mi, 'naut mi', 'ft');
mission.Velocity_fps = [5284.9, 5564.9]'; % [ft/s] (in Inertial frame)
mission.FlightPathAngle_deg = [-0.06, 0.03]'; % [deg] (measured upward from local horizontal plane)
mission.HeadingAngle_deg = [-75.19 -101.23]'; % [deg] (measured East of North)
disp(table({'Range Zero (lift-off)'; 'Descent Orbit Insertion (Engine ignition)'}, ...
    mission.Latitude_deg, mission.Longitude_deg, mission.Altitude_mi, ...
    mission.Velocity_fps, mission.FlightPathAngle_deg, mission.HeadingAngle_deg, ...
    VariableNames=["Mission Phase", ...
        "Latitude (deg)", "Longitude (deg)", "Altitude (mi)", ...
        "Velocity (ft/s)", "Flight path angle (deg)", "Heading (deg)"]));
```

Mission Phase	Latitude (deg)	Longitude (deg)	Altitude (mi)
{'Range Zero (lift-off)'} }	-1.16	-141.88	57.8
{'Descent Orbit Insertion (Engine ignition)'} }	1.02	39.39	6.4

Model Initialization

Initialize model parameters for the mission phase "Descent Orbit Insertion (Engine cutoff)" using the data defined above.

The initialization function `aero_dap3dofdata` requires information about the orientation of the Moon, which can be calculated using the Aerospace Blockset function `moonLibration`. This function requires "Ephemeris Data for Aerospace Toolbox". Use `aeroDataPackage` to install this data if it is not already installed.

```
mission.LibrationAngles_deg = moonLibration(juliandate(mission.t_descentInsertion), "405");
```

This example uses saved libration angle data corresponding with `t_descentInsertion`. Use the above command after installing the required ephemeris data.

```
mission.LibrationAngles_deg = [0.006379917345247; 0.382328074214300; 6.535718297208969];
```

Run the initialization function:

```
[moon, ic, vehicle, rcs] = aero_dap3dofdata(...
    mission.Latitude_deg(1), mission.Longitude_deg(1), mission.Altitude_ft(1), ...
    mission.Velocity_fps(1), mission.FlightPathAngle_deg(1), ...
    mission.HeadingAngle_deg(1), mission.LibrationAngles_deg)
```

```
moon = struct with fields:
    r_moon_eq: 5702428
```

```
f_moon: 0.0012

ic = struct with fields:
  t_runtime: 120
  pos_inertial: [-3.6488e+06 -4.4381e+06 -1.9070e+06]

```

Closing Remarks

Building a digital autopilot was a daunting task in 1961 because there was very little industrial infrastructure for it - everything about it was in the process of being invented. Here is an excerpt from the technical article *The Apollo 11 Moon Landing: Spacecraft Design Then and Now*:

"One reason why the [autopilot's machine code] was so complex is that the number of jets that could be used to control the rotations about the pilot axes was large. A decision was made to change the axes that the autopilot was controlling to the "jet axes" shown in `aero_dap3dof`. This change dramatically reduced the number of lines of code and made it much easier to program the autopilot in the existing computer. Without this improvement, it would have been impossible to have the autopilot use only 2000 words of storage. The lesson of this change is that when engineers are given the opportunity to code the computer with the system they are designing, they can often modify the design to greatly improve the code."

Designing a High Angle of Attack Pitch Mode Control

Control Design Using Simulink®

This example shows how to use the Control System Toolbox™ and Simulink® Control Design™ to interact with Simulink to design a digital pitch control for the aircraft. In this example, we will design the controller to permit the aircraft to operate at a high angle of attack with minimal pilot workload.

Our example takes you through the first pass at designing a digital autopilot for a high angle of attack controller. To run everything in this example you must have the Control System Toolbox, Simulink Control Design, Simulink, and Simulink® Coder™. If you don't have all of these products, you can still run portions of the example using cell execution mode of the MATLAB® editor.

Below is a Simulink model of the aircraft. The control systems in the Controllers block can be switched in the model to allow you to see the analog response and then to switch to a design created using the Control System Toolbox's Linear Time Invariant (LTI) objects. A controller is also included that is a discrete implementation of the analog design that is similar to the algorithm that would go into an on-board flight computer. Take a few moments to explore the model.

Copyright 2013 -2014 The MathWorks, Inc.

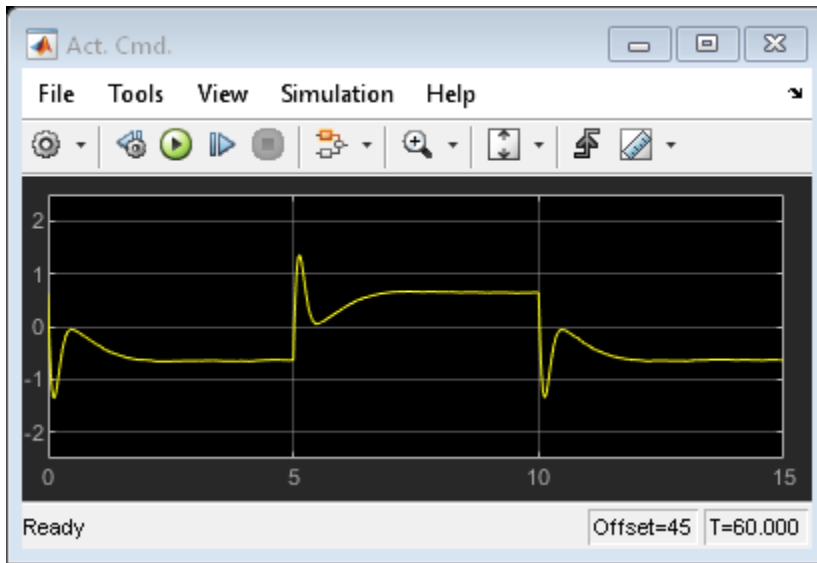

Figure 1: Simulink model of the aircraft flight control system.

Trimming and Linearization

You can linearize the model using Simulink Control Design software. To interactively linearize the model, use the **Model Linearizer** app. To open the app, in the Simulink Editor, on the **Apps** tab, under **Control Systems**, click **Model Linearizer**. You can also programmatically linearize the model using the `linearize` function.

Open the `slexAircraftPitchControlAutopilot` model.

To view the linearized model parameters:

```
apmdl = 'slexAircraftPitchControlAutopilot';
open_system(apmdl);
op = operpoint(apmdl);
io = getlinio(apmdl);
contap = linearize(apmdl,op,io)
```

contap =

A =	Alpha-sensor	Pitch Rate L	Proportional	Stick Prefil
Alpha-sensor	-2.526	0	0	0
Pitch Rate L	0	-4.144	0	0
Proportional	-1.71	0.9567	0	10
Stick Prefil	0	0	0	-10

B =	Alpha Sensed	Stick	q Sensed
Alpha-sensor	1	0	0
Pitch Rate L	0	0	1
Proportional	0	0	-0.8156
Stick Prefil	0	1	0

C =	Alpha-sensor	Pitch Rate L	Proportional	Stick Prefil
Sum	2.986	-1.67	-3.864	-17.46

D =	Alpha Sensed	Stick	q Sensed
Sum	0	0	1.424

Continuous-time state-space model.

The Original Analog Autopilot for the High Angle of Attack Mode

?

This autopilot configuration uses a traditional design.
The parameters T_s , T_{al} , W_1 , W_2 , K_a , K_q , K_f , and K_i need to be optimized.

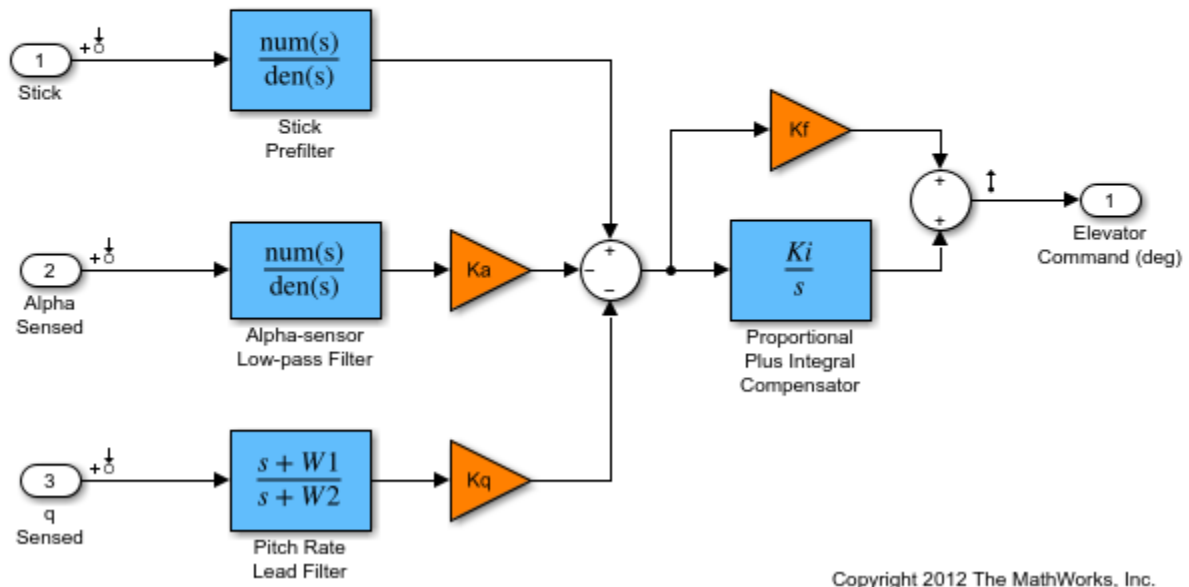

Figure 2: Original analog autopilot.

Linear Time-Invariant (LTI) Systems

There are three types of LTI objects you can use to develop a linear model:

State Space (SS), Transfer Function (TF), and Zero-Pole-Gain (ZPG) objects.

The variable `contap` is a State Space object. You can then get one of the other types with the other commands. When you create the object in MATLAB, you can manipulate it using operations such as `*`, `+`, `-`, etc. This is called "overloading" the MATLAB operators. Try creating an object of your own and see what happens when adding, multiplying, etc. with the `contap` object.

To see exactly what is stored in the LTI object, type `get(contap)` or `contap.InputName` for example.

To view Zero/Pole/Gain transfer functions:

```
contap = tf(contap);
contap = zpk(contap)
```

```
contap =
```

```
From input "Alpha Sensed" to output "Sum":
2.9857 (s+2.213)
-----
s (s+2.526)
```

```

From input "Stick" to output "Sum":
-17.46 (s+2.213)
-----
      s (s+10)

From input "q Sensed" to output "Sum":
 1.424 (s+2.971) (s+2.213)
-----
      s (s+4.144)

```

Continuous-time zero/pole/gain model.

Discretized Controller Using Zero-Order Hold

Now the LTI object will be used to design the digital autopilot that will replace the analog autopilot. The analog system is coded into the LTI object called `contap` (CONTinuous AutoPilot).

The first attempt at creating a digital autopilot will use a zero-order hold with a sample time of 0.1 seconds. Note that the discrete object maintains the type (ss, tf, or zpk).

It is clear from Bode plot below that the systems do not match in phase from 3 rad/sec to the half sample frequency (the vertical black line) for the pilot stick input and the angle of attack sensor. This design has poorer response than the analog system. Go to the Simulink model and start the simulation (make sure you can see the scope windows). While the simulation is running, double-click the manual switch labeled Analog or Digital.

Does the simulation verify the conclusion reached by interpreting the Bode diagram?

```

discap = c2d(contap, 0.1, 'zoh');
get(discap)
bode(contap,discap)

      Z: {[0.8016] [0.8039] [2x1 double]}
      P: {[2x1 double] [2x1 double] [2x1 double]}
      K: [0.2943 -1.2458 1.4240]
DisplayFormat: 'roots'
Variable: 'z'
  IODelay: [0 0 0]
 InputDelay: [3x1 double]
OutputDelay: 0
      Ts: 0.1000
 TimeUnit: 'seconds'
 InputName: {3x1 cell}
 InputUnit: {3x1 cell}
InputGroup: [1x1 struct]
OutputName: {'Sum'}
OutputUnit: {''}
OutputGroup: [1x1 struct]
      Notes: [0x1 string]
   UserData: []
      Name: ''
SamplingGrid: [1x1 struct]

```

Figure 3: Bode diagram comparing analog and ZOH controllers.

Tustin (Bilinear) Discretization

Now try different conversion techniques. You can use the Tustin transformation. In the command window type the commands above.

It should be clear that the systems still do not match in phase from 3 rad/sec to the half sample frequency, the Tustin transformation does better. The simulation uses the LTI object as it is designed. To see how the object is used look in the Controllers subsystem by using the browser or by double clicking the icon. The LTI block picks up an LTI object from the workspace. You can change the object name used in the block to any LTI object in the workspace.

Try using "discap1", the Tustin discretization of the analog design:

```
discap1 = c2d(contap,0.1,'tustin');
bode(contap,discap,discap1)
```

Figure 4: Bode diagram comparing analog and 0.1 sec Tustin controllers.

Selecting a Sample Time

The Tustin transform performs better than the zero-order hold from the analysis so far. The sample time of 0.1 second appears to be too slow for the discrete system to track the performance of the analog system at half the sample frequency.

Now transform the analog design using the Tustin transform with a 0.05 second sample period:

```
discap = c2d(contap,0.05,'tustin')
bode(contap,discap)
```

```
discap =
```

```
From input "Alpha Sensed" to output "Sum":
0.074094 (z-0.8951) (z+1)
-----
(z-1) (z-0.8812)
```

```
From input "Stick" to output "Sum":
-0.36852 (z-0.8951) (z+1)
-----
(z-1) (z-0.6)
```

```
From input "q Sensed" to output "Sum":
```

$$\frac{1.4629 (z-0.8617) (z-0.8951)}{(z-1) (z-0.8123)}$$

Sample time: 0.05 seconds
Discrete-time zero/pole/gain model.

Figure 5: Bode diagram comparing analog and 0.05 sec Tustin controllers.

Real-World Considerations

Now that we have what appears to be a workable design, we need to implement it in a form that will include some of the necessary elements that were ignored in the linear analysis. For example, if you look at the analog autopilot that is in the Controllers subsystem, you will see some logic that stops the integrator from winding up when the actuator saturates:

Open the AnalogControl subsystem.

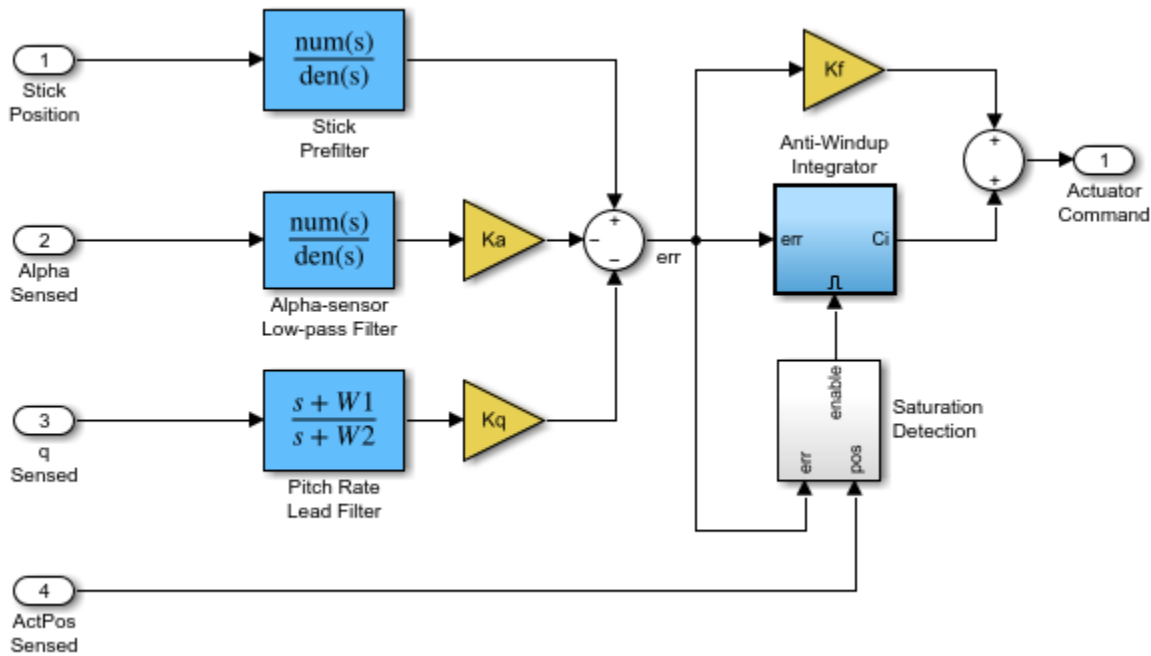

Figure 6: AnalogControl subsystem.

Implementation of the Full Design

The integrator wind-up is only one of the practical issues that needs to be addressed. Another is the need to eliminate aliased high frequency signals that could enter at measurement points. These aliased signals can be prevented by specifying analog filters in front of the sample and hold (ZOH) blocks that model the analog-to-digital converter (ADC) devices typically used for measuring signals in an embedded application. Additionally, the filters in the digital section of the autopilot operate at a higher sampling rate than the compensator to provide a conditioned signal to the compensator. The analog filters are necessary because once a signal is aliased, there is no way to separate the valid in-band frequency content from aliased content.

This new controller is called Digital Control. The filters have a sample time of deltat1 (set to be $1/10$ of deltat). The zero-order hold blocks specify these sample times for various downstream blocks through sample time inheritance.

The switches in the `slexAircraftPitchControlExample` model are set up so you can switch between the analog autopilot, the digital LTI object, and the digital autopilot that could be implemented using software.

Try simulating the system again and switch among the three autopilot designs. You should see that the designs are not significantly affected by which autopilot is active. You can also increase the amplitude of the wind gust and verify that the anti-aliasing filters are working satisfactorily. To increase the gust amplitude, open the Dryden Wind Gust subsystem and change (by double clicking the icon) the noise variance of the White Noise that drives the gust simulation.

Open the DigitalControl subsystem.

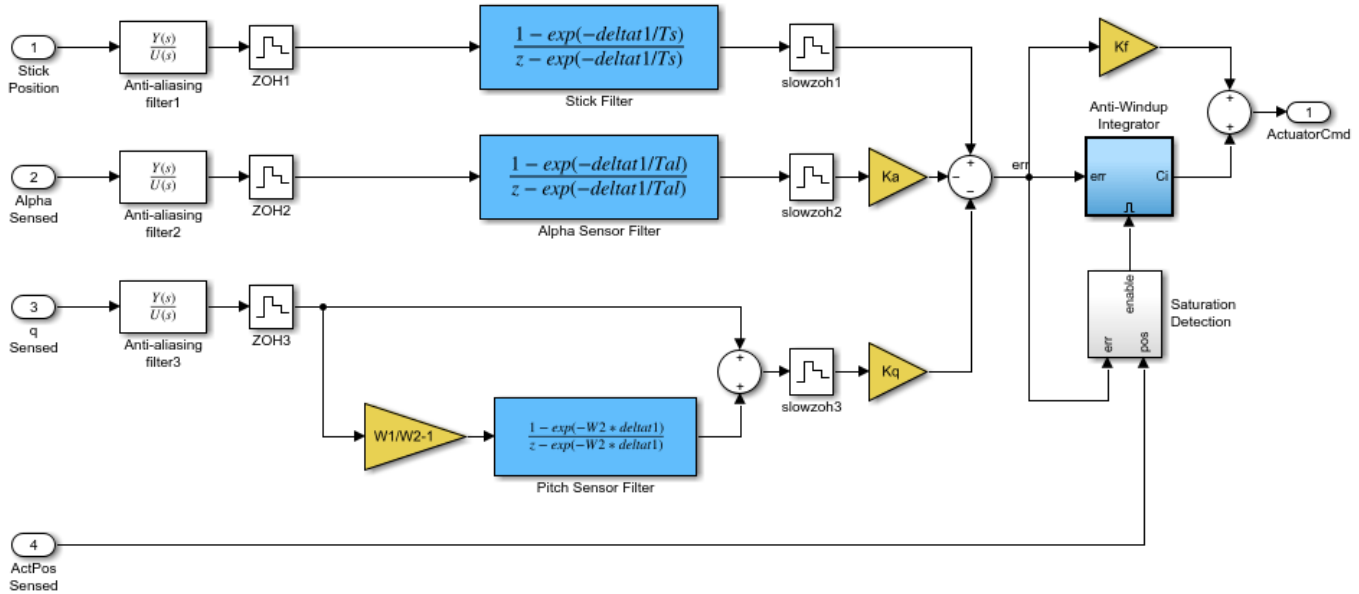

Figure 7: DigitalControl subsystem.

Variant Systems for Design Variants

The actuators in the Simulink model use the Variant Subsystems block to represent multiple actuator implementations, where only one implementation is active during simulation. You can double-click the Variant Actuator Subsystem block to view the different actuator implementations.

To make the simulation change, use the nonlinear actuator instead of the linear one. You can do this by using the Variant Subsystem block **Variant > Override using** context menu.

Note that Simulink must be stopped in order to reconfigure the actuator selection. You should also note that the nonlinear actuator has saturations on position and rate.

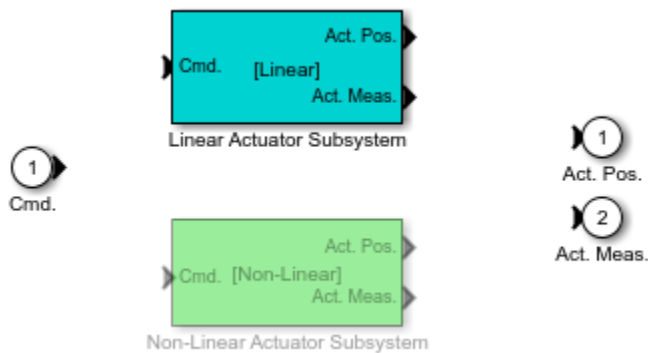

Figure 8: Variant Subsystem for Actuators

Code Generation

The autopilot design can be transformed into embeddable code using Simulink Coder. A separate model of the digital autopilot, slxAircraftPitchControlDAP, is open below; it was coded into a host-

based standalone program using Simulink Coder and the compiler specified using the `mex -setup` configuration. The simulation results can be used as a validation baseline for the functional correctness of the generated code.

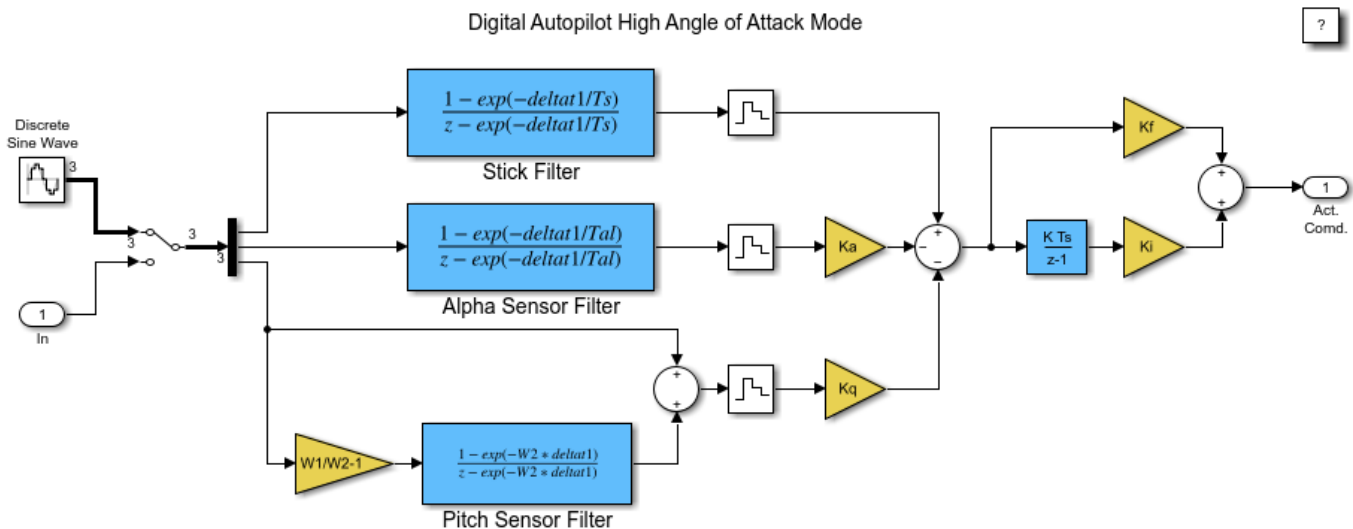

The executable file resulting from code generation and compilation is `slexAircraftPitchControlDAP.exe`. If you create it, it can be run from the OS shell (DOS) command line directly or from MATLAB by typing:

```
>> !slexAircraftPitchControlDAP.exe
```

The executable program creates a file called `slexAircraftPitchControlDAP.mat` that you can load by typing `load slexAircraftPitchControlDAP`.

Two variables called `rt_tout` and `rt_yout` will be in the workspace and their variance against the simulation baseline can be plotted. Note that the variance is effectively zero for this model on this host. Some small numeric variance is to be expected in more complex calculations due to differing compiler optimizations and use of intermediate register variables having higher precision than the 64-bit storage format of a double. Significant variances should be examined as they could indicate a numerical stability problem in your model's algorithms, a compiler or run-time library bug, or other problems.

Open the `slexAircraftPitchControlDAP` model.

Figure 9: Comparison of simulation and code generation results.

Behavior of the First Pass Design

Here is the time response of the high angle of attack mode digital pitch controller design:

Figure 10: Response of the aircraft Digital Pitch Control Design.

Summary

Further work on this design might include incorporating and analyzing more of the real-world effects on the compensator such as the effect of the anti-aliasing filter dynamics and computational delay of the embedded digital computer on the overall "plant" seen by the digital computations. The combination of the real plant, the computational delay, the anti-aliasing filters, and the sample-and-hold delay are just a few of the additional items that might affect the design of the digital compensator parameters.

Aircraft Longitudinal Flight Control

This example shows how to model flight control for the longitudinal motion of an aircraft. First order linear approximations of the aircraft and actuator behavior are connected to an analog flight control design that uses the pilot's stick pitch command as the set point for the aircraft's pitch attitude and uses aircraft pitch angle and pitch rate to determine commands. A simplified Dryden wind gust model is incorporated to perturb the system.

The Viewers and Generators Manager was used in this model to create the model scope for viewing signals, Scope1. Found on **Simulation > Prepare > Viewers Manager**, the Viewers and Generators Manager allows you to instrument your model without having to add blocks to the model. If you close a model scope, such as for batch simulations, you can later reopen it by double-clicking the "scope" icon on the signal of interest.

Parameters for the model are stored in a file named `slexAircraftData.m`. This file is loaded by the model into the model workspace. You can view and edit data in the model workspace directly by using the Model Explorer, which is launched using the **Modeling > Design > Model Explorer** menu item.

Simulink Model Discretizer

This interactive example discretizes the Actuator Model in the `slexAircraftExample` model. If you haven't already, click **Open Model** to open the model.

Open the Model Discretizer

To open the Model Discretizer, in the Simulink Editor, on the **Apps** tab, under **Apps**, under **Control Systems**, click **Model Discretizer**. This opens the Model Discretizer.

The Simulink model window and the Model Discretizer GUI are laid out in the screen for easy navigation.

- The model tree is shown in the left panel of the Model Discretizer GUI.
- Discretization parameters are set through the right panel of the Model Discretizer GUI.
- Discretization status is shown in the lower part of the right panel.
- By default, only continuous blocks are shown in the Model Discretizer GUI.
- In the Simulink model window, blocks in red color are continuous blocks.

You can browse through the continuous blocks one by one using the model tree view. In the Simulink Model Discretizer, select the **View > Next continuous block**. This highlights the Actuator Model.

Before discretizing the Actuator Model block, set the discretization parameters: transform method, sample time, critical frequency. Critical frequency has to be specified if the transform method 'tustin with prewarping' is selected.

After setting the discretization parameters, select **Discretize > Discretize current block** in the Model Discretizer. Or you can just click the s->z button icon in the tool bar. The discretized Actuator Model is highlighted in blue color in the model.

By default, the Actuator Model was replaced by a discrete block beneath a continuous block dialog, allowing you to continue entering the Actuator Model parameters in the s-domain. In the model window, double-click the Actuator model. Two new fields 'Sample time' and 'Method' were added to the block dialog window. These parameters are used to automatically convert the continuous parameters to equivalent discrete parameters.

Optical Sensor Image Generation

Generating an Optical Sensor Image From Simulated Movement Data

This example shows how to generate a movie with 64 frames and a frame size of 64 by 64 pixels (at 10 frames per second). The movie contains a simulation of a moving target that is moving through a structured background that is itself moving. A jitter motion caused by random vibration is also generated (in a Simulink® model called "aero_vibrati") and the jitter motion is added into the overall sensor motion. Finally, the image is blurred through a Gaussian optical point spread function.

Note: Changing `delt` here also requires a change in the parameters set-up dialog box in the Simulink model "vibration".

```
delt = 0.1;           % Sample time of the generated sequence
num_frames= 64;      % Number of frames to generate
framesize = 64;      % Square frame size in pixels

out = zeros(framesize,framesize,num_frames); % Initialize movie storage as a 3D Array
```

Generate a Target and Define Its Motion

The first stage is to define the shape and motion of the target object. The shape chosen is a large plus sign, and the image is defined by a matrix representing the image intensity at each pixel position. The Target is defined to be traveling from center to bottom right of the image.

```
target = [zeros(3,11)
          zeros(1,5) 6 zeros(1,5)
          zeros(1,5) 6 zeros(1,5)
          zeros(1,3) 6 6 6 6 zeros(1,3) % Target is a plus sign 5 by 5 pixels across
          zeros(1,5) 6 zeros(1,5)      % with an intensity of 6 (S/N ratio is ~4).
          zeros(1,5) 6 zeros(1,5)      % The total target image is made on an 11x11 grid to
          zeros(3,11)];                 % allow the image to be interpolated without error.

target_velx = 1; % target velocity in x direction in pixels per second
target_vely = 1; % target velocity in y direction in pixels per second
target_x_initially = framesize/2; % the target is initially in the center of the frame in x
target_y_initially = framesize/2; % and in y

figure(1);
colormap('gray');
image(target*32);
title('Target Image')
```

Build Background and Target Composite Image

Generate a sinusoidally correlated background and give it a drift motion. Then, overlay the target onto the background image.

```

backsize = framesize+36; % Make the background bigger than the frame so when it
                        % drifts there are new pixels available to drift into.
xygrid = (1:backsize)/backsize;
B=2*sin(2*pi*xygrid).^2*cos(2*pi*xygrid).^2;

psd = fft2(B);
psd = real(psd.*conj(psd));

background = B + 0.5*randn(backsize); % Add a specular Gaussian white
                                     % sequence to the structure with
                                     % variance of 0.25 (sigma of 0.5).

xoff = 10;
yoff = 10; % Sensor location is offset from the 0,0 of the background
driftx = 1;
drifty = 1; % drift rate of the background in a and y directions pix/sec.

minout = min(min(min(background)));
maxout = max(max(max(background)));
colormap('gray');
image((background-minout)*64/(maxout-minout))
title('Background image with additive white specular noise')

```

Simulate the Tracker's Rotational Vibration

Rotational vibration of the tracker is simulated using model `aero_vibrati`. The data required to simulate the vibration of the tracker is generated by running the Simulink model "aero_vibrati".

Run Simulink vibration model using `sim` command (Note -- if the `delt` is changed from 0.1 seconds, the Simulink model must be changed also to ensure that the sample time for the vibration match the sample time in this tracker image model).

The resulting random rotations are shown in Figure 1.

```
omega = 2*pi*5;           % The structural frequencies are 5, 10 and 15 Hz in the model.
zeta   = 0.01;           % Damping ratio for all modes

open_system('aero_vibrati')
simout = sim('aero_vibrati', 'SrcWorkspace', 'current');

vibdat = simout.get('vibdat');           % The Simulink model "aero_vibrati"
                                         % generates the vibration data at
                                         % a sample time of 0.01 sec.
vibx   = vibdat(1:10:1000);             % The output of simulation is
                                         % returned as the variable simout
viby   = vibdat(1001:10:2000);          % The variable simout contains
                                         % the in array vibdat that contains
                                         % the vibration data

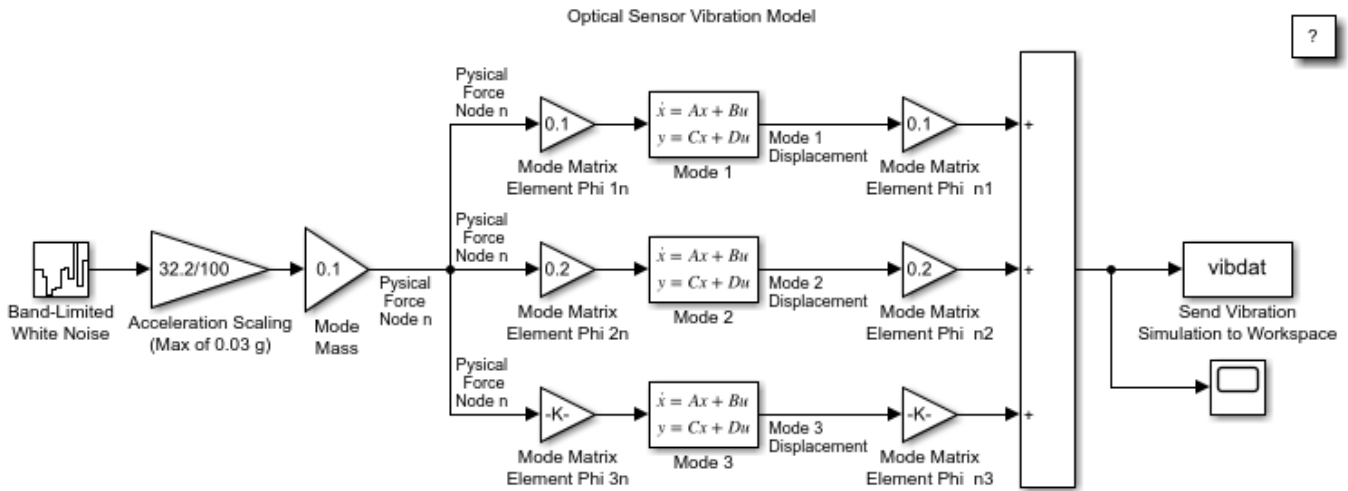

levarmx = 10;   % Rotational lever arm for vibration noise in x
```

```

levarmy = 10; % and in y.

subplot(211);
plot(0.01*(1:10:1000),vibx);grid;
title('Time history of the random Tracker rotations')
xlabel('Time');ylabel('x direction')

subplot(212);
plot(0.01*(1:10:1000),viby);grid;
xlabel('Time');ylabel('y direction')
    
```

Simulate the Motion Effects From the Background, Target, and Jitter

The frames that will make up the movie are now created and stored in a multidimensional array (out). Each frame has the background and target at differing positions due to the target motion, background drift, and tracker vibration. The first frame of the movie will be shown in Figure 1.

```
clf; drawnow;
```

```
for t = 1:num_frames
```

```
    % Drift the Background at the rate driftx and drifty
    % (in pixels/second) and add in the vibration:
    xshift = driftx*delt*t+levarmx*vibx(t,1);
    yshift = drifty*delt*t+levarmy*viby(t,1);
```

```
    % Interpolate the 2D image using the MATLAB(R) function interp2:
    [xgrid, ygrid] = meshgrid(1:backsize);
    [xindex, yindex] = meshgrid(xshift:1:xshift+backsize,yshift:1:yshift+backsize);
    outtemp = interp2(xgrid,ygrid,background,xindex,yindex);
```

```
    % Truncate the drifted image down from backsize to framesize:
    out(:, :, t) = outtemp(xoff:xoff+framesize-1,xoff:xoff+framesize-1);
```

```
    % Now let the target move also:
    tpixinx = floor(target_velx*delt*t);
    tpixiny = floor(target_vely*delt*t); % Before interpolating extract the number of pixels moved
    txi = target_velx*delt*t - tpixinx;
```

```

tyi = target_vely*delt*t - tpixiny; % Interpolate on sub-pixels around the origin only
[txgrid tygrid] = meshgrid(1:11); % meshgrid here generates a matrix of grid elements
[txi tyi] = meshgrid(txi+1:txi+11,tyi+1:tyi+11); % meshgrid generates 2 matrices with the x and y coordinates

% Interpolate the intensity values first using interp2 -- a built in MATLAB command
temp = interp2(txgrid,tygrid,target,txi,tyi);

% Insert the target at the location determined by the initial offset, and the number of whole pixels
tx = tpixinx + target_x_initially-1;
ty = tpixiny + target_y_initially-1;
out(tx:tx+6,ty:ty+6,t) = temp(9:-1:3,9:-1:3) + out(tx:tx+6,ty:ty+6,t);

end

minout = min(min(min(out)));
maxout = max(max(max(out)));
colormap('gray');
image((out(:,:,1)-minout) * 64/(maxout-minout));
title('First frame of combined target and background image.')

```

Pass the Images Through Optics -- Use a Gaussian "Aperture Function"

This code segment can use a measured aperture function just as easily - simply replace the next five lines by "load measured_aperture" where measured_aperture is the measured function stored in ASCII and the data stored in the file measured_aperture.mat is a MATLAB® .mat file that contains the matrix apfunction. (in MATLAB type "help load" for how to use load and look at the c and fortran code that shows how to read and write MATLAB .mat files).

(Note: When the Point Spread Function is Gaussian, then so is the Aperture function)

To simulate the effect of the tracker optics, each of the movie frames is now blurred using a 2-D FFT (Fast Fourier Transform). The first frame of the resulting image is shown in Figure 1.

```
x = 1:framesize;
y = 1:framesize;
sigma = 120;
apfunction = exp(-(x-framesize/2).^2/(2*sigma))' * exp(-(y-framesize/2).^2/(2*sigma));
apfunction = fftshift(apfunction); % Rotate so it conforms with FFT convention

for j = 1:num_frames
    out(:,:,j) = real(ifft2(apfunction.*fft2(out(:,:,j))));
end

minout = min(min(min(out)));
maxout = max(max(max(out)));
colormap('gray');
image((out(:,:,1)-minout)*64/(maxout-minout));
title('First frame of blurred image.')
```

Generate the MATLAB® Movie and Play It Back

Scale the movie frame so that it has 64 intensity values from the min to the max and then show the result as an image. See MATLAB help for how the `moviein` and `getframe` work.

```
minout = min(min(min(out)));
maxout = max(max(max(out)));
```

```
M = moviein(num_frames);
for j = 1:num_frames
    image((out(:,:,j)-minout)*64/(maxout-minout))
    drawnow
    M(:,j) = getframe;
end

% colormap('gray')
% movie(M);
```

OPTIONAL: Save the Movie in a .mat File

You can optionally save the generated tracker movie in a mat file and also save the psd of the background for later use with the movie.

```
save trackerimage out
save psdback psd
save moviedat M
```

```
bdclose('aero_vibrati');
```

Air Traffic Control Radar Design

This example shows how to model a conceptual air traffic control (ATC) radar simulation based on the radar range equation.

Model Description

To make parameters for *Radar System Design* easier to change and easier to determine their values, the model has a GUI. Radar and weather parameters may be changed from this GUI. While simulating, the effects of these parameters can be seen on the scope display which shows the actual aircraft range in yellow and the estimated aircraft range from the radar in magenta. Another output that can be viewed is the calculated signal to noise ratio (SNR) is compared to the ideal SNR. Ideal SNR is also specified from the GUI. The result is shown in the display block and will be either 1 (SNR \geq ideal SNR) or 0 (SNR $<$ ideal SNR).

Simulink® and Stateflow® are used in the model, which is divided into three main subsystems, radar, aircraft, and weather.

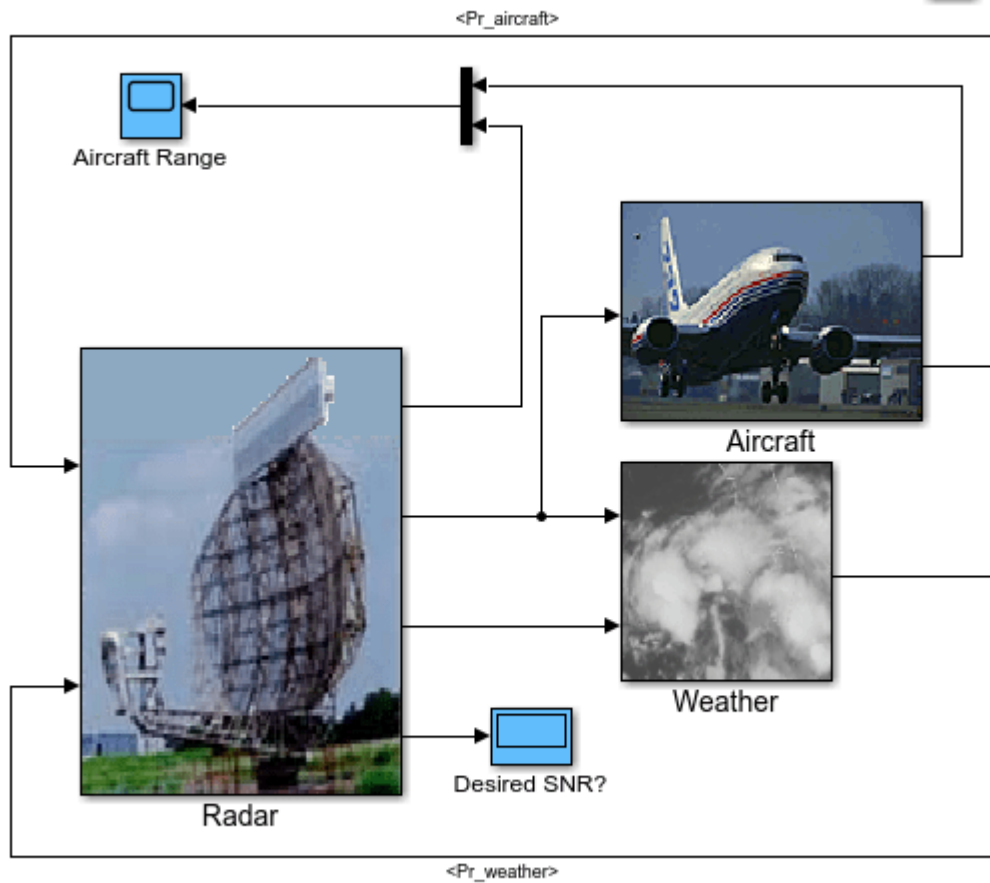

Using subsystems is helpful in two ways: the model is organized and easier to understand and the work can be split between multiple engineers by subsystems. The Stateflow machine labeled "check SNR" performs the logic comparing calculated SNR to the ideal SNR and output data based on this comparison.

You can run the simulation to determine if the radar can pick up the aircraft by the output on the scope. Using the GUI, the radar and the weather parameters can be altered and will change the range where the aircraft can be "seen".

Open and simulate the `aero_atc` model.

```
open_system('aero_atc');
```

Design Issues

Radar systems are designed for a specific purpose and can very seldom be used for other applications effectively. Each new radar specification requires the computation of new parameter values. When designing a radar for an application, there are a number of parameters which shape the design. Some of these parameters are contained or derived logically from the customer specification. Others are selected arbitrarily using the design engineer's best judgment. This is the first approximate solution for the system design. From here, continual refinement of the design parameters takes place until an optimum design is reached. If any changes occur in the customer specification, it could cause a need to rework the design process over from the beginning. The parametric nature of this design strategy lends itself to automation.

Design Specification

We're interested in performing conceptual design for a ground-based air traffic control (ATC) radar. Let's take a look at a potential customer specification.

- **Customer Requirements**

- Maximum Range = 50 Nautical Miles
- Lateral Resolution = 2 Nautical Miles
- Range Resolution = 150 meters

- **Logically Derived Parameters**

- Scan Time, Hits per Scan, Receiver Bandwidth, SNR, Antenna Gain, $\text{Power}_{\text{ave}} * \text{Antenna Aperture}$

- **Best-Judgement Parameters**

- Target Cross-Section, Detection Performance, Coverage, Pulse Repetition Frequency, Integration Efficiency, Transmitted Waveform, Receiver Noise Figure, Attenuation, System Losses

- **Additional Concerns**

- Weather

© 1999 The MathWorks, Inc.

This is an example of a customer specification upon which a design process would be based. The customer, possibly the FAA, provides some basic requirements for the radar design leaving a number of parameter selections up to the design engineer.

It should be noted that some of the logically derived parameters depend on assumptions made by the engineer and would need to be recalculated each time the best-judgment parameters are optimized. This problem lends itself well to simulation. By using Simulink and Stateflow, the design engineer has the analysis capability to have time-varying design cases for Monte Carlo test runs, i.e.: aircraft cross-sections and locations, weather cross-sections, and locations.

MathWorks® Products in the Design Process

Here's how MathWorks® products fit the job of conceptual radar design:

Using the customer specification and the radar range equations along with equations describing the physics of the system, a model is built in MATLAB®, Simulink, and Stateflow. Using the model with the `sim` command for batch runs, those best-judgment parameters can be optimized for various conditions, weather, aircraft, using a Monte Carlo simulation run to prove robustness. The result is a set of optimized radar parameters that can be used to build a detailed block diagram model of the full radar system for further system analysis in Simulink with the DSP System Toolbox™.

Designing a Guidance System in MATLAB and Simulink

This example shows how to use the model of the missile airframe presented in a number of published papers (References [1], [2] and [3]) on the use of advanced control methods applied to missile autopilot design. The model represents a tail controlled missile traveling between Mach 2 and Mach 4, at altitudes ranging between 10,000ft (3,050m) and 60,000ft (18,290m), and with typical angles of attack ranging between +/-20 degrees.

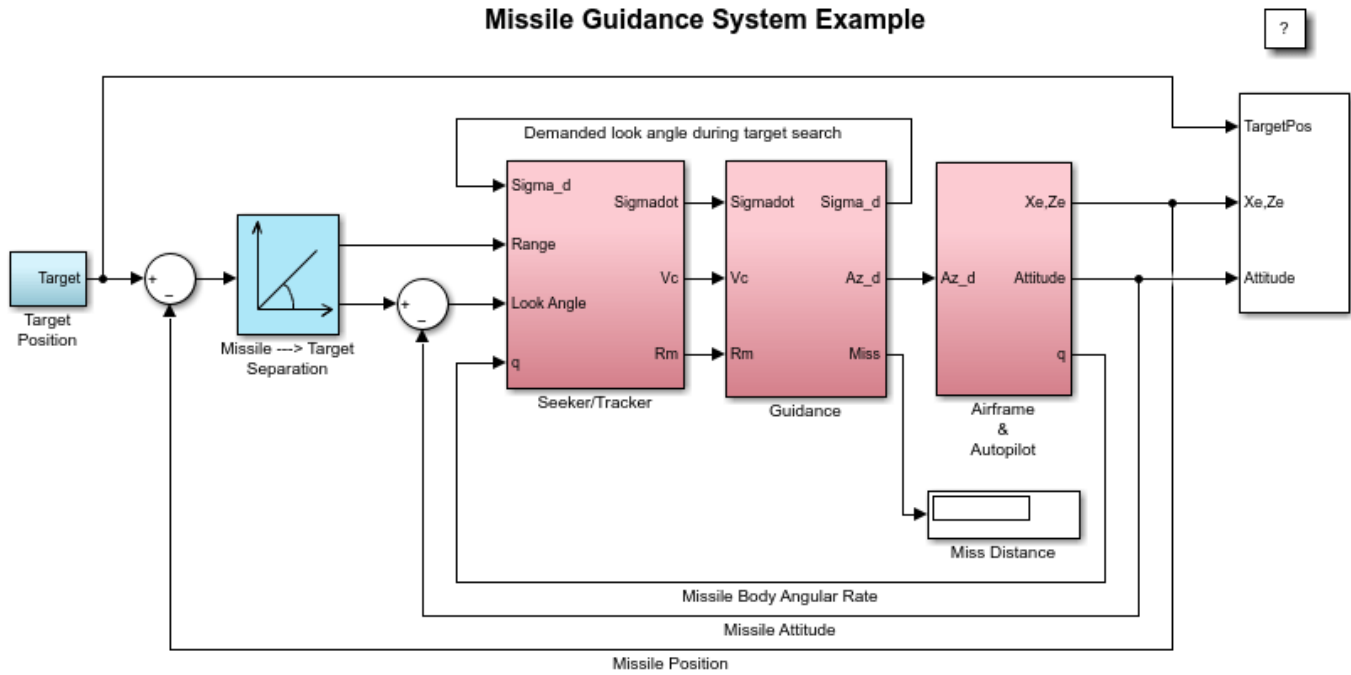

Model of the Airframe Dynamics

The core element of the model is a nonlinear representation of the rigid body dynamics of the airframe. The aerodynamic forces and moments acting on the missile body are generated from coefficients that are non-linear functions of both incidence and Mach number. The model can be created with Simulink® and the Aerospace Blockset™. The aim of this blockset is to provide reference components, such as atmosphere models, which will be common to all models irrespective of the airframe configuration. Simplified versions of the components available in the Aerospace Blockset are included with these examples to give you a sense of the potential for reuse available from standard block libraries.

Open the model.

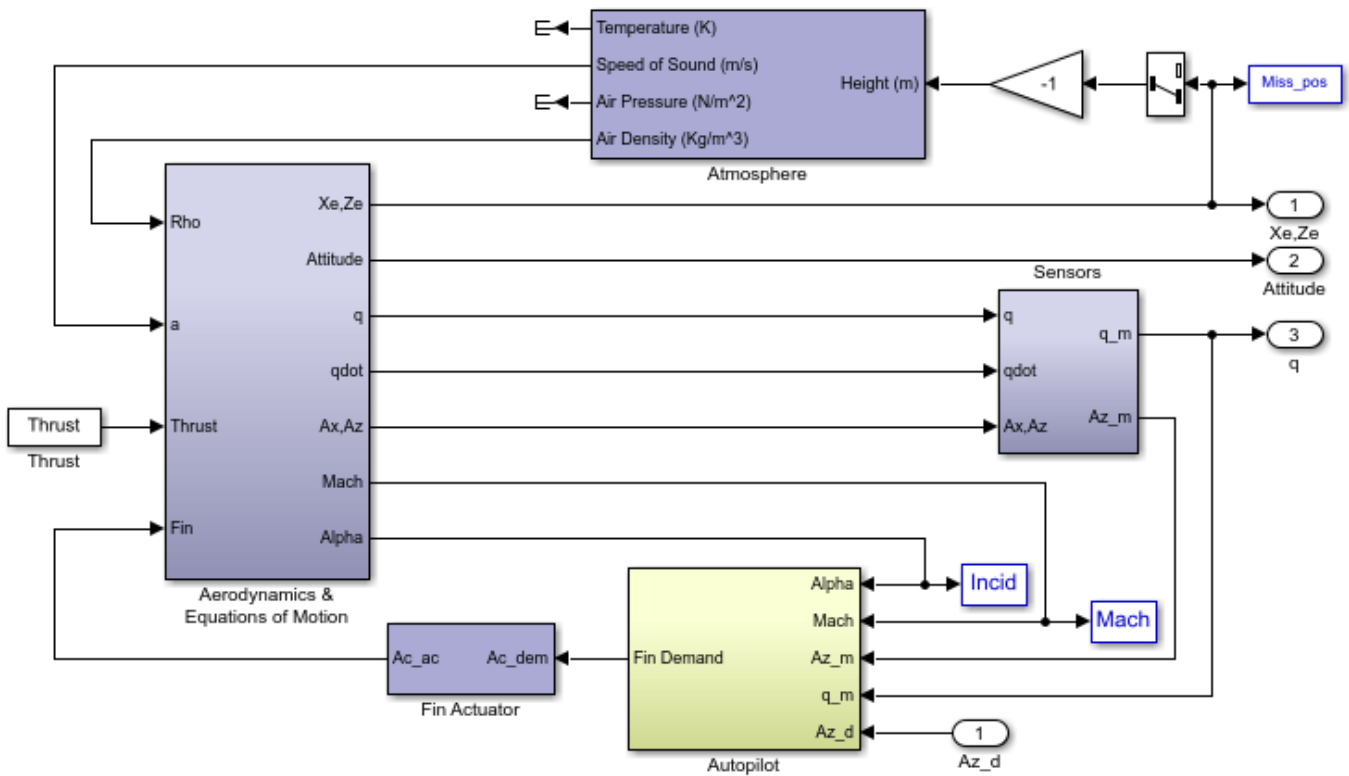

Missile Guidance System Example

Copyright 1990-2014 The MathWorks, Inc.

Representing the Airframe in Simulink

The airframe model consists of four principal subsystems, controlled through the acceleration-demand autopilot. The Atmosphere model calculates the change in atmospheric conditions with changing altitude, the Fin Actuator and Sensors models couple the autopilot to the airframe, and the Aerodynamics and Equations of Motion model calculates the magnitude of the forces and moments acting on the missile body, and integrates the equations of motion.

International Standard Atmosphere Model

$$\text{Troposphere Model} = \begin{cases} T = T_0 - Lh \\ \rho = \rho_0 \left(\frac{T}{T_0} \right)^{(g/LR)-1} \\ P = P_0 \left(\frac{T}{T_0} \right)^{(g/LR)} \\ a = \sqrt{\gamma RT} \end{cases}$$

T_0 = Absolute temperature at mean sea level [K]

ρ_0 = Air density at mean sea level [Kg/m³]

P_0 = Static pressure at mean sea level [N/m²]

h = Altitude [m]

T = Temperature at altitude h

ρ = Air density at altitude h

P = Static pressure at altitude h

a = Speed of sound at altitude h

L = Lapse rate [K/m]

R = Characteristic gas constant [J/Kg/K]

g = Acceleration due to gravity [m/s²]

The Atmosphere Subsystem that is used is an approximation to the International Standard Atmosphere, and is split into two separate regions. The troposphere region lies between sea level and 11Km, and in this region there is assumed to be a linear temperature drop with changing altitude. Above the troposphere lies the lower stratosphere region ranging between 11Km and 20Km. In this region the temperature is assumed to remain constant.

Aerodynamic Coefficients for Constructing Forces and Moments

The Aerodynamics & Equations of Motion Subsystem generates the forces and moments applied to the missile in body axes, and integrates the equations of motion which define the linear and angular motion of the airframe.

The aerodynamic coefficients are stored in datasets, and during the simulation the value at the current operating condition is determined by interpolation using 2-D lookup table blocks.

Classical Three Loop Autopilot Design

The aim of the missile autopilot is to control acceleration normal to the missile body. In this example the autopilot structure is a three loop design using measurements from an accelerometer placed

ahead of the center of gravity, and a rate gyro to provide additional damping. The controller gains are scheduled on incidence and Mach number, and are tuned for robust performance at an altitude of 10,000 ft.

To design the autopilot using classical design techniques requires that linear models of the airframe pitch dynamics be derived about a number of trimmed flight conditions. MATLAB® can determine the trim conditions, and derive linear state space models directly from the non-linear Simulink model, saving both time, and aiding in the validation of the model that has been created. The functions provided by the MATLAB Control System Toolbox™ and Simulink® Control Design™ allow the designer to visualize the behavior of the airframe open loop frequency (or time) responses. To see how to trim and linearize the airframe model you can run the companion example, "Airframe Trim and Linearize".

Airframe Frequency Response

Autopilot designs are carried out on a number of linear airframe models derived at varying flight conditions across the expected flight envelope. To implement the autopilot in the non-linear model involves storing the autopilot gains in 2 dimensional lookup tables, and incorporating an anti-windup gain to prevent integrator windup when the fin demands exceed the maximum limits. Testing the autopilot in the nonlinear Simulink model is then the best way to show satisfactory performance in the presence of non-linearities such as actuator fin and rate limits, and with the gains now dynamically varying with changing flight condition.

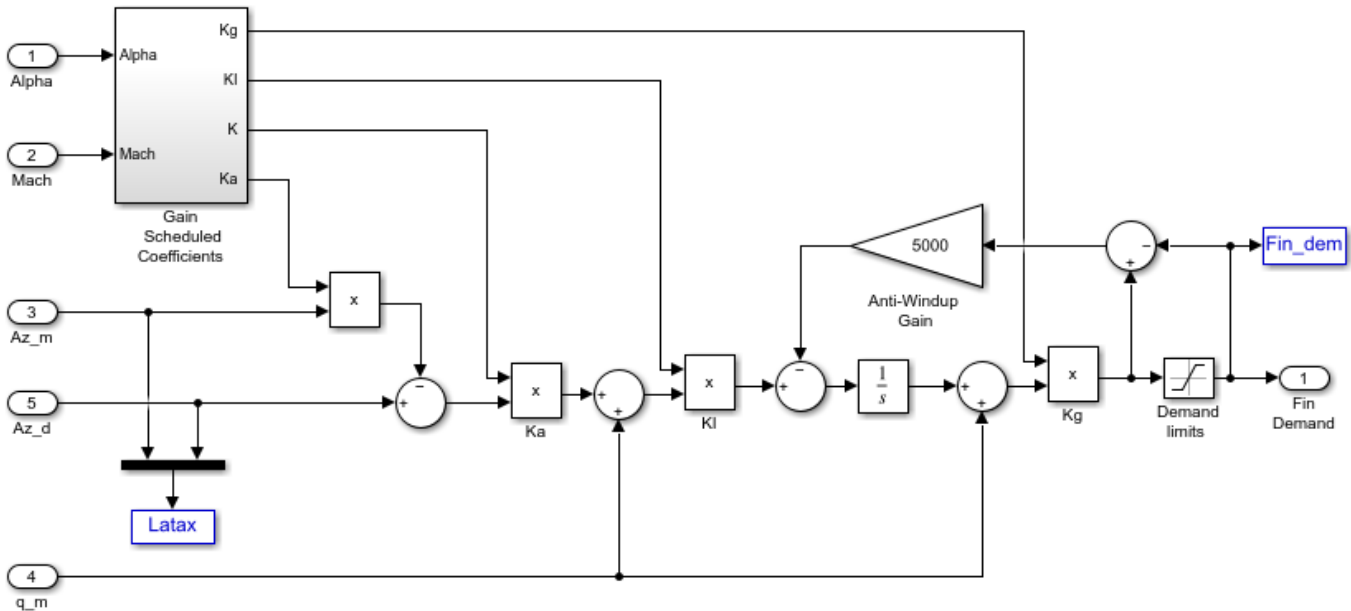

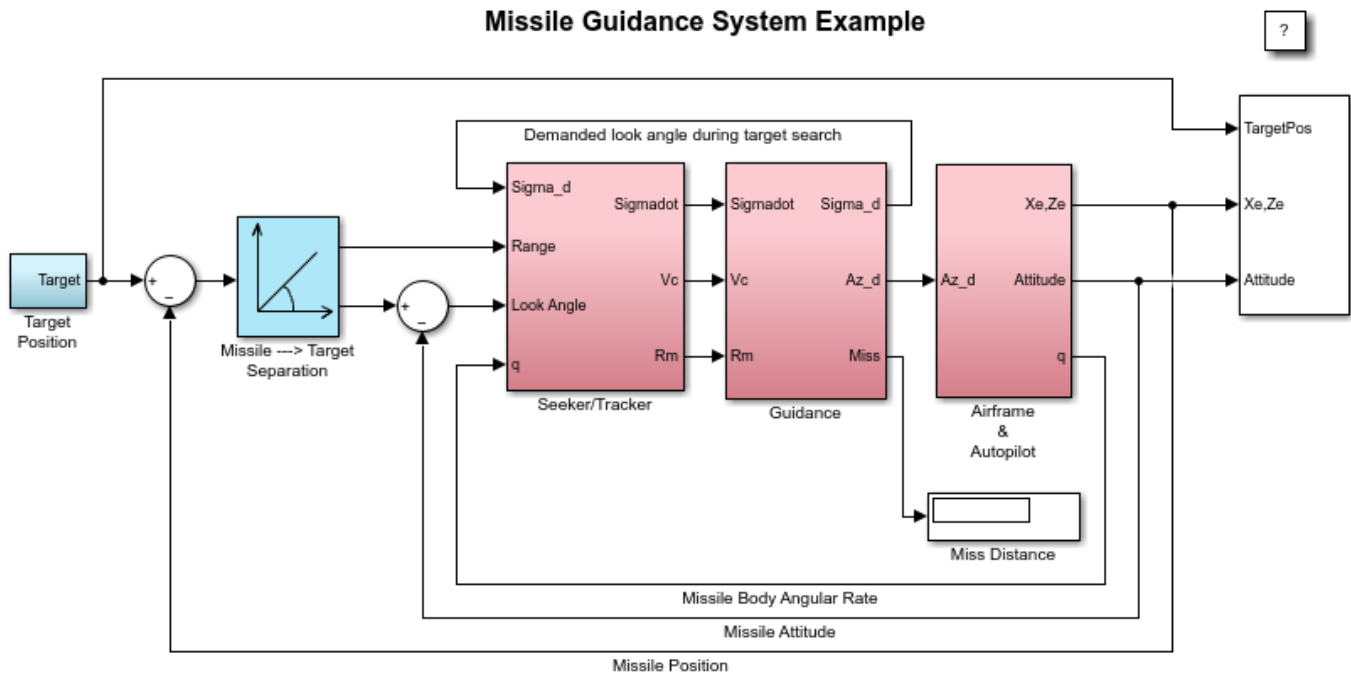

Figure: Simulink implementation of gain scheduled autopilot

Homing Guidance Loop

The complete Homing Guidance Loop consists of a Seeker/Tracker Subsystem which returns measurements of the relative motion between the missile and target, and the Guidance Subsystem which generates normal acceleration demands which are passed to the autopilot. The autopilot is now part of an inner loop within the overall homing guidance system. Reference [4] provides information on the differing forms of guidance that are currently in use, and provides background information on the analysis techniques that are used to quantify guidance loop performance.

Guidance Subsystem

The function of the Guidance subsystem is to not only generate demands during closed loop tracking, but also perform an initial search to locate the target position. A Stateflow® model is used to control the transfer between these differing modes of operation. Switching between modes is triggered by events generated either in Simulink, or internal to the Stateflow model. Controlling the way the Simulink model then behaves is achieved by changing the value of the variable **Mode** that is passed out to Simulink. This variable is used to switch between the differing control demands that can be generated. During target search the Stateflow model controls the tracker directly by sending demands to the seeker gimbals (**Sigma**). Target acquisition is flagged by the tracker once the target lies within the beamwidth of the seeker (**Acquire**), and after a short delay closed loop guidance starts. Stateflow is an ideal tool for rapidly defining all the operational modes, whether they are for normal operation, or unusual situations. For example, the actions to be taken should there be loss of lock on the target, or should a target not be acquired during target search are catered for in this Stateflow diagram.

Proportional Navigation Guidance

Once the seeker has acquired the target a Proportional Navigation Guidance (PNG) law is used to guide the missile until impact. This form of guidance law has been used in guided missiles since the 1950s, and can be applied to radar, infrared or television guided missiles. The navigation law requires measurements of the closing velocity between the missile and target, which for a radar guided missile could be obtained using a Doppler tracking device, and an estimate for the rate of change of the inertial sightline angle.

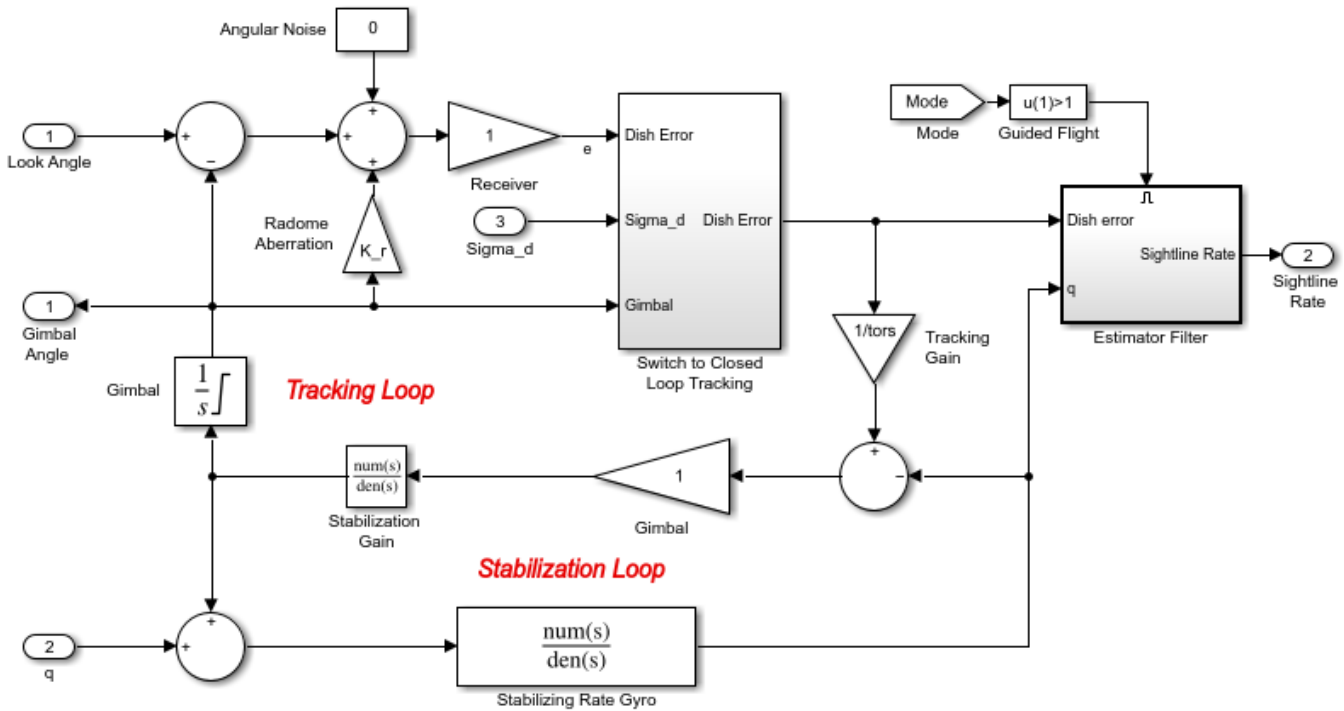

Figure: Proportional Navigation Guidance Law

Seeker/Tracker Subsystem

The aim of the Seeker/Tracker Subsystem is both to drive the seeker gimbals to keep the seeker dish aligned with the target, and to provide the guidance law with an estimate of the sightline rate. The tracker loop time constant **tors** is set to 0.05 seconds, and is chosen as a compromise between maximizing speed of response, and keeping the noise transmission to within acceptable levels. The stabilization loop aims to compensate for body rotation rates, and the gain **Ks**, which is the loop cross-over frequency, is set as high as possible subject to the limitations of the bandwidth of the stabilizing rate gyro. The sightline rate estimate is a filtered value of the sum of the rate of change of the dish angle measured by the stabilizing rate gyro, and an estimated value for the rate of change of the angular tracking error (**e**) measured by the receiver. In this example the bandwidth of the estimator filter is set to half that of the bandwidth of the autopilot.

Radome Aberration

For radar guided missiles a parasitic feedback effect that is commonly modelled is that of radome aberration. It occurs because the shape of the protective covering over the seeker distorts the returning signal, and then gives a false reading of the look angle to the target. Generally the amount of distortion is a nonlinear function of the current gimbal angle, but a commonly used approximation is to assume a linear relationship between the gimbal angle and the magnitude of the distortion. In the above system, the radome aberration is accounted for in the gain block labeled "Radome Aberration". Other parasitic effects, such as sensitivity in the rate gyros to normal acceleration, are also often modelled to test the robustness of the target tracker and estimator filters.

Figure: Radome aberration geometry

Running the Guidance Simulation

Now to show the performance of the overall system. In this case the target is defined to be traveling at a constant speed of 328m/s, on a reciprocal course to the initial missile heading, and 500m above the initial missile position. From the simulation results it can be determined that acquisition occurred 0.69 seconds into the engagement, with closed loop guidance starting after 0.89 seconds. Impact with the target occurred at 3.46 seconds, and the range to go at the point of closest approach was calculated to be 0.265m.

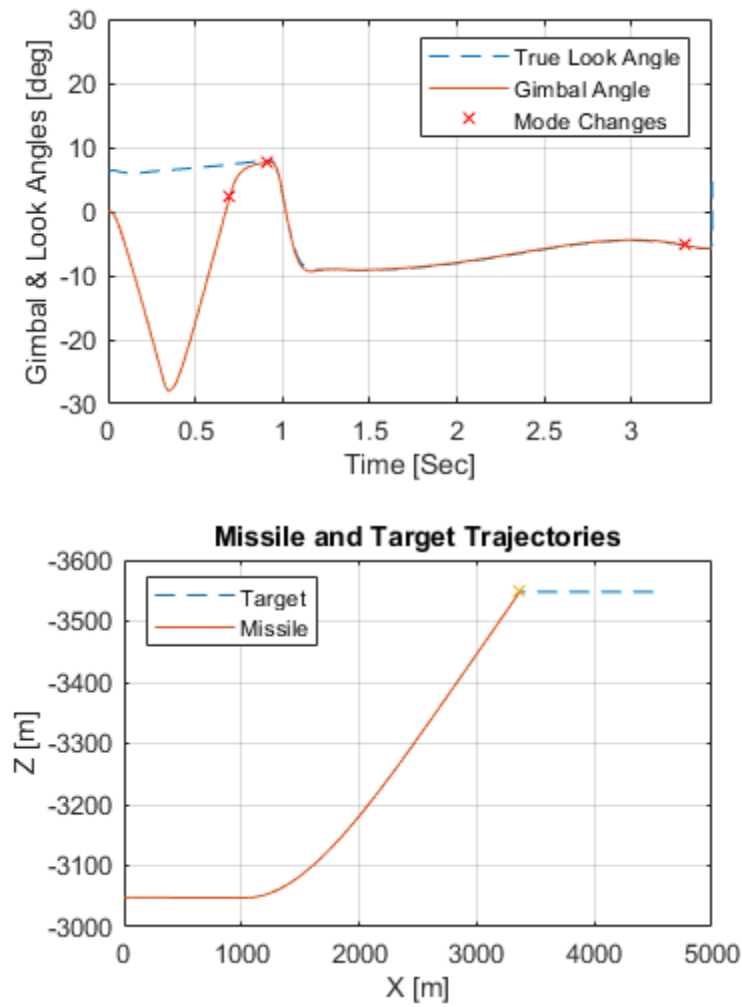

The `aero_guid_plot.m` script creates a performance analysis

Airframe Trim and Linearize

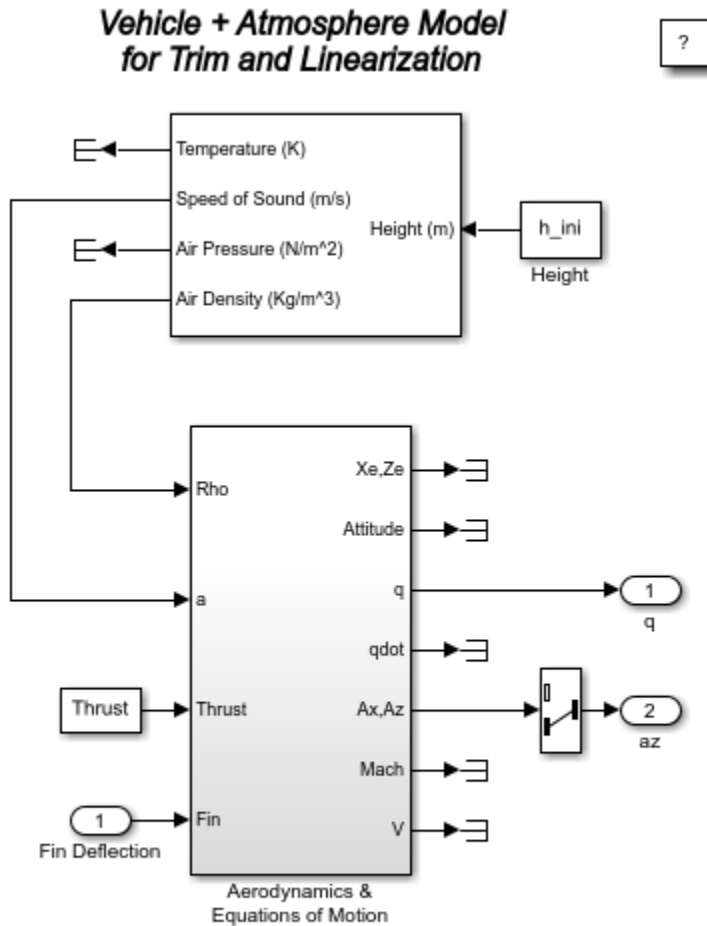

This example shows how to trim and linearize an airframe using Simulink® Control Design™

Designing an autopilot using classical design techniques requires linear models of the airframe pitch dynamics for a number of trimmed flight conditions. MATLAB® can determine the trim conditions and derive linear state-space models directly from the nonlinear Simulink® and Aerospace Blockset™ model. This saves time and helps to validate the model. The functions provided by Simulink Control Design allow you to visualize the behavior of the airframe in terms of open-loop frequency (or time) responses.

Initialize Guidance Model

The first problem is to find the elevator deflection, and the resulting trimmed body rate (q), which will generate a given incidence value when the missile is traveling at a set speed. Once the trim condition is found, a linear model can be derived for the dynamics of the perturbations in the states around the trim condition.

```
open_system('aero_guidance_airframe');
```

Define State Values

```

h_ini    = 10000/m2ft;      % Trim Height [m]
M_ini    = 3;               % Trim Mach Number
alpha_ini = -10*d2r;       % Trim Incidence [rad]
theta_ini = 0*d2r;         % Trim Flightpath Angle [rad]
v_ini    = M_ini*(340+(295-340)*h_ini/11000); % Total Velocity [m/s]

q_ini    = 0;              % Initial pitch Body Rate [rad/sec]

```

Set Operating Point and State Specifications

The first state specifications are Position states, the second state specification is Theta. Both are known, but not at steady state. The third state specifications are body axis angular rates of which the variable w is at steady state.

```

opspec = operspec('aero_guidance_airframe');
opspec.States(1).Known = [1;1];
opspec.States(1).SteadyState = [0;0];
opspec.States(2).Known = 1;

```

```
opspec.States(2).SteadyState = 0;
opspec.States(3).Known = [1 1];
opspec.States(3).SteadyState = [0 1];
```

Search for Operating Point, Set I/O, then Linearize

```
op = findop('aero_guidance_airframe',opspec);

io(1) = linio('aero_guidance_airframe/Fin Deflection',1,'input');
io(2) = linio('aero_guidance_airframe/Selector',1,'output');
io(3) = linio(sprintf(['aero_guidance_airframe/Aerodynamics &\n', ...
    'Equations of Motion']),3,'output');

sys = linearize('aero_guidance_airframe',op,io);
```

Operating point search report:

Anti-Windup Control Using a PID Controller

Model Description

This example shows how to use anti-windup schemes to prevent integration wind-up in PID controllers when the actuators are saturated. We use the PID Controller block in Simulink® which features two built-in anti-windup methods, back-calculation and clamping, as well as a tracking mode to handle more complex scenarios.

The plant to be controlled is a saturated first-order process with dead-time.

We start by opening the model.

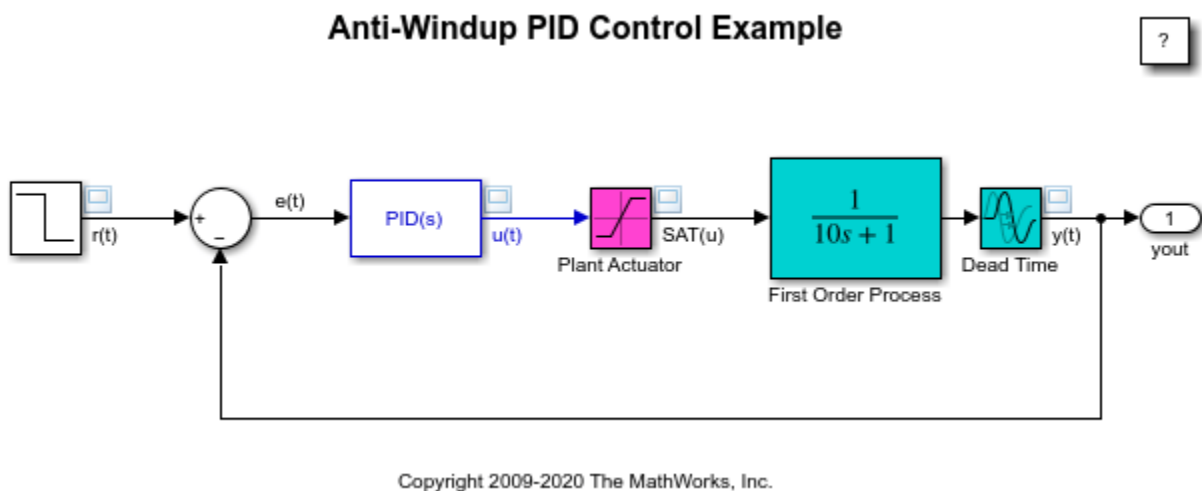

Figure 1: Simulink model of PID control of a plant with input saturation.

To open this model, type `sldemo_antiwindup` in a MATLAB® terminal.

The PID Controller has been tuned with saturation ignored using the PID tuner of Simulink® Control Design™.

The controlled plant is a first-order process with dead-time described by

$$P(s) = \frac{1}{10s + 1} e^{-2s}$$

The plant has known input saturation limits of $[-10, 10]$, which are accounted for in the Saturation block labeled Plant Actuator. The PID Controller block in Simulink features two built-in anti-windup methods that allow the PID Controller block to account for the available information about the plant input saturation.

Performance Without Using Anti-Windup

First, we examine the effect of saturation on the closed-loop when the saturation model is not considered by the PID Controller block. Simulating the model in Figure 1 generates the results shown below.

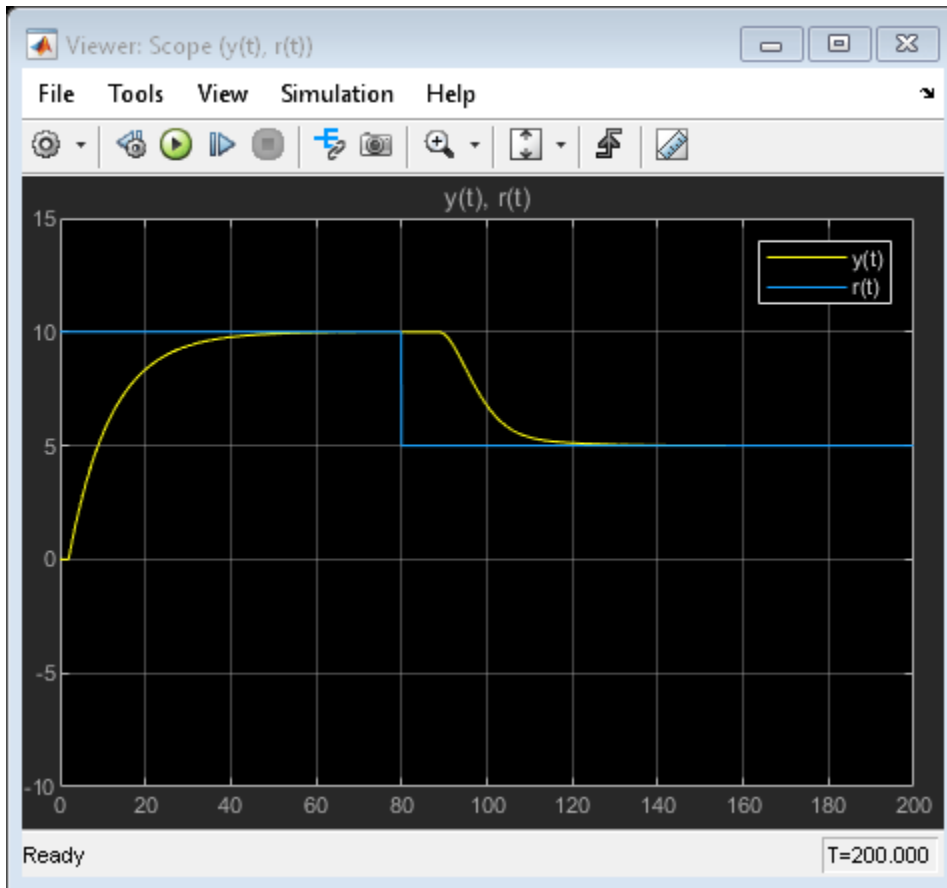

Figure 2: Setpoint vs. measured output with no anti-windup.

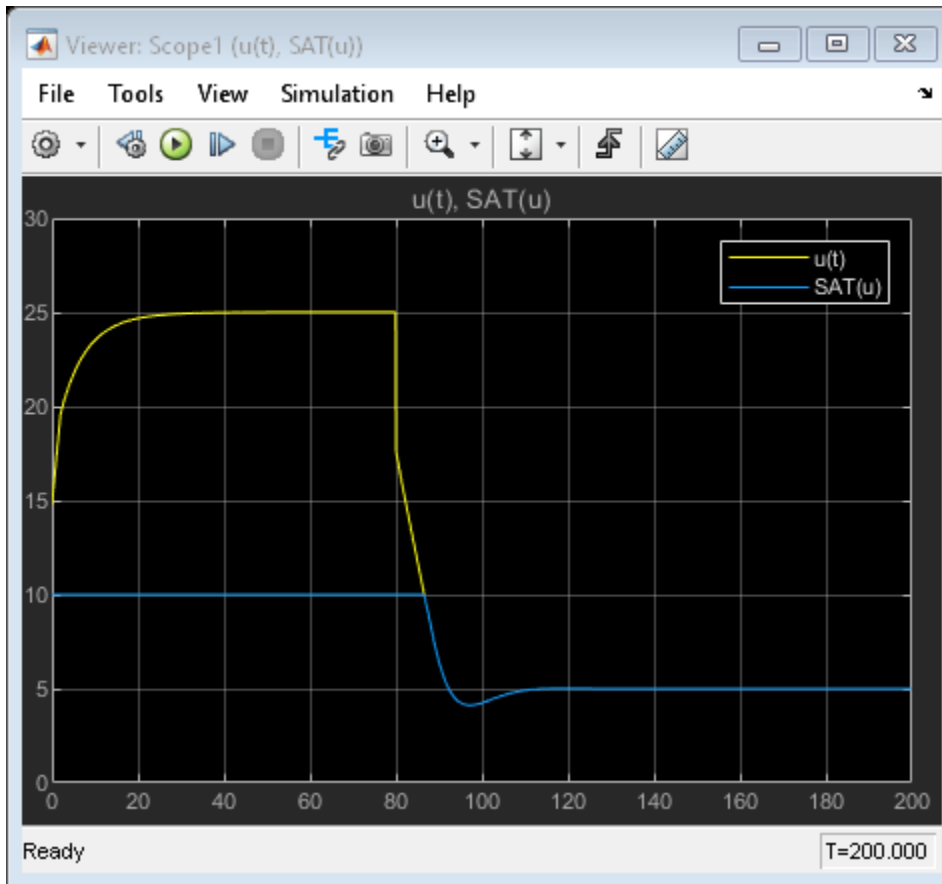

Figure 3: Controller output and saturated input with no anti-windup.

Figures 2 and 3 highlight two of the problems that arise when controlling a system with input saturation:

- 1 When the setpoint value is 10, the PID control signal reaches a steady-state at about 24, outside the range of the actuator. The controller is therefore operating in a nonlinear region where increasing the control signal has no effect on the system output, a condition known as *winding up*. Note that the dc-gain of the plant is unity, and therefore there is no reason for the controller output to have a steady-state value outside the actuator's range.
- 2 When the setpoint value becomes 5, there is a considerable delay before the PID controller output returns to within the actuator range.

Designing the PID controller to account for the effect of saturation will improve its performance by allowing it to operate in the linear region most of the time and recover quickly from nonlinearity. Anti-windup circuitry is one way to achieve this.

Configuring the Block for Anti-Windup Based on Back-Calculation

The back-calculation anti-windup method uses a feedback loop to discharge the PID Controller internal integrator when the controller hits specified saturation limits and enters nonlinear operation. To enable anti-windup, go to the **Output Saturation** tab in the block dialog; select **Limit output**; and enter the plant's saturation limits. Then, select **back-calculation** from the **Anti-windup method** menu and specify the **Back-calculation coefficient (Kb)**. The inverse of this gain is the

time constant of the anti-windup loop. In this example, the back-calculation gain is chosen to be 1. For more information on how to choose this value, see Reference [1].

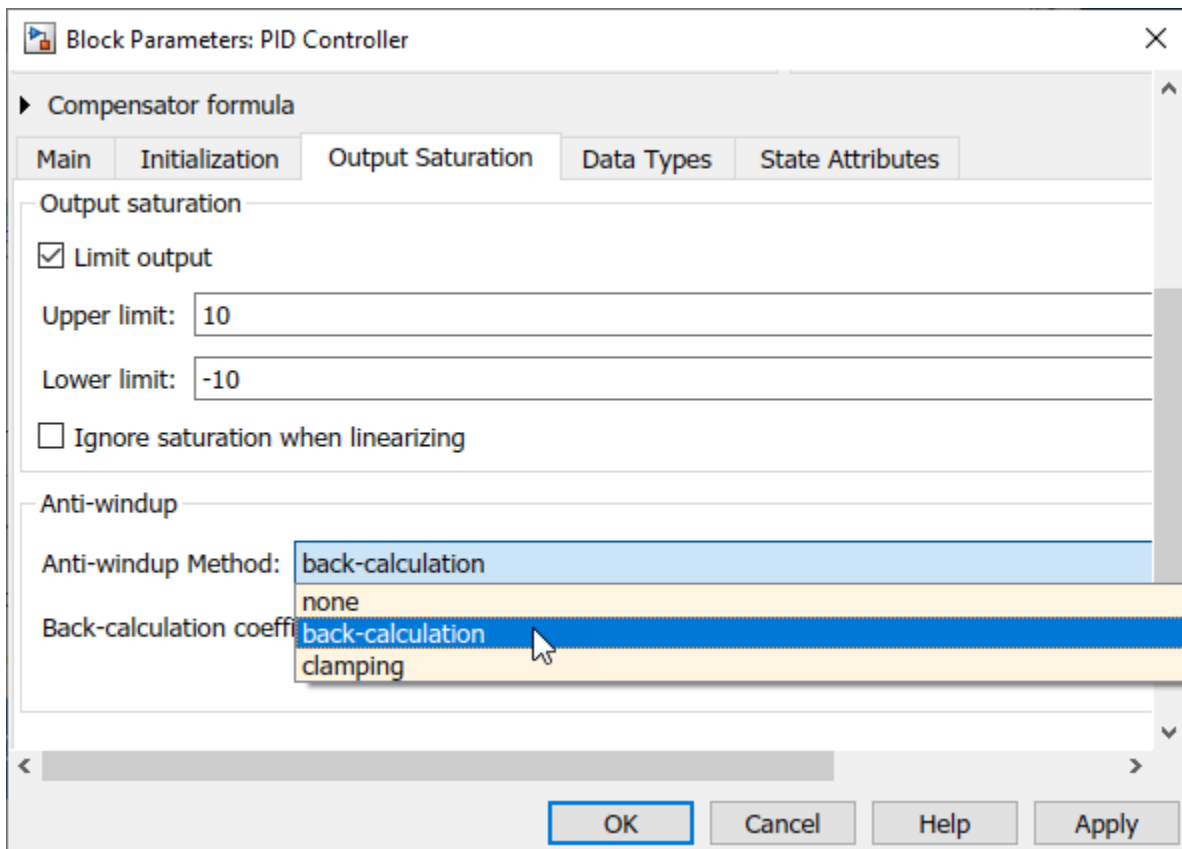

Figure 4: Enabling the back-calculation anti-windup method.

Once back-calculation is enabled, the block has an internal tracking loop that discharges the Integrator output.

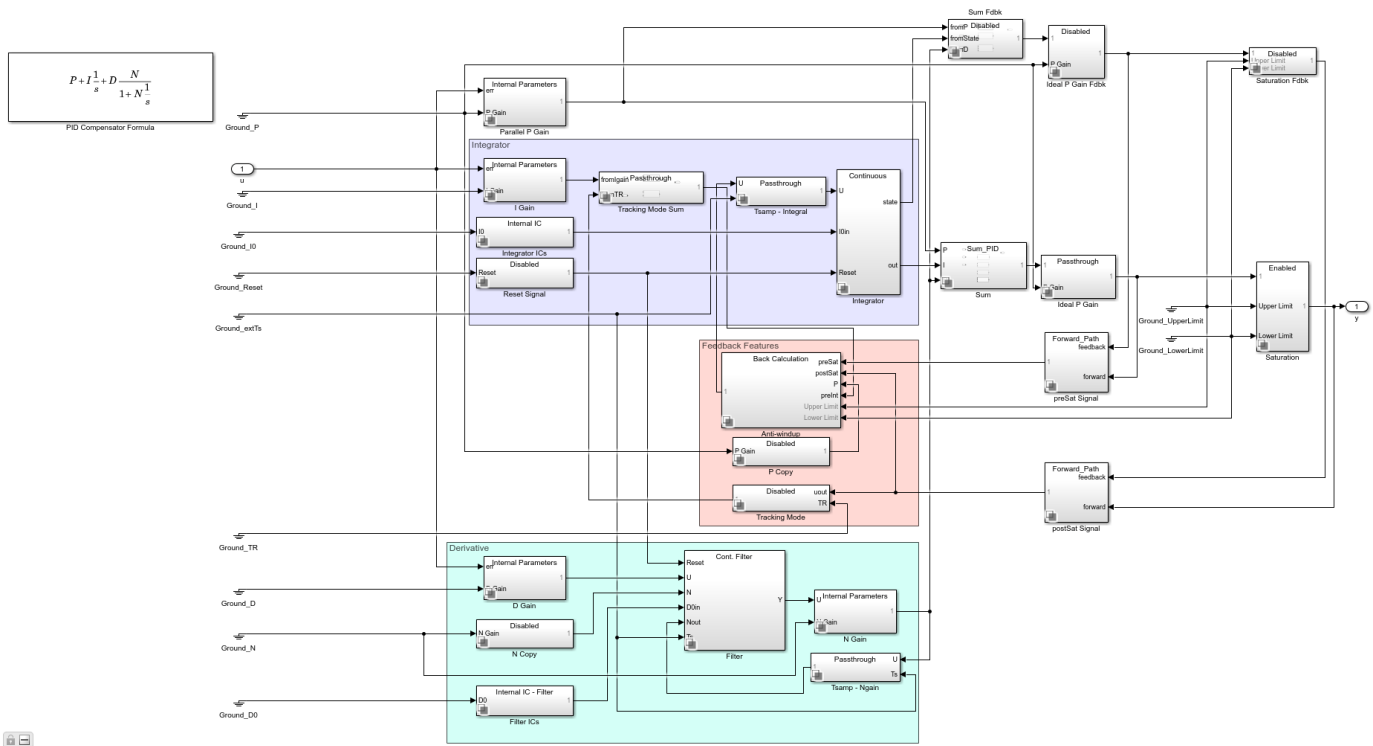

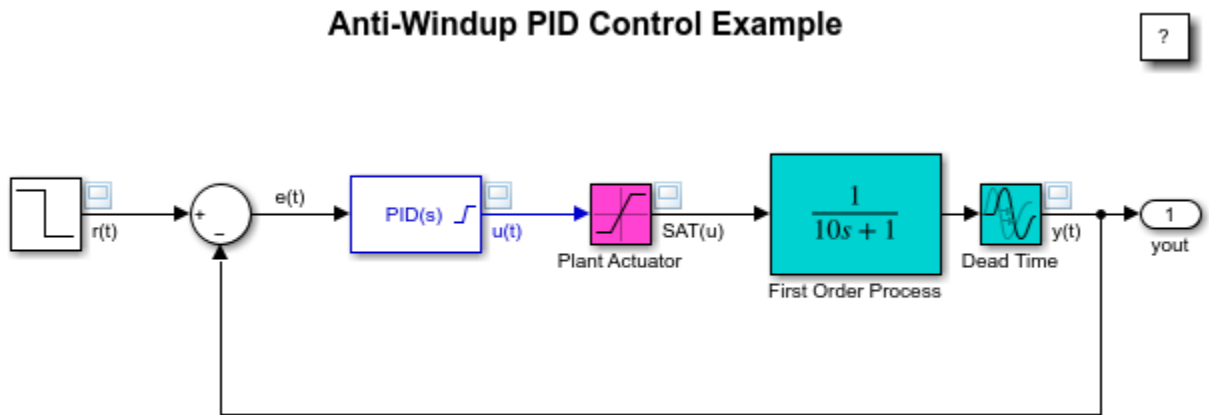

Figure 5: Under-mask view of the PID Controller block with back-calculation.

Figures 6 and 7 illustrate the result of simulating the model with anti-windup activated. Note how quickly the PID control signal returns to the linear region and how fast the loop recovers from saturation.

Copyright 2009-2020 The MathWorks, Inc.

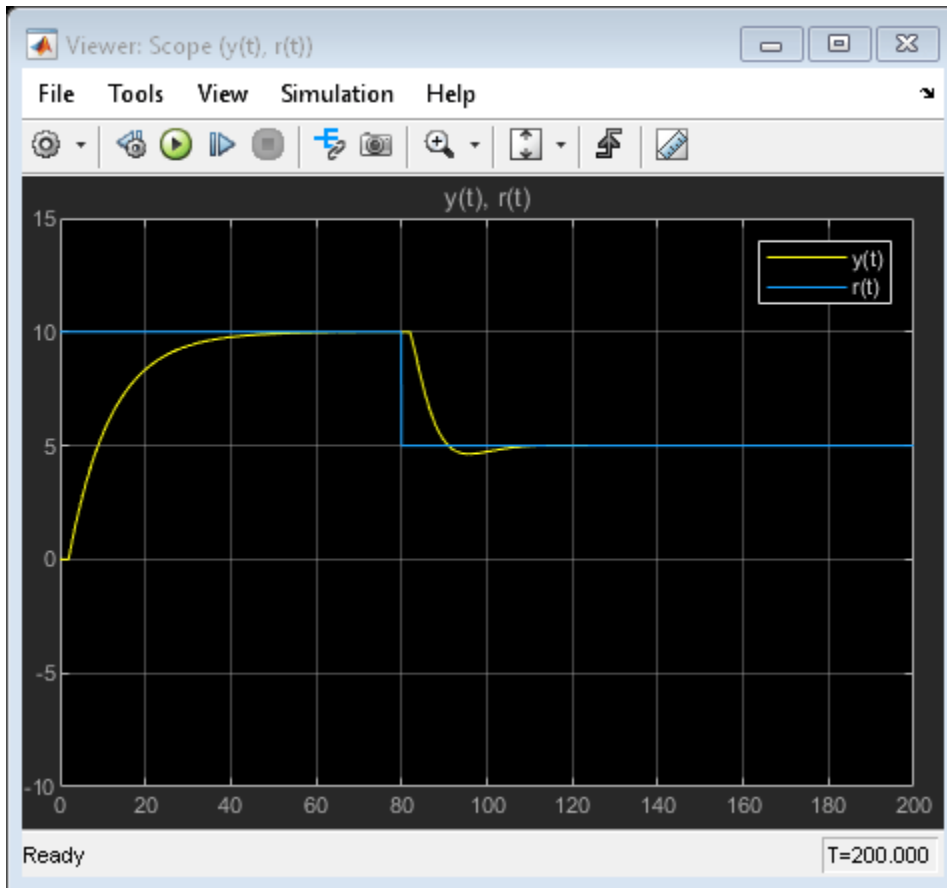

Figure 6: Setpoint vs. measured output with back-calculation.

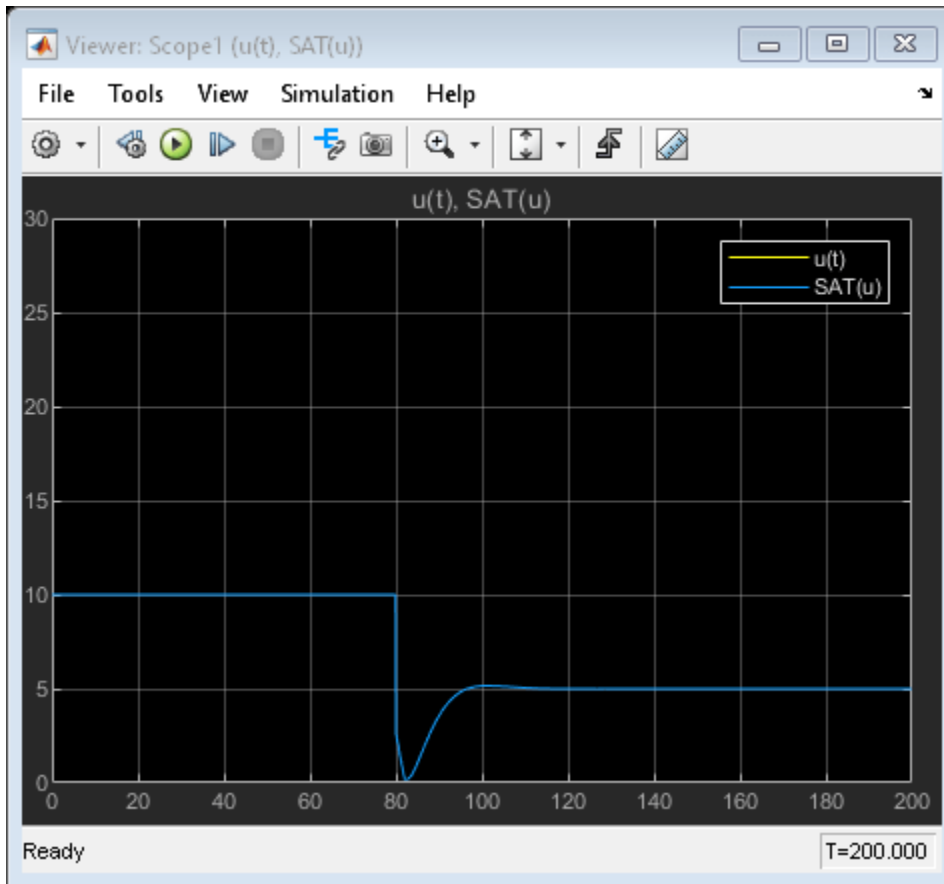

Figure 7: Controller output and saturated input with back-calculation.

Figure 7 shows that the controller output $u(t)$ and the saturated input $SAT(u)$ coincide with each other because **Limit output** is enabled.

To better visualize the effect of anti-windup, Figure 8 illustrates the plant measured output $y(t)$ with and without anti-windup.

Figure 8: Measured output with and without anti-windup.

Configuring the Block for Anti-Windup Based on Integrator Clamping

Another commonly used anti-windup strategy is based on conditional integration. To enable anti-windup, go to the **PID Advanced** tab in the block's dialog; select **Limit output**; and enter the plant's saturation limits. Then, select **clamping** from the **Anti-windup method** menu.

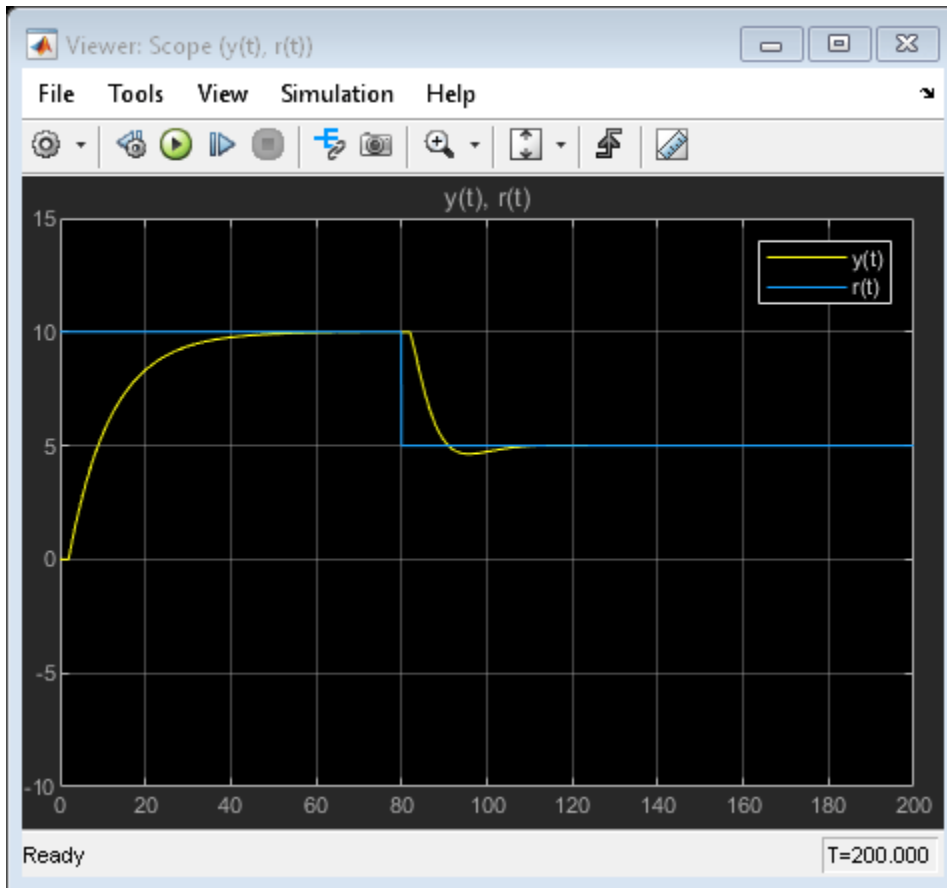

Figure 9: Setpoint vs. measured output with clamping.

Figure 10: Controller output and saturated input with clamping.

Figure 10 shows that the controller output $u(t)$ and the saturated input $SAT(u)$ coincide with each other because **Limit output** is enabled.

For more information on when to use *clamping*, see Reference [1].

Using Tracking Mode to Handle Complex Anti-Windup Scenarios

The previously discussed anti-windup strategies relied on built-in methods to process the saturation information provided to the block via its dialog. For those built-in techniques to work as intended, two conditions must be met:

- 1 The plant's saturation limits are known and can be entered into the dialog of the block.
- 2 The PID Controller output signal is the only signal feeding the actuator.

These conditions may be restrictive when handling general anti-windup scenarios. The PID Controller block features a tracking mode that allows the user to set up a back-calculation anti-windup loop externally. The following two examples are considered to illustrate the use of tracking mode for anti-windup purposes:

- 1 Anti-windup for saturated actuators with cascaded dynamics
- 2 Anti-windup for PID control with Feedforward

Constructing Anti-Windup Circuitry for Saturated Actuators with Cascaded Dynamics

In the following model, the actuator has complex dynamics. This is common when an actuator has its own closed-loop dynamics. The PID controller is in an outer loop and sees the actuator dynamics as an inner loop, or simply a cascaded saturated dynamics as shown in Figure 1.

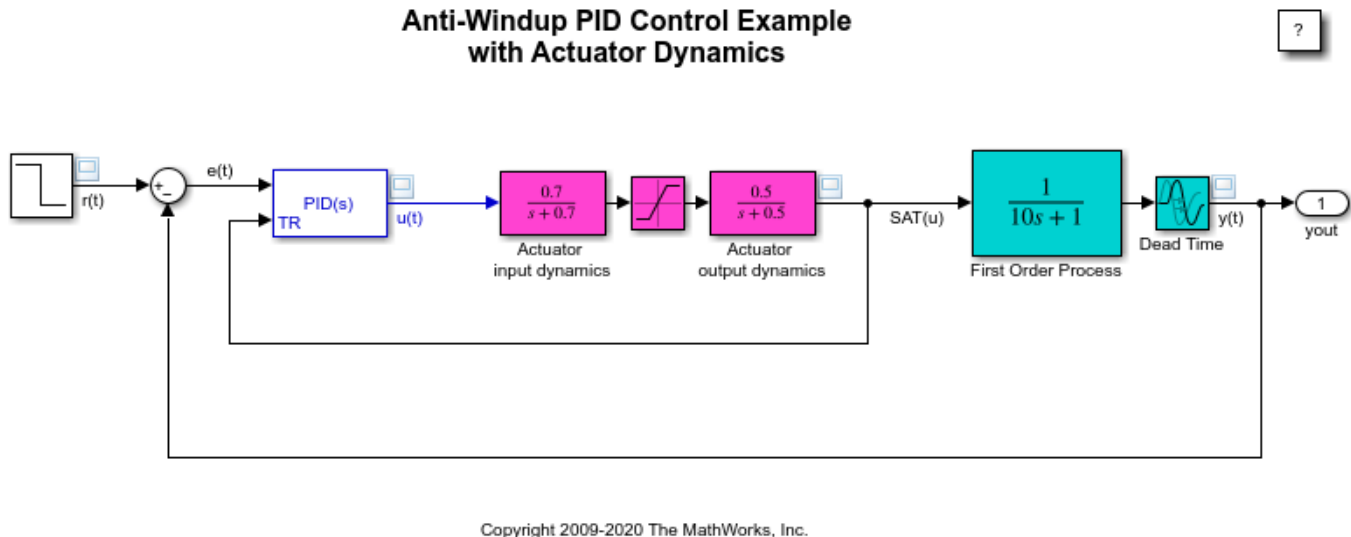

Figure 11: Simulink model of PID controller with cascaded actuator dynamics.

To open this model, type `sldemo_antiwindupactuator` in a MATLAB terminal.

In this case, a successful anti-windup strategy requires feeding back the actuator output to the tracking port of the PID Controller block as shown in Figure 11. To configure the tracking mode of the PID Controller block, go to the **PID Advanced** tab in the block's dialog; select **Enable tracking mode**; and specify the gain K_t . The inverse of this gain is the time constant of the tracking loop. For more information on how to choose this gain, see Reference [1].

Figures 12 and 13 show that the plant's measured output $y(t)$ and the controller output $u(t)$ are responding almost immediately to changes in the setpoint. Without the anti-windup circuit, these responses would be sluggish with long delays.

Figure 12: Setpoint vs. measured output.

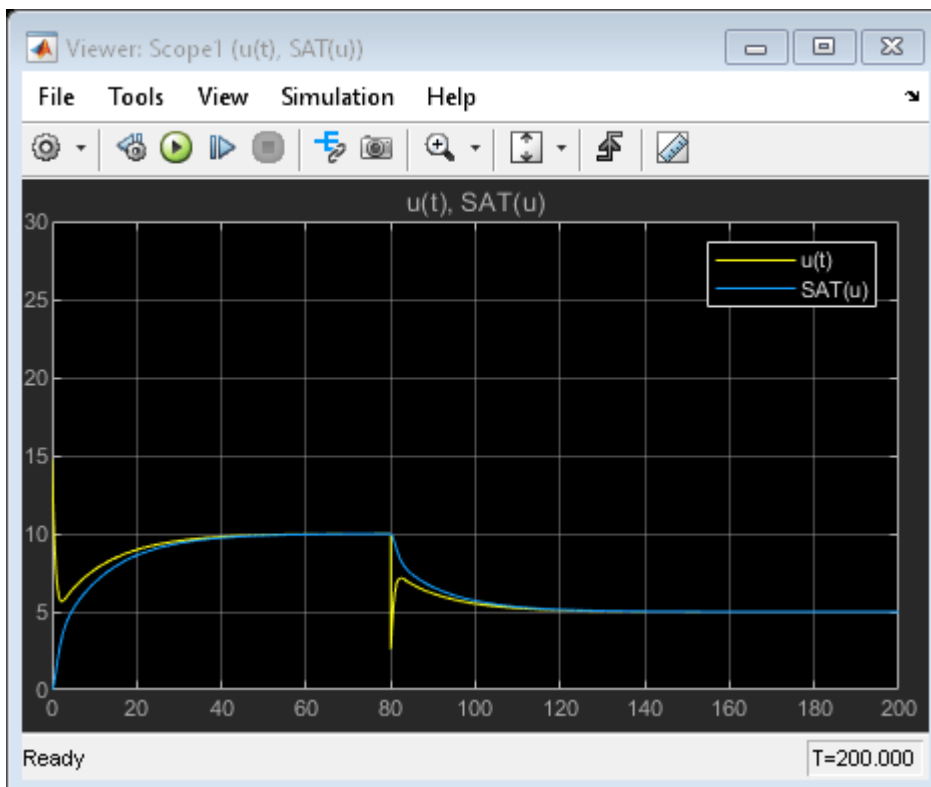

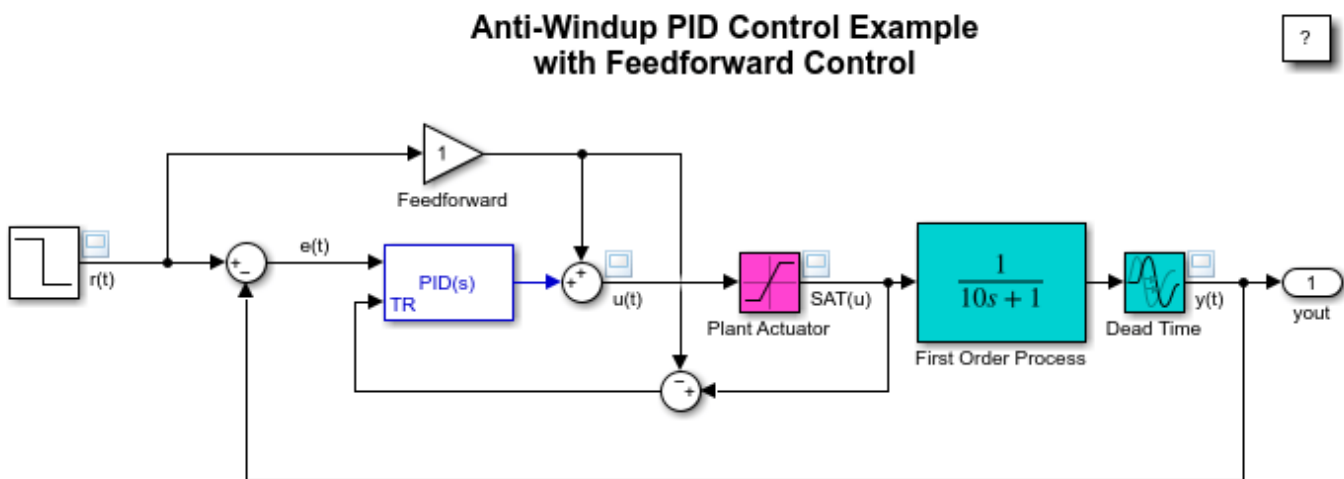

Figure 13: Controller output and effective saturated input.

Constructing Anti-Windup Circuitry for PID Control with Feedforward

In another common control configuration, the actuator receives a control signal that is a combination of a PID control signal and a feedforward control signal.

To accurately build a back-calculation anti-windup loop, the tracking signal should subtract the contribution of the feedforward signal. This allows the PID Controller block to know its share of the effective control signal applied to the actuator.

The following model includes a feedforward control.

Copyright 2009-2020 The MathWorks, Inc.

Figure 14: Simulink model of PID controller with feedforward, and plant input saturation.

The feedforward gain is selected to be unity here because the plant has a dc-gain of 1.

To open this model, type `sldemo_antiwindupfeedforward` in a MATLAB terminal.

Figures 15 and 16 show that the plant's measured output $y(t)$ and the controller output $u(t)$ are responding almost immediately to changes in the setpoint. When the setpoint value is 10, note how in Figure 16 the controller output $u(t)$ reduces to be within the range of the actuator.

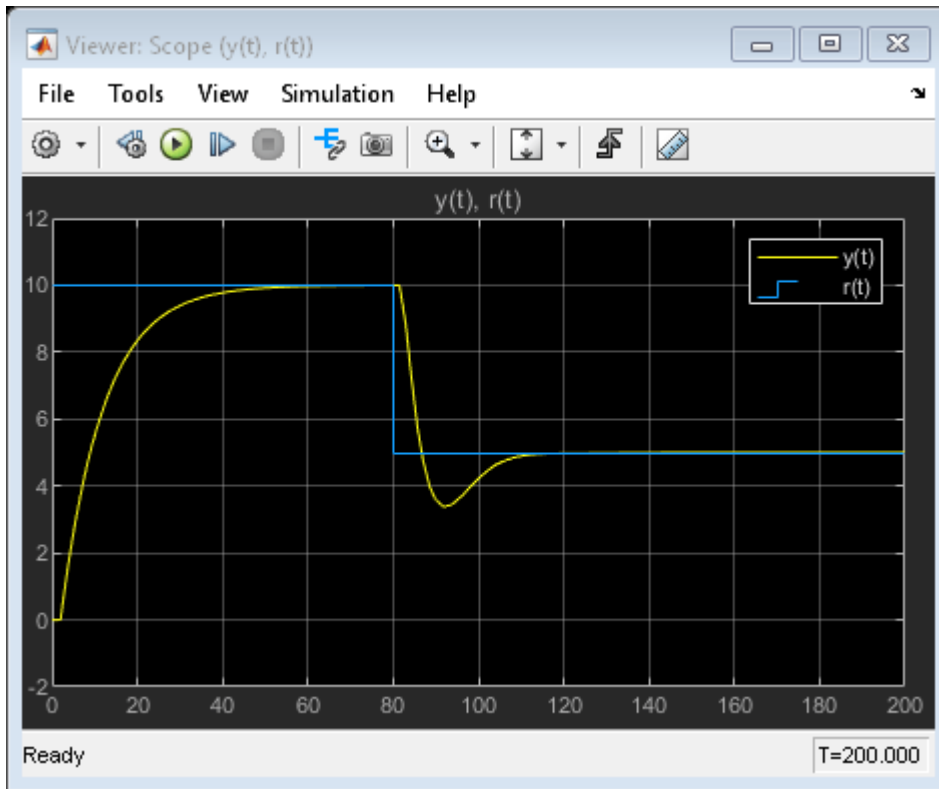

Figure 17: Setpoint vs. measured output without anti-windup.

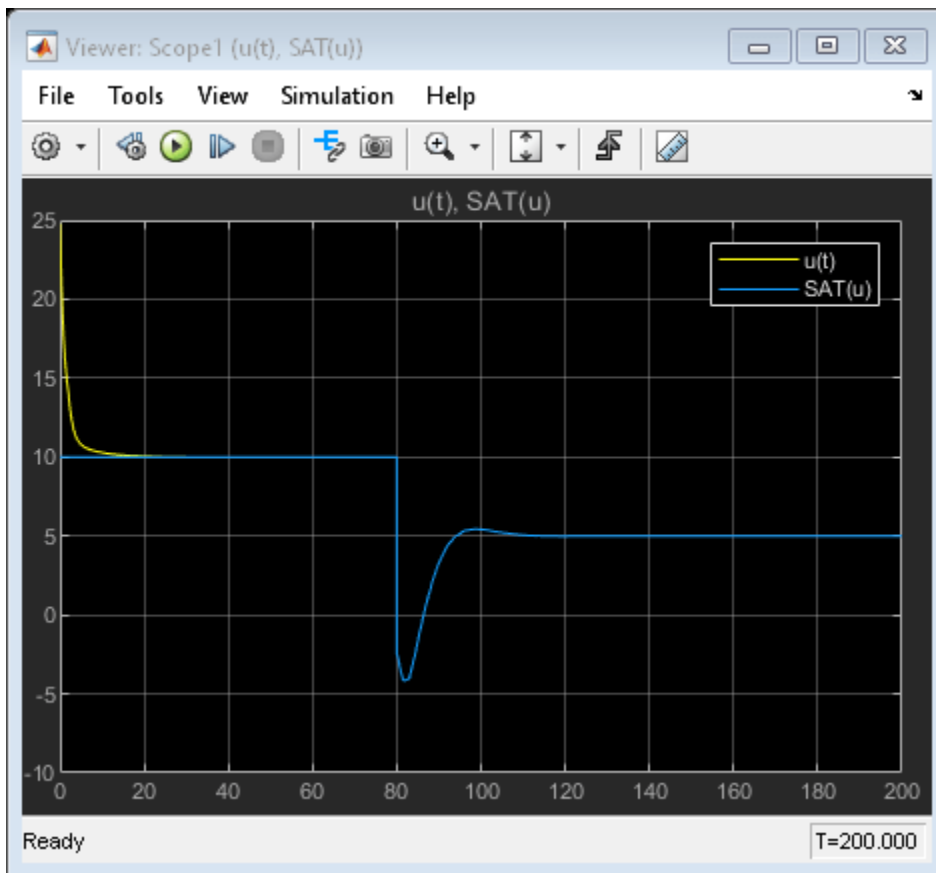

Figure 18: Controller output and saturated input with anti-windup.

Summary

The PID Controller block supports several features that allow it to handle controller windup issues under commonly encountered industrial scenarios.

Bumpless Control Transfer Between Manual and PID Control

Model Description

This example shows how to achieve bumpless control transfer when switching from manual control to PID control. We use the PID Controller block in Simulink® to control a first-order process with dead-time.

We start by opening the model.

Copyright 2009-2018 The MathWorks, Inc.

Figure 1: Simulink model of PID control with bumpless transfer.

To open this model, type `sldemo_bumpless` in a MATLAB® terminal.

The PID Controller has been tuned with saturation ignored using the PID tuner of Simulink® Control Design™.

The controlled plant is a first-order process with dead-time described by

$$P(s) = \frac{4}{2.5s + 1} e^{-s}$$

For several operational reasons, the engineers decided to start the control process in an open-loop manner by feeding the plant input with a saturating ramp signal to drive the output of the plant slowly to a desired steady-state value of 40. A control transfer is scheduled to happen at $t = 150$. This transition between open-loop control and closed-loop control therefore involves two control phases of operation:

- 1 Manual: A saturated ramp signal feeds the plant input during start-up until $t = 150$.

- Automatic: A PID controller will engage the plant at $t = 150$, and must take over the process without introducing bumps at the plant input.

To support smooth control transition, the PID Controller block supports two modes of operation: a **tracking mode** and a **control mode**. In control mode, the PID Controller block operates as an ordinary PID controller. In tracking mode, however, the block has an extra input that allows the PID block to adjust its internal state by changing its integrator output so that the block output tracks a prescribed signal feeding this extra input port.

To achieve bumpless control transfer, the PID Controller block must be in tracking mode when the plant is in the manual control phase (open-loop control), and in control mode when the plant is in the automatic control phase (closed-loop control).

Configuring the Block for Tracking Mode

To activate signal tracking, go to the **Initialization** tab in the block dialog; select **Enable tracking mode**, and specify the gain K_t . The inverse of this gain is the time constant of the tracking loop. For more information on how to choose this gain, see Reference [1].

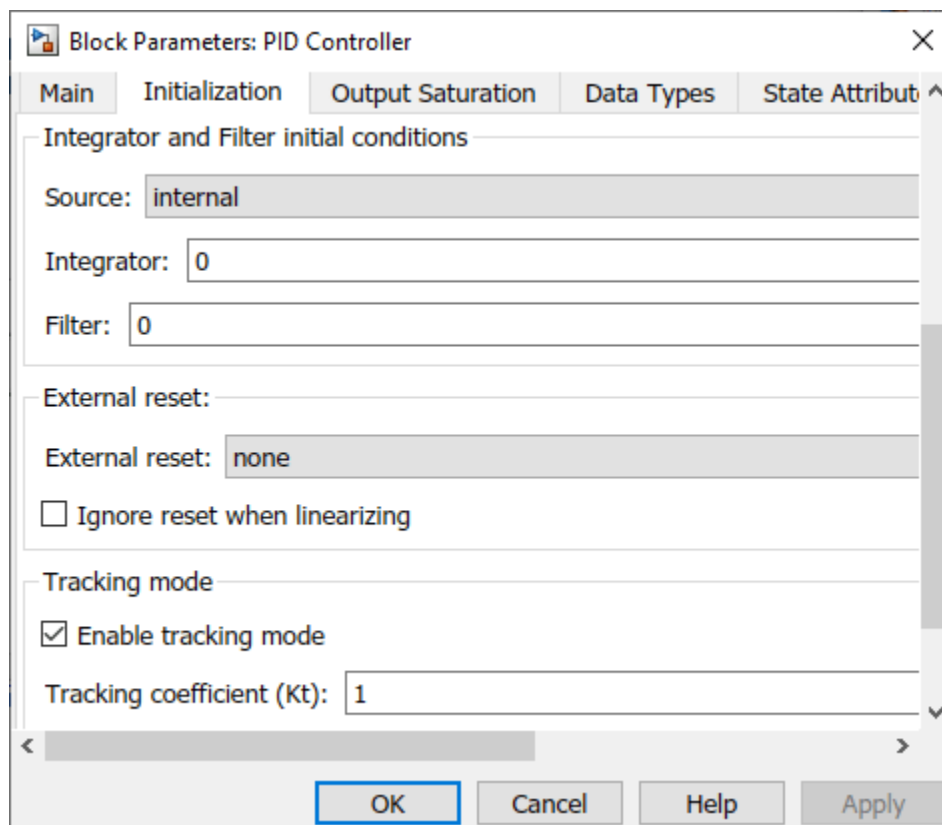

Figure 2: Enabling the tracking mode of the PID Controller block.

As shown in Figure 1, once tracking mode is enabled, the block has a second input port denoted by TR. Internally this new port is wired as shown under mask:

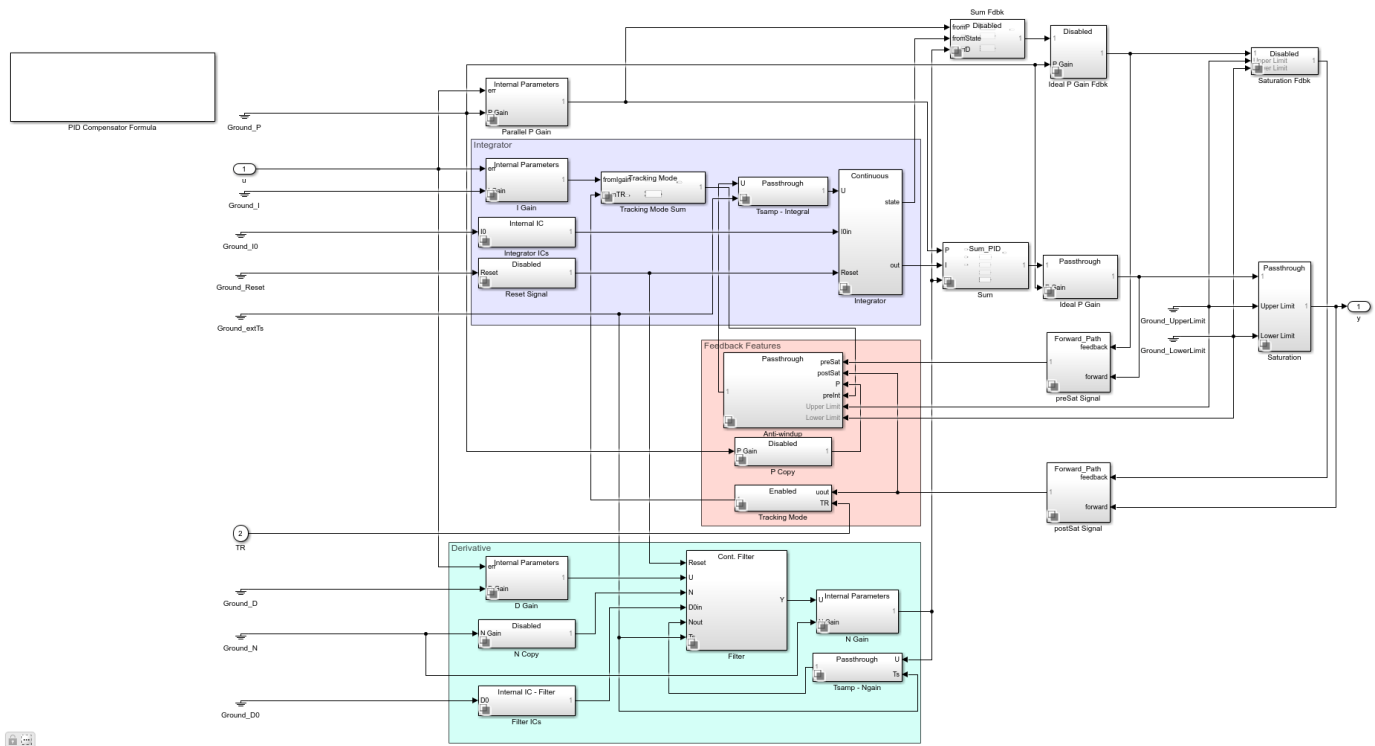

Figure 3: Under-mask view of the PID Controller block with tracking mode.

Setting Up the Switching Mechanism

In addition to enabling tracking mode for the PID Controller block, a switching mechanism is needed to achieve the control transfer. Switch 1 determines which signal feeds the plant input and feeds the tracking port of the PID Controller block.

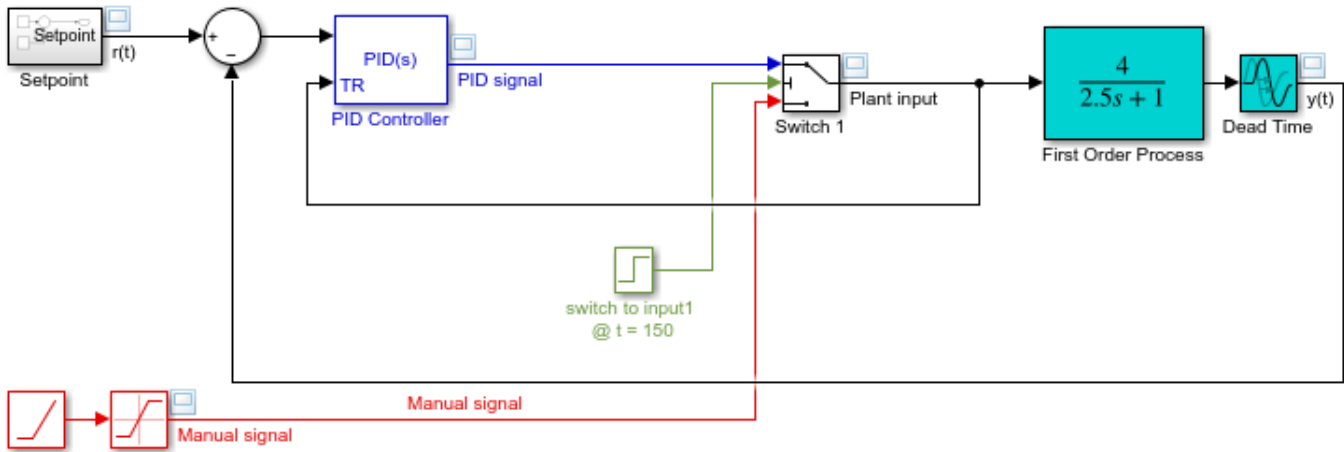

At time $t = 0$, Switch 1 directs the manual control signal to the plant input and the tracking port of the PID Controller block. This allows the output of the PID Controller block to track the manual control signal during the manual phase by adjusting the PID Controller's internal integrator. When control transfer occurs, therefore, the PID Controller output will be approximately the same as the manual control signal.

At time $t = 150$, Switch 1 switches, directing the output of the PID Controller block to the plant input and the PID Controller block's tracking input. The PID Controller block now tracks its own output, which is equivalent to control mode.

Simulating the Bumpless Control Transfer

The setpoint signal and the closed-loop response of the model are shown in Figure 4.

Bumpless Control Transfer Demonstration

Copyright 2009-2018 The MathWorks, Inc.

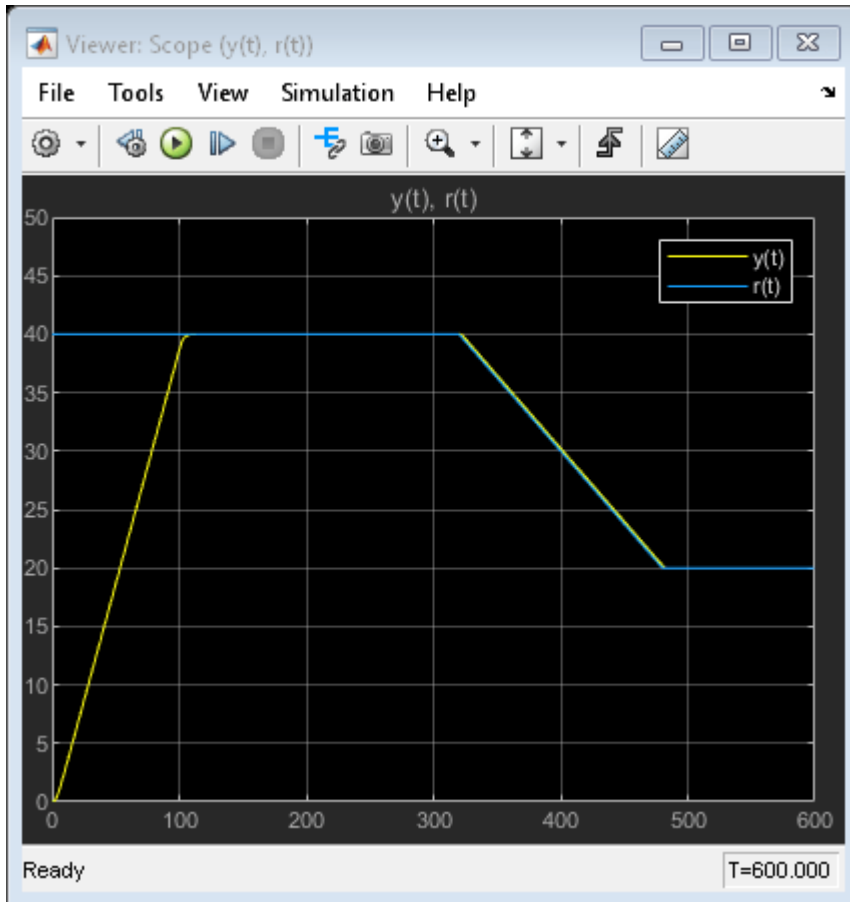

Figure 4: Setpoint vs. measured output.

Figure 4 clearly shows that the measured output tracks the Setpoint profile without any output bumps at the time of switching ($t = 150$). To investigate this further, the plant input, control signals are shown in Figure 5.

Figure 5: Control signal switching.

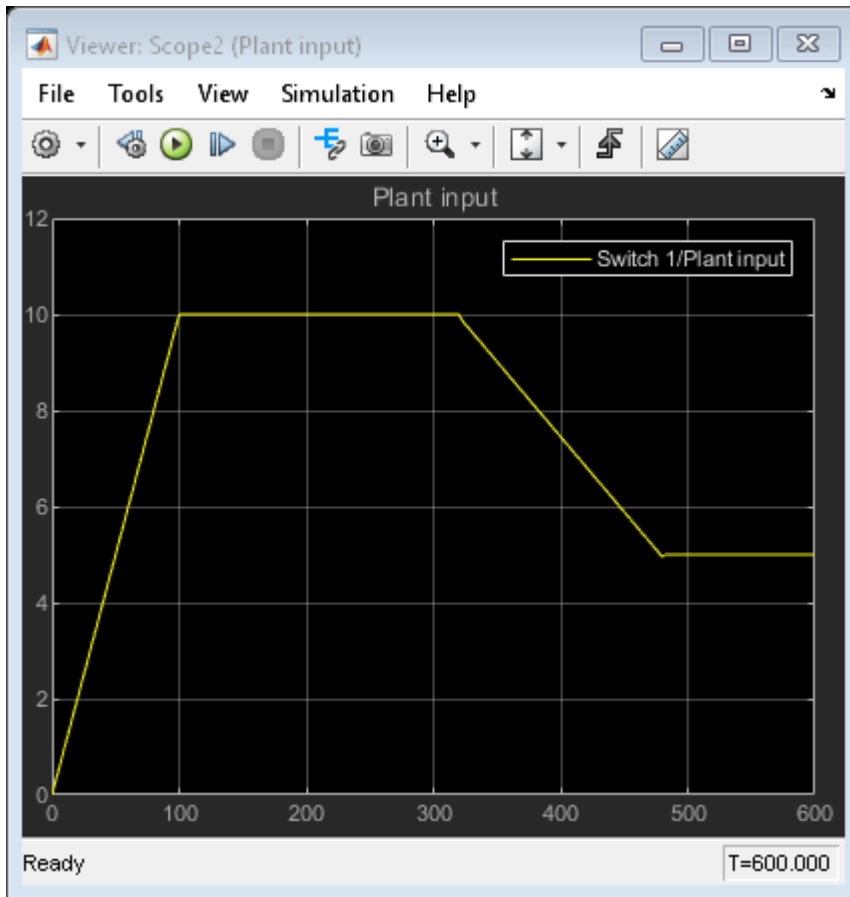

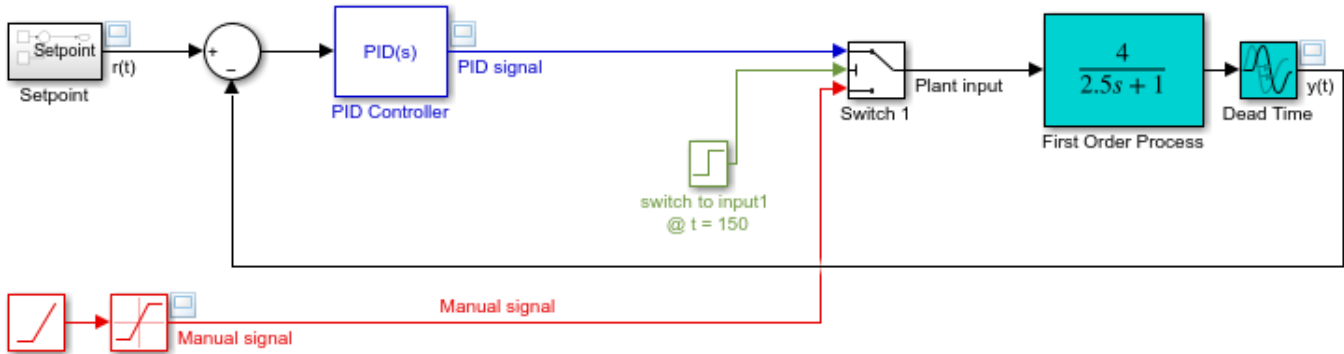

Figure 6: Plant input.

Figures 5 and 6 show that at the switching instance, the plant input has experienced no step changes (bumps), and therefore the control transfer happens in smooth bumpless fashion as intended.

To see the significance of the bumpless transfer setup, consider the case where tracking mode is not used. In this case, the following setup is obtained:

Control Transfer with Bumps Demonstration

?

Copyright 2009-2018 The MathWorks, Inc.

Figure 7: Simulink model of PID control with no bumpless transfer.

To open this model, type `sldemo_bumplessno` in a MATLAB terminal.

Figures 8 and 9 show the performance in the absence of an appropriate bumpless control transfer strategy.

Figure 8: Setpoint vs. measured output.

Figure 9: Control signal switching.

It is evident from Figures 8 and 9 that allowing the PID controller to float while the plant is under manual control can result in undesirable large transients upon switching.

Summary

As this example shows, the PID Controller block supports bumpless control transfer through the use of tracking mode.

Two Degree-of-Freedom PID Control for Setpoint Tracking

Model Description

This example shows how to regulate the speed of an electric motor using two degrees-of-freedom PID control with set-point weighting. The model uses the PID Controller (2DOF) block. The model changes the setpoint values between 550 and 250 rpm. To convert the units to rad/s for use in the PID controller, the model uses a Signal Conversion block.

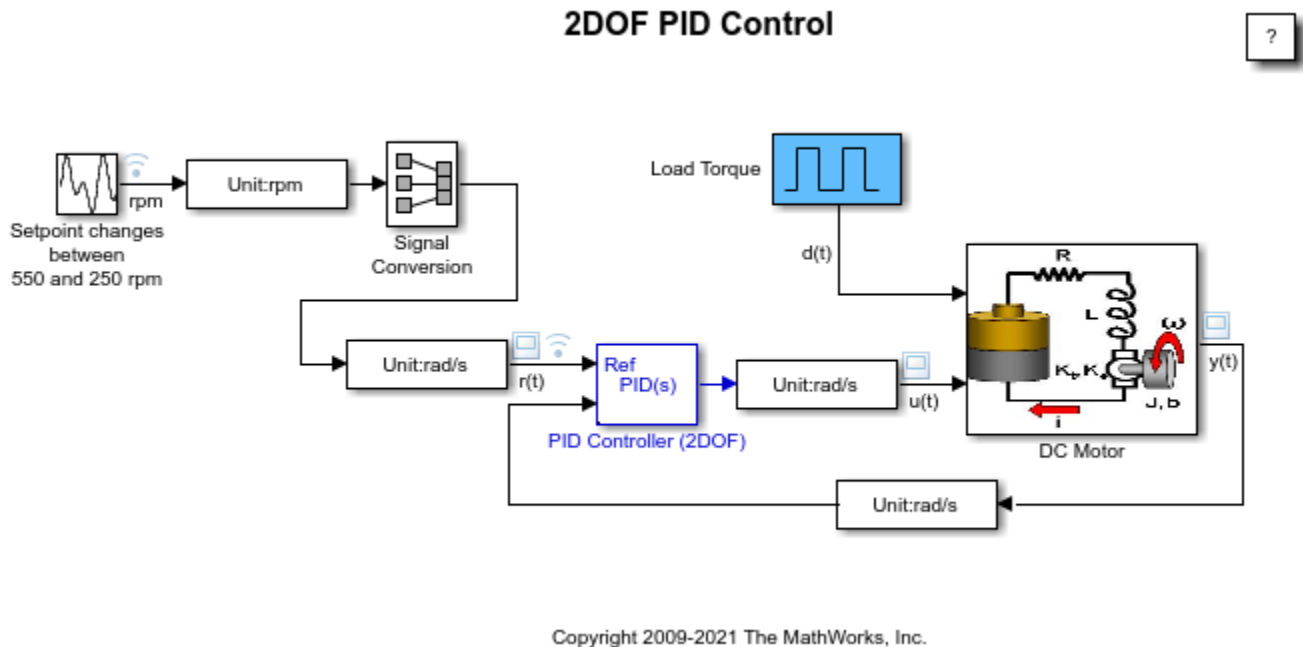

Figure 1: Simulink model with two degree-of-freedom PID control of a DC motor.

The electric motor is an armature-controlled DC motor. Voltage input controls the shaft speed of the motor. Figure 2 shows the block diagram of the motor. The motor experiences a load torque T_d (0-5 Nm).

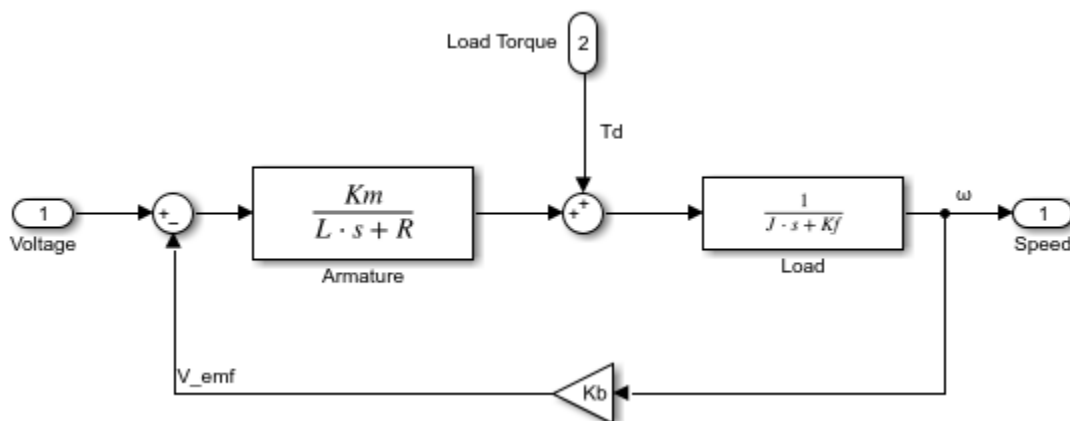

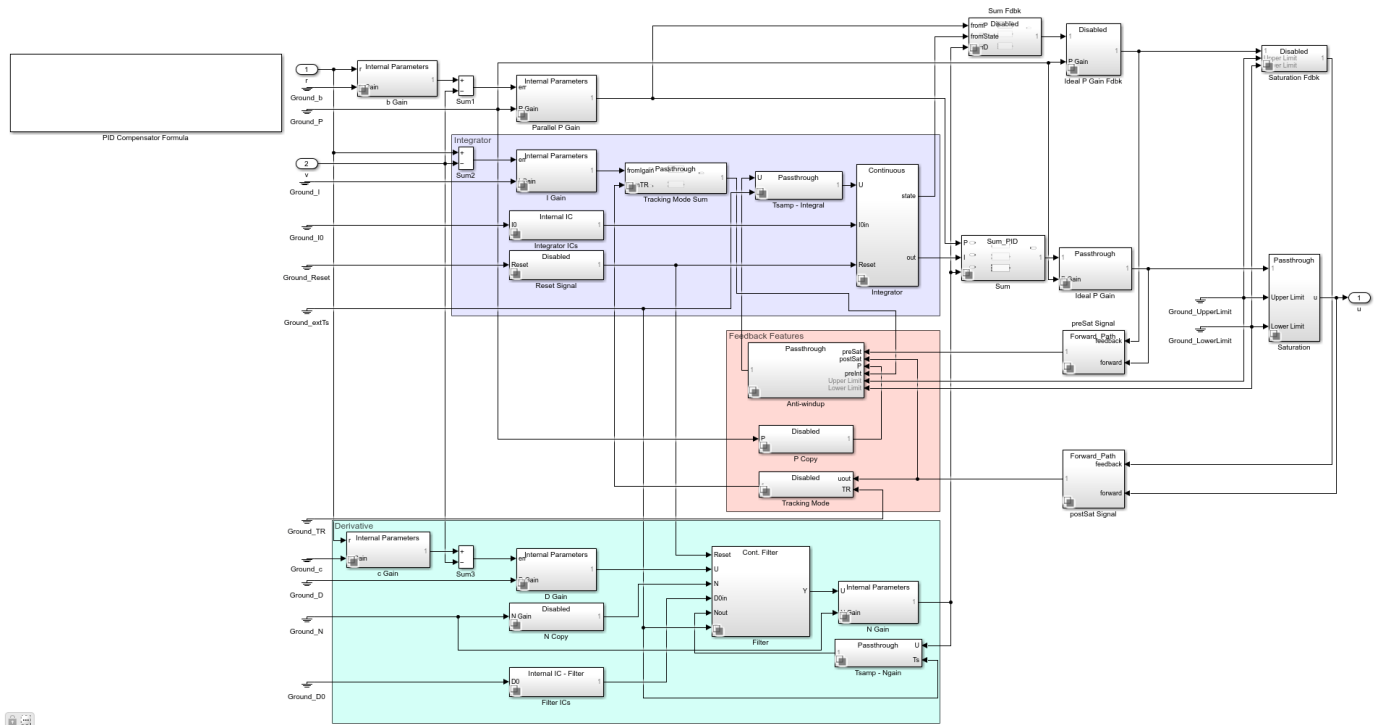

Figure 2: Block diagram of the motor.**Two Degree-of-Freedom PID Control**

In contrast to the PID Controller block, the PID Controller (2DOF) block provides an extra degree of freedom, allowing you to weight the setpoint as it passes through the proportional action channel and the derivative action channel. Figure 3 shows the PID Controller (2DOF) block diagram.

**Figure 3:** Under-mask view of the PID Controller (2DOF).

As shown in Figure 3, the proportional action error signal is given by

$$b * r - y$$

The signal seen by the derivative action signal is given by

$$c * r - y$$

and the integral action signal is given by

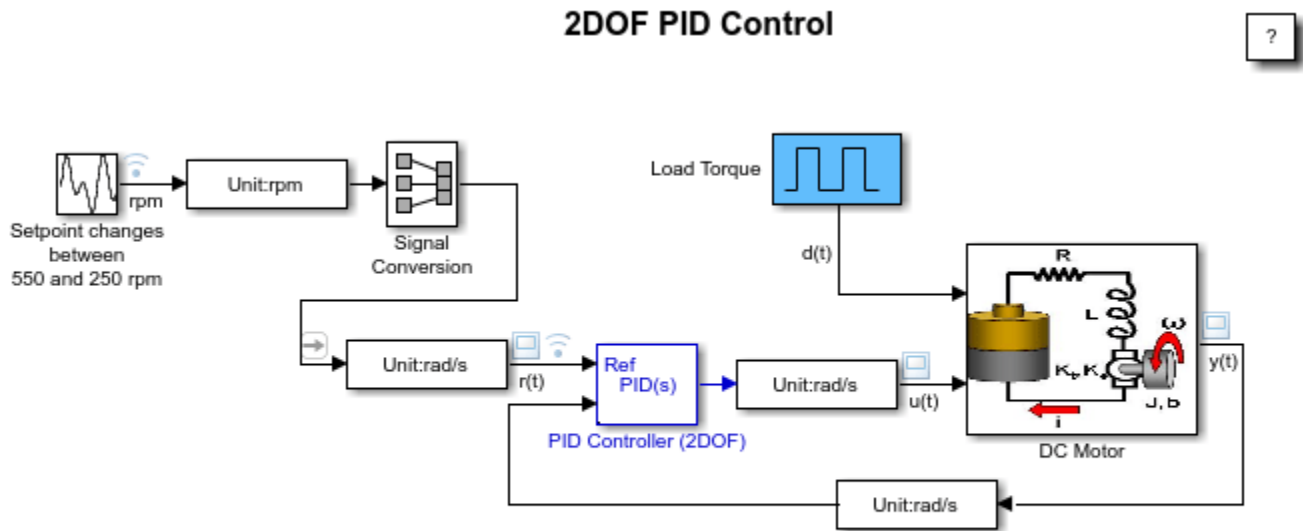

$$r - y$$

In general, the setpoint weight c is set to 0. This prevents undesirable transients if the setpoint changes, an effect known as *derivative kick*. The setpoint b affects the overshoot performance of the controller. Generally, a small b value reduces overshoot. However, smaller b values can also result in slower response to setpoint changes. For more details on picking the right setpoint values, see Reference [1].

When $b = 1$ and $c = 1$, the behavior of the two degree-of-freedom PID controller is identical to a classical PID controller.

Simulating with $b = 1$ and $c = 1$

When $b = 1$ and $c = 1$, the behavior of the two degree-of-freedom PID controller is identical to a classical PID controller. The control signal, setpoint signal, and closed-loop response of the model are shown in Figure 4.

Copyright 2009-2021 The MathWorks, Inc.

Figure 4: Control signal, setpoint vs. measured output.

Figure 4 clearly shows the spikes in the control signal, caused by aggressive proportional and derivative response to the setpoint change. Modifying the b and c weights can make this response less aggressive, as shown next.

Simulating with the $b = 0$ and $c = 0$

In this case, the two degree-of-freedom PID controller is known as I-PD where only the I action acts on the classical error signal, and the PD action acts only on the measured output.

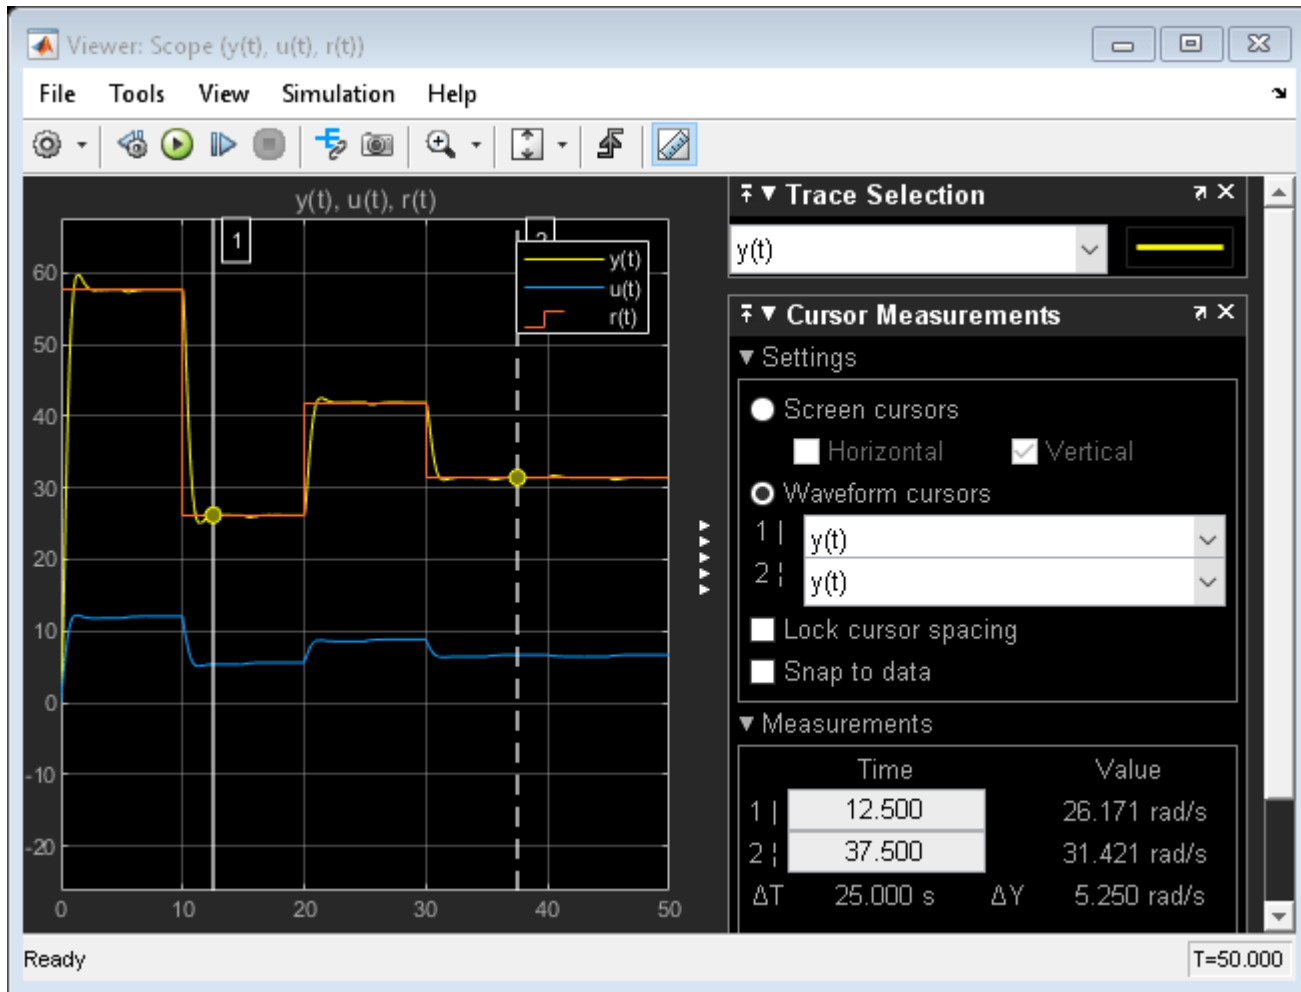

Figure 5: Control signal, setpoint vs. measured output.

The simulation results show the absence of large transients in the control signal due to the sudden changes in the setpoint.

See Reference [1] for more information on how to choose b and c .

Summary

The PID Controller (2DOF) block supports two degree-of-freedom PID control. Use this block for tracking complex setpoint profiles and moderating the impact of sudden setpoint changes on control signal transients. You can use the PID tuner in Simulink® Control Design™ to automatically tune all the gains (P , I , D , N , b , c) of the PID Controller (2DOF) block.

Data Typing in Simulink

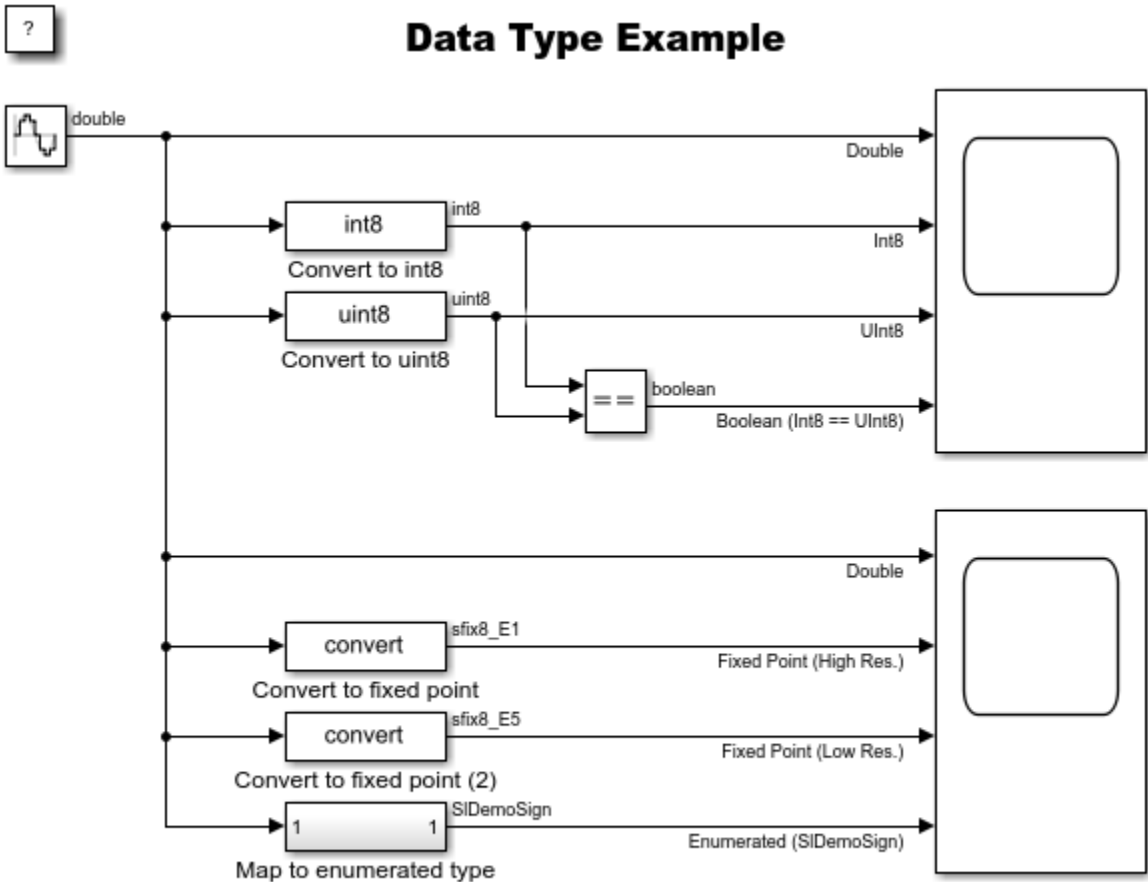

This example shows how to use data types in Simulink®. The model used in this example converts a double-precision sine wave having an amplitude of 150 to various data types and displays the converted signals on two scopes.

The first scope shows the original sine wave and the result of converting this signal to signed and unsigned 8-bit integer data types with saturation enabled. The bottom axes show the boolean results of comparing the signed and unsigned integer values.

The second scope shows the original sine wave and the result of converting this signal to two fixed-point data types: one high-resolution, the other lower resolution. The bottom axes show the result of mapping the sine wave to an enumerated data type that indicates whether the signal is positive, negative, or zero.

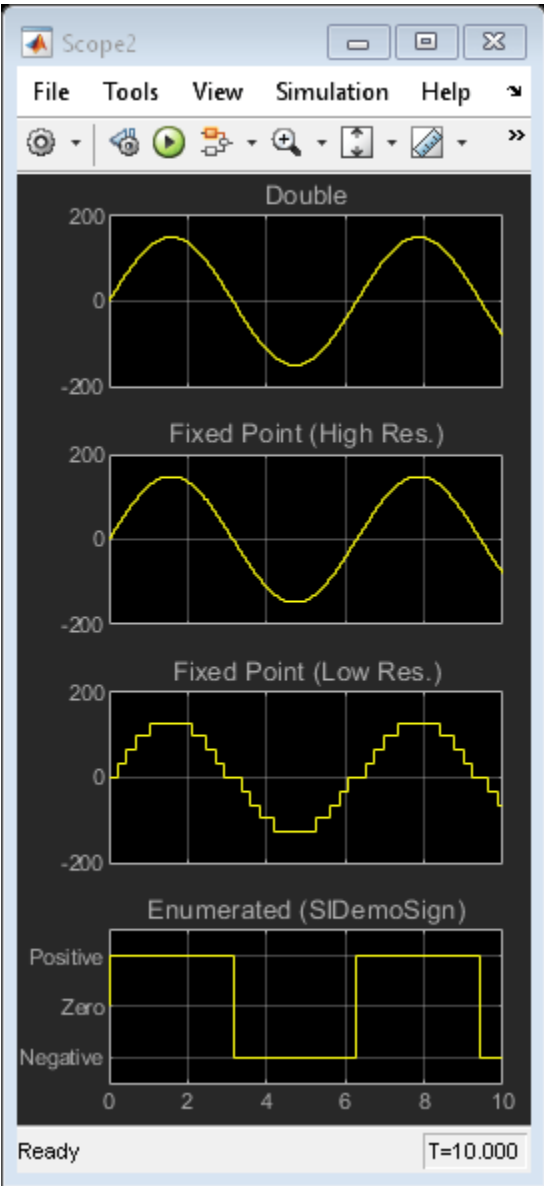

Similar data type support exists for parameters and states. Simulink also supports other integer and floating-point data types, such as, single, int16, and uint32, and fixed-point types with slope/bias and wordlengths from 1 to 128 bits. You can also define types for bus signals and aliases for existing types.

NOTE: If you do not have a license for Fixed-Point Designer™ then the fixed-point signals will be replaced by single-precision signals.

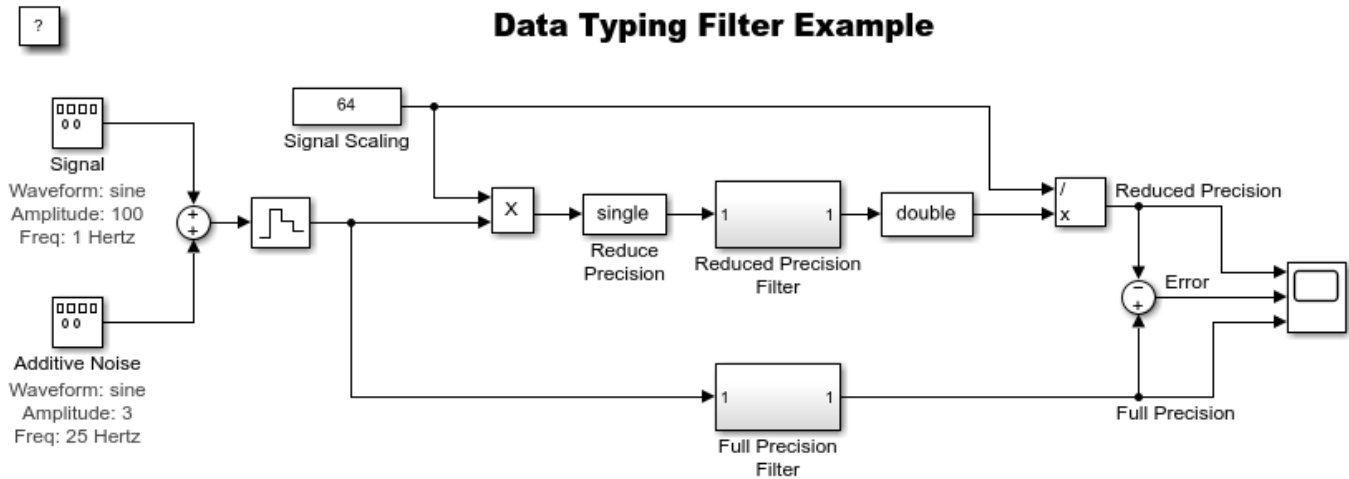

Copyright 2004-2015 The MathWorks, Inc.

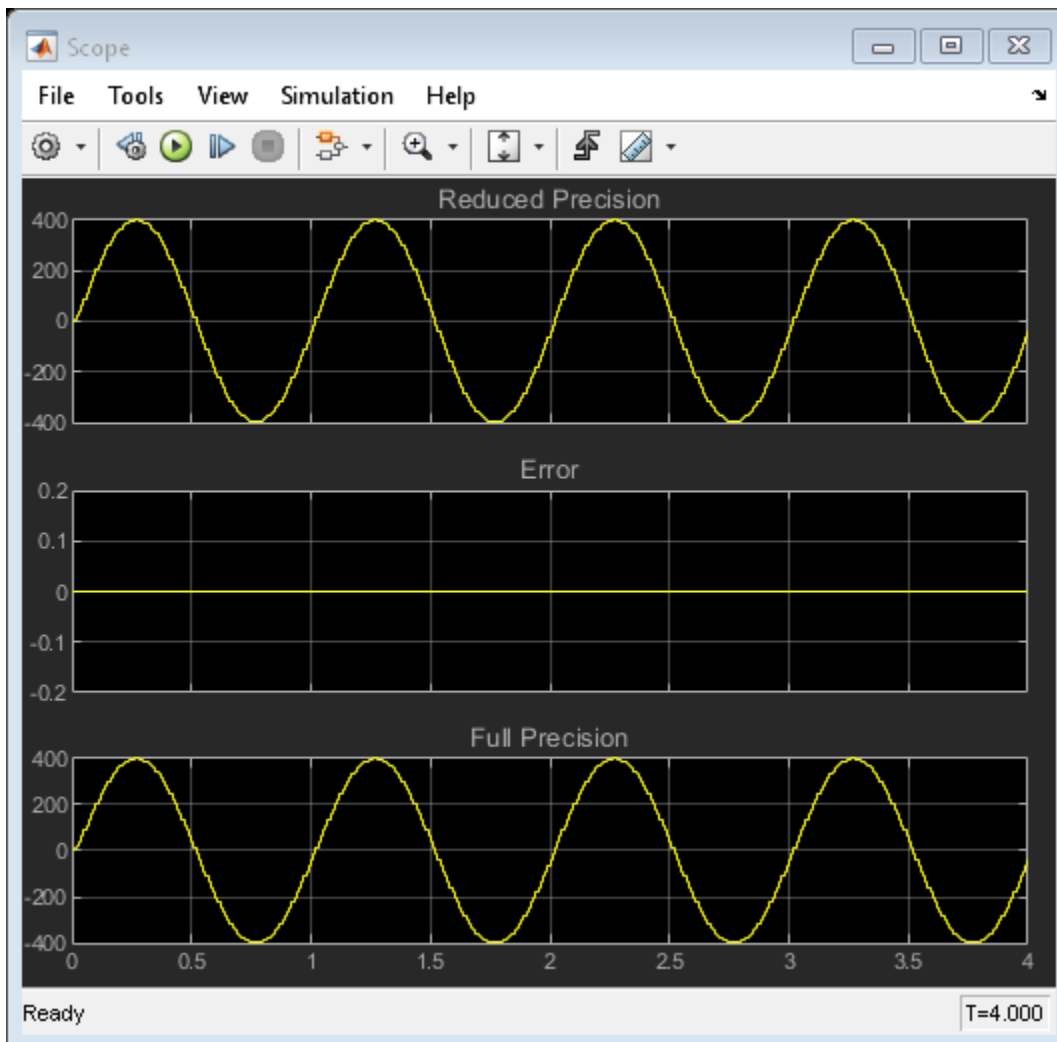

Data Typing Filter

This example shows how to apply a filter to signals of different data types using standard Simulink® blocks. In this example, a signal with some noise is produced. This signal is then fed into a filter as a single precision data type and a standard double data type. The output from the filter for each signal is then compared and the error is displayed on the scope.

Display Bus Line Styles

When you open a model that contains buses, the buses have the same line style as scalar signals. To update the line styles, on the **Modeling** tab, select **Update Model**.

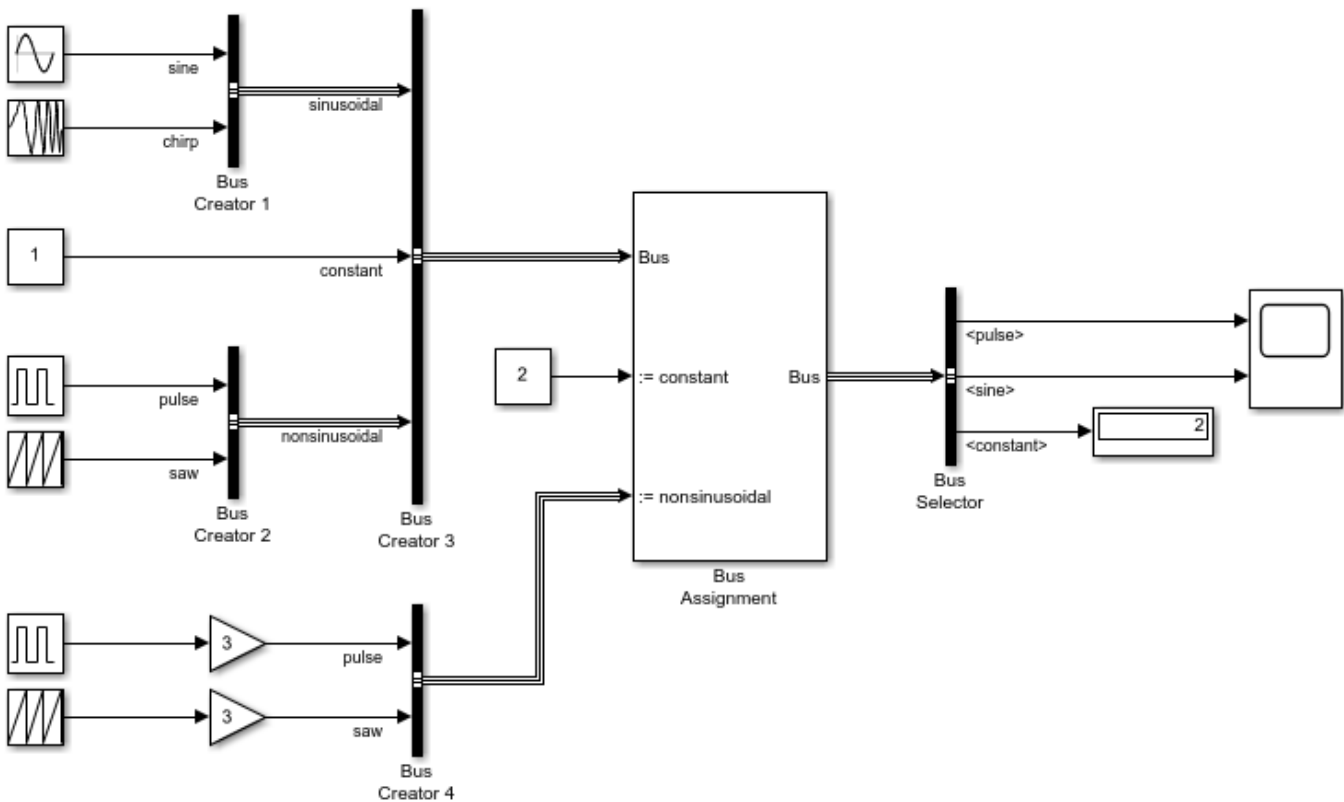

After the model compiles, several lines appear with three lines. This line style indicates that the line represents a bus.

Work with Buses in Components

The contents of the subsystem in the Working with Buses in Components area demonstrate how to:

- Create buses using Bus Creator blocks.
- Replace elements in a bus using a Bus Assignment block.
- Extract elements from a bus using a Bus Selector block.

Each Bus Creator block groups the elements connected to its input port into a bus. A bus represents a set of elements, analogous to a bundle of wires tied together. For example, the bus created by the Bus Creator block named Bus Creator 1 contains the signals `sine` and `chirp`, which are connected to its input ports.

To view the hierarchy of the bus, click the bus and, on the **Signal** tab, select **Signal Hierarchy**.

You can also create *nested* buses. For example, `sinusoidal` and `nonsinusoidal` are nested buses in the bus created by the Bus Creator block named Bus Creator 3.

A Bus Assignment block replaces one or more elements in the bus that connects to its **Bus** input port. For example, the Bus Assignment block replaces the signals `constant` and `nonsinusoidal` in the bus created by the Bus Creator block named Bus Creator 3 with new signals. You can use the Bus Assignment block to replace nested buses and nonbus elements.

A Bus Selector block extracts one or more elements from the bus connected to its input. For example, the Bus Selector block selects the `nonsinusoidal.pulse`, `sinusoidal.sine`, and `constant` signals. To display the values of `nonsinusoidal.pulse` and `sinusoidal.sine` in the Scope block and `constant` in the Display block, simulate the model.

Use Bus Ports at Component Interfaces

The subsystems in the Using Bus Ports at Component Interfaces area demonstrate how to:

- Create buses at the output ports of components by using Out Bus Element blocks.
- Extract bus elements from the input ports of components by using In Bus Element blocks.

The first subsystem consists of five source blocks and five Out Bus Element blocks.

*Click label text to edit name of output port and bus element.
Double-click block to open dialog box for port.*

*Copy and paste block to create new element.
Right-click and drag, then select **Create New Port** to create new port.*

Out Bus Element blocks are similar to a Bus Creator block connected to an Outport block. Each Out Bus Element block has a label that you can edit directly to change the names of the output port and bus elements.

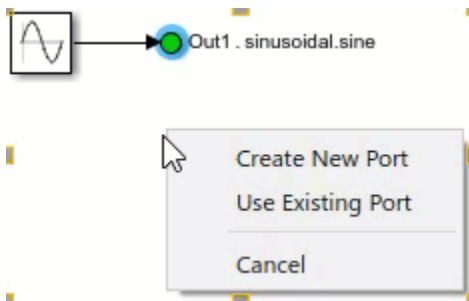

You can display the label in either expanded or compact notation.

- **Expanded Notation:** Label displays the corresponding port name and the element hierarchy. For example, the Out Bus Element block with the label `Out1.sinusoidal.sine` creates a bus element named `sine` in a nested bus named `sinusoidal` at the output port named **Out1**.
- **Compact Notation:** Label displays only the leaf bus element name. For example, the label `Out1.sinusoidal.sine` becomes `sine`.

In either mode, you can directly edit both parts of the label.

To create a new element in the bus, copy and paste an Out Bus Element block. To create a new output port at the interface, right-click and drag an Out Bus Element block, then select **Create New Port**.

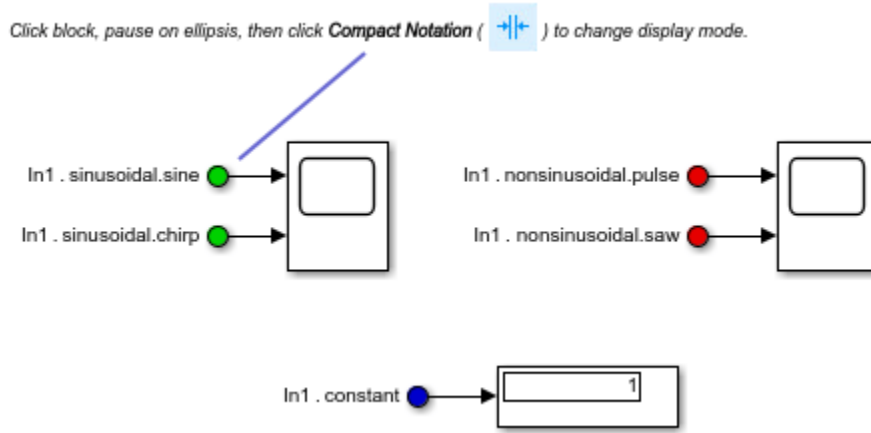

To see the bus created by a group of Out Bus Element blocks, double-click one of the blocks to open the dialog box for port properties. From the dialog box, you can:

- Change the name and number of the port.
- Highlight the lines that correspond to the elements you select.
- Change the colors of the blocks individually, by bus, or by selected elements.
- Reorder the elements in the bus.
- Add or delete bus elements and their corresponding blocks.
- Specify attributes.

The second subsystem consists of two Scope blocks, one Display block, and five In Bus Element blocks.

In Bus Element blocks are similar to an Inport block connected to a Bus Selector block. The labels of In Bus Element blocks work the same way as Out Bus Element block labels do. For example, the In Bus Element block with the label `In1.sinusoidal.sine` selects a bus element named `sine` in a nested bus named `sinusoidal`.

To change the element selected from the input bus, edit the label text directly. When a bus is connected to the corresponding input port, you can select from the list of available signals.

To select a new element from the bus, copy and paste an In Bus Element block. To create a new input port at the subsystem interface, right-click and drag an In Bus Element block, then select **Create New Port**.

To see the bus accessed by a group of In Bus Element blocks, double-click the icon of one of the blocks to open the dialog box for the port properties. From the dialog box, you can:

- Change the name and number of the port.
- Change the colors of the blocks individually, by bus, or by selected elements.
- Observe any missing or unused elements in the incoming bus.
- Add or delete blocks that correspond to selected elements.
- Specify attributes.

For more information about using In Bus Element and Out Bus Element blocks, see “Simplify Subsystem and Model Interfaces with Buses”.

Perform Common Bus Workflows Faster

The subsystems in the Smart Editing to Perform Common Bus Workflows Faster area show how to speed up common bus tasks:

- Convert Bus Selector and Bus Creator blocks to In Bus Element and Out Bus Element blocks.
- Create buses at subsystem interfaces and bundle outputs of individual blocks into a bus.
- Automatically create ports to add new elements to a Bus Creator block and select new elements from a Bus Selector block.

The **Bus Ports** smart editing cue converts Bus Selector and Bus Creator blocks at subsystem interfaces to In Bus Element and Out Bus Element blocks.

- 1 Click on a Bus Selector block that is connected to an Inport block or a Bus Creator block that is connected to an Outport block.
- 2 Select **Bus Ports** from the action bar.

The **Create Bus** smart editing cue bundles multiple elements into a bus.

- 1 Drag a selection box around elements.
- 2 Select **Create Bus** from the action bar.

When creating a bus at subsystem interfaces, this action bundles the selected elements in a bus, replaces the Inport and Outport blocks with In Bus Element and Out Bus Element blocks in the subsystem, and adds Bus Creator and Bus Selector blocks to maintain connectivity outside of the subsystem.

When creating a bus at the outputs of individual blocks, this action inserts a Bus Creator block, resizes it, and connects the elements.

To add an element to a bus, drag a line to a Bus Creator block. To select an element from a bus, drag a line to a Bus Selector block and choose the element you want from the list of available elements.

Model Arrays of Buses

Arrays of buses represent structured data compactly, eliminating the need to include multiple copies of the same buses. They also support iterative processing with for-each subsystems.

The input buses for an array of buses must be nonvirtual and of the same data type (with the same names, hierarchies, and attributes for the bus elements).

The `sldemo_bus_arrays` model demonstrates multiple ways to use an array of buses.

In this model, a Vector Concatenate block creates an array of buses from nonvirtual buses. Bus Creator blocks create two of the nonvirtual buses, and a Constant block creates a nonvirtual bus from a struct.

The model uses the array of buses with:

- Selector blocks, to extract buses from the array of buses.
- An Assignment block, to assign new values to a bus in the array.
- A For Each Subsystem block, to iteratively process each bus in the array.
- A Memory block, to output the array of buses input from the previous time step.

Variable-Size Signal Basic Operations

This example shows how variable-size signals can be generated. It also illustrates some of the operations that can be applied to them. The purpose of this example is to introduce the basic operations associated with variable-size signals.

About This Example

The model contains several blocks that support variable-size signals.

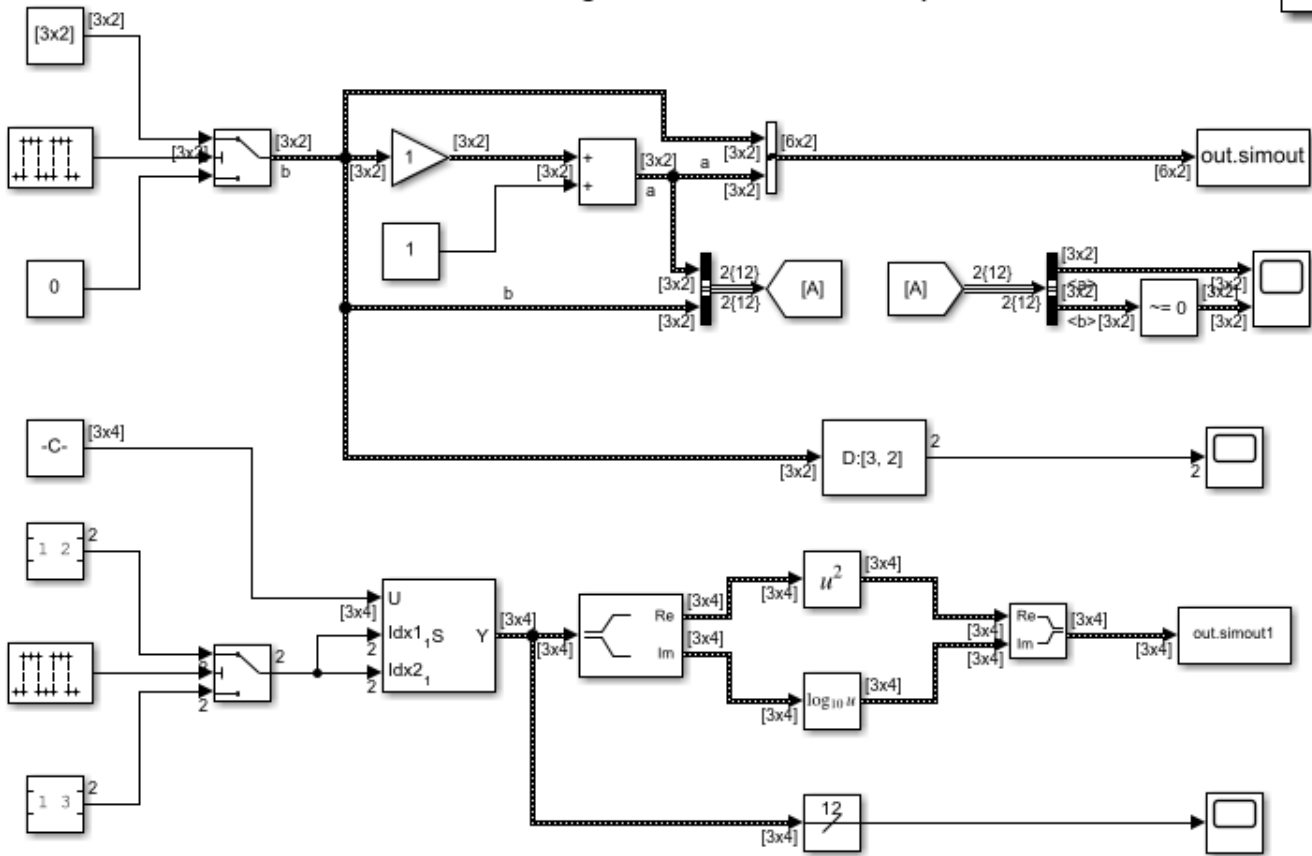

Common ways of generating variable-size signals are:

- Use a Switch block with a different size signal at each input port.
- Use a Selector block and allow the size selection index to change over time.

Eighty blocks can operate with variable-size signals including the Gain block, the Sum block, the Math Function block, the Matrix Concatenate block, and the Bus Creator block. In addition, you can probe variable-size signals using the Width or the Probe block, display variable-size signals on Scope blocks, and save variable-size signals to the workspace using the To Workspace block.

For a complete list of blocks that support variable-size signals, see “Simulink Block Support for Variable-Size Signals”.

Variable-Size Signal Generation and Operations

Copyright 2009-2013 The MathWorks, Inc.

Variable-Size Signal Length Adaptation

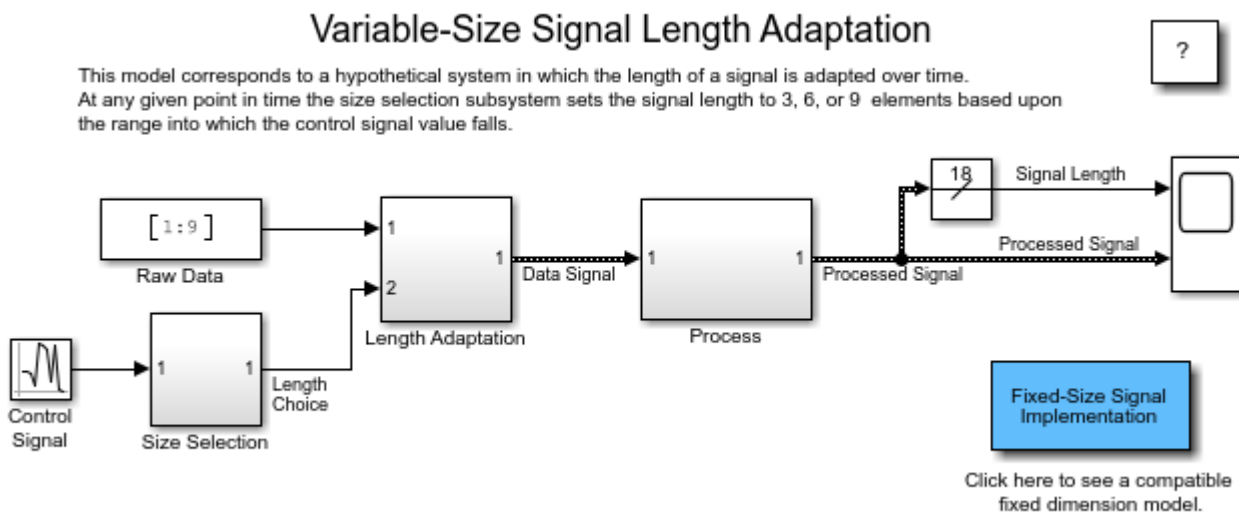

This example shows a hypothetical system where the length of a signal changes over time by adapting to the changes of a control signal.

About This Example

Open the example model.

This model consists of two sections: the left section generates a signal and converts the signal to variable size; the right section processes the variable-size signal and outputs it to a scope. Length adaptation is based on the value of the control signal. When the control signal falls within one of the three predefined ranges, the size of the data signal changes accordingly.

This variable-size signal is then fed into a processing block, where blocks supportive of variable-size signals operate on it. Note the application of a MATLAB Function block with both the input and the output signals of variable-size. The resulting signal and the signal width are fed to a scope for visualization.

Copyright 2009-2015 The MathWorks, Inc.

Multimode Variable-Size Signal

This model shows how to use different operation modes to correspond to different signal sizes.

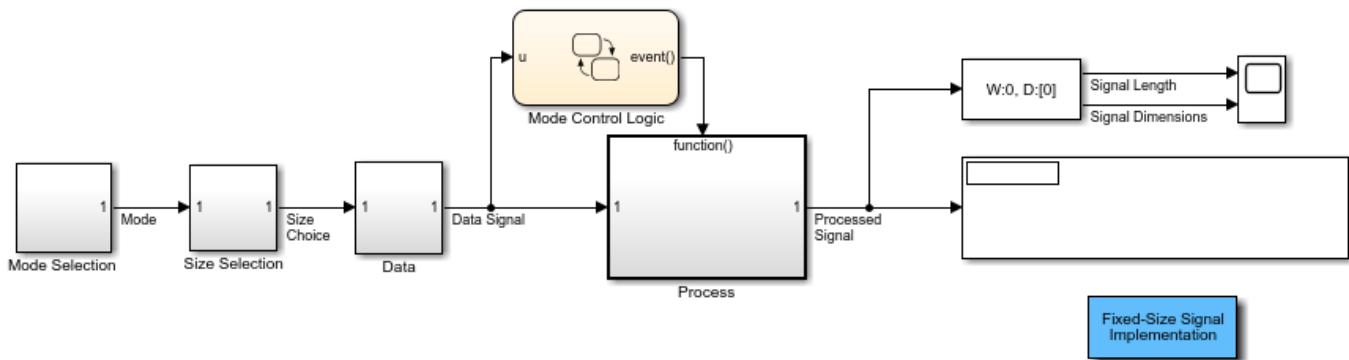

About This Example

Open the example model:

Mode-Dependent Variable-Size Signals

This model represents a system that has three operation modes. For each mode, the signal has a different size. One Function-Call subsystem with variable-size signals handles the processing of the different signal sizes for each mode. The Mode Control Logic block detects the data signal length changes, and responds by issuing mode switching events. This event triggers the reset of the state and the repropagation of signal sizes within the subsystem.

[Click here to see a compatible fixed-size model.](#)

Copyright 2009-2015 The MathWorks, Inc.

The processing subsystem in this model receives a variable-size signal, where the size of the signal depends on the operation mode of the system. For each mode change, the Mode Control Logic Stateflow® Chart generates a function-call to reset the blocks contained in the Process subsystem.

Parallel Channel Power Allocation

This model shows a potential use of the Find Nonzero Elements block. This block outputs a variable-size signal containing the indices of the nonzero values of the input.

Open the example model `sldemo_varsize_channel_pow_alloc`. This model implements the waterfilling algorithm for obtaining the optimal power allocation for communication channels when a power budget exists. The communication channels involved are independent (i.e., parallel channels) and have different noise levels.

The algorithm iteratively increases the value of the waterline, so that the channels which have a noise level less than the waterline are broadcast. The power used by these transmitting channels is equal to the difference between the waterline and the noise level of the channel. The sum of the power used by all the channels transmitting should satisfy the power budget within the specified tolerance.

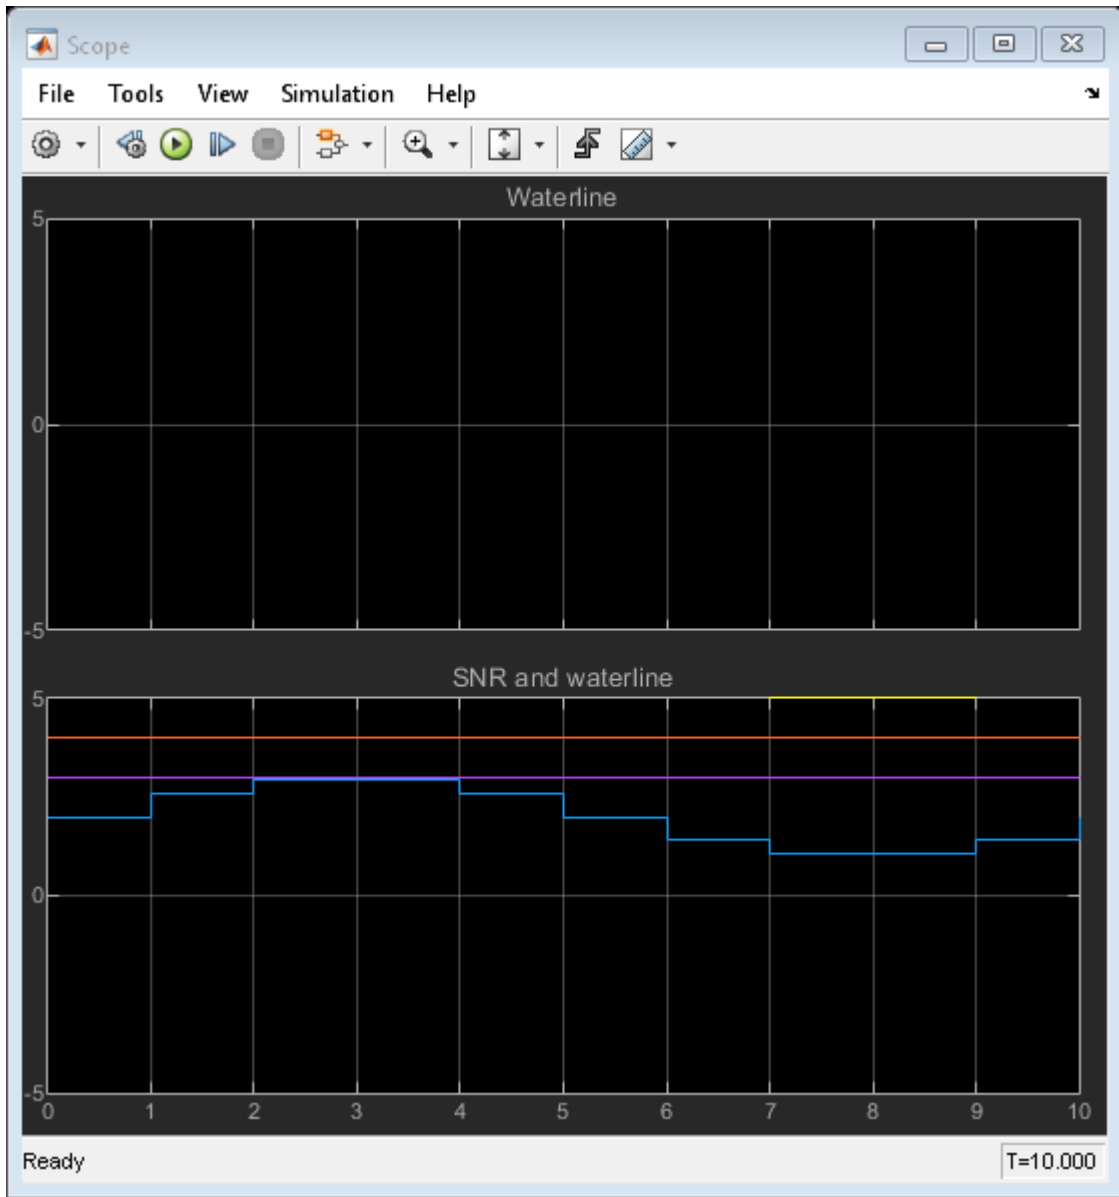

The Find Nonzero Elements block is used in the calculation of the total power used for a certain waterline value. The channels which are set to transmit at that waterline level are selected using logical indexing. The logical indices are obtained after thresholding the difference of the waterline and the channel noise levels. As a result, the channels with noise levels larger than the waterline are assigned a logical 0, and those with noise levels below the waterline are assigned a logical 1. The Find Nonzero Elements block is used for converting the logical indices into linear indices. Note that this signal is properly modeled by a variable-size signal, since the number of channels below the threshold is unknown at compile time. The linear indices are fed into a Selector block that picks the channel transmission powers. Subsequently, these powers are summed to get the current value of used power. If this value is smaller than the power budget, the waterline is increased and the process is repeated until the used power equals the power constraint.

Optimal Power Allocation for Parallel Channels (Waterfilling)

The NL signal contains the channel noise levels.
The Pcon signal is the total available power budget.
Tol is the tolerance to use in the search for the waterline level.

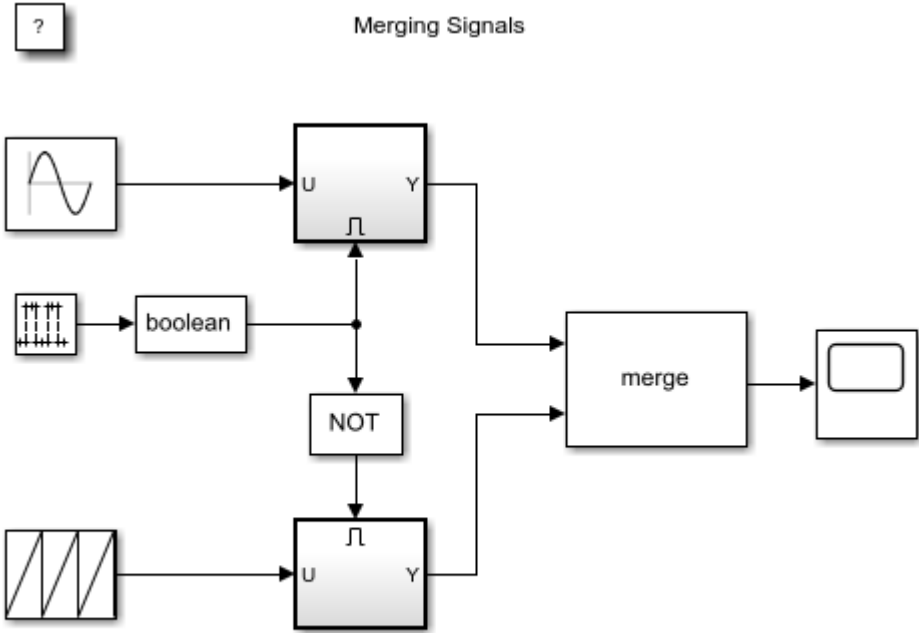

Copyright 2009-2013 The MathWorks, Inc.

Merging Signals

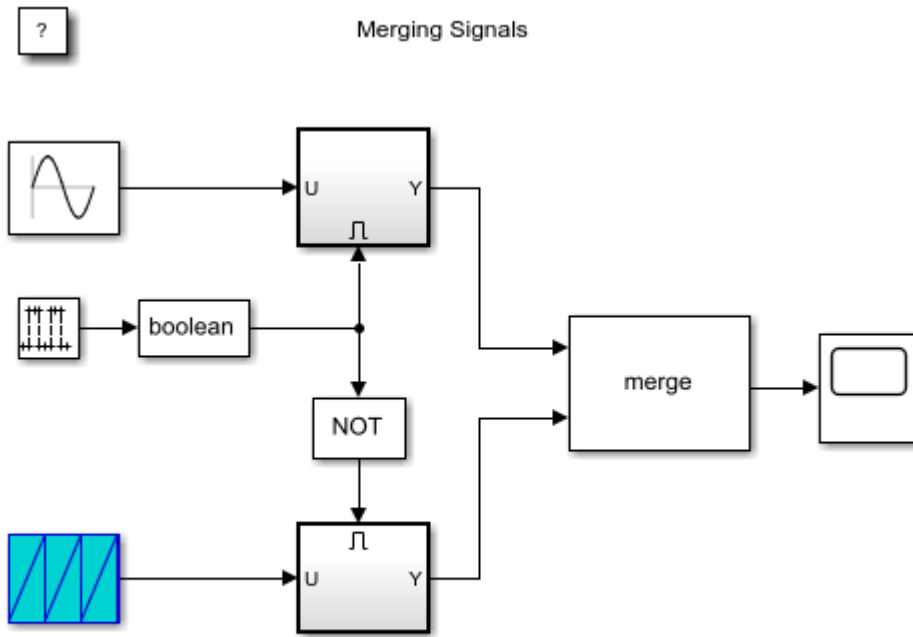

This example shows how to use conditionally executed subsystems and the Merge block to combine two inputs into a single output. The Merge block output value at any time is equal to the most recently computed output of its driving blocks.

Use Merge blocks to interleave input signals that update at different times into a combined signal in which the interleaved values retain their separate identities and times. To combine signals that update at the same time into an array or matrix signal, use a Vector Concatenate, Matrix Concatenate block.

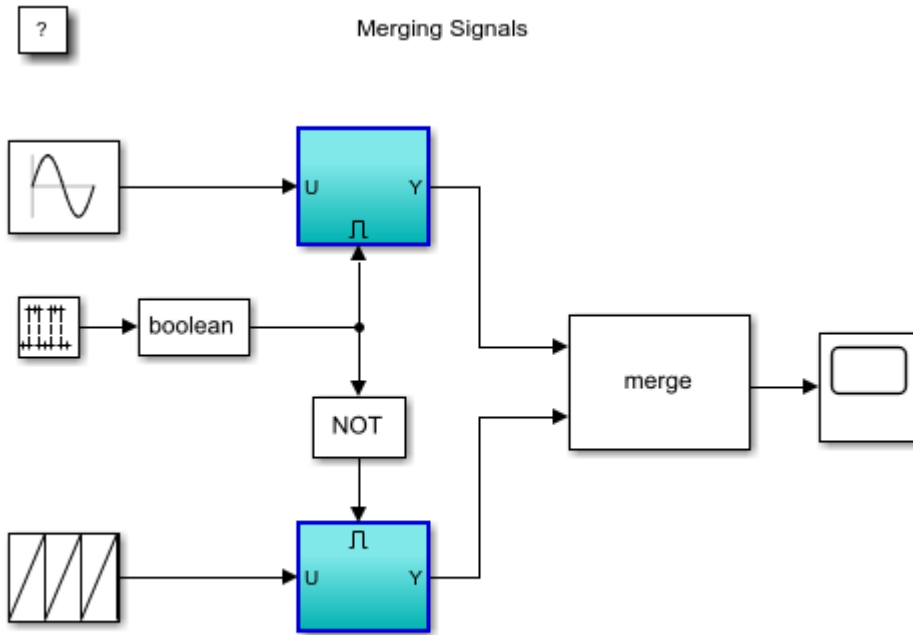

Copyright 2004-2015 The MathWorks, Inc.

The left side of the model contains two blocks Repeating Sequence blocks from the Simulink Sources library. Each block generates a scalar output signal of the form displayed on the block icon.

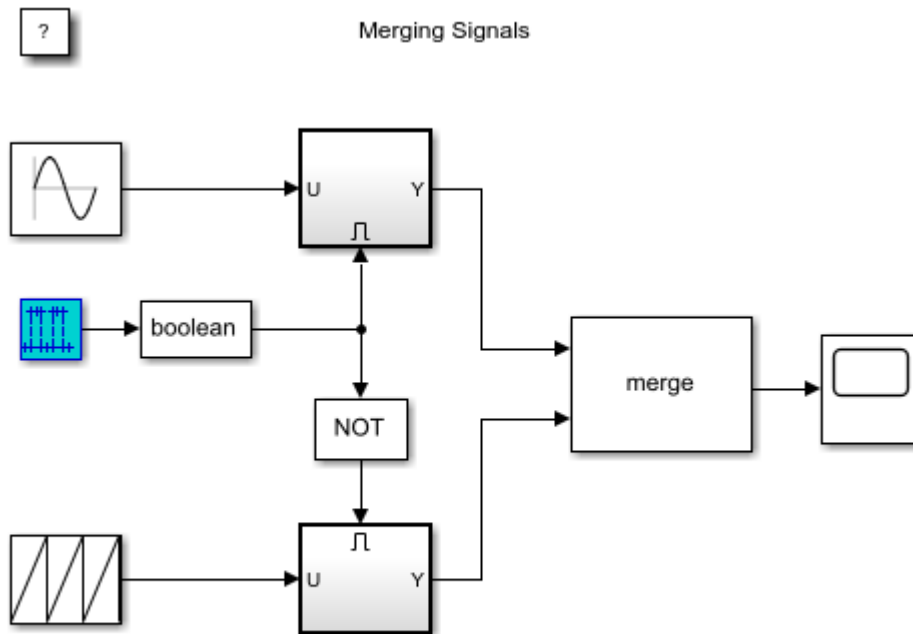

Copyright 2004-2015 The MathWorks, Inc.

These two signals are input into different Enabled Subsystem blocks, which are outlined with thick lines.

Copyright 2004-2015 The MathWorks, Inc.

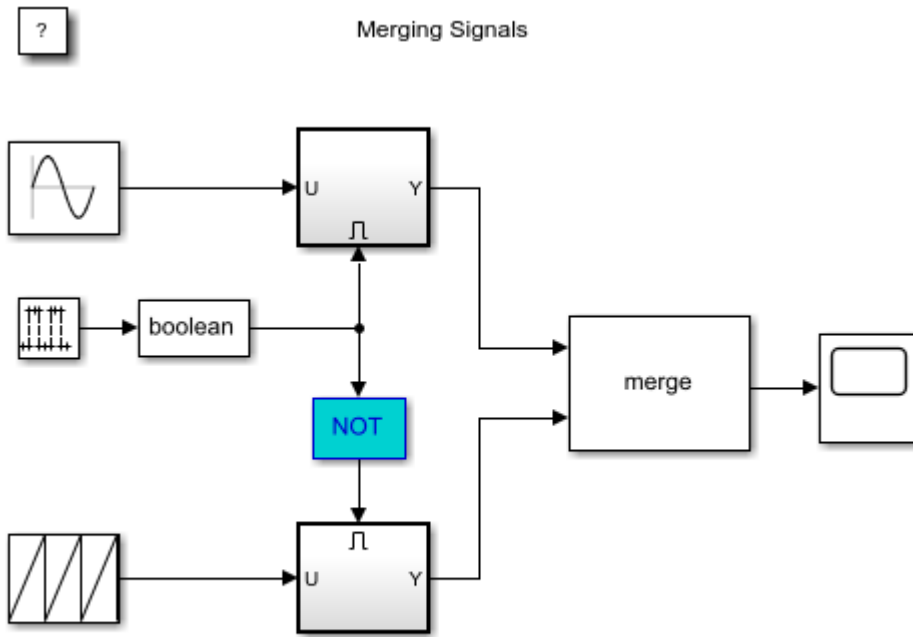

A signal generated by the Pulse Generator block controls the enabled (or conditionally executed) subsystems.

Copyright 2004-2015 The MathWorks, Inc.

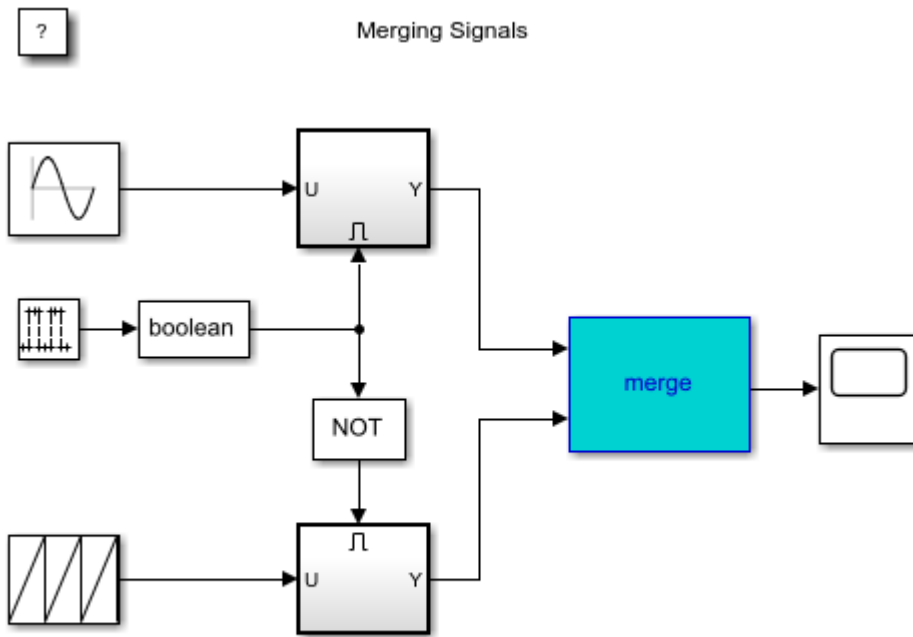

This block output toggles between the values of zero and one every five seconds. When the output of the Discrete Pulse Generator block is positive, the top enabled subsystem is simulating. When the output of the Discrete Pulse Generator block is zero, the bottom enabled subsystem is simulating.

To force the bottom enabled subsystem to simulate when the Discrete Pulse Generator block output is zero, the output is passed through a Logical Operator block set to the NOT operator. The NOT block outputs a value of one when its input is zero.

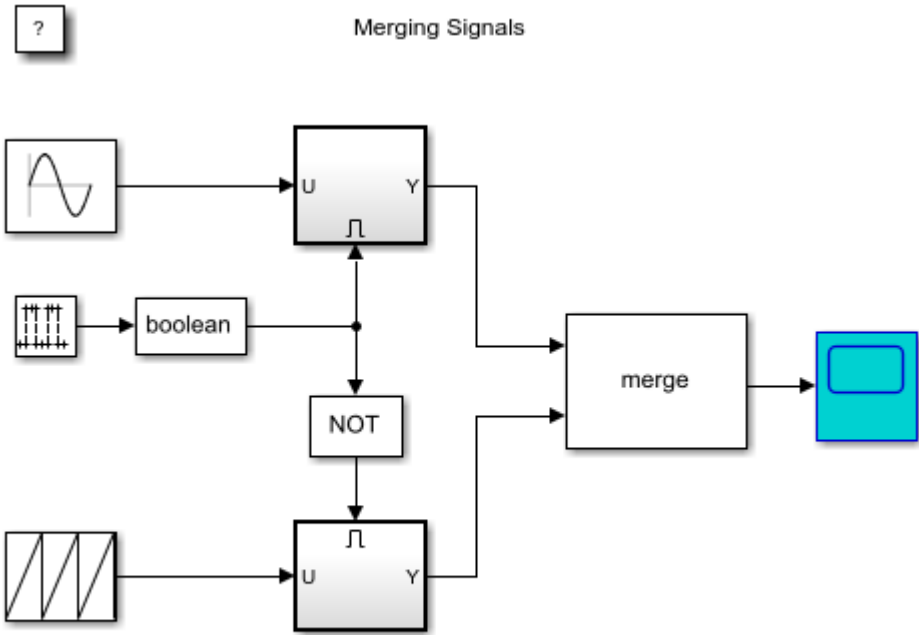

Copyright 2004-2015 The MathWorks, Inc.

The outputs of the two enabled subsystems are input into a Merge block.

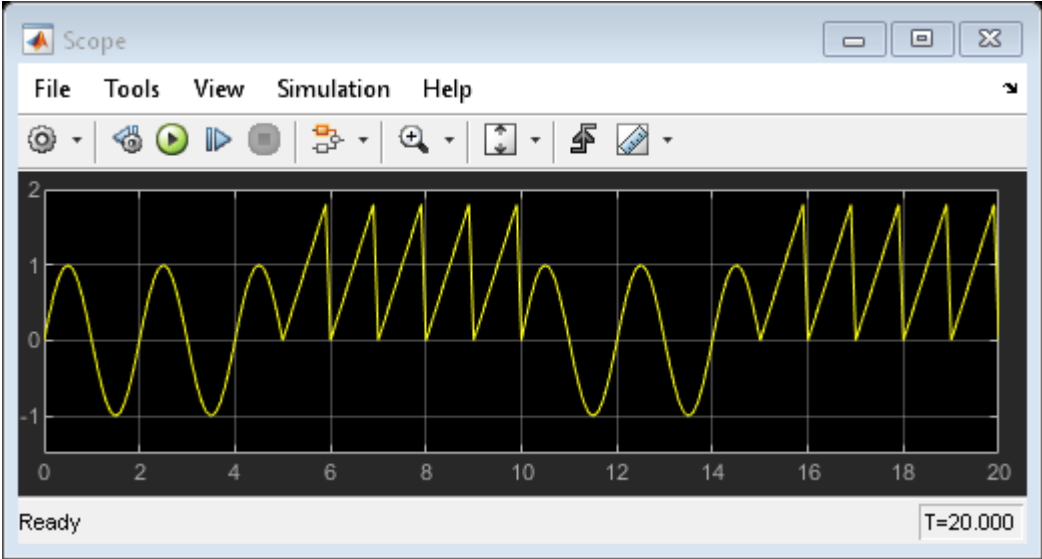

Copyright 2004-2015 The MathWorks, Inc.

A Scope block displays the Merge block output.

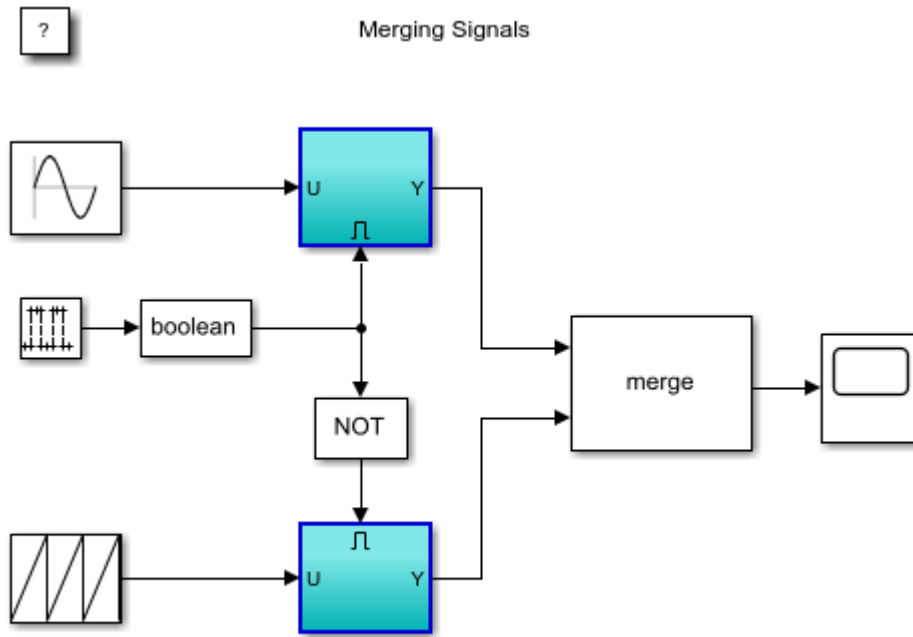

Copyright 2004-2015 The MathWorks, Inc.

Run the simulation to see the output of the Merge block on the Scope. Notice that the type of waveform shown on the Scope changes every five seconds. Due to the behavior of the Merge block, the type of waveform shown on the Scope changes every five seconds.

Conditionally Executed Subsystems

This Merge block example contains two conditionally executed subsystems.

Copyright 2004-2015 The MathWorks, Inc.

A conditionally executed subsystem is a subsystem that is only executed at times during the simulation when certain conditions are met. In this case, the subsystems are enabled subsystems, distinguished by their icons and the additional input port on the top or bottom of the block.

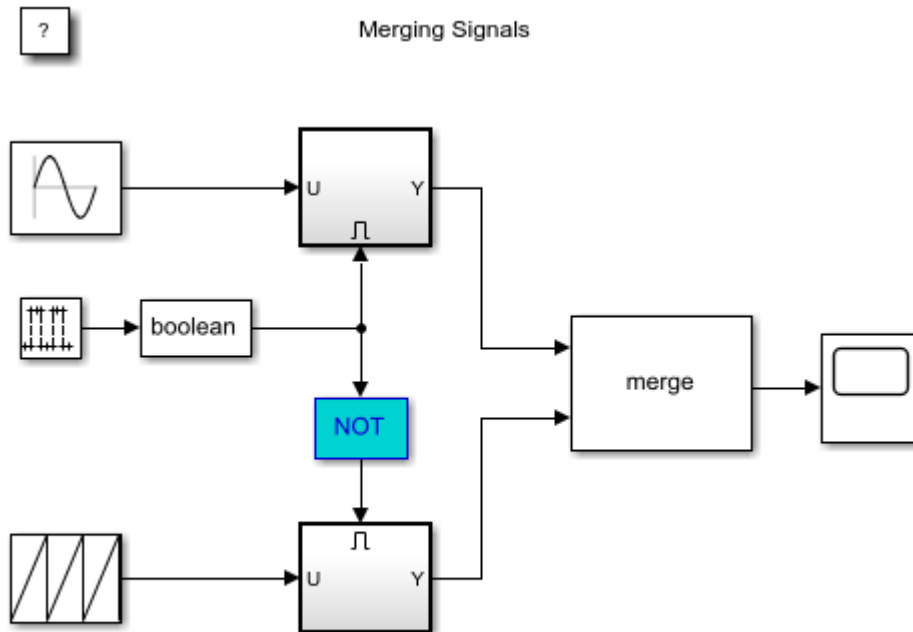

The signal feeding into the additional port is called the control signal. The value of this signal provides the condition that determines whether the subsystem is executed or not, at any given time step. Enabled subsystems are executed when the control signal is strictly positive.

In this example, you want to execute one of the enabled subsystems when the control signal is positive, and the other when the control signal is zero. You can do this by using the Logical Operator block.

Logical Operator Block

The Logical Operator block provides a method for incorporating logical operators and boolean signals into your model.

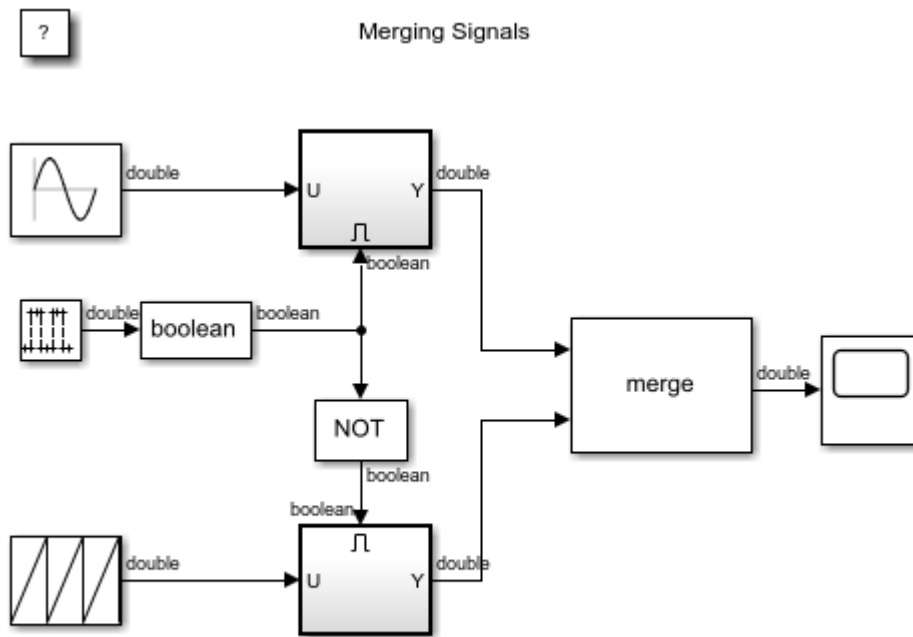

Copyright 2004-2015 The MathWorks, Inc.

Open the Logical Operator block to see the different types of operators. The current setting of NOT returns 1 (or TRUE) when the input signal is non-zero, or 0 (FALSE) when the input signal is strictly zero.

In this example, use this feature to generate a positive value when the control signal goes to zero by maintaining the current operator setting of NOT and closing the dialog.

Note: In the Simulink Editor, on the **Debug** tab, the **Information Overlays** menu offers options for displaying signal and port properties on the block diagram.

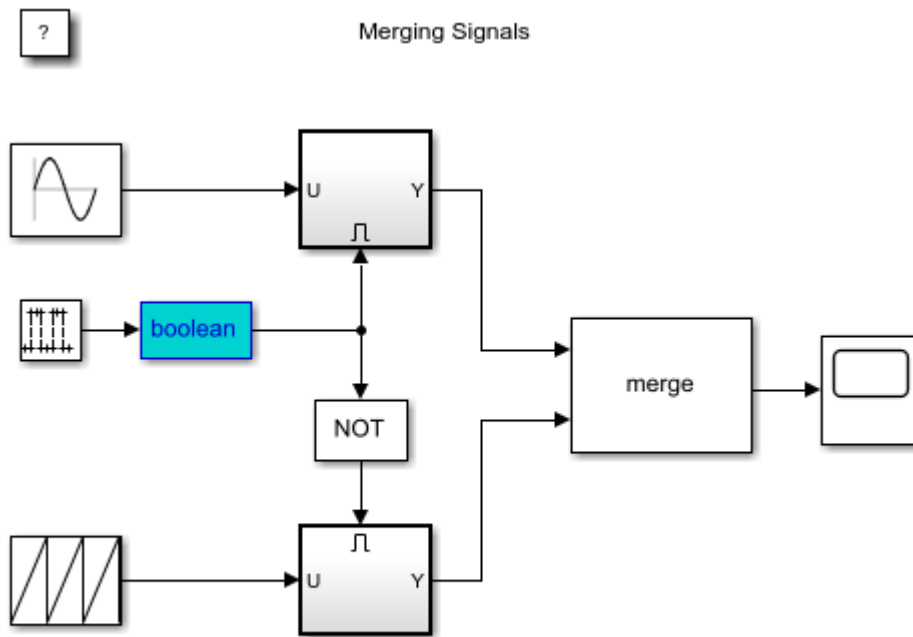

Copyright 2004-2015 The MathWorks, Inc.

Boolean Signals

You can have Simulink use boolean or double values for the inputs and outputs of the Logical Operator block, using the following steps.

1. To open the Configuration Parameters dialog box, in the Simulink Editor, on the **Modeling** tab, select **Model Settings**.
2. Go to the Optimization page in the Configuration Parameters dialog.
3. Verify that the **Implement logic signals as boolean data (vs. double)** parameter is enabled. This optimization tells Simulink whether or not it should allow a signal whose data type is double to be passed into and out of blocks that support the boolean data type.
4. Click the **OK** button on the **Configuration Parameters dialog**.

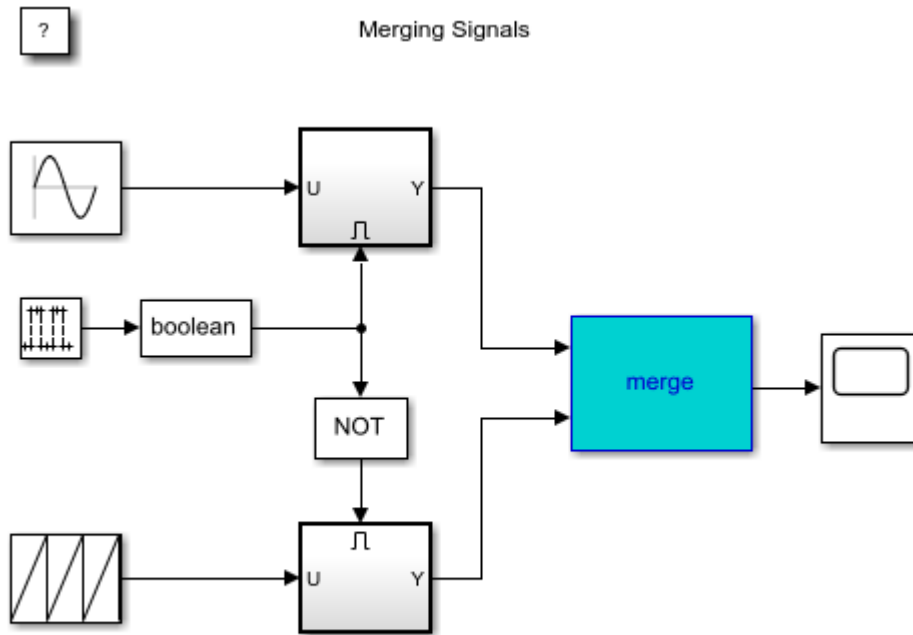

Placing the Data Type Conversion block after the Discrete Pulse Generator block avoids an error indicating that the Logical Operator block expects a boolean input signal.

Copyright 2004-2015 The MathWorks, Inc.

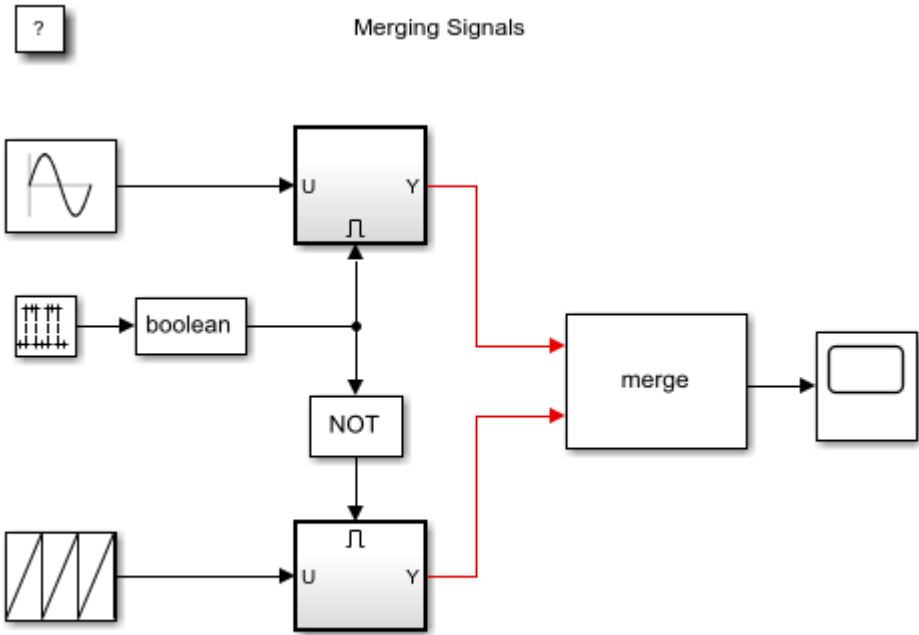

Merge Block and Alternately Enabling Subsystems

Use the Merge block to create a single signal that is equal to the output of whichever enabled subsystem is currently executing.

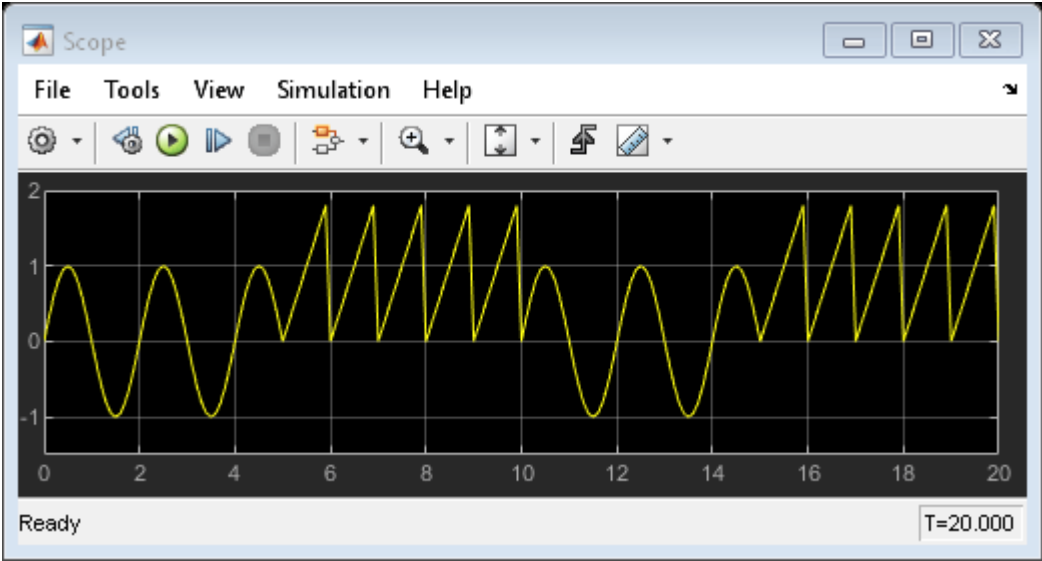

Copyright 2004-2015 The MathWorks, Inc.

1. Open the Merge block dialog box by double-clicking the block.
2. Specify the **Number of inputs** as the number of enabled subsystems whose outputs you want to merge. In this case you want to set the *Number of inputs *to 2.
3. Leave the **Initial output field** empty to specify that the Merge block sets its initial output to the initial value of one of its input signals. In this case, the output will be the initial value of the subsystem that is enabled when the simulation starts.
4. Close the Merge block dialog box.
5. Connect the output of the two conditionally executed subsystems to the inputs of the Merge block.

Copyright 2004-2015 The MathWorks, Inc.

As before, when you run the simulation, the output of the Merge block is the value of whatever conditionally executed subsystem is executing at any point in time.

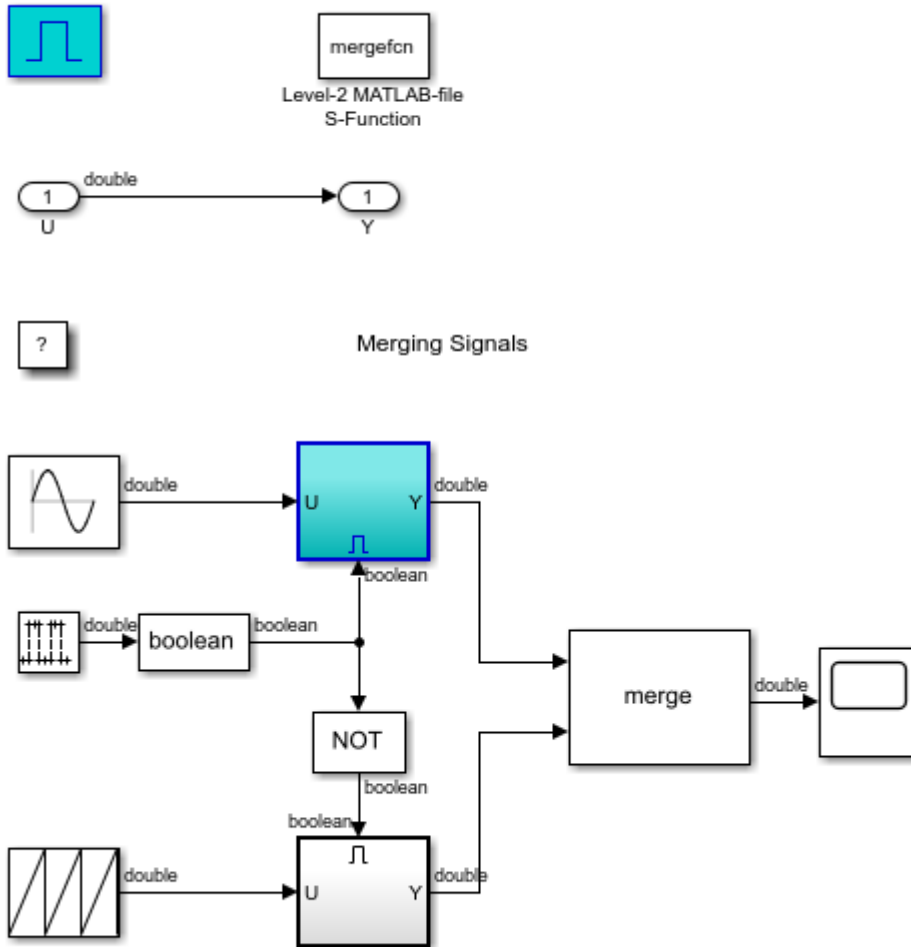

Programmatically Change Block Background Color

When you run the simulation, the color of the currently executing conditionally executing subsystems change. This does **not** happen automatically for all conditionally executing subsystems. This example uses an S-function and MATLAB® code to change the block background color.

To see the code, double-click the one of the enabled subsystems to open it.

1. The Enable block makes this a conditionally executed subsystem and adds the input port for the control signal.

Copyright 2004-2015 The MathWorks, Inc.

2. The Level-2 MATLAB-file S-function block runs the MATLAB file S-function mergefcn.m.

At each time step, the S-function `mdlUpdate` subfunction executes. It sets the `BackgroundColor` property of the subsystems based on whether it is currently executing, or not, with the following command.

```
set_param('mergedemo/Subsystem','BackgroundColor','green')
```

Share Data Store Between Instances of a Reusable Algorithm

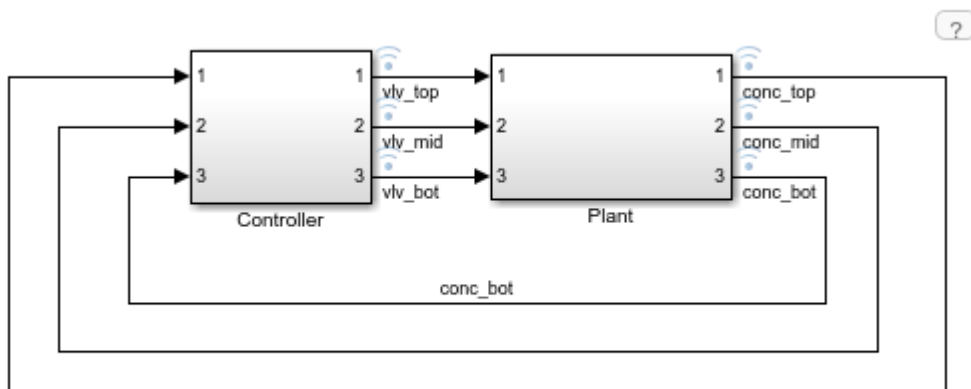

To reuse an algorithm, instead of copying and pasting the blocks, you can encapsulate them in a separate model file. Then, you can refer to the model repeatedly with Model blocks. Each Model block is a standalone instance of the algorithm.

By default, each instance calculates and stores its own copy of the signals that the model contains. Therefore, the instances do not interact. However, you can use a data store to share a piece of data between the instances.

This example shows how to share a fault indication between all instances of a reusable control algorithm. Any instance can set the fault, causing all instances to take action to clear it.

Explore Example Models

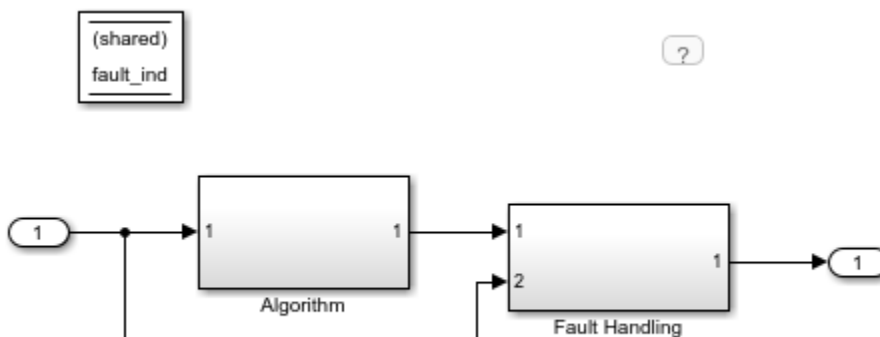

Open the example model `sldemo_shared_data`.

Copyright 2017 The MathWorks, Inc.

The Controller subsystem refers to the controller algorithm model, `sldemo_shared_data_alg`, multiple times through three Model blocks.

Open the algorithm model.

Copyright 2017-2020 The MathWorks, Inc.

The Data Store Memory block `fault_ind` represents a fault indication. The block parameter **Signal Attributes > Share across model instances** is selected, so all instances of `sldemo_shared_data_alg` share the indication. Because the block exists in `sldemo_shared_data_alg`, the indication is local to the model. Other models that refer to `sldemo_shared_data_alg` cannot read or write to the indication.

The Algorithm subsystem uses a PID controller to generate a position command for an actuator (represented by a block in `sldemo_shared_data`).

The Fault Handling subsystem sets and clears the fault indication. Each time an instance of the algorithm experiences a fault condition (the controlled input exceeds 2.63), the subsystem increments the value of the data store by 1. Each time an instance clears its fault condition, the subsystem decrements the value by 1.

Simulate Example Models

Simulate the parent model, `sldemo_shared_data`.

Use the Simulation Data Inspector to observe the position commands and the controlled signals. In the Simulink Editor toolbar, click the highlighted button.

Partway through the simulation, the controlled signal `conc_mid` experiences a disturbance.

Current plot held

The disturbance triggers a fault in the corresponding instance of the control algorithm. Due to the fault, all three position commands (the `vlv` signals) lock at zero.

Later, when the fault condition clears, all of the position commands and controlled signals return to nominal values.

Attaching Input Data to External Inputs via Custom Input Mappings

This example shows how to create a custom mapping function for the Root Inport Mapper tool. The Root Inport Mapper tool associates MAT-file data with a specific input port, based on one of these criteria.

- **Port Order** - Maps in the order it appears in the file to the corresponding port number.
- **Block Name** - Maps by variable name to the corresponding root inport with the matching block name.
- **Signal Name** - Maps by variable name to the corresponding root inport with the matching signal name.
- **Block Path** - Maps by the BlockPath parameter to the corresponding root inport with the matching block path.
- **Custom** - Maps using a MATLAB function.

Use a custom mapping criteria when the data you are trying to map does not match any of the other mapping criteria.

Custom Mapping Scenario

If the combination of input data and the model input ports does not match Port Order, Block Name, Signal Name, or Block Path mapping criteria, you can do one of the following:

- Rename the input data in the MAT-file
- Rename the input ports on the model
- Use the custom mapping mode

This example shows how to write a custom mapping function.

The workflow described below includes

- Create a MATLAB File to contain the custom mapping function
- Declare the custom mapping function name, inputs, and outputs
- Initialize the output for assignment of the return value
- Define and implement your mapping algorithm
- Validate your mapping algorithm

Create a New MATLAB Function File

Create a MATLAB function file. This file will contain your custom mapping function.

Declare Custom Mapping Function

Declare a custom mapping function name, and specify the inputs and outputs. `slexCustomMappingMyCustomMap` is the custom mapping function in this example. It declares the function inputs and outputs as defined below.

Inputs

- *modelName* - String that contains the model name.
- *signalNames* - Cell array of strings that contain variable names of signals to map
- *signals* - Cell array of signal data aligned with *signalNames* such that *signalNames*{1} is the variable name of the signal stored in *signals*{1}.

Outputs

- *inputMap* - Array or scalar of objects that result from the `getRootInportMap` function.

Initialize the Output

Initialize the value of the output variable `inputMap`. To do this use the `getRootInportMap` command with the empty property as shown in the example function `slexCustomMappingMyCustomMap` or in the code snippet below. This initializes the output variable to empty so that a value can be assigned to the output.

```
inputMap = getRootInportMap('empty');
```

Define Your Custom Mapping Algorithm

Things to think about when defining your custom mapping algorithm.

- What is the criteria for mapping signals to a root-level inport, for example `BlockName` mapping matches the name of the input signal to the name of the root-level inport block name.
- What information is needed to create a mapping.
- What happens if the mapping criteria determines that there is no match between signal and root-level inport.

The example addresses these items by

- Using the root-level port number and signal name for mapping criteria.
- Using a utility function `slexCustomMappingGetPortNames` to get root-level inport block names to provide as input along with the variable `|signalName|` to the `getRootInportMap` function which creates the mapping.
- Including a logical condition to handle the case where there is no match between port number and signal name.

Implement Your Mapping Algorithm

Next, implement your mapping algorithm.

In the `slexCustomMappingMyCustomMap` implementation, the root-level inport port number is the mapping criteria. The algorithm gets this port number from the root-level inport block. It then gets the numerical values appended to the names of the signals that are passed into the function, and compares the port number with the numerical values.

NOTE: In addition to implementing your mapping algorithm, you should also include a logical statement to handle situations where a mapping is not possible. The example function does this by using an `if` statement with the `isempty` function to determine if a mapping can be made.

Create the Mapping

The final step is to use the `getRootInportMap` function to create a custom map. The `getRootInportMap` function uses Property-Value pairs to create a custom map. The properties are:

- *model* - String that represents the model name.
- *signalName* - String or cell of strings that contains the value of the variable name of the signal to map.
- *blockName* - String or cell of strings that contains the value of the block name of the port to be mapped.

The following code is an example of this function. This same code appears in the example function `slexCustomMappingMyCustomMap`.

```
inputMap = getRootInportMap(...
    'model',modelName,...
    'signalName',signalNames,...
    'blockName',portNames);
```

Validate the Custom Mapping Function

To validate the custom mapping function at the command line:

- 1 Open the model against which you want to test your function.
- 2 Create some input signals to support the model.
- 3 Call your custom mapping function with the correct input parameters.
- 4 Validate the expected input string to send to the `sim` command, or to place in the model configuration parameters External Input String edit box.

Execute the lines of code in the following example. This code uses the custom mapping function provided with this example. If the custom map function succeeds, you should see a comma-separated list of variable names displayed in the order of the port number to which they are assigned ('port1,port2').

```
load_system('slexAutotransRootInportsExample'); port1 =
timeseries(ones(10,1)*10); port2 =
timeseries(zeros(10,1)); inputMap =
slexCustomMappingMyCustomMap('slexAutotransRootInportsExample',{'port1'
, 'port2'},{port1 , port2}); externalInputString =
getInputString(inputMap,'base');
close_system('slexAutotransRootInportsExample',0);
```

If your signals are in a `Simulink.SimulationData.Dataset`, you can execute the lines of code in the following example. This code uses the custom mapping function provided with this example. If the custom mapping function succeeds, you should see a comma-separated list of variable names displayed in the order of the port number to which they are assigned ('ds.getElement(1),port1,ds.getElement(2)').

```
load_system('slexAutotransRootInportsExample');
ds = Simulink.SimulationData.Dataset;
ds = ds.addElement( timeseries(ones(10,1)*10), 'port1');
ds = ds.addElement( timeseries(zeros(10,1)), 'port1');
inputMap = slexCustomMappingMyCustomMap('slexAutotransRootInportsExample',{'ds'},{ ds
```

```
externalInputString = getInputString(inputMap,'base');  
close_system('slexAutotransRootInportsExample',0);
```

Using Mapping Modes with Custom-Mapped External Inputs

This example shows how to implement a custom mapping algorithm similar to a Simulink mapping mode. It uses the `getSlRootInportMap` and `getRootInportMap` functions to implement the custom mapping.

Before running this example, make sure that you are familiar with the `getRootInportMap` command and the Root Inport Mapper Tool. For more information, see “Map Root Inport Signal Data”.

Workflow

This example shows how you can use a built-in Simulink mapping mode to perform as many mappings as possible. It then flags the root inports that were not able to be assigned a signal. The algorithm then overrides the flagged mappings with custom mappings to map the remaining signals. To implement such a solution, create a custom mapping function using the `getSlRootInportMap`.

This example uses a list of inputs with two kinds of signals:

- Signals that can be mapped using the Simulink block name mapping mode.
- Signals that cannot be mapped using the Simulink block name mapping mode. You must map these signals with a custom mapping mode.

Assume the following scenario:

- You want to use a group of signals as inputs to your Simulink model.
- The signals are named such that the variable names match the block name of the root-level inport.
- Each signal that uses this naming convention is within tolerance.
- Each signal that has the 'x' character appended to its name is considered outside tolerance.

This example uses a mapping mode similar to the Simulink block name mapping method.

The root-level inport block names are:

- Throttle
- Brake

The signal variable names are:

- Throttlex
- Brake

To map inputs to root-level inport blocks in this scenario, you need a custom mapping function for the Root Inport Mapper tool. This example uses the `AlmostBlockName` custom mapping function.

For this example, you will use the `slexAutotransRootInportsExample` model to validate your custom mapping function.

Declare the Custom Mapping Function

Declare the function name, inputs, and outputs. To do this, copy and paste the following code snippet into a MATLAB file and save the file as `AlmostBlockName.m`.

```
function inputMap = AlmostBlockName( modelName, signalNames, signals )
```

Get the Simulink BlockName Mapping

Next, map all the signals. To do this, first map all the signals within tolerance using the Simulink block name mapping mode, then map the signals outside tolerance.

To map signals within tolerance to a model using one of the Simulink mapping modes, use the function `getSlRootInportMap`. This function returns the `inputMap` and a vector of logical values. Each logical value indicates a successful or unsuccessful mapping of `inputMap` to a signal. To map by block name, insert the following lines of code just after the function declaration.

```
inputMap = getRootInportMap('empty');
if ~bdIsLoaded(modelName)
    load_system(modelName);
end

[inputMap, hasASignal] = getSlRootInportMap('Model', modelName, ...
    'MappingMode','BlockName',...
    'signalName',signalNames, 'signalValue', signals);
```

Find the Missing Input Signals

In the previous step, you created a mapping using a block name mapping mode. You must now account for an empty `inputMap` and for `inputMap(s)` that were not associated with a signal within tolerance. The function `getSlRootInportMap` has flagged these signals with the output variable `hasASignal`. To do this:

- 1 Check the `inputMap` variable.
- 2 If the `inputMap` variable is not empty, determine which elements of the `inputMap` vector were not assigned a signal. To do this, use the logical `~` on the `hasASignal` vector as shown below. The `emptyIndex` vector now contains a logical vector where true means the `inputMap` does not have a signal mapped to it.
- 3 Copy and paste the following code snippet under the call to the `getSlRootInportMap` and before the `end` to the `if bdIsLoaded(modelName)`.

```
if ~isempty(inputMap)
    emptyIndex = ~hasASignal;
end
```

The code snippet performs steps one and two for you.

Complete the Mapping

In the previous step, you created a logical vector `emptyIndex` to see if any of the `inputMap` objects were not associated to a signal. If all the elements of the `emptyIndex` vector are false, you have a complete mapping and the code added in this section will not be executed.

If the `emptyIndex` vector contains at least one value that is true, you have `inputMap` objects that are not associated to a signal. Manually assign the variable `signal(s)` to that `inputMap`. Then, override the `inputMap` with the signal name that matches the expected signal name:

- 1 In the `emptyIndex` vector, find all the items that are true. These items point to the `inputMap(s)` that still need to be associated with a signal.
- 2 For each `inputMap`, use the 'BlockName' property to get the name of the inport block that the `inputMap` is assigned to.

- 3 Append an 'x' to the block name to get the name of the signal to be assigned to the `inputMap`.
- 4 Compare the result to each item in the `signalNames` variable cell array.
- 5 If a match is found, override the `inputMap` with the signal name that matches the expected signal name. To override the `inputMap` object, use the `getRootInportMap` function with the 'InputMap' and the 'SignalName' properties.

```

if isa( signals{1}, 'Simulink.SimulationData.Dataset')
    signalNames = signals{1}.getElementNames';
end

idxEmpty = find(emptyIndex==true);
for kEmpty =1:length(idxEmpty)
    idxOfEmpty = idxEmpty(kEmpty);
    destBlockName = get(inputMap(idxOfEmpty),'BlockName');
    outSideToleranceSig = [destBlockName 'x'];
    isAMatch = strcmp(signalNames, outSideToleranceSig);
    if any(isAMatch)
        inputMap(idxOfEmpty) = getRootInportMap('InputMap', ...
            inputMap(idxOfEmpty),'SignalName',outSideToleranceSig);
    end
end
end

```

The Custom Map File

When you are done, the file `AlmostBlockName.m` should resemble the following code.

```

function inputMap = AlmostBlockName(modelName, signalNames, signals)
inputMap = getRootInportMap('empty');
if bdIsLoaded(modelName)

    [inputMap, hasASignal] = getSlRootInportMap('Model', modelName, ...
        'MappingMode','BlockName',...
        'signalName',signalNames, 'signalValue', signals);

    if ~isempty(inputMap)
        emptyIndex = ~hasASignal;
        idxEmpty = find(emptyIndex==1);

        if isa( signals{1}, 'Simulink.SimulationData.Dataset')
            signalNames = signals{1}.getElementNames';
        end

        for kEmpty =1:length(idxEmpty)
            idxOfEmpty = idxEmpty(kEmpty);
            destBlockName = get(inputMap(idxOfEmpty),'BlockName');
            nonNominalSig = [destBlockName 'x'];
            isAMatch = strcmp(signalNames, nonNominalSig);
            if any(isAMatch)
                inputMap(idxOfEmpty) = getRootInportMap('InputMap', ...
                    inputMap(idxOfEmpty),'SignalName',nonNominalSig);
            end
        end
    end

end
end
end

```

Validate the Custom Mapping

To validate your custom mapping:

- 1 Save the AlmostBlockName function in a file on the MATLAB path.
- 2 To see the results of your mapping function, copy and paste the following code snippet to the MATLAB Command Window.

```
modelName = 'slexAutotransRootInportsExample';  
Throttlex = timeseries(zeros(10,1));  
Brake     = timeseries(ones(10,1));  
signalNames= {'Throttlex' , 'Brake'};  
signals   = { Throttlex , Brake };  
open_system(modelName);  
inputMap  = AlmostBlockName(modelName, signalNames, signals);  
inputStr  = getInputString(inputMap, 'base');  
close_system(modelName);
```

After running the code snippet, the variable `inputStr` contains the string 'Throttlex,Brake'.

If your signals are in a `Simulink.SimulationData.Dataset`, to see the results of your mapping function, use the following code snippet at the MATLAB Command Window.

```
modelName = 'slexAutotransRootInportsExample';  
Throttlex = timeseries(zeros(10,1));  
Brake     = timeseries(ones(10,1));  
ds        = Simulink.SimulationData.Dataset;  
ds        = ds.addElement( Throttlex, 'Throttlex' );  
ds        = ds.addElement( Brake, 'Brake' );  
signalNames= {'ds'};  
signals   = { ds };  
open_system(modelName);  
inputMap  = AlmostBlockName(modelName, signalNames, signals);  
inputStr  = getInputString(inputMap, 'base');  
close_system(modelName);
```

After running the code snippet for signals in a `Simulink.SimulationData.Dataset`, the variable `inputStr` contains the string 'ds.getElement('Throttlex'),ds.getElement('Brake')'.

Converting Harness-Driven Models to Use Harness-Free External Inputs

This example shows how to convert a harness model that uses a Signal Editor block as an input to a harness-free model with root input ports. The example uses data from the MAT-file of Signal Editor block of the harness model for the harness-free model. The example removes the Signal Editor block from the harness model and adds root input ports to create a harness-free model. Then, the data in the MAT-files is mapped to the root input ports of the model.

Open the Example Model

For this example, open and modify the model `sldemo_autotrans` from “Modeling an Automatic Transmission Controller” on page 13-179.

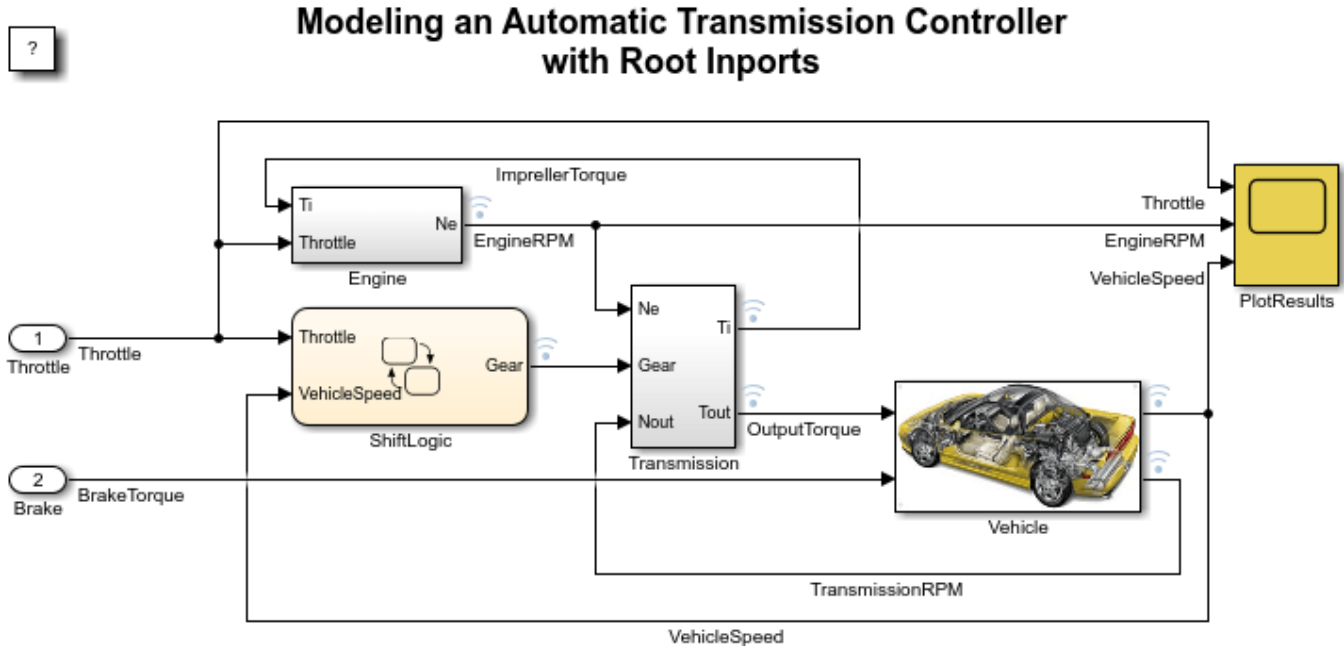

Remove the Signal Editor Block

Replace the Signal Editor block named `ManeuversGUI` with two input ports.

- 1 Delete the Signal Editor block named `ManeuversGUI`.
- 2 From the **Simulink/Commonly Used Blocks** library, drag two `Inport` blocks into the model.
- 3 Connect the input ports to the lines previously connected to the Signal Editor block.
- 4 Rename the input ports. Name the input port connected to the `Throttle` line **Throttle**. Name the input port connected to the `BrakeTorque` line **Brake**.

Save the model as `slxAutotransRootInportsExample1.slx` or use `slxAutotransRootInportsExample.slx`.

The remaining steps of this example use the model `slexAutotransRootImportsExample.slx`. If you saved the model with a different name use your model name in the steps going forward.

Copyright 2012 - 2014 The MathWorks, Inc.

Set Up Harness-Free Inputs

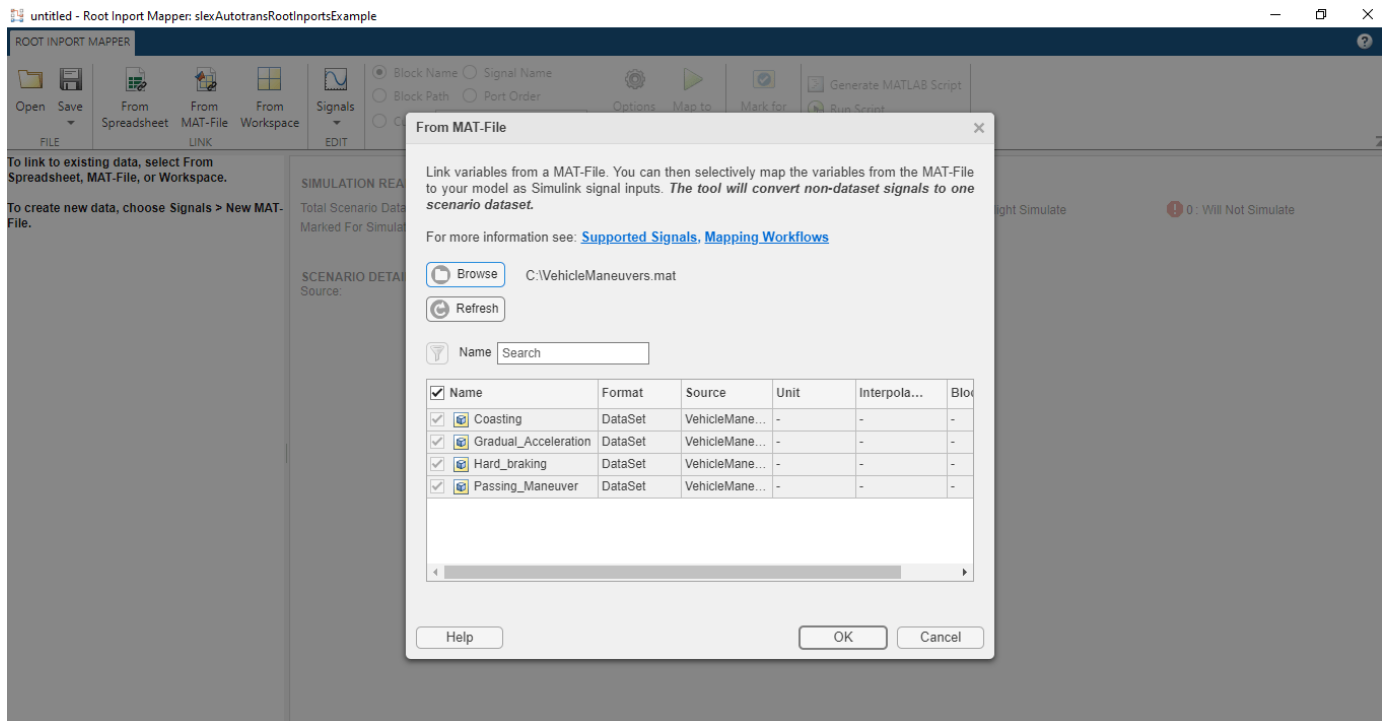

Now that the model is harness-free, set up the inputs from the MAT-file previously used by the Signal Editor block.

In the Modeling tab, select Model Settings. In the Data Import/Export pane, click the **Connect Inputs** button.

Map Signals to Root Import

The Root Import Mapper tool opens.

The example uses this tool to set up the model inputs from the MAT-file and map those inputs to an input port, based on a mapping algorithm. To select the MAT-file that contains the input data, click the **From MAT-File** button on the Root Import Mapper toolbar. When the link dialog appears, click the Browse button. In the browser, select the MAT-file from the local working example folder. For this example, the file name is `VehicleManeuvers.mat`.

Select a Mapping Mode

When you select the MAT-file `VehicleManeuvers.mat`, determine the root input port to which to send input data. Simulink matches input data with input ports based on one of five criteria:

- **Port Order** - Maps in the order it appears in the file to the corresponding port number.
- **Block Name** - Maps by variable name to the corresponding root input port with the matching block name.
- **Signal Name** - Maps by variable name to the corresponding root input port with the matching signal name.
- **Block Path** - Maps by the BlockPath parameter to the corresponding root input port with the matching block path.
- **Custom** - Maps using a MATLAB function.

The selected MAT-file has input data with variables of the same name as the harness signals Throttle and Brake, and input ports with names matching the variables. Given the set of conditions for the input data and the model input ports, the best choice for a mapping criteria is **Block Name**. Using this criteria, Simulink tries to match input data variable names to the names of the input ports. To select this option:

- 1 Click the **Block Name** radio button.
- 2 Click the **Options** button and select **Update Model**. This verifies the mapping.
- 3 Click the **Map** button.

When compiling the data, Simulink evaluates input ports against the following criteria to determine compatibility issues. The status of this compatibility is reflected by the table colors green, orange, or red. Warnings and errors are flagged with diagnostic messages. If the **Options > Update Model**

option is not selected, Root Inport Mapper determines the compatibility status by evaluating these block parameters and assigned signals:

- **Data Type** - Double, single, enum,
- **Complexity** - Real or complex
- **Dimensions** - Signal dimensions vs port dimensions

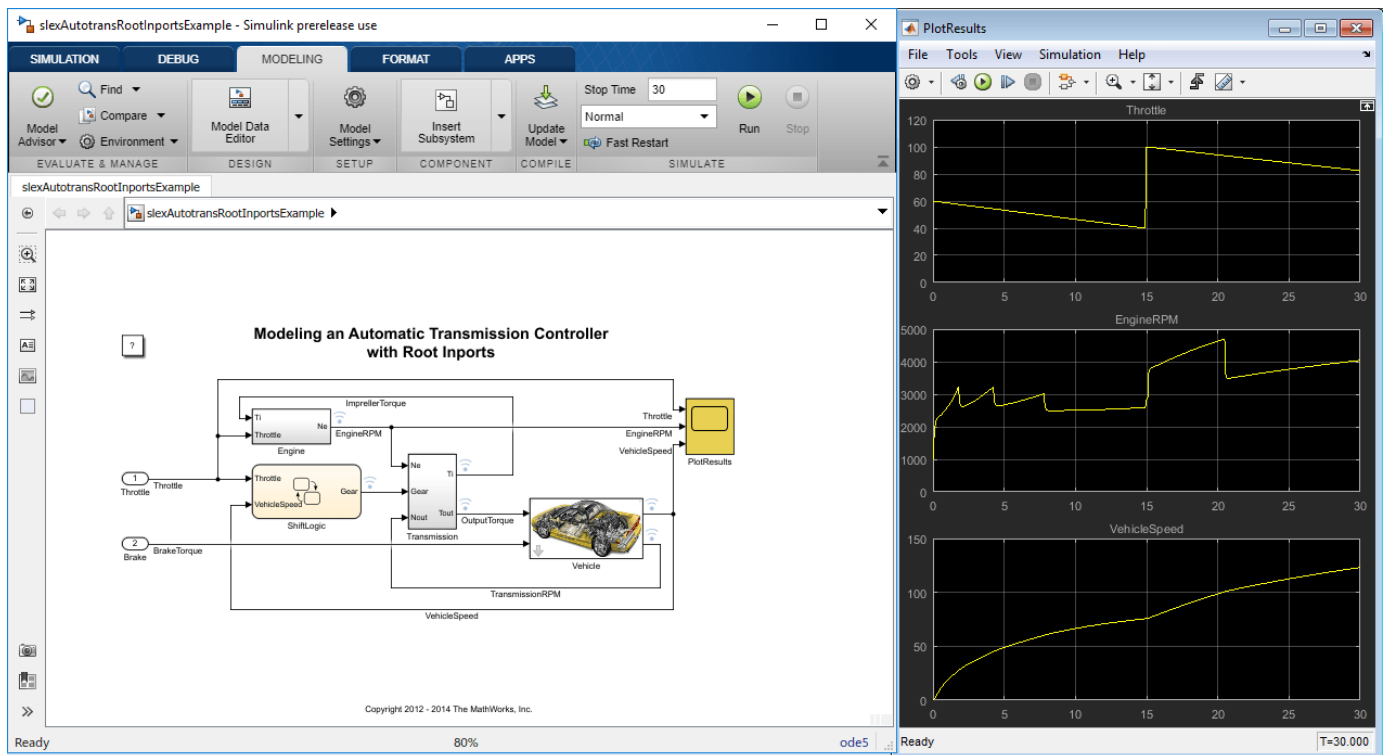

Status	Scenario Signal	Port	Block Name	Mapped Signal
✓	Throttle	1	Throttle	Passing_Maneuver.getElement('Throttle')
✓	Brake	2	Brake	Passing_Maneuver.getElement('Brake')

Finalize the Inputs to the Model

Review the results of the mapping compatibility. Click the Scenario Dataset 'Passing_Maneuver' in the scenario dataset list. To prepare for simulation, click **Mark for Simulation**. This action applies the mapping variables to the Configuration Parameter **Data Import/Export > External Input** text box. If this text box has content, it is overwritten.

Simulating the Model

With the changes applied you can now simulate the model and view the results. Run the model. To view the results of the simulation, double-click the Scope Block **PlotResults**.

Logging States in Structure Format

Logging states using the Structure format can provide advantages over the Array format. When you log states using the Array format, the ordering of the states along the columns in the logged array depends on the block sorted order. Various factors can affect the block sorted order, which can alter the ordering of the states from one simulation to the next. When you use the Structure format, the block names are stored along with the logged state data for that block, so you can process your data without considering the block sorted order.

Logging States in Array Format

When you log states using the Array format, the logged data is stored in an array with N columns, where N is the number of states, and M rows, one for each simulation time step. This M-by-N matrix form is easy to manipulate in MATLAB®. However, the ordering of the state variables along the columns of the logged matrix depends on the block sorted order. Therefore, any MATLAB code which expects a fixed mapping between the states of blocks in the model and the columns of the states matrix is prone to breaking when the block sorted order changes due to changes in the model.

For example, consider the models `sldemo_state_logging1` and `sldemo_state_logging2`.

```
mdl1 = 'sldemo_state_logging1';
mdl2 = 'sldemo_state_logging2';
open_system(mdl1);
open_system(mdl2);
```

Copyright 2006-2013 The MathWorks, Inc.

Copyright 2006-2013 The MathWorks, Inc.

The two models contain the same blocks, connected the same way. The only difference is the order of the output ports. Simulate the models and log the states using the Array format.

```
simOut1 = sim mdl1, 'SaveFormat', 'Array');
simOut2 = sim mdl2, 'SaveFormat', 'Array');
```

Extract the states vectors from the `Simulink.SimulationOutput` object, which contains all data logged in the simulation.

```
x1 = simOut1.get('xout');
x2 = simOut2.get('xout');
```

The logged states data for `x1` and `x2` are different because the blocks are ordered differently, so the mapping between the columns in the logged array and the blocks in the model is different.

```
isequal(x1, x2)
```

```
ans =
```

```
logical
```

```
0
```

Log States Using the Structure Format

Simulate the models again, but this time log the states in structure format.

```
simOut1=sim mdl1, 'SaveFormat', 'Structure');
simOut2=sim mdl2, 'SaveFormat', 'Structure');
```

Extract the structures, which contain the logged states, from the `SimulationOutput` object.

```
x1s = simOut1.get('xout');
x2s = simOut2.get('xout');
```

Display these structures, which contain two fields: `time` and `signals`. The `time` field is empty because the data was logged using the `Structure` format and not the `StructureWithTime` format. You can use the `StructureWithTime` format when you need to save the time data along with the states data.

```
disp(x1s);
disp(x2s);
```

```
time: []
signals: [1x2 struct]
```

```
time: []
signals: [1x2 struct]
```

The structure `signals` field is an array of structures, with one structure for each block in the model that has state data. Each block data structure within the `signals` field contains a `values` field with the states data and a `blockName` field with the name of the block that produced that state data. You can extract the states data into a matrix that you can process similar to how you would had you logged the states using the Array format.

To fix the state ordering problem, first use the block names to sort the states data into a fixed order. For example, you could sort the states data so that the blocks are in alphabetical order, which will stay the same from one simulation to the next, regardless of the block sorted order.

```
[~, idx1] = sort({x1s.signals.blockName});  
x1 = [x1s.signals(idx1).values];
```

```
[~, idx2] = sort({x2s.signals.blockName});  
x2 = [x2s.signals(idx2).values];
```

```
isequal(x1, x2)
```

```
ans =
```

```
    logical
```

```
     1
```

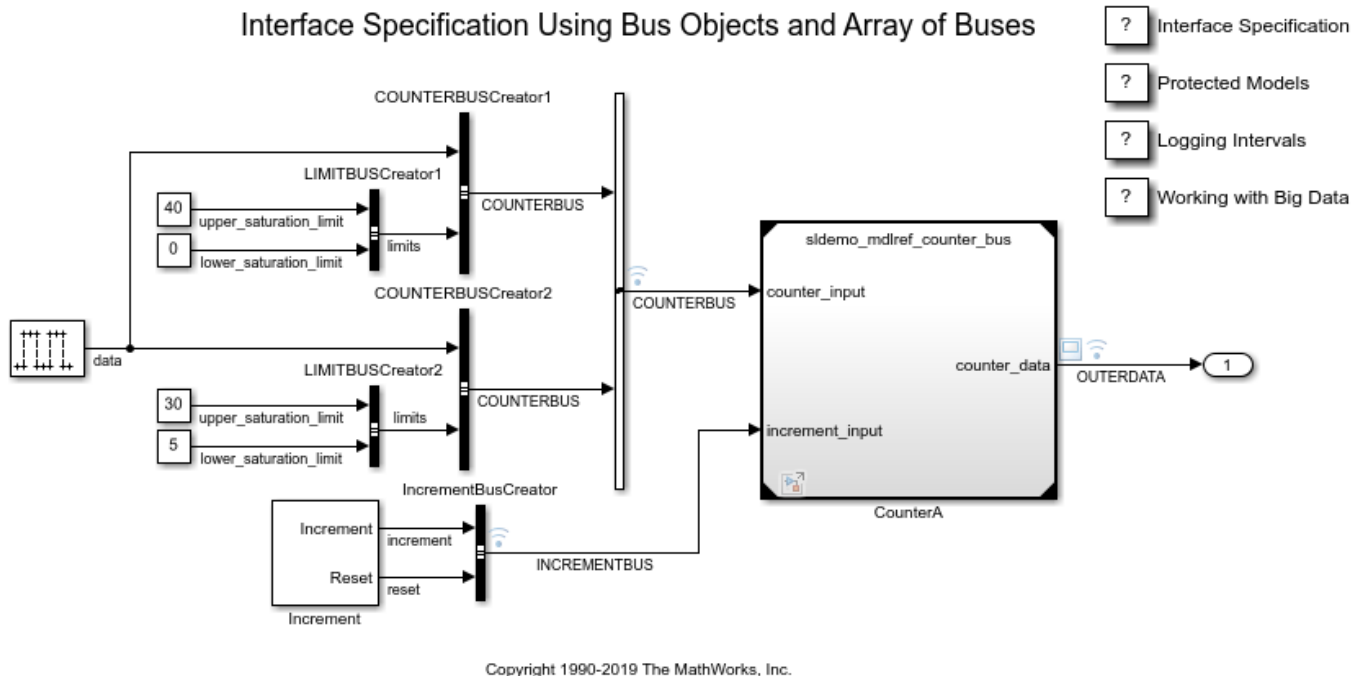

Once you reorder the signals fields alphabetically by block name, if you extract the values field data in the same order, you can then process the data similar to how you would when you use the Array format, but the order of the block states data does not change from one simulation to the next.

Logging Intervals

This example shows how to specify logging intervals. Simulink® limits the data logging to the specified intervals.

Open the Example Model

Open the example model, `sldemo_mdhref_bus`.

Set Logging Intervals

To reduce the amount of logged data, limit data logging to specific simulation time intervals. In this example, you specify two intervals to log the data of two system events triggered by the `increment` and `reset` signals. The first interval captures the first reset event. The second interval captures the behavior of the system after the increment event takes place and the signals reach the lower saturation limits. The intervals are based on the `increment` and `reset` signal values.

To set the **Logging Intervals** configuration parameter, in the Simulink Toolstrip, on the **Modeling** tab, click **Model Settings**. In the Configuration Parameters dialog box, on the **Data Import/Export** tab, enable the **Logging Intervals** parameter by selecting **Single simulation output**.

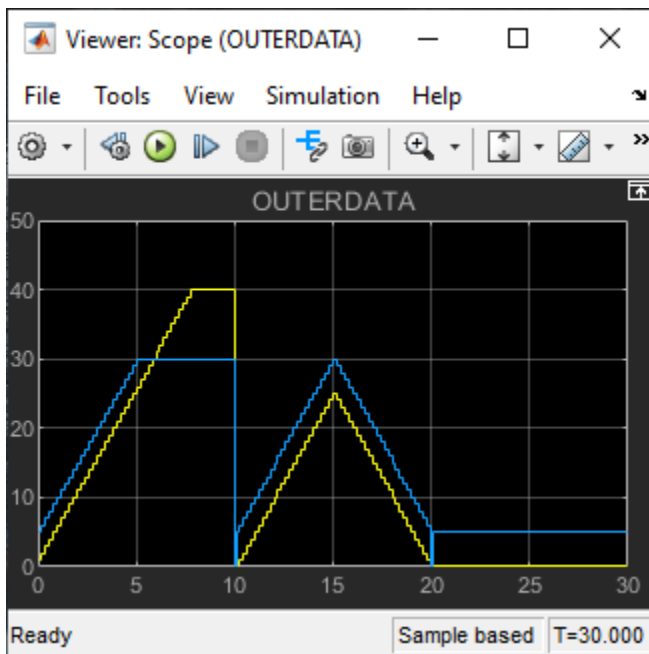

The **Logging Intervals** parameter value must be a real double matrix with two columns. The matrix elements must not be NaN. Each row defines the start and end times for an interval. Intervals must be disjoint and ordered.

For this example, set **Logging Intervals** to `[9, 10.5; 14.5, 30]`.

Simulate the Model and View Results

Simulate the model.

OUTERDATA is a wide signal with two elements. The scope shows the values of the OUTERDATA signal during simulation. The scope does not honor the **Logging Intervals** setting.

The **Logging Intervals** setting is honored when logging time, root outputs, signals, data store memory, states, and other kinds of data. To display the logged values of OUTERDATA captured as part of signal logging, use the `stem` function, which ignores the interpolation settings of the data.

```
time = out.get('topOut').get('OUTERDATA').Values.Time;
data = out.get('topOut').get('OUTERDATA').Values.Data;
stem(time,data,':. ');
xlabel('Simulation Time');
xlim([0 35]);
ylabel('OUTERDATA');
ylim([0 45]);
```

Working with Big Data

This example shows how Simulink models handle big data as input to and output from a simulation.

Description of the Example

Big data refers to data that is too large to load into system memory all at once.

Simulink can produce big data as simulation output and consume big data as simulation input. To handle big data for both input and output, the entire data is stored in a MAT-file on the hard disk. Only small chunks of this data are loaded into system memory at any time during simulation. This approach is known as streaming. Simulink can stream data to and from a MAT-file. Streaming solves the memory issues because the capacity of the hard disk is typically much greater than the capacity of the random access memory.

This example shows how to handle big data in Simulink simulations. The logging to file capability is used to stream big data as the output of a simulation. Streaming from file then supplies big data as input to a simulation.

Set up Logging to File

To stream output data to a MAT-file, enable logging to file.

Enable logging to file by selecting the "**Configuration Parameters > Data Import/Export > Log Dataset data to file**" option. You can also specify the name of the file that will contain the result.

The programmatic way to enable Logging to file is by setting the model parameter `LoggingToFile` to on.

When logging to file is enabled on a model, simulation of that model streams logged signals directly into the MAT-file. Additionally, if logging of States or Output is enabled and `SaveFormat` is specified as Dataset, those values are streamed into same the MAT-file.

Simulate the Model

This example changes the directory to a temporary directory, which has write permissions. Then the example calls the `sim` command to simulate the model, logging to file.

Set the parameter `SignalLoggingName`, which specifies the name of the Dataset object to hold the result of signal logging, to `topOut`. Set the parameter `LoggingFileName`, which specifies the name of the resulting MAT-file, to `top.mat`. The `StopTime` parameter is set to 5000 seconds. For a more realistic big data example, the stop time would be a much larger value, which would result in many more data samples to log. `cd(tempdir);`

Create a DatasetRef Object to Reference the Logged Dataset Within the MAT-file

Use a DatasetRef object to reference the resulting Dataset in the logged MAT-file. The benefit of using DatasetRef is that the referenced MAT-file is not loaded into memory. DatasetRef is a very light wrapper object for referencing a Dataset that is stored in a file. The alternative of calling the load function on this file loads the entire file into memory, which might not be possible if this Dataset contains big data.

Obtain a Reference to a Logged Signal

You can use { } indexing of DatasetRef object to reference individual signals within a Dataset, without loading these signals into memory. For example, to reference the seconds signal:

The Values field of sig2 is a SimulationDatastore object, which is a light-weight reference to the data of signal 2, stored on disk:

```
ans =
```

```
SimulationDatastore with properties:
```

```
    ReadSize: 100
  NumSamples: 50001
    FileName: 'C:\TEMP\Bdoc22a_1891349_13144\ibC86E06\8\tp1b7691b8\ex31145726\top.mat'
```

```
Data Preview:
```

Time	Data
0 sec	1 5
0.1 sec	1 5
0.2 sec	2 6
0.3 sec	2 6
0.4 sec	3 7
:	:

Obtain More References to Other Logged Signals

This example uses some of these logged signals as inputs to the simulation of the referenced model. Create light-weight references for each of these. These are bus signals in the model and the resulting Values fields are structures of SimulationDatastore objects. Each structure reflects the hierarchy of the original bus signal.

Create a New Dataset Object to Use as Simulation Input

Specify the input signals to a simulation through a Dataset object. Each element in this Dataset provides input data to the inport block corresponding to the same index. Create an empty Dataset ds and then place the references to the logged signals into it as elements number one and two.

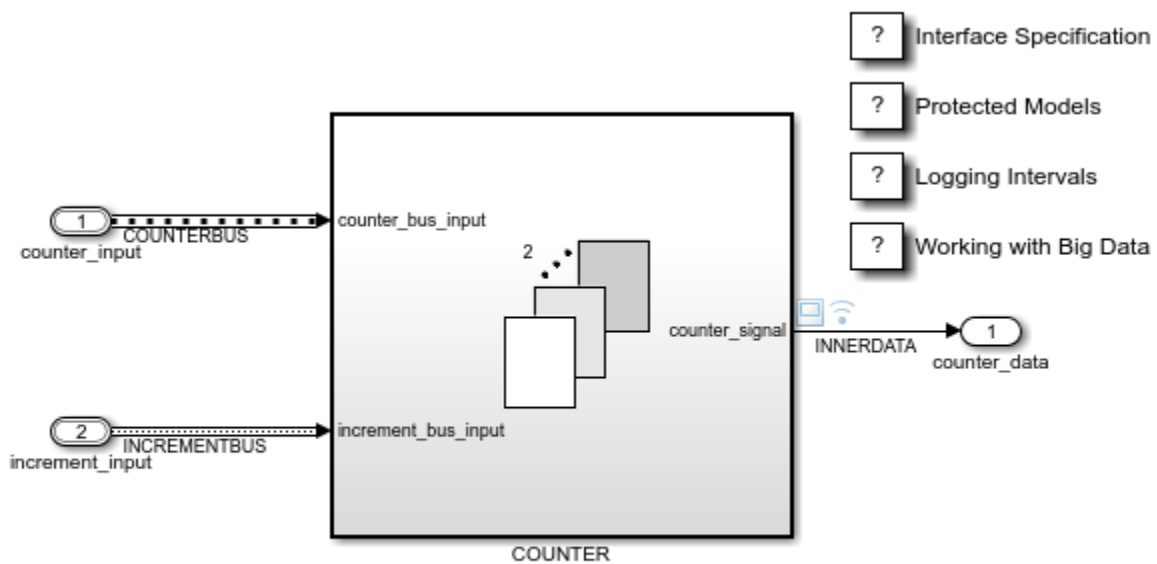

Use { } indexing on the Dataset object to assign elements into appropriate positions.

Within each element of the Dataset, you can mix references to signal data (e.g., SimulationDatastore object) with in-memory data (e.g., timeseries objects). To change one of the upper saturation limits from 30 to 37:

Stream Input Data into Simulation

Now simulate the referenced model `sldemo_md\ref_counter_bus`, and use the Dataset `ds` as input. The data that is referenced by SimulationDatastore objects is streamed into the simulation without overwhelming the system.

The data for upper saturation limit is not streamed because that signal is specified as an in-memory timeseries. The change in saturation limit is reflected at around time 6 in the scope (the signal now saturates to a value of 37 instead of 30).

Copyright 1990-2019 The MathWorks, Inc.

Summary

This example has demonstrated a round trip workflow of big data from and to simulation. Logging to persistent storage was used to stream data from the first simulation into a MAT-file. A second simulation was then set up to stream the data from that file as input. A more realistic example would have a larger value for the model `StopTime` parameter, resulting in a larger logged MAT-file. The second simulation could also be configured for a longer `StopTime`. However, even with the larger data files for output and input, the memory requirements for the longer simulations remain the same!

MATLAB® Workflow

SimulationDatastore allows you to analyze the logged data incrementally in MATLAB. Going back to the reference to the second logged signal, assign the datastore to a new variable to simplify access to it.

Access the Data in Chunks

`SimulationDatastore` allows incremental reading of the referenced data. The reading is done in chunks and is controlled by the `ReadSize` property. The default value for `ReadSize` is 100 samples (each sample for a signal is the data logged for a single time step of simulation). Change it to 1000 for this example. Each read of the datastore returns a timetable representation of the data.

Reset the `SimulationDatastore` Read Counter

Each read on the datastore advances the read counter. You can reset this counter and start reading from the beginning:

Iterate Through All Data in the Datastore

Use `SimulationDatastore` for incremental access to the logged simulation data for big data analysis in MATLAB. You can iterate over the entire data record and chunks:

- “Subsystems”

If-Then-Else Blocks

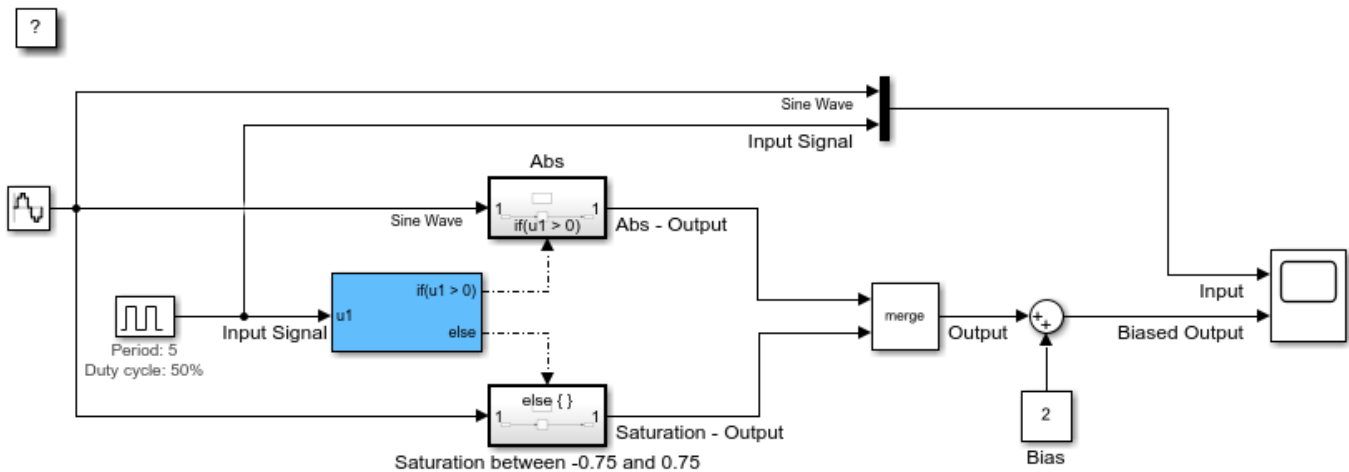

This example shows the effect of feeding a sine wave into If Action Subsystem blocks. It is designed to illustrate the similarity between the If Action Subsystem block and the Enabled Subsystem block.

A pulse generator is connected to an If block, which compares the input to zero. If the input is positive, as specified by the `if` condition, then the If Action Subsystem `Abs` is activated, which outputs the absolute value of the sine wave input signal. If the input to the If block is not positive, as specified by the `else` condition, then the If Action Subsystem `Saturation between -0.75 and 0.75` is activated, which outputs a clipped version of the sine wave signal using a Saturation block.

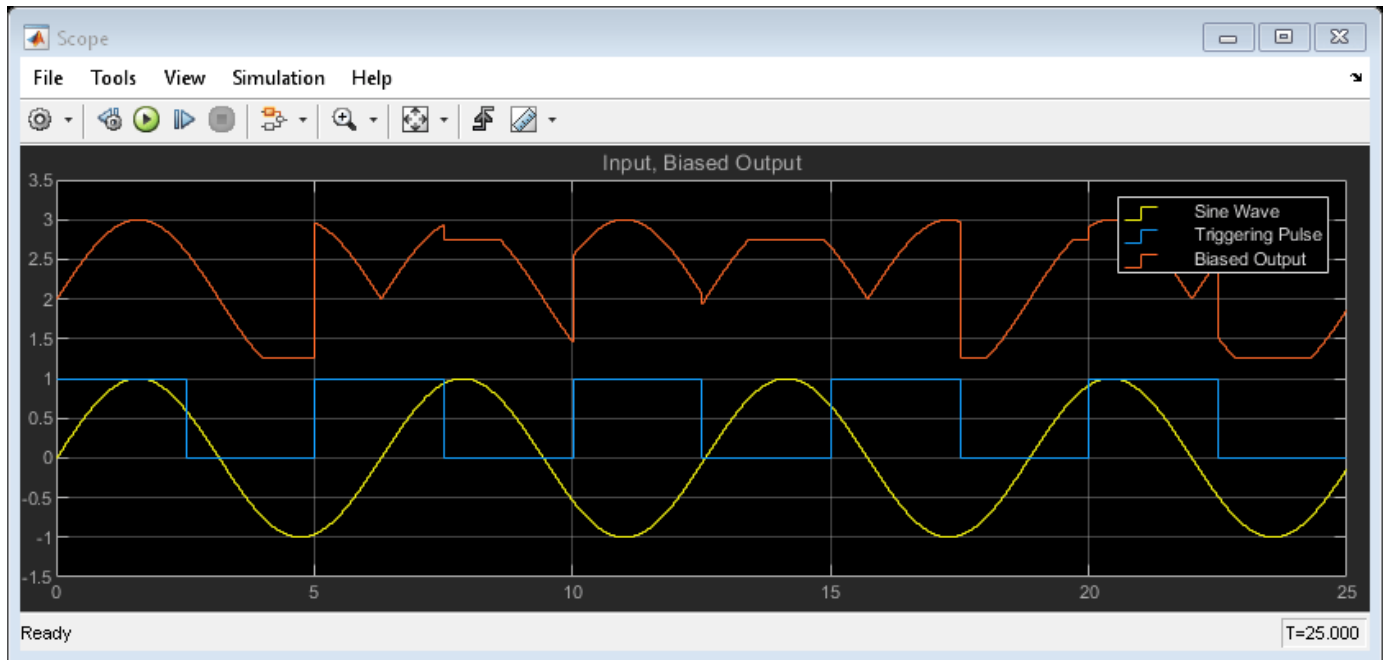

The outputs of the two subsystems are never active at the same time and are merged into one signal with a Merge block. The output signal is then biased by +2.

The scope shows the sine wave input, the triggering pulse input, and the merged and biased output. When the pulse is on, the output is the absolute value of the sine wave. When the pulse is off, the output is the clipped version of the sine wave. In each case, the output is biased by +2.

Related Examples

- “Simulink Subsystem Semantics” on page 13-368

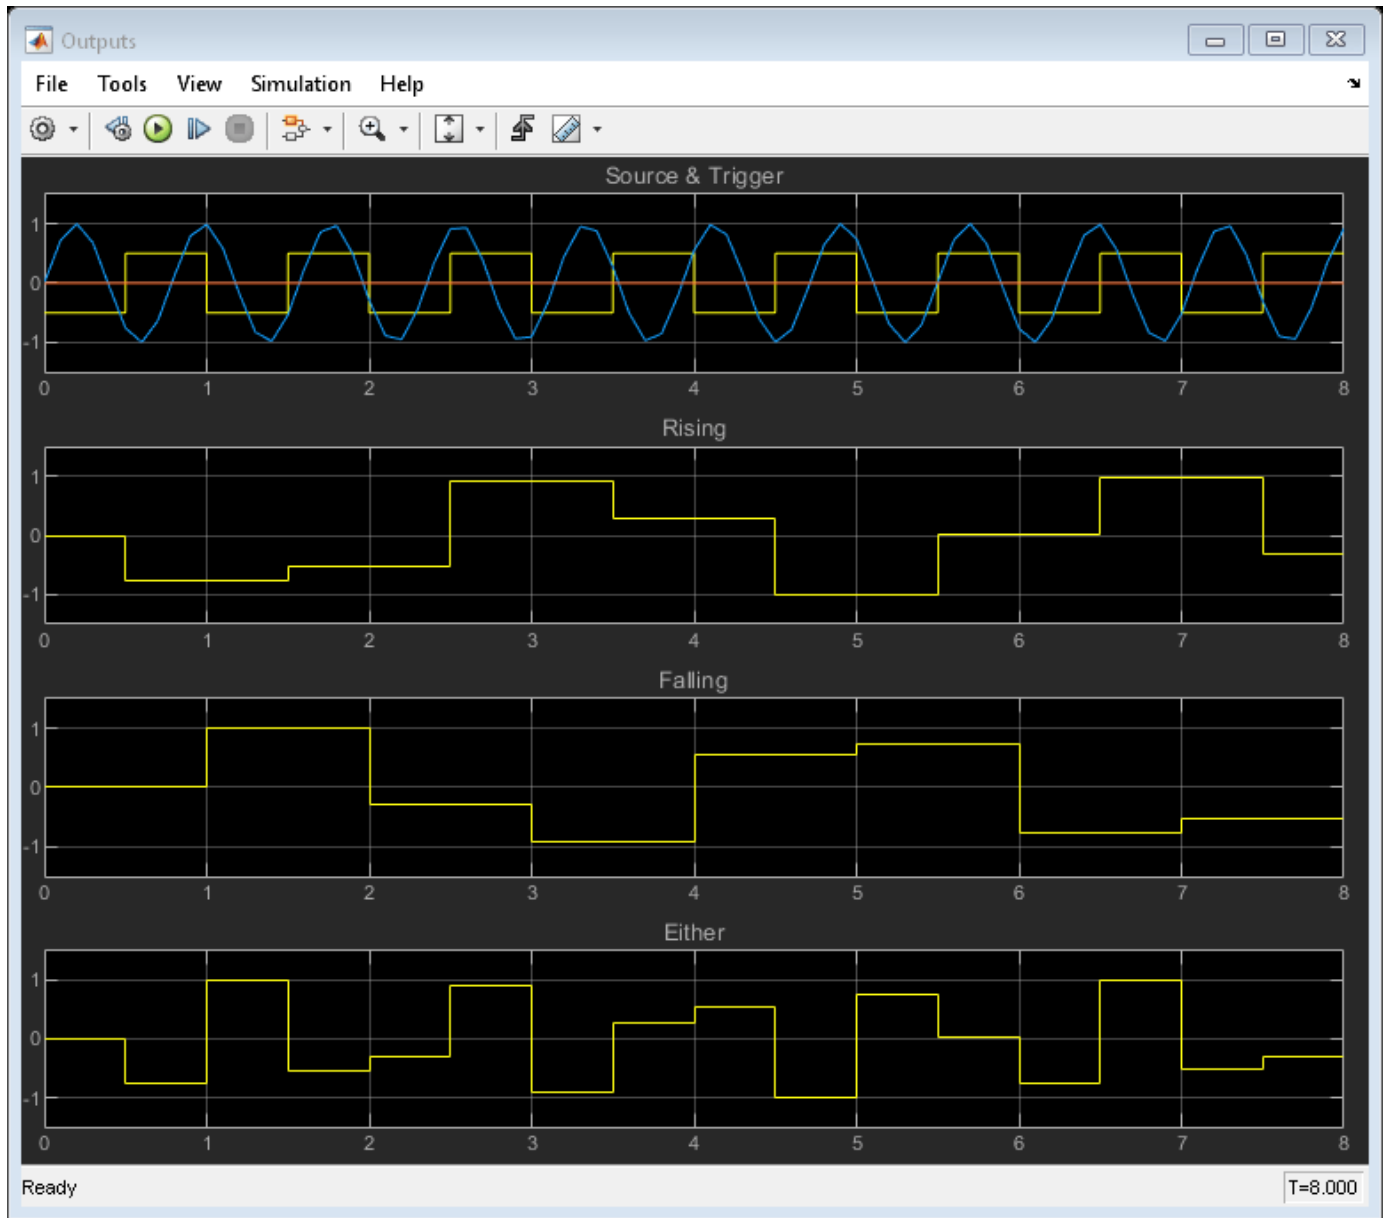

Triggered Subsystems

This model shows triggered subsystems and describes the different trigger types. A triggered subsystem is executed for a single time step whenever the trigger port transitions in a specified direction. The transition of the trigger port may occur when the direction of the transition is rising, falling, or either rising or falling. A rising transition occurs when the trigger signal transitions from zero or below to a positive value. A falling transition occurs when the trigger signal transitions from zero or above to a negative value.

After running the simulation, look closely at the top plot in the scope. This shows a sine wave, a waveform, and the grounded value of zero. As the waveform transitions through zero, each of the subsystems is triggered appropriately. The output of each subsystem is equal to the current value of the sine wave at that time.

Copyright 1990-2015 The MathWorks, Inc.

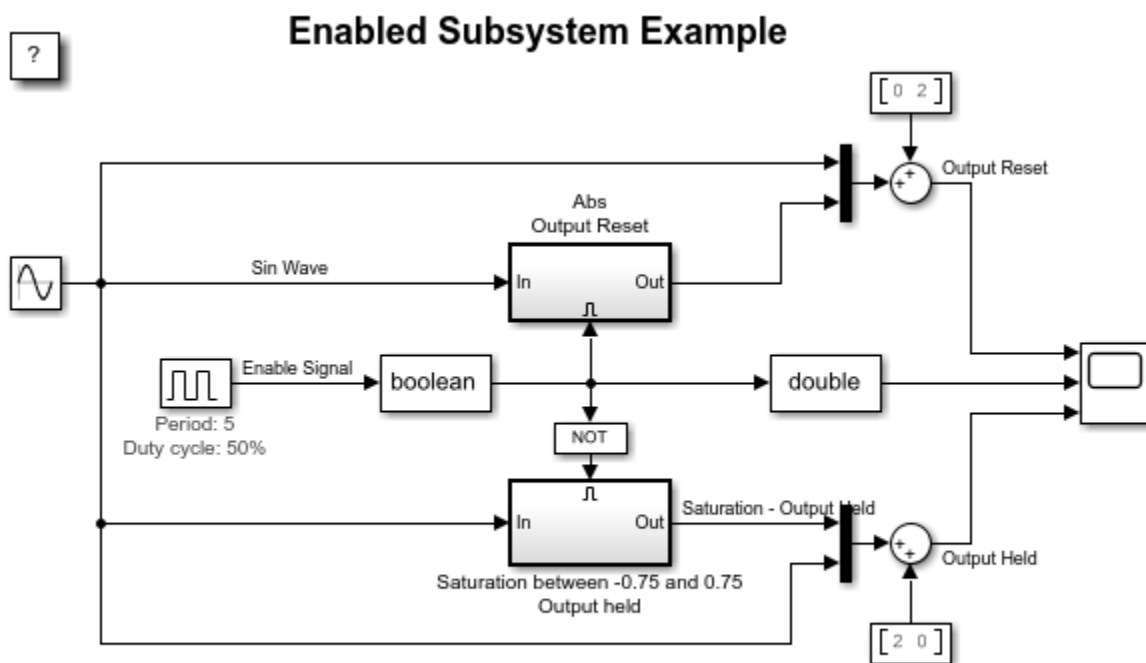

Enabled Subsystems

This example shows what happens when a sine wave is fed into an enabled subsystem. After running the simulation, the scope shows three plots.

The first of these plots shows the original sine wave and the absolute value of the original sine wave offset by two. The absolute value of the sine wave is shown only when the subsystem is enabled. This occurs between 0 and 2.5 seconds, and between 5 and 7.5 seconds. When the subsystem is not enabled, the output of the subsystem is reset to 0. The value of 0 is determined by the initial condition of the output. You can see when the subsystem is enabled by looking at the second plot. A value of 1 indicates that it is enabled.

The second plot shows the original value of the enable signal. When the signal is towards the top of the plot, the subsystem related to the first plot is enabled. When the signal is towards the bottom of the plot, the subsystem related to the third plot is enabled. The difference in when the subsystems are enabled is caused by the logical NOT block.

The third plot shows the original sine wave and the saturation limited sine wave offset by two. The saturated value of the sine wave is shown only when the subsystem is enabled. This occurs between 2.5 and 5 seconds, and between 7.5 and 10 seconds.

Copyright 2004-2015 The MathWorks, Inc.

Advanced Enabled Subsystems

This model shows what happens when a sine wave is fed into an enabled subsystem. The four subsystems in the model contain integrators, either discrete or continuous as described by the subsystem name. After running the simulation, the two scopes show the results for the discrete enabled subsystems (top scope) and continuous enabled subsystems (bottom scope).

Each scope shows the output for all combinations of the states and outputs of the enabled subsystem being either held or reset when the subsystem is disabled. The colors on the scope correspond to the following state and output configurations:

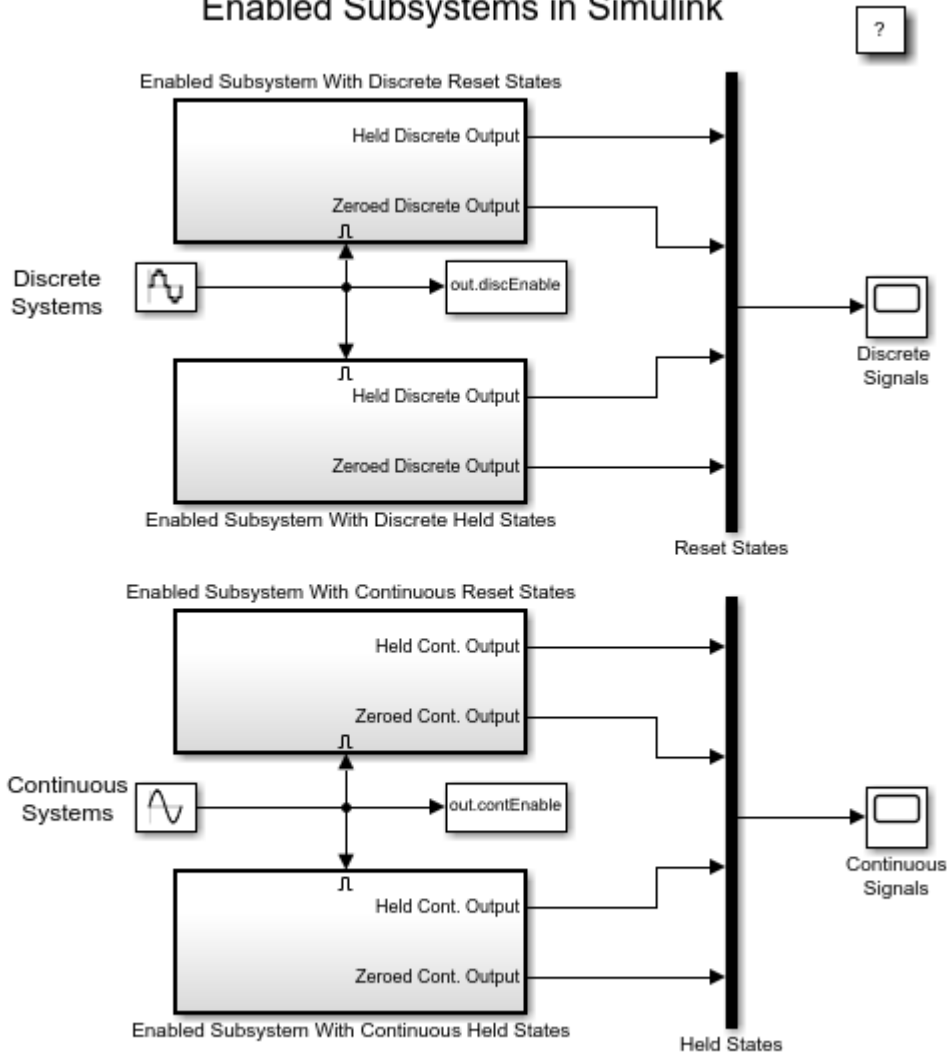

Yellow: Reset states; Held outputs

Purple: Reset states; Reset outputs

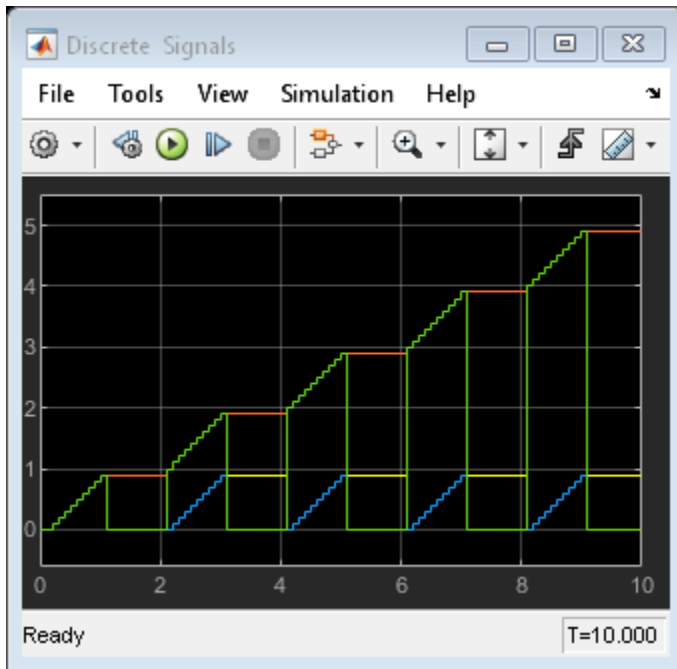

Cyan: Held states; Held outputs

Red: Held states; Reset outputs

Enabled Subsystems in Simulink

Copyright 2004-2015 The MathWorks, Inc.

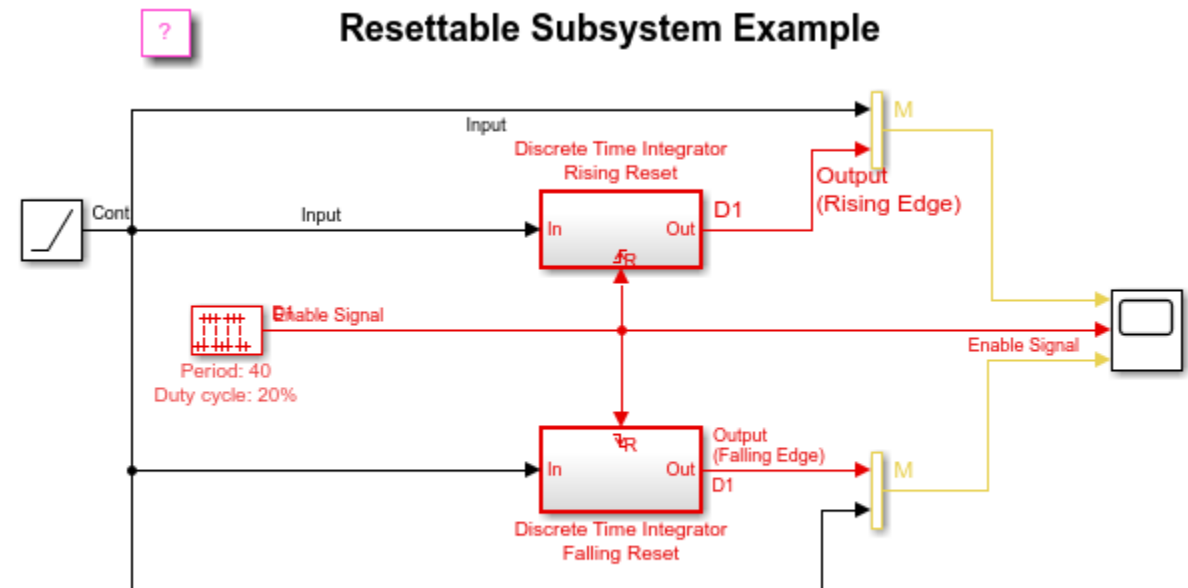

Resettable Subsystems

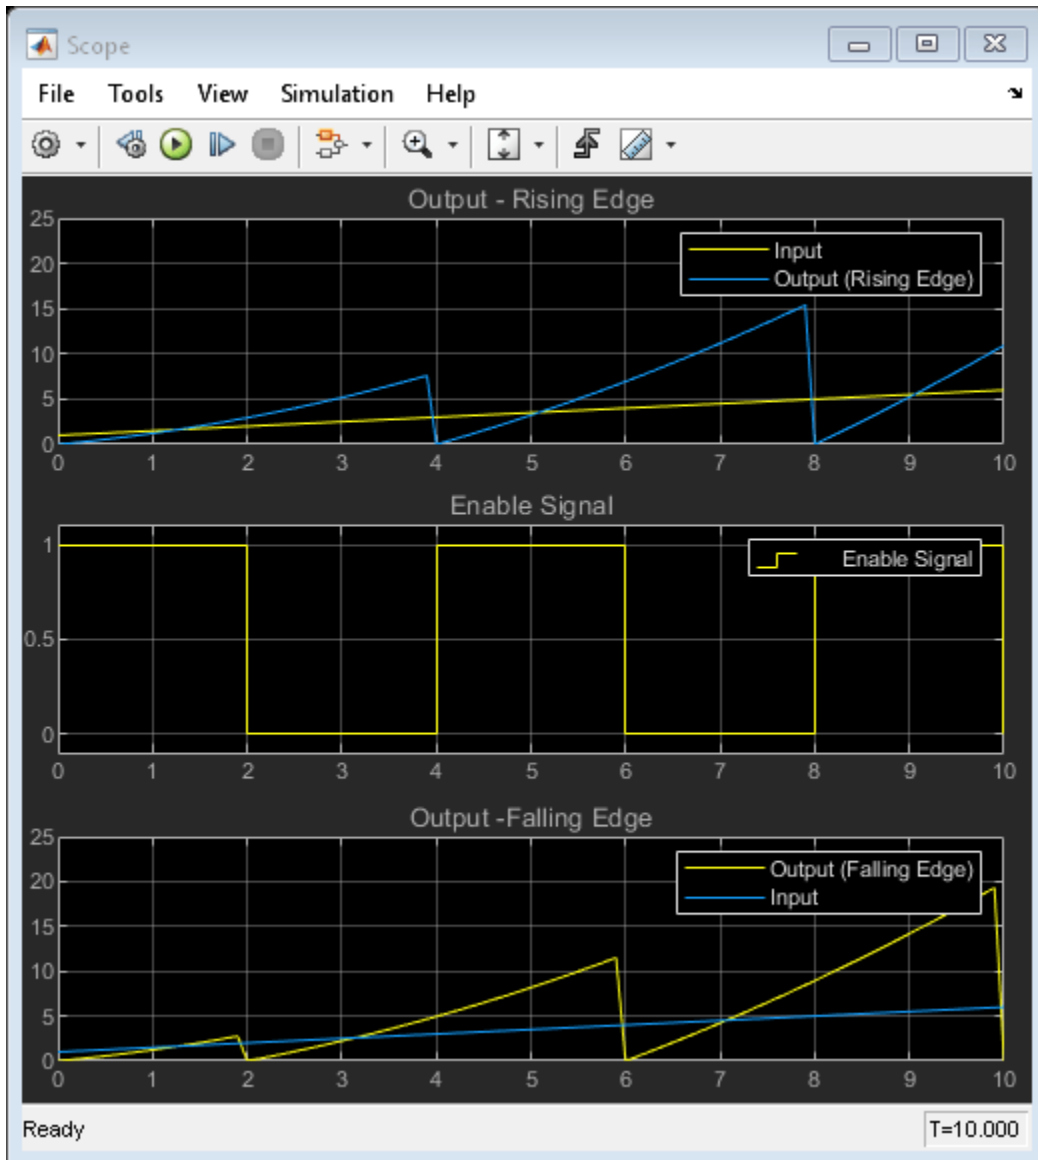

This example shows how to use two resettable subsystems to implement a ramp signal. Consider using resettable subsystems when you want to conditionally reset the states of all blocks within a subsystem to their initial condition. A resettable subsystem executes at every time step but conditionally resets the states of blocks within it when a trigger signal occurs at the reset port. For more information, see “Using Resettable Subsystems”.

After running the simulation, the scope shows three plots. The top and bottom plots show the original ramp as a reference, along with its integration. The subsystems corresponding to the top and bottom plots reset on every rising and falling edge of the pulse, respectively. When each subsystem resets, the state of the Integrator block is set to its initial condition value, which is 0. Refer to the middle plot to determine when each subsystem resets.

The reset happens for blocks within the subsystem, without the need for each block to have its own reset port. This provides a more convenient way of handling resets at a subsystem level.

Block Priority

This model shows what happens when blocks are assigned different priorities. The block priority affects the order in which the blocks are executed. You can set the block priority through the Block Properties dialog. A smaller number indicates a higher priority.

The block sorting order is calculated only at the beginning of a simulation. For this reason, changes to a block's Priority property are only updated when the simulation is started. Double click on the green block to change the priority levels for the blocks and see what happens.

Inside of each triggered subsystem is an S-Function which controls the coloring of the blocks and also slows down the simulation. The priority level of the block is displayed using the format attribute string that can be set in the Block Properties dialog.

Monitoring Ink Status on a Shared Printer Using Simulink Functions

This example shows how clients, in this case three computers, can send jobs to a server, a printer, and receive status from that server. This example highlights how Simulink functions can be called from different subsystems and interact in both Simulink® and Stateflow®. (Note that when you simulate the example, Stateflow might generate code in the current working folder.)

The computers each generate randomly sized print jobs at regular intervals. The printer interacts with the computers through two Simulink functions on the Simulink canvas and one exported graphical function in Stateflow.

The clients use Function Caller blocks to invoke the `addPrintJob` interface of the printer. The client-server interaction modeled by this call may have a negative return value if the printer has run out of ink.

The example also shows how to interface Simulink and Stateflow using functions.

The implementation of `addPrintJob` uses a Function Caller block to invoke `queuePrintJob`, a Stateflow exported graphical function. The `queuePrintJob` function interacts with other content in the chart using a local chart variable `work`.

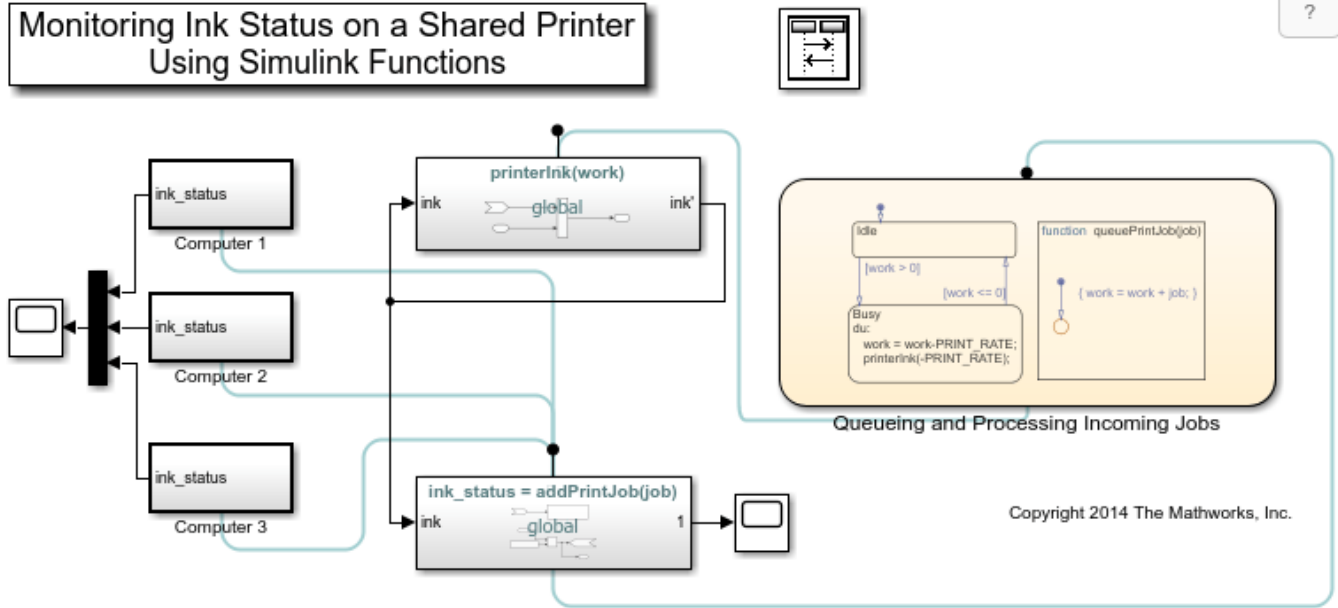

The implementation of the chart makes a call to `printerInk`, a Simulink function, which uses the graphical input and outputs to interact with the `addPrintJob` function.

You can also visualize and debug Simulink functions.

To enable the visualization lines connecting functions and their respective callers, in the Simulink Editor, on the **Debug** tab, under **Information Overlays**, click **Function Connectors**.

The Sequence Viewer block shows where calls to functions are generated and which functions are called at different times. This information allows you to understand the flow of calls with respect to time and analyze the arguments sent during these calls to functions.

Monitoring Ink Status on a Shared Printer Using Simulink Functions

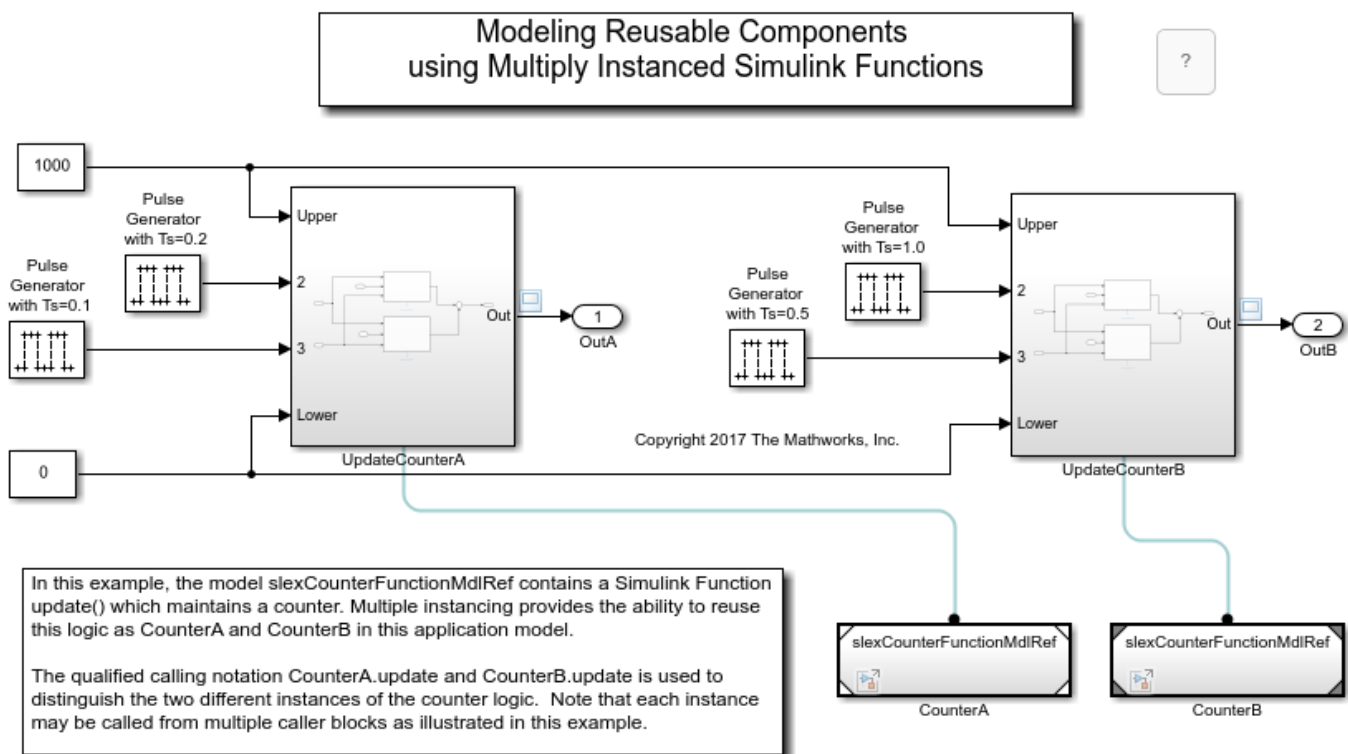

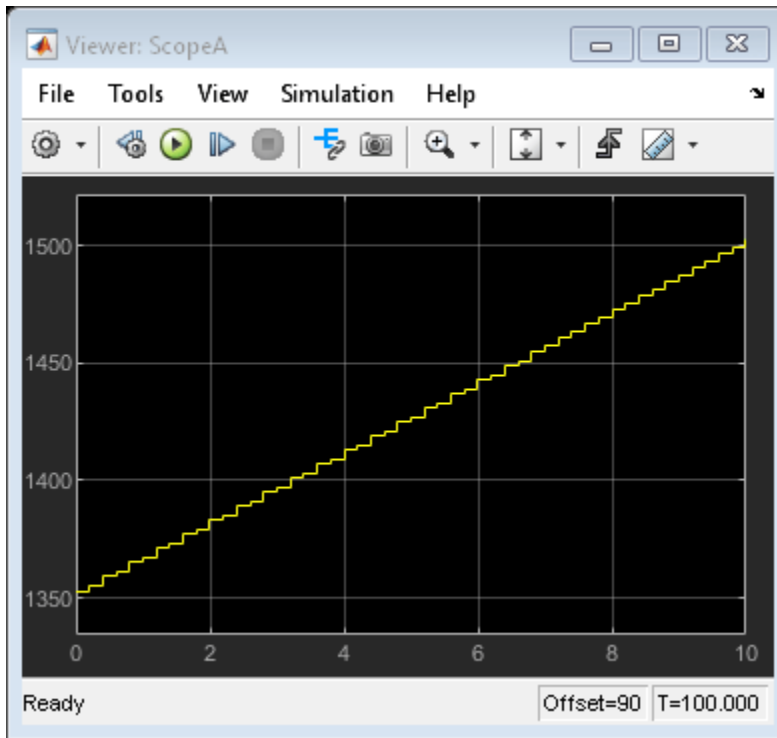

Modeling Reusable Components Using Multiply Instanced Simulink Functions

In this example, the model `slexCounterFunctionMdlRef` contains a Simulink function `update()`, which maintains a counter. Multiple instancing provides the ability to reuse this logic as `CounterA` and `CounterB` in this application model.

Overview

The qualified calling notation `CounterA.update` and `CounterB.update` is used to distinguish the two different instances of the counter logic. Note that each instance may be called from multiple caller blocks as illustrated in this example.

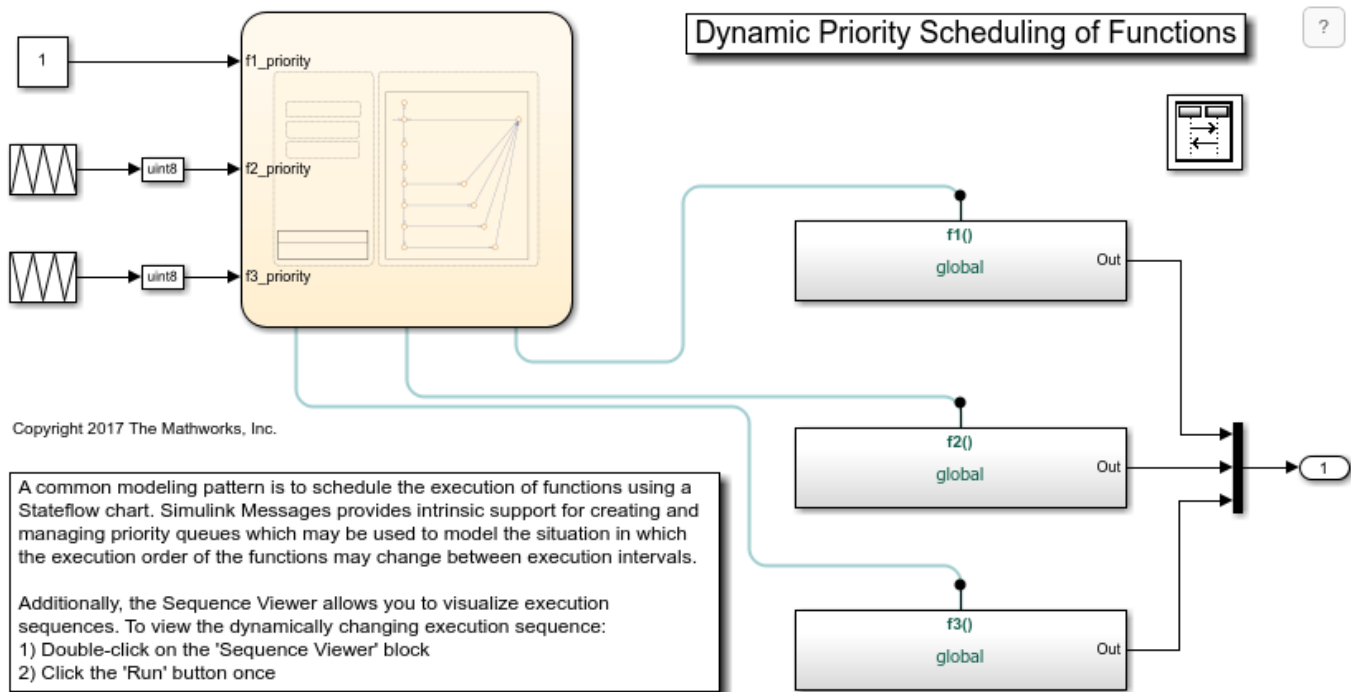

Dynamic Priority Scheduling of Functions

This example shows a common modeling pattern to dynamically schedule the execution of functions using a Stateflow® chart.

Overview

Simulink messages provide intrinsic support for creating and managing priority queues, which may be used to model a situation in which the execution order of the functions may change between execution intervals.

Additionally, the Sequence Viewer allows you to visualize execution sequences. To view the dynamically changing execution sequence: 1. Double-click on the 'Sequence Viewer' block 2. Click the 'Run' button once

Component-Based Modeling with Model Reference

This example walks you through simulation and code generation of a model that references another model multiple times. In this example, Simulink® generates code for accelerated simulation, and Simulink® Coder™ generates code that can be deployed in standalone applications.

Model Reference Behavior

Model Reference has several advantages over subsystems:

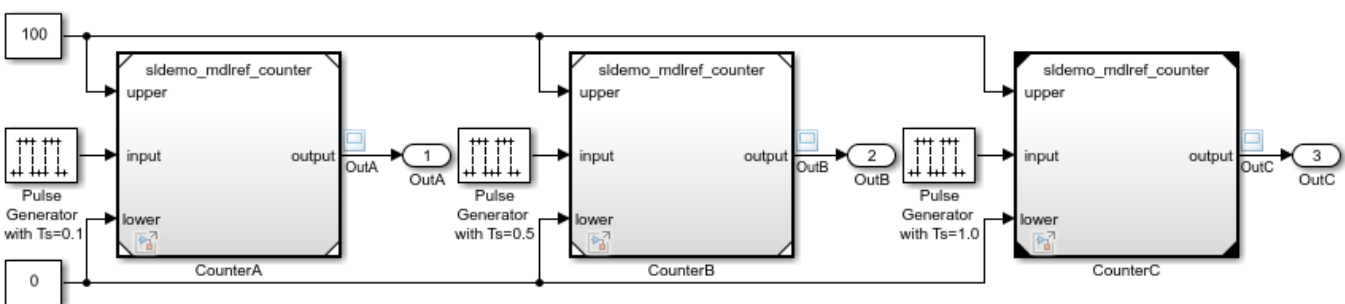

- You can develop the referenced model independently from the models in which it is used.
- You can reference a model multiple times in another model without having to make redundant copies.
- Multiple models can reference a single model.
- The referenced model is not loaded until it is needed. This incremental loading speeds up model load times.
- If a model is referenced in accelerator mode, Simulink creates special binaries to be used in simulations. If the referenced model has not changed since the binaries were created, and the binaries are therefore up to date, no code generation occurs when models that use these binaries are simulated or compiled. This process is called *incremental code generation*. The use of binaries makes updating and simulating the model faster and increases modularity in code generation.
- Generating code for a model with Model blocks also takes advantage of incremental code generation.

Incremental Loading

Open the example model.

```
open_system('sldemo_mdref_basic')
```

Component-Based Modeling with Model Reference

Copyright 1990-2014 The MathWorks, Inc.

This model contains three Model blocks: CounterA, CounterB and CounterC. These blocks reference the same model, `sldemo_mdref_counter`, which is a separate model and not a subsystem of `sldemo_mdref_basic`.

To determine what models are loaded in memory after opening the top model in the model hierarchy, enter this command:

```
get_param(Simulink.allBlockDiagrams, 'Name')
```

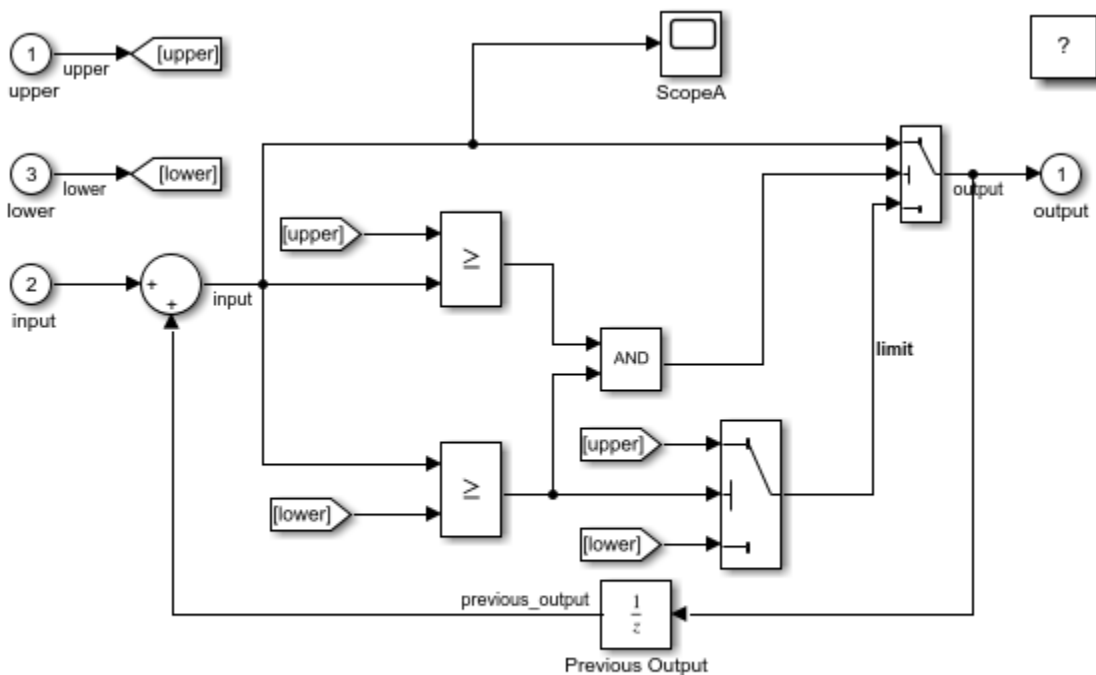

```
ans =
```

```
    'sldemo_mdref_basic'
```

The referenced model is not listed because it is not loaded.

Open the referenced model by double-clicking on any Model block or by entering this command:

```
open_system('sldemo_mdref_counter')
```

Copyright 1990-2014 The MathWorks, Inc.

Query the models loaded in memory again.

```
get_param(Simulink.allBlockDiagrams, 'Name')
```

```
ans =
```

```
2x1 cell array
```

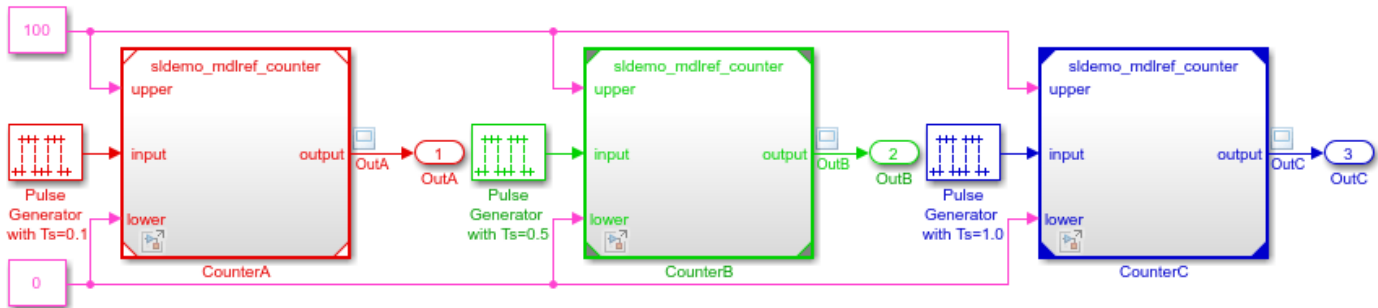

```
    {'sldemo_mdref_counter'}  
    {'sldemo_mdref_basic' }
```

The referenced model is now listed, demonstrating that models are loaded incrementally as they are needed.

Inherited Sample Times

Navigate back to the parent model `sldemo_mdref_basic`.

`sldemo_mdref_basic` is configured to display sample time colors when it is compiled. On the **Debug** tab, click **Update Model**.

The Model blocks inherit different sample times because the referenced model `sldemo_mdref_counter` does not explicitly specify a sample time.

Simulation Through Code Generation (Does Not Require Simulink Coder)

Model blocks have a **Simulation mode** parameter that controls how the referenced model is simulated. If the parameter is set to `Normal`, the referenced model is simulated in interpreted mode. If the parameter is set to `Accelerator`, the referenced model is simulated through code generation. This process uses a binary file called a *simulation target* for each unique model referenced in accelerator mode. Generating a simulation target does not require a Simulink Coder license.

In this model, CounterA and CounterB reference `sldemo_mdref_counter` in normal mode, which is indicated by the hollow corners on the Model block icons. The other instance, CounterC, references `sldemo_mdref_counter` in accelerator mode, which is indicated by the filled corners on the Model block icon.

You can create the simulation target for the `sldemo_mdref_counter` model by performing any of these actions:

- Updating `sldemo_mdref_basic`
- Simulating `sldemo_mdref_basic`

To build the simulation target programmatically, use this command:

```
slbuild('sldemo_mdref_counter', 'ModelReferenceSimTarget')
```

Once the simulation target is built, subsequently simulating or updating `sldemo_mdref_basic` does not trigger a rebuild of the simulation target unless `sldemo_mdref_counter` has changed.

If all three instances of the referenced model were set to simulate in normal mode, the simulation target would not be built.

Code Generation for Standalone Applications (Requires Simulink Coder)

When creating a standalone executable for `sldemo_mdref_basic`, the build first generates the code and binaries for the *model reference coder target* of `sldemo_mdref_counter`. Generating a model reference coder target requires a Simulink Coder license.

You can build the model reference coder target for `sldemo_mdref_counter` and the standalone executable for `sldemo_mdref_basic` by performing any of these actions:

- Building the standalone executable for `sldemo_mdref_basic`.
- Building the model reference coder target of `sldemo_mdref_counter`, then building the standalone executable for `sldemo_mdref_basic`.

To build the standalone executable programmatically, use this command:

```
slbuild('sldemo_mdref_basic', 'StandaloneCoderTarget')
```

Once the model reference coder target is built, subsequently building `sldemo_mdref_basic` does not trigger a rebuild of the model reference coder target unless `sldemo_mdref_counter` has changed. The code generated for the referenced model `sldemo_mdref_counter` is reused.

The code generation report for `sldemo_mdref_basic` links to the report for `sldemo_mdref_counter` in the **Referenced Models** section.

Viewing Signals in Model Reference Instances

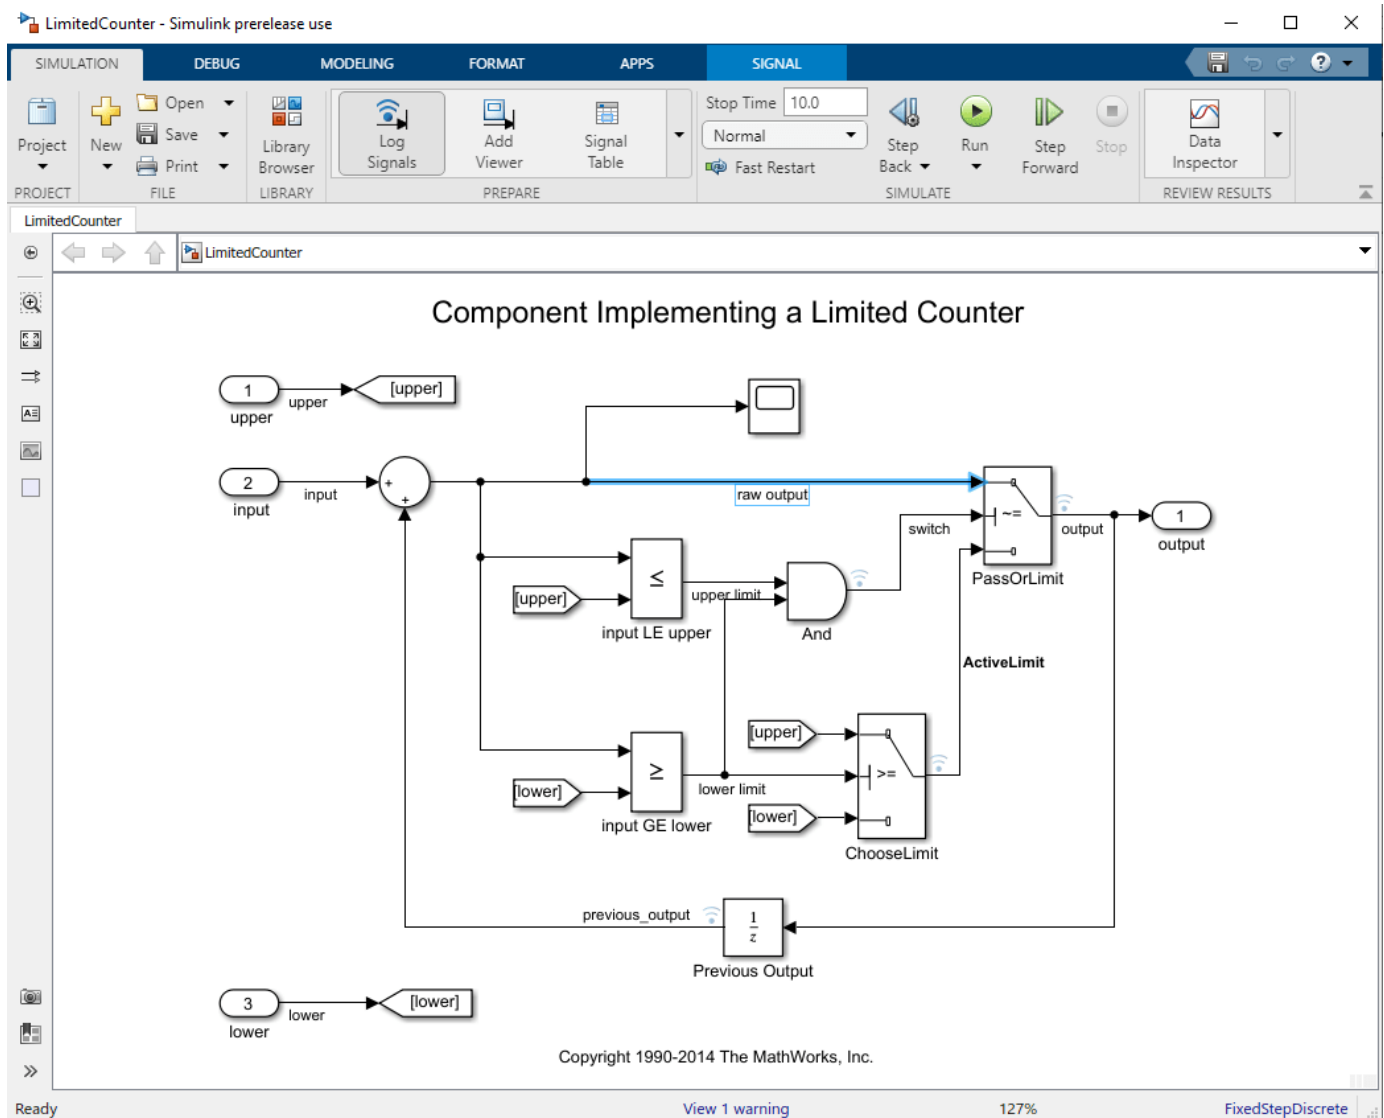

This example shows how to use the Simulation Data Inspector to view and analyze signals in referenced models. The Simulation Data Inspector relies on signal logging so this example shows how to configure your model to log signals in referenced models.

```
origdir = pwd;
```

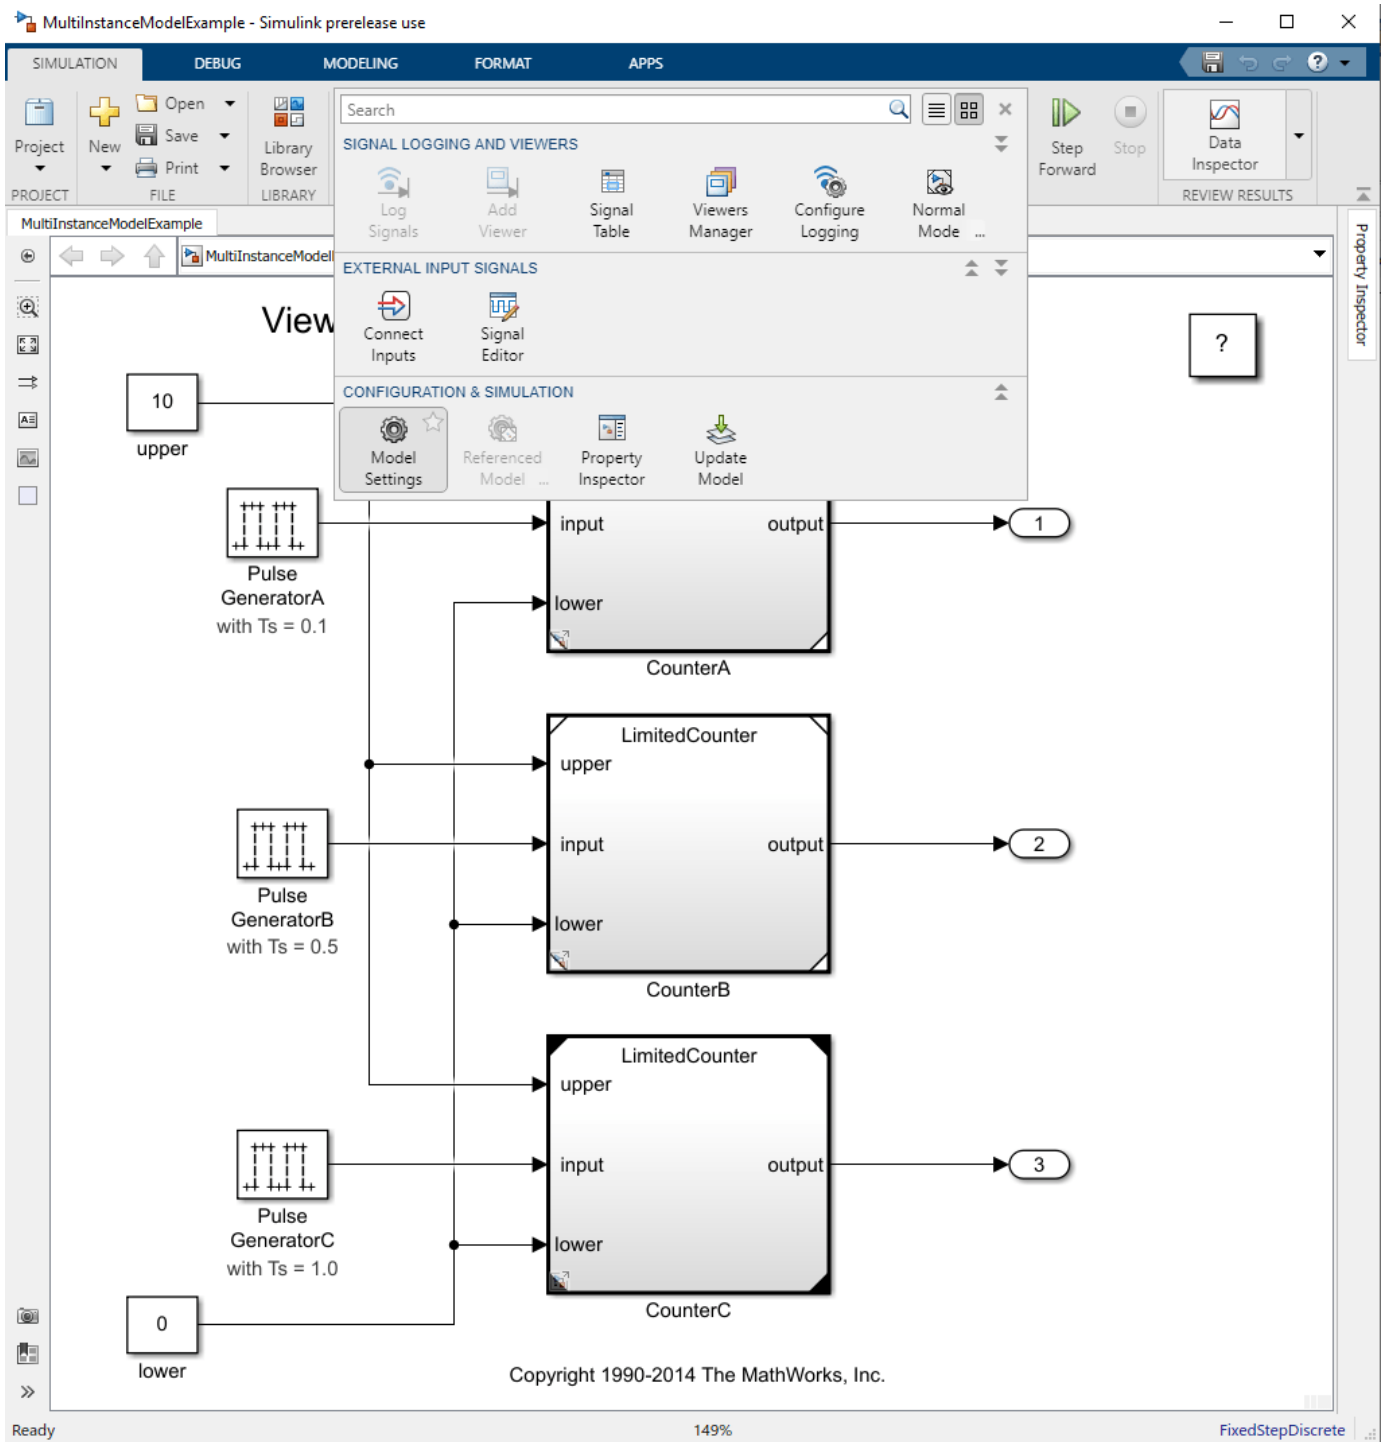

Configure Signals to Log in Referenced Models

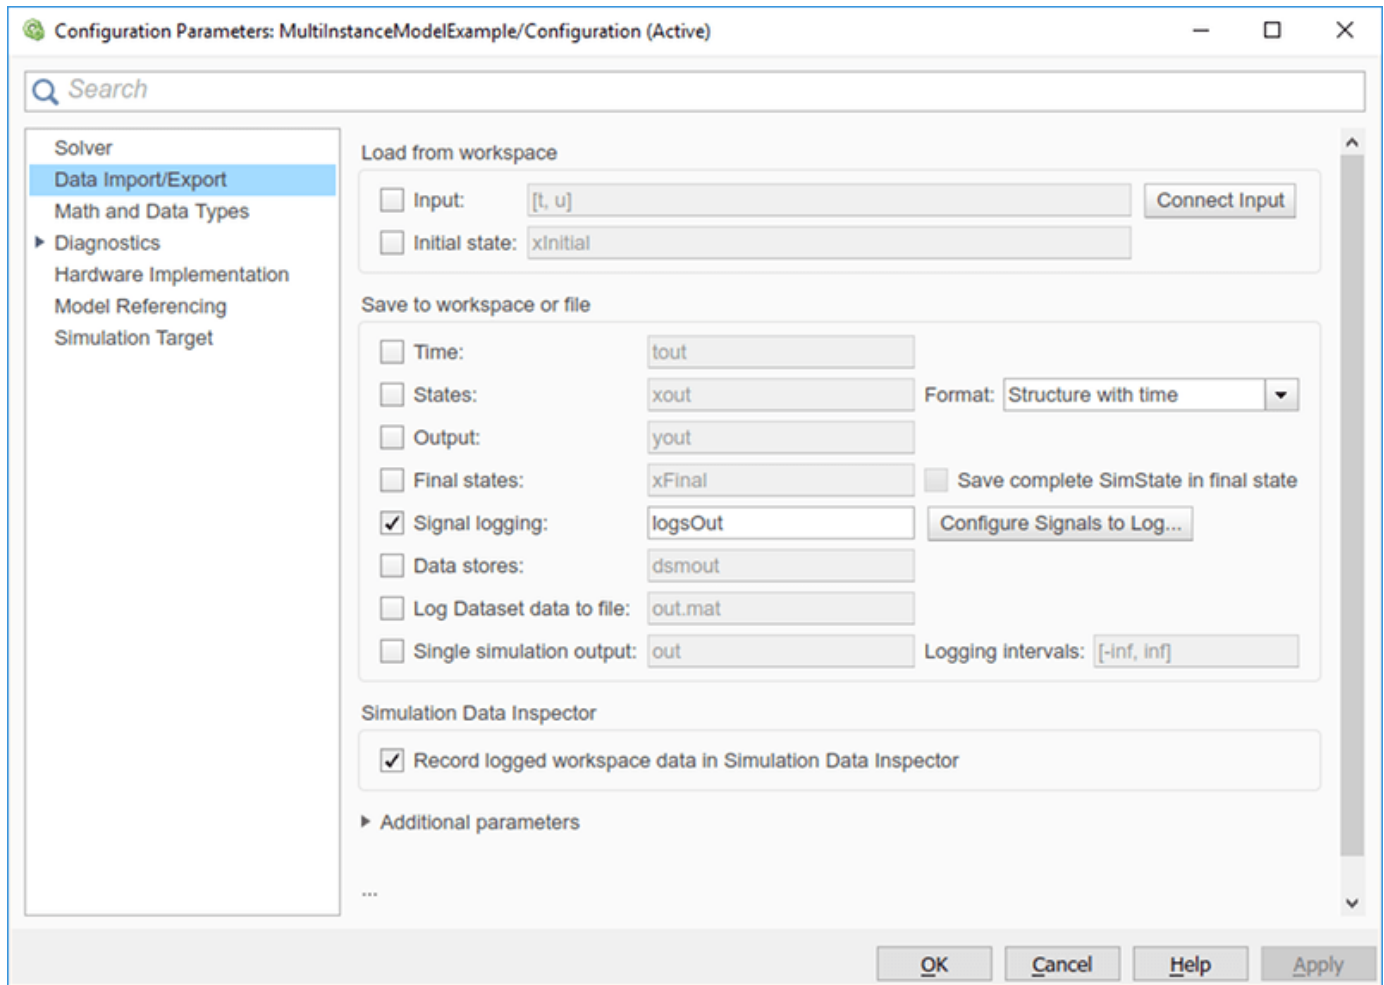

The first task in setting up a referenced model to view signals using the Simulation Data Inspector is to configure that model for logging. To do that, edit the referenced model and mark the signals for logging. Four signals are already marked for logging in the referenced model. To mark the `raw_output` signal for logging, select the signal. Then, on the **Simulation** tab, select **Log Signals**.

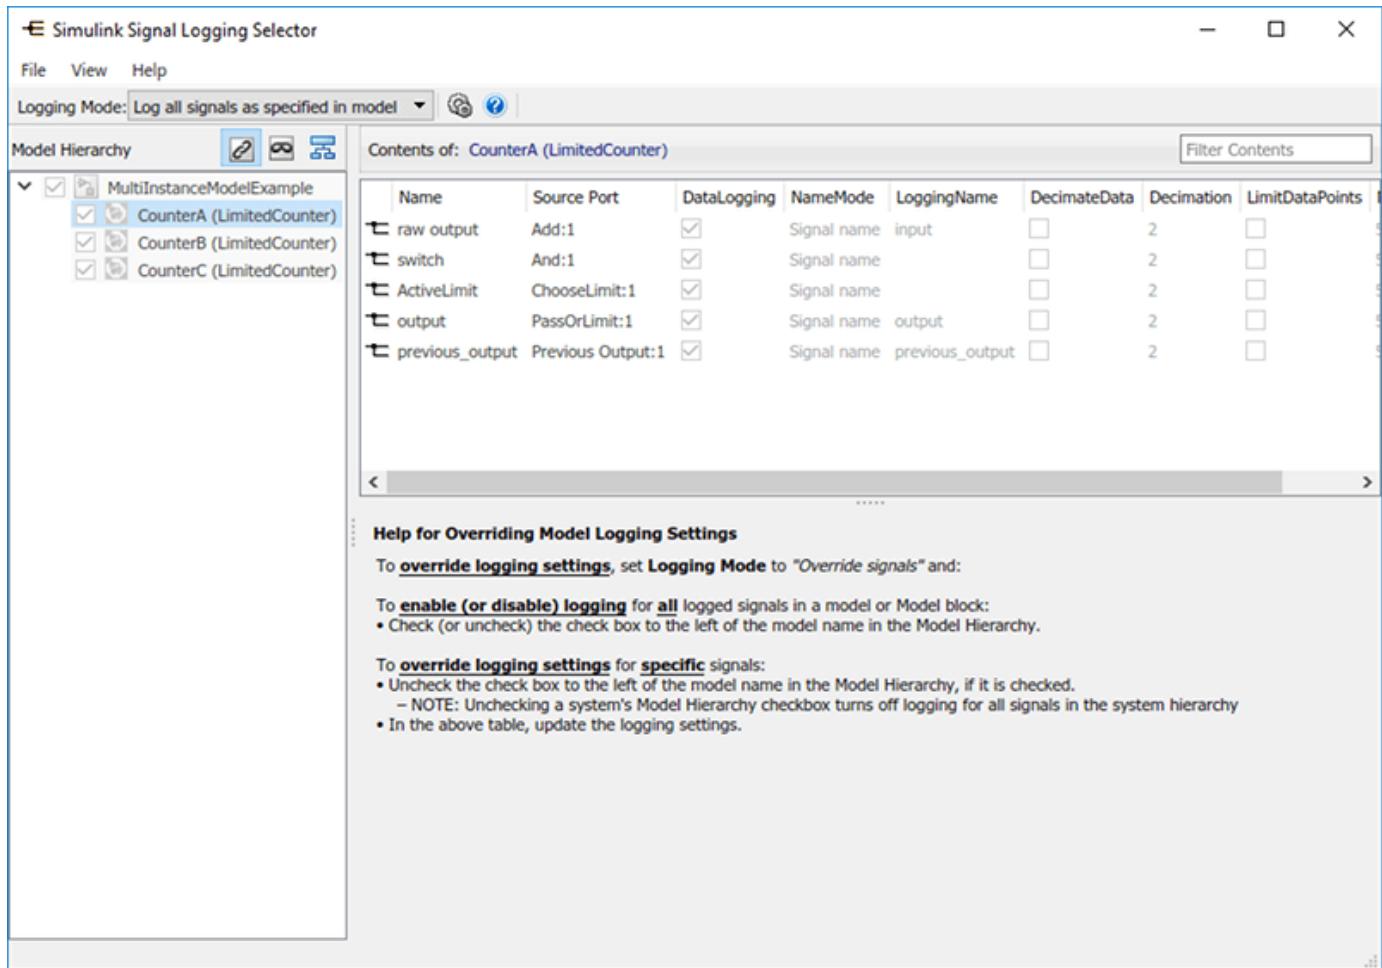

Once the signals to log have been selected in the referenced model, the next step is to select which signals to actually log from the topmost model in the hierarchy. In the top model, on the **Modeling** tab, click **Model Settings**.

On the **Data Import/Export** pane, click the **Configure Signals to Log...** button to activate the Simulink Signal Logging Selector dialog.

There are two Logging modes that can be used when logging signals in referenced models. The first is **Log all signals as specified in model**, which will honor any logging settings that were made in referenced models. If you need to override any of those settings, such as selecting only a subset of logged signals, then you should use the **Override signals** mode. In this mode, you are given the ability to select a subset of loggable signals and configure their properties, such as decimation and name.

Viewing and Analyzing Logged Signals Using the Simulation Data Inspector

Once logging has been configured for a model hierarchy and all changes to the models have been saved, the model can be simulated. The simulation creates a Dataset object in the base workspace. You can analyze and view the logged data in this object using standard MATLAB® tools. In addition, Simulink® provides the Simulation Data Inspector for viewing and analyzing data created from simulations.

With the Simulation Data Inspector, you can:

- View signal traces for any logged signals
- Visually compare signal values for any logged signals
- Compare signal values collected over multiple simulations

For example, you can use the Simulation Data Inspector to view the **output** signal of two of the instances of the model **LimitedCounter**. In the Simulation Data Inspector, you can see that **CounterA** increases more rapidly than **CounterB**. This behavior is expected because the Pulse Generator driving this model is running at a faster rate.

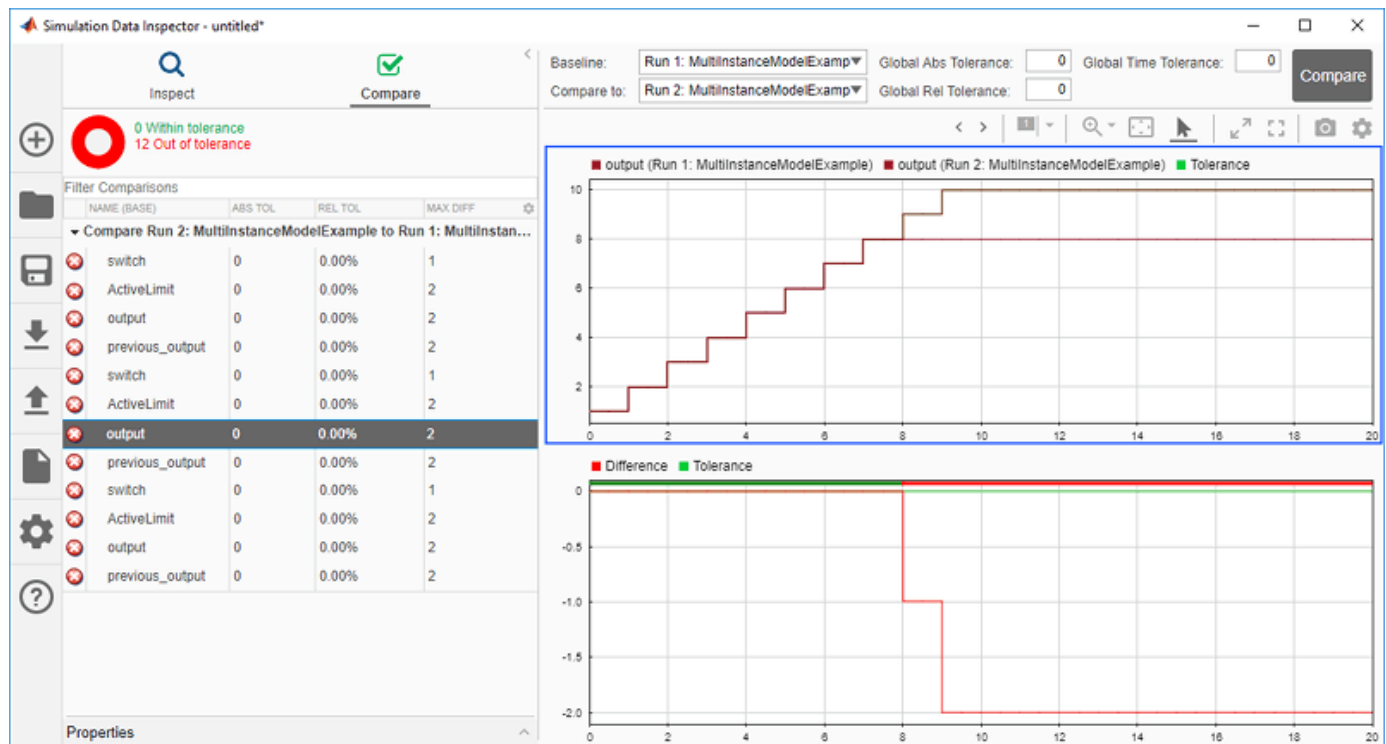

You can configure what to display in the inspect table by clicking the gear icon at the right top of the table.

Another useful tool that the Simulation Data Inspector provides is the ability to compare multiple simulation runs. This functionality can help you understand how changes to your model affect results. For example, you can change the value of the upper limit of the counter models to 8 and simulate the model again to see how that affects output values. To change the value, double click on the block `MultiInstanceModelExample/upper` and modify the Value parameter to 8.

Now if you compare the results from the first simulation for the output of the CounterA instance of LimitedCounter, you see that the upper limit of this signal has changed from 10 to 8, as expected. Because the tolerances are set to zero, the red octagon next to each signal indicates that the values have changed between runs.

Visualize Model Reference Hierarchies

This example shows how to view, explore, and analyze model dependencies using the Dependency Analyzer. It shows how to find referenced models and interact with the dependency graph.

Open Model

Open the example model `sldemo_md1ref_depgraph`, which contains multiple referenced models in a model hierarchy.

Copyright 1990-2014 The MathWorks, Inc.

Find Referenced Models

Use the `find_md1refs` function to programmatically find referenced models and Model blocks. For example, enter this command in the MATLAB Command Window:

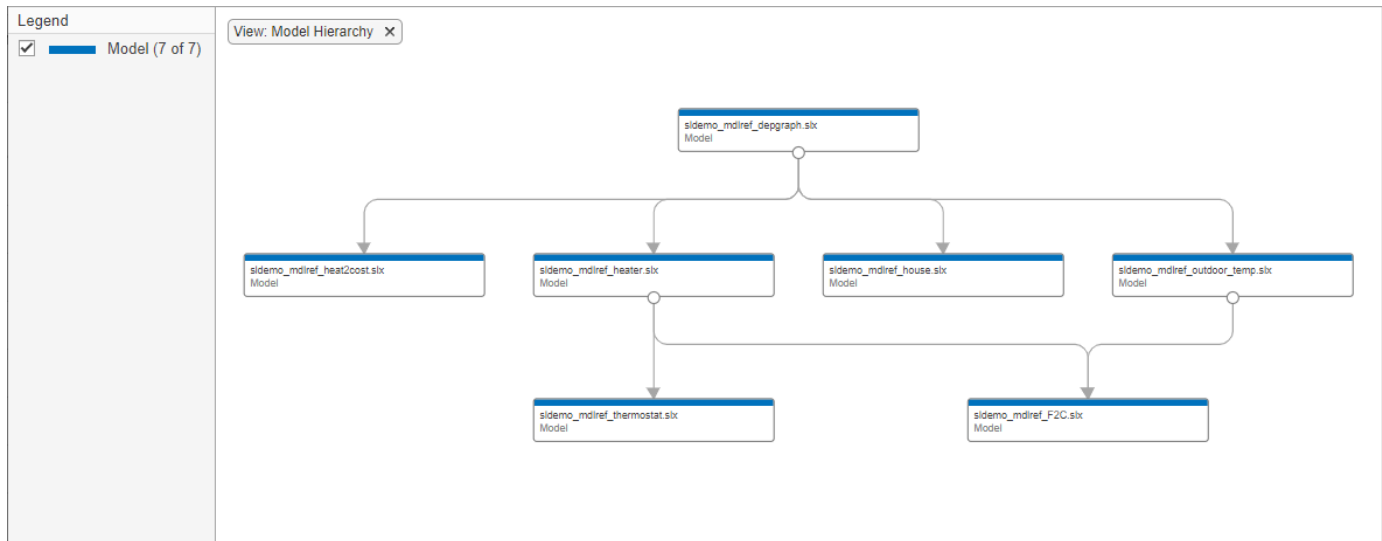

```
[refMdls, modelBlks] = find_md1refs('sldemo_md1ref_depgraph')
```

`find_md1refs` returns two cell arrays, `refMdls` and `modelBlks`. `refMdls` contains the names of all models that are directly or indirectly referenced by `sldemo_md1ref_depgraph`. By default, the last element in `refMdls` is the name of the input model. `modelBlks` contains block paths for all Model blocks in the top model and all referenced models.

View Model Reference Dependency Graph

To view the dependency graph for the `sldemo_md1ref_depgraph` model, perform one of these actions to open the Dependency Analyzer for a model:

- Use the `depview` function.
- In the **Modeling** tab, in the **Design** section, click **Dependency Analyzer**.

In the dependency graph, the boxes represent Simulink models. The arrows indicate dependencies. For example, the link from `sldemo_mdiref_depgraph` to `sldemo_mdiref_house` indicates that `sldemo_mdiref_depgraph` references `sldemo_mdiref_house`. If the model references libraries, subsystems, or protected models, the dependency graph shows them in the hierarchy.

In this view, only one box exists for each model in the graph and at most one arrow exists from one box to another box. The dependency graph does not show if multiple references exist from one model to another model. This view does not show which models are referenced in normal mode and which models are referenced in accelerator mode.

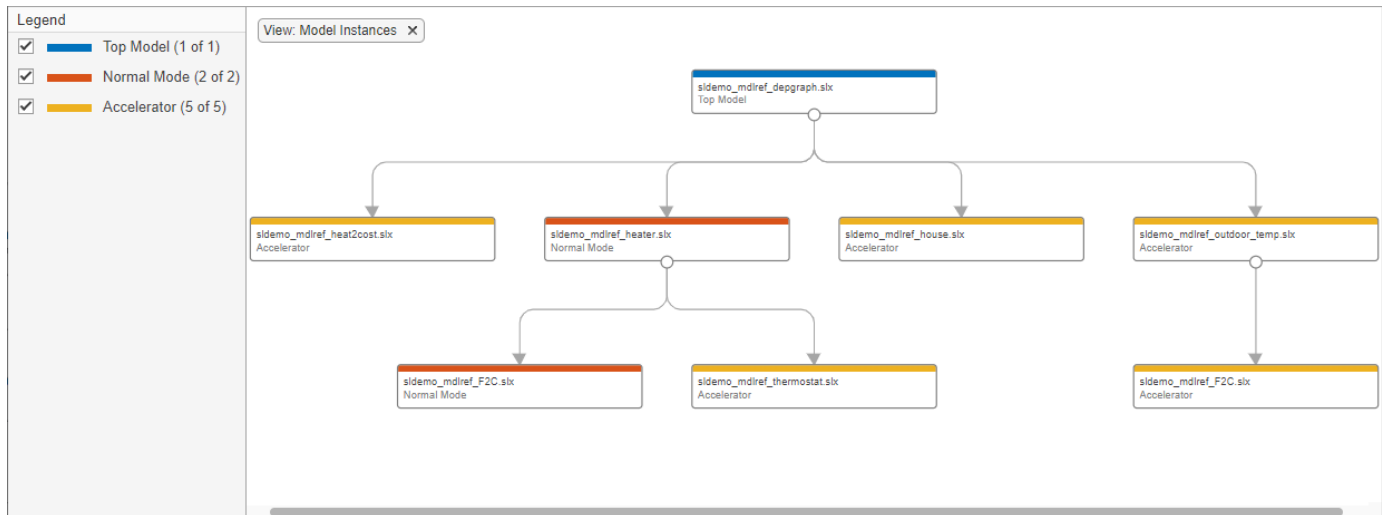

Interact with Dependency Graph

- To select a box, click it.
- To open the model or library associated with a box, double-click it.
- To pan the dependency graph, click and hold the mouse wheel button then drag the mouse.
- To zoom in and out, use the mouse wheel.
- To center the dependency graph and adjust the zoom so that the dependency graph fills the available space, press the space bar.

View Model Instances Dependency Graph

To view the referenced model instances in the dependency graph, perform one of these actions:

- Use `depview('sldemo_mdiref_depgraph', 'ModelReferenceInstance', true)`.
- From the Dependency Analyzer, in the **Views** section, select **Model Instances**.

In the instance view, the boxes represent Simulink models. The arrows indicate dependencies. The dependency graph shows when multiple references exist from one model to another model. In the instance view, libraries are never shown.

In this view two boxes are labeled `sldemo_mdiref_F2C` because this model is referenced twice, once by `sldemo_mdiref_outdoor_temp` and once by `sldemo_mdiref_heater`. The top model is colored in blue. The red color denotes a normal mode reference, and the yellow color denotes an accelerator mode reference.

`sldemo_mdiref_heater` makes a normal mode reference to `sldemo_mdiref_F2C` and an accelerator mode reference to `sldemo_mdiref_thermostat`.

Explore Model Instance Views

Currently, the reference `sldemo_mdiref_outdoor_temp` makes to `sldemo_mdiref_F2C` is an accelerator mode reference. Suppose you want to change this reference to be a normal mode reference:

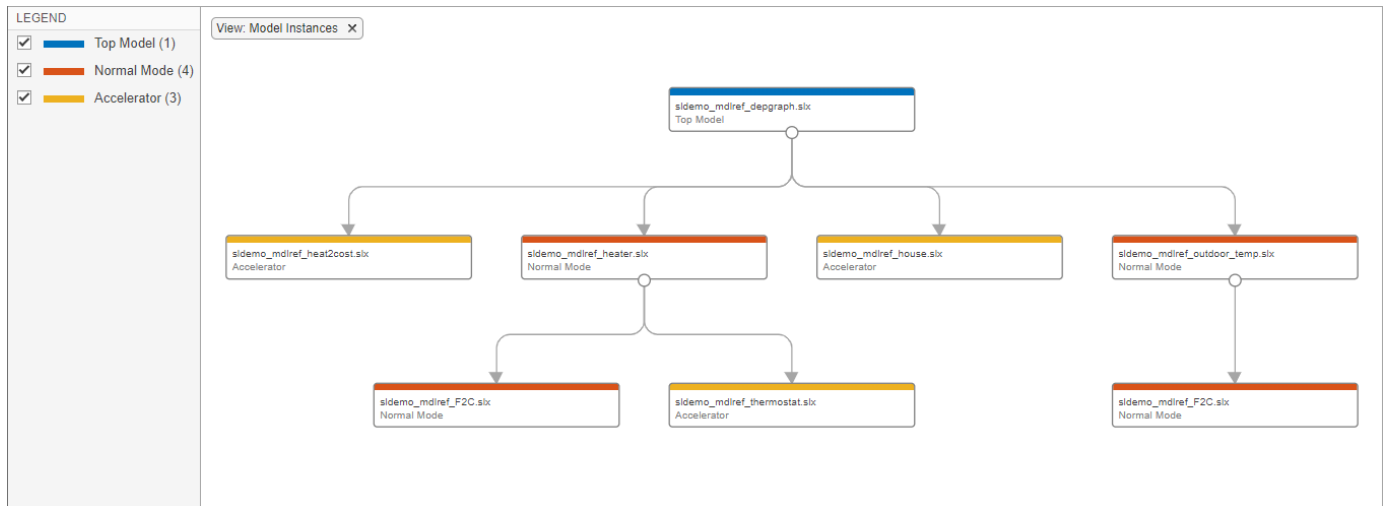

- 1 Select the arrow linking `sldemo_mdiref_outdoor_temp` to `sldemo_mdiref_F2C`.
- 2 In the **Properties** pane on the right, in the dependency table, click Fahrenheit to Celsius. Simulink opens the model `sldemo_mdiref_outdoor_temp` and highlights the Model block named Fahrenheit to Celsius. This Model block references `sldemo_mdiref_F2C`.
- 3 Select the Model block named Fahrenheit to Celsius.
- 4 In the **Model Block** tab, change the **Simulation Mode** to Normal.
- 5 To see this change, go to the dependency graph and click **Analyze**.

The dependency graph now shows the reference `sldemo_mdref_outdoor_temp` makes to `sldemo_mdref_F2C` as a Normal Mode (Overridden) reference. Note that `sldemo_mdref_F2C` is configured to run in normal mode but its parent, `sldemo_mdref_outdoor_temp`, is configured to run in accelerator mode. Normal mode references from models running in accelerator mode are not supported, so `sldemo_mdref_F2C` will run in accelerator mode during simulation.

To make this model run in normal mode, you must configure all of its ancestors to run in normal mode. To do this:

- 1 Select the arrow linking `sldemo_mdref_depgraph` to `sldemo_mdref_outdoor_temp`.
- 2 In the **Properties** pane on the right, in the dependency table, click `outdoor temp`. Simulink opens the model `sldemo_mdref_depgraph` and highlights the Model block named `outdoor temp`. This Model block references `sldemo_mdref_outdoor_temp`.
- 3 Select the Model block named `outdoor temp`.
- 4 In the **Model Block** tab, change the **Simulation Mode** to `Normal`. (If there were more accelerator mode ancestors of `sldemo_mdref_F2C`, these would also need to be changed to normal mode references.)
- 5 To see this change, go to the dependency graph and click **Analyze**.

Introduction to Managing Data with Model Reference

This example shows the basic concepts related to managing data with model reference.

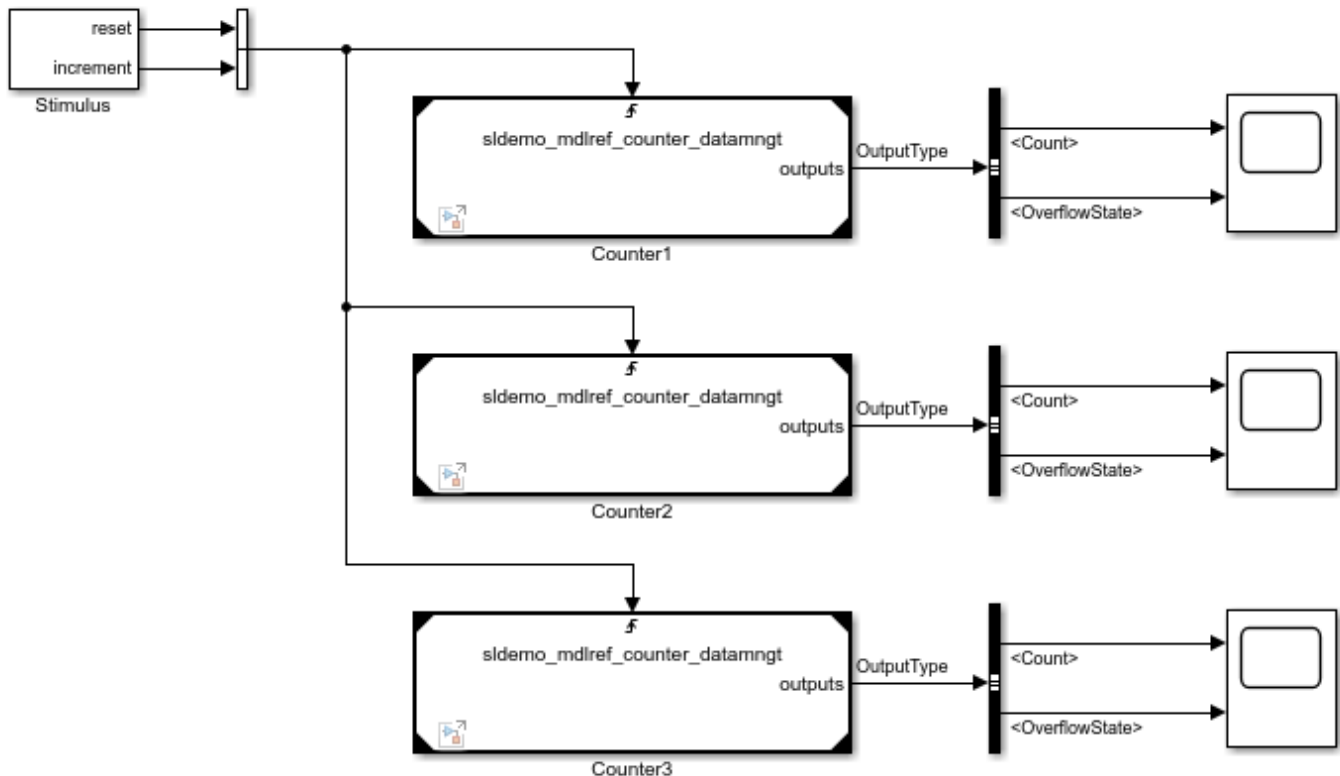

For a more detailed discussion of this topic, see “Detailed Workflow for Managing Data with Model Reference” on page 13-417.

NOTE: This example uses the same model as the more detailed example. As a result, the model uses certain features that this introductory example does not describe.

Open the Example Model

Open the example model `sldemo_mdref_datamngt`.

? Managing Data with Model Reference

Copyright 1990-2014 The MathWorks, Inc.

Example Content

This example uses a top model `sldemo_mdref_datamngt` that contains three Model blocks: Counter1, Counter2, and Counter3. These blocks reference the same model `sldemo_mdref_counter_datamngt`.

The referenced model implements a limited counter algorithm that:

- Resets the counter if the first trigger input changes
- Increments the counter by a specified amount if the second input changes
- Saturates the counter between the specified upper and lower limits

The referenced model outputs a bus signal that contains:

- **Count:** the value of the counter as an 8-bit integer
- **OverflowState:** an enumerated value that indicates whether the counter is at the upper limit, lower limit, or in range

Example Outline

The sequence of steps in the example is as follows:

1. Prepare the referenced model (sldemo_mdhref_counter_datamngt) to use structures for the signals and parameters in its external interface.
2. Prepare the top model (sldemo_mdhref_datamngt) to call the referenced model.
3. Simulate the top model and examine the results.

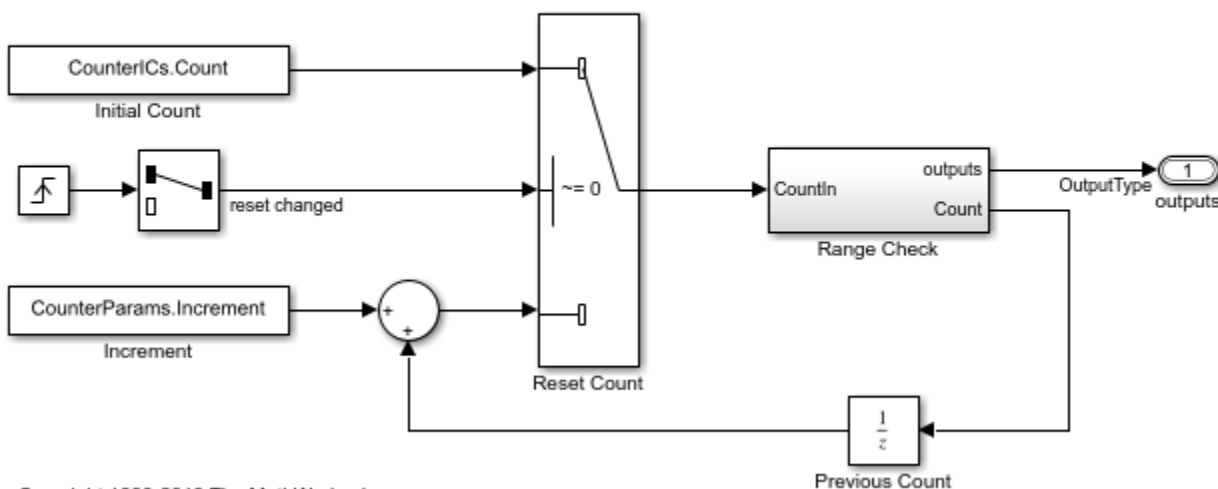

Referenced Model: Setting Up Parameters

The referenced model has two model arguments (CounterParams, CounterICs) that parameterize the blocks in the model. Model arguments provide different parameter values to each instance of a referenced model. In this model, the arguments are defined as parameter structures to reduce the number of arguments being passed to the referenced model.

The process for defining the model arguments is as follows:

1. Open the referenced model sldemo_mdhref_counter_datamngt.

- * If reset input changes, set count to initial condition.
- * Otherwise (increment input changed), increment count.
- * In either case, limit the count to the upper/lower limits specified.

Copyright 1990-2013 The MathWorks, Inc.

2. Define MATLAB structures to parameterize the referenced model.

```
CounterParams.Increment = int8(1);  
CounterParams.LowerLimit = int8(-10);  
CounterParams.UpperLimit = int8(10);  
  
CounterICs.Count = int8(0);  
CounterICs.OverflowState = SLDemoRangeCheck.InRange;
```

NOTE: This example uses an 8-bit integer for the counter, so the numeric fields also use 8-bit integers.

3. Use the MATLAB structures as model arguments.

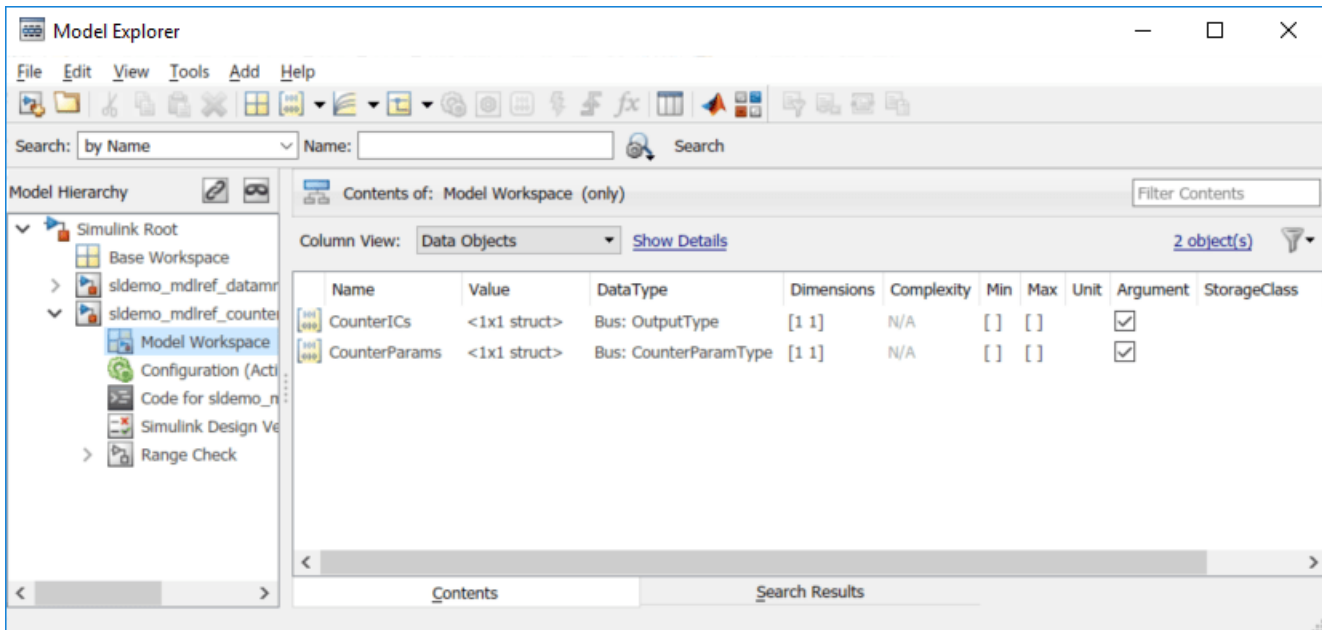

Model arguments are defined as variables in the model workspace of a referenced model. You can initialize the model workspace from a number of different data sources. This example uses a MATLAB script (`sldemo_mdref_counter_datamngt_wsdata`) to create the parameter structures for the model arguments. Using a MATLAB script makes it easy to create and modify the parameter structure outside the model. It also facilitates incremental changes, version control, and data differencing.

Set the data source in the dialog of the model workspace.

You can use the Model Explorer to view and edit the contents of the model workspace.

Select the Argument checkbox to configure variables as model arguments.

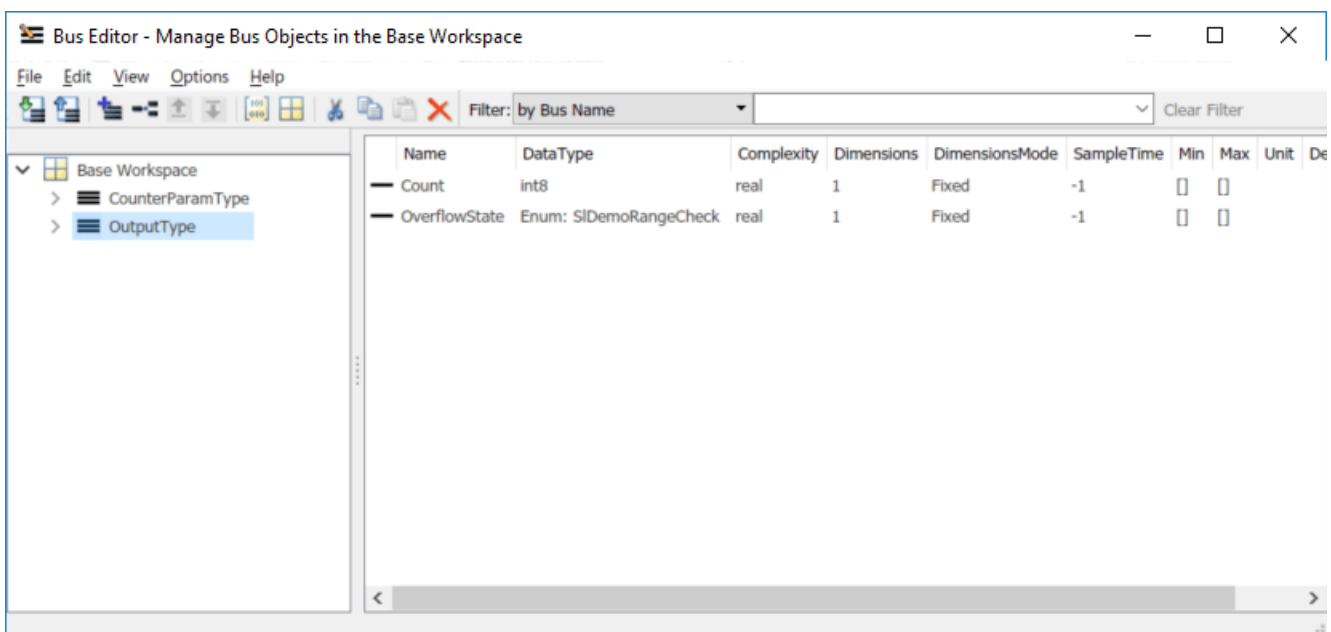

Referenced Model: Defining the Shape of the Output Bus Signal

The referenced model produces two results and packages them into a bus signal:

- **Count:** the value of the counter as an 8-bit integer
- **OverflowState:** an enumerated value that indicates whether the counter is at the upper limit, lower limit, or in range

To define the bus type for the root output of the referenced model:

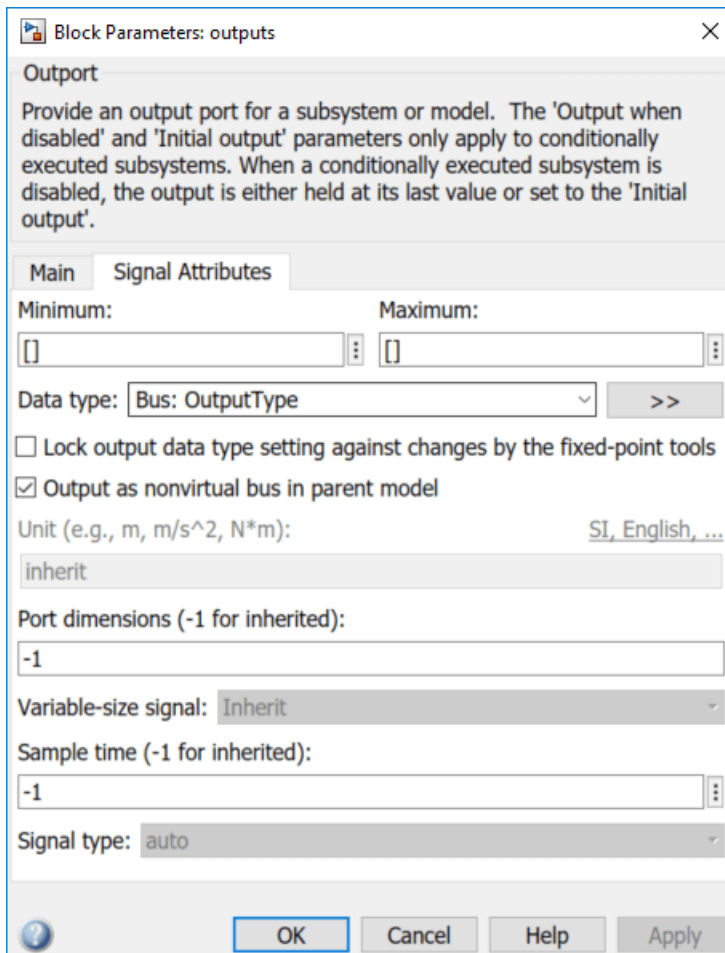

1. Use the Bus Editor to define the bus object (OutputType).

Alternatively, you can create the bus object at the MATLAB command line:

```
OutputType = Simulink.Bus;
OutputType.Elements = Simulink.BusElement;
OutputType.Elements(1).Name = 'Count';
OutputType.Elements(1).DataType = 'int8';
OutputType.Elements(2) = Simulink.BusElement;
OutputType.Elements(2).Name = 'OverflowState';
OutputType.Elements(2).DataType = 'Enum: SLDemoRangeCheck';
```

2. Configure the root outputport of the referenced model to output a nonvirtual bus signal based on this bus object (OutputType).

Referenced Model: Setting Initial Value for Bus Output

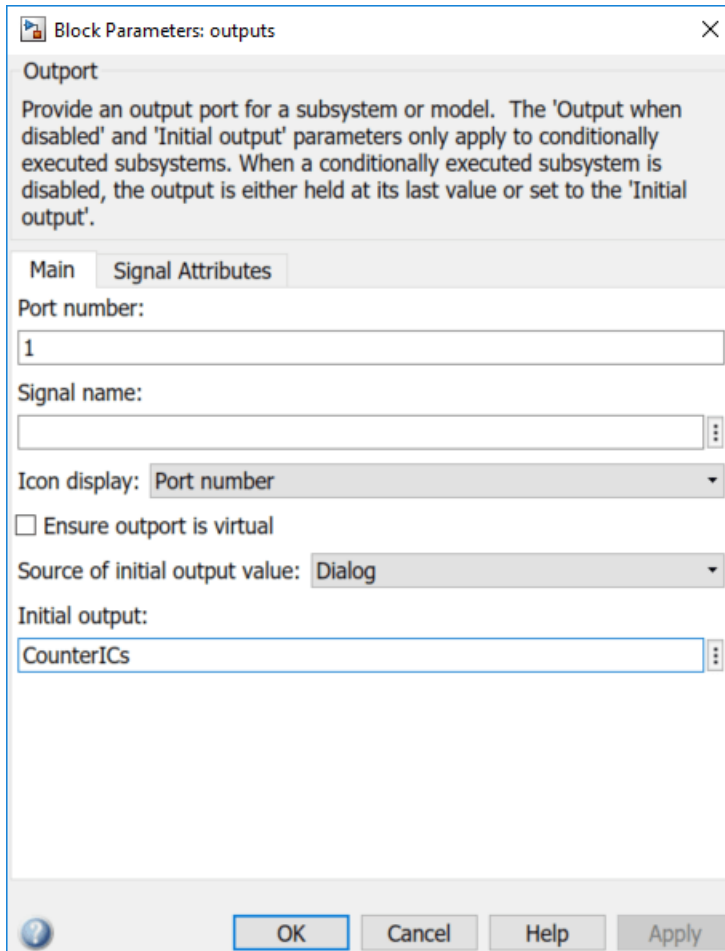

In general, the initial values for bus signals and states can be specified as '0', in which case all of the elements of the bus will be initialized to zero (or the relevant ground value). However, in certain cases, it is desirable to specify nonzero initial values for bus signals and states. In this example, the initial condition of the counter is tunable, so the initial value of output signal must be set consistently.

To specify the initial value of the output of the referenced model:

1. Create a parameter structure that is compatible with the bus signal that you want to initialize. One of the model arguments (CounterICs) is a parameter structure that matches the shape of the output signal. This structure was defined as follows:

```
CounterICs.Count          = int8(0);
CounterICs.OverflowState = SLDemoRangeCheck.InRange;
```

2. Open the dialog box for the root outputport and enter the name of the structure (CounterICs) into the **Initial output** field.

NOTE: In general, when initializing a bus signal or state, the parameter structure does not need to match the bus type exactly, but its fields must be a subset of the elements in the bus object and the attributes of these fields must match the elements in the bus object.

Referenced Model: Masking Referenced Model

It is often useful to mask the referenced model to customize the user interface. You can create a mask on a model and then reference it from a Model block. To mask a model, click **Create Model Mask** in the model workspace section of Model Explorer for the model.

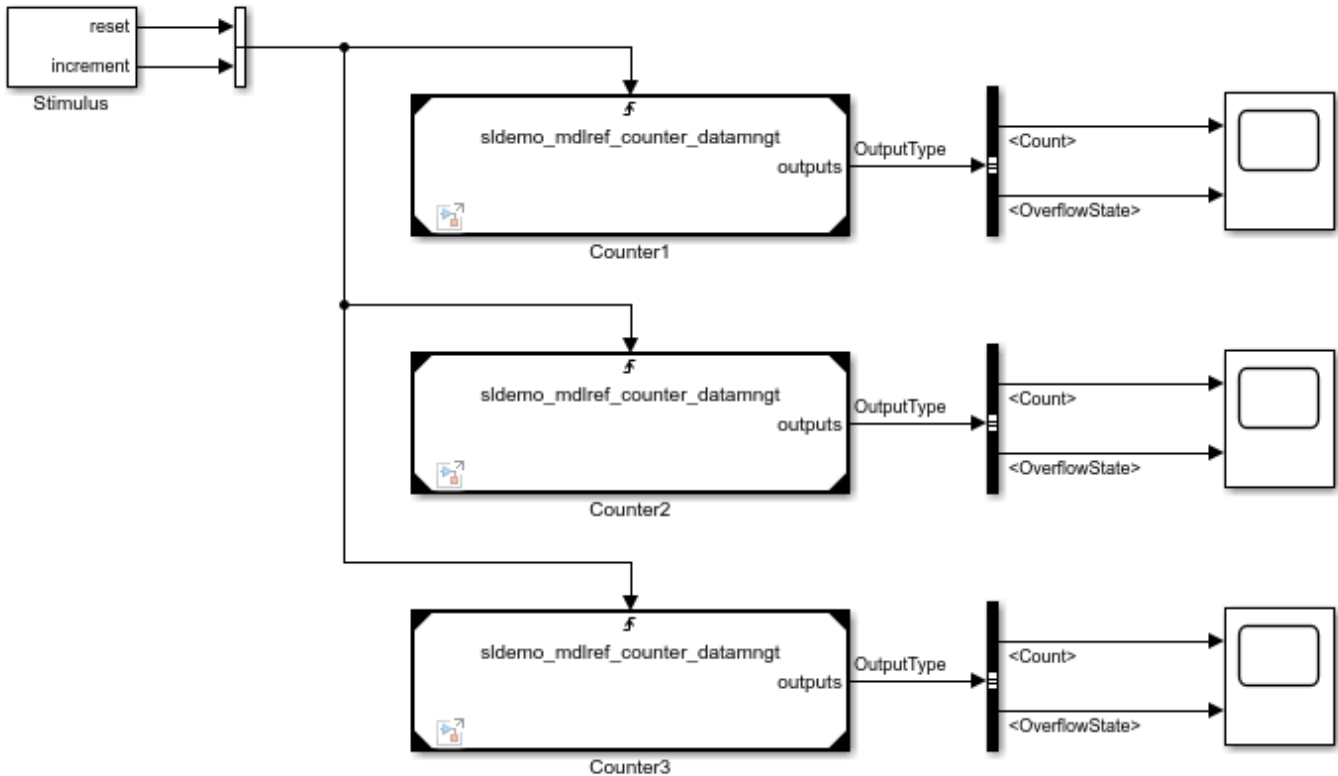

Top Model: Parameterizing Model Blocks

The referenced model is configured to accept a structure for its model argument. This example calls each instance of the referenced model with different parameter values.

1. Open the top model sldemo_mdref_datamngt.

? Managing Data with Model Reference

Copyright 1990-2014 The MathWorks, Inc.

2. Create parameter structures with the same "shape" as the model arguments defined in the referenced model.

```
clear Param1 Param2 IC1 IC2;
Param1.Increment = int8(1);
Param1.LowerLimit = int8(-20);
Param1.UpperLimit = int8(20);

Param2 = Param1;
Param2.Increment = int8(2);

IC1.Count = int8(0);
IC1.OverflowState = SLDemoRangeCheck.InRange;

IC2 = IC1;
IC2.Count = int8(-10);
```

3. Set the mask parameters on the masked Model blocks to use these parameters.

For example, the parameters of the first Model block 'sldemo_mdref_datamngt/Counter1' are set as:

- **Param1** for the **Counter parameters**
- **IC1** for the **Initial conditions**

Top Model: Scheduling Calls to the Referenced Model

As mentioned earlier, the referenced model implements a limited counter algorithm with two trigger inputs. The algorithm detects "rising edges" in the trigger inputs and reacts as follows:

- Resets the counter if the first trigger input changes.
- Increments the counter by a specified amount if the second input changes.

In this example, you drive all three instances of the counter algorithm with the same trigger inputs, generated by the Stimulus subsystem. The period and sample time of the trigger inputs are defined by the values entered for the mask parameters of the Stimulus subsystem:

- Reset counter every 4 seconds.
- Increment counter 5 times per second (period = 0.2 second).
- Sample time is 0.1 second.

NOTE: Reset and increment periods must be at least 2 times the sample time.

Simulating the Top Model

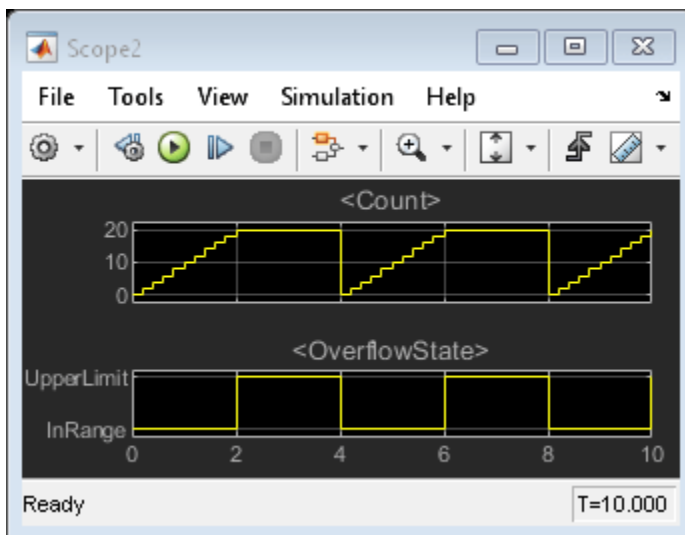

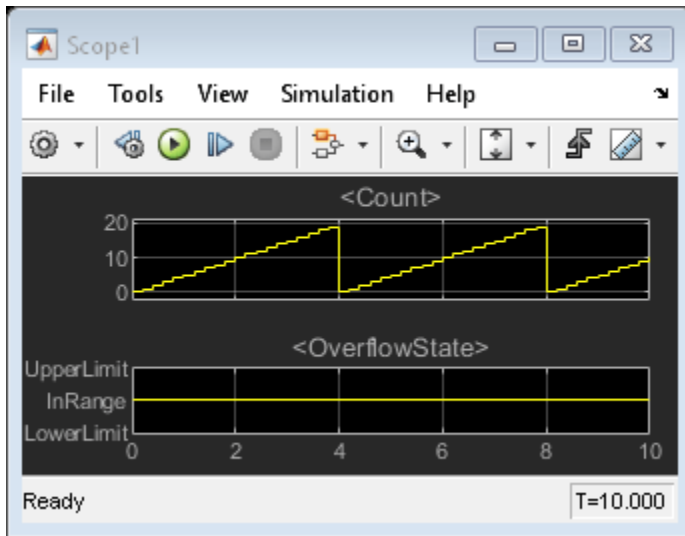

1. Save or close the referenced model.

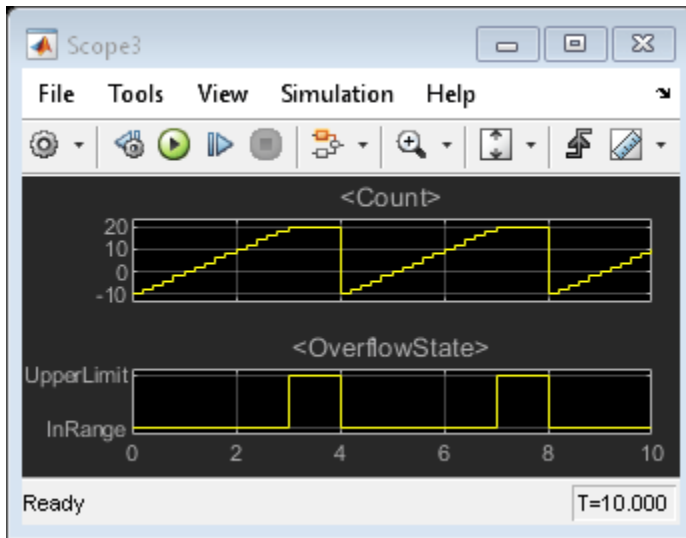

You need to save the referenced model before it can be used by the top model. Alternatively, you can close the referenced model and use the original version of the model provided with this example.

2. Simulate the top model by selecting **Simulation > Run**.

NOTE: Simulating the top model automatically generates a simulation target for the referenced model.

3. Review the simulation results as displayed by the Scope blocks.

Detailed Workflow for Managing Data with Model Reference

This example shows a number of tools and techniques that make up a workflow for managing data with model reference.

For a basic introduction to this topic, see: “Introduction to Managing Data with Model Reference” on page 13-406.

Example Requirements

During this example, Simulink® and Simulink® Coder™ generate code in the code generation folder created in the current directory. If you do not want to (or if you cannot) generate files in this directory, you should change your working directory. Simulink Coder is required to generate model reference binaries to be deployed in standalone applications.

If you plan to alter the example models:

1. Preserve the example in its original state by copying the following files from your MATLAB® installation directory, without changing their names, to a different directory:

```
toolbox/simulink/simdemos/simfeatures/modelreference/sldemo_mdref_datamngt.slx
toolbox/simulink/simdemos/simfeatures/modelreference/sldemo_mdref_datamngt_wsdata.m
toolbox/simulink/simdemos/simfeatures/modelreference/sldemo_mdref_counter_datamngt.slx
toolbox/simulink/simdemos/simfeatures/modelreference/sldemo_mdref_counter_datamngt_types.m
toolbox/simulink/simdemos/simfeatures/modelreference/sldemo_mdref_counter_datamngt_wsdata.m
```

2. Change your current directory to the directory to which you copied the files.

3. Continue with the example.

Open the Example Model

```
open_system('sldemo_mdref_datamngt')
```

Managing Data with Model Reference

Copyright 1990-2014 The MathWorks, Inc.

Example Content

This example uses a top model (`sldemo_mdhref_datamngt`) that contains three Model blocks: Counter1, Counter2, and Counter3. These blocks reference the same model (`sldemo_mdhref_counter_datamngt`).

The referenced model implements a limited counter algorithm that:

- Resets the counter if the first trigger input changes
- Increments the counter by a specified amount if the second input changes
- Saturates the counter between the specified upper and lower limits

The referenced model outputs a bus signal that contains:

- **Count:** the value of the counter as an 8-bit integer
- **OverflowState:** an enumerated value that indicates whether the counter is at the upper limit, lower limit, or in range

This model is configured to show a number of Simulink features working together:

- **Tunable parameter structures:** Collect variables into a MATLAB structure that parameterizes the model. In this example, the model arguments of the referenced model are defined as parameter structures.
- **Model arguments:** Pass different parameter values to each model reference instance.
- **Bus objects:** Define the "shape" of structures for signals and parameters used in the model reference interface. Define type name for structure parameters and signals in generated code.
- **Simulink.Bus.createMATLABStruct:** Static method for creating a MATLAB structure that matches the shape of the bus object.
- **Bus initialization:** Uses a parameter structure to initialize bus signals and states.
- **Masked Model block:** Creates a customized interface for a model reference block.
- **Triggered model reference:** Explicit control over scheduling of components.

This example also uses other features that are useful for managing data in Simulink:

- **Simulink.saveVars:** Serialize workspace variables to a MATLAB script. Supports incremental modification, data differencing, and version control.
- **Simulink.findVars:** Discover how workspace variables are used by a model.

Example Outline

The sequence of steps in the example is as follows:

1. Prepare the referenced model (sldemo_mdref_counter_datamngt) to use structures for the signals and parameters in its external interface.
2. Prepare the top model (sldemo_mdref_datamngt) to call the referenced model.
3. Simulate the top model and examine the results.
4. Generate code to create a standalone executable for the top model.

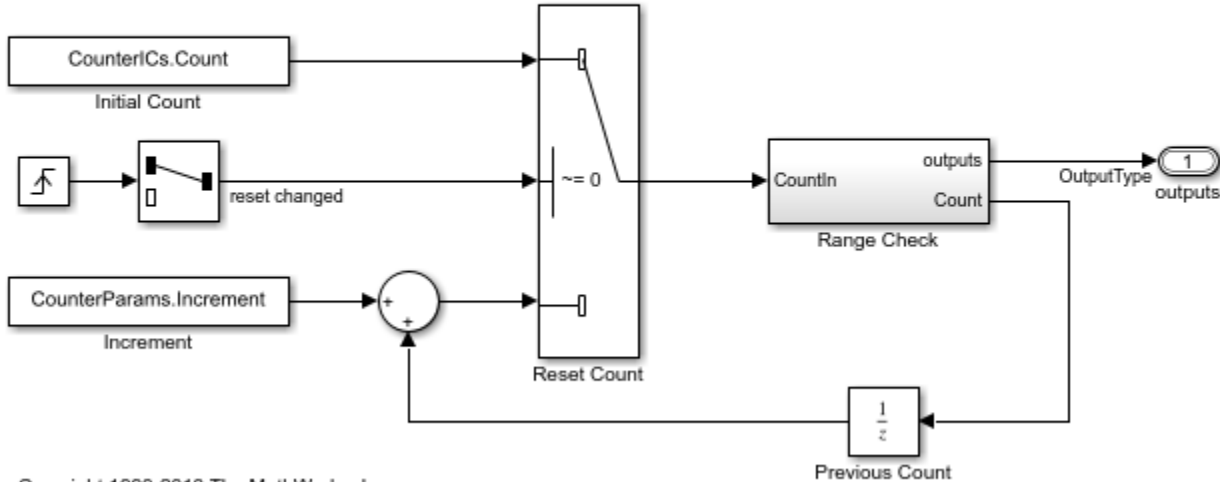

Referenced Model: Setting Up Parameters

The referenced model has two model arguments (CounterParams, CounterICs) that parameterize the blocks in the model. Model arguments provide different parameter values to each instance of a referenced model. In this model, the arguments are defined as parameter structures to reduce the number of arguments being passed to the referenced model.

The process for defining the model arguments is as follows:

1. Open the referenced model (sldemo_mdref_counter_datamngt).

- * If reset input changes, set count to initial condition.
- * Otherwise (increment input changed), increment count.
- * In either case, limit the count to the upper/lower limits specified.

Copyright 1990-2013 The MathWorks, Inc.

2. Define MATLAB structures to parameterize the referenced model.

```
CounterParams.Increment = int8(1);
CounterParams.LowerLimit = int8(-10);
CounterParams.UpperLimit = int8(10);

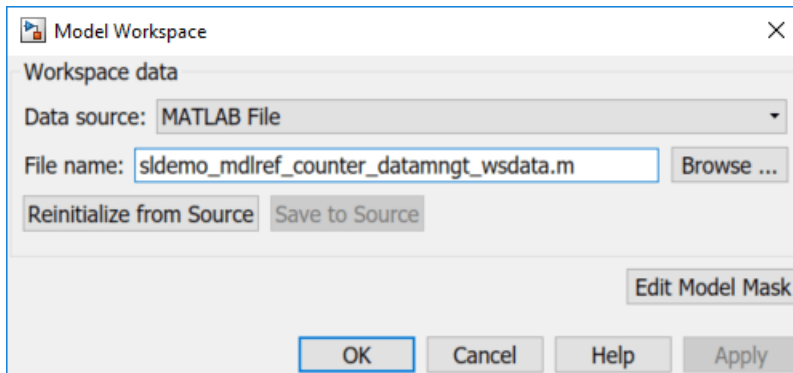

CounterICs.Count = int8(0);
CounterICs.OverflowState = SLDemoRangeCheck.InRange;
```

NOTE: This example uses an 8-bit integer for the counter, so the numeric fields also use 8-bit integers.

3. Use the MATLAB structures as model arguments.

Model arguments are defined as variables in the model workspace of a referenced model. You can initialize the model workspace from a number of different data sources. This example uses a MATLAB script (`sldemo_mdref_counter_datamngt_wsdata`) to create the parameter structures for the model arguments. Using a MATLAB script makes it easy to create and modify the parameter structure outside the model. It also facilitates incremental changes, version control, and data differencing.

Set the data source in the dialog of the model workspace.

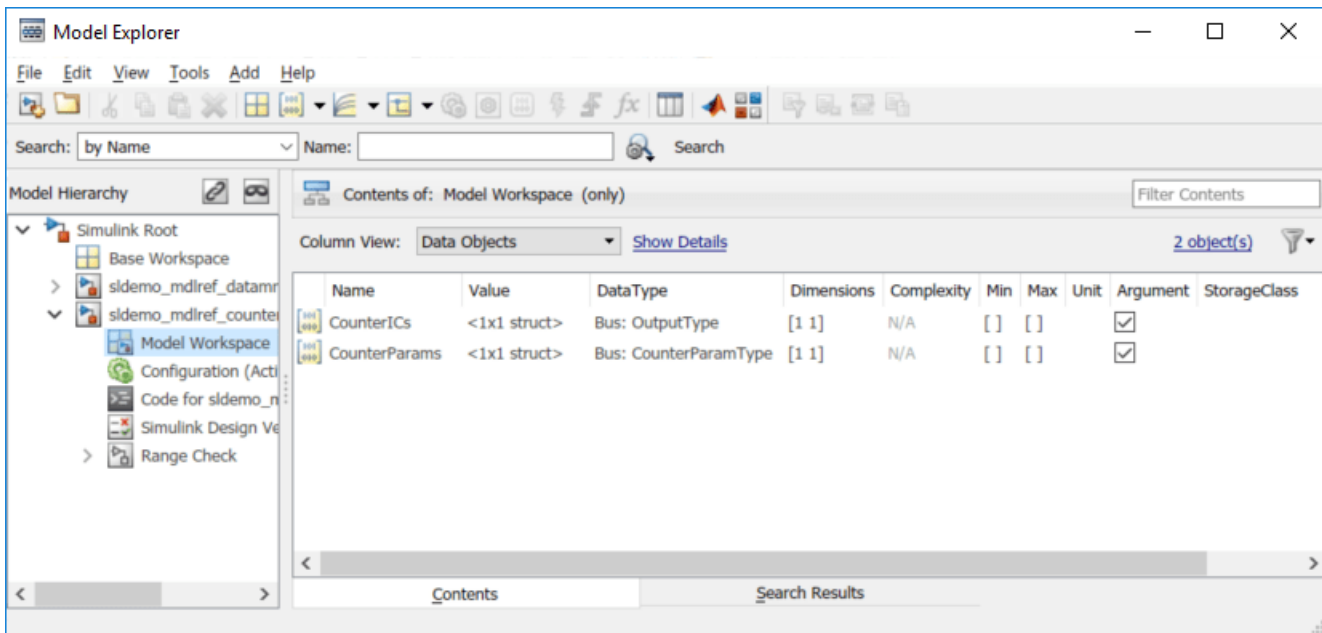

Alternatively, you can set the data source from the MATLAB command line:

```
hWS = get_param('sldemo_mdref_counter_datamngt', 'ModelWorkspace');
hWS.DataSource = 'MATLAB File';
hWS.FileName = 'sldemo_mdref_counter_datamngt_wsdata.m';
hWS.reload;
```

You can use the Model Explorer to view and edit the contents of the model workspace.

Select the Argument checkbox to configure variables as model arguments.

Alternatively, you can set the list of model arguments from the MATLAB command line:

```
set_param('sldemo_mdref_counter_datamngt', ...
    'ParameterArgumentNames', 'CounterParams,CounterICs');
```

4. Explore how the referenced model uses the model arguments.

A number of blocks in the referenced model use the model arguments:

- A Constant block specifies the increment amount (CounterParams.Increment).
- Various blocks inside the "Range Check" subsystem use the values of the lower and upper limits (CounterParams.LowerLimit and CounterParams.UpperLimit).
- Various blocks use the initial condition of the counter (CounterICs.Count).
- The root Output block uses the initial condition structure (CounterICs) to initialize the system output prior to execution.

You can use **Simulink.findVars** to discover the blocks that use the model argument.

```
paramInfo = Simulink.findVars('sldemo_mdref_counter_datamngt', ...
                             'Name', 'CounterParams');
icInfo     = Simulink.findVars('sldemo_mdref_counter_datamngt', ...
                             'SearchMethod', 'cached', ...
                             'Name',       'CounterICs');
```

```
paramBlks = paramInfo.UsedByBlocks
icBlks     = icInfo.UsedByBlocks
```

```
paramBlks =
```

```
3x1 cell array
```

```
 {'sldemo_mdref_counter_datamngt/Increment'          }
 {'sldemo_mdref_counter_datamngt/Range Check/Detect Overflow'}
 {'sldemo_mdref_counter_datamngt/Range Check/Saturate Count' }
```

```
icBlks =
```

```
3x1 cell array
```

```
 {'sldemo_mdref_counter_datamngt/Initial Count' }
 {'sldemo_mdref_counter_datamngt/Previous Count'}
 {'sldemo_mdref_counter_datamngt/outputs'      }
```

NOTE: Once you have compiled the model, you can use `Simulink.findVars` to retrieve the **'cached'** variable usage information.

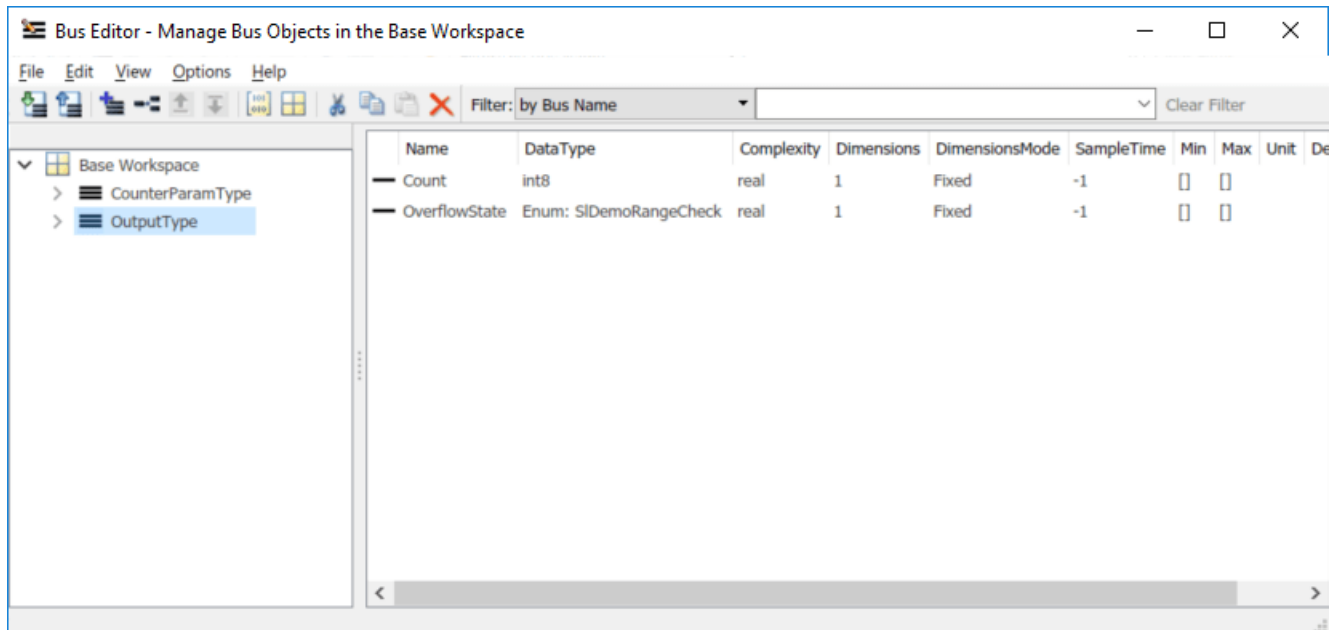

Referenced Model: Defining the Shape of the Output Bus Signal

The referenced model produces two results and packages them into a bus signal:

- **Count:** the value of the counter as an 8-bit integer
- **OverflowState:** an enumerated value that indicates whether the counter is at the upper limit, lower limit, or in range

To define the bus type for the root output of the referenced model:

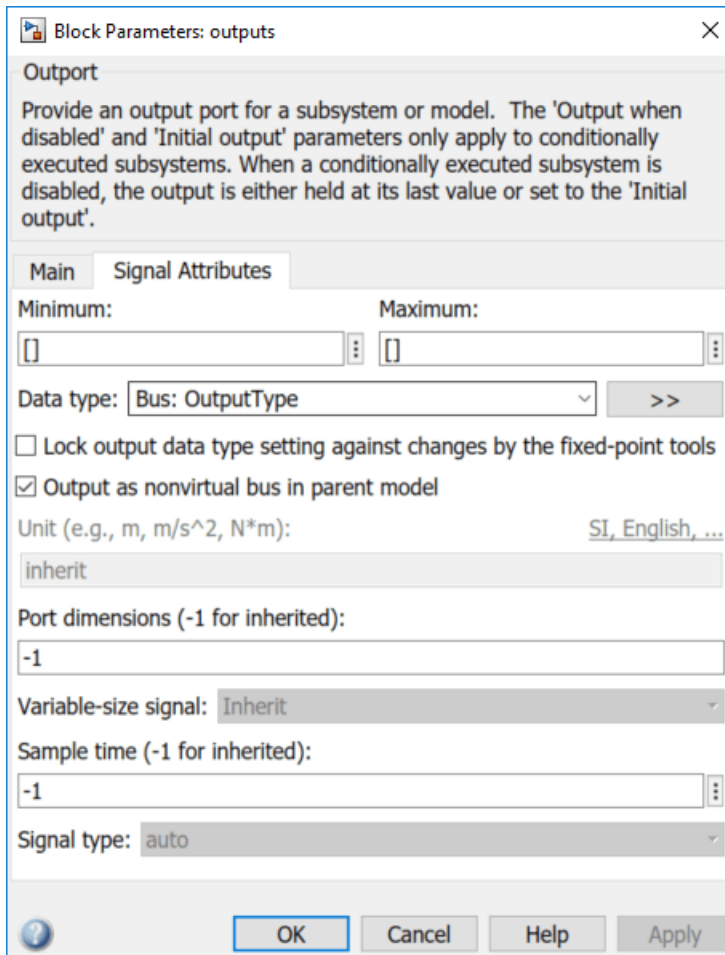

1. Use the Bus Editor to define the bus object (OutputType).

Alternatively, you can create the bus object at the MATLAB command line:

```
OutputType = Simulink.Bus;
OutputType.Elements = Simulink.BusElement;
OutputType.Elements(1).Name = 'Count';
OutputType.Elements(1).DataType = 'int8';
OutputType.Elements(2) = Simulink.BusElement;
OutputType.Elements(2).Name = 'OverflowState';
OutputType.Elements(2).DataType = 'Enum: SLDemoRangeCheck';
```

2. Configure the root output of the referenced model to output a nonvirtual bus signal based on this bus object (OutputType).

Alternatively, you can set the block parameters from the MATLAB command line:

```
set_param('sldemo_mdref_counter_datamngt/outputs', ...
          'UseBusObject', 'on', ...
          'BusObject', 'OutputType', ...
          'BusOutputAsStruct', 'on');
```

3. Create a MATLAB script to recreate this bus object.

This example uses a MATLAB script (`sldemo_mdref_counter_datamngt_types`) to recreate the bus objects used by the referenced model.

You can create this MATLAB script manually, or use **Simulink.saveVars**:

```
Simulink.saveVars('sldemo_mdref_counter_datamngt_types.m', 'OutputType');
```

4. Configure the referenced model to create the global data that it uses.

It is common practice for a model to recreate all of the global data and types that it uses. In this example, the referenced model's **PreLoadFcn** is used to execute the MATLAB script that creates the bus objects for the referenced model. The referenced model does not use any other global variables.

To set the **PreLoadFcn** model callback, open the Model Properties dialog box from the **Modeling** tab by clicking the **Model Settings** button arrow, and then under **Top Model**, selecting **Model**

Properties. On the **Callbacks** tab of the Model Properties dialog box, in the **Model pre-load function** box, call the `sldemo_mdhref_counter_datamngt_types` script, and then click **Apply**.

Alternatively, set the callback from the MATLAB command line.

```
set_param('sldemo_mdhref_counter_datamngt', ...
          'PreLoadFcn', 'sldemo_mdhref_counter_datamngt_types');
```

5. Explore how the bus type is used in the model hierarchy.

This bus type forms part of the interface for the referenced model and is referred to by blocks in both the top and referenced models. Use **find_mdhrefs** and **Simulink.findVars** to find out about all the places where this bus object is used in the model reference hierarchy.

```
models = find_mdhrefs('sldemo_mdhref_datamngt');
open_system(models);
varInfo = Simulink.findVars(models, 'Name', 'OutputType');
blks = vars.UsedByBlocks
```

```
models =
```

```
2x1 cell array
```

```
 {'sldemo_mdhref_counter_datamngt'}
 {'sldemo_mdhref_datamngt' }
```

```
blks =
```

```
7x1 cell array
```

```
 {'sldemo_mdhref_counter_datamngt/Initial Count' }
 {'sldemo_mdhref_counter_datamngt/Previous Count' }
 {'sldemo_mdhref_counter_datamngt/Range Check/Bus Creator'}
 {'sldemo_mdhref_counter_datamngt/outputs' }
 {'sldemo_mdhref_datamngt/Counter1' }
 {'sldemo_mdhref_datamngt/Counter2' }
 {'sldemo_mdhref_datamngt/Counter3' }
```

Referenced Model: Setting Initial Value for Bus Output

In general, the initial values for bus signals and states can be specified as '0', in which case all of the elements of the bus will be initialized to zero (or the relevant ground value). However, in certain cases, it is desirable to specify nonzero initial values for bus signals and states. In this example, the initial condition of the counter is tunable, so the initial value of output signal must be set consistently.

To specify the initial value of the output of the referenced model:

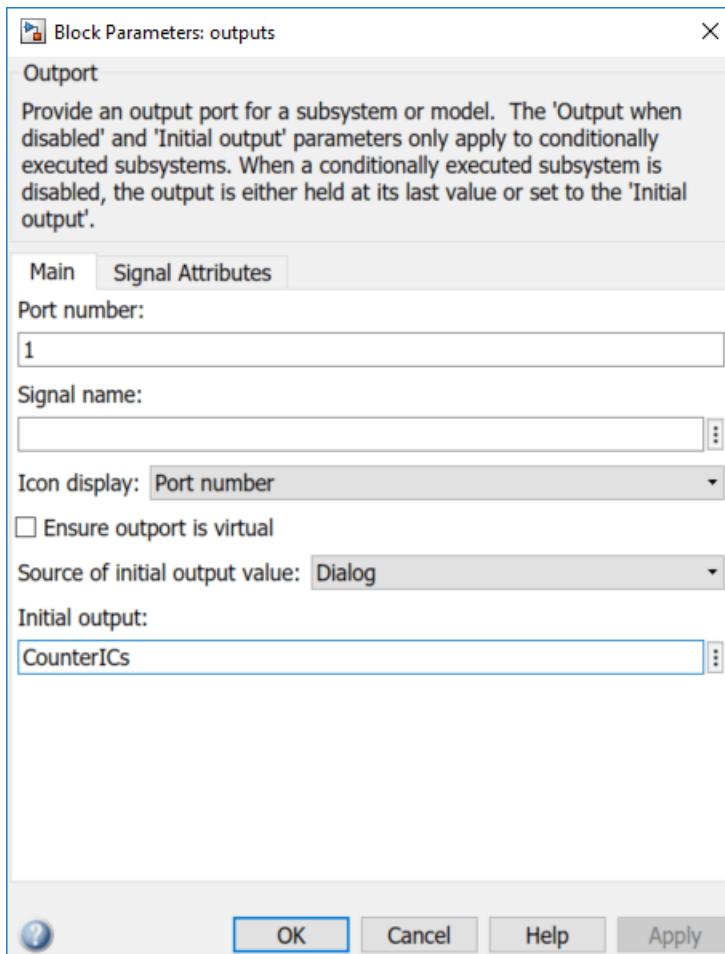

1. Create a parameter structure that is compatible with the bus signal that you want to initialize. One of the model arguments (CounterICs) is a parameter structure that matches the shape of the output signal. This structure was defined as follows:

```
CounterICs.Count = int8(0);
CounterICs.OverflowState = SLDemoRangeCheck.InRange;
```

Alternatively, you could have used the static method, `Simulink.Bus.createMATLABStruct` to create the structure using the ground value of the OutputType.

```
CounterICs = Simulink.Bus.createMATLABStruct('OutputType');
```

2. Open the dialog box for the root outport and enter the name of the structure (CounterICs) into the **Initial output** field.

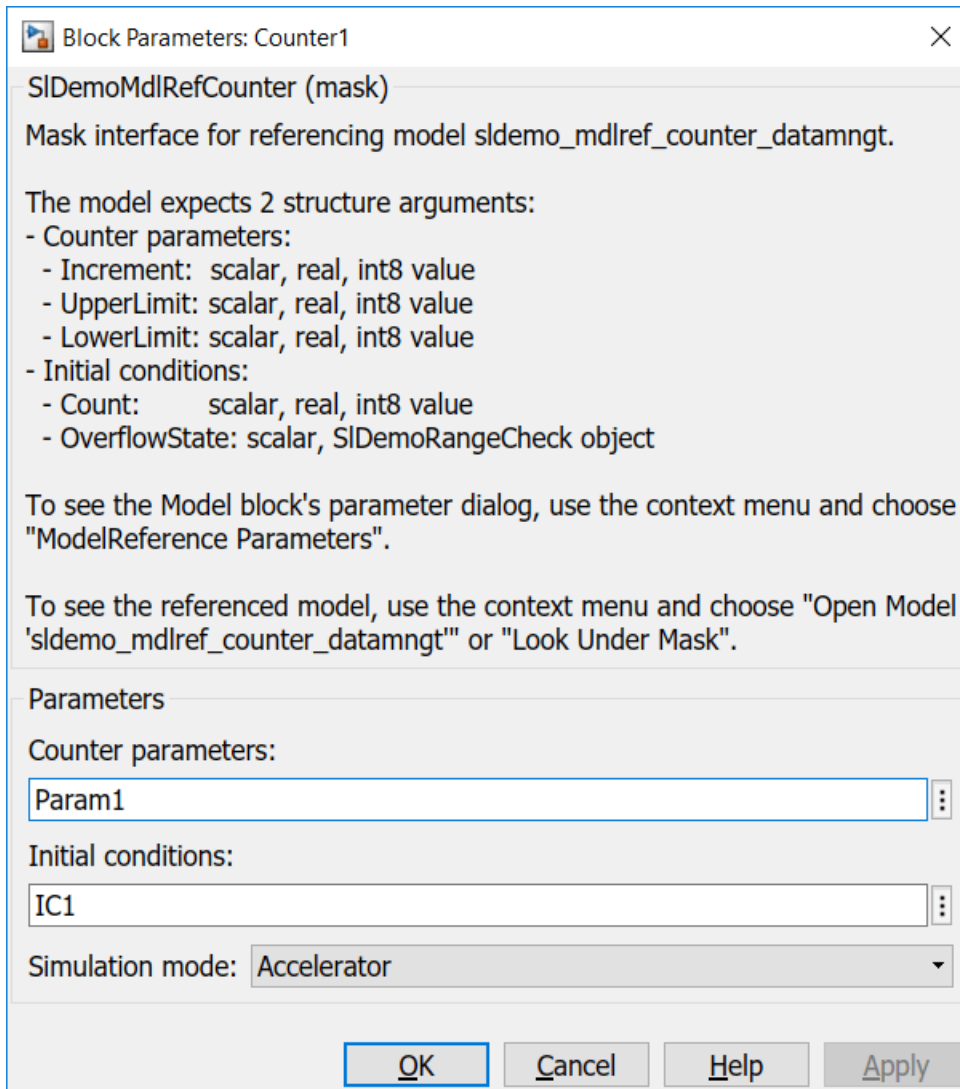

Alternatively, you can set the block parameters from the MATLAB command line:

```
set_param('sldemo_mdref_counter_datamngt/outputs', ...
    'InitialOutput', 'CounterICs');
```

NOTE: In general, when initializing a bus signal or state, the parameter structure does not need to match the bus type exactly, but its fields must be a subset of the elements in the bus object and the attributes of these fields must match the elements in the bus object.

Referenced Model: Masking Referenced Model

It is often useful to mask the referenced model to customize the user interface. You can create a mask on a model and then reference it from a Model block. To mask a model, click **Create Model Mask** in the model workspace section of Model Explorer for the model.

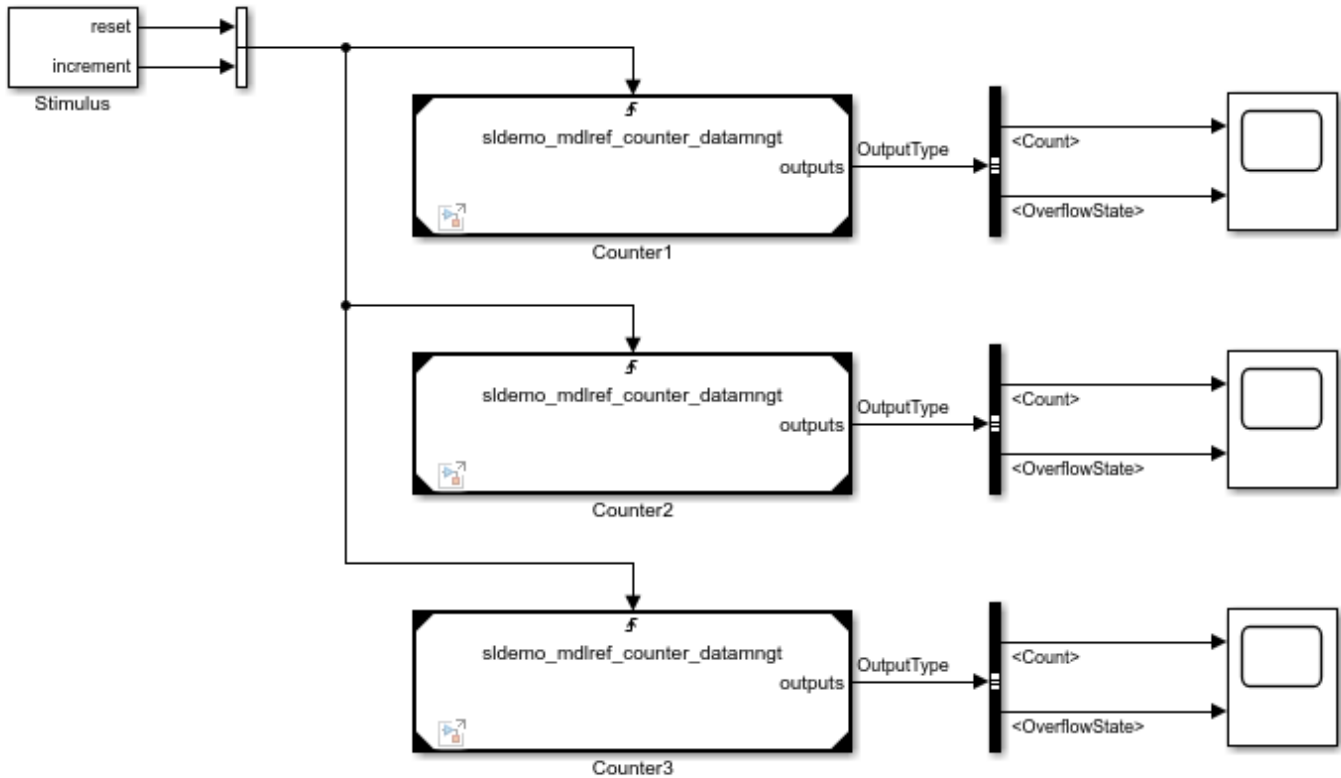

When you reference a masked model from a Model block, a mask is generated automatically on the Model block. For more information, see the topic **Create and Reference a Masked Model**.

Top Model: Parameterizing Model Blocks

The referenced model is configured to accept a structure for its model argument. This example calls each instance of the referenced model with different parameter values.

1. Open the top model (sldemo_mdref_datamngt).

Managing Data with Model Reference

Copyright 1990-2014 The MathWorks, Inc.

2. Create parameter structures with the same "shape" as the model arguments defined in the referenced model.

```
Param1.Increment = int8(1);
Param1.LowerLimit = int8(-20);
Param1.UpperLimit = int8(20);
```

```
Param2 = Param1;
Param2.Increment = int8(2);
```

```
IC1.Count = int8(0);
IC1.OverflowState = SLDemoRangeCheck.InRange;
```

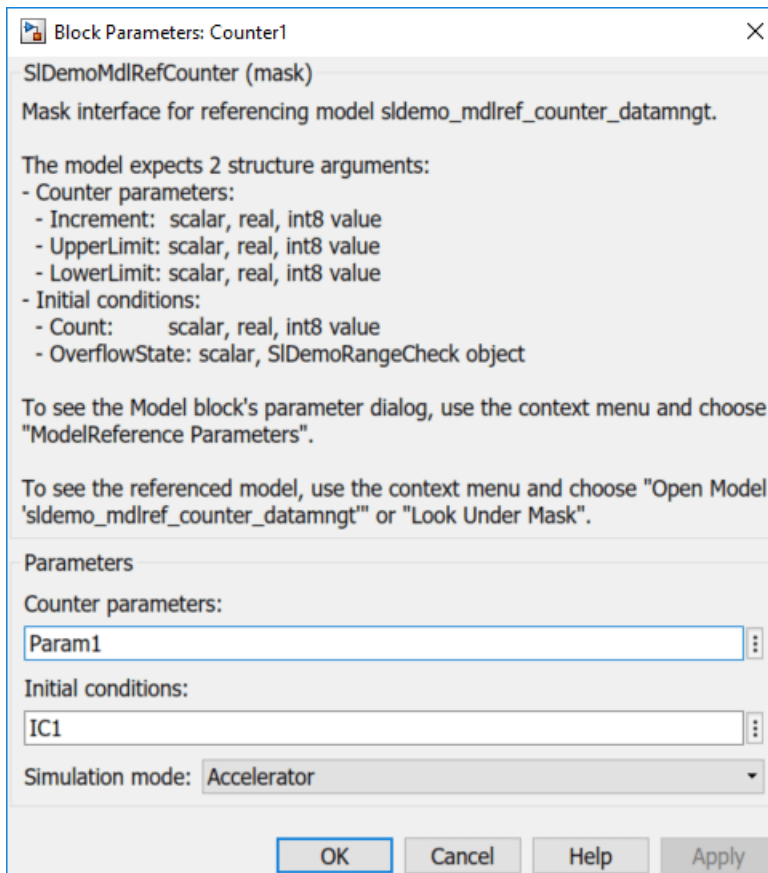

```
IC2 = IC1;
IC2.Count = int8(-10);
```

3. Set the mask parameters on the masked Model blocks to use these parameters.

For example, the parameters of the first Model block ('sldemo_mdref_datamngt/Counter1') are set as:

- **Param1** for the **Counter** parameters

- **IC1** for the **Initial conditions**

Alternatively, you can set the block parameters from the MATLAB command line:

```
set_param('sldemo_mdref_datamngt/Counter1', ...
          'CounterParams', 'Param1', ...
          'CounterICs', 'IC1');
```

3. Create a MATLAB script to recreate these workspace variables.

This example uses a MATLAB script (`sldemo_mdref_datamngt_wsdata`) to recreate these workspace variables.

You can create this MATLAB script manually, or use **Simulink.saveVars**:

```
Simulink.saveVars('sldemo_mdref_datamngt_wsdata.m', 'Param*');
```

4. Configure the top model to create all global variables.

It is good practice for the top model to recreate all of the global data and types used throughout the model reference hierarchy. This configuration avoids loading referenced models when simulating the top model.

In this example, the top model's **PreLoadFcn** is used to execute the MATLAB scripts that create the workspace data for the top model and the types for the referenced model. The referenced model does not use any global data.

```
set_param('sldemo_mdref_datamngt', ...
         'PreLoadFcn', ['sldemo_mdref_datamngt_wsdata; ', ...
                       'sldemo_mdref_counter_datamngt_types']);
```

Top Model: Scheduling Calls to the Referenced Model

As mentioned earlier, the referenced model implements a limited counter algorithm with two trigger inputs. The algorithm detects "rising edges" in the trigger inputs and reacts as follows:

- Resets the counter if the first trigger input changes.
- Increments the counter by a specified amount if the second input changes.

In this example, you drive all three instances of the counter algorithm with the same trigger inputs, generated by the Stimulus subsystem. The period and sample time of the trigger inputs are defined by the values entered for the mask parameters of the Stimulus subsystem:

- Reset counter every 4 seconds.
- Increment counter 5 times per second (period = 0.2 second).
- Sample time is 0.1 second.

NOTE: Reset and increment periods must be at least 2 times the sample time.

Simulating the Top Model

1. Save or close the referenced model.

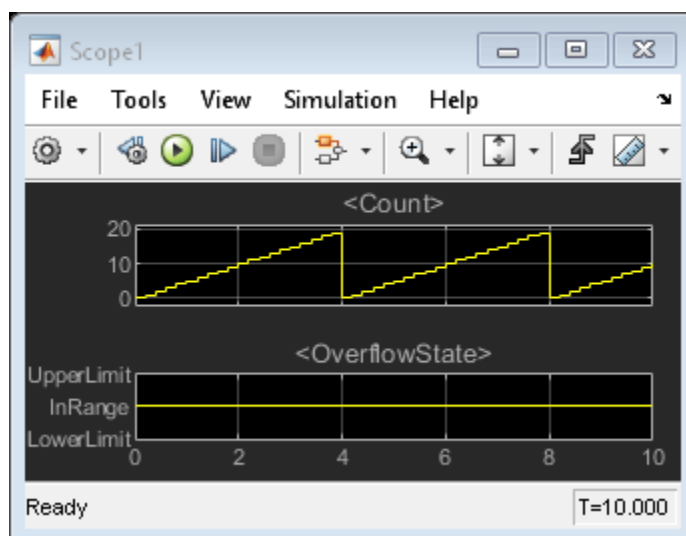

You need to save the referenced model before it can be used by the top model. Alternatively, you can close the referenced model and use the original version of the model provided with this example.

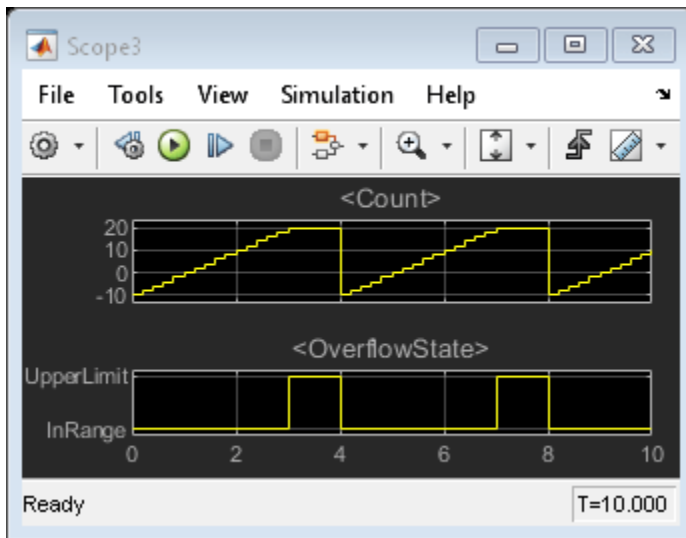

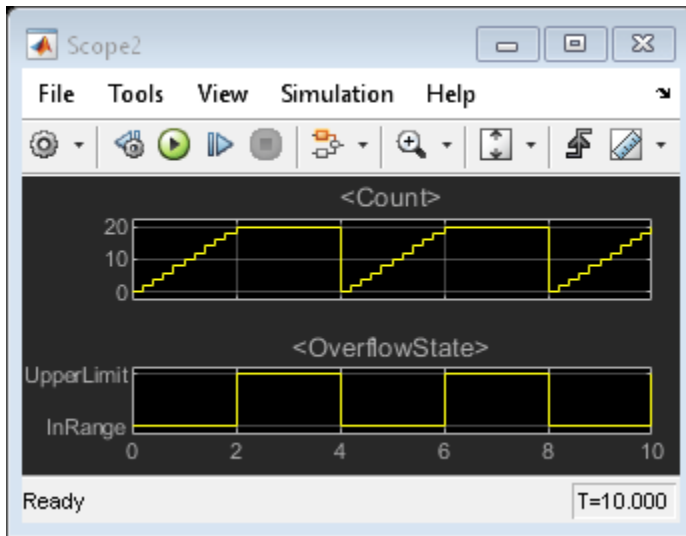

2. Simulate the top model by selecting **Simulation > Run**.

```
sim('sldemo_mdref_datamngt')
```

NOTE: Simulating the top model automatically generates a simulation target for the referenced model.

3. Review the simulation results as displayed by the Scope blocks.

Generating Code for the Top Model (Requires Simulink Coder)

To generate code and build a standalone executable for the top model, open the top model, and then press **Ctrl+B**.

Alternatively, use `rtwbuild` at the MATLAB command line.

```
rtwbuild('sldemo_mdhref_datamngt')
```

NOTE: When you generate code for the top model, Simulink Coder automatically generates code for the referenced model. Use Embedded Coder™ to generate embedded code for production deployment.

Controlling the Type Name for the Model Argument

By default, Simulink Coder generates an automatic name for the type of the parameter structures. This name is unique and deterministic, but not easy to recognize. You can control this type name by

using `Simulink.Parameter` objects to define the parameter structures and `Simulink.Bus` objects to define the type.

1. Define the bus type for the model argument by using the Bus Editor or by typing the following commands at the MATLAB command line:

```
CounterParamType = Simulink.Bus;
CounterParamType.Elements = Simulink.BusElement;
CounterParamType.Elements(1).Name = 'Increment';
CounterParamType.Elements(1).DataType = 'int8';
CounterParamType.Elements(2) = Simulink.BusElement;
CounterParamType.Elements(2).Name = 'LowerLimit';
CounterParamType.Elements(2).DataType = 'int8';
CounterParamType.Elements(3) = Simulink.BusElement;
CounterParamType.Elements(3).Name = 'UpperLimit';
CounterParamType.Elements(3).DataType = 'int8';
```

2. Modify the existing MATLAB script to recreate this bus object.

This bus type must be defined in the base workspace, along with the bus type for the referenced model's output. You can manually modify the MATLAB script that defines the types for the referenced model or use **Simulink.saveVars** to append this variable to the existing MATLAB script.

```
Simulink.saveVars('sldemo_mdref_counter_datamngt_types.m', 'CounterParamType', '-append');
```

3. Create `Simulink.Parameters` to define the model arguments.

To associate the bus types with the model arguments, you must use `Simulink.Parameter` objects in place of the MATLAB structures in the model workspace of the referenced model.

```
CounterParams = Simulink.Parameter;
CounterParams.Value.Increment = 1;
CounterParams.Value.LowerLimit = -10;
CounterParams.Value.UpperLimit = 10;
CounterParams.DataType = 'Bus: CounterParamType';

CounterICs = Simulink.Parameter;
CounterICs.Value.Count = 0;
CounterICs.Value.OverflowState = SLDemoRangeCheck.InRange;
CounterICs.DataType = 'Bus: OutputType';
```

NOTE: When you set the data type of a parameter object to be a bus, you can use double-precision values for the numeric fields of the parameter structure. Simulink converts these double-precision values to the appropriate numeric data type during model compilation.

You can manually modify the MATLAB script that defines the model argument or use **Simulink.saveVars** to update the existing MATLAB script.

```
Simulink.saveVars('sldemo_mdref_counter_datamngt_wsdata.m', '-update');
```

NOTE: When you use the **-update** option, you do not need to specify the variables to be written out because **Simulink.saveVars** writes out only the values of variables already defined in the MATLAB script.

5. Reload the contents of the model workspace.

You have modified the data source that is used by the referenced model's workspace. If this model is open, you must reload the contents of the model workspace.

You can reload by using the model workspace's dialog box or at the MATLAB command line.

```
hWS = get_param('sldemo_mdref_counter_datamngt', 'ModelWorkspace');
hWS.reload;
```

Controlling Representation of Parameters in the Top Model

You can use a similar approach to convert the parameter structures in the top model to use Simulink.Parameter objects. This configuration gives you control over the type name and enables you to control how these parameters appear in the generated code.

1. Create Simulink.Parameter objects with the ExportedGlobal storage class to define the parameter structures for the top model as a exported, tunable variables in the generated code.

```
Param1 = Simulink.Parameter;
Param1.Value.Increment = 1;
Param1.Value.LowerLimit = -10;
Param1.Value.UpperLimit = 10;
Param1.DataType = 'Bus: CounterParamType';
Param1.CoderInfo.StorageClass = 'ExportedGlobal';

Param2 = Param1.copy;
Param2.Value.Increment = 2;

IC1 = Simulink.Parameter;
IC1.Value.Count = 0;
IC1.Value.OverflowState = SLDemoRangeCheck.InRange;
IC1.DataType = 'Bus: OutputType';
IC1.CoderInfo.StorageClass = 'ExportedGlobal';

IC2 = IC1.copy;
IC2.Value.Count = -10;
```

2. Modify the existing MATLAB script to recreate these workspace variables.

You can manually modify the MATLAB script that defines the parameters for the top model or use **Simulink.saveVars** to update the existing MATLAB script.

```
Simulink.saveVars('sldemo_mdref_datamngt_wsdata.m', '-update');
```

NOTE: When you use the **-update** option, you do not need to specify the variables to be written out because **Simulink.saveVars** writes out only the values of variables already defined in the MATLAB script.

Regenerate Code for the Top Model (Requires Simulink Coder)

To generate code and build a standalone executable for the top model, open the top model, and then press **Ctrl+B**.

Alternatively, use `rtwbuild` at the MATLAB command line.

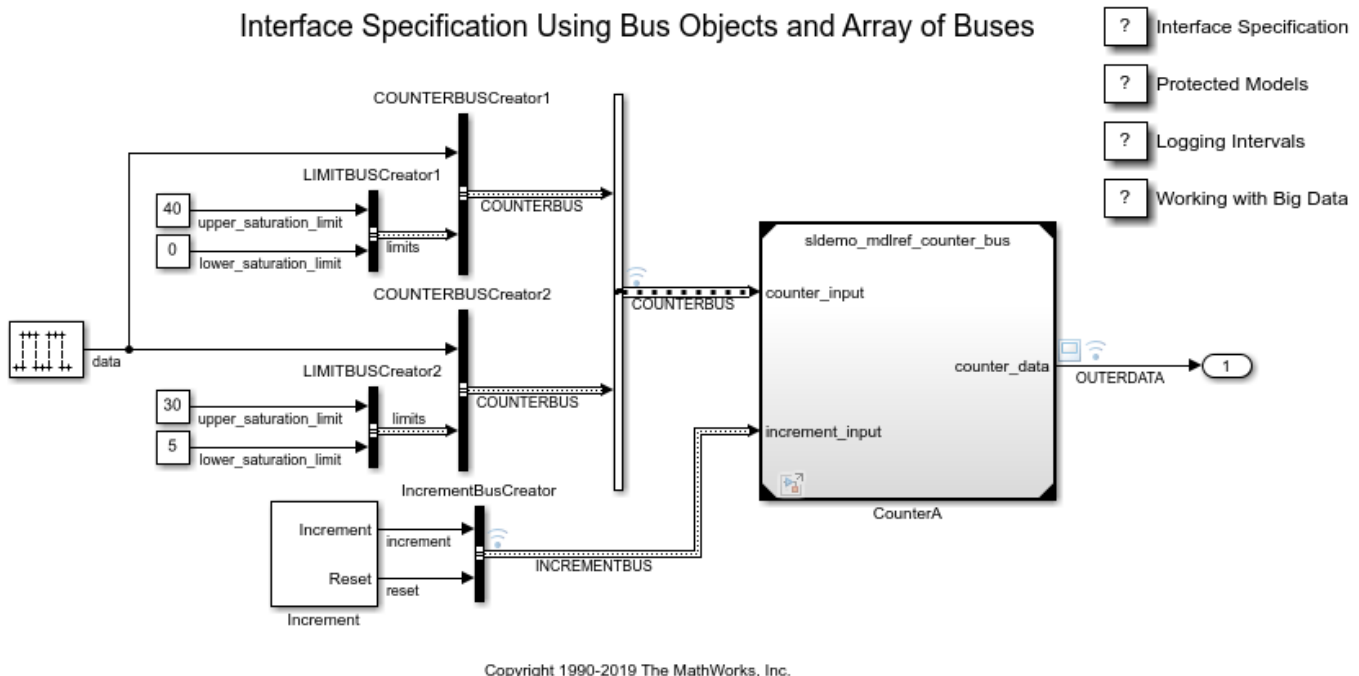

```
rtwbuild('sldemo_mdref_datamngt')
```

Interface Specification Using Bus Objects

This example shows how to propagate buses into referenced models. It also shows how you can simulate the referenced models independently using logged signal data from the parent model.

Open the Example Model

Open and simulate the example model `sldemo_mdhref_bus`.

Examine the Model

The model contains a Model block named CounterA that references `sldemo_mdhref_counter_bus`, which is a model of a simple counter.

An array of buses named COUNTERBUS feeds the data and the saturation limits of the counter into the model. The buses named COUNTERBUS each contain two elements: a data signal and a nested bus named LIMITBUS. The data is used in counting, and LIMITBUS contains the upper and lower limit values of the counter.

The Model block has a second input port that connects to a bus named INCREMENTBUS. This bus contains elements that change the increment and reset the counter.

The model uses a data dictionary file named `sldemo_mdhref_bus.sldd` that contains Simulink.Bus objects that define the elements of COUNTERBUS, LIMITBUS, and INCREMENTBUS.

To view the Bus objects, open the Bus Editor. In the Simulink® Toolstrip, on the **Modeling** tab, in the **Design** gallery, click **Bus Editor**.

The model uses the Bus objects to specify the outputs of the following Bus Creator blocks:

- COUNTERBUSCreator1
- COUNTERBUSCreator2
- LIMITBUSCreator1
- LIMITBUSCreator2
- IncrementBusCreator

The Inport block named `counter_input` in `sldemo_mdref_counter_bus` specifies the Bus object named COUNTERBUS. Double-click the block. In the Block Parameters dialog box, on the **Signal Attributes** tab, **Data type** is set to Bus: COUNTERBUS.

The Inport block named `increment_input` is similarly configured to use the Bus object named INCREMENTBUS.

Log Signal Data

These signals are marked for signal logging:

- COUNTERBUS
- INCREMENTBUS
- OUTERDATA
- INNERDATA

After you simulate the model, the logged signals are available in the base workspace in the `topOut` variable.

```
topOut =
```

```
Simulink.SimulationData.Dataset 'topOut' with 4 elements
```

		Name	BlockPath
1	[1x1 Signal]	COUNTERBUS	sldemo_mdref_bus/Concatenate
2	[1x1 Signal]	OUTERDATA	sldemo_mdref_bus/CounterA
3	[1x1 Signal]	INCREMENTBUS	sldemo_mdref_bus/IncrementBusCreator
4	[1x1 Signal]	INNERDATA	...erA\sldemo_mdref_counter_bus/COUNTER

- Use braces { } to access, modify, or add elements using index.

The model uses Dataset format for signal logging. To access Dataset format logged data for a given signal, use the `getElement` method:

```
topOut.getElement('COUNTERBUS')
```

```
ans =
```

```
Simulink.SimulationData.Signal
Package: Simulink.SimulationData
```

```
Properties:
```

```
    Name: 'COUNTERBUS'
  PropagatedName: ''
```

```
BlockPath: [1x1 Simulink.SimulationData.BlockPath]
PortType: 'outport'
PortIndex: 1
Values: [2x1 struct]
```

Bus data is logged as a MATLAB® structure in the Values field:

```
topOut.getElement('COUNTERBUS').Values
```

```
ans =
```

```
2x1 struct array with fields:
```

```
data
limits
```

This structure contains MATLAB timeseries objects for each bus:

```
topOut.getElement('COUNTERBUS').Values(1).data
```

```
timeseries
```

```
Common Properties:
```

```
    Name: 'data'
    Time: [301x1 double]
    TimeInfo: tsdata.timemetadata
    Data: [301x1 int32]
    DataInfo: tsdata.datametadata
```

```
topOut.getElement('COUNTERBUS').Values(2).data
```

```
timeseries
```

```
Common Properties:
```

```
    Name: 'data'
    Time: [301x1 double]
    TimeInfo: tsdata.timemetadata
    Data: [301x1 int32]
    DataInfo: tsdata.datametadata
```

You can also plot the logged data using the plot function:

```
topOut.getElement('OUTERDATA').Values.plot()
```

Log Referenced Model Signals

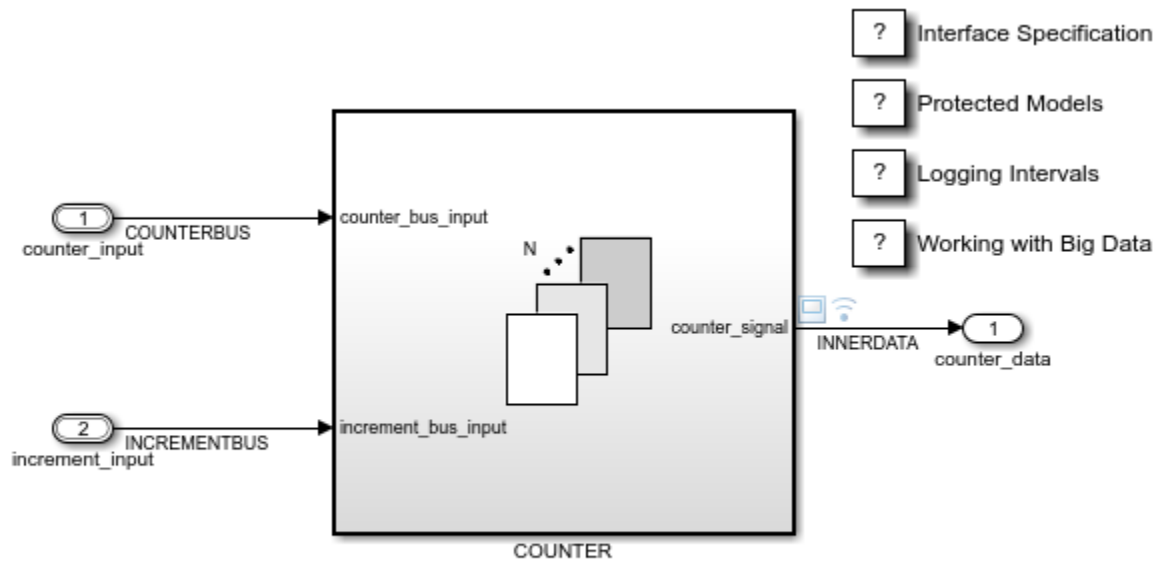

To log signals in the referenced model, select the Model block and click **Log Signals** on the **Model Block** tab.

For this model, **Logging Mode** is set to Log all signals as specified in model. All the signals that are logged when simulating `sldemo_mdref_counter_bus` as a top model are also logged when simulating it as a referenced model. To change logging for any of these signals or to log a subset of signals:

- 1 Set **Logging Mode** to Override signals.
- 2 In the **Model Hierarchy** pane, clear the **CounterA (sldemo_mdref_counter_bus)** check box to indicate that this model should not use the Log all signals as specified in model setting.
- 3 In the table, select the signals to log when simulating the top model.
- 4 To save the changes, save the top model.

Load Data

Open the referenced model `sldemo_mdref_counter_bus` as a top model by clicking the **Open As Top Model** badge at the lower left corner of the Model block.

Copyright 1990-2019 The MathWorks, Inc.

The referenced model is configured to read the logged signal data through the root Inport blocks. To see this configuration, open the Configuration Parameters dialog box. In the Simulink Toolstrip, on the **Modeling** tab, click **Model Settings**. On the **Data Import/Export** tab, **Input** uses a comma-separated list to specify logged data from `topOut` for the two input ports. The **counter_input** port uses an array of structure of timeseries to load data for COUNTERBUS, and the **increment_input** port uses a structure of timeseries to load data for INCREMENTBUS.

- `topOut.getElement('COUNTERBUS')`
- `topOut.getElement('INCREMENTBUS')`

You can configure the **Input** field by clicking the **Connect Input** button. The Root Inport Mapper tool opens. In this example, the tool uses a mapping algorithm to set up the **Input** field from logged data in the base workspace.

To select the data to import:

- 1 In the Root Inport Mapper, click **From Workspace**.
- 2 Select the logged data `topOut` and click **OK**.
- 3 In the dialog box that opens, specify a file name and click **Save**.

With the data loaded into the Root Inport Mapper tool, you can determine the root input port for which to assign input data. Simulink matches input data with input ports based on one of these criteria: block name, block path, signal name, port order, or a custom algorithm. Because `topOut` is logged using signal names from the model, the best choice for a mapping criterion is **Signal Name**. Using this criterion, Simulink tries to match input data variable names to the names of the input signals.

To select this option:

- 1 In the Root Inport Mapper hierarchy pane, select scenario dataset `topOut`.

- 2 Click the **Signal Name** radio button.
- 3 Click the **Map to Model** button arrow, then click **Map All**.

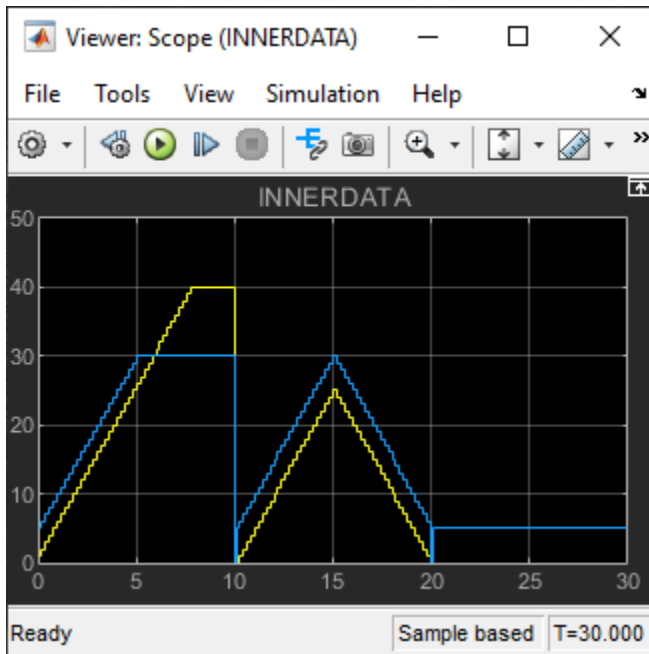

When mapping data, Simulink evaluates input ports against the input data to determine compatibility. The Root Inport Mapper table reflects the status of this compatibility with a green check mark, orange warning triangle, or red error exclamation mark. In this example, the table shows a green status indicating there is no compatibility issue. You can simulate the model with this mapping of input data to input ports. The mapping also sets **Input** in the **Data Import/Export** tab of the Configuration Parameters dialog to the proper comma-separated list of inputs. To apply the changes to the model, in the Configuration Parameters dialog, click **Apply**.

Simulate Model with Imported Data

Simulate `sldemo_mdref_counter_bus`.

After simulation, the scopes from `sldemo_mdref_bus` (OUTERDATA) and `sldemo_mdref_counter_bus` (INNERDATA) show the same trace.

The signal feeding the scope in the referenced model is also logged. The logged data is available in the MATLAB workspace under the variable `subOut`. You can verify that the data in `topOut.getElement('OUTERDATA')` and `subOut.getElement('INNERDATA')` is the same.

Convert Subsystem to Referenced Model

This example demonstrates how to convert a subsystem to a referenced model by using the **Model Reference Conversion Advisor** tool or the `Simulink.SubSystem.convertToModelReference` function.

Examine Example Model

Open and simulate the example model.

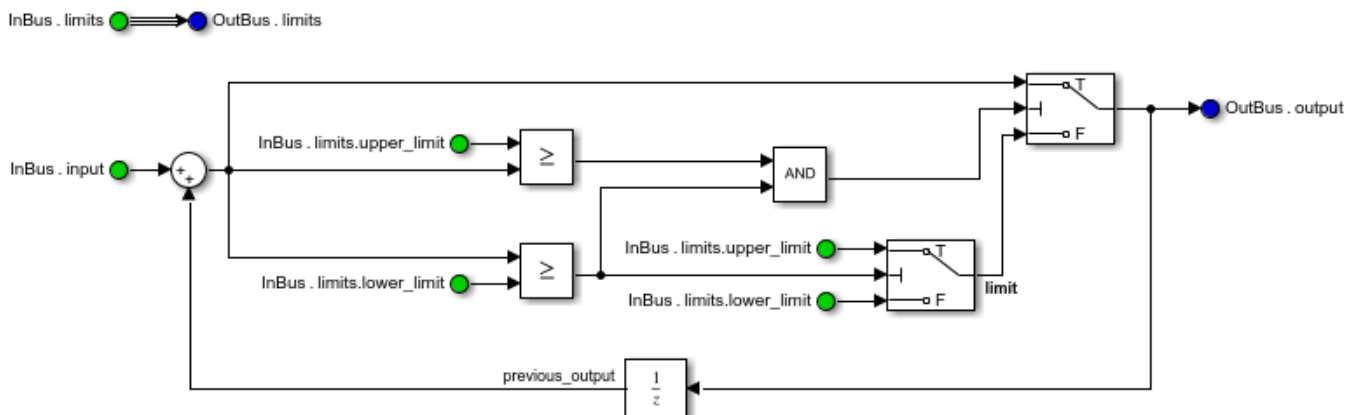

Conversion to Model Reference Example

Double-click here to convert the Bus Counter subsystem to a referenced model.

Copyright 1990-2020 The MathWorks, Inc.

The `sldemo_mdref_conversion` model contains an atomic subsystem named `Bus Counter` that models a counter algorithm.

The subsystem interface uses In Bus Element and Out Bus Element blocks to pass a virtual bus into and out of the subsystem. The virtual buses inherit their data types. To more strongly define the interface of the new model after conversion, create `Simulink.Bus` objects and use them as the data types of the buses.

Interactively Convert Subsystem to Referenced Model

Use the Model Reference Conversion Advisor to interactively convert the subsystem. Select a Subsystem block, then on the **Subsystem Block** tab, select **Convert > Model Block**. In the Model Reference Conversion Advisor, set **New model name** to `sldemo_bus_counter`, then click **Convert**.

You can also open the Model Reference Conversion Advisor by setting `'UseConversionAdvisor'` to `'true'` when calling the `Simulink.SubSystem.convertToModelReference` function.

Programmatically Convert Subsystem to Referenced Model

Use the `Simulink.SubSystem.convertToModelReference` function to programmatically convert the atomic subsystem to a referenced model. To convert the Bus Counter subsystem to a referenced model named `sldemo_bus_counter` and to replace the Subsystem block with a Model block that references the new model, enter this command in the MATLAB® Command Window:

```
Simulink.SubSystem.convertToModelReference(...  
    'sldemo_mdref_conversion/Bus Counter', ...  
    'sldemo_bus_counter', ...  
    'ReplaceSubsystem', true);
```

Alternatively, double-click the blue block, which uses an `OpenFcn` block callback to execute this command.

Using Data Stores Across Multiple Models

This example shows how to use and log local data stores. It also shows how to define, use and log global data stores to share global data among referenced models.

Open the Example Models

Open the example models. The top model `sldemo_mdhref_dsm` references models `sldemo_mdhref_dsm_bot` and `sldemo_mdhref_dsm_bot2`. Logging of data stores is turned on for `sldemo_mdhref_dsm` on the Data Import/Export pane of the Configuration Parameters dialog box.

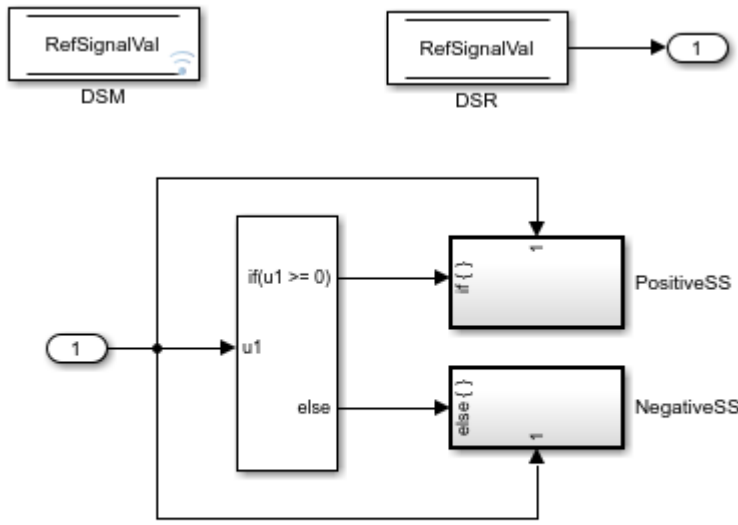

Reference model `sldemo_mdhref_dsm_bot` amplifies the incoming signal by 5 if the signal is positive or by 2 if the signal is negative and writes the value of this signal to local data store `RefSignalVal`. This local data store is configured to log all written values to the workspace after simulation. The logging parameters for this local data store are controlled by the **Logging** tab of the block parameters dialog.

Reference model `sldemo_mdhref_dsm_bot2` sets the value of a global boolean data store named `ErrorCond` to true if the value of its incoming signal is outside of the range $(-0.8, 0.8)$. The top model also monitors the data store `ErrorCond` and switches between the outputs of the two referenced models, depending on the value of that data store.

Using Data Stores Across Multiple Models

Copyright 1990-2013 The MathWorks, Inc.

Copyright 1990-2013 The MathWorks, Inc.

Copyright 1990-2013 The MathWorks, Inc.

Copyright 1990-2013 The MathWorks, Inc.

Copyright 1990-2013 The MathWorks, Inc.

Define a Global Data Store Using a Simulink® Signal Object

To specify to Simulink that the top model and both of the referenced models use the same memory for the data store named `ErrorCond` in each model, create an instance of a `Simulink.Signal` object named `ErrorCond` in a workspace or data dictionary that is visible to each model. Since this object is visible to each model, its scope encompasses the individual models and implies that there is one global data store of that name that is shared among the models. Note that none of the three models contains a Data Store Memory block with a data store name of `ErrorCond`. If any model contained such a block, that block would define a data store local to the model, which would shadow the global data store.

Since the object `ErrorCond` defines a global data store, it must explicitly define the `DataType`, `Complexity`, and `Dimensions` properties to non-inherited settings. `SampleTime` and `StorageClass` may be left as their inherited values, or explicitly set.

The example includes a MAT-file named `sldemo_mdref_dsm_data.mat` that contains the `Simulink.Signal` object `ErrorCond`. The preload function of the model `sldemo_mdref_dsm` loads this MAT-file causing the object to be loaded in the base workspace. You can view this object by selecting the base workspace in the Model Explorer. You can also create this object from the MATLAB® command prompt. The following commands define the object used in this example:

```
ErrorCond = Simulink.Signal;
ErrorCond.Description = 'Use to signal that subsystem output is invalid';
ErrorCond.DataType = 'boolean';
ErrorCond.Complexity = 'real';
ErrorCond.Dimensions = 1;
ErrorCond.SampleTime = 0.1;
ErrorCond.LoggingInfo.DataLogging = true;
```

Logging a Global Data Store

To log all the values written to the global data store, set the `DataLogging` property of the `LoggingInfo` property of the `Simulink.Signal` object. The `LoggingInfo` property also allows specification of other logging parameters such as decimation and maximum points.

```
Simulink.LoggingInfo (handle)
  DataLogging: 1
  NameMode: 0
  LoggingName: ''
  DecimateData: 0
  Decimation: 2
  LimitDataPoints: 0
  MaxPoints: 5000
```

Simulate the Model

Now you can simulate `sldemo_mdhref_dsm` to see the output. The reference model `sldemo_mdhref_dsm_bot` writes to the data store `ErrorCond` while the top model `sldemo_mdhref_dsm` reads from the data store. The blue line represents the input to `sldemo_mdhref_dsm_bot`; the green line represents the output of the Switch block. Note that the output switches when the magnitude of the input signal falls outside of the range.

View Logged Results

Both the global data store `ErrorCond` and the local data store `RefSignalVal` are configured to log all written values after simulation. These logged results are stored in the base workspace in the `dsmout` variable.

```
dsmout =
```

```
Simulink.SimulationData.Dataset 'dsmout' with 2 elements
```

	Name	BlockPath
1	[1x1 DataStoreMemory] ErrorCond	''
2	[1x1 DataStoreMemory] RefSignalVal	...dhref_dsm/A/sldemo_mdhref_dsm_bot/DSM

- Use braces `{ }` to access, modify, or add elements using index.

To access the data stored for the local data store, use the `getElement` function to get the correct data store element based on the name `RefSignalVal`.

```
>> dsmout.getElement('RefSignalVal')

Simulink.SimulationData.DataStoreMemory
Package: Simulink.SimulationData

Properties:
    Name: 'RefSignalVal'
    BlockPath: [1x1 Simulink.SimulationData.BlockPath]
    Scope: 'local'
    DSMWriterBlockPaths: [1x2 Simulink.SimulationData.BlockPath]
    DSMWriters: [101x1 uint32]
    Values: [1x1 timeseries]
```

Data is stored in a `timeseries` within the `Values` field.

```
>> plot(dsmout.getElement('RefSignalVal').Values);
```

To determine which block wrote to the data store at a given time, use the `DSMWriters` property. This array contains a list of indices into the `DSMWriterBlockPaths` array. For example, the block path of the Data Store Write block that wrote the 5th value to the data store can be obtained as follows:

```
>> dsm = dsmout.getElement('RefSignalVal');
>> dsm.DSMWriterBlockPaths(dsm.DSMWriters(5))
```

```
Simulink.SimulationData.BlockPath  
Package: Simulink.SimulationData
```

```
Block Path:  
  'sldemo_mdref_dsm/A'  
  'sldemo_mdref_dsm_bot/PositiveSS/DSW'
```

Use the `getBlock` method to access block path character vectors from this object.

Model Reference Function-Call

This example shows how to use a Model block that is explicitly triggered by means of its function-call trigger port.

Examine Example Model

Open the example model.

Copyright 1990-2014 The MathWorks, Inc.

This model contains three Model blocks: 500ms Counter, 1 sec Counter and Asynchronous Counter. These blocks reference the same model (`sldemo_mdref_fcncall_cntr`). The Model blocks represent saturating counters that increment their output values by one each time they are explicitly triggered through their function-call trigger ports. The Stateflow® chart calls each Model block at its specified rate.

Simulate Model and Examine Results

Simulate the model, and verify the behavior of the counters by examining the results displayed by the scope.

Explore Protected Model Capabilities

This example shows how to create a protected model and use it in normal mode simulation, accelerator mode simulation, and code generation.

To create protected models, you must have Simulink® Coder™ installed. To generate the read-only view of protected models, you must have Simulink® Report Generator™ installed.

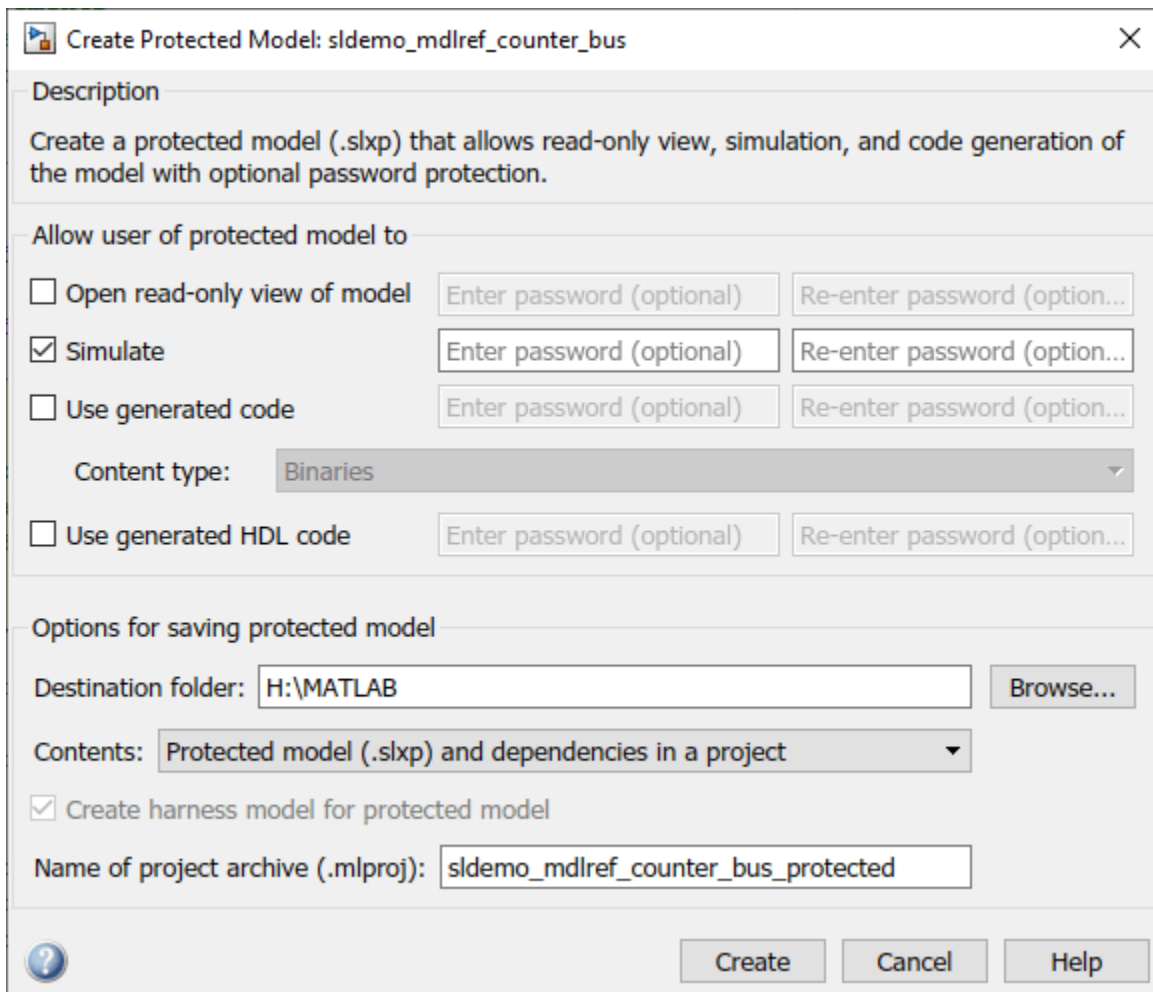

Open the Example Model

Open and simulate the example model `sldemo_mdref_bus`.

Protect the Referenced Model

The example model contains one Model block named CounterA. To protect the model referenced by this block, select the Model block and click **Protect** on the **Model Block** tab in the toolstrip. A dialog box opens where you can select options for creating a protected model.

Under **Allow user of protected model to**, select **Open read-only view of model**, **Simulate**, and **Use generated code**. To password-protect these actions, you can enter a unique password for each action. Then, click **Create**.

A project archive for the protected model, `sldemo_mdhref_counter_bus_protected.mlproj`, is generated in the specified destination folder.

Double-click the project archive in the **Current Folder** browser to open the corresponding project that contains the protected model (`sldemo_mdhref_counter_bus.slxp`). The project also contains a harness model that provides an isolated environment for the protected model and a data dictionary that defines the variables used by the protected model.

You can use the protected model in normal mode simulation, accelerator mode simulation, and code generation. You can also open a read-only view of the model. The original model file is not required.

Use the Protected Model

When a Model block references a protected model, the block displays a shield badge.

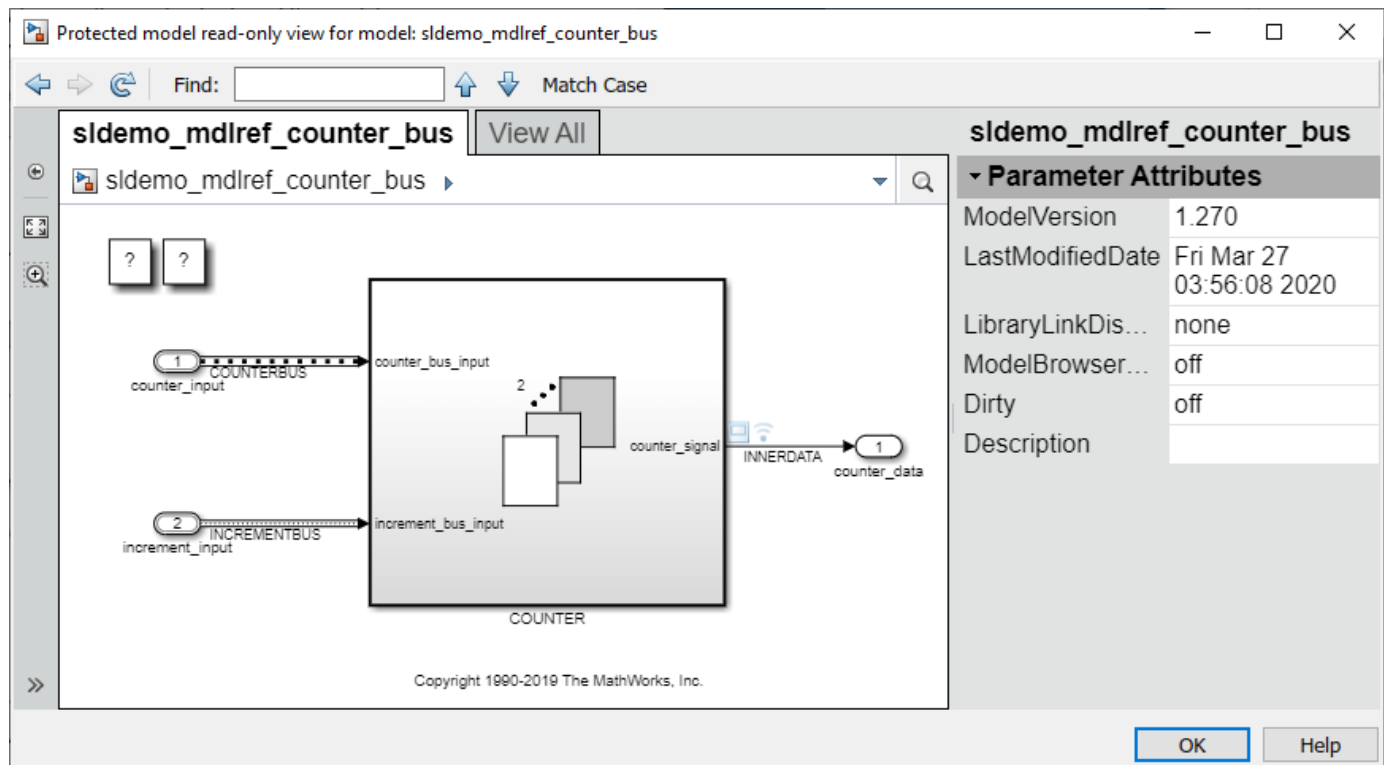

To enable password-protected functionality, right-click the shield badge and select **Authorize**. Enter the passwords you set while creating the protected model.

The screenshot shows a dialog box titled 'Password entry for model: 'sldemo_mdiref_counter_bus''. The dialog has a close button (X) in the top right corner. The main text reads: 'A password protected model 'sldemo_mdiref_counter_bus' is used in the current model reference hierarchy. Authorization is needed to proceed with the requested actions.' Below this text, there are three rows, each with a label on the left and an input field on the right. The labels are 'Model view', 'Simulation', and 'Code generation'. Each input field contains the text 'Enter password'. At the bottom right of the dialog, there are two buttons: 'OK' and 'Cancel'.

After entering the passwords, you can simulate the model in either normal or accelerator mode. You can also generate code for the top model.

To open a read-only view of the protected model, double-click the Model block or right-click the shield badge and select **Show Webview**.

To open the protected model report, right-click the shield badge and select **Display Report**.

The screenshot shows a window titled "Protected Model report" with a search bar and "Match Case" option. The main content area displays a "Summary for sldemo_mdref_counter_bus" with two sections: "Environment" and "Supported functionality".

Model Reference Variants

This example shows how to use model reference variants. A Model block is used to reference one Simulink® model from another Simulink model. A Variant Subsystem block can contain Model blocks as variants. A *variant* describes one of N possible modes in which a Variant Subsystem block can operate. Each variant references a specific model with its associated model-specific arguments. For a given Variant Subsystem block, only one variant is active during simulation. You can switch the active variant by changing the values of variables in the base workspace or by manually overriding variant selection using the Variant Subsystem block dialog box.

Switching Active Variants

The `sldemo_mdref_variants` model contains a Variant Subsystem block named Controller that references two models.

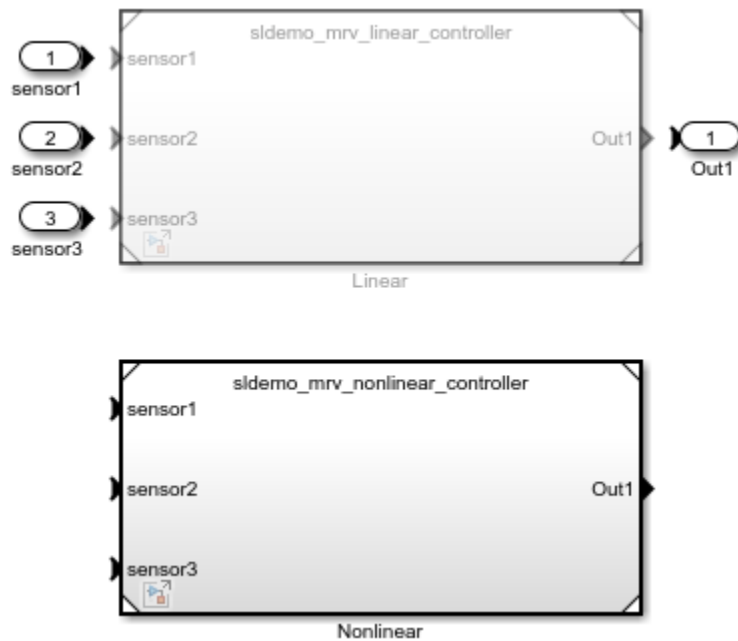

```
open_system('sldemo_mdref_variants')
```

Copyright 2009-2020 The MathWorks, Inc.

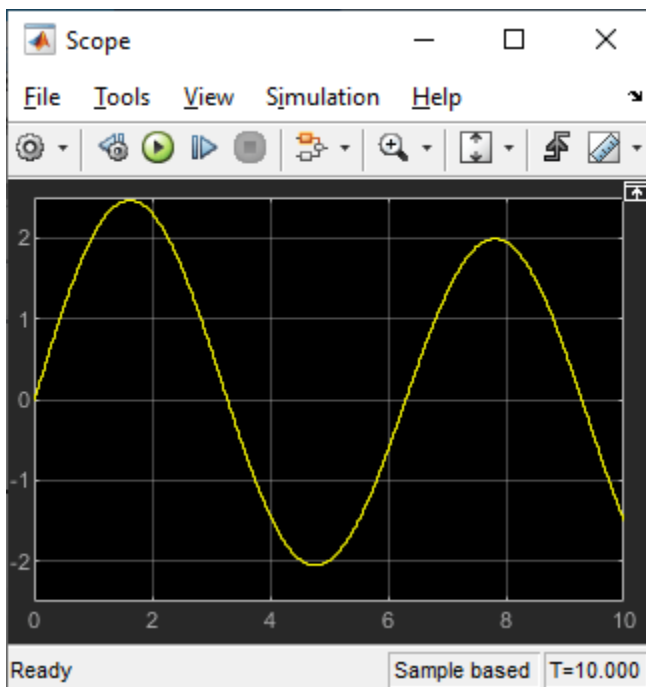

To see the variant choices, right-click the Variant Subsystem block named Controller and select **Block Parameters (Subsystem)**. The active variant is determined by the value of the CTRL variable in the MATLAB® base workspace. Defining CTRL=1 activates the Model block named Linear, and defining CTRL=2 activates the Model block named Nonlinear.

Opening the `sldemo_mdref_variants` model runs the **PreLoadFcn** model callback, which sets CTRL to 2.

To simulate using the linear controller, define CTRL=1 in the base workspace, then simulate the model.

```
CTRL=1;
sim('sldemo_mdlref_variants');
```

To simulate using the nonlinear controller, define CTRL=2 in the base workspace, then simulate the model.

```
CTRL=2;
sim('sldemo_mdref_variants');
```

Enumerations and Reuse

The `sldemo_mdref_variants_enum` model demonstrates `Simulink.Variant` object capabilities:

- **Enumerations:** MATLAB enumeration classes can be used to improve the readability of the conditions of the `Variant` object.
- **Reuse:** `Variant` objects can be reused in different `Variant Subsystem` blocks.

The `Variant Subsystem` blocks in this model require the following variables be defined in the MATLAB base workspace:

- `VE_LINEAR_CONTROLLER = Simulink.Variant('E_CTRL==sldemo_mrv_CONTROLLER_TYPE.LINEAR')`
- `VE_NONLINEAR_CONTROLLER = Simulink.Variant('E_CTRL==sldemo_mrv_CONTROLLER_TYPE.NONLINEAR')`
- `E_CTRL = sldemo_mrv_CONTROLLER_TYPE.LINEAR`
- `VE_PROTOTYPE = Simulink.Variant('E_CURRENT_BUILD==sldemo_mrv_BUILD_TYPE.PROTOTYPE')`
- `VE_PRODUCTION = Simulink.Variant('E_CURRENT_BUILD==sldemo_mrv_BUILD_TYPE.PRODUCTION')`
- `E_CURRENT_BUILD = sldemo_mrv_BUILD_TYPE.PRODUCTION`

Each variant is associated with a `Simulink.Variant` object that uses either the `sldemo_mrv_BUILD_TYPE.m` or `sldemo_mrv_CONTROLLER_TYPE.m` enumeration class.

The `Variant` objects have a `Condition` property that is an expression. The expression evaluates to a Boolean and determines which variant is active. The expression can consist of scalar variables,

enumerations, equality, inequality, &&, ||, and ~. Parenthesis () can be used for precedence grouping. Variables may be standard MATLAB variables or Simulink.Parameter objects.

Opening the model `sldemo_mdref_variants_enum` runs the **PreLoadFcn** model callback. This callback is set up to populate the base workspace with the variables required by the Variant Subsystem blocks.

```
open_system('sldemo_mdref_variants_enum')
```

Copyright 2009-2017 The MathWorks, Inc.

The `VE_PROTOTYPE` and `VE_PRODUCTION` Variant objects are reused across the Variant Subsystem blocks named Filter1, Filter2, and Filter3.

The Block Parameters dialog box of the Variant Subsystem blocks show the **Condition** property of the related Variant objects.

Assigning Tasks to Cores for Multicore Programming

This example shows how to take advantage of executing code on a multicore processor by graphical partitioning. This example requires Simulink Coder™ to generate multithreaded code.

Introduction

Multicore programming allows you to make use of the processing power of modern multicore processors to create high-performance applications. Simulink™ allows you to take advantage of multicore programming by allowing you to graphically partition your algorithms and to assign the code generated from those partitions to parallel threads on your multicore processor.

The parallel threads are typically scheduled by an operating system, assigning threads to cores dynamically. This allows the scheduler to make good use of the cores while providing a notion of fairness. However, in many applications, you may need additional control on how the cores are used or you may want to dedicate a set of cores to specific logic, for example to improve determinism. This level of control is achievable through graphical partitioning and is illustrated in this example.

Try the Example

A typical situation for multicore consists of a multi-rate model for which you want to assign code for the fast rates to one core and the code for the slower rates to other cores. This may allow you to add more logic to these faster rates or to achieve more determinism. More generally, you may want to dedicate cores to application logic with the greatest demand on resources. To begin, open the multicore project:

slexMulticoreExample

Copyright 2015 The MathWorks, Inc.

Generate Code and Profile Report (Double-Click)

Generate Multithreaded Code

This application model is already partitioned into four concurrent tasks through the Concurrent Execution dialog which you may access from the Solvers pane of the model's Configuration Parameters. Use this dialog to specify logic, task and core assignments. In this example, we have partitioned the application logic as:

Name	TriggerType	Period
Block: Fc1		
Core1:Task1	Periodic	.1
Block: Fc2		
Core2:Task4	Periodic	.4
Core2:Task3	Periodic	.2
Block: Fc3		
Core1:Task2	Periodic	.1

Double-click on the 'Generate Code and Profile Report' button to generate multi-threaded code, and profile its execution. This action runs and instruments the generated executable and produces both profiling results and a core occupancy map, the latter illustrated below. The illustration shows how the cores were utilized at each time step of execution. In this example, the first core was used for the fast rates (Task1 and Task2) and the second core was used for the slower rates (Task3 and Task4).

You may go back to the Concurrent Execution dialog to try out different core assignments. In particular, you may try to specify no core affinity by leaving the 'Affinity' property as '[]'. This is the default setting which allows Simulink™ to generate multi-threaded code suitable for dynamic scheduling on your multicore processor.

Clock Tick / Task	0	10																		19
Task1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Task2	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Task3	1	NR	1	NR	1	NR	1	NR	1	NR	1	NR	1	NR	1	NR	1	NR	1	NR
Task4	1	NR	NR	NR	1	NR	NR	NR	1	NR	NR	NR	1	NR	NR	NR	1	NR	NR	NR

Implement an FFT on a Multicore Processor and an FPGA

This example shows you how to take advantage of a multicore processor target with FPGA acceleration by graphically partitioning a model. This example requires Simulink Coder™ to generate multi-threaded code and HDL Coder™ to generate HDL code. You cannot generate HDL code on Macintosh systems.

Introduction

Several modern processors include multicore processors integrated with FPGA components to create high-performance applications. These require multicore and FPGA programming, including programming of parallel threads, HDL, and communication interfaces between the cores of the system. Simulink™ allows you to take advantage of these approaches by graphically partitioning your algorithms and by assigning the software generated from those partitions to threads on your processor and to modules on your FPGA. The example uses one application level model to generate one executable, consisting of multiple threads and HDL code, to take advantage of the hardware parallelism of the FPGA. This is illustrated in the figure below.

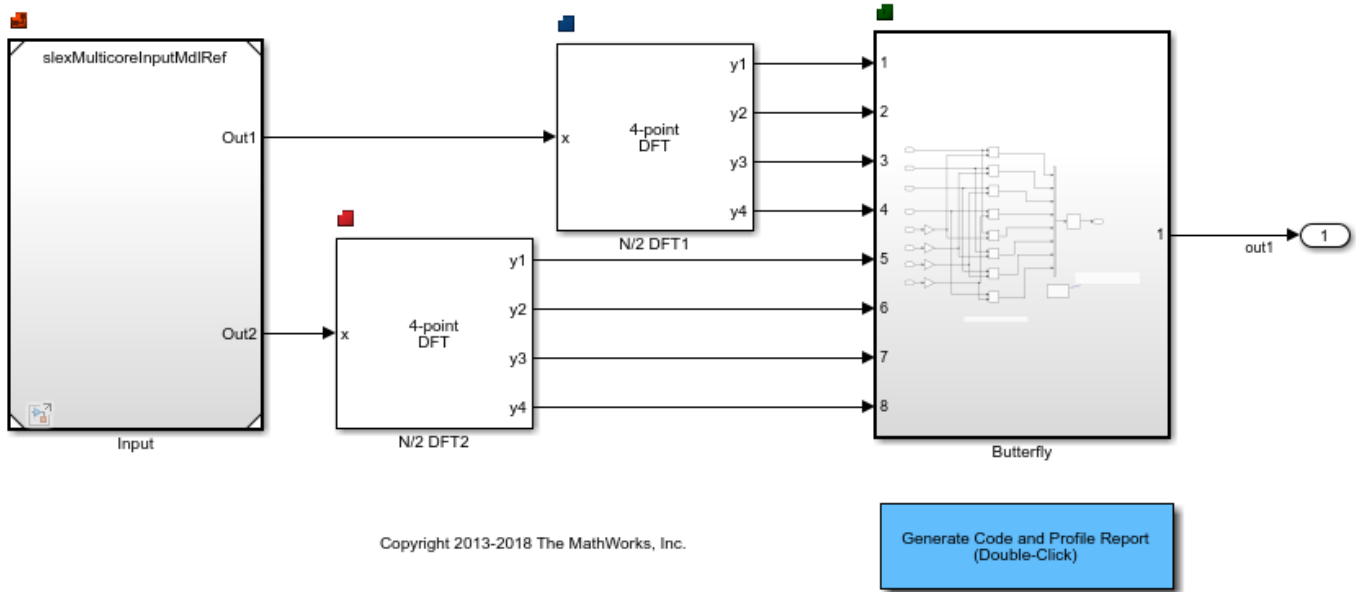

Example Model

Load the example model:

```
slexMulticoreFPGAExample
```

Implement an FFT on a Multicore Processor and an FPGA

Architecture Definition

All concurrent execution settings for this model can be accessed in the Concurrent Execution dialog box (Configuration Parameters>Solvers>Configure Tasks).

The first step to implement our algorithm is to define structural elements of our target architecture. This includes structural elements of the hardware, such as the number and type of processing nodes (CPU, FPGA) and the communication channels (AXI, PCI).

This also includes software settings in the model's Configuration Parameters (e.g. System Target File, hardware Implementation, data transfer settings). In this example we have selected the pre-configured target architecture 'Sample architecture'. This architecture uses your desktop as a stand-in for the deployment process.

Partitioning and Mapping the Model

Partition the model to decide which functions run sequentially and which run concurrently.

The example model is partitioned explicitly, consisting of MATLAB System blocks, a Model block, an Atomic Subsystem and an Outport block. Explicit partitioning creates partitions based on these blocks at the root-level of the model. Implicit partitioning, on the other hand, creates partitions based on the block sample times and other scheduling constraints.

After partitioning the model, you can map partitions to CPU tasks and FPGA nodes. You can change the mapping for design space exploration, through the GUI or the API. During mapping, signals will be auto-mapped to channels.

You can change how the blocks are mapped to the threads and to the FPGA in the Concurrent Execution dialog box. For more information, see “Optimize and Deploy on a Multicore Target”.

Map blocks to tasks

Refresh mapping table (*invokes update diagram) 

Name	TriggerType	Period	Autogenerated
Block: Butterfly			
 Butterfly	Periodic	0.2	No
Block: Input			
 FPGA2	FPGA		No
Block: N//2 DFT1			
 DFT:DFT1	Periodic	.2	No
Block: N//2 DFT2			
 DFT:DFT2	Periodic	.2	No

Generate Multithreaded and HDL Code

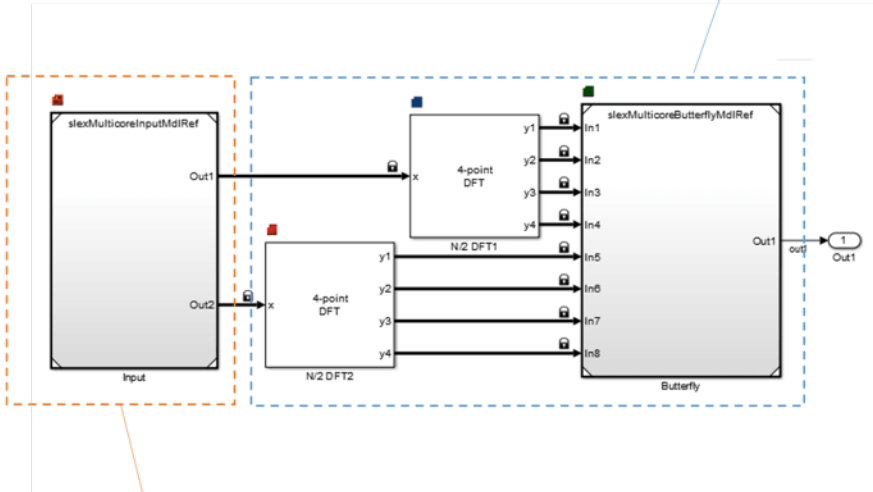

Double-click on the 'Generate Code and Profile Report' button to generate multithreaded code. In this example, the host computer replaces the target environment. C code is generated for blocks mapped to processor tasks. This code is organized using threads native to the desktop machine. The code snippet shows how threads are created. In addition, HDL code is generated for blocks mapped to hardware nodes. The code snippet below illustrates how the module/entity is created in VHDL.

Host
Computer
Code

```
int main(int argc, char *argv[])
{
    /* Create periodic threads */
    for (i = 0; i < 2; i++) {
        periodicThread[i].index = (int_T) i;
        periodicThread[i].exitFlag = 0;

        /* Create the events that will be used by the thread */
        periodicThread[i].startEvent = CreateEvent(NULL, false, false, NULL);
        periodicThread[i].stopEvent = CreateEvent(NULL, false, true, NULL);

        /* Create the thread in suspended mode */
        periodicThread[i].threadHandle = (HANDLE) beginthreadex(NULL, 0,
            &periodicTask, &periodicThread[i], CREATE_SUSPENDED, &periodicThread[i].
            threadID);
    }
}
```

VHDL

Multicore Programming of a Field-Oriented Control on Zynq

This example demonstrates how to implement a control algorithm containing multiple rates on Zynq. To take advantage of both the cores and the FPGA hardware, the example uses graphical partitioning approach such that code from different partitions are distributed across the cores and the hardware.

Introduction

In this example, we show a workflow for generating code for a motor control algorithm, and testing the generated code on a Xilinx® Zynq™-7000 SoC ZC702 evaluation board. The motor control algorithm in the example is a Field-Oriented Control algorithm composed of a speed controller (fast component) and a torque controller (slow component). One typical workflow is to generate code for these two components of the controller, upload the generated code to an evaluation board, and then connect the evaluation board to a real-world motor. This workflow is illustrated in the block diagram below.

In order for this example to be self-contained, and since there is redundant computer power on the target processor, we model the motor using one of the tasks of the CPU of the evaluation board.

The example assumes that a Xilinx® Zynq™-7000 SoC ZC702 evaluation board is connected to your computer. You can find the connection and installation steps in the “Install Support for Xilinx Zynq Platform” (Embedded Coder Support Package for Xilinx Zynq Platform) documentation.

This example requires Embedded Coder™ to generate multi-threaded code, HDL Coder™ to generate HDL code, and Simscape Power Systems™ to model the permanent magnet synchronous machine in the example. You cannot generate HDL code on Macintosh systems.

Example Model

The example model consists of two Simulink areas. In the Permanent Magnet Synchronous Machine area, there are two blocks: "Speed and Torque Inputs" block which provides the reference inputs to the feedback system, and "Invertor and Motor" block which is the plant we aim to control in this example. The "Invertor and Motor" block also contains peripherals: a scope that can be used for investigating the simulation results and a UDP sender. The generated code for the UDP sender is responsible for sending the simulation data from the Zynq ZC702 evaluation board to the host machine. The Field-Oriented Control contains the controller blocks "Speed controller" and "Torque controller". To load the model, enter

```
slexFocZynqExample
```

Multicore Programming of a Field-Oriented Control on Zynq

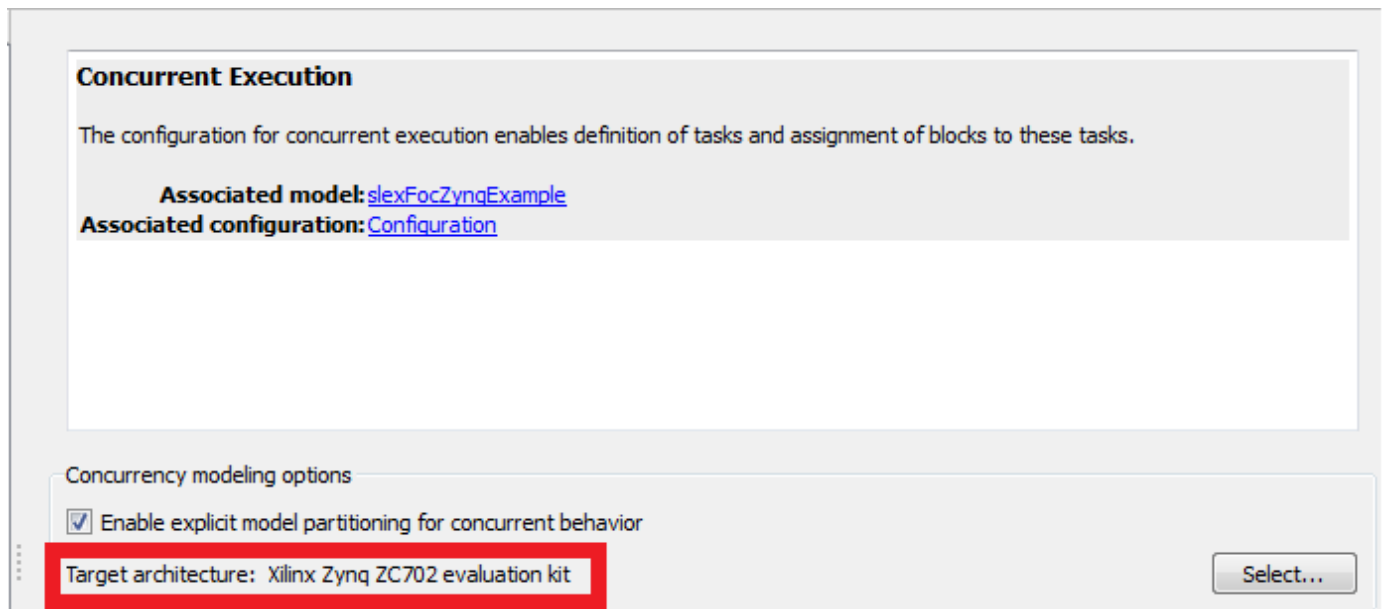

Copyright 2015 - 2020 The MathWorks, Inc.

Architecture Definition

The target architecture in the example is Xilinx Zynq ZC702 evaluation kit. This can be verified by accessing the **Concurrent Execution** dialog box.

In the **Modeling** tab, select **Model Settings**. In the **Model Configuration Parameters** dialog box, on the **Solver** tab, select **Allow tasks to execute concurrently on target**, then click **Configure Tasks**.

The evaluation board has an ARM Cortex-A9 CPU and a field-programmable gate array (FPGA). There are two tasks running on the ARM CPU. The "Torque controller" is mapped to the first task and the blocks that constitute the plant ("Speed and Torque Inputs" block and "Invertor and Motor") are mapped to the second task. The "Speed controller", which operates at high frequency in the control loop, is mapped to the FPGA. These settings can be changed in the "Tasks and Mapping" section of the "Concurrent Execution" dialog box.

Generate Multi-threaded and HDL Code

Enter Ctrl-B or select **Deploy to Hardware** to generate the multi-threaded and HDL code. The generated executable and the FPGA bitstream will be uploaded to Zynq board automatically. This step requires that the Zynq board is connected to the computer and that the environment is set up

properly. For more information, see “Install Support for Xilinx Zynq Platform” (Embedded Coder Support Package for Xilinx Zynq Platform).

Receive Data from the Zynq

Open the scope by selecting **View Simulation Results**, and run the simulation to obtain the following output:

Compare this simulation output with the output of the executable that runs on the Zynq ZC702 board. In order to make this comparison, access the UDP receiver model by selecting **View Deployment Results**. When the UDP receiver model is selected, run the simulation. The run command will send a signal to the Zynq ZC702 board to start running the executable on the board. The simulation data will be sent via UDP from the Zynq ZC702 board to the host machine. The captured UDP signal is displayed on the scope of the UDP Receiver model.

Close the Model

```
close_system('slexFocZynqExample', 0);
```

Multicore Deployment of a Plant Model

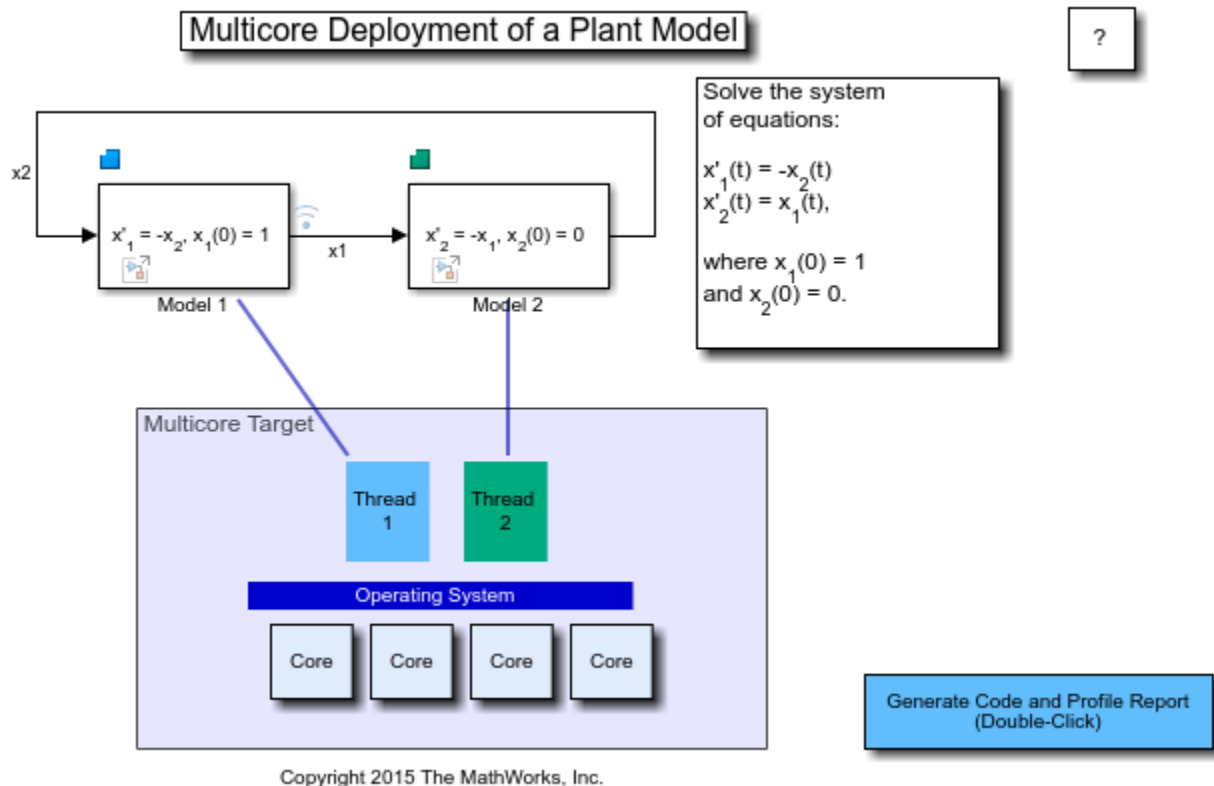

This example illustrates how to take advantage of executing multithreaded code on a multicore processor using graphical partitioning. This example requires Simulink® Coder™ to generate multithreaded code.

Overview

One objective of model-based design is to create realistic models of physical systems and to simulate these models in real-time, for example, to verify controllers using hardware-in-the-loop (HIL). However, as more features are added to the plant model, the computational requirements may exceed the resources available by single-core processing systems.

Partitioning the plant and controller into separate pieces is one way to address the computational needs of complex models. With Simulink® you can partition a plant using Model blocks and then assign the code generated by each sub-model to threads for real-time execution on an HIL system such as Simulink Real-Time™. To see how this works, let us use our host computer as a stand-in for the real-time execution environment and generate real-time multi-threaded code for the following model.

slexMulticoreSolverExample

Symmetric Multicore Processing

The illustration above shows that the code generated for the model is separated into two threads. In this example, the target is assumed to be a Symmetric Multicore Processor, so that the threads are

not associated with any particular core. The operating system is responsible for making the best use of the cores when scheduling thread execution. Ideally, to provide maximum flexibility, the number of threads (Nt) should be greater than the number of cores (Nc). Double-click on the 'Generate Code and Profile Report' button to generate multi-threaded code, profile its execution and visualize the results. The visualization shows a core occupancy map of how the cores were utilized at each time step of execution. It can be seen that the threads float across cores as deemed best by the operating system scheduler. This kind of scheduling is good when the operating system also needs to run other processes.

Clock Tick / Task	0	10	19
Thread1	14 6 6 12 12 14 12 12 12 4 4 0 0 4 6 8 14 10 10 12		
Thread2	10 2 0 0 0 0 14 14 14 2 2 14 14 2 2 0 0 0 14 4		

Thread Synchronization

Simulink® Coder™ generates code such that the two threads may execute simultaneously and possibly on two different cores. This means that the signal values for x_1 and x_2 must be synchronized between the two threads. Simulink® provides several options to handle this requirement as illustrated here:

Data Transfer Options

Defaults

- Periodic signals: Ensure deterministic transfer (maximum delay)
- Continuous signals: Ensure deterministic transfer (maximum delay)
- Extrapolation method: Ensure data integrity only
Ensure deterministic transfer (maximum delay)
- Automatically handle: Ensure deterministic transfer (minimum delay)

Using the script below, we will simulate and demonstrate the effect of the deterministic modes to understand how Simulink® handles synchronization.

- Reference solution (ode3) - Simulink® is configured to provide the reference solution by synchronizing data at each major and minor time step.
- Zero Order Hold - Each thread is solving a sub-system of equations using its own solver, while synchronizing data only on major time steps.
- Linear extrapolation - In addition to the Zero Order Hold mode, each solver extrapolates data using linear predictions to compensate for data latency errors.

For most systems where the synchronization points are smooth, the linear extrapolation mode provides a good tradeoff between communication bottlenecks and numerical accuracy.

```
h = figure;
hVal = ishold;
hold on;
mdl = 'slexMulticoreSolverExample';
dt = get_param(mdl, 'DataTransfer');

modes = { ...
    'Ensure deterministic transfer (minimum delay)', ...
    'None', 'k:', ...
    'Ensure deterministic transfer (maximum delay)', ...
    'Zero Order Hold', 'm', ...
    'Ensure deterministic transfer (maximum delay)', ...
    'Linear', 'b' ...
};

for i=1:3:length(modes)
dt.DefaultTransitionBetweenContTasks = modes{i};
dt.DefaultExtrapolationMethodBetweenContTasks = modes{i+1};
out = sim(mdl);
plot(out.logout.get('x1').Values.Time, ...
    out.logout.get('x1').Values.Data, ...
    modes{i+2});
end
```

```
legend('Reference solution (ode3)', ...  
      'Zero Order Hold Extrapolation', ...  
      'Linear Extrapolation');
```

Closing the Models

```
close_system('slexMulticoreSolverExample',0);  
close_system('slexMulticoreSolverMdlref',0);  
if ~hVal, hold off; end  
delete(h);
```

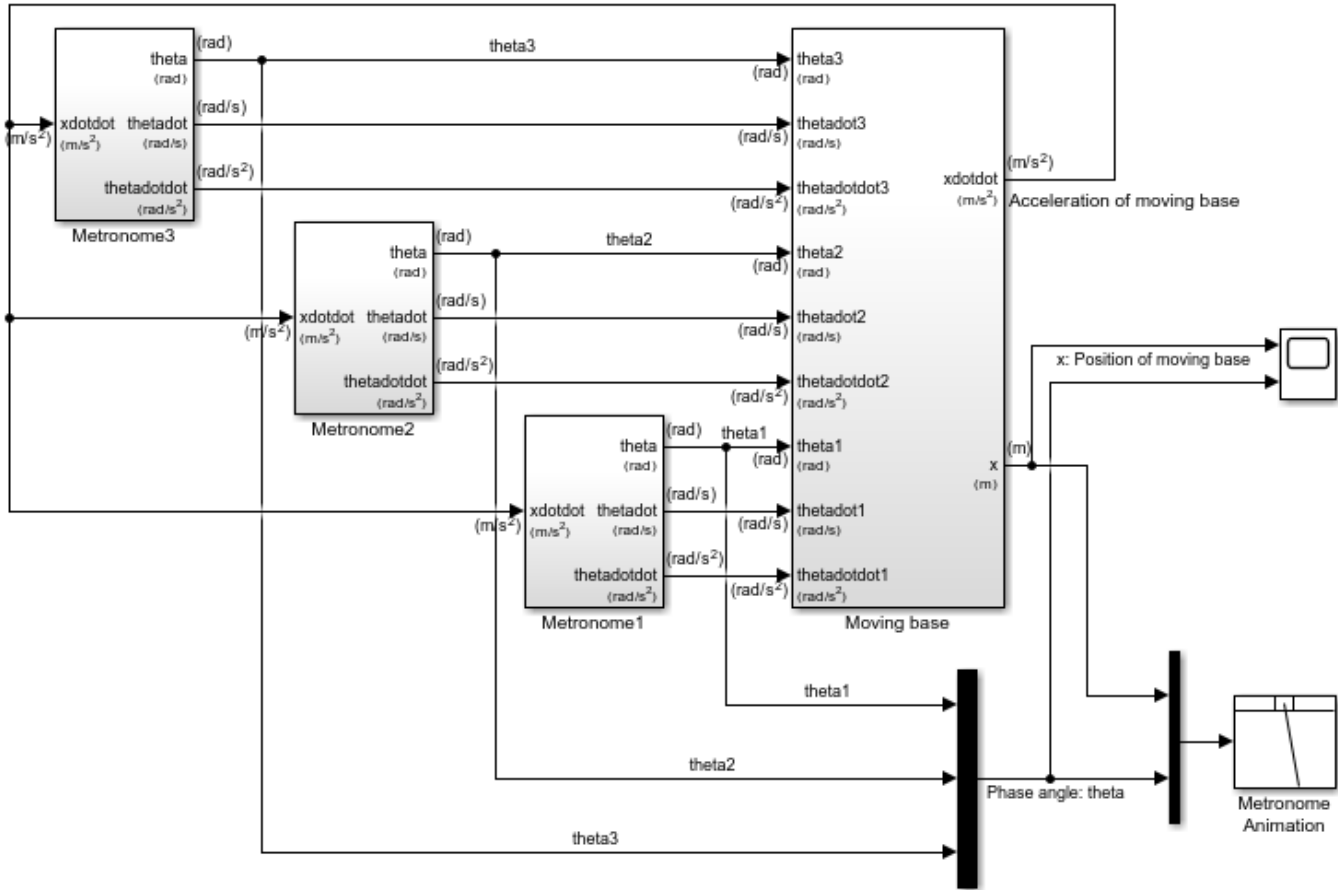

Modeling Objects with Identical Dynamics Using For Each Subsystem

This example shows how to model multiple objects with identical dynamics using the For Each subsystem. The number of objects is parameterized by the length of the input signal.

This example illustrates how you can implement the model `sldemo_metro_basic`, using one For Each subsystem to model three identical metronomes and another to model the identical effect that the motion of each metronome has on the moving base.

The continuous dynamics of the three identical metronomes in `sldemo_metro_basic` are modeled in identical subsystems: `sldemo_metro_basic/Metronome1`, `sldemo_metro_basic/Metronome2`, and `sldemo_metro_basic/Metronome3`. You can represent these three subsystems as one For Each subsystem. The initial position of the metronomes is passed in as a mask parameter to the For Each subsystem, and is used as an initial condition for one of the integrators. The For Each subsystem is configured to partition this parameter along the first dimension. As a result, an input vector with three elements defines the initial positions for the three metronomes.

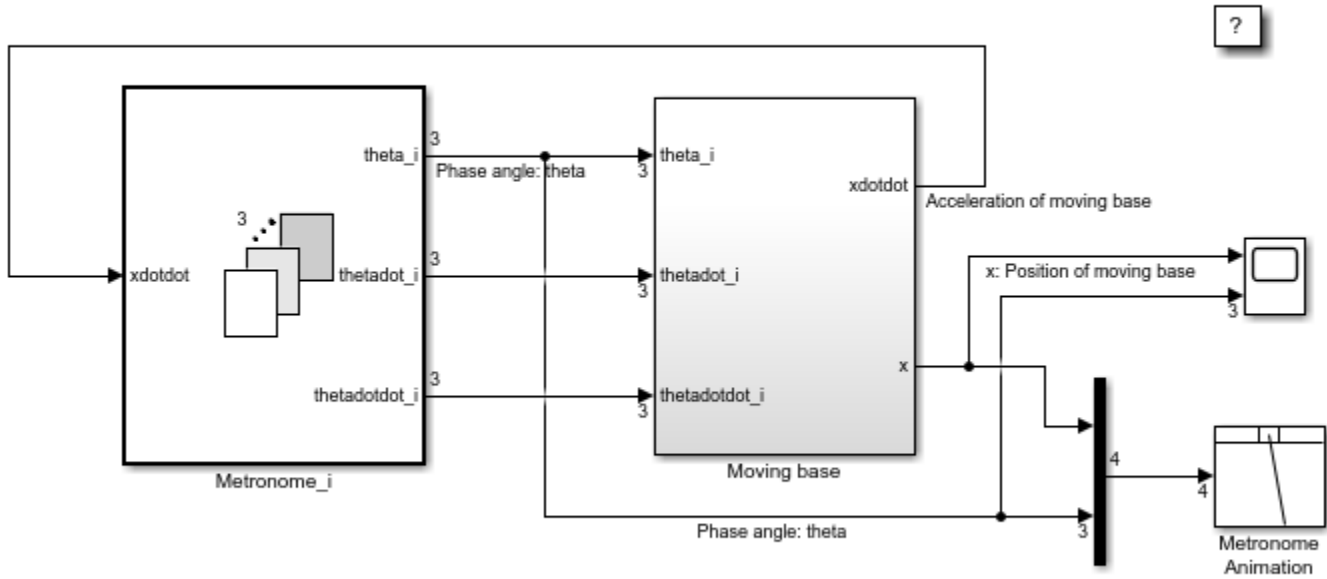

Exploring the Solver Jacobian Structure of a Model Base model for sldemo_metro_foreach

Figure 1: Metronomes modeled using three subsystems with identical dynamics

Modeling Objects with Identical Dynamics using For Each Subsystem

Copyright 2011-2014 The MathWorks, Inc.

Figure 2: Metronomes modeled using one For Each subsystem

On examining the dynamics of the moving base, note that it involves three identical second-order differential terms corresponding to each metronome. You can replace the three copies with one For Each Subsystem. Instead of nine input signals, the For Each subsystem requires only three input signals: the angular displacements, the angular velocities, and the angular accelerations for all metronomes. The For Each subsystem is configured to partition the input signal along the first dimension and operates on one element from each signal for one iteration (i.e. one metronome).

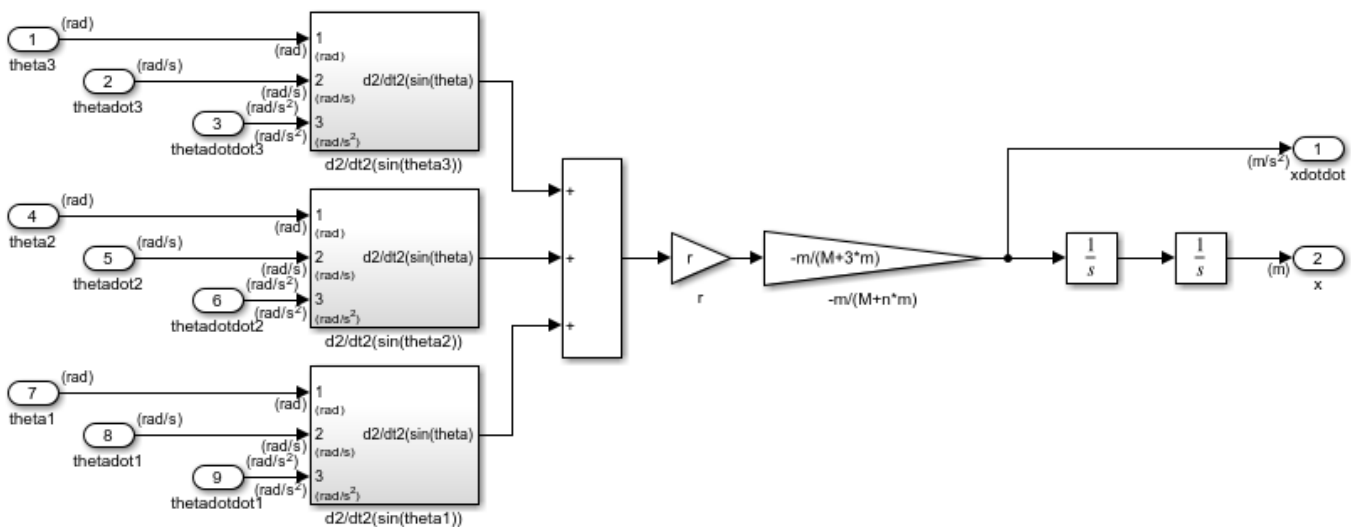

Figure 3: Second-order differential terms modeled using copies of the same subsystem

Figure 4: Second-order differential terms modeled using one For Each subsystem

After implementing the original model with two For Each subsystems, the model is now parameterized for the number of metronomes. To increase the number of metronomes, introduce a new value to the mask parameter.

For example:

Theta4 = 0.7568;

Double-click on the Metronome_i block to open the mask dialog and change Input Positions (Partitioned) to: [Theta1 Theta2 Theta3 Theta4]

Execute the model to see the displacement angles of the four metronomes and the position of the moving base.

```
sim('sldemo_metro_foreach');
```

Figure 5: Simulation animation with For Each subsystem parameterized for four metronomes

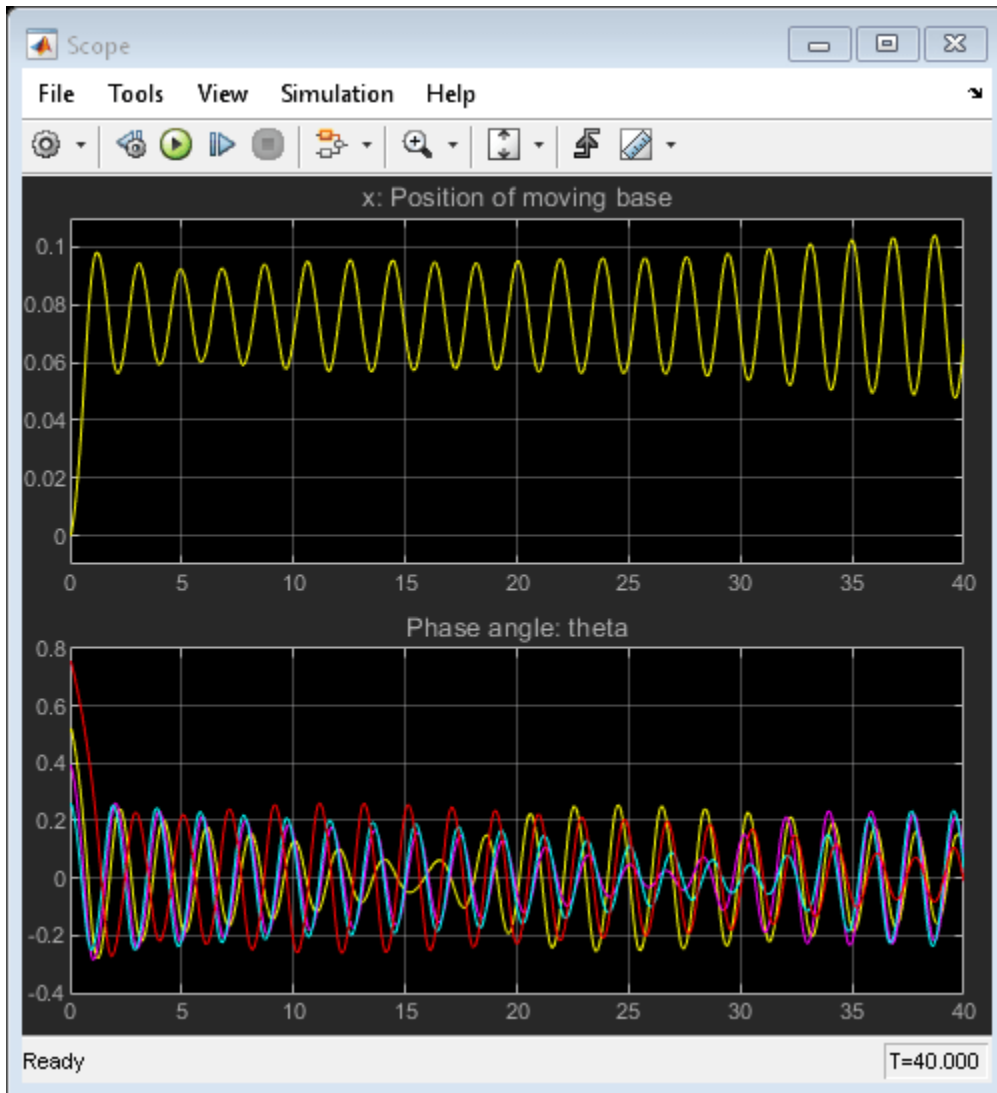

Figure 6: Simulation result with For Each subsystem parameterized for four metronomes

Vectorizing a Scalar Algorithm with a For Each Subsystem

This example shows how to use the For Each subsystem. In this example the operations are performed on a vector for simplicity.

Use the **Open Model** button to open the example model `sldemo_foreach_vectorized`. This model contains a For Each subsystem that processes the input signals one by one.

The inputs to the For Each subsystem are the signals to process, the coefficients of the FIR filter to use with each of these signals, and the common gain.

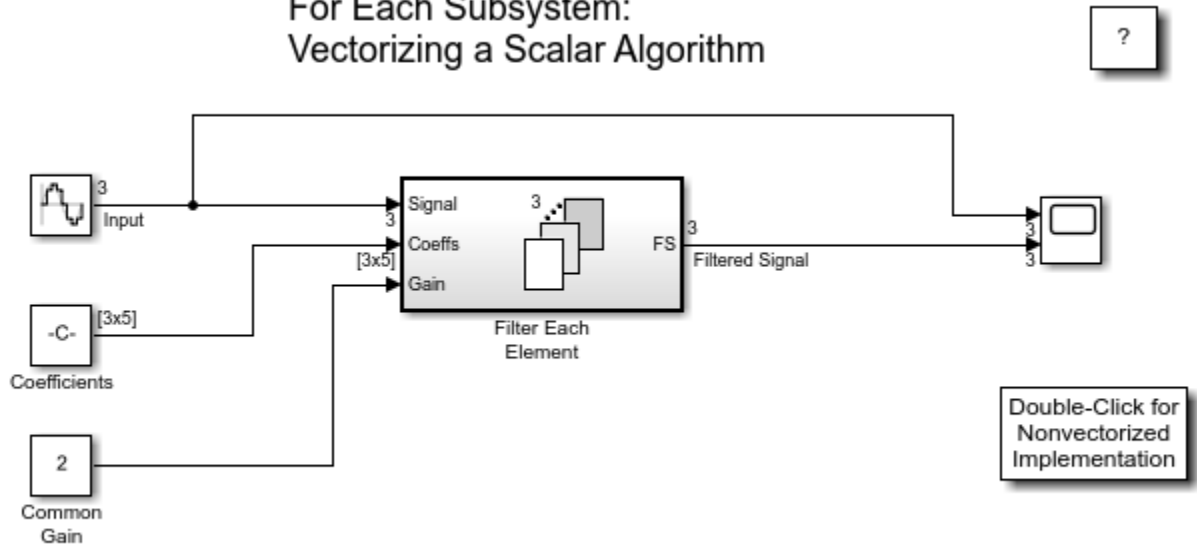

Each signal is scalar and needs to be processed individually. Consequently, the For Each block that controls the partition dimension is set to partition the input signal along dimension 1, by slicing through a partition width of 1. For each input signal, a corresponding set of coefficients must also be partitioned using the same criteria. The gain is common to all the signals, so this input is not partitioned.

Since the output signal dimension is expected to match the input signal dimension, the concatenation dimension is set equal to the partition dimension. If you prefer to change the signal dimension (a transpose in this case), you can choose 2 as the concatenation dimension.

For the For Each subsystem, you must set the partition dimension and width, but not the input signal size. A check then ensures that this size is a multiple of the partition width. If no error is detected, the subsystem then calculates the number of independent executions that the enclosed subsystem will perform. These executions are independent, in that the state associated with a given block contained in the subsystem has a unique value in each of the respective executions.

To see a non-vectorized implementation for this model, double-click on the block in the lower-right corner of the model. This implementation does not use the For Each subsystem, but mimics its functionality by replicating the subsystem as many times as necessary and also by selecting and concatenating the signals appropriately. This replication process is prone to error and is not scalable -- changing the input signal size would require changing the model accordingly.

For Each Subsystem: Vectorizing a Scalar Algorithm

Copyright 2009-2015 The MathWorks, Inc.

Tiled Processing of 2D Signals with For Each Subsystem

This example shows how to use the For Each Subsystem. In this example the operations are performed on matrices.

Open the example model `sldemo_foreach_tiled`. This model contains a For Each subsystem that processes submatrices of a matrix input signal.

To process submatrices of a matrix signal, you will need to use nested For Each subsystems. The outer subsystem can be used to partition the signal along the first dimension, while the inner one can be used to partition along the second dimension. This order is arbitrary, and can be changed without affecting the result.

In this example a 4-by-4 matrix is to be partitioned into 2-by-2 submatrices. The outer subsystem partitions the signal along the first dimension. The resulting subarrays are then partitioned by the inner subsystem along the second dimension. Concatenation of the outputs respects the partitioning order to preserve the shape of the input signal. Note, however, that the output dimensions change since the processing of the submatrices results in scalar outputs.

To see a tile repetition implementation for this model, double-click on the subsystem in the lower-right corner of the model window. This implementation does not use the For Each Subsystem. Instead, it mimics the functionality of the For Each Subsystem by replicating the subsystem as many times as necessary and by selecting and concatenating the signals appropriately. This replication process is prone to error and is not scalable -- changing the input signal size would require changing the model accordingly.

Neighborhood Processing Using For Each Subsystems

This example shows how to use the For Each Subsystem block to process submatrix data when neighboring submatrices overlap each other. To demonstrate this data processing approach, the example implements image edge detection with linear filters using the For Each Subsystem block. Each For Each Subsystem block has a For Each block that needs to be configured for partitioning and concatenation.

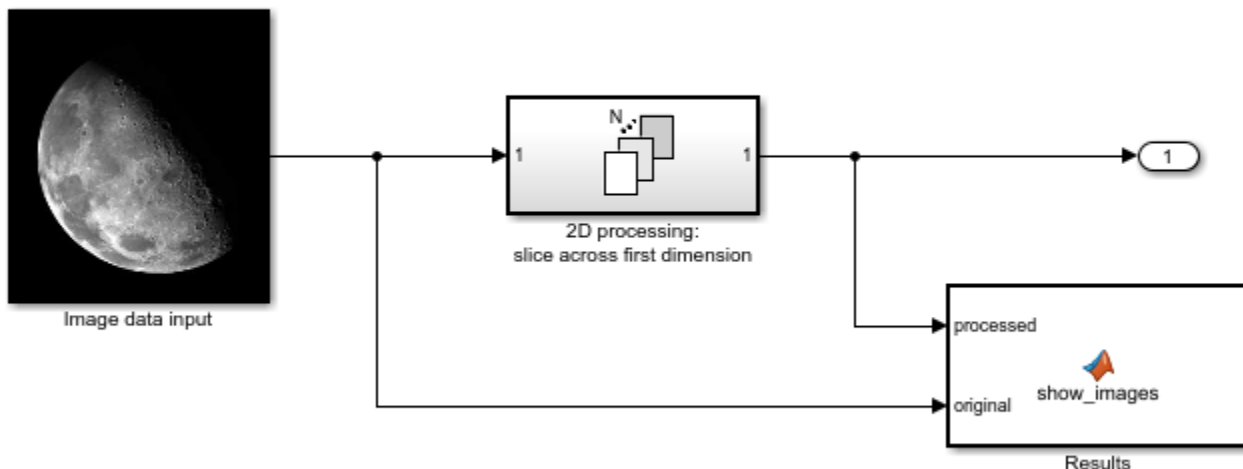

Open the example model `slxForEachOverlapExample`. This model uses a 3-by-3 kernel to implement the edge detection application for a given two-dimensional image. Because of the two-dimensional input signal, this example uses nested For Each subsystems.

- The outer For Each subsystem partitions the signal along the first dimension. The outer For Each block is configured to partition the input signal along dimension 1. The block specifies a partition width of 3 and a partition offset of -2. (A partition offset of -2 indicates that each slice overlaps its neighboring slices by 2 elements.)
- The inner For Each subsystem partitions the signal along the second dimension. The inner For Each block has the same settings as the outer For Each block, except that the inner block is set to partition and concatenate signals along dimension 2.

The partitioning order is arbitrary. To ensure correctness of the result, the concatenation order of the outputs follows the partitioning order.

For simplicity, this example does not handle data padding. As a result, the size of the output image is slightly smaller than that of the input image.

Neighborhood Processing Using For Each Subsystems: Image Edge Detection

The result of the comparison between the original image and the processed image is shown below.

Figure 1: Original image vs. processed image

Using a Project with SVN

This example shows how to use a project to manage the files within your design. Starting with an existing project that is already checked into source control, this example shows how to view modified files, compare file revisions, and analyze project dependencies.

Set Up the Example Files and Open the Project

Create and open a working copy of the project example files. MATLAB® copies the files to an example folder so that you can edit them. The example project is under Subversion (SVN) version control.

```
sldemo_slproject_airframe_svn
```

```
Building with 'MinGW64 Compiler (C)'.
MEX completed successfully.
```

```
ans =
```

```
Project with properties:
```

```

        Name: "Airframe Example"
SourceControlIntegration: "SVN (1.9)"
  RepositoryLocation: "file:///C:/workSpace/examples/repositories/airframe2/trunk"
SourceControlMessages: [1x0 string]
        ReadOnly: 0
        TopLevel: 1
  Dependencies: [1x1 digraph]
    Categories: [1x1 matlab.project.Category]
        Files: [1x30 matlab.project.ProjectFile]
    Shortcuts: [1x7 matlab.project.Shortcut]
    ProjectPath: [1x7 matlab.project.PathFolder]
ProjectReferences: [1x0 matlab.project.ProjectReference]
  StartupFiles: [1x0 string]
  ShutdownFiles: [1x0 string]
DefinitionFileType: FixedPathMultiFile
  Description: "This is an example project. Use the "Project Shortcuts" toolstrip
  RootFolder: "C:\workSpace\examples\airframe2"
SimulinkCodeGenFolder: "C:\workSpace\examples\airframe2\work\codegen"
SimulinkCacheFolder: "C:\workSpace\examples\airframe2\work\cache"
ProjectStartupFolder: "C:\workSpace\examples\airframe2"
```

Manage the Project Path

When you open your project, MATLAB adds the project path to the MATLAB search path before applying startup shortcuts.

When you close your project, MATLAB removes the project path from the MATLAB search path after applying shutdown shortcuts.

1. To add or remove folders to the project path, on the **Project** tab, in the **Environment** section, click **Project Path**:

- To add a folder (without subfolders) to the project path, click **Add Folder**. If you want to add a folder and its subfolders, click **Add with Subfolders** instead. Then use the Open dialog box to add the new folder.
- To remove a folder from the project path, from the display list, select the folder. Then click **Remove**.

It is important to add project files to the project path to ensure the Dependency Analyzer detects all project files.

Specify Project Details, Startup Folder, and Derived Files Folders

2. On the **Project** tab, in the **Environment** section, click **Details**. Use the Project Details dialog box to:

- Edit the project name or add a description.
- View the **Project root** folder. You can change your project root by moving your entire project on your file system, and reopening your project in its new location. All project file paths are stored as relative paths.

- View or edit the **Start Up** folder. By default, this is set to the project root. When you open the project, the current working folder changes to the project root folder. You can specify a different startup folder or click **Clear**.
- View or edit the **Simulation cache folder** and **Code generation folder**.

To change the default project root for new projects, on the MATLAB **Home** tab, in the **Environment** section, click **Preferences**. Select **MATLAB > Project** and specify the **Default folder**.

Automate Startup and Shutdown Tasks

You can set project files, such as MATLAB scripts and Simulink® models, to run, open, or close when the project opens or closes.

3. To configure an existing file to run on project startup and shutdown, or to specify environment options, click the **Startup Shutdown** button in the **Project** tab. In the Manage Project Startup and Shutdown dialog box

- Add or remove startup and shutdown files. If execution order is important, change the order using the arrow buttons.
- Use the check boxes to specify environment options. Select **Start Simulink before this project starts** to start Simulink when you open the project. Select **Refresh Simulink customizations** to run `sl_customization` files on project startup and shutdown.

Project Shortcuts for Common Tasks

Create project shortcuts for common tasks to make it easy to find and access important files and operations. For example, find and open top models, run code, and simulate models.

4. On the **Project Shortcuts** tab, this example project has shortcuts for the top-level model, a utility function to rebuild s-functions, and a design description document.

- Click the shortcut *F14 Model* to open the root model for this project.
- Click the shortcut *Rebuild Project's S-functions* to generate the S-Function.
- Click the **New Shortcut** button to create new shortcuts for a project file.
- Right-click a shortcut and select **Edit Shortcut** to edit a shortcut.

View Source Control Information

On the **Project** tab, in the **Source Control** section, click **SVN Details**.

5. Use the Source Control Information dialog box to:

- View the **Repository location** folder. You can change your project root by moving your entire project on your file system, and reopening your project in its new location. All project file paths are stored as relative paths.
- View or change the used source control integration.

Explore Files Views

6. In the **Files** view, select the **Project (number of files)** view to manage the files within your project. This view only shows files that are part of your project.

7. Use the **All** view to see all the files in your working copy. This shows all the files that are under the project root, not just the files that are in the project. This view is useful for adding files to your project from your working copy.

8. Use the **Modified (number of files)** view to review the modified files before committing your changes to source control. The modified files view is visible only if you are using source control with your project.

9. In any **Files** view, at the top right, change the layout from **Tree** to **List** to view the files as a list. Click the Organize View button  to customize the views and to sort files.

The **SVN** column provides source control information on individual files such as Unmodified, Added, Modified, or Deleted.

View Modified Files and Compare Revisions

10. Open and make a change to one of the models in the `models` folder or to one of the MATLAB files in the `utility` folder. For example, add a comment in `find_top_models.m` in the `utility` folder.

11. To review, analyze, and commit modified or added project files, use the **Modified (number of files)** view. You see:

- The file you made changes to, for example, `find_top_models.m`.
- The files stored in the `resources/project` folder. These are internal project definition files generated by your changes. The project definition files allow you to add metadata to files, for example, by creating shortcuts, adding labels, and adding a project description. Project definition files also define the files that are added to your project. You can review changes in revisions of project definition files like any other project files.

12. To review changes in a modified file, right-click selected file, for example, `find_top_models.m`

- Select **Compare > Compare to Ancestor** to run a comparison against the local Git repository.
- Select **Compare > Compare to Revision** to compare the file to other revisions.

13. The Comparison Tool summarizes results in a report. Purple indicates modified items, blue indicates inserted items, and yellow indicates deleted items. To save a printable version of the report, select **Publish > HTML, Word, or PDF**.

14. If you are happy with your changes, on the **Project** tab, click the **Commit** button to commit your changes to source control.

Analyze Project Dependencies

15. Use the Dependency Analyzer to investigate dependencies visually and explore the structure of your project. On the **Project** tab, click the down arrow to expand the **Tools** gallery. Under **Apps**, click **Dependency Analyzer**.

The Dependency Analyzer summarizes the results in the pane on the right. It lists the names of the used **Products** and **Add-Ons**. It detects problems, such as missing files, files not in the project, unsaved changes, and out-of-date derived files. In this example, the analyzer identifies a "File not in project" and tags it with a warning sign .

16. To highlight problem files, in the **Problems** section, point to the problem message and click the magnifying glass. In this example, the `timesthree.mexw64` file is required by the project but is

not currently part of it. Right-click `timesthree.mexw64` and select **Add to Project** or **Hide Warnings**. The next time you run the dependency analysis, the analyzer will not mark this file as a problem.

17. Perform an impact analysis on a selected file.

An impact analysis shows you how a change affects other files before you make the change. For example, to find required files for `timesthree.mexw64` to run properly, right-click `timesthree.mexw64` and select **Find Required**. To find how changes to `timesthree.mexw64` impact files, right-click `timesthree.mexw64` and select **Find Impacted**.

Manage the Project Path

When you open your project, MATLAB adds the project path to the MATLAB search path before applying startup shortcuts.

When you close your project, MATLAB removes the project path from the MATLAB search path after applying shutdown shortcuts.

1. To add or remove folders to the project path, on the **Project** tab, in the **Environment** section, click **Project Path**:

- To add a folder (without subfolders) to the project path, click **Add Folder**. If you want to add a folder and its subfolders, click **Add with Subfolders** instead. Then use the Open dialog box to add the new folder.
- To remove a folder from the project path, from the display list, select the folder. Then click **Remove**.

It is important to add project files to the project path to ensure the Dependency Analyzer detects all project files.

Specify Project Details, Startup Folder, and Derived Files Folders

2. On the **Project** tab, in the **Environment** section, click **Details**. Use the Project Details dialog box to:

- Edit the project name or add a description.
- View the **Project root** folder. You can change your project root by moving your entire project on your file system, and reopening your project in its new location. All project file paths are stored as relative paths.

- View or edit the **Start Up** folder. By default, this is set to the project root. When you open the project, the current working folder changes to the project root folder. You can specify a different startup folder or click **Clear**.
- View or edit the **Simulation cache folder** and **Code generation folder**.

To change the default project root for new projects, on the MATLAB **Home** tab, in the **Environment** section, click **Preferences**. Select **MATLAB > Project** and specify the **Default folder**.

Automate Startup and Shutdown Tasks

You can set project files, such as MATLAB scripts and Simulink® models, to run, open, or close when the project opens or closes.

3. To configure an existing file to run on project startup and shutdown, or to specify environment options, click the **Startup Shutdown** button in the **Project** tab. In the Manage Project Startup and Shutdown dialog box

- Add or remove startup and shutdown files. If execution order is important, change the order using the arrow buttons.
- Use the check boxes to specify environment options. Select **Start Simulink before this project starts** to start Simulink when you open the project. Select **Refresh Simulink customizations** to run `sl_customization` files on project startup and shutdown.

Project Shortcuts for Common Tasks

Create project shortcuts for common tasks to make it easy to find and access important files and operations. For example, find and open top models, run code, and simulate models.

4. On the **Project Shortcuts** tab, this example project has shortcuts for the top-level model, a utility function to rebuild s-functions, and a design description document.

- Click the shortcut *F14 Model* to open the root model for this project.
- Click the shortcut *Rebuild Project's S-functions* to generate the S-Function.
- Click the **New Shortcut** button to create new shortcuts for a project file.
- Right-click a shortcut and select **Edit Shortcut** to edit a shortcut.

View Source Control Information

On the **Project** tab, in the **Source Control** section, click **Git Details**.

5. Use the Source Control Information dialog box to:

- View the **Repository location** folder. You can change your project root by moving your entire project on your file system, and reopening your project in its new location. All project file paths are stored as relative paths.
- View or change the used source control integration.

Explore Files Views

6. In the **Files** view, select the **Project (number of files)** view to manage the files within your project. This view only shows files that are part of your project.

7. Use the **All** view to see all the files in your working copy. This shows all the files that are under the project root, not just the files that are in the project. This view is useful for adding files to your project from your working copy.

8. Use the **Modified (number of files)** view to review the modified files before committing your changes to source control. The modified files view is visible only if you are using source control with your project.

9. In any **Files** view, at the top right, change the layout from **Tree** to **List** to view the files as a list. Click the Organize View button  to customize the views and to sort files.

The **Git** column provides source control information on individual files such as Unmodified, Added, Modified, or Deleted.

View Modified Files and Compare Revisions

10. Open and make a change to one of the models in the `models` folder or to one of the MATLAB files in the `utility` folder. For example, add a comment in `find_top_models.m` in the `utility` folder.

11. To review, analyze, and commit modified or added project files, use the **Modified (number of files)** view. You see:

- The file you made changes to, for example, `find_top_models.m`.
- The files stored in the `resources/project` folder. These are internal project definition files generated by your changes. The project definition files allow you to add metadata to files, for example, by creating shortcuts, adding labels, and adding a project description. Project definition files also define the files that are added to your project. You can review changes in revisions of project definition files like any other project files.

12. To review changes in a modified file, right-click selected file, for example, `find_top_models.m`

- Select **Compare > Compare to Ancestor** to run a comparison against the local Git repository.
- Select **Compare > Compare to Revision** to compare the file to other revisions.

13. The Comparison Tool summarizes results in a report. Purple indicates modified items, blue indicates inserted items, and yellow indicates deleted items. To save a printable version of the report, select **Publish > HTML, Word, or PDF**.

14. If you are happy with your changes, on the **Project** tab, click the **Commit** button to commit your changes to source control.

Analyze Project Dependencies

15. Use the Dependency Analyzer to investigate dependencies visually and explore the structure of your project. On the **Project** tab, click the down arrow to expand the **Tools** gallery. Under **Apps**, click **Dependency Analyzer**.

The Dependency Analyzer summarizes the results in the pane on the right. It lists the names of the used **Products** and **Add-Ons**. It detects problems, such as missing files, files not in the project, unsaved changes, and out-of-date derived files. In this example, the analyzer identifies a "File not in project" and tags it with a warning sign .

16. To highlight problem files, in the **Problems** section, point to the problem message and click the magnifying glass. In this example, the `timesthree.mexw64` file is required by the project but is

not currently part of it. Right-click `timesthree.mexw64` and select **Add to Project** or **Hide Warnings**. The next time you run the dependency analysis, the analyzer will not mark this file as a problem.

17. Perform an impact analysis on a selected file.

An impact analysis shows you how a change affects other files before you make the change. For example, to find required files for `timesthree.mexw64` to run properly, right-click `timesthree.mexw64` and select **Find Required**. To find how changes to `timesthree.mexw64` impact files, right-click `timesthree.mexw64` and select **Find Impacted**.

Further Information

“Project Management”

Get started with MATLAB Projects

This example shows how to use an existing project to manage the files within your design. It shows how to automate startup and shutdown tasks, add shortcuts for common tasks, run checks, upgrade project files, analyze project dependencies, and share your project.

As a design grows, managing referenced files and dependencies becomes more complicated. Projects help you organize large hierarchies by finding required files, managing and sharing files and settings, and interacting with source control.

This project example is not under source control. As a result, essential tools needed in a collaborative environment are not available for use, for example, comparing files to their ancestors, comparing revisions and resolving conflicts.

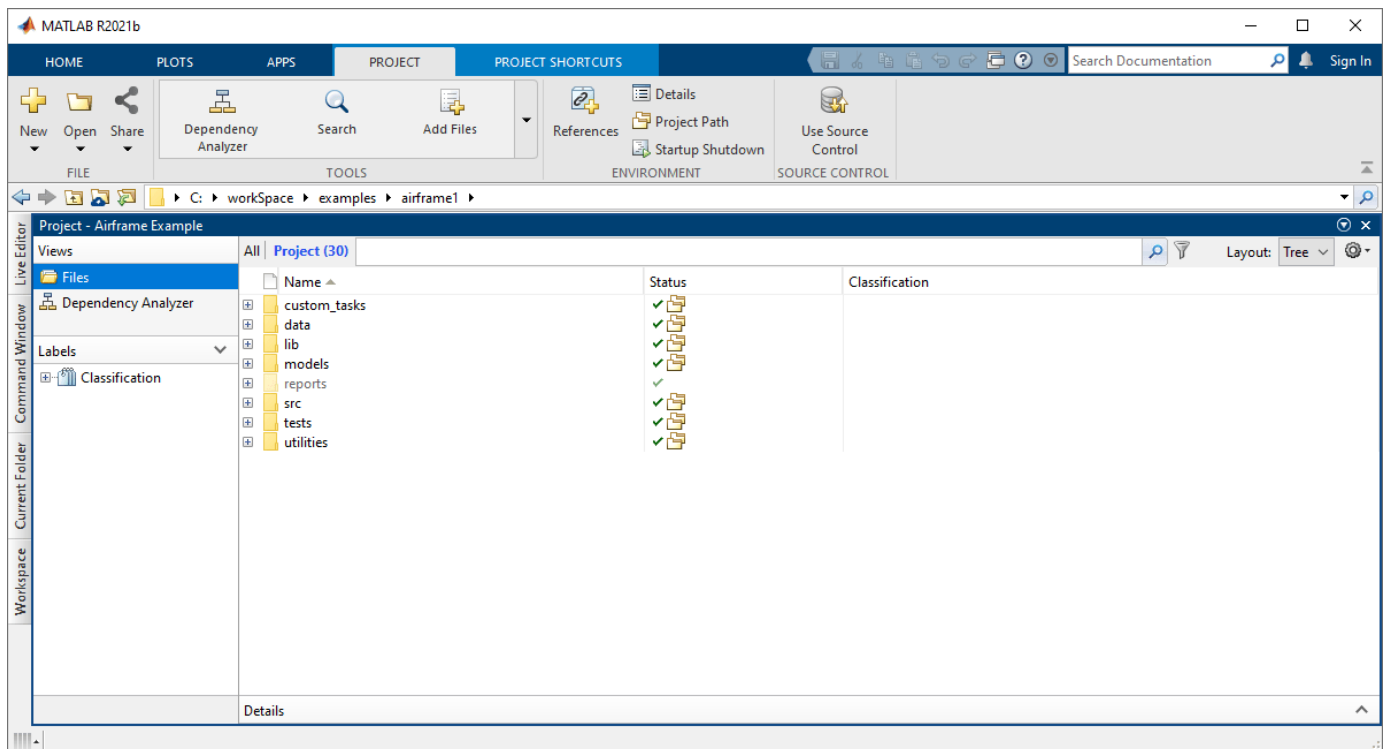

- To use available source control integration in MATLAB® such as Git™ and SVN, see “Using a Project with Git” on page 13-493 or “Using a Project with SVN” on page 13-488 example instead.
- To use an external source control with project, put the project folder under the source control of choice and customize it to use the MATLAB® Comparison Tool for diff and merge. For more information, see “Customize External Source Control to Use MATLAB for Diff and Merge”.

Set up the Example Files and Open the Project

Create and open a working copy of the project example files. MATLAB® copies the files to an example folder so that you can edit them.

```
sldemo_slproject_airframe_setup;
```

```
Building with 'MinGW64 Compiler (C)'.  
MEX completed successfully.
```

Manage the Project Path

When you open your project, MATLAB adds the project path to the MATLAB search path before applying startup shortcuts.

When you close your project, MATLAB removes the project path from the MATLAB search path after applying shutdown shortcuts.

1. To add or remove folders to the project path, on the **Project** tab, in the **Environment** section, click **Project Path**:

- To add a folder (without subfolders) to the project path, click **Add Folder**. If you want to add a folder and its subfolders, click **Add with Subfolders** instead. Then use the Open dialog box to add the new folder.
- To remove a folder from the project path, from the display list, select the folder. Then click **Remove**.

It is important to add project files to the project path to ensure the Dependency Analyzer detects all project files.

Specify Project Details, Startup Folder, and Derived Files Folders

2. On the **Project** tab, in the **Environment** section, click **Details**. Use the Project Details dialog box to:

- Edit the project name or add a description.
- View the **Project root** folder. You can change your project root by moving your entire project on your file system, and reopening your project in its new location. All project file paths are stored as relative paths.
- View or edit the **Start Up** folder. By default, this is set to the project root. When you open the project, the current working folder changes to the project root folder. You can specify a different startup folder or click **Clear**.
- View or edit the **Simulation cache folder** and **Code generation folder**.

To change the default project root for new projects, on the MATLAB **Home** tab, in the **Environment** section, click **Preferences**. Select **MATLAB > Project** and specify the **Default folder**.

Automate Startup and Shutdown Tasks

You can set project files, such as MATLAB scripts and Simulink® models, to run, open, or close when the project opens or closes.

3. To configure an existing file to run on project startup and shutdown, or to specify environment options, click the **Startup Shutdown** button in the **Project** tab. In the Manage Project Startup and Shutdown dialog box

- Add or remove startup and shutdown files. If execution order is important, change the order using the arrow buttons.
- Use the check boxes to specify environment options. Select **Start Simulink before this project starts** to start Simulink when you open the project. Select **Refresh Simulink customizations** to run `sl_customization` files on project startup and shutdown.

Project Shortcuts for Common Tasks

Create project shortcuts for common tasks to make it easy to find and access important files and operations. For example, find and open top models, run code, and simulate models.

4. On the **Project Shortcuts** tab, this example project has shortcuts for the top-level model, a utility function to rebuild s-functions, and a design description document.

- Click the shortcut *F14 Model* to open the root model for this project.
- Click the shortcut *Rebuild Project's S-functions* to generate the S-Function.
- Click the **New Shortcut** button to create new shortcuts for a project file.
- Right-click a shortcut and select **Edit Shortcut** to edit a shortcut.

Explore Files Views

6. In the **Files** view, select the **Project (number of files)** view to manage the files within your project. This view only shows files that are part of your project.

7. Use the **All** view to see all the files in your working copy. This shows all the files that are under the project root, not just the files that are in the project. This view is useful for adding files to your project from your working copy.

8. In any **Files** view, at the top right, change the layout from **Tree** to **List** to view the files as a list. Click the Organize View button  to customize the views and to sort files.

Analyze Project Dependencies

9. Use the Dependency Analyzer to investigate dependencies visually and explore the structure of your project. On the **Project** tab, click the down arrow to expand the **Tools** gallery. Under **Apps**, click **Dependency Analyzer**.

The Dependency Analyzer summarizes the results in the pane on the right. It lists the names of the used **Products** and **Add-Ons**. It detects problems, such as missing files, files not in the project, unsaved changes, and out-of-date derived files. In this example, the analyzer identifies a "File not in project" and tags it with a warning sign .

10. To highlight problem files, in the **Problems** section, point to the problem message and click the magnifying glass. In this example, the `timesthree.mexw64` file is required by the project but is not part of it. Right-click `timesthree.mexw64` and select **Add to Project** or **Hide Warnings**. The next time you run the dependency analysis, the analyzer will not mark this file as a problem.

11. Perform an impact analysis on a selected file.

An impact analysis shows you how a change affects other files before you make the change. For example, to find required files for `timesthree.mexw64` to run properly, right-click `timesthree.mexw64` and select **Find Required**. To find how changes to `timesthree.mexw64` impact files, right-click `timesthree.mexw64` and select **Find Impacted**.

Run Checks and Upgrade Project Files

12. Upgrade all models, libraries, and MATLAB code files in your project to the latest release using a simple workflow. On the **Project** tab, click the down arrow to expand the **Tools** gallery. Under **Project Checks**, click **Upgrade Project**.

To upgrade all files, run all checks, and apply fixes automatically where possible, click **Upgrade**. If you want to change the settings, use these options before clicking **Upgrade**:

- If you want to run upgrade checks but not apply fixes automatically where possible, clear the check box **Apply upgrades automatically**.
- If you want to change which files to upgrade and which checks to run, click **Change Options**. In the Upgrade Options dialog box, clear check boxes for models and checks you want to exclude from the upgrade.

The Upgrade Project tool apply all fixes automatically when possible, upgrade all model hierarchies in the project at once, and produce a report.

Share Project

Before sharing projects with other users, it is helpful to find required files and products using the Dependency Analyzer.

13. On the **Project** tab, select **Share** and explore the different sharing options.

You can share your project as an archive and send it by email. On the **Project** tab, select **Share > Archive**. You can export the whole project or just a part of it using **Export profile**. If you decide to exclude files from your project, use the Dependency Analyzer to examine the impact of excluding a file on the project. If you have referenced projects and want to export the referenced project files, then select the **Include referenced projects** check box.

You can also share your project and make it publicly available on GitHub®. This adds Git source control to the open project.

Further Information

“Project Management”

Perform Impact Analysis with a Project

This example shows how to perform file-level impact analysis using the Dependency Analyzer. It shows how to visualize project structure, analyze project dependencies, find required add-ons and products, identify and fix problems, and assess how a change will affect other project files.

You can run a dependency analysis at any point in your workflow. In a collaborative environment, you typically check dependencies

- when you first set up or explore a project
- when you run tests to validate changes to your design
- before you submit a version of your project to source control
- before you share or package your project

Set Up the Example Files and Open the Project

Create and open a working copy of the project example files. MATLAB® copies the files to an example folder so that you can edit them. The example project is under Git™ source control.

```
sldemo_slproject_airframe;
```

```
Building with 'MinGW64 Compiler (C)'.  
MEX completed successfully.
```

Visualize Project Structure and Dependencies

Run a dependency analysis on all the files in your project.

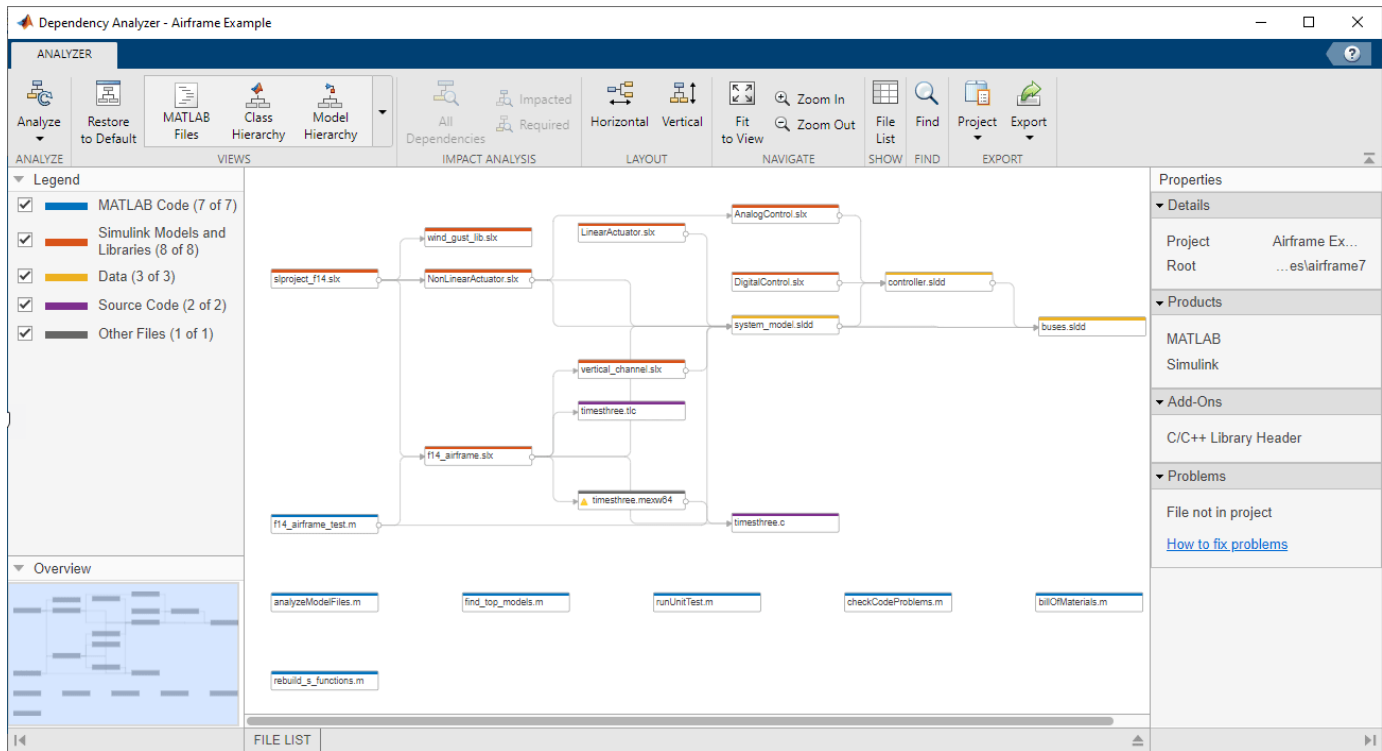

1. On the **Project** tab, click the down arrow to expand the **Tools** section. Under **Apps**, click **Dependency Analyzer**.

The dependency graph shows:

- Your project structure and its file dependencies, including how files such as models, libraries, functions, data files, source files, and derived files relate to each other. Each item in the graph represents a file and each arrow represents a dependency
- Relationships between source and derived files (such as .m and .p files, .slx and .slxp, and .c and .mex files), and between C/C++ source and header files

When no file is selected, the **Properties** pane shows:

- The project details
- The required products and add-ons for the entire project
- The list of problems for the entire project, such as missing files, files not in the project, files with unsaved changes, and out-of-date derived files

Investigate and Resolve Problems

The Dependency Analyzer identifies problems, such as missing files, files not in the project, unsaved changes, and out-of-date derived files. You can examine problem files using the dependency graph or the file list.

Use the graph to investigate problem files.

2. In the **Properties** pane, in the **Problems** section, point to **File not in project** and click the magnifying glass icon .

The graph highlights the files with this specific problem, in this example, `timesthree.mexw64`.

Take actions to resolve the problem file.

3. Right-click `timesthree.mexw64` and select **Add to Project**. To remove `timesthree.mexw64` from the problem list without adding it to the project, right-click and select **Hide Warnings**.

4. Click **Analyze** to update the graph and the **Problems** list.

Tip: For large projects, use the **File List** to investigate your project problem files. For more details, see “Investigate Problem Files in File List”.

View Modified Files

5. Open and make a change to one of the models, for example, `vertical_channel.slx`.

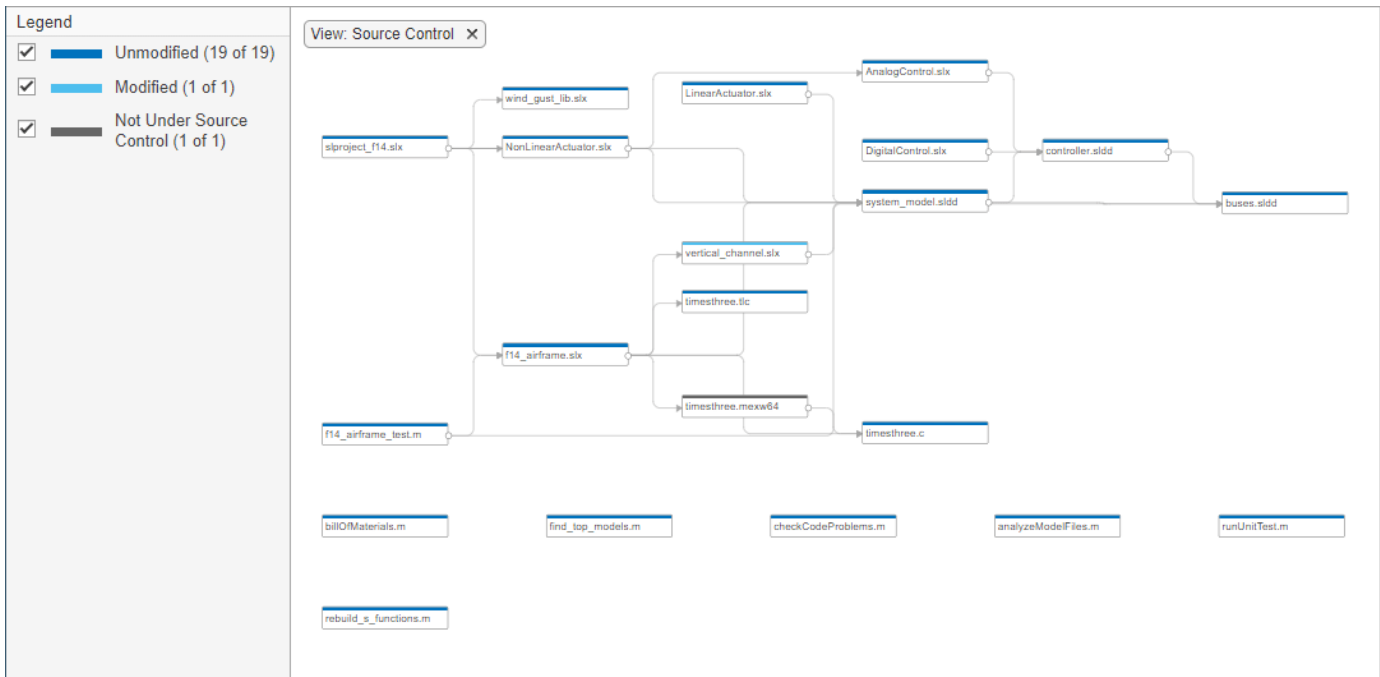

a. In the dependency graph, double-click `vertical_channel.slx` to open it.

b. Move a block in `vertical_channel.slx` and save the model.

Use the **Views** gallery to display the source control status of each file in the dependency graph.

6. In the Dependency Analyzer toolstrip, expand the **Views** gallery and click **Source Control**.

The color of each item in the graph now represents its source control status. Since you made a change to `vertical_channel.slx`, its source control status is **Modified**.

Find the Impact of the Change

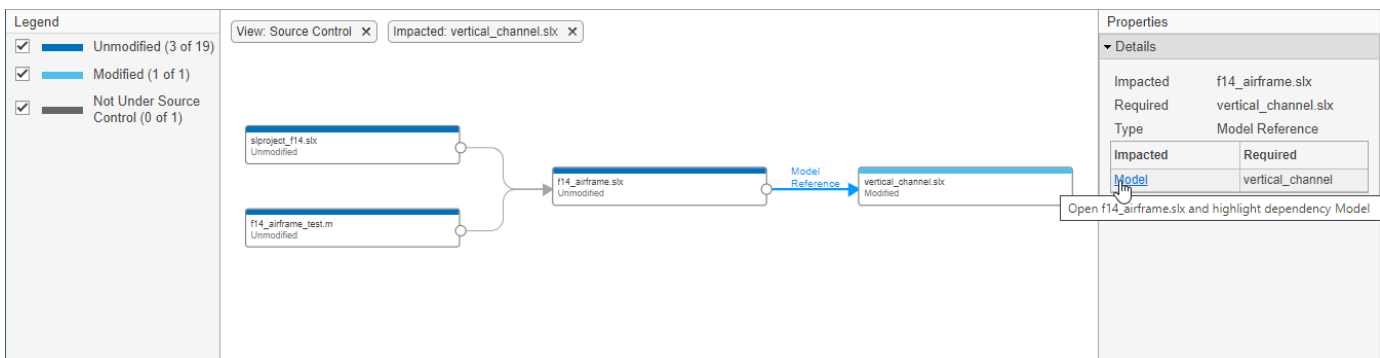

You can use the **Impact Analysis** tools to find:

- the files impacted by a change to a file
- the files required by a file to run successfully

7. Use the **Impact Analysis** tools to assess the impact your change has on other files.

- In the dependency graph, select the file you modified, for example, `vertical_channel.slx`.
- In the **Impact Analysis** section, click **Impacted**.

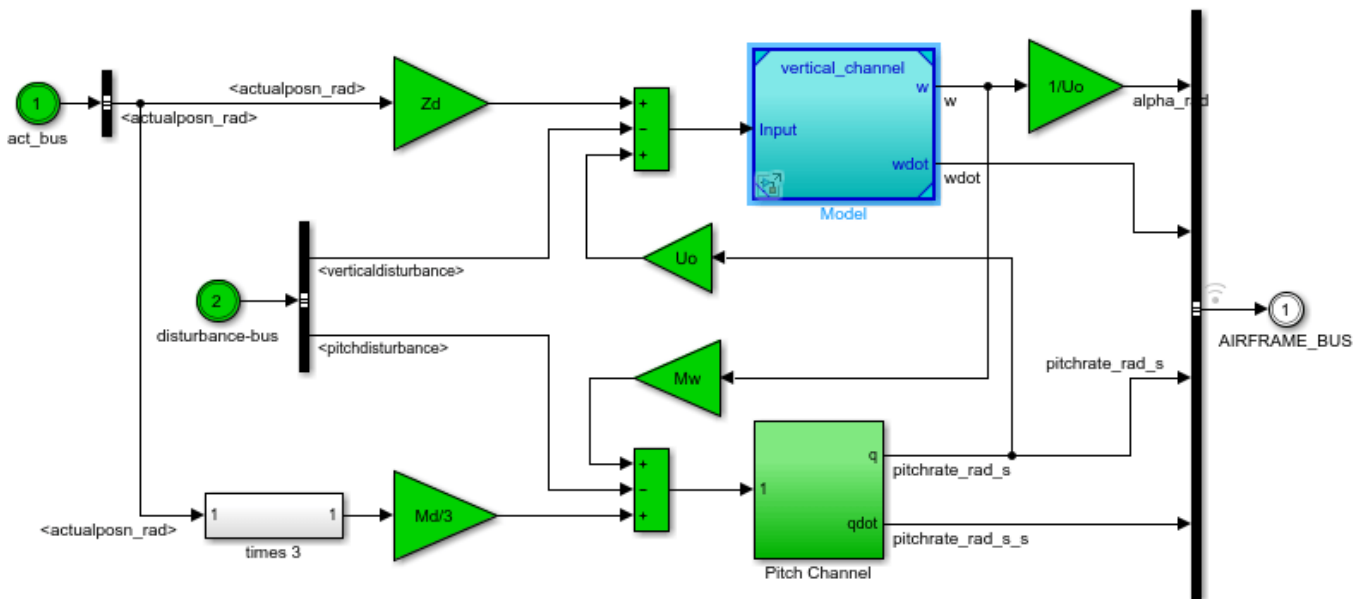

The dependency graph filters files and shows only those impacted by the changes you made to `vertical_channel.slx`.

8. Find where the dependency to `vertical_channel.slx` is introduced in `f14_airframe.slx`.

- Select the dependency arrow linking `f14_airframe.slx` to `vertical_channel.slx`.

b. In the **Properties** pane, click the link under **Impacted**. Simulink® opens the model `f14_airframe.slx` and highlights the model block `vertical_channel`.

Copyright 1990-2018 The MathWorks, Inc.

Identify Tests to Run

Project automatically associates Classification labels to each project files. This includes **Design**, **Artifact**, **Convenience**, **Derived**, and **Test** labels. The **Test** label identifies which files are tests. You can create additional classification to label your files. See “Add Labels to Files”.

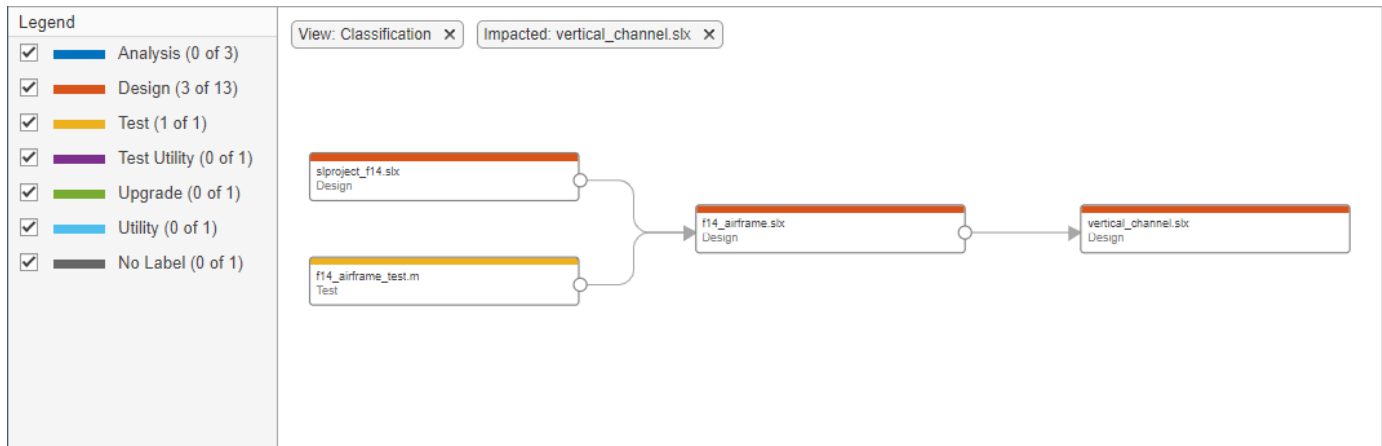

9. Determine which tests you need to run to validate the changes you made to `vertical_channel.slx`.

a. To display the Classification labels associated to each file in the dependency graph, expand the **Views** gallery and click **Classification**.

The dependency graph showing only files impacted by the changes you made to `vertical_channel.slx` is now colored by label Classifications.

b. Identify the tests affected by your change.

In the graph, there are two **Design** files and one **Test** file impacted by the changes you made to `vertical_channel.slx`. `f14_airframe_test.m` is the test you need to run to validate the design changes.

Tip: To clear all filters and restore the graph to show all analyzed dependencies in the project, click **Restore to Default**. Alternatively, manually remove all filters showing at the top of the graph.

Export Results and Run Tests

You can send files to other Project tools using the **Project** menu. MATLAB exports only the selected files in the current filtered view.

10. Run the selected test to validate the design changes.

a. Select the test you want to run, in this example, `f14_airframe_test.m`.

b. In the Dependency Analyzer toolstrip, in the **Export** section, select **Project > Send to Custom Task**.

In the Custom Task dialog box, the test file `f14_airframe_test.m` exported from the impact analysis is already selected.

c. In the Custom Task dialog box, in the **Custom task** field, select **Run Unit Tests** and Click **Run Task**.

The **Run Unit Tests** custom task runs the MATLAB unit test you selected and creates a summary report. Examine the **Results** section after selecting the test you run, in this example `f14_airframe_test.m`.

- To save the selected file paths to a variable, select **Export > Save to Workspace**.
- To switch to the project **Files** view with the files selected, select **Project > Show in Project**.

Referencing Projects from Another Project

This example shows how to use referenced projects as independent components within your project.

Setting Up the Example Files and Opening the Project

Create and open a working copy of the project example files. MATLAB® copies the files to an example folder so that you can edit them.

```
sldemo_slproject_airframe_references;
```

How Referenced Projects Work

When the parent project is loaded, the referenced projects are loaded first, to add project paths from the referenced project to the MATLAB search path, and to run startup shortcuts from the referenced projects.

- You can run the shortcuts in referenced projects from the parent project, using the Project Shortcuts tab.
- You can examine and open referenced projects by clicking the References node in the Views pane.

Example Referenced Projects

This project provides an airframe simulation which brings in functionality from these other projects by referencing them:

- Signal Multiplier: This referenced project shows how to develop an S-function as an independent project. The referenced project provides source code, build support and path management. The build directory is on the project path, so it is also on the path for the parent project. You can run the "rebuild s-function" shortcut from the parent project on the Project Shortcuts tab.
- Wind Gust library: This referenced project provides a library and a data dictionary that contains the required bus objects for the library. This project's path ensures that the library is set up for use in the parent project.

"Componentization of Large Projects"

Automate Label Management in a Project

This example shows how to use the project functions to manage labels.

Open the Airframe Example Project

Create and open a working copy of the project example files. MATLAB® copies the files to an example folder so that you can edit them.

```
sldemo_slproject_airframe;
```

```
Starting: Simulink  
Building with 'MinGW64 Compiler (C)'.  
MEX completed successfully.
```

Get a Project Object.

Create a project object to manipulate the currently open project at the command line.

```
project = currentProject;
```

View the Labels of a File

Examine the files in the project.

```
files = project.Files;  
disp(files);
```

```
1×31 ProjectFile array with properties:
```

```
Path  
Labels  
Revision  
SourceControlStatus
```

Use indexing to access files in this list. For example, get file number 10. Each file has two properties describing its path and attached labels.

```
aFile = files(10);  
disp(aFile);
```

```
ProjectFile with properties:
```

```
Path: "C:\workSpace\examples\airframe2\data\system_model.sldd"  
Labels: [1×1 matlab.project.Label]  
Revision: "57973f5e87ca65215ab688e3544287e07db794c4"  
SourceControlStatus: Unmodified
```

Find information about a file attached labels by indexing into the file object Labels property. The following command gets the first label attached to this particular file.

```
label = aFile.Labels(1);  
disp(label);
```

```
Label with properties:
```

```
File: "C:\workSpace\examples\airframe2\data\system_model.sldd"  
DataType: 'none'
```

```
Data: []
Name: "Design"
CategoryName: "Classification"
```

Attach a Label to a Subset of Files.

The following code attaches the label **Design** in the **Classification** category to all files in the project with the .m file extension.

First get the list of files:

```
files = project.Files;
```

Then loop through each file and attach the label **Design** from the **Classification** category if the file has the extension .m.

```
for fileIdx = 1:numel(files)
    file = files(fileIdx);
    [~, ~, fileExtension] = fileparts(file.Path);
    if strcmp(fileExtension, '.m')
        addLabel(file, 'Classification', 'Design');
    end
end
```

Find a Named Label

You can set and query data on a label that is attached to a file. To do this, you first need to find the file object. You can do this by looping through all files in the project, as shown in the previous step. Alternatively, you can use the `findFile` function on the project.

The following code finds the file object for the file 'utilities/rebuild_s_functions.m'.

```
pathToLocate = fullfile('utilities', 'rebuild_s_functions.m');
file = findFile(project, pathToLocate);
```

Examine the `Labels` property to get an array of Label objects, one for each label attached to the file.

```
labels = file.Labels;
disp(labels);
```

Label with properties:

```
File: "C:\workSpace\examples\airframe2\utilities\rebuild_s_functions.m"
DataType: 'none'
Data: []
Name: "Design"
CategoryName: "Classification"
```

To find a label by name, use `findLabel` on the file object.

```
label = findLabel(file, 'Classification', 'Design');
disp(label);
```

Label with properties:

```
File: "C:\workSpace\examples\airframe2\utilities\rebuild_s_functions.m"
DataType: 'none'
Data: []
```

```
Name: "Design"  
CategoryName: "Classification"
```

Create a New Category

You must create new labels before you can attach them to a file. You define labels in categories, giving each category a name and supported data type.

The following code creates a category of labels called Engineers which can be used to denote file ownership in a project. These labels have the char datatype for attaching String data.

```
createCategory(project, 'Engineers', 'char');  
engineersCategory = findCategory(project, 'Engineers');  
createLabel(engineersCategory, 'Sam');  
createLabel(engineersCategory, 'Pat');  
createLabel(engineersCategory, 'Alex');
```

You can now attach an Sam label from the 'Engineers' category to a file in the project.

```
addLabel(file, 'Engineers', 'Sam');  
label = findLabel(file, 'Engineers', 'Sam');
```

Set Label Data

The following command sets the data for the attached label.

```
label.Data = 'Maintenance responsibility';  
disp(label)
```

Label with properties:

```
File: "C:\workSpace\examples\airframe2\utilities\rebuild_s_functions.m"  
DataType: 'char'  
Data: 'Maintenance responsibility'  
Name: "Sam"  
CategoryName: "Engineers"
```

Further Information

“Project Management”

Run Custom Tasks with a Project

This example shows how to apply a custom task to a set of files managed by project. The example custom task analyzes the Simulink models which are in the project and reports the number of blocks in each model.

Set Up the Example Files and Open the Project

1. Create and open a working copy of the project example files. MATLAB® copies the files to an example folder so that you can edit them.

```
sldemo_slproject_airframe;
```

```
Building with 'MinGW64 Compiler (C)'.  
MEX completed successfully.
```

Select a Custom Task

2. On the **Project** tab, click the down arrow to expand the **Tools** gallery. Under **Project Checks**, click **Custom Tasks**.

You define a custom task with a MATLAB® function. The example Airframe project contains example custom tasks in the *custom_tasks* folder.

3. The **Custom task** menu lists available custom tasks.

To view, edit, and create custom tasks, on the **Project** tab, click the down arrow to expand the **Tools** gallery. Under **Project Checks**, click **Custom Tasks**. In the Custom Task dialog box, click **Manage**.

4. Select the *Analyze Model Files* custom task.

The function name of your selected custom task appears in the **Custom task** field. The example *analyzeModelFiles* adds a label from the category *Metrics* to each model file in the project. Labels in this category have numerical data. The custom task counts the number of blocks in each model and attaches this number to the label.

Select Files to Include in the Custom Task

5. In the Custom Task dialog box, in the **Include** column, verify that all the model files check boxes are selected.

Run a Custom Task

6. To run the custom task, click **Run Task**.

The results for a selected file are shown in the **Results** pane at the bottom of the dialog box. This can be useful when the returned results are long, or contain HTML markup.

The following example shows the dialog box after running the custom task on some models. You can customize the columns to show with the cog icon button .

The screenshot shows the 'Custom Task Report - analyzeModelFiles' window. The task is 'analyzeModelFiles', it ran on 23 files, and was completed on 13/08/2019 at 08:23. The report table is as follows:

Name	Path	Results
controller.sldd	\$(data)	
DigitalControl.slx	\$(models)	Block Count: 47
f14_airframe.slx	\$(models)	Block Count: 28
f14_airframe_test.m	\$(tests)	
find_top_models.m	\$(utilities)	
LinearActuator.slx	\$(models)	Block Count: 8
NonLinearActuator.slx	\$(models)	Block Count: 9
readme.txt	\$(lib)	
rebuild_s_functions.m	\$(utilities)	
runUnitTest.m	\$(custom_tasks)	
slproject_f14.pdf	\$(reports)	
slproject_f14.slx	\$(models)	Block Count: 39

Results: DigitalControl.slx
Block Count: 47

Buttons: Publish Report, Close

Custom task: analyzeModelFiles [Browse...]

15 files are included but not shown in the current view [Run Task]

Edit an Existing Custom Task

Custom Tasks are MATLAB functions. Edit your custom task with the MATLAB Editor. For example, modify the custom task to programmatically add a label with data, as well as saving any dirty model files.

7. Run the following MATLAB code to create a Metrics category and a Block Count label in the project.

```
project = currentProject;
category = createCategory(project, 'Metrics', 'double');
```

8. Double-click *analyzeModelFiles.m* to edit it in the MATLAB Editor.

9. Add the following lines just after the `sprintf` command:

```
[~, compileStats] = sldiagnostics(name, 'CompileStats');
addLabel(projectFile, 'Metrics', 'CPU Compile Time', sum([compileStats.Statistics.CPUTime]));
```

You can use the MATLAB Editor to set breakpoints and debug a custom task function, just as with any other MATLAB function.

If you rerun the custom task, it adds the CPU Compile Time label to each model file that can be compiled, and attaches data to the label showing the total time for all compilation phases for the model. Models that cannot be compiled show **Failed to analyze file** in the Custom Task Report, and details display as a warning in the Command Window. Examine the custom task *analyzeModelFiles.m* to see how to handle errors.

To view the new metrics data, either show the **Metrics** column in the Custom Task Report, or look in the project **Files** view.

Create a New Custom Task

Create a new custom task by creating a new MATLAB function. Your custom tasks must:

- Be saved on the MATLAB path.
- Accept a single input argument: a full path to a file.
- Return a single output argument.

To create custom tasks, on the **Project** tab, click the down arrow to expand the **Tools** gallery. Under **Project Checks**, click **Custom Tasks**. In the Custom Task dialog box, click **Manage**. In the Manage Custom Tasks dialog box, click **Add** to open a new file with instructions that guide you to create a custom task with the correct function signature.

10. Select **Add>Add Using New Script**.

A file dialog opens asking you to choose where to create the new custom task. The custom task must be saved on the MATLAB path to run.

11. Provide a file name and save the file in the *custom_tasks* folder within the project.

The MATLAB editor opens the file pre-populated with a simple example custom task.

12. To create your new custom task, edit the contents of the example custom task function and save.

“Project Management”

Upgrade Simulink Models Using a Project

Easily upgrade all the models in your project using the Upgrade Project tool in a project.

Setting Up the Example Files and Opening the Project

Run the following commands to create and open a working copy of the project files.

```
sldemo_slproject_airframe;
```

```
Building with 'MinGW64 Compiler (C)'.  
MEX completed successfully.
```

The project example copies files to a new folder so that you can edit them and use them under Git version control. Placing your files under version control lets you compare the upgraded model files with the original versions.

Automatically Upgrade All Project Models and MATLAB Code at Once

Upgrade all models and MATLAB code in your project to the latest release using a simple workflow. The Upgrade Project tool can apply fixes automatically when possible, upgrade all model hierarchies in the project at once, and produce a report.

On the Project tab, click the down arrow to expand the Tools gallery. Under Project Checks, click Upgrade Project.

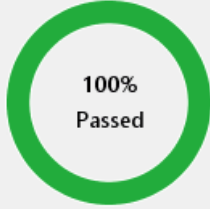

This loads the upgrade advisor checks and runs a dependency analysis on your project to ensure the project hierarchy is handled correctly.

Click Upgrade to run all upgrade checks on all models, libraries and MATLAB code in your project. If any check fails and there is a fix available, the project automatically applies the fix and runs the relevant checks again to ensure they now pass.

Inspect the results of the upgrade in the report.

“Model Upgrades”

“Upgrade All Project Models, Libraries, and MATLAB Code Files”

Export a Subset of a Project Using an Export Profile

This example shows how to export a release version of a project using an export profile. The example export profile streamlines the exported project by removing files from the project which are only useful for the development of the project, but are not necessary for running the project's top-level models.

Set Up the Example Files and Open the Project

1. Run the following commands to create and open a working copy of the airframe project.

```
sldemo_slproject_airframe;
```

```
Building with 'MinGW64 Compiler (C)'.  
MEX completed successfully.
```

The classification label set is used to define the purpose of each file in the project. This example project adds several new labels to the 'classification' label set: 'analysis', 'upgrade', and 'utility'. These labels are used to identify files which are used for custom analysis tasks, upgrading to the latest version and general purpose utility functions.

Some files in the project are useful for the development of the project, but do not need including in a release version of the project when it is exported. For this example, files labelled in the project with the labels 'analysis', 'test', 'upgrade' and 'artifact' do not need including in the release version of the project.

This example demonstrates how the export profile management feature can be used to exclude files from a project export based on the attached labels.

Open the Export Profile Manager Tool

To view the available export profiles for a project:

2. Click the "Share" button in the Project toolbar tab.
3. Select the menu item "Manage Export Profiles..."

The Manage Export Profiles dialog box will appear.

The left hand panel shows all of the defined export profiles. The airframe project defines one export profile called 'Release', which should be already be selected in the dialog box.

The export profile shows two panels. The first panels shows the labels which will cause a file to not be exported if attached to a file. The release profile has been defined such that any file which has the 'analysis', 'test', 'artifact', or 'upgrade' label attached will not be exported.

The second panel defines labels which will not be included in the exported project. Here the labels 'analysis' and 'upgrade' are removed because no files in the exported project will use them.

The export profile interface allows new profiles to be defined and existing profiles to be removed.

Using an Export Profile When Exporting a Project

To use an export profile:

4. Click the "Share" button in the Project toolbar tab.

5. Select the "Zip Archive".

6. In the project archive dialog, select the export profile to be applied. Select the 'Release' profile to use the profile that is defined by the airframe project.

7. Click the Archive button to export the project using the selected export profile.

Further Information

"Project Management"

Create and Reference a Project Programmatically

This example shows how to programmatically create a new project and add it as a reference project in your main project. It covers how to create a project from the command line, add files and folders, set up the project path, define project shortcuts and create a reference to the new project in another project.

Set up the Example Files

1. Create a working copy of the `Airframe Example` project and open the project. MATLAB® copies the files to an examples folder so that you can edit them. Use `currentProject` to create a project object from the currently loaded project.

```
sldemo_slproject_airframe_api;
mainProject = currentProject
```

```
mainProject =
```

```
Project with properties:
```

```

        Name: "Airframe Example"
SourceControlIntegration: "Git"
  RepositoryLocation: "C:\workSpace\examples\repositories\airRef9"
SourceControlMessages: ["Current branch: master"      "No remote tracking branch"      "Branch
        ReadOnly: 0
        TopLevel: 1
  Dependencies: [1x1 digraph]
    Categories: [1x1 matlab.project.Category]
        Files: [1x22 matlab.project.ProjectFile]
    Shortcuts: [1x5 matlab.project.Shortcut]
  ProjectPath: [1x4 matlab.project.PathFolder]
ProjectReferences: [1x1 matlab.project.ProjectReference]
  StartupFiles: [1x0 string]
  ShutdownFiles: [1x0 string]
DefinitionFileType: FixedPathMultiFile
  Description: "This example project demonstrates the Project referencing feature
  RootFolder: "C:\workSpace\examples\airRef9\airRef"
SimulinkCacheFolder: "C:\workSpace\examples\airRef9\airRef\work\cache"
ProjectStartupFolder: "C:\workSpace\examples\airRef9\airRef"
SimulinkCodeGenFolder: "C:\workSpace\examples\airRef9\airRef\work\codegen"
```

The `Airframe Example` project is a top level project (`TopLevel: 1`) with one referenced project (`ProjectReferences: [1x1]`).

Create New Project

2. Create a new project called Wind Gust Library. Airframe project will use Wind Gust Library through a project reference.

a. Create a blank project and set the project name.

```
windGustFolder = fullfile(mainProject.RootFolder, "..", "WindGustLibrary");
windGust = matlab.project.createProject(windGustFolder);
windGust.Name = "Wind Gust Library";
```

b. Add the data folder and the wind_gust_lib.slx file to the Wind Gust Library project.

```
addFolderIncludingChildFiles(windGust, "data");
addFile(windGust, "wind_gust_lib.slx");
```

c. Add the data folder and the Wind Gust Library project root folder to the Wind Gust Library project path. This makes the files available when the Airframe Example project or any project that references the Wind Gust Library project is loaded.

```
addPath(windGust, "data");
addPath(windGust, windGust.RootFolder);
```

d. Create a Wind Gust Library project shortcut.

```
shortcut = addShortcut(windGust, "wind_gust_lib.slx");
shortcut.Group = "Top Level Model";
```

Add a Project Reference

3. Add the new Wind Gust Library project to the Airframe Example project as a project reference. This allows the Airframe Example project to view, edit, and run files in the Wind Gust Library project.

```
reload(mainProject);
addReference(mainProject,windGust)

ans =
    ProjectReference with properties:
        Project: [1x1 matlab.project.Project]
        File: "C:\workSpace\examples\airRef9\WindGustLibrary"
        StoredLocation: "../WindGustLibrary"
        Type: "Relative"
```

The main project Airframe Example references the Wind Gust Library stored in "../refs/Wind Gust Library".

4. Use ProjectReferences method to query the Wind Gust Library project.

```
mainProject.ProjectReferences(2).Project

ans =
    Project with properties:
```

```
Name: "Wind Gust Library"
SourceControlIntegration: ""
RepositoryLocation: ""
SourceControlMessages: [1x0 string]
ReadOnly: 1
TopLevel: 0
Dependencies: [1x1 digraph]
Categories: [1x1 matlab.project.Category]
Files: [1x3 matlab.project.ProjectFile]
Shortcuts: [1x1 matlab.project.Shortcut]
ProjectPath: [1x2 matlab.project.PathFolder]
ProjectReferences: [1x0 matlab.project.ProjectReference]
StartupFiles: [1x0 string]
ShutdownFiles: [1x0 string]
DefinitionFileType: FixedPathMultiFile
Description: ""
RootFolder: "C:\workSpace\examples\airRef9\WindGustLibrary"
```

The Wind Gust Library project is not a top level project (`TopLevel: 0`). It is referenced by the top level project Airframe Example (`TopLevel: 1`).

Close Project

5. Close the project to run shutdown scripts and check for unsaved files.

```
close(mainProject)
```

Compare and Merge Simulink Models

This example shows how to use the comparison report in MATLAB® to understand what has changed between two different designs. It shows how to view and merge the changes between two Simulink® models from the comparison report.

Comparing Models

Create a working copy of the example files. MATLAB® copies the files to an example folder so that you can edit them.

```
slcomparisons.examples.simulinkMerge;
```

A user made some changes to the model `sl_aircraft1` and saved the resulting model as `sl_aircraft2`.

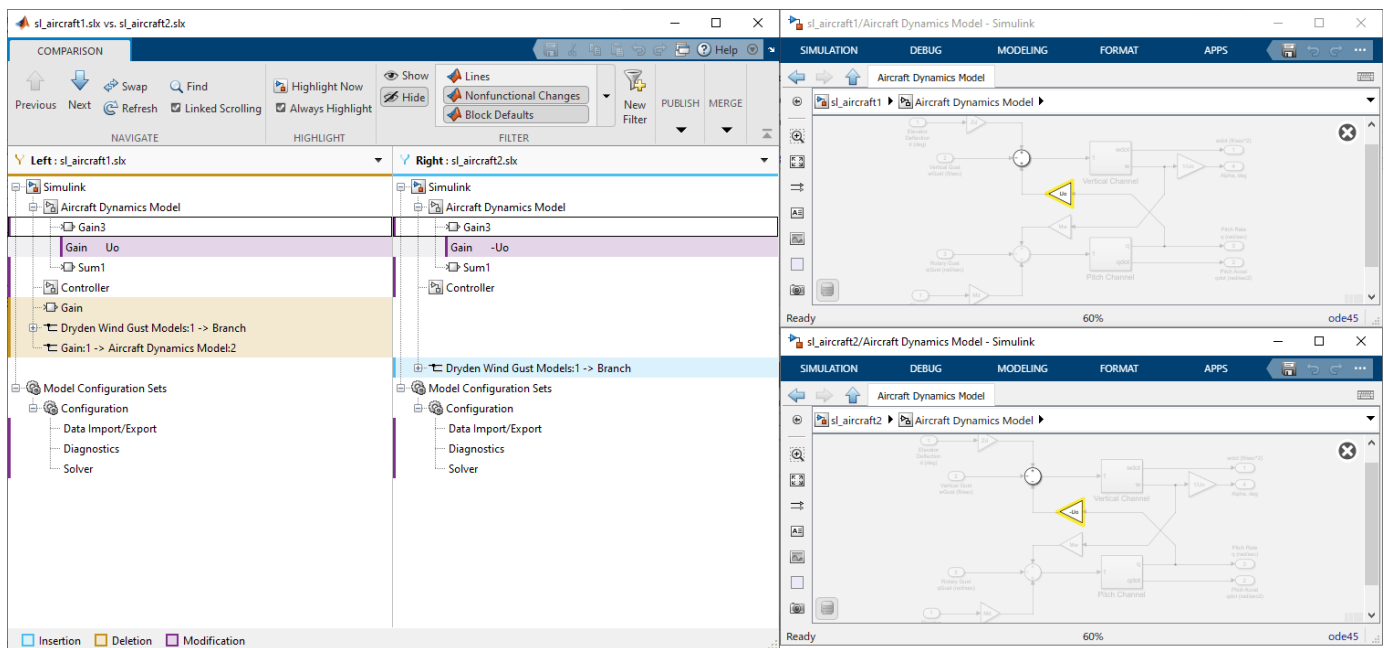

Use `visdiff` to compare the `sl_aircraft1` and `sl_aircraft2` models.

```
visdiff('sl_aircraft1','sl_aircraft2');
```

Understanding Results

The Comparison Tool shows a report that only includes the differences between the two models, not the complete model hierarchies.

Colors indicate if items have been modified (purple), inserted (blue), or deleted (yellow).

Stepping Through Differences

Use the **Next** and **Previous** navigation buttons on the **Comparison** tab to step through groups of changes in the report:

- The report goes through the changes one by one. If the selected item in the **Left** tree has a match, it will also be selected in the **Right** tree.

- MATLAB displays both models next to the report. The report highlights the selected items in both Simulink models if it is possible.

To control highlighting in models, on the **Comparison** tab, in the **Highlight** section, select or clear the check box **Always Highlight**. You can click the **Highlight Now** button to highlight the currently selected report node at any time.

Filtering Results

You can control the type of changes displayed in the comparison report by applying filters. To see the available filters and whether or not they are applied to the current report, on the **Comparison** tab, in the **Filter** section, click the down arrow to expand the filter gallery. Click filter names to toggle whether they are applied. In the **Filter** section, click **Show** or **Hide** to control how the filters are applied.

For example, some information in the Simulink model file is defined as being nonfunctional. These are changes that are unlikely to change the behavior of the design. Nonfunctional items are hidden by default. You can show them by deselecting the **Nonfunctional Changes** button when the **Hide** filter button is selected.

Publish Results

To save a printable version of a model comparison report, select **Publish > HTML, Word, or PDF**.

Merge Changes in Simulink Models

You can merge the changes between the two Simulink models by clicking the **Merge Mode** button in the toolbar. This creates a third file, `targetFile`, which can contain the changes from either the left model (`sl_aircraft1`) or right model (`sl_aircraft2`). Use the buttons in the **Target** tree to select the differences to keep in the `targetFile`.

Click the **Save File** button to save the changes you selected over the right model (`sl_aircraft2`).

Tip: Merge blocks before lines, and merge states and junctions before merging transitions. See “Merging Tips”.

Compare and Merge Simulink Models Containing Stateflow

This example shows how to use the comparison report in MATLAB® to understand what has changed between two different designs. It shows how to view and merge the changes between two Simulink® models containing Stateflow® using the comparison report. A Stateflow license is required to run this example.

Compare Models

Create a working copy of the example files. MATLAB® copies the files to an example folder so that you can edit them.

```
slcomparisons.examples.stateflowMerge;
```

A user added a new kickdown mode to the `shift_logic`. You can use the Simulink Model Comparison to compare the two models and produce a report to explore and merge the differences.

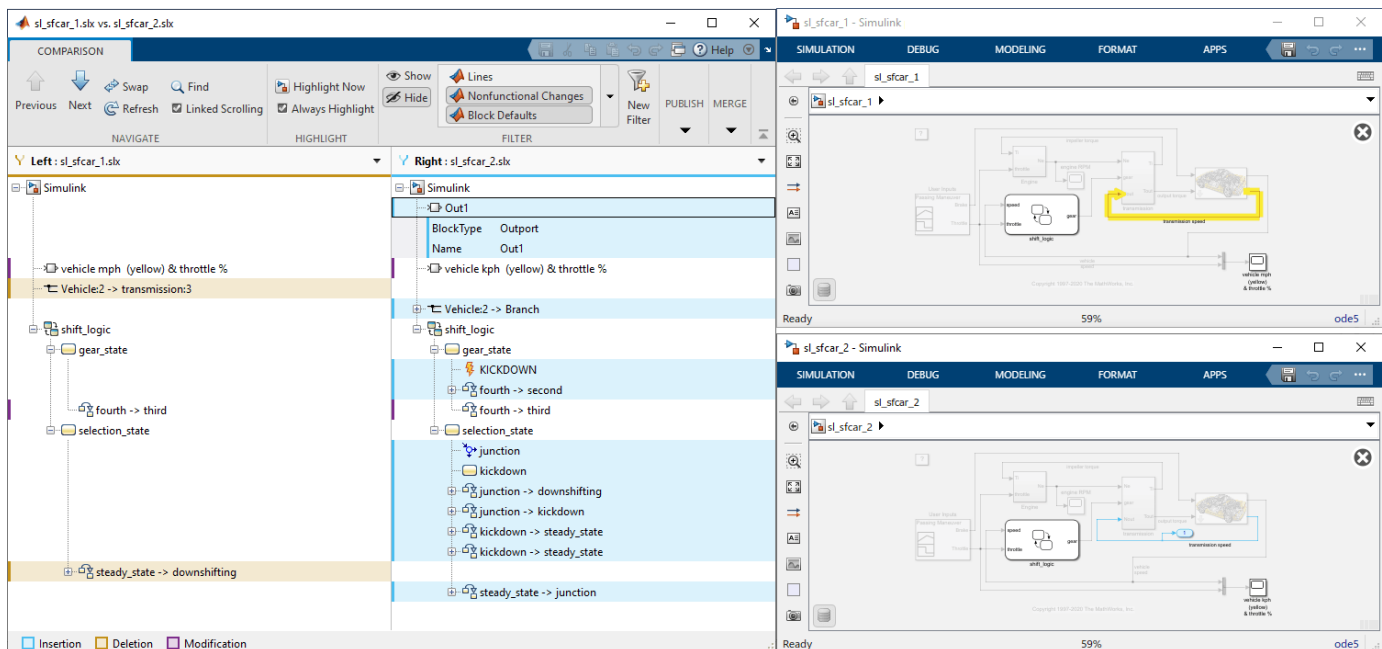

Use `visdiff` to compare the `sl_sfcar_1` and `sl_sfcar_2` models.

```
visdiff('sl_sfcar_1','sl_sfcar_2');
```

Understand Results

The Comparison Tool shows a report that only includes the differences between the two models, not the complete model hierarchies.

Colors indicate if items have been modified (purple), inserted (blue), or deleted (yellow).

Stepping Through Differences

Use the **Next** and **Previous** navigation buttons on the **Comparison** tab to step through groups of changes in the report:

- The report goes through the changes one by one. If the selected item in the **Left** tree has a match, it will also be selected in the **Right** tree.
- MATLAB displays both models next to the report. The report highlights the selected items in both Simulink models if it is possible.

Highlight Differences in the Simulink Models

Select the tree node Out1 in the **Right** tree. Observe the report highlights Out1 in the report, and the corresponding block in the model sl_sfcar_2.

To control highlighting in models, on the **Comparison** tab, in the **Highlight** section, select or clear the check box **Always Highlight**. You can click the **Highlight Now** button to highlight the currently selected report node at any time.

Highlight Differences in a Stateflow Chart

Browse down the tree to locate the Stateflow charts in the report. Observe the Stateflow chart icon next to the shift_logic node. Click kickdown in the **Right** tree. The report displays both shift_logic Stateflow charts. Observe where the new kickdown functionality has been added to one of the charts.

Filtering Results

You can control the type of changes displayed in the comparison report by applying filters. To see the available filters and whether or not they are applied to the current report, on the **Comparison** tab, in the **Filter** section, click the down arrow to expand the filter gallery. Click filter names to toggle whether they are applied. In the **Filter** section, click **Show** or **Hide** to control how the filters are applied.

For example, some information in the Simulink model file is defined as being nonfunctional. These are changes that are unlikely to change the behavior of the design. Nonfunctional items are hidden by default. You can show them by deselecting the **Nonfunctional Changes** button when the **Hide** filter button is selected.

Merge Changes in Models Containing Stateflow

You can merge the changes between the two Simulink and Stateflow models by clicking the **Merge Mode** button in the toolbar. This creates a third file, targetFile, which can contain the changes from either the left model or right model. Use the buttons in the **Target** tree to select the differences to keep in the targetFile.

Click the **Save File** button to save the changes you selected over the right model (sl_sfcar_2).

Tip: Merge blocks before lines, and merge states and junctions before merging transitions. See “Merging Tips”.

Resolve Conflicts with Simulink Three-Way Merge

This example shows you how to use Simulink® Three-Way Merge to resolve conflicts in Simulink models. You can view and merge the Simulink model differences in the resulting report.

Set up the Example Project

Create and open a working copy of the example project. MATLAB® copies the files to an example folder so that you can edit them.

```
slcomparisons.examples.simulinkThreeWayMerge;
```

```
Building with 'MinGW64 Compiler (C)'.  
MEX completed successfully.
```

Simulink Model Changes and Conflicts

The example project is under Git™ source control. You attempt to merge the changes of another user on the master Git branch into your TaskBranch. This operation results in conflicts.

To resolve the conflicts using the Three-Way Model Merge tool, this example shows how to examine your local file (**Mine**), the conflicting revision (**Theirs**) and the common ancestor of these two files (**Base**).

Theirs: Another user updated the pilot model subsystem to use an explicit gain block for the amplitude of the pilot's input commands. He also updated the Simulation stop time.

Mine: You changed some configuration settings for the pilot model subsystem.

The Merge tool automatically merges nonconflicted differences. Follow the steps below to review the automerge choices, edit if desired, and decide how to resolve any remaining differences. After resolving the conflicts, commit the resolved model to source control.

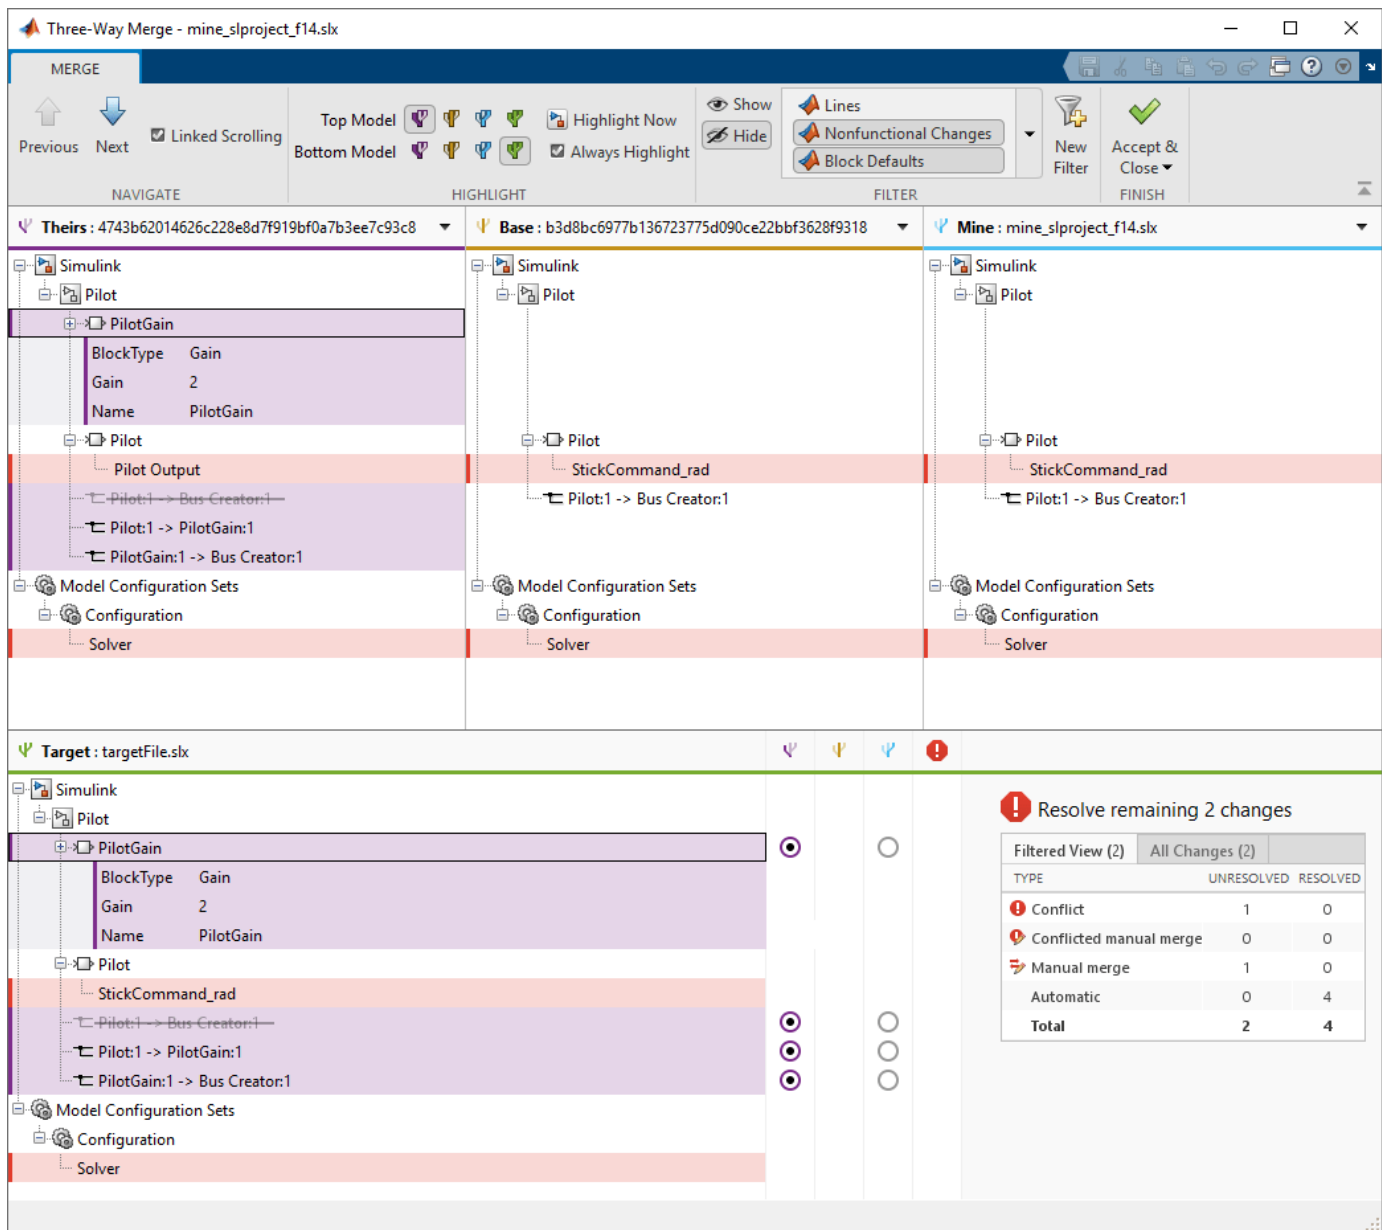

Open Simulink Three-Way Merge

Look for conflicted files in the project files view. The `slproject_f14` file shows a red warning symbol in the Git column, which indicates a conflict.

1. To see a detailed report of the conflicts, right-click the `slproject_f14` file and select **View Conflicts**.

View Changes

The Three-Way Merge tool shows the changes to the two Simulink designs that have caused this file conflict.

- The **Theirs**, **Base** and **Mine** trees show the differences between the conflicting revision, your revision, and the base ancestor of these files.
- The **Target** tree shows the file that you will merge changes into. This is a temporary file and will be copied into the project when you choose to accept the merge result.

2. Examine a difference by clicking a row in one of the trees. The merge tool displays the change for each model in an editor, for example the Simulink Editor or Configuration Parameters dialog box, to the right of the Three-Way Merge window.

3. On the **Merge** tab, in the **Highlight** section, choose the models to display with the **Top Model** or **Bottom Model** buttons.

Review Automatic Merges

The merge tool automatically merges most nonconflicted differences.

4. Examine the first change at the top of the **Theirs** tree by clicking the row called `PilotGain`. This node has been merged automatically and you can adjust the automatic choices using the buttons in the **Target** tree. If you want, review the other automatic merge choices.

Resolve Conflicts

There are two types of difference that require user action.

Conflict: The merge tool cannot automatically resolve these differences and you need to choose which design you want in the target file. In the **Target** pane, look for warnings in the conflict column

Manual merge: Some differences must be merged manually in Simulink or ignored. In the **Target**

pane, these items are indicated by a pencil icon in the conflict column .

5. Select the `StickCommand_rad` row. This difference requires a manual merge, indicated by a pencil icon in the conflict column .

Resolve the line change difference in the `targetFile` by renaming the line connected to the output of the block named `Pilot` in the Simulink Editor from `StickCommand_rad` to `Pilot Output`.

After resolving the difference save the changes in the Editor, and mark the change resolved using the manual merge control in the Conflicts column.

The merge report does not update to show any changes you make in the Editor.

6. Use the **Next** toolbar button to review and resolve the changes until you reach a conflict. This `StopTime` parameter has been changed by both users and is conflicted. Resolve the conflict using the **Mine** change. Select the button next to `StopTime` in the mine column in the **Target** pane.

Change Filters

By default, the report hides all nonfunctional changes, such as the repositioning of items.

7. On the **Merge** tab, in the **Filter** section, turn on and off filters to explore the different changes between these designs.

Accept Changes

8. After you resolve all filtered and unfiltered changes, click **Accept & Close**. The merge tool closes the report and the models, accepts the merge result in the `targetFile`, and marks the conflict as resolved in the source control tool. You can now commit changes to source control and continue your work.

Call C Functions Using C Caller Block

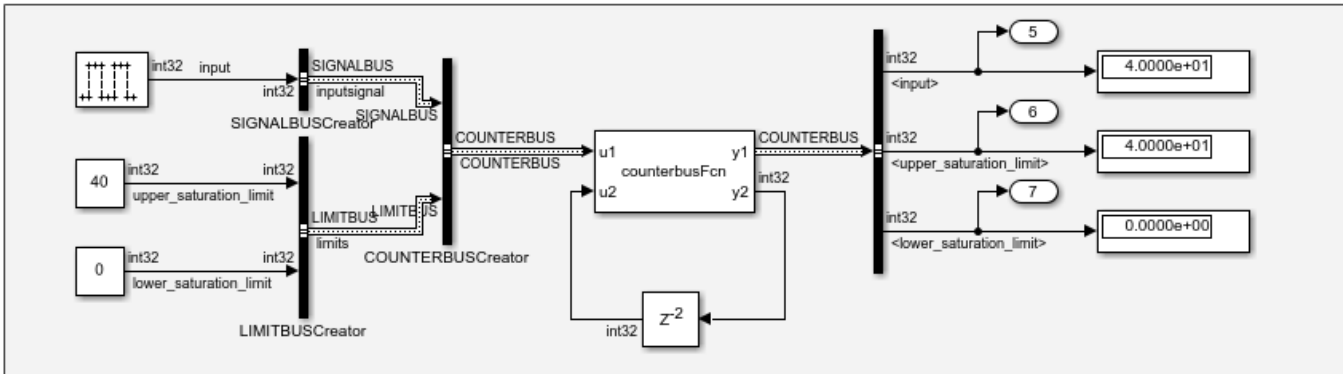

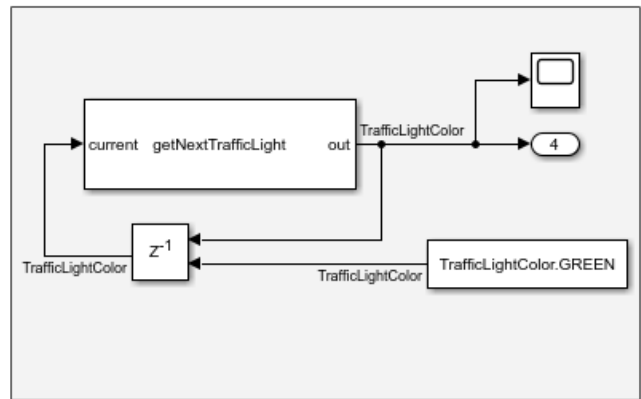

This example shows how to use the C Caller block to call your handwritten C functions.

In this example, five custom C functions are defined in `my_func.h` and implemented in `my_func.c`.

The header file and the source file are specified in the **Simulation Target** pane of the Model Configuration Parameters. Then C functions can be called via C Caller blocks. For example, the block `add` adds a signal and a constant together and the block `timesK` multiplies the signal by a parameter `K`. The C Caller block supports C structure and enumeration types. Use command `Simulink.importExternalCTypes` to import these types into Simulink as matching `Simulink.Bus` objects or `Simulink.IntEnumType` classes.

Call C Functions Using C Caller Block

Copyright 2019 The MathWorks, Inc.

Set up custom C code in model configuration

Add '#include "my_func.h"' to "Configuration Parameters > Simulation Target > Include headers" field.

Add 'include' to "Configuration Parameters > Simulation Target > Include directories" field.

Add 'src/my_func.c' to "**Configuration Parameters > Simulation Target > Source files**" field.

Bring Custom Image Filter Algorithms as Reusable Blocks in Simulink

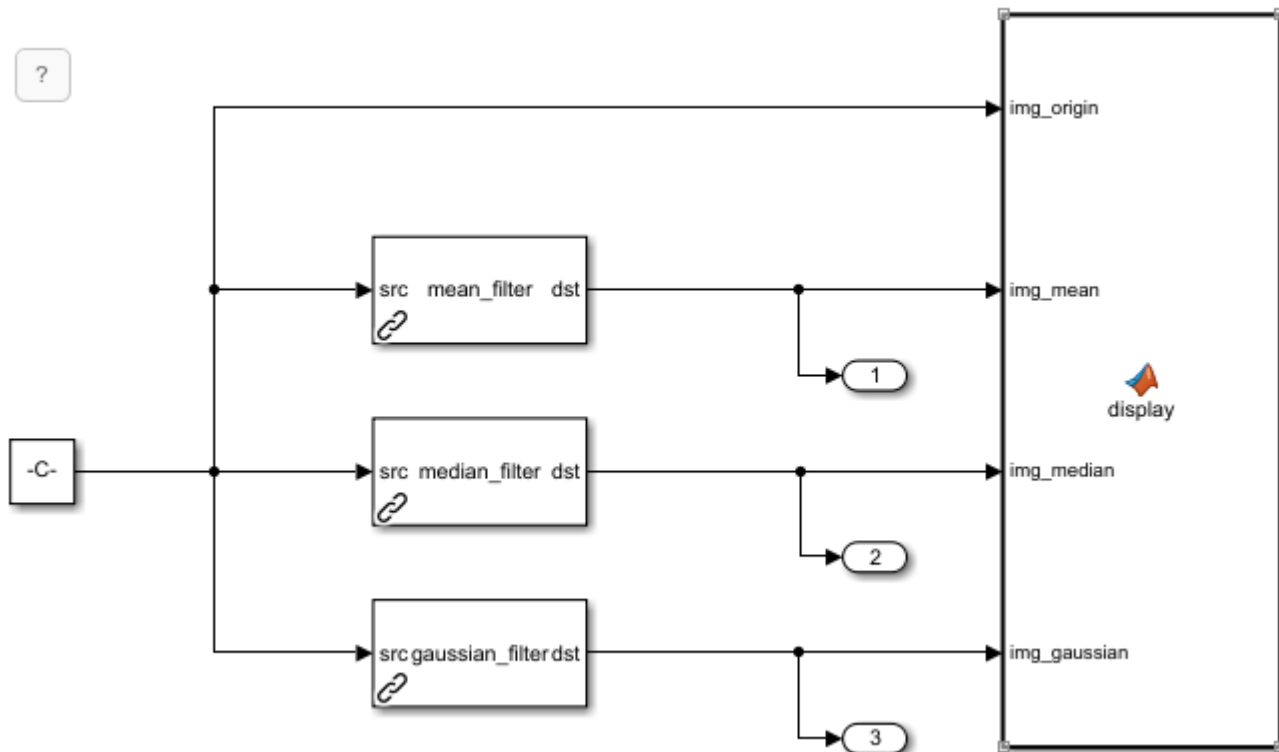

This example shows how to bring in C code image filter algorithms using C Caller blocks in a reusable Simulink library.

In this example, three image filter blocks are C Caller blocks in a library model. Their dependent C code is specified in the library model custom code settings.

The image filter C functions are implemented using "Row-major" array layout. Library custom code settings have "Default function array layout" set accordingly to "Row-major".

These library image filter blocks can be reused by adding them to models.

```
model = 'slexCCallerExampleImageFilter';
open_system(model);
```

As the simulation runs, the MATLAB Function block displays the filtered images.

```
evalc('sim(model)');
```

```
slcc('clearCustomCodeModules'); % unload custom libs before delete slprj folder
```

Custom Code and Hand Coded Blocks using the S-function API

This library launches examples of different types of Simulink® S-functions. Simulink S-functions allow you to extend Simulink with new hand coded blocks, interface to custom external code, and create live interfaces to other programs. Use this example to access models containing S-functions in the C, C++, M, and Fortran.

Each example contains a model that exercises an S-function block and a link for editing the S-function code. You can also access the main S-function file by using the Edit button on the S-function block dialog. In some of the models, use **Look Under Mask** to access the S-function. Additionally, the S-function Builder block is a masked version of the S-function block. The block includes an editor that builds an S-function out of a core algorithm.

By default, the S-function Builder also creates a TLC file for use with Simulink® Code™ and Embedded Code™.

Inputs Passed by Value or Address to Legacy Functions

This example shows you how to use the Legacy Code Tool to integrate legacy C functions that pass their input arguments by value versus address.

The Legacy Code Tool allows you to:

- Provide the legacy function specification,
- Generate a C-MEX S-function that is used during simulation to call the legacy code, and
- Compile and build the generated S-function for simulation.

Providing the Legacy Function Specification

Functions provided with the Legacy Code Tool take a specific data structure or array of structures as the argument. The data structure is initialized by calling the function `legacy_code()` using 'initialize' as the first input. After initializing the structure, you have to assign its properties to values corresponding to the legacy code being integrated. The prototypes of the legacy functions being called in this example are:

- `FLT filterV1(const FLT signal, const FLT prevSignal, const FLT gain)`
- `FLT filterV2(const FLT* signal, const FLT prevSignal, const FLT gain)`

where `FLT` is a typedef to `float`. The legacy source code is found in the files `your_types.h`, `myfilter.h`, `filterV1.c`, and `filterV2.c`.

Note the difference in the `OutputFcnSpec` defined in the two structures; the first case specifies that the first input argument is passed by value, while the second case specifies pass by pointer.

```

defs = [];

% sldemo_sfun_filterV1
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_filterV1';
def.OutputFcnSpec = 'single y1 = filterV1(single u1, single u2, single p1)';
def.HeaderFiles = {'myfilter.h'};
def.SourceFiles = {'filterV1.c'};
def.IncPaths = {'sldemo_lct_src'};
def.SrcPaths = {'sldemo_lct_src'};
defs = [defs; def];

% sldemo_sfun_filterV2
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_filterV2';
def.OutputFcnSpec = 'single y1 = filterV2(single u1[1], single u2, single p1)';
def.HeaderFiles = {'myfilter.h'};
def.SourceFiles = {'filterV2.c'};
def.IncPaths = {'sldemo_lct_src'};
def.SrcPaths = {'sldemo_lct_src'};
defs = [defs; def];

```

Generating and Compiling an S-Function for Use During Simulation

The function `legacy_code()` is called again with the first input set to 'generate_for_sim' in order to automatically generate and compile the C-MEX S-function according to the description provided by the input argument 'defs'. This S-function is used to call the legacy functions in simulation. The

source code for the S-function is found in the files `sldemo_sfund_filterV1.c` and `sldemo_sfund_filterV2.c`.

```
legacy_code('generate_for_sim', defs);
```

```
### Start Compiling sldemo_sfund_filterV1
    mex('-IC:\TEMP\Bdoc22a_1891349_13144\ibC86E06\8\tp1b7691b8\ex08075368\sldemo_lct_src', '-IC:

Building with 'Microsoft Visual C++ 2019 (C)'.
MEX completed successfully.
### Finish Compiling sldemo_sfund_filterV2
### Exit
```

Generating an `rtwmakecfg.m` File for Code Generation

After the TLC block file is created, the function `legacy_code()` can be called again with the first input set to `'rtwmakecfg_generate'` in order to generate an `rtwmakecfg.m` file to support code generation through Simulink® Coder™. Generate the `rtwmakecfg.m` file if the required source and header files for the S-functions are not in the same directory as the S-functions, and you want to add these dependencies in the makefile produced during code generation.

Note: Complete this step only if you are going to simulate the model in accelerated mode.

```
legacy_code('rtwmakecfg_generate', def);
```

Generating Masked S-Function Blocks for Calling the Generated S-Functions

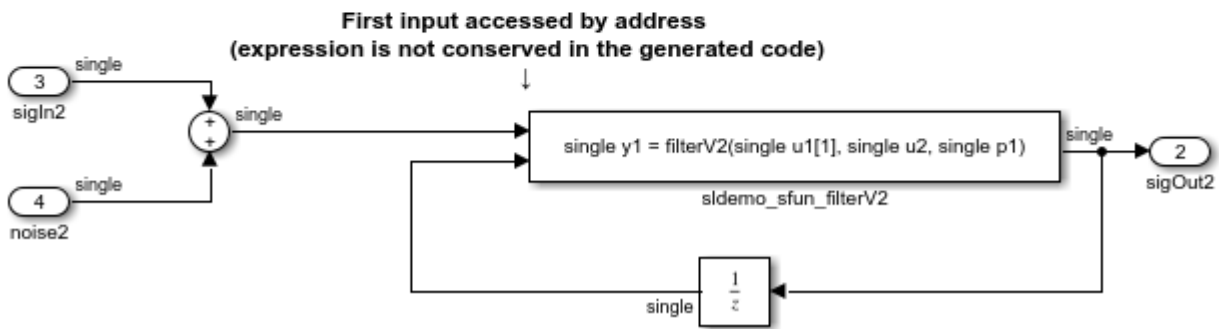

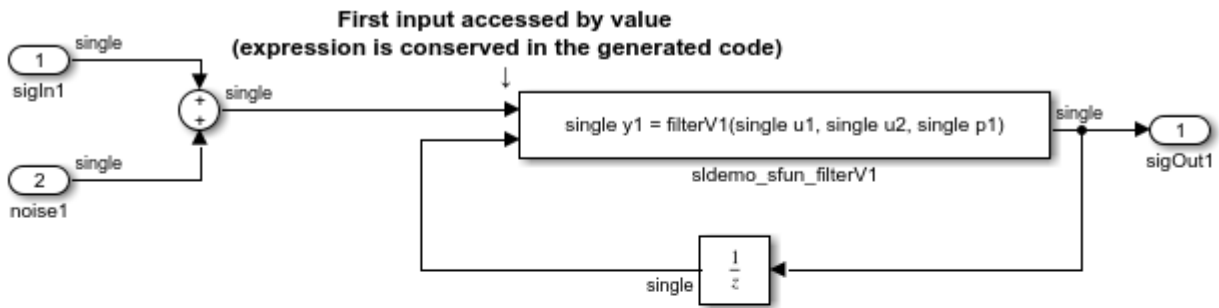

After the C-MEX S-function source is compiled, the function `legacy_code()` can be called again with the first input set to `'slblock_generate'` in order to generate masked S-function blocks which are configured to call those S-functions. The blocks are placed in a new model and can be copied to an existing model.

```
% legacy_code('slblock_generate', defs);
```

Integrate the Legacy Code

The model `sldemo_lct_filter` shows integration with the legacy code. The subsystem `TestFilter` serves as a harness for the calls to the legacy C functions via the generate S-functions, with unit delays serving to store the previous output values.

```
open_system('sldemo_lct_filter')
open_system('sldemo_lct_filter/TestFilter')
sim('sldemo_lct_filter');
```

Output Passed by Return Argument from Legacy Functions

This example shows you how to use the Legacy Code Tool to integrate legacy C functions that pass their output as a return argument.

The Legacy Code Tool allows you to:

- Provide the legacy function specification,
- Generate a C-MEX S-function that is used during simulation to call the legacy code, and
- Compile and build the generated S-function for simulation.

Providing the Legacy Function Specification

Functions provided with the Legacy Code Tool take a specific data structure or array of structures as the argument. The data structure is initialized by calling the function `legacy_code()` using 'initialize' as the first input. After initializing the structure, you have to assign its properties to values corresponding to the legacy code being integrated. The prototype of the legacy functions being called in this example is:

```
FLT gainScalar(const FLT in, const FLT gain)
```

where FLT is a typedef to float. The legacy source code is found in the files `your_types.h`, `gain.h`, and `gainScalar.c`.

```
% sldemo_sfun_gain_scalar
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_gain_scalar';
def.OutputFcnSpec = 'single y1 = gainScalar(single u1, single p1)';
def.HeaderFiles    = {'gain.h'};
def.SourceFiles    = {'gainScalar.c'};
def.IncPaths       = {'sldemo_lct_src'};
def.SrcPaths       = {'sldemo_lct_src'};
```

Generating and Compiling an S-Function for Use During Simulation

The function `legacy_code()` is called again with the first input set to 'generate_for_sim' in order to automatically generate and compile the C-MEX S-function according to the description provided by the input argument 'def'. This S-function is used to call the legacy functions in simulation. The source code for the S-function is found in the file `sldemo_sfun_gain_scalar.c`.

```
legacy_code('generate_for_sim', def);
```

```
### Start Compiling sldemo_sfun_gain_scalar
    mex('-IC:\TEMP\Bdoc22a_1891349_13144\ibC86E06\8\tp1b7691b8\ex60439838\sldemo_lct_src', '-IC:
Building with 'Microsoft Visual C++ 2019 (C)'.
MEX completed successfully.
    mex('sldemo_sfun_gain_scalar.c', '-IC:\TEMP\Bdoc22a_1891349_13144\ibC86E06\8\tp1b7691b8\ex604
Building with 'Microsoft Visual C++ 2019 (C)'.
MEX completed successfully.
### Finish Compiling sldemo_sfun_gain_scalar
### Exit
```

Generating an `rtwmakecfg.m` File for Code Generation

After the TLC block file is created, the function `legacy_code()` can be called again with the first input set to 'rtwmakecfg_generate' in order to generate an `rtwmakecfg.m` file to support code

generation through Simulink® Coder™. Generate the `rtwmakecfg.m` file if the required source and header files for the S-functions are not in the same directory as the S-functions, and you want to add these dependencies in the makefile produced during code generation.

Note: Complete this step only if you are going to simulate the model in accelerated mode.

```
legacy_code('rtwmakecfg_generate', def);
```

Generating a Masked S-Function Block for Calling the Generated S-Function

After the C-MEX S-function source is compiled, the function `legacy_code()` can be called again with the first input set to `'slblock_generate'` in order to generate a masked S-function block that is configured to call that S-function. The block is placed in a new model and can be copied to an existing model.

```
% legacy_code('slblock_generate', def);
```

Integrate the Legacy Code

The model `sldemo_lct_gain` shows integration with the legacy code. The subsystem `TestGain` serves as a harness for the call to the legacy C function via the generate S-function.

```
if isempty(find_system('SearchDepth',0,'Name','sldemo_lct_gain'))
    open_system('sldemo_lct_gain')
    open_system('sldemo_lct_gain/TestGain')
    sim('sldemo_lct_gain');
end
```

“Implement Algorithms Using Legacy Code Tool”

Fixed Point Signals in Legacy Functions

This example shows you how to use the Legacy Code Tool to integrate legacy C functions that pass their inputs and outputs using signals of fixed point data type.

The Legacy Code Tool allows you to:

- Provide the legacy function specification,
- Generate a C-MEX S-function that is used during simulation to call the legacy code, and
- Compile and build the generated S-function for simulation.

Providing the Legacy Function Specification

Functions provided with the Legacy Code Tool take a specific data structure or array of structures as the argument. The data structure is initialized by calling the function `legacy_code()` using 'initialize' as the first input. After initializing the structure, you have to assign its properties to values corresponding to the legacy code being integrated. The prototype of the legacy functions being called in this example is:

```
myFixpt timesS16(const myFixpt in1, const myFixpt in2, const uint8_T fracLength)
```

where `myFixpt` is logically a fixed point data type which is physically a typedef to a 16-bit integer:

```
myFixpt = Simulink.NumericType;
myFixpt.DataTypeMode = 'Fixed-point: binary point scaling';
myFixpt.Signed = true;
myFixpt.WordLength = 16;
myFixpt.FractionLength = 10;
myFixpt.IsAlias = true;
myFixpt.HeaderFile = 'timesFixpt.h';
```

The legacy source code is found in the files `timesFixpt.h` and `timesS16.c`.

```
% sldemo_sfun_times_s16
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_times_s16';
def.OutputFcnSpec = 'myFixpt y1 = timesS16(myFixpt u1, myFixpt u2, uint8 p1)';

MEX completed successfully.
### Finish Compiling sldemo_sfun_times_s16
### Exit
```

Generating an `rtwmakecfg.m` File for Code Generation

After the TLC block file is created, the function `legacy_code()` can be called again with the first input set to `'rtwmakecfg_generate'` in order to generate an `rtwmakecfg.m` file to support code generation through Simulink® Coder™. Generate the `rtwmakecfg.m` file if the required source and header files for the S-functions are not in the same directory as the S-functions, and you want to add these dependencies in the makefile produced during code generation.

Note: Complete this step only if you are going to simulate the model in accelerated mode.

```
legacy_code('rtwmakecfg_generate', def);
```

Generating a Masked S-Function Block for Calling the Generated S-Function

After the C-MEX S-function source is compiled, the function `legacy_code()` can be called again with the first input set to `'slblock_generate'` in order to generate a masked S-function block that is configured to call that S-function. The block is placed in a new model and can be copied to an existing model.

```
% legacy_code('slblock_generate', def);
```

Integration with Legacy Code

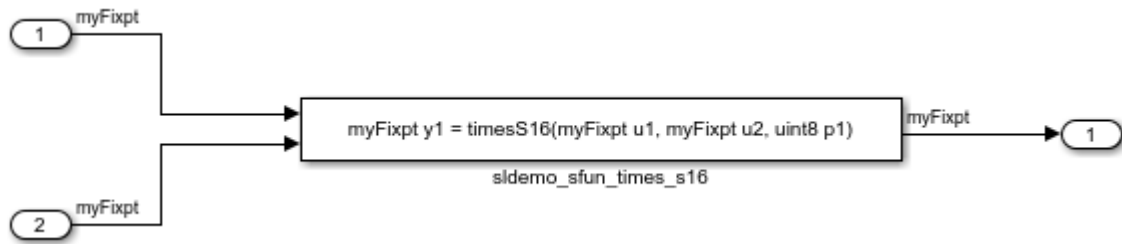

The model `sldemo_lct_fixpt_signals` shows integration with the legacy code. The subsystem `TestFixpt` serves as a harness for the call to the legacy C function via the generated S-function, and the scope compares the output of the function with the output of the built-in Simulink® product block; the results are identical.

```
open_system('sldemo_lct_fixpt_signals')
open_system('sldemo_lct_fixpt_signals/TestFixpt')
sim('sldemo_lct_fixpt_signals')

ans =

    Simulink.SimulationOutput:
        yout: [101x2 double]

    SimulationMetadata: [1x1 Simulink.SimulationMetadata]
    ErrorMessage: [0x0 char]
```

Fixed Point Parameters in Legacy Functions

This example shows you how to use the Legacy Code Tool to integrate legacy C functions that pass their inputs and outputs using parameters of fixed point data type.

The Legacy Code Tool allows you to:

- Provide the legacy function specification,
- Generate a C-MEX S-function that is used during simulation to call the legacy code, and
- Compile and build the generated S-function for simulation.

Providing the Legacy Function Specification

Functions provided with the Legacy Code Tool take a specific data structure or array of structures as the argument. The data structure is initialized by calling the function `legacy_code()` using 'initialize' as the first input. After initializing the structure, you have to assign its properties to values corresponding to the legacy code being integrated. The prototype of the legacy functions being called in this example is:

```
myFixpt timesS16(const myFixpt in1, const myFixpt in2, const uint8_T fracLength)
```

where `myFixpt` is logically a fixed point data type which is physically a typedef to a 16-bit integer:

```
myFixpt = Simulink.NumericType;
myFixpt.DataTypeMode = 'Fixed-point: binary point scaling';
myFixpt.Signed = true;
myFixpt.WordLength = 16;
myFixpt.FractionLength = 10;
myFixpt.IsAlias = true;
myFixpt.HeaderFile = 'timesFixpt.h';
```

The legacy source code is found in the files `timesFixpt.h`, and `timesS16.c`.

```
% sldemo_sfun_gain_fixpt
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_gain_fixpt';
def.OutputFcnSpec = 'myFixpt y1 = timesS16(myFixpt u1, myFixpt p1, uint8 p2)';
def.HeaderFiles = {'timesFixpt.h'};
def.SourceFiles = {'timesS16.c'};
def.IncPaths = {'sldemo_lct_src'};
def.SrcPaths = {'sldemo_lct_src'};
```

Generating and Compiling an S-Function for Use During Simulation

The function `legacy_code()` is called again with the first input set to 'generate for sim' in order to automatically generate and compile the C-MEX S-function according to the description provided by the input argument 'def'. This S-function is used to call the legacy functions in simulation. The source code for the S-function is found in the file `sldemo_sfun_gain_fixpt.c`.

```
legacy_code('generate_for_sim', def);
```

```
### Start Compiling sldemo_sfun_gain_fixpt

Lookup Tables Implemented in Legacy Functions

This example shows you how to use the Legacy Code Tool to integrate legacy C functions that implement N-dimensional table lookups.

The Legacy Code Tool allows you to:

- Provide the legacy function specification,
- Generate a C-MEX S-function that is used during simulation to call the legacy code, and
- Compile and build the generated S-function for simulation.

Providing the Legacy Function Specification

Functions provided with the Legacy Code Tool take a specific data structure or array of structures as the argument. The data structure is initialized by calling the function `legacy_code()` using 'initialize' as the first input. After initializing the structure, you have to assign its properties to values corresponding to the legacy code being integrated. The prototype of the legacy function being called in this example is:

```
FLT directLookupTableND(const FLT *tableND, const UINT32 nbDims, const UINT32 *tableDims,
const UINT32 *tableIdx)
```

where FLT is a typedef to float, and UINT32 is a typedef to unsigned int32. The legacy source code is found in the files `your_types.h`, `lookupTable.h`, and `directLookupTableND.c`.

```
defs = [];
evalin('base','load sldemo_lct_data.mat')
```

```
% sldemo_sfun_dlut3D
```

```
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_dlut3D';

Start and Terminate Actions Within Legacy Functions

This example shows you how to use the Legacy Code Tool to integrate legacy C functions that have start and terminate actions.

The Legacy Code Tool allows you to:

- Provide the legacy function specification,
- Generate a C-MEX S-function that is used during simulation to call the legacy code, and
- Compile and build the generated S-function for simulation.

Providing the Legacy Function Specification

Functions provided with the Legacy Code Tool take a specific data structure or array of structures as the argument. The data structure is initialized by calling the function `legacy_code()` using the 'initialize' first input. After initializing the structure, you have to assign its properties to values corresponding to the legacy code being integrated. The prototypes of the legacy functions being called in this example are:

- `void initFaultCounter(unsigned int *counter)`
- `void openLogFile(void **fid)`
- `void incAndLogFaultCounter(void *fid, unsigned int *counter, double time)`
- `void closeLogFile(void **fid)`

To open the model and files, click **Open Model**. The legacy source code is found in the files `your_types.h`, `fault.h`, and `fault.c`.

```
% sldemo_sfun_fault
def = legacy_code('initialize');
def.SFunctionName           = 'sldemo_sfun_fault';
def.InitializeConditionsFcnSpec = 'initFaultCounter(uint32 work2[1])';
def.StartFcnSpec           = 'openLogFile(void **work1)';
def.OutputFcnSpec          = 'incAndLogFaultCounter(void *work1, uint32 work2[1], double u)';
def.TerminateFcnSpec       = 'closeLogFile(void **work1)';
def.HeaderFiles            = {'fault.h'};
def.SourceFiles            = {'fault.c'};
def.IncPaths               = {'sldemo_lct_src'};
def.SrcPaths               = {'sldemo_lct_src'};
def.Options.useTlcWithAccel = false;
```

Generating and Compiling an S-Function for Use During Simulation

The function `legacy_code()` is called again with the first input set to 'generate_for_sim' in order to automatically generate and compile the C-MEX S-function according to the description provided by the input argument 'def'. This S-function is used to call the legacy functions in simulation. The source code for the S-function is found in the file `sldemo_sfun_fault.c`.

```
legacy_code('generate_for_sim', def);

### Start Compiling sldemo_sfun_fault
mex('-IC:\TEMP\Bdoc22a_1891349_13144\ibC86E06\8\tp1b7691b8\ex33158503\sldemo_lct_src', '-IC:
Building with 'Microsoft Visual C++ 2019 (C)'.
MEX completed successfully.
```

```

    mex('sldemo_sfun_fault.c', '-IC:\TEMP\Bdoc22a_1891349_13144\ibC86E06\8\tp1b7691b8\ex33158503
Building with 'Microsoft Visual C++ 2019 (C)'.
MEX completed successfully.
### Finish Compiling sldemo_sfun_fault
### Exit

```

Generating an rtwmakecfg.m File for Code Generation

After the TLC block file is created, the function `legacy_code()` can be called again with the first input set to `'rtwmakecfg_generate'` in order to generate an `rtwmakecfg.m` file to support code generation through Simulink® Coder™. Generate the `rtwmakecfg.m` file if the required source and header files for the S-functions are not in the same directory as the S-functions, and you want to add these dependencies in the makefile produced during code generation.

Note: Complete this step only if you are going to simulate the model in accelerated mode.

```
legacy_code('rtwmakecfg_generate', def);
```

Generating a Masked S-Function Block for Calling the Generated S-Function

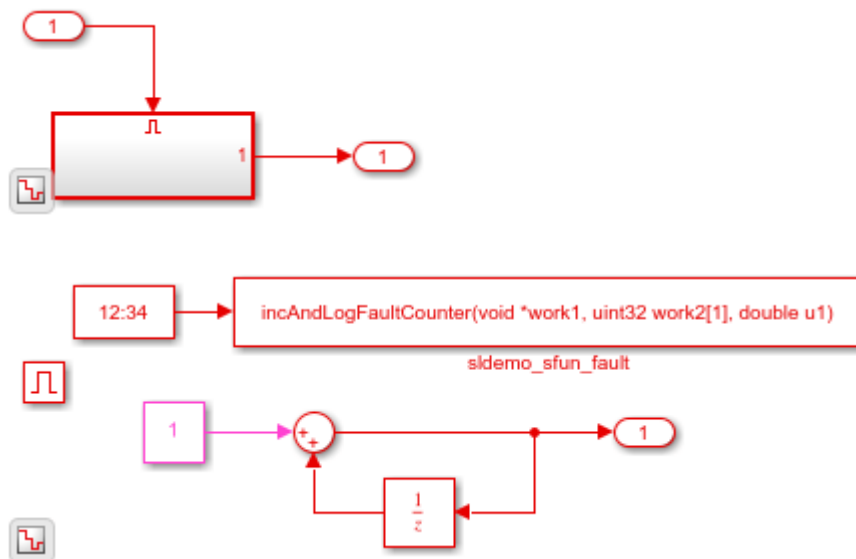

After the C-MEX S-function source is compiled, the function `legacy_code()` can be called again with the first input set to `'slblock_generate'` in order to generate a masked S-function block that is configured to call that S-function. The block is placed in a new model and can be copied to an existing model.

```
% legacy_code('slblock_generate', def);
```

Integrate the Legacy Code

The model `sldemo_lct_start_term` shows integration with the legacy code. The subsystem `TestFixpt` serves as a harness for the call to the legacy C function, and the scope compares the output of the function with the output of the built-in Simulink® product block; the results should be identical.

```
open_system('sldemo_lct_start_term')
open_system('sldemo_lct_start_term/TestFault')
sim('sldemo_lct_start_term');
```

Use the Legacy Code Tool to call legacy functions that have start and terminate actions

mdlInitializeConditions → call `initFaultCounter()` → reset the fault counter
 mdlStart → call `openLogFile()` → open the file 'sldemo_lct_fault.log' for logging faults
 mdlOutput → call `incAndLogFaultCounter()` → increment the fault counter and append one line in the log file
 mdlTerminate → call `closeLogFile()` → close the logging file

- run the model and edit the generated logging file 'sldemo_lct_fault.log'

To view the source files, click these links.

- open legacy files `fault.h` and `fault.c`
- open generated S-Function `sldemo_sfuns_fault.c`

Generating an `rtwmakecfg.m` File for Code Generation

After the TLC block file is created, the function `legacy_code()` can be called again with the first input set to `'rtwmakecfg_generate'` in order to generate an `rtwmakecfg.m` file to support code generation through Simulink® Coder™. Generate the `rtwmakecfg.m` file if the required source and header files for the S-functions are not in the same directory as the S-functions, and you want to add these dependencies in the makefile produced during code generation.

Note: Complete this step only if you need to simulate the model in accelerated mode.

```
legacy_code('rtwmakecfg_generate', def);
```

Generating Masked S-Function Blocks for Calling the Generated S-Functions

After the C-MEX S-function source is compiled, the function `legacy_code()` can be called again with the first input set to `'slblock_generate'` in order to generate masked S-function blocks which are configured to call those S-functions. The blocks are placed in a new model and can be copied to an existing model.

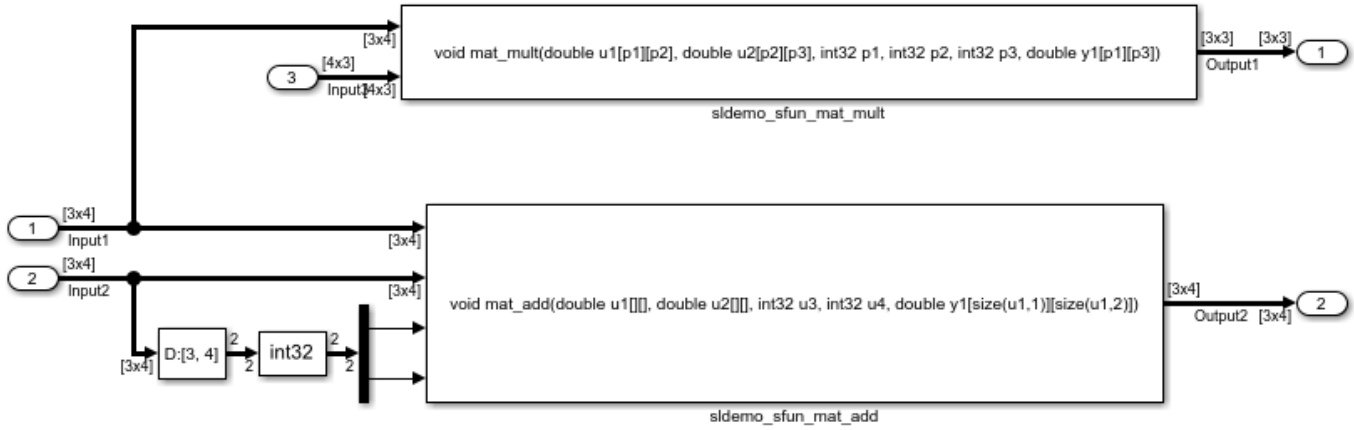

```
% legacy_code('slblock_generate', defs);
```

Integrate the Legacy Code

The model `sldemo_lct_inherit_dims` shows integration with the legacy code. The subsystem `TestMatOps` serves as a harness for the calls to the legacy C functions, with unit delays serving to store the previous output values.

```
open_system('sldemo_lct_inherit_dims')
open_system('sldemo_lct_inherit_dims/TestMatOps')
sim('sldemo_lct_inherit_dims');
```

Input/Output matrix dimensions are related to the parameter's values

Input matrices are dynamically sized
the Output matrix dimensions are related to the Input matrices dimensions

C++ Object Methods as Legacy Functions

This example shows you how to use the Legacy Code Tool to integrate legacy C++ object methods.

The Legacy Code Tool allows you to:

- Provide the legacy function specification,
- generate a C++ MEX S-function that is used during simulation to call the legacy code, and
- Compile and build the generated S-function for simulation.

Providing the Legacy Function Specification

Functions provided with the Legacy Code Tool take a specific data structure or array of structures as the argument. The data structure is initialized by calling the function `legacy_code()` using 'initialize' as the first input. After initializing the structure, you have to assign its properties to values corresponding to the legacy code being integrated. The definition of the legacy C++ class being used in this example is:

```
class adder {
private:
    int int_state;
public:
    adder();
    int add_one(int increment);
    int get_val();
};
```

The legacy source code is found in the files `adder_cpp.h` and `adder_cpp.cpp`.

```
% sldemo_sfun_adder_cpp
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_adder_cpp';
def.StartFcnSpec = 'createAdder()';
def.OutputFcnSpec = 'int32 y1 = adderOutput(int32 u1)';
def.TerminateFcnSpec = 'deleteAdder()';
def.HeaderFiles = {'adder_cpp.h'};
def.SourceFiles = {'adder_cpp.cpp'};
def.IncPaths = {'sldemo_lct_src'};
def.SrcPaths = {'sldemo_lct_src'};
def.Options.language = 'C++';
def.Options.useTlcWithAccel = false;
```

Generating and Compiling an S-Function for Use During Simulation

The function `legacy_code()` is called again with the first input set to 'generate_for_sim' in order to automatically generate and compile the C-MEX S-function according to the description provided by the input argument 'def'. This S-function is used to call the legacy functions in simulation. The source code for the S-function is found in the file `sldemo_sfun_adder_cpp.cpp`.

```
legacy_code('generate_for_sim', def);
```

```
### Start Compiling sldemo_sfun_adder_cpp
mex('-IC:\TEMP\Bdoc22a_1891349_13144\ibC86E06\8\tp1b7691b8\ex93865240\sldemo_lct_src', '-IC:

```

Generating an `rtwmakecfg.m` File for Code Generation

After the TLC block file is created, the function `legacy_code()` can be called again with the first input set to `'rtwmakecfg_generate'` in order to generate an `rtwmakecfg.m` file to support code generation through Simulink® Coder™. Generate the `rtwmakecfg.m` file if the required source and header files for the S-functions are not in the same directory as the S-functions, and you want to add these dependencies in the makefile produced during code generation.

Note: Complete this step only if you are going to simulate the model in accelerated mode.

```
legacy_code('rtwmakecfg_generate', def);
```

Generating a Masked S-Function Block for Calling the Generated S-Function

After the C-MEX S-function source is compiled, the function `legacy_code()` can be called again with the first input set to `'slblock_generate'` in order to generate a masked S-function block that is configured to call that S-function. The block is placed in a new model and can be copied to an existing model.

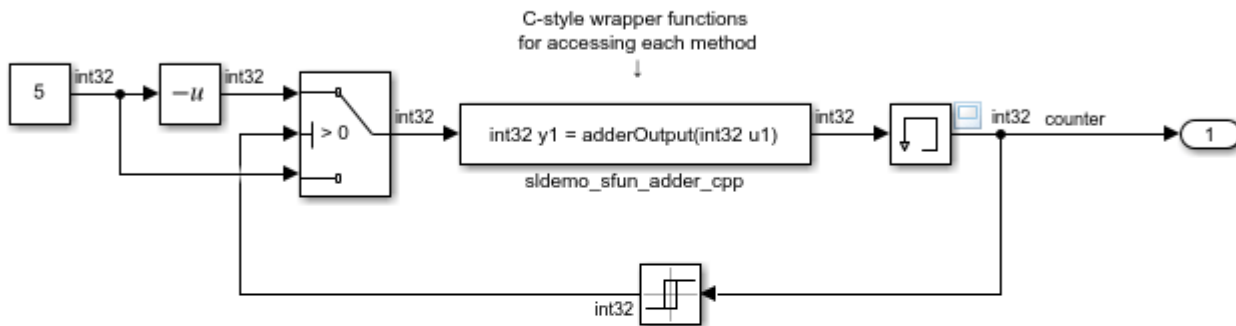

```
% legacy_code('slblock_generate', def);
```

Integration with Legacy Code

The model `sldemo_lct_cpp` `sldemo_lct_cpp` shows integration with the legacy code.

```
open_system('sldemo_lct_cpp')
sim('sldemo_lct_cpp');
```

Use the Legacy Code Tool to
call C++ object member functions

For this example to run, at the MATLAB command prompt enter: `>> mex -setup`
and select a C++ compiler.

To view the source files, click these links.

- open legacy files [adder_cpp.h](#) and [adder_cpp.cpp](#)
- open generated S-Function [sldemo_sfund_adder_cpp.cpp](#)

Persistent Memory Within Legacy Functions

This example shows you how to use the Legacy Code Tool to integrate legacy C functions with instance-specific persistent memory.

The Legacy Code Tool allows you to:

- Provide the legacy function specification,
- Generate a C-MEX S-function that is used during simulation to call the legacy code, and
- Compile and build the generated S-function for simulation.

Providing the Legacy Function Specification

Functions provided with the Legacy Code Tool take a specific data structure or array of structures as the argument. The data structure is initialized by calling the function `legacy_code()` using 'initialize' as the first input. After initializing the structure, you have to assign its properties to values corresponding to the legacy code being integrated. The prototype of the legacy functions being called in this example are:

```
void memory_bus_init(COUNTERBUS *mem, int32_T upper_sat, int32_T lower_sat);
void memory_bus_step(COUNTERBUS *input, COUNTERBUS *mem, COUNTERBUS *output);
```

where `mem` is an instance-specific persistent memory for applying a one integration step delay. `COUNTERBUS` is a struct typedef defined in `counterbus.h` and implemented with a `Simulink.Bus` object in the base workspace. The legacy source code is found in the files `memory_bus.h` and `memory_bus.c`.

```
evalin('base','load sldemo_lct_data.mat')
```

```
% sldemo_sfun_work
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_work';
def.InitializeConditionsFcnSpec = 'void memory_bus_init(COUNTERBUS work1[1], int32 p1, int32 p2)';
def.OutputFcnSpec = 'void memory_bus_step(COUNTERBUS u1[1], COUNTERBUS work1[1], COUNTERBUS y1[1])';
def.HeaderFiles = {'memory_bus.h'};
def.SourceFiles = {'memory_bus.c'};
def.IncPaths = {'sldemo_lct_src'};
def.SrcPaths = {'sldemo_lct_src'};
```

Generating and Compiling an S-Function for Use During Simulation

The function `legacy_code()` is called again with the first input set to 'generate_for_sim' in order to automatically generate and compile the C-MEX S-function according to the description provided by the input argument 'def'. This S-function is used to call the legacy functions in simulation. The source code for the S-function is found in the file `sldemo_sfun_work.c`.

```
legacy_code('generate_for_sim', def);
```

```
### Start Compiling sldemo_sfun_work

```

```
Building with 'Microsoft Visual C++ 2019 (C)'.  
MEX completed successfully.  
### Finish Compiling sldemo_sfunk_work  
### Exit
```

Generating an `rtwmakecfg.m` File for Code Generation

After the TLC block file is created, the function `legacy_code()` can be called again with the first input set to `'rtwmakecfg_generate'` in order to generate an `rtwmakecfg.m` file to support code generation through Simulink® Coder™. Generate the `rtwmakecfg.m` file if the required source and header files for the S-functions are not in the same directory as the S-functions, and you want to add these dependencies in the makefile produced during code generation.

Note: Complete this step only if you are going to simulate the model in accelerated mode.

```
legacy_code('rtwmakecfg_generate', def);
```

Generating a Masked S-Function Block for Calling the Generated S-Function

After the C-MEX S-function source is compiled, the function `legacy_code()` can be called again with the first input set to `'slblock_generate'` in order to generate a masked S-function block that is configured to call that S-function. The block is placed in a new model and can be copied to an existing model.

```
% legacy_code('slblock_generate', def);
```

Integrate the Legacy Code

The model `sldemo_lct_work` shows integration with the legacy code. The subsystem `memory_bus` serves as a harness for the call to the legacy C function.

```
open_system('sldemo_lct_work')  
open_system('sldemo_lct_work/memory_bus')  
sim('sldemo_lct_work')  
  
ans =  
  
Simulink.SimulationOutput:  
    ScopeDataA: [11x3 double]  
        tout: [11x1 double]  
  
SimulationMetadata: [1x1 Simulink.SimulationMetadata]  
    ErrorMessage: [0x0 char]
```

This legacy function apply a one integration step delay. The output is the previous input value. The parameters P1 and P2 set the initial values of the sub structure fields "upper_saturation_limit" and "lower_saturation_limit"

Multi-Dimensional Signals in Legacy Functions

This example shows you how to use the Legacy Code Tool to integrate legacy C functions with Multi-Dimensional Signals.

The Legacy Code Tool allows you to:

- Provide the legacy function specification,
- Generate a C-MEX S-function that is used during simulation to call the legacy code, and
- Compile and build the generated S-function for simulation.

Providing the Legacy Function Specification

Functions provided with the Legacy Code Tool take a specific data structure or array of structures as the argument. The data structure is initialized by calling the function `legacy_code()` using 'initialize' as the first input. After initializing the structure, you have to assign its properties to values corresponding to the legacy code being integrated. The prototype of the legacy functions being called in this example are:

```
void array3d_add(real_T *y1, real_T *u1, real_T *u2, int32_T nbRows, int32_T nbCols, int32_T nbPages);
```

where `real_T` is a typedef to `double`, and `int32_T` is a typedef to a 32-bit integer. The legacy source code is found in the files `ndarray_ops.h` and `ndarray_ops.c`.

```
% sldemo_sfun_ndarray_add
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_ndarray_add';
def.OutputFcnSpec = ['void array3d_add(double y1[size(u1,1)][size(u1,2)][size(u1,3)], ', ...
                    'double u1[][][], double u2[][][], ' ...
                    'int32 size(u1,1), int32 size(u1,2), int32 size(u1,3))'];
def.HeaderFiles    = {'ndarray_ops.h'};
def.SourceFiles    = {'ndarray_ops.c'};
def.IncPaths       = {'sldemo_lct_src'};
def.SrcPaths       = {'sldemo_lct_src'};
```

where `y1` is a 3-D output signal of same dimensions as the 3-D input signal `u1`. Note that the last 3 arguments passed to the legacy function correspond to the number of element in each dimension of the 3-D input signal `u1`.

Generating and Compiling an S-Function for Use During Simulation

The function `legacy_code()` is called again with the first input set to 'generate_for_sim' in order to automatically generate and compile the C-MEX S-function according to the description provided by the input argument 'def'. This S-function is used to call the legacy functions in simulation. The source code for the S-function is found in the file `sldemo_sfun_ndarray_add.c`.

```
legacy_code('generate_for_sim', def);
```

```
### Start Compiling sldemo_sfun_ndarray_add
mex('-IC:\TEMP\Bdoc22a_1891349_13144\ibC86E06\8\tp1b7691b8\ex68315702\sldemo_lct_src', '-IC:
Building with 'Microsoft Visual C++ 2019 (C)'.
MEX completed successfully.
mex('sldemo_sfun_ndarray_add.c', '-IC:\TEMP\Bdoc22a_1891349_13144\ibC86E06\8\tp1b7691b8\ex68
```

```
Building with 'Microsoft Visual C++ 2019 (C)'.
MEX completed successfully.
### Finish Compiling sldemo_sfun_ndarray_add
### Exit
```

Generating an rtwmakecfg.m File for Code Generation

After the TLC block file is created, the function `legacy_code()` can be called again with the first input set to `rtwmakecfg_generate` in order to generate an `rtwmakecfg.m` file to support code generation through Simulink® Coder™. Generate the `rtwmakecfg.m` file if the required source and header files for the S-functions are not in the same directory as the S-functions, and you want to add these dependencies in the makefile produced during code generation.

Note: Complete this step only if you are going to simulate the model in accelerated mode.

```
legacy_code('rtwmakecfg_generate', def);
```

Generating a Masked S-Function Block for Calling the Generated S-Function

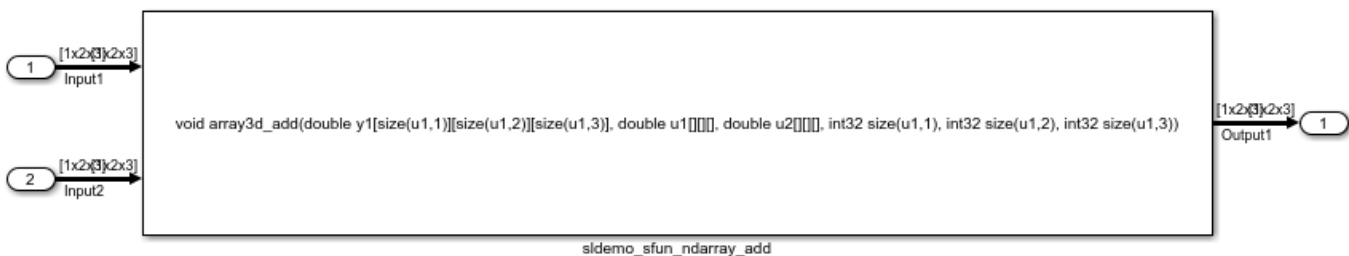

After the C-MEX S-function source is compiled, the function `legacy_code()` can be called again with the first input set to `slblock_generate` in order to generate a masked S-function block that is configured to call that S-function. The block is placed in a new model and can be copied to an existing model.

```
% legacy_code('slblock_generate', def);
```

Integrate the Legacy Code

The model `sldemo_lct_ndarray` shows integration with the legacy code. The subsystem `ndarray_add` serves as a harness for the call to the legacy C function.

```
open_system('sldemo_lct_ndarray')
open_system('sldemo_lct_ndarray/ndarray_add')
sim('sldemo_lct_ndarray');
```

```
This legacy function computes the addition of the 2 input signals:
- Input1 and Input2 are dynamically sized 3D arrays
- Output1 is a dynamically sized 3D array of same size as Input1
- the last 3 function's arguments allow to pass the Input1's dimensions to the legacy function
```

Illustration of Law of Large Numbers

This example shows how to use MATLAB System blocks to illustrate the law of large numbers.

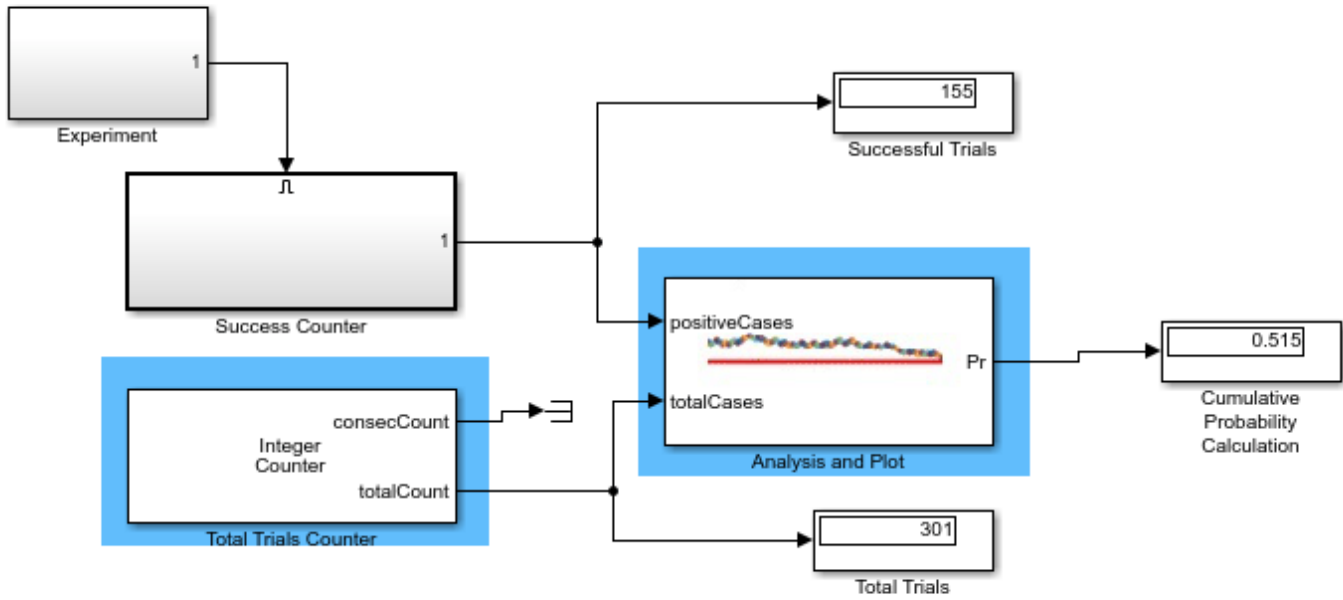

The law of large numbers states that the cumulative average probability of an event approaches the expected value as the number of trials approaches infinity. You can see this in the generated plot.

A Uniform Random Number block connected to Compare To Constant block acts as a Bernoulli trial. The example uses the high value as successful outcome of the experiment.

This example highlights the use of MATLAB System block as follows:

- The Success Counter counts the number of successful trials. The Total Trials Counter counts the total number of trials. Both blocks use the same System object™. This System object is a source block that uses the "resetImpl" method to count the number of times the block has run at consecutive time steps.
- The Analysis and Plot block calculates the average probability and plots it. It uses a System object that inherits from the interface classes matlab.System. The interface class matlab.System is required for all System objects. To use features not supported for code generation, such as unsupported functions, define propagator methods for the System object. As a result, this block cannot simulate in "Code generation" mode. It must simulate in "Interpreted execution" mode.
- The two MATLAB System blocks use custom icons. The Analysis and Plot block uses an image file icon. The Total Trials Counter block uses a multiline text icon. The "getIconImpl" methods of the corresponding System objects define these custom icons.

MATLAB System Block Example: Illustration of Law of Large Numbers

Using Buses with MATLAB System Blocks

This example shows how to use buses as inputs and outputs to the MATLAB System block.

The Gain block uses a System object™ that applies the gain specified in the block to the bus elements 'a' and 'b' of the incoming bus. The output of the block is the same bus type as the input.

The Math Operations block uses a System object that computes the sum, product, and difference between the two bus elements 'a' and 'b' of the input bus. The output of the block is a bus with three elements: 'sum', 'prod', and 'diff'.

If a MATLAB System block output bus is the same type as the input bus, you must still specify the output bus name in the 'getOutputDataTypeImpl' method. This is because the 'propagatedInputDataType' method does not return the input bus object during bus propagation.

Before model initialization, all bus types used as either inputs or outputs to the MATLAB System block must be available in the MATLAB base workspace.

Run Quality Checks on S-Functions

This example shows how to use S-Function analyzer APIs to check S-functions, in order to identify potential problems and improvements.

The S-Function analyzer MATLAB command line APIs consist of:

- **Simulink.sfunction.Analyzer** - Class used to launch S-function analyzer and get analysis results.
- **Simulink.sfunction.analyzer.BuildInfo** - Class used to create an object to specify the build information for an S-function.
- **Simulink.sfunction.analyzer.Options** - Class used to specify the running options for S-function Analyzer.
- **Simulink.sfunction.analyzer.findSfunctions** - Static method to return all feasible S-functions in a model or library for S-function analyzer.

See the help for more detailed information about the above APIs.

Specify the Input Model or Library (required)

The S-Function analyzer requires a model or a library in MATLAB path as input, which contains the S-function blocks to be analyzed.

```
model = 'slexSfunctionCheckExample';
```

Specify the Build Information for S-functions (optional)

S-Function analyzer checks the source code of S-functions when they are available. Heuristics are applied to automatically locate the source code based on S-function names. For example, if S-function source code and the input model are in the same folder, the source code will be included in the analysis automatically. Otherwise, the build information has to be specified through `Simulink.sfunction.analyzer.BuildInfo`. If no source code is available, this section can be skipped.

To specify the build information, first determine the eligible S-functions in the input model, then create a `Simulink.sfunction.analyzer.BuildInfo` object for each S-function. For S-function `slexBadSFcn`, there are two associated source files: `slexBadSFcn.c` and `slexBadSFcn_wrapper.c`

```
sfunctions= Simulink.sfunction.analyzer.findSfunctions(model);
bdInfo= Simulink.sfunction.analyzer.BuildInfo(fullfile(matlabroot,'examples','simulink_features',
    'ExtraSrcFileList',{'slexBadSFcn_wrapper.c'},...
    'SrcPaths',{fullfile(matlabroot,'examples','simulink_features','slexBadSFcn')});
```

Specify the Running Options for S-function Analyzer (optional)

The execution options for S-function analyzer can be configured through `Simulink.sfunction.analyzer.Options` object, such as whether to enable Polyspace checks and Parameter Robustness checks, model simulation timeout, and output path for result report. If no specific options are needed, this section can be skipped. All default options will be applied.

```
opts = Simulink.sfunction.analyzer.Options();
opts.EnableRobustness = 1;
```

Run the S-function Analyzer and See the Result (required)

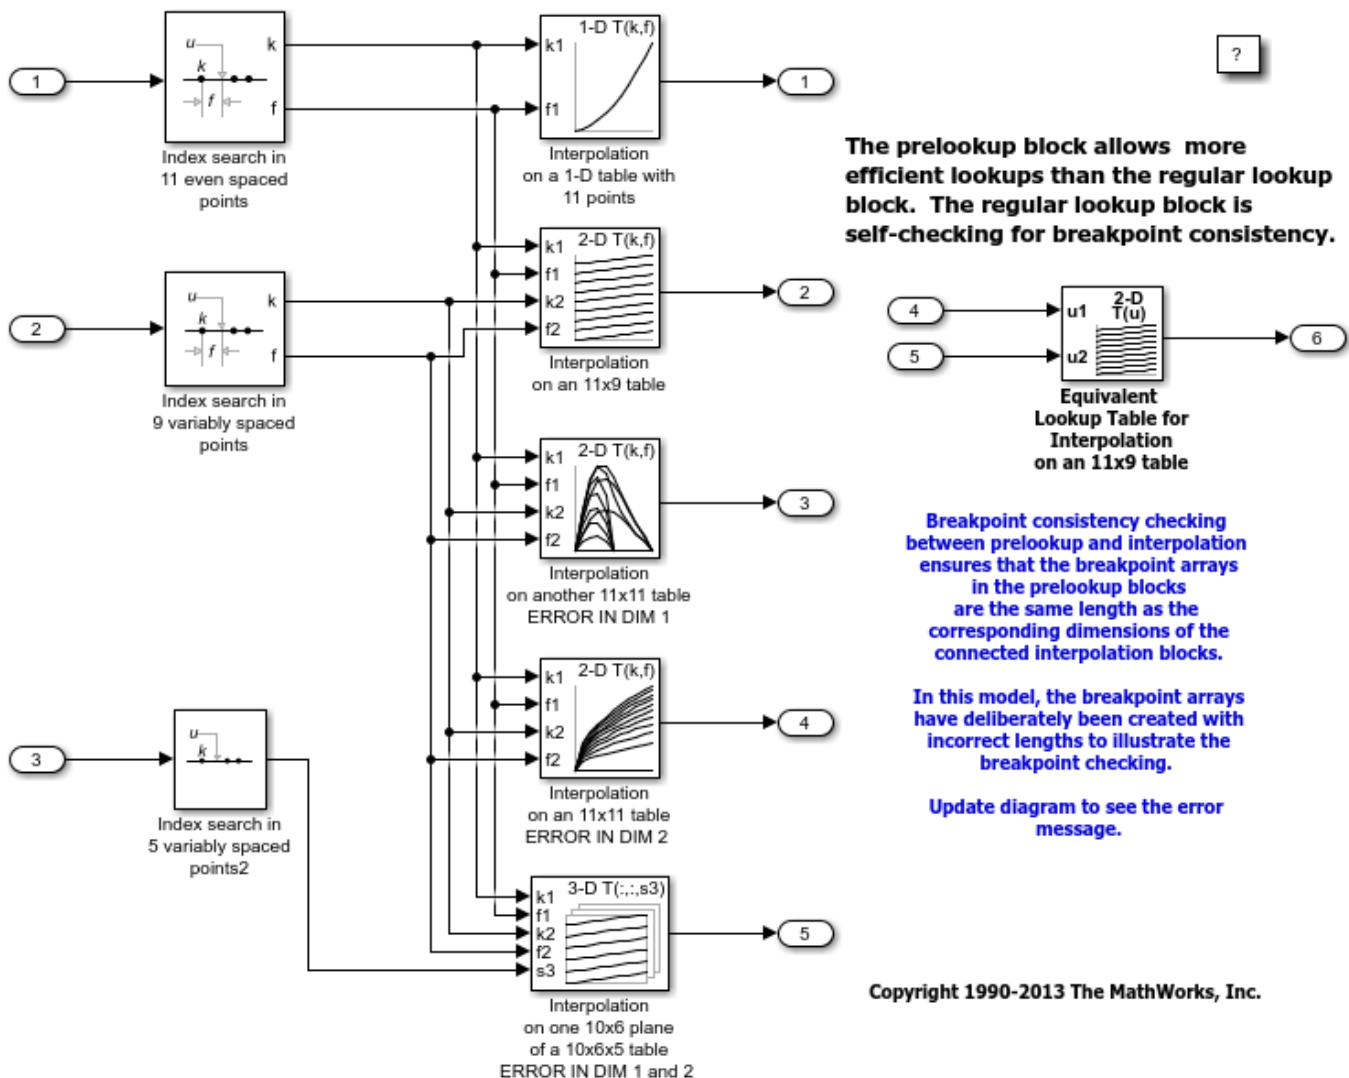

```
sfunAnalyzer = Simulink.sfunction.Analyzer(model, 'BuildInfo', {bdInfo}, 'Options', opts);  
analysisResult=sfunAnalyzer.run();  
sfunAnalyzer.generateReport();
```

Using the Prelookup and Interpolation Blocks

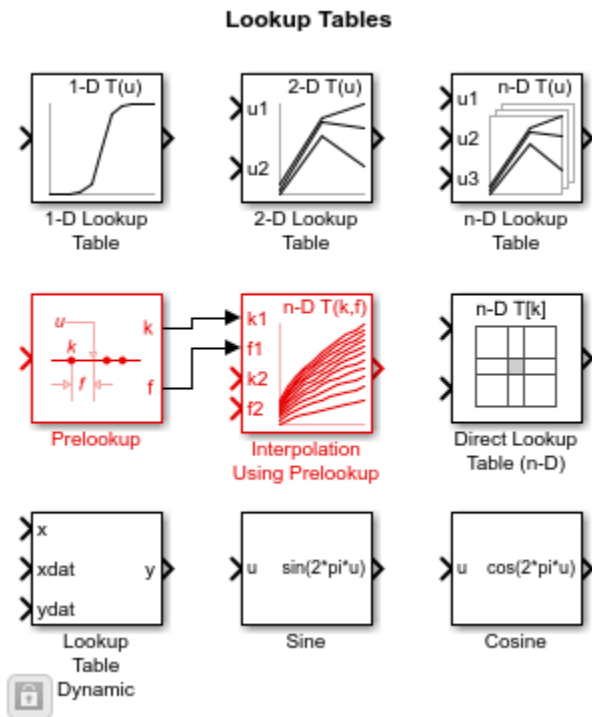

This examples shows how to use the Prelookup and Interpolation Using Prelookup blocks.

Introduction

This model uses Prelookup and Interpolation Using Prelookup blocks. The Prelookup block minimizes the number of index searches performed across a set of lookup tables. It also mixes clipping, extrapolation, and index search algorithms within one table calculation. Note how the Prelookup blocks perform the index search portion of the computation and the Interpolation Using Prelookup blocks perform the rest:

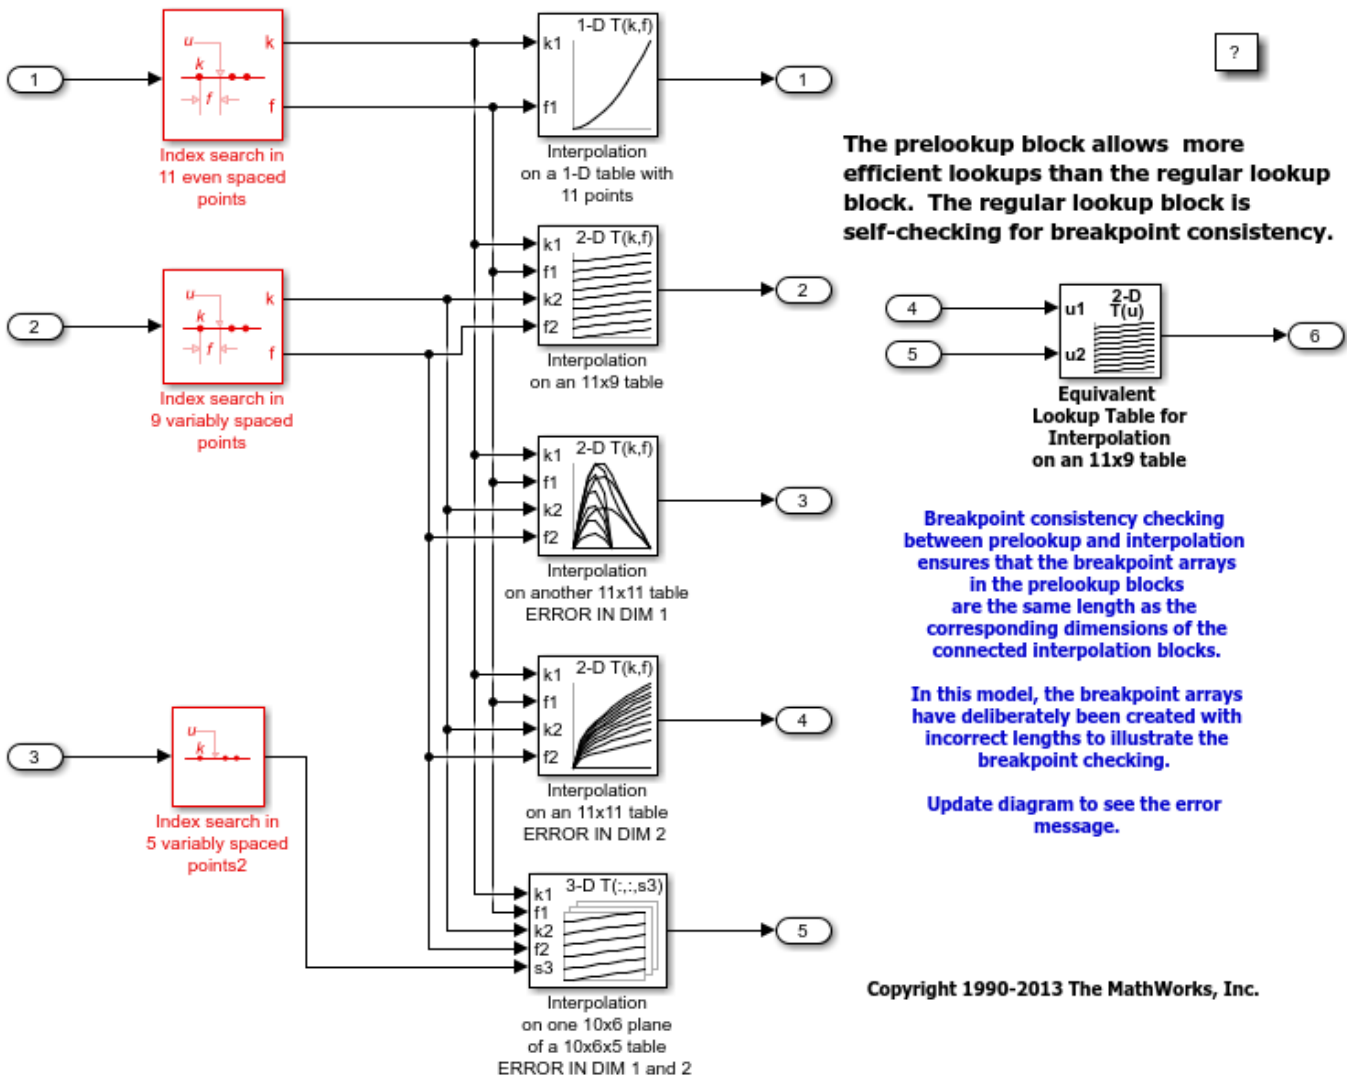

These blocks are in the Simulink® block library in the Lookup Tables sublibrary:

Optimization: PreLookup and Interpolation Using Prelookup Blocks

Consider using PreLookup block for tables with intensive index searches in breakpoint sets. The Prelookup blocks allow you to perform an index search once and reuse the result in many table lookups. In this model, three index search results are used in five blocks in a total of ten uses. Equivalent regular lookup tables such as the example to the right would have required ten index searches instead of three.

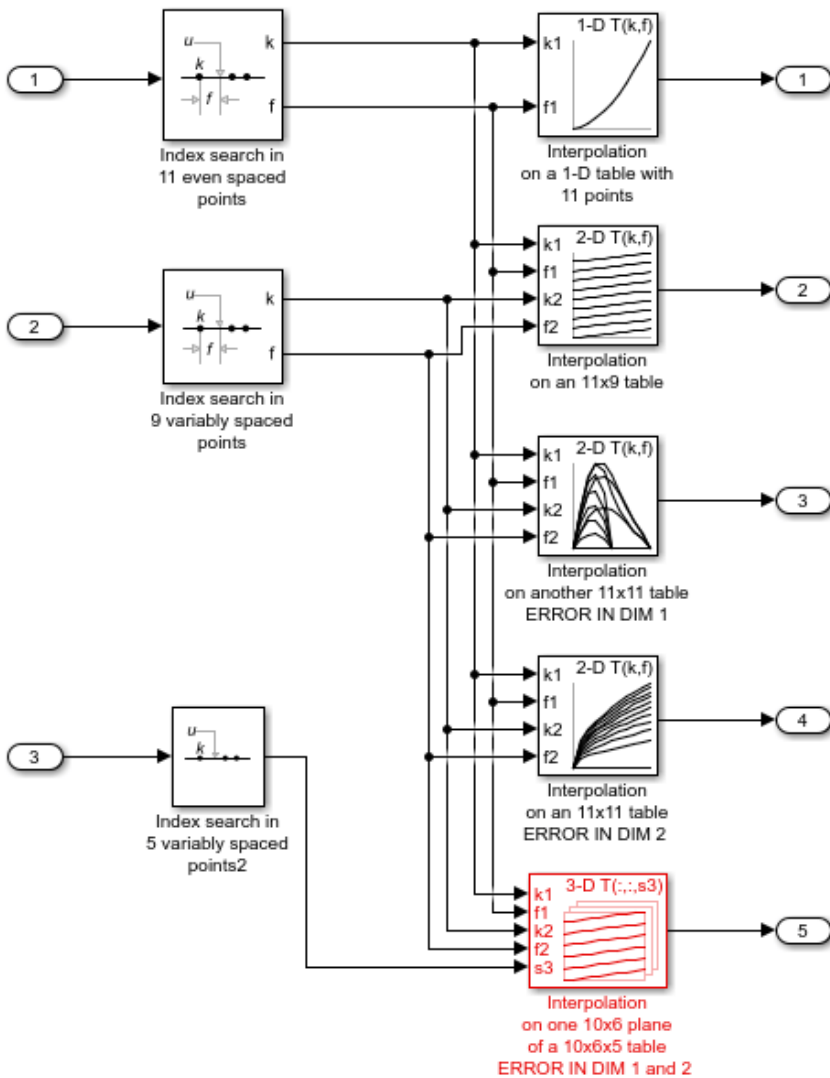

Optimization: Subtable Selection Option in the Interpolation Using Prelookup Blocks

One of the interpolation blocks in this model is configured using a capability: trailing dimensions of an n-D table can be marked as "selection dimensions", meaning that the input for that dimension is an integer used only to make a subtable selection, such as picking a 2-D plane from a 3-D table. The subtable is then interpolated normally.

Interpolation of subtables can save tremendous amounts of computation. For every dimension eliminated from interpolation, the computation almost halves. Since an N-dimensional interpolation takes $(2^N) - 1$ individual interpolation operations ($y = y_{low} + f \cdot (y_{high} - y_{low})$), just one dimension of selection can almost double the speed of the interpolation. Extreme example: a 5-D table with three dimensions of subtable selection and 2-D interpolation: 5-D interpolation would take $2^5 - 1 = 31$ interpolations, but a 2-D interpolation takes only $2^2 - 1 = 3$.

The selection ports support vectorization to allow multiple subtable selection/interpolations in a single block.

The prelookup block allows more efficient lookups than the regular lookup block. The regular lookup block is self-checking for breakpoint consistency.

Breakpoint consistency checking between prelookup and interpolation ensures that the breakpoint arrays in the prelookup blocks are the same length as the corresponding dimensions of the connected interpolation blocks.

In this model, the breakpoint arrays have deliberately been created with incorrect lengths to illustrate the breakpoint checking.

Update diagram to see the error message.

Copyright 1990-2013 The MathWorks, Inc.

The subtable or multitable mode of operation is activated by setting a positive integer for the 'Number of sub-table selections dimensions' parameter in the block parameter dialog. The number you set is interpreted as the number of dimensions to select from the highest dimensions. For example, if you have a 3-D table and choose 2, that means the first dimension will be interpolated and dimensions 2 and 3 will be selected:

NOTE: You can remove highlighting from a model using the View/Remove highlighting menu item or this command:

```
set_param mdl, 'HiliteAncestors', 'none')
```

Breakpoint and Table Data Consistency Checking

Using Prelookup and Interpolation Using Prelookup blocks introduces a need to ensure that the length of the 'Breakpoint data' parameter in the Prelookup blocks matches the corresponding dimension of the 'Table data' parameter in the connected Interpolation Using Prelookup blocks.

Simulink® always checks the consistency between the two blocks when updating the block diagram. Simulink reports errors if it encounters inconsistent breakpoint and table data. For example:

```
try
    evalc(['sim(', mdl, ')']);
catch E
    disp(['Error:', E.message]);
end
```

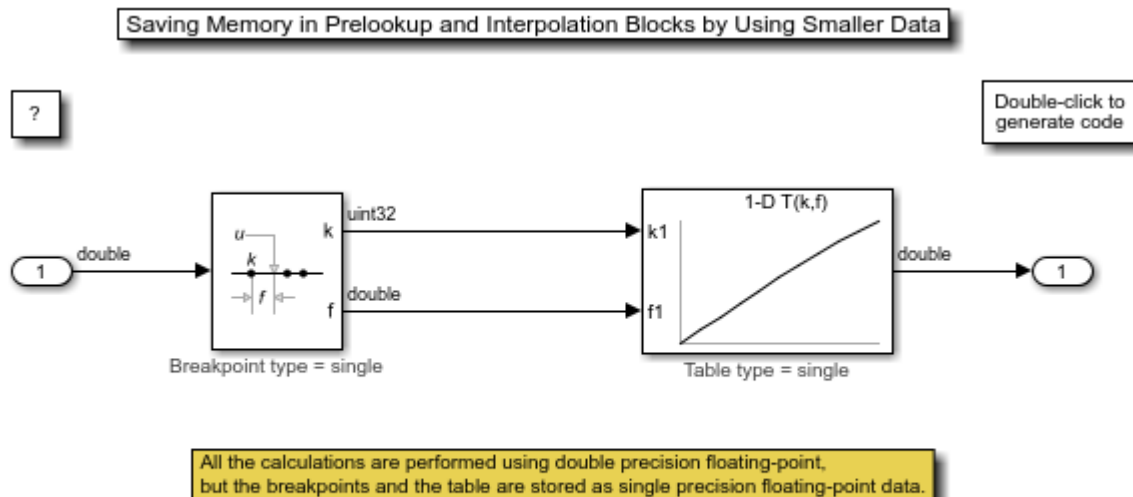

Error:The range of values for input port k2 of block '[k2](matlab:open_and_hilite_hyperlink)' is not consistent with the table data.

Saving Memory in Prelookup and Interpolation Blocks by Using Smaller Data

This example shows how to save memory in Prelookup and Interpolation blocks. The Prelookup and Interpolation Using Prelookup blocks allow you to explicitly set data type storing breakpoints and table data. Note that the Prelookup block allows the breakpoint data to differ from the input data type, and the Interpolation Using Prelookup block allows the table data to differ from the output data type.

In this model, the breakpoints and table are stored using single precision floating-point data type, and the calculations are performed using double precision floating-point data type. This reduces the amount of breakpoint and table data memory by half.

To see this in the generated code, open the model and build it.

Copyright 2008-2013 The MathWorks, Inc.

Model Advisor

This example shows the capabilities of the Model Advisor to check a model or subsystem for conditions and configuration settings that can result in inaccurate or inefficient simulation of the system represented by the model or generation of inefficient code from the model. The Model Advisor produces a report that lists all the suboptimal conditions or settings that it finds, suggesting better model configuration settings where appropriate.

The Model Advisor can be started through menus or the command line and can also be configured and used through a comprehensive API.

```
open_system('sldemo_mdldv')  
evalc('sim(''sldemo_mdldv'')');
```

Introduction to Profiling Models

This example shows how to use the **Simulink Profiler** to examine the `slAccelDemoF14` model and identify issues that can contribute to poor simulation performance. Consider using the **Simulink Profiler** to manually optimize model settings, identify simulation slowdowns, and resolve performance bottlenecks.

To automatically optimize your model and achieve faster simulation, see “Improve Simulation Performance Using Performance Advisor”.

To learn more about accelerator modes for faster simulation, see “What Is Acceleration?”.

Activate the Profiler

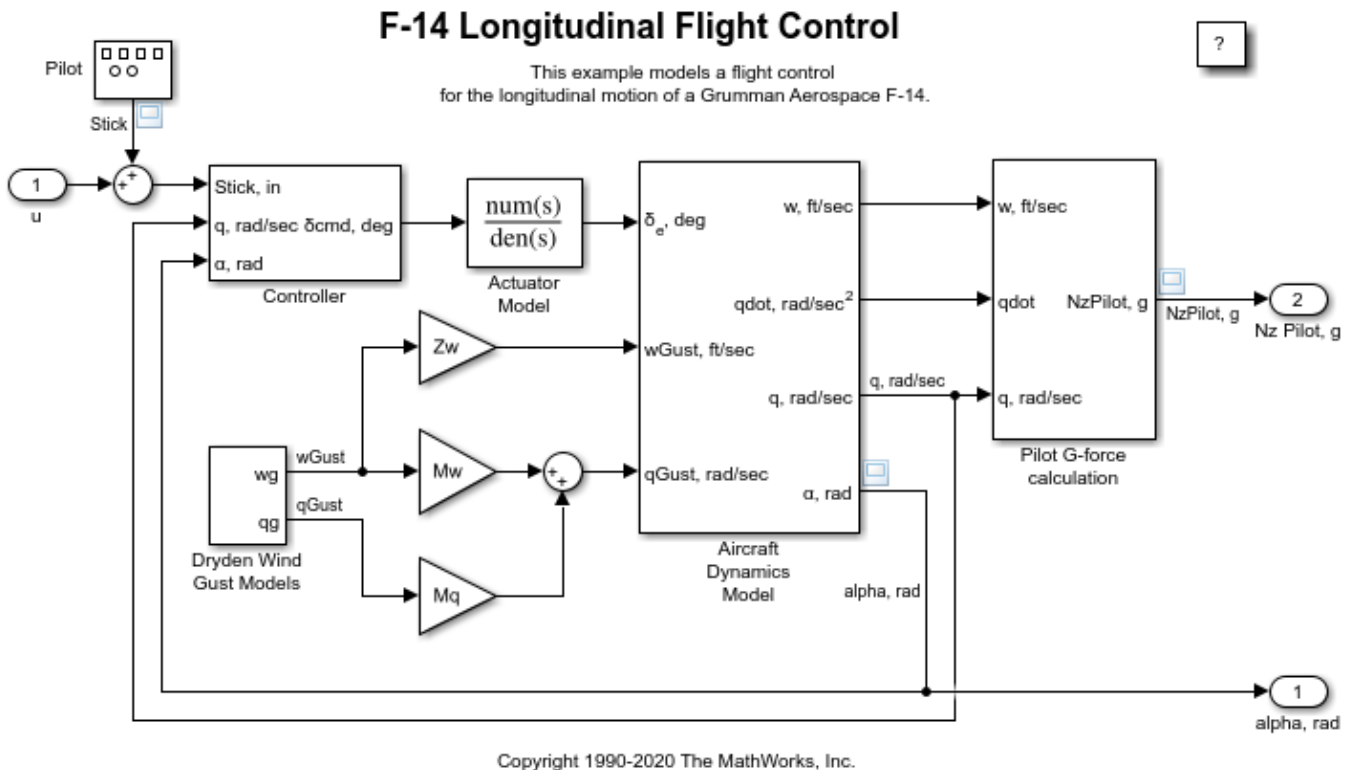

To activate the Simulink® Profiler, in the Simulink Editor, on the **Debug** tab, under **Performance Advisor**, click **Simulink Profiler**. You can also issue a `set_param` command at the command prompt.

```
modelName = 'slAccelDemoF14';  
load_system(modelName)  
set_param(modelName, 'Profile', 'on');
```

Run Simulation

While the simulation runs, the profiler is collecting data for the report. Once the simulation is complete it creates an HTML report.

```
open_system(modelName)  
sim(modelName);
```

View Report

A detailed profiling report is shown in a docked panel on the Simulink Editor. Select a row to see the breakdown of the self-time of the specific model element in the Property Inspector.

The screenshot displays the Simulink Profiler interface for the 'F-14 Longitudinal Flight Control' model. The main workspace shows the block diagram of the control system, including components like 'Stick in', 'Controller', 'Dryden-Wind Gust Models', 'Actuator Model', 'Aircraft Dynamics Model', and 'Pilot G-force calculation'. The Profiler Report is visible at the bottom, showing a table of performance metrics for various blocks.

Path	Time (s) (dark band - Self Time)	Total Time (s)	Self Time (s)	Number of Calls
slAccelDemoF14	4.388	5.629	25002	
Scope1	0.456	0.456	39556	
Controller	0.023	0.008	0	
...to-sensor Low-pass Filter	0.008	0.008	21709	
Stick Profiler	0.002	0.002	21709	
PI2H_Rule_Lateral_Filter	0.002	0.002	21709	
Sum2	0.002	0.002	39557	
...les Integral compensator	0.002	0.002	21709	
Gain2	0.001	0.001	39556	
Gain3	0.001	0.001	39556	
Sum3	0.001	0.001	39557	
Gain	0.001	0.001	39556	

The Profiler Report also includes a 'Total Time Breakdown for Stick Profiler' section, which shows the following data:

Path	Time (s)	Number of Calls
TransferFcs.Derivatives	0.001	8218
TransferFcs.Outputs.Mixer	0.001	8218
TransferFcs.Derivatives	0.000	800
TransferFcs.ClearHeightTilt...	0.000	1
TransferFcs.Outputs.Mixer	0.000	1343
TransferFcs.Update	0.000	1343
TransferFcs.InitializeControl...	0.000	1
TransferFcs.SetupRunTime...	0.000	1

Share Report

You can share the profiling report with others as an HTML report or as a MAT file. To share your profiling run, select the desired run from the **Run** menu of the Profiling Report. Then select your desired export format from the **Share** menu on the Toolstrip.

Introduction to Accelerating Models

Simulink® Accelerator™ speeds up the execution of your model, by creating and compiling C code. This C code takes the place of the interpretive code that Simulink uses when in Normal mode (that is, when Simulink® is not in Accelerator mode). Simulink Accelerator generates the C code from the Simulink model and invokes the MATLAB® mex function to compile and dynamically link the generated code to Simulink. This code generation and compilation process happens the first time you accelerate the model and any time the model changes are significant enough to require re-generation (for example, the addition of a block).

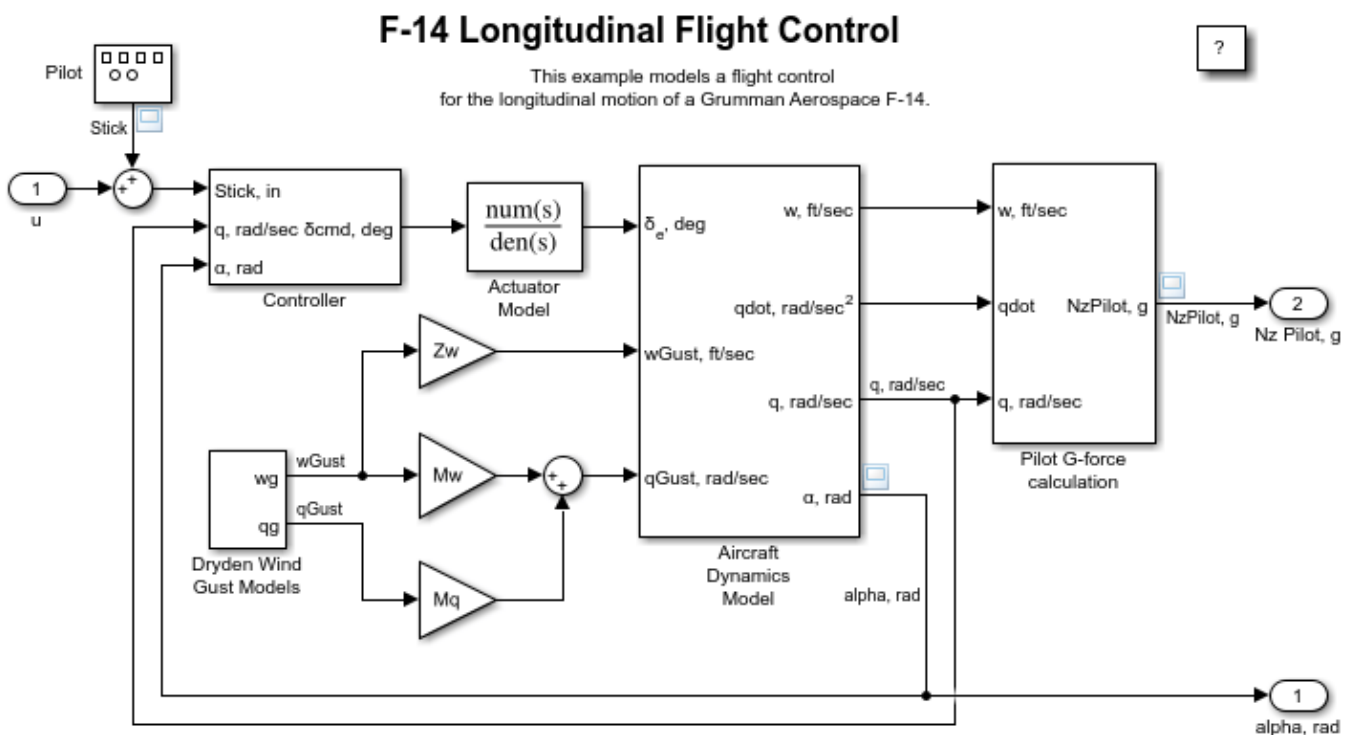

This example uses the slAccelDemoF14 model to illustrate the use of Simulink Accelerator.

Measure Non-accelerated Time

Open the slAccelDemoF14 model and set the stop time to 3000 seconds. Simulate the model and time how long it takes using TIC/TOC.

```
modelName = 'slAccelDemoF14';
open_system(modelName)
set_param(modelName, 'stoptime', '3000')
tic
sim(modelName);
toc
```

Elapsed time is 31.085915 seconds.

Turn on the Accelerator

To activate the Simulink® Accelerator, in the Simulink Editor, on the **Simulation** tab, under **Simulate**, select **Accelerator**. You can also issue a `set_param` command at the MATLAB® command prompt.

```
set_param(modelName, 'SimulationMode', 'Accelerator')
```

Build Accelerated Model

Build the accelerated model and simulate it. When running in Accelerator mode, you can start the model by selecting **Run** on the **Simulation** tab or by running the command:

```
sim(modelName)
```

at the MATLAB prompt. In either case, the progress of the code generation process will be displayed in the MATLAB command window. To suppress this display wrap the `sim` command inside an `evalc`.

```
evalc('sim(modelName);');
```

Simulate the Accelerated Model

Simulate the model again. Notice the model simulation runs much faster on subsequent runs.

```
tic
sim(modelName);
toc
```

```
Elapsed time is 7.420516 seconds.
```

Change Tunable Parameter and Simulate Accelerated Model

Change the value of one of the tunable parameters in the model and simulate the model again. Notice the accelerated version of the model does not have to be re-generated and so the simulation still runs more quickly in Accelerated mode than in Normal mode.

```
modelWorkspace = get_param(modelName, 'ModelWorkspace');
evalin(modelWorkspace, 'Mw=Mw*2;')
tic
sim(modelName);
toc
```

```
Elapsed time is 6.650912 seconds.
```

Determine Why Simulink Accelerator Is Regenerating Code

Sometimes Simulink® regenerates the simulation target for a model at the beginning of a simulation in Accelerator Mode but it is not always clear why regeneration happens. This example shows how to use Simulink MATLAB® commands to determine why Simulink regenerates code for Accelerator Mode simulations.

Simulink's Accelerator Mode speeds up simulation of your model by creating an executable version of the model, called a simulation target, and running this target instead of interpreting the model, as is done during Normal Mode simulation.

The process of code generation happens during the first time that you simulate your model in Accelerator Mode. Additionally, code generation may happen on subsequent simulations, especially if the model changes between simulations (for example, after addition of a block). Code generation takes times and it is often desirable to avoid it, in order to maximize the number of simulations within a given time span.

Simulink uses the model's checksum to determine if the code needs to be regenerated. This checksum is an array of four integers computed by using an md5 checksum algorithm based on attributes of the model and the blocks that it contains. Any change in the model that changes the checksum causes Simulink to regenerate the simulation target for Accelerator Mode.

Sometimes, it is not clear which model change triggered a checksum change and hence code regeneration. This example shows how to investigate why Simulink needs to regenerate code for Accelerator Mode simulation for a given model and its configuration.

Open an Example Model

We will use a simple model, `slAccelDemoWhyRebuild`, throughout this example.

```
model = 'slAccelDemoWhyRebuild';
open_system(model)
```

Determine Why Simulink Accelerator Re-Builds

```
set_param(model, 'AccelVerboseBuild', 'on');
```

The first time the model runs in Accelerator mode, it generates and compiles code as expected.

```
simOutput = evalc(['sim('',model,')']);
if ~isempty(strfind(simOutput,'Building the Accelerator target for model'))
    disp('Built Simulink Accelerator mex file')
else
    disp('Did not build Simulink Accelerator mex file')
end
```

```
Built Simulink Accelerator mex file
```

If the simulation is run again, without any changes to the model, we expect that Simulink can reuse the existing code and does not need to regenerate the code. Execute the same commands to verify.

```
simOutput = evalc(['sim('',model,'')']);
if ~isempty(strfind(simOutput,'Building the Accelerator target for model'))
    disp('Built Simulink Accelerator mex file')
else
    disp('Did not build Simulink Accelerator mex file')
end
```

```
Did not build Simulink Accelerator mex file
```

Now we change some parameters in the model. We will set the following settings for the block 'Integrator':

- Set 'Ignore limit and reset when linearizing' to 'on'
- Set 'Initial Condition' to '5'

```
set_param([model,'/Integrator'],'IgnoreLimit','on');
set_param([model,'/Integrator'],'InitialCondition','5');
```

When we run the simulation again, we see that Simulink regenerates the code.

```
simOutput = evalc(['sim('',model,'')']);
if ~isempty(strfind(simOutput,'Building the Accelerator target for model'))
    disp('Built Simulink Accelerator mex file')
else
    disp('Did not build Simulink Accelerator mex file')
end
```

```
Built Simulink Accelerator mex file
```

We would like to know why.

To determine if the previously generated code is still valid for the current model configuration, Simulink compares the checksum of the model as used to generate the code to the current checksum. If they are equal, the previously generated code is still valid and Simulink Accelerator Mode reuses it for the current simulation. If the values differ, Simulink Accelerator Mode regenerates and rebuilds the code. Thus, examining the details of the checksum computation can reveal why Simulink regenerated the code.

Get Checksum Details

The following command gets the model checksum computation details:

```
[cs1,csdet1]=Simulink.BlockDiagram.getChecksum(model);
```

The first output is the model checksum value itself. The second output gives details of what went into the checksum computation.

Let us set the modified block parameters to their original values and get the checksum and details for that configuration.

```
set_param([model,'/Integrator'],'IgnoreLimit','off');
set_param([model,'/Integrator'],'InitialCondition','0');
[cs2,csdet2]=Simulink.BlockDiagram.getChecksum(model);
```

Comparing these two checksum values is equivalent to determining if the Simulink Accelerator will regenerate code. Note that the checksum values are different, as we expect based on the fact that Simulink Accelerator regenerates code every time it runs.

```
if (cs1 ~= cs2)
    disp('Checksums are different')
else
    disp('Checksums are the same')
end
```

Checksums are different

Now that we know that the checksums differ, the next question is why. Many things go into the checksum computation, including signal data types, some block parameter values, and block connectivity information. To understand why the checksums differ, we need to see what has changed about the items used in computing the checksum. The checksum details returned as the second argument give that information.

```
csdet1

csdet1 = struct with fields:
    ContentsChecksum: [1x1 struct]
    InterfaceChecksum: [1x1 struct]
    ContentsChecksumItems: [188x1 struct]
    InterfaceChecksumItems: [49x1 struct]
```

The checksum details is a structure array with four fields. Two of the fields are the component checksums of the model checksum (these are called ContentsChecksum and InterfaceChecksum) and the other two are the corresponding checksum details. These details correspond to various information which went into to the computation of the two component checksums. The model [structural] checksum is a function of ContentsChecksum and InterfaceChecksum.

First, let's determine if the difference lies in the model's contents or the model's interface.

```
if (csdet1.ContentsChecksum.Value ~= csdet2.ContentsChecksum.Value)
    disp('Contents checksums are different')
else
    disp('Contents checksums are the same')
end
```

Contents checksums are different

```
if (csdet1.InterfaceChecksum.Value ~= csdet2.InterfaceChecksum.Value)
    disp('Interface checksums are different')
else
    disp('Interface checksums are the same')
end
```

Interface checksums are the same

Use Details to Determine Why Checksum Changed

Now that we know the change is in the ContentsChecksum, we can look at the ContentsChecksumItems to see what has changed.

```
idxForDifferences=[];
for idx = 1:length(csdet1.ContentsChecksumItems)
```

```

if (~strcmp(csdet1.ContentsChecksumItems(idx).Handle, ...
           csdet2.ContentsChecksumItems(idx).Handle))
    idxForDifferences=[idxForDifferences,idx];
    disp(['Handles different for item ',num2str(idx)]);
end
if (~strcmp(csdet1.ContentsChecksumItems(idx).Identifier, ...
           csdet2.ContentsChecksumItems(idx).Identifier))
    disp(['Identifiers different for item ',num2str(idx)]);
    idxForDifferences=[idxForDifferences,idx];
end
if(ischar(csdet1.ContentsChecksumItems(idx).Value))
    if (~strcmp(csdet1.ContentsChecksumItems(idx).Value, ...
               csdet2.ContentsChecksumItems(idx).Value))
        disp(['String Values different for item ',num2str(idx)]);
        idxForDifferences=[idxForDifferences,idx];
    end
end
if(isnumeric(csdet1.ContentsChecksumItems(idx).Value))
    if (csdet1.ContentsChecksumItems(idx).Value ~= ...
        csdet2.ContentsChecksumItems(idx).Value)
        disp(['Numeric values are different for item ',num2str(idx)]);
        idxForDifferences=[idxForDifferences,idx];
    end
end
end
end

```

```
String Values different for item 40
```

Now that we know the differences are in the items at the indices listed in `idxForDifferences`, we can look at those items in the two `ContentsChecksumItems` arrays.

```

blk1 = csdet1.ContentsChecksumItems(idxForDifferences(1)).Handle

blk1 =
'slAccelDemoWhyRebuild/Integrator'

blk2 = csdet2.ContentsChecksumItems(idxForDifferences(1)).Handle

blk2 =
'slAccelDemoWhyRebuild/Integrator'

id1 = csdet1.ContentsChecksumItems(idxForDifferences(1)).Identifier

id1 =
'IgnoreLimit'

id2 = csdet2.ContentsChecksumItems(idxForDifferences(1)).Identifier

id2 =
'IgnoreLimit'

```

The Handle for both items is 'slAccelDemoWhyRebuild/Integrator', which indicates the block with the changing data. The identifier for both is 'IgnoreLimit' which tells us that this was the block setting which changed, resulting in a different checksum for the model. The setting for the Initial Condition of the block does not appear in the checksum detail. Therefore, we expect that if only the setting for the Initial Condition is modified, that no rebuild will occur.

Avoid Rebuild on Successive Simulations

Now that we found the parameter which causes the checksums to differ for this workflow, we can validate the findings by keeping that parameter constant and seeing whether rebuild occurs on successive simulations.

Let's simulate the model in Accelerator mode again. We expect it to rebuild for this simulation because we changed the parameter ('IgnoreLimit') for the checksum computation above.

```
simOutput = evalc(['sim('',model,'')']);
if ~isempty(strfind(simOutput,'Building the Accelerator target for model'))
    disp('Built Simulink Accelerator mex file')
else
    disp('Did not build Simulink Accelerator mex file')
end
```

Built Simulink Accelerator mex file

Now let's only change the Initial Condition setting and simulate again. We expect that no rebuild should happen this time.

```
set_param([model,'/Integrator'],'InitialCondition','-3');
simOutput = evalc(['sim('',model,'')']);
if ~isempty(strfind(simOutput,'Building the Accelerator target for model'))
    disp('Built Simulink Accelerator mex file')
else
    disp('Did not build Simulink Accelerator mex file')
end
```

Did not build Simulink Accelerator mex file

As expected from the checksum analysis, changing the parameter for 'Initial Condition' does not cause a regeneration of code for simulation in Accelerator mode.

Parallel Simulations Using Parsim: Test-Case Sweep

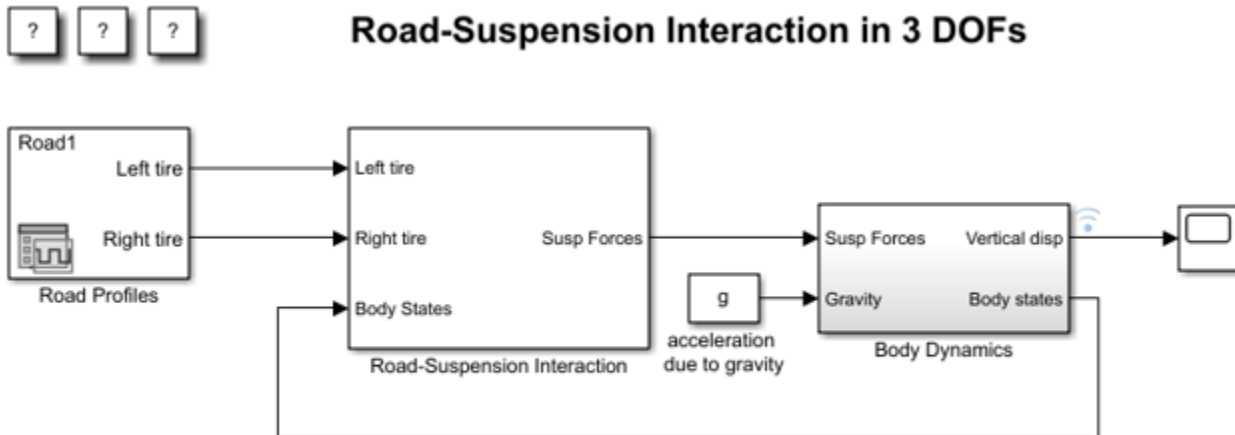

This example shows how you can run multiple Simulink® simulations corresponding to different test cases in the Signal Editor block using SimulationInput objects and the `parsim` command. The `parsim` command uses Parallel Computing Toolbox™, if it is available, to run simulations in parallel, otherwise the simulations are run in serial.

Model Overview

The model `sldemo_suspn_3dof` shown below simulates the vehicle dynamics based on the road - suspension interaction for different road profiles. The vehicle dynamics are captured in three degrees of freedom: vertical displacement, roll, and pitch. The road profile data for the left and right tires is imported into the Signal Editor block as different test cases. The Road-Suspension Interaction subsystem calculates the suspension forces on the vehicle at the four tire locations based on the road data and the current vehicle state. In the Body Dynamics subsystem these forces and the resulting pitch and roll moments are used to determine the vehicle motion in three degrees of freedom: vertical displacement, roll, and pitch.

The suspension model is simulated using different road profiles to determine if the design meets desired performance goals. Parallel Computing Toolbox is used to speed up these multiple simulations, as illustrated below.

```
mdl = 'sldemo_suspn_3dof';
isModelOpen = bdIsLoaded(mdl);
open_system(mdl);
```

Copyright 2011-2018 The MathWorks, Inc.

Set up Data Required for Multiple Simulations

Determine the number of cases in the Signal Editor block using the `NumberOfScenarios` parameter of the Signal Editor block. The number of cases is used to determine the number of iterations to run in step 3.

```
sigEditBlk = [mdl '/Road Profiles'];
numCases = str2double(get_param(sigEditBlk, 'NumberOfScenarios'));
```

Create an array of `Simulink.SimulationInput` objects to define the set of simulations to run. Each `SimulationInput` object corresponds to one simulation and will be stored as an array in a variable, `in`. The mask parameter, `ActiveScenario`, specifies the sweep value for the Signal Editor block scenario. The active scenario is set for each simulation.

```
for idx = numCases:-1:1
    in(idx) = Simulink.SimulationInput mdl;
    in(idx) = setBlockParameter(in(idx), sigEditBlk, 'ActiveScenario', idx);
end
```

Note that specifying the model parameter on the `SimulationInput` object does not apply it to the model immediately. The specified value will be applied during the simulation and reverted back to its original value, if possible, after the simulation finishes.

Run Simulations in Parallel Using Parsim

Use the `parsim` function to execute the simulations in parallel. The array of `SimulationInput` objects, `in`, created in the last step is passed into the `parsim` function as the first argument. The output from the `parsim` command is an array of `Simulink.SimulationOutput` objects which is stored in the variable `out`. Set the `'ShowProgress'` option to `'on'` to print a progress of the simulations on the MATLAB command window.

```
out = parsim(in, 'ShowProgress', 'on');
```

Each `SimulationOutput` object contains the logged signal along with the `SimulationMetadata`. When running multiple simulations using `parsim`, errors are captured so that subsequent simulations can continue to run. Any errors would show up in the `ErrorMessage` property of the `SimulationOutput` object.

Plot Results

Plot the vertical vehicle displacement from the different simulations to see how the vehicle performed to the different road profiles. The signal is logged in the SimulationOutput object in the Dataset format. Use the get method to obtain the timeseries object containing the time and signal data from each element of out.

```

legend_labels = cell(1,numCases);
for i = 1:numCases
    simOut = out(i);
    ts = simOut.logout.get('vertical_disp').Values;
    ts.plot;
    legend_labels{i} = ['Run ' num2str(i)];
    hold all
end
title('Response of a 3-DoF Suspension Model')
xlabel('Time (s)');
ylabel('Vehicle vertical displacement (m)');
legend(legend_labels,'Location','NorthEastOutside');

```

Close MATLAB Workers

Last, close the parallel pool and the model if they were not previously opened.

```

if(~isModelOpen)
    close_system mdl, 0);

```

```
end  
delete(gcf('nocreate'));
```

Parallel Simulations Using Parsim: Parameter Sweep in Normal Mode

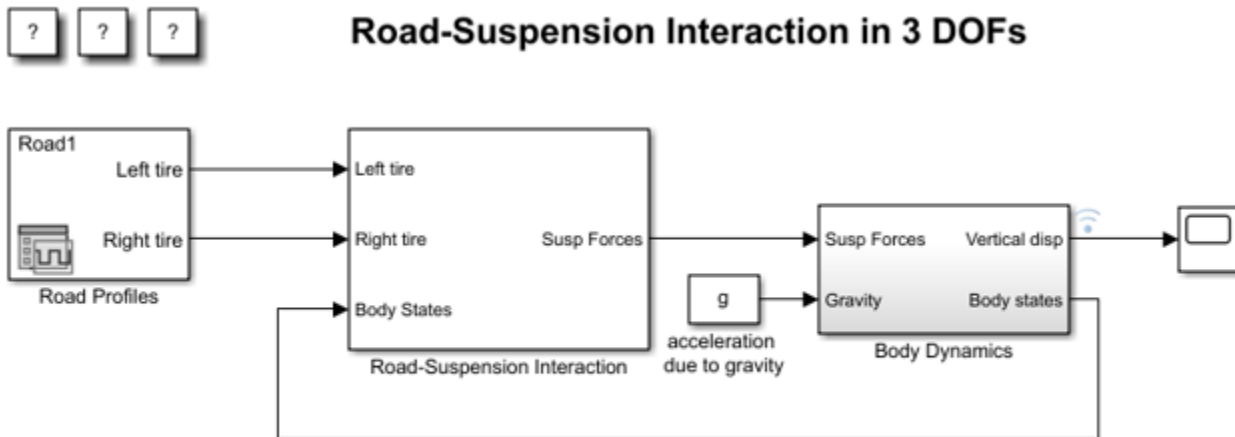

This example shows how to run multiple simulations of a Monte Carlo study in parallel by using Parallel Computing Toolbox™. Parallel execution leverages the multiple cores of your host machine to run many simulations more quickly. These simulations could also be run in parallel on computer clusters using the MATLAB Parallel Server™. This example will work even if the Parallel Computing Toolbox™ or the MATLAB Parallel Server™ is not available, but the simulations will run in serial.

Explore Example Model

The model `sldemo_suspn_3dof` simulates vehicle dynamics based on the interaction between road and suspension for different road profiles. The model captures vehicle dynamics in three degrees of freedom: vertical displacement, roll, and pitch. The Signal Editor block stores measured road profile data for the left and right tires as different test groups. The Road-Suspension Interaction subsystem calculates the suspension forces on the vehicle at the four tire locations based on the road data and the current vehicle state. The Body Dynamics subsystem uses these forces and the resulting pitch and roll moments to calculate the vehicle motion in each of the three degrees of freedom.

In this Monte Carlo study, you inspect the impact of the front suspension coefficients on the vehicle dynamics. You run multiple simulations, each with a different coefficient value.

```
mdl = 'sldemo_suspn_3dof';
isModelOpen = bdIsLoaded(mdl);
open_system(mdl);
```

Copyright 2011-2018 The MathWorks, Inc.

In the model, double-click the Road-Suspension Interaction block. The mask dialog box opens. The mask parameter **Front susp. damping** sets the value of the damping coefficient, 150.

For the Body Dynamics block, find the signal that exits the `Vertical disp` output port. This signal represents the vertical vehicle displacement over time, which the suspension damping coefficient influences.

Right-click the signal and select **Properties**.

In the Signal Properties dialog box, the **Logging and accessibility** tab has **Log signal data** checked on, indicating that the signal is configured for logging. After the simulation finishes, you can use the specified logging name, `vertical_disp`, to identify the signal and acquire the simulation output data from the `SimulationOutput` object.

Prepare Parameter Inputs

Calculate the sweep values for the coefficient as percentages of the design value ranging from 5% to 95% in increments of 10%. Store the values in a variable, `Cf_sweep`, in the base workspace.

```
Cf_sweep = Cf*(0.05:0.1:0.95);
```

Determine the number of simulations to run, which is equal to the number of sweep values. Store the number in a variable, `numSims`.

```
numSims = length(Cf_sweep);
```

Use a `for` loop to:

- 1 Create `Simulink.SimulationInput` objects for the model. Create one object per simulation. Store the objects as an array in a variable, `in`.
- 2 Specify the sweep value for each simulation. Identify the target mask parameter by its underlying name, `Cf`.

```
for i = numSims:-1:1
    in(i) = Simulink.SimulationInput mdl;
    in(i) = setBlockParameter(in(i), [mdl '/Road-Suspension Interaction'], 'Cf', num2str(Cf_sweep(i)));
end
```

Note that specifying the block parameter on the `SimulationInput` object does not apply it to the model immediately. The specified value will be applied during the simulation and reverted back to its original value, if possible, after the simulation finishes.

Run Simulations in Parallel Using Parsim

Use the `parsim` function to execute the simulations in parallel. The array of `SimulationInput` objects, `in`, created in the last step is passed into the `parsim` function as the first argument. The output from the `parsim` command is an array of `SimulationOutput` objects which is stored in the variable `out`. Set the `'ShowProgress'` option to `'on'` to print a progress of the simulations on the MATLAB command window.

```
out = parsim(in, 'ShowProgress', 'on');
```

```

Parallel Simulations Using Parsim: Parameter Sweep in Rapid Accelerator Mode

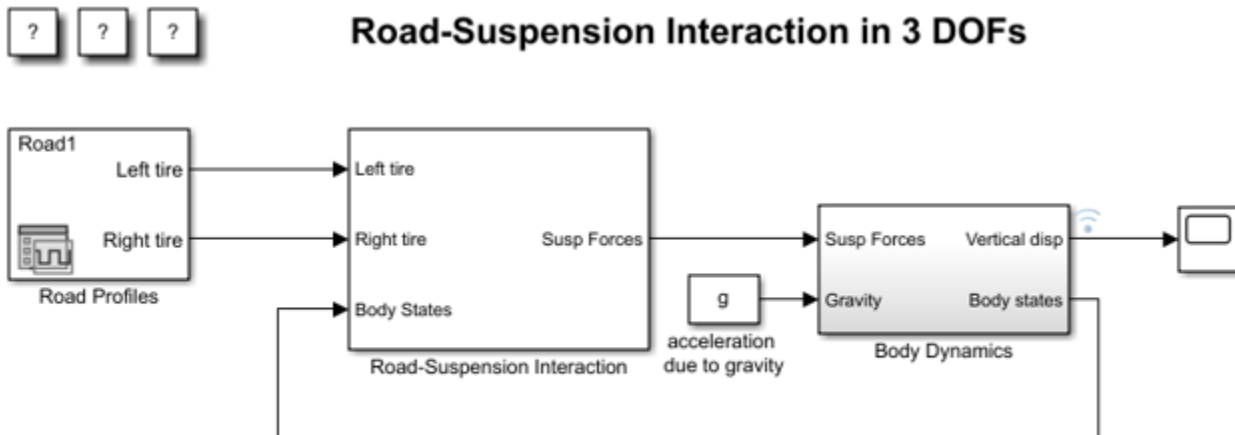

This example shows how to run multiple simulations of a Monte Carlo study in parallel by using Parallel Computing Toolbox™. Parallel execution leverages the multiple cores of your host machine to run many simulations more quickly. These simulations could also be run in parallel on computer clusters using the MATLAB Parallel Server™. This example will work even if the Parallel Computing Toolbox™ or the MATLAB Parallel Server™ is not available, but the simulations will run in serial.

Explore Example Model

The model `sldemo_suspn_3dof` simulates vehicle dynamics based on the interaction between road and suspension for different road profiles. The model captures vehicle dynamics in three degrees of freedom: vertical displacement, roll, and pitch. The Signal Editor block stores measured road profile data for the left and right tires as different test groups. The Road-Suspension Interaction subsystem calculates the suspension forces on the vehicle at the four tire locations based on the road data and the current vehicle state. The Body Dynamics subsystem uses these forces and the resulting pitch and roll moments to calculate the vehicle motion in each of the three degrees of freedom.

In this Monte Carlo study, the vehicle mass is varied to study its effect on the vehicle dynamics. Parallel Computing Toolbox is used to speed up these multiple simulations, as illustrated below.

```
mdl = 'sldemo_suspn_3dof';
isModelOpen = bdIsLoaded(mdl);
open_system(mdl);
```

Copyright 2011-2018 The MathWorks, Inc.

Setup to Build the Rapid Accelerator Target

The Rapid Accelerator executable for the model is built in the `SetupFcn` call using the `Simulink.BlockDiagram.buildRapidAcceleratorTarget` function. The `buildRapidAcceleratorTarget` function returns the default run-time parameter set which is assigned to a global variable, `RTP`, in the `SetupFcn` and is used in the next step to modify the parameter values. Open `sldemo_parsim_paramsweep_suspn_raccel_setup` in the editor to inspect the

code. Note that the build process is optimized so that if the build files are already present and compatible with the model and machine architecture then it returns early.

Set up Multiple Simulations Using SimulationInput Objects

Store the sweep values in a variable, `Mb_sweep`, in the base workspace.

```
Mb_sweep = Mb*(0.5:5:45.5);
```

Determine the number of simulations to run, which is equal to the number of sweep values. Store the number in a variable, `numSims`.

```
numSims = length(Mb_sweep);
```

Use a for loop to:

- 1 Create `Simulink.SimulationInput` objects for the model. Create one object per simulation. Store the objects as an array in a variable, `in`.
- 2 Specify the model parameters on the `SimulationInput` object.

```
for i = numSims:-1:1
    in(i) = Simulink.SimulationInput mdl;
    in(i) = in(i).setModelParameter('SimulationMode', 'rapid', ...
        'RapidAcceleratorUpToDateCheck', 'off');
    in(i).PreSimFcn = @(x) sldemo_parsim_paramsweep_suspn_raccel_presim(x, Mb_sweep(i));
end
```

The `SimulationInput` object is used to modify the model parameters. 'SimulationMode' is set to use rapid accelerator and 'RapidAcceleratorUpToDateCheck' model parameter is set to 'off' to skip up-to-date checks since there are no structural changes made to the model between simulations and the same build files can be used. Note that specifying the model parameter on the `SimulationInput` object does not apply it to the model immediately. The specified value will be applied during the simulation and reverted back to its original value, if possible, after the simulation finishes. Inspect the code in the `PreSimFcn`, `sldemo_parsim_paramsweep_suspn_raccel_presim`. It uses `modifyTunableParameters` from the `Simulink.BlockDiagram` package to change the parameter corresponding to vehicle mass. The first argument to the `PreSimFcn` is always the `SimulationInput` object, and is passed into the function by `Simulink@`. The `PreSimFunction` adds another model parameter to the `SimulationInput` object and returns it to be used for simulation.

Run Simulations in Parallel Using Parsim

Use the `parsim` function to execute the simulations in parallel. The array of `SimulationInput` objects, `in`, created in the last step is passed into the `parsim` function as the first argument. The output from the `parsim` command is an array of `Simulink.SimulationOutput` objects which is stored in the variable `out`. Set the 'ShowProgress' option to 'on' to print a progress of the simulations on the MATLAB command window. As mentioned earlier, the `SetupFcn` is passed as a parameter to the `parsim` command to build the rapid accelerator target on the workers if required.

```
out = parsim(in, 'ShowProgress', 'on', ...
    'SetupFcn', @() sldemo_parsim_paramsweep_suspn_raccel_setup mdl);
```

```

Rapid Accelerator Simulations Using Parsim

This example shows the use of Rapid Accelerator in applications that require running parallel simulations for a range of input and parameter values.

The example uses a model that simulates the idle speed of an engine. The model input is the voltage of the bypass air valve. The output is the idle speed.

Use `parsim` to run parallel simulations with two sets of valve voltages. Independently vary two of the three transfer function gain parameters over a range of two values. The following table lists the eight simulations, along with the parameter values. In Step 2, create the external inputs, `inpSets`. The variables `gain2` and `gain3` correspond to the two gain parameters.

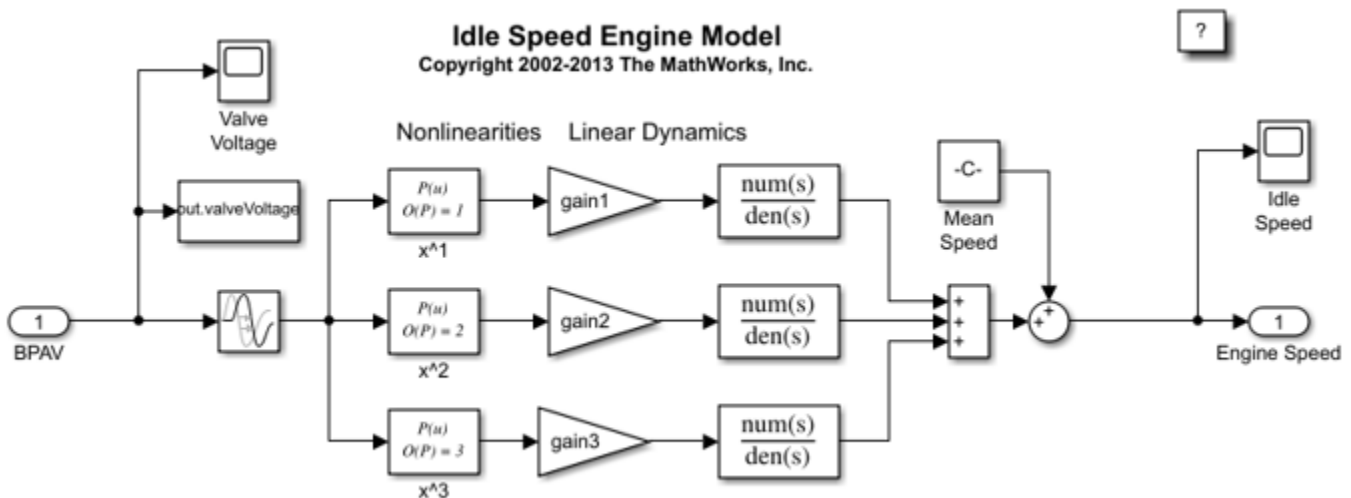

Run 1	<code>inpSets(1)</code>	<code>gain2 = 25</code>	<code>gain3 = 20</code>
Run 2	<code>inpSets(1)</code>	<code>gain2 = 25</code>	<code>gain3 = 30</code>
Run 3	<code>inpSets(1)</code>	<code>gain2 = 35</code>	<code>gain3 = 20</code>
Run 4	<code>inpSets(1)</code>	<code>gain2 = 35</code>	<code>gain3 = 30</code>
Run 5	<code>inpSets(2)</code>	<code>gain2 = 25</code>	<code>gain3 = 20</code>
Run 6	<code>inpSets(2)</code>	<code>gain2 = 25</code>	<code>gain3 = 30</code>
Run 7	<code>inpSets(2)</code>	<code>gain2 = 35</code>	<code>gain3 = 20</code>
Run 8	<code>inpSets(2)</code>	<code>gain2 = 35</code>	<code>gain3 = 30</code>

Step 1: Preparation

First, open the model. The simulation mode is set to Rapid Accelerator. The default input data, and the required parameters are preloaded in the base workspace.

Open model:

```
mdl = 'sldemo_raccel_engine_idle_speed';
open_system(mdl);
```

Step 2: Create Input Sets

Perturb the default input values vector to obtain a new input values vector.

```
inpSets(1) = timeseries(inpData, time);
rndPertb = 0.5 + rand(length(time), 1);
inpSets(2) = timeseries(inpData.*rndPertb, time);
numInpSets = length(inpSets);
```

Step 3: Create Parameter Sets

Next, examine how the idle speed changes for different values of parameters `gain2` and `gain3`. Create an array of `Simulink.SimulationInput` objects to specify the different parameter values and external input for each simulation. The array of `SimulationInput` objects is preallocated for better performance. Note that you can directly specify the external input on the `SimulationInput` object instead of using a model parameter.

```
gain2_vals = 25:10:35;
gain3_vals = 20:10:30;

num_gain2_vals = length(gain2_vals);
num_gain3_vals = length(gain3_vals);

numSims = num_gain2_vals*num_gain3_vals*numInpSets;
in(1:numSims) = Simulink.SimulationInput mdl);

idx = 1;
for iG2 = 1:num_gain2_vals
    for iG3 = 1:num_gain3_vals
        for inpSetsIdx = 1:numInpSets
            in(idx) = in(idx).setModelParameter('SimulationMode', 'rapid', ...
                'RapidAcceleratorUpToDateCheck', 'off', ...
                'SaveTime', 'on', ...
                'SaveOutput', 'on');
            % Use setVariable to specify a new value for a variable during
            % simulations
            in(idx) = in(idx).setVariable('gain2', gain2_vals(iG2));
            in(idx) = in(idx).setVariable('gain3', gain3_vals(iG3));
            in(idx).ExternalInput = inpSets(inpSetsIdx);
            idx = idx + 1;
        end
    end
end
```

Note: This example uses the `setModelParameter` method of the `SimulationInput` object to set model parameters to run the simulations in Rapid Accelerator mode and enable logging. The Rapid Accelerator target is built using the `SetupFcn`. The Rapid Accelerator target is built once and used by all subsequent simulations, saving the time required for model compilation. Here is the code for the `SetupFcn`

```
function sldemo_parallel_rapid_accel_sims_script_setup mdl)
    % Temporarily change the current folder on the workers to an empty
    % folder so that any existing slprj folder on the client does not
    % interfere in the build process.
    currentFolder = pwd;
    tempDir = tempname;
    mkdir(tempDir);
```

```
    cd (tempDir);
    oc = onCleanup(@() cd (currentFolder));
    Simulink.BlockDiagram.buildRapidAcceleratorTarget mdl);
end
```

Step 4: Execute Simulations

Use the `parsim` function to execute the simulations in parallel. The array of `SimulationInput` objects, `in`, created in the last step is passed into the `parsim` function as the first argument. Store the simulation output data in a variable, `out`, whose value is an array of `SimulationOutput` objects. Each `SimulationOutput` object contains the logged signal along with the `SimulationMetadata`. When running multiple simulations using `parsim`, errors are captured so that subsequent simulations can continue to run. Any errors would show up in the `ErrorMessage` property of the `SimulationOutput` object.

```
out = parsim(in, 'ShowProgress', 'on', ...
    'SetupFcn', @() sldemo_parallel_rapid_accel_sims_script_setup mdl));
```

```

Multiple Simulations Workflow Tips

The goal of this example is to provide helpful tips for running multiple simulations using parallel simulation tools. This example will work even if the Parallel Computing Toolbox™ is not available, but the simulations will run in serial. We will be using the model `sldemo_suspn_3dof`.

```
mdl = 'sldemo_suspn_3dof';
isModelOpen = bdIsLoaded(mdl);
open_system(mdl);
```

Road-Suspension Interaction in 3 DOFs

Copyright 2011-2018 The MathWorks, Inc.

Initializing an Array of Simulink.SimulationInput Objects

Typically you will construct an array of `Simulink.SimulationInput` objects in order to run multiple simulations. There are several ways to initialize the array before populating it with data.

```
numSims = 5;
Cf_sweep = Cf*linspace(.05,.95, numSims);
```

Method 1: Initialize the array before the loop

```
in(numSims) = Simulink.SimulationInput;
for idx = 1:numSims
    % Need to populate the model name since we get any empty array by default
    in(idx).ModelName = 'sldemo_suspn_3dof';
    in(idx) = in(idx).setVariable('Cf', Cf_sweep(idx));
end
```

Method 2: Initialize the array in the loop

Note that the loop variable `idx` starts from the largest value so that the entire array is pre-allocated.

```
for idx = numSims:-1:1
    % Since we are indexing from 5 to 1, the first iteration will
    % initialize the array.
    in(idx) = Simulink.SimulationInput('sldemo_suspn_3dof');
```

```

    in(idx) = in(idx).setVariable('Cf', Cf_sweep(idx));
end

```

Setting Model and Block Parameters

The `setModelParameter` and `setBlockParameter` methods use the same parameter-value pair syntax that the `set_param` API uses. This means that most values you pass in to these methods should be character arrays, not their literal value.

```

for idx = numSims:-1:1
    in(idx) = Simulink.SimulationInput('sldemo_suspn_3dof');

    % Incorrect
    in(idx) = in(idx).setModelParameter('StartTime', 5);

    % Correct
    in(idx) = in(idx).setModelParameter('StartTime', '3');
end

```

Setting Variables

The `setVariable` method expects that you will pass the literal value you want to assign to a variable. The idea is that this closely reflects the `assignin` syntax.

```

for idx = numSims:-1:1
    in(idx) = Simulink.SimulationInput('sldemo_suspn_3dof');

    % Incorrect, Cf is expected to be a double, not a character array
    in(idx) = in(idx).setVariable('Cf', '2500');

    % Correct, Cf is a scalar double
    in(idx) = in(idx).setVariable('Cf', 2500);
end

```

Diagnosing Runtime Errors

Assume that you've accidentally set up an array of `Simulink.SimulationInput` objects with an incorrect value.

```

Mb_sweep = linspace(0, 1500, numSims);
for idx = numSims:-1:1
    in(idx) = Simulink.SimulationInput('sldemo_suspn_3dof');

    % Accidentally set the Mass to 0 on the first iteration
    in(idx) = in(idx).setVariable('Mb', Mb_sweep(idx));

    % Shorten the stop time
    in(idx) = in(idx).setModelParameter('StopTime', '1');
end

```

Simulating these will cause a runtime error

```
out = sim(in);
```

```

Streamline Simulink Blockset Authoring Process with Blockset Designer

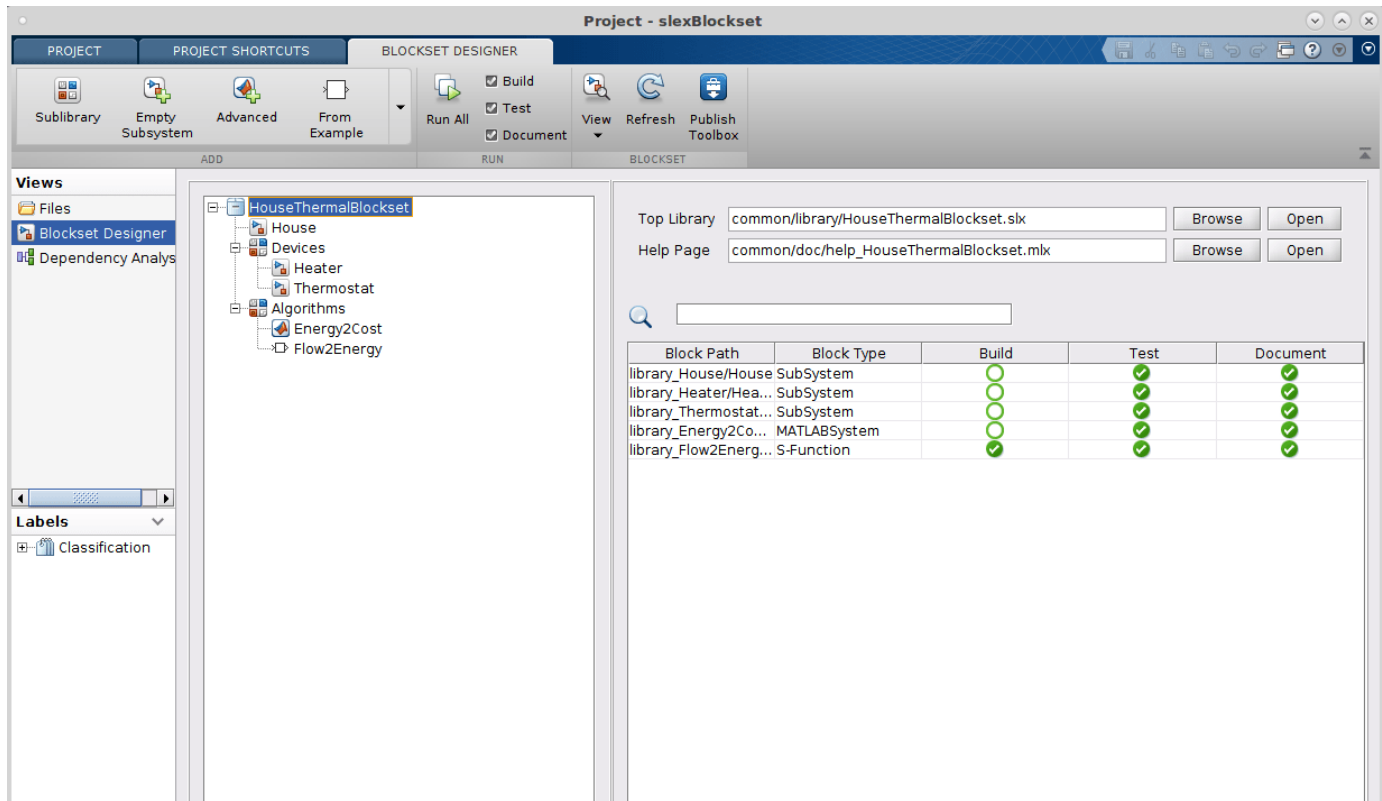

This example shows how to manage artifacts associated with a Simulink blockset with a single Blockset Designer Project.

Introduction

Simulink Blockset Designer is a Project™ based environment to author a Simulink blockset. It provides a one-stop shop for the development and maintenance of Simulink blockset artifacts such as source code, TLC-files, build scripts, test suites, libraries, models, and documentations. This example demonstrates how to streamline such a Simulink blockset project.

Try the Example

Run `slexBlocksetDesignerExample` to open the Simulink Blockset Designer project. Then click the 'Run All' button in toolstrip to start.

The screenshot shows the Simulink Blockset Designer interface for a project named 'slexBlockset'. The interface is divided into several sections:

- Top Bar:** Contains tabs for 'PROJECT', 'PROJECT SHORTCUTS', and 'BLOCKSET DESIGNER'. Below these are icons for 'Sublibrary', 'Empty Subsystem', 'Advanced', and 'From Example'. A 'Run All' button is prominently displayed, along with checkboxes for 'Build', 'Test', and 'Document'. Other icons include 'View', 'Refresh', and 'Publish Toolbox'.
- Views Panel (Left):** Shows a tree view of the project structure. The root is 'HouseThermalBlockset', which contains subfolders for 'House', 'Devices', 'Algorithms', and 'Energy2Cost'. Under 'House', there are 'Heater' and 'Thermostat'. Under 'Algorithms', there is 'Energy2Cost'. Under 'Energy2Cost', there is 'Flow2Energy'.
- Main Area (Right):** Contains a search bar and a table of block status. The table has columns for 'Block Path', 'Block Type', 'Build', 'Test', and 'Document'. All entries in the 'Build', 'Test', and 'Document' columns have green checkmarks, indicating that all blocks are ready for these actions.

Block Path	Block Type	Build	Test	Document

Simplify Interface for Structured Data with FMU Import Block

This examples shows how to use the FMU block to simplify the Simulink interface for structured data. The FMU block imports existing functional mockup units (FMUs) into Simulink®.

This FMU file models a simple system that computes the weighted average of two input bus signals, `vehicle`, packed into an array of buses, `wheel`. Each bus element contains two scalar signals, `position` and `speed`. The FMU accepts two structure parameters, `Weight` and `Bias`, and uses them to compute the weighted average ev of input signals:

```
ev.wheel(i).position = vehicle(1).wheel(i).position * Weight.v1 + Bias.v1 +
vehicle(2).wheel(i).position * Weight.v2 + Bias.v2
```

```
ev.wheel(i).speed = vehicle(1).wheel(i).speed * Weight.v1 + Bias.v1 +
vehicle(2).wheel(i).speed * Weight.v2 + Bias.v2
```

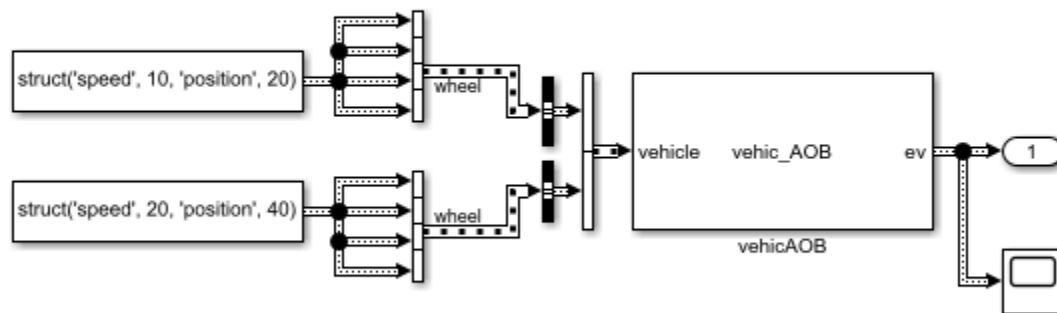

where

`i = 1...4.`

The FMU file supports FMI 1.0 Model Exchange mode.

The FMU Import block supports non-virtual bus types. You must create a bus object whose structure matches the associated structure in the FMU file. When naming the bus object structures, use the variable names defined in the `modelDescription.xml` of the FMU file.

Co-Simulation Signal Compensation

This example shows how to use co-simulation and signal compensation for interfacing signals.

In co-simulation application, components simulate with local solvers. Local solvers maintain separate timelines and integrate from a previous time point to the current time using I/O data exchanged between components and integration model. Co-simulation components do not expose internal states to global solver.

When co-simulation components are integrated in Simulink, you can use periodic discrete rate to exchange I/O data between components. However, communication between co-simulation components may introduce error caused by one-step delay during data exchange. This may cause simulation to be less accurate or unstable.

To mitigate this issue, Simulink automatically identifies interfacing signals between these components that are eligible for numerical compensation. These signals are ideally continuous quantities that have to be discretized due to co-simulation. Simulink automatically compensate for these signals to reduce co-simulation error. A 'gear' icon is displayed on input port if a signal is compensated.

Two co-simulation components with PI Controller

This example model contains two co-simulation components and a discrete PI controller. A monolithic system with two continuous rate systems and same PI controller is used as the baseline for result comparison.

Co-Simulation Numerical Compensation for Components with Local Solvers

Plant #1, realized by an S-Function `cosim_plant1_sfcn.c`, is equivalent to a state-space model `cosim_plant1.slx`:

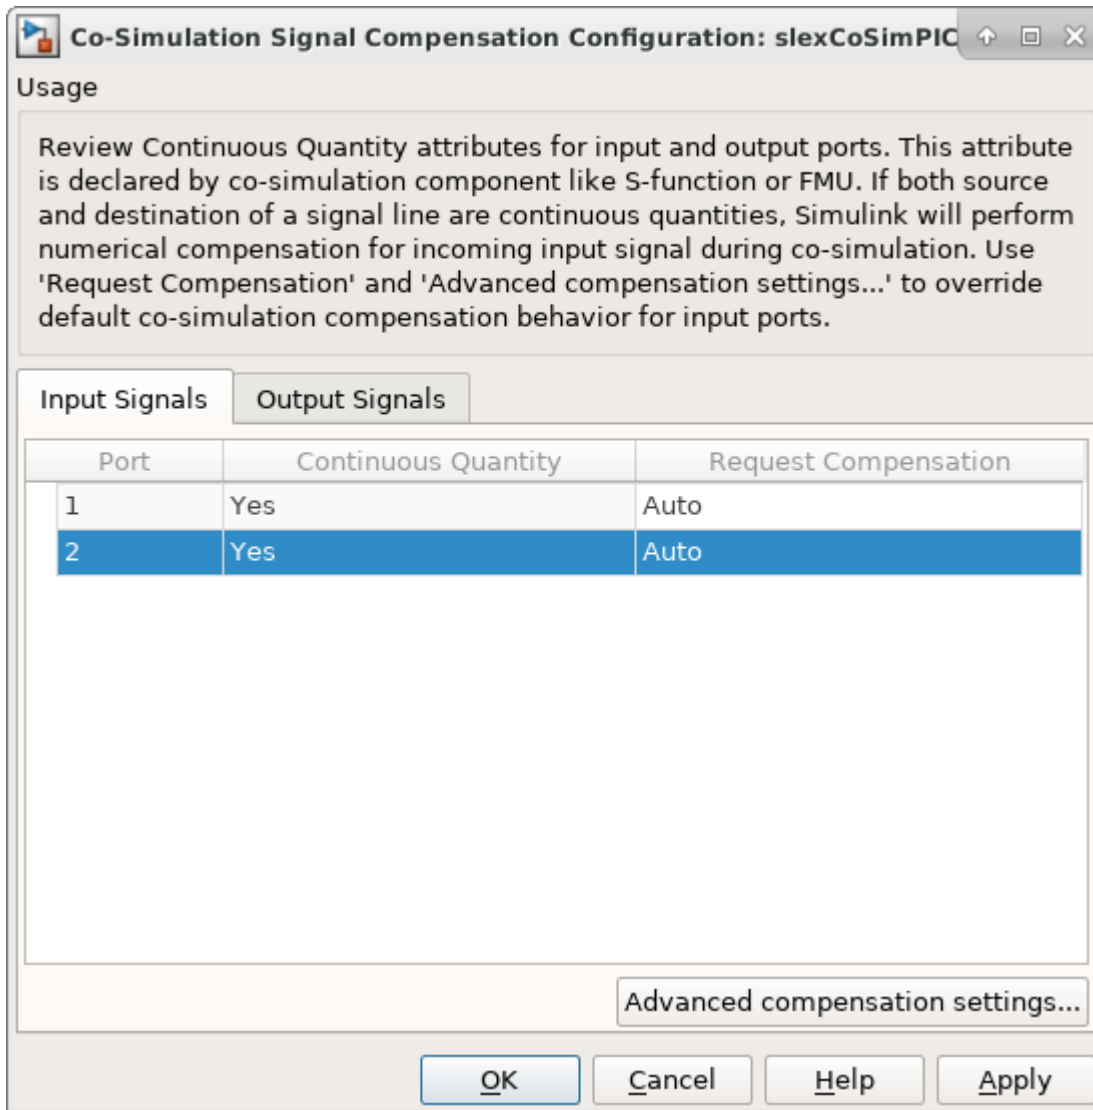

Plant #2, realized by a Co-Simulation FMU v2.0 `cosim_plant2_fmu.fmu`, is equivalent to a transfer function `cosim_plant2.slx`:

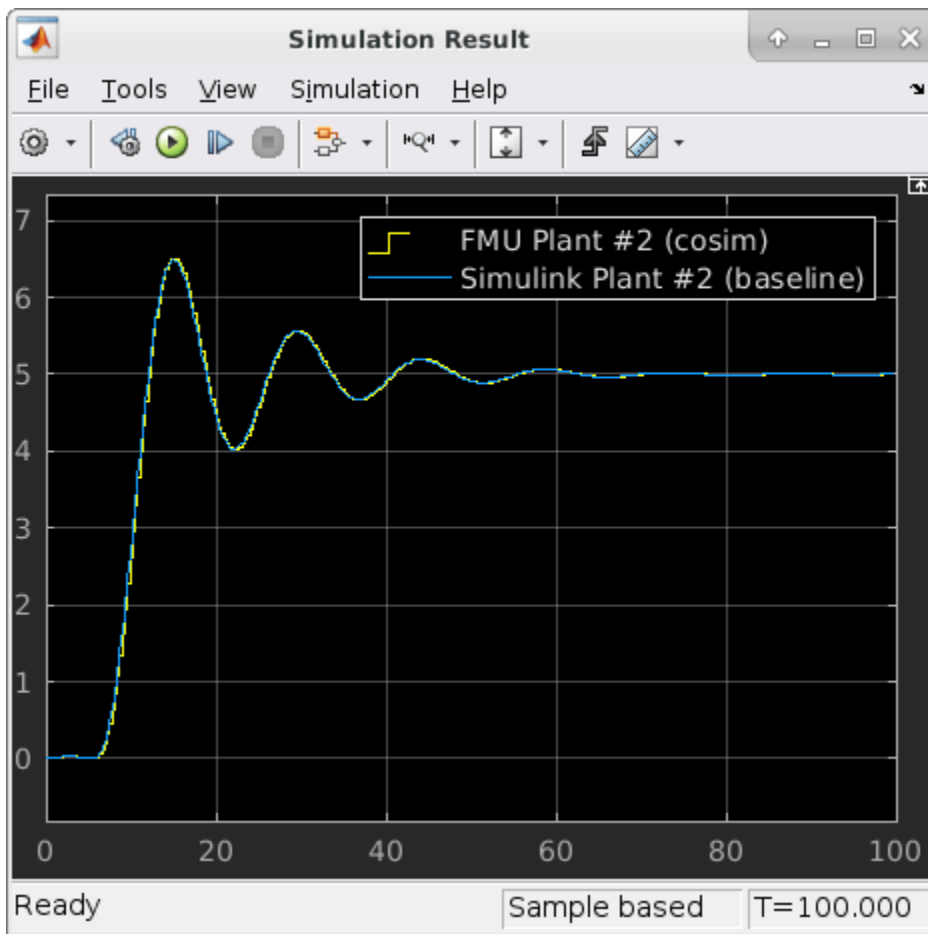

Both are causal systems where output signal does not directly depend on inputs. Local solver step size is 0.01. Communication step size is 0.3.

After updating integration model, a gear icon appears at the input ports of the two co-simulation components, indicating Simulink has identified a signal eligible for numerical compensation. Alternatively, you can right click on the icon (or block) and open 'Co-simulation Numerical Compensation' dialog:

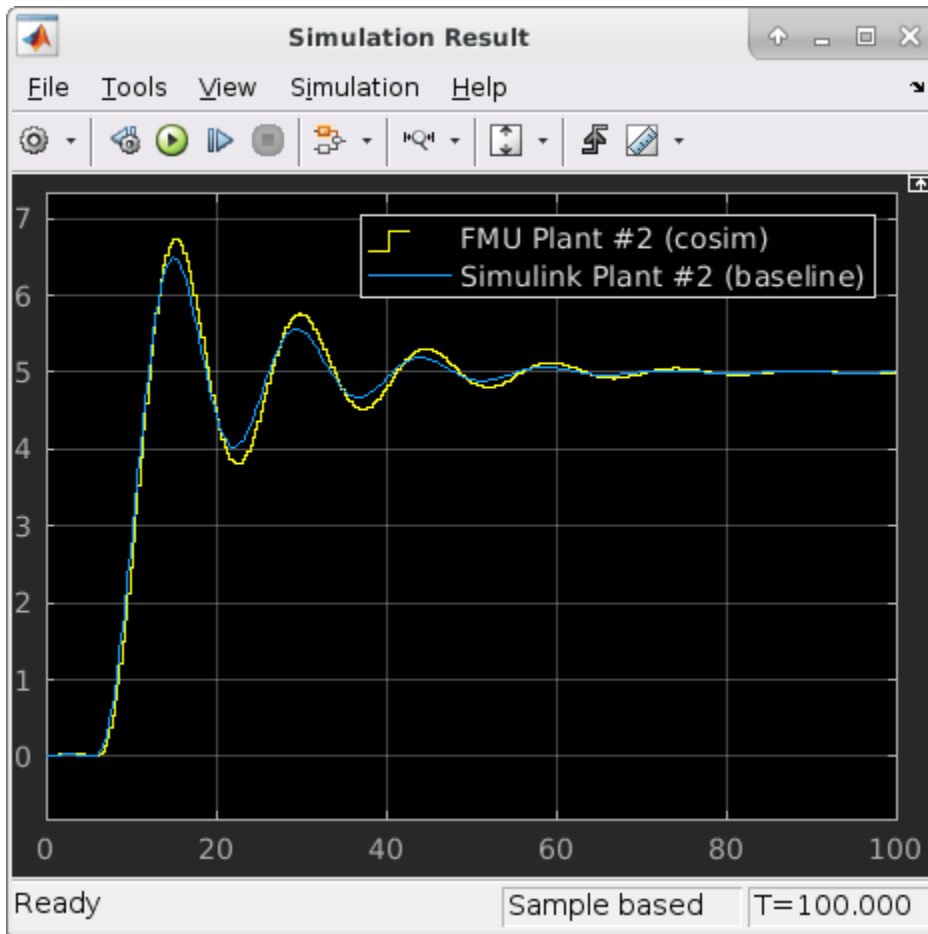

- **Continuous Quantity** column shows whether the co-simulation component itself has declared its I/O as continuous quantity. If both source and destination of this signal meet certain requirements, Simulink will mark it for auto-compensation. For example, input port 1 of Plant #1 is declared as continuous quantity, but its source, output port 1 of PI controller is a discrete rate control signal. As a result, input pot1 of Plant #1 will not be auto-compensated.
- **Request Compensation** column allows you to override this behavior by always allowing or disallowing numerical compensation. When a signal is marked as 'Always' or is already eligible, you can use **Advanced compensation settings...** button to configure more numerical compensation settings.

The following plots show the difference between enabling and disabling numerical compensation for this model. With numerical compensation turned on:

Accumulated error due to co-simulation is 0.4342.

Without numerical compensation:

Accumulated error due to co-simulation is 6.8520.

Using Numerical Compensation for Co-Simulation Integration

This example shows how to reduce potential simulation errors introduced by co-simulation using numerical compensation.

An Example Co-Simulation Component

A typical co-simulation component can be represented by a dynamic system with continuous states and a local solver that performs integration between communication time points. These functions export the standalone Co-Simulation FMU `cosim_component.fmu` from this model:

```
componentMdl = 'cosim_component';
open_system(componentMdl);
```

This model contains a transfer function and has a local fixed-step solver with step size $ts=0.02s$. You can use the generated FMU as a co-simulation component in an integration model.

Note that co-simulation components can only use input values given at communication time points. This requirement introduces a co-simulation error when the communication step is relatively large compared to the dynamic behavior of the component. Reducing the communication step size improves the simulation result but increases data transfer overhead. Changing local solver types or reducing local solver step size can give better integration results within a communication step, but cannot compensate for co-simulation error due to undersampling.

Using Numerical Compensation in Integration Model

The co-simulation component is used in the following model for integration:

```
integrationMdl = 'cosim_integration';
open_system(integrationMdl);
set_param(integrationMdl, 'SimulationCommand', 'Update');
```

This model contains two connected FMU co-simulation components in the top branch. Both co-simulation components, FMU Cosim Component 1 and FMU Cosim Component 2, have their own local solver. They only exchange data at a discretized communication rate $D2$, where $ts=0.2s$. Two continuous-time Transfer Function blocks in the bottom branch are the monolithic, non-co-simulation approach of the same system, which uses the global solver and serves as the baseline for the simulation result. The two non-co-simulation components exchange data at a continuous rate, and the global solver step size is set to $ts=0.02s$. In this example, we focus on the numerical behavior of FMU Cosim Component 2 and assume that co-simulation discretization of its input signal is inevitable.

After updating block diagram, a gear icon appears at the input port for the second co-sim component, FMU Cosim Component 2. This indicates that Simulink has automatically determined that this input port needs numerical compensation because:

- Source (and destination) blocks declare their output (and non-directfeedthrough input) ports as continuous quantities.
- Source and destination blocks are co-simulation components (e.g. S-Function or Co-Simulation FMU)
- The signal has a double data type and periodic discrete sample rate

To turn off auto-compensation, left-click on the icon. Alternatively, to programmatically turn it off:

```
blk = 'cosim_integration/FMU Cosim Component 2';
p = get_param(blk, 'PortHandles')
```

```
p = struct with fields:
  Inport: 18.0005
  Outport: 44.0004
  Enable: []
  Trigger: []
  State: []
  LConn: []
  RConn: []
  Ifaction: []
  Reset: []
  Event: []
```

```
set_param(p.Inport, 'CoSimSignalCompensationMode', 'Auto_Off')
out_off = sim(integrationMdl);
```

Simulink does not compensate for co-simulation error on this input port when the gear icon appears as disabled. The following functions plot the result without numerical compensation:

```
figure(1); hold on;
plot(out_off.yout{1}.Values, 'r');
plot(out_off.yout{2}.Values, 'black');
plot(out_off.yout{3}.Values, 'g');
plot(out_off.yout{4}.Values, 'b');
legend({'cosim response(no compensation)', 'ideal response', 'cosim input', 'ideal input'}, 'Loca
```

The co-simulation input signal (a double-typed periodic discrete signal that represents a continuous quantity) jumps from 0 to a positive value at $t=0.4\text{s}$. The co-simulation response shows a delay to its input when compared to the ideal (non-co-simulation) response. The co-simulation scheme causes this delay, where the input signal cannot vary between two communication time points. For example, when co-simulation component FMU Cosim Component 2 pauses at communication time point $t=0.4\text{s}$, the local solver takes a positive input for integration; then the local solver integrates over communication step $[0.4, 0.6]$, and returns a positive output value at the next communication time point $t=0.6\text{s}$.

When numerical compensation is enabled, Simulink attempts to compute a better input value for co-simulation component FMU Cosim Component 2 so that the co-simulation input value is closer to the average non-co-simulation input between two communication time points. For example, instead of using the co-simulation input value $y=0.165$ at $t=0.4\text{s}$, a better averaged input over communication step $[0.4, 0.6]$ is somewhere around $y=0.241$, which is the midpoint of $y=0.165$ ($t=0.4\text{s}$) and $y=0.316$ ($t=0.6\text{s}$). This is like using the midpoint Riemann sum instead of the left sum to estimate the area under the curve of an ideal input signal.

However, at communication time point $t=0.4\text{s}$, the value of $y=0.316$ ($t=0.6\text{s}$) is still not available. To get an estimate of y value at $t=0.6\text{s}$, Simulink extrapolates the signal data as a polynomial based on earlier time points (e.g. $t=0.2\text{s}$, $t=0.4\text{s}$). You can select a different **extrapolation method** in **Co-simulation Numerical Compensation** dialog when right-clicking the icon. Alternatively, use the functions:

```
set_param(p.Inport, 'CoSimSignalCompensationConfig', '{"ExtrapolationMethod": "LinearExtrapolation"}');
```

The following plot compares the result of enabling or disabling the compensation:

```

set_param(p.Inport, 'CoSimSignalCompensationMode', 'Auto')
out_linear = sim(integrationMdl);
figure(2); hold on;
plot(out_off.yout{1}.Values, 'r')
plot(out_linear.yout{1}.Values, 'm')
plot(out_off.yout{2}.Values, 'black')
legend({'cosim response(no compensation)', 'cosim response(linear extrapolation)', 'ideal response'})

```

With numerical compensation, the co-simulation response at communication timepoints are much closer to the ideal non-co-simulation output. The numerical error (delay) introduced by co-simulation is reduced.

The following plot shows the impact of the different extrapolation methods:

```

set_param(p.Inport, 'CoSimSignalCompensationConfig', '{"ExtrapolationMethod": "QuadraticExtrapolation"}')
out_quadratic = sim(integrationMdl);
set_param(p.Inport, 'CoSimSignalCompensationConfig', '{"ExtrapolationMethod": "CubicExtrapolation"}')
out_cubic = sim(integrationMdl);
figure(3); hold on;
plot(out_linear.yout{1}.Values, 'r')
plot(out_quadratic.yout{1}.Values, 'g')
plot(out_cubic.yout{1}.Values, 'b')
plot(out_off.yout{2}.Values, 'black')
legend({'cosim response(linear extrapolation)', 'cosim response(quadratic extrapolation)', 'cosim response(cubic extrapolation)', 'ideal response'})

```

The extrapolated output value introduces an estimation error, for example, when comparing extrapolated y value at $t=0.6\text{s}$ (estimated at $t=0.4\text{s}$) to the real y value at $t=0.6\text{s}$ (recorded at $t=0.6\text{s}$). Simulink can optionally compensate for this error in the following communication steps when you specify a non-zero **signal correction coefficient** in **Co-simulation Numerical Compensation** dialog. Alternatively, use these functions:

```
set_param(p.Inport, 'CoSimSignalCompensationConfig', '{"ExtrapolationMethod": "LinearExtrapolation"
```

This coefficient is valid within $[0, 1]$, where 0 means the estimation error will be ignored, and 1 means estimation error is fully compensated in the following communication steps. Setting this value to 1 might be useful when the co-simulation signal represents, or is proportional to, a flux of some conserved quantity (e.g. current, mass or volumetric flow rate).

The following plot shows the impact of different values of the signal correction coefficient:

```
set_param(p.Inport, 'CoSimSignalCompensationConfig', '{"ExtrapolationMethod": "LinearExtrapolation"
out_linear_0 = sim(integrationMdl);
set_param(p.Inport, 'CoSimSignalCompensationConfig', '{"ExtrapolationMethod": "LinearExtrapolation"
out_linear_0_5 = sim(integrationMdl);
set_param(p.Inport, 'CoSimSignalCompensationConfig', '{"ExtrapolationMethod": "LinearExtrapolation"
out_linear_1 = sim(integrationMdl);
figure(4); hold on;
plot(out_linear_0.yout{1}.Values, 'r')
plot(out_linear_0_5.yout{1}.Values, 'g')
plot(out_linear_1.yout{1}.Values, 'b')
plot(out_off.yout{2}.Values, 'black')
legend({'cosim response(coefficient: 0)', 'cosim response(coefficient: 0.5)', 'cosim response(coef
```

```
close_system(componentMdl, 0);  
close_system(integrationMdl, 0);
```

Multithread Co-Simulation

This example shows how to run co-simulation on multiple threads.

Simulink is an integration platform that supports co-simulation between components with local solvers or that involves simulation tools. For example, co-simulation can involve an S-function as a co-simulation gateway between Simulink and third-party tools or custom code. It can also involve an FMU in co-simulation mode imported to Simulink.

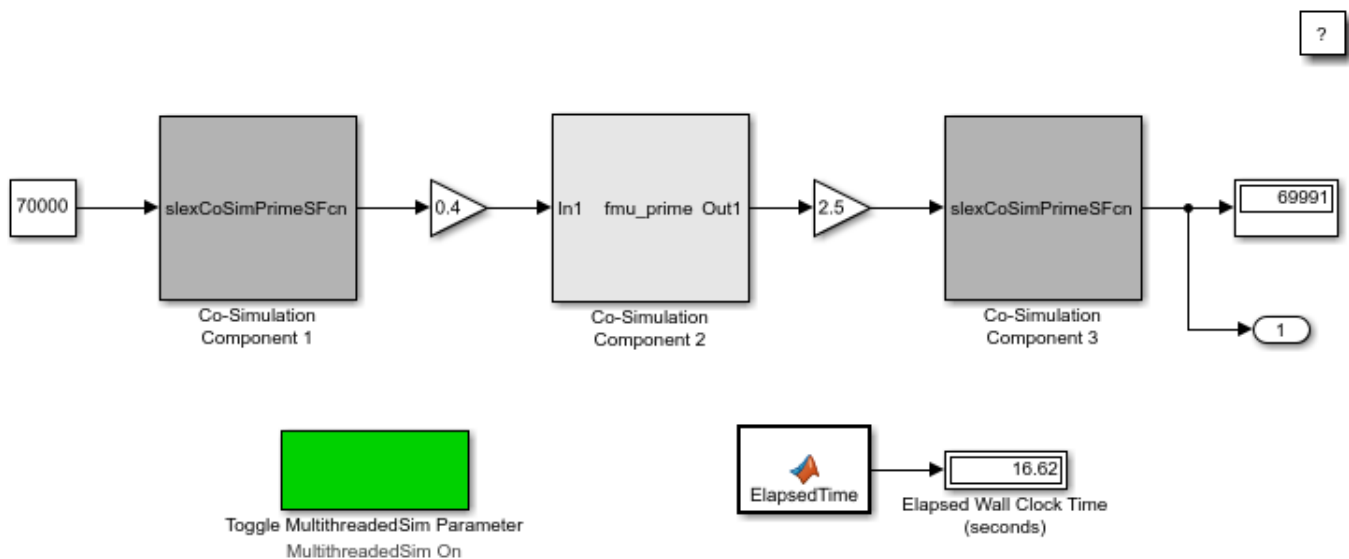

By default, Simulink configures all models to run on multiple threads with the `MultiThreadCoSim` parameter.

This example shows how to run multithreaded co-simulation of three components (two implemented in C-MEX S-Function, one implemented using FMU Co-Simulation v2.0). These components compute prime numbers to find the maximum prime number that is smaller than or equal to the given input.

Multithreaded co-simulation best suits models with computationally intensive and loosely coupled components. In this example, each component computes prime numbers using a brute-force search. The intensity of the computation is directly proportional to the given range, which is a block input that you can experiment with. Also, components exchange a scalar signal, which is the maximum prime number within the given range, at communication times.

Experiment toggling the `MultithreadedSim` parameter and measuring the wall clock time.

```
open_system('slexCoSimPrimeExample')
sim('slexCoSimPrimeExample');
```

Pulse Width Modulation Using MATLAB System Block

This example shows how to use MATLAB System block to generate Pulse Width Modulation (PWM) signals based on the input period and duty cycle signals by using controllable sample time and `setNumTicksUntilNextHit`.

In this example, MATLAB System block registers a controllable sample time so that it can schedule the next hit while changing the output value. In this example, the MATLAB System block has two input ports and one output port. The first input port is the duty cycle signal and the second input port is the period signal. The MATLAB System block has two block parameters: the amplitude of the generated PWM signal and the resolution of the controllable sample time.

In this example, the MATLAB System block demonstrates the use of the function: `* createSampleTime(obj, 'Type', 'Controllable', 'TickTime', obj.Resolution)` to register a controllable sample time in `getSampleTimeImpl` method. The resolution must be a positive finite integer that defines the fundamental step size that the MATLAB System block can schedule the next hit for this sample time.

MATLAB System Block demonstrates the use of the method: `* setNumTicksUntilNextHit(obj, numTicks)` to schedule the next hit of the controllable sample time. The next hit happens after $t = t_{\text{current}} + \text{numTicks} * \text{resolution}$. `numTicks` must be a positive integer. The MATLAB System block can use this method to schedule the execution of the controllable sample time in `setupImpl` and `stepImpl`.

Modeling Cyber-Physical Systems

Cyber-physical systems combine computer and physical systems to achieve design goals. Simulation of cyber-physical systems requires a combination of modeling techniques such as continuous-time, discrete-time, discrete-event, and finite state modeling. Simulink® and its companion products provide functionality to apply a wide range of modeling techniques and seamlessly integrate them in one simulation environment, which is ideal for modeling cyber-physical systems.

This example shows how continuous-time, discrete-event, and finite-state modeling techniques combine to simulate the behavior of a variable speed conveyor belt system. In SimEvents®, entities are discrete items of interest in a discrete-event simulation. Because passengers are discrete individuals, they are modeled by SimEvents® entities, created by the Entity Generator block. A Stateflow® chart models the operational modes and motor dynamics of the variable speed conveyor belt. Finally, the Entity Transport Delay block models passenger throughput as a function of conveyor belt dynamics, providing a bridge between the discrete-event and continuous-time domains.

Note: The example uses blocks from SimEvents® and Stateflow®. If you do not have a SimEvents or Stateflow license, you can open and simulate the model but only make basic changes such as modifying block parameters.

Model Structure

The model includes these key components:

- **Passengers** — Models the arrival of passengers as a Poisson process. The output is a sequence of SimEvents® entities corresponding to the passengers who step on the conveyor belt. The

distribution of inter-arrival time (Δt) of a Poisson process is $P(\Delta t) = \lambda e^{-\lambda \Delta t}$, where λ is the arrival rate. λ is modeled by a MATLAB action in the Entity Generator block for *rush hour*, *normal hour*, and *free hour*. The passenger arrival rate changes with time as:

$$\lambda(t) = \begin{cases} 2, & \text{mod}(t, 300) \in [0, 180), \quad \text{rush hour} \\ 0.5, & \text{mod}(t, 300) \in [180, 240), \quad \text{normal hour} \\ 0.1, & \text{mod}(t, 300) \in [240, 300), \quad \text{free hour} \end{cases}$$

- **Entity Transport Delay** — Holds the passengers on the conveyor belt until they arrive at the other terminal, based on the time delay calculated by the Stateflow chart.
- **Dynamics of conveyor belt** — Models the operation of a variable speed conveyor belt. See the Conveyor Belt Dynamics section for more details.
- **Dashboard** — Shows the runtime status of the conveyor belt. The color of the Mode Lamp indicates the mode of the conveyor belt.

Conveyor Belt Dynamics

A Stateflow® chart models the dynamics of the variable speed conveyor belt. Note in the chart that the velocity and power of the belt are plotted against a logarithmic scale of the load weight. The conveyor belt has these modes:

- **Idle** — The weight of the load is small. The belt maintains a low velocity to save energy. The Mode Lamp is gray in this mode.

- **OnDemand** — This is the normal operating mode, which maintains the optimal velocity for passenger comfort and throughput. The power will proportionally increase with the weight of the load. The Mode Lamp is green in this mode.
- **Max** — Maximum power mode. The weight of the load is too large for the conveyor belt to maintain the optimal velocity. The conveyor belt operates at the maximum possible velocity that does not exceed the maximum power. The Mode Lamp is red in this mode.

Results

The Scope and blocks in the DashBoard show the simulation results.

Simulation results: 1. Number of passengers versus simulation time. 2. Velocity (blue) and power (red) versus simulation time.

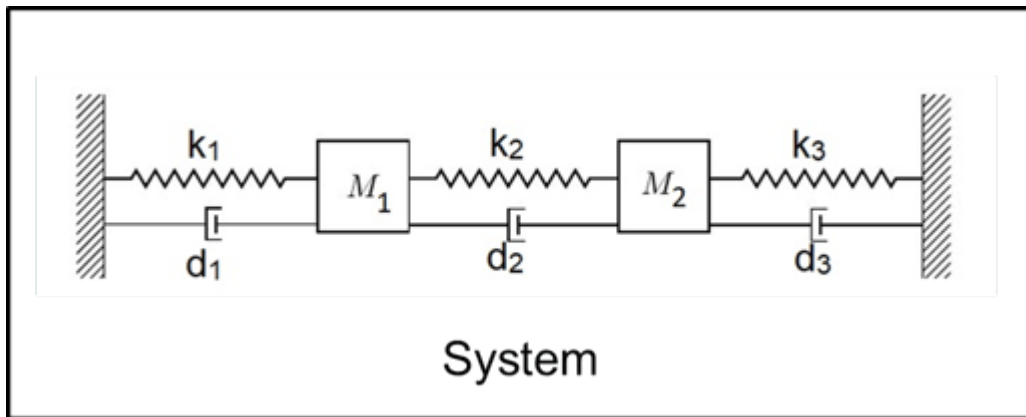

Three operation cycles are observed within a time span of 900. Each cycle has a period of 300, which aligns with the period of the arrival rate. The top plot shows the number of passengers on the conveyor belt over time, and the bottom plot shows the velocity and power of the conveyor belt. The velocity and power are normalized for better visualization.

The first two thirds of each period correspond to *rush hour*, and the number of passengers on the conveyor belt increases dramatically. Consequently, the conveyor belt enters into the **Max** mode quickly, which is characterized by the maximum output power with a velocity that is inversely proportional to the number of passengers. In the last third of each period, the airport is in the *normal hour* followed by the *free hour*. Therefore, the number of passengers on the conveyor belt drops and even becomes zero for some time.

The conveyor belt then operates in **OnDemand** and **Idle** modes accordingly. In **OnDemand** mode, the velocity is locked to a default value, and the power is proportional to the number of passengers. In **Idle** mode, both the velocity and power are maintained at low values to reduce energy consumption. Overall, the conveyor belt operates according to the load of the airport.

Power Analysis of Spring Mass Damper System

This example shows how to analyze the mechanical power and energy of a spring mass damper system using functionality available with the Powertrain Blockset™. The model subsystems contain Power Accounting Bus Creator blocks that report system power and energy consumption across the spring mass damper system.

Run Simulation

Click **Run** to create an `autoblks.pwr.PlantInfo` object that analyzes the model energy consumption. Use the `PwrUnits` and `EnrgyUnits` properties to set the units.

```
SysName = 'powerAnalysis';
open(SysName);
SysPwrAnalysis = autoblks.pwr.PlantInfo(SysName);
SysPwrAnalysis.PwrUnits = 'kW';
SysPwrAnalysis.EnrgyUnits = 'MJ';
```

Use `run` method to turn on logging, run simulation, and add logged data to the object.

```
SysPwrAnalysis.run;
```

Overall Summary

Display the final energy values for each subsystem.

```
SysPwrAnalysis.dispSysSummary
```

System Name	Efficiency	Energy Loss (MJ)	Energy Input (MJ)	Energy Output (MJ)

Schedule an Export-Function Model Using the Schedule Editor

This example shows how to view and edit the order of function-calls in an export-function model using the Schedule Editor. As in all export-function models, the desired functionality is modeled as function-call subsystems. These function-call subsystems define the partitions that are scheduled by the Schedule Editor.

With the Schedule Editor, you can easily view and edit the schedule of the function-calls. The behavior of the system depends on the order of these partitions. In this example, we change the order and observe its effects on the behavior of the system by simulating the model. To see the impact of editing the schedule on the simulation, we compare the model simulations before and after scheduling.

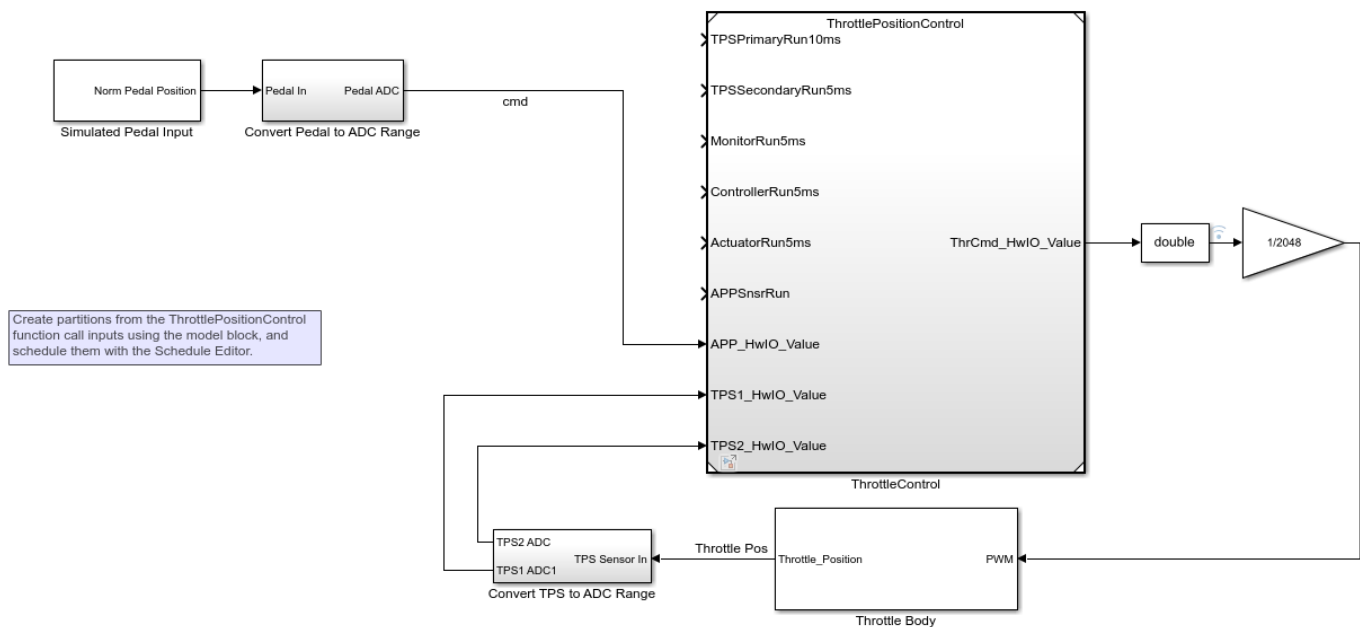

Create Partitions from Referenced Export-Function Model

To view and edit the schedule of the export-function model, reference the model.

```
open_system('ThrottlePositionControlTop.slx');
```

Schedule an Export-Function Model with the Schedule Editor

Copyright 2018 The MathWorks, Inc.

ThrottlePositionControl is the referenced export-function model. By default, each function has an input port that can be used to trigger these functions. The Schedule Editor automatically handles these ports. To use the Schedule Editor, set the Schedule Rates With parameter to Schedule Editor.

```
set_param('ThrottlePositionControlTop/ThrottleControl', 'ScheduleRatesWith', 'Schedule Editor');
```

Establish a Simulation Baseline

To observe the impact of scheduling on the model behavior, establish a baseline by simulating the model before editing the schedule. Simulate the model.

```
sim('ThrottlePositionControlTop');
```

Open the Schedule Editor

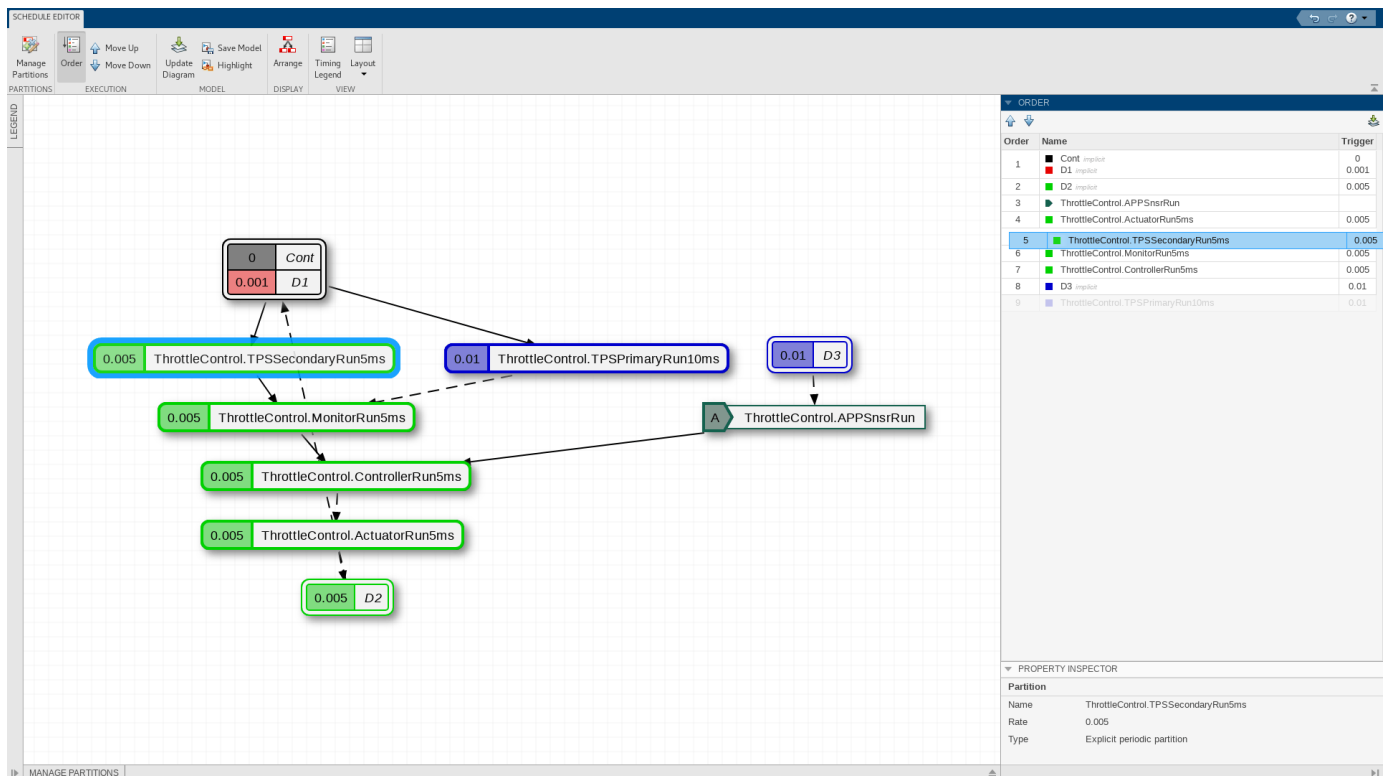

To open the Schedule Editor, click **Schedule Editor** in the **Design** section of the **Modeling** tab. In the Schedule Editor, different components of the model are represented as partitions. Update the diagram to see the partitions. Partitions are the entry-points in the model. The Schedule Editor shows the order and data communications of these partitions. The arrows are data connections between the partitions that show the data flow. The dashed lines indicate that there is a delay because the source runs after the destination. The solid lines indicate that there is no delay as the source runs before the destination.

Edit Partition Schedule

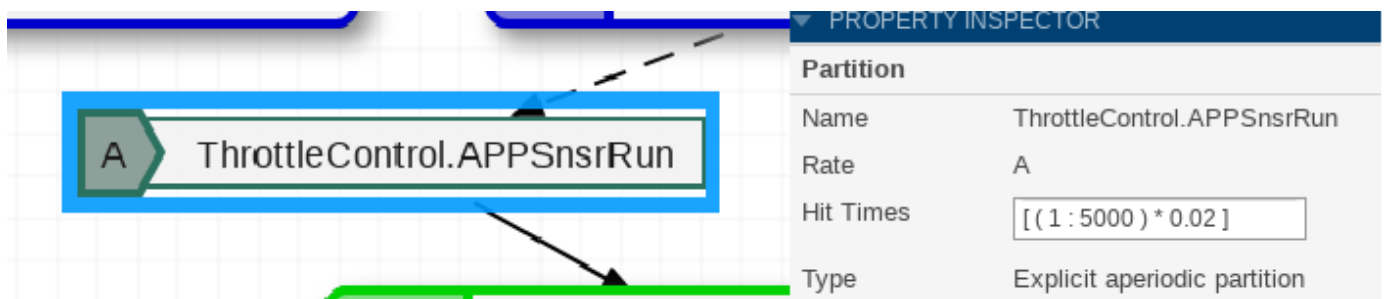

The Order pane shows the order the partitions run in at a given time step. Assume that the order of the partitions is in an imperfect state. In this case, to remove the delay, you want to run the `ThrottleControl.ActuatorRun5ms` partition after the `ThrottleControl.ControllerRun5ms` partition.

Drag `ThrottleControl.ActuatorRun5ms` after the `ThrottleControl.ControllerRun5ms` in the Order pane. Observe that the delay between the `ThrottleControl.ControllerRun5ms` and the `ThrottleControl.ActuatorRun5ms` partitions changes to a dependency. Observe that now there is no delay between the executions of `ThrottleControl.ControllerRun5ms` and `ThrottleControl.ActuatorRun5ms`.

Schedule the Execution of Aperiodic Partitions

The export-function model contains an unconstrained partition, AccelerationPedalPositionSensor. Suppose you want to schedule an unconstrained partition to simulate as if it were discrete. Schedule `ThrottleControl.APPSnrRun` partition to run at `[0:0.02:100]` to observe its behavior at different instances of time. Click the unconstrained partition and enter `[(1:5000)*.02]` for Trigger in the Property Inspector.

Compare the Runs in Simulation Data Inspector

Now, simulate the model with the changed schedule.

Open the Simulation Data Inspector. Select the two runs and compare. You can see how changing the schedule impacts the model behavior.

Graph-Based Multithread Simulation

This example shows how graph-based algorithms optimize simulation on multiple threads.

Graph-based algorithm

This example contains four nondirect feedthrough blocks followed by four direct feedthrough blocks. Direct feedthrough means that the output port signal of a block is computed from the values of its input port signals in the same time step. The graph-based algorithm runs the four nondirect feedthrough blocks in parallel and groups the following direct feedthrough blocks into the same branch. Then, the model uses multithreading to run those four branches. Thus, the algorithm speeds up the simulation almost four times on a four or more core machine compared to a single-threaded simulation on the same machine.

Open model and simulate

```
open_system('slexGraphBasedMultiThreadSimExample');  
  
% Press "Toggle MultithreadedSim Parameter" block to turn off / on  
% multithreaded simulation and compare the elapsed time.
```

Graph-based multithreaded simulation enables DirectFeedThrough blocks to run in parallel.

Find Shortest Control Path in Simulink Model

Model Description

This example shows how to find the shortest control path for a hybrid electrical vehicle using Signal Tracing Command-line API.

To open the model, enter this command in the example folder.

```
open_system('sldemo_hevc')
```

In this model, a hybrid electrical vehicle drives on a slope and the initial speed is 0 m/s. Set the target speed to 30 m/s. In **Driver**, a PID control compares the actual speed with the target speed and sends a command to increase or decrease speed to the power demand estimation module. **Power demand estimation** converts to the desired power, and the power is primarily provided by the electrical motor. If electrical motor is unable to provide enough torque, then the engine and provides additional torque. In **Vehicle Dynamic**, road resistance including rolling resistance and gravity resistance as well as the aero drag are calculated. The actual speed of the vehicle is constantly returned to **Driver** through the feedback loop until the vehicle reaches the target speed.

Trace All Sources that Control the Actual Speed

Use the signal tracing API to find the shortest control path to the actual speed. Since the actual speed signal goes into the second inport of Scope, use Scope as the tracing origin.

```
g = sltrace('sldemo_hevc/Scope', 'source', 'port', '2', 'traceall', 'on');
highlight(g);
```

Obtain the Trace Graph

The tracing results can be expressed as a MATLAB digraph. The trace graph includes edges and nodes.

A node in trace graph corresponds to a block port in a Simulink® model. The second port of Scope is a node. You can find the node information nodes table.

```
nodes = g.TraceGraph.Nodes;
```

The edges are shown as pair of node indexes in trace graph. You can access the node information from the nodes table with the corresponding node index. The Simulink® line between nodes is shown as segment handle(s).

```
edges = g.TraceGraph.Edges;
```

Compute the edges of the trace graph of the `sltrace.Graph` object and use built-in MATLAB® digraph features to plot the trace graph, as shown in the figure.

```
fig = g.TraceGraph.plot('Layout', 'force');
```

Find the Shortest Control Path from the Simulink Model

The edges table contains two types of edges: real edges and virtual edges, including internal edges and hidden edges. First, filter out the virtual edges using the MATLAB find function.

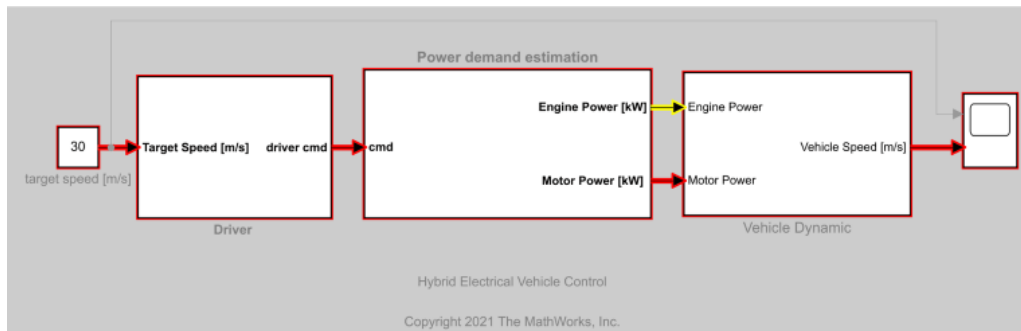

```
realEdgeIdx = find(cellfun(@(x) ~ischar(x), edges.Segments) == 1);
realEdges = edges(realEdgeIdx, :);
```

Process each node in the shortest path to obtain the corresponding blocks and segments. Since one source node may be connected to multiple destination nodes, iterate over all the edges from the same source node and find the target destination node on the shortest path.

```
elements = [];
for i = 1:length(shortestPath) - 1
    srcNodeIdx = shortestPath(i);
    dstNodeIdx = shortestPath(i+1);
    srcBlockHandle = nodes.Block(srcNodeIdx);
    srcNodeEdgeIdx = find(realEdges.EndNodes(:,2) == dstNodeIdx);
    if length(srcNodeEdgeIdx) > 1
        dstNodeEdgeIdx = find(realEdges.EndNodes(srcNodeEdgeIdx, 2) == dstNodeIdx);
        edgeIdx = srcNodeEdgeIdx(dstNodeEdgeIdx);
    elseif length(srcNodeEdgeIdx) == 1
        edgeIdx = srcNodeEdgeIdx;
    else
        continue;
    end
    elements = [elements srcBlockHandle flip(realEdges.Segments{edgeIdx})];
end
```

Process the last node in the shortest path and highlight the shortest path in the Simulink model, as shown in the figure.

```
lastNodeIdx = shortestPath(end);  
lastBlockHandle = nodes.Block(lastNodeIdx);  
elements = [elements lastBlockHandle];  
highlight(g, elements)
```

Use Fixed-Step Zero-Crossing Detection for Faster Simulations

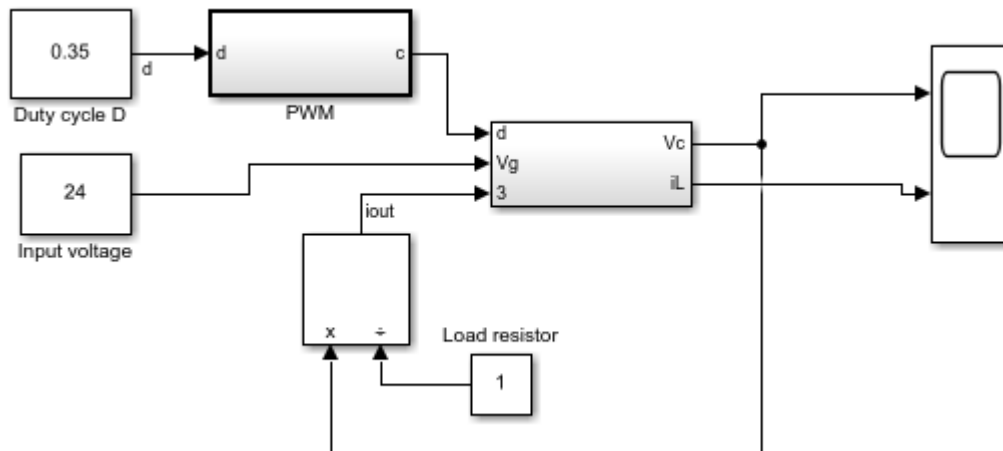

This example shows how fixed-step zero-crossing detection can be used to speed up simulation by increasing the fixed-step size without sacrificing simulation accuracy. Zero-crossing detection is essential if a system contains events that will change the equations in the system. The location and reaction to these events is important for accurate simulation.

Load Model

This example uses a model of a buck converter, a DC-DC power converter. The converter is controlled via pulse width modulation (PWM), where a switch, represented by the Relay block in the PWM subsystem, is controlled by comparing the control voltage to a triangular voltage.

This model implements an open-loop version of the buck converter.

```
model = 'buck_ol';
open_system(model);
```

Examine PWM Generation System

The buck converter in this model uses PWM to control the power transmitted to the load. The Relay block in the PWM subsystem represents a switch and is controlled by comparing the control voltage to a triangular voltage. The frequency of the triangle wave is 100 kHz. To accurately detect PWM switching, check that the solver takes steps smaller than 1.0e-5. The relay block in a PWM system detects zero crossings when the triangle wave intersects with the duty cycle.

```
pwmGenSubsys = [model '/PWM'];
open_system(pwmGenSubsys);
```

Simulate with a Variable-Step Solver

To achieve accurate simulation results, you must accurately locate the switching times that occur in the PWM subsystem. To see what the results should look like, you can first simulate the model using a variable-step solver with zero-crossing detection. Limit the max-step size of the solver to $1e-6$ to ensure that you do not miss PWM switching events.

```
set_param(model, 'Solver', 'ode45', 'MaxStep', '1e-6', ...  
    'ReturnWorkspaceOutputs', 'on')  
simout = sim(model);  
plot(simout.tout, simout.xout(:,1));  
title('Output Voltage');  
legend('Variable-step (expected)');  
xlim([0 1e-3]);
```

Use Fixed-Step Simulation

Now that you know what the expected simulation results should look like, you can simulate the model using a fixed-step solver. You should select the largest possible fixed-step size where the solver is still able to step near the PWM switching times. Using a large fixed-step size will result in the fastest possible simulation while still obtaining accurate results.

Use the simulation results generated by the variable-step solver to inform your choice for a fixed-step size. Start by using a fixed-step size of $1.0e-6$, similar to the maximum step size used for the variable-step simulation.

```
set_param(model, 'Solver', 'ode3', 'FixedStep', '1.0e-6');
set_param(model, 'EnableFixedStepZeroCrossing', 'off')

simout_FS_1ms = sim(model);

plot(simout.tout, simout.xout(:,1), ...
      simout_FS_1ms.tout, simout_FS_1ms.xout(:,1), '-s');
title('Output Voltage');
legend('Variable-step (expected)', 'Fixed-step: 1ms', ...
       'Location', 'southeast');
xlim([0 1e-3]);
```

Reduce Fixed-Step Size

This plot shows that the results obtained with a fixed-step size of $1.0e-6$ are not very accurate when compared to the variable-step baseline. Reducing the step size to $5.0e-8$ produces more accurate results. Without zero-crossing detection, $5.0e-8$ is the largest fixed-step size you can use for this model while still obtaining accurate simulation results.

```
set_param(model, 'FixedStep', '5.0e-8');
simout_FS_50ns = sim(model);

plot(simout.tout, simout.xout(:,1), ...
      simout_FS_50ns.tout, simout_FS_50ns.xout(:,1), '-s');
title('Output Voltage')
legend('Variable-step (expected)', 'Fixed-step: 50ns', ...
       'Location', 'southeast')
xlim([0 1e-3]);
```

Enable Zero-Crossing Detection for fixed-step simulation

Open up the solver pane of the configuration parameters and select **Enable zero-crossing detection for fixed-step simulation**. Enabling this parameter allows Simulink to detect zero crossings between major time steps and apply corrections to continuous states in the model. Use the default value for **Maximum number of zero-crossings per step**.

Solver selection

Type: Solver:

▼ Solver details

Fixed-step size (fundamental sample time):

Solver Jacobian method:

Number of Newton's iterations:

Zero-crossing options

Enable zero-crossing detection for fixed-step simulation

Zero-crossing control:

Maximum number of bracketing iterations:

Maximum number of zero-crossings per step:

```
set_param(model, 'EnableFixedStepZeroCrossing', 'on')
set_param(model, 'FixedStep', '1.0e-6', 'MaxZcPerStep', '2');
simout_FSZC_1ms = sim(model);
```

Compare Results

With zero-crossing detection enabled for fixed-step simulation, you can use a step size that is twenty times larger than the fixed step size used without zero-crossing detection and still obtain accurate results. This larger step size leads to faster simulation times.

```
figure()
state = 1;
plot(simout.tout, simout.xout(:,state), ...
     simout_FS_50ns.tout, simout_FS_50ns.xout(:,state), '-s' , ...
     simout_FSZC_1ms.tout, simout_FSZC_1ms.xout(:,state), '-x');
title('Output Voltage')
legend('Variable-step (expected)', 'Fixed-step: 50ns', 'Fixed-step ZC: 1ms', ...
      'Location', 'southeast')
xlim([0 1e-3]);
```

Zoom in to see that the results are accurate with zero crossing detection enabled, even with this larger step size.

```
xlim([2.5e-4 3e-4])
ylim([7.4 7.56])
```

Finally, note that the simulation time is faster at this larger step size with zero-crossing detection enabled.

```
bar([simout_FS_50ns.SimulationMetadata.TimingInfo.ExecutionElapsedWallTime, ...
     simout_FSZC_1ms.SimulationMetadata.TimingInfo.ExecutionElapsedWallTime])
xticklabels(gca, {'Zc Disabled @ 5.0e-8', 'ZC Enabled @ 1.0e-6'});
xtickangle(45);
ylabel("Wallclock Time (seconds)")
```

Close the model.

```
bdclose(model);
```
