## Analyze Generated Data Code Interface

### In this section...

- “Navigating Code Interface Report Subsections” on page 54-13
- “Interpreting the Entry-Point Functions Subsection” on page 54-14
- “Interpreting the Inports and Outports Subsections” on page 54-17
- “Interpreting the Interface Parameters Subsection” on page 54-18
- “Interpreting the Data Stores Subsection” on page 54-19
- “Code Interface Report Limitations” on page 54-19

When you generate a code generation report, you can include a code interface report, which documents the generated code interface including model entry-point functions and interface data. The code interface information helps you to review the generated code and integrate it with other code. The information in the report depends on the type of code interface configuration that you use. For models that use service interface code configuration, the code interface report also includes information about services, as described in “Analyze Generated Service Code Interface” on page 54-21.

For code configured with data interfaces, the code interface report includes the following subsections:

- **Entry-Point Functions** — interface information about each model entry-point function, including `model_initialize`, `model_step`, and (if applicable) `model_reset` and `model_terminate`.
- **Inports and Outports** — interface information about each model inport and output.
- **Interface Parameters** — interface information about tunable parameters that are associated with the model.
- **Data Stores** — interface information about global data stores and data stores with non-auto storage that are associated with the model.

To generate a code interface report, select the configuration parameters **Create code generation report** and **Code Interface Report**, as described in “Generate Code Generation Report” on page 54-5. For limitations that apply to code interface reports, see “Code Interface Report Limitations” on page 54-19.

For illustration purposes, this section uses the following models:

- `rtwdemo_configinterface` for examples of report subsections
- `rtwdemo_mrmtbb` for examples of timing information
- `rtwdemo_fcncnprotctrl` for examples of function argument and return value information

### Navigating Code Interface Report Subsections

To help you navigate code interface descriptions, the code interface report provides collapse/expand tokens and hyperlinks.

- For a large subsection, the report provides [ - ] and [ + ] symbols that allow you to collapse or expand that section.
- The code interface report provides several forms of hyperlink navigation. For example:

- The **Table of Contents** located at the top of the code interface report provides links to each subsection.
- You can click each function name to go to its definition in *model.c*.
- You can click the header file name for each function to go to the header file source listing.
- If you selected the configuration parameter **Code-to-model**, to go to the corresponding location in the model display, you can click hyperlinks for these constructs:
  - Function argument
  - Function return value
  - Variable representing an inport
  - Variable representing an outport
  - Interface parameter (if the parameter source is a block)
  - Variable representing a data store (if the data store source is a Data Store Memory block)

For backward and forward navigation within the HTML code generation report, use the **Back** and **Forward** buttons above the **Contents** section in the upper-left corner of the report.

## Interpreting the Entry-Point Functions Subsection

The **Entry-Point Functions** subsection of the code interface report provides the following interface information about each model entry-point function, including `model_initialize`, `model_step`, and (if applicable) `model_reset` and `model_terminate`.

Field	Description
<b>Function</b>	The function name. You can click the function name to go to its definition in <i>model.c</i> .
<b>Prototype</b>	Displays the function prototype, including the function return value, name, and arguments.
<b>Description</b>	Provides a text description of the purpose of the function in the application.
<b>Timing</b>	Describes the timing characteristics of the function, such as how many times the function is called, or if it is called periodically, and at what time interval. For a multirate timing example, see the following <code>rtwdemo_mrmtbb</code> report excerpt.
<b>Arguments</b>	If the function has arguments, displays the number, name, data type, and Simulink description for each argument. For argument examples, see the <code>rtwdemo_fcnprotoctrl</code> report excerpt below.
<b>Return value</b>	If the function has a return value, this field displays the return value data type and Simulink description. If you selected the <b>Code-to-model</b> parameter for your model, you can click the hyperlink in the description to go to the block corresponding to the return value in the model display. For a return value example, see the following <code>rtwdemo_fcnprotoctrl</code> report excerpt.
<b>Header file</b>	The name of the header file for the function. You can click the header file name to go to the header file source listing.

For example, here is the **Entry-Point Functions** subsection for the model `rtwdemo_configinterface`.

#### Entry-Point Functions

Function: [rtwdemo\\_configinterface\\_initialize](#)

Prototype	<code>void rtwdemo_configinterface_initialize(void)</code>
Description	Initialization entry point of generated code
Timing	Must be called exactly once
Arguments	None
Return value	None
Header file	<a href="#">rtwdemo_configinterface.h</a>

Function: [rtwdemo\\_configinterface\\_step](#)

Prototype	<code>void rtwdemo_configinterface_step(void)</code>
Description	Output entry point of generated code
Timing	Must be called periodically, every 1 second
Arguments	None
Return value	None
Header file	<a href="#">rtwdemo_configinterface.h</a>

Function: [rtwdemo\\_configinterface\\_terminate](#)

Prototype	<code>void rtwdemo_configinterface_terminate(void)</code>
Description	Termination entry point of generated code
Timing	Must be called exactly once
Arguments	None
Return value	None
Header file	<a href="#">rtwdemo_configinterface.h</a>

To illustrate how timing information might be listed for a multirate model, here are the **Entry-Point Functions** and **Inports** subsections for the model `rtwdemo_mrrmtbb`. This multirate, discrete-time, multitasking model contains Inport blocks 1 and 2, which specify 1-second and 2-second sample times, respectively. The sample times are constrained to the specified times by the **Periodic sample time constraint** option on the **Solver** pane of the Configuration Parameters dialog box.

**Entry-Point Functions**Function: [rtwdemo\\_mrmtbb\\_initialize](#)

Prototype	<b>void rtwdemo_mrmtbb_initialize(void)</b>
Description	Initialization entry point of generated code
Timing	Must be called exactly once
Arguments	None
Return value	None
Header file	<a href="#">rtwdemo_mrmtbb.h</a>

Function: [rtwdemo\\_mrmtbb\\_step0](#)

Prototype	<b>void rtwdemo_mrmtbb_step0(void)</b>
Description	Output entry point of generated code
Timing	Must be called periodically, every 1 second
Arguments	None
Return value	None
Header file	<a href="#">rtwdemo_mrmtbb.h</a>

Function: [rtwdemo\\_mrmtbb\\_step1](#)

Prototype	<b>void rtwdemo_mrmtbb_step1(void)</b>
Description	Output entry point of generated code
Timing	Must be called periodically, every 2 seconds
Arguments	None
Return value	None
Header file	<a href="#">rtwdemo_mrmtbb.h</a>

**Inports**

Block Name	Code Identifier	Data Type	Dimension
<a href="#">&lt;Root&gt;/In1_1s</a>	rtU.In1_1s	real_T	1
<a href="#">&lt;Root&gt;/In2_2s</a>	rtU.In2_2s	real_T	1

To illustrate how function arguments and return values are displayed in the report, here is the entry-point function description of the model step function for model `rtwdemo_fcncnprotctrl`.

Function: [rtwdemo\\_fcncnprotctrl\\_step\\_custom](#)

Prototype	<b>boolean_T rtwdemo_fcncnprotctrl_step_custom(const real_T argIn1, const BusObject *const argIn2, BusObject *argOut2, const BusObject *const argIn3, uint8_T *argIn4)</b>		
Description	Output entry point of generated code		
Timing	Can be called at any time		
Arguments	[-]		
	<b>#</b>	<b>Name</b>	<b>Data Type</b>
	1	argIn1	const real_T
	2	argIn2	const BusObject *const
	3	argOut2	BusObject *
	4	argIn3	const BusObject *const
	5	argIn4	uint8_T *
			<b>Description</b>
			<a href="#">&lt;Root&gt;/In1</a>
			<a href="#">&lt;Root&gt;/In2</a>
			<a href="#">&lt;Root&gt;/Out2</a>
			<a href="#">&lt;Root&gt;/In3</a>
			<a href="#">&lt;Root&gt;/In4</a>
Return value	<b>Data Type</b>	<b>Description</b>	
	<b>boolean_T</b>	<a href="#">&lt;Root&gt;/Out1</a>	
Header file	<a href="#">rtwdemo_fcncnprotctrl.h</a>		

## Interpreting the Inports and Outports Subsections

The **Inports** and **Outports** subsections of the code interface report provide the following interface information about each inport and output in the model.

Field	Description
<b>Block Name</b>	Displays the Simulink block name of the inport or output. If you selected the <b>Code-to-model</b> parameter for your model, you can click on each inport or output <b>Block Name</b> value to go to its location in the model display.
<b>Code Identifier</b>	Lists the identifier associated with the inport or output data in the generated code, as follows: <ul style="list-style-type: none"> <li>• If the data is defined in the generated code, the field displays the identifier text.</li> <li>• If the data is declared but not defined in the generated code — for example, if the data is resolved with an imported storage class — the field displays the identifier text prefixed with the label 'Imported data:'.</li> <li>• If the data is neither defined nor declared in the generated code — for example, if model configuration parameter <b>Code interface packaging</b> is set to <b>Reusable function</b> — the field displays the text 'Defined externally'.</li> </ul>
<b>Data Type</b>	Lists the data type of the inport or output.
<b>Scaling</b>	For fixed-point entries, lists the data type and fraction length using Simulink fixed-point data type notation. <p><b>Note</b> You must have a Fixed-Point Designer license to see fixed-point scaling information in the report. For more information on how scaling is represented in the table, see “Fixed-Point Data Type and Scaling Notation” (Fixed-Point Designer).</p>
<b>Dimension</b>	Lists the dimensions of the inport or output (for example, 1 or [4, 5]).

For example, here are the **Inports** and **Outports** subsections for the model `rtwdemo_configinterface`.

### Inports

[ - ]

Block Name	Code Identifier	Data Type	Dimension
<a href="#">&lt;Root&gt;/In1</a>	Imported data: input1	MYTYPE	1
<a href="#">&lt;Root&gt;/In2</a>	Imported data: input2	MYTYPE	1
<a href="#">&lt;Root&gt;/In3</a>	Imported data: input3	MYTYPE	1
<a href="#">&lt;Root&gt;/In4</a>	Imported data: input4	MYTYPE	1

### Outports

Block Name	Code Identifier	Data Type	Dimension
<a href="#">&lt;Root&gt;/Out1</a>	output	MYTYPE	1

## Interpreting the Interface Parameters Subsection

The **Interface Parameters** subsection of the code interface report provides the following interface information about tunable parameters that are associated with the model.

Field	Description
<b>Parameter Source</b>	Lists the source of the parameter value, as follows: <ul style="list-style-type: none"> <li>If the source of the parameter value is a block, the field displays the block name, such as &lt;Root&gt;/Gain2 or &lt;S1&gt;/Lookup1. If you selected the <b>Code-to-model</b> parameter for your model, you can click the <b>Parameter Source</b> value to go to the parameter's location in the model display.</li> <li>If the source of the parameter value is a workspace variable, the field displays the name of the workspace variable.</li> </ul>
<b>Code Identifier</b>	Lists the identifier associated with the tunable parameter data in the generated code, as follows: <ul style="list-style-type: none"> <li>If the data is defined in the generated code, the field displays the identifier text.</li> <li>If the data is declared but not defined in the generated code — for example, if the data is resolved with an imported storage class — the field displays the identifier text prefixed with the label 'Imported data:'.</li> <li>If the data is neither defined nor declared in the generated code — for example, if model configuration parameter <b>Code interface packaging</b> is set to <b>Reusable function</b> — the field displays the text 'Defined externally'.</li> </ul>
<b>Data Type</b>	Lists the data type of the tunable parameter.
<b>Scaling</b>	For fixed-point entries, lists the data type and fraction length using Simulink fixed-point data type notation. <p><b>Note</b> You must have a Fixed-Point Designer license to see fixed-point scaling information in the report. For more information on how scaling is represented in the table, see “Fixed-Point Data Type and Scaling Notation” (Fixed-Point Designer).</p>
<b>Dimension</b>	Lists the dimensions of the tunable parameter (for example, 1 or [4, 5, 6]).

For example, here is the **Interface Parameters** subsection for the model `rtwdemo_configinterface`.

### Interface Parameters

[ - ]

Parameter Source	Code Identifier	Data Type	Dimension
'Table1' in model workspace	Table1	const volatile Table1_Type	1
'Table2' in model workspace	Table2	const volatile Table2_Type	1
'K1' in model workspace	K1	const volatile int8_T	1

## Interpreting the Data Stores Subsection

The **Data Stores** subsection of the code interface report provides the following interface information about global data stores and data stores with non-auto storage that are associated with the model.

Field	Description
<b>Data Store Source</b>	Lists the source of the data store memory, as follows: <ul style="list-style-type: none"> <li>If the data store is defined using a Data Store Memory block, the field displays the block name, such as &lt;Root&gt;/DS1. If you selected the <b>Code-to-model</b> parameter for your model, you can click on the <b>Data Store Source</b> value to go to the data store's location in the model display.</li> <li>If the data store is defined using a Simulink.Signal object, the field displays the name of the Simulink.Signal object.</li> </ul>
<b>Code Identifier</b>	Lists the identifier associated with the data store data in the generated code, as follows: <ul style="list-style-type: none"> <li>If the data is defined in the generated code, the field displays the identifier text.</li> <li>If the data is declared but not defined in the generated code — for example, if the data is resolved with an imported storage class — the field displays the identifier text prefixed with the label 'Imported data:'.</li> <li>If the data is neither defined nor declared in the generated code — for example, if model configuration parameter <b>Code interface packaging</b> is set to Reusable function — the field displays the text 'Defined externally'.</li> </ul>
<b>Data Type</b>	Lists the data type of the data store.
<b>Scaling</b>	For fixed-point entries, lists the data type and fraction length using Simulink fixed-point data type notation. <p><b>Note</b> You must have a Fixed-Point Designer license to see fixed-point scaling information in the report. For more information on how scaling is represented in the table, see “Fixed-Point Data Type and Scaling Notation” (Fixed-Point Designer).</p>
<b>Dimension</b>	Lists the dimensions of the data store (for example, 1 or [1, 2]).

For example, here is the **Data Stores** subsection for the model `rtwdemo_configinterface`.

### Data Stores

Data Store Source	Code Identifier	Data Type	Dimension
<a href="#">&lt;Root&gt;/Data Store Memory</a>	mode	volatile boolean_T	1

## Code Interface Report Limitations

The following limitations apply to the code interface section of the HTML code generation reports.

- The code interface report supports data resolved with most storage classes, except when the storage class properties are set in one of the following ways:
  - The storage class property **Type** is set to `FlatStructure`. For example, the `BitField` and `Struct` storage classes in the Simulink package have **Type** set to `FlatStructure`.
  - The storage class property **Type** is set to `Other`. For example, the `GetSet` storage class in the Simulink package has **Type** set to `Other`.
  - The storage class property **Data access** is set to `Pointer`, indicating that imported symbols are declared as pointer variables rather than simple variables. This property is accessible only when the storage class property **Data scope** is set to `Imported` or `Instance-specific`.

In these cases, the report displays empty **Data Type** and **Dimension** fields.

- For outputs, the code interface report cannot describe the associated memory (data type and dimensions) if the memory is optimized. In these cases, the report displays empty **Data Type** and **Dimension** fields.
- The code interface report does not support data type replacement using the **Code Generation > Data Type Replacement** pane of the Configuration Parameters dialog box. The data types listed in the report link to built-in data types rather than their specified replacement data types.

## Analyze Generated Service Code Interface

When you generate a code generation report, you can include a code interface report, which documents the generated code interface including model entry-point functions and services. The code interface information helps you to review the generated code and integrate it with other code. The information in the report depends on the type of code interface configuration that you use. For models that use data interface configuration for the generated code, the code interface report includes information about data and functions, as described in “Analyze Generated Data Code Interface” on page 54-13.

For code configured with service interfaces, the code interface report includes the following subsections:

- **Introduction** — a high-level description of how the code interface is generated to work with services provided by the target platform software.
- **Execution** — interface information about each model execution entry-point function, including `model_initialize`, `model_step`, and (if applicable) `model_reset` and `model_terminate`.
- **Services** — interface information about platform services that the generated code uses, including data transfer and timer services.

To generate a code interface report, select the configuration parameters **Create code generation report** and **Code Interface Report**, as described in “Generate Code Generation Report” on page 54-5. For limitations that apply to code interface reports, see “Code Interface Report Limitations” on page 54-24.

### Navigating Code Interface Report Subsections

To help you navigate code interface descriptions, the code interface report provides collapse/expand tokens and hyperlinks.

- For a large subsection, the report provides [Hide] and [Show] buttons that allow you to collapse or expand that section.
- The code interface report provides several forms of hyperlink navigation. For example:
  - You can click each function name to go to its definition in `model.c`.
  - You can click the header file name for each function to go to the header file source listing.
  - If you selected the configuration parameter **Code-to-model**, to go to the corresponding location in the model display, you can click hyperlinks for these constructs:
    - Function argument
    - Function return value
    - Variable representing an input
    - Variable representing an output
    - Interface parameter (if the parameter source is a block)
    - Variable representing a data store (if the data store source is a Data Store Memory block)

For backward and forward navigation within the HTML code generation report, use the **Back** and **Forward** arrow buttons above the **Content** section in the upper-left corner of the report.

## Interpreting the Execution Subsection

The **Execution** subsection of the code interface report provides the following interface information about each model entry-point function, including `model_initialize`, `model_step`, and (if applicable) `model_reset` and `model_terminate`.

Field	Description
<b>Function</b>	The function name. You can click the function name to go to its definition in <code>model.c</code> .
<b>Prototype</b>	Displays the function prototype, including the function return value, name, and arguments.
<b>Description</b>	Provides a text description of the purpose of the function in the application.
<b>Sample time</b>	If the function is called periodically, sample time describes the time interval. If the function is not called periodically, no sample time is shown.
<b>Arguments</b>	If the function has arguments, displays the number, name, data type, and Simulink description for each argument.
<b>Return value</b>	If the function has a return value, this field displays the return value data type and Simulink description. If you selected the <b>Code-to-model</b> parameter for your model, you can click the hyperlink in the description to go to the block corresponding to the return value in the model display.
<b>Header file</b>	The name of the header file for the function.

For each execution function, the report shows interface information for the receiver, sender, and timer services for the function. The report provides this information about each service.

Field	Description
<b>Prototype</b>	Displays the function prototype for calling the service, including the function return value, name, and arguments.
<b>Data communication method</b>	Indicates how the service accesses data. The options are outside execution, during execution, or direct access.
<b>Header file</b>	The name of the header file that contains the service interface prototypes.

For example, here is the **Execution** subsection for the model `Guideline_DataTransfer`.

**Execution** [\[hide\]](#)

A target platform initiates execution of a component by calling execution entry-point functions generated for the model. Periodic and aperiodic (asynchronous) entry-point functions implement component behavior. The type of function code that the code generator produces for a component model depends on the modeling style and periodic rates represented in the model. The modeling style might be either or a combination of rate-based and function-call (exported-function) based. Initialize, reset, and terminate entry-point functions implement startup, reset, and shutdown interfaces. They are represented in a model as Initialize Function and Terminate Function blocks.

**Periodic Functions**

Function: [Guideline\\_DataTransfer\\_Run2](#)

Prototype	void Guideline_DataTransfer_Run2(void)
Description	Exported function: <Root>/Run2
Sample time	1
Header file	Guideline_DataTransfer.h

No receiver services for 'Guideline\_DataTransfer\_Run2'.

Sender services for Guideline\_DataTransfer\_Run2

Prototype	Data communication method	Header file
<b>set_Out1(void)</b>	Outside execution	services.h

No timer services for 'Guideline\_DataTransfer\_Run2'.

**Aperiodic Functions**

Function: [Guideline\\_DataTransfer\\_Run1](#)

Prototype	void Guideline_DataTransfer_Run1(void)
Description	Exported function: <Root>/Run1
Header file	Guideline_DataTransfer.h

Receiver services for Guideline\_DataTransfer\_Run1

Prototype	Data communication method	Header file
<b>get_In2(void)</b>	Outside execution	services.h
<b>real_T get_In1(void)</b>	Outside execution	services.h

No sender services for 'Guideline\_DataTransfer\_Run1'.

No timer services for 'Guideline\_DataTransfer\_Run1'.

**Initialize Functions**

Function: [Guideline\\_DataTransfer\\_initialize](#)

Prototype	void Guideline_DataTransfer_initialize(void)
Description	Initialization entry point of generated code
Header file	Guideline_DataTransfer.h

**Reset Functions**

No reset functions in model.

**Terminate Functions**

## Interpreting the Services Section

The **Services** section of the code interface report provides this interface information about each service in the generated code.

Field	Description
<b>Service:</b>	Lists the service name.
<b>Prototype</b>	Displays the service prototype, including the service return value, name, and arguments.
<b>Data communication method</b>	Indicates how the service accesses data. The options are outside execution, during execution, or direct access.
<b>Receiving function</b>	Name of the function for receiving data.
<b>Sending function</b>	Name of the function for sending data.
<b>Header file</b>	Lists the name of the header file that contains the service interface prototypes.

For example, here is the **Services** section for the model `Guideline_DataTransfer`.

### Services [\[hide\]](#)

Services offered by a platform might include timer, data transfer, nonvolatile memory, parameter tuning, and measurement services.

#### Data Transfer Services

Within a platform environment, callable functions within a component exchange data by calling platform data transfer services. A call to data transfer service is represented in a model as a signal line that connects communicating functions.

#### Data Transfer Service: `DataTransfer`

Receiver service prototype	<code>get_Guideline_DataTransfer_Run2_DataTransfer(void)</code>
Sender service prototype	<code>set_Guideline_DataTransfer_Run1_DataTransfer(void)</code> <code>set_ModelInitialize_DataTransfer(void)</code>
Data communication method	Outside execution
Receiving function	
Sending function	
Header file	<code>services.h</code>

#### Tunable Parameter Interface

No interface/tunable parameters in model.

## Code Interface Report Limitations

The following limitations apply to the code interface section of the HTML code generation reports.

- The code interface report supports data resolved with most storage classes, except when the storage class properties are set in one of the following ways:
  - The storage class property **Type** is set to `FlatStructure`. For example, the `BitField` and `Struct` storage classes in the `Simulink` package have **Type** set to `FlatStructure`.

- The storage class property **Type** is set to **Other**. For example, the `GetSet` storage class in the `Simulink` package has **Type** set to **Other**.
- The storage class property **Data access** is set to **Pointer**, indicating that imported symbols are declared as pointer variables rather than simple variables. This property is accessible only when the storage class property **Data scope** is set to **Imported** or **Instance-specific**.

In these cases, the report displays empty **Data Type** and **Dimension** fields.

- For outports, the code interface report cannot describe the associated memory (data type and dimensions) if the memory is optimized. In these cases, the report displays empty **Data Type** and **Dimension** fields.
- The code interface report does not support data type replacement using the **Code Generation > Data Type Replacement** pane of the Configuration Parameters dialog box. The data types listed in the report link to built-in data types rather than their specified replacement data types.

## Static Code Metrics

### In this section...

“Static Code Metrics” on page 54-26

“Static Code Metrics Analysis” on page 54-26

“View Static Code Metrics and Definitions Within the Generated Code” on page 54-28

“Static Code Metrics Report Limitations” on page 54-28

### Static Code Metrics

The code generator performs static analysis on page 54-26 of the generated C or C++ code and provides these metrics in the **Static Code Metrics Report** section of the HTML Code Generation Report. When you place your cursor over a function or a variable in the generated code, you can also see metrics.

You can use the information in the report to:

- Find the number of files and lines of code in each file.
- Estimate the number of lines of code and stack usage per function.
- Compare the difference in terms of how many files, functions, variables, and lines of code are generated every time you change the model or MATLAB algorithm.
- Determine a target platform and allocation of RAM to the stack, based on the size of global variables plus the estimated stack size.
- Determine possible performance slow points, such as the largest global variables or the most costly call path in terms of stack usage.
- View the cyclomatic complexity of a function, which counts the number of linearly independent paths through a function.
- View the function call tree. Determine the longest call path to estimate the worst case execution timing.
- View how target functions, provided by the selected code replacement library, are used in the generated code.

For examples, see:

- “Generate Static Code Metrics Report for Simulink Model” on page 54-29
- “Generating a Static Code Metrics Report for Code Generated from MATLAB Code” on page 54-33

### Static Code Metrics Analysis

Static analysis of the generated code is performed only on the source code without executing the program. The results of the static code metrics analysis are included in the **Static Code Metrics** section of the HTML Code Generation Report. The report is not available if you generate a MEX function from MATLAB code.

Static analysis of the generated source code files:

- Uses the specified C data types. For Simulink models, you specify these data types in the **Hardware Implementation > Production hardware** pane of the Configuration Parameters dialog box. For code generation from MATLAB code, you specify them in the **Hardware** tab of the MATLAB Coder project settings dialog box or using a code generation configuration object. Actual object code metrics might differ due to target-specific compiler and platform settings.
- Includes custom code only if you specify it. For Simulink models, you specify custom code on the **Code Generation > Custom Code** pane in the model configuration. For code generation from MATLAB code, you specify it on the **Debugging** tab of the MATLAB Coder project settings dialog box or using a code generation configuration object. An error report is generated if the generated code includes platform-specific files not contained in the standard C run-time library.
- For Simulink models, includes the generated code from referenced models.
- Uses 1-byte alignment for all members of a structure for estimating global and local data structure sizes. The size of a structure is calculated by summing the sizes of all of its fields. This estimation represents the smallest possible size for a structure.
- Calculates the self stack size of a function as the size of local data within a function, excluding input arguments. The accumulated stack size of a function is the self stack size plus the maximum of the accumulated stack sizes of its called functions. For example, if the accumulated stacks sizes for the called functions are represented as `accum_size1...accum_sizeN`, then the accumulated stack size for a function is

$$\text{accumulated\_stack\_size} = \text{self\_stack\_size} + \max(\text{accum\_size1}, \dots, \text{accum\_sizeN})$$

For example consider this piece of generated code:

```
/* Real-time model */
RT_MODEL rtM_;
RT_MODEL *const rtM = &rtM_;
static void Debug_b(const real_T rtu_In1[6], const real_T rtu_In2[6], real_T
 rtd_A[6], real_T rtd_B[6]);
```

Now consider the code metrics shown below:

Static Code Metrics reported stack sizes

Function Name	Accumulated Stack Size (bytes)	Self Stack Size (bytes)	Lines of Code
(-) local_demo_step	12	0	1
Debug_b	12	12	6
local_demo_initialize	0	0	0

The accumulated stack size is 12 bytes because the self stack size of the function `Debug_b` is 12 bytes and the 4 input arguments do not contribute to the calculation of accumulated stack size.

- When estimating the stack size of a function, static analysis stops at the first instance of a recursive call. The **Function Information** table indicates when recursion occurs in a function call path. Code generation generates only recursive code for Stateflow event broadcasting and for graphical functions if it is written as a recursive function.
- Calculates the cyclomatic complexity of a function as the number of decisions plus one:

$$CC = \text{Number of decisions} + 1$$

The following constructs add a decision:

- If statement
- Else-If statement
- Switch statement (1 decision for each case branch)
- Loop statements: While, For, Do-while

---

**Note** Boolean operators in the preceding constructs do not add extra decisions.

---

- Does not include `ert_main.c`, because you have the option to provide your own `main.c`.

## View Static Code Metrics and Definitions Within the Generated Code

When you view code in the Code view or in the code generation report, place your cursor over the global variables and functions to see code metrics information.

```

44
45 /* D Definition Integrator' */
46 if (Variable defined in rtwdemo_attitude.c Integrator_PrevResetState != 0) {
47 | rt 22 D_work rtDWork;
48 | }
49
50 if (rtDWork.Integrator_DSTATE >= 5.0) {
51 | rtDWork.Integrator_DSTATE = 5.0;
52 | } else if (rtDWork.Integrator_DSTATE <= -5.0) {
53 | rtDWork.Integrator_DSTATE = -5.0;
54 | }

```

The screenshot shows a code editor with a tooltip over the variable `rtDWork` on line 47. The tooltip contains the following information:

- Definition:** Variable defined in `rtwdemo_attitude.c`
- Code metrics:** size: 16 byte

The tooltip provides a link to the definition for the variable or function.

```

21 /* Block signals and states (default storage) */
22 D_work rtDWork;
23
24 /* External inputs (root inport signals with default storage) */
25 ExternalInputs rtU;

```

## Static Code Metrics Report Limitations

Static code metrics are not available if the target configuration for a model results in generated code that:

- Includes a header file that is not generated by the model hierarchy and is not a system header file
- Uses a macro that is not recognized

## Generate Static Code Metrics Report for Simulink Model

The **Static Code Metrics Report** is a section included in the HTML Code Generation Report. For more information on the static analysis of the generated code, see “Static Code Metrics Analysis” on page 54-26.

- 1 To generate the static code metrics report in the HTML Code Generation Report, open the Configuration Parameters dialog box for your model. On the **Code Generation > Report** pane, select the Generate static code metrics check box. If your model includes referenced models, select the **Generate static code metrics** check box in each referenced model’s configuration set. Otherwise, you cannot view a separate static code metrics report for a referenced model.

Alternatively, after you generate code, generate only the static code metrics report by using the function `coder.report.generateCodeMetrics`.

- 2 Press **Ctrl+B** to build your model and generate the HTML code generation report. For more information, see “Generate Code Generation Report” on page 54-5.
- 3 If the HTML Code Generation Report is not already open, open the report. On the left navigation pane, in the **Contents** section, select **Static Code Metrics Report**.

If you generated only the static code metrics report, open the report. By default, the static code metrics report file `metrics.html` is generated in the current folder.

- 4 To see the generated files and how many lines of code are generated per file, look at the **File Information** section.

**1. File Information** [\[hide\]](#)

[-] Summary (excludes ert\_main.c)

Number of .c files : 2  
 Number of .h files : 4  
 Lines of code : 1,132  
 Lines : 1,958

[-] File details

File Name	Lines of Code	Lines	Generated On
<a href="#">fuel_rate_control.c</a>	665	1,107	06/10/2016 4:17 PM
<a href="#">fuel_rate_control_data.c</a>	253	342	06/10/2016 4:17 PM
<a href="#">rtwtypes.h</a>	97	177	06/10/2016 4:17 PM
<a href="#">fuel_rate_control.h</a>	88	249	06/10/2016 4:17 PM
<a href="#">fuel_rate_control_types.h</a>	22	52	06/10/2016 4:17 PM
<a href="#">fuel_rate_control_private.h</a>	7	31	06/10/2016 4:17 PM

- 5 Hover your cursor over column titles and some column values to see a description of the corresponding data.
- 6 If your model includes referenced models, the File information section includes a **Referenced Model** column. In this column, click the referenced model name to open its static code metrics report. If the static code metrics report is not available for a referenced model, specify the **Generate static code metrics** parameter in the referenced model's configuration set and rebuild your model.
- 7 To view the global variables in the generated code, their size, and the number of accesses, see the **Global Variables** section.

**2. Global Variables** [\[hide\]](#)

Global variables defined in the generated code.

Global Variable	Size (bytes)	Reads / Writes	Reads / Writes in a Function
[+] <a href="#">fuel_rate_control_DW</a>	23	175	78
[+] <a href="#">fuel_rate_control_B</a>	21	42	26
[+] <a href="#">fuel_rate_control_U</a>	16	27	24
[+] <a href="#">fuel_rate_control_M</a>	8	0*	0*
[+] <a href="#">fuel_rate_control_Y</a>	4	4	3
<b>Total</b>	<b>72</b>	<b>248</b>	

\* The global variable is not directly used in any function.

The **Reads/Writes** column displays the total number of read and write accesses to the global variable. The **Reads/Writes in a Function** column displays the maximum number of read and write accesses to the global variable within a function. You use this information to estimate the benefit of turning on optimizations, which reduce the number of global references. For more information, see "Optimize Global Variable Usage" on page 78-2.

Click [+] to expand structures.

Global variables defined in the generated code.

Global Variable	Size (bytes)	Reads / Writes	Reads / Writes in a Function

<a href="#">[-] fuel_rate_control_Y</a>	4	4	3
fuel_rate	4	4	3
<b>Total</b>	<b>72</b>	<b>248</b>	

\* The global variable is not directly used in any function.

- 8 To navigate from the report to the source code, click a global variable or function name. These names are hyperlinks to their definitions.
- 9 To view the function call tree of the generated code, in the **Function Information** section, click **Call Tree** at the top of the table.

### 3. Function Information [\[hide\]](#)

View function metrics in a call tree format or table format. Accumulated stack numbers include the estimated stack size of the function plus the maximum of the accumulated stack size of the subroutines that the function calls.

View: Call Tree | [Table](#)

Function Name	Accumulated Stack Size (bytes)	Self Stack Size (bytes)	Lines of Code	Lines	Complexity
<a href="#">[-] fuel_rate_control_step</a>	52	16	272	504	43
<a href="#">.look2_iff_linlca</a>	36	36	55	100	12
<a href="#">[-] fuel_rate_control_Fail</a>	4	4	67	103	13
<a href="#">fuel_rate_control_Fueling_Mode</a>	0	0	166	240	19
<a href="#">fuel_rate_control_Fueling_Mode</a>	0	0	166	240	19
<a href="#">[+] fuel_rate_control_initialize</a>	0	0	43	67	1
<a href="#">fuel_rate_control_terminate</a>	0	0	0	4	1

ert\_main.c is not included in the code metrics analysis, therefore it is not shown in the call tree format. The **Complexity** column includes the cyclomatic complexity of each function.

- 10 To view the functions in a table format, click **Table**.

### 3. Function Information [\[hide\]](#)

View function metrics in a call tree format or table format. Accumulated stack numbers include the estimated stack size of the function plus the maximum of the accumulated stack size of the subroutines that the function calls.

View: [Call Tree](#) | [Table](#)

Function Name	Called By (number of call sites)	Accumulated Stack Size (bytes)	Self Stack Size (bytes)	Lines of Code	Lines	Complexity
<a href="#">fuel_rate_control_Fail</a>	<a href="#">fuel_rate_control_step</a> (9)	4	4	67	103	13
<a href="#">fuel_rate_control_Fueling_Mode</a>	<a href="#">fuel_rate_control_step</a> <a href="#">fuel_rate_control_Fail</a> (2)	0	0	166	240	19
<a href="#">fuel_rate_control_initialize</a>		0	0	43	67	1
<a href="#">fuel_rate_control_step</a>		52	16	272	504	43
<a href="#">fuel_rate_control_terminate</a>		0	0	0	4	1
<a href="#">look2_iff_linlca</a>	<a href="#">fuel_rate_control_step</a> (5)	36	36	55	100	12
memset	<a href="#">fuel_rate_control_initialize</a> (2)	<i>Not available</i>	-	-	-	-

The second column, **Called By**, lists functions that call the function listed in the first column, using the following criteria:

- If a function is called by multiple functions, all functions are listed.
- If a function has no called function, this column is empty.

For example, `Fueling_Mode` is called by `Fail` and `fuel_rate_control_step`. The number of call sites is included in parentheses. `Fail` calls `Fueling_Mode` twice.

- “Generate Code Generation Report” on page 54-5
- “Generate Code Generation Report Programmatically” on page 54-7

## Generating a Static Code Metrics Report for Code Generated from MATLAB Code

The static code metrics report contains the results of static analysis of the generated C/C++ code, including generated file information, number of lines, and memory usage. For more information, see “Static Code Metrics” on page 54-26. To produce a static code metrics report, you must use Embedded Coder to generate standalone C/C++ code and produce a code generation report. See “Code Generation Reports”.

By default, static code metrics analysis does not run at code generation time. Instead, if and when you want to run the analysis and view the results, click **Code Metrics** on the **Summary** tab of the code generation report.

### Example Static Code Metrics Report

This example runs static code metrics analysis and examines a static code metrics report.

Create the example function `averaging_filter`.

```
function y = averaging_filter(x) %#codegen
% Use a persistent variable 'buffer' that represents a sliding window of
% 16 samples at a time.
persistent buffer;
if isempty(buffer)
 buffer = zeros(16,1);
end
y = zeros(size(x), class(x));
for i = 1:numel(x)
 % Scroll the buffer
 buffer(2:end) = buffer(1:end-1);
 % Add a new sample value to the buffer
 buffer(1) = x(i);
 % Compute the current average value of the window and
 % write result
 y(i) = sum(buffer)/numel(buffer);
end
```

Create sample data.

```
v = 0:0.00614:2*pi;
x = sin(v) + 0.3*rand(1,numel(v));
```

Enable production of a code generation report by using a configuration object for standalone code generation (static library, dynamically linked library, or executable program).

```
cfg = coder.config('lib', 'ecoder', true);
cfg.GenerateReport=true;
```

Alternatively, use the `codegen -report` option.

Generate code by using `codegen`. Specify the type of the input argument by providing an example input with the `-args` option. Specify the configuration object by using the `-config` option.

```
codegen averaging_filter -config cfg -args {x}
```

To open the code generation report, click **View report**.

To run the static code metrics analysis and view the code metrics report, on the **Summary** tab of the code generation report, click **Code Metrics**.

Explore the code metrics report.

- 1 To see the generated files and the number of lines of code per file, click **File Information**.

averaging\_filter.m Code Metrics x

<a href="#">averaging_filter_terminate.c</a>	5	30
<a href="#">averaging_filter_types.h</a>	4	22

- 2 To see the global variables in the generated code, go to the **Global Variables** section.

2. **Global Variables** [\[hide\]](#)

Global variables defined in the generated code.

Global Variable	Size (bytes)	Reads / Writes	Reads / Writes in a Function
<a href="#">buffer</a>	128	5	4
<b>Total</b>	<b>128</b>	<b>5</b>	

To navigate from the report to the source code, click a global variable name.

- 3 To view the function call tree of the generated code, in the **Function Information** section, click **Call Tree**.

3. **Function Information** [\[hide\]](#)

View function metrics in a call tree format or table format. Accumulated stack numbers include the estimated stack size of the function plus the maximum of the accumulated stack size of the subroutines that the function calls.

View: [Call Tree](#) | [Table](#)

Function Name	Accumulated Stack Size (bytes)	Self Stack Size (bytes)	Lines of Code	Lines	Complexity
[ - ] <a href="#">averaging_filter</a>	136	136	14	24	3
<a href="#">double_to_uint64_helper</a>	8	8	6	8	1
[ + ] <a href="#">averaging_filter_initialize</a>	0	0	1	4	1
<a href="#">averaging_filter_terminate</a>	0	0	0	4	1

To navigate from the report to the function code, click a function name.

- 4 To view the functions in a table format, click **Table**.

3. **Function Information** [\[hide\]](#)

View function metrics in a call tree format or table format. Accumulated stack numbers include the estimated stack size of the function plus the maximum of the accumulated stack size of the subroutines that the function calls.

View: [Call Tree](#) | [Table](#)

Function Name	Called By (number of call sites)	Accumulated Stack Size (bytes)	Self Stack Size (bytes)	Lines of Code	Lines	Complexity
<a href="#">averaging_filter</a>		136	136	14	24	3
<a href="#">averaging_filter_init</a>	<a href="#">averaging_filter_initialize</a>	0	0	1	4	1
<a href="#">averaging_filter_initialize</a>		0	0	1	4	1
<a href="#">averaging_filter_terminate</a>		0	0	0	4	1

The second column, **Called By**, lists functions that call the function listed in the first column. If multiple functions call that function, all functions are listed. If no functions call that function, this column is empty.

## Requirements for Running Static Code Metrics Analysis After Code Generation

By default, static code metrics analysis does not run at code generation time. Instead, you can run the analysis later by clicking **Code Metrics** in the code generation report. Running static code metrics analysis after code generation has these requirements and limitations:

- You must have Embedded Coder and use the platform that you used for code generation. Once you run the static code metrics analysis, you can open the code metrics report without Embedded Coder or open it on a different platform.
- If you make the code generation report read-only before you run the analysis, each time that you click **Code Metrics**, the analysis runs.

## Running Static Code Metrics at Code Generation Time

If you want the code generator to run static code metrics analysis and produce the code metrics report at code generation time:

- In an Embedded Coder code generation configuration object, set `GenerateCodeMetricsReport` to `true`.
- In the MATLAB Coder app, on the **Debugging** tab, set **Static code metrics** to **Yes**.

- “Code Generation Reports”

## Analyze Code Replacements in Generated Code

When you select the check box **Summarize which blocks triggered code replacements** for an ERT-based model, a Code Replacements Report section is automatically included in the generated HTML report. The Code Replacements Report section documents the SIMD instruction sets and code replacement library (CRL) functions that were used for code replacements during code generation, providing a mapping between each replacement instance and the Simulink block that triggered the replacement. To enable display of the Simulink block information, select the **Code Generation > Comments** check box **Include comments**. On the same pane, select either the **Simulink block comments** checkbox or the **Simulink block descriptions** check box if present, or both.

You can use the report to:

- Determine which replacement functions were used in the generated code.
- Trace each replacement instance back to the block that triggered the replacement.

The figure below shows a Code Replacements Report generated for the CRL model `rtwdemo_crladdsub`. Each replacement function used is listed with a link to the block that triggered the replacement.

The screenshot shows a window titled "Code Generation Report" with a search bar and "Match Case" option. The main content area is titled "Code replacements in rtwdemo\_crladdsub" and contains the following text:

Code replacements for library 'Addition & Subtraction Examples'. The library comprises:

- Addition & Subtraction Examples
  - crl\_table\_addsub

To see the replacements and misses in the Code Replacement Viewer, look [here](#).

**1. Addition operator replacements [hide]**

The following table provides a mapping from the addition operators used from the selected Code Replacement Library to the blocks in the model that triggered the replacement.

Function	Block
u8_add_u8_u8	<Root>/Add8
u16_add_u16_u16	<Root>/Add16
s16_add_s16_s16	<S1>:1

**2. Subtraction operator replacements [hide]**

The following table provides a mapping from the subtraction operators used from the selected Code Replacement Library to the blocks in the model that triggered the replacement.

Function	Block
s8_sub_s8_s8	<Root>/Sub8
s32_sub_s32_s32	<Root>/Sub32
u32_sub_u32_u32	<Root>/EmbSub32

The left sidebar shows a "Content" pane with a tree view of reports and a "Code" pane with a file tree. The "Code" pane shows a tree structure with "Main file" (ert\_main.c), "Model files" (rtwdemo\_crladdsub.c, rtwdemo\_crladdsub.h), and "Utility files" (rtwtypes.h).

If you click a block path in the report, the block that triggered the replacement is highlighted in the model diagram. If the replacement was triggered by a Stateflow chart or a MATLAB function, a window opens to display the chart or function.

For more information, see "Verify Code Replacement Library" on page 72-55.

## Document Generated Code with Simulink Report Generator

### In this section...

- “Generate Code for the Model” on page 54-38
- “Open the Report Generator” on page 54-39
- “Set Report Name, Location, and Format” on page 54-41
- “Include Models and Subsystems in a Report” on page 54-42
- “Customize the Report” on page 54-42
- “Generate the Report” on page 54-43

The Simulink Report Generator software creates documentation from your model in multiple formats, including HTML, PDF, RTF, Microsoft Word, and XML. This example shows one way to document a code generation project in Microsoft Word. The generated report includes:

- System snapshots (model and subsystem diagrams)
- Block execution order list
- Simulink Coder and model version information for generated code
- List of generated files
- Optimization configuration parameter settings
- System target file selection and build process configuration parameter settings
- Subsystem map
- File name, path, and generated code listings for the source code

To adjust Simulink Report Generator settings to include custom code and then generate a report for a model, complete the following tasks:

- 1 “Generate Code for the Model” on page 54-38
- 2 “Open the Report Generator” on page 54-39
- 3 “Set Report Name, Location, and Format” on page 54-41
- 4 “Include Models and Subsystems in a Report” on page 54-42
- 5 “Customize the Report” on page 54-42
- 6 “Generate the Report” on page 54-43

A Simulink Report Generator license is required for the following report formats: PDF, RTF, Microsoft Word, and XML. For more information on generating reports in these formats, see the Simulink Report Generator documentation.

### Generate Code for the Model

Before you use the Report Generator to document your project, generate code for the model.

- 1 In the MATLAB Current Folder browser, navigate to a folder where you have write access.
- 2 Create a working folder from the MATLAB command line by typing:

```
mkdir report_ex
```

- 3 Make report\_ex your working folder:

```
cd report_ex
```

- 4 Open the slxAircraftExample model. In the Command Window, enter:

```
openExample('slxAircraftExample')
```

- 5 On the **Simulation** tab, in the **Save** list, select **Save as**. Navigate to the working folder, report\_ex, and save a copy of the slxAircraftExample model as myModel.
- 6 Open the Configuration Parameters dialog box. Set the **Solver > Solver selection > Type** parameter to Fixed-step.
- 7 Select the **Code Generation** pane. Select **Generate code only**.
- 8 Click **Apply**.
- 9 In the model window, press **Ctrl+B**. The build process generates code for the model.

## Open the Report Generator

After you generate the code, open the Report Generator.

- 1 Open the Report Generator app. In the model diagram window, in the **Apps** gallery, click **Report Generator**.
- 2 In the Report Explorer window, in the options pane (center), click the folder **rtw (\toolbox\rtw)**. Click the setup file that it contains, **codegen.rpt**.

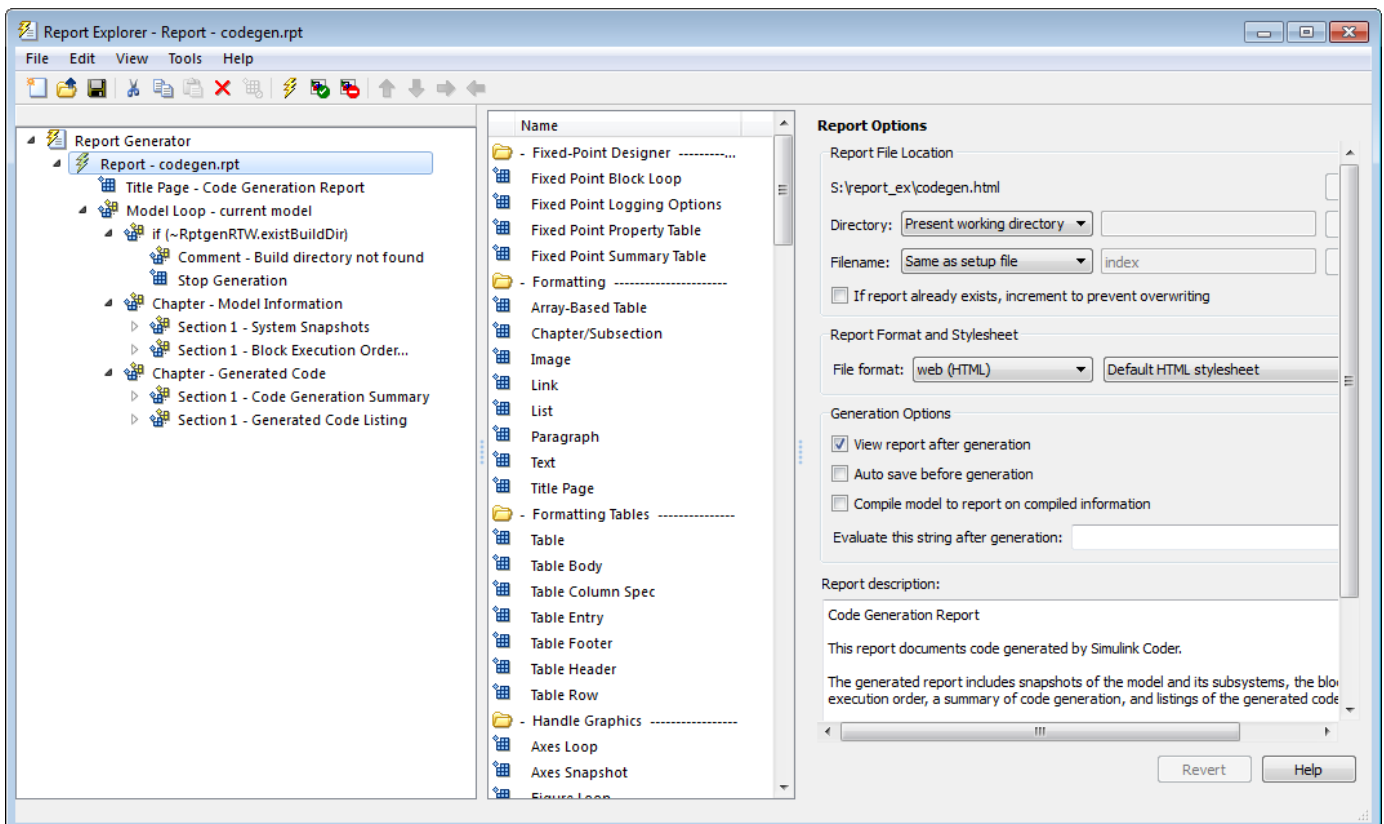

- 3 Double-click **codegen.rpt** or select it and click the **Open report** button. The Report Explorer displays the structure of the setup file in the outline pane (left).

## Set Report Name, Location, and Format

Before generating a report, you can specify report output options, such as the folder, file name, and format. For example, to generate a Microsoft Word report named `MyCGModelReport.rtf`:

- 1 In the properties pane, under **Report Options**, review the options listed.

- 2 Leave the **Directory** field set to Present working directory.
- 3 For **Filename**, select Custom: and replace index with the name MyModelCGReport.
- 4 For **File format**, specify Rich Text Format and replace Standard Print with Numbered Chapters & Sections.

## Include Models and Subsystems in a Report

Specify the models and subsystems that you want to include in the generated report by setting options in the Model Loop component.

- 1 In the outline pane (left), select **Model Loop**. Report Generator displays Model Loop component options in the properties pane.
- 2 If not already selected, select Current block diagram for the **Model name** option.
- 3 In the outline pane, click **Report - codegen.rpt\***.

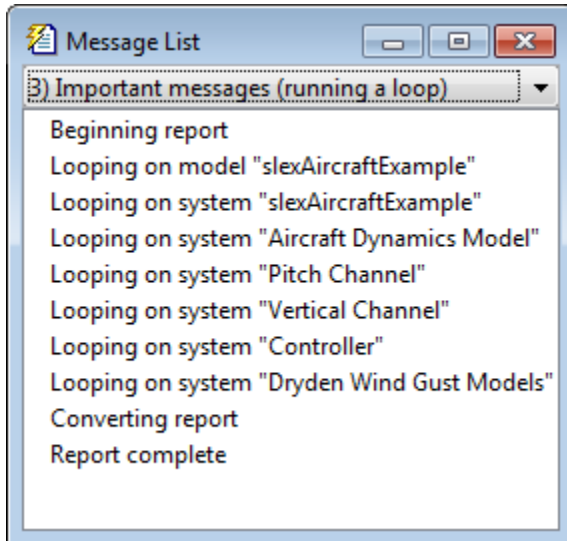

## Customize the Report

After specifying the models and subsystems to include in the report, you can customize the sections included in the report.

- 1 In the outline pane (left), expand the node **Chapter - Generated Code**. By default, the report includes two sections, each containing one of two report components.
- 2 Expand the node **Section 1 — Code Generation Summary**.
- 3 Select **Code Generation Summary**. Options for the component are displayed in the properties pane.
- 4 Click **Help** to review the report customizations that you can make with the Code Generation Summary component. For this example, do not customize the component.
- 5 In the Report Explorer window, expand the node **Section 1 — Generated Code Listing**.
- 6 Select **Import Generated Code**. Options for the component are displayed in the properties pane.
- 7 Click **Help** to review the report customizations that you can make with the Import Generated Code component.

## Generate the Report

After you adjust the report options, from the **Report Explorer** window, generate the report by clicking **File > Report**. A **Message List** dialog box opens, which displays messages that you can monitor as the report is generated. Model snapshots also appear during report generation. The **Message List** dialog box might be hidden behind other dialog boxes.

When the report is complete, open the report, `MyModelCGReport.rtf` in the folder `report_ex` (in this example).

## Get Code Description of Generated Code

You can use the code descriptor API to obtain metadata about the generated code. For each model build, the code generator, by default, creates a `codedescriptor.dmr` file in the build folder. When simulating the model in Accelerator and Rapid Accelerator modes, the `codedescriptor.dmr` is not generated.

You can use the code descriptor API once the code is generated. Use the code descriptor API to describe these items in the generated code:

- Data Interfaces: inports, outports, parameters, data stores, and internal data.
- Function Interfaces: initialize, output, update, and terminate.
- Run-time information of the data and function interfaces, such as timing requirements of each interface entity.
- Model hierarchy information and code description of referenced models.

### Get Data Interface Information

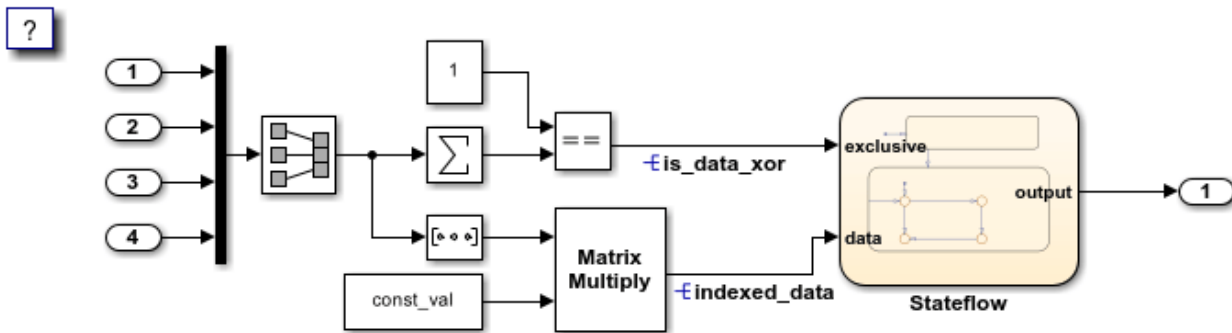

The `coder.descriptor.DataInterface` object describes various properties for a specified data interface in the generated code. In the model `rtwdemo_comments`, there are four inports, one outport, and a tunable external parameter. For more information about the data interfaces in your model, use the `coder.codedescriptor.CodeDescriptor` object and its methods.

1. Create a temporary folder for the build and inspection process.

```
currentDir = pwd;
[~,cgDir] = rtwdemodir();
```

2. Open and build the model.

```
open_system('rtwdemo_comments');
evalc('slbuild(''rtwdemo_comments'')');
```

History

Copyright 1994-2020 The MathWorks, Inc.

3. Create a `coder.codedescriptor.CodeDescriptor` object for the required model by using the `getCodeDescriptor` function.

```
codeDescriptor = coder.getCodeDescriptor('rtwdemo_comments');
```

4. To obtain a list of all the data interface types in the generated code, use the `getDataInterfaceTypes` method.

```
dataInterfaceTypes = codeDescriptor.getDataInterfaceTypes()
```

```
dataInterfaceTypes =
```

```
5x1 cell array
```

```
{'Inports' }
{'Outports' }
{'Parameters' }
{'ExternalParameterObjects'}
{'InternalData' }
```

To obtain a list of all the supported data interfaces, use the `getAllDataInterfaceTypes` method.

5. To obtain more information about a particular data interface type, use the `getDataInterfaces` method.

```
dataInterface = codeDescriptor.getDataInterfaces('Inports');
```

This method returns properties of the Inport blocks in the generated code.

6. Because this model has four inports, `dataInterface` is an array of `coder.descriptor.DataInterface` objects. Obtain the details of the first Inport of the model by accessing the first location in the array.

```
dataInterface(1)
```

```
ans =
```

```
DataInterface with properties:
 Type: [1x1 coder.descriptor.types.Type]
 SID: 'rtwdemo_comments:99'
 GraphicalName: 'In1'
 VariantInfo: [1x0 coder.descriptor.VariantInfo]
 Implementation: [1x1 coder.descriptor.DataImplementation]
 Timing: [1x1 coder.descriptor.TimingInterface]
 Unit: ''
 Range: [1x0 coder.descriptor.Range]
```

### Get Function Interface Information

The function interfaces are the entry-point functions in the generated code. In the model `rtwdemo_roll`, the entry-point functions are `model_initialize`, `model_step`, and `model_terminate`. For more information about the function interfaces in your model, use the `coder.descriptor.FunctionInterface` object.

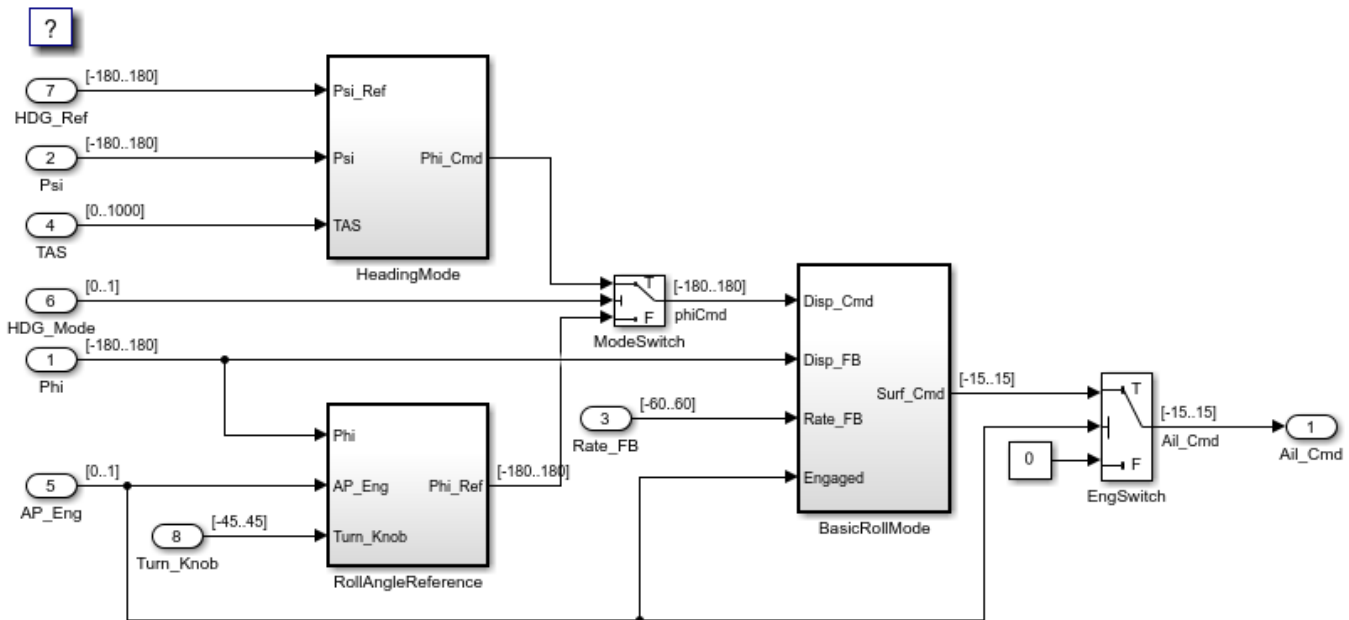

1. Create a temporary folder for the build and inspection process.

```
currentDir = pwd;
[~,cgDir] = rtwdemodir();
```

2. Open and build the model.

```
open_system('rtwdemo_roll');
evalc('slbuild(''rtwdemo_roll'')');
```

Copyright 1990-2020 The MathWorks, Inc.

3. Create a `coder.codedescriptor.CodeDescriptor` object for the required model by using the `getCodeDescriptor` function.

```
codeDescriptor = coder.getCodeDescriptor('rtwdemo_roll');
```

4. To obtain a list of all the function interface types in the generated code, use the `getFunctionInterfaceTypes` method.

```
functionInterfaceTypes = codeDescriptor.getFunctionInterfaceTypes()
```

```
functionInterfaceTypes =
```

```
2x1 cell array
```

```
 {'Initialize'}
 {'Output' }
```

To obtain a list of all the supported function interfaces, use the `getAllFunctionInterfaceTypes` method.

5. To obtain more information about a particular function interface type, use the `getFunctionInterfaces` method.

```
functionInterface = codeDescriptor.getFunctionInterfaces('Initialize')
```

```
functionInterface =
```

```
FunctionInterface with properties:
 Prototype: [1x1 coder.descriptor.types.Prototype]
```

```
ActualReturn: [1x0 coder.descriptor.DataInterface]
VariantInfo: [1x0 coder.descriptor.VariantInfo]
FunctionOwner: [1x0 coder.descriptor.TypedRegion]
 Timing: [1x1 coder.descriptor.TimingInterface]
ActualArgs: [1x0 coder.descriptor.DataInterface Sequence]
```

6. You can further expand on the properties to obtain detailed information. To get the function return value, name, and arguments:

```
functionInterface.Prototype
```

```
ans =
```

```
Prototype with properties:
 Name: 'rtwdemo_roll_initialize'
 Return: [1x0 coder.descriptor.types.Argument]
 HeaderFile: 'rtwdemo_roll.h'
 SourceFile: 'rtwdemo_roll.c'
 Arguments: [1x0 coder.descriptor.types.Argument Sequence]
```

### Get Model Hierarchy Information

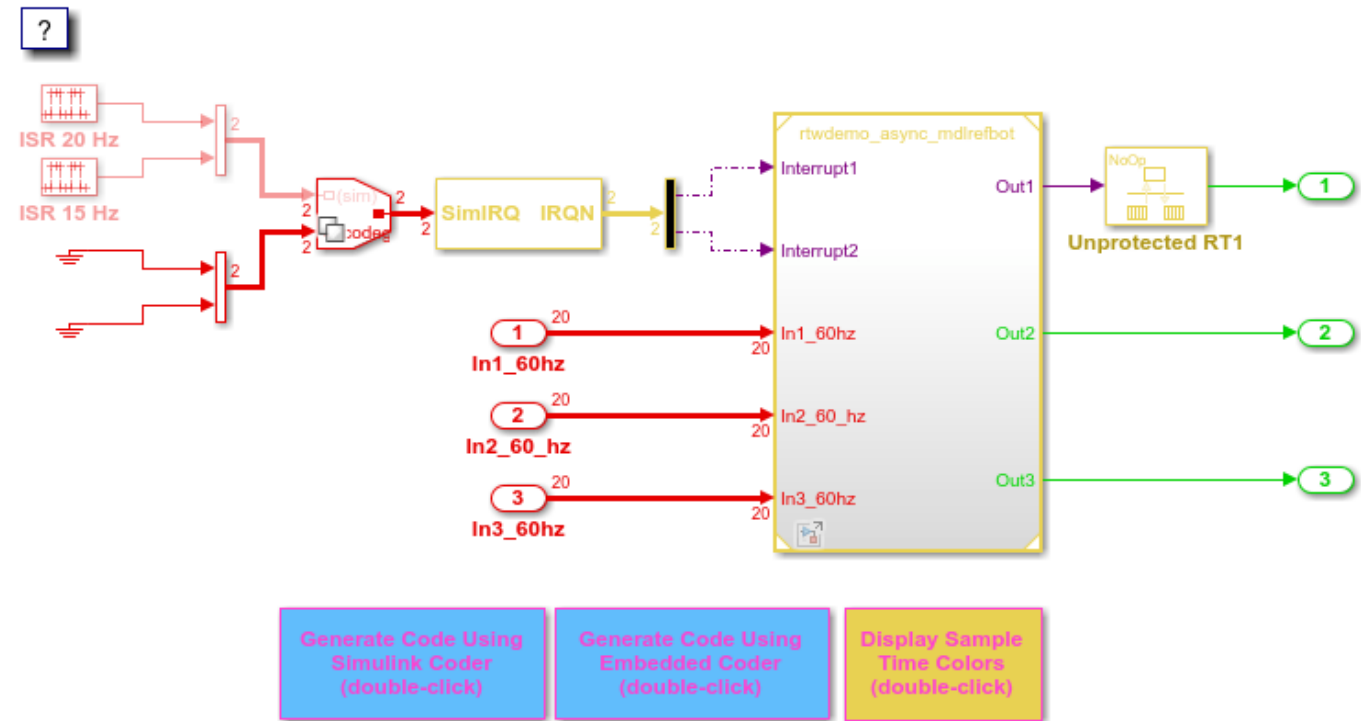

Use the `coder.codedescriptor.CodeDescriptor` object to get the entire model hierarchy information. The model `rtwdemo_async_mdltreftop` has model `rtwdemo_async_mdltreftop` as the referenced model.

1. Create a temporary folder for the build and inspection process.

```
currentDir = pwd;
[~,cgDir] = rtwdemodir();
```

2. Open and build the model.

```
open_system('rtwdemo_async_mdltreftop');
evalc('slbuild(''rtwdemo_async_mdltreftop'')');
```

Copyright 2010-2020 The MathWorks, Inc.

3. Create a `coder.codedescriptor.CodeDescriptor` object for the required model by using the `getCodeDescriptor` function.

```
codeDescriptor = coder.getCodeDescriptor('rtwdemo_async_mdrefbot');
```

4. Get a list of all the referenced models by using the `getReferencedModelNames` method.

```
refModels = codeDescriptor.getReferencedModelNames()
```

```
refModels =
```

```
1x1 cell array
```

```
 {'rtwdemo_async_mdrefbot'}
```

5. To obtain the `coder.codedescriptor.CodeDescriptor` object for the referenced model, use the `getReferencedModelCodeDescriptor` method.

```
refCodeDescriptor = codeDescriptor.getReferencedModelCodeDescriptor('rtwdemo_async_mdrefbot');
```

You can now use the `refCodeDescriptor` object to obtain more information about the referenced model by using all the available methods in the Code Descriptor API.

### **Related Examples**

- “Analyze Generated Data Code Interface” on page 54-13
- `coder.codedescriptor.CodeDescriptor`
- “Get Generated Type and Name of Inport Structures” on page 54-51

## Get Generated Type and Name of Inport Structures

To obtain the generated type and name of inport and outport structures, use the code descriptor API. The code generator stores this information within a `DataImplementation` object field on a `DataInterface` object when it generates the code.

To interface your generated code with other components of your application, use the code descriptor API.

### Open and Build Model

Open the model.

```
open_system('rtwdemo_sum');
```

Copyright 2015-2018 The MathWorks, Inc.

Build the model.

```
evalc('slbuild(''rtwdemo_sum'')');
```

The generated code includes a structure representing the inports.

```
/* External inputs (root inport signals with default storage) */
ExtU rtU;
```

### Get Code Descriptor and Inport Structure Names and Types

Get the code descriptor object.

```
codeDescObj = coder.getCodeDescriptor('rtwdemo_sum')
```

```
codeDescObj =
```

```
CodeDescriptor with properties:
```

```
ModelName: 'rtwdemo_sum'
```

```
BuildDir: 'C:\TEMP\Bdoc22b_2054784_11640\ib975175\18\tpc0e1dfa3\simulinkcoder-ex78186698\rtv'
```

Get the list of data interface types in the generated code.

```
dataInterfaceTypes = codeDescObj.getDataInterfaceTypes()
```

```
dataInterfaceTypes = 2x1 cell
 {'Inports' }
 {'Outports'}
```

Get the `DataInterface` object that represents the inports.

```
inports = codeDescObj.getDataInterfaces('Inports')
```

```
inports =
 1x2 DataInterface array with properties:
```

```
 Type
 SID
 GraphicalName
 VariantInfo
 Implementation
 Timing
 Unit
 Range
```

Get the `Implementation` object that represents the first inport. In this example, the inports are each represented as a `StructExpression`, which is a subclass of `DataImplementation`.

```
impl = inports(1).Implementation
```

```
impl =
 StructExpression with properties:
 Type: [1x1 coder.descriptor.types.Type]
 BaseRegion: [1x1 coder.descriptor.TypedRegion]
 ElementIdentifier: 'In1'
 Variant: ''
```

Get the `Type` of the first inport. The `Type` of the inport is `real_T`.

```
implType = impl.Type
```

```
implType =
 Double with properties:
 Identifier: 'real_T'
 Name: 'double'
 ReadOnly: 0
 Volatile: 0
 WordLength: 64
 Signedness: 1
```

Get the `BaseRegion` of the first inport. `BaseRegion` represents the structure that contains the inport. The `BaseRegion` is `rtU`.

```
baseRegion = impl.BaseRegion
```

```
baseRegion =
 Variable with properties:
 Type: [1x1 coder.descriptor.types.Type]
 Identifier: 'rtU'
 VarOwner: 'rtwdemo_sum'
```

```
StorageSpecifier: ''
```

Get the Type of the BaseRegion. The Type of the BaseRegion is ExtU.

```
baseRegionType = baseRegion.Type
```

```
baseRegionType =
 Struct with properties:
 Identifier: 'ExtU'
 Name: 'ExtU'
 ReadOnly: 0
 Volatile: 0
 Elements: [1x2 coder.descriptor.types.AggregateElement Sequence]
 Checksum: [1x0 Integer Sequence]
```

### Close Model

```
bdclose('all');
```

### See Also

- “Get Code Description of Generated Code” on page 54-44

## Get Metadata About Service Interface

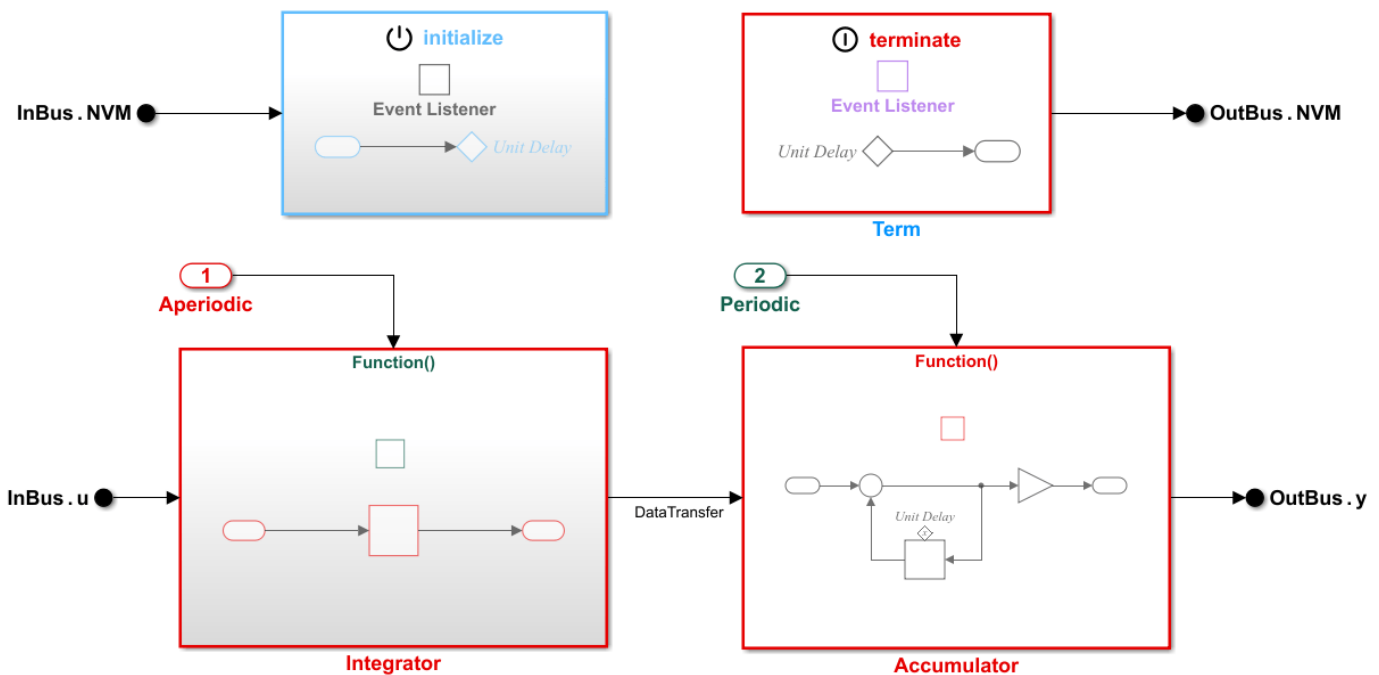

This example shows how you can use the code descriptor programming interface to retrieve metadata about the code interfaces generated for a model. You can use this metadata to declare and define your target platform service functions.

Use the Embedded Coder Dictionary to create code interface definitions for services that your generated code uses. For more information, see “Create a Service Interface Configuration” on page 32-11.

In this example, you build code for a model, create a `coder.codedescriptor.CodeDescriptor` object, and then use the various methods in the code descriptor programming interface.

Open example model `ComponentDeploymentFcn`. This model uses the shared Embedded Coder Dictionary `ComponentDeploymentCoderDictionary.sldd`.

```
model = 'ComponentDeploymentFcn';
open_system(model);
```

To use the code descriptor programming interface, build the model and create a `coder.codedescriptor.CodeDescriptor` object for the model.

```
evalc('slbuild(model)');
codeDescObj = coder.getCodeDescriptor(model);
```

### Get Service Function Declaration

1. Retrieve the function prototype for a specified service function by using the `getServiceFunctionPrototype` method. You can locate the name of a service function in the code generation report. To open the report, in the **Embedded Coder** app, on **C Code** tab, click the **Open**

**Report** button. In the report, select the **Code Interface Report** tab and view the service functions listed under **Service Interface** section.

```
serviceFunctionName = 'set_CD_integrator_DataTransfer';
serviceFunctionPrototype = getServiceFunctionPrototype(codeDescObj, ...
 serviceFunctionName)

serviceFunctionPrototype =
 Prototype with properties:
 Name: 'set_CD_integrator_DataTransfer'
 Return: [1x1 coder.descriptor.types.Argument]
 HeaderFile: ''
 SourceFile: ''
 Arguments: [1x0 coder.descriptor.types.Argument Sequence]
```

The code generator returns a `coder.descriptor.types.Prototype` object.

2. Retrieve the function declaration of the specified service function by using the `getServiceFunctionDeclaration` method.

```
serviceFunctionDeclaration = getServiceFunctionDeclaration(codeDescObj, ...
 serviceFunctionPrototype)

serviceFunctionDeclaration =
'real_T * set_CD_integrator_DataTransfer(void)'
```

The code generator returns the function declaration as produced in the generated code. You can use this function declaration to generate your own service header files to ease component code integration with target platform services.

### Get Service Interface Information

Retrieve the service interface object, also referred as a code configuration object, by using the `getServices` method.

```
serviceObj = codeDescObj.getServices();
```

The code generator returns a `coder.descriptor.ServiceInterface` object. Use this object to retrieve metadata about the service interface configuration that you define in the shared Embedded Coder Dictionary.

You can retrieve information of these types of service interface by specifying the corresponding enumerated values as input:

- Sender and Receiver — `coder.descriptor.Services.SenderReceiver`
- Data Transfer — `coder.descriptor.Services.DataTransfer`
- Timer — `coder.descriptor.Services.Timer`

For example, to retrieve information about the data transfer service interface by using the `getServiceInterface` method, use these commands:

```
serviceInterfaceType = coder.descriptor.Services.DataTransfer;
serviceInterfaceTypeObj = getServiceInterface(serviceObj, serviceInterfaceType)

serviceInterfaceTypeObj =
 DataTransferServiceInterface with properties:
```

```
DataTransferElements: [1x1 coder.descriptor.DataTransferElement Sequence]
```

The code generator returns a `coder.descriptor.DataTransferServiceInterface` object. Use this object to further retrieve metadata about `coder.descriptor.DataTransferElement` and `coder.descriptor.DataTransferFunction` objects.

Similarly, you can get information for the `coder.descriptor.SenderReceiverServiceInterface` and `coder.descriptor.TimerServiceInterface` objects.

### Get Service Function Information

Use the various methods of the `coder.descriptor.ServiceInterface` class to retrieve information about service functions.

- To retrieve the name of the header file that contains the service interface prototypes, use the `getServicesHeaderFileName` method. The code generator returns a character vector that represents the header file name.

```
serviceHeaderFile = getServicesHeaderFileName(serviceObj)
```

```
serviceHeaderFile =
'services.h'
```

- To retrieve a list of entry-point functions that call a specified service function, use the `getCallableFunctionsThatCallServiceFunction` method. The code generator returns the list of entry-point functions.

```
serviceFunctionName = 'set_CD_integrator_DataTransfer';
entryPointFunctions = getCallableFunctionsThatCallServiceFunction(serviceObj, serviceFunctionName)
```

```
entryPointFunctions = 1x1 cell array
 {'CD_integrator'}
```

- To retrieve a list of service functions that call a specified entry-point function, use the `getCalledServiceFunctions` method. The code generator returns the `coder.descriptor.ServiceFunctions` object that contains a representation of the number of service functions of each type present in the generated code.

```
entryPointFunctionName = 'CD_integrator';
serviceFunctions = getCalledServiceFunctions(serviceObj, entryPointFunctionName)
```

```
serviceFunctions =
ServiceFunctions with properties:
 ReceiverFunctions: [1x1 StdString Set]
 SenderFunctions: [1x0 StdString Set]
 DataTransferFunctions: [1x1 StdString Set]
 TimerFunctions: [1x1 StdString Set]
```

- To retrieve information about the data communication method, as specified in the Embedded Coder Dictionary, for a specified service function, use the `getServiceDataCommMethod` method. The code generator returns an enumerated value of type `DataCommunicationMethodEnum`.

```
serviceFunctionName = 'get_CD_accumulator_DataTransfer';
dataCommMethod = getServiceDataCommMethod(serviceObj, serviceFunctionName)
```

```
dataCommMethod =
 DataCommunicationMethodEnum enumeration

 OutsideExecution
```

## Customize Code Comments to Enhance Readability and Traceability

This example shows how to add comments to numerous types of objects in Simulink® and Stateflow®.

```
model='rtwdemo_comments';
open_system(model)
```

- ▶ Simulink Block
- ▶ Stateflow State
- ▶ Stateflow Transition
- ▶ Simulink Signal Object
- ▶ Simulink Parameter Object
- ▶ MPT Signal Object
- ▶ MPT Callback Function

- ▶ Open International Example
- ▶ Open Comments Settings
- ▶ Comments Documentation
- ▶ Customize banners via code templates

### More About

- “Model Configuration Parameters: Comments”

## Add Custom Comments for Variables in the Generated Code

To control code generation options for signals, states, and parameters in a model, you can create data objects in a workspace or data dictionary. You can generate comments in the code that help you to document the purpose and properties of the data in each object. Associate handwritten comments with each object, or write a function that generates comments based on the properties of the object.

For more information about data objects, see “Data Objects”.

### Embed Handwritten Comments for Signals or Parameters

To embed handwritten comments in the generated code near the definition of a signal, state, or parameter:

- 1 Open a Simulink model.

```
openExample('ex_param_array');
```

- 2 Create a data object to represent a signal, state, or parameter. You can use a data object from any package such as Simulink. For example, use a data object of the classes `Simulink.Signal` or `Simulink.Parameter`, which are defined in the package `Simulink`.

```
myParam = Simulink.Parameter(15.23);
```

- 3 In the model, under the **PREPARE** section select **Property Inspector**. Click the target Gain block. Set its parameter value to `myParam`.
- 4 Set the storage class of the data object so that optimizations do not eliminate the signal or parameter from the generated code. For example, use the storage class `ExportedGlobal`.

```
myParam.StorageClass = 'ExportedGlobal';
```

- 5 Set the **Description** property of the object. The description that you specify appears in the generated code as lines of comments.

```
myParam.Description = 'This parameter represents multiplication';
```

- 6 In the **Model Configuration Parameters** select **Simulink data object descriptions**.
- 7 Generate code from the model. In the code, the data object description appears near the definition of the corresponding variable.

```
/* Exported block parameters */
real_T myParam = 15.23; /* Variable: myParam
 * Referenced by: '<S1>/Gain'
 * This parameter represents multiplication.
 */
```

### Generate Dynamic Comments Based on Data Properties

You can generate dynamic comments that include the properties of a data object such as data type, units, and dimensions. If you change the properties of the data object in Simulink, the code generator

maintains the accuracy of the comments. For example, this comment displays some of the property values for a data object named MAP for the Simulink model in the previous example:

- 1 Create a data object from the package `mpt` and apply a custom storage class to the object. The default storage class is the custom storage class `Global (Custom)`.

```
myParam = mpt.Parameter;
```

To generate dynamic comments, you must use a data object from the package `mpt` and you must apply a custom storage class to the object.

- 2 Write a MATLAB or TLC function that generates the comment text. For an example MATLAB function, see the function `matlabroot/toolbox/rtw/rtwdemos/rtwdemo_comments_mptfun.m`.

The function must accept three input arguments that correspond to `objectName`, `modelName`, and `request`. If you write a TLC file, you can use the library function `LibGetSLDataObjectInfo` to get the property values of the data object.

- 3 Save the function as a MATLAB file or a TLC file. Place the file in a folder that is on your MATLAB path.
- 4 In the **Model Configuration Parameters** select **Custom comments (MPT objects only)**.
- 5 Set **Custom comments function** to the name of the MATLAB file or TLC file that you created.
- 6 Generate code from the model. The comments that your function generates appear near the code that represents each data object.

```
/* Object: myParam - user description:
 DataType -- auto
 Units --
 CSC -- Global */
```

### Limitations

- To generate comments by using the **Custom comments (MPT objects only)** and **Custom comments function** options, you must create data objects from the package `mpt`. The data objects must use a custom storage class.
- Only the custom storage classes from the `mpt` package that create unstructured variables support the custom comments function.

### See Also

## Add Global Comments in the Generated Code

### In this section...

“Use a Simulink DocBlock to Add a Comment” on page 55-5

“Use a Simulink Annotation to Add a Comment” on page 55-7

“Use Sorted Notes to Add Comments” on page 55-8

“Limitations” on page 55-9

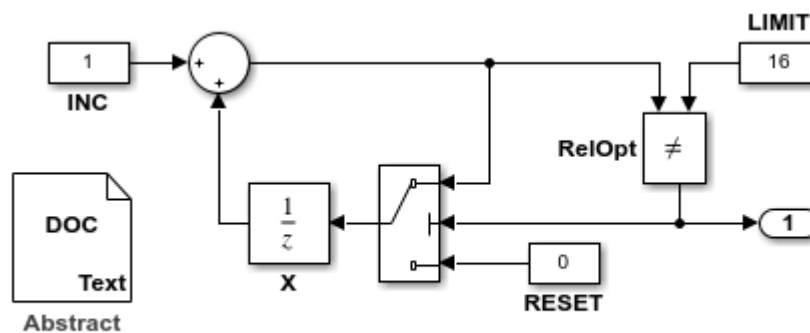

These examples show how to add a global comment to a Simulink model so that the comment text appears in the generated file or files. Specify a template symbol name with a Simulink DocBlock, a Simulink annotation, or a Stateflow note. You can also use a sorted-notes capability that works with Simulink annotations or Stateflow notes, but not DocBlocks. For more information about template symbols, see “Template Symbols and Rules” on page 55-81.

**Note** Template symbol names **Description** and **Model Information** are fields in the **Property Inspector** dialog box. If you use one of these symbol names for global comment text and its **Property Inspector** fields also has text in it, both names appear in the generated files.

### Use a Simulink DocBlock to Add a Comment

- 1 Open a Simulink model.

```
model='rtwdemo_codetemplate';
open_system(model)
```

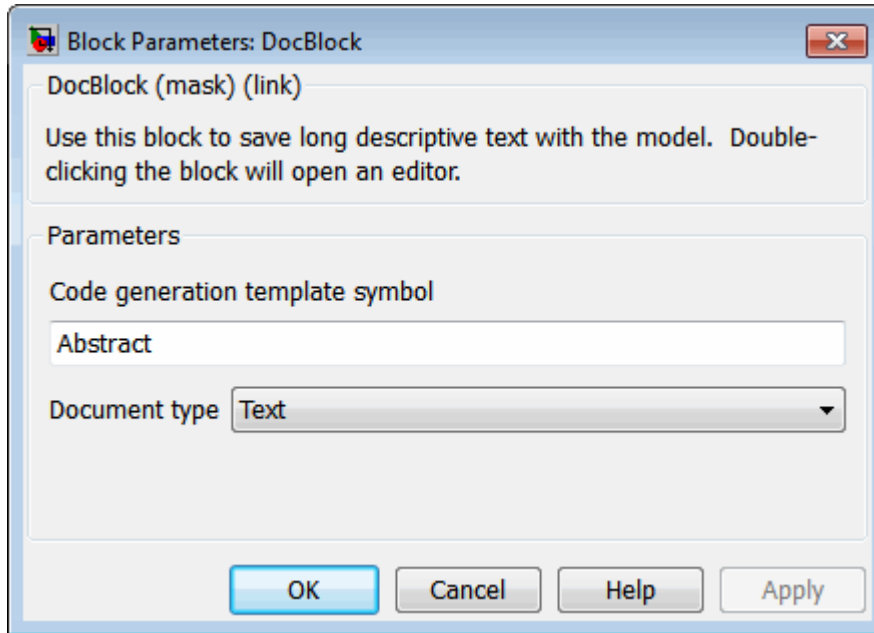

<S:Note>This Simulink annotation maps to the code template %<Note> symbol.

- 2 Under Configuration Parameters, set the **Code templates** to `rtwdemocodetemplate.cgt`. This code template contains the required customizations to generate global comments.
- 3 Right-click the DocBlock and select **Mask > Mask Parameters**.
- 4 In the **Code generation template symbol** box, type one of the following:
  - Abstract
  - Description
  - History

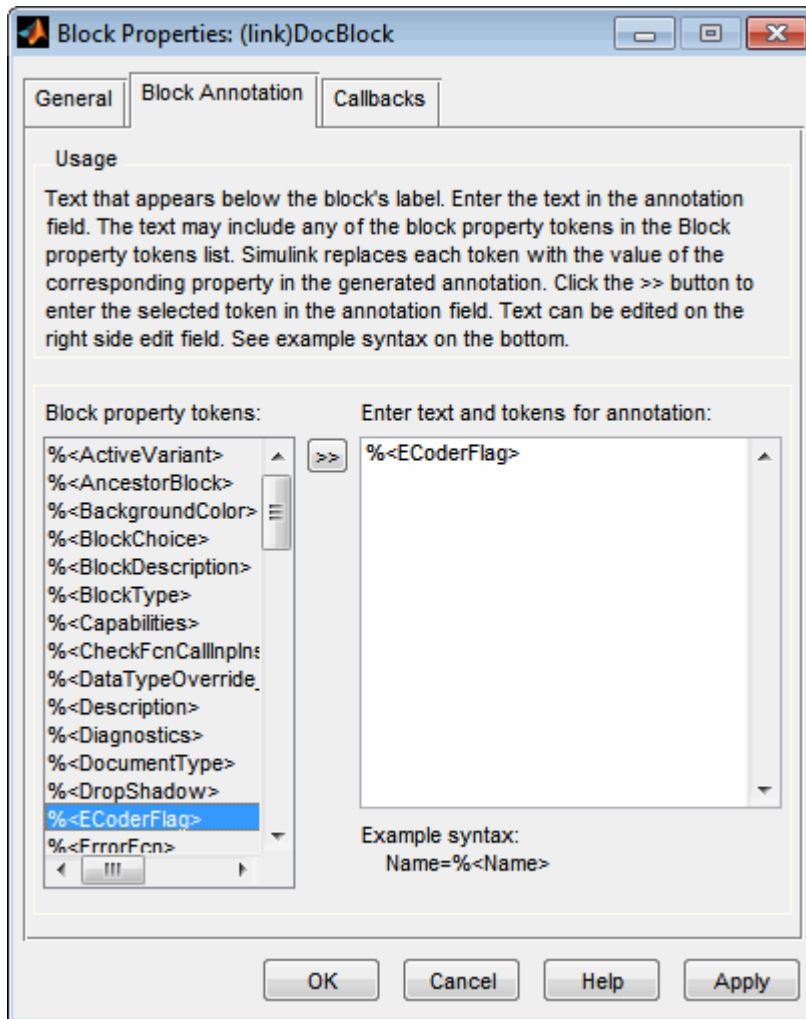

- Notes

Click **OK**. Template symbol names are case-sensitive.

If you are using a DocBlock to add comments to your code, set the **Document type** to Text. If you set **Document type** to RTF or HTML, your comments do not appear in the code.

- 5 In the Block Properties dialog box, on the **Block Annotation** tab, select %<ECoderFlag> and click **OK**. The symbol name that you typed in the previous step now appears under the DocBlock in the model.

- 6 Save the model. After you generate code, the code generator places the comment in each generated file whose template has the symbol name that you designated. The code generator places the comment in the generated file at the location that corresponds to where the symbol name is located in the template file.

The relevant fragment from the generated file for this model is:

```
*
* ABSTRACT:
* This text maps to the code template %<Abstract> symbol.
```

- 7 To add more comments to the generated files, repeat steps 2-6.

## Use a Simulink Annotation to Add a Comment

- 1 Open the model `rtwdemo_codetemplate`.
- 2 Double-click the unoccupied area on the model where you want to place the comment. See “Describe Models Using Notes and Annotations”.
- 3 Type `<S:Symbol_name>` followed by the comment. `Symbol_name` is one of the following:

- Abstract
- Description
- History
- Notes

For example, type `<S:Description>This is the description I want`. Template symbol names are case-sensitive. If you want the code generator to sort multiple comments for the **Notes** symbol name, replace the next step with “Use Sorted Notes to Add Comments” on page 55-8.

- 4 Click outside the annotation rectangle and save the model. After you generate code, the code generator places the comment in each generated file whose template has the symbol name that you assigned. The code generator places the comment in the generated file at the location that corresponds to where the symbol name is located in the template file. If you want the code generator to sort multiple comments for the **Notes** symbol name, replace the next step with “Use Sorted Notes to Add Comments” on page 55-8.
- 5 To add one or more other comments to the generated files, repeat steps 2-4.

## Use Sorted Notes to Add Comments

The sorted-notes capability enables you to add sorted comments to the generated files. The code generator places these comments in each generated file at the location that corresponds to where the **Notes** symbol is located in the template file.

The code generator uses this sorting order:

- Numbers before letters.
- Among numbers, zero is placed first.
- Among letters, uppercase letters are placed before lowercase letters.

You can use sorted notes for a Simulink annotation or a Stateflow note, but not with a DocBlock.

- In the Simulink annotation or the Stateflow note, type `<S:NoteY>` followed by the first comment. Y is a number or a letter.
- Repeat this process for as many additional comments you want. Replace Y with a subsequent number or letter.

This figure illustrates sorted notes on a model. It shows where the code generator places each note in a generated file.

<S:Note>This Simulink annotation maps to the code template %<Note> symbol.

<S:Note1>Another Simulink annotation .

The relevant fragment from the generated file for this model is:

```
*
* NOTES:
* Note: This Simulink annotation maps to the code template %<Note> symbol.
* Note1: Another Simulink annotation .
*
```

## Limitations

You cannot generate global comments using template symbol names inside a Simulink DocBlock, when the **Language** for code generation is C++.

### More About

- “Model Configuration Parameters: Comments”

## Customize Generated Identifier Naming Rules

### In this section...

“Apply Naming Rules to Identifiers Globally” on page 55-10

“Apply Custom Naming Conventions to Identifiers” on page 55-11

For GRT and RSim targets, the code generator constructs identifiers for variables and functions in the generated code. For ERT targets, you can customize the naming of identifiers in the generated code by specifying parameters on the **Code Generation > Identifiers** pane in the Configuration Parameters dialog box. You can also specify parameters that control identifiers generated from Simulink data objects. For detailed information about these parameters, see “Model Configuration Parameters: Code Generation Identifiers”.

### Apply Naming Rules to Identifiers Globally

Goal	Specification
Set the maximum number of characters that the code generator uses for function, typedef, and variable names (default 31).	An integer value for the Maximum identifier length parameter. For more information, see “Specify Identifier Length to Avoid Naming Collisions”. If you expect your model to generate lengthy identifiers (due to use of long signal or parameter names, for example), or if identifiers are mangled more than you expect, increase the value of this parameter.
Define a macro that specifies certain text included within generated identifiers for: <ul style="list-style-type: none"> <li>• Global variables</li> <li>• Global types</li> <li>• Field names of global types</li> <li>• Subsystem methods</li> <li>• Subsystem method arguments</li> <li>• Local temporary variables</li> <li>• Local block output variables</li> <li>• Constant macros</li> <li>• Shared utilities identifier format</li> </ul>	A macro for the <b>Identifier format control</b> parameters. For more information, see “Identifier Format Control” on page 55-17. See also “Exceptions to Identifier Formatting Conventions” on page 55-28 and “Identifier Format Control Parameters Limitations” on page 55-29.
Set the minimum number of characters that the code generator uses for the mangling text.	An integer value for the Minimum mangle length parameter. For more information, see “Control Name Mangling in Generated Identifiers” on page 55-25

Goal	Specification
Control whether the software uses shortened names for system-generated identifiers.	Shortened for the System-generated identifiers parameter. This setting: <ul style="list-style-type: none"> <li>• Provides more space for user names.</li> <li>• Provides a more predictable and consistent naming system that uses camel case.</li> <li>• Does not include underscores or plurals.</li> <li>• Provides consistent abbreviations for both a type and a variable.</li> </ul>
Control whether the generated code expresses scalar inlined parameter values as literal values or as macros.	The value <code>Literals</code> or <code>Macros</code> for the Generate scalar inlined parameters as parameter. <ul style="list-style-type: none"> <li>• <b>Literals:</b> If you set <b>Default parameter behavior</b> to <code>Inlined</code>, parameters are expressed as numeric constants.</li> <li>• <b>Macros:</b> Parameters are expressed as variables (with <code>#define</code> macros). This setting makes code more readable.</li> </ul>

## Apply Custom Naming Conventions to Identifiers

This example shows how to apply uniform naming rules for Simulink® data objects, including signals, parameters, and data store memory variables.

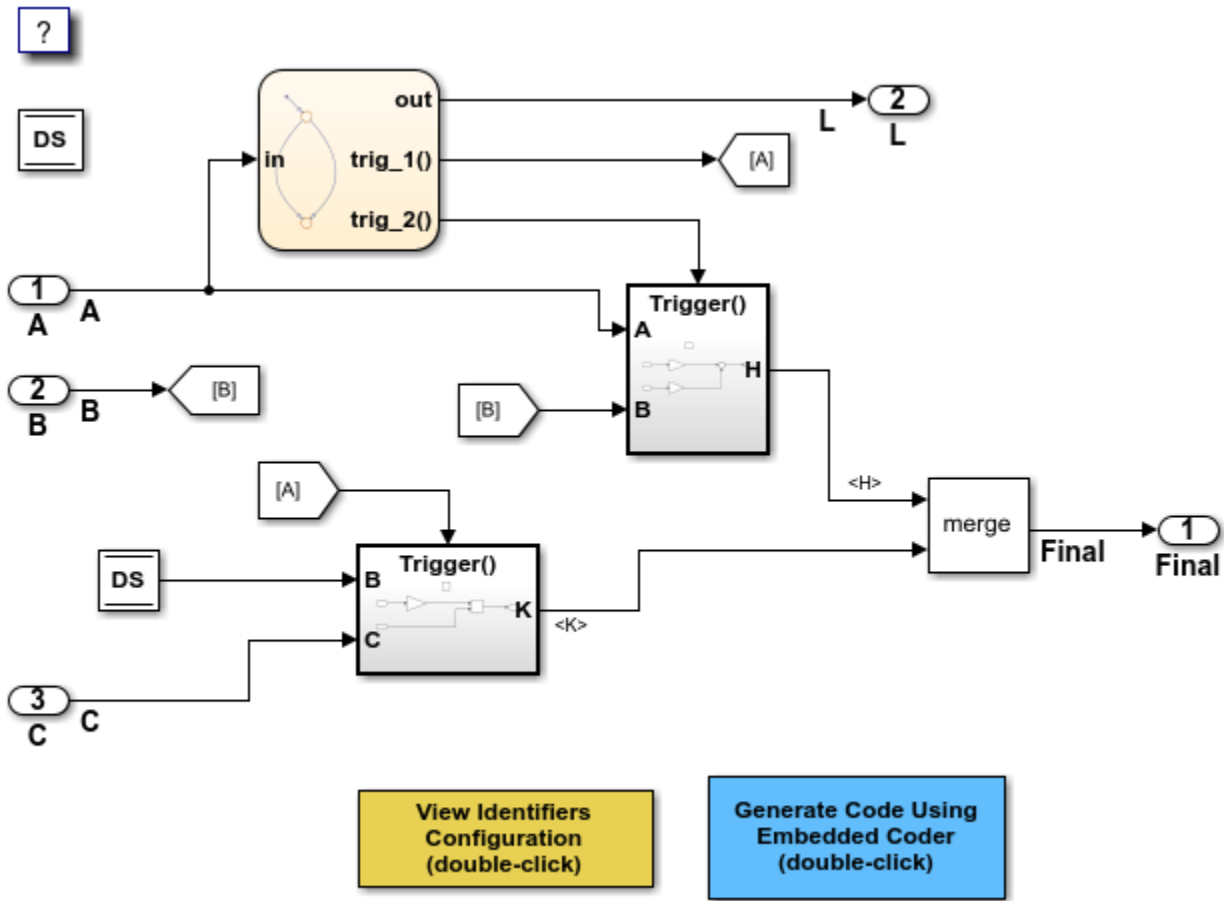

When your model uses Simulink data objects from the `Simulink` package, identifiers in the generated code copy the names of the objects by default. For example, a `Simulink.Signal` object named `Speed` appears as the identifier `Speed` in generated code.

You can control these identifiers by specifying naming rules that are specific to Simulink data objects. When you specify naming rules for generated code, follow ANSI® C/C++ rules for naming identifiers.

### Apply Lowercase Naming Rule

1. Open the model.

```
model='rtwdemo_namerules';
open_system(model)
```

Copyright 1994-2020 The MathWorks, Inc.

2. Open the **C Code** tab and click **View Code**.

3. In the **Model Configuration Parameters**, navigate to **Identifiers > Advanced parameters > Simulink data object naming rules**. In this model, all three rules are set to Force lower case.

Simulink data object naming rules

Signal naming:	Force lower case	
M-function:	<empty>	Browse... Edit...
Parameter naming:	Force lower case	
M-function:	<empty>	Browse... Edit...
#define naming:	Force lower case	
M-function:	<empty>	Browse... Edit...

4. Generate code for the model. The generated file `rtwdemo_namerules.c` uses lowercase identifiers for parameters.

```
/* Exported block parameters */
real_T f1 = 2.0; /* Variable: F1
 * Referenced by: '<Root>/Chart'
 */
real_T g1 = 3.0; /* Variable: G1
 * Referenced by:
 * '<Root>/Chart'
 * '<S3>/Gain1'
 */
real_T g2 = 4.0; /* Variable: G2
 * Referenced by: '<S3>/Gain2'
 */
real_T g3 = 5.0; /* Variable: G3
 * Referenced by: '<S2>/Gain'
 */
```

### Apply Naming Rule Using a Function

You can customize identifiers in generated code by defining a MATLAB® function.

1. Write a MATLAB function that returns an identifier by modifying a data object name, then save the function in your working folder. For example, the following function returns an identifier name by appending a data object's data type to that data object's name.

```
function revisedName = append_text(name, object)
% APPEND_TEXT: Returns an identifier for generated
% code by appending text to a data object name.
%
% Input arguments:
% name: data object name as spelled in model
% object: information about model
%
% Output arguments:
% revisedName: altered identifier returned for use in
% generated code.
%
%
DataType = Simulink.data.evalinGlobal(object.modelName,[name, '.DataType']);

revisedName = [name, '_', DataType];
```

2. In the **Model Configuration Parameters**, navigate to **Identifiers > Advanced parameters > Simulink data object naming rules**. From the **Parameter naming** drop-down list, select Custom M-function.

3. In the **M-function** field under **Parameter naming**, type the name of the file that defines the MATLAB function, `append_text.m`, then click **Apply**.

Simulink data object naming rules

Signal naming:	Force lower case	
M-function:	<empty>	Browse... Edit...
Parameter naming:	Custom M-function	
M-function:	append_text.m	Browse... Edit...
#define naming:	Force lower case	
M-function:	<empty>	Browse... Edit...

4. Generate code for the model. The generated code implements the parameter object naming rule in `rtwdemo_namerules.c`.

```

/* Exported block parameters */
real_T F1_auto = 2.0; /* Variable: F1
 * Referenced by: '<Root>/Chart'
 */
real_T G1_auto = 3.0; /* Variable: G1
 * Referenced by:
 * '<Root>/Chart'
 * '<S3>/Gain1'
 */
real_T G2_auto = 4.0; /* Variable: G2
 * Referenced by: '<S3>/Gain2'
 */
real_T G3_auto = 5.0; /* Variable: G3
 * Referenced by: '<S2>/Gain'
 */

```

### Specify Naming Rule for Storage Class `define`

You can specify a naming rule that applies only to Simulink data objects whose storage class you set to `Define`.

1. Open the **Code Mappings Editor**. On the **C Code** tab, select **Code Interface > Default Code Mappings**.
2. In the **Parameters** tab of the **Code Mappings Editor**, find the data table row labeled **External Parameter Objects**. Click the **Refresh** button in that row.
3. Find the row in the data table that corresponds to the Simulink.Parameter object `G1`, which resides in the base workspace. From the drop-down menu, set the Storage Class for `G1` to `Define`.

External Parameter Objects (5)		Refresh
 F1	ExportedGlobal	
 G1	Define	
 G2	ExportedGlobal	
 G3	ExportedGlobal	
 K1	Define	

4. In the **Model Configuration Properties**, navigate to **Identifiers > Advanced parameters > Simulink data object naming rules**. From the #define naming drop-down list, select **Custom M-function**.

5. In the **M-function** field under #define naming, type the name of the file that defines the MATLAB function, `append_text.m`.

6. From the **Parameter naming** drop-down list, select **Force lower case**, then click **Apply**.

Simulink data object naming rules

Signal naming:	Force lower case	
M-function:	<empty>	Browse... Edit...
Parameter naming:	Force lower case	
M-function:	append_text.m	Browse... Edit...
#define naming:	Custom M-function	
M-function:	append_text.m	Browse... Edit...

7. Generate code for the model. The generated file `rtwdemo_namerules.h` represents G1 with G1\_auto and K1 with K1\_auto.

```
/* Definition for custom storage class: Define */
#define G1_auto 3.0 /* Referenced by:
 * '<Root>/Chart'
 * '<S3>/Gain1'
 */
#define K1_auto 6.0 /* Referenced by: '<Root>/Chart
```

### Override Data Object Naming Rules

You can override data object naming rules for individual data objects by specifying the **Identifier** property. Generated code uses the text that you specify as the identifier to represent the data object, regardless of naming rules.

1. In the **Parameters** tab of the **Code Mappings Editor**, find the row in the data table that corresponds to the Simulink.Parameter object G2. Right click the row and select **Open**.

2. In the Property Inspector, go to the **Code Generation** tab. Specify the **Identifier** property as `myIdentifier`. Click **Apply**.

3. Generate code for the model. The generated file `rtwdemo_namerules.c` represents G2 with the variable `myIdentifier`.

```
/* Exported block parameters */
real_T f1 = 2.0; /* Variable: F1
 * Referenced by: '<Root>/Chart'
 */
real_T myIdentifier = 4.0; /* Variable: G2
 * Referenced by: '<S3>/Gain2'
 */
real_T g3 = 5.0; /* Variable: G3
```

```
* Referenced by: '<S2>/Gain'
*/
```

Signal naming

## Identifier Format Control

You can customize generated identifiers by specifying the **Identifier format control** parameters on the **Code Generation > Identifiers** pane in the Configuration Parameters dialog box. For each parameter, you can enter a macro that specifies whether, and in what order, certain text is included within generated identifiers. For example, you can specify that the root model name be inserted into each identifier using the \$R token.

The macro can include:

- Valid tokens, which are listed in Identifier Format Tokens. You can use or omit tokens depending on what you want to include in the identifier name. The **Shared utilities identifier format** parameter requires you to specify the checksum token, \$C. The other parameters require the mangling token, \$M. For more information, see “Control Name Mangling in Generated Identifiers” on page 55-25. The mangling token is subject to the use and ordering restrictions noted in Identifier Format Control Parameter Values.
- Token decorators, which are listed in “Control Case by Using Token Decorators” on page 55-22. You can use token decorators to control the case of generated identifiers for each token.
- Valid C or C++ language identifier characters (a-z, A-Z, \_ , 0-9).

The build process generates each identifier by expanding tokens and inserting the resultant text into the identifier. The tokens are expanded in the order listed in Identifier Format Tokens. Groups of characters are inserted in the positions that you specify around tokens directly into the identifier. Contiguous token expansions are separated by the underscore (\_) character.

### Identifier Format Tokens

Token	Description
\$C	This token is required for <b>Shared utilities identifier format</b> . If the identifier exceeds the <b>Maximum identifier length</b> , the code generator inserts an 8-character checksum to avoid naming collisions. The position of the \$C token in the <b>Identifier format control</b> parameter specification determines the position of the checksum in the generated identifier. For example, if you use the specification \$N\$C, the checksum is appended to the end of the identifier. This token is available only for shared utilities.
\$M	This token is required. If necessary, the code generator inserts name-mangling text to avoid naming collisions. Modify checksum character length by using <b>Shared checksum length</b> parameter. The position of the \$M token in the <b>Identifier format control</b> parameter specification determines the position of the name-mangling text in the generated identifier. For example, if you use the specification \$R\$N\$M, the name-mangling text is appended (if required) to the end of the identifier. For more information, see “Control Name Mangling in Generated Identifiers” on page 55-25.
\$U	Insert text that you specify for the \$U token. Use the <b>Custom token text</b> parameter to specify this text.
\$F	Insert method name (for example, <code>_Update</code> for update method). This token is available only for subsystem methods.
\$N	Insert name of object (block, signal or signal object, state, parameter, shared utility function or parameter object) for which identifier is being generated.
\$R	Insert root model name into identifier, replacing unsupported characters with the underscore ( <code>_</code> ) character. When you use referenced models, this token is required in addition to \$M (see “Avoid Identifier Name Collisions with Referenced Models” on page 55-26).  <b>Note:</b> This token replaces the <b>Prefix model name to global identifiers</b> option in previous releases.
\$H	Insert tag indicating system hierarchy level. For root-level blocks, the tag is the text <code>root_</code> . For blocks at the subsystem level, the tag is of the form <code>sN_</code> . N is a unique system number assigned by the Simulink software. This token is available only for subsystem methods and field names of global types.  <b>Note:</b> This token replaces the <b>Include System Hierarchy Number in Identifiers</b> option in previous releases.
\$A	Insert data type acronym (for example, <code>i32</code> for integers) to signal and work vector identifiers. This token is available for local block output variables, local temporary variables, and field names of global types.  <b>Note:</b> This token replaces the <b>Include data type acronym in identifier</b> option in previous releases.

Token	Description
\$I	<ul style="list-style-type: none"> <li>• Insert <code>u</code> if the argument is an input.</li> <li>• Insert <code>y</code> if the argument is an output.</li> <li>• Insert <code>uy</code> if the argument is an input and output.</li> </ul> <p>For example, <code>rtu_</code> for an input argument, <code>rty_</code> for an output argument, and <code>rtuy_</code> for an input and output argument. This token is available only for subsystem method arguments.</p>
\$G	<p>Insert the name of a storage class that is associated with the data item. This token is also available in the naming rule that you specify for the <b>Header File</b> for a storage class in the Embedded Coder Dictionary.</p>
\$E	<p>Insert the file type. <code>\$E</code> represents these instances of file types:</p> <ul style="list-style-type: none"> <li>• <code>capi</code></li> <li>• <code>capi_host</code></li> <li>• <code>dt</code></li> <li>• <code>testinterface</code></li> <li>• <code>private</code></li> <li>• <code>types</code></li> </ul> <p>This token is required for <b>Header files</b> and <b>Source files</b>.</p>
\$X	<p>This token applies only to sender and receiver service function naming rules. Insert the name of the entry-point callable function that encloses the sender or receiver service function call.</p>

Identifier Format Control Parameter Values lists the default macro value, the supported tokens, and the applicable restrictions for each **Identifier format control** parameter.

## Identifier Format Control Parameter Values

Parameter	Default Value	Supported Tokens	Restrictions
<b>Global variables</b>	\$R\$N\$M	\$M, \$R, \$N, \$U	\$F, \$H, \$A, \$E, \$I, and \$G are not allowed.
<b>Global types</b>	\$N\$R\$M_T	\$M, \$R, \$N, \$U	\$F, \$H, \$A, \$E, \$I, and \$G are not allowed.
<b>Field name of global types</b>	\$N\$M	\$M, \$N, \$H, \$A, \$U	\$R, \$F, \$G, \$E, and \$I are not allowed.
<b>Subsystem methods</b>	\$R\$N\$M\$F	\$M, \$R, \$N, \$H, \$F, \$U	\$F and \$H are empty for Stateflow functions; \$A, \$G, \$E, and \$I are not allowed.
<b>Subsystem method arguments</b>	rt\$I\$N\$M	\$M, \$N, \$I, \$U	\$R, \$F, \$H, \$G, \$E, and \$A are not allowed.
<b>Local temporary variables</b>	\$N\$M	\$M, \$R, \$N, \$A, \$U	\$F, \$H, \$G, \$E, and \$I are not allowed.
<b>Local block output variables</b>	rtb_ \$N\$M	\$M, \$N, \$A, \$U	\$R, \$F, \$H, \$G, \$E, and \$I are not allowed.
<b>Constant macros</b>	\$R\$N\$M	\$M, \$R, \$N, \$U	\$F, \$H, \$A, \$G, \$E, and \$I are not allowed.
<b>Shared utilities identifier format</b>	\$N\$C	\$N, \$C, \$R, \$U	\$C is required. \$M, \$F, \$H, \$A, \$G, \$E, and \$I are not allowed.
<b>EMX array utility functions identifier format</b>	emx\$M\$N	\$M, \$N, \$R	\$C, \$U, \$F, \$H, \$A, \$G, \$E, and \$I are not allowed.
<b>EMX array types identifier format</b>	emxArray_ \$M\$N	\$M, \$N, \$R	\$C, \$U, \$F, \$H, \$A, \$G, \$E, and \$I are not allowed.
<b>Header files</b>	\$R\$E	\$R, \$U, \$E	\$C, \$M, \$N, \$F, \$H, \$A, \$G, and \$I are not allowed.
<b>Source files</b>	\$R\$E	\$R, \$U, \$E	\$C, \$M, \$N, \$F, \$H, \$A, \$G, and \$I are not allowed.
<b>Data files</b>	\$R_data	\$R, \$U	\$C, \$M, \$N, \$F, \$H, \$A, \$G, \$E, and \$I are not allowed.

Non-ERT-based targets (such as the GRT target) implicitly use a default \$R\$N\$M specification. This default specification consists of the root model name, followed by the name of the generating object (signal, parameter, state, and so on), followed by name-mangling text.

For limitations that apply to **Identifier format control** parameters, see “Exceptions to Identifier Formatting Conventions” on page 55-28 and “Identifier Format Control Parameters Limitations” on page 55-29.

## \$N Embedded Coder Dictionary Resolution

The \$N token resolves to the name of the object for which an identifier is being generated. The object type varies by the context of the naming rule. This table lists the objects to which \$N resolves for items in the Embedded Coder Dictionary.

Category	Service Interface	Customization Entity	Default Naming Rule	Resolution of \$N
<b>Execution</b>	<b>Initialize and Terminate Functions</b>	<b>Function Naming Rule</b>	\$R\$N	init for Initialize Function blocks, term for Terminate Function blocks
	<b>Periodic and Aperiodic Functions</b>	<b>Function Naming Rule</b>	\$R\$N	reset for periodic functions, step for aperiodic functions
<b>Service Interfaces</b>	<b>Receiver</b>	<b>Function Naming Rule</b>	get_{\$X}\$N	Inport block name
	<b>Sender</b>	<b>Function Naming Rule for Value</b>	set_{\$X}\$N	Outport block name
		<b>Function Naming Rule for Reference</b>		
	<b>Data Transfer</b>	<b>Receiver Function Naming Rule</b>	get_{\$X}\$N	Data transfer signal name, such as DataTransferAt <Block><Outport><PortNumber>
<b>Sender Function Naming Rule</b>		set_{\$X}\$N		
<b>Internal Functions</b>	<b>Subcomponent Functions</b>	<b>Function Naming Rule</b>	\$R\$N	Associated function element, such as the name of the port for an exported function
	<b>Shared Utility Functions</b>	<b>Function Naming Rule</b>	\$N\$C	Name of the function
<b>Memory</b>	<b>Storage Class</b>	<b>Header File</b>	\$N.h	Model or subsystem with which the data is associated
		<b>Definition File</b>	\$N.c	Model or subsystem with which the data is associated

Category	Service Interface	Customization Entity	Default Naming Rule	Resolution of \$N
		Type Name	\$R\$\$N\$G\$M	Model or subsystem with which the data is associated
		Instance Name	\$G\$N\$M	Model or subsystem with which the data is associated
		Name of Getter	get_\$\$N\$M	Associated data element
		Name of Setter	set_\$\$N\$M	Associated data element

## Control Case by Using Token Decorators

On the **Code Generation > Identifiers** pane, you can use token decorators to control the case of generated identifiers. Place a decorator immediately after the target token and enclose the decorator in square brackets [ ]. For example, you can set **Global variables** to `$R[uL]$$N$M`, which capitalizes the first letter of the model name and forces the remaining characters in the model name to lowercase.

The table shows how to manipulate the expansion of the \$R token for a model whose name is `modelName`.

Desired Expansion	Description	Token and Decorator
<code>modelName</code>	First letter of model name is uppercase. Remaining characters are not modified.	<code>\$R[u]</code>
<code>Modelname</code>	First letter of model name is uppercase. Remaining characters are lowercase.	<code>\$R[uL]</code>
<code>MODELNAME</code>	All characters are uppercase.	<code>\$R[U]</code>
<code>modelname</code>	All characters are lowercase.	<code>\$R[L]</code>
<code>mODELNAME</code>	First letter of model name is lowercase. Remaining characters are uppercase.	<code>\$R[lU]</code>
<code>modelName</code>	First letter of model name is lowercase. Remaining characters are not modified.	<code>\$R[l]</code>

When you use a decorator, the code generator removes the underscore character ( `_` ) that appears between tokens by default. However, you can append each decorator with an underscore: `$R[U_]$$N`. For example, if you set the **Global variables** parameter to `$R[u_]$$N[uL]$$M` for a model named `modelName` and a `DWork` structure represented by `DW`, the result is `modelName_Dw`.

## Modify Identifiers by Using Regular Expression Decorators

To modify identifiers in ways other than by case, you can use regular expressions. To use a regular expression, enclose the decorator in double quotes. A regular expression decorator contains two

regular expressions separated by a forward slash. The code generator searches for substrings of the token that match the first regular expression and replaces those substrings using the second regular expression. For example, the following identifier naming rule takes the root model name \$R and replaces instances of a with b: \$R["a/b"]. The code generator interprets regular expression syntax in a way that is consistent with the `regexpr` function, except regular expression decorators do not support dynamic expressions, which use MATLAB commands.

You can configure a regular expression decorator by appending a list of options to the end of the decorator. Separate the options from the second regular expression by using a forward slash and separate the options from each other by using the pipe character. For example, the following identifier naming rule takes the root model name \$R and replaces only the first instance of a with b, ignoring case: \$R["a/b/once|ignorecase"].

Category	Option	Description	Example Decorator	Example Input	Example Output
Match/replace occurrence	all (default)	Match and replace the expression as many times as possible.	["a/-/all"]	afabcswbc	-f-bcswbc
	once	Match and replace the expression only once.	["a/-/once"]	afabcswbc	-fabcswbc
	N	Where N is an integer, match and replace the Nth occurrence of a match.	["a/-/2"]	afabcswbc	af-bcswbc
Case matching	matchcase (default)	Match letter case.	["aBcD/wXyZ/matchcase"]	abcdABCD	abcdABCD
	ignorecase	Ignore letter case.	["aBcD/wXyZ/ignorecase"]	wXyZwXyZ	wXyZwXyZ
	preservecase	Ignore letter case while matching but preserve the case of corresponding characters in the original text while replacing.	["aBcD/wXyZ/preservecase"]	wxyzWXYZ	wxyzWXYZ
Empty matching	noemptymatch (default)	Ignore zero-length matches.	["^/prefix/noemptymatch"]	abcdABCD	abcdABCD
	emptymatch	Include zero-length matches.	["^/prefix/emptymatch"]	prefixabcdABCD	prefixabcdABCD

If a regular expression decorator results in uncompileable code, the code generator produces an error before building the code.

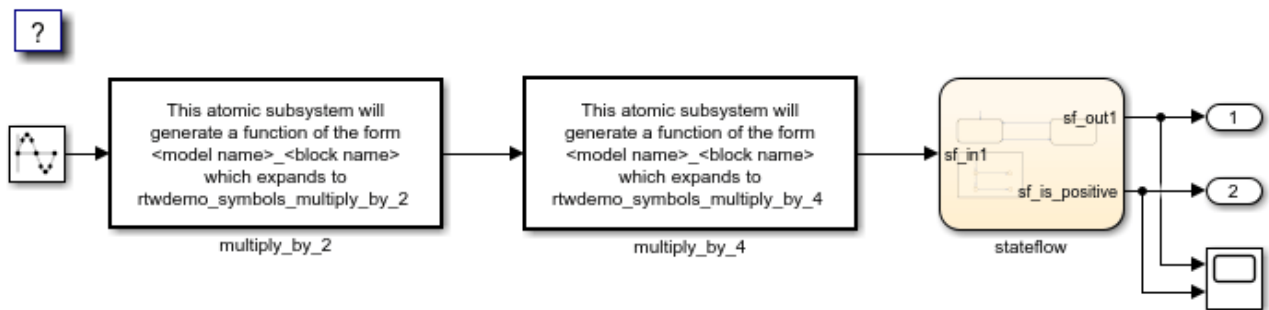

## Regular Expression Limitations

- Regular expression decorators are applicable only to \$G, \$N, and \$R tokens.
- Unlike `regexprep`, regular expression decorators do not support dynamic expressions, which use MATLAB commands.
- Regular expression decorators are not supported for function mappings in the **Code Mappings** editor.
- The code generator cannot evaluate whether a regular expression is valid. An invalid regular expression does not result in a change to the affected token and does not produce a warning.

## Control Formatting of Identifiers

This example shows how to customize generated identifiers by specifying the **Identifier format control** parameters on the **Code Generation > Identifiers** pane in the Configuration Parameters dialog box. To maintain model traceability, it is important that incremental revisions to a model have minimal impact on the identifier names that appear in the generated code. This example shows how to use name mangling by specifying the **Identifier format control** parameters to minimally impact the identifier names.

```
model='rtwdemo_symbols';
open_system(model)
```

▶ Double-click to view identifier format

▶ Double-click to view mangle settings

Global variable names  
contain model name.  
(double-click to toggle)

Global structure type names  
contain model name.  
(double-click to toggle)

Generate Code Using  
Embedded Coder  
(double-click)

Copyright 1994-2020 The MathWorks, Inc.

```
% Cleanup
rtwdemoclean;
close_system(model,0)
```

## Control Name Mangling in Generated Identifiers

The position of the \$M token in the **Identifier format control** parameter specification determines the position of the name-mangling text in the generated identifiers. For example, if you use the specification \$R\$N\$M, the name-mangling text is appended (if required) to the end of the identifier. For more information, see “Identifier Format Control” on page 55-17.

### Name-Mangling Text Per Object

Object Type	Source of Mangling Text
Block diagram	Name of block diagram
Simulink block	Automatically assigned Simulink identifier
Simulink parameter	Full name of parameter owner (model or block) and parameter name
Simulink signal	Signal name, full name of source block, and port number
Stateflow objects	Complete path to Stateflow block and Stateflow computed name (unique within chart)

The length of the name-mangling text is specified by the Minimum mangle length parameter. The default value is 1, but this automatically increases during code generation as a function of the number of collisions. To minimize disturbance to the generated code during development, specify a larger **Minimum mangle length**. A **Minimum mangle length** of 4 is a conservative value. A value of 4 allows for over 1.5 million collisions for a particular identifier before the mangle length is increased.

### Minimize Name Mangling

The length of generated identifiers is limited by the **Maximum identifier length** parameter. When a name collision exists, the \$M token is expanded to the minimum number of characters required to avoid the collision. Other tokens are expanded in the order listed in Identifier Format Tokens. If the **Maximum identifier length** is not large enough to accommodate full expansions of the other tokens, partial expansions are used. To avoid partial expansions, it is good practice to:

- Avoid name collisions. One way to avoid name collisions is to not use default block names (for example, Gain1, Gain2. . .) when there are many blocks of the same type in the model.
- Where possible, increase the **Maximum identifier length** to accommodate the length of the identifiers that you expect to generate.
- Set the **Maximum identifier length** parameter to reserve at least three characters for the name-mangling text. The length of the name-mangling text increases as the number of name collisions increases.

If changes to the model create more or fewer collisions, existing name-mangling text increases or decreases in length. If the length of the name-mangling text increases, additional characters are appended to the existing text. For example, the mangling text 'xyz' can change to 'xyzQ'. For fewer collisions, the name-mangling text 'xyz' changes to 'xy'.

## Avoid Identifier Name Collisions with Referenced Models

Within a model that uses referenced models, collisions between the names of the models are not allowed. When generating code from a model that uses model referencing:

- You must include the \$R token in the **Identifier format control** parameter specifications (in addition to the \$M token).
- The **Maximum identifier length** must be large enough to accommodate full expansions of the \$R and \$M tokens. If **Maximum identifier length** is too small, a code generation error occurs.

When a name conflict occurs between an identifier within the scope of a higher-level model and an identifier within the scope of a referenced model, the identifier from the referenced model is preserved. Name mangling is performed on the identifier from the higher-level model.

If your model contains two referenced models with the same input or output port names, and one of the referenced models contains an atomic subsystem with “Function packaging” set to `Nonreusable function`, a name conflict can occur and the build process produces an error.

### Use Model Advisor to Detect Identifier Names Changed During Code Generation

For a referenced model, if the following parameters do not have specifications that do not contain a \$R token (which represents the name of the reference model), code generation prepends the \$R token to the identifier format.

- Global variables
- Global types
- Subsystem methods
- Constant macros

You can use the Model Advisor to identify referenced models in a model referencing hierarchy for which code generation changes these configuration parameter settings.

- 1 In the **Modeling** tab, click **Model Advisor**.
- 2 Select **By Task**.
- 3 Run the **Check code generation identifier formats used for model reference** check.

## Maintain Traceability for Generated Identifiers

To verify your model, you can trace back and forth between generated identifiers and corresponding entities within the model. To maintain traceability, it is important that incremental revisions to a model have minimal impact on the identifier names that appear in generated code. There are two ways to minimally impact the identifier names:

- Choose unique names for Simulink objects (blocks, signals, states, and so on) as much as possible.
- Use name mangling when conflicts cannot be avoided.

The position of the name-mangling text is specified by the placement of the `$M` token in the **Identifier format control** parameters. Mangle characters consist of alphanumeric characters that are unique to each object. For more information, see “Control Name Mangling in Generated Identifiers” on page 55-25.

## Exceptions to Identifier Formatting Conventions

There are some exceptions to the identifier formatting conventions described in “Identifier Format Control” on page 55-17.

- Type name generation: name mangling conventions do not apply to type names (that is, typedef statements) generated for global data types. If the \$R token is included in the **Identifier format control** parameter specification, the model name is included in the typedef. When generating type definitions, the **Maximum identifier length** parameter is not respected.
- Non-Auto storage classes: the **Identifier format control** parameters specification does not affect objects (such as signals and parameters) that have a storage class other than Auto (such as ImportedExtern or ExportedGlobal).
- For shared utilities, code generation inserts the checksum specified by \$C to prevent name collisions in the following situations:
  - \$C is specified without \$N.
  - The length of \$N plus the length of the text that you specify exceeds the **Maximum identifier length**. Code generation truncates \$N and inserts an 8-character checksum where you specified \$C in the formatting scheme.

## Identifier Format Control Parameters Limitations

The following limitations apply to the **Identifier format control** parameters:

- The following autogenerated identifiers currently do not fully comply with the setting of the **Maximum identifier length** parameter on the **Code Generation > Identifiers** pane of the Configuration Parameters dialog box.
  - Model methods
    - The applicable format scheme is \$R\$F, and the longest \$F is `_derivatives`, which is 12 characters long. The model name can be up to 19 characters without exceeding the default **Maximum identifier length** of 31.
  - Local functions generated by S-functions or by add-on products such as DSP System Toolbox that rely on S-functions
  - Local variables generated by S-functions or by add-on products such as DSP System Toolbox that rely on S-functions
  - DW identifiers generated by S-functions in referenced models
  - Fixed-point shared utility macros or shared utility functions
  - Simulink `rtm` macros
    - Most are within the default **Maximum identifier length** of 31, but some exceed the limit. Examples are `RTMSpecAccsGetStopRequestedValStoredAsPtr`, `RTMSpecAccsGetErrorStatusPointer`, and `RTMSpecAccsGetErrorStatusPointerPointer`.
  - Define protection guard macros
    - Header file guards, such as `_RTW_HEADER_(filename)_h_`, which can exceed the default **Maximum identifier length** of 31 given a filename such as `$R_private.h`.
    - Include file guards, such as `_$R_COMMON_INCLUDES_`.
    - typedef guards, such as `_CSCI_$R_CHARTSTRUCT_`.
- In some situations, the following identifiers potentially can conflict with others.
  - Model methods
  - Reentrant model function arguments
  - Local functions generated by S-functions or by add-on products such as DSP System Toolbox that rely on S-functions
  - Local variables generated by S-functions or by add-on products such as DSP System Toolbox that rely on S-functions
  - Fixed-point shared utility macros or shared utility functions
  - Include header guard macros
- The following external identifiers that are unknown to the Simulink software might conflict with autogenerated identifiers.
  - Identifiers defined in custom code
  - Identifiers defined in custom header files

- Identifiers introduced through a non-ANSI C standard library
- Identifiers defined by custom TLC code
- Identifiers generated for simulation targets might exceed the **Maximum identifier length**. Simulation targets include the model reference simulation target, the accelerated simulation target, the RSim target, and the S-function target.
- Identifiers generated using a model name and bus object data type name, which are both long names, might exceed the **Maximum identifier length**. For example, a ground value variable name is generated as `<model_name>_rtZ<bus_name>`. If the *model\_name* and *bus\_name* are close to the maximum identifier length, the name exceeds the maximum identifier length.

## Control Parentheses in Generated Code

C code contains some syntactically required parentheses, and can contain additional parentheses that change semantics by overriding default operator precedence. C code can also contain optional parentheses that have no functional significance, but only increase the readability of the code. Optional C parentheses vary between two stylistic extremes:

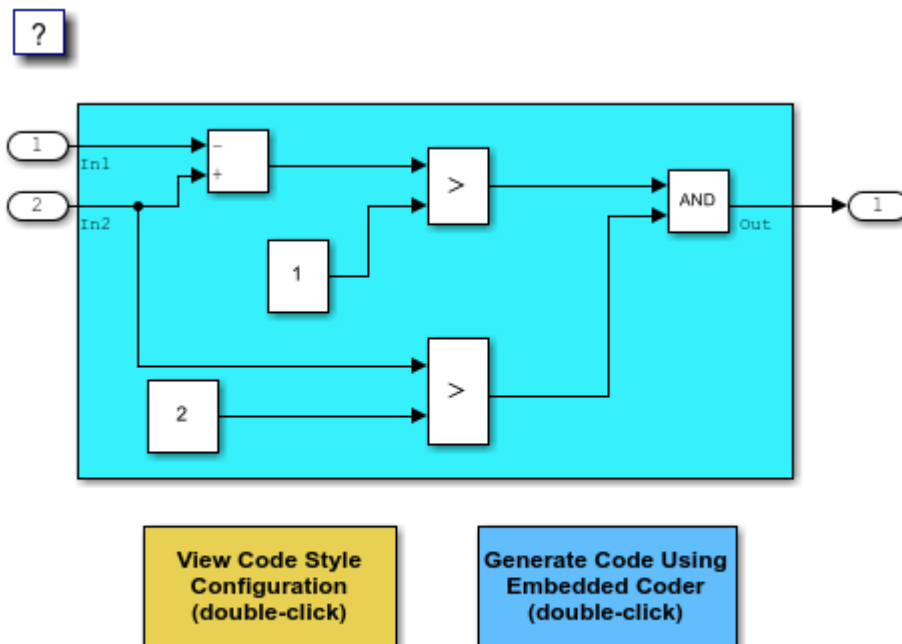

- Include the minimum parentheses required by C syntax and precedence overrides so that C precedence rules specify all semantics unless overridden by parentheses.
- Include the maximum parentheses that can exist without duplication so that C precedence rules become irrelevant. Parentheses alone completely specify all semantics.

Understanding code with minimum parentheses can require applying nonobvious precedence rules. Maximum parentheses can hinder code reading by belaboring obvious precedence rules. Various parenthesization standards exist that specify one or the other extreme, or define an intermediate style useful to people who read code.

### Control Use of Parentheses

This example shows that Embedded Coder® provides three levels of control for parentheses in the generated code.

```
model='rtwdemo_parentheses';
open_system(model)
```

Copyright 2006-2020 The MathWorks, Inc.

```
rtwdemoclean;
close_system(model,0)
```

## Optimize Code by Reordering Commutable Operands

This example shows how to reorder commutable operands to make expressions left-recursive. Left-recursive reordering saves stack space in memory. This optimization improves code efficiency.

### Example Model

To reorder commutable operands, create this model and name it `operand_order`. The output signal is the result of multiplying the signal from Inport block In1 by the sum of the signals from Inport blocks In2 and In3.

### Generate Code

- 1 Open the Model Configuration Parameters dialog box. On the **Code Style** tab, select the **Preserve operand order in expression** parameter.
- 2 Generate code for the model.

In the `operand_order.c` file, the `operand_order_step` function contains this code:

```
operand_order_Y.Out1 = operand_order_U.In1 * (operand_order_U.In2 +
operand_order_U.In3);
```

The code generator preserves the specified expression order in the model, which increases the readability of the code for code traceability.

### Generate Code with Optimization

- 1 Open the Model Configuration Parameters dialog box. On the **Code Style** tab, clear the **Preserve operand order in expression** parameter.
- 2 Generate code for the model.

In the `operand_order.c` file, the `operand_order_step` function contains this code:

```
operand_order_Y.Out1 = (operand_order_U.In2 + operand_order_U.In3) *
operand_order_U.In1;
```

The code generator optimizes the code by reordering the commutable operands to make the expression left-recursive, which improve code efficiency.

## Suppress Generation of Default Cases for Unreachable Stateflow Switch Statements

This example shows how to specify whether to generate default cases for switch-case statements in the code for Stateflow charts. Generated code that does not contain default cases conserves ROM consumption and enables better code coverage because every branch in the generated code is falsifiable.

Some coding standards, such as MISRA, require the default case for switch-case statements. If you want to increase your chances of producing MISRA C compliant code, generate default cases for unreachable Stateflow switch statements.

### Example

Figures 1, 2, and 3 show relevant portions of the `sldemo_fuelsys` model, a closed-loop system containing a plant and controller. The Air-fuel rate controller logic is a Stateflow chart that specifies the different operation modes.

Figure 1: Top-level model of the plant and controller

### Fuel Rate Control Subsystem

Figure 2: Fuel rate controller subsystem

Figure 3: Fuel rate controller logic

## Generate Code with Default Cases for Unreachable Stateflow Switch Statements

- 1 In the MATLAB Command Window, to open `sldemo_fuelsys` enter:

```
openExample('sldemo_fuelsys');
```

- 2 Open the Model Configuration parameters dialog box. On the **Code Generation > Code Style** tab, clear the **Suppress generation of default cases for Stateflow switch statements if unreachable** parameter.

- 3 In the MATLAB Command Window, to build the model, enter:

```
slbuild('sldemo_fuelsys/fuel_rate_control');
```

For the different operation modes, the `fuel_rate_control.c` file contains default cases for unreachable switch statements. For example, for the Shutdown operation mode, the generated code contains this default statement:

```
default:
/* Unreachable state, for coverage only */
rtDWork.bitsForTID0.is_Fuel_Disabled = IN_NO_ACTIVE_CHILD;
break;
```

For the Warmup operation mode, the generated code contains this default statement:

```
default:
/* Unreachable state, for coverage only */
rtDWork.bitsForTID0.is_Low_Emissions = IN_NO_ACTIVE_CHILD;
break;
```

## Suppress Default Cases for Unreachable Stateflow Switch Statements

- 1 Open the Configuration Parameters dialog box. On the **Code Generation > Code Style** tab, select the **Suppress generation of default cases for Stateflow switch statements if unreachable** parameter.
- 2 Build the model.

Read through the `fuel_rate_control.c` file. The default cases for unreachable switch statements are not in the generated code.

## See Also

## Replace Multiplication by Powers of Two with Signed Bitwise Shifts

This example shows how to generate code that replaces multiplication by powers of two with signed bitwise shifts. Code that contains bitwise shifts executes faster than the code containing multiplication by powers of two.

Some coding standards, such as MISRA, do not allow bitwise operations on signed integers. If you want to increase your chances of producing MISRA C compliant code, do not replace multiplication by powers of two with bitwise shifts.

### Example

To replace multiplication by powers of two with bitwise shifts, create the following model. In this model, a signal of **Data type** `int16` feeds into a Shift Arithmetic block. In the Shift Arithmetic Block Parameters dialog box, the **Bits to shift** > **Direction** parameter is set to `Left`. The **Bits to shift** > **Number** parameter is set to 3. This parameter corresponds to a value of 8, or raising 2 to the power of 3.

### Generate Code with Signed Bitwise Shifts

- 1 Open the Model Configuration Parameters dialog box and select the **Code Style** tab. The **Replace multiplications by powers of two with signed bitwise shifts** parameter is on by default.
- 2 Generate code for the model.

In the `bitwise_multiplication.c` file, the `bitwise_multiplication` step function contains this code:

```
bitwise_multiplication_Y.Out1 = (int16_T)(bitwise_multiplication_U.In1 << 3);
```

The signed integer, `bitwise_multiplication_U.In1`, is shifted three bits to the left.

### Generate Code with Multiplication by Powers of Two

- 1 Open the Model Configuration Parameters dialog box and select the **Code Style** tab.
- 2 Clear the **Replace multiplications by powers of two with signed bitwise shifts** parameter.
- 3 Generate code for the model.

In the `bitwise_multiplication.c` file, the `bitwise_multiplication` step function contains this code:

```
bitwise_multiplication_Y.Out1 = (int16_T)(bitwise_multiplication_U.In1 * 8);
```

The signed integer `bitwise_multiplication_U.In1` is multiplied by 8.

## **See Also**

### **Related Examples**

- Replace multiplications by powers of two with signed bitwise shifts
- “Model Configuration Parameters: Code Style”

## Generate Code Containing Right Shifts on Signed Integers

This example shows how to control whether the generated code contains right shifts on signed integers. Generated code that does not contain right shifts on signed integers first casts the signed integers to unsigned integers, and then right shifts the unsigned integers.

Some coding standards, such as MISRA, do not allow right shifts on signed integers because different hardware can store negative integers differently. For negative integers, you can get different answers depending on the hardware. If you want to increase your chances of producing MISRA C compliant code, do not allow right shifts on signed integers.

### Example Model

To generate code with right shifts on signed integers, create this model. A signal of **Data type** `int16` feeds into a Shift Arithmetic block. In the Shift Arithmetic Block Parameters dialog box, the **Bits to shift** > **Direction** parameter is set to Right. The **Bits to shift** > **Number** parameter is set to 3.

## Generate Code Containing Right Shifts on Signed Integers

- 1 Open the Model Configuration Parameters dialog box and select the **Code Style** tab. The **Allow right shifts on signed integers** parameter is on by default.
- 2 Generate code for the model.

In the `rightshift.c` file, the `rightshift_step` function contains this code:

```
rightshift_Y.Out1 = (int16_T)(rightshift_U.In1 >> 3);
```

The signed integer `rightshift_U.In1` is shifted three bits to the right.

## Generate Code That Does Not Allow Right Shifts on Signed Integers

- 1 Open the Model Configuration Parameters dialog box and select the **Code Style** tab. Clear the **Allow right shifts on signed integers** parameter.
- 2 Generate code for the model.

In the `rightshift.c` file, the `rightshift_step` function contains this code:

```
rightshift_Y.Out1 = (int16_T)asr_s32(rightshift_U.In1, 3U);
```

When you clear the **Allow right shifts on signed integers** parameter, the generated code contains a function call instead of a right shift on a signed integer. The function `asr_s32` contains this code:

```
int32_T asr_s32(int32_T u, uint32_T n)
{
```

```
int32_T y;
if (u >= 0) {
 y = (int32_T)((uint32_T)u >> n);
} else {
 y = -(int32_T)((uint32_T)-(u + 1) >> n) - 1;
}

return y;
}
```

The `asr_s32` function casts a signed integer to an unsigned integer, and then right shifts the unsigned integer.

## Control Cast Expressions in Generated Code

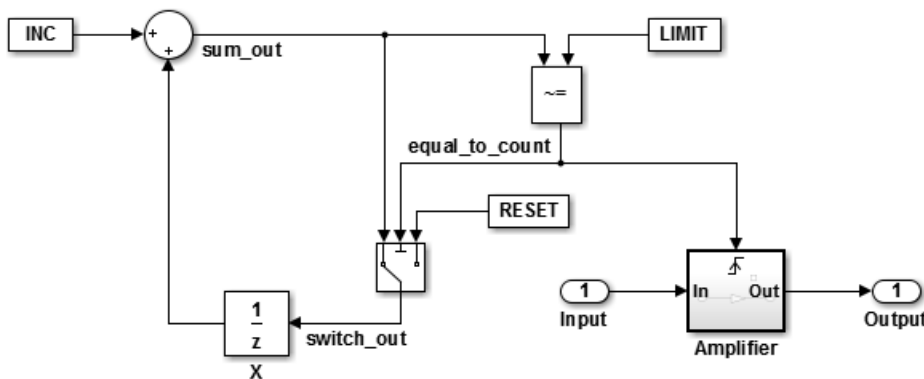

You can choose how the code generator specifies data type casts in the generated code. In the Configuration Parameters dialog box, select **Code Generation > Code Style**. From the **Casting modes** drop-down list, three parameter options control how the code generator casts data types.

- **Nominal** instructs the code generator to generate code that has minimal data type casting. When you do not have special data type information requirements, choose **Nominal**.
- **Standards Compliant** instructs the code generator to cast data types to conform to MISRA standards when it generates code. The MISRA data type casting eliminates common MISRA standard violations, including address arithmetic and assignment. It reduces 10.1, 10.2, 10.3, and 10.4 violations.

For more information, see “MISRA C” on page 23-11.

- **Explicit** instructs the code generator to cast data type values explicitly when it generates code. You can see how a value is stored, which tells you how much memory space the code uses for the variable. The data type informs you how much precision is possible in calculations involving the variable.

Open the example model `rtwdemo_rtwecintro`.

## Enable Nominal Casting Mode and Generate Code

When you choose **Nominal** casting mode, the code generator does not create data type casts for variables in the generated code.

- 1 On the **Code Generation > Code Style** pane, from the **Casting modes** drop-down list, select **Nominal**.
- 2 On the **Code Generation > Report** pane, select **Create code generation report**.
- 3 On the **Code Generation** pane, select **Generate code only**.
- 4 Click **Apply**.
- 5 In the model window, press **Ctrl+B** to generate code.
- 6 In the Code Generation report left pane, click `rtwdemo_rtwecintro.c` to see the code.

```
/* Model step function */
void rtwdemo_rtwecintro_step(void)
{
 boolean_T rtb_equal_to_count;
```

```

/* Sum: 'XRootX/Sum' incorporates:
 * Constant: 'XRootX/INC'
 * UnitDelay: 'XRootX/X'
 */
rtDWork.X++;

/* RelationalOperator: 'XRootX/RelOpt' incorporates:
 * Constant: 'XRootX/LIMIT'
 */
rtb_equal_to_count = (rtDWork.X != 16);

/* Outputs for Triggered SubSystem: 'XRootX/Amplifier' incorporates:
 * TriggerPort: 'XS1X/Trigger'
 */
if (rtb_equal_to_count && (rtPrevZCSigState.Amplifier_Trig_ZCE != POS_ZCSIG))
{
 /* Output: 'XRootX/Output' incorporates:
 * Gain: 'XS1X/Gain'
 * Inport: 'XRootX/Input'
 */
 rtY.Output = rtU.Input << 1;
}

rtPrevZCSigState.Amplifier_Trig_ZCE = (uint8_T)(rtb_equal_to_count ? (int32_T)
 POS_ZCSIG : (int32_T)ZERO_ZCSIG);

/* End of Outputs for SubSystem: 'XRootX/Amplifier' */

/* Switch: 'XRootX/Switch' */
if (!rtb_equal_to_count) {
 /* Update for UnitDelay: 'XRootX/X' incorporates:
 * Constant: 'XRootX/RESET'
 */
 rtDWork.X = 0U;
}

/* End of Switch: 'XRootX/Switch' */
}

```

## Enable Standards Compliant Casting Mode and Generate Code

When you choose Standards Compliant casting mode, the code generator creates MISRA standards compliant data type casts for variables in the generated code.

- 1 On the **Code Style** pane, from the **Casting modes** drop-down list, select Standards Compliant.
- 2 On the **Code Generation** pane, click **Apply**.
- 3 In the model window, press **Ctrl+B** to generate code.
- 4 In the Code Generation report left pane, click `rtwdemo_rtwecintro.c` to see the code.

```

void rtwdemo_rtwecintro_step(void)
{
 boolean_T rtb_equal_to_count;

 /* Sum: '<Root>/Sum' incorporates:
 * Constant: '<Root>/INC'
 * UnitDelay: '<Root>/X'
 */
 rtDWork.X++;

 /* RelationalOperator: '<Root>/RelOpt' incorporates:
 * Constant: '<Root>/LIMIT'
 */
 rtb_equal_to_count = (boolean_T)(int32_T)((int32_T)rtDWork.X != (int32_T)16);

 /* Outputs for Triggered SubSystem: '<Root>/Amplifier' incorporates:
 * TriggerPort: '<S1>/Trigger'
 */
 if (((int32_T)rtb_equal_to_count) && (rtPrevZCSigState.Amplifier_Trig_ZCE !=
 POS_ZCSIG)) {
 /* Output: '<Root>/Output' incorporates:
 * Gain: '<S1>/Gain'

```

```

 * Inport: '<Root>/Input'
 */
 rtY.Output = (int32_T)(uint32_T)((uint32_T)rtU.Input << (uint32_T)(int8_T)1);
}

rtPrevZCSigState.Amplifier_Trig_ZCE = (uint8_T)(int32_T)(rtb_equal_to_count ?
(int32_T)(uint8_T)POS_ZCSIG : (int32_T)(uint8_T)ZERO_ZCSIG);

/* End of Outputs for SubSystem: '<Root>/Amplifier' */

/* Switch: '<Root>/Switch' */
if (!rtb_equal_to_count) {
 /* Update for UnitDelay: '<Root>/X' incorporates:
 * Constant: '<Root>/RESET'
 */
 rtDWork.X = 0U;
}

/* End of Switch: '<Root>/Switch' */
}

```

## Enable Explicit Casting Mode and Generate Code

When you choose **Explicit** casting mode, the code generator creates explicit data type casts for variables in the generated code.

- 1 On the **Code Style** pane, from the **Casting modes** drop-down list, select **Explicit**.
- 2 On the **Code Generation** pane, click **Apply**.
- 3 In the model window, press **Ctrl+B** to generate code.
- 4 In the Code Generation report left pane, click `rtwdemo_rtwecintro.c` to see the code.

```

/* Model step function */
void rtwdemo_rtwecintro_step(void)
{
 boolean_T rtb_equal_to_count;

 /* Sum: '<Root>/Sum' incorporates:
 * Constant: '<Root>/INC'
 * UnitDelay: '<Root>/X'
 */
 rtDWork.X = (uint8_T)(1U + (uint32_T)(int32_T)rtDWork.X);

 /* RelationalOperator: '<Root>/RelOpt' incorporates:
 * Constant: '<Root>/LIMIT'
 */
 rtb_equal_to_count = (boolean_T)((int32_T)rtDWork.X != 16);

 /* Outputs for Triggered SubSystem: '<Root>/Amplifier' incorporates:
 * TriggerPort: '<S1>/Trigger'
 */
 if (((int32_T)rtb_equal_to_count) && ((int32_T)((int32_T)
rtPrevZCSigState.Amplifier_Trig_ZCE != (int32_T)POS_ZCSIG)) {
 /* Output: '<Root>/Output' incorporates:
 * Gain: '<S1>/Gain'
 * Inport: '<Root>/Input'
 */
 rtY.Output = rtU.Input << 1;
 }

 rtPrevZCSigState.Amplifier_Trig_ZCE = (uint8_T)(rtb_equal_to_count ? (int32_T)
POS_ZCSIG : (int32_T)ZERO_ZCSIG);

 /* End of Outputs for SubSystem: '<Root>/Amplifier' */

 /* Switch: '<Root>/Switch' */
 if (!(int32_T)rtb_equal_to_count) {
 /* Update for UnitDelay: '<Root>/X' incorporates:
 * Constant: '<Root>/RESET'
 */
 rtDWork.X = 0U;
 }

 /* End of Switch: '<Root>/Switch' */
}

```

## Customize Code Organization and Format

### In this section...

“Custom File Processing Components” on page 55-46

“Custom File Processing Configuration” on page 55-47

Custom file processing (CFP) tools allow you to customize the organization and formatting of generated code. With these tools, you can:

- Generate a source (.c or .cpp) or header (.h) file. If you configure the **Code interface packaging** for a model to be `Reusable function` or `Nonreusable function` (not C++ class), you can use a *custom file processing template* to control how the code generator:
  - Emits code to standard generated files---*model.c* or *.cpp* and *model.h*
  - Produces files that are independent of model code
- Organize generated code into sections (such as includes, typedefs, functions, and more). Your CFP template can emit code (for example, functions), directives (such as `#define` or `#include` statements), or comments into each section.
- Generate custom *file banners* (comment sections) at the start and end of generated code files and custom *function banners* that precede functions in the generated code.
- Generate code to call model functions, such as *model\_initialize*, *model\_step*, and so on.
- Generate code to read and write model inputs and outputs.
- Generate a main program module.
- Obtain information about the model and the generated files from the model.

### Custom File Processing Components

The custom file processing features are based on the following interrelated components:

- *Code generation template* (CGT) files: a CGT file defines the top-level organization and formatting of generated code. See “Code Generation Template (CGT) Files” on page 55-49.
- The *code template API*: a high-level Target Language Compiler (TLC) API that provides functions with which you can organize code into named sections and subsections of generated source and header files. The code template API also provides utilities that return information about generated files, generate standard model calls, and perform other functions. See “Code Template API Summary” on page 55-71.
- *Custom file processing (CFP) templates*: a CFP template is a TLC file that manages the process of custom code generation. A CFP template assembles code to be generated into buffers. A CFP template also calls the code template API to emit the buffered code into specified sections of generated source and header files. A CFP template interacts with a CGT file, which defines the ordering of major sections of the generated code. See “Custom File Processing (CFP) Templates” on page 55-55.

To use CFP templates, you must understand TLC programming, for more information, see “Target Language Compiler”.

## Custom File Processing Configuration

Customize generated code by specifying code and data templates on the **Code Generation > Templates** pane:

Goal	Action
Specify a template that defines the top-level organization and formatting of generated source code (.c or .cpp) files	Enter a code generation template (CGT) file for the <b>Source file (*.c) template</b> parameter.
Specify a template that defines the top-level organization and formatting of generated header (.h) files	Enter a CGT file for the <b>Header file (*.h) template</b> parameter. This template file can be the same template file that you specify for <b>Source file (.c) template</b> . If you use the same template file, source and header files contain identical banners. The default template is <i>matlabroot/toolbox/rtw/targets/ecoder/ert_code_template.cgt</i> .
Specify a template that organizes generated code into sections (such as includes, typedefs, functions, and more)	Enter a custom file processing (CFP) template file for the File customization template parameter. A CFP template can emit code, directives, or comments into each section. For more information, see “Custom File Processing (CFP) Templates” on page 55-55.
Generate a model-specific example main program module	Select <b>Generate an example main program</b> . For more information, see “Generate Code for an Application” on page 71-2.

---

**Note** Place the template files that you specify on the MATLAB path.

---

## Specify Templates For Code Generation

To use custom file processing features, create CGT files and CFP templates. These files are based on default templates provided by the code generation software. Once you have created your templates, you must integrate them into the code generation process.

Select and edit CGT files and CFP templates, and specify their use in the code generation process in the **Code Generation > Templates** pane of a model configuration set. The following figure shows options configured for their defaults.

The options related to custom file processing are:

- The **Source file (.c) template** field in the **Code templates** and **Data templates** sections. This field specifies the name of a CGT file to use when generating source (.c or .cpp) files. You must place this file on the MATLAB path.
- The **Header file (.h) template** field in the **Code templates** and **Data templates** sections. This field specifies the name of a CGT file to use when generating header (.h) files. You must place this file on the MATLAB path.

By default, the template for both source and header files is `matlabroot/toolbox/rtw/targets/ecoder/ert_code_template.cgt`.

- The **File customization template** edit field in the **Custom templates** section. This field specifies the name of a CFP template file to use when generating code files. You must place this file on the MATLAB path. The default CFP template is `matlabroot/toolbox/rtw/targets/ecoder/example_file_process.tlc`.

In each of these fields, click **Browse** to navigate to and select an existing CFP template or CGT file. Click **Edit** to open the specified file into the MATLAB editor where you can customize it.

## Code Generation Template (CGT) Files

Code Generation Template (CGT) files define the top-level organization and formatting of generated source code and header files. CGT files have the following applications:

- Generation of custom banners (comments sections) in code files. See “Generate Custom File and Function Banners” on page 55-74.
- Generation of custom code using a CFP template requires a CGT file. To use CFP templates, you must understand the CGT file structure. In many cases, however, you can use the default CGT file without modifying it.

### Default CGT file

The code generation software provides a default CGT file, *matlabroot/toolbox/rtw/targets/ecoder/ert\_code\_template.cgt*. Base your custom CGT files on the default file.

### CGT File Structure

A CGT file consists of one required section and four optional sections:

#### Code Insertion Section

(Required) This section contains tokens that define an ordered partitioning of the generated code into a number of sections (such as `Includes` and `Defines` sections). Tokens have the form of:

```
%<SectionName>
```

For example,

```
%<Includes>
```

The code generation software defines a minimal set of required tokens. These tokens generate C or C++ source or header code. They are *built-in* tokens (see “Built-In Tokens and Sections” on page 55-50). You can also define custom tokens on page 55-67 and custom sections on page 55-66.

Each token functions as a placeholder for a corresponding section of generated code. The ordering of the tokens defines the order in which the corresponding sections appear in the generated code. If you do not include a token, then the corresponding section is not generated. To generate code into a given section, explicitly call the code template API from a CFP template, as described in “Custom File Processing (CFP) Templates” on page 55-55.

The CGT tokens define the high-level organization of generated code. Using the code template API, you can partition each code section into named subsections, as described in “Subsections” on page 55-51.

In the code insertion section, you can also insert C or C++ comments between tokens. Such comments emit directly into the generated code.

#### File Banner Section

(Optional) This section contains comments and tokens you use in generating a custom file banner.

### Function Banner Section

(Optional) This section contains comments and tokens for use in generating a custom function banner.

### Shared Utility Function Banner Section

(Optional) This section contains comments and tokens for use in generating a custom shared utility function banner.

### File Trailer Section

(Optional) This section contains comments for use in generating a custom trailer banner.

For more information on these sections, see “Generate Custom File and Function Banners” on page 55-74.

## Built-In Tokens and Sections

The following code extract shows the required code insertion section of the default CGT file with the required built-in tokens.

```
%%%
%% Code insertion section (required)
%% These are required tokens. You can insert comments and other tokens in
%% between them, but do not change their order or remove them.
%%
%<Includes>
%<Defines>
%<Types>
%<Enums>
%<Definitions>
%<Declarations>
%<Functions>
```

Note the following requirements for customizing a CGT file:

- Do not remove required built-in tokens.
- Built-in tokens must appear in the order shown because each successive section has dependencies on previous sections.
- Only one token per line.
- Do not repeat tokens.
- You can add custom tokens and comments to the code insertion section as long as you do not violate the previous requirements.

---

**Note** If you modify a CGT file and then rebuild your model, the code generation process does not force a top model build. To regenerate the code, see “Force Regeneration of Top Model Code”.

---

The following table summarizes the built-in tokens and corresponding section names, and describes the code sections.

## Built-In CGT Tokens and Corresponding Code Sections

Token and Section Name	Description
Includes	<code>#include</code> directives section
Defines	<code>#define</code> directives section
Types	<code>typedef</code> section. <code>typedef</code> s can depend on a previously defined type
Enums	Enumerated types section
Definitions	Data definitions (for example, <code>double x = 3.0;</code> )
Declarations	Data declarations (for example, <code>extern double x;</code> )
Functions	C or C++ functions

## Subsections

You can define one or more named subsections for any section. Some of the built-in sections have predefined subsections summarized in table Subsections Defined for Built-In Sections.

---

**Note** Sections and subsections emit to the source or header file in the order listed in the CGT file.

---

Using the custom section feature, you can define additional sections. See “Generate a Custom Section” on page 55-66.

**Subsections Defined for Built-In Sections**

Section	Subsections	Subsection Description
Includes	N/A	
Defines	N/A	
Types	IntrinsicTypes	Intrinsic typedef section. Intrinsic types depend only on intrinsic C or C++ types.
Types	PrimitiveTypedefs	Primitive typedef section. Primitive typedefs depend only on intrinsic C or C++ types and on typedefs previously defined in the IntrinsicTypes section.
Types	UserTop	You can place any type of code in this section, including code that has dependencies on the previous sections.
Types	Typedefs	typedef section. Typedefs can depend on previously defined types
Enums	N/A	
Definitions	N/A	
Declarations	N/A	
Functions		C or C++ functions
Functions	CompilerErrors	<code>#error</code> directives
Functions	CompilerWarnings	<code>#warning</code> directives
Functions	Documentation	Documentation (comment) section
Functions	UserBottom	You can place any code in this section.

## Format Generated Code Files by Using Templates

This example shows how to use code generation templates to add custom code banners, rearrange data and functions, and insert additional code segments and documentation into generated code files.

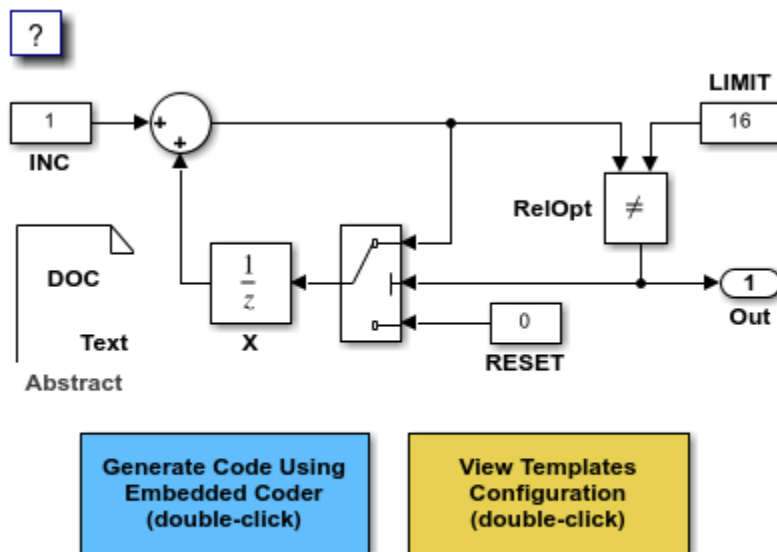

The model extracts text from the Model Description, a DOC block, and a Simulink® annotation. The Simulink annotation maps to the code template %<Note> symbol.

The templates provide consistent file layout and elaboration for your organization's coding standards. Embedded Coder® provides extensible code generation templates for formatting generated code. The layout and format of the code template file controls the output of the generated code.

Code generation templates (.cgt files) enable you to add custom code banners, rearrange data and functions, and insert additional code segments and documentation into the generated code files. Code generation templates are imported automatically from the MATLAB® path. For this model, the code generation template `rtwdemocodetemplate.cgt` is used.

1. Open model `rtwdemo_codetemplate`.

```
model='rtwdemo_codetemplate';
open_system(model)
```

Copyright 1994-2020 The MathWorks, Inc.

2. In the Configuration Parameters dialog box, open **Code Generation > Templates** pane.
3. In the **Code templates** section, click the **Edit** button beside **Source file template**. The `rtwdemocodetemplate.cgt` template opens in the MATLAB Command Window. Inspect the code template.
4. Build the model and generate code. On the **C Code** tab, click **Build**.
5. Open `rtwdemo_codetemplate.c` to inspect the generated code.

```
rtwdemoclean;
close_system(model,0)
```

## Custom File Processing (CFP) Templates

The files provided to support custom file processing are:

- `matlabroot/rtw/c/tlc/mw/codetemplatelib.tlc`: A TLC function library that implements the code template API. `codetemplatelib.tlc` also provides the comprehensive documentation of the API in the comments headers preceding each function.
- `matlabroot/toolbox/rtw/targets/ecoder/example_file_process.tlc`: An example custom file processing (CFP) template, which you should use as the starting point for creating your own CFP templates. Guidelines and examples for creating a CFP template are provided in “Generate Source and Header Files with a Custom File Processing (CFP) Template” on page 55-62.
- TLC files supporting generation of single-rate and multirate main program modules (see “Customizing Example Main Program Module Generation” on page 55-65).

Once you have created a CFP template, you must integrate it into the code generation process, using the **File customization template** edit field. See “Specify Templates For Code Generation” on page 55-48.

### Custom File Processing (CFP) Template Structure

A custom file processing (CFP) template imposes a simple structure on the code generation process. The template, a code generation template (CGT) file, partitions the code generated for each file into a number of sections. These sections are summarized in Built-In CGT Tokens and Corresponding Code Sections and Subsections Defined for Built-In Sections.

Code for each section is assembled in buffers and then emitted, in the order listed, to the file being generated.

To generate a file section, your CFP template must first assemble the code to be generated into a buffer. Then, to emit the section, your template calls the TLC function

```
LibSetSourceFileSection(fileH, section, tmpBuf)
```

where

- `fileH` is a file reference to a file being generated.
- `section` is the code section or subsection to which code is to be emitted. `section` must be one of the section or subsection names listed in Subsections Defined for Built-In Sections.

Determine the `section` argument as follows:

- If Subsections Defined for Built-In Sections does not define subsections for a given section, use the section name as the `section` argument.
- If Subsections Defined for Built-In Sections defines one or more subsections for a given section, you can use either the section name or a subsection name as the `section` argument.
- If you have defined a custom token denoting a custom section, do not call `LibSetSourceFileSection`. Special API calls are provided for custom sections (see “Generate a Custom Section” on page 55-66).
- `tmpBuf` is the buffer containing the code to be emitted.

There is no requirement to generate all of the available sections. Your template need only generate the sections you require in a particular file.

Note that legality or syntax checking is not performed on the custom code within each section.

See “Generate Source and Header Files with a Custom File Processing (CFP) Template” on page 55-62, for typical usage examples.

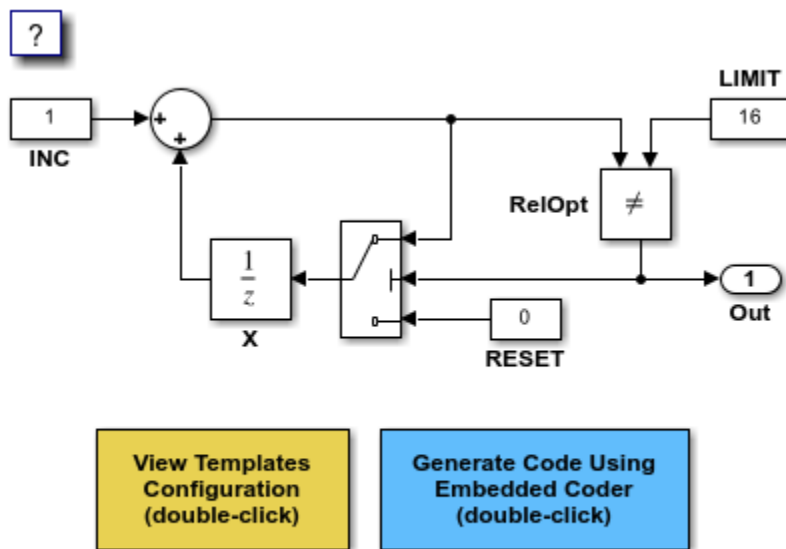

## Generate Additional Files Required to Interface with an Application

Embedded Coder® provides an extensible API to augment generated code and to generate additional files. The model configuration parameter **File customization template** specifies a custom Target Language Compiler (TLC) script that executes at the end of the code generation process. Using this script, you can generate additional code to interface with application code.

In this example, the TLC script file `rtwdemofileprocess.tlc` creates an additional entry-point function, `rtwdemo_fileprocess`, which calls the step function and initializes the model, if necessary. The initialization function is transparent to the caller.

1. Open the example model `rtwdemo_fileprocess`.

```
open_system('rtwdemo_fileprocess');
```

Copyright 1994-2020 The MathWorks, Inc.

2. Verify the model configuration parameter **File customization template** is set to `rtwdemofileprocess.tlc` by double-clicking the yellow button labeled **View Templates Configuration**.

3. Generate code.

4. Inspect the generated code. An additional function, `rtwdemo_fileprocess`, appears at the end of the generated file `rtwdemo_fileprocess.c`. The entry point is declared `extern` in `rtwdemo_fileprocess.h` as the `rtwdemofileprocess.tlc` script specifies.

## Change the Organization of a Generated File

The files created during code generation are organized according to the general code generation template. This template has the filename `ert_code_template.cgt`, and is specified by default in **Code Generation > Templates** pane of the Configuration Parameters dialog box.

The following fragment shows the `rtwdemo_configinterface.c` file header that is generated using this default template:

```
/*
 * File: rtwdemo_configinterface.c
 *
 * Code generated for Simulink model 'rtwdemo_configinterface'.
 *
 * Model version : 1.387
 * Simulink Coder version : 9.4 (R2020b) 19-May-2020
 * C/C++ source code generated on : Thu Jun 11 14:31:07 2020
 *
 * Target selection: ert.tlc
 * Embedded hardware selection: Intel->x86-64 (Windows64)
 * Code generation objectives: Unspecified
 * Validation result: Not run
 */
```

You can change the organization of generated files using code templates and data templates. Code templates organize the files that contain functions, primarily. Data templates organize the files that contain identifiers. In this procedure, you organize the generated files, using the supplied code and data templates:

- 1 In the Configuration Parameters dialog box, open the **Code Generation > Templates** pane.
- 2 In the **Code templates** section, in the **Source file template** box, type `code_c_template.cgt`.
- 3 In the **Header file template** box, type `code_h_template.cgt`.
- 4 In the **Data templates** section, in the **Source file template** box, type `data_c_template.cgt`.
- 5 In the **Header file template** box, type `data_h_template.cgt`.
- 6 Click **Apply**.
- 7 In the model window, press **Ctrl+B**. Now the files are organized using the templates you specified. For example, the `rtwdemo_configinterface.c` file header now is organized like this:

```
/**

 ** FILE INFORMATION:
 ** Filename: rtwdemo_configinterface.c
 ** File Creation Date: 11-Jun-2020
 **
 ** ABSTRACT:
 **
 ** NOTES:
 **
 ** MODEL INFORMATION:
 ** Model Name: rtwdemo_configinterface
 ** Model Description: Data Dictionary Driven Modeling Using
 ** Simulink(R) Data Objects
```

This model shows how to use Simulink data objects to define data independently from the diagram which supports a data dictionary

```
driven modeling style.
** Model Version: 1.387
** Model Author: The MathWorks, Inc. - Mon Nov 27 14:36:56 2000

```

## Customize Generated File Names

The code generator creates *model.\** files during the code generation and build process. When you generate C/C++ code for ERT-based models, you can customize the names of the generated header, source, and data files. You cannot customize the generated files for referenced models. Custom file names enable you to:

- Comply with naming standards of the company or industry.
- Integrate with external code.

In the Configuration Parameters dialog box, on the **Code Generation > Code Placement** pane, use the **Auto-generated file naming rules** group to customize the names of generated files. When you use Modular or Compact(with separate date file) file packaging, you can specify custom names for generated header, source, and data files. When you use Compact file packaging, you can specify custom names for generated header and source files.

- 1 Open any ERT-based model, for example, `rtwdemo_dynamicio`. In the Configuration Parameters dialog box, change the **System target file** to `ert.tlc`.
- 2 On the **Code Generation > Code Placement** pane, select **File packaging format** as `Compact(with separate date file)`.
- 3 Specify custom file names by using the naming rules for these parameters:

- **Header files:** `$R$E_header`
- **Source files:** `$R$E_source`
- **Data files:** `$R_data`

`$E` is mandatory for **Header files** and **Source files**. `$E` represents these instances of file types:

- `capi`
- `capi_host`
- `dt`
- `testinterface`
- `private`
- `types`

- 4 To build the model, press **Ctrl + B**. In the code generation report, the generated files are listed on the left pane under **Model files** and **Data files** section.

**Generated Code**[-] **Main file**[ert\\_main.c](#)[-] **Model files**[rtwdemo\\_dynamicicio\\_header.h](#)[rtwdemo\\_dynamicicio\\_private\\_header.h](#)[rtwdemo\\_dynamicicio\\_source.c](#)[rtwdemo\\_dynamicicio\\_types\\_header.h](#)[-] **Data files**[rtwdemo\\_dynamicicio\\_data.c](#)

In this example, \$E resolves to `private` and `types`. The generated header files resolve to the model name with the value for \$E and custom text header. The generated source files resolve to the model name with custom text `source`. The generated data file resolves to the model name with custom text `data`. Here is a summary of naming rules applied and the corresponding generated files:

Type of File	Token Specification	Custom Text	Generated File Name
Header file	\$R\$E	header	rtwdemo_dynamicicio_header.h
Header file	\$R\$E	header	rtwdemo_dynamicicio_private_header.h
Source file	\$R\$E	source	rtwdemo_dynamicicio_source.c
Header file	\$R\$E	header	rtwdemo_dynamicicio_types_header.h
Data file	\$R	data	rtwdemo_dynamicicio_data.c

## Generate Source and Header Files with a Custom File Processing (CFP) Template

### In this section...

“Generate Code with a CFP Template” on page 55-62

“Analysis of the Example CFP Template and Generated Code” on page 55-63

“Generate a Custom Section” on page 55-66

“Custom Tokens” on page 55-67

This example shows you the process of generating a simple source (.c or .cpp) and header (.h) file using the example CFP template. Then, it examines the template and the code generated by the template.

The example CFP template, `matlabroot/toolbox/rtw/targets/ecoder/example_file_process.tlc`, demonstrates some of the capabilities of the code template API, including

- Generation of simple source (.c or .cpp) and header (.h) files
- Use of buffers to generate file sections for includes, functions, and so on
- Generation of includes, defines, into the standard generated files (for example, `model.h`)
- Generation of a main program module

### Generate Code with a CFP Template

This section sets up a CFP template and configures a model to use the template in code generation. The template generates (in addition to the standard model files) a source file (`timestwo.c` or `.cpp`) and a header file (`timestwo.h`).

Follow the steps below to become acquainted with the use of CFP templates:

- 1 Copy the example CFP template, `matlabroot/toolbox/rtw/targets/ecoder/example_file_process.tlc`, to a folder outside of the MATLAB folder structure (that is, not under `matlabroot`). If the folder is not on the MATLAB path or the TLC path, then add it to the MATLAB path. It is good practice to locate the CFP template in the same folder as your system target file, which is on the TLC path.
- 2 Rename the copied `example_file_process.tlc` to `test_example_file_process.tlc`.
- 3 Open `test_example_file_process.tlc` into the MATLAB editor.
- 4 Uncomment the following line:

```
% %assign ERTCustomFileTest = TLC_TRUE
```

It now reads:

```
%assign ERTCustomFileTest = TLC_TRUE
```

If `ERTCustomFileTest` is not assigned as shown, the CFP template is ignored in code generation.

- 5 Save your changes to the file. Keep `test_example_file_process.tlc` open, so you can refer to it later.

- 6 Open the `UserDefinedDataTypes` model.
- 7 Open the Simulink Model Explorer. Select the active configuration set of the model, and open the **Code Generation** pane of the active configuration set.
- 8 On the **Templates** tab, in the **File customization template** field, specify `test_example_file_process.tlc`. This is the file you previously edited and is now the specified CFP template for your model.
- 9 On the **General** tab, select the **Generate code only** check box.
- 10 Click **Apply**.
- 11 In the model window, press **Ctrl+B**. During code generation, notice the following message in the **Diagnostic Viewer**:

Warning: Overriding example ert\_main.c!

This message is displayed because `test_example_file_process.tlc` generates the main program module, overriding the default action of the ERT target. This is explained in greater detail below.

- 12 The `UserDefinedDataTypes` model is configured to generate an HTML code generation report. After code generation is complete, view the report.

Notice that the **Generated Code** list contains the following files:

- Under **Main file**, `ert_main.c`.
- Under **Other files**, `timestwo.c` and `timestwo.h`.

The files were generated by the CFP template. The next section examines the template to learn how this was done.

- 13 Keep the model, the code generation report, and the `test_example_file_process.tlc` file open so you can refer to them in the next section.

## Analysis of the Example CFP Template and Generated Code

This section examines excerpts from `test_example_file_process.tlc` and some of the code it generates. Refer to the comments in `matlabroot/rtw/c/tlc/mw/codetemplatelib.tlc` while reading the following discussion.

### Generating Code Files

Source (`.c` or `.cpp`) and header (`.h`) files are created by calling `LibCreateSourceFile`, as in the following excerpts:

```
%assign cFile = LibCreateSourceFile("Source", "Custom", "timestwo")
...
%assign hFile = LibCreateSourceFile("Header", "Custom", "timestwo")
```

Subsequent code refers to the files by the file reference returned from `LibCreateSourceFile`.

### File Sections and Buffers

The code template API lets you partition the code generated to each file into sections, tagged as **Definitions**, **Includes**, **Functions**, **Banner**, and so on. You can append code to each section as many times as required. This technique gives you a great deal of flexibility in the formatting of your custom code files.

Subsections Defined for Built-In Sections describes the available file sections and their order in the generated file.

For each section of a generated file, use `%openfile` and `%closefile` to store the text for that section in temporary buffers. Then, to write (append) the buffer contents to a file section, call `LibSetSourceFileSection`, passing in the desired section tag and file reference. For example, the following code uses two buffers (`typesBuf` and `tmpBuf`) to generate two sections (tagged "Includes" and "Functions") of the source file `timestwo.c` or `.cpp` (referenced as `cFile`):

```
%openfile typesBuf

#include "rtwtypes.h"

%closefile typesBuf

%<LibSetSourceFileSection(cFile,"Includes",typesBuf)>

 %openfile tmpBuf

 /* Times two function */
 real_T timestwofcn(real_T input) {
 return (input * 2.0);
 }

%closefile tmpBuf

%<LibSetSourceFileSection(cFile,"Functions",tmpBuf)>
```

These two sections generate the entire `timestwo.c` or `.cpp` file:

```
#include "rtwtypes.h"

/* Times two function */
FLOAT64 timestwofcn(FLOAT64 input)
{
 return (input * 2.0);
}
```

### Adding Code to Standard Generated Files

The `timestwo.c` or `.cpp` file generated in the previous example was independent of the standard code files generated from a model (for example, `model.c` or `.cpp`, `model.h`, and so on). You can use similar techniques to generate custom code within the model files. The code template API includes functions to obtain the names of the standard models files and other model-related information. The following excerpt calls `LibGetMdlPubHdrBaseName` to obtain the name for the `model.h` file. It then obtains a file reference and generates a definition in the `Defines` section of `model.h`:

```
%% Add a #define to the model's public header file model.h

%assign pubName = LibGetMdlPubHdrBaseName()
%assign modelH = LibCreateSourceFile("Header", "Simulink", pubName)

%openfile tmpBuf

 #define ACCELERATION 9.81

%closefile tmpBuf

%<LibSetSourceFileSection(modelH,"Defines",tmpBuf)>
```

Examine the generated `UserDefinedDataTypes.h` file to see the generated `#define` directive.

### Customizing Example Main Program Module Generation

ERT-based system target files determine whether and how to generate an example main program module (`ert_main.c` or `ert_main.cpp`) based on the settings of the model configuration parameters **Generate an example main program** and **Target operating system**. You can override the default behavior and generate a main program customized for your target environment.

Two TLC files support generation of an example main program module:

- `bareboard_srmain.tlc`: TLC code for generating a single-rate example main program module for a bare-board target environment. TLC function `FcnSingleTaskingMain` generates the code.
- `bareboard_mrmain.tlc`: TLC code for generating a multirate example main program module for a bare-board target environment. TLC function `FcnMultiTaskingMain` generates the code.

In the example CFP template file `matlabroot/toolbox/rtw/targets/ecoder/example_file_process.tlc`, this code generates a single- or multitasking example main program module. The logic depends on information obtained from the code template calls to `LibIsSingleRateModel` and `LibIsSingleTasking`.

```
%% Create a simple main. Files are located in MATLAB/rtw/c/tlc/mw.
```

```
%if LibIsSingleRateModel() || LibIsSingleTasking()
%include "bareboard_srmain.tlc"
%<FcnSingleTaskingMain()>
%else
%include "bareboard_mrmain.tlc"
%<FcnMultiTaskingMain()>
%endif
```

Files `bareboard_srmain.tlc` and `bareboard_mrmain.tlc` use the code template programming interface to generate the example main program modules `ert_main.c` or `ert_main.cpp`.

By default, the code generator produces an example main program module. To disable generation of that module, set the TLC variable `OverrideSampleERTMain` to `TLC_TRUE`.

For example:

```
%if GenerateSampleERTMain
%assign CompiledModel.OverrideSampleERTMain = TLC_TRUE
%warning Overriding example ert_main.c!
%endif
```

Alternatively, you can implement a `SelectCallback` function for your target. A `SelectCallback` function is a MATLAB function that is triggered when you:

- Load the model.
- Update model configuration parameter settings.
- Build the model.

Your `SelectCallback` clears the model configuration parameter **Generate an example main program**. Clearing the parameter prevents TLC variable `GenerateSampleERTMain` from being set to `TLC_TRUE`.

For information on how to create a `SelectCallback` function, see “`rtwgensettings` Structure”.

This code shows how to clear the **Generate an example main program** parameter in the context of a `SelectCallback` function.

```
slConfigUISetVal(hDlg, hSrc, 'GenerateSampleERTMain', 'off');
slConfigUISetEnabled(hDlg, hSrc, 'GenerateSampleERTMain', 0);
hSrc.refreshDialog;
```

Creation of a main program for your target environment requires customization. For example, in a bare-board environment, you need to attach `rt_OneStep` to a timer interrupt and customize the generated code, the generating TLC code, or both. For more information, see “Guidelines for Modifying Main Program” on page 71-3 and “Guidelines for Modifying `rt_OneStep`” on page 71-7.

## Generate a Custom Section

You can define custom tokens on page 55-67 in a CGT file and direct generated code into an associated built-in section. This feature gives you additional control over the formatting of code within each built-in section. For example, you could add subsections to built-in sections that do not already define subsections. Custom sections must be associated with one of the built-in sections: `Includes`, `Defines`, `Types`, `Enums`, `Definitions`, `Declarations`, or `Functions`. To create custom sections, you must

- Add a custom token to the code insertion section of your CGT file.
- In your CFP file:
  - Assemble code to be generated to the custom section into a buffer.
  - Declare an association between the custom section and a built-in section, with the code template API function `LibAddSourceFileCustomSection`.
  - Emit code to the custom section with the code template API function `LibSetSourceFileCustomSection`.

The following code examples illustrate the addition of a custom token, `Myincludes`, to a CGT file, and the subsequent association of the custom section `Myincludes` with the built-in section `Includes` in a CFP file.

---

**Note** If you have not already created custom CGT and CFP files for your model, copy the default template files `matlabroot/toolbox/rtw/targets/ecoder/ert_code_template.cgt` and `matlabroot/toolbox/rtw/targets/ecoder/example_file_process.tlc` to a work folder that is outside the MATLAB folder structure but on the MATLAB or TLC path, rename them (for example, add the prefix `test_` to each file), and update the **Templates** pane of the Configuration Parameters dialog box to reference them.

---

First, add the token `Myincludes` to the code insertion section of your CGT file. For example:

```
%<Includes>
%<Myincludes>
%<Defines>
%<Types>
%<Enums>
%<Definitions>
%<Declarations>
%<Functions>
```

Next, in the CFP file, add code to generate `include` directives into a buffer. For example, in your copy of the example CFP file, you could insert the following section between the `Includes` section and the `Create a simple main` section:

```
%% Add a custom section to the model's C file model.c

%openfile tmpBuf
#include "moretables1.h"
#include "moretables2.h"
%closefile tmpBuf

%<LibAddSourceFileCustomSection(modelC,"Includes","Myincludes")>
%<LibSetSourceFileCustomSection(modelC,"Myincludes",tmpBuf)>
```

The `LibAddSourceFileCustomSection` function call declares an association between the built-in section `Includes` and the custom section `Myincludes`. `Myincludes` is a subsection of `Includes`. The `LibSetSourceFileCustomSection` function call directs the code in the `tmpBuf` buffer to the `Myincludes` section of the generated file. `LibSetSourceFileCustomSection` is syntactically identical to `LibSetSourceFileSection`.

In the generated code, the include directives generated to the custom section appear after other code directed to `Includes`.

```
#include "UserDefinedDataTypes.h"
#include "UserDefinedDataTypes_private.h"

/* #include "mytables.h" */
#include "moretables1.h"
#include "moretables2.h"
```

---

**Note** The placement of the custom token in this example CGT file is arbitrary. By locating `%<Myincludes>` after `%<Includes>`, the CGT file specifies only that the `Myincludes` code appears after `Includes` code.

---

## Custom Tokens

Custom tokens are automatically translated to TLC syntax as a part of the build process. To escape a token, that is to prepare it for normal TLC expansion, use the `!` character. For example, the token `%<!TokenName>` is expanded to `%<TokenName>` by the template conversion program. You can specify valid TLC code, including TLC function calls: `%<!MyTLCFcn()>`.

Custom tokens are not supported when you generate C++ code.

## Comparison of a Template and Its Generated File

This figure shows part of a user-modified custom file processing (CFP) template and the resulting generated code. The figure illustrates how you can use a template to:

- Define what code the code generation software should add to the generated file
- Control the location of code in the file
- Optionally insert comments in the generated file

Notice %<Includes>, for example, on the template. The term Includes is a symbol name. A percent sign and brackets (%< >) must enclose every symbol name. You can add the desired symbol name (within the %< > delimiter) at a particular location in the template. This is how you control where the code generator places an item in the generated file.

### Template and Generated File

## Mapping Template Specification to Code Generation

This part of the template...		Generates in the file...		Explanation
		Line	Description	
(1)	<code>/*#INCLUDES*/ %&lt;Includes&gt;</code>	26-28	An <code>/*#INCLUDES*/</code> comment, followed by <code>#include</code> statements	The code generator adds the C/C++ comment as a header, and then interprets the <code>%&lt;Includes&gt;</code> template symbol to list the required <code>#include</code> statements in the file. This code is first in this section of the file because the template entries are first.
(2)	<code>/*#DEFINES*/ %&lt;Defines&gt;</code>	30	A <code>/*#DEFINES*/</code> comment, but no <code>#define</code> statements	Next, the code generator places the comment as a header for <code>#define</code> statements, but the file does not need <code>#define</code> . No code is added.
(3)	<code>#pragma string1</code>	31	<code>#pragma</code> statements	While the code generator requires <code>%&lt;&gt;</code> delimiters for template symbols, it can also interpret C/C++ statements in the template without delimiters. In this case, the generator adds the specified statements to the code, following the order in which the statements appear in the template.
(5)	<code>#pragma string2</code>	42		
(4)	<code>/*DEFINITIONS*/ %&lt;Definitions&gt;</code>	32-41	<code>/*DEFINITIONS*/</code> comment, followed by definitions	The code generator places the comment and definitions in the file between the <code>#pragma</code> statements, according to the order in the template. It also inserts comments (lines 33 and 36) that are preset in the model's Configuration Parameters dialog box.
(6)	<code>%&lt;Declarations&gt;</code>	43	No declarations	The file needs no declarations, so the code generator does not generate declarations for this file. The template does not have a comment to provide a header. Line 43 is left blank.
(7)	<code>%&lt;Functions&gt;</code>	44-74	Functions	Finally, the code generator adds functions from the model, plus comments that are preset in the Configuration Parameters dialog box. But it adds no comments as a header for the functions, because the template does not have one. This code is last because the template entry is last.

For a list of template symbols and the rules for using them, see “Template Symbol Groups” on page 55-81, “Template Symbols” on page 55-83, and “Rules for Modifying or Creating a Template” on

page 55-85. To set comment options, in the Configuration Parameters dialog box, select the **Code Generation > Comments** pane. For details, see "Configure Code Comments".

## Code Template API Summary

Code Template API Functions summarizes the code template API. See the source code in *matlabroot/rtw/c/tlc/mw/codetemplatelib.tlc* for detailed information on the arguments, return values, and operation of these calls.

## Code Template API Functions

Function	Description
LibClearFileSectionContents	Clears a file section with custom values before writing file to disk.
LibGetNumSourceFiles	Returns the number of created source files (.c or .cpp and .h).
LibGetSourceFileTag	Returns <filename>_h and <filename>_c for header and source files, respectively, where filename is the name of the model file.
LibCreateSourceFile	Creates a new C or C++ file and returns its reference. If the file already exists, simply returns its reference.
LibGetFileRecordName	Returns a model file name (including the path) without the extension.
LibGetSourceFileFromIdx	Returns a model file reference based on its index. This is useful for a common operation on all files, such as to set the leading file banner of all files.
LibSetSourceFileSection	Adds to the contents of a specified section within a specified file (see also “Custom File Processing (CFP) Template Structure” on page 55-55).
LibIndentSourceFile	Indents a file (from within the TLC environment).
LibCallModelInitialize	Returns code for calling the model's <i>model_initialize</i> function (valid for ERT only).
LibCallModelStep	Returns code for calling the model's <i>model_step</i> function (valid for ERT only).
LibCallModelTerminate	Returns code for calling the model's <i>model_terminate</i> function (valid for ERT only).
LibCallSetEventForThisBaseStep	Returns code for calling the model's set events function (valid for ERT only).
LibWriteModelData	Returns data for the model (valid for ERT only).
LibSetRTModelErrorStatus	Returns the code to set the model error status.
LibGetRTModelErrorStatus	Returns the code to get the model error status.
LibIsSingleRateModel	Returns true if model is single rate and false otherwise.
LibGetModelName	Returns name of the model (without an extension).
LibGetMdlSrcBaseName	Returns the name of model's main source file (for example, <i>model.c</i> or <i>.cpp</i> ).
LibGetMdlPubHdrBaseName	Returns the name of model's public header file (for example, <i>model.h</i> ).
LibGetMdlPrvHdrBaseName	Returns the name of the model's private header file (for example, <i>model_private.h</i> ).
LibIsSingleTasking	Returns true if the model is configured for single-tasking execution.

Function	Description
LibWriteModelInput	Returns the code to write to a particular root input (that is, a model inport block). (valid for ERT only).
LibWriteModelOutput	Returns the code to write to a particular root output (that is, a model outport block). (valid for ERT only).
LibWriteModelInputs	Returns the code to write to root inputs (that is, all model inport blocks). (valid for ERT only)
LibWriteModelOutputs	Returns the code to write to root outputs (that is, all model outport blocks). (valid for ERT only).
LibNumDiscreteSampleTimes	Returns the number of discrete sample times in the model.
LibSetSourceFileCodeTemplate	Set the code template to be used for generating a specified source file.
LibSetSourceFileOutputDirectory	Set the folder into which a specified source file is to be generated.
LibAddSourceFileCustomSection	Add a custom section to a source file. The custom section must be associated with one of the built-in (required) sections: Includes, Defines, Types, Enums, Definitions, Declarations, or Functions.
LibSetSourceFileCustomSection	Adds to the contents of a specified custom section within a specified file. The custom section must have been previously created with LibAddSourceFileCustomSection.

## Generate Custom File and Function Banners

Using code generation template (CGT) files, you can specify custom file banners and function banners for the generated code files. File banners are comment sections in the header and trailer sections of a generated file. Function banners are comment sections for each function in the generated code. Use these banners to add a company copyright statement, specify a special version symbol for your configuration management system, remove time stamps, and for many other purposes. These banners can contain characters, which propagate to the generated code.

To specify banners, create a custom CGT file with customized banner sections. The build process creates an executable TLC file from the CGT file. The code generation process then invokes the TLC file.

You do not need to be familiar with TLC programming to generate custom banners. You can modify example files that are supplied with the ERT target.

---

**Note** Prior releases supported direct use of customized TLC files as banner templates. You specified these with the **Source file (.c) banner template** and **Header file (.h) banner template** options of the ERT target. You can still use a custom TLC file banner template, however, you can now use CGT files instead.

---

ERT template options on the **Code Generation > Templates** pane of a configuration set, in the **Code templates** section, support banner generation.

The options for function and file banner generation are:

- Code templates: Source file (\*.c) template: CGT file to use when generating source (.c or .cpp) files. Place this file on the MATLAB path.
- Code templates: Header file (\*.h) template: CGT file to use when generating header (.h) files. You must place this file on the MATLAB path. This file can be the same template specified in the **Code templates: Source file (\*.c) template** field, in which case identical banners are generated in source and header files.

By default, the template for both source and header files is `matlabroot/toolbox/rtw/targets/ecoder/ert_code_template.cgt`.

- In each of these fields, click **Browse** to navigate to and select an existing CGT file for use as a template. Click **Edit** to open the specified file into the MATLAB editor, where you can customize it.

### Create a Custom File and Function Banner Template

To customize a CGT file for custom banner generation, make a local copy of the default code template and edit it, as follows:

- 1 Activate the configuration set that you want to work with.
- 2 Open the **Code Generation** pane of the active configuration set.
- 3 Click the **Templates** tab.
- 4 By default, the code template specified in the **Code templates: Source file (\*.c) template** and **Code templates: Header file (\*.h) template** fields is `matlabroot/toolbox/rtw/targets/ecoder/ert_code_template.cgt`.

- 5 If you want to use a different template as your starting point, click **Browse** to locate and select a CGT file.
- 6 Click **Edit** button to open the CGT file into the MATLAB editor.
- 7 Save a local copy of the CGT file. Store the copy in a folder that is outside of the MATLAB folder structure, but on the MATLAB path. If required, add the folder to the MATLAB path.
- 8 If you intend to use the CGT file with a custom target, locate the CGT file in a folder under your target root folder.
- 9 Rename your local copy of the CGT file. When you rename the CGT file, update the associated **Code templates: Source file (\*.c) template** or **Code templates: Header file (\*.h) template** field to match the new file name.
- 10 Edit and customize the local copy of the CGT file for banner generation, using the information provided in “Customize a Code Generation Template (CGT) File for File and Function Banner Generation” on page 55-75.
- 11 Save your changes to the CGT file.
- 12 Click **Apply** to update the configuration set.
- 13 Save your model.
- 14 Generate code. Examine the generated source and header files to confirm that they contain the banners specified by the template or templates.

## Customize a Code Generation Template (CGT) File for File and Function Banner Generation

This section describes how to edit a CGT file for custom file and function banner generation. For a description of CGT files, see “Code Generation Template (CGT) Files” on page 55-49.

### Components of the File and Function Banner Sections in the CGT file

In a CGT file, you can modify the following sections: file banner, function banner, shared utility function banner, and file trailer. Each section is defined by open and close tags. The tags specific to each section are shown in the following table.

CGT File Section	Open Tag	Close Tag
File Banner on page 55-77	<FileBanner>	</FileBanner>
Function Banner on page 55-78	<FunctionBanner>	</FunctionBanner>
Shared-utility Banner on page 55-79	<SharedUtilityBanner>	</SharedUtilityBanner>
File Trailer on page 55-79	<FileTrailer>	</FileTrailer>

You can customize your banners by including tokens and comments between the open and close tag for each section. Tokens are typically TLC variables, for example <ModelVersion>, which are replaced with values in the generated code.

**Note** Including C comment indicators, '/\*' or a '\*/', in the contents of your banner might introduce an error in the generated code.

An open tag includes tag attributes. Enclose the value of the attribute in double quotes. The attributes available for an open tag are:

- `width`: specifies the width of the file or function banner comments in the generated code. The default value is 80.
- `style`: specifies the boundary for the file or function banner comments in the generated code.

The open tag syntax is as follows:

```
<OpenTag style = "style_value" width = "num_width">
```

---

**Note** If the **Configuration Parameters > Code Generation > Language** parameter is set to C++, to select a comment style that uses C comment notation (`/*...*/`), you must also set the **Configuration Parameters > Comments > Comment style** parameter to `Multi-line`.

---

The built-in style options for the `style` attribute are:

- `classic`

```
/* single line comments */
/*
 * multiple line comments
 * second line
 */
```

- `classic_cpp`

```
// single line comments
//
// multiple line comments
// second line
//
```

- `box`

```
/******
/* banner contents */
/******
```

- `box_cpp`

```
//////////
// banner contents //
//////////
```

- `open_box`

```
/******
 * banner contents

```

- `open_box_cpp`

```
//////////
// banner contents
//////////
```

- `doxygen`

```

/** single line comments */

/**
 * multiple line comments
 * second line
 */

```

- doxygen\_cpp

```

/// single line comments

///
/// multiple line comments
/// second line
///

```
- doxygen\_qt

```

/*! single line comments */

/*!
 * multiple line comments
 * second line
 */

```
- doxygen\_qt\_cpp

```

//! single line comments

//!
//! multiple line comments
//! second line
//!

```

## File Banner

This section contains comments and tokens for use in generating a custom file banner. The file banner precedes C or C++ code generated by the model. If you omit the file banner section from the CGT file, then no file banner emits to the generated code.

---

**Note** If you customize your file banner, the software does not emit the customized banner for the file `const_params.c`.

---

The following section is the file banner section provided with the default CGT file, `matlabroot/toolbox/rtw/targets/ecoder/ert_code_template.cgt`.

```

%%
% Custom file banner section (optional)
%
<FileBanner style="classic">
File: %<FileName>

Code generated for Simulink model %<ModelName>.

Model version : %<ModelVersion>
Simulink Coder version : %<RTWFileVersion>
C/C++ source code generated on : %<SourceGeneratedOn>
%<CodeGenSettings>
</FileBanner>

```

### Summary of Tokens for File Banner Generation

FileName	Name of the generated file (for example, "UserDefinedDataTypes.c").
FileType	Either "source" or "header". Designates whether generated file is a .c or .cpp file or an .h file.
FileTag	Given file names file.c or .cpp and file.h; the file tags are "file_c" and "file_h", respectively.
ModelName	Name of generating model.
ModelVersion	Version number of model.
Description	Description of the model specified in the CGT file or the text specified in the <b>Descripton</b> tab in <b>Model Properties (Modeling &gt; Model Settings)</b> . This token is not supported for referenced models in a model reference hierarchy.
RTWFileVersion	Version number of <i>model.rtw</i> file.
RTWFileGeneratedOn	Timestamp of <i>model.rtw</i> file.
TLCVersion	Version of Target Language Compiler.
SourceGeneratedOn	Timestamp of generated file.
CodeGenSettings	Code generation settings for model: target language, target selection, production hardware selection, test hardware selection, code generation objectives (in priority order), and Code Generation Advisor validation result.

### Function Banner

This section contains comments and tokens for use in generating a custom function banner. The function banner precedes C or C++ function generated during the build process. If you omit the function banner section from the CGT file, the default function banner emits to the generated code. The following section is the default function banner section provided with the default CGT file, *matlabroot/toolbox/rtw/targets/ecoder/ert\_code\_template.cgt*.

```

%%
%% Custom function banner section (optional)
%% Customize function banners by using the following predefined tokens:
%% %<ModelName>, %<FunctionName>, %<FunctionDescription>, %<Arguments>,
%% %<ReturnType>, %<GeneratedFor>, %<BlockDescription>.
%%
<FunctionBanner style="classic">
%<FunctionDescription>
%<BlockDescription>
</FunctionBanner>

```

### Summary of Tokens for Function Banner Generation

FunctionName	Name of function
Arguments	List of function arguments
ReturnType	Return type of function
ModelName	Name of generating model
FunctionDescription	Short abstract about the function
GeneratedFor	Full block path for the generated function
BlockDescription	User input from the <b>Block Description</b> parameter of the block properties dialog box. <b>BlockDescription</b> contains an optional token attribute, <b>style</b> . The only valid value for <b>style</b> is <b>content_only</b> , which is case-sensitive and enclosed in double quotes. Use the <b>content_only</b> style when you want to include only the block description content that you entered in the block parameter dialog. The syntax for the token attribute <b>style</b> is:  %<BlockDescription style = "content_only">

### Shared Utility Function Banner

The shared utility function banner section contains comments and tokens for use in generating a custom shared utility function banner. The shared utility function banner precedes C or C++ shared utility function generated during the build process. If you omit the shared utility function banner section from the CGT file, the default shared utility function banner emits to the generated code. The following section is the default shared utility function banner section provided with the default CGT file, *matlabroot/toolbox/rtw/targets/ecoder/ert\_code\_template.cgt*.

```

%%
%% Custom shared utility function banner section (optional)
%% Customize banners for functions generated in shared location by using the
%% following predefined tokens: %<FunctionName>, %<FunctionDescription>,
%% %<Arguments>, %<ReturnType>.
%%
<SharedUtilityBanner style="classic">
%<FunctionDescription>
</SharedUtilityBanner>

```

### Summary of Tokens for Shared Utility Function Banner Generation

FunctionName	Name of function
Arguments	List of function arguments
ReturnType	Return type of function
FunctionDescription	Short abstract about function

### File Trailer

The file trailer section contains comments for generating a custom file trailer. The file trailer follows C or C++ code generated from the model. If you omit the file trailer section from the CGT file, no file trailer emits to the generated code. The following section is the default file trailer provided in the default CGT file.

```

%%
%% Custom file trailer section (optional)
%%
<FileTrailer style="classic">

```

File trailer for generated code.

```
[EOF]
</FileTrailer>
```

Tokens available for the file banner are available for the file trailer. See Summary of Tokens for File Banner Generation.

## Template Symbols and Rules

### In this section...

“Introduction” on page 55-81

“Template Symbol Groups” on page 55-81

“Template Symbols” on page 55-83

“Rules for Modifying or Creating a Template” on page 55-85

### Introduction

“Template Symbol Groups” on page 55-81 and “Template Symbols” on page 55-83 describe custom file processing (CFP) template symbols and rules for using them. The location of a symbol in one of the supplied template files (`code_c_template.cgt`, `code_h_template.cgt`, `data_c_template.cgt`, or `data_h_template.cgt`) determines where the items associated with that symbol are located in the corresponding generated file. “Template Symbol Groups” on page 55-81 identifies the symbol groups, starting with the parent (“Base”) group, followed by the children of each parent. “Template Symbols” on page 55-83 lists the symbols alphabetically.

**Note** If you are using custom CGT sections, for files generated to the `_sharedutils` folder, you can only use symbol names in the Base symbol group.

### Template Symbol Groups

Symbol Group	Symbol Names in This Group
Base (Parents)	Declarations Defines Definitions Documentation Enums Functions Includes Types
Declarations	ExternalCalibrationLookup1D ExternalCalibrationLookup2D ExternalCalibrationScalar ExternalVariableScalar

Symbol Group	Symbol Names in This Group
Defines	LocalDefines LocalMacros
Definitions	FilescopeCalibrationLookup1D FilescopeCalibrationLookup2D FilescopeCalibrationScalar FilescopeVariableScalar GlobalCalibrationLookup1D GlobalCalibrationLookup2D GlobalCalibrationScalar GlobalVariableScalar
Documentation	Abstract Banner Created Creator Date Description FileName History LastModifiedDate LastModifiedBy ModelName ModelVersion ModifiedBy
	Notes ToolVersion
Functions	CFunctionCode
Types	This parent has no children.

## Template Symbols

Symbol Name*	Symbol Group	Symbol Scope	Symbol Description (What the symbol puts in the generated file)
Abstract	Documentation	N/A	User-supplied description of the model or file. Placed in the generated file based on the Stateflow note, Simulink annotation, or DocBlock on the model.**
Banner	Documentation	N/A	Comments located near top of the file. Contains information that includes model and software versions, and date file was generated.
CFunctionCode	Functions	File	C/C++ functions. Must be at the bottom of the template.
Created	Documentation	N/A	Date when model was created. From <b>Created on</b> field on Model Properties dialog box.
Creator	Documentation	N/A	User who created model. From <b>Created by</b> field on Model Properties dialog box.
Date	Documentation	N/A	Date file was generated. Taken from computer clock.
Declarations	Base		Data declaration of a signal or parameter. For example, <code>extern real_T globalvar;</code>
Defines	Base	File	Required <code>#defines</code> of <code>.h</code> files.
Definitions	Base	File	Data definitions of signals or parameters.
Description	Documentation	N/A	Description of model. From <b>Model description</b> field on Model Properties dialog box.**
Documentation	Base	N/A	Comments about how to interpret the generated files.
Enums	Base	File	Enumerated data type definitions.
ExternalCalibrationLookup1D	Declarations	External	***
ExternalCalibrationLookup2D	Declarations	External	***
ExternalCalibrationScalar	Declarations	External	***
ExternalVariableScalar	Declarations	External	***
FileName	Documentation	N/A	Name of the generated file.
FilescopeCalibrationLookup1D	Definitions	File	***

Symbol Name*	Symbol Group	Symbol Scope	Symbol Description (What the symbol puts in the generated file)
FilescopeCalibrationLookup2D	Definitions	File	***
FilescopeCalibrationScalar	Definitions	File	***
FilescopeVariableScalar	Definitions	File	***
Functions	Base	File	Generated function code.
GlobalCalibrationLookup1D	Definitions	Global	***
GlobalCalibrationLookup2D	Definitions	Global	***
GlobalCalibrationScalar	Definitions	Global	***
GlobalVariableScalar	Definitions	Global	***
History	Documentation	N/A	User-supplied revision history of the generated files. Placed in the generated file based on the Stateflow note, Simulink annotation, or DocBlock on the model.**
Includes	Base	File	#include preprocessor directives.
LastModifiedDate	Documentation	N/A	Date when model was last saved. From <b>Last saved on</b> field on Model Properties dialog box.
LastModifiedBy	Documentation	N/A	User who last saved model. From <b>Last saved by</b> field on Model Properties dialog box.
LocalDefines	Defines	File	#define preprocessor directives from code-generation data objects.
LocalMacros	Defines	File	C/C++ macros local to the file.
ModelName	Documentation	N/A	Name of the model.
ModelVersion	Documentation	N/A	Number incremented by 1 each time you save the model.
ModifiedBy	Documentation	N/A	Name of user who last modified the model.
Notes	Documentation	N/A	User-supplied miscellaneous notes about the model or generated files. Placed in the generated file based on the Stateflow note, Simulink annotation, or DocBlock on the model.**
ToolVersion	Documentation	N/A	A list of the versions of the toolboxes used in generating the code.
Types	Base		Data types of generated code.

\* Symbol names must be enclosed between %< >. For example, %<Functions>.

\*\* This symbol can be used to add a comment to the generated files. See “Add Global Comments in the Generated Code” on page 55-5. The code generator places the comment in each generated file whose template has this symbol name. The code generator places the comment at the location that corresponds to where the symbol name is located in the template file.

\*\*\* The description can be deduced from the symbol name. For example, `GlobalCalibrationScalar` is a symbol that identifies a scalar. It contains data of global scope that you can calibrate.

## Rules for Modifying or Creating a Template

The following are the rules for creating an MPF template. “Comparison of a Template and Its Generated File” on page 55-68 illustrates several of these rules.

- 1 Place a symbol on a template within the `%< >` delimiter. For example, the symbol named `Includes` should look like this on a template: `%<Includes>`. *Note that symbol names are case-sensitive.*
- 2 Place a symbol on a template where desired. Its location on the template determines where the item associated with this symbol is located in the generated file. If no item is associated with it, the symbol is ignored.
- 3 Place a C/C++ statement outside of the `%< >` delimiter, and on a different line than a `%< >` delimiter, for that statement to appear in the generated file. For example, `#pragma message ("my text")` in the template results in `#pragma message ("my text")` at the corresponding location in the generated file. Note that the statement must be compatible with your C/C++ compiler.
- 4 Use the `.cgt` extension for every template filename. ("`cgt`" stands for code generation template.)
- 5 Note that `%% $Revision: 1.1.4.10.4.1 $` appears at the top of the MathWorks supplied templates. This is for internal MathWorks use only. It does not need to be placed on a user-defined template and does not show in a generated file.
- 6 Place a comment on the template between `/* */` as in standard ANSI C<sup>5</sup>. This results in `/*comment*/` on the generated file.
- 7 Each MPF template must have all of the Base group symbols, in predefined order. They are listed in “Template Symbol Groups” on page 55-81. Each symbol in the Base group is a parent. For example, `Declarations` is a parent symbol.
- 8 Each symbol in a non-Base group is a child. For example, `LocalMacros` is a child.
- 9 Except for Documentation children, children must be placed after their parent, before the next parent, and before the `Functions` symbol.
- 10 Documentation children can be located before or after their parent in any order anywhere in the template.
- 11 If a non-Documentation child is missing from the template, the code generator places the information associated with this child at its parent location in the generated file.
- 12 If a Documentation child is missing from the template, the code generator omits the information associated with that child from the generated file.

## Annotate Code for Justifying Polyspace Checks

This example shows how to turn on comments in the generated code that suppress error detection through Polyspace®.

### Polyspace Checks

With the Polyspace Code Prover™ software you can apply Polyspace verification to Embedded Coder® generated code. The software detects run-time errors in the generated code and helps you to locate and fix model faults. Polyspace might highlight overflows for certain operations that are legitimate because of the way the code generator implements these operations. These legitimate overflows should not be flagged by Polyspace. Generate comments in the code that suppress this error detection.

### Code Generation

1. Open the example Simulink® model mSatAddSub.

```
model='mSatAddSub';
open_system(model);
```

Copyright 2021 The MathWorks, Inc.

2. In the Embedded Coder app on the **Configuration Parameters** dialog box, turn off **Operator annotations**.

```
set_param('mSatAddSub','OperatorAnnotations','off');
```

3. To build the model and generate code, press **Ctrl+B**.

```
evalc('slbuild(''mSatAddSub'')');
```

*%The generated code is:*

```
file = fullfile('mSatAddSub_ert_rtw','mSatAddSub.c');
rtwdemodbtype(file,'/* Model step function */',...
 'End of Sum',1,1);
```

```
/* Model step function */
void mSatAddSub_step(void)
{
 uint32_T qY;

 /* Sum: '<Root>/SubUnsigned' incorporates:
 * Inport: '<Root>/In1'
 * Inport: '<Root>/In2'
 */
```

```

qY = U1 - U2;
if (qY > U1) {
 qY = 0U;
}

/* Sum: '<Root>/SubUnsigned' */
USub = qY;

/* Output: '<Root>/Out3' */
mSatAddSub_Y.Out3 = USub;

/* Matfile logging */
rt_UpdateTXYLogVars(mSatAddSub_M->rtwLogInfo, (&mSatAddSub_M->Timing.taskTime0));

/* signal main to stop simulation */
{
 /* Sample time: [1.0s, 0.0s] */
 if ((rtmGetTFinal(mSatAddSub_M)!=-1) &&
 !((rtmGetTFinal(mSatAddSub_M)-mSatAddSub_M->Timing.taskTime0) >
 mSatAddSub_M->Timing.taskTime0 * (DBL_EPSILON))) {
 rtmSetErrorStatus(mSatAddSub_M, "Simulation finished");
 }
}

/* Update absolute time for base rate */
/* The "clockTick0" counts the number of times the code of this task has
 * been executed. The absolute time is the multiplication of "clockTick0"
 * and "Timing.stepSize0". Size of "clockTick0" ensures timer will not
 * overflow during the application lifespan selected.
 */
mSatAddSub_M->Timing.taskTime0 =
 ((time_T)(++mSatAddSub_M->Timing.clockTick0)) *
 mSatAddSub_M->Timing.stepSize0;
}

/* Model initialize function */

/* set currSigDims field */
rt_LoggedCurrentSignalDimensions[0] = &rt_LoggedOutputWidths[0];
}

rtliSetLogY(mSatAddSub_M->rtwLogInfo, "yout");
}

/* block I/O */

/* exported global signals */
USub = 0U;

/* external inputs */
U1 = 0U;
U2 = 0U;

/* external outputs */
mSatAddSub_Y.Out3 = 0U;

```

```

/* Matfile logging */
rt_StartDataLoggingWithStartTime(mSatAddSub_M->rtwLogInfo, 0.0, rtmGetTFinal
(mSatAddSub_M), mSatAddSub_M->Timing.stepSize0, (&rtmGetErrorStatus
(mSatAddSub_M)));
}

/* Model terminate function */
void mSatAddSub_terminate(void)
{
/* (no terminate code required) */
}

/*
 * File trailer for generated code.
 *
 * [EOF]
 */

```

4. Run the Polyspace check. The code generator recognizes that the largest built-in data type is 32-bit. It is not possible to saturate all the results of the subtractions using 0U and a bigger single-word integer data type. Instead the software detects the results overflow and the direction of the overflow, and saturates the result. The operation is flagged by Polyspace because it fails to recognize the saturation.

5. In the Embedded Coder app on the **Configuration Parameters** dialog box, turn off **Operator annotations**.

```

set_param('mSatAddSub','OperatorAnnotations','on');
evalc('slbuild(''mSatAddSub'')');

```

6. The generated code is:

```

file = fullfile('mSatAddSub_ert_rtw','mSatAddSub.c');
rtwdemodbtype(file,'/* Model step function */',...
'End of Sum',1,1);

```

```

rtliSetLogYSignalInfo(mSatAddSub_M->rtwLogInfo, rt_LoggedOutputSignalInfo);

/* set currSigDims field */
rt_LoggedCurrentSignalDimensions[0] = &rt_LoggedOutputWidths[0];
}

rtliSetLogY(mSatAddSub_M->rtwLogInfo, "yout");
}

/* block I/O */

/* exported global signals */
Usub = 0U;

/* external inputs */
U1 = 0U;
U2 = 0U;

/* external outputs */
mSatAddSub_Y.Out3 = 0U;

/* Matfile logging */
rt_StartDataLoggingWithStartTime(mSatAddSub_M->rtwLogInfo, 0.0, rtmGetTFinal
(mSatAddSub_M), mSatAddSub_M->Timing.stepSize0, (&rtmGetErrorStatus
(mSatAddSub_M)));
}

/* Model terminate function */
void mSatAddSub_terminate(void)
{
 /* (no terminate code required) */
}

```

```
/*
 * File trailer for generated code.
 *
 * [EOF]
 */
```

The code generator inserts the `/*MW:0vSat0k*/` comment that suppresses the error detected by Polyspace.

7. Close the model.

```
bdclose(model)
rtwdemoclean;
```

## Enhance Readability of Code for Flow Charts

### In this section...

“Appearance of Generated Code for Flow Charts” on page 55-95

“Convert If-Elseif-Else Code to Switch-Case Statements” on page 55-97

“Example of Converting Code to Switch-Case Statements” on page 55-99

### Appearance of Generated Code for Flow Charts

If you have Embedded Coder and you generate code for models that include Stateflow objects, the code from a flow chart resembles the samples that follow.

The following characteristics apply:

- By default, the generated code uses `if-elseif-else` statements to represent switch patterns. To convert the code to use `switch-case` statements, see “Convert If-Elseif-Else Code to Switch-Case Statements” on page 55-97.
- By default, variables that appear in the flow chart do not retain their names in the generated code. Modified identifiers make sure that no naming conflicts occur.
- Traceability comments for the transitions appear between each set of `/*` and `*/` markers. To learn more about traceability, see “Trace Stateflow Elements in Generated Code” on page 85-12.

```

if (modelName_U.In1 == 1.0) {
 /* Transition: '<S1>:11' */
 /* Transition: '<S1>:12' */
 modelName_Y.Out1 = 10.0;

 /* Transition: '<S1>:15' */
 /* Transition: '<S1>:16' */
} else {
 /* Transition: '<S1>:10' */

```

```

if (modelName_U.In1 == 2.0) {
 /* Transition: '<S1>:13' */
 /* Transition: '<S1>:14' */
 modelName_Y.Out1 = 20.0;

 /* Transition: '<S1>:16' */
} else {
 /* Transition: '<S1>:17' */
 modelName_Y.Out1 = 30.0;
}
}

```

### Sample Code for a Decision Logic Pattern

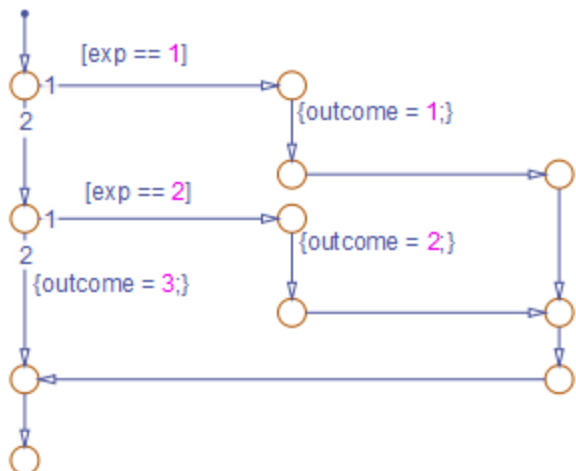

```

for (sf_i = 0; sf_i < 10; sf_i++) {
 /* Transition: '<S1>:40' */
 /* Transition: '<S1>:41' */
 modelName_B.y = modelName_B.y +
 modelName_U.In1;

 /* Transition: '<S1>:39' */
}

```

### Sample Code for an Iterative Loop Pattern

```

if (modelname_U.In1 == 1.0) {
 /* Transition: '<S1>:149' */
 /* Transition: '<S1>:150' */
 modelname_Y.Out1 = 1.0;

 /* Transition: '<S1>:151' */
 /* Transition: '<S1>:152' */
 /* Transition: '<S1>:158' */
 /* Transition: '<S1>:159' */
} else {
 /* Transition: '<S1>:156' */
 if (modelname_U.In1 == 2.0) {
 /* Transition: '<S1>:153' */
 /* Transition: '<S1>:154' */
 modelname_Y.Out1 = 2.0;

 /* Transition: '<S1>:155' */
 /* Transition: '<S1>:158' */
 /* Transition: '<S1>:159' */
 } else {
 /* Transition: '<S1>:161' */
 modelname_Y.Out1 = 3.0;
 }
}
}

```

### Sample Code for a Switch Pattern

## Convert If-Elseif-Else Code to Switch-Case Statements

When you generate code for embedded real-time targets, you can choose to convert `if-elseif-else` code to `switch-case` statements. This conversion can enhance readability of the code. For example, when a flow chart contains a long list of conditions, the `switch-case` structure:

- Reduces the use of parentheses and braces
- Minimizes repetition in the generated code

### How to Convert If-Elseif-Else Code to Switch-Case Statements

Step	Task	Reference
1	Verify that your flow chart follows the rules for conversion.	"Verify the Contents of the Flow Chart" on page 55-100
2	Enable the conversion and generate code for your model.	"Enable the Conversion" on page 55-101
3	Troubleshoot the generated code. <ul style="list-style-type: none"> <li>• If you see <code>switch-case</code> statements for your flow chart, you can stop.</li> <li>• If you see <code>if-elseif-else</code> statements for your flow chart, update the chart and repeat the previous step.</li> </ul>	"Troubleshoot the Generated Code" on page 55-101

## Rules of Conversion

For the conversion to occur, following these guidelines. LHS and RHS refer to the left-hand side and right-hand side of a condition, respectively.

Construct	Rules to Follow
Flow chart	Must have a default and two or more <i>unique</i> conditions. For more information, see “Duplicate Conditions” on page 55-98.
Each condition	Must test equality only. Must use the same variable or expression for the LHS. You can reverse the LHS and RHS.
Each LHS	Must be a single variable or expression. Cannot be a constant. Must have an integer or enumerated data type. Cannot have any side effects on simulation. For example, the LHS can read from but not write to global variables.
Each RHS	Must be a constant or a parameter. Must have an integer or enumerated data type.

## Duplicate Conditions

If a flow chart has duplicate conditions, the conversion preserves only the first condition. The code discards the other instances of duplicate conditions.

After removal of duplicates, two or more unique conditions must exist. If not, the conversion does not occur and the code contains all duplicate conditions.

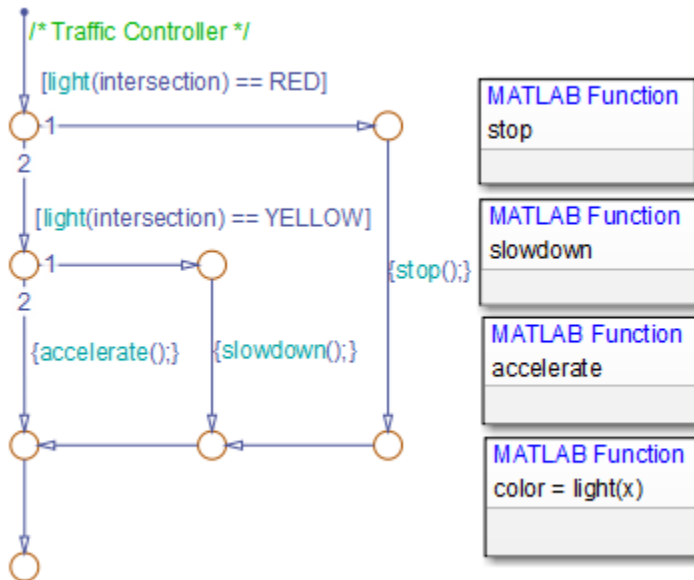

Example of Generated Code	Code After Conversion
<pre>if (x == 1) {     block1 } else if (x == 2) {     block2 } else if (x == 1) { // duplicate     block3 } else if (x == 3) {     block4 } else if (x == 1) { // duplicate     block5 } else {     block6 }</pre>	<pre>switch (x) {     case 1:         block1; break;     case 2:         block2; break;     case 3:         block4; break;     default:         block6; break; }</pre>
<pre>if (x == 1) {     block1 } else if (x == 1) { // duplicate     block2 } else {     block3 }</pre>	No change, because only one unique condition exists

## Example of Converting Code to Switch-Case Statements

Suppose that you have this model containing a single chart.

The chart contains a flow chart and four MATLAB functions.

The MATLAB functions in the chart contain the code listed in the table. In each case, the **Function Inline Option** is Auto. For more information about function inlining, see “Specify Properties of Graphical Functions” (Stateflow).

MATLAB Function	Code
stop	<pre>function stop %#codegen coder.extrinsic('disp'); disp('Not moving.')  traffic_speed = 0;</pre>
slowdown	<pre>function slowdown %#codegen coder.extrinsic('disp') disp('Slowing down.')  traffic_speed = 1;</pre>

MATLAB Function	Code
accelerate	<pre>function accelerate %#codegen coder.extrinsic('disp'); disp('Moving along.')  traffic_speed = 2;</pre>
light	<pre>function color = light(x) %#codegen if (x &lt; 20)     color = TrafficLights.GREEN; elseif (x &gt;= 20 &amp;&amp; x &lt; 25)     color = TrafficLights.YELLOW; else     color = TrafficLights.RED; end</pre>

The output color of the function `light` uses the enumerated type `TrafficLights`. The enumerated type definition in `TrafficLights.m` is:

```
classdef TrafficLights < Simulink.IntEnumType
 enumeration
 RED(0)
 YELLOW(5)
 GREEN(10)
 end
end
```

For more information, see “Define Enumerated Data Types” (Stateflow).

### Verify the Contents of the Flow Chart

Check that the flow chart in your Stateflow chart follows the rules in “Rules of Conversion” on page 55-98.

Construct	How the Construct Follows the Rules
Flow chart	<p>A default condition and two unique conditions exist:</p> <ul style="list-style-type: none"> <li>• <code>[light(intersection) == RED]</code></li> <li>• <code>[light(intersection) == YELLOW]</code></li> </ul>
Each condition	<p>Each condition:</p> <ul style="list-style-type: none"> <li>• Tests equality</li> <li>• Uses the same function call <code>light(intersection)</code> for the LHS</li> </ul>
Each LHS	<p>Each LHS:</p> <ul style="list-style-type: none"> <li>• Contains a single expression</li> <li>• Is the output of a function call, not a constant</li> <li>• Is of enumerated type <code>TrafficLights</code>, which you define in <code>TrafficLights.m</code> on the MATLAB path. See “Define Enumerated Data Types” (Stateflow).</li> <li>• Uses a function call that does not have side effects</li> </ul>

Construct	How the Construct Follows the Rules
Each RHS	Each RHS: <ul style="list-style-type: none"> <li>• Is an enumerated value and therefore a constant</li> <li>• Is of enumerated type TrafficLights</li> </ul>

### Enable the Conversion

- 1 Open the Model Configuration Parameters dialog box.
- 2 In the **Code Generation** pane, select `ert.tlc` for the **System target file** for an ERT-based target for your model.
- 3 In the **Code Generation > Code Style** pane, select the **Convert if-elseif-else patterns to switch-case statements** check box.

If you select this check box, the conversion applies to:

- Flow charts in all charts of a model
  - MATLAB functions in all charts of a model
  - All MATLAB Function blocks in that model
- 4 In the model, on the **C Code** tab, click **Build** to generate source code from the model.

### Troubleshoot the Generated Code

The generated code for the flow chart appears like this code:

```

if (sf_color == RED) {
 /* Transition: '<S1>:11' */
 /* Transition: '<S1>:12' */
 /* MATLAB Function 'stop': '<S1>:23' */
 /* '<S1>:23:6' */
 rtb_traffic_speed = 0;

 /* Transition: '<S1>:15' */
 /* Transition: '<S1>:16' */
} else {
 /* Transition: '<S1>:10' */
 /* MATLAB Function 'light': '<S1>:19' */
 if (ifelse_using_enums_U.In1 < 20.0) {
 /* '<S1>:19:3' */
 /* '<S1>:19:4' */
 sf_color = GREEN;
 } else if ((ifelse_using_enums_U.In1 >= 20.0) &&
 (ifelse_using_enums_U.In1 < 25.0)) {
 /* '<S1>:19:5' */
 /* '<S1>:19:6' */
 sf_color = YELLOW;
 } else {
 /* '<S1>:19:8' */
 sf_color = RED;
 }
}

if (sf_color == YELLOW) {
 /* Transition: '<S1>:13' */
 /* Transition: '<S1>:14' */

```

```

 /* MATLAB Function 'slowdown': '<S1>:24' */
 /* '<S1>:24:6' */
 rtb_traffic_speed = 1;

 /* Transition: '<S1>:16' */
} else {
 /* Transition: '<S1>:17' */
 /* MATLAB Function 'accelerate': '<S1>:25' */
 /* '<S1>:25:6' */
 rtb_traffic_speed = 2;
}
}
}

```

Because the MATLAB function `light` appears inlined, inequality comparisons appear in these lines of code:

```

if (ifelse_using_enums_U.In1 < 20.0) {
....
} else if ((ifelse_using_enums_U.In1 >= 20.0) &&
 (ifelse_using_enums_U.In1 < 25.0)) {
....

```

Because inequalities appear in the body of the `if-elseif-else` code for the flow chart, the conversion to `switch-case` statements does not occur. Do one of the following:

- Specify that the function `light` does not appear inlined. See “Change the Inlining Property for the Function” on page 55-102.
- Modify the flow chart. See “Modify the Flow Chart to Ensure Switch-Case Statements” on page 55-103.

### Change the Inlining Property for the Function

If you do not want to modify your flow chart, change the inlining property for the function `light`:

- 1 Right-click the function box for `light` and select **Properties**.
- 2 In the properties dialog box, for **Function Inline Option**, select **Function**.
- 3 Click **OK** to close the dialog box.

---

**Note** You do not have to change the inlining property for the other three MATLAB functions in the chart. Because the flow chart does not call those functions during evaluation of conditions, the inlining property for those functions can remain **Auto**.

---

When you regenerate code for your model, the code for the flow chart now appears like this code:

```

switch (ifelse_using_enums_light(ifelse_using_enums_U.In1)) {
case RED:
 /* Transition: '<S1>:11' */
 /* Transition: '<S1>:12' */
 /* MATLAB Function 'stop': '<S1>:23' */
 /* '<S1>:23:6' */
 ifelse_using_enums_Y.Out1 = 0.0;

 /* Transition: '<S1>:15' */
 /* Transition: '<S1>:16' */

```

```

 break;

case YELLOW:
 /* Transition: '<S1>:10' */
 /* Transition: '<S1>:13' */
 /* Transition: '<S1>:14' */
 /* MATLAB Function 'slowdown': '<S1>:24' */
 /* '<S1>:24:6' */
 ifelse_using_enums_Y.Out1 = 1.0;

 /* Transition: '<S1>:16' */
 break;

default:
 /* Transition: '<S1>:17' */
 /* MATLAB Function 'accelerate': '<S1>:25' */
 /* '<S1>:25:6' */
 ifelse_using_enums_Y.Out1 = 2.0;
 break;
}

```

Because the MATLAB function `light` no longer appears inlined, the conversion to switch-case statements occurs. To enhance readability, the switch-case statements provide these benefits:

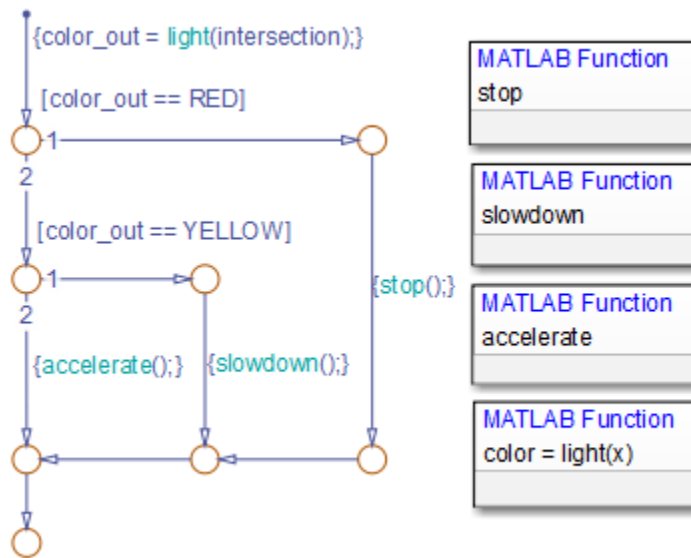

- The code reduces the use of parentheses and braces.
- The LHS expression `ifelse_using_enums_light(ifelse_using_enums_U.In1)` appears only once, minimizing repetition in the code.

### Modify the Flow Chart to Ensure Switch-Case Statements

If you do not want to change the inlining property for the function `light`, modify your flow chart:

- 1 Add chart local data `color_out` with the enumerated type `TrafficLights`.
- 2 Replace each instance of `light(intersection)` with `color_out`.
- 3 Add the action `{color_out = light(intersection)}` to the default transition of the flow chart.

The chart now looks similar to this chart:

When you regenerate code for your model, the code for the flow chart uses switch-case statements.

## Enhance Code Readability for MATLAB Function Blocks

### In this section...

“Requirements for Using Readability Optimizations” on page 55-105

“Converting If-Elseif-Else Code to Switch-Case Statements” on page 55-105

“Example of Converting Code for If-Elseif-Else Decision Logic to Switch-Case Statements” on page 55-107

### Requirements for Using Readability Optimizations

To use readability optimizations in your code, you must have an Embedded Coder license. These optimizations appear only in code that you generate for an embedded real-time (ert) target.

**Note** These optimizations do not apply to MATLAB files that you call from the MATLAB Function block.

For more information, see “Configure a System Target File” on page 50-2.

### Converting If-Elseif-Else Code to Switch-Case Statements

When you generate code for embedded real-time targets, you can choose to convert `if-elseif-else` decision logic to `switch-case` statements. This conversion can enhance readability of the code.

For example, when a MATLAB Function block contains a long list of conditions, the `switch-case` structure:

- Reduces the use of parentheses and braces
- Minimizes repetition in the generated code

#### How to Convert If-Elseif-Else Code to Switch-Case Statements

The following procedure describes how to convert generated code for the MATLAB Function block from `if-elseif-else` to `switch-case` statements.

Step	Task	Reference
1	Verify that your block follows the rules for conversion.	“Verifying the Contents of the Block” on page 55-108
2	Enable the conversion.	“Enabling the Conversion” on page 55-109
3	Generate code for your model.	“Generating Code for Your Model” on page 55-109

#### Rules for Conversion

For the conversion to occur, the following rules must hold. LHS and RHS refer to the left-hand side and right-hand side of a condition, respectively.

Construct	Rules to Follow
MATLAB Function block	Must have two or more <i>unique</i> conditions, in addition to a default. For more information, see “How the Conversion Handles Duplicate Conditions” on page 55-106.
Each condition	Must test equality only.
	Must use the same variable or expression for the LHS.
	<b>Note</b> You can reverse the LHS and RHS.
Each LHS	Must be a single variable or expression, not a compound statement.
	Cannot be a constant.
	Must have an integer or enumerated data type.
	Must not have side effects on simulation. For example, the LHS can read from but not write to global variables.
Each RHS	Must be a constant.
	Must have an integer or enumerated data type.

### How the Conversion Handles Duplicate Conditions

If a MATLAB Function block has duplicate conditions, the conversion preserves only the first condition. The generated code discards other instances of duplicate conditions.

After removal of duplicates, two or more unique conditions must exist. Otherwise, a conversion does not occur and the generated code contains instances of duplicate conditions.

The following examples show how the conversion handles duplicate conditions.

Example of Generated Code	Code After Conversion
<pre>if (x == 1) {     block1 } else if (x == 2) {     block2 } else if (x == 1) { // duplicate     block3 } else if (x == 3) {     block4 } else if (x == 1) { // duplicate     block5 } else {     block6 }</pre>	<pre>switch (x) {     case 1:         block1; break;     case 2:         block2; break;     case 3:         block4; break;     default:         block6; break; }</pre>
<pre>if (x == 1) {     block1 } else if (x == 1) { // duplicate     block2 } else {     block3 }</pre>	Does not change, because only one unique condition exists

## Example of Converting Code for If-Elseif-Else Decision Logic to Switch-Case Statements

Suppose that you have the following model with a MATLAB Function block. Assume that the output data type is double and the input data type is Controller, an enumerated type that you define.

The block contains the following code:

```
function system = fcn(type)
%#codegen

if (type == Controller.P)
 system = 0;
elseif (type == Controller.I)
 system = 1;
elseif (type == Controller.PD)
 system = 2;
elseif (type == Controller.PI)
 system = 3;
elseif (type == Controller.PID)
 system = 4;
else
 system = 10;
end
```

The enumerated type definition in Controller.m is:

```
classdef Controller < Simulink.IntEnumType
 enumeration
 P(0)
 I(1)
 PD(2)
 PI(3)
 PID(4)
 UNKNOWN(10)
 end
end
```

If you generate code for an embedded real-time target using default settings, you see something like this:

```
if (if_to_switch_eml_blocks_U.In1 == P) {
 /* '<S1>:1:4' */
 /* '<S1>:1:5' */
 if_to_switch_eml_blocks_Y.Out1 = 0.0;
} else if (if_to_switch_eml_blocks_U.In1 == I) {
 /* '<S1>:1:6' */
 /* '<S1>:1:7' */
```

```

 if_to_switch_eml_blocks_Y.Out1 = 1.0;
} else if (if_to_switch_eml_blocks_U.In1 == PD) {
 /* '<S1>:1:8' */
 /* '<S1>:1:9' */
 if_to_switch_eml_blocks_Y.Out1 = 2.0;
} else if (if_to_switch_eml_blocks_U.In1 == PI) {
 /* '<S1>:1:10' */
 /* '<S1>:1:11' */
 if_to_switch_eml_blocks_Y.Out1 = 3.0;
} else if (if_to_switch_eml_blocks_U.In1 == PID) {
 /* '<S1>:1:12' */
 /* '<S1>:1:13' */
 if_to_switch_eml_blocks_Y.Out1 = 4.0;
} else {
 /* '<S1>:1:15' */
 if_to_switch_eml_blocks_Y.Out1 = 10.0;
}

```

The LHS variable `if_to_switch_eml_blocks_U.In1` appears multiple times in the generated code.

---

**Note** By default, variables that appear in the block do not retain their names in the generated code. Modified identifiers prevent naming conflicts.

---

Traceability comments appear between each set of `/*` and `*/` markers. To learn more about traceability, see “Use Traceability in MATLAB Function Blocks” on page 85-35.

### Verifying the Contents of the Block

Check that the block follows the rules in “Rules for Conversion” on page 55-105.

Construct	How the Construct Follows the Rules
MATLAB Function block	Five unique conditions exist, in addition to the default: <ul style="list-style-type: none"> <li>• (type == Controller.P)</li> <li>• (type == Controller.I)</li> <li>• (type == Controller.PD)</li> <li>• (type == Controller.PI)</li> <li>• (type == Controller.PID)</li> </ul>
Each condition	Each condition: <ul style="list-style-type: none"> <li>• Tests equality</li> <li>• Uses the same input for the LHS</li> </ul>

Construct	How the Construct Follows the Rules
Each LHS	Each LHS: <ul style="list-style-type: none"> <li>• Contains a single variable</li> <li>• Is the input to the block and therefore not a constant</li> <li>• Is of enumerated type <code>Controller</code>, which you define in <code>Controller.m</code> on the MATLAB path</li> <li>• Does not impact simulation</li> </ul>
Each RHS	Each RHS: <ul style="list-style-type: none"> <li>• Is an enumerated value and therefore a constant</li> <li>• Is of enumerated type <code>Controller</code></li> </ul>

### Enabling the Conversion

- 1 Open the Configuration Parameters dialog box.
- 2 In the **Code Generation** pane, select `ert.tlc` for the **System target file**.

This step specifies an embedded real-time target for your model.

- 3 In the **Code Generation > Code Style** pane, select the **Convert if-elseif-else patterns to switch-case statements** check box.

---

**Tip** This conversion works on a per-model basis. If you select this check box, the conversion applies to:

- MATLAB Function blocks in a model
- MATLAB functions in Stateflow charts of that model
- Flow charts in Stateflow charts of that model

For more information, see “Enhance Readability of Code for Flow Charts” on page 55-95.

---

### Generating Code for Your Model

In the model window, press **Ctrl+B**.

The code for the MATLAB Function block uses switch-case statements instead of if-elseif-else code:

```
switch (if_to_switch_eml_blocks_U.In1) {
case P:
 /* '<S1>:1:4' */
 /* '<S1>:1:5' */
 if_to_switch_eml_blocks_Y.Out1 = 0.0;
 break;

case I:
 /* '<S1>:1:6' */
 /* '<S1>:1:7' */
 if_to_switch_eml_blocks_Y.Out1 = 1.0;
 break;
}
```

```
case PD:
 /* '<S1>:1:8' */
 /* '<S1>:1:9' */
 if_to_switch_eml_blocks_Y.Out1 = 2.0;
 break;

case PI:
 /* '<S1>:1:10' */
 /* '<S1>:1:11' */
 if_to_switch_eml_blocks_Y.Out1 = 3.0;
 break;

case PID:
 /* '<S1>:1:12' */
 /* '<S1>:1:13' */
 if_to_switch_eml_blocks_Y.Out1 = 4.0;
 break;

default:
 /* '<S1>:1:15' */
 if_to_switch_eml_blocks_Y.Out1 = 10.0;
 break;
}
```

The switch-case statements provide the following benefits to enhance readability:

- The code reduces the use of parentheses and braces.
- The LHS variable `if_to_switch_eml_blocks_U.In1` appears only once, minimizing repetition in the code.

- “Model Configuration Parameters: Code Style”

## Improve Data Coherency in Generated Code

For models containing read and write operations for Data Store Memory blocks, you can generate code that contains a single variable to hold the value for each Data Store Read and Write operation. Generating one variable for each operation improves data access coherency.

### Example Model

The `data_store_latching` model contains a single Data Store Memory block that is accessed by two different Data Store Memory Read and two Data Store Memory Write blocks. Two Sum blocks perform addition on the input generated by the Data Store Read blocks and output the data to the Data Store Write blocks.

### Generate Code Without Parameter Enabled

Building the model with the **Implement each data store block as a unique access point** parameter turned off by default, generates this code:

```
void data_store_latching_step(void)
{
 /* DataStoreWrite: '<Root>/Data Store Write' incorporates:
 * DataStoreRead: '<Root>/Data Store Read'
 * Sum: '<Root>/Add'
 */
 data_store_latching_DW.A += data_store_latching_DW.A +
 data_store_latching_DW.A;

 /* DataStoreWrite: '<Root>/Data Store Write1' incorporates:
 * DataStoreRead: '<Root>/Data Store Read1'
 * Sum: '<Root>/Add1'
 */
}
```

```

 */
 data_store_latching_DW.A += data_store_latching_DW.A +
 data_store_latching_DW.A;
}

```

For both data read and write operations, the code contains the global variable `data_store_latching_DW.A`.

## Generate Code With Parameter Enabled

In the Configuration Parameters dialog box, on the **Interface** pane, select the **Implement each data store block as a unique access point** parameter. Click **Apply**.

The generated code is now:

```

void data_store_latching_step(void)
{
 real_T rtb_DataStoreRead;
 real_T rtb_DataStoreRead1;

 /* DataStoreRead: '<Root>/Data Store Read' */
 rtb_DataStoreRead = data_store_latching_DW.A;

 /* DataStoreWrite: '<Root>/Data Store Write' incorporates:
 * Sum: '<Root>/Add'
 */
 data_store_latching_DW.A = (rtb_DataStoreRead + rtb_DataStoreRead) +
 rtb_DataStoreRead;

 /* DataStoreRead: '<Root>/Data Store Read1' */
 rtb_DataStoreRead1 = data_store_latching_DW.A;

 /* DataStoreWrite: '<Root>/Data Store Write1' incorporates:
 * Sum: '<Root>/Add1'
 */
 data_store_latching_DW.A = (rtb_DataStoreRead1 + rtb_DataStoreRead1) +
 rtb_DataStoreRead1;
}

```

For each data store read operation, the code contains a variable. The variables are `rtb_DataStoreRead` and `rtb_DataStoreRead1`. These separate variables improve data access coherency.

## What Is Code Replacement?

Code replacement is a technique to change the code that the code generator produces for functions and operators to meet application code requirements. For example, you can replace generated code to meet requirements such as:

- Optimization for a specific run-time environment, including, but not limited to, specific target hardware.
- Integration with existing application code.
- Compliance with a standard, such as AUTOSAR.
- Modification of code behavior, such as enabling or disabling nonfinite or inline support.
- Application- or project-specific code requirements, such as:
  - Elimination of `math.h`.
  - Elimination of system header files.
  - Elimination of calls to `memcpy` or `memset`.
  - Use of BLAS.
  - Use of a specific BLAS.

To apply this technique, configure the code generator to apply a code replacement library (CRL) during code generation. By default, the code generator does not apply a code replacement library. You can choose from libraries that MathWorks provides and that you create and register by using the Embedded Coder product. The list of available libraries depends on:

- Installed support packages.
- System target file, language, language standard, and device vendor configuration.
- Whether you have created and registered libraries, using the Embedded Coder product.

Libraries that include GNU99 extensions are intended for use with the GCC compiler. If you use one of those libraries with another compiler, generated code might not compile.

### Code Replacement Libraries

A code replacement library consists of one or more code replacement tables that specify application-specific implementations of functions and operators. For example, a library for a specific embedded processor specifies function and operator replacements that optimize generated code for that processor.

A code replacement table contains one or more code replacement entries, with each entry representing a potential replacement for a function or operator. Each entry maps a conceptual representation of a function or operator to an implementation representation and priority.

Table Entry Component	Description
Conceptual representation	<p>Identifies the table entry and contains match criteria for the code generator. Consists of:</p> <ul style="list-style-type: none"> <li>• Function name or a key. The function name identifies most functions. For operators and some functions, a series of characters, called a key identifies a function or operator. For example, function name 'cos' and operator key 'RTW_OP_ADD'.</li> <li>• Conceptual arguments that observe code generator naming ('y1', 'u1', 'u2', ...), with corresponding I/O types (output or input) and data types.</li> <li>• Other attributes, such as an algorithm, fixed-point saturation, and rounding modes, which identify matching criteria for the function or operator.</li> </ul>
Implementation representation	<p>Specifies replacement code. Consists of:</p> <ul style="list-style-type: none"> <li>• Function name. For example, 'cos_dbl' or 'u8_add_u8_u8'.</li> <li>• Implementation arguments, with corresponding I/O types (output or input) and data types.</li> <li>• Parameters that provide additional implementation details, such as header and source file names and paths of build resources.</li> </ul>
Priority	<p>Defines the entry priority relative to other entries in the table. The value can range from 0 to 100, with 0 being the highest priority. If multiple entries have the same priority, the code generator uses the first match with that priority.</p>

When the code generator looks for a match in a code replacement library, it creates and populates a call site object with the function or operator conceptual representation. If a match exists, the code generator uses the matched code replacement entry populated with the implementation representation and uses it to generate code.

The code generator searches the tables in a code replacement library for a match in the order that the tables appear in the library. If the code generator finds multiple matches within a table, the priority determines the match. The code generator uses a higher-priority entry over a similar entry with a lower priority.

## Code Replacement Terminology

Term	Definition
Cache hit	A code replacement entry for a function or operator, defined in the specified code replacement library, for which the code generator finds a match.
Cache miss	A conceptual representation of a function or operator for which the code generator does not find a match.
Call site object	Conceptual representation of a function or operator that the code generator uses when it encounters a call site for a function or operator. The code generator uses the object to query the code replacement library for a conceptual representation match. If a match exists, the code generator returns a code replacement object, fully populated with the conceptual representation, implementation representation, and priority, and uses that object to generate replacement code.
Code replacement library	One or more code replacement tables that specify application-specific implementations of functions and operators. When configured to use a code replacement library, the code generator uses criteria defined in the library to search for matches. If a match is found, the code generator replaces code that it generates by default with application-specific code defined in the library.
Code replacement table	One or more code replacement table entries. Provides a way to group related or shared entries for use in different libraries.
Code replacement entry	Represents a potential replacement for a function or operator. Maps a conceptual representation of a function or operator to an implementation representation and priority.
Conceptual argument	Represents an input or output argument for a function or operator being replaced. Conceptual arguments observe naming conventions ('y1', 'u1', 'u2', ...) and data types familiar to the code generator.
Conceptual representation	Represents match criteria that the code generator uses to qualify functions and operators for replacement. Consists of: <ul style="list-style-type: none"> <li>• Function or operator name or key</li> <li>• Conceptual arguments with type, dimension, and complexity specification for inputs and output</li> <li>• Attributes, such as an algorithm and fixed-point saturation and rounding modes</li> </ul>
Implementation argument	Represents an input or output argument for a C or C++ replacement function. Implementation arguments observe C/C++ name and data type specifications.

Term	Definition
Implementation representation	<p>Specifies C or C++ replacement function prototype. Consists of:</p> <ul style="list-style-type: none"> <li>• Function name (for example, 'cos_dbl' or 'u8_add_u8')</li> <li>• Implementation arguments specifying type, type qualifiers, and complexity for the function inputs and output</li> <li>• Parameters that provide build information, such as header and source file names and paths of build resources and compile and link flags</li> </ul>
Key	<p>Identifies a function or operator that is being replaced. A function name or key appears in the conceptual representation of a code replacement entry. The key RTW_OP_ADD identifies the addition operator.</p>
Priority	<p>Defines the match priority for a code replacement entry relative to other entries, which have the same name and conceptual argument list, within a code replacement library. The priority can range from 0 to 100, with 0 being the highest priority. The default is 100. If a library provides two implementations for a function or operator, the implementation with the higher priority shadows the one with the lower priority.</p>

## Code Replacement Limitations

**Code replacement verification** — It is possible that code replacement behaves differently than you expect. For example, data types that you observe in code generator input might not match what the code generator uses as intermediate data types during an operation. Verify code replacements by examining generated code.

**Code replacement for matrices** — Code replacement libraries do not support Dynamic and Symbolic sized matrices.

## Configure a Code Replacement Library

### In this section...

“About Choosing a Code Replacement Library” on page 56-6

“Explore Available Code Replacement Libraries” on page 56-6

“Explore Code Replacement Library Contents” on page 56-6

### About Choosing a Code Replacement Library

By default, the code generator does not use a code replacement library.

If you are considering using a code replacement library:

- 1 Explore available libraries. Identify one that best meets your application needs.
  - Consider the lists of application code replacement requirements and libraries that MathWorks provides in “What Is Code Replacement?” on page 57-2.
  - See “Explore Available Code Replacement Libraries” on page 56-6.
- 2 Explore the contents of the library. See “Explore Code Replacement Library Contents” on page 56-6.

If you do not find a suitable library and you have an Embedded Coder license, you can create a custom code replacement library.

### Explore Available Code Replacement Libraries

Select the “Code replacement library” to use for code generation from the **Configuration Parameters > Code Generation > Interface** pane. To view a description of a library, select and hover your cursor over the library name. A tooltip describes the library and lists the tables that it contains. The tooltip lists the tables in the order that the code generator searches for a function or operator match.

### Explore Code Replacement Library Contents

Use the **Code Replacement Viewer** to explore the content of a code replacement library.

- 1 At the command prompt, type `crviewer`.

```
>> crviewer
```

The viewer opens. To view the content of a specific library, specify the name of the library as an argument in single quotes. For example:

```
>> crviewer('GNU C99 extensions')
```

- 2 In the left pane, select the name of a library. The viewer displays information about the library in the right pane.
- 3 In the left pane, expand the library, explore the list of tables it contains, and select a table from the list. In the middle pane, the viewer displays the function and operator entries that are in that table, along with abbreviated information for each entry.

- 4 In the middle pane, select a function or operator. The viewer displays information from the table entry in the right pane.

If you select an operator entry that specifies net slope fixed-point parameters (instantiated from entry class `RTW.TfLCOperationEntryGenerator` or `RTW.TfLCOperationEntryGenerator_NetSlope`), the viewer displays an additional tab that shows fixed-point settings.

See **Code Replacement Viewer** for details on what the viewer displays.

## Replace Code Generated from Simulink Models

This example shows how to replace generated code, using a code replacement library. Code replacement is a technique you can use to change the code that the code generator produces for functions and operators to meet application code requirements. For example, you can replace generated code to meet requirements such as:

- Optimization for a specific run-time environment, including, but not limited to, specific target hardware.
- Integration with existing application code.
- Compliance with a standard, such as AUTOSAR.
- Modification of code behavior, such as enabling or disabling nonfinite or inline support.
- Application- or project-specific code requirements, such as elimination of `math.h`, system header files, or calls to `memcpy` or `memset`, or use of BLAS.

### Prepare for Code Replacement

1. Make sure that MATLAB®, Simulink®, Simulink Coder™, and a C compiler are installed on your system. Some code replacement libraries available in your development environment can require Embedded Coder®.

To install MathWorks® products, see the MATLAB installation documentation. If you have installed MATLAB and want to see which other MathWorks products are installed, in the Command Window, enter `ver`.

2. Identify an existing Simulink model or create a model for which you want the code generator to replace code.

### Choose a Code Replacement Library

By default, the code generator does not apply a code replacement library. You can choose from libraries that MathWorks® provides and that you create and register by using the Embedded Coder® product. The list of available libraries depends on:

- Installed support packages.
- System target file, language, standard math library, and device vendor configuration.
- Whether you have created and registered libraries, using the Embedded Coder® product.

Libraries that include GNU99 extensions are intended for use with the GCC compiler. If you use one of those libraries with another compiler, generated code might not compile.

Depending on the product licenses that you have, other libraries might be available. If you have an Embedded Coder license, you can view and choose from other libraries and you can create custom code replacement libraries.

### Configure Code Generator to Use Code Replacement Library

1. Configure the code generator to apply a code replacement library during code generation for the model. Do one of the following:

- In the Configuration Parameters dialog box, on the **Code Generation > Interface** pane, select a library for the “Code replacement library” parameter.

- Set the `CodeReplacementLibrary` parameter at the command line or programmatically.
2. Configure the code generator to produce code only (not build an executable program) so you can verify your code replacements before building an executable program. Do one of the following:
    - In the Configuration Parameters dialog box, on the **Code Generation** pane, select Generate code only.
    - Set the `GenCodeOnly` parameter at the command line or programmatically.

### **Include Code Replacement Information in Code Generation Report**

If you have an Embedded Coder license, you can configure the code generator to include a code replacement section in the code generation report. The additional information can help you verify code replacements.

1. Configure the code generator to generate a report. In the Configuration Parameters dialog box, on the **Code Generation > Report** pane, select Create code generation report. Consider having the report open automatically. Select Open report automatically.
2. Include the code replacement section in the report. Select Summarize which blocks triggered code replacements.

### **Generate Replacement Code**

Generate C/C++ code from the model and, if you configured the code generator accordingly, a code generation report. For example, in the model window, press **Ctrl+B**.

The code generator produces the code and displays the report.

### **Verify Code Replacements**

Verify code replacements by examining the generated code. It is possible that code replacement behaves differently than you expect. For example, data types that you observe in the code generator input might not match what the code generator uses as intermediate data types during an operation.

## What Is Code Replacement?

Code replacement is a technique to change the code that the code generator produces for functions and operators to meet application code requirements. For example, you can replace generated code to meet requirements such as:

- Optimization for a specific run-time environment, including, but not limited to, specific target hardware.
- Integration with existing application code.
- Compliance with a standard, such as AUTOSAR.
- Modification of code behavior, such as enabling or disabling nonfinite or inline support.
- Application- or project-specific code requirements, such as:
  - Elimination of `math.h`.
  - Elimination of system header files.
  - Elimination of calls to `memcpy` or `memset`.
  - Use of BLAS.
  - Use of a specific BLAS.

To apply this technique, configure the code generator to apply a code replacement library (CRL) during code generation. By default, the code generator does not apply a code replacement library. You can choose from libraries that MathWorks provides and that you create and register by using the Embedded Coder product. The list of available libraries depends on:

- Installed support packages.
- System target file, language, language standard, and device vendor configuration.
- Whether you have created and registered libraries, using the Embedded Coder product.

Libraries that include GNU99 extensions are intended for use with the GCC compiler. If you use one of those libraries with another compiler, generated code might not compile.

### Code Replacement Libraries

A code replacement library consists of one or more code replacement tables that specify application-specific implementations of functions and operators. For example, a library for a specific embedded processor specifies function and operator replacements that optimize generated code for that processor.

A code replacement table contains one or more code replacement entries, with each entry representing a potential replacement for a function or operator. Each entry maps a conceptual representation of a function or operator to an implementation representation and priority.

Table Entry Component	Description
Conceptual representation	<p>Identifies the table entry and contains match criteria for the code generator. Consists of:</p> <ul style="list-style-type: none"> <li>Function name or a key. The function name identifies most functions. For operators and some functions, a series of characters, called a key identifies a function or operator. For example, function name 'cos' and operator key 'RTW_OP_ADD'.</li> <li>Conceptual arguments that observe code generator naming ('y1', 'u1', 'u2', ...), with corresponding I/O types (output or input) and data types.</li> <li>Other attributes, such as an algorithm, fixed-point saturation, and rounding modes, which identify matching criteria for the function or operator.</li> </ul>
Implementation representation	<p>Specifies replacement code. Consists of:</p> <ul style="list-style-type: none"> <li>Function name. For example, 'cos_dbl' or 'u8_add_u8_u8'.</li> <li>Implementation arguments, with corresponding I/O types (output or input) and data types.</li> <li>Parameters that provide additional implementation details, such as header and source file names and paths of build resources.</li> </ul>
Priority	<p>Defines the entry priority relative to other entries in the table. The value can range from 0 to 100, with 0 being the highest priority. If multiple entries have the same priority, the code generator uses the first match with that priority.</p>

When the code generator looks for a match in a code replacement library, it creates and populates a call site object with the function or operator conceptual representation. If a match exists, the code generator uses the matched code replacement entry populated with the implementation representation and uses it to generate code.

The code generator searches the tables in a code replacement library for a match in the order that the tables appear in the library. If the code generator finds multiple matches within a table, the priority determines the match. The code generator uses a higher-priority entry over a similar entry with a lower priority.

## Code Replacement Terminology

Term	Definition
Cache hit	A code replacement entry for a function or operator, defined in the specified code replacement library, for which the code generator finds a match.
Cache miss	A conceptual representation of a function or operator for which the code generator does not find a match.
Call site object	Conceptual representation of a function or operator that the code generator uses when it encounters a call site for a function or operator. The code generator uses the object to query the code replacement library for a conceptual representation match. If a match exists, the code generator returns a code replacement object, fully populated with the conceptual representation, implementation representation, and priority, and uses that object to generate replacement code.
Code replacement library	One or more code replacement tables that specify application-specific implementations of functions and operators. When configured to use a code replacement library, the code generator uses criteria defined in the library to search for matches. If a match is found, the code generator replaces code that it generates by default with application-specific code defined in the library.
Code replacement table	One or more code replacement table entries. Provides a way to group related or shared entries for use in different libraries.
Code replacement entry	Represents a potential replacement for a function or operator. Maps a conceptual representation of a function or operator to an implementation representation and priority.
Conceptual argument	Represents an input or output argument for a function or operator being replaced. Conceptual arguments observe naming conventions ('y1', 'u1', 'u2', ...) and data types familiar to the code generator.
Conceptual representation	Represents match criteria that the code generator uses to qualify functions and operators for replacement. Consists of: <ul style="list-style-type: none"> <li>• Function or operator name or key</li> <li>• Conceptual arguments with type, dimension, and complexity specification for inputs and output</li> <li>• Attributes, such as an algorithm and fixed-point saturation and rounding modes</li> </ul>
Implementation argument	Represents an input or output argument for a C or C++ replacement function. Implementation arguments observe C/C++ name and data type specifications.

Term	Definition
Implementation representation	Specifies C or C++ replacement function prototype. Consists of: <ul style="list-style-type: none"> <li>• Function name (for example, 'cos_dbl' or 'u8_add_u8')</li> <li>• Implementation arguments specifying type, type qualifiers, and complexity for the function inputs and output</li> <li>• Parameters that provide build information, such as header and source file names and paths of build resources and compile and link flags</li> </ul>
Key	Identifies a function or operator that is being replaced. A function name or key appears in the conceptual representation of a code replacement entry. The key RTW_OP_ADD identifies the addition operator.
Priority	Defines the match priority for a code replacement entry relative to other entries, which have the same name and conceptual argument list, within a code replacement library. The priority can range from 0 to 100, with 0 being the highest priority. The default is 100. If a library provides two implementations for a function or operator, the implementation with the higher priority shadows the one with the lower priority.

## Code Replacement Limitations

Code replacement verification — It is possible that code replacement behaves differently than you expect. For example, data types that you observe in code generator input might not match what the code generator uses as intermediate data types during an operation. Verify code replacements by examining generated code.

Code replacement for matrices — Code replacement libraries do not support Dynamic and Symbolic sized matrices.

“Explore Available Code Replacement Libraries” on page 57-6

“Explore Code Replacement Library Contents” on page 57-6

### About Choosing a Code Replacement Library

By default, the code generator does not use a code replacement library.

If you are considering using a code replacement library:

- 1 Explore available libraries. Identify one that best meets your application needs.
  - Consider the lists of application code replacement requirements and libraries that MathWorks provides in “What Is Code Replacement?” on page 57-2.
  - See “Explore Available Code Replacement Libraries” on page 57-6.
- 2 Explore the contents of the library. See “Explore Code Replacement Library Contents” on page 57-6.

If you do not find a suitable library and you have an Embedded Coder license, you can create a custom code replacement library.

### Explore Available Code Replacement Libraries

Select the “Code replacement library” to use for code generation from the **Configuration Parameters > Code Generation > Interface** pane. To view a description of a library, select and hover your cursor over the library name. A tooltip describes the library and lists the tables that it contains. The tooltip lists the tables in the order that the code generator searches for a function or operator match.

### Explore Code Replacement Library Contents

Use the **Code Replacement Viewer** to explore the content of a code replacement library.

- 1 At the command prompt, type `crviewer`.
 

```
>> crviewer
```

The viewer opens. To view the content of a specific library, specify the name of the library as an argument in single quotes. For example:

```
>> crviewer('GNU C99 extensions')
```
- 2 In the left pane, select the name of a library. The viewer displays information about the library in the right pane.
- 3 In the left pane, expand the library, explore the list of tables it contains, and select a table from the list. In the middle pane, the viewer displays the function and operator entries that are in that table, along with abbreviated information for each entry.

- 4 In the middle pane, select a function or operator. The viewer displays information from the table entry in the right pane.

If you select an operator entry that specifies net slope fixed-point parameters (instantiated from entry class `RTW.TfLCOperationEntryGenerator` or `RTW.TfLCOperationEntryGenerator_NetSlope`), the viewer displays an additional tab that shows fixed-point settings.

See **Code Replacement Viewer** for details on what the viewer displays.

## Replace Code Generated from Simulink Models

This example shows how to replace generated code, using a code replacement library. Code replacement is a technique you can use to change the code that the code generator produces for functions and operators to meet application code requirements. For example, you can replace generated code to meet requirements such as:

- Optimization for a specific run-time environment, including, but not limited to, specific target hardware.
- Integration with existing application code.
- Compliance with a standard, such as AUTOSAR.
- Modification of code behavior, such as enabling or disabling nonfinite or inline support.
- Application- or project-specific code requirements, such as elimination of `math.h`, system header files, or calls to `memcpy` or `memset`, or use of BLAS.

### Prepare for Code Replacement

1. Make sure that MATLAB®, Simulink®, Simulink Coder™, and a C compiler are installed on your system. Some code replacement libraries available in your development environment can require Embedded Coder®.

To install MathWorks® products, see the MATLAB installation documentation. If you have installed MATLAB and want to see which other MathWorks products are installed, in the Command Window, enter `ver`.

2. Identify an existing Simulink model or create a model for which you want the code generator to replace code.

### Choose a Code Replacement Library

By default, the code generator does not apply a code replacement library. You can choose from libraries that MathWorks® provides and that you create and register by using the Embedded Coder® product. The list of available libraries depends on:

- Installed support packages.
- System target file, language, standard math library, and device vendor configuration.
- Whether you have created and registered libraries, using the Embedded Coder® product.

Libraries that include GNU99 extensions are intended for use with the GCC compiler. If you use one of those libraries with another compiler, generated code might not compile.

Depending on the product licenses that you have, other libraries might be available. If you have an Embedded Coder license, you can view and choose from other libraries and you can create custom code replacement libraries.

### Configure Code Generator to Use Code Replacement Library

1. Configure the code generator to apply a code replacement library during code generation for the model. Do one of the following:

- In the Configuration Parameters dialog box, on the **Code Generation > Interface** pane, select a library for the “Code replacement library” parameter.

- Set the `CodeReplacementLibrary` parameter at the command line or programmatically.
2. Configure the code generator to produce code only (not build an executable program) so you can verify your code replacements before building an executable program. Do one of the following:
    - In the Configuration Parameters dialog box, on the **Code Generation** pane, select Generate code only.
    - Set the `GenCodeOnly` parameter at the command line or programmatically.

### **Include Code Replacement Information in Code Generation Report**

If you have an Embedded Coder license, you can configure the code generator to include a code replacement section in the code generation report. The additional information can help you verify code replacements.

1. Configure the code generator to generate a report. In the Configuration Parameters dialog box, on the **Code Generation > Report** pane, select Create code generation report. Consider having the report open automatically. Select Open report automatically.
2. Include the code replacement section in the report. Select Summarize which blocks triggered code replacements.

### **Generate Replacement Code**

Generate C/C++ code from the model and, if you configured the code generator accordingly, a code generation report. For example, in the model window, press **Ctrl+B**.

The code generator produces the code and displays the report.

### **Verify Code Replacements**

Verify code replacements by examining the generated code. It is possible that code replacement behaves differently than you expect. For example, data types that you observe in the code generator input might not match what the code generator uses as intermediate data types during an operation.

# External Code Integration in Simulink Coder

---

The code generator includes multiple approaches for integrating legacy or custom code with generated code. Legacy code is existing handwritten code or code for environments that you integrate with code produced by the code generator. Custom code is legacy code or other user-specified lines of code that you include in the code generator build process. Collectively, legacy and custom code are called external code.

You integrate external code by importing existing external code into code produced by the code generator, exporting generated code into an existing external code base, or you can do both. For example, you can import code by calling an external function, by using the Legacy Code Tool, or place external code at specific locations in generated code by including Custom Code blocks in a model. When you import external code, the resulting generated code interfaces with generated scheduling code.

You can export generated code as a plug-in function for use in an external development environment. When you export generated code, you intend to interface that code manually with a scheduling mechanism in your application run-time environment.

For guidance on choosing an approach based on your application, see “Choose an External Code Integration Workflow” .

- “Choose an External Code Integration Workflow” on page 58-2

## Choose an External Code Integration Workflow

### In this section...

“Choose a Software Execution Framework for Scheduling Code Execution” on page 58-3

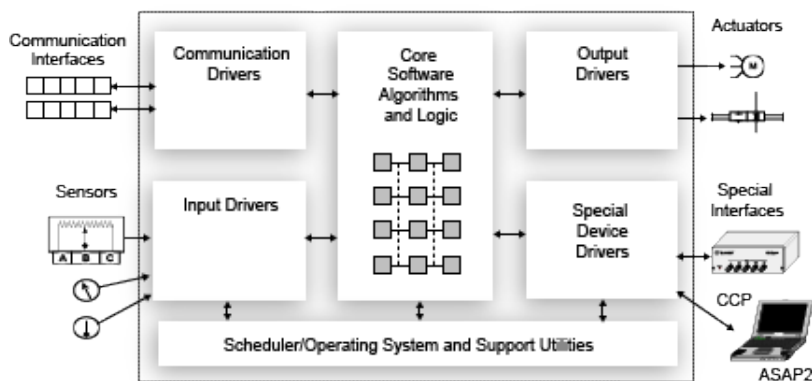

“Evaluate Characteristics of External Code” on page 58-4

“Identify Integration Requirements” on page 58-6

“Choose a Workflow” on page 58-7

Software projects typically involve combining code from multiple sources. A typical system structure for a code generation application consists of a framework that combines code from multiple sources, including external code and code generated from Simulink models.

This figure shows an application that requires integration of existing driver code for hardware devices. The core software algorithms and logic can be a combination of code modules for external reusable algorithms integrated into the Simulink environment and code generated as part of an overall model design.

Completing these tasks helps you choose external code integration workflows and tooling that align with your project.

Task	Action	More Information
1	Partition your application, map algorithms to components, and identify integration points.	“Software Deployment Objectives and Deployment Types” on page 1-2, “Divide Software Problem” on page 2-2, and “Map Embedded System Architecture to Simulink Modeling Environment” on page 2-3
2	Determine whether you can rely on scheduling code that the code generator produces, or whether you must integrate generated code with scheduling mechanisms that are specific to your run-time environment.	“Choose a Software Execution Framework for Scheduling Code Execution” on page 58-3
3	Evaluate the characteristics of the external code that you are importing.	“Evaluate Characteristics of External Code” on page 58-4

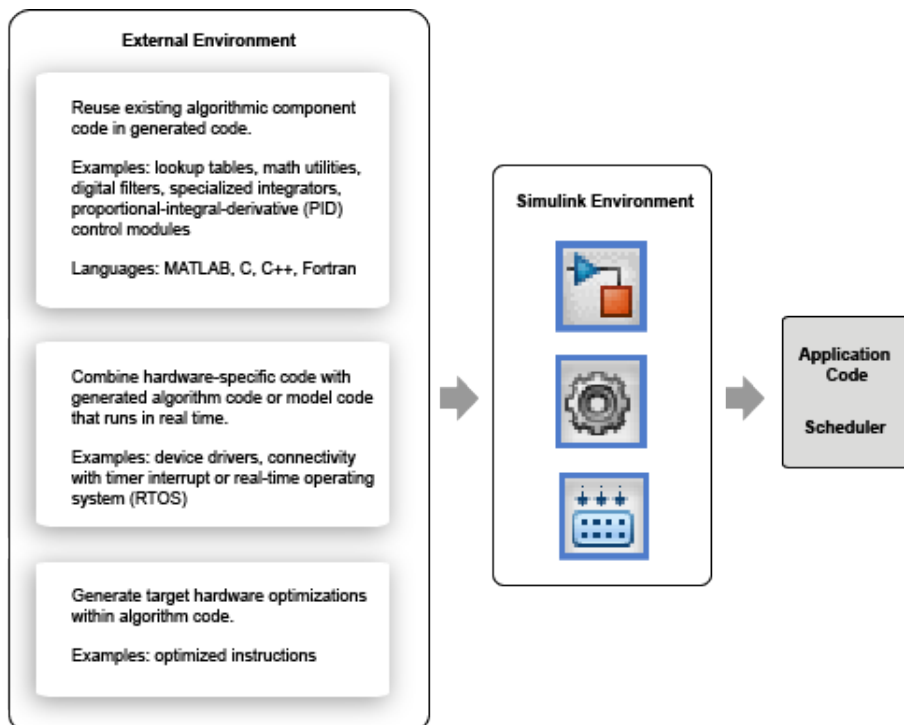

Task	Action	More Information
4	Identify integration requirements, which assists with choosing optimal tooling for your integration.	“Identify Integration Requirements” on page 58-6
5	Based on the results of tasks 1-4, choose a workflow.	“Choose a Workflow” on page 58-7

## Choose a Software Execution Framework for Scheduling Code Execution

The code generator supports two types of software execution frameworks—single top model and multiple top-level. The first question to answer concerns which of the two frameworks meets the scheduling and other needs of your project. For example, you can import external code into a single, rate-based top model. You can export code from a single top model or multiple top-level models for integration with custom (external) scheduling mechanisms.

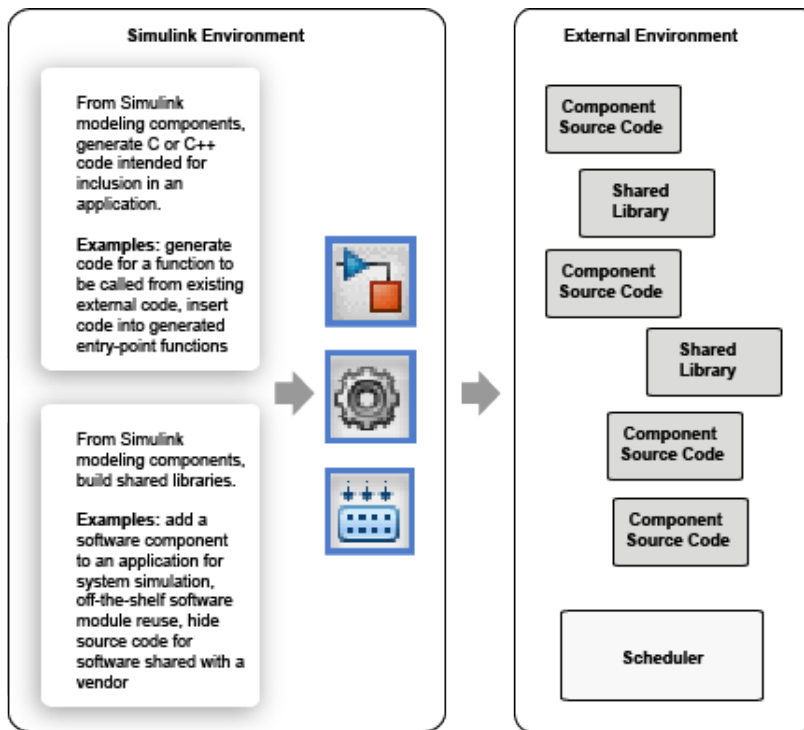

- Single top model

Generate one set of application code files from external code and code that the Simulink C/C++ code generator produces. The generated code includes a scheduler. In this case, you *import* code into the Simulink code generation environment.

- Single top model or multiple top-level models

Integrate C or C++ code that the code generator produces from model components with external application code and an external scheduler. You *export* generated code from the Simulink code generation environment.

Importing calls to external device driver code into a model and generating code for that model for export involves importing and exporting code.

Based on goals and requirements, external code integration is characterized in several ways, requiring different workflows and integration tooling:

- Import existing external code into generated code.
  - Call reusable external algorithm code for simulation and code generation.
  - Place external C/C++ code in generated code.
  - Call external device drivers.
  - Apply function and operator code replacements.
  - Interface with external timer interrupt or scheduler.
  - Generate replacement code for specific run-time environment.
- Export generated code for inclusion in external code base. Requires Embedded Coder .
  - Generate component source code for export.
  - Generate shared library for export.

For more information on exporting generated code, see “Callable Function Integration”.

Next, see “Evaluate Characteristics of External Code” on page 58-4.

## Evaluate Characteristics of External Code

Before choosing an external integration workflow, evaluate these characteristics of the external code. To interface with external code, generated C or C++ code handles one or more of the external code

characteristics. An understanding of these characteristics and your requirements for modeling, simulation, and code generation helps you choose the optimal workflow for your integration scenario. (See “Identify Integration Requirements” on page 58-6.)

Characteristic	What to Consider
Hardware dependency	<p>Is the external code hardware-dependent? Utility functions, lookup tables, and filters are examples of hardware-independent code.</p> <p>Device drivers interact directly with hardware. They depend on characteristics of the hardware. For example, a device driver for an analog-to-digital converter initializes, reads data from, and writes data to hardware registers. Hardware differences and dependencies concern data type size, endianness, shift operations, compiler directives, and optimized function and operator support. Other code interfaces with device drivers by using an API and data mapped to specific memory addresses. Typically, simulation on a development computer is not possible. Reading from and writing to a register during simulation on a development computer produces unexpected and unwanted results.</p>
Reusable	<p>Is the external code a reusable software module? Examples include utility functions, lookup tables, filters, specialized integrators, and proportional-integral-derivative (PID) control modules.</p>
Dependency on data persistence between function calls	<p>Does the external code require persistent data? For example, a call to a first order filter function uses the output of the previous call to the function to calculate a new output value. You have the option of defining the data as global or using shared memory outside the context of the function.</p>
Data typing and interface	<p>How complex is the data that the external code uses? What does the data interface look like? It consists of arguments, a return value, global variables, and access functions. What data types does the code use? Are the types limited to basic ANSI C integers, floating-point types, arrays of integers or floating-point types, and pointers to these types? Does the interface include structures or pointers to structures?</p>
Fixed-point code	<p>Is the external code designed to run on integer-only processors? If yes, the code exchanges and uses data represented as integers only. Data can be associated with fixed-point scaling or offsets.</p>
External resource dependencies	<p>Does the external code use data, functions, or macros defined outside the scope of the code? For example, the function can use a standard ANSI function, a shared library, or predefined constants. In these cases, you must inform the compiler and linker of the paths and file names of the external resources.</p>
External solver required	<p>Are you using the external function for advanced development or rapid prototyping to describe a system with a continuous transfer function or a set of differential equations? If yes, the external code relies on an external solver.</p>

Next, see “Identify Integration Requirements” on page 58-6.

## Identify Integration Requirements

Before choosing an external integration workflow, review these integration requirements. An understanding of these requirements and the characteristics of your external code helps you choose the optimal workflow for your integration scenario. (See “Evaluate Characteristics of External Code” on page 58-4.)

Requirement	What to Consider
Effort	What level of effort is planned for the integration project—low, medium, or high?
Learning effort	What is the programming experience of assigned project resources? How much experience do assigned resources have with Simulink and MathWorks C/C++ code generation products?
Simulation and code generation behaviors	Do you want to take advantage of Model-Based Design? To take full advantage of Model-Based Design, convert code to modeling elements, which you can then use in the Simulink and Stateflow simulation environment. Then, simulate and generate code for the integrated component. Use software-in-the-loop (SIL) or processor-in-the-loop (PIL) testing to verify whether algorithm behavior is the same in both environments.
Data interface and typing	<ul style="list-style-type: none"> <li>• Does your model or generated code need to exchange data with the external function? If so, map inputs, outputs, and parameters to the external function interface. Typical function interfaces involve function arguments and return values, global variables, and access functions, such as <code>getRPM</code>.</li> <li>• Do you want to represent arrays, structures, or enumerated types? In the Simulink environment, you can represent these types as vectors, buses, and <code>IntEnum</code>, respectively.</li> <li>• Is fixed-point support required? If you use the Simulink fixed-point interface, you can scale and specify offsets.</li> <li>• Does the external code use company-specific data types? If yes and you have Embedded Coder software, create alias types to represent those external types. The code generator uses the alias types in the code that it produces. For example, once defined, you can specify an alias type in a function prototype, for a temporary variable, or for block output.</li> <li>• Does the code exchange data with shared memory? If yes, define and use memory sections.</li> </ul>
Direct function call	Do you want to call C external code directly from a model? You can choose from mechanisms, such as the C Function block, the C Caller block, Legacy Code Tool, Stateflow external code interface and chart action language, and the MATLAB Function block.
Insertion of external code into generated code	Do you want to control the placement of external code within generated code? Do you want to insert code into generated entry-point functions? You can place code within generated code by using model configuration parameters or custom code blocks.

Requirement	What to Consider
Code generation optimization support	Do you want to optimize the code that the code generator produces? If so, you can configure the model for the code generator to optimize the code it produces based on application objectives, such as execution, ROM, and RAM efficiency. You also have the option of using code replacement libraries.
Files required	Do you want to minimize the number of files that you maintain? Some external code integration tools require that you maintain separate files for defining simulation and code generation.

Next, see “Choose a Workflow” on page 58-7.

## Choose a Workflow

To choose a workflow for integrating external code into the Simulink environment, use the following table with links to more information.

Goal	Action	More Information
Call hardware-independent reusable external algorithmic code from generated code. For example: utility functions, lookup tables, and digital filters.	Choose an approach for integrating external code into the Simulink environment for code generation based on your programming language and other integration requirements.	“Call Reusable External Algorithm Code for Simulation and Code Generation” on page 58-15
Call hardware-dependent external reusable external algorithmic code from generated code. For example: device drivers.	Call external driver code from the Simulink environment.	“Call External Device Drivers” on page 58-31
Place external C/C++ code in generated code.	Augment functions with external code using model configuration parameters or custom code blocks.	“Place External C/C++ Code in Generated Code” on page 58-23
Change the code that the code generator produces for functions and operators to meet application code requirements.	Use code replacements to specify application-specific implementations of functions and operators.	“Apply Function and Operator Code Replacements” on page 58-32

## See Also

## Configure Target Hardware Characteristics

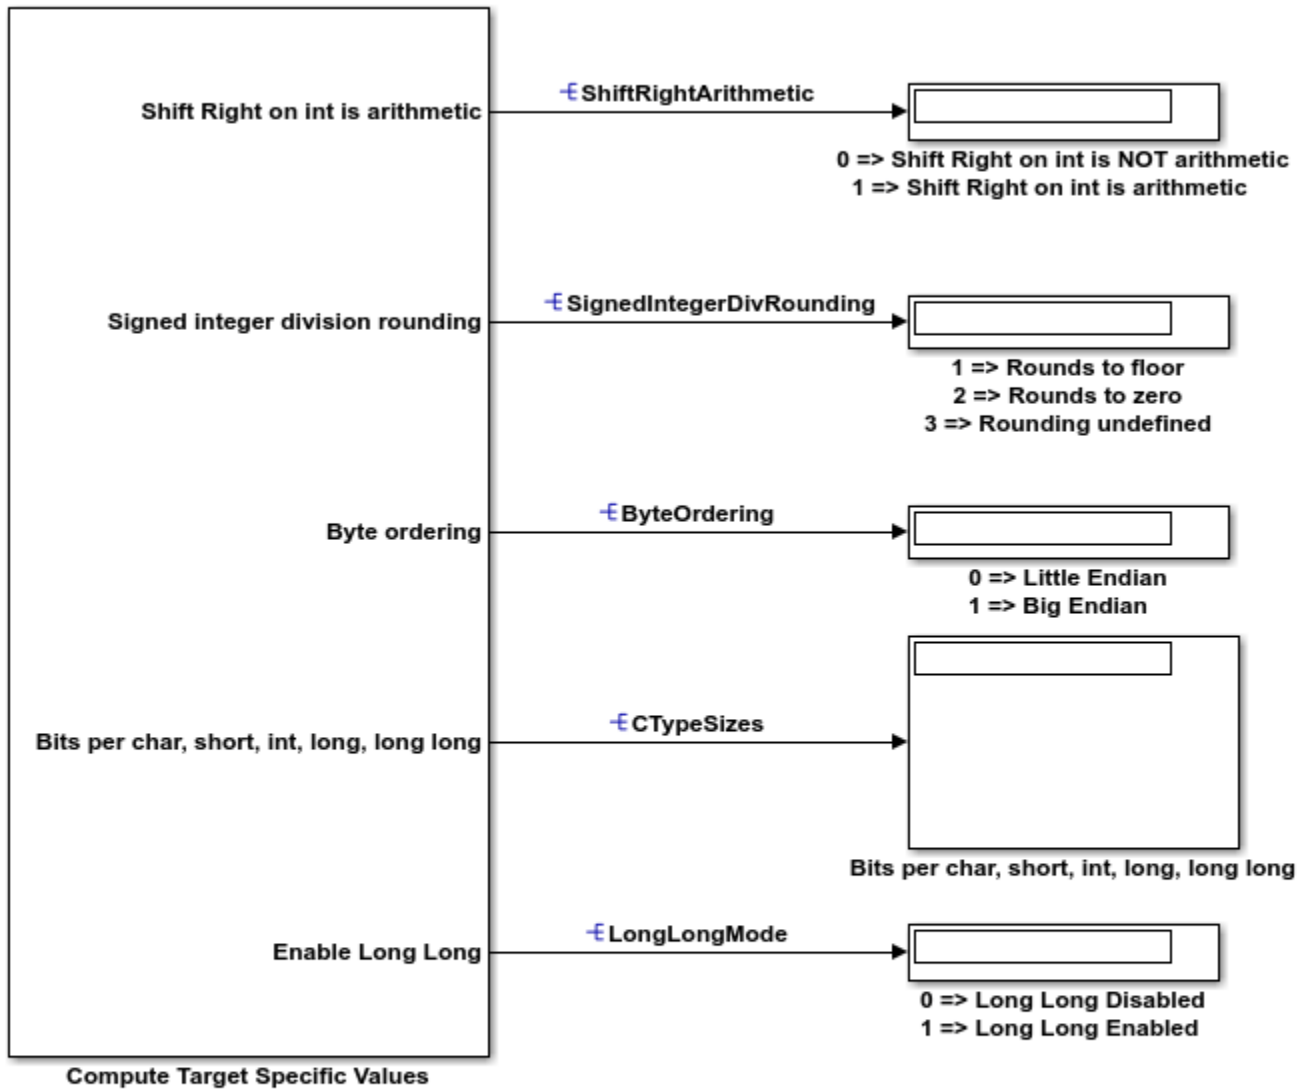

Simulink® allows you to configure the hardware implementation characteristics of your target system. Failure to do so can result in code that is incorrect or inefficient.

### **Open Example Model**

Open the example model `rtwdemo_targetsettings`.

```
open_system('rtwdemo_targetsettings');
```

?

View Hardware Configuration (double-click)

Generate Code Using Simulink Coder (double-click)

Generate Code Using Embedded Coder (double-click)

My microprocessor is not listed ...

Open the **Hardware Implementation** pane of the Configuration Parameters dialog box by double-clicking the yellow button in the model.

## Hardware Board Configuration

By default, the model is configured for the code generator to determine the hardware board configuration based on the specified system target file. The default system target file setting is `grt.tlc`.

If you have installed support for a hardware board, that board should appear in the **Hardware board** menu. If you select it, the dialog box displays parameters that are relevant to your hardware board.

### My Hardware Board Is Not Listed

If you are using a hardware board that is not listed, add it to the menu by installing the corresponding target support package. Start the Support Package Installer by setting **Hardware board** to `Get hardware Support Packages`, or by entering `supportPackageInstaller` in the MATLAB® Command Window.

After installing support for a hardware board, reopen the Configuration Parameters dialog box and select the hardware board.

### Cross-Development Systems That Include Source Level Debuggers

If you use a cross-development system that includes a source level debugger:

1. Configure the model for your hardware board.
2. Generate code and build an executable using your target development system. For details about retrieving file and path information, see the documentation on the Simulink Coder® Build Information API.
3. Download the executable to the target hardware and set breakpoints at the model output code for each output of the model.
4. Run a debugging session and observe the behavior of the code as it executes on the target hardware. As you step through the code, it computes the values for target hardware device characteristics.

If your target development system does not support source level debugging, generate code and add `printf` statements or other code that gets the results.

5. On the **Hardware Implementation** pane of the Configuration Parameters dialog box, set **Device vendor** to `Custom processor`, click the **Device details** arrow, and adjust the microprocessor device settings manually.

## Check Code Generation Assumptions

The code generator implements assumptions that depend, for example, on the hardware implementation settings for your model. It is important to check that the assumptions are valid for your target hardware. Use the `buildStandaloneCoderAssumptions` function to create an application that performs assumption checks on your target hardware.

When you configure your model, try to specify hardware implementation and build configuration settings that match your target hardware. Then, to check code generator assumptions for your target hardware, use this workflow:

- 1 With `GenerateReport` set to 'on', build (**Ctrl+B**) your model.
- 2 To view the list of code generator assumptions that you can check, open the code generation report and click the **Coder Assumptions** link.

For more information, see “Coder Assumptions List” on page 58-13.

- 3 Run `buildStandaloneCoderAssumptions`, which uses the generated code in the build folder to create an application that runs code generation assumption checks.
- 4 Download the application onto the target hardware or target environment, and then run the application.
- 5 While the application runs, use a debug tool to view check results that are in a data structure.

## Check Code Generator Assumptions for Development Computer

If the target hardware is, for example, your Windows development computer, you can use Microsoft Visual Studio® to run and debug the application:

- 1 To open a model, in the Command Window, enter:

```
openExample('ecoder/SILPILVerificationExample', ...
 supportingFile='SILTopModel.slx')
```

- 2 In the Model Configuration Parameters dialog box, in the **Hardware Implementation** pane, specify settings to match the target hardware. For example, for a 64-bit Windows computer specify these parameter settings:

- **Device vendor** -- Intel
- **Device type** -- x86-64 (Windows 64)

- 3 Clear model configuration parameter **Enable portable word sizes**.
- 4 Build the model (**Ctrl+B**).
- 5 To view the list of code generator assumptions, open the code generation report and click the **Coder Assumptions** link.
- 6 From the Command Window, in the working folder, run:

```
buildStandaloneCoderAssumptions('SILTopModel_ert_rtw')
```

In the build folder, the function creates the `coderassumptions\standalone` subfolder, which contains the target application, `SILTopModel_ca`.

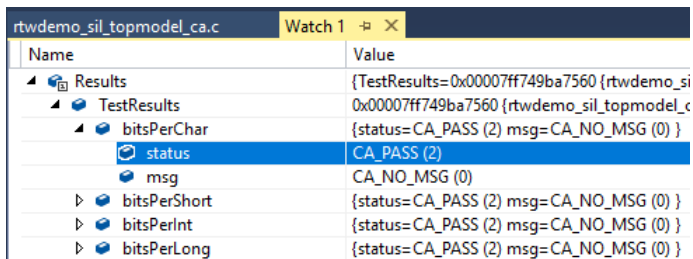

- 7 Open Microsoft Visual Studio and select **File > Open > Project/Solution**

- 8 Using the Open Project dialog box, navigate to the `coderrassumptions\standalone` subfolder and select `SILTopModel_ca`. Then, click **Open**.
- 9 Select **File > Open > File**. Using the Open File dialog box, select `coderrassumptions\standalone\SILTopModel_ca.c`
- 10 At the return statement, insert a break point.
- 11 Select **Debug > Start Debugging**.
- 12 To verify code generator assumptions, use a Watch window to inspect the Results data structure:
  - a In the `SILTopModel_ca.c` code, right-click `Results`.
  - b From the context menu, select **Add Watch**.

The variables in the data structure contain:

- Check outcomes (`TestResults`)
- Target hardware truths (`ActualValues`)
- Code generator assumptions (`ExpectedValues`)

For example, if the code generator assumption for `bitsPerChar` is accurate, you see the `CA_PASS` value in the `status` variable.

## Coder Assumptions List

The contents section of the code generation report has a link to the Coder Assumptions page. The page provides a list of:

- Code generation assumptions that you can check
- Expected results for the assumption checks

This table describes the labels that you see in the list.

Category	Label	Assumption You Can Check
C/C++ Language Configuration for Target Hardware or Development Computer	BitPerChar	Number of bits per char (ProdBitPerChar)
	BitPerShort	Number of bits per short (ProdBitPerShort)
	BitPerInt	Number of bits per int (ProdBitPerInt)

Category	Label	Assumption You Can Check
	BitPerLong	Number of bits per long (ProdBitPerLong)
	BitPerFloat	Size of float (Only if PurelyIntegerCode is 'off')
	BitPerDouble	Size of double (Only if PurelyIntegerCode is 'off')
	BitPerPointer	Number of bits per pointer (ProdBitPerPointer)
	BitPerSizeT	Number of bits per size_t (ProdBitPerSizeT)
	BitPerPtrDiffT	Number of bits per ptrdiff_t (ProdBitPerPtrDiffT)
	Endianess	Byte ordering (ProdEndianess)
	Shift right for signed integer is arithmetic shift	Sign bit behavior (ProdShiftRightIntArith)
	Signed integer division rounds to	Rounding behavior for integer division (ProdIntDivRoundTo)
C/C++ Language Standard	Initial value of a global integer variable and dynamically allocated memory is zero	Zero initialization of memory (ZeroExternalMemoryAtStartup, ZeroInternalMemoryAtStartup, and GenerateAllocFcn)
Floating-Point Numbers	Flush-to-zero computed subnormal values (FTZ)	Flush-to-zero subnormal number processing
	Flush-to-zero incoming subnormal values (DAZ)	Denormals-are-zero subnormal number processing

## Call Reusable External Algorithm Code for Simulation and Code Generation

Code reuse offers business and technological advantages. From a business perspective, code reuse saves time and resources. From a technological perspective, code reuse promotes consistency and reduces memory requirements. Other considerations include:

- Modularizing an application
- Reusing an optimized algorithm
- Interfacing with a predefined dataset
- Developing application variants

Examples of reusable hardware-independent algorithmic code to consider importing into the Simulink environment for simulation and code generation include:

- Utility functions
- Lookup tables
- Digital filters
- Specialized integrators
- Proportional-integral-derivative (PID) control modules

### Workflow

To call reusable external algorithm code for simulation and code generation, iterate through the tasks listed in this table.

Task	Action	More Information
1	Review your assessment of external code characteristics and integration requirements.	"Choose an External Code Integration Workflow" on page 58-2
2	Based on the programming language of the external code, choose an integration approach to add the external code to a Simulink model.	"Choose an Integration Approach" on page 58-16
3	Verify algorithm behavior and performance by simulating the model.	"Simulation"
4	Define the representation of model data for code generation.	"Code Interface Configuration" and "Exchange Data Between External C/C++ Code and Simulink Model or Generated Code" on page 58-61
5	Configure the model for code generation.	"Model Configuration Set Customization"
6	Generate code and a code generation report.	"Code Generation"
7	Review the generated code interface and static code metrics.	"Analyze Generated Data Code Interface" on page 54-13 and "Static Code Metrics" on page 54-26

Task	Action	More Information
8	Build an executable program from the model.	“Build Integrated Code Within the Simulink Environment” on page 58-33
9	Verify that executable program behaves as expected.	“Verification, Testing, and Certification”

## Choose an Integration Approach

Several approaches are available for integrating reusable algorithmic code into the Simulink environment for code generation. Some approaches integrate external code directly. Other approaches convert the external code to Simulink or Stateflow modeling elements for simulation, and later for code generation from the modeled design. The integration approach that you choose depends on:

- Programming language of the external code — MATLAB, C, C++, or Fortran
- Your programming language experience and preference
- Performance requirements
- Whether the algorithm must model continuous time dynamics or you are integrating the algorithm into an application that uses discrete and continuous time
- Whether you want to take advantage of Model-Based Design
- Level of control required over the code that the code generator produces

To choose an approach for a reusable algorithm, see the subsection that matches the programming language of your external algorithm code.

- “Integration Approaches for External MATLAB Code” on page 58-16
- “Integration Approaches for External C or C++ Code” on page 58-18
- “Integration Approaches for External Fortran Code” on page 58-21

### Integration Approaches for External MATLAB Code

Multiple approaches are available for integrating external MATLAB code into the Simulink environment. The following table helps you choose the best integration approach for your application based on integration requirements.

Condition or Requirement	Action	More Information
<ul style="list-style-type: none"> <li>• External code complies with the MATLAB code generation subset</li> <li>• You want to call MATLAB code from a Simulink model</li> </ul>	Add a MATLAB Function block to the model. Embed the MATLAB code in that block.	<ul style="list-style-type: none"> <li>• “Integrate C Code by Using the MATLAB Function Block”</li> <li>• MATLAB Function</li> </ul>

Condition or Requirement	Action	More Information
<ul style="list-style-type: none"> <li>External code complies with the MATLAB code generation subset</li> <li>You want to call MATLAB code from a Simulink model</li> <li>Your algorithm includes iterative computations that process large streams of data</li> </ul>	Add a MATLAB System block to the model. Embed the MATLAB code in that block as a System object™.	<ul style="list-style-type: none"> <li>“Integrate C Code by Using the MATLAB Function Block”</li> <li>MATLAB System</li> </ul>
<ul style="list-style-type: none"> <li>External code complies with the MATLAB code generation subset</li> <li>You want to call MATLAB code from a Simulink model</li> <li>Your algorithm includes design logic that is based on state machines and flow charts</li> </ul>	Add a Stateflow chart to the model. Call the external code from the chart, using MATLAB as the action language.	<ul style="list-style-type: none"> <li>“Chart Programming Basics” (Stateflow)</li> <li>“Insert External Code into Stateflow Charts” on page 58-21</li> </ul>
You want to use the <code>parfor</code> function for parallel computing or interface data types that are available to MATLAB Coder, Simulink Coder, and Embedded Coder. To use <code>parfor</code> , Parallel Computing Toolbox must be installed.	Use software to generate C code. Then, call that generated code as external C code.	<ul style="list-style-type: none"> <li>“Generate C Code by Using the MATLAB Coder App”</li> <li>“Get Started with MATLAB Coder”</li> </ul>
You have C or C++ programming experience and the external MATLAB code is compact and primarily uses C or C++ constructs.	Manually convert the MATLAB code to C or C++ code. Choose an integration approach for C or C++ code.	“Integration Approaches for External C or C++ Code” on page 58-18
Sections of the external MATLAB code map to built-in blocks.	Develop the algorithm in the context of a model, using the applicable built-in blocks.	<ul style="list-style-type: none"> <li>“Interactive Model Editing” and “Project Management”</li> <li>“Use Blocks and Products Supported for Code Generation”</li> </ul>
The algorithm must model continuous state dynamics.	Write a MATLAB S-function and, for generating code, a corresponding TLC file for the algorithm. Add the S-function to your model.	<ul style="list-style-type: none"> <li>“Create and Configure MATLAB S-Functions”</li> <li>“S-Functions”</li> <li>“Target Language Compiler”</li> </ul>

To embed external MATLAB code in a MATLAB Function block or generate C or C++ code from MATLAB code with the MATLAB Coder software, the MATLAB code must use functions and classes supported for C/C++ code generation.

- “Functions and Objects Supported for C/C++ Code Generation”

### Integration Approaches for External C or C++ Code

Multiple approaches are available for integrating external C or C++ code into the Simulink environment. The following table helps you choose the best integration approach for your application based on integration requirements.

Condition or Requirement	Action	More Information
You want to integrate external C code with generated C++ code or conversely	Match the language choice for the generated code by modifying the language of the external code.	“Modify Programming Language of External Code to Match Generated Code” on page 58-20
<ul style="list-style-type: none"> <li>• You have existing C code that models custom functionality. You want to integrate the code into Simulink blocks.</li> <li>• Your functions do not read or write global/static variables.</li> <li>• You want to easily integrate with Simulink Coverage, Simulink Test, and Simulink Design Verifier™</li> </ul>	For simple algorithms written in C, consider using the Simulink C Caller block.	“Integrate C Code Using C Caller Blocks”
<ul style="list-style-type: none"> <li>• You have existing C code that models custom functionality. You want to call multiple C functions from a Simulink block, or call C functions conditionally.</li> <li>• You want to include C code to preprocess and postprocess data before and after calling C functions.</li> <li>• You want to specify different code for simulation and code generation.</li> </ul>	Add a C Function block to your model.	“Integrate C Code by Using the MATLAB Function Block”

Condition or Requirement	Action	More Information
<ul style="list-style-type: none"> <li>The algorithm must model discrete and continuous state dynamics for simulation and rapid prototyping.</li> <li>The external code requires a fixed-point interface.</li> <li>Programming experience is limited. You want ease of use with basic flexibility for controlling what code the code generator produces for rapid prototyping.</li> </ul>	<p>Generate S-function and TLC files by using the S-Function Builder. If necessary, refine the generated code manually to meet application requirements. (If you change the generated code, you lose the changes if you regenerate the S-function and TLC files.)</p>	<ul style="list-style-type: none"> <li>“Use a Bus with S-Function Builder to Create an S-Function”</li> </ul>
<ul style="list-style-type: none"> <li>You want to simulate and generate external code for a discrete time application. Optimizing generated code is essential.</li> <li>You want ease of use with moderate flexibility for controlling what code the code generator produces.</li> <li>You have C or C++ programming experience, but you prefer to generate the files for adding the code to a model.</li> </ul>	<p>Generate S-function and TLC files by using the Legacy Code Tool. If necessary, refine the generated code manually to meet application requirements. (If you change the generated code, you lose the changes if you regenerate the S-function and TLC files.)</p>	<ul style="list-style-type: none"> <li>“Integrate C Functions Using Legacy Code Tool”</li> <li>“Import Calls to External Code into Generated Code with Legacy Code Tool”</li> <li>“Integrate C Code Using C Caller Blocks”</li> </ul>
<ul style="list-style-type: none"> <li>The application requires more entry-point functions than the code generator typically produces—for example, more than <i>model_step</i>, <i>model_initialize</i>, and <i>model_terminate</i>.</li> </ul> <p>You want maximum flexibility for controlling what code the code generator produces.</p>	<p>Manually write an S-function and TLC file.</p>	<ul style="list-style-type: none"> <li>“C/C++ S-Function Basics”</li> <li>“S-Functions and Code Generation” on page 13-2</li> <li>“C S-Function Examples” and “C++ S-Function Examples”</li> </ul>

Condition or Requirement	Action	More Information
Your algorithm includes design logic that is based on state machines and flow charts. Or, a function that you want to integrate must exchange data with a model by using global variables. The function defines the global variables and uses them to write output rather than returning a value (return) or writing output to an argument.	Add a Stateflow chart to the model. Call the external code from the chart, using C as the action language. In the chart, write code that calls the external function and reads from and writes to the global variables. To perform calculations with output of the external code, the model must read from the global variable during execution.	"Insert External Code into Stateflow Charts" on page 58-21
You want to include external C or C++ code in a Stateflow chart for simulation and code generation.	Configure the model that contains the chart to apply the external C or C++ code.	<ul style="list-style-type: none"> <li>• "Custom Code" (Stateflow)</li> <li>• "Call C Library Functions in C Charts" (Stateflow)</li> <li>• "Insert External Code into Stateflow Charts" on page 58-21</li> </ul>
You quickly want to embed a call to external C or C++ code in a model. Performance is not an issue.	Call the C or C++ code with the <code>coder.ceval</code> function from within a MATLAB Function block.	<ul style="list-style-type: none"> <li>• <code>coder.ceval</code> function</li> <li>• "Integrate C Code by Using the MATLAB Function Block"</li> <li>• MATLAB Function block</li> </ul>

### Modify Programming Language of External Code to Match Generated Code

To integrate external C code with generated C++ code or conversely, modify the language of the external code to match the programming language choice for the generated code. Options for making the programming language match include:

- Writing or rewriting the external code in the language choice for the generated code.
- If you are generating C++ code and the external code is C code, for each C function, create a header file that prototypes the function. Use this format:

```
#ifdef __cplusplus
extern "C" {
#endif
int my_c_function_wrapper();
#ifdef __cplusplus
}
#endif
```

The prototype serves as a function wrapper. If your compiler supports C++ code, the value `__cplusplus` is defined. The linkage specification `extern "C"` specifies C linkage without name mangling.

- If you are generating C code and the external code is C++ code, include an `extern "C"` linkage specification in each `.cpp` file. For example, the following example shows C++ code in the file `my_func.cpp`:

```
extern "C" {

int my_cpp_function()
{
```

```

} ...
}

```

## Integration Approaches for External Fortran Code

To integrate external Fortran code:

- 1 Write an S-function and corresponding TLC file.
- 2 Add the S-function to your model.
- 3 If necessary, add support files and control model code generation and builds within the Simulink environment.

See “C/C++ S-Function Basics”, “Implement Algorithms Using Fortran Code”, “S-Functions and Code Generation” on page 13-2, and “Fortran S-Function Examples”.

## Insert External Code into Stateflow Charts

- “Integrate External Code for Library Charts” on page 58-21
- “Integrate External Code for All Charts” on page 58-21

### Integrate External Code for Library Charts

To integrate external code that applies only to Stateflow library charts for code generation, for each library model that contributes a chart to your main model, complete these steps. Then, generate code.

- 1 In the Stateflow Editor, open the Model Configuration Parameters dialog box. Select parameter **Use local custom code settings (do not inherit from main model)**,

The library model retains its own custom code settings during code generation.

- 2 Specify your custom code in the subpanes.

Follow the guidelines in “Specify Relative Paths to Your Custom Code” (Stateflow).

If you specified custom code settings for simulation, you can apply these settings to code generation. To avoid entering the same information twice, select **Use the same custom code settings as Simulation Target**.

- 3 Click **OK**.

After completing these steps for each library model, generate code.

### Integrate External Code for All Charts

To integrate external code that applies to all charts for code generation:

- 1 Specify custom code options for code generation of your main model.
  - a In the Model Configuration Parameters dialog box, select **Code Generation > Custom Code**.
  - b In the custom code text fields, specify your custom code.

Follow the guidelines in “Specify Relative Paths to Your Custom Code” (Stateflow).

If you specified custom code settings for simulation, you can apply these settings to code generation. To avoid entering the same information twice, select **Use the same custom code settings as Simulation Target**.

- 2** Configure code generation for each library model that contributes a chart to your main model. In the Stateflow Editor, open the Model Configuration Parameters dialog box. Clear parameter **Use local custom code settings (do not inherit from main model)**. The library charts inherit the custom code settings of your main model. Click **OK**.
- 3** Generate code.

## Place External C/C++ Code in Generated Code

In this section...
“Workflow” on page 58-23
“Choose an Integration Approach” on page 58-24
“Integrate External Code by Using Custom Code Blocks” on page 58-25
“Integrate External Code by Using Model Configuration Parameters” on page 58-27
“Integrate External C Code into Generated Code by Using Custom Code Blocks and Model Configuration Parameters” on page 58-28

You can customize code that the code generator produces for a model by specifying external code with custom code blocks or model configuration parameters.

- Place code at the start and end of the generated code for the root model.
- Place declaration, body, and exit code in generated function code for blocks in the root model or nonvirtual subsystems.

The functions that you can augment with external code depends on the functions that the code generator produces for blocks that are in the model. For example, if a model or atomic subsystem includes blocks that have states, you can specify code for a disable function. Likewise, if you need the code for a block to save data, free memory, or reset target hardware, specify code for a terminate function. For more information, see “Block Target File Methods”.

### Workflow

To place external C or C++ code at specific locations in code that the code generator produces for root models and subsystems, iterate through the tasks listed in this table.

Task	Action	More Information
1	If you want to integrate external C code with generated C++ code or conversely, modify the language of the external code to match the language choice for the generated code.	“Modify Programming Language of External Code to Match Generated Code”
2	Review your assessment of external code characteristics and integration requirements.	“Choose an External Code Integration Workflow” on page 58-2
3	If necessary, rewrite code in C or C++.	
4	Choose an integration approach to add the external code to a Simulink model.	“Choose an Integration Approach” on page 58-24
5	Define the representation of model data for code generation.	“Exchange Data Between External C/C++ Code and Simulink Model or Generated Code” on page 58-61
6	Configure the model for code generation.	“Model Configuration Set Customization”

## Choose an Integration Approach

Within the Simulink modeling environment, two approaches are available for placing external C or C++ code into sections of code that the code generator produces:

- Add blocks from the Custom Code library to a root model or atomic subsystem.
- Set model configuration parameters on the **Code Generation > Custom Code** pane.

The following table compares the two approaches. Choose the approach that aligns best with your integration requirements. For more information about how to apply each approach, see "Integrate External Code by Using Custom Code Blocks" on page 58-25 and "Integrate External Code by Using Model Configuration Parameters" on page 58-27.

Requirement	Blocks	Model Configuration Parameters
Include a representation of your external code in the modeling canvas	✓	
Place code in functions generated for root models	✓	✓
Place code in functions generated for atomic subsystems	✓	
Save code placement in a model configuration set		✓
Place code at the top and bottom of the header and source files generated for a model	✓	✓
Place code within declaration, execution, and exit sections of the <code>SystemInitialize</code> and <code>SystemTerminate</code> functions that the code generator creates	✓	✓
Place code within declaration, execution, and exit sections of the <code>SystemStart</code> , <code>SystemEnable</code> , <code>SystemDisable</code> , <code>SystemOutputs</code> , <code>SystemUpdate</code> , or <code>SystemDerivatives</code> functions that the code generator creates	✓	
Add preprocessor macro definitions to generated code		✓
Use the custom code settings that are specified for the simulation target		✓

Requirement	Blocks	Model Configuration Parameters
Configure a library model to use custom code settings of the parent model to which the library is linked		✓

## Integrate External Code by Using Custom Code Blocks

- “Custom Code Block Library” on page 58-25
- “Add Custom Code Blocks to the Modeling Canvas” on page 58-26
- “Add External Code to Generated Start Function” on page 58-26

### Custom Code Block Library

The Custom Code block library contains blocks that you can use to place external C or C++ code into specific locations and functions within code that the code generator produces. The library consists of 10 blocks that add your code to the model header (*model.h*) and source (*model.c* or *model.cpp*) files that the code generator produces.

The Model Header and Model Source blocks add external code at the top and bottom of header and source files that the code generator produces for a root model. These blocks display two text fields into which you can type or paste code. One field specifies code that you want to place at the top of the generated header or source file. The second field specifies code that you want to place at the bottom of the file.

The remaining blocks add external code to functions that the code generator produces for the root model or atomic subsystem that contains the block. The blocks display text fields into which you can type or paste code that customizes functions that the code generator produces. The text fields correspond to the declaration, execution, and exit sections of code for a given function.

To Customize Code That	Use This Block
Computes continuous states	System Derivatives
Disables state	System Disable
Enables state	System Enable
Resets state	System Initialize
Produces output	System Outputs
Executes once	System Start
Saves data, free memory, reset target hardware	System Terminate
Requires updates at each major time step	System Update

The block and its location within a model determines where the code generator places the external code. For example, if the System Outputs block is at the root model level, the code generator places the code in the model `Outputs` function. If the block resides in a triggered or enabled subsystem, the code generator places the code in the subsystem `Outputs` function.

If the code generator does not need to generate a function that corresponds to a Custom Code block that you include in a model, the code generator does one of the following:

- Omits the external code that you specify in the Custom Code block.
- Returns an error, indicating that the model does not include a relevant block. In this case, remove the Custom Code block from the model.

For more information, see “Block Target File Methods”.

---

**Note** To avoid a potential mismatch between simulation and code generation results, do not use custom code blocks to read from and write to global Simulink data (signals, states, and block parameters). Instead, use the proper modeling pattern (for example, Data Store Read, Data Store Write, State Reader, and State Writer blocks.)

---

### Add Custom Code Blocks to the Modeling Canvas

To add the Custom Code library blocks to a model:

- 1 In the Simulink Library Browser, expand the Simulink Coder node then select the Custom Code block library.
- 2 Drag the blocks that you want into your model or subsystem. Drag Model Header and Model Source blocks into root models only. Drag function-based Custom Code blocks into root models or atomic subsystems.

You can use models that contain Custom Code blocks as referenced models. The code generator ignores the blocks when producing code for a simulation target. When producing code for a code generation target, the code generator includes and compiles the custom code.

### Add External Code to Generated Start Function

This example shows how to use the System Start block to place external C code in the code that the code generator produces for a model that includes a discrete filter.

- 1 Create the following model.

- 2 Configure the model for code generation.
- 3 Double-click the System Start block.
- 4 In the block parameters dialog box, in the **System Start Function Declaration Code** field, enter this code:

```
unsigned int *ptr = 0xFFEE;
```

- 5 In the **System Start Function Execution Code** field, enter this code:

```
/* Initialize hardware */
*ptr = 0;
```

- 6 Click **OK**.
- 7 Generate code and a code generation report.
- 8 View the generated `model.c` file. Search for the string `start` function. You should find the following code, which includes the external code that you entered in steps 4 and 5.

```

{
 {
 /* user code (Start function Header) */
 /* System '<Root>' */
 unsigned int *ptr = 0xFFEE;

 /* user code (Start function Body) */
 /* System '<Root>' */
 /* Initialize hardware */
 *ptr = 0;
 }
}

```

For another example, see “Integrate External C Code into Generated Code by Using Custom Code Blocks and Model Configuration Parameters” on page 58-28.

## Integrate External Code by Using Model Configuration Parameters

Model configuration parameters provide a way to place external C or C++ code into specific locations and functions within code that the code generator produces.

To	Select
Insert external code near the top of the generated <code>model.c</code> or <code>model.cpp</code> file	<b>Additional code</b> , and enter the external code to insert.  If you generate subsystem code into separate files, that code does not have access to external code that you specify with the <b>Additional code</b> parameter. For example, if you specify an include file as a <b>Additional code</b> setting, the code generator inserts the <code>#include</code> near the top of the <code>model.c</code> or <code>model.cpp</code> file. The subsystem code that the code generator places in a separate file does not have access to declarations inside your included file. In this case, consider specifying your external code with the <b>Include headers</b> parameter.
Insert external code near the top of the generated <code>model.h</code> file	<b>Include headers</b> , and enter the external code to insert.
Insert external code inside the model initialize function in the <code>model.c</code> or <code>model.cpp</code> file	<b>Initialize code</b> , and enter the external code to insert.
Insert external code inside the model terminate function in the <code>model.c</code> or <code>model.cpp</code> file	<b>Terminate code</b> , and enter the external code to insert. Also select the <b>Terminate function required</b> parameter on the <b>Interface</b> pane.

To	Select
Add preprocessor macro definitions	<b>Defines</b> , and enter a space-separated list of preprocessor macro definitions to add to the generated code. The list can include simple definitions (for example, -DEF1) and definitions with a value (for example, -DDEF2=1). Definitions can omit the -D (for example, -DF00=1 and F00=1 are equivalent). If a definition includes -D, the toolchain can override the flag if the toolchain uses a different flag for defines.
Use the same custom code parameter settings as the settings specified for simulation of MATLAB Function blocks, Stateflow charts, and Truth Table blocks	<b>Use the same custom code settings as Simulation Target</b>  This parameter refers to the <b>Simulation Target</b> pane in the Configuration Parameters dialog box.
Enable a library model to use custom code settings unique from the parent model to which the library is linked	<b>Use local custom code settings (do not inherit from main model)</b>  This parameter is available only for library models that contain MATLAB Function blocks, Stateflow charts, or Truth Table blocks.

To include a header file in an external header file, add `#ifndef` code. Using this code avoids multiple inclusions. For example, in `rtwtypes.h`, the following `#include` guards are added:

```
#ifndef RTW_HEADER_rtwtypes_h_
#define RTW_HEADER_rtwtypes_h_
...
#endif /* RTW_HEADER_rtwtypes_h_ */
```

For more information on how to add files names and locations of header, source, and shared library files to the build process, see “Build Integrated Code Within the Simulink Environment” on page 58-33.

---

**Note** The code generator includes external code that you include in a configuration set when generating code for software-in-the-loop (SIL) and processor-in-the-loop (PIL) simulations. However, the code generator ignores external code that you include in a configuration set when producing code with the S-function, rapid simulation, or simulation system target file.

---

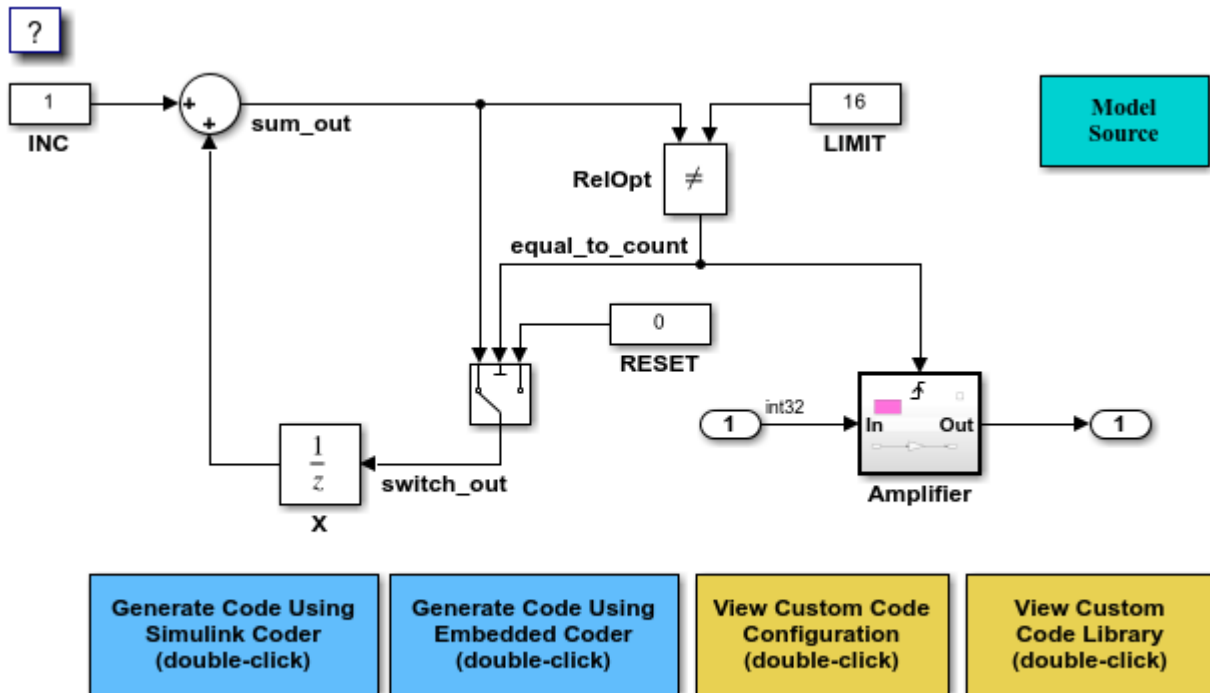

For more information about **Custom Code** parameters, see “Model Configuration Parameters: Code Generation Custom Code”. For an example, see “Integrate External C Code into Generated Code by Using Custom Code Blocks and Model Configuration Parameters” on page 58-28.

## Integrate External C Code into Generated Code by Using Custom Code Blocks and Model Configuration Parameters

This example shows how to place external code in generated code by using custom code blocks and model configuration parameters.

1. Open the model `rtwdemo_slcustcode`.

```
open_system('rtwdemo_slcustcode')
```

Copyright 1994-2020 The MathWorks, Inc.

2. Open the **Simulink Coder** or **Embedded Coder** app.
3. Open the Model Configuration Parameters dialog box and navigate to the **Custom Code** pane.
4. On the **Additional source code** tab, examine the settings for model configuration parameters **Additional code** and **Initialize code**.
  - **Additional code** specifies a comment and sets the variable GLOBAL\_INT2 to -1.
  - **Initialize code** initializes the variable GLOBAL\_INT2 to 1.
5. Close the dialog box.
6. Double-click the Model Source block. Block parameter **Top of Model Source** specifies that the code generator declare the variable GLOBAL\_INT1 and set it to 0 at the top of the generated file `rtwdemo_slcustcode.c`.
7. Open the triggered subsystem **Amplifier**. The subsystem includes the System Outputs block. The code generator places code that you specify in that block in the generated code for the nearest parent atomic subsystem. In this case, the code generator places the external code in the generated code for the **Amplifier** subsystem. The external code:
  - Declares the pointer variable `*intPtr` and initializes it with the value of variable GLOBAL\_INT1.
  - Sets the pointer variable to -1 during execution.
  - Resets the pointer variable to 0 before exiting.
8. Generate code and a code generation report.

9. Examine the code in the generated source file `rtwdemo_slcustcode.c`. At the top of the file, after the `#include` statements, you find the following declaration code. The example specifies the first declaration with the **Additional code** configuration parameter and the second declaration with the Model Source block.

```
int_T GLOBAL_INT2 = -1;
```

```
int_T GLOBAL_INT1 = 0;
```

The Output function for the `Amplifier` subsystem includes the following code, which shows the external code integrated with generated code that applies the gain. The example specifies the three lines of code for the pointer variable with the System Outputs block in the `Amplifier` subsystem.

```
int_T *intPtr = &GLOBAL_INT1;
```

```
*intPtr = -1;
```

```
rtwdemo_slcustcode_Y.Output = rtwdemo_slcustcode_U.Input << 1;
```

```
*intPtr = 0;
```

The following assignment appears in the model initialize entry-point function. The example specifies this assignment with the **Initialize code** configuration parameter.

```
GLOBAL_INT2 = 1;
```

## Call External Device Drivers

Device drivers for protocols and target hardware are essential to many real-time development projects. For example, you can have a working device driver that you want to integrate with algorithmic code that has to read data from and write data to the I/O device that the driver supports. The code generator can produce a single set of application source files from an algorithm model and integrated driver code written in C or C++.

To call external device driver code from the Simulink environment, iterate through the tasks in this table.

Task	Action	More Information
1	Review your assessment of external code characteristics and integration requirements.	"Choose an External Code Integration Workflow" on page 58-2
2	Define the representation of model data for code generation.	"Exchange Data Between External C/C++ Code and Simulink Model or Generated Code" on page 58-61
3	Generate S-function and TLC files by using the Legacy Code Tool. If necessary, refine the generated code manually to meet application requirements.	<ul style="list-style-type: none"> <li>"Integrate C Functions Using Legacy Code Tool"</li> <li>"Import Calls to External Code into Generated Code with Legacy Code Tool"</li> </ul>
4	Verify algorithm behavior and performance by simulating the model.	"Simulation"
5	Configure the model for code generation.	"Model Configuration Set Customization"
6	Generate code and a code generation report.	"Code Generation"
7	Review the generated code interface and static code metrics.	"Analyze Generated Data Code Interface" on page 54-13 and "Static Code Metrics" on page 54-26
8	Build an executable program from the model.	"Build Integrated Code Within the Simulink Environment" on page 58-33
9	Verify that executable program behaves and performs as expected.	"Verification, Testing, and Certification"

## Apply Function and Operator Code Replacements

If your generated code must use functions and operators that are consistent with external code, configure the code generator to use a code replacement library (CRL). By default, the code generator does not apply a code replacement library. You can choose from several libraries that MathWorks provides, including GNU C99 extensions, AUTOSAR 4.0, and several Intel platform-specific IPP and IPP/SSE libraries. Depending on the products that you have, other libraries might be available. If you have Embedded Coder software, you can view and choose from additional libraries and you can create custom code replacement libraries.

# Build Integrated Code Within the Simulink Environment

## Workflow

To build executable programs that integrate generated code and external C or C++ code, iterate through the tasks in this table.

Task	Action	More Information
1	Choose a build approach.	<p>“Approaches for Building Code Generated from Simulink Models” on page 59-11</p> <p>For an example, see “Build Process Workflow for Real-Time Systems” on page 59-31.</p>
2	Configure build process support for your external code.	“Configure Parameters for Integrated Code Build Process” on page 58-33
3	Configure S-Function build support for your external code.	<p>“Build Support for S-Functions” on page 58-35</p> <p>“Use makecfg to Customize Generated Makefiles for S-Functions” on page 93-15</p> <p>For examples, see “Call External C Code from Model and Generated Code” on page 53-48 and “Call Reusable External Algorithm Code for Simulation and Code Generation” on page 58-15.</p>
4	Configure build process to find the external code source, library, and header files.	<p>“Manage Build Process File Dependencies” on page 52-42</p> <p>“Control Library Location and Naming During Build” on page 93-3</p>
5	Set up custom build processing required for your external code integration.	<p>For the build process customization workflow, see “Customize Post-Code-Generation Build Processing” on page 93-7.</p> <p>To automate applying build customizations to a toolchain approach build, see “Customize Build Process with sl_customization.m” on page 93-29.</p> <p>To automate applying build customizations to a template makefile approach build, see “Customize Build Process with STF_make_rtw_hook File” on page 93-25.</p>

## Configure Parameters for Integrated Code Build Process

The table provides a guide to model configuration parameters on **Code Generation > Custom Code** pane of the Model Configuration Parameters dialog box that support the build process for external code integration. For information about folders for your external code, see “Manage Build Process Folders” on page 52-30. If you choose to place your external code in the “Code generation folder”, see “Preserve External Code Files in Build Folder” on page 58-34.

To	Select
Add include folders, which contain header files, to the build process	<p><b>Code information &gt; Include directories</b>, and enter the absolute or relative paths to the folders.</p> <p>If you specify relative paths, the paths must be relative to the folder containing your model files, not relative to the build folder. The order in which you specify the folders is the order in which they are searched for header, source, and library files.</p>
Add source files to be compiled and linked	<p><b>Code information &gt; Source files</b>, and enter the full paths or just the file names for the files.</p> <p>Enter just the file name if the file is in the current MATLAB folder or in one of the include folders. For each additional source that you specify, the build process expands a generic rule in the template makefile for the folder in which the source file is located. For example, if a source file is located in folder <code>inc</code>, the build process adds a rule similar to the following:</p> <pre>%.obj: builddir\inc\%.c     \$(CC) -c -Fo\$(@F) \$(CFLAGS) \$&lt;</pre> <p>The build process adds the rules in the order that you list the source files.</p>
Add libraries to be linked	<p><b>Code information &gt; Libraries</b>, and enter the full paths or just the file names for the libraries.</p> <p>Enter just the file name if the library is located in the current MATLAB folder or in one of the include folders.</p>
Use the same custom code settings as those specified for simulation of MATLAB Function blocks, Stateflow charts, and Truth Table blocks	<p><b>Use the same custom code settings as Simulation Target</b></p> <p>This parameter refers to the <b>Simulation Target</b> pane in the Configuration Parameters dialog box.</p>
Enable a library model to use custom code settings unique from the parent model to which the library is linked	<p><b>Use local custom code settings (do not inherit from main model)</b></p> <p>This parameter is available only for library models that contain MATLAB Function blocks, Stateflow charts, or Truth Table blocks.</p>

## Preserve External Code Files in Build Folder

By default, the build process deletes foreign source files. You can preserve foreign source files by following these guidelines.

If you put a `.c/.cpp` or `.h` source file in a build folder, and you want to prevent the code generator from deleting it during the TLC code generation process, insert the text `target specific file` in the first line of the `.c/.cpp` or `.h` file. For example:

```
/* COMPANY-NAME target specific file
 *
 * This file is created for use with the
```

```
* COMPANY-NAME target.
* It is used for ...
*/
...
```

Make sure that you spell the text “target specific file” as shown in the preceding example, and that the text is in the first line of the source file. Other text can appear before or after this text.

Flagging user files in this manner prevents postprocessing these files to indent them with generated source files. Auto-indenting occurred in previous releases to build folder files with names having the pattern *model\_\*.c/.cpp* (where \* was text). The indenting is harmless, but can cause differences detected by source control software that can potentially trigger unnecessary updates.

## Build Support for S-Functions

User-written S-Function blocks provide a powerful way to incorporate external code into the Simulink development environment. In most cases, you use S-functions to integrate existing external code with generated code. Several approaches to writing S-functions are available:

- “Write Noninlined S-Function” on page 13-91
- “Write Wrapper S-Function and TLC Files” on page 13-93
- “Write Fully Inlined S-Functions” on page 13-100
- “Write Fully Inlined S-Functions with mdlRTW Routine” on page 13-102
- “S-Functions for Code Reuse” on page 13-81
- “S-Functions for Multirate Multitasking Environments” on page 13-86

S-functions also provide the most flexible and capable way of including build information for legacy and custom code files in the build process.

There are different ways of adding S-functions to the build process.

### Implicit Build Support

When building models with S-functions, the build process adds rules, include paths, and source file names to the generated makefile. The source files (.h, .c, and .cpp) for the S-function must be in the same folder as the S-function MEX-file. Whether using the toolchain approach or template makefile approach for builds, the build process propagates this information through the toolchain or template makefile.

- If the file *sfcname.h* exists in the same folder as the S-function MEX-file (for example, *sfcname.mexext*), the folder is added to the include path.
- If the file *sfcname.c* or *sfcname.cpp* exists in the same folder as the S-function MEX-file, the build process adds a makefile rule for compiling files from that folder.
- When an S-function is not inlined with a TLC file, the build process must compile the S-function source file. To determine the name of the source file to add to the list of files to compile, the build process searches for *sfcname.cpp* on the MATLAB path. If the source file is found, the build process adds the source file name to the makefile. If *sfcname.cpp* is not found on the path, the build process adds the file name *sfcname.c* to the makefile, whether or not it is on the MATLAB path.

---

**Note** For the Simulink engine to find the MEX-file for simulation and code generation, it must exist on the MATLAB path or exist in our current MATLAB working folder.

---

### Specify Additional Source Files for an S-Function

If your S-function has additional source file dependencies, you must add the names of the additional modules to the build process. Specify the file names:

- In the **S-function modules** field in the S-Function block parameter dialog box
- With the `SFunctionModules` parameter in a call to the `set_param` function

For example, suppose you build your S-function with multiple modules.

```
mex sfun_main.c sfun_module1.c sfun_module2.c
```

You can then add the modules to the build process by doing one of the following:

- In the S-function block dialog box, specify `sfun_main`, `sfun_module1`, and `sfun_module2` in the **S-function modules** field.
- At the MATLAB command prompt, enter:

```
set_param(sfun_block, 'SFunctionModules', 'sfun_module1 sfun_module2')
```

Alternatively, you can define a variable to represent the parameter value.

```
modules = 'sfun_module1 sfun_module2'
set_param(sfun_block, 'SFunctionModules', modules)
```

The **S-function modules** field and `SFunctionModules` parameter do not support complete source file path specifications. To use the parameter, the code generator must find the additional source files when executing the makefile. For the code generator to locate the additional files, place them in the same folder as the S-function MEX-file. You can then leverage the implicit build support described in “Implicit Build Support” on page 58-35.

When you are ready to generate code, force the code generator to rebuild the top model, as described in “Control Regeneration of Top Model Code”.

For more complicated S-function file dependencies, such as specifying source files in other locations or specifying libraries or object files, use the `rtwmakecfg.m` API, as described in “Use `rtwmakecfg.m` API to Customize Generated Makefiles” on page 93-17.

### Use TLC Library Functions

If you inline your S-function by writing a TLC file, you can add source file names to the build process by using the TLC library function `LibAddToModelSources`. For details, see “`LibAddSourceFileCustomSection(file, builtInSection, newSection)`”.

---

**Note** This function does not support complete source file path specifications. The function assumes that the code generator can find the additional source files when executing the makefile.

---

Another useful TLC library function is `LibAddToCommonIncludes`. Use this function in a `#include` statement to include S-function header files in the generated `model.h` header file. For details, see “`LibAddToCommonIncludes(incFileName)`”.

For more complicated S-function file dependencies, such as specifying source files in other locations or specifying libraries or object files, use the `rtwmakecfg.m` API, as described in “Use `rtwmakecfg.m` API to Customize Generated Makefiles” on page 93-17.

## Precompile S-Function Libraries

You can precompile new or updated S-function libraries (MEX-files) for a model by using the MATLAB language function `rtw_precompile_libs`. Using a specified model and a library build specification, this function builds and places the libraries in a precompiled library folder.

By precompiling S-function libraries, you can optimize system builds. Once your precompiled libraries exist, the build process can omit library compilation from subsequent builds. For models that use numerous libraries, the time savings for build processing can be significant.

To use `rtw_precompile_libs`:

- 1 Set the library file suffix, including the file type extension, based on your system platform.

Consider determining the type of platform, and then use the `TargetLibSuffix` parameter to set the library suffix accordingly. For example, when applying a suffix for a GRT target, you can set the suffix to `_std.a` for a UNIX platform and `_vcx64.lib` for a Windows platform.

```
if isunix
 suffix = '_std.a';
else
 suffix = '_vcx64.lib';
end

set_param(my_model, 'TargetLibSuffix', suffix);
```

There are a number of factors that influence the precompiled library suffix and extension. The following table provides examples for typical selections of system target file, the compiler toolchain, and other options that affect your choice of suffix and extension. For more information, examine the template make files in the `matlab/rtw/c/grt` folder or `matlab/rtw/c/ert` folder.

TMF File	COMPILER _TOOL_CHAIN Value	Precompiler Libraries (PRECOMP_LIBRARIES)			
		Library Suffix S-Function (EXPAND _LIBRARY _NAME Value)	Library Suffix Integer- Only Code (EXPAND _LIBRARY _NAME Value)	Library Suffix Optimize for Speed (EXPAND _LIBRARY _NAME Value)	Library Extension (EXPAND _LIBRARY _NAME Value)
ert_lcc64.tmf	lcc	_rtwsfcn_lcc	_int_ert_lcc	_ert_lcc	.lib
ert_vcx64.tmf	vcx64	_rtwsfcn_vcx64	_int_ert_vcx64	_ert_vcx64	.lib
ert_unix.tmf	unix	_rtwsfcn	_int_ert	_ert	.a
grt_lcc64.tmf	lcc	n/a	n/a	_lcc	.lib
grt_vcx64.tmf	vcx64	n/a	n/a	_vcx64	.lib
grt_unix.tmf	unix	n/a	n/a	_std	.a

- 2 Set the precompiled library folder.

Use one of the following methods to set the precompiled library folder:

- Set the `TargetPreCompLibLocation` parameter, as described in “Specify the Location of Precompiled Libraries” on page 93-4.
- Set the `makeInfo.precompile` field in an `rtwmakecfg.m` function file. (For more information, see “Use `rtwmakecfg.m` API to Customize Generated Makefiles” on page 93-17.)

If you set `TargetPreCompLibLocation` and `makeInfo.precompile`, the setting for `TargetPreCompLibLocation` takes precedence.

The following command sets the precompiled library folder for model `my_model` to folder `lib` under the current working folder.

```
set_param(my_model,'TargetPreCompLibLocation', fullfile(pwd,'lib'));
```

---

**Note** If you set both the target folder for the precompiled library files and a target library file suffix, the build process detects whether any precompiled library files are missing while processing builds.

---

### 3 Define a build specification.

Set up a structure that defines a build specification. The following table describes fields that you can define in the structure. These fields are optional, except for `rtwmakecfgDirs`.

Field	Description
<code>rtwmakecfgDirs</code>	<p>A cell array of character vectors that name the folders containing <code>rtwmakecfg</code> files for libraries to be precompiled. The function uses the <code>Name</code> and <code>Location</code> elements of <code>makeInfo.library</code>, as returned by <code>rtwmakecfg</code>, to specify the name and location of the precompiled libraries. If you set the <code>TargetPreCompLibLocation</code> parameter to specify the library folder, that setting overrides the <code>makeInfo.library.Location</code> setting.</p> <p><b>Note:</b> The specified model must contain blocks that use precompiled libraries specified by the <code>rtwmakecfg</code> files because the TMF-to-makefile conversion generates the library rules only if the build process uses the libraries.</p>
<code>libSuffix</code>	<p>A character vector that specifies the suffix, including the file type extension, to be appended to the name of each library (for example, <code>.a</code> or <code>_vc.lib</code>). The character vector must include a period (<code>.</code>). You must set the suffix with either this field or the <code>TargetLibSuffix</code> parameter. If you specify a suffix with both mechanisms, the <code>TargetLibSuffix</code> setting overrides the setting of this field.</p>
<code>intOnlyBuild</code>	<p>A Boolean flag. When set to true, the flag indicates the libraries are to be optimized such that they are compiled from integer code only. This field applies to ERT targets only.</p>
<code>makeOpts</code>	<p>A character vector that specifies an option to be included in the <code>rtwMake</code> command line.</p>
<code>addLibs</code>	<p>A cell array of structures that specify libraries to be built that are not specified by an <code>rtwmakecfg</code> function. Each structure must be defined with two fields that are character arrays:</p> <ul style="list-style-type: none"> <li><code>libName</code> — the name of the library without a suffix</li> <li><code>libLoc</code> — the location for the precompiled library</li> </ul> <p>The target makefile (TMF) can specify other libraries and how those libraries are built. Use this field to precompile those libraries.</p>

The following commands set up build specification `build_spec`, which indicates that the files to be compiled are in folder `src` under the current working folder.

```
build_spec = [];
build_spec.rtwmakecfgDirs = {fullfile(pwd,'src')};
```

**4** Issue a call to `rtw_precompile_libs`.

The call must specify the model for which you want to build the precompiled libraries and the build specification. For example:

```
rtw_precompile_libs(my_model,build_spec);
```

## Generate Component Source Code for Export to External Code Base

### In this section...

“Modeling Options” on page 58-40

“Requirements” on page 58-40

“Limitations for Export-Function Subsystems” on page 58-42

“Workflow” on page 58-42

“Choose an Integration Approach” on page 58-43

“Generate C Function Code for Export-Function Model” on page 58-44

“Generate C++ Function and Class Code for Export-Function Model” on page 58-47

“Generate Code for Export-Function Subsystems” on page 58-52

If you have Embedded Coder software, you can generate function source code from modeling components to use in an external code base. The generated code does not include supporting scheduling code (for example, a step function). Controlling logic outside of the Simulink environment invokes the generated function code.

### Modeling Options

You can generate function code to export for these modeling components:

- Export-function models (model containing functional blocks that consist exclusively of function-call subsystems, function-call model blocks, or other export-function models, as described in “Export-Function Models Overview”)
- Export-function subsystems (virtual subsystem that contains function-call subsystems)

To export code that the code generator produces for these modeling components, the modeling components must meet specific requirements on page 58-40.

For models designed in earlier releases, the code generator can export functions from triggered subsystems. The requirements stated for export-function subsystems also apply to exporting functions from triggered subsystems, with the following exceptions:

- Encapsulate triggered subsystems from which you intend to export functions in a top-level virtual subsystem.
- Triggered subsystems do not have to meet requirements and limitations identified for virtual subsystems that contain function-call subsystem.
- “Export Functions That Use Absolute or Elapsed Time” on page 58-41 does not apply to exporting functions from triggered subsystems.

### Requirements

- Model solver must be a fixed-step discrete solver.
- You must configure each root-level Inport block that triggers a function-call subsystem to output a function-call trigger. These Inport blocks cannot connect to an Asynchronous Task Specification block.

- Model or subsystem, must contain only the following blocks at the root level:
  - Function-call blocks (such as Function-Call Subsystem, Simulink Function, S-Functions, and Function-Call Model blocks at the root level if the solver model configuration parameter **Tasking and sample time options > Periodic sample time constraint** is set to Ensure sample time independent)
  - Inport and Outport blocks (ports)
  - Constant blocks (including blocks that resolve to constants, such as Add)
  - Blocks with a sample time of Inf
  - Merge and data store memory blocks
  - Virtual connection blocks (such as, Function-Call Split, Mux, Demux, Bus Creator, Bus Selector, Signal Specification, and virtual subsystems that contain these blocks)
  - Signal-viewer blocks, such as Scope blocks (export-function subsystems only)
- When a constant block appears at the top level of the model or subsystem, you must set the model configuration parameter **Optimization > Default parameter behavior** for the model or containing model to **Inlined**.
- Blocks inside the model or subsystem must support code generation.
- Blocks that use absolute or elapsed time must be inside a periodic function-call subsystem with a discrete sample time specified on the corresponding function-call root-level Inport block. See “Export Functions That Use Absolute or Elapsed Time” on page 58-41.
- Data signals that cross the boundary of an exported system cannot be a virtual bus and cannot be implemented as a Goto-From connection. Data signals that cross the export boundary must be scalar, muxed, or a nonvirtual bus.

In addition, for export-function models, you cannot generate code for a rate-based model that includes multiple instances of an export-function model. For example, you cannot generate code for a test harness model that you use for scheduling reusable export-function models during simulation.

For export-function subsystems, the following additional requirements apply:

- A trigger signal that crosses the boundary of an export-function subsystem must be scalar. Input and output data signals that do not act as triggers do not have to be scalar.
- When a constant signal drives an output port of an export-function subsystem, the signal must specify a storage class.

### Export Functions That Use Absolute or Elapsed Time

If you want to export function code for a modeling component with blocks that use absolute or elapsed time, those blocks must be inside a function-call subsystem that:

- You configure for periodic execution
- You configure the root-level Inport block with a discrete sample time

To configure a function-call subsystem for periodic execution:

- 1** In the function-call subsystem, right-click the Trigger block and choose **Block Parameters** from the context menu.
- 2** Set parameter **Sample time type** to **periodic**.
- 3** Set **Sample time** to the same granularity specified (directly or by inheritance) in the function-call initiator.

#### 4 Click **OK** or **Apply**.

For more information, see “Absolute and Elapsed Time Computation”.

## Limitations for Export-Function Subsystems

- Subsystem block parameters do not control the names of the files containing the generated code. The file names begin with the name of the exported subsystem.
- Subsystem block parameters do not control the names of top-level functions in the generated code. Each function name reflects the name of the signal that triggers the function or (for an unnamed signal) reflects the block from which the signal originates.
- You can export function-call systems for the C++ class code interface packaging only when its function specification is set to **Default step method**. See “Interactively Configure C++ Interface” on page 44-2. The exported function is compatible with single-threaded execution. To avoid potential data race conditions for shared signals, invoke all members for the class from the same execution thread.
- The code generator supports a SIL or PIL block in accelerator mode only if its function-call initiator is noninlined in accelerator mode. Examples of noninlined initiators include Stateflow charts.
- A Level-2 S-function initiator block, such as a Stateflow chart or the built-in Function-Call Generator block, must drive a SIL block.
- You can export an asynchronous (sample-time) function-call system, but the software does not support the SIL or PIL block for an asynchronous system.
- The use of the TLC function `LibIsFirstInit` has been removed for export-function subsystems.

## Workflow

To generate code for an exported function, iterate through the tasks listed in this table.

Task	Action	More Information
1	Review your assessment of external code characteristics and integration requirements.	“Choose an External Code Integration Workflow” on page 58-2
2	Verify that the model or subsystem that you are exporting satisfies function exporting requirements.	“Requirements” on page 58-40
3	Address data interface requirements by modifying the model or subsystem.	“Exchange Data Between External C/C++ Code and Simulink Model or Generated Code” on page 58-61
4	If necessary, configure function prototype.	“Configure Entry-Point Function Interfaces for Simulink Function and Function Caller Blocks” on page 42-2 and, for fixed-step rate-based models, “Configure Generated C Function Interface for Model Entry-Point Functions” on page 33-114 or “Interactively Configure C++ Interface” on page 44-2

Task	Action	More Information
5	If necessary , update the model to place external application-specific code in generated system functions.	"Place External C/C++ Code in Generated Code" on page 58-23
6	Verify that the functions behave and perform as expected during simulation by creating and using a test harness model. The test harness model schedules execution of the functions during simulation.	"Configure Model, Generate Code, and Simulate" on page 52-2 and, if you have Simulink Test software, "Test Authoring" (Simulink Test)
7	Configure the model or subsystem for code generation.	"Model Configuration Set Customization"
8	Generate code and a code generation report.	"Code Generation"
9	Review the generated code interface and static code metrics.	"Analyze Generated Data Code Interface" on page 54-13 and "Static Code Metrics" on page 54-26
10	Build an executable program that includes the exported function code.	"Build Integrated Code Outside the Simulink Environment" on page 53-53
11	Verify that executable program behaves and performs as expected.	"Verification, Testing, and Certification"

## Choose an Integration Approach

Multiple approaches are available for generating function code for export to an external development environment. The following table compares approaches. Choose the approach that aligns best with your integration requirements. For more information on how to create export-function models, see "Export-Function Models Overview". For more information on generating code for function call subsystems, see "Generate Component Source Code for Export to External Code Base" on page 58-40.

## Generate C Function Code for Export-Function Model

This example shows how to generate function code for individual Simulink® function blocks and function-call subsystems in a model without generating scheduling code.

To generate function code for export:

- 1 Create a model that contains the functions for export.
- 2 Create a test harness model that schedules execution of the functions during simulation.

- 3 Simulate the model that contains the functions by using the test harness model.
- 4 Generate code for the model that contains the functions.

### Create Model That Contains Functions for Export

The model with functions for export must satisfy architectural constraints at the model root level. At the root level, valid blocks are:

- Inport
- Outport
- Function-Call Subsystem
- Simulink Function
- Goto
- From
- Merge

The code generator produces function code for Function-Call Subsystem, Simulink Function, Initialize Function, and Reset Function blocks. For a Function-call Subsystem block, you connect the block input ports to root Inport blocks that assert function-call signals. The subsystem is executed based on the function-call signal that it receives. A Simulink Function block is executed in response to the execution of a corresponding Function Caller block or Stateflow chart. An Initialize Function block is executed on a model initialize event and a Reset Function block is executed on a user-defined reset event.

For exporting functions, model `rtwdemo_functions` contains two function-call subsystems (`f1_alg` and `f2_alg`) and a Simulink Function block (`f3`) for exporting functions. The model also contains an Initialize Function block (`Initialize Function`) and a Reset Function block (`Reset Function`). To calculate initial conditions for blocks with state in other parts of the model, State Writer blocks are used inside the Initialize Function and Reset Function blocks.

```
open_system('rtwdemo_functions')
```

### Create Model That Contains Function Caller Block

Use a Function Caller block to invoke a Simulink Function block. The Function Caller block can be in the same model or in a different model as the Simulink Function block.

Multiple Function Caller blocks can invoke a Simulink Function block. You can place the Function Caller block inside a function-call subsystem. During code generation, the code generator exports a function from the function-call subsystem.

The model `rtwdemo_caller` exports a function-call subsystem that contains a Function Caller block.

```
open_system('rtwdemo_caller')
```

### Create Test Harness Model for Simulation

When you export functions, the generated code does not include a scheduler. Create a test harness model to handle scheduling during simulation. Do not use the test harness model to generate code that you deploy.

Model `rtwdemo_export_functions` is a test harness. The model:

- Schedules the Simulink Function block with the Function Caller block in `rtwdemo_caller`.
- Provides function-call signals to other models in this example to schedule the model contents, including the model initialize and reset events.

```
open_system('rtwdemo_export_functions')
```

### Simulate the Test Harness Model

Verify that the model containing the functions that you want to export is executed as you expect by simulating the test harness model. For example, simulate `rtwdemo_export_functions`.

```
sim('rtwdemo_export_functions')
```

### Generate Function Code

Open the **Embedded Coder** app. Then, generate code for the functions that you want to export. For example, generate code for `rtwdemo_functions`.

```
slbuild('rtwdemo_functions')
```

```
Starting build procedure for: rtwdemo_functions
Successful completion of code generation for: rtwdemo_functions
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_functions	Code generated.	Code generation information file does not exist.

```
1 of 1 models built (0 models already up to date)
Build duration: 0h 0m 19.674s
```

### Review Generated Code

Review the generated code.

- `ert_main.c` is an example main program (execution framework) for the model. This code shows how to call the exported functions. The code also shows how to initialize and execute the generated code.
- `rtwdemo_functions.c` calls the initialization function, including `Initialize Function`, and exported functions for model components `f1_alg`, `f2_alg`, and `f3`.
- `rtwdemo_functions.h` declares model data structures and a public interface to the exported entry-point functions and data structures.
- `f3.h` is a shared file that declares the call interface for the Simulink function `f3`.
- `rtwtypes.h` defines data types, structures, and macros that the generated code requires.

### Write Interface Code

Open and review the Code Interface Report. To write the interface code for your execution framework, use the information in that report.

- 1 Include the generated header files by adding directives `#include rtwdemo_functions.h`, `#include f3.h`, and `#include rtwtypes.h`.

- 2 Write input data to the generated code for model Inport blocks.
- 3 Call the generated entry-point functions.
- 4 Read data from the generated code for model Outport blocks.

Input ports:

- rtU.U1 of type `real_T` with dimension 1
- rtU.U2 of type `real_T` with dimension 1

Entry-point functions:

- Initialize entry-point function, `void rtwdemo_functions_initialize(void)`. At startup, call this function once.
- Reset entry-point function, `void rtwdemo_functions_reset(void)`. Call this function as needed.
- Exported function, `void f1(void)`. Call this function as needed.
- Exported function, `void f2(void)`. Call this function as needed.
- Simulink function, `void f3(real_T rtu_u, real_T *rty_y)`. Call this function as needed.

Output ports:

- rtY.Accumulator1 of type `int8_T` with dimension [2]
- rtY.Accumulator2 of type `int8_T` with dimension [2]
- rtY.TicToc10 of type `int8_T` with dimension 1

- “Configure Generated C Function Interface for Model Entry-Point Functions” on page 33-114
- “Generate Code for a Simulink Function and Function Caller”

### Close Example Models

```
bdclose('rtwdemo_export_functions')
bdclose('rtwdemo_functions')
bdclose('rtwdemo_caller')
```

## Generate C++ Function and Class Code for Export-Function Model

This example shows how to generate function code for an export-function model that includes a function-call subsystem. The code generator produces function and class code that does not include scheduling code.

To generate function code for export:

- 1 Create a model that contains the functions for export.
- 2 Create a test harness model that schedules execution of the functions during simulation.

- 3 Simulate the model that contains the functions by using the test harness model.
- 4 Generate code for the model that contains the functions.

### **Create Model That Contains Functions and C++ Class Interface for Export**

The model with functions for export with a C++ model class interface must satisfy architectural constraints at the model root level. For C++ class generation, blocks that are valid at the root level are:

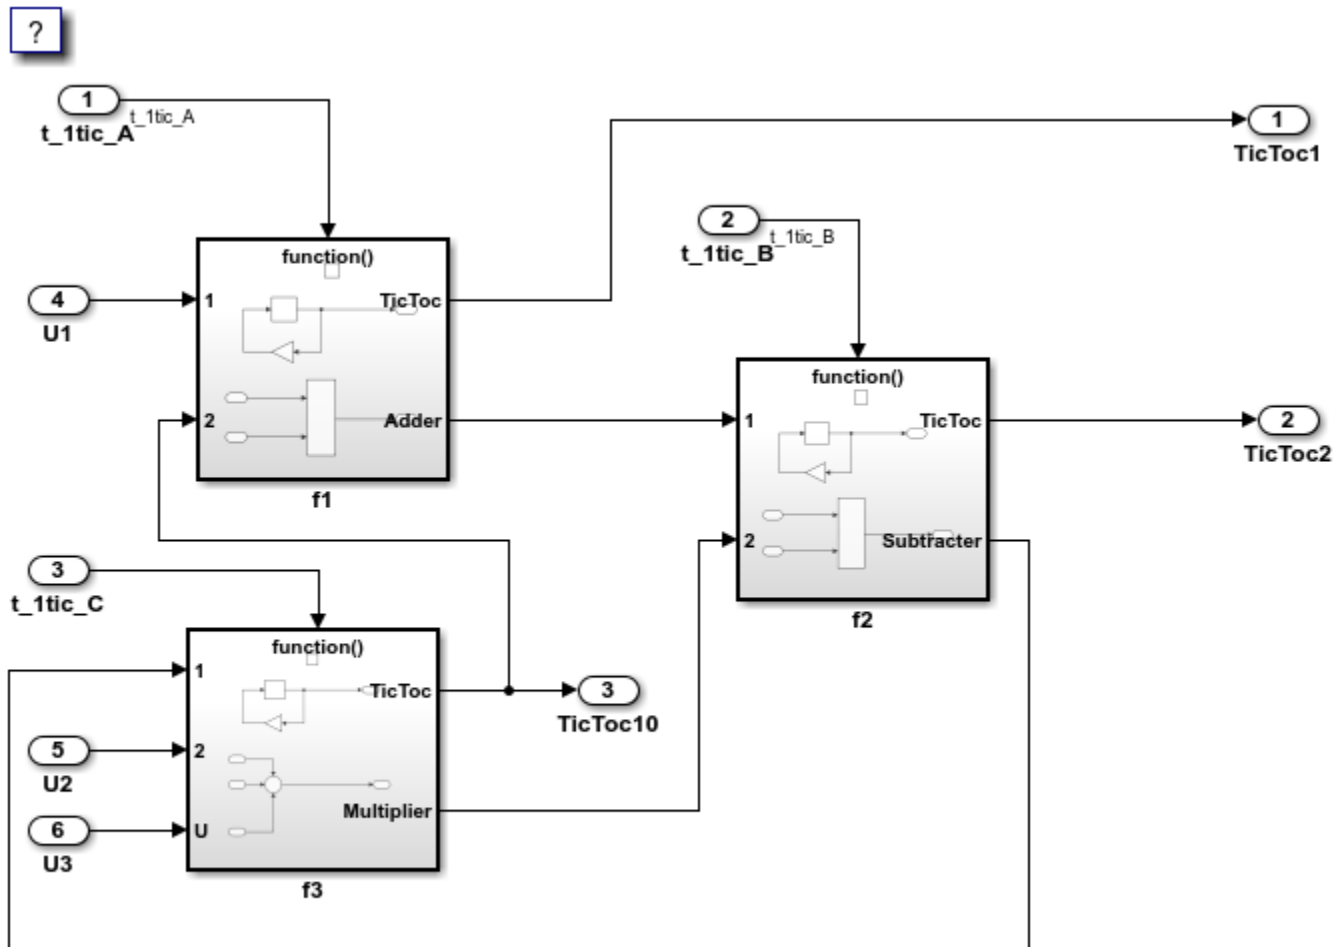

- Inport
- Outport
- Function-Call Subsystem
- Goto
- From
- Merge

**Note:** Export Function-Call Subsystem with C++ class interface does not support Simulink Function blocks.

The code generator produces function code for the Function-Call Subsystem block. For a Function-call Subsystem block, you connect the block input ports to root Inport blocks that assert function-call signals. The subsystem is executed based on the function-call signal that it receives.

Model `rtwdemo_cppclass_functions` contains function-call subsystems `f1`, `f2`, and `f3` for exporting functions.

```
open_system('rtwdemo_cppclass_functions')
```

Copyright 2016-2020 The MathWorks, Inc.

### Create Test Harness Model for Simulation

When you export functions, the generated code does not include a scheduler. Create a test harness model to handle scheduling during simulation. Do not use the test harness model to generate code that you deploy.

Model `rtwdemo_cppclass_export_functions` is a test harness. The model provides function-call signals to other models in this example to schedule the model contents.

```
open_system('rtwdemo_cppclass_export_functions')
```

Copyright 2014-2020 The MathWorks, Inc.

### Simulate the Test Harness Model

Verify that the model containing the functions that you want to export is executed as you expect by simulating the test harness model. For example, simulate `rtwdemo_cppclass_export_functions`.

```
sim('rtwdemo_cppclass_export_functions')
```

### Generate Function Code and Report

Generate code and a code generation report for the functions that you want to export. For example, generate code for `rtwdemo_cppclass_functions`.

```
slbuild('rtwdemo_cppclass_functions')
```

```
Starting build procedure for: rtwdemo_cppclass_functions
Successful completion of build procedure for: rtwdemo_cppclass_functions
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_cppclass_functions	Code generated and compiled.	Code generation information file does not exist.

```
1 of 1 models built (0 models already up to date)
Build duration: 0h 0m 24.899s
```

### Review Generated Code

From the code generation report, review the generated code.

- `ert_main.cpp` is an example main program (execution framework) for the model. This code shows how to call the exported functions. The code also shows how to initialize and execute the generated code.
- `rtwdemo_cppclass_functions.cpp` calls the initialization function, including `InitializeFunction`, and exported functions for model subsystem components `f1`, `f2`, and `f3`.
- `rtwdemo_cppclass_functions.h` declares model data structures and a public interface to the exported entry-point functions and data structures.
- `rtwtypes.h` defines data types, structures, and macros that the generated code requires.

### Write Interface Code

Open and review the Code Interface Report. To write the interface code for your execution framework, use the information in that report.

- 1 Include the generated header files by adding directives `#include rtwdemo_cppclass_functions.h` and `#include rtwtypes.h`.
- 2 Write input data to the generated code for model Inport blocks.
- 3 Call the generated entry-point functions.
- 4 Read data from the generated code for model Outport blocks.

Input ports:

- `rtU.U1` of type `real_T` with dimension 1
- `rtU.U2` of type `real_T` with dimension 1
- `rtU.U3` of type `real_T` with dimension 1

Entry-point functions:

- Initialize entry-point function, `void initialize(void)`. At startup, call this function once.
- Exported function, `void t_ltic_A(void)`. Call this function as needed.
- Exported function, `void t_ltic_B(void)`. Call this function as needed.
- Exported function, `void t_ltic_C(void)`. Call this function as needed.

Output ports:

- `rtY.TicToc1` of type `int8_T` with dimension [2]
- `rtY.TicToc2` of type `int8_T` with dimension [2]
- `rtY.TicToc10` of type `int8_T` with dimension 1

### More About

- “Generate Component Source Code for Export to External Code Base” on page 58-40

### Close Example Models

```
bdclose('rtwdemo_cppclass_export_functions')
bdclose('rtwdemo_cppclass_functions')
```

## Generate Code for Export-Function Subsystems

- “Specify a Custom Initialize Function Name” on page 58-52
- “Specify a Custom Description” on page 58-53
- “Optimize Code Generated for Export-Function Subsystems” on page 58-53

To generate code for an export-function subsystem:

- 1 Verify that the subsystem for which you are generating code satisfies exporting requirements on page 58-40.
- 2 In the Configuration Parameters dialog box:
  - a Set the parameter **System target file** to an ERT-based system target file, such as `ert.tlc`.
  - b If you want a SIL block with the generated code, for verification purposes, set model configuration parameter **Create block** to SIL.
  - c Click **OK** or **Apply**.
- 3 Right-click the subsystem block and select **C/C++ Code > Export Functions** from the context menu.

The operation creates and builds a new model, `subsystem.slx`, that contains the content of the original subsystem and creates a `ScratchModel` that contains a `Model` block. This block references the newly created `subsystem.slx` model.

The code generator produces code and places it in the working folder.

If you set **Create block** to SIL in step 2b, Simulink opens a new window that contains an S-function block that represents the generated code. This block has the same size, shape, and connectors as the original subsystem.

Code generation and optional block creation are now complete. You can test and use the code and optional block as you do for generated ERT code and S-function block. For optional workflow tasks, see “Specify a Custom Initialize Function Name” on page 58-52 and “Specify a Custom Description” on page 58-53.

### Specify a Custom Initialize Function Name

You can specify a custom name for the initialize function of your exported function as an argument to the `slbuild` command. The command takes the following form:

```
blockHandle = slbuild('subsystem', 'Mode', 'ExportFunctionCalls',...
 'ExportFunctionInitializeFunctionName', 'fcname')
```

`fcname` specifies the function name. For example, if you specify the name `'myinitfcn'`, the build process emits code similar to:

```
/* Model initialize function */
void myinitfcn(void){
```

```
...
}
```

### Specify a Custom Description

You can enter a custom description for an exported function by using the Block Properties dialog box of an Inport block.

- 1 Right-click the Inport block that drives the control port of the subsystem for which you are exporting code.
- 2 Select **Properties**.
- 3 In the **General** tab, in the **Description** field, enter your descriptive text.

During function export, the text you enter is emitted to the generated code in the header for the Inport block. For example, if you open the example program `rtwdemo_exporting_functions` and enter a description in the Block Properties dialog box for port `t_ltic_A`, the code generator produces code that is similar to:

```
/*
 * Output and update for exported function: t_ltic_A
 *
 * My custom description of the exported function
 */
void t_ltic_A(void)
{
 ...
}
```

### Optimize Code Generated for Export-Function Subsystems

To optimize the code generated for an export-function subsystem, specify a separate storage class for each input signal and output signal that crosses the boundary of the subsystem.

For each function-call subsystem that you are exporting:

- 1 Right-click the subsystem.
- 2 From the context menu, choose **Block Parameters (Subsystem)**.
- 3 Select the **Code Generation** tab.
- 4 Set **Function packaging** to Auto.
- 5 Click **OK** or **Apply**.

## Generate Shared Library for Export to External Code Base

### In this section...

“About Generated Shared Libraries” on page 58-54

“Workflow” on page 58-54

“Generate Shared Libraries” on page 58-55

“Create Application Code That Uses Generated Shared Libraries” on page 58-55

“Limitations” on page 58-58

### About Generated Shared Libraries

If you have Embedded Coder software, you can generate a shared library—Windows dynamic link library (.dll), UNIX shared object (.so), or Macintosh OS X dynamic library (.dylib)— from a model component. You or others can integrate the shared library into an application that runs on a Windows, UNIX, or Macintosh OS X development computer. Uses of shared libraries include:

- Adding a software component to an application for system simulation
- Reusing software modules among applications on a development computer
- Hiding intellectual property associated with software that you share with vendors

When producing a shared library, the code generator exports:

- Variables and signals of type `ExportedGlobal` as data
- Real-time model structure (`model_M`) as data
- Functions essential to executing the model code

### Workflow

To generate a shared library from a model component and use the library, complete the tasks listed in this table.

Task	Action	More Information
1	Review your assessment of external code characteristics and integration requirements.	<ul style="list-style-type: none"> <li>• “Choose an External Code Integration Workflow” on page 58-2</li> <li>• “Shared Library Limitations” on page 69-6</li> </ul>
2	Configure the model for code generation.	“Model Configuration Set Customization”
3	Configure the model for the code generator to produce a shared library and initiate code generation.	“Generate Shared Libraries” on page 58-55

Task	Action	More Information
4	<p>Verify that the generated shared library meets requirements. For example, review the code generation report and view the list of symbols in the library.</p> <ul style="list-style-type: none"> <li>• On Windows, use the Dependency Walker utility, downloadable from <a href="http://www.dependencywalker.com">www.dependencywalker.com</a></li> <li>• On UNIX, use <code>nm -D model.so</code></li> <li>• On Macintosh OS X, use <code>nm -g model.dylib</code></li> </ul>	
5	Use the shared library in application code.	“Create Application Code That Uses Generated Shared Libraries” on page 58-55
6	Compile and link application code that loads and uses the generated shared library.	“Build Integrated Code Within the Simulink Environment” on page 58-33
7	Verify that executable program behaves and performs as expected.	“Verification, Testing, and Certification”

## Generate Shared Libraries

- 1 When configuring the model for code generation, select the system target file `ert_shrlib.tlc`.
- 2 Build the model. The code generator produces source code for the model and a shared library version of the code. The code generator places the source code in the code generation folder and the shared library (`.dll`, `.so`, or `.dylib` file) in your current working folder. The code generator also produces and retains a `.lib` file to support implicit linking.

## Create Application Code That Uses Generated Shared Libraries

This example application code is generated for the example “Interface to a Development Computer Simulator by Using a Shared Library” on page 58-59.

- 1 Create an application header file that contains type declarations for model external input and output. For example:

```
#ifndef _APP_MAIN_HEADER_
#define _APP_MAIN_HEADER_

typedef struct {
 int32_T Input;
} ExternalInputs_rtwdemo_shrlib;

typedef struct {
 int32_T Output;
} ExternalOutputs_rtwdemo_shrlib;

#endif /* _APP_MAIN_HEADER_ */
```

- 2 In the application C source code, dynamically load the shared library. Use preprocessing conditional statements to invoke platform-specific commands. For example:

```

#if defined(_WIN32)||defined(_WIN64) /* WINDOWS */
#include <windows.h>
#define GETSYMBOLADDR GetProcAddress
#define LOADLIB LoadLibrary
#define CLOSELIB FreeLibrary

#else /* UNIX */
#include <dlfcn.h>
#define GETSYMBOLADDR dlsym
#define LOADLIB dlopen
#define CLOSELIB dlclose

#endif

int main()
{
 void* handleLib;
 ...
#if defined(_WIN64)
 handleLib = LOADLIB("./rtwdemo_shrlib_win64.dll");
#else #if defined(_WIN32)
 handleLib = LOADLIB("./rtwdemo_shrlib_win32.dll");
#else /* UNIX */
 handleLib = LOADLIB("./rtwdemo_shrlib.so", RTLD_LAZY);
#endif
#endif
 ...
 return(CLOSELIB(handleLib));
}

```

- 3 From the application C source code, access exported data and functions generated from the model. The code uses hooks to add user-defined initialization, step, and termination code.

```

int32_T i;
...
void (*mdl_initialize)(boolean_T);
void (*mdl_step)(void);
void (*mdl_terminate)(void);

ExternalInputs_rtwdemo_shrlib (*mdl_Uptr);
ExternalOutputs_rtwdemo_shrlib (*mdl_Yptr);

uint8_T (*sum_outptr);
...
#if defined(LCCDLL)||defined(BORLANDCDLL)
/* Exported symbols contain leading underscores
when DLL is linked with LCC or BORLANDC */
mdl_initialize =
 (void (*)(boolean_T))GETSYMBOLADDR(handleLib ,
 "_rtwdemo_shrlib_initialize");
mdl_step =
 (void (*)(void))GETSYMBOLADDR(handleLib ,
 "_rtwdemo_shrlib_step");
mdl_terminate =
 (void (*)(void))GETSYMBOLADDR(handleLib ,
 "_rtwdemo_shrlib_terminate");
mdl_Uptr =
 (ExternalInputs_rtwdemo_shrlib*)GETSYMBOLADDR(handleLib ,

```

```

 "_rtwdemo_shrplib_U");
mdl_Yptr =
 (ExternalOutputs_rtwdemo_shrplib*)GETSYMBOLADDR(handleLib ,
 "_rtwdemo_shrplib_Y");
sum_outptr =
 (uint8_T*)GETSYMBOLADDR(handleLib , "_sum_out");
#else
mdl_initialize =
 (void*)(boolean_T)GETSYMBOLADDR(handleLib ,
 "rtwdemo_shrplib_initialize");
mdl_step =
 (void*)(void)GETSYMBOLADDR(handleLib ,
 "rtwdemo_shrplib_step");
mdl_terminate =
 (void*)(void)GETSYMBOLADDR(handleLib ,
 "rtwdemo_shrplib_terminate");
mdl_Uptr =
 (ExternalInputs_rtwdemo_shrplib*)GETSYMBOLADDR(handleLib ,
 "rtwdemo_shrplib_U");
mdl_Yptr =
 (ExternalOutputs_rtwdemo_shrplib*)GETSYMBOLADDR(handleLib ,
 "rtwdemo_shrplib_Y");
sum_outptr =
 (uint8_T*)GETSYMBOLADDR(handleLib , "sum_out");
#endif

if ((mdl_initialize &&
 mdl_step &&
 mdl_terminate &&
 mdl_Uptr &&
 mdl_Yptr &&
 sum_outptr)) {
 /* user application
 initialization function */
 mdl_initialize(1);
 /* insert other user defined
 application initialization code here */

 /* user application
 step function */
 for(i=0;i<=12;i++){
 mdl_Uptr->Input = i;
 mdl_step();
 printf("Counter out(sum_out):
 %d\tAmplifier in(Input):
 %d\tout(Output):
 %d\n", *sum_outptr, i,
 mdl_Yptr->Output);
 /* insert other user defined
 application step function
 code here */
 }

 /* user application
 terminate function */
 mdl_terminate();
 /* insert other user defined
 application termination

```

```
 code here */
 }
 else {
 printf("Cannot locate the specified
 reference(s) in the shared library.\n");
 return(-1);
 }
}
```

## Limitations

- Code generation for the `ert_shrlib.tlc` system target file exports the following as data:
  - Variables and signals of type `ExportedGlobal`
  - Real-time model structure (`model_M`)
- Code generation for the `ert_shrlib.tlc` system target file supports the C language only (not C++). When you select `ert_shrlib.tlc`, language selection is unavailable on the **Code Generation** pane in the Configuration Parameters dialog box.
- To reconstruct a model simulation by using a generated shared library, the application author must maintain the timing between system and shared library function calls in the original application. The timing must be consistent so that you can compare the simulation and integration results. Additional simulation considerations apply if generating a shared library from a model that enables model configuration parameters **Support: continuous time** and **Single output/update function**. For more information, see [Single output/update function \(Simulink Coder\) dependencies](#).

## Interface to a Development Computer Simulator by Using a Shared Library

This example generates a shared library for interfacing to a simulator that runs on your development computer. Generate the shared library by using the system target file `ert_shrplib.tlc`.

To build a shared library from the model and use the library in an application:

1. Develop your model. For this example, open the model `rtwdemo_shrplib`. Save a copy of the model to a writable location.

```
open_system('rtwdemo_shrplib');
```

Copyright 2006-2020 The MathWorks, Inc.

The model is a single-rate, discrete-time model. An 8-bit counter feeds the triggered subsystem named Amplifier. Parameters INC, LIMIT, and RESET are set to constant values 1, 4, and 0, respectively. When signal `equal_to_count` is true, the subsystem amplifies its input signal by a gain factor  $K=3$  and the output signal is updated.

2. Open the **Embedded Coder** app.
3. Set model configuration parameter **System target file** to `ert_shrplib.tlc`.

4. Build the shared library file. The file that the code generator produces depends on your development platform. For example, on a Windows® system, the code generator produces the library file `rtwdemo_shrlib_win64.dll`.

5. Create application code that uses the shared library. This example uses application code that is available in these files:

```
matlabroot\toolbox\rtw\rtwdemos\shrlib_demo\rtwdemo_shrlib_app.h matlabroot
\toolbox\rtw\rtwdemos\shrlib_demo\rtwdemo_shrlib_app.c
```

To view the source code in these files, in the model, click the white buttons for the `.h` and `.c` files.

6. Compile and link the file application and shared library files to produce an executable program. The following script compiles, builds, and runs the program.

```
matlabroot\toolbox\rtw\rtwdemos\shrlib_demo\run_rtwdemo_shrlib_app.m
```

To view the script code, in the model, click the white button for the `.m` file.

To build the model and run the application that uses the generated shared library, in the model, double-click the blue button.

For more information about using a shared library, see “Package Generated Code as Shared Libraries” on page 69-2.

### More About

- “Generate Shared Library for Export to External Code Base” on page 58-54

## Exchange Data Between External C/C++ Code and Simulink Model or Generated Code

Whether you import your external code into a Simulink model (for example, by using the Legacy Code Tool) or export the generated code to an external environment, the model or the generated code typically exchange data (signals, states, and parameters) with your code.

Functions in C or C++ code, including your external functions, can exchange data with a caller or a called function through:

- Arguments (formal parameters) of functions. When a function exchanges data through arguments, an application can call the function multiple times. Each instance of the called function can manipulate its own independent set of data so that the instances do not interfere with each other.
- Direct access to global variables. Global variables can:
  - Enable different algorithms (functions) and instances of the same algorithm to share data such as calibration parameters and error status.
  - Enable the different rates (functions) of a multitasking system to exchange data.
  - Enable different algorithms to exchange data asynchronously.

In Simulink, you can organize and configure data so that a model uses these exchange mechanisms to provide, extract, and share data with your code.

Before you attempt to match data interfaces, to choose an overall integration approach, see “Choose an External Code Integration Workflow” on page 58-2.

### Import External Code into Model

To exchange data between your model and your external function, choose an exchange mechanism based on the technique that you chose to integrate the function.

- To exchange data through the arguments of your external function, construct and configure your model to create and package the data according to the data types of the arguments. Then, you connect and configure the block that calls or represents your function to accept, produce, or refer to the data from the model.

For example, if you use the Legacy Code Tool to generate an S-Function block that calls your function, the ports and parameters of the block correspond to the arguments of the function. You connect the output signals of upstream blocks to the input ports and set parameter values in the block mask. Then, you can create signal lines from the output ports of the block and connect those signals to downstream blocks.

- To exchange data through global variables that your external code already defines, a best practice is to use a Stateflow chart to call your function and to access the variables. You write algorithmic C code in the chart so that during simulation or execution of the generated code, the model reads and writes to the variables.

To use such a global variable as an item of parameter data (not signal or state data) elsewhere in a model, you can create a numeric MATLAB variable or `Simulink.Parameter` object that represents the variable. If you change the value of the C-code variable in between simulation runs, you must manually synchronize the value of the Simulink variable or object. If your algorithmic

code (function) changes the value of the C-code variable during simulation, the corresponding Simulink variable or object does not change.

If you choose to create a Simulink representation of the C-code variable, you can configure the Simulink representation so that the generated code reads and writes to the variable but does not duplicate the variable definition. Apply a storage class to the Simulink representation.

Technique for Integrating External Function	Mechanism to Exchange Data with Model	Examples and More Information
S-Function block	Function arguments	To call your function through an S-function that you create by using the Legacy Code Tool, see “Integrate C Functions into Simulink Models with Legacy Code Tool”.
Stateflow chart	Function arguments and direct access to global variables	To call your function and access global variables in a Stateflow chart, see “Access Custom Code Variables and Functions in Stateflow Charts” (Stateflow). For information about creating data items in a chart (which you can pass to your function as arguments), see “Add Stateflow Data” (Stateflow).
<code>coder.ceval</code> in MATLAB Function block	Function arguments	To call your function in a MATLAB Function block by using <code>coder.ceval</code> , see “Integrate C Code by Using the MATLAB Function Block”. For information about creating data items in a MATLAB Function block (which you can pass to your function as arguments), see “Create and Define MATLAB Function Block Variables”.

## Export Generated Code to External Environment

To export the generated code into your external code, see “Exchange Data Between External Calling Code and Generated Code”.

## Simulink Representations of C Data Types and Constructs

To model and reuse your custom C data such as structures, enumerations, and typedef aliases, use the information in these tables.

**Modeling Patterns for Matching Data in External C Code**

<b>C Data Type or Construct</b>	<b>Example C Code</b>	<b>Simulink Equivalent</b>	<b>More Information</b>
Primitive type alias (typedef)	typedef float mySinglePrec_T;	<p>Create a <code>Simulink.AliasType</code> object. Use the object to:</p> <ul style="list-style-type: none"> <li>• Set the data types of signals and block parameters in a model.</li> <li>• Configure data type replacements for code generation.</li> </ul> <p>Generating code that uses an alias data type requires Embedded Coder.</p>	<p>For information about defining custom data types for your model, see <code>Simulink.AliasType</code> and “Control Data Type Names in Generated Code” on page 38-2.</p> <p>For an example that shows how to export the generated code into your external code, see “Replace and Rename Data Types to Conform to Coding Standards” on page 38-22.</p>
Array	int myArray[6];	<p>Specify signal and parameter dimensions as described in “Determine Signal Dimensions”.</p> <p>The generated code defines and accesses multidimensional data, including matrices, as column-major serialized vectors. If your external code uses a different format, consider using alternative techniques to integrate the generated code. See “Code Generation of Matrices and Arrays” on page 52-61.</p>	<p>For information about how the generated code stores nonscalar data (including limitations), see “Code Generation of Matrices and Arrays”.</p> <p>For an example that shows how to export the generated code into your external code, see “Reuse Parameter Data from External Code in the Generated Code” on page 40-2.</p> <p>To model lookup tables, see <code>Simulink.LookupTable</code>.</p>

C Data Type or Construct	Example C Code	Simulink Equivalent	More Information
Enumeration	<pre>typedef enum myColorsType {     Red = 0,     Yellow,     Blue } myColorsType;</pre>	Define a Simulink enumeration that corresponds to your enumeration definition. Use the Simulink enumeration to set data types in a model.	<p>To use enumerated data in a Simulink model, see “Use Enumerated Data in Simulink Models”.</p> <p>For an example that shows how to generate enumerated parameter data, see “Enumeration” on page 26-20.</p> <p>For an example that shows how to export the generated code into your external code by exchanging enumerated data, see “Exchange Structured and Enumerated Data Between Generated and External Code” on page 38-27.</p>

C Data Type or Construct	Example C Code	Simulink Equivalent	More Information
Structure	<pre>typedef struct myStructType {     int count;     double coeff; } myStructType;</pre>	<p>Create a <code>Simulink.Bus</code> object that corresponds to your structure type.</p> <p>To create structured signal or state data, package multiple signal lines in a model into a single nonvirtual bus signal.</p> <p>To create structured parameter data, create a parameter object (such as <code>Simulink.Parameter</code>) that stores a MATLAB structure. Use the bus object as the data type of the parameter object.</p> <p>To package lookup table data into a structure, use <code>Simulink.LookupTable</code> and, optionally, <code>Simulink.Breakpoint</code> objects.</p>	<p>For information about bus signals, see “Group Signals or Messages into Virtual Buses”. For information about structures of parameters, see “Organize Related Block Parameter Definitions in Structures”.</p> <p>For an example that shows how to import your external code into a model by using the Legacy Code Tool, see “Integrate C Function Whose Arguments Are Pointers to Structures”.</p> <p>For examples that show how to export the generated code into your external code, see “Exchange Structured and Enumerated Data Between Generated and External Code” on page 38-27 and “Access Structured Data Through a Pointer That External Code Defines” on page 40-10.</p> <p>To package lookup table data into a structure, <code>Simulink.LookupTable</code>.</p> <p>For general information about creating structures in the generated code, see “Organize Data into Structures in Generated Code”.</p>

## Additional Modeling Patterns for Code Generation (Embedded Coder)

C Data Type or Construct	Example C Code	Simulink Equivalent	More Information
Macro	<pre>#define myParam 9.8</pre>	<p>Apply the storage classes <code>Define</code> and <code>ImportedDefine</code> to parameters. With macros, you can reuse a parameter value in multiple locations in an algorithm and change the parameter value between code compilations without consuming memory to store the value. Typically, macros represent engineering constants that you do not expect to change during code execution.</p> <p>This technique requires Embedded Coder.</p>	“Macro Definitions ( <code>#define</code> )” on page 26-56
Storage type qualifiers such as <code>const</code> and <code>volatile</code>	<pre>const myParam = 9.8;</pre>	Apply the storage classes <code>Const</code> , <code>Volatile</code> , and <code>ConstVolatile</code> to data items.	“Protect Global Data with Keywords <code>const</code> and <code>volatile</code> ”
Bit field	<pre>typedef struct myBitField {     unsigned short int MODE : 1;     unsigned short int FAIL : 1;     unsigned short int OK : 1; } myBitField</pre>	<ul style="list-style-type: none"> <li>Apply the storage class <code>BitField</code> to signals, states, and parameters whose data type is <code>boolean</code>.</li> <li>Use a model configuration parameter to aggregate <code>Boolean</code> data into bit fields.</li> </ul> <p>These techniques require Embedded Coder.</p>	<p>“Bitfields” on page 26-74</p> <p>“Optimize Generated Code by Packing Boolean Data into Bitfields” on page 80-11</p>

C Data Type or Construct	Example C Code	Simulink Equivalent	More Information
Call to custom external function that reads or writes to data	External code: <pre> /* Call this function to acquire the value of the signal. */ double get_inSig(void) {     return myBigGlobalStruct.inSig; } </pre> Generated algorithmic code: <pre> algorithmInput = get_inSig(); </pre>	Apply the storage class <code>GetSet</code> to signals, states, and parameters. Each data item appears in the generated code as a call to your custom functions that read and write to the target data.  This technique requires Embedded Coder.	“Access Data Through Functions with Storage Class <code>GetSet</code> ” on page 40-25

## Considerations for Other Modeling Goals

Goal	Considerations and More Information
Use Simulink to run and interact with the generated code	<p>You can use SIL, PIL, and external mode simulations to connect your model to the corresponding generated application for simulation. When you import parameter data from your external code:</p> <ul style="list-style-type: none"> <li>At the time that you begin an external mode simulation, the external executable uses the value that your code uses to initialize the parameter data. However, when you change the corresponding value in Simulink during the simulation (for example by modifying the <code>Value</code> property of the corresponding parameter object), Simulink downloads the new value to the executable.</li> <li>SIL and PIL simulations do not import the parameter value from your code. Instead, the simulations use the parameter value from Simulink. If you include your external code in the Simulink Coder build process, duplicate data definitions can prevent the generated code from compiling.</li> </ul> <p>For information about SIL and PIL, see “Choose a SIL or PIL Approach” on page 88-11. For information about external mode simulation, see “External Mode Simulations for Parameter Tuning, Signal Monitoring, and Code Execution Profiling”.</p>
Generate code comments that describe attributes of exported data including physical units, real-world initial value, and data type	<p>Generating these comments can help you match data interfaces while handwriting integration code. See “Add Custom Comments for Variables in the Generated Code” on page 55-3.</p>

## Exchange Data Between External Calling Code and Generated Code

To export the generated code into your external code, you configure the generated code to match the data interface of your external code. For example, if your external code defines a global variable for storing output data and you need the generated code to read that data as input, you can configure a corresponding Inport block so that the generated code interacts with the existing variable.

- You can generate reentrant code from a model. The generated entry-point functions typically accept data through arguments. Your calling code passes data through these arguments. You can call the functions multiple times in a single application—the application can maintain multiple instances of the model. See “Data Exchange for Reentrant Generated Code”.
- When you generate nonreentrant code, by default, the entry-point functions exchange data between the generated code and your code through global variables. You can generate variable definitions for your code to use or you can share and reuse existing variables that your code already defines. See “Data Exchange for Nonreentrant Generated Code”.

Alternatively, you can configure the entry-point functions to exchange system inputs and outputs (root-level Inport and Outport blocks) through arguments instead of global variables. Apply function prototype control to the model, which requires Embedded Coder. For more information about function prototype control, see “Configure Generated C Function Interface for Model Entry-Point Functions” on page 33-114.

For general information about exchanging data between generated and external code, including how to match specific C code patterns, see “Exchange Data Between External C/C++ Code and Simulink Model or Generated Code”.

### Data Exchange for Reentrant Generated Code

When you generate reentrant code, the model entry-point functions exchange data through arguments. You can control some of the characteristics of the arguments. For more information, see “Control Data and Function Interface in Generated Code”.

For information about creating a separate set of data for each call site in your external code, see “Modify Static Main to Allocate and Access Model Instance Data” on page 71-10.

### Data Exchange for Nonreentrant Generated Code

To make the generated code read or write to an item of signal, state, or parameter data as a global variable, apply a storage class to the data in the model. The storage class also determines whether the generated code exports the variable definition to your external code or imports the definition from your code. For general information about controlling the data interface of a model that you configure to generate nonreentrant code, see “Control Data Interface for Nonreentrant Code”. For examples, see “Design Data Interface by Configuring Inport and Outport Blocks” and “Integrate External Application Code with Code Generated from PID Controller” on page 40-45.

When you generate code that defines (allocates memory for) global data, the generated code exports that data. When your external code defines data, the generated code imports that data. Typically, storage classes that import data have the word `Import` in the storage class name, for example, `ImportedExternPointer`.

### Control File Placement of Exported Global Data (Embedded Coder)

When you export data from the generated code by using storage classes, the code generator creates an `extern` declaration. By default, this declaration typically appears in the generated header file `model.h`. You can include (`#include`) this header file in your external code.

By default, the definition (memory allocation) of exported data typically appears in `model.c`.

You can control the file placement of the declarations and definitions to:

- Create separate object files that store only global parameter data.
- Modularize the generated code by organizing declarations into separate files.

For more information about controlling file placement of declarations and definitions, see “Control Placement of Global Data Definitions and Declarations in Generated Files” on page 37-2. For an example, see “Definition, Initialization, and Declaration of Parameter Data” on page 26-5.

### Prevent Duplicate Initialization Code for Global Variables

When your external code defines global variables, you can generate code that interacts with those variables. For example, use the storage class `ImportFromFile` (see “Choose Storage Class for Controlling Data Representation in Generated Code”).

For imported variables that represent signal or state data, the code generator can produce initialization code as described in “Initialization of Signal, State, and Parameter Data in the Generated Code”. If your code already initializes a variable, consider preventing the generation of duplicate initialization code. Create your own storage class and, for that storage class, set **Data initialization** to `None`. For information about creating and applying your own storage class, see “Define Service Interfaces, Storage Classes, Memory Sections, and Function Templates for Software Architecture” on page 32-2.

### Protect Global Data with Keywords `const` and `volatile`

When your external code and the generated code exchange data through global variables, you can generate code that uses C type qualifiers `const` and `volatile` to protect data integrity and improve the safety of your application. For example:

- Apply `const` to a calibration parameter.
- Apply `volatile` to a global variable that stores the output of a hardware device operating asynchronously.
- Apply `const` and `volatile` to signals, states, and parameters that represent data defined by your external code. Then, the generated code declares and interacts with the external data by using the corresponding storage type qualifiers.

You must have Embedded Coder. For more information, see “Protect Global Data with `const` and `volatile` Type Qualifiers” on page 45-13.

## Generate Code That Matches Appearance of External Code

A key aspect of code integration, especially for larger projects, is adherence to guidelines and standards for code appearance. If code appearance requirements apply to your project, review the requirements in this table. To learn more, see the relevant information.

Requirement	More Information
Thoroughly document code or document code in a specific way.	<ul style="list-style-type: none"> <li>• “Configure Code Comments” on page 48-22</li> <li>• “Annotate Code for Justifying Polyspace Checks” on page 55-86</li> <li>• “Add Custom Comments for Variables in the Generated Code” on page 55-3</li> <li>• “Add Global Comments in the Generated Code” on page 55-5</li> </ul>
Control the length and naming of code identifiers (symbols), including the use of reserved names.	<ul style="list-style-type: none"> <li>• “Identifier Format Control” on page 55-17</li> <li>• “Specify Identifier Length to Avoid Naming Collisions” on page 48-29</li> <li>• “Specify Reserved Names for Generated Identifiers” on page 48-30</li> <li>• “Customize Generated Identifier Naming Rules” on page 55-10</li> <li>• “Avoid Identifier Name Collisions with Referenced Models” on page 55-26</li> <li>• “Control Name Mangling in Generated Identifiers” on page 55-25</li> <li>• “Specify Boolean and Data Type Limit Identifiers” on page 38-34</li> </ul>

Requirement	More Information
Control style aspects of code: <ul style="list-style-type: none"> <li>• Level of parenthesization</li> <li>• Order of operations in expressions</li> <li>• Empty primary condition expressions in <code>if</code> statements</li> <li>• <code>if-elseif-else</code> or <code>switch-case</code> statements for decision logic</li> <li>• Use of <code>extern</code> keyword in function declarations</li> <li>• Use of <code>static</code> keyword in function declarations</li> <li>• Use of <code>default</code> cases for <code>switch-case</code> statements</li> <li>• Use multiplications by powers of two or signed bitwise shifts</li> <li>• Cast expressions</li> <li>• Indent style (Kernighan and Ritchie or Allman) and size</li> <li>• Newline style</li> </ul>	“Model Configuration Parameters: Code Style”
Placement of data definitions and declarations, including location of global identifiers and global data declarations ( <code>extern</code> )	“Control Placement of Global Data Definitions and Declarations in Generated Files” on page 37-2
Appearance of code for flow charts	“Enhance Readability of Code for Flow Charts” on page 55-95
Apply code templates to control organization of code and use of banners	<ul style="list-style-type: none"> <li>• “Customize Code Organization and Format” on page 55-46</li> <li>• “Template Symbols and Rules” on page 55-81</li> <li>• “Specify Templates For Code Generation” on page 55-48</li> <li>• “Generate Custom File and Function Banners” on page 55-74</li> <li>• “Change the Organization of a Generated File” on page 55-58</li> <li>• “Generate Source and Header Files with a Custom File Processing (CFP) Template” on page 55-62</li> <li>• “Customize Generated File Names” on page 55-60</li> </ul>

## Select C or C++ Programming Language

The default programming language selection for code generation is C language. In the code generation workflow, after the steps in “Select a Solver That Supports Code Generation” and “Select a System Target File from STF Browser”, an optional step is to change the programming language selection for code generation.

To change the programming language setting:

- 1 In the Configuration Parameters dialog box, from the **Language** list, select C or C++. Alternatively, set the `TargetLang` parameter at the command line.

The code generator produces `.c` or `.cpp` files, depending on your selection, and places the generated files in your build folder.

For more information, see [Language](#).

- 2 Check whether you must choose and configure a compiler. If you select C++, you must choose and configure a compiler. For details, see “Select and Configure C or C++ Compiler”.
- 3 Check whether the language standard is configured for your compiler. By default, the code generator uses the ISO/IEC 9899:1999 C (C99 (ISO)) library for the C language and the ISO/IEC 14882:2003 C++ (C++03 (ISO)) library for the C++ language.

For more information, see [Language standard](#).

- “Troubleshoot Compiler Issues”

## Select and Configure C or C++ Compiler

The build process requires a supported compiler. *Compiler*, in this context, refers to a development environment containing a linker and make utility, and a high-level language compiler. For details on supported compiler versions, see:

[https://www.mathworks.com/support/compilers/current\\_release](https://www.mathworks.com/support/compilers/current_release)

When creating an executable program, the build process must be able to access a supported compiler. The build process can find a compiler to use based on your default MEX compiler.

The build process also requires the selection of a toolchain or template makefile. The toolchain or template makefile determines which compiler runs, during the make phase of the build. For more information, see “Configure Toolchain (ToolchainInfo) or Template Makefile Build Process” on page 59-18.

To determine which templates makefiles are available for your compiler and system target file, see “Compare System Target File Support Across Products”.

For both generated files and user-supplied files, the file extension, `.c` or `.cpp`, determines whether the build process uses a C or a C++ compiler. If the file extension is `.c`, the build process uses C compiler to compile the file, and the symbols use the C linkage convention. If the file extension is `.cpp`, the build process uses a C++ compiler to compile the file, and the symbols use the C++ linkage specification.

### Language Standards Compliance

The code generator produces code that is compliant with the following standards:

Language	Supported Standard	Other Names
C	ISO/IEC 9899:1990	C89/C90
	ISO/IEC 9899:1999	C99
C++	ISO/IEC 14882:2003	C++03
	ISO/IEC 14882:2011	C++11

Code that the code generator produces from these sources is ANSI C/C++ compliant:

- Simulink built-in block algorithmic code
- Generated system-level code (task ID [TID] checks, management, functions, and so on)
- Code from other blocksets, including the Fixed-Point Designer product and the Communications Toolbox product
- Code from other code generators, such as MATLAB functions

Also, the code generator can incorporate code from:

- Embedded system target files (for example, startup code, device driver blocks)
- Custom S-functions or TLC files

---

**Note** Coding standards for these two sources are beyond the control of the code generator. These standards can be a source for compliance problems, such as code that uses C99 features not supported in the ANSI C, C89/C90 subset.

---

## Programming Language Considerations

The code generator produces C and C++ code. Consider the following as you choose a programming language:

- Does your project require you to configure the code generator to use a specific compiler? C/C++ code generation on Windows requires this selection.
- Does your project require you to change the default language configuration setting for the model? See “Select C or C++ Programming Language” on page 59-2.
- Does your project require you to integrate legacy or custom code with generated code? For a summary of integration options, see “Choose an External Code Integration Workflow” on page 58-2.
- Does your project require you to integrate C and C++ code? If so, see “Choose an External Code Integration Workflow” on page 58-2.

---

**Note** You can mix C and C++ code when integrating generated code with custom code. However, you must be aware of the differences between C and default C++ linkage conventions, and add the `extern "C"` linkage specifier where required. For the details of the differing linkage conventions and how to apply `extern "C"`, refer to a C++ programming language reference book.

---

- Does your project require code generation support from other products? See “C++ Language Support Limitations” on page 59-4.

For C++ code generation examples with Stateflow, see the `sfcdemo_cppcount` model or `sf_cpp` model.

## C++ Language Support Limitations

To use C++ language support, you could need to configure the code generator to use a specific compiler. For example, if a supported compiler is not installed on your Microsoft Windows computer, the default compiler is the `lcc` C compiler shipped with the MATLAB product. This compiler does not support C++. If you do not configure the code generator to use a C++ compiler before you specify C++ for code generation, the software produces an error message.

Code generator limitations on C++ support include:

- The code generator does not support C++ code generation for the following:
  - Simscape Driveline
  - Simscape Multibody First Generation (Simscape Multibody Second Generation is supported)
  - Simscape Electrical Power Systems
  - Simulink Real-Time
- For ERT and ERT-based system target files with **Code interface packaging** set to **Nonreusable function**, the following fields currently do not support the `.cpp` extension.

- **Data definition filename**
- **Definition file** for a data object, which is an object of the `Simulink.Signal` or `Simulink.Parameter` classes or their subclasses.

If you specify a file name with a `.c` extension or with no extension and specify C++ for the code generation language, the code generator produces a `.cpp` file.

## Code Generator Assumes Wrap on Signed Integer Overflows

The code generator reduces memory usage and enhances generated code execution by assuming signed integer C operations wrap on overflow. A signed integer overflow occurs when the result of an arithmetic operation is outside the range of values that the output data type can represent. The C programming language does not define the results of such operations. Some C compilers aggressively optimize signed operations for in-range values at the expense of overflow conditions. Other compilers preserve the full wrap-on-overflow behavior. For example, the gcc and MinGW compilers provide an option to wrap on overflow reliably for signed integer overflows. The generated program image for a model can produce results that differ from model simulation results because the handling of overflows varies, depending on your compiler.

When you generate code, if you use a supported compiler with the default options configured by the code generator, the compiler preserves the full wrap-on-overflow behavior. If you change the compiler options or compile the code in another development environment, it is possible that the compiler does not preserve the full wrap-on-overflow behavior. In this case, the executable program can produce unpredictable results.

If this issue is a concern for your application, consider one or more of the following actions:

- Verify that the compiled code produces expected results.
- If your compiler can force wrapping behavior, turn it on. For example, for the gcc compiler or a compiler based on gcc, such as MinGW, configure the build process to use the compiler option `-fwrapv`.
- Choose a compiler that wraps on integer overflow.
- If you have Embedded Coder installed, develop and apply a custom code replacement library to replace code generated for signed integers. For more information, see “Code Replacement Customization”.

## Choose and Configure Compiler

To view the installed compilers and select the default compiler, in the Command Window, type:

```
mex -setup
```

On a Windows computer, you can install supported compilers and select a default compiler.

On a UNIX platform, the default compiler is GNU gcc/g++ for GNU or Xcode for Mac.

Unless the build approach configuration selects a specific compiler, the code generator uses the default compiler for the build process.

Primarily, the specified system target file determines the compiler that the code generator requires:

- If you select a toolchain-based system target file such as `grt.tlc` (Generic Real-Time Target), `ert.tlc` (Embedded Coder), or `autosar.tlc` (Embedded Coder for AUTOSAR), the **Build process** subpane displays configuration parameters for the build process. Use the **Toolchain** configuration parameter to select a compiler and associated tools for your model build. To validate the selected toolchain, click the **Validate Toolchain**.
- If you select a template makefile (TMF) based system target file, such as `rsim.tlc`, the **Build process** subpane displays template makefile parameters for configuring the build process. The **Template makefile** parameter displays the default TMF file for the selected system target file. If the system target file supports compiler-specific template makefiles (for example, Rapid Simulation or S-Function system target files), you can set **Template makefile** to a compiler-specific TMF. For valid TMF names, see “Compare System Target File Support Across Products”.

If the generated code exceeds the 2 Gb static memory limit, a compiler error occurs. To resolve this issue:

- For GRT-based system target files, set model configuration parameter **Code interface packaging** to `Reusable function`.
- For ERT-based system target files, set model configuration parameter **Code interface packaging** to `Reusable function` and select parameter **Use dynamic memory allocation for model initialization**.

## Include S-Function Source Code

When the code generator builds models with S-functions, source code for the S-functions can be either in the current folder or in the same folder as their MEX-file. The code generator adds an include path to the generated makefiles whenever it finds a file named `sfcnname.h` in the same folder as the S-function MEX-file. This folder must be on the MATLAB path.

Similarly, the code generator adds a rule for the folder when it finds a file `sfcnname.c` (or `.cpp`) in the same folder as the S-function MEX-file is in.

## Compiler Version Mismatch Errors

### Description

The build process produces a compiler version mismatch error.

### Action

- 1 Check the list of supported and compatible compilers available at [www.mathworks.com/support/compilers/current\\_release/](http://www.mathworks.com/support/compilers/current_release/).
- 2 Upgrade or change your compiler. For more information, see “Choose and Configure Compiler” on page 59-5.
- 3 Rebuild the model.

## Results for Model Simulation and Program Execution Differ

### Description

The program generated for the model produces different results from model simulation results. The generated source code includes an arithmetic operation that produces a signed integer overflow. It is possible that your compiler does not implement wrapping behavior for signed integer overflow conditions. Or, if you are using a compiler that supports wrapping, it is possible that you did not configure it to use the `-fwrapv` option.

For more information, see “Code Generator Relies on Undefined Behavior of C Language for Integer Overflows.”

### Action

- If your compiler can force wrapping behavior, turn it on. For example, for the gcc compiler or a compiler based on gcc, such as MinGW, specify the compiler option `-fwrapv`.
- Choose a compiler that checks for integer overflows.
- If you have Embedded Coder, develop and apply a code replacement library to replace code generated for signed integers.

## Generates Expected Code and Produces Unexpected Results

### Description

The build process generates expected source code, but the executable program produces unexpected results. The generated source code appears as expected. However, the executable program produces unexpected results.

### Action

Do one of the following:

- Lower the compiler optimization level.
  - 1 Set the **Compiler optimization level** configuration parameter to **Custom**.
  - 2 In the **Custom compiler optimization flags** field, specify a lower optimization level.
  - 3 Rebuild the model.
- Disable compiler optimizations.
  - 1 Set **Compiler optimization level** to **Optimizations off (faster builds)**.
  - 2 Rebuild the model.

For more information, see “Control Compiler Optimizations” and your compiler documentation.

## Compile-Time Issues

Issue	Action
Error is present in the compiler configuration.	Make sure that MATLAB supports the compiler and version that you want to use. For a list of currently supported and compatible compilers, see <a href="http://www.mathworks.com/support/compilers/current_release/">www.mathworks.com/support/compilers/current_release/</a> . If necessary, upgrade or change your compiler (see “Choose and Configure Compiler” on page 59-5 or “Choose and Configure Compiler” on page 59-5).
Environment variables are incorrectly set up for your make utility, compiler, or linker. For example, installation of Cygwin tools on a Windows platform affects environment variables used by other compilers.	Review the environment variable settings for your system by using the <code>set</code> command on a Windows platform or <code>setenv</code> on a Linux platform. Make sure that the settings match what is required for the tools you are using.
Error is present in custom code specified as an S-Function block or in <b>Custom Code</b> . For example, the code refers to a header file that the compiler cannot find.	To isolate the source of the problem, remove the custom code from the model, debug, and rebuild the model.
The model includes a block, such as a device driver block, which is not intended for use with the currently selected system target file.	Remove the system target file-specific block or configure the model for use with another system target file.

Issue	Action
<p>A linker error about an undefined reference to the data appears when the model build generates an executable program from the model reference hierarchy and these conditions are true:</p> <ul style="list-style-type: none"> <li>You represent signal, state, or parameter data by creating a data object such as <code>Simulink.Signal</code>. You use the object in a model reference hierarchy.</li> <li>You use a custom storage class with the data object. Custom storage classes require Embedded Coder.</li> <li>You set the owner of the object to a model that does not directly access the data.</li> <li>You use the toolchain <code>lcc-win64</code>.</li> </ul>	<p>To resolve the issue, choose one of these methods:</p> <ul style="list-style-type: none"> <li>In the data object, clear the <code>Owner</code> property. Alternatively, set the owner to a model that directly accesses the data.</li> <li>Use a different toolchain, such as <code>gcc</code>, instead of <code>lcc</code>.</li> </ul>

## LCC Compiler Does Not Support Ampersands in Source Folder Paths

### Description

If you use the LCC compiler and your model folder path contains an ampersand (&), the build process produces an error.

### Action

Remove the ampersand from the model folder path. Then, rebuild the model.

## LCC Compiler Might Not Support Line Lengths of Rapid Accelerator Code

### Description

If you are compiling Rapid Accelerator code, the LCC compiler might produce an error related to line limits. Rapid Accelerator code can have longer line lengths due to obfuscation.

### Action

Compile your Rapid Accelerator code using a compiler that supports longer code lines.

## Approaches for Building Code Generated from Simulink Models

Use one of these approaches for building (compiling and linking) code that you generate from Simulink models:

- **CMake** — CMake is a third-party, open-source tool for build process management, which uses configuration (CMakeLists.txt) files to generate standard build files for native build environments, for example, makefiles, Ninja files, or Microsoft Visual Studio and Xcode projects. You can specify a shipped CMake toolchain definition or, using the `target` package, provide a custom CMake toolchain definition. See “Create Custom CMake Toolchain Definition” on page 59-15.

MATLAB ships the CMake executable file. Simulink Coder and Embedded Coder support CMake versions from 3.12.0 onwards.

- **ToolchainInfo** — The build process generates makefiles and supports custom toolchains. You can control the build process with toolchain information objects that you define by using MATLAB scripts.
- **Template makefile** — The build process uses a template makefile with a toolchain that you specify. Optionally, you can control the build process through a toolchain information object.

Each build approach supports:

- Simulink model configuration parameters -- see “Configure CMake Build Process” on page 59-12 and “Configure Toolchain (ToolchainInfo) or Template Makefile Build Process” on page 59-18.
- `slbuild`, **Ctrl+B**, and `codebuild`
- “SIL and PIL Simulations” on page 88-2
- “External Mode Simulations for Parameter Tuning, Signal Monitoring, and Code Execution Profiling” on page 60-2

For information about customizing a build approach, see “Code Compilation Customization”.

## Configure CMake Build Process

CMake is a third-party, open-source tool for build process management. To build code generated from Simulink models, the software provides CMake toolchain definitions for:

- Microsoft Visual C++ and MinGW on Windows, GCC on Linux, and Xcode on Mac computers, using Ninja and makefile generators.
- Microsoft Visual Studio and Xcode project builds.

If a supported toolchain is installed on your development computer, you can specify the corresponding CMake toolchain definition for your model. When you run `slbuild`, press **Ctrl+B**, or run a software-in-the-loop (SIL), processor-in-the-loop (PIL), or external mode simulation, CMake:

- 1 Uses configuration (`CMakeLists.txt`) files to generate standard build files.
- 2 Runs the compiler and other build tools to create executable code.

You can provide custom CMake toolchain definitions by using the `target` package. For more information, see “Create Custom CMake Toolchain Definition” on page 59-15.

### Specify CMake Toolchain Definition

In the Configuration Parameters dialog box:

- 1 On the Hardware Implementation pane, specify parameter values for your target device, which determines the selection of toolchain definitions that is available. For more information, see “Available CMake Toolchain Definitions” on page 59-13.
- 2 On the Code Generation pane, specify these parameters:
  - **Toolchain** — From the drop-down list, select a CMake toolchain definition.
  - **Build configuration** — Select one of these values:
    - Release — Optimizations enabled.
    - Debug — Optimizations disabled, debug symbols generated.
    - RelWithDebInfo — Optimizations enabled, debug symbols generated.
    - MinSizeRel — Optimized for size, debug symbols not generated.
    - Specify — Enables you to specify toolchain details through the **CMake Configure** and **CMake Build** fields.
  - **Toolchain details** — If **Build configuration** is Specify, populate these fields:
    - **CMake Configure** — Additional command-line arguments to pass to CMake when generating the project build system builder artifacts for the downstream tools.
    - **CMake Build** — Additional command-line arguments to pass to CMake when using it in build mode.

For more information, see <https://cmake.org/cmake/help/latest/manual/cmake.1.html>.

## Available CMake Toolchain Definitions

Platform	Shipped Toolchain Definition	Device Vendor and Type that Make Definition Available
Windows	Microsoft Visual C++ 2017 v15.0   CMake/nmake (64-bit Windows)	Intel-x86-64 (Windows64)
	Microsoft Visual C++ 2017 v15.0   CMake/Ninja (64-bit Windows)	AMD-x86-64 (Windows64)
	Microsoft Visual Studio Project 2017   CMake (64-bit Windows)	
	Microsoft Visual Studio Project 2019   CMake (64-bit Windows)	
	Microsoft Visual C++ 2019 v16.0   CMake/Ninja (64-bit Windows)	
	Microsoft Visual C++ 2022 v17.0   CMake/nmake (64-bit Windows)	
	Microsoft Visual C++ 2022 v17.0   CMake/Ninja (64-bit Windows)	
	MinGW64   CMake/gmake (64-bit Windows)	
	MinGW64   CMake/Ninja (64-bit Windows)	
	Microsoft Visual C++ 2017 v15.0   CMake/nmake (32-bit Windows)	Intel-x86-32 (Windows32)
	Microsoft Visual C++ 2017 v15.0   CMake/Ninja (32-bit Windows)	AMD-x86-32 (Windows32)
	Microsoft Visual Studio Project 2017   CMake (32-bit Windows)	
	Microsoft Visual Studio Project 2019   CMake (32-bit Windows)	
	Microsoft Visual C++ 2019 v16.0   CMake/nmake (32-bit Windows)	
	Microsoft Visual C++ 2019 v16.0   CMake/Ninja (32-bit Windows)	
	Microsoft Visual C++ 2022 v17.0   CMake/nmake (32-bit Windows)	
	Microsoft Visual C++ 2022 v17.0   CMake/Ninja (32-bit Windows)	
	GNU gcc/g++   CMake/gmake (64-bit Linux)	
	GNU gcc/g++   CMake/Ninja (64-bit Linux)	AMD-x86-64 (Linux 64)

Platform	Shipped Toolchain Definition	Device Vendor and Type that Make Definition Available
Mac	Xcode with Clang   CMake/gmake (64-bit Mac)	Intel-x86-64 (Mac OS X)
	Xcode with Clang   CMake/Ninja (64-bit Mac)	AMD-x86-64 (Mac OS X)
	Xcode with Clang Project   CMake (64-bit Mac)	

---

**Note** If the **Test hardware is the same as production hardware** check box is not selected, the **Test hardware** settings for device vendor and type control the availability of shipped toolchain definitions.

## Create Custom CMake Toolchain Definition

CMake is a third-party, open-source tool for build process management. To build code generated from Simulink models, the software provides CMake toolchain definitions that you can select from the **Toolchain** drop-down list. You can also create custom CMake toolchain definitions by using the `target` package. When you add a custom CMake toolchain definition to an internal database, the toolchain is available for building generated code. This example shows how you can create a CMake toolchain definition using the Ninja generator. You can use the toolchain definition on computers with these operating systems:

- Windows (provided MATLAB Support for MinGW-w64 C/C++ Compiler is installed).
- Linux
- Mac

Create a `target.Toolchain` object.

```
tc = target.create('Toolchain', 'Name', 'Example Custom CMake Toolchain');
```

Use the `Builder` property and `target.CMakeBuilder` object to configure how CMake builds generated code.

```
tc.Builder = target.create('CMakeBuilder');
tc.Builder.Generator = 'Ninja';
tc.Builder.ToolchainFile = fullfile(pwd, 'ExampleCMakeToolchain.cmake');
tc.Builder.SupportedBuildTypes(end+1) = ...
 target.create('CMakeBuildType', ...
 'Name', 'FastMath', ...
 'GeneratesDebugSymbols', false, ...
 'DebugBuildType', 'FastMathWithDebug');
tc.Builder.SupportedBuildTypes(end+1) = ...
 target.create('CMakeBuildType', ...
 'Name', 'FastMathWithDebug', ...
 'GeneratesDebugSymbols', true);
```

Using an editor, create `ExampleCMakeToolchain.cmake`, a file that contains these lines.

```
Example CMake toolchain

Configure to use GCC
if(WIN32)
 list(APPEND CMAKE_PROGRAM_PATH "$ENV{MW_MINGW64_LOC}")
endif()
set(CMAKE_C_COMPILER "gcc")
set(CMAKE_CXX_COMPILER "g++")

Add some custom build configurations: FastMath, and FastMathWithDebug
set(CMAKE_C_FLAGS_FASTMATH "-Ofast")
set(CMAKE_CXX_FLAGS_FASTMATH "-Ofast")
set(CMAKE_C_FLAGS_FASTMATHWITHDEBUG "-Ofast -g")
set(CMAKE_CXX_FLAGS_FASTMATHWITHDEBUG "-Ofast -g")
```

For information about CMake toolchain files, see <https://cmake.org/cmake/help/book/mastering-cmake/chapter/Cross%20Compiling%20With%20CMake.html>.

Use the first element of the `EnvironmentConfiguration` property to provide system environment setup commands and paths for the Windows operating system.

```
tc.EnvironmentConfiguration(1).HostOperatingSystemSupport.Linux = false;
tc.EnvironmentConfiguration(1).HostOperatingSystemSupport.Windows = true;
tc.EnvironmentConfiguration(1).HostOperatingSystemSupport.Mac = false;
tc.EnvironmentConfiguration(1).SystemPaths = ...
 {'$(MW_MINGW64_LOC)/bin', '$(MATLAB_ROOT)/toolbox/shared/coder/ninja/$(ARCH)'};
```

Use the second element of the `EnvironmentConfiguration` property to provide system environment setup commands and paths for Linux and Mac operating systems.

```
tc.EnvironmentConfiguration(2) = target.create('EnvironmentConfiguration');
tc.EnvironmentConfiguration(2).HostOperatingSystemSupport.Linux = true;
tc.EnvironmentConfiguration(2).HostOperatingSystemSupport.Windows = false;
tc.EnvironmentConfiguration(2).HostOperatingSystemSupport.Mac = true;
tc.EnvironmentConfiguration(2).SystemPaths = ...
 {'$(MATLAB_ROOT)/toolbox/shared/coder/ninja/$(ARCH)'};
```

By default, the software uses the CMake executable file that ships with MATLAB. To specify another version of CMake, you can create an object that provides the required path.

Optionally, associate the toolchain definition with your target devices, for example:

```
windowsProc = target.get('Processor', 'Intel-x86-64 (Windows64)');
tc.SupportedHardware(end+1) = ...
 target.create('HardwareComponentSupport', 'Component', windowsProc);

linuxProc = target.get('Processor', 'Intel-x86-64 (Linux 64)');
tc.SupportedHardware(end+1) = ...
 target.create('HardwareComponentSupport', 'Component', linuxProc);

macProc = target.get('Processor', 'Intel-x86-64 (Mac OS X)');
tc.SupportedHardware(end+1) = ...
 target.create('HardwareComponentSupport', 'Component', macProc);
```

Add the toolchain definition to the internal database:

```
target.add(tc);
```

To use the custom toolchain definition for building generated code, in the Configuration Parameters dialog box:

- 1 On the **Hardware Implementation** pane, select your target device by setting **Device vendor** to Intel and **Device type** to x86-64 (Windows64).
- 2 On the **Code Generation** pane, from the **Toolchain** list, select Example Custom CMake Toolchain. The **Build configuration** list contains these values:
  - Release
  - Debug
  - RelWithDebInfo
  - MinSizeRel
  - FastMath
  - FastMathWithDebug
  - Specify
- 3 Under **Advanced parameters**, click **Validate Toolchain**, which generates a validation report.

## Validation Report for: Example Custom CMake Toolchain

### Toolchain Validation Result: Passed

#### Validation report:

Validating definition of toolchain "Example Custom CMake Toolchain":

Passed.

Validating that the location of the CMake tool is uniquely defined for your development computer:

Passed.

#### ### Validation of build tool "CMake"

Configuring test CMakeLists.txt file:

Passed.

Validating that CMake generator "Ninja" is a single-configuration generator:

Passed.

When you run, for example, the `slbuild` function or a software-in-the-loop (SIL) simulation, the build process uses the custom toolchain to build generated code.

If you want to remove the custom toolchain definition from the internal database, run:

```
customToolChainDef = target.get('Toolchain', 'Example Custom CMake Toolchain');
target.remove(customToolChainDef);
```

`target.remove` summary:

```
Objects removed from internal database:
 target.Toolchain "Example Custom CMake Toolchain"
```

## Configure Toolchain (ToolchainInfo) or Template Makefile Build Process

This topic shows how to specify the toolchain (`ToolchainInfo`) or template makefile approach for building code generated from a model.

If you set the System target file configuration parameter to:

- `ert.tlc`, `ert_shrlib.tlc`, `grt.tlc`, or any toolchain-compliant system target file, the build process uses the toolchain approach on page 59-18.
- Any non-toolchain-compliant system target file, the build process uses the template makefile approach on page 59-22.

You can switch from the toolchain approach to the template makefile approach by using this command:

```
set_param(model, 'MakeCommand', 'make_rtw TMF=1')
```

### Toolchain Approach

**Toolchain settings** appear under **Build process** when you set **System target file** to:

- `grt.tlc` – Generic Real-Time Target
- `ert.tlc` – Embedded Coder (requires the Embedded Coder product)
- `ert_shrlib.tlc` – Embedded Coder (host-based shared library target) (requires Embedded Coder)
- Any toolchain-compliant system target file (If ERT-based, requires Embedded Coder)

For more information about toolchain-compliant system target files, see “Support Toolchain Approach with Custom Target”.

The **Toolchain settings** include these configuration parameters:

- **Toolchain** -- Specifies the collection of third-party software tools that builds the generated code. A toolchain can include a compiler, linker, and archiver, and other prebuild or postbuild tools.

The default value of **Toolchain** is **Automatically locate an installed toolchain**. The **Toolchain** parameter displays name of the located toolchain just below **Automatically locate an installed toolchain**.

To check that the toolchain is present and validate that the code generator has the information required to use the toolchain, in the **Advanced Parameters** section, click **Validate Toolchain**. The resulting Validation Report gives a pass/fail value for the selected toolchain, and shows issues that require resolution.

- **Build configuration** -- Specifies the optimization settings. By default, **Build Configuration** is set to **Faster Builds**. You can also select **Faster Runs**, **Debug**, and **Specify**. If you select **Specify**, you can customize the options for the toolchain. When you click **Apply**, the custom toolchain settings apply to the current model.

**Note** The following system target files, which use the template makefile approach, have the same names but different descriptions from system target files that use the toolchain approach:

- `ert.tlc` – Create Visual C/C++ Solution File for Embedded Coder
- `grt.tlc` – Create Visual C/C++ Solution File for Simulink Coder

To avoid confusion, click **Browse** to select the system target file and look at the description of each file.

---

## Upgrade Model to Use Toolchain Approach

When you open a model created before R2013b that uses the following system target files, the software tries to upgrade the model. The upgrade changes the configuration from using template makefile settings to using the toolchain settings:

- `ert.tlc` – Embedded Coder
- `ert_shrlib.tlc` – Embedded Coder (host-based shared library target)
- `grt.tlc` – Generic Real-Time Target

---

**Note** To upgrade models using a custom system target file to use the toolchain approach, see “Support Toolchain Approach with Custom Target” on page 94-59.

---

Some model configuration parameter values prevent the software from upgrading a model to use toolchain settings. The following instructions show you ways to complete the upgrade process.

Consider upgrading your models and use the toolchain build approach. Doing so is not required. You can continue generating code from a model that has not been upgraded.

---

**Note** The software does not upgrade models that use the following system target files:

- `ert.tlc` – Create Visual C/C++ Solution File for Embedded Coder
  - `grt.tlc` – Create Visual C/C++ Solution File for Simulink Coder
- 

To see if a model has been upgraded:

- 1 If the **Toolchain** and **Build configuration** configuration parameters are specified, the model has been upgraded.

If makefile configuration parameters such as **Generate makefile**, **Make command**, and **Template makefile** are specified, the model has not been upgraded.

Start by creating a working copy of the model using **File > Save As**. This action preserves the original model and configuration parameters for reference.

Try to upgrade the model using Upgrade Advisor:

- 1 On the **Modeling** tab, in the **Evaluate & Manage** section, select **Upgrade Advisor**.
- 2 In Upgrade Advisor, select **Check and update model to use toolchain approach to build generated code** and click **Run This Check**.
- 3 Perform the suggested actions and/or click **Update Model**.

When you cannot upgrade the model using Upgrade Advisor, one or more of the following parameters is not set to its default value, shown here:

- **Compiler optimization level** — Optimizations off (faster builds)
- **Generate makefile** — Enabled
- **Template makefile** — System target file-specific template makefile

- **Make command** — `make_rtw` without arguments

Sometimes, a model cannot be upgraded. Try the following procedure:

- If **Generate makefile** is disabled, this case cannot be upgradable. However, you can try enabling it and try upgrading the model using Upgrade Advisor.
- If **Compiler optimization level** is set to `Optimizations on (faster runs)`:
  - 1 Set **Compiler optimization level** is to `Optimizations off (faster builds)`.
  - 2 Upgrade the model using Upgrade Advisor.
  - 3 Set **Build configuration** to `Faster Runs`.
- If **Compiler optimization level** is set to `Custom`:
  - 1 Copy the **Custom compiler optimization flags** to a text file.
  - 2 Set **Compiler optimization level** to `Optimizations off (faster builds)`.
  - 3 Upgrade the model using Upgrade Advisor.
  - 4 Set **Build configuration** to `Specify`.
  - 5 To perform the same optimizations, edit the compiler options.
- If **Template makefile** uses a customized template makefile, this case cannot be upgradable. However, you can try the following:
  - 1 Update **Template makefile** to use the default makefile for the system target file.

---

**Note** To get the default makefile name, change the **System target file**, click **Apply**, change it back, and click **Apply** again.

---

- 2 Upgrade the model using Upgrade Advisor.
- 3 If the template makefile contains build tool options, such as compiler optimization flags, set **Build configuration** to `Specify` and update the options.
- 4 If the template makefile uses custom build tools, create and register a custom toolchain, as described in “Custom Toolchain Registration” . Then, set the **Toolchain** parameter to use the custom toolchain.

---

**Note** After registering the custom toolchain, update **Toolchain** to use the custom toolchain.

---

- 5 If the template makefile contains custom rules and logic, these customizations cannot be applied to the upgraded model.

## Template Makefile Approach

When the **System target file** is set to a `tlc` file that uses the template makefile approach, the software displays **Compiler optimization level**, **Generate makefile**, **Make command**, and **Template makefile** parameters.

### Specify Whether to Generate a Makefile

The **Generate makefile** option specifies whether the build process is to generate a makefile for a model. By default, the build process generates a makefile. Suppress generation of a makefile, for example in support of custom build processing that is not based on makefiles, by clearing **Generate makefile**. When you clear this parameter:

- The **Make command** and **Template makefile** options are unavailable.
- Set up post code generation build processing using a user-defined command, as explained in “Customize Post-Code-Generation Build Processing”.

### Specify a Make Command

Each template makefile-based system target file has an associated **make** command. The code generator uses this internal MATLAB command to control the build process. The command appears in the **Make command** field and runs when you start a build.

Most system target files use the default command, `make_rtw`. Third-party system target files could supply another make command. See the documentation from the vendor.

In addition to the name of the **make** command, you can supply makefile options in the **Make command** field. These options could include compiler-specific options, include paths, and other

parameters. When the build process invokes the `make` utility, these options are passed on the `make` command line, which adds them to the overall flags passed to the compiler.

“Template Makefiles and Make Options” on page 59-28 lists the **Make command** options you can use with each supported compiler.

### Specify the Template Makefile

The **Template makefile** field has these functions:

- If you selected a system target file with the System Target File Browser, this field displays the name of a MATLAB language file that selects a template makefile for your development environment. For example, in “Model Configuration Parameters: Code Generation”, the **Template makefile** field displays `grt_default_tmf`, indicating that the build process invokes `grt_default_tmf.m`.

“Template Makefiles and Make Options” on page 59-28 gives a detailed description of the logic by which the build process selects a template makefile.

- Alternatively, you can explicitly enter the name of a specific template makefile (including the extension) or a MATLAB language file that returns a template makefile in this field. Use this approach if you are using a system target file that does not appear in the System Target File Browser. For example, use this approach if you have written your own template makefile for a custom system target file.

If you specify your own template makefile, be sure to include the file name extension. If you omit the extension, the build process attempts to find and execute a file with the extension `.m` (that is, a MATLAB language file). The template make file (or a MATLAB language file that returns a template make file) must be on the MATLAB path. To determine whether the file is on the MATLAB path, enter the following command in the MATLAB Command Window:

```
which tmf_filename
```

### Associate the Template Makefile with a Toolchain

Specify a toolchain for the template makefile build process. This example provides a definition for a minimal toolchain and shows how you can associate the toolchain with a template makefile that is a copy of `ert_unix.tmf` or `ert_vcx64.tmf`.

- 1 Use a copy of `ert_unix.tmf` or `ert_vcx64.tmf` as the template makefile.

```
copyfile(fullfile(matlabroot, 'toolbox', 'coder', ...
 'compile', 'tmf', 'ert_vcx64.tmf'), ...
 'ert_copy.tmf')
```

- 2 In the template makefile, i.e. `ert_copy.tmf`, edit the `TOOLCHAIN_NAME` macro.

```
TOOLCHAIN_NAME = "Minimal Toolchain for TMF Build"
```

---

**Note** The `ert_unix.tmf` and `ert_vcx64.tmf` files from the current release are simplified compared to the corresponding files from releases before R2018a. The software determines whether your template makefile uses the simplified approach by checking for the presence of the variable `TOOLCHAIN_NAME`. A template makefile that is based on `ert_unix.tmf` and `ert_vcx64.tmf` files from releases before R2018a does not specify the `TOOLCHAIN_NAME` variable.

Through the `|>MODEL_MODULES<|` token, the simplified approach specifies the main, *model*, and other source files that require compiling. The template makefile that is based on `ert_unix.tmf` and `ert_vcx64.tmf` files from releases before R2018a explicitly adds the main and *model* source files to the list of source files that require compiling.

To update a template makefile that originates from a release before R2018a:

- a Remove references to `ert_main.c`, `classic_main.c` or `rt_main.c`. For example, literal references like `ert_main.c` or tokenized references like `ert_main.$(TARGET_LANG_EXT)`.
- b Remove references to `$(MODEL).c` or `$(MODEL).$(TARGET_LANG_EXT)`.

### 3 Associate the toolchain with the template make file.

- a Create a toolchain definition file. For this example, use this code:

#### Toolchain Definition File

```
function tc = minimalToolchainForTMF
% Create a toolchain object
tc = coder.make.ToolchainInfo('Name', 'Minimal Toolchain for TMF Build');

% Specify that the linker requires a response file instead of
% including all object file modules on the linker command line
tc.addAttribute('RequiresCommandFile', true);

if ispc
 objExt = '.obj';
else
 objExt = '.o';
end

% Specify source file and object file extension used by the C compiler
tool = tc.getBuildTool('C Compiler');
tool.setFileExtension('Source', '.c');
tool.setFileExtension('Header', '.h');
tool.setFileExtension('Object', objExt);

% Specify source file and object file extension used by the C++ compiler
tool = tc.getBuildTool('C++ Compiler');
tool.setFileExtension('Source', '.cpp');
tool.setFileExtension('Header', '.hpp');
tool.setFileExtension('Object', objExt);
```

- b Run the toolchain definition file, which generates a `ToolchainInfo` object, `tc`.

```
tc = minimalToolchainForTMF;
```

- c Save the `ToolchainInfo` object to a MAT file.

```
save('tcMinimal', 'tc')
```

- d Register the toolchain in `RTW.TargetRegistry`.

- i Place this code in an `rtwTargetInfo.m` file.

```
function rtwTargetInfo(tr)
tr.registerTargetInfo(@loc_createToolchain);
end

function config = loc_createToolchain
config(1) = coder.make.ToolchainInfoRegistry;
config(1).Name = 'Minimal Toolchain for TMF Build';
config(1).FileName = fullfile(fileparts(mfilename('fullpath'))),...
```

```

 'tcMinimal.mat');
 config(1).TargetHWDeviceType = {'*'};
 config(1).Platform = {computer('arch')};
end

```

- ii Save the file in the current working folder or in a folder that is on the MATLAB search path.
- iii Reset the TargetRegistry.

```

 RTW.TargetRegistry.getInstance('reset');

```

- 4 Associate the template makefile with your model and build the model.

```

set_param(model, 'TemplateMakefile', 'ert_copy.tmf');
slbuild(model);

```

## Specify TLC for Code Generation

Target Language Compiler (TLC) is an integral part of the code generator. It enables you to customize generated code. Through customization, you can produce platform-specific code, or you can incorporate your own algorithmic changes for execution speed, code size, or compatibility with existing methods that you prefer to maintain. For additional information, see “Target Language Compiler Overview”.

TLC options that you specify for code generation appear in the summary section of the generated HTML code generation report.

---

**Note** Specifying TLC command-line options does not add flags to the make command line.

---

You can specify Target Language Compiler (TLC) command-line options and arguments for code generation using the model parameter `TLCOptions` in a `set_param` function call. For example,

```
>> set_param(gcs, 'TLCOptions', '-p0 -aWarnNonSaturatedBlocks=0')
```

Some common uses of TLC options include the following:

- `-aVarName=1` to declare a TLC variable and/or assign a value to it
- `-IC:\Work` to specify an include path
- `-v` to obtain verbose output from TLC processing (for example, when debugging)

## Use of Checksums in Recompilation of Generated Code

When you build a model with `GenerateMakefile` set to 'on' and `GenCodeOnly` set to 'off', the software generates a makefile and runs the makefile to compile the generated code. When the compilation is complete, the software creates and saves checksums for source files and configuration data.

If checksums from a previous build are available when you build the model:

- 1 The software uses the checksums to determine whether the source files and configuration data are different from the previous build.

2 If the software detects a difference, the software:

- Regenerates the makefile.
- Recomiles the generated code.

If the build process uses a template makefile, you can disable the use of checksums by adding this text to the template makefile:

```
DO_NOT_USE_CHECKSUMS=1
```

In this case, the software uses file timestamps to determine whether it should recompile the generated code.

- “Configure CMake Build Process” on page 59-12

## Template Makefiles and Make Options

The code generator includes a set of built-in template makefiles that build programs for specific system target files.

### Types of Template Makefiles

There are two types of template makefiles:

- *Compiler-specific* template makefiles are for a particular compiler or development system.

By convention, compiler-specific template makefiles names correspond to the system target file and compiler (or development system). For example, `grt_vcx64.tmf` is the template makefile for building a generic real-time program under the Visual C++ compiler; `ert_lcc64.tmf` is the template makefile for building an Embedded Coder program under the `lcc` compiler.

- *Default* template makefiles make your model designs more portable, by choosing the compiler-specific makefile and compiler for your installation. “Select and Configure C or C++ Compiler” on page 59-3 describes the operation of default template makefiles in detail.

Default template makefiles have names that follow the pattern `target_default_tmf`. They are MATLAB language files that, when run, select the TMF for the specified system target file configuration. For example, `grt_default_tmf` is the default template makefile for building a generic real-time program; `ert_default_tmf` is the default template makefile for building an Embedded Coder program.

For details on the structure of template makefiles, see “Customize Template Makefiles” on page 94-44. This section describes compiler-specific template makefiles and common options you can use with each.

### Specify Template Makefile Options

You can specify template makefile options through the **Make command** configuration parameter. Append the options after `make_rtw` (or other make command), as in the following example:

```
make_rtw OPTS="-DMYDEFINE=1"
```

The syntax for make command options differs slightly for different compilers.

---

**Note** To control compiler optimizations for a makefile build, use the **Compiler optimization level** configuration parameter, which provides:

- System target file-independent values `Optimizations on` (faster runs) and `Optimizations off` (faster builds), which easily allow you to toggle compiler optimizations on and off during code development
- The value `Custom` for entering custom compiler optimization flags at Simulink GUI level (rather than at other levels of the build process)

If you specify compiler options for your makefile build using `OPT_OPTS`, `MEX_OPTS` (except `MEX_OPTS="-v"`), or `MEX_OPT_FILE`, the value of **Compiler optimization level** is ignored and a warning is issued about the ignored parameter.

---

## Template Makefiles for UNIX Platforms

The template makefiles for UNIX platforms are for the Free Software Foundation's GNU Make. These makefiles conform to the guidelines specified in the IEEE<sup>6</sup> Std 1003.2-1992 (POSIX) standard:

- `ert_unix.tmf`
- `grt_unix.tmf`

You can supply options to makefiles through the **Make command** configuration parameter. Options specified in **Make command** are passed to the command-line invocation of the `make` utility, which adds them to the overall flags passed to the compiler. The following options can be used to modify the behavior of the build:

- `OPTS` — User-specific options, for example,
 

```
OPTS="-DMYDEFINE=1"
```
- `OPT_OPTS` — Optimization options. Default is `-O`. To enable debugging, specify the option as `OPT_OPTS=-g`. Because of optimization problems in `IBM_RS`, the default is to not optimize.
- `CPP_OPTS` — C++ compiler options.
- `USER_SRCS` — Additional user sources, such as files used by S-functions.
- `USER_INCLUDES` — Additional include paths, for example,
 

```
USER_INCLUDES="-Iwhere-ever -Iwhere-ever2"
```
- `DEBUG_BUILD` — Add debug information to generated code, for example,
 

```
DEBUG_BUILD=1
```

These options are also documented in the comments at the head of the respective template makefiles.

## Template Makefiles for the Microsoft Visual C++ Compiler

To build an executable file using the Visual C++ compiler, use one of the `target_vcx64.tmf` template makefiles:

- `ert_vcx64.tmf`
- `grt_vcx64.tmf`

You can supply options to makefiles through the **Make command** configuration parameter. Options specified in **Make command** are passed to the command-line invocation of the `make` utility, which adds them to the overall flags passed to the compiler. The following options can be used to modify the behavior of the build:

- `OPT_OPTS` — Optimization option. Default is `-O2`. To enable debugging, specify the option as `OPT_OPTS=-Zi`.
- `OPTS` — User-specific options. For example:
 

```
OPTS="/D MYDEFINE=1"
```
- `CPP_OPTS` — C++ compiler options.
- `USER_SRCS` — Additional user sources, such as files used by S-functions.

6 IEEE is a registered trademark of The Institute of Electrical and Electronics Engineers, Inc.

- `USER_INCLUDES` — Additional include paths, for example,  
`USER_INCLUDES="-Iwhere-ever -Iwhere-ever2"`
- `DEBUG_BUILD` — Add debug information to generated code, for example,  
`DEBUG_BUILD=1`

These options are also documented in the comments at the head of the respective template makefiles.

## Template Makefiles for the LCC Compiler

The code generator provides template makefiles to create an executable for the Windows platform using Lcc compiler Version 2.4 and GNU Make (gmake).

- `ert_lcc64.tmf`
- `grt_lcc64.tmf`

You can supply options to makefiles by using the **Make command** configuration parameter. Options specified in the **Make command** field are passed to the command-line invocation of the `make` utility, which adds them to the overall flags passed to the compiler. The following options can be used to modify the behavior of the build:

- `OPTS` — User-specific options, for example,  
`OPTS="-DMYDEFINE=1"`
- `OPT_OPTS` — Optimization options. Default is to not use options. To enable debugging, specify `-g4`:  
`OPT_OPTS="-g4"`
- `CPP_OPTS` — C++ compiler options.
- `USER_SRCS` — Additional user sources, such as files used by S-functions.
- `USER_INCLUDES` — Additional include paths. For example:  
`USER_INCLUDES="-Iwhere-ever -Iwhere-ever2"`

For `lcc`, use `/` as file separator before the file name instead of `\`, for example, `d:\work\proj1\myfile.c`.

- `DEBUG_BUILD` — Add debug information to generated code, for example,  
`DEBUG_BUILD=1`

These options are also documented in the comments at the head of the respective template makefiles.

- "Associate the Template Makefile with a Toolchain" on page 59-24

## Build Process Workflow for Real-Time Systems

The building process includes generating code in C or C++ from a model and building an executable program from the generated code. This example can use a generic real-time (GRT) or an embedded real-time (ERT) system target file (STF) for code generation. The resulting standalone program runs on your development computer, independent of external timing and events.

### Working Folder

This example uses a local copy of the `slexAircraftExample` model, stored in its own folder, `aircraftexample`. Set up your *working folder* as follows:

- 1 In the MATLAB Current Folder browser, navigate to a folder to which you have write access.
- 2 To create the working folder, enter the following MATLAB command:

```
mkdir aircraftexample
```

- 3 Make `aircraftexample` your working folder:

```
cd aircraftexample
```

- 4 Open the `slexAircraftExample` model:

```
openExample('slexAircraftExample')
```

The model appears in the Simulink Editor model window.

- 5 In the model window, choose **File > Save As**. Navigate to your working folder, `aircraftexample`. Save a copy of the `slexAircraftExample` model as `myAircraftExample`.

### Build Folder and Code Generation Folders

While producing code, the code generator creates a *build folder* within your working folder. The build folder name is `model_target_rtw`, derived from the name of the source model and the chosen system target file. The build folder stores generated source code and other files created during the build process. Examine the build folder contents at the end of this example.

When a model contains Model blocks (references to other models), the model build creates special subfolders in your “Code generation folder” to organize code for the referenced models. These code generation folders exist alongside product build folders and are named `slprj`. For more information, see “Generate Code for Model Reference Hierarchy”.

Under the `slprj` folder, a subfolder named `_sharedutils` contains generated code that can be shared between models.

### Set Model Parameters for Code Generation

To generate code from your model, you must change some of the model configuration parameters. In particular, the generic real-time (GRT) system target file and most other system target files require that the model specifies a fixed-step solver.

---

**Note** For models that specify variable-step solvers, the code generator produces code only if the models also specify rapid simulation (`rsim`) or S-function system target files.

---

- 1 Open the `myAircraftExample` model if it is not already open.
- 2 In the Configuration Parameters dialog box, specify configuration parameter values for the solver:
  - **Start time:** `0.0`
  - **Stop time:** `60`
  - **Type:** Fixed-step
  - **Solver:** `ode5` (Dormand-Prince)
  - **Fixed step size (fundamental sample time):** `0.1`
  - **Treat each discrete rate as a separate task:** `Off`
- 3 Click **Apply**.
- 4 Save the model.

## Configure Build Process

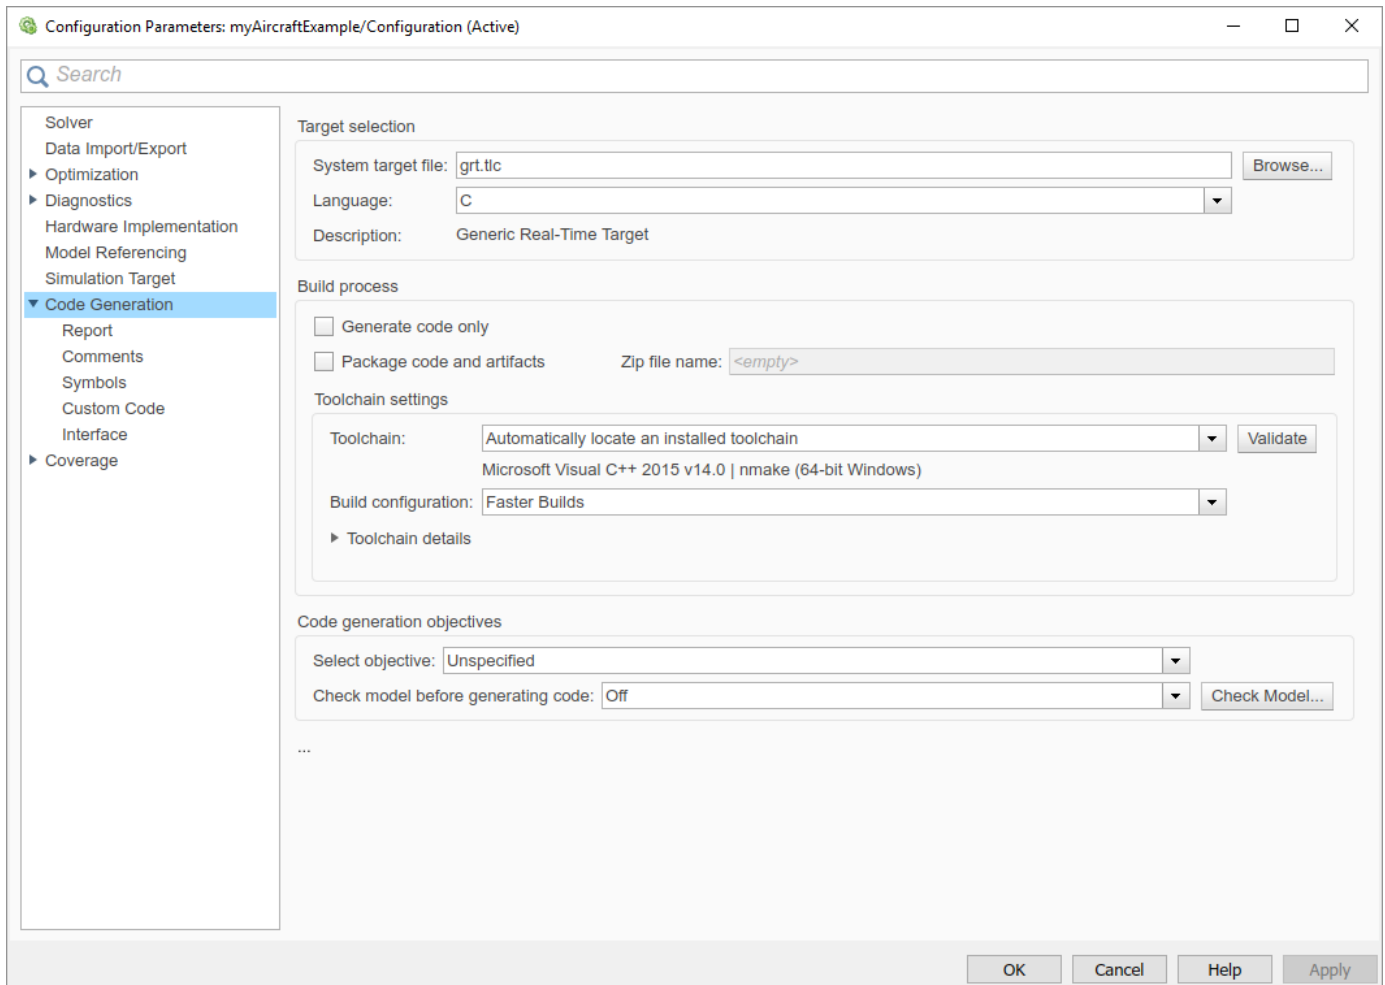

To configure the build process for your model, choose a system target file, a toolchain or template makefile, and a make command.

In these examples and in most applications, you do not need to specify these parameters individually. The examples use the ready-to-run generic real-time target (GRT) configuration. The GRT system target file builds a standalone executable program that runs on your desktop computer.

To select the GRT system target file:

- 1 Open the `myAircraftExample` model if it is not already open.
- 2 In the Configuration Parameters dialog box, in the **System target file** field, enter `grt.tlc`. Then click **Apply**.

You see selections for **Toolchain** (Automatically locate an installed toolchain), and **Build Configuration** (Faster Builds).

3 Save the model.

**Note** If you click **Browse**, a System Target File Browser opens and displays the system target files on the MATLAB path. Some system target files require additional products. For example, `ert.tlc` requires Embedded Coder.

## Set Code Generation Parameters

- 1 Open the `myAircraftExample` model if it is not already open.
- 2 In the Configuration Parameters dialog box, specify settings:
  - a Use the default settings for the **Code Generation** advanced parameters, which control build verbosity and debugging:
    - **Verbose build** (RTWVerbose)
    - **Retain .rtw file** (RetainRTWFile)
    - **Profile TLC** (ProfileTLC)
    - **Start TLC debugger when generating code** (TLCDebug)

- **Start TLC coverage when generating code** (TLCCoverage)
  - **Enable TLC assertion** (TLCAssert)
- b** Use the default **Code Generation > Comments** settings.
  - c** The **Code Generation > Identifiers** options control the look and feel of generated code. Use the default settings.
  - d** Select **Code Generation > Interface**.
    - i** From the **Shared code placement** list, select **Shared** location. The build process places generated code for utilities in a subfolder within your “Code generation folder”.
    - ii** Under the **Advanced parameters**, clear the **Classic call interface** check box.
    - iii** Under the **Advanced parameters**, select the **Single output/update function** check box.
  - e** In **Code Generation > Report**, select **Create code generation report** and **Open report automatically**. This action enables the software to create and display a code generation report for the myAircraftExample model.
- 3** Click **Apply** and save the model.

## Build and Run a Program

The build process generates C code from the model. It then compiles and links the generated program to create an executable image. To build and run the program:

- 1** With the myAircraftExample model open, perform one of these actions:
  - On the **Apps** tab, open the **Simulink Coder** app. In the **C Code** tab, click **Build**.
  - Press **Ctrl+B**.
  - Run the `slbuild` command from the MATLAB command line.

You see code generation and compilation messages in the Command Window. The initial message is:

```
Starting build procedure for model: myAircraftExample
```

The contents of many of the succeeding messages depends on your compiler and operating system. The final messages include:

```
Created executable myAircraftExample.exe
Successful completion of build procedure for model: myAircraftExample
Creating HTML report file index.html
```

The code generation folder now contains an executable, myAircraftExample.exe (Microsoft Windows platforms) or myAircraftExample (UNIX platforms). In addition, the build process has created an `slprj` folder and a myAircraftExample\_grt\_rtw folder in your “Code generation folder”.

---

**Note** After generating the code for the myAircraftExample model, the build process displays a code generation report. See “Report Generation” for more information about how to create and use a code generation report.

---

- 2** To see the contents of the working folder after the build, enter the `dir` or `ls` command:

```
>> dir
. myAircraftExample.slx slprj
.. myAircraftExample.slx.autosave
myAircraftExample.exe myAircraftExample_grt_rtw
```

- 3 To run the executable from the Command Window, type `!myAircraftExample`. The `!` character passes the command that follows it to the operating system, which runs the standalone `myAircraftExample` program.

```
>> !myAircraftExample
** starting the model **
** created myAircraftExample.mat **
```

- 4 To see the files created in the build folder, use the `dir` or `ls` command again. The exact list of files produced varies among MATLAB platforms and versions. Here is a sample list from a Windows platform:

```
>> dir myAircraftExample_grt_rtw
. rt_main.obj myAircraftExample_data.c
.. rtmodel.h myAircraftExample_data.obj
buildInfo.mat rtw_proj.tmw myAircraftExample_private.h
codeInfo.mat myAircraftExample.bat myAircraftExample_ref.rsp
myAircraftExample.c myAircraftExample_types.h html
myAircraftExample.h myAircraftExample.mk
rt_logging.obj myAircraftExample.obj
```

## Contents of the Build Folder

The build process creates a build folder and names it `model_target_rtw`, where `model` is the name of the source model and `target` is the system target file selected for the model. In this example, the build folder is named `myAircraftExample_grt_rtw`.

The build folder includes the following generated files.

File	Description
<code>myAircraftExample.c</code>	Standalone C code that implements the model
<code>myAircraftExample.h</code>	An include header file containing definitions of parameters and state variables
<code>myAircraftExample_private.h</code>	Header file containing common include definitions
<code>myAircraftExample_types.h</code>	Forward declarations of data types used in the code
<code>rtmodel.h</code>	Master header file for including generated code in the static main program (its name does not change, and it simply includes <code>myAircraftExample.h</code> )

The code generation report that you created for the `myAircraftExample` model displays a link for each of these files. You can click the link [explore the file contents](#).

The build folder contains other files used in the build process. They include:

- `myAircraftExample.mk` — Makefile for building executable using the specified Toolchain.
- Object (`.obj`) files
- `myAircraftExample.bat` — Batch control file
- `rtw_proj.tmw` — Marker file

- `buildInfo.mat` — Build information for relocating generated code to another development environment
- `myAircraftExample_ref.rsp` — Data to include as command-line arguments to `mex` (Windows systems only)

The build folder also contains a subfolder, `html`, which contains the files that make up the code generation report. For more information, see “Reports for Code Generation”.

## Customized Makefile Generation

After producing code, the code generator produces a customized makefile, `model.mk`. The generated makefile instructs the `make` system utility to compile and link source code generated from the model, any required harness program, libraries, or user-provided modules. The code generator produces the file `model.mk` regardless of the approach that you use for build process control:

- If you use the toolchain approach, the code generator creates `model.mk` based on the model **Toolchain settings**. You can modify generation of the makefile through the `rtwmakecfg.m` API.
- If you use the template makefile approach, the code generator creates `model.mk` from a system template file, `system.tmf` (where `system` stands for the selected system target file name). The system template makefile is designed for your system target file. You can modify the template makefile to specify compilers, compiler options, and additional information for the creation of the executable.

For more information, see “Configure Toolchain (ToolchainInfo) or Template Makefile Build Process” on page 59-18.

## Build Models from a Windows Command Prompt Window

This example shows how to build models by using a batch file, entering commands at the Command Prompt in Windows®.

### About MATLAB Command-Line (Start Up) Arguments

When you start MATLAB® from a Command Prompt in Windows (as done in a batch file), you can control MATLAB start up with a number of command-line arguments.

For a description of these command-line arguments, in the Command Prompt window, type `matlab -help`.

To start MATLAB from a Command Prompt window, use these steps:

- 1 From the Windows Start menu, open a Command Prompt window.
- 2 From the Windows Command Prompt, type: `matlab`.

**Tip:** To display the path to the MATLAB root folder, at the MATLAB command prompt type: `matlabroot`.

### Run MATLAB with a Batch File

When you run MATLAB with a batch file, you can:

- Control MATLAB start up with command-line arguments
- Run a series of operating system commands (such as source control checkout/commit)
- Run a series of MATLAB scripts

A batch approach also lets you automate your overall build process. Such a process can generate code from one or more Simulink® models, then use your makefile to compile custom code and generated code.

This batch file sets the `MATLABROOT` environment variable, sets the `PATH` environment variable to include `MATLABROOT`, and starts MATLAB with an input script argument `%1` and a logfile argument.

**Note:** Customize the `MATLABROOT` value in the batch file to match your system. The batch file assumes that a `c:\temp` folder exists on your system.

### Create a batch file named `mat.bat`

```
SET MATLABROOT="C:\Program Files\MATLAB\R2019a"
PATH=%MATLABROOT%;%PATH%
START matlab.exe -batch %1 -logfile c:\temp\logfile
PAUSE
```

### Create a MATLAB script `myFilesToBuild.m`

```
my_rtwdemo_counter_builder
my_rtwdemo_rtwintro_builder
exit
```

### Create a MATLAB script `my_rtwdemo_counter_builder.m`

```
open_system('rtwdemo_counter');
save_system('rtwdemo_counter','my_rtwdemo_counter')
slbuild('my_rtwdemo_counter');
close_system('my_rtwdemo_counter');
```

### Create a MATLAB script `my_rtwdemo_rtwintr_builder.m`

```
open_system('rtwdemo_rtwintr');
save_system('rtwdemo_rtwintr','my_rtwdemo_rtwintr')
slbuild('my_rtwdemo_rtwintr');
close_system('my_rtwdemo_rtwintr');
```

### Run the batch file

From the Windows Start menu, open a Command Prompt window, change folders to the folder containing the batch file, and type:

```
mat myFilesToBuild
```

When you run the batch file with the input MATLAB script, the batch file runs MATLAB and loads, builds, and closes each of the example Simulink models.

### Observe the log of MATLAB operations

After the batch file runs, view the `c:\temp\logfile` file.

Omitting the semicolon (;) from the `slbuild` line in each script provides more build information in the log file.

### Optimize Your Batch File

Use the MATLAB command-line arguments to optimize the batch file. For example:

- Suppress the MATLAB splash screen on startup with the `-nosplash` argument.
- Provide command-line input to the input script or function selected with the `-batch` argument.

You can call a function `myfile.m`, which accepts two arguments:

```
matlab -batch myfile(arg1,arg2)
```

To pass numeric values into `myfile.m`, replace `arg1` and `arg2` with numeric values.

To pass string or character values into `myfile.m`, replace `arg1` and `arg2` with the string or character values surrounded in single quotes. For example, to pass the string values `hello` and `world` into `myfile.m`, in the Command Prompt window, type:

```
matlab -batch myfile('hello','world')
```

## Rebuild a Model

If you update generated source code or makefiles manually to add customizations, you can rebuild the files with the `rtwrebuild` command. This command recompiles the modified files by invoking the generated makefile. Alternatively, you can rebuild from the Model Explorer:

- 1 Open the Model Explorer
- 2 In the **Model Hierarchy** pane, expand the node for the model.
- 3 Click the **Code for *model*** node.
- 4 In the **Code** pane, next to **Code Recompile Command**, click **rebuild generated code**.

### More About

- `rtwrebuild`
- “Build Process Workflow for Real-Time Systems”

## Control Regeneration of Top Model Code

When you rebuild a model, by default, the build process performs checks to determine whether changes to the model or relevant settings require regeneration of the top model code. The model build regenerates top model code if any of the following conditions is true:

- The structural checksum of the model has changed.
- The top-model-only checksum has changed. The top-model-only checksum provides information about top model parameters, such as application lifespan, maximum stack size, make command, verbose and `.rtw` file debug settings, and `TLCOptions`.
- Any of the following TLC debugging configuration parameters is selected:
  - **Start TLC debugger when generating code** (`TLCDebug`)
  - **Start TLC coverage when generating code** (`TLCCoverage`)
  - **Enable TLC assertion** (`TLCAssert`)
  - **Profile TLC** (`ProfileTLC`)

Whether the top model code is regenerated, the build process calls the build process hooks and reruns the makefile. The hooks include the `STF_make_rtw_hook` functions and the post code generation command. This process recompiles and links the external dependencies.

System target file authors can perform actions related to code regeneration in the `STF_make_rtw_hook` functions that the build process calls. These actions include forcing or reacting to code regeneration. For more information, see “Control Code Regeneration Using `STF_make_rtw_hook.m`” on page 93-27.

### Regeneration of Top Model Code

If the checks determine that top model code generation is required, the build process fully regenerates and compiles the model code. An example check is whether previously generated code is not current due to a model update.

The build process omits regeneration of the top model code when the checks indicate both:

- The top model generated code is current for the model.
- Model settings do not require full regeneration.

This omission can significantly reduce model build times.

With an Embedded Coder license, if you modify a code generation template (CGT) file then rebuild your model, the code generation process does not force a top model build. In this case, see “Force Regeneration of Top Model Code” on page 59-41.

### Force Regeneration of Top Model Code

If you want to control or override the default top model build behavior, use one of the following command-line options:

- To ignore the checksum and force regeneration of the top model code:

- `slbuild(model, 'ForceTopModelBuild', true)`
- `slbuild(model, 'StandaloneCoderTarget', 'ForceTopModelBuild', true)`
- To clean the model build area enough to trigger regeneration of the top model code at the next build (slbuild only):  
    `slbuild(model, 'CleanTopModel')`

You can also force regeneration of the top model code by deleting the `slprj` folder in the “Code generation folder”. If you delete the `slprj` folder, delete the `model.slxc` file too.

`codebuild`

## More About

- “Control Code Regeneration Using `STF_make_rtw_hook.m`” on page 93-27
- “Approaches for Building Code Generated from Simulink Models” on page 59-11
- “Rebuild a Model” on page 59-40
- “Reduce Build Time for Referenced Models by Using Parallel Builds” on page 59-43

## Reduce Build Time for Referenced Models by Using Parallel Builds

For models that contain large model reference hierarchies, you can reduce code generation and compilation time by building the referenced models in parallel. With Parallel Computing Toolbox software, you can distribute the code generation and compilation for referenced models across a parallel pool of MATLAB workers. If you also have MATLAB Parallel Server™ software, you can distribute the code generation and compilation across remote workers in your MATLAB Parallel Server configuration.

### Build Referenced Models in Parallel

To build referenced models in parallel:

- 1 Open the Configuration Parameters dialog box for the top model of the model hierarchy.
- 2 Select the **Enable parallel model reference builds** check box.
- 3 For each MATLAB worker, you can set up a MATLAB environment that is consistent with the MATLAB environment of the client. From the **MATLAB worker initialization for builds** drop-down list, select one of these values:
  - **None** -- Simulink does not initialize workers.
  - **Copy base workspace** -- Simulink attempts to copy the base workspace to each MATLAB worker.
  - **Load top model** -- Simulink loads the top model onto each MATLAB worker.
- 4 Build your model from the command line or the Simulink Editor Code perspective:
  - **Command line** -- Use, for example, `slbuild`. The build process displays build log messages in the Command Window.
  - **Simulink Editor Code perspective** -- Click the **Build** button. The build process displays build log messages in the Diagnostic Viewer.

If the Parallel Computing Toolbox parallel preference **Automatically create a parallel pool** is selected, a parallel pool of MATLAB workers is automatically started. For more information, see “Specify Your Parallel Preferences” (Parallel Computing Toolbox).

If a parallel pool of MATLAB workers is not running when you build your model, MATLAB automatically opens a parallel pool of workers by using the default cluster profile. To change the default behaviour of the worker cluster, you can modify properties of the cluster profile. If you have not touched your parallel preferences, the default profile is `local`. Control parallel behavior with the parallel preferences, including scaling up to a cluster, automatic pool creation, and preferred number of workers. For more information, see “Discover Clusters and Use Cluster Profiles” (Parallel Computing Toolbox).

For more general information about parallel computing, see “Run MATLAB Functions with Automatic Parallel Support” (Parallel Computing Toolbox).

### Monitor Parallel Building of Referenced Models

Through the Build Status window, you can:

- View the overall build progress for a model hierarchy.
- View the build status of individual models in the model hierarchy.
- Cancel the parallel build process.

---

**Note** The Build Status window supports only parallel building of model hierarchies. Do not use the Build Status window for serial builds.

---

To open the Build Status window, use one of these line commands:

- `coder.buildstatus.open('model')`
- `slbuild('model', ... 'OpenBuildStatusAutomatically',true)`
- `slbuild('model','StandaloneCoderTarget', ... 'OpenBuildStatusAutomatically',true)`

This example shows how you can monitor the build process for a model hierarchy. In the hierarchy, `rtwdemo_parabuild_a_1` references `rtwdemo_parabuild_b_1`, `rtwdemo_parabuild_b_2`, and `rtwdemo_parabuild_b_3`.

- 1 Copy the model files to a local folder.

```
src_dir = ...
 fullfile(matlabroot,'toolbox','rtw','rtwdemos');
if exist(fullfile('.', 'myTempFolder'),'dir')
 rmdir('myTempFolder','s')
end
mkdir myTempFolder

copyfile(fullfile(src_dir,'rtwdemo_parabuild_a_1.slx'), ...
 'myTempFolder');
copyfile(fullfile(src_dir,'rtwdemo_parabuild_b_1.slx'), ...
 'myTempFolder');
copyfile(fullfile(src_dir,'rtwdemo_parabuild_b_2.slx'), ...
 'myTempFolder');
copyfile(fullfile(src_dir,'rtwdemo_parabuild_b_3.slx'), ...
 'myTempFolder');

cd myTempFolder
```

- 2 Open the top model.

```
open_system('rtwdemo_parabuild_a_1')
```

- 3 View the model dependencies with the Dependency Analyzer.

On the **Modeling** tab, click on the down arrow to expand the **Design** gallery. Under **Dependencies**, click **Dependency Analyzer**.

- 4 Start parallel building of the model hierarchy and open the Build Status window.

```
slbuild('rtwdemo_parabuild_a_1','OpenBuildStatusAutomatically',true)
```

The Build Status window displays the overall build progress and the build status for models as the code generator works through the model hierarchy.

Model Name	Status	Elapsed Time
rtwdemo_parabuild_a_1	Building	-
rtwdemo_parabuild_b_1	Completed	00:00:23
rtwdemo_parabuild_b_2	Completed	00:00:23
rtwdemo_parabuild_b_3	Completed	00:00:23

This table explains the **Status** column values.

Status	Description
Blocked	The code generator cannot schedule the model build because the build is blocked by dependencies. For example, a child model build is not complete.
Scheduled	In parallel building, the code generator schedules a model build when the build is not blocked by dependencies. The status of the model build is Scheduled until a parallel pool worker becomes available.
Building	The model is being built on a worker.
Completed	When a model is built without errors, the status changes to Completed.
Error	If the model build fails, the status changes to Error.

Status	Description
Up To Date	Code generation is not required for the model because the current generated code is up to date.
Canceling	When you click the <b>Cancel Build</b> button, the build process changes the status of incomplete builds to <b>Canceling</b> .
Canceled	The canceling operation is complete.

The **Elapsed Time** column shows the build times for models in the hierarchy. To reduce the total build time, analyse the build times for referenced models together with model dependency information. Then, consider, for example:

- Restructuring the referenced model hierarchy.
- Increasing the number of workers in the parallel pool.

## Relocate or Share Generated Code

To relocate or share static and generated code files, you can use the `packNGo` function. For example, use the function when you want to relocate generated code to a development environment that does not provide MATLAB and Simulink products.

### Package and Relocate Generated Code

To package generated code:

- 1 In the Configuration Parameters dialog box, select **Package code and artifacts**. This option configures the build process to run the `packNGo` function after code generation.
- 2 In the **Zip file name** field, enter the name of the ZIP file in which you want to package the generated code and artifacts. You can specify the file name with or without the `.zip` extension. If you do not specify an extension or an extension other than `.zip`, the ZIP utility adds the `.zip` extension. If you do not specify a value, the build process uses the name `model.zip`, where `model` is the name of the top model.

- 3 Apply the changes and then generate code for your model.

- 4 Verify that the packaged code is ready for relocation by using a ZIP tool to inspect the resulting ZIP file.

Relocate the ZIP file to the destination development environment and use a ZIP tool to unpack the file. To compile the unpacked code, use a build tool.

If the destination environment provides Simulink Coder or Embedded Coder, you can use `codebuild` to compile the unpacked code.

## Package and Relocate Generated Code From Command Line

To package and relocate generated code by using line commands, use this workflow:

- 1 Select a structure for the zip file. on page 59-49
- 2 Select a name for the zip file. on page 59-50
- 3 Package the model code files in the zip file. on page 59-50
- 4 Inspect the generated zip file. on page 59-51
- 5 Relocate and unpack the zip file. on page 59-51

### Select a Structure for the ZIP File

Before you generate and package the files for a model build, decide whether you want the files to be packaged in a flat or hierarchical folder structure. By default, the `packNGo` function packages the files in a single, flat folder structure.

If...	Then Use a...
You are relocating files to an IDE that does not use the generated makefile, or the code is not dependent on the relative location of required static files	Single, flat folder structure
The destination development environment must maintain the folder structure of the source environment because it uses the generated makefile, or the code depends on the relative location of files	Hierarchical structure

If you use a hierarchical structure, the `packNGo` function creates two levels of zip files, a primary zip file, which in turn contains the following secondary zip files:

- `mlrFiles.zip` — files in your `matlabroot` folder tree
- `sDirFiles.zip` — files in and under your build folder where you initiated code generation for the model
- `otherFiles.zip` — required files not in the `matlabroot` or `start` folder trees

Paths for the secondary zip files are relative to the root folder of the primary zip file, maintaining the source development folder structure.

## Select a Name for the Zip File

By default, the `packNGo` function names the primary zip file `model`. You have the option of specifying a different name. If you specify a file name and omit the file type extension, the function appends `.zip` to the name that you specify.

## Package Model Code in a Zip File

Package model code files by using the `PostCodeGenCommand` configuration parameter, `packNGo` function, and build information object for the model. You can set up the packaging operation to use:

- A system generated build information object.

In this case, before generating the model code, use `set_param` to set the configuration parameter `PostCodeGenCommand` to an explicit call to the `packNGo` function. For example:

```
set_param(bdroot, 'PostCodeGenCommand', 'packNGo(buildInfo);');
```

After generating and writing the model code to disk and before generating a makefile, this command instructs the build process to evaluate the call to `packNGo`. This command uses the system generated build information object for the currently selected model.

- A build information object that you construct programmatically.

In this case, you could use other build information functions to include paths and files selectively in the build information object that you then specify with the `packNGo` function. For example:

```
.
.
.
myModelBuildInfo = RTW.BuildInfo;
addSourceFiles(myModelBuildInfo, {'test1.c' 'test2.c' 'driver.c'});
.
.
.
packNGo(myModelBuildInfo);
```

The following examples show how you can change the default behavior of `packNGo`.

To...	Specify...
Change the structure of the file packaging to hierarchical	<code>packNGo(buildInfo, 'packType' 'hierarchical');</code>
Rename the primary zip file	<code>packNGo(buildInfo, 'fileName' 'zippedsrcs');</code>
Change the structure of the file packaging to hierarchical and rename the primary zip file	<code>packNGo(buildInfo, 'packType' 'hierarchical'... 'fileName' 'zippedsrcs');</code>
Include header files found on the include path in the zip file	<code>packNGo(buildInfo, 'minimalHeaders' false);</code>
Generate warnings for parse errors and missing files	<code>packNGo(buildInfo, 'ignoreParseError' true... 'ignoreFileMissing' true);</code>

**Note** The `packNGo` function can modify the build information in the `RTW.BuildInfo` object that is passed as the first argument of the function. The function might find additional files from source and include paths recorded in build information for the model and add that information to the `RTW.BuildInfo` object.

## Inspect Generated ZIP File

To verify that the generated ZIP file is ready for relocation, use a ZIP tool to inspect the file. Some ZIP tools allow you to view the file contents without unpacking the file. If unpacking is required and the model code files are packaged as a hierarchical structure, you have to unpack the primary and secondary ZIP files. When you unpack the secondary ZIP files, relative paths of the files are preserved.

## Relocate and Unpack ZIP File

Relocate the ZIP file to the destination development environment and use a ZIP tool to unpack the file. To compile the unpacked code, use a build tool.

If the destination environment provides Simulink Coder or Embedded Coder, you can use `codebuild` to compile the unpacked code.

## Code Packaging Example

This example shows how to package code files generated for the example model `rtwdemo_rtwinintro`:

- 1 Set your working folder to a writable folder.
- 2 Open the model `rtwdemo_rtwinintro` and save a copy to your working folder.
- 3 In the Command Window, enter:
 

```
set_param('rtwdemo_rtwinintro', 'PostCodeGenCommand',...
'packNGo(buildInfo, 'packType' 'hierarchical'));
```
- 4 Generate code for the model.
- 5 Inspect the generated ZIP file, `rtwdemo_rtwinintro.zip`. The ZIP file contains two secondary ZIP files, `mLrFiles.zip` and `sDirFiles.zip`.
- 6 Inspect `mLrFiles.zip` and `sDirFiles.zip`.
- 7 Relocate the ZIP file to your destination folder and unpack it.
- 8 To compile the unpacked code, use the `codebuild` function.

## Limitations

### packNGo Function

For information about limitations that apply to this function, see `packNGo`.

### Executable File with Nondefault Extension

If a build process uses the template makefile approach, then `packNGo` uses the executable file extension specified by the linker tool to determine binary artifacts that require packaging.

If you generate an executable file with an extension that is not a default value, check that the extension is saved in the toolchain associated with the template makefile. For more information, see “Associate the Template Makefile with a Toolchain”.

If the build process generates an executable file with an extension that is different from the extension saved in the toolchain, `packNGo` does not package the executable file.

# Compile and Debug Generated C Code with Microsoft Visual Studio

This example shows how to generate code from a model and produce a Visual Studio® Solution. For the base example, see `rtwdemo_counter`.

## About This Example

Building this example model generates a Visual Studio Solution. These model configuration parameter settings control this code generation:

- Set **System target file** to `grt.tlc`.
- Set **Template makefile** to `RTW.MSVCCBuild`.

When you build the model with this configuration, Simulink® Coder™ generates code in a Visual Studio Solution. Add this solution to a Visual Studio C/C++ project to integrate generated code with your custom Visual Studio code.

## Before You Start

- This example builds code for Microsoft® Visual Studio running on Microsoft Windows® platforms.
- This example works with Microsoft Visual Studio, but not with Visual Studio Express.
- Simulink Coder uses the GRT code format, which is intended for rapid prototyping.
- Embedded Coder® uses the ERT code format, which is intended for production deployment.

## Example Steps

- 1 Open the example model `rtwdemo_counter_msvc`. In the Command Window, type:  
`open_system('rtwdemo_counter_msvc');`
- 2 To generate debug output in the generated Visual Studio Solution, set the model configuration parameter **Make command** to `make_rtw DEBUG_BUILD=1`. (Omit this step if debug output is not required in the solution.)
- 3 To generate code and build a program executable, initiate the build process.
- 4 After the build process is complete, you can see a Visual Studio Solution was generated and placed in the `msvc` folder under folder `rtwdemo_counter_msvc_grt_rtw`.
- 5 In Microsoft Visual Studio, open the `rtwdemo_counter_msvc.sln` solution file.

Use the solution to build and debug the generated code in Visual Studio.

## Executable Program Generation

The following figure shows how the process for program building.

During the final stage of processing, the build process invokes the generated makefile, *model.mk*, which in turn compiles and links the generated code. On PC platforms, a batch file is created to invoke the generated makefile. The batch file sets up the environment for invoking the make utility and related compiler tools. To avoid recompiling C files, the make utility performs date checking on the dependencies between the object and C files; only out-of-date source files are compiled. Optionally, the makefile can download the resulting executable image to your target hardware.

This stage is optional, as illustrated by the control logic in the preceding figure. You could choose to omit this stage (for example, if you are targeting an embedded microcontroller board).

To omit this stage of processing, in the Configuration Parameters dialog box, select the **Generate code only** check box. You can then cross-compile your code and download it to your target hardware.

If you also select the **Create code generation report** check box, the code generator produces an HTML report. To view the report, on the **C Code** tab, select **Open Latest Report**. This example is a code generation report for a generic real-time (GRT) system target file.

## External Mode Simulations for Parameter Tuning, Signal Monitoring, and Code Execution Profiling

You can use external mode simulations for rapid prototyping. An external mode simulation establishes a communication channel between Simulink on your development computer (host) and the target hardware that runs the executable file created by the code generation and build process.

Through the communication channel, you can:

- Modify or tune block parameters in real time. When you change parameters in your model, Simulink downloads the new values to the executing target application.
- Monitor and save signal data from the executing target application.
- Retrieve execution-time metrics if code execution profiling is enabled for the external code simulation.

The low-level transport layer of the channel handles the transmission of messages. Simulink and the generated model code are independent of this layer. The transport layer and its interface code are isolated in separate modules that format, transmit, and receive messages and data packets.

## Communication Mechanisms for External Mode

Simulink supports two communication mechanisms for external mode simulation. To decide which mechanism to use, see the information in this table.

Communication Mechanism	Supports	Reasons for Selecting Communication Mechanism
XCP, the Universal Measurement and Calibration Protocol	ERT and GRT system target files.  Some Simulink support packages. For details, see <a href="https://www.mathworks.com/hardware-support.html?q=&amp;page=1">https://www.mathworks.com/hardware-support.html?q=&amp;page=1</a> .	XCP external mode: <ul style="list-style-type: none"> <li>• Uses a standard communication protocol.</li> <li>• Requires only a lightweight communication software stack on the target hardware.</li> <li>• Supports signal logging and streaming for Dashboard blocks and the Simulation Data Inspector. You can stream signals from within a referenced model hierarchy.</li> <li>• Provides documented <code>ext_mode.h</code> API for external mode target connectivity.</li> <li>• Supports streaming of execution-time metrics to the Simulation Data Inspector for host-based and support package external mode simulations.</li> </ul> For information about running XCP external mode simulations, see: <ul style="list-style-type: none"> <li>• “External Mode Simulation by Using XCP Communication” on page 60-8</li> <li>• “Customize XCP Server Software” on page 60-44</li> </ul>
TCP/IP and serial (RS-232)	ERT, GRT, and RSim system target files.  Simulink support packages.	XCP external mode simulations do not support your target hardware because of known limitations.  For information about running TCP/IP and serial external mode simulations, see: <ul style="list-style-type: none"> <li>• “External Mode Simulation with TCP/IP or Serial Communication” on page 60-54</li> <li>• “Create a Transport Layer for TCP/IP or Serial External Mode Communication” on page 60-93</li> </ul>

## Simulink Feature Support for External Mode

This table summarizes feature support for both forms of external mode simulations.

Feature		XCP Support	TCP/IP and Serial Support
Parameter tuning	With Dashboard blocks	Yes	Yes

Feature		XCP Support	TCP/IP and Serial Support
	Of tunable block parameters	Yes	Yes
Simulation Data Inspector		Yes. Includes signals within referenced models.	No
Logic Analyzer		Yes. Includes signals within referenced models.	No
Blocks that receive and display signals from target application	Dashboard library	Yes	No
	Floating Scope, Scope	Yes	Yes
	Spectrum Analyzer, Time Scope (DSP System Toolbox)	Yes	Yes
	Display	Yes	Yes
	To Workspace	Yes	Yes
	User-written S-Function.  A method, which enables user-written blocks to support external mode, is built into the S-function API.  See <code>matlabroot/simulink/include/simstruc.h</code> .	Yes	Yes
	Record, XY Graph	Yes	Yes
Signal Viewing Subsystem on page 60-73		Yes	Yes

## External Mode Simulations by Using the Run on Custom Hardware App

To run external mode simulations on your development computer or target hardware that is not supported by MathWorks support packages, use the Run on Custom Hardware app. For an external mode simulation, you:

- 1 Build the target application on your development computer.
- 2 Deploy the target application to the target hardware.
- 3 Connect Simulink to the target application that runs on the target hardware.
- 4 Start execution of generated code on the target hardware.

With the app, you can perform the steps separately or by using one-click. This table shows the workflow support that the app provides for your target hardware.

Workflow Feature or Task		Target Hardware	
		Development Computer	Custom Hardware
One-click 		Yes	Yes, if you set up connectivity on page 60-34 between Simulink and your target hardware.
Step-by-step	<b>Build for Monitoring</b> 	Yes	Yes. Software builds target application on development computer by using the toolchain that you specify.
	<b>Deploy</b> 	Yes	Yes, if you set up connectivity on page 60-34 between Simulink and your target hardware.
	<b>Connect</b> 	Yes	Yes
	<b>Start</b> 	Yes	Yes

## External Mode Control Panel

Using the External Mode Control Panel, you can perform some of the functions that the Run on Custom Hardware app provides, for example, **Connect**, **Start**, and **Disconnect**. You can also open the External Signal & Triggering dialog box, which enables you to:

- Select logged signals that you want to monitor.
- Configure a trigger for uploading target application data.

For details, see XCP panel on page 60-27 or TCP/IP and serial panel on page 60-60.

## Security for External Mode Simulations

Ensure that access to your development computer and the target hardware is secure.

Provide a secure communication channel between your development computer and the target application by applying the security measures listed in this table.

Communication Protocol	Security Measure
XCP on TCP/IP, TCP/IP	Run your development computer and target application within a trusted private network or virtual private network (VPN).
XCP on serial, serial	Use a point-to-point link between your development computer and target application, for example, a serial cable.

Before generating code for production, to reduce the risk of unintended access to the target application, disable external mode settings.

## External Mode Simulation by Using XCP Communication

In an external mode simulation, you can tune parameters in real time and monitor target application signals. Using the Run on Custom Hardware app, you can set up and run on your development computer or custom hardware external mode simulations that use an XCP communication channel.

For an external mode simulation, you:

- 1 Build the target application on your development computer.
- 2 Deploy the target application to the target hardware.
- 3 Connect Simulink to the target application that runs on the target hardware.
- 4 Start execution of generated code on the target hardware.

### Run XCP External Mode Simulation on Development Computer

Configure and run an external mode simulation that uses the XCP communication protocol. During the simulation:

- Monitor a signal by using a Scope block, a Dashboard block, and the Simulation Data Inspector.
- Tune a parameter by using a Dashboard block.

#### Configure Signal Monitoring and Parameter Tuning for XCP

- 1 Create a folder for this example.

```
mkdir ext_mode_xcp_example
cd ext_mode_xcp_example
```

- 2 Open Simulink and create a simple model, `xcpExample`, which contains these blocks:
  - Sine Wave
  - Gain
  - Scope
  - Half Gauge
  - Knob
- 3 Double-click the Sine Wave block. Set **Sample time** to 0.1, and then click **OK**.
- 4 Double-click the Gain block. Set **Gain** to 2, and then click **OK**.
- 5 Connect the Sine Wave block to the Gain block and name the connection, for example, `Test Signal`.
- 6 Connect the Gain block to the Scope block and name the connection, for example, `Output Signal`.
- 7 Configure `Test Signal` for logging:
  - a Select `Test Signal`.
  - b On the **Signal** tab, in the **Monitor** section, select **Log Signals**.

If you do not enable signal logging, you cannot stream `Test Signal` to the Simulation Data Inspector.

- 8 Configure the Half Gauge block to monitor the value of Test Signal:
  - a Double-click the Half Gauge block.
  - b In the Simulink Editor, select Test Signal.
  - c In the Block Parameters dialog box:
    - Connect the block to Test Signal.
    - In the **Maximum** field, enter a value, for example, 1.
  - d Click **OK**.
- 9 Configure the Knob block to tune the **Amplitude** parameter of the Sine Wave block:
  - a Double-click the Knob block.
  - b In the Simulink Editor, select the Sine Wave block.
  - c In the Block Parameters dialog box:
    - Connect the block to the **Amplitude** parameter of the Sine Wave block.
    - In the **Minimum** and **Maximum** fields, enter values, for example, 0.1 and 1 respectively.
  - d Click **OK**.
- 10 Save the model as xcpExample.

### Specify Hardware and Prepare Model

- 1 From the **Apps** tab on the Simulink toolstrip, in the **Setup to Run on Hardware** section, click **Run on Custom Hardware**. On the Run on Custom Hardware pop-up dialog box, click **Finish**.
- 2 In the **Hardware** section, specify the system target file. For this example, use the default, `grt.tlc`. If you have Embedded Coder, you can specify `ert.tlc`.
- 3 In the **Prepare** gallery, under **Model Configuration**, click **Hardware Settings**. The Configuration Parameters dialog box opens, displaying **Hardware Implementation** settings that are determined by the system target file.
- 4 On the **Solver** pane:

- a In the **Type** field, specify **Fixed-step**.
- b Under **Solver details**, in the **Fixed-step size** field, specify a value, for example, 0.1.
- 5 On the **Code Generation > Optimization** pane, set **Default parameter behavior** to **Tunable**.
- 6 On the **Code Generation > Interface** pane, select the **External mode** check box.
- 7 Set **Transport layer** to **XCP on TCP/IP**, which:
  - Specifies `ext_xcp` for **MEX-file name**.
  - Selects the **Automatically allocate static memory** check box.
  - Enables **Maximum duration**. For this example, use the default value.
- 8 If **System target file** is `ert.tlc`, on the **Code Generation > Templates** pane:
  - Select the **Generate an example main program** check box.
  - Set **Target operating system** to **BareBoardExample**.

Using the documented APIs of the external mode abstraction layer that are available in `matlabroot\toolbox\coder\xcp\src\target\ext_mode\include\ext_mode.h`, the code generator creates an example that shows how you can provide XCP external mode target connectivity for a bare board that does not run an operating system.

- 9 Click **OK**. Then save the model.

### Build and Run Target Application

In the **Run on Hardware** section:

- 1 To specify a nondefault value for the simulation stop time, in the **Stop Time** field, specify your value, for example, `inf`.

- 2 . The software:

- a Builds the target application:
  - In Windows, the build process creates:
    - `xcpExample.exe` -- The executable file.
    - `xcpExample.pdb` -- A debugging symbols file for signals and parameters.
  - In Linux, the build process places DWARF format debugging information in the created ELF executable file, `xcpExample`.
- b Runs the target application as separate process on your development computer.
- c Connects Simulink to the target application.
- d Runs the generated model code.

To perform the steps separately, click **Monitor & Tune**. Under **Step By Step Commands**, click:

- a **Build for Monitoring** 

- b **Deploy** 

### Monitor Signal and Tune Parameter

You can monitor Test Signal through the:

- Scope block -- Double-click the block.
- Simulation Data Inspector -- Click the Simulation Data Inspector button. When the Simulation Data Inspector opens, select the **Test Signal** check box, which displays streamed data.
- Half-Gauge block.

To change the amplitude of the sine wave, rotate the pointer on the Knob block to the required value.

This table describes more ways of tuning tunable block parameters during a simulation.

Approach	Details
Model Data Editor	<p>To tune parameters through the Model Data Editor:</p> <ol style="list-style-type: none"> <li><b>1</b> On the <b>Hardware</b> tab of the Simulink Editor, in the <b>Prepare</b> section, click <b>Tune Parameters</b>, which opens the Model Data Editor.</li> <li><b>2</b> If you want to update multiple tunable parameters simultaneously, in the <b>Prepare</b> section, toggle on <b>Hold Updates</b>.</li> <li><b>3</b> On the <b>Parameters</b> tab of the Model Data Editor, in the <b>Value</b> column, specify new values for your tunable parameters.</li> <li><b>4</b> Toggle off <b>Hold Updates</b> or click <b>Update All Parameters (Ctrl+D)</b>. Simulink downloads the new values to the target application simultaneously.</li> </ol> <p>If <b>Hold Updates</b> is off, then immediately after you specify a new value, Simulink downloads the new value to the target application.</p> <p>For more information, see <b>Model Data Editor</b>.</p>

Approach	Details
Block Parameter dialog box	<p>To tune parameters through the Block Parameter dialog box:</p> <ol style="list-style-type: none"> <li><b>1</b> For each block that you want to update:               <ol style="list-style-type: none"> <li><b>a</b> Double-click the block, which opens the Block Parameter dialog box.</li> <li><b>b</b> In the parameter fields, specify new parameter values.</li> <li><b>c</b> Click <b>Apply</b> or <b>OK</b>.</li> </ol> </li> <li><b>2</b> If <b>Hold Updates</b> is on, toggle off <b>Hold Updates</b> or click <b>Update All Parameters (Ctrl+D)</b>. Simulink downloads the new values to the target application simultaneously.               <p>If <b>Hold Updates</b> is off, then immediately after you click <b>Apply</b> or <b>OK</b>, Simulink downloads the new block values to the target application.</p> </li> </ol>
MATLAB workspace	<p>If block parameters are MATLAB workspace variables:</p> <ol style="list-style-type: none"> <li><b>1</b> In the Command Window, assign new values to the variables.</li> <li><b>2</b> On the <b>Hardware</b> tab of the Simulink Editor, in the <b>Prepare</b> section, click <b>Update All Parameters (Ctrl+D)</b>. Simulink downloads the new values to the target application.</li> </ol> <p>For more information, see “Create and Edit Variables”.</p>

For more information about parameter tuning with generated code, see “External Mode Simulation with TCP/IP or Serial Communication” on page 60-54 and “Create Tunable Calibration Parameter in the Generated Code” on page 36-111.

If your model contains a Stateflow chart, you can view state activity. For more information, see “Animate Stateflow Charts” (Stateflow).

### Stop Target Application

To stop the execution of generated model code before `StopTime` is reached and disconnect the target application, on the Simulink Editor toolbar, click the Stop button .

If you want to disconnect the target application from Simulink without stopping code execution, click . Then, under **Step By Step Commands**, click **Disconnect**.

## Triggered Signal Monitoring for XCP External Mode Simulations

For XCP external mode simulations, you can configure a trigger that starts the uploading of target application data for signal monitoring in Simulink.

### 1 Create a simple model in a local folder.

In the Command Window, enter these commands:

```
% Create work folder
if mkdir('workFolder')
 rmdir('workFolder' 's')
 mkdir('workFolder')
end
cd workFolder
open_system(new_system('myModel'));

% Add, configure, and connect blocks
add_block('simulink/Sources/Sine Wave','myModel/Signal',...
 'Bias','5',...
 'Amplitude','2',...
 'SampleTime','0.01');
set_param('myModel/Signal','position',[140,80,180,120]);

add_block('simulink/Math Operations/Gain','myModel/Signal Gain',...
 'Gain','2');
set_param('myModel/Signal Gain','position',[340,80,380,120]);
add_line('myModel','Signal/1','Signal Gain/1');

% Label signal
signal=get_param('myModel/Signal','PortHandles');
set_param(signal.Outport(1),'Name','test_signal');

% And so on
add_block('simulink/Math Operations/Product','myModel/Product');
set_param('myModel/Product','position',[540,160,580,200]);
add_line('myModel','Signal Gain/1','Product/1');

add_block('simulink/Sources/Sine Wave','myModel/Carrier',...
 'Bias','5',...
 'Amplitude','10',...
 'Frequency','3',...
 'SampleTime','0.02');

set_param('myModel/Carrier','position',[140,240,180,280]);

add_block('simulink/Math Operations/Gain','myModel/Carrier Gain');
set_param('myModel/Carrier Gain','position',[340,240,380,280]);
add_line('myModel','Carrier/1','Carrier Gain/1');

signal=get_param('myModel/Carrier','PortHandles');
set_param(signal.Outport(1),'Name','test_carrier');

add_block('simulink/Signal Attributes/Rate Transition',...
 'myModel/Rate Transition');
set_param('myModel/Rate Transition','position',[440,200,480,240]);
add_line('myModel','Carrier Gain/1','Rate Transition/1');
add_line('myModel','Rate Transition/1','Product/2');

add_block('simulink/Sources/Constant','myModel/Constant',...
 'Value','0');
set_param('myModel/Constant','position',[340,320,380,360]);

add_block('simulink/Logic and Bit Operations/Relational Operator',...
 'myModel/Relational Operator','Operator','>=');
set_param('myModel/Relational Operator','position',[540,300,580,340]);
add_line('myModel','Carrier Gain/1','Relational Operator/1');
add_line('myModel','Constant/1','Relational Operator/2');

signal=get_param('myModel/Carrier Gain','PortHandles');
```

```

set_param(signal.Outport(1), 'Name', 'pos_carrier');

add_block('simulink/Sinks/Scope', 'myModel/ScopeA');
set_param('myModel/ScopeA', 'position', [740, 160, 780, 200]);
add_line('myModel', 'Product/1', 'ScopeA/1');

signal=get_param('myModel/Product', 'PortHandles');
set_param(signal.Outport(1), 'Name', 'test_output');

add_block('simulink/Sinks/Scope', 'myModel/ScopeB');
set_param('myModel/ScopeB', 'position', [740, 300, 780, 340]);
add_line('myModel', 'Relational Operator/1', 'ScopeB/1');

signal=get_param('myModel/Relational Operator', 'PortHandles');
set_param(signal.Outport(1), 'Name', 'cmp_output');

% Finally, save the model
save_system('myModel');

```

2 In the Simulink Editor, configure these signals for logging by right-clicking each signal and then selecting **Log Selected Signals**:

- test\_signal
- test\_carrier
- test\_output
- cmp\_output

- 3 From the **Apps** tab on the Simulink toolstrip, in the **Setup to Run on Hardware** section, click **Run on Custom Hardware**. On the Run on Custom Hardware pop-up dialog box, click **Finish**.
- 4 In the **Prepare** gallery, under **Model Configuration**, click **Hardware Settings**.
- 5 On the **Solver** pane, in the **Type** field, specify Fixed-step.
- 6 On the **Code Generation > Interface** pane, select the **External mode** check box.
- 7 Set **Transport layer** to XCP on TCP/IP, which specifies ext\_xcp for **MEX-file name**.
- 8 Click **OK**. Then save the model.
- 9 To open the External Signal & Triggering dialog box, from the **Prepare** gallery, under **Signal Monitoring & Tracing**, click **Control Panel**.

- 10** In the **Configuration** section, click **Signal & Triggering**, which opens the External Signal & Triggering dialog box.

Signal selection

Trigger	Selected	Signal	Source Port
	X	test_carrier	myModel/Carrier:1
	X	test_output	myModel/Product:1
	X	cmp_output	myModel/Relational Operator:1
	X	test_signal	myModel/Signal:1

Select all  
 Clear all  
 on  
 off  
 Trigger Signal  
 Go To Signal

Trigger options  
 Source: manual Mode: normal Duration: 1000 Delay: 0  
 Arm when connecting to target  Send multiple contiguous samples in same packet

Trigger signal  
 Direction: rising Level: 0 Hold-off: 0

OK Cancel Help Apply

Through this dialog box, you can select signals for monitoring and configure the trigger for uploading data from the target application. For this example, use the default settings. For example:

- The **Select all** check box is selected — The dialog box displays an X in each row of the **Selected** column. You can monitor all logged signals during the simulation.
- **Source** is set to **manual** -- The External Mode Control Panel provides manual control of data uploading, for example, the **Arm Trigger** button.
- The **Arm when connecting to target** check box is selected — When you connect Simulink to the target application, the trigger is armed.

- 11** Click **OK**.

- 12** From the **Hardware** tab in the Simulink Editor, in the **Run on Hardware** section:

**a** In the **Stop Time** field, specify your value, for example, `inf`.

**b** Save the model.

**c**

Click . The software:

- i Builds the target application:
- ii Runs the target application as separate process on your development computer.
- iii Connects Simulink to the target application.
- iv Runs the generated model code.

To view the scope displays, double-click ScopeA and ScopeB.

To monitor signals in the Simulation Data Inspector, in the **Review Results** section, click the **Data Inspector** button.

From the External Mode Control Panel, you can suspend or resume signal logging and monitoring. In the **Connection and triggering** section, click **Cancel Trigger** or **Arm Trigger** respectively.

To stop the execution of the target application and disconnect Simulink from the target environment, click **Stop Real-Time Code**.

For information about signal monitoring and trigger options, see “XCP External Mode Control Panel” on page 60-27 and “XCP External Signal & Triggering Dialog Box” on page 60-28.

## Run XCP External Mode Simulation From Command Line

You can use commands to run XCP external mode simulations. To retrieve and set the values of model parameters, use the `get_param` and `set_param` commands.

To run these commands, you must have a Simulink model open and a target application running.

- 1 Set the model simulation mode to external mode.

```
set_param(gcs, 'SimulationMode', 'external');
```

- 2 Connect Simulink to the target application.

```
set_param(gcs, 'SimulationCommand', 'connect')
```

- 3 Run generated model code.

```
set_param(gcs, 'SimulationCommand', 'start');
```

- 4 To tune a parameter, change its workspace variable value through a line command. For example, if a block parameter value is specified as a `Simulink.Parameter` object, assign the new value to the `Value` property.

```
myParamObj.Value = 5.23;
```

- 5 To download the new value to the target application, update the model.

```
set_param(gcs, 'SimulationCommand', 'update');
```

- 6 Stop the target application and disconnect Simulink from the target environment.

```
set_param(gcs, 'SimulationCommand', 'stop');
```

To disconnect Simulink from the target application without stopping execution of generated code, use this command:

```
set_param(gcs, 'SimulationCommand', 'disconnect');
```

The `set_param` commands that use the `'SimulationCommand'` argument are asynchronous. If you run the commands successively from a script, each command starts without waiting for the previous

command to complete. To check that each command is complete, in the script, use the `get_param` command with the 'SimulationStatus' argument. For example, for steps 1 to 3, specify these commands in the script:

```
set_param(gcs, 'SimulationMode', 'external');
set_param(gcs, 'SimulationCommand', 'connect');

isExternalSimulationActive = false;
while ~isExternalSimulationActive
 simStatus = get_param(gcs, 'SimulationStatus');
 isExternalSimulationActive = strcmp(simStatus, 'external');
end
set_param(gcs, 'SimulationCommand', 'start');
```

For more information, see “Run Simulations Programmatically”.

The Diagnostic Viewer displays error messages produced by the `get_param` and `set_param` commands.

This table gives parameters that you can use in `get_param` and `set_param` commands.

## XCP External Mode Command-Line Parameters

Parameter and Values	Dialog Box Equivalent	Description
ExtModeArmWhenConnect off, on	External Signal & Triggering: <b>Arm when connecting to target</b> check box	Arm the trigger as soon as the Simulink Coder software connects to the target.
ExtModeBatchMode off, on	External Mode Control Panel: <b>Batch download</b> check box	Enable or disable downloading of parameters in batch mode.
ExtModeConnected off, on	External Mode Control Panel: <b>Connect/Disconnect</b> button	Indicate the state of the connection with the target application.
ExtModeEnableFloating off, on	External Mode Control Panel: <b>Enable data uploading</b> check box	Enable or disable the arming and canceling of triggers when a connection is established with floating scopes.
ExtModeLogAll off, on	External Signal & Triggering: <b>Select all</b> check box	Upload available signals from the target to the host.
ExtModeSendContiguousSamples off, on	External Signal & Triggering: <b>Send multiple contiguous samples in same packet</b> check box	Specify XCP DAQ packed mode for streaming signals to Simulink. Target application sends samples from multiple time steps in a packet. ExtModeTrigDuration determines number of samples sent in the packet.
ExtModeTrigDelay integer (0)	External Signal & Triggering: <b>Delay</b> text field	Specify the amount of time (expressed in base rate steps) that elapses between a trigger occurrence and the start of data collection.
ExtModeTrigDirection character vector - <b>rising</b> , falling, either	External Signal & Triggering: <b>Direction</b> menu	Specify the direction in which the signal must be traveling when it crosses the threshold value.

Parameter and Values	Dialog Box Equivalent	Description
ExtModeTrigDuration <i>integer (1000)</i>	External Signal & Triggering: <b>Duration</b> text field	Specify the number of base rate steps for which external mode logs data after a trigger event.  If ExtModeSendContiguousSamples is on, the number of samples sent in a packet from the target application to Simulink is equal to:  $\text{ExtModeTrigDuration}/n$ where $n = (\text{base rate})/(\text{sample rate})$  For $n=1$ , number of samples sent in a packet is exactly ExtModeTrigDuration value. For subrates in multirate models, number of samples sent in a packet is rounded down to the nearest integer. The target application discards buffer samples that are not sent to Simulink.
ExtModeTrigHoldOff <i>integer (0)</i>	External Signal & Triggering: <b>Hold-off</b> text field	Specify the base rate steps between when a trigger event terminates and the trigger is rearmed.
ExtModeTrigLevel <i>integer (0)</i>	External Signal & Triggering: <b>Level</b> text field	Specify the threshold value the trigger signal must cross to fire the trigger.
ExtModeTrigMode <i>character vector - normal, oneshot</i>	External Signal & Triggering: <b>Mode</b> menu	Specify whether the trigger is to rearm automatically after each trigger event or whether only one buffer of data is to be collected each time the trigger is armed.
ExtModeTrigSignalBlockPath <i>character vector</i>	External Signal & Triggering: In <b>Signal selection</b> view, select signal and then click <b>Trigger Signal</b> button.	Specify the path to the block that contains the output port that provides the trigger signal.
ExtModeTrigSignalOutputPortIndex <i>integer</i>	External Signal & Triggering: In <b>Signal selection</b> view, select signal and then click <b>Trigger Signal</b> button.	Specify the index of the trigger signal output port for the block specified by ExtModeTrigSignalBlockPath.

Parameter and Values	Dialog Box Equivalent	Description
ExtModeTrigType <i>character vector</i> - <code>manual</code> , <code>signal</code>	External Signal & Triggering: <b>Source</b> menu	Specify whether to start logging data when the trigger is armed or when a specified trigger signal satisfies trigger conditions.

## Memory Allocation for Communication Buffers During XCP External Mode Simulation

You do not have to manually determine memory requirements for XCP-based external mode simulations with models that, for example, stream a large amount of data to Simulink or run on low-memory target devices.

Setting **Transport layer** to `XCP` on `TCP/IP` or `XCP` on `Serial` enables these configuration parameters:

- **Automatically allocate static memory** (`ExtModeAutomaticAllocSize`)
- **Maximum duration** (`ExtModeMaxTrigDuration`) — Default is 10 base-rate steps.

The software uses model information, including the **Maximum duration** value, to allocate memory for:

- Internal data structures used by the XCP stack
- Storage of XCP packets

If you clear the **Automatically allocate static memory** check box:

- Memory allocated for internal data structures is a default value.
- You can use the **Static memory buffer size** (`ExtModeStaticAllocSize`) field to specify memory allocated for XCP packets. The default value is 1,000,000 bytes.

If insufficient memory is allocated, the external mode simulation issues an out-of-memory error when it tries to reserve memory for internal data structures or signal streaming. In this case, reselect the **Automatically allocate static memory** check box to enable the software to compute the amount of memory required.

## Target Application Arguments

You can run your target application with optional arguments. You can pass the optional arguments to your target application through your custom launcher implementation.

Argument	Description
<code>-w</code>	Specify that the target application enters and stays in a wait state until it receives a message from Simulink.  If you do not specify <code>-w</code> , the target application executes model code immediately. The model code runs with parameter values from the time when you built the model.

Argument	Description
<code>-tf <i>time</i></code>	<p>Override the model parameter <code>StopTime</code>.</p> <p>Specify <i>time</i> in:</p> <ul style="list-style-type: none"> <li>• Seconds if <code>PurelyIntegerCode</code> is set to 'off'.</li> <li>• Base rate steps if <code>PurelyIntegerCode</code> is set to 'on'.</li> </ul> <p><code>-tf inf</code> specifies that the model runs indefinitely when model code is executed.</p>

For host-based external mode simulations, you can specify additional `rtiostream` on page 88-42 arguments.

Argument	Description
<code>-verbose <i>level</i></code>	<p>Specify verbosity level:</p> <ul style="list-style-type: none"> <li>• 0 -- No information</li> <li>• 1 -- Detailed information</li> </ul>
<code>-port <i>number</i></code>	<p>For XCP on TCP/IP transport layer, specify the port number of the TCP/IP server. Use an integer value between 256 and 65535. Default is 17725.</p> <p>For XCP on Serial transport layer, specify the serial port ID. For example:</p> <p>On Windows, 'COM1' or 1 for COM1, 'COM2' or 2 for COM2, and so on.</p> <p>On Linux, '/dev/ttyS0', and so on.</p>
<code>-baud <i>value</i></code>	<p>For XCP on Serial transport layer, specify the baud value: 1200, 2400, 4800, 9600, 14400, 19200, 38400, 57600 (default), or 115200.</p>

## XCP External Mode Limitations

This table describes limitations that apply to external mode simulations that use XCP communication.

Feature	Details
Parameter updates that change model structure	<p>You cannot change:</p> <ul style="list-style-type: none"> <li>• The number of states, inputs, or outputs of a block</li> <li>• The sample time or the number of sample times</li> <li>• The integration algorithm for continuous systems</li> <li>• The name of the model or of a block</li> </ul> <p>If you make parameter updates that change the model structure, you must rebuild the target application.</p> <p>You can change numerator and denominator polynomial parameters for the Transfer Fcn, Discrete Transfer Fcn, and Discrete Filter blocks if the number of states does not change.</p> <p>You cannot change zero entries in the State-Space, Zero-Pole, and Discrete Zero-Pole blocks in the user-specified or computed parameters, that is, the A, B, C, and D matrices obtained by a zero-pole to state-space transformation.</p> <p>In the State-Space block, if you specify the matrices in the controllable canonical realization, then changes to the A, B, C, and D matrices that preserve this realization and the dimensions of the matrices are allowed.</p> <p>If the Simulink block diagram does not match the target application, Simulink produces an error stating that the checksums do not match. The checksums take into account the top models, but not referenced models. To rebuild the target application, use the updated block diagram.</p>
Signal value display	<p>The graphical display of signal values during a simulation is not supported. For example, you cannot use the <b>Data Display in Simulation</b> menu items <b>Show Value Labels When Hovering</b>, <b>Toggle Value Labels When Clicked</b>, and <b>Show Value Label of Selected Port</b>. For more information, see “Display Signal Values in Model Diagrams”.</p>
Data archiving	<p><b>Data Archiving</b> features available on the <b>External Mode Control Panel</b> are not supported. You can use the Simulation Data Inspector to collect and export data.</p>
Overriding signal logging settings	<p>If you use the Signal Logging Selector to override signal logging settings, the controls to override the <b>Decimation</b> and <b>Limit data points</b> settings are not supported.</p>

Feature	Details
Subsystem signal logging	<p>For external mode simulations, signal logging occurs in response to an event on the target hardware. Currently, the only supported logging event is a new sample time tick. Some subsystems are enabled or disabled by control signals. For these subsystems, the software logs signal values even when the control signals for the subsystems are not enabled.</p> <p>For example, if signals in an Enabled Subsystem block are configured for logging, the software logs the signal values even when the control signal for the subsystem is not greater than zero. In this case, the logged values are the values the signals had when the control signal was last greater than zero.</p> <p>For more information about the subsystems for which this limitation applies, see “Simulink Subsystem Semantics”.</p>
Compiler debug symbol format	<p>Your toolchain must generate debug information in one of these formats:</p> <ul style="list-style-type: none"> <li>• DWARF</li> <li>• PDB</li> </ul>
Global variables	<p>Signals, parameters, and states must be specified as global variables. The target memory locations where the variables are stored must lie in the range 0 - 4294967295.</p>
Parameter structures	<p>You cannot tune parameters that are structures.</p>
Pure integer code	<p>Pure integer code is supported. For code generation, if <code>PurelyIntegerCode</code> is 'on', specify <code>FixedStep</code> with a resolution that is greater or equal to 1 microsecond. For example, specify 1.000001, but not 1.0000001.</p> <p>If you do not specify <code>-tf finalTime</code> in the execution command, the target application runs the generated model code indefinitely, ignoring <code>StopTime</code>.</p> <p>If you specify <code>-tf finalTime</code> in the execution command:</p> <ul style="list-style-type: none"> <li>• The <code>finalTime</code> value represents base rate steps, not seconds.</li> <li>• The maximum value for <code>finalTime</code>, in ticks, is <code>MAX_int32_T</code>.</li> </ul>
Variable-size signals	<p>Uploading of variable-size signals is not supported.</p>
Compiler support	<p><code>lcc-win64</code> is not supported.</p>
Address granularity	<p>Target hardware that uses word addresses is not supported.</p>
Portable word sizes	<p>When the production target hardware is word-addressable, the generation of a host-based target application by using portable word sizes is not supported. The production target hardware must support 8-bit, 16-bit, and 32-bit native data types.</p>

Feature	Details
Scope blocks	If your model uses Scope blocks and the amount of data logged during an external mode simulation becomes very large, Simulink might slow down. Instead of Scope blocks, you can use the Simulation Data Inspector or equivalent blocks from the Dashboard library. For more information, see “Decide How to Visualize Simulation Data”.
Scope and Floating Scope blocks, and Scope Viewer	Some signal data types are not supported. The simulation produces a warning.
Floating Scope blocks and Scope Viewer	You cannot use Floating Scope blocks and Scope Viewers to monitor signals in referenced models during external mode simulations. To monitor referenced model signals, enable signal logging and use the Simulation Data Inspector.
Scopes in referenced models	In a model hierarchy, if the top model runs in external mode, scopes in the referenced models are not displayed. To monitor signals within a referenced model, enable signal logging and use the Simulation Data Inspector.
Scope and Display blocks connected to Simulink message blocks	<p>During external mode simulations, Scope and Display blocks connected to Simulink message blocks do not provide displays.</p> <p>To visualize messages, use the Simulation Data Inspector or Dashboard blocks.</p>
Nonzero simulation start time	Nonzero simulation start times are not supported. Use the default value for <b>Solver &gt; Start time</b> , 0.0.
Intermediate step values	<p>Some Simulink blocks can generate multiple values in a simulation time step. For example:</p> <ul style="list-style-type: none"> <li>• A Simulink Function or Function-Call Subsystem block that is invoked multiple times in a time step.</li> <li>• Iterator subsystem blocks that execute multiple times in a time step.</li> </ul> <p>For each time step in an external mode simulation, Simulink uploads from the target application only the final values of such blocks. Simulink does not upload the intermediate values generated during the step.</p>
Service code interface	Using XCP communication for tuning parameters and monitoring signals as generated code executes in a target environment is not supported for code generated from component models configured with an ERT-based system target file and service code interface.
File-scoped data	<p>File-scoped data is not supported. For example, data items to which you apply the built-in custom storage class <code>FileScope</code>. The simulation produces a warning.</p> <p>For more information about the <code>FileScope</code> storage class, see “Choose Storage Class for Controlling Data Representation in Generated Code” on page 36-75.</p>
Row-major code generation	Code generated with the row-major format is not supported.

Feature	Details																																										
Concurrent execution	<p>On Windows and Linux computers, concurrent execution is supported.</p> <p>On Mac computers, concurrent execution using the native threads example is not supported. If the <b>External mode</b> and <b>Allow tasks to execute concurrently on target</b> check boxes are selected, you cannot build the target application unless you are using a target hardware support package that supports concurrent execution for external mode simulations.</p> <p>On a Windows computer, at run time, the base sample time in the target application is quantized to the nearest multiple of the system timer interrupt interval (usually 15.625 ms). Sampling subrates are the expected multiples of the base sample rate. Logged timestamps in the Simulation Data Inspector (SDI) correspond to simulation times rather than wall-clock times. As an example, this table shows the step times for a Simulink model that has a base sample time of 10 ms and a subrate sample time of 20 ms.</p> <table border="1" data-bbox="605 850 1464 1220"> <thead> <tr> <th colspan="3">Base Rate</th> <th colspan="3">Subrate</th> </tr> <tr> <th>Step</th> <th>Wall-Clock Time (ms)</th> <th>Logged Timestamp (ms)</th> <th>Step</th> <th>Wall-Clock Time (ms)</th> <th>Logged Timestamp (ms)</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> </tr> <tr> <td>1</td> <td>15.625</td> <td>10</td> <td></td> <td></td> <td></td> </tr> <tr> <td>2</td> <td>31.250</td> <td>20</td> <td>1</td> <td>31.250</td> <td>20</td> </tr> <tr> <td>3</td> <td>46.875</td> <td>30</td> <td></td> <td></td> <td></td> </tr> <tr> <td>4</td> <td>62.500</td> <td>40</td> <td>2</td> <td>62.500</td> <td>40</td> </tr> </tbody> </table>	Base Rate			Subrate			Step	Wall-Clock Time (ms)	Logged Timestamp (ms)	Step	Wall-Clock Time (ms)	Logged Timestamp (ms)	0	0	0	0	0	0	1	15.625	10				2	31.250	20	1	31.250	20	3	46.875	30				4	62.500	40	2	62.500	40
Base Rate			Subrate																																								
Step	Wall-Clock Time (ms)	Logged Timestamp (ms)	Step	Wall-Clock Time (ms)	Logged Timestamp (ms)																																						
0	0	0	0	0	0																																						
1	15.625	10																																									
2	31.250	20	1	31.250	20																																						
3	46.875	30																																									
4	62.500	40	2	62.500	40																																						
Saving simulation output as a single object	Saving the XCP external mode simulation output as a single object is not supported. The simulation produces a warning.

## Graphical Controls for XCP External Mode Simulations

### In this section...

“Equivalent Controls on Hardware Tab and External Mode Control Panel” on page 60-26

“XCP External Mode Control Panel” on page 60-27

“XCP External Signal & Triggering Dialog Box” on page 60-28

You can control an XCP external mode simulation through:

- The **Hardware** tab on the Simulink Editor toolbar. To display the **Hardware** tab, from the **Apps** tab on the Simulink toolstrip, click **Run on Custom Hardware**.
- The External Mode Control Panel. To open this dialog box, on the **Hardware** tab, in the **Prepare** section, click . Then, under **Signal Monitoring & Tracing**, click **Control Panel**.

### Equivalent Controls on Hardware Tab and External Mode Control Panel

This table lists external mode actions that you can perform by using controls that are available in the **Hardware** tab and the External Mode Control Panel.

External Mode Action	Hardware Tab	External Mode Control Panel
Build target application.	<b>Run on Hardware &gt; Build for Monitoring</b> 	N/A
Run application on target hardware.	<b>Run on Hardware &gt; Deploy</b> 	N/A
Connect Simulink to a waiting or running target application.	<b>Run on Hardware &gt; Connect</b> 	<b>Connect</b>
Start real-time execution of generated code in the target environment.	<b>Run on Hardware &gt; Start</b> 	<b>Start Real-Time Code</b>
Disconnect Simulink from the target environment, but do not stop real-time execution of code.	<b>Run on Hardware &gt; Disconnect</b> 	<b>Disconnect</b>
Stop target application execution and disconnect Simulink from the target environment.  If you want to reestablish the external mode connection after stopping the target application, you must perform the <b>Deploy</b> step.	In <b>Run on Hardware</b> section, <b>Stop</b> button 	<b>Stop Real-Time Code</b>

External Mode Action	Hardware Tab	External Mode Control Panel
Tune batch of block parameters. You can modify values of tunable parameters in Simulink, and then update the parameters in the target application simultaneously. See "Monitor Signal and Tune Parameter".	In <b>Prepare</b> section, <b>Hold Updates</b>  and <b>Update All Parameters</b>  buttons.	<b>Batch download</b> and <b>Download</b>

## XCP External Mode Control Panel

The External Mode Control Panel provides these controls for XCP external mode simulations.

Section	Control	Description
<b>Connection and triggering</b>	<b>Connect</b>	Connect Simulink to a waiting or running target application.  When Simulink is connected to the target application, <b>Connect</b> changes to <b>Disconnect</b> .
	<b>Start Real-Time Code</b>	Start real-time execution of generated code in the target environment.  When the generated code starts executing, the button changes to <b>Stop Real-Time Code</b> .
	<b>Arm Trigger</b>	Arm the trigger that you specify through the External Signal & Triggering dialog box. If Simulink is not connected to the target application, the button appears dimmed.  If Simulink is connected to the target application and the trigger is armed, the button becomes <b>Cancel Trigger</b> .
	<b>Cancel Trigger</b>	Disarm the trigger. Once the trigger is disarmed, the button changes to <b>Arm Trigger</b> .
<b>Floating scope</b>	<b>Enable data uploading</b>	Selecting the check box arms the trigger for uploading target application data to Floating Scope blocks.
	<b>Duration</b>	Not supported.
<b>Parameter tuning</b>	<b>Batch download</b>	To tune a batch of block parameters: <ol style="list-style-type: none"> <li>1 In the External Mode Control Panel, select <b>Batch download</b>.</li> <li>2 In the Simulink Editor, modify the required block parameters.</li> <li>3 When you modify parameters, the External Mode Control Panel displays this message next to <b>Download</b>:  Parameter changes pending...  Simulink stores the modified parameters locally.</li> <li>4 Click <b>Download</b>. Simulink downloads the batch of modified parameters to the target application.</li> </ol>

Section	Control	Description
	<b>Download</b>	If the <b>Batch download</b> check box is not selected, the button appears dimmed.
<b>Configuration</b>	<b>Signal &amp; Triggering</b>	Open the External Signal & Triggering dialog box.
	<b>Data Archiving</b>	XCP external mode simulations do not support this button, which appears dimmed.

## XCP External Signal & Triggering Dialog Box

For an XCP external mode simulation, you can use the External Signal & Triggering dialog box to:

- Specify the logged signals that you want to monitor.
- Configure a trigger that starts the uploading of data from the target application.

The External Signal & Triggering dialog box provides these controls.

Section	Control	Description
<b>Signal selection</b>	<b>Select all</b>	The <b>Signal selection</b> view lists top-model and referenced-model signals that are configured for logging. Simulink uploads a logged signal for monitoring only if the signal is selected in the <b>Signal selection</b> view. By default, this check box is selected, which enables monitoring of all logged signals.
	<b>Clear all</b>	Deselect the signals that are selected for monitoring. If the <b>Select all</b> check box is selected, this button appears dimmed.
	<b>on, off</b>	If you select a row, clicking <b>on</b> selects the corresponding signal for monitoring. The <b>Selected</b> column displays the letter X. Clicking <b>off</b> deselects the signal. If the <b>Select all</b> check box is selected, these radio buttons appear dimmed.

Section	Control	Description
	<b>Trigger Signal</b>	<p>If you select a row, clicking this button sets the corresponding signal as the trigger for uploading target application data. The <b>Trigger</b> column displays the letter T. If the signal is already selected, clicking this button deselects the signal.</p> <p>If the configuration parameter <code>PurelyIntegerCode</code> is set to 'on', the trigger signal must be a non-complex, <code>int32</code> scalar.</p> <p>If the configuration parameter <code>PurelyIntegerCode</code> is set to 'off', the trigger signal must be a non-complex, <code>double</code> scalar.</p>
	<b>Go To Signal</b>	To locate a signal in the model, select the corresponding row in the <b>Signal selection</b> view and then click this button.
<b>Trigger options</b>	<b>Source</b>	<p>Specify how the trigger is armed:</p> <ul style="list-style-type: none"> <li>• <code>manual</code> (default) — Arm the trigger by selecting the <b>Arm when connecting to target</b> check box or by clicking the <b>Arm Trigger</b> button on the External Mode Control Panel.</li> <li>• <code>signal</code> — Use specific characteristics of the trigger signal to start uploading data.</li> </ul>

Section	Control	Description
	<b>Mode</b>	Specify trigger rearming after a trigger event is complete: <ul style="list-style-type: none"><li>• <b>normal</b> (default) — The external mode simulation rearms the trigger after each trigger event.</li><li>• <b>one-shot</b>— The external mode simulation collects only one buffer of data for each time that you arm the trigger.</li></ul>

Section	Control	Description
	<b>Duration</b>	<p>Specify the number of base rate steps for which the external mode simulation uploads data after a trigger event (default is 1000). For example, if <b>Duration</b> is set to 1000, and the base (fastest) rate of the model is one second:</p> <ul style="list-style-type: none"> <li>• For a signal sampled at the base rate, one second (1.0 Hz), the external mode simulation collects 1000 contiguous samples during a trigger event.</li> <li>• For a signal sampled at two seconds (0.5 Hz), the external mode simulation collects 500 samples during a trigger event.</li> </ul> <p>If <b>Send multiple contiguous samples in same packet</b> is also selected, on the target hardware, the target application:</p> <ol style="list-style-type: none"> <li><b>1</b> Stores data samples in a buffer.</li> <li><b>2</b> Sends samples from multiple time steps in a packet.</li> </ol> <p>The <b>Duration</b> value, say <code>durationFieldValue</code>, determines the number of samples sent in a packet:</p> $\text{numOfSamplesSent} = \text{durationFieldValue} / n$ <p>where <math>n = (\text{base rate}) / (\text{sample rate})</math></p> <p>When the sample rate is the base rate (<math>n=1</math>), <code>numOfSamples</code> is exactly <code>durationFieldValue</code>. For subrates (<math>n=2, 3, \dots</math>), <code>numOfSamplesSent</code> is rounded down to the nearest integer. The target application discards</p>

Section	Control	Description
		buffer samples that are not sent to Simulink.
	<b>Delay</b>	<p>Apply a delay to data collection, which is the time between a trigger event and the start of data collection expressed in base rate steps. You can specify a positive value or zero (default).</p> <p>An XCP external mode simulation does not support a negative delay (pretriggering).</p>
	<b>Arm when connecting to target</b>	<p>This check box is selected by default. Connecting Simulink to the target application arms the trigger.</p> <ul style="list-style-type: none"> <li>• If the trigger <b>Source</b> is <b>manual</b>, data uploading begins immediately.</li> <li>• If the trigger <b>Source</b> is <b>signal</b>, monitoring of the trigger signal begins immediately. Data uploading begins when the trigger signal satisfies trigger conditions (as defined in the <b>Trigger signal</b> section).</li> </ul> <p>If you clear the check box, you can arm the trigger by clicking the <b>Arm Trigger</b> button on the External Mode Control Panel.</p>
	<b>Send multiple contiguous samples in same packet</b>	<p>This check box is not selected by default.</p> <p>If you select the check box, the XCP server uses the XCP DAQ packed mode for streaming signals to Simulink, which improves the ratio of useful data to control data in streamed signals.</p> <p>The target application sends samples from multiple time steps in a packet. The <b>Duration</b> value determines the number of samples in the packet.</p>

Section	Control	Description
<b>Trigger signal</b>	<b>Direction</b>	<p>To enable the uploading of data from the target application when the trigger signal crosses the threshold value (specified by <b>Level</b>), specify the required direction of the signal:</p> <ul style="list-style-type: none"> <li>• <b>rising</b> (default) — Signal must be increasing in value.</li> <li>• <b>falling</b> — Signal must be decreasing in value.</li> <li>• <b>either</b> — Signal can be increasing or decreasing in value.</li> </ul>
	<b>Level</b>	Specify the threshold value that the signal must cross to start the uploading of target application data. Default is 0.
	<b>Hold-off</b>	Specify, in base rate steps, the time between the termination of one trigger event and the rearming of the trigger. Applies only when <b>Mode</b> value is normal. Default is 0.

## Set Up External Mode Connectivity Between Simulink and Target Hardware

For external mode simulations, you can use the `target` Package to provide connectivity between Simulink and your target hardware.

This diagram gives an overview of the components of an external mode simulation.

The `target` package provides classes for the implementation of components. This table lists the main classes.

Component	Class	Purpose
Target hardware	<code>target.Board</code>	Provide MATLAB with a description of target hardware.
Deployment tools	<code>target.SystemCommandExecutionTool</code>	You can use the classes to:

Component	Class	Purpose
	target.ExecutionService target.ExecutionTool	<ul style="list-style-type: none"> <li>• Capture system commands for running the target application from your development computer.</li> <li>• Describe the execution service implementation for the target application.</li> <li>• Provide the MATLAB service interface for the tool that manages the target application execution.</li> </ul> <p>To provide <b>Monitor &amp; Tune, Deploy, Connect, and Start</b> functionality, the Run on Custom Hardware app requires the use of target.ExecutionTool.</p>
Connectivity	target.ExternalMode	Provide communication protocol for data transfer between Simulink and target hardware.
	target.CommunicationInterface	Provide target hardware with details of the communication channel and the rtiostream API on page 90-16 implementation.

## Customise Connectivity for XCP External Mode Simulations

For code that is generated by using ERT (ert.tlc) and GRT (grt.tlc) system target files, you can run external mode simulations that use the XCP communication protocol:

- On your development computer.
- On other target hardware by using support packages.

If your system target file for custom target hardware is derived from the ERT or GRT system target files, use classes from the target Package to customise connectivity. For example, target.ExternalMode and target.CommunicationInterface.

This example shows how you can customise connectivity for XCP-based external mode simulations. To set up connectivity between Simulink and the target hardware:

### 1 Create board description

Create a `target.Board` object that provides MATLAB with a description of your target hardware. To support code generation, associate the object with a processor.

```
processor = target.get('Processor', 'Intel-x86-64 (Windows64)');
board = target.create('Board', ...
 'Name', 'Example Intel Board', ...
 'Processors', processor);
```

## 2 Choose deployment tool

Use one of these classes:

- `target.ExecutionTool` -- Provides the `getApplicationStatus` method, which is required by the Run on Custom Hardware app for **Monitor & Tune**, **Deploy**, **Connect**, and **Start** functionality.
- `target.SystemCommandExecutionTool` -- The `getApplicationStatus` method is not available with this class. The **Monitor & Tune**, **Deploy**, **Connect**, and **Start** functionality of the Run on Custom Hardware app is not fully supported.

In step 3 and step 4, the availability of a tool that can download the target application onto the target hardware is assumed.

## 3 Using `target.ExecutionTool`

Implement the MATLAB service interface in a class called `MyImplementationClass`. For an example pseudocode implementation, see “Execution Tool Template” on page 60-40.

```
classdef MyImplementationClass < target.ExecutionTool
 properties (Access=private)
 ...
 end

 methods
 ...
 end

 methods (Access=private)
 ...
 end
end
```

Create a `target.ExecutionService` object that contains details about executing the target application. The object describes the tool that is required to run the target application on the target hardware.

```
matlabExecution = ...
 target.create('ExecutionService', ...
 'Name', 'My Application Launcher');
matlabExecution.APIImplementation = ...
 target.create('APIImplementation', ...
 'Name', 'MyServiceImplementation');
matlabExecution.APIImplementation.BuildDependencies = ...
 target.create('MATLABDependencies');
matlabExecution.APIImplementation.BuildDependencies.Classes = ...
 {'MyImplementationClass'};
matlabExecution.APIImplementation.API = ...
 target.get('API', 'ExecutionTool');
```

Associate the `target.ExecutionService` object with the `target.Board` object.

```
board.Tools.ExecutionTools = matlabExecution;
```

## 4 Using `target.SystemCommandExecutionTool`

Create a `target.SystemCommandExecutionTool` object that captures system commands for running the target application from your development computer.

```

executionTool = target.create('SystemCommandExecutionTool', ...
 'Name', 'My Execution Tool');
executionTool.StartCommand.String = 'customDownloadTool';
executionTool.StartCommand.Arguments = {'$(EXE)'};

```

Associate the `target.SystemCommandExecutionTool` object with the `target.Board` object.

```
board.Tools.ExecutionTools = executionTool;
```

## 5 Create communication interface for target hardware

Create a `target.CommunicationInterface` object that provides the target hardware with details of the communication channel and the `rtiostream` API on page 88-42 implementation.

For the `rtiostream` API, use a `BuildDependencies` object to specify the source files that are compiled with the target application. This example uses the shipped TCP/IP `rtiostream` implementation source file, which enables you to run external mode simulations on your development computer. For your target hardware, provide your own `rtiostream` implementation.

```

buildDependencies = target.create('BuildDependencies', ...
 'SourceFiles', ...
 {fullfile('$(MATLAB_ROOT)', ...
 'toolbox', 'coder', ...
 'rtiostream', ...
 'src', ...
 'rtiostreamtcpip', ...
 'rtiostream_tcpip.c')});

apiImplementation = target.create('APIImplementation', ...
 'Name', 'TCP x86 RTIOStream Implementation', ...
 'API', target.get('API', 'rtiostream'), ...
 'BuildDependencies', buildDependencies);

tcpComms = target.create('CommunicationInterface', ...);
 'Name', 'Windows TCP Interface', ...
 'Channel', 'TCPChannel', ...
 'APIImplementations', apiImplementation);

```

To specify a TCP channel, this example uses the name-value argument `'Channel'`, `'TCPChannel'`. You can specify a serial communication channel by using the name-value argument `'Channel'`, `'RS232Channel'`.

Associate the `target.CommunicationInterface` object with the `target.Board` object.

```
board.CommunicationInterfaces = tcpComms;
```

## 6 Specify communication protocol stack

Create an object that provides the communication protocol for data transfer between Simulink and target hardware.

- a Use the `target.XCPPlatformAbstraction` class to utilize your custom implementation of the XCP platform abstraction layer. The layer provides a static memory allocator and other platform abstraction functionality.

```

xcpPlatformAbstraction = target.create('XCPPlatformAbstraction', ...
 'Name', 'XCP Platform Abstraction');

xcpPlatformAbstraction.BuildDependencies.Defines = {'XCP_CUSTOM_PLATFORM'};
customPlatformAbstractionPath = 'pathToImplementationFolder';
xcpPlatformAbstraction.BuildDependencies.SourceFiles = ...
 {fullfile(customPlatformAbstractionPath, 'myXCPPlatform.c')};
xcpPlatformAbstraction.BuildDependencies.IncludePaths = ...
 {customPlatformAbstractionPath};

```

- b** Use the `target.XCPTCPIPTransport` class to implement the XCP transport layer, which transmits and receives messages from the communication medium according to ASAM specifications. In this example, the transport protocol is TCP/IP. For serial transport, replace `target.XCPTCPIPTransport` with `target.XCPSerialTransport`.

```
xcpTransport = target.create('XCPTCPIPTransport', ...
 'Name', 'XCP Transport');
```

- c** Create a `target.XCP` object that represents the XCP protocol stack for the target hardware.

```
xcpConfiguration = target.create('XCP', ...
 'Name', 'XCP Configuration', ...
 'XCPTransport', xcpTransport, ...
 'XCPPlatformAbstraction', xcpPlatformAbstraction);
```

- d** Create an object that represents the XCP external mode connectivity options that are available in the XCP protocol stack.

```
extModeConnectivity = ...
 target.create('XCPEXternalModeConnectivity', ...
 'Name', 'External Mode Connectivity', ...
 'XCP', xcpConfiguration);
```

- e** Create an external mode protocol stack object.

```
externalMode = target.create('ExternalMode', ...
 'Name', 'External Mode', ...
 'Connectivities', extModeConnectivity);
```

---

**Note** You can create the object in a single call to `target.create`.

```
externalMode = target.create('ExternalMode', ...
 'Name', 'External Mode', ...
 'XCPTransportLayer', 'TCP', ...
 'Defines', {'XCP_CUSTOM_PLATFORM'}, ...
 'SourceFiles', {fullfile('pathToImplementationFolder', 'myXCPPlatform.c')}, ...
 'IncludePaths', {'pathToImplementationFolder'});
```

---

- f** Add the object to the list of communication protocols that the target hardware supports.

```
board.CommunicationProtocolStacks = externalMode;
```

## 7 Make board object persist across MATLAB sessions

Add the board object to an internal database and make the object persist over MATLAB sessions.

```
target.add(board, 'UserInstall', true);
```

## 8 Select board for model

In the Configuration Parameters dialog box, set **Hardware board** to Example Intel Board.

## 9 Specify connection between Simulink and target hardware

In the Configuration Parameters dialog box:

- From the **Transport layer** list, select XCP on TCP/IP. The transport protocol is in the list because of the connectivity customization.
- In the **Mex-file arguments** field, enter 'localhost' 1 0. For more information, see “MEX-file arguments”.

## Customize Connectivity for TCP/IP or Serial External Mode Simulations

For TCP/IP or serial external mode simulations, you can customize connectivity through a workflow that:

- Implements transport and communication protocols.
- Specifies the execution tool for the target application by using the `target Package` package.

To set up connectivity between Simulink and the target hardware, use the workflow described in “Customise Connectivity for XCP External Mode Simulations” with these differences:

- After step 1, using the information in “Choose Communication Protocol for Client and Server” on page 60-77 and “Create a Transport Layer for TCP/IP or Serial External Mode Communication” on page 60-93, implement the client and server sides of external mode communication for TCP/IP or serial protocols.
- Do not perform step 5 and step 6.

## Execution Tool Template

This section provides a pseudocode example for a `target.ExecutionTool` service interface. The tool starts and tracks an application on the target hardware.

```
classdef MyExecutionTool < target.ExecutionTool
 methods
 function errFlag = startApplication(this)
 % Call "customDownloadTool" to download the application.
 [status, result] = ...
 system(sprintf('customDownloadTool %s', this.Application));
 if status == 0
 errFlag = false;
 else
 disp(result);
 errFlag = true;
 end
 end

 function errFlag = stopApplication(~)
 % Add code here to stop the application, if possible.
 errFlag = false;
 end

 function [status, errFlag] = getApplicationStatus(~)
 % Add code here to return the application status, if known.
 status = target.ApplicationStatus.Unknown;
 errFlag = false;
 end
 end
end
```

## External Websites

- <https://www.asam.net/standards/detail/mcd-1-xcp/wiki/>

## Register Custom Launcher

---

**Note** The use of a custom launcher to set up connectivity between Simulink and your target hardware is not recommended. Use the `target` package instead. For more information, see “Set Up External Mode Connectivity Between Simulink and Target Hardware” on page 60-34

---

To support the one-click workflow or **Deploy** step for custom hardware, register your custom launcher for the target application.

- 1 Create an `rtw.connectivity.Config` subclass, which requires `myCustomLauncher`, a launcher that you provide. `myCustomLauncher` is a subclass of `rtw.connectivity.Launcher`. In `myCustomLauncher`, to support one-click functionality, provide an implementation of the `getApplicationStatus` method. For the communicator and builder subclasses, you can use dummy classes.

```
classdef myTargetConnectivityConfig < rtw.connectivity.Config
 methods
 % Constructor
 function this = myTargetConnectivityConfig(componentArgs)

 % Launcher with port 0 argument to start TCP/IP server on free port
 modelName = componentArgs.getModelName();
 bDirInfo = RTW.getBuildDir(modelName);
 exeName = fullfile(bDirInfo.CodeGenFolder, modelName);
 if ispc
 exeName = [exeName, '.exe'];
 end
 launcher = myCustomLauncher(componentArgs);
 launcher.setExe(exeName);

 % Create dummy communicator and builder
 communicator = rtw.connectivity.RtIOStreamHostCommunicator.empty();
 builder = rtw.connectivity.MakefileBuilder.empty();

 % Call super class constructor to register components
 this@rtw.connectivity.Config(componentArgs, builder, launcher, communicator);
 end
 end
end
```

- 2 To register the implementation in Simulink, create an `sl_customization.m` file.

```
function sl_customization(cm)
 cm.registerTargetInfo(@loc_createConfig);
end
% local function
function config = loc_createConfig
 config = rtw.connectivity.ConfigRegistry;
 config.ConfigClass = 'myTargetConnectivityConfig';

 % Specify compatible model configuration. For example,
 % through SystemTargetFile and TargetHWDeviceType properties.
 config.SystemTargetFile = {'ert.tlc'};
 config.TargetHWDeviceType = { 'ARM Compatible->ARM Cortex' };
end
```

See “Create `sl_customization.m` File”.

- 3 Add the folder containing `sl_customization.m` to the search path and refresh your customizations.

```
addpath(sl_customization_path);
sl_refresh_customizations;
```

## Customize XCP Server Software

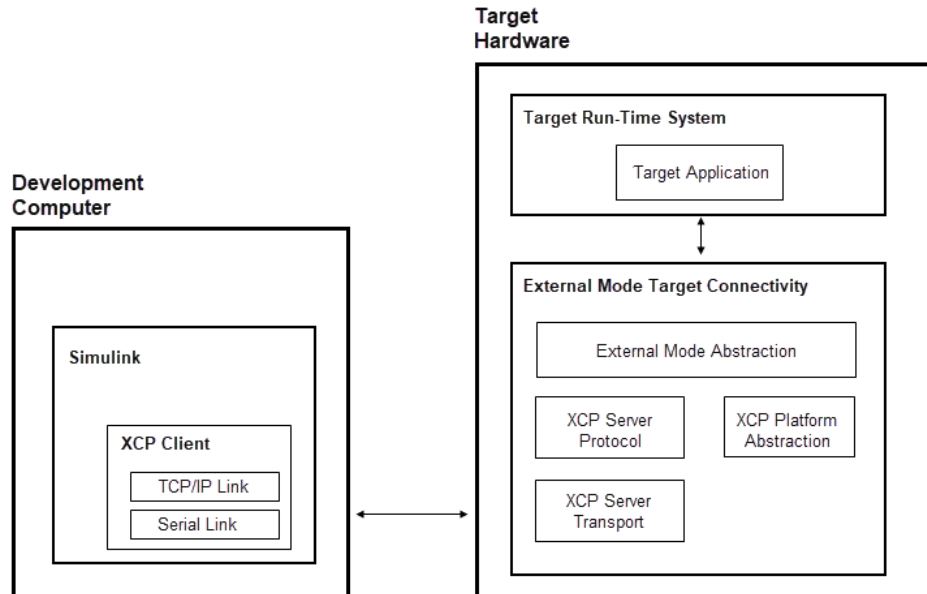

The XCP communication protocol for Simulink external mode simulations is a client-server communication protocol. By default, the software supports XCP external mode simulations:

- On your development computer for code that is generated by using ERT (`ert.tlc`) and GRT (`grt.tlc`) system target files.
- For some support packages on page 60-2.

If your system target file for custom target hardware is derived from the ERT or GRT system target files, you can use supplied APIs to provide XCP target connectivity. XCP external mode limitations on page 60-21 apply.

The external mode target connectivity software comprises:

- External mode abstraction layer
- XCP server protocol layer
- XCP server transport layer
- XCP platform abstraction layer

## External Mode Abstraction Layer

To communicate with Simulink during an external mode simulation, your target application must invoke functions from the external mode abstraction layer.

The parent folder for source code files is:

```
matlabroot\toolbox\coder\xcp\src\target\ext_mode
```

The layer APIs are declared in `include\ext_mode.h` and implemented in `src\xcp_ext_mode.c`.

To communicate with Simulink, the target application uses services exposed by the external mode abstraction layer. This flow chart shows the required target application steps to establish communication with Simulink.

This table lists the functions that your target application must invoke at each stage.

Stage	Function	Purpose
INITIALIZE	<code>extmodeParseArgs</code>	Extract external mode command-line arguments.
	<code>modelName_initialize</code>	Initialize generated Simulink model code.
	<code>extmodeInit</code>	Initialize external mode target connectivity.
HOST START REQUEST	<code>extmodeWaitForHostRequest</code>	Wait for a start request from development computer, which is created when you click Run button.
RUN	<code>modelName_step</code>	Run single step of generated Simulink model code.
	<code>extmodeEvent</code>	For sample time ID of the model, sample signals generated by model step function and pass packet content to transport layer of communication protocol for transmission to development computer.
	<code>extmodeBackgroundRun</code>	Transmit and receive packet from physical communication interface and process packet content in accordance with selected communication protocol.
HOST STOP REQUEST OR SIMULATION COMPLETE	<code>extmodeStopRequested</code>	Check whether a request to stop external mode simulation is received from the model on the development computer. The request is created when you click the Stop button.
	<code>extmodeSimulationComplete</code>	Check whether execution of generated model code is complete.
RESET	<code>modelName_terminate</code>	Terminate generated Simulink model code.
	<code>extmodeReset</code>	Reset the external mode target connectivity to initial state.

This pseudo-code example shows how you can implement the various flowchart stages in your target application. During the RUN stage, the external mode run-time environment requires at least two threads:

- A periodic thread that is responsible for the execution of the generated model code.
- A background thread that is responsible for running the external mode communication stack and transmitting and receiving packets.

The pseudo-code simulates multithreading by running `periodicThread` and `extmodeBackgroundRun` sequentially within the same `while()` loop.

```

/*----- Pseudo-Code Example -----*/
/* Define periodic thread */
void periodicThread(void)
{
 /* Run model step function */

```

```

 modelName_step();
 /* Notify external mode abstraction layer about periodic event */
 extmodeEvent(PERIODIC_EVENT_ID, currentSimulationTime);
}

/* Main function for target application */
main(int argc, char *argv[])
{
 /*----- INITIALIZE -----*/
 /* Parse external mode command line arguments */
 extmodeParseArgs(argc, argv);

 /* Initialize model */
 modelName_initialize();

 /* Initialize external mode target connectivity */
 extmodeInit(extModeInfo, finalSimulationTime);

 /*----- HOST START REQUEST -----*/
 /* Wait until a start request is received from development computer */
 extmodeWaitForHostRequest(EXTMODE_WAIT_FOREVER);

 /*----- HOST STOP REQUEST OR SIMULATION COMPLETE -----*/
 /* While simulation is not complete and stop request is not received */
 while (!extmodeSimulationComplete() && !extmodeStopRequested()) {

 /*----- RUN -----*/
 periodicThread();
 extmodeBackgroundRun();
 }

 /*----- RESET -----*/
 /* Terminate model */
 modelName_terminate();

 /* Reset external mode target connectivity */
 extmodeReset();
 return 0;
}

```

To see code that invokes the functions, complete the example in “External Mode Simulation by Using XCP Communication” on page 60-8 with **System target file** set to `ert.tlc`. Then, from the code generation folder, open `ert_main.c`.

---

**Note** If your system target file is `grt.tlc` or GRT-based, the code generator creates `rt_main.c`, and, by default, uses API defined by the internal file `ext_work.h`. To enable the use of `ext_mode.h` API, before building the target application, run:

```
set_param(model, 'TLCOptions', '-aExtModeXCPClassicInterface=0');
```

If your system target file is `ert.tlc` or ERT-based and `GenerateSampleERTMain` is set to 'on', the code generator creates `ert_main.c` and, by default, uses API defined by `ext_mode.h`. To enable the use of `ext_work.h` API, before building the target application, run:

```
set_param(model, 'TLCOptions', '-aExtModeXCPClassicInterface=1');
```

---

## XCP Server Protocol Layer

The XCP server protocol layer interprets XCP commands and data according to the Association for Standardisation of Automation and Measuring Systems (ASAM) standard, ASAM MCD-1 XCP.

The source code folder is:

```
matlabroot\toolbox\coder\xcp\src\target\slave\protocol\src
```

In an external mode simulation, the build process automatically adds the required files to the build information object.

## XCP Server Transport Layer

The XCP server transport layer transmits and receives messages from the communication medium according to ASAM specifications.

The source folder is:

```
matlabroot\toolbox\coder\xcp\src\target\slave\transport\src
```

In an external mode simulation, the build process automatically adds the required files to the build information object.

## XCP Platform Abstraction Layer

The XCP platform abstraction layer provides:

- An XCP driver on page 60-48 for sending and receiving raw data through the physical communication interface.
- The implementation of a static memory allocator on page 60-49.
- Other target hardware-specific functionality.

You can use the `target` package to provide connectivity between Simulink and your target hardware. To specify:

- The XCP driver, use the `target.CommunicationInterface` class.
- Other parts of the XCP platform abstraction layer, use the `target.XCPPlatformAbstraction` class.

If you do not specify the XCP platform abstraction layer, the software uses the default platform abstraction layer, which supports Linux, Windows, and Mac platforms. For more information, see “Customise Connectivity for XCP External Mode Simulations” on page 60-35.

For a customization example, see “Create Custom Abstraction Layer” on page 60-52.

## XCP Driver

The XCP driver sends and receives XCP messages through the communication channel. In an external mode simulation, the build process automatically adds the driver files to build information.

The XCP driver is based on the `rtiostream` API. For example, host-based external mode simulations use these `rtiostream` files:

- *matlabroot*\toolbox\coder\rtiostream\src\rtiostreamtcpip\rtiostream\_tcpip.c
- *matlabroot*\toolbox\coder\rtiostream\src\rtiostreamserial\rtiostream\_serial.c

For details on implementing and testing an `rtiostream` communications channel, see:

- “Communications `rtiostream` API” on page 88-42

- `rtiostreamtest`

To provide `rtiostream` information:

- If you use the `target` package for connectivity, use the `target.CommunicationInterface` class. See “Customise Connectivity for XCP External Mode Simulations” on page 60-35.
- If you do not use the `target` package, add your `rtiostream` files to a build information object.

For more information, see “Create Custom Abstraction Layer” on page 60-52.

### Memory Allocator

The XCP server software requires the dynamic allocation of variable-size, contiguous memory blocks to hold internal data structures. In an external mode simulation, the build process automatically adds memory allocator files to the build information object.

Configure alignment for the memory allocator through the `XCP_MEM_ALIGNMENT` preprocessor macro. For example:

```
#define XCP_MEM_ALIGNMENT 8
```

If you use the `target` package for connectivity, use the `BuildDependencies` property of the `target.XCPPlatformAbstraction` class. For example:

```
xcpPlatformAbstraction.BuildDependencies.Defines = {'XCP_MEM_ALIGNMENT=8'};
```

See “Customise Connectivity for XCP External Mode Simulations” on page 60-35.

### Other Platform Abstraction Layer Functionality

This file defines the platform abstraction layer interface:

```
matlabroot\toolbox\coder\xcp\src\target\slave\platform\include\xcp_platform.h
```

This table describes the functionality that you must provide for the XCP server software that you deploy on your target hardware.

Functionality	Details
Mutual exclusion	<p>To access system data structures with <i>mutual exclusion</i> support, the XCP driver depends on basic APIs for definition, initialization, lock, and unlock.</p> <p>To support mutual exclusion for your target hardware, provide a custom implementation.</p> <p>The default implementation for Linux and Windows supports mutual exclusion.</p> <pre data-bbox="589 590 1266 919"> #if defined(_WIN32)    defined(__WIN32__)    defined(WIN32) ... #define XCP_MUTEX_DEFINE(lock) HANDLE lock #define XCP_MUTEX_INIT(lock) lock = CreateMutex(0, FALSE, 0) #define XCP_MUTEX_LOCK(lock) WaitForSingleObject((lock), INFINITE) #define XCP_MUTEX_UNLOCK(lock) ReleaseMutex(lock) #else ... #include &lt;pthread.h&gt; #define XCP_MUTEX_DEFINE(lock) pthread_mutex_t lock #define XCP_MUTEX_INIT(lock) pthread_mutex_init(&amp;(lock), NULL) #define XCP_MUTEX_LOCK(lock) pthread_mutex_lock(&amp;(lock)) #define XCP_MUTEX_UNLOCK(lock) pthread_mutex_unlock(&amp;(lock)) ... #endif </pre>
Sleep	<p>Provide a sleep API that makes the calling thread sleep until a specified time has elapsed. The default implementation for Linux and Windows systems is:</p> <pre data-bbox="589 1041 1450 1392"> #if defined(_WIN32)    defined(__WIN32__)    defined(WIN32) ... #define XCP_SLEEP(seconds,microseconds) Sleep((seconds) * 1000 \ + ((microseconds) + 1000 - 1) / 1000) #else ... #if _POSIX_C_SOURCE &gt;= 199309L #define XCP_SLEEP(seconds,microseconds) do {struct timespec t;\ t.tv_sec = seconds; t.tv_nsec = microseconds * 1000; nanosleep(&amp;t, NULL);} while(0) #else /* nanosleep is not available. Use select instead. */ #define XCP_SLEEP(seconds,microseconds) do {struct timeval t; t.tv_sec = seconds;\ t.tv_usec = microseconds; select(0, NULL, NULL, NULL, &amp;t);} while(0) #endif /* _POSIX_C_SOURCE &gt;= 199309L */ ... #endif </pre>
Logging	<p>To generate diagnostic messages, the XCP server software requires a custom print API that supports logging services provided by the target hardware. If you do not define the <code>XCP_PRINTF</code> preprocessor macro, the default implementation is empty.</p>

Functionality	Details
Address conversion	<p>The XCP standard expresses the address of a variable in memory as a 32-bit address with an 8-bit extension.</p> <p>The XCP client extracts the addresses of signals and parameters of the model by parsing the debug information that the build process creates. The debug information is in DWARF or PDB format.</p> <p>The XCP client requests access to parameters and signals by sending an XCP command that contains the arguments <code>addressExtension</code> and <code>address</code>.</p> <p>When <code>addressExtension</code> and <code>address</code> information is received by the target hardware, the XCP server must convert the address to the location of the variable in the target hardware memory. The variable location is assigned by the loader and is target-specific.</p> <p>Use the <code>XCP_ADDRESS_GET()</code> macro to specify the conversion logic. The default implementation for Linux and Windows systems is:</p> <pre data-bbox="589 863 1125 1003"> #if defined(__MINGW32__)    defined(__MINGW64__) #define XCP_ADDRESS_GET(addressExtension, address) \ (uint8_T*) ((uintptr_t) address) #else #define XCP_ADDRESS_GET(addressExtension, address) \ (uint8_T*) ((address) + (uint8_T*)&amp;_ImageBase) #endif </pre> <p>Currently, only 32-bit hardware architectures are supported, so <code>addressExtension</code> is 0.</p>
Set and copy memory	<p>You can specify an optimized version of copy memory and set memory operations.</p> <p>If you do not define the <code>XCP_MEMCPY</code> and <code>XCP_MEMSET</code> preprocessor macros, the default implementation specifies the standard C functions, <code>memcpy</code> and <code>memset</code>.</p> <pre data-bbox="589 1304 849 1444"> #ifndef XCP_MEMCPY #define XCP_MEMCPY memcpy #endif  #ifndef XCP_MEMSET #define XCP_MEMSET memset #endif </pre>
Parsing command-line arguments	<p>If your target hardware does not support the parsing of command-line arguments, define the preprocessor macro <code>EXTMODE_DISABLE_ARGS_PROCESSING</code>.</p> <p>To replace the <code>-w</code> option, you can use this command to specify that the target application enters and stays in a wait state until it receives a Connect message from Simulink:</p> <pre data-bbox="589 1696 1325 1728"> set_param(modelName, 'OnTargetWaitForStart', 'on'); </pre> <p>The build process provides the required option (<code>-DON_TARGET_WAIT_FOR_START=1</code>) to the compiler.</p>

Functionality	Details
Structure packing and alignment	<p>The XCP software stack implementation requires the packing and alignment of some internal C structures. In the platform abstraction layer, provide packing and alignment information by using preprocessor directives that are compiler-specific.</p> <p>To pack and align C structures, provide these preprocessor directives:</p> <pre>#define XCP_PRAGMA_PACK_BEGIN(n) #define XCP_PRAGMA_PACK_END() #define XCP_ATTRIBUTE_ALIGNED(n) #define XCP_ATTRIBUTE_PACKED</pre> <p>For example:</p> <pre>XCP_PRAGMA_PACK_BEGIN(1) typedef struct XCP_ATTRIBUTE_PACKED XcpSetDaqListModeCmdPacketFrame {     uint8_T    PID;        /* Packet identifier, always XCP_PID_SET_DAQ_LIST_MODE */     uint8_T    mode;      /* DAQ list mode (XCP DAQ Mode bit masks) */     uint16_T   daqListId; /* DAQ list Id */     uint16_T   eventId;   /* Event Channel Id */     uint8_T    prescaler; /* Transmission rate prescaler */     uint8_T    priority;  /* DAQ list priority (0xFF -&gt; highest) */ } XcpSetDaqListModeCmdPacketFrame; XCP_PRAGMA_PACK_END()</pre> <pre>XCP_PRAGMA_PACK_BEGIN(XCP_MEM_ALIGNMENT) struct XCP_ATTRIBUTE_ALIGNED(XCP_MEM_ALIGNMENT) xcpFifoEntry {     struct xcpFifoEntry *next;     size_t msgFrameSize; /* in AG units */ }; XCP_PRAGMA_PACK_END()</pre> <p>For a GCC compiler, use these directives:</p> <pre>#define XCP_PRAGMA_PACK_BEGIN(n) #define XCP_PRAGMA_PACK_END() #define XCP_ATTRIBUTE_ALIGNED(n) __attribute__((aligned(n))) #define XCP_ATTRIBUTE_PACKED __attribute__((packed))</pre> <p>For a Microsoft Visual C++ compiler, use these directives:</p> <pre>#define PRAGMA(n) _Pragma(#n) #define XCP_PRAGMA_PACK_BEGIN(n) PRAGMA(pack(push, n)) #define XCP_PRAGMA_PACK_END() PRAGMA(pack(pop)) #define XCP_ATTRIBUTE_ALIGNED(n) #define XCP_ATTRIBUTE_PACKED</pre>

## Create Custom Abstraction Layer

To create a custom platform abstraction layer:

- 1 Specify the header file `xcp_platform_custom.h`. This Linux example defines the required functions.

```
#ifndef XCP_PLATFORM_CUSTOM_H
#define XCP_PLATFORM_CUSTOM_H

/* XCP_ADDRESS_GET */
#include <stdint.h>
#define XCP_ADDRESS_GET(addressExtension, address) (uint8_T*) ((uintptr_t) address)

/* XCP_MUTEX */
#include <pthread.h>
#define XCP_MUTEX_DEFINE(lock) pthread_mutex_t lock
```

```

#define XCP_MUTEX_INIT(lock) pthread_mutex_init(&(lock), NULL)
#define XCP_MUTEX_LOCK(lock) pthread_mutex_lock(&(lock))
#define XCP_MUTEX_UNLOCK(lock) pthread_mutex_unlock(&(lock))

/* XCP_SLEEP */
#include <sys/time.h> /* gettimeofday */
#if _POSIX_C_SOURCE >= 199309L
#include <time.h> /* for nanosleep */
#else
#include <stddef.h>
#include <sys/select.h> /* for select */
#endif

/* _POSIX_C_SOURCE >= 199309L */
#if _POSIX_C_SOURCE >= 199309L
#define XCP_SLEEP(seconds,microseconds) do {struct timespec t;\
 t.tv_sec = seconds; t.tv_nsec = microseconds * 1000; nanosleep(&t, NULL);} while(0)
#else
/* nanosleep is not available. Use select instead. */
#define XCP_SLEEP(seconds,microseconds) do {struct timeval t; t.tv_sec = seconds;\
 t.tv_usec = microseconds; select(0, NULL, NULL, NULL, &t);} while(0)
#endif /* _POSIX_C_SOURCE >= 199309L */
#endif

```

## 2 Register the header file:

- If you use the `target` package for connectivity, use the `BuildDependencies` property of the `target.XCPPlatformAbstraction` class to specify the required information. See “Customise Connectivity for XCP External Mode Simulations” on page 60-35.
- If you do not use the `target` package for connectivity, define a post-code generation command:

```

function myXCPTargetPostCodeGenCommand(buildInfo)

 buildInfo.addDefines('-DXCP_CUSTOM_PLATFORM', 'OPTS');

 % Add my rtiostream
 buildInfo.addSourceFiles(customRtIOStreamFileName, ...
 customRtIOStreamSrcPath);

 % If the target hardware does not support parsing of command
 % line arguments
 buildInfo.addDefines('-DEXTMODE_DISABLE_ARGS_PROCESSING', 'OPTS');

end

```

## External Mode Simulation with TCP/IP or Serial Communication

Set up and run an external mode simulation that uses a TCP/IP or serial (RS-232) communication channel.

- 1 Create and configure a simple model.
- 2 Build the target executable file.
- 3 Run the target application.
- 4 Tune parameters.

The example, which uses the GRT target, does not require external hardware. The generated executable file runs:

- On the development computer that hosts Simulink and Simulink Coder.
- As a separate process from MATLAB and Simulink.

### Create and Configure Model

In this part of the example, you create a simple model, `ex_extModeExample`. You also create a folder called `ext_mode_example` to store the model and the generated executable.

To create the folder and the model:

- 1 From the MATLAB command line, type:

```
mkdir ext_mode_example
```

- 2 Make `ext_mode_example` your working folder:

```
cd ext_mode_example
```

- 3 Create a model in Simulink with a Sine Wave block for the input signal, two Gain blocks in parallel, and two Scope blocks. Be sure to label the Gain and Scope blocks as shown.

- 4 Define and assign two MATLAB workspace variables, A and B:

```
A = 2;
B = 3;
```

- 5 Open Gain block A and set its **Gain** parameter to the variable A.

- 6 Open Gain block B and set its **Gain** parameter to the variable B.

When the target application is built and connected to Simulink in external mode, you can download new gain values to the executing target application. To do this, you can assign new values to workspace variables A and B, or edit the values in the block parameters dialog box. For more information, see “Tune Parameters” on page 60-57.

- 7 Verify operation of the model. Open the Scope blocks and run the model. When  $A = 2$  and  $B = 3$ , the output appears as shown.

- 8 Save the model as ex\_extModeExample.

## Build Target Executable

Set up the model and code generation parameters required for an external mode target application. Then, generate code and build the target application.

- 1 From the **Apps** tab on the Simulink toolstrip, in the **Setup to Run on Hardware** section, click **Run on Custom Hardware**.
- 2 In the **Hardware** section, from the **System Target File Description** list, select **Generic Real-Time Target (grt.tlc)**.
- 3 In the **Prepare** section, click **Hardware Settings**. The Configuration Parameters dialog box opens, displaying **Hardware Implementation** settings that are determined by the system target file.
- 4 On the **Solver** pane:
  - a In the **Type** field, select **Fixed-step**.
  - b In the **Solver** field, select **discrete (no continuous states)**.
  - c Click **Solver details**. In the **Fixed-step size** field, specify **0.1**. (Otherwise, when you generate code, the Simulink Coder build process produces a warning and supplies a value.)
  - d Click **Apply**.
- 5 On the **Data Import/Export** pane, clear the **Time** and **Output** check boxes. In this example, data is not logged to the workspace or to a MAT-file. Click **Apply**.
- 6 On the **Code Generation > Optimization** pane, check that **Default parameter behavior** is set to **Tunable**. If you make a change, click **Apply**.
- 7 On the **Code Generation > Interface** pane, in the **Data exchange interface** section, select **External mode**.
- 8 In the **External mode configuration** section, make sure that the default value **tcip** is selected for the **Transport layer** parameter.

External mode

External mode configuration

Transport layer:  MEX-file name:

MEX-file arguments:

Static memory allocation

External mode supports communication via TCP/IP, serial, and custom transport protocols. The **MEX-file name** specifies the name of a MEX-file that implements host-target communication. The default for TCP/IP is `ext_comm`, a MEX-file provided with the Simulink Coder software. You can override this default by supplying other files. If you need to support other transport layers, see “Create a Transport Layer for TCP/IP or Serial External Mode Communication”.

The **MEX-file arguments** field lets you specify arguments, such as a TCP/IP server port number, to be passed to the external interface program. These arguments are specific to the external interface that you are using. For information on setting these arguments, see “MEX-File Optional Arguments for TCP/IP Transport” and “MEX-File Optional Arguments for Serial Transport”.

This example uses the default arguments. Leave the **MEX-file arguments** field blank.

The **Static memory allocation** check box controls how memory is allocated for external mode communication buffers in the target. For this example, do not select the check box. For more information, see “Control Memory Allocation for Communication Buffers in Target” on page 60-60.

- 9 Click **Apply** to save the external mode settings.
- 10 Save the model.
- 11 Select the **Code Generation** pane. Make sure that **Generate code only** is cleared.
- 12 To generate code and create the target application, in the model window, press **Ctrl+B**. Or, on the **Hardware** tab, in the **Run on Hardware** section, click **Monitor & Tune**. Then, under **Step By Step Commands**, click **Build for Monitoring**.

The software creates the `ex_extModeExample` executable file in your working folder.

## Run Target Application

You now run the `ex_extModeExample` target executable and use Simulink as an interactive front end to the running target application. The executable file is in your working folder. Run the target application and establish communication between Simulink and the target.

---

**Note** An external mode program like `ex_extModeExample` is a host-based executable. Its execution is not tied to a real-time operating system (RTOS) or a periodic timer interrupt, and it does not run in real time. The program just runs as fast as possible, and the time units it counts off are simulated time units that do not correspond to time in the world outside the program.

---

To run the target application:

- 1 On the **Hardware** tab, in the **Run on Hardware** section:
  - a In the **Stop Time** field, specify `inf`, which makes the model run until the target application receives a stop message from Simulink
  - b Click **Monitor & Tune**. Then, under **Step By Step Commands**, click **Deploy**.

The target application begins execution, and enters a wait state.

- 2 Open the Scope blocks in the model. Signals are not visible on the scopes until you begin model execution.
- 3 On the **Hardware** tab, in the **Run on Hardware** section, click **Monitor & Tune**. Then, under **Step By Step Commands**, click **Connect**. This action initiates a handshake between Simulink and the target application. When Simulink and the target are connected, the **Connect** button changes to **Disconnect**.
- 4 In the **Run on Hardware** section, click , which starts execution of the generated model code. The two scopes in your model display the outputs of Gain blocks A and B.

You have established communication between Simulink and the running target application. You can now tune block parameters in Simulink and observe the effects of parameter changes.

## Tune Parameters

This table describes how you can tune tunable block parameters during a simulation.

Approach	Details
Model Data Editor	<p>To tune parameters through the Model Data Editor:</p> <ol style="list-style-type: none"> <li><b>1</b> On the <b>Hardware</b> tab of the Simulink Editor, in the <b>Prepare</b> section, click <b>Tune Parameters</b>, which opens the Model Data Editor.</li> <li><b>2</b> If you want to update multiple tunable parameters simultaneously, in the <b>Prepare</b> section, toggle on <b>Hold Updates</b>.</li> <li><b>3</b> On the <b>Parameters</b> tab of the Model Data Editor, in the <b>Value</b> column, specify new values for your tunable parameters.</li> <li><b>4</b> Toggle off <b>Hold Updates</b> or click <b>Update All Parameters (Ctrl+D)</b>. Simulink downloads the new values to the target application simultaneously.</li> </ol> <p>If <b>Hold Updates</b> is off, then immediately after you specify a new value, Simulink downloads the new value to the target application.</p> <p>For more information, see <b>Model Data Editor</b>.</p>
Block Parameter dialog box	<p>To tune parameters through the Block Parameter dialog box:</p> <ol style="list-style-type: none"> <li><b>1</b> For each block that you want to update: <ol style="list-style-type: none"> <li><b>a</b> Double-click the block, which opens the Block Parameter dialog box.</li> <li><b>b</b> In the parameter fields, specify new parameter values.</li> <li><b>c</b> Click <b>Apply</b> or <b>OK</b>.</li> </ol> </li> <li><b>2</b> If <b>Hold Updates</b> is on, toggle off <b>Hold Updates</b> or click <b>Update All Parameters (Ctrl+D)</b>. Simulink downloads the new values to the target application simultaneously.</li> </ol> <p>If <b>Hold Updates</b> is off, then immediately after you click <b>Apply</b> or <b>OK</b>, Simulink downloads the new block values to the target application.</p>

Approach	Details
MATLAB workspace	<p>If block parameters are MATLAB workspace variables:</p> <ol style="list-style-type: none"> <li><b>1</b> In the Command Window, assign new values to the variables.</li> <li><b>2</b> On the <b>Hardware</b> tab of the Simulink Editor, in the <b>Prepare</b> section, click <b>Update All Parameters (Ctrl+D)</b>. Simulink downloads the new values to the target application.</li> </ol> <p>For more information, see “Create and Edit Variables”.</p>

You cannot change the sample time of the Sine Wave block during simulation. Block sample times are part of the structural definition of the model and are part of the generated code. Therefore, if you want to change a block sample time, you must stop the external mode simulation, reset the sample time of the block, and rebuild the executable.

Block parameter tunability during external mode simulation depends on the way that the generated code represents block parameters.

For example, in the Gain A block dialog box, you cannot change the expression A in the **Gain** parameter during simulation. Instead, you must change the value of the variable A in the base workspace. You cannot change the expression because the generated code does not allocate storage in memory for the **Gain** parameter. Instead, the code creates a field A in a structure:

```

/* Parameters (auto storage) */
struct P_ex_extModeExample_T_ {
 real_T A; /* Variable: A
 */
 real_T B; /* Variable: B
 */
 real_T SineWave_Amp; /* Expression: 1
 */
 real_T SineWave_Bias; /* Expression: 0
 */
 real_T SineWave_Freq; /* Expression: 1
 */
 real_T SineWave_Phase; /* Expression: 0
 */
};

```

The generated code algorithm uses that field in the code that represents the block Gain A. In this case, the global structure variable `ex_extModeExample_P` uses the type `P_ex_extModeExample_T_`:

```
ex_extModeExample_B.GainA = ex_extModeExample_P.A * rtb_SineWave;
```

When you change the value of A in the base workspace, the simulation downloads the new value to the field A in the target application.

You can change the expressions in the Sine Wave block parameters during simulation because the generated code creates a field in the global structure `ex_extModeExample_P` to represent each

parameter in the block. When you change an expression in the block dialog box, the simulation first evaluates the new expression. The simulation then downloads the resulting numeric value to the corresponding structure field in the target application.

See “Create Tunable Calibration Parameter in the Generated Code” on page 36-111.

## Stop Target Application

To simultaneously disconnect Simulink from the host/target communication and end execution of the target application, on the **Hardware** tab, in the **Run on Hardware** section, click **Stop**.

## Control Memory Allocation for Communication Buffers in Target

If you select the **Code Generation > Interface > Static memory allocation** check box (for GRT and ERT targets), the code generator produces code for external mode that uses only static memory allocation (“malloc-free” code). Selecting **Static memory allocation** enables the **Static memory buffer size** parameter. Use this parameter to specify the size of the external mode static memory buffer. The default value is 1,000,000 bytes. If you enter too small a value for your program, the external mode simulation issues an out-of-memory error when it tries to allocate more memory than specified. In such cases, increase the value in the **Static memory buffer size** field and regenerate the code.

To determine how much memory to allocate, enable verbose mode on the target (by including `OPTS=" -DVERBOSE"` on the make command line). As it executes, external mode displays the amount of memory it tries to allocate and the amount of memory available to it each time it attempts an allocation. If an allocation fails, you can use this console log to determine the required value for the **Static memory buffer size** field.

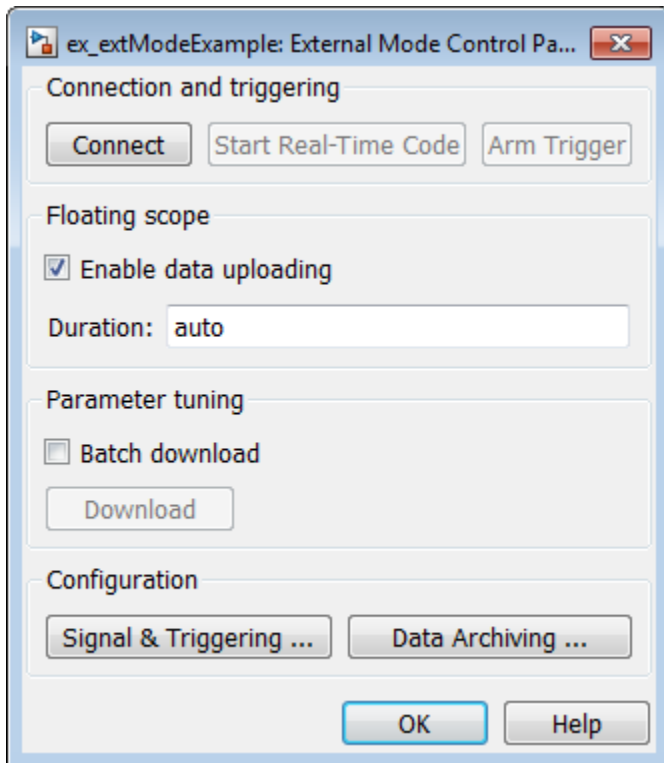

## TCP/IP or Serial External Mode Control Panel

The External Mode Control Panel provides controls for TCP/IP or serial external mode operations, including:

- “Connect, Start, and Stop” on page 60-61
- “Upload Target Application Signal Data to Host” on page 60-61
- “Download Parameters to Target Application” on page 60-62
- “Configure Host Monitoring of Target Application Signal Data” on page 60-63
- “Configure Host Archiving of Target Application Signal Data” on page 60-69

To open the External Mode Control Panel dialog box, on the **Hardware** tab, in the **Prepare** section, click **Control Panel**.

### Connect, Start, and Stop

The External Mode Control Panel performs the same connect/disconnect and start/stop functions found on the **Hardware** tab on the Simulink toolstrip (see “Summary of Graphical Controls for TCP/IP or Serial External Mode Simulation” on page 60-71).

Clicking the **Connect** button connects your model to a waiting or running target application. While you are connected, the button changes to a **Disconnect** button. **Disconnect** disconnects your model from the target environment, but does not halt real-time code running in the target environment.

Clicking the **Start Real-Time Code** button commands the target to start running real-time code. While real-time code is running in the target environment, the button changes to a **Stop Real-Time Code** button. **Stop Real-Time Code** stops target application execution and disconnects your model from the target environment.

### Upload Target Application Signal Data to Host

The External Mode Control Panel allows you to trigger and cancel data uploads to the host. The destination for the uploaded data can be a scope block, Display block, To Workspace block, or another block or subsystem listed in “Blocks and Subsystems Compatible with External Mode” on page 60-72.

The **Arm Trigger** and **Cancel Trigger** buttons provide manual control of data uploading to compatible blocks or subsystems, except floating scopes. (For floating scopes, use the **Floating scope** section of the External Mode Control Panel.)

- To trigger data uploading to compatible blocks or subsystems, click the **Arm Trigger** button. The button changes to **Cancel Trigger**.

- To cancel data uploading, click the **Cancel Trigger** button. The button reverts to **Arm Trigger**.

You can trigger data uploads manually or automatically. To configure signals and triggers for data uploads, see “Configure Host Monitoring of Target Application Signal Data” on page 60-63.

A subset of external mode compatible blocks, including Scope, Time Scope, and To Workspace, allow you to log uploaded data to disk. To configure data archiving, see “Configure Host Archiving of Target Application Signal Data” on page 60-69.

The **Floating scope** section of the External Mode Control Panel controls when and for how long data is uploaded to Floating Scope blocks. When used in external mode, floating scopes:

- Do not appear in the External Signal & Triggering dialog box.
- Do not log data to external mode archiving.
- Support manual triggering only.

The **Floating scope** section contains the following parameters:

- **Enable data uploading** option, which functions as an **Arm Trigger** button for floating scopes. When the target is disconnected, the option controls whether to arm the trigger when connecting the floating scopes. When the target is connected, the option acts as a toggle button to arm or cancel the trigger.
  - To trigger data uploading to floating scopes, select **Enable data uploading**.
  - To cancel data uploading to floating scopes, clear **Enable data uploading**.
- **Duration** edit field, which specifies the number of base-rate steps for which external mode logs floating scopes data after a trigger event. By default, it is set to `auto`, which causes the duration value set in the External Signal & Triggering dialog box to be used. The default duration value is 1000 base rate steps.

### Download Parameters to Target Application

The **Batch download** option on the External Mode Control Panel enables or disables batch parameter changes.

By default, batch download is disabled. If batch download is disabled, when you click **OK** or **Apply**, changes made directly to block parameters by editing block parameter dialog boxes are sent to the target. When you perform an **Update Diagram**, changes to MATLAB workspace variables are sent.

If you select **Batch download**, the **Download** button is enabled. Until you click **Download**, changes made to block parameters are stored locally. When you click **Download**, the changes are sent in a single transmission.

When parameter changes are awaiting batch download, the External Mode Control Panel displays the message `Parameter changes pending...` to the right of the **Download** button. This message remains visible until the Simulink engine receives notification that the new parameters have been installed in the parameter vector of the target system.

The next figure shows the External Mode Control Panel with the **Batch download** option activated and parameter changes pending.

## Configure Host Monitoring of Target Application Signal Data

- “Role of Trigger in Signal Data Uploading” on page 60-63
- “Configure Signal Data Uploading” on page 60-64
- “Default Trigger Options” on page 60-65
- “Select Signals to Upload” on page 60-65
- “Configure Trigger Options” on page 60-65
- “Select Trigger Signal” on page 60-67
- “Set Trigger Conditions” on page 60-67
- “Modify Signal and Triggering Options While Connected” on page 60-68

### Role of Trigger in Signal Data Uploading

In external mode, uploading target application signal data to the host depends on a *trigger*. The trigger is a set of conditions that must be met for data uploading to begin. The trigger can be armed or not armed.

- When the trigger is armed, the software checks for the trigger conditions that allow data uploading to begin.
- If the trigger is not armed, the software does not check for the trigger conditions and data uploading cannot begin.
- The trigger can be armed automatically, when the host connects to the target, or manually, by clicking the **Arm Trigger** button on the External Mode Control Panel.

When the trigger is armed and the trigger conditions are met, the trigger fires and data uploading begins.

When data has been collected for a defined duration, the trigger event completes and data uploading stops. The trigger can then rearm, or remain unarmed until you click the **Arm Trigger** button.

To select the target application signals to upload and configure how uploads are triggered, see “Configure Signal Data Uploading” on page 60-64.

### Configure Signal Data Uploading

Clicking the **Signal & Triggering** button of the External Mode Control Panel opens the External Signal & Triggering dialog box.

The External Signal & Triggering dialog box displays a list of blocks and subsystems in your model that support external mode signal uploading. For information on which types of blocks are external mode compatible, see “Blocks and Subsystems Compatible with External Mode” on page 60-72.

In the External Signal & Triggering dialog box, you can select the signals that are collected from the target system and viewed in external mode. You can also select a trigger signal, which triggers uploading of data based on meeting certain signal conditions, and define the triggering conditions.

## Default Trigger Options

The preceding figure shows the default settings of the External Signal & Triggering dialog box. The default operation of the External Signal & Triggering dialog box simplifies monitoring the target application. If you use the default settings, you do not need to preconfigure signals and triggers. You start the target application and connect the Simulink engine to it. External mode compatible blocks are selected and the trigger is armed. Signal uploading begins immediately upon connection to the target application.

The default configuration of trigger options is:

- **Select all:** on
- **Source:** manual
- **Mode:** normal
- **Duration:** 1000
- **Delay:** 0
- **Arm when connecting to target:** on

## Select Signals to Upload

External mode compatible blocks in your model appear in the **Signal selection** list of the External Signal & Triggering dialog box. You use this list to select signals that you want to view. In the **Selected** column, an X appears for each selected block.

The **Select all** check box selects all signals. By default, **Select all** is selected.

If **Select all** is cleared, you can select or clear individual signals using the **on** and **off** options. To select a signal, click its list entry and select the **on** option. To clear a signal, click its list entry and select the **off** option.

The **Clear all** button clears all signals.

## Configure Trigger Options

As described in “Role of Trigger in Signal Data Uploading” on page 60-63, signal data uploading depends on a trigger. The trigger defines conditions that must be met for uploading to begin. Also, the trigger must be armed for data uploading to begin. When the trigger is armed and trigger conditions are met, the trigger fires and uploading begins. When data has been collected for a defined duration, the trigger event completes and data uploading stops.

To control when and how signal data is collected (uploaded) from the target system, configure the following **Trigger options** in the External Signal & Triggering dialog box.

- **Source:** manual or signal. Controls whether a button or a signal triggers data uploading.

Selecting **manual** directs external mode to use the **Arm Trigger** button on the External Mode Control Panel as the trigger to start uploading data. When you click **Arm Trigger**, data uploading begins.

Selecting **signal** directs external mode to use a trigger signal as the trigger to start uploading data. When the trigger signal satisfies trigger conditions (that is, the signal crosses the trigger level in the specified direction), a *trigger event* occurs. (Specify trigger conditions in the **Trigger signal** section.) If the trigger is *armed*, external mode monitors for the occurrence of a trigger event. When a trigger event occurs, data uploading begins.

- **Mode:** normal or one-shot. Controls whether the trigger rearms after a trigger event completes.

In normal mode, external mode automatically rearms the trigger after each trigger event. The next data upload begins when the trigger fires.

In one-shot mode, external mode collects only one buffer of data each time you arm the trigger.

For more information on the **Mode** setting, see “Configure Host Archiving of Target Application Signal Data” on page 60-69.

- **Duration:** Specifies the number of base rate steps for which external mode uploads data after a trigger event (default is 1000). For example, if **Duration** is set to 1000, and the base (fastest) rate of the model is one second:
  - For a signal sampled at the base rate, one second (1.0 Hz), external mode collects 1000 contiguous samples during a trigger event.
  - For a signal sampled at two seconds (0.5 Hz), external mode collects 500 samples during a trigger event.
- **Delay:** Specifies a delay to be applied to data collection. The delay represents the amount of time that elapses between a trigger event and the start of data collection. The delay is expressed in base rate steps. It can be positive or negative (default is 0). A negative delay corresponds to pretriggering. When the delay is negative, data from the time preceding the trigger event is collected and uploaded.
- **Arm when connecting to target:** Selected or cleared. Whether a button or a signal triggers data uploading (as defined by **Source**), the trigger must be armed to allow data uploading to begin.

If you select this option, connecting to the target arms the trigger.

- If the trigger **Source** is manual, data uploading begins immediately.
- If the trigger **Source** is signal, monitoring of the trigger signal begins immediately. Data uploading begins when the trigger signal satisfies trigger conditions (as defined in the **Trigger signal** section).

If you clear **Arm when connecting to target**, manually arm the trigger by clicking the **Arm Trigger** button on the External Mode Control Panel.

When simulating in external mode, each rate in the model creates a buffer on the target. Each entry in the buffer is big enough to hold all of the data required of every signal in that rate for one time step (time plus data plus external mode indices identifying the signal). The number of entries in the circular buffer is determined by the external mode trigger **Duration** parameter (ExtModeTrigDuration). The memory allocated on the target for buffering signals is proportional to the **Duration** and the number of signals uploading. The **Duration** also provides an indication of the number of base rate steps with log data after a trigger event in external mode.

The **Duration** value specifies the number of contiguous points of data to be collected in each buffer of data. You should enter a **Duration** value equal to the number of continuous sample points that you need to collect rather than relying on a series of buffers to be continuous. If you enter a value less than the total number of sample points, you may lose sample points during the time spent transferring values from the data buffer to the MATLAB workspace. The Simulink software maintains point continuity only within one buffer. Between buffers, because of transfer time, some samples may be omitted.

The **Duration** value can affect the **Limit data points to last** value of Scope and To Workspace blocks. The number of sample points that the blocks save to the MATLAB workspace is the smaller of the two values. To set the number of sample points that the blocks save, clear **Limit data points to last**. Then, use **Duration** to specify the number of sample points saved.

### Select Trigger Signal

You can designate one signal as a trigger signal. To select a trigger signal, from the **Source** menu in the **Trigger options** section, select **signal**. This action enables the parameters in the **Trigger signal** section. Then, select a signal in the **Signal selection** list, and click the **Trigger Signal** button.

When you select a signal to be a trigger, a T appears in the **Trigger** column of the **Signal selection** list. In the next figure, the **Scope A** signal is the trigger. **Scope B** is also selected for viewing, as indicated by the X in the **Selected** column.

After selecting the trigger signal, you can use the **Trigger signal** section to define the trigger conditions and set the trigger signal **Port** and **Element** parameters.

### Set Trigger Conditions

Use the **Trigger signal** section of the External Signal & Triggering dialog box to set trigger conditions and attributes. **Trigger signal** parameters are enabled only when the trigger parameter **Source** is set to **signal** in the **Trigger options** section.

By default, any element of the first input port of a specified trigger block can cause the trigger to fire (that is, Port 1, any element). You can modify this behavior by adjusting the **Port** and **Element** values in the **Trigger signal** section. The **Port** field accepts a number or the keyword `last`. The **Element** field accepts a number or the keywords `any` or `last`.

In the **Trigger signal** section, you also define the conditions under which a trigger event occurs.

- **Direction:** `rising`, `falling`, or `either`. The direction in which the signal must be traveling when it crosses the threshold value. The default is `rising`.
- **Level:** A value indicating the threshold the signal must cross in a designated direction to fire the trigger. By default, the level is 0.
- **Hold-off:** Applies only to `normal` mode. Expressed in base rate steps, **Hold-off** is the time between the termination of one trigger event and the rearming of the trigger.

### Modify Signal and Triggering Options While Connected

After you configure signal data uploading, and connect Simulink to a running target executable, you can modify signal and triggering options without disconnecting from the target.

If the trigger is armed (for example, if the trigger option **Arm when connecting to the target** is selected, which is the default), the External Signal & Triggering dialog box cannot be modified. To modify signal and triggering options:

- 1 Open the External Mode Control Panel.
- 2 Click **Cancel Trigger**. Triggering and display of uploaded data stops.
- 3 Open the External Signal & Triggering dialog box and modify signal and trigger options as required. For example, in the **Signal selection** section, you can enable or disable a scope, and in the **Trigger options** section, change the trigger **Mode**, for example, from `normal` to `one-shot`.
- 4 Click **Arm Trigger**. Triggering and display of uploaded data resumes, with your modifications.

## Configure Host Archiving of Target Application Signal Data

In external mode, you can use the Simulink Scope and To Workspace blocks to archive data to disk.

To understand how the archiving features work, consider the handling of data when archiving is not enabled. There are two cases, one-shot mode and normal mode.

- In one-shot mode, after a trigger event occurs, each selected block writes its data to the workspace, as it would at the end of a simulation. If another one-shot is triggered, the existing workspace data is overwritten.
- In normal mode, external mode automatically rearms the trigger after each trigger event. Consequently, you can think of normal mode as a series of one-shots. Each one-shot in this series, except for the last, is referred to as an *intermediate result*. Because the trigger can fire at any time, writing intermediate results to the workspace can result in unpredictable overwriting of the workspace variables. For this reason, the default behavior is to write only the results from the final one-shot to the workspace. The intermediate results are discarded. If you know that enough time exists between triggers for inspection of the intermediate results, you can override the default behavior by selecting the **Write intermediate results to workspace** option. This option does not protect the workspace data from being overwritten by subsequent triggers.

If you use a Simulink Scope block to archive data to disk, open the Scope parameters dialog box and select the option **Log data to workspace**. The option is required for these reasons:

- The data is first transferred from the scope data buffer to the MATLAB workspace, before being written to a MAT-file.

- The **Variable name** entered in the Scope parameters dialog box is the same as the one in the MATLAB workspace and the MAT-file. Enabling the data to be saved enables a variable named with the **Variable name** parameter to be saved to a MAT-file.

---

**Note** If you do not select the Scope block option **Log data to workspace**, the MAT-files for data logging are created, but they are empty.

---

The Enable Data Archiving dialog box supports:

- Folder notes
- File notes
- Automated data archiving

On the External Mode Control Panel, click the **Data Archiving** button to open the Enable Data Archiving dialog box. If your model is connected to the target environment, disconnect it while you configure data archiving. To enable the other controls in the dialog box, select **Enable archiving**.

These operations are supported by the Enable Data Archiving dialog box.

### Folder Notes

To add annotations for a collection of related data files in a folder, in the Enable Data Archiving dialog box, click **Edit Directory Note**. The MATLAB editor opens. Place comments that you want saved to a file in the specified folder in this window. By default, the comments are saved to the folder last written to by data archiving.

### File Notes

To add annotations for an individual data file, in the Enable Data Archiving dialog box, click **Edit File Note**. A file finder window opens, which by default is set to the last file to which you have written.

Selecting a MAT-file opens an edit window. In this window, add or edit comments that you want saved with your individual MAT-file.

### Automated Data Archiving

To configure automatic writing of logging results to disk, optionally including intermediate results, use the **Enable archiving** option and the controls it enables. The dialog box provides the following related controls:

- **Directory:** Specifies the folder in which data is saved. If you select **Increment directory when trigger armed**, external mode appends a suffix.
- **File:** Specifies the name of the file in which data is saved. If you select **Increment file after one-shot**, external mode appends a suffix.
- **Increment directory when trigger armed:** Each time that you click the **Arm Trigger** button, external mode uses a different folder for writing log files. The folders are named incrementally, for example, `dirname1`, `dirname2`, and so on.
- **Increment file after one-shot:** New data buffers are saved in incremental files: `filename1`, `filename2`, and so on. File incrementing happens automatically in normal mode.
- **Append file suffix to variable names:** Whenever external mode increments file names, each file contains variables with identical names. Selecting **Append file suffix to variable name** results in each file containing unique variable names. For example, external mode saves a variable named `xdata` in incremental files (`file_1`, `file_2`, and so on) as `xdata_1`, `xdata_2`, and so on. This approach supports loading the MAT-files into the workspace and comparing variables at the MATLAB command prompt. Without the unique names, each instance of `xdata` would overwrite the previous one in the MATLAB workspace.
- **Write intermediate results to workspace:** If you want the Simulink Coder software to write intermediate results to the workspace, select this option.

## Summary of Graphical Controls for TCP/IP or Serial External Mode Simulation

You can control a TCP/IP or serial external mode simulation through:

- The **Hardware** tab on the Simulink toolstrip. To display the **Hardware** tab, from the **Apps** tab on the Simulink toolstrip, click **Run on Custom Hardware**.
- The External Mode Control Panel. To open this dialog box, in Simulink Editor, on the **Hardware** tab, in the **Prepare** section, click . Then under **Signal Monitoring & Tracing**, click **Control Panel**.

This table lists external mode actions that you can perform by using controls that are available in the **Hardware** tab and the External Mode Control Panel.

External Mode Action	Hardware Tab	External Mode Control Panel
Build target application.	<b>Run on Hardware &gt; Build for</b>  <b>Monitoring</b> 	N/A

External Mode Action	Hardware Tab	External Mode Control Panel
Run application on target hardware.	<b>Run on Hardware &gt; Deploy</b> 	N/A
Connect Simulink to a waiting or running target application.	<b>Run on Hardware &gt; Connect</b>  When Simulink is connected to the target application, <b>Connect</b> appears dimmed and <b>Disconnect</b>  is active.	<b>Connect</b> When Simulink is connected to the target application, <b>Connect</b> changes to <b>Disconnect</b> .
Start real-time execution of generated code in the target environment.	<b>Run on Hardware &gt; Start</b> 	<b>Start Real-Time Code</b> When the generated code starts executing, the button changes to <b>Stop Real-Time Code</b> .
Disconnect Simulink from the target environment, but do not stop real-time execution of code.	<b>Run on Hardware &gt;</b> <b>Disconnect</b>  When Simulink is disconnected from the target application, <b>Disconnect</b> appears dimmed and <b>Connect</b>  is active.	<b>Disconnect</b>
Stop target application execution and disconnect Simulink from the target environment.	In <b>Run on Hardware</b> section, <b>Stop</b> button  .	<b>Stop Real-Time Code</b>
Tune batch of block parameters.	In <b>Prepare</b> section, <b>Hold Updates</b>  and <b>Update All Parameters</b>  buttons.	<b>Batch download</b> and <b>Download</b>

## Blocks and Subsystems Compatible with External Mode

- “Compatible Blocks” on page 60-72
- “Signal Viewing Subsystems” on page 60-73
- “Supported Blocks for Data Archiving” on page 60-74

### Compatible Blocks

In external mode, you can use the following types of blocks to receive and view signals uploaded from the target application:

- Floating Scope and Scope blocks
- Spectrum Analyzer and Time Scope blocks from the DSP System Toolbox product
- Display blocks
- To Workspace blocks
- User-written S-Function blocks

An external mode method is built into the S-function API. This method allows user-written blocks to support external mode. See `matlabroot/simulink/include/simstruc.h`.

- Record, XY Graph blocks

You can designate certain subsystems as Signal Viewing Subsystems and use them to receive and view signals uploaded from the target application. See “Signal Viewing Subsystems” on page 60-73 for more information.

You select external mode compatible blocks and subsystems, and arm the trigger, by using the External Signal & Triggering dialog box. By default, such blocks in a model are selected, and a manual trigger is set to be armed when connected to the target application.

### Signal Viewing Subsystems

A Signal Viewing Subsystem is an atomic subsystem that encapsulates processing and viewing of signals received from the target system. A Signal Viewing Subsystem runs only on the host, and does not generate code in the target system. Signal Viewing Subsystems run in normal, accelerator, rapid accelerator, and external simulation modes.

---

**Note** Signal Viewing Subsystems are inactive if placed inside a SIL or PIL component, such as a top model in SIL or PIL mode, a Model block in SIL or PIL mode, or a SIL or PIL block. However, a SIL or PIL component can feed a Signal Viewing Subsystem running in a supported mode.

---

Signal Viewing Subsystems are useful in situations where you want to process or condition signals before viewing or logging them, but you do not want to perform these tasks on the target system. By using a Signal Viewing Subsystem, you can generate smaller and more efficient code on the target system.

Like other external mode compatible blocks, Signal Viewing Subsystems are displayed in the External Signal & Triggering dialog box.

To declare a subsystem to be a Signal Viewing Subsystem:

- 1 In the Block Parameters dialog box, select the **Treat as atomic unit** option.

For more information on atomic subsystems, see “Simulink Modeling Components”.

- 2 To turn the `SimViewingDevice` property on, use the `set_param` command:

```
set_param('blockname', 'SimViewingDevice', 'on')
```

'blockname' is the name of the subsystem.

- 3 Make sure the subsystem meets the following requirements:

- It must be a pure Sink block. That is, it must not contain Outport blocks or Data Store blocks. It can contain Goto blocks only if the corresponding From blocks are contained within the subsystem boundaries.
- It must not have continuous states.

The following model, `sink_examp`, contains an atomic subsystem, `theSink`.

The subsystem `theSink` applies a gain and an offset to its input signal and displays it on a Scope block.

If `theSink` is declared as a Signal Viewing Subsystem, the generated target application includes only the code for the Sine Wave block. If `theSink` is selected and armed in the External Signal & Triggering dialog box, the target application uploads the sine wave signal to `theSink` during simulation. You can then modify the parameters of the blocks within `theSink` and observe the uploaded signal.

If `theSink` were not declared as a Signal Viewing Subsystem, its Gain, Constant, and Sum blocks would run as subsystem code on the target system. The Sine Wave signal would be uploaded to the Simulink engine after being processed by these blocks, and viewed on `sink_examp/theSink/Scope2`. Processing demands on the target system would be increased by the additional signal processing, and by the downloading of changes in block parameters from the host.

### Supported Blocks for Data Archiving

In external mode, you can use the following types of blocks to archive data to disk:

- Scope blocks
- To Workspace blocks

You configure data archiving by using the Enable Data Archiving dialog box, as described in “Configure Host Archiving of Target Application Signal Data” on page 60-69.

### External Mode Mechanism for Downloading Tunable Parameters

- “Download Mechanism” on page 60-75

- “Inlined and Tunable Parameters” on page 60-76

Depending on the setting of the **Default parameter behavior** option when the target application is generated, there are differences in the way parameter updates are handled. “Download Mechanism” on page 60-75 describes the operation of external mode communication with **Default parameter behavior** set to **Tunable**. “Inlined and Tunable Parameters” on page 60-76 describes the operation of external mode with **Default parameter behavior** set to **Inlined**.

### Download Mechanism

In external mode, the Simulink engine does not simulate the system represented by the block diagram. By default, when external mode is enabled, the Simulink engine downloads parameters to the target system. After the initial download, the engine remains in a waiting mode until you change parameters in the block diagram or until the engine receives data from the target.

When you change a parameter in the block diagram, the Simulink engine calls the external interface MEX-file, passing new parameter values (along with other information) as arguments. The external interface MEX-file contains code that implements one side of the interprocess communication (IPC) channel. This channel connects the Simulink process (where the MEX-file executes) to the process that is executing the external program. The MEX-file transfers the new parameter values by using this channel to the external program.

The other side of the communication channel is implemented within the external program. This side writes the new parameter values into the target's parameter structure (*model\_P*).

The Simulink side initiates the parameter download operation by sending a message containing parameter information to the external program. In the terminology of client/server computing, the Simulink side is the client and the external program is the server. The two processes can be remote, or they can be local. Where the client and server are remote, a protocol such as TCP/IP is used to transfer data. Where the client and server are local, a serial connection or shared memory can be used to transfer data.

The next figure shows this relationship. The Simulink engine calls the external interface MEX-file whenever you change parameters in the block diagram. The MEX-file then downloads the parameters to the external program by using the communication channel.

## External Mode Architecture

### Inlined and Tunable Parameters

By default, parameters (except those listed in “TCP/IP and Serial External Mode Limitations” on page 60-89) in an external mode program are tunable; that is, you can change them by using the download mechanism described in this section.

If you set **Default parameter behavior** to **Inlined** (on the **Optimization** pane of the Configuration Parameters dialog box), the Simulink Coder code generator embeds the numerical values of model parameters (constants), instead of symbolic parameter names, in the generated code. Inlining parameters generates smaller and more efficient code. However, inlined parameters, because they effectively become constants, are not tunable.

The Simulink Coder software lets you improve overall efficiency by inlining most parameters, while at the same time retaining the flexibility of run-time tuning for selected parameters that are important to your application. When you inline parameters, you can use `Simulink.Parameter` objects to remove individual parameters from inlining and declare them to be tunable. In addition, you can use these objects to control how parameters are represented in the generated code.

For more information on tunable parameters, see “Create Tunable Calibration Parameter in the Generated Code” on page 36-111.

### Automatic Parameter Uploading on Host/Target Connection

Each time the Simulink engine connects to a target application that was generated with **Default parameter behavior** set to **Inlined**, the target application uploads the current value of its tunable parameters to the host. These values are assigned to the corresponding MATLAB workspace variables. This procedure synchronizes the host and target with respect to parameter values. If the tunable parameters are stored in the model workspace or a data dictionary, the values are not uploaded and Simulink produces a warning.

Workspace variables required by the model must be initialized at the time of host/target connection. Otherwise the uploading cannot proceed and an error results. Once the connection is made, these variables are updated to reflect the current parameter values on the target system.

Automatic parameter uploading takes place only if the target application was generated with **Default parameter behavior** set to **Inlined**. “Download Mechanism” on page 60-75 describes the operation of external mode communication with **Default parameter behavior** set to **Tunable**.

## Choose Communication Protocol for Client and Server

- “Introduction” on page 60-77
- “Using the TCP/IP Implementation” on page 60-77
- “Using the Serial Implementation” on page 60-80
- “Run the External Program” on page 60-81
- “Implement an External Mode Protocol Layer” on page 60-83

### Introduction

The Simulink Coder product provides code to implement both the client and server side of external mode communication using either TCP/IP or serial protocols. You can use the socket-based external mode implementation provided by the Simulink Coder product with the generated code, provided that your target system supports TCP/IP. If not, use or customize the serial transport layer option provided.

A low-level *transport layer* handles physical transmission of messages. Both the Simulink engine and the model code are independent of this layer. Both the transport layer and code directly interfacing to the transport layer are isolated in separate modules that format, transmit, and receive messages and data packets.

### Using the TCP/IP Implementation

You can use TCP/IP-based client/server implementation of external mode with real-time programs on The Open Group UNIX or PC systems. For help in customizing external mode transport layers, see “Create a Transport Layer for TCP/IP or Serial External Mode Communication”.

To use Simulink external mode over TCP/IP:

- Make sure that the external interface MEX-file for your target's TCP/IP transport is specified.

Targets provided by MathWorks specify the name of the external interface MEX-file in `matlabroot/toolbox/simulink/simulink/extmode_transports.m`. The name of the interface appears as uneditable text in the **External mode configuration** section of the **Interface** pane of the Configuration Parameters dialog box. The TCP/IP default is `ext_comm`.

To specify a TCP/IP transport for a custom target, you must add an entry of the following form to an `sl_customization.m` file on the MATLAB path:

```
function sl_customization(cm)
 cm.ExtModeTransports.add('stf.tlc', 'transport', 'mexfile', 'Level1');
%end function
```

- `stf.tlc` is the name of the system target file for which you are registering the transport (for example, 'mytarget.tlc')
- `transport` is the transport name to display in the **Transport layer** menu on the **Interface** pane of the Configuration Parameters dialog box (for example, 'tcpip')
- `mexfile` is the name of the transport's associated external interface MEX-file (for example, 'ext\_comm')

You can specify multiple targets and/or transports with additional `cm.ExtModeTransports.add` lines, for example:

```
function sl_customization(cm)
 cm.ExtModeTransports.add('mytarget.tlc', 'tcpip', 'ext_comm', 'Level1');
 cm.ExtModeTransports.add('mytarget.tlc', 'serial', ...
 'ext_serial_win32_comm', 'Level1');
%end function
```

- Be sure that the template makefile is configured to link the source files for the TCP/IP server code and that it defines the compiler flags when building the generated code.
- Build the external program.
- Run the external program.
- Set the Simulink model to external mode and connect to the target.

The next figure shows the structure of the TCP/IP-based implementation.

## TCP/IP-Based Client/Server Implementation for External Mode

### MEX-File Optional Arguments for TCP/IP Transport

In the External Target Interface dialog box, you can specify optional arguments that are passed to the external mode interface MEX-file for communicating with executing targets.

- Target network name: the network name of the computer running the external program. By default, this is the computer on which the Simulink product is running, for example, 'myComputer'. You can also use the IP address, for example, '148.27.151.12'.
- Verbosity level: controls the level of detail of the information displayed during the data transfer. The value is either 0 or 1 and has the following meaning:
  - 0 — No information
  - 1 — Detailed information
- TCP/IP server port number: The default value is 17725. You can change the port number to a value between 256 and 65535 to avoid a port conflict.

The arguments are positional and must be specified in the following order:

<TargetNetworkName> <VerbosityLevel> <ServerPortNumber>

For example, if you want to specify the verbosity level (the second argument), then you must also specify the target network name (the first argument). Arguments can be delimited by white space or commas. For example:

```
'148.27.151.12' 1 30000
```

You can specify command-line options to the external program when you launch it. See “Run the External Program” on page 60-81.

### Using the Serial Implementation

Controlling host/target communication on a serial channel is similar to controlling host/target communication on a TCP/IP channel.

To use Simulink external mode over a serial channel, you must:

- Make sure that the external interface MEX-file for your target's serial transport is specified.

Targets provided by MathWorks specify the name of the external interface MEX-file in *matlabroot/toolbox/simulink/simulink/extmode\_transports.m*. The name of the interface appears as uneditable text in the **External mode configuration** section of the **Interface** pane of the Configuration Parameters dialog box. The serial default is `serial`.

To specify a serial transport for a custom target, you must add an entry of the following form to an *sl\_customization.m* file on the MATLAB path:

```
function sl_customization(cm)
 cm.ExtModeTransports.add('stf.tlc', 'transport', 'mexfile', 'Level1');
%end function
```

- *stf.tlc* is the name of the system target file for which you are registering the transport (for example, 'mytarget.tlc')
- *transport* is the transport name to display in the **Transport layer** menu on the **Interface** pane of the Configuration Parameters dialog box (for example, 'serial')
- *mexfile* is the name of the transport's associated external interface MEX-file (for example, 'ext\_serial\_win32\_comm')

You can specify multiple targets and/or transports with additional `cm.ExtModeTransports.add` lines, for example:

```
function sl_customization(cm)
 cm.ExtModeTransports.add('mytarget.tlc', 'tcpip', 'ext_comm', 'Level1');
 cm.ExtModeTransports.add('mytarget.tlc', 'serial', ...
 'ext_serial_win32_comm', 'Level1');
%end function
```

- Be sure that the template makefile is configured to link the source files for the serial server code and that it defines the compiler flags when building the generated code.
- Build the external program.
- Run the external program.
- Set the Simulink model to external mode and connect to the target.

### MEX-File Optional Arguments for Serial Transport

In the **MEX-file arguments** field of the **Interface** pane of the Configuration Parameters dialog box, you can specify arguments that are passed to the external mode interface MEX-file for communicating with the executing targets. For serial transport, the optional arguments to `ext_serial_win32_comm` are as follows:

- **Verbosity level:** This argument controls the level of detail of the information displayed during data transfer. The value of this argument is:

- 0 (no information), or
- 1 (detailed information)
- Serial port ID: The port ID of the host, specified as an integer or character vector. For example, specify the port ID of a USB to serial converter as `'/dev/ttyusb0'`. Simulink Coder prefixes integer port IDs with `\\.COM` on Windows and by `/dev/ttyS` on Unix.

When you start the target application using a serial connection, you must specify the port ID to use to connect it to the host. Do this by including the `-port` command-line option. For example:

```
mytarget.exe -port 2 -w
```

- Baud rate: Specify an integer value. The default value is 57600.

The MEX-file options arguments are positional and must be specified in the following order:

```
<VerbosityLevel> <SerialPortID> <BaudRate>
```

For example, if you want to specify the serial port ID (the second argument), then you must also specify the verbosity level (the first argument). Arguments can be delimited by white space or commas. For example:

```
1 '/dev/ttyusb0' 57600
```

When you launch the external program, you can specify command-line options.

### Run the External Program

Before you can use the Simulink product in external mode, the external program must be running.

If the target application is executing on the same machine as the host and communication is through a loopback serial cable, the target's port ID must differ from that of the host (as specified in the **MEX-file arguments** edit field).

To run the external program, you type a command of the form:

```
model -opt1 ... -optN
```

`model` is the name of the external program and `-opt1 ... -optN` are options. (See “Command-Line Options for the External Program” on page 60-82.) In the examples in this section, the name of the external program is `ext_example`.

### Running the External Program in the Windows Environment

In the Windows environment, you can run the external programs in either of the following ways:

- Open a Command Prompt window. At the command prompt, type the name of the target executable, followed by possible options, such as:

```
ext_example -tf inf -w
```

- Alternatively, you can launch the target executable from the MATLAB Command Window. The command must be preceded by an exclamation point (!) and followed by an ampersand (&), as in the following example:

```
!ext_example -tf inf -w &
```

The ampersand (&) causes the operating system to spawn another process to run the target executable. If you do not include the ampersand, the program still runs, but you cannot enter commands at the MATLAB command prompt or manually terminate the executable.

### Running the External Program in the UNIX Environment

In the UNIX environment, you can run the external programs in either of the following ways:

- Open an Xterm window. At the command prompt, type the name of the target executable, followed by possible options, such as:

```
./ext_example -tf inf -w
```

- Alternatively, you can launch the target executable from the MATLAB Command Window. You must run it in the background so that you can still access the Simulink environment. The command must be preceded by an exclamation point (!), dot slash (./ indicating the current directory), and followed by an ampersand (&), as in the following example:

```
!./ext_example -tf inf -w &
```

The ampersand (&) causes the operating system to spawn another process to run the target executable.

### Command-Line Options for the External Program

External mode target executables generated by the Simulink Coder code generator support the following command-line options:

- `-tf n`

The `-tf` option overrides the stop time set in the Simulink model. The argument `n` specifies the number of seconds the program will run. The value `inf` directs the model to run indefinitely. In this case, the model code runs until the target application receives a stop message from the Simulink engine.

The following example sets the stop time to 10 seconds.

```
ext_example -tf 10
```

When integer-only ERT targets are built and executed in external mode, the stop time parameter (`-tf`) is interpreted by the target as the number of base rate steps rather than the number of seconds to execute.

- `-w`

Instructs the target application to enter a wait state until it receives a message from the host. At this point, the target is running, but not executing the model code. The start message is sent when you select **Start Real-Time Code** from the **Simulation** menu or click the **Start Real-Time Code** button in the External Mode Control Panel.

Use the `-w` option if you want to view target application execution data from time step 0, or if you want to modify parameters before the target application begins execution of model code.

- `-port n`

Specifies the TCP/IP port number or the serial port ID, `n`, for the target application. The port number of the target application must match that of the host for TCP/IP transport. The port number depends on the type of transport.

- For TCP/IP transport: Port number is an integer between 256 and 65535, with the default value being 17725. The selected port must not be used by another TCP/IP service that runs on the target hardware.
- For serial transport: Port ID is an integer or a character vector. For example, specify the port ID of a USB to serial converter as  `'/dev/ttyusb0'`
- `-baud r`

Specified as an integer, this option is only available for serial transport.

### Implement an External Mode Protocol Layer

If you want to implement your own transport layer for external mode communication, you must modify certain code modules provided by the Simulink Coder product and create a new external interface MEX-file. See “Create a Transport Layer for TCP/IP or Serial External Mode Communication”.

### Use External Mode Programmatically

You can run external mode simulations from the MATLAB command line or programmatically in scripts. Use the `get_param` and `set_param` commands to retrieve and set the values of model simulation command-line parameters, such as `SimulationMode` and `SimulationCommand`, and external mode command-line parameters, such as `ExtModeCommand` and `ExtModeTrigType`.

The following model simulation commands assume that a Simulink model is open and that you have loaded a target application to which the model will connect using external mode.

- 1 Change the Simulink model to external mode:
 

```
set_param(gcs, 'SimulationMode', 'external')
```
- 2 Connect the open model to the loaded target application:
 

```
set_param(gcs, 'SimulationCommand', 'connect')
```
- 3 Start running the target application:
 

```
set_param(gcs, 'SimulationCommand', 'start')
```
- 4 Stop running the target application:
 

```
set_param(gcs, 'SimulationCommand', 'stop')
```
- 5 Disconnect the target application from the model:
 

```
set_param(gcs, 'SimulationCommand', 'disconnect')
```

The `set_param` commands that use the `'SimulationCommand'` argument are asynchronous. If you run the commands successively from a script, each command starts without waiting for the previous command to complete. To check that each command is complete, in the script, use the `get_param` command with the `'SimulationStatus'` argument. For example, for steps 1 to 3, specify these commands in the script:

```
set_param(gcs, 'SimulationMode', 'external');
set_param(gcs, 'SimulationCommand', 'connect');

isExternalSimulationActive = false;
while ~isExternalSimulationActive
```

```
 simStatus = get_param(gcs, 'SimulationStatus');
 isExternalSimulationActive = strcmp(simStatus, 'external');
end
set_param(gcs, 'SimulationCommand', 'start');
```

For more information, see “Run Simulations Programmatically”.

The Diagnostic Viewer displays error messages produced by the `get_param` and `set_param` commands.

To tune a workspace parameter, change its value at the command prompt. If the workspace parameter is a `Simulink.Parameter` object, assign the new value to the `Value` property.

```
myVariable = 5.23;
myParamObj.Value = 5.23;
```

To download the workspace parameter in external mode, you update the model diagram. The following model simulation command initiates a model update:

```
set_param(gcs, 'SimulationCommand', 'update')
```

To trigger or cancel data uploading to scopes, use the `ExtModeCommand` values `armFloating` and `cancelFloating`, or `armWired` and `cancelWired`. For example, to trigger and then cancel data uploading to wired (nonfloating) scopes:

```
set_param(gcs, 'ExtModeCommand', 'armWired')
set_param(gcs, 'ExtModeCommand', 'cancelWired')
```

The next table lists external mode command-line parameters that you can use in `get_param` and `set_param` commands. The table provides brief descriptions, valid values (bold type highlights defaults), and a mapping to External Mode dialog box equivalents. For external mode parameters that are equivalent to **Interface** pane options in the Configuration Parameters dialog box, see “Model Configuration Parameters: Code Generation Interface”.

**External Mode Command-Line Parameters**

<b>Parameter and Values</b>	<b>Dialog Box Equivalent</b>	<b>Description</b>
ExtModeAddSuffixToVar <b>off</b> , on	Enable Data Archiving: <b>Append file suffix to variable names</b> check box	Increment variable names for each incremented filename.
ExtModeArchiveDirName <i>character vector</i>	Enable Data Archiving: <b>Directory</b> text field	Save data in specified folder.
ExtModeArchiveFileName <i>character vector</i>	Enable Data Archiving: <b>File</b> text field	Save data in specified file.
ExtModeArchiveMode <i>character vector</i> - <b>off</b> , auto, manual	Enable Data Archiving: <b>Enable archiving</b> check box	Activate automated data archiving features.  To specify manual, run <code>set_param(gcs, 'ExtModeArchiveMode', 'manual')</code> .  Note that if you specify <b>auto</b> , <code>ExtModeAutoIncOneShot</code> is set to <b>on</b> .
ExtModeArmWhenConnect <b>off</b> , <b>on</b>	External Signal & Triggering: <b>Arm when connecting to target</b> check box	Arm the trigger as soon as the Simulink Coder software connects to the target.
ExtModeAutoIncOneShot <b>off</b> , on	Enable Data Archiving: <b>Increment file after one-shot</b> check box	Save new data buffers in incremental files.
ExtModeAutoUpdateStatusClock (Windows platforms only) <b>off</b> , <b>on</b>	Not available	Continuously upload and display target time on the model window status bar.
ExtModeBatchMode <b>off</b> , on	External Mode Control Panel: <b>Batch download</b> check box	Enable or disable downloading of parameters in batch mode.
ExtModeChangesPending <b>off</b> , on	Not available	When <code>ExtModeBatchMode</code> is enabled, indicates whether parameters remain in the queue of parameters to be downloaded to the target.

Parameter and Values	Dialog Box Equivalent	Description
ExtModeCommand <i>character vector</i> - armFloating, armWired, cancelFloating, cancelWired	<ul style="list-style-type: none"> <li>armFloating and cancelFloating are equivalent to selecting and clearing External Mode Control Panel check box <b>Floating scope &gt; Enable data uploading</b></li> <li>armWired and cancelWired are equivalent to External Mode Control Panel buttons <b>Arm Trigger</b> and <b>Cancel Trigger</b></li> </ul>	Issue an external mode command to the target application.
ExtModeConnected <b>off</b> , on	External Mode Control Panel: <b>Connect/Disconnect</b> button	Indicate the state of the connection with the target application.
ExtModeEnableFloating off, <b>on</b>	External Mode Control Panel: <b>Enable data uploading</b> check box	Enable or disable the arming and canceling of triggers when a connection is established with floating scopes.
ExtModeIncDirWhenArm <b>off</b> , on	Enable Data Archiving: <b>Increment directory when trigger armed</b> check box	Write log files to incremental folders each time the trigger is armed.
ExtModeLogAll off, <b>on</b>	External Signal & Triggering: <b>Select all</b> check box	Upload available signals from the target to the host.
ExtModeParamChangesPending <b>off</b> , on	Not available	When the Simulink Coder software is connected to the target and ExtModeBatchMode is enabled, indicates whether parameters remain in the queue of parameters to be downloaded to the target. More efficient than ExtModeChangesPending, because it checks for a connection to the target.
ExtModeSkipDownloadWhenConnect <b>off</b> , on	Not available	Connect to the target application without downloading parameters.
ExtModeTrigDelay <i>integer (0)</i>	External Signal & Triggering: <b>Delay</b> text field	Specify the amount of time (expressed in base rate steps) that elapses between a trigger occurrence and the start of data collection.
ExtModeTrigDirection <i>character vector</i> - <b>rising</b> , falling, either	External Signal & Triggering: <b>Direction</b> menu	Specify the direction in which the signal must be traveling when it crosses the threshold value.

Parameter and Values	Dialog Box Equivalent	Description
ExtModeTrigDuration <i>integer (1000)</i>	External Signal & Triggering: <b>Duration</b> text field	Specify the number of base rate steps for which external mode is to log data after a trigger event.
ExtModeTrigDurationFloating <i>character vector - integer (auto)</i>	External Mode Control Panel: <b>Duration</b> text field	Specify the duration for floating scopes. If <b>auto</b> is specified, the value of ExtModeTrigDuration is used.
ExtModeTrigElement <i>character vector - integer, any, last</i>	External Signal & Triggering: <b>Element</b> text field	Specify the elements of the input port of the specified trigger block that can cause the trigger to fire.
ExtModeTrigHoldOff <i>integer (0)</i>	External Signal & Triggering: <b>Hold-off</b> text field	Specify the base rate steps between when a trigger event terminates and the trigger is rearmed.
ExtModeTrigLevel <i>integer (0)</i>	External Signal & Triggering: <b>Level</b> text field	Specify the threshold value the trigger signal must cross to fire the trigger.
ExtModeTrigMode <i>character vector - normal, oneshot</i>	External Signal & Triggering: <b>Mode</b> menu	Specify whether the trigger is to rearm automatically after each trigger event or whether only one buffer of data is to be collected each time the trigger is armed.
ExtModeTrigPort <i>character vector - integer (1), last</i>	External Signal & Triggering: <b>Port</b> text field	Specify the input port of the specified trigger block for which elements can cause the trigger to fire.
ExtModeTrigType <i>character vector - manual, signal</i>	External Signal & Triggering: <b>Source</b> menu	Specify whether to start logging data when the trigger is armed or when a specified trigger signal satisfies trigger conditions.
ExtModeUploadStatus <i>character vector - inactive, armed, uploading</i>	Not available	Return the status of the external mode upload mechanism — inactive, armed, or uploading.
ExtModeWriteAllDataToWs <b>off, on</b>	Enable Data Archiving: <b>Write intermediate results to workspace</b> check box	Write intermediate results to the workspace.

## Animate Stateflow Charts in External Mode

If you have Stateflow, you can animate a chart in external mode. In external mode, you can animate states in a chart, and view test point signals in a floating scope or signal viewer.

- “Animate States During Simulation in External Mode” on page 60-88
- “View Test Point Data in Floating Scopes and Signal Viewers” on page 60-88

### Animate States During Simulation in External Mode

To animate states in a chart in external mode:

- 1 Load the chart you want to animate to the target machine.
- 2 In the Configuration Parameters dialog box, select the **External mode** check box.
- 3 Open the External Mode Control Panel dialog box.
- 4 Click **Signal & Triggering**.
- 5 In the External Signal & Triggering dialog box, set these parameters.

In:	Select:
<b>Signal selection</b> pane	Chart you want to animate
<b>Trigger options</b> pane	<b>Arm when connecting to target</b> check box
<b>Trigger options</b> pane	normal from drop-down menu in <b>Mode</b> field

- 6 Build the model to generate an executable file.
- 7 Deploy the target application.
- 8 Connect Simulink to the target application.
- 9 Start execution of the generated model code. The chart highlights states as they execute.

### View Test Point Data in Floating Scopes and Signal Viewers

When you simulate a chart in external mode, you can designate chart data of local scope to be test points and view the test point data in floating scopes and signal viewers.

To view test point data during simulation in external mode:

- 1 Open the Model Explorer and for each data you want to view, follow these steps:
  - a In the middle **Contents** pane, select the state or local data of interest.
  - b In the right **Dialog** pane, select the **Logging** tab and select **Test point** check box.
- 2 From a floating scope or signal viewer, click the signal selection button:

The Signal Selector dialog box opens.

- 3 In the Signal Selector **Model hierarchy** pane, select the chart.
- 4 In the Signal Selector **List contents** menu, select **Testpointed/Logged signals only** and then select the signals you want to view.
- 5 Simulate the model in external mode as described in “Animate States During Simulation in External Mode” on page 60-88.

The scope or viewer displays the values of the test point signals as the simulation runs.

For more information, see “Behavior of Scopes and Viewers with Rapid Accelerator Mode”.

## TCP/IP and Serial External Mode Limitations

Feature	Details
Service code interface	Using external mode for tuning parameters and monitoring signals as generated code executes in a target environment is not supported for code generated from component models configured with an ERT-based system target file and service code interface.
Changing parameters	<p>In general, you cannot change a parameter if doing so results in a change in the structure of the model. For example, you cannot change</p> <ul style="list-style-type: none"> <li>• The number of states, inputs, or outputs of a block</li> <li>• The sample time or the number of sample times</li> <li>• The integration algorithm for continuous systems</li> <li>• The name of the model or of a block</li> </ul> <p>If you make these changes to the block diagram, then you must rebuild the program with newly generated code.</p> <p>You can change parameters in transfer function and state space representation blocks in specific ways:</p> <ul style="list-style-type: none"> <li>• The parameters (numerator and denominator polynomials) for the Transfer Fcn (continuous and discrete) and Discrete Filter blocks can be changed (as long as the number of states does not change).</li> <li>• Zero entries in the State-Space and Zero Pole (both continuous and discrete) blocks in the user-specified or computed parameters (that is, the A, B, C, and D matrices obtained by a zero-pole to state-space transformation) cannot be changed once external simulation is started.</li> <li>• In the State-Space block, if you specify the matrices in the controllable canonical realization, then all changes to the A, B, C, D matrices that preserve this realization and the dimensions of the matrices are allowed.</li> </ul> <p>If the Simulink block diagram does not match the external program, Simulink produces an error stating that the checksums do not match. The checksums take into account the top models, but not referenced models. Use the updated block diagram to rebuild the target application.</p>
Uploading data	For parameters with fixed-point values, uploading of parameter values from the target application is not supported.
Uploading variable-size signals	<p>Uploading of variable-size signals is not supported for these targets:</p> <ul style="list-style-type: none"> <li>• Simulink Real-Time</li> <li>• Texas Instruments C2000™</li> </ul>

Feature	Details
Signal value display in simulation	Graphical display of signal values in models (described in “Display Signal Values in Model Diagrams”) is not supported. For example, you cannot use the <b>Data Display in Simulation</b> menu selections <b>Show Value Labels When Hovering</b> , <b>Toggle Value Labels When Clicked</b> , and <b>Show Value Label of Selected Port</b> .
Tunable structure parameters	Uploading or downloading of tunable structure parameters is not supported.
C++ code	Generated C++ code is not supported. The simulation produces an error if you specify these configuration parameter settings: <ul style="list-style-type: none"> <li>• <b>Language</b> — C++</li> <li>• <b>Code interface packaging</b> — C++ class</li> </ul>
Pure integer code	Pure integer code is supported.  If you do not specify <code>-tf finalTime</code> in the execution command, the target application runs the generated model code indefinitely, ignoring <code>StopTime</code> .  If you specify <code>-tf finalTime</code> in the execution command: <ul style="list-style-type: none"> <li>• The <i>finalTime</i> value represents base rate steps, not seconds.</li> <li>• The maximum value for <i>finalTime</i>, in ticks, is <code>MAX_int32_T</code>.</li> <li>• When the 16-bit or 32-bit tick counter overflows, the simulation time in Scope blocks returns to zero.</li> </ul>
Half precision	Half-precision data types are not supported.
<code>Simulink.ImageType</code>	<code>Simulink.ImageType</code> data type is not supported.
Archiving data	For archiving data to disk, Scope and To Workspace blocks are supported. However, other scopes are not supported for data archiving. For example, you cannot use Floating Scope blocks or Viewers and Generators Manager viewer objects to archive data.
Scopes in referenced models	In a model hierarchy, if the top model simulates in external mode and a referenced model simulates in normal or accelerator mode, scopes in the referenced model are not displayed.  However, if the top model is changed to simulate in normal mode, the behavior of scopes in the referenced models differs between normal and accelerator mode. Scopes in a referenced model simulating in normal mode are displayed, while scopes in a referenced model simulating in accelerator mode are not displayed.
Scope and Display blocks connected to Simulink message blocks	During external mode simulations, Scope and Display blocks connected to Simulink message blocks do not provide displays.
Simulation start time	Nonzero simulation start times are not supported. In the Configuration Parameters dialog box, <b>Solver</b> pane, leave <b>Start time</b> set to the default value of <code>0.0</code> .

Feature	Details
Intermediate step values	<p>Some Simulink blocks can generate multiple values in a simulation time step. For example:</p> <ul style="list-style-type: none"> <li>• A Simulink Function or Function-Call Subsystem block that is invoked multiple times in a time step.</li> <li>• Iterator subsystem blocks that execute multiple times in a time step.</li> </ul> <p>For each time step in an external mode simulation, Simulink uploads from the target application only the final values of such blocks. Simulink does not upload the intermediate values generated during the step.</p>
File-scoped data	File-scoped data are not supported, for example, data items to which you apply the built-in custom storage class, FileScope. File-scoped data are not externally accessible.
Signals with custom storage classes	Uploading of signals with custom storage classes (CSC) is not supported.
Use of printf Statements	To show target application error and information messages on the target hardware display, you can use <code>printf</code> calls. For some target hardware, the use of <code>printf</code> statements can increase the external mode binary file size. To disable <code>printf</code> calls, specify the preprocessor macro definition <code>EXTMODE_DISABLEPRINTF</code> for your target application compiler.
Command-line arguments	<p>You can use command-line arguments for running target applications. These limitations apply:</p> <ul style="list-style-type: none"> <li>• Parsing of the command-line arguments requires the <code>sscanf</code> function, which increases the program size for some target hardware.</li> <li>• Some target applications do not accept command-line arguments.</li> </ul> <p>If your target hardware does not support the parsing of command-line arguments, specify the preprocessor macro definition <code>EXTMODE_DISABLE_ARGS_PROCESSING=1</code> for your target application compiler.</p> <p>To replace the <code>-w</code> option, you can use this command to specify that the target application enters and stays in a wait state until it receives a Connect message from Simulink:</p> <pre>set_param(modelName, 'OnTargetWaitForStart', 'on');</pre> <p>The build process provides the required option (<code>-DON_TARGET_WAIT_FOR_START=1</code>) to the compiler.</p>
Row-major code generation	Code generated with the row-major format is not supported.

“External Mode Source Files” on page 60-96

“Implement a Custom Transport Layer” on page 60-99

This section helps you to connect your custom target by using external mode using your own low-level communications layer. The topics include:

- An overview of the design and operation of external mode
- A description of external mode source files
- Guidelines for modifying the external mode source files and building an executable to handle the tasks of the default `ext_comm` MEX-file

This section assumes that you are familiar with the execution of Simulink Coder programs, and with the basic operation of external mode.

## Design of External Mode

External mode communication between the Simulink engine and a target system is based on a client/server architecture. The client (the Simulink engine) transmits messages requesting the server (target) to accept parameter changes or to upload signal data. The server responds by executing the request.

A low-level *transport layer* handles physical transmission of messages. Both the Simulink engine and the model code are independent of this layer. Both the transport layer and code directly interfacing to the transport layer are isolated in separate modules that format, transmit, and receive messages and data packets.

This design makes it possible for different targets to use different transport layers. The GRT, ERT, and RSim targets support host/target communication by using TCP/IP and RS-232 (serial) communication. The Simulink Desktop Real-Time target supports shared memory communication. The Wind River Systems Tornado® target supports TCP/IP only.

The Simulink Coder product provides full source code for both the client and server-side external mode modules, as used by the GRT, ERT, Rapid Simulation, and Tornado targets, and the Simulink Desktop Real-Time and Simulink Real-Time products. The main client-side module is `ext_comm.c`. The main server-side module is `ext_svr.c`.

These two modules call the specified transport layer through the following source files.

## Built-In Transport Layer Implementations

Protocol	Client or Server?	Source Files
TCP/IP	Client (host)	<ul style="list-style-type: none"> <li><i>matlabroot/toolbox/coder/simulinkcoder_core/ext_mode/host/common/rtiostream_interface.c</i></li> <li><i>matlabroot/toolbox/coder/rtiostream/src/rtiostreamtcpip/rtiostream_tcpip.c</i></li> </ul>
	Server (target)	<ul style="list-style-type: none"> <li><i>matlabroot/rtw/c/src/ext_mode/common/rtiostream_interface.c</i></li> <li><i>matlabroot/toolbox/coder/rtiostream/src/rtiostreamtcpip/rtiostream_tcpip.c</i></li> </ul>
Serial	Client (host)	<ul style="list-style-type: none"> <li><i>matlabroot/toolbox/coder/simulinkcoder_core/ext_mode/host/serial/ext_serial_transport.c</i></li> <li><i>matlabroot/toolbox/coder/rtiostream/src/rtiostreamserial/rtiostream_serial.c</i></li> </ul>
	Server (target)	<ul style="list-style-type: none"> <li><i>matlabroot/rtw/c/src/ext_mode/serial/ext_svr_serial_transport.c</i></li> <li><i>matlabroot/toolbox/coder/rtiostream/src/rtiostreamserial/rtiostream_serial.c</i></li> </ul>

For serial communication, the modules *ext\_serial\_transport.c* and *rtiostream\_serial.c* implement the client-side transport functions and the modules *ext\_svr\_serial\_transport.c* and *rtiostream\_serial.c* implement the corresponding server-side functions. For TCP/IP communication, the modules *rtiostream\_interface.c* and *rtiostream\_tcpip.c* implement both client-side and server-side functions. You can edit copies of these files (but do not modify the originals). You can support external mode using your own low-level communications layer by creating similar files using the following templates:

- Client (host) side: *matlabroot/toolbox/coder/rtiostream/src/rtiostreamtcpip/rtiostream\_tcpip.c* (TCP/IP) or *matlabroot/toolbox/coder/rtiostream/src/rtiostreamserial/rtiostream\_serial.c* (serial)
- Server (target) side: *matlabroot/toolbox/coder/rtiostream/src/rtiostreamtcpip/rtiostream\_tcpip.c* (TCP/IP) or *matlabroot/toolbox/coder/rtiostream/src/rtiostreamserial/rtiostream\_serial.c* (serial)

The *rtiostream\_interface.c* file is an interface between the external mode protocol and an *rtiostream* communications channel. For more details on implementing and testing an *rtiostream* communications channel, see:

- “Communications *rtiostream* API” on page 88-42
- *rtiostreamtest*

Implement your *rtiostream* communications channel by using the documented interface to avoid having to make changes to the file *rtiostream\_interface.c* or other external mode related files.

---

**Note** Do not modify working source files. Use the templates provided in the */custom* or */rtiostream* folder as starting points, guided by the comments within them.

---

You need only provide code that implements low-level communications. You need not be concerned with issues such as data conversions between host and target, or with the formatting of messages. The Simulink Coder software handles these functions.

On the client (Simulink engine) side, communications are handled by `ext_comm` (for TCP/IP) and `ext_serial_win32_comm` (for serial) MEX-files.

On the server (target) side, external mode modules are linked into the target executable. This takes place automatically at code generation time if you select **External mode** and is based on the **Transport layer** option that you specify. The modules, called from the main program and the model execution engine, are independent of the generated model code.

The general procedure for implementing your own client-side low-level transport protocol is as follows:

- 1 Edit the template `rtiostream_tcpip.c` to replace low-level communication calls with your own communication calls.
- 2 Generate a MEX-file executable for your custom transport.
- 3 Register your new transport layer with the Simulink software, so that the transport can be selected for a model using the **Interface** pane of the Configuration Parameters dialog box.

For more details, see “Create a Custom Client (Host) Transport Protocol” on page 60-99.

The general procedure for implementing your own server-side low-level transport protocol is as follows:

- 1 Edit the template `rtiostream_tcpip.c` to replace low-level communication calls with your own communication calls. Typically this involves writing or integrating device drivers for your target hardware.
- 2 Modify template makefiles to support the new transport.

For more details, see “Create a Custom Server (Target) Transport Protocol” on page 60-102.

## External Mode Communications Overview

This section gives a high-level overview of how a Simulink Coder generated program communicates with Simulink external mode. This description is based on the TCP/IP version of external mode that ships with the Simulink Coder product.

For communication to take place, both the server (target) program and the Simulink software must be executing. This does not mean that the model code in the server system must be executing. The server can be waiting for the Simulink engine to issue a command to start model execution.

The client and server communicate by using bidirectional sockets carrying packets. Packets consist either of *messages* (commands, parameter downloads, and responses) or *data* (signal uploads).

If the target application was invoked with the `-w` command-line option, the program enters a wait state until it receives a message from the host. Otherwise, the program begins execution of the model. While the target application is in a wait state, the Simulink engine can download parameters to the target and configure data uploading.

When the user chooses the **Connect to Target** option from the **Simulation** menu, the host initiates a handshake by sending an `EXT_CONNECT` message. The server responds with information about itself. This information includes

- Checksums. The host uses model checksums to determine that the target code is an exact representation of the current Simulink model.
- Data format information. The host uses this information when formatting data to be downloaded, or interpreting data that has been uploaded.

At this point, host and server are connected. The server is either executing the model or in the wait state. (In the latter case, the user can begin model execution by selecting **Start Real-Time Code** from the **Simulation** menu.)

During model execution, the message server runs as a background task. This task receives and processes messages such as parameter downloads.

Data uploading comprises both foreground execution and background servicing of the signal packets. As the target computes model outputs, it also copies signal values into data upload buffers. This occurs as part of the task associated with each task identifier (`tid`). Therefore, data collection occurs in the foreground. Transmission of the collected data, however, occurs as a background task. The background task sends the data in the collection buffers to the Simulink engine by using data packets.

The host initiates most exchanges as messages. The target usually sends a response confirming that it has received and processed the message. Examples of messages and commands are:

- Connection message / connection response
- Start target simulation / start response
- Parameter download / parameter download response
- Arm trigger for data uploading / arm trigger response
- Terminate target simulation / target shutdown response

Model execution terminates when the model reaches its final time, when the host sends a terminate command, or when a Stop Simulation block terminates execution. On termination, the server informs the host that model execution has stopped, and shuts down its socket. The host also shuts down its socket, and exits external mode.

## External Mode Source Files

- “Client (Host) MEX-file Interface Source Files” on page 60-96
- “Server (Target) Source Files” on page 60-98
- “Other Files in the Server Folder” on page 60-99

### Client (Host) MEX-file Interface Source Files

The source files for the MEX-file interface component are located in the folder `matlabroot/toolbox/coder/simulinkcoder_core/ext_mode/host` (open), except as noted:

- `common/ext_comm.c`

This file is the core of external mode communication. It acts as a relay station between the target and the Simulink engine. `ext_comm.c` communicates to the Simulink engine by using a shared data structure, `ExternalSim`. It communicates to the target by using calls to the transport layer.

Tasks carried out by `ext_comm.c` include establishment of a connection with the target, downloading of parameters, and termination of the connection with the target.

- `common/rtiostream_interface.c`

This file is an interface between the external mode protocol and an `rtiostream` communications channel. For more details on implementing an `rtiostream` communications channel, see “Communications `rtiostream` API” on page 88-42. Implement your `rtiostream` communications channel using the documented interface to avoid having to change the file `rtiostream_interface.c` or other external mode related files.

- `matlabroot/toolbox/coder/rtiostream/src/rtiostreamtcpip/rtiostream_tcpip.c`

This file implements required TCP/IP transport layer functions. The version of `rtiostream_tcpip.c` shipped with the Simulink Coder software uses TCP/IP functions including `recv()`, `send()`, and `socket()`.

- `matlabroot/toolbox/coder/rtiostream/src/rtiostreamserial/rtiostream_serial.c`

This file implements required serial transport layer functions. The version of `rtiostream_serial.c` shipped with the Simulink Coder software uses serial functions including `ReadFile()`, `WriteFile()`, and `CreateFile()`.

- `serial/ext_serial_transport.c`

This file implements required serial transport layer functions. `ext_serial_transport.c` includes `ext_serial_utils.c`, which is located in `matlabroot/rtw/c/src/ext_mode/serial` (open) and contains functions common to client and server sides.

- `common/ext_main.c`

This file is a MEX-file wrapper for external mode. `ext_main.c` interfaces to the Simulink engine by using the standard `mexFunction` call. (See the `mexFunction` reference page and “Integrate MATLAB with External Programming Languages and Systems” for more information.) `ext_main.c` contains a function dispatcher, `esGetAction`, that sends requests from the Simulink engine to `ext_comm.c`.

- `common/ext_convert.c` and `ext_convert.h`

This file contains functions used for converting data from host to target formats (and vice versa). Functions include byte-swapping (big to little- endian), conversion from non-IEEE floats to IEEE doubles, and other conversions. These functions are called both by `ext_comm.c` and directly by the Simulink engine (by using function pointers).

---

**Note** You do not need to customize `ext_convert` to implement a custom transport layer. However, you might want to customize `ext_convert` for the intended target. For example, if the target represents the `float` data type in Texas Instruments format, `ext_convert` must be modified to perform a Texas Instruments to IEEE conversion.

---

- `common/extsim.h`

This file defines the `ExternalSim` data structure and access macros. This structure is used for communication between the Simulink engine and `ext_comm.c`.

- `common/extutil.h`

This file contains only conditionals for compilation of the `assert` macro.

- `common/ext_transport.h`

This file defines functions that must be implemented by the transport layer.

### Server (Target) Source Files

These files are linked into the `model.exe` executable. They are located within `matlabroot/rtw/c/src/ext_mode` (open) except as noted.

- `common/ext_svr.c`

`ext_svr.c` is analogous to `ext_comm.c` on the host, but generally is responsible for more tasks. It acts as a relay station between the host and the generated code. Like `ext_comm.c`, `ext_svr.c` carries out tasks such as establishing and terminating connection with the host. `ext_svr.c` also contains the background task functions that either write downloaded parameters to the target model, or extract data from the target data buffers and send it back to the host.

- `common/rtiostream_interface.c`

This file is an interface between the external mode protocol and an `rtiostream` communications channel. For more details on implementing an `rtiostream` communications channel, see “Communications `rtiostream` API” on page 88-42. Implement your `rtiostream` communications channel by using the documented interface to avoid having to change the file `rtiostream_interface.c` or other external mode related files.

- `matlabroot/toolbox/coder/rtiostream/src/rtiostreamtcpip/rtiostream_tcpip.c`

This file implements required TCP/IP transport layer functions. The version of `rtiostream_tcpip.c` shipped with the Simulink Coder software uses TCP/IP functions including `recv()`, `send()`, and `socket()`.

- `matlabroot/toolbox/coder/rtiostream/src/rtiostreamserial/rtiostream_serial.c`

This file implements required serial transport layer functions. The version of `rtiostream_serial.c` shipped with the software uses serial functions including `ReadFile()`, `WriteFile()`, and `CreateFile()`.

- `matlabroot/toolbox/coder/rtiostream/src/rtiostream.h`

This file defines the `rtIOStream*` functions implemented in `rtiostream_tcpip.c`.

- `serial/ext_svr_serial_transport.c`

This file implements required serial transport layer functions. `ext_svr_serial_transport.c` includes `serial/ext_serial_utils.c`, which contains functions common to client and server sides.

- `common/updown.c`

`updown.c` handles the details of interacting with the target model. During parameter downloads, `updown.c` does the work of installing the new parameters into the model's parameter vector. For data uploading, `updown.c` contains the functions that extract data from the model's `blockio` vector and write the data to the upload buffers. `updown.c` provides services both to `ext_svr.c` and to the model code (for example, `grt_main.c`). It contains code that is called by using the

background tasks of `ext_svr.c` as well as code that is called as part of the higher priority model execution.

- `matlabroot/rtw/c/src/dt_info.h` (included by generated model build file `model.h`)

These files contain data type transition information that allows access to multi-data type structures across different computer architectures. This information is used in data conversions between host and target formats.

- `common/updown_util.h`

This file contains only conditionals for compilation of the `assert` macro.

- `common/ext_svr_transport.h`

This file defines the `Ext*` functions that must be implemented by the server (target) transport layer.

### Other Files in the Server Folder

- `common/ext_share.h`

Contains message code definitions and other definitions required by both the host and target modules.

- `serial/ext_serial_utils.c`

Contains functions and data structures for communication, MEX link, and generated code required by both the host and target modules of the transport layer for serial protocols.

- The serial transport implementation includes the additional files
  - `serial/ext_serial_pkt.c` and `ext_serial_pkt.h`
  - `serial/ext_serial_port.h`

## Implement a Custom Transport Layer

- “Requirements for Custom Transport Layers” on page 60-99
- “Create a Custom Client (Host) Transport Protocol” on page 60-99
- “MATLAB Commands to Rebuild `ext_comm` and `ext_serial_win32` MEX-Files” on page 60-100
- “Register a Custom Client (Host) Transport Protocol” on page 60-101
- “Create a Custom Server (Target) Transport Protocol” on page 60-102
- “Serial Receive Buffer Smaller than 64 Bytes” on page 60-103

### Requirements for Custom Transport Layers

- By default, `ext_svr.c` and `updown.c` use `malloc` to allocate buffers in target memory for messages, data collection, and other purposes, although there is also an option to preallocate static memory. If your target uses another memory allocation scheme, you must modify these modules.
- The target is assumed to support both `int32_T` and `uint32_T` data types.

### Create a Custom Client (Host) Transport Protocol

To implement the client (host) side of your low-level transport protocol,

- 1 Edit the template file `matlabroot/toolbox/coder/rtiostream/src/rtiostreamtcpip/rtiostream_tcpip.c` to replace low-level communication calls with your own communication calls.
  - a Copy and rename the file to `rtiostream_name.c` (replacing *name* with a name meaningful to you).
  - b Replace the functions `rtIOStreamOpen`, `rtIOStreamClose`, `rtIOStreamSend`, and `rtIOStreamRecv` with functions (of the same name) that call your low-level communication primitives. These functions are called from other external mode modules via `rtiostream_interface.c`. For more information, see “Communications rtiostream API” on page 88-42.
  - c Build your `rtiostream` implementation into a shared library that exports the `rtIOStreamOpen`, `rtIOStreamClose`, `rtIOStreamRecv` and `rtIOStreamSend` functions.
- 2 Build the customized MEX-file executable using the MATLAB `mex` function. See “MATLAB Commands to Rebuild `ext_comm` and `ext_serial_win32` MEX-Files” on page 60-100 for examples of `mex` invocations.

Do not replace the existing `ext_comm` MEX-file if you want to preserve its functionality. Instead, use the `-output` option to name the new executable file, for example, `my_ext_comm`. For more information, see `mex`.

- 3 Register your new client transport layer with the Simulink software, so that the transport can be selected for a model using the **Interface** pane of the Configuration Parameters dialog box. For details, see “Register a Custom Client (Host) Transport Protocol” on page 60-101.

Sample commands for rebuilding external mode MEX-files are listed in “MATLAB Commands to Rebuild `ext_comm` and `ext_serial_win32` MEX-Files” on page 60-100.

### MATLAB Commands to Rebuild `ext_comm` and `ext_serial_win32` MEX-Files

The following table lists the commands for building the standard `ext_comm` and `ext_serial_win32` modules on PC and UNIX platforms.

Platform	Commands
Windows, TCP/IP	<pre>cd (matlabroot) mex toolbox/coder/simulinkcoder_core/ext_mode/host/common/ext_comm.c ...     toolbox/coder/simulinkcoder_core/ext_mode/host/common/ext_convert.c ...     toolbox/coder/simulinkcoder_core/ext_mode/host/common/rtiostream_interface.c ...     toolbox/coder/simulinkcoder_core/ext_mode/host/common/ext_util.c ... -R2018a ... -Itoolbox/coder/rtiostream/src ... -Itoolbox/coder/rtiostream/src/Utils_host ... -Itoolbox/coder/simulinkcoder_core/ext_mode/host/common/include ... -Irtw/c/src/ext_mode/common ... -lmwrtiostreamutils -lmwsl_services ... -DEXTMODE_TCPIP_TRANSPORT ... -DSL_EXT_DLL -output my_ext_comm</pre> <p><b>Note</b> The <code>rtiostream_interface.c</code> function defines <code>RTIOSTREAM_SHARED_LIB</code> as <code>libmwrtiostreamtcpip</code> and dynamically loads the MathWorks TCP/IP <code>rtiostream</code> shared library. Modify this file if you need to load a different <code>rtiostream</code> shared library.</p>

Platform	Commands
Linux, TCP/IP	Use the Windows commands, with these changes: <ul style="list-style-type: none"> <li>• Change -DSL_EXT_DLL to -DSL_EXT_S0.</li> <li>• Replace back slashes with forward slashes.</li> </ul>
Mac, TCP/IP	Use the Windows commands, with these changes: <ul style="list-style-type: none"> <li>• Change -DSL_EXT_DLL to -DSL_EXT_DYLIB.</li> <li>• Replace back slashes with forward slashes.</li> </ul>
Windows, serial	<pre>cd (matlabroot) mex toolbox\coder\simulinkcoder_core\ext_mode\host\common\ext_comm.c ... toolbox\coder\simulinkcoder_core\ext_mode\host\common\ext_convert.c ... toolbox\coder\simulinkcoder_core\ext_mode\host\serial\ext_serial_transport.c ... toolbox\coder\simulinkcoder_core\ext_mode\host\serial\ext_serial_pkt.c ... toolbox\coder\simulinkcoder_core\ext_mode\host\serial\rtiostream_serial_interface.c ... toolbox\coder\simulinkcoder_core\ext_mode\host\common\ext_util.c ... -R2018a ... -Itoolbox\coder\rtiostream\src ... -Itoolbox\coder\rtiostream\src\utils_host ... -Itoolbox\coder\simulinkcoder_core\ext_mode\host\common ... -Itoolbox\coder\simulinkcoder_core\ext_mode\host\common\include ... -Irtw\c\src\ext_mode\common ... -Irtw\c\src\ext_mode\serial ... -lmwrtiostreamutils -lmwsl_services ... -DEXTMODE_SERIAL_TRANSPORT -DSL_EXT_DLL ... -output my_ext_serial_comm</pre> <p><b>Note</b> The <code>rtiostream_interface.c</code> function defines <code>RTIOSTREAM_SHARED_LIB</code> as <code>libmwrtiostreamserial</code> and dynamically loads the MathWorks serial <code>rtiostream</code> shared library. Modify this file if you need to load a different <code>rtiostream</code> shared library.</p>
Linux, serial	Use the Windows commands, with these changes: <ul style="list-style-type: none"> <li>• Change -DSL_EXT_DLL to -DSL_EXT_S0.</li> <li>• Replace back slashes with forward slashes.</li> </ul>
Mac, serial	Use the Windows commands, with these changes: <ul style="list-style-type: none"> <li>• Change -DSL_EXT_DLL to -DSL_EXT_DYLIB.</li> <li>• Replace back slashes with forward slashes.</li> </ul>

**Note** `mex` requires a compiler supported by the MATLAB API. See the `mex` reference page and “Integrate MATLAB with External Programming Languages and Systems” for more information about the `mex` function.

### Register a Custom Client (Host) Transport Protocol

To register a custom client transport protocol with the Simulink software, you must add an entry of the following form to an `sl_customization.m` file on the MATLAB path:

```
function sl_customization(cm)
 cm.ExtModeTransports.add('stf.tlc', 'transport', 'mexfile', 'Level1');
% -- end of sl_customization
```

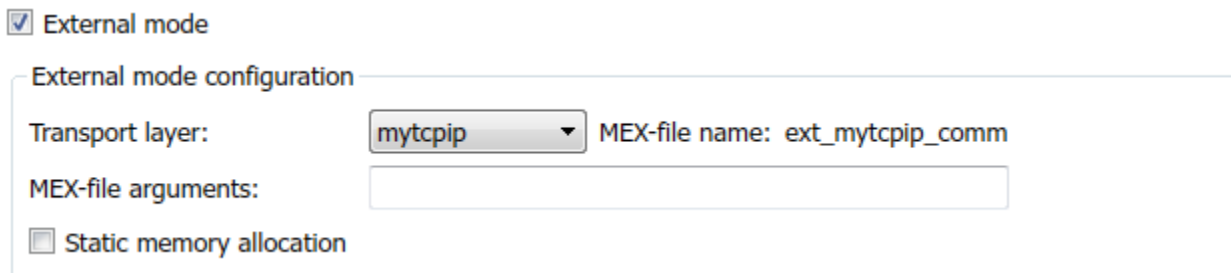

where

- *stf.tlc* is the name of the system target file for which the transport will be registered (for example, 'grt.tlc')
- *transport* is the transport name to display in the **Transport layer** menu on the **Interface** pane of the Configuration Parameters dialog box (for example, 'mytcpip')
- *mexfile* is the name of the transport's associated external interface MEX-file (for example, 'ext\_mytcpip\_comm')

You can specify multiple targets and/or transports with additional `cm.ExtModeTransports.add` lines, for example:

```
function sl_customization(cm)
 cm.ExtModeTransports.add('grt.tlc', 'mytcpip', 'ext_mytcpip_comm', 'Level1');
 cm.ExtModeTransports.add('ert.tlc', 'mytcpip', 'ext_mytcpip_comm', 'Level1');
% -- end of sl_customization
```

If you place the `sl_customization.m` file containing the transport registration information on the MATLAB path, your custom client transport protocol will be registered with each subsequent Simulink session. The name of the transport will appear in the **Transport layer** menu on the **Interface** pane of the Configuration Parameters dialog box. When you select the transport for your model, the name of the associated external interface MEX-file will appear in the noneditable **MEX-file name** field, as shown in the following figure.

### Create a Custom Server (Target) Transport Protocol

The `rtIOStream*` function prototypes in `matlabroot/toolbox/coder/rtiostream/src/rtiostream.h` define the calling interface for both the server (target) and client (host) side transport layer functions.

- The TCP/IP implementations are in `matlabroot/toolbox/coder/rtiostream/src/rtiostreamtcpip/rtiostream_tcpip.c`.
- The serial implementations are in `matlabroot/toolbox/coder/rtiostream/src/rtiostreamserial/rtiostream_serial.c`.

---

**Note** The `Ext*` function prototypes in `matlabroot/rtw/c/src/ext_mode/common/ext_svr_transport.h` are implemented in `matlabroot/rtw/c/src/ext_mode/common/rtiostream_interface.c` or `matlabroot/rtw/c/src/ext_mode/serial/rtiostream_serial_interface.c`. In most cases you will not need to modify `rtiostream_interface.c` or `rtiostream_serial_interface.c` for your custom TCP/IP or serial transport layer.

---

To implement the server (target) side of your low-level TCP/IP or serial transport protocol:

- 1 Edit the template `matlabroot/toolbox/coder/rtiostream/src/rtiostreamtcpip/rtiostream_tcpip.c` or `matlabroot/toolbox/coder/rtiostream/src/rtiostreamserial/rtiostream_serial.c` to replace low-level communication calls with your own communication calls.
  - a Copy and rename the file to `rtiostream_name.c` (replacing *name* with a name meaningful to you).
  - b Replace the functions `rtIOStreamOpen`, `rtIOStreamClose`, `rtIOStreamSend`, and `rtIOStreamRecv` with functions (of the same name) that call your low-level communication drivers.

You must implement the functions defined in `rtiostream.h`, and your implementations must conform to the prototypes defined in that file. Refer to the original `rtiostream_tcpip.c` or `rtiostream_serial.c` for guidance.

- 2 Incorporate the external mode source files for your transport layer into the model build process. Use a build process mechanism such as a post code generation command or a `before_make` hook function to make the transport files available to the build process. For more information on the build process mechanisms, see “Customize Post-Code-Generation Build Processing”, “Customize Build Process with `STF_make_rtw_hook` File”, and “Customize Build Process with `sl_customization.m`”.

For example:

- Add the file created in the previous step to the build information:

```
path/rtiostream_name.c
```

- For TCP/IP, add the following file to the build information:

```
matlabroot/rtw/c/src/ext_mode/common/rtiostream_interface.c
```

- For serial, add the following files to the build information:

```
matlabroot/rtw/c/src/ext_mode/serial/ext_serial_pkt.c
matlabroot/rtw/c/src/ext_mode/serial/rtiostream_serial_interface.c
matlabroot/rtw/c/src/ext_mode/serial/ext_svr_serial_transport.c
```

---

**Note** For external mode, check that `rtIOStreamRecv` is not a blocking implementation. Otherwise, it might cause the external mode server to block until the host sends data through the `comm` layer.

---

### Serial Receive Buffer Smaller than 64 Bytes

For serial communication, if the serial receive buffer of your target is smaller than 64 bytes:

- 1 Update the following macro with the actual target buffer size:

```
#define TARGET_SERIAL_RECEIVE_BUFFER_SIZE 64
```

Implement the change in the following files:

```
matlabroot/rtw/c/src/ext_mode/serial/ext_serial_utils.c
matlabroot/toolbox/coder/simulinkcoder_core/ext_mode/host/serial/ext_serial_utils.c
```

- 2 Run the command to rebuild the `ext_serial_win32` MEX-file. See “MATLAB Commands to Rebuild `ext_comm` and `ext_serial_win32` MEX-Files” on page 60-100.

# Logging in Simulink Coder

---

## Log Program Execution Results

Multiple techniques are available by which a program generated by the Simulink Coder software can save data to a MAT-file for analysis. A generated executable can save system states, outputs, and simulation time at each model execution time step. The data is written to a MAT-file, named (by default) *model.mat*, where *model* is the name of your model. See “Log Data for Analysis” on page 61-2 for a data logging tutorial.

---

**Note** Data logging is available only for system target files that have access to a file system. In addition, only the RSim target executables are capable of accessing MATLAB workspace data.

For MAT-file logging limitations, see the configuration parameter “MAT-file logging”.

---

### Log Data for Analysis

- “Set Up and Configure Model” on page 61-2
- “Data Logging During Simulation” on page 61-3
- “Data Logging from Generated Code” on page 61-5

#### Set Up and Configure Model

This example shows how data generated by a copy of the model `slexAircraftExample` is logged to the file `myAircraftExample.mat`. Refer to “Build Process Workflow for Real-Time Systems” on page 59-31 for instructions on setting up a copy of `slexAircraftExample` as `myAircraftExample` in a working folder if you have not done so already.

---

**Note** When you configure the code generator to produce code that includes support for data logging during execution, the code generator can include text for block names in the block paths included in the log file. If the text includes characters that are unrepresented in the character set encoding for the model, the code generator replaces the characters with XML escape sequences. For example, the code generator replaces the Japanese full-width Katakana letter `ア` with the escape sequence `&#x30A2;`. For more information, see “Internationalization and Code Generation”.

---

To configure data logging, open the Configuration Parameters dialog box and select the **Data Import/Export** pane. The process is the same as configuring a Simulink model to save output to the MATLAB workspace. For each workspace return variable you define and enable, the Simulink Coder software defines a parallel MAT-file variable. For example, if you save simulation time to the variable `tout`, your generated program logs the same data to a variable named `rt_tout`. You can change the prefix `rt_` to a suffix (`_rt`), or eliminate it entirely. You do this by setting model configuration parameter **MAT-file variable name modifier**.

To log signals in generated code, use the **Data Import/Export** model configuration parameters described below or include To File or To Workspace blocks in your model.

---

**Note** MAT-file logging for code generation does not support signal logging. If you enable MAT-file and signal logging by using **Data Import/Export** model configuration parameters and select signals for logging in the Simulink Editor, when you build the model, the code generator displays this warning:

Warning: MAT-file logging does not support signal logging.  
When your model code executes, the signal logging variable 'rt\_logout' will not be saved to the MAT-file.

To avoid this warning, clear the model configuration parameter **Signal logging**.

---

In this example, you modify the `myAircraftExample` model so that the generated program saves the simulation time and system outputs to the file `myAircraftExample.mat`. Then you load the data into the base workspace and plot simulation time against one of the outputs. The `myAircraftExample` model should be configured as described in “Build Process Workflow for Real-Time Systems” on page 59-31.

### Data Logging During Simulation

To use the data logging feature:

- 1 Open the `myAircraftExample` model if it is not already open.
- 2 Open the Configuration Parameters dialog box.
- 3 Select the **Data Import/Export** pane. The **Data Import/Export** pane lets you specify which output data is to be saved to the workspace and what variable names to use for it.
- 4 Set parameter **Format** to **Structure with time**. When you select this format, Simulink saves the model states and outputs in structures that have their names specified in the **Save to workspace or file** area. By default, the structures are `xout` for states and `yout` for output. The structure used to save output has two top-level fields: `time` and `signals`. The `time` field contains a vector of simulation times and `signals` contains an array of substructures, each of which corresponds to a model output port.
- 5 Select **Output**. This tells Simulink to save output signal data during simulation as a variable named `yout`. Selecting **Output** enables the code generator to create code that logs the root Output block (`alpha`, `rad`) to a MAT-file.
- 6 Set **Decimation** to 1.
- 7 If other parameters are selected, clear them.
- 8 Click **Apply** and **OK** to register your changes and close the dialog box.
- 9 Save the model.
- 10 In the model window, double-click the scope symbol next to the Aircraft Dynamics Model block, then simulate the model. The resulting scope display is shown below.

- 11** Verify that the simulation time and outputs have been saved to the base workspace in MAT-files. At the MATLAB prompt, type:

```
whos yout
```

Simulink displays:

Name	Size	Bytes	Class	Attributes
yout	1x1	10756	struct	

- 12** Verify that `alpha, rad` was logged by plotting simulation time versus that variable. In the Command Window, type:

```
plot(yout.time,yout.signals.values)
```

## Data Logging from Generated Code

In the second part of this example, you build and run an executable program built by the code generator for model `myAircraftExample`. The program outputs a MAT-file containing the simulation time and output you previously examined. Even though you have already generated code for the `myAircraftExample` model, you must now regenerate that code because you have changed the model by enabling data logging. The steps below explain this procedure.

To avoid overwriting workspace data with data from simulation runs, the code generator modifies identifiers for variables logged by Simulink. You can control these modifications.

- 1 Set model configuration parameter **MAT-file variable name modifier** to `_rt`. This adds the suffix `_rt` to each variable that you selected to be logged in the first part of this example.
- 2 Click **Apply** and **OK** to register your changes and close the dialog box.
- 3 Save the model.
- 4 Build an executable.
- 5 When the build concludes, run the executable program with the command:

```
!myAircraftExample
```

- 6 The program now produces two message lines, indicating that the MAT-file has been written.

```
** starting the model **
** created myAircraftExample.mat **
```

- 7 Load the MAT-file data created by the executable and look at the workspace variables from simulation and the generated program by typing:

```
load myAircraftExample.mat
whos yout*
```

Simulink displays:

Name	Size	Bytes	Class	Attributes
yout	1x1	10756	struct	
yout_rt	1x1	10756	struct	

Note the size and bytes of the structures resulting from the simulation run and generated code are the same.

- 8 Plot the generated code output by entering the following command in the Command Window:

```
plot(yout_rt.time,yout_rt.signals.values)
```

The plot should be identical to the plot that you produced in the previous part of this example.

---

**Tip** For UNIX platforms, run the executable program in the Command Window with the syntax `!./executable_name`. If preferred, run the executable program from an OS shell with the syntax `./executable_name`. For more information, see “Run External Commands, Scripts, and Programs”.

---

## Configure State, Time, and Output Logging

The **Data Import/Export** pane enables a generated program to save system states, outputs, and simulation time at each model execution time step. The data is written to a MAT-file, named (by default) `model.mat`.

Before using this data logging feature, you should learn how to configure a Simulink model to return output to the MATLAB workspace. This is discussed in “Export Simulation Data”.

For each workspace return variable that you define and enable, the code generator defines a MAT-file variable. For example, if your model saves simulation time to the workspace variable `tout`, your generated program logs the same data to a variable named (by default) `rt_tout`.

The code generated by the code generator logs the following data:

- Root Output blocks

The default MAT-file variable name for system outputs is `rt_yout`.

The sort order of the `rt_yout` array is based on the port number of the Output block, starting with 1.

- Continuous and discrete states in the model

The default MAT-file variable name for system states is `rt_xout`.

- Simulation time

The default MAT-file variable name for simulation time is `rt_tout`.

- “Override Default MAT-File Variable Names” on page 61-7
- “Override Default MAT-File Name or Buffer Size” on page 61-7

### Override Default MAT-File Variable Names

By default, the code generator prefixes the text `rt_` to the variable names for system outputs, states, and simulation time to form MAT-file variable names. To change this prefix for a model, set model configuration parameter **MAT-file variable name modifier** to `(rt_)`, a suffix `(_rt)`, or no modifier (none). Other system target files might not support this parameter.

### Override Default MAT-File Name or Buffer Size

You can specify compiler options to override the following MAT-file attributes in generated code:

MAT-File Attribute	Default	Compiler Option
Name	<code>model.mat</code>	<code>-DSAVEFILE=<i>filename</i></code>
Size of data logging buffer	1024 bytes	<code>-DDEFAULT_BUFFER_SIZE=<i>n</i></code>

**Note** Valid option syntax can vary among compilers. For example, Microsoft Visual C++ compilers typically accept `/DSAVEFILE=filename` as well as `-DSAVEFILE=filename`.

For a template makefile (TMF) based target, set model configuration parameter **Make command** to the compiler option. For example:

```
Make command: make_rtw OPTS="-DSAVEFILE=myCodeLog.mat"
```

For a toolchain-based system target file such as GRT or ERT, add the compiler option to model configuration. Set parameter **Build configuration** to `Specify`, and add the compiler option to the **C Compiler** row of the **Tool/Options** table. For example:

Tool	Options
C Compiler	<code>\$(cflags) \$(CVARSFLAG) \$(CFLAGS_ADDITIONAL) -DSAVEFILE=myCodeLog.mat /Od /Oy-</code>

To add the compiler option to a custom toolchain, you can modify and reregister the custom toolchain using the procedures shown in the example “Add Custom Toolchains to MATLAB® Coder™ Build Process”. For example, to add the compiler option to the MATLAB source file for the custom toolchain, you could define `myCompilerOpts` as follows:

```
optimsOff0pts = {'/c /Od'};
optimsOn0pts = {'/c /O2'};
cCompilerOpts = '$(cflags) $(CVARSFLAG) $(CFLAGS_ADDITIONAL)';
cppCompilerOpts = '$(cflags) $(CVARSFLAG) $(CPPFLAGS_ADDITIONAL)';
myCompilerOpts = {' -DSAVEFILE=myCodeLog.mat '};
...
```

Then you can add `myCompilerOpts` to the flags for each configuration and compiler to which it applies, for example:

```
cfg = tc.getBuildConfiguration('Faster Builds');
cfg.setOption('C Compiler', horzcat(cCompilerOpts, myCompilerOpts, optimsOff0pts));
```

As shown in “Add Custom Toolchains to MATLAB® Coder™ Build Process”, after modifying the custom toolchain, you save the configuration to a MAT-file and refresh the target registry.

## Log Data with Scope and To Workspace Blocks

The code generated by the code generator also logs data from these sources:

- Scope blocks that have the block parameter **Log data to workspace** enabled

You must specify the variable name and data format in each Scope block's dialog box.

- To Workspace blocks in the model

You must specify the variable name and data format in each To Workspace block's dialog box.

The variables are written to `model.mat`, along with variables logged from the **Workspace I/O** pane.

## Log Data with To File Blocks

You can also log data to a To File block. The generated program creates a separate MAT-file (distinct from `model.mat`) for each To File block in the model. The file contains the block time and input data. You must specify the file name, variable name, decimation, and sample time in the To File block dialog box.

---

**Note** Models referenced by Model blocks do not perform data logging in that context except for states, which you can include in the state logged for top models. Code generated by the Simulink Coder software for referenced models does not perform data logging to MAT-files.

---

## Data Logging Differences Between Single- and Multitasking

When logging data in single-tasking and multitasking systems, you will notice differences in the logging of

- Noncontinuous root Output blocks
- Discrete states

In multitasking mode, the logging of states and outputs is done after the first task execution (and not at the end of the first time step). In single-tasking mode, the code generated by the build procedure logs states and outputs after the first time step.

See *Data Logging in Single-Tasking and Multitasking Model Execution* for more details on the differences between single-tasking and multitasking data logging.

---

**Note** The rapid simulation target (RSim) provides enhanced logging options. See “Accelerate, Refine, and Test Hybrid Dynamic System on Host Computer by Using RSim System Target File” for more information.

## Exchange Data Between Generated and External Code Using C API

Some Simulink Coder applications must interact with signals, states, root-level inputs/outputs, or parameters in the generated code for a model. For example, calibration applications monitor and modify parameters. Signal monitoring or data logging applications interface with signal, state, and root-level input/output data. Using the Simulink Coder C API, you can build target applications that log signals, states, and root-level inputs/outputs, monitor signals, states, and root-level inputs/outputs, and tune parameters, while the generated code executes.

The C API minimizes its memory footprint by sharing information common to signals, states, root-level inputs/outputs, and parameters in smaller structures. Signal, state, root-level input/output, and parameter structures include an index into the structure map, allowing multiple signals, states, root-level inputs/outputs, or parameters to share data.

To get started with an example, see “Use C API to Access Model Signals and States” on page 62-19 or “Use C API to Access Model Parameters” on page 62-24.

“Description of C API Files” on page 62-5

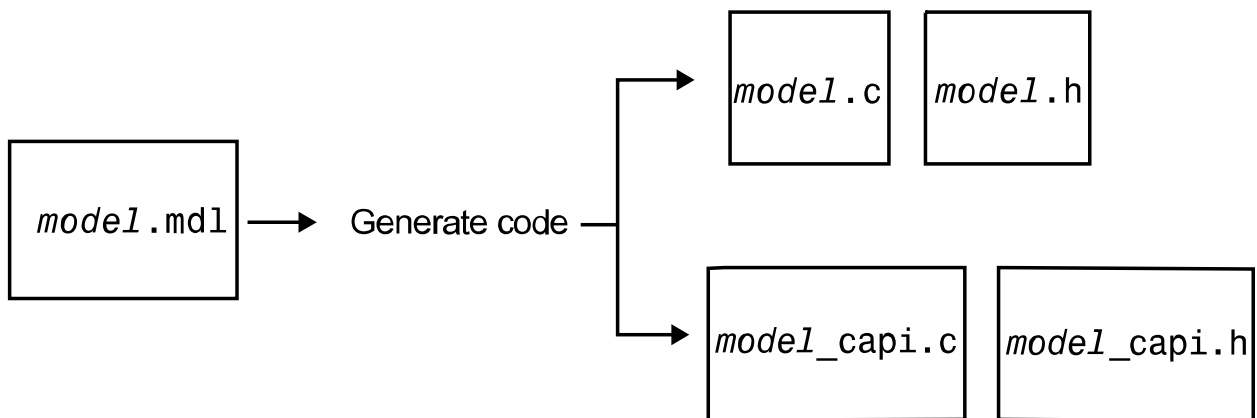

“Generate C API Data Definition File for Exchanging Data with a Target System” on page 62-16

“C API Limitations” on page 62-17

### Generated C API Files

When you configure a model to use the C API, the Simulink Coder code generator generates two additional files, *model\_capi.c* (or *.cpp*) and *model\_capi.h*, where *model* is the name of the model. The code generator places the two C API files in the build folder, based on settings in the Configuration Parameters dialog box. The C API source code file contains information about global block output signals, states, root-level inputs/outputs, and global parameters defined in the generated code model source code. The C API header file is an interface header file between the model source code and the generated C API. You can use the information in these C API files to create your application. Among the files generated are those shown in the next figure.

**Note** When you configure the code generator to produce code that includes support for the C API interface and data logging, the code generator can include text for block names in the block paths logged to C API files *model\_capi.c* (or *.cpp*) and *model\_capi.h*. If the text includes characters that are unrepresented in the character set encoding for the model, the code generator replaces the characters with XML escape sequences. For example, the code generator replaces the Japanese full-width Katakana letter  $\text{ア}$  with the escape sequence `&#x30A2;`. For more information, see “Internationalization and Code Generation”.

---

## Generate C API Files

To generate C API files for your model:

- 1 Select the C API interface for your model. There are two ways to select the C API interface for your model, as described in the following sections.
  - “Select C API with Configuration Parameters Dialog” on page 62-4
  - “Select C API from the Command Line” on page 62-4
- 2 Generate code for your model.

After generating code, you can examine the files *model\_capi.c* (or *.cpp*) and *model\_capi.h* in the model build folder.

### Select C API with Configuration Parameters Dialog

- 1 Open your model, and open the Configuration Parameters dialog box.
- 2 In the **Code Generation > Interface** pane, in the **Data exchange interface** subgroup, select one or more C API options. Based on the options you select, support for accessing signals, parameters, states, and root-level I/O will appear in the C API generated code.
  - If you want to generate C API code for global block output signals, select **Generate C API for: signals**.
  - If you want to generate C API code for global block parameters, select **Generate C API for: parameters**.
  - If you want to generate C API code for discrete and continuous states, select **Generate C API for: states**.
  - If you want to generate C API code for root-level inputs and outputs, select **Generate C API for: root-level I/O**.

### Select C API from the Command Line

From the MATLAB command line, you can use the `set_param` function to select or clear C API model configuration parameters. At the MATLAB command line, enter one or more of the following commands, where `modelname` is the name of your model.

To select **Generate C API for: signals**, enter:

```
set_param('modelname','RTWCAPISignals','on')
```

To clear **Generate C API for: signals**, enter:

```
set_param('modelname','RTWCAPISignals','off')
```

To select **Generate C API for: parameters**, enter:

```
set_param('modelName', 'RTWCAPIParams', 'on')
```

To clear **Generate C API for: parameters**, enter:

```
set_param('modelName', 'RTWCAPIParams', 'off')
```

To select **Generate C API for: states**, enter:

```
set_param('modelName', 'RTWCAPIStates', 'on')
```

To clear **Generate C API for: states**, enter:

```
set_param('modelName', 'RTWCAPIStates', 'off')
```

To select **Generate C API for: root-level I/O**, enter:

```
set_param('modelName', 'RTWCAPIRootIO', 'on')
```

To clear **Generate C API for: root-level I/O**, enter:

```
set_param('modelName', 'RTWCAPIRootIO', 'off')
```

## Description of C API Files

- “C API Root-Level Inputs and Outputs” on page 62-12
- “C API Parameters” on page 62-14
- “Map C API Data Structures to rtModel” on page 62-15

### About C API Files

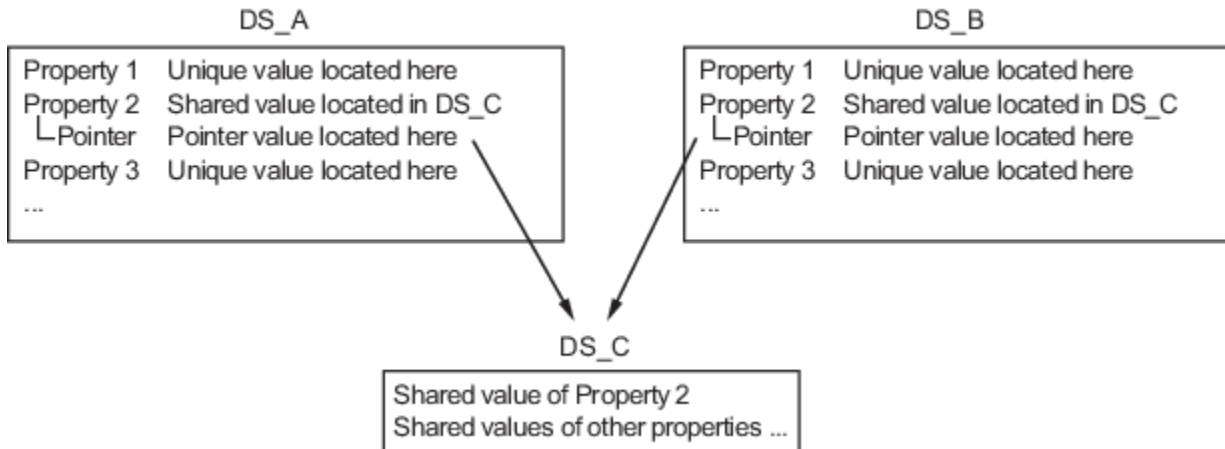

The `model_capi.c` (or `.cpp`) file provides external applications with a consistent interface to model data. Depending on your configuration settings, the data could be a signal, state, root-level input or output, or parameter. In this document, the term data item refers to either a signal, a state, a root-level input or output, or a parameter. The C API uses structures that provide an interface to the data item properties. The interface packages the properties of each data item in a data structure. If the model contains multiple data items, the interface generates an array of data structures. The members of a data structure map to data properties.

To interface with data items, an application requires the following properties for each data item:

- Name
- Block path
- Port number (for signals and root-level inputs/outputs only)
- Address
- Data type information: native data type, data size, complexity, and other attributes
- Dimensions information: number of rows, number of columns, and data orientation (scalar, vector, matrix, or  $n$ -dimensional)

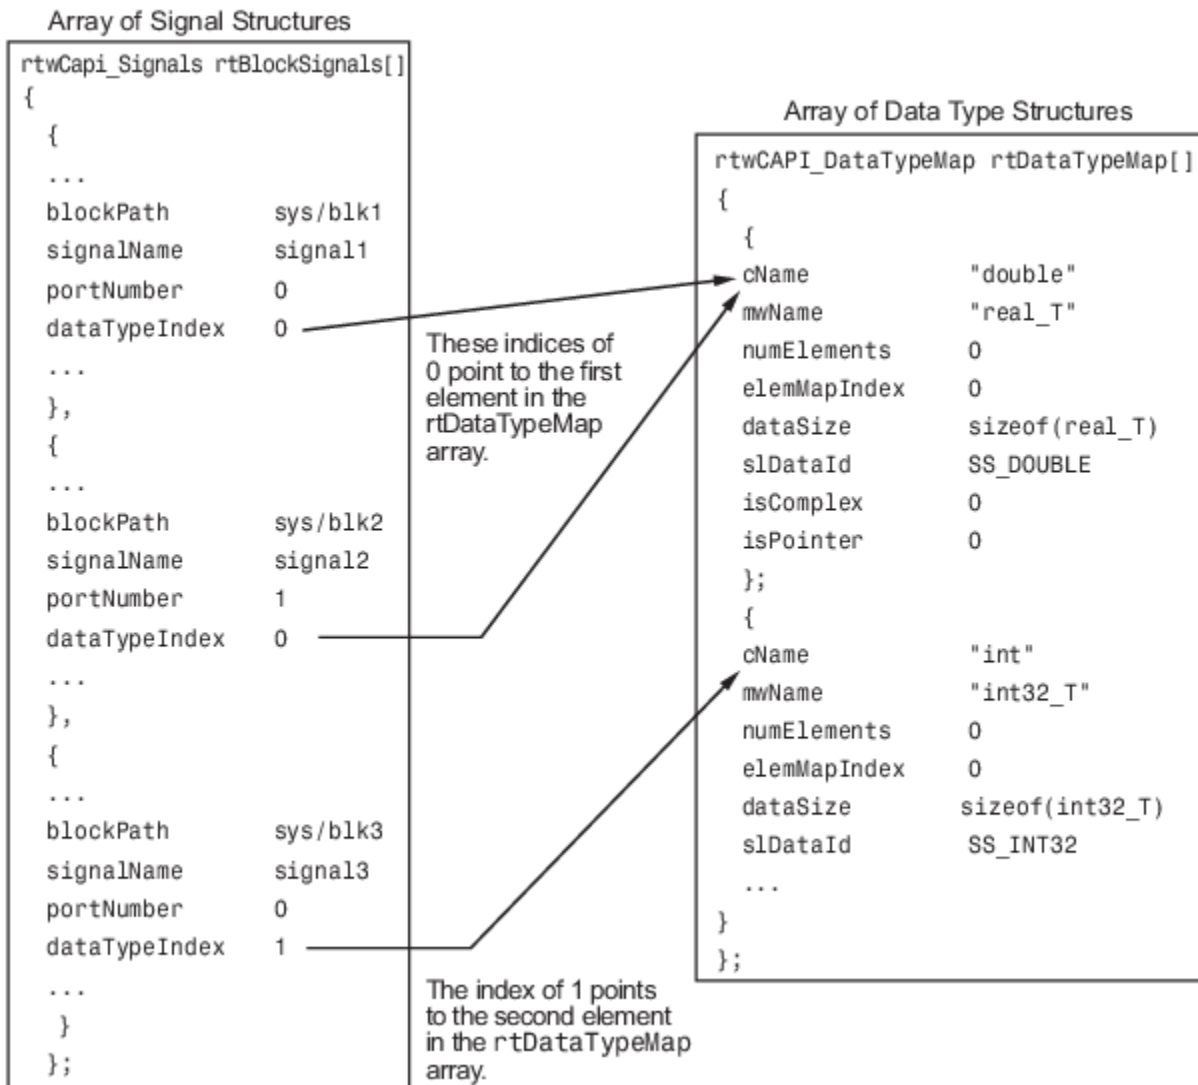

- Fixed-point information: slope, bias, scale type, word length, exponent, and other attributes
- Sample-time information (for signals, states, and root-level inputs/outputs only): sample time, task identifier, frames

As illustrated in the next figure, the properties of data item A, for example, are located in data structure DS\_A. The properties of data item B are located in data structure DS\_B.

Some property *values* can be unique to each data item, and there are some property values that several data items can share in common. Name, for example, has a unique value for each data item. The interface places the unique property values directly in the structure for the data item. The name value of data item A is in DS\_A, and the name value of data item B is in DS\_B.

But data type could be a property whose value several data items have in common. The ability of some data items to share a property allows the C API to have a reuse feature. In this case, the interface places only an index value in DS\_A and an index value in DS\_B. These indices point to a different data structure, DS\_C, that contains the actual data type value. The next figure shows this scheme with more detail.

The figure shows three signals. `signal1` and `signal2` share the same data type, `double`. Instead of specifying this data type value in each signal data structure, the interface provides only an index value, 0, in the structure. "double" is described by entry 0 in the `rtDataTypeMap` array, which is referenced by both signals. Additionally, property values can be shared between signals, states, root-level inputs/outputs, and parameters, so states, root-level inputs/outputs, and parameters also might reference the `double` entry in the `rtDataTypeMap` array. This reuse of information reduces the memory size of the generated interface.

### Structure Arrays Generated in C API Files

As with data type, the interface maps other common properties (such as address, dimension, fixed-point scaling, and sample time) into separate structures and provides an index in the structure for the data item. For a complete list of structure definitions, refer to the file `matlabroot/rtw/c/src/rtw_capi.h`. This file also describes each member in a structure. The structure arrays generated in the `model_capi.c` (or `.cpp`) file are of structure types defined in the `rtw_capi.h` file. Here is a brief description of the structure arrays generated in `model_capi.c` (or `.cpp`):

- **rtBlockSignals** is an array of structures that contains information about global block output signals in the model. Each element in the array is of type `struct rtwCAPI_Signals`. The members of this structure provide the signal name, block path, block port number, address, and indices to the data type, dimension, fixed-point, and sample-time structure arrays.
- **rtBlockParameters** is an array of structures that contains information about the tunable block parameters in the model by block name and parameter name. Each element in the array is of type `struct rtwCAPI_BlockParameters`. The members of this structure provide the parameter name, block path, address, and indices to data type, dimension, and fixed-point structure arrays.
- **rtBlockStates** is an array of structures that contains information about discrete and continuous states in the model. Each element in the array is of type `struct rtwCAPI_States`. The members of this structure provide the state name, block path, type (continuous or discrete), and indices to the address, data type, dimension, fixed-point, and sample-time structure arrays.
- **rtRootInputs** is an array of structures that contains information about root-level inputs in the model. Each element in the array is of type `struct rtwCAPI_Signals`. The members of this structure provide the root-level input name, block path, block port number, address, and indices to the data type, dimension, fixed-point, and sample-time structure arrays.
- **rtRootOutputs** is an array of structures that contains information about root-level outputs in the model. Each element in the array is of type `struct rtwCAPI_Signals`. The members of this structure provide the root-level output name, block path, block port number, address, and indices to the data type, dimension, fixed-point, and sample-time structure arrays.
- **rtModelParameters** is an array of structures that contains information about workplace variables that one or more blocks or Stateflow charts in the model reference as block parameters. Each element in the array is of data type `rtwCAPI_ModelParameters`. The members of this structure provide the variable name, address, and indices to data type, dimension, and fixed-point structure arrays.
- **rtDataAddrMap** is an array of base addresses of signals, states, root-level inputs/outputs, and parameters that appear in the `rtBlockSignals`, `rtBlockParameters`, `rtBlockStates`, and `rtModelParameters` arrays. Each element of the `rtDataAddrMap` array is a pointer to `void (void*)`.
- **rtDataTypeMap** is an array of structures that contains information about the various data types in the model. Each element of this array is of type `struct rtwCAPI_DataTypeMap`. The members of this structure provide the data type name, size of the data type, and information on whether or not the data is complex.
- **rtDimensionMap** is an array of structures that contains information about the various data dimensions in the model. Each element of this array is of type `struct rtwCAPI_DimensionMap`. The members of this structure provide information on the number of dimensions in the data, the orientation of the data (whether it is scalar, vector, or a matrix), and the actual dimensions of the data.
- **rtFixPtMap** is an array of structures that contains fixed-point information about the signals, states, root-level inputs/outputs, and parameters. Each element of this array is of type `struct rtwCAPI_FixPtMap`. The members of this structure provide information about the data scaling, bias, exponent, and whether or not the fixed-point data is signed. If the model does not have fixed-point data (signal, state, root-level input/output, or parameter), the Simulink Coder software assigns NULL or zero values to the elements of the `rtFixPtMap` array.
- **rtSampleTimeMap** is an array of structures that contains sampling information about the global signals, states, and root-level inputs/outputs in the model. (This array does not contain information about parameters.) Each element of this array is of type `struct rtwCAPI_SampleTimeMap`. The members of this structure provide information about the sample period, offset, and whether or not the data is frame-based or sample-based.

## Generate Example C API Files

Subtopics “C API Signals” on page 62-9, “C API States” on page 62-12, “C API Root-Level Inputs and Outputs” on page 62-12, and “C API Parameters” on page 62-14 discuss generated C API structures using the example model `rtwdemo_capi`. To generate code from the example model, do the following:

- 1 Open the model by clicking the `rtwdemo_capi` link above or by typing `rtwdemo_capi` on the MATLAB command line.
- 2 If you want to generate C API structures for root-level inputs/outputs in `rtwdemo_capi`, select model configuration parameter **Generate C API for: root-level I/O**.

The setting this parameter must match between the top model and the referenced model. If you modify the parameter setting, save the top model and the referenced model to the same writable work folder.

- 3 Generate code for the model.

The C API code examples in the next subtopics are generated with C as the target language.

This model has three global block output signals that will appear in C API generated code:

- `top_sig1`, which is a test point at the output of the Gain1 block in the top model
- `sig2_eg`, which appears in the top model and is defined in the base workspace as a `Simulink.Signal` object having storage class `ExportedGlobal`
- `bot_sig1`, which appears in the referenced model `rtwdemo_capi_bot` and is defined as a `Simulink.Signal` object having storage class `Model default`

The model also has two discrete states that will appear in the C API generated code:

- `top_state`, which is defined for the Delay1 block in the top model
- `bot_state`, which is defined for the Discrete Filter block in the referenced model

The model has root-level inputs/outputs that will appear in the C API generated code if you select model configuration parameter **Generate C API for: root-level I/O**:

- Four root-level inputs, `In1` through `In4`
- Six root-level outputs, `Out1` through `Out6`

Additionally, the model has five global block parameters that will appear in C API generated code:

- `Kp` (top model Gain1 block and referenced model Gain2 block share)
- `Ki` (referenced model Gain3 block)
- `p1` (lookup table `lu1d`)
- `p2` (lookup table `lu2d`)
- `p3` (lookup table `lu3d`)

## C API Signals

The `rtwC_API_Signals` structure captures signal information including the signal name, address, block path, output port number, data type information, dimensions information, fixed-point information, and sample-time information.

Here is the section of code in `rtwdemo_capi_capi.c` that provides information on C API signals for the top model in `rtwdemo_capi`:

```
/* Block output signal information */
static const rtwC_API_Signals rtBlockSignals[] = {
 /* addrMapIndex, sysNum, blockPath,
 * signalName, portNumber, dataTypeIndex, dimIndex, fxpIndex, sTimeIndex
 */
 { 0, 0, "rtwdemo_capi/Gain1",
 "top_sig1", 0, 0, 0, 0, 0 },

 { 1, 0, "rtwdemo_capi/lu2d",
 "sig2_eg", 0, 0, 1, 0, 0 },

 {
 0, 0, (NULL), (NULL), 0, 0, 0, 0, 0
 }
};
```

**Note** To better understand the code, read the comments in the file. For example, notice the comment that begins on the third line in the preceding code. This comment lists the members of the `rtwC_API_Signals` structure, in order. This tells you the order in which the assigned values for each member appear for a signal. In this example, the comment tells you that `signalName` is the fourth member of the structure. The following lines describe the first signal:

```
{ 0, 0, "rtwdemo_capi/Gain1",
 "top_sig1", 0, 0, 0, 0, 0 },
```

From these lines you infer that the name of the first signal is `top_sig1`.

Each array element, except the last, describes one output port for a block signal. The final array element is a sentinel, with all elements set to null values. For example, examine the second signal, described by the following code:

```
{ 1, 0, "rtwdemo_capi/lu2d",
 "sig2_eg", 0, 0, 1, 0, 0 },
```

This signal, named `sig2_eg`, is the output signal of the first port of the block `rtwdemo_capi/lu2d`. (This port is the first port because the zero-based index for `portNumber` displayed on the second line is assigned the value 0.)

The address of this signal is given by `addrMapIndex`, which, in this example, is displayed on the first line as 1. This provides an index into the `rtDataAddrMap` array, found later in `rtwdemo_capi_capi.c`:

```
/* Declare Data Addresses statically */
static void* rtDataAddrMap[] = {
 &rtwdemo_capi_B.top_sig1, /* 0: Signal */
 &sig2_eg[0], /* 1: Signal */
 &rtwdemo_capi_DWork.top_state, /* 2: Discrete State */
 &rtP_Ki, /* 3: Model Parameter */
 &rtP_Kp, /* 4: Model Parameter */
 &rtP_p1[0], /* 5: Model Parameter */
 &rtP_p2[0], /* 6: Model Parameter */
 &rtP_p3[0], /* 7: Model Parameter */
};
```

The index of 1 points to the second element in the `rtDataAddrMap` array. From the `rtDataAddrMap` array, you can infer that the address of this signal is `&sig2_eg[0]`.

This level of indirection supports multiple code instances of the same model. For multiple instances, the signal information remains constant, except for the address. In this case, the model is a single instance. Therefore, the `rtDataAddrMap` is declared statically. If you choose to generate reusable code, an initialize function is generated that initializes the addresses dynamically per instance. For details on generating reusable code, see “Configure Generated C Function Interface for Model Entry-Point Functions” and see “Configure Code Reuse Support” on page 50-10.

The `dataTypeIndex` provides an index into the `rtDataTypeMap` array, found later in `rtwdemo_capi_capi.c`, indicating the data type of the signal:

```
/* Data Type Map - use dataTypeMapIndex to access this structure */
static const rtwCAPI_DataTypeMap rtDataTypeMap[] = {
 /* cName, mwName, numElements, elemMapIndex, dataSize, slDataId, *
 * isComplex, isPointer */
 { "double", "real_T", 0, 0, sizeof(real_T), SS_DOUBLE, 0, 0 }
};
```

Because the index is 0 for `sig2_eg`, the index points to the first structure element in the array. You can infer that the data type of the signal is `double`. The value of `isComplex` is 0, indicating that the signal is not complex. Rather than providing the data type information directly in the `rtwCAPI_Signals` structure, a level of indirection is introduced. The indirection allows multiple signals that share the same data type to point to one map structure, saving memory for each signal.

The `dimIndex` (dimensions index) provides an index into the `rtDimensionMap` array, found later in `rtwdemo_capi_capi.c`, indicating the dimensions of the signal. Because this index is 1 for `sig2_eg`, the index points to the second element in the `rtDimensionMap` array:

```
/* Dimension Map - use dimensionMapIndex to access elements of ths structure*/
static const rtwCAPI_DimensionMap rtDimensionMap[] = {
 /* dataOrientation, dimArrayIndex, numDims, vardimsIndex */
 { rtwCAPI_SCALAR, 0, 2, 0 },

 { rtwCAPI_VECTOR, 2, 2, 0 },
 ...
};
```

From this structure, you can infer that this is a nonscalar signal having a dimension of 2. The `dimArrayIndex` value, 2, provides an index into `rtDimensionArray`, found later in `rtwdemo_capi_capi.c`:

```
/* Dimension Array- use dimArrayIndex to access elements of this array */
static const uint_T rtDimensionArray[] = {
 1, /* 0 */
 1, /* 1 */
 2, /* 2 */
 ...
};
```

The `fxpIndex` (fixed-point index) provides an index into the `rtFixPtMap` array, found later in `rtwdemo_capi_capi.c`, indicating fixed-point information about the signal. Your code can use the scaling information to compute the real-world value of the signal, using the equation  $V = SQ + B$ , where  $V$  is “real-world” (that is, base-10) value,  $S$  is user-specified slope,  $Q$  is “quantized fixed-point value” or “stored integer,” and  $B$  is user-specified bias. For details, see “Scaling” (Fixed-Point Designer).

Because this index is 0 for `sig2_eg`, the signal does not have fixed-point information. A fixed-point map index of zero means that the signal does not have fixed-point information.

The `sTimeIndex` (sample-time index) provides the index to the `rtSampleTimeMap` array, found later in `rtwdemo_capi_capi.c`, indicating task information about the signal. If you log multirate signals or conditionally executed signals, the sampling information can be useful.

---

**Note** `model_capi.c` (or `.cpp`) includes `rtw_capi.h`. A source file that references the `rtBlockSignals` array also must include `rtw_capi.h`.

---

## C API States

The `rtwCAPI_States` structure captures state information including the state name, address, block path, type (continuous or discrete), data type information, dimensions information, fixed-point information, and sample-time information.

Here is the section of code in `rtwdemo_capi_capi.c` that provides information on C API states for the top model in `rtwdemo_capi`:

```
/* Block states information */
static const rtwCAPI_States rtBlockStates[] = {
 /* addrMapIndex, contStateStartIndex, blockPath,
 * stateName, pathAlias, dWorkIndex, dataTypeIndex, dimIndex,
 * fixPtIdx, sTimeIndex, isContinuous
 */
 { 2, -1, "rtwdemo_capi/Delay1",
 "top_state", "", 0, 0, 0, 0, 0, 0 },

 {
 0, -1, (NULL), (NULL), (NULL), 0, 0, 0, 0, 0, 0
 }
};
```

Each array element, except the last, describes a state in the model. The final array element is a sentinel, with all elements set to null values. In this example, the C API code for the top model displays one state:

```
{ 2, -1, "rtwdemo_capi/Delay1",
 "top_state", "", 0, 0, 0, 0, 0, 0 },
```

This state, named `top_state`, is defined for the block `rtwdemo_capi/Delay1`. The value of `isContinuous` is zero, indicating that the state is discrete rather than continuous. The other fields correspond to the like-named signal equivalents described in “C API Signals” on page 62-9, as follows:

- The address of the signal is given by `addrMapIndex`, which, in this example, is 2. This is an index into the `rtDataAddrMap` array, found later in `rtwdemo_capi_capi.c`. Because the index is zero based, 2 corresponds to the third element in `rtDataAddrMap`, which is `&rtwdemo_capi_DWork.top_state`.
- The `dataTypeIndex` provides an index into the `rtDataTypeMap` array, found later in `rtwdemo_capi_capi.c`, indicating the data type of the parameter. The value 0 corresponds to a double, noncomplex parameter.
- The `dimIndex` (dimensions index) provides an index into the `rtDimensionMap` array, found later in `rtwdemo_capi_capi.c`. The value 0 corresponds to the first entry, which is `{ rtwCAPI_SCALAR, 0, 2, 0 }`.
- The `fixPtIndex` (fixed-point index) provides an index into the `rtFixPtMap` array, found later in `rtwdemo_capi_capi.c`, indicating fixed-point information about the parameter. As with the corresponding signal attribute, a fixed-point map index of zero means that the parameter does not have fixed-point information.

## C API Root-Level Inputs and Outputs

The `rtwCAPI_Signals` structure captures root-level input/output information including the input/output name, address, block path, port number, data type information, dimensions information, fixed-

point information, and sample-time information. (This structure also is used for block output signals, as previously described in “C API Signals” on page 62-9.)

Here is the section of code in `rtwdemo_capi_capi.c` that provides information on C API root-level inputs/outputs for the top model in `rtwdemo_capi`:

```

/* Root Inputs information */
static const rtwC_API_Signals rtRootInputs[] = {
 /* addrMapIndex, sysNum, blockPath,
 * signalName, portNumber, dataTypeIndex, dimIndex, fxpIndex, sTimeIndex
 */
 { 3, 0, "rtwdemo_capi/In1",
 "", 1, 0, 0, 0, 0, 0 },

 { 4, 0, "rtwdemo_capi/In2",
 "", 2, 0, 0, 0, 0, 0 },

 { 5, 0, "rtwdemo_capi/In3",
 "", 3, 0, 0, 0, 0, 0 },

 { 6, 0, "rtwdemo_capi/In4",
 "", 4, 0, 0, 0, 0, 0 },

 {
 0, 0, (NULL), (NULL), 0, 0, 0, 0, 0, 0
 }
};

/* Root Outputs information */
static const rtwC_API_Signals rtRootOutputs[] = {
 /* addrMapIndex, sysNum, blockPath,
 * signalName, portNumber, dataTypeIndex, dimIndex, fxpIndex, sTimeIndex
 */
 { 7, 0, "rtwdemo_capi/Out1",
 "", 1, 0, 0, 0, 0, 0 },

 { 8, 0, "rtwdemo_capi/Out2",
 "", 2, 0, 0, 0, 0, 0 },

 { 9, 0, "rtwdemo_capi/Out3",
 "", 3, 0, 0, 0, 0, 0 },

 { 10, 0, "rtwdemo_capi/Out4",
 "", 4, 0, 0, 0, 0, 0 },

 { 11, 0, "rtwdemo_capi/Out5",
 "sig2_eg", 5, 0, 1, 0, 0, 0 },

 { 12, 0, "rtwdemo_capi/Out6",
 "", 6, 0, 1, 0, 0, 0 },

 {
 0, 0, (NULL), (NULL), 0, 0, 0, 0, 0, 0
 }
};

```

---

**Note** When you generate C++ code, the code generator does not provide information on C API root-level inputs/outputs.

---

For information about interpreting the values in the `rtwC_API_Signals` structure, see the previous section “C API Signals” on page 62-9.

## C API Parameters

The `rtwCAPI_BlockParameters` and `rtwCAPI_ModelParameters` structures capture parameter information including the parameter name, block path (for block parameters), address, data type information, dimensions information, and fixed-point information.

The `rtModelParameters` array contains entries for workspace variables that are referenced as tunable Simulink block parameters or Stateflow data of machine scope. For example, tunable parameters include `Simulink.Parameter` objects that use a storage class other than `Auto`. The Simulink Coder software assigns its elements only `NULL` or zero values in the absence of such data.

The setting that you select for the model configuration parameter **Default parameter behavior** determines how information is generated into the `rtBlockParameters` array in `model_capi.c` (or `.cpp`).

- If you set **Default parameter behavior** to `Tunable`, the `rtBlockParameters` array contains an entry for every modifiable parameter of every block in the model. However, if you use a MATLAB variable or a tunable parameter to specify a block parameter, the block parameter does not appear in `rtBlockParameters`. Instead, the variable or tunable parameter appears in `rtModelParameters`.
- If you set **Default parameter behavior** to `Inlined`, the `rtBlockParameters` array is empty. The Simulink Coder software assigns its elements only `NULL` or zero values.

The last member of each array is a sentinel, with all elements set to null values.

Here is the `rtBlockParameters` array that is generated by default in `rtwdemo_capi_capi.c`:

```
/* Individual block tuning is not valid when inline parameters is *
 * selected. An empty map is produced to provide a consistent *
 * interface independent of inlining parameters. *
 */
static const rtwCAPI_BlockParameters rtBlockParameters[] = {
 /* addrMapIndex, blockPath,
 * paramName, dataTypeIndex, dimIndex, fixPtIdx
 */
 {
 0, (NULL), (NULL), 0, 0, 0
 }
};
```

In this example, only the final, sentinel array element is generated, with all members of the structure `rtwCAPI_BlockParameters` set to `NULL` and zero values. This is because **Default parameter behavior** is set to `Inlined` by default for the `rtwdemo_capi` example model. If you set **Default parameter behavior** to `Tunable`, the block parameters are generated in the `rtwCAPI_BlockParameters` structure. However, MATLAB variables and tunable parameters appear in the `rtwCAPI_ModelParameters` structure.

Here is the `rtModelParameters` array that is generated by default in `rtwdemo_capi_capi.c`:

```
/* Tunable variable parameters */
static const rtwCAPI_ModelParameters rtModelParameters[] = {
 /* addrMapIndex, varName, dataTypeIndex, dimIndex, fixPtIndex */
 { 2, TARGET_STRING("Ki"), 0, 0, 0 },
 { 3, TARGET_STRING("Kp"), 0, 0, 0 },
 { 4, TARGET_STRING("p1"), 0, 2, 0 },
 { 5, TARGET_STRING("p2"), 0, 3, 0 },
 { 6, TARGET_STRING("p3"), 0, 4, 0 },
};
```

```
{ 0, (NULL), 0, 0, 0 }
};
```

In this example, the `rtModelParameters` array contains entries for each variable that is referenced as a tunable Simulink block parameter.

For example, the `varName` (variable name) of the fourth parameter is `p2`. The other fields correspond to the like-named signal equivalents described in “C API Signals” on page 62-9, as follows:

- The address of the fourth parameter is given by `addrMapIndex`, which, in this example, is 5. This is an index into the `rtDataAddrMap` array, found later in `rtwdemo_capi_capi.c`. Because the index is zero based, 5 corresponds to the sixth element in `rtDataAddrMap`, which is `rtP_p2`.
- The `dataTypeIndex` provides an index into the `rtDataTypeMap` array, found later in `rtwdemo_capi_capi.c`, indicating the data type of the parameter. The value 0 corresponds to a double, noncomplex parameter.
- The `dimIndex` (dimensions index) provides an index into the `rtDimensionMap` array, found later in `rtwdemo_capi_capi.c`. The value 3 corresponds to the fourth entry, which is `{ rtwCAPI_MATRIX_COL_MAJOR, 6, 2, 0 }`.
- The `fixPtIndex` (fixed-point index) provides an index into the `rtFixPtMap` array, found later in `rtwdemo_capi_capi.c`, indicating fixed-point information about the parameter. As with the corresponding signal attribute, a fixed-point map index of zero means that the parameter does not have fixed-point information.

For more information about tunable parameter storage in the generated code, see “How Generated Code Stores Internal Signal, State, and Parameter Data” on page 36-49.

### Map C API Data Structures to `rtModel`

The real-time model data structure encapsulates model data and associated information that describes the model fully. When you select the C API feature and generate code, the Simulink Coder code generator adds another member to the real-time model data structure generated in `model.h`:

```
/*
 * DataMapInfo:
 * The following substructure contains information regarding
 * structures generated in the model's C API.
 */
struct {
 rtwCAPI_ModelMappingInfo mmi;
} DataMapInfo;
```

This member defines `mmi` (for model mapping information) of type `struct rtwCAPI_ModelMappingInfo`. The structure is located in `matlabroot/rtw/c/src/rtw_modelmap.h`. The `mmi` substructure defines the interface between the model and the C API files. More specifically, members of `mmi` map the real-time model data structure to the structures in `model_capi.c` (or `.cpp`).

Initializing values of `mmi` members to the arrays accomplishes the mapping, as shown in “Map Model to C API Arrays of Structures” on page 62-16. Each member points to one of the arrays of structures in the generated C API file. For example, the address of the `rtBlockSignals` array of structures is allocated to the first member of the `mmi` substructure in `model.c` (or `.cpp`), using the following code in the `rtw_modelmap.h` file:

```
/* signals */
struct {
```

```

rtwC_API_Signals const *signals; /* Signals Array */
uint_T numSignals; /* Num Signals */
rtwC_API_Signals const *rootInputs; /* Root Inputs array */
uint_T numRootInputs; /* Num Root Inputs */
rtwC_API_Signals const *rootOutputs; /* Root Outputs array */
uint_T numRootOutputs; /* Num Root Outputs */
} Signals;

```

The model initialize function in *model.c* (or *.cpp*) performs the initializing by calling the C API initialize function. For example, the following code is generated in the model initialize function for example model *rtwdemo\_capi*:

```

/* Initialize DataMapInfo substructure containing ModelMap for C API */
rtwdemo_capi_initializeDataMapInfo(rtwdemo_capi_M);

```

### Map Model to C API Arrays of Structures

**Note** This figure lists the arrays in the order that their structures appear in *rtw\_modelmap.h*, which differs slightly from their generated order in *model\_capi.c*.

## Generate C API Data Definition File for Exchanging Data with a Target System

This example shows how to use the target-based C API to interface with generated code that represents signals, states, parameters, and root-level I/O.

## Open Example Model

Open the example model `rtwdemo_capi`.

```
open_system('rtwdemo_capi');
```

The C API is useful for interacting with application data in generated code, without stopping program execution or recompiling the generated code. To use the C API interface, for a top model and its referenced models:

1. Set up a client/server protocol (such as TCP/IP or a dual-port memory connection) between your development computer and the target computer.
2. Select at least one of the C API model configuration parameters: **signals**, **parameters**, **states**, and **root-level I/O**.
3. Configure the data elements that you want to access with the C API with addressable storage classes.

C API configuration settings for the top model and referenced models must match.

The code generator places the C API interface in the file `model_capi.c`. Depending on your configuration settings, the data can represent signals, states, parameters, and root-level I/O configured with addressable storage classes. The file includes structures that provide an interface to data properties.

## C API Limitations

The C API feature has the following limitations.

- The C API does not support the following values for the CodeFormat TLC variable:
  - `S-Function`
  - `Accelerator_S-Function` (for accelerated simulation)
- For ERT-based targets, the C API requires that support for floating-point code be enabled.
- Local block output signals are not supported.
- Local Stateflow parameters are not supported.
- The following custom storage class objects are not supported:
  - Objects without the package `csc_registration` file
  - Grouped custom storage classes
  - Objects defined by using macros
  - `BitField` objects
  - `FileScope` objects
- Customized data placement is disabled when you are using the C API. The interface looks for global data declaration in `model.h` and `model_private.h`. Declarations placed in any other file by customized data placement result in code that does not compile.

---

**Note** Custom Storage Class objects work in code generation, only if you use the ERT system target file and clear the model configuration parameter **Ignore custom storage classes**.

---

## Use C API to Access Model Signals and States

This example helps you get started writing application code to interact with model signals and states. To get started writing application code to interact with model parameters, see “Use C API to Access Model Parameters” on page 62-24.

The C API provides you with the flexibility of writing your own application code to interact with model signals, states, root-level inputs/outputs, and parameters. Your target-based application code is compiled with the Simulink Coder generated code into an executable. The target-based application code accesses the C API structure arrays in *model\_capi.c* (or *.cpp*). You might have host-based code that interacts with your target-based application code. Or, you might have other target-based code that interacts with your target-based application code. The files *rtw\_modelmap.h* and *rtw\_capi.h*, located in *matlabroot/rtw/c/src* (open), provide macros for accessing the structures in these arrays and their members.

Here is an example application that logs global signals and states in a model to a text file. This code is intended as a starting point for accessing signal and state addresses. You can extend the code to perform signal logging and monitoring, state logging and monitoring, or both.

This example uses the following macro and function interfaces:

- `rtmGetDataMapInfo` macro

Accesses the model mapping information (MMI) substructure of the real-time model structure. In the following macro call, `rtM` is the pointer to the real-time model structure in *model.c* (or *.cpp*):

```
rtwCAPI_ModelMappingInfo* mmi = &(rtmGetDataMapInfo(rtM).mmi);
```

- `rtmGetTPtr` macro

Accesses the absolute time information for the base rate from the timing substructure of the real-time model structure. In the following macro call, `rtM` is the pointer to the real-time model structure in *model.c* (or *.cpp*):

```
rtmGetTPtr(rtM)
```

- Custom functions `capi_StartLogging`, `capi_UpdateLogging`, and `capi_TerminateLogging`, provided via the files *rtwdemo\_capi\_data\_log.h* and *rtwdemo\_capi\_data\_log.c*. These files are located in *matlabroot/toolbox/rtw/rtwdemos* (open).
  - `capi_StartLogging` initializes signal and state logging.
  - `capi_UpdateLogging` logs a signal and state value at each time step.
  - `capi_TerminateLogging` terminates signal and state logging and writes the logged values to a text file.

You can integrate these custom functions into generated code for a model by using these methods:

- **Custom Code** of the Model Configuration Parameters dialog box.
- Custom Code library blocks
- TLC custom code functions

This tutorial uses the **Custom Code** pane of the Model Configuration Parameters dialog box and the System Outputs block from the Custom Code library to insert calls to the custom functions into *model.c* (or *.cpp*), as follows:

- `capi_StartLogging` is called in the `model_initialize` function.
- `capi_UpdateLogging` is called in the `model_step` function.
- `capi_TerminateLogging` is called in the `model_terminate` function.

The following excerpts of generated code from `model.c` (rearranged to reflect their order of execution) show how the function interfaces are used.

```
void rtwdemo_capi_initialize(void)
{
...
/* user code (Initialize function Body) */

/* C API Custom Logging Function: Start Signal and State logging via C API.
 * capi_StartLogging: Function prototype in rtwdemo_capi_dataolog.h
 */
{
 rtwCAPI_ModelMappingInfo *MMI = &(rtmGetDataMapInfo(rtwdemo_capi_M).mmi);
 printf("*** Started state/signal logging via C API **\n");
 capi_StartLogging(MMI, MAX_DATA_POINTS);
}
...
}
...
/* Model step function */
void rtwdemo_capi_step(void)
{
...
/* user code (Output function Trailer) */

/* System '<Root>' */

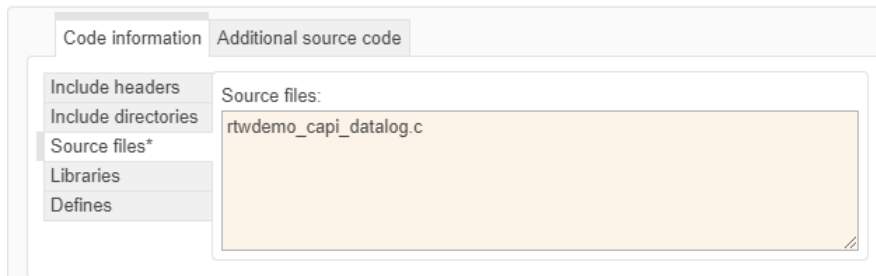

/* C API Custom Logging Function: Update Signal and State logging buffers.
 * capi_UpdateLogging: Function prototype in rtwdemo_capi_dataolog.h
 */
{
 rtwCAPI_ModelMappingInfo *MMI = &(rtmGetDataMapInfo(rtwdemo_capi_M).mmi);
 capi_UpdateLogging(MMI, rtmGetTPtr(rtwdemo_capi_M));
}
...
}
...
/* Model terminate function */
void rtwdemo_capi_terminate(void)
{
 /* user code (Terminate function Body) */

 /* C API Custom Logging Function: Dump Signal and State buffers into a text file.
 * capi_TerminateLogging: Function prototype in rtwdemo_capi_dataolog.h
 */
 {
 capi_TerminateLogging("rtwdemo_capi_ModelLog.txt");
 printf("*** Finished state/signal logging. Created rtwdemo_capi_ModelLog.txt **\n");
 }
}
}
```

The following procedure illustrates how you can use the C API macro and function interfaces to log global signals and states in a model to a text file.

- 1 At the MATLAB command line, enter `rtwdemo_capi` to open the example model.
- 2 Save the top model `rtwdemo_capi` and the referenced model `rtwdemo_capi_bot` to the same writable work folder.
- 3 Open the Configuration Parameters dialog box.
- 4 If you are licensed for Embedded Coder software and you want to use the `ert.tlc` system target file instead of the default `grt.tlc`, change the setting of model configuration parameter **System target file**. Make sure that you also select `ert.tlc` for the referenced model `rtwdemo_capi_bot`.
- 5 For the top model, confirm these model configuration parameter settings:

- a Select parameters **Generate C API for signals**, **Generate C API for states**, and **Generate C API for parameters**.
  - b If you are using the `ert.tlc` system target file, select **Support complex numbers**
  - c Select **MAT-file logging**.
  - d Click **Apply**.
  - e Update configuration parameter settings in the referenced model, `rtwdemo_capi_bot`, to match changes you made in the top model.
- 6 Use the **Custom Code** pane to embed your custom application code in the generated code. Select the **Custom Code** pane. On the **Code information** tab, click **Include directories**. The **Include directories** input field is displayed.
  - 7 In the **Include directories** field, type `matlabroot/toolbox/rtw/rtwdemos`, where `matlabroot` represents the root of your MATLAB installation folder. (If you are specifying a Windows path that contains a space, place the text inside double quotes.)
  - 8 On the same tab, click **Source files**, and type `rtwdemo_capi_data_log.c`.

- 9 On the **Additional source code** tab, click **Additional code**, and type or copy and paste the following include statement:
 

```
#include "rtwdemo_capi_data_log.h"
```
- 10 On the same tab, in the **Initialize code** field, type or copy and paste the following application code:

```
/* C API Custom Logging Function: Start Signal and State logging via C API.
 * capi_StartLogging: Function prototype in rtwdemo_capi_data_log.h
 */
{
 rtwC_API_ModelMappingInfo *MMI = &(rtmGetDataMapInfo(rtwdemo_capi_M).mmi);
 printf("*** Started state/signal logging via C API **\n");
 capi_StartLogging(MMI, MAX_DATA_POINTS);
}
```

---

**Note** If you renamed the top model `rtwdemo_capi`, update the name `rtwdemo_capi_M` in the application code to reflect the new model name.

---

- 11 On the same tab, in the **Terminate code** field, type or copy and paste the following application code:

```
/* C API Custom Logging Function: Dump Signal and State buffers into a text file.
 * capi_TerminateLogging: Function prototype in rtwdemo_capi_data_log.h
 */
{
 capi_TerminateLogging("rtwdemo_capi_ModelLog.txt");
 printf("*** Finished state/signal logging. Created rtwdemo_capi_ModelLog.txt **\n");
}
```

Click **Apply**.

- 12** In the MATLAB Command Window, enter `custcode` to open the Simulink Coder Custom Code library. At the top level of the `rtwdemo_capi` model, add a System Outputs block.
- 13** Double-click the System Outputs block to open the System Outputs Function Custom Code dialog box. In the **System Outputs Function Exit Code** field, type or copy and paste the following application code:

```
/* C API Custom Logging Function: Update Signal and State logging buffers.
 * capi_UpdateLogging: Function prototype in rtwdemo_capi_dataLog.h
 */
{
 rtwCAPI_ModelMappingInfo *MMI = &(rtmGetDataMapInfo(rtwdemo_capi_M).mmi);
 capi_UpdateLogging(MMI, rtmGetTPtr(rtwdemo_capi_M));
}
```

If you renamed the top model `rtwdemo_capi`, update two instances of the name `rtwdemo_capi_M` in the application code to reflect the new model name.

Click **OK**.

- 14** Clear model configuration parameter **Generate code only**.

Build the model and generate an executable program. For example, on a Windows system, the build generates the executable file `rtwdemo_capi.exe` in your current working folder.

- 15** In the MATLAB Command Window, enter the command `!rtwdemo_capi` to run the executable file. During execution, signals and states are logged using the C API and then written to the text file `rtwdemo_capi_ModelLog.txt` in your current working folder.

```
>> !rtwdemo_capi

** starting the model **
** Started state/signal logging via C API **
** Logging 2 signal(s) and 1 state(s). In this demo, only scalar named
 signals/states are logged **
** Finished state/signal logging. Created rtwdemo_capi_ModelLog.txt **
```

- 16** Examine the text file in the MATLAB editor or other text editor. Here is an excerpt of the signal and state logging output.

```

## Use C API to Access Model Parameters

This example helps you get started writing application code to interact with model parameters. To get started writing application code to interact with model signals and states, see “Use C API to Access Model Signals and States” on page 62-19.

The C API provides you with the flexibility of writing your own application code to interact with model signals, states, root-level inputs/outputs, and parameters. Your target-based application code is compiled with generated code into an executable program. The target-based application code accesses the C API structure arrays in *model\_capi.c* (or *.cpp*). You might have host-based code that interacts with your target-based application code. Or, you might have other target-based code that interacts with your target-based application code. The files *rtw\_modelmap.h* and *rtw\_capi.h*, located in *matlabroot/rtw/c/src* (open), provide macros for accessing the structures in these arrays and their members.

Here is an example application that prints the parameter values of tunable parameters in a model to the standard output. This code is intended as a starting point for accessing parameter addresses. You can extend the code to perform parameter tuning. The application:

- Uses the `rtmGetDataMapInfo` macro to access the mapping information in the `mmi` substructure of the real-time model structure

```
rtwCAPI_ModelMappingInfo* mmi = &(rtmGetDataMapInfo(rtM).mmi);
```

where `rtM` is the pointer to the real-time model structure in *model.c* (or *.cpp*).

- Uses `rtwCAPI_GetNumModelParameters` to get the number of model parameters in mapped C API:

```
uint_T nModelParams = rtwCAPI_GetNumModelParameters(mmi);
```

- Uses `rtwCAPI_GetModelParameters` to access the array of model parameter structures mapped in C API:

```
rtwCAPI_ModelParameters* capiModelParams = \
 rtwCAPI_GetModelParameters(mmi);
```

- Loops over the `capiModelParams` array to access individual parameter structures. A call to the function `capi_PrintModelParameter` displays the value of the parameter.

The example application code is provided below:

```
{
/* Get CAPI Mapping structure from Real-Time Model structure */
rtwCAPI_ModelMappingInfo* capiMap = \
&(rtmGetDataMapInfo(rtwdemo_capi_M).mmi);

/* Get number of Model Parameters from capiMap */
uint_T nModelParams = rtwCAPI_GetNumModelParameters(capiMap);
printf("Number of Model Parameters: %d\n", nModelParams);

/* If the model has Model Parameters, print them using the
application capi_PrintModelParameter */
if (nModelParams == 0) {
 printf("No Tunable Model Parameters in the model \n");
}
else {
```

```

unsigned int idx;

for (idx=0; idx < nModelParams; idx++) {
 /* call print utility function */
 capi_PrintModelParameter(capiMap, idx);
}
}
}

```

The print utility function is located in `matlabroot/rtw/c/src/rtw_capi_examples.c`. This file contains utility functions for accessing the C API structures.

To become familiar with the example code, try building a model that displays the tunable block parameters and MATLAB variables. You can use `rtwdemo_capi`, the C API example model. The following steps apply to both `grt.tlc` and `ert.tlc` system target files, unless otherwise indicated.

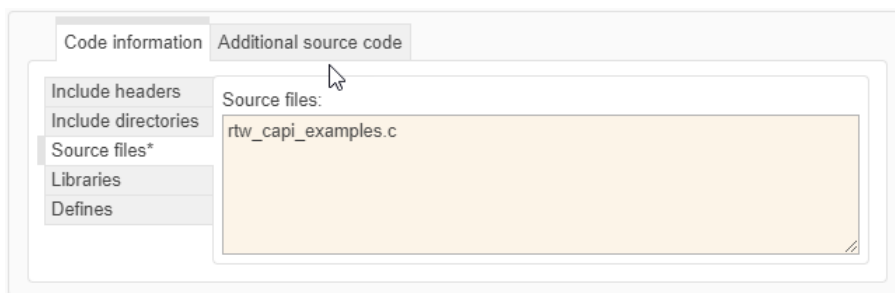

- 1 At the MATLAB command line, enter `rtwdemo_capi` to open the example model.
- 2 Save the top model `rtwdemo_capi` and the referenced model `rtwdemo_capi_bot` to the same writable work folder.
- 3 If you are licensed for Embedded Coder software and you want to use the `ert.tlc` system target file instead of the default `grt.tlc`, use model configuration parameter **System target file** to select an `ert.tlc` system target file. Make sure that you also select `ert.tlc` for the referenced model `rtwdemo_capi_bot`.
- 4 Confirm these model configuration parameter settings:
  - a Select **Generate C API for parameters**.
  - b If you are using the `ert.tlc` system target file, select **Support complex numbers**.
  - c Select **MAT-file logging**.
  - d Click **Apply**.
  - e Update configuration parameter settings in the referenced model, `rtwdemo_capi_bot`, to match changes you made in the top model.
- 5 Use the **Custom Code** pane to embed your custom application code in the generated code. Select the **Custom Code** pane. On the **Additional source code** tab, click **Initialize code**. The **Initialize code** input field is displayed.
- 6 In the **Initialize code** input field, type or copy and paste the example application code shown above step 1. This embeds the application code in the `model_initialize` function.

---

**Note** If you renamed the top model `rtwdemo_capi`, update the name `rtwdemo_capi_M` in the application code to reflect the new model name.

---

- 7 On the **Code information** tab, click **Include directories**, and type `matlabroot/rtw/c/src`, where `matlabroot` represents the root of your MATLAB installation folder. (If you are specifying a Windows path that contains a space, place the text inside double quotes.)
- 8 On the same tab, click **Source files**, and type `rtw_capi_examples.c`.

Click **Apply**.

- 9 Clear model configuration parameter **Generate code only**.

Build the model and generate an executable program. For example, on a Windows system, the build generates the executable file `rtwdemo_capi.exe` in your current working folder.

- 10 In the MATLAB Command Window, enter `!rtwdemo_capi` to run the executable file. Running the program displays parameter information in the Command Window.

```
>> !rtwdemo_capi

** starting the model **
Number of Model Parameters: 5
Ki =

- “Calibrate Generated Code and Monitor Signals” on page 63-9

## Export ASAP2 File for Data Measurement and Calibration

The ASAM MCD-2 MC standard, also known as ASAP2, is a data definition standard proposed by the Association for Standardization of Automation and Measuring Systems (ASAM). ASAP2 is a non-object-oriented description of the data used for measurement, calibration, and diagnostic systems. For more information on ASAM and the ASAM MCD-2 MC (ASAP2) standard, see the ASAM website at [www.asam.net](http://www.asam.net).

The code generator enables you to export an ASAP2 file containing information about your model during the code generation process.

Simulink Coder support for ASAP2 file generation is version-neutral. By default, the software generates ASAP2 version 1.31 format, but the generated model information is generally compatible with other ASAP2 versions. ASAP2 file generation is also neutral with respect to the specific needs of ASAP2 measurement and calibration tools. The software provides customization APIs that you can use to customize ASAP2 file generation to generate an ASAP2 version and to meet the specific needs of your ASAP2 tools.

### In this section...

“What You Should Know” on page 63-2

“System Target Files Supporting ASAP2” on page 63-2

“Define ASAP2 Information” on page 63-3

“Generate an ASAP2 File” on page 63-6

“Structure of ASAP2 File” on page 63-8

### What You Should Know

To make use of ASAP2 file generation, you should become familiar with:

- ASAM and the ASAP2 standard and terminology. See the ASAM Web site at [www.asam.net](http://www.asam.net).
- Configuring model data elements for code generation. See **Code Mappings Editor - C**.
- Storage and representation of signals and parameters in generated code. See “Data Access for Prototyping and Debugging”.
- If you have Embedded Coder, see “Data Representation”.

### System Target Files Supporting ASAP2

You can use ASAP2 file generation with varying system target file configurations. For example, GRT- and ERT- based configurations enables you to generate an ASAP2 file as part of the code generation and build process.

For Adaptive AUTOSAR target and Simulink Real-Time targets, you can generate the ASAP2 file for C++ language. For ERT and GRT targets, you can generate ASAP2 file only for language C and language C++ is not supported.

For procedures for generating ASAP2 files by using the system target file configurations, see “Generate an ASAP2 File” on page 63-6.

## Define ASAP2 Information

- “Define ASAP2 Information for Parameters and Signals” on page 63-3
- “Memory Address Attribute” on page 63-3
- “Automatic ECU Address Replacement for ASAP2 Files (Embedded Coder)” on page 63-4
- “Define ASAP2 Information for Lookup Tables” on page 63-5

### Define ASAP2 Information for Parameters and Signals

The ASAP2 file generation process requires information about parameters and signals in your model. Some of this information is contained in the model itself. Use Simulink data objects in a workspace or data dictionary to complete the ASAP2 file generation process. In some cases, the use of workspace objects is optional.

Use the Model Data Editor and built-in Simulink data objects to provide information, such as using `Simulink.Signal` objects to provide MEASUREMENT information and `Simulink.Parameter` objects to provide CHARACTERISTIC information. You can use data objects from data classes that are derived from `Simulink.Signal` and `Simulink.Parameter` to provide the information. See “Data Objects” and **Model Data Editor**.

This table contains the minimum set of data attributes required for ASAP2 file generation. Some data attributes are defined in the model. Others attributes are supplied in the properties of objects. For attributes that are defined in `Simulink.Signal` or `Simulink.Parameter` objects, the table lists the associated property name.

Data Attribute	Defined In	Property Name
Name (symbol)	Model and data object	Inherited from the handle of the data object to which parameter or signal name resolves
Description	Data object	Description
Data type	Model or data object	DataType
Scaling (if fixed-point data type)	Model or data object	DataType
Minimum allowable value	Model or data object	Min
Maximum allowable value	Model or data object	Max
Unit	Model or data object	Unit
Memory address (optional)	Model or data object	MemoryAddress_ASAP2 (optional; see “Memory Address Attribute” on page 63-3.)

### Memory Address Attribute

If the memory address attribute is unknown before code generation, the code generator inserts ECU Address placeholder text in the generated ASAP2 file. You can substitute an actual address for the placeholder by postprocessing the generated file. For an example, see the file `matlabroot/toolbox/rtw/targets/asap2/asap2/asap2post.m`. `asap2post.m` parses through the linker map file that you provide and replaces the ECU Address placeholders in the ASAP2 file with the actual memory addresses. Because linker map files vary from compiler to compiler, you might need to modify the regular expression code in `asap2post.m` to match the format of the linker map that you use.

If you have Embedded Coder installed on your system, and if you are generating Executable and Linkable Format (ELF) or Program Database (PDB) files for your embedded target, you can use the `rtw.asap2SetAddress` function to automate ECU address replacement. For more information, see “Automatic ECU Address Replacement for ASAP2 Files (Embedded Coder)” on page 63-4.

If the memory address attribute is known before code generation, it can be defined in the data item or data object. By default, the `MemoryAddress_ASAP2` property does not exist in the `Simulink.Signal` or `Simulink.Parameter` data object classes. If you want to add the attribute, add a property called `MemoryAddress_ASAP2` to a custom class that is a subclass of the `Simulink` or `ASAP2` class. For information on subclassing Simulink data classes, see “Define Data Classes”.

This table indicates the Simulink object properties that have replaced the ASAP2 object properties of the previous release.

### Differences Between ASAP2 and Simulink Parameter and Signal Object Properties

ASAP2 Object Properties (Previous)	Simulink Object Properties (Current)
LONGID_ASAP2	Description
PhysicalMin_ASAP2	Min
PhysicalMax_ASAP2	Max
Units_ASAP2	Unit

### Automatic ECU Address Replacement for ASAP2 Files (Embedded Coder)

If you have Embedded Coder installed on your system, and if you are generating Executable and Linkable Format (ELF) or Program Database (PDB) files for your embedded target, you can use the `rtw.asap2SetAddress` function to automate the replacement of ECU Address placeholder memory address values with actual addresses in the generated ASAP2 file.

If the memory address attribute is unknown before code generation, the code generator inserts ECU Address placeholder text in the generated ASAP2 file, as shown

```
/begin CHARACTERISTIC
/* Name */ Ki
/* Long Identifier */ ""
/* Type */ VALUE
/* ECU Address */ 0x0000 /* @ECU_Address@Ki@ */
```

To substitute actual addresses for the ECU Address placeholders, process the generated ASAP2 file by using the `rtw.asap2SetAddress` function. The syntax is:

```
rtw.asap2SetAddress(ASAP2File,InfoFile)
```

The arguments are character vectors specifying the name of the generated ASAP2 file and the name of the generated executable ELF file, PDB file from Microsoft toolchain, or DWARF debug information files for the model. When called, `rtw.asap2SetAddress` extracts the actual ECU address from the specified ELF, PDB, or DWARF file and replaces the placeholder in the ASAP2 file with the actual address, for example:

```
/begin CHARACTERISTIC
/* Name */ Ki
/* Long Identifier */ ""
/* Type */ VALUE
/* ECU Address */ 0x40009E60
```

## Define ASAP2 Information for Lookup Tables

Simulink Coder software generates ASAP2 descriptions for lookup table data and its breakpoints. The software represents 1-D table data as **CURVE** information, 2-D table data as **MAP** information, and breakpoints as **AXIS\_DESCR** and **AXIS\_PTS** information. You can model lookup tables by using one of the following Simulink Lookup Table blocks:

- Direct Lookup Table (n-D) — 1 and 2 dimensions
- Interpolation Using Prelookup — 1 and 2 dimensions
- 1-D Lookup Table
- 2-D Lookup Table
- n-D Lookup Table — 1 and 2 dimensions

The software supports these types of lookup table breakpoints (axis points).

Breakpoint Type	Information Generated
Tunable and shared among multiple table axes (common axis)	COM_AXIS
Fixed and nontunable (fixed axis)	One of these variants of FIX_AXIS: <ul style="list-style-type: none"> <li>• FIX_AXIS_PAR if breakpoints are integers with equidistant spacing and the equidistant spacing is a power of two</li> <li>• FIX_AXIS_PAR_DIST if breakpoints are integers with equidistant spacing</li> <li>• FIX_AXIS_PAR_LIST if breakpoints are integers with non-equidistant spacing</li> </ul>
Tunable but not shared among multiple tables (standard axis)	STD_AXIS

When you configure the blocks for ASAP2 code generation:

- For table data, use a `Simulink.Parameter` data object with a non-Auto storage class.
- For tunable breakpoint data that is shared among multiple table axes (COM\_AXIS), use a `Simulink.Parameter` data object that has a non-Auto storage class.
- For fixed, nontunable breakpoint data (FIX\_AXIS), use workspace variables or arrays specified in the block parameters dialog box. The breakpoints must be stored as integers in the code. The data type must be a built-in integer type (`int8`, `int16`, `int32`, `uint8`, `uint16`, or `uint32`), a fixed-point data type, or an equivalent alias type.
- For tunable breakpoint data that is not shared among multiple tables (STD\_AXIS):
  - 1 Create a `Simulink.Bus` object to define the `struct` packaging (names and order of the fields). The fields of the parameter structure must correspond to the lookup table data and each axis of the lookup table block. For example, in an n-D Lookup Table block that has 2 dimensions, the structure must contain only three fields. This bus object describes the record layout for the lookup characteristic.
  - 2 Create a `Simulink.Parameter` object to represent a tunable parameter.
  - 3 Create table and axis values.

- 4 Optionally, specify the **Units**, **Minimum**, and **Maximum** properties for the parameter object.

Here is an example of an n-D Lookup Table record generated into an ASAP2 file in Standard Axis format:

```
/begin CHARACTERISTIC
/* Name */ STDAxisParam
...
/* Record Layout */ Lookup1D_X_WORD_Y_FLOAT32_IEEE
...
begin AXIS_DESCR
/* Description of X-Axis Points */
/* Axis Type */ STD_AXIS
...
/end AXIS_DESCR
/end CHARACTERISTIC

/begin RECORD_LAYOUT Lookup1D_X_WORD_Y_FLOAT32_IEEE
 AXIS_PTS_X 1 WORD INDEX_INCR DIRECT
 FNC_VALUES 2 FLOAT32_IEEE COLUMN_DIR DIRECT
/end RECORD_LAYOUT
```

## Generate an ASAP2 File

- “Generating ASAP2 Files” on page 63-6
- “Use GRT- or ERT- Based System Target File” on page 63-6
- “Generate ASAP2 Files for Referenced Models” on page 63-7
- “Merge ASAP2 Files for Top and Referenced Models” on page 63-7

### Generating ASAP2 Files

Use the Generic Real-Time system target file or a Embedded Coder system target file to generate an ASAP2 file as part of the code generation and build process.

Generate ASAP2 file by using the system target files that have built-in ASAP2 support.

### Use GRT- or ERT- Based System Target File

To generate the ASAP2 data definition for a model by using a Generic Real-Time(GRT) system target file or Embedded Coder system target file:

- 1 Use the **Code Mappings Editor - C** to apply storage classes to signals, block states, and model parameters, as described in “C Code Generation Configuration for Model Interface Elements” on page 33-2.

Parameters are not represented in the ASAP2 file if one or more of the following conditions exist:

- You apply storage class `Auto`, `FileScope`, `Struct`, or `Default` (through `Model default`).
  - You apply storage class through `Embedded Coder Dictionary`.
  - You apply a storage class that causes the code generator to generate a macro or non-addressable variable.
- 2 Use the Property Inspector to configure the remaining storage class properties for each data element.

- 3 Set the model configuration parameter **System target file** to a GRT- or ERT- based system target file.
- 4 Enable the configuration parameter **ASAP2 interface** with the command
 

```
set_param('model_Name','GenerateASAP2',true);
```

---

**Note** You can no longer enable generation of ASAP2 files from the Model Configuration Parameter dialog box. As “Generate ASAP2 and CDF Calibration Files” on page 64-2 describes, use the Generate Calibration Files tool, or use the command line model configuration parameter `GenerateASAP2`.

---

- 5 Select parameter **Generate code only**.
- 6 Click **Apply**.
- 7 Generate code.

The code generator writes the ASAP2 file to the build folder. By default, the file is named `model.a2l`, where `model` is the name of the model. The ASAP2 setup file controls the ASAP2 file name. For details, see “Customize Generated ASAP2 File” on page 92-2.

### Generate ASAP2 Files for Referenced Models

The build process can generate an ASAP2 file for each referenced model in a model reference hierarchy. In the generated ASAP2 file, MEASUREMENT records represent signals and states inside the referenced model.

To generate ASAP2 files for referenced models, select ASAP2 file generation for the top model and for each referenced model in the reference hierarchy. If you are using the Generic Real-Time Target or an Embedded Coder target, follow the procedure described in “Use GRT- or ERT- Based System Target File” on page 63-6 for the top model and each referenced model.

### Merge ASAP2 Files for Top and Referenced Models

Use function `rtw.asap2MergeMdlRefs` to merge the ASAP2 files generated for top and referenced models. The function has this syntax:

```
[status,info] = rtw.asap2MergeMdlRefs(topModelName,asap2FileName)
```

- `topModelName` is the name of the model containing one or more referenced models.
- `asap2FileName` is the name that you specify for the merged ASAP2 file.
- *Optional:* `status` returns false (logical 0) if the merge completed and returns true (logical 1) otherwise.
- *Optional:* `info` returns additional information about merge failure if `status` is true. Otherwise, it returns an empty character vector.

Consider the following example.

```
[status,info] = rtw.asap2MergeMdlRefs('myTopMdl','merged.a2l')
```

This command merges the ASAP2 files generated for the top model `myTopMdl` and its referenced models in the file `merged.a2l`.

## Structure of ASAP2 File

This table outlines the basic structure of the ASAP2 file and describes the Target Language Compiler (TLC) functions and files used to create each part of the file:

- Static parts of the ASAP2 file are shown in **bold**.
- Function calls are indicated by `%<FunctionName()>`.

File Section	Contents of asap2main.tlc	TLC File Containing Function Definition

## Calibrate Generated Code and Monitor Signals

When you create an external mode target application that uses an ASAM MCD-1 XCP communication channel, you can also generate an ASAP2 file that provides a description of the Simulink Coder Universal Measurement and Calibration Protocol (XCP) server configuration. The description enables third-party calibration tools, such as ETAS® INCA and Vector CANape®, to connect to the external mode target application. You can use the third-party tools to calibrate generated code and monitor signals in environments supported by the third-party tools, for example, a vehicle, a test bench, or a virtual environment on a PC.

Configure your model to generate an ASAP2 file that provides a description of the XCP server configuration:

- 1 On the **Apps** tab, click **Run on Custom Hardware**, which displays the **Hardware** tab.
- 2 In the **Hardware** section, in the **System Target File Description** field, select **Embedded Coder (ert.tlc)**.
- 3 In the **Prepare** section, click **Hardware Settings**, which opens the Configuration Parameters dialog box.
- 4 Clear **Generate code only**.
- 5 Specify **Toolchain settings** for your development computer.
- 6 Select **External mode**.
- 7 Set **Transport layer** to **XCP on TCP/IP** or **XCP on Serial**.
- 8 For **Mex-file arguments**, specify the required arguments. For example:
  - For **XCP on TCP/IP**, specify the IP address of the target processor and the port number of the TCP/IP server.
  - For **XCP on Serial**, specify the serial port ID and the baud value.
- 9 Click **OK**.

To generate the target application and the ASAP2 file:

- 1 On the **Hardware** tab, in the **Run on Hardware** section, click **Monitor & Tune**.
- 2 Under **Step By Step Commands**, click **Build for Monitoring**.
- 3 Use **Generate Calibration Files** tool to generate the ASAP2 file. Or generate the file by using this command:

```
coder.asap2.export('modelName', 'MapFile', 'symbolFileName');
```

- 4 In the code generation folder, the build process generates the XCP external mode target application *modelName.exe* and the **Generate Calibration Files** tool generates ASAP2 file *modelName.a2l*. The ASAP2 file contains an IF\_DATA XCP block that describes the Simulink Coder XCP server configuration.

```
...
/begin IF_DATA XCP
 /begin PROTOCOL_LAYER
 ...
 /end PROTOCOL_LAYER
 ...
 /begin XCP_ON_TCP_IP
 ...
```

```
 /end XCP_ON_TCP_IP
 /end IF_DATA
 ...
```

Import the ASAP2 file into your third-party tool and manually run the external mode application on your target hardware. Through XCP, connect the third-party tool to the target application. Then, using that tool, perform data acquisition and calibration of the generated code.

### **See Also**

`coder.asap2.export`

# Generate ASAP2 and CDF Calibration Files

---

## Generate ASAP2 and CDF Calibration Files

Generate and customize an ASAP2 file and a CDF (Calibration Data Format) file for a model by using the **Generate Calibration Files** tool. By default, the tool generates the latest supported version of the A2L file according to ASAM MCD-2 MC standards. You can choose to generate a different version. You can customize the options for calibration files, such as the version for the A2L file and the schema type, for the CDF file. For more information on the ASAM MCD-2 MC (ASAP2) standard and the ASAM CDF Standards, see the ASAM website at [www.asam.net](http://www.asam.net).

### Open Generate Calibration Files Tool

- 1 Open the model.
- 2 Open the Embedded Coder app.
- 3 Generate code for the model.
- 4 On the **C Code** tab, select **Share > Generate Calibration Files**.

---

**Note** For AUTOSAR models, select **Autosar > Share > Generate Calibration Files**.

---

Using the tool, you can generate A2L and cdfx files at the same time for a model. You can use the tool for models configured with an ERT-based, GRT-based, Simulink Real-Time, Classic AUTOSAR, or Adaptive AUTOSAR system target file. The tool remembers the last used settings, such as the version of the ASAP2 file, include or exclude comments, turn off or on the ASAP2 file and CDF file generation. Simulink saves these settings in the MATLAB preferences. The settings will override the default settings.

For Adaptive AUTOSAR and Simulink Real-Time system target files, you can generate the ASAP2 file for the C++ language. For GRT- and ERT- based system target files, you can generate an ASAP2 file only for C.

For classic AUTOSAR models, the tool allows you to include or exclude RTE elements into the ASAP2 file by using the `Include AUTOSAR RTE elements` option.

Generate Calibration Files (Classic\_Autosar)

Generate a2l and cdfx files according to "ASAM MCD-2 MC (ASAP2/A2L)" and "ASAM AE CDF" standards, respectively.

## ASAP2 File Generation

ASAP2 defines the description format of the internal ECU variables used tuning parameters and measuring signal data as an application executes. To generate an ASAP2 file:

- 1 By default the **Generate ASAP2** option is enabled. If it is not enabled, slide the **Generate ASAP2** slider to the on position to enable A2L generation.
- 2 To change the name of the A2L file, in the **File name** field, specify the name.
- 3 By default, the code generator uses the build folder for the folder path of the selected model. If you want to specify a different folder path for the A2L file, you can do that in the **Folder path** field.
- 4 To replace ECU addresses in the A2L file, in the **Symbol file** field, provide a symbol file associated with the application executable. Otherwise, clear the **Address replacement** field.

The tool supports an ELF, PDB, DWARF, or executable file as a symbol file to replace the ECU addresses.

- 5 Set **Version** to the required version of the A2L file to be generated. The default version is 1.71.
- 6 To exclude comments in the A2L file, clear **Include comments**.
- 7 For Classic AUTOSAR models, to exclude RTE elements in the A2L file, clear **Include AUTOSAR RTE elements**.
- 8 Click **Generate**.

To generate the A2L file programmatically, use the `coder.asap2.export` function.

## CDF File Generation

ASAM CDF defines the data description format for storing the ECU parameter values and the associated meta data. The ASAM CDF files use XML, which can be easily validated, edited, imported, and exported by calibration tools and XML editors. To generate a CDF file by using the tool:

- 1 Slide the **Generate CDF** slider to the on position.
- 2 To change the name of the CDF file, specify it in the **File name** field.
- 3 By default, the code generator selects the build folder for the folder path of the selected model. If you want to specify a different folder path for the CDF file, in the **Folder path** field, specify the path.
- 4 Use the **Schema type** field to set to **XSD** (XML Schema Definition) or **DTD** (Document Type Definition). The **DTD** schema type is the default.

To generate the CDF file programmatically, use `coder.cdf.export` function.

---

**Note** CDF file generation is disabled for Simulink Real-Time system target file.

---

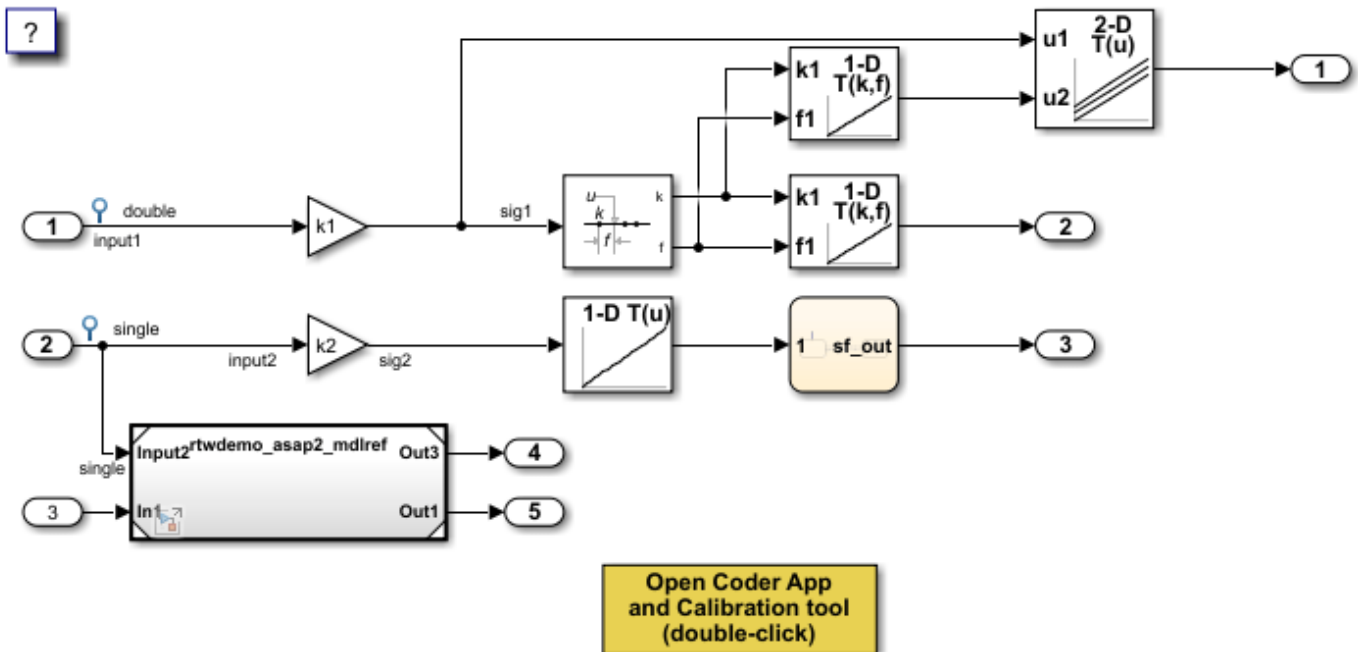

## Create a Host-Based ASAM-ASAP2 Data Definition File for Data Measurement and Calibration

This model shows ASAP2 data export. ASAP2 is a data definition standard proposed by the Association for Standardization of Automation and Measuring Systems (ASAM).

### Open Example Model

“Customize Computation Method Names” on page 65-2  
 “Export Characteristics and Measurement Objects in Groups” on page 65-3  
 “Generate Record Layouts” on page 65-4  
 “Exclude Structures and 64-Bit Integers” on page 65-4  
 “Generate ASAP2 Containing Default Event List” on page 65-5  
 “Specify ECU Address Extension” on page 65-6

You can customize the fields of an ASAP2 file by using the code generator in any of these ways:

### Customize Computation Method Names

In generated ASAP2 files, computation methods translate the electronic control unit (ECU) internal representation of measurement and calibration quantities into a physical model-oriented representation. Using Simulink Coder software, you can customize the names of computation methods. You can provide names that are more intuitive, enhancing ASAP2 file readability, or names that meet organizational requirements.

To customize computation method names, use the MATLAB function `getCompuMethodName`, which is defined in `matlabroot/toolbox/rtw/targets/asap2/asap2/user/getCompuMethodName.m`.

The `getCompuMethodName` function constructs a computation method name. The function prototype is:

```
cmName = getCompuMethodName(dataTypeName, cmUnits)
```

where

- *dataTypeName* is the name of the data type associated with the computation method.
- *cmUnits* are the units as specified in the Unit property of a Simulink.Parameter or Simulink.Signal object (for example, rpm or m/s).
- *cmName* returns the constructed computation method name.

The default constructed name returned by the function has the format:

```
<localPrefix><datatype>_<cmUnits>
```

where

- `<local_Prefix>` is a local prefix, `CM_`, defined in `matlabroot/toolbox/rtw/targets/asap2/asap2/user/getCompuMethodName.m`.
- `<datatype>` and `<cmUnits>` are the arguments that you specified to the `getCompuMethodName` function.

Special characters in *cmUnits* are not supported in the computation method name in ASAP2 file. The special characters are converted as shown in this table.

Special Character	Conversion
%	_percent_
-	_dash_
/	_per_
*	_into_
°	_deg_

For example, if you call the `getCompuMethodName` function by using the *dataTypeName* argument 'int16' and the *cmUnits* argument 'm/s', and then generate an ASAP2 file for a model named `myModel`, the computation method name appears in the generated file:

```
/begin COMPU_METHOD
 /* Name of CompuMethod */ myModel_CM_int16_m_per_s
 /* Units */ "m/s"
 ...
/end COMPU_METHOD
```

## Export Characteristics and Measurement Objects in Groups

Starting in R2021b, you can group the characteristic and measurement objects in the ASAP2 file based on their properties. By default, the generated ASAP2 file contains GROUPS and SUB\_GROUPS based on the subsystems present in the model.

- 1 Open the `sldemo_fuelsys` model.
- 2 Build the model.
- 3 Generate the ASAP2 file by using the Generate Calibration Files tool or by using this command:

```
coder.asap2.export("sldemo_fuelsys")
```

The data elements are grouped based on the model architecture. The top model is referred to as GROUP and subsystems in the model are referred to as SUB\_GROUPS. The generated file contains these lines:

```
/begin GROUP
 /* Name */ sldemo_fuelsys
 /* Long identifier */ "sldemo_fuelsys"
 /* Root */ ROOT
 /begin SUB_GROUP
 rtB.es_o
 sldemo_fuelsys_Dashboard
 sldemo_fuelsys_Engine_Gas_Dynamics
 sldemo_fuelsys_Throttle_Command
 sldemo_fuelsys_To_Controller
 sldemo_fuelsys_To_Plant
 sldemo_fuelsys_fuel_rate_control
 /end SUB_GROUP
/end GROUP
```

- 4 To group the scalar objects into a group named GROUP\_TYPE\_SCALAR in the ASAP2 file, use this command:

```
coder.asap2.export("sldemo_fuelsys",CustomizeGroupsBy={'SCALAR'})
```

You can also group the objects of type array, and lookup tables into MAP, CURVE, CUBOID, CUBE\_4, and CUBE\_5 based on dimensions of the table.

## Generate Record Layouts

- 1 Open the sldemo\_fuelsys model.

```
open_system("sldemo_fuelsys")
```

- 2 Build the model.

- 3 Generate the ASAP2 file by using this command:

```
coder.asap2.export("sldemo_fuelsys",IncludeAllRecordLayouts=true)
```

- 4 The RecordLayouts.a2l file is generated according to the version of the ASAP2 file. In the ASAP2 file, verify this line:

```
/include "RecordLayouts.a2l"
```

- 5 The generated RecordLayouts.a2l file contains the record layouts of the data types present in the model.

---

**Note** The RecordLayouts.a2l file is required to be in the same folder as the ASAP2 file.

---

- 6 coder.asap2.export("sldemo\_fuelsys",IncludeAllRecordLayouts=false) does not generate separate record layouts file, but includes the record layouts of the data types of exported data objects in the ASAP2 file.

```
/begin RECORD_LAYOUT Scalar_FLOAT32_IEEE
 FNC_VALUES 1 FLOAT32_IEEE COLUMN_DIR DIRECT
/end RECORD_LAYOUT

/begin RECORD_LAYOUT Scalar_FLOAT64_IEEE
 FNC_VALUES 1 FLOAT64_IEEE COLUMN_DIR DIRECT
/end RECORD_LAYOUT
...
```

---

**Tip** In the ASA2P file, to preserve the shape of a lookup table that is used as a model argument, make sure that the LookUp Table block is in the referenced model. Pass the LookUp table object from the top model as an instance parameter value.

---

## Exclude Structures and 64-Bit Integers

Starting in R2022a, you can exclude the structure elements and 64-bit integers in the generated A2L file. By default, structures and 64-bit integers are included in the A2L file.

- 1 Open the sldemo\_fuelsys model.

```
open_system("sldemo_fuelsys")
```

- 2 Build the model.

- 3 Generate the ASAP2 file by using this command:

```
coder.asap2.export("sldemo_fuelsys", SupportStructureElements=false, ...
Support64bitIntegers=false)
```

The generated ASAP2 file does not have 64-bit integers and structure elements in it.

---

**Note** Starting in R2022a, the pointer variables will not be generated in the ASAP2 file.

---

## Generate ASAP2 Containing Default Event List

Starting in R2022a, for a multirate model, the ASAP2 file contains the IF\_DATA section that has the DEFAULT\_EVENT\_LIST, enabling you to view the respective raster values for the data elements in the calibration tools.

- 1 Open the sldemo\_fuelsys model.

```
open_system("sldemo_fuelsys")
```

- 2 Build the model.

- 3 Generate the ASAP2 file by using Generate Calibration Files tool or by using this command:

```
coder.asap2.export("sldemo_fuelsys")
```

- 4 The model has a single rate of 0.01. The generated file defines measurements as:

```
/begin MEASUREMENT
/* Name */ rtB.es_o.throttle
/* Long identifier */ ""
/* Data type */ FLOAT32_IEEE
/* Conversion method */ sldemo_fuelsys_CM_single
/* Resolution (Not used) */ 0
/* Accuracy (Not used) */ 0
/* Lower limit */ -3.4E+38
/* Upper limit */ 3.4E+38
ECU_ADDRESS 0x0000 /* @ECU_Address@rtB.es_o.throttle@ */
/end MEASUREMENT
```

- 5 Convert the model into multirate model by using this command:

```
blockName = ['sldemo_fuelsys' '/EGO Fault Switch'];
set_param(blockName, 'SampleTime', '0.02');
```

- 6 Build the model.

- 7 Generate the ASAP2 file by using this command:

```
coder.asap2.export("sldemo_fuelsys")
```

- 8 The generated file now defines the measurements as:

```
/begin MEASUREMENT
/* Name */ rtB.es_o.throttle
/* Long identifier */ ""
/* Data type */ FLOAT32_IEEE
/* Conversion method */ sldemo_fuelsys_CM_single
/* Resolution (Not used) */ 0
/* Accuracy (Not used) */ 0
/* Lower limit */ -3.4E+38
/* Upper limit */ 3.4E+38
ECU_ADDRESS 0x0000 /* @ECU_Address@rtB.es_o.throttle@ */
/begin IF_DATA XCP
/begin DAQ_EVENT VARIABLE
/begin DEFAULT_EVENT_LIST
EVENT 0x0001
/end DEFAULT_EVENT_LIST
```

```

 /end DAQ_EVENT
 /end IF_DATA
/end MEASUREMENT

```

- 9 To generate the ASAP2 file without DEFAULT\_EVENT\_LIST, use the command:

```
coder.asap2.export("sldemo_fuelsys", IncludeDefaultEventList=false);
```

## Specify ECU Address Extension

Starting in R2022a, you can specify additional address information in the ASAP2 file by specifying an integer value for the `EcuAddressExtension` property. By default, no additional address information is provided.

- 1 Open the `sldemo_fuelsys` model.

```
open_system("sldemo_fuelsys")
```

- 2 Build the model.

- 3 Generate the ASAP2 file by using this command:

```
coder.asap2.export("sldemo_fuelsys", EcuAddressExtension=4)
```

The `ECU_ADDRESS_EXTENSION` key word for the characteristics, measurements, and axis points are in the ASAP2 file, enabling you to specify additional address information.

```

/begin MEASUREMENT
/* Name */ rtB.MinMax
/* Long identifier */ ""
/* Data type */ FLOAT64_IEEE
/* Conversion method */ sldemo_fuelsys_CM_double
/* Resolution (Not used) */ 0
/* Accuracy (Not used) */ 0
/* Lower limit */ -1.7E+308
/* Upper limit */ 1.7E+308
ECU_ADDRESS 0x0000 /* @ECU_Address@rtB.MinMax@ */
ECU_ADDRESS_EXTENSION 4
/end MEASUREMENT

```

## Create and Add Custom Data Elements

Generate an ASAP2 file by adding custom characteristics, measurements, axis-points, functions, and compu methods. By default, an ASAP2 file contains the data elements present in model that were configured to export.

Using the Simulink Coder you can:

- Create and add custom data elements such as characteristics, measurements, axis-points, functions, and compu methods.
- Remove data elements from the ASAP2 file.
- Filter and filter data elements based on their properties.
- Get or update the properties of data elements.

### Customize an ASAP2 File

This example shows how to add, update, filter, find, and remove ECU descriptions in an ASAP2 file.

#### Open and build the example model

Open the example model `rtwdemo_asap2`

```
open_system("rtwdemo_asap2");
```

Copyright 1994-2021 The MathWorks, Inc.

Build the model.

```
rtwbuild("rtwdemo_asap2");
```

```

Starting serial model reference code generation build.
Successfully updated the model reference code generation target for: rtwdemo_asap2 mdlref
Starting build procedure for: rtwdemo_asap2
Successful completion of build procedure for: rtwdemo_asap2

```

Build Summary

Code generation targets built:

Model	Action	Rebuild Reason
rtwdemo_asap2 mdlref	Code generated and compiled.	rtwdemo_asap2 mdlref.c does not exist.

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_asap2	Code generated and compiled.	Code generation information file does not exist.

2 of 2 models built (0 models already up to date)

Build duration: 0h 0m 30.237s

Create the ECU description object for the model.

```
descObj=coder.asap2.getEcuDescriptions("rtwdemo_asap2");
```

Get the list of available compu methods in the description object using the command:

```
find(descObj,"CompuMethod")
```

```

ans = 1x10 string
 Columns 1 through 3
 "rtwdemo_asap2_CM..." "rtwdemo_asap2_CM..." "rtwdemo_asap2_CM..."
 Columns 4 through 6
 "rtwdemo_asap2_CM..." "rtwdemo_asap2_CM..." "rtwdemo_asap2_CM..."
 Columns 7 through 9
 "rtwdemo_asap2_CM..." "rtwdemo_asap2_CM..." "rtwdemo_asap2_md..."
 Column 10
 "rtwdemo_asap2_md..."

```

Filter the compu methods and get the list of compu methods with units as "rpm".

```
find(descObj,"CompuMethod",Units='rpm')
```

```

ans = 1x3 string
 "rtwdemo_asap2_CM..." "rtwdemo_asap2_CM..." "rtwdemo_asap2_md..."

```

### Create and Add a Custom Compu Method

To add a new compu method to the ASAP2 file, create a custom compu method using the commands:

```

CompuMethod_CM1 = coder.asap2.CompuMethod;
CompuMethod_CM1.Name = 'CompuMethod_1';
CompuMethod_CM1.ConversionType = 'LINEAR';
CompuMethod_CM1.Coefficients = [2 3];
CompuMethod_CM1.LongIdentifier = 'longIdentifierTest';
CompuMethod_CM1.Format = '%2.3';
CompuMethod_CM1.Units = 's';

```

Add the custom compu method to the ECU description object using the command:

```
add(descObj, CompuMethod_CM1);
```

Get the properties of the newly added compu method using the command:

```
get(descObj, "CompuMethod", "CompuMethod_1")
```

```

ans =
 CompuMethod with properties:
 Name: 'CompuMethod_1'
 LongIdentifier: 'longIdentifierTest'
 Format: '%2.3'
 Units: 's'
 Coefficients: [2 3]
 ConversionType: 'LINEAR'
 CompuVTabValues: [1x1 struct]

```

To modify any property of the compu method, use set function. Update the "LongIdentifier" field of the compu method using the command:

```
set(descObj, "CompuMethod", "CompuMethod_1", LongIdentifier="longIdentifierCM1")
```

Generate the ASAP2 file using the updated ECU description object and verify that the ASAP2 file contains the compu method with name "CompuMethod\_1".

```
coder.asap2.export("rtwdemo_asap2", CustomEcuDescriptions=descObj);
```

Following Characteristics or Measurements with unsupported data types are not exported in ASAP2

### Delete a Compu Method

Remove the newly added compu method from the description object using the command:

```
delete(descObj, "CompuMethod", "CompuMethod_1");
```

### Create and Add Custom Characteristic

To add a new characteristic to the ASAP2 file, create a custom characteristic using the commands:

```

Parameter_1 = coder.asap2.Characteristic;
Parameter_1.Name = 'Custom_parameter1';
Parameter_1.LongIdentifier = 'longIdentifierParam';
Parameter_1.UpperLimit = 255;
Parameter_1.LowerLimit = 0;

```

Add the custom characteristic to the ECU description object using the command:

```
add(descObj, Parameter_1);
```

Get the properties of the newly added characteristic using the command:

```
get(descObj, "Characteristic", "Custom_parameter1")
```

```
ans =
 Characteristic with properties:
 Name: 'Custom_parameter1'
 LongIdentifier: 'longIdentifierParam'
 Type: 'VALUE'
 EcuAddress: '0x0000'
 CompuMethodName: 'NO_COMPU_METHOD'
 LowerLimit: 0
 UpperLimit: 255
 EcuAddressComment: ""
 EcuAddressExtension: []
 CalibrationAccess: 'Calibration'
 DisplayIdentifier: ""
 Format: ""
 BitMask: []
 AxisInfo: []
 RecordLayout: ""
 Dimensions: []
 Export: 1
 SymbolLink: [1x1 struct]
```

To modify any property of the characteristic, use set function. Update the "UpperLimit" field of the characteristic using the command:

```
set(descObj, "Characteristic", "Custom_parameter1", UpperLimit=128)
```

Generate the ASAP2 file using the updated ECU description object and verify that the ASAP2 file contains the characteristic with name "Custom\_parameter1".

```
coder.asap2.export("rtwdemo_asap2", CustomEcuDescriptions=descObj);
```

Following Characteristics or Measurements with unsupported data types are not exported in ASAP2

Remove the newly added characteristic from the description object using the command:

```
delete(descObj, "Characteristic", "Custom_parameter1");
```

### Create and Add Custom Measurement

To add a new measurement to the ASAP2 file, create a custom measurement using the commands:

```
Signal_1 = coder.asap2.Measurement;
Signal_1.Name = 'Custom_signal1';
Signal_1.LongIdentifier = 'longIdentifierSignal';
Signal_1.UpperLimit = 255;
Signal_1.LowerLimit = 0;
```

Add the custom measurement to the ECU description object using the command:

```
add(descObj, Signal_1);
```

Get the properties of the newly added measurement using the command:

```

get(descObj, "Measurement", "Custom_signal1")

ans =
 Measurement with properties:
 Name: 'Custom_signal1'
 LongIdentifier: 'longIdentifierSignal'
 DataType: 'UBYTE'
 EcuAddress: '0x0000'
 CompuMethodName: ''
 LowerLimit: 0
 UpperLimit: 255
 Raster: [1x1 struct]
 EcuAddressComment: ''
 EcuAddressExtension: []
 CalibrationAccess: 'NoCalibration'
 DisplayIdentifier: ''
 Format: ''
 BitMask: []
 Dimensions: []
 Export: 1
 SymbolLink: [1x1 struct]

```

To modify any property of the measurement, use set function. Update the "CalibrationAccess" field of the measurement using the command:

```
set(descObj, "Measurement", "Custom_signal1", CalibrationAccess='Calibration')
```

Generate the ASAP2 file using the updated ECU description object and verify that the ASAP2 file contains the measurement with name "Custom\_signal1".

```
coder.asap2.export("rtwdemo_asap2", CustomEcuDescriptions=descObj);
```

Following Characteristics or Measurements with unsupported data types are not exported in ASAP2

Remove the newly added measurement from the description object using the command:

```
delete(descObj, "Measurement", "Custom_signal1");
```

### Create and Add a Lookup Table Parameter

To add a lookup table parameter, create a parameter using the commands:

```

LUT_Parameter = coder.asap2.Characteristic;
LUT_Parameter.Name = "custom_lookup_table";
LUT_Parameter.Type = "MAP";

```

Create and add axis information to the parameter.

```

axis_data = coder.asap2.AxisInfo;
axis_data(1).Name = 'BP3';
axis_data(2).Name = 'Bp4';
axis_data(1).CompuMethodName = 'rtwdemo_asap2_CM_double';
axis_data(2).CompuMethodName = 'rtwdemo_asap2_CM_double';
axis_data(1).MaxAxisPoints = '3';
axis_data(2).MaxAxisPoints = '3';
axis_data(1).AxisType = 'STD_AXIS';

```

```
axis_data(2).AxisType = 'STD_AXIS';
LUT_Parameter.AxisInfo = axis_data;
```

Add the lookup table parameter to the description object.

```
add(descObj,LUT_Parameter)
```

Generate the ASAP2 file using the updated ECU description object and verify that the ASAP2 file contains the lookup table parameter with name "custom\_lookup\_table".

```
coder.asap2.export("rtwdemo_asap2",CustomEcuDescriptions=descObj);
```

Following Characteristics or Measurements with unsupported data types are not exported in ASAP2

## See Also

| [coder.asap2.Measurement](#) | [coder.asap2.CompuMethod](#) | [coder.asap2.Function](#)

## Related Examples

- "Generate ASAP2 and CDF Calibration Files" on page 64-2

## Customize Using Base Files

You can add custom A2L file fragments such as PROJECT, MODULE, MOD, MOD\_PAR, and MOD\_COMMON settings to the ASAP2 file. You can do it in the following ways:

### Customize ASAP2 Fields by Using Base Class

- 1 Create an object from the base class using the `coder.asap2.UserCustomizeBase` function.

```
obj = coder.asap2.UserCustomizeBase;
```

- 2 Define the object fields.

```
obj.HeaderComment = 'Header comment';
obj.ModParComment = 'Mod Par comment';
obj.ModCommonComment = 'Mod Common comment';
obj.ASAP2FileName = 'File_name';
obj.ByteOrder = 'BYTEORDER MSB_LAST';
```

- 3 Pass the object to the function and generate the ASAP2 file.

```
coder.asap2.export(modelName,CustomizationObject=obj);
```

### Customize ASAP2 Sections by Deriving from Base Class

- 1 Derive from the base class `coder.asap2.UserCustomizeBase`. You can place the derived file anywhere on the MATLAB path.
- 2 To edit the Header section, use the `writeHeader` function.
- 3 Use the `writeHardwareInterface` function to edit the hardware interface section consisting of the MOD\_PAR and MOD\_COMMON fields of the ASAP2 file.
- 4 To add text at the beginning of the ASAP2 file, use the `writeFileHead` function.
- 5 To add text at the end of the ASAP2 file, use the `writeFileTail` function.

For example, the code for generating a derived class `TestASAP2Customization` might look like this code:

```
classdef TestASAP2Customization < coder.asap2.UserCustomizeBase
% Customization class for asap2 file
methods
function header = writeHeader(obj)
header = sprintf([' /begin HEADER ' 'test Header text' '\n',...
'header test comments from user\n',...
' /end HEADER']);
end

function hardwareInterface = writeHardwareInterface(obj)
hardwareInterface = sprintf([' /begin MOD_PAR "' 'UserDefined' '"\n',...
' test comments from user\n',...
' /end MOD_PAR\n\n',...
' /begin MOD_COMMON "' 'UserDefined MOD_COMMON' '"\n',...
' user defined values for MOD_COMMON\n',...
' obj.ByteOrder '\n',...
' /end MOD_COMMON']);
end

function fileTail = writeFileTail(obj)
fileTail = sprintf(['/* This File can be used for ' ,...
'calibration .*/\n'...
'/* EOF ',obj.ASAP2FileName, '*/']);
end
end
```

```

function fileHeader = writeFileHead(obj)
 fileHeader = sprintf(['/*****\n
 ' This is a a2l file which can be used for calibration with INCA or CANAPE\n',...
 ' *****/']);
 end
end
end

```

- 6 Create an object from the derived class. For example, this command creates an object from `TestASAP2Customization`.

```
obj = TestASAP2Customization;
```

- 7 Pass the object to the function that generates the ASAP2 file.

```
coder.asap2.export(modelName,CustomizationObject=obj);
```

## Customize an ASAP2 File

This example shows how to add, update, filter, find, and remove ECU descriptions in an ASAP2 file.

### Open and build the example model

Open the example model `rtwdemo_asap2`

```
open_system("rtwdemo_asap2");
```

Copyright 1994-2021 The MathWorks, Inc.

Build the model.

```
rtwbuild("rtwdemo_asap2");
```

```
Starting serial model reference code generation build.
Successfully updated the model reference code generation target for: rtwdemo_asap2_mdlref
Starting build procedure for: rtwdemo_asap2
Successful completion of build procedure for: rtwdemo_asap2
```

Build Summary

Code generation targets built:

Model	Action	Rebuild Reason
rtwdemo_asap2_mdlref	Code generated and compiled.	rtwdemo_asap2_mdlref.c does not exist.

Top model targets built:

Model	Action	Rebuild Reason
-------	--------	----------------

```
=====
rtwdemo_asap2 Code generated and compiled. Code generation information file does not exist.
```

```
2 of 2 models built (0 models already up to date)
Build duration: 0h 0m 30.237s
```

Create the ECU description object for the model.

```
descObj=coder.asap2.getEcuDescriptions("rtwdemo_asap2");
```

Get the list of available compu methods in the description object using the command:

```
find(descObj,"CompuMethod")

ans = 1x10 string
 Columns 1 through 3
 "rtwdemo_asap2_CM..." "rtwdemo_asap2_CM..." "rtwdemo_asap2_CM..."
 Columns 4 through 6
 "rtwdemo_asap2_CM..." "rtwdemo_asap2_CM..." "rtwdemo_asap2_CM..."
 Columns 7 through 9
 "rtwdemo_asap2_CM..." "rtwdemo_asap2_CM..." "rtwdemo_asap2_md..."
 Column 10
 "rtwdemo_asap2_md..."
```

Filter the compu methods and get the list of compu methods with units as "rpm".

```
find(descObj,"CompuMethod",Units='rpm')

ans = 1x3 string
 "rtwdemo_asap2_CM..." "rtwdemo_asap2_CM..." "rtwdemo_asap2_md..."
```

### Create and Add a Custom Compu Method

To add a new compu method to the ASAP2 file, create a custom compu method using the commands:

```
CompuMethod_CM1 = coder.asap2.CompuMethod;
CompuMethod_CM1.Name = 'CompuMethod_1';
CompuMethod_CM1.ConversionType = 'LINEAR';
CompuMethod_CM1.Coefficients = [2 3];
CompuMethod_CM1.LongIdentifier = 'longIdentifierTest';
CompuMethod_CM1.Format = '%2.3';
CompuMethod_CM1.Units = 's';
```

Add the custom compu method to the ECU description object using the command:

```
add(descObj,CompuMethod_CM1);
```

Get the properties of the newly added compu method using the command:

```
get(descObj,"CompuMethod","CompuMethod_1")
```

```
ans =
 CompuMethod with properties:
 Name: 'CompuMethod_1'
 LongIdentifier: 'longIdentifierTest'
 Format: '%2.3'
 Units: 's'
 Coefficients: [2 3]
 ConversionType: 'LINEAR'
 CompuVTabValues: [1x1 struct]
```

To modify any property of the compu method, use set function. Update the "LongIdentifier" field of the compu method using the command:

```
set(descObj, "CompuMethod", "CompuMethod_1", LongIdentifier="longIdentifierCM1")
```

Generate the ASAP2 file using the updated ECU description object and verify that the ASAP2 file contains the compu method with name "CompuMethod\_1".

```
coder.asap2.export("rtwdemo_asap2", CustomEcuDescriptions=descObj);
```

Following Characteristics or Measurements with unsupported data types are not exported in ASAP2

### Delete a Compu Method

Remove the newly added compu method from the description object using the command:

```
delete(descObj, "CompuMethod", "CompuMethod_1");
```

### Create and Add Custom Characteristic

To add a new characteristic to the ASAP2 file, create a custom characteristic using the commands:

```
Parameter_1 = coder.asap2.Characteristic;
Parameter_1.Name = 'Custom_parameter1';
Parameter_1.LongIdentifier = 'longIdentifierParam';
Parameter_1.UpperLimit = 255;
Parameter_1.LowerLimit = 0;
```

Add the custom characteristic to the ECU description object using the command:

```
add(descObj, Parameter_1);
```

Get the properties of the newly added characteristic using the command:

```
get(descObj, "Characteristic", "Custom_parameter1")
```

```
ans =
 Characteristic with properties:
 Name: 'Custom_parameter1'
 LongIdentifier: 'longIdentifierParam'
 Type: 'VALUE'
 EcuAddress: '0x0000'
 CompuMethodName: 'NO_COMPU_METHOD'
 LowerLimit: 0
 UpperLimit: 255
 EcuAddressComment: ""
```

```

EcuAddressExtension: []
CalibrationAccess: 'Calibration'
DisplayIdentifier: ""
 Format: ""
 BitMask: []
 AxisInfo: []
RecordLayout: ""
 Dimensions: []
 Export: 1
SymbolLink: [1x1 struct]

```

To modify any property of the characteristic, use set function. Update the "UpperLimit" field of the characteristic using the command:

```
set(descObj, "Characteristic", "Custom_parameter1", UpperLimit=128)
```

Generate the ASAP2 file using the updated ECU description object and verify that the ASAP2 file contains the characteristic with name "Custom\_parameter1".

```
coder.asap2.export("rtwdemo_asap2", CustomEcuDescriptions=descObj);
```

Following Characteristics or Measurements with unsupported data types are not exported in ASAP2

Remove the newly added characteristic from the description object using the command:

```
delete(descObj, "Characteristic", "Custom_parameter1");
```

### Create and Add Custom Measurement

To add a new measurement to the ASAP2 file, create a custom measurement using the commands:

```

Signal_1 = coder.asap2.Measurement;
Signal_1.Name = 'Custom_signal1';
Signal_1.LongIdentifier = 'longIdentifierSignal';
Signal_1.UpperLimit = 255;
Signal_1.LowerLimit = 0;

```

Add the custom measurement to the ECU description object using the command:

```
add(descObj, Signal_1);
```

Get the properties of the newly added measurement using the command:

```
get(descObj, "Measurement", "Custom_signal1")
```

```

ans =
 Measurement with properties:

 Name: 'Custom_signal1'
 LongIdentifier: 'longIdentifierSignal'
 DataType: 'UBYTE'
 EcuAddress: '0x0000'
 CompuMethodName: ""
 LowerLimit: 0
 UpperLimit: 255
 Raster: [1x1 struct]
 EcuAddressComment: ""
 EcuAddressExtension: []

```

```

CalibrationAccess: 'NoCalibration'
DisplayIdentifier: ""
 Format: ""
 BitMask: []
 Dimensions: []
 Export: 1
SymbolLink: [1x1 struct]

```

To modify any property of the measurement, use set function. Update the "CalibrationAccess" field of the measurement using the command:

```
set(descObj, "Measurement", "Custom_signal1", CalibrationAccess='Calibration')
```

Generate the ASAP2 file using the updated ECU description object and verify that the ASAP2 file contains the measurement with name "Custom\_signal1".

```
coder.asap2.export("rtwdemo_asap2", CustomEcuDescriptions=descObj);
```

Following Characteristics or Measurements with unsupported data types are not exported in ASAP2

Remove the newly added measurement from the description object using the command:

```
delete(descObj, "Measurement", "Custom_signal1");
```

### Create and Add a Lookup Table Parameter

To add a lookup table parameter, create a parameter using the commands:

```

LUT_Parameter = coder.asap2.Characteristic;
LUT_Parameter.Name = "custom_lookup_table";
LUT_Parameter.Type = "MAP";

```

Create and add axis information to the parameter.

```

axis_data = coder.asap2.AxisInfo;
axis_data(1).Name = 'BP3';
axis_data(2).Name = 'Bp4';
axis_data(1).CompuMethodName = 'rtwdemo_asap2_CM_double';
axis_data(2).CompuMethodName = 'rtwdemo_asap2_CM_double';
axis_data(1).MaxAxisPoints = '3';
axis_data(2).MaxAxisPoints = '3';
axis_data(1).AxisType = 'STD_AXIS';
axis_data(2).AxisType = 'STD_AXIS';
LUT_Parameter.AxisInfo = axis_data;

```

Add the lookup table parameter to the description object.

```
add(descObj, LUT_Parameter)
```

Generate the ASAP2 file using the updated ECU description object and verify that the ASAP2 file contains the lookup table parameter with name "custom\_lookup\_table".

```
coder.asap2.export("rtwdemo_asap2", CustomEcuDescriptions=descObj);
```

Following Characteristics or Measurements with unsupported data types are not exported in ASAP2

# Configure Model Data Elements for ASAP2 File Generation

---

## Configure Model Data Elements for ASAP2 File Generation

When you generate an ASAP2 file from a model, the ASAP2 file includes information about the data elements in your model such as characteristics and measurement variables. Each data element is described by information such as the memory address, storage structure, data types and conversion rules. In Simulink you can now customize how the data elements are described in an ASAP2 file. You can choose only those characteristics and measurements that you are interested in exporting into ASAP2 file.

To configure data elements for ASAP2 file generation in the **Code Mappings Editor - C** display, use the tabs:

- Inports
- Outports
- Parameters
- Data Stores
- Signals/States

### View Calibration Attributes

- 1 Open a model with multiple data elements.  
`open_system('rtwdemo_configrpinterface')`
- 2 Open the Embedded Coder app. On the **C Code** tab, select **Code Interface + Individual Element Code Mappings**.
- 3 On the **C Code** tab, select **Settings + Calibration and Measurement properties**.

## Configure Inport for ASAP2 File Generation

- 1 On the **Inports** tab, select an inport and click the  icon.
- 2 Specify the measurement property fields for the inport.

Copyright 1994-2020 The MathWorks

Source	Storage Class
In1	ImportedExtern
In2	Model default: ImportedExternPointer
In3	Model default: ImportedExternPointer

3 Alternatively, at the command line, you can enter these commands:

```
setInport(cm, 'In1', 'CalibrationAccess', 'Calibration');
setInport(cm, 'In1', 'CompuMethod', 'CM_Inport');
setInport(cm, 'In1', 'DisplayIdentifier', 'inport_display_name');
setInport(cm, 'In1', 'Format', '%4.2');
```

4 Build the model.

5 Generate the ASAP2 file by using this command:

```
coder.asap2.export('rtwdemo_configrinterface');
```

- 6 Verify the exported inport in the ASAP2 file and verify the fields that you specified are present.

```

/begin MEASUREMENT
/* Name */ input1
/* Long identifier */ ""
/* Data type */ FLOAT64_IEEE
/* Conversion method */ CM_Inport
/* Resolution (Not used) */ 0
/* Accuracy (Not used) */ 0
/* Lower limit */ -20
/* Upper limit */ 20
ECU_ADDRESS 0x0000 /* @ECU_Address@input1@ */
DISPLAY_IDENTIFIER inport_display_name
FORMAT "%4.2"
READ_WRITE
/end MEASUREMENT

```

You can configure an outport in the same way. By default, all the inports and outports are exported to A2L file. To avoid exporting an inport or an outport to A2L file, set the `Export` property to false using the command:

```
setInport(cm, 'In1', 'Export', false);
```

## Configure Parameter for ASAP2 File Generation

- 1 On the **Parameters** tab, select a parameter and click the  icon.
- 2 Specify the calibration property fields for the parameter.

Copyright 1994-2020 The MathWorks, Inc.

Source	Storage Class
External Parameter Objects...	
Model Parameter Arguments (2)	
LOWER	Auto

3 Alternatively, at the command line, you can enter these commands:

```
setModelParameter(cm, 'LOWER', 'CalibrationAccess', 'NoCalibration');
setModelParameter(cm, 'LOWER', 'CompuMethod', 'CM_param');
setModelParameter(cm, 'LOWER', 'DisplayIdentifier', 'param_lower');
setModelParameter(cm, 'LOWER', 'Format', '%4.2');
```

4 Build the model.

5 Generate the ASAP2 file by using this command:

```
coder.asap2.export('rtwdemo_configrinterface');
```

- 6 Verify the exported parameter in the ASAP2 file and verify the fields that you specified are present.

```

/begin CHARACTERISTIC
/* Name */ rtwdemo_configrpinterface_InstP.LOWER
/* Long Identifier */ ""
/* Type */ VALUE
/* ECU Address */ 0x0000 /* @ECU_Address@rtwdemo_configrpinterface_InstP.LOWER@ */
/* Record Layout */ Scalar_FLOAT64_IEEE
/* Maximum Difference */ 0
/* Conversion Method */ CM_param
/* Lower Limit */ -20.000000
/* Upper Limit */ 0.000000
CALIBRATION_ACCESS NO_CALIBRATION
DISPLAY_IDENTIFIER param_lower
FORMAT "%4.2"
/end CHARACTERISTIC

```

You can configure data stores, states in the same way. By default, signals, states, and data stores are exported to A2L file. To avoid exporting a data element to A2L file, set the Export property to false using the command:

```
setModelParameter(cm, 'LOWER', 'Export', false);
```

---

**Note** To export signals, states, data stores, and parameters to the A2L file, configure the data element to a non-auto storage class.

# Direct Memory Access to Generated Code for Simulink Coder

---

## Access Memory in Generated Code Using Global Data Map

Simulink Coder provides a Target Language Compiler (TLC) function library that lets you create a global data map record. The global data map record, when generated, is added to the `CompiledModel` structure in the `model.rtw` file. The global data map record is a database containing information required for accessing memory in the generated code, including

- Signals (Block I/O)
- Parameters
- Data type work vectors (DWork)
- External inputs
- External outputs

Use of the global data map requires knowledge of the Target Language Compiler and of the structure of the `model.rtw` file. See “Target Language Compiler Overview” for information on these topics.

The TLC functions that are required to generate and access the global data map record are contained in `matlabroot/rtw/c/tlc/mw/globalmaplib.tlc`. The comments in the source code fully document the global data map structures and the library functions.

The global data map structures and functions might be modified or enhanced in future releases.

## Accelerate, Refine, and Test Hybrid Dynamic System on Host Computer by Using RSim System Target File

After you create a model, you can use the rapid simulation (RSim) system target file to characterize model behavior. The executable program that results from the build process is for non-real-time execution on your development computer. The executable program is highly optimized for simulating models of hybrid dynamic systems, including models that use variable-step solvers and zero-crossing detection. The speed of the generated code makes the RSim system target file ideal for building programs for batch or Monte Carlo simulations.

### About Rapid Simulation

Use the RSim target to generate an executable that runs fast, standalone simulations. You can repeat simulations with varying data sets, interactively or programmatically with scripts, without rebuilding the model. This can accelerate the characterization and tuning of model behavior and code generation testing.

Using command-line options:

- Define parameter values and input signals in one or more MAT-files that you can load and reload at the start of simulations without rebuilding your model.
- Redirect logging data to one or more MAT-files that you can then analyze and compare.
- Control simulation time.
- Specify external mode options.

---

**Note** To run an RSim executable, configure your computer to run MATLAB and have the MATLAB and Simulink installation folders accessible. To deploy a standalone host executable ( i.e., without MATLAB and Simulink installed), consider using the Host-Based Shared Library target (ert\_shrplib)."

---

### Rapid Simulation Advantage

The advantage that you gain from rapid simulation varies. Larger simulations achieve speed improvements of up to 10 times faster than standard Simulink simulations. Some models might not show noticeable improvement in simulation speed. To determine the speed difference for your model, time your standard Simulink simulation and compare the results with a rapid simulation. In addition, test the model simulation in Rapid Accelerator simulation mode.

### General Rapid Simulation Workflow

Like other stages of Model-Based Design, characterization and tuning of model behavior is an iterative process, as shown in the general workflow diagram in the figure. Tasks in the workflow are:

- 1 Identify your rapid simulation requirements. on page 68-3
- 2 Configure Inport blocks on page 68-4 that provide input source data for rapid simulations.
- 3 Configure the model on page 68-4 for rapid simulation.
- 4 Set up simulation input data. on page 68-6

## 5 Run the rapid simulations. on page 68-13

## Identify Rapid Simulation Requirements

The first step to setting up a rapid simulation is to identify your simulation requirements.

Question...	For More Information, See...
How long do you want simulations to run?	"Configure and Build Model for Rapid Simulation" on page 68-4
Are there solver requirements? Do you expect to use the same solver for which the model is configured for your rapid simulations?	"Configure and Build Model for Rapid Simulation" on page 68-4
Do your rapid simulations need to accommodate flexible custom code interfacing? Or, do your simulations need to retain storage class settings?	"Configure and Build Model for Rapid Simulation" on page 68-4
Will you be running simulations with multiple data sets?	"Set Up Rapid Simulation Input Data" on page 68-6
Will the input data consist of global parameters, signals, or both?	"Set Up Rapid Simulation Input Data" on page 68-6
What type of source blocks provide input data to the model — From File, Inport, From Workspace?	"Set Up Rapid Simulation Input Data" on page 68-6

Question...	For More Information, See...
Will the model's parameter vector ( <i>model_P</i> ) be used as input data?	"Create a MAT-File That Includes a Model Parameter Structure" on page 68-6
What is the data type of the input parameters and signals?	"Set Up Rapid Simulation Input Data" on page 68-6
Will the source data consist of one variable or multiple variables?	"Set Up Rapid Simulation Input Data" on page 68-6
Does the input data include tunable parameters?	"Create a MAT-File That Includes a Model Parameter Structure" on page 68-6
Do you need to gain access to tunable parameter information — model checksum and parameter data types, identifiers, and complexity?	"Create a MAT-File That Includes a Model Parameter Structure" on page 68-6
Will you have a need to vary the simulation stop time for simulation runs?	"Configure and Build Model for Rapid Simulation" on page 68-4 and "Override a Model Simulation Stop Time" on page 68-15
Do you want to set a time limit for the simulation? Consider setting a time limit if your model experiences frequent zero crossings and has a small minor step size.	"Set a Clock Time Limit for a Rapid Simulation" on page 68-15
Do you need to preserve the output of each simulation run?	"Specify a New Output File Name for a Simulation" on page 68-21 and "Specify New Output File Names for To File Blocks" on page 68-21
Do you expect to run the simulations interactively or in batch mode?	"Scripts for Batch and Monte Carlo Simulations" on page 68-13

## Configure Inports to Provide Simulation Source Data

You can use Inport blocks as a source of input data for rapid simulations. To do so, configure the blocks so that they can import data from external MAT-files. By default, the Inport block inherits parameter settings from downstream blocks. In most cases, to import data from an external MAT-file, you must explicitly set these block parameters to match the source data in the MAT-file.

- **Main > Interpolate data**
- **Signal Attributes > Port dimensions**
- **Signal Attributes > Data type**
- **Signal Attributes > Signal type**

If you do not have control over the model content, you might need to modify the data in the MAT-file to conform to what the model expects for input. Input data characteristics and specifications of the Inport block that receives the data must match.

For details on adjusting these parameters and on creating a MAT-file for use with an Inport block, see "Create a MAT-File for an Inport Block" on page 68-10. For descriptions of the preceding block parameters, see the block description of Inport.

## Configure and Build Model for Rapid Simulation

After you identify your rapid simulation requirements, configure the model for rapid simulation.

- 1 Set model configuration parameter **System target file** to `rsim.tlc` (Rapid Simulation Target).
- 2 Click **RSim Target** to view the **RSim Target** pane.

The screenshot shows the RSim Target configuration pane with the following settings:

- Parameter loading:**  Enable RSim executable to load parameters from a MAT-file
- Solver:** Solver selection: auto
- Storage classes:**  Force storage classes to AUTO

- 3 Set the RSim target configuration parameters for your rapid simulation requirements.

If You Want to...	Then...
Generate code that allows the RSim executable to load parameters from a MAT-file	Select <b>Enable RSim executable to load parameters from a MAT-file</b> (default).
Let the target choose a solver based on the solver already configured for the model	Set <b>Solver selection</b> to <code>auto</code> (default). The code generator uses a built-in solver if a fixed-step solver is specified on the <b>Solver</b> pane or calls the Simulink solver module (a shared library) if a variable-step solver is specified.
Explicitly instruct the target to use a fixed-step solver	Set <b>Solver selection</b> to <code>Use fixed-step solvers</code> . In the Configuration Parameters dialog box, on the <b>Solver</b> pane, specify a fixed-step solver.
Explicitly instruct the target to use a variable-step solver	Set <b>Solver selection</b> to <code>Use Simulink solver module</code> . In the Configuration Parameters dialog box, on the <b>Solver</b> pane, specify a variable-step solver.
Force storage classes to Auto for flexible custom code interfacing	Select <b>Force storage classes to AUTO</b> (default).
Retain storage class settings, such as <code>ExportedGlobal</code> or <code>ImportedExtern</code> , due to application requirements	Clear <b>Force storage classes to AUTO</b> .

- 4 Set up data import and export options. On the **Data Import/Export** pane, in the **Save to Workspace** section, select the **Time**, **States**, **Outputs**, and **Final States** parameters, as they apply. By default, the code generator saves simulation logging results to a file named `model.mat`. For more information, see “Export Simulation Data”.
- 5 If you are using external mode communication, set up the interface, using the **Code Generation > Interface** pane. See “External Mode Simulations for Parameter Tuning, Signal Monitoring, and Code Execution Profiling” for details.
- 6 Press **Ctrl+B**. The code generator builds a highly optimized executable program that you can run on your development computer with varying data, without rebuilding.

For more information on compilers that are compatible with the Simulink Coder product, see “Select and Configure C or C++ Compiler” on page 59-3 and “Template Makefiles and Make Options” on page 59-28 .

## Set Up Rapid Simulation Input Data

- “About Rapid Simulation Data Setup” on page 68-6
- “Create a MAT-File That Includes a Model Parameter Structure” on page 68-6
- “Create a MAT-File for a From File Block” on page 68-9
- “Create a MAT-File for an Inport Block” on page 68-10

### About Rapid Simulation Data Setup

The format and setup of input data for a rapid simulation depends on your requirements.

If the Input Data Source Is...	Then...
The model's global parameter vector ( <i>model_P</i> )	Use the <code>rsimgetrtp</code> function to get the vector content and then save it to a MAT-file.
The model's global parameter vector and you want a mapping between the vector and tunable parameters	Call the <code>rsimgetrtp</code> function to get the global parameter structure and then save it to a MAT-file.
Provided by a From File block	Create a MAT-file that a From File block can read.
Provided by an Inport block	Create a MAT-file that adheres to one of the three data file formats that the Inport block can read.
Provided by a From Workspace block	Create structure variables in the MATLAB workspace.

The RSim target requires that MAT-files used as input for From File and Inport blocks contain data. The grt target inserts MAT-file data directly into the generated code, which is then compiled and linked as an executable. In contrast, RSim allows you to replace data sets for each successive simulation. A MAT-file containing From File or Inport block data must be present if a From File block or Inport block exists in your model.

### Create a MAT-File That Includes a Model Parameter Structure

To create a MAT-file that includes a model global parameter structure (*model\_P*),

- 1 Get the structure by calling the function `rsimgetrtp`.
- 2 Save the parameter structure to a MAT-file.

If you want to run simulations over varying data sets, consider converting the parameter structure to a cell array and saving the parameter variations to a single MAT-file.

#### Get the Parameter Structure for a Model

Get the global parameter structure (*model\_P*) for a model by calling the function `rsimgetrtp`.

```
param_struct = rsimgetrtp('model')
```

Argument	Description
<code>model</code>	The model for which you are running the rapid simulations.

The `rsimgetrtp` function forces an update diagram action for the specified model and returns a structure that contains the following fields.

Field	Description
<code>modelChecksum</code>	A four-element vector that encodes the structure of the model. The code generator uses the checksum to check whether the structure of the model has changed since the RSim executable was generated. If you delete or add a block, and then generate a new <code>model_P</code> vector, the new checksum does not match the original checksum anymore. The RSim executable detects this incompatibility in parameter vectors and exits to avoid returning incorrect simulation results. If the model structure changes, you must regenerate the code for the model.
<code>parameters</code>	A structure that contains the model's global parameters.

The parameter structure contains the following information.

Field	Description
<code>dataTypeName</code>	The name of the parameter data type, for example, <code>double</code>
<code>dataTypeID</code>	Internal data type identifier used by the code generator
<code>complex</code>	The value 0 if real; 1 if complex
<code>dtTransIdx</code>	Internal data index used by the code generator
<code>values</code>	A vector of the parameter values associated with this structure
<code>map</code>	This field contains the mapping information that correlates the 'values' to the tunable parameters of the model. This mapping information, in conjunction with <code>rsimsetrtpparam</code> , is useful for creating subsequent <code>rtp</code> structures without compiling the block diagram.

The code generator reports a tunable fixed-point parameter according to its stored value. For example, an `sfix(16)` parameter value of 1.4 with a scaling of  $2^{-8}$  has a value of 358 as an `int16`.

In the following example, `rsimgetrtp` returns the parameter structure for the example model `rtwdemo_rsimtf` to `param_struct`.

```
param_struct = rsimgetrtp('rtwdemo_rsimtf')
param_struct =
 modelChecksum: [1.7165e+009 3.0726e+009 2.6061e+009 2.3064e+009]
 parameters: [1x1 struct]
```

### Save the Parameter Structure to a MAT-File

After you issue a call to `rsimgetrtp`, save the return value of the function call to a MAT-file. Using a command-line option, you can then specify that MAT-file as input for rapid simulations.

The following example saves the parameter structure returned for `rtwdemo_rsimtf` to the MAT-file `myrsimdemo.mat`.

```
save myrsimdemo.mat param_struct;
```

For information on using command-line options to specify required files, see “Run Rapid Simulations” on page 68-13.

### Convert the Parameter Structure for Running Simulations on Varying Data Sets

To use rapid simulations to test changes to specific parameters, you can convert the model parameter structure to a cell array. You can then access a specific parameter set by using the @ operator to specify the index for a specific parameter set in the file.

To convert the structure to a cell array:

- 1 Use the function `rsimgetrtp` to get a structure containing parameter information for the example model `rtwdemo_rsimtf`. Store the structure in a variable `param_struct`.

```
param_struct = rsimgetrtp('rtwdemo_rsimtf');
```

The `parameters` field of the structure is a substructure that contains parameter information. The `values` field of the `parameters` substructure contains the numeric values of the parameters that you can tune during execution of the simulation code.

- 2 Use the function `rsimsetrtpparam` to expand the structure so that it contains more parameter sets. In this case, create two more parameter sets (for a total of three sets).

```
param_struct = rsimsetrtpparam(param_struct,3);
```

The function converts the `parameters` field to a cell array with three elements. Each element contains information for a single parameter set. By default, the function creates the second and third elements of the cell array by copying the first element. Therefore, all of the parameter sets use the same parameter values.

- 3 Specify new values for the parameters in the second and third parameter sets.

```
param_struct.parameters{2}.values = [-150 -5000 0 4950];
param_struct.parameters{3}.values = [-170 -5500 0 5100];
```

- 4 Save the structure containing the parameter set information to a MAT-file.

```
save rtwdemo_rsimtf.mat param_struct;
```

Alternatively, you can modify the block parameters in the model, and use `rsimgetrtp` to create multiple parameter sets:

- 1 Use the function `rsimgetrtp` to get a structure containing parameter information for the example model `rtwdemo_rsimtf`. Store the structure in a variable `param_struct`.

```
param_struct = rsimgetrtp('rtwdemo_rsimtf');
```

- 2 Use the function `rsimsetrtpparam` to expand the structure so that it contains more parameter sets. In this case, create two more parameter sets (for a total of three sets).

```
param_struct = rsimsetrtpparam(param_struct,3);
```

The function converts the `parameters` field to a cell array with three elements. Each element contains information for a single parameter set. By default, the function creates the second and third elements of the cell array by copying the first element. Therefore, all of the parameter sets use the same parameter values.

- 3 Change the values of block parameters or workspace variables. For example, change the value of the variable `w` from 70 to 72.

```
w = 72;
```

- 4 Use `rimsgetrtp` to get another structure containing parameter information. Store the structure in a temporary variable `rtp_temp`.

```
rtp_temp = rsimgetrtp('rtwdemo_rsimtf');
```

- 5 Assign the value of the `parameters` field of `rtp_temp` to the structure `param_struct` as a second parameter set.

```
param_struct.parameters{2} = rtp_temp.parameters;
```

- 6 Change the value of the variable `w` from 72 to 75.

```
w = 75;
```

- 7 Use `rimsgetrtp` to get another structure containing parameter information. Then, assign the value of the `parameters` field to `param_struct` as a third parameter set.

```
rtp_temp = rsimgetrtp('rtwdemo_rsimtf');
param_struct.parameters{3} = rtp_temp.parameters;
```

- 8 Save the structure containing the parameter set information to a MAT-file.

```
save rtwdemo_rsimtf.mat param_struct;
```

For more information on how to specify each parameter set when you run the simulations, see “Change Block Parameters for an RSim Simulation” on page 68-20.

### Create a MAT-File for a From File Block

You can use a MAT-file as the input data source for a From File block. The format of the data in the MAT-file must match the data format expected by that block. For example, if you are using a matrix as an input for the MAT file, this cannot be different from the matrix size for the executable.

To create a MAT-file for a From File block:

- 1 For array format data, in the workspace create a matrix that consists of two or more rows. The first row must contain monotonically increasing time points. Other rows contain data points that correspond to the time point in that column. The time and data points must be data of type `double`.

For example:

```
t=[0:0.1:2*pi]';
Ina1=[2*sin(t) 2*cos(t)];
Ina2=sin(2*t);
Ina3=[0.5*sin(3*t) 0.5*cos(3*t)];
var_matrix=[t Ina1 Ina2 Ina3]';
```

For other supported data types, such as `int16` or fixed-point, the time data points must be of type `double`, just as for array format data. However, the sample data can be of any dimension.

For more information on setting up the input data, see the block description of From File.

- 2 Save the matrix to a MAT-file.

The following example saves the matrix `var_matrix` to the MAT-file `myrsimdemo.mat` in Version 7.3 format.

```
save '-v7.3' myrsimdemo.mat var_matrix;
```

Using a command-line option, you can then specify that MAT-file as input for rapid simulations.

### Create a MAT-File for an Inport Block

You can use a MAT-file as the input data source for an Inport block.

The format of the data in the MAT-file must adhere to one of the three column-based formats listed in the following table. The table lists the formats in order from least flexible to most flexible.

Format	Description
Single time/data matrix	<ul style="list-style-type: none"> <li>Least flexible.</li> <li>One variable.</li> <li>Two or more <i>columns</i>. Number of columns must equal the sum of the dimensions of all root Inport blocks plus 1. First column must contain monotonically increasing time points. Other columns contain data points that correspond to the time point in a given row.</li> <li>Data of type <code>double</code>.</li> </ul> <p>For an example, see <b>Single time/data matrix</b> in the following procedure, step 4. For more information, see “Loading Data Arrays to Root-Level Inputs”.</p>
Signal-and-time structure	<ul style="list-style-type: none"> <li>More flexible than the single time/data matrix format.</li> <li>One variable.</li> <li>Must contain two top-level fields: <code>time</code> and <code>signals</code>. The <code>time</code> field contains a <i>column</i> vector of the simulation times. The <code>signals</code> field contains an array of substructures, each of which corresponds to an Inport block. The substructure index corresponds to the Inport block number. Each <code>signals</code> substructure must contain a field named <code>values</code>. The <code>values</code> field must contain an array of inputs for the corresponding Inport block, where each input corresponds to a time point specified by the <code>time</code> field.</li> <li>If the <code>time</code> field is set to an empty value, clear the check box for the Inport block <b>Interpolate data</b> parameter.</li> <li>Data type must match Inport block settings.</li> </ul> <p>For an example, see <b>Signal-and-time structure</b> in the following procedure, step 4. For more information on this format, see “Loading Data Structures to Root-Level Inputs”.</p>

Format	Description
Per-port structure	<ul style="list-style-type: none"> <li>• Most flexible</li> <li>• Multiple variables. Number of variables must equal the number of Inport blocks.</li> <li>• Consists of a separate structure-with-time or structure-without-time for each Inport block. Each Inport block data structure has only one <code>signals</code> field. To use this format, in the <b>Input</b> text field, enter the names of the structures as a comma-separated list, <code>in1, in2, ..., inN</code>, where <code>in1</code> is the data for your model's first port, <code>in2</code> for the second port, and so on.</li> <li>• Each variable can have a different time vector.</li> <li>• If the <code>time</code> field is set to an empty value, clear the check box for the Inport block <b>Interpolate data</b> parameter.</li> <li>• Data type must match Inport block settings.</li> <li>• To save multiple variables to the same data file, you must save them in the order expected by the model, using the <code>-append</code> option.</li> </ul> <p>For an example, see <b>Per-port structure</b> in the following procedure, step 4. For more information, see “Loading Data Structures to Root-Level Inputs”.</p>

The supported formats and the following procedure are illustrated in `rtwdemo_rsim_i`.

To create a MAT-file for an Inport block:

- 1 Choose one of the preceding data file formats.
- 2 Update Inport block parameter settings and specifications to match specifications of the data to be supplied by the MAT-file.

By default, the Inport block inherits parameter settings from downstream blocks. To import data from an external MAT-file, explicitly set the following parameters to match the source data in the MAT-file.

- **Main > Interpolate data**
- **Signal Attributes > Port dimensions**
- **Signal Attributes > Data type**
- **Signal Attributes > Signal type**

If you choose to use a structure format for workspace variables and the `time` field is empty, clear block parameter **Interpolate data** or modify the parameter so that it is set to a nonempty value. Interpolation requires time data.

For descriptions of the preceding block parameters, see the block description of Inport.

- 3 Build an RSim executable program for the model. The build process creates and calculates a structural checksum for the model and embeds it in the generated executable. The RSim target uses the checksum to verify that data being passed into the model is consistent with what the model executable expects.
- 4 Create the MAT-file that provides the source data for the rapid simulations. You can create the MAT-file from a workspace variable. Using the specifications in the preceding format comparison table, create the workspace variables for your simulations.

An example of each format follows:

**Single time/data matrix**

```
t=[0:0.1:2*pi]';
Ina1=[2*sin(t) 2*cos(t)];
Ina2=sin(2*t);
Ina3=[0.5*sin(3*t) 0.5*cos(3*t)];
var_matrix=[t Ina1 Ina2 Ina3];
```

**Signal-and-time structure**

```
t=[0:0.1:2*pi]';
var_single_struct.time=t;
var_single_struct.signals(1).values(:,1)=2*sin(t);
var_single_struct.signals(1).values(:,2)=2*cos(t);
var_single_struct.signals(2).values=sin(2*t);
var_single_struct.signals(3).values(:,1)=0.5*sin(3*t);
var_single_struct.signals(3).values(:,2)=0.5*cos(3*t);
v=[var_single_struct.signals(1).values...
var_single_struct.signals(2).values...
var_single_struct.signals(3).values];
```

**Per-port structure**

```
t=[0:0.1:2*pi]';
Inb1.time=t;
Inb1.signals.values(:,1)=2*sin(t);
Inb1.signals.values(:,2)=2*cos(t);
t=[0:0.2:2*pi]';
Inb2.time=t;
Inb2.signals.values(:,1)=sin(2*t);
t=[0:0.1:2*pi]';
Inb3.time=t;
Inb3.signals.values(:,1)=0.5*sin(3*t);
Inb3.signals.values(:,2)=0.5*cos(3*t);
```

- 5 Save the workspace variables to a MAT-file.

**Single time/data matrix**

The following example saves the workspace variable `var_matrix` to the MAT-file `rsim_i_matrix.mat`.

```
save rsim_i_matrix.mat var_matrix;
```

**Signal-and-time structure**

The following example saves the workspace structure variable `var_single_struct` to the MAT-file `rsim_i_single_struct.mat`.

```
save rsim_i_single_struct.mat var_single_struct;
```

**Per-port structure**

To order data when saving per-port structure variables to a single MAT-file, use the `save` command's `-append` option. Be sure to append the data in the order that the model expects it.

The following example saves the workspace variables `Inb1`, `Inb2`, and `Inb3` to MAT-file `rsim_i_multi_struct.mat`.

```
save rsim_i_multi_struct.mat Inb1;
save rsim_i_multi_struct.mat Inb2 -append;
save rsim_i_multi_struct.mat Inb3 -append;
```

The `save` command does not preserve the order in which you specify your workspace variables in the command line when saving data to a MAT-file. For example, if you specify the variables `v1`, `v2`, and `v3`, in that order, the order of the variables in the MAT-file could be `v2 v1 v3`.

Using a command-line option, you can then specify the MAT-files as input for rapid simulations.

## Scripts for Batch and Monte Carlo Simulations

The RSim target is for batch simulations in which parameters and input signals vary for multiple simulations. New output file names allow you to run new simulations without overwriting prior simulation results. You can set up a series of simulations to run by creating a `.bat` file for use on a Microsoft Windows platform.

Create a file for the Windows platform with a text editor and execute it by typing the file name, for example, `mybatch`, where the name of the text file is `mybatch.bat`.

```
rtwdemo_rsimtf -f rtwdemo_rsimtf.mat=run1.mat -o results1.mat -tf 10.0
rtwdemo_rsimtf -f rtwdemo_rsimtf.mat=run2.mat -o results2.mat -tf 10.0
rtwdemo_rsimtf -f rtwdemo_rsimtf.mat=run3.mat -o results3.mat -tf 10.0
rtwdemo_rsimtf -f rtwdemo_rsimtf.mat=run4.mat -o results4.mat -tf 10.0
```

In this case, batch simulations run using four sets of input data in files `run1.mat`, `run2.mat`, and so on. The RSim executable saves the data to the files specified with the `-o` option.

The variable names containing simulation results in each of the files are identical. Therefore, loading consecutive sets of data without renaming the data once it is in the MATLAB workspace results in overwriting the prior workspace variable with new data. To avoid overwriting, you can copy the result to a new MATLAB variable before loading the next set of data.

You can also write MATLAB scripts to create new signals and new parameter structures, as well as to save data and perform batch runs using the bang command (`!`).

For details on running simulations and available command-line options, see “Run Rapid Simulations” on page 68-13. For an example of a rapid simulation batch script, see the example “Run Batch Simulations Without Recompiling Generated Code”.

## Run Rapid Simulations

- “Requirements for Running Rapid Simulations” on page 68-15
- “Set a Clock Time Limit for a Rapid Simulation” on page 68-15
- “Override a Model Simulation Stop Time” on page 68-15
- “Read the Parameter Vector into a Rapid Simulation” on page 68-16
- “Specify New Signal Data File for a From File Block” on page 68-16
- “Specify Signal Data File for an Inport Block” on page 68-18
- “Change Block Parameters for an RSim Simulation” on page 68-20

- “Specify a New Output File Name for a Simulation” on page 68-21
- “Specify New Output File Names for To File Blocks” on page 68-21

### Rapid Simulations

Using the RSim target, you can build a model once and run multiple simulations to study effects of varying parameter settings and input signals. You can run a simulation directly from your operating system command line, redirect the command from the MATLAB command line by using the bang (!) character, or execute commands from a script.

From the operating system command line, use

```
rtwdemo_rsimtf
```

From the MATLAB command line, use

```
!rtwdemo_rsimtf
```

The following table lists ways you can use RSim target command-line options to control a simulation.

To...	Use...
Read input data for a From File block from a MAT-file other than the MAT-file used for the previous simulation	<code>model -f oldfilename.mat=newfilename.mat</code>
Print a summary of the options for RSim executable targets	<code>executable filename -h</code>
Read input data for an Inport block from a MAT-file	<code>model -i filename.mat</code>
Time out after $n$ clock time seconds, where $n$ is a positive integer value	<code>model -L n</code>
Write MAT-file logging data to file <i>filename.mat</i>	<code>model -o filename.mat</code>
Read a parameter vector from file <i>filename.mat</i>	<code>model -p filename.mat</code>
Override the default TCP port (17725) for external mode	<code>model -port TCPport</code>
Write MAT-file logging data to a MAT-file other than the MAT-file used for the previous simulation	<code>model -t oldfilename.mat=newfilename.mat</code>
Run the simulation until the time value <i>stoptime</i> is reached	<code>model -tf stoptime</code>
Run in verbose mode	<code>model -v</code>
Wait for the Simulink engine to start the model in external mode	<code>model -w</code>

The following sections use the `rtwdemo_rsimtf` example model in examples to illustrate some of these command-line options. In each case, the example assumes you have already done the following:

- Created or changed to a working folder.
- Opened the example model.
- Copied the data file `matlabroot/toolbox/rtw/rtwdemos/rsimdemos/rsim_tfdata.mat` to your working folder. You can perform this operation using the command:

```
copyfile(fullfile(matlabroot,'toolbox','rtw','rtwdemos',...
'rsimdemos','rsim_tfdata.mat'),pwd);
```

## Requirements for Running Rapid Simulations

The following requirements apply to both fixed and variable step executables.

- You must run the RSim executable on a computer configured to run MATLAB. Also, the RSim.exe file must be able to access the MATLAB and Simulink installation folders on this machine. To obtain that access, your PATH environment variable must include /bin and /bin/(\$ARCH), where (\$ARCH) represents your operating system architecture. For example, for a personal computer running on a Windows platform, (\$ARCH) is “win64”, whereas for a Linux machine, (\$ARCH) is “glnxa64”.
- On GNU Linux platforms, to run an RSim executable, define the LD\_LIBRARY\_PATH environment variable to provide the path to the MATLAB installation folder, as follows:

```
% setenv LD_LIBRARY_PATH /matlab/sys/os/glnx64:$LD_LIBRARY_PATH
```

- On the Apple Macintosh OS X platform, to run RSim target executables, you must define the environment variable DYLD\_LIBRARY\_PATH to include the folders bin/mac and sys/os/mac under the MATLAB installation folder. For example, if your MATLAB installation is under /MATLAB, add /MATLAB/bin/mac and /MATLAB/sys/os/mac to the definition for DYLD\_LIBRARY\_PATH.

## Set a Clock Time Limit for a Rapid Simulation

If a model experiences frequent zero crossings and the model's minor step size is small, consider setting a time limit for a rapid simulation. To set a time limit, specify the -L option with a positive integer value. The simulation aborts after running for the specified amount of clock time (not simulation time). For example,

```
!rtwdemo_rsimmtf -L 20
```

Based on your clock, after the executable runs for 20 seconds, the program terminates. You see a message similar to one of the following:

- On a Microsoft Windows platform,

```
Exiting program, time limit exceeded
Logging available data ...
```
- On The Open Group UNIX platform,

```
** Received SIGALRM (Alarm) signal @ Fri Jul 25 15:43:23 2003
** Exiting model 'vdp' @ Fri Jul 25 15:43:23 2003
```

You do not need to do anything to your model or to its configuration to use this option.

## Override a Model Simulation Stop Time

By default, a rapid simulation runs until the simulation time reaches the time specified the Configuration Parameters dialog box, on the **Solver** pane. You can override the model simulation stop time by using the -tf option. For example, the following simulation runs until the time reaches 6.0 seconds.

```
!rtwdemo_rsimmtf -tf 6.0
```

The RSim target stops and logs output data using MAT-file data logging rules.

If the model includes a From File block, the end of the simulation is regulated by the stop time setting specified in the Configuration Parameters dialog box, on the **Solver** pane, or with the RSim target option `-tf`. The values in the block time vector are ignored. However, if the simulation time exceeds the endpoints of the time and signal matrix (if the final time is greater than the final time value of the data matrix), the signal data is extrapolated to the final time value.

### Read the Parameter Vector into a Rapid Simulation

To read the model parameter vector into a rapid simulation, you must first create a MAT-file that includes the parameter structure as described in “Create a MAT-File That Includes a Model Parameter Structure” on page 68-6. You can then specify the MAT-file in the command line with the `-p` option.

For example:

- 1 Build an RSim executable for the example model `rtwdemo_rsimtf`.
- 2 Modify parameters in your model and save the parameter structure.

```
param_struct = rsimgetrtp('rtwdemo_rsimtf');
save myrsimdata.mat param_struct
```

- 3 Run the executable with the new parameter set.

```
!rtwdemo_rsimtf -p myrsimdata.mat
```

```
** Starting model 'rtwdemo_rsimtf' @ Tue Dec 27 12:30:16 2005
** created rtwdemo_rsimtf.mat **
```

- 4 Load workspace variables and plot the simulation results by entering the following commands:

```
load rtwdemo_rsimf.mat
plot(rt_yout)
```

### Specify New Signal Data File for a From File Block

If your model's input data source is a From File block, you can feed the block with input data during simulation from a single MAT-file or you can change the MAT-file from one simulation to the next. Each MAT-file must adhere to the format described in “Create a MAT-File for a From File Block” on page 68-9.

To change the MAT-file after an initial simulation, you specify the executable with the `-f` option and an `oldfile.mat=newfile.mat` parameter, as shown in the following example.

- 1 Set some parameters in the MATLAB workspace. For example:

```
w = 100;
theta = 0.5;
```

- 2 Build an RSim executable for the example model `rtwdemo_rsimtf`.
- 3 Run the executable.

```
!rtwdemo_rsimtf
```

The RSim executable runs a set of simulations and creates output MAT-files containing the specific simulation result.

- 4 Load the workspace variables and plot the simulation results by entering the following commands:

```
load rtwdemo_rsimgtf.mat
plot(rt_yout)
```

The resulting plot shows simulation results based on default input data.

- 5 Create a new data file, `newfrom.mat`, that includes the following data:

```
t=[0:.001:1];
u=sin(100*t.*t);
tu=[t;u];
save newfrom.mat tu;
```

- 6 Run a rapid simulation with the new data by using the `-f` option to replace the original file, `rsim_tfdata.mat`, with `newfrom.mat`.

```
!rtwdemo_rsimgtf -f rsim_tfdata.mat=newfrom.mat
```

- 7 Load the data and plot the new results by entering the following commands:

```
load rtwdemo_rsimgtf.mat
plot(rt_yout)
```

The next figure shows the resulting plot.

From File blocks require input data of type `double`. If you need to import signal data of a data type other than `double`, use an Inport block (see “Create a MAT-File for an Inport Block” on page 68-10) or a From Workspace block with the data specified as a structure.

Workspace data must be in the format:

```
variable.time
variable.signals.values
```

If you have more than one signal, use the following format:

```
variable.time
variable.signals(1).values
variable.signals(2).values
```

### Specify Signal Data File for an Inport Block

If your model's input data source is an Inport block, you can feed the block with input data during simulation from a single MAT-file or you can change the MAT-file from one simulation to the next. Each MAT-file must adhere to one of the three formats described in “Create a MAT-File for an Inport Block” on page 68-10.

To specify the MAT-file after a simulation, you specify the executable with the `-i` option and the name of the MAT-file that contains the input data. For example:

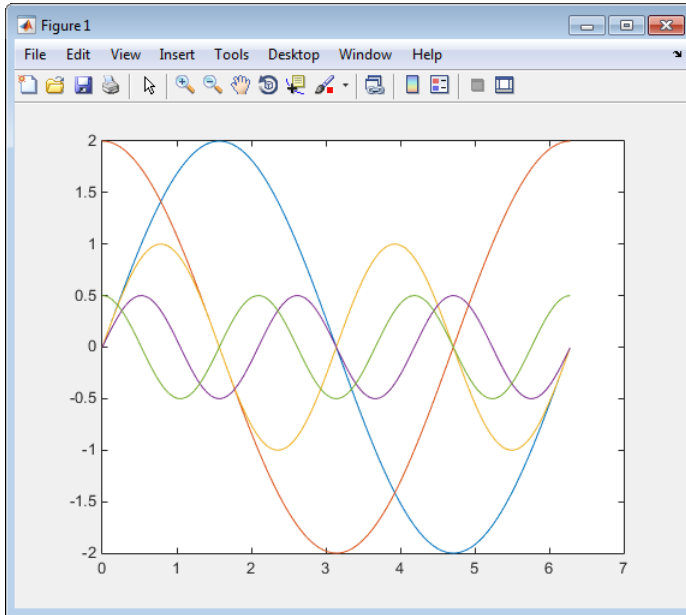

- 1 Open the model `rtwdemo_rsim_i`.
- 2 Check the Inport block parameter settings. The following Inport block data parameter settings and specifications that you specify for the workspace variables must match settings in the MAT-file, as indicated in “Configure Inports to Provide Simulation Source Data” on page 68-4:
  - **Main > Interpolate data**
  - **Signal Attributes > Port dimensions**
  - **Signal Attributes > Data type**

- **Signal Attributes > Signal type**

- 3 Build the model.
- 4 Set up the input signals. For example:

```
t=[0:0.01:2*pi]';
s1=[2*sin(t) 2*cos(t)];
s2=sin(2*t);
s3=[0.5*sin(3*t) 0.5*cos(3*t)];
plot(t, [s1 s2 s3])
```

- 5 Prepare the MAT-file by using one of the three available file formats described in “Create a MAT-File for an Inport Block” on page 68-10. The following example defines a signal-and-time structure in the workspace and names it `var_single_struct`.

```
t=[0:0.1:2*pi]';
var_single_struct.time=t;
var_single_struct.signals(1).values(:,1)=2*sin(t);
var_single_struct.signals(1).values(:,2)=2*cos(t);
var_single_struct.signals(2).values=sin(2*t);
var_single_struct.signals(3).values(:,1)=0.5*sin(3*t);
var_single_struct.signals(3).values(:,2)=0.5*cos(3*t);
v=[var_single_struct.signals(1).values...
var_single_struct.signals(2).values...
var_single_struct.signals(3).values];
```

- 6 Save the workspace variable `var_single_struct` to MAT-file `rsim_i_single_struct`.
- 7 Run a rapid simulation with the input data by using the `-i` option. Load and plot the results.

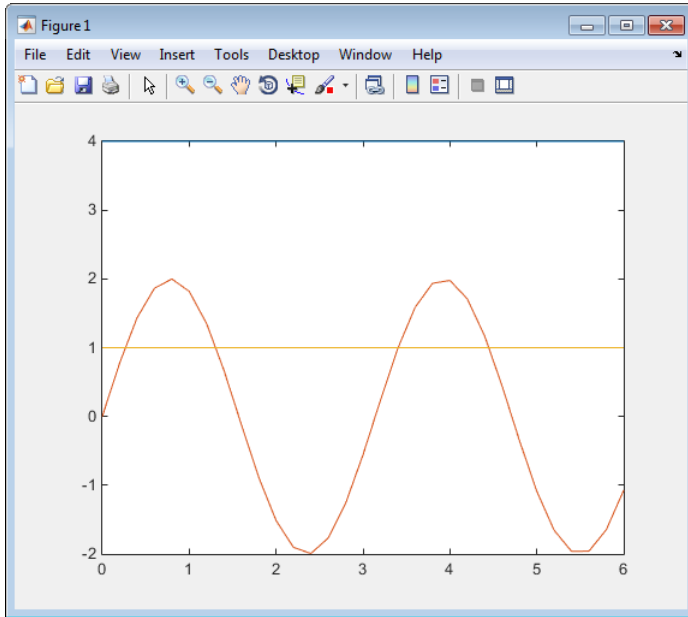

```
!rtwdemo_rsim_i -i rsim_i_single_struct.mat

** Starting model 'rtwdemo_rsim_i' @ Tue Aug 19 10:26:53 2014
*** rsim_i_single_struct.mat is successfully loaded! ***
** created rtwdemo_rsim_i.mat **

** Execution time = 0.02024185130718954s
```

- 8 Load and plot the results.

```
load rtwdemo_rsim_i.mat
plot(rt_tout, rt_yout);
```

### Change Block Parameters for an RSim Simulation

As described in “Create a MAT-File That Includes a Model Parameter Structure” on page 68-6, after you alter one or more parameters in a Simulink block diagram, you can extract the parameter vector, *model\_P*, for the entire model. You can then save the parameter vector, along with a model checksum, to a MAT-file. This MAT-file can be read directly by the standalone RSim executable, allowing you to replace the entire parameter vector or individual parameter values, for running studies of variations of parameter values representing coefficients, new data for input signals, and so on.

RSim can read the MAT-file and replace the entire *model\_P* structure whenever you change one or more parameters, without recompiling the entire model.

For example, assume that you changed one or more parameters in your model, generated the new *model\_P* vector, and saved *model\_P* to a new MAT-file called *mylogfile.mat*. To run the same *rtwdemo\_rsimtf* model and use these new parameter values, use the *-p* option, as shown in the following example:

```
!rtwdemo_rsimtf -p mylogfile.mat
load rtwdemo_rsimtf
plot(rt_yout)
```

If you have converted the parameter structure to a cell array for running simulations on varying data sets, as described in “Convert the Parameter Structure for Running Simulations on Varying Data Sets” on page 68-8, you must add an *@n* suffix to the MAT-file specification. *n* is the element of the cell array that contains the specific input that you want to use for the simulation.

The following example converts `param_struct` to a cell array, changes parameter values, saves the changes to MAT-file `mymatfile.mat`, and then runs the executable using the parameter values in the second element of the cell array as input.

```
param_struct = rsimgetrtf('rtwdemo_rsimtf');
param_struct = rsimsetrtpparam(param_struct,2);
param_struct.parameters{1}

ans =

 dataTypeName: 'double'
 dataTypeId: 0
 complex: 0
 dtTransIdx: 0
 values: [-140 -4900 0 4900]
 map: []
 structParamInfo: []

param_struct.parameters{2}.values=[-150 -5000 0 4950];
save mymatfile.mat param_struct;
!rtwdemo_rsimtf -p mymatfile.mat@2 -o rsim2.mat
```

### Specify a New Output File Name for a Simulation

If you have specified one or more of the **Save to Workspace** parameters — **Time**, **States**, **Outputs**, or **Final States** — in the Configuration Parameters dialog box, on the **Data Import/Export** pane, the default is to save simulation logging results to the file `model.mat`. For example, the example model `rtwdemo_rsimtf` normally saves data to `rtwdemo_rsimtf.mat`, as follows:

```
!rtwdemo_rsimtf
created rtwdemo_rsimtf.mat
```

You can specify a new output file name for data logging by using the `-o` option when you run an executable.

```
!rtwdemo_rsimtf -o rsim1.mat
```

In this case, the set of parameters provided at the time of code generation, including From File block data parameters, is run.

### Specify New Output File Names for To File Blocks

In much the same way as you can specify a new system output file name, you can also provide new output file names for data saved from one or more To File blocks. To do this, specify the original file name at the time of code generation with a new name, as shown in the following example:

```
!rtwdemo_rsimtf -t rtwdemo_rsimtf_data.mat=mynewsimdata.mat
```

In this case, assume that the original model wrote data to the output file `rtwdemo_rsimtf_data.mat`. Specifying a new file name forces RSim to write to the file `mynewsimdata.mat`. With this technique, you can avoid overwriting an existing simulation run.

## Tune Parameters Interactively During Rapid Simulation

The RSim system target file was designed to let you run batch simulations at the fastest possible speed. Using variable-step or fixed-step solvers with that system target file and a tunable parameter

data structure, whether you set **Default parameter behavior** to Tunable or to Inlined, you can create multiple parameter sets. You can run the data sets with the generated executable program (.exe on Windows). Each invocation of the executable program allows specification of the file name to use for results.

For this example, **Default parameter behavior** is set to Inlined. The model declares workspace variables as tunable parameters. To use the RSim system target file with **Default parameter behavior** set to Tunable, and without explicitly declaring tunable parameters, see “Run Batch Simulations Without Recompiling Generated Code”.

### Open Example Model

Open the example model `rtwdemo_rsim_param_tuning`.

```
open_system('rtwdemo_rsim_param_tuning');
```

This model uses the RSim target and the `rsimget` rtp function to allow a non real time executable to be passed new data without the need to recompile the Simulink model. This feature allows you to get a map of the tunable parameters declared in a model and save it in a MAT-file. You can then create your own MATLAB GUI or a standalone GUI (independent of MATLAB) to read and write the MAT-file and rerun the executable to produce new output files.

In the model, double-click the buttons sequentially to run the example.

To review the code used to create the MATLAB graphical interface and the standalone graphical interface, double-click the **View MATLAB programs** button.

For more information, see “Accelerate, Refine, and Test Hybrid Dynamic System on Host Computer by Using RSim System Target File”.

## Rapid Simulation Target Limitations

The RSim target has the following limitations:

- Does not support algebraic loops.
- Does not support Interpreted MATLAB Function blocks.
- Does not support noninlined MATLAB language or Fortran S-functions.
- If an RSim build includes referenced models (by using Model blocks), set up these models to use fixed-step solvers to generate code for them. The top model, however, can use a variable-step solver as long as the blocks in the referenced models are discrete.
- In certain cases, changing block parameters can result in structural changes to your model that change the model checksum. An example of such a change is changing the number of delays in a DSP simulation. In such cases, you must regenerate the code for the model.

## Run Rapid Simulations over a Range of Parameter Values

This example shows how to use the RSim system target file to run simulations over a range of parameter values. The example uses the Van der Pol oscillator and performs a parameter sweep over a range of initial state values to obtain the phase diagram of a nonlinear system.

You can customize this example for your own application by modifying the MATLAB® script used to build this example. Click the link in the top left corner of this page to edit the MATLAB script. Click the link in the top right corner to run this example from MATLAB. Run the example from writable location. The example creates files that you may want to investigate later.

For this example, set model configuration parameter **Default parameter behavior** to **Inlined**. In the example, you create `Simulink.Parameter` objects as tunable parameters. To use RSim with **Default parameter behavior** set to **Tunable**, and without explicitly declaring tunable parameters, see “Run Batch Simulations Without Recompiling Generated Code”.

To run multiple simulations in the Simulink® environment, consider using rapid accelerator instead of RSim. For information about rapid accelerator, see “What Is Acceleration?”. To sweep parameter values, see “Optimize, Estimate, and Sweep Block Parameter Values”.

### Preparation Model

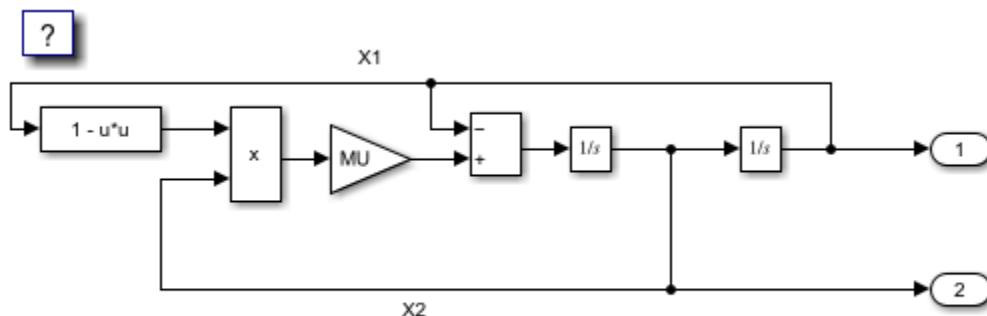

Make sure the current folder is writable. The example creates files.

```
[stat, fa] = fileattrib(pwd);
if ~fa.UserWrite
 disp('This script must be run in a writable directory');
 return
end
```

Open the model. Then, open the **Simulink Coder** app. Set model configuration parameter **System target file** to `rsim.tlc`.

For more information on doing this graphically and setting up other RSim target related options, see “Configure a System Target File”.

```
mdlName = 'rtwdemo_rsim_vdp';
open_system(mdlName);
cs = getActiveConfigSet(mdlName);
cs.switchTarget('rsim.tlc', []);
```

Copyright 2005-2020 The MathWorks, Inc.

Specify variables INIT\_X1 (the initial condition for state x1), INIT\_X2 (the initial condition for state x2), and MU (the gain value) as tunable. To create tunable parameters, convert the variables to Simulink.Parameter objects, and configure the objects to use a storage class other than Auto. In this example you investigate how the state trajectories evolve from different initial values for states x1 and x2 in the model.

```
INIT_X1 = Simulink.Parameter(INIT_X1);
INIT_X1.StorageClass = 'Model default';
```

```
INIT_X2 = Simulink.Parameter(INIT_X2);
INIT_X2.StorageClass = 'Model default';
```

```
MU = Simulink.Parameter(MU);
MU.StorageClass = 'Model default';
```

Define the names of files that will be created.

```
prmFileName = [mdlName, '_prm_sets.mat'];
logFileName = [mdlName, '_run_scr.log'];
batFileName = [mdlName, '_run_scr'];
exeFileName = mdlName;
if ispc
 exeFileName = [exeFileName, '.exe'];
 batFileName = [batFileName, '.bat'];
end
aggDataFile = [mdlName, '_results'];
startTime = cputime;
```

### Build Model

Build the RSim executable program for the model. During the build process, a structural checksum is calculated for the model and embedded into the generated executable program. This checksum is used to check that a parameter set passed to the executable program is compatible with the program.

```
slbuild(mdlName);

Starting build procedure for: rtwdemo_rsim_vdp
Successful completion of build procedure for: rtwdemo_rsim_vdp
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_rsim_vdp	Code generated and compiled	Code generation information file does not exist.

```
1 of 1 models built (0 models already up to date)
Build duration: 0h 0m 37.492s
```

### Get Default Parameter Set for Model

Get the default rtP structure (parameter set) for the model. The modelChecksum field in the rtP structure is the structural checksum of the model. This must match the checksum embedded in the RSim executable program. If the two checksums do not match, the executable program produces an error. rsimgetrtP generates an rtP structure with entries for the named tunable variables INIT\_X1, INIT\_X2, and MU.

```

rtp = rsimgetrtp mdlName

rtp =
 struct with fields:
 modelChecksum: [410569968 1.5914e+09 3.4411e+09 ...]
 parameters: [1x1 struct]
 globalParameterInfo: [1x1 struct]
 collapsedBaseWorkspaceVariables: []
 nonTunableVariables: [1x0 struct]

```

### Create Parameter Sets

Using the `rtp` structure, build a structure array with different values for the tunable variables in the model. As mentioned earlier, in this example you want to see how the state trajectories evolve for different initial values for states `x1` and `x2` in the model. To do this, generate different parameter sets with different values for `INIT_X1` and `INIT_X2` and leave tunable variable `MU` set to the default value.

```

INIT_X1_vals = -5:1:5;
INIT_X2_vals = -5:1:5;
MU_vals = 1;
nPrmSets = length(INIT_X1_vals)*length(INIT_X2_vals)*length(MU_vals)

```

```

nPrmSets =
 121

```

This example has `nPrmSets` parameter sets. You need to run that many simulations. Initialize `aggData`, which is a structure array that holds the parameter set and corresponding results.

```

aggData = struct('tout', [], 'yout', [], ...
 'prms', struct('INIT_X1', [], 'INIT_X2', [], 'MU', []))
aggData = repmat(aggData, nPrmSets, 1);

```

```

aggData =
 struct with fields:
 tout: []
 yout: []
 prms: [1x1 struct]

```

The utility function `rsimsetrtpparam` builds the `rtP` structure by adding parameter sets one at a time with different parameter values.

```

idx = 1;
for iX1 = INIT_X1_vals
 for iX2 = INIT_X2_vals
 for iMU = MU_vals
 rtp = rsimsetrtpparam(rtp, idx, 'INIT_X1', iX1, 'INIT_X2', iX2, 'MU', iMU);
 end
 end
end

```

```

 aggData(idx).prms.INIT_X1 = iX1;
 aggData(idx).prms.INIT_X2 = iX2;
 aggData(idx).prms.MU = iMU;
 idx = idx + 1;
 end
end
end

```

Save the `rtP` structure array with the parameter sets to a MAT-file.

```
save(prmFileName, 'rtp');
```

### Create Batch File

Create a batch script file to run the RSim executable program over the parameter sets. Each run reads the specified parameter set from the parameter MAT-file and writes the results to the specified output MAT-file. Use the time out option so that if a run hangs (for example, because the model has a singularity for that parameter set), abort the run after the specified time limit and proceed to the next run.

For example, this command (on Windows®) specifies using the third parameter set from the `rtP` structure in `prm.mat`, writes the results to `run3.mat`, and aborts execution if a run takes longer than 3600 seconds of CPU time. While running, the script pipes messages from `model.exe` to `run.log`, which you can use to debug issues.

```

 model.exe -p prm.mat@3 -o run3.mat -L 3600 2>&1>> run.log

fid = fopen(batFileName, 'w');
idx = 1;
for iX1 = INIT_X1_vals
 for iX2 = INIT_X2_vals
 for iMU = MU_vals
 outMatFile = [mdlName, '_run', num2str(idx), '.mat'];
 cmd = [exeFileName, ...
 '-p ', prmFileName, '@', int2str(idx), ...
 '-o ', outMatFile, ...
 '-L 3600'];
 if ispc
 cmd = [cmd, ' 2>&1>> ', logFileName];
 else % (unix)
 cmd = ['./ filesep cmd, ' 1> ', logFileName, ' 2>&1'];
 end
 fprintf(fid, ['echo "', cmd, '"\n']);
 fprintf(fid, [cmd, '\n']);
 idx = idx + 1;
 end
 end
end
if isunix,
 system(['touch ', logFileName]);
 system(['chmod +x ', batFileName]);
end
fclose(fid);

```

Creating a batch/script file to run simulations enables you to call the system command once to run the simulations (or even run the batch script outside MATLAB) instead of calling the system command in a loop for each simulation. This improves performance because the system command has significant overhead.

## Execute Batch File to Run Simulations

Run the batch/script file, which runs the RSim executable program once for each parameter set and saves the results to a different MAT-file each time. You can run the batch file from outside MATLAB.

```
[stat, res] = system(['.' filesep batFileName]);
if stat ~= 0
 error(['Error running batch file ', batFileName, ' :', res]);
end
```

This example logs simulation run results in one batch file as it runs the batch file to sequentially run  $n$  simulations over  $n$  parameter sets. You can modify the script to generate multiple batch files and run them in parallel by distributing them across multiple computers. Also, you can run the batch files without launching MATLAB.

## Load Output MAT-Files and Collate Results

Collect the simulation results from the output MAT-files into the structure `aggData`. If the output MAT-file corresponding to a particular run is not found, set the results corresponding to that run to NaN (not a number). This situation occurs if a simulation run with a particular set of parameters encounters singularities in the model.

```
idx = 1;
for iX1 = INIT_X1_vals
 for iX2 = INIT_X2_vals
 for iMU = MU_vals
 outMatFile = [mdlName, '_run', num2str(idx), '.mat'];
 if exist(outMatFile, 'file')
 load(outMatFile);
 aggData(idx).tout = rt_tout;
 aggData(idx).yout = rt_yout;
 else
 aggData(idx).tout = nan;
 aggData(idx).yout = nan;
 end
 idx = idx + 1;
 end
 end
end
```

Save the `aggData` structure to the results MAT-file. At this point, you can delete the other MAT-files, as the `aggData` data structure contains the aggregation of input (parameters sets) and output data (simulation results).

```
save(aggDataFile, 'aggData');
disp(['Took ', num2str(cputime-startTime), ...
 ' seconds to generate results from ', ...
 num2str(nPrmSets), ' simulation runs (Steps 2 to 7).']);
```

Took 29.0781 seconds to generate results from 121 simulation runs (Steps 2 to 7).

## Analyze Simulation Results

Plot the phase diagram (X2 versus X1) with different initial values for X1 and X2. The diagram shows that, irrespective of the initial condition, the Van der Pol oscillator converges to its natural oscillator mode.

```
colors = {'b','g','r','c','m','y','k'}; nColors = length(colors);
for idx = 1:nPrmSets
 col = colors{idx - nColors*floor(idx/nColors) + 1};
 plot(aggData(idx).prms.INIT_X1, aggData(idx).prms.INIT_X2, [col,'x'], ...
 aggData(idx).yout(:,1), aggData(idx).yout(:,2),col);
 hold on
end
grid on
xlabel('X1');
ylabel('X2');
axis('square');
title('Phase diagram for Van der Pol equation');
```

## Run Batch Simulations Without Recompiling Generated Code

This example shows how to run batch simulations without recompiling the generated code. The example modifies input signal data and model parameters by reading data from a MAT-file. In the first part (steps 1-5), ten parameter sets are created from the Simulink® model by changing the transfer function damping factor. The ten parameter sets are saved to a MAT-file, and the RSim executable reads the specified parameter set from the file. In the second part (step 6-7) of this example, five sets of signal data chirps are created with increasingly high frequencies. In both parts, the RSim executable runs the set of simulations and creates output MAT-files containing the specific simulation result. Finally, a composite of runs appears in a MATLAB® figure.

To quickly run multiple simulations in the Simulink environment, consider using rapid accelerator instead of RSim. See “What Is Acceleration?”.

### Step 1. Preparation

Make sure the current directory is writable because this example will be creating files.

```
[stat, fa] = fileattrib(pwd);
if ~fa.UserWrite
 disp('This script must be run in a writable directory');
 return;
end
```

Open the model and configure it to use the RSim target. For more information on doing this graphically and setting up other RSim target related options, see “Configure a System Target File” on page 50-2.

```
mdlName = 'rtwdemo_rsimtfc';
open_system(mdlName);
cs = getActiveConfigSet(mdlName);
cs.switchTarget('rsim.tlc', []);
```

Copyright 2005-2020 The MathWorks, Inc.

The MAT-file rsim\_tfdata.mat is required in the local directory.

```
if ~isempty(dir('rsim_tfdata.mat')),
 delete('rsim_tfdata.mat');
end
str1 = fullfile(matlabroot, 'toolbox', 'rtw', 'rtwdemos', 'rsimdemos', 'rsim_tfdata.mat');
str2 = ['copyfile('', str1, '', 'rsim_tfdata.mat', 'writable')'];
eval(str2);
```

## Step 2. Build the Model

Build the RSim executable for the model. During the build process, a structural checksum is calculated for the model and embedded into the generated executable. This checksum is used to check that a parameter set passed to the executable is compatible with it.

```
evalin('base','w = 70;')
evalin('base','theta = 1.0;')
disp('Building compiled RSim simulation.')
slbuild mdlName);

Building compiled RSim simulation.
Starting build procedure for: rtwdemo_rsimtf
Successful completion of build procedure for: rtwdemo_rsimtf
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_rsimtf	Code generated and compiled.	Code generation information file does not exist.

1 of 1 models built (0 models already up to date)  
Build duration: 0h 0m 20.557s

## Step 3. Get the Default Parameter Set and Create 10 Parameters Sets

```
disp('Creating rtP data files')
for i=1:10
 % Extract current rtP structure using new damping factor.
 [rtpstruct]=evalin('base','rsimgetrtP(''rtwdemo_rsimtf'')');
 savestr = strcat('save params',num2str(i),'.mat rtpstruct');
 eval(savestr);
 evalin('base','theta = theta - .1;');
end
disp('Finished creating parameter data files.')
```

Creating rtP data files  
Finished creating parameter data files.

## Step 4. Run 10 RSim Simulations Using New Parameter Sets and Plot the Results

```
figure
for i=1:10
 % Bang out and run a simulation using new parameter data
 runstr = ['./', filesep, 'rtwdemo_rsimtf -p params',num2str(i),'.mat', ' -v'];
 [status, result] = system(runstr);
 if status ~= 0, error(result); end
 % Load simulation data into MATLAB for plotting.
 load rtwdemo_rsimtf.mat;
 axis([0 1 0 2]);
 plot(rt_tout, rt_yout)
 hold on
end
```

The plot shows 10 simulations, each using a different damping factor.

### Step 5. Set Up a Time Vector and an Initial Frequency Vector

The time vector has 4096 points in the event we want to do windowing and spectral analysis on simulation results.

```
dt = .001;
nn = [0:1:4095];
t = dt*nn; [m,n] = size(t);
wlo = 1; whi = 4;
omega = [wlo:((whi-wlo)/n):whi - (whi-wlo)/n];
```

### Step 6. Create 5 Sets of Signal Data in MAT Files

Creating .mat files with chirp data.

```
disp('This part of the example illustrates a sequence of 5 plots. Each')
disp('plot shows an input chirp signal of certain frequency range.')
for i = 1:5
 wlo = whi; whi = 3*whi; % keep increasing frequencies
 omega = [wlo:((whi-wlo)/n):whi - (whi-wlo)/n];
 % In a real application we recommend shaping the chirp using
 % a windowing function (hamming or hanning window, etc.)
 % This example does not use a windowing function.
 u = sin(omega.*t);
 tudata = [t;u];
 % At each pass, save one more set of tudata to the next
```

```

% .mat file.
savestr = strcat('save sweep',num2str(i),'.mat tudata');
eval(savestr);
% Display each chirp. Note that this is only input data.
% Simulations have not been run yet.
plotstr = strcat('subplot(5,1,',num2str(i),')');
eval(plotstr);
plot(t,u)
pause(0.3)
end

```

This part of the example illustrates a sequence of 5 plots. Each plot shows an input chirp signal of certain frequency range.

### Step 7. Run the RSim Compiled Simulation Using New Signal Data

Replace the original signal data (rsim\_tfdata.mat) with the files sweep1.mat, sweep2.mat, and so on.

```

disp('Starting batch simulations.')
for i = 1:5
% Bang out and run the next set of data with RSim
runstr = ['. ', filesep, 'rtwdemo_rsimtf -f rsim_tfdata.mat=sweep', ...
num2str(i), '.mat -v -tf 4.096'];
[status, result] = system(runstr);
if status ~= 0, error(result); end
% Load the data to MATLAB and plot the results.
load rtwdemo_rsimtf.mat
plotstr = strcat('subplot(5,1,',num2str(i),')');

```

```
eval(plotstr);
plot(rt_tout, rt_yout); axis([0 4.1 -3 3]);
end
zoom on
% cleanup
evalin('base','clear w theta')
disp('This part of the example illustrates a sequence of 5 plots. Each plot')
disp('shows the simulation results for the next frequency range. Using the')
disp('mouse, zoom in on each signal to observe signal amplitudes.')
close_system mdlName, 0);
```

Starting batch simulations.

This part of the example illustrates a sequence of 5 plots. Each plot shows the simulation results for the next frequency range. Using the mouse, zoom in on each signal to observe signal amplitudes.

## Use MAT-Files to Feed Data to Inport Blocks for Rapid Simulations

This example shows how the code generator RSim -i option lets you use a MAT-file as the input data source for Inport blocks for rapid simulations. The data in such a MAT-file can be presented in the following formats:

- One variable that defines a time/input data matrix of double values.
- One variable that defines a structure that uses a combination of Simulink® data types.
- Multiple variables, each defining a structure that uses a combination of Simulink® data types.

This flexibility lends itself well to applications for which you must run simulations over a range of input data stored in different data files. This example explains how to use this feature.

To quickly run multiple simulations in the Simulink environment, consider using rapid accelerator instead of RSim. See “What Is Acceleration?”.

### Prepare Model

Open the model and save a copy to a writable location. Then, open the **Simulink Coder** app. Set model configuration parameter \*System target file to `rsim.tlc`.

For more information on doing this graphically and setting up other model configuration parameters relate to the RSim system target file, see “Configure a System Target File” on page 50-2.

```
mdlName = 'rtwdemo_rsim_i';
open_system(mdlName);
cs = getActiveConfigSet(mdlName);
cs.switchTarget('rsim.tlc',[]);
```

### Configure Inport Blocks

To use the RSim -i option, you must configure each Inport block properly. You can double-click an Inport block to view its properties. By default, Inport blocks inherit their properties from downstream blocks. Before you can import data from external MAT-files, you must set the parameters of each Inport block to match the data in the MAT file. In most cases, these parameters of an Inport block must be set:

- **Interpolate Data**
- **Port Dimensions**
- **Data Type**
- **Signal Type**

For more information on these parameters, click the Help button. This example model includes three Inport blocks. A requirement for the example is for Inport 1 and Inport 2 to interpolate between data, and for Inport 3 to not interpolate. The dimension of the Inport blocks are 2, 1, and 2, respectively. Signals are real. The settings are as follows:

```
for i =1:3
 portName =['/In', num2str(i)];
 Interp = get_param(strcat(mdlName,portName), 'Interpolate');
 PortDimension = get_param(strcat(mdlName,portName), 'PortDimensions');
```

```

 DataType = get_param(strcat mdlName, portName), 'OutDataTypeStr');
 SignalType = get_param(strcat mdlName, portName), 'SignalType');
end

```

- For inports In1 and In2, interpolation is selected. For inport In3, interpolation is cleared.
- For inports In1 and In3, port dimension is set to 2. For inport In2, port dimension is set to 1.
- For inports In1, In2, and In3, data type is double and signal type is real.

### Build Model

Build an executable for the model. During the build process, a structural checksum is calculated and embedded into the generated executable program. This checksum is used to check that a parameter set passed to the executable program is compatible with the program.

```
evalc('slbuild mdlName');
```

### Identify Signals for Data File

After you configure the Inport block, prepare the data file based on the Inport blocks. This figure shows the input signals to be used.

```

t=[0:0.01:2*pi]';
s1 = [2*sin(t) 2*cos(t)];
s2 = sin(2*t);
s3 = [0.5*sin(3*t) 0.5*cos(3*t)];
figure;
plot(t, [s1 s2 s3]);

```

This figure displays the input signals.

### Prepare MAT-File

Generally, you can create the MAT-file from a workspace variable. The RSim -i option supports three data file formats:

#### One variable in TU matrix format of doubles

For this format, the first column is the time vector and the remaining columns are input vectors. The number of columns in the TU matrix equals the sum of the dimensions of the root Inport blocks plus 1. This MATLAB® code generates a MAT-file containing one variable `var_matrix` in TU matrix format. You can use this format only if the input ports in the model have the same data type.

```
t=[0:0.1:2*pi]';
Ina1 = [2*sin(t) 2*cos(t)];
Ina2 = sin(2*t);
Ina3 = [0.5*sin(3*t) 0.5*cos(3*t)];
var_matrix = [t Ina1 Ina2 Ina3];
save rsim_i_matrix.mat var_matrix;
```

MAT-file `rsim_i_matrix.mat` contains one variable `var_matrix` in TU matrix format.

#### One variable in structure format

For this format, the variable must contain two fields: time and signals. If you set the block parameter **Interpolate data** for one of the Inport blocks, the time field of the variable must not be an empty vector and the width of the signals must equal the total width of the Inport blocks. This code generates a MAT-file that contains one variable `var_matrix` in signal variable structure format. This format is more flexible than the TU matrix format because it can support input ports with different data types.

```
t= [0:0.1:2*pi]';
var_single_struct.time = t;
var_single_struct.signals(1).values(:,1) = 2*sin(t);
var_single_struct.signals(1).values(:,2) = 2*cos(t);
var_single_struct.signals(2).values = sin(2*t);
var_single_struct.signals(3).values(:,1) = 0.5*sin(3*t) ;
var_single_struct.signals(3).values(:,2) = 0.5*cos(3*t) ;
v=[var_single_struct.signals(1).values var_single_struct.signals(2).values ...
 var_single_struct.signals(3).values];
save rsim_i_single_struct.mat var_single_struct;
```

MAT-file `rsim_i_single_struct.mat` contains one variable `var_single_struct` in struct format.

#### Multiple variables in structure format

For this format, the number of variables equals the number of Inport blocks. Different variables can have different time vectors. This code generates a MAT-file that contains multiple variables, each in structure format. This is the most flexible format because it allows each Inport block to have its own time vector.

```
t= [0:0.1:2*pi]';
Inb1.time = t;
Inb1.signals.values(:,1) = 2*sin(t);
Inb1.signals.values(:,2) = 2*cos(t);
```

```

t= [0:0.2:2*pi]';
Inb2.time = t;
Inb2.signals.values(:,1) = sin(2*t);
t= [0:0.1:2*pi]';
Inb3.time = t;
Inb3.signals.values(:,1) = 0.5*sin(3*t);
Inb3.signals.values(:,2) = 0.5*cos(3*t);
save rsim_i_multi_struct.mat Inb1;
save rsim_i_multi_struct.mat Inb2 -append;
save rsim_i_multi_struct.mat Inb3 -append;

```

MAT-file `rsim_i_multi_struct.mat` contains three variables `Inb1`, `Inb2`, and `Inb3` in struct format. Use the `save` command with the `-append` option to preserve the order of variables in the generated MAT-file.

### Run RSim Simulations and Plot Results

You can use RSim `-i` options for batch mode simulation. Prepare different MAT-files and run the RSim program executable with them.

This part of the example shows three plots. Each plot shows simulation results for a MAT-file with a different variable format. The model is compiled once.

```

figure
fileName = ({'rsim_i_matrix', 'rsim_i_single_struct', 'rsim_i_multi_struct'});
for i=1:3
 % bang out and run a simulation using new parameter data
 name = fileName(i);
 runstr = ['.', filesep, 'rtwdemo_rsim_i -i ',char(name),'.mat', ' -v'];
 evalc('system(runstr)');
 pause(0.5);
 % load simulation data into MATLAB(R) for plotting.
 load rtwdemo_rsim_i.mat;
 subplot(3,1,i);
 axis([0,6, -5, 5]);
 plot(rt_tout, rt_yout);
 hold on
end

```

```
close_system mdlName, 0;
```

## Use S-Function Target for Model or Subsystem

S-functions are a class of system target file for which the code generator can produce code. An S-function target can encapsulate a subsystem to increase its execution efficiency, facilitate code reuse, and protect its intellectual property.

---

**Note** While you can use the S-function target to deploy an application component for reuse while shielding its internal logic from inspection and modification, the preferred solutions for protecting intellectual property in distributed components are:

- The protected model, a referenced model that hides block and line information. For more information, see “Protect Models to Conceal Contents”.
- The shared library system target file, used to generate a shared library for a model or subsystem for use in a system simulation external to Simulink. For more information, see “Package Generated Code as Shared Libraries” on page 69-2.

These solutions also increase execution efficiency and facilitate code reuse.

---

You can use a generated S-function target with a Generated S-Function block.

The 'S-Function' value for the CodeFormat TLC variable used by the S-function target generates code that conforms to the Simulink C MEX S-function application programming interface (API).

### Required Files for S-Function Deployment

There are different files required to deploy a generated S-Function block for simulation versus code generation.

To deploy your generated S-Function block for inclusion in other models *for simulation*, you need only provide the binary MEX-file object that was generated in the current working folder when the S-Function block was created. The required file is:

- `subsys_sf.mexext`

where *subsys* is the subsystem name and *mexext* is a platform-dependent MEX-file extension (see *mexext*). For example, `SourceSubsys_sf.mexw64`.

To deploy your generated S-Function block for inclusion in other models *for code generation*, provide the files that were generated in the current working folder when the S-Function block was created. The required files are:

- `subsys_sf.c` or `.cpp`, where *subsys* is the subsystem name (for example, `SourceSubsys_sf.c`)
- `subsys_sf.h`
- `subsys_sf.mexext`, where *mexext* is a platform-dependent MEX-file extension (see *mexext*)
- Subfolder `subsys_sfcn_rtw` and its contents

The generated S-function code uses **Configuration Parameters > Hardware Implementation** parameter values that match the host system on which the function was built. When you use the S-

function in a model for code generation, make sure that these parameter values for the model match the parameter values of the S-function.

## Sample Time Propagation in Generated S-Functions

A generated S-Function block can inherit its sample time from the model in which it is placed if certain criteria are met. Conditions that govern sample time propagation for both Model blocks and generated S-Function blocks are described in “Referenced Model Sample Times” and “S-Functions That Specify Sample Time Inheritance Rules” on page 13-77.

To generate an S-Function block that meets the criteria for inheriting sample time, you must constrain the solver for the model from which the S-Function block is generated. Set model configuration parameter **Type** to **Fixed-step** and **Periodic sample time constraint** to **Ensure sample time independent**. If the model is unable to inherit sample times, this setting causes the Simulink software to display an error message when building the model. For more information about this option, see “Periodic sample time constraint”.

## Solver Type for Top Models with Generated S-Functions

The table shows the possible combinations of top model solver types as these types relate to whether the model has discrete or continuous sample times and solver types for generated S-functions.

### Top Model Solver Options and Sample Times

	Model Configuration Parameters: Top-level model configuration	
Sample Times	Solver Options, Type: Variable-step	Solver Options, Type: Fixed-step
Discrete	Generated S-function requires a variable-step solver	Generated S-function can have a variable-step solver or a fixed-step solver
Continuous	Generated S-function requires a variable-step solver	Generated S-function requires a fixed-step solver

S-functions generated from a subsystem have parameters that are hardcoded into the block. Simulink calculates parameters such as sample time when it generates the block, not during simulation run time. It is important to verify whether the generated S-Function block works as expected in the destination model.

## Tunable Parameters in Generated S-Functions

To use tunable parameters in generated S-functions, use model configuration parameters to declare desired block parameters tunable. See “Declare Workspace Variables as Tunable Parameters Using the Model Parameter Configuration Dialog Box”.

Block parameters that you declare as tunable with the `auto` storage class in the source model become tunable parameters of the generated S-function. These parameters do not become part of a generated `model_P` (formerly `rtP`) parameter data structure, as they would in code generated from other system target files. Instead, the generated code accesses these parameters by using MEX API calls such as `mxGetPr` or `mxGetData`. Your code should access these parameters in the same way.

For more information on MEX API calls, see “About C MEX S-Functions” and “Integrate MATLAB with External Programming Languages and Systems”.

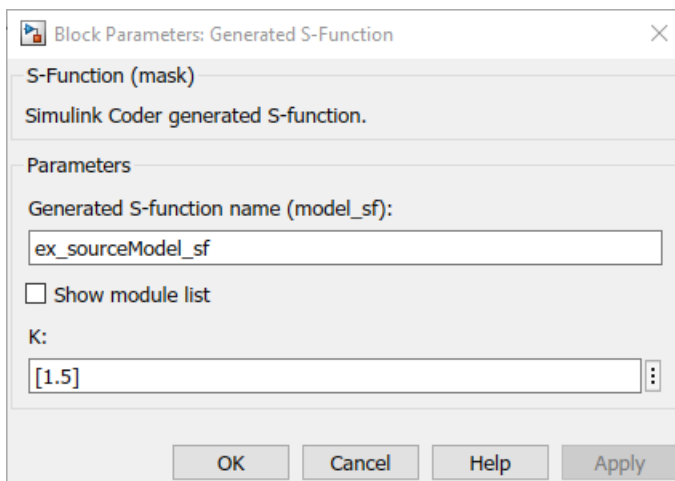

S-Function blocks created by using the S-function target are automatically masked. The mask displays each tunable parameter in an edit field. By default, the edit field displays the parameter by variable name, as in the following example.

You can choose to display the value of the parameter rather than its variable name by selecting model configuration parameter **Use value for tunable parameters**.

When select this parameter, the value of the variable (at code generation time) is displayed in the edit field.

## Macro Parameters

Suppose that you apply a storage class such as `Define` to a `Simulink.Parameter` object so that the parameter appears as a macro in the generated code. If you use the parameter object inside a subsystem from which you generate an ERT S-function, you cannot select the parameter object as a tunable parameter. Instead, the S-function code generator applies the custom storage class to the parameter object. This generation of macros in the S-function code enables you to generate S-functions from subsystems that contain variant elements, such as Variant Subsystem blocks, that you configure to produce preprocessor conditionals in the generated code. You cannot change the value of the parameter during simulation of the S-function.

To select the parameter object as a tunable parameter, apply a different storage class or create your own storage class. Storage classes that treat parameters as macros include `Define`, `ImportedDefine`, `CompilerFlag`, and storage classes that you create by setting **Data initialization** to `Macro` in the Custom Storage Class Designer. If you use a non-macro storage class, you cannot use the parameter object as a variant control variable and generate preprocessor conditionals.

If you apply a storage class that treats the parameter object as an imported macro, before you generate the ERT S-function, provide the macro definition. For example, suppose that you apply the storage class `ImportedDefine` to a `Simulink.Parameter` object and use the parameter object as a variant control variable in the subsystem. If you set the custom attribute `HeaderFile` to `'myHdr.h'`, when you generate the S-function, place the custom header file `myHdr.h` in the current folder. The generated S-function uses the macro value from your header file instead of the value from the `Value` property of the parameter object.

To use a macro that you define through a compiler option, for example by applying the storage class `CompilerFlag`, use the model configuration parameter **Code Generation > Custom Code > Code information > Defines** to specify the compiler option. For more information, see Code Generation Pane: Custom Code: Additional Build Information: Defines.

## System Target File

The `rtwsfcn.tlc` system target file is provided for use with the S-function target.

## Checksums and the S-Function Target

The code generator creates a checksum for a model and uses the checksum during the build process for code reuse, model reference, and external mode features.

The code generator calculates a model checksum by

- 1 Calculating a checksum for each subsystem in the model. A subsystem's checksum is the combination of properties (data type, complexity, sample time, port dimensions, and so forth) of the subsystem blocks.
- 2 Combining the subsystem checksums and other model-level information.

An S-function can add additional information, not captured during the block property analysis, to a checksum by calling the function `ssSetChecksumVal`. For the S-Function target, the value that gets added to the checksum is the checksum of the model or subsystem from which the S-function is generated.

The code generator applies the subsystem and model checksums as follows:

- Code reuse — If two subsystems in a model have the same checksum, the code generator produces code for one function only.
- Model reference — If the current model checksum matches the checksum when the model was built, the build process does not rebuild referenced models.
- External mode — If the current model checksum does not match the checksum of the code that is running on the target hardware, the build process generates an error.

## Generated S-Function Compatibility

When you build a MEX S-function from your model, the code generator builds a level 2 noninlined S-function. Cross-release usage limitations on the generated code and binary MEX file (for example, \*.mexw64) include:

- S-function target generated code from previous MATLAB release software is not compatible with newer releases. Do not recompile the generated code from a previous release with newer MATLAB release software. Use the same MATLAB release software to generate code for the S-function target and compile the code into a MEX file.
- You can use binary S-function MEX files generated from previous MATLAB release software with the same or newer releases with the same compatibility considerations as handwritten S-functions. For more information, see “S-Function Compatibility”.
- The code generator can generate code and build an executable from a model that contains generated S-functions. This support requires that the S-functions are built with the same MATLAB release software that builds the model. It is not possible to incorporate a generated S-function MEX file from previous MATLAB release software into a model and build the model with newer releases.

## Inport and Outport Blocks with Continuous Sample Time

The right-click build method for generating an S-function does not preserve continuous sample time for Inport and Outport blocks. Because the sample time is not preserved, simulation of the generated S-Function block can be affected.

## Tunable Variables in Expressions

Certain limitations apply to the use of tunable variables in expressions. When the code generator encounters an unsupported expression while producing code, a warning appears and the equivalent numeric value is generated in the code. For a list of the limitations, see “Tunable Expression Limitations” on page 36-121.

## Parameter Tuning

The S-Function block does not support tuning of tunable parameters with:

- Complex values.
- Values or data types that are transformed to a constant (by setting the model configuration parameter **Optimization > Default parameter behavior** to Inlined).
- Data types that are not built-in.
- Floating-point data types that are not equivalent to a built-in type.

## Run-Time Parameters and S-Function Compatibility Diagnostics

If you set model configuration parameter **S-function upgrades needed** to warning or error, the code generator instructs you to upgrade S-functions generated from subsystems. The S-function system target file does not register run-time parameters. Run-time parameters are only supported for inlined S-functions, and the generated S-function supports features that prevent it from being inlined, for example, it can call or contain other noninlined S-functions.

To work around this limitation, set parameter **S-function upgrades needed** to none.

## Goto and From Blocks

When using the S-function system target file, the code generator restricts input and output to correspond to the root model Inport and Outport blocks (or the Inport and Outport blocks of the Subsystem block from which the S-function target was generated). The code generator does not produce code for Goto or From blocks.

To work around this restriction, create your model and subsystem with the required Inport and Outport blocks, instead of using Goto and From blocks to pass data between the root model and subsystem. In the model that incorporates the generated S-function, you would then add Goto and From blocks.

## Example Before Work Around

- Root model that includes a From block and subsystem, Subsystem1

- Subsystem1 that includes a Goto block that has global visibility and passes its input to the From block in the root model

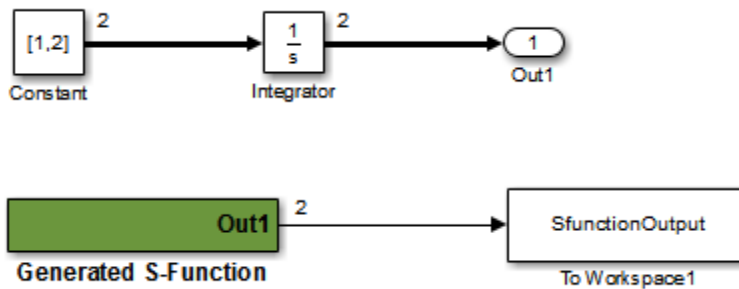

- Subsystem1 replaced with an S-function generated with the S-Function system target file — a warning results when you run the model because the generated S-function does not implement the Goto block

### Example After Work Around

An Outport block replaces the GoTo block in Subsystem1. When you plug the generated S-function into the root model, its output connects directly to the To Workspace block.

### Building and Updating S-Functions

The following limitations apply to building and updating S-functions using the S-function system target file:

- You cannot build models that contain Model blocks using the S-function system target file. This also means that you cannot build a subsystem by using the right-click context menu if the subsystem contains Model blocks. This restriction applies only to S-functions generated using the S-function target, not to ERT S-functions.
- You can build a model with:
  - A toolchain only if the toolchain supports MEX-file generation.
  - A template makefile only if the template makefile is associated with a toolchain on page 59-24 that supports MEX-file generation.
- If you modify the model that generated an S-Function block, the build process does not automatically rebuild models containing the generated S-Function block. This is in contrast to the

practice of automatically rebuilding models referenced by Model blocks when they are modified (depending on the Model Reference **Rebuild** configuration setting).

- Handwritten S-functions without corresponding TLC files must contain exception-free code. For more information on exception-free code, see “Exception Free Code”.

### Unsupported Blocks

The S-function format does not support the following built-in blocks:

- Interpreted MATLAB Function block
- S-Function blocks containing any of the following:
  - MATLAB language S-functions (unless you supply a TLC file for C code generation)
  - Fortran S-functions (unless you supply a TLC file for C code generation)
  - C/C++ MEX S-functions that call into the MATLAB environment
- Simulink Function block
- Function Caller block
- Scope block
- To Workspace block

The S-function format does not support blocks from the `embeddedtargetslib` block library.

### Model Operating Point not Supported for Code Generation

You can write C-MEX and Level-2 MATLAB S-functions that leverage the model operating point, which is used to save and restore the simulation state, as described in “S-Function Compliance with the ModelOperatingPoint”. The model operating point is not supported for code generation, including with the S-function system target file.

When you generate code for an S-function that specifies default operating point compliance or no operating point support, the generated code does not include the model operating point functionality. You cannot generate code for an S-function that implements custom operating point functionality.

### Nesting S-Functions

The following limitations apply to nesting a generated S-Function block in a model or subsystem from which you generate another S-function:

- The software does not support nonvirtual bus input and output for a nested S-function.
- Avoid nesting an S-function in a model or subsystem having the same name as the S-function (possibly several levels apart). In such situations, the S-function can be called recursively. The software currently does not detect such loops in S-function dependency, which can result in aborting or hanging your MATLAB session. To prevent this from happening, name the subsystem or model to be generated as an S-function target uniquely to avoid duplicating existing MEX filenames on the MATLAB path.

### User-Defined Data Types

The S-function system target file does not support the `HeaderFile` property that can be specified on user-defined data types, including those based on `Simulink.AliasType`, `Simulink.Bus`, and `Simulink.NumericType` objects. If a user-defined data type in your model uses the `HeaderFile`

property to specify an associated header file, code generation with the S-function system target file disregards the value and does not generate a corresponding include statement.

### Right-Click Generation of an S-Function Target

If you generate an S-function target by right-clicking a Function-Call Subsystem block, the original subsystem and the generated S-function might not be consistent. An inconsistency occurs when the **States when enabling** parameter of the Trigger Port block inside the Function-Call Subsystem block is set to **inherit**. You must set the **States when enabling** parameter to **reset** or **held**, otherwise Simulink reports an error.

### Bus Input and Output

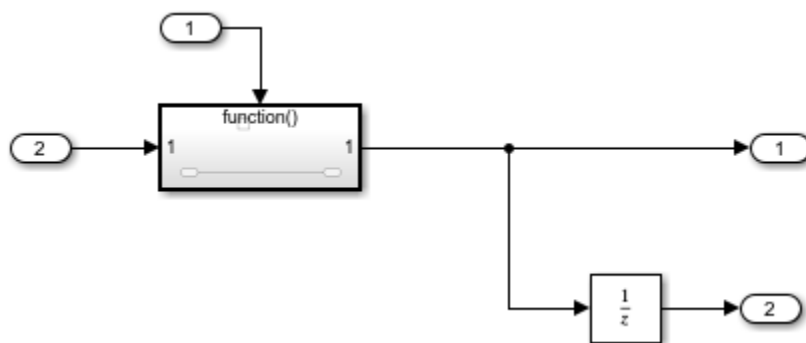

If an S-function generated using the S-function target has bus input or output, the generated bus data structures might include padding to align fields of the bus elements with the Simulink representation used during simulation. However, if you insert the S-function in a model and generate code using a model target such as `grt.tlc`, the bus structure alignment generated for the model build might be incompatible with the padding generated for the S-function and might impact the numerical results of code execution. To make the structure alignment consistent between model simulation and execution of the model code, for each `Simulink.Bus` object, you can modify the `HeaderFile` property to remove the unpadding bus structure header file. This will cause the bus typedefs generated for the S-function to be reused in the model code.

### Subsystems with Function-Call Input and Output Signals

The S-function target does not support creating an S-Function block from a subsystem that has a function-call trigger input or a function-call output.

### Function-Call Subsystem Modeling Pattern

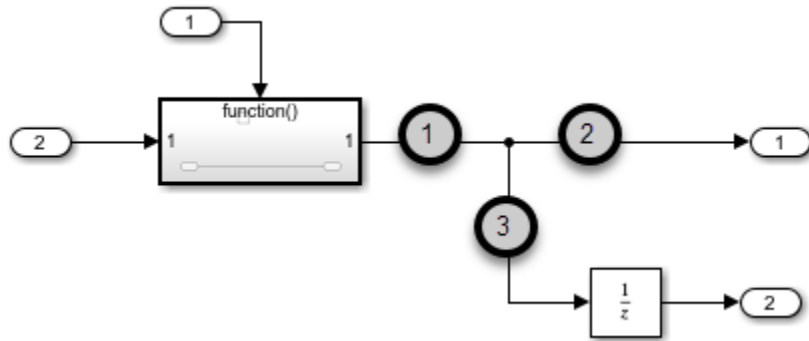

When you add a generated S-Function block to a model and then simulate that model, MATLAB might crash if the generated S-function uses this function-call subsystem modeling pattern.

The function-call subsystem connects directly to an Output block. The signal line that connects the subsystem to the Output block branches to a block that has an `Update` function, that is, a block that updates at each major time step, such as Unit Delay and Memory. The branch can be inside or outside of the subsystem.

In the model that includes the function-call subsystem, a Signal Conversion block in one of these locations can work around the problem with the generated S-function:

- 1 Between the subsystem block and the branch
- 2 Between the branch and the root Output block
- 3 Between the branch and the block that has the Update function

The Signal Conversion block in the workaround has these parameter settings:

- **Output** set to `Signal copy`
- **Exclude this block from 'Block reduction' optimization** selected

### Data Store Access

When an S-Function block in your model accesses a data store during simulation, Simulink disables data store diagnostics.

- If you created the S-Function block from a model, the diagnostic is disabled for global data stores as well.
- If you created the S-Function block from a subsystem, the diagnostic is disabled for the following data stores:
  - Global data stores
  - Data stores placed outside the subsystem, but accessed by Data Store Read or Data Store Write blocks.

### Inport or Output Block Parameters Through Subsystem Mask

S-functions generated from a subsystem with Inport or Output block parameters specified by subsystem mask variables produce an error when you try to run a simulation that uses the S-Function block.

```
Invalid setting in 'testSystem/Subsystem/__OutputSSForSFun__/Out2'
for parameter 'PortDimensions'
...
```

### MEX S-Function Wrappers

Use a MEX S-function wrapper only in the MATLAB version in which the wrapper is created.

## Package Generated Code as Shared Libraries

If you have an Embedded Coder license, you can package generated source code from a model component for easy distribution and shared use by building the code as a shared library—Windows dynamic link library (.dll), UNIX shared object (.so), or Macintosh OS X dynamic library (.dylib). You or others can integrate the shared library into an application that runs on a Windows, UNIX, or Macintosh OS X development computer. The generated .dll, .so, or .dylib file is shareable among different applications and upgradeable without having to recompile the applications that use it.

### About Generated Shared Libraries

You build a shared library by configuring the code generator to use the system target file `ert_shrlib.tlc`. Code generation for that system target file exports:

- Variables and signals of type `ExportedGlobal` as data
- Real-time model structure (`model_M`) as data
- Functions essential to executing your model code

To view a list of symbols contained in a generated shared library:

- On Windows, use the Dependency Walker utility, downloadable from <https://www.dependencywalker.com>
- On UNIX, use `nm -D model.so`
- On Macintosh OS X, use `nm -g model.dylib`

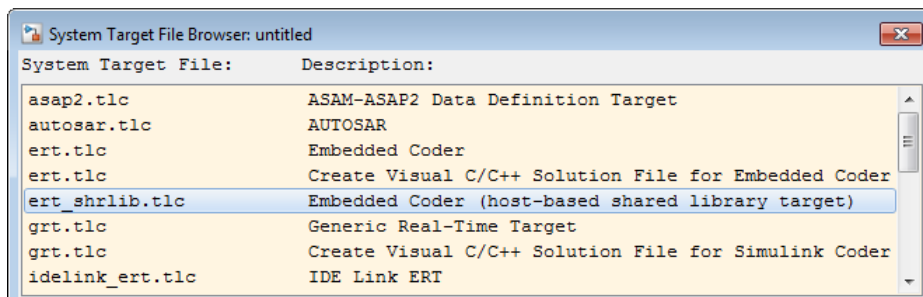

To generate and use a shared library:

- 1 Generate a shared library version of your model code
- 2 Create application code to load and use your shared library file

### Generate Shared Library Version of Model Code

To generate a shared library version of your model code:

- 1 Open your model and configure it to use the `ert_shrlib.tlc` system target file.

Selecting the `ert_shrlib.tlc` system target file causes the build process to generate a shared library version of your model code into your current working folder. The selection does not change the code that the code generator produces for your model.

- 2 Build the model.
- 3 After the build completes, examine the generated code in the model subfolder and examine the `.dll`, `.so`, or `.dylib` file in your current folder.

## Create Application Code to Use Shared Library

To illustrate how application code can load a shared library file and access its functions and data, MathWorks provides the model `rtwdemo_shrplib`.

---

**Note** Navigate to a writable working folder before running the `rtwdemo_shrplib` script.

---

In the model, click the blue button to run a script. The script:

- 1 Builds a shared library file from the model (for example, `rtwdemo_shrplib_win64.dll` on 64-bit Windows).
- 2 Compiles and links an example application, `rtwdemo_shrplib_app`, that loads and uses the shared library file.
- 3 Executes the example application.

---

**Tip** Explicit linking is preferred for portability. However, on Windows systems, the `ert_shrplib` system target file generates and retains the `.lib` file to support implicit linking.

To use implicit linking, the generated header file needs a small modification for you to use it with the generated C file. For example, if you are using Visual C++, declare `__declspec(dllimport)` in front of data to be imported implicitly from the shared library file.

---

The model uses the following example application files, which are located in the folder `matlabroot/toolbox/rtw/rtwdemos/shrplib_demo` (open).

File	Description
<code>rtwdemo_shrplib_app.h</code>	Example application header file
<code>rtwdemo_shrplib_app.c</code>	Example application that loads and uses the shared library file generated for the model
<code>run_rtwdemo_shrplib_app.m</code>	Script to compile, link, and execute the example application

You can view each of these files by clicking white buttons in the model window. Additionally, running the script places the relevant source and generated code files in your current folder. The files can be used as templates for writing application code for your own ERT shared library files.

The following sections present key excerpts of the example application files.

### Example Application Header File

The example application header file `rtwdemo_shrplib_app.h` contains type declarations for the model's external input and output.

```
#ifndef _APP_MAIN_HEADER_
#define _APP_MAIN_HEADER_
```

```

typedef struct {
 int32_T Input;
} ExternalInputs_rtwdemo_shrlib;

typedef struct {
 int32_T Output;
} ExternalOutputs_rtwdemo_shrlib;

#endif /*_APP_MAIN_HEADER_*/

```

### Example Application C Code

The example application `rtwdemo_shrlib_app.c` includes the following code for dynamically loading the shared library file. Notice that, depending on platform, the code invokes Windows or UNIX library commands.

```

#if (defined(_WIN32)||defined(_WIN64)) /* WINDOWS */
#include <windows.h>
#define GETSYMBOLADDR GetProcAddress
#define LOADLIB LoadLibrary
#define CLOSELIB FreeLibrary

#else /* UNIX */
#include <dlfcn.h>
#define GETSYMBOLADDR dlsym
#define LOADLIB dlopen
#define CLOSELIB dlclose

#endif

int main()
{
 void* handleLib;
 ...
#if defined(_WIN64)
 handleLib = LOADLIB("./rtwdemo_shrlib_win64.dll");
#else
#if defined(_WIN32)
 handleLib = LOADLIB("./rtwdemo_shrlib_win32.dll");
#else /* UNIX */
 handleLib = LOADLIB("./rtwdemo_shrlib.so", RTLD_LAZY);
#endif
#endif
 ...
 return(CLOSELIB(handleLib));
}

```

The following code excerpt shows how the C application accesses the model's exported data and functions. Notice the hooks for adding user-defined initialization, step, and termination code.

```

 int32_T i;
 ...
 void (*mdl_initialize)(boolean_T);
 void (*mdl_step)(void);
 void (*mdl_terminate)(void);

 ExternalInputs_rtwdemo_shrlib (*mdl_Uptr);
 ExternalOutputs_rtwdemo_shrlib (*mdl_Yptr);

 uint8_T (*sum_outp_ptr);
 ...
#if (defined(LCCDLL)||defined(BORLANDCDLL))
/* Exported symbols contain leading underscores when DLL is linked with
LCC or BORLANDC */
mdl_initialize =(void*)(boolean_T)GETSYMBOLADDR(handleLib ,
 "_rtwdemo_shrlib_initialize");
mdl_step =(void*)(void)GETSYMBOLADDR(handleLib ,
 "_rtwdemo_shrlib_step");
mdl_terminate =(void*)(void)GETSYMBOLADDR(handleLib ,

```

```

 "_rtwdemo_shrplib_terminate");
mdl_Uptr =(ExternalInputs_rtwdemo_shrplib*)GETSYMBOLADDR(handleLib ,
 "_rtwdemo_shrplib_U");
mdl_Yptr =(ExternalOutputs_rtwdemo_shrplib*)GETSYMBOLADDR(handleLib ,
 "_rtwdemo_shrplib_Y");
sum_outptr =(uint8_T*)GETSYMBOLADDR(handleLib , "_sum_out");
#else
mdl_initialize =(void*)(boolean_T)GETSYMBOLADDR(handleLib ,
 "rtwdemo_shrplib_initialize");
mdl_step =(void*)(void)GETSYMBOLADDR(handleLib ,
 "rtwdemo_shrplib_step");
mdl_terminate =(void*)(void)GETSYMBOLADDR(handleLib ,
 "rtwdemo_shrplib_terminate");
mdl_Uptr =(ExternalInputs_rtwdemo_shrplib*)GETSYMBOLADDR(handleLib ,
 "rtwdemo_shrplib_U");
mdl_Yptr =(ExternalOutputs_rtwdemo_shrplib*)GETSYMBOLADDR(handleLib ,
 "rtwdemo_shrplib_Y");
sum_outptr =(uint8_T*)GETSYMBOLADDR(handleLib , "sum_out");
#endif

if ((mdl_initialize && mdl_step && mdl_terminate && mdl_Uptr && mdl_Yptr &&
 sum_outptr)) {
 /* === user application initialization function === */
 mdl_initialize(1);
 /* insert other user defined application initialization code here */

 /* === user application step function === */
 for(i=0;i<=12;i++){
 mdl_Uptr->Input = i;
 mdl_step();
 printf("Counter out(sum_out): %d\tAmplifier in(Input): %d\tout(Output): %d\n",
 *sum_outptr, i, mdl_Yptr->Output);
 /* insert other user defined application step function code here */
 }

 /* === user application terminate function === */
 mdl_terminate();
 /* insert other user defined application termination code here */
}
else {
 printf("Cannot locate the specified reference(s) in the shared library.\n");
 return(-1);
}
}

```

### Example Application Script

The application script `run_rtwdemo_shrplib_app` loads and rebuilds the model, and then compiles, links, and executes the model's shared library target file. You can view the script source file by opening `rtwdemo_shrplib` and clicking a white button to view source code. The script constructs platform-dependent command character vectors for compilation, linking, and execution that may apply to your development environment. To run the script, click the blue button.

---

**Note** To run the `run_rtwdemo_shrplib_app` script without first opening the `rtwdemo_shrplib` model, navigate to a writable working folder and issue the following MATLAB command:

```
addpath(fullfile(matlabroot,'toolbox','rtw','rtwdemos','shrplib_demo'))
```

---

**Note** It is invalid to invoke the terminate function twice in a row. The terminate function clears pointers and sets them to NULL. Invoking the function a second time dereferences null pointers and results in a program failure.

---

## Shared Library Limitations

The following limitations apply to building shared libraries:

- Code generation for the `ert_shrlib.tlc` system target file exports the following as data:
  - Variables and signals of type `ExportedGlobal`
  - Real-time model structure (`model_M`)
- For a model that contains a function-call subsystem, code generation for the `ert_shrlib.tlc` system target file exports to the shared library only symbols associated with the initialize and terminate entry-point functions.
- Code generation for the `ert_shrlib.tlc` system target file supports the C language only (not C++). When you select `ert_shrlib.tlc`, model configuration parameter **Language** is greyed out.
- To reconstruct a model simulation using a generated shared library, the application author must maintain the timing between system and shared library function calls in the original application. The timing needs to be consistent so that you can compare the simulation and integration results. Additional simulation considerations apply if generating a shared library from a model that enables model configuration parameters **Support: continuous time** and **Single output/update function**. For more information, see “Single output/update function” dependencies.

## Deploy Algorithm Model for Real-Time Rapid Prototyping

Use the code generator to deploy algorithm models for real-time rapid prototyping.

### About Real-Time Rapid Prototyping

Real-time rapid prototyping requires the use of a real-time simulator, potentially connected to system hardware (for example, physical plant or vehicle) being controlled. You generate, deploy, and tune code as it runs on the real-time simulator or embedded microprocessor. This design step is crucial for verifying whether a component can adequately control the system, and allows you to assess, interact with, and optimize code.

The following figure shows a typical approach for real-time rapid prototyping.

### Goals of Real-Time Rapid Prototyping

Assuming that you have documented functional requirements, refined concept models, system hardware for the physical plant or vehicle being controlled, and access to target products you intend to use (for example, for example, the Simulink Real-Time or Simulink Desktop Real-Time product), you can use real-time prototyping to:

- Refine component and environment model designs by rapidly iterating between algorithm design and prototyping
- Validate whether a component can adequately control the physical system in real time
- Evaluate system performance before laying out hardware, coding production software, or committing to a fixed design
- Test hardware

### Refine Code With Real-Time Rapid Prototyping

To perform real-time rapid prototyping:

- 1 Create or acquire a real-time system that runs in real time on rapid prototyping hardware. The Simulink Real-Time product facilitates real-time rapid prototyping. This product provides a real-

time operating system that makes PCs run in real time. It also provides device driver blocks for numerous hardware I/O cards. You can then create a rapid prototyping system using inexpensive commercial-off-the-shelf (COTS) hardware. In addition, third-party vendors offer products based on the Simulink Real-Time product or other code generation technology that you can integrate into a development environment.

- 2 Use provided system target files to generate code that you can deploy onto a real-time simulator. See the following information.

Engineering Tasks	Related Product Information	Examples
Generate code for real-time rapid prototyping	“Compare System Target File Support Across Products” “Event-Based Scheduling” Embedded Coder “Support for Standards and Guidelines” on page 23-2	rtwdemo_counter rtwdemo_counter_msvc
Generate code for rapid prototyping in hard real time, using PCs	Simulink Real-Time “Simulink Real-Time Options Pane” (Simulink Real-Time)	slrt_ex_osc (and others)
Generate code for rapid prototyping in soft real time, using PCs	Simulink Desktop Real-Time “Simulink Desktop Real-Time Pane” (Simulink Desktop Real-Time)	sldrtex_vdp (and others)

- 3 Monitor signals, tune parameters, and log data.

## Deploy Environment Model for Real-Time Hardware-In-the-Loop (HIL) Simulation

### In this section...

“About Hardware-In-the-Loop Simulation” on page 70-4

“Set Up and Run HIL Simulations” on page 70-4

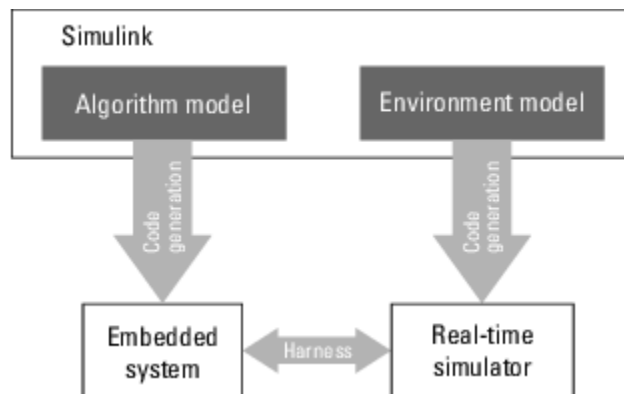

### About Hardware-In-the-Loop Simulation

Hardware-in-the-loop (HIL) simulation tests and verifies an embedded system or control unit in the context of a software test platform. Examples of test platforms include real-time target systems and instruction set simulators (IISs). You use Simulink software to develop and verify a model that represents the test environment. Using the code generator, you produce, build, and download an executable program for the model to the HIL simulation platform. After you set up the environment, you can run the executable to validate the embedded system or control unit in real time.

During HIL simulation, you gradually replace parts of a system environment with hardware components as you refine and fabricate the components. HIL simulation offers an efficient design process that eliminates costly iterations of part fabrication.

The code that you build for the system simulator provides real-time system capabilities. For example, the code can include VxWorks from Wind River or another real-time operating system (RTOS).

The following figure shows a typical HIL setup.

The HIL platform available from MathWorks is the Simulink Real-Time product. Several third-party products are also available for use as HIL platforms. The Simulink Real-Time product offers hard real-time performance for PCs with Intel or AMD® 32-bit processors functioning as your real-time target. The Simulink Real-Time product enables you to add I/O interface blocks to your models and automatically generate code with code generation technology. The Simulink Real-Time product can download the code to a second PC running the Simulink Real-Time real-time kernel. System integrator solutions that are based on Simulink Real-Time are also available.

### Set Up and Run HIL Simulations

To set up and run HIL simulations iterate through the following steps:

- 1** Develop a model that represents the environment or system under development.  
For more information, see “Compare System Target File Support Across Products”.
- 2** Generate an executable for the environment model.
- 3** Download the executable for the environment model to the HIL simulation platform.
- 4** Replace software representing a system component with corresponding hardware.
- 5** Test the hardware in the context of the HIL system.
- 6** Repeat steps 4 and 5 until you can simulate the system after including components that require testing.

- “Real-Time Simulation and Testing” (Simulink Real-Time)

## Untrusted Custom Code, Custom Targets, and Callbacks

You can use custom code in:

- Simulations on your development computer.
- Applications that you deploy on external hardware.

Untrusted custom code, custom targets, or callbacks have risks. For example, unintended modification of your design, unauthorized acquisition of sensitive code and data by third parties, and unapproved destruction of data.

Best practices for exchanging sensitive code and data with a supplier or customer are:

- For code packaging, use a secure container that supports encryption such as an Open Packaging Conventions (OPC) container.
- For file transfer, use a secure transfer protocol such as HTTPS or SFTP.

## Deploy Applications to Target Hardware

By default, the Embedded Coder software generates application code that does not require an external real-time executive or operating system. Generated application code requires minimal modification to be adapted to the target hardware. The architecture of the application code supports execution of models with single or multiple sample rates.

## Generate Code for an Application

To generate code for an application:

- 1 Select the model configuration parameter **Generate an example main program**. This enables the **Target operating system** menu.
- 2 From the **Target operating system** menu, select **BareBoardExample**.
- 3 Generate code.

Different code is generated for multirate models depending on these factors:

- Whether the model executes in single-tasking or multitasking mode.
- Whether or not reusable code is being generated.

These factors can impact the scheduling algorithms used in generated code, and in some cases impact the API for the model entry-point functions. The following sections discuss these variants.

## Generated Application Code

The core of generated application code is the main loop. On each iteration, the main loop executes a background or null task and checks for a termination condition.

The main loop is periodically interrupted by a timer. The function `rt_OneStep` is installed as a timer interrupt service routine (ISR) or is called from a timer ISR at each clock step.

The execution driver, `rt_OneStep`, sequences calls to `model_step` functions. The operation of `rt_OneStep` differs depending on whether the model is single-rate or multirate. For a single-rate model, `rt_OneStep` simply calls the `model_step` function. For a multirate model, `rt_OneStep` prioritizes and schedules execution of blocks according to the rates at which they run.

## Main Program

- “Overview of Operation” on page 71-3
- “Guidelines for Modifying Main Program” on page 71-3

### Overview of Operation

This pseudocode shows the execution of a generated example main program.

```
main()
{
 Initialization (including installation of rt_OneStep as an
 interrupt service routine for a real-time clock)
 Initialize and start timer hardware
 Enable interrupts
 While(not Error) and (time < final time)
 Background task
 EndWhile
 Disable interrupts (Disable rt_OneStep from executing)
 Complete any background tasks
 Shutdown
}
```

The pseudocode is a design for a harness program to drive code generated for your model. The main program implements this design partially. You must modify it according to target environment software specifications.

### Guidelines for Modifying Main Program

Make these changes in the production version of the main program module that implements your harness program:

- 1 Call *model\_initialize*.
- 2 Initialize target-specific data structures and hardware, such as ADCs or DACs.
- 3 Install *rt\_OneStep* as a timer ISR.
- 4 Initialize timer hardware.
- 5 Enable timer interrupts and start the timer.

*rtModel* is not in a valid state until the main program calls *model\_initialize*. The main program should not start servicing timer interrupts until after calling *model\_initialize*.

- 6 Optionally, insert background task calls in the main loop.
- 7 On termination of the main loop (if applicable):
  - Disable timer interrupts.
  - Perform target-specific cleanup such as zeroing DACs.
  - Detect and handle errors. Note that even if your program is designed to run indefinitely, you may need to handle severe error conditions, such as timer interrupt overruns.

You can use the macros *rtmGetErrorStatus* and *rtmSetErrorStatus* to detect and signal errors.

## rt\_OneStep and Scheduling Considerations

- “Overview of Operation” on page 71-4
- “Single-Rate Single-Tasking Operation” on page 71-4
- “Multirate Multitasking Operation” on page 71-5
- “Multirate Single-Tasking Operation” on page 71-7
- “Guidelines for Modifying rt\_OneStep” on page 71-7

### Overview of Operation

The operation of `rt_OneStep` depends upon

- Whether the model is single-rate or multirate. In a single-rate model, the sample times of blocks in the model and the model fixed step size are the same. A model for which the sample times and step size do not meet these conditions is a multirate model.
- The model solver mode (SingleTasking versus MultiTasking)

Permitted Solver Modes for Embedded Real-Time System Target Files summarizes the valid solver modes for single-rate and multirate models. For a single-rate model, only SingleTasking solver mode is allowed.

### Permitted Solver Modes for Embedded Real-Time System Target Files

Mode	Single-Rate	Multirate
SingleTasking	Allowed	Allowed
MultiTasking	Disallowed	Allowed
Auto	Allowed (defaults to SingleTasking)	Allowed (defaults to MultiTasking)

The generated code for `rt_OneStep` (and associated timing data structures and support functions) is tailored to the number of rates in the model and to the solver mode.

### Single-Rate Single-Tasking Operation

The only valid solver mode for a single-rate model is SingleTasking. Such models run in “single-rate” operation.

This pseudocode shows the design of `rt_OneStep` in a single-rate program.

```
rt_OneStep()
{
 Check for interrupt overflow or other error
 Enable "rt_OneStep" (timer) interrupt
 Model_Step() -- Time step combines output, logging, update
}
```

For the single-rate case, the generated `model_step` function is

```
void model_step(void)
```

Single-rate `rt_OneStep` executes `model_step` within a single clock period. To enforce this timing constraint, `rt_OneStep` maintains and checks a timer overrun flag. On entry, the main program disables timer interrupts until after checking the overrun flag and for other error conditions. If the overrun flag is clear, `rt_OneStep` sets the flag, and proceeds with timer interrupts enabled.

The main program clears the overrun flag if `model_step` returns without being reinterrupted by the timer. If `rt_OneStep` is reinterrupted by the timer before completing `model_step`, the main program detects the reinterruption through the overrun flag and an error condition results. If the main program detects this condition, `rt_OneStep` signals an error and returns immediately. You can change this behavior if you want to handle the condition differently.

The design of `rt_OneStep` assumes that the main program disables interrupts before calling `rt_OneStep`. The main program should not interrupt `rt_OneStep` until after checking the setting of the interrupt overflow flag.

### Multirate Multitasking Operation

In a multirate multitasking system, the generated example main program uses a prioritized, preemptive multitasking scheme to execute the different sample rates in a model.

This pseudocode shows the design of `rt_OneStep` in a multirate multitasking program.

```
rt_OneStep()
{
 Check for base-rate interrupt overrun
 Enable "rt_OneStep" interrupt
 Determine which rates need to run this time step

 Model_Step0() -- run base-rate time step code

 For N=1:NumTasks-1 -- iterate over sub-rate tasks
 If (sub-rate task N is scheduled)
 Check for sub-rate interrupt overrun
 Model_StepN() -- run sub-rate time step code
 EndIf
 EndFor
}
```

### Task Identifiers

The generated main program groups the execution of blocks that use different sample rates into different tasks. The code generator assigns each block that executes at a given sample rate a *task identifier* (`tid`), which associates the code for that block with a task that executes at that rate. Where there are `NumTasks` tasks in the system, the range of task identifiers is `0..NumTasks-1`.

### Prioritization of Base-Rate and Subrate Tasks

The scheduler prioritizes tasks in descending order by rate. The *base-rate* task runs at the fastest rate in the system (the hardware clock rate). The base-rate task has highest priority (`tid 0`). The next fastest task (`tid 1`) has the next highest priority, and so on down to the slowest, lowest priority task (`tid NumTasks-1`).

The slower tasks, running at multiples of the base rate, are *subrate* tasks.

### Rate Grouping and Rate-Specific `model_step` Functions

For a single-rate model, the main program performs block output computations by calling a single entry-point function, `model_step`. For multirate, multitasking models, the main program applies *rate*

*grouping*. The generated code includes a separate *model\_step* entry-point function for the base rate task and each subrate task in the model. The function naming convention for these functions is as follows, where *N* is a task identifier:

*model\_stepN*

For example, for a model named `my_model` that has three rates, the code generator produces these entry-point functions:

```
void my_model_step0 (void);
void my_model_step1 (void);
void my_model_step2 (void);
```

Each *model\_stepN* function executes the code generated for blocks that share `tid N`. The code generator groups block code that executes within task *N* into the associated *model\_stepN* function.

### Scheduling *model\_stepN* Execution

On each clock tick, `rt_OneStep` maintains scheduling counters and *event flags* for each subrate task. The code generator implements:

- Counters as `taskCounter` arrays indexed on `tid`
- Event flags as arrays indexed on `tid`.

The scheduler uses `rt_OneStep` to maintain scheduling counters and task flags for subrates. The scheduling counters are clock rate dividers that count up the sample period associated with each subrate task. A pair of tasks that exchanges data maintains an interaction flag at the faster rate. Task interaction flags indicate that fast and slow tasks are scheduled to run.

The event flags indicate whether a given task is scheduled for execution. `rt_OneStep` maintains the event flags based on a task counter that is maintained by code in the main program for the model. When a counter indicates that the sample period for a task has elapsed, the main code sets the event flag for that task.

On each invocation, `rt_OneStep` updates its scheduling data structures and steps the base-rate task (`rt_OneStep` calls *model\_step0* because the base-rate task must execute on every clock step). Then, `rt_OneStep` iterates over the scheduling flags in `tid` order, unconditionally calling *model\_stepN* for each task for which the flag is set. The scheduler executes the tasks in priority order.

### Preemption

The design of `rt_OneStep` assumes that the main program disables interrupts before calling `rt_OneStep`. The main program should not interrupt `rt_OneStep` until after checking the base-rate interrupt overflow flag (see pseudocode above).

The event flag array and loop variables that `rt_OneStep` uses are stored as local stack variables, making `rt_OneStep` reentrant. If `rt_OneStep` is reinterrupted, higher priority tasks preempt lower priority tasks. Upon return from interrupt, lower priority tasks resume in the previously scheduled order.

### Overrun Detection

Multirate `rt_OneStep` maintains an array of timer overrun flags. `rt_OneStep` detects timer overrun, per task, by the same logic as single-rate `rt_OneStep`.

If you have developed multirate S-functions, or if you use a customized static main program module, see “Rate Grouping Compliance and Compatibility Issues” on page 71-12 for information about how to adapt your code for rate grouping compatibility. This adaptation produces more efficient code for multirate, multitasking models.

### Multirate Single-Tasking Operation

In a multirate single-tasking program, sample times in the model must be an integer multiple of the fixed-step size configured for the model.

In a multirate single-tasking program, blocks execute at different rates, but under the same task identifier. The operation of `rt_OneStep` is a simplified version of multirate multitasking operation. Rate grouping is not used. The only task is the base-rate task. The code generator produces one `model_step` entry-point function:

```
void model_step(void)
```

On each clock tick, `rt_OneStep` checks the overrun flag and calls `model_step`. The scheduling function for a multirate single-tasking program is `rate_scheduler` (rather than `rate_monotonic_scheduler`). The scheduler maintains scheduling counters on each clock tick. There is one counter for each sample rate in the model. The counters are implemented in an array (indexed on `tid`) within the Timing structure of `rtModel`.

The counters are clock rate dividers that count the sample period associated with each subrate task. When a counter indicates that a sample period for a given rate has elapsed, `rate_scheduler` clears the counter. This condition indicates that blocks running at that rate should execute on the next call to `model_step`, which is responsible for checking the counters.

### Guidelines for Modifying `rt_OneStep`

`rt_OneStep` does not require extensive modification. The only required change is to reenables interrupts after the overrun flags and error conditions are checked. If applicable:

- Save and restore your FPU context on entry and exit to `rt_OneStep`.
- Set model inputs associated with the base rate before calling `model_step0`.
- Get model outputs associated with the base rate after calling `model_step0`. If you modify `rt_OneStep` to read a value from a continuous output port after each base-rate model step, see the relevant cautionary guideline below.
- In a multirate, multitasking model, set model inputs associated with subrates before calling `model_stepN` in the subrate loop.
- In a multirate, multitasking model, get model outputs associated with subrates after calling `model_stepN` in the subrate loop.

Comments in `rt_OneStep` indicate the place to add your code.

In multirate `rt_OneStep`, you can optimize the generated code by unrolling `for` and `while` loops.

In addition, you can modify the overrun behavior to continue execution after error recovery is complete.

Observe these guidelines:

- You should not modify the way in which the counters, event flags, or other timing data structures are set in `rt_OneStep`, or in functions called from `rt_OneStep`. The `rt_OneStep` timing data structures (including `rtModel`) and logic are critical to the operation of the generated program.
- If you customize the main program module to read model outputs after each base-rate model step and select model configuration parameters **Support: continuous time** and **Single output/update function** can cause output values read from `main` for a continuous output port to differ from the corresponding output values in data logged for the model. While logged data is a snapshot of output at major time steps, output read from `main` after the base-rate model step function executes reflects intervening minor time steps. To eliminate the discrepancy, separate the generated output and update functions (clear model configuration parameter **Single output/update function**) or place a Zero-Order Hold block before the continuous output port.
- You might observe a mismatch between results from simulation and logged MAT file results from generated code if you do not set model inputs before each time you call the model step function. In the generated example main program, the following comments show the locations for setting the inputs and stepping the model with your code:

```
/* Set model inputs here */
/* Step the model */
```

If your model applies signal reuse and you are using `MatFileLogging` for comparing results from simulation against generated code, modify `rt_OneStep` to write model inputs in every time step as directed by these comments. Alternatively, you use a SIL or PIL approach for verification (see “Choose a SIL or PIL Approach” on page 88-11).

## Static Main Program Module

- “Overview” on page 71-8
- “Rate Grouping and Static Main Program” on page 71-9
- “Modify the Static Main Program” on page 71-9
- “Modify Static Main to Allocate and Access Model Instance Data” on page 71-10

### Overview

A strategy for deploying generated application code is to use model configuration parameter **Generate an example main program option** to generate an example main program module (`ert_main.c` or `.cpp`). For more information, see “Generate Code for an Application” on page 71-2.

Alternatively, you can clear the **Generate an example main program** parameter and use a generated static main program module as an example or template for developing your embedded application. Static main program modules provided by MathWorks include:

- `matlabroot/rtw/c/src/common/rt_main.c` — Supports the `Nonreusable` function setting for model configuration parameter **Code interface packaging**.
- `matlabroot/rtw/c/src/common/rt_malloc_main.c` — Supports the `Reusable` function setting for parameter **Code interface packaging**. Select model configuration parameter **Use dynamic memory allocation for model initialization** and set parameter **Pass root-level I/O as to Part of model data structure**.
- `matlabroot/rtw/c/src/common/rt_cppclass_main.cpp` — Supports the `C++ class` setting for parameter **Code interface packaging**.

Static main programs are not part of the generated code. The programs are provided as a basis for developing custom modifications and for use in simulation.

A static main program contains:

- `rt_OneStep`—A timer interrupt service routine (ISR) that calls the entry-point function `model_step` to execute processing for one clock period of the model.
- Skeletal `main` function—As provided, `main` is useful for simulation only. You must modify `main` for real-time interrupt-driven execution.

For single-rate models, operation of `rt_OneStep` and the `main` function in the static main program are the same as they are in the automatically generated version described in “Deploy Applications to Target Hardware” on page 71-2. For multirate, multitasking models, the static main program and generated code differ as described in the next section.

To develop an application by using a static main program:

- 1 Copy the program module to your working folder.
- 2 Rename the file. For example, rename `rt_main.c` to `model_rt_main.c`.
- 3 Customize the program module content.
- 4 Modify the template makefile or toolchain settings such that the build process creates a corresponding object file, such as `model_rt_main.obj` (on UNIX, `model_rt_main.o`), in the build folder.

If your existing application depends upon a static `ert_main.c` developed in releases before R2012b, `rt_main.c`, `rt_malloc_main.c`, or `rt_cppclass_main.cpp`, you might need to continue using that static main program.

### Rate Grouping and Static Main Program

ERT-based system target files can use a static main program module and disallow use of the model configuration parameter **Generate an example main program**. A custom system target file does not disallow use of that model configuration parameter when target-specific changes have been made to the static main program and those modifications must be preserved. A generated example main program does not preserve the changes to the static main program.

For models configured for multitasking (**Treat each discrete rate as a separate task** is selected) or concurrency (**Allow task to execute concurrently on target** is selected), the code generator uses a rate grouping scheme, producing a step entry-point function for each rate (`model_stepN`, where *N* identifies the rate). The Code Interface Report lists the individual entry-point functions that a main program can call.

To specify that only the rate-based step functions are generated without the wrapper function, use the TLC variable `RateBasedStepFcn`. If your target calls the rate grouping compatible function directly, set `RateBasedStepFcn` to 1. In this case, the wrapper function is not generated.

In your system target file, prior to the `%include "codegenentry.tlc"` statement, set the TLC variable `RateBasedStepFcn` to 1. Alternatively, set `RateBasedStepFcn` to 1 in your `target_settings.tlc` file.

### Modify the Static Main Program

Make few modifications to the main loop and the `rt_OneStep` function. See “Guidelines for Modifying Main Program” on page 71-3 and “Guidelines for Modifying `rt_OneStep`” on page 71-7.

Replace the `rt_OneStep` call in the main loop with a background task call or null statement.

Other modifications you might need to make are:

- If applicable, follow comments in the code regarding where to add code for reading and writing model I/O and saving and restoring FPU context.
- If you modify `rt_main.c`, `rt_malloc_main.c`, or `rt_cppclass_main.cpp` to read a value from a continuous output port after each base-rate model step, see the relevant guideline in “Guidelines for Modifying `rt_OneStep`” on page 71-7.
- When you clear the model configuration parameter **Generate an example main program**, the code generator produces `rtmodel.h` to provide an interface between the main program module and generated model code. If you create your own static main program module, include `rtmodel.h`.

Alternatively, you can suppress generation of `rtmodel.h` and include `model.h` directly in your main program module. To suppress generation of `rtmodel.h`, add this statement to your system target file:

```
%assign AutoBuildProcedure = 0
```

- If you cleared model configuration parameter **Terminate function required**, remove or comment out these items in your production version of `rt_main.c`, `rt_malloc_main.c`, or `rt_cppclass_main.cpp`:
  - The `#if TERMFCN...` compile-time error check
  - The call to `MODEL_TERMINATE`
- For only `rt_main.c`: If you do *not* want to combine output and update functions, clear model configuration parameter **Single output/update function** and make these changes in your production version of `rt_main.c`:
  - Replace calls to `MODEL_STEP` with calls to `MODEL_OUTPUT` and `MODEL_UPDATE`.
  - Remove the `#if ONESTEPFCN...` error check.
- The static program module `rt_main.c` does not support `Reusable` function code interface packaging. If you try to use it, a compile-time error occurs.

```
#if MULTI_INSTANCE_CODE==1
```

### Modify Static Main to Allocate and Access Model Instance Data

If you are using a static main program module and your model is configured for `Reusable` function code interface packaging, but the model configuration parameter **Use dynamic memory allocation for model initialization** is cleared, allocate model instance data statically or dynamically by the calling main code. Pointers to the individual model data structures, such as Block IO, `DWork`, and Parameters, must be set up in the top-level real-time model data structure.

To support main modifications, the build process generates a subset of these real-time model (RTM) macros, based on the data requirements of your model, into `model.h`.

RTM Macro Syntax	Description
<code>rtmGetBlockIO(rtm)</code>	Get the block I/O data structure
<code>rtmSetBlockIO(rtm, val)</code>	Set the block I/O data structure

RTM Macro Syntax	Description
<code>rtmGetContStates(rtm)</code>	Get the continuous states data structure
<code>rtmSetContStates(rtm, val)</code>	Set the continuous states data structure
<code>rtmGetDefaultParam(rtm)</code>	Get the default parameters data structure
<code>rtmSetDefaultParam(rtm, val)</code>	Set the default parameters data structure
<code>rtmGetPrevZCSigState(rtm)</code>	Get the previous zero-crossing signal state data structure
<code>rtmSetPrevZCSigState(rtm, val)</code>	Set the previous zero-crossing signal state data structure
<code>rtmGetRootDWork(rtm)</code>	Get the DWork data structure
<code>rtmSetRootDWork(rtm, val)</code>	Set the DWork data structure
<code>rtmGetU(rtm)</code>	Get the root inputs data structure (when root inputs are passed as part of the model data structure)
<code>rtmSetU(rtm, val)</code>	Set the root inputs data structure (when root inputs are passed as part of the model data structure)
<code>rtmGetY(rtm)</code>	Get the root outputs data structure (when root outputs are passed as part of the model data structure)
<code>rtmSetY(rtm, val)</code>	Set the root outputs data structure (when root outputs are passed as part of the model data structure)

To access individual model data structures within the RTM data structure, use these macros in your static main program. For example, suppose that the example model `rtwdemo_reusable` is configured with `Reusable` function code interface packaging, **Use dynamic memory allocation for model initialization** cleared, **Pass root-level I/O as** set to `Individual` arguments, and **Optimization** pane option **Remove root level I/O zero initialization** is cleared. Building the model generates these model data structures and model entry-points into `rtwdemo_reusable.h`:

```
/* Block states (auto storage) for system '<Root>' */
typedef struct {
 real_T Delay_DSTATE; /* '<Root>/Delay' */
} D_Work;

/* Parameters (auto storage) */
struct Parameters_ {
 real_T k1; /* Variable: k1
 * Referenced by: '<Root>/Gain'
 */
};

/* Model entry point functions */
extern void rtwdemo_reusable_initialize(RT_MODEL *const rtM, real_T *rtU_In1,
 real_T *rtU_In2, real_T *rtY_Out1);
extern void rtwdemo_reusable_step(RT_MODEL *const rtM, real_T rtU_In1, real_T
 rtU_In2, real_T *rtY_Out1);
```

If you do not select the model configuration parameter **Generate an example main program** for the model, `rtwdemo_reusable.h` contains definitions for the RTM macros `rtmGetDefaultParam`, `rtmsetDefaultParam`, `rtmGetRootDWork`, and `rtmSetRootDWork`.

For reference, the generated `rtmodel.h` file contains an example parameter definition that has initial values (nonexecuting code):

```
#if 0

/* Example parameter data definition with initial values */
static Parameters rtP = {
 2.0 /* Variable: k1
```

```

 * Referenced by: '<Root>/Gain'
 */
};
 /* Modifiable parameters */
#endif

```

In the definitions section of your static main file, you can use this code to statically allocate the real-time model data structures and arguments for the `rtwdemo_reusable` model:

```

static RT_MODEL rtM_;
static RT_MODEL *const rtM = &rtM_; /* Real-time model */
static Parameters rtP = {
 2.0
 /* Variable: k1
 * Referenced by: '<Root>/Gain'
 */
};
 /* Modifiable parameters */

static D_Work rtDWork; /* Observable states */

/* '<Root>/In1' */
static real_T rtU_In1;

/* '<Root>/In2' */
static real_T rtU_In2;

/* '<Root>/Out1' */
static real_T rtY_Out1;

```

In the body of your main function, you can use these RTM macro calls to set up the model parameters and DWork data in the real-time model data structure:

```

int_T main(int_T argc, const char *argv[])
{
 ...
 /* Pack model data into RTM */

 rtmSetDefaultParam(rtM, &rtP);
 rtmSetRootDWork(rtM, &rtDWork);

 /* Initialize model */
 rtwdemo_reusable_initialize(rtM, &rtU_In1, &rtU_In2, &rtY_Out1);
 ...
}

```

Follow a similar approach to set up multiple instances of model data, where the real-time model data structure for each instance has its own data. You must initialize the parameter structure (`rtP`) for each instance, to the values that you want, statically as part of the `rtP` data definition or at run time.

## Rate Grouping Compliance and Compatibility Issues

- “Main Program Compatibility” on page 71-12
- “Make Your S-Functions Rate Grouping Compliant” on page 71-12

### Main Program Compatibility

When you clear model configuration parameter **Generate an example main program**, the code generator produces slightly different rate grouping code, for compatibility with the older static `ert_main.c` module. See “Rate Grouping and Static Main Program” on page 71-9 for details.

### Make Your S-Functions Rate Grouping Compliant

Built-in Simulink blocks and DSP System Toolbox blocks are compliant with the requirements for generating rate grouping code. However, user-written multirate inlined S-functions might not be rate

grouping compliant. Noncompliant blocks generate less efficient code, but are otherwise compatible with rate grouping. To take full advantage of the efficiency of rate grouping, upgrade multirate inlined S-functions to be fully rate grouping compliant. You should upgrade your TLC S-function implementations, as described in this section.

Use of noncompliant multirate blocks to generate rate-grouping code generates dead code. This can cause two problems:

- Reduced code efficiency.
- Warning messages issued at compile time. Such warnings are caused when dead code references temporary variables before initialization. Since the dead code does not run there is no impact to the run-time behavior of the generated code.

To make your S-functions rate grouping compliant, use these TLC functions to generate `ModelOutputs` and `ModelUpdate` code, respectively:

```
OutputsForTID(block, system, tid)
UpdateForTID(block, system, tid)
```

These code listings illustrate generation of output computations without rate grouping (Listing 1) and with rate grouping (Listing 2).

- The `tid` argument is a task identifier ( $0 \dots \text{NumTasks} - 1$ ).
- Only code guarded by the `tid` passed into `OutputsForTID` is generated. The `if (%<LibIsSFcnSampleHit(portName)>)` test is not used in `OutputsForTID`.
- When generating rate grouping code, `OutputsForTID` and/or `UpdateForTID` is called during code generation. When generating non-rate-grouping code, `Outputs` and/or `Update` is called.
- In rate grouping compliant code, the top-level `Outputs` and/or `Update` functions call `OutputsForTID` and/or `UpdateForTID` functions for each rate (`tid`) involved in the block. The code returned by `OutputsForTID` and `UpdateForTID` must be guarded by the corresponding `tid` guard as in Listing 2:

```
if (%<LibIsSFcnSampleHit(portName)>)
```

 %if LibGetSFcnTIDType("InputPortIdx0") == "continuous"
 %% Only check the enable signal on a major time step.
 if (%<LibIsMajorTimeStep(>)) {
 %<enabled> = (%<enable> > 0.0);
 }
 %else
 %<enabled> = (%<enable> > 0.0);
 %endif
 %break
 %case LibGetGlobalTIDFromLocalSFcnTID("OutputPortIdx0")
 if (%<enabled>) {
 %assign y = LibBlockOutputSignal(0, "", "", 0)
 %<y> = %<signal>;
 }
 %break
 %case LibGetGlobalTIDFromLocalSFcnTID("OutputPortIdx1")
 if (%<enabled>) {
 %assign y = LibBlockOutputSignal(1, "", "", 0)
 %<y> = %<signal>;
 }
 %break
 %default
 %% error it out
%endswitch

%endfunction

%% [EOF] sfun_multirate.tlc

```

## Generate Code That Dereferences Data from a Literal Memory Address

This example shows how to generate code that reads the value of a signal by dereferencing a memory address that you specify. With this technique, you can generate a control algorithm that interacts with memory that your hardware populates (for example, memory that stores the output of an analog-to-digital converter in a microcontroller).

In this example, you generate an algorithm that acquires input data from a 16-bit block of memory at address `0x8675309`. Assume that a hardware device asynchronously populates only the lower 10 bits of the address. The algorithm must treat the address as read-only (`const`), volatile (`volatile`) data, and ignore the upper 6 bits of the address.

The generated code can access the data by defining a macro that dereferences `0x8675309` and masks the unnecessary bits:

```
#define A2D_INPUT ((*(volatile const uint16_T *)0x8675309)&0x03FF)
```

To configure a model to generate code that defines and uses this macro:

- 1 Create the example model.
- 2 Create package to contain definitions of data class and storage class.
- 3 Use Custom Storage Class Designer to create a storage class.
- 4 Define a class to store property settings for the storage class.
- 5 Write Target Language Compiler (TLC) code that emits the correct C code for the storage class.
- 6 Define a class for the inport data.
- 7 Load the package into the Embedded Coder® Dictionary.
- 8 Configure the model root-level inport to use the storage class.

## 9 Generate and inspect the code.

For an example that shows how to use the Custom Storage Class Designer without writing TLC code, see “Create and Apply a Storage Class” on page 40-14.

As an alternative to writing TLC code, you can use memory sections to generate code that includes pragmas. Depending on your build toolchain, you can use pragmas to specify a literal memory address for storing a global variable. For more information about memory sections, see “Control Data and Function Placement in Memory by Inserting Pragmas” on page 45-2.

### Derivation of Macro Syntax

In this example, you configure the generated code to define and use the dereferencing macro. To determine the correct syntax for the macro, start by recording the target address.

```
0x8675309
```

Cast the address as a pointer to a 16-bit integer. Use the Simulink® Coder™ data type name `uint16_T`.

```
(uint16_T *)0x8675309
```

Add the storage type qualifier `const` because the generated code must not write to the address. Add `volatile` because the hardware can populate the address at an arbitrary time.

```
(volatile const uint16_T *)0x8675309
```

Dereference the address.

```
*(volatile const uint16_T *)0x8675309
```

After the dereference operation, apply a mask to retain only the 10 bits that the hardware populates. Use explicit parentheses to control the order of operations.

```
(* (volatile const uint16_T *)0x8675309) & 0x03FF
```

As a safe coding practice, wrap the entire construct in another layer of parentheses.

```
((*(volatile const uint16_T *)0x8675309) & 0x03FF)
```

### Create Example Model

Create the example model `ex_memmap_simple`.

Copyright 2022 The MathWorks, Inc.

For the Inport block, set the output data type to `uint16`. Name the signal as `A2D_INPUT`. The Inport block and the signal line represent the data that the hardware populates.

For the Gain block, set the output data type to `double`.

## Create Package to Contain Definitions of Data Class and Storage Class

In your current folder, create a folder named +MemoryMap. The folder defines a package named MemoryMap.

To make the package available for use outside of your current folder, you can add the folder containing the +MemoryMap folder to the MATLAB® path.

### Create Storage Class

To generate code that defines and reads A2D\_INPUT as a macro, you must create a storage class that you can apply to the model root-level inport. Later, you write TLC code that complements the storage class.

Open the Custom Storage Class designer in advanced mode. To design a storage class that operates through custom TLC code, you must use the advanced mode.

```
cscdesigner('MemoryMap', '-advanced');
```

In the Custom Storage Class Designer, click **New**. A new custom storage class, NewCSC\_1, appears in the list of storage class definitions.

Rename the storage class to MemoryMappedAddress.

For MemoryMappedAddress, on the **General** tab, set:

- **Type** to `Other`. The storage class can operate through custom TLC code that you write later.
- **Data scope** to `Exported`. For data items that use this custom storage class, Simulink Coder generates the definition (for example, the `#define` statement that defines a macro).
- **Data initialization** to `None`. Simulink Coder does not generate code that initializes the data item. Use this setting because this custom storage class represents read-only data. You do not select `Macro` because the Custom Storage Class Designer does not allow you to use `Macro` for signal data.
- **Definition file** to `Specify` (leave the text box empty). For data items that consume memory in the generated code, **Definition file** specifies the `.c` source file that allocates the memory. This storage class yields a macro, which does not require memory. Typically, header files (`.h`), not `.c` files, define macros. Setting **Definition file** to `Specify` instead of `Instance specific` prevents users of the storage class from unnecessarily specifying a definition file.
- **Header file** to `Instance specific`. To control the file placement of the macro definition, the user of the storage class must specify a header file for each data item that uses this storage class.
- **Owner** to `Specify` (leave the text box empty). **Owner** applies only to data items that consume memory.

After you finish selecting the settings, click **Apply** and **Save**.

Now, when you apply the storage class to a data item, such as inport In1, you can specify a header file to contain the generated macro definition. You cannot yet specify a memory address for the data item. To enable specification of a memory address, create a custom attributes class that you can associate with the MemoryMappedAddress storage class.

### Define Class to Store Property Settings for Storage Class

Define a MATLAB class to store additional information for data items that use the storage class. In this case, the additional information is the memory address.

In the MemoryMap package (the +MemoryMap folder), create a folder named @MemoryMapAttribs.

In the @MemoryMapAttribs folder, create a file named MemoryMapAttribs. The file defines a class that derives from the built-in class Simulink.CustomStorageClassAttributes.

```
classdef MemoryMapAttribs < Simulink.CustomStorageClassAttributes
 properties(PropertyType = 'char')
 MemoryAddress = '';
 end
end
```

Later, you associate this MATLAB class with the MemoryMappedAddress storage class. Then, when you apply the storage class to a data item, you can specify a memory address.

### Write TLC Code That Emits Correct C Code

Write TLC code that uses the attributes of the storage class, such as HeaderFile and MemoryAddress, to generate correct C code for each data item.

In the +MemoryMap folder, create a folder named tlc.

Navigate to the new folder.

Inspect the built-in template TLC file, TEMPLATE\_v1.tlc.

```
edit(fullfile(matlabroot,...
 'toolbox','rtw','targets','ecoder','csc_templates','TEMPLATE_v1.tlc'))
```

Save a copy of TEMPLATE\_v1.tlc in the tlc folder. Rename the copy memory\_map\_csc.tlc.

In memory\_map\_csc.tlc, find the portion that controls the generation of C-code data declarations.

```
%case "declare"

 %% LibDefaultCustomStorageDeclare is the default declare function to
 %% declares a global variable whose identifier is the name of the data.
 %return "extern %<LibDefaultCustomStorageDeclare(record)>"
 %%break

 %% =====
```

The declare case (%case) constructs a return value (%return), which the code generator emits into the header file that you specify for each data item. To control the C code that declares each data item, adjust the return value in the declare case.

Replace the existing %case content with this new code, which specifies a different return value:

```
%case "declare"

 %% In TLC code, a 'record' is a data item (for example, a signal line).
 %% 'LibGetRecordIdentifier' returns the name of the data item.
 %assign id = LibGetRecordIdentifier(record)

 %assign dt = LibGetRecordCompositeDataTypeName(record)
```

```

%% The 'CoderInfo' property of a data item stores a
%% 'Simulink.CoderInfo' object, which stores code generation settings
%% such as the storage class or custom storage class that you specify
%% for the item.
%assign ci = record.Object.ObjectProperties.CoderInfo
%% The 'ci' variable now stores the 'Simulink.CoderInfo' object.

%% By default, the 'CustomAttributes' property of a 'Simulink.CoderInfo'
%% object stores a 'Simulink.CustomStorageClassAttributes' object.
%% This nested object stores specialized code generation settings
%% such as the header file and definition file that you specify for
%% the data item.
%%
%% The 'MemoryMap' package derives a new class,
%% 'MemoryMapAttribs', from 'Simulink.CustomStorageClassAttributes'.
%% The new class adds a property named 'MemoryAddress'.
%% This TLC code determines the memory address of the data item by
%% acquiring the value of the 'MemoryAddress' property.
%assign ca = ci.Object.ObjectProperties.CustomAttributes
%assign address = ca.Object.ObjectProperties.MemoryAddress

%assign width = LibGetDataWidth(record)

%% This TLC code constructs the full macro, with correct C syntax,
%% based on the values of TLC variables such as 'address' and 'dt'.
%% This TLC code also asserts that the data item must be a scalar.
%if width == 1
 %assign macro = ...
 "#define %<id> ((*volatile const %<dt>*)%<address>) & 0x03FF)"
%else
 %error("Non scalars are not supported yet.")
%endif

%return "%<macro>"
%%break

%% =====

```

The new TLC code uses built-in, documented TLC functions, such as `LibGetRecordIdentifier`, and other TLC commands and operations to access information about the data item. Temporary variables such as `dt` and `address` store that information. The TLC code constructs the full macro, with the correct C syntax, by expanding the variables, and stores the macro in the variable `macro`.

In the same file, find the portion that controls the generation of data definitions.

```

%case "define"

%% LibDefaultCustomStorageDefine is the default define function to define
%% a global variable whose identifier is the name of the data. If the
%% data is a parameter, the definition is also statically initialized to
%% its nominal value (as set in MATLAB).
%return "%<LibDefaultCustomStorageDefine(record)>"
%%break

%% =====

```

The `define` case derives a return value that the code generator emits into a `.c` file, which defines data items that consume memory.

Replace the existing `%case` content with this new content:

```
%case "define"
 %return ""
 %%break

%% =====
```

`MemoryMappedAddress` yields a macro in the generated code, so you use the `declare` case instead of the `define` case to construct and emit the macro. To prevent the `define` case from emitting a duplicate macro definition, the new TLC code returns an empty string.

Find the portion that controls the generation of code that initializes data.

```
%case "initialize"

 %% LibDefaultCustomStorageInitialize is the default initialization
 %% function that initializes a scalar element of a global variable to 0.
 %return LibDefaultCustomStorageInitialize(record, idx, reim)
 %%break

%% =====
```

The `initialize` case generates code that initializes data items (for example, in the `model_initialize` function).

Replace the existing `%case` content with this new content:

```
%case "initialize"
 %return ""
 %%break

%% =====
```

`MemoryMappedAddress` yields a macro, so the generated code must not attempt to initialize the value of the macro. The new TLC code returns an empty string.

### Complete the Definition of the Storage Class

Your new MATLAB class, `MemoryMapAttribs`, can enable users of your storage class, `MemoryMappedAddress`, to specify a memory address for each data item. To allow this specification, associate `MemoryMapAttribs` with `MemoryMappedAddress`. To generate correct C code based on the information that you specify for each data item, associate the customized TLC file, `memory_map_csc.tlc`, with `MemoryMappedAddress`.

Navigate to the folder that contains the `+MemoryMap` folder.

Open the Custom Storage Class Designer again.

```
cscdesigner('MemoryMap', '-advanced');
```

For `MemoryMappedAddress`, on the **Other Attributes** tab, set:

- **TLC file name** to `memory_map_csc.tlc`.
- **CSC attributes class** to `MemoryMap.MemoryMapAttribs`.

Click **Apply** and **Save**.

### Define Signal Data Class

To apply the storage class to a data element in a model, in the `MemoryMap` package, you must create a MATLAB class that derives from `Simulink.Signal`. When you configure the signal in the model, you select this new data class instead of the default class, `Simulink.Signal`.

In the `MemoryMap` package, create a folder named `@Signal`.

In the `@Signal` folder, create a file named `Signal.m`.

```
classdef Signal < Simulink.Signal
 methods
 function setupCoderInfo(this)
 useLocalCustomStorageClasses(this, 'MemoryMap');
 return;
 end
 end
end
```

The file defines a class named `MemoryMap.Signal`. The class definition overrides the `setupCoderInfo` method, which the `Simulink.Signal` class already implements. The new implementation specifies that objects of the `MemoryMap.Signal` class use custom storage classes from the `MemoryMap` package (instead of storage classes from the `Simulink` package). When you configure a signal in a model by selecting the `MemoryMap.Signal` class, you can select the new custom storage class, `MemoryMappedAddress`.

### Load Package into Embedded Coder Dictionary

Navigate to the folder that contains the example model and open the model.

Open the **Embedded Coder** app.

Open the Embedded Coder Dictionary. On the **C Code** tab, select **Code Interface > Embedded Coder Dictionary**.

In the Embedded Coder Dictionary, click **Manage Packages**.

In the Manage Package dialog box, click **Refresh**. When the refresh is complete, select the package `MemoryMap`. Click **Load**.

Close the Embedded Coder Dictionary.

### Configure Root-Level Inport to Use Storage Class

In the **Embedded Coder** app, use the Code Mappings editor and Property Inspector to configure Inport In1 to use the storage class that you defined.

Open the Code Mappings editor. On the **C Code** tab, select **Code Interface > Individual Element Code Mappings**.

In the Code Mappings Editor, on the **Inports** tab, select inport In1. Set the storage class for In1 to MemoryMappedAddress.

In the Property Inspector, under **Code**, set the **HeaderFile** property to `memory_mapped_addresses.h` and the **MemoryAddress** property to `0x8675309`.

Save the model.

### Generate and Inspect Code

Generate code from the model.

```
Starting build procedure for: ex_memmap_simple
```

```
tf =
```

```
 logical
```

```
 0
```

```
Successful completion of build procedure for: ex_memmap_simple
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
ex_memmap_simple	Code generated and compiled.	Code generation information file does not exist.

1 of 1 models built (0 models already up to date)

Build duration: 0h 0m 33.533s

Inspect the generated header file `memory_mapped_addresses.h`. The file defines the macro `A2D_INPUT`, which corresponds to the signal line in the model.

```
/* Declaration of data with custom storage class MemoryMappedAddress */
#define A2D_INPUT ((*(volatile const uint16_T*)0x8675309) & 0x03FF)
```

Inspect the generated file `ex_memmap_simple.c`. The generated algorithmic code (which corresponds to the Gain block) calculates the model output, `rtY.Out1`, by operating on `A2D_INPUT`.

```
/* Model step function */
void step(void)
{
 /* Output: '<Root>/Out1' incorporates:
 * Gain: '<Root>/Gain'
 * Inport: '<Root>/In1'
 */
 */
```

```
 rtY.Out1 = 42.0 * (real_T)A2D_INPUT;
}
```

## Deploy Component Algorithm as Component Model Library by Using CMake

This example shows how to use the CMake approach of building code from a component algorithm model for deploying the algorithm code as a component model library. CMake is a third-party, open-source tool for build process management. CMake uses configuration files (CMakeLists.txt) to generate standard build files for native build environments such as, makefiles, Ninja files, or Microsoft® Visual Studio® projects. The example guides you through these steps:

- 1 Open the model.
- 2 Generate component code from the model.
- 3 Implement handwritten integration code.
- 4 Configure CMake for your target environment.
- 5 Generate build artifacts and build integrated code.
- 6 Run the executable program.

### Open Model

Open example model ComponentDeploymentFcn.slx.

```
open_system('ComponentDeploymentFcn');
```

### Generate Component Code from Model

- 1 Configure your target platform for the code generator.
- 2 Generate source code.
- 3 Create a CMakeLists.txt file for the component model library.

- 4 Optionally, package generated code files and CMakeLists.txt files into a ZIP file that you can use to relocate the files.

### Configure Model Target Environment Device Type

Inform the code generator about the C language constraints for your target platform by defining a workspace variable (*prodHWDeviceType*) that you can use for setting model configuration parameter *ProdHWDeviceType*.

```
switch computer('arch')
 case 'win64'
 prodHWDeviceType = 'Intel->x86-64 (Windows64)';
 case 'glnxa64'
 prodHWDeviceType = 'Intel->x86-64 (Linux 64)';
 case 'maci64'
 prodHWDeviceType = 'Intel->x86-64 (Mac OS X)';
 case 'maca64'
 prodHWDeviceType = 'Apple->ARM64';
 otherwise
 assert(false, 'Platform not supported');
end
set_param('ComponentDeploymentFcn', 'ProdHWDeviceType', prodHWDeviceType);
```

### Generate Code

```
slbuild('ComponentDeploymentFcn', 'GenerateCodeOnly', true)

Starting build procedure for: ComponentDeploymentFcn
Successful completion of code generation for: ComponentDeploymentFcn
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
ComponentDeploymentFcn	Code generated.	Code generation information file does not exist.

1 of 1 models built (0 models already up to date)  
Build duration: 0h 0m 31.373s

### Create CMakeLists.txt File for Component Model Library

```
codebuild('ComponentDeploymentFcn_ert_rtw/services/lib', 'BuildMethod', 'cmake');
```

### Package Generated Files

To relocate files to another development environment, use the packNGo utility to package generated code, build artifact, and CMakeLists.txt files into a ZIP file.

```
%% Optional
packNGo('ComponentDeploymentFcn_ert_rtw', 'packType', 'hierarchical', 'nestedZipFiles', false);
copyfile('ComponentDeploymentFcn.zip', 'path-for-destination');
cd path-for-destination
unzip('ComponentDeploymentFcn.zip');
```

## Implement Handwritten Integration Code

### main function

Implement handwritten code for a `main` function in the `src` subfolder of your code generation folder (`codeGenerationFolder/src/`). For this example, you can use the function in file `ComponentDeploymentFcnIntegration.c`.

```
open('ComponentDeploymentFcnIntegration.c');

#include "ComponentDeploymentFcn.h"
#include <stddef.h>
#include <stdio.h>
extern uint32_T tick; // Variable used by timer service implementation
const size_t nIter = 3;
int main(void) {

 // Run model initialize function
 printf("\nRunning model initialize function\n");
 CD_initialize();

 for (size_t k = 0; k < nIter; ++k) {

 // Run periodic Accumulator function at every iteration
 printf("\nRunning Accumulator function (iteration %llu)\n", k);
 CD_accumulator();

 if (k == 1) {
 // The asynchronous Integrator function only runs when k == 1
 printf("\nRunning Integrator function (iteration %llu)\n", k);
 CD_integrator();
 }

 // Increment timer tick count
 tick++;
 }

 // Run model terminate function
 printf("\nRunning model terminate function\n");
 CD_terminate();
}
```

### services.c

Create handwritten code that provides implementations of the target platform services in the `src` subfolder of your code generation folder (`codeGenerationFolder/src/`). For this example, you can use the code in file `services.c`.

```
open('services.c');

#include "services.h"

#include <stdio.h>

uint32_T tick = 0;

static real_T DataTransfer_storage = 0;
```

```

static real_T input_storage = 0;
static real_T NVM_storage = 100;
static real_T output_storage = 0;

/* timer services */
uint32_T get_tick_outside_CD_integrator(void) {
 printf("Service function called: get_tick_outside_CD_integrator.\n");
 return tick;
}

/* data transfer services */
const real_T * get_CD_accumulator_DataTransfer(void) {
 printf("Service function called: get_CD_accumulator_DataTransfer.\n");
 return &DataTransfer_storage;
}

real_T * set_CD_integrator_DataTransfer(void) {
 printf("Service function called: set_CD_integrator_DataTransfer.\n");
 return &DataTransfer_storage;
}

real_T * set_ModelInitialize_DataTransfer(void) {
 printf("Service function called: set_ModelInitialize_DataTransfer.\n");
 return &DataTransfer_storage;
}

/* receiver services */
const real_T * get_CD_integrator_InBus_u(void) {
 printf("Service function called: get_CD_integrator_InBus_u.\n");
 return &input_storage;
}

const real_T * get_CD_initialize_InBus_NVM(void) {
 printf("Service function called: get_CD_initialize_InBus_NVM.\n");
 return &NVM_storage;
}

/* sender services */
real_T * getref_CD_accumulator_OutBus_y(void) {
 printf("Service function called: getref_CD_accumulator_OutBus_y.\n");
 return &output_storage;
}

real_T * getref_CD_terminate_OutBus_NVM(void) {
 printf("Service function called: getref_CD_terminate_OutBus_NVM.\n");
 return &NVM_storage;
}

```

### **CMakeLists.txt**

Create a `CMakeLists.txt` file in your code generation folder (*codeGenerationFolder*). For this example, you can use the provided `CMakeLists.txt` file.

```

cmake_minimum_required(VERSION 3.12)

Set a name for the project
project(ComponentDeploymentFcnIntegration)

```

```

Use the "add_subdirectory" command to reference the CMakeLists.txt file
that was generated by codebuild for the code generated from
the Simulink model. This has defined a static library target
named "ComponentDeploymentFcn" which we will link into
the application further down.
add_subdirectory(ComponentDeploymentFcn_ert_rtw/services/lib)

Use the "add_executable" command to define an executable target named
"ComponentDeploymentFcnIntegration" that is built from the hand-written
source files.
add_executable(ComponentDeploymentFcnIntegration
 src/ComponentDeploymentFcnIntegration.c
 src/services.c)

Specify that the executable target "ComponentDeploymentFcnIntegration"
incorporating the handwritten code should be linked against the the
"ComponentDeploymentFcn" library target containing the code
generated from the Simulink model.
target_link_libraries(ComponentDeploymentFcnIntegration PRIVATE ComponentDeploymentFcn)

```

### Configure CMake

Configure the CMake command and arguments for your target environment. You can use one of these examples.

#### Windows - Microsoft Visual Studio 2017 Solution

```

cmakeCommand = ['"', fullfile(matlabroot, 'bin', 'win64', 'cmake', 'bin', 'cmake.exe'), ''];
cmakeArguments = '-G "Visual Studio 15 2017"';

```

#### Windows - Microsoft Visual Studio 2019 Solution

```

cmakeCommand = ['"', fullfile(matlabroot, 'bin', 'win64', 'cmake', 'bin', 'cmake.exe'), ''];
cmakeArguments = '-G "Visual Studio 16 2019"';

```

#### Windows - Microsoft Visual Studio with NMake

```

[status, msvcInstall] = system('%ProgramFiles(x86)%\Microsoft Visual Studio\Installer\vswhere'
msvcInstall = strtrim(msvcInstall);
assert(status == 0 && ~isempty(msvcInstall), 'Could not find location of Microsoft Visual Studio
vcvarsAll = fullfile(msvcInstall, 'VC', 'Auxiliary', 'Build', 'vcvarsall.bat');
envSetupCommand = ['" ' vcvarsAll '" amd64 && '];
cmakeCommand = [envSetupCommand, '"', fullfile(matlabroot, 'bin', 'win64', 'cmake', 'bin', 'cmake
cmakeArguments = '-G "NMake Makefiles"';

```

#### Windows - MinGW

```

mingwLoc = getenv('MW_MINGW64_LOC');
assert(~isempty(mingwLoc), 'Could not find location of MinGW installation');
mingwLocBin = [mingwLoc, '/bin'];
envSetupCommand = ['set PATH=', mingwLocBin, '%PATH% && '];
cmakeCommand = [envSetupCommand, '"', fullfile(matlabroot, 'bin', 'win64', 'cmake', 'bin', 'cmake
cmakeArguments = ['-G "MinGW Makefiles" ', ...
 '-DCMAKE_C_COMPILER="gcc.exe" ', ...
 '-DCMAKE_CXX_COMPILER="g++.exe"'];

```

**Linux - GCC and GMake**

```
cmakeCommand = ['"', fullfile(matlabroot, 'bin', 'glnxa64', 'cmake', 'bin', 'cmake'), ''];
cmakeArguments = '-G "Unix Makefiles"';
```

**Mac - XCode with Clang**

```
cmakeCommand = ['"', fullfile(matlabroot, 'bin', computer('arch'), 'cmake', 'bin', 'cmake'), ''];
cmakeArguments = '-G "Xcode"';
```

**Generate Build Artifacts and Build Integrated Code**

To generate required build artifacts and build the integrated code, run CMake. In *codeGenerationFolder*, run these commands:

```
[status1, cmdout1] = system([cmakeCommand ' -S . -B build ', cmakeArguments], '-echo');
[status2, cmdout2] = system([cmakeCommand ' --build build'], '-echo');
```

The location of the executable program file that the CMake generator produces depends on the CMake generator that you use.

- Makefile based CMake generator - Relative to your current working folder, places the executable program file in subfolder *build*.
- Project-based CMake generator - Relative to your current working folder, places the executable program file in folder *build/Debug*.

**Windows - Visual Studio Solution**

```
exeLocation = fullfile('build', 'Debug', 'ComponentDeploymentFcnIntegration.exe');
```

**Windows - NMake Makefiles or GMake Makefiles**

```
exeLocation = fullfile('build', 'ComponentDeploymentFcnIntegration.exe');
```

**Linux - GMake Makefiles**

```
exeLocation = fullfile('build', 'ComponentDeploymentFcnIntegration');
```

**Mac - Xcode project**

```
exeLocation = fullfile('build', 'Debug', 'ComponentDeploymentFcnIntegration');
```

**Run Executable Program**

Use this command to run the compiled executable program:

```
[status3, cmdout3] = system(exeLocation, '-echo');
```

Example output:

```
Running model initialize function
Service function called: set_ModelInitialize_DataTransfer.
Service function called: get_CD_initialize_InBus_NVM.
```

```
Running Accumulator function (iteration 0)
Service function called: get_CD_accumulator_DataTransfer.
Service function called: getref_CD_accumulator_OutBus_y.
Service function called: getref_CD_accumulator_OutBus_y.
Service function called: getref_CD_accumulator_OutBus_y.
```

```
Service function called: getref_CD_accumulator_OutBus_y.
Service function called: getref_CD_accumulator_OutBus_y.
Service function called: getref_CD_accumulator_OutBus_y.
Service function called: getref_CD_accumulator_OutBus_y.
Service function called: getref_CD_accumulator_OutBus_y.
Service function called: getref_CD_accumulator_OutBus_y.
Service function called: getref_CD_accumulator_OutBus_y.
```

```
Running Accumulator function (iteration 1)
Service function called: get_CD_accumulator_DataTransfer.
Service function called: getref_CD_accumulator_OutBus_y.
Service function called: getref_CD_accumulator_OutBus_y.
Service function called: getref_CD_accumulator_OutBus_y.
Service function called: getref_CD_accumulator_OutBus_y.
Service function called: getref_CD_accumulator_OutBus_y.
Service function called: getref_CD_accumulator_OutBus_y.
Service function called: getref_CD_accumulator_OutBus_y.
Service function called: getref_CD_accumulator_OutBus_y.
Service function called: getref_CD_accumulator_OutBus_y.
Service function called: getref_CD_accumulator_OutBus_y.
```

```
Running Integrator function (iteration 1)

## Generate Main Program for Deployment to Bare-Metal Target Hardware

This example shows how to configure a model such that the code generator produces an example main program that you can customize for deployment on bare-metal target hardware (does not have an operating system). When you select the model configuration parameter **Generate an example main program**, the code generator produces the example `ert_main.c` or `ert_main.cpp` file. The file includes:

- `main()` function for the generated program
- Task scheduling code that determines how and when block computations execute on each time step of the model

Operation of the main program and the scheduling algorithm depend primarily on:

- Whether the model is a single-rate or multirate model
- Whether the model solver mode is set to single-tasking or multitasking

For more information, see “Deploy Applications to Target Hardware” on page 71-2.

Alternatively, you can configure a model to generate an example main program for deployment on target hardware that is running threaded code that runs on your host operating system. The example file `ert_main.c` that the code generator produces, shows how to deploy the generated example code.

You can customize a generated main program by using a custom file processing (CFP) template. Consider using a template file to:

- Assemble generated code in buffers
- Call an API to obtain buffered code into specific sections of generated source and header files

For more information, see File customization template.

### Open Example Model

Open the example model `rtwdemo_exemplemain`.

```
open_system('rtwdemo_exemplemain');
```

### Configure Model

1. Open the **Embedded Coder** app.
2. Select model configuration parameter **Generate an example main program**. When you select this parameter, you enable parameter **Target operating system**.
3. Set parameter **Target operating system** to `BareBoardExample` or `NativeThreadsExample`. For more information, see Target operating system.
4. Consider whether you want to specify a custom file processing template. To configure a template, specify the file name and extension for your template TLC file as a string for model configuration parameter **File customization template**.

**Generate Code**

Generate and inspect the code.

**Add Hand-Coded Customizations**

Augment the generated code with hand code as needed.

# Deploy Generated Component Software to Application Target Platforms

The code generator supports integration of generated code with operating systems and processors. For details, see “Embedded Coder Supported Hardware”.

## Interface to an Example Real-Time Multitasking System

This example shows how to simulate and generate code for asynchronous events on a real-time multitasking system.

The operating system integration techniques that the example demonstrates use one or more blocks in the `vxlib1` library. These blocks provide starting point examples to help you develop custom blocks for your target environment.

### Example Model

Open the `rtwdemo_vxworks` model.

```
model = 'rtwdemo_vxworks';
open_system(model);
%
```

### Model Description

The example model contains two asynchronously executed subsystems, `Count` and `Algorithm`. `Count` executes at interrupt level. `Algorithm` executes in an asynchronous task. The generated code for these blocks is tailored for the VxWorks® operating system. However, you can modify the `Async Interrupt` and `Task Sync` blocks to generate code for your run-time environment whether you are using an operating system or not.

### Data Transfer Assumptions

This example assumes the following about the target platform environment:

- Data transitions occur between a single task that reads data and a single task that writes data.
- A read or write of a byte-sized variable is atomic.
- When two tasks interact during a data transfer, only one of the tasks can preempt the other task.
- For periodic tasks, the task that executes at the faster rate has a higher priority than the tasks that executes at the slower rate. The task executing at the faster rate preempts the tasks executing at the slower rate.
- Tasks run on a single processor. Time slicing is not allowed.
- Processes do not crash and restart during a data transfers.

## What Is Code Replacement Customization?

Customize how and when the code generator replaces C/C++ code that it generates by default for functions and operators by developing a custom code replacement library. You can develop libraries interactively with the **Code Replacement Tool** or programmatically.

- Develop libraries tailored to specific application requirements
- Add identifiers to the list of reserved keywords the code generator considers during code replacement
- Customize the code generator’s match and replacement process for functions

To get started, “Quick Start Code Replacement Library Development - Simulink” on page 72-21.

### Code Replacement Match and Replacement Process

When the code generator encounters a call site for a function or operator, it:

- 1 Creates and partially populates a code replacement entry object with the function or operator name or key and conceptual arguments.
- 2 Uses the entry object to query the configured code replacement library for a conceptual representation match. The code generator searches the tables in a code replacement library for a match in the order that the tables appear in the library. When searching for a match, the code generator takes into account:
  - Conceptual name or key
  - Arguments, including quantity, type, type qualifiers, and complexity
  - Algorithm (computation method)
  - Fixed-point saturation and rounding modes
  - Priority
- 3 When a match exists, the code generator returns a code replacement object, fully populated with the conceptual representation, implementation representation, and priority. If the code generator finds multiple matches within a table, the entry priority determines the match. The priority can range from 0 to 100. The highest priority is 0. The code generator uses a higher-priority entry over a similar entry with a lower priority.
- 4 Uses the C or C++ replacement function prototype in the code replacement object to generate code.

### Code Replacement Customization Limitations

- Code replacement verification — It is possible that code replacement behaves differently than you expect. For example, data types that you observe in code generator input might not match what the code generator uses as intermediate data types during an operation. Verify code replacements by examining generated code. See “Verify Code Replacement Library” on page 72-55.
- Code replacement for matrices — Code replacement libraries do not support the replacement of functions that have variable-size inputs.
- Tokens in file paths—You can include tokens in file paths when specifying build information for a code replacement entry by using the programming interface only. The ability to include tokens is

not available from the Code Replacement Tool. See Specify build information in “Define Code Replacement Library Optimizations” on page 72-36.

- Addition and subtraction operation replacements—See “Replace Addition and Subtraction Operator Code” on page 72-151 for relevant limitations.
- Data alignment—
  - Not supported for
    - Arguments associated with a built-in storage class with `DataScope` set to `Exported` or the imported built-in storage class `GetSet`
    - Software-in-the-loop (SIL)
    - Processor-in-the-loop (PIL)
    - Model reference parameters
    - Exported functions in Stateflow charts
    - Replaced functions that are generated with C function prototype control or C++ class I/O arguments step method and that use root-level I/O variables
    - Replaced functions that are generated with the AUTOSAR system target file and that use root-level I/O or AUTOSAR inter-runnable access functions
  - If the following conditions exist, the code generator includes data alignment directives for root-level I/O variables in the `ert_main.c` or `ert_main.cpp` file it produces:
    - Compiler supports global variable alignment
    - Generate an example main program (select **Configuration Parameters > Generate an example main program**)
    - Generate a reusable function interface for the model (set **Configuration Parameters > Code Generation > Interface > Code interface packaging** to `Reusable function`)
    - Function uses root-level I/O variables that are passed in as individual arguments (set **Configuration Parameters > Code Generation > Interface > Pass root-level I/O as to Individual arguments**)
    - Replaced function uses a root-level I/O variable
    - Replaced function imposes alignment requirements
  - If you discard the generated example main program, align used root-level I/O variables correctly.
  - If you choose not to generate an example main program in this case, the code generator does not replace the function.
  - If a replacement imposes alignment requirements on the shared utility interface arguments, the code generator does not honor data alignment. Under these conditions, replacement does not occur. Replacement is allowed if the registered data alignment type specification supports alignment of local variables, and the replacement involves only local variables.
- For `Simulink.Bus`:
  - If user registered alignment specifications do not support structure field alignment, aligning `Simulink.Bus` objects is not supported unless the `Simulink.Bus` is imported.
  - When aligning a `Simulink.Bus` data object, the elements in the bus object are aligned on the same boundary. The boundary is the lowest common multiple of the alignment requirements for each individual bus element.

- When you specify alignment for functions that occur in a model reference hierarchy, and multiple models in the hierarchy operate on the same function data, the bottommost model dictates alignment for the rest of the hierarchy. If the alignment requirement for a function in a model higher in the hierarchy cannot be honored due to the alignment set by a model lower in the hierarchy, the replacement in the higher model does not occur. In some cases, an error message is generated. To work around this issue, if the shared data is represented by a bus or signal object, manually set the alignment property on the shared data by setting the alignment property of the `Simulink.Bus` or `Simulink.Signal` object.
- It is your responsibility to honor the `Alignment` property setting for storage classes that you create.

See “Data Alignment for Code Replacement” on page 72-105.

- `coder.replace` function — See `coder.replace` for relevant limitations.

## Code You Can Replace From Simulink Models

Code that the code generator replaces depends on the code replacement library (CRL) that you use. By default, the code generator does not apply a code replacement library. Your choice of libraries is dependent on product licensing and whether you have access to custom libraries.

For information on how to explore functions and operators that a code replacement library supports, see “Choose a Code Replacement Library” on page 57-6.

### Math Functions - Simulink Support

When generating C/C++ code from a Simulink model, depending on code replacement libraries available in your development environment, you can configure the code generator to replace instances of the following math functions with application-specific implementations.

Function	Data Type Support	Scalar, Vector, Matrix Support	Real, Complex Support
abs <sup>1</sup>	Integer Floating point Fixed point	Scalar Vector Matrix	Real
acos	Floating point	Scalar	Real Complex input/complex output Real input/complex output

$\log_{10}^2$	Floating point	Scalar Vector Matrix	Real Complex
$\log_2^3$	Floating point	Scalar Vector Matrix	Real Complex
$\max$	Integer Floating point	Scalar	Real
$\min$	Integer Floating point	Scalar	Real
$\text{pow}$	Floating point	Scalar	Real
$\sec^3$	Floating point	Scalar Vector Matrix	Real Complex
$\secd^3$	Floating point	Scalar Vector Matrix	Real Complex
$\text{sech}^3$	Floating point	Scalar Vector Matrix	Real Complex

Function	Data Type Support	Scalar, Vector, Matrix Support	Real, Complex Support
$\sin^2$	Floating point	Scalar Vector Matrix	Real Complex Complex input/complex output Real input/complex output
$\text{cind}^3$	Floating point	Scalar Vector Matrix	Real Complex
$\sinh^2$	Floating point	Scalar Vector Matrix	Real Complex Complex input/complex output Real input/complex output
$\text{sqrt}$	Floating point	Scalar	Real
$\tan^2$	Floating point	Scalar Vector Matrix	Real Complex Complex input/complex output Real input/complex output
$\text{tand}^3$	Floating point	Scalar Vector Matrix	Real Complex
$\tanh^2$	Floating point	Scalar Vector Matrix	Real Complex Complex input/complex output Real input/complex output
<sup>1</sup> Wrap on integer overflow only. <sup>2</sup> For models involving vectors or matrices, the code generator replaces only functions coded in the MATLAB action language. <sup>3</sup> The code generator replaces only functions coded in the MATLAB action language. <sup>4</sup> Embedded Coder does not support the use of code replacement libraries for machine-parented data.			

## Memory Functions

Depending on code replacement libraries available in your development environment, you can configure the code generator to replace instances of the following memory functions with application-specific implementations.

Function	Data Type Support	Scalar, Vector, Matrix Support	Real, Complex Support
memcpy	Void pointer (void*)	Scalar Vector Matrix	Real Complex
memcpy	Void pointer (void*)	Scalar Vector Matrix	Real Complex
memset	Void pointer (void*)	Scalar Vector Matrix	Real Complex
memset2zero	Void pointer (void*)	Scalar Vector Matrix	Real Complex

Some target processors provide optimized functions to set memory to zero. Use the code replacement library programming interface to replace the `memset2zero` function with more efficient target-specific functions.

## Nonfinite Functions

Depending on code replacement libraries available in your development environment, you can configure the code generator to replace instances of the following nonfinite functions with application-specific implementations.

Function	Data Type Support	Scalar, Vector, Matrix Support	Real, Complex Support
getInf	Floating point	Scalar	Real
getMinusInf	Floating point	Scalar	Real
getNaN	Floating point	Scalar	Real
rtIsInf	Floating point	Scalar	Real Complex
rtIsNaN	Floating point	Scalar	Real Complex

## Mutex and Semaphore Functions

Mutex and semaphore functions control access to resources shared by multiple processes in multicore target environments. MathWorks provides code replacement libraries that support mutex and semaphore replacement for Rate Transition and Task Transition blocks on Windows, Linux, Mac, and VxWorks platforms.

Generated mutex and semaphore code typically consists of:

- In model initialization code, an initialization function call to create a mutex or semaphore to control entry to a critical section of code.
- In model step code:

- Before code for a data transfer between tasks enters the critical section, mutex lock or semaphore wait function calls to reserve a critical section of code.
- After code for a data transfer between tasks finishes executing the critical section, mutex unlock or semaphore post function calls to release the critical section of code.
- In model termination code, an optional destroy function call to explicitly delete the mutex or semaphore.

Depending on code replacement libraries available in your development environment, you can configure the code generator to replace instances of the following mutex and semaphore functions with application-specific implementations.

Function	Key
Mutex Destroy	RTW_MUTEX_DESTROY
Mutex Init	RTW_MUTEX_INIT
Mutex Lock	RTW_MUTEX_LOCK
Mutex Unlock	RTW_MUTEX_UNLOCK
Semaphore Destroy	RTW_SEM_DESTROY
Semaphore Init	RTW_SEM_INIT
Semaphore Post	RTW_SEM_POST
Semaphore Wait	RTW_SEM_WAIT

## Operators

When generating C/C++ code from a Simulink model, depending on code replacement libraries available in your development environment, you can configure the code generator to replace instances of the following operators with application-specific implementations.

Mixed data type support indicates that you can specify different data types for different inputs.

Operator	Key	Data Type Support	Scalar, Vector, Matrix Support	Real, Complex Support
Addition (+) <sup>1</sup>	RTW_OP_ADD	Integer Floating point Fixed-point Mixed	Scalar Vector Matrix	Real Complex
Subtraction (-) <sup>1</sup>	RTW_OP_MINUS	Integer Floating point Fixed-point Mixed	Scalar Vector Matrix	Real Complex
Multiplication (*) <sup>2</sup>	RTW_OP_MUL	Integer Floating point Fixed-point Mixed	Scalar Vector Matrix	Real Complex

<b>Operator</b>	<b>Key</b>	<b>Data Type Support</b>	<b>Scalar, Vector, Matrix Support</b>	<b>Real, Complex Support</b>
Division (/)	RTW_OP_DIV	Integer Floating point Fixed-point Mixed	Scalar	Real Complex
Data type conversion (cast)	RTW_OP_CAST	Integer Floating point <sup>3</sup> Fixed-point Mixed	Scalar Vector Matrix	Real Complex
Shift left (<<)	RTW_OP_SL	Integer Fixed-point Mixed	Scalar Vector Matrix <sup>4</sup>	Real
Shift right arithmetic (>>) <sup>5</sup>	RTW_OP_SRA	Integer Fixed-point Mixed	Scalar Vector Matrix <sup>4</sup>	Real
Shift right logical (>>)	RTW_OP_SRL	Integer Fixed-point Mixed	Scalar Vector Matrix <sup>4</sup>	Real
Element-wise matrix multiplication (.*) <sup>6</sup>	RTW_OP_ELEM_MUL	Integer Floating point Fixed-point Mixed	Vector Matrix	Real Complex
Matrix right division (/)	RTW_OP_RDIV	Integer Floating point Fixed-point Mixed	Vector Matrix	Real Complex
Matrix left division (\)	RTW_OP_LDIV	Integer Floating point Fixed-point Mixed	Vector Matrix	Real Complex
Matrix inversion (inv)	RTW_OP_INV	Integer Floating point Fixed-point Mixed	Vector Matrix	Real Complex
Complex conjugation	RTW_OP_CONJUGATE	Integer Floating point Fixed-point Mixed	Scalar Vector Matrix	Real Complex
Transposition (.')	RTW_OP_TRANS	Integer Floating point Fixed-point Mixed	Vector Matrix	Real Complex

<b>Operator</b>	<b>Key</b>	<b>Data Type Support</b>	<b>Scalar, Vector, Matrix Support</b>	<b>Real, Complex Support</b>
Hermitian (complex conjugate) transposition (')	RTW_OP_HERMITIAN	Integer Floating point Fixed-point Mixed	Vector Matrix	Real Complex
Multiplication with transposition <sup>2</sup>	RTW_OP_TRMUL	Integer Floating point Fixed-point Mixed	Vector Matrix	Real Complex
Multiplication with Hermitian transposition <sup>2</sup>	RTW_OP_HMMUL	Integer Floating point Fixed-point Mixed	Vector Matrix	Real Complex
Multiplication followed by shift right arithmetic ( $u1*u2>>u3$ ) <sup>7</sup>	RTW_OP_MUL_SRA	Integer Fixed-point	Scalar	Real
Multiplication followed by division ( $u1*u2/u3$ ) <sup>8</sup>	RTW_OP_MULDIV	Integer Fixed-point	Scalar	Real
Greater than (>)	RTW_OP_GREATER_THAN	Integer Floating point Fixed-point Mixed	Scalar Vector Matrix	Real Complex
Greater than or equal (>=)	RTW_OP_GREATER_THAN_OR_EQUAL	Integer Floating point Fixed-point Mixed	Scalar Vector Matrix	Real Complex

## Develop a Code Replacement Library

Iterate through the following steps, as necessary, to develop a code replacement library:

- 1 “Identify Code Replacement Library Requirements” on page 72-35
- 2 “Define Code Replacement Library Optimizations” on page 72-36
- 3 “Register Code Replacement Library” on page 72-51
- 4 “Verify Code Replacement Library” on page 72-55
- 5 “Deploy Code Replacement Library” on page 72-57

To experiment with the process and tools, see “Quick Start Code Replacement Library Development - Simulink” on page 72-21.

# Quick Start Code Replacement Library Development - Simulink

This example shows how to develop a code replacement library that includes an entry for generating replacement code for the math function `sin`. You use the Code Replacement Tool.

## Prerequisites

To complete this example, install the following software:

- MATLAB®
- MATLAB Coder™
- Simulink®
- Simulink Coder™
- Embedded Coder®
- Compiler

For instructions on installing MathWorks® products, see the MATLAB installation documentation. If you have installed MATLAB and want to see what other MathWorks products are installed, in the Command Window, enter `ver`.

For a list of supported compilers, see [https://www.mathworks.com/support/compilers/current\\_release/](https://www.mathworks.com/support/compilers/current_release/).

## Open the Code Replacement Tool

1. Start a MATLAB session.
2. Create or navigate (`cd`) to an empty folder.
3. At the command prompt, enter the `crtool` command. The Code Replacement Tool window opens.

## Create Code Replacement Table

1. In the Code Replacement Tool window, select **File > New table**
2. In the right pane, name the table `crl_table_sinfcn` and click **Apply**. When you save the table, the tool saves it with the file name `crl_table_sinfcn.m`.

### Create Table Entry

Create a table entry that maps a `sin` function with double input and double output to a custom implementation function.

1. In the left pane, select table `crl_table_sinfcn`. Then, select **File > New entry > Function**. The entry appears in the middle pane, initially without a name.
2. In the middle pane, select the new entry.
3. In the right pane, on the **Mapping Information** tab, from the **Function** menu, select `sin`.
4. Leave **Algorithm** set to `Unspecified`, and leave parameters in the **Conceptual function** group set to default values.
5. In the **Replacement function** group, name the replacement function `sin_dbl`.
6. Leave the remaining parameters in the **Replacement function** group set to default values.
7. Click **Apply**. The tool updates the **Function signature preview** to reflect the specified replacement function name.
8. Scroll to the bottom of the **Mapping Information** tab and click **Validate entry**. The tool validates your entry.

The following figure shows the completed mapping information.

Mapping Information

Build Information

Function: sin

Entry information

Algorithm: Unspecified

Conceptual function

*Used by code generation process for matching purposes*

Conceptual arguments

y1  
u1

Argument properties

Data type: double

Complex

Argument type: Scalar

Make conceptual and implementation argument types the same

Replacement function

Function prototype

Name: sin\_dbl C++ namespace:

Function returns void

Rounding mode: Unspecified Rounding

Allow expressions as inputs

Function modifies internal or global state

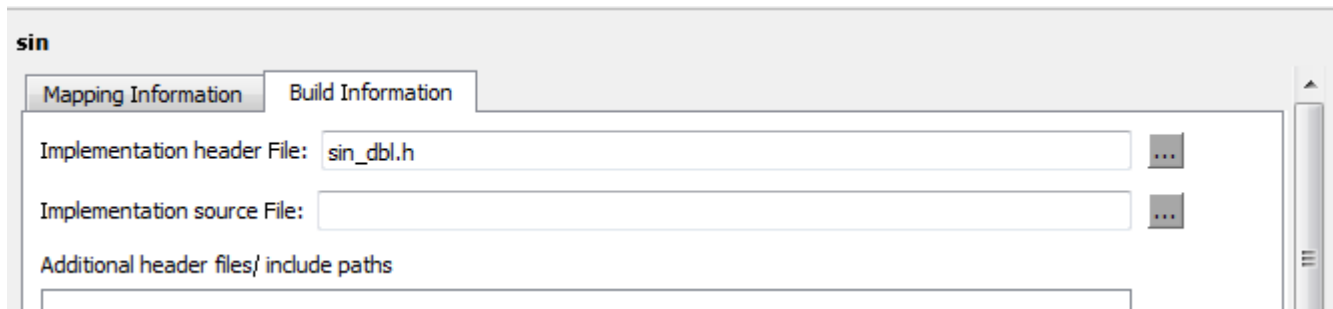

[Click here to add Build Information](#)

Validation

Validate entry
Status: Validated

### Specify Build Information for Replacement Code

1. On the **Build Information** tab, for the **Implementation header file** parameter, enter `sin_dbl.h`.
2. Leave the remaining parameters set to default values.
3. Click **Apply**.

4. Optionally, you can revalidate the entry. Return to the **Mapping Information** tab and click **Validate entry**.

### Create Another Table Entry

Create an entry that maps a `sin` function with `single` input and `double` output to a custom implementation function named `sin_sgl`. Create the entry by copying and pasting the `sin_dbl` entry.

1. In the middle pane, select the `sin_dbl` entry.
2. Select **Edit > Copy**.
3. Select **Edit > Paste**.
4. On the **Mapping Information** tab, in the **Conceptual function** section, set the data type of input argument `u1` to `single`.
5. In the **Replacement function** section, name the function `sin_sgl`. Set the data type of input argument `u1` to `single`.
6. Click **Apply**. Note the changes that appear for the **Function signature preview**.
7. On the **Build Information** tab, for the **Implementation header file** parameter, enter `sin_sgl.h`. Leave the remaining parameters set to default values and click **Apply**.

### Validate the Code Replacement Table

1. Select **Actions > Validate table**.
2. If the tool reports errors, fix them, and rerun the validation. Repeat fixing and validating errors until the tool does not report errors. The following figure shows a validation report.

Name	Implementation	NumIn	In1Type	In2Type	Out1Type	Out2Type	Priority
✓ sin	sin_dbl	1	double		double		100
✓ sin	sin_sgl	1	single		double		100

### Save the Code Replacement Table

Save the code replacement table to a MATLAB file in your working folder. Select **File > Save table**. By default, the tool uses the table name to name the file. For this example, the tool saves the table in the file `crl_table_sinfcn.m`.

### Review the Code Replacement Table Definition

Consider reviewing the MATLAB code for your code replacement table definition. After using the tool to create an initial version of a table definition file, you can update, enhance, or copy the file in a text editor.

To review it, in MATLAB or another text editor, open the file `crl_table_sinfcn.m`.

### Generate a Registration File

Before you can use your code replacement table, you must register it as part of a code replacement library. Use the Code Replacement Tool to generate a registration file.

1. In the Code Replacement Tool, select **File > Generate registration file**.
2. In the **Generate registration file** dialog box, edit the dialog box fields to match the following figure, and click **OK**.

3. In the **Select location to save the registration file** dialog box, specify a location for the registration file. The location must be on the MATLAB path or in the current working folder. Save the file. The tool saves the file as `rtwTargetInfo.m`.

### Register the Code Replacement Table

At the command prompt, enter:

```
RTW.TargetRegistry.getInstance('reset');
```

### Review and Test Code Replacements

Apply your code replacement library. Verify that the code generator makes code replacements that you expect.

1. Check for errors. At the command line, invoke the table definition file. For example:

```
tbl = crl_table_sinfcn
```

```
tbl =
```

```
TflTable with properties:
```

```
 Version: '1.0'
 ReservedSymbols: []
StringResolutionMap: []
 AllEntries: [2x1 RTW.TflCFunctionEntry]
 EnableTrace: 1|
```

If an error exists in the definition file, the invocation triggers a message. Fix the error and try again.

2. Use the Code Replacement Viewer to check your code replacement entries. For example:

```
crviewer('Sin Function Example')
```

In the viewer, select entries in your table and verify that the content is what you expect. The viewer can help you detect issues such as:

- Incorrect argument order.
- Conceptual argument names that do not match what the code generator expects.
- Incorrect priority settings.

3. Identify existing model or create a model that includes a Trigonometric block that is set to the `sin` function. For example:

4. Open the model and configure it for code generation with an Embedded Coder (ERT-based) target.

5. See whether your library is listed as an available option for the **Code Generation > Interface > Code replacement library** model configuration parameter. If it is, select it.

If it is not listed, open the registration file, `rtwTargetInfo.m`. See whether you entered the correct code replacement table name when you created the file. If you hover the cursor over the selected library, a tool tip appears. This tip contains information derived from your code replacement library registration file, such as the library description and the list of tables it contains.

6. To find parameters quickly, in the Configuration Parameters dialog box **Search** field, type the parameter name. Configure the code generation report for code replacement analysis by selecting the following parameters:

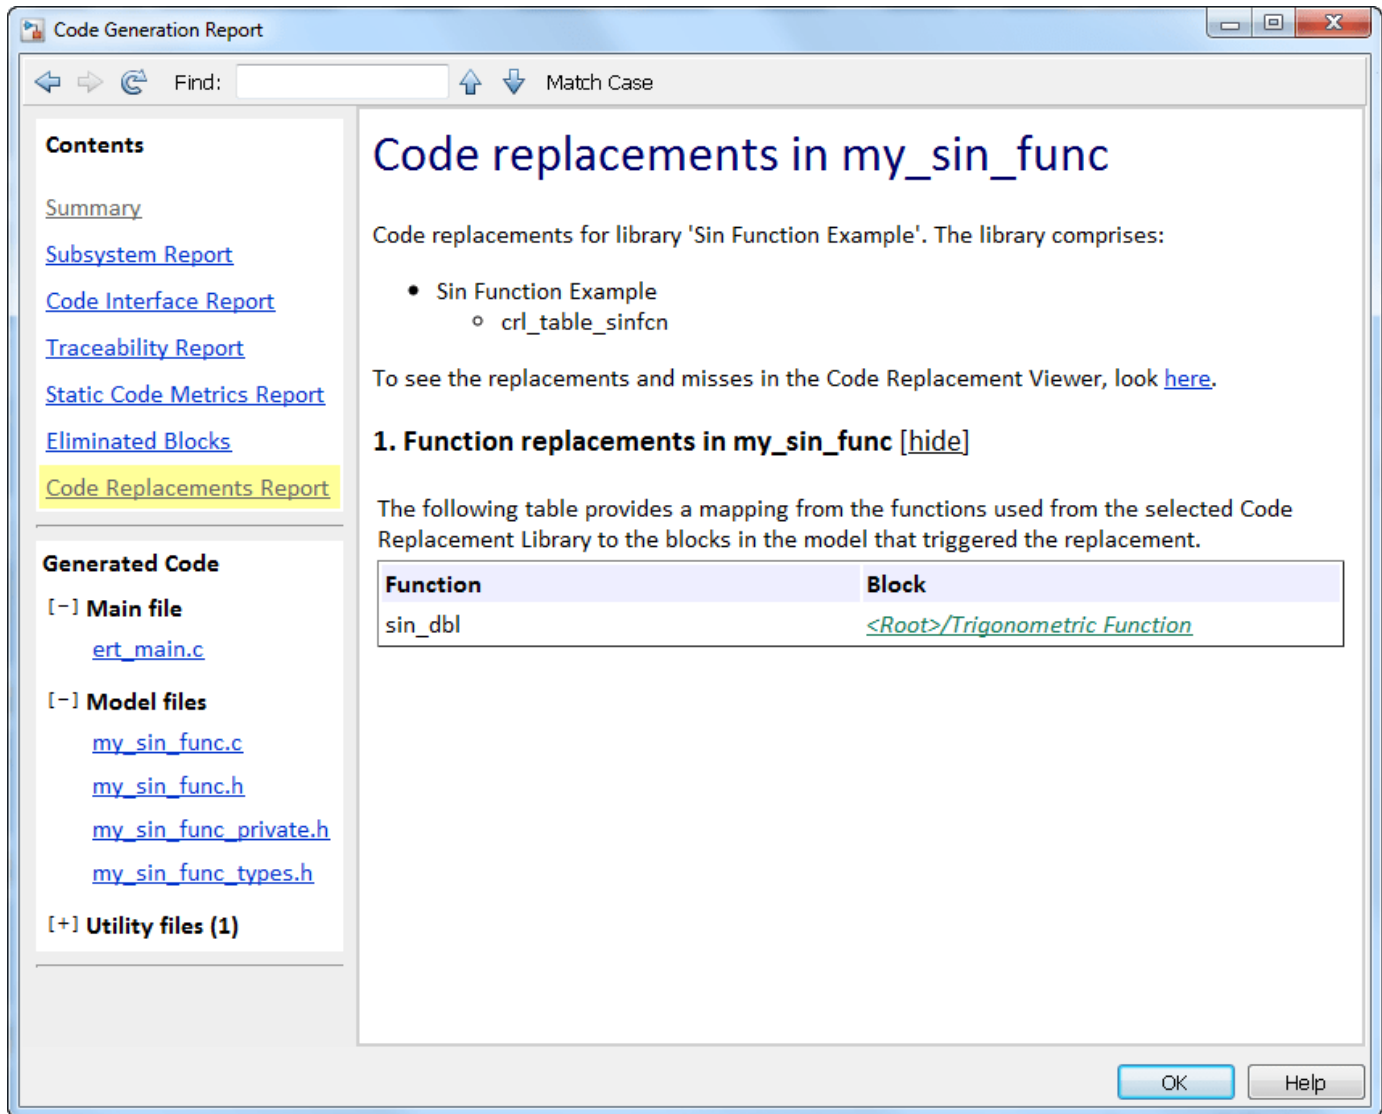

- **Create code generation report**
- **Open report automatically**
- **Code-to-model**
- **Model-to-code**
- **Summarize which blocks triggered code replacements**
- **Include comments**
- **Simulink block comments**
- **Simulink block descriptions**

7. Configure the model to generate code only. Before you build an executable program, confirm that the code generator is replacing code as expected.

8. Generate code for the model.

9. Review code replacement results in the Code Replacement Report section of the code generation report.

The report indicates that the code generator found a match and applied the replacement code for the function `sin_dbl`.

10. Review the code replacements. In the model window, right-click the Trigonometric Function block. Select **C/C++ Code > Navigate to C/C++ Code**. The code generation report opens and highlights the code replacement in `my_sin_func.c`. In this case, the code generator replaced `sin` with `sin_dbl`.

## Semaphore and Mutex Function Replacement

You can create a code replacement table for a custom target that supports concurrent execution. Create table entries that specify custom implementations of semaphore or mutex operations. The table must have four semaphore entries, four mutex entries, or both, and include the table in a custom code replacement library. (The semaphore or mutex entries are mutually dependent. Provide them in complete sets of four.)

---

**Note** A custom target that supports concurrent multitasking must set the target configuration parameter `ConcurrentExecutionCompliant`. For more information, see “Support Concurrent Execution of Multiple Tasks”.

---

If the build process generates semaphore or mutex function calls for data transfer between tasks during code generation for a multicore target environment, use a custom library. The library can specify code replacements for custom semaphore or mutex implementations that are optimal for your target environment. Using the Code Replacement Tool (`crtool`) or equivalent code replacement functions, you can:

- Configure code replacement table entries for custom semaphore or mutex functions. During system startup, execution of the code for data transfer between tasks, and system shutdown the generated code calls these functions.
- Configure DWork arguments that represent global data, which the semaphore or mutex functions access. A DWork pointer is passed to the model entry functions.

Generated mutex and semaphore code typically consists of these elements:

Code	Generated Code
Model initialization	Initialization function call that creates a mutex or semaphore function to control entry to a critical section of code.
Model step	<ul style="list-style-type: none"> <li>• Before code for a data transfer between tasks enters the critical section, mutex lock or semaphore wait function calls reserve the critical section of code.</li> <li>• After code for a data transfer between tasks finishes executing the critical section, mutex unlock or semaphore post function calls release the critical section of code.</li> </ul>
Model termination	Optional destroy function call to delete the mutex or semaphore explicitly.

This example shows how to create code replacement table entries for a mutex replacement scenario. You configure a multicore target model for concurrent execution and for data transfer between tasks of differing rates, which Rate Transition blocks handle. In the generated code for the model, each Rate Transition block has a separate, unique mutex. Mutex lock and unlock operations within the Rate Transition block generated code share access to the same global data. They achieve this by using the unique mutex created for that Rate Transition block.

- 1 Open the **Code Replacement Tool**.
- 2 Create and open a new table.

- 3 Name the table `cr1_table_rt_mutex`.
- 4 Create an entry for a mutex initialization function replacement.
  - a Select **File > New entry > Semaphore entry** to open a new table entry for configuring a semaphore or mutex replacement.
  - b In the **Mapping Information** tab, use the **Function** parameter to select `Mutex Init`. Initial default values for the table entry appear. In the **Conceptual function** section, typically you can leave the argument settings at their defaults.
  - c In the **DWork attributes** section, the **Allocate DWork** option is selected. The dialog box provides a unique entry tag for the DWork argument `d1`.

The screenshot shows a dialog box titled "DWork attributes". At the top, there is a checked checkbox labeled "Allocate DWork". Below this, there is a section for "DWork argument" containing a text field "Entry tag (unique):" with the value "entry\_25576". To the left of the "Argument properties" section is a list box titled "DWork arguments" containing the entry "d1". The "Argument properties" section on the right has a "Data type:" field set to "void" and a checked checkbox labeled "Pointer".

On the **DWork attributes** pane, configure a DWork argument to the replacement function. The DWork argument supports sharing of a semaphore or mutex between:

- Code that creates the semaphore or mutex
- Code that requests and relinquishes access
- Code that deletes the semaphore or mutex

In this example, the DWork argument for the `Mutex Init` function defines a unique entry tag, `entry_25576`. That function also defines DWork arguments for `Mutex Lock`, `Mutex Unlock`, and `Mutex Destroy`, which reference the entry tag to share the DWork data.

The only data type supported for the DWork **Data type** parameter is `void*`.

- d In the **Replacement function** section, enter a function name in the **Name** field. This example uses `myMutexCreate`. In the list of **Function arguments**, leave the DWork argument `d1` data type as `void**`.

The C function signature preview is:

```
void myMutexCreate (void** d1);
```

- e In the **Replacement function** section, select **Function modifies internal or global state**. This option instructs the code generator not to optimize away the implementation function described by this entry because it accesses global memory values. Click **Apply**. Optionally, you can click **Validate entry** to validate the information entered in the **Mapping Information** tab.
 

To create a sample table entry, configure the replacement function signature without the replacement function and its build information. If header and source files for these functions are available, select the **Build Information** table to specify them.
- f The `Mutex Init` table entry is complete. Optionally, you can save the table to a file, and inspect the MATLAB code created for the table definition so far.
- 5 Repeat the following sequence to create the table entries for the mutex lock, unlock, and destroy function replacements. Each table entry references the `DWork` unique tag entry, `entry_25576`, defined in the `Mutex Init` table entry.
  - a Select **File > New entry > Semaphore entry**.
  - b In the **Mapping Information** tab, use the **Function** parameter to select `Mutex Lock`, `Mutex Unlock`, or `Mutex Destroy`. Initial default values for the table entry appear. In the **Conceptual function** section, typically you can leave the argument settings at their defaults.
  - c For a Rate Transition block mutex, the wait, post, and destroy functions operate on the `DWork` allocated at system startup by the mutex initialization function. In the **DWork attributes** section, verify that the **Allocate DWork** option is cleared. From the **DWork Allocator entry** drop-down list, select the entry tag matching the value in the `Mutex Init` table entry. In this example, the entry tag is `entry_25576`.

DWork attributes

Allocate DWork

DWork Allocator entry:

- d** In the **Replacement function** section, **Name** field, enter a function name. This example uses `myMutexLock`, `myMutexUnlock`, and `myMutexDelete`. In the list of **Function arguments**, leave the DWork argument `d1` data type as `void*`.

Replacement function

Function prototype

Name:  C++ namespace:

Function returns void

Function arguments

y1(return arg)	
d1	

Argument properties

Data type:  I/O type:

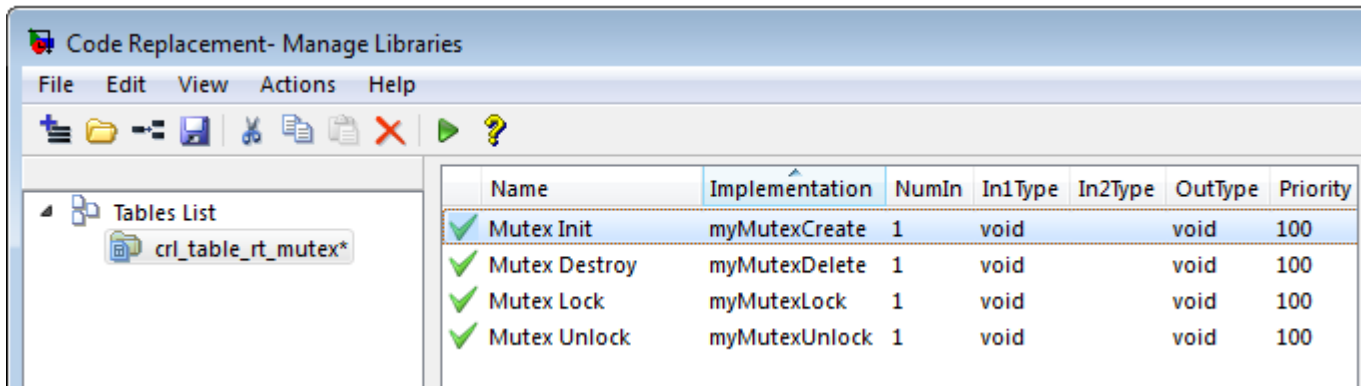

Const  Pointer  Pointer-Pointer

Alignment value:

Function signature preview

```
void myMutexLock (void* d1);
```

- e** In the **Implementation attributes** section, select the option **Function modifies internal or global state**. This option instructs the code generator not to optimize away the implementation function described by this entry because it accesses global memory values.
- f** Optionally, supply build information for the replacement function on the **Build Information** tab.
- g** Click **Apply**. In the middle pane, right-click the table entry and select **Validate entry(s)**.
- 6** When you have added the table entries for `Mutex Lock`, `Mutex Unlock`, and `Mutex Destroy` to the entry for `Mutex Init`, the rate transition mutex replacement table is complete. In the left-most pane, right-click the table name and select **Validate table**. Address errors and repeat the table validation.

- 7 Save the table to a MATLAB file in your working folder, for example, using **File > Save table**. The name of the saved file is the table name, `crl_table_rt_mutex`, with an `.m` extension. Optionally, you can open the saved file and examine the MATLAB code for the code replacement table definition.

To test this example:

- 1 Register the code replacement mapping.
- 2 Create a model that contains a rate transition for which the build process generates mutex function calls. For example:

- 3 Configure the model for a multicore target environment and the following settings:
  - On the **Solver** pane, select a fixed-step solver.
  - On the **Code Generation** pane, select an ERT-based system target file.
  - On the **Code Generation > Interface** pane, select the code replacement library that contains your mutex entry.

# Identify Code Replacement Library Requirements

## What Is a Code Replacement Library?

A code replacement library defines optimizations for generated C or C++ code from Simulink models or MATLAB code for specific targets. You can configure the code generator to use your code replacement library to replace specified functions in your model or MATLAB code with optimized implementations.

## What Functions Can Be Optimized with a Code Replacement Library?

You can use a code replacement library to optimize the performance of functions defined either by Simulink models or MATLAB code. To look up functions that are available to optimize, see “Code You Can Replace From Simulink Models” on page 72-6 and “Code You Can Replace from MATLAB Code” on page 73-5.

## How to Develop a Code Replacement Library

You can develop a code replacement library either interactively, using the **Code Replacement Tool** (crtool), or programmatically, using the MATLAB programming interface. The Code Replacement Tool is quick, easy, and ideal for first time library development, while the MATLAB Programming interface provides more customization and control options. To determine which approach to use, identify your use case below:

### Interactive Approach:

- Developing a code replacement library for the first time
- Rapid prototyping

### Programmatic Approach:

- Specifying code replacement attributes not available with the Code Replacement Tool
- Creating or modifying code replacement library entries by copying, pasting, and editing
- Modifying a registration file by copying and pasting content

## Identify Basic Requirements

- What model or MATLAB code do you want to optimize by using a code replacement library?
- What functions and operations within your model or MATLAB code do you want to replace? What is the signature for each function or operation that you want to replace?
- What build files (source, header, object) do you need to provide to the code generator?

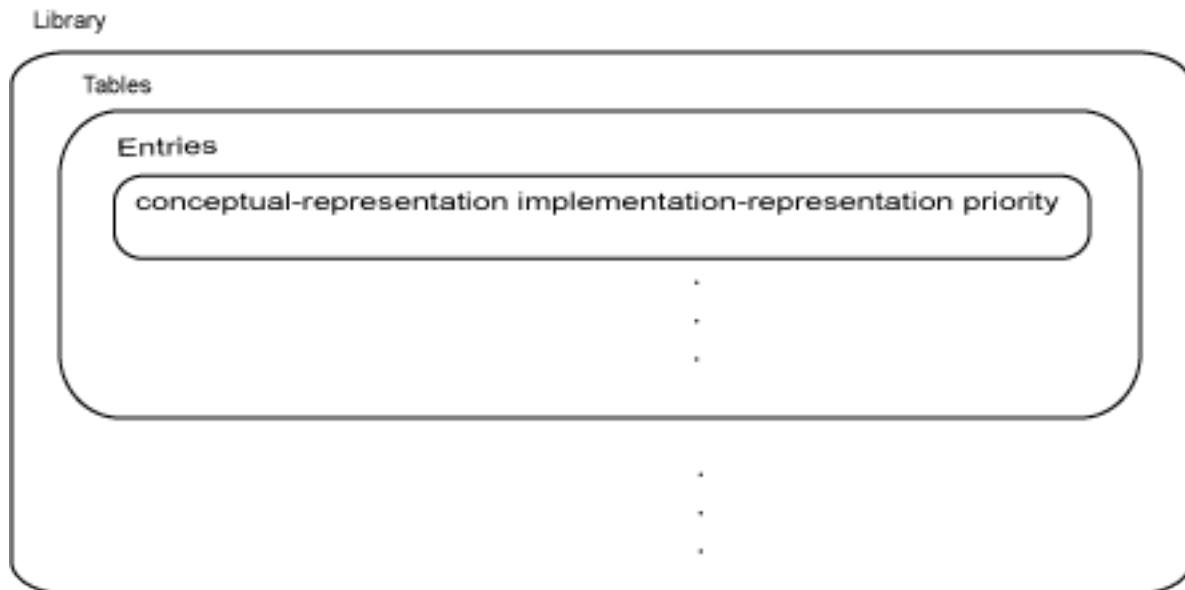

## See Also

### More About

- “Develop a Code Replacement Library” on page 72-20
- “What Is Code Replacement Customization?” on page 72-3

## Define Code Replacement Library Optimizations

A code replacement library contains one or more code replacement tables. Each table contains one or more code replacement entries. Each entry contains a mapping and entry parameters. The entry maps the conceptual representation of an automatically generated MATLAB or Simulink function to an implementation representation of an optimized C or C++ function. The entry parameters describe additional properties for the code generator to honor during code replacement.

To define a code replacement library, first define code replacement tables in a customization file. Then, during the registration step, create a code replacement library by selecting tables to include in your library. You can define your code replacement tables both interactively or programmatically using the same work flow.

The interactive and programmatic approaches both follow these 8 steps:

- 1 Open the environment.
- 2 Create a table.
- 3 Create an entry.
- 4 Create entry parameters.
- 5 Create the conceptual representation.
- 6 Create the implementation representation.
- 7 Specify build information.
- 8 Validate and save.

### Interactively Develop a Code Replacement Library

- 1 Open the environment.

To interactively create a code replacement library, open the **Code Replacement Tool** (crtool) from the MATLAB command line with the command:

```
>> crtool
```

## 2 Create a table.

A code replacement table organizes code replacement entries into groupings that are easier to manage.

To create a code replacement table:

- a** From the crtool menu, select **File > New table**.
- b** In the right pane, name the table and click **Apply**.

## 3 Create an entry.

A code replacement table entry contains entry parameters and a mapping of a conceptual representation that describes a generated function to an implementation representation that describes an optimized implementation of that function.

To create a code replacement entry, use one of these methods:

- From the crtool toolbar, click the **entry-type** icon then select the **entry-type**.
- From the crtool menu, select **File > New entry > entry-type**.
- Right-click on a table and select **New entry > entry-type**.

The new entry appears without a name in the middle pane.

## 4 Create entry parameters.

Entry parameters specify optimization and build requirements for the code generator to honor during code replacement. These parameters vary and automatically appear in various sections of the crtool interface depending on the type of function replacement.

To create entry parameters:

- In the **Function** or **Operation** drop-down list, select the name of the function you want to replace.

This selection determines the entry parameters that appear in the crtool.

## 5 Create the conceptual representation.

The conceptual representation describes the signature of the function you want to replace. The conceptual representation consists of the function name, return arguments, and parameters. The return arguments are referred to as output arguments, and the parameters are referred to as input arguments. Specify each conceptual argument with a name, I/O type, and, depending on the type of replacement, other properties that appear in the crtool.

To define your conceptual representation:

- In the **Conceptual Function** or **Conceptual Operation** subsection of the crtool, specify the input and output arguments of the function you want the code generator to replace.

## 6 Create the implementation representation.

The implementation representation describes the signature of the replacement function defined in the code replacement library. The implementation representation consists of a function name, return arguments, and parameters. Specify each implementation argument with a type, type qualifier, and complexity.

To define your implementation representation:

- In the **Implementation Function** or **Operation Function** subsection of the crtool, specify the input and output arguments for the optimized function defined in the code replacement library.

## 7 Specify build information.

Build information provides the code generator with the files to perform function replacement.

To specify build information:

- In the crtool, click the **Build Information** tab to open the build requirements pane. Specify necessary build information in these fields:

Parameter	Description
Implementation header file	Name of header file needed for code replacement.
Implementation source file	Name of source file needed for code replacement.
Additional header files/include paths	Name and path of additional header files needed for code replacement.
Additional source files/paths	Name and path of additional source files needed for code replacement.
Additional object files/paths	Name and path of additional object files needed for code replacement.
Additional link flags	Flags the linker needs to generate an executable file for the replacement code.
Additional compile flags	Flags the compiler needs to generate object code for the replacement code.
Copy files to build directory	Flags whether to copy header, source, or object files, which are required to generate replacement code, to the build folder before code generation. If you specify files with <b>Additional header files/include paths</b> or <b>Additional source files/ paths</b> and you copy files, the compiler and utilities such as packNGo might find duplicate instances of files.

## 8 Validate and save.

Save your code replacement library with the same name as your code replacement table on your MATLAB path. Saving your library automatically validates unvalidated content.

To validate and save your library:

- From the crtool menu, select **File > Save Table > Save**.

## Programmatically Develop a Code Replacement Library

### 1 Open the environment.

To programmatically create a code replacement library, open a MATLAB function file. From the MATLAB menu select **New > Function**.

### 2 Create a table.

A code replacement table organizes code replacement entries into groupings that are easier to manage.

To create a code replacement table:

- a Create a function you can use to call your code replacement library table. The function should not have arguments and return a table object.
- b Create a table object with a call to `RTW.TflTable`.

```
function hTable = code_replacement_library_table()
% Create a function to call code replacement library table

%% Create a code replacement library table object
hTable = RTW.TflTable;

end
```

### 3 Create an entry.

A code replacement table entry contains entry parameters and a mapping of a conceptual representation of a generated function to the implementation representation of an optimized implementation of that function.

To create a code replacement table:

- a Identify the type of function you want to replace.
- b Call the corresponding Entry Function to create an entry in your table.

Type of Function You Want to Replace	Entry Function
Math Operation	RTW.TflCOperationEntry
Function	RTW.TflCFunctionEntry
BLAS operation	RTW.TflBlasEntryGenerator
CBLAS operation	RTW.TflCBlasEntryGenerator
Fixed-point addition and subtraction operations	RTW.TflCOperationEntryGenerator
Net slope fixed-point operation	RTW.TflCOperationEntryGenerator_NetSlope
Semaphore or mutex	RTW.TflCSemaphoreEntry
Custom function	RTW.TflCFunctionEntryML
Custom operation	RTW.TflCOperationEntryML

```
function hTable = code_replacement_library_table()
% Create a function to call code replacement library table
```

```

%% Create a code replacement library table object
hTable = RTW.TflTable;

%% Create a code replacement library entry
% Pick one from list below
hEntry = RTW.TfLCOperationEntry;
hEntry = RTW.TflCFunctionEntry;
hEntry = RTW.TflBlasEntryGenerator;
hEntry = RTW.TflCBlasEntryGenerator;
hEntry = RTW.TfLCOperationEntryGenerator;
hEntry = RTW.TfLCOperationEntryGenerator_NetSlope;
hEntry = RTW.TflCSemaphoreEntry;
hEntry = RTW.TflCFunctionEntryML;
hEntry = RTW.TfLCOperationEntryML;

end

```

#### 4 Create entry parameters.

Entry parameters specify optimization and build requirements for the code generator to honor during code replacement. These parameters vary depending on the type of function replacement.

To create your entry parameters:

- Call the Set Parameters function that corresponds with the type of function you want to replace identified in the previous step (step 3).

Type of Function You Want to Replace	Set Parameters function
Math operation, BLAS operation, CBLAS operation, Fixed-Point, Net Slope Fixed-Point, Custom operation	setTfLCOperationEntryParameters
Function, Custom function	setTflCFunctionEntryParameters
Semaphore or Mutex	setTflCSemaphoreEntryParameters

Each Set Parameter function is shown with all available properties set to their default values. The exact properties and values you need to specify depends on the function you replace. See examples for specific replacement details.

```

function hTable = code_replacement_library_table()
% Create a function to call code replacement library table

%% Create a code replacement library table object
hTable = RTW.TflTable;

%% Create a code replacement library entry
% Pick one from list below
hEntry = RTW.TfLCOperationEntry;
hEntry = RTW.TflCFunctionEntry;
hEntry = RTW.TflBlasEntryGenerator;
hEntry = RTW.TflCBlasEntryGenerator;
hEntry = RTW.TfLCOperationEntryGenerator;
hEntry = RTW.TfLCOperationEntryGenerator_NetSlope;

##### 5 Create the conceptual representation.

The conceptual representation describes the signature of the function you want to replace. It consists of the function name, return arguments, and parameters. The return arguments are referred to as output arguments, and the parameters are referred to as input arguments. Specify each conceptual argument with the required properties, and, depending on the type of replacement, other optional properties.

Required properties:

- **Name**- Defined as y1..yn for output arguments and u1..un for input arguments
- **I/O type**- Defined as RTW\_IO\_OUTPUT or RTW\_IO\_INPUT

To define your conceptual representation, use one of these approaches:

Approach	Function	Goal
1	createAndAddConceptualArg	Customization and control. If you want to explicitly specify arguments as scalar or matrix and other properties.
2	getTflArgFromString	Rapid prototyping. If you want to quickly specify arguments with built-in data types.

Programming approaches are shown with all available properties set to default values. The exact properties and values you need to specify depends on the function you replace. See examples for specific replacement details.

```

function hTable = code_replacement_library_table()
% Create a function to call code replacement library table

%% Create a code replacement library table object
hTable = RTW.TflTable;

%% Create a code replacement library entry
% Pick one from list below
hEntry = RTW.TflCOperationEntry;
hEntry = RTW.TflCFunctionEntry;
hEntry = RTW.TflBlasEntryGenerator;
hEntry = RTW.TflCBlasEntryGenerator;
hEntry = RTW.TflCOperationEntryGenerator;
hEntry = RTW.TflCOperationEntryGenerator_NetSlope;
hEntry = RTW.TflCSemaphoreEntry;
hEntry = RTW.TflCFunctionEntryML;
hEntry = RTW.TflCOperationEntryML;

%% Create entry parameters
% Pick one from list below
% To view properties, see step 4
hEntry.setTflCOperationEntryParameters();
hEntry.setTflCFunctionEntryParameters();
hEntry.setTflCSemaphoreEntryParameters();

%% Create the conceptual representation

% Approach 1: createAndAddConceptualArg
% arg = createAndAddConceptualArg(hEntry, argType, varargin)
% argType - 'RTW.TflArgNumeric' | 'RTW.TflArgMatrix'
% varargin - 'name', 'value' pairs shown below set to default values,
% includes name and I/O type

% Define Output Arguments
hEntry.createAndAddConceptualArg(...
 'RTW.TflArgNumeric', ...
 'Name', 'y1', ...
 'IOType', 'RTW_IO_OUTPUT', ...
 'IsSigned', true, ...
 'WordLength', 32, ...
 'CheckSlope', true, ...
 'CheckBias', true, ...
 'DataTypeMode', 'Fixed-point:binary point scaling', ...
 'DataType', 'Fixed', ...
 'Scaling', 'BinaryPoint', ...
 'Slope', 1, ...
 'SlopeAdjustmentFactor', 1.0, ...
 'FixedExponent', -15, ...
 'Bias', 0.0, ...
 'FractionLength', 15, ...
 'BaseType', 'double', ...
 'DimRange', [2,2]);

% Define Input Arguments
hEntry.createAndAddConceptualArg(...
 'RTW.TflArgNumeric', ...
 'Name', 'u1', ...
 'IOType', 'RTW_IO_INPUT', ...

```

```

 'IsSigned', true, ...
 'WordLength', 32, ...
 'CheckSlope', true, ...
 'CheckBias', true, ...
 'DataTypeMode', 'Fixed-point:binary point scaling', ...
 'DataType', 'Fixed', ...
 'Scaling', 'BinaryPoint', ...
 'Slope', 1, ...
 'SlopeAdjustmentFactor', 1.0, ...
 'FixedExponent', -15, ...
 'Bias', 0.0, ...
 'FractionLength', 15, ...
 'BaseType', 'double', ...
 'DimRange', [2,2]);

% Approach 2: getTflArgFromString
% arg = getTflArgFromString(hEntry, name, I/O type)
% name- y1..yn | u1..un
% I/O type- RTW_IO_OUTPUT | RTW_IO_INPUT

% Define Output Arguments
arg = getTflArgFromString('y1', 'double');
arg.IOType = 'RTW_IO_OUTPUT';
hEntry.addConceptualArg(arg);

% Define Input Arguments
arg = getTflArgFromString('u1', 'double');
arg.IOType = 'RTW_IO_INPUT';
hEntry.addConceptualArg(arg);

end

```

## 6 Create the implementation representation.

The implementation representation describes the signature of the replacement function defined by the code replacement library. It consists of the function name, return arguments, and parameters. Specify the implementation arguments with a type, type qualifier, and complexity. After you define your implementation representation, add your completed entry to the code replacement table with a call to the function `addEntry`.

To define your implementation representation, use one of these approaches:

Approach	Function	Goal
1	<code>copyConceptualArgsToImplementation</code>	Identical arguments.  Specify implementation arguments and conceptual arguments have the same properties.
2	<code>createAndAddImplementationArg</code> <code>createAndSetCImplementationReturn</code>	Same order, different properties.  Specify implementation arguments have the same order as conceptual arguments but have different properties.

Approach	Function	Goal
3	getTflArgFromString	Add constant value.  Specify implementation arguments with a constant value.
4	getTflDWorkFromString	Mutex/Semaphore replacement.  Specify implementation arguments for mutex or semaphore functions.
5	createCRLEntry	Create entry with one function.  Declare and define a code replacement table entry (conceptual and implementation arguments) in one function.

Programming approaches are shown with all available properties set to their default values. The exact properties and values you need to specify depends on the function you replace. See examples for specific replacement details.

```
function hTable = code_replacement_library_table()
% Create a function to call code replacement library table

%% Create a code replacement library table object
hTable = RTW.TflTable;

%% Create a code replacement library entry
% Pick one from list below
hEntry = RTW.TflCOperationEntry;
hEntry = RTW.TflCFunctionEntry;
hEntry = RTW.TflBlasEntryGenerator;
hEntry = RTW.TflCBlasEntryGenerator;
hEntry = RTW.TflCOperationEntryGenerator;
hEntry = RTW.TflCOperationEntryGenerator_NetSlope;
hEntry = RTW.TflCSemaphoreEntry;
hEntry = RTW.TflCFunctionEntryML;
hEntry = RTW.TflCOperationEntryML;

%% Create entry parameters
% Pick one from list below
% To view properties, see step 4
hEntry.setTflCOperationEntryParameters();
hEntry.setTflCFunctionEntryParameters();
hEntry.setTflCSemaphoreEntryParameters();

%% Create the conceptual representation

% Approach 1: createAndAddConceptualArg
% arg = createAndAddConceptualArg(hEntry, argType, varargin)
% argType - 'RTW.TflArgNumeric' | 'RTW.TflArgMatrix'
% varargin - 'name', 'value' pairs shown below set to default values,
% includes name and I/O type, to view properties, see step 5

% Define Output Arguments
hEntry.createAndAddConceptualArg();
```

```

% Define Input Arguments
hEntry.createAndAddConceptualArg();

% Approach 2: getTflArgFromString
% arg = getTflArgFromString(hEntry, name, I/O type)
% name- y1..yn | u1..un
% I/O type- RTW_IO_OUTPUT | RTW_IO_INPUT

% Define Output Arguments
arg = getTflArgFromString('y1', 'double');
arg.IOType = 'RTW_IO_OUTPUT';
hEntry.addConceptualArg(arg);

% Define Input Arguments
arg = getTflArgFromString('u1', 'double');
arg.IOType = 'RTW_IO_INPUT';
hEntry.addConceptualArg(arg);

%% Create the implementation representation

% Approach 1: copyConceptualArgsToImplementation
copyConceptualArgsToImplementation(hEntry);

% Approach 2: createAndSetCImplementation, createAndSetCImplementationArg
% arg = createAndAddImplementation(hEntry, argType,varargin),
% arg = createAndSetCImplementationReturn(hEntry, argType,varargin)
% argType - 'RTW.TflArgNumeric' | 'RTW.TflArgMatrix'
% varargin - 'name', 'value' pairs shown below set to default values,
% includes name and I/O type

% Define Output Arguments
hEntry.createAndSetCImplementationReturn(...
 'RTW.TflArgNumeric', ...
 'Name', 'y1', ...
 'IOType', 'RTW_IO_OUTPUT', ...
 'IsSigned', true, ...
 'WordLength', 16, ...
 'DataTypeMode', 'Fixed-point:binary point scaling', ...
 'DataType', 'Fixed', ...
 'Scaling', 'BinaryPoint', ...
 'Slope', 1.0, ...
 'SlopeAdjustmentFactor', 1.0, ...
 'FixedExponent', -15, ...
 'Bias', 0.0, ...
 'FractionLength', 15, ...
 'Value', 0);

% Define Input Arguments
hEntry.createAndAddImplementationArg(...
 'RTW.TflArgNumeric', ...
 'Name', 'u1', ...
 'IOType', 'RTW_IO_INPUT', ...

```

```

 'IsSigned', true, ...
 'WordLength', 16, ...
 'DataTypeMode', 'Fixed-point:binary point scaling', ...
 'DataType', 'Fixed', ...
 'Scaling', 'BinaryPoint', ...
 'Slope', 1.0, ...
 'SlopeAdjustmentFactor', 1.0, ...
 'FixedExponent', -15, ...
 'Bias', 0.0, ...
 'FractionLength', 15, ...
 'Value', 0);

% Approach 3: getTflArgFromString
% arg = getTflArgFromString(hEntry, name, datatype)
% name- y1..yn | u1..un, datatype - built-in data type

% Define Output arguments
arg = getTflArgFromString(hEntry, 'y1', 'double');
arg.IOType = 'RTW_IO_OUTPUT';
hEntry.Implementation.setReturn(arg);

% Define Input arguments
arg = getTflArgFromString(hEntry, 'u1', 'double', 0);
hEntry.Implementation.addArgument(arg);

% Approach 4: getTflDWorkFromString
% arg = getTflDWorkFromString(hEntry, name, datatype)

% Define arguments
arg = getTflDWorkFromString('d1', 'void*');
hEntry.addDWorkArg(arg);

% Approach 5: createCRLEntry
% tableEntry = createCRLEntry(crTable,conceptualSpecification,implementationSpecification)

% Define code replacement conceptual and implementation arguments
hEntry = createCRLEntry(...
 hTable, ...
 'conceptualSpecification', ...
 'implementationSpecification');

%% Add code replacement library entry to table
hTable.addEntry(hEntry);

end

```

## 7 Specify build information.

Specify build information for your code replacement library. Build information provides the code generator with the files necessary to perform function replacement.

To specify build information:

- Specify your build parameters in the Entry Parameters function you defined in step 4 or with the specified functions. Specify build information with the following properties:

Parameter	Description
Implementation header file Set properties <code>ImplementationHeaderFile</code> and <code>ImplementationHeaderPath</code> .	Name of header file needed for code replacement.
Implementation source file Set properties <code>ImplementationSourceFile</code> and <code>ImplementationSourcePath</code> .	Name of source file needed for code replacement.
Additional header files/include paths For each file, specify the file name and path in calls to the functions <code>addAdditionalHeaderFile</code> and <code>addAdditionalIncludePath</code> .	Name and path of additional header files needed for code replacement.
Additional source files/paths For each file, specify the file name and path in calls to the functions <code>addAdditionalSourceFile</code> and <code>addAdditionalSourcePath</code> .	Name and path of additional source files needed for code replacement.
Additional object files/paths For each file, specify the file name and path in calls to the functions <code>addAdditionalLinkObj</code> and <code>addAdditionalLinkObjPath</code> .	Name and path of additional object files needed for code replacement.
Additional link flags Set the entry property <code>AdditionalLinkFlags</code> to a cell array of character vectors or string array representing the required compile flags.	Flags the linker needs to generate an executable file for the replacement code.
Additional compile flags Set the entry property <code>AdditionalCompileFlags</code> to a cell array of character vectors or string array representing the required link flags.	Flags the compiler needs to generate object code for the replacement code.

Parameter	Description
<p>Copy files to build directory.</p> <p>Set property GenCallback to 'RTW.copyFileToBuildDir'.</p> <p>If a match occurs for a table entry, a call to the function RTW.copyFileToBuildDir copies required files to the build folder.</p> <p>If you specify additional header files/include paths or additional source files/paths and you copy files, the compiler and utilities such as packNGo might find duplicate instances of files.</p>	<p>Flags whether to copy header, source, or object files, which are required to generate replacement code, to the build folder before code generation. If you specify files with <b>Additional header files/include paths</b> or <b>Additional source files/ paths</b> and you copy files, the compiler and utilities such as packNGo might find duplicate instances of files.</p>

- If an entry uses header, source, or object files, consider whether to make the files accessible to the code generator. You can copy files to the build folder or you can specify individual file names and paths explicitly.
- If you specify *additional* header files/include paths or source files/paths and you copy files, the compiler and utilities such as packNGo might find duplicate instances of files (an instance in the build folder and an instance in the original folder).
- If you choose to copy files to the build folder and you are using the packNGo function to relocate static and generated code files to another development environment:
  - In the call to packNGo, specify the property-value pair 'minimalHeaders' true (the default). That setting instructs the function to include the minimal header files required to build the code in the zip file.
  - Do not collocate files that you copy with files that you do not copy. If the packNGo function finds multiple instances of the same file, the function returns an error.
- If you use the programming interface, paths that you specify can include tokens. A token is a variable defined as a character vector, cell array of character vectors, or string array in the MATLAB workspace that you enclose with dollar signs (*\$variable\$*). The code generator evaluates and replaces a token with the defined value. For example, consider the path \$myfolder\$\folder1, where myfolder is a character vector or string scalar variable defined in the MATLAB workspace as 'd:\work\source\module1'. The code generator generates the custom path as d:\work\source\module1\folder1.

## 8 Validate and save.

Save your code replacement library customization file with the same name as your code replacement library table on your MATLAB path.

To save and validate your library:

- Save your file. From the MATLAB menu, select **File > Save**.
- Validate your library by calling it from the MATLAB command line. For example:

```
>> hTable = code_replacement_library_table()
```

## **See Also**

## Register Code Replacement Library

Create a code replacement library by defining in a registration file the library name, code replacement tables, and other information. After you define and register your library it becomes available to the code generator for code replacement.

### Interactively Develop and Load a Registration file

- 1 In the crtool, select **File > Generate registration file**.

- 2 In the **Generate registration file** dialog box, specify registration information. Then click **OK**.

Parameter	Description
Registry name (Required)	Code replacement library name.
Table list (Required)	Comma-separated list of one or more code replacement tables that you want in the library. Specify tables by using either their names (if located on the MATLAB search path), absolute paths, or relative paths.
Base CRL	Enables you to specify library hierarchies. Provide the name of a registered library to serve as a base for the library that you are currently registering. For example, a TI device library can be a base for a TI C28x library.
Target HW device	Comma-separated list of one or more hardware devices that this library supports. Indicate support of all devices with an asterisk (*).
Description	Description of the purpose and content of the library.

Parameter	Description
Generate data alignment specification	Flag that enables data alignment.

- To use your registered code replacement library, refresh your current MATLAB session with the command:

```
>> sl_refresh_customizations
```

## Programmatically Develop and Load a Registration File

- Open a MATLAB function file. From the MATLAB menu, select **New > Function**.
- Save the function file with the name `rtwTargetInfo.m`.
- Copy and paste the following code into your file to use as a template.

```
function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry; %instantiates a registration entry
this(1).Name = 'Example Code Replacement Library';
this(1).TableList = {'example_code_replacement_table.m'};
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'This registers an example library';

end
```

- In the template, specify the following registration information:

Parameter	Description
Registry name (Required)	Code replacement library name.
Table list (Required)	Comma-separated list of one or more code replacement tables that you want in the library. Specify tables by using either their names (if located on the MATLAB search path), absolute paths, or relative paths.
Base CRL	Enables you to specify library hierarchies. Provide the name of a registered library to serve as a base for the library that you are currently registering. For example, a TI device library can be a base for a TI C28x library.
Target HW device	Comma-separated list of one or more hardware devices that this library supports. Indicate support of all devices with an asterisk (*).
Description	Description of the purpose and content of the library.
Generate data alignment specification	Flag that enables data alignment.

- 5 Save the file on your MATLAB path.
- 6 To use your registered code replacement library, refresh your current MATLAB session with the command:

```
>> sl_refresh_customizations
```

## Examples

### Register one code replacement library

```
function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry; %instantiates a registration entry
this(1).Name = 'Example Code Replacement Library';
this(1).TableList = {'example_code_replacement_table.m'};
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'This registers an example library';

end
```

### Register multiple code replacement libraries

```
function rtwTargetInfo(cm)
cm.registerTargetInfo(@loc_register_crl);
end

function thisCRL = loc_register_crl
% Register a code replacement library for use with model: rtwdemo_crladdsub
thisCrl(1) = RTW.TflRegistry;
thisCrl(1).Name = 'Addition & Subtraction Examples';
thisCrl(1).Description = 'Example of addition/subtraction op replacement';
thisCrl(1).TableList = {'crl_table_addsub'};
thisCrl(1).TargetHWDeviceType = {'*'};

% Register a code replacement library for use with model: rtwdemo_crlmuldiv
thisCrl(2) = RTW.TflRegistry;
thisCrl(2).Name = 'Multiplication & Division Examples';
thisCrl(2).Description = 'Example of mult/div op repl for built-in integers';
thisCrl(2).TableList = {'c:/work_crl/crl_table_muldiv'};
thisCrl(2).TargetHWDeviceType = {'*'};

% Register a code replacement library for use with model: rtwdemo_crlfixpt
thisCrl(3) = RTW.TflRegistry;
thisCrl(3).Name = 'Fixed-Point Examples';
thisCrl(3).Description = 'Example of fixed-point operator replacement';
thisCrl(3).TableList = {fullfile('${MATLAB_ROOT}', ...
 'toolbox', 'rtw', 'rtwdemos', 'crl_demo', 'crl_table_fixpt')};
thisCrl(3).TargetHWDeviceType = {'*'};

end
```

### Register a code replacement hierarchy

```
function rtwTargetInfo(cm)
```

```
cm.registerTargetInfo(@loc_register_crl);
end

function thisCrl = loc_register_crl
% Register a code replacement library that includes common entries
thisCrl(1) = RTW.TflRegistry;
thisCrl(1).Name = 'Common Replacements';
thisCrl(1).Description = 'Common code replacement entries shared by other libraries';
thisCrl(1).TableList = {'crl_table_general'};
thisCrl(1).TargetHWDeviceType = {'*'};

% Register a code replacement library for TI devices
thisCrl(2) = RTW.TflRegistry;
thisCrl(2).Name = 'TI Device Replacements';
thisCrl(2).Description = 'Code replacement entries shared across TI devices';
thisCrl(2).TableList = {'crl_table_TI_devices'};
thisCrl(2).TargetHWDeviceType = {'TI C28x', 'TI C55x', 'TI C62x', 'TI C64x', 'TI 67x'};
thisCrl(2).BaseTfl = 'Common Replacements';

% Register a code replacement library for TI c6xx devices
thisCrl(3) = RTW.TflRegistry;
thisCrl(3).Name = 'TI c6xx Device Replacements';
thisCrl(3).Description = 'Code replacement entries shared across TI C6xx devices';
thisCrl(3).TableList = {'crl_table_TIC6xx_devices'};
thisCrl(3).TargetHWDeviceType = {'TI C62x', 'TI C64x', 'TI 67x'};

% Register a code replacement library for the TI c67x device
thisCrl(4) = RTW.TflRegistry;
thisCrl(4).Name = 'TI c67x Device Replacements';
thisCrl(4).Description = 'Code replacement entries for the TI C67x device';
thisCrl(4).TableList = {'crl_table_TIC67x_device'};
thisCrl(4).TargetHWDeviceType = {'TI 67x'};

end
```

## Verify Code Replacement Library

Verify your code replacement library by examining its structure, replacement, and performance. Use the Code Replacement Viewer (crviewer) to verify the structure of your library. Use the code replacement report to verify the replacements made with your library in generated code. Use crviewer again to verify the performance of your library during code generation by examining the replacement hit and miss logs.

### Verify Library Structure

Use the Code Replacement Viewer (crviewer) to open and view the structure of your code replacement library by examining its tables and table entries.

- 1 From the MATLAB command prompt, open your code replacement library using the crviewer with the command:
 

```
>> crviewer('library')
```
- 2 The viewer opens your code replacement library and shows its code replacement tables in the left pane. Verify that your library lists all required tables in the correct relative order.
- 3 Open and view the entries for each code replacement table. In the crtool, click each table listed in the left pane to view its entries in the middle pane.

If you are not using the crviewer, you can open each table directly from the MATLAB command prompt with the command:

```
crviewer(table)
```

- 4 For each table in your library, verify that it lists all required entries in the correct relative order. Verify that the conceptual representation and implementation representation are correct for each entry in the table.

### Verify Library Replacement

Use the Code Replacements Report to verify that when the code generator uses your code replacement library it creates replacements as expected in the generated code. For each instance of replacement, the Code Replacements Report provides a mapping between the Simulink block that triggered the replacement and its implementation in the generated code. Use this mapping to verify correct code replacement by tracing between the report and the code in either direction (from report to code or code to report).

To generate the Code Replacements Report:

- 1 Configure your model to use your code replacement library.
- 2 Configure your model to open the Code Generation Report. The Code Replacements Report is a tab within this report. In the Model Configuration Parameters dialog box, in the **Code Generation > Report** pane, select:
  - **Create code generation report**
  - **Open report automatically**
  - **Model-to-code**

- **Summarize which block triggered code replacements**
- 3 Configure the generated code to include comments. In the Model Configuration Parameters dialog box, in the **Code Generation > Comments** pane, select:
    - **Include comments**
    - Either or both of **Simulink block comments** and **Simulink block descriptions**
  - 4 Build your model to generate code only. The Code Generation Report opens automatically. On the left pane, click to open the Code Replacements Report.
  - 5 Verify that code replacements occur as expected.
    - **Navigate from report to model:** In the Code Replacements Report, click each block link to see the source that triggered replacement.
    - **Navigate from model to report:** In the Simulink model window, use model-to-code highlighting to trace code replacements. Right-click blocks where you expected code replacement to occur and select **C/C++ Code > Navigate to C/C++ Code**. The report appears with the corresponding replacement code highlighted.

## Verify Library Performance

Verify the performance of your code replacement library by examining the hits and misses that occurred during code generation using your library. During code generation, when the code generator finds a match for code replacement from your code replacement library, it logs the hit in a hit cache. When it does not find a code replacement match, it logs the failed attempt in the miss cache. Each time that you generate code, the code generator overwrites its previous hit and miss cache logs.

To review trace information from the hit and miss cache data, use the Code Replacement Viewer (crviewer). From the hit cache, you can identify when code replacement successfully occurred, and from the miss cache, you can troubleshoot when code replacement did not take place. The miss cache trace information provides you information about the reason for the miss, a link to the relevant source location for the miss, and the call site object of the miss. For more information, see “Troubleshoot Code Replacement Misses” on page 72-59.

## Deploy Code Replacement Library

Package and deploy your code replacement library.

- 1** Move your code replacement library customization and registration files to a location on the MATLAB® search path that is accessible to other users. If another registration file already exists in that location, copy and paste the information for your code replacement library into the existing registration file.
- 2** Refresh your session and verify that the library is available as a configuration option for the code generator.
- 3** Verify that code replacement occurs as expected in generated code.
- 4** Inform users that the code replacement library is available.

## Troubleshoot Code Replacement Library Registration

If a code replacement library is not listed as a configuration option or does not appear in the Code Replacement Viewer:

- Refresh the library registration information within the current MATLAB session (RTW.TargetRegistry.getInstance('reset'); or for the Simulink environment,sl\_refresh\_customizations).
- See whether the registration file, rtwTargetInfo.m, contains an error.

## Troubleshoot Code Replacement Misses

Use miss reason messages that appear in the **Code Replacement Viewer** to analyze and correct code replacement misses.

### Miss Reason Messages

The Code Replacement Viewer displays miss reason messages in trace information for code replacement misses. A legend listing each message that appears in the miss report precedes the report details. A message consists of:

- Numeric identifier, which identifies the message in the report details.
- Message text, which in some cases includes placeholders for names of arguments, call site object values, table entry values, and property names.

For example:

1. Mismatched data types (argument name, CS0 value, table entry value)

The parenthetical information represents placeholders for actual values that appear in the report details.

In the **Miss Source Locations** table that lists the miss details, the **Reason** column includes:

- The message identifier, as listed in the legend.
- The placeholder values for that instance of the miss reason message.

The following **Reason** details indicate a data type mismatch because the call site object specifies data type `int8` for arguments `y1`, `u1`, and `u2`, while the code replacement table entry specifies `uint32`.

1. `y1, int8, uint32`  
`u1, int8, uint32`  
`u2, int8, uint32`

Depending on your situation and the reported miss reason, troubleshoot reported misses by looking for instances of the following:

- A typo in the code replacement table entry definition or a source parameter setting.
- Information missing from the code replacement table entry or a source parameter setting.
- Invalid or incorrect information in the code replacement table entry definition or a source parameter setting.
- Arguments incorrectly ordered in the code replacement table entry definition or the source being replaced with replacement code.
- Failed algorithm classification for an addition or subtraction operation due to:
  - An ideal accumulator not being calculated because the type of an input argument is not fixed-point or the slope adjustment factors of the input arguments are not equal.
  - Input or output casts with a floating-point cast type.
  - Input or output casts with cast types that have different slope adjustment factors or biases.
  - Output casts not being convertible to a single output cast.

- Input casts resulting in loss of bits.

## Analyze and Correct Code Replacement Misses

The following example shows how to use Code Replacement Viewer trace information to troubleshoot code replacement misses. You must have already reviewed and tested code replacements for your model.

- 1 Review the code generated for a model element, looking for expected code replacements. For this example, examine the code generated for block Sub32 in model `rtwdemo_crladdsub`. Right-click the block and select **C/C++ Code > Navigate to C/C++ Code**.

The Code Generation Report opens to the location of the generated code for that block.

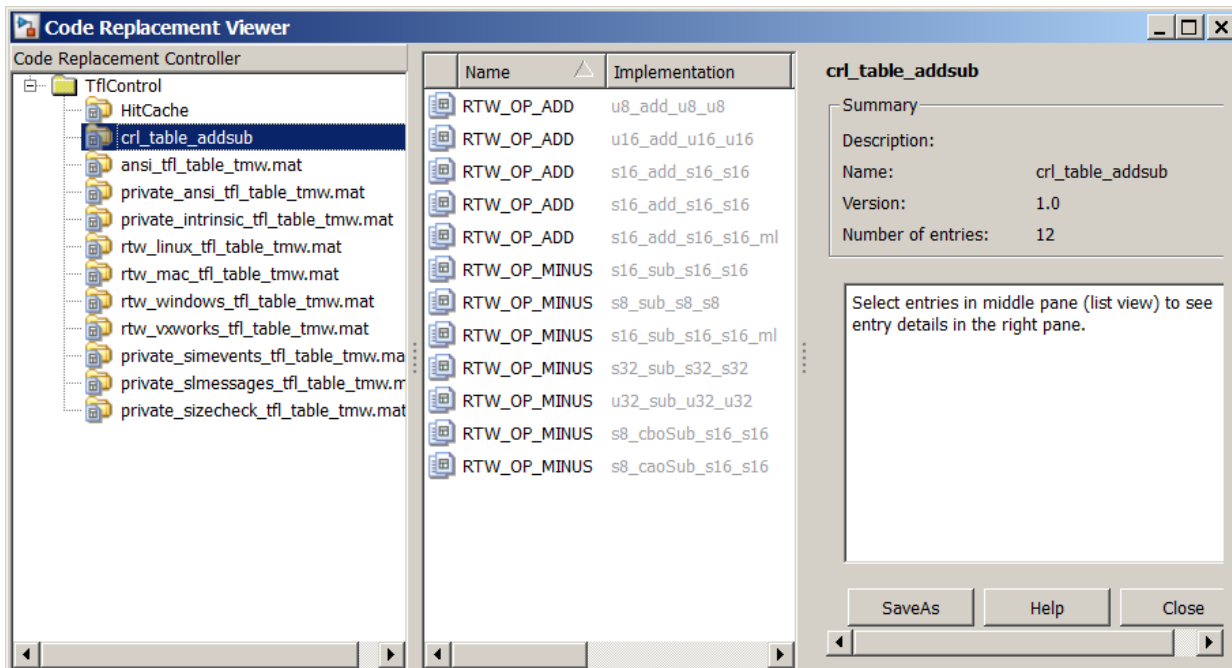

```

63 /* Output: '<Root>/Out5' incorporates:
64 * Inport: '<Root>/In10'
65 * Inport: '<Root>/In9'
66 * Sum: '<Root>/Sub32'
67 */
68 rtY.Out5 = s32_sub_s32_s32(rtU.In9, rtU.In10);

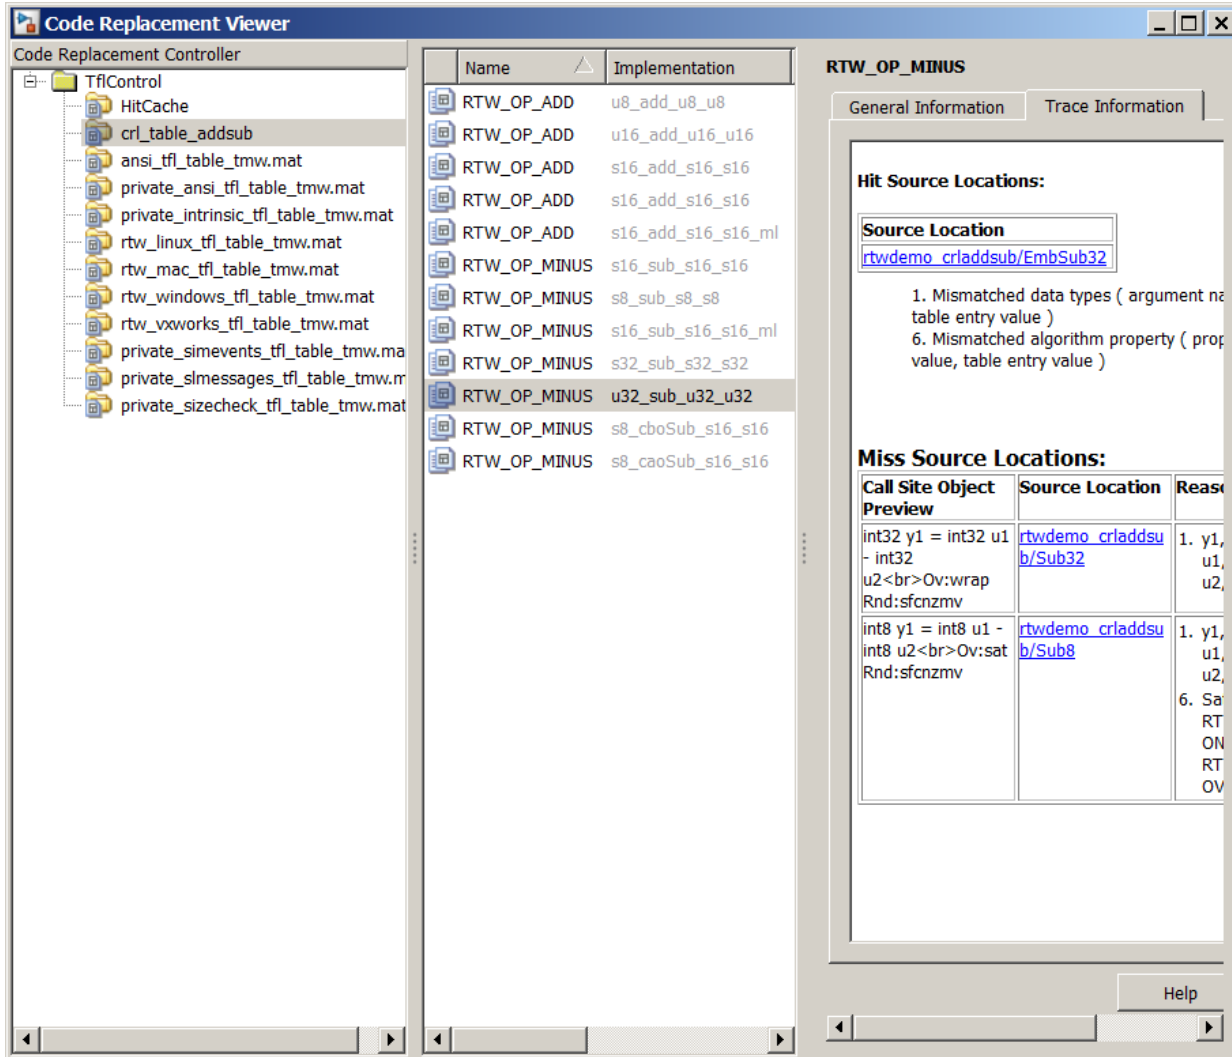

```

The code generator replaced code, but the replacement was for the signed version of the 32-bit subtraction operation. You expected an unsigned operation.

- 2 Regenerate or reopen the Code Replacements Report for your model. If you already generated the code generation report that includes the Code Replacements Report for model `rtwdemo_crladdsub`, open the file `rtwdemo_crladdsub_ert_rtw/html/index.html`. For information on how to regenerate the report, see “Verify Code Replacement Library” on page 72-55.
- 3 Click the link to open the Code Replacement Viewer.
- 4 In the viewer left pane, select your code replacement table. The following display shows entries for code replacement table `crl_table_addsub`.

- 5 In the middle pane, select table entry RTW\_OP\_MINUS with implementation function u32\_sub\_u32\_u32.
- 6 In the right pane, select the **Trace Information** tab.

The **Trace Information** is a table that lists the following information for each miss:

- Call site object preview. The call site object is the conceptual representation of a subtraction operator. The code generator uses this object to query the code replacement library for a match.
- A link to the source location in the model for which the code generator considered replacing code.
- The reasons that the miss occurred. For the list of reasons that misses occur, see “Miss Reason Messages” on page 72-59.

For this example, the report shows misses for two blocks: Sub32 and Sub8.

- 7 Find that source in the trace information. Depending on your situation and the reported miss reason, consider looking for a condition such as a typo in the code replacement table entry

definition or in a source parameter setting. “Miss Reason Messages” on page 72-59 lists conditions to consider.

For this example, determine why code for the Sub32 block was not replaced with code for an unsigned 32-bit subtraction operation. The miss reason for the Sub32 block indicates a data type mismatch. The data type in the call site object for the three arguments is a signed 32-bit integer. The code replacement entry specifies an unsigned 32-bit integer.

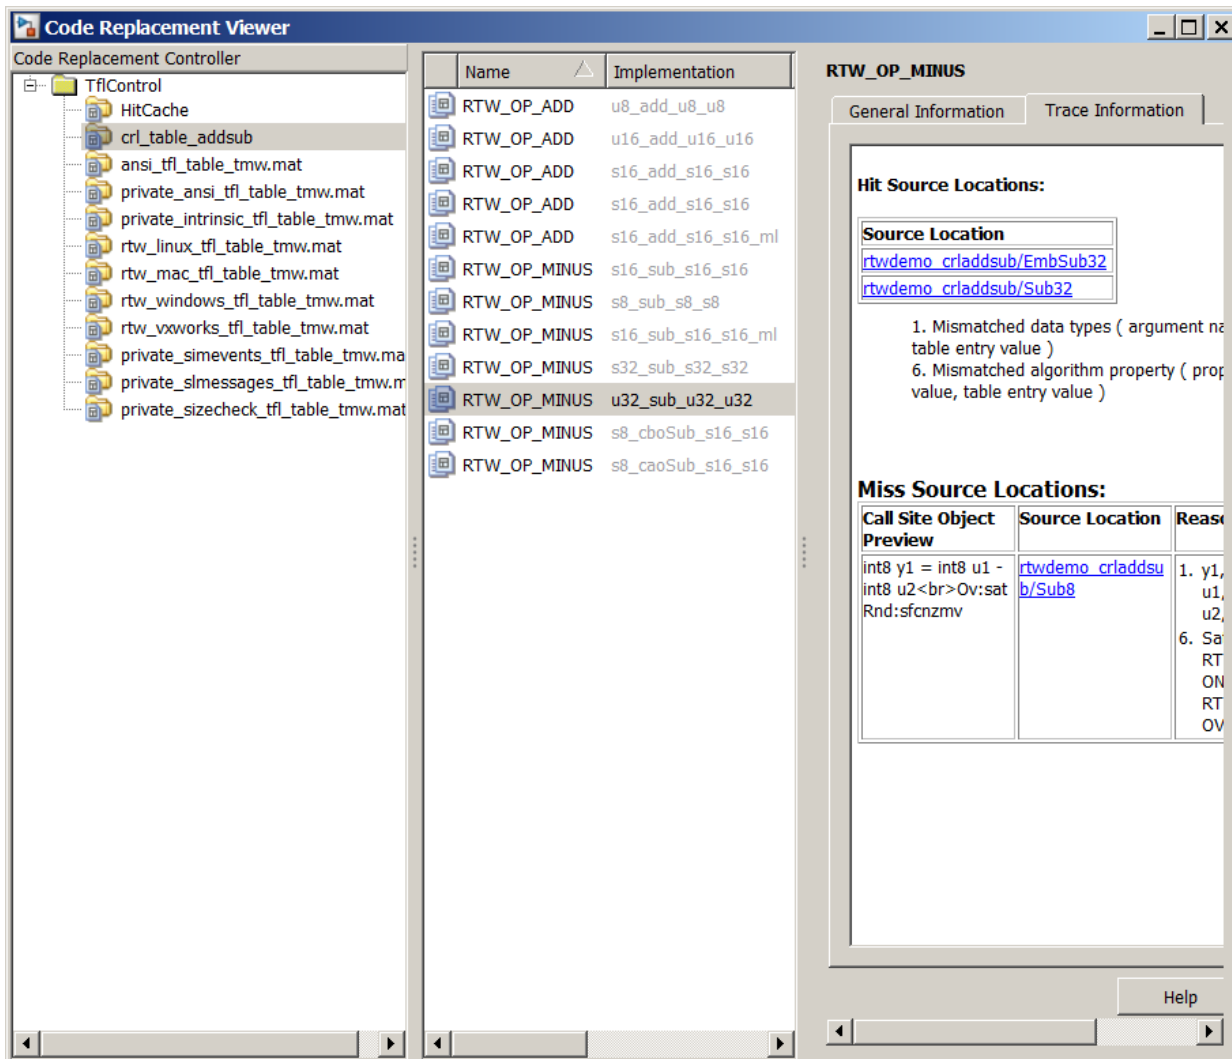

- 8 Correct the model or code replacement table entry. If the issue is in the model, use the source location link in the trace information to find the model element to correct. For this example, you expected an unsigned subtraction operation for the Sub32 block. Click the link in the trace report for the Sub32 block.

The model opens with the Sub32 block highlighted.

Change the data type setting for the two input signals and the output signal for the Sub32 block to `uint32`.

- 9 Regenerate code. Use the Code Replacement Viewer trace information to verify that your model or code replacement table entry corrects the code replacement issue. In the following display, the trace information shows a hit for block Sub32.

## Math Function Code Replacement

This example shows how to develop a code replacement library to optimize the performance of math functions by providing information on how to define code replacement for a `sin` function. To develop a code replacement library use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 72-20.

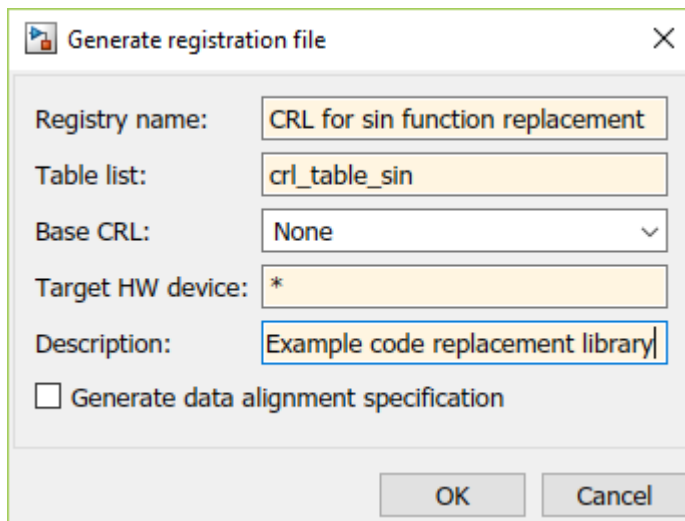

### Interactively Develop a Code Replacement Library

- 1 Open the **Code Replacement Tool** (crtool), from the MATLAB command line with the following command:  

```
>>crtool
```
- 2 Create a table.
  - a From the crtool context menu, select **File > New Table**.
  - b In the right pane, name the table `crl_table_sin`. Click **Apply**.
- 3 Create an entry. From the crtool context menu, select **File > New entry > Function**.
- 4 Create entry parameters. In the **Function** drop-down list, select `sin`. Algorithm information appears in the crtool. For this example, leave the parameter unspecified.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, `y1`, and the input argument, `u1`, with the **Data Type** of `double` and the **Argument Type** of `Scalar`.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box.
- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. Click the **Mapping Information** tab and verify the fields are filled in as shown. Click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
  - a Create a function with the name of your code replacement library table that does not have arguments and returns a table object. You can use this function to call your code replacement library table.
  - b Create a table object by calling `RTW.TflTable`.

```
function hTable = crl_table_sin
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TflCFunctionEntry`.

```
function hTable = crl_table_sin
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = rtw.TflCFunctionEntry;
```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTflCFunctionEntryParameters`.

```
function hTable = crl_table_sin()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
hEntry.setTflCFunctionEntryParameters(...
 'Key', 'sin', ...
 'Priority', 30, ...
 'ImplementationName', 'mySin', ...
 'ImplementationHeaderFile', 'basicMath.h', ...
 'ImplementationSourceFile', 'basicMath.c');
```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `createAndAddConceptualArg`.

```
function hTable = crl_table_sin()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
hEntry.setTflCFunctionEntryParameters(...
 'Key', 'sin', ...
 'Priority', 30, ...
 'ImplementationName', 'mySin', ...
 'ImplementationHeaderFile', 'basicMath.h', ...
 'ImplementationSourceFile', 'basicMath.c');
```

```
%% Create the conceptual representation
hEntry.createAndAddConceptualArg(...
 'RTW.TflArgNumeric', ...
 'Name', 'y1',...
 'IOType', 'RTW_IO_OUTPUT',...
 'DataTypeMode', 'double');
```

```
hEntry.createAndAddConceptualArg(...
 'RTW.TflArgNumeric', ...
 'Name', 'u1', ...
 'IOType', 'RTW_IO_INPUT',...
 'DataTypeMode', 'double');
```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function `copyConceptualArgsToImplementation`. Add the complete entry to the table by calling the function `addEntry`.

```

function hTable = crl_table_sin()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
hEntry.setTflCFunctionEntryParameters(...
 'Key', 'sin', ...
 'Priority', 30, ...
 'ImplementationName', 'mySin', ...
 'ImplementationHeaderFile', 'basicMath.h', ...
 'ImplementationSourceFile', 'basicMath.c');

%% Create the conceptual representation
hEntry.createAndAddConceptualArg(...
 'RTW.TflArgNumeric', ...
 'Name', 'y1', ...
 'IOType', 'RTW_IO_OUTPUT', ...
 'DataTypeMode', 'double');

hEntry.createAndAddConceptualArg(...
 'RTW.TflArgNumeric', ...
 'Name', 'u1', ...
 'IOType', 'RTW_IO_INPUT', ...
 'DataTypeMode', 'double');

%% Create the Implementation Representation
copyConceptualArgsToImplementation(hEntry);

%% Add the entry to the table
hTable.addEntry(hEntry);

```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_sin
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file (a new function file) with these specifications:

```

function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for sin function replacement';
this(1).TableList = {'crl_table_sin.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

```

```
end
```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Generate Code by Using Math Code Replacement Library

In this section, you generate code using the code replacement library that you created in the first two sections of this example. A math function `sin` is replaced with a call to a custom function in the generated code. This example does not provide an implementation function. Write your own implementation.

### Example Model

Open the model `crl_mathfunction` for configuring the code replacement library.

```
open_system('crl_mathfunction');
```

```
copyfile mathFnRtwTargetInfo.txt rtwTargetInfo.m
```

Run the MATLAB® customization file to create a code replacement table and register the file. The customization file has already been executed. Run the `sl_refresh_customizations` function to register the library.

```
sl_refresh_customizations;
```

### Enable Code Replacement Library

- 1 Open the Configuration Parameters dialog box.
- 2 On the **Interface** pane, set **Code Replacement Library** by clicking **Select** and adding CRL for `sin` function replacement to the **Selected code replacement libraries - prioritized** list pane. Alternatively, use the command-line API to enable the code replacement:

```
set_param('crl_mathfunction', 'CodeReplacementLibrary', 'CRL for sin function replacement');
```

Generate code from the model:

```
evalc('slbuild(''crl_mathfunction'')');
```

View the generated code. Here is a portion of `crl_mathfunction.c`.

```

cfile = fullfile('crl_mathfunction_ert_rtw','crl_mathfunction.c');
rtwdemodbtype(cfile,'/* Model step function ','/* Model initialize function',1, 1);

/* Model step function */
void crl_mathfunction_step(void)
{
 /* Output: '<Root>/Y1' incorporates:
 * Inport: '<Root>/U1'
 * Trigonometry: '<Root>/Trigonometric Function'
 */
 crl_mathfunction_Y.Y1 = mySin(crl_mathfunction_U.U1);
}

```

The `sin` function is replaced with a custom `mysin` function.

Close the model and code generation report.

```

delete ./rtwTargetInfo.m
bdclose('crl_mathfunction');
rtwdemoclean;

```

## Buffer Index Calculation Code Replacement

This example shows how to develop a code replacement library to optimize the performance of the buffer index calculation for a Delay block. Optimize the buffer index calculation by defining a code replacement for the circular index calculation function. To develop a code replacement library, use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 72-20.

### Interactively Develop a Code Replacement Library

- 1 Open the **Code Replacement Tool** (crtool). At the MATLAB command line, enter:  

```
>>crtool
```
- 2 Create a table.
  - a From the crtool context menu, select **File > New Table**.
  - b In the right pane, name the table `crl_table_circularIndex`. Click **Apply**.
- 3 Create an entry. From the crtool context menu, select **File > New entry > Function**.
- 4 Create entry parameters. In the **Function** drop-down list, select `circularIndex`.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, `y1`, and the input arguments, `u1`, `u2`, and `u3`, that use the **Data Type** of `int32` and the **Argument Type** of `Scalar`.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box.
- 7 Specify the name of the replacement function. In the **Replacement Function** section, set **Name** to `myCircularIndexFunc`.
- 8 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 9 Validate and save the table. Click the **Mapping Information** tab and verify that the fields are filled in as shown. Click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

**10** Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

- **Registry name** — CRL for circular buffer index replacement
- **Table list** — `crl_table_circularIndex`
- **Description** — Example code replacement library

To use your code replacement library, refresh your current MATLAB session. At the command line, enter:

```
>>sl_refresh_customizations
```

**11** Verify the code replacement library. At the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
  - a Create a function with the name of your code replacement library table that does not have arguments and returns a table object. You can use this function to call your code replacement library table.
  - b Create a table object by calling `RTW.TfTable`.

```

 'DataTypeMode', 'int32');

hEntry.createAndAddConceptualArg(...
 'RTW.TflArgNumeric', ...
 'Name', 'u1', ...
 'IOType', 'RTW_IO_INPUT',...
 'DataTypeMode', 'int32');

hEntry.createAndAddConceptualArg(...
 'RTW.TflArgNumeric', ...
 'Name', 'u2', ...
 'IOType', 'RTW_IO_INPUT',...
 'DataTypeMode', 'int32');

hEntry.createAndAddConceptualArg(...
 'RTW.TflArgNumeric', ...
 'Name', 'u3', ...
 'IOType', 'RTW_IO_INPUT',...
 'DataTypeMode', 'int32');

```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function `copyConceptualArgsToImplementation`. Add the complete entry to the table by calling the function `addEntry`.

```

function hTable = crl_table_circularIndex()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflFunctionEntry;

%% Create entry parameters
hEntry.setTflFunctionEntryParameters(...
 'Key', 'circularIndex', ...
 'Priority', 30, ...
 'ImplementationName', 'myCircularIndexFunc');

%% Create the conceptual representation
hEntry.createAndAddConceptualArg(...
 'RTW.TflArgNumeric', ...
 'Name', 'y1',...
 'IOType', 'RTW_IO_OUTPUT',...
 'DataTypeMode', 'int32');

hEntry.createAndAddConceptualArg(...
 'RTW.TflArgNumeric', ...
 'Name', 'u1', ...
 'IOType', 'RTW_IO_INPUT',...
 'DataTypeMode', 'int32');

hEntry.createAndAddConceptualArg(...
 'RTW.TflArgNumeric', ...
 'Name', 'u2', ...
 'IOType', 'RTW_IO_INPUT',...

```

```

 'DataTypeMode', 'int32');

hEntry.createAndAddConceptualArg(...
 'RTW.TflArgNumeric', ...
 'Name', 'u3', ...
 'IOType', 'RTW_IO_INPUT',...
 'DataTypeMode', 'int32');

%% Create the Implementation Representation
copyConceptualArgsToImplementation(hEntry);

%% Add the entry to the table
hTable.addEntry(hEntry);

```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator requires for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. At the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_circularIndex
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file (a new function file) by using these specifications:

```

function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for circular index calculation replacement';
this(1).TableList = {'crl_table_circularIndex.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end

```

To use your code replacement library, refresh your current MATLAB session. At the command line, enter:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. At the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Generate Code by Using Circular Index Code Replacement Library

Generate code by using the code replacement library that you previously created in this example. The code that calculates the circular index for a delay buffer is replaced with a call to a custom function in the generated code. This example does not provide an implementation function. Write your own implementation or use the target specific implementation.

### Example Model

The example model contains a Delay block with these properties:

- **Delay length** — Input port
- **Input processing** — Columns as channels (frame-based)
- **Use circular buffer for state** — On

The Delay block receives a 32 by 2 data input signal and a scalar delay length input signal. To replace the buffer index calculation, for the Delay block, you must enable **Use circular buffer for state** enabled and use frame-based input processing. Frame-based input processing requires DSP System Toolbox. For more information, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

### Enable Code Replacement Library

- 1 Open the Configuration Parameters dialog box.
- 2 On the **Interface** pane, set **Code Replacement Library** by clicking **Select**. Add CRL for circular index calculation replacement to the **Selected code replacement libraries - prioritized** list pane. Alternatively, use the command-line API to enable the code replacement.

```
set_param('delayModel', 'CodeReplacementLibrary', 'CRL for circular index calculation');
```

- 3 Generate code from the model.

View the generated code. The portion of `delayModel.c` that calculates the buffer index uses the replacement function `myCircularIndexFunc`.

```
/* Update for Delay: '<Root>/Delay' incorporates:
 * Inport: '<Root>/Input'
 */
currIdx = rtDW->CircBufIdx;
for (frameIdx = 0; frameIdx < 32; frameIdx++) {
 rtDW->Delay_DSTATE[currIdx] = rtInput[frameIdx];
 rtDW->Delay_DSTATE[currIdx + 200] = rtInput[frameIdx + 32];
 currIdx = myCircularIndexFunc(currIdx, 1, 200);
}

if (rtDW->CircBufIdx < 168) {
 rtDW->CircBufIdx += 32;
} else {
 rtDW->CircBufIdx -= 168;
}

/* End of Update for Delay: '<Root>/Delay' */
```

- “Develop a Code Replacement Library” on page 72-20

## Memory Function Code Replacement

This example shows how to develop a code replacement library to optimize the performance of memory functions by providing information on how to define code replacement for a memcpy function. To develop a code replacement library use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 72-20.

### Interactively Develop a Code Replacement Library

- 1 Open the **Code Replacement Tool** (crtool), from the MATLAB command line with the following command:

```
>>crtool
```

- 2 Create a table.
  - a From the crtool context menu, select **File > New Table**.
  - b In the right pane, name the table `cr1_table_memcpy`. Click **Apply**.
- 3 Create an entry. From the crtool context menu, select **File > New entry > Function**.
- 4 Create entry parameters. In the **Function** drop-down list, select `memcpy`.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, `y1`, with the **Data Type** of `void` and the **Argument Type** of `Pointer`, the input arguments, `u1` and `u2` with the **Data Type** of `void` and the **Argument Type** of `Pointer` and `u3` with the **Data Type** of `unsigned integral` and the **Argument Type** of `Scalar`.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box.

Specify a **Name** for the replacement function under **Function prototype**.
- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. In the **Mapping Information** tab, click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:  
`>>sl_refresh_customizations`

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
  - a Create a function to call your code replacement library table. The function should not have arguments and return a table object.
  - b Create a table object by calling `RTW.TflTable`.

```
function hTable = crl_table_memcpy()
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TflCFunctionEntry`.

```
function hTable = crl_table_memcpy()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = rtw.TflCFunctionEntry;
```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTflCFunctionEntryParameters`.

```
function hTable = crl_table_memcpy()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
% Set SideEffects to 'true' for function returning void to prevent it from
% being optimized away.
hEntry.setTflCFunctionEntryParameters(...
 'Key', 'memcpy', ...
 'Priority', 90, ...
 'ImplementationName', 'memcpy_int', ...
 'ImplementationHeaderFile', 'memcpy_int.h',...
 'SideEffects', true);
```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `getTflArgFromString`.

```

function hTable = crl_table_memcpy()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflFunctionEntry;

%% Create entry parameters
% Set SideEffects to 'true' for function returning void to prevent it from
% being optimized away.
hEntry.setTflFunctionEntryParameters(...
 'Key', 'memcpy', ...
 'Priority', 90, ...
 'ImplementationName', 'memcpy_int', ...
 'ImplementationHeaderFile', 'memcpy_int.h', ...
 'SideEffects', true);

%% Create conceptual arguments
arg = getTflArgFromString(hTable, 'y1', 'void*');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hTable, 'u1', 'void*');
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hTable, 'u2', 'void*');
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hTable, 'u3', 'size_t');
addConceptualArg(hEntry, arg);

```

- 6** Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function `copyConceptualArgsToImplementation`. Add the complete entry to the table by calling the function `addEntry`.

```

function hTable = crl_table_memcpy()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflFunctionEntry;

%% Create entry parameters
setTflFunctionEntryParameters(hEntry, ...
 'Key', 'memcpy', ...
 'Priority', 90, ...
 'ImplementationName', 'memcpy_int', ...
 'ImplementationHeaderFile', 'memcpy_int.h', ...
 'SideEffects', true);

%% Create conceptual arguments
arg = getTflArgFromString(hTable, 'y1', 'void*');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hTable, 'u1', 'void*');
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hTable, 'u2', 'void*');
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hTable, 'u3', 'size_t');
addConceptualArg(hEntry, arg);

```

```

%% Create the Implementation Representation
copyConceptualArgsToImplementation(hEntry);

```

```

%% Add the entry to the table
hTable.addEntry(hEntry);

```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_memcpy
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file with these specifications:

```

function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for memory function replacement';
this(1).TableList = {'crl_table_memcpy.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end

```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Nonfinite Function Code Replacement

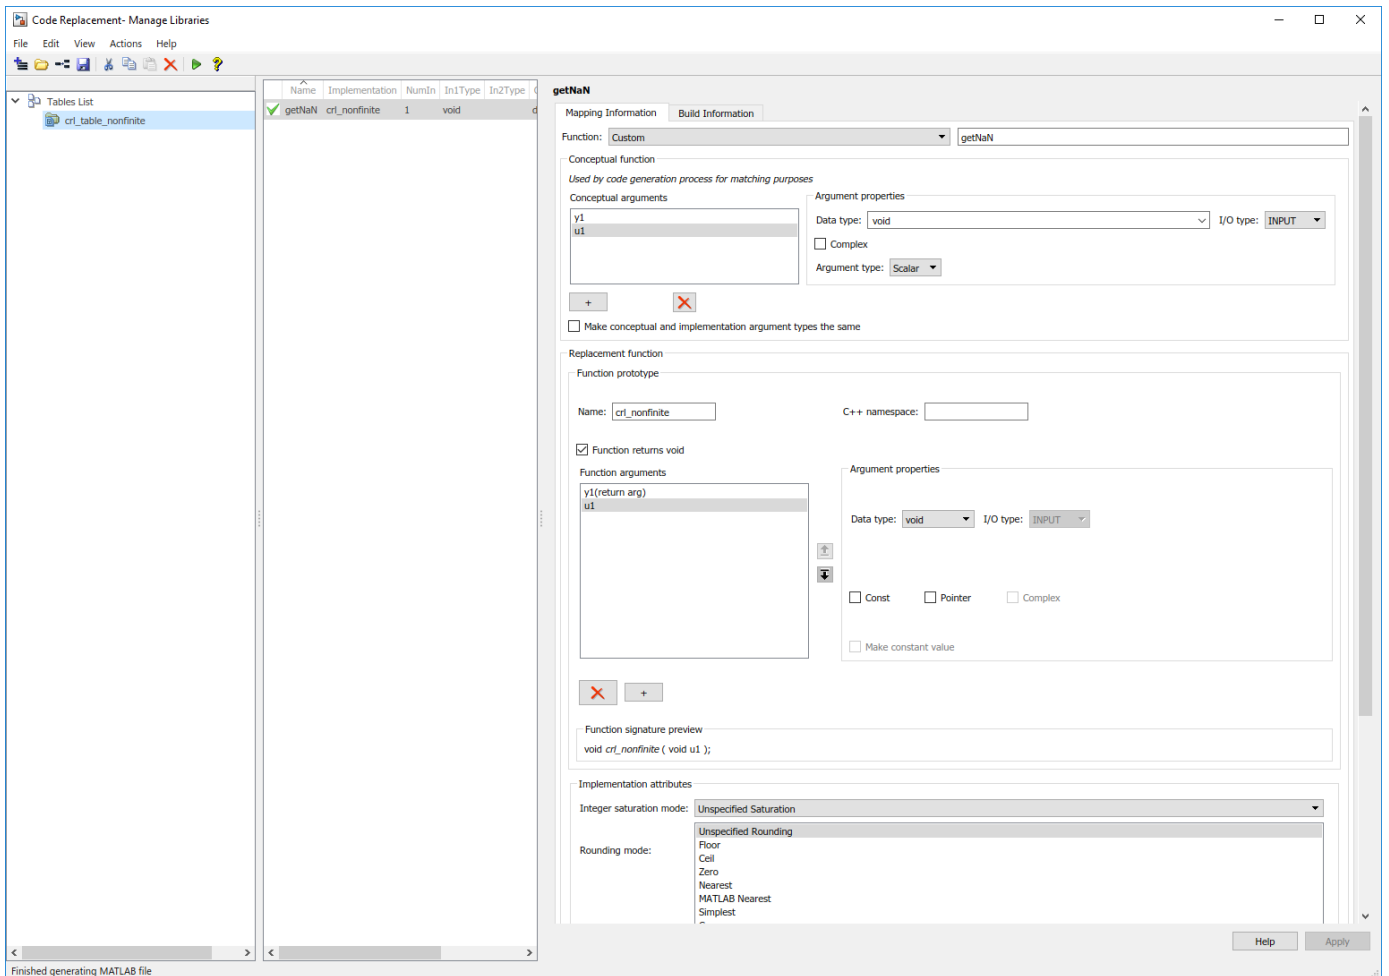

This example shows how to develop a code replacement library to optimize the performance of nonfinite functions by providing information on how to define code replacement for a `sqrt` function. To develop a code replacement library use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 72-20.

### Interactively Develop a Code Replacement Library

- 1 Open the **Code Replacement Tool** (crtool), from the MATLAB command line with the following command:
 

```
>>crtool
```
- 2 Create a table.
  - a From the crtool context menu, select **File > New Table**.
  - b In the right pane, name the table `cr1_table_nonfinite`. Click **Apply**.
- 3 Create an entry. From the crtool context menu, select **File > New entry > Function**.
- 4 Create entry parameters. In the **Function** drop-down list, select `custom`. Function information appears in the crtool. For this example, specify the parameter as `getNaN`.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, `y1`, with the **Data Type** of `double` and the **Argument Type** of `scalar` and the input argument, `u1`, with the **Data Type** of `void` and the **Argument Type** of `scalar`.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box.
 

Specify a **Name** for the replacement function under **Function prototype**.
- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, set the **Implementation header file** to `nonfin.h`.
- 8 Validate and save the table. In the **Mapping Information** tab, click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
  - a Create a function to call your code replacement library table. The function should not have arguments and return a table object.
  - b Create a table object by calling `RTW.TflTable`.

```
function hTable = crl_table_nonfinite()
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TflCFunctionEntry`.

```
function hTable = crl_table_nonfinite()
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = rtw.TflCFunctionEntry;
```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTflCFunctionEntryParameters`.

```
function hTable = crl_table_nonfinite()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
hEntry.setTflCFunctionEntryParameters(...
 'Key', 'getNaN', ...
 'Priority', 30, ...
 'ImplementationName', 'mygetNaN', ...
 'ImplementationHeaderFile', 'getInf.h', ...
 'ImplementationSourceFile', 'getInf.c');
```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `getTflArgFromString`.

```
function hTable = crl_table_nonfinite()
% Create a code replacement library table
```

```

%% Create a table object
hTable = RTW.TfllTable;

%% Create an entry
hEntry = RTW.TfllFunctionEntry;

%% Create entry parameters
hEntry.setTfllFunctionEntryParameters(...
 'Key', 'getNaN', ...
 'Priority', 30, ...
 'ImplementationName', 'mygetNaN', ...
 'ImplementationHeaderFile', 'getInf.h', ...
 'ImplementationSourceFile', 'getInf.c');

%% Create the conceptual representation
arg = getTfllArgFromString(hTable, 'y1', 'double');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);

arg = getTfllArgFromString(hTable, 'u1', 'void');
addConceptualArg(hEntry, arg);

```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function `copyConceptualArgsToImplementation`. Add the complete entry to the table by calling the function `addEntry`.

```

function hTable = crl_table_nonfinite()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TfllTable;

%% Create an entry
hEntry = RTW.TfllFunctionEntry;

%% Create entry parameters
hEntry.setTfllFunctionEntryParameters(...
 'Key', 'getNaN', ...
 'Priority', 30, ...
 'ImplementationName', 'mygetNaN', ...
 'ImplementationHeaderFile', 'getInf.h', ...
 'ImplementationSourceFile', 'getInf.c');

%% Create the conceptual representation
arg = getTfllArgFromString(hTable, 'y1', 'double');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);

arg = getTfllArgFromString(hTable, 'u1', 'void');
addConceptualArg(hEntry, arg);

%% Create the Implementation Representation
copyConceptualArgsToImplementation(hEntry);

%% Add the entry to the table
addEntry(hTable, hEntry);

```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_nonfinite
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file with these specifications:

```

function rtwTargetInfo(cm)
cm.registerTargetInfo(@loc_register_crl);

```

```
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for nonfinite function replacement';
this(1).TableList = {'crl_table_nonfinite.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end
```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10** Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Algorithm-Based Code Replacement

You can develop a code replacement library to optimize the performance of certain math functions based on the computation or approximation algorithm configured for a block.

For example, you can configure:

- The Reciprocal Sqrt block to use the Newton-Raphson or Exact computation method.
- The Trigonometric Function block, with **Function** set to `sin`, `cos`, `sincos`, or `atan2`, to use the approximation method CORDIC, Lookup, or None.

To develop a code replacement library, use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 72-20.

### Interactively Develop a Code Replacement Library

- 1 Open the **Code Replacement Tool** (crtool), from the MATLAB command line with the following command:

```
>>crtool
```

- 2 Create a table.

- a From the crtool context menu, select **File > New Table**.
- b In the right pane, name the table `cr1_rsqr`. Click **Apply**.

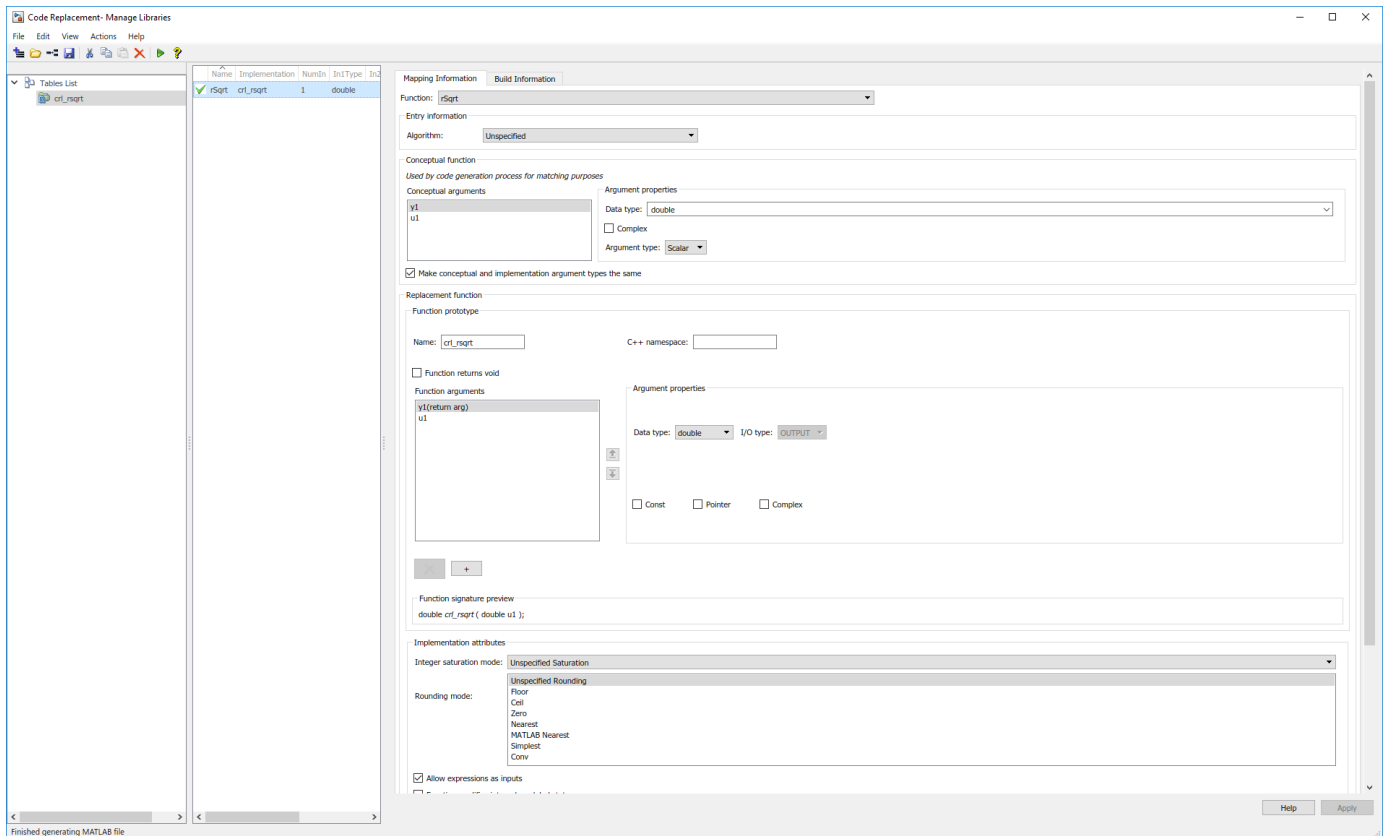

- 3 Create an entry. From the crtool context menu, select **File > New entry > Function**.

- 4 Create entry parameters. In the **Function** drop-down list, select `rSqr`. Algorithm information appears in the crtool. For this example, set the parameter to **Newton Raphson**.

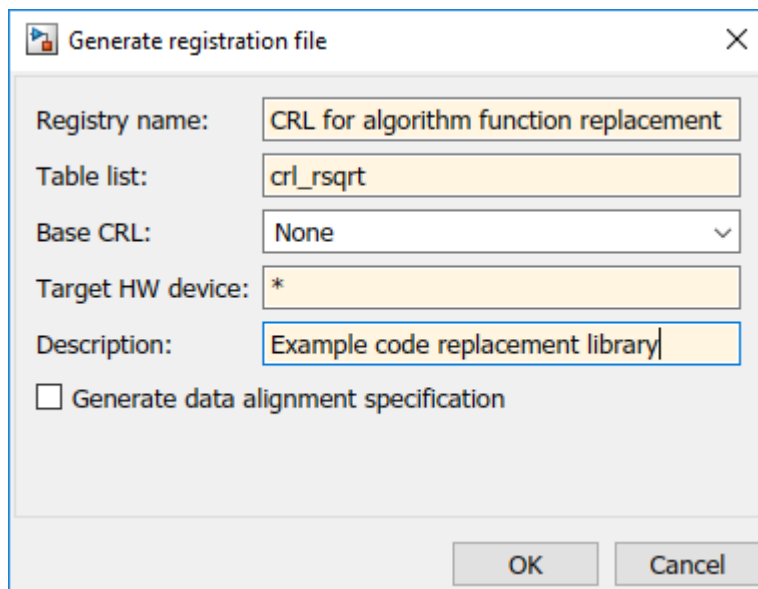

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, `y1`, and the input argument, `u1`, by using the **Data Type** of double and the **Argument Type** of Scalar.

Specify a **Name** for the replacement function under **Function prototype**.

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box.
- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. In the **Mapping Information** tab, click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10** Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
  - a Create a function to call your code replacement library table. The function cannot have arguments or return a table object.
  - b Create a table object by calling `RTW.TflTable`.

```
function hTable = crl_rsqr()
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TflCFunctionEntry`.

```
function hTable = crl_rsqr()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;
```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTflCFunctionEntryParameters`.

To use the algorithm for a function in an entry definition, set the `EntryInfoAlgorithm` property in a call to the function `setTflCFunctionEntryParameters` as `RTW_Newton_Raphson`.

```
function hTable = crl_rsqr()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
hEntry.setTflCFunctionEntryParameters(...
 'Key', 'rSqr', ...
 'Priority', 80, ...
 'ImplementationName', 'rsqr_newton', ...
 'ImplementationHeaderFile', 'rsqr.h', ...
 'EntryInfoAlgorithm', 'RTW_NEWTON_RAPHSON');
```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `createAndAddConceptualArg`.

```
function hTable = crl_rsqr()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
hEntry.setTflCFunctionEntryParameters(...
 'Key', 'rSqr', ...
 'Priority', 80, ...
 'ImplementationName', 'rsqr_newton', ...
 'ImplementationHeaderFile', 'rsqr.h', ...
 'EntryInfoAlgorithm', 'RTW_NEWTON_RAPHSON');

%% Create the conceptual representation
createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'y1', ...
 'IOType', 'RTW_IO_OUTPUT', ...
 'DataTypeMode', 'double');

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'u1', ...
 'DataTypeMode', 'double');
```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function `copyConceptualArgsToImplementation`. Add the complete entry to the table by calling the function `addEntry`.

```
function hTable = crl_rsqr()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
hEntry.setTflCFunctionEntryParameters(...
 'Key', 'rSqr', ...
 'Priority', 80, ...
 'ImplementationName', 'rsqr_newton', ...
 'ImplementationHeaderFile', 'rsqr.h', ...
 'EntryInfoAlgorithm', 'RTW_NEWTON_RAPHSON');

%% Create the conceptual representation
createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'y1', ...
 'IOType', 'RTW_IO_OUTPUT', ...
```

```

 'DataTypeMode', 'double');

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'u1', ...
 'DataTypeMode', 'double');

%% Create the Implementation Representation
copyConceptualArgsToImplementation(hEntry);

%% Add the entry to the table
hTable.addEntry(hEntry);

```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_rsqr
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file by using these specifications:

```

function rtwTargetInfo(cm)
cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl
this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for algorithm function replacement';
this(1).TableList = {'crl_rsqr.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';
end

```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Lookup Table Function Code Replacement

You can configure the algorithm for table lookup operations and index searches and generate code. If the code generated for available algorithm options does not meet requirements for your application, create custom code replacement table entries to replace the generated algorithm code. You can develop a code replacement library to optimize the performance of algorithms in a lookup table block. For more information, see “Develop a Code Replacement Library” on page 72-20. For more information about using lookup table blocks, see “Nonlinearity”.

### Lookup Table Function Signatures

To create code replacement table entries for a function corresponding to a lookup table algorithm, you must have:

- Information about the conceptual function signature.
- Relevant algorithm parameters.

This table provides the conceptual function signature information.

Conceptual Function Signature	Argument Summary
<code>y1 = interp1D(u1, u2, u3, u4)</code>	y1 - output u1 - index u2 - fraction u3 - table data u4 - table dimension length
<code>y1 = interp2D(u1, u2, u3, u4, u5, u6, u7)</code>	y1 - output u1, u3 - index u2, u4 - fraction u5 - table data u6, u7 - table dimension lengths
<code>y1 = interp3D(u1, u2, u3, u4, u5, u6, u7, u8, u9, u10)</code>	y1 - output u1, u3, u5 - index u2, u4, u6 - fraction u7 - table data u8, u9, u10 - table dimension lengths
<code>y1 = interp4D(u1, u2, u3, u4, u5, u6, u7, u8, u9, u10, u11, u12, u13)</code>	y1 - output u1, u3, u5, u7 - index u2, u4, u6, u8 - fraction u9 - table data u10, u11, u12, u13 - table dimension lengths
<code>y1 = interp5D(u1, u2, u3, u4, u5, u6, u7, u8, u9, u10, u11, u12, u13, u14, u15, u16)</code>	y1 - output u1, u3, u5, u7, u9 - index u2, u4, u6, u8, u10 - fraction u11 - table data u12, u13, u14, u15, u16 - table dimension lengths

Conceptual Function Signature	Argument Summary
$y1 = \text{interpND}(\{u_i, u_f, \dots, u_t, u_n, \dots\})$	y1 - output $u_i, u_f$ is an index and fraction pair per dimension $u_t$ - table data $u_n$ - table dimension lengths
Explicit values $y1 = \text{lookup1D}(u1, u2, u3, u4)$	y1 - output u1 - input u2 - breakpoint data u3 - table data u4 - table dimension length
Even spacing $y1 = \text{lookup1D}(u1, u2, u3, u4, u5)$	y1 - output u1 - input u2 - first point of breakpoint data u3 - spacing of breakpoints u4 - table data u5 - table dimension length
Explicit values $y1 = \text{lookup2D}(u1, u2, u3, u4, u5, u6, u7)$	y1 - output u1, u2 - input u3, u4 - breakpoint data u5 - table data u6, u7 - table dimension lengths
Even spacing $y1 = \text{lookup2D}(u1, u2, u3, u4, u5, u6, u7, u8, u9)$	y1 - output u1, u2 - input u3, u5 - first point of breakpoint data u4, u6 - spacing of breakpoints u7 - table data u8, u9 - table dimension lengths
Explicit spacing $y1 = \text{lookup3D}(u1, u2, u3, u4, u5, u6, u7, u8, u9, u10)$	y1 - output u1, u2, u3 - input u4, u5, u6 - breakpoint data u7 - table data u8, u9, u10 - table dimension lengths
Even spacing $y1 = \text{lookup3D}(u1, u2, u3, u4, u5, u6, u7, u8, u9, u10, u11, u12, u13)$	y1 - output u1, u2, u3 - input u4, u6, u8 - first point of breakpoint data u5, u7, u9 - spacing of breakpoints u10 - table data u11, u12, u13 - table dimension lengths
Explicit values $y1 = \text{lookup4D}(u1, u2, u3, u4, u5, u6, u7, u8, u9, u10, u11, u12, u13)$	y1 - output u1, u2, u3, u4 - input u5, u6, u7, u8 - breakpoint data u9 - table data u10, u11, u12, u13 - table dimension lengths

Conceptual Function Signature	Argument Summary
Even spacing <code>y1 = lookup4D(u1, u2, u3, u4, u5, u6, u7, u8, u9, u10, u11, u12, u13, u14, u15, u16, u17)</code>	y1 - output u1, u2, u3, u4 - input u5, u7, u9, u11 - first point of breakpoint data u6, u8, u10, u12 - spacing of breakpoints u13 - table data u14, u15, u16, u17 - table dimension lengths
Explicit values <code>y1 = lookup5D(u1, u2, u3, u4, u5, u6, u7, u8, u9, u10, u11, u12, u13, u14, u15, u16)</code>	y1 - output u1, u2, u3, u4, u5 - input u6, u7, u8, u9, u10 - breakpoint data u11 - table data u12, u13, u14, u15, u16 - table dimension lengths
Even spacing <code>y1 = lookup5D(u1, u2, u3, u4, u5, u6, u7, u8, u9, u10, u11, u12, u13, u14, u15, u16, u17, u18, u19, u20, u21)</code>	y1 - output u1, u2, u3, u4, u5 - input u6, u8, u10, u12, u14 - first point of breakpoint data u7, u9, u11, u13, u15 - spacing of breakpoints u16 - table data u17, u18, u19, u20, u21 - table dimension lengths
Explicit values <code>y1 = lookupND(un,..., ub,..., ut, un...)</code>	y1 - output un, input per dimension ub, breakpoint per dimension ut - table data un - table dimension lengths
Even spacing <code>y1 = lookupND(un,..., {ufn, usn,...} ut, un...)</code>	y1 - output un - input per dimension ufn - first point of breakpoint data per dimension usn - spacing of breakpoint per dimension ut - table data un - table dimension lengths
<code>y1 = lookupND_Direct(u1, u2,...ui, ui+1)</code>	y1 - output u1...ui - input ui+1 - table data
Explicit values <code>y1, y2 = prelookup(u1, u2, u3)</code>	y1 - index y2 - fraction u1 - input u2 - breakpoint data u3 - number of breakpoints

Conceptual Function Signature	Argument Summary
Evenly spaced y1, y2 = prelookup(u1, u2, u3, u4)	y1 - index y2 - fraction u1 - input u2 - first point of breakpoint data u3 - spacing of breakpoints u4 - number of breakpoints

For the table and breakpoint data, the conceptual function uses matrix arguments by default. If the lookup table object has the parameter **Allow multiple instances of this type to have different table and breakpoint sizes** enabled, the conceptual function uses pointer arguments for the table and breakpoint data. To replace a lookup table function that uses pointer arguments, you must create the entry programmatically.

When defining a table entry programmatically, you might also need to change the values of required (primary) and optional algorithm parameters.

- Set values for required parameters to achieve code replacement.
- If you do not set a value for an optional parameter, the algorithm parameter software applies don't care. The code replacement software ignores the parameter while searching for matches.

## Interactively Develop a Code Replacement Library

This example shows how to specify a code replacement table entry for a lookup table algorithm `interp1D` by using the Code Replacement Tool.

- 1 Open the **Code Replacement Tool** (`crtool`), from the MATLAB command line with the following command:
 

```
>>crtool
```
- 2 Create a table.
  - a From the `crtool` context menu, select **File > New Table**.
  - b In the right pane, name the table `cr_l_LUT`. Click **Apply**.
- 3 Create an entry. From the `crtool` context menu, select **File > New entry > Function**.
- 4 Create entry parameters. In the **Function** drop-down list, select `custom`. Function information appears in the `crtool`. For this example, specify the parameter as `lookup1D`. Set these algorithm parameters as shown in the `crtool` snapshot below:
  - **Extrapolation method** — Linear
  - **Interpolation method** — Linear point-slope
  - **Integer rounding mode** — Round
  - **Saturate on overflow** — off
  - **Index search method** — Linear search
  - **Remove out-of-range input protection** — off
  - **Support tunable table size** — off
  - **Use last table value for inputs at or above last breakpoint** — off
  - **Begin index search using previous index result** — off

- **Use algorithms optimized for row-major array layout** — off
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, y1, and the input argument u1 with the **Data Type** of double and u4, with the **Data Type** of uint32 and the **Argument Type** of Scalar.

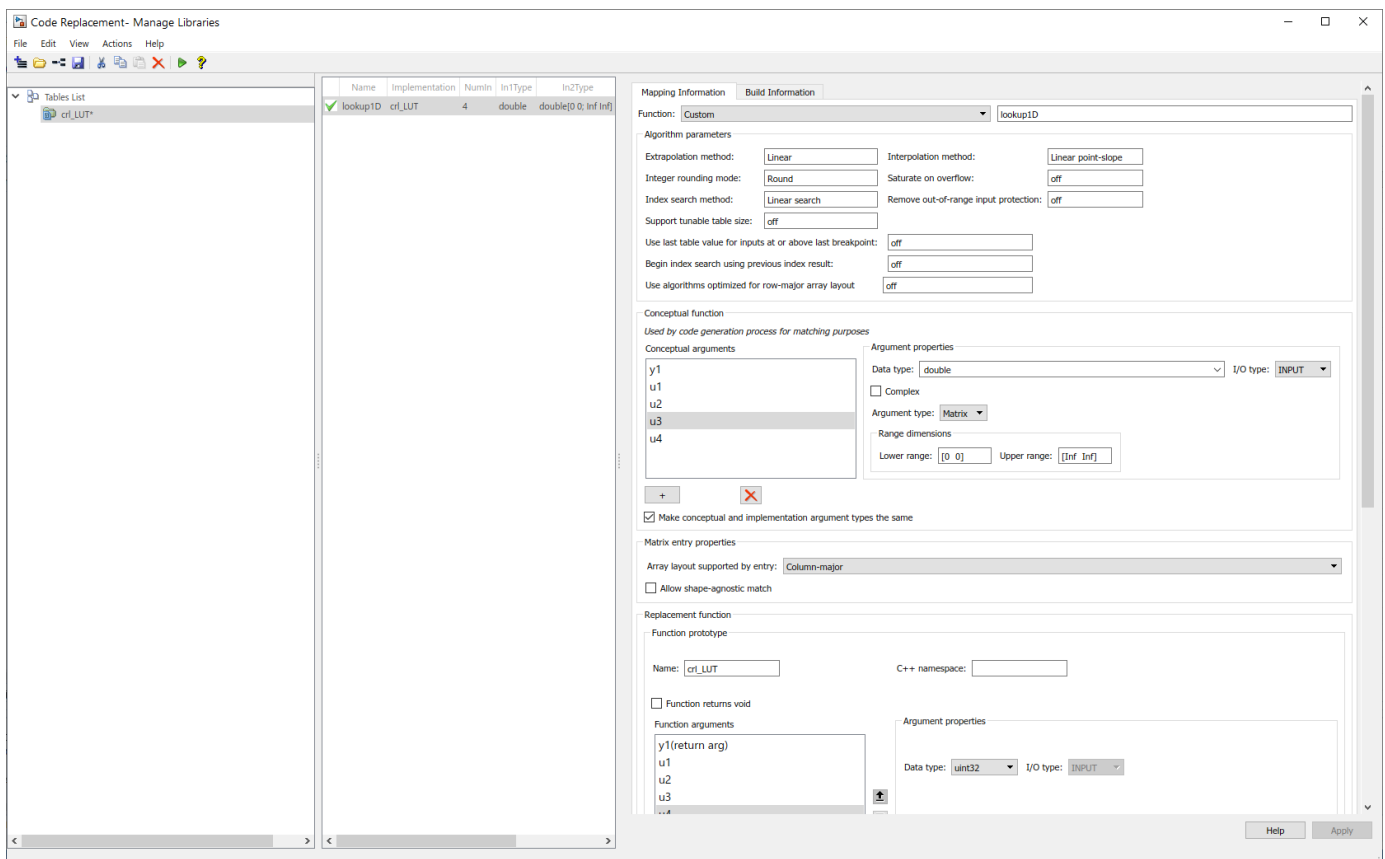

Specify the **Argument Type** of input arguments u2 and u3 as **Matrix** and **Data Type** as double. Set the **Algorithm parameters** as shown in the figure below.

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box.

Add the return argument y1 and the arguments u1, u2, u3 and u4.

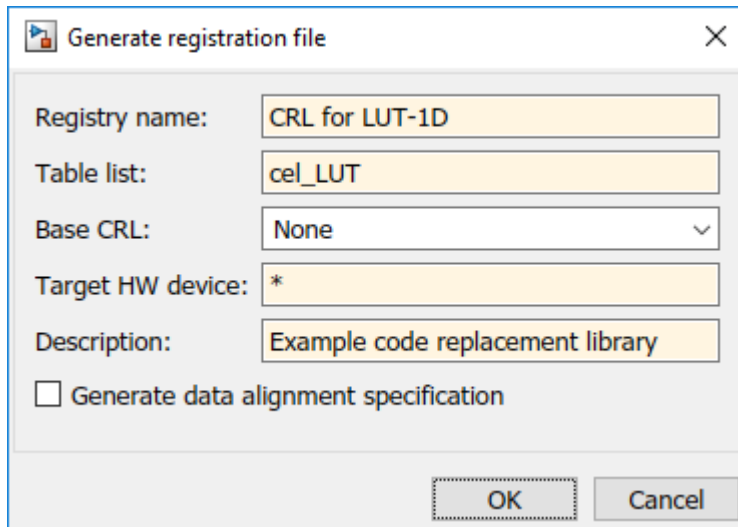

Specify a **Name** for the replacement function under **Function prototype**.

- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. Click the **Mapping Information** tab and verify the fields are filled in as shown. Click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Programmatically develop a code replacement library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
  - a Create a function with the name of your code replacement library table that does not have arguments and returns a table object. You can use this function to call your code replacement library table.
  - b Create a table object by calling `RTW.TflTable`.

```
function hTable = my_lookup_replacement_table
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TflCFunctionEntry`.

```
function hTable = my_lookup_replacement_table
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;
```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTflCFunctionEntryParameters`.

```
function hTable = my_lookup_replacement_table()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
setTflCFunctionEntryParameters(hEntry, ...
 'Key', 'lookup1D', ...
 'Priority', 100, ...
 'ImplementationName', 'my_Lookup1D_Repl', ...
 'ImplementationHeaderFile', 'myLookup1D.h', ...
 'ImplementationSourceFile', 'myLookup1D.c', ...
 'GenCallback', 'RTW.copyFileToBuildDir');
```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `getTflArgFromString`.

```
function hTable = my_lookup_replacement_table()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
setTflCFunctionEntryParameters(hEntry, ...
 'Key', 'lookup1D', ...
 'Priority', 100, ...
 'ImplementationName', 'my_Lookup1D_Repl', ...
 'ImplementationHeaderFile', 'myLookup1D.h', ...
 'ImplementationSourceFile', 'myLookup1D.c', ...
 'GenCallback', 'RTW.copyFileToBuildDir');

%% Create the conceptual representation
arg = hEntry.getTflArgFromString('y1', 'double');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);

arg = hEntry.getTflArgFromString('u1', 'double');
addConceptualArg(hEntry, arg);

arg = RTW.TflArgMatrix('u2', 'RTW_IO_INPUT', 'double');
arg.DimRange = [0 0; Inf Inf];
addConceptualArg(hEntry, arg);

arg = RTW.TflArgMatrix('u3', 'RTW_IO_INPUT', 'double');
arg.DimRange = [0 0; Inf Inf];
addConceptualArg(hEntry, arg);
```

```
arg = hEntry.getTflArgFromString('u4','uint32');
addConceptualArg(hEntry, arg);
```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function `getTflArgFromString`.

```
function hTable = my_lookup_replacement_table()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
setTflCFunctionEntryParameters(hEntry, ...
 'Key', 'lookupID', ...
 'Priority', 100, ...
 'ImplementationName', 'my_LookupID_Repl', ...
 'ImplementationHeaderFile', 'myLookupID.h', ...
 'ImplementationSourceFile', 'myLookupID.c', ...
 'GenCallback', 'RTW.copyFileToBuildDir');

%% Create the conceptual representation
arg = hEntry.getTflArgFromString('y1','double');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);

arg = hEntry.getTflArgFromString('u1','double');
addConceptualArg(hEntry, arg);

arg = RTW.TflArgMatrix('u2', 'RTW_IO_INPUT', 'double');
arg.DimRange = [0 0; Inf Inf];
addConceptualArg(hEntry, arg);

arg = RTW.TflArgMatrix('u3', 'RTW_IO_INPUT', 'double');
arg.DimRange = [0 0; Inf Inf];
addConceptualArg(hEntry, arg);

arg = hEntry.getTflArgFromString('u4','uint32');
addConceptualArg(hEntry, arg);

algParams = getAlgorithmParameters(hEntry);
algParams.InterpMethod = 'Linear';
algParams.ExtrapMethod = 'Clip';
algParams.UseRowMajorAlgorithm = 'off';
algParams.RndMeth = 'Round';
algParams.IndexSearchMethod = 'Linear search';
algParams.UseLastTableValue = 'off';
algParams.RemoveProtectionInput = 'off';
algParams.SaturateOnIntegerOverflow = 'off';
algParams.SupportTunableTableSize = 'off';
algParams.BPPower2Spacing = 'off';
algParams.BeginIndexSearchUsingPreviousIndexResult = 'off';
setAlgorithmParameters(hEntry, algParams);

%% Create the Implementation Representation
arg = hEntry.getTflArgFromString('y1','double');
arg.IOType = 'RTW_IO_OUTPUT';
hEntry.Implementation.setReturn(arg);

arg = hEntry.getTflArgFromString('u1','double');
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTflArgFromString('u2','double*');
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTflArgFromString('u3','double*');
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTflArgFromString('u4','uint32');
hEntry.Implementation.addArgument(arg);
```

```

%% Add the entry to the table
hTable.addEntry(hEntry);

```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = my_lookup_replacement_table
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file (a new function file) with these specifications:

```

function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for LUT 1D function replacement';
this(1).TableList = {'my_lookup_replacement_table.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end

```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Generate Code by Using Lookup Table Code Replacement Library

In this section, you generate code using the code replacement library that you created in the first two sections of this example. A Lookup table function is replaced with a call to a custom function in the generated code. This example does not provide an implementation function. Write your own implementation.

### Example Model

Open the model `crl_LUTfunction` for configuring the code replacement library.

```
open_system('crl_LUTfunction');
```

```
copyfile LutFnRtwTargetInfo.txt rtwTargetInfo.m
```

Run the MATLAB customization file to create a code replacement table and register the file. The customization file has already been executed. Run the `sl_refresh_customizations` function to load the library.

```
sl_refresh_customizations;
```

### Enable Code Replacement Library

- 1 Open the Configuration Parameters dialog box.
- 2 On the **Interface** pane, set **Code Replacement Library** by clicking **Select** and adding CRL for LUT function replacement to the **Selected code replacement libraries - prioritized** list pane.

```
%
% Alternatively, use the command-line API to enable the code replacement:
set_param('crl_LUTfunction', 'CodeReplacementLibrary', 'CRL for LUT function replacement');
```

Generate code from the model:

```
evalc('slbuild(bdroot)');
```

View the generated code. Here is a portion of `crl_LUTfunction.c`.

```
cfile = fullfile('crl_LUTfunction_ert_rtw','crl_LUTfunction.c');
rtwdemodbtype(cfile,'/* Model step function ','/* Model initialize function',1, 1);

/* Model step function */
void crl_LUTfunction_step(void)
{
 int32_T iU;

 /* Lookup_n-D: '<Root>/1-D Lookup Table2' incorporates:
 * Constant: '<Root>/Constant2'
 */
 for (iU = 0; iU < 9; iU++) {
 crl_LUTfunction_Y.Y1[iU] = my_Lookup1D_Repl
 (crl_LUTfunction_ConstP.Constant2_Value[iU],
 &crl_LUTfunction_ConstP.uDLookupTable2_bp01Data[0],
 &crl_LUTfunction_ConstP.uDLookupTable2_tableData[0], 10U);
 }

 /* End of Lookup_n-D: '<Root>/1-D Lookup Table2' */
}
```

The Lookup Table function is replaced with a custom `my_Lookup1D_Repl` function.

Close the model and code generation report.

```
delete ./rtwTargetInfo.m
bdclose('crl_LUTfunction');
rtwdemoclean;
```

## Data Alignment for Code Replacement

Code replacement libraries can align data objects passed into a replacement function to a specified boundary.

### Code Replacement Data Alignment

You can take advantage of function implementations that require aligned data to optimize application performance. To configure data alignment for a function implementation:

- 1 Specify the data alignment requirements in a code replacement entry. Specify alignment separately for each implementation function argument or collectively for all function arguments. See “Specify Data Alignment Requirements for Function Arguments” on page 72-105.
- 2 Specify the data alignment capabilities and syntax for one or more compilers. Include the alignment specifications in a library registration entry in the `rtwTargetInfo.m` file. See “Provide Data Alignment Specifications for Compilers” on page 72-106.
- 3 Register the library containing the table entry and alignment specification object.
- 4 Configure the code generator to use the code replacement library and generate code. Observe the results.

For examples, see “Basic Example of Code Replacement Data Alignment” on page 72-109 and the “Data Alignment for Function Implementations” section of the “Optimize Generated Code by Developing and Using Code Replacement Libraries - Simulink” on page 79-31 example page.

### Specify Data Alignment Requirements for Function Arguments

To specify the data alignment requirement for an argument in a code replacement entry:

- If you are defining a replacement function in a code replacement table registration file, create an argument descriptor object (`RTW.ArgumentDescriptor`). Use its `AlignmentBoundary` property to specify the required alignment boundary and assign the object to the `Descriptor` property.
- If you are defining a replacement function using the **Code Replacement Tool**, on the **Mapping Information** tab, in the **Argument properties** section for the replacement function, enter a value for the **Alignment value** parameter.

The screenshot shows the 'Replacement function' configuration window. It is divided into several sections:

- Function prototype:**
  - Name: `sin_dbl`
  - C++ namespace: (empty)
  - Function returns void
- Function arguments:**
  - A list box containing `y1(return arg)` and `u1`. `y1(return arg)` is selected.
  - Up and down arrow buttons are next to the list box.
- Argument properties:**
  - Data type: `double` (dropdown menu)
  - I/O type: `INPUT` (dropdown menu)
  - Const
  - Pointer
  - Complex
  - Alignment value: `-1` (text input field)

The `AlignmentBoundary` property (or **Alignment value** parameter) specifies the alignment boundary for data passed to a function argument, in number of bytes. The `AlignmentBoundary` property is valid only for addressable objects, including matrix and pointer arguments. It is not applicable for value arguments. Valid values are:

- -1 (default) — If the data is a `Simulink.Bus`, `Simulink.Signal`, or `Simulink.Parameter` object, specifies that the code generator determines an optimal alignment based on usage. Otherwise, specifies that there is not an alignment requirement for this argument.
- Positive integer that is a power of 2 — Specifies number of bytes in the boundary. The starting memory address for the data allocated for the function argument is a multiple of the specified value. If you specify an alignment boundary that is less than the natural alignment of the argument data type, the alignment directive is emitted in the generated code. However, the target compiler ignores the directive.

The following code specifies the `AlignmentBoundary` for an argument as 16 bytes.

```
hLib = RTW.TflTable;
entry = RTW.TflCOperationEntry;
arg = getTflArgFromString(hLib, 'u1', 'single*');
desc = RTW.ArgumentDescriptor;
desc.AlignmentBoundary = 16;
arg.Descriptor = desc;
entry.Implementation.addArgument(arg);
```

The equivalent alignment boundary specification in the Code Replacement Tool dialog box is in this figure.

The image shows a dialog box titled "Argument properties". It contains several controls:
 

- "Data type:" dropdown menu set to "single".
- "I/O type:" dropdown menu set to "INPUT".
- Three checkboxes: "Const" (unchecked), "Pointer" (checked), and "Complex" (unchecked).
- "Alignment value:" text input field containing the number "16".

**Note** If your model imports `Simulink.Bus`, `Simulink.Parameter`, or `Simulink.Signal` objects, specify an alignment boundary in the object properties, using the **Alignment** property. For more information, see `Simulink.Bus`, `Simulink.Parameter`, and `Simulink.Signal`.

## Provide Data Alignment Specifications for Compilers

To support data alignment in generated code, describe the data alignment capabilities and syntax for your compilers in the code replacement library registration. Provide one or more alignment specifications for each compiler in a library registry entry.

To describe the data alignment capabilities and syntax for a compiler:

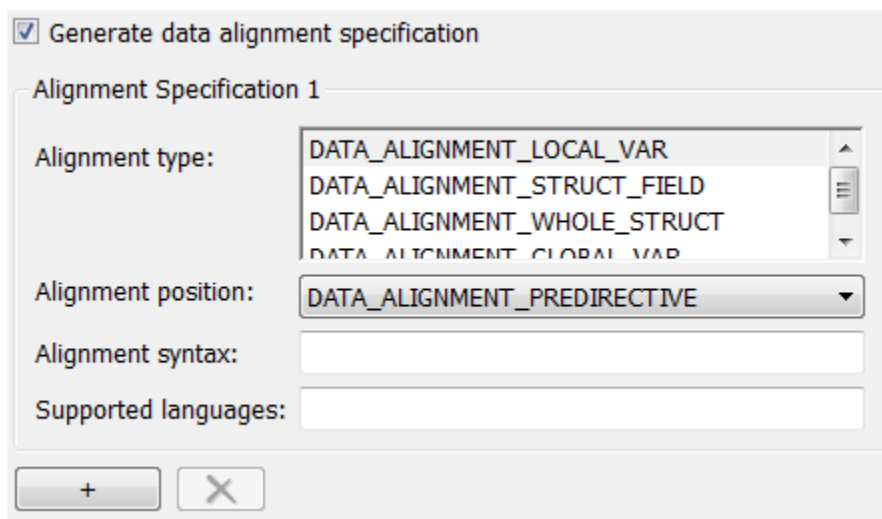

- If you are defining a code replacement library registration entry in a `rtwTargetInfo.m` customization file, add one or more `AlignmentSpecification` objects to an `RTW.DataAlignment` object. Attach the `RTW.DataAlignment` object to the `TargetCharacteristics` object of the registry entry.

The `RTW.DataAlignment` object also has the property `DefaultMallocAlignment`, which specifies the default alignment boundary, in bytes, that the compiler uses for dynamically allocated memory. If the code generator uses dynamic memory allocation for a data object involved in a code replacement, this value determines if the memory satisfies the alignment requirement of the replacement. If not, the code generator does not use the replacement. The default value for `DefaultMallocAlignment` is `-1`, indicating that the default alignment boundary used for dynamically allocated memory is unknown. In this case, the code generator uses the natural alignment of the data type to determine whether to allow a replacement.

Additionally, you can specify the alignment boundary for complex types by using the `addComplexTypeAlignment` function.

- If you are generating a customization file function using the Code Replacement Tool, fill out the following fields for each compiler.

Generate data alignment specification

Alignment Specification 1

Alignment type: DATA\_ALIGNMENT\_LOCAL\_VAR  
DATA\_ALIGNMENT\_STRUCT\_FIELD  
DATA\_ALIGNMENT\_WHOLE\_STRUCT  
DATA\_ALIGNMENT\_GLOBAL\_VAR

Alignment position: DATA\_ALIGNMENT\_PREDIRECTIVE

Alignment syntax:

Supported languages:

+ -

Click the plus (+) symbol to add additional compiler specifications.

For each data alignment specification, provide the following information.

Alignment-Specification Property	Dialog Box Parameter	Description
AlignmentType	<b>Alignment type</b>	<p>Cell array of predefined enumerated strings, specifying which types of alignment this specification supports.</p> <ul style="list-style-type: none"> <li>• DATA_ALIGNMENT_LOCAL_VAR — Local variables.</li> <li>• DATA_ALIGNMENT_GLOBAL_VAR — Global variables.</li> <li>• DATA_ALIGNMENT_STRUCT_FIELD — Individual structure fields.</li> <li>• DATA_ALIGNMENT_WHOLE_STRUCT — Whole structure, with padding (individual structure field alignment, if specified, is favored and takes precedence over whole structure alignment).</li> </ul> <p>Each alignment specification must specify at least DATA_ALIGNMENT_GLOBAL_VAR and DATA_ALIGNMENT_STRUCT_FIELD.</p>
AlignmentPosition	<b>Alignment position</b>	<p>Predefined enumerated string specifying the position in which you must place the compiler alignment directive for alignment type DATA_ALIGNMENT_WHOLE_STRUCT:</p> <ul style="list-style-type: none"> <li>• DATA_ALIGNMENT_PREDIRECTIVE — The alignment directive is emitted before <code>struct st_tag{...}</code>, as part of the type definition statement (for example, MSVC).</li> <li>• DATA_ALIGNMENT_POSTDIRECTIVE — The alignment directive is emitted after <code>struct st_tag{...}</code>, as part of the type definition statement (for example, gcc).</li> <li>• DATA_ALIGNMENT_PRECEDING_STATEMENT — The alignment directive is emitted as a standalone statement immediately preceding the definition of the structure type. A semicolon (;) must terminate the registered alignment syntax.</li> <li>• DATA_ALIGNMENT_FOLLOWING_STATEMENT — The alignment directive is emitted as a standalone statement immediately following the definition of the structure type. A semicolon (;) must terminate the registered alignment syntax.</li> </ul> <p>For alignment types other than DATA_ALIGNMENT_WHOLE_STRUCT, code generation uses alignment position DATA_ALIGNMENT_PREDIRECTIVE.</p>

Alignment-Specification Property	Dialog Box Parameter	Description
AlignmentSyntax-Template	<b>Alignment syntax</b>	Specifies the alignment directive string that the compiler supports. The string is registered as a syntax template that has placeholders in it. These placeholders are supported: <ul style="list-style-type: none"> <li>• %n — Replaced by the alignment boundary for the replacement function argument.</li> <li>• %s — Replaced by the aligned symbol, usually the identifier of a variable.</li> </ul> For example, for the gcc compiler, you can specify <code>__attribute__((aligned(%n)))</code> , or for the MSVC compiler, <code>__declspec(align(%n))</code> .
SupportedLanguages	<b>Supported languages</b>	Cell array specifying the languages to which this alignment specification applies, among c and c++. Sometimes alignment syntax and position differ between languages for a compiler.

Here is a data alignment specification for the GCC compiler:

```
da = RTW.DataAlignment;

as = RTW.AlignmentSpecification;
as.AlignmentType = {'DATA_ALIGNMENT_LOCAL_VAR', ...
 'DATA_ALIGNMENT_STRUCT_FIELD', ...
 'DATA_ALIGNMENT_GLOBAL_VAR'};
as.AlignmentSyntaxTemplate = '__attribute__((aligned(%n)))';
as.AlignmentPosition = 'DATA_ALIGNMENT_PREDIRECTIVE';
as.SupportedLanguages = {'c', 'c++'};
da.addAlignmentSpecification(as);

tc = RTW.TargetCharacteristics;
tc.DataAlignment = da;
```

Here is the corresponding specification in the **Generate customization** dialog box of the Code Replacement Tool.

Generate data alignment specification

Alignment Specification 1

Alignment type: DATA\_ALIGNMENT\_LOCAL\_VAR  
DATA\_ALIGNMENT\_STRUCT\_FIELD  
DATA\_ALIGNMENT\_WHOLE\_STRUCT  
DATA\_ALIGNMENT\_GLOBAL\_VAR

Alignment position: DATA\_ALIGNMENT\_PREDIRECTIVE

Alignment syntax: \_\_attribute\_\_((aligned(%n)))

Supported languages: c, c++

## Basic Example of Code Replacement Data Alignment

A simple example of the complete workflow for data alignment specified for code replacement is:

- 1 Create and save the following code replacement table definition file, `crl_table_mmul_4x4_single_align.m`. This table defines a replacement entry for the \* (multiplication) operator, the single data type, and input dimensions [4,4]. The entry also specifies a data alignment boundary of 16 bytes for each replacement function argument. The entry expresses the requirement that the starting memory address for the data allocated for the function arguments during code generation is a multiple of 16.

```
function hLib = crl_table_mmul_4x4_single_align
%CRL_TABLE_MMUL_4x4_SINGLE_ALIGN - Describe matrix operator entry with data alignment

hLib = RTW.TflTable;
entry = RTW.TflCOperationEntry;
setTflCOperationEntryParameters(entry, ...
 'Key', 'RTW_OP_MUL', ...
 'Priority', 90, ...
 'ImplementationName', 'matrix_mul_4x4_s');

% conceptual arguments
createAndAddConceptualArg(entry, 'RTW.TflArgMatrix',...
 'Name', 'y1', ...
 'IOType', 'RTW_IO_OUTPUT', ...
 'BaseType', 'single', ...
 'DimRange', [4 4]);

createAndAddConceptualArg(entry, 'RTW.TflArgMatrix',...
 'Name', 'u1', ...
 'BaseType', 'single', ...
 'DimRange', [4 4]);

createAndAddConceptualArg(entry, 'RTW.TflArgMatrix',...
 'Name', 'u2', ...
 'BaseType', 'single', ...
 'DimRange', [4 4]);

% implementation arguments
arg = getTflArgFromString(hLib, 'y2', 'void');
arg.IOType = 'RTW_IO_OUTPUT';
entry.Implementation.setReturn(arg);

arg = getTflArgFromString(hLib, 'y1', 'single*');
arg.IOType = 'RTW_IO_OUTPUT';
desc = RTW.ArgumentDescriptor;
desc.AlignmentBoundary = 16;
arg.Descriptor = desc;
entry.Implementation.addArgument(arg);

arg = getTflArgFromString(hLib, 'u1', 'single*');
desc = RTW.ArgumentDescriptor;
desc.AlignmentBoundary = 16;
arg.Descriptor = desc;
entry.Implementation.addArgument(arg);

arg = getTflArgFromString(hLib, 'u2', 'single*');
desc = RTW.ArgumentDescriptor;
desc.AlignmentBoundary = 16;
arg.Descriptor = desc;
entry.Implementation.addArgument(arg);

hLib.addEntry(entry);
```

- 2 Create and save the following registration file, `rtwTargetInfo.m`. If you want to compile the code generated in this example, first modify the `AlignmentSyntaxTemplate` property for the compiler that you use. For example, for the MSVC compiler, replace the gcc template specification `__attribute__((aligned(%n)))` with `__declspec(align(%n))`.

```
function rtwTargetInfo(cm)
% rtwTargetInfo function to register a code replacement library (CRL)
% for use with code generation
```

```

% Register the CRL defined in local function locCrlRegFcn
cm.registerTargetInfo(@locCrlRegFcn);

end % End of RTWTARGETINFO

% Local function to define a CRL containing crl_table_mmul_4x4_single_align
function thisCrl = locCrlRegFcn

% create an alignment specification object, assume gcc
as = RTW.AlignmentSpecification;
as.AlignmentType = {'DATA_ALIGNMENT_LOCAL_VAR', ...
 'DATA_ALIGNMENT_GLOBAL_VAR', ...
 'DATA_ALIGNMENT_STRUCT_FIELD'};
as.AlignmentSyntaxTemplate = '__attribute__((aligned(%n)))';
as.SupportedLanguages={'c', 'c++'};

% add the alignment specification object
da = RTW.DataAlignment;
da.addAlignmentSpecification(as);

% add the data alignment object to target characteristics
tc = RTW.TargetCharacteristics;
tc.DataAlignment = da;

% Instantiate a CRL registry entry
thisCrl = RTW.TflRegistry;

% Define the CRL properties
thisCrl.Name = 'Data Alignment Example';
thisCrl.Description = 'Example of replacement with data alignment';
thisCrl.TableList = {'crl_table_mmul_4x4_single_align'};
thisCrl.TargetCharacteristics = tc;

end % End of LOCCRLREGFCN

```

- 3 To register your library with code generator without having to restart MATLAB, enter this command:

```
RTW.TargetRegistry.getInstance('reset');
```
- 4 Configure the code generator to use your code replacement library.
- 5 Generate code and a code generation report.
- 6 Review the code replacements. For example, check whether a multiplication operation is replaced with a `matrix_mul_4x4_s` function call. In `mmalign.h`, check whether the gcc alignment directive `__attribute__((aligned(16)))` is generated to align the function variables.

## Replace MATLAB Functions with Custom Code by Using the `coder.replace` Function

You can develop a code replacement library to optimize the performance of MATLAB functions specified within a MATLAB function block containing a `coder.replace` function. To develop a code replacement library, use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 72-20.

### Interactively Develop a Code Replacement Library

- 1 Open the **Code Replacement Tool** (crtool), from the MATLAB command line with the following command:

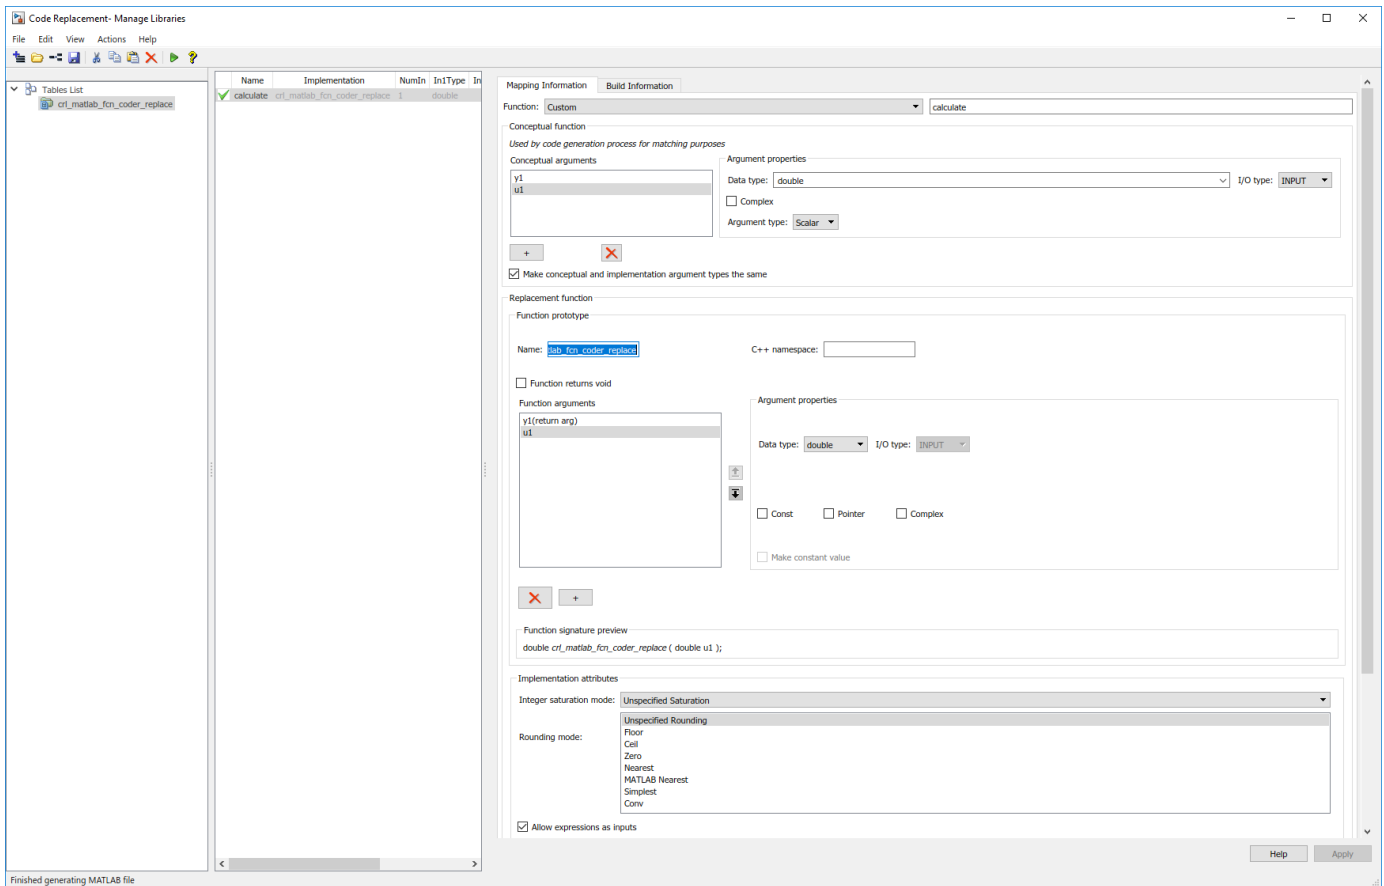

```
>>crtool
```

- 2 Create a table.
  - a From the crtool context menu, select **File > New Table**.
  - b In the right pane, name the table `cr1_matlab_fcn_coder_replace`. Click **Apply**.
- 3 Create an entry. From the crtool context menu, select **File > New entry > Function**.
- 4 Create entry parameters. In the **Function** drop-down list, select `custom`. Function information appears in the crtool. For this example, specify the parameter as `calculate`.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, `y1`, and the input argument, `u1`, with the **Data Type** of `double` and the **Argument Type** of `Scalar`.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box.

Add the return argument `y1` and the arguments `u1`.

Specify a **Name** for the replacement function under **Function prototype**.

- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. Click the **Mapping Information** tab and verify the fields are filled in as shown. Click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
  - a Create a function with the name of your code replacement library table that does not have arguments and returns a table object. You can use this function to call your code replacement library table.
  - b Create a table object by calling `RTW.TflTable`.

```
function hTable = crl_matlab_fcn_coder_replace
% Create a function to call the code replacement library table
```

```
%% Create a table object
hTable = RTW.TflTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TflCFunctionEntry`.

```
function hTable = crl_matlab_fcn_coder_replace
% Create a function to call the code replacement library table
```

```
%% Create a table object
hTable = RTW.TflTable;
```

```
%% Create an entry
hEntry = RTW.TflCFunctionEntry;
```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTflCFunctionEntryParameters`.

```
function hTable = crl_matlab_fcn_coder_replace
% Create a function to call the code replacement library table
```

```
%% Create a table object
hTable = RTW.TflTable;
```

```
%% Create an entry
hEntry = RTW.TflCFunctionEntry;
```

```
%% Create entry parameters
setTflCFunctionEntryParameters(hEntry, ...
 'Key', 'calculate', ...
 'Priority', 100, ...
 'ArrayLayout', 'COLUMN_MAJOR', ...
 'ImplementationName', ...
```

```

'replacement_calculate_impl', ...
'ImplementationHeaderFile', ...
'replacement_calculate_impl.h', ...
'ImplementationSourceFile', ...
'replacement_calculate_impl.c');

```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `getTflArgFromString`.

```

function hTable = cml_matlab_fcn_coder_replace
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
setTflCFunctionEntryParameters(hEntry, ...
 'Key', 'calculate', ...
 'Priority', 100, ...
 'ArrayLayout', 'COLUMN_MAJOR', ...
 'ImplementationName', ...
 'replacement_calculate_impl', ...
 'ImplementationHeaderFile', ...
 'replacement_calculate_impl.h', ...
 'ImplementationSourceFile', ...
 'replacement_calculate_impl.c');

%% Create the conceptual representation
arg = getTflArgFromString(hEntry, 'y1','double');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hEntry, 'u1','double');
addConceptualArg(hEntry, arg);

```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function `getTflArgFromString`.

```

function hTable = cml_matlab_fcn_coder_replace
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
setTflCFunctionEntryParameters(hEntry, ...
 'Key', 'calculate', ...
 'Priority', 100, ...
 'ArrayLayout', 'COLUMN_MAJOR', ...
 'ImplementationName', ...

```

```

'replacement_calculate_impl', ...
'ImplementationHeaderFile', ...
'replacement_calculate_impl.h', ...
'ImplementationSourceFile', ...
'replacement_calculate_impl.c');

%% Create the conceptual representation
arg = getTflArgFromString(hEntry, 'y1','double');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hEntry, 'u1','double');
addConceptualArg(hEntry, arg);

%% Create the Conceptual Representation
arg = getTflArgFromString(hEntry, 'y1','double');
arg.IOType = 'RTW_IO_OUTPUT';
hEntry.Implementation.setReturn(arg);

arg = getTflArgFromString(hEntry, 'u1','double');
hEntry.Implementation.addArgument(arg);

%% Add the entry to the table
hTable.addEntry(hEntry);

```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = cml_matlab_fcn_coder_replace
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file by using these specifications:

```

function rtwTargetInfo(cm)
cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for matlab function with custom code using coder.replace';
this(1).TableList = {'crl_matlab_fcn_coder_replace.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end

```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Replace `coder.ceval` Calls to External Functions

The `coder.ceval` function calls external C/C++ functions from code generated from MATLAB code. The code replacement software supports replacement of the function that you specify in a call to `coder.ceval`. An application of this code replacement scenario is to write generic MATLAB code that you can customize for different platforms with code replacements. A code replacement library can define hardware-specific code replacements for the function call. Use `coder.ceval` in MATLAB code from which you want to generate C code using:

- MATLAB Coder
- MATLAB code in a Simulink MATLAB Function block

To develop a code replacement library use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 72-20.

### Example Files

For the examples in “Interactively Develop a Code Replacement Library” on page 73-86 and “Programmatically Develop a Code Replacement Library” on page 72-121 you must have set up the following:

- Custom C function `my_add.c`.

```
/* my_add.c */

#include "my_add.h"

double my_add(double in1, double in2)
{
 return in1 + in2;
}
```

- Custom C header file `my_add.h`.

```
/* my_add.h */

double my_add(double in1, double in2);
```

- MATLAB function `call_my_add.m`, which uses `coder.ceval` to invoke `my_add.c`.

```
function y = call_my_add(in1, in2) %#codegen

y=0.0;

if ~coder.target('Rtw')
% Executing in MATLAB, call MATLAB equivalent of C function my_add
 y= in1+in2;
else
% Executing in generated code, call C function my_add
 y = coder.ceval('my_add', in1, in2);
end
```

- MATLAB test function `call_my_add_test.m`, which calls `call_my_add.m`.

```
in1=10;
in2=20;
```

```

y = call_my_add(in1, in2);

disp('Output')
disp('y =')
disp(y);

```

- Replacement C function my\_add\_replacement.c.

```

/* my_add_replacement.c */

#include "my_add_replacement.h"

double my_add_replacement(double in1, double in2)
{
 return in1 + in2;
}

```

- Replacement C header file my\_add\_replacement.h.

```

/* my_add_replacement.h */

double my_add_replacement(double in1, double in2);

```

## Interactively Develop a Code Replacement Library

- 1 Open the **Code Replacement Tool** (crtool), from the MATLAB command line with the following command:

```
>>crtool
```

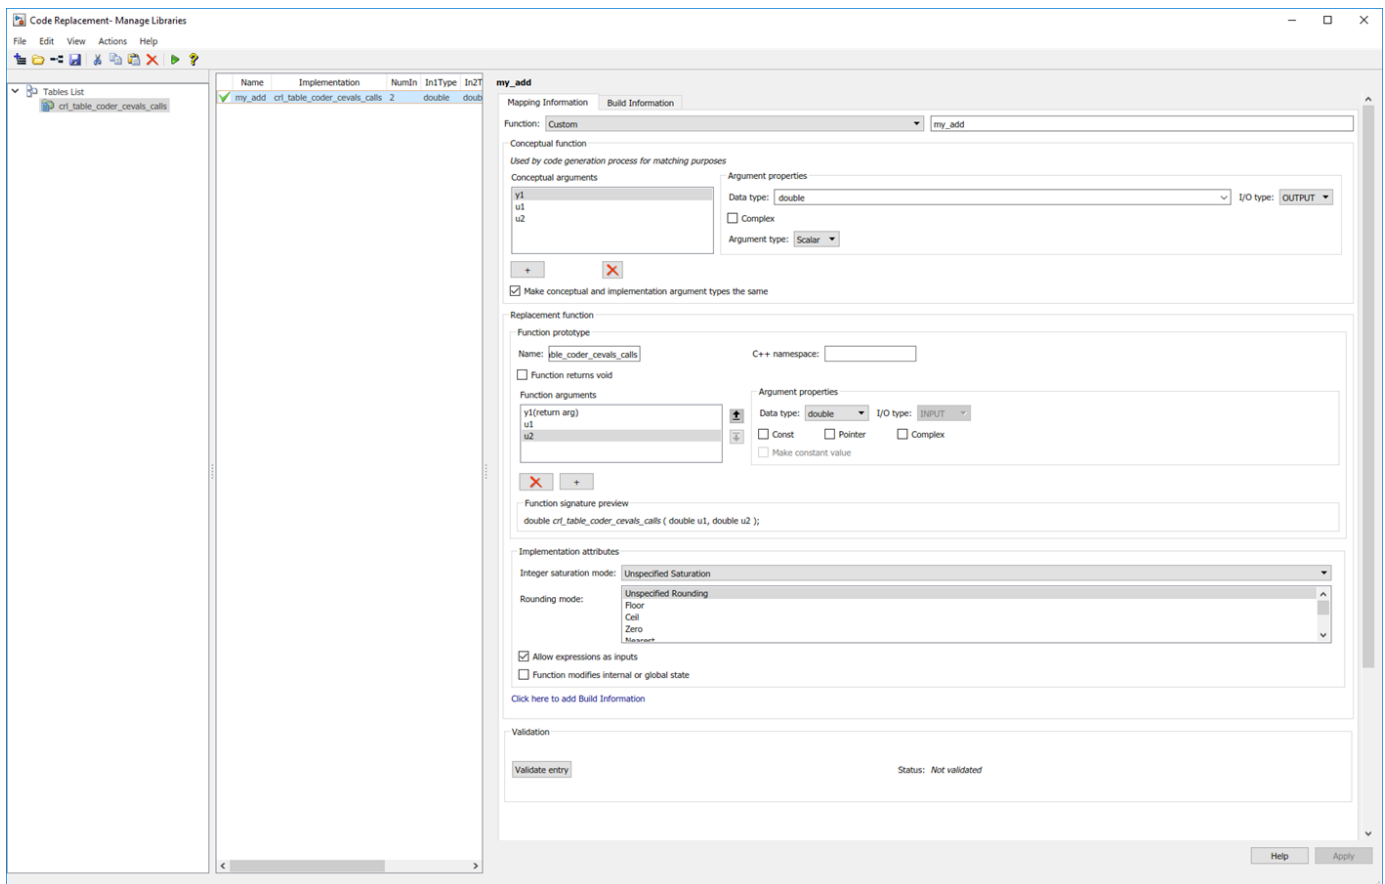

- 2 Create a table.
  - a From the crtool menu, select **File > New Table**.
  - b In the right pane, name the table crl\_table\_coder\_cevals\_calls. Click **Apply**.

- 3 Create an entry. From the crtool menu, select **File > New entry > Function**.

- 4 Create entry parameters. In the **Function** drop-down list, select **custom**. Function information appears in the crtool. For this example, specify the parameter as my\_add .
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, y1, and the input arguments, u1 and u2 with the **Data Type** of double and the **Argument Type** of Scalar.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box.

Specify a **Name** for the replacement function under **Function prototype**.

- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, set the **Implementation header file** to my\_add\_replacement.h.
- 8 Validate and save the table. Click the **Mapping Information** tab and verify the fields are filled in as shown. Click **Validate entry**. In the crtool menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
  - a Create a function with the name of your code replacement library table that does not have arguments and returns a table object. You can use this function to call your code replacement library table.
  - b Create a table object by calling `RTW.TflTable`.

```
function hTable = crl_table_coder_cevals_calls()
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TflCFunctionEntry`.

```
function hTable = crl_table_coder_cevals_calls()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;
```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTflCFunctionEntryParameters`.

```
function hTable = crl_table_coder_cevals_calls()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
hEntry.setTflCFunctionEntryParameters(...
 'Key', 'my_add', ...
 'Priority', 100, ...
 'ImplementationName', 'my_add_replacement', ...
 'ImplementationHeaderFile', 'my_add_replacement.h', ...
 'ImplementationSourceFile', 'my_add_replacement.c');
```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `getTflArgFromString`.

```
function hTable = crl_table_coder_cevals_calls()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
hEntry.setTflCFunctionEntryParameters(...
 'Key', 'my_add', ...
 'Priority', 100, ...
 'ImplementationName', 'my_add_replacement', ...
 'ImplementationHeaderFile', 'my_add_replacement.h', ...
 'ImplementationSourceFile', 'my_add_replacement.c');

%% Create the conceptual representation
arg = hEntry.getTflArgFromString('y1','double');
arg.IOType = 'RTW_IO_OUTPUT';
hEntry.addConceptualArg(arg);

arg = hEntry.getTflArgFromString('u1','double');
hEntry.addConceptualArg(arg);

arg = hEntry.getTflArgFromString('u2','double');
hEntry.addConceptualArg(arg);
```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function `getTflArgFromString`.

```
function hTable = crl_table_coder_cevals_calls()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
hEntry.setTflCFunctionEntryParameters(...
 'Key', 'my_add', ...
 'Priority', 100, ...
 'ImplementationName', 'my_add_replacement', ...
 'ImplementationHeaderFile', 'my_add_replacement.h', ...
 'ImplementationSourceFile', 'my_add_replacement.c');

%% Create the conceptual representation
arg = hEntry.getTflArgFromString('y1','double');
arg.IOType = 'RTW_IO_OUTPUT';
hEntry.addConceptualArg(arg);
```

```
arg = hEntry.getTflArgFromString('u1','double');
hEntry.addConceptualArg(arg);
```

```
arg = hEntry.getTflArgFromString('u2','double');
hEntry.addConceptualArg(arg);
```

```
%% Create the implementation representation
arg = hEntry.getTflArgFromString('y1','double');
arg.IOType = 'RTW_IO_OUTPUT';
hEntry.Implementation.setReturn(arg);
```

```
arg = hEntry.getTflArgFromString('u1','double');
hEntry.Implementation.addArgument(arg);
```

```
arg = hEntry.getTflArgFromString('u2','double');
hEntry.Implementation.addArgument(arg);
```

```
%% Add the entry to the table
hTable.addEntry(hEntry);
```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_coder_cevals_calls
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file by using these specifications:

```
function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for coder.ceval calls to external functions code replacement';
this(1).TableList = {'crl_table_coder_cevals_calls.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end
```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Custom Function Code Replacement

This example shows how to replace a custom function from your model with a different function in the generated code. Use this replacement when your model uses a MATLAB Function block to call a function for simulation and you want the generated code to use a different version of the function that is optimized for your code generation target. You can replace a function in these scenarios:

- The MATLAB function uses the `coder.ceval` function to call a custom C function.
- The MATLAB function uses the `coder.replace` function to indicate that you want to replace a call to a custom MATLAB function.

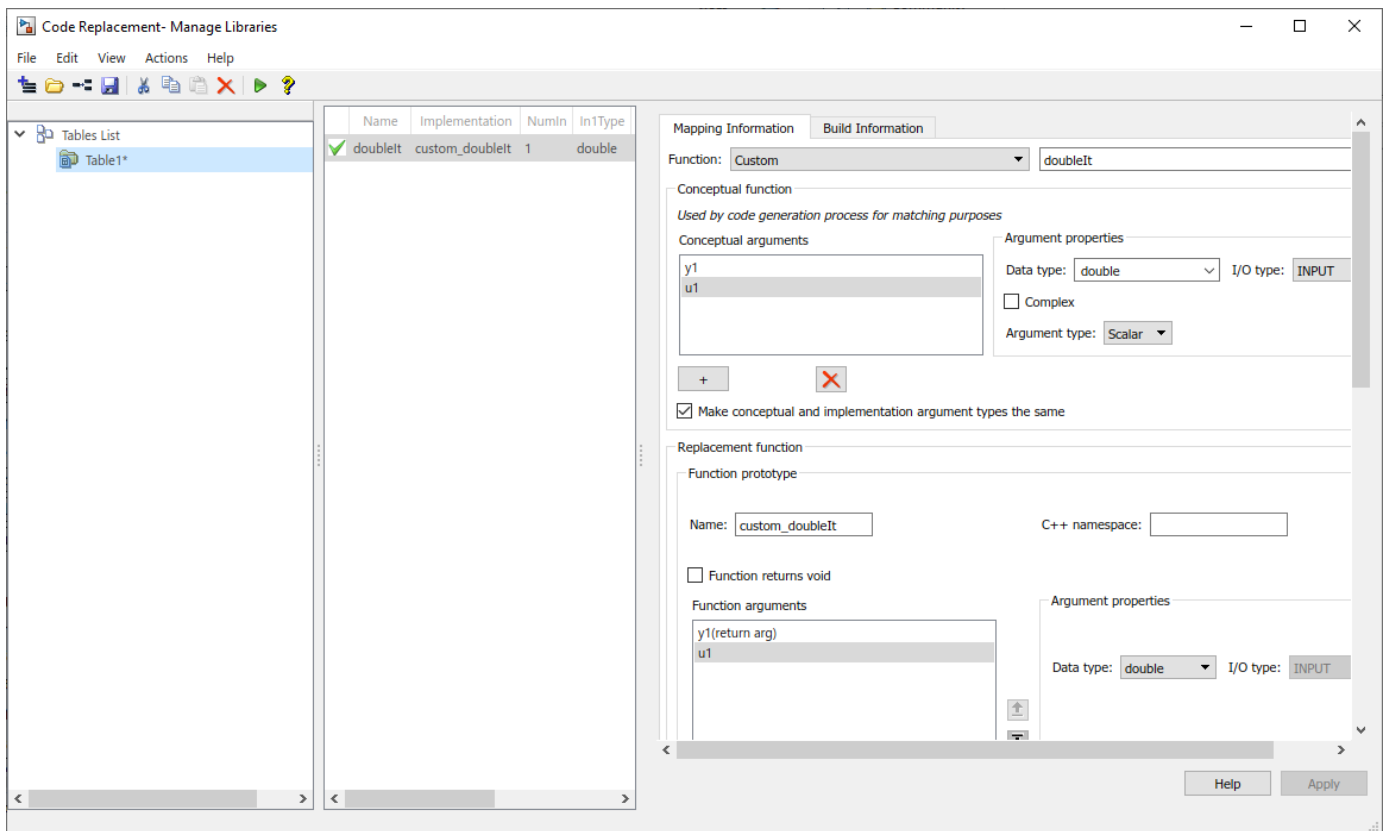

To replace a custom function, define a custom entry in a code replacement library.

### Interactively Develop a Code Replacement Library

Specify a code replacement entry for a custom C function by using the Code Replacement Tool.

- 1 At the MATLAB command prompt, open the Code Replacement Tool by using the `crtool` command.
 

```
crtool
```
- 2 Create a table. From the `crtool` context menu, select **File > New Table**.
- 3 Create an entry. From the `crtool` context menu, select **File > New entry > Function**.
- 4 Create entry parameters. In the **Function** drop-down list, select **Custom**. Next to the drop-down list, specify the name of the function that you want to replace. For this example, set the function name to `doubleIt`.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection, add the return argument `y1` and the input argument `u1`. For both arguments, specify the **Data Type** of **double** and the **Argument Type** of **scalar**. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box.
- 6 Create the implementation representation. In the **Replacement function > Function prototype** section, specify the name of the replacement function. For this example, set the name to `custom_doubleIt`. In the **Function arguments** section, add the return argument `y1` and the input argument `u1`.
- 7 Optionally, specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, specify the source file `custom_doubleIt.c` and the header file `custom_doubleIt.h`.
- 8 Validate and save the table. Click the **Mapping Information** tab and verify that the fields are filled in as shown. Click **Validate entry**. In the `crtool` context menu, select **File > Save table > Save** and name the table `customCRL.m`.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, specify the registry name Custom Function CRL and the table list customCRL. To use your code replacement library, refresh your current MATLAB session by using the command `sl_refresh_customizations`.

```
sl_refresh_customizations
```

- 10 Verify the code replacement library. At the MATLAB command prompt, open the library by using the Code Replacement Viewer and verify that the table and entry are correctly specified.

## Programmatically Develop a Code Replacement Library

Programmatically specify a code replacement entry for a custom C function.

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
  - a Create a function that has the name of your code replacement library table, which does not have arguments and returns a table object. Use this function to call your code replacement library table.
  - b Create a table object by calling `RTW.TfTable`.

```
function hTable = crl_table_custom()
% Create a function to call the code replacement library table
```

```
%% Create a table object
hTable = RTW.TflTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TflCFunctionEntry`.

```
function hTable = crl_table_custom()
% Create a code replacement library table
```

```
%% Create a table object
hTable = RTW.TflTable;
```

```
%% Create an entry
hEntry = RTW.TflCFunctionEntry;
```

- 4 Create entry parameters. Because this example replaces a function, create entry parameters by calling the function `setTflCFunctionEntryParameters`.

```
function hTable = crl_table_custom()
% Create a code replacement library table
```

```
%% Create a table object
hTable = RTW.TflTable;
```

```
%% Create an entry
hEntry = RTW.TflCFunctionEntry;
```

```
%% Create entry parameters
hEntry.setTflCFunctionEntryParameters(...
 'Key', 'doubleIt', ...
 'ImplementationName', 'custom_doubleIt', ...
 'ImplementationHeaderFile', 'custom_doubleIt.h', ...
 'ImplementationSourceFile', 'custom_doubleIt.c');
```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `getTflArgFromString`.

```
function hTable = crl_table_custom()
% Create a code replacement library table
```

```
%% Create a table object
hTable = RTW.TflTable;
```

```
%% Create an entry
hEntry = RTW.TflCFunctionEntry;
```

```
%% Create entry parameters
hEntry.setTflCFunctionEntryParameters(...
 'Key', 'doubleIt', ...
 'ImplementationName', 'custom_doubleIt', ...
 'ImplementationHeaderFile', 'custom_doubleIt.h', ...
 'ImplementationSourceFile', 'custom_doubleIt.c');
```

```
%% Create the conceptual representation
arg = getTflArgFromString(hTable, 'y1', 'double');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);
```

```
arg = getTflArgFromString(hTable, 'u1', 'double');
```

```
arg.IOType = 'RTW_IO_INPUT';
addConceptualArg(hEntry, arg);
```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function `copyConceptualArgsToImplementation`. Add the entry to the table by calling the function `addEntry`.

```
function hTable = crl_table_custom()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
hEntry.setTflCFunctionEntryParameters(...
 'Key', 'doubleIt', ...
 'ImplementationName', 'custom_doubleIt', ...
 'ImplementationHeaderFile', 'custom_doubleIt.h', ...
 'ImplementationSourceFile', 'custom_doubleIt.c');

%% Create the conceptual representation
arg = getTflArgFromString(hTable, 'y1', 'double');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hTable, 'u1', 'double');
arg.IOType = 'RTW_IO_INPUT';
addConceptualArg(hEntry, arg);

%% Create the implementation representation
copyConceptualArgsToImplementation(hEntry);

%% Add the entry to the table
hTable.addEntry(hEntry);
end
```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator requires for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. At the command prompt, validate the code replacement library table by calling it:

```
>> hTable = crl_table_custom
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file by using these specifications:

```
function rtwTargetInfo(cm)
cm.registerTargetInfo(@loc_register_crl);
end
function this = loc_register_crl
```

```

this(1) = RTW.TflRegistry;
this(1).Name = 'Custom Function CRL';
this(1).TableList = {'crl_table_custom.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end

```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. At the command prompt, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Generate Code by Using Custom Function Code Replacement

Generate code using the code replacement library that you previously created. A custom C function that is called in a MATLAB Function block is replaced with a call to a different custom function in the generated code.

### Example Model

Open the model `myDoubleModel` for configuring the code replacement library.

```
open_system('myDoubleModel')
```

The MATLAB Function block in the model uses the `coder.ceval` function to call the custom C function `doubleIt`.

```
function y = fcn(u)

y = 0.0;

y = coder.ceval('doubleIt',u);
```

The code replacement library replaces this function with a call to the custom function `custom_doubleIt`. For this example, the code replacement table is saved in the file `customCRL.m` and the library is registered in the registration file `rtwTargetInfo.m`.

To use the code replacement library, refresh the current MATLAB session.

```
copyfile targetInfoFile/rtwTargetInfo.m
sl_refresh_customizations
```

### Enable Code Replacement Library

Configure the model to use the code replacement library and generate code.

- 1 Open the Configuration Parameters dialog box. On the **Modeling** tab, click **Settings**.
- 2 On the **Code Generation > Interface** pane, for the **Code replacement libraries** parameter, click **Select**. Select the code replacement library `Custom Function CRL` and click **OK**.

*% Alternatively, use the command-line API to enable the code replacement:*  
`set_param('myDoubleModel', 'CodeReplacementLibrary', 'Custom Function CRL');`

Generate code for the model. Press **Ctrl+B** or open the Embedded Coder app and click **Generate Code**.

```
evalc('slbuild(bdroot)');
```

In the Code view, confirm that the step function calls the custom C function `custom_doubleIt`.

```
cfile = fullfile('myDoubleModel_ert_rtw','myDoubleModel.c');
rtwdemodbtype(cfile,'/* Model step function ','/* Model initialize function',1, 1);

/* Model step function */
void myDoubleModel_step(void)
{
 /* Output: '<Root>/y' incorporates:
 * Inport: '<Root>/u'
 * MATLAB Function: '<Root>/MATLAB Function'
 */
 myDoubleModel_Y.y = custom_doubleIt(myDoubleModel_U.u);
}
```

The function `doubleIt` is replaced with the custom function `custom_doubleIt`.

## Reserved Identifiers and Code Replacement

The code generator and C programming language use, internally, reserved keywords for code generation. Do not use reserved keywords as identifiers or function names. Reserved keywords for code generation include many code replacement library identifiers, the majority of which are function names, such as `acos`.

To view a list of reserved identifiers for the code replacement library that you use to generate code, specify the name of the library in a call to the function

`RTW.TargetRegistry.getInstance.getTflReservedIdentifiers`. For example:

```
crL_ids = RTW.TargetRegistry.getInstance.getTflReservedIdentifiers('GNU99 (GNU)')
```

In a code replacement table, the code generator registers each function implementation name defined by a table entry as a reserved identifier. You can register additional reserved identifiers for the table on a per-header-file basis. Providing additional reserved identifiers can help prevent duplicate symbols and other identifier-related compile and link issues.

To register additional code replacement reserved identifiers, use the `setReservedIdentifiers` function. This function registers specified reserved identifiers to be associated with a code replacement table.

You can register up to four reserved identifier structures in a code replacement table. You can associate one set of reserved identifiers with a code replacement library, while the other three (if present) must be associated with ANSI C. The following example shows a reserved identifier structure that specifies two identifiers and the associated header file.

```
d{1}.LibraryName = 'ANSI_C';
d{1}.HeaderInfos{1}.HeaderName = 'math.h';
d{1}.HeaderInfos{1}.ReservedIds = {'y0', 'y1'};
```

The code generator adds the identifiers to the list of reserved identifiers and honors them during the build procedure.

## Customize Match and Replacement Process

During the build process, the code generator uses:

- Preset match criteria to identify functions and operators for which application-specific implementations replace default implementations.
- Preset replacement function signatures.

It is possible that preset match criteria and preset replacement function signatures do not completely meet your function and operator replacement needs. For example:

- You want to replace an operator with a particular fixed-point implementation function only when fraction lengths are within a particular range.
- When a match occurs, you want to modify your replacement function signature based on compile-time information, such as passing fraction-length values into the function.

To add extra logic into the code replacement match and replacement process, create custom code replacement table entries. With custom entries, you can specify additional match criteria and modify the replacement function signature to meet application needs.

To create a custom code replacement entry:

- 1 Create a custom code replacement entry class, derived from `RTW.TfLCFunctionEntryML` (for function replacement) or `RTW.TfLCOperationEntryML` (for operator replacement).
- 2 In your derived class, implement a `do_match` method with a fixed preset signature as a MATLAB function. In your `do_match` method, provide either or both of the following customizations that instantiate the class:
  - Add match criteria that the base class does not provide. The base class provides a match based on:
    - Argument number
    - Argument name
    - Signedness
    - Word size
    - Slope (if not specified with wildcards)
    - Bias (if not specified with wildcards)
    - Math modes, such as saturation and rounding
    - Operator or function key
  - Modify the implementation signature by adding additional arguments or setting constant input argument values. You can inject a constant value, such as an input scaling value, as an additional argument to the replacement function.
- 3 Create code replacement entries that instantiate the custom entry class.
- 4 Register a library containing the code replacement table that includes your entries.

During code generation, the code replacement match process tries to match function or operator call sites with the base class of your derived entry class. If the process finds a match, the software calls your `do_match` method to execute your additional match logic (if any) and your replacement function customizations (if any).

## Customize Code Match and Replacement for Functions

This example shows how to use custom code replacement table entries to refine the match and replacement logic for functions. The example shows how to:

- Modify a sine function replacement only if the integer size on the current target platform is 32 bits.
  - Change the replacement such that the implementation function passes in a degrees-versus-radians flag as an input argument.
- 1 To exercise the table entries that you create in this example, create an ERT-based model with a sine function block. For example:

In the Inport block parameters, set the signal **Data type** to `double`. If the value selected for **Configuration Parameters > Hardware Implementation > Device type** supports an integer size other than 32, do one of the following:

- Select a temporary target platform with a 32-bit integer size.
  - Modify the code to match the integer size of your target platform.
- 2 Create a class, for example `TflCustomFunctionEntry`, that is derived from the base class `RTW.TflCFunctionEntryML`. The derived class defines a `do_match` method with the signature:

```
function ent = do_match(hThis, ...
 hCS0, ...
 targetBitPerChar, ...
 targetBitPerShort, ...
 targetBitPerInt, ...
 targetBitPerLong, ...
 targetBitPerLongLong)
```

In the `do_match` signature:

- `ent` is the return handle, which is returned either as empty (indicating that the match failed) or as a `TflCFunctionEntry` handle.
- `hThis` is a handle to the class instance.
- `hCS0` is a handle to an object that the code generator creates for querying the library for a replacement.
- Remaining arguments are the number of bits for various data types of the current target.

The `do_match` method:

- Adds required additional match criteria that the base class does not provide.
- Makes required modifications to the implementation signature.

In this case, the `do_match` method must match only `targetBitPerInt`, representing the number of bits in the C `int` data type for the current target, to the value 32. If the code generator finds a match, the method sets the return handle and creates and adds an input argument. The input argument represents whether units are expressed as degrees or radians, to the replacement function signature.

Alternatively, create and add the additional implementation function argument for passing a units flag in each code replacement table definition file that instantiates this class. In that case, this class definition code does not create the argument. That code sets only the argument value. For an example of creating and adding additional implementation function arguments in a table definition file, see “Customize Code Match and Replacement for Scalar Operations” on page 72-138.

```
classdef TflCustomFunctionEntry < RTW.TflCFunctionEntryML
 methods
 function ent = do_match(hThis, ...
 hCS0, ... %#ok
 targetBitPerChar, ... %#ok
 targetBitPerShort, ... %#ok
 targetBitPerInt, ... %#ok
 targetBitPerLong, ... %#ok
 targetBitPerLongLong) %#ok
 % DO_MATCH - Create a custom match function. The base class
 % checks the types of the arguments prior to calling this
 % method. This will check additional data and perhaps modify
 % the implementation function.

 ent = []; % default the return to empty, indicating the match failed.

 % Match sine function only if the target int size is 32 bits
 if targetBitPerInt == 32
 % Need to modify the default implementation, starting from a copy
 % of the standard TflCFunctionEntry.
 ent = RTW.TflCFunctionEntry(hThis);

 % If the target int size is 32 bits, the implementation function
 % takes an additional input flag argument indicating degrees vs.
 % radians. The additional argument can be created and added either
 % in the CRL table definition file that instantiates this class, or
 % here in the class definition, as follows:
 createAndAddImplementationArg(ent, 'RTW.TflArgNumericConstant', ...
 'Name', 'u2', ...
 'IsSigned', true, ...
 'WordLength', 32, ...
 'FractionLength', 0, ...
 'Value', 1);
 end
 end
 end
end
```

Exit the class folder and return to the previous working folder.

- 3 Create and save the following code replacement table definition file, `crl_table_custom_sinfcn_double.m`. This file defines a code replacement table that contains a function table entry for sine with `double` input and output. This entry instantiates the derived class from the previous step, `TflCustomFunctionEntry`.

```
function hTable = crl_table_custom_sinfcn_double

hTable = RTW.TflTable;

%% Add TflCustomFunctionEntry
fcn_entry = TflCustomFunctionEntry;
setTflCFunctionEntryParameters(fcn_entry, ...
 'Key', 'sin', ...
 'Priority', 30, ...
 'ImplementationName', 'mySin', ...
 'ImplementationHeaderFile', 'mySin.h', ...
 'ImplementationSourceFile', 'mySin.c');

createAndAddConceptualArg(fcn_entry, 'RTW.TflArgNumeric', ...
 'Name', 'y1', ...
 'IOType', 'RTW_IO_OUTPUT', ...
 'DataTypeMode', 'double');
```

```

createAndAddConceptualArg(fcn_entry, 'RTW.TflArgNumeric', ...
 'Name', 'u1', ...
 'IOType', 'RTW_IO_INPUT', ...
 'DataTypeMode', 'double');

% TflCustomFunctionEntry class do_match method will create and add
% an implementation function argument during code generation if
% the supported integer size on the current target is 32 bits.
copyConceptualArgsToImplementation(fcn_entry);

addEntry(hTable, fcn_entry);

```

#### 4 Check the validity of the code replacement table entry.

- At the command prompt, invoke the table definition file.
 

```
tbl = crl_table_custom_sinfcn_double
```
- In the Code Replacement Viewer, view the table definition file.
 

```
crviewer(crl_table_custom_sinfcn_double)
```

## Customize Code Match and Replacement for Nonscalar Operations

This example shows how to create custom code replacement entries that add logic to the code match and replacement process for a nonscalar operation. Custom entries specify additional match criteria or modify the replacement function signature to meet application needs.

This example restricts the match criteria for an element-wise multiplication replacement to entries with a specific dimension range. When a match occurs, the custom `do_match` method modifies the replacement signature to pass the number of elements into the function.

Files for developing and testing this code replacement library example are available in `matlab/help/toolbox/ecoder/examples/code_replacement/custom_lemmult`:

- `do_match` method — `@MyElemMultEntry/MyElemMultEntry.m`
- Replacement function source and header files — `src/myMulImplLib.c` and `src/myMulImplLib.h`
- Model — `myElemMul.slx`
- Code replacement table definition — `myElemMultCrlTable.m`
- Registration file — `rtwTargetInfo.m`

To create custom code replacement entries that add logic to the code replacement match and replacement process:

- 1 Create a class, for example `MyElemMultEntry`, which is derived from the base class `RTW.TflCOperationEntryML`. The derived class defines a `do_match` method with the following signature:

```

function ent = do_match(hThis, ...
 hCS0, ...
 targetBitPerChar, ...
 targetBitPerShort, ...
 targetBitPerInt, ...
 targetBitPerLong, ...
 targetBitPerLongLong)

```

In the `do_match` signature:

- ent is the return handle, which is returned as empty (indicating that the match failed) or as a TflCOperationEntry handle.
- hThis is the handle to the derived instance.
- hCSO is a handle to an object that the code generator creates for querying the library for a replacement.
- Remaining arguments are the number of bits for various data types of the current target.

The do\_match method:

- Adds match criteria that the base class does not provide.
- Makes changes to the implementation signature.

The do\_match method relies on the base class for checking data types and dimension ranges. If the code generator finds a match, do\_match:

- Sets the return handle.
- Uses the conceptual arguments to compute the number of elements in the array. In the replacement entry returned, sets the value of the constant implementation argument as the number of elements of the array.
- Updates the code replacement entry such that it matches CSOs that have the same argument dimensions.

```
classdef MyElemMultEntry < RTW.TflCOperationEntryML
 methods
 function obj = MyElemMultEntry(varargin)
 mlock;
 obj@RTW.TflCOperationEntryML(varargin{:});
 end

 function ent = do_match(hThis, ...
 hCSO, ... %#ok
 targetBitPerChar, ... %#ok
 targetBitPerShort, ... %#ok
 targetBitPerInt, ... %#ok
 targetBitPerLong, ... %#ok
 targetBitPerLongLong) %#ok

 % Fourth implementation arg represents number of elements for producing matches.
 assert(strcmp(hThis.Implementation.Arguments(4).Name, 'numElements'));

 ent = RTW.TflCOperationEntry(hThis);

 % Calculate number of elements and set value of injected constant.
 ent.Implementation.Arguments(4).Value = prod(hCSO.ConceptualArgs(1).DimRange(1,:));

 % Since implementation has been modified for specific DimRange, update
 % returned entry to match similar CSOs only.
 for idx =1:3
 ent.ConceptualArgs(idx).DimRange = hCSO.ConceptualArgs(idx).DimRange;
 end
 end
 end
end
```

- 2 Create and save the following code replacement table definition file, myElemMultCrlTable.m. This file defines a code replacement table that contains an operator entry generator for element-wise multiplication. The table entry:

- Instantiates the derived class myElemMultEntry from the previous step.
- Sets operator entry parameters with the call to the setTflCOperationEntryParameters function.

- Creates conceptual arguments `y1`, `u1`, and `u2`. The argument class `RTW.TflArgMatrix` specifies matrix arguments to match. The three arguments are set up to match 2-dimensional matrices with at least two elements in each dimension.
- Calls the `getTflArgFromString` function to create a return value and four implementation arguments. Arguments `u1` and `u2` are the operands, `y1` is the product, and the fourth argument is the number of elements.

Alternatively, the `do_match` method of the derived class `myElemMultEntry` can create and add the implementation arguments. When the number of additional implementation arguments required can vary based on compile-time information, use the alternative approach.

- Calls `addEntry` to add the entry to a code replacement table.

```
function hLib = myElemMultCrLTable

libPath = fullfile(fileparts(which(mfilename)), 'src');

hLib = RTW.TflTable;
%----- entry: RTW_OP_ELEM_MUL -----
hEnt = MyElemMultEntry;
hEnt.setTflCoperationEntryParameters(...
 'Key', 'RTW_OP_ELEM_MUL', ...
 'Priority', 100, ...
 'SaturationMode', 'RTW_WRAP_ON_OVERFLOW', ...
 'ImplementationName', 'myElemMul_s32', ...
 'ImplementationSourceFile', 'myMulImplLib.c', ...
 'ImplementationSourcePath', libPath, ...
 'ImplementationHeaderFile', 'myMulImplLib.h', ...
 'ImplementationHeaderPath', libPath, ...
 'SideEffects', true, ...
 'GenCallback', 'RTW.copyFileToBuildDir');

% Conceptual Args

arg = RTW.TflArgMatrix('y1', 'RTW_IO_OUTPUT', 'int32');
arg.DimRange = [2 2; Inf Inf];
hEnt.addConceptualArg(arg);

arg = RTW.TflArgMatrix('u1', 'RTW_IO_INPUT', 'int32');
arg.DimRange = [2 2; Inf Inf];
hEnt.addConceptualArg(arg);

arg = RTW.TflArgMatrix('u2', 'RTW_IO_INPUT', 'int32');
arg.DimRange = [2 2; Inf Inf];
hEnt.addConceptualArg(arg);

% Implementation Args

arg = hEnt.getTflArgFromString('unused', 'void');
arg.IOType = 'RTW_IO_OUTPUT';
hEnt.Implementation.setReturn(arg);

arg = hEnt.getTflArgFromString('u1', 'int32*');
hEnt.Implementation.addArgument(arg);

arg = hEnt.getTflArgFromString('u2', 'int32*');
```

```

hEnt.Implementation.addArgument(arg);

arg = hEnt.getTflArgFromString('y1','int32*');
arg.IOType = 'RTW_IO_OUTPUT';
hEnt.Implementation.addArgument(arg);

arg = hEnt.getTflArgFromString('numElements','uint32',0);
hEnt.Implementation.addArgument(arg);

hLib.addEntry(hEnt);

```

**3** Check the validity of the code replacement table entry.

- At the command prompt, invoke the table definition file.

```
tbl = myElemMultCrlTable
```

- In the Code Replacement Viewer, view the table definition file.

```
crviewer(myElemMultCrlTable)
```

## Customize Code Match and Replacement for Scalar Operations

This example shows how to create custom code replacement entries that add logic to the code match and replacement process for a scalar operation. Custom entries specify additional match criteria or modify the replacement function signature to meet application needs.

For example:

- When fraction lengths are within a specific range, replace an operator with a fixed-point implementation function.
- When a match occurs, modify the replacement function signature based on compile-time information, such as passing fraction-length values into the function.

This example modifies a fixed-point addition replacement such that the implementation function passes in the fraction lengths of the input and output data types as arguments.

To create custom code replacement entries that add logic to the code replacement match and replacement process:

- 1** Create a class, for example `TflCustomOperationEntry`, that is derived from the base class `RTW.TflCOperationEntryML`. The derived class defines a `do_match` method with the following signature:

```

function ent = do_match(hThis, ...
 hCS0, ...
 targetBitPerChar, ...
 targetBitPerShort, ...
 targetBitPerInt, ...
 targetBitPerLong, ...
 targetBitPerLongLong)

```

In the `do_match` signature:

- `ent` is the return handle, which is returned as empty (indicating that the match failed) or as a `TflCOperationEntry` handle.

- hThis is the handle to the class instance.
- hCS0 is a handle to an object that the code generator creates for querying the library for a replacement.
- Remaining arguments are the number of bits for various data types of the current target.

The `do_match` method adds match criteria that the base class does not provide. The method makes modifications to the implementation signature. In this case, the `do_match` method relies on the base class for checking word size and signedness. `do_match` must match only the number of conceptual arguments to the value 3 (two inputs and one output) and the bias for each argument to value 0. If the code generator finds a match, `do_match`:

- Sets the return handle.
- Removes slope and bias wild cards from the conceptual arguments (the match is for specific slope and bias values).
- Writes fraction-length values for the inputs and output into replacement function arguments 3, 4, and 5.

You can create and add three additional implementation function arguments for passing fraction lengths in the class definition or in each code replacement entry definition that instantiates this class. This example creates the arguments, adds them to a code replacement table definition file, and sets them to specific values in the class definition code.

```
classdef TflCustomOperationEntry < RTW.TflCOperationEntryML
 methods
 function ent = do_match(hThis, ...
 hCS0, ... %#ok
 targetBitPerChar, ... %#ok
 targetBitPerShort, ... %#ok
 targetBitPerInt, ... %#ok
 targetBitPerLong, ... %#ok
 targetBitPerLongLong) %#ok

 % DO_MATCH - Create a custom match function. The base class
 % checks the types of the arguments prior to calling this
 % method. This class will check additional data and can
 % modify the implementation function.

 % The base class checks word size and signedness. Slopes and biases
 % have been wildcarded, so the only additional checking to do is
 % to check that the biases are zero and that there are only three
 % conceptual arguments (one output, two inputs)

 ent = []; % default the return to empty, indicating the match failed

 if length(hCS0.ConceptualArgs) == 3 && ...
 hCS0.ConceptualArgs(1).Type.Bias == 0 && ...
 hCS0.ConceptualArgs(2).Type.Bias == 0 && ...
 hCS0.ConceptualArgs(3).Type.Bias == 0

 % Modify the default implementation. Since this is a
 % generator entry, a concrete entry is created using this entry
 % as a template. The type of entry being created is a standard
 % TflCOperationEntry. Using the standard operation entry
 % provides required information, and you do not need
 % a custom match function.
 ent = RTW.TflCOperationEntry(hThis);

 % Since this entry is modifying the implementation for specific
 % fraction-length values (arguments 3, 4, and 5), the conceptual argument
 % wild cards must be removed (the wildcards were inherited from the
 % generator when it was used as a template for the concrete entry).
 % This concrete entry is now for a specific slope and bias.
 % hCS0 holds the slope and bias values (created by the code generator).
```

```

 for idx=1:3
 ent.ConceptualArgs(idx).CheckSlope = true;
 ent.ConceptualArgs(idx).CheckBias = true;

 % Set the specific Slope and Biases
 ent.ConceptualArgs(idx).Type.Slope = hCS0.ConceptualArgs(idx).Type.Slope;
 ent.ConceptualArgs(idx).Type.Bias = 0;
 end

 % Set the fraction-length values in the implementation function.
 ent.Implementation.Arguments(3).Value = ...
 -1.0*hCS0.ConceptualArgs(2).Type.FixedExponent;
 ent.Implementation.Arguments(4).Value = ...
 -1.0*hCS0.ConceptualArgs(3).Type.FixedExponent;
 ent.Implementation.Arguments(5).Value = ...
 -1.0*hCS0.ConceptualArgs(1).Type.FixedExponent;
end
end
end
end

```

Exit the class folder and return to the previous working folder.

- 2 Create and save the following code replacement table definition file, `crl_table_custom_add_ufix32.m`. This file defines a code replacement table that contains a single operator entry, an entry generator for unsigned 32-bit fixed-point addition operations, with arbitrary fraction-length values on the inputs and the output. The table entry:

- Instantiates the derived class `TflCustomOperationEntry` from the previous step. If you want to replace word sizes and signedness attributes, you can use the same derived class, but not the same entry, because you cannot use a wild card with the `WordLength` and `IsSigned` arguments. For example, to support `uint8`, `int8`, `uint16`, `int16`, and `int32`, add five other distinct entries. To use different implementation functions for saturation and rounding modes other than overflow and round to floor, add entries for those match permutations.
- Sets operator entry parameters with the call to the `setTflCOperationEntryParameters` function.
- Calls the `createAndAddConceptualArg` function to create conceptual arguments `y1`, `u1`, and `u2`.
- Calls `createAndSetCImplementationReturn` and `createAndAddImplementationArg` to define the signature for the replacement function. Three of the calls to `createAndAddImplementationArg` create implementation arguments to hold the fraction-length values for the inputs and output. Alternatively, the entry can omit those argument definitions. Instead, the `do_match` method of the derived class `TflCustomOperationEntry` can create and add the three implementation arguments. When the number of additional implementation arguments required can vary based on compile-time information, use the alternative approach.
- Calls `addEntry` to add the entry to a code replacement table.

```

function hTable = crl_table_custom_add_ufix32

hTable = RTW.TflTable;

% Add TflCustomOperationEntry
op_entry = TflCustomOperationEntry;

setTflCOperationEntryParameters(op_entry, ...
 'Key', 'RTW_OP_ADD', ...
 'Priority', 30, ...
 'SaturationMode', 'RTW_SATURATE_ON_OVERFLOW', ...

```

```

'RoundingModes', {'RTW_ROUND_FLOOR'}, ...
'ImplementationName', 'myFixptAdd', ...
'ImplementationHeaderFile', 'myFixptAdd.h', ...
'ImplementationSourceFile', 'myFixptAdd.c');

createAndAddConceptualArg(op_entry, 'RTW.TflArgNumeric', ...
 'Name', 'y1', ...
 'IOType', 'RTW_IO_OUTPUT', ...
 'CheckSlope', false, ...
 'CheckBias', false, ...
 'DataType', 'Fixed', ...
 'Scaling', 'BinaryPoint', ...
 'IsSigned', false, ...
 'WordLength', 32);

createAndAddConceptualArg(op_entry, 'RTW.TflArgNumeric', ...
 'Name', 'u1', ...
 'IOType', 'RTW_IO_INPUT', ...
 'CheckSlope', false, ...
 'CheckBias', false, ...
 'DataType', 'Fixed', ...
 'Scaling', 'BinaryPoint', ...
 'IsSigned', false, ...
 'WordLength', 32);

createAndAddConceptualArg(op_entry, 'RTW.TflArgNumeric', ...
 'Name', 'u2', ...
 'IOType', 'RTW_IO_INPUT', ...
 'CheckSlope', false, ...
 'CheckBias', false, ...
 'DataType', 'Fixed', ...
 'Scaling', 'BinaryPoint', ...
 'IsSigned', false, ...
 'WordLength', 32);

% Specify replacement function signature
createAndSetCImplementationReturn(op_entry, 'RTW.TflArgNumeric', ...
 'Name', 'y1', ...
 'IOType', 'RTW_IO_OUTPUT', ...
 'IsSigned', false, ...
 'WordLength', 32, ...
 'FractionLength', 0);

createAndAddImplementationArg(op_entry, 'RTW.TflArgNumeric', ...
 'Name', 'u1', ...
 'IOType', 'RTW_IO_INPUT', ...
 'IsSigned', false, ...
 'WordLength', 32, ...
 'FractionLength', 0);

createAndAddImplementationArg(op_entry, 'RTW.TflArgNumeric', ...
 'Name', 'u2', ...
 'IOType', 'RTW_IO_INPUT', ...
 'IsSigned', false, ...
 'WordLength', 32, ...
 'FractionLength', 0);

% Add 3 fraction-length args. Actual values are set during code generation.

```

```
createAndAddImplementationArg(op_entry, 'RTW.TflArgNumericConstant', ...
 'Name', 'fl_in1', ...
 'IOType', 'RTW_IO_INPUT', ...
 'IsSigned', false, ...
 'WordLength', 32, ...
 'FractionLength', 0, ...
 'Value', 0);

createAndAddImplementationArg(op_entry, 'RTW.TflArgNumericConstant', ...
 'Name', 'fl_in2', ...
 'IOType', 'RTW_IO_INPUT', ...
 'IsSigned', false, ...
 'WordLength', 32, ...
 'FractionLength', 0, ...
 'Value', 0);

createAndAddImplementationArg(op_entry, 'RTW.TflArgNumericConstant', ...
 'Name', 'fl_out', ...
 'IOType', 'RTW_IO_INPUT', ...
 'IsSigned', false, ...
 'WordLength', 32, ...
 'FractionLength', 0, ...
 'Value', 0);

addEntry(hTable, op_entry);
```

**3** Check the validity of the operator entry.

- At the command prompt, invoke the table definition file.  

```
tbl = crl_table_custom_add_ufix32
```
- In the Code Replacement Viewer, view the table definition file.  

```
crviewer(crl_table_custom_add_ufix32)
```

## Scalar Operator Code Replacement

This example shows how to develop a code replacement library to optimize the performance of scalar operators by providing information on how to define code replacement for a `multiply` operation. To develop a code replacement library use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 72-20.

### Interactively Develop a Code Replacement Library

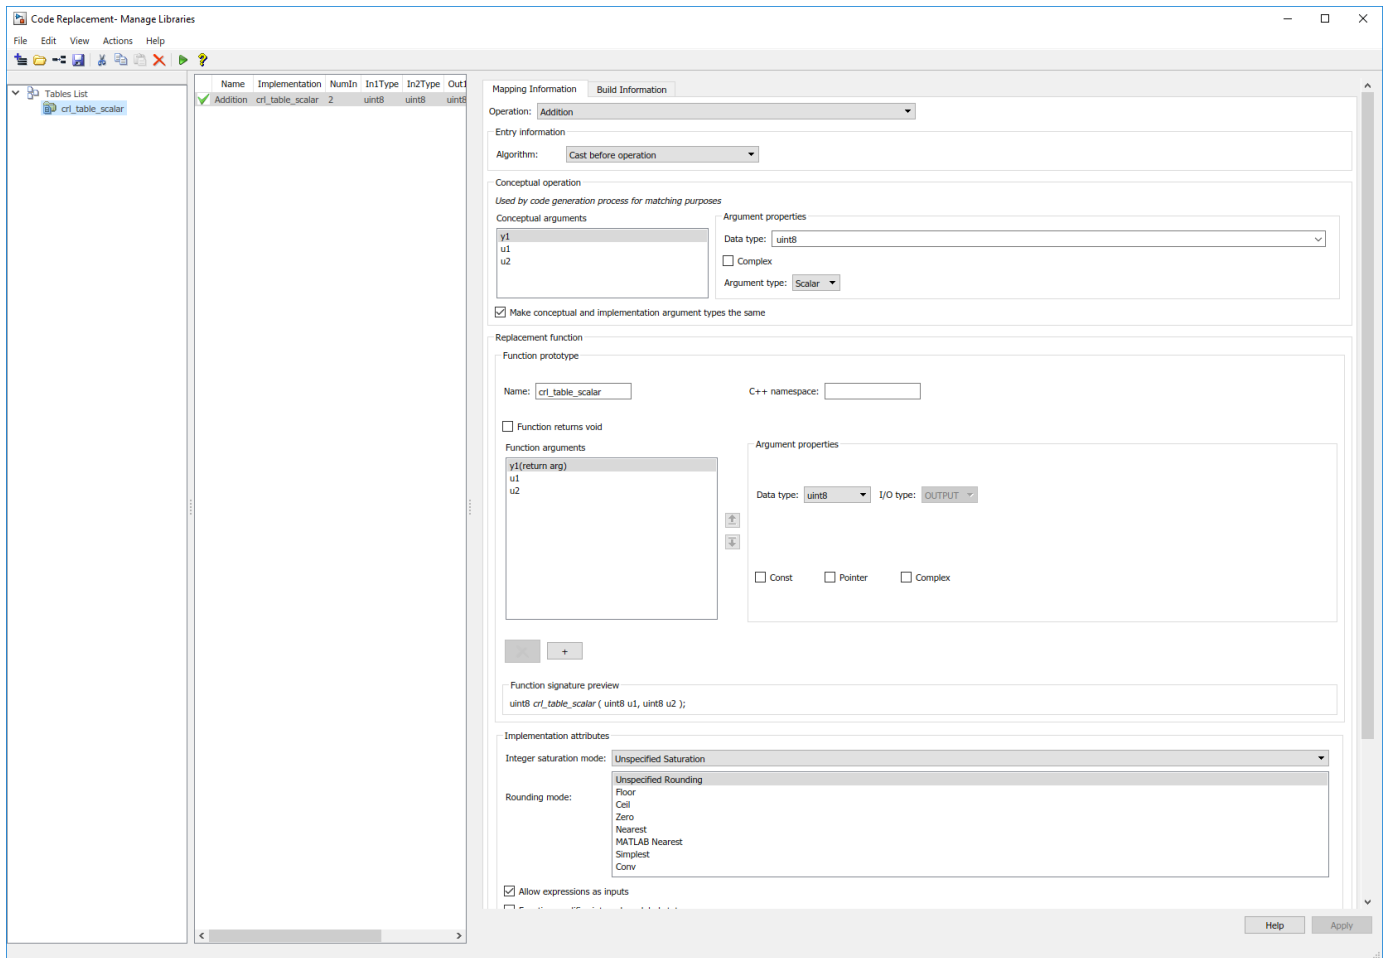

- 1 Open the **Code Replacement Tool** (crtool), from the MATLAB command line with the following command:

```
>>crtool
```

- 2 Create a table.
  - a From the crtool context menu, select **File > New Table**.
  - b In the right pane, name the table `cr1_table_scalar`. Click **Apply**.
- 3 Create an entry. From the crtool context menu, select **File > New entry > Math Operation**.
- 4 Create entry parameters. In the **Operation** drop-down list, select **Multiply**.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, `y1`, and the input arguments, `u1` and `u2` with the **Data Type** of `uint8` and the **Argument Type** of **Scalar**.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box.

Specify a **Name** for the replacement function under **Function prototype**.

- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. In the **Mapping Information** tab, click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
  - a Create a function to call your code replacement library table. The function should not have arguments and return a table object.
  - b Create a table object by calling `RTW.TflTable`.

```
function hTable = crl_table_scalar()
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function .

```
function hTable = crl_table_scalar()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;
```

```
%% Create an entry
hEntry = RTW.TflCOperationEntry;
```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTflCFunctionEntryParameters`.

```
function hTable = crl_table_scalar()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntry;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
 'Key', 'RTW_OP_MUL', ...
 'Priority', 90, ...
 'SaturationMode', 'RTW_SATURATE_ON_OVERFLOW', ...
 'RoundingModes', {'RTW_ROUND_UNSPECIFIED'}, ...
 'ImplementationName', 'u8_mul_u8_u8', ...
 'ImplementationHeaderFile', 'u8_mul_u8_u8.h', ...
 'ImplementationSourceFile', 'u8_mul_u8_u8.c');
```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `getTflArgFromString`.

```

function hTable = crl_table_scalar()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntry;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
 'Key', 'RTW_OP_MUL', ...
 'Priority', 90, ...
 'SaturationMode', 'RTW_SATURATE_ON_OVERFLOW', ...
 'RoundingModes', {'RTW_ROUND_UNSPECIFIED'}, ...
 'ImplementationName', 'u8_mul_u8_u8', ...
 'ImplementationHeaderFile', 'u8_mul_u8_u8.h', ...
 'ImplementationSourceFile', 'u8_mul_u8_u8.c');

%% Create the conceptual representation
arg = getTflArgFromString(hTable, 'y1', 'uint8');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hTable, 'u1', 'uint8');
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hTable, 'u2', 'uint8');
addConceptualArg(hEntry, arg);

```

- 6** Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function `copyConceptualArgsToImplementation`. Add the complete entry to the table by calling the function `addEntry`.

```

function hTable = crl_table_scalar()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntry;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
 'Key', 'RTW_OP_MUL', ...
 'Priority', 90, ...
 'SaturationMode', 'RTW_SATURATE_ON_OVERFLOW', ...
 'RoundingModes', {'RTW_ROUND_UNSPECIFIED'}, ...
 'ImplementationName', 'u8_mul_u8_u8', ...
 'ImplementationHeaderFile', 'u8_mul_u8_u8.h', ...
 'ImplementationSourceFile', 'u8_mul_u8_u8.c');

%% Create the conceptual representation
arg = getTflArgFromString(hTable, 'y1', 'uint8');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hTable, 'u1', 'uint8');
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hTable, 'u2', 'uint8');
addConceptualArg(hEntry, arg);

%% Create the Implementation Representation
copyConceptualArgsToImplementation(hEntry);

```

```
%% Add the entry to the table
hTable.addEntry(hEntry);
```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_scalar
```

- 9 Create a registration file for the code replacement library with these specifications:

```
function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for scalar operator replacement';
this(1).TableList = {'crl_table_scalar.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end
```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Addition and Subtraction Algorithm Types for Code Replacement

When you replace an addition or subtraction operator, your library function algorithm must match the algorithm type of the operator that you want to replace. Addition and subtraction operations are either cast-before-operation or cast-after-operation algorithms. First, determine which type of algorithm your library function implements. Then, to replace an operator in the generated code, determine how the code generator classifies the operator algorithm. Match your library function algorithm to the classification. For an example, see “Replace Addition and Subtraction Operator Code” on page 72-151.

### Algorithm Options

When creating a code replacement table entry for an addition or subtraction operator, first determine the type of algorithm that your library function implements.

- Cast-before-operation (CBO), default — Prior to performing the addition or subtraction operation, the algorithm type casts input values to the output type. If the output data type cannot exactly represent the input values, losses can occur as a result of the cast to the output type. Additional loss can occur when the result of the operation is cast to the final output type.

- Cast-after-operation (CAO) — The algorithm computes the ideal result of the addition or subtraction operation of the two inputs. The algorithm then type casts the result to the output data type. Loss occurs during the type cast. This algorithm behaves similarly to the C language except when the signedness of the operands does not match. For example, when you add a signed long operand to an unsigned long operand, standard C language rules convert the signed long operand to an unsigned long operand. The result is a value that is not ideal.

### Algorithm Classification

During code generation, the code generator examines addition and subtraction operations, including adjacent type cast operations, to determine the type of algorithm to compute the expression result. Based on the data types in the expression and the type of the accumulator (type used to hold the result of the addition or subtraction operation), the code generator uses these rules.

- Floating-point types only

Input 1 Data Type	Input 2 Data Type	Accumulator Data Type	Output Data Type	Classification
double	double	double	double	CBO, CAO
double	double	double	single	—
double	double	single	double	—

Input 1 Data Type	Input 2 Data Type	Accumulator Data Type	Output Data Type	Classification
double	double	single	single	CBO
double	single	double	double	CBO, CAO
double	single	double	single	—
double	single	single	double	—
double	single	single	single	CBO
single	single	single	single	CBO, CAO
single	single	single	double	—
single	single	double	single	—
single	single	double	double	CBO, CAO

- Floating-point and fixed-point types on the immediate addition or subtraction operation

Algorithm	Conditions
CBO	One of the following is true: <ul style="list-style-type: none"> <li>• Operation type is double.</li> <li>• Operation type is single and input types are single or fixed-point.</li> </ul>
CAO	Operation type is a superset of input types—that is, output type can represent values of input types without loss of data.

- Fixed-point types only

Algorithm	Conditions
CBO	At least one of the following is true: <ul style="list-style-type: none"> <li>• Accumulator type equals output type (<math>T_{acc} == T_{out}</math>).</li> <li>• Output type is a superset of input types (<math>T_{acc} \geq \{T_{in1}, T_{in2}\}</math>) and accumulator type is a superset of output type (<math>T_{acc} \geq T_{out}</math>).</li> <li>• Operation does not incur range or precision loss.</li> </ul>
CAO	Net bias is zero and the data types in the expression have equal slope adjustment factors. For more information on net bias, see “Addition” or “Subtraction” in “Fixed-Point Operator Code Replacement” on page 73-134 (for MATLAB code) or “Fixed-Point Operator Code Replacement” on page 72-186 (for Simulink models).

In many cases, the numerical result of a CBO operation is equal to that of a CAO operation. For example, if the input and output types are such that the operation produces the ideal result, as in the case of  $int8 + int8 \rightarrow int16$ . To maximize the probability of code replacement occurring in such cases, set the algorithm to cast-after-operation.

## Limitations

- When classifying an operation as a CAO operation, the code generator includes the adjacent casts in the expression when the expression involves only fixed-point types. Otherwise, the code generator classifies and replaces only the immediate addition or subtraction operation. Casts that the code generator excludes from the classification appear in the generated code.

- To enable the code generator to include multiple cast operations, which follow an addition or subtraction of fixed-point data, in the classification of an expression, the rounding mode must be `simplest` or `floor`. Consider the expression `y=(cast A)(cast B)(u1+u2)`. If the rounding mode of `(cast A)`, `(cast B)`, and the addition operator `(+)` are set to `simplest` or `floor`, the code generator takes into account `(cast A)` and `(cast B)` when classifying the expression and performing the replacement only.

## Replace Addition and Subtraction Operator Code

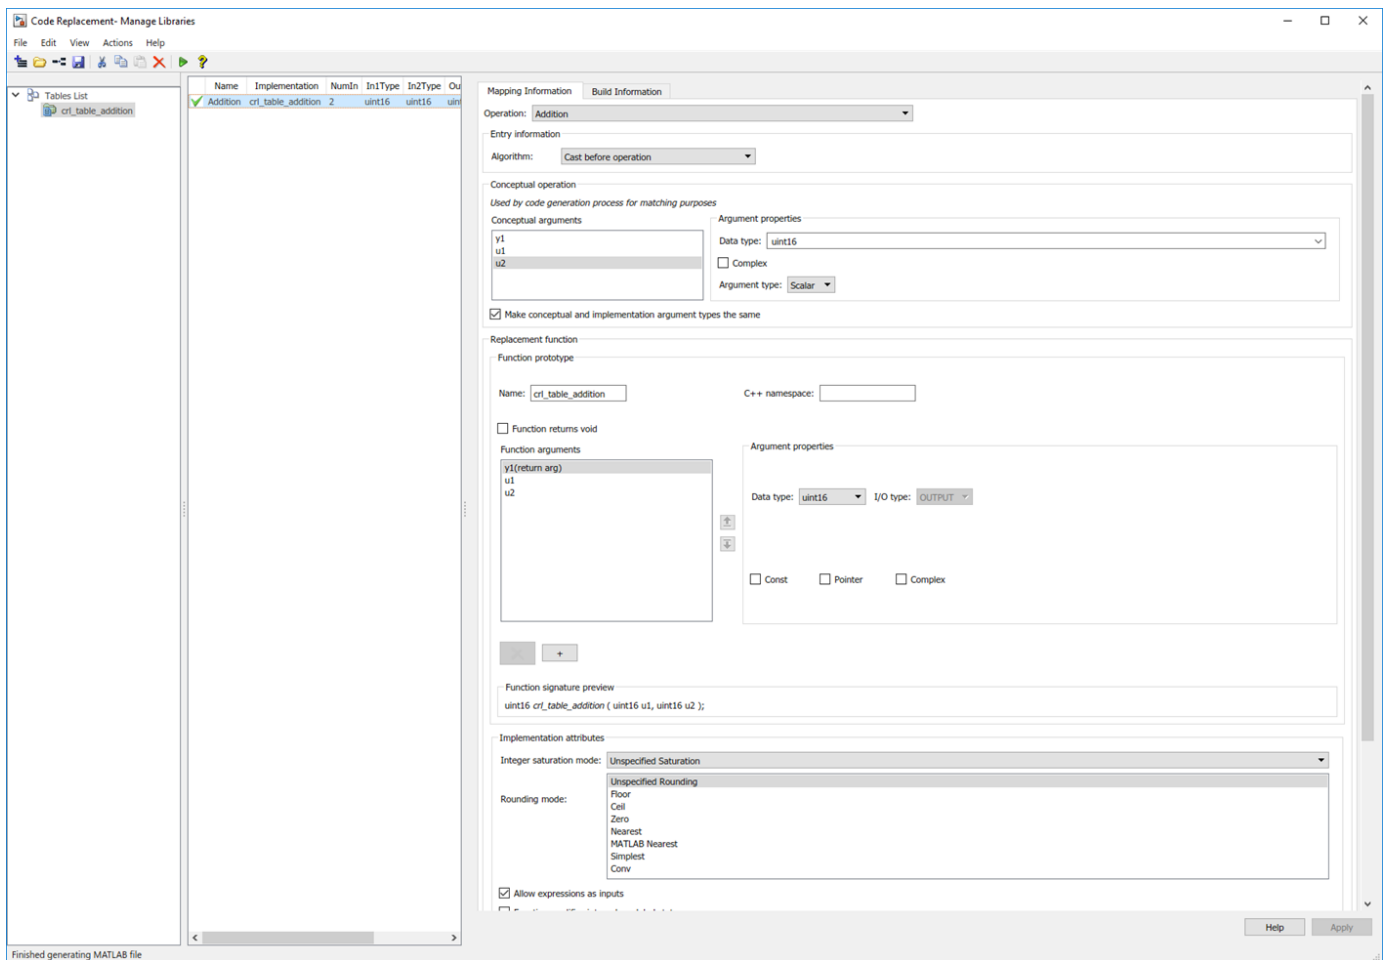

This example shows how to develop a code replacement library to optimize the performance of addition and subtraction operators by providing information on how to define code replacement for a addition operator. To develop a code replacement library use either the interactive or programmatic approach. When you replace an addition or subtraction operator, your library function algorithm must match the algorithm type of the operator that you want to replace. For more information, see “Addition and Subtraction Algorithm Types for Code Replacement” on page 72-148.

### Interactively Develop a Code Replacement Library

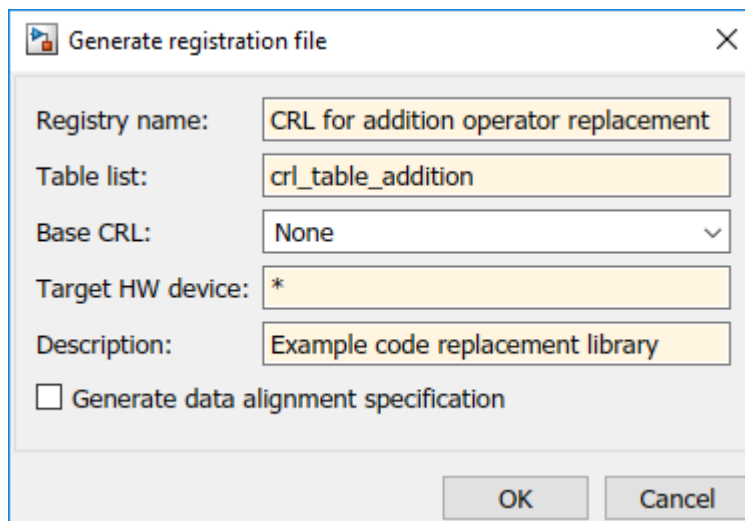

- 1 Open the **Code Replacement Tool** (crtool), from the MATLAB command line with the following command:
 

```
>>crtool
```
- 2 Create a table.
  - a From the crtool context menu, select **File > New Table**.
  - b In the right pane, name the table `cr1_table_addition`. Click **Apply**.
- 3 Create an entry. From the crtool context menu, select **File > New entry > Math Operation**.
- 4 Create entry parameters. In the **Function** drop-down list, select **Addition**. Algorithm information appears in the crtool. For this example, select the parameter to `Cast` before operation.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, `y1`, with the **Data Type** of `uint8` and the **Argument Type** of `Scalar`, the input arguments, `u1` and `u2` with the **Data Type** of `uint16` and the **Argument Type** of `Scalar`.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box.
 

Specify a **Name** for the replacement function under **Function prototype**.
- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. In the **Mapping Information** tab, click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
  - a Create a function with the name of your code replacement library table that does not have arguments and returns a table object. You can use this function to call your code replacement library table.
  - b Create a table object by calling `RTW.TflTable`.

```
function hTflTable = make_cbo_add_crl_table
% Create a function to call the code replacement library table

%% Create a table object
hTflTable = RTW.TflTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TflCOperationEntry`.

```
function hTflTable = make_cbo_add_crl_table
% Create a function to call the code replacement library table

%% Create a table object
hTflTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntry;
```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTflCOperationEntryParameters`.

```
function hTflTable = make_cbo_add_crl_table
% Create a function to call the code replacement library table

%% Create a table object
hTflTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntry;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
 'Key', 'RTW_OP_ADD', ...
 'EntryInfoAlgorithm', 'RTW_CAST_BEFORE_OP', ...
 'ImplementationName', 'u8_add_cao_u16_u16');
```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `getTflArgFromString`.

```
function hTflTable = make_cbo_add_crl_table
% Create a function to call the code replacement library table
```

```

%% Create a table object
hTflTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntry;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
 'Key', 'RTW_OP_ADD', ...
 'EntryInfoAlgorithm', 'RTW_CAST_BEFORE_OP', ...
 'ImplementationName', 'u8_add_cao_u16_u16');

%% Create the conceptual representation
arg = getTflArgFromString(hTflTable, 'y1', 'uint8');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hTflTable, 'u1', 'uint16');
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hTflTable, 'u2', 'uint16');
addConceptualArg(hEntry, arg);

```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function `copyConceptualArgsToImplementation`. Add the complete entry to the table by calling the function `addEntry`.

```

function hTflTable = make_cbo_add_crl_table()
% Create a function to call the code replacement library table

%% Create a table object
hTflTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntry;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
 'Key', 'RTW_OP_ADD', ...
 'EntryInfoAlgorithm', 'RTW_CAST_BEFORE_OP', ...
 'ImplementationName', 'u8_add_cao_u16_u16');

%% Create the conceptual representation
arg = getTflArgFromString(hTflTable, 'y1', 'uint8');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hTflTable, 'u1', 'uint16');
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hTflTable, 'u2', 'uint16');
addConceptualArg(hEntry, arg);

%% Create the Implementation Representation
copyConceptualArgsToImplementation(hEntry);

%% Add the entry to the table
addEntry(hTflTable, hEntry);

```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = make_cbo_add_crl_table
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file (a new function file) with these specifications:

```
function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for addition subtraction operator replacement';
this(1).TableList = {'make_cbo_add_crl_table.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end
```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Generate Code using Addition and Subtraction Operator Code Replacement Library

In this section, you generate code using the code replacement library that you created in the first two sections of this example. The generated code contains the implementation function signature that modifies an addition operator. For this example, the addition operator contains the **Cast before operation** parameter. This example does not provide an implementation function. You should write the implementation function that contains the optimization that you want to see in the generated code.

### Example Model

Open the model `crl_AddSubfunction` for configuring the code replacement library.

```
crl_AddSubfunction
```

```
copyfile AddSubFnRtwTargetInfo.txt rtwTargetInfo.m
```

The input ports are of data type `uint16` and the output port is of data type `uint8`. For the Add block, the **Accumulator data type** is set to `uint8`. Based on these data types, the addition is a cast-before-operation algorithm.

To create a code replacement table and register the file, run the MATLAB customization file. For this example, the customization file has already been executed. To register the library, run the `sl_refresh_customizations` function.

```
sl_refresh_customizations;
```

### Enable Code Replacement Library

- 1 Open the Configuration Parameters dialog box.
- 2 On the **Interface** pane, set **Code Replacement Library**. Click **Select** and add CRL for Addition and Subtraction operator replacement to the **Selected code replacement libraries - prioritized** list pane. Alternatively, use the command-line API to enable the code replacement:

```
set_param('crl_AddSubfunction', 'CodeReplacementLibrary', 'CRL for Addition and Subtraction operator');
```

Generate code from the model:

```
evalc('slbuild(''crl_AddSubfunction'')');
```

View the generated code. Here is a portion of `crl_AddSubfunction.c`.

```
cfile = fullfile('crl_AddSubfunction_ert_rtw','crl_AddSubfunction.c');
rtwdemodbtype(cfile,'/* Model step function ','/* Model initialize function',1, 1);

/* Model step function */
void crl_AddSubfunction_step(void)
{
 /* Output: '<Root>/Out1' incorporates:
 * Inport: '<Root>/In1'
 * Inport: '<Root>/In2'
 * Sum: '<Root>/Add8'
 */
 crl_AddSubfunction_Y.Out1 = u8_add_cbo_u16_u16(crl_AddSubfunction_U.In1,
 crl_AddSubfunction_U.In2);
}
```

The + operator can be replaced with your custom implementation.

Close the model.

```
delete ./rtwTargetInfo.m
bdclose('crl_AddSubfunction');
rtwdemoclean;
```

## Matrix Multiplication Operation to MathWorks BLAS Code Replacement

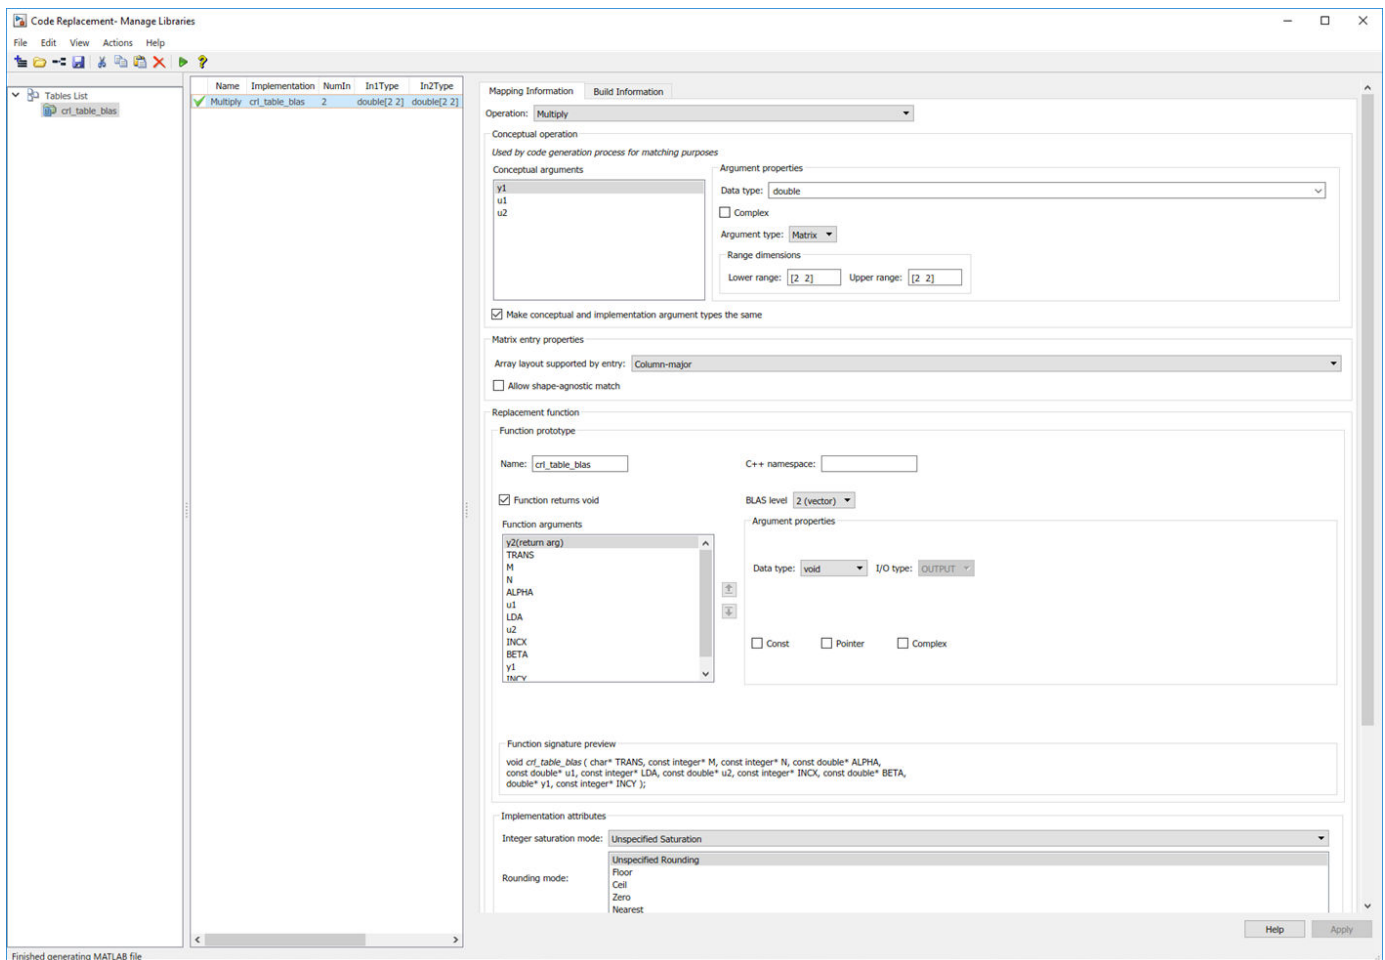

You can develop a code replacement library for floating-point matrix/matrix and matrix/vector multiplication operations with the multiplication functions `dgemm` and `dgemv` defined in the MathWorks BLAS library. If you use a third-party BLAS library for replacement, you must change the build requirements in this example to point to your library. To develop a code replacement library use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 72-20.

### Interactively Develop a Code Replacement Library

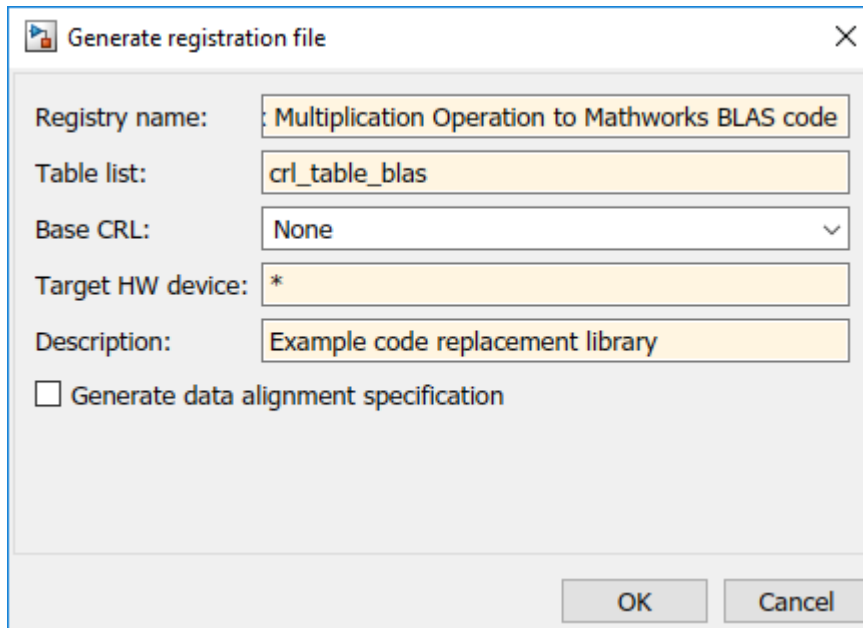

- 1 Open the **Code Replacement Tool** (crtool), from the MATLAB command line with the following command:
 

```
>>crtool
```
- 2 Create a table.
  - a From the crtool context menu, select **File > New Table**.
  - b In the right pane, name the table `cr1_table_blas`. Click **Apply**.
- 3 Create an entry. From the crtool context menu, select **File > New entry > Blas Operation (Fortran)**.
- 4 Create entry parameters. In the **Function** drop-down list, select **Multiply**.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, `y1`, and the input argument, `u1` and `u2` with the **Data Type** of **double** and the **Argument Type** of **Matrix**.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box. Set the **BLAS level** to **2(Vector)**.
 

Specify a **Name** for the replacement function under **Function prototype**.
- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. In the **Mapping Information** tab, click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
  - a Create a function to call your code replacement library table. The function should not have arguments and return a table object.
  - b Create a table object by calling `RTW.TfTable`.

```
function hTable = crl_table_blas
% Create a function to call the code replacement library table
```

```
%% Create a table object
hTable = RTW.TfTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TfBlasEntryGenerator`.

```
function hTable = crl_table_blas
% Create a code replacement library table
```

```
%% Create a table object
hTable = RTW.TfTable;
```

```
%% Create an entry
```

```

%%% Define library path for Windows or UNIX block%%%
arch = computer('arch');
if ~ispc
 LibPath = fullfile('$MATLAB_ROOT', 'bin', arch);
else
 % Use Stateflow to get the compiler info
 compilerInfo = sf('Private','compilerman','get_compiler_info');
 compilerName = compilerInfo.compilerName;
 if strcmp(compilerName, 'msvc90') || ...
 strcmp(compilerName, 'msvc80') || ...
 strcmp(compilerName, 'msvc71') || ...
 strcmp(compilerName, 'msvc60'), ...
 compilerName = 'microsoft';
 end
 LibPath = fullfile('$MATLAB_ROOT', 'extern', 'lib', arch, compilerName);
end

if ispc
 libExt = 'lib';
elseif ismac
 libExt = 'dylib';
else
 libExt = 'so';
end

```

```

%%% Beginning of entries for the first dgemm block%%%

```

```

% Create table entry for dgemm32
hEntry = RTW.TflBlasEntryGenerator;

```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTflCFunctionEntryParameters`.

```

function hTable = crl_table_blas
% Create a code replacement library table

% Create a table object
hTable = RTW.TflTable;

% Create an entry
%%% Define library path for Windows or UNIX block%%%
arch = computer('arch');
if ~ispc
 LibPath = fullfile('$MATLAB_ROOT', 'bin', arch);
else
 % Use Stateflow to get the compiler info
 compilerInfo = sf('Private','compilerman','get_compiler_info');
 compilerName = compilerInfo.compilerName;
 if strcmp(compilerName, 'msvc90') || ...
 strcmp(compilerName, 'msvc80') || ...
 strcmp(compilerName, 'msvc71') || ...
 strcmp(compilerName, 'msvc60'), ...
 compilerName = 'microsoft';
 end
 LibPath = fullfile('$MATLAB_ROOT', 'extern', 'lib', arch, compilerName);
end

if ispc
 libExt = 'lib';
elseif ismac
 libExt = 'dylib';
else
 libExt = 'so';
end

```

```

%%% Beginning of entries for the first dgemm block%%%

```

```

% Create table entry for dgemm32
hEntry = RTW.TflBlasEntryGenerator;

% Create entry parameters
setTflCOperationEntryParameters(hEntry, ...
 'Key', 'RTW_OP_MUL', ...

```

```

 'Priority', 100, ...
 'ImplementationName', 'dgemm32', ...
 'ImplementationHeaderFile', 'blascompat32_crl.h', ...
 'ImplementationHeaderPath', fullfile('${MATLAB_ROOT}','extern','include'), ...
 'AdditionalLinkObjs', {'libmwbblascompat32.' libExt}}, ...
 'AdditionalLinkObjsPaths', {LibPath}, ...
 'SideEffects', true);

```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `createAndAddConceptualArg`. To specify a matrix argument in the function call, use the argument class `RTW.TflArgMatrix` and specify the base type and the dimensions for which the argument is valid. This type of table entry supports a range of dimensions specified in the format `[Dim1Min Dim2Min ... DimNMin; Dim1Max Dim2Max ... DimNMax]`. For example, `[2 2; inf inf]` means a two-dimensional matrix of size 2x2 or larger. The conceptual output argument for the `dgemm32` entry for matrix/matrix multiplication replacement specifies dimensions `[2 2; inf inf]`, while the conceptual output argument for the `dgemv32` entry for matrix/vector multiplication replacement specifies dimensions `[2 1; inf 1]`.

```

function hTable = crl_table_blas
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
%%

arch = computer('arch');
if ~ispc
 LibPath = fullfile('${MATLAB_ROOT}', 'bin', arch);
else
 % Use Stateflow to get the compiler info
 compilerInfo = sf('Private','compilerman','get_compiler_info');
 compilerName = compilerInfo.compilerName;
 if strcmp(compilerName, 'msvc90') || ...
 strcmp(compilerName, 'msvc80') || ...
 strcmp(compilerName, 'msvc71') || ...
 strcmp(compilerName, 'msvc60'), ...
 compilerName = 'microsoft';
 end
 LibPath = fullfile('${MATLAB_ROOT}', 'extern', 'lib', arch, compilerName);
end

if ispc
 libExt = 'lib';
elseif ismac
 libExt = 'dylib';
else
 libExt = 'so';
end

%%

% Create table entry for dgemm32
hEntry = RTW.TflBlasEntryGenerator;

%% Create entry parameters
setTflCoperationEntryParameters(hEntry, ...
 'Key', 'RTW_OP_MUL', ...
 'Priority', 100, ...
 'ImplementationName', 'dgemm32', ...
 'ImplementationHeaderFile', 'blascompat32_crl.h', ...
 'ImplementationHeaderPath', fullfile('${MATLAB_ROOT}','extern','include'), ...

 'Name', 'u2', ...
 'BaseType', 'double', ...
 'DimRange', [1 1; inf inf]);

```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function `getTfLArgFromString`. The example code configures special implementation arguments that are required for `dgemm` and `dgemv` function replacements. The convenience methods `setReturn` and `addArgument` specify whether an argument is a return value or argument and adds the argument to the entry's array of implementation arguments. Add the complete entry to the table by calling the function `addEntry`.

```

function hTable = crl_table_blas
% Create a code replacement library table

%% Create a table object
hTable = RTW.TfLTable;

%% Create an entry
%%
arch = computer('arch');
if ~ispc
 LibPath = fullfile('$MATLAB_ROOT', 'bin', arch);
else
 % Use Stateflow to get the compiler info
 compilerInfo = sf('Private','compilerman','get_compiler_info');
 compilerName = compilerInfo.compilerName;
 if strcmp(compilerName, 'msvc90') || ...
 strcmp(compilerName, 'msvc80') || ...
 strcmp(compilerName, 'msvc71') || ...
 strcmp(compilerName, 'msvc60'), ...
 compilerName = 'microsoft';
 end
 LibPath = fullfile('$MATLAB_ROOT', 'extern', 'lib', arch, compilerName);
end

if ispc
 libExt = 'lib';
elseif ismac
 libExt = 'dylib';
else
 libExt = 'so';
end

%%

% Create table entry for dgemm32

 'BaseType', 'double', ...
 'DimRange', [1 1; inf inf]);

%% Create the Implementation Representation
% Using RTW.TflBlasEntryGenerator for xgemv requires the following
% implementation signature:
%
% void f(char* TRANSA, char* TRANSB, int* M, int* N, int* K,
% type* ALPHA, type* u1, int* LDA, type* u2, int* LDB,
% type* BETA, type* y, int* LDC)
%
% When a match occurs, the code generator computes the
% values for M, N, K, LDA, LDB, and LDC and inserts them into the
% generated code. TRANSA and TRANSB are set to 'N'.

% Specify replacement function signature

arg = getTflArgFromString(hTable, 'y2', 'void');
arg.IOType = 'RTW_IO_OUTPUT';
hEntry.Implementation.setReturn(arg);

arg = RTW.TflArgCharConstant('TRANSA');
% Possible values for PassByType property are
% RTW_PASSBY_AUTO, RTW_PASSBY_POINTER,
% RTW_PASSBY_VOID_POINTER, RTW_PASSBY_BASE_POINTER
arg.PassByType = 'RTW_PASSBY_POINTER';
hEntry.Implementation.addArgument(arg);

arg = RTW.TflArgCharConstant('TRANSB');
arg.PassByType = 'RTW_PASSBY_POINTER';
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'M', 'integer', 0);
arg.PassByType = 'RTW_PASSBY_POINTER';
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'N', 'integer', 0);
arg.PassByType = 'RTW_PASSBY_POINTER';
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'K', 'integer', 0);
arg.PassByType = 'RTW_PASSBY_POINTER';
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'ALPHA', 'double', 0);
arg.PassByType = 'RTW_PASSBY_POINTER';
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'u1', ['double' '*']);
arg.PassByType = 'RTW_PASSBY_POINTER';
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'LDA', 'integer', 0);
arg.PassByType = 'RTW_PASSBY_POINTER';
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'u2', ['double' '*']);
arg.PassByType = 'RTW_PASSBY_POINTER';
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'LDB', 'integer', 0);
arg.PassByType = 'RTW_PASSBY_POINTER';
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'BETA', 'double', 0);
arg.PassByType = 'RTW_PASSBY_POINTER';
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

```

```

arg = getTflArgFromString(hTable, 'y1', ['double' '*']);
arg.IOType = 'RTW_IO_OUTPUT';
arg.PassByType = 'RTW_PASSBY_POINTER';
hEntry.Implementation.addArgument(arg);

```

```

arg = getTflArgFromString(hTable, 'LDC', 'integer', 0);
arg.PassByType = 'RTW_PASSBY_POINTER';
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

```

```

%% Add the entry to the table
addEntry(hTable, hEntry);

```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_blas
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file with these specifications:

```

function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for matrix multiplication for Mathworks Blas code';
this(1).TableList = {'crl_table_blas.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end

```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

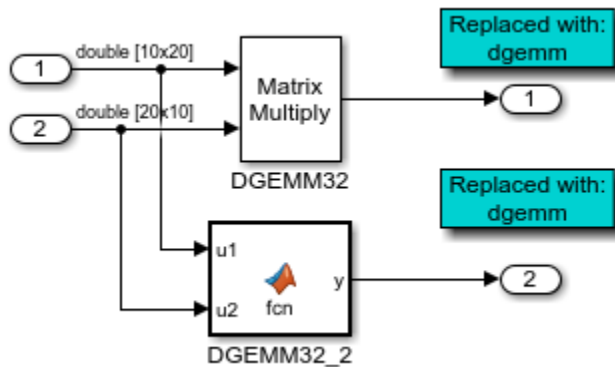

## Convert a Matrix Multiplication Operation to MathWorks BLAS Through Code Replacement

In this section, you generate code using the code replacement library that you created in the first two sections of this example. A floating-point matrix/matrix multiplication operation is replaced with a custom multiplication function `dgemm` in the generated code. This example does not provide an implementation function. Write your own implementation.

### Example Model

Open the model `crl_blas` for configuring the code replacement library.

```
open_system('crl_blas');
copyfile BlasTargetInfo.txt rtwTargetInfo.m
```

Run the MATLAB customization file to create a code replacement table and register the file. The customization file has already been executed. Run the `sl_refresh_customizations` function to register the library.

```
sl_refresh_customizations;
```

### Enable Code Replacement Library

- 1 Open the Configuration Parameters dialog box.
- 2 On the **Interface** pane, set **Code Replacement Library** by clicking **Select** and adding CRL for matrix multiplication for Mathworks Blas code to the **Selected code replacement libraries - prioritized** list pane. Alternatively, use the command-line API to enable the code replacement:

```
set_param('crl_blas', 'CodeReplacementLibrary', 'CRL for matrix multiplication for Mathworks Blas');
```

Generate code from the model:

```
evalc('slbuild(''crl_blas'')');
```

View the generated code. Here is a portion of `crl_blas.c`.

```
cfile = fullfile('crl_blas_ert_rtw','crl_blas.c');
rtwdemodbtype(cfile,'/* Model step function ','/* Model initialize function',1, 1);

/* Model step function */
void crl_blas_step(void)
{
 real_T ALPHA;
 real_T BETA;
 int32_T K;
 int32_T LDA;
 int32_T LDB;
 int32_T LDC;
 int32_T M;
 int32_T N;
 char_T TRANSA;
```

```

char_T TRANSB;

/* Product: '<Root>/DGEMM32' */
TRANSA = 'N';
TRANSB = 'N';
M = 10;
N = 10;
K = 20;
ALPHA = 1.0;
LDA = 10;
LDB = 20;
BETA = 0.0;
LDC = 10;

/* Outport: '<Root>/Out1' incorporates:
 * Inport: '<Root>/In1'
 * Inport: '<Root>/In2'
 * Product: '<Root>/DGEMM32'
 */
dgemm32(&TRANSA, &TRANSB, &M, &N, &K, &ALPHA, &rtU.In1[0], &LDA, &rtU.In2[0],
 &LDB, &BETA, &rtY.Out1[0], &LDC);

/* MATLAB Function: '<Root>/DGEMM32_2' */
/* MATLAB Function 'DGEMM32_2': '<S1>:1' */
/* '<S1>:1:5' */
TRANSA = 'N';
TRANSB = 'N';

/* Outport: '<Root>/Out7' incorporates:
 * Inport: '<Root>/In1'
 * Inport: '<Root>/In2'
 * MATLAB Function: '<Root>/DGEMM32_2'
 */
dgemm32(&TRANSA, &TRANSB, &M, &N, &K, &ALPHA, &rtU.In1[0], &LDA, &rtU.In2[0],
 &LDB, &BETA, &rtY.Out7[0], &LDC);
}

```

The matrix/matrix multiplication operation is replaced with the custom `dgemm32` function.

Close the model and code generation report.

```

delete ./rtwTargetInfo.m
bdclose('crl_blas');
rtwdemoclean;

```

## Matrix Multiplication Operation to ANSI/ISO C BLAS Code Replacement

You can develop a code replacement library for floating-point matrix/matrix and matrix/vector multiplication operations with the multiplication functions `sgemm` defined in the MathWorks C BLAS library. Use a third-party C BLAS library for replacement and change the build requirements in this example to point to your library. To develop a code replacement library use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 72-20.

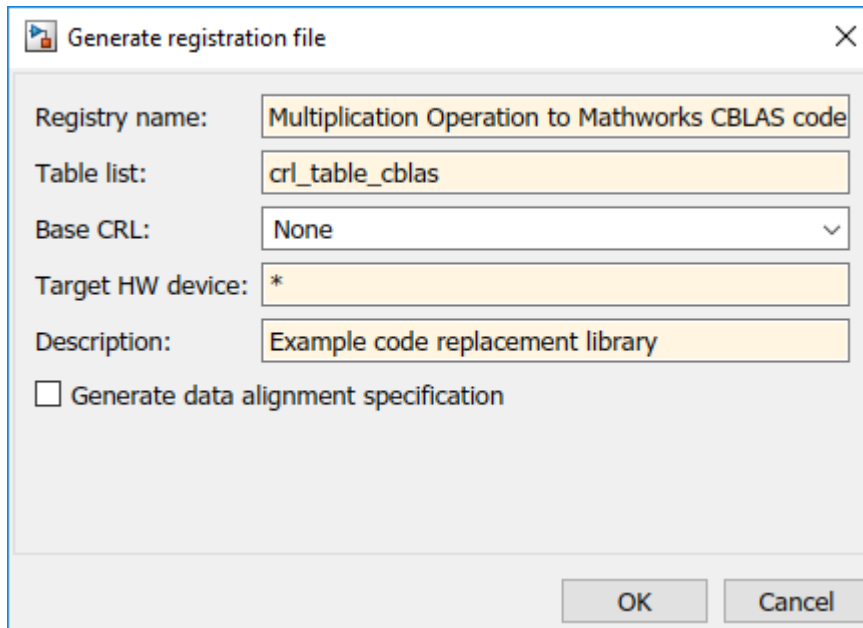

### Interactively Develop a Code Replacement Library

- 1 Open the **Code Replacement Tool** (`crtool`), from the MATLAB command line with the following command:  

```
>>crtool
```
- 2 Create a table.
  - a From the `crtool` context menu, select **File > New Table**.
  - b In the right pane, name the table `cr1_table_cblas`. Click **Apply**.
- 3 Create an entry. From the `crtool` context menu, select **File > New entry > CBlas Operation (Atlas)**.
- 4 Create entry parameters. In the **Function** drop-down list, select **Multiply**.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the `crtool`, specify the return argument, `y1`, and the input argument, `u1` and `u2` with the **Data Type** of `single` and the **Argument Type** of `Matrix`.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box. Set the **BLAS level** to `3(Vector)`.  
  
Specify a **Name** for the replacement function under **Function prototype**.
- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. In the **Mapping Information** tab, click **Validate entry**. In the `crtool` context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
  - a Create a function to call your code replacement library table. The function should not have arguments and return a table object.
  - b Create a table object by calling `RTW.TfTable`.

```
function hTable = crl_table_cblas
% Create a function to call the code replacement library table
```

```
%% Create a table object
hTable = RTW.TfTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TfCblasEntryGenerator`.

```
function hTable = crl_table_cblas
% Create a code replacement library table
```

```
%% Create a table object
hTable = RTW.TfTable;
```

```
%% Create an entry
```

```

%%% Define library path Cblas library file%%%
LibPath = fullfile('<Specify the path of your cblas library>');

if ispc
 libExt = 'lib';
elseif ismac
 libExt = 'dylib';
else
 libExt = 'so';
end

```

```

% Create table entry for dgemm32
hEntry = RTW.TfLCLblasEntryGenerator;

```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTfLCLFunctionEntryParameters`.

```

function hTable = crl_table_cblas
% Create a code replacement library table

%% Create a table object
hTable = RTW.TfLTable;

%% Create an entry
%%% Define library path Cblas library file%%%
LibPath = fullfile('<Specify the path of your cblas library>');

if ispc
 libExt = 'lib';
elseif ismac
 libExt = 'dylib';
else
 libExt = 'so';
end

% Create table entry for dgemm32
hEntry = RTW.TfLCLblasEntryGenerator;

%% Create entry parameters
hEntry.setTfLCLOperationEntryParameters(...
 'Key', 'RTW_OP_MUL', ...
 'Priority', 100, ...
 'ImplementationName', 'cblas_sgemm', ...
 'ImplementationSourceFile', 'ccblas.c', ...
 'ImplementationHeaderFile', 'ccblas.h', ...
 'AdditionalIncludePaths', {LibPath}, ...
 'AdditionalLinkObjs', {'libcblas' libExt}, ...
 'AdditionalLinkFlags', {'-lgfortran'}, ...
 'SideEffects', true);

```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `createAndAddConceptualArg`. To specify a matrix argument in the function call, use the argument class `RTW.TfLArgMatrix` and specify the base type and the dimensions for which the argument is valid. This type of table entry supports a range of dimensions specified in the format `[Dim1Min Dim2Min ... DimNMin; Dim1Max Dim2Max ... DimNMax]`. For example, `[2 2; inf inf]` means a two-dimensional matrix of size 2x2 or larger.

```

function hTable = crl_table_cblas
% Create a code replacement library table

%% Create a table object
hTable = RTW.TfLTable;

%% Create an entry
%%% Define library path Cblas library file%%%
LibPath = fullfile('<Specify the path of your cblas library>');

if ispc
 libExt = 'lib';
elseif ismac
 libExt = 'dylib';
else
end

```

```

 libExt = 'so';
end

% Create table entry for dgemm32
hEntry = RTW.TfLCBlasEntryGenerator;

%% Create entry parameters
hEntry.setTfLCOperationEntryParameters(...
 'Key', 'RTW_OP_MUL', ...
 'Priority', 100, ...
 'ImplementationName', 'cblas_sgemm', ...
 'ImplementationSourceFile', 'ccblas.c', ...
 'ImplementationHeaderFile', 'ccblas.h', ...
 'AdditionalIncludePaths', {LibPath}, ...
 'AdditionalLinkObjs', {['libcblas' libExt]}, ...
 'AdditionalLinkFlags', { '-lgfortran'}, ...
 'SideEffects', true);

%% Create the conceptual representation
arg = RTW.TfLArgMatrix('y1', 'RTW_IO_OUTPUT', 'single');
arg.DimRange = [2 2; Inf Inf];
hEnt.addConceptualArg(arg);

arg = RTW.TfLArgMatrix('u1', 'RTW_IO_INPUT', 'single');
arg.DimRange = [2 1; Inf Inf];
hEnt.addConceptualArg(arg);

arg = RTW.TfLArgMatrix('u2', 'RTW_IO_INPUT', 'single');
arg.DimRange = [1 2; Inf Inf];
hEnt.addConceptualArg(arg);

```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function `getTfLArgFromString`. The example code configures special implementation arguments that are required for `dgemm` and `dgemv` function replacements. The convenience methods `setReturn` and `addArgument` specify whether an argument is a return value or argument and adds the argument to the entry's array of implementation arguments. Add the complete entry to the table by calling the function `addEntry`.

```

function hTable = crl_table_cblas
% Create a code replacement library table

%% Create a table object
hTable = RTW.TfLTable;

%% Create an entry
%%
LibPath = fullfile('<Specify the path of your cblas library>');

if ispc
 libExt = 'lib';
elseif ismac
 libExt = 'dylib';
else
 libExt = 'so';
end

% Create table entry for dgemm32
hEntry = RTW.TfLCBlasEntryGenerator;

%% Create entry parameters
hEntry.setTfLCOperationEntryParameters(...
 'Key', 'RTW_OP_MUL', ...
 'Priority', 100, ...
 'ImplementationName', 'cblas_sgemm', ...
 'ImplementationSourceFile', 'ccblas.c', ...
 'ImplementationHeaderFile', 'ccblas.h', ...
 'AdditionalIncludePaths', {LibPath}, ...
 'AdditionalLinkObjs', {['libcblas' libExt]}, ...
 'AdditionalLinkFlags', { '-lgfortran'}, ...
 'SideEffects', true);

%% Create the conceptual representation

```

```

arg = RTW.TfLArgMatrix('y1', 'RTW_IO_OUTPUT', 'single');
arg.DimRange = [2 2; Inf Inf];
hEnt.addConceptualArg(arg);

arg = RTW.TfLArgMatrix('u1', 'RTW_IO_INPUT', 'single');
arg.DimRange = [2 1; Inf Inf];
hEnt.addConceptualArg(arg);

arg = RTW.TfLArgMatrix('u2', 'RTW_IO_INPUT', 'single');
arg.DimRange = [1 2; Inf Inf];
hEnt.addConceptualArg(arg);

%% Create the Implementation Representation
% Using RTW.TfLCBlasEntryGenerator for sgemm requires the following
% implementation signature:
%
% void no_name(const integer ORDER, const integer TRANSA, const integer TRANSB,
% const integer M, const integer N, const integer K, const double ALPHA,
% const double* u1, const integer LDA, const double* u2, const integer LDB,
% const double BETA, double* y1, const integer LDC);
%
% When a match occurs, the code generator computes the
% values for M, N, K, LDA, LDB, and LDC and inserts them into the
% generated code. TRANSA and TRANSB are set to 'N'.

% Specify replacement function signature
arg = hEntry.getTfLArgFromString('y2', 'void');
arg.IOType = 'RTW_IO_OUTPUT';
hEntry.Implementation.setReturn(arg);

arg = hEntry.getTfLArgFromString('ORDER', 'integer', 102.00000000000000);
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTfLArgFromString('TRANSA', 'integer', 111.00000000000000);
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTfLArgFromString('TRANSB', 'integer', 111.00000000000000);
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTfLArgFromString('M', 'integer', 0.00000000000000);
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTfLArgFromString('N', 'integer', 0.00000000000000);
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTfLArgFromString('K', 'integer', 0.00000000000000);
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTfLArgFromString('ALPHA', 'double', 1.00000000000000);
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTfLArgFromString('u1', 'single*');
arg.Type.BaseType.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTfLArgFromString('LDA', 'integer', 0.00000000000000);
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTfLArgFromString('u2', 'single*');
arg.Type.BaseType.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTfLArgFromString('LDB', 'integer', 0.00000000000000);
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTfLArgFromString('BETA', 'double', 0.00000000000000);
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTfLArgFromString('y1', 'single*');
arg.IOType = 'RTW_IO_OUTPUT';
hEntry.Implementation.addArgument(arg);

```

```
arg = hEntry.getTflArgFromString('LDC','integer',0.0000000000000000);
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);
```

```
%% Add the entry to the table
addEntry(hTable, hEntry);
```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = cml_table_cblas
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file with these specifications:

```
function rtwTargetInfo(cm)
cm.registerTargetInfo(@loc_register_cml);
end

function this = loc_register_cml

this(1) = RTW.TflRegistry;
this(1).Name = 'CML for matrix multiplication for Mathworks Cblas code';
this(1).TableList = {'cml_table_cblas.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end
```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>cml_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Small Matrix Operation to Processor Code Replacement

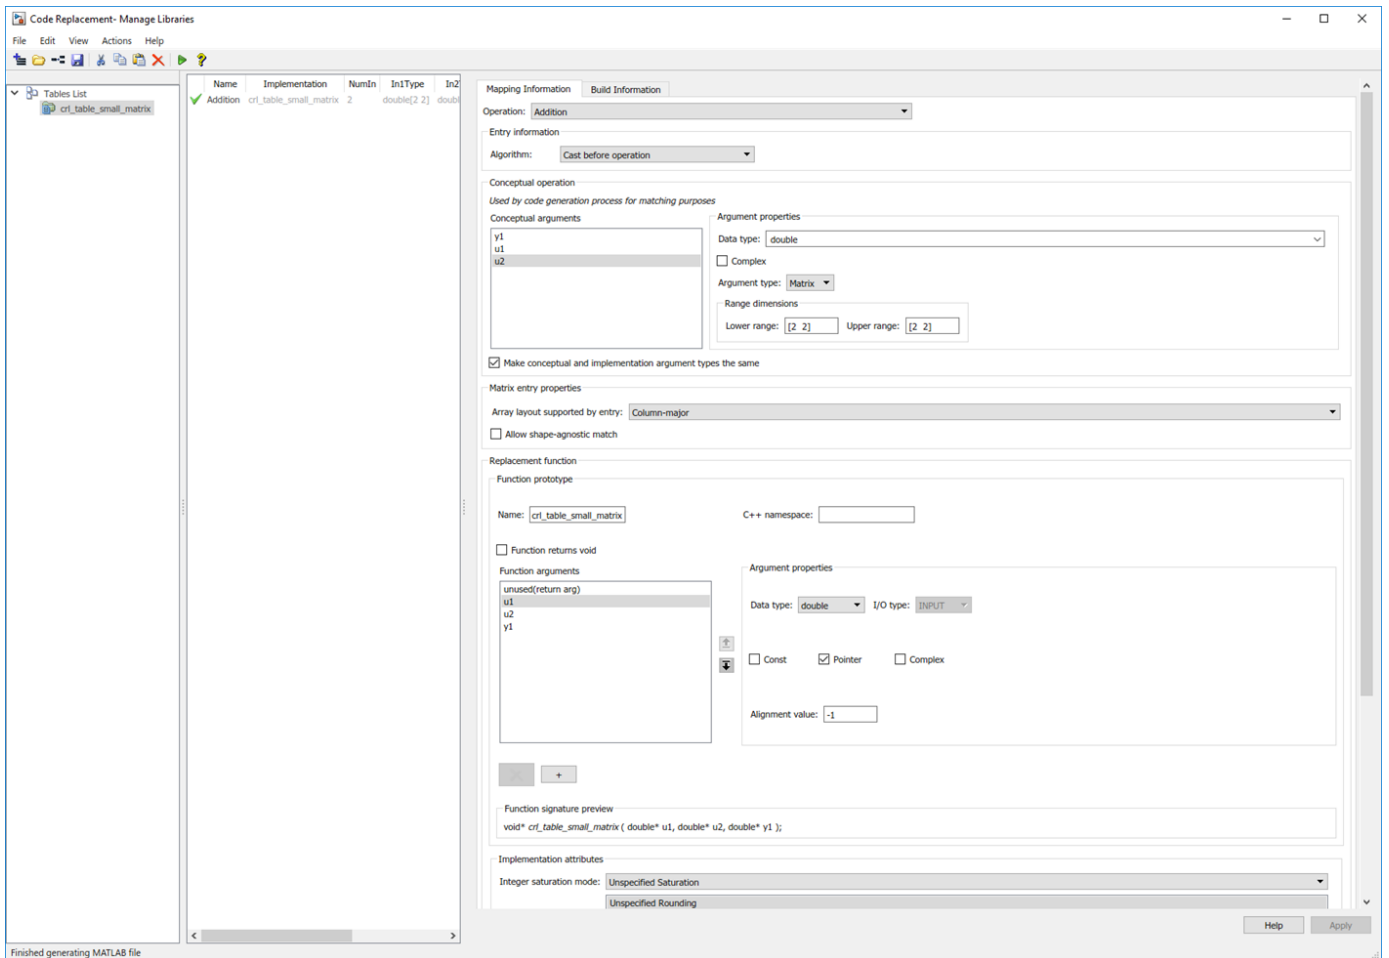

This example shows how to develop a code replacement library to optimize the performance of non-scalar small matrix operations with processor-specific intrinsic functions by providing information on how to define code replacement for a **addition** operator. To develop a code replacement library use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 72-20.

### Interactively Develop a Code Replacement Library

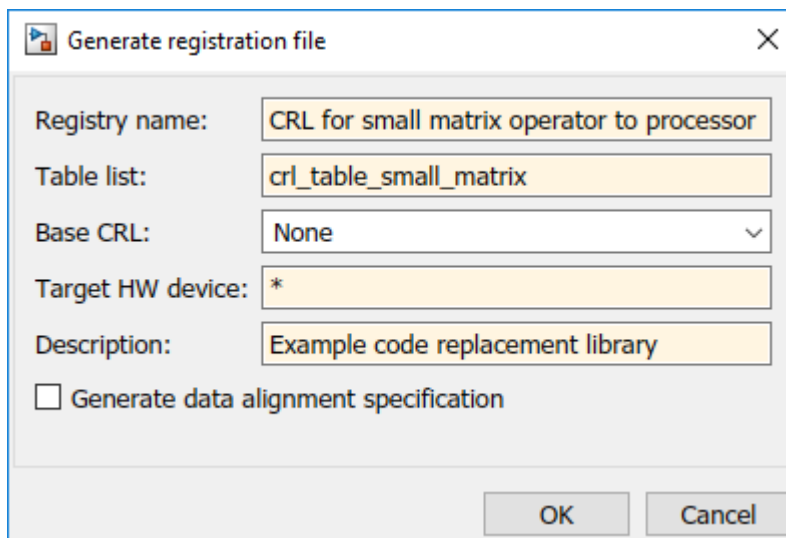

- 1 Open the **Code Replacement Tool** (crtool), from the MATLAB command line with the following command:
 

```
>>crtool
```
- 2 Create a table.
  - a From the crtool context menu, select **File > New Table**.
  - b In the right pane, name the table `cr1_table_small_matrix`. Click **Apply**.
- 3 Create an entry. From the crtool context menu, select **File > New entry > Math Operation**.
- 4 Create entry parameters. In the **Function** drop-down list, select **Addition**. Algorithm information appears in the crtool. For this example, select the parameter to **Cast before operation**.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, `y1`, with the **Data Type** of `double` and the **Argument Type** of `Matrix`, the input argument, `u1` with the **Data Type** of `double` and the **Argument Type** of `Matrix` and the input argument, `u2` with the **Data Type** of `double` and the **Argument Type** of `Matrix`.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box. Specify the return argument `y1`, `u1` and `u2`, with the **Data Type** of `double` and select the **Pointer** dialog box.
 

Specify a **Name** for the replacement function under **Function prototype**.
- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. In the **Mapping Information** tab, click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
  - a Create a function with the name of your code replacement library table that does not have arguments and returns a table object. You can use this function to call your code replacement library table.
  - b Create a table object by calling `RTW.TflTable`.

```
function hTable = crl_table_small_matrix_operator()
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
LibPath= fullfile(matlabroot, 'examples', 'coder');
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TflCOperationEntry`.

```
function hTable = crl_table_small_matrix_operator()
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
LibPath= fullfile(matlabroot, 'examples', 'coder');
```

```
%% Create an entry
hEntry = RTW.TflCOperationEntry;
```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTflCOperationEntryParameters`.

```
function hTable = crl_table_small_matrix_operator()
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
LibPath= fullfile(matlabroot, 'examples', 'coder');
```

```
%% Create an entry
hEntry = RTW.TflCOperationEntry;
```

```
%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
 'Key', 'RTW_OP_ADD', ...
```

```

 'Priority', 30, ...
 'SaturationMode', 'RTW_WRAP_ON_OVERFLOW', ...
 'ImplementationName', 'matrix_sum_2x2_double', ...
 'ImplementationHeaderFile', 'MatrixMath.h', ...
 'ImplementationSourceFile', 'MatrixMath.c', ...
 'ImplementationHeaderPath', LibPath, ...
 'ImplementationSourcePath', LibPath, ...
 'AdditionalIncludePaths', {LibPath}, ...
 'GenCallback', 'RTW.copyFileToBuildDir', ...
 'SideEffects', true);

```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `createAndAddConceptualArg`.

```

function hTable = cml_table_small_matrix_operator()
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
LibPath= fullfile(matlabroot, 'examples', 'coder');

%% Create an entry
hEntry = RTW.TflCOperationEntry;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
 'Key', 'RTW.OP_ADD', ...
 'Priority', 30, ...
 'SaturationMode', 'RTW_WRAP_ON_OVERFLOW', ...
 'ImplementationName', 'matrix_sum_2x2_double', ...
 'ImplementationHeaderFile', 'MatrixMath.h', ...
 'ImplementationSourceFile', 'MatrixMath.c', ...
 'ImplementationHeaderPath', LibPath, ...
 'ImplementationSourcePath', LibPath, ...
 'AdditionalIncludePaths', {LibPath}, ...
 'GenCallback', 'RTW.copyFileToBuildDir', ...
 'SideEffects', true);

%% Create the conceptual representation
createAndAddConceptualArg(hEntry, 'RTW.TflArgMatrix', ...
 'Name', 'y1', ...
 'IOType', 'RTW_IO_OUTPUT', ...
 'BaseType', 'double', ...
 'DimRange', [2 2]);
createAndAddConceptualArg(hEntry, 'RTW.TflArgMatrix', ...
 'Name', 'u1', ...
 'BaseType', 'double', ...
 'DimRange', [2 2]);
createAndAddConceptualArg(hEntry, 'RTW.TflArgMatrix', ...
 'Name', 'u2', ...
 'BaseType', 'double', ...
 'DimRange', [2 2]);

```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function `getTflArgFromString`.

```

function hTable = crl_table_small_matrix_operator()
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
LibPath= fullfile(matlabroot,'examples','coder');

%% Create an entry
hEntry = RTW.TflCOperationEntry;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
 'Key', 'RTW_OP_ADD', ...
 'Priority', 30, ...
 'SaturationMode', 'RTW_WRAP_ON_OVERFLOW', ...
 'ImplementationName', 'matrix_sum_2x2_double', ...
 'ImplementationHeaderFile', 'MatrixMath.h', ...
 'ImplementationSourceFile', 'MatrixMath.c', ...
 'ImplementationHeaderPath', LibPath, ...
 'ImplementationSourcePath', LibPath, ...
 'AdditionalIncludePaths', {LibPath}, ...
 'GenCallback', 'RTW.copyFileToBuildDir', ...
 'SideEffects', true);

%% Create the conceptual representation
createAndAddConceptualArg(hEntry, 'RTW.TflArgMatrix', ...
 'Name', 'y1', ...
 'IOType', 'RTW_IO_OUTPUT', ...
 'BaseType', 'double', ...
 'DimRange', [2 2]);
createAndAddConceptualArg(hEntry, 'RTW.TflArgMatrix',...
 'Name', 'u1', ...
 'BaseType', 'double', ...
 'DimRange', [2 2]);
createAndAddConceptualArg(hEntry, 'RTW.TflArgMatrix',...
 'Name', 'u2', ...
 'BaseType', 'double', ...
 'DimRange', [2 2]);

%% Create the Implementation Representation
arg = getTflArgFromString(hTable, 'y2', 'void');
arg.IOType = 'RTW_IO_OUTPUT';
hEntry.Implementation.setReturn(arg);

arg = getTflArgFromString(hTable, 'u1', ['double' '*']);
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'u2', ['double' '*']);
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'y1', ['double' '*']);

arg.IOType = 'RTW_IO_OUTPUT';
hEntry.Implementation.addArgument(arg);

```

```
%% Add the entry to the table
hTable.addEntry(hEntry);
```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_small_matrix
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file (a new function file) with these specifications:

```
function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for small matrix operator to processor';
this(1).TableList = {'crl_table_small_matrix.m'};
% table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end
```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Generate Code to Optimize Performance of a Small Matrix Operation for Processor-Specific Intrinsic Function

In this section, you generate code using the code replacement library that you created in the first two sections of this example. A nonscalar small matrix multiplication operation is replaced with a call to a custom function in the generated code. This example does not provide an implementation of the custom function. Write your own implementation.

### Example Model

Open the model `crl_SmallMatrixOperation` for configuring the code replacement library.

```
open_system('crl_SmallMatrixOperation');
copyfile SmallMatrixOperatorTargetInfo.txt rtwTargetInfo.m
```

Copyright 2007-2020 The MathWorks, Inc.

Run the MATLAB® customization file to create a code replacement table and register the file. The customization file has already been executed. Run the `sl_refresh_customizations` function to register the library.

```
sl_refresh_customizations;
```

### Enable Code Replacement Library

- 1 Open the Configuration Parameters dialog box.
- 2 On the **Interface** pane, set **Code Replacement Library** by clicking **Select** and adding CRL for `small matrix operator` to the **Selected code replacement libraries - prioritized** list pane. Alternatively, use the command-line API to enable the code replacement:

```
set_param('crl_SmallMatrixOperation', 'CodeReplacementLibrary', 'CRL for small matrix operator')
```

Generate code from the model:

```
evalc('slbuild(''crl_SmallMatrixOperation'')');
```

View the generated code. Here is a portion of `crl_SmallMatrixOperation.c`.

```
cfile = fullfile('crl_SmallMatrixOperation_ert_rtw','crl_SmallMatrixOperation.c');
rtwdemodbtype(cfile,'/* Model step function ','/* Model initialize function',1, 1);

/* Model step function */
void crl_SmallMatrixOperation_step(void)
{
 /* Outport: '<Root>/Out1' incorporates:
 * Inport: '<Root>/In1'
 * Inport: '<Root>/In2'
 * Sum: '<Root>/Add'
 */
 matrix_sum_2x2_double(&crl_SmallMatrixOperation_U.In1[0],
 &crl_SmallMatrixOperation_U.In2[0],
 &crl_SmallMatrixOperation_Y.Out1[0]);
}
```

The matrix multiplication operation on 2X2 matrices are replaced with the `matrix_sum_2x2_double` function.

Close the model and code generation report.

```
delete ./rtwTargetInfo.m
bdclose('crl_SmallMatrixOperation');
rtwdemoclean;
```

## Remap Operator Output to Function Input

If your generated code must meet a specific coding pattern or you want more flexibility, for example, to further improve performance, you can remap operator outputs to input positions in an implementation function argument list.

---

**Note** Remapping outputs to implementation function inputs is supported only for operator replacement.

---

For example, for a sum operation, the code generator produces code similar to:

```
add8_Y.Out1 = u8_add_u8_u8(add8_U.In1, add8_U.In2);
```

If you remap the output to the first input, the code generator produces code similar to:

```
u8_add_u8_u8(&add8_Y.Out1;, add8_U.In1, add8_U.In2);
```

The following table definition file for a sum operation remaps operator output y1 as the first function input argument.

- 1 Create a table definition file that contains a function definition. For example:

```
function hTable = crl_table_add_uint8
```

- 2 Within the function body, create the table by calling the function `RTW.TflTable`.

```
hTable = RTW.TflTable;
```

- 3 Create an entry for the operator mapping with a call to the `RTW.TflCOperationEntry` function.

```
% Create operation entry
op_entry = RTW.TflCOperationEntry;
```

- 4 Set operator entry parameters with a call to the `setTflCOperationEntryParameters` function. In the function call, set the property `SideEffects` to `true`.

```
setTflCOperationEntryParameters(op_entry, ...
 'Key', 'RTW_OP_ADD', ...
 'Priority', 90, ...
 'ImplementationName', 'u8_add_u8_u8', ...
 'ImplementationHeaderFile', 'u8_add_u8_u8.h', ...
 'ImplementationSourceFile', 'u8_add_u8_u8.c', ...
 'SideEffects', true);
```

- 5 Create conceptual arguments y1, u1, and u2. There are multiple ways to set up the conceptual arguments. This example uses calls to the `getTflArgFromString` and `addConceptualArg` functions to create and add the arguments.

```
arg = getTflArgFromString(hTable, 'y1', 'uint8');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(op_entry, arg);
```

```
arg = getTflArgFromString(hTable, 'u1', 'uint8');
addConceptualArg(op_entry, arg);
```

```
arg = getTflArgFromString(hTable, 'u2', 'uint8');
addConceptualArg(op_entry, arg);
```

- 6 Create the implementation arguments. There are multiple ways to set up the implementation arguments. This example uses calls to the `getTflArgFromString` function to create the

arguments. When defining the implementation function return argument, create a new `void` output argument, for example, `y2`. When defining the implementation function argument for the conceptual output argument (`y1`), set the operator output argument as an additional input argument. Mark its `IOType` as output. Make its type a pointer type. The convenience methods `setReturn` and `addArgument` specify whether an argument is a return value or argument and adds the argument to the entry's array of implementation arguments.

```
% Create new void output y2
arg = getTflArgFromString(hTable, 'y2', 'void');
arg.IOType = 'RTW_IO_OUTPUT';
op_entry.Implementation.setReturn(arg);

% Set y1 as first input arg, mark IOType as output, and use pointer type
arg=getTflArgFromString(hTable, 'y1', 'uint8*');
arg.IOType = 'RTW_IO_OUTPUT';
op_entry.Implementation.addArgument(arg);

arg=getTflArgFromString(hTable, 'u1', 'uint8');
op_entry.Implementation.addArgument(arg);

arg=getTflArgFromString(hTable, 'u2', 'uint8');
op_entry.Implementation.addArgument(arg);
```

- 7 Add the entry to a code replacement table with a call to the `addEntry` function.

```
addEntry(hTable, op_entry);
```

- 8 Save the table definition file. Use the name of the table definition function to name the file.

To test this example:

- 1 Register the code replacement mapping.
- 2 Create a model that includes an Add block.

- 3 Configure the model with the following settings:
  - On the **Solver** pane, select a fixed-step solver.
  - On the **Code Generation** pane, select an ERT-based system target file.
  - On the **Code Generation > Interface** pane, select the code replacement library that contains your addition operation entry.
  - Set the **Optimize global data access** parameter to Use global to hold temporary results to reduce data copies in the generated code.
- 4 Generate code and a code generation report.
- 5 Review the code replacements.

## Fixed-Point Operator Code Replacement

If you have a Fixed-Point Designer license, you can define fixed-point operator code replacement entries to match:

- A binary-point-only scaling combination on the operator inputs and output.
- A slope bias scaling combination on the operator inputs and output.
- Relative scaling or net slope between multiplication or division operator inputs and output. Use one of these methods to map a range of slope and bias values to a replacement function for multiplication or division.
- Equal slope and zero net bias across addition or subtraction operator inputs and output. Use this method to disregard specific slope and bias values and map relative slope and bias values to a replacement function for addition or subtraction.

### Common Ways to Match Fixed-Point Operator Entries

The following table maps common ways to match fixed-point operator code replacement entries with the associated fixed-point parameters that you specify in a code replacement table definition file.

Match	Create entry	Minimally specify parameters
A specific binary-point-only scaling combination on the operator inputs and output.	RTW.Tf1COperationEntry	createAndAddConceptualArg function: <ul style="list-style-type: none"> <li>• CheckSlope: Specify the value true.</li> <li>• CheckBias: Specify the value true.</li> <li>• DataTypeMode (or DataType/Scaling equivalent): Specify fixed-point binary-point-only scaling.</li> <li>• FractionLength: Specify a fraction length (for example, 3).</li> </ul>
A specific slope bias scaling combination on the operator inputs and output.	RTW.Tf1COperationEntry	createAndAddConceptualArg function: <ul style="list-style-type: none"> <li>• CheckSlope: Specify the value true.</li> <li>• CheckBias: Specify the value true.</li> <li>• DataTypeMode (or DataType/Scaling equivalent): Specify fixed-point [slope bias] scaling.</li> <li>• Slope (or SlopeAdjustmentFactor/ - FixedExponent equivalent): Specify a slope value (for example, 15).</li> <li>• Bias: Specify a bias value (for example, 2).</li> </ul>

Match	Create entry	Minimally specify parameters
Net slope between operator inputs and output (multiplication and division).	RTW.TfLCOperationEntry-Generator_NetSlope	setTfLCOperationEntryParameters function: <ul style="list-style-type: none"> <li>• NetSlopeAdjustmentFactor: Specify the slope adjustment factor (F) part of the net slope, <math>F2^E</math> (for example, 1.0).</li> <li>• NetFixedExponent: Specify the fixed exponent (E) part of the net slope, <math>F2^E</math> (for example, -3.0).</li> </ul> createAndAddConceptualArg function: <ul style="list-style-type: none"> <li>• CheckSlope: Specify the value false.</li> <li>• CheckBias: Specify the value false.</li> <li>• DataType: Specify the value 'Fixed'.</li> </ul>
Relative scaling between operator inputs and output (multiplication and division).	RTW.TfLCOperationEntry-Generator	setTfLCOperationEntryParameters function: <ul style="list-style-type: none"> <li>• RelativeScalingFactorF: Specify the slope adjustment factor (F) part of the relative scaling factor, <math>F2^E</math> (for example, 1.0).</li> <li>• RelativeScalingFactorE: Specify the fixed exponent (E) part of the relative scaling factor, <math>F2^E</math> (for example, -3.0).</li> </ul> createAndAddConceptualArg function: <ul style="list-style-type: none"> <li>• CheckSlope: Specify the value false.</li> <li>• CheckBias: Specify the value false.</li> <li>• DataType: Specify the value 'Fixed'.</li> </ul>
Equal slope and zero net bias across operator inputs and output (addition and subtraction).	RTW.TfLCOperationEntry-Generator	setTfLCOperationEntryParameters function: <ul style="list-style-type: none"> <li>• SlopesMustBeTheSame: Specify the value true.</li> <li>• MustHaveZeroNetBias: Specify the value true.</li> </ul> createAndAddConceptualArg function: <ul style="list-style-type: none"> <li>• CheckSlope: Specify the value false.</li> <li>• CheckBias: Specify the value false.</li> </ul>

## Fixed-Point Numbers and Arithmetic

Fixed-point numbers use integers and integer arithmetic to represent real numbers and arithmetic with the following encoding scheme:

$$V = \tilde{V} = SQ + B$$

- $V$  is an arbitrarily precise real-world value.
- $\tilde{V}$  is the approximate real-world value that results from fixed-point representation.
- $Q$  is an integer that encodes  $\tilde{V}$ , referred to as the quantized integer.
- $S$  is a coefficient of  $Q$ , referred to as the slope.
- $B$  is an additive correction, referred to as the bias.

The general equation for an operation between fixed-point operands is:

$$(S_0Q_0 + B_0) = (S_1Q_1 + B_1) < op > (S_2Q_2 + B_2)$$

The objective of fixed-point operator replacement is to replace an operator that accepts and returns fixed-point or integer inputs and output with a function that accepts and returns built-in C numeric data types. The following sections provide additional programming information for each supported operator.

## Addition

The operation  $V_0 = V_1 + V_2$  implies that

$$Q_0 = \left(\frac{S_1}{S_0}\right)Q_1 + \left(\frac{S_2}{S_0}\right)Q_2 + \left(\frac{B_1 + B_2 - B_0}{S_0}\right)$$

If an addition replacement function is defined such that the scaling on the operands and sum are equal and the net bias

$$\left(\frac{B_1 + B_2 - B_0}{S_0}\right)$$

is zero (for example, a function `s8_add_s8_s8` that adds two signed 8-bit values and produces a signed 8-bit result), then the operator entry must set the operator entry parameters `SlopesMustBeTheSame` and `MustHaveZeroNetBias` to `true`. To match for replacement, the slopes must be the same for all addition conceptual arguments. (For parameter descriptions, see the reference page for the function `setTfLCOperationEntryParameters`.)

## Subtraction

The operation  $V_0 = V_1 - V_2$  implies that

$$Q_0 = \left(\frac{S_1}{S_0}\right)Q_1 - \left(\frac{S_2}{S_0}\right)Q_2 + \left(\frac{B_1 - B_2 - B_0}{S_0}\right)$$

If a subtraction replacement function is defined such that the scaling on the operands and difference are equal and the net bias

$$\left(\frac{B_1 - B_2 - B_0}{S_0}\right)$$

is zero (for example, a function `s8_sub_s8_s8` that subtracts two signed 8-bit values and produces a signed 8-bit result), then the operator entry must set the operator entry parameters

`SlopesMustBeTheSame` and `MustHaveZeroNetBias` to `true`. To match for replacement, the slopes must be the same for all subtraction conceptual arguments. (For parameter descriptions, see the reference page for the function `setTfLCOperationEntryParameters`.)

## Multiplication

There are different ways to specify multiplication replacements. The most direct way is to specify an exact match of the input and output types. This is feasible if a model contains only a few known slope and bias combinations. Use the `TfLCOperationEntry` class and specify the exact values of slope and bias on each argument. For scenarios where there are numerous slope/bias combinations, it is not feasible to specify each value with a different entry. Use a net slope entry or create a custom entry.

The operation  $V_0 = V_1 * V_2$  implies, for binary-point-only scaling, that

$$S_0 Q_0 = (S_1 Q_1)(S_2 Q_2)$$

$$Q_0 = \left( \frac{S_1 S_2}{S_0} \right) Q_1 Q_2$$

$$Q_0 = S_n Q_1 Q_2$$

where  $S_n$  is the net slope.

It is common to replace all multiplication operations that have a net slope of 1.0 with a function that performs C-style multiplication. For example, to replace all signed 8-bit multiplications that have a net scaling of 1.0 with the `s8_mul_s8_u8` replacement function, the operator entry must define a net slope factor,  $F2^E$ . You specify the values for  $F$  and  $E$  using operator entry parameters `NetSlopeAdjustmentFactor` and `NetFixedExponent`. For the `s8_mul_s8_u8` function, set `NetSlopeAdjustmentFactor` to 1 and `NetFixedExponent` to 0.0. Also, set the operator entry parameter `SlopesMustBeTheSame` to `false` and the parameter `MustHaveZeroNetBias` to `true`. To match for replacement, the biases must be zero for all multiplication conceptual arguments. (For parameter descriptions, see the reference page for the function `setTfLCOperationEntryParameters`.)

---

**Note** When an operator entry specifies `NetSlopeAdjustmentFactor` and `NetFixedExponent`, matching entries must have arguments with zero bias.

---

## Division

There are different ways to specify division replacements. The most direct way is to specify an exact match of the input and output types. This is feasible if a model contains only a few known slope and bias combinations. Use the `TfLCOperationEntry` class and specify the exact values of slope and bias on each argument. For scenarios where there are numerous slope/bias combinations, it is not feasible to specify each value with a different entry. Use a net slope entry or create a custom entry (see “Customize Match and Replacement Process” on page 72-132).

The operation  $V_0 = (V_1 / V_2)$  implies, for binary-point-only scaling, that

$$S_0 Q_0 = \left( \frac{S_1 Q_1}{S_2 Q_2} \right)$$

$$Q_0 = S_n \left( \frac{Q_1}{Q_2} \right)$$

where  $S_n$  is the net slope.

It is common to replace all division operations that have a net slope of 1.0 with a function that performs C-style division. For example, to replace all signed 8-bit divisions that have a net scaling of 1.0 with the `s8_mul_s8_u8_` replacement function, the operator entry must define a net slope factor,  $F2^E$ . You specify the values for  $F$  and  $E$  using operator entry parameters `NetSlopeAdjustmentFactor` and `NetFixedExponent`. For the `s16_netslope0p5_div_s16_s16` function, you would set `NetSlopeAdjustmentFactor` to 1 and `NetFixedExponent` to 0.0. Also, set the operator entry parameter `SlopesMustBeTheSame` to `false` and the parameter `MustHaveZeroNetBias` to `true`. To match for replacement, the biases must be zero for all division conceptual arguments. (For parameter descriptions, see the reference page for the function `setTfLCOperationEntryParameters`.)

---

**Note** When an operator entry specifies `NetSlopeAdjustmentFactor` and `NetFixedExponent`, matching entries must have arguments with zero bias.

---

## Data Type Conversion (Cast)

The data type conversion operation  $V_0 = V_1$  implies, for binary-point-only scaling, that

$$Q_0 = \left( \frac{S_1}{S_0} \right) Q_1$$
$$Q_0 = S_n Q_1$$

where  $S_n$  is the net slope. Set the operator entry parameter `SlopesMustBeTheSame` to `false` and the parameter `MustHaveZeroNetBias` to `true`. To match for replacement, the biases must be zero for all cast conceptual arguments. (For parameter descriptions, see the reference page for the function `setTfLCOperationEntryParameters`.)

## Shift

The shift left or shift right operation  $V_0 = (V_1 / 2^n)$  implies, for binary-point-only scaling, that

$$S_0 Q_0 = \left( \frac{S_1 Q_1}{2^n} \right)$$
$$Q_0 = \left( \frac{S_1}{S_0} \right) \left( \frac{Q_1}{2^n} \right)$$
$$Q_0 = S_n \left( \frac{Q_1}{2^n} \right)$$

where  $S_n$  is the net slope. Set the operator entry parameter `SlopesMustBeTheSame` to `false` and the parameter `MustHaveZeroNetBias` to `true`. To match for replacement, the biases must be zero for all shift conceptual arguments. (For parameter descriptions, see the reference page for the function `setTfLCOperationEntryParameters`.)

## Binary-Point-Only Scaling Code Replacement

You can define code replacement entries for operations on fixed-point data types such that they match a binary-point-only scaling combination of operator inputs and output. This example shows how to develop a code replacement library to optimize the performance of fixed point data type operations by providing information that maps a binary point scale entry to a addition operator. To develop a code replacement library use only the programmatic approach. For more information, see “Develop a Code Replacement Library” on page 72-20.

This example modifies a fixed-point addition replacement such that the implementation function passes in the fraction lengths of the input and output data types as arguments.

To create custom code replacement entries that add logic to the code replacement match and replacement process see “Customize Code Match and Replacement for Scalar Operations” on page 72-138. You can create and add three additional implementation function arguments for passing fraction lengths in the class definition or in each code replacement entry definition that instantiates this class. This example creates the arguments, adds them to a code replacement table definition file, and sets them to specific values in the class definition code.

```
classdef TflCustomOperationEntryBinaryPoint < RTW.TflCOperationEntryML
 methods
 function ent = do_match(hThis, ...
 hCS0, ... %#ok
 targetBitPerChar, ... %#ok
 targetBitPerShort, ... %#ok
 targetBitPerInt, ... %#ok
 targetBitPerLong, ... %#ok
 targetBitPerLongLong) %#ok

 % DO_MATCH - Create a custom match function. The base class
 % checks the types of the arguments prior to calling this
 % method. This class will check additional data and can
 % modify the implementation function.

 % The base class checks word size and signedness. Slopes and biases
 % have been wildcarded, so the only additional checking to do is
 % to check that the biases are zero and that there are only three
 % conceptual arguments (one output, two inputs)

 ent = []; % default the return to empty, indicating the match failed

 if length(hCS0.ConceptualArgs) == 3 && ...
 hCS0.ConceptualArgs(1).Type.Bias == 0 && ...
 hCS0.ConceptualArgs(2).Type.Bias == 0 && ...
 hCS0.ConceptualArgs(3).Type.Bias == 0

 % Modify the default implementation. Since this is a
 % generator entry, a concrete entry is created using this entry
 % as a template. The type of entry being created is a standard
 % TflCOperationEntry. Using the standard operation entry
 % provides required information, and you do not need
 % a custom match function.
 ent = RTW.TflCOperationEntry(hThis);

 % Since this entry is modifying the implementation for specific
 % fraction-length values (arguments 3, 4, and 5), the conceptual argument
 % wild cards must be removed (the wildcards were inherited from the
 % generator when it was used as a template for the concrete entry).
 % This concrete entry is now for a specific slope and bias.
 % hCS0 holds the slope and bias values (created by the code generator).
 for idx=1:3
 ent.ConceptualArgs(idx).CheckSlope = true;
 ent.ConceptualArgs(idx).CheckBias = true;

 % Set the specific Slope and Biases
 ent.ConceptualArgs(idx).Type.Slope = hCS0.ConceptualArgs(idx).Type.Slope;
 ent.ConceptualArgs(idx).Type.Bias = 0;
 end

 % Set the fraction-length values in the implementation function.
 ent.Implementation.Arguments(3).Value = ...

```

```

-1.0*hCS0.ConceptualArgs(2).Type.FixedExponent;
ent.Implementation.Arguments(4).Value = ...
-1.0*hCS0.ConceptualArgs(3).Type.FixedExponent;
ent.Implementation.Arguments(5).Value = ...
-1.0*hCS0.ConceptualArgs(1).Type.FixedExponent;
end
end
end
end

```

## Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
  - a Create a function with the name of your code replacement library table that does not have arguments and returns a table object. You can use this function to call your code replacement library table.
  - b Create a table object by calling `RTW.TflTable`.

```

function hTable = crl_table_fixed_binptscale()
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;

```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the custom entry function .

```

function hTable = crl_table_fixed_binptscale()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

```

```

%% Create an entry
hEntry = TflCustomOperationEntryBinaryPoint;

```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTflCOperationEntryParameters`.

```

function hTable = crl_table_fixed_binptscale()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = TflCustomOperationEntryBinaryPoint;

%% Create entry parameters
setTflCOperationEntryParameters(hEntry, ...
 'Key', 'RTW_OP_ADD', ...
 'Priority', 30, ...
 'SaturationMode', 'RTW_SATURATE_ON_OVERFLOW', ...
 'RoundingModes', {'RTW_ROUND_FLOOR'}, ...
 'ImplementationName', 'myFixptAdd_binarypoint', ...
 'ImplementationHeaderFile', 'myFixptAdd.h', ...
 'ImplementationSourceFile', 'myFixptAdd.c');

```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `createAndAddConceptualArg`.

```
function hTable = crl_table_fixed_binptscale()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = TflCustomOperationEntryBinaryPoint;

%% Create entry parameters
setTflCoperationEntryParameters(hEntry, ...
 'Key', 'RTW_OP_ADD', ...
 'Priority', 30, ...
 'SaturationMode', 'RTW_SATURATE_ON_OVERFLOW', ...
 'RoundingModes', {'RTW_ROUND_FLOOR'}, ...
 'ImplementationName', 'myFixptAdd_binarypoint', ...
 'ImplementationHeaderFile', 'myFixptAdd.h', ...
 'ImplementationSourceFile', 'myFixptAdd.c');

%% Create the conceptual representation
createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'y1', ...
 'IOType', 'RTW_IO_OUTPUT', ...
 'CheckSlope', false, ...
 'CheckBias', false, ...
 'DataType', 'Fixed', ...
 'Scaling', 'BinaryPoint', ...
 'IsSigned', false, ...
 'WordLength', 32);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'u1', ...
 'IOType', 'RTW_IO_INPUT', ...
 'CheckSlope', false, ...
 'CheckBias', false, ...
 'DataType', 'Fixed', ...
 'Scaling', 'BinaryPoint', ...
 'IsSigned', false, ...
 'WordLength', 32);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'u2', ...
 'IOType', 'RTW_IO_INPUT', ...
 'CheckSlope', false, ...
 'CheckBias', false, ...
 'DataType', 'Fixed', ...
 'Scaling', 'BinaryPoint', ...
 'IsSigned', false, ...
 'WordLength', 32);
```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function `createAndSetCImplementationReturn` and `createAndAddImplementationArg`. Add the complete entry to the table by calling the function `addEntry`.

```
function hTable = crl_table_fixed_binptscale()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = TflCustomOperationEntryBinaryPoint;

%% Create entry parameters
setTflCoperationEntryParameters(hEntry, ...
 'Key', 'RTW_OP_ADD', ...
 'Priority', 30, ...
 'SaturationMode', 'RTW_SATURATE_ON_OVERFLOW', ...
 'RoundingModes', {'RTW_ROUND_FLOOR'}, ...
 'ImplementationName', 'myFixptAdd_binarypoint', ...
```

```

 'ImplementationHeaderFile', 'myFixptAdd.h', ...
 'ImplementationSourceFile', 'myFixptAdd.c');

%% Create the conceptual representation
createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'y1', ...
 'IOType', 'RTW_IO_OUTPUT', ...
 'CheckSlope', false, ...
 'CheckBias', false, ...
 'DataType', 'Fixed', ...
 'Scaling', 'BinaryPoint', ...
 'IsSigned', false, ...
 'WordLength', 32);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'u1', ...
 'IOType', 'RTW_IO_INPUT', ...
 'CheckSlope', false, ...
 'CheckBias', false, ...
 'DataType', 'Fixed', ...
 'Scaling', 'BinaryPoint', ...
 'IsSigned', false, ...
 'WordLength', 32);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'u2', ...
 'IOType', 'RTW_IO_INPUT', ...
 'CheckSlope', false, ...
 'CheckBias', false, ...
 'DataType', 'Fixed', ...
 'Scaling', 'BinaryPoint', ...
 'IsSigned', false, ...
 'WordLength', 32);

%% Create the implementation Representation
% Specify replacement function signature
createAndSetImplementationReturn(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'y1', ...
 'IOType', 'RTW_IO_OUTPUT', ...
 'IsSigned', false, ...
 'WordLength', 32, ...
 'FractionLength', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'u1', ...
 'IOType', 'RTW_IO_INPUT', ...
 'IsSigned', false, ...
 'WordLength', 32, ...
 'FractionLength', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'u2', ...
 'IOType', 'RTW_IO_INPUT', ...
 'IsSigned', false, ...
 'WordLength', 32, ...
 'FractionLength', 0);

% Add 3 fraction-length args. Actual values are set during code generation.
createAndAddImplementationArg(hEntry, 'RTW.TflArgNumericConstant', ...
 'Name', 'fl_in1', ...
 'IOType', 'RTW_IO_INPUT', ...
 'IsSigned', false, ...
 'WordLength', 32, ...
 'FractionLength', 0, ...
 'Value', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumericConstant', ...
 'Name', 'fl_in2', ...
 'IOType', 'RTW_IO_INPUT', ...
 'IsSigned', false, ...
 'WordLength', 32, ...
 'FractionLength', 0, ...
 'Value', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumericConstant', ...
 'Name', 'fl_out', ...
 'IOType', 'RTW_IO_INPUT', ...
 'IsSigned', false, ...
 'WordLength', 32, ...
 'FractionLength', 0, ...
 'Value', 0);

```

```

 % Add the entry to the table
 hTable.addEntry(op_entry);

```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_fixed_binptscale
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file (a new function file) with these specifications:

```

function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for binary point scaling CRL';
this(1).TableList = {'crl_table_fixed_binptscale.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end

```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Slope Bias Scaling Code Replacement

You can define code replacement for operations on fixed-point data types as matching a slope bias scaling combination on the operator inputs and output. This example shows how to develop a code replacement library to optimize the performance of fixed point data type operations by providing information on how to define code replacement for a division operator. To develop a code replacement library use only the programmatic approach. For more information, see “Develop a Code Replacement Library” on page 72-20.

This example modifies a fixed-point addition replacement such that the implementation function passes in the fraction lengths of the input and output data types as arguments.

To create custom code replacement entries that add logic to the code replacement match and replacement process, see “Customize Code Match and Replacement for Scalar Operations” on page 72-138. You can create and add three additional implementation function arguments for passing fraction lengths in the class definition or in each code replacement entry definition that instantiates this class. This example creates the arguments, adds them to a code replacement table definition file, and sets them to specific values in the class definition code.

```
classdef TflCustomOperationEntrySlopeBias < RTW.TflCOperationEntryML
 methods
 function ent = do_match(hThis, ...
 hCS0, ... %#ok
 targetBitPerChar, ... %#ok
 targetBitPerShort, ... %#ok
 targetBitPerInt, ... %#ok
 targetBitPerLong, ... %#ok
 targetBitPerLongLong) %#ok

 % DO_MATCH - Create a custom match function. The base class
 % checks the types of the arguments prior to calling this
 % method. This class will check additional data and can
 % modify the implementation function.

 % The base class checks word size and signedness. Slopes and biases
 % have been wildcarded, so the only additional checking to do is
 % to check that the biases are zero and that there are only three
 % conceptual arguments (one output, two inputs)

 ent = []; % default the return to empty, indicating the match failed

 if length(hCS0.ConceptualArgs) == 3

 % Modify the default implementation. Since this is a
 % generator entry, a concrete entry is created using this entry
 % as a template. The type of entry being created is a standard
 % TflCOperationEntry. Using the standard operation entry
 % provides required information, and you do not need
 % a custom match function.
 ent = RTW.TflCOperationEntry(hThis);

 % Since this entry is modifying the implementation for specific
 % fraction-length values (arguments 3, 4, and 5), the conceptual argument
 % wild cards must be removed (the wildcards were inherited from the
 % generator when it was used as a template for the concrete entry).
 % This concrete entry is now for a specific slope and bias.
 % hCS0 holds the slope and bias values (created by the code generator).
 for idx=1:3
 ent.ConceptualArgs(idx).CheckSlope = true;
 ent.ConceptualArgs(idx).CheckBias = true;

 % Set the specific Slope and Biases
 ent.ConceptualArgs(idx).Type.Slope = hCS0.ConceptualArgs(idx).Type.Slope;
 ent.ConceptualArgs(idx).Type.Bias = hCS0.ConceptualArgs(idx).Type.Bias;
 end

 % Set the Slope and Bias values in the implementation function.
 ent.Implementation.Arguments(3).Value = hCS0.ConceptualArgs(2).Type.Slope;
 ent.Implementation.Arguments(4).Value = hCS0.ConceptualArgs(2).Type.Bias;
 ent.Implementation.Arguments(5).Value = hCS0.ConceptualArgs(3).Type.Slope;
 ent.Implementation.Arguments(6).Value = hCS0.ConceptualArgs(3).Type.Bias;
 end
 end
 end
end
```

```

ent.Implementation.Arguments(7).Value = hCS0.ConceptualArgs(1).Type.Slope;
ent.Implementation.Arguments(8).Value = hCS0.ConceptualArgs(1).Type.Bias;
end
end
end
end

```

## Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
  - a Create a function with the name of your code replacement library table that does not have arguments and returns a table object. You can use this function to call your code replacement library table.
  - b Create a table object by calling `RTW.TflTable`.

```

function hTable = crl_table_custom_add_ufix32_slopebias
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;

```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the custom entry function .

```

function hTable = crl_table_custom_add_ufix32_slopebias
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = TflCustomOperationEntrySlopeBias;;

```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTflCFunctionEntryParameters`.

```

function hTable = crl_table_custom_add_ufix32_slopebias
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = TflCustomOperationEntrySlopeBias;;

%% Create entry parameters
setTflCFunctionEntryParameters(hEntry, ...
 'Key', 'RTW_OP_ADD', ...
 'Priority', 30, ...
 'SaturationMode', 'RTW_SATURATE_ON_OVERFLOW', ...
 'RoundingModes', {'RTW_ROUND_FLOOR'}, ...
 'ImplementationName', 'myFixptAdd_slopebias', ...
 'ImplementationHeaderFile', 'myFixptAdd.h', ...
 'ImplementationSourceFile', 'myFixptAdd.c');

```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `createAndAddConceptualArg`.

```
function hTable = crl_table_custom_add_ufix32_slopebias
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = TflCustomOperationEntrySlopeBias;;

%% Create entry parameters
setTflCOperationEntryParameters(hEntry, ...
 'Key', 'RTW_OP_ADD', ...
 'Priority', 30, ...
 'SaturationMode', 'RTW_SATURATE_ON_OVERFLOW', ...
 'RoundingModes', {'RTW_ROUND_FLOOR'}, ...
 'ImplementationName', 'myFixptAdd_slopebias', ...
 'ImplementationHeaderFile', 'myFixptAdd.h', ...
 'ImplementationSourceFile', 'myFixptAdd.c');

%% Create the conceptual representation
createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'y1', ...
 'IOType', 'RTW_IO_OUTPUT', ...
 'CheckSlope', false, ...
 'CheckBias', false, ...
 'DataType', 'Fixed', ...
 'Scaling', 'SlopeBias', ...
 'IsSigned', false, ...
 'WordLength', 32);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'u1', ...
 'IOType', 'RTW_IO_INPUT', ...
 'CheckSlope', false, ...
 'CheckBias', false, ...

 'IsSigned', false, ...
 'WordLength', 32, ...
 'FractionLength', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'u2', ...
 'IOType', 'RTW_IO_INPUT', ...
 'IsSigned', false, ...
 'WordLength', 32, ...
 'FractionLength', 0);

% Add 6 args for slopes and biases.
% Actual values are set during code generation.
createAndAddImplementationArg(hEntry, 'RTW.TflArgNumericConstant', ...
 'Name', 'slope_in1', ...
 'IOType', 'RTW_IO_INPUT', ...
 'IsSigned', false, ...
 'WordLength', 32, ...
 'FractionLength', 0, ...
 'Value', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumericConstant', ...
 'Name', 'bias_in1', ...
 'IOType', 'RTW_IO_INPUT', ...
 'IsSigned', true, ...
 'WordLength', 32, ...
 'FractionLength', 0, ...
 'Value', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumericConstant', ...
 'Name', 'slope_in2', ...
 'IOType', 'RTW_IO_INPUT', ...
 'IsSigned', false, ...
 'WordLength', 32, ...
 'FractionLength', 0, ...
 'Value', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumericConstant', ...
 'Name', 'bias_in2', ...
 'IOType', 'RTW_IO_INPUT', ...
 'IsSigned', true, ...
 'WordLength', 32, ...
 'FractionLength', 0, ...
 'Value', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumericConstant', ...
 'Name', 'slope_out1', ...
 'IOType', 'RTW_IO_INPUT', ...
 'IsSigned', false, ...
 'WordLength', 32, ...
 'FractionLength', 0, ...
 'Value', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumericConstant', ...
 'Name', 'bias_out1', ...
 'IOType', 'RTW_IO_INPUT', ...
 'IsSigned', true, ...
 'WordLength', 32, ...
 'FractionLength', 0, ...
 'Value', 0);

addEntry(hTable, hEntry);

```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_custom_add_ufix32_slopebias
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file (a new function file) with these specifications:

```
function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for slope bias scaling function replacement';
this(1).TableList = {'crl_table_custom_add_ufix32_slopebias.m'};
% table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end
```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Net Slope Scaling Code Replacement

You can define code replacement entries for multiplication and division operations on fixed-point data types such that they match the net slope between operator inputs and output. The net slope entries can map a range of slope and bias values to a replacement function for multiplication or division.

This example shows how to develop a code replacement library to optimize the performance of fixed point net slope operations by providing information on how to define code replacement for a `divide` operation. To develop a code replacement library use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 72-20.

### Interactively Develop a Code Replacement Library

- 1 Open the **Code Replacement Tool** (crtool), from the MATLAB command line with the following command:

```
>>crtool
```

- 2 Create a table.
  - a From the crtool context menu, select **File > New Table**.
  - b In the right pane, name the table `crl_table_netslopeScaling`. Click **Apply**.
- 3 Create an entry. From the crtool context menu, select **File > New entry > Fixed Point Net Slope Operation**.
- 4 Create entry parameters. In the **Operation** drop-down list, select `Divide`.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, `y1`, and the input argument, `u1` and `u2` with the **Data Type** of `fixdt(true,16,*,*)` and the **Argument Type** of `Scalar`.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. In the **Function arguments** subsection of the crtool, specify the return argument, `y1`, and the input argument, `u1` and `u2` with the **Data Type** of `int16`. Also set the **Net slope Adjustment Factor** as 1 and **Net Fixed Exponent** as 0.

Specify a **Name** for the replacement function under **Function prototype**.

- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. In the **Mapping Information** tab, click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For

more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
  - a Create a function with the name of your code replacement library table that does not have arguments and returns a table object. You can use this function to call your code replacement library table.
  - b Create a table object by calling `RTW.TfTable`.

```
function hTable = crl_table_netslopeScaling
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TfTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TfCOperationEntryGenerator_NetSlope`.

```
function hTable = crl_table_netslopeScaling
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TfTable;
```

```
%% Create an entry
hEntry = RTW.TfCOperationEntryGenerator_NetSlope;
```

- 4 Set operator entry parameters with a call to the `setTfCOperationEntryParameters` function. The parameters specify the type of operation as division, the saturation mode as wrap on overflow, rounding modes as unspecified, and the name of the replacement function as `user_div_*`. `NetSlopeAdjustmentFactor` and `NetFixedExponent` specify the F and E parts of the net slope  $F2^E$ .

```
function hTable = crl_table_netslopeScaling
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TfTable;
```

```
%% Create an entry
hEntry = RTW.TfCOperationEntryGenerator_NetSlope;
```

```
%% Create entry parameters
hEntry.setTfCOperationEntryParameters(...
 'Key', 'RTW_OP_DIV', ...
 'Priority', 90, ...
 'SaturationMode', 'RTW_WRAP_ON_OVERFLOW', ...
 'RoundingModes', {'RTW_ROUND_CEILING'}, ...
 'NetSlopeAdjustmentFactor', 1.0, ...
 'NetFixedExponent', 0.0, ...
 'ImplementationName', 's16_div_s16_s16', ...
```

- ```
'ImplementationHeaderFile', 's16_div_s16_s16.h', ...
'ImplementationSourceFile', 's16_div_s16_s16.c');
```
- 5 Create conceptual arguments y1, u1, and u2. This example uses calls to the `createAndAddConceptualArg` function to create and add an argument with one function call. Specify each argument as fixed-point, 16 bits, and signed. Also, for each argument, specify that code replacement request processing does *not* check for an exact match to the call-site slope and bias values.

```
function hTable = crl_table_netslopeScaling
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntryGenerator_NetSlope;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
    'Key', 'RTW_OP_DIV', ...
    'Priority', 90, ...
    'SaturationMode', 'RTW_WRAP_ON_OVERFLOW', ...
    'RoundingModes', {'RTW_ROUND_CEILING'}, ...
    'NetSlopeAdjustmentFactor', 1.0, ...
    'NetFixedExponent', 0.0, ...
    'ImplementationName', 's16_div_s16_s16', ...
    'ImplementationHeaderFile', 's16_div_s16_s16.h', ...
    'ImplementationSourceFile', 's16_div_s16_s16.c');

%% Create the conceptual representation
createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'y1', ...
    'IOType', 'RTW_IO_OUTPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'DataType', 'Fixed', ...
    'IsSigned', true, ...
    'WordLength', 16);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u1', ...
    'IOType', 'RTW_IO_INPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'DataType', 'Fixed', ...
    'IsSigned', true, ...
    'WordLength', 16);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u2', ...
    'IOType', 'RTW_IO_INPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'DataType', 'Fixed', ...
    'IsSigned', true, ...
    'WordLength', 16);
```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. This example uses calls to the `createAndSetCImplementationReturn` and `createAndAddImplementationArg` functions to create and add implementation arguments to the entry. Implementation arguments must describe fundamental numeric data types (not fixed-point data types). In this case, the output and input arguments are 16 bits and signed (`int16`).

```
function hTable = crl_table_netslopeScaling
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntryGenerator_NetSlope;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
    'Key', 'RTW_OP_DIV', ...
    'Priority', 90, ...
    'SaturationMode', 'RTW_WRAP_ON_OVERFLOW', ...
    'RoundingModes', {'RTW_ROUND_CEILING'}, ...
    'NetSlopeAdjustmentFactor', 1.0, ...
    'NetFixedExponent', 0.0, ...
    'ImplementationName', 's16_div_s16_s16', ...
    'ImplementationHeaderFile', 's16_div_s16_s16.h', ...
    'ImplementationSourceFile', 's16_div_s16_s16.c');

%% Create the conceptual representation
createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'y1', ...
    'IOType', 'RTW_IO_OUTPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'DataType', 'Fixed', ...
    'IsSigned', true, ...
    'WordLength', 16);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u1', ...
    'IOType', 'RTW_IO_INPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'DataType', 'Fixed', ...
    'IsSigned', true, ...
    'WordLength', 16);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u2', ...
    'IOType', 'RTW_IO_INPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'DataType', 'Fixed', ...
    'IsSigned', true, ...
    'WordLength', 16);

%% Create the Implementation Representation
```

```

createAndSetCImplementationReturn(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'y1', ...
    'IOType', 'RTW_IO_OUTPUT', ...
    'IsSigned', true, ...
    'WordLength', 16, ...
    'FractionLength', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u1', ...
    'IOType', 'RTW_IO_INPUT', ...
    'IsSigned', true, ...
    'WordLength', 16, ...
    'FractionLength', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u2', ...
    'IOType', 'RTW_IO_INPUT', ...
    'IsSigned', true, ...
    'WordLength', 16, ...
    'FractionLength', 0);

```

```

%% Add the entry to the table
addEntry(hTable, hEntry);

```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_netslopeScaling
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file by using these specifications:

```

function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for net slope scaling';
this(1).TableList = {'crl_table_netslopeScaling.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end

```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Limitations

- For the conceptual arguments of a net slope operation replacement entry, you must set these parameters:
 - `CheckSlope` — `false`
 - `CheckBias` — `false`
- For net slope operation replacement entries, you must set `MustHaveZeroNetBias` to `true`.
- You must set `SlopesMustBeTheSame` depending on the operation type:
 - `Add/Minus` — `true`
 - `Cast/Shift` — `true`
 - `Mul/Div/MulDiv` — `false`
- For non-trivial net slope or bias cases, use `RTW.TfLCOperationEntryML` instead.

Equal Slope and Zero Net Bias Code Replacement

You can define code replacement entries for addition or subtraction of fixed-point data types such that they match the relative slope and bias values (equal slope and zero net bias) across operator inputs and output. These entries allow you to disregard slope and bias values when mapping relative slope and bias values to a replacement function for addition or subtraction.

This example shows how to develop a code replacement library to optimize the performance of fixed point net slope operations by providing information on how to define code replacement for an addition operation. To develop a code replacement library use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 72-20.

Interactively Develop a Code Replacement Library

- 1 Open the **Code Replacement Tool** (crtool), from the MATLAB command line with the following command:

```
>>crtool
```

- 2 Create a table.
 - a From the crtool context menu, select **File > New Table**.
 - b In the right pane, name the table `crl_table_equal_slope_netbias_add`. Click **Apply**.
- 3 Create an entry. From the crtool context menu, select **File > New entry > Fixed Point Net Slope Operation**.
- 4 Create entry parameters. In the **Operation** drop-down list, select **Addition**.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, `y1`, and the input argument, `u1` and `u2` with the **Data Type** of `fixdt(true,16,*,*)` and the **Argument Type** of **Scalar**.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. In the **Function arguments** subsection of the crtool, specify the return argument, `y1`, and the input argument, `u1` and `u2` with the **Data Type** of `int16`.

Specify a **Name** for the replacement function under **Function prototype**.

- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. In the **Mapping Information** tab, click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
 - a Create a function to call your code replacement library table. The function should not have arguments and return a table object.
 - b Create a table object by calling `RTW.TflTable`.

```
function hTable = crl_table_equal_slope_netbias_add
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TflCOperationEntryGenerator_NetSlope`.

```
function hTable = crl_table_equal_slope_netbias_add
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
```

```
%% Create an entry
hEntry = RTW.TflCOperationEntryGenerator_NetSlope;
```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTflCOperationEntryParameters`.

```
function hTable = crl_table_equal_slope_netbias_add
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntryGenerator_NetSlope;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
    'Key', 'RTW_OP_ADD', ...
    'Priority', 90, ...
    'SaturationMode', 'RTW_WRAP_ON_OVERFLOW', ...
    'RoundingModes', {'RTW_ROUND_UNSPECIFIED'}, ...
    'SlopesMustBeTheSame', true, ...
    'MustHaveZeroNetBias', true, ...
    'ImplementationName', 'u16_add_SameSlopeZeroBias', ...
    'ImplementationHeaderFile', 'u16_add_SameSlopeZeroBias.h', ...
    'ImplementationSourceFile', 'u16_add_SameSlopeZeroBias.c');
```

- 5 Create conceptual arguments `y1`, `u1`, and `u2`. This example uses calls to the `createAndAddConceptualArg` function to create and add an argument with one function call. Specify each argument as fixed-point, 16 bits, and signed. Also, for each argument, specify that code replacement request processing does *not* check for an exact match to the call-site slope and bias values.

```
function hTable = crl_table_equal_slope_netbias_add
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntryGenerator_NetSlope;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
    'Key', 'RTW_OP_ADD', ...
    'Priority', 90, ...
    'SaturationMode', 'RTW_WRAP_ON_OVERFLOW', ...
    'RoundingModes', {'RTW_ROUND_UNSPECIFIED'}, ...
    'SlopesMustBeTheSame', true, ...
    'MustHaveZeroNetBias', true, ...
    'ImplementationName', 'u16_add_SameSlopeZeroBias', ...
    'ImplementationHeaderFile', 'u16_add_SameSlopeZeroBias.h', ...
    'ImplementationSourceFile', 'u16_add_SameSlopeZeroBias.c');

%% Create the conceptual representation
createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'y1', ...
    'IOType', 'RTW_IO_OUTPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'IsSigned', false, ...
    'WordLength', 16);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u1', ...
    'IOType', 'RTW_IO_INPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'IsSigned', false, ...
    'WordLength', 16);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u2', ...
    'IOType', 'RTW_IO_INPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'IsSigned', false, ...
    'WordLength', 16);
```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. This example uses calls to the `createAndSetCImplementationReturn` function to create and add implementation arguments to the entry. Implementation arguments must describe fundamental numeric data types (not fixed-point data types). In this case, the output and input arguments are 16 bits and signed (`int16`).

```
function hTable = crl_table_equal_slope_netbias_add
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntryGenerator_NetSlope;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
    'Key', 'RTW_OP_ADD', ...
    'Priority', 90, ...
    'SaturationMode', 'RTW_WRAP_ON_OVERFLOW', ...
    'RoundingModes', {'RTW_ROUND_UNSPECIFIED'}, ...
    'SlopesMustBeTheSame', true, ...
    'MustHaveZeroNetBias', true, ...
```

```

    'ImplementationName', 'u16_add_SameSlopeZeroBias', ...
    'ImplementationHeaderFile', 'u16_add_SameSlopeZeroBias.h', ...
    'ImplementationSourceFile', 'u16_add_SameSlopeZeroBias.c');

%% Create the conceptual representation
createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'y1', ...
    'IOType', 'RTW_IO_OUTPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'IsSigned', false, ...
    'WordLength', 16);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u1', ...
    'IOType', 'RTW_IO_INPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'IsSigned', false, ...
    'WordLength', 16);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u2', ...
    'IOType', 'RTW_IO_INPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'IsSigned', false, ...
    'WordLength', 16);

%% Create the Implementation Representation
createAndSetCImplementationReturn(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'y1', ...
    'IOType', 'RTW_IO_OUTPUT', ...
    'IsSigned', false, ...
    'WordLength', 16, ...
    'FractionLength', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u1', ...
    'IOType', 'RTW_IO_INPUT', ...
    'IsSigned', false, ...
    'WordLength', 16, ...
    'FractionLength', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u2', ...
    'IOType', 'RTW_IO_INPUT', ...
    'IsSigned', false, ...
    'WordLength', 16, ...
    'FractionLength', 0);

%% Add the entry to the table
addEntry(hTable, hEntry);

```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_equal_slope_netbias_add
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file with these specifications:

```

function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for equal slope and zero net bias code replacement';

```

```
this(1).TableList = {'crl_table_equal_slope_netbias_add.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end
```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10** Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Data Type Conversions (Casts) and Operator Code Replacement

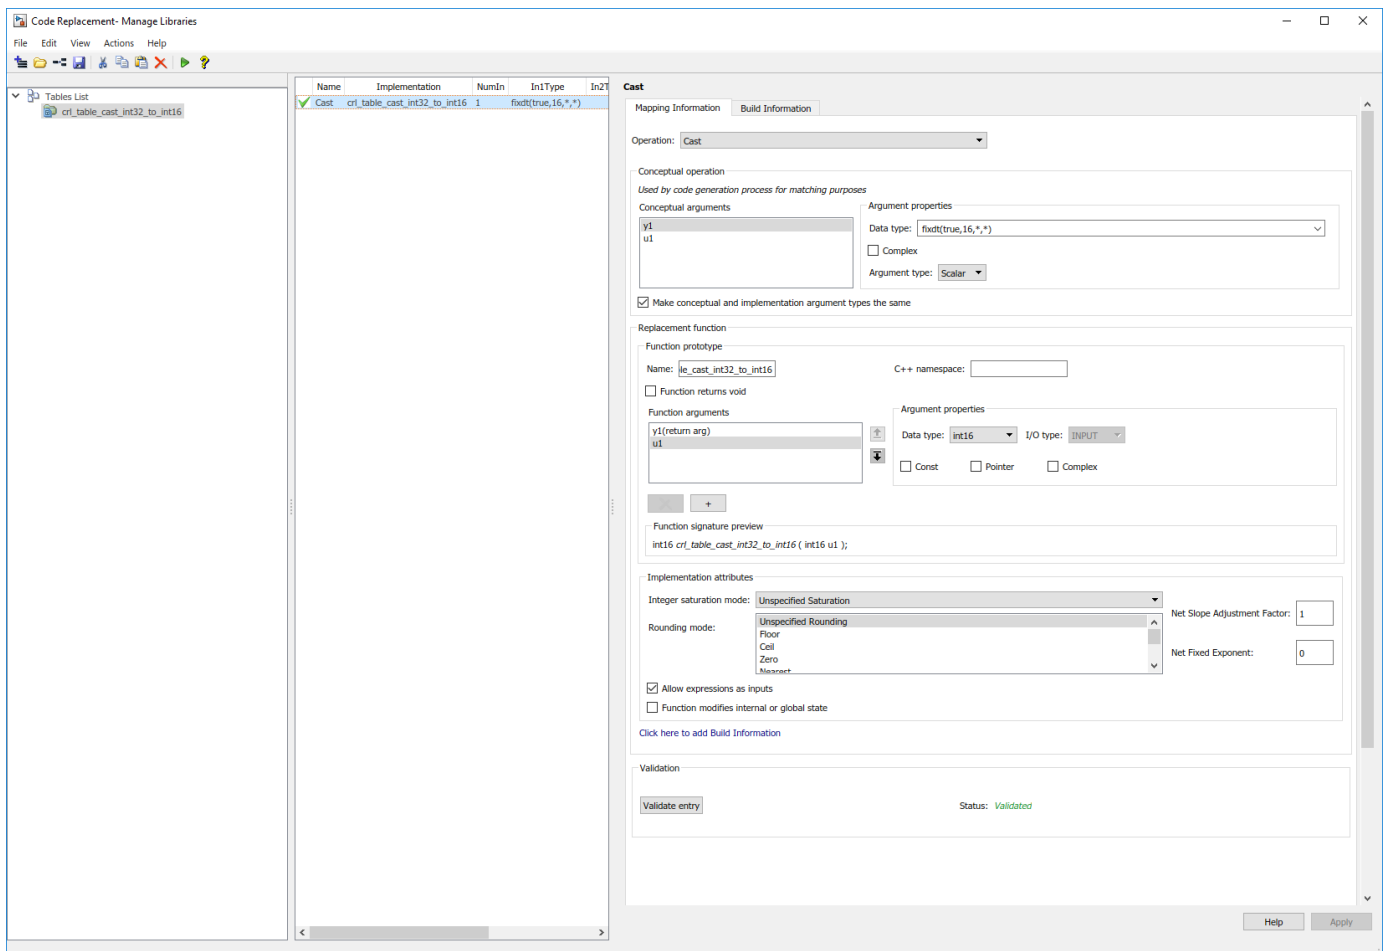

You can use code replacement entries to replace code that the code generator produces for data type conversion (cast) operations. To develop a code replacement library use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 72-20.

Interactively Develop a Code Replacement Library

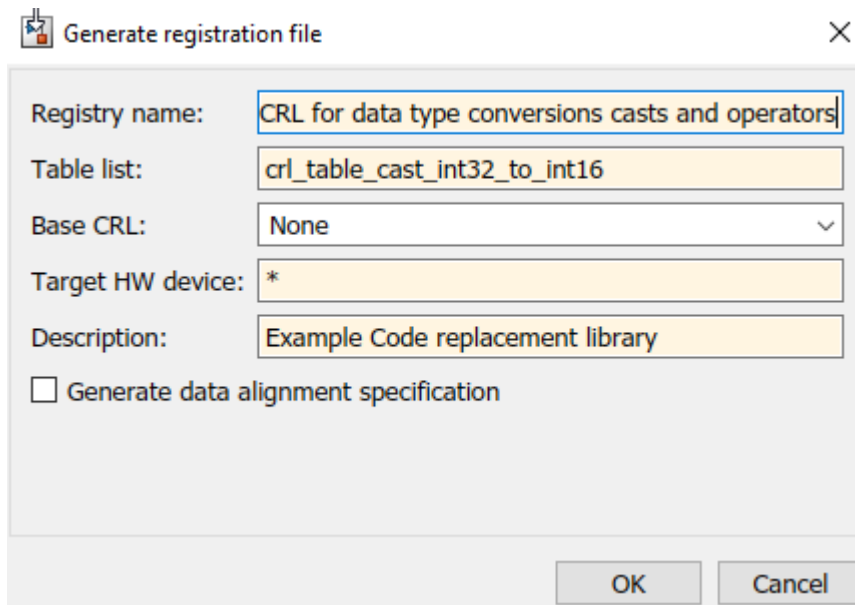

- 1 Open the **Code Replacement Tool** (crtool), at the MATLAB command line, enter:

```
>>crtool
```
- 2 Create a table.
 - a From the crtool context menu, select **File > New Table**.
 - b In the right pane, name the table `cr1_table_cast_int32_to_int16`. Click **Apply**.
- 3 Create entry parameters. In the **Operation** drop-down list, select **Cast**.
- 4 Create an entry. From the crtool context menu, select **File > New entry > Fixed Point Net Slope Operation**.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, `y1` with the **Data Type** of `int16`, and the input argument, `u1` with the **Data Type** of `int32` and the **Argument Type** of **Scalar**.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box. In the **Function arguments** subsection of the crtool, specify the return argument, `y1`, and the input argument, `u1` with the **Data Type** of `int16` and `int32`.

Specify a **Name** for the replacement function under **Function prototype**.
- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. In the **Mapping Information** tab, click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
 - a Create a function to call your code replacement library table. The function should not have arguments and return a table object.
 - b Create a table object by calling `RTW.TflTable`.

```
function hTable = crl_table_cast_int32_to_int16()
% Create a function to call the code replacement library table
```

```
%% Create a table object
hTable = RTW.TflTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TflCOperationEntry`.

```
function hTable = crl_table_cast_int32_to_int16()
% Create a code replacement library table
```

```
%% Create a table object
hTable = RTW.TflTable;
```

```
%% Create an entry
hEntry = RTW.TfLCOperationEntry;
```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTfLCOperationEntryParameters`. The parameters specify the type of operation as cast, the saturation mode as saturate on integer overflow, rounding modes as toward negative infinity, and the name of the replacement function as `my_sat_cast`.

```
function hTable = crl_table_cast_int32_to_int16()
% Create a code replacement library table
```

```
%% Create a table object
hTable = RTW.TfLTable;
```

```
%% Create an entry
hEntry = RTW.TfLCOperationEntry;
```

```
%% Create entry parameters
hEntry.setTfLCOperationEntryParameters(...
    'Key', 'RTW_OP_CAST', ...
    'Priority', 50, ...
    'ImplementationName', 'my_sat_cast', ...
    'SaturationMode', 'RTW_SATURATE_ON_OVERFLOW', ...
    'RoundingModes', {'RTW_ROUND_FLOOR'}, ...
    'ImplementationHeaderFile', 'some_hdr.h', ...
    'ImplementationSourceFile', 'some_hdr.c');
```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `getTfLArgFromString`.

```
function hTable = crl_table_cast_int32_to_int16()
% Create a code replacement library table
```

```
%% Create a table object
hTable = RTW.TfLTable;
```

```
%% Create an entry
hEntry = RTW.TfLCOperationEntry;
```

```
%% Create entry parameters
hEntry.setTfLCOperationEntryParameters(...
    'Key', 'RTW_OP_CAST', ...
    'Priority', 50, ...
    'ImplementationName', 'my_sat_cast', ...
    'SaturationMode', 'RTW_SATURATE_ON_OVERFLOW', ...
    'RoundingModes', {'RTW_ROUND_FLOOR'}, ...
    'ImplementationHeaderFile', 'some_hdr.h', ...
    'ImplementationSourceFile', 'some_hdr.c');
```

```
%% Create the conceptual representation
```

```
arg = getTfLArgFromString(hTable, 'y1', 'int16');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);
hEntry.Implementation.setReturn(arg);
```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the

same order and properties as the conceptual arguments, call the function `getTflArgFromString`. Add the complete entry to the table by calling the function `addEntry`.

```
function hTable = crl_table_cast_int32_to_int16()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntry;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
    'Key', 'RTW_OP_CAST', ...
    'Priority', 50, ...
    'ImplementationName', 'my_sat_cast', ...
    'SaturationMode', 'RTW_SATURATE_ON_OVERFLOW', ...
    'RoundingModes', {'RTW_ROUND_FLOOR'}, ...
    'ImplementationHeaderFile', 'some_hdr.h', ...
    'ImplementationSourceFile', 'some_hdr.c');

%% Create the conceptual and implementation representation

arg = getTflArgFromString(hTable, 'y1', 'int16');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);
hEntry.Implementation.setReturn(arg);

arg = getTflArgFromString(hTable, 'u1', 'int32');
addConceptualArg(hEntry, arg);
hEntry.Implementation.addArgument(arg);

%% Add the entry to the table
addEntry(hTable,hEntry);
```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_cast_int32_to_int16
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file with these specifications:

```
function rtwTargetInfo(cm)
cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl
this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for data type conversions(casts) abd operator code replacement';
this(1).TableList = {'crl_table_cast_int32_to_int16.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';
end
```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10** Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Shift Left Operations and Code Replacement

This example shows how to develop a code replacement library to optimize the performance of shift left (<<) operation by providing information on how to define code replacement for a `shift left` function. To develop a code replacement library use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 72-20.

Interactively Develop a Code Replacement Library

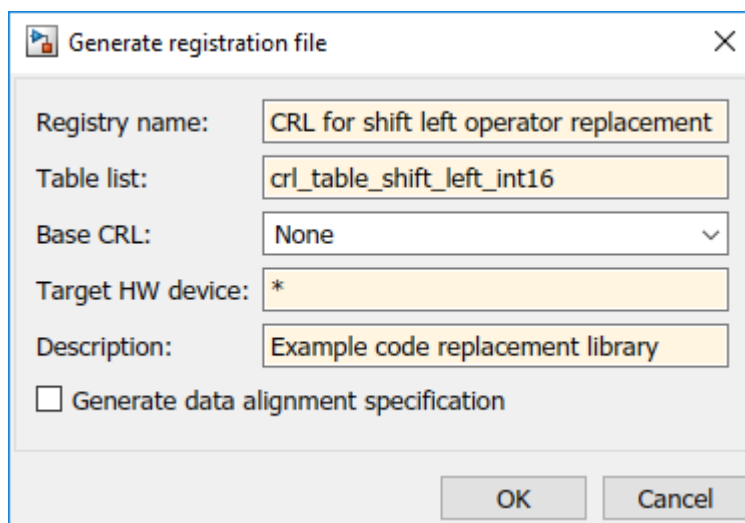

- 1 Open the **Code Replacement Tool** (crtool), from the MATLAB command line with the following command:

```
>>crtool
```
- 2 Create a table.
 - a From the crtool context menu, select **File > New Table**.
 - b In the right pane, name the table `cr1_table_shift_left_int16`. Click **Apply**.
- 3 Create an entry. From the crtool context menu, select **File > New entry > Math Operation**.
- 4 Create entry parameters. In the **Operator** drop-down list, select `Shift Left`.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, `y1`, and the input arguments, `u1`, and `u2`, with **Data Type** of `int16` and the **Argument Type** of `scalar`.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box.

Under **Function prototypes** specify a **Name** for the replacement function.
- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. Click the **Mapping Information** tab and verify the fields are filled in as shown. Click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:
`>>sl_refresh_customizations`

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Programatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
 - a Create a function with the name of your code replacement library table that does not have arguments and returns a table object. You can use this function to call your code replacement library table.
 - b Create a table object by calling `RTW.TflTable`.

```
function hTable = crl_table_shift_left_int16
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TflCOperationEntry`.

```
function hTable = crl_table_shift_left_int16()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntry;
```

- 4 Create entry parameters. Because this example replaces a function, create entry parameters by calling the function `setTflCFunctionEntryParameters`.

```
function hTable = crl_table_shift_left_int16()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntry;

%% Create entry parameters
setTflCFunctionEntryParameters(hEntry, ...
    'Key', 'RTW_OP_SL', ...
    'Priority', 50, ...
    'ImplementationName', 'my_shift_left', ...
    'ImplementationHeaderFile', 'some_hdr.h', ...
    'ImplementationSourceFile', 'some_hdr.c');
```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `getTflArgFromString` and `addConceptualArg`.

```

function hTable = crl_table_shift_left_int16()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntry;

%% Create entry parameters
setTflCOperationEntryParameters(hEntry, ...
    'Key', 'RTW_OP_SL', ...
    'Priority', 50, ...
    'ImplementationName', 'my_shift_left', ...
    'ImplementationHeaderFile', 'some_hdr.h', ...
    'ImplementationSourceFile', 'some_hdr.c');

%% Create the conceptual representation
arg = getTflArgFromString(hTable, 'y1', 'int16');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);
hEntry.Implementation.setReturn(arg);

arg = getTflArgFromString(hTable, 'u1', 'int16');
addConceptualArg(hEntry, arg);
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'u2', 'int16');
arg.CheckType = false;
addConceptualArg(hEntry, arg);
hEntry.Implementation.addArgument(arg);

```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. To explicitly specify argument properties, call the function `getTflArgFromString`.

```

function hTable = crl_table_shift_left_int16()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntry;

%% Create entry parameters
setTflCOperationEntryParameters(hEntry, ...
    'Key', 'RTW_OP_SL', ...
    'Priority', 50, ...
    'ImplementationName', 'my_shift_left', ...
    'ImplementationHeaderFile', 'some_hdr.h', ...
    'ImplementationSourceFile', 'some_hdr.c');

%% Create the conceptual and implementation representation
arg = getTflArgFromString(hTable, 'y1', 'int16');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);
hEntry.Implementation.setReturn(arg);

arg = getTflArgFromString(hTable, 'u1', 'int16');
addConceptualArg(hEntry, arg);
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'u2', 'int16');
arg.CheckType = false;
addConceptualArg(hEntry, arg);
hEntry.Implementation.addArgument(arg);

```

```

%% Add the entry to the table
hTable.addEntry(hEntry);

```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_shift_left_int16
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file (a new function file) by using these specifications.

```

function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for shift left operation';
this(1).TableList = {'crl_table_shift_left_int16.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end

```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Optimize Generated Code by Using Multiple Code Replacement Libraries

You can generate code that has code replacements enabled by multiple code replacement libraries. You can select multiple Code Replacement libraries in a unified workflow so that the generated code contains optimizations from varied code replacement libraries such as AUTOSAR 4.0 and GNU C99 extensions. You can also select your own custom code replacement libraries along with libraries included with Embedded Coder® to further optimize the generated code. You can select and use a combination of libraries and achieve the requisite functionalities, and need not author separate libraries. In instances where there are multiple custom code replacement libraries and you need functionalities from all of them, individually select the libraries.

Example Model

This example shows how to replace the generated code for a model containing an Add block and an Abs block by using multiple code replacement libraries. You replace the Abs block using a code replacement customization that replaces the regular `fabs` function with the custom implementation `CRL_abs_d` from the `ScalarFcn` library. You replace the Add block with the custom implementation `CRL_d_add_d_d_cao` from the `ScalarOp` library.

Open the model `mMultiLibrary_abs` that has an Add block and an Abs block.

```
model = 'mMultiLibrary_abs';
open_system(model);
```

```
copyfile multipleFnRtwTargetInfo.txt rtwTargetInfo.m
```

Copyright 2021 The MathWorks, Inc.

The MATLAB® customization files `hcr1_make_abs` and `hcr1_sum_float` have already been executed. Run the `sl_refresh_customizations` function to register the libraries `ScalarFcn` and `ScalarOp`.

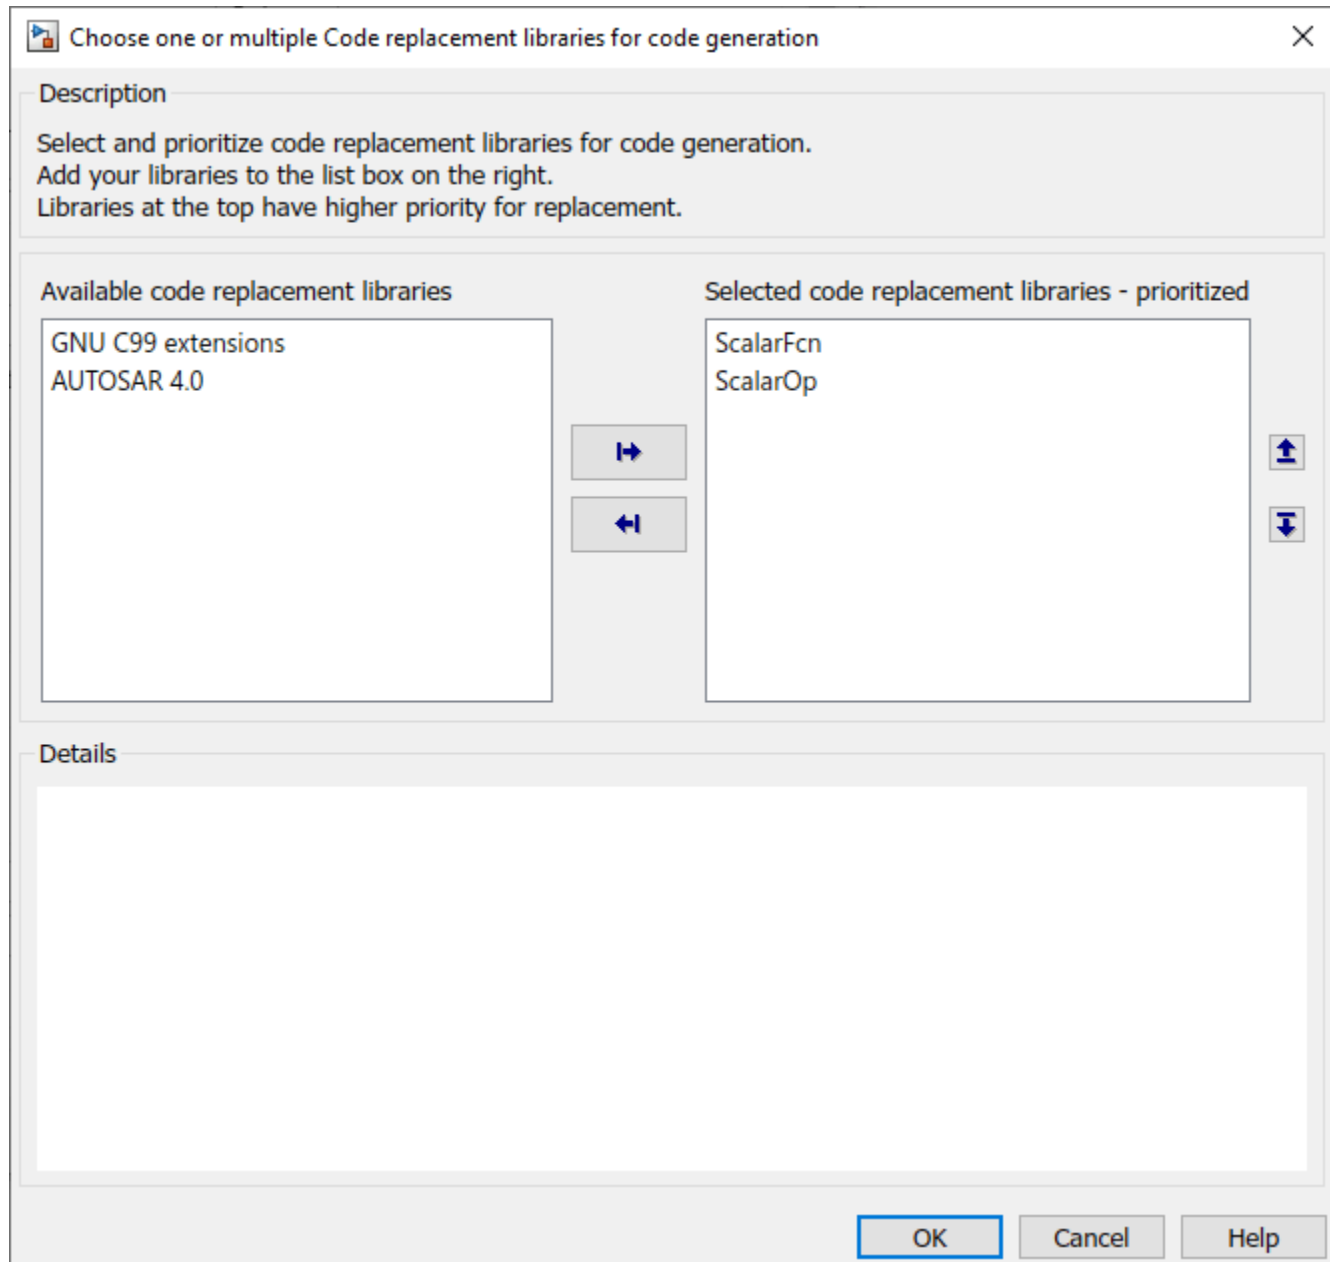

```
sl_refresh_customizations;
```

Select Code Replacement Libraries

- 1 Open the Configuration Parameters dialog box.
- 2 In the Configuration Parameters dialog box, set the correct **Device Vendor** and **Device Type** depending on the hardware target. In this example Intel is the **Device Vendor** and x86-64 (Windows64) is the **Device Type**.
- 3 On the **Interface** pane, set **Code Replacement Library** parameter by clicking **Select** and adding the code replacement libraries to the **Selected code replacement libraries -**

prioritized list pane. For this example, choose ScalarFcn and ScalarOp. The libraries work on the Windows® platforms. Linux® users must supply a different library.

- 4 Order the code replacement libraries according to the priority in which you want to see them replaced in the generated code. Code replacement libraries at the top of order have a higher priority during code replacement.

Alternatively, use the command-line API to enable the code replacement:

```
set_param('mMultiLibrary_abs', 'CodeReplacementLibrary', 'ScalarFcn,ScalarOp')
```

Generate code for the model.

```
evalc('slbuild(model)');
```

NOTE: When registering a code replacement library, you cannot use a comma in the code replacement library name.

View the generated code with the replacements. Here is a portion of `mMultiLibrary_abs.c`.

```
cfile = fullfile('mMultiLibrary_abs_ert_rtw','mMultiLibrary_abs.c');
rtwdemodbtype(cfile,'/* Model step function ','/* Model initialize function',1, 1);

/* Model step function */
void mMultiLibrary_abs_step(void)
{
    int32_T i;

    /* Output: '<Root>/Out1' incorporates:
     * Abs: '<Root>/Abs1'
     * Inport: '<Root>/In1'
     */
    mMultiLibrary_abs_Y.Out1 = CRL_abs_d(mMultiLibrary_abs_U.In1);

    /* Output: '<Root>/Output' incorporates:
     * Inport: '<Root>/In2'
     * Inport: '<Root>/In3'
     * Sum: '<Root>/Add'
     */
    for (i = 0; i < 2500; i++) {
        mMultiLibrary_abs_Y.Output[i] = CRL_d_add_d_d_cao(mMultiLibrary_abs_U.In2[i],
            mMultiLibrary_abs_U.In3[i]);
    }

    /* End of Output: '<Root>/Output' */
}
```

The generated code contains the `CRL_abs_d` function enabled by the custom code replacement library `ScalarFcn`. Note that this library only works for Windows. The code also contains the function `CRL_d_add_d_d_cao` enabled by the `ScalarOp` code replacement library. Selecting multiple code replacement libraries enables multiple optimizations in the generated code.

Close the model and code generation report.

```
delete ./rtwTargetInfo.m
bdclose(model)
rtwdemoclean;
```

Limitations:

- When you use different argument types such as matrix and scalar, the priority ordering is ignored. A matrix code replacement library has a higher priority than a scalar code replacement library, regardless of the order specified by the code replacement library.

- When the code replacement library parameter specifies a Standard Math Library, for instance through its BaseTfl, and it does not match the **Standard Math Library** parameter, the library specified by the **Standard Math Library** parameter is used.

Compare Rounding and Overflow Modes in C/C++ Code and Simulink

This example shows the use of a Simulink® C Caller block to determine the Simulink rounding mode that matches the results obtained from the C/C++ implementation. This technique can help you to identify the correct overflow mode or rounding mode that you need to match when creating entries in a Code Replacement Library.

Introduction to Rounding and Overflow Modes

While creating a code replacement entry for a Simulink model, the saturation mode and the rounding modes need to be specified for operations that can overflow or lose precision. To create Code Replacement Library entries that replace the correct operations, compare the rounding and saturating behavior of the model with the behavior of your implementation in C/C++.

The goal of this example is to find the rounding behavior of the division operation with integer inputs and outputs in C++.

Example Model Setup

The model `Cr1MathModeComparison` performs division between two randomly generated inputs using the Simulink Divide block and the C Caller block and compares the results. If there is a mismatch, the Assertion block is activated, and the simulation stops.

The following blocks are used from the Simulink blocks library:

- 1 Assertion block
- 2 C Caller block
- 3 Divide block
- 4 Relational Operator block
- 5 Subsystem to generate random numbers

Define Custom C/C++ Implementation of the Division Function in C Caller Block

You can write a custom implementation of the division function to replace the function in the generated code. Specify the source and header files for your implementation by setting the model configuration parameter **Simulation Target > Include Headers**.

Once you set this parameter, the function name appears in the drop-down list inside the C Caller block parameters.

Results

The results from the custom division function using C++ code match the results from the Divide block when the **Integer rounding mode** is set to `Zero` or `Simplest`, as displayed in the scope.

For the other rounding modes, the simulation will generate different results from the C++ implementation.

Example Replacement Table

From the above example, we understand that a division operation between inputs of type `int32` and output of type `int32` in the custom C++ function rounds to zero. A Division block in Simulink with **Integer rounding mode** is set to `Zero` or `Simplest` will give the same behavior.

Hence, while registering a code replacement entry for an integer division operation using the code replacement tool, the rounding mode for the entry can be set to `RTW_ROUND_ZERO` or `RTW_ROUND_SIMPLEST`.

The table `DivisionCr1Example` demonstrates such an entry.

Limitations

For the given example, the model is unable to distinguish between different saturation modes in the Divide block. The overflow condition can be observed when the smallest number that can be represented by `int32`, i.e. `-2147483648` is divided by `-1`. Since this model uses randomly generated values for division inputs, it is unable to verify the behavior for such edge cases. Hence, it is advisable to further compare the results from the custom C/C++ implementation with the results from a Simulink model using specific inputs that cover any special conditions or edge cases.

What Is Code Replacement Customization?

Customize how and when the code generator replaces C/C++ code that it generates by default for functions and operators by developing a custom code replacement library. You can develop libraries interactively with the **Code Replacement Tool** or programmatically.

- Develop libraries tailored to specific application requirements
- Add identifiers to the list of reserved keywords the code generator considers during code replacement
- Customize the code generator’s match and replacement process for functions

To get started, “Quick Start Code Replacement Library Development - Simulink” on page 72-21.

Code Replacement Match and Replacement Process

When the code generator encounters a call site for a function or operator, it:

- 1 Creates and partially populates a code replacement entry object with the function or operator name or key and conceptual arguments.
- 2 Uses the entry object to query the configured code replacement library for a conceptual representation match. The code generator searches the tables in a code replacement library for a match in the order that the tables appear in the library. When searching for a match, the code generator takes into account:
 - Conceptual name or key
 - Arguments, including quantity, type, type qualifiers, and complexity
 - Algorithm (computation method)
 - Fixed-point saturation and rounding modes
 - Priority
- 3 When a match exists, the code generator returns a code replacement object, fully populated with the conceptual representation, implementation representation, and priority. If the code generator finds multiple matches within a table, the entry priority determines the match. The priority can range from 0 to 100. The highest priority is 0. The code generator uses a higher-priority entry over a similar entry with a lower priority.
- 4 Uses the C or C++ replacement function prototype in the code replacement object to generate code.

Code Replacement Customization Limitations

- Code replacement verification — It is possible that code replacement behaves differently than you expect. For example, data types that you observe in code generator input might not match what the code generator uses as intermediate data types during an operation. Verify code replacements by examining generated code. See “Verify Code Replacement Library” on page 73-43.
- Tokens in file paths—You can include tokens in file paths when specifying build information for a code replacement entry by using the programming interface only. The ability to include tokens is not available from the Code Replacement Tool. See Specify build information in “Define Code Replacement Library Optimizations” on page 73-23.
- Addition and subtraction operation replacements—See “Addition and Subtraction Operator Code Replacement” on page 73-104 for relevant limitations.

- `coder.replace` function — See `coder.replace` for relevant limitations.
- `coder.dataAlignment` function — See `coder.dataAlignment` for relevant limitations.

Code You Can Replace from MATLAB Code

Code that the code generator replaces depends on the code replacement library (CRL) that you use. By default, the code generator does not apply a code replacement library. Your choice of libraries is dependent on product licensing and whether you have access to custom libraries.

Memory Functions

Depending on code replacement libraries available in your development environment, you can configure the code generator to replace instances of the following memory functions with application-specific implementations.

| Function | Data Type Support | Scalar, Vector, Matrix Support | Real, Complex Support |
|-------------|----------------------|--------------------------------|-----------------------|
| memcmp | Void pointer (void*) | Scalar
Vector
Matrix | Real
Complex |
| memcpy | Void pointer (void*) | Scalar
Vector
Matrix | Real
Complex |
| memset | Void pointer (void*) | Scalar
Vector
Matrix | Real
Complex |
| memset2zero | Void pointer (void*) | Scalar
Vector
Matrix | Real
Complex |

Some target processors provide optimized functions to set memory to zero. Use the code replacement library programming interface to replace the `memset2zero` function with more efficient target-specific functions.

Operators

When generating C/C++ code from MATLAB code, depending on code replacement libraries available in your development environment, you can configure the code generator to replace instances of the following operators with application-specific implementations.

Mixed data type support indicates you can specify different data types of different inputs.

| Operator | Key | Data Type Support | Scalar, Vector, Matrix Support | Real, Complex Support |
|---------------------------------|--------------|---|--------------------------------|-----------------------|
| Addition (+) ¹ | RTW_OP_ADD | Integer

Develop a Code Replacement Library

Iterate through the following steps, as necessary, to develop a code replacement library:

- 1 “Identify Code Replacement Library Requirements” on page 73-21
- 2 “Define Code Replacement Library Optimizations” on page 73-23
- 3 “Register Code Replacement Library” on page 73-38
- 4 “Verify Code Replacement Library” on page 73-43
- 5 “Deploy Code Replacement Library” on page 73-50

To get started, see “Identify Code Replacement Library Requirements” on page 73-21.

To experiment with the process and tools, see “Quick Start Library Development” on page 73-14.

More About

- “Identify Code Replacement Library Requirements” on page 73-21
- “Code You Can Replace from MATLAB Code” on page 73-5
- “Quick Start Library Development” on page 73-14
- “What Is Code Replacement Customization?” on page 73-3

Quick Start Library Development

This example shows how to develop a code replacement library that includes an entry for generating replacement code for the math function `sin`. You use the **Code Replacement Tool**.

Prerequisites

To complete this example, install the following software:

- MATLAB
- MATLAB Coder
- Embedded Coder
- C compiler

For instructions on installing MathWorks products, see “Installation and Licensing”. If you have installed MATLAB and want to see what other MathWorks products are installed, in the Command Window, enter `ver`.

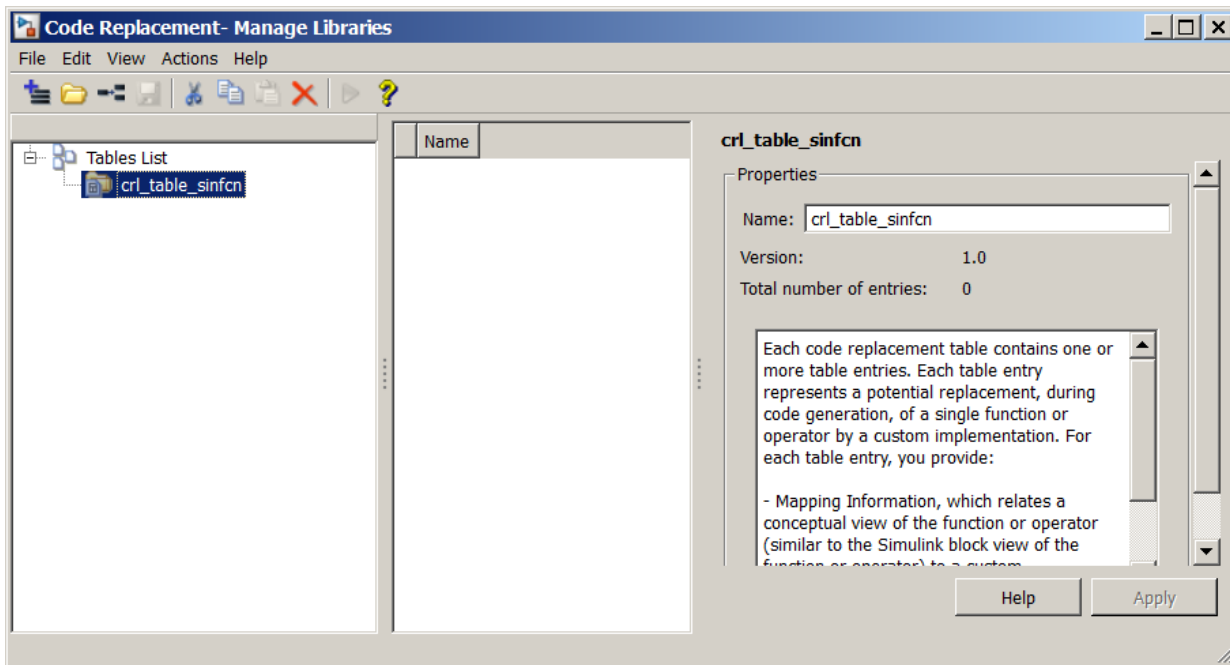

For a list of supported compilers, see https://www.mathworks.com/support/compilers/current_release/.

Open the Code Replacement Tool

- 1 Start a new MATLAB session.
- 2 Create or navigate (`cd`) to an empty folder.
- 3 At the command prompt, enter the `crtool` command. The **Code Replacement Tool** window opens.

Create Code Replacement Table

- 1 In the **Code Replacement Tool** window, select **File > New table**.
- 2 In the right pane, name the table `crl_table_sinfcn` and click **Apply**. Later, when you save the table, the tool saves it with the file name `crl_table_sinfcn.m`.

Create Table Entry

Create a table entry that maps a `sin` function with double input and double output to a custom implementation function.

- 1 In the left pane, select table `crl_table_sinfcn`. Then, select **File > New entry > Function**. The new entry appears in the middle pane, initially without a name.
- 2 In the middle pane, select the new entry.
- 3 In the right pane, on the **Mapping Information** tab, from the **Function** menu, select `sin`.
- 4 Leave **Algorithm** set to **Unspecified**, and leave parameters in the **Conceptual function** group set to default values.
- 5 In the **Replacement function** group, name the replacement function `sin_dbl`.
- 6 Leave the remaining parameters in the **Replacement function** group set to default values.
- 7 Click **Apply**. The tool updates the **Function signature preview** to reflect the specified replacement function name.
- 8 Scroll to the bottom of the **Mapping Information** tab and click **Validate entry**. The tool validates your entry.

The following figure shows the completed mapping information.

The screenshot shows the 'Build Information' tab for the 'sin' function. The 'Function' dropdown is set to 'sin'. Under 'Entry information', the 'Algorithm' is 'Unspecified'. The 'Conceptual function' section includes 'Conceptual arguments' (y1, u1) and 'Argument properties' (Data type: double, Complex: unchecked, Argument type: Scalar). A checkbox 'Make conceptual and implementation argument types the same' is checked. The 'Replacement function' section shows 'Function prototype' with Name: 'sin_dbl' and C++ namespace: empty. 'Function returns void' is unchecked. 'Function arguments' are 'y1(return arg)' and 'u1'. 'Argument properties' show Data type: 'double', I/O type: 'OUTPUT', and Const, Pointer, and Complex checkboxes are unchecked. The 'Function signature preview' shows 'double sin_dbl(double u1);'. The 'Implementation attributes' section has 'Integer saturation mode: Unspecified Saturation' and 'Rounding mode: Unspecified Rounding'. 'Allow expressions as inputs' is checked, and 'Function modifies internal or global state' is unchecked. A link 'Click here to add Build Information' is present. The 'Validation' section has a 'Validate entry' button and 'Status: Validated'. At the bottom are 'Help' and 'Apply' buttons.

Specify Build Information for Replacement Code

- 1 On the **Build Information** tab, for the **Implementation header file** parameter, enter `sin_dbl.h`.
- 2 Leave the remaining parameters set to default values.
- 3 Click **Apply**.

This screenshot shows the 'Build Information' tab with the 'Implementation header File' field set to 'sin_dbl.h'. The 'Implementation source File' field is empty. The 'Additional header files/ include paths' field is also empty. The 'Mapping Information' tab is visible in the background.

- Optionally, you can revalidate the entry. Return to the **Mapping Information** tab and click **Validate entry**.

Create Another Table Entry

Create an entry that maps a `sin` function with `single` input and `double` output to a custom implementation function named `sin_sgl`. Create the entry by copying and pasting the `sin_dbl` entry.

- In the middle pane, select the `sin_dbl` entry.
- Select **Edit > Copy**
- Select **Edit > Paste**
- On the **Mapping Information** tab, in the **Conceptual function** section, set the data type of input argument `u1` to `single`.
- In the **Replacement function** section, name the function `sin_sgl`. Set the data type of input argument `u1` to `single`.
- Click **Apply**. Note the changes that appear for the **Function signature preview**.
- On the **Build Information** tab, for the **Implementation header file** parameter, enter `sin_sgl.h`. Leave the remaining parameters set to default values and click **Apply**.

Validate the Code Replacement Table

- Select **Actions > Validate table**.
- If the tool reports errors, fix them, and rerun the validation. Repeat fixing and validating errors until the tool does not report errors. The following figure shows a validation report.

| Name | Implementation | NumIn | In1Type | In2Type | Out1Type | Out2Type | Priority |
|-------|----------------|-------|---------|---------|----------|----------|----------|
| ✓ sin | sin_dbl | 1 | double | | double | | 100 |
| ✓ sin | sin_sgl | 1 | single | | double | | 100 |

Save the Code Replacement Table

Save the code replacement table to a MATLAB file in your working folder. Select **File > Save table**. By default, the tool uses the table name to name the file. For this example, the tool saves the table in the file `crl_table_sinfcn.m`.

Review the Code Replacement Table Definition

Consider reviewing the MATLAB code for your code replacement table definition. After using the tool to create an initial version of a table definition file, you can update, enhance, or copy the file in a text editor.

To review it, in MATLAB or another text editor, open the file `crl_table_sinfcn.m`.

Generate a Registration File

Before you can use your code replacement table, you must register it as part of a code replacement library. Use the Code Replacement Tool to generate a registration file.

- In the Code Replacement Tool, select **File > Generate registration file**.
- In the **Generate registration file** dialog box, edit the dialog box fields to match the following figure, and then click **OK**.

- 3 In the **Select location to save the registration file** dialog box, specify a location for the registration file. The location must be on the MATLAB path or in the current working folder. Save the file. The tool saves the file as `rtwTargetInfo.m`.

Register the Code Replacement Table

At the command prompt, enter:

```
RTW.TargetRegistry.getInstance('reset');
```

Review and Test Code Replacements

Apply your code replacement library. Verify that the code generator makes code replacements that you expect.

- 1 Check for errors. At the command line, invoke the table definition file. For example:

If an error exists in the definition file, the invocation triggers a message to appear. Fix the error and try again.

```
tbl = crl_table_sinfcn
```

```
tbl =
```

```
TfLTable with properties:
    Version: '1.0'
    ReservedSymbols: []
    StringResolutionMap: []
    AllEntries: [2x1 RTW.TfLFunctionEntry]
    EnableTrace: 1|
```

- 2 Use the Code Replacement Viewer to check your code replacement entries. For example:

```
crviewer('Sin Function Example')
```

In the viewer, select entries in your table and verify that the content is what you expect. The viewer can help you detect issues such as:

- Incorrect argument order.
- Conceptual argument names that do not match what is expected by the code generator.
- Incorrect priority settings.

- 3 Identify existing or create new MATLAB code that calls the `sin` function. For example:

```
function y = my_sin_fnc(x)
    y = sin(x);
end
```

Note If you are replacing a custom function, use the `coder.replace` function.

- 4 Open the MATLAB Coder app.
- 5 Add the function that includes a call to the `sin` function as an entry-point file. For example, add `my_sin_func.m`. The app creates a project named `my_sin_func.prj`.
- 6 Click **Next** to go to the **Define Input Type** step. Define the types for the entry-point function inputs.
- 7 Click **Next** to go to the **Check for Run-Time Issues** step. This step is optional. However, it is a best practice to perform this step. Provide a test file that calls your entry-point function. The app generates a MEX function from your entry-point function. Then, the app runs the test file, replacing calls to the MATLAB function with calls to the generated MEX function.
- 8 Click **Next** to go to the **Generate Code** step. To open the **Generate** dialog box, click the **Generate** arrow .
- 9 Set **Build type** to generate a library or executable.
- 10 Click **More Settings**.
- 11 Configure the code generator to use your code replacement library. On the **Custom Code** tab, set the **Code replacement library** parameter to the name of your library. For example, `Sin Function Example`.
- 12 Configure the code generation report. On the **Debug** tab, set the **Always create a report**, **Code replacements**, and **Automatically launch a report if one is generated** parameters.
- 13 Configure the code generator to generate code only. For **Build type**, select **Source code**. You want to review your code replacements in the generated code before building an executable.
- 14 Click **Generate** to generate C code and a report.
- 15 Review code replacement results in the Code Replacements Report section of the code generation report.

The report indicates that the code generator found a match and applied the replacement code for the function `sin_dbl`.

- 16 Review the code replacements. In the report, click the MATLAB function that triggered the replacement, `my_sin_func.m`. The MATLAB Editor opens and highlights the function call that triggers the code replacement.

Identify Code Replacement Library Requirements

What Is a Code Replacement Library?

A code replacement library defines optimizations for generated C or C++ code from Simulink models or MATLAB code for specific targets. You can configure the code generator to use your code replacement library to replace specified functions in your model or MATLAB code with optimized implementations.

What Functions Can Be Optimized with a Code Replacement Library?

You can use a code replacement library to optimize the performance of functions defined either by Simulink models or MATLAB code. To look up functions that are available to optimize, see “Code You Can Replace From Simulink Models” on page 72-6 and “Code You Can Replace from MATLAB Code” on page 73-5.

How to Develop a Code Replacement Library

You can develop a code replacement library either interactively, using the **Code Replacement Tool** (crtool), or programmatically, using the MATLAB programming interface. The Code Replacement Tool is quick, easy, and ideal for first time library development, while the MATLAB Programming interface provides more customization and control options. To determine which approach to use, identify your use case below:

Interactive Approach:

- Developing a code replacement library for the first time
- Rapid prototyping

Programmatic Approach:

- Specifying code replacement attributes not available with the Code Replacement Tool
- Creating or modifying code replacement library entries by copying, pasting, and editing
- Modifying a registration file by copying and pasting content

Identify Basic Requirements

- What model or MATLAB code do you want to optimize by using a code replacement library?
- What functions and operations within your model or MATLAB code do you want to replace? What is the signature for each function or operation that you want to replace?
- What build files (source, header, object) do you need to provide to the code generator?

- “Code You Can Replace from MATLAB Code” on page 73-5

Define Code Replacement Library Optimizations

A code replacement library contains one or more code replacement tables. Each table contains one or more code replacement entries. Each entry contains a mapping and entry parameters. The entry maps the conceptual representation of an automatically generated MATLAB or Simulink function to an implementation representation of an optimized C or C++ function. The entry parameters describe additional properties for the code generator to honor during code replacement.

To define a code replacement library, first define code replacement tables in a customization file. Then, during the registration step, create a code replacement library by selecting tables to include in your library. You can define your code replacement tables both interactively or programmatically using the same work flow.

The interactive and programmatic approaches both follow these 8 steps:

- 1 Open the environment.
- 2 Create a table.
- 3 Create an entry.
- 4 Create entry parameters.
- 5 Create the conceptual representation.
- 6 Create the implementation representation.
- 7 Specify build information.
- 8 Validate and save.

Interactively Develop a Code Replacement Library

- 1 Open the environment.

To interactively create a code replacement library, open the **Code Replacement Tool** (crtool) from the MATLAB command line with the command:

```
>> crtool
```

2 Create a table.

A code replacement table organizes code replacement entries into groupings that are easier to manage.

To create a code replacement table:

- a From the crtool menu, select **File > New table**.
- b In the right pane, name the table and click **Apply**.

3 Create an entry.

A code replacement table entry contains entry parameters and a mapping of a conceptual representation that describes a generated function to an implementation representation that describes an optimized implementation of that function.

To create a code replacement entry, use one of these methods:

- From the crtool toolbar, click the **entry-type** icon then select the **entry-type**.
- From the crtool menu, select **File > New entry > entry-type**.
- Right-click on a table and select **New entry > entry-type**.

The new entry appears without a name in the middle pane.

4 Create entry parameters.

Entry parameters specify optimization and build requirements for the code generator to honor during code replacement. These parameters vary and automatically appear in various sections of the crtool interface depending on the type of function replacement.

To create entry parameters:

- In the **Function** or **Operation** drop-down list, select the name of the function you want to replace.

This selection determines the entry parameters that appear in the crtool.

5 Create the conceptual representation.

The conceptual representation describes the signature of the function you want to replace. The conceptual representation consists of the function name, return arguments, and parameters. The return arguments are referred to as output arguments, and the parameters are referred to as input arguments. Specify each conceptual argument with a name, I/O type, and, depending on the type of replacement, other properties that appear in the crtool.

To define your conceptual representation:

- In the **Conceptual Function** or **Conceptual Operation** subsection of the crtool, specify the input and output arguments of the function you want the code generator to replace.

6 Create the implementation representation.

The implementation representation describes the signature of the replacement function defined in the code replacement library. The implementation representation consists of a function name, return arguments, and parameters. Specify each implementation argument with a type, type qualifier, and complexity.

To define your implementation representation:

- In the **Implementation Function** or **Operation Function** subsection of the crtool, specify the input and output arguments for the optimized function defined in the code replacement library.

7 Specify build information.

Build information provides the code generator with the files to perform function replacement.

To specify build information:

- In the crtool, click the **Build Information** tab to open the build requirements pane. Specify necessary build information in these fields:

| Parameter | Description |
|---------------------------------------|---|
| Implementation header file | Name of header file needed for code replacement. |
| Implementation source file | Name of source file needed for code replacement. |
| Additional header files/include paths | Name and path of additional header files needed for code replacement. |
| Additional source files/paths | Name and path of additional source files needed for code replacement. |
| Additional object files/paths | Name and path of additional object files needed for code replacement. |
| Additional link flags | Flags the linker needs to generate an executable file for the replacement code. |
| Additional compile flags | Flags the compiler needs to generate object code for the replacement code. |
| Copy files to build directory | Flags whether to copy header, source, or object files, which are required to generate replacement code, to the build folder before code generation. If you specify files with Additional header files/include paths or Additional source files/ paths and you copy files, the compiler and utilities such as packNGo might find duplicate instances of files. |

8 Validate and save.

Save your code replacement library with the same name as your code replacement table on your MATLAB path. Saving your library automatically validates unvalidated content.

To validate and save your library:

- From the crtool menu, select **File > Save Table > Save**.

Programmatically Develop a Code Replacement Library

- 1 Open the environment.

To programmatically create a code replacement library, open a MATLAB function file. From the MATLAB menu select **New > Function**.

- 2 Create a table.

A code replacement table organizes code replacement entries into groupings that are easier to manage.

To create a code replacement table:

- a Create a function you can use to call your code replacement library table. The function should not have arguments and return a table object.
- b Create a table object with a call to `RTW.TflTable`.

```
function hTable = code_replacement_library_table()
% Create a function to call code replacement library table

%% Create a code replacement library table object
hTable = RTW.TflTable;

end
```

- 3 Create an entry.

A code replacement table entry contains entry parameters and a mapping of a conceptual representation of a generated function to the implementation representation of an optimized implementation of that function.

To create a code replacement table:

- a Identify the type of function you want to replace.
- b Call the corresponding Entry Function to create an entry in your table.

| Type of Function You Want to Replace | Entry Function |
|---|--|
| Math Operation | RTW.TflCOperationEntry |
| Function | RTW.TflCFunctionEntry |
| BLAS operation | RTW.TflBlasEntryGenerator |
| CBLAS operation | RTW.TflCBlasEntryGenerator |
| Fixed-point addition and subtraction operations | RTW.TflCOperationEntryGenerator |
| Net slope fixed-point operation | RTW.TflCOperationEntryGenerator_NetSlope |
| Semaphore or mutex | RTW.TflCSemaphoreEntry |
| Custom function | RTW.TflCFunctionEntryML |
| Custom operation | RTW.TflCOperationEntryML |

```
function hTable = code_replacement_library_table()
% Create a function to call code replacement library table
```

```

%% Create a code replacement library table object
hTable = RTW.TflTable;

%% Create a code replacement library entry
% Pick one from list below
hEntry = RTW.TfLCOperationEntry;
hEntry = RTW.TflCFunctionEntry;
hEntry = RTW.TflBlasEntryGenerator;
hEntry = RTW.TflCBlasEntryGenerator;
hEntry = RTW.TfLCOperationEntryGenerator;
hEntry = RTW.TfLCOperationEntryGenerator_NetSlope;
hEntry = RTW.TflCSemaphoreEntry;
hEntry = RTW.TflCFunctionEntryML;
hEntry = RTW.TfLCOperationEntryML;

end

```

4 Create entry parameters.

Entry parameters specify optimization and build requirements for the code generator to honor during code replacement. These parameters vary depending on the type of function replacement.

To create your entry parameters:

- Call the Set Parameters function that corresponds with the type of function you want to replace identified in the previous step (step 3).

| Type of Function You Want to Replace | Set Parameters function |
|---|---------------------------------|
| Math operation, BLAS operation, CBLAS operation, Fixed-Point, Net Slope Fixed-Point, Custom operation | setTfLCOperationEntryParameters |
| Function, Custom function | setTflCFunctionEntryParameters |
| Semaphore or Mutex | setTflCSemaphoreEntryParameters |

Each Set Parameter function is shown with all available properties set to their default values. The exact properties and values you need to specify depends on the function you replace. See examples for specific replacement details.

```

function hTable = code_replacement_library_table()
% Create a function to call code replacement library table

%% Create a code replacement library table object
hTable = RTW.TflTable;

%% Create a code replacement library entry

end

```

5 Create the conceptual representation.

The conceptual representation describes the signature of the function you want to replace. It consists of the function name, return arguments, and parameters. The return arguments are referred to as output arguments, and the parameters are referred to as input arguments. Specify each conceptual argument with the required properties, and, depending on the type of replacement, other optional properties.

Required properties:

- **Name**- Defined as y1..yn for output arguments and u1..un for input arguments
- **I/O type**- Defined as RTW_IO_OUTPUT or RTW_IO_INPUT

To define your conceptual representation, use one of these approaches:

| Approach | Function | Goal |
|----------|---------------------------|---|
| 1 | createAndAddConceptualArg | Customization and control.
If you want to explicitly specify arguments as scalar or matrix and other properties. |
| 2 | getTfLArgFromString | Rapid prototyping.
If you want to quickly specify arguments with built-in data types. |

Programming approaches are shown with all available properties set to default values. The exact properties and values you need to specify depends on the function you replace. See examples for specific replacement details.

```

function hTable = code_replacement_library_table()
% Create a function to call code replacement library table

%% Create a code replacement library table object
hTable = RTW.TflTable;

%% Create a code replacement library entry
% Pick one from list below
hEntry = RTW.TflCOperationEntry;
hEntry = RTW.TflCFunctionEntry;
hEntry = RTW.TflBlasEntryGenerator;
hEntry = RTW.TflCBlasEntryGenerator;
hEntry = RTW.TflCOperationEntryGenerator;
hEntry = RTW.TflCOperationEntryGenerator_NetSlope;
hEntry = RTW.TflCSemaphoreEntry;
hEntry = RTW.TflCFunctionEntryML;
hEntry = RTW.TflCOperationEntryML;

%% Create entry parameters
% Pick one from list below
% To view properties, see step 4
hEntry.setTflCOperationEntryParameters( );
hEntry.setTflCFunctionEntryParameters( );
hEntry.setTflCSemaphoreEntryParameters( );

%% Create the conceptual representation

% Approach 1: createAndAddConceptualArg
% arg = createAndAddConceptualArg(hEntry, argType, varargin)
% argType - 'RTW.TflArgNumeric' | 'RTW.TflArgMatrix'
% varargin - 'name', 'value' pairs shown below set to default values,
% includes name and I/O type

% Define Output Arguments
hEntry.createAndAddConceptualArg(...
    'RTW.TflArgNumeric', ...
    'Name', 'y1', ...
    'IOType', 'RTW_IO_OUTPUT', ...
    'IsSigned', true, ...
    'WordLength', 32, ...
    'CheckSlope', true, ...
    'CheckBias', true, ...
    'DataTypeMode', 'Fixed-point:binary point scaling', ...
    'DataType', 'Fixed', ...
    'Scaling', 'BinaryPoint', ...
    'Slope', 1, ...
    'SlopeAdjustmentFactor', 1.0, ...
    'FixedExponent', -15, ...
    'Bias', 0.0, ...
    'FractionLength', 15, ...
    'BaseType', 'double', ...
    'DimRange', [2,2]);

% Define Input Arguments
hEntry.createAndAddConceptualArg(...
    'RTW.TflArgNumeric', ...
    'Name', 'u1', ...
    'IOType', 'RTW_IO_INPUT', ...

```

```

        'IsSigned',           true, ...
        'WordLength',       32, ...
        'CheckSlope',       true, ...
        'CheckBias',        true, ...
        'DataTypeMode',     'Fixed-point:binary point scaling', ...
        'DataType',         'Fixed', ...
        'Scaling',          'BinaryPoint', ...
        'Slope',            1, ...
        'SlopeAdjustmentFactor', 1.0, ...
        'FixedExponent',    -15, ...
        'Bias',             0.0, ...
        'FractionLength',   15, ...
        'BaseType',         'double', ...
        'DimRange',         [2,2]);

% Approach 2: getTflArgFromString
% arg = getTflArgFromString(hEntry, name, I/O type)
% name- y1..yn | u1..un
% I/O type- RTW_IO_OUTPUT | RTW_IO_INPUT

% Define Output Arguments
arg = getTflArgFromString('y1', 'double');
arg.IOType = 'RTW_IO_OUTPUT';
hEntry.addConceptualArg(arg);

% Define Input Arguments
arg = getTflArgFromString('u1', 'double');
arg.IOType = 'RTW_IO_INPUT';
hEntry.addConceptualArg(arg);

end

```

6 Create the implementation representation.

The implementation representation describes the signature of the replacement function defined by the code replacement library. It consists of the function name, return arguments, and parameters. Specify the implementation arguments with a type, type qualifier, and complexity. After you define your implementation representation, add your completed entry to the code replacement table with a call to the function `addEntry`.

To define your implementation representation, use one of these approaches:

| Approach | Function | Goal |
|----------|--|--|
| 1 | <code>copyConceptualArgsToImplementation</code> | Identical arguments.

Specify implementation arguments and conceptual arguments have the same properties. |
| 2 | <code>createAndAddImplementationArg</code>
<code>createAndSetCImplementationReturn</code> | Same order, different properties.

Specify implementation arguments have the same order as conceptual arguments but have different properties. |

| Approach | Function | Goal |
|----------|-----------------------|---|
| 3 | getTflArgFromString | Add constant value.

Specify implementation arguments with a constant value. |
| 4 | getTflDWorkFromString | Mutex/Semaphore replacement.

Specify implementation arguments for mutex or semaphore functions. |
| 5 | createCRLEntry | Create entry with one function.

Declare and define a code replacement table entry (conceptual and implementation arguments) in one function. |

Programming approaches are shown with all available properties set to their default values. The exact properties and values you need to specify depends on the function you replace. See examples for specific replacement details.

```
function hTable = code_replacement_library_table()
% Create a function to call code replacement library table

%% Create a code replacement library table object
hTable = RTW.TflTable;

%% Create a code replacement library entry
% Pick one from list below
hEntry = RTW.TflCOperationEntry;
hEntry = RTW.TflCFunctionEntry;
hEntry = RTW.TflBlasEntryGenerator;
hEntry = RTW.TflCBlasEntryGenerator;
hEntry = RTW.TflCOperationEntryGenerator;
hEntry = RTW.TflCOperationEntryGenerator_NetSlope;
hEntry = RTW.TflCSemaphoreEntry;
hEntry = RTW.TflCFunctionEntryML;
hEntry = RTW.TflCOperationEntryML;

%% Create entry parameters
% Pick one from list below
% To view properties, see step 4
hEntry.setTflCOperationEntryParameters( );
hEntry.setTflCFunctionEntryParameters( );
hEntry.setTflCSemaphoreEntryParameters( );

%% Create the conceptual representation

% Approach 1: createAndAddConceptualArg
% arg = createAndAddConceptualArg(hEntry, argType, varargin)
% argType - 'RTW.TflArgNumeric' | 'RTW.TflArgMatrix'
% varargin - 'name', 'value' pairs shown below set to default values,
% includes name and I/O type, to view properties, see step 5

% Define Output Arguments
hEntry.createAndAddConceptualArg( );
```

```

% Define Input Arguments
hEntry.createAndAddConceptualArg( );

% Approach 2: getTflArgFromString
% arg = getTflArgFromString(hEntry, name, I/O type)
% name- y1..yn | u1..un
% I/O type- RTW_IO_OUTPUT | RTW_IO_INPUT

% Define Output Arguments
arg = getTflArgFromString('y1', 'double');
arg.IOType = 'RTW_IO_OUTPUT';
hEntry.addConceptualArg(arg);

% Define Input Arguments
arg = getTflArgFromString('u1', 'double');
arg.IOType = 'RTW_IO_INPUT';
hEntry.addConceptualArg(arg);

%% Create the implementation representation

% Approach 1: copyConceptualArgsToImplementation
copyConceptualArgsToImplementation(hEntry);

% Approach 2: createAndSetCImplementation, createAndSetCImplementationArg
% arg = createAndAddImplementation(hEntry, argType,varargin),
% arg = createAndSetCImplementationReturn(hEntry, argType,varargin)
% argType - 'RTW.TflArgNumeric' | 'RTW.TflArgMatrix'
% varargin - 'name', 'value' pairs shown below set to default values,
% includes name and I/O type

% Define Output Arguments
hEntry.createAndSetCImplementationReturn(...
    'RTW.TflArgNumeric',      ...
    'Name',                  'y1', ...
    'IOType',                'RTW_IO_OUTPUT', ...
    'IsSigned',              true, ...
    'WordLength',            16, ...
    'DataTypeMode',          'Fixed-point:binary point scaling', ...
    'DataType',              'Fixed', ...
    'Scaling',               'BinaryPoint', ...
    'Slope',                 1.0, ...
    'SlopeAdjustmentFactor', 1.0, ...
    'FixedExponent',         -15, ...
    'Bias',                  0.0, ...
    'FractionLength',        15, ...
    'Value',                 0);

% Define Input Arguments
hEntry.createAndAddImplementationArg(...
    'RTW.TflArgNumeric',      ...
    'Name',                  'u1', ...
    'IOType',                'RTW_IO_INPUT', ...

```

```

        'IsSigned',           true, ...
        'WordLength',       16, ...
        'DataTypeMode',    'Fixed-point:binary point scaling', ...
        'DataType',        'Fixed', ...
        'Scaling',         'BinaryPoint', ...
        'Slope',           1.0, ...
        'SlopeAdjustmentFactor', 1.0, ...
        'FixedExponent',   -15, ...
        'Bias',            0.0, ...
        'FractionLength',  15, ...
        'Value',           0);

% Approach 3: getTflArgFromString
% arg = getTflArgFromString(hEntry, name, datatype)
% name- y1..yn | u1..un, datatype - built-in data type

% Define Output arguments
arg = getTflArgFromString(hEntry, 'y1', 'double');
arg.IOType = 'RTW_IO_OUTPUT';
hEntry.Implementation.setReturn(arg);

% Define Input arguments
arg = getTflArgFromString(hEntry, 'u1', 'double', 0);
hEntry.Implementation.addArgument(arg);

% Approach 4: getTflDWorkFromString
% arg = getTflDWorkFromString(hEntry, name, datatype)

% Define arguments
arg = getTflDWorkFromString('d1', 'void*');
hEntry.addDWorkArg(arg);

% Approach 5: createCRLEntry
% tableEntry = createCRLEntry(crTable,conceptualSpecification,implementationSpecification)

% Define code replacement conceptual and implementation arguments
hEntry = createCRLEntry(...
    hTable, ...
    'conceptualSpecification', ...
    'implementationSpecification');

%% Add code replacement library entry to table
hTable.addEntry(hEntry);

end

```

7 Specify build information.

Specify build information for your code replacement library. Build information provides the code generator with the files necessary to perform function replacement.

To specify build information:

- Specify your build parameters in the Entry Parameters function you defined in step 4 or with the specified functions. Specify build information with the following properties:

| Parameter | Description |
|---|---|
| Implementation header file
Set properties
<code>ImplementationHeaderFile</code> and
<code>ImplementationHeaderPath</code> . | Name of header file needed for code replacement. |
| Implementation source file
Set properties
<code>ImplementationSourceFile</code> and
<code>ImplementationSourcePath</code> . | Name of source file needed for code replacement. |
| Additional header files/include paths
For each file, specify the file name and path in calls to the functions
<code>addAdditionalHeaderFile</code> and
<code>addAdditionalIncludePath</code> . | Name and path of additional header files needed for code replacement. |
| Additional source files/paths
For each file, specify the file name and path in calls to the functions
<code>addAdditionalSourceFile</code> and
<code>addAdditionalSourcePath</code> . | Name and path of additional source files needed for code replacement. |
| Additional object files/paths
For each file, specify the file name and path in calls to the functions
<code>addAdditionalLinkObj</code> and
<code>addAdditionalLinkObjPath</code> . | Name and path of additional object files needed for code replacement. |
| Additional link flags
Set the entry property
<code>AdditionalLinkFlags</code> to a cell array of character vectors or string array representing the required compile flags. | Flags the linker needs to generate an executable file for the replacement code. |
| Additional compile flags
Set the entry property
<code>AdditionalCompileFlags</code> to a cell array of character vectors or string array representing the required link flags. | Flags the compiler needs to generate object code for the replacement code. |

| Parameter | Description |
|---|---|
| Copy files to build directory.
Set property GenCallback to 'RTW.copyFileToBuildDir'.
If a match occurs for a table entry, a call to the function RTW.copyFileToBuildDir copies required files to the build folder.
If you specify additional header files/include paths or additional source files/paths and you copy files, the compiler and utilities such as packNGo might find duplicate instances of files. | Flags whether to copy header, source, or object files, which are required to generate replacement code, to the build folder before code generation. If you specify files with Additional header files/include paths or Additional source files/ paths and you copy files, the compiler and utilities such as packNGo might find duplicate instances of files. |

- If an entry uses header, source, or object files, consider whether to make the files accessible to the code generator. You can copy files to the build folder or you can specify individual file names and paths explicitly.
- If you specify *additional* header files/include paths or source files/paths and you copy files, the compiler and utilities such as packNGo might find duplicate instances of files (an instance in the build folder and an instance in the original folder).
- If you choose to copy files to the build folder and you are using the packNGo function to relocate static and generated code files to another development environment:
 - In the call to packNGo, specify the property-value pair 'minimalHeaders' true (the default). That setting instructs the function to include the minimal header files required to build the code in the zip file.
 - Do not collocate files that you copy with files that you do not copy. If the packNGo function finds multiple instances of the same file, the function returns an error.
- If you use the programming interface, paths that you specify can include tokens. A token is a variable defined as a character vector, cell array of character vectors, or string array in the MATLAB workspace that you enclose with dollar signs (*\$variable\$*). The code generator evaluates and replaces a token with the defined value. For example, consider the path \$myfolder\$\folder1, where myfolder is a character vector or string scalar variable defined in the MATLAB workspace as 'd:\work\source\module1'. The code generator generates the custom path as d:\work\source\module1\folder1.

8 Validate and save.

Save your code replacement library customization file with the same name as your code replacement library table on your MATLAB path.

To save and validate your library:

- Save your file. From the MATLAB menu, select **File > Save**.
- Validate your library by calling it from the MATLAB command line. For example:

```
>> hTable = code_replacement_library_table()
```

Register Code Replacement Library

Create a code replacement library by defining in a registration file the library name, code replacement tables, and other information. After you define and register your library it becomes available to the code generator for code replacement.

Interactively Develop and Load a Registration file

- 1 In the crtool, select **File > Generate registration file**.

- 2 In the **Generate registration file** dialog box, specify registration information. Then click **OK**.

| Parameter | Description |
|--------------------------|---|
| Registry name (Required) | Code replacement library name. |
| Table list (Required) | Comma-separated list of one or more code replacement tables that you want in the library. Specify tables by using either their names (if located on the MATLAB search path), absolute paths, or relative paths. |
| Base CRL | Enables you to specify library hierarchies. Provide the name of a registered library to serve as a base for the library that you are currently registering. For example, a TI device library can be a base for a TI C28x library. |
| Target HW device | Comma-separated list of one or more hardware devices that this library supports. Indicate support of all devices with an asterisk (*). |
| Description | Description of the purpose and content of the library. |

| Parameter | Description |
|---------------------------------------|-----------------------------------|
| Generate data alignment specification | Flag that enables data alignment. |

- To use your registered code replacement library, refresh your current MATLAB session with the command:

```
>> sl_refresh_customizations
```

Programmatically Develop and Load a Registration File

- Open a MATLAB function file. From the MATLAB menu, select **New > Function**.
- Save the function file with the name `rtwTargetInfo.m`.
- Copy and paste the following code into your file to use as a template.

```
function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry; %instantiates a registration entry
this(1).Name = 'Example Code Replacement Library';
this(1).TableList = {'example_code_replacement_table.m'};
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'This registers an example library';

end
```

- In the template, specify the following registration information:

| Parameter | Description |
|---------------------------------------|---|
| Registry name (Required) | Code replacement library name. |
| Table list (Required) | Comma-separated list of one or more code replacement tables that you want in the library. Specify tables by using either their names (if located on the MATLAB search path), absolute paths, or relative paths. |
| Base CRL | Enables you to specify library hierarchies. Provide the name of a registered library to serve as a base for the library that you are currently registering. For example, a TI device library can be a base for a TI C28x library. |
| Target HW device | Comma-separated list of one or more hardware devices that this library supports. Indicate support of all devices with an asterisk (*). |
| Description | Description of the purpose and content of the library. |
| Generate data alignment specification | Flag that enables data alignment. |

- 5 Save the file on your MATLAB path.
- 6 To use your registered code replacement library, refresh your current MATLAB session with the command:

```
>> sl_refresh_customizations
```

Examples

Register one code replacement library

```
function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry; %instantiates a registration entry
this(1).Name = 'Example Code Replacement Library';
this(1).TableList = {'example_code_replacement_table.m'};
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'This registers an example library';

end
```

Register multiple code replacement libraries

```
function rtwTargetInfo(cm)
cm.registerTargetInfo(@loc_register_crl);
end

function thisCRL = loc_register_crl
% Register a code replacement library for use with model: rtwdemo_crladdsub
thisCrl(1) = RTW.TflRegistry;
thisCrl(1).Name = 'Addition & Subtraction Examples';
thisCrl(1).Description = 'Example of addition/subtraction op replacement';
thisCrl(1).TableList = {'crl_table_addsub'};
thisCrl(1).TargetHWDeviceType = {'*'};

% Register a code replacement library for use with model: rtwdemo_crlmuldiv
thisCrl(2) = RTW.TflRegistry;
thisCrl(2).Name = 'Multiplication & Division Examples';
thisCrl(2).Description = 'Example of mult/div op repl for built-in integers';
thisCrl(2).TableList = {'c:/work_crl/crl_table_muldiv'};
thisCrl(2).TargetHWDeviceType = {'*'};

% Register a code replacement library for use with model: rtwdemo_crlfixpt
thisCrl(3) = RTW.TflRegistry;
thisCrl(3).Name = 'Fixed-Point Examples';
thisCrl(3).Description = 'Example of fixed-point operator replacement';
thisCrl(3).TableList = {fullfile('${MATLAB_ROOT}', ...
    'toolbox', 'rtw', 'rtwdemos', 'crl_demo', 'crl_table_fixpt')};
thisCrl(3).TargetHWDeviceType = {'*'};

end
```

Register a code replacement hierarchy

```
function rtwTargetInfo(cm)
```

```
cm.registerTargetInfo(@loc_register_crl);
end

function thisCRL = loc_register_crl
% Register a code replacement library that includes common entries
thisCrl(1) = RTW.TflRegistry;
thisCrl(1).Name = 'Common Replacements';
thisCrl(1).Description = 'Common code replacement entries shared by other libraries';
thisCrl(1).TableList = {'crl_table_general'};
thisCrl(1).TargetHWDeviceType = {'*'};

% Register a code replacement library for TI devices
thisCrl(2) = RTW.TflRegistry;
thisCrl(2).Name = 'TI Device Replacements';
thisCrl(2).Description = 'Code replacement entries shared across TI devices';
thisCrl(2).TableList = {'crl_table_TI_devices'};
thisCrl(2).TargetHWDeviceType = {'TI C28x', 'TI C55x', 'TI C62x', 'TI C64x', 'TI 67x'};
thisCrl(1).BaseTfl = 'Common Replacements'

% Register a code replacement library for TI c6xx devices
thisCrl(3) = RTW.TflRegistry;
thisCrl(3).Name = 'TI c6xx Device Replacements';
thisCrl(3).Description = 'Code replacement entries shared across TI C6xx devices';
thisCrl(3).TableList = {'crl_table_TIC6xx_devices'};
thisCrl(3).TargetHWDeviceType = {'TI C62x', 'TI C64x', 'TI 67x'};

% Register a code replacement library for the TI c67x device
thisCrl(4) = RTW.TflRegistry;
thisCrl(4).Name = 'TI c67x Device Replacements';
thisCrl(4).Description = 'Code replacement entries for the TI C67x device';
thisCrl(4).TableList = {'crl_table_TIC67x_device'};
thisCrl(4).TargetHWDeviceType = {'TI 67x'};

end
```

- “What Is Code Replacement Customization?” on page 73-3
- “Code You Can Replace from MATLAB Code” on page 73-5

Troubleshoot Code Replacement Library Registration

If a code replacement library is not listed as a configuration option or does not appear in the Code Replacement Viewer:

- Refresh the library registration information within the current MATLAB session (RTW.TargetRegistry.getInstance('reset'); or for the Simulink environment,sl_refresh_customizations).
- See whether the registration file, rtwTargetInfo.m, contains an error.

See Also

More About

- “Register Code Replacement Library” on page 73-38

Verify Code Replacement Library

Verify your code replacement library by examining its structure, replacement, and performance. Use the Code Replacement Viewer (crviewer) to verify the structure of your library. Use the code replacement report to verify the replacements made with your library in generated code. Use crviewer again to verify the performance of your library during code generation by examining the replacement hit and miss logs.

Verify Library Structure

Use the Code Replacement Viewer (crviewer) to open and view the structure of your code replacement library by examining its tables and table entries.

- 1 From the MATLAB command prompt, open your code replacement library using the crviewer with the command:

```
>> crviewer('library')
```
- 2 The viewer opens your code replacement library and shows its code replacement tables in the left pane. Verify that your library lists all required tables in the correct relative order.
- 3 Open and view the entries for each code replacement table. In the crtool, click each table listed in the left pane to view its entries in the middle pane.

If you are not using the crviewer, you can open each table directly from the MATLAB command prompt with the command:

```
crviewer(table)
```

- 4 For each table in your library, verify that it lists all required entries in the correct relative order. Verify that the conceptual representation and implementation representation are correct for each entry in the table.

Verify Library Replacement

Use the Code Replacements Report to verify that when the code generator uses your code replacement library it creates replacements as expected in the generated code. For each instance of replacement, the Code Replacements Report provides a mapping between the Simulink block that triggered the replacement and its implementation in the generated code. Use this mapping to verify correct code replacement by tracing between the report and the code in either direction (from report to code or code to report).

To generate the Code Replacements Report:

- 1 Configure your model to use your code replacement library.
- 2 Configure your model to open the Code Generation Report. The Code Replacements Report is a tab within this report. In the Model Configuration Parameters dialog box, in the **Code Generation > Report** pane, select:
 - **Create code generation report**
 - **Open report automatically**
 - **Model-to-code**

- **Summarize which block triggered code replacements**
- 3 Configure the generated code to include comments. In the Model Configuration Parameters dialog box, in the **Code Generation > Comments** pane, select:
 - **Include comments**
 - Either or both of **Simulink block comments** and **Simulink block descriptions**
 - 4 Build your model to generate code only. The Code Generation Report opens automatically. On the left pane, click to open the Code Replacements Report.
 - 5 Verify that code replacements occur as expected.
 - **Navigate from report to model:** In the Code Replacements Report, click each block link to see the source that triggered replacement.
 - **Navigate from model to report:** In the Simulink model window, use model-to-code highlighting to trace code replacements. Right-click blocks where you expected code replacement to occur and select **C/C++ Code > Navigate to C/C++ Code**. The report appears with the corresponding replacement code highlighted.

Verify Library Performance

Verify the performance of your code replacement library by examining the hits and misses that occurred during code generation using your library. During code generation, when the code generator finds a match for code replacement from your code replacement library, it logs the hit in a hit cache. When it does not find a code replacement match, it logs the failed attempt in the miss cache. Each time that you generate code, the code generator overwrites its previous hit and miss cache logs.

To review trace information from the hit and miss cache data, use the Code Replacement Viewer (crviewer). From the hit cache, you can identify when code replacement successfully occurred, and from the miss cache, you can troubleshoot when code replacement did not take place. The miss cache trace information provides you information about the reason for the miss, a link to the relevant source location for the miss, and the call site object of the miss. For more information, see “Troubleshoot Code Replacement Misses” on page 72-59.

Review Code Replacements

After you review the content of your code replacement library and tables, generate code and a code generation report. Verify that the code generator replaces code as you expect.

The Code Replacements Report details the code replacement library functions that the code generator uses for code replacements. The report provides a mapping between each replacement instance and the line of MATLAB code that triggered the replacement. The Code Replacements report is not available for generated MEX functions.

The following example illustrates two complementary approaches for reviewing code replacements:

- Check the Code Replacements Report section of the code generation report for expected replacements.
- Trace code replacements.

- 1 Identify the MATLAB function where you anticipate that a function or operator replacement occurs. This example uses the function `matlabroot/toolbox/rtw/rtwdemos/crl_demo/addsub_two_int16.m`.

```
function [y1, y2] = addsub_two_int16(u1, u2)

y1 = int16(u1 + u2);
y2 = int16(u1 - u2);
```

- 2 Identify or create code or a script to exercise the function. For example, consider test file `addsub_to_int16_test.m`, which includes the following code:

```
disp('Input')
u1 = int16(10)
u2 = int16(10)

[y1, y2] = addsub_two_int16(u1, u2);

disp('Output')
disp('y1 =')
disp(y1);
disp('y2 =')
disp(y2);
```

- 3 Open the MATLAB Coder app.
- 4 On the **Select Source Files** page, add your function to the project. For this example, add function `addsub_two_int16`. Click **Next**.
- 5 On the **Define Input Types** page, use the test file `addsub_to_int16_test` to automatically define the input types. Click **Next**.
- 6 On the **Check for Run-Time Issues** page, specify the test file `addsub_to_int16_test`. The app runs the test file, replacing calls to `addsub_to_int16_test` with calls to a MEX version of `addsub_to_int16_test`. Click **Next**.
- 7 To open the **Generate** dialog box, on the **Generate Code** page, click the **Generate** arrow .
- 8 Set **Build type** to generate source code. Before you build an executable, you want to review your code replacements in the generated code.
- 9 In the Generate dialog box, click **More Settings**.
- 10 Configure the code generator to use your code replacement library. On the **Custom Code** tab, set the **Code replacement library** parameter to the name of your library. For this example, set the library to `Addition & Subtraction Examples`.
- 11 Configure the code generation report to include the Code Replacements Report. On the **Debugging** tab, select:
 - **Always create a code generation report**
 - **Code replacements**
 - **Automatically launch a report if one is generated**
- 12 To generate code and a report, set **Build type** to `Source Code`. Then, click **Generate**.
- 13 Open the **Code Replacements Report** section of the code generation report.

That report lists the replacement functions that the code generator used. The report provides a mapping between each replacement instance and the MATLAB code that triggered the replacement.

Review the report:

- Check whether expected function and operator code replacements occurred.
- In the replacements sections, click each code link to see the source that triggered the reported code replacement.

If a function or operator is not replaced as expected, the code generator used a higher-priority (lower-priority value) match or did not find a match.

To analyze and troubleshoot code replacement misses, use the trace information that the **Code Replacement Viewer** provides.

Troubleshoot Code Replacement Misses

Use miss reason messages that appear in the **Code Replacement Viewer** to analyze and correct code replacement misses.

Miss Reason Messages

The Code Replacement Viewer displays miss reason messages in trace information for code replacement misses. A legend listing each message that appears in the miss report precedes the report details. A message consists of:

- Numeric identifier, which identifies the message in the report details.
- Message text, which in some cases includes placeholders for names of arguments, call site object values, table entry values, and property names.

For example:

1. Mismatched data types (argument name, CS0 value, table entry value)

The parenthetical information represents placeholders for actual values that appear in the report details.

In the **Miss Source Locations** table that lists the miss details, the **Reason** column includes:

- The message identifier, as listed in the legend.
- The placeholder values for that instance of the miss reason message.

The following **Reason** details indicate a data type mismatch because the call site object specifies data type `int8` for arguments `y1`, `u1`, and `u2`, while the code replacement table entry specifies `uint32`.

1. `y1, int8, uint32`
`u1, int8, uint32`
`u2, int8, uint32`

Depending on your situation and the reported miss reason, troubleshoot reported misses by looking for instances of the following:

- A typo in the code replacement table entry definition or a source parameter setting.
- Information missing from the code replacement table entry or a source parameter setting.
- Invalid or incorrect information in the code replacement table entry definition or a source parameter setting.
- Arguments incorrectly ordered in the code replacement table entry definition or the source being replaced with replacement code.
- Failed algorithm classification for an addition or subtraction operation due to:
 - An ideal accumulator not being calculated because the type of an input argument is not fixed-point or the slope adjustment factors of the input arguments are not equal.
 - Input or output casts with a floating-point cast type.
 - Input or output casts with cast types that have different slope adjustment factors or biases.
 - Output casts not being convertible to a single output cast.

- Input casts resulting in loss of bits.

Analyze and Correct Code Replacement Misses

The following example shows how to use Code Replacement Viewer trace information to troubleshoot code replacement misses. You must have already reviewed and tested code replacements for your MATLAB code.

- 1 Review the code generated for a specific code element, looking for expected code replacement. Regenerate or reopen the code generation report for your MATLAB code. If you already generated the code generation report that includes the Code Replacements Report for *matlabroot/toolbox/rtw/rtwdemos/crl_demo/addsub_two_int16.m*, open the file *codegen/lib/addsub_two_int16/html/mldatx.html*. For information on how to regenerate the report, see “Verify Code Replacement Library” on page 73-43.

To examine the code generated for the function, from the code generation report, open the generated file *addsub_two_int16.h*.

```
extern void addsub_two_int16(double u1, double u2, short *b_y1, short *y2);
```

The code generator replaced code, but the replacement is for the signed version of the 16-bit addition and subtraction operations. You expected code replacements for operations on unsigned data.

- 2 Open the Code Replacements Report for the MATLAB code.
- 3 Click the link to open the Code Replacement Viewer.
- 4 In the viewer left pane, select your code replacement table. For this example, select code replacement table *crl_table_addsub*.
- 5 In the middle pane, select table entry *RTW_OP_ADD* with implementation function *u16_add_u16_u16*.
- 6 In the right pane, select the **Trace Information** tab.

The **Trace Information** is a table that lists the following information for each miss:

- Call site object preview. The call site object is the conceptual representation of addition operator. The code generator uses this object to query the code replacement library for a match.
- A link to the source location in the MATLAB function where the code generator considered replacing code.
- The reasons that the miss occurred. See “Miss Reason Messages” on page 73-47.

For this example, the report shows misses for function *addsub_two_int16.m*.

- 7 Find the source in the trace information. Depending on your situation and the reported miss reason, consider looking for a condition such as a typo in the code replacement table entry definition or a source parameter setting. For a list of conditions to consider, see “Miss Reason Messages” on page 73-47.

For this example, determine why code for function *addsub_two_int16* is not replaced with code for an unsigned 16-bit addition operation. The miss reasons for the function indicate data type and algorithm mismatches:

- The data type in the call site object is a signed 16-bit integer. The code replacement entry specifies an unsigned 16-bit integer.

- The algorithm property in the call site object is `RTW_CAST_AFTER_OP` while the code replacement entry specifies `RTW_CAST_BEFORE_OP`.
- 8** Fix the specified MATLAB code and relevant specifications or code replacement table entry. If the issue concerns the MATLAB code, use the source location in the trace information to find the code to fix. For this example, you expected an unsigned addition operation to occur for the `addsub_two_int16` function.

To fix the mismatches, in the test file `addsub_to_int16_test`, change the data types definitions for `u1` and `u2` as follows:

```
u1 = uint16(10)
u2 = uint16(10)
```

In the MATLAB Coder app:

- Open the project that contains the `addsub_to_int16` function.
 - Use the updated test file `addsub_to_int16_test` to automatically redefine the input types.
 - Change the addition and subtraction algorithm setting. Open the code replacement library `crl_table_addsub`. Change the entry **Algorithm** parameter setting from `Cast before operation (RTW_CAST_BEFORE_OP)` to `Cast after operation (RTW_CAST_AFTER_OP)`.
 - Regenerate code and a report.
- 9** From the Code Replacements Report, open the Code Replacement Viewer. Use the Code Replacement Viewer trace information to verify that your MATLAB code or code replacement table entry corrects the code replacement issue. The trace information shows a hit for function `addsub_two_int16`.

Deploy Code Replacement Library

Package and deploy your code replacement library.

- 1** Move your code replacement library customization and registration files to a location on the MATLAB® search path that is accessible to other users. If another registration file already exists in that location, copy and paste the information for your code replacement library into the existing registration file.
- 2** Refresh your session and verify that the library is available as a configuration option for the code generator.
- 3** Verify that code replacement occurs as expected in generated code.
- 4** Inform users that the code replacement library is available.

Math Function Code Replacement

This example shows how to develop a code replacement library to optimize the performance of math functions by providing information on how to define code replacement for a `sin` function. To develop a code replacement library use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 73-13.

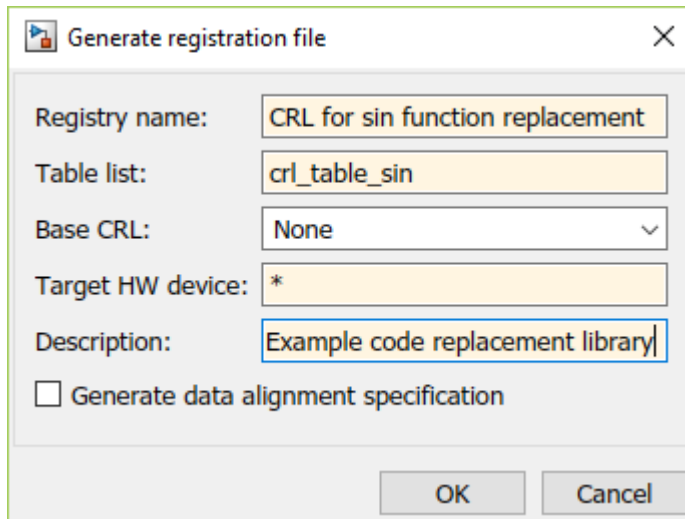

Interactively Develop a Code Replacement Library

- 1 Open the **Code Replacement Tool** (crtool), from the MATLAB command line with the following command:

```
>>crtool
```
- 2 Create a table.
 - a From the crtool context menu, select **File > New Table**.
 - b In the right pane, name the table `cr1_table_sin`. Click **Apply**.
- 3 Create an entry. From the crtool context menu, select **File > New entry > Function**.
- 4 Create entry parameters. In the **Function** drop-down list, select `sin`. Algorithm information appears in the crtool. For this example, leave the parameter unspecified.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, `y1`, and the input argument, `u1`, with the **Data Type** of double and the **Argument Type** of Scalar.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box.
- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. Click the **Mapping Information** tab and verify the fields are filled in as shown. Click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
 - a Create a function with the name of your code replacement library table that does not have arguments and returns a table object. You can use this function to call your code replacement library table.
 - b Create a table object by calling `RTW.TflTable`.

```
function hTable = crl_table_sin
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TflCFunctionEntry`.

```
function hTable = crl_table_sin
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = rtw.TflCFunctionEntry;
```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTflCFunctionEntryParameters`.

```
function hTable = crl_table_sin()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
hEntry.setTflCFunctionEntryParameters(...
    'Key', 'sin', ...
    'Priority', 30, ...
    'ImplementationName', 'mySin', ...
    'ImplementationHeaderFile', 'basicMath.h', ...
    'ImplementationSourceFile', 'basicMath.c');
```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `createAndAddConceptualArg`.

```
function hTable = crl_table_sin()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
hEntry.setTflCFunctionEntryParameters(...
    'Key', 'sin', ...
    'Priority', 30, ...
    'ImplementationName', 'mySin', ...
    'ImplementationHeaderFile', 'basicMath.h', ...
    'ImplementationSourceFile', 'basicMath.c');
```

```
%% Create the conceptual representation
hEntry.createAndAddConceptualArg(...
    'RTW.TflArgNumeric', ...
    'Name', 'y1',...
    'IOType', 'RTW_IO_OUTPUT',...
    'DataTypeMode', 'double');
```

```
hEntry.createAndAddConceptualArg(...
    'RTW.TflArgNumeric', ...
    'Name', 'u1', ...
    'IOType', 'RTW_IO_INPUT',...
    'DataTypeMode', 'double');
```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function `copyConceptualArgsToImplementation`. Add the complete entry to the table by calling the function `addEntry`.

```

function hTable = crl_table_sin()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
hEntry.setTflCFunctionEntryParameters(...
    'Key', 'sin', ...
    'Priority', 30, ...
    'ImplementationName', 'mySin', ...
    'ImplementationHeaderFile', 'basicMath.h', ...
    'ImplementationSourceFile', 'basicMath.c');

%% Create the conceptual representation
hEntry.createAndAddConceptualArg(...
    'RTW.TflArgNumeric', ...
    'Name', 'y1', ...
    'IOType', 'RTW_IO_OUTPUT', ...
    'DataTypeMode', 'double');

hEntry.createAndAddConceptualArg(...
    'RTW.TflArgNumeric', ...
    'Name', 'u1', ...
    'IOType', 'RTW_IO_INPUT', ...
    'DataTypeMode', 'double');

%% Create the Implementation Representation
copyConceptualArgsToImplementation(hEntry);

%% Add the entry to the table
hTable.addEntry(hEntry);

```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_sin
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file (a new function file) with these specifications:

```

function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for sin function replacement';
this(1).TableList = {'crl_table_sin.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

```

end

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10** Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

More About

- “Code You Can Replace from MATLAB Code” on page 73-5
- “Define Code Replacement Library Optimizations” on page 73-23
- “Develop a Code Replacement Library” on page 73-13
- “Memory Function Code Replacement” on page 73-57

Memory Function Code Replacement

This example shows how to develop a code replacement library to optimize the performance of memory functions by providing information on how to define code replacement for a memcpy function. To develop a code replacement library use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 73-13.

Interactively Develop a Code Replacement Library

- 1 Open the **Code Replacement Tool** (crtool), from the MATLAB command line with the following command:

```
>>crtool
```

- 2 Create a table.

- a From the crtool context menu, select **File > New Table**.

- b In the right pane, name the table `cr1_table_memcpy`. Click **Apply**.

- 3 Create an entry. From the crtool context menu, select **File > New entry > Function**.

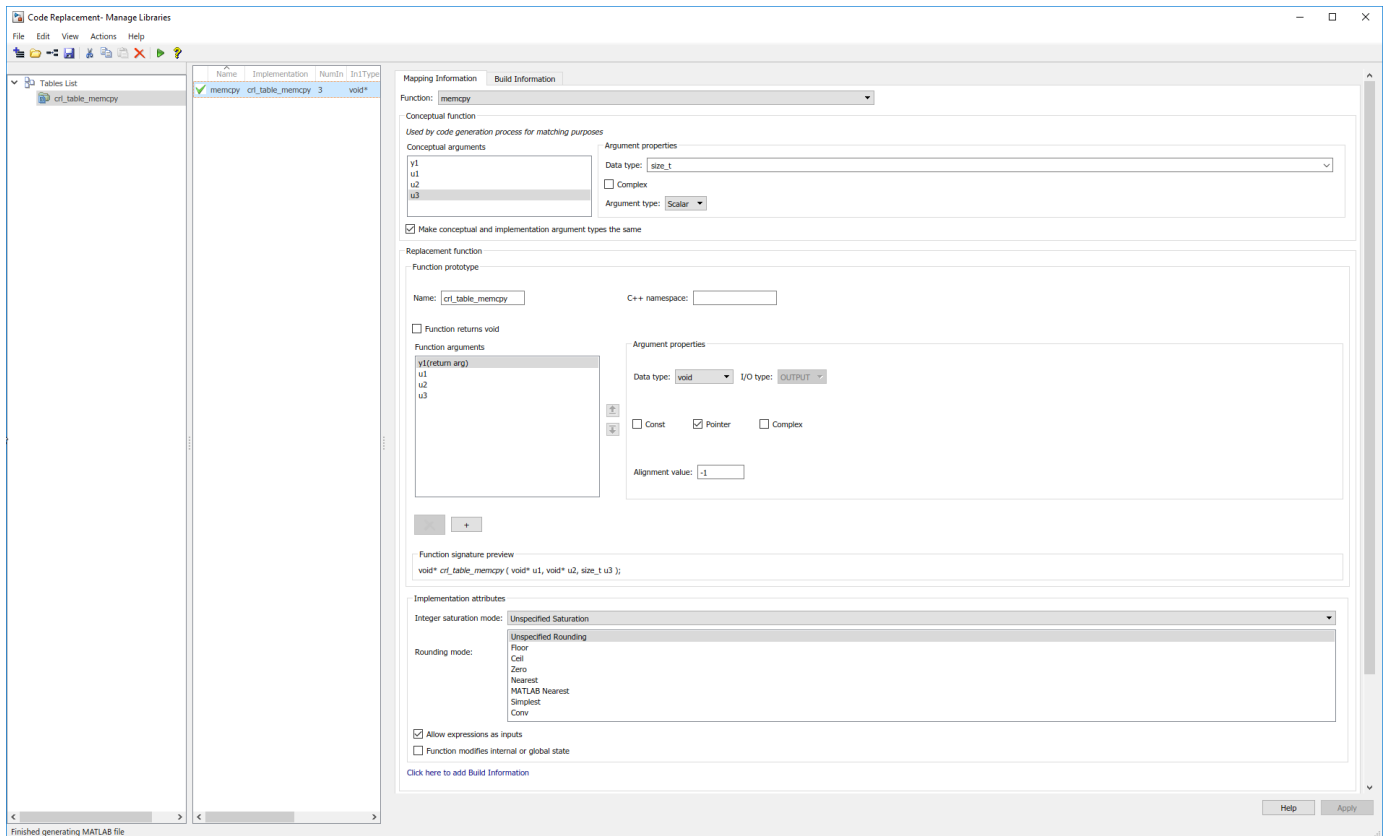

- 4 Create entry parameters. In the **Function** drop-down list, select `memcpy`.

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, `y1`, with the **Data Type** of `void` and the **Argument Type** of `Pointer`, the input arguments, `u1` and `u2` with the **Data Type** of `void` and the **Argument Type** of `Pointer` and `u3` with the **Data Type** of `unsigned integral` and the **Argument Type** of `Scalar`.

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box.

Specify a **Name** for the replacement function under **Function prototype**.

- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. In the **Mapping Information** tab, click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:
`>>sl_refresh_customizations`

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
 - a Create a function to call your code replacement library table. The function should not have arguments and return a table object.
 - b Create a table object by calling `RTW.TflTable`.

```
function hTable = crl_table_memcpy()
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TflCFunctionEntry`.

```
function hTable = crl_table_memcpy()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = rtw.TflCFunctionEntry;
```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTflCFunctionEntryParameters`.

```
function hTable = crl_table_memcpy()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
% Set SideEffects to 'true' for function returning void to prevent it from
% being optimized away.
hEntry.setTflCFunctionEntryParameters(...
    'Key', 'memcpy', ...
    'Priority', 90, ...
    'ImplementationName', 'memcpy_int', ...
    'ImplementationHeaderFile', 'memcpy_int.h',...
    'SideEffects', true);
```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `getTflArgFromString`.

```

function hTable = crl_table_memcpy()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflFunctionEntry;

%% Create entry parameters
% Set SideEffects to 'true' for function returning void to prevent it from
% being optimized away.
hEntry.setTflFunctionEntryParameters(...
    'Key', 'memcpy', ...
    'Priority', 90, ...
    'ImplementationName', 'memcpy_int', ...
    'ImplementationHeaderFile', 'memcpy_int.h', ...
    'SideEffects', true);

%% Create conceptual arguments
arg = getTflArgFromString(hTable, 'y1', 'void*');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hTable, 'u1', 'void*');
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hTable, 'u2', 'void*');
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hTable, 'u3', 'size_t');
addConceptualArg(hEntry, arg);

```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function `copyConceptualArgsToImplementation`. Add the complete entry to the table by calling the function `addEntry`.

```

function hTable = crl_table_memcpy()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflFunctionEntry;

%% Create entry parameters
setTflFunctionEntryParameters(hEntry, ...
    'Key', 'memcpy', ...
    'Priority', 90, ...
    'ImplementationName', 'memcpy_int', ...
    'ImplementationHeaderFile', 'memcpy_int.h', ...
    'SideEffects', true);

%% Create conceptual arguments
arg = getTflArgFromString(hTable, 'y1', 'void*');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hTable, 'u1', 'void*');
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hTable, 'u2', 'void*');
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hTable, 'u3', 'size_t');
addConceptualArg(hEntry, arg);

```

```

%% Create the Implementation Representation
copyConceptualArgsToImplementation(hEntry);

```

```

%% Add the entry to the table
hTable.addEntry(hEntry);

```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_memcpy
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file with these specifications:

```

function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for memory function replacement';
this(1).TableList = {'crl_table_memcpy.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end

```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Specify In-Place Code Replacement

In-place code replacement is an optimization technique that uses a single buffer, that is, the same memory, to store function input and output data, as in $x = \text{foo}(x)$.

You can develop a code replacement library to optimize in-place function argument replacement. To develop a code replacement library use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 73-13.

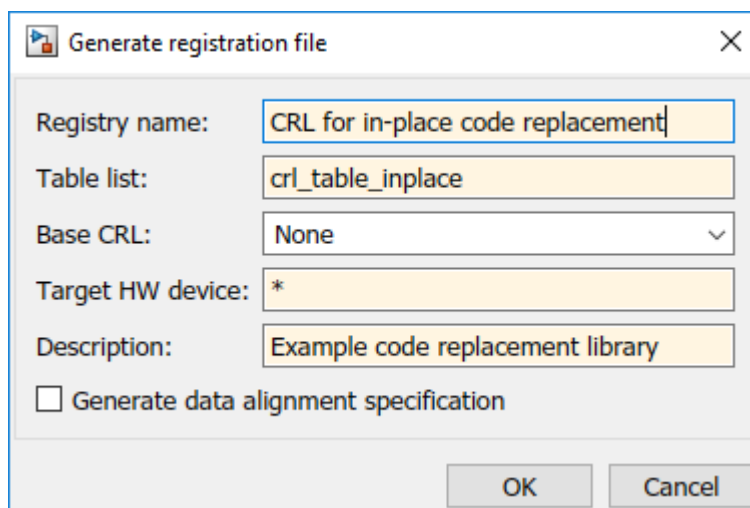

Interactively Develop a Code Replacement Library

- 1 Open the **Code Replacement Tool** (crtool), from the MATLAB command line with the following command:

```
>>crtool
```
- 2 Create a table.
 - a From the crtool context menu, select **File > New Table**.
 - b In the right pane, name the table `crl_table_inplace`. Click **Apply**.
- 3 Create an entry. From the crtool context menu, select **File > New entry > Function**.
- 4 Create entry parameters. In the **Function** drop-down list, select **custom**. Function information appears in the crtool. For this example, specify the parameter as `customFunction`.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, `y1`, and the input argument, `u1`, with the **Data Type** of **double** and the **Argument Type** of **Pointer**.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. Add the implementation parameter `y1` and `u1`. For each input argument that you want to specify as in-place with a corresponding output argument, in the **Argument** properties box, select the **Pointer** check box. For the implementation parameter `y1` in the **Argument properties** section of the dialog box, set the **In-place argument** to `u1`.
- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. In the **Mapping Information** tab, click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For

more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
 - a Create a function with the name of your code replacement library table that does not have arguments and returns a table object. You can use this function to call your code replacement library table.
 - b Create a table object by calling `RTW.TflTable`.

```
function hTable = crl_table_inplace()
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TflCFunctionEntry`.

```
function hTable = crl_table_inplace
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;
```

```
%% Create an entry
hEntry = rtw.TflCFunctionEntry;
```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTflCFunctionEntryParameters`.

```
function hTable = crl_table_inplace()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
hEntry.setTflCFunctionEntryParameters(...
    'Key', 'customFunction', ...
    'Priority', 100, ...
    'ImplementationName', 'custom_function_inplace_impl', ...
    'SideEffects', true);
```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `getTflArgFromString` and `addConceptualArg`.

```
function hTable = crl_table_inplace()
% Create a code replacement library table
```

```

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
hEntry.setTflCFunctionEntryParameters(...
    'Key', 'customFunction', ...
    'Priority', 100, ...
    'ImplementationName', 'custom_function_inplace_impl', ...
    'SideEffects', true);

%% Create the conceptual representation
arg = getTflArgFromString(hEntry, 'y1','double');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hEntry, 'u1','double');
addConceptualArg(hEntry, arg);

```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. This example uses calls to the `getTflArgFromString` function to create implementation arguments that map to arguments in the replacement function prototype: output argument `y1` and input argument `u1`. For each argument, the example uses the convenience method `setReturn` or `addArgument` to specify whether an argument is a return value or argument. For each argument, this example adds the argument to the entry array of implementation arguments.

```

function hTable = crl_table_inplace()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
hEntry.setTflCFunctionEntryParameters(...
    'Key', 'customFunction', ...
    'Priority', 100, ...
    'ImplementationName', 'custom_function_inplace_impl', ...
    'SideEffects', true);

%% Create the conceptual representation
arg = getTflArgFromString(hEntry, 'y1','double');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hEntry, 'u1','double');
addConceptualArg(hEntry, arg);

%% Create the Implementation Representation

arg = getTflArgFromString(hEntry, 'y2','void');
arg.IOType = 'RTW_IO_OUTPUT';

```

```

hEntry.Implementation.setReturn(arg);

arg = getTflArgFromString(hEntry, 'u1', 'double*');
arg.ArgumentForInPlaceUse = 'y1';
hEntry.Implementation.addArgument(arg);

```

```
%% Add the entry to the table
```

```
hTable.addEntry(hEntry);
```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_inplace
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file (a new function file) with these specifications:

```

function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for inplace function replacement';
this(1).TableList = {'crl_table_inplace.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end

```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Data Alignment for Code Replacement

Code replacement libraries can align data objects passed into a replacement function to a specified boundary.

Code Replacement Data Alignment

You can take advantage of function implementations that require aligned data to optimize application performance when using MATLAB Coder. To configure data alignment for a function implementation:

- 1 Specify the data alignment requirements in a code replacement entry. Specify alignment separately for each implementation function argument or collectively for all function arguments. See “Specify Data Alignment Requirements for Function Arguments” on page 72-105.
- 2 Specify the data alignment capabilities and syntax for one or more compilers. Include the alignment specifications in a library registration entry in the `rtwTargetInfo.m` file. See “Provide Data Alignment Specifications for Compilers” on page 72-106.
- 3 Register the library containing the table entry and alignment specification object.
- 4 Configure the code generator to use the code replacement library and generate code. Observe the results.

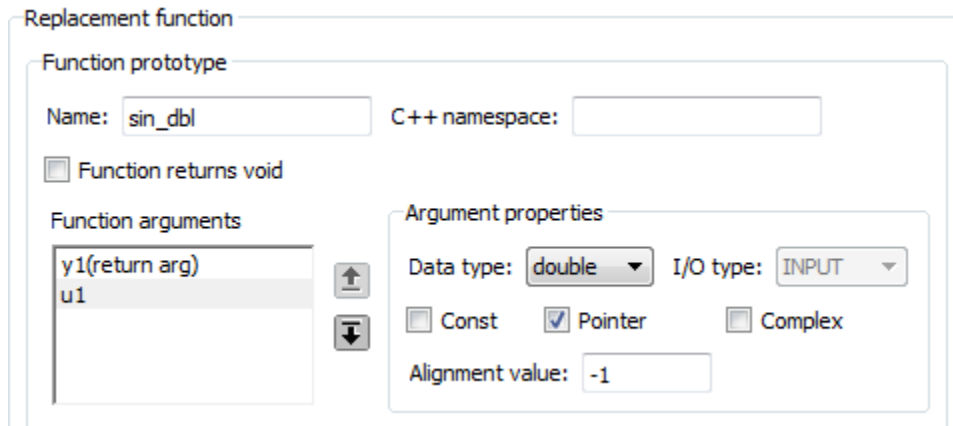

For examples, see “Basic Example of Code Replacement Data Alignment” on page 72-109 and the “Data Alignment for Function Implementations” section of the “Optimize Generated Code by Developing and Using Code Replacement Libraries - Simulink” on page 79-31 example page.

Note If replacement that requires alignment uses imported data (for example, I/O of an entry-point function or exported function), specify the data alignment with `coder.dataAlignment` statements in the MATLAB code. Specify alignment separately for each instance of imported data. See “Specify Data Alignment in MATLAB Code for Imported Data” on page 73-72.

Specify Data Alignment Requirements for Function Arguments

To specify the data alignment requirement for an argument in a code replacement entry:

- If you are defining a replacement function in a code replacement table registration file, create an argument descriptor object (`RTW.ArgumentDescriptor`). Use its `AlignmentBoundary` property to specify the required alignment boundary and assign the object to the `ArgumentDescriptor` property.
- If you are defining a replacement function using the **Code Replacement Tool**, on the **Mapping Information** tab, in the **Argument properties** section for the replacement function, enter a value for the **Alignment value** parameter.

The `AlignmentBoundary` property (or **Alignment value** parameter) specifies the alignment boundary for data passed to a function argument, in number of bytes. The `AlignmentBoundary` property is valid only for addressable objects, including matrix and pointer arguments. It is not applicable for value arguments. Valid values are:

- -1 (default) — If the data is a `Simulink.Bus`, `Simulink.Signal`, or `Simulink.Parameter` object, specifies that the code generator determines an optimal alignment based on usage. Otherwise, specifies that there is not an alignment requirement for this argument.
- Positive integer that is a power of 2 — Specifies number of bytes in the boundary. The starting memory address for the data allocated for the function argument is a multiple of the specified value. If you specify an alignment boundary that is less than the natural alignment of the argument data type, the alignment directive is emitted in the generated code. However, the target compiler ignores the directive.

The following code specifies the `AlignmentBoundary` for an argument as 16 bytes.

```
hLib = RTW.TflTable;
entry = RTW.TflOperationEntry;
arg = getTflArgFromString(hLib, 'u1', 'single*');
desc = RTW.ArgumentDescriptor;
desc.AlignmentBoundary = 16;
arg.Descriptor = desc;
entry.Implementation.addArgument(arg);
```

The equivalent alignment boundary specification in the Code Replacement Tool dialog box is in this figure.

Note If your model imports `Simulink.Bus`, `Simulink.Parameter`, or `Simulink.Signal` objects, specify an alignment boundary in the object properties, using the **Alignment** property. For more information, see `Simulink.Bus`, `Simulink.Parameter`, and `Simulink.Signal`.

Provide Data Alignment Specifications for Compilers

To support data alignment in generated code, describe the data alignment capabilities and syntax for your compilers in the code replacement library registration. Provide one or more alignment specifications for each compiler in a library registry entry.

To describe the data alignment capabilities and syntax for a compiler:

- If you are defining a code replacement library registration entry in a `rtwTargetInfo.m` customization file, add one or more `AlignmentSpecification` objects to an `RTW.DataAlignment` object. Attach the `RTW.DataAlignment` object to the `TargetCharacteristics` object of the registry entry.

The `RTW.DataAlignment` object also has the property `DefaultMallocAlignment`, which specifies the default alignment boundary, in bytes, that the compiler uses for dynamically allocated memory. If the code generator uses dynamic memory allocation for a data object involved in a code replacement, this value determines if the memory satisfies the alignment requirement of the replacement. If not, the code generator does not use the replacement. The default value for `DefaultMallocAlignment` is `-1`, indicating that the default alignment boundary used for dynamically allocated memory is unknown. In this case, the code generator uses the natural alignment of the data type to determine whether to allow a replacement.

Additionally, you can specify the alignment boundary for complex types by using the `addComplexTypeAlignment` function.

- If you are generating a customization file function using the Code Replacement Tool, fill out the following fields for each compiler.

Click the plus (+) symbol to add additional compiler specifications.

For each data alignment specification, provide the following information.

| Alignment-Specification Property | Dialog Box Parameter | Description |
|----------------------------------|---------------------------|--|
| AlignmentType | Alignment type | <p>Cell array of predefined enumerated strings, specifying which types of alignment this specification supports.</p> <ul style="list-style-type: none"> • DATA_ALIGNMENT_LOCAL_VAR — Local variables. • DATA_ALIGNMENT_GLOBAL_VAR — Global variables. • DATA_ALIGNMENT_STRUCT_FIELD — Individual structure fields. • DATA_ALIGNMENT_WHOLE_STRUCT — Whole structure, with padding (individual structure field alignment, if specified, is favored and takes precedence over whole structure alignment). <p>Each alignment specification must specify at least DATA_ALIGNMENT_GLOBAL_VAR and DATA_ALIGNMENT_STRUCT_FIELD.</p> |
| AlignmentPosition | Alignment position | <p>Predefined enumerated string specifying the position in which you must place the compiler alignment directive for alignment type DATA_ALIGNMENT_WHOLE_STRUCT:</p> <ul style="list-style-type: none"> • DATA_ALIGNMENT_PREDIRECTIVE — The alignment directive is emitted before <code>struct st_tag{...}</code>, as part of the type definition statement (for example, MSVC). • DATA_ALIGNMENT_POSTDIRECTIVE — The alignment directive is emitted after <code>struct st_tag{...}</code>, as part of the type definition statement (for example, gcc). • DATA_ALIGNMENT_PRECEDING_STATEMENT — The alignment directive is emitted as a standalone statement immediately preceding the definition of the structure type. A semicolon (;) must terminate the registered alignment syntax. • DATA_ALIGNMENT_FOLLOWING_STATEMENT — The alignment directive is emitted as a standalone statement immediately following the definition of the structure type. A semicolon (;) must terminate the registered alignment syntax. <p>For alignment types other than DATA_ALIGNMENT_WHOLE_STRUCT, code generation uses alignment position DATA_ALIGNMENT_PREDIRECTIVE.</p> |

| Alignment-Specification Property | Dialog Box Parameter | Description |
|----------------------------------|----------------------------|--|
| AlignmentSyntax-Template | Alignment syntax | Specifies the alignment directive string that the compiler supports. The string is registered as a syntax template that has placeholders in it. These placeholders are supported: <ul style="list-style-type: none"> • %n — Replaced by the alignment boundary for the replacement function argument. • %s — Replaced by the aligned symbol, usually the identifier of a variable. For example, for the gcc compiler, you can specify <code>__attribute__((aligned(%n)))</code> , or for the MSVC compiler, <code>__declspec(align(%n))</code> . |
| SupportedLanguages | Supported languages | Cell array specifying the languages to which this alignment specification applies, among c and c++. Sometimes alignment syntax and position differ between languages for a compiler. |

Here is a data alignment specification for the GCC compiler:

```
da = RTW.DataAlignment;

as = RTW.AlignmentSpecification;
as.AlignmentType = {'DATA_ALIGNMENT_LOCAL_VAR', ...
                  'DATA_ALIGNMENT_STRUCT_FIELD', ...
                  'DATA_ALIGNMENT_GLOBAL_VAR'};
as.AlignmentSyntaxTemplate = '__attribute__((aligned(%n)))';
as.AlignmentPosition = 'DATA_ALIGNMENT_PREDIRECTIVE';
as.SupportedLanguages = {'c', 'c++'};
da.addAlignmentSpecification(as);

tc = RTW.TargetCharacteristics;
tc.DataAlignment = da;
```

Here is the corresponding specification in the **Generate customization** dialog box of the Code Replacement Tool.

Generate data alignment specification

Alignment Specification 1

Alignment type: DATA_ALIGNMENT_LOCAL_VAR
DATA_ALIGNMENT_STRUCT_FIELD
DATA_ALIGNMENT_WHOLE_STRUCT
DATA_ALIGNMENT_GLOBAL_VAR

Alignment position: DATA_ALIGNMENT_PREDIRECTIVE

Alignment syntax: __attribute__((aligned(%n)))

Supported languages: c, c++

Specify Data Alignment in MATLAB Code for Imported Data

If MATLAB Coder code replacements that require data alignment use imported data, such as an entry-point or exported function I/O, specify data alignment to external code with `coder.dataAlignment` statements in the MATLAB code.

If MATLAB Coder code replacements occur that require data alignment (uses imported data), such as an entry-point or exported function with I/O, specify code replacement data alignment with `coder.DataAlignment` statements in the MATLAB code.

To specify the data alignment requirements for imported data in a MATLAB code:

- For each instance of imported data that requires data alignment, specify the alignment in the function with a `coder.dataAlignment` statement of the form:

```
coder.dataAlignment('varName', align_value)
```

- The *varName* is a character array of the variable name that requires alignment information specification. The *align_value* is an integer number which should be a power of 2. This number specifies the power-of-2 byte alignment boundary.
- An example function that specifies data alignment is:

```
function y = testFunction(x1,x2)

coder.dataAlignment('x1',16);    % Specifies information
coder.dataAlignment('x2',16);    % Specifies information
coder.dataAlignment('y',16);     % Specifies information

y = x1 + x2;

end
```

If `testFunction` is an entry-point or exported function, imported data `x1`, `x2`, and `y` are not aligned automatically by the code generator. The `coder.DataAlignment` statements for these variables are only meant as information for the code generator. The call sites allocating memory for the data need to ensure that the data is aligned as specified.

You also can specify code replacement data alignment for exported data, such as a `global` variable or an `ExportedGlobal` storage class. For more information, see “Choose Storage Class for Controlling Data Representation in Generated Code” on page 36-75.

Array Layout and Code Replacement

To improve execution speed of algorithms or simplify integration with external code or data, you can define code replacement mappings that apply a specific layout for storing array elements in memory. By default, the code generator stores array elements in a column-major layout. To change the layout to row-major, change the value of the entry parameter `ArrayLayout` to `ROW_MAJOR`.

The following table definition file for a sum operation uses the row-major array layout.

- 1 Create a table definition file that contains a function definition. For example:

```
function hTable = crl_table_rowmajor_matrix
```

- 2 Within the function body, create the table by calling the function `RTW.TflTable`.

```
hTable = RTW.TflTable;
```

- 3 Create an entry for the operator mapping with a call to the `RTW.TflCOperationEntry` function.

```
% Create operation entry
hEnt = RTW.TflCOperationEntry;
```

- 4 Set operator entry parameters with a call to the `setTflCOperationEntryParameters` function. In the function call, set the parameter `ArrayLayout` to `ROW_MAJOR`

```
setTflCOperationEntryParameters(hEnt, ...
    'Key', 'RTW_OP_ADD', ...
    'Priority', 100, ...
    'ArrayLayout', 'ROW_MAJOR', ...
    'ImplementationName', 'MyMul_ROW', ...
    'ImplementationHeaderFile', 'MyMul_ROW.h', ...
    'ImplementationSourceFile', 'MyMul_ROW.c');
```

- 5 Create conceptual arguments `y1`, `u1`, and `u2`. There are multiple ways to set up the conceptual arguments. This example uses calls to the `getTflArgFromString` and `addConceptualArg` functions to create and add the arguments.

```
arg = RTW.TflArgMatrix('y1', 'RTW_IO_OUTPUT', 'double');
arg.DimRange = [2 2; 50 50];
hEnt.addConceptualArg(arg);
```

```
arg = RTW.TflArgMatrix('u1', 'RTW_IO_INPUT', 'double');
arg.DimRange = [2 3; 2 3];
hEnt.addConceptualArg(arg);
```

```
arg = RTW.TflArgMatrix('u2', 'RTW_IO_INPUT', 'double');
arg.DimRange = [3 4; 3 4];
hEnt.addConceptualArg(arg);
```

- 6 Create the implementation arguments. There are multiple ways to set up the implementation arguments. This example uses calls to the `getTflArgFromString` function to create the arguments. When defining the implementation function return argument, create a `void` output argument. When defining the implementation function argument for the conceptual output argument (`y1`), set the operator output argument as an additional input argument. Mark its `IOType` as `output`. Make its type a pointer type. The convenience methods `setReturn` and `addArgument` specify whether an argument is a return value or argument and adds the argument to the entry's array of implementation arguments.

```
% Implementation Args
arg = hEnt.getTflArgFromString('unused','void');
arg.IOType = 'RTW_IO_OUTPUT';
hEnt.Implementation.setReturn(arg);

arg = hEnt.getTflArgFromString('u1','double*');
hEnt.Implementation.addArgument(arg);

arg = hEnt.getTflArgFromString('u2','double*');
hEnt.Implementation.addArgument(arg);

arg = hEnt.getTflArgFromString('y1','double*');
arg.IOType = 'RTW_IO_OUTPUT';
hEnt.Implementation.addArgument(arg);

arg = hEnt.getTflArgFromString('u3','uint32',2);
arg.Type.ReadOnly = true;
hEnt.Implementation.addArgument(arg);

arg = hEnt.getTflArgFromString('u4','uint32',3);
hEnt.Implementation.addArgument(arg);

arg = hEnt.getTflArgFromString('u5','uint32',3);
hEnt.Implementation.addArgument(arg);

arg = hEnt.getTflArgFromString('u6','uint32',4);
hEnt.Implementation.addArgument(arg);
```

- 7 Add the entry to a code replacement table with a call to the `addEntry` function.

```
addEntry(hTable, hEnt);
```

- 8 Save the table definition file. To name the file, use the name of the table definition function . Then, generate code and a code generation report and review the code replacements.

- “Define Code Replacement Library Optimizations” on page 72-36

Allow Shape Agnostic Match

Code replacement shape-agnostic match allows matrix inputs for certain operations to be matched based on the number of elements as opposed to matrix shape. For example, a 6×1 matrix matches a 2×3 matrix in shape-agnostic match because both have a total of 6 elements. Such matches can only be made if the output and inputs are contiguously allocated in memory and if the replacement function can be performed element-wise. Shape-agnostic matrix match increases replacement rate so it is advantageous for replacement that does not require matrix shape to be considered.

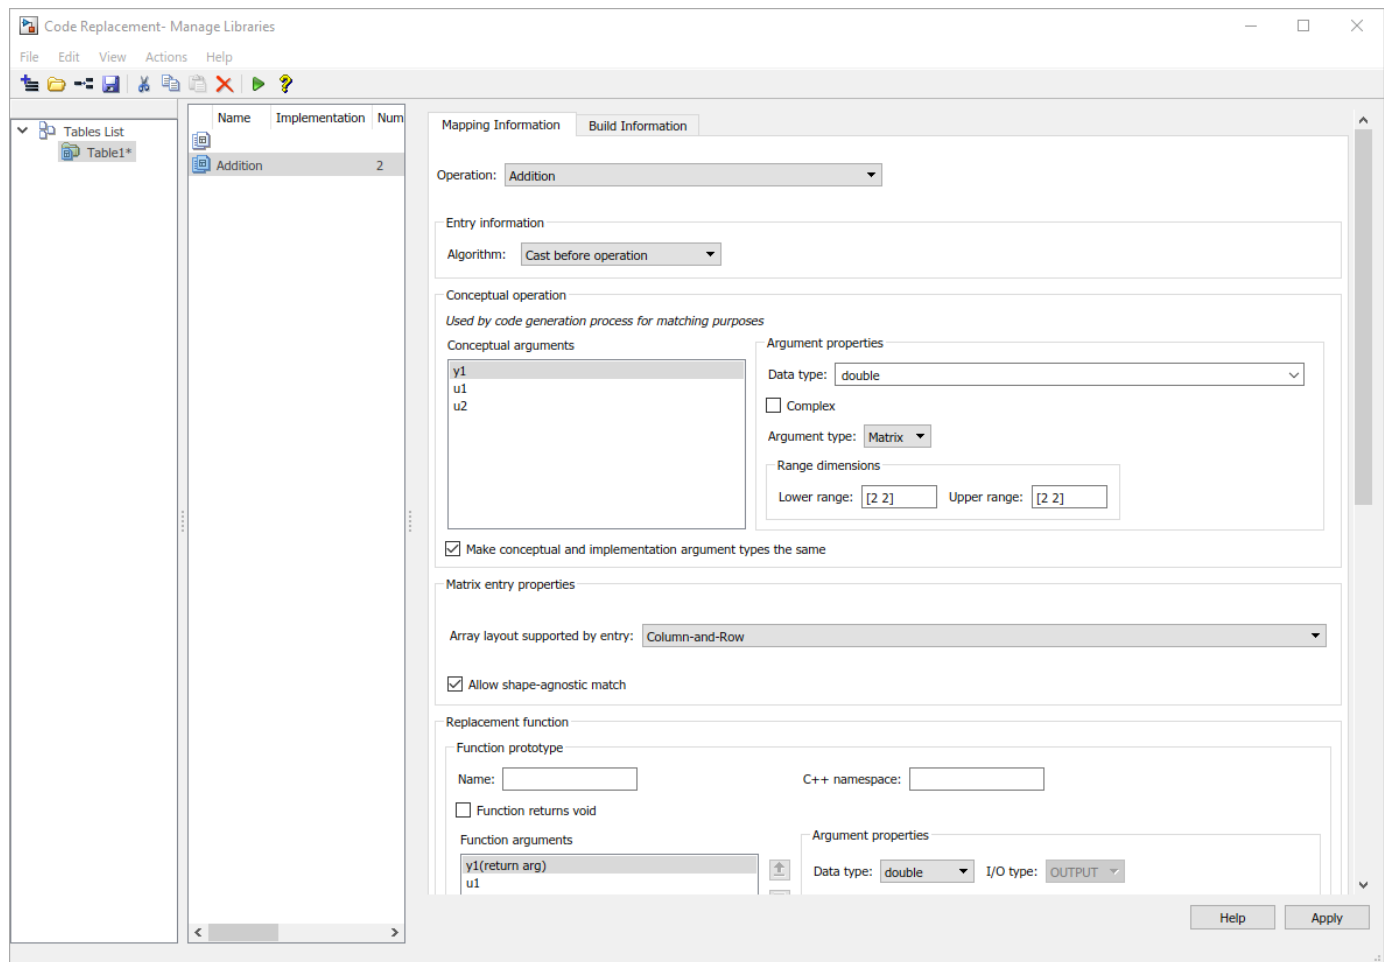

Shape-agnostic code replacement entries can be created either with the user interface of the **Code Replacement Tool** or programmatically.

User Interface Method- Code Replacement Tool

This example shows how to set up shape-agnostic matrix replacement for an addition code replacement table entry.

- 1 Open the Code Replacement Tool. From the MATLAB command line, enter `crtool`.
- 2 Create a code replacement table. Go to **File > New Table**.
- 3 Create a table entry. Shape-agnostic matrix replacement only supports **Math Operation** table entries. Either right-click on your table or go to **File > New Entry** and select **Math Operation**. Mapping information appears. From the Operation drop down menu, select **addition**.
- 4 Create conceptual arguments. The **Conceptual operation** section defines each of your conceptual arguments. To enable shape-agnostic replacement set the **Argument type:** to **matrix** to open the **Matrix entry properties** menu.
- 5 Set entry parameters. In the **Matrix entry properties** menu, select the **Allow shape-agnostic match** checkbox to enable shape-agnostic replacement.
- 6 Validate your table entry. Either click the **validate entry** button or right-click the entry and select **Validate entries**.
- 7 Click **save**.

This display shows the **Code Replacement Tool** settings for this example.

Programmatic Method

This example shows how to set up a shape-agnostic matrix replacement for an addition code replacement table entry.

- 1 Create the code replacement table. Create a function definition with the table name 'ShapeAgnosticTable'. Call `RTW.TflTable` to create the table.

```
function hLib = ShapeAgnosticTable
hLib = RTW.TflTable;
```

- 2 Create a table entry for code replacement. Shape-agnostic replacement only supports operation entries, as specified with a call to `RTW.TflCOperationEntry`.

```
hEnt = RTW.TflCOperationEntry;
```

- 3 Set entry parameters to customize input processing. You can enable shape-agnostic matrix replacement by setting the entry parameter 'AllowShapeAgnosticMatch' to true.

```
hEnt.setTflCOperationEntryParameters( ...
    'Key', 'RTW_OP_ADD', ...
    'Priority', 100, ...
    'AllowShapeAgnosticMatch', true, ...
```

```
'ImplementationName', 'MyAdd_Matrix', ...
'SideEffects', true);
```

- 4 Create conceptual arguments. For this example, create conceptual arguments y1, u1, and u2 with calls to the create function, `RTW.TflArgMatrix`, and add function, `addConceptualArg`.

```
arg = RTW.TflArgMatrix('y1', 'RTW_IO_OUTPUT', 'double');
arg.DimRange = [2 2; 50 50];
hEnt.addConceptualArg(arg);
```

```
arg = RTW.TflArgMatrix('u1', 'RTW_IO_INPUT', 'double');
arg.DimRange = [2 3; 2 3];
hEnt.addConceptualArg(arg);
```

```
arg = RTW.TflArgMatrix('u2', 'RTW_IO_INPUT', 'double');
arg.DimRange = [2 3; 2 3];
hEnt.addConceptualArg(arg);
```

- 5 Create implementation arguments. For this example, call the function `getTflArgFromString` to create the arguments. Define the implementation return argument as a void output argument. Define the conceptual output argument, y1, as a pointer with the IOType as output.

```
arg = hEnt.getTflArgFromString('unused','void');
arg.IOType = 'RTW_IO_OUTPUT';
hEnt.Implementation.setReturn(arg);
```

```
arg = hEnt.getTflArgFromString('u1','double*');
hEnt.Implementation.addArgument(arg);
```

```
arg = hEnt.getTflArgFromString('u2','double*');
hEnt.Implementation.addArgument(arg);
```

```
arg = hEnt.getTflArgFromString('y1','double*');
arg.IOType = 'RTW_IO_OUTPUT';
hEnt.Implementation.addArgument(arg);
```

```
arg = hEnt.getTflArgFromString('numElements','uint32',6);
hEnt.Implementation.addArgument(arg);
```

- 6 Add this entry to a code replacement table with the function `addEntry`.

```
hLib.addEntry( hEnt );
```

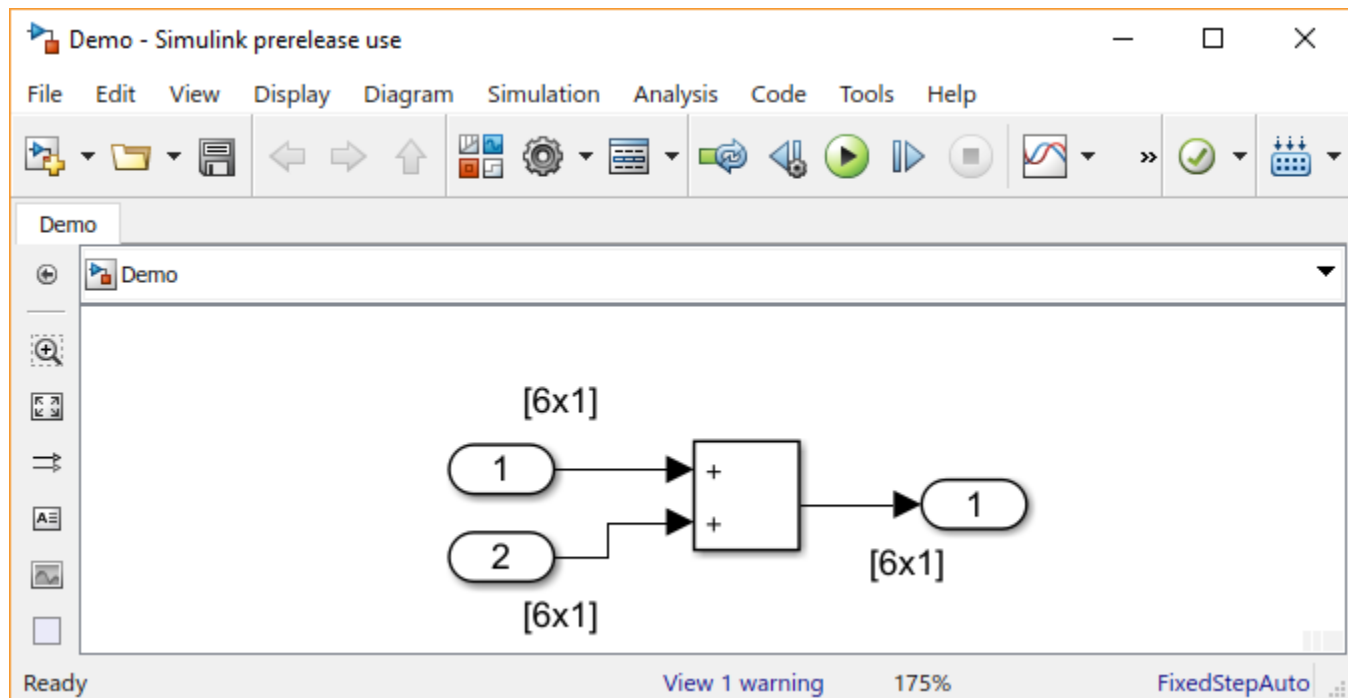

- 7 Save the table as its function name. For this example, `ShapeAgnosticTable`.

- 8 Validate your entry at the MATLAB command line. Invoke the table definition file with the following command.

```
hTbl = ShapeAgnosticTable
```

Example Model

An example of this code replacement table entry is demonstrated through the following model. Even though the matrix shape in this model does not match the entry, the operation can be performed element-wise and the entry enables shape-agnostic match, so code replacement is observed in the generated code.

```

/* Outport: '<Root>/Out1' incorporates:
 * Inport: '<Root>/In1'
 * Inport: '<Root>/In2'
 * Sum: '<Root>/Add'
 */
MyAdd_Matrix(Demo_U.In1, Demo_U.In2, Demo_Y.Out1, 6U);

```

Limitations

- If you enable shape-agnostic match for an operation that is inherently not computed element-wise, a regular match is performed.
- When shape-agnostic match is enabled, code replacement does not honor the setting for 'DimRange'. Instead, it computes the number of elements and uses that value to match.
- If you are working with customized code replacement entries, adjust the 'do_match' function to accept the total number of elements as opposed to matrix dimensions. For more information, see “Customize Match and Replacement Process” on page 72-132.

More About

- “What Is Code Replacement Customization?” on page 72-3
- “Define Code Replacement Library Optimizations” on page 73-23

Replace MATLAB Functions with Custom Code by Using the `coder.replace` Function

You can develop a code replacement library to optimize the performance of MATLAB functions containing a `coder.replace` function. To develop a code replacement library, use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 73-13.

Interactively Develop a Code Replacement Library

- 1 Open the **Code Replacement Tool** (`crtool`), from the MATLAB command line with the following command:

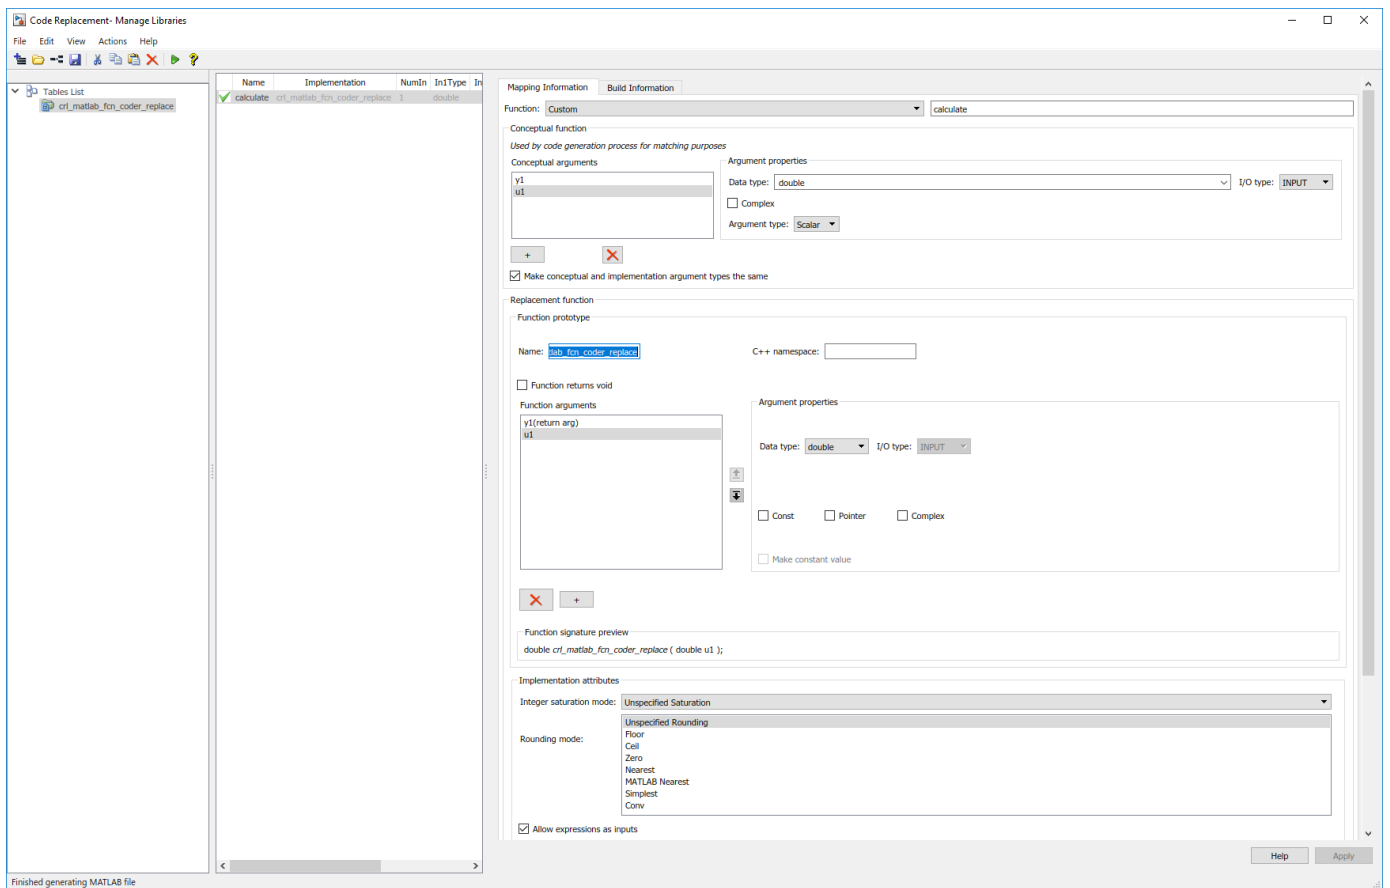

```
>>crtool
```

- 2 Create a table.
 - a From the `crtool` context menu, select **File > New Table**.
 - b In the right pane, name the table `cr1_matlab_fcn_coder_replace`. Click **Apply**.
- 3 Create an entry. From the `crtool` context menu, select **File > New entry > Function**.
- 4 Create entry parameters. In the **Function** drop-down list, select `custom`. Function information appears in the `crtool`. For this example, specify the parameter as `calculate`.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the `crtool`, specify the return argument, `y1`, and the input argument, `u1`, with the **Data Type** of `double` and the **Argument Type** of `Scalar`.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box.

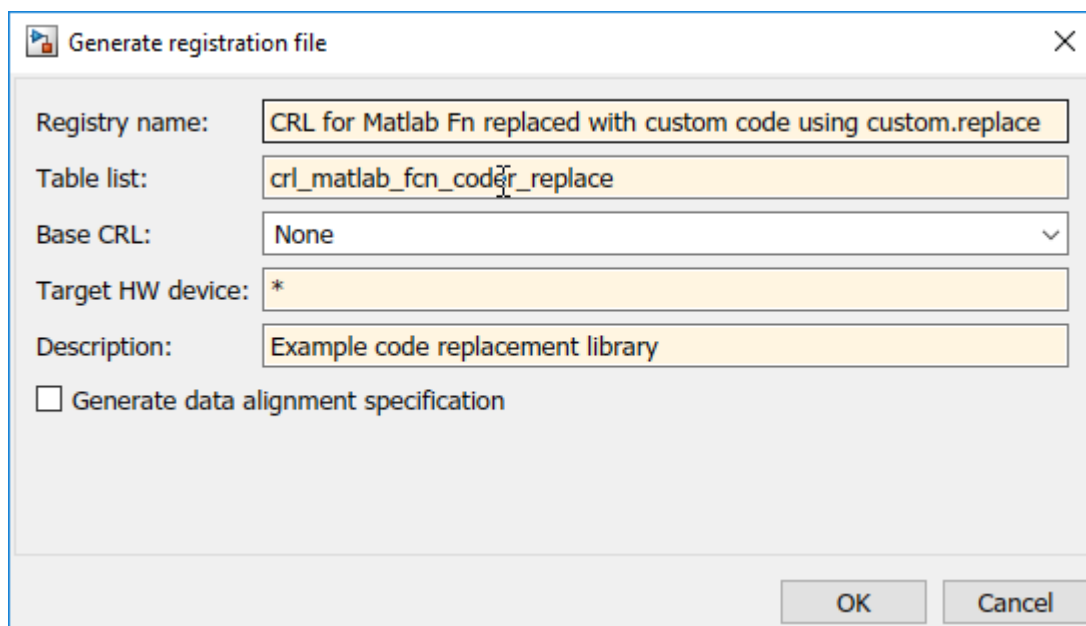

Add the return argument `y1` and the arguments `u1`.

Specify a **Name** for the replacement function under **Function prototype**.

- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. Click the **Mapping Information** tab and verify the fields are filled in as shown. Click **Validate entry**. In the `crtool` context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
 - a Create a function with the name of your code replacement library table that does not have arguments and returns a table object. You can use this function to call your code replacement library table.
 - b Create a table object by calling `RTW.TflTable`.

```
function hTable = crl_matlab_fcn_coder_replace
% Create a function to call the code replacement library table
```

```
%% Create a table object
hTable = RTW.TflTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TflCFunctionEntry`.

```
function hTable = crl_matlab_fcn_coder_replace
% Create a function to call the code replacement library table
```

```
%% Create a table object
hTable = RTW.TflTable;
```

```
%% Create an entry
hEntry = RTW.TflCFunctionEntry;
```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTflCFunctionEntryParameters`.

```
function hTable = crl_matlab_fcn_coder_replace
% Create a function to call the code replacement library table
```

```
%% Create a table object
hTable = RTW.TflTable;
```

```
%% Create an entry
hEntry = RTW.TflCFunctionEntry;
```

```
%% Create entry parameters
setTflCFunctionEntryParameters(hEntry, ...
    'Key', 'calculate', ...
    'Priority', 100, ...
    'ArrayLayout', 'COLUMN_MAJOR', ...
    'ImplementationName', ...
```

```

'replacement_calculate_impl', ...
'ImplementationHeaderFile', ...
'replacement_calculate_impl.h', ...
'ImplementationSourceFile', ...
'replacement_calculate_impl.c');

```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `getTflArgFromString`.

```

function hTable = crl_matlab_fcn_coder_replace
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
setTflCFunctionEntryParameters(hEntry, ...
    'Key', 'calculate', ...
    'Priority', 100, ...
    'ArrayLayout', 'COLUMN_MAJOR', ...
    'ImplementationName', ...
    'replacement_calculate_impl', ...
    'ImplementationHeaderFile', ...
    'replacement_calculate_impl.h', ...
    'ImplementationSourceFile', ...
    'replacement_calculate_impl.c');

%% Create the conceptual representation
arg = getTflArgFromString(hEntry, 'y1','double');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hEntry, 'u1','double');
addConceptualArg(hEntry, arg);

```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function `getTflArgFromString`.

```

function hTable = crl_matlab_fcn_coder_replace
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
setTflCFunctionEntryParameters(hEntry, ...
    'Key', 'calculate', ...
    'Priority', 100, ...
    'ArrayLayout', 'COLUMN_MAJOR', ...
    'ImplementationName', ...

```

```

'replacement_calculate_impl', ...
'ImplementationHeaderFile', ...
'replacement_calculate_impl.h', ...
'ImplementationSourceFile', ...
'replacement_calculate_impl.c');

%% Create the conceptual representation
arg = getTflArgFromString(hEntry, 'y1','double');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hEntry, 'u1','double');
addConceptualArg(hEntry, arg);

%% Create the Conceptual Representation
arg = getTflArgFromString(hEntry, 'y1','double');
arg.IOType = 'RTW_IO_OUTPUT';
hEntry.Implementation.setReturn(arg);

arg = getTflArgFromString(hEntry, 'u1','double');
hEntry.Implementation.addArgument(arg);

%% Add the entry to the table
hTable.addEntry(hEntry);

```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = cml_matlab_fcn_coder_replace
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file by using these specifications:

```

function rtwTargetInfo(cm)
cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for matlab function with custom code using coder.replace';
this(1).TableList = {'crl_matlab_fcn_coder_replace.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end

```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

- “Replace coder.ceval Calls to External Functions” on page 73-85

Replace coder.ceval Calls to External Functions

The `coder.ceval` function calls external C/C++ functions from code generated from MATLAB code. The code replacement software supports replacement of the function that you specify in a call to `coder.ceval`. An application of this code replacement scenario is to write generic MATLAB code that you can customize for different platforms with code replacements. A code replacement library can define hardware-specific code replacements for the function call. Use `coder.ceval` in MATLAB code from which you want to generate C code using:

- MATLAB Coder
- MATLAB code in a Simulink MATLAB Function block

To develop a code replacement library use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 73-13.

Example Files

For the examples in “Interactively Develop a Code Replacement Library” on page 73-86 and “Programmatically Develop a Code Replacement Library” on page 72-121 you must have set up the following:

- Custom C function `my_add.c`.

```
/* my_add.c */

#include "my_add.h"

double my_add(double in1, double in2)
{
    return in1 + in2;
}
```

- Custom C header file `my_add.h`.

```
/* my_add.h */

double my_add(double in1, double in2);
```

- MATLAB function `call_my_add.m`, which uses `coder.ceval` to invoke `my_add.c`.

```
function y = call_my_add(in1, in2) %#codegen

y=0.0;

if ~coder.target('Rtw')
% Executing in MATLAB, call MATLAB equivalent of C function my_add
    y= in1+in2;
else
% Executing in generated code, call C function my_add
    y = coder.ceval('my_add', in1, in2);
end
```

- MATLAB test function `call_my_add_test.m`, which calls `call_my_add.m`.

```
in1=10;
in2=20;
```

```

y = call_my_add(in1, in2);

disp('Output')
disp('y =')
disp(y);

```

- Replacement C function `my_add_replacement.c`.

```

/* my_add_replacement.c */

#include "my_add_replacement.h"

double my_add_replacement(double in1, double in2)
{
    return in1 + in2;
}

```

- Replacement C header file `my_add_replacement.h`.

```

/* my_add_replacement.h */

double my_add_replacement(double in1, double in2);

```

Interactively Develop a Code Replacement Library

- 1 Open the **Code Replacement Tool** (`crtool`), from the MATLAB command line with the following command:

```
>>crtool
```

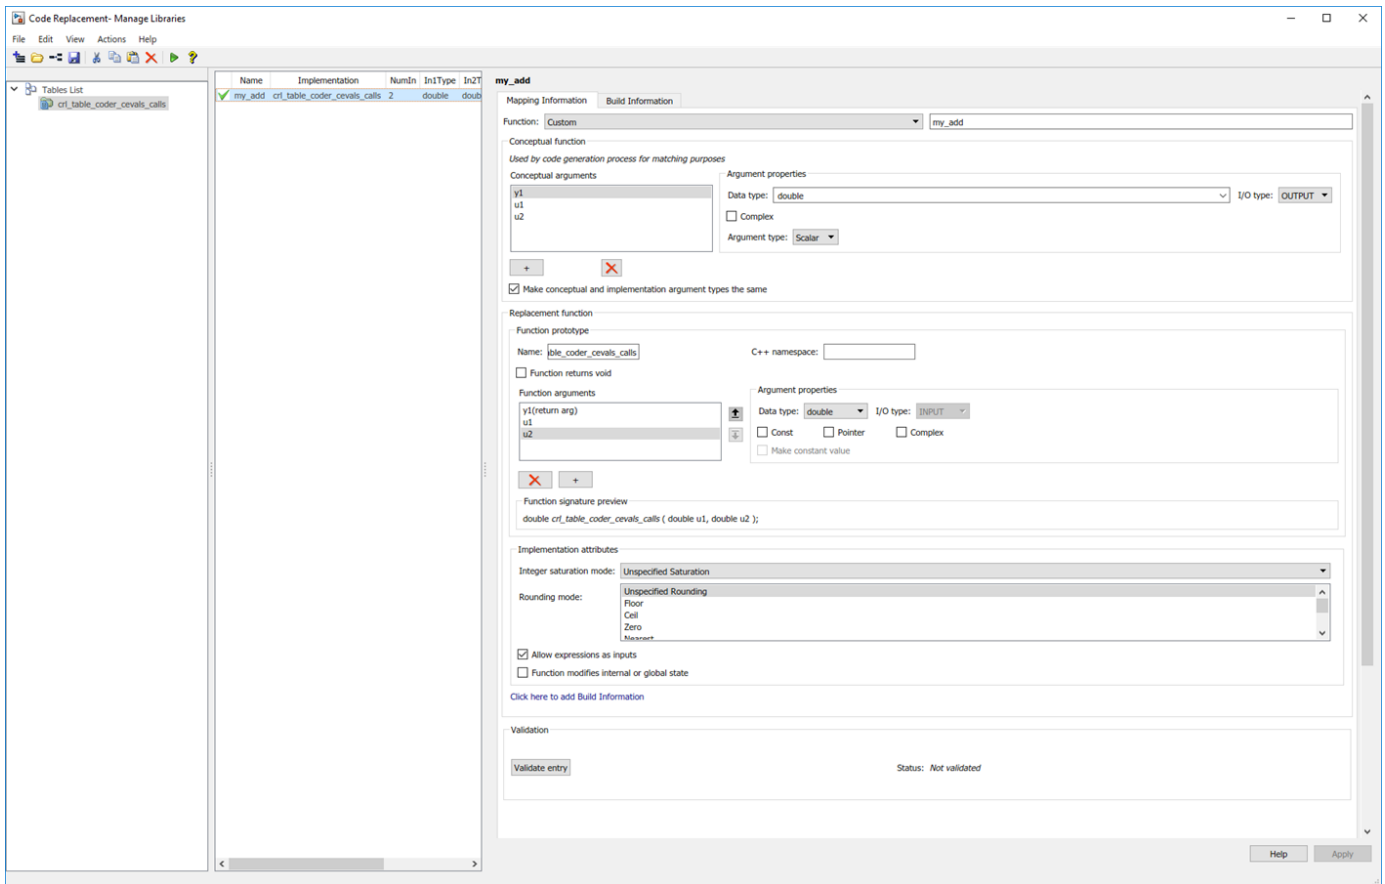

- 2 Create a table.
 - a From the `crtool` menu, select **File > New Table**.
 - b In the right pane, name the table `crl_table_coder_cevals_calls`. Click **Apply**.

- 3 Create an entry. From the `crtool` menu, select **File > New entry > Function**.

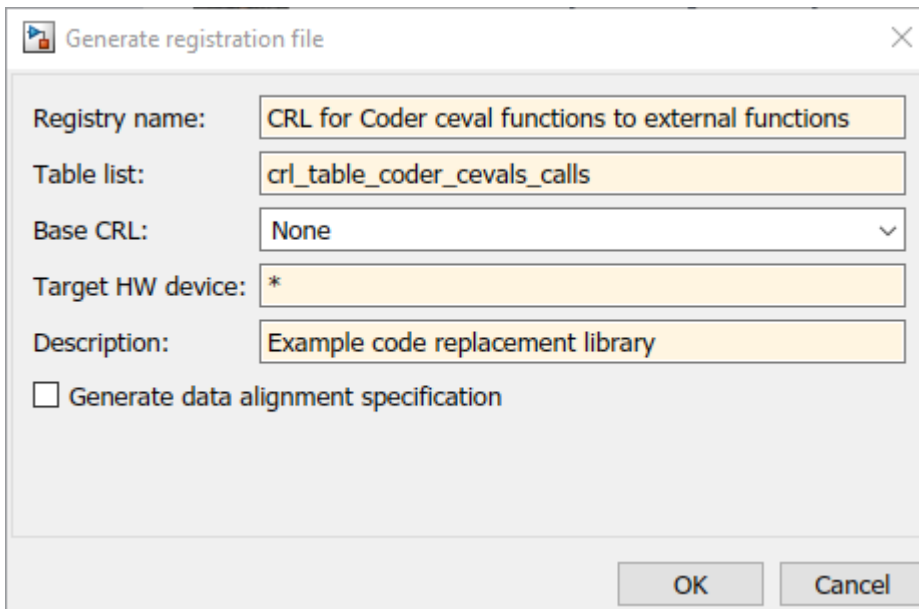

- 4 Create entry parameters. In the **Function** drop-down list, select `custom`. Function information appears in the `crtool`. For this example, specify the parameter as `my_add`.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the `crtool`, specify the return argument, `y1`, and the input arguments, `u1` and `u2` with the **Data Type** of `double` and the **Argument Type** of `Scalar`.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box.

Specify a **Name** for the replacement function under **Function prototype**.

- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, set the **Implementation header file** to `my_add_replacement.h`.
- 8 Validate and save the table. Click the **Mapping Information** tab and verify the fields are filled in as shown. Click **Validate entry**. In the `crtool` menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
 - a Create a function with the name of your code replacement library table that does not have arguments and returns a table object. You can use this function to call your code replacement library table.
 - b Create a table object by calling `RTW.TflTable`.

```
function hTable = crl_table_coder_cevals_calls()
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TflCFunctionEntry`.

```
function hTable = crl_table_coder_cevals_calls()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;
```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTflCFunctionEntryParameters`.

```
function hTable = crl_table_coder_cevals_calls()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
hEntry.setTflCFunctionEntryParameters( ...
    'Key', 'my_add', ...
    'Priority', 100, ...
    'ImplementationName', 'my_add_replacement', ...
    'ImplementationHeaderFile', 'my_add_replacement.h', ...
    'ImplementationSourceFile', 'my_add_replacement.c');
```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `getTflArgFromString`.

```
function hTable = crl_table_coder_cevals_calls()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
hEntry.setTflCFunctionEntryParameters( ...
    'Key', 'my_add', ...
    'Priority', 100, ...
    'ImplementationName', 'my_add_replacement', ...
    'ImplementationHeaderFile', 'my_add_replacement.h', ...
    'ImplementationSourceFile', 'my_add_replacement.c');

%% Create the conceptual representation
arg = hEntry.getTflArgFromString('y1','double');
arg.IOType = 'RTW_IO_OUTPUT';
hEntry.addConceptualArg(arg);

arg = hEntry.getTflArgFromString('u1','double');
hEntry.addConceptualArg(arg);

arg = hEntry.getTflArgFromString('u2','double');
hEntry.addConceptualArg(arg);
```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function `getTflArgFromString`.

```
function hTable = crl_table_coder_cevals_calls()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCFunctionEntry;

%% Create entry parameters
hEntry.setTflCFunctionEntryParameters( ...
    'Key', 'my_add', ...
    'Priority', 100, ...
    'ImplementationName', 'my_add_replacement', ...
    'ImplementationHeaderFile', 'my_add_replacement.h', ...
    'ImplementationSourceFile', 'my_add_replacement.c');

%% Create the conceptual representation
arg = hEntry.getTflArgFromString('y1','double');
arg.IOType = 'RTW_IO_OUTPUT';
hEntry.addConceptualArg(arg);
```

```
arg = hEntry.getTflArgFromString('u1','double');
hEntry.addConceptualArg(arg);
```

```
arg = hEntry.getTflArgFromString('u2','double');
hEntry.addConceptualArg(arg);
```

```
%% Create the implementation representation
arg = hEntry.getTflArgFromString('y1','double');
arg.IOType = 'RTW_IO_OUTPUT';
hEntry.Implementation.setReturn(arg);
```

```
arg = hEntry.getTflArgFromString('u1','double');
hEntry.Implementation.addArgument(arg);
```

```
arg = hEntry.getTflArgFromString('u2','double');
hEntry.Implementation.addArgument(arg);
```

```
%% Add the entry to the table
hTable.addEntry(hEntry);
```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_coder_cevals_calls
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file by using these specifications:

```
function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for coder.ceval calls to external functions code replacement';
this(1).TableList = {'crl_table_coder_cevals_calls.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end
```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Reserved Identifiers and Code Replacement

The code generator and C programming language use, internally, reserved keywords for code generation. Do not use reserved keywords as identifiers or function names. Reserved keywords for code generation include many code replacement library identifiers, the majority of which are function names, such as `acos`.

To view a list of reserved identifiers for the code replacement library that you use to generate code, specify the name of the library in a call to the function

`RTW.TargetRegistry.getInstance.getTflReservedIdentifiers`. For example:

```
crl_ids = RTW.TargetRegistry.getInstance.getTflReservedIdentifiers('GNU99 (GNU)')
```

In a code replacement table, the code generator registers each function implementation name defined by a table entry as a reserved identifier. You can register additional reserved identifiers for the table on a per-header-file basis. Providing additional reserved identifiers can help prevent duplicate symbols and other identifier-related compile and link issues.

To register additional code replacement reserved identifiers, use the `setReservedIdentifiers` function. This function registers specified reserved identifiers to be associated with a code replacement table.

You can register up to four reserved identifier structures in a code replacement table. You can associate one set of reserved identifiers with a code replacement library, while the other three (if present) must be associated with ANSI C. The following example shows a reserved identifier structure that specifies two identifiers and the associated header file.

```
d{1}.LibraryName = 'ANSI_C';  
d{1}.HeaderInfos{1}.HeaderName = 'math.h';  
d{1}.HeaderInfos{1}.ReservedIds = {'y0', 'y1'};
```

The code generator adds the identifiers to the list of reserved identifiers and honors them during the build procedure.

More About

- “Code You Can Replace from MATLAB Code” on page 73-5
- “Customize Match and Replacement Process” on page 73-93
- “Define Code Replacement Library Optimizations” on page 73-23
- “Develop a Code Replacement Library” on page 73-13

Customize Match and Replacement Process

During the build process, the code generator uses:

- Preset match criteria to identify functions and operators for which application-specific implementations replace default implementations.
- Preset replacement function signatures.

It is possible that preset match criteria and preset replacement function signatures do not completely meet your function and operator replacement needs. For example:

- You want to replace an operator with a particular fixed-point implementation function only when fraction lengths are within a particular range.
- When a match occurs, you want to modify your replacement function signature based on compile-time information, such as passing fraction-length values into the function.

To add extra logic into the code replacement match and replacement process, create custom code replacement table entries. With custom entries, you can specify additional match criteria and modify the replacement function signature to meet application needs.

To create a custom code replacement entry:

- 1 Create a custom code replacement entry class, derived from `RTW.TfLCFunctionEntryML` (for function replacement) or `RTW.TfLCOperationEntryML` (for operator replacement).
- 2 In your derived class, implement a `do_match` method with a fixed preset signature as a MATLAB function. In your `do_match` method, provide either or both of the following customizations that instantiate the class:
 - Add match criteria that the base class does not provide. The base class provides a match based on:
 - Argument number
 - Argument name
 - Signedness
 - Word size
 - Slope (if not specified with wildcards)
 - Bias (if not specified with wildcards)
 - Math modes, such as saturation and rounding
 - Operator or function key
 - Modify the implementation signature by adding additional arguments or setting constant input argument values. You can inject a constant value, such as an input scaling value, as an additional argument to the replacement function.
- 3 Create code replacement entries that instantiate the custom entry class.
- 4 Register a library containing the code replacement table that includes your entries.

During code generation, the code replacement match process tries to match function or operator call sites with the base class of your derived entry class. If the process finds a match, the software calls your `do_match` method to execute your additional match logic (if any) and your replacement function customizations (if any).

Customize Match and Replacement Process for Operators

This example shows how to create custom code replacement entries that add logic to the code match and replacement process for a scalar operation. Custom entries specify additional match criteria or modify the replacement function signature to meet application needs.

For example:

- When fraction lengths are within a specific range, replace an operator with a fixed-point implementation function.
- When a match occurs, modify the replacement function signature based on compile-time information, such as passing fraction-length values into the function.

This example modifies a fixed-point addition replacement such that the implementation function passes in the fraction lengths of the input and output data types as arguments.

To create custom code replacement entries that add logic to the code replacement match and replacement process:

- 1 Create a class, for example `TflCustomOperationEntry`, that is derived from the base class `RTW.TflCOperationEntryML`. The derived class defines a `do_match` method with the following signature:

```
function ent = do_match(hThis, ...
    hCS0, ...
    targetBitPerChar, ...
    targetBitPerShort, ...
    targetBitPerInt, ...
    targetBitPerLong, ...
    targetBitPerLongLong)
```

In the `do_match` signature:

- `ent` is the return handle, which is returned as empty (indicating that the match failed) or as a `TflCOperationEntry` handle.
- `hThis` is the handle to the class instance.
- `hCS0` is a handle to an object that the code generator creates for querying the library for a replacement.
- Remaining arguments are the number of bits for various data types of the current target.

The `do_match` method adds match criteria that the base class does not provide. The method makes modifications to the implementation signature. In this case, the `do_match` method relies on the base class for checking word size and signedness. `do_match` must match only the number of conceptual arguments to the value 3 (two inputs and one output) and the bias for each argument to value 0. If the code generator finds a match, `do_match`:

- Sets the return handle.
- Removes slope and bias wild cards from the conceptual arguments (the match is for specific slope and bias values).
- Writes fraction-length values for the inputs and output into replacement function arguments 3, 4, and 5.

You can create and add three additional implementation function arguments for passing fraction lengths in the class definition or in each code replacement entry definition that instantiates this

class. This example creates the arguments, adds them to a code replacement table definition file, and sets them to specific values in the class definition code.

```

classdef TflCustomOperationEntry < RTW.TflCOperationEntryML
    methods
        function ent = do_match(hThis, ...
            hCS0, ... %#ok
            targetBitPerChar, ... %#ok
            targetBitPerShort, ... %#ok
            targetBitPerInt, ... %#ok
            targetBitPerLong, ... %#ok
            targetBitPerLongLong) %#ok

            % DO_MATCH - Create a custom match function. The base class
            % checks the types of the arguments prior to calling this
            % method. This class will check additional data and can
            % modify the implementation function.

            % The base class checks word size and signedness. Slopes and biases
            % have been wildcarded, so the only additional checking to do is
            % to check that the biases are zero and that there are only three
            % conceptual arguments (one output, two inputs)

            ent = []; % default the return to empty, indicating the match failed

            if length(hCS0.ConceptualArgs) == 3 && ...
                hCS0.ConceptualArgs(1).Type.Bias == 0 && ...
                hCS0.ConceptualArgs(2).Type.Bias == 0 && ...
                hCS0.ConceptualArgs(3).Type.Bias == 0

                % Modify the default implementation. Since this is a
                % generator entry, a concrete entry is created using this entry
                % as a template. The type of entry being created is a standard
                % TflCOperationEntry. Using the standard operation entry
                % provides required information, and you do not need
                % a custom match function.
                ent = RTW.TflCOperationEntry(hThis);

                % Since this entry is modifying the implementation for specific
                % fraction-length values (arguments 3, 4, and 5), the conceptual argument
                % wild cards must be removed (the wildcards were inherited from the
                % generator when it was used as a template for the concrete entry).
                % This concrete entry is now for a specific slope and bias.
                % hCS0 holds the slope and bias values (created by the code generator).
                for idx=1:3
                    ent.ConceptualArgs(idx).CheckSlope = true;
                    ent.ConceptualArgs(idx).CheckBias = true;

                    % Set the specific Slope and Biases
                    ent.ConceptualArgs(idx).Type.Slope = hCS0.ConceptualArgs(idx).Type.Slope;
                    ent.ConceptualArgs(idx).Type.Bias = 0;
                end

                % Set the fraction-length values in the implementation function.
                ent.Implementation.Arguments(3).Value = ...
                    -1.0*hCS0.ConceptualArgs(2).Type.FixedExponent;
                ent.Implementation.Arguments(4).Value = ...
                    -1.0*hCS0.ConceptualArgs(3).Type.FixedExponent;
                ent.Implementation.Arguments(5).Value = ...
                    -1.0*hCS0.ConceptualArgs(1).Type.FixedExponent;
            end
        end
    end
end
end

```

Exit the class folder and return to the previous working folder.

- 2 Create and save the following code replacement table definition file, `crl_table_custom_add_ufix32.m`. This file defines a code replacement table that contains a

single operator entry, an entry generator for unsigned 32-bit fixed-point addition operations, with arbitrary fraction-length values on the inputs and the output. The table entry:

- Instantiates the derived class `TflCustomOperationEntry` from the previous step. If you want to replace word sizes and signedness attributes, you can use the same derived class, but not the same entry, because you cannot use a wild card with the `WordLength` and `IsSigned` arguments. For example, to support `uint8`, `int8`, `uint16`, `int16`, and `int32`, add five other distinct entries. To use different implementation functions for saturation and rounding modes other than overflow and round to floor, add entries for those match permutations.
- Sets operator entry parameters with the call to the `setTflCOperationEntryParameters` function.
- Calls the `createAndAddConceptualArg` function to create conceptual arguments `y1`, `u1`, and `u2`.
- Calls `createAndSetCImplementationReturn` and `createAndAddImplementationArg` to define the signature for the replacement function. Three of the calls to `createAndAddImplementationArg` create implementation arguments to hold the fraction-length values for the inputs and output. Alternatively, the entry can omit those argument definitions. Instead, the `do_match` method of the derived class `TflCustomOperationEntry` can create and add the three implementation arguments. When the number of additional implementation arguments required can vary based on compile-time information, use the alternative approach.
- Calls `addEntry` to add the entry to a code replacement table.

```
function hTable = crl_table_custom_add_ufix32

hTable = RTW.TflTable;

% Add TflCustomOperationEntry
op_entry = TflCustomOperationEntry;

setTflCOperationEntryParameters(op_entry, ...
    'Key', 'RTW_OP_ADD', ...
    'Priority', 30, ...
    'SaturationMode', 'RTW_SATURATE_ON_OVERFLOW', ...
    'RoundingModes', {'RTW_ROUND_FLOOR'}, ...
    'ImplementationName', 'myFixptAdd', ...
    'ImplementationHeaderFile', 'myFixptAdd.h', ...
    'ImplementationSourceFile', 'myFixptAdd.c');

createAndAddConceptualArg(op_entry, 'RTW.TflArgNumeric', ...
    'Name', 'y1', ...
    'IOType', 'RTW_IO_OUTPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'DataType', 'Fixed', ...
    'Scaling', 'BinaryPoint', ...
    'IsSigned', false, ...
    'WordLength', 32);

createAndAddConceptualArg(op_entry, 'RTW.TflArgNumeric', ...
    'Name', 'u1', ...
    'IOType', 'RTW_IO_INPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'DataType', 'Fixed', ...
```

```

        'Scaling',    'BinaryPoint', ...
        'IsSigned',  false, ...
        'WordLength', 32);

createAndAddConceptualArg(op_entry, 'RTW.TflArgNumeric', ...
    'Name',          'u2', ...
    'IOType',        'RTW_IO_INPUT', ...
    'CheckSlope',    false, ...
    'CheckBias',     false, ...
    'DataType',      'Fixed', ...
    'Scaling',        'BinaryPoint', ...
    'IsSigned',      false, ...
    'WordLength',    32);

% Specify replacement function signature
createAndSetCImplementationReturn(op_entry, 'RTW.TflArgNumeric', ...
    'Name',          'y1', ...
    'IOType',        'RTW_IO_OUTPUT', ...
    'IsSigned',      false, ...
    'WordLength',    32, ...
    'FractionLength', 0);

createAndAddImplementationArg(op_entry, 'RTW.TflArgNumeric', ...
    'Name',          'u1', ...
    'IOType',        'RTW_IO_INPUT', ...
    'IsSigned',      false, ...
    'WordLength',    32, ...
    'FractionLength', 0);

createAndAddImplementationArg(op_entry, 'RTW.TflArgNumeric', ...
    'Name',          'u2', ...
    'IOType',        'RTW_IO_INPUT', ...
    'IsSigned',      false, ...
    'WordLength',    32, ...
    'FractionLength', 0);

% Add 3 fraction-length args. Actual values are set during code generation.
createAndAddImplementationArg(op_entry, 'RTW.TflArgNumericConstant', ...
    'Name',          'fl_in1', ...
    'IOType',        'RTW_IO_INPUT', ...
    'IsSigned',      false, ...
    'WordLength',    32, ...
    'FractionLength', 0, ...
    'Value',         0);

createAndAddImplementationArg(op_entry, 'RTW.TflArgNumericConstant', ...
    'Name',          'fl_in2', ...
    'IOType',        'RTW_IO_INPUT', ...
    'IsSigned',      false, ...
    'WordLength',    32, ...
    'FractionLength', 0, ...
    'Value',         0);

createAndAddImplementationArg(op_entry, 'RTW.TflArgNumericConstant', ...
    'Name',          'fl_out', ...
    'IOType',        'RTW_IO_INPUT', ...
    'IsSigned',      false, ...
    'WordLength',    32, ...

```

```
'FractionLength', 0, ...  
'Value',          0);
```

```
addEntry(hTable, op_entry);
```

3 Check the validity of the operator entry.

- At the command prompt, invoke the table definition file.

```
tbl = crl_table_custom_add_ufix32
```

- In the Code Replacement Viewer, view the table definition file.

```
crviewer(crl_table_custom_add_ufix32)
```

Scalar Operator Code Replacement

This example shows how to develop a code replacement library to optimize the performance of scalar operators by providing information on how to define code replacement for a `multiply` operation. To develop a code replacement library use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 73-13.

Interactively Develop a Code Replacement Library

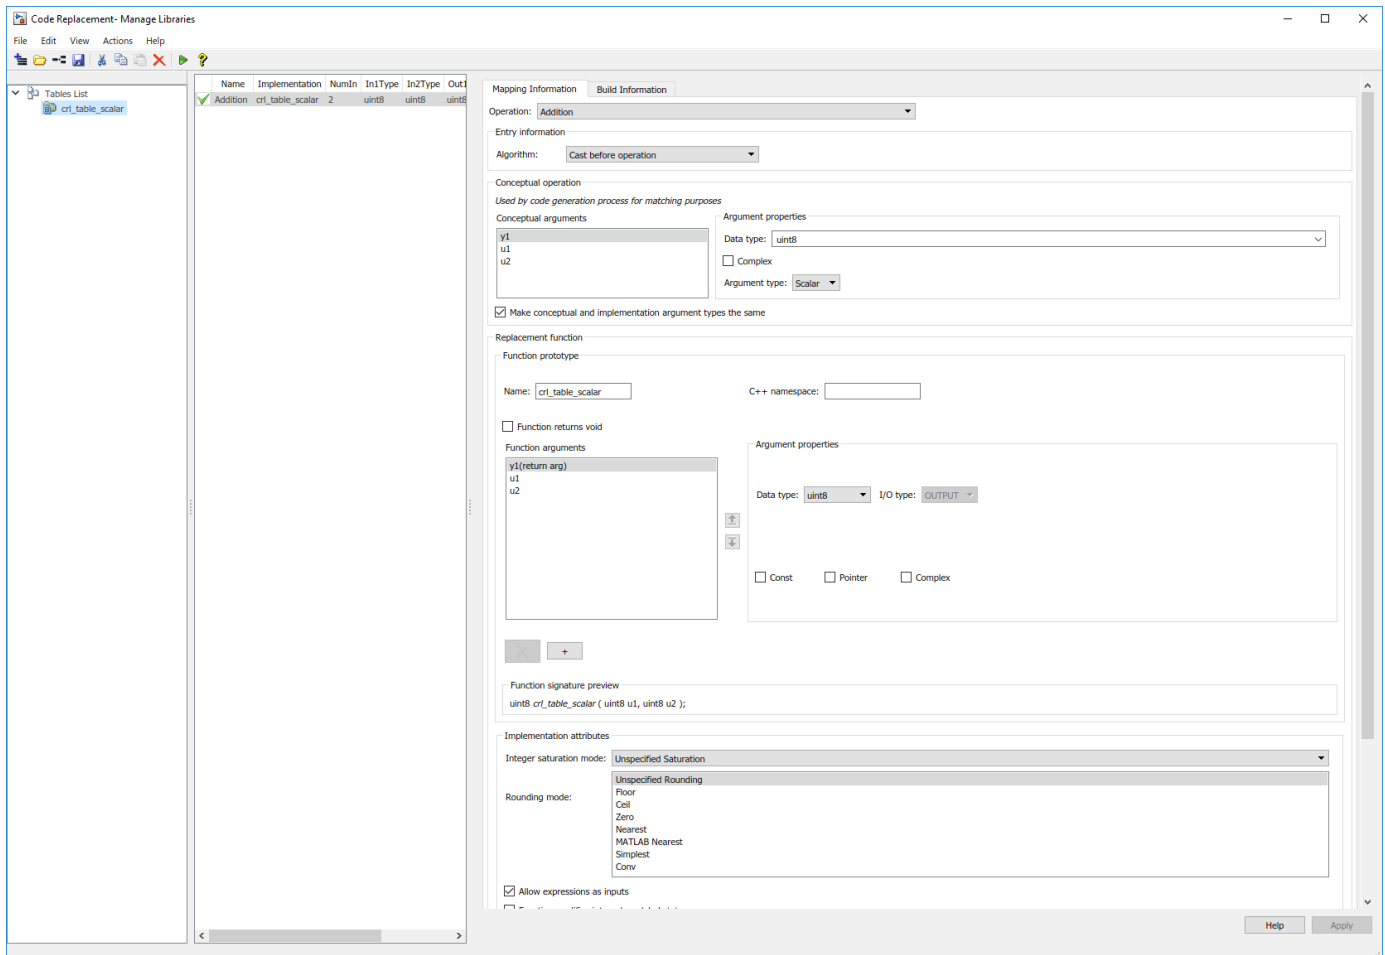

- 1 Open the **Code Replacement Tool** (crtool), from the MATLAB command line with the following command:

```
>>crtool
```

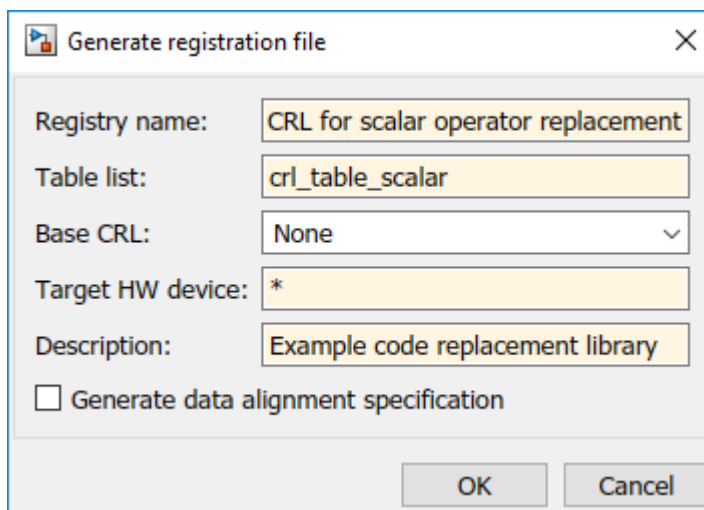

- 2 Create a table.
 - a From the crtool context menu, select **File > New Table**.
 - b In the right pane, name the table `crl_table_scalar`. Click **Apply**.
- 3 Create an entry. From the crtool context menu, select **File > New entry > Math Operation**.
- 4 Create entry parameters. In the **Operation** drop-down list, select `Multiply`.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, `y1`, and the input arguments, `u1` and `u2` with the **Data Type** of `uint8` and the **Argument Type** of `Scalar`.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box.

Specify a **Name** for the replacement function under **Function prototype**.

- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. In the **Mapping Information** tab, click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
 - a Create a function to call your code replacement library table. The function should not have arguments and return a table object.
 - b Create a table object by calling `RTW.TflTable`.

```
function hTable = crl_table_scalar()
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function .

```
function hTable = crl_table_scalar()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;
```

```
%% Create an entry
hEntry = RTW.TflCOperationEntry;
```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTflCFunctionEntryParameters`.

```
function hTable = crl_table_scalar()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntry;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
    'Key', 'RTW_OP_MUL', ...
    'Priority', 90, ...
    'SaturationMode', 'RTW_SATURATE_ON_OVERFLOW', ...
    'RoundingModes', {'RTW_ROUND_UNSPECIFIED'}, ...
    'ImplementationName', 'u8_mul_u8_u8', ...
    'ImplementationHeaderFile', 'u8_mul_u8_u8.h', ...
    'ImplementationSourceFile', 'u8_mul_u8_u8.c' );
```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `getTflArgFromString`.

```

function hTable = crl_table_scalar()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntry;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
    'Key', 'RTW_OP_MUL', ...
    'Priority', 90, ...
    'SaturationMode', 'RTW_SATURATE_ON_OVERFLOW', ...
    'RoundingModes', {'RTW_ROUND_UNSPECIFIED'}, ...
    'ImplementationName', 'u8_mul_u8_u8', ...
    'ImplementationHeaderFile', 'u8_mul_u8_u8.h', ...
    'ImplementationSourceFile', 'u8_mul_u8_u8.c' );

%% Create the conceptual representation
arg = getTflArgFromString(hTable, 'y1', 'uint8');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hTable, 'u1', 'uint8');
addConceptualArg(hEntry, arg );

arg = getTflArgFromString(hTable, 'u2', 'uint8');
addConceptualArg(hEntry, arg );

```

- 6** Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function `copyConceptualArgsToImplementation`. Add the complete entry to the table by calling the function `addEntry`.

```

function hTable = crl_table_scalar()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntry;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
    'Key', 'RTW_OP_MUL', ...
    'Priority', 90, ...
    'SaturationMode', 'RTW_SATURATE_ON_OVERFLOW', ...
    'RoundingModes', {'RTW_ROUND_UNSPECIFIED'}, ...
    'ImplementationName', 'u8_mul_u8_u8', ...
    'ImplementationHeaderFile', 'u8_mul_u8_u8.h', ...
    'ImplementationSourceFile', 'u8_mul_u8_u8.c' );

%% Create the conceptual representation
arg = getTflArgFromString(hTable, 'y1', 'uint8');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hTable, 'u1', 'uint8');
addConceptualArg(hEntry, arg );

arg = getTflArgFromString(hTable, 'u2', 'uint8');
addConceptualArg(hEntry, arg );

%% Create the Implementation Representation
copyConceptualArgsToImplementation(hEntry);

```

```

%% Add the entry to the table
hTable.addEntry(hEntry);

```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_scalar
```

- 9 Create a registration file for the code replacement library with these specifications:

```

function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for scalar operator replacement';
this(1).TableList = {'crl_table_scalar.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end

```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Addition and Subtraction Operator Code Replacement

This example shows how to develop a code replacement library to optimize the performance of addition and subtraction operators by providing information on how to define code replacement for an addition operator. To develop a code replacement library use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 73-13.

Algorithm Options

When creating a code replacement table entry for an addition or subtraction operator, first determine the type of algorithm that your library function implements.

- Cast-before-operation (CBO), default — Prior to performing the addition or subtraction operation, the algorithm type casts input values to the output type. If the output data type cannot exactly represent the input values, losses can occur as a result of the cast to the output type. Additional loss can occur when the result of the operation is cast to the final output type.

- Cast-after-operation (CAO) — The algorithm computes the ideal result of the addition or subtraction operation of the two inputs. The algorithm then type casts the result to the output data type. Loss occurs during the type cast. This algorithm behaves similarly to the C language except when the signedness of the operands does not match. For example, when you add a signed long operand to an unsigned long operand, standard C language rules convert the signed long operand to an unsigned long operand. The result is a value that is not ideal.

Algorithm Classification

During code generation, the code generator examines addition and subtraction operations, including adjacent type cast operations, to determine the type of algorithm to compute the expression result. Based on the data types in the expression and the type of the accumulator (type used to hold the result of the addition or subtraction operation), the code generator uses these rules.

- Floating-point types only

| Input 1 Data Type | Input 2 Data Type | Accumulator Data Type | Output Data Type | Classification |
|-------------------|-------------------|-----------------------|------------------|----------------|
| double | double | double | double | CBO, CAO |
| double | double | double | single | — |
| double | double | single | double | — |
| double | double | single | single | CBO |
| double | single | double | double | CBO, CAO |
| double | single | double | single | — |

| Input 1 Data Type | Input 2 Data Type | Accumulator Data Type | Output Data Type | Classification |
|-------------------|-------------------|-----------------------|------------------|----------------|
| double | single | single | double | — |
| double | single | single | single | CBO |
| single | single | single | single | CBO, CAO |
| single | single | single | double | — |
| single | single | double | single | — |
| single | single | double | double | CBO, CAO |

- Floating-point and fixed-point types on the immediate addition or subtraction operation

| Algorithm | Conditions |
|-----------|--|
| CBO | One of the following is true: <ul style="list-style-type: none"> • Operation type is double. • Operation type is single and input types are single or fixed-point. |
| CAO | Operation type is a superset of input types—that is, output type can represent values of input types without loss of data. |

- Fixed-point types only

| Algorithm | Conditions |
|-----------|--|
| CBO | At least one of the following is true: <ul style="list-style-type: none"> • Accumulator type equals output type ($T_{acc} == T_{out}$). • Output type is a superset of input types ($T_{acc} \geq \{T_{in1}, T_{in2}\}$) and accumulator type is a superset of output type ($T_{acc} \geq T_{out}$). • Operation does not incur range or precision loss. |
| CAO | Net bias is zero and the data types in the expression have equal slope adjustment factors. For more information on net bias, see “Addition” or “Subtraction” in “Fixed-Point Operator Code Replacement” on page 73-134 (for MATLAB code) or “Fixed-Point Operator Code Replacement” on page 72-186 (for Simulink models). |

In many cases, the numerical result of a CBO operation is equal to that of a CAO operation. For example, if the input and output types are such that the operation produces the ideal result, as in the case of $int8 + int8 \rightarrow int16$. To maximize the probability of code replacement occurring in such cases, set the algorithm to cast-after-operation.

Interactively Develop a Code Replacement Library

- 1 Open the **Code Replacement Tool** (crtool), from the MATLAB command line with the following command:

```
>>crtool
```

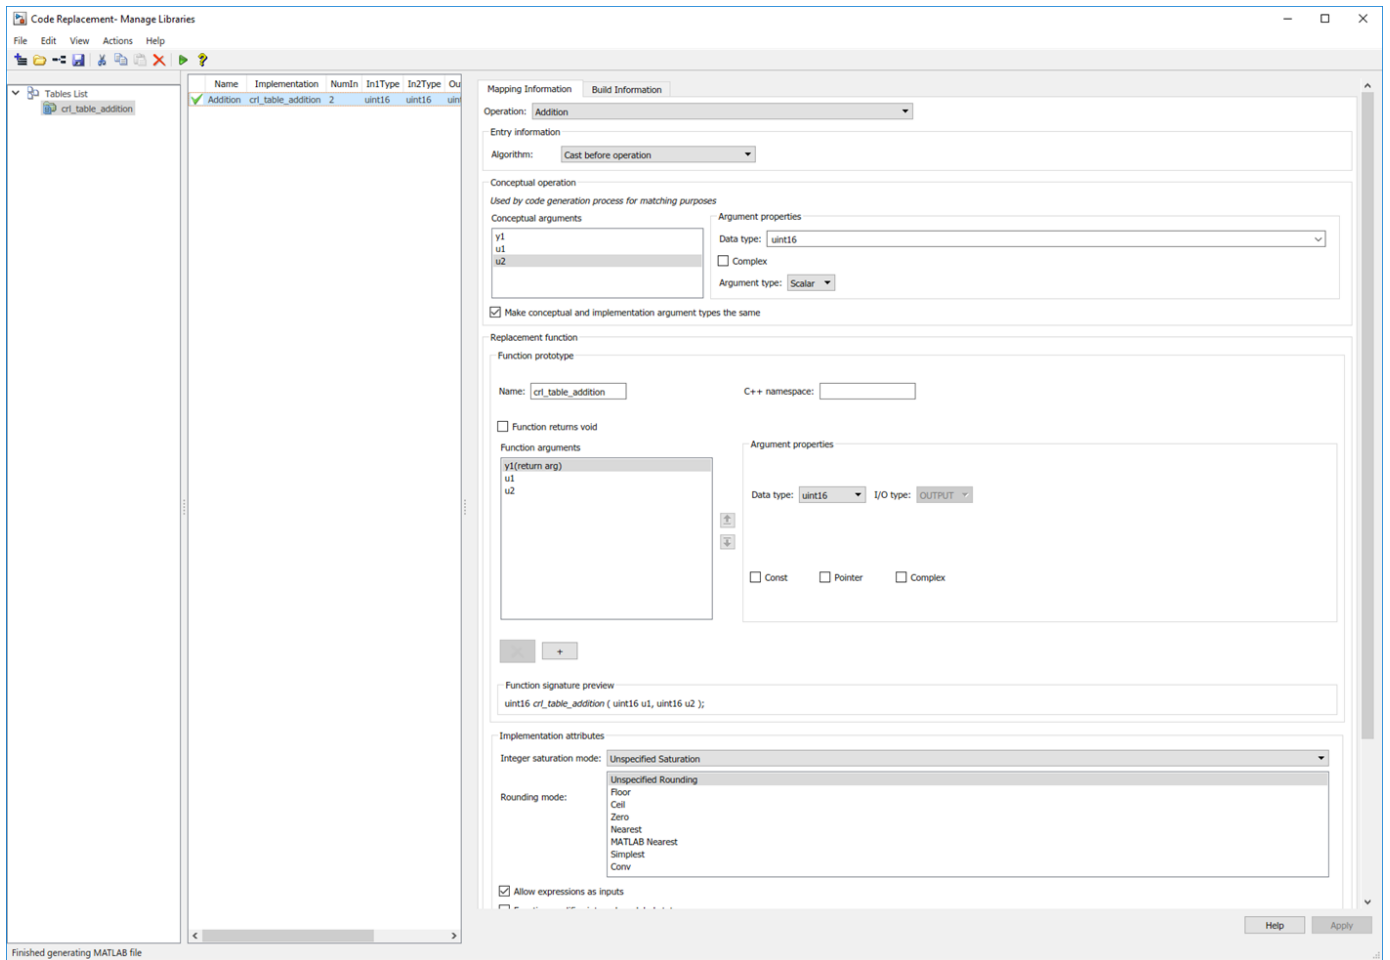

- 2 Create a table.

- a From the crtool context menu, select **File > New Table**.

- b** In the right pane, name the table `cr1_table_addition`. Click **Apply**.
- 3** Create an entry. From the crtool context menu, select **File > New entry > Math Operation**.
- 4** Create entry parameters. In the **Function** drop-down list, select **Addition**. Algorithm information appears in the crtool. For this example, select the parameter to **Cast before operation**.
- 5** Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, `y1`, with the **Data Type** of `uint8` and the **Argument Type** of **Scalar**, the input arguments, `u1` and `u2` with the **Data Type** of `uint16` and the **Argument Type** of **Scalar**.
- 6** Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box.

Specify a **Name** for the replacement function under **Function prototype**.

- 7** Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8** Validate and save the table. In the **Mapping Information** tab, click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
 - a Create a function with the name of your code replacement library table that does not have arguments and returns a table object. You can use this function to call your code replacement library table.
 - b Create a table object by calling `RTW.TflTable`.

```
function hTflTable = make_cbo_add_crl_table
% Create a function to call the code replacement library table

%% Create a table object
hTflTable = RTW.TflTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TflCOperationEntry`.

```
function hTflTable = make_cbo_add_crl_table
% Create a function to call the code replacement library table

%% Create a table object
hTflTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntry;
```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTflCOperationEntryParameters`.

```
function hTflTable = make_cbo_add_crl_table
% Create a function to call the code replacement library table

%% Create a table object
hTflTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntry;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
    'Key', 'RTW_OP_ADD', ...
    'EntryInfoAlgorithm', 'RTW_CAST_BEFORE_OP', ...
    'ImplementationName', 'u8_add_cao_u16_u16');
```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `getTflArgFromString`.

```
function hTflTable = make_cbo_add_crl_table
% Create a function to call the code replacement library table
```

```

%% Create a table object
hTflTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntry;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
    'Key', 'RTW_OP_ADD', ...
    'EntryInfoAlgorithm', 'RTW_CAST_BEFORE_OP', ...
    'ImplementationName', 'u8_add_cao_u16_u16');

%% Create the conceptual representation
arg = getTflArgFromString(hTflTable, 'y1', 'uint8');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hTflTable, 'u1', 'uint16');
addConceptualArg(hEntry, arg );

arg = getTflArgFromString(hTflTable, 'u2', 'uint16');
addConceptualArg(hEntry, arg );

```

- 6** Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function `copyConceptualArgsToImplementation`. Add the complete entry to the table by calling the function `addEntry`.

```

function hTflTable = make_cbo_add_crl_table()
% Create a function to call the code replacement library table

%% Create a table object
hTflTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntry;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
    'Key', 'RTW_OP_ADD', ...
    'EntryInfoAlgorithm', 'RTW_CAST_BEFORE_OP', ...
    'ImplementationName', 'u8_add_cao_u16_u16');

%% Create the conceptual representation
arg = getTflArgFromString(hTflTable, 'y1', 'uint8');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);

arg = getTflArgFromString(hTflTable, 'u1', 'uint16');
addConceptualArg(hEntry, arg );

arg = getTflArgFromString(hTflTable, 'u2', 'uint16');
addConceptualArg(hEntry, arg );

%% Create the Implementation Representation
copyConceptualArgsToImplementation(hEntry);

%% Add the entry to the table
addEntry(hTflTable, hEntry);

```

- 7** Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8** Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = make_cbo_add_crl_table
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file (a new function file) with these specifications:

```
function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for addition subtraction operator replacement';
this(1).TableList = {'make_cbo_add_crl_table.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end
```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Limitations

- When classifying an operation as a CAO operation, the code generator includes the adjacent casts in the expression when the expression involves only fixed-point types. Otherwise, the code generator classifies and replaces only the immediate addition or subtraction operation. Casts that the code generator excludes from the classification appear in the generated code.
- To enable the code generator to include multiple cast operations, which follow an addition or subtraction of fixed-point data, in the classification of an expression, the rounding mode must be `simplest` or `floor`. Consider the expression `y=(cast A)(cast B)(u1+u2)`. If the rounding mode of `(cast A)`, `(cast B)`, and the addition operator `(+)` are set to `simplest` or `floor`, the code generator takes into account `(cast A)` and `(cast B)` when classifying the expression and performing the replacement only.

Small Matrix Operation to Processor Code Replacement

This example shows how to develop a code replacement library to optimize the performance of non-scalar small matrix operations with processor-specific intrinsic functions by providing information on how to define code replacement for a **addition** operator. To develop a code replacement library use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 73-13.

Interactively Develop a Code Replacement Library

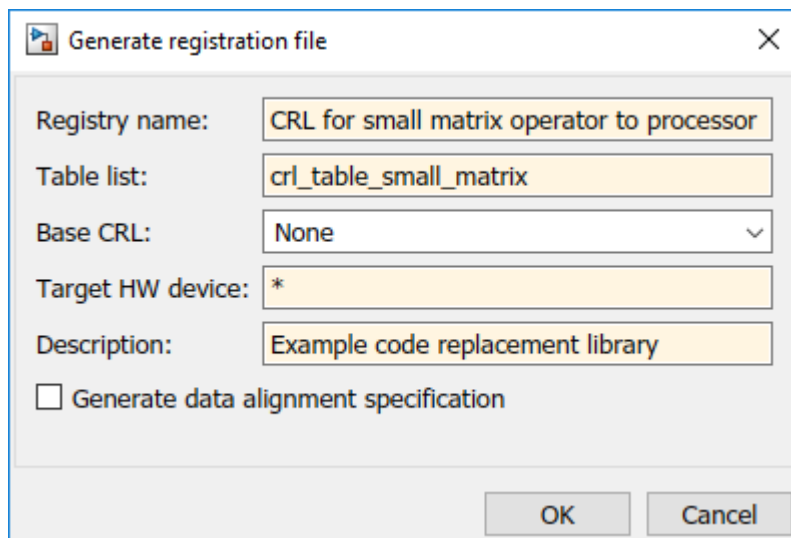

- 1 Open the **Code Replacement Tool** (crtool), from the MATLAB command line with the following command:

```
>>crtool
```
- 2 Create a table.
 - a From the crtool context menu, select **File > New Table**.
 - b In the right pane, name the table `cr1_table_small_matrix`. Click **Apply**.
- 3 Create an entry. From the crtool context menu, select **File > New entry > Math Operation**.
- 4 Create entry parameters. In the **Function** drop-down list, select **Addition**. Algorithm information appears in the crtool. For this example, select the parameter to **Cast before operation**.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, `y1`, with the **Data Type** of `double` and the **Argument Type** of **Matrix**, the input argument, `u1` with the **Data Type** of `double` and the **Argument Type** of **Matrix** and the input argument, `u2` with the **Data Type** of `double` and the **Argument Type** of **Matrix**.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box. Specify the return argument `y1`, `u1` and `u2`, with the **Data Type** of `double` and select the **Pointer** dialog box.

Specify a **Name** for the replacement function under **Function prototype**.
- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. In the **Mapping Information** tab, click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
 - a Create a function with the name of your code replacement library table that does not have arguments and returns a table object. You can use this function to call your code replacement library table.
 - b Create a table object by calling `RTW.TflTable`.

```
function hTable = crl_table_small_matrix_operator()
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
LibPath= fullfile(matlabroot, 'examples', 'coder');
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TflCOperationEntry`.

```
function hTable = crl_table_small_matrix_operator()
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
LibPath= fullfile(matlabroot, 'examples', 'coder');
```

```
%% Create an entry
hEntry = RTW.TflCOperationEntry;
```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTflCOperationEntryParameters`.

```
function hTable = crl_table_small_matrix_operator()
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
LibPath= fullfile(matlabroot, 'examples', 'coder');
```

```
%% Create an entry
hEntry = RTW.TflCOperationEntry;
```

```
%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
    'Key', 'RTW_OP_ADD', ...
```

```

    'Priority',          30, ...
    'SaturationMode',  'RTW_WRAP_ON_OVERFLOW', ...
    'ImplementationName', 'matrix_sum_2x2_double', ...
    'ImplementationHeaderFile', 'MatrixMath.h', ...
    'ImplementationSourceFile', 'MatrixMath.c', ...
    'ImplementationHeaderPath', LibPath, ...
    'ImplementationSourcePath', LibPath, ...
    'AdditionalIncludePaths', {LibPath}, ...
    'GenCallback',       'RTW.copyFileToBuildDir', ...
    'SideEffects',      true);

```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `createAndAddConceptualArg`.

```

function hTable = cml_table_small_matrix_operator()
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
LibPath= fullfile(matlabroot, 'examples', 'coder');

%% Create an entry
hEntry = RTW.TflCOperationEntry;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
    'Key',          'RTW.OP_ADD', ...
    'Priority',     30, ...
    'SaturationMode', 'RTW_WRAP_ON_OVERFLOW', ...
    'ImplementationName', 'matrix_sum_2x2_double', ...
    'ImplementationHeaderFile', 'MatrixMath.h', ...
    'ImplementationSourceFile', 'MatrixMath.c', ...
    'ImplementationHeaderPath', LibPath, ...
    'ImplementationSourcePath', LibPath, ...
    'AdditionalIncludePaths', {LibPath}, ...
    'GenCallback',  'RTW.copyFileToBuildDir', ...
    'SideEffects',  true);

%% Create the conceptual representation
createAndAddConceptualArg(hEntry, 'RTW.TflArgMatrix', ...
    'Name',          'y1', ...
    'IOType',        'RTW_IO_OUTPUT', ...
    'BaseType',      'double', ...
    'DimRange',      [2 2]);
createAndAddConceptualArg(hEntry, 'RTW.TflArgMatrix', ...
    'Name',          'u1', ...
    'BaseType',      'double', ...
    'DimRange',      [2 2]);
createAndAddConceptualArg(hEntry, 'RTW.TflArgMatrix', ...
    'Name',          'u2', ...
    'BaseType',      'double', ...
    'DimRange',      [2 2]);

```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function `getTflArgFromString`.

```

function hTable = crl_table_small_matrix_operator()
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
LibPath= fullfile(matlabroot,'examples','coder');

%% Create an entry
hEntry = RTW.TflCOperationEntry;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
    'Key', 'RTW_OP_ADD', ...
    'Priority', 30, ...
    'SaturationMode', 'RTW_WRAP_ON_OVERFLOW', ...
    'ImplementationName', 'matrix_sum_2x2_double', ...
    'ImplementationHeaderFile', 'MatrixMath.h', ...
    'ImplementationSourceFile', 'MatrixMath.c', ...
    'ImplementationHeaderPath', LibPath, ...
    'ImplementationSourcePath', LibPath, ...
    'AdditionalIncludePaths', {LibPath}, ...
    'GenCallback', 'RTW.copyFileToBuildDir', ...
    'SideEffects', true);

%% Create the conceptual representation
createAndAddConceptualArg(hEntry, 'RTW.TflArgMatrix', ...
    'Name', 'y1', ...
    'IOType', 'RTW_IO_OUTPUT', ...
    'BaseType', 'double', ...
    'DimRange', [2 2]);
createAndAddConceptualArg(hEntry, 'RTW.TflArgMatrix',...
    'Name', 'u1', ...
    'BaseType', 'double', ...
    'DimRange', [2 2]);
createAndAddConceptualArg(hEntry, 'RTW.TflArgMatrix',...
    'Name', 'u2', ...
    'BaseType', 'double', ...
    'DimRange', [2 2]);

%% Create the Implementation Representation
arg = getTflArgFromString(hTable, 'y2', 'void');
arg.IOType = 'RTW_IO_OUTPUT';
hEntry.Implementation.setReturn(arg);

arg = getTflArgFromString(hTable, 'u1', ['double' '*']);
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'u2', ['double' '*']);
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'y1', ['double' '*']);

arg.IOType = 'RTW_IO_OUTPUT';
hEntry.Implementation.addArgument(arg);

```

```
%% Add the entry to the table
hTable.addEntry(hEntry);
```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_small_matrix
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file (a new function file) with these specifications:

```
function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for small matrix operator to processor';
this(1).TableList = {'crl_table_small_matrix.m'};
% table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end
```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Matrix Multiplication Operation to MathWorks BLAS Code Replacement

You can develop a code replacement library for floating-point matrix/matrix and matrix/vector multiplication operations with the multiplication functions `dgemm` and `dgemv` defined in the MathWorks BLAS library. If you use a third-party BLAS library for replacement, you must change the build requirements in this example to point to your library. To develop a code replacement library use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 73-13.

Interactively Develop a Code Replacement Library

- 1 Open the **Code Replacement Tool** (crtool), from the MATLAB command line with the following command:

```
>>crtool
```
- 2 Create a table.
 - a From the crtool context menu, select **File > New Table**.
 - b In the right pane, name the table `cr1_table_blas`. Click **Apply**.
- 3 Create an entry. From the crtool context menu, select **File > New entry > Blas Operation (Fortran)**.
- 4 Create entry parameters. In the **Function** drop-down list, select **Multiply**.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, `y1`, and the input argument, `u1` and `u2` with the **Data Type** of **double** and the **Argument Type** of **Matrix**.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box. Set the **BLAS level** to **2(Vector)**.

Specify a **Name** for the replacement function under **Function prototype**.
- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. In the **Mapping Information** tab, click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
 - a Create a function to call your code replacement library table. The function should not have arguments and return a table object.
 - b Create a table object by calling `RTW.TfTable`.

```
function hTable = crl_table_blas
% Create a function to call the code replacement library table
```

```
%% Create a table object
hTable = RTW.TfTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TfBlasEntryGenerator`.

```
function hTable = crl_table_blas
% Create a code replacement library table
```

```
%% Create a table object
hTable = RTW.TfTable;
```

```
%% Create an entry
```

```

%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%% Define library path for Windows or UNIX block%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
arch = computer('arch');
if ~ispc
    LibPath = fullfile('$MATLAB_ROOT', 'bin', arch);
else
    % Use Stateflow to get the compiler info
    compilerInfo = sf('Private','compilerman','get_compiler_info');
    compilerName = compilerInfo.compilerName;
    if strcmp(compilerName, 'msvc90') || ...
        strcmp(compilerName, 'msvc80') || ...
        strcmp(compilerName, 'msvc71') || ...
        strcmp(compilerName, 'msvc60'), ...
        compilerName = 'microsoft';
    end
    LibPath = fullfile('$MATLAB_ROOT', 'extern', 'lib', arch, compilerName);
end

if ispc
    libExt = 'lib';
elseif ismac
    libExt = 'dylib';
else
    libExt = 'so';
end

```

```

%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%% Beginning of entries for the first dgemm block%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%

```

```

% Create table entry for dgemm32
hEntry = RTW.TfLBlasEntryGenerator;

```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTfLCFunctionEntryParameters`.

```

function hTable = crl_table_blas
% Create a code replacement library table

% Create a table object
hTable = RTW.TfLTable;

% Create an entry
%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%% Define library path for Windows or UNIX block%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
arch = computer('arch');
if ~ispc
    LibPath = fullfile('$MATLAB_ROOT', 'bin', arch);
else
    % Use Stateflow to get the compiler info
    compilerInfo = sf('Private','compilerman','get_compiler_info');
    compilerName = compilerInfo.compilerName;
    if strcmp(compilerName, 'msvc90') || ...
        strcmp(compilerName, 'msvc80') || ...
        strcmp(compilerName, 'msvc71') || ...
        strcmp(compilerName, 'msvc60'), ...
        compilerName = 'microsoft';
    end
    LibPath = fullfile('$MATLAB_ROOT', 'extern', 'lib', arch, compilerName);
end

if ispc
    libExt = 'lib';
elseif ismac
    libExt = 'dylib';
else
    libExt = 'so';
end

```

```

%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%% Beginning of entries for the first dgemm block%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%

```

```

% Create table entry for dgemm32
hEntry = RTW.TfLBlasEntryGenerator;

```

```

% Create entry parameters
setTfLCOperationEntryParameters(hEntry, ...
    'Key', 'RTW_OP_MUL', ...

```

```

'Priority',          100, ...
'ImplementationName', 'dgemm32', ...
'ImplementationHeaderFile', 'blascompat32_crl.h', ...
'ImplementationHeaderPath', fullfile('${MATLAB_ROOT}','extern','include'), ...
'AdditionalLinkObjs', {'libmwblascompat32.' libExt}}, ...
'AdditionalLinkObjsPaths', {LibPath}, ...
'SideEffects',      true);

```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `createAndAddConceptualArg`. To specify a matrix argument in the function call, use the argument class `RTW.TflArgMatrix` and specify the base type and the dimensions for which the argument is valid. This type of table entry supports a range of dimensions specified in the format `[Dim1Min Dim2Min ... DimNMin; Dim1Max Dim2Max ... DimNMax]`. For example, `[2 2; inf inf]` means a two-dimensional matrix of size 2x2 or larger. The conceptual output argument for the `dgemm32` entry for matrix/matrix multiplication replacement specifies dimensions `[2 2; inf inf]`, while the conceptual output argument for the `dgemv32` entry for matrix/vector multiplication replacement specifies dimensions `[2 1; inf 1]`.

```

function hTable = crl_table_blas
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%

arch = computer('arch');
if ~ispc
    LibPath = fullfile('${MATLAB_ROOT}', 'bin', arch);
else
    % Use Stateflow to get the compiler info
    compilerInfo = sf('Private','compilerman','get_compiler_info');
    compilerName = compilerInfo.compilerName;
    if strcmp(compilerName, 'msvc90') || ...
        strcmp(compilerName, 'msvc80') || ...
        strcmp(compilerName, 'msvc71') || ...
        strcmp(compilerName, 'msvc60'), ...
        compilerName = 'microsoft';
    end
    LibPath = fullfile('${MATLAB_ROOT}', 'extern', 'lib', arch, compilerName);
end

if ispc
    libExt = 'lib';
elseif ismac
    libExt = 'dylib';
else
    libExt = 'so';
end

%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%

% Create table entry for dgemm32
hEntry = RTW.TflBlasEntryGenerator;

%% Create entry parameters
setTflCoperationEntryParameters(hEntry, ...
    'Key',          'RTW_OP_MUL', ...
    'Priority',     100, ...
    'ImplementationName', 'dgemm32', ...
    'ImplementationHeaderFile', 'blascompat32_crl.h', ...
    'ImplementationHeaderPath', fullfile('${MATLAB_ROOT}','extern','include'), ...
    'AdditionalLinkObjs', {'libmwblascompat32.' libExt}}, ...
    'AdditionalLinkObjsPaths', {LibPath}, ...
    'SideEffects',      true);

%% Create the conceptual representation
createAndAddConceptualArg(hEntry, 'RTW.TflArgMatrix', ...
    'Name',          'y1', ...
    'IOType',        'RTW_IO_OUTPUT', ...
    'BaseType',      'double', ...

```

```

        'DimRange',    [2 2; inf inf]);
createAndAddConceptualArg(hEntry, 'RTW.TfLArgMatrix', ...
    'Name',            'u1', ...
    'BaseType',        'double', ...
    'DimRange',        [2 2; inf inf]);
createAndAddConceptualArg(hEntry, 'RTW.TfLArgMatrix', ...
    'Name',            'u2', ...
    'BaseType',        'double', ...
    'DimRange',        [1 1; inf inf]);

```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function `getTfLArgFromString`. The example code configures special implementation arguments that are required for `dgemm` and `dgemv` function replacements. The convenience methods `setReturn` and `addArgument` specify whether an argument is a return value or argument and adds the argument to the entry's array of implementation arguments. Add the complete entry to the table by calling the function `addEntry`.

```

function hTable = crl_table_blas
% Create a code replacement library table

%% Create a table object
hTable = RTW.TfLTable;

%% Create an entry
%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%

arch = computer('arch');
if ~ispc
    LibPath = fullfile('$MATLAB_ROOT', 'bin', arch);
else
    % Use Stateflow to get the compiler info
    compilerInfo = sf('Private','compilerman','get_compiler_info');
    compilerName = compilerInfo.compilerName;
    if strcmp(compilerName, 'msvc90') || ...
        strcmp(compilerName, 'msvc80') || ...
        strcmp(compilerName, 'msvc71') || ...
        strcmp(compilerName, 'msvc60'), ...
        compilerName = 'microsoft';
    end
    LibPath = fullfile('$MATLAB_ROOT', 'extern', 'lib', arch, compilerName);
end

if ispc
    libExt = 'lib';
elseif ismac
    libExt = 'dylib';
else
    libExt = 'so';
end

%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%

% Create table entry for dgemm32
hEntry = RTW.TfLBlasEntryGenerator;

%% Create the Implementation Representation
% Using RTW.TflBlasEntryGenerator for xgemv requires the following
% implementation signature:
%
% void f(char* TRANSA, char* TRANSB, int* M, int* N, int* K,
%        type* ALPHA, type* u1, int* LDA, type* u2, int* LDB,
%        type* BETA, type* y, int* LDC)
%
% When a match occurs, the code generator computes the
% values for M, N, K, LDA, LDB, and LDC and inserts them into the
% generated code. TRANSA and TRANSB are set to 'N'.

% Specify replacement function signature

arg = getTflArgFromString(hTable, 'y2', 'void');
arg.IOType = 'RTW_IO_OUTPUT';
hEntry.Implementation.setReturn(arg);

arg = RTW.TflArgCharConstant('TRANSA');
% Possible values for PassByType property are
% RTW_PASSBY_AUTO, RTW_PASSBY_POINTER,
% RTW_PASSBY_VOID_POINTER, RTW_PASSBY_BASE_POINTER
arg.PassByType = 'RTW_PASSBY_POINTER';
hEntry.Implementation.addArgument(arg);

arg = RTW.TflArgCharConstant('TRANSB');
arg.PassByType = 'RTW_PASSBY_POINTER';
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'M', 'integer', 0);
arg.PassByType = 'RTW_PASSBY_POINTER';
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'N', 'integer', 0);
arg.PassByType = 'RTW_PASSBY_POINTER';
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'K', 'integer', 0);
arg.PassByType = 'RTW_PASSBY_POINTER';
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'ALPHA', 'double', 0);
arg.PassByType = 'RTW_PASSBY_POINTER';
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'u1', ['double' '*']);
arg.PassByType = 'RTW_PASSBY_POINTER';
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'LDA', 'integer', 0);
arg.PassByType = 'RTW_PASSBY_POINTER';
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'u2', ['double' '*']);
arg.PassByType = 'RTW_PASSBY_POINTER';
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'LDB', 'integer', 0);
arg.PassByType = 'RTW_PASSBY_POINTER';
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'BETA', 'double', 0);
arg.PassByType = 'RTW_PASSBY_POINTER';
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

```

```

arg = getTflArgFromString(hTable, 'y1', ['double' '*']);
arg.IOType = 'RTW_IO_OUTPUT';
arg.PassByType = 'RTW_PASSBY_POINTER';
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'LDC', 'integer', 0);
arg.PassByType = 'RTW_PASSBY_POINTER';
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

```

```

%% Add the entry to the table
addEntry(hTable, hEntry);

```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_blas
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file with these specifications:

```

function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for matrix multiplication for Mathworks Blas code';
this(1).TableList = {'crl_table_blas.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end

```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Matrix Multiplication Operation to ANSI/ISO C BLAS Code Replacement

You can develop a code replacement library for floating-point matrix/matrix and matrix/vector multiplication operations with the multiplication functions `sgemm` defined in the MathWorks C BLAS library. Use a third-party C BLAS library for replacement and change the build requirements in this example to point to your library. To develop a code replacement library use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 73-13.

Interactively Develop a Code Replacement Library

- 1 Open the **Code Replacement Tool** (`crtool`), from the MATLAB command line with the following command:

```
>>crtool
```
- 2 Create a table.
 - a From the `crtool` context menu, select **File > New Table**.
 - b In the right pane, name the table `cr1_table_cblas`. Click **Apply**.
- 3 Create an entry. From the `crtool` context menu, select **File > New entry > CBlas Operation (Atlas)**.
- 4 Create entry parameters. In the **Function** drop-down list, select **Multiply**.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the `crtool`, specify the return argument, `y1`, and the input argument, `u1` and `u2` with the **Data Type** of single and the **Argument Type** of Matrix.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box. Set the **BLAS level** to 3(Vector).

Specify a **Name** for the replacement function under **Function prototype**.
- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. In the **Mapping Information** tab, click **Validate entry**. In the `crtool` context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
 - a Create a function to call your code replacement library table. The function should not have arguments and return a table object.
 - b Create a table object by calling `RTW.TfTable`.

```
function hTable = crl_table_cblas
% Create a function to call the code replacement library table
```

```
%% Create a table object
hTable = RTW.TfTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TfCblasEntryGenerator`.

```
function hTable = crl_table_cblas
% Create a code replacement library table
```

```
%% Create a table object
hTable = RTW.TfTable;
```

```
%% Create an entry
```

```

%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%% Define library path Cblas library file%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
LibPath = fullfile('<Specify the path of your cblas library>');

if ispc
    libExt = 'lib';
elseif ismac
    libExt = 'dylib';
else
    libExt = 'so';
end

```

```

% Create table entry for dgemm32
hEntry = RTW.TfLcBblasEntryGenerator;

```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTfLcFunctionEntryParameters`.

```

function hTable = crl_table_cblas
% Create a code replacement library table

%% Create a table object
hTable = RTW.TfLTable;

%% Create an entry
%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%% Define library path Cblas library file%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
LibPath = fullfile('<Specify the path of your cblas library>');

if ispc
    libExt = 'lib';
elseif ismac
    libExt = 'dylib';
else
    libExt = 'so';
end

% Create table entry for dgemm32
hEntry = RTW.TfLcBblasEntryGenerator;

```

```

%% Create entry parameters
hEntry.setTfLcOperationEntryParameters( ...
    'Key', 'RTW_OP_MUL', ...
    'Priority', 100, ...
    'ImplementationName', 'cblas_sgemm', ...
    'ImplementationSourceFile', 'ccblas.c', ...
    'ImplementationHeaderFile', 'ccblas.h', ...
    'AdditionalIncludePaths', {LibPath}, ...
    'AdditionalLinkObjs', {'libcblas' libExt}, ...
    'AdditionalLinkFlags', {'-lgfortran'}, ...
    'SideEffects', true);

```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `createAndAddConceptualArg`. To specify a matrix argument in the function call, use the argument class `RTW.TfLArgMatrix` and specify the base type and the dimensions for which the argument is valid. This type of table entry supports a range of dimensions specified in the format `[Dim1Min Dim2Min ... DimNMin; Dim1Max Dim2Max ... DimNMax]`. For example, `[2 2; inf inf]` means a two-dimensional matrix of size 2x2 or larger.

```

function hTable = crl_table_cblas
% Create a code replacement library table

%% Create a table object
hTable = RTW.TfLTable;

%% Create an entry
%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%% Define library path Cblas library file%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
LibPath = fullfile('<Specify the path of your cblas library>');

if ispc
    libExt = 'lib';
elseif ismac
    libExt = 'dylib';
else
    libExt = 'so';
end

```

```

    libExt = 'so';
end

% Create table entry for dgemm32
hEntry = RTW.TfLCBlasEntryGenerator;

%% Create entry parameters
hEntry.setTfLCOperationEntryParameters( ...
    'Key', 'RTW_OP_MUL', ...
    'Priority', 100, ...
    'ImplementationName', 'cblas_sgemm', ...
    'ImplementationSourceFile', 'ccblas.c', ...
    'ImplementationHeaderFile', 'ccblas.h', ...
    'AdditionalIncludePaths', {LibPath}, ...
    'AdditionalLinkObjs', {[ 'libcblas' libExt]}, ...
    'AdditionalLinkFlags', { '-lgfortran'}, ...
    'SideEffects', true);

%% Create the conceptual representation
arg = RTW.TfLArgMatrix('y1', 'RTW_IO_OUTPUT', 'single');
arg.DimRange = [2 2; Inf Inf];
hEnt.addConceptualArg(arg);

arg = RTW.TfLArgMatrix('u1', 'RTW_IO_INPUT', 'single');
arg.DimRange = [2 1; Inf Inf];
hEnt.addConceptualArg(arg);

arg = RTW.TfLArgMatrix('u2', 'RTW_IO_INPUT', 'single');
arg.DimRange = [1 2; Inf Inf];
hEnt.addConceptualArg(arg);

```

- 6** Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function `getTfLArgFromString`. The example code configures special implementation arguments that are required for `dgemm` and `dgemv` function replacements. The convenience methods `setReturn` and `addArgument` specify whether an argument is a return value or argument and adds the argument to the entry's array of implementation arguments. Add the complete entry to the table by calling the function `addEntry`.

```

function hTable = crl_table_cblas
% Create a code replacement library table

%% Create a table object
hTable = RTW.TfLTable;

%% Create an entry
%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
LibPath = fullfile('<Specify the path of your cblas library>');

if ispc
    libExt = 'lib';
elseif ismac
    libExt = 'dylib';
else
    libExt = 'so';
end

% Create table entry for dgemm32
hEntry = RTW.TfLCBlasEntryGenerator;

%% Create entry parameters
hEntry.setTfLCOperationEntryParameters( ...
    'Key', 'RTW_OP_MUL', ...
    'Priority', 100, ...
    'ImplementationName', 'cblas_sgemm', ...
    'ImplementationSourceFile', 'ccblas.c', ...
    'ImplementationHeaderFile', 'ccblas.h', ...
    'AdditionalIncludePaths', {LibPath}, ...
    'AdditionalLinkObjs', {[ 'libcblas' libExt]}, ...
    'AdditionalLinkFlags', { '-lgfortran'}, ...
    'SideEffects', true);

%% Create the conceptual representation

```

```

arg = RTW.TflArgMatrix('y1', 'RTW_IO_OUTPUT', 'single');
arg.DimRange = [2 2; Inf Inf];
hEnt.addConceptualArg(arg);

arg = RTW.TflArgMatrix('u1', 'RTW_IO_INPUT', 'single');
arg.DimRange = [2 1; Inf Inf];
hEnt.addConceptualArg(arg);

arg = RTW.TflArgMatrix('u2', 'RTW_IO_INPUT', 'single');
arg.DimRange = [1 2; Inf Inf];
hEnt.addConceptualArg(arg);

%% Create the Implementation Representation
% Using RTW.TflCBlasEntryGenerator for sgemm requires the following
% implementation signature:
%
% void no_name( const integer ORDER, const integer TRANSA, const integer TRANSB,
% const integer M, const integer N, const integer K, const double ALPHA,
% const double* u1, const integer LDA, const double* u2, const integer LDB,
% const double BETA, double* y1, const integer LDC );
%
% When a match occurs, the code generator computes the
% values for M, N, K, LDA, LDB, and LDC and inserts them into the
% generated code. TRANSA and TRANSB are set to 'N'.

% Specify replacement function signature
arg = hEntry.getTflArgFromString('y2','void');
arg.IOType = 'RTW_IO_OUTPUT';
hEntry.Implementation.setReturn(arg);

arg = hEntry.getTflArgFromString('ORDER','integer',102.00000000000000);
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTflArgFromString('TRANSA','integer',111.00000000000000);
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTflArgFromString('TRANSB','integer',111.00000000000000);
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTflArgFromString('M','integer',0.00000000000000);
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTflArgFromString('N','integer',0.00000000000000);
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTflArgFromString('K','integer',0.00000000000000);
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTflArgFromString('ALPHA','double',1.00000000000000);
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTflArgFromString('u1','single*');
arg.Type.BaseType.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTflArgFromString('LDA','integer',0.00000000000000);
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTflArgFromString('u2','single*');
arg.Type.BaseType.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTflArgFromString('LDB','integer',0.00000000000000);
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTflArgFromString('BETA','double',0.00000000000000);
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);

arg = hEntry.getTflArgFromString('y1','single*');
arg.IOType = 'RTW_IO_OUTPUT';
hEntry.Implementation.addArgument(arg);

```

```
arg = hEntry.getTflArgFromString('LDC','integer',0.0000000000000000);
arg.Type.ReadOnly = true;
hEntry.Implementation.addArgument(arg);
```

```
%% Add the entry to the table
addEntry(hTable, hEntry);
```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_cblas
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file with these specifications:

```
function rtwTargetInfo(cm)
cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for matrix multiplication for Mathworks CBlas code';
this(1).TableList = {'crl_table_cblas.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end
```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Remap Operator Output to Function Input

If your generated code must meet a specific coding pattern or you want more flexibility, for example, to further improve performance, you can remap operator outputs to input positions in an implementation function argument list.

Note Remapping outputs to implementation function inputs is supported only for operator replacement.

For example, for a sum operation, the code generator produces code similar to:

```
add8_Y.Out1 = u8_add_u8_u8(add8_U.In1, add8_U.In2);
```

If you remap the output to the first input, the code generator produces code similar to:

```
u8_add_u8_u8(&add8_Y.Out1;, add8_U.In1, add8_U.In2);
```

The following table definition file for a sum operation remaps operator output y1 as the first function input argument.

- 1 Create a table definition file that contains a function definition. For example:

```
function hTable = crl_table_add_uint8
```

- 2 Within the function body, create the table by calling the function `RTW.TflTable`.

```
hTable = RTW.TflTable;
```

- 3 Create an entry for the operator mapping with a call to the `RTW.TflCOperationEntry` function.

```
% Create operation entry
op_entry = RTW.TflCOperationEntry;
```

- 4 Set operator entry parameters with a call to the `setTflCOperationEntryParameters` function. In the function call, set the property `SideEffects` to `true`.

```
setTflCOperationEntryParameters(op_entry, ...
    'Key', 'RTW_OP_ADD', ...
    'Priority', 90, ...
    'ImplementationName', 'u8_add_u8_u8', ...
    'ImplementationHeaderFile', 'u8_add_u8_u8.h', ...
    'ImplementationSourceFile', 'u8_add_u8_u8.c', ...
    'SideEffects', true );
```

- 5 Create conceptual arguments y1, u1, and u2. There are multiple ways to set up the conceptual arguments. This example uses calls to the `getTflArgFromString` and `addConceptualArg` functions to create and add the arguments.

```
arg = getTflArgFromString(hTable, 'y1', 'uint8');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(op_entry, arg);
```

```
arg = getTflArgFromString(hTable, 'u1', 'uint8');
addConceptualArg(op_entry, arg );
```

```
arg = getTflArgFromString(hTable, 'u2', 'uint8');
addConceptualArg(op_entry, arg );
```

- 6 Create the implementation arguments. There are multiple ways to set up the implementation arguments. This example uses calls to the `getTflArgFromString` function to create the

arguments. When defining the implementation function return argument, create a new `void` output argument, for example, `y2`. When defining the implementation function argument for the conceptual output argument (`y1`), set the operator output argument as an additional input argument. Mark its `IOType` as output. Make its type a pointer type. The convenience methods `setReturn` and `addArgument` specify whether an argument is a return value or argument and adds the argument to the entry's array of implementation arguments.

```
% Create new void output y2
arg = getTflArgFromString(hTable, 'y2', 'void');
arg.IOType = 'RTW_IO_OUTPUT';
op_entry.Implementation.setReturn(arg);

% Set y1 as first input arg, mark IOType as output, and use pointer type
arg=getTflArgFromString(hTable, 'y1', 'uint8*');
arg.IOType = 'RTW_IO_OUTPUT';
op_entry.Implementation.addArgument(arg);

arg=getTflArgFromString(hTable, 'u1', 'uint8');
op_entry.Implementation.addArgument(arg);

arg=getTflArgFromString(hTable, 'u2', 'uint8');
op_entry.Implementation.addArgument(arg);
```

- 7 Add the entry to a code replacement table with a call to the `addEntry` function.

```
addEntry(hTable, op_entry);
```

- 8 Save the table definition file. Use the name of the table definition function to name the file.

Fixed-Point Operator Code Replacement

If you have a Fixed-Point Designer license, you can define fixed-point operator code replacement entries to match:

- A binary-point-only scaling combination on the operator inputs and output.
- A slope bias scaling combination on the operator inputs and output.
- Relative scaling or net slope between multiplication or division operator inputs and output. Use one of these methods to map a range of slope and bias values to a replacement function for multiplication or division.
- Equal slope and zero net bias across addition or subtraction operator inputs and output. Use this method to disregard specific slope and bias values and map relative slope and bias values to a replacement function for addition or subtraction.

Common Ways to Match Fixed-Point Operator Entries

The following table maps common ways to match fixed-point operator code replacement entries with the associated fixed-point parameters that you specify in a code replacement table definition file.

| Match | Create entry | Minimally specify parameters |
|---|------------------------|---|
| A specific binary-point-only scaling combination on the operator inputs and output. | RTW.TfLCOperationEntry | createAndAddConceptualArg function: <ul style="list-style-type: none"> • CheckSlope: Specify the value true. • CheckBias: Specify the value true. • DataTypeMode (or DataType/Scaling equivalent): Specify fixed-point binary-point-only scaling. • FractionLength: Specify a fraction length (for example, 3). |
| A specific slope bias scaling combination on the operator inputs and output. | RTW.TfLCOperationEntry | createAndAddConceptualArg function: <ul style="list-style-type: none"> • CheckSlope: Specify the value true. • CheckBias: Specify the value true. • DataTypeMode (or DataType/Scaling equivalent): Specify fixed-point [slope bias] scaling. • Slope (or SlopeAdjustmentFactor/ - FixedExponent equivalent): Specify a slope value (for example, 15). • Bias: Specify a bias value (for example, 2). |

| Match | Create entry | Minimally specify parameters |
|---|---|--|
| Net slope between operator inputs and output (multiplication and division). | RTW.TfLCOperationEntry-Generator_NetSlope | setTfLCOperationEntryParameters function: <ul style="list-style-type: none"> • NetSlopeAdjustmentFactor: Specify the slope adjustment factor (F) part of the net slope, $F2^E$ (for example, 1.0). • NetFixedExponent: Specify the fixed exponent (E) part of the net slope, $F2^E$ (for example, -3.0). createAndAddConceptualArg function: <ul style="list-style-type: none"> • CheckSlope: Specify the value false. • CheckBias: Specify the value false. • DataType: Specify the value 'Fixed'. |

Fixed-Point Numbers and Arithmetic

Fixed-point numbers use integers and integer arithmetic to represent real numbers and arithmetic with the following encoding scheme:

$$V = \tilde{V} = SQ + B$$

- V is an arbitrarily precise real-world value.
- \tilde{V} is the approximate real-world value that results from fixed-point representation.
- Q is an integer that encodes \tilde{V} , referred to as the quantized integer.
- S is a coefficient of Q , referred to as the slope.
- B is an additive correction, referred to as the bias.

The general equation for an operation between fixed-point operands is:

$$(S_0Q_0 + B_0) = (S_1Q_1 + B_1) < op > (S_2Q_2 + B_2)$$

The objective of fixed-point operator replacement is to replace an operator that accepts and returns fixed-point or integer inputs and output with a function that accepts and returns built-in C numeric data types. The following sections provide additional programming information for each supported operator.

Addition

The operation $V_0 = V_1 + V_2$ implies that

$$Q_0 = \left(\frac{S_1}{S_0}\right)Q_1 + \left(\frac{S_2}{S_0}\right)Q_2 + \left(\frac{B_1 + B_2 - B_0}{S_0}\right)$$

If an addition replacement function is defined such that the scaling on the operands and sum are equal and the net bias

$$\left(\frac{B_1 + B_2 - B_0}{S_0}\right)$$

is zero (for example, a function `s8_add_s8_s8` that adds two signed 8-bit values and produces a signed 8-bit result), then the operator entry must set the operator entry parameters `SlopesMustBeTheSame` and `MustHaveZeroNetBias` to `true`. To match for replacement, the slopes must be the same for all addition conceptual arguments. (For parameter descriptions, see the reference page for the function `setTfLCOperationEntryParameters`.)

Subtraction

The operation $V_0 = V_1 - V_2$ implies that

$$Q_0 = \left(\frac{S_1}{S_0}\right)Q_1 - \left(\frac{S_2}{S_0}\right)Q_2 + \left(\frac{B_1 - B_2 - B_0}{S_0}\right)$$

If a subtraction replacement function is defined such that the scaling on the operands and difference are equal and the net bias

$$\left(\frac{B_1 - B_2 - B_0}{S_0}\right)$$

is zero (for example, a function `s8_sub_s8_s8` that subtracts two signed 8-bit values and produces a signed 8-bit result), then the operator entry must set the operator entry parameters

`SlopesMustBeTheSame` and `MustHaveZeroNetBias` to `true`. To match for replacement, the slopes must be the same for all subtraction conceptual arguments. (For parameter descriptions, see the reference page for the function `setTfLCOperationEntryParameters`.)

Multiplication

There are different ways to specify multiplication replacements. The most direct way is to specify an exact match of the input and output types. This is feasible if a model contains only a few known slope and bias combinations. Use the `TfLCOperationEntry` class and specify the exact values of slope and bias on each argument. For scenarios where there are numerous slope/bias combinations, it is not feasible to specify each value with a different entry. Use a net slope entry or create a custom entry.

The operation $V_0 = V_1 * V_2$ implies, for binary-point-only scaling, that

$$S_0 Q_0 = (S_1 Q_1)(S_2 Q_2)$$

$$Q_0 = \left(\frac{S_1 S_2}{S_0} \right) Q_1 Q_2$$

$$Q_0 = S_n Q_1 Q_2$$

where S_n is the net slope.

It is common to replace all multiplication operations that have a net slope of 1.0 with a function that performs C-style multiplication. For example, to replace all signed 8-bit multiplications that have a net scaling of 1.0 with the `s8_mul_s8_u8` replacement function, the operator entry must define a net slope factor, $F2^E$. You specify the values for F and E using operator entry parameters `NetSlopeAdjustmentFactor` and `NetFixedExponent`. For the `s8_mul_s8_u8` function, set `NetSlopeAdjustmentFactor` to 1 and `NetFixedExponent` to 0.0. Also, set the operator entry parameter `SlopesMustBeTheSame` to `false` and the parameter `MustHaveZeroNetBias` to `true`. To match for replacement, the biases must be zero for all multiplication conceptual arguments. (For parameter descriptions, see the reference page for the function `setTfLCOperationEntryParameters`.)

Note When an operator entry specifies `NetSlopeAdjustmentFactor` and `NetFixedExponent`, matching entries must have arguments with zero bias.

Division

There are different ways to specify division replacements. The most direct way is to specify an exact match of the input and output types. This is feasible if a model contains only a few known slope and bias combinations. Use the `TfLCOperationEntry` class and specify the exact values of slope and bias on each argument. For scenarios where there are numerous slope/bias combinations, it is not feasible to specify each value with a different entry. Use a net slope entry or create a custom entry (see “Customize Match and Replacement Process” on page 72-132).

The operation $V_0 = (V_1 / V_2)$ implies, for binary-point-only scaling, that

$$S_0 Q_0 = \left(\frac{S_1 Q_1}{S_2 Q_2} \right)$$

$$Q_0 = S_n \left(\frac{Q_1}{Q_2} \right)$$

where S_n is the net slope.

It is common to replace all division operations that have a net slope of 1.0 with a function that performs C-style division. For example, to replace all signed 8-bit divisions that have a net scaling of 1.0 with the `s8_mul_s8_u8_` replacement function, the operator entry must define a net slope factor, $F2^E$. You specify the values for F and E using operator entry parameters `NetSlopeAdjustmentFactor` and `NetFixedExponent`. For the `s16_netslope0p5_div_s16_s16` function, you would set `NetSlopeAdjustmentFactor` to 1 and `NetFixedExponent` to 0.0. Also, set the operator entry parameter `SlopesMustBeTheSame` to `false` and the parameter `MustHaveZeroNetBias` to `true`. To match for replacement, the biases must be zero for all division conceptual arguments. (For parameter descriptions, see the reference page for the function `setTfLCOperationEntryParameters`.)

Note When an operator entry specifies `NetSlopeAdjustmentFactor` and `NetFixedExponent`, matching entries must have arguments with zero bias.

Data Type Conversion (Cast)

The data type conversion operation $V_0 = V_1$ implies, for binary-point-only scaling, that

$$Q_0 = \left(\frac{S_1}{S_0} \right) Q_1$$

$$Q_0 = S_n Q_1$$

where S_n is the net slope. Set the operator entry parameter `SlopesMustBeTheSame` to `false` and the parameter `MustHaveZeroNetBias` to `true`. To match for replacement, the biases must be zero for all cast conceptual arguments. (For parameter descriptions, see the reference page for the function `setTfLCOperationEntryParameters`.)

Shift

The shift left or shift right operation $V_0 = (V_1 / 2^n)$ implies, for binary-point-only scaling, that

$$S_0 Q_0 = \left(\frac{S_1 Q_1}{2^n} \right)$$

$$Q_0 = \left(\frac{S_1}{S_0} \right) \left(\frac{Q_1}{2^n} \right)$$

$$Q_0 = S_n \left(\frac{Q_1}{2^n} \right)$$

where S_n is the net slope. Set the operator entry parameter `SlopesMustBeTheSame` to `false` and the parameter `MustHaveZeroNetBias` to `true`. To match for replacement, the biases must be zero for all shift conceptual arguments. (For parameter descriptions, see the reference page for the function `setTfLCOperationEntryParameters`.)

Binary-Point-Only Scaling Code Replacement

You can define code replacement entries for operations on fixed-point data types such that they match a binary-point-only scaling combination of operator inputs and output. This example shows how to develop a code replacement library to optimize the performance of fixed point data type operations by providing information that maps a binary point scale entry to a addition operator. To develop a code replacement library use only the programmatic approach. For more information, see “Develop a Code Replacement Library” on page 73-13.

This example modifies a fixed-point addition replacement such that the implementation function passes in the fraction lengths of the input and output data types as arguments.

To create custom code replacement entries that add logic to the code replacement match and replacement process see “Customize Code Match and Replacement for Scalar Operations” on page 72-138. You can create and add three additional implementation function arguments for passing fraction lengths in the class definition or in each code replacement entry definition that instantiates this class. This example creates the arguments, adds them to a code replacement table definition file, and sets them to specific values in the class definition code.

```
classdef TflCustomOperationEntryBinaryPoint < RTW.TflCOperationEntryML
    methods
        function ent = do_match(hThis, ...
            hCS0, ... %#ok
            targetBitPerChar, ... %#ok
            targetBitPerShort, ... %#ok
            targetBitPerInt, ... %#ok
            targetBitPerLong, ... %#ok
            targetBitPerLongLong) %#ok

            % DO_MATCH - Create a custom match function. The base class
            % checks the types of the arguments prior to calling this
            % method. This class will check additional data and can
            % modify the implementation function.

            % The base class checks word size and signedness. Slopes and biases
            % have been wildcarded, so the only additional checking to do is
            % to check that the biases are zero and that there are only three
            % conceptual arguments (one output, two inputs)

            ent = []; % default the return to empty, indicating the match failed

            if length(hCS0.ConceptualArgs) == 3 && ...
                hCS0.ConceptualArgs(1).Type.Bias == 0 && ...
                hCS0.ConceptualArgs(2).Type.Bias == 0 && ...
                hCS0.ConceptualArgs(3).Type.Bias == 0

                % Modify the default implementation. Since this is a
                % generator entry, a concrete entry is created using this entry
                % as a template. The type of entry being created is a standard
                % TflCOperationEntry. Using the standard operation entry
                % provides required information, and you do not need
                % a custom match function.
                ent = RTW.TflCOperationEntry(hThis);

                % Since this entry is modifying the implementation for specific
                % fraction-length values (arguments 3, 4, and 5), the conceptual argument
                % wild cards must be removed (the wildcards were inherited from the
                % generator when it was used as a template for the concrete entry).
                % This concrete entry is now for a specific slope and bias.
                % hCS0 holds the slope and bias values (created by the code generator).
                for idx=1:3
                    ent.ConceptualArgs(idx).CheckSlope = true;
                    ent.ConceptualArgs(idx).CheckBias = true;

                    % Set the specific Slope and Biases
                    ent.ConceptualArgs(idx).Type.Slope = hCS0.ConceptualArgs(idx).Type.Slope;
                    ent.ConceptualArgs(idx).Type.Bias = 0;
                end

                % Set the fraction-length values in the implementation function.
                ent.Implementation.Arguments(3).Value = ...

```

```

-1.0*hCS0.ConceptualArgs(2).Type.FixedExponent;
ent.Implementation.Arguments(4).Value = ...
-1.0*hCS0.ConceptualArgs(3).Type.FixedExponent;
ent.Implementation.Arguments(5).Value = ...
-1.0*hCS0.ConceptualArgs(1).Type.FixedExponent;
end
end
end
end

```

Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
 - a Create a function with the name of your code replacement library table that does not have arguments and returns a table object. You can use this function to call your code replacement library table.
 - b Create a table object by calling `RTW.TflTable`.

```

function hTable = crl_table_fixed_binptscale()
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;

```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the custom entry function .

```

function hTable = crl_table_fixed_binptscale()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

```

```

%% Create an entry
hEntry = TflCustomOperationEntryBinaryPoint;

```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTflCOperationEntryParameters`.

```

function hTable = crl_table_fixed_binptscale()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = TflCustomOperationEntryBinaryPoint;

%% Create entry parameters
setTflCOperationEntryParameters(hEntry, ...
    'Key', 'RTW_OP_ADD', ...
    'Priority', 30, ...
    'SaturationMode', 'RTW_SATURATE_ON_OVERFLOW', ...
    'RoundingModes', {'RTW_ROUND_FLOOR'}, ...
    'ImplementationName', 'myFixptAdd_binarypoint', ...
    'ImplementationHeaderFile', 'myFixptAdd.h', ...
    'ImplementationSourceFile', 'myFixptAdd.c');

```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `createAndAddConceptualArg`.

```
function hTable = crl_table_fixed_binptscale()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = TflCustomOperationEntryBinaryPoint;

%% Create entry parameters
setTflCoperationEntryParameters(hEntry, ...
    'Key', 'RTW_OP_ADD', ...
    'Priority', 30, ...
    'SaturationMode', 'RTW_SATURATE_ON_OVERFLOW', ...
    'RoundingModes', {'RTW_ROUND_FLOOR'}, ...
    'ImplementationName', 'myFixptAdd_binarypoint', ...
    'ImplementationHeaderFile', 'myFixptAdd.h', ...
    'ImplementationSourceFile', 'myFixptAdd.c');

%% Create the conceptual representation
createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'y1', ...
    'IOType', 'RTW_IO_OUTPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'DataType', 'Fixed', ...
    'Scaling', 'BinaryPoint', ...
    'IsSigned', false, ...
    'WordLength', 32);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u1', ...
    'IOType', 'RTW_IO_INPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'DataType', 'Fixed', ...
    'Scaling', 'BinaryPoint', ...
    'IsSigned', false, ...
    'WordLength', 32);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u2', ...
    'IOType', 'RTW_IO_INPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'DataType', 'Fixed', ...
    'Scaling', 'BinaryPoint', ...
    'IsSigned', false, ...
    'WordLength', 32);
```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function `createAndSetCImplementationReturn` and `createAndAddImplementationArg`. Add the complete entry to the table by calling the function `addEntry`.

```
function hTable = crl_table_fixed_binptscale()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = TflCustomOperationEntryBinaryPoint;

%% Create entry parameters
setTflCoperationEntryParameters(hEntry, ...
    'Key', 'RTW_OP_ADD', ...
    'Priority', 30, ...
    'SaturationMode', 'RTW_SATURATE_ON_OVERFLOW', ...
    'RoundingModes', {'RTW_ROUND_FLOOR'}, ...
    'ImplementationName', 'myFixptAdd_binarypoint', ...
```

```

    'ImplementationHeaderFile', 'myFixptAdd.h', ...
    'ImplementationSourceFile', 'myFixptAdd.c');

%% Create the conceptual representation
createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'y1', ...
    'IOType', 'RTW_IO_OUTPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'DataType', 'Fixed', ...
    'Scaling', 'BinaryPoint', ...
    'IsSigned', false, ...
    'WordLength', 32);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u1', ...
    'IOType', 'RTW_IO_INPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'DataType', 'Fixed', ...
    'Scaling', 'BinaryPoint', ...
    'IsSigned', false, ...
    'WordLength', 32);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u2', ...
    'IOType', 'RTW_IO_INPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'DataType', 'Fixed', ...
    'Scaling', 'BinaryPoint', ...
    'IsSigned', false, ...
    'WordLength', 32);

%% Create the implementation Representation
% Specify replacement function signature
createAndSetImplementationReturn(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'y1', ...
    'IOType', 'RTW_IO_OUTPUT', ...
    'IsSigned', false, ...
    'WordLength', 32, ...
    'FractionLength', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u1', ...
    'IOType', 'RTW_IO_INPUT', ...
    'IsSigned', false, ...
    'WordLength', 32, ...
    'FractionLength', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u2', ...
    'IOType', 'RTW_IO_INPUT', ...
    'IsSigned', false, ...
    'WordLength', 32, ...
    'FractionLength', 0);

% Add 3 fraction-length args. Actual values are set during code generation.
createAndAddImplementationArg(hEntry, 'RTW.TflArgNumericConstant', ...
    'Name', 'fl_in1', ...
    'IOType', 'RTW_IO_INPUT', ...
    'IsSigned', false, ...
    'WordLength', 32, ...
    'FractionLength', 0, ...
    'Value', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumericConstant', ...
    'Name', 'fl_in2', ...
    'IOType', 'RTW_IO_INPUT', ...
    'IsSigned', false, ...
    'WordLength', 32, ...
    'FractionLength', 0, ...
    'Value', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumericConstant', ...
    'Name', 'fl_out', ...
    'IOType', 'RTW_IO_INPUT', ...
    'IsSigned', false, ...
    'WordLength', 32, ...
    'FractionLength', 0, ...
    'Value', 0);

```

```

    % Add the entry to the table
    hTable.addEntry(op_entry);

```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_fixed_binptscale
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file (a new function file) with these specifications:

```

function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for binary point scaling CRL';
this(1).TableList = {'crl_table_fixed_binptscale.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end

```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Slope Bias Scaling Code Replacement

You can define code replacement for operations on fixed-point data types as matching a slope bias scaling combination on the operator inputs and output. This example shows how to develop a code replacement library to optimize the performance of fixed point data type operations by providing information on how to define code replacement for a division operator. To develop a code replacement library use only the programmatic approach. For more information, see “Develop a Code Replacement Library” on page 73-13.

This example modifies a fixed-point addition replacement such that the implementation function passes in the fraction lengths of the input and output data types as arguments.

To create custom code replacement entries that add logic to the code replacement match and replacement process, see “Customize Code Match and Replacement for Scalar Operations” on page 72-138. You can create and add three additional implementation function arguments for passing fraction lengths in the class definition or in each code replacement entry definition that instantiates this class. This example creates the arguments, adds them to a code replacement table definition file, and sets them to specific values in the class definition code.

```
classdef TflCustomOperationEntrySlopeBias < RTW.TflCOperationEntryML
    methods
        function ent = do_match(hThis, ...
            hCS0, ... %#ok
            targetBitPerChar, ... %#ok
            targetBitPerShort, ... %#ok
            targetBitPerInt, ... %#ok
            targetBitPerLong, ... %#ok
            targetBitPerLongLong) %#ok

            % DO_MATCH - Create a custom match function. The base class
            % checks the types of the arguments prior to calling this
            % method. This class will check additional data and can
            % modify the implementation function.

            % The base class checks word size and signedness. Slopes and biases
            % have been wildcarded, so the only additional checking to do is
            % to check that the biases are zero and that there are only three
            % conceptual arguments (one output, two inputs)

            ent = []; % default the return to empty, indicating the match failed

            if length(hCS0.ConceptualArgs) == 3

                % Modify the default implementation. Since this is a
                % generator entry, a concrete entry is created using this entry
                % as a template. The type of entry being created is a standard
                % TflCOperationEntry. Using the standard operation entry
                % provides required information, and you do not need
                % a custom match function.
                ent = RTW.TflCOperationEntry(hThis);

                % Since this entry is modifying the implementation for specific
                % fraction-length values (arguments 3, 4, and 5), the conceptual argument
                % wild cards must be removed (the wildcards were inherited from the
                % generator when it was used as a template for the concrete entry).
                % This concrete entry is now for a specific slope and bias.
                % hCS0 holds the slope and bias values (created by the code generator).
                for idx=1:3
                    ent.ConceptualArgs(idx).CheckSlope = true;
                    ent.ConceptualArgs(idx).CheckBias = true;

                    % Set the specific Slope and Biases
                    ent.ConceptualArgs(idx).Type.Slope = hCS0.ConceptualArgs(idx).Type.Slope;
                    ent.ConceptualArgs(idx).Type.Bias = hCS0.ConceptualArgs(idx).Type.Bias;
                end

                % Set the Slope and Bias values in the implementation function.
                ent.Implementation.Arguments(3).Value = hCS0.ConceptualArgs(2).Type.Slope;
                ent.Implementation.Arguments(4).Value = hCS0.ConceptualArgs(2).Type.Bias;
                ent.Implementation.Arguments(5).Value = hCS0.ConceptualArgs(3).Type.Slope;
                ent.Implementation.Arguments(6).Value = hCS0.ConceptualArgs(3).Type.Bias;
            end
        end
    end
end
```

```

ent.Implementation.Arguments(7).Value = hCS0.ConceptualArgs(1).Type.Slope;
ent.Implementation.Arguments(8).Value = hCS0.ConceptualArgs(1).Type.Bias;
end
end
end
end

```

Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
 - a Create a function with the name of your code replacement library table that does not have arguments and returns a table object. You can use this function to call your code replacement library table.
 - b Create a table object by calling `RTW.TflTable`.

```

function hTable = crl_table_custom_add_ufix32_slopebias
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;

```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the custom entry function .

```

function hTable = crl_table_custom_add_ufix32_slopebias
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = TflCustomOperationEntrySlopeBias;;

```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTflCFunctionEntryParameters`.

```

function hTable = crl_table_custom_add_ufix32_slopebias
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = TflCustomOperationEntrySlopeBias;;

%% Create entry parameters
setTflCFunctionEntryParameters(hEntry, ...
    'Key', 'RTW_OP_ADD', ...
    'Priority', 30, ...
    'SaturationMode', 'RTW_SATURATE_ON_OVERFLOW', ...
    'RoundingModes', {'RTW_ROUND_FLOOR'}, ...
    'ImplementationName', 'myFixptAdd_slopebias', ...
    'ImplementationHeaderFile', 'myFixptAdd.h', ...
    'ImplementationSourceFile', 'myFixptAdd.c');

```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `createAndAddConceptualArg`.

```
function hTable = crl_table_custom_add_ufix32_slopebias
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = TflCustomOperationEntrySlopeBias;;

%% Create entry parameters
setTflCOperationEntryParameters(hEntry, ...
    'Key', 'RTW_OP_ADD', ...
    'Priority', 30, ...
    'SaturationMode', 'RTW_SATURATE_ON_OVERFLOW', ...
    'RoundingModes', {'RTW_ROUND_FLOOR'}, ...
    'ImplementationName', 'myFixptAdd_slopebias', ...
    'ImplementationHeaderFile', 'myFixptAdd.h', ...
    'ImplementationSourceFile', 'myFixptAdd.c');

%% Create the conceptual representation
createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'y1', ...
    'IOType', 'RTW_IO_OUTPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'DataType', 'Fixed', ...
    'Scaling', 'SlopeBias', ...
    'IsSigned', false, ...
    'WordLength', 32);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u1', ...
    'IOType', 'RTW_IO_INPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'DataType', 'Fixed', ...
    'Scaling', 'SlopeBias', ...
    'IsSigned', false, ...
    'WordLength', 32);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u2', ...
    'IOType', 'RTW_IO_INPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'DataType', 'Fixed', ...
    'Scaling', 'SlopeBias', ...
    'IsSigned', false, ...
    'WordLength', 32);
```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the same order and properties as the conceptual arguments, call the function

createAndSetCImplementationReturn and createAndAddImplementationArg. Add the complete entry to the table by calling the function addEntry.

```
function hTable = crl_table_custom_add_ufix32_slopebias
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = TflCustomOperationEntrySlopeBias;;

%% Create entry parameters
setTflCOperationEntryParameters(hEntry, ...
    'Key', 'RTW_OP_ADD', ...
    'Priority', 30, ...
    'SaturationMode', 'RTW_SATURATE_ON_OVERFLOW', ...
    'RoundingModes', {'RTW_ROUND_FLOOR'}, ...
    'ImplementationName', 'myFixptAdd_slopebias', ...
    'ImplementationHeaderFile', 'myFixptAdd.h', ...
    'ImplementationSourceFile', 'myFixptAdd.c');

%% Create the conceptual representation
createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'y1', ...
    'IOType', 'RTW_IO_OUTPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'DataType', 'Fixed', ...
    'Scaling', 'SlopeBias', ...
    'IsSigned', false, ...
    'WordLength', 32);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u1', ...
    'IOType', 'RTW_IO_INPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'DataType', 'Fixed', ...
    'Scaling', 'SlopeBias', ...
    'IsSigned', false, ...
    'WordLength', 32);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u2', ...
    'IOType', 'RTW_IO_INPUT', ...
    'CheckSlope', false, ...
    'CheckBias', false, ...
    'DataType', 'Fixed', ...
    'Scaling', 'SlopeBias', ...
    'IsSigned', false, ...
    'WordLength', 32);

%% Create the implementation Representation
% Specify replacement function signature
createAndSetCImplementationReturn(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'y1', ...
    'IOType', 'RTW_IO_OUTPUT', ...
    'IsSigned', false, ...
    'WordLength', 32, ...
    'FractionLength', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u1', ...
    'IOType', 'RTW_IO_INPUT', ...
    'IsSigned', false, ...
    'WordLength', 32, ...
    'FractionLength', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u2', ...
    'IOType', 'RTW_IO_INPUT', ...
    'IsSigned', false, ...
    'WordLength', 32, ...
    'FractionLength', 0);

% Add 3 fraction-length args. Actual values are set during code generation.
createAndSetCImplementationReturn(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'y1', ...
    'IOType', 'RTW_IO_OUTPUT', ...
```

```

    'IsSigned', false, ...
    'WordLength', 32, ...
    'FractionLength', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u1', ...
    'IOType', 'RTW_IO_INPUT', ...
    'IsSigned', false, ...
    'WordLength', 32, ...
    'FractionLength', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumeric', ...
    'Name', 'u2', ...
    'IOType', 'RTW_IO_INPUT', ...
    'IsSigned', false, ...
    'WordLength', 32, ...
    'FractionLength', 0);

% Add 6 args for slopes and biases.
% Actual values are set during code generation.
createAndAddImplementationArg(hEntry, 'RTW.TflArgNumericConstant', ...
    'Name', 'slope_in1', ...
    'IOType', 'RTW_IO_INPUT', ...
    'IsSigned', false, ...
    'WordLength', 32, ...
    'FractionLength', 0, ...
    'Value', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumericConstant', ...
    'Name', 'bias_in1', ...
    'IOType', 'RTW_IO_INPUT', ...
    'IsSigned', true, ...
    'WordLength', 32, ...
    'FractionLength', 0, ...
    'Value', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumericConstant', ...
    'Name', 'slope_in2', ...
    'IOType', 'RTW_IO_INPUT', ...
    'IsSigned', false, ...
    'WordLength', 32, ...
    'FractionLength', 0, ...
    'Value', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumericConstant', ...
    'Name', 'bias_in2', ...
    'IOType', 'RTW_IO_INPUT', ...
    'IsSigned', true, ...
    'WordLength', 32, ...
    'FractionLength', 0, ...
    'Value', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumericConstant', ...
    'Name', 'slope_out1', ...
    'IOType', 'RTW_IO_INPUT', ...
    'IsSigned', false, ...
    'WordLength', 32, ...
    'FractionLength', 0, ...
    'Value', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumericConstant', ...
    'Name', 'bias_out1', ...
    'IOType', 'RTW_IO_INPUT', ...
    'IsSigned', true, ...
    'WordLength', 32, ...
    'FractionLength', 0, ...
    'Value', 0);

addEntry(hTable, hEntry);

```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_custom_add_ufix32_slopebias
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file (a new function file) with these specifications:

```
function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for slope bias scaling function replacement';
this(1).TableList = {'crl_table_custom_add_ufix32_slopebias.m'};
% table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end
```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Net Slope Scaling Code Replacement

You can define code replacement entries for multiplication and division operations on fixed-point data types such that they match the net slope between operator inputs and output. The net slope entries can map a range of slope and bias values to a replacement function for multiplication or division.

This example shows how to develop a code replacement library to optimize the performance of fixed point net slope operations by providing information on how to define code replacement for a `divide` operation. To develop a code replacement library use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 73-13.

Interactively Develop a Code Replacement Library

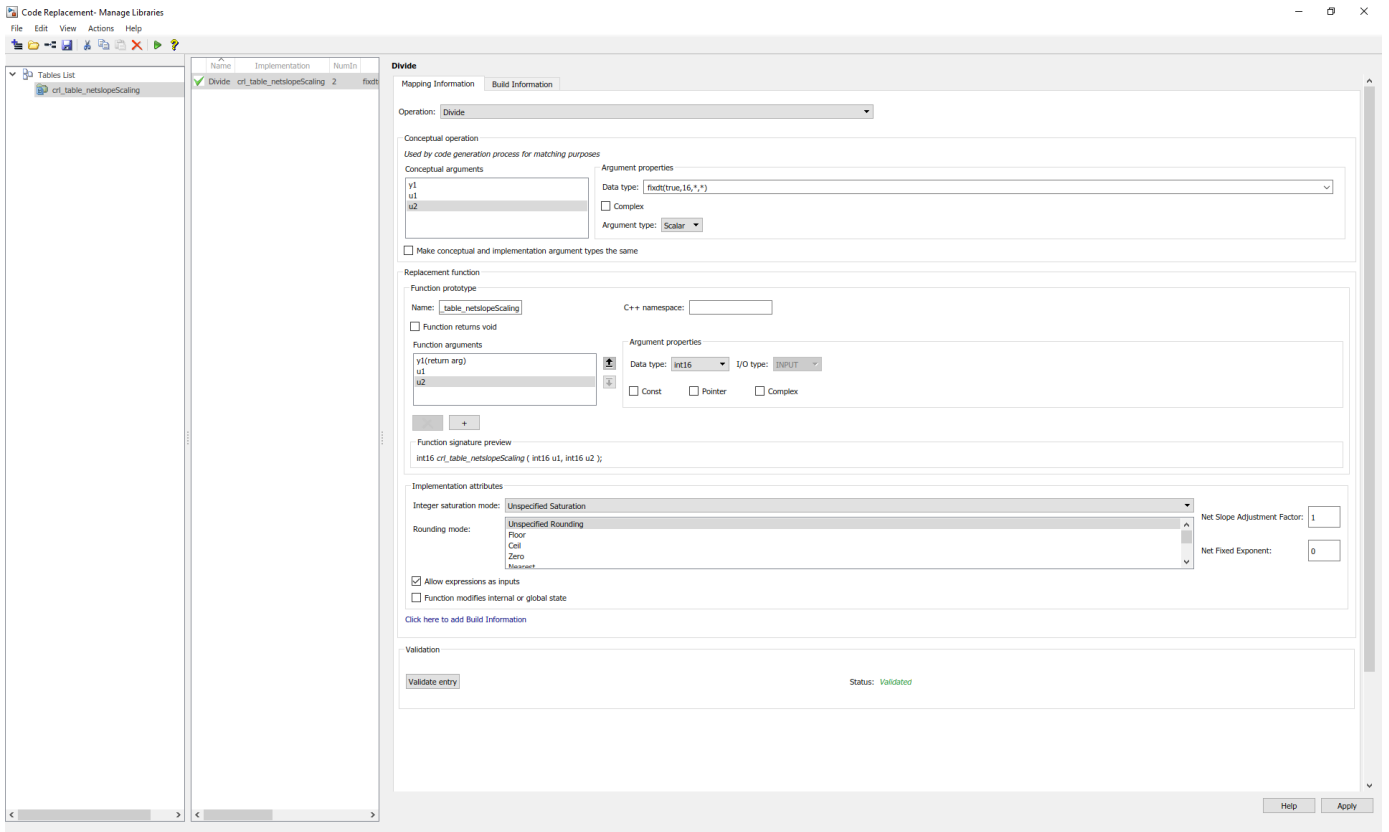

- 1 Open the **Code Replacement Tool** (crtool), from the MATLAB command line with the following command:

```
>>crtool
```

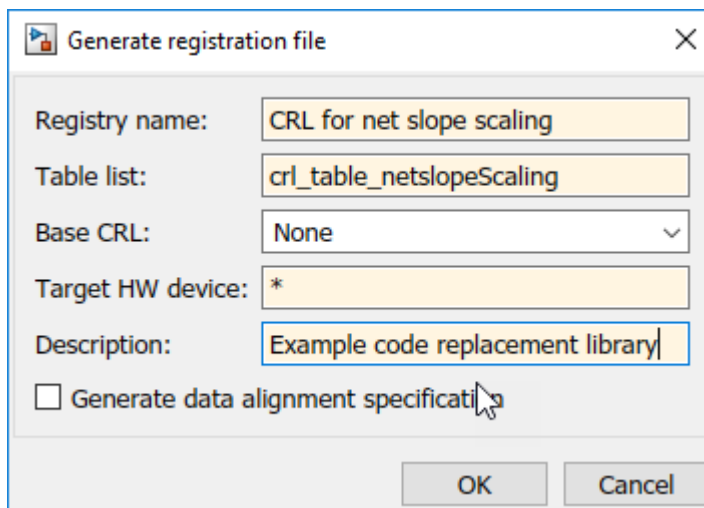

- 2 Create a table.
 - a From the crtool context menu, select **File > New Table**.
 - b In the right pane, name the table `crl_table_netslopeScaling`. Click **Apply**.
- 3 Create an entry. From the crtool context menu, select **File > New entry > Fixed Point Net Slope Operation**.
- 4 Create entry parameters. In the **Operation** drop-down list, select `Divide`.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, `y1`, and the input argument, `u1` and `u2` with the **Data Type** of `fixdt(true,16,*,*)` and the **Argument Type** of `Scalar`.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. In the **Function arguments** subsection of the crtool, specify the return argument, `y1`, and the input argument, `u1` and `u2` with the **Data Type** of `int16`. Also set the **Net slope Adjustment Factor** as 1 and **Net Fixed Exponent** as 0.

Specify a **Name** for the replacement function under **Function prototype**.

- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. In the **Mapping Information** tab, click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For

more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
 - a Create a function with the name of your code replacement library table that does not have arguments and returns a table object. You can use this function to call your code replacement library table.
 - b Create a table object by calling `RTW.TflTable`.

```
function hTable = crl_table_netslopeScaling
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TflCOperationEntryGenerator_NetSlope`.

```
function hTable = crl_table_netslopeScaling
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
```

- 4 Set operator entry parameters with a call to the `setTflCOperationEntryParameters` function. The parameters specify the type of operation as division, the saturation mode as wrap on overflow, rounding modes as unspecified, and the name of the replacement function as `user_div_*`. `NetSlopeAdjustmentFactor` and `NetFixedExponent` specify the F and E parts of the net slope $F2^E$.

```
function hTable = crl_table_netslopeScaling
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntryGenerator_NetSlope;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
    'Key', 'RTW_OP_DIV', ...
    'Priority', 90, ...
    'SaturationMode', 'RTW_WRAP_ON_OVERFLOW', ...
    'RoundingModes', {'RTW_ROUND_CEILING'}, ...
    'NetSlopeAdjustmentFactor', 1.0, ...
    'NetFixedExponent', 0.0, ...
    'ImplementationName', 's16_div_s16_s16', ...
```

- ```

 'ImplementationHeaderFile', 's16_div_s16_s16.h', ...
 'ImplementationSourceFile', 's16_div_s16_s16.c');

```
- 5 Create conceptual arguments y1, u1, and u2. This example uses calls to the `createAndAddConceptualArg` function to create and add an argument with one function call. Specify each argument as fixed-point, 16 bits, and signed. Also, for each argument, specify that code replacement request processing does *not* check for an exact match to the call-site slope and bias values.

```

function hTable = crl_table_netslopeScaling
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntryGenerator_NetSlope;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
 'Key', 'RTW_OP_DIV', ...
 'Priority', 90, ...
 'SaturationMode', 'RTW_WRAP_ON_OVERFLOW', ...
 'RoundingModes', {'RTW_ROUND_CEILING'}, ...
 'NetSlopeAdjustmentFactor', 1.0, ...
 'NetFixedExponent', 0.0, ...
 'ImplementationName', 's16_div_s16_s16', ...
 'ImplementationHeaderFile', 's16_div_s16_s16.h', ...
 'ImplementationSourceFile', 's16_div_s16_s16.c');

%% Create the conceptual representation
createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'y1', ...
 'IOType', 'RTW_IO_OUTPUT', ...
 'CheckSlope', false, ...
 'CheckBias', false, ...
 'DataType', 'Fixed', ...
 'IsSigned', true, ...
 'WordLength', 16);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'u1', ...
 'IOType', 'RTW_IO_INPUT', ...
 'CheckSlope', false, ...
 'CheckBias', false, ...
 'DataType', 'Fixed', ...
 'IsSigned', true, ...
 'WordLength', 16);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'u2', ...
 'IOType', 'RTW_IO_INPUT', ...
 'CheckSlope', false, ...
 'CheckBias', false, ...
 'DataType', 'Fixed', ...
 'IsSigned', true, ...
 'WordLength', 16);

```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. This example uses calls to the `createAndSetCImplementationReturn` and `createAndAddImplementationArg` functions to create and add implementation arguments to the entry. Implementation arguments must describe fundamental numeric data types (not fixed-point data types). In this case, the output and input arguments are 16 bits and signed (`int16`).

```
function hTable = crl_table_netslopeScaling
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntryGenerator_NetSlope;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
 'Key', 'RTW_OP_DIV', ...
 'Priority', 90, ...
 'SaturationMode', 'RTW_WRAP_ON_OVERFLOW', ...
 'RoundingModes', {'RTW_ROUND_CEILING'}, ...
 'NetSlopeAdjustmentFactor', 1.0, ...
 'NetFixedExponent', 0.0, ...
 'ImplementationName', 's16_div_s16_s16', ...
 'ImplementationHeaderFile', 's16_div_s16_s16.h', ...
 'ImplementationSourceFile', 's16_div_s16_s16.c');

%% Create the conceptual representation
createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'y1', ...
 'IOType', 'RTW_IO_OUTPUT', ...
 'CheckSlope', false, ...
 'CheckBias', false, ...
 'DataType', 'Fixed', ...
 'IsSigned', true, ...
 'WordLength', 16);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'u1', ...
 'IOType', 'RTW_IO_INPUT', ...
 'CheckSlope', false, ...
 'CheckBias', false, ...
 'DataType', 'Fixed', ...
 'IsSigned', true, ...
 'WordLength', 16);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'u2', ...
 'IOType', 'RTW_IO_INPUT', ...
 'CheckSlope', false, ...
 'CheckBias', false, ...
 'DataType', 'Fixed', ...
 'IsSigned', true, ...
 'WordLength', 16);

%% Create the Implementation Representation
```

```

createAndSetCImplementationReturn(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'y1', ...
 'IOType', 'RTW_IO_OUTPUT', ...
 'IsSigned', true, ...
 'WordLength', 16, ...
 'FractionLength', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'u1', ...
 'IOType', 'RTW_IO_INPUT', ...
 'IsSigned', true, ...
 'WordLength', 16, ...
 'FractionLength', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'u2', ...
 'IOType', 'RTW_IO_INPUT', ...
 'IsSigned', true, ...
 'WordLength', 16, ...
 'FractionLength', 0);

```

```

%% Add the entry to the table
addEntry(hTable, hEntry);

```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_netslopeScaling
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file by using these specifications:

```

function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for net slope scaling';
this(1).TableList = {'crl_table_netslopeScaling.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end

```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Equal Slope and Zero Net Bias Code Replacement

You can define code replacement entries for addition or subtraction of fixed-point data types such that they match the relative slope and bias values (equal slope and zero net bias) across operator inputs and output. These entries allow you to disregard slope and bias values when mapping relative slope and bias values to a replacement function for addition or subtraction.

This example shows how to develop a code replacement library to optimize the performance of fixed point net slope operations by providing information on how to define code replacement for an addition operation. To develop a code replacement library use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 73-13.

### Interactively Develop a Code Replacement Library

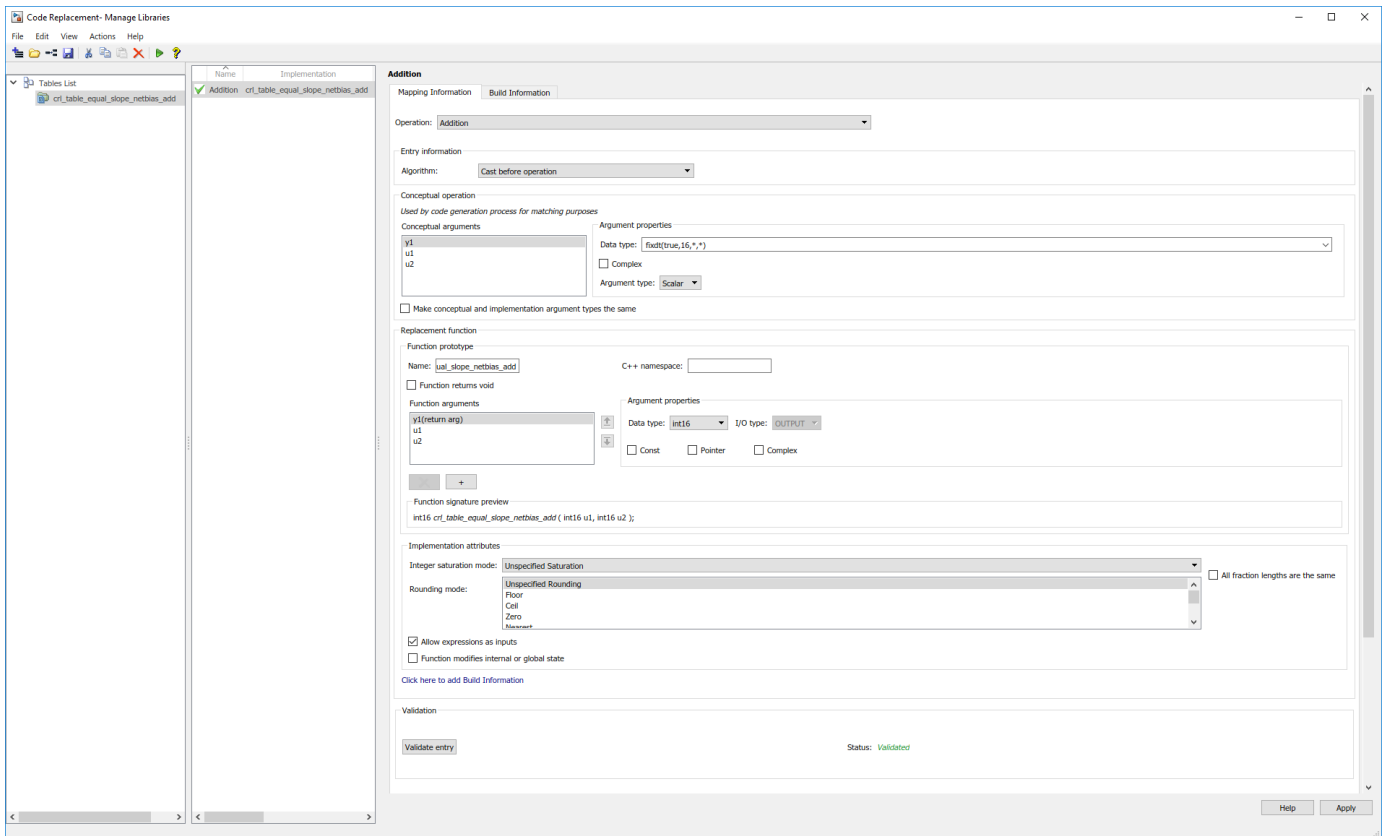

- 1 Open the **Code Replacement Tool** (crtool), from the MATLAB command line with the following command:

```
>>crtool
```

- 2 Create a table.
  - a From the crtool context menu, select **File > New Table**.
  - b In the right pane, name the table `crl_table_equal_slope_netbias_add`. Click **Apply**.
- 3 Create an entry. From the crtool context menu, select **File > New entry > Fixed Point Net Slope Operation**.
- 4 Create entry parameters. In the **Operation** drop-down list, select **Addition**.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, `y1`, and the input argument, `u1` and `u2` with the **Data Type** of `fixdt(true,16,*,*)` and the **Argument Type** of **Scalar**.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. In the **Function arguments** subsection of the crtool, specify the return argument, `y1`, and the input argument, `u1` and `u2` with the **Data Type** of `int16`.

Specify a **Name** for the replacement function under **Function prototype**.

- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. In the **Mapping Information** tab, click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
  - a Create a function to call your code replacement library table. The function should not have arguments and return a table object.
  - b Create a table object by calling `RTW.TflTable`.

```
function hTable = crl_table_equal_slope_netbias_add
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TflCOperationEntryGenerator_NetSlope`.

```
function hTable = crl_table_equal_slope_netbias_add
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
```

```
%% Create an entry
hEntry = RTW.TflCOperationEntryGenerator_NetSlope;
```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTflCOperationEntryParameters`.

```
function hTable = crl_table_equal_slope_netbias_add
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntryGenerator_NetSlope;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
 'Key', 'RTW_OP_ADD', ...
 'Priority', 90, ...
 'SaturationMode', 'RTW_WRAP_ON_OVERFLOW', ...
 'RoundingModes', {'RTW_ROUND_UNSPECIFIED'}, ...
 'SlopesMustBeTheSame', true, ...
 'MustHaveZeroNetBias', true, ...
 'ImplementationName', 'u16_add_SameSlopeZeroBias', ...
 'ImplementationHeaderFile', 'u16_add_SameSlopeZeroBias.h', ...
 'ImplementationSourceFile', 'u16_add_SameSlopeZeroBias.c');
```

- 5 Create conceptual arguments `y1`, `u1`, and `u2`. This example uses calls to the `createAndAddConceptualArg` function to create and add an argument with one function call. Specify each argument as fixed-point, 16 bits, and signed. Also, for each argument, specify that code replacement request processing does *not* check for an exact match to the call-site slope and bias values.

```
function hTable = crl_table_equal_slope_netbias_add
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TfLTable;

%% Create an entry
hEntry = RTW.TfLCOperationEntryGenerator_NetSlope;

%% Create entry parameters
hEntry.setTfLCOperationEntryParameters(...
 'Key', 'RTW_OP_ADD', ...
 'Priority', 90, ...
 'SaturationMode', 'RTW_WRAP_ON_OVERFLOW', ...
 'RoundingModes', {'RTW_ROUND_UNSPECIFIED'}, ...
 'SlopesMustBeTheSame', true, ...
 'MustHaveZeroNetBias', true, ...
 'ImplementationName', 'u16_add_SameSlopeZeroBias', ...
 'ImplementationHeaderFile', 'u16_add_SameSlopeZeroBias.h', ...
 'ImplementationSourceFile', 'u16_add_SameSlopeZeroBias.c');

%% Create the conceptual representation
createAndAddConceptualArg(hEntry, 'RTW.TfLArgNumeric', ...
 'Name', 'y1', ...
 'IOType', 'RTW_IO_OUTPUT', ...
 'CheckSlope', false, ...
 'CheckBias', false, ...
 'IsSigned', false, ...
 'WordLength', 16);

createAndAddConceptualArg(hEntry, 'RTW.TfLArgNumeric', ...
 'Name', 'u1', ...
 'IOType', 'RTW_IO_INPUT', ...
 'CheckSlope', false, ...
 'CheckBias', false, ...
 'IsSigned', false, ...
 'WordLength', 16);

createAndAddConceptualArg(hEntry, 'RTW.TfLArgNumeric', ...
 'Name', 'u2', ...
 'IOType', 'RTW_IO_INPUT', ...
 'CheckSlope', false, ...
 'CheckBias', false, ...
 'IsSigned', false, ...
 'WordLength', 16);
```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. This example uses calls to the `createAndSetCImplementationReturn` function to create and add implementation arguments to the entry. Implementation arguments must describe fundamental numeric data types (not fixed-point data types). In this case, the output and input arguments are 16 bits and signed (`int16`).

```
function hTable = crl_table_equal_slope_netbias_add
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TfLTable;

%% Create an entry
hEntry = RTW.TfLCOperationEntryGenerator_NetSlope;

%% Create entry parameters
hEntry.setTfLCOperationEntryParameters(...
 'Key', 'RTW_OP_ADD', ...
 'Priority', 90, ...
 'SaturationMode', 'RTW_WRAP_ON_OVERFLOW', ...
 'RoundingModes', {'RTW_ROUND_UNSPECIFIED'}, ...
 'SlopesMustBeTheSame', true, ...
 'MustHaveZeroNetBias', true, ...
```

```

 'ImplementationName', 'u16_add_SameSlopeZeroBias', ...
 'ImplementationHeaderFile', 'u16_add_SameSlopeZeroBias.h', ...
 'ImplementationSourceFile', 'u16_add_SameSlopeZeroBias.c');

%% Create the conceptual representation
createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'y1', ...
 'IOType', 'RTW_IO_OUTPUT', ...
 'CheckSlope', false, ...
 'CheckBias', false, ...
 'IsSigned', false, ...
 'WordLength', 16);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'u1', ...
 'IOType', 'RTW_IO_INPUT', ...
 'CheckSlope', false, ...
 'CheckBias', false, ...
 'IsSigned', false, ...
 'WordLength', 16);

createAndAddConceptualArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'u2', ...
 'IOType', 'RTW_IO_INPUT', ...
 'CheckSlope', false, ...
 'CheckBias', false, ...
 'IsSigned', false, ...
 'WordLength', 16);

%% Create the Implementation Representation
createAndSetCImplementationReturn(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'y1', ...
 'IOType', 'RTW_IO_OUTPUT', ...
 'IsSigned', false, ...
 'WordLength', 16, ...
 'FractionLength', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'u1', ...
 'IOType', 'RTW_IO_INPUT', ...
 'IsSigned', false, ...
 'WordLength', 16, ...
 'FractionLength', 0);

createAndAddImplementationArg(hEntry, 'RTW.TflArgNumeric', ...
 'Name', 'u2', ...
 'IOType', 'RTW_IO_INPUT', ...
 'IsSigned', false, ...
 'WordLength', 16, ...
 'FractionLength', 0);

%% Add the entry to the table
addEntry(hTable, hEntry);

```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = cml_table_equal_slope_netbias_add
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file with these specifications:

```

function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for equal slope and zero net bias code replacement';

```

```
this(1).TableList = {'crl_table_equal_slope_netbias_add.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end
```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10** Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Data Type Conversions (Casts) and Operator Code Replacement

You can use code replacement entries to replace code that the code generator produces for data type conversion (cast) operations. To develop a code replacement library use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 73-13.

### Interactively Develop a Code Replacement Library

- 1 Open the **Code Replacement Tool** (crtool), at the MATLAB command line, enter:  

```
>>crtool
```
- 2 Create a table.
  - a From the crtool context menu, select **File > New Table**.
  - b In the right pane, name the table `cr1_table_cast_int32_to_int16`. Click **Apply**.
- 3 Create entry parameters. In the **Operation** drop-down list, select **Cast**.
- 4 Create an entry. From the crtool context menu, select **File > New entry > Fixed Point Net Slope Operation**.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, `y1` with the **Data Type** of `int16`, and the input argument, `u1` with the **Data Type** of `int32` and the **Argument Type** of **Scalar**.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box. In the **Function arguments** subsection of the crtool, specify the return argument, `y1`, and the input argument, `u1` with the **Data Type** of `int16` and `int32`.  
  
Specify a **Name** for the replacement function under **Function prototype**.
- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. In the **Mapping Information** tab, click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Programmatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
  - a Create a function to call your code replacement library table. The function should not have arguments and return a table object.
  - b Create a table object by calling `RTW.TflTable`.

```
function hTable = crl_table_cast_int32_to_int16()
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TflCOperationEntry`.

```
function hTable = crl_table_cast_int32_to_int16()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;
```

```
%% Create an entry
hEntry = RTW.TfLCOperationEntry;
```

- 4 Create entry parameters. Because this examples replaces a function, create entry parameters by calling the function `setTfLCOperationEntryParameters`. The parameters specify the type of operation as `cast`, the saturation mode as `saturate on integer overflow`, rounding modes as `toward negative infinity`, and the name of the replacement function as `my_sat_cast`.

```
function hTable = crl_table_cast_int32_to_int16()
% Create a code replacement library table
```

```
%% Create a table object
hTable = RTW.TfLTable;
```

```
%% Create an entry
hEntry = RTW.TfLCOperationEntry;
```

```
%% Create entry parameters
hEntry.setTfLCOperationEntryParameters(...
 'Key', 'RTW_OP_CAST', ...
 'Priority', 50, ...
 'ImplementationName', 'my_sat_cast', ...
 'SaturationMode', 'RTW_SATURATE_ON_OVERFLOW', ...
 'RoundingModes', {'RTW_ROUND_FLOOR'}, ...
 'ImplementationHeaderFile', 'some_hdr.h', ...
 'ImplementationSourceFile', 'some_hdr.c');
```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `getTfLArgFromString`.

```
function hTable = crl_table_cast_int32_to_int16()
% Create a code replacement library table
```

```
%% Create a table object
hTable = RTW.TfLTable;
```

```
%% Create an entry
hEntry = RTW.TfLCOperationEntry;
```

```
%% Create entry parameters
hEntry.setTfLCOperationEntryParameters(...
 'Key', 'RTW_OP_CAST', ...
 'Priority', 50, ...
 'ImplementationName', 'my_sat_cast', ...
 'SaturationMode', 'RTW_SATURATE_ON_OVERFLOW', ...
 'RoundingModes', {'RTW_ROUND_FLOOR'}, ...
 'ImplementationHeaderFile', 'some_hdr.h', ...
 'ImplementationSourceFile', 'some_hdr.c');
```

```
%% Create the conceptual representation
```

```
arg = getTfLArgFromString(hTable, 'y1', 'int16');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);
hEntry.Implementation.setReturn(arg);
```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. To specify that the implementation arguments have the

same order and properties as the conceptual arguments, call the function `getTflArgFromString`. Add the complete entry to the table by calling the function `addEntry`.

```
function hTable = crl_table_cast_int32_to_int16()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntry;

%% Create entry parameters
hEntry.setTflCOperationEntryParameters(...
 'Key', 'RTW_OP_CAST', ...
 'Priority', 50, ...
 'ImplementationName', 'my_sat_cast', ...
 'SaturationMode', 'RTW_SATURATE_ON_OVERFLOW', ...
 'RoundingModes', {'RTW_ROUND_FLOOR'}, ...
 'ImplementationHeaderFile', 'some_hdr.h', ...
 'ImplementationSourceFile', 'some_hdr.c');

%% Create the conceptual and implementation representation

arg = getTflArgFromString(hTable, 'y1', 'int16');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);
hEntry.Implementation.setReturn(arg);

arg = getTflArgFromString(hTable, 'u1', 'int32');
addConceptualArg(hEntry, arg);
hEntry.Implementation.addArgument(arg);

%% Add the entry to the table
addEntry(hTable,hEntry);
```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_cast_int32_to_int16
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file with these specifications:

```
function rtwTargetInfo(cm)
cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for data type conversions(casts) abd operator code replacement';
this(1).TableList = {'crl_table_cast_int32_to_int16.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end
```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10** Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Shift Left Operations and Code Replacement

This example shows how to develop a code replacement library to optimize the performance of shift left (<<) operation by providing information on how to define code replacement for a `shift left` function. To develop a code replacement library use either the interactive or programmatic approach. For more information, see “Develop a Code Replacement Library” on page 73-13.

### Interactively Develop a Code Replacement Library

- 1 Open the **Code Replacement Tool** (crtool), from the MATLAB command line with the following command:

```
>>crtool
```

- 2 Create a table.
  - a From the crtool context menu, select **File > New Table**.
  - b In the right pane, name the table `cr1_table_shift_left_int16`. Click **Apply**.
- 3 Create an entry. From the crtool context menu, select **File > New entry > Math Operation**.
- 4 Create entry parameters. In the **Operator** drop-down list, select `Shift Left`.
- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. In the **Conceptual function** subsection of the crtool, specify the return argument, `y1`, and the input arguments, `u1`, and `u2`, with **Data Type** of `int16` and the **Argument Type** of `scalar`.
- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. For this example, to specify that the implementation arguments have the same order and properties as the conceptual arguments, select the **Make conceptual and implementation argument types the same** check box.

Under **Function prototypes** specify a **Name** for the replacement function.
- 7 Specify build information. Click the **Build Information** tab to open the build requirements pane. Specify the files (source, header, object) that the code generator requires for code replacement. For this example, you do not need to specify build information.
- 8 Validate and save the table. Click the **Mapping Information** tab and verify the fields are filled in as shown. Click **Validate entry**. In the crtool context menu, select **File > Save table > Save**.

- 9 Register a code replacement library. Registration creates a library composed of the tables that you specify. Select **File > Generate registration file**. In the Generate registration file dialog box, fill out these fields:

To use your code replacement library, refresh your current MATLAB session with the command:  
`>>sl_refresh_customizations`

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Programatically Develop a Code Replacement Library

- 1 Open the programmatic interface from the **MATLAB** menu by selecting **New > Function**.
- 2 Create a table.
  - a Create a function with the name of your code replacement library table that does not have arguments and returns a table object. You can use this function to call your code replacement library table.
  - b Create a table object by calling `RTW.TflTable`.

```
function hTable = crl_table_shift_left_int16
% Create a function to call the code replacement library table

%% Create a table object
hTable = RTW.TflTable;
```

- 3 Create an entry. Because this example replaces a function, create a code replacement entry in your table by calling the entry function `RTW.TflCOperationEntry`.

```
function hTable = crl_table_shift_left_int16()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntry;
```

- 4 Create entry parameters. Because this example replaces a function, create entry parameters by calling the function `setTflCFunctionEntryParameters`.

```
function hTable = crl_table_shift_left_int16()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntry;

%% Create entry parameters
setTflCFunctionEntryParameters(hEntry, ...
 'Key', 'RTW_OP_SL', ...
 'Priority', 50, ...
 'ImplementationName', 'my_shift_left', ...
 'ImplementationHeaderFile', 'some_hdr.h', ...
 'ImplementationSourceFile', 'some_hdr.c');
```

- 5 Create the conceptual representation. The conceptual representation describes the signature of the function that you want to replace. To explicitly specify argument properties, call the function `getTflArgFromString` and `addConceptualArg`.

```

function hTable = crl_table_shift_left_int16()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntry;

%% Create entry parameters
setTflCOperationEntryParameters(hEntry, ...
 'Key', 'RTW_OP_SL', ...
 'Priority', 50, ...
 'ImplementationName', 'my_shift_left', ...
 'ImplementationHeaderFile', 'some_hdr.h', ...
 'ImplementationSourceFile', 'some_hdr.c');

%% Create the conceptual representation
arg = getTflArgFromString(hTable, 'y1', 'int16');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);
hEntry.Implementation.setReturn(arg);

arg = getTflArgFromString(hTable, 'u1', 'int16');
addConceptualArg(hEntry, arg);
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'u2', 'int16');
arg.CheckType = false;
addConceptualArg(hEntry, arg);
hEntry.Implementation.addArgument(arg);

```

- 6 Create the implementation representation. The implementation representation describes the signature of the optimization function. To explicitly specify argument properties, call the function `getTflArgFromString`.

```

function hTable = crl_table_shift_left_int16()
% Create a code replacement library table

%% Create a table object
hTable = RTW.TflTable;

%% Create an entry
hEntry = RTW.TflCOperationEntry;

%% Create entry parameters
setTflCOperationEntryParameters(hEntry, ...
 'Key', 'RTW_OP_SL', ...
 'Priority', 50, ...
 'ImplementationName', 'my_shift_left', ...
 'ImplementationHeaderFile', 'some_hdr.h', ...
 'ImplementationSourceFile', 'some_hdr.c');

%% Create the conceptual and implementation representation
arg = getTflArgFromString(hTable, 'y1', 'int16');
arg.IOType = 'RTW_IO_OUTPUT';
addConceptualArg(hEntry, arg);
hEntry.Implementation.setReturn(arg);

arg = getTflArgFromString(hTable, 'u1', 'int16');
addConceptualArg(hEntry, arg);
hEntry.Implementation.addArgument(arg);

arg = getTflArgFromString(hTable, 'u2', 'int16');
arg.CheckType = false;
addConceptualArg(hEntry, arg);
hEntry.Implementation.addArgument(arg);

```

```

%% Add the entry to the table
hTable.addEntry(hEntry);

```

- 7 Specify build information. In the entry parameters, specify files (header, source, object) that the code generator needs for code replacement. For this example, build information is not required.
- 8 Validate and save the customization file. From the **MATLAB** menu, save this customization file by selecting **File > Save**. From the command line, validate the code replacement library table by calling it:

```
>> hTable = crl_table_shift_left_int16
```

- 9 Register the code replacement library. Registration creates a code replacement library by defining the library name, code replacement tables, and other information. Create a registration file (a new function file) by using these specifications.

```

function rtwTargetInfo(cm)

cm.registerTargetInfo(@loc_register_crl);
end

function this = loc_register_crl

this(1) = RTW.TflRegistry;
this(1).Name = 'CRL for shift left operation';
this(1).TableList = {'crl_table_shift_left_int16.m'}; % table created in this example
this(1).TargetHWDeviceType = {'*'};
this(1).Description = 'Example code replacement library';

end

```

To use your code replacement library, refresh your current MATLAB session with the command:

```
>>sl_refresh_customizations
```

- 10 Verify the code replacement library. From the MATLAB command line, open the library by using the **Code Replacement Viewer** and verify that the table and entry are correctly specified. For more information, see “Verify Code Replacement Library” on page 72-55. Configure your model to use the code replacement library, generate code, and verify that replacement occurs as expected. If unexpected behavior occurs, examine the hit and miss logs to troubleshoot the issues.

## Optimize Generated Code by Developing and Using Code Replacement Libraries - MATLAB

Develop and use code replacement libraries to replace function and operators in generated code. Code replacement is a technique to change the code that the code generator produces for functions and operators to meet application code requirements. For example, you can replace generated code to meet requirements such as:

- Optimization for a specific run-time environment, including, but not limited to, specific target hardware
- Integration with existing application code
- Compliance with a standard, such as AUTOSAR
- Modification of code behavior, such as enabling or disabling nonfinite or inline support
- Application- or project-specific code requirements, such as use of BLAS or elimination of `math.h`, system header files, or calls to `memcpy` or `memset`.

You can configure the code generator to use a code replacement library that MathWorks® provides. If you have an Embedded Coder® license, you can develop your own code replacement library interactively with the Code Replacement Tool or programmatically.

This example provides MATLAB® code that shows a variety of ways you can define code replacement mappings. With each example MATLAB function, the example provides MATLAB files that illustrate how to develop function and operator code replacements programmatically.

For more information, see “What Is Code Replacement Customization?” on page 73-3 and “Develop a Code Replacement Library” on page 73-13.

### Create a Registration File

Create and save a registration file. Because an `rtwTargetInfo.m` file may already exist on the path, this example creates a new file from a file with a different name.

```
copyfile myRtwTargetInfoCRL.txt rtwTargetInfo.m
```

### Steps for Developing a Code Replacement Library

- 1 Identify your code replacement requirements with respect to function or operating mappings, build information, and registration information.
- 2 Prepare for code replacement library development (for example, identify or develop models to test your library).
- 3 Define code replacement mappings.
- 4 Specify build information for replacement code.
- 5 Register code replacement mappings.
- 6 Verify code replacements.
- 7 Deploy the library.

For more information, see “Develop a Code Replacement Library” on page 73-13.

## Math Function Replacement

This example defines and registers code replacement mappings for math functions. You can define code replacement mappings for a variety of functions. For details, see “Code You Can Replace from MATLAB Code” on page 73-5.

1. The `replace_math_fcns.m` file contains this code:

```
function [y1, y2] = replace_math_fcns(u1, u2) %#codegen

% Copyright 2008-2010 The MathWorks, Inc.

y1 = single(atan2(u1,u2));
y2 = double(cos(double(u1)) + sin(double(u2)));
```

2. Configure the code generator to use the code replacement library **Function Replacement Examples**.

```
RTW.TargetRegistry.getInstance('reset');
cfg = coder.config('lib','ecoder',true);
cfg.CodeReplacementLibrary = 'Function Replacement Examples';
cfg.GenerateReport = false;
cfg.LaunchReport = false;
```

3. Set up the configuration parameters to build and define the function input type.

```
t = single(2);
```

4. Open and explore the code replacement table definition file, `crl_table_functions.m`.

5. Compile the MATLAB program into a C source file by using the configuration parameters that point to the code replacement library and the example input class defined in step 3 as input parameters to the `codegen` command.

```
codegen('replace_math_fcns', '-config', cfg, '-args', {t, t});
```

Code generation successful.

6. The `replace_math_fcns.c` file contains this generated code:

```
file = fullfile('codegen','lib','replace_math_fcns','replace_math_fcns.c');
rtwdemodbtype(file,'#include "replace_math_fcns.h",'* File trailer for replace_math_fcns.c',1,0)

#include "replace_math_fcns.h"
#include "MyMath.h"

/* Function Definitions */
/*
 * Copyright 2008 The MathWorks, Inc.
 *
 * Arguments : float u1
 * float u2
 * float *b_y1
 * double *y2
 * Return Type : void
 */
void replace_math_fcns(float u1, float u2, float *b_y1, double *y2)
{
```

```

 *b_y1 = atan2_single(u1, u2);
 *y2 = cos_double(u1) + sin_double(u2);
}

/*

```

For more information on math function replacement, see “Math Function Code Replacement” on page 73-51.

## Addition and Subtraction Operator Replacement

This example shows how to define and register code replacement mappings for addition (+) and subtraction (-) operations. When defining entries for addition and subtraction operations, you can specify which of the following algorithms (`EntryInfoAlgorithm`) your library functions implement:

- Cast-before-operation (CBO) (`RTW_CAST_BEFORE_OP`), the default
- Cast-after-operation (CAO) (`RTW_CAST_AFTER_OP`)

1. The `addsub_two_int16.m` file contains this code:

```

function [y1, y2] = addsub_two_int16(u1, u2) %#codegen

% Copyright 2008-2010 The MathWorks, Inc.

y1 = int16(u1 + u2);
y2 = int16(u1 - u2);

```

Note, the code uses the default algorithm, CBO.

2. Configure the code generator to use a code replacement library **Addition & Subtraction Examples**.

```

RTW.TargetRegistry.getInstance('reset');
cfg = coder.config('lib','ecoder',true);
cfg.CodeReplacementLibrary = 'Addition & Subtraction Examples';
cfg.GenerateReport = false;
cfg.LaunchReport = false;

```

3. Set up the configuration parameters to build and define the operation input type.

```
t = int16(2);
```

4. Open and explore the code replacement table definition file, `addsub_two_int16(u1, u2).m`.

5. Compile the MATLAB program into a C source file by using the configuration parameters that point to the desired code replacement library and the example input class defined in step 3 as input parameters to the `codegen` command.

```
codegen('addsub_two_int16','-config',cfg,'-args',{t,t});
```

Code generation successful.

6. The `addsub_two_int16.c` file contains this generated code.

```

file = fullfile('codegen','lib','addsub_two_int16','addsub_two_int16.c');
rtwdemodbtype(file,'#include "addsub_two_int16.h",'* File trailer for addsub_two_int16.c',1,0);

#include "addsub_two_int16.h"
#include "MyMath.h"

```

```

/* Function Definitions */
/*
 * Copyright 2008 The MathWorks, Inc.
 *
 * Arguments : short u1
 * short u2
 * short *b_y1
 * short *y2
 * Return Type : void
 */
void addsub_two_int16(short u1, short u2, short *b_y1, short *y2)
{
 *b_y1 = s16_add_s16_s16(u1, u2);
 *y2 = s16_sub_s16_s16(u1, u2);
}

/*

```

For more information on addition and subtraction operator replacement, see “Scalar Operator Code Replacement” on page 73-99 and “Addition and Subtraction Operator Code Replacement” on page 73-104.

### Matrix Operator Replacement

This example defines and registers code replacement mappings for matrix operations: addition, subtraction, multiplication, transposition, conjugate, and Hermitian.

Supported types include:

- single, double
- int8, uint8
- int16, uint16
- int32, uint32
- csingle, cdouble
- cint8, cuint8
- cint16, cuint16
- cint32, cuint32
- fixed-point integers
- mixed types (different type on each input)

1. The `replace_matrix_ops.m` file contains this code:

```

function [y1, y2, y3] = replace_matrix_ops(u1, u2) %#codegen
% This block supports the Embedded MATLAB subset.
% See the help menu for details.

% Copyright 2010 The MathWorks, Inc.

y1 = u1 + u2;
y2 = u1 - u2;
y3 = y2';

```

## 2. Configure the code generator to use a code replacement library **Matrix Op Replacement Examples**.

```
RTW.TargetRegistry.getInstance('reset');
cfg = coder.config('lib','ecoder',true);
cfg.CodeReplacementLibrary = 'Matrix Op Replacement Examples';
cfg.GenerateReport = false;
cfg.LaunchReport = false;
```

## 3. Set up the configuration parameters to build and define the operation input type.

```
t = [1.0 2.0; 3.0, 4.0];
```

## 4. Open and explore the code replacement table definition file, `crl_table_matops.m`.

5. Compile the MATLAB program using the configuration parameters that point to the desired code replacement library and the example input class defined in step 3 as input parameters to the `codegen` command.

```
codegen('replace_matrix_ops', '-config', cfg, '-args', {t, t});
```

Code generation successful.

## 6. The `replace_matrix_ops.c` file contains this generated code:

```
file = fullfile('codegen','lib','replace_matrix_ops','replace_matrix_ops.c');
rtwdemodbtype(file,'#include "replace_matrix_ops.h",'* File trailer for replace_matrix_ops.c',1,0)

#include "replace_matrix_ops.h"
#include "MatrixMath.h"

/* Function Definitions */
/*
 * This block supports the Embedded MATLAB subset.
 * See the help menu for details.
 *
 * Arguments : const double u1[4]
 * const double u2[4]
 * double b_y1[4]
 * double y2[4]
 * double y3[4]
 * Return Type : void
 */
void replace_matrix_ops(const double u1[4], const double u2[4], double b_y1[4],
 double y2[4], double y3[4])
{
 /* Copyright 2015 The MathWorks, Inc. */
 matrix_sum_2x2_double((double *)&u1[0], (double *)&u2[0], &b_y1[0]);
 matrix_sub_2x2_double((double *)&u1[0], (double *)&u2[0], &y2[0]);
 y3[0] = y2[0];
 y3[1] = y2[1];
 y3[2] = y2[2];
 y3[3] = y2[3];
}

/*
```

For more information on matrix operator replacement, see “Small Matrix Operation to Processor Code Replacement” on page 73-111.

## Matrix Multiplication Replacement for BLAS

This example defines and registers code replacement mappings for Basic Linear Algebra Subroutines (BLAS) subroutines xGEMM and xGEMV. You can map the following operations to a BLAS subroutine:

- Matrix multiplication
- Matrix multiplication with transpose on single or both inputs
- Matrix multiplication with Hermitian operation on single or both inputs

1. The `replace_matrix_ops_blas.m` file contains this code:

```
function [y1, y2] = replace_matrix_ops_blas(u1, u2) %#codegen
% This block supports the MATLAB Coder subset.
% See the help menu for details.

% Copyright 2010 The MathWorks, Inc.

y1 = u1 * u2;
y2 = u1 * u2;
```

2. Configure the code generator to use a code replacement library **BLAS Replacement Examples**.

```
RTW.TargetRegistry.getInstance('reset');
cfg = coder.config('lib','ecoder',true);
cfg.CodeReplacementLibrary = 'BLAS Replacement Examples';
cfg.GenerateReport = false;
cfg.LaunchReport = false;
```

3. Set up the configuration parameters to build and define the function input type.

```
t = [1.0 2.0 3.0; 4.0 5.0 6.0; 7.0 8.0 9.0];
```

4. Open and explore the code replacement table definition file, `crl_table_blas.m` file.

5. Compile the MATLAB program using the configuration parameters that point to the desired code replacement library and the example input class defined in step 3 as input parameters to the `codegen` command.

```
codegen('replace_matrix_ops_blas', '-config', cfg, '-args', {t, t});
```

Code generation successful.

6. The `replace_matrix_ops_blas.c` file contains this generated code.

```
file = fullfile('codegen','lib','replace_matrix_ops_blas','replace_matrix_ops_blas.c');
rtwdemodbtype(file,'#include "replace_matrix_ops_blas.h"', '* File trailer for replace_matrix_ops_blas.h');

#include "replace_matrix_ops_blas.h"
#include "blascompat32.h"
#include <string.h>

/* Function Definitions */
/*
 * This block supports the MATLAB Coder subset.
 * See the help menu for details.
 *
 * Arguments : const double u1[9]
 * const double u2[9]
```

```

* double b_y1[9]
* double y2[9]
* Return Type : void
*/
void replace_matrix_ops_blas(const double u1[9], const double u2[9],
 double b_y1[9], double y2[9])
{
 double ALPHA;
 double BETA;
 int K;
 int LDA;
 int LDB;
 int LDC;
 int M;
 int N;
 char TRANSA;
 char TRANSB;
 /* Copyright 2015 The MathWorks, Inc. */
 TRANSA = 'N';
 TRANSB = 'N';
 M = 3;
 N = 3;
 K = 3;
 ALPHA = 1.0;
 LDA = 3;
 LDB = 3;
 BETA = 0.0;
 LDC = 3;
 dgemm32(&TRANSA, &TRANSB, &M, &N, &K, &ALPHA, &u1[0], &LDA, &u2[0], &LDB,
 &BETA, &b_y1[0], &LDC);
 memcpy(&y2[0], &b_y1[0], 9U * sizeof(double));
}

/*

```

For more information on matrix multiplication replacement for BLAS, see “Matrix Multiplication Operation to MathWorks BLAS Code Replacement” on page 73-117.

### MATLAB Function Replacement Using Coder.Replace

Code replacement libraries support the replacement of MATLAB functions with scalar and matrix inputs and outputs for built-in, complex, and fixed-point data types.

1. The `coder_replace_fcn.m` file contains this code:

```

function [y1, y2, y3] = coder_replace_fcn(u1, u2) %#codegen
% Copyright 2012 The MathWorks, Inc.

y1 = myScalarFunction(u1(1),u1(2));
y2 = myMatrixFunction(u1, u2);
complexValue = u1 + 1i;
y3 = myComplexFunction(complexValue, u2(1));
end

%-----
% Lookup this function for CRL replacement
% Function: myScalarFunction

```

```

% Inputs: u1: double scalar
% u2: double scalar
% Outputs: y1: double scalar
%-----
function y1 = myScalarFunction(u1, u2)

% Trigger CRL lookup
coder.replace('-errorifnoreplacement');
y1 = sin(u1) + cos(u2);
end

%-----
% Lookup this function for CRL replacement
% Function: myMatrixFunction
% Inputs: u1: 2x2 double matrix
% u2: 2x2 double matrix
% Outputs: y1: 2x2 double matrix
%-----
function y1 = myMatrixFunction(u1, u2)

% Trigger CRL lookup
coder.replace('-errorifnoreplacement');
y1 = u1 + u2;
end

%-----
% Lookup this function for CRL replacement
% Function: myComplexFunction
% Inputs: u1: 2x2 complex double matrix
% u2: double scalar
% Outputs: y1: 2x2 complex double matrix
%-----
function y1 = myComplexFunction(u1, u2)

% Trigger CRL lookup
coder.replace('-errorifnoreplacement');
y1 = u1 + u2;
end

```

2. Configure the code generator to use a code replacement library **Coder Replace Examples**.

```

RTW.TargetRegistry.getInstance('reset');
cfg = coder.config('lib','ecoder',true);
cfg.CodeReplacementLibrary = 'Coder Replace Examples';
cfg.GenerateReport = false;
cfg.LaunchReport = false;

```

3. Set up the configuration parameters to build and define the function input type.

```
t = [1 2; 3 4];
```

4. Explore the code replacement table definition file, `crl_table_coder_replace.m`.

5. Compile the MATLAB program using the configuration parameters that point to the desired code replacement library and the example input class defined in step 3 as input parameters to the `codegen` command.

```
codegen('coder_replace_fcn', '-config', cfg, '-args', {t, t});
```

Code generation successful.

6. The `coder_replace_fcn.c` file contains this generated code.

```
file = fullfile('codegen','lib','coder_replace_fcn','coder_replace_fcn.c');
rtwdemodbtype(file,'#include "coder_replace_fcn.h','* File trailer for coder_replace_fcn.c',1,0)

#include "coder_replace_fcn.h"
#include "MyMath.h"

/* Function Definitions */
/*
 * Copyright 2012 The MathWorks, Inc.
 *
 * Arguments : const double u1[4]
 * const double u2[4]
 * double *b_y1
 * double y2[4]
 * creal_T y3[4]
 * Return Type : void
 */
void coder_replace_fcn(const double u1[4], const double u2[4], double *b_y1,
 double y2[4], creal_T y3[4])
{
 creal_T dcv[4];
 *b_y1 = myScalarFunction_impl(u1[0], u1[1]);
 myMatrixFunction_impl(&y2[0], (double *)&u1[0], (double *)&u2[0]);
 dcv[0].re = u1[0];
 dcv[0].im = 1.0;
 dcv[1].re = u1[1];
 dcv[1].im = 1.0;
 dcv[2].re = u1[2];
 dcv[2].im = 1.0;
 dcv[3].re = u1[3];
 dcv[3].im = 1.0;
 myComplexFunction_impl(&y3[0], &dcv[0], u2[0]);
}

/*
```

For more information, see “Replace MATLAB Functions with Custom Code by Using the `coder.replace` Function” on page 73-79.

### Build Information

For each entry in a code replacement table, you can specify build information such as the following, for replacement functions:

- Header file dependencies
- Source file dependencies
- Additional include paths
- Additional source paths
- Additional link flags

Additionally, you can specify `RTW.copyFileToBuildDir` to copy header, source, or object files, which are required to generate replacement code, to the build folder before code generation. You can specify `RTW.copyFileToBuildDir` by setting it as the value of:

- Property `GenCallback` in a call to `setTfLCFunctionEntryParameters`, `setTfLCOperationEntryParameters`, or `setTfLCSemaphoreEntryParameters`.
- Argument `genCallback` in a call to `registerCFunctionEntry`, `registerCOperationEntry`, or `registerCSemaphoreEntry`.

**Note:** The `.m` scripts in this example are configured for code generation only because the implementations for the replacement functions are not provided.

For more information on specifying build information for replacement code, see “Develop a Code Replacement Library” on page 73-13.

### **Cleanup**

Refresh the library registration information within the current MATLAB session.

```
RTW.TargetRegistry.getInstance('reset');
```

# Embedded Coder Support Package for Linux Applications

---

- “Support Package Installation” on page 74-2
- “Setup Linux Target Computer” on page 74-3
- “Build Simulink Model and Deploy Application” on page 74-5
- “Start and Stop Deployed Applications” on page 74-8
- “Tune Parameters and Measure Signal Data for Deployed Applications” on page 74-10
- “Analyze Logged Messages” on page 74-12

## Support Package Installation

To install the Embedded Coder Support Package for Linux Applications, follow these steps:

- 1 On the MATLAB **Home** tab, in the **Environment** section, select **Add-Ons > Get Hardware Support Packages**.
- 2 In the Add-On Explorer window, search for Embedded Coder Support Package for Linux Applications. Click **install**.
- 3 Sign in using the MathWorks account.
- 4 Accept the license agreement **MathWorks Auxillary Software License Agreement**.

Installation for the support package starts. After the installation is completed, you can exit the process or continue to setup the target. To setup the target:

- Click the **Setup Now** button.
- In the **Hardware Setup** window, enter the details of target such as Target Name, IP Address, Username, Password, and Deployment Location and click **Submit**.
- After the target setup is completed, a message appears and then click **Finish** button to complete and exit from the installation procedure.

### See Also

Linux Runtime Manager | `linux.Targets` | `connect` | `setDeploymentLocation`

### Related Examples

- “Setup Linux Target Computer” on page 74-3
- “Build Simulink Model and Deploy Application” on page 74-5

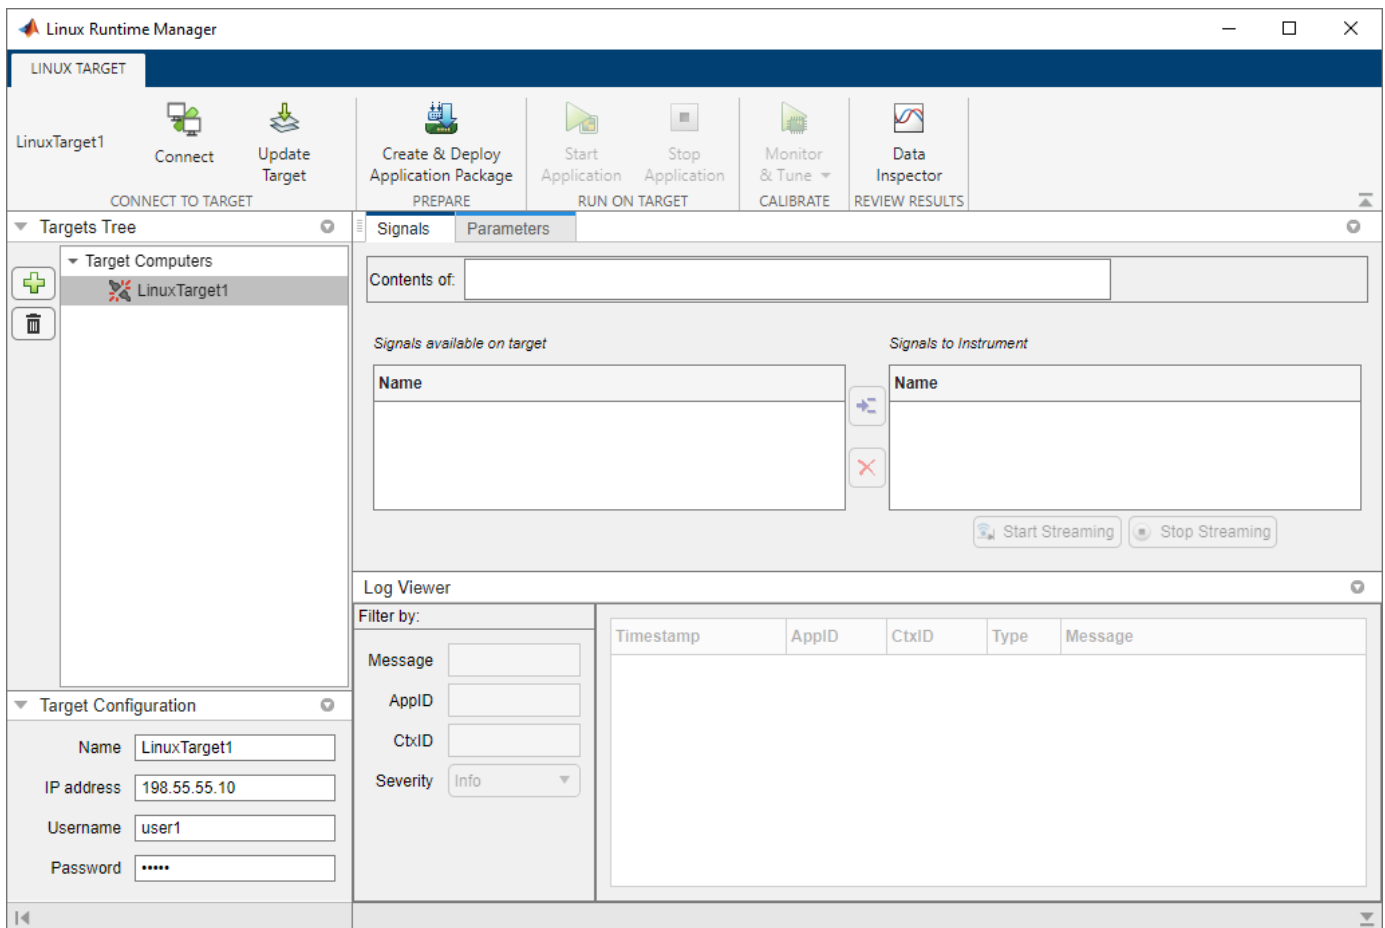

## Setup Linux Target Computer

Use the Linux Runtime Manager application to connect, disconnect, add, remove, and update Linux target computers.

To connect to a target computer that is running the Linux operating system:

- 1 Open the Linux Runtime Manager.

```
linux.RuntimeManager.open
```

- 2 Add a target computer by clicking the plus button. In **Target Configuration** section, enter details for the target computer.

programmatically:

```
tgs = linux.Targets();
tg = tgs.addTarget(<targetName>, <ipAddress>, <userName>, <password>);
```

- 3 For a newly added target computer, enter the location at which you want to deploy the application using this command:

```
tg.setDeploymentLocation(<Deployment location>);
```

- 4 Select a target and click the **Linux Target > Connect To Target > Connect** button.

Programmatically:

```
tg.connect();
```

---

**Note** This step prompts you to provide a deployment location for the target computer if one is already not set.

---

- 5 To update software on the target computer, select the target computer and click **Linux Target > Connect To Target > Update Target**.

Programmatically:

```
tg.updateTarget();
```

- 6 To disconnect the target computer, select the target computer and click **Linux Target > Connect To Target > Disconnect**.

Programmatically:

```
tg.disconnect();
```

- 7 To completely remove the target computer files and its storage, use this command:

```
tgs.uninstallTarget(<Target Name>);
```

- 8 To remove a target computer, select the target computer and click the delete button. This action removes the target computer from the **Targets Tree**, but the applications deployed to the target computer and its docker image still exist in storage.

Programmatically:

```
tgs.removeTarget(<Target Name>);
```

Using this application, you can connect to multiple target computers at the same time.

## See Also

`linux.Targets` | `addTarget` | `connect` | `setDeploymentLocation`

## Related Examples

- “Build Simulink Model and Deploy Application” on page 74-5

## Build Simulink Model and Deploy Application

After connecting the development computer to the target computer, build the Simulink model and deploy the standalone Linux application to the Linux environment.

- Click the **Linux Target > Prepare > Create & Deploy Application Package**.
- If you have an application package (.mldatax) file already created, select it. Or you can select the Simulink model.

Programmatically:

To create application package from Simulink model:

```
linux.createApplicationPackage(<modelName>);
```

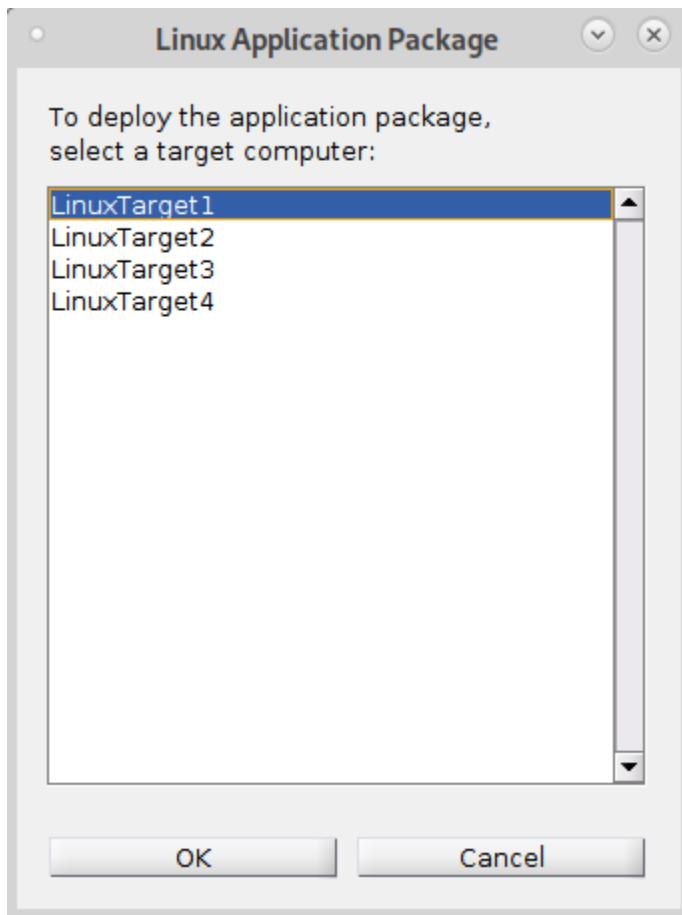

To deploy the application package:

```
tg.deployApplicationPackage(<NameOfSoftwarePackage>);
```

- The Linux Runtime Manager builds the model, creates the application package, and deploys the package.

If there is an application package (.mldatax) file available, you can also deploy it on target in the following way:

- Right-click the application package and select **Open**. The following window opens.

- Choose a target and click the **OK** button. The selected application gets deployed on the target.

The application name is displayed under the target computer. To view the list of measurable signals and tunable parameters, select the deployed application.

Alternatively, use these commands.

To view the available signals:

```
availableSignals = tg.getMeasurements(<applicationName>);
```

To view the tunable parameters:

```
availableParameters = tg.getParameters(<applicationName>);
```

You can also deploy DDS Blockset models by converting them to Adaptive AUTOSAR models by using the function `linux.utils.migrateDds2Adaptive`.

## See Also

`linux.utils.migrateDds2Adaptive` | `deployApplicationPackage`

## Related Examples

- “Setup Linux Target Computer” on page 74-3

- “Start and Stop Deployed Applications” on page 74-8

## Start and Stop Deployed Applications

The deployed applications are shown under the target computer name in the **Targets Tree**. Select an application and:

- To start the application, click **Linux Target > Run On Target > Start Application**.

Programmatically:

```
tg.startApplication(<applicationName>);
```

- To pause the application, click the **Linux Target > Run On Target > Pause Application**.

Programmatically:

```
tg.pauseApplication(<applicationName>);
```

- To resume the application, click the **Linux Target > Run On Target > Resume Application**.

Programmatically:

```
tg.resumeApplication(<applicationName>);
```

- To stop the application, click the **Linux Target > Run On Target > Stop Application**.

Programmatically:

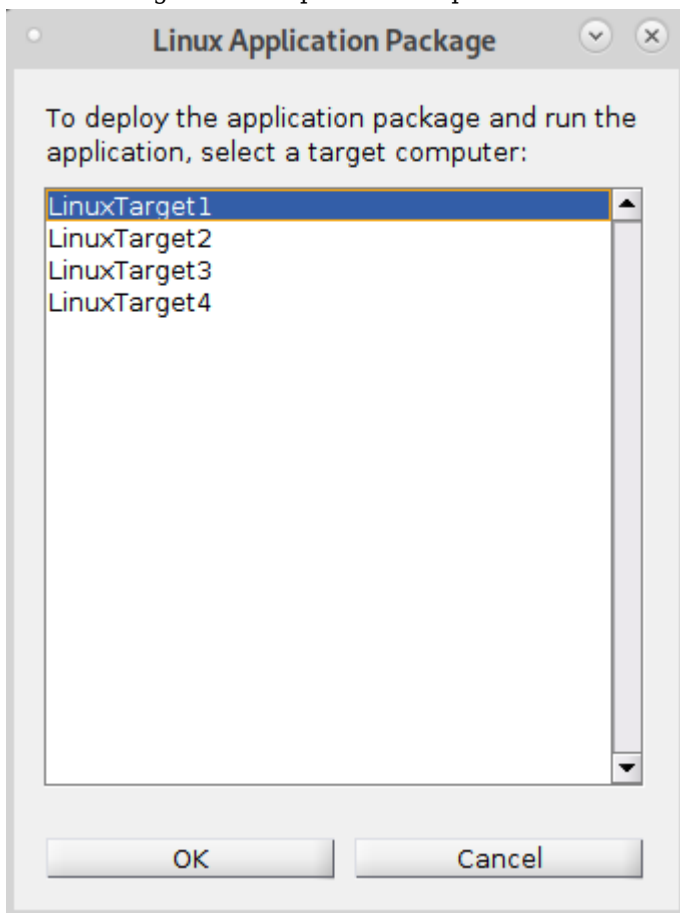

```
tg.stopApplication(<applicationName>);
```

- Click the delete button to delete the application.

Programmatically:

```
tg.removeApplicationPackage(<applicationName>);
```

You can also start running the application by right-clicking the application package (.mldatax) file and selecting the **Run** option. This opens a window.

Choose a target to run the application and click **OK**.

### See Also

`stopApplication` | `startApplication` | `removeApplicationPackage`

### Related Examples

- “Tune Parameters and Measure Signal Data for Deployed Applications” on page 74-10

## Tune Parameters and Measure Signal Data for Deployed Applications

After you deploy an application to a Linux target environment, you can view the list of measurable signals and tunable parameters in **Signals** and **Parameters** tabs respectively by selecting the application in the target tree. To set up the data:

- Select the signals to measure and move them from **Signals available on target** to **Signals to Instrument**.

Programmatically:

```
tg.selectSignalsToInstrument(<applicationName>, <SignalNamesArray>);
```

- Remove signals from **Signals to Instrument** by selecting them and clicking the delete button.

Programmatically:

```
tg.removeSignalsFromInstrument(<applicationName>, <SignalNamesArray>);
```

- If the application is in running state, stop it by clicking the **Linux Target > Run On Target > Stop Application**.
- Start tuning the parameters clicking the **Linux Target > Calibrate > Monitor & Tune**.

Programmatically:

```
tg.startMonitorAndTune(<applicationName>);
```

---

**Note** If the application is in running state, you can start the calibration by clicking **Linux Target > Calibrate > Monitor & Tune > Connect**.

Programmatically:

```
tg.startMonitorAndTune(<applicationName>, false);
```

- 
- To see a plot of the selected signals, open the Simulation Data Inspector by selecting **Linux Target > Review Results > Data Inspector**.

Programmatically:

```
Simulink.sdi.view
```

- You can add more signals or remove signals for measurement.
- To view an updated list of signals to appear on Simulink Data Inspector, click the **Restart Streaming** button.

Programmatically:

```
tg.restartStreaming(<applicationName>);
```

- On the **Parameters** tab, you can read parameter values.

Programmatically:

To read a specific parameter:

```
tg.readParameter(<applicationName>, <paramName>);
```

To read the parameters available:

```
tg.readParameters(<applicationName>);
```

- To tune parameters, select **Parameters** tab and specify a value in the value field of the parameter of interest.

Programmatically:

```
tg.writeParameter(<applicationName>, <paramName>, <paramValue>);
```

The paramValue accepts multiple data types to support various kinds of parameters.

---

**Note** To enable calibration for AUTOSAR Adaptive models, configure the XCP communication interface by setting the **Code Generation > AUTOSAR Code Generation > XCP Slave Configuration > Transport layer** to XCP 0n TCP/IP.

---

In Simulink Data Inspector, you can observe changes to signal data as you tune parameters.

- To stop streaming of signal data:

```
tg.stopStreaming(<applicationName>);
```

- You can stop signal measurement and parameter tuning by clicking **Linux Target > Calibrate > Stop Monitor & Tune**.

Programmatically:

```
tg.stopMonitorAndTune(<applicationName>);
```

## See Also

## Related Examples

- “Start and Stop Deployed Applications” on page 74-8
- “Analyze Logged Messages” on page 74-12

## Analyze Logged Messages

After you start an application, you can view the log messages of the application in the **Log Viewer** panel. Each logged message contains these fields:

- Time when message is logged - Timestamp
- Unique application id - AppId
- Context id of the message. An application can have multiple contexts - CtxId
- Type of the message. Possible types are Error, Warn, Fatal, Info, Verbose, and Debug - Type
- Message text - Message

To filter the messages to view on the application, use **Filter by:** column.

The screenshot shows the 'Log Viewer' window. On the left, there is a 'Filter by:' section with four controls: a text input for 'Message', a text input for 'AppID', a text input for 'CtxID', and a dropdown menu for 'Severity' currently showing 'Info'. To the right of the filters is a table with the following columns: 'Timestamp', 'AppID', 'CtxID', 'Type', and 'Message'. The table body is currently empty.

To create an object for the log messages from the command line, use this command:

```
logObj = linux.LogMessages(<targetName>);
```

From the log messages object, you can get the required messages by using this command:

```
msgs = logObj.get('MessageFilter', <message>, 'AppIdFilter',
<appId>, 'CtxIdFilter', <ctxId>, 'SeverityFilter', <severityLevel>)
```

To filter messages based on applications:

```
msgs_appName = logObj('AppIdFilter', <appId>);
```

To filter messages based on context:

```
msgs_ctx = logObj('AppIdFilter', <appId>, 'CtxIdFilter', <ctxId>);
```

To filter messages based on severity:

```

# Data Communication Methods

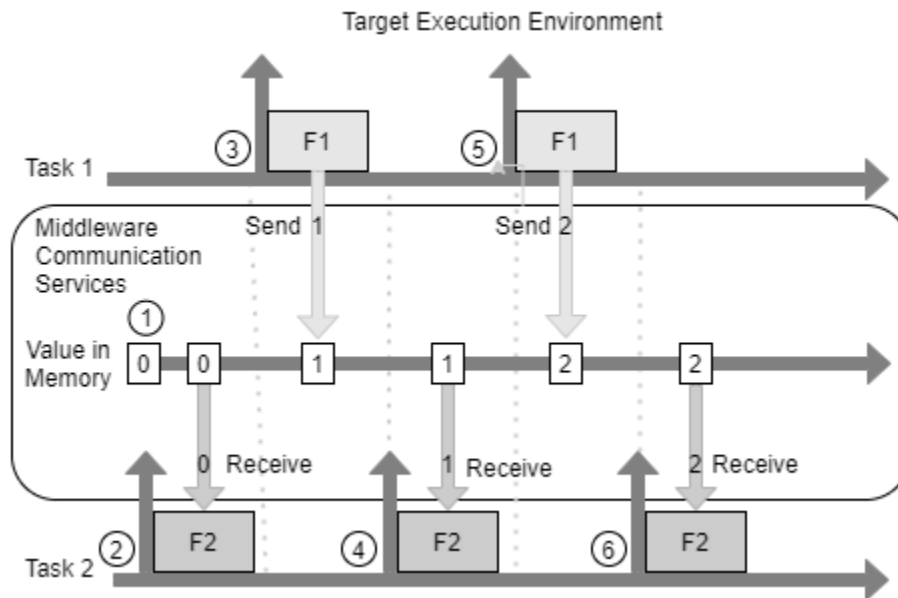

---

## Sample Target Environment Service Implementations of Data Communication Methods

### Direct-Access Data Communication

To maximize performance of component code or if mutual exclusion is inherent in the component model design, use direct-access data communication. Generated function code communicates with other functions directly by using memory that platform services manage for the target execution environment. Platform services maintain memory persistence across time during one start and shutdown cycle.

This figure shows two generated callable functions that use direct-access data communication. The numeric callouts in the figure are keyed to the list that follows the figure.

- 1 At startup, the platform service allocates a buffer and initializes the buffer to 0. The buffer is persistent across time.
- 2 The service calls function F2 to receive data. The function reads value 0 from the buffer without safeguards.
- 3 The service calls function F1 to send data. The function writes the value 1 to the buffer. Direct access communication assumes that functions F1 and F2 do not access the buffer concurrently and a safeguard is not needed.
- 4 The service calls function F2. During its second execution, function F2 receives the new data. The function reads the value 1 from the buffer.
- 5 The service calls function F1. During its second execution, function F1 sends the value 2 to the buffer.
- 6 The service calls function F2. During its third execution, function F2 receives the value 2 by reading the new value from the buffer.

Functions F1 and F2 have direct access to memory for the duration of function execution. The platform service assumes that the functions do not access the buffer concurrently and applies no data concurrency safeguards.

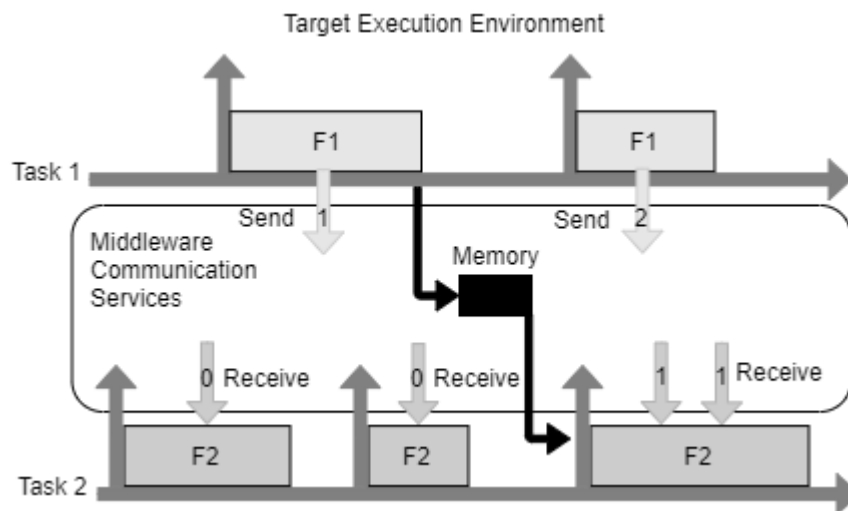

## Outside-Execution Data Communication

To favor memory optimizations over data freshness or when the platform service code is autogenerated based on full knowledge of your application, use outside-execution data communication. The platform communicates data with other functions outside (before and after) function execution. As component model designer, you accept how the platform applies safeguards for concurrent data access. For the duration of its execution, a function can access memory.

The platform communication services:

- Allocate buffer and, at startup, initialize the buffer.
- Lock the buffer at the beginning of function execution.
- Unlock the buffer at the end of function execution.
- Switch buffers to maintain memory exclusivity for function execution.
- Maintain memory persistence during function execution within the context of a power cycle.

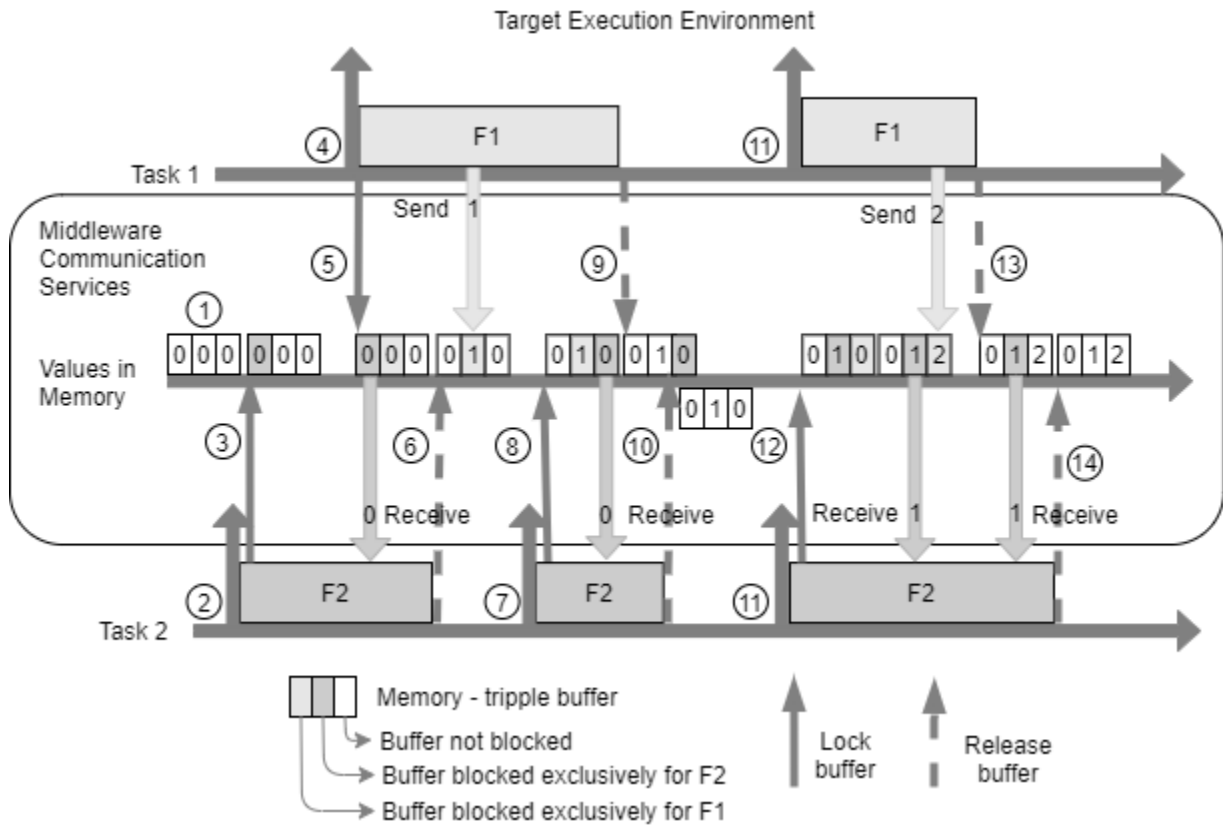

This figure shows platform communication services that use an outside-execution data communication algorithm.

Generated callable functions F1 and F2 send and receive data while executing. The platform services communicate the data before and after function execution.

- Data that function F1 sends becomes accessible to function F2 after F1 completes execution.
- The platform service locks the buffer and holds the data that function F2 receives constant while F2 executes.
- F2 can access the received data as needed until execution completes.

This figure shows how a platform service might implement outside-execution communication by using a triple-buffer algorithm. The numeric callouts in the figure are keyed to the list that follows the figure.

With this algorithm, a platform service:

- 1 Allocates three buffers and initializes the buffers with value 0.
- 2 Calls generated callable function F2.
- 3 Locks the first buffer for F2. F2 can read from the locked buffer as needed while executing. Because data has not been sent to the buffer, the function receives the value 0.
- 4 Calls generated callable function F1.
- 5 Locks the second buffer for F1. F1 can write to the locked buffer as needed while executing. The function writes the value 1 to the buffer.
- 6 When F2 completes execution, unlocks the first buffer.
- 7 Calls F2.
- 8 Locks the third buffer for F2. Because the second buffer is locked for F1, the value 1 in that buffer is not accessible to F2. F2 receives the value that is in the third buffer, which is 0.
- 9 When F1 completes execution, unlocks the second buffer.
- 10 When F2 completes execution, unlocks the third buffer.
- 11 Calls F1 and F2.
- 12 Locks the second and third buffers. The service locks the second buffer so that F2 can receive the freshest data, which is the value 1. The service locks the third buffer so that F1 can write a new value to that buffer. F1 writes the value 2 to the third buffer.
- 13 When F1 completes execution, unlocks the third buffer.

- 14 When F2 completes execution, unlocks the second buffer. Because the service retains the lock on the second buffer until F2 completes execution, F2 receives the value 1 a second time.

## During-Execution Data Communication

To favor data freshness over memory usage or when there is no aggregate service generation phase, use during-execution data communication. The platform service communicates data with other functions immediately during function execution. As component model designer, you accept how the service applies safeguards for concurrent data access. For the duration of its execution, a function can access memory. A function maintains value coherence during execution by using a local buffer.

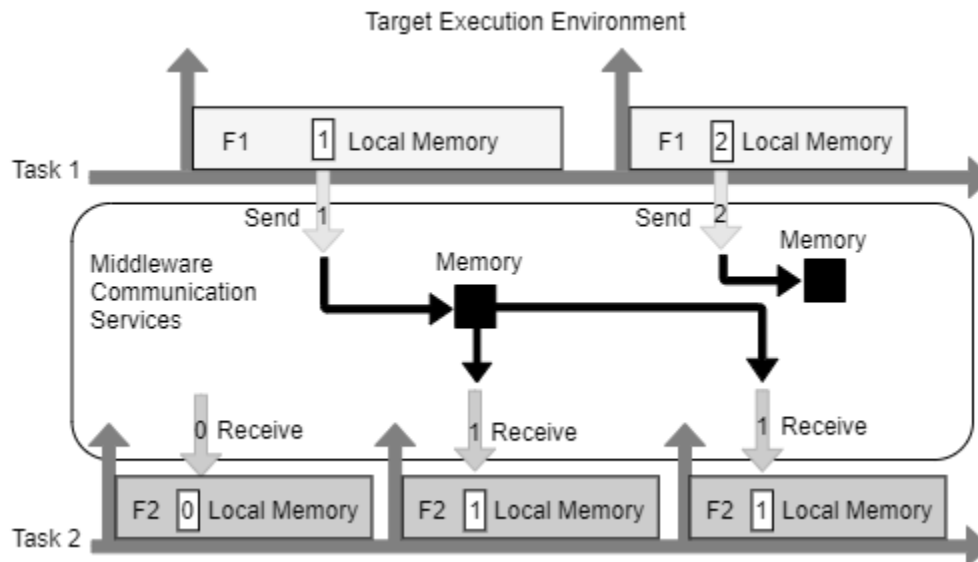

The platform communication services:

- Allocate a buffer and initializes the buffer to 0 at startup.
- Lock the buffer during a receive or send operation.
- Unlock the buffer immediately after reading a value from or writing a value to the buffer.
- Switch buffers to maintain memory exclusivity for function execution.
- Do not maintain memory persistence during a power cycle or during function execution.

During-execution communication can be nonblocking or blocking.

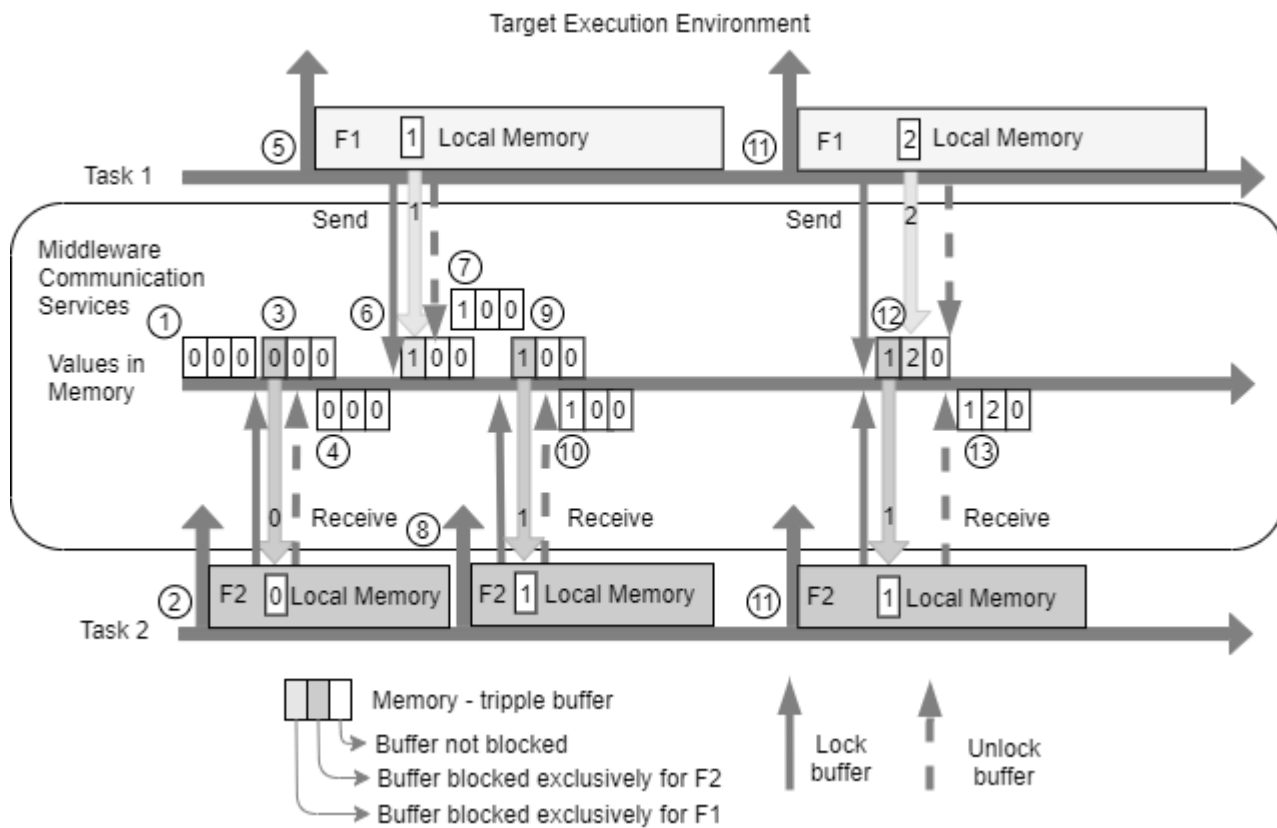

### Nonblocking During-Execution Data Communication

This figure shows platform communication services that use a nonblocking during-execution data communication algorithm.

Data that generated callable function F1 sends becomes accessible to generated callable function F2 during the execution of F1. The receiver, function F2, uses local memory to hold the value constant during execution.

This figure shows how a platform service might implement nonblocking during-execution communication by using a triple-buffer approach. The numeric callouts in the figure are keyed to the list that follows the figure.

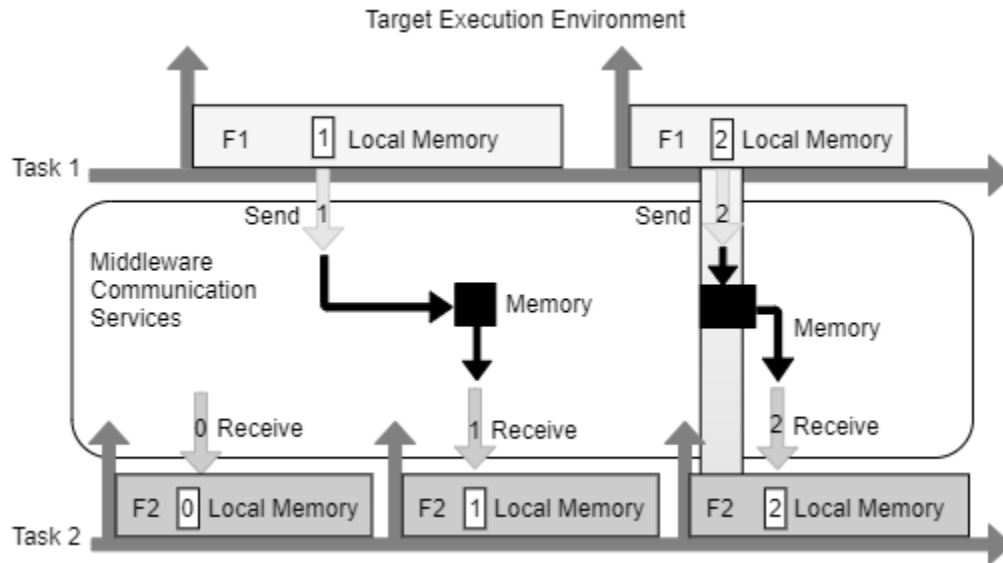

With this algorithm, a platform service:

- 1 Allocates three buffers and initializes the buffers with value 0.
- 2 Calls generated callable function F2.
- 3 Locks the first buffer for F2. F2 reads data from the buffer immediately.
- 4 When the read operation is complete, unlocks the buffer immediately. F2 cannot access the buffer again during execution. For additional read operations, F2 must preserve the value in local memory.
- 5 Calls generated callable function F1.
- 6 Locks the first buffer for F1. F1 writes the value 1 to the buffer immediately.
- 7 When the write operating is complete, unlocks the buffer immediately.
- 8 Calls F2.
- 9 Locks the buffer that contains the freshest data. The first buffer contains the freshest data, which is the value 1.
- 10 When the write operation is complete, unlocks the buffer immediately.
- 11 Calls F1 and F2.
- 12 For F2, locks the buffer that contains the freshest data. The first buffer contains the freshest data, which is the value 1. For F1, locks the buffer that contains the stalest data. The second buffer contains the stalest data, which is the value 2.
- 13 When the read and write operations are complete, unlocks the buffers immediately.

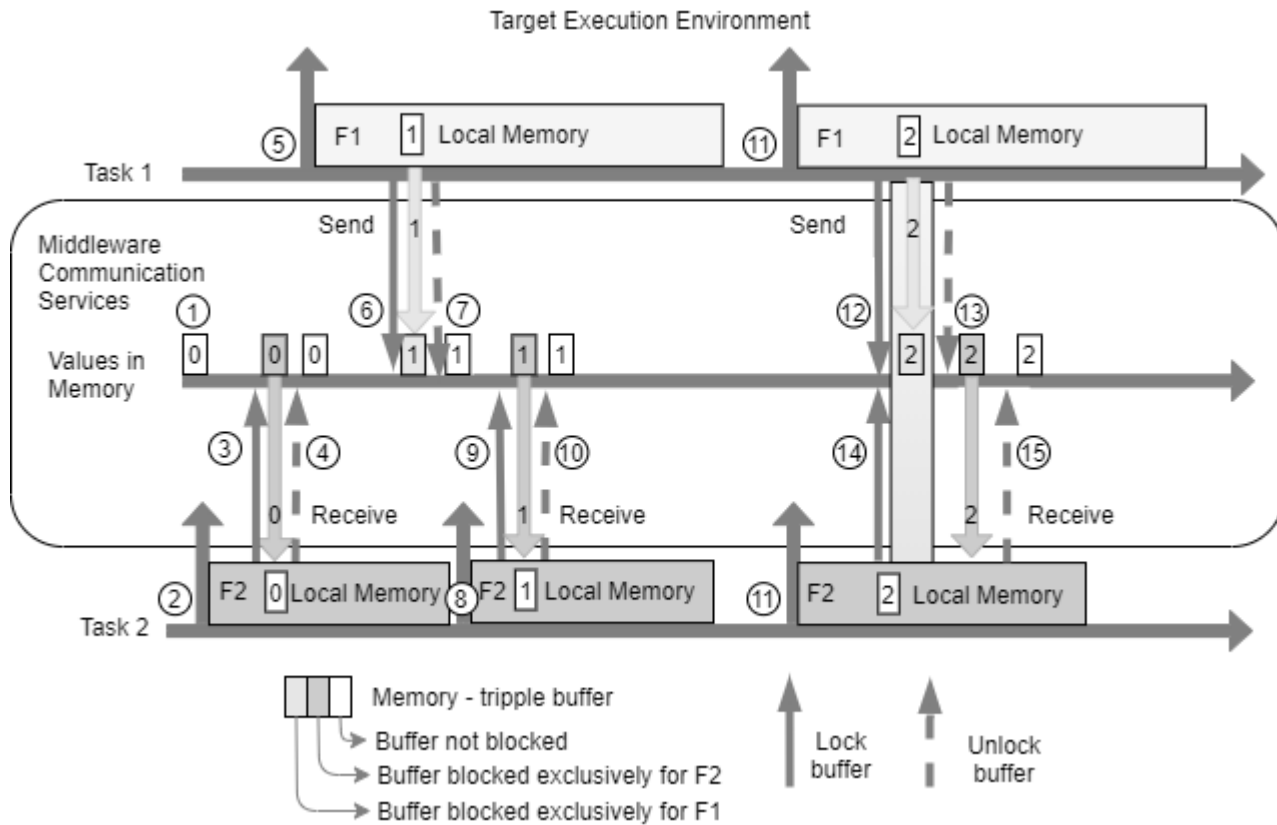

### Blocking During-Execution Data Communication

This figure shows platform communication services that use a blocking during-execution data communication algorithm. A blocking algorithm must avoid live-lock and dead-lock concurrency issues.

Data that the generated callable function F1 sends becomes accessible to generated callable function F2 during the execution of F1. The sender, in this case F1, might block the receiver. The receiver, function F2, uses local memory to hold the value constant during execution. The service might maintain memory persistence for a power cycle.

This figure shows how service might implement blocking during-execution communication by using a single-buffer approach. The numeric callouts in the figure are keyed to the list that follows the figure.

With this algorithm, the a service:

- 1 Allocates a buffer and initializes the buffer with value 0.
- 2 Calls generated callable function F2.
- 3 Locks the buffer for F2. F2 reads the value in the buffer, 0, until a send occurs. For multiple read operations, F2 must preserve the value in local memory.
- 4 When a read operation is complete, unlocks the buffer immediately.
- 5 Calls generated callable function F1.
- 6 Locks the buffer for F1. F1 writes the value 1 to the buffer immediately.
- 7 When the write operation is complete, unlocks the buffer immediately.
- 8 Calls F2.
- 9 Locks the buffer for F2. F2 reads the value 1 from the buffer.
- 10 When the read operation is complete, unlocks the buffer immediately.
- 11 Calls F1 and F2.
- 12 Blocks F2 and locks the buffer for F1. F1 writes the value 2 to the buffer.
- 13 When the write operation is complete, unlocks the buffer immediately.
- 14 Unblocks F2 and locks the buffer for F2. F2 reads the value 2 from the buffer.
- 15 When the read operation is complete, unlocks the buffer immediately.

## Increase Code Generation Speed

### In this section...

“Build a Model in Increments” on page 76-3

“Build Large Model Reference Hierarchies in Parallel” on page 76-3

“Minimize Memory Requirements During Code Generation” on page 76-4

“Generate Only Code” on page 76-4

“Suppress Creation of a Code Generation Report” on page 76-4

The amount of time it takes to generate code for a model depends on the size and configuration settings of the model. For instance, if you are working with a large model, it can take awhile to generate code. To decrease the amount of time for code generation of a model, try one or more of the following methods:

- Build a model in increments
- Build large model reference hierarchies in parallel
- Minimize memory requirements during code generation
- Generate only code
- Disable the creation of a code generation report

### Build a Model in Increments

You can use the `slbuild` command to build a model and generate code. By default, when rebuilding a model, `slbuild` provides an incremental model build, which only rebuilds a model or submodels that have changed since the most recent model build. Incremental model build saves code generation time. Use the **Rebuild** parameter on the **Model Referencing** pane to change the method that Simulink uses to determine when to rebuild code for referenced models. For more information on the **Rebuild** parameter, see “Rebuild”.

### Build Large Model Reference Hierarchies in Parallel

In a parallel computing environment, whenever conditions allow, you can increase the speed of code generation and compilation by building models containing large model reference hierarchies in parallel. For example, if you have Parallel Computing Toolbox software, you can distribute code generation and compilation for each referenced model across the cores of a multicore host computer. If you have MATLAB Parallel Server software, you can distribute code generation and compilation for each referenced model across remote workers in your MATLAB Parallel Server configuration.

The execution speed improvement realized by using parallel builds for referenced models depends on several factors, including:

- How many models can be built in parallel for a given model referencing hierarchy
- The size of the referenced models
- Parallel computing resources such as the number of local and remote workers available
- The hardware attributes of the local and remote machines (amount of RAM, number of cores, and so on)

For more information, see “Reduce Build Time for Referenced Models by Using Parallel Builds”.

## Minimize Memory Requirements During Code Generation

Models that have large amounts of parameter and constant data (such as lookup tables) can tax memory resources and slow code generation. The code generator copies this data to the `model.rtw` file. The `model.rtw` file is a partial representation of the model that the Target Language Compiler parses to transform block computations, parameters, signals, and constant data into a high-level language (for example, C). The Target Language Compiler (TLC) is an integral part of the code generator. The code generator copies parameters and data into `model.rtw`, whether they originate in the model or come from variables or objects in a workspace.

You can improve code generation speed by specifying the maximum number of elements that data vectors can have for the code generator to copy this data to `model.rtw`. When a data vector exceeds the specified size, the code generator places a reference key in `model.rtw`. The TLC uses this key to access the data from Simulink and format it into the generated code. Reference keys result in maintaining only one copy of large data vectors in memory.

The default value above which the code generator uses reference keys in place of actual data values is 10 elements. You can verify this value. In the Command Window, type the following command:

```
get_param(0, 'RTWDataReferencesMinSize')
```

To set the threshold to a different value, in the Command Window, type the following `set_param` function:

```
set_param(0, 'RTWDataReferencesMinSize', <size>)
```

Provide an integer value for `size` that specifies the number of data elements above which the code generator uses reference keys in place of actual data values.

## Generate Only Code

You can increase code generation speed by specifying that the build process generate code and a makefile, but not invoke the make command. When the code generator invokes the make command, the build process takes longer because the code generator generates code, compiles code, and creates an executable file.

On the **Code Generation** pane in the Model Configuration Parameters dialog box, you can specify that the build process generate only code by selecting the **Generate code only** parameter. You can specify that the code generation process build a makefile by selecting the **Configuration Parameters > Code Generation > Build process > Makefile configuration > Generate makefile** parameter.

## Suppress Creation of a Code Generation Report

You can speed up code generation by not generating a code generation report as a part of the build process. To disable the creation of a code generation report, on the **Code Generation > Report** pane, clear the **Create code generation report** parameter. To generate a code generation report after the build process, see “Generate Code Generation Report” on page 54-5.

## Control Compiler Optimizations

To control compiler optimizations for a makefile build at the GUI level, use the **Compiler optimization level** parameter. The **Compiler optimization level** parameter provides

- Target-independent values `Optimizations on (faster runs)` and `Optimizations off (faster builds)`, which allow you to easily toggle compiler optimizations on and off during code development
- The value `Custom` for entering custom compiler optimization flags at the Simulink GUI level, rather than editing compiler flags into template makefiles (TMFs) or supplying compiler flags to build process make commands

The default setting is `Optimizations off (faster builds)`. Selecting the value `Custom` enables the **Custom compiler optimization flags** field, in which you can enter custom compiler optimization flags (for example, `-O2`).

If you specify compiler options for your makefile build using `OPT_OPTS`, `MEX_OPTS` (except `MEX_OPTS="-v"`), or `MEX_OPT_FILE`, the value of **Compiler optimization level** is ignored and a warning is issued about the ignored parameter.

For a rapid simulation that uses the MinGW compiler:

- If `RTWCompilerOptimization` is set to `'on'`, the build process customizes compiler optimization to minimize run time. The build process ignores the `BuildConfiguration` and `CustomToolchainOptions` settings.
- If `RTWCompilerOptimization` is set to `'custom'` or `'off'`, the build process uses `BuildConfiguration` and `CustomToolchainOptions` settings. The build process ignores the `RTWCompilerOptimization` setting.

# Optimize Generated Code with Code Efficiency Tools and Techniques

## Use the Model Advisor to Optimize a Model for Code Generation

You can use the Model Advisor to analyze a model for code generation and identify aspects of your model that impede production deployment or limit code efficiency. You can select from a set of checks to run on a model's current configuration. The Model Advisor analyzes the model and generates check results providing suggestions for improvements in each area. Most Model Advisor diagnostics do not require the model to be in a compiled state; those that do are noted.

Before running the Model Advisor, select the target you plan to use for code generation. The Model Advisor works most effectively with ERT and ERT-based system target files.

Use the following examples to investigate optimizing models for code generation using the Model Advisor:

- `rtwdemo_advisor1`
- `rtwdemo_advisor2`
- `rtwdemo_advisor3`

---

**Note** Example models `rtwdemo_advisor2` and `rtwdemo_advisor3` require Stateflow and Fixed-Point Designer software.

---

For more information on using the Model Advisor, see “Run Model Advisor Checks”. For more information about the checks, see “Simulink Coder Checks”.

## Design Tips for Optimizing Generated Code for Stateflow Objects

### Do Not Access Machine-Parented Data In a Graphical Function

This restriction prevents long parameter lists from appearing in the code generated for a graphical function. You can access local data that resides in the same chart as the graphical function. For more information, see “Reuse Logic Patterns by Defining Graphical Functions” (Stateflow).

### Be Explicit About the Inline Option of a Graphical Function

When you use a graphical function in a Stateflow chart, select **Inline** or **Function** for the property **Function Inline Option**. Otherwise, the code generated for a graphical function may not appear as you want. For more information, see “Specify Properties of Graphical Functions” (Stateflow).

### Avoid Using Multiple Edge-Triggered Events in Stateflow Charts

If you use more than one trigger, you generate multiple code statements to handle rising or falling edge detections. If multiple triggers are required, use function-call events instead. For more information, see “Activate a Stateflow Chart by Sending Input Events” (Stateflow).

## Combine Input Signals of a Chart Into a Single Bus Object

When you use a bus object, you reduce the number of parameters in the parameter list of a generated function. This guideline also applies to output signals of a chart. For more information, see “Define Stateflow Structures” (Stateflow).

## Use Charts with Discrete Sample Times

The code generated for discrete charts that are not inside a triggered or enabled subsystem uses integer counters to track time instead of Simulink provided time. This allows for more efficient code generation in terms of overhead and memory, as well as enabling this code for use in software-in-the-loop (SIL) and processor-in-the-loop (PIL) simulations.

## Additional Optimization Techniques

You can apply the following techniques to optimize a model for code generation:

- For Embedded Coder users, if your application uses only integer arithmetic, clear the **Support floating-point numbers** parameter in the **Software environment** section of the **Interface** pane so that the generated code does not contain floating-point data or operations. When this parameter is cleared, an error is raised if noninteger data or expressions are encountered during code generation. The error message reports the offending blocks and parameters.
- Disable the **Configuration Parameters > Code Generation > Interface > Advanced parameters > MAT-file logging** parameter. Deselecting this parameter eliminates extra code and memory usage for initializing, updating, and cleaning-up logging variables. In addition, the code generated to support MAT-file logging invokes `malloc`, which can be undesirable for your application.
- Use the Upgrade Advisor to upgrade older models (saved by prior versions or the current version) to use current features. For details, see “Model Upgrades”.
- Before building, set optimization flags for the compiler (for example, `-O2` for `gcc`, `-Ot` for the Microsoft Visual C++ compiler).
- Directly inline C/C++ S-functions into the generated code by writing a TLC file for the S-function. For more information, see “Use S-Function Target for Model or Subsystem” and see “Inline C MEX S-Functions”.
- Use a Simulink data type other than `double` when possible. The available data types are `Boolean`, signed and unsigned 8-, 16-, and 32-bit integers, and 32- and 64-bit floats (a `double` is a 64-bit float). For more information, see “About Data Types in Simulink”. For a block-by-block summary, click `showblockdatatypetable` or type the command in the Command Window.
- For tunable block parameters that you configure to store in memory in the generated code, you can match parameter data types with signal data types to eliminate unnecessary typecasts and C shifts. Where possible, store parameter values in small integer data types. See “Parameter Data Types in the Generated Code” on page 36-130.
- Remove repeated values in lookup table data.
- Use the Merge block to merge the output of signals wherever possible. This block is particularly helpful when you need to control the execution of function-call subsystems with a Stateflow chart. The following model shows an example of how to use the Merge block.

When more than one signal connected to a Merge block has a non-Auto storage class, all non-Auto signals connected to that block must *be identically labeled* and *have the same storage class*. When Merge blocks connect directly to one another, these rules apply to the signals connected to any of the Merge blocks in the group.

## Control Memory Allocation for Time Counters

The **Application lifespan (days)** parameter lets you control the allocation of memory for absolute and elapsed time counters. Such counters exist in the code for blocks that use absolute or elapsed time. For a list of such blocks, see “Absolute Time Limitations”.

The size of the time counters in generated code is 8, 16, 32, or 64 bits. The size is set automatically to the minimum that can accommodate the duration value specified by **Application lifespan (days)** given the step size specified in the Configuration Parameters **Solver** pane. To minimize the amount of RAM used by time counters, specify the smallest lifespan possible and the largest step size possible.

An application runs to its specified lifespan. It may be able to run longer. For example, running a model with a step size of one millisecond (0.001 seconds) for one day requires a 32-bit timer, which could continue running without overflow for 49 days more.

To maximize application lifespan, specify **Application lifespan (days)** as `inf`. This value allocates 64 bits (two `uint32` words) for each timer. Using 64 bits to store timing data would allow a model with a step size of 0.001 microsecond (10E-09 seconds) to run for more than 500 years, which would rarely be required. 64-bit counters do not violate the usual code generator length limitation of 32 bits because the value of a time counter does not provide the value of a signal, state, or parameter.

## Execution Profiling for Generated Code

Use code execution profiling to:

- Determine whether the generated code meets execution time requirements for real-time deployment on your target hardware.
- Identify code sections that require execution speed improvements.

The following tasks represent a general workflow that uses code execution profiling:

- 1 With the Simulink model, design and optimize your algorithm.
- 2 Configure the model for code execution profiling, and generate code.
- 3 Execute generated code on target hardware. For example, you can:
  - Run a software-in-the-loop (SIL) simulation on your development computer.
  - Run a processor-in-the-loop (PIL) simulation using a target support package or custom PIL target.
  - Run an XCP-based external mode simulation on your development computer or on custom hardware.
  - Perform real-time execution with Simulink Real-Time or a target support package.
- 4 Analyze execution speed through code execution profiling plots and reports. For example, check that the algorithm code satisfies execution time requirements for real-time deployment:
  - If the algorithm code easily meets the requirements, consider enhancing your algorithm to exploit available processing power.
  - If the code cannot be executed in real time, look for ways to reduce execution time.

Identify the tasks that require the most time. For these tasks, investigate whether trade-offs between functionality and speed are possible.

If your target is a multicore processor, distribute the execution of algorithm code across available cores.

- 5 If required, refine the model and return to step 2.

To find information about code execution profiling with Simulink products, use the following table.

## Optimize Generated Code by Combining Multiple for Constructs

This example shows how the code generator combines for loops. The generated code uses for constructs to represent a variety of modeling patterns, such as a matrix signal or Iterator blocks. Using data dependency analysis, the code generator combines for constructs to reduce static code size and runtime branching.

The benefits of optimizing for loops are:

- Reducing ROM and RAM consumption.
- Increasing execution speed.

### for Loop Modeling Patterns

In the model, `rtwdemo_forloop`, the Switch block and MATLAB Function block represent for constructs. In the In1 Block Parameters dialog box, the **Port dimensions** parameter is set to 10 .

Copyright 1994-2020 The MathWorks, Inc.

### Generate Code

The model does not contain data dependencies across the for loop iterations. Therefore, the code generator combines for loops into one loop. Open the **Simulink Coder** or **Embedded Coder** app. Then, generate and view the code.

```
Starting build procedure for: rtwdemo_forloop
Successful completion of build procedure for: rtwdemo_forloop
```

## Build Summary

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_forloop	Code generated and compiled.	Code generation information file does not exist.

1 of 1 models built (0 models already up to date)  
Build duration: 0h 0m 28.38s

The generated file, `rtwdemo_forloop.c`, contains the code for the single for loop.

```

/* Model step function */
void rtwdemo_forloop_step(void)
{
 int32_T k;

 /* MATLAB Function: '<Root>/Accum' */
 /* MATLAB Function 'Accum': '<S1>:1' */
 /* '<S1>:1:3' */
 /* '<S1>:1:4' */
 rtwdemo_forloop_Y.Out1 = 0.0;

 /* '<S1>:1:5' */
 for (k = 0; k < 10; k++) {
 /* Switch: '<Root>/Switch' incorporates:
 * Gain: '<Root>/G1'
 * Gain: '<Root>/G3'
 * Inport: '<Root>/In1'
 * Sum: '<Root>/Sum1'
 * Sum: '<Root>/Sum2'
 * UnitDelay: '<Root>/Delay'
 */
 if (3.0 * rtwdemo_forloop_U.In1[k] >= 0.0) {
 rtwdemo_forloop_DW.Delay_DSTATE[k] = rtwdemo_forloop_U.In1[k] -
 rtwdemo_forloop_DW.Delay_DSTATE[k];
 } else {
 rtwdemo_forloop_DW.Delay_DSTATE[k] = (rtwdemo_forloop_DW.Delay_DSTATE[k] -
 rtwdemo_forloop_U.In1[k]) * 5.0;
 }

 /* End of Switch: '<Root>/Switch' */

 /* MATLAB Function: '<Root>/Accum' */
 /* '<S1>:1:6' */
 rtwdemo_forloop_Y.Out1 += ((real_T)k + 1.0) +
 rtwdemo_forloop_DW.Delay_DSTATE[k];
 }
}

```

Close the model.

## Subnormal Number Execution Speed

Subnormal numbers, formerly known as denormal numbers in floating-point literature, fill the underflow gap around zero in floating-point arithmetic. Subnormal values are a special category of floating-point values that are too close to 0.0 to be represented as a normalized value. The leading significand (mantissa) of a subnormal number is zero. When adding and subtracting floating-point numbers, subnormal numbers prevent underflow.

Using subnormal numbers provides precision beyond the normal representation by using leading zeros in the significand to represent smaller values after the representation reaches the minimum exponent. As the value approaches 0.0, you trade off precision for extended range. Subnormal numbers are useful if your application requires extra range.

However, in a real-time system, using subnormal numbers can dramatically increase execution latency, resulting in excessive design margins and real-time overruns. If the simulation or generated code performs calculations that produce or consume subnormal numbers, the execution of these calculations can be up to 50 times slower than similar calculations on normal numbers. The actual simulation or code execution time for subnormal number calculations depends on your computer operating environment. Typically, for desktop processors, the execution time for subnormal number calculations is five times slower than similar calculations on normal numbers.

To minimize the possibility of execution slowdowns or overruns due to subnormal number calculation latency, do one of the following:

- In your model, manually flush to zero any incoming or computed subnormal values at inputs and key operations, such as washouts and filters. For an example, see “Flush Subnormal Numbers to Zero” on page 76-17.

To detect a subnormal value for a single precision, 32-bit floating-point number:

- 1 Find the smallest normalized number on a MATLAB host. In the Command Window, type:

```
>> SmallestNormalSingle = realmin('single')
```

In the C language, `FLT_MIN`, defined in `float.h`, is equivalent to `realmin('single')`.

- 2 Look for values in range:

$$0 < \text{fabsf}(x) < \text{SmallestNormalSingle}$$

To detect a subnormal value for a double precision, 64-bit floating-point number:

- 1 Find the smallest normalized number on a MATLAB host. In the Command Window, type:

```
>> SmallestNormalDouble = realmin('double')
```

In the C language, `DBL_MIN`, defined in `float.h`, is equivalent to `realmin('double')`.

- 2 To detect a subnormal value, look for values in this range:

$$0 < \text{fabs}(x) < \text{SmallestNormalDouble}$$

- Set the **Simulation behavior for denormal numbers** parameter to **Flush to zero (FTZ)** to emulate flush-to-zero behavior for all denormal results from arithmetic operations. For more information, see “Simulation behavior for denormal numbers”.

- On your processor, set flush-to-zero mode or, with your compiler, specify an option to disable subnormal numbers. Flush-to-zero modes treat a subnormal number as 0 when it is an input to a floating-point operation. Underflow exceptions do not occur in flush-to-zero mode.

For example, in Intel processors, the flush-to-zero (FTZ) and denormals-are-zero (DAZ) flags in the MXCSR register control floating-point calculations. For the gcc compiler on Linux, `-ffast-math` sets abrupt underflow (FTZ), flush-to-zero, while `-O3 -ffast-math` reverts to gradual underflow, using subnormal numbers.

For more information, see the IEEE Standard 754, *IEEE Standard for Floating-Point Arithmetic*.

## Simulation Time With and Without Subnormal Numbers

This model shows how using subnormal numbers increases simulation time by ~5 times.

Open the model `ex_subnormal`. The Gain is set to subnormal value `realmin('double')/2`.

To run a simulation, in the Command Window, type for `k=1:5`, `tic; sim('ex_subnormal');` `toc,end`. Observe the elapsed times for simulation using subnormals, similar to the following:

```
>> for k=1:5, tic; sim('ex_subnormal'); toc,end
Elapsed time is 9.909326 seconds.
Elapsed time is 9.617966 seconds.
Elapsed time is 9.797183 seconds.
Elapsed time is 9.702397 seconds.
Elapsed time is 9.893946 seconds.
```

Set the Gain to a number, 2, that is not a subnormal value:

```
>> set_param('ex_subnormal/Gain', 'Gain', '2');
```

To run a simulation, in the Command Window, type for `k=1:5`, `tic; sim('ex_subnormal');` `toc,end`. Observe elapsed times for simulations that do not use subnormal values, similar to the following:

```
>> for k=1:5, tic; sim('ex_subnormal'); toc,end
Elapsed time is 2.045123 seconds.
Elapsed time is 1.796598 seconds.
Elapsed time is 1.758458 seconds.
Elapsed time is 1.721721 seconds.
Elapsed time is 1.780569 seconds.
```

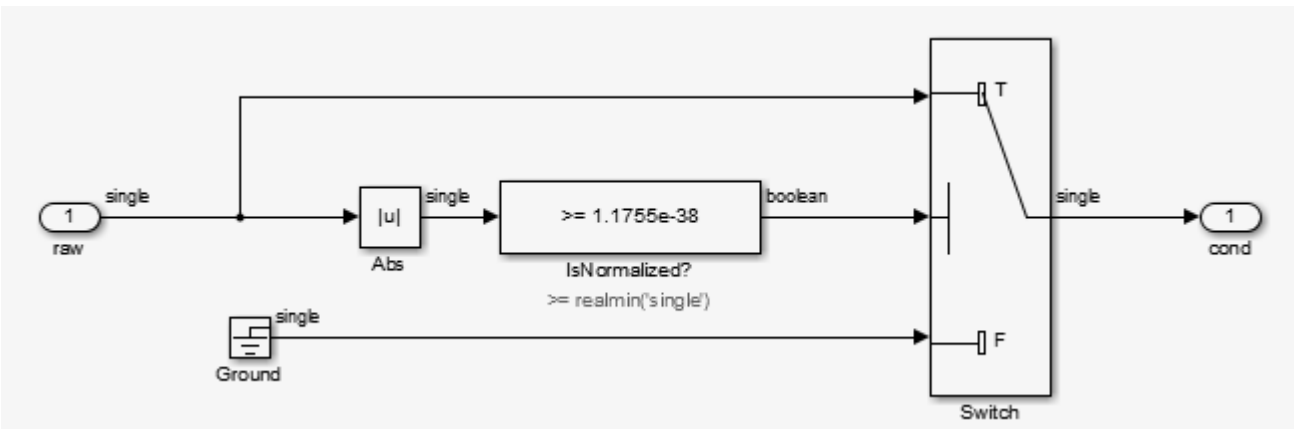

## Flush Subnormal Numbers to Zero

This example shows how to flush single precision subnormal numbers to zero.

- 1 Open the model `ex_flush_to_zero`:

- Repeating Sequence Stair generates a sequence of numbers from two raised to the power of 0 through two raised to the power of -165. The sequence approaches zero.
- ConditionRealScalar flushes subnormal single precision values that are less than `realmin('single')` to zero.

- MATLAB function block `log2` generates the base 2 logarithm of the Repeating Sequence Stair output. Specifically, `log2` generates the numbers 0 through -165.
- 2 On the **Simulation > Step Back > Configure simulation stepping** pane:
    - Select **Enable stepping back**.
    - Select **Pause simulation when time reaches** and enter 121.
  - 3 In the model window, run the simulation. The simulation pauses at  $T=121$ . The displayed values:
    - ConditionRealScalar output approaches zero.
    - Repeating Sequence Stair output approaches zero.
  - 4 Step the simulation forward to  $T=127$ . ConditionRealScalar flushes the subnormal value output from Repeating Sequence Stair to zero.

- Continue stepping the simulation forward. `ConditionRealScalar` flushes the subnormal single precision values output from `Repeating Sequence Stair` to zero. When  $T=150$ , the output of `Repeating Sequence Stair` is itself zero.

## Remove Code for Out-of-Range Floating Point to Integer Conversions

This example shows how to generate optimized code by removing code for out-of-range floating point to integer conversions. Standard C does not define the behavior of out-of-range floating point to integer conversions, while these conversions are well-defined during simulation. When you select the configuration parameter **Remove code from floating-point to integer conversions that wraps out-of-range values**, the code generator removes the wrapping code that handles out-of-range floating point to integer conversion and improves code efficiency. Without this code, there might be a mismatch between simulation and code generation results for out-of range values.

If the input values in your application are in the range of the output type, remove code for out-of-range floating-point to integer conversions. Removing this code reduces the size and increases the speed of the generated code.

### Example Model

Open the example model `rtwdemo_float_mul_for_net_slope_correction`.

```
model = 'rtwdemo_float_mul_for_net_slope_correction';
open_system(model);
```

Copyright 2014-2020 The MathWorks, Inc.

The model contains a Data Type Conversion block. To configure the model to convert the input signal from a `single` to a `uint8`, open the Data Type Conversion dialog box. For the **Output data type** parameter, select `uint8`. Alternatively, use this command-line API to set the **Output data type**:

```
set_param('rtwdemo_float_mul_for_net_slope_correction/Data Type Conversion', 'OutDataTypeStr', 'u8');
```

A `uint8` can support values from 0 to 255. If the input signal has a value outside of this range, an out-of-range conversion occurs.

### Generate Code Without Optimization

1. Create a temporary folder for the build and inspection process.

```
currentDir = pwd;
[~,cgDir] = rtwdemodir();
```

2. Open the Configuration Parameters dialog box. On the Optimization pane, clear the **Remove code from floating-point to integer conversions that wraps out-of-range values** parameter check box. Alternatively, use the command-line API to disable the optimization:

```
set_param(model, 'EfficientFloat2IntCast', 'off');
```

3. Build the model by using the `slbuild` function or by pressing **Ctrl+B**.

```
slbuild(model)

Starting build procedure for: rtwdemo_float_mul_for_net_slope_correction
Successful completion of build procedure for: rtwdemo_float_mul_for_net_slope_correction

Build Summary

Top model targets built:

Model Action Rebuild Reason
=====
rtwdemo_float_mul_for_net_slope_correction Code generated and compiled. Code generation inform
1 of 1 models built (0 models already up to date)
Build duration: 0h 0m 26.195s
```

4. Inspect the generated `rtwdemo_float_mul_for_net_slope_correction_step` step function in the `rtwdemo_float_mul_for_net_slope_correction.c`.

```
file = fullfile('rtwdemo_float_mul_for_net_slope_correction_ert_rtw','rtwdemo_float_mul_for_net_
rtwdemodbtype(file,'/* Model step function */','/* Model initialize function',1,1);

/* Model step function */
void rtwdemo_float_mul_for_net_slope_correction_step(void)
{
 real32_T tmp;

 /* DataTypeConversion: '<Root>/Data Type Conversion' incorporates:
 * Inport: '<Root>/Input'
 */
 tmp = (real32_T)fmod((real_T)(real32_T)floor((real_T)rtU.Input), 256.0);

 /* Outport: '<Root>/Output' incorporates:
 * DataTypeConversion: '<Root>/Data Type Conversion'
 */
 rtY.Output = (uint8_T)(tmp < 0.0F ? (int32_T)(uint8_T)(int32_T)-(int32_T)
 (int8_T)(uint8_T)-tmp : (int32_T)(uint8_T)tmp);
}
```

The code generator applies the `fmod` function to handle out-of-range-results. In this case, the generated code is larger but the results of the generated code match the simulation results.

### Generate Code with Optimization

1. Open the Configuration Parameters dialog box. On the Optimization pane, select the **Remove code from floating-point to integer conversions that wraps out-of-range values** parameter. Alternatively, use the command-line API to enable the optimization:

```
set_param(model, 'EfficientFloat2IntCast', 'on')
```

2. Build the model. Inspect the generated `rtwdemo_float_mul_for_net_slope_correction_step` step function with optimization in the `rtwdemo_float_mul_for_net_slope_correction.c`

```

slbuild(model);
file = fullfile('rtwdemo_float_mul_for_net_slope_correction_ert_rtw','rtwdemo_float_mul_for_net_
rtwdemodbtype(file,'/* Model step function */','/* Model initialize function',1,1);

Starting build procedure for: rtwdemo_float_mul_for_net_slope_correction
Successful completion of build procedure for: rtwdemo_float_mul_for_net_slope_correction

Build Summary

Top model targets built:

Model Action Rebuild Reason
=====
rtwdemo_float_mul_for_net_slope_correction Code generated and compiled. Generated code was out

1 of 1 models built (0 models already up to date)
Build duration: 0h 0m 21.834s

/* Model step function */
void rtwdemo_float_mul_for_net_slope_correction_step(void)
{
 /* Output: '<Root>/Output' incorporates:
 * DataTypeConversion: '<Root>/Data Type Conversion'
 * Inport: '<Root>/Input'
 */
 rtY.Output = (uint8_T)rtU.Input;
}

```

The generated code is more efficient without the protective code, but it is possible that the execution of the generated code does not produce the same results as simulation for values not in the range of 0 to 255.

### Clean Up Example Folders and Files

Close the model and remove temporary folders and files.

```

bdclose(model);
cd(currentDir);
rtwdemoclean;

```

- “Remove Code That Maps NaN to Integer Zero” on page 76-23

## Remove Code That Maps NaN to Integer Zero

This example shows how to remove code that maps NaN to integer zero. For floating point to integer conversions involving saturation, Simulink® converts NaN to integer zero during simulation. If your model contains an input value of NaN, you can specify that the code generator produce code that maps NaN to zero. Without this code, there is a mismatch between simulation and code generation results because in Standard C, every condition involving NaN evaluates to false.

If input values of NaN do not exist in your application, you can remove code that maps NaN to integer zero. Removing this code reduces the size and increases the speed of the generated code.

### Example Model

Open the example model `rtwdemo_float_mul_for_net_slope_correction` by entering the model name in the Command Window.

Copyright 2014-2020 The MathWorks, Inc.

The model contains a Data Type Conversion block. Configure the model to convert the input signal from a `single` to a `uint8`.

1. Open the Data Type Conversion dialog box. For the **Output data type** parameter, select `uint8`.
2. Select the **Saturate on integer overflow** parameter check box. Selecting this parameter specifies that an out-of-range signal value equals either the minimum or maximum value that the data type can represent.
3. Open the Configuration Parameters dialog box. Select the **Support: non-finite numbers** parameter check box. Selecting this parameter enables generating nonfinite data and operations on nonfinite data.

### Generate Code Without Optimization

1. Create a temporary folder for the build and inspection process.
2. Open the Configuration Parameters dialog box. On the Optimization pane, clear the **Remove code from floating-point to integer conversions with saturation that maps NaN to zero** parameter check box.
3. Build the model.

```
Starting build procedure for: rtwdemo_float_mul_for_net_slope_correction
Successful completion of build procedure for: rtwdemo_float_mul_for_net_slope_correction
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_float_mul_for_net_slope_correction	Code generated and compiled.	Code generation information

1 of 1 models built (0 models already up to date)  
Build duration: 0h 0m 20.627s

4. Inspect the generated `rtwdemo_float_mul_for_net_slope_correction_step` step function in the `rtwdemo_float_mul_for_net_slope_correction.c`.

```

/* Model step function */
void rtwdemo_float_mul_for_net_slope_correction_step(void)
{
 /* DataTypeConversion: '<Root>/Data Type Conversion' incorporates:
 * Inport: '<Root>/Input'
 */
 if (rtU.Input < 256.0F) {
 if (rtU.Input >= 0.0F) {
 /* Output: '<Root>/Output' */
 rtY.Output = (uint8_T)rtU.Input;
 } else {
 /* Output: '<Root>/Output' */
 rtY.Output = 0U;
 }
 } else if (rtU.Input >= 256.0F) {
 /* Output: '<Root>/Output' */
 rtY.Output = MAX_uint8_T;
 } else {
 /* Output: '<Root>/Output' */
 rtY.Output = 0U;
 }

 /* End of DataTypeConversion: '<Root>/Data Type Conversion' */
}

```

The code generator applies condition to map NaN to integer zero. In this case, the generated code is larger but the results of the generated code match with simulation results.

### Generate Code with Optimization

1. Open the Configuration Parameters dialog box.
2. On the Optimization pane, select the **Remove code from floating-point to integer conversions with saturation that maps NaN to zero** parameter.
3. Build the model.

```

Starting build procedure for: rtwdemo_float_mul_for_net_slope_correction
Successful completion of build procedure for: rtwdemo_float_mul_for_net_slope_correction

```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_float_mul_for_net_slope_correction	Code generated and compiled.	Generated code was out

1 of 1 models built (0 models already up to date)  
Build duration: 0h 0m 21.348s

4. Inspect the generated `rtwdemo_float_mul_for_net_slope_correction_step` step function with optimization in the `rtwdemo_float_mul_for_net_slope_correction.c`.

```

/* Model step function */
void rtwdemo_float_mul_for_net_slope_correction_step(void)
{
 /* DataTypeConversion: '<Root>/Data Type Conversion' incorporates:
 * Inport: '<Root>/Input'
 */
 if (rtU.Input < 256.0F) {
 if (rtU.Input >= 0.0F) {
 /* Output: '<Root>/Output' */
 rtY.Output = (uint8_T)rtU.Input;
 } else {
 /* Output: '<Root>/Output' */
 rtY.Output = 0U;
 }
 } else {
 /* Output: '<Root>/Output' */
 rtY.Output = MAX_uint8_T;
 }

 /* End of DataTypeConversion: '<Root>/Data Type Conversion' */
}

```

The generated code maps NaN to 255 and not integer zero. The generated code is more efficient without the extra code that maps NaN to integer zero. But it is possible that the execution of generated code does not produce the same results as the simulation for NaN values.

## Disable Nonfinite Checks or Inlining for Math Functions

When the code generator produces code for math functions:

- If the model option **Support non-finite numbers** is selected, nonfinite number checking is generated uniformly for math functions, without the ability to specify that nonfinite number checking should be generated for some functions, but not for others.
- By default, inlining is applied uniformly for math functions, without the ability to specify that inlining should be generated for some functions, while invocations should be generated for others.

You can use code replacement library (CRL) customization entries to:

- Selectively disable nonfinite checks for math functions. This can improve the execution speed of the generated code.
- Selectively disable inlining of math functions. This can increase code readability and decrease code size.

The functions for which these customizations are supported include the following:

- Floating-point only: `atan2`, `copysign`, `fix`, `hypot`, `log`, `log10`, `round`, `sincos`, and `sqrt`
- Floating-point and integer: `abs`, `max`, `min`, `mod`, `rem`, `saturate`, and `sign`

The general workflow for disabling nonfinite number checking and/or inlining is as follows:

- 1 If you can disable nonfinite number checking for a particular math function, or if you want to disable inlining for a particular math function and instead generate a function invocation, you can copy the following MATLAB function code into a MATLAB file with an `.m` file name extension, for example, `crl_table_customization.m`.

```
function hTable = crl_table_customization

% Create an instance of the Code Replacement Library table for controlling
% function intrinsic inlining and nonfinite support

hTable = RTW.TflTable;

% Inline - true (if function needs to be inline)
% false (if function should not be inlined)
% SNF (support nonfinite) - ENABLE (if non-finite checking should be performed)
% DISABLE (if non-finite checking should NOT be performed)
% UNSPECIFIED (Default behavior)

% registerCustomizationEntry(hTable, ...
% Priority, numInputs, key, inType, outType, Inline, SNF);

 100, 1, 'sign', 'integer', 'integer', true, 'UNSPECIFIED');

registerCustomizationEntry(hTable, ...

```

```

 100, 1, 'sqrt', 'double', 'double', true, 'UNSPECIFIED');
registerCustomizationEntry(hTable, ...
 100, 1, 'sqrt', 'single', 'single', true, 'UNSPECIFIED');

registerCustomizationEntry(hTable, ...
 100, 1, 'fix', 'double', 'double', false, 'UNSPECIFIED');
registerCustomizationEntry(hTable, ...
 100, 1, 'fix', 'single', 'single', false, 'UNSPECIFIED');

registerCustomizationEntry(hTable, ...
 100, 1, 'copy sign', 'double', 'double', true, 'UNSPECIFIED');
registerCustomizationEntry(hTable, ...
 100, 1, 'copy sign', 'single', 'single', true, 'UNSPECIFIED');

```

- 2 To reduce the size of the file, you can delete the `registerCustomizationEntry` lines for functions for which the default nonfinite number checking and inlining behavior is acceptable.
- 3 For each remaining entry,
  - Set the `Inline` argument to `true` if the function should be inlined or `false` if it should not be inlined.
  - Set the `SNF` argument to `ENABLE` if nonfinite checking should be generated, `DISABLE` if nonfinite checking should not be generated, or `UNSPECIFIED` to accept the default behavior based on the model option settings.

Save the file.

- 4 Optionally, perform a quick check of the syntactic validity of the customization table entries by invoking the table definition file at the MATLAB command line (`>> tbl = crl_table_customization`). Fix syntax errors that are flagged.
- 5 Optionally, view the customization table entries in the **Code Replacement Viewer** (`>> crviewer(crl_table_customization)`). For more information about viewing code replacement tables, see “Configure a Code Replacement Library”.
- 6 To register these changes and make them appear in the **Code replacement library** drop-down list located on the **Code Generation > Interface** pane of the Configuration Parameters dialog box, first copy the following MATLAB function code into an instance of the file `rtwTargetInfo.m`.

---

**Note** For the example below, specify the argument `'RTW'` if a GRT target is selected for your model, otherwise omit the argument.

---

```

function rtwTargetInfo(cm)
% rtwTargetInfo function to register a code replacement library (CRL)

 % Register the CRL defined in local function locCrlRegFcn
 cm.registerTargetInfo(@locCrlRegFcn);

end % End of RTWTARGETINFO

% Local function to define a CRL containing crl_table_customization
function thisCrl = locCrlRegFcn

 % Instantiate a CRL registry entry - specify 'RTW' for GRT
 thisCrl = RTW.TflRegistry('RTW');

 % Define the CRL properties
 thisCrl.Name = 'CRL Customization Example';
 thisCrl.Description = 'Example of CRL Customization';
 thisCrl.TableList = {'crl_table_customization'};
 thisCrl.TargetHWDeviceType = {'*'};

```

```
end % End of LOCCRLREGFCN
```

You can edit the **Name** field to specify the library name that appears in the **Code replacement library** drop-down list. Also, the file name in the **TableList** field must match the name of the file you created in step 1.

To register your changes, with both of the MATLAB files you created present in the MATLAB path, enter the following command at the MATLAB command line:

```
sl_refresh_customizations
```

- 7** Create or open a model that generates function code corresponding to one of the math functions for which you specified a change in nonfinite number checking or inlining behavior.
- 8** Open the Configuration Parameters dialog box, go to the **Code Generation > Interface** pane, and use the **Code replacement library** drop-down list to select the code replacement entry you registered in step 6, for example, **CRL Customization Example**.
- 9** Generate code for the model and examine the generated code to verify that the math functions are generated as expected.

## Fold Expressions

Expression folding optimizes code to minimize the computation of intermediate results at block outputs and the storage of such results in temporary buffers or variables. When expression folding is on, the code generator collapses (folds) block computations into a single expression, instead of generating separate code statements and storage declarations for each block in a model. Most Simulink® blocks support expression folding.

Expression folding improves the efficiency of generated code, frequently achieving results that compare favorably to hand-optimized code. In many cases, entire groups of model computations fold into a single, highly optimized line of code.

### Example Model

```
model = 'rtwdemo_slexprfold';
open_system(model);
```

Copyright 1994-2020 The MathWorks, Inc.

### Generate Code

Expression folding is available only when the **Signal storage reuse** parameter is set to on because expression folding operates only on expressions involving local variables. The **Signal storage reuse** and **Eliminate superfluous local variables (expression folding)** parameters are on by default. Clear the **Eliminate superfluous local variables (expression folding)** parameter or enter the following command in the MATLAB® Command Window to turn the parameter off:

```
set_param(model, 'ExpressionFolding', 'off');
```

Create a temporary folder for the build and inspection process.

```
currentDir = pwd;
[~,cgDir] = rtwdemodir();
```

Build the model.

```
slbuild(model)
```

```
Starting build procedure for: rtwdemo_slexprfold
Successful completion of build procedure for: rtwdemo_slexprfold
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_slexprfold	Code generated and compiled.	Code generation information file does not exist

1 of 1 models built (0 models already up to date)  
Build duration: 0h 0m 20.204s

With expression folding off, in the `rtwdemo_slexprfold.c` file, there are separate code statements before and in the Switch block operation.

```
cfile = fullfile(cgDir,'rtwdemo_slexprfold_grt_rtw','rtwdemo_slexprfold.c');
rtwdemodbtype(cfile,'/* Model step', '/* Model initialize', 1, 0);

/* Model step function */
void rtwdemo_slexprfold_step(void)
{
 real_T rtb_Gain;
 boolean_T rtb_LogicalOperator;
 boolean_T rtb_RelationalOperator;

 /* RelationalOperator: '<Root>/Relational Operator1' incorporates:
 * Constant: '<Root>/Constant'
 * Inport: '<Root>/In2'
 */
 rtb_LogicalOperator = (rtwdemo_slexprfold_P.UPPER >= rtwdemo_slexprfold_U.In2);

 /* RelationalOperator: '<Root>/Relational Operator' incorporates:
 * Constant: '<Root>/Constant1'
 * Inport: '<Root>/In2'
 */
 rtb_RelationalOperator = (rtwdemo_slexprfold_U.In2 <=
 rtwdemo_slexprfold_P.LOWER);

 /* Logic: '<Root>/Logical Operator' */
 rtb_LogicalOperator = (rtb_LogicalOperator || rtb_RelationalOperator);

 /* Switch: '<Root>/Switch' */
 if (rtb_LogicalOperator) {
 /* Gain: '<Root>/Gain' incorporates:
 * Inport: '<Root>/In1'
 */
 rtb_Gain = 2.0 * rtwdemo_slexprfold_U.In1;
 }
}
```

```

 /* Lookup_n-D: '<Root>/Look-Up Table' incorporates:
 * Gain: '<Root>/Gain'
 */
 rtwdemo_slexprfold_Y.Out1 = look1_binlx(rtb_Gain,
 rtwdemo_slexprfold_P.T1Break, rtwdemo_slexprfold_P.T1Data, 10U);
} else {
 /* Lookup_n-D: '<Root>/Look-Up Table' incorporates:
 * Inport: '<Root>/In3'
 * Inport: '<Root>/In4'
 * Lookup_n-D: '<Root>/Look-Up Table (2-D)'
 */
 rtwdemo_slexprfold_Y.Out1 = look2_binlx(rtwdemo_slexprfold_U.In3,
 rtwdemo_slexprfold_U.In4, rtwdemo_slexprfold_P.T2Break,
 rtwdemo_slexprfold_P.T2Break, rtwdemo_slexprfold_P.T2Data,
 rtCP_LookUpTable2D_maxIndex, 3U);
}

/* End of Switch: '<Root>/Switch' */
}

```

### Generate Code with Optimization

Enter the following command to turn expression folding on:

```
set_param(model, 'ExpressionFolding', 'on');
```

Build the model.

```
slbuild(model);
```

```
Starting build procedure for: rtwdemo_slexprfold
Successful completion of build procedure for: rtwdemo_slexprfold
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason

```
1 of 1 models built (0 models already up to date)
Build duration: 0h 0m 17.602s
```

The following is a portion of rtwdemo\_slexprfold.c. In the optimized code, the code generator folds all computations into the Switch block operation.

```
rtwdemodbtype(cfile, '/* Model step', '/* Model initialize', 1, 0);
```

```

/* Model step function */
void rtwdemo_slexprfold_step(void)
{
 /* Switch: '<Root>/Switch' incorporates:
 * Constant: '<Root>/Constant'
 * Constant: '<Root>/Constant1'
 * Inport: '<Root>/In2'
 * Logic: '<Root>/Logical Operator'
 * RelationalOperator: '<Root>/Relational Operator'

```

```
* RelationalOperator: '<Root>/Relational Operator1'
*/
if ((rtwdemo_slexprfold_P.UPPER >= rtwdemo_slexprfold_U.In2) ||
 (rtwdemo_slexprfold_U.In2 <= rtwdemo_slexprfold_P.LOWER)) {
/* Output: '<Root>/Out1' incorporates:
 * Gain: '<Root>/Gain'
 * Inport: '<Root>/In1'
 * Lookup_n-D: '<Root>/Look-Up Table'
 */
rtwdemo_slexprfold_Y.Out1 = look1_binlx(2.0 * rtwdemo_slexprfold_U.In1,
 rtwdemo_slexprfold_P.T1Break, rtwdemo_slexprfold_P.T1Data, 10U);
} else {
/* Output: '<Root>/Out1' incorporates:
 * Inport: '<Root>/In3'
 * Inport: '<Root>/In4'
 * Lookup_n-D: '<Root>/Look-Up Table (2-D)'
 */
rtwdemo_slexprfold_Y.Out1 = look2_binlx(rtwdemo_slexprfold_U.In3,
 rtwdemo_slexprfold_U.In4, rtwdemo_slexprfold_P.T2Break,
 rtwdemo_slexprfold_P.T2Break, rtwdemo_slexprfold_P.T2Data,
 rtCP_LookUpTable2D_maxIndex, 3U);
}

/* End of Switch: '<Root>/Switch' */
}
```

Close the model and code generation report.

```
bdclose(model)
rtwdemoclean;
cd(currentDir)
```

## Minimize Computations and Storage for Intermediate Results at Block Outputs

### In this section...

“Expression Folding” on page 76-35  
 “Example Model” on page 76-35  
 “Generate Code” on page 76-35  
 “Enable Optimization” on page 76-36  
 “Generate Code with Optimization” on page 76-36

### Expression Folding

*Expression folding* optimizes code to minimize the computation of intermediate results at block outputs and the storage of such results in temporary buffers or variables. When expression folding is on, the code generator collapses (folds) block computations into a single expression, instead of generating separate code statements and storage declarations for each block in the model. Most Simulink blocks support expression folding.

Expression folding improves the efficiency of generated code, frequently achieving results that compare favorably to hand-optimized code. In many cases, entire groups of model computations fold into a single, highly optimized line of code.

You can use expression folding in your own inlined S-function blocks. For more information, see “S-Functions That Support Expression Folding”.

### Example Model

### Generate Code

With expression folding off, in the `exprfld.c` file, the code generator generates this code.

```

/* Model step function */
void exprfld_step(void)
{
 /* Gain: '<Root>/Gain' incorporates:
 * Inport: '<Root>/In1'
 */
}

```

```

exprfld_B.S1 = exprfld_P.Gain_Gain * exprfld_U.i1;

/* Gain: '<Root>/Gain1' incorporates:
 * Inport: '<Root>/In2'
 */
exprfld_B.S2 = exprfld_P.Gain1_Gain * exprfld_U.i2;

/* Outport: '<Root>/Out1' incorporates:
 * Product: '<Root>/Product'
 */
exprfld_Y.Out1 = exprfld_B.S1 * exprfld_B.S2;
}

```

There are separate code statements for both Gain blocks. Before final output, these code statements compute temporary results for the Gain blocks.

## Enable Optimization

Expression folding is on by default. To see if expression folding is on for an existing model:

- 1 Expression folding is available only when the **Configuration Parameters > Signal storage reuse** parameter is selected because expression folding operates only on expressions involving local variables. Enable the **Signal storage reuse** parameter.
- 2 When you select **Signal storage reuse**, the **Enable local block outputs**, **Reuse local block outputs**, and **Eliminate superfluous local variables (expression folding)** parameters are all on by default.

## Generate Code with Optimization

With expression folding, the code generator generates a single-line output computation, as shown in the `expfld.c` file. The generated comments document the block parameters that appear in the expression.

```

/* Model step function */
void exprfld_step(void)
{
 /* Outport: '<Root>/Out1' incorporates:
 * Gain: '<Root>/Gain'
 * Gain: '<Root>/Gain1'
 * Inport: '<Root>/In1'
 * Inport: '<Root>/In2'
 * Product: '<Root>/Product'
 */
 exprfld_Y.Out1 =
 exprfld_P.Gain_Gain *
 exprfld_U.i1 *
 (exprfld_P.Gain1_Gain * exprfld_U.i2);
}

```

For an example of expression folding in the context of a more complex model, click `rtwdemo_sllexprfold`, or at the command prompt, type:

```
rtwdemo_sllexprfold
```

For more information, see “Enable and Reuse Local Block Outputs in Generated Code”

## Inline Invariant Signals

You can optimize the generated code by selecting **Inline invariant signals** on the **Optimization** pane. The generated code uses the numerical values of the invariant signals instead of their symbolic names.

An invariant signal is a block output signal that does not change during Simulink simulation. For example, the signal `S3` is an invariant signal. An *invariant signal* is not the same as an *invariant constant*. The two constants (1 and 2) and the gain value of 3 are invariant constants. To inline invariant constants, set **Default parameter behavior** to **Inlined**.

## Optimize Generated Code Using Inline Invariant Signals

This example shows how to use inline invariant signals to optimize the generated code. This optimization transforms symbolic names of invariant signals into constant values.

The `InlineInvariantSignals` optimization:

- Reduces ROM and RAM consumption.
- Improves execution speed.

### Example Model

Consider the model `rtwdemo_inline_invariant_signals`.

```
model = 'rtwdemo_inline_invariant_signals';
open_system(model);
```

Copyright 2014-2020 The MathWorks, Inc.

### Generate Code

Create a temporary folder (in your system temporary folder) for the build and inspection process.

```
currentDir = pwd;
[~,cgDir] = rtwdemodir();
```

Build the model using Simulink® Coder™.

```
slbuild(model)

Starting build procedure for: rtwdemo_inline_invariant_signals
Successful completion of build procedure for: rtwdemo_inline_invariant_signals
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_inline_invariant_signals	Code generated and compiled.	Code generation information file

1 of 1 models built (0 models already up to date)  
Build duration: 0h 0m 21.476s

View the generated code without the optimization. These lines of code are in `rtwdemo_inline_invariant_signals.c`.

```
cfile = fullfile(cgDir,'rtwdemo_inline_invariant_signals_grt_rtw',...
 'rtwdemo_inline_invariant_signals.c');
rtwdemodbtype(cfile,'/* Output and update for atomic system',...
 '/* Model output', 1, 0);

/* Output and update for atomic system: '<Root>/InlinedConstFcn' */
void rtwdemo_inline__InlinedConstFcn(int32_T rtu_In1,
 B_InlinedConstFcn_rtwdemo_inl_T *localB, const ConstB_InlinedConstFcn_rtwdem_T
 *localC)
{
 /* Product: '<S1>/Product' */
 localB->Product = rtu_In1 * localC->Sum_p;
}
```

### Enable Optimization

- 1 Open the Configuration Parameters dialog box.
- 2 On the **Optimization** pane, select **Inline Invariant Signals**.

Alternatively, you can use the command-line API to enable the optimization:

```
set_param(model, 'InlineInvariantSignals', 'on');
```

### Generate Code with Optimization

The generated code uses the numerical values of the folded constants instead of creating an additional structure (`rtwdemo_inline_invariant_ConstB`).

Build the model using Simulink Coder.

```
slbuild(model)

Starting build procedure for: rtwdemo_inline_invariant_signals
Successful completion of build procedure for: rtwdemo_inline_invariant_signals
```

### Build Summary

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_inline_invariant_signals	Code generated and compiled.	Generated code was out of date.

1 of 1 models built (0 models already up to date)  
Build duration: 0h 0m 17.679s

View the generated code with the optimization. These lines of code are in `rtwdemo_minmax.c`.

```
rtwdemodbtype(cfile,...
 /* Output and update for atomic system', /* Model output', 1, 0);

/* Output and update for atomic system: '<Root>/InlinedConstFcn' */
void rtwdemo_inline__InlinedConstFcn(int32_T rtu_In1,
 B_InlinedConstFcn_rtwdemo_inl_T *localB)
{
 /* Product: '<S1>/Product' */
 localB->Product = rtu_In1 << 5;
}
```

Close the model and code generation report.

```
bdclose(model)
rtwdemoclean;
cd(currentDir)
```

- “Inline Numeric Values of Block Parameters” on page 76-41

# Inline Numeric Values of Block Parameters

This example shows how to optimize the generated code by inlining the numeric values of block parameters. *Block parameters* include the **Gain** parameter of a Gain block and the table data and breakpoint sets of an n-D Lookup Table block.

This optimization determines whether numeric block parameters occupy global memory in the generated code. The optimization can:

- Improve execution speed.
- Reduce RAM and ROM consumption.

## Explore Example Model

Open the example model `rtwdemo_paraminline` and configure it to show the generated names of blocks.

```
load_system('rtwdemo_paraminline')
set_param('rtwdemo_paraminline','HideAutomaticNames','off')
open_system('rtwdemo_paraminline')
```

Copyright 1994-2020 The MathWorks, Inc.

The model contains blocks that have these numeric parameters:

- The **Gain** parameters of the Gain blocks
- The **Constant value** parameters of the Constant blocks
- The table data and breakpoint sets of the n-D Lookup Table blocks

The output of the block G2, and the outputs of blocks upstream of G2, change only if you tune the values of the block parameters during simulation or during code execution. When you update the model diagram, these blocks and signal lines appear magenta in color.

Several blocks use `Simulink.Parameter` objects in the base workspace to set the values of their parameters. The parameter objects all use the storage class `Auto`, which means that you can configure the generated code to inline the parameter values.

### Generate Code Without Optimization

Create a temporary folder for the build and inspection process.

```
currentDir = pwd;
[~,cgDir] = rtwdemodir();
```

Disable the optimization by setting **Configuration Parameters > Default parameter behavior** to `Tunable`.

```
set_param('rtwdemo_paraminline','DefaultParameterBehavior','Tunable')
```

Generate code from the model.

```
slbuild('rtwdemo_paraminline')
```

```
Starting build procedure for: rtwdemo_paraminline
Successful completion of build procedure for: rtwdemo_paraminline
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_paraminline	Code generated and compiled.	Code generation information file does not exist

```
1 of 1 models built (0 models already up to date)
Build duration: 0h 0m 21.528s
```

In the code generation report, view the source file `rtwdemo_paraminline_data.c`. The code defines a global structure that contains the block parameter values. Each block parameter in the model, such as a lookup table array, breakpoint set, or gain, appears as a field of the structure.

```
cfile = fullfile(...
 cgDir,'rtwdemo_paraminline_grt_rtw','rtwdemo_paraminline_data.c');
rtwdemodbtype(cfile,'/* Block parameters (default storage) */','}','', 1, 1);
```

```
/* Block parameters (default storage) */
P_rtwdemo_paraminline_T rtwdemo_paraminline_P = {
 /* Variable: MAX_LIFT
 * Referenced by: '<Root>/Constant'
 */
 10.0,

 /* Variable: SLIDER_POS
 * Referenced by: '<Root>/Constant1'
 */
 0.0,

 /* Variable: T1Break
 * Referenced by: '<Root>/1D Lookup'
 */
```

```

{ -5.0, -4.0, -3.0, -2.0, -1.0, 0.0, 1.0, 2.0, 3.0, 4.0, 5.0 },

/* Variable: T1Data
 * Referenced by: '<Root>/1D Lookup'
 */
{ -1.0, -0.99, -0.98, -0.96, -0.76, 0.0, 0.76, 0.96, 0.98, 0.99, 1.0 },

/* Variable: T2Break
 * Referenced by: '<Root>/2D Lookup'
 */
{ 1.0, 2.0, 3.0 },

/* Variable: T2Data
 * Referenced by: '<Root>/2D Lookup'
 */
{ 4.0, 16.0, 10.0, 5.0, 19.0, 18.0, 6.0, 20.0, 23.0 },

/* Expression: 2
 * Referenced by: '<Root>/G1'
 */
2.0,

/* Expression: -2
 * Referenced by: '<Root>/G2'
 */
-2.0,

/* Computed Parameter: uDLookup_maxIndex
 * Referenced by: '<Root>/2D Lookup'
 */
{ 2U, 2U }
};

```

You can tune the structure fields during code execution because they occupy global memory. However, at each step of the generated algorithm, the code must calculate the output of each block, including the outputs of the block G2 and the upstream blocks. View the algorithm in the model step function in the file `rtwdemo_paraminline.c`.

```

cfile = fullfile(cgDir, 'rtwdemo_paraminline_grt_rtw', 'rtwdemo_paraminline.c');
rtwdemodbtype(...
 cfile, /* Model step function */, /* Model initialize function */, 1, 0);

/* Model step function */
void rtwdemo_paraminline_step(void)
{
 /* Output: '<Root>/Out1' incorporates:
 * Constant: '<Root>/Constant'
 * Constant: '<Root>/Constant1'
 * Gain: '<Root>/G1'
 * Gain: '<Root>/G2'
 * Inport: '<Root>/In1'
 * Lookup_n-D: '<Root>/1D Lookup'
 * Lookup_n-D: '<Root>/2D Lookup'
 * Sum: '<Root>/Sum'
 */
 rtwdemo_paraminline_Y.Out1 = rtwdemo_paraminline_P.G1_Gain *
 rtwdemo_paraminline_U.In1 + rtwdemo_paraminline_P.G2_Gain * look2_binlx

```

```

 (rtwdemo_paraminline_P.MAX_LIFT, look1_binlx
 (rtwdemo_paraminline_P.SLIDER_POS, rtwdemo_paraminline_P.T1Break,
 rtwdemo_paraminline_P.T1Data, 10U), rtwdemo_paraminline_P.T2Break,
 rtwdemo_paraminline_P.T2Break, rtwdemo_paraminline_P.T2Data,
 rtwdemo_paraminline_P.udLookup_maxIndex, 3U);
}

```

### Generate Code with Optimization

Set **Default parameter behavior** to Inlined.

```
set_param('rtwdemo_paraminline','DefaultParameterBehavior','Inlined')
```

Generate code from the model.

```
slbuild('rtwdemo_paraminline')
```

```
Starting build procedure for: rtwdemo_paraminline
Successful completion of build procedure for: rtwdemo_paraminline
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_paraminline	Code generated and compiled.	Global variable MAX_LIFT changed.

1 of 1 models built (0 models already up to date)  
Build duration: 0h 0m 16.012s

In the code generation report, view the algorithm in the file `rtwdemo_paraminline.c`.

```

rtwdemodbtype(...
 cfile, /* Model step function */, /* Model initialize function */, 1, 0);

/* Model step function */
void rtwdemo_paraminline_step(void)
{
 /* Output: '<Root>/Out1' incorporates:
 * Gain: '<Root>/G1'
 * Inport: '<Root>/In1'
 * Sum: '<Root>/Sum'
 */
 rtwdemo_paraminline_Y.Out1 = 2.0 * rtwdemo_paraminline_U.In1 + 150.0;
}

```

The code does not allocate memory for block parameters or for parameter objects that use the storage class `Auto`. Instead, the code generator uses the parameter values from the model, and from the parameter objects, to calculate and inline the constant output of the block `G2`, `150.0`. The generator also inlines the value of the **Gain** parameter of the Gain block `G1`, `2.0`.

With the optimization, the generated code leaves out computationally expensive algorithmic code for blocks such as the lookup tables. The optimized code calculates the output of a block only if the output can change during execution. For this model, only the outputs of the Inport block `In1`, the Gain block `G1`, and the Sum block can change.

Close the model and the code generation report.

```
bdclose('rtwdemo_paraminline')
rtwdemoclean;
cd(currentDir)
```

### Preserve Block Parameter Tunability

When you set **Default parameter behavior** to **Inlined**, you can preserve block parameter tunability by creating `Simulink.Parameter` objects for individual parameters. You can configure each object to appear in the code as a tunable field of the global parameter structure or as an individual global variable. You can change parameter values during code execution and interface the generated code with your own handwritten code. For more information, see “Create Tunable Calibration Parameter in the Generated Code”.

### Inline Invariant Signals

You can select the **Inline invariant signals** code generation option (which also places constant values in the generated code) only when you set **Default parameter behavior** to **Inlined**. See “Inline Invariant Signals”.

### See Also

Default parameter behavior

## Configure Loop Unrolling Threshold

The **Loop unrolling threshold** parameter on the **Optimization** pane determines when a wide signal or parameter should be wrapped into a `for` loop and when it should be generated as a separate statement for each element of the signal. The default threshold value is 5.

For example, consider the model below:

The gain parameter of the Gain block is the vector `myGainVec`.

Assume that the loop unrolling threshold value is set to the default, 5.

If `myGainVec` is declared as

```
myGainVec = [1:10];
```

an array of 10 elements, `myGainVec_P.Gain_Gain[]`, is declared within the `Parameters_model` data structure. The size of the gain array exceeds the loop unrolling threshold. Therefore, the code generated for the Gain block iterates over the array in a `for` loop, as shown in the following code:

```
{
 int32_T i1;

 /* Gain: '<Root>/Gain' */
 for(i1=0; i1<10; i1++) {
 myGainVec_B.Gain_f[i1] = rtb_foo *
 myGainVec_P.Gain_Gain[i1];
 }
}
```

If `myGainVec` is declared as

```
myGainVec = [1:3];
```

an array of three elements, `myGainVec_P.Gain_Gain[]`, is declared within the `Parameters` data structure. The size of the gain array is below the loop unrolling threshold. The generated code consists of inline references to each element of the array, as in the code below.

```
/* Gain: '<Root>/Gain' */
myGainVec_B.Gain_f[0] = rtb_foo * myGainVec_P.Gain_Gain[0];
myGainVec_B.Gain_f[1] = rtb_foo * myGainVec_P.Gain_Gain[1];
myGainVec_B.Gain_f[2] = rtb_foo * myGainVec_P.Gain_Gain[2];
```

See “Explore Variable Names and Loop Rolling” for more information on loop rolling.

---

**Note** When a model includes Stateflow charts or MATLAB Function blocks, you can apply a set of Stateflow optimizations on the **Optimization** pane. The settings you select for the Stateflow options also apply to MATLAB Function blocks in the model. This is because the MATLAB Function blocks and Stateflow charts are built on top of the same technology and share a code base. You do not need a Stateflow license to use MATLAB Function blocks.

---

**Note** If your MATLAB Function block contains code with two nested `for`-loops:

- If the number of iterations of the inner loop is less than the threshold, the code generator first unrolls the inner loop. Subsequently, if the product of the number of iterations of the two loops is also less than the threshold, the code generator unrolls the outer loop. Otherwise the code generator produces the outer `for`-loop.
  - If the number of iterations of the inner loop is equal to or greater than the threshold, the code generator produces both `for`-loops
  - For an N-Dimensional array the code generator unrolls each contiguous loop until the product of loop iterations is less than the threshold value.
-

## Use memcpy Function to Optimize Generated Code for Vector Assignments

### In this section...

“Example Model” on page 76-48

“Generate Code” on page 76-49

“Generate Code with Optimization” on page 76-50

You can use the **Use memcpy for vector assignment** parameter to optimize generated code for vector assignments by replacing `for` loops with `memcpy` function calls. The `memcpy` function is more efficient than `for`-loop controlled element assignment for large data sets. This optimization improves execution speed.

Selecting the **Use memcpy for vector assignment** parameter enables the associated parameter **Memcpy threshold (bytes)**, which allows you to specify the minimum array size in bytes for which `memcpy` function calls should replace `for` loops in the generated code. For more information, see [Use memcpy for vector assignment and Memcpy threshold \(bytes\)](#). In considering whether to use this optimization,

- Verify that your target supports the `memcpy` function.
- Determine whether your model uses signal vector assignments (such as `Y=expression`) to move large amounts of data, for example, using the Selector block.

To apply this optimization,

- 1 Consider first generating code without this optimization and measuring its execution speed, to establish a baseline for evaluating the optimized assignment.
- 2 Select **Use memcpy for vector assignment** and examine the setting of **Memcpy threshold (bytes)**, which by default specifies 64 bytes as the minimum array size for which `memcpy` function calls replace `for` loops. Based on the array sizes used in your application's signal vector assignments, and target environment considerations that might bear on the threshold selection, accept the default or specify another array size.
- 3 Generate code, and measure its execution speed against your baseline or previous iterations. Iterate on steps 2 and 3 until you achieve an optimal result.

---

**Note** The `memcpy` optimization may not occur under certain conditions, including when other optimizations have a higher precedence than the `memcpy` optimization, or when the generated code is originating from Target Language Compiler (TLC) code, such as a TLC file associated with an S-function block.

---

---

**Note** If you are licensed for Embedded Coder software, you can use a code replacement library (CRL) to provide your own custom implementation of the `memcpy` function to be used in generated model code. For more information, see [“Memory Function Code Replacement”](#) on page 72-78.

---

### Example Model

To examine the result of using the **Use memcpy for vector assignment** parameter on the generated vector assignment code, create a model that generates signal vector assignments. For example,

- 1 Use In, Out, and Selector blocks to create the following model.

- 2 Open Model Explorer and configure the **Signal Attributes** for the In1 and In2 source blocks. For each, set **Port dimensions** to [1, 100], and set **Data type** to int32. Apply the changes and save the model. In this example, the model has the name vectorassign.
- 3 For each Selector block, set the **Index** parameter to 1:50. Set the **Input port size** parameter to 100.

## Generate Code

- 1 The **Use memcpy for vector assignment** parameter is on by default. To turn off the parameter, go to the **Optimization** pane and clear the **Use memcpy for vector assignment** parameter.
- 2 Go to the **Code Generation > Report** pane of the Configuration Parameters dialog box and select the **Create code generation report** parameter and the **Open report automatically** parameter. Then go to the **Code Generation** pane, select the **Generate code only** option, and generate code for the model. When code generation completes, the HTML code generation report is displayed.
- 3 In the HTML code generation report, click the vectorassign.c section and inspect the model step function. Notice that the vector assignments are implemented using for loops.

```

/* Model step function */
void vectorassign_step(void)
{
 int32_T i;
 for (i = 0; i < 50; i++) {
 /* Output: '<Root>/Out1' incorporates:
 * Inport: '<Root>/In1'
 */
 vectorassign_Y.Out1[i] = vectorassign_U.In1[i];

 /* Output: '<Root>/Out2' incorporates:
 * Inport: '<Root>/In2'
 */
 vectorassign_Y.Out2[i] = vectorassign_U.In2[i];
 }
}

```

## Generate Code with Optimization

- 1 Go to the **Optimization** pane of the Configuration Parameters dialog box and select the **Use memcpy for vector assignment** option. Leave the **Memcpy threshold (bytes)** option at its default setting of 64. Apply the changes and regenerate code for the model. When code generation completes, the HTML code generation report again is displayed.
- 2 In the HTML code generation report, click the `vectorassign.c` section and inspect the model output function. Notice that the vector assignments now are implemented using `memcpy` function calls.

```
/* Model step function */
void vectorassign_step(void)
{
 /* Output: '<Root>/Out1' incorporates:
 * Inport: '<Root>/In1'
 */
 memcpy(&vectorassign_Y.Out1[0], &vectorassign_U.In1[0], 50U * sizeof(real_T));

 /* Output: '<Root>/Out2' incorporates:
 * Inport: '<Root>/In2'
 */
 memcpy(&vectorassign_Y.Out2[0], &vectorassign_U.In2[0], 50U * sizeof(real_T));
}
```

## See Also

Use `memcpy` for vector assignment

## Generate Target Optimizations Within Algorithm Code

Some application components are hardware-specific and cannot simulate on a host system. For example, consider a component that includes pragmas and assembly code for enabling hardware instructions for saturate on add operations or a Fast Fourier Transform (FFT) function.

The following table lists integration options to customize generated algorithm code with target-specific optimizations.

---

**Note** Solutions marked with *EC only* require an Embedded Coder license.

---

If...	Then...	For More Information, See
You want to optimize the execution speed and memory of the model code by replacing default math functions and operators with target-specific code	<i>EC only</i> —Implement function and operator replacements by using the <b>Code Replacement Tool</b> , code replacement library (CRL) API, and <b>Code Replacement Viewer</b> to create, examine, validate, and register hardware-specific replacement tables	“Optimize Generated Code by Developing and Using Code Replacement Libraries - Simulink” on page 79-31
You want to control how code generation technology declares, stores, and represents signals, tunable parameters, block states, and data objects in generated code	<i>EC only</i> —Design (create) and apply custom storage classes	<ul style="list-style-type: none"> <li>• rtwdemo_cscpredef</li> <li>• rtwdemo_importstruct</li> <li>• rtwdemo_configinterface</li> <li>• “Organize Parameter Data into a Structure by Using Struct Storage Class” on page 33-67</li> </ul>

---

**Note** To simulate an algorithm that includes target-specific elements in a host environment, you must create code that is equivalent to the target code and can run in the host environment.

---

## Remove Code for Blocks That Have No Effect on Computational Results

This example shows how the code generator optimizes generated code by removing code that has no effect on computational results. This optimization:

- Increases execution speed.
- Reduces ROM consumption.

### Example

In the model `rtwdemo_blockreduction`, a Gain block of value `1.0` is in between Inport and Output blocks.

```
model = 'rtwdemo_blockreduction';
open_system(model);
```

Copyright 2014-2020 The MathWorks, Inc.

### Generate Code

Create a temporary folder for the build and inspection process.

```
currentDir=pwd;
[~,cgDir]=rtwdemodir();
```

Build the model.

```
set_param(model, 'BlockReduction', 'off');
slbuild(model)
```

```
Starting build procedure for: rtwdemo_blockreduction
Successful completion of build procedure for: rtwdemo_blockreduction
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_blockreduction	Code generated and compiled.	Code generation information file does not e

```
1 of 1 models built (0 models already up to date)
Build duration: 0h 0m 22.413s
```

This code is the code from `rtwdemo_blockreduction.c`.

```

cfile = fullfile(cgDir,'rtwdemo_blockreduction_ert_rtw','rtwdemo_blockreduction.c');
rtwdemodbtype(cfile, '/* Model step function */',...
 '/* Model initialize function */', 1, 0);

/* Model step function */
void rtwdemo_blockreduction_step(void)
{
 /* Outport: '<Root>/Out1' incorporates:
 * Gain: '<Root>/Gain'
 * Inport: '<Root>/In1'
 */
 rtwdemo_blockreduction_Y.Out1 = 1.0 * rtwdemo_blockreduction_U.In1;
}

```

### Enable Optimization

- 1 Open the Configuration Parameters dialog box.
- 2 If the **Block reduction** check box is not selected, select it.

Alternatively, use the command-line API to enable the optimization.

```
set_param(model, 'BlockReduction', 'on');
```

### Generate Code with Optimization

```
slbuild(model)
```

```

Starting build procedure for: rtwdemo_blockreduction
Successful completion of build procedure for: rtwdemo_blockreduction

```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_blockreduction	Code generated and compiled.	Generated code was out of date.

1 of 1 models built (0 models already up to date)

Build duration: 0h 0m 22.203s

Here is the optimized code from `rtwdemo_blockreduction.c`.

```

cfile = fullfile(cgDir,'rtwdemo_blockreduction_ert_rtw','rtwdemo_blockreduction.c');
rtwdemodbtype(cfile, '/* Model step function */',...
 '/* Model initialize function */', 1, 0);

/* Model step function */
void rtwdemo_blockreduction_step(void)
{
 /* Outport: '<Root>/Out1' incorporates:
 * Inport: '<Root>/In1'
 */
 rtwdemo_blockreduction_Y.Out1 = rtwdemo_blockreduction_U.In1;
}

```

Because multiplying the input signal by a value of 1.0 does not impact computational results, the code generator excludes the Gain block from the generated code. Close the model and clean up.

```
bdclose(model)
rtwdemoclean;
cd(currentDir)
```

### Limitations

The code generator cannot remove blocks under these circumstances:

- The block output is configured as a test point or has a storage class and the block input and output have different data types, complexities, or widths.
- The block has a nonconstant sample time, has an output connected to a root output, and has a source that has a constant sample time.
- The block has multiple sources, some of which have constant sample times and some of which have nonconstant sample times.
- The block output has a storage class and has a source that is muxed, is a virtual bus, is connected to a root output, is configured as a test point, or has a storage class.
- The block has an output that is connected to the block input.
- The block is inside an Initialize Function subsystem, Reset Function subsystem, or Terminate Function subsystem whose output is connected to an output of the subsystem.
- The block has an output that is connected to a Subsystem Output block that has an initial condition.
- The block has an output that is connected to an output of an Initialize Function subsystem, Reset Function subsystem, or Terminate Function subsystem.
- The block has an output that is connected to an output for which the parameter **Ensure output is virtual** is selected.
- The block has an output that is connected to an output that has an initial condition parameter.
- The block has an output that is connected to a Merge, a Vector Concatenate, or a Matrix Concatenate block.
- The block has tunable run-time parameters.
- The block is inside a reusable subsystem whose output is connected to a block outside the reusable subsystem.
- The block has a continuous state.
- The block has a discrete state and the states are logged or have a nonauto storage class.
- The block is an S-Function, unless you use `ssSetBlockReduction` to enable block reduction.
- The block output is configured as a test point or has a storage class and its source is a block inside a different conditional subsystem.

## Eliminate Dead Code Paths in Generated Code

This example shows how the code generator eliminates dead (that is, unused) code paths from generated code. This optimization increases execution speed and conserves ROM and RAM consumption.

### Example

In the `DeadPathElimination` model, the signal leaving the Sum block divides into two separate code paths. The top path is not a dead code path. If the user disables the Assertion block, the bottom path becomes a dead code path.

```
model = 'DeadPathElimination';
open_system(model);
```

Copyright 2019-2020 The MathWorks, Inc.

### Generate Code with an Enabled Assertion Block

- 1 For the Assertion block, open the block parameters dialog box.
- 2 Select the **Enable assertion** box. Alternatively, use the command-line API to enable the Assertion block.

```
set_param([model '/Assert1'], 'Enabled', 'on');
```

Build the model.

```
slbuild(model)
```

```
Starting build procedure for: DeadPathElimination
Successful completion of build procedure for: DeadPathElimination
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
DeadPathElimination	Code generated and compiled.	Code generation information file does not exist.

```
1 of 1 models built (0 models already up to date)
Build duration: 0h 0m 17.26s
```

Because the Assertion block is enabled, these lines of `DeadPathElimination.c` include code for the Gain and Assertion blocks.

```
cfile = fullfile('DeadPathElimination_grt_rtw','DeadPathElimination.c');
rtwdemodbtype(cfile,'/* Model step', '/* Model initialize function */', 0, 1);

void DeadPathElimination_step(void)
{
 /* Sum: '<Root>/Sum1' incorporates:
 * Constant: '<Root>/Constant1'
 * Inport: '<Root>/In1'
 */
 DeadPathElimination_Y.Out1 = DeadPathElimination_U.In1 + 1.0;

 /* Assertion: '<Root>/Assert1' incorporates:
 * Gain: '<Root>/G1'
 */
 utAssert(2.0 * DeadPathElimination_Y.Out1 != 0.0);
}
```

### Generate Code with a Disabled Assertion Block

Disable the Assertion block to generate a dead code path. The code generator detects the dead code path and eliminates it from the generated code.

- 1 For the Assertion block, open the Block Parameters dialog box.
- 2 Deselect the **Enable assertion** box.

Alternatively, use the command-line API to disable the Assertion block.

```
set_param([model '/Assert1'], 'Enabled', 'off');
```

Build the model.

```
slbuild(model)

Starting build procedure for: DeadPathElimination
Successful completion of build procedure for: DeadPathElimination

Build Summary

Top model targets built:

Model Action Rebuild Reason
=====
DeadPathElimination Code generated and compiled. Generated code was out of date.

1 of 1 models built (0 models already up to date)
Build duration: 0h 0m 16s
```

Because the Assertion block is disabled, these lines of `DeadpathElim.c` do not include code for the Gain and Assertion blocks.

```
rtwdemodbtype(cfile,'/* Model step', '/* Model initialize function */', 0, 1);

void DeadPathElimination_step(void)
```

```
{
 /* Outport: '<Root>/Out1' incorporates:
 * Constant: '<Root>/Constant1'
 * Inport: '<Root>/In1'
 * Sum: '<Root>/Sum1'
 */
 DeadPathElimination_Y.Out1 = DeadPathElimination_U.In1 + 1.0;
}
```

### **Close the Model and Clean Up**

```
bdclose(model)
rtwdemoclean;
```

For another example of how the code generator eliminates dead code paths in the generated code, see `rtwdemo_deadpath`.

## Floating-Point Multiplication to Handle a Net Slope Correction

This example shows how to use floating-point multiplication to handle a net slope correction. When converting floating-point data types to fixed-point data types in the generated code, a net slope correction is one method of scaling fixed-point data types. Scaling the fixed-point data types avoids overflow conditions and minimizes quantization errors.

For processors that support efficient multiplication, using floating-point multiplication to handle a net slope correction improves code efficiency. If the net slope correction has a value that is not a power of two, using division improves precision.

**Note:** This example requires a Fixed-Point Designer™ license.

### Example

In the model `rtwdemo_float_mul_for_net_slope_correction`, a Convert block converts an input signal from a floating-point data type to a fixed-point data type. The net slope correction has a value of 3.

```
model = 'rtwdemo_float_mul_for_net_slope_correction';
open_system(model);
```

Copyright 2014-2020 The MathWorks, Inc.

### Generate Code

Create a temporary folder for the build and inspection process.

```
currentDir = pwd;
[~,cgDir] = rtwdemodir();
```

Build the model.

```
slbuild(model)
```

```
Starting build procedure for: rtwdemo_float_mul_for_net_slope_correction
Successful completion of build procedure for: rtwdemo_float_mul_for_net_slope_correction
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_float_mul_for_net_slope_correction	Code generated and compiled.	Code generation informa

```
1 of 1 models built (0 models already up to date)
Build duration: 0h 0m 21.274s
```

In these lines of `rtwdemo_float_mul_for_net_slope_correction.c` code, the code generator divides the input signal by  $3.0F$ .

```
cfile = fullfile(cgDir, 'rtwdemo_float_mul_for_net_slope_correction_ert_rtw', ...
 'rtwdemo_float_mul_for_net_slope_correction.c');
rtwdemodbtype(cfile, /* Model step', /* Model initialize', 1, 0);

/* Model step function */
void rtwdemo_float_mul_for_net_slope_correction_step(void)
{
 /* Output: '<Root>/Output' incorporates:
 * DataTypeConversion: '<Root>/Data Type Conversion'
 * Inport: '<Root>/Input'
 */
 rtY.Output = (int16_T)(real32_T)floor((real_T)(rtU.Input / 3.0F));
}
```

### Enable Optimization

- 1 Open the Configuration Parameters dialog box.
- 2 On the **Math and Data Types** pane, select **Use floating-point multiplication to handle net slope corrections**. This optimization is on by default.

Alternatively, you can use the command-line API to enable the optimization.

```
set_param(model, 'UseFloatMulNetSlope', 'on');
```

### Generate Code with Optimization

```
slbuild(model)

Starting build procedure for: rtwdemo_float_mul_for_net_slope_correction
Successful completion of build procedure for: rtwdemo_float_mul_for_net_slope_correction

## Use Conditional Input Branch Execution

This example shows how to optimize the generated code for a model that contains Switch and Multiport Switch blocks. When you select the model configuration parameter **Conditional input branch execution**, Simulink® executes only blocks that compute the control input and data input that the control input selects. This optimization improves execution speed.

### Example Model

In this example, switch paths are conditionally executed. If Switch1 control input is true, Switch1 executes blocks grouped in the Switch1:Path1 branch. If Switch1 control input is false, Switch1 executes blocks grouped in the Switch1:Path2 branch. If Switch1 executes blocks in the Switch1:Path2 branch and Switch2 control input is true, Switch2 executes blocks in the Switch2:Path1 branch. If Switch2 control input is false, Switch2 executes blocks in the Switch2:Path2 branch. The pseudo code shows this logic.

```
model='ConditionalInput';
open_system(model);
```

Copyright 1994-2020 The MathWorks, Inc.

### Generate Code

The **Conditional input branch execution** parameter is on by default. Enter the following command-line API to turn off the parameter.

```
set_param(model, 'ConditionallyExecuteInputs', 'off');
```

**Build the model**

```
slbuild(model)
```

```
Starting build procedure for: ConditionalInput
Successful completion of build procedure for: ConditionalInput
```

```
Build Summary
```

```
Top model targets built:
```

Model	Action	Rebuild Reason
ConditionalInput	Code generated and compiled.	Code generation information file does not exist.

```
1 of 1 models built (0 models already up to date)
Build duration: 0h 0m 19.121s
```

View the generated code without the optimization. These lines of code are in the `ConditionalInput.c` file.

```
cfile = fullfile('ConditionalInput_grt_rtw','ConditionalInput.c');
rtwdemodbtype(cfile,'/* Model step', '/* Model initialize', 1, 0);

/* Model step function */
void ConditionalInput_step(void)
{
 /* Switch: '<Root>/ Switch2' incorporates:
 * Constant: '<Root>/C_5'
 * Inport: '<Root>/input'
 * RelationalOperator: '<Root>/Relational Operator'
 */
 if (ConditionalInput_U.input >= -5.0) {
 /* Switch: '<Root>/Switch1' incorporates:
 * Gain: '<Root>/ G3'
 */
 ConditionalInput_Y.output = 3.0 * ConditionalInput_U.input;
 } else {
 /* Switch: '<Root>/Switch1' incorporates:
 * Sum: '<Root>/ Sum'
 */
 ConditionalInput_Y.output = ConditionalInput_U.input - 10.0;
 }

 /* End of Switch: '<Root>/ Switch2' */

 /* Switch: '<Root>/Switch1' incorporates:
 * Constant: '<Root>/C5'
 * Inport: '<Root>/input'
 * RelationalOperator: '<Root>/Relational Operator1'
 */
 if (ConditionalInput_U.input >= 5.0) {
 /* Switch: '<Root>/Switch1' incorporates:
 * Constant: '<Root>/ C10'
 * Outport: '<Root>/output'
 * Sum: '<Root>/ Sum1'
 */
 }
}
```

```

 ConditionalInput_Y.output = ConditionalInput_U.input + 10.0;
}

/* End of Switch: '<Root>/Switch1' */
}

```

The generated code contains an `if-else` statement for the `Switch2` block and an `if` statement for the `Switch1` block. Therefore, the generated code for `Switch1:Path2` executes even if the `if` statement for `Switch1:Path1` evaluates to true.

### Enable Optimization

- 1 Open the Configuration Parameters dialog box.
- 2 Select the **Conditional input branch execution** parameter. Alternatively, you can use the command-line API to enable the optimization.

```
set_param(model, 'ConditionallyExecuteInputs', 'on');
```

### Generate Code with Optimization

```

slbuild(model)
cfile = fullfile('ConditionalInput_grt_rtw', 'ConditionalInput.c');
rtwdemodbtype(cfile, '/* Model step', '/* Model initialize', 1, 0);

```

```

Starting build procedure for: ConditionalInput
Successful completion of build procedure for: ConditionalInput

```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
ConditionalInput	Code generated and compiled.	Generated code was out of date.

```

1 of 1 models built (0 models already up to date)
Build duration: 0h 0m 22.094s

```

```

/* Model step function */
void ConditionalInput_step(void)
{
 /* Switch: '<Root>/Switch1' incorporates:
 * Constant: '<Root>/C5'
 * Constant: '<Root>/C_5'
 * Inport: '<Root>/input'
 * RelationalOperator: '<Root>/Relational Operator'
 * RelationalOperator: '<Root>/Relational Operator1'
 * Switch: '<Root>/ Switch2'
 */
 if (ConditionalInput_U.input >= 5.0) {
 /* Output: '<Root>/output' incorporates:
 * Constant: '<Root>/ C10'
 * Sum: '<Root>/ Sum1'
 */
 ConditionalInput_Y.output = ConditionalInput_U.input + 10.0;
 } else if (ConditionalInput_U.input >= -5.0) {
 /* Switch: '<Root>/ Switch2' incorporates:
 * Gain: '<Root>/ G3'

```

```

 * Output: '<Root>/output'
 */
 ConditionalInput_Y.output = 3.0 * ConditionalInput_U.input;
} else {
 /* Output: '<Root>/output' incorporates:
 * Sum: '<Root>/ Sum'
 * Switch: '<Root>/ Switch2'
 */
 ConditionalInput_Y.output = ConditionalInput_U.input - 10.0;
}

/* End of Switch: '<Root>/Switch1' */
}

```

The generated code contains one `if` statement. The generated code for `Switch1:Path2` only executes if the `if` statement evaluates to false.

### Close Model and Code Generation Report

```

bdclose(model)
rtwdemoclean;

```

## Optimize Generated Code for Complex Signals

This example shows how Simulink® Coder™ handles complex signals efficiently. To view the data types of the signals, update the model. On the **Debug** menu, select **Update Model**. Complex signals are represented as structures in generated code. Simulink Coder performs various optimizations on these structures. For example:

- Expression Folding: Gain and Sum operations on the complex signal are folded into a single expression.
- For-loop fusion: Two separate for-loops, one for the complex signal and one for noncomplex signal, are combined into a single for-loop.
- Inlined block parameters: The value of Gain block "pi" is inlined in the expression of the complex Gain-Sum.

Because of optimizations such as these, the code generated for complex and noncomplex signals is equally efficient.

### Example Model

```
model='rtwdemo_complex';
open_system(model);
```

## Speed Up Linear Algebra in Code Generated from a MATLAB Function Block

To improve the execution speed of code generated for certain linear algebra functions in a MATLAB Function block, specify that the code generator produce LAPACK calls. LAPACK is a software library for numerical linear algebra. The code generator uses the LAPACKE C interface to LAPACK. If you specify that you want to generate LAPACK calls, and the input arrays for the linear algebra functions meet certain criteria, the code generator produces the LAPACK calls. Otherwise, the code generator produces code for the linear algebra functions.

The code generator uses the LAPACK library that you specify. Specify a LAPACK library that is optimized for your execution environment. See [www.netlib.org/lapack/faq.html#\\_what\\_and\\_where\\_are\\_the\\_lapack\\_vendors\\_implementations](http://www.netlib.org/lapack/faq.html#_what_and_where_are_the_lapack_vendors_implementations).

### Specify LAPACK Library

To generate LAPACK calls, you must have access to a LAPACK callback class. A LAPACK callback class specifies the LAPACK library and LAPACKE header file for the LAPACK calls. To indicate that you want to generate LAPACK calls and that you want to use a specific LAPACK library, specify the name of the LAPACK callback class. In the Configuration Parameters dialog box, set **Custom LAPACK library callback** to the name of the callback class, for example, useMyLAPACK.

### Write LAPACK Callback Class

To specify the locations of a particular LAPACK library and LAPACKE header file, write a LAPACK callback class. Share the callback class with others who want to use this LAPACK library for LAPACK calls in generated code.

The callback class must derive from the abstract class `coder.LAPACKCallback`. Use this example callback class as a template.

```
classdef useMyLAPACK < coder.LAPACKCallback
 methods (Static)
 function hn = getHeaderFilename()
 hn = 'mylapacke_custom.h';
 end
 function updateBuildInfo(buildInfo, buildctx)
 buildInfo.addIncludePaths(fullfile(pwd,'include'));
 libName = 'mylapack';
 libPath = fullfile(pwd,'lib');
 [~,linkLibExt] = buildctx.getStdLibInfo();
 buildInfo.addLinkObjects([libName linkLibExt], libPath, ...
 '', true, true);
 buildInfo.addDefines('HAVE_LAPACK_CONFIG_H');
 buildInfo.addDefines('LAPACK_COMPLEX_STRUCTURE');
 buildInfo.addDefines('LAPACK_ILP64');
 end
 end
end
```

You must provide the `getHeaderFilename` and `updateBuildInfo` methods. The `getHeaderFilename` method returns the LAPACKE header file name. In the example callback class, replace `mylapacke_custom.h` with the name of your LAPACKE header file. The `updateBuildInfo`

method provides the information required for the build process to link to the LAPACK library. Use code like the code in the template to specify the location of header files and the full path name of the LAPACK library. In the example callback class, replace `mylapack` with the name of your LAPACK library.

If your compiler supports only complex data types that are represented as structures, include these lines in the `updateBuildInfo` method.

```
buildInfo.addDefines('HAVE_LAPACK_CONFIG_H');
buildInfo.addDefines('LAPACK_COMPLEX_STRUCTURE');
```

You must specify the integer type that your LAPACK library uses. Not specifying this integer type can result in incorrect behaviors or crashes. Do one of the following:

- Include these lines in the `updateBuildInfo` method.

```
buildInfo.addDefines('HAVE_LAPACK_CONFIG_H');
buildInfo.addDefines('LAPACK_ILP64');
```

- Alternatively, you can directly specify the integer type that your LAPACK library uses. For example, if the integer type is `long long`, include this line in the `updateBuildInfo` method.

```
buildInfo.addDefines('lapack_int=long long');
```

## Generate LAPACK Calls by Specifying a LAPACK Callback Class

This example shows how to generate code that calls LAPACK functions in a specific LAPACK library. For this example, assume that the LAPACK callback class `useMyLAPACK` specifies the LAPACK library that you want.

- 1 Create a Simulink model.
- 2 Add a MATLAB Function block to the model.
- 3 In the MATLAB Function block, add code that calls a linear algebra function. For example, add the function `mysvd` that calls the MATLAB function `svd`.

```
function s = mysvd(A)
 %#codegen
 s = svd(A);
end
```

- 4 Add a Constant block to the left of the MATLAB Function block. Set the value to `zeros(500)`.
- 5 Add an Outport block to the right of the MATLAB Function block.
- 6 Connect the blocks.

- 7 Set the **Configuration Parameters > Code Generation > Advanced parameters > Custom LAPACK library callback** parameter to `useMyLAPACK`.

The callback class must be on the MATLAB path.

- 8 Build the model.

If the input to `mysvd` is large enough, the code generator produces a LAPACK call for `svd`. An example of a call to the LAPACK library function for `svd` is:

```
info_t = LAPACKE_dgesvd(...
 LAPACK_COL_MAJOR, 'N', 'N', (lapack_int)500, ...
 (lapack_int)500, &A[0], (lapack_int)500, &S[0], ...
 NULL, (lapack_int)1, NULL, (lapack_int)1, &superb[0]);
```

## Locate LAPACK Library in Execution Environment

The LAPACK library must be available in your execution environment. If your LAPACK library is shared, use environment variables or linker options to specify the location of the LAPACK library.

- On a Windows platform, modify the `PATH` environment variable.
- On a Linux platform, modify the `LD_LIBRARY_PATH` environment variable or use the `rpath` linker option.
- On a macOS platform, modify the `DYLD_LIBRARY_PATH` environment variable or use the `rpath` linker option.

To specify the `rpath` linker option, you can use the build information `addLinkFlags` method in the `updateBuildInfo` method of your `coder.LAPACKCallback` class. For example, for a GCC compiler:

```
buildInfo.addLinkFlags(sprintf('-Wl,-rpath,"%s"', libPath));
```

## Speed Up Matrix Operations in Code Generated from a MATLAB Function Block

To improve the execution speed of code generated for certain low-level vector and matrix operations (such as matrix multiplication) in a MATLAB Function block, specify that you want the code generator to produce BLAS calls. BLAS is a software library for low-level vector and matrix computations that has several highly optimized machine-specific implementations. The code generator uses the CBLAS C interface to BLAS. If you specify that you want to generate BLAS calls, and the input arrays for the matrix functions meet certain criteria, the code generator produces the BLAS calls. Otherwise, the code generator produces code for the matrix functions.

The code generator uses the BLAS library that you specify. Specify a BLAS library that is optimized for your execution environment.

### Specify BLAS Library

To produce BLAS calls in generated code, you must have access to a BLAS callback class. A BLAS callback class specifies the BLAS library, the CBLAS header file, certain C data types the particular CBLAS interface uses and the compiler and linker options for the build process.

To indicate that you want to generate BLAS calls and use a specific BLAS library, specify the name of the BLAS callback class. In the Configuration Parameters dialog box, set **Custom BLAS library callback** to the name of the callback class.

### Write BLAS Callback Class

To generate calls to a specific BLAS library in the generated code, write a BLAS callback class. Share the callback class with others who want to use this BLAS library for BLAS calls in standalone code.

The callback class must derive from the abstract class `coder.BLASCallback`. This example is an implementation of the callback class `mklcallback` for integration with the Intel MKL BLAS library on a Windows platform.

```
classdef mklcallback < coder.BLASCallback
 methods (Static)
 function updateBuildInfo(buildInfo, ~)
 libPath = fullfile(pwd, 'mkl', 'WIN', 'lib', 'intel64');
 libPriority = '';
 libPreCompiled = true;
 libLinkOnly = true;
 libs = {'mkl_intel_ilp64.lib' 'mkl_intel_thread.lib' 'mkl_core.lib'};
 buildInfo.addLinkObjects(libs, libPath, libPriority, libPreCompiled, ...
 libLinkOnly);
 buildInfo.addLinkObjects('libiomp5md.lib', fullfile(matlabroot, 'bin', ...
 'win64'), libPriority, libPreCompiled, libLinkOnly);
 buildInfo.addIncludePaths(fullfile(pwd, 'mkl', 'WIN', 'include'));
 buildInfo.addDefines('-DMKL_ILP64');
 end
 function headerName = getHeaderFilename()
 headerName = 'mkl_cblas.h';
 end
 function intTypeName = getBLASIntTypeName()
 intTypeName = 'MKL_INT';
 end
 end
end
```

```

 end
 end
end

```

You must provide the `getHeaderFilename`, `getBLASIntTypeName`, and `updateBuildInfo` methods. The `getHeaderFilename` method returns the CBLAS header file name. If you are using a different BLAS library, replace `mkL_cblas.h` with the name of your CBLAS header file. The `getBLASIntTypeName` method returns the name of the integer data type that your CBLAS interface uses. If you are using a different BLAS library, replace `MKL_INT` with the name of the integer data type specific to your CBLAS interface. The `updateBuildInfo` method provides the information required for the build process to link to the BLAS library. Use code that is like the code in the example callback class to specify the location of header file, the full path name of the BLAS library, and the compiler and linker options. If you use the Intel MKL BLAS library, use the link line advisor to see which libraries and compiler options are recommended for your use case.

There are three other methods that are already implemented in `coder.BLASCallback`. These methods are `getBLASDoubleComplexTypeName`, `getBLASSingleComplexTypeName`, and `useEnumNameRatherThanTypedef`. By default, your callback class inherits these implementations from `coder.BLASCallback`. In certain situations, you must override these methods with your own definitions when you define your callback class.

The `getBLASDoubleComplexTypeName` method returns the type used for double-precision complex variables in the generated code. If your BLAS library takes a type other than `double*` and `void*` for double-precision complex array arguments, include this method in your callback class definition.

```

function doubleComplexTypeName = getBLASDoubleComplexTypeName()
doubleComplexTypeName = 'my_double_complex_type';
end

```

Replace `my_double_complex_type` with the type that your BLAS library takes for double-precision complex array arguments.

The `getBLASSingleComplexTypeName` method returns the type used for single-precision complex variables in the generated code. If your BLAS library takes a type other than `float*` and `void*` for single-precision complex array arguments, include this method in your callback class definition.

```

function singleComplexTypeName = getBLASSingleComplexTypeName()
doubleComplexTypeName = 'my_single_complex_type';
end

```

Replace `my_single_complex_type` with the type that your BLAS library takes for single-precision complex array arguments.

The `useEnumNameRatherThanTypedef` method returns `false` by default. If types for enumerations in your BLAS library include the `enum` keyword, redefine this method to return `true` in your callback class definition.

```

function p = useEnumNameRatherThanTypedef()
p = true;
end

```

An excerpt from generated C source code that includes the `enum` keyword is:

```

enum CBLAS_SIDE t;
enum CBLAS_UPLO b_t;
double temp;

```

```
enum CBLAS_TRANSPOSE c_t;
enum CBLAS_DIAG d_t;
```

## Generate BLAS Calls by Specifying a BLAS Callback Class

This example shows how to generate code that calls BLAS functions in a specific BLAS library. The BLAS callback class `useMyBLAS` specifies the BLAS library that you want to use in this example.

- 1 Create a Simulink model.
- 2 Add a MATLAB Function block to the model.
- 3 In the MATLAB Function block, add code that calls a function for a basic matrix operation. For example, add the function `myMultiply` that multiplies two matrices A and B.

```
function C = myMultiply(A,B) %#codegen
C = A*B;
end
```

- 4 Add two Constant blocks to the left of the MATLAB Function block. Set their values to `zeros(1000)`.
- 5 Add an Output block to the right of the MATLAB Function block.
- 6 Connect the blocks.

- 7 In the Configuration Parameters dialog box, set **Custom BLAS library callback** to the name of the callback class `useMyBLAS`.

The callback class must be on the MATLAB path.

- 8 Build the model.

If A and B are large enough, the code generator produces a BLAS call for the matrix multiplication function.

## Locate BLAS Library in Execution Environment

The BLAS library must be available in your execution environment. If your BLAS library is shared, use environment variables or linker options to specify the location of the BLAS library.

- On a Windows platform, modify the `PATH` environment variable.
- On a Linux platform, modify the `LD_LIBRARY_PATH` environment variable or use the `rpath` linker option.
- On a macOS platform, modify the `DYLD_LIBRARY_PATH` environment variable or use the `rpath` linker option.

To specify the `rpath` linker option, use the build information `addLinkFlags` method in the `updateBuildInfo` method of your BLAS callback class. For example, for a GCC compiler:

```
buildInfo.addLinkFlags(sprintf('-Wl,-rpath,"%s"', libPath));
```

## Usage Notes and Limitations for OpenBLAS Library

If you generate code that includes calls to the OpenBLAS library functions, follow these guidelines and restrictions:

- If you generate C++ code that includes calls to OpenBLAS library functions, compiling it with the `-pedantic` option produces warnings. To disable the `-pedantic` compiler option, include these lines in the `updateBuildInfo` method:

```
if ctx.getTargetLang() == 'C++'
 buildInfo.addCompileFlags('-Wno-pedantic');
end
```

- OpenBLAS does not support the C89/C90 standard.

## Speed Up Fast Fourier Transforms in Code Generated from a MATLAB Function Block

This example shows how to generate calls to a specific installed FFTW library. For more information about FFTW, see [www.fftw.org](http://www.fftw.org).

When you simulate a model that includes a MATLAB Function block that calls MATLAB fast Fourier transform (FFT) functions, the simulation software uses the library that MATLAB uses for FFT algorithms. If you generate C/C++ code for this model, by default, the code generator produces code for the FFT algorithms instead of producing FFT library calls. To increase the speed of fast Fourier transforms in generated code, specify that the code generator produce calls to a specific installed FFTW library.

The code generator produces FFTW library calls when all of these conditions are true:

- A MATLAB Function block calls one of these MATLAB functions: `fft`, `fft2`, `fftn`, `ifft`, `ifft2`, or `ifftn`.
- You generate C/C++ code from a model that includes the MATLAB Function block.
- You have access to an FFTW library installation, version 3.2 or later.
- You specify the FFTW library installation in an FFT library callback class that derives from `coder.fftw.StandaloneFFTW3Interface`.
- You set the **Custom FFT library callback** configuration parameter to the name of the callback class.

### Install an FFTW Library

If you do not have access to an installed FFTW library, version 3.2 or later, then you must install one.

For a Linux platform or a Mac platform, consider using a package manager to install the FFTW library.

For a Windows platform, in addition to `.dll` files, you must have `.lib` import libraries, as described in the Windows installation notes on the FFTW website.

See the installation instructions for your platform on the FFTW website.

### Write FFT Callback Class

To specify your installation of the FFTW library, write an FFT callback class. Share the callback class with others who want to use this FFTW library for FFTW calls.

The callback class must derive from the abstract class `coder.fftw.StandaloneFFTW3Interface`. Use this example callback class as a template.

```
% copyright 2017 The MathWorks, Inc.
classdef useMyFFTW < coder.fftw.StandaloneFFTW3Interface
 methods (Static)
 function th = getNumThreads
 coder.inline('always');
 th = int32(coder.const(1));
 end
 end
end
```

```

function updateBuildInfo(buildInfo, ctx)
 fftwLocation = '/usr/lib/fftw';
 includePath = fullfile(fftwLocation, 'include');
 buildInfo.addIncludePaths(includePath);
 libPath = fullfile(fftwLocation, 'lib');

 %Double
 libName1 = 'libfftw3-3';
 [~, libExt] = ctx.getStdLibInfo();
 libName1 = [libName1 libExt];
 addLinkObjects(buildInfo, libName1, libPath, 1000, true, true);

 %Single
 libName2 = 'libfftw3f-3';
 [~, libExt] = ctx.getStdLibInfo();
 libName2 = [libName2 libExt];
 addLinkObjects(buildInfo, libName2, libPath, 1000, true, true);
end
end

```

Implement the `updateBuildInfo` and `getNumThreads` methods. In the `updateBuildInfo` method, set `fftwLocation` to the full path for your installation of the library. Set `includePath` to the full path of the folder that contains `fftw3.h`. Set `libPath` to the full path of the folder that contains the library files. If your FFTW installation uses multiple threads, modify the `getNumThreads` method to return the number of threads that you want to use.

Optionally, you can implement these methods:

- `getPlanMethod` to specify the FFTW planning method. See `coder.fftw.StandaloneFFTW3Interface`.
- `lock` and `unlock` to synchronize multithreaded access to the FFTW planning process. See “Synchronize Multithreaded FFTW Planning in Code Generated from a MATLAB Function Block”.

## Generate FFTW Calls by Specifying an FFT Callback Class

- 1 Create a Simulink model.
- 2 Add a MATLAB Function block to the model.
- 3 In the MATLAB Function block, add code that calls a MATLAB FFT function. For example, add the function `myfft` that calls the MATLAB function `fft`.

```

function y = myfft()
 t = 0:1/50:10-1/50;
 x = sin(2*pi*15*t) + sin(2*pi*20*t);
 y = fft(x);
end

```

- 4 Connect the blocks.

- 5 Indicate that the code generator produce calls to the FFTW library specified in the FFT library callback class `useMyFFTW`. In the Configuration Parameters dialog box, set **Custom FFT library callback** to `useMyFFTW`.

The callback class must be on the MATLAB path.

## 6 Build the model.

### Locate FFTW Library in Execution Environment

The FFTW library must be available in your execution environment. If the FFTW library is shared, use environment variables or linker options to specify the location of the library.

- On a Windows platform, modify the PATH environment variable.
- On a Linux platform, modify the LD\_LIBRARY\_PATH environment variable or use the rpath linker option.
- On a macOS platform, modify the DYLD\_LIBRARY\_PATH environment variable or use the rpath linker option.

To specify the rpath linker option, you can use the build information `addLinkFlags` method in the `updateBuildInfo` method of your `coder.fftw.StandaloneFFTW3Interface` class. For example, for a GCC compiler:

```
buildInfo.addLinkFlags(sprintf('-Wl,-rpath,"%s"',libPath));
```

### See Also

## Synchronize Multithreaded FFTW Planning in Code Generated from a MATLAB Function Block

This example shows how to generate code that synchronizes multithreaded access to the FFTW planning process for FFTW library calls in code generated from a MATLAB Function block.

The code generator produces FFTW library calls when all of these conditions are true:

- A MATLAB Function block calls one of these functions: `fft`, `fft2`, `fftn`, `ifft`, `ifft2`, or `ifftn`.
- You generate C/C++ code for a model that includes the MATLAB Function block.
- You have access to an FFTW library installation, version 3.2 or later.
- You specify the FFTW library installation in an FFT library callback class that derives from `coder.fftw.StandaloneFFTW3Interface`.
- You set the **Custom FFT library callback** configuration parameter to the name of the callback class.

If you integrate the code that contains the FFTW calls with external code that runs on multiple threads, then you must prevent concurrent access to the FFTW planning process. In your FFT library callback class, implement the `lock` and `unlock` methods. You must also provide C code that manages a lock or mutex. Many libraries, such as OpenMP, pthreads, and the C++ standard library (C++ 11 and later), provide locks. This example shows how to implement the `lock` and `unlock` methods and provide supporting C code. To manage a lock, this example uses the OpenMP library.

### Prerequisites

Before you start, for the basic workflow for generating FFTW library calls for fast Fourier transforms in a MATLAB Function block, see “Speed Up Fast Fourier Transforms in Code Generated from a MATLAB Function Block”.

You must have:

- Access to an installed FFTW library.
- A compiler that supports the OpenMP library. To use a different library, such as pthreads, modify the supporting C code accordingly.

### Create a Model with a MATLAB Function Block That Calls an FFT Function

- 1 Create a Simulink model and add a MATLAB Function block to it.
- 2 Add this code to the MATLAB Function block.

```
function y = mycustomfft()

t = 0:1/50:10-1/50;
x = sin(2*pi*15*t) + sin(2*pi*20*t);
y = fft(x);
for k = 1:100
 y = y + ifft(x+k);
end
```

- 3 Add an `outport` block and connect it to the MATLAB Function block.

## Write Supporting C Code

Write C functions that initialize, set, and unset a lock. This example uses the OpenMP library to manage the lock. For a different library, modify the code accordingly.

- Create a file `mylock.c` that contains this C code:

```
#include "mylock.h"
#include "omp.h"

static omp_nest_lock_t lockVar;

void mylock_initialize(void)
{
 omp_init_nest_lock(&lockVar);
}

void mylock(void)
{
 omp_set_nest_lock(&lockVar);
}

void myunlock(void)
{
 omp_unset_nest_lock(&lockVar);
}
```

- Create a header file `mylock.h` that contains:

```
#ifndef MYLOCK_H
#define MYLOCK_H

void mylock_initialize(void);
void mylock(void);
void myunlock(void);

#endif
```

## Create an FFT Library Callback Class

Write an FFT callback class `myfftc` that:

- Specifies the FFTW library.
- Implements `lock` and `unlock` methods that call the supporting C code to control access to the FFTW planning.

Use this class as a template. Replace `fftwLocation` with the location of your FFTW library installation.

```
classdef myfftwcb < coder.fftw.StandaloneFFTW3Interface

 methods (Static)
 function th = getNumThreads
 coder.inline('always');
 th = int32(coder.const(1));
 end

 function lock()
 coder.cinclude('mylock.h', 'InAllSourceFiles', true);
 coder.inline('always');
 coder.ceval('mylock');
 end

 function unlock()
 coder.cinclude('mylock.h', 'InAllSourceFiles', true);
 coder.inline('always');
 coder.ceval('myunlock');
 end

 function updateBuildInfo(buildInfo, ctx)
 fftwLocation = '\usr\lib\fftw';
 includePath = fullfile(fftwLocation, 'include');
 buildInfo.addIncludePaths(includePath);
 libPath = fullfile(fftwLocation, 'lib');

 %Double
 libName1 = 'libfftw3-3';
 [~, libExt] = ctx.getStdLibInfo();
 libName1 = [libName1 libExt];
 addLinkObjects(buildInfo, libName1, libPath, 1000, true, true);

 %Single
 libName2 = 'libfftw3f-3';
 [~, libExt] = ctx.getStdLibInfo();
 libName2 = [libName2 libExt];
 addLinkObjects(buildInfo, libName2, libPath, 1000, true, true);
 end
 end
end
```

## Configure Code Generation Parameters and Build the Model

- 1 Configure code generation to use the FFTW callback class and the C code called by the `lock` and `unlock` methods. Configure code generation to generate a call to `mylock_initialize` in the initialization code.

In the Configuration Parameters dialog box:

- Set **Custom FFT library callback** to `myfftwcb`.
- In **Code Generation > Custom Code**, under **Additional build information**, set **Source files** to `mylock.c`.

- In **Code Generation > Custom Code**, under **Insert custom C code in generated**, set **Initialize function** to `mylock_initialize();`.

2 Build the model.

## Control Memory Allocation for Variable-Size Arrays in a MATLAB Function Block

Dynamic memory allocation allocates memory on the heap as needed at run time, instead of allocating memory statically on the stack. You can use dynamic memory allocation for arrays inside a MATLAB Function block.

You cannot use dynamic memory allocation for:

- Input and output signals. Variable-size input and output signals must have an upper bound.
- Parameters or global variables. Parameters and global variables must be fixed-size.
- Fields of bus arrays. Bus arrays cannot have variable-size fields.
- Discrete state properties of System objects associated with a MATLAB System block.

Dynamic memory allocation is beneficial when:

- You do not know the upper bound of an array.
- You do not want to allocate memory on the stack for large arrays.

Dynamic memory allocation and the freeing of this memory can result in slower execution of the generated code. To control the use of dynamic memory allocation for variable-size arrays in a MATLAB Function block, you can:

- Provide upper bounds for variable-size arrays on page 76-82.
- Disable dynamic memory allocation for MATLAB Function blocks on page 76-82.
- Modify the dynamic memory allocation threshold on page 76-82.

### Provide Upper Bounds for Variable-Size Arrays

For an unbounded variable-size array, the code generator allocates memory dynamically on the heap. For a bounded variable-size array, if the size, in bytes, is less than the dynamic memory allocation threshold, the code generator allocates memory statically on the stack. To avoid dynamic memory allocation, provide upper bounds for the array dimensions so that the size of the array, in bytes, is less than the dynamic memory allocation threshold. See “Specify Upper Bounds for Variable-Size Arrays”.

### Disable Dynamic Memory Allocation for MATLAB Function Blocks

By default, dynamic memory allocation for MATLAB Function blocks is enabled for GRT-based targets and disabled for ERT-based targets. To change the setting, in the Configuration Parameters dialog box, clear or select **Dynamic memory allocation in MATLAB functions**.

If you disable dynamic memory allocation, you must provide upper bounds for variable-size arrays.

### Modify the Dynamic Memory Allocation Threshold

Instead of disabling dynamic memory allocation for all variable-size arrays, you can use the dynamic memory allocation threshold to specify when the code generator uses dynamic memory allocation.

Use the dynamic memory allocation threshold to:

- Disable dynamic memory allocation for smaller arrays. For smaller arrays, static memory allocation can speed up generated code. However, static memory allocation can lead to unused storage space. You can decide that the unused storage space is not a significant consideration for smaller arrays.
- Enable dynamic memory allocation for larger arrays. For larger arrays, when you use dynamic memory allocation, you can significantly reduce storage requirements.

The default value of the dynamic memory allocation threshold is 64 kilobytes. To change the threshold, in the Configuration Parameters dialog box, set the **Dynamic memory allocation threshold in MATLAB functions** parameter.

To use dynamic memory allocation for all variable-size arrays, set the threshold to 0.

## Optimize Memory Usage for Time Counters

This example shows how to optimize the amount of memory that the code generator allocates for time counters. The example optimizes the memory that stores elapsed time, the interval of time between two events.

The code generator represents time counters as unsigned integers. The word size of time counters is based on the setting of the model configuration parameter **Application lifespan (days)**, which specifies the expected maximum duration of time the application runs. You can use this parameter to prevent time counter overflows. The default size is 64 bits.

The number of bits that a time counter uses depends on the setting of the **Application lifespan (days)** parameter. For example, if a time counter increments at a rate of 1 kHz, to avoid an overflow, the counter has the following number of bits:

- Lifespan < 0.25 sec: 8 bits
- Lifespan < 1 min: 16 bits
- Lifespan < 49 days: 32 bits
- Lifespan > 50 days: 64 bits

A 64-bit time counter does not overflow for 590 million years.

### Open Example Model

Open the example model `rtwdemo_abstime`.

Copyright 1994-2020 The MathWorks, Inc.

The model consists of three subsystems SS1, SS2, and SS3. Open the Model Configuration Parameters dialog box. On the **Math and Data Types** pane, the **Application lifespan (days)** parameter is set to the default, which is `inf`.

The three subsystems contain a discrete-time integrator that requires elapsed time as input to compute its output value. The subsystems vary as follows:

- SS1 - Clocked at 1 kHz. Does not require a time counter. **Sample time type** parameter for trigger port is set to `periodic`. Elapsed time is inlined as 0.001.
- SS2 - Clocked at 100 Hz. Requires a time counter. Based on a lifespan of 1 day, a 32-bit counter stores the elapsed time.
- SS3 - Clocked at 0.5 Hz. Requires a time counter. Based on a lifespan of 1 day, a 16-bit counter stores the elapsed time.

### Simulate the Model

Simulate the model. By default, the model is configured to show sample times in different colors. Discrete sample times for the three subsystems appear red, green, and blue. Triggered subsystems are blue-green.

### Generate Code and Report

1. Create a temporary folder for the build and inspection process.
2. Configure the model for the code generator to use the GRT system target file and a lifespan of `inf` days.
3. Build the model.

```
Starting build procedure for: rtwdemo_abstime
Successful completion of build procedure for: rtwdemo_abstime
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_abstime	Code generated and compiled.	Code generation information file does not exist.

```
1 of 1 models built (0 models already up to date)
Build duration: 0h 0m 20.793s
```

### Review Generated Code

Open the generated source file `rtwdemo_abstime.h`.

```
struct tag_RTM_rtwdemo_abstime_T {
 const char_T *errorStatus;

 /*
 * Timing:
 * The following substructure contains information regarding
 * the timing information for the model.
 */
};
```

```

 struct {
 uint32_T clockTick1;
 uint32_T clockTickH1;
 uint32_T clockTick2;
 uint32_T clockTickH2;
 struct {
 uint16_T TID[3];
 uint16_T cLimit[3];
 } TaskCounters;
 } Timing;
};

/* Block states (default storage) */
extern DW_rtdemo_abstime_T rtdemo_abstime_DW;

/* Zero-crossing (trigger) state */
extern PrevZCX_rtdemo_abstime_T rtdemo_abstime_PrevZCX;

/* External inputs (root inport signals with default storage) */
extern ExtU_rtdemo_abstime_T rtdemo_abstime_U;

/* External outputs (root outputs fed by signals with default storage) */
extern ExtY_rtdemo_abstime_T rtdemo_abstime_Y;

/* Model entry point functions */
extern void rtdemo_abstime_initialize(void);
extern void rtdemo_abstime_step0(void);
extern void rtdemo_abstime_step1(void);
extern void rtdemo_abstime_step2(void);
extern void rtdemo_abstime_terminate(void);

/* Real-time Model object */
extern RT_MODEL_rtdemo_abstime_T *const rtdemo_abstime_M;

/*-
 * The generated code includes comments that allow you to trace directly
 * back to the appropriate location in the model. The basic format
 * is <system>/block_name, where system is the system number (uniquely
 * assigned by Simulink) and block_name is the name of the block.
 *
 * Use the MATLAB hilite_system command to trace the generated code back
 * to the model. For example,
 *
 * hilite_system('<S3>') - opens system 3
 * hilite_system('<S3>/Kp') - opens and selects block Kp which resides in S3
 *
 * Here is the system hierarchy for this model
 *
 * '<Root>' : 'rtdemo_abstime'
 * '<S1>' : 'rtdemo_abstime/SS1'
 * '<S2>' : 'rtdemo_abstime/SS2'
 * '<S3>' : 'rtdemo_abstime/SS3'
 */
#endif
/* RTW_HEADER_rtdemo_abstime_h_ */

```

Four 32-bit unsigned integers, `clockTick1`, `clockTickH1`, `clockTick2`, and `clockTickH2` are counters for storing the elapsed time of subsystems SS2 and SS3.

## Enable Optimization and Regenerate Code

1. Reconfigure the model to set the lifespan to 1 day.
2. Build the model.

```
Starting build procedure for: rtwdemo_abstime
Successful completion of build procedure for: rtwdemo_abstime
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_abstime	Code generated and compiled.	Incremental checksum changed.

```
1 of 1 models built (0 models already up to date)
Build duration: 0h 0m 21.025s
```

## Review the Regenerated Code

```
struct tag_RTM_rtwdemo_abstime_T {
 const char_T *errorStatus;

 /*
 * Timing:
 * The following substructure contains information regarding
 * the timing information for the model.
 */
 struct {
 uint32_T clockTick1;
 uint16_T clockTick2;
 struct {
 uint16_T TID[3];
 uint16_T cLimit[3];
 } TaskCounters;
 } Timing;
};

/* Block states (default storage) */
extern DW_rtwdemo_abstime_T rtwdemo_abstime_DW;

/* Zero-crossing (trigger) state */
extern PrevZCX_rtwdemo_abstime_T rtwdemo_abstime_PrevZCX;

/* External inputs (root inport signals with default storage) */
extern ExtU_rtwdemo_abstime_T rtwdemo_abstime_U;

/* External outputs (root outports fed by signals with default storage) */
extern ExtY_rtwdemo_abstime_T rtwdemo_abstime_Y;

/* Model entry point functions */
extern void rtwdemo_abstime_initialize(void);
extern void rtwdemo_abstime_step0(void);
extern void rtwdemo_abstime_step1(void);
extern void rtwdemo_abstime_step2(void);
```

```

extern void rtwdemo_abstime_terminate(void);

/* Real-time Model object */
extern RT_MODEL_rtwdemo_abstime_T *const rtwdemo_abstime_M;

/*-
 * The generated code includes comments that allow you to trace directly
 * back to the appropriate location in the model. The basic format
 * is <system>/block_name, where system is the system number (uniquely
 * assigned by Simulink) and block_name is the name of the block.
 *
 * Use the MATLAB hilite_system command to trace the generated code back
 * to the model. For example,
 *
 * hilite_system('<S3>') - opens system 3
 * hilite_system('<S3>/Kp') - opens and selects block Kp which resides in S3
 *
 * Here is the system hierarchy for this model
 *
 * '<Root>' : 'rtwdemo_abstime'
 * '<S1>' : 'rtwdemo_abstime/SS1'
 * '<S2>' : 'rtwdemo_abstime/SS2'
 * '<S3>' : 'rtwdemo_abstime/SS3'
 */
#endif /* RTW_HEADER_rtwdemo_abstime_h_ */

```

The new setting for the **Application lifespan (days)** parameter instructs the code generator to set aside less memory for the time counters. The regenerated code includes:

- 32-bit unsigned integer, `clockTick1`, for storing the elapsed time of the task for SS2
- 16-bit unsigned integer, `clockTick2`, for storing the elapsed time of the task for SS3

## Optimize Generated Code Using Boolean Data for Logical Signals

Optimize generated code by storing logical signals as Boolean data. When you select the model configuration parameter **Implement logic signals as Boolean data (vs. double)**, blocks that generate logic signals output Boolean signals.

The optimization:

- Reduces the ROM and RAM consumption.
- Improves execution speed.

### Example Model

Consider the model `rtwdemo_logicalAsBoolean`. The outputs of the Relational Operator, Logical Operator and HitCrossing blocks are double, even though they represent logical data.

```
model = 'rtwdemo_logicalAsBoolean';
open_system(model);
```

Copyright 1994-2020 The MathWorks, Inc.

### Generate Code

Create a temporary folder (in your system temporary folder) for the build and inspection process.

```
currentDir = pwd;
[~,cgDir] = rtwdemodir();
```

Build the model.

```
slbuild(model)
```

```
Starting build procedure for: rtwdemo_logicalAsBoolean
Successful completion of build procedure for: rtwdemo_logicalAsBoolean
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_logicalAsBoolean	Code generated and compiled.	Code generation information file does not

```
1 of 1 models built (0 models already up to date)
Build duration: 0h 0m 53.589s
```

View the generated code without the optimization. These lines of code are in `rtwdemo_logicalAsBoolean.h`.

```
hfile = fullfile(cgDir,'rtwdemo_logicalAsBoolean_ert_rtw',...
 'rtwdemo_logicalAsBoolean.h');
rtwdemodbtype(hfile,'/* External outputs','/* Parameters (default storage) */',1,0);
```

```
/* External outputs (root outputs fed by signals with default storage) */
typedef struct {
 real_T Out1; /* '<Root>/Out1' */
 real_T Out2; /* '<Root>/Out2' */
 real_T Out3; /* '<Root>/Out3' */
} ExtY_rtwdemo_logicalAsBoolean_T;
```

### Enable Optimization

- 1 Open the Configuration Parameters dialog box.
- 2 Select the **Implement logic signals as Boolean data (vs. double)** parameter.

Alternatively, you can use the command-line API to enable the optimization:

```
set_param(model,'BooleanDataType','on');
```

### Generate Code with Optimization

The generated code stores the logical signal output as Boolean data.

Build the model.

```
slbuild(model)
```

```
Starting build procedure for: rtwdemo_logicalAsBoolean
Successful completion of build procedure for: rtwdemo_logicalAsBoolean
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
-------	--------	----------------

```
=====
rtwdemo_logicalAsBoolean Code generated and compiled. Generated code was out of date.
```

```
1 of 1 models built (0 models already up to date)
Build duration: 0h 0m 21.854s
```

View the generated code with the optimization. These lines of code are in `rtwdemo_logicalAsBoolean.h`.

```
rtwdemodbtype(hfile, '/* External outputs', '/* Parameters (default storage) */', 1, 0);
```

```
/* External outputs (root outports fed by signals with default storage) */
typedef struct {
 boolean_T Out1; /* '<Root>/Out1' */
 boolean_T Out2; /* '<Root>/Out2' */
 boolean_T Out3; /* '<Root>/Out3' */
} ExtY_rtwdemo_logicalAsBoolean_T;
```

Close the model and code generation report.

```
bdclose(model)
rtwdemoclean;
cd(currentDir)
```

## Reduce Memory Usage for Boolean and State Configuration Variables

- 1 Open the Model Configuration Parameters dialog box.
- 2 In the Model Configuration Parameters dialog box, select the **Optimization** pane.
- 3 Choose from these options:
  - **Use bitsets for storing state configuration** — Reduces the amount of memory that stores state configuration variables. However, it can increase the amount of memory that stores target code if the target processor does not include instructions for manipulating bitsets.
  - **Use bitsets for storing Boolean data** — Reduces the amount of memory that stores Boolean variables. However, it can increase the amount of memory that stores target code if the target processor does not include instructions for manipulating bitsets.

---

**Note** You cannot use bitsets when you generate code for these cases:

- An external mode simulation
  - A target that specifies an explicit structure alignment
-

## Customize Stack Space Allocation

Your application might be constrained by limited memory. Controlling the maximum allowable size for the stack is one way to modify whether data is defined as local or global in the generated code. You can limit the use of stack space by specifying a positive integer value for the **Maximum stack size (bytes)** parameter, on the **Optimization** pane of the Configuration parameter dialog box. Specifying the maximum allowable stack size provides control over the number of local and global variables in the generated code. Specifically, lowering the maximum stack size might generate more variables into global structures. The number of local and global variables help determine the required amount of stack space for execution of the generated code.

If your model contains a variable that is larger than 4096 bytes, the code generator implements it in global memory by default. You can increase the size of variables that the code generator places in local memory by changing the value of the TLC variable `MaxStackVariableSize`. You can change this value by typing the following command in MATLAB Command Window:

```
set_param(modelName, 'TLCOptions', '-aMaxStackVariableSize=N')
```

The default setting for Maximum stack size (bytes) is `Inherit from target`. In this case, the value of the maximum stack size is the smaller value of the following: the default value set by the code generator (200,000 bytes) or the value of the TLC variable `MaxStackSize` found in the system target file (`ert.tlc`).

To specify a smaller stack size for your application, select the **Specify a value** option of the **Maximum stack size (bytes)** parameter and enter a positive integer value. To specify a smaller stack size at the command line, use:

```
set_param(model_name, 'MaxStackSize', 65000);
```

---

**Note** For overall executable stack usage metrics, you might want to do a target-specific measurement, such as using runtime (empirical) analysis or static (code path) analysis with object code.

---

It is recommended that you use the **Maximum stack size (bytes)** parameter to control stack space allocation instead of modifying the TLC variable, `MaxStackSize`, in the system target file. However, a target author might want to set the TLC variable, `MaxStackSize`, for a target. To set `MaxStackSize`, use `assign` statements in the system target file (`ert.tlc`), as in the following example.

```
%assign MaxStackSize = 4096
```

Write your `%assign` statements in the **Configure RTW code generation settings** section of the system target file. The `%assign` statement is described in “Target Language Compiler”.

## Optimize Generated Code Using memset Function

This example shows how to optimize the generated code by using the `memset` function to clear the internal storage. When you select the model configuration parameter **Use memset to initialize floats and doubles to 0.0**, the `memset` function clears internal storage, to the integer bit pattern 0 (that is, all bits are off).

If your compiler and target CPU both represent floating-point zero with the integer bit pattern 0, consider setting this parameter to gain execution and ROM efficiency.

**NOTE:** The command-line values are the reverse of the settings values. 'on' in the command line corresponds to clearing the setting. 'off' in the command line corresponds to selecting the setting.

This optimization:

- Reduces ROM consumption.
- Improves execution speed.

### Example Model

Consider the model `matlab:rtwdemo_memset`.

```
model = 'rtwdemo_memset';
open_system(model);
```

Copyright 2014-2020 The MathWorks, Inc.

### Generate Code

The code generator uses a loop to initialize the Constant block values.

Create a temporary folder (in your system temporary folder) for the build and inspection process.

```
currentDir = pwd;
[~,cgDir] = rtwmoddir();
```

Build the model.

```
slbuild(model)
```

```
Starting build procedure for: rtwdemo_memset
Successful completion of build procedure for: rtwdemo_memset
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_memset	Code generated and compiled.	Code generation information file does not exist.

1 of 1 models built (0 models already up to date)  
Build duration: 0h 0m 19.275s

View the generated code without the optimization. These lines of code are in `rtwdemo_memset.c`.

```

cfile = fullfile(cgDir,'rtwdemo_memset_grt_rtw','rtwdemo_memset.c');
rtwdemodbtype(cfile,'/* Model initialize function */',...
 '/* Model terminate function */',1,0);

/* Model initialize function */
void rtwdemo_memset_initialize(void)
{
 /* Registration code */

 /* initialize error status */
 rtmSetErrorStatus(rtwdemo_memset_M, (NULL));

 /* external outputs */
 {
 int32_T i;
 for (i = 0; i < 50; i++) {
 rtwdemo_memset_Y.Out1[i] = 0.0;
 }
 }

 {
 int32_T i;

 /* ConstCode for Outport: '<Root>/Out1' */
 for (i = 0; i < 50; i++) {
 rtwdemo_memset_Y.Out1[i] = 56.0;
 }

 /* End of ConstCode for Outport: '<Root>/Out1' */
 }
}

```

### Enable Optimization

- 1 Open the Configuration Parameters dialog box.
- 2 In the Configuration Parameter dialog box select the **Use memset to initialize floats and doubles to 0.0** parameter. Alternatively, you can use the command-line API to enable the optimization:

```
set_param(model,'InitFltsAndDblsToZero','off');
```

*% # Open the Configuration Parameters dialog box.*

### Generate Code with Optimization

The code generator uses the `memset` function to initialize the Constant block values.

Build the model.

```
slbuild(model)

Starting build procedure for: rtwdemo_memset
Successful completion of build procedure for: rtwdemo_memset
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_memset	Code generated and compiled.	Generated code was out of date.

1 of 1 models built (0 models already up to date)  
Build duration: 0h 0m 15.972s

View the generated code with the optimization. These lines of code are in `rtwdemo_memset.c`.

```
rtwdemodbtype(cfile, /* Model initialize function */, ...
 /* Model terminate function */, 1, 0);

/* Model initialize function */
void rtwdemo_memset_initialize(void)
{
 /* Registration code */

 /* initialize error status */
 rtmSetErrorStatus(rtwdemo_memset_M, (NULL));

 /* external outputs */
 (void)memset(&rtwdemo_memset_Y, 0, sizeof(ExtY_rtwdemo_memset_T));

 {
 int32_T i;

 /* ConstCode for Output: '<Root>/Out1' */
 for (i = 0; i < 50; i++) {
 rtwdemo_memset_Y.Out1[i] = 56.0;
 }

 /* End of ConstCode for Output: '<Root>/Out1' */
 }
}
```

Close the model and the code generation report.

```
bdclose(model)
rtwdemoclean;
cd(currentDir)
```

## Vector Operation Optimization

This example shows how Simulink® Coder™ optimizes generated code by setting block output that generates vectors to scalars, for blocks such as the Mux, Sum, Gain, and Bus. This optimization reduces stack memory by replacing temporary local arrays with local variables.

### Example Model

In the model, `rtwdemo_VectorOptimization`, the output of Gain blocks G1 and G2 are the vector signals `tmp1` and `tmp2`. These vectors have a width of 10.

```
model = 'rtwdemo_VectorOptimization';
open_system(model);
set_param(model, 'SimulationCommand', 'update')
```

Copyright 2014-2020 The MathWorks, Inc.

### Generate Code

Create a temporary folder (in your system temporary folder) for the build and inspection process.

```
currentDir = pwd;
[~,cgDir] = rtwmoddir();
```

Build the model.

```
slbuild(model)
```

```
Starting build procedure for: rtwdemo_VectorOptimization
Successful completion of build procedure for: rtwdemo_VectorOptimization
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_VectorOptimization	Code generated and compiled.	Code generation information file does not exist

```
1 of 1 models built (0 models already up to date)
Build duration: 0h 0m 25.347s
```

The optimized code is in `rtwdemo_VectorOptimization.c`. The signals `tmp1` and `tmp2` are the local variables `rtb_tmp1` and `rtb_tmp2`.

```

cfile = fullfile(cgDir, 'rtwdemo_VectorOptimization_grt_rtw', ...
 'rtwdemo_VectorOptimization.c');
rtwdemodbtype(cfile, '/* Model step', '/* Model initialize', 1, 0);

/* Model step function */
void rtwdemo_VectorOptimization_step(void)
{
 real_T rtb_Sum3_j;
 real_T rtb_tmp1_a;
 real_T rtb_tmp2_j;
 int32_T i;
 for (i = 0; i < 10; i++) {
 /* Gain: '<Root>/G2' incorporates:
 * UnitDelay: '<Root>/X2'
 */
 rtb_tmp2_j = 0.3 * rtwdemo_VectorOptimization_DW.X2_DSTATE[i];

 /* Gain: '<Root>/G1' incorporates:
 * UnitDelay: '<Root>/X1'
 */
 rtb_tmp1_a = 0.2 * rtwdemo_VectorOptimization_DW.X1_DSTATE[i];

 /* Sum: '<Root>/Sum3' incorporates:
 * Gain: '<Root>/G3'
 * Inport: '<Root>/In2'
 * Sum: '<Root>/Sum1'
 * Sum: '<Root>/Sum2'
 * UnitDelay: '<Root>/X3'
 */
 rtb_Sum3_j = ((rtwdemo_VectorOptimization_U.In2[i] - 0.4 *
 rtwdemo_VectorOptimization_DW.X3_DSTATE[i]) - rtb_tmp2_j) -
 rtb_tmp1_a;

 /* Outport: '<Root>/Out2' */
 rtwdemo_VectorOptimization_Y.Out2[i] = rtb_Sum3_j;

 /* Update for UnitDelay: '<Root>/X3' */
 rtwdemo_VectorOptimization_DW.X3_DSTATE[i] = rtb_tmp2_j;

 /* Update for UnitDelay: '<Root>/X2' */
 rtwdemo_VectorOptimization_DW.X2_DSTATE[i] = rtb_tmp1_a;

 /* Update for UnitDelay: '<Root>/X1' */
 rtwdemo_VectorOptimization_DW.X1_DSTATE[i] = rtb_Sum3_j;
 }
}

```

Close the model and code generation report.

```
bdclose(model)
rtwdemoclean;
cd(currentDir)
```

## Enable and Reuse Local Block Outputs in Generated Code

### In this section...

“Example Model” on page 76-102

“Generate Code Without Optimization” on page 76-102

“Enable Local Block Outputs and Generate Code” on page 76-103

“Reuse Local Block Outputs and Generate Code” on page 76-104

This example shows how to specify block output as local variables. The code generator can potentially reuse these local variables in the generated code. Declaring block output as local variables conserves ROM consumption. Reusing local variables conserves RAM consumption, reduces data copies, and increases execution speed.

### Example Model

- 1 Use Inport, Outport, Gain, and Switch blocks to create the following model. In this example, the model is named `local_variable_ex`.

- 2 For G2, open the Gain Block Parameters dialog box. Enter a value of 2.
- 3 For G1, enter a value of 3.
- 4 For the Switch block, open the Block Parameters dialog box. For the **Criteria for passing first input** parameter, select `u2 >= Threshold`.

### Generate Code Without Optimization

- 1 Open the Model Configuration Parameters dialog box. Select the **Solver** pane. For the **Type** parameter, select `Fixed-step`.
- 2 Clear the **Configuration Parameters > Signal storage reuse** parameter.
- 3 Select the **Code Generation > Report** pane and select **Create code generation report**.
- 4 Select the **Code Generation** pane. Select **Generate code only**, and then, in the model window, press **Ctrl+B**. When code generation is complete, an HTML code generation report appears.
- 5 In the code generation report, select the `local_variable_ex.c` section and view the model step function. The Gain block outputs are the global variables `local_variable_ex_B.G2` and `local_variable_ex_B.G1`.

```

/* Model step function */
void local_variable_ex_step(void)
{
 /* Switch: '<Root>/Switch' incorporates:
 * Inport: '<Root>/In1'
 */
 if (local_variable_ex_U.In1 >= 0.0) {
 /* Gain: '<Root>/G2' */
 local_variable_ex_B.G2 = 2.0 * local_variable_ex_U.In1;

 /* Output: '<Root>/Out1' */
 local_variable_ex_Y.Out1 = local_variable_ex_B.G2;
 } else {
 /* Gain: '<Root>/G1' */
 local_variable_ex_B.G1 = 3.0 * local_variable_ex_U.In1;

 /* Output: '<Root>/Out1' */
 local_variable_ex_Y.Out1 = local_variable_ex_B.G1;
 }

 /* End of Switch: '<Root>/Switch' */
}

```

## Enable Local Block Outputs and Generate Code

- 1 Select the **Configuration Parameters > Signal Storage Reuse** parameter. The **Signal Storage Reuse** enables the following optimization parameters:
  - **Enable local block outputs**
  - **Reuse local block outputs**
  - **Eliminate superfluous local variables (expression folding)**
- 2 Clear **Reuse local block outputs** and **Eliminate superfluous local variables (expression folding)**.
- 3 Generate code and view the model step function. There are three local variables in the model step function because you selected the optimization parameter **Enable Local Block Outputs**. The local variables `rtb_G2` and `rtb_G1` hold the outputs of the Gain blocks. The local variable `rtb_Switch` holds the output of the Switch block.

```

/* Model step function */
void local_variable_ex_step(void)
{
 real_T rtb_Switch;
 real_T rtb_G2;
 real_T rtb_G1;

 /* Switch: '<Root>/Switch' incorporates:
 * Inport: '<Root>/In1'
 */
 if (local_variable_ex_U.In1 >= 0.0) {
 /* Gain: '<Root>/G2' */
 rtb_G2 = 2.0 * local_variable_ex_U.In1;
 rtb_Switch = rtb_G2;
 } else {
 /* Gain: '<Root>/G1' */
 rtb_G1 = 3.0 * local_variable_ex_U.In1;
 rtb_Switch = rtb_G1;
 }
}

```

```

}

/* End of Switch: '<Root>/Switch' */

/* Output: '<Root>/Out1' */
local_variable_ex_Y.Out1 = rtb_Switch;

```

## Reuse Local Block Outputs and Generate Code

- 1 Select the **Configuration Parameters > Reuse local block outputs** parameter.
- 2 Generate code. In the `local_variable_ex.c` section, view the model step function. There is one local variable, `rtb_G2`, that the code generator uses three times.

```

/* Model step function */
void local_variable_ex_step(void)
{
 real_T rtb_G2;

 /* Switch: '<Root>/Switch' incorporates:
 * Inport: '<Root>/In1'
 */
 if (local_variable_ex_U.In1 >= 0.0) {
 /* Gain: '<Root>/G2' */
 rtb_G2 = 2.0 * local_variable_ex_U.In1;
 } else {
 /* Gain: '<Root>/G1' */
 rtb_G2 = 3.0 * local_variable_ex_U.In1;
 }

 /* End of Switch: '<Root>/Switch' */

 /* Output: '<Root>/Out1' */
 local_variable_ex_Y.Out1 = rtb_G2;

```

The extra temporary variable `rtb_Switch` and the associated data copy is not in the generated code.

## Generate SIMD Code from Simulink Blocks

You can generate single instruction, multiple data (SIMD) code from certain Simulink blocks by using Intel SSE and, if you have Embedded Coder, Intel AVX technology. SIMD is a computing paradigm in which a single instruction processes multiple data. Many modern processors have SIMD instructions that, for example, perform several additions or multiplications at once. For computationally intensive operations on supported blocks, SIMD intrinsics can significantly improve the performance of the generated code on Intel platforms.

### Blocks That Support SIMD Code Generation

When certain conditions are met, you can generate SIMD code by using Intel SSE or Intel AVX technology. This table lists blocks that support SIMD code generation. The table also details the conditions under which the support is available.

Block	Conditions
Add	<ul style="list-style-type: none"> <li>For AVX, SSE, and FMA, the input signal has a data type of <code>single</code> or <code>double</code>.</li> <li>For AVX2, SSE4.1, and SSE2, the input signal has a data type of <code>single</code>, <code>double</code>, <code>int8</code>, <code>int16</code>, <code>int32</code>, or <code>int64</code>.</li> <li>For AVX512F, the input signal has a data type of <code>single</code> or <code>double</code>.</li> </ul>
Subtract	<ul style="list-style-type: none"> <li>For AVX, SSE, and FMA, the input signal has a data type of <code>single</code> or <code>double</code>.</li> <li>For AVX2, SSE4.1, and SSE2, the input signal has a data type of <code>single</code>, <code>double</code>, <code>int8</code>, <code>int16</code>, <code>int32</code>, or <code>int64</code>.</li> <li>For AVX512F, the input signal has a data type of <code>single</code> or <code>double</code>.</li> </ul>
Sum of Elements	<ul style="list-style-type: none"> <li>For AVX, SSE, and FMA, the input signal has a data type of <code>single</code> or <code>double</code>.</li> <li>For AVX2, SSE4.1, and SSE2, the input signal has a data type of <code>single</code>, <code>double</code>, <code>int8</code>, <code>int16</code>, <code>int32</code>, or <code>int64</code>.</li> <li>For AVX512F, the input signal has a data type of <code>single</code> or <code>double</code>.</li> <li>The <b>Optimize reductions</b> configuration parameter is set to <code>on</code>.</li> </ul>

Block	Conditions
Product	<ul style="list-style-type: none"> <li>• For AVX, SSE, and FMA, the input signal has a data type of <code>single</code> or <code>double</code>.</li> <li>• For AVX2, SSE4.1, and SSE2, the input signal has a data type of <code>single</code>, <code>double</code>, <code>int16</code> or <code>int32</code>.</li> <li>• For AVX512F, the input signal has a data type of <code>single</code> or <code>double</code>.</li> <li>• Set <b>Multiplication</b> parameter to <code>Element-wise(.*)</code></li> </ul>
Product of Elements	<ul style="list-style-type: none"> <li>• For AVX, SSE, and FMA, the input signal has a data type of <code>single</code> or <code>double</code>.</li> <li>• For AVX2, SSE4.1, and SSE2, the input signal has a data type of <code>single</code>, <code>double</code>, <code>int16</code> or <code>int32</code>.</li> <li>• For AVX512F, the input signal has a data type of <code>single</code> or <code>double</code>.</li> <li>• Set <b>Multiplication</b> parameter to <code>Element-wise(.*)</code></li> <li>• Set the <b>Optimize reductions</b> configuration parameter to <code>on</code>.</li> </ul>
Gain	<ul style="list-style-type: none"> <li>• For AVX, and SSE, the input signal has a data type of <code>single</code> or <code>double</code>.</li> <li>• For AVX2, SSE4.1, and SSE2, the input signal has a data type of <code>single</code>, <code>double</code>, <code>int16</code>, or <code>int32</code>.</li> <li>• For Intel AVX512F, the input signal has a data type of <code>single</code> or <code>double</code>.</li> <li>• Set <b>Multiplication</b> parameter to <code>Element-wise(.*)</code></li> </ul>
Divide	The input signal has a data type of <code>single</code> or <code>double</code> .
Sqrt	The input signal has a data type of <code>single</code> or <code>double</code> .
Ceil	<ul style="list-style-type: none"> <li>• For AVX2, AVX, SSE4.1, SSE2, and SSE, the input signal has a data type of <code>single</code> or <code>double</code>.</li> <li>• AVX512F is not supported.</li> </ul>
Floor	<ul style="list-style-type: none"> <li>• For AVX2, AVX, SSE4.1, SSE2, and SSE, the input signal has a data type of <code>single</code> or <code>double</code>.</li> <li>• AVX512F is not supported.</li> </ul>

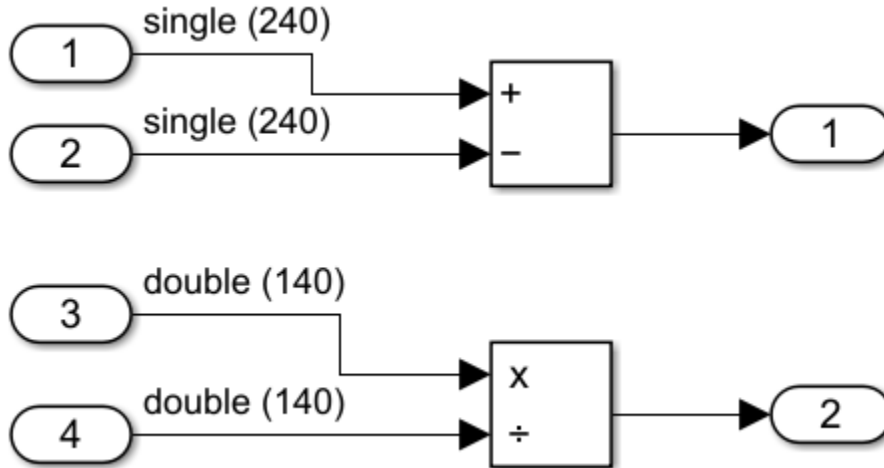

Block	Conditions
MinMax	<ul style="list-style-type: none"> <li>The input signal has a data type of single or double.</li> <li>The value of the <b>Support: non-finite numbers</b> configuration parameter is set to off.</li> </ul>
MinMax of Elements	<ul style="list-style-type: none"> <li>The input signal has a data type of single or double.</li> <li>The value of the <b>Support: non-finite numbers</b> configuration parameter is set to off.</li> <li>The <b>Optimize reductions</b> configuration parameter is set to on.</li> </ul>
MATLAB Function	MATLAB code meets the conditions specified in this topic: “Generate SIMD Code for MATLAB Functions” on page 97-27.
For Each Subsystem	<ul style="list-style-type: none"> <li>The For Each Subsystem block contains a block listed in this table that meets the specified conditions.</li> <li>The value of the <b>Partition Dimension</b> block parameter must be above the value of the <b>Loop unrolling threshold</b> configuration parameter.</li> </ul>
Bitwise Operator	<ul style="list-style-type: none"> <li>The value of the <b>Operator</b> block parameter must be AND, OR, or XOR.</li> <li>For SSE2, the input signal has a data type of int8, int16, int32, or int64.</li> <li>For AVX2, and AVX512F, the input signal has a data type of int8, int16, int32, or int64.</li> </ul>
Shift Arithmetic	<ul style="list-style-type: none"> <li>The input signal has a data type of int32.</li> </ul>

If you have DSP System Toolbox, you can also generate SIMD code from certain DSP System Toolbox blocks. For more information, see “Simulink Blocks in DSP System Toolbox that Support SIMD Code Generation” (DSP System Toolbox).

If you have the Embedded Coder Support Package for ARM Cortex®-A Processors, you can generate SIMD code optimized for ARM Cortex A processors by setting the “Code replacement libraries” parameter to GCC ARM Cortex-A. You will also need to set the **Device vendor** parameter to ARM Compatible and the **Device type** parameter to ARM Cortex-A.

## Generate SIMD Code Compared to Plain C Code

For this example, create a simple model `simdDemo` that has a Subtract block and a Divide block. The Subtract block has an input signal that has a dimension of 240 and an input data type of `single`. The Divide block has an input signal that has a dimension of 140 and an input data type of `double`.

The plain generated C code for this model is:

```
void simdDemo_step(void)
{
 int32_T i;
 for (i = 0; i < 240; i++) {
 simdDemo_Y.Out1[i] = simdDemo_U.In1[i] - simdDemo_U.In2[i];
 }

 for (i = 0; i < 140; i++) {
 simdDemo_Y.Out2[i] = simdDemo_U.In3[i] / simdDemo_U.In4[i];
 }
}
```

In the plain (non-SIMD) C code, each loop iteration produces one result.

To generate SIMD code:

- 1 Open the Simulink Coder app or the Embedded Coder app.
- 2 Click **Settings > Hardware Implementation**.
- 3 Set the **Device vendor** parameter to Intel or AMD.
- 4 Set the **Device type** parameter to x86-64(Windows 64) or x86-64(Linux 64).
- 5 On the **Optimization** pane, for the **Leverage target hardware instruction set extensions** parameter, select the instruction set extension that your processor supports. For example, select SSE2. If you use Embedded Coder, you can also select from the instruction sets SSE, SSE4.1, AVX, AVX2, FMA, and AVX512F. For more information, see <https://www.intel.com/content/www/us/en/support/articles/000005779/processors.html>.
- 6 Optionally, select the **Optimize reductions** parameter to generate SIMD code for reduction operations.
- 7 Generate code from the model.

```
void simdDemo_step(void)
{
 int32_T i;
 for (i = 0; i <= 236; i += 4) {
 _mm_storeu_ps(&simdDemo_Y.Out1[i], _mm_sub_ps(_mm_loadu_ps(&simdDemo_U.In1[i]),
 _mm_loadu_ps(&simdDemo_U.In2[i])));
 }
}
```

```

}
for (i = 0; i <= 138; i += 2) {
 _mm_storeu_pd(&simdDemo_Y.Out2[i], _mm_div_pd(_mm_loadu_pd(&simdDemo_U.In3[i]),
 _mm_loadu_pd(&simdDemo_U.In4[i])));
}
}

```

This code is for the SSE2 instruction set extension. The SIMD instructions are the intrinsic functions that start with the identifier `_mm`. These functions process multiple data in a single iteration of the loop because the loop increments by four for single data types and by two for double data types. For models that process more data and are computationally more intensive than this one, the presence of SIMD instructions can significantly speed up the code execution time.

For a list of a Intel intrinsic functions for supported Simulink blocks, see <https://www.intel.com/content/www/us/en/docs/intrinsics-guide/index.html>.

## Limitations

The generated code is not optimized through SIMD if:

- The code in a MATLAB Function block contains scalar data types outside the body of loops. For instance, if `a`, `b`, and `c` are scalars, the generated code does not optimize an operation such as `c=a+b`.
- The code in a MATLAB Function block contains indirectly indexed arrays or matrices. For instance if `A`, `B`, `C`, and `D` are vectors, the generated code is not vectorized for an operation such as `D(A)=C(A)+B(A)`.
- The blocks within a reusable subsystem might not be optimized.
- If the code in a MATLAB Function block contains parallel for-Loops (`parfor`), the `parfor` loop is not optimized with SIMD code, but loops within the body of the `parfor` loop can be optimized with SIMD code.
- Polyspace does not support analysis of generated code that includes SIMD instructions. Disable SIMD code generation by setting the **Leverage target hardware instruction set extensions** parameter to `None`.
- Reduction operations that operate on floating-point values when support for nonfinite numbers is enabled. To generate SIMD code for reduction operations that operate on floating-point values, set the configuration parameter **Support: non-finite numbers** to `Off`.

## Optimize Code for Reduction Operations by Using SIMD

This example shows how to generate optimized single instruction, multiple data (SIMD) code that performs reduction operations. A reduction is an operation that reduces a set of elements, such as an array, to a single value using an associative binary operator. For example, calculating the sum of the elements in an array is a reduction operation that uses the addition operator. For processors that support SIMD instructions, you can optimize reduction operations by generating parallel code that uses the SIMD instructions for the operation.

### Example Model

Open the example model `ex_rowmajor_algorithm`. The model calculates the sum of the elements in a 4 by 3 by 2 array.

```
model = 'ex_rowmajor_algorithm';
open_system(model)
```

Copyright 2021 The MathWorks, Inc.

### Generate SIMD Code Without Reduction Optimization

Open the configuration parameters for the model. On the **Modeling** tab, click **Settings**. On the **Code Generation** pane, set **System target file** to `grt.tlc`. On the **Optimization** pane, set the **Leverage target hardware instruction set extensions** to `SSE2`. Alternatively, use the command-line.

```
set_param(model, 'SystemTargetFile', 'grt.tlc');
set_param(model, 'SaveOutput', 'off');
set_param(model, 'RTWVerbose', 'off');
set_param(model, 'InstructionSetExtensions', 'SSE2');
```

De-select the parameter **Optimize reductions**.

```
set_param(model, 'OptimizeReductions', 'off');
```

Build the model.

```
slbuild(model);
```

```
Starting build procedure for: ex_rowmajor_algorithm
Successful completion of build procedure for: ex_rowmajor_algorithm
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
ex_rowmajor_algorithm	Code generated and compiled.	Code generation information file does not exist

1 of 1 models built (0 models already up to date)

Build duration: 0h 0m 15.563s

Inspect the generated `ex_rowmajor_algorithm_step` function.

```
file = fullfile('ex_rowmajor_algorithm_grt_rtw','ex_rowmajor_algorithm.c');
rtwdemodbtype(file,'/* Model step function */','/* End of Sum',1,1);

/* Model step function */
void ex_rowmajor_algorithm_step(void)
{
 int32_T i;

 /* Sum: '<Root>/Sum of Elements Dim1' incorporates:
 * Constant: '<Root>/Constant1'
 */
 ex_rowmajor_algorithm_Y.Out2 = -0.0F;
 for (i = 0; i < 24; i++) {
 ex_rowmajor_algorithm_Y.Out2 +=
 ex_rowmajor_algorithm_ConstP.Constant1_Value[i];
 }
}
```

The generated code contains a non-vectorized loop that adds each array element individually.

### Generate SIMD Code With Reduction Optimization

Open the configuration parameters for the model. On the **Modeling** tab, click **Settings**. On the **Optimization** pane, set the **Leverage target hardware instruction set extensions** to SSE2. Alternatively, use the command-line.

```
set_param(model, 'InstructionSetExtensions', 'SSE2');
```

Select the parameter **Optimize reductions**. If you want to optimize reduction operations that operate on floating-point values, set **Support: Non-finite numbers** to Off. Reduction optimization does not support operations on floating-point values when non-finite numbers are supported.

```
set_param(model, 'OptimizeReductions', 'on');
```

Build the model.

```
slbuild(model);
```

```
Starting build procedure for: ex_rowmajor_algorithm
Successful completion of build procedure for: ex_rowmajor_algorithm
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
ex_rowmajor_algorithm	Code generated and compiled.	Generated code was out of date.

1 of 1 models built (0 models already up to date)  
Build duration: 0h 0m 11.342s

Inspect the generated `ex_rowmajor_algorithm_step` function.

```
file = fullfile('ex_rowmajor_algorithm_grt_rtw','ex_rowmajor_algorithm.c');
rtwdemodbtype(file,'/* Model step function */','/* Matfile',1,1);

/* Model step function */
void ex_rowmajor_algorithm_step(void)
{
 int32_T i;

 /* Sum: '<Root>/Sum of Elements Dim1' incorporates:
 * Constant: '<Root>/Constant1'
 */
 ex_rowmajor_algorithm_Y.Out2 = -0.0F;
 for (i = 0; i < 24; i++) {
 ex_rowmajor_algorithm_Y.Out2 +=
 ex_rowmajor_algorithm_ConstP.Constant1_Value[i];
 }

 /* End of Sum: '<Root>/Sum of Elements Dim1' */
}
```

The vectorized loop uses the SSE2 function `mm_add_ps`, which adds four elements of the array to the sum in one step. This optimization improves the execution speed of the generated code.

Open the code generation report. On the **C Code** tab, click **Open Report**.

## Additional Information

Code Generation Advisor	Not run
Optimize reductions	Reductions are optimized using SSE2 Instruction Set Extensions

On the report summary, in the **Additional Information** section, the report indicates that reduction operations are optimized using the SSE2 instruction set.

## Set Hardware Implementation Parameters

Specification of target hardware device characteristics (such as word sizes for `char`, `short`, `int`, and `long` data types, or desired rounding behaviors in integer operations) for generated code can be critical in embedded systems development. The **Hardware Implementation** category of parameters in a configuration set provides a way to control such characteristics in simulation and code generation.

By configuring the **Hardware Implementation** parameters of the active configuration set for a model to match the behaviors of your compiler and hardware, you can generate more efficient code. For example, if you specify the **Byte ordering** parameter, you can avoid generation of extra code that tests the byte ordering of the target CPU.

Before generating and deploying code, get familiar with the **Hardware Implementation** pane of the Configuration Parameters dialog box. By default, target hardware microprocessor device details are hidden. To view the details, click the **Device details** arrow. See “Hardware Implementation Pane” and “Configure Run-Time Environment Options” for more information.

## Optimize Global Variable Usage

### In this section...

“Use Global to Hold Temporary Results” on page 78-2

“Minimize Global Data Access” on page 78-6

To tune your application and choose tradeoffs for execution speed and memory usage, you can choose a global variable reference optimization for the generated code.

On the Configuration Parameters dialog box, in the **Optimize global data access** drop-down list, three parameter options control global variable usage optimizations.

- **None.** Use default optimizations. This choice works well for most models. The code generator balances the use of local and global variables. It generates code which balances RAM and ROM consumption and execution speed.
- **Use global to hold temporary results.** Reusing global variables improves code efficiency and readability. This optimization reuses global variables, which results in the code generator defining fewer variables. It reduces RAM and ROM consumption and data copies.
- **Minimize global data access.** Using local variables to cache global data reduces ROM consumption by reducing code size. This optimization improves execution speed because the code uses fewer instructions for local variable references than for global variable references.

Minimizing the use of global variables by using local variables interacts with stack usage control. For example, stack size can determine the number of local and global variables that the code generator can allocate in the generated code. For more information, see “Customize Stack Space Allocation”.

### Use Global to Hold Temporary Results

The code generator uses global and local variables when you select **None** versus when you select **Use global to hold temporary results**.

#### Example Model

In the model `matlab:rtwdemo_optimize_global_ebf`, an Assignment block assigns values coming from the Inport and Constant blocks to an output signal. The output signal feeds into a Gain block.

```

model = 'rtwdemo_optimize_global_ebf';
load_system('rtwdemo_optimize_global_ebf')

```

## Generate Code Without Optimization

- 1 In the Configuration Parameters dialog box, verify that the **Signal storage reuse** parameter is selected.
- 2 In the Configuration Parameters dialog box, for the **Optimize global data access** parameter, select **None** or enter the following command in the MATLAB® Command Window:

```
set_param('rtwdemo_optimize_global_ebf','GlobalVariableUsage','None');
```

In your system's temporary folder, create a folder for the build and inspection process:

```
currentDir = pwd;
[~,cgDir] = rtwdemodir();
```

Build the model.

```
slbuild(model);

Starting build procedure for: rtwdemo_optimize_global_ebf
Successful completion of build procedure for: rtwdemo_optimize_global_ebf
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_optimize_global_ebf	Code generated and compiled.	Code generation information file does

1 of 1 models built (0 models already up to date)  
Build duration: 0h 0m 21.026s

View the generated code without the optimization. Here is a portion of `rtwdemo_optimize_global_ebf.c`.

```
cfile = fullfile(cgDir,'rtwdemo_optimize_global_ebf_ert_rtw',...
 'rtwdemo_optimize_global_ebf.c');
rtwdemodbtype(cfile,'/* Model step','/* Model initialize',1, 0);

/* Model step function */
void rtwdemo_optimize_global_ebf_step(void)
{
 real_T rtb_Assignment[5];
 int32_T i;

 /* SignalConversion generated from: '<Root>/Assignment' incorporates:
 * Constant: '<Root>/Constant'
 */
 for (i = 0; i < 5; i++) {
 rtb_Assignment[i] = rtCP_Constant_Value[i];
 }

 /* End of SignalConversion generated from: '<Root>/Assignment' */

 /* Assignment: '<Root>/Assignment' incorporates:
 * Inport: '<Root>/In1'
 */
 rtb_Assignment[1] = rtU.In1;
```

```

/* Outport: '<Root>/Out1' incorporates:
 * Gain: '<Root>/Gain'
 */
for (i = 0; i < 5; i++) {
 rtY.Out1[i] = 2.0 * rtb_Assignment[i];
}

/* End of Outport: '<Root>/Out1' */
}

```

The code assigns values to the local vector `rtb_Assignment`. The last statement copies the values in the local vector `rtb_Assignment` to the global vector `rtY.Out1`. Fewer global variable references result in improved execution speed. The code uses more instructions for global variable references than for local variable references.

In the Static Code Metrics Report, examine the Global Variables section.

- 1 In the Code Generation Report window, select **Static Code Metrics Report**.
- 2 Scroll down to the **Global Variables** section.
- 3 Select the **[+]** sign before each variable to expand it.

Global Variable	Size (bytes)	Reads / Writes	Reads / Writes in a Function
<a href="#">[-] rtY</a>	40	1	1
Out1	40	1	1
<a href="#">[-] rtU</a>	8	1	1
In1	8	1	1
<a href="#">[-] rtM_</a>	4	0*	0*
errorStatus	4	0	0
<b>Total</b>	<b>52</b>	<b>2</b>	

\* The global variable is not directly used in any function.

The total number of reads and writes for global variables is 2.

### Generate Code with Optimization

In the Configuration Parameters dialog box, for the **Optimize global data access** parameter, select **Use global to hold temporary results**, or enter the following command in the MATLAB Command Window:

```

set_param('rtwdemo_optimize_global_ebf',...
 'GlobalVariableUsage','Use global to hold temporary results');

```

Build the model.

```

slbuild(model);

```

```

Starting build procedure for: rtwdemo_optimize_global_ebf
Successful completion of build procedure for: rtwdemo_optimize_global_ebf

```

## Build Summary

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_optimize_global_ebf	Code generated and compiled.	Generated code was out of date.

1 of 1 models built (0 models already up to date)  
Build duration: 0h 0m 19.866s

View the generated code with the optimization. Here is a portion of `rtwdemo_optimize_global_ebf.c`.

```
cfile = fullfile(cgDir, 'rtwdemo_optimize_global_ebf_ert_rtw', ...
 'rtwdemo_optimize_global_ebf.c');
rtwdemodbtype(cfile, '/* Model step', '/* Model initialize', 1, 0);

/* Model step function */
void rtwdemo_optimize_global_ebf_step(void)
{
 int32_T i;

 /* SignalConversion generated from: '<Root>/Assignment' incorporates:
 * Assignment: '<Root>/Assignment'
 * Constant: '<Root>/Constant'
 */
 for (i = 0; i < 5; i++) {
 rtY.Out1[i] = rtCP_Constant_Value[i];
 }

 /* End of SignalConversion generated from: '<Root>/Assignment' */

 /* Assignment: '<Root>/Assignment' incorporates:
 * Inport: '<Root>/In1'
 */
 rtY.Out1[1] = rtU.In1;

 /* Outport: '<Root>/Out1' incorporates:
 * Assignment: '<Root>/Assignment'
 * Gain: '<Root>/Gain'
 */
 for (i = 0; i < 5; i++) {
 rtY.Out1[i] *= 2.0;
 }

 /* End of Outport: '<Root>/Out1' */
}
```

The code assigns values to the global vector `rtY.Out1` without using a local variable. This assignment improves ROM and RAM consumption and reduces data copies. The code places the value in the destination variable for each assignment instead of copying the value at the end. In the Static Code Metrics Report, examine the Global Variables section.

Global Variable	Size (bytes)	Reads / Writes	Reads / Writes in a Function
[ - ] <a href="#">rtY</a>	40	4	4
Out1	40	4	4
[ - ] <a href="#">rtU</a>	8	1	1
In1	8	1	1
[ - ] <a href="#">rtM_</a>	4	0*	0*
errorStatus	4	0	0
<b>Total</b>	<b>52</b>	<b>5</b>	

\* The global variable is not directly used in any function.

As a result of using global variables to hold local results, the total number of reads and writes for global variables has increased from 2 to 5. This optimization reduces data copies by reusing global variables.

Close the code generation report.

```
rtwdemoclean;
cd(currentDir)
```

## Minimize Global Data Access

Generate optimized code that reads from and writes to global variables less frequently.

### Example Model

In the model `matlab:rtwdemo_optimize_global`, five signals feed into a Multiport Switch block.

```
model = 'rtwdemo_optimize_global';
load_system('rtwdemo_optimize_global')
```

### Generate Code Without Optimization

- 1 In the Configuration Parameters dialog box, verify that the **Signal storage reuse** parameter is selected.
- 2 In the Configuration Parameters dialog box, for the **Optimize global data access** parameter, select **None** or enter the following command in the MATLAB® Command Window:

```
set_param('rtwdemo_optimize_global', 'GlobalVariableUsage', 'None');
```

In your system's temporary folder, create a folder for the build and inspection process.

```
currentDir = pwd;
[~,cgDir] = rtwdemodir();
```

Build the model.

```
slbuild(model);
```

```
Starting build procedure for: rtwdemo_optimize_global
Successful completion of build procedure for: rtwdemo_optimize_global
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_optimize_global	Code generated and compiled.	Code generation information file does not

```
1 of 1 models built (0 models already up to date)
Build duration: 0h 0m 21.076s
```

View the generated code without the optimization. Here is a portion of `rtwdemo_optimize_global.c`.

```

cfile = fullfile(cgDir,'rtwdemo_optimize_global_ert_rtw',...
 'rtwdemo_optimize_global.c');
rtwdemodbtype(cfile,'/* Model step','/* Model initialize',1, 0);

/* Model step function */
void rtwdemo_optimize_global_step(void)
{
 /* MultiPortSwitch: '<Root>/Multiport Switch' incorporates:
 * Inport: '<Root>/In1'
 */
 switch ((int32_T)rtU.In1) {
 case 1:
 /* Outport: '<Root>/Out1' incorporates:
 * Constant: '<Root>/Constant'
 */
 rtY.Out1 = 1.0;
 break;

 case 2:
 /* Outport: '<Root>/Out1' incorporates:
 * Constant: '<Root>/Constant1'
 */
 rtY.Out1 = 2.0;
 break;

 case 3:
 /* Outport: '<Root>/Out1' incorporates:
 * Constant: '<Root>/Constant2'
 */
 rtY.Out1 = 3.0;
 break;

 default:
 /* Outport: '<Root>/Out1' incorporates:
 * Constant: '<Root>/Constant3'
 */
 rtY.Out1 = 4.0;
 break;
 }

 /* End of MultiPortSwitch: '<Root>/Multiport Switch' */
}

```

In the Static Code Metrics Report, examine the `Global Variables` section.

- 1 In the Code Generation Report window, select **Static Code Metrics Report**.
- 2 Scroll down to the `Global Variables` section.
- 3 Select the **[+]** sign before each variable to expand it.

Global variables defined in the generated code.

Global Variable	Size (bytes)	Reads / Writes	Reads / Writes in a Function
[ - ] <a href="#">rtU</a>	8	1	1
In1	8	1	1
[ - ] <a href="#">rtY</a>	8	4	4
Out1	8	4	4
[ - ] <a href="#">rtM</a>	4	0*	0*
errorStatus	4	0	0
<b>Total</b>	<b>20</b>	<b>5</b>	

\* The global variable is not directly used in any function.

The total number of reads and writes for global variables is 5.

### Enable Optimization and Generate Code

In the Configuration Parameters dialog box, for the **Optimize global data access** parameter, select **Minimize global data access** or enter the following command in the MATLAB Command Window:

```
set_param('rtwdemo_optimize_global',...
 'GlobalVariableUsage','Minimize global data access');
```

Build the model.

```
slbuild(model);
```

```
Starting build procedure for: rtwdemo_optimize_global
Successful completion of build procedure for: rtwdemo_optimize_global
```

Build Summary

Top model targets built:

Model	Action	Rebuild Reason
rtwdemo_optimize_global	Code generated and compiled.	Generated code was out of date.

1 of 1 models built (0 models already up to date)  
Build duration: 0h 0m 17.072s

View the generated code with the optimization. Here is a portion of `rtwdemo_optimize_global.c`.

```
cfile = fullfile(cgDir,'rtwdemo_optimize_global_ert_rtw',...
 'rtwdemo_optimize_global.c');
rtwdemodbtype(cfile,'/* Model step','/* Model initialize',1, 0);

/* Model step function */
void rtwdemo_optimize_global_step(void)
{
 real_T tmp_Out1;

 /* MultiPortSwitch: '<Root>/Multiport Switch' incorporates:
```

```
* Inport: '<Root>/In1'
*/
switch ((int32_T)rtU.In1) {
case 1:
/* Outport: '<Root>/Out1' incorporates:
 * Constant: '<Root>/Constant'
 */
tmp_Out1 = 1.0;
break;

case 2:
/* Outport: '<Root>/Out1' incorporates:
 * Constant: '<Root>/Constant1'
 */
tmp_Out1 = 2.0;
break;

case 3:
/* Outport: '<Root>/Out1' incorporates:
 * Constant: '<Root>/Constant2'
 */
tmp_Out1 = 3.0;
break;

default:
/* Outport: '<Root>/Out1' incorporates:
 * Constant: '<Root>/Constant3'
 */
tmp_Out1 = 4.0;
break;
}

/* End of MultiPortSwitch: '<Root>/Multiport Switch' */

/* Outport: '<Root>/Out1' */
rtY.Out1 = tmp_Out1;
}
```

In `rtwdemo_optimize_global.c`, the code assigns a constant value to the local variable `tmp_Out1` in each case statement. The last statement in the code copies the value of `tmp_Out1` to the global variable `rtY.Out1`. Fewer global variable references result in fewer instructions and improved execution speed.

In the **Static Code Metrics Report**, examine the **Global Variables** section. As a result of minimizing global data accesses, the total number of reads and writes for global variables has decreased from 5 to 2.

Global variables defined in the generated code.

Global Variable	Size (bytes)	Reads / Writes	Reads / Writes in a Function
[ - ] <a href="#">rtU</a>	8	1	1
In1	8	1	1
[ - ] <a href="#">rtY</a>	8	1	1
Out1	8	1	1
[ - ] <a href="#">rtM</a>	4	0*	0*
errorStatus	4	0	0
